ROUTINE TESTS REPORT

VOLTAGE TRANSFORMER

Type: TJP 4.3
Rated frequency: 50/60 Hz
Accuracy class: 0,5(3P)/0,5(3P)/3P
Production number: 1VLT5224010781

Highest voltage: 7.2 kV
Rated ratio: 6600/√3//110/√3/110/√3/110/3 V
Output: 20/30/30 VA
Year of production: 2024

TESTS:

1. Verification of terminal marking acc. to IEC 61869-1 clause 7.3.6
   Conclusion: Satisfactory
2. Power-frequency voltage withstand tests on primary terminals acc.to IEC 61869-3 clause 7.3.1
   Common mode (separate source) power frequency withstand test acc.to IEC 61869-3 clause 7.3.1.302
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
3. Differential mode (induced) AC voltage test acc. to IEC 61869-3 clause 7.3.1.303
   Test value: 20.0 kV, 100 Hz, 1 minute
   Conclusion: Satisfactory
4. Partial discharge measurment acc. to IEC 61869-3 clause 7.3.2 procedure A
   Conclusion: Satisfactory
5. Power-frequency voltage withstand test on secondary terminals acc.to IEC 61869-3 clause 7.3.4
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
6. Tests for accuracy acc.to IEC 61869-3 clause 7.3.5.
   Winding: I: 20 VA/class 0,5(3P)
   Winding: II: 30 VA/class 0,5(3P)
   Winding: III: 30 VA/class 3P
   Conclusion: Satisfactory

The voltage transformer complies with tests required according to IEC Publications 61869-3.

ROUTINE TESTS REPORT

VOLTAGE TRANSFORMER

Type: TJP 4.3
Rated frequency: 50/60 Hz
Accuracy class: 0,5(3P)/0,5(3P)/3P
Production number: 1VLT5224010782

Highest voltage: 7.2 kV
Rated ratio: 6600/√3//110/√3/110/√3/110/3 V
Output: 20/30/30 VA
Year of production: 2024

TESTS:

1. Verification of terminal marking acc. to IEC 61869-1 clause 7.3.6
   Conclusion: Satisfactory
2. Power-frequency voltage withstand tests on primary terminals acc.to IEC 61869-3 clause 7.3.1
   Common mode (separate source) power frequency withstand test acc.to IEC 61869-3 clause 7.3.1.302
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
3. Differential mode (induced) AC voltage test acc. to IEC 61869-3 clause 7.3.1.303
   Test value: 20.0 kV, 100 Hz, 1 minute
   Conclusion: Satisfactory
4. Partial discharge measurment acc. to IEC 61869-3 clause 7.3.2 procedure A
   Conclusion: Satisfactory
5. Power-frequency voltage withstand test on secondary terminals acc.to IEC 61869-3 clause 7.3.4
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
6. Tests for accuracy acc.to IEC 61869-3 clause 7.3.5.
   Winding: I: 20 VA/class 0,5(3P)
   Winding: II: 30 VA/class 0,5(3P)
   Winding: III: 30 VA/class 3P
   Conclusion: Satisfactory

The voltage transformer complies with tests required according to IEC Publications 61869-3.

ROUTINE TESTS REPORT

VOLTAGE TRANSFORMER

Type: TJP 4.3
Rated frequency: 50/60 Hz
Accuracy class: 0,5(3P)/0,5(3P)/3P
Production number: 1VLT5224010785

Highest voltage: 7.2 kV
Rated ratio: 6600/√3//110/√3/110/√3/110/3 V
Output: 20/30/30 VA
Year of production: 2024

TESTS:

1. Verification of terminal marking acc. to IEC 61869-1 clause 7.3.6
   Conclusion: Satisfactory
2. Power-frequency voltage withstand tests on primary terminals acc.to IEC 61869-3 clause 7.3.1
   Common mode (separate source) power frequency withstand test acc.to IEC 61869-3 clause 7.3.1.302
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
3. Differential mode (induced) AC voltage test acc. to IEC 61869-3 clause 7.3.1.303
   Test value: 20.0 kV, 100 Hz, 1 minute
   Conclusion: Satisfactory
4. Partial discharge measurment acc. to IEC 61869-3 clause 7.3.2 procedure A
   Conclusion: Satisfactory
5. Power-frequency voltage withstand test on secondary terminals acc.to IEC 61869-3 clause 7.3.4
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
6. Tests for accuracy acc.to IEC 61869-3 clause 7.3.5.
   Winding: I: 20 VA/class 0,5(3P)
   Winding: II: 30 VA/class 0,5(3P)
   Winding: III: 30 VA/class 3P
   Conclusion: Satisfactory

The voltage transformer complies with tests required according to IEC Publications 61869-3.

2. Power-frequency voltage withstand tests on primary terminals acc.to IEC 61869-3 clause 7.3.1
   Common mode (separate source) power frequency withstand test acc.to IEC 61869-3 clause 7.3.1.302
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
3. Differential mode (induced) AC voltage test acc. to IEC 61869-3 clause 7.3.1.303
   Test value: 20.0 kV, 100 Hz, 1 minute
   Conclusion: Satisfactory
4. Partial discharge measurment acc. to IEC 61869-3 clause 7.3.2 procedure A
   Conclusion: Satisfactory
5. Power-frequency voltage withstand test on secondary terminals acc.to IEC 61869-3 clause 7.3.4
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
6. Tests for accuracy acc.to IEC 61869-3 clause 7.3.5.
   Winding: I: 20 VA/class 0,5(3P)
   Winding: II: 30 VA/class 0,5(3P)
   Winding: III: 30 VA/class 3P
   Conclusion: Satisfactory

The voltage transformer complies with tests required according to IEC Publications 61869-3.

ROUTINE TESTS REPORT

VOLTAGE TRANSFORMER

Type: TJP 4.3
Rated frequency: 50/60 Hz
Accuracy class: 0,5(3P)/0,5(3P)/3P
Production number: 1VLT5224010886

Highest voltage: 7.2 kV
Rated ratio: 6600/√3//110/√3/110/√3/110/3 V
Output: 20/30/30 VA
Year of production: 2024

TESTS:

1. Verification of terminal marking acc. to IEC 61869-1 clause 7.3.6
   Conclusion: Satisfactory
2. Power-frequency voltage withstand tests on primary terminals acc.to IEC 61869-3 clause 7.3.1
   Common mode (separate source) power frequency withstand test acc.to IEC 61869-3 clause 7.3.1.302
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
3. Differential mode (induced) AC voltage test acc. to IEC 61869-3 clause 7.3.1.303
   Test value: 20.0 kV, 100 Hz, 1 minute
   Conclusion: Satisfactory
4. Partial discharge measurment acc. to IEC 61869-3 clause 7.3.2 procedure A
   Conclusion: Satisfactory
5. Power-frequency voltage withstand test on secondary terminals acc.to IEC 61869-3 clause 7.3.4
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
6. Tests for accuracy acc.to IEC 61869-3 clause 7.3.5.
   Winding: I: 20 VA/class 0,5(3P)
   Winding: II: 30 VA/class 0,5(3P)
   Winding: III: 30 VA/class 3P
   Conclusion: Satisfactory

The voltage transformer complies with tests required according to IEC Publications 61869-3.

ROUTINE TESTS REPORT

VOLTAGE TRANSFORMER

Type: TJP 4.3
Rated frequency: 50/60 Hz
Accuracy class: 0,5(3P)/0,5(3P)/3P
Production number: 1VLT5224010889

Highest voltage: 7.2 kV
Rated ratio: 6600/√3//110/√3/110/√3/110/3 V
Output: 20/30/30 VA
Year of production: 2024

TESTS:

1. Verification of terminal marking acc. to IEC 61869-1 clause 7.3.6
   Conclusion: Satisfactory
2. Power-frequency voltage withstand tests on primary terminals acc.to IEC 61869-3 clause 7.3.1
   Common mode (separate source) power frequency withstand test acc.to IEC 61869-3 clause 7.3.1.302
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
3. Differential mode (induced) AC voltage test acc. to IEC 61869-3 clause 7.3.1.303
   Test value: 20.0 kV, 100 Hz, 1 minute
   Conclusion: Satisfactory
4. Partial discharge measurment acc. to IEC 61869-3 clause 7.3.2 procedure A
   Conclusion: Satisfactory
5. Power-frequency voltage withstand test on secondary terminals acc.to IEC 61869-3 clause 7.3.4
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
6. Tests for accuracy acc.to IEC 61869-3 clause 7.3.5.
   Winding: I: 20 VA/class 0,5(3P)
   Winding: II: 30 VA/class 0,5(3P)
   Winding: III: 30 VA/class 3P
   Conclusion: Satisfactory

The voltage transformer complies with tests required according to IEC Publications 61869-3.

ROUTINE TESTS REPORT

VOLTAGE TRANSFORMER

Type: TJP 4.3
Rated frequency: 50/60 Hz
Accuracy class: 0,5(3P)/0,5(3P)/3P
Production number: 1VLT5224010943

Highest voltage: 7.2 kV
Rated ratio: 6600/√3//110/√3/110/√3/110/3 V
Output: 20/30/30 VA
Year of production: 2024

TESTS:

1. Verification of terminal marking acc. to IEC 61869-1 clause 7.3.6
   Conclusion: Satisfactory
2. Power-frequency voltage withstand tests on primary terminals acc.to IEC 61869-3 clause 7.3.1
   Common mode (separate source) power frequency withstand test acc.to IEC 61869-3 clause 7.3.1.302
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
3. Differential mode (induced) AC voltage test acc. to IEC 61869-3 clause 7.3.1.303
   Test value: 20.0 kV, 100 Hz, 1 minute
   Conclusion: Satisfactory
4. Partial discharge measurment acc. to IEC 61869-3 clause 7.3.2 procedure A
   Conclusion: Satisfactory
5. Power-frequency voltage withstand test on secondary terminals acc.to IEC 61869-3 clause 7.3.4
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
6. Tests for accuracy acc.to IEC 61869-3 clause 7.3.5.
   Winding: I: 20 VA/class 0,5(3P)
   Winding: II: 30 VA/class 0,5(3P)
   Winding: III: 30 VA/class 3P
   Conclusion: Satisfactory

The voltage transformer complies with tests required according to IEC Publications 61869-3.

ROUTINE TESTS REPORT

VOLTAGE TRANSFORMER

Type: TJP 4.3
Rated frequency: 50/60 Hz
Accuracy class: 0,5(3P)/0,5(3P)/3P
Production number: 1VLT5224010946

Highest voltage: 7.2 kV
Rated ratio: 6600/√3//110/√3/110/√3/110/3 V
Output: 20/30/30 VA
Year of production: 2024

TESTS:

1. Verification of terminal marking acc. to IEC 61869-1 clause 7.3.6
   Conclusion: Satisfactory
2. Power-frequency voltage withstand tests on primary terminals acc.to IEC 61869-3 clause 7.3.1
   Common mode (separate source) power frequency withstand test acc.to IEC 61869-3 clause 7.3.1.302
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
3. Differential mode (induced) AC voltage test acc. to IEC 61869-3 clause 7.3.1.303
   Test value: 20.0 kV, 100 Hz, 1 minute
   Conclusion: Satisfactory
4. Partial discharge measurment acc. to IEC 61869-3 clause 7.3.2 procedure A
   Conclusion: Satisfactory
5. Power-frequency voltage withstand test on secondary terminals acc.to IEC 61869-3 clause 7.3.4
   Test value: 3 kV, 50/60 Hz, 1 minute
   Conclusion: Satisfactory
6. Tests for accuracy acc.to IEC 61869-3 clause 7.3.5.
   Winding: I: 20 VA/class 0,5(3P)
   Winding: II: 30 VA/class 0,5(3P)
   Winding: III: 30 VA/class 3P
   Conclusion: Satisfactory

The voltage transformer complies with tests required according to IEC Publications 61869-3.

Brno, the: 23.05.2024

(a) Effettuare la misura dello spessore sul provino e su un pezzo ogni 15 del lotto (o almeno un pezzo tra i componenti con stesso RAL), indicando il valore misurato sullo spazio apposito, la prova di aderenza va eseguita esclusivamente sul provino (una ogni RAL diverso)

N.B. Il provino per commessa deve essere il primo pezzo montato sulla catena, per ogni commessa/costruzione

(a)Measure the thickness on the specimen and on one piece every 15 of the lot (or at least one pièce among the components with the same RAL), indicating the value measured on the space provided, the adhesion test must be performed exclusively on the specimen (one each different RAL)

N.B. The order specimen must be the first piece mounted on the chain, for each order / construction

CERTIFICATO DI CONFORMITÀ DEL CONTROLLO DELLA PRODUZIONE IN FABBRICA / *CERTIFICATE OF CONFORMITY OF THE FACTORY PRODUCTION CONTROL*

N./*No.* 0474-CPR-2451

In conformità al Regolamento (UE) N. 305/2011 del Parlamento Europeo e del Consiglio del 9 marzo 2011 (Regolamento Prodotti da Costruzione o CPR), questo certificato si applica al prodotto da costruzione /

In compliance with Regulation (EU) No. 305/2011 of the European Parliament and of the Council of 9 March 2011 (the Construction Products Regulation or CPR), this certificate applies to the construction product

Componenti strutturali e kit per strutture di acciaio /
Structural components and kits for steel structures

come descritto nell'allegato al presente certificato / *as described in the annex to this certificate*

immesso sul mercato con il nome o con il marchio di / *placed on the market under the name or trade mark of*

EUROMETAL S.R.L.

Via Ciro Amedeo Moriconi, 4 - 60035 Jesi (AN)

e fabbricato nello stabilimento di produzione / *and produced in the manufacturing plant*

Via Ciro Amedeo Moriconi, 4 - 60035 Jesi (AN)

Il presente certificato attesta che tutte le disposizioni riguardanti la valutazione e la verifica della costanza della prestazione descritte nell'Allegato ZA della norma /

This certificate attests that all provisions concerning the assessment and verification of constancy of performance described in Annex ZA of the standard

EN 1090-1:2009+A1:2011

nell'ambito del sistema 2+ sono applicate e che / *under system 2+ are applied and that*

il controllo della produzione in fabbrica è valutato conforme ai requisiti applicabili /
the factory production control is assessed to be in conformity with the applicable requirements

Il presente certificato è stato emesso la prima volta il 16/12/2021 ed ha validità sino a che né la norma armonizzata, il prodotto da costruzione, i metodi AVCP né le condizioni di produzione nell'impianto sono significativamente modificati, a meno che non sia sospeso o ritirato dall'organismo notificato di certificazione del controllo della produzione in fabbrica /

This certificate was first issued on 16/12/2021 and will remain valid as long as neither the harmonised standard, the construction product, the AVCP methods nor the manufacturing conditions in the plant are modified significantly, unless suspended or withdrawn by the notified factory production control certification body

WELDING PROCEDURE QUALIFICATION RECORD (WPQR)

LEVEL 2

N. 21FI00494PW2/A

Manufacturer **EUROMETAL S.R.L. – Jesi (AN)**

WPQR No. **02/21-A** Dated **27/10/2021**

Manufacturer's welding procedure (WPS) No. **02/21** Dated **27/09/2021**

RANGE OF QUALIFICATION

Welding process **135** Type **Partly mechanized**

Joint type **Plates and Pipes and build-up FW**

Single/Multiple pass **Multiple** (**Impact properties not applied**)

Parent material group(s) **1-1** ISO/TR 15608; ISO/TR20172; ISO/TR 20173; ISO/TR20174 with a specified minimum yield strength ≤ 355 MPa

Parent material thickness (mm) Butt Joint = **N.A.** Fillet Joint t_1 **= 5 and over** t_2 **= 5 and over**

Throat thickness (mm) **No restriction**

Weld deposit thickness (mm) **N.A.**

Outside pipe diameter (mm) **>150 (PA, PB, PF rotated position); >500 (all other qualified positions)**

Filler metal make **N.A.** Nr. of wires for process 12: **N.A.**

Flux make **N.A.** Flux Designation: **N.A.**

Filler metal designation **Solid wire EN ISO 14341-A: G 42 4 M 3Si1**

Shielding gas (ISO 14175) **M20 with CO2% min. 6,4 max. 9,6** Backing gas (ISO 14175) **N.A.**

Type of welding current **DCEP** **Heat Input** kJ/cm **Min. 7,6**

Welding position **PB** Transfer Mode **Spray, Pulse, Globular transfer**

Preheat min. (°C) **30** (if ISO/TR 17671-2 requirements are fulfilled)

Interpass temp. Max. (°C) **250** Postheat min. (°C) **N.A.** Time (minutes) **N.A.**

Post weld heat treatment / Ageing **None** Time (minutes) **N.A.**

Other information **-**

Welder's/Operator's name **Marini Federico** Stamp No. **MF**

Welding test conducted by **EUROMETAL S.R.L. – Jesi (AN)**

Mechanical test conducted by **Meccano Spa - Fabriano (AN)** Laboratory test No. **RPLMA 023121/03 dated 20/10/2021**

At presence of RINA Surveyor **M. Giacomini**

We confirm that statements in this record are correct and that the test welds were prepared, welded and tested and have fulfilled the requirements in accordance with **UNI EN ISO 15614-1: 2019** Standard

Issued at: Genova on 27 October 2021

DISTRIBUTION SOLUTIONS

VD4

Medium voltage vacuum circuit breakers 12...40.5 kV - 630...4000 A - 16...63 kA

VD4 medium voltage circuit breakers use vacuum interrupters embedded in the poles. This construction method makes the poles particularly sturdy and protects the interrupter from shocks, dust and condensation.

VD4 circuit breakers are the best choice for the majority of modern electricity distribution applications and are used in transformer and distribution substations to control and protect motors, transformers, capacitor banks and for protecting cables.

VD4:
its strengths, your benefits

Global availability

Safety and protection

Reliable in extreme conditions

Productivity
Maximize your output

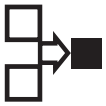
Services and training
- Dedicated training for installation and maintenance
  - Specialized ABB personnel for installation and maintenance
- Backup at your location and analysis for special applications
  - ABB technical support helps you choose the best solution for your specific application

Easy to install
- Withdrawable version available
  - Circuit breaker can be rapidly racked-in/out for maintenance
  - The complete circuit breaker is ready for installation in the switchgear

Speed up your projects
- Breaker+cassette proposal
  - Speedier engineering thanks to tried-and-tested ABB design
- Technical collaboration agreements
  - New switchgear configurations take less time to develop

Continuous operation
- Excellent quality product thanks to high process automation
  - Reliable, high quality product

Reliability
Protect your assets



Safety and protection
- Motor-driven truck for remote circuit breaker racking-in/out
  – The breaker can be safely put into the service or test position without the need for an operator in front of the switchgear
- Truck interlocking magnet: prevents breaker from being racked into switchgear with different rated current or without the auxiliary circuit plug connected
  – No risk of installing the wrong breaker in the switchgear or without its protection functions having been activated.

Reliable in extreme conditions
- Vacuum interrupters embedded in the poles
  – The core components of the breaker are completely protected against mechanical shocks, dust and condensation

Global availability
- The world’s best-selling circuit breaker
  – Our worldwide presence means you can rely on us for any type of support you may require

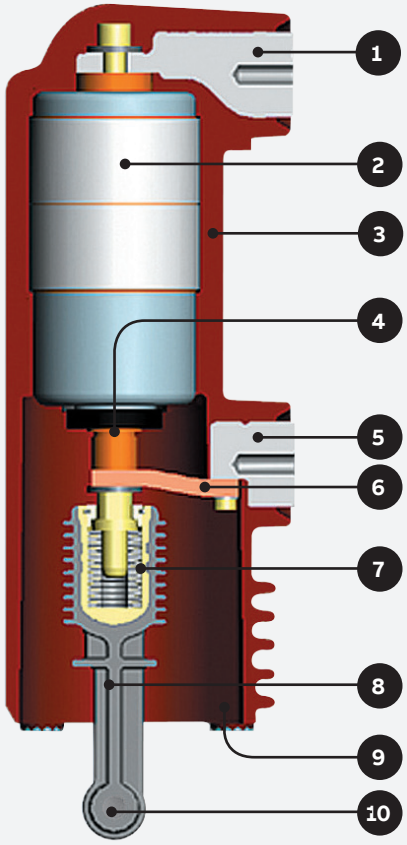
Optimized interface

- Standardized product family up to 40.5 kV, 4000A
  - A common, simplified interface and accessories for the whole product family
- Mechanically Interchangeable with HD4
  - The same switchgear configuration is used to host breakers with both interruption technologies
- Fixed version with truck assembled and ready to be customized
  - The contact system most suited to your switchgear can be designed and created thanks to the already assembled interlocking system

Efficiency
Optimize your investments

Affordable Range

- Technical collaboration agreements
  - Allow you to cut investment costs when new switchgears are designed



Optimized logistics

- Poles in thermoplastic material make the breaker lighter
  - Easily handled breakers and reduced transport charges

Description

These new VD4 circuit breakers exemplify ABB's proven vacuum interrupter engineering and manufacturing technology, as well as the superior design standards employed in the production of circuit breakers.
VD4 medium voltage circuit breakers use vacuum interrupters embedded in the poles. This construction technique makes the poles of the circuit breaker particularly sturdy and protects the interrupter from shocks, dust and condensation. The vacuum interrupter houses the contacts and forms the interruption chamber.

Vacuum current interruption
The vacuum circuit breaker does not require an interrupting and insulating medium. Interrupters do not, in fact, contain ionizable material.
The electric arc that generates when the contacts separate is merely formed by melted and vaporized contact material.
Supported by the external energy, the electric arc persists until the current annuls near natural zero crossing. In that instant, the dielectric properties are very rapidly restored by the sharp reduction in the density of the conveyed load and rapid condensation of the metallic vapor.
Thus the vacuum interrupter recovers insulating capacity and the ability to withstand transient recovery voltage, thereby definitively extinguishing the arc.

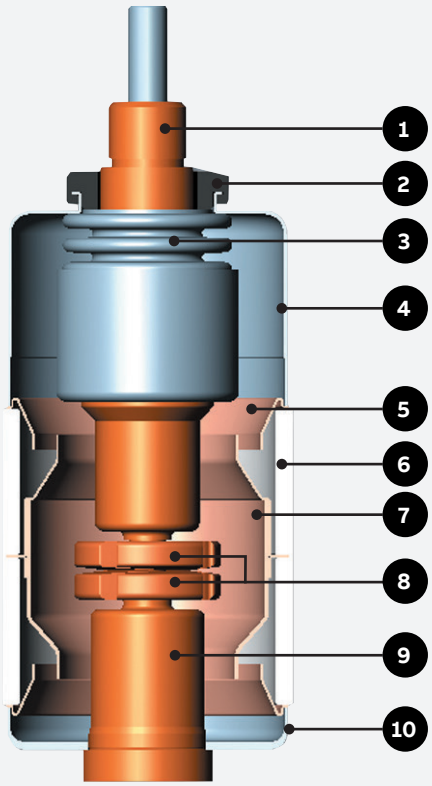
Vacuum interrupter embedded in the pole

- **Vacuum interruption technique**
- **Vacuum contacts protected against oxidation and contamination**
- **Vacuum interrupter embedded in the pole**
- **Interrupter protected against shocks, dust and condensation**
- **Operation under different climatic conditions**
- **Limited switching energy**
- **Stored energy operating mechanism with anti-pumping device supplied as standard**
- **Simple customizing with a complete range of accessories**
- **Fixed and withdrawable version**
- **Compact dimensions**
- **Sealed-for-life poles**
- **Sturdy and reliable**
- **Limited maintenance**
- **Circuit breaker racked in and out with door closed**
- **Incorrect and hazardous operations are prevented thanks to special locks in the operating mechanism and truck**
- **High environmental compatibility**

Since high dielectric strength can be reached in the vacuum, even with minimum distances, circuit breaking is also guaranteed when the contacts separate a few milliseconds before natural current zero crossing.
The special shape of the contacts, the material used, as well as the limited duration and low voltage of the arc, guarantee minimum contact wear and long life. In addition, the vacuum also prevents contact oxidation and contamination.

Operating mechanism
The low speed of the contacts, their reduced travel and exposed conductive part, limit the energy required for the operation and therefore guarantee extremely low wear on the system.
This means that the circuit breaker only requires very little maintenance.

VD4 circuit breakers have mechanical operating mechanisms with stored energy and free trip. These characteristics allow opening and closing operations to be performed independently of the operator. The operating mechanism is of a simple design, easy to use and can be customized with a wide range of accessories which are straightforward and rapidly installed. This simplicity enhances the reliability of the apparatus.



The structure
The operating mechanism and the poles are fixed to a metal frame which also acts as the support for the fixed version of the circuit breaker.
The compact structure is sturdy and ensures mechanical reliability.
Apart from the isolating contacts and the cord with plug for connecting the auxiliary circuits, the withdrawable version is complete with truck for racking it in and out of the switchgear or enclosure with the door closed.

Description

Interruption principle of ABB interrupters

In a vacuum interrupter, the electric arc begins the instant in which the contacts separate. It persists until zero current is reached and can be influenced by the magnetic field.

1. Stem/terminal
2. Twist protection
3. Metal bellows
4. Interrupter enclosure

10. Interrupter enclosure

Vacuum interrupter

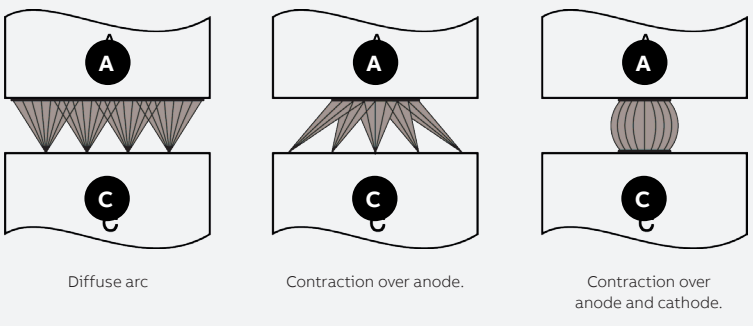

Diagram of transition from diffuse arc to contracted arc in a vacuum interrupter.

Vacuum arc – diffuse or contracted

Individual melting points form on the surface of the cathode after the contacts separate. This leads to the formation of metallic vapors which support the arc itself.

The diffuse vacuum arc is characterized by expansion over the contact surface itself and by evenly distributed thermal stress.

At the rated current of the vacuum interrupter, the electric arc is always of the diffuse type. Contact erosion is very limited and the number of current interruptions very high.

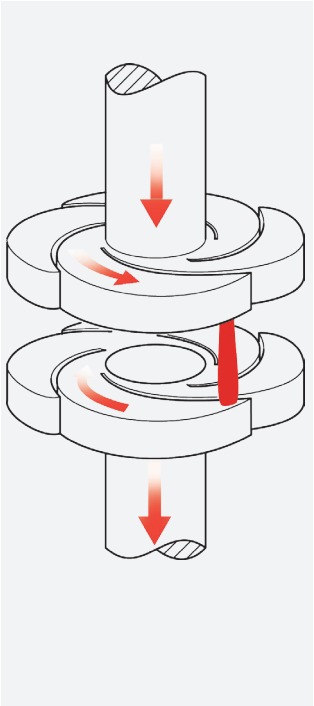
As the interrupted current value increases (beyond rated value), the electric arc tends to change from the diffuse to contracted type, owing to the Hall effect.

Starting out from the anode, the arc contracts and tends to concentrate as the current increases. There is a temperature rise on a level with the affected area and the contact is consequently subjected to thermal stress.

To prevent the contacts from overheating and becoming eroded, the arc is made to rotate. By turning, the arc becomes similar to a moving conductor through which current passes.

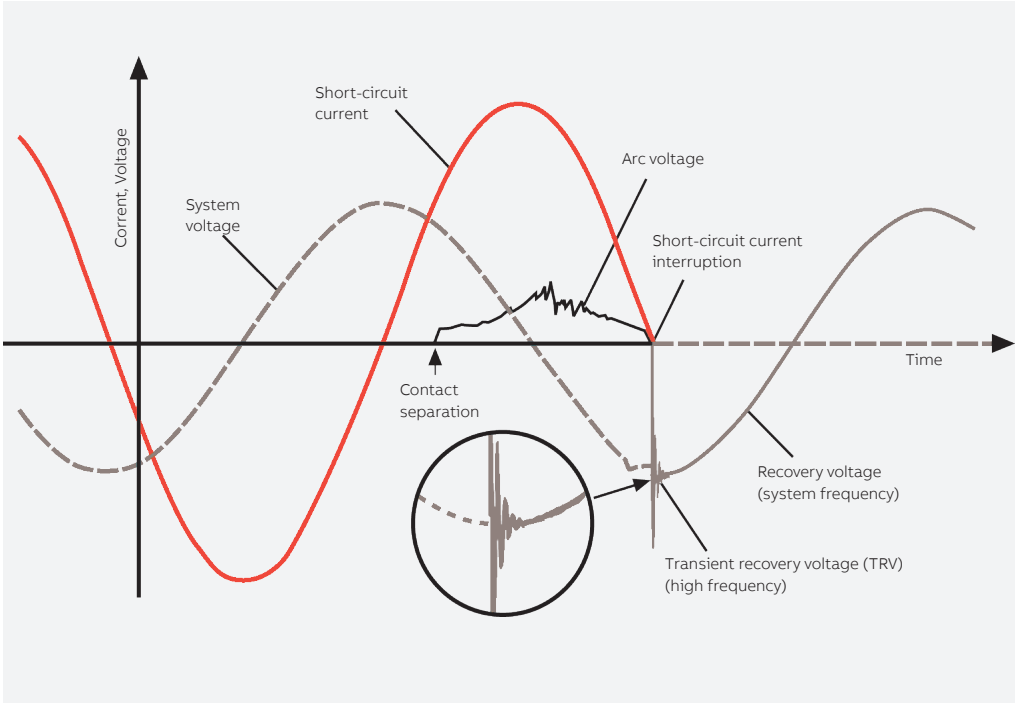
The spiral shape of ABB vacuum interrupter contacts

The special spiral shape of the contacts generates a radial magnetic field in all parts of the arc column, concentrated around the circumferences of the contacts.



The electromagnetic force that self-generates, acts tangentially and causes the arc to spin rapidly around the axis of the contacts.

This forces the arc to turn and affect a larger area than that of a fixed contracted arc.



Besides minimizing the thermal stress to which the contacts are subjected, all this ensures that these latter are only eroded to a negligible extent and, above all, allows the interruption process to be controlled even with very high short-circuit current values.

ABB vacuum interrupters interrupt at natural current zero crossing, thereby preventing the arc from restriking after this has occurred.

Rapid reduction in current density at the same time as the zero current instant allow maximum dielectric strength to be re-established between the interrupter contacts within a few microseconds.

Geometry of radial magnetic field contact with a rotating vacuum arc.

Development of current and voltage trends during a single phase vacuum interruption process.

Description

Versions available

VD4 circuit breakers are available in the fixed and withdrawable versions with front operating mechanism.
The withdrawable version is available for UniGear ZS1, ZS2, ZS8.4 and UniSec switchgear and for PowerCube and Powerbloc enclosures.

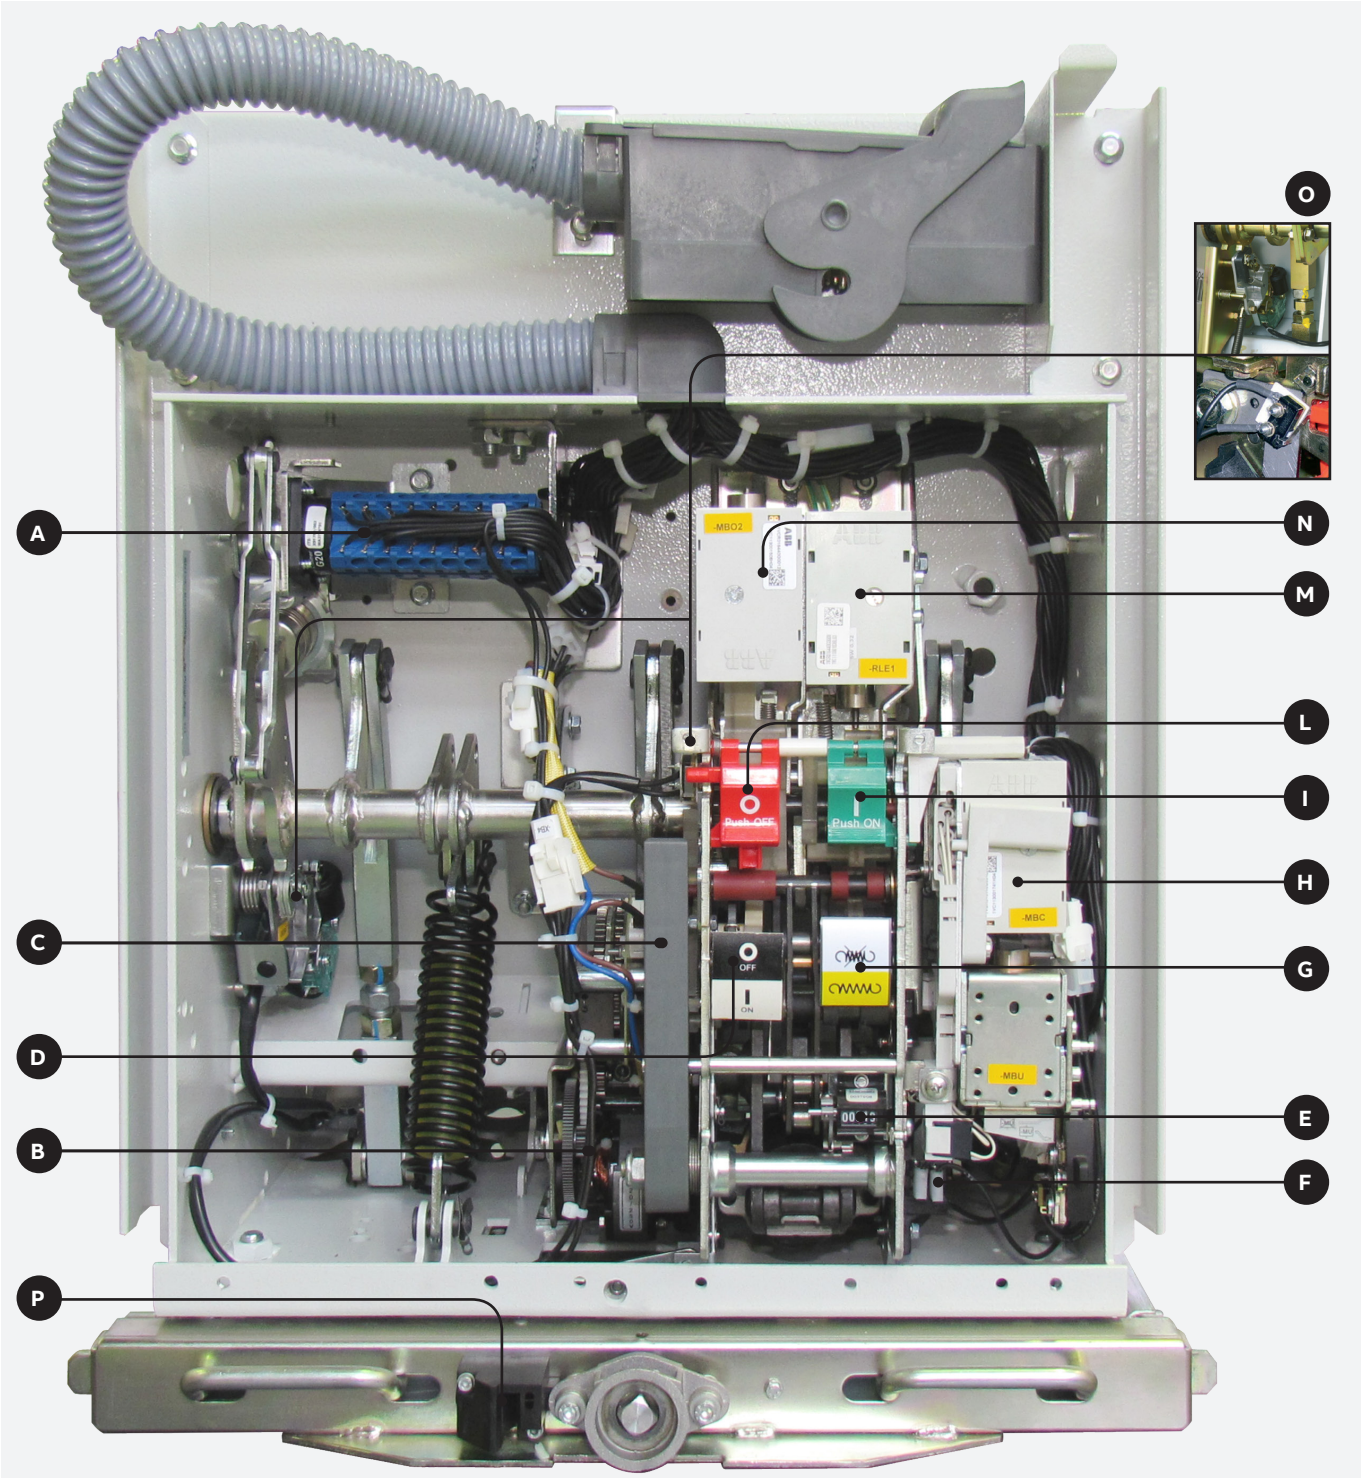
Fields of application

VD4 circuit breakers are used in power distribution systems for controlling and protecting cables, transformer and distribution substations, motors, transformers and capacitor banks.

Standards

VD4 circuit breakers comply with IEC 62271-100 Standards and those of the major industrialized countries.
VD4 circuit breakers undergo the tests indicated below and guarantee the safety and reliability of apparatus in service in every installation.

- **Type tests:** temperature rise, tests to verify the insulation level (tests with rated lightning impulse withstand voltage and power frequency withstand voltage), peak and short-time withstand current tests, mechanical life, shortcircuit current making and breaking capacity.
- **Individual tests:** insulation of the main circuits with voltage at power frequency, auxiliary and operating circuit insulation, measurement of the main circuit resistance, mechanical and electrical operation.



Safe service

Thanks to the complete range of mechanical and electrical locks (available on request), VD4 circuit breakers can be used to create reliable distribution switchgear.
The locking devices are designed to prevent incorrect operations and allow the installations to be inspected in conditions of operator safety.
Key locks or padlocks enable the opening and closing and/or racking in and out operations.
The device for racking-out with the door closed only allows the circuit breaker to be racked in or out of the switchgear with the door closed.
Anti-racking-in locks prevent circuit breakers with different rated currents from being racked in, and racking-in and out operations with the circuit breaker closed.

- **Highly reliable operating mechanisms since they have very few components**
- **Extremely limited, simple maintenance**
- **Accessories common to the entire range**
- **Electrical accessories that can be easily and quickly installed or replaced thanks to wiring pre-engineered with plug-socket connectors**
- **Mechanical anti-pumping device supplied as standard equipment**
- **Built-in closing spring loading lever**
- **Circuit breaker open key lock**
- **Protective covering over the opening and closing pushbuttons that can only operated with a special tool**
- **Padlock device on the operating pushbuttons**

Accessories

VD4 circuit breakers have a complete range of accessories able to meet all installation requirements.
The operating mechanism has a standardized range of accessories and replacement parts which are easy to identify and order.
The accessories are installed conveniently from the front of the circuit breaker. Electrical connection is performed with plug-socket connectors.
Use, maintenance and operation of the apparatus are simple and require limited use of resources.

Circuit breaker operating mechanism

A Open/closed auxiliary contacts
B Geared motor for loading closing spring
C Built-in closing spring loading lever
D Mechanical signaling device for circuit breaker open/closed
E Mechanical operation counter
F Contacts for signaling spring loaded/discharged
G Signaling device for closing springs loaded/discharged
H Service releases
I Closing pushbutton
L Opening pushbutton
M Operating mechanism locking electromagnet
N Additional shunt opening release
O Transient contact

Description

VD4 evo
Evolution that Empowers

Complete health status assessment for intelligent operation and maintenance

30%

Reduction of unexpected outages

Reliability

60%

Operation and maintenance efficiency increase

Efficiency

15%

Footprint optimization and time savings

Productivity

Improve your OpEx by cutting outages and maintenance cost with the future of medium voltage circuit breakers

VD4 is now available with the new VD4 evo series of accessories and configuration coming from the ABB family of Digital components.

The primary components of the circuit breaker are the same assuring full interchangeably with previous version and keeping same reliability and performance, but enhancing Digital features.

Such new accessories can be equipped on the new units recognizable from the new cover design, that will be available on all the VD4 family very soon.

VD4 evo can be ordered with different configurations specific for your need: either fully equipped device option for Advanced Monitor & Diagnostic features or as a standard configuration, but with possibility of future upgrade. Check the accessories section of the catalogue for the full list and the rating table section for the available ratings.

Digital transformation starts from breaker evolution

Available versions

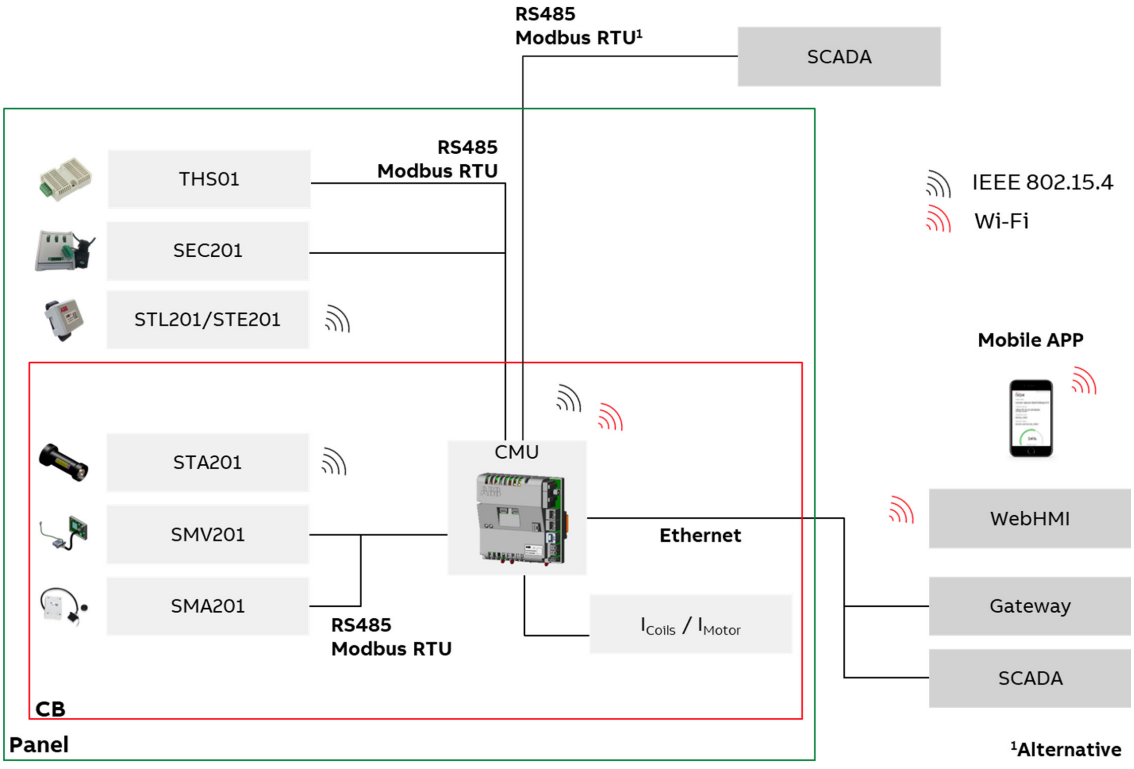
VD4 in VD4 evo version evo is available in either Standard or Digital configurations, depending on customer application needs.

The Digital version is available in 3 main packages:

- **Basic,** offers a basic yet comprehensive health and status management of the main circuit breaker components like the actuator and conductor integrity via thermal monitoring;
- **Advanced,** in addition to basic offering it is possible to get more comprehensive mechanical checks with travel curve monitoring, dynamic thermal monitoring and VI life check;
- **Flexible,** features can be selected individually depending on the application needs.

The Standard VD4 evo offers the possibility of upgrade to Digital version with the “Digital upgrade” kits, but does not provide monitoring and diagnostic features by default.

Features	Digital			Standard
	VD4 evo Basic	VD4 evo Advanced	VD4 evo Flexible	VD4 evo
Warnings and alarms with suggestions from expert	•	•	•	Upgradable
Environmental temperature and humidity monitoring	•	•	•	
Basic mechanical kinematic chain anomalies detection	•	•	•	
Accessories monitoring and replacement suggestions	•	•		
Loose connections detection and CB contacts monitoring	•	•		
Predict CB mechanical failures		•	•	
Advanced thermal checks & VI life		•	•	
Advanced mechanical chain and travel curve monitor		•		



See the accessories section of the catalogue for more information on the available sensors and kits.

Interfaces

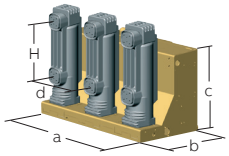
You have access to the circuit breaker information from the new dedicated WebHMI, that was designed to be intuitive and familiar as other ABB products. To access the Digital features, there are different connectivity options:

- Locally in site using the breaker hotspot Wi-Fi connection, with the option of using the Mobile APP RXplore for one-click connection via QR-CODE
- Via ethernet cable included in the breaker plug (if selected)
- Connecting the breaker to a SCADA system through Modbus TCP

For connections details and instruction see the dedicated Configuration Manual.

*SMV201 Vibration sensor coming soon

Description



General characteristics of the VD4 series

The VD4 series of vacuum circuit breakers conform to the specifications of the following standards:

Quality System
Complies with EN ISO 9001 Standards, certified by an independent organisation.

Test Laboratory
Complies with EN ISO/IEC 17025 Standards, accredited by an independent organisation.

Environmental Management System
Complies with EN ISO 14001 Standards, certified by an independent organisation.

Health and Safety Management System
Complies with OHSAS 18001 Standards, certified by an independent organisation.

Akkreditierung
Die Deutsche Akkreditierungsstelle Technik (DATech) e.V. bestätigt hiermit, dass das Prüflaboratorium
PEHLA Testing Laboratories Ratingen
Oberhausener Str. 33
D-40472 Ratingen
die Kompetenz nach DIN EN ISO/IEC 17025 besitzt, Prüfungen in den Bereichen
Hochspannungsschaltanlagen und -schaltgeräte,
Strom- und Spannungswandler, Transformatoren und
Sammelschienensysteme
nach den in der Anlage aufgeführten Normen und Spezifikationen auszuführen.
Die Akkreditierung ist gültig bis: 14.10.2008
Die Anlage ist Bestandteil der Urkunde und besteht aus 2 Seiten.

(1) Poles in polyamide
(2) On request, the closing spring can be loaded by means of a removable crank handle outside operating mechanism (instead of linear loading by a lever built into the front of operating mechanism)
(3) Up to 4000 A with forced ventilation

W = Width of circuit breaker.
D = Depth of circuit breaker.
u/l = Distance between bottom and top terminals.
l/g = Distance between bottom terminal and bearing surface of circuit breaker.
P = Horizontal center distance of poles.

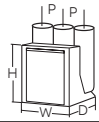
Standard equipment of fixed circuit breakers
The basic versions of the fixed circuit breakers are three-pole and equipped with:

- EL or Classic manual operating mechanism
- mechanical signaling device for closing springs loaded/discharged
- mechanical signaling device for circuit breaker open/closed
- closing pushbutton, opening pushbutton and operation counter
- set of ten auxiliary circuit breaker break/make contacts
  Note: three break contacts (signaling circuit breaker open) and five make contacts (signaling circuit breaker closed) are available with the group of ten auxiliary contacts supplied as standard and the maximum number of electrical applications.
- lever built into operating mechanism for linear loading of closing spring.

VD4 - up to 24 kV



VD4 - 36 kV

(1) Rated current guaranteed with circuit breaker installed in UniGear ZS1 switchgear and with 40 °C ambient temperature.
(2) Available at 10kV according to GOST R 52565 standard with Ud=42kV
(3) Poles in polyamide
(4) On request, the closing spring can be loaded by means of a removable crank handle outside the operating mechanism (instead of linear loading, only possible with the door open, by means of a lever built into the front of the operating mechanism).
(5) For 1s
(6) Refer to chapter “Description” for more details

([1]) Rated current guaranteed with circuit breaker installed in UniGear ZS1 switchgear and with 40 °C ambient temperature.
([2]) Please consult drawing 2RDA032149 of “Overall dimensions” section for 210 mm pole center distance.
([3]) Poles in polyamide
([4]) On request, the closing spring can be loaded by means of a removable crank handle outside the operating mechanism (instead of linear loading, only possible with the door open, by means of a lever built into the front of the operating mechanism).
([5]) For 1s
([6]) Refer to chapter “Description” for more details

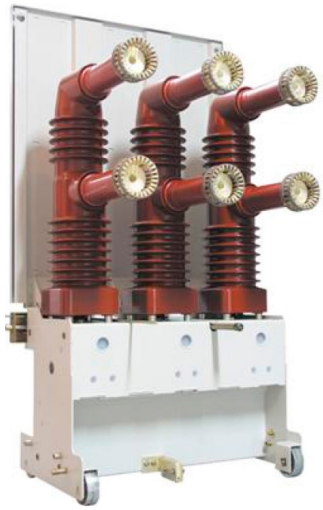
P = Horizontal center distance of poles
(1) Version only available with forced ventilation and assembled pole

Standard equipment of withdrawable circuit breakers for UniGear ZS1, ZS2, ZS3.2 switchgear and similar panels

The basic versions of the withdrawable circuit breakers are three-pole and equipped with:

- EL manual operating mechanism
- mechanical signaling device for closing springs loaded/discharged
- mechanical signaling device for circuit breaker open/closed
- closing pushbutton
- opening pushbutton
- operation counter
- set of ten circuit breaker open/closed auxiliary contacts

  Note: three break contacts (signaling circuit breaker open) and four make contacts (signaling circuit breaker closed) are available with the group of ten auxiliary contacts supplied as standard and the maximum number of electrical applications.
- lever built into operating mechanism for linear loading of closing spring
- isolating contacts
- cord with connector (plug only) for auxiliary circuits, with striker pins which prevent the plug from being inserted into the socket if the rated current of the circuit breaker is lower than the rated current of the panel
- racking-out/in lever (the quantity depends on the number of apparatuses ordered)
- locking electromagnet in the truck (mandatory for ABB switchgear). This device prevents the circuit breaker from being racked into the switchgear when the auxiliary circuits are not connected (plug not in in the socket)
- door interlock (mandatory for ABB switchgear). This device prevents the circuit breaker from being racked into the switchgear when the switchgear door is open.



VD4 with poles in polyamide

(1) Rated current guaranteed with circuit breaker installed in PowerCube enclosure and with 40 °C ambient temperature
(2) Up to 4000 A with forced ventilation.
(3) Poles in polyamide
(4) Available in 10 kV voltage version to GOST standards
(5) On request, the closing spring can be loaded by means of a removable crank handle outside the operating mechanism(instead of linear loading, only possible with the door open, by means of a lever built into the front of the operating mechanism).
(6) VD4/W does not need insulation for the feed-through and tulip contacts in module PB2. On request, the same circuit breaker with insulated feed-through and tulip contacts is available for installation in enclosures not produced by ABB (version VD4/PW)

W = Enclosure width.
P = Horizontal center distance of poles.
u/l = Distance between bottom and top terminals.
ø = Diameter of isolating contact.
(1) Up to 2500 A rated current guaranteed with forced ventilation.

Standard equipment of withdrawable circuit breakers for PowerCube modules

The basic versions of the withdrawable circuit breakers are always three-pole and equipped with:

- EL manual operating mechanism
- mechanical signaling device for closing springs loaded/discharged
- mechanical signaling device for circuit breaker open/closed
- closing pushbutton
- opening pushbutton
- operation counter
- set of ten circuit breaker open/closed auxiliary contacts

  Note: three break contacts (signaling circuit breaker open) and four make contacts (signaling circuit breaker closed) are available with the group of ten auxiliary contacts supplied as standard and the maximum number of electrical applications.
- lever built into the operating mechanism for linear loading of closing spring
- isolating contacts
- cord with connector (plug only) for auxiliary circuits, with striker pins which prevent the plug from being inserted into the socket if the rated current of the circuit breaker is different from the rated current of the switchgear
- racking-in/out lever (the quantity depends on the number of apparatuses ordered)
- locking electromagnet in the truck. This prevents the circuit breaker from being racked into the switchgear when the auxiliary circuits are not connected (plug not in in the socket).
- door interlock (mandatory for ABB switchgear); this device prevents the circuit breaker from being racked into the switchgear when the switchgear door is open.

W = Switchgear width.
P = Horizontal center distance of poles.
u/l = Distance between bottom and top terminals.
Ø = Diameter of isolating contact.

Standard equipment of withdrawable circuit breakers for ZS8.4 switchgear

The basic versions of the withdrawable circuit breakers are three-pole and equipped with:

- EL manual operating mechanism
- mechanical signaling device for closing springs loaded/discharged
- mechanical signaling device for circuit breaker open/closed
- closing pushbutton
- opening pushbutton
- operation counter
- set of ten circuit breaker open/closed auxiliary contacts

  Note: three break contacts (signaling circuit breaker open) and four make contacts (signaling circuit breaker closed) are available with the group of ten auxiliary contacts supplied as standard and the maximum number of electrical applications.

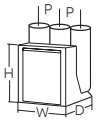
- lever built into the operating mechanism for linear loading of closing spring for VD4/Z8 and VD4/ZT8, external with crank operation for VD4/ZS8
- racking in/out lever (the quantity depends on the number of apparatuses ordered)

VD4/ZS8

- device for loading the closing springs with the door closed, by means of a removable crank handle outside the operating mechanism and the switchgear
- Harting 64-pin socket with mechanical interlock which prevents the circuit breaker from being moved when the plug is not in in the socket
- door interlock, which prevents the spring loading lever from being inserted when the circuit breaker is closed
- door interlock and Harting 64-pin socket, which prevent the door from closing when the plug is not in in the socket.

VD4/Z8 - VD4/ZT8

- Harting 64-pin socket with mechanical interlock which prevents the circuit breaker from being moved when the plug is not in in the socket.



Key

1) Device with crank handle for loading closing spring (only version VD4/ZS8)
2) Harting 64 plus socket with mechanical interlock which prevents circuit breaker from being moved when socket is not inserted
3) Interlock that prevents door from closing if plug is not in socket (only version VD4/ZS8)

P = Horizontal center distance between poles.
u/l = Distance between top and bottom terminals.
Ø = Diameter of isolating contacts.

Standard equipment of withdrawable circuit breakers for UniSec switchgear

The basic versions of the withdrawable circuit breakers are three-pole and equipped with:

- EL manual operating mechanism
- mechanical signaling device for closing springs loaded/discharged
- mechanical signaling device for circuit breaker open/closed
- closing pushbutton
- opening pushbutton
- operation counter
- set of ten circuit breaker open/closed auxiliary contacts

  Note: three break contacts (signaling circuit breaker open) and four make contacts (signaling circuit breaker closed) are available with the group of ten auxiliary contacts supplied as standard and the maximum number of electrical applications.
- lever built into the operating mechanism for linear loading of closing spring
- isolating contacts
- cord with connector (plug only) for auxiliary circuits, with striker pins which prevent the plug from being inserted into the socket if the rated current of the circuit breaker is different from the rated current of the switchgear
- racking-in/out lever (the quantity depends on apparatuses ordered)

Selection and ordering
Optional accessories

For circuit breakers up to 36 kV, 50 kA with EL operating mechanism
Accessories with the same number are alternative to each other.

1 Shunt opening release (-MBO1)
Allows the opening command of the apparatus to be enabled by remote control.
This release is suitable for both instantaneous and permanent duty. However, there is always an auxiliary contact, -BGB1, that de-energizes it after the circuit breaker has opened. In the case of instantaneous service, the current impulse must last at least 100 ms.
This release can be controlled by the following devices: coil continuity control (CCC), opening circuit supervision (TCS)(*) or the ABB STU functionality control device (see accessory 21, supplied on request).

Characteristics	
Un	24-30-48-60-110...132-220...250 V DC
Un	48-60-110...127-220...250 V AC 50-60 Hz
Operating limits	65 ... 120% Un
Inrush power (Ps)	60...100 W / VA
Continuous power consumption (Pc)	1.5 W
Electronics self-consumption (no coil supplied); value independent of voltage applied	1.5 mA
Opening time	33...60 ms
Insulation voltage	2000 V 50 Hz (for 1 min)

2 Additional shunt opening release (-MBO2)
Similarly to shunt opening release -MBO1, this allows the opening command of the apparatus to be transmitted by remote control. It can be supplied by the same circuit as main shunt opening release -MBO1 or by a circuit that is completely separate from release -MBO1.
This release is suitable for both instantaneous and permanent duty. However, there is always an auxiliary contact, -BGB1, that de-energizes it after the circuit breaker has opened.
To guarantee the release action, the current impulse must last at least 100 ms.
Continuity functionality can be checked with a continuity control device (CCC), opening circuit supervision (TCS)(*) or the STU functionality control device (see accessory 21, supplied on request).
-MBO2 has the same electrical and operating characteristics as release -MBO1.

(*) The minimum current that the relay with TCS function (used for monitoring coil continuity) detects as a condition denoting that the trip circuit is operating correctly (specified for each relay in the relative manual), must be sensibly higher than the self-consumption current of the actual coil (~1.5 mA).
If this fails to occur, always add, in parallel to the TCS, a circuit able to absorb sufficient current to compensate the gap while preventing the total current in the TCS circuit from rising above the maximum threshold up to 100mA.
A simple resistor can be sized for the purpose, depending on the parameters of the TCS and the auxiliary voltage range used.
For further details consult the Guidelines for use of the Smart Coil 1VCD601416

3 Opening solenoid (-MBO3)

The opening solenoid (-MBO3) is a special demagnetization release to be used in conjunction with an overcurrent protection relay of the self-supplied type.
It is situated in the operating mechanism (in the left side) and is not an alternative to the additional shunt opening release **(-MBO2).**
It is not available for 40 and 50 kA circuit breakers.
Should this accessory be required, specify at the time of order since it cannot be installed later on by the customer.
Note: ask ABB for info for use in conjunction with the protection relay.

The opening solenoid (-MBO3) is available in two versions:

- For DC (release by discharging the energy stored in protection relay against overcurrents of the self-supplied type)
- For AC (release by means of the energy supplied by an summation current transformer on the secondaries of the protection current transformers (the transformer is at customer's charge)

4 Shunt closing release (-MBC)

Allows the closing command of apparatus to be transmitted by remote control.
This release is suitable for both instantaneous and permanent duty. An auxiliary contact that de-energizes it after the circuit breaker has closed is not envisaged.
The permanently supplied release provides the electrical anti-pumping function with both electrical opening and re-closing commands maintained. To guarantee the closing action, the current impulse must last at least 100 ms.
If there is the same supply voltage for shunt closing release -MBC and under-voltage release -MBU and the circuit breaker must close automatically when auxiliary voltage returns, there must be a delay of at least 50 ms between under-voltage release energizing and energizing of the shunt closing release to allow the closing operation to take place. Continuity functionality can be checked with a continuity control device (CCC), opening circuit supervision (TCS)(*) or the STU functionality control device (see accessory 21, supplied on request).

Characteristics	
Un	24-30-48-60-110...132-220...250 V DC
Un	48-60-110...127-220...250 V AC 50-60 Hz
Operating limits	65 … 120% Un
Inrush power (Ps)	60...100 W / VA
Continuous power consumption (Pc)	1.5 W
Electronics self-consumption (no coil supplied; value independent of voltage applied	1.5 mA
Closing time	30...60 ms
Insulation voltage	2000 V 50 Hz (for 1 min)

(*) The minimum current that the relay with TCS function (used for monitoring coil continuity) detects as a condition denoting that the trip circuit is operating correctly (specified for each relay in the relative manual), must be sensibly higher than the current consumption of the actual coil (~1.5 mA).
If this fails to occur, always add, in parallel to the TCS, a circuit able to absorb sufficient current to compensate the gap while preventing the total current in the TCS circuit from rising above the maximum threshold up to 100mA.
A simple resistor can be sized for the purpose, depending on the parameters of the TCS and the auxiliary voltage range used.
For further details, consult the Guidelines for use of the Smart Coil 1VCD601416

Selection and ordering
Optional accessories

5 Undervoltage release (-MBU)
The undervoltage release opens the circuit breaker when there is a sensible reduction or lack of the voltage that powers it. The circuit breaker can only close when the release is energized (the closing lock is obtained mechanically).
It can be used for remote release (by means of a pushbutton of the normally closed type) and for locking on automatic closing/opening in the absence of voltage in the auxiliary circuits.
Supplied by means of the secondary output of a voltage transformer, it provides locking upon automatic closing/opening in the absence of voltage in the Medium Voltage main circuit.
If there is the same supply voltage for shunt closing release -MBC and undervoltage release -MBU and the circuit breaker must close automatically when auxiliary voltage returns, there must be a delay of at least 50 ms between under-voltage release energizing and energizing of the shunt closing release to allow the closing operation to take place.

The undervoltage release is available in the following versions:

5A Undervoltage release (with supply shunted from a transformer on the supply side of the circuit breaker or from an auxiliary power supply, regardless of the state in which the circuit breaker is to be found).

5B Undervoltage release with -KFT electronic time-lag device (0.5 - 1 - 1.5 - 2 - 3 s) (with power supply as indicated for 5A); this device is supplied with a 0.5 s setting (the adjustments are described in the Circuit diagrams chapter)

Characteristics	
Un	24-30-48-60-110...132-220...250 V DC
Un	48-60-110...127-220...250 V AC 50-60 Hz
Operating limits	– circuit breaker opening: 35-70% Un
	– circuit breaker closing: 85-110% Un
Inrush power (Ps)	150 W / VA
Continuous power consumption (Pc)	1.55 W
Electronics self-consumption (no coil supplied); value independent of voltage applied	1.5 mA
Insulation voltage	2000 V 50 Hz (for 1 min)

Note
As an alternative to the undervoltage release, an additional shunt opening release (-MBO4) with the same electrical and operating specifications as shunt opening release (-MBO1) can be installed on request (only for 12..17.5 kV circuit breakers up to 40 kA and 24 kV up to 31.5 kA).
Warning! Since installation of the additional shunt opening release (-MBO4) requires a special mounting plate for releases, ask for application (-MBO4) when ordering and not after delivery.

5C Electronic time-lag device (-KFT)

The electronic time-lag device must be installed outside the circuit breaker. It allows release tripping to be delayed by preset and adjustable times.

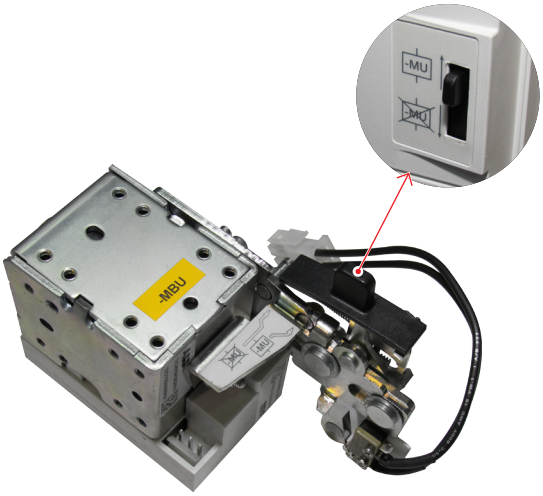
Use of the undervoltage release is recommended for the purpose of preventing trips when the power supply network of the release may be subject to interruptions or voltage drops of short duration.

If it is not being energized, circuit breaker closing is inhibited.

The time-lag device must be used in conjunction with an undervoltage release for d.c.

The voltage of the undervoltage release must be within the operating range of the electronic time-lag device.

Characteristics of the time-lag device	
Un	24...30 - 48 - 60 - 110...127 - 220...250 V–
Un	48 - 60 - 110...127 - 220...240 - V~ 50/60 Hz
Adjustable opening time (release + time-lag device):	0.5-1-1.5-2-3 s



6 Mechanical override of the undervoltage release

This is a mechanical device which allows the undervoltage release trip to be temporarily excluded.

It is always equipped with electrical signaling.

If this accessory is required, it must be specified at the time of order since it cannot be installed later on by the customer.

Selection and ordering
Optional accessories

7a Auxiliary contacts of the circuit breaker (-BGB1) for 12 to 24 kV versions

Electrical signaling of circuit breaker open/closed can be obtained with a group of 10, 16, 20 or 24 auxiliary contacts for the fixed version and 10 or 16 auxiliary contacts for the withdrawable version. The standard equipment comprises 10 auxiliary contacts.

Note

The following are available using the standard group of ten auxiliary contacts and the maximum number of electrical accessories:

- for fixed circuit breakers: three closing contacts “a” for signaling circuit breaker open and five opening contacts “b” for signaling circuit breaker closed;
- for withdrawable circuit breakers: three closing contacts “a” for signaling circuit breaker open and four opening contacts “b” for signalling circuit breaker closed.

Circuit breakers in the fixed version are available with two finishing accessories (to be specified when ordering):

- non-wired auxiliary contacts; wiring to the terminals of the contacts is at the customer’s charge (photo at left; the terminal box to which the other electrical accessories are wired is at the top); ask for instructions 1VCD601204 (available in the main languages) which describe how to remove, wire the auxiliary contacts more easily and fit the auxiliary contact unit back into its housing;
- auxiliary contacts already wired to the terminal box (see photo at right)

Consult circuit diagrams 1VCD400151 for fixed circuit breakers and 1VCD400155 for withdrawable circuit breakers.

Note: The main shunt opening release and/or the additional shunt opening release use 1 and/or 2 closing contacts “a”, thereby reducing the number of auxiliary contacts available. Always check the maximum number of contacts available with non-standard equipment.

The new diagrams are interchangeable with the existing ones, with the following exceptions:

- diagram 1VCD400151 (substitutes 1VCD400046 and 1VCD400099)
  - fig. 34 on the previous diagrams is represented by fig. 31 + fig. 32 on the new diagram;
  - fig. 33 and fig. 35 on the previous diagrams are not available with the new layout
- diagram 1VCD400155 (substitutes 1VCD400047)

Auxiliary contacts –BGB1 conform to the following standards/regulations/directives:

- IEC 62271-100
- IEEE C37.54
- EN 61373 cat. 1 class B / impact and vibration test
- Germanish Loyd regulation / vibrations envisaged by the shipping registers
- UL 508
- EN 60947 (DC-21A DC-22A DC-23A AC-21A)
- RoHS Directive

General characteristics	
Insulation voltage to standard VDE 0110, Group C	660 V AC 800 V DC
Rated voltage	24 V ... 660 V
Test voltage	2 kV for 1 min
Maximum rated current	10 A - 50/60 Hz
Breaking capacity	Class 1 (IEC 62271-1)
Number of contacts	5
Groups of contacts	10 / 16 / 20
Contact travel	90°
Actuating force	0.66 Nm
Resistance	<6.5 mΩ
Storage temperature	–30 °C ... +120 °C
Operating temperature	–20 °C ... +70 °C (-30° ref. ANSI 37.09)
Contact overtemperature	10 K
Mechanical life	30.000 mechanical operations
Protection class	IP20
Cable section	1 mm²

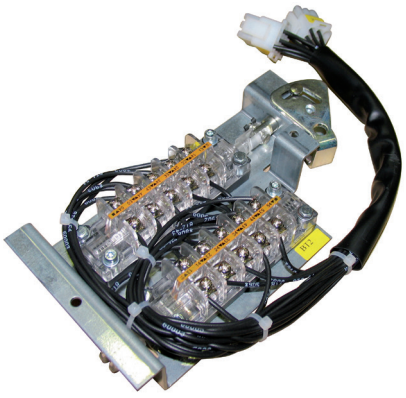
Electrical characteristics (according to IEC 60947)		
Rated current Un		Breaking capacity (10000 interruptions)
220 V AC	Cosφ = 0.70	20 A
220 V AC	Cosφ = 0.45	10 A
24 V DC	1 ms (*)	12 A
	15 ms	9 A
	50 ms	6 A
60 V DC	1 ms	10 A
	15 ms	6 A
	50 ms	4.6 A
110 V DC	1 ms	7 A
	15 ms	4.5 A
	50 ms	3.5 A
220 V DC	1 ms	2 A
	15 ms	1.7 A
	50 ms	1.5 A
250 V DC	1 ms	2 A
	15 ms	1.4 A
	50 ms	1.2 A

Electrical characteristics (according to IEC 62271-100 class 1)	
Rated voltage Un	Breaking capacity
24 V DC 20 ms	18.8 mA
60 V DC 20 ms	7.4 mA
110 V DC 20 ms	4.2 mA
250 V DC 20 ms	1.8 mA

(*) For application at 24Vdc and with currents lower than 2,5mA golden contacts are recommended.

8 Transient contact (-BGB4)

This contact closes momentarily (duration > 30 ms) upon circuit breaker opening controlled remotely with a shunt opening release.
The indication is not provided when opening is manual and local. In this case, a contact (–BGB11) is activated by the manual pushbutton and cuts off the transient contact closing signal (–BGB4).
The transient contact is activated directly from the main operating shaft, thus the indication is provided only on actual opening of the main circuit breaker contacts.



Selection and ordering
Optional accessories

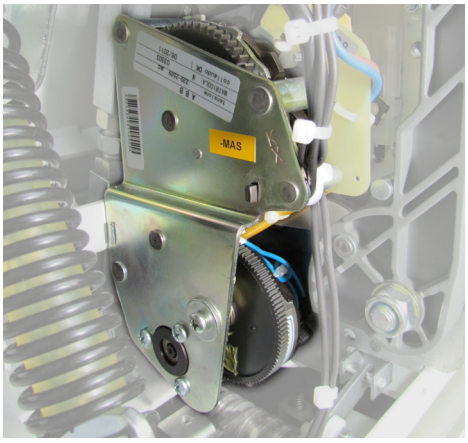
9 Position contact (-BGT3)
This contact is used, together with the locking magnet in the operating mechanism **(-RLE1)**, to prevent remote closing as the circuit breaker is racked into the compartment.
It is only supplied for withdrawable circuit breakers for UniGear ZS1 switchgear and PowerCube modules.
It cannot be supplied when transmitted contacts in the truck are requested **(-BGT1; -BGT2)**.

10 Transmitted contacts (*) in the truck (-BGT1; -BGT2)
Transmitted contacts of withdrawable circuit breakers (installed in the circuit breaker truck - only for VD4/P withdrawable circuit breakers). These contacts are either in addition or alternatives to the position contacts (for signaling circuit breaker racked out). They also act as position contacts **(-BGT3)**.

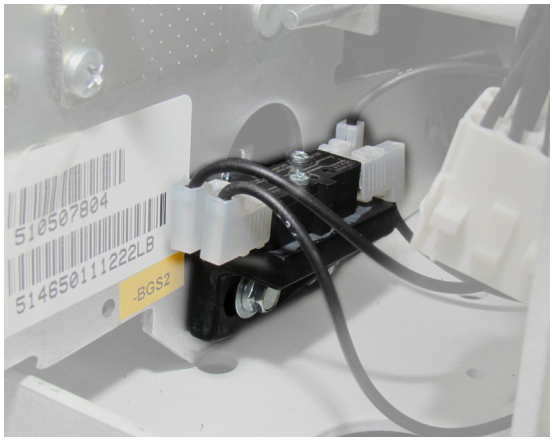
(*) For application at 24Vdc and with currents lower than 10mA golden contacts are recommended.

11 Motor operator (-MAS)

Automatically loads the closing springs of the circuit breaker operating mechanism. After circuit breaker closing, the geared motor immediately reloads the closing springs.
If there is a power cut or during maintenance work, the closing spring can be loaded in the manual mode (by means of the special crank handle built into in the operating mechanism).



Characteristics		
Un	24...30 - 48...60 - 110...130 - 220...250 V–	
Un	100...130 - 220...250 V~ 50/60 Hz	
Operating limits	85 ... 110% Un	
Inrush power (Ps)	≤ 40 kA	50 kA
	DC = 600 W; AC = 600 VA	DC = 900 W; AC = 900 VA
Rated power (Pn)	DC = 200 W; AC = 200 VA	DC = 350 W; AC = 350 VA
Inrush duration	0.2 s	0.2 s
Loading time	6-7 s	6-7 s
Insulation voltage	2000 V 50 Hz (for 1 min)	2000 V 50 Hz (for 1 min)



12 Contact for signaling closing spring loaded/ discharged (-BGS2)

Consists of a microswitch which allows the state of the closing spring of the circuit breaker operating mechanism to be remotely signaled.
The following signals are possible:
- contact open: spring loaded signal
- contact closed: spring discharged signal.

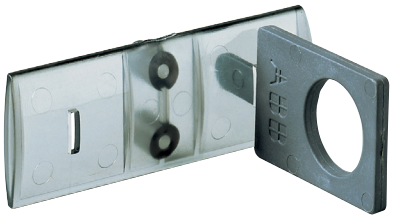
The two signals must be used for circuits with the same power supply voltage.

Rated voltage (a.c.)	250	V
Rated current	10	A
Thermal capacity	17	A
Short-time withstand current	20	A for 30 sec
Withstand voltage at 50 Hz for 1 minute between live parts and ground	>2000	V
Distance between open contacts	0.5	mm

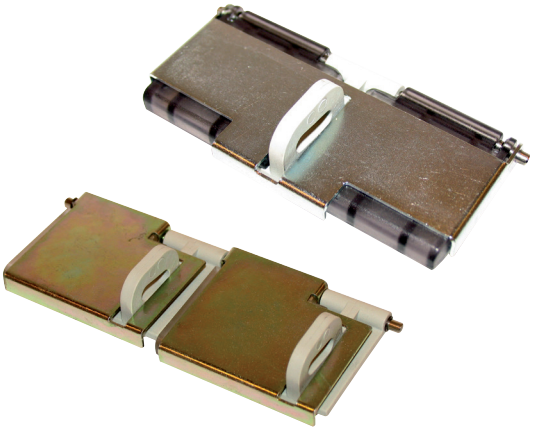
Selection and ordering
Optional accessories

Protections and locks

Various mechanical and electromechanical locking and protection devices are available.



13 Opening and closing pushbutton protection
The protection only allows the opening and closing pushbuttons to be operated using a special tool.



14 Opening and closing pushbutton padlock
The device allows the opening and closing pushbuttons to be locked using up to three ø 4 mm diameter padlocks (not supplied).
The padlock is available in two versions:

14A Possibility of padlocking both the pushbuttons without distinction

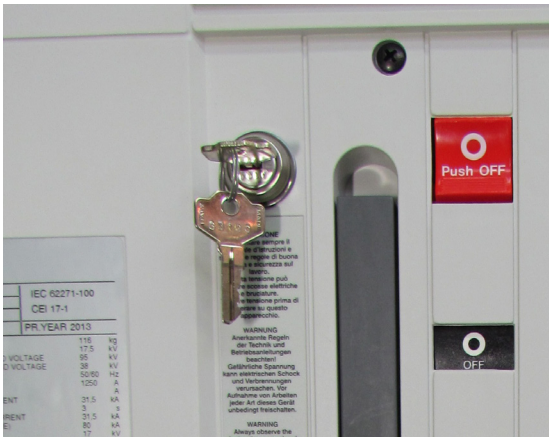
14B Separate padlocking of the opening and/or closing pushbutton.

N.B. Lock 14A prevents closing by remote control; lock 14B does not prevent closing by remote control.

15 Key lock in open position

The lock is activated by a special circular lock. Different keys (for a single circuit breaker), or the same keys (for several circuit breakers) are available.

To activate the lock, keep the opening pushbutton pressed down, turn the key and remove it.



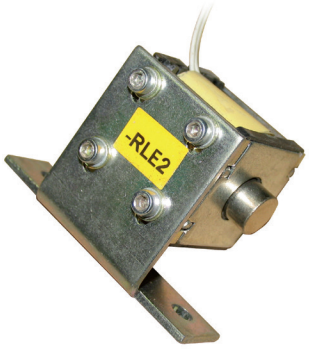
With the key removed, the opening pushbutton automatically remains in the pressed position, thereby preventing local manual closing and remote electrical closing.

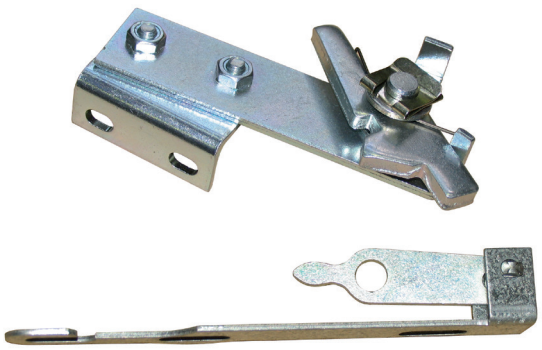
Different keys(for the same breaker) or same keys (for different breakers) are available, Ronis type.

16 Locking magnet on the operating mechanism (-RLE1)

Only allows the command to be activated when the electromagnet is energized.

The locking electromagnet in the operating mechanism has the same electrical characteristics as shunt closing release -MBC.





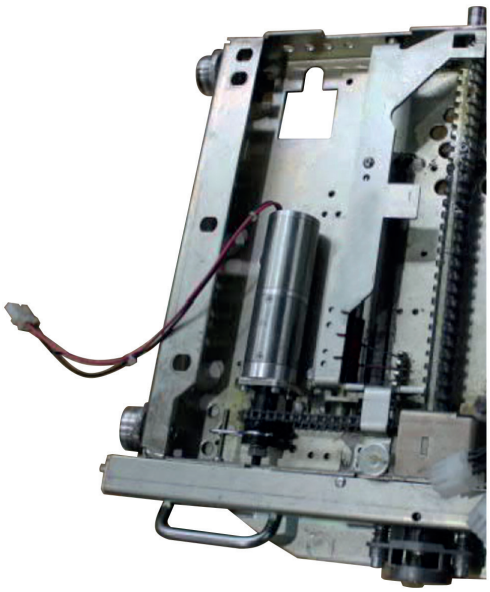
Selection and ordering
Optional accessories

17 Locking magnet on the truck (-RLE2)
Mandatory accessory for withdrawable circuit breakers for UniGear ZS1 switchgear and PowerCube modules. Prevents the circuit breaker from racking into the switchgear when the auxiliary circuit plug is disconnected.
The plug also acts as an anti-insertion lock if the rated current is different. Special striker pins prevent the plug from being inserted into the socket if the rated current of the circuit breaker is lower than the rated current of the panel.
Note: a specific version for the circuit breakers of ZS8.4 switchgear is available on request. This accessory is not available when the motor-operated truck is required

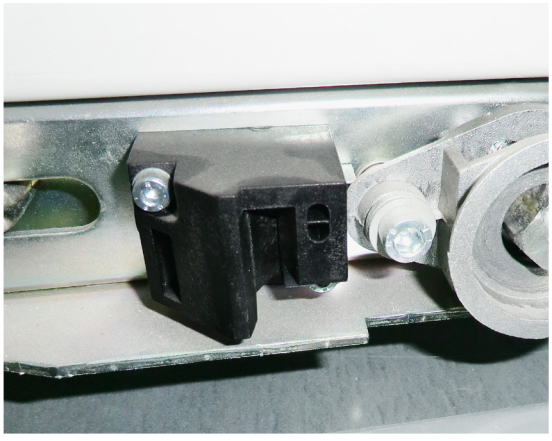
Characteristics	
Un	24 - 30 - 48 - 60 - 110 - 125 - 127 - 132 - 220 - 240 V–
Un	24 - 30 - 48 - 60 - 110 - 125 - 127 - 220 - 230 ... 240 V~ 50/60 Hz
Operating limits	85 ... 110% Un
Inrush power (Pn)	DC 250 W; AC = 250 VA
Continuous power (Pc)	DC = 5 W; AC = 5 VA
Inrush duration	150 ms
Insulation voltage	2000 V 50 Hz (for 1 min)

18 Interlock for fixed circuit breakers
Device for fixed circuit breakers which have been converted into withdrawable ones by the customer. It allows a mechanical lock to be created by the customer to prevent racking-out/in with the circuit breaker closed and prevents circuit breaker closing while moving.
Note: The device must be requested when ordering since it must be assembled and tested in the factory.

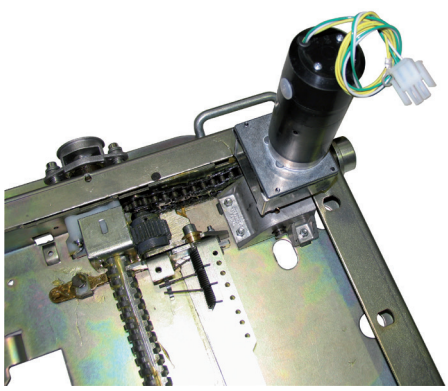
19 Mechanical interlock with door



This device prevents the circuit breaker from being racked-in when the switchgear door is open. It is only provided for circuit breakers used in UniGear ZS1 switchgear and PowerCube modules equipped with a special actuator on the door.
It is not available for circuit breakers with motor-driven truck (-MAT).



20 Motor-driven truck (-MAT)



Allows the circuit breaker to be remotely racked-in and out of the switchgear (only for withdrawable circuit breakers for UniGear ZS1 and ZS8.4 switchgear and PowerCube modules).
The motor-driven version with clutch can be ordered on request. It enables the circuit breaker to be racked-in/out in an emergency if the truck motor fails to operate.

Characteristics	
Un	24 - 30 - 48 - 60 - 110 - 220 V–
Operating limits	85 … 110% Un
Rated power (Pn)	40 W

It is also possible to order the magnetothermic micro circuit breaker protect the motor from over current and temperature. Provided as loose part.

Selection and ordering
Optional accessories

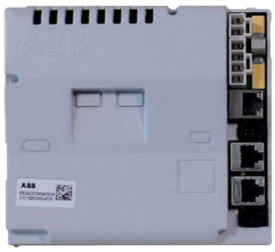
21 STU Shunt Test Unit
Device which monitors the functionality and continuity of opening/closing shunt releases. Owing to their particular construction, checking the functionality of closing (-MBC) and opening (-MBO1, -MBO2) shunt releases cannot be performed by dedicated relays (e.g. TCS Test Control Supervision, CCC Control Coil Continuity) or with the REF control and protection unit. The only device able to monitor the functionality of these releases is the STU device. Please contact us if this function must be provided by devices other than STU.
The STU Shunt Test Unit can be used in conjunction with the shunt opening release **(-MBO1; -MBO2)** or shunt closing release **(-MBC)** to check their functionality and continuity.
The Shunt Test Unit allows the continuity of releases with rated operating voltage between 24 V and 250 V (AC and DC) to be monitored, as well as the functionality of the electronic circuit of the release.
Continuity is monitored cyclically with intervals of 20 seconds between one test and the next.
The unit has optical signals with LEDs on the front. The following information is given:
- POWER ON: power supply present
- (-MO) TESTING: test in progress
- TEST FAILED: signal following a failed test or in the absence of auxiliary power supply
- ALARM: signal after three failed tests.

Two relays and a changeover are also available on the unit and allow the following two events to be remotely signaled:
- failure of a test (with automatic reset when alarm ceases)
- failure of three tests (resetting can only be obtained by means of the manual - RESET – from the front of the unit).

There is also a manual - RESET – key on the front of the unit.

Characteristics	
Un	24 ... 250 V AC/DC
Maximum interrupted current	6 A
Maximum interrupted voltage	250 V AC

22 Extension cord for 58 pins plug
The extension cord with 58 pins available in two lengths 1.5m and 3m, in addition to the standard plug.



Digital accessories for VD4 evo

23 CMU

The CMU is an embedded Monitoring & Diagnostic unit, capable of advanced local data analytics. It also embeds sensors for basic breaker monitoring features. It can be ordered stand alone or in combination with a range of Sensors from ABB sensors portfolio, depending on the monitoring needs (see next section).

For more details please see the CMU datasheet 2RDA044111 6 and CMU Dashboard Manual 2RDA044113.

Parameter	Unit	Min Value	Max Value
AUX Rated voltage	AC (V) DC (V)	85 110	250 370
Working temperature range	°C	-20	+55
Storage temperature	°C	-30	+80

24 Monitor & Diagnostic Sensors

24a STA201 Primary contacts thermal monitoring

The STA201 sensors embedded in the primary contact arms allow direct measurement of the temperature in one of the most critical points of the circuit breaker. The measurement is shared through wireless to the concentrator unit for Monitor & Diagnostic features.

For installation or replacements please consult dedicated device documentation.

24b SMA201 Smart Angle sensor

The SMA201 sensor is assembled on the breaker kinematic chain to allow direct measurement of the most important characteristic of a proper Opening or Closing operation. The measurement is shared to with the concentrator unit for Monitor & Diagnostic features.

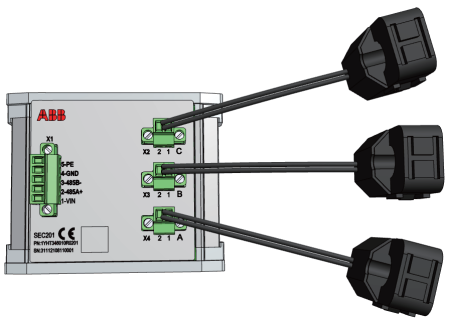
For installation or replacements please consult dedicated device documentation.

24c STE201/STL201 Cables/BusBars thermal monitoring

The STE201/STL201 Temperature monitoring devices are key components in ABB's switchgear and apparatus monitoring & diagnostic solutions. The devices are battery-free, self-powered smart temperature sensors, using wireless communication technology for connecting to ABB's monitoring and diagnostics data concentrators. The sensor devices can be installed directly on high-voltage parts, inside medium-voltage switchgear.

For installation or replacements please consult dedicated device documentation.

Selection and ordering
Optional accessories



24d THS01 Environmental monitoring
The THS01 senors allows the monitoring of the circuit breaker at room parameters for monitor and diagnostic purposes.
For installation or replacements please consult dedicated device documentation.

25 Digital upgrade KIT
It is available a complete kit to upgrade a VD4 evo with Digital feature for monitor and diagnostic.
It includes the necessary connectors, concentrator unit CMU, and a flexible selection of ABB sensors.
Please contact your sales representative for more information.
Please contact ABB for more details based on your needs.

24e SEC201 Primary Current Sensor
The SEC201 sensor allows the measurement of primary currents for monitor and diagnostic of the circuit breaker from the current transformer secondary circuit. It allows electrical life monitoring and in combination with the thermal sensors enables advanced thermal monitoring and diagnostic features.
For installation or replacements please consult dedicated device documentation.

26 Serial Hub
The Serial communication hub is automatically delivered when more than one sensor with serial communication embedded in the CB has been ordered.
To be purchased separately in case of sensors upgrade after the ordering of the circuit breaker.

For circuit breakers up to 40.5 kV, 40 kA with Classic operating mechanism

Accessories with the same number are alternatives to each other.

1 Shunt opening release -MO1 (-Y2)

The shunt opening release allows the apparatus to be opened by remote control.
An auxiliary contact -BB2 (-S4) always de-energizes it after opening.

Characteristics	
Ua: 24 - 30 - 48 - 60 - 110 - 125 - 220 - 240 V-	
Ua: 100 - 110 - 125 - 220 - 230 - 240 V ~ 50 … 60 Hz	
Service tolerances:	DC 70 … 110% Ua
	AC 85 … 110% Ua
Short-term power consumption:	approx. DC 250 W; approx. AC 250 VA
Admissible maximum operating time:	8 s

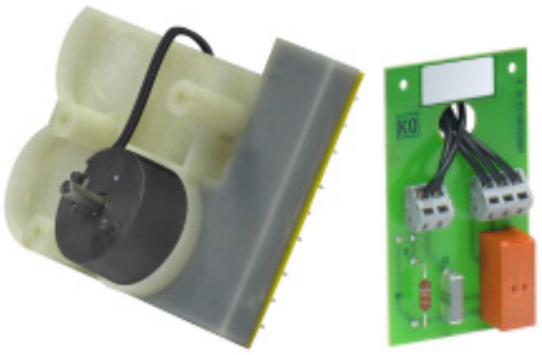
2 Additional shunt opening release -MO2 (-Y9)

The additional shunt opening release has the same function as shunt opening release -MO1 (-YO2).
The additional shunt opening release is available on request and requires use of auxiliary contact -BB1 (-S3), which is part of the standard equipment.

Characteristics	
Ua: 24 - 30 - 48 - 60 - 110 - 125 - 220 - 240 V-	
Ua: 100 - 110 - 125 - 220 - 230 - 240 V ~ 50 … 60 Hz	
Service tolerances:	DC 70 … 110% Ua
	AC 85 … 110% Ua
Short-term power consumption:	approx. DC 250 W; approx. AC 250 VA
Admissible maximum operating time:	8 s

Selection and ordering
Optional accessories

3 Shunt closing release -MC (-Y3)



The shunt closing release allows the circuit breaker to be closed by remote control.
Auxiliary contact -BS1 (-S1) cuts off the power supplied to the release after the closing springs have been loaded, while auxiliary contact -BB1 (-S3) cuts off the power supplied to the release after the circuit breaker has closed.
Both are required and are part of the standard equipment.
The shunt closing release is optional in circuit breakers with manual opening mechanisms but mandatory for circuit breakers with motor-operated drives.
Application of the shunt closing release includes anti-pumping relay -K0.
The permanently supplied release provides the electrical anti-pumping function with both electrical opening and re-closing commands maintained.
Circuit breaker closing is only re-enabled once the active closing command has been interrupted.

Characteristics	
Ua: 24 - 30 - 48 - 60 - 110 - 125 - 220 - 240 V-	
Ua: 100 - 110 - 125 - 220 - 230 - 240 V ~ 50 ... 60 Hz	
Service tolerances:	DC 70 ... 110% Ua
	AC 70 ... 110% Ua
Short-term power consumption:	approx. DC 250 W; approx. AC 250 VA
Admissible maximum operating time:	8 s

4 Locking magnet on operating mechanism RL1 (-Y1) with auxiliary contacts -BL1 (-S2)

Only allows the operating mechanism to be activated when the electromagnet is energized.
To enable the circuit breaker to close, the locking magnet must be energized for at least 100 ms before the circuit breaker closing command.
Auxiliary contact -BL1 (-S2) is required and is part of the standard equipment.

Characteristics	
Ua: 24 - 30 - 48 - 60 - 110 - 125 - 220 - 240 V-	
Ua: 100 - 110 - 125 - 220 - 230 - 240 V ~ 50 ... 60 Hz	
Service tolerances:	DC 85 ... 110% Ua
	AC 85 ... 110% Ua
Short-term power consumption:	approx. DC 10 W; approx. AC 10 VA
Admissible maximum operating time:	unlimited

5 Undervoltage release -MU (-Y4)

The undervoltage release opens the circuit breaker when there is an appreciable drop or lack of the voltage that supplies it.
It trips when the auxiliary voltage is between 70% and 30% of its rated value.
The circuit breaker can only close again when the voltage reaches 85% of its rated value.
The undervoltage release trips instantaneously, but can also be accompanied by an electronic time-lag device.

Characteristics of the non-delayed version	
Ua: 24 - 30 - 48 - 60 - 110 - 125 - 220 V-	
Ua: 100 - 110 - 125 - 220 V ~ 50 … 60 Hz	
Power consumption:	approx. DC 10 W
	approx. AC 11 VA
Maximum service tolerance:	110% Ua
Voltage for readiness closing:	> 85% UN
Trip voltage:	30 … 70% Ua
Operating time:	immediate
Admissible maximum operating time:	none

5.1 Electronic time-lag device -KT (-RN3U)

Use of the delayed undervoltage release is useful for preventing trips when the supply network of the release may be subject to power cuts or brief voltage dips.
The voltage of the undervoltage release must be within the operating range of the electronic time-lag device (a coupler transformer must be connected in series for rated voltages other than 100-110 V AC).
The electronic time-lag device must be assembled externally in relation to the circuit breaker. It allows the tripping action of the release to be delayed on the basis of preset and adjustable time settings.

Characteristics	
Ua: 100 - 110 V ~ 50 … 60 Hz	
Power consumption:	approx. AC 10 VA
Service tolerances:	110% Ua
Voltage for readiness closing:	> 70% Ua
Trip voltage:	< 70% Ua
a) standard: operating time 0.5... 4 s, adjustable in 0.5 s steps	
b) when closing is performed by means of auxiliary contacts: operating time is 0.5... 2s, adjustable in 0.5s steps with suitable coil	
Admissible maximum operating time:	none

Selection and ordering
Optional accessories

6 Opening solenoid -MO3 (-Y7)

Use of the overcurrent release may be advisable in systems where the auxiliary voltage is unable to provide reliable continuity of service.
The release must receive the opening pulse on the basis of the current from the secondary winding of an intermediate current transformer or a delayed overvoltage relay.
During continuous service, the secondary winding of the MO3 is short-circuited by an auxiliary contact.

Characteristics	
Power consumption in continuous service mode:	connection to 2 phases 35 VA connection to 3 phases 2 VA
Trippping power consumption:	approx. 15 VA
Readiness tripping:	70% IN
Power consumption of intermediate current transformer at IN = 5 A and continuous operation (short-circuited secondary winding):	Winding A 1 VA Winding B 1 VA Winding C 1.5 VA
Power consumption of intermediate current transformer at IN = 5 A and continuous operation (open secondary winding):	Winding A 15 VA Winding B 15 VA Winding C 25 VA
Primary current of intermediate current transformer:	3 x 5
Secondary current of intermediate current transformer:	~ 0.4 A

7 Auxiliary contacts of circuit breaker -BS1, -BB1, -BB2, -BB3 (S1, S3, S4, S5)

The circuit breaker can be equipped with five-pole auxiliary contacts for monitoring, interlocking and signaling. Auxiliary contact -BB2 (-S4) is part of the basic equipment of all circuit breakers with motor-driven operating mechanisms.
Auxiliary contact -BB3 (-S5) is optional.
Also consult the circuit-diagram.

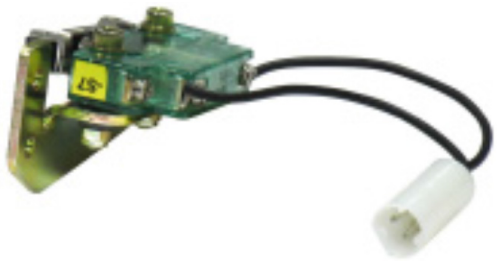
Characteristics	
Ua:	24 (*) ... 250 V
Test voltage:	2.5 kV
Rated current:	Ith^2 = 10 A

(*) For application at 24Vdc and with currents lower than 10 mA golden contacts are recommended.

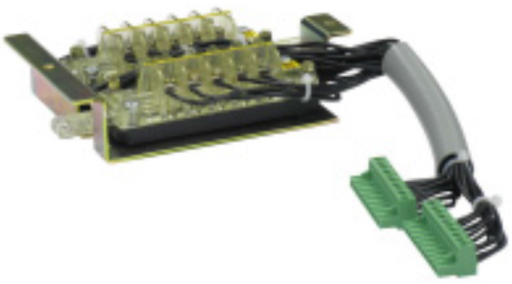
8 Auxiliary contact for signaling effective opening -BB4 (-S7)

Auxiliary contact -BB4 (-S7), also known as transient contact, is part of the basic equipment of all circuit breakers.
It is used for signaling effective opening of the circuit breaker (the transient signal lasts 30ms).

Characteristics	
Ua:	24 (*) ... 250 V
Test voltage:	2.5 kV
Rated current:	Ith^2 = 10 A



(*) For application at 24Vdc and with currents lower than 10 mA golden contacts are recommended.



9 Transmitted contacts in truck -BT1, -BT2 (-S8, -S9)

The auxiliary contacts signal whether the circuit breaker is racked in or out.
In the intermediate position, the circuit breaker is mechanically interlocked.

Characteristics	
Ua:	24 (*) ... 250 V
Test voltage:	2.5 kV
Rated current:	Ith^2 = 10 A

(*) For application at 24Vdc and with currents lower than 10 mA golden contacts are recommended.

Selection and ordering
Optional accessories

10 Motor-operated drive -MS (-M0)

The spiral spring of circuit breakers with motor-operated drive is automatically loaded by an electric motor installed in the actual drive on the load side of each closing operation.

Characteristics	
Ua:	24 - 30 - 48 - 60 - 110 - 125 - 220 - 240 V-
Ua:	110 - 240 V ~ 50 ... 60 Hz
Loading time:	max. 15 s
Reloading time:	max. 15 s
Service tolerances:	85 ... 110% Ua
Power consumption during loading:	approx. DC 230 ... 260 W; approx. AC 260 VA
Weight:	1.5 kg

Fuse motor:

rated supply voltage	power consumption	Fuse motor (ABB-Stotz mcb)	loading time (maximum)

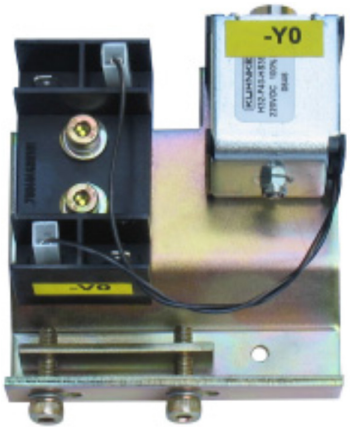
220	140	0.75	15
240	150	0.75	15



* VD4 63 kA motor

11 Locking magnet on truck -RL2 (-Y0)

The locking magnet on the truck prevents circuit breaker travel in the absence of auxiliary voltage.

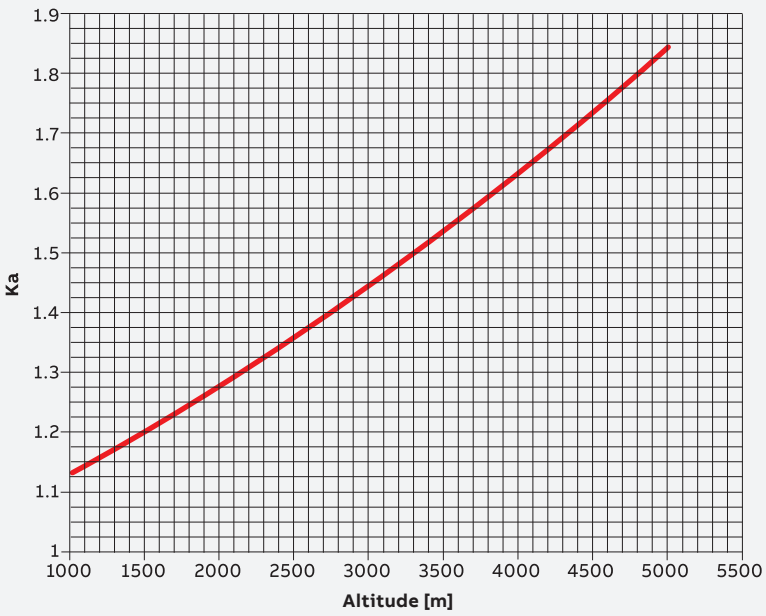
Characteristics	
Ua: 24 - 30 - 48 - 60 - 110 - 125 - 220 - 240 V-	
Ua: 100 - 110 - 125 - 220 - 230 - 240 V ~ 50 … 60 Hz	
Service tolerances:	DC; AC 85 … 110% Ua
Power consumption:	approx. DC 10 W; approx. AC 10 VA
Admissible maximum operating time:	unlimited

Specific product characteristics

Vibration resistance

VD4 circuit breakers are designed to provide high levels of resistance to stress caused by mechanical vibrations.
Many versions comply with the type-approval criteria of the major International Shipping Registers (DNV, Lloyd's Register, RINA) and the qualification criteria of the International Seismic Standards (IEEE 344, IEEE 323 and IEC 60980).
Please contact us if you wish to know which versions have been type-approved by the shipping registers.

Tropicalization



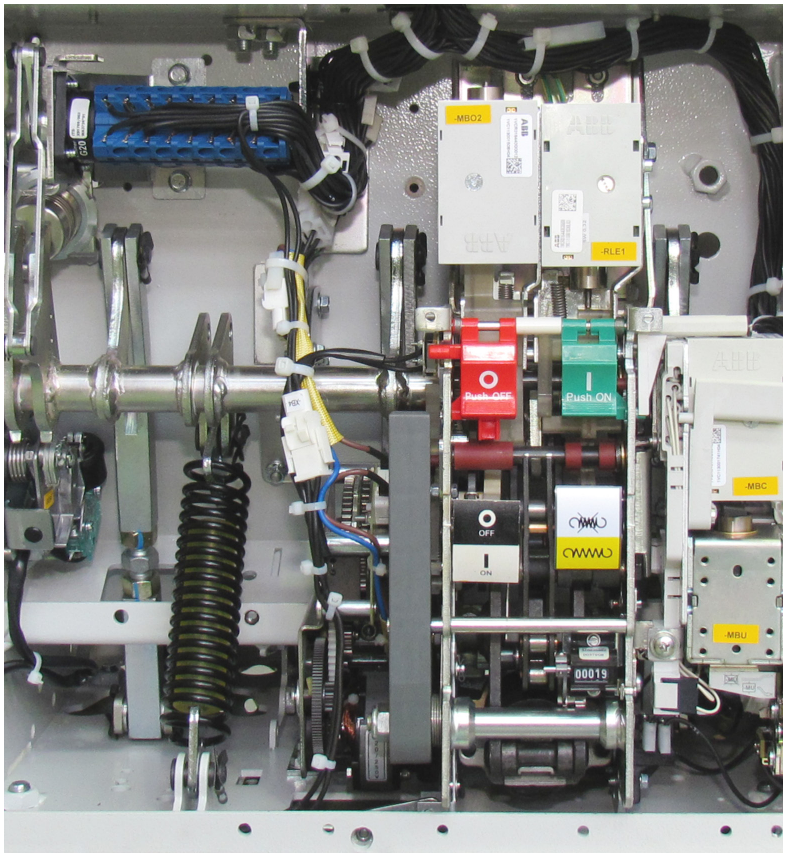
VD4 circuit breakers are manufactured in compliance with the most stringent specifications concerning their use in hot-humid-saline climates.
All the more important metal parts are treated against corrosive substances in compliance with atmospheric **corrosivity class C5 of standard BS EN 12500.**
Galvanizing treatment is applied in accordance with ISO 2081 Standards, classification code Fe/Zn 12, thickness $12x10^{-6}$ m, protected by a conversion layer formed mainly by chromates in compliance with ISO 4520 Standards.

Altitude

The insulating property of air decreases as the altitude increases, therefore this must always be considered with regard to the external insulation of the apparatus (the internal insulation of the interrupters is not liable to change since it is guaranteed by the vacuum).
Altitude must always be taken into account when the insulating components of apparatus to be installed over 1000 m above sea level is designed. In these cases a correction coefficient must be applied. This can be found from the graph on the next page, which has been created on the basis of the indications in Standard IEC 62271-1.
The following example provides a clear interpretation of the indications given above.

Graph for determining the Ka correction factor according to altitude, Example (IEC):

Ka = $e^{mH/8150}$ with m=1
H = altitude in meters
m = value with reference to power frequency test voltage and lightning impulse withstand voltage as well as line-to-line voltage. Value defined for m = 1



- Installation altitude: 2000 m
- Service at 7 kV rated voltage
- Power frequency withstand voltage 20 kV rms
- Impulse withstand voltage 60 kVp
- Ka Factor = 1.28 (see graph).

On the basis of the parameters above, the apparatus must ensure the following withstand values (test performed at zero altitude i.e. at sea level):

- power frequency withstand voltage equal to: 20 x 1.28 = 25.6 kVrms
- impulse withstand voltage equal to: 60 x 1.28 = 76.8 kVp.

It will be apparent from the above that apparatus with 17 kV rated voltage characterized by 38 kV rms power frequency insulation levels and 95 kVp impulse withstand voltage must be provided for installations at an altitude of 2000 m above sea level with 12 kV service voltage.

Specific product characteristics

Anti-pumping device

The EL operating mechanism of VD4 circuit breakers (in all versions) is equipped with a mechanical anti-pumping device which prevents re-closing due to both electrical and mechanical commands.
Should both the closing command and any one of the opening commands (local or remote) be active at the same time, there would be a continuous succession of opening and closing commands.
The anti-pumping device prevents this situation by ensuring that each closing operation is only followed by an opening operation and that there is no other closing operation after this. To obtain a further closing operation, the closing command must be released and then enabled again.
Furthermore, the anti-pumping device only allows the circuit breaker to be closed if the following conditions are present at the same time:

- operating mechanism spring fully loaded
- opening pushbutton and/or shunt opening release (-MBO1/-MBO2) not activated
- circuit breaker open.

REF 601 protection device

On request, the REF 601 switchgear protection device is available for protecting the installations. It requires an auxiliary power supply in order to operate, unlike the previous PR512 which was a self-supplied relay.
REF 601 has protections and trip curves that conform to IEC 255-3 Standards. It protects against overloads (51), against instantaneous and delayed short-circuits (50-51) and against instantaneous and delayed homopolar earth faults (50N and 51N). It also detects the second harmonic component to prevent unwarranted tripping when a transformer is switched-in (68).

The unit has 3 inputs from current sensors of the Rogowsky coil type and one input from an external ring-type CT. 4 rated currents can be set via the keyboard: 40, 80, 250 and 1250 A.
If the unit is connected to 3 current sensors, the 50N and 51N protection functions are obtained by means of the vectorial sum of the phase currents.
If only 2 current sensors are used, an external ring-type current transformer must be provided for functions 50N and 51N.
The external ring-type current transformer can have an openable or closed core and any transformation ratio so long as the secondary current is 1 A.
The ABB current sensors of the Rogowsky coil type provided for REF 601 are only suitable for installation on MV insulated cables.
The characteristics of the device are:

- trip precision
- broad adjustment ranges
- single and simultaneous adjustment of the three phases
- no limitation (due to the current sensors) to the rated breaking capacity or short-time withstand current of the circuit breaker
- pushbuttons for local electrical operation of the circuit breaker (opening and closing pushbutton
- 5 distinct indicators: “relay operating”, “relay in trip threshold”, “relay tripped”, “relay tripped due to phase current having been exceeded”, “relay tripped for earth fault current having been exceeded”
- interface consisting of an LCD display and “arrow”, “enter” and “esc” keys for facilitated navigation in the “measurement” menu, “data recording”, “event recording”, “settings”, “configuration” and “test” menus

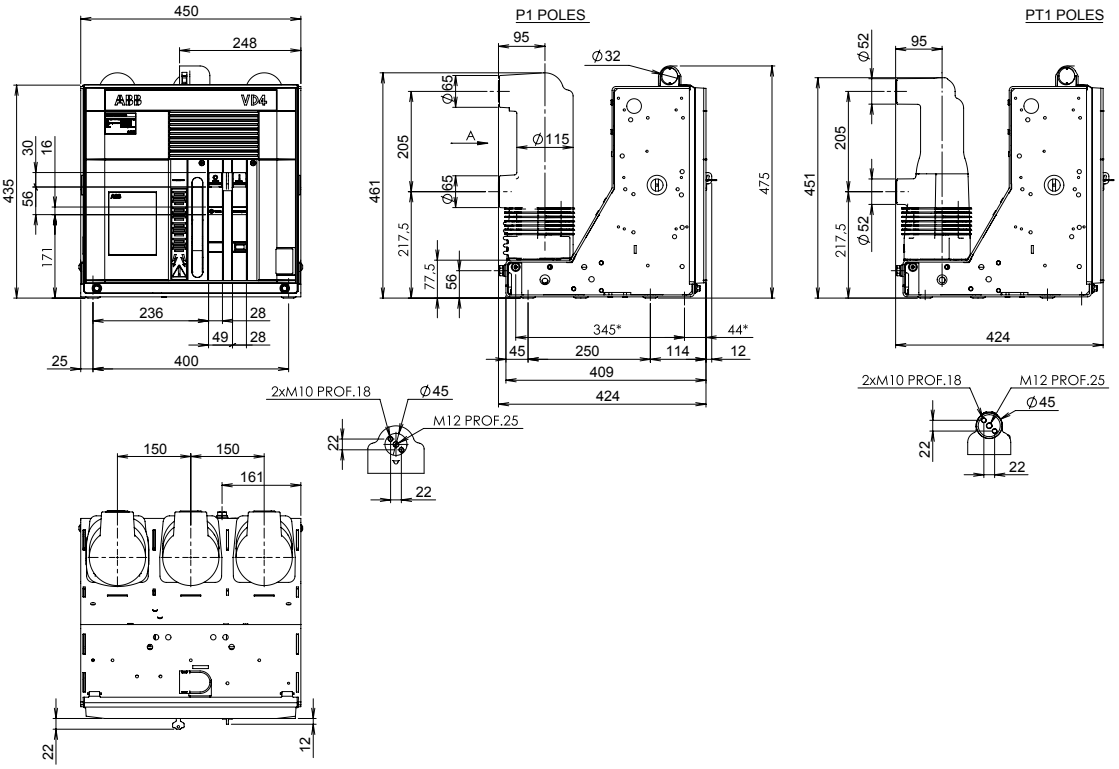
- three user levels: “operator” (display only, with free access by keeping this key pressed for at least 5 sec.), “configurator” (same as the previous level) but also with authorization to set the protection parameters (i.e. times and thresholds), and communication if present (access limited by a password), “administrator” (same as the previous levels), but also with authorization to set the password and configure the basic settings of the device, such as the rated current (access limited by a password)
- continuous display of the current on the most highly loaded phase and of the earth current
- recording of the value of the currents which caused the device to trip
- storage of the number of openings carried out by the device
- event log (storage of the parameters described above in the last 5 trips of the device) in a non-volatile memory
- curves “ß = 1” or “ß = 5” and curve “RI” specifically designed for the Belgian market (only REF 601 IEC)
- circuit breaker opening by means of an undervoltage release (only REF 601 CEI)
- version, on request, with RS485 4-wire serial communication
- MODBUS RTU full duplex protocol
- multi-voltage feeder 24 … 240 V AC- DC
- REF 601 is also available in a version specifically designed for the Italian market to CEI 0-16 standards (see brochure entitled “Solutions for upgrading to CEI 0-16 standards”) , with 80 or 250 A rated current which can be selected via the keyboard. It is always supplied with 3 sensors for installation on insulated MV cable, a 40/1 A ring-type CT for homopolar protection and undervoltage release for the circuit breaker opening operation.

Environmental protection programme

VD4 circuit breakers are manufactured in accordance with the ISO 14000 Standards (Guidelines for environmental management).
The production processes are implemented in accordance with the environmental protection standards as to the reduction of energy consumption and the production of waste.
All this is achieved thanks to the environmental management system applied in the medium voltage apparatus manufacturing facility.
Assessment of the environmental impact during the life-cycle of the product obtained by reducing the overall energy consumption and use of raw materials to the minimum, is put into effect during the design engineering stage through an accurate choice of materials, processes and packaging.
This to allow the products and components to be recycled to the utmost degree at the end of their useful life.

Spare parts

- Shunt opening release
- Additional shunt opening release
- Undervoltage release
- Time-lag device for undervoltage release
- Shunt closing release
- Spring loading geared motor with electrical signaling of spring loaded
- Contact signaling geared motor protection circuit breaker open/closed
- Contact signaling closing spring loaded/ discharged
- Transient contact with momentary closing during circuit breaker opening
- Circuit breaker auxiliary contacts
- Locking electromagnet on the operating mechanism
- Position contact of the withdrawable truck
- Contacts signaling connected/isolated
- Opening solenoid
- Open position key lock
- Isolation interlock with door
- Protection for opening pushbutton
- Protection for closing pushbutton
- Locking electromagnet on withdrawable truck
- Set of six isolating contacts.



Ordering

For availability and to order spare parts, please contact our Service department, specifying the circuit breaker serial number.

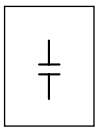
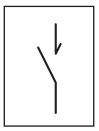
Electric circuit diagram



Note
The wiring diagrams in this section might not be the latest versions and are shown as exemplary of possible electrical wiring configurations. The wiring diagram depends on the specific circuit breaker configuration selected during ordering phase.
For VD4 evo Digital version refer please refer to documents 1VCD400316, 1VCD400311 and 1VCD400312



Operating state shown
The diagrams are shown the following conditions:
- Circuit breaker open and connected (only withdrawable circuit breaker)
- Circuits de-energized
- Closing springs discharged

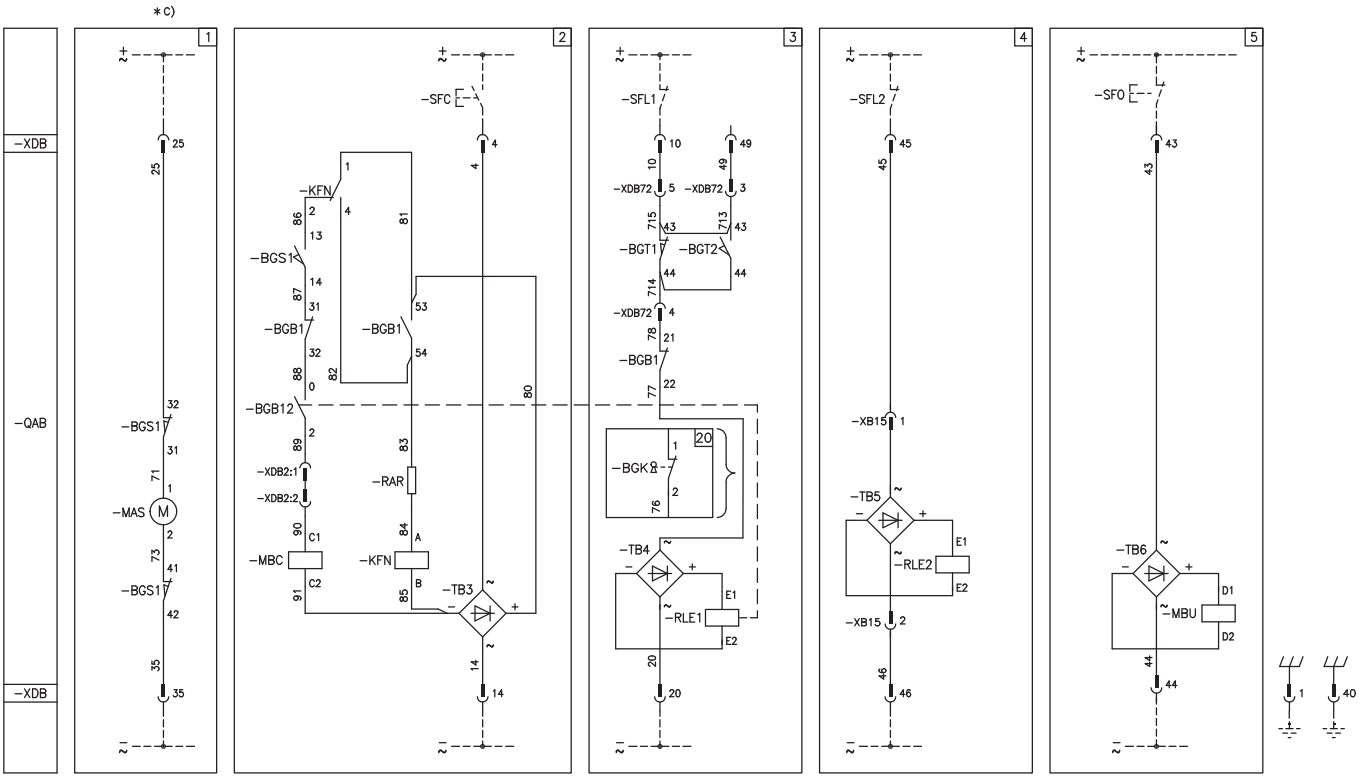
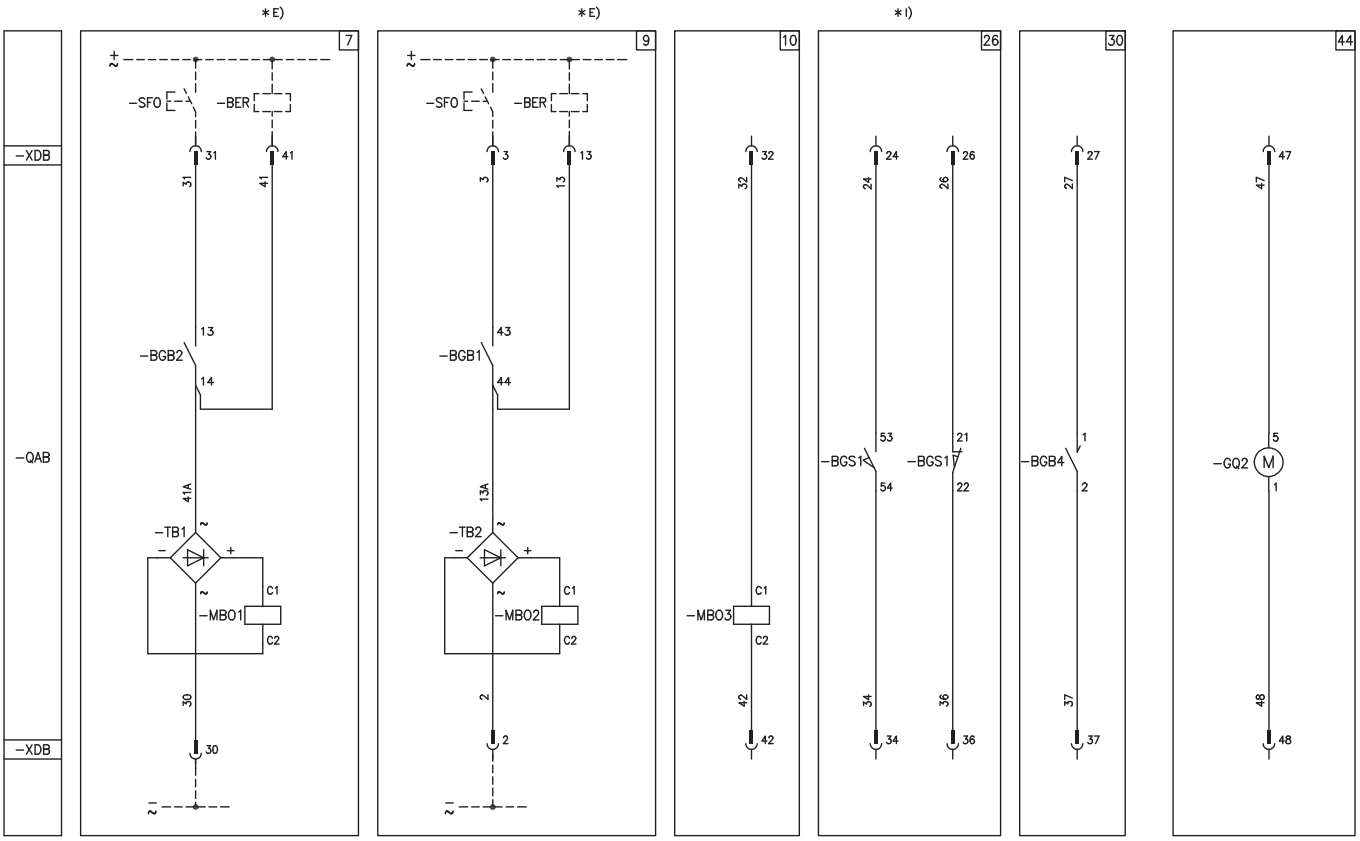
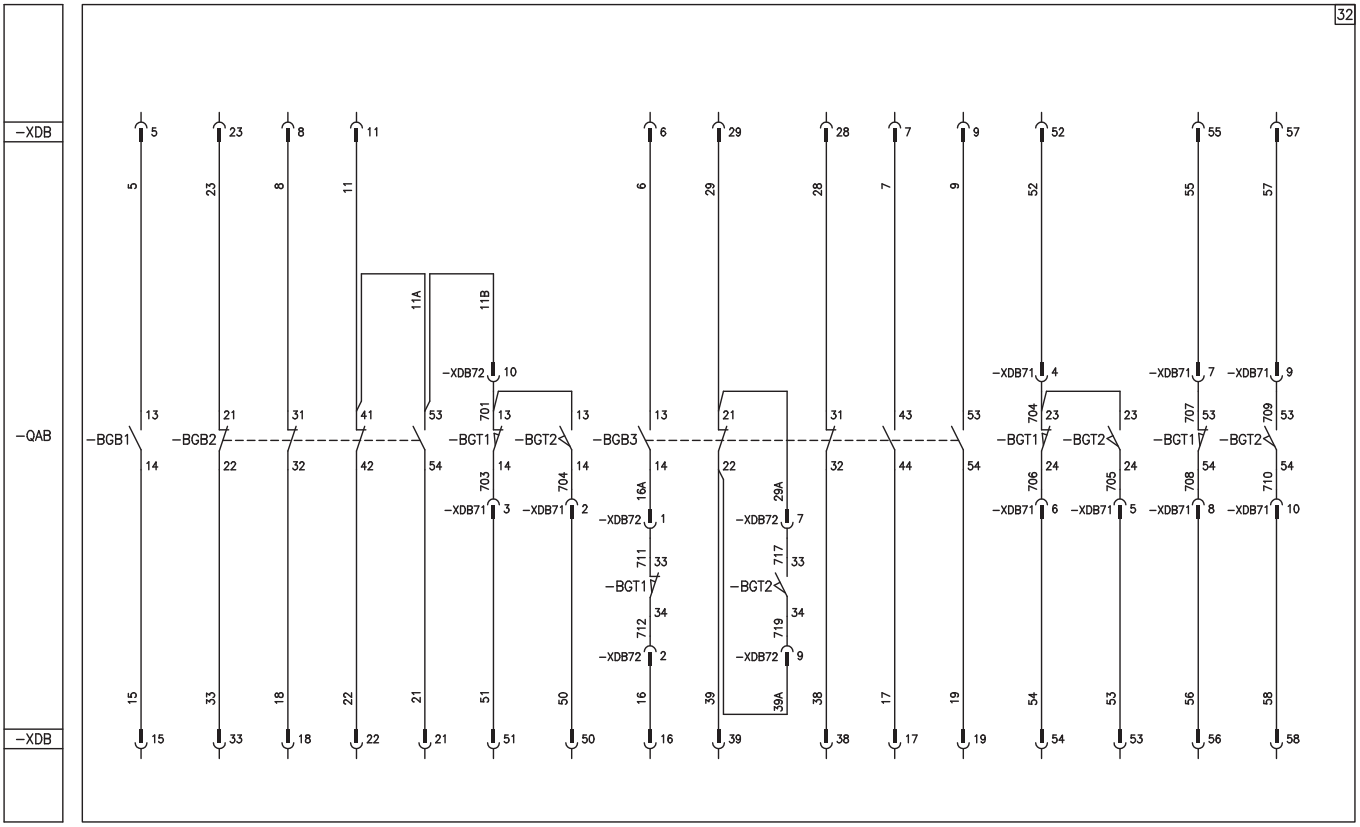
Description of the figures		
Fig. 1	=	Circuit of motor for loading closing springs (see note C).
Fig. 2	=	Shunt closing release (anti-pumping is achieved mechanically), (see note D).
Fig. 3	=	Locking magnet. Mechanically inhibits circuit breaker closing if de-energized. Consumption can be limited by connecting a delayed operation enabling pushbutton in series.
Fig. 5	=	Instantaneous undervoltage release (see note B).
Fig. 6, 66	=	Circuit of third shunt opening release with possibility of continuous control of winding (see note D).
Fig. 7, 67	=	Circuit of first shunt opening release with possibility of continuous control of winding (see note D).
Fig. 9, 69	=	Circuit of second shunt opening release with possibility of continuous control of winding (see note D).
Fig. 10	=	Opening solenoid for release outside circuit breaker.
Fig. 11	=	Opening solenoid for release outside circuit breaker with AC supply.
Fig. 26	=	Electrical signaling of closing springs loaded and discharged.
Fig. 30	=	Auxiliary let-through contact of circuit breaker with momentary closing during circuit breaker opening.
Fig. 31, 91	=	Available auxiliary contacts of circuit breaker (see note E).
Fig. 32, 92	=	Available auxiliary contacts of circuit breaker (see note E).
Fig. 33, 93	=	Available auxiliary contacts of circuit breaker (see note E).
Fig. 60	=	Contact for electrical signaling of undervoltage release de-energized.



Incompatibility			
The circuits indicated in the following figures cannot be supplied at the same time in the same circuit breaker:			
5-6-66	7-67	9-69	31-91
32-92	33-93	10-11	



Notes	
A)	The circuit breaker is equipped solely with the applications specified in the order confirmation. Consult this catalog for information about how to make out an order.
B)	The undervoltage release can be supplied for energizing with voltage derived from the supply side of the circuit breaker or from an independent source. Circuit breaker closing is only allowed when the release is energized (closing lock is obtained mechanically). If there is the same power supply for the shunt closing and undervoltage releases and the circuit breaker must close automatically when auxiliary voltage returns, there must be a 50 ms delay between the under-voltage release's enabling instant and energizing of the shunt closing release. Incompatible with -MBO4.
C)	Check power of auxiliary circuit to find out whether several motors for loading the closing springs can be started at the same time. To prevent excessive power draw, the springs must be loaded by hand before the auxiliary circuit is powered.
D)	The circuit for monitoring the continuity of the release winding must only be used for that purpose. The SOR Test Unit can be used for checking the continuity of the various different releases. -MBO4 incompatible with -MBU. -MBO4 not available for VD4 50 kA.
E)	When fig. 6 is required, contact -BGB1 (23-24) of fig.32 is not available. When fig. 7 is required, contact -BGB1 (3-4) of fig. 31 is not available. When fig. 9 is required, contact -BGB1 (7-8) of fig. 31 is not available. When fig. 32 is required, it is obligatory to supply the auxiliary contacts of fig. 31. When fig. 33 is required, it is obligatory to supply the auxiliary contacts of fig. 32. When fig. 66 is required, contact -BGB1 (23-24) of fig. 92 is not available. When fig. 67 is required, contact -BGB1 (3-4) of fig. 91 is not available. When fig. 69 is required, contact -BGB1 (7-8) of fig. 91 is not available. When fig. 92 is required, it is obligatory to supply the auxiliary contacts of fig. 91. When fig. 93 is required, it is obligatory to supply the auxiliary contacts of fig. 92. Figs. 33 and 93 are not available for VD4 50 kA.
F)	Figs. 10 and 11 are only available for VD4 up to 31.5 kA.
G)	The energizing voltage must be the same for both signals.



Electric circuit diagram

Electric circuit diagram of 36-40.5 kV fixed circuit breakers with Classic operating mechanism 1VCD400231

The electric circuit diagram in this section concerns 36 - 40.5 kV fixed circuit breakers with Classic operating mechanism.

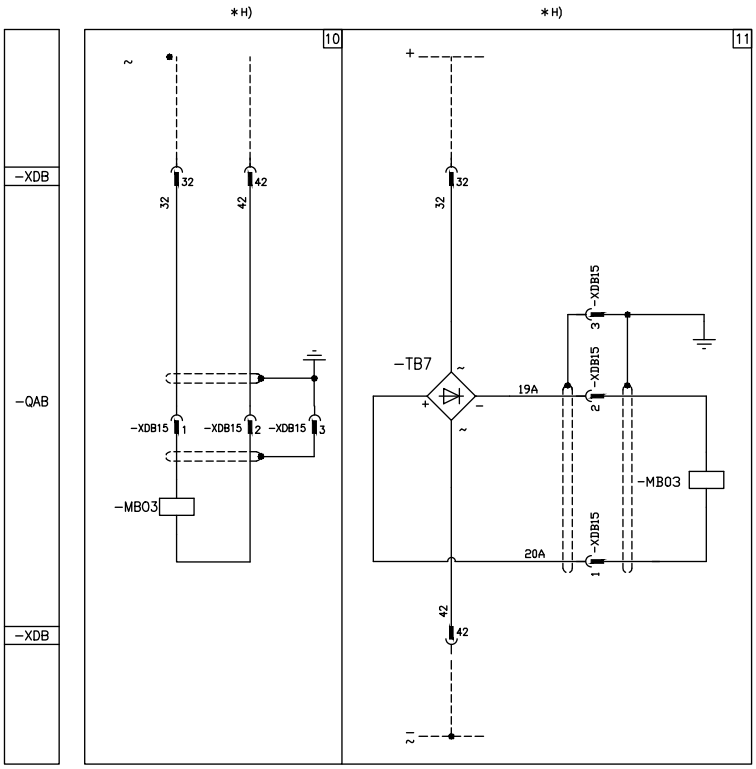
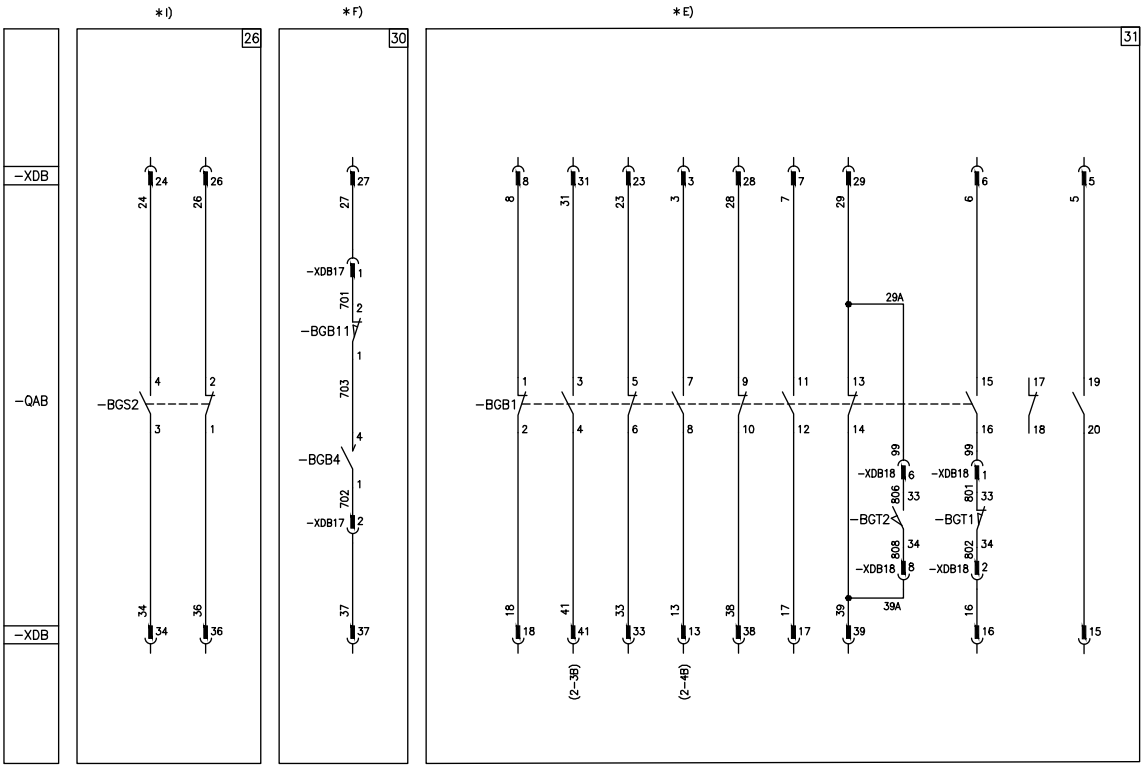
Fig. 30	=	Wiping contact 35ms for C.B. tripped indication
Fig. 32	=	C. breaker available auxiliary contacts
Fig. 44	=	Ventilation circuit

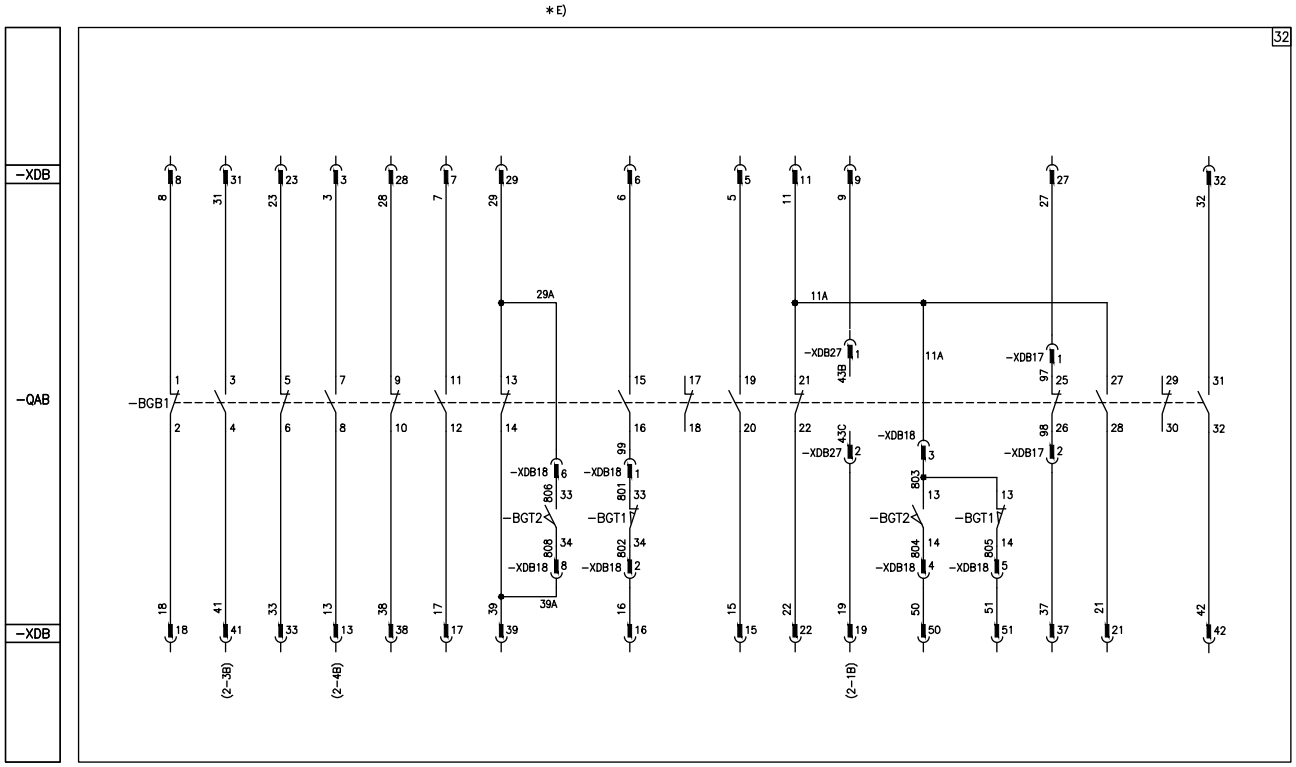
Notes	
A)	The circuit breaker is delivered complete with the accessories listed in the order aknowledgement only. To draw up the order examine the apparatus catalogue.
C)	Check the power supply available on the auxiliary circuit to verify if it is odeguate to start several closing spring-charging motors simultaneously. To prevent excessive consumption the closing springs must be charged manually before energizing the auxiliary circuit.
E)	The circuit for the supervision of shunt opening release coil continuity shall be used for this function only.
I)	Both limit switches signalling must be working at the same supply voltage.

Electric circuit diagram of 12 .. 24 kV withdrawable circuit breakers for UniGear switchgear and PowerCube enclosure 1VCD400155

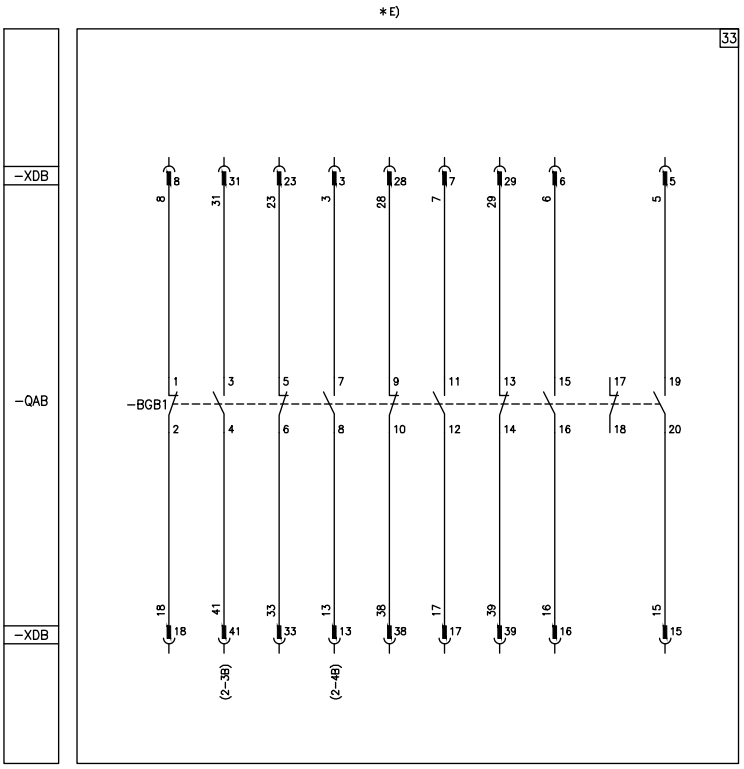




Electric circuit diagram



The electric circuit diagram in this section concerns 12 .. 24 kV withdrawable circuit breakers for UniGear switchgear and PowerCube enclosures. See diagram 1VCD400156 for withdrawable circuit breakers with motor-driven truck.



The following diagrams are available for circuit breakers for ZS8.4 switchgear:

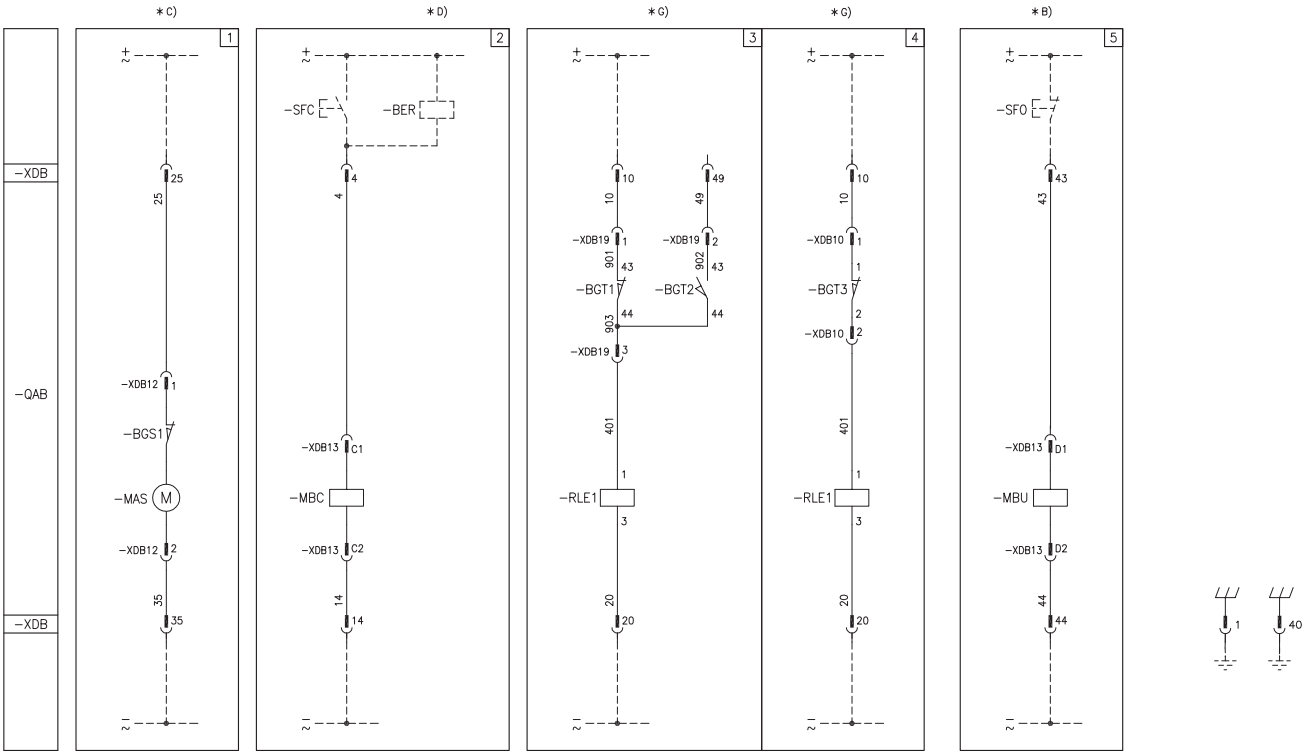
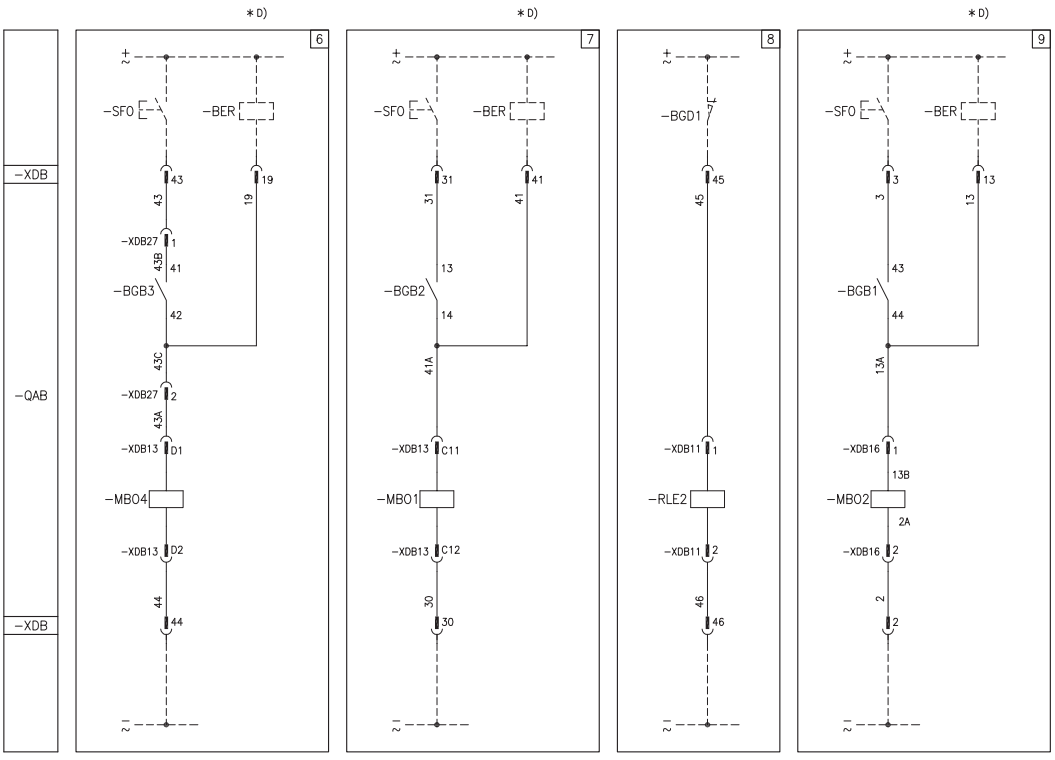
Fig. 60	=	Contact for electrical signaling of undervoltage release de-energized.

Electric circuit diagram



Incompatibility				
The circuits indicated in the following figures cannot be supplied at the same time in the same circuit breaker:				
3-4	**3-33-34**	**4-31-32**	**5-6**	**10-11**
31-32-33-34	**31-32-52**	**33-34-51**	**51-52**	



Notes	
A)	Circuit breaker is equipped solely with the applications specified in the order confirmation. Consult this catalog for information about how to make out an order.
B)	The undervoltage release can be supplied for energizing with voltage derived from the supply side of the circuit breaker or from an independent source. Circuit breaker closing is only allowed when the release is energized (closing lock is obtained mechanically). If there is the same power supply for the shunt closing and undervoltage releases and the circuit breaker must close automatically when auxiliary voltage returns, there must be a 50 ms delay between the undervoltage release's enabling instant and energizing of the shunt closing release. Incompatible with -MBO4.
C)	Check power of auxiliary circuit to find out whether several motors for loading the closing springs can be operated at the same time. To prevent excessive power draw, the springs must be loaded by hand before auxiliary circuit is powered.
D)	The circuit for monitoring the continuity of the release windings must only be used for that purpose. The SOR Test Unit can be used for checking the continuity of the various different releases: -MBO4 incompatible with -MBU. -MBO4 not available on Vmax and VD4 50kA.
E)	When fig. 6 is required, contact -BGB1 (23-24) of fig. 32-34 is not available. When fig. 7 is required, contact -BGB1 (3-4) of fig. 31-32-33-34 is not available. When fig. 9 is required, contact -BGB1 (7-8) of fig. 31-32-33-34 is not available. When fig. 10 or 11 are required, contact -BGB1 (31-32) of fig. 32 and 34 is not available. When fig. 30 is required, contact -BGB1 (25-26) of fig. 32 and 34 is not available.
F)	The contacts for electrical signaling of circuit breaker in isolated and racked-in position (-BGT1 and BGT2) shown in fig. 51-52 are installed on circuit breaker truck (movable part).
G)	Fig. 3 is supplied when fig. 31 or 32 are required. Fig. 4 is supplied when fig. 33 or 34 are required (in this case, it is obligatory to supply –BGT3).
H)	Fig. 10 is only available for VD4 up to 31.5 kA and Vmax. Fig. 11 is only available for VD4 up to 31.5 kA.
I)	The energizing voltage must be the same for both signals.

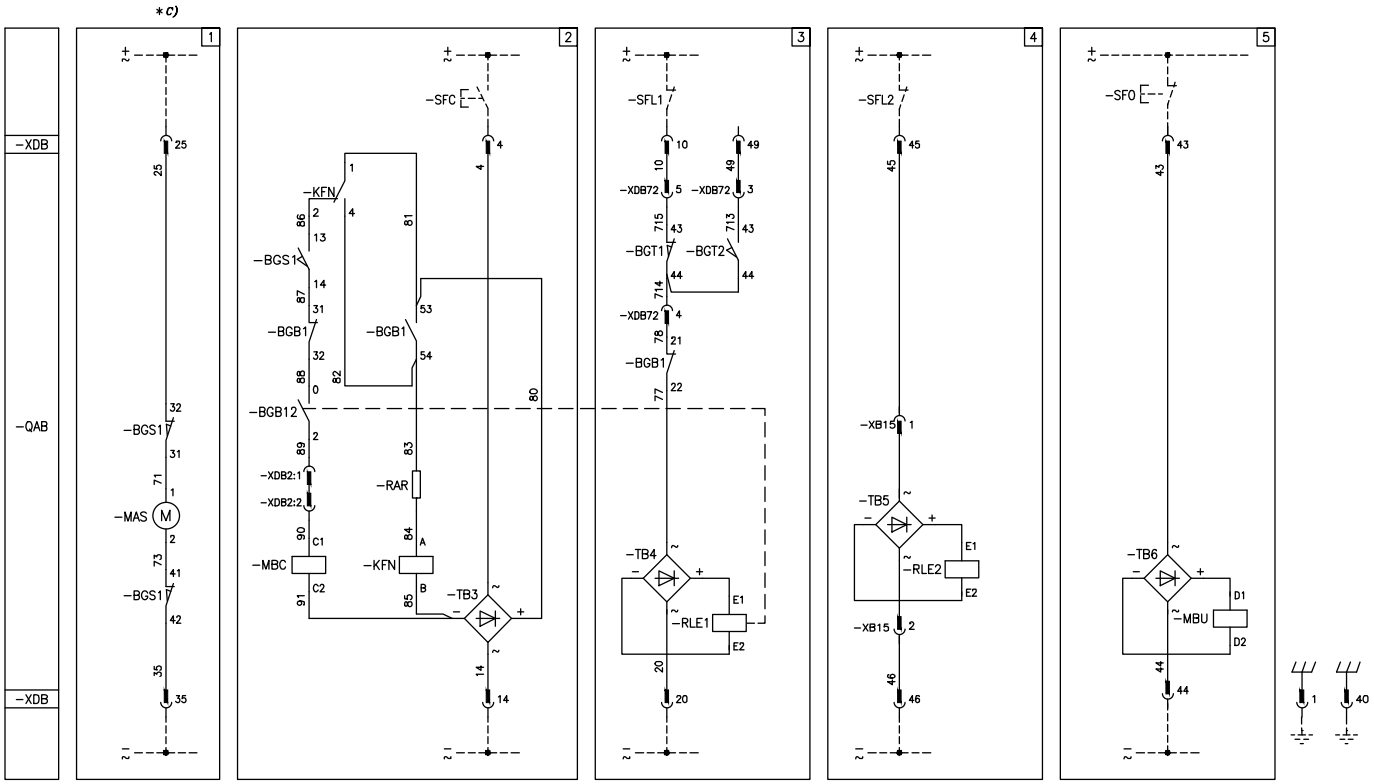
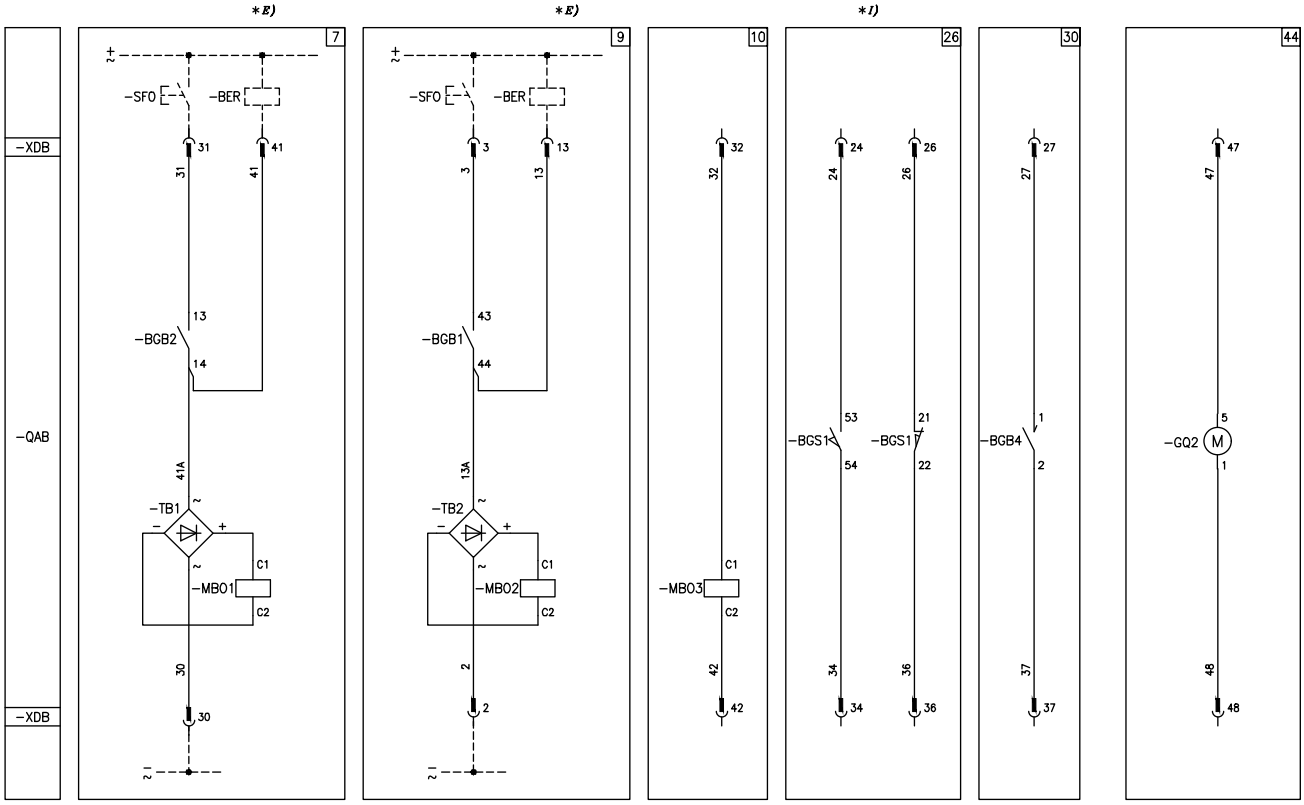
Fig. 60	=	Contact for electrical signaling of undervoltage release de-energized.

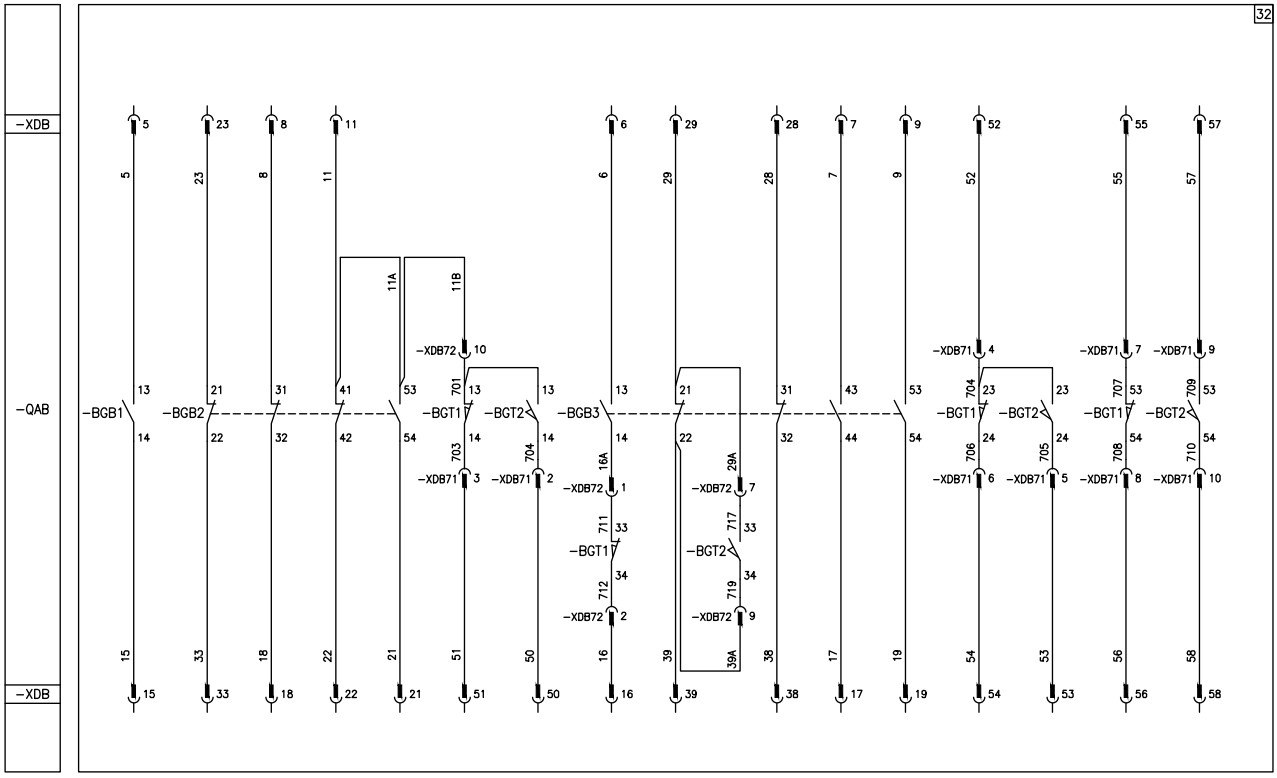


Electric circuit diagram

Incompatibility				
The circuits indicated in the following figures cannot be supplied at the same time in the same circuit breaker:				
3-4	**3-33-34**	**4-31-32**	**5-6**	**10-11**
31-32-33-34	**31-32-52**	**33-34-51**	**51-52**	



Notes	
A)	The circuit breaker is equipped solely with the applications specified in the order confirmation. Consult this catalog for information about how to make out an order.
B)	The undervoltage release can be supplied for energizing with voltage derived from the supply side of the circuit breaker or from an independent source. Circuit breaker closing is only allowed when the release is energized (closing lock is obtained mechanically). If there is the same power supply for the shunt closing and under-voltage releases and the circuit breaker must close automatically when auxiliary voltage returns, there must be a 50 ms delay between the undervoltage release's enabling instant and energizing of the shunt closing release. Incompatible with -MBO4.
C)	Check power of auxiliary circuit to find out whether several motors for loading the closing springs can be operated at the same time. To prevent excessive power draw, springs must be loaded by hand before auxiliary circuit is powered.
D)	The circuit for monitoring the continuity of the release windings must only be used for that purpose. The SOR Test Unit can be used for checking the continuity of the various different releases. -MBO4 incompatible with -MBU.
E)	When fig. 6 is required, contact -BGB3 (41-42) of fig. 32-34 is not available. When fig. 9 is required, contact -BGB1 (43-44) of fig. 31-32-33-34 is not available. When fig. 10 or 11 are required, contact -BGB3 (31-32) of fig. 32 and 34 is not available. When fig. 30 is required, contact -BGB3 (53-54) of fig. 32 and 34 is not available.
F)	The contacts for electrical signaling of circuit breaker in racked-in and isolated positions (-BGT1 and -BGT2) shown in fig. 51-52 are located on circuit breaker truck (moving part).
G)	Fig. 3 is supplied when fig. 31 or 32 are required. Fig. 4 is supplied when fig. 33 or 34 are required (in this case, it is obligatory for -BGT3 to be supplied).
H)	Fig. 10 is only available for VD4 up to 31.5 kA. Fig. 11 is only available for VD4 up to 31.5 kA.
I)	The energizing voltage must be the same for both signals.



Electric circuit diagram for 36-40.5 kV and 63 kA withdrawable circuit breakers with Classic operating mechanisms 1VCD400231

The circuit diagram in this section concerns 36-40.5 kV plug-in circuit breakers with Classic operating mechanism.

Electric circuit diagram

Fig. 4	=	Locking magnet on the truck. If de-energized it prevents the circuit breaker racking-in and racking-out mechanically
Fig. 5	=	Instantaneous undervoltage release
Fig. 7	=	First shunt opening release circuit with possibility of permanent supervision of coil continuity (see note E)
Fig. 9	=	Second shunt opening release circuit with possibility of permanent supervision of coil continuity (see note E)
Fig. 10	=	Indirect overcurrent relay
Fig. 26	=	Contact signalling charged or discharged closing springs (see note I)
Fig. 30	=	Wiping contact 35ms for C.B. tripped indication
Fig. 32	=	Circuit breaker available auxiliary contacts
Fig. 44	=	Ventilation circuit

Notes	
A)	The circuit breaker is delivered complete with the accessories listed in the order aknowledgement only. To draw up the order examine the apparatus catalogue.
C)	Check the power eupply available on the auxiliary circuit to verify if it is adeguate to start several closing spring-charging motors simultaneously. To prevent excessive consumption the closing springs must be charged manually before energizing the auxiliary circuit.
E)	The circuit for the supervision of shunt opening release coil continuity shall be used for this function only.
I)	Both limit switches signalling must be working at the same supply voltage.

I. For your safety!

- **Make sure that the installation room (spaces, divisions and ambient) is suitable for the electrical apparatus.**
- **Check that all the installation, putting into service and maintenance operations are carried out by qualified personnel with suitable knowledge of the apparatus.**
- **Make sure that the standard and legal prescriptions are complied with during installation, putting into service and maintenance, so that installations according to the rules of good working practice and safety in the work place are constructed.**
- **Strictly follow the information given in this instruction manual.**
- **Check that the rated performance of the apparatus is not exceeded during service.**
- **Check that the personnel operating the apparatus have this instruction manual to hand as well as the necessary information for correct intervention.**
- **Pay special attention to the danger notes indicated in the manual by the following symbol:**

Responsible behaviour safeguards your own and others' safety!
For any requests, please contact the ABB Assistance Service.

II. Introduction

This publication contains the information needed to install medium voltage VD4 circuit breakers and put them into service.
For correct use of the product, please read it carefully.
Like all the apparatus we manufacture, the VD4 circuit breakers are designed for different installation configurations.
However, this apparatus allows further technical-construction modifications (at the customer's request) to adapt to special installation requirements.
Consequently, the information given below may sometimes not contain instructions concerning special configurations.
Apart from this manual, it is therefore always necessary to consult the latest technical documentation (electric circuit and wiring diagrams, assembly and installation drawings, any protection coordination studies, etc.), especially regarding any variants requested in relation to the standardised configurations.
Only use original spare parts for maintenance operations.
For further information, please also see the technical catalogue of the circuit breaker and the spare parts catalogue.

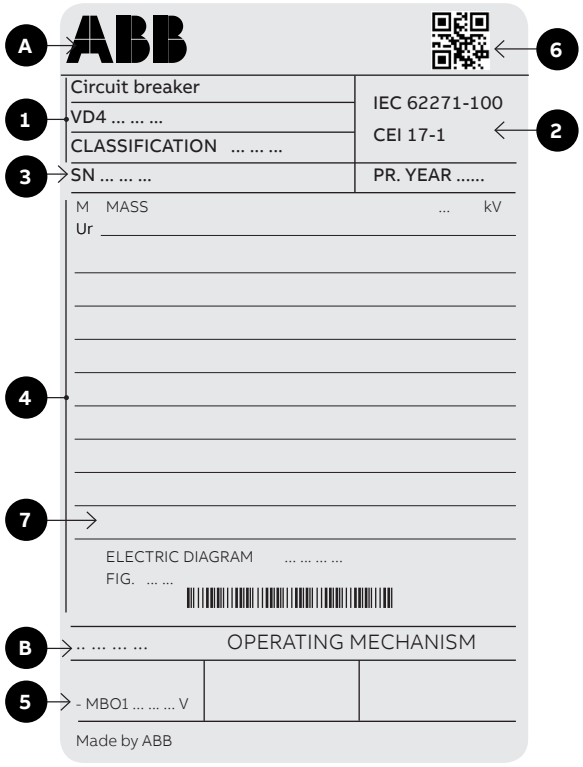
All the installation, putting into service, running and maintenance operations must be carried out by skilled personnel with in-depth knowledge of the apparatus.

III. Environmental protection programme

The VD4 circuit breakers are manufactured in accordance with the ISO 14000 Standards (Guidelines for environmental management).
The production processes are carried out in compliance with the Standards for environmental protection in terms of reduction in energy consumption as well as in raw materials and production of waste materials. All this is thanks to the medium voltage apparatus manufacturing facility environmental management system.

1. Packing and transport

The circuit breaker is shipped in special packing, in the open position and with the spring discharged. Each piece of apparatus is protected by a plastic cover to prevent any infiltration of water during the loading and unloading stages and to keep the dust off during storage.



2. Checking on receipt

Before carrying out any operation, always make sure that the operating mechanism spring is discharged and that the apparatus is in the open position.

On receipt, check the state of the apparatus, integrity of the packing and correspondence with the nameplate data (see fig. 1) with what is specified in the order confirmation and in the accompanying shipping note.
Also make sure that all the materials described in the shipping note are included in the supply.
Should any damage or irregularity be noted in the supply on unpacking, notify ABB (directly or through the agent or supplier) as soon as possible and in any case within five days of receipt.
The apparatus is only supplied with the accessories specified at the time of ordering and validated in the order confirmation sent by ABB.

The accompanying documents inserted in the shipping packing are:
- instruction manual (this document)
- test certification
- identification label
- copy of the shipping documents
- electric wiring diagram.

Other documents which are sent prior to shipment of the apparatus are:
- order confirmation
- original shipping advice note
- any drawings or documents referring to special configurations/conditions.

3. Storage

When a period of storage is foreseen, our workshops can (on request) provide suitable packing for the specified storage conditions.
On receipt the apparatus must be carefully unpacked and checked as described in Checking on receipt (chap. 2).
If immediate installation is not possible, the packing must be replaced, using the original material supplied.
Insert packets of special hygroscopic substances inside the packing, with at least one standard packet for piece of apparatus.
Should the original packing not be available and immediate installation is not possible, store in a covered, well-ventilated, dry, dust-free, non-corrosive ambient, away from any easily flammable materials and at a temperature between – 5 °C and + 45 °C.
In any case, avoid any accidental impacts or positioning which stresses the structure of the apparatus.

4. Handling

Before carrying out any operations, always make sure that the operating mechanism spring is discharged and that the apparatus is in the open position.
To lift and handle the circuit breaker, proceed as follows (fig. 2):

- use a special lifting tool (1) (not supplied) fitted with ropes with safety hooks (2);
- insert the hooks (2) in the supports (3) fixed to the frame of the circuit breaker and lift. Put the hooks (2) into the support holes (3) according to the type of apparatus (see table);
- on completion of the operation (and in any case before putting into service) unhook the lifting tool (1) and dismantle the supports (3) from the frame.

During handling, take great care not to stress the insulating parts and the terminals of the circuit breaker.

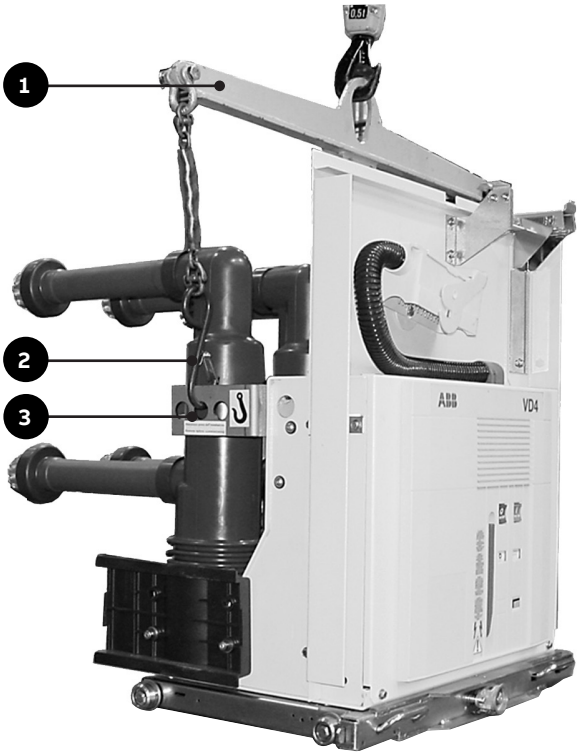

Fig. 2

The apparatus must not be handled by putting lifting devices directly under the apparatus itself.
Should it be necessary to use this technique, put the circuit breaker onto a pallet or a sturdy supporting surface (see fig. 3).
In any case, it is always advisable to carry out lifting using the supports (3).

5. Description

5.1. General

The VD4 are vacuum circuit breaker for indoor installation.
For the electrical performances, please refer to the corresponding technical catalogue code 1VCP000001.
For special installation requirements, please contact ABB.
The following versions are available:

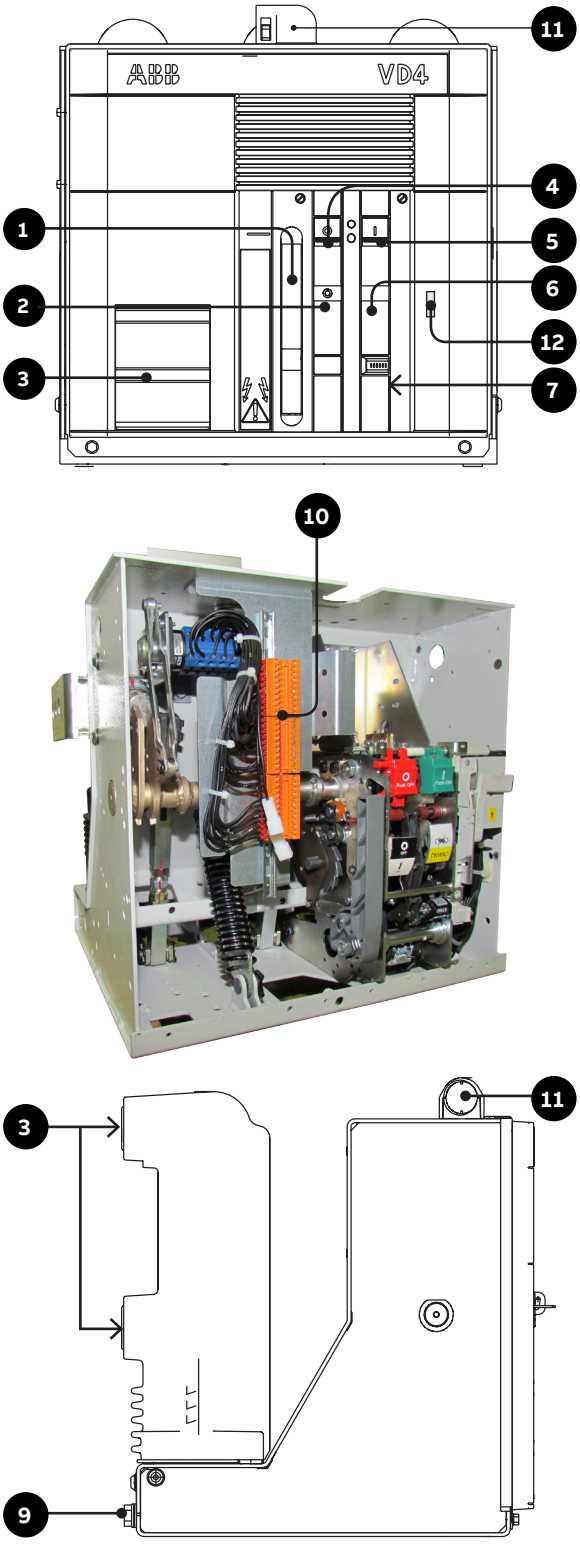
- fixed
- withdrawable for UniGear ZS1 switchgear and PowerCube modules.

5.2. Reference Standards

The VD4 circuit breakers conform to the IEC 62271-100, CEI - VDE - BS Standards are equivalent to IEC Standards due to harmonization with IEC.
Some ratings are qualified also according to ANSI/ IEEE standards.

5.3. EL operating mechanism

VD4 circuit breakers are equipped with modular EL spring operating mechanisms. The operating mechanism is designed to cover the whole range of performances as shown in the following table:



Type of operating mechanism	Rated short-circuit current
EL1 - EL2	Up to 31.5 kA
EL3 - EL3	Up to 40 kA - 24 kV, 31.5 kA
EL3 - EL3-S	40.5 kV up to 31.5 kA 40 kA up to 17.5 kV
EL1 TWIN	Up to 50 kA (rated current up to 2000 A)
EL2 TWIN	Up to 50 kA (rated current ≥ 2500 A)

5.4. VD4 evo

VD4 evo availablen with digital capabilities and sensors.

5.5. Fixed circuit breakers

The fixed circuit breaker (fig. 4) is the basic version complete with structure and front protection screen. The fixing holes are made in the lower part of the structure.
For the electrical connections of the circuit breaker auxiliary circuits, the terminal box (10) is available (also see par. 7.8.1.).
The earthing screw is placed in the rear part of the circuit breaker. For further details please see the caption to figure 4.

(1) Poles in polyamide
(2) Available in 10 kV voltage version in accordance with GOST standards up to 50 kA
(3) Up to 4000 A with forced ventilation
(4) On request, the closing spring can be loaded by means of a removable crank handle outside operating mechanism (instead of linear loading by a lever built into the front of operating mechanism)
*) Consult ABB for the 4000 A version with natural ventilation

H = Height of the circuit breaker.
W = Width of the circuit breaker.
D = Depth of the circuit breaker.
u/l = Distance between bottom and top terminal.
l/g = Distance between the bottom terminal and the resting surface of the circuit breaker.
P = Pole horizontal centre distance.

5.5.3. Standard fittings for fixed circuit breakers

The basic versions of the fixed circuit breakers are three-pole and fitted with:

- EL type manual operating mechanism
- mechanical signalling device for closing spring charged/ discharged
- mechanical signalling device for circuit breaker open/closed
- closing pushbutton, opening pushbutton and operation counter
- set of ten circuit breaker open/closed auxiliary contacts

  Note: with the set of ten auxiliary contacts supplied as standard and the maximum number of electrical applications possible, three make contacts (signalling circuit breaker open) and five break contacts (signalling circuit breaker closed) are available.

- lever for manual closing spring charging

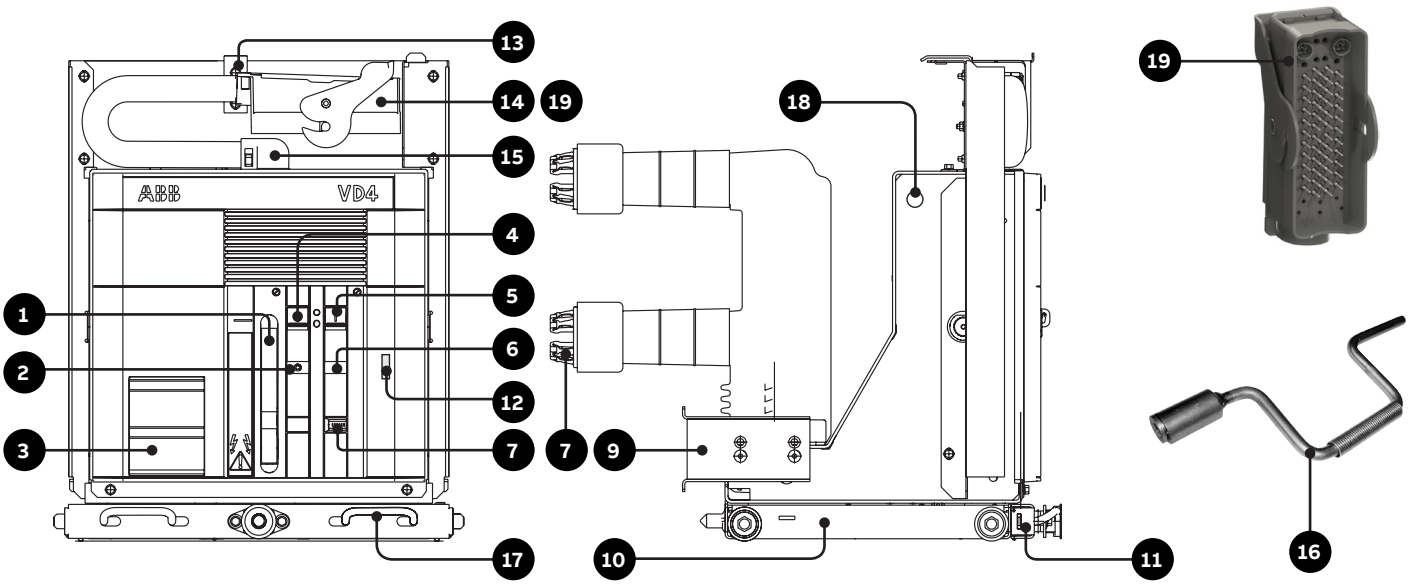
VD4 evo - up to 17 kV

VD4 - up to 24 kV

VD4 - 36 kV

5.6. Withdrawable circuit breakers

The withdrawable circuit breakers up to 24 kV are available for UniGear ZS1 and UniSec switchgear, PowerCube modules (see fig. 5a) and for ZS8.4 switchgear (see fig. 5b).
The 36 kV circuit breakers are available for ZS2 switchgear.
They consist of a truck on which the supporting structure of the circuit breaker is fixed.



Circuit breakers for UniGear ZS1 and UniSec switchgear and for PowerCube modules (fig. 5a)
The cord with the connector (14) (plug) for connection of the operating mechanism electrical accessories comes out of the connection (15).
The strikers for operating the contacts (connected/ isolated) placed in the switchgear are fixed in the top part of the circuit breaker.
The shutter actuator (9) (roller (18) for UniSec version) are provided for operating the segregation shutters of the medium voltage contacts of the enclosure or of the switchgear are fixed on the sides of the circuit breaker.
The crosspiece with the handles (17) for hooking up the circuit breaker for the racking-in/out operations by means of the special operating lever (16) is mounted on the front part of the circuit breaker truck.
The circuit breaker is completed with the isolating contacts (8).

5. Description

The withdrawable circuit breaker is fitted with special locks on the front crosspiece, which allow hooking up into the corresponding couplings of the switchgear.
The locks can only be activated by the handles with the truck fully resting against the crosspiece.
The operating lever (16) must be fully inserted (also see par. 7.5.). A lock prevents the truck from advancing into the enclosure or fixed part when the earthing switch is closed.
Another lock prevents racking-in and racking-out with the circuit breaker closed. With the truck in an intermediate position between isolated and connected, a further lock prevents circuit breaker closing (either mechanical or electrical).
A locking magnet is also mounted on the truck which, when de-energised, prevents the truck racking-in operation.

On request, an interlock is available which prevents racking-in of the circuit breaker with the door open, and door opening with the circuit breaker closed.
The lever for loading the closing spring (1) in the manual mode is built into the operating mechanism.
The spring is loaded by repeatedly lowering the lever with linear movements until the yellow indicator (6) appears to show that loading is complete.
The spring can only be loaded with the switchgear door open.
Comply with the instructions in the UniGear switchgear manual for the operations that can be performed with the door open.

Note: on request, the closing spring loading device for withdrawable circuit breakers for UniGear switchgear can be supplied with the lever outside the operating mechanism and a rotary loading movement. This device is part of the standard equipment for VD4/ZS8 withdrawable circuit breakers only (see detail 1 of Fig. 5b on the next page). This rotary loading device allows the closing spring to be loaded with the switchgear door closed.

1 Lever for manually charging the closing spring
2 Signalling device for circuit breaker open/closed
3 Rating plate
4 Opening pushbutton
5 Closing pushbutton
6 Signalling device for closing spring charged/discharged
7 Operation counter
8 Isolating contacts
9 Slide for operating the switchgear shutters (UniGear ZS1, PowerCube, ZS8.4)
10 Truck
11 Locks for hooking into the fixed part
12 Mechanical override of the undervoltage release (on request)
13 Strikers for activating the contacts placed in the enclosure
14 Connector (plug)
15 Cabling connection
16 Operating lever for circuit breaker racking-in/out
17 Handles for activating the locks (11)
18 Shutters actuator (for UniSec version only)
19 Connector (plug) with two Harting connectors - VD4 evo only

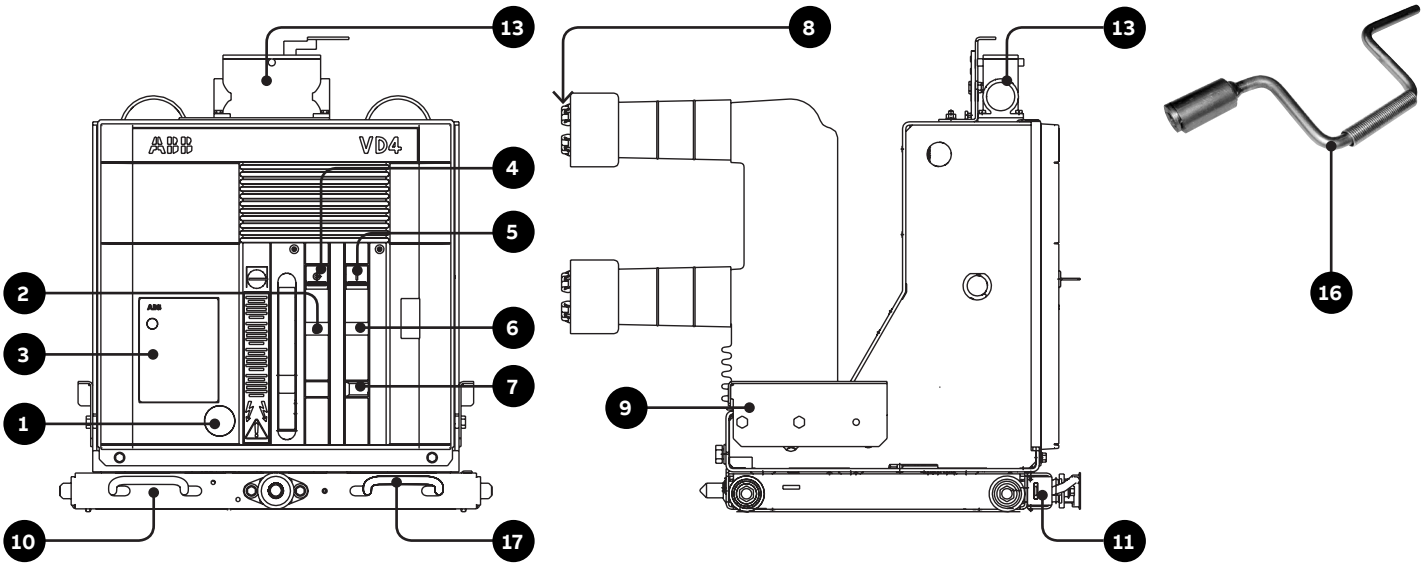
Fig. 5a

Circuit breakers for ZS8.4 switchgear (fig. 5b)
The socket (13) takes the connector (plug) placed in the switchgear.
The slides (9) for operating the segregation shutters of the medium voltage contacts of the switchgear are fixed on the sides of the circuit breaker.
The crosspiece with the handles (17) for hooking up the circuit breaker for the racking-in/out operations by means of the special operating lever (16) is mounted on the front part of the circuit breaker truck.
The circuit breaker is completed with the isolating contacts (8).
The withdrawable circuit breaker is fitted with special locks, described below (see fig. 5c - 5d).

1) Prevention of traverse with circuit breaker closed

With the circuit breaker closed, the feeler pin (16 - fig. 5c) prevents the shutter sliding (19 - fig. 5c) and therefore insertion of the lever (20 - fig. 5c) for traverse of the apparatus.

2) Prevention of traverse with socket-plug disconnected



When the plug is not inserted in the socket (13), the stem (21 - fig. 5c) prevents the plate (22 - fig. 5c) lifting and traverse of the apparatus.

3) Prevention of switchgear door closing with socketplug disconnected (*)

When the plug is not inserted in the socket (13), the feeler pin (23 - fig. 5d) prevents door closing.

4) Prevention of circuit breaker racking-out with the socket-plug connected (*)

When the plug is inserted in the socket (13), the lock bolt (29 - fig. 5d) hits the pin (30 - fig. 5d) preventing the apparatus from being racked out of the switchgear.

H = Height of the circuit breaker.
W = Width of the switchgear.
D = Depth of the circuit breaker.
u/l = Distance between bottom and top terminal.
l/g = Distance between the bottom terminal and the resting surface of the circuit breaker.
P = Pole horizontal centre distance.
(1) 2500 A rated current guaranteed with forced ventilation and tulip contacts diameter 79 mm (TN 1VYN300901-RA).
(2) 3150 A rated current guaranteed with forced ventilation.

5.6.3. Standard fittings of withdrawable circuit breakers for UniGear ZS1 switchgear (up to 24 kV) - UniGear ZS2 and PowerCube modules (VD4 36 kV)

The basic versions of the withdrawable circuit breakers are three-pole and fitted with:

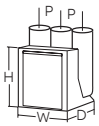
- EL type manual operating mechanism
- mechanical signalling device for closing spring charged/discharged
- mechanical signalling device for circuit breaker open/closed
- closing pushbutton
- opening pushbutton
- operation counter
- set of ten auxiliary circuit breaker open/closed contacts

  Note: with the set of ten auxiliary contacts supplied as standard and the maximum number of electrical applications possible, three make contacts (signalling circuit breaker open) and four break contacts (signalling circuit breaker closed) are available.
- lever for manually charging the closing spring
- isolating contacts
- cord with connector (plug only) for auxiliary circuits, withstriker pin which does not allow connection of the plugin the socket if the rated current of the circuit breaker isdifferent from the rated current of the panel
- racking-in/out lever (the quantity must be defined according to the number of pieces of apparatus ordered)
- locking electromagnet in the truck. This prevents the circuit breaker from being racked into the panel with auxiliary circuits not connected (plug not inserted in the socket).

VD4 with poles in polyamide

VD4 - 36 kV

VD4 - up to 24 kV



VD4 evo - up to 17 kV

W = Width of the switchgear.
P = Pole horizontal centre distance.
u/l = Distance between bottom and top terminal.
ø = Diameter of the isolating contact.
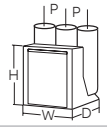
(1) Up to 2500 A rated current guaranteed with forced ventilation.

Standard fittings of withdrawable circuit breakers for PowerCube modules

The basic versions of the withdrawable circuit breakers are always three-pole and fitted with:

- EL type manual operating mechanism
- mechanical signalling device for closing springs charged/discharged
- mechanical signalling device for circuit breaker open/closed
- closing pushbutton
- opening pushbutton
- operation counter
- set of ten circuit breaker open/closed auxiliary contacts
  Note: with the group of ten auxiliary contacts supplied as standard and the maximum number of electrical applications, three break contacts (signalling circuit breaker open) and four make contacts (signalling circuit breaker closed) are available.
- lever built into operating mechanism for linear loading of closing spring
- isolating contacts
- cord with connector (plug only) for auxiliary circuits, with striker pin which does not allow the plug to be inserted into the socket if the rated current of the circuit breaker is different from the rated current of the panel
- racking-in/out lever (the quantity must be defined according to the number of pieces of apparatus ordered)
- electromagnet lock in the truck. Prevents the circuit breaker from being racked into the panel when the auxiliary circuits are not connected (plug not in socket)
- door interlock (compulsory for ABB switchgear); this device prevents racking the circuit breaker into the switchgear when the switchgear door is open.



VD4 with poles in polyamide

W = Width of the switchgear.
P = Pole horizontal centre distance.
u/l = Distance between bottom and top terminal.
Ø = Diameter of the isolating contact.

5.6.8. Standard fittings for withdrawable circuit breakers for ZS8.4 switchgear

The basic versions of the withdrawable circuit breakers are always three-pole and fitted with:

- EL type manual operating mechanism
- mechanical signalling device for closing spring charged/ discharged
- mechanical signalling device for circuit breaker open/closed
- closing pushbutton
- opening pushbutton
- operation counter
- set of ten auxiliary circuit breaker open/closed contacts

  Note: with the set of ten auxiliary contacts supplied as standard and the maximum number of electrical applications possible, three make contacts (signalling circuit breaker open) and four break contacts (signalling circuit breaker closed) are available.

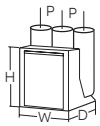
- lever for manually charging the closing springs incorporatedin the operating mechanism for VD4/ Z8 and VD4/ZT8,external with rotary movement for VD4/ZS8
- isolating contacts
- cord with connector (only plug) for auxiliary circuits, withstriker pin which does not allow connection of the plugin the socket if the rated current of the circuit breaker isdifferent from the rated current of the panel
- racking-in/out lever (the quantity must be defined accordingto the number of pieces of apparatus ordered)

5.6.9. VD4/ZS8 (Preussen Elektra-EON version)

- Device for recharging the closing spring, with door closed, by means of removable rotary handle and outside the operating mechanism and the switchgear
- 64-pin Harting socket with mechanical interlock which prevents traverse of the circuit breaker when the plug is not inserted in the socket
- Interlock with the door which prevents insertion of the spring charging lever when the circuit breaker is closed
- Interlock with the door and the 64-pin Harting socket which prevents door closure when the plug is not inserted in the socket.

5.6.10. VD4/Z8 - VD4/ZT8

- Harting 64-pin socket with mechanical interlock which prevents traverse of the circuit breaker when the plug is not inserted in the socket.



Caption

1) Device for spring charging with rotary handle
2) Harting 64-pin socket with mechanical interlock which prevents traverse when the socket is not inserted
3) Door-socket-spring charging device interlock (only VD4/ZS8 version)

P = Pole horizontal centre distance.
u/l = Distance between bottom and top terminal.
Ø = Diameter of the isolating contact.

5.6.12. Standard fittings of withdrawable circuit breakers for UniSec

The basic versions of the withdrawable circuit breakers are three-pole and fitted with:

- EL type manual operating mechanism
- mechanical signalling device for closing springs charged/discharged
- mechanical signalling device for circuit breaker open/closed
- closing pushbutton
- opening pushbutton
- operation counter
- set of ten circuit breaker open/closed auxiliary contacts

Note: with the group of ten auxiliary contacts supplied as standard and the maximum number of electrical applications, three break contacts (signalling circuit breaker open) and four make contacts (signalling circuit breaker closed) are available.

- lever built into operating mechanism for linear loading of closing spring
- isolating contacts
- cord with connector (plug only) for auxiliary circuits, with striker pin which does not allow the plug to be inserted into the socket if the rated current of the circuit breaker is different from the rated current of the panel
- racking-in/out lever (the quantity must be defined according to the number of pieces of apparatus ordered)

5. Description

5.7. Characteristics of the electrical accessories

The accessories identified with the same number are alternative to each other.

1 Shunt opening release (-MBO1)

Allows opening command of apparatus to be enabled by remote control.
This release is suitable for both instantaneous and permanent duty. However, an auxiliary contact -BGB1 de-energizes it after circuit breaker has opened. In the case of instantaneous service, the current impulse must last at least 100 ms.
This release can be controlled by the following devices: coil continuity control (CCC), opening circuit supervision (TCS)(*) or the ABB STU functionality control device (see accessory 21, supplied on request).

Characteristics	
Un	24-30-48-60-110...132-220...250 V DC
Un	48-60-110...127-220...250 V AC 50-60 Hz
Operating limits	65 ... 120% Un
Inrush power (Ps)	60...100 W / VA
Continuous power consumption (Pc)	1.5 W
Electronics self-consumption (no coil supplied); value independent of voltage applied	1.5 mA
Opening time	33...60 ms
Insulation voltage	2000 V 50 Hz (for 1 min)

(*) The minimum current that the relay with TCS function (used for monitoring coil continuity) detects as a condition denoting that the trip circuit is operating correctly (specified for each relay in the relative manual), must be sensibly higher than the current consumption of the actual coil (~1.5 mA).
If this fails to occur, always add, in parallel to the TCS, a circuit able to absorb sufficient current to compensate the gap while preventing the total current in the TCS circuit from rising above the maximum threshold (Itcs < 10 mA for High Voltage coils - from 110V to 250V, and Itcs < 50 mA for Low Voltage coils from 24 V to 60 V).
A simple resistor can be sized for the purpose, depending on the parameters of the TCS and the auxiliary voltage range used.

2 Additional shunt opening release (-MBO2)

Similarly to shunt opening release -MBO1, this allows the opening command of the apparatus to be transmitted by remote control. It can be powered by the same circuit as main shunt opening release -MBO1 or by a circuit that is completely separate from release -MBO1.
This release is suitable for both instantaneous and permanent duty. However, an auxiliary contact -BGB1 de-energizes it after the circuit breaker has opened.
To guarantee the release action, the current impulse must last at least 100 ms.
Continuity functionality can be checked with a continuity control device (CCC), opening circuit supervision (TCS)(*) or the STU functionality control device (see accessory 21, supplied on request).
-MBO2 has the same electrical and operating characteristics as release -MBO1.

3 Opening solenoid (-MO3)

The opening solenoid (-MO3) is a special release with demagnetisation to be combined with an overcurrent protection relay of the self-supplied type.
It is located in the operating mechanism (in the left side piece) and is not alternative to the additional shunt opening release (-MO2).
It is not available for 40 and 50 kA circuit breakers.
Should the application of this accessory be required, specify the request at the time of order since subsequent application by the customer is not possible.

Note: for combination with the protection relays, please ask for the document: Data sheet 1VCD600854.

The opening solenoid (-MBO3) is available in two versions:

- For DC (release by discharging energy stored in protection relay against overcurrent of the self-supplied type)
- For AC (release by means of the energy supplied by an adder transformer on the secondaries of the protection current transformers (the TA is at customer's charge)

(*) The minimum current that the relay with TCS function (used for monitoring coil continuity) detects as a condition denoting that the trip circuit is operating correctly (specified for each relay in the relative manual), must be sensibly higher than the current consumption of the actual coil (~1.5 mA).
If this fails to occur, always add, in parallel to the TCS, a circuit able to absorb sufficient current to compensate the gap while preventing the total current in the TCS circuit from rising above the maximum threshold (Itcs < 10 mA for High Voltage coils - from 110V to 250V, and Itcs < 50 mA for Low Voltage coils from 24 V to 60 V).
A simple resistor can be sized for the purpose, depending on the parameters of the TCS and the auxiliary voltage range used.

4 Shunt closing release (-MC)

Allows closing command of apparatus to be transmitted by remote control.
This release is suitable for both instantaneous and permanent duty. An auxiliary contact that de-energizes it after the circuit breaker has closed is not envisaged.
The permanently supplied release provides the electrical anti-pumping function with both electrical opening and re-closing commands maintained. To guarantee the closing action, the current impulse must last at least 100 ms.
If there is the same supply voltage for shunt closing release -MBC and under-voltage release -MBU and the circuit breaker must close automatically when auxiliary voltage returns, there must be a delay of at least 50 ms between under-voltage release energizing and energizing of the shunt closing release to allow the closing operation to take place.Continuity functionality can be checked with a continuity control device (CCC), opening circuit supervision (TCS)(*) or the STU functionality control device (see accessory 21, supplied on request).

Characteristics	
Un	24-30-48-60-110...132-220...250 V DC
Un	48-60-110...127-220...250 V AC 50-60 Hz
Operating limits	65 ... 120% Un
Inrush power (Ps)	60...100 W / VA
Continuous power consumption (Pc)	1.5 W
Electronics self-consumption (no coil supplied); value independent of voltage applied	1.5 mA
Opening time	33...60 ms
Insulation voltage	2000 V 50/60 Hz (for 1 min)

5. Description

5 Undervoltage release (-MBU)

The undervoltage release opens the circuit breaker when there is a sensible reduction or lack of the voltage that powers it. The circuit breaker can only close when the release is energized (the closing lock is obtained mechanically).
It can be used for remote release (by means of a pushbutton of the normally closed type), for locking on automatic closing/opening in the absence of voltage in the auxiliary circuits. Supplied by means of the secondary output of a voltage transformer, it provides locking upon automatic closing/opening in the absence of voltage in the Medium Voltage main circuit.
If there is the same supply voltage for shunt closing release -MBC and under-voltage release -MBU and the circuit breaker must close automatically when auxiliary voltage returns, there must be a delay of at least 50 ms between under-voltage release energizing and energizing of the shunt closing release to allow the closing operation to take place.

The undervoltage release is available in the following versions:

5A Undervoltage release (with supply shunted from a transformer on the supply side of the circuit breaker or from an auxiliary power supply, regardless of the state in which the circuit breaker is to be found).

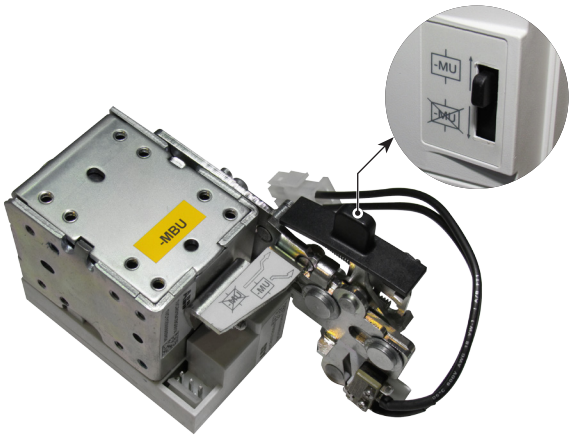
5B Undervoltage release with -KFT electronic time-lag device (0.5 - 1 - 1.5 - 2 - 3 s) (with power supply as indicated for 5A); this device is supplied with a 0.5 s setting (the adjustments are described in the Circuit diagrams chapter)

Characteristics	
Un	24-30-48-60-110...132-220...250 V DC
Un	48-60-110...127-220...250 V AC 50-60 Hz
Operating limits	– circuit breaker opening: 35-70% Un
	– circuit breaker closing: 85-110% Un
Inrush power (Ps)	150 W / VA
Continuous power consumption (Pc)	1.55 W
Electronics self-consumption (no coil supplied); value independent of voltage applied	1.5 mA
Opening time	60...80 ms
Insulation voltage	2000 V 50/60 Hz (for 1 min)

Note
As an alternative to the undervoltage release, an additional shunt opening release (-MBO4) with the same electrical and operating specifications as shunt opening release (-MBO1) can be installed on request (only for circuit breakers 12..17.5 kV up to 40 kA and 24 kV up to 31.5 kA).
Warning! Since installation of the additional shunt opening release (-MBO4) requires a special mounting plate for releases, ask for application (-MBO4) when ordering and not after delivery.

5a Electronic time delay device (-KFT)

The electronic time delay device must be mounted externally in relation to the circuit breaker. It allows release trip delay with established and adjustable times.
The use of the undervoltage release is recommended in order to prevent trips when the power supply network of the release may be subject to cuts or voltage drops of short duration.
If it is not supplied, circuit breaker closing is disabled.
The time delay device must be combined with an undervoltage release for d.c.
Rated voltage of the undervoltage release must be within the selected range of working of the time-delay device.



Characteristics of the time-delay device	
Un	24...30 - 48 - 60 - 110...127 - 220...250 V–
Un	48 - 60 - 110...127 - 220...240 - V~ 50/60 Hz
Adjustable opening time (release + time delay device): 0.5-1-1.5-2-3 s	

6 Undervoltage release mechanical override

This is a mechanical device which allows the undervoltage release trip to be temporarily excluded.
It is always fitted with electrical signalling.

Should the application of this accessory be required, specify the request at the time of order since subsequent application by the customer is not possible.

5. Description

7a Auxiliary contacts of the circuit breaker (-BGB1) for 12 to 24 kV versions

Electrical signalling of circuit breaker open/closed can be obtained with a group of 10, 16 or 20 auxiliary contacts for the fixed version and 10 or 16 auxiliary contacts for the withdrawable version. The standard equipment comprises 10 auxiliary contacts.

Note

The following are available using the standard group of ten auxiliary contacts and the maximum number of electrical accessories:

- for fixed circuit breakers: three closing contacts "a" for signalling circuit breaker open and five opening contacts "b" for signalling circuit breaker closed;
- for withdrawable circuit breakers: three closing contacts "a" for signalling circuit breaker open and four opening contacts "b" for signalling circuit breaker closed;

Circuit breakers in the fixed version are available with two finishing accessories (to be specified when ordering):

- non-wired auxiliary contacts; wiring to the terminals of the contacts is at the customer's charge (photo below left; the terminal box to which the other electrical accessories are wired is at the top); ask for instructions 1VCD601204 (available in the main languages) which describe how to remove, wire auxiliary contacts more easily and fit auxiliary contacts unit back into its housing;
- auxiliary contacts already wired to the terminal box (see photo at top right).

Consult circuit diagrams 1VCD400151 for fixed circuit breakers and 1VCD400155 for withdrawable circuit breakers.

Note: The main shunt opening release and/or the additional shunt opening release use 1 and/or 2 closing contacts "a", thereby reducing the number of auxiliary contacts available. Always check the maximum number of contacts available with non-standard equipment.

The new diagrams are interchangeable with the existing ones, with the following exceptions:

- diagram 1VCD400151 (substitutes 1VCD400046 and 1VCD400099)
- fig. 34 on the previous diagrams is represented by fig. 31 + fig. 32 on the new diagram;
- fig. 33 and fig. 35 on the previous diagrams are not available with the new layout
- diagram 1VCD400155 (substitutes 1VCD400047)

Auxiliary contacts –BGB1 conform to the following standards/regulations/directives:

- IEC 62271-100
- IEEE C37.54
- EN 61373 cat.1 class B / impact and vibration test
- Germanish Loyd regulation / vibrations envisaged by the shipping registers
- UL 508
- EN 60947 (DC-21A DC-22A DC-23A AC-21A)
- RoHS Directive

General characteristics	
Insulation voltage to standard VDE 0110, Group C	660 V AC 800 V DC
Rated voltage	24 V ... 660 V
Test voltage	2 kV for 1 min
Maximum rated current	10 A - 50/60 Hz
Breaking capacity	Class 1 (IEC 62271-1)
Number of contacts	5
Groups of contacts	10 / 16 / 20
Contact travel	90°
Actuating force	0.66 Nm
Resistance	<6.5 mΩ
Storage temperature	–30 °C ... +120 °C
Operating temperature	–20 °C ... +70 °C (-30° ref. ANSI 37.09)
Contact overtemperature	10 K
Mechanical life	30.000 mechanical operations
Protection class	IP20
Cable section	1 mm²

	50 ms	1.5 A
250 V DC	1 ms	2 A
	15 ms	1.4 A
	50 ms	1.2 A

Electrical characteristics (according to IEC 62271-100 class 1)	
Rated current Un	Breaking capacity
24 V DC 20 ms	18.8 A
60 V DC 20 ms	7.4 A
110 V DC 20 ms	4.2 A
250 V DC 20 ms	1.8 A

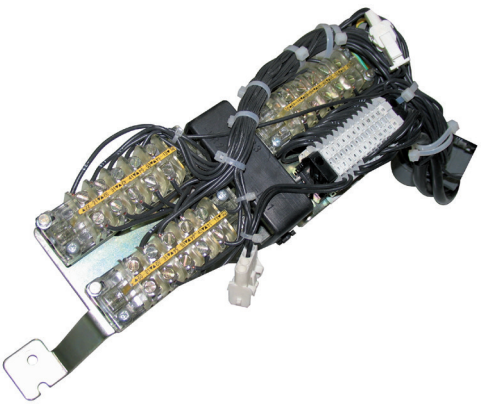
5. Description

7b Auxiliary contacts of the circuit breaker (-BGB1, -BGB2, -BGB3) for 36 kV version

As an alternative to the standard 10 contacts, electrical signaling of circuit breaker open/closed can be obtained with a group of 15 auxiliary contacts.
Consult the following circuit diagrams for VD4 36 kV series with “7b” auxiliary contacts:

- for fixed circuit breakers: 1VCD400236
- for withdrawable circuit breakers: 1VCD400237

Note



The following are available with the standard group of ten contacts and maximum electrical applications:
- three make contacts (circuit breaker open signal) and five break contacts (circuit breaker closed signal), and five break contacts (circuit breaker closed signal) for fixed circuit breakers, four break contacts (circuit breaker closed signal) for withdrawable circuit breakers.

Depending on the electrical applications required, the following are available with the group of 15 auxiliary circuits:

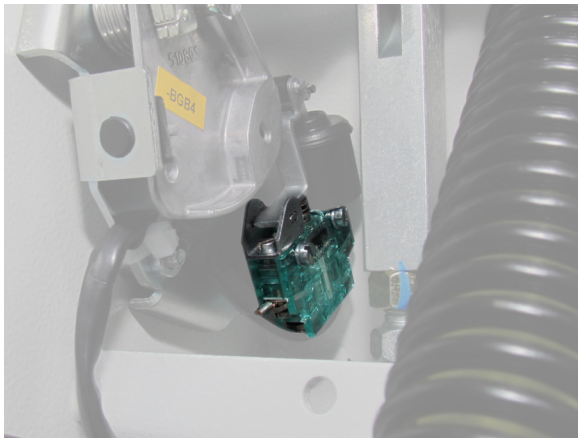
- for fixed circuit breakers: thirteen auxiliary contacts comprising the numbers of break contacts and make contacts established by the required wiring configuration;
- for withdrawable circuit breakers, since the plug of the auxiliary circuits has a limited number of pins: five make contacts (circuit breaker open signal) and five break contacts (circuit breaker closed signal).

General characteristics	
Insulation voltage to standard VDE 0110, Group C	660 V AC 800 V DC
Rated voltage	24 V ... 660 V AC
Test voltage	2 kV 50 Hz (for 1 min)
Maximum rated current	10 A
Number of contacts	5
Contact travel	6 mm ... 7 mm
Actuating force	26 N
Resistance	3 mΩ
Storage temperature	–20 °C ... +120 °C
Operating temperature	–20 °C ... +70 °C
Contact overtemperature	20 K
Number of cycles	30.000
Unlimited breaking capacity if used with 10 A fuse in series	

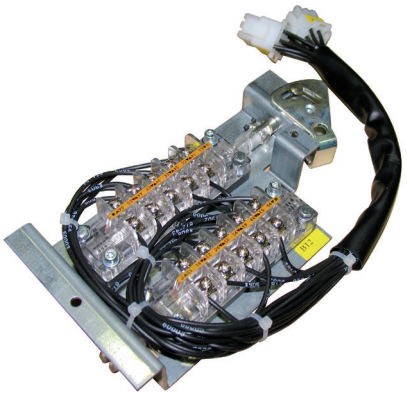
Electrical characteristics			
Un		Rated current	Breaking capacity
220 V AC	Cosφ = 0.7	2.5 A	25 A
380 V AC	Cosφ = 0.7	1.5 A	15 A
500 V AC	Cosφ = 0.7	1.5 A	15 A
660 V AC	Cosφ= 0.7	1.2 A	12 A
24 V DC	1 ms	10 A	12 A
	15 ms	10 A	12 A
	50 ms	8 A	10 A
	200 ms	6 A	7.7 A
60 V DC	1 ms	8 A	10 A
	15 ms	6 A	8 A
	50 ms	5 A	6 A
	200 ms	4 A	5.4 A
110 V DC	1 ms	6 A	8 A
	15 ms	4 A	5 A
	50 ms	2 A	4.6 A
	200 ms	1 A	2.2 A
220 V DC	1 ms	1.5 A	2 A
	15 ms	1 A	1.4 A
	50 ms	0.75 A	1.2 A
	200 ms	0.5 A	1 A

8 Transient contact (-BGB4)

This contact closes momentarily (duration > 30 ms) on circuit breaker opening controlled remotely with a shunt opening release.
The indication is not provided when opening is manual and local. In fact, a contact (–BGB11) is activated by the manual pushbutton and cuts off the transient contact closure (–BGB4).
The transient contact is activated directly from the main operating shaft when the indication is provided only on actual opening of the main circuit breaker contacts.



9 Position contact (-BGT3)



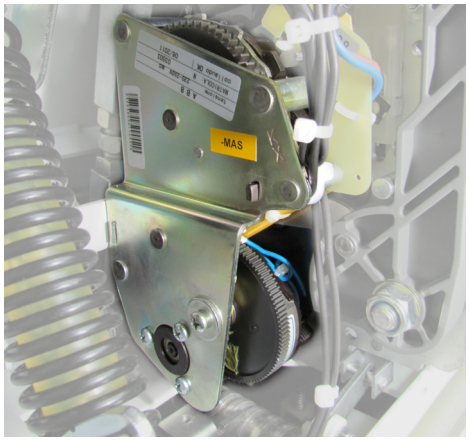
This contact is used, together with the locking magnet in the operating mechanism **(-RLE1)** to prevent remote closing during traverse into the unit.
It is only supplied for the withdrawable version circuit breakers for UniGear ZS1 switchgear and PowerCube modules.
It cannot be supplied when the transmitted contacts are requested in the truck **(-BGT1; -BGT2)**.

10 Transmitted contacts in the truck (-BGT1; -BGT2)

Transmitted contacts of the withdrawable circuit breaker (installed in the circuit breaker truck - only for VD4/P withdrawable circuit breaker).
These contacts are either in addition or as an alternative to the position contacts (for signalling circuit breaker racked out) located in the unit. They also carry out the function of the position contact **(-BGT3)**.
Contacts -BGT1 and BGT2 have the same general and electrical characteristics as auxiliary contacts "7b. -BGB1, -BGB2, -BGB3".

5. Description

11 Motor operator (-MAS)



This carries out automatic charging of the circuit breaker operating mechanism closing spring. After circuit breaker closing, the geared motor immediately recharges the closing springs.
In the case of a power cut or during maintenance work, the closing spring can be charged manually in any case (by means of the special crank handle incorporated in the operating mechanism).

Characteristics		
Un	24...30 - 48...60 - 110...130 - 220...250 V–	
Un	100...130 - 220...250 V~ 50/60 Hz	
Operating limits	85 ... 110% Un	
Power on inrush (Ps)	≤ 40 kA	50 kA
	DC = 600 W; AC = 600 VA	DC = 900 W; AC = 900 VA
Rated power (Pn)	DC = 200 W; AC = 200 VA	DC = 350 W; AC = 350 VA
Inrush duration	0.2 s	0.2 s
Charging time	6-7 s	6-7 s
Insulating voltage	2000 V 50/60 Hz (for 1 min)	2000 V 50 Hz (for 1 min)

12 Contact for signalling closing spring charged/ discharged (-BGS2)

This consists of a microswitch which allows remote signalling of the state of the circuit breaker operating mechanism closing pring.
The following signals are possible:
- contact open: signalling spring charged
- contact closed: signalling spring discharged.

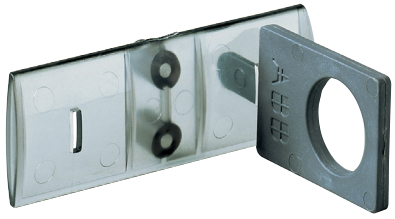
The two signals must be used for circuits which have the same power supply voltage.

Protections and locks

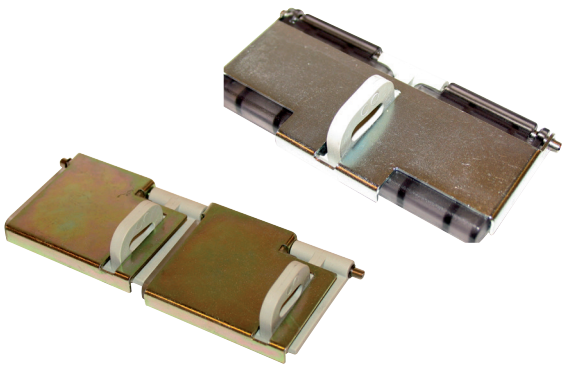
Various mechanical and electromechanical locking and protection devices are available.

13 Opening and closing pushbutton protection

The protection only allows the opening and closing pushbuttons to be operated using a special tool.



14 Opening and closing pushbutton padlock

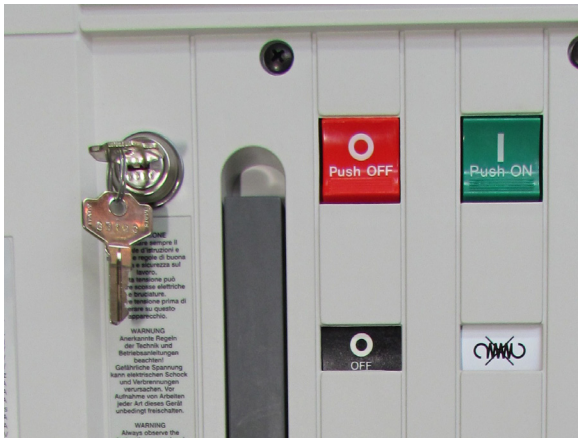


The device allows the opening and closing pushbuttons to be locked using a maximum of three padlocks (not supplied): ø 4 mm. Also prevents closing using remote control.
This lock is available in two versions:

14A Possibility of padlocking both the pushbuttons without distinction

14B Separate padlocking of the opening and/or closing pushbutton.

N.B. Lock 14A prevents closure by remote control; lock 14B does not prevent closure by remote control.



5. Description

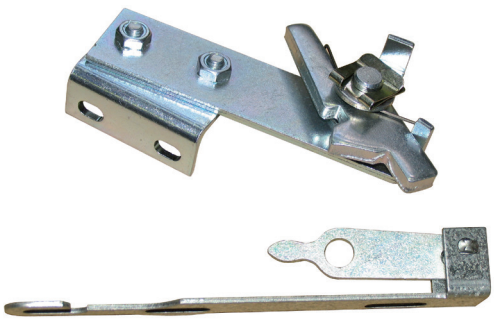
15 Key lock in open position

The lock is activated by a special circular lock. Different keys (for a single circuit breaker) are available, or the same keys (for several circuit breakers).
To activate the lock, keep the opening pushbutton pressed down, turn the key and remove it.
With the key removed, the opening pushbutton automatically remains in the pressed position preventing local manual closing and remote electrical closing.

16 Locking magnet on the operating mechanism (-RLE1)

Only allows activation of the command with the electromagnet supplied.
The locking electromagnet in the operating mechanism has the same electrical characteristics as shunt closing release -MBC.

17 Locking magnet on the truck (-RLE2)



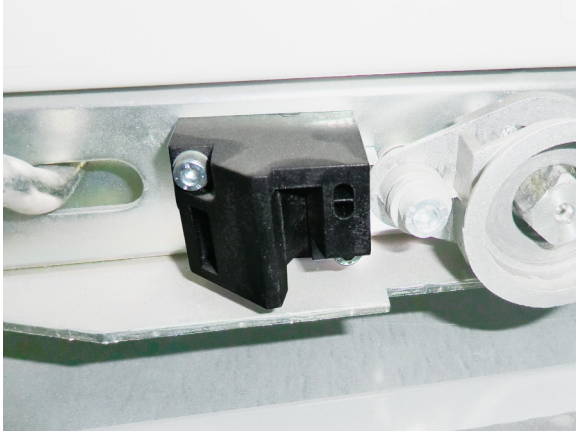
Compulsory accessory for the withdrawable versions for UniGear ZS1 switchgear and PowerCube modules, to prevent circuit breaker racking into the switchgear with the auxiliary circuit plug disconnected.
The plug also makes the anti-insertion lock for a different rated current. Special striker pins do not allow insertion of the plug in the socket if the rated current of the circuit breaker is lower than the rated current of the panel.
Note: a specific version for the circuit breakers of ZS8.4 switchgear is available on request. This accessory is not available when the motor-operated truck is required.

Characteristics	
Un	24 - 30 - 48 - 60 - 110 - 125 - 127 - 132 - 220 - 240 V–
Un	24 - 30 - 48 - 60 - 110 - 125 - 127 - 220 - 230 ... 240 V~ 50/60 Hz
Operating limits	85 ... 110% Un
Power on inrush (Ps)	d.c. 250 W; a.c. = 250 VA
Continuous power (Pc)	d.c. = 5 W; a.c. = 5 VA
Inrush duration	150 ms
Insulating voltage	2000 V 50/60 Hz (for 1 min)

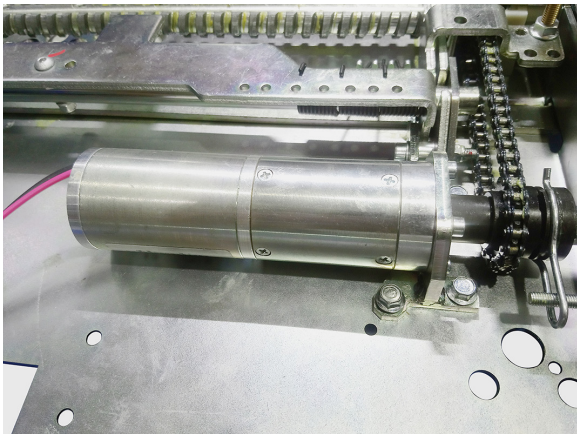
18 Interlock for fixed circuit breaker

Device for fixed circuit breakers which are converted into withdrawable ones by the customer. It allows a mechanical lock to be made, by the customer, which prevents racking-out/in with the circuit breaker closed and prevents circuit breaker closing during translation.
Note: The device must be requested when ordering since it must be assembled and tested in the factory.

5. Description



19 Mechanical interlock with the door



This device prevents circuit breaker racking-in when the switchgear door is open. It is only provided for circuit breakers used in switchgear UniGear ZS1 and PowerCube modules, fitted with a special actuator on the door.

20 Motorised truck (-MAT)

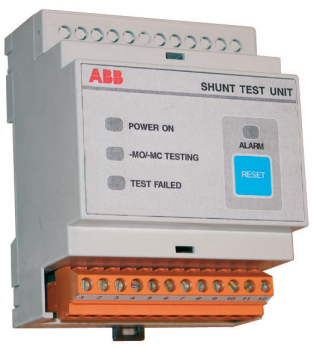
It allows racking-in and racking-out of the circuit breaker in the switchgear to be carried out remotely, (only for circuit breaker in withdrawable version for UniGear ZS1 and ZS8.4 switchgear and PowerCube modules).
The motor version with clutch is supplied as standard, so that racking-in/ out can be performed in an emergency if the truck motor fails to operate.

Characteristics	
Un	24 - 30 - 48 - 60 - 110 - 220 V–
Operating limits	85 ... 110% Un
Nominal power (Pn)	40 W

21 STU Shunt Test Unit

Due to the particular construction of these releases, checking the functionality of the shunt closing (-MBC) and opening (-MBO1, -MBO2) releases is not possible with dedicated relays (e.g. TCS Test Control Supervision, CCC Control Coil Continuity) or with the REF control and protection unit. The only device able to carry out a check of the functionality is the STU device. Please contact us if you want to carry out this control with devices other than STU.
This device can be combined with the shunt opening release **(-MBO1; -MBO2)** or with the shunt closing release **(-MBC)** to check functionality and continuity.

The control/monitoring Shunt Test Unit allows the continuity of releases with a rated operating voltage between 24 V and 250 V (AC and DC) to be checked, as well as the functionality of the electronic circuit of the release.
Checking continuity is carried out cyclically with an interval of 20 seconds between one test and the next.
The unit has optical signals by means of LEDs on the front. In particular the following information is indicated:



- POWER ON: power supply present
- (-MO) TESTING: test being carried out
- TEST FAILED: signal following a failed test or in the absence of auxiliary power supply
- ALARM: signal after three failed tests.

Two relays and a changeover are also available on board the unit, which allow remote signalling of the following two events:

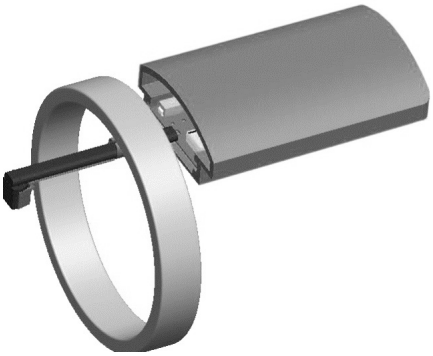
- failure of a test (resetting is carried out automatically when the alarm stops)
- failure of three tests (resetting is only carried out by means of the manual - RESET – from the front of the unit).

There is also a manual - RESET – button on the front of the unit.

Characteristics	
Un	24 ... 250 V AC/DC
Maximum interrupted current	6 A
Maximum interrupted voltage	250 V AC

22 Digital accessories for VD4 evo CMU

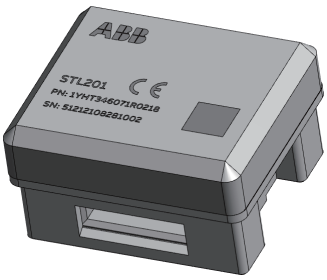
The CMU is an embedded unit with Monitor & Diagnostic capabilities. It also embeds sensors for basic breaker monitoring features. It can be ordered stand alone or in combination with a range of Sensors from ABB sensors portfolio, depending on the monitoring needs (see next section).
For more details please see the CMU datasheet 2RDA044111 6 CMU Dashboard Manual 2RDA044113.



Parameter	Unit	Min Value	Max Value
AUX Rated voltage	AC (V)	85	250
Working temperature range	°C	-20	+55
Storage temperature	°C	-30	+80

5. Description

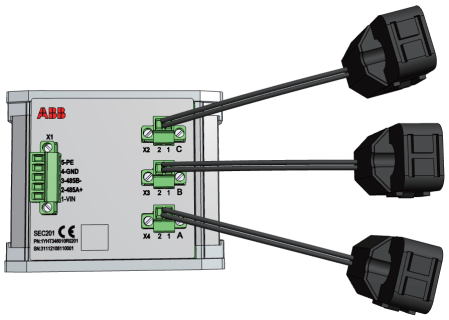
23 Monitor & Diagnostic Sensors



23a STA201 Primary contacts thermal monitoring
The STA201 sensors embedded in the primary contact arms allow direct measurement of the temperature in one of the most critical points of the circuit breaker. The measurement is shared through wireless to the concentrator unit for Monitor & Diagnostic features.
For installation or replacements please consult dedicated device documentation.

23b SMA201 Smart Angle sensor
The SMA201 sensor is assembled on the breaker kinematic chain to allow direct measurement of the most important characteristic of a proper Opening or Closing operation. The measurement is shared to with the concentrator unit for Monitor & Diagnostic features.
For installation or replacements please consult dedicated device documentation.

23c STE201/STL201 Cables/BusBars thermal monitoring
The STE201/STL201 Temperature monitoring devices are key components in ABB's switchgear and apparatus monitoring & diagnostic solutions. The devices are battery-free, self-powered smart temperature sensors, using wireless communication technology for connecting to ABB's monitoring and diagnostics data concentrators. The sensor devices can be installed directly on high-voltage parts, inside medium-voltage switchgear.
For installation or replacements please consult dedicated device documentation.



23d THS01 Environmental monitoring
The THS01 senors allows the monitoring of the circuit breaker at room parameters for monitor and diagnostic purposes.
For installation or replacements please consult dedicated device documentation.

23e SEC201 Primary Current Sensor

The SEC201 sensor allows the measurement of primary currents for monitor and diagnostic of the circuit breaker from the current transformer secondary circuit. It allows electrical life monitoring and in combination with the thermal sensors enables advanced thermal monitoring and diagnostic features.
For installation or replacements please consult dedicated device documentation.

24 Digital upgrade KIT

It is available a complete kit to upgrade a VD4 evo with Digital feature for monitor and diagnostic.
It includes the necessary connectors, concentrator unit CMU, and a flexible selection of ABB sensors.
Please contact your sales representative for more information.
Please contact ABB for more details based on your needs.

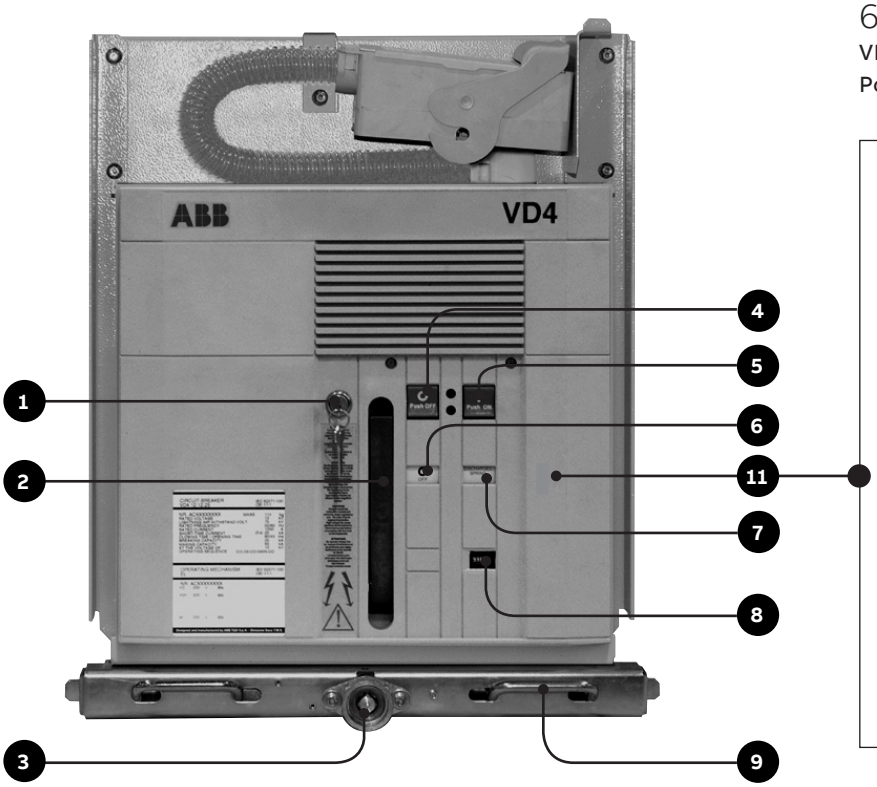
25 Serial Hub

The Serial communication hub is automatically delivered when more than one sensor with serial communication embedded in the CB has been ordered.
To be purchased separately in case of sensors upgrade after the ordering of the circuit breaker.

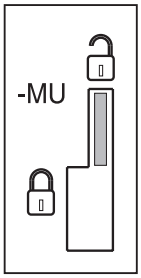
6. Instructions for operating the circuit breaker

6.1. Safety indications

The VD4 circuit breakers guarantee a minimum IP2X degree of protection when installed in the following conditions:



- **fixed circuit breaker, installed behind a protective metal net**
- **withdrawable circuit breaker, installed in switchgear.**

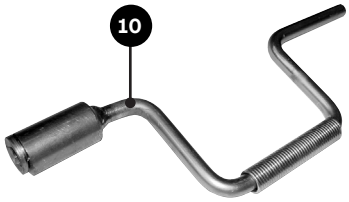


Under these conditions the operator is totally guaranteed against accidental contact with moving parts.
Should mechanical operations be carried out on the circuit breaker outside of the switchgear, take great care of the moving parts.

If the operations are prevented, do not force the mechanical interlocks and check that the operating sequence is correct.
Racking the circuit breaker in and out of the switchgear must be done gradually to avoid shocks which may deform the mechanical interlocks.
Due to safety reasons, the circuit breaker has to be treated as "switched on" if the switching position cannot be clearly determined.
In this case all high voltage connections to the circuit breaker have to be de-energized and zero potential on the primary side of the circuit breaker has to be confirmed prior to commissioning, operation, maintenance or repair work.

6.2. Switching and signalling parts

VD4 circuit breakers for UniGear switchgear and PowerCube modules (fig. 6a)



Mechanical override of the undervoltage release (on request)

Undervoltage release enabled. The circuit breaker can only be closed if the undervoltage release is supplied with power.

Undervoltage release disabled. The circuit breaker can also be closed if the undervoltage release is not supplied with power.

Caption
1 Key lock (if provided) (*)
2 Lever for manually charging the closing spring (except version VD4/ZS8 - see figure 6b)
3 Coupling lever for racking-out operation (withdrawable circuit breakers only)
4 Opening pushbutton
5 Closing pushbutton
6 Signalling device for circuit breaker open/closed
7 Signalling device for closing springs charged/discharged
8 Operation counter.
9 Handles for operating the truck locks (only for withdrawable circuit breakers)
10 Operating lever for circuit breaker racking-in/out (there is a special version for VD4/ZS8)
11 Mechanical undervoltage release override (on request).
(*) Warning! To activate the key lock: open the circuit breaker, keep the opening pushbutton depressed, then turn the key and remove it from the housing.

Fig. 6a

6.3. Circuit breaker closing and opening operations

Circuit breaker operation can be either manual or electrical (fig. 6 - fig. 7).

a1) Manual closing spring charging for VD4 circuit breakers for UniGear switchgear and PowerCube modules (fig. 7a)

Repeatedly activate the charging lever (2) (maximum rotation angle of the lever: about 90°) until the yellow indicator (7) appears.
The maximum forces which can normally be applied to the lever are < 150 N for the EL1operating mechanism, < 200 N for the EL2 operating mechanism and < 250 N for EL3 operating mechanism.
EL1 Twin and EL2 Twin type operating mechanisms are provided for circuit breakers with 50 kA breaking capacity.
For manual charging, the additional lever (1) should be inserted fully, as indicated in fig. 7c. In this way, the maximum force to be applied is < 200 N. For the type of operating mechanism, please refer to the rating plate in fig. 1.

a2) Closing spring loading in the manual mode for withdrawable VD4 circuit breakers for UniGear switchgear equipped with a hand-operated rotaryc loading device for the closing spring (refer to fig. 6b for indicative details)

Rotate the charging lever (2) (rotate about 12 times) until the yellow indicator (7) appears. The maximum force which can normally be applied to the lever is < 150 N for the EL1 operating mechanism and < 230 N for the EL3 operating mechanism.
The operation can be carried out with the door either open or closed and the circuit breaker either withdrawn or connected.
WARNING (fig. 6b): Fit the hand-operated loading lever of the closing spring (2b) into its housing (2a). Turn the lever clockwise (about 12 times) until the yellow indicator (7) appears to show that loading is complete. Once this happens, the lever will continue for half a turn without loading (without exercising any force), after which it will lock owing to a sudden load increase. Do not exercise force or try to continue loading as this will damage the device.

VD4 circuit breakers for ZS8.4 switchgear (fig. 6b)

a3) Manual closing spring charging for VD4 circuit breakers (fig. 7b)

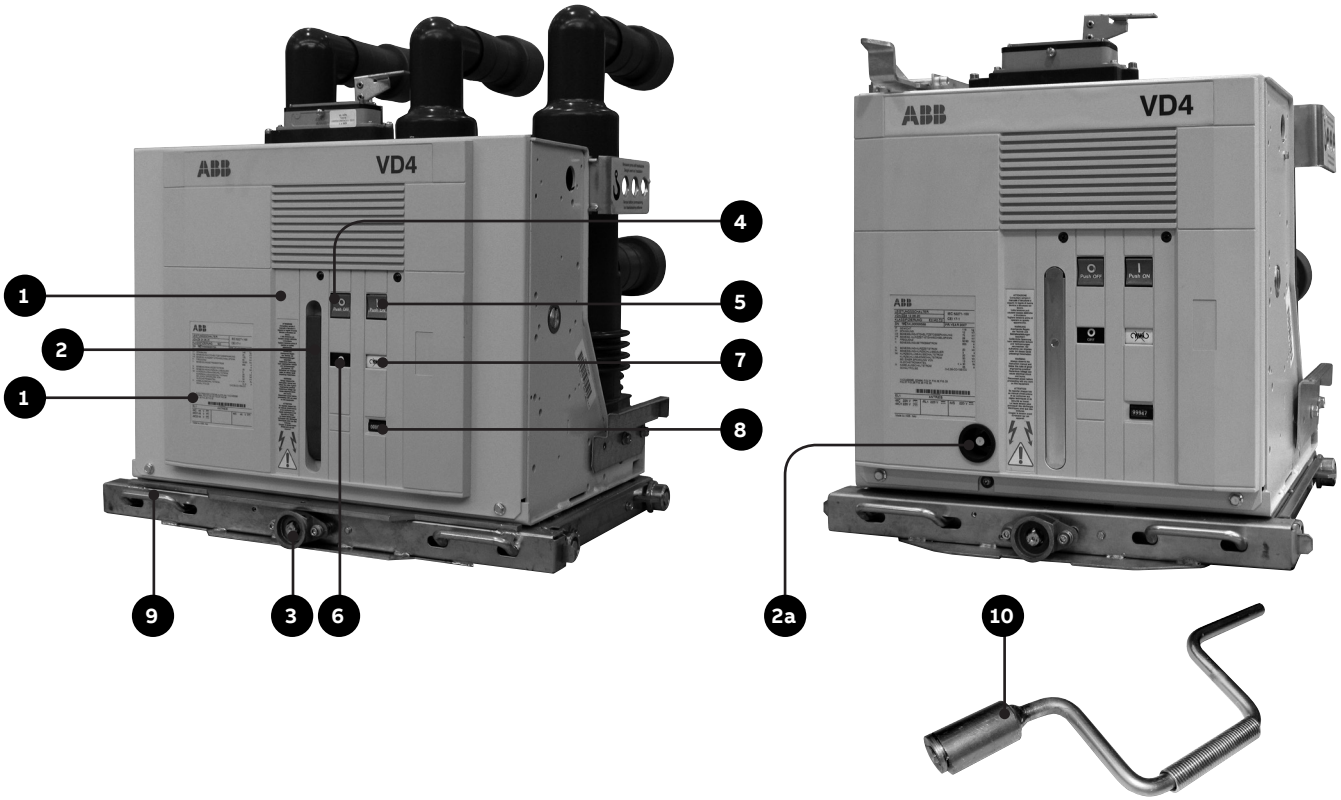
Ruotare la leva di carica (2) fino alla comparsa del
Rotate the charging lever (2) until the yellow indicator (7) appears. The maximum force which can normally be applied to the lever is < 150 N for the EL1 operating mechanism and < 230 N for the EL3 operating mechanism.
The operation can be carried out with the door either open or closed and the circuit breaker either withdrawn or connected.

WARNING (fig. 6b): Fit the hand-operated loading lever of the closing spring (2b) into its housing (2a). Turn the lever clockwise (about 12 times) until the yellow indicator (7) appears to show that loading is complete. Once this happens, the lever will continue for half a turn without loading (without exercising any force), after which it will lock owing to a sudden load increase. Do not exercise force or try to continue loading as this will damage the device.

b) Electrical spring charging operation

On request, the circuit breaker can be fitted with the following accessories for electrical operation:
- geared motor for automatic closing spring charging
- shunt closing release
- shunt opening release.

The geared motor automatically recharges the spring after each closing operation until the yellow indicator (7) appears. If the power is cut off during charging, the geared motor stops and automatically starts recharging the springs again when the power returns.
In any case, it is always possible to complete the charging operation manually.



c) Circuit breaker closing

The operation can only be carried out with the closing spring completely charged.
For manual closing, press the pushbutton (5 - fig. 6b).
When there is a shunt closing release, the operation can also be carried out remotely by means of a special control circuit. Closing having taken place is indicated by the signalling device (6 - fig. 6b).

d) Circuit breaker opening

The operation can only be carried out with the closing spring completely charged.
For manual closing, press the pushbutton (5 - fig. 6b).
When there is a shunt closing release, the operation can also be carried out remotely by means of a special control circuit.
Closing having taken place is indicated by the signalling device (6 - fig. 6b).

6. Instructions for operating the circuit breaker

Caption
1 Key lock (if provided)
2 Lever for manually charging the closing spring
2a Coupling for manual closing spring charging (when lever 2 is not provided)
2b Lever for manual closing spring charging for rotary charging device
3 Coupling for racking-out operation lever (only for withdrawable circuit breakers)
4 Opening pushbutton
5 Closing pushbutton
6 Signalling device for circuit breaker open/closed
7 Signalling device for closing spring charged/discharged
8 Operation counter.

6.4 Detailed instruction of sensors and CMU Usage is in 2RDA044113 &2RDA044114. only for VD4 evo

7. Installation

7.1. General

Correct installation is of primary importance. The manufacturer's instructions must be carefully studied and followed. It is good practice to use gloves for handling the pieces during installation.

7.2. Installation and operating conditions

The following Standards must be taken into particular consideration during installation and service:

- IEC 62271-1/DIN VDE 0101
- VDE 0105: Electrical installation service
- DIN VDE 0141: Earthing systems for installations with rated voltage above 1 kV
- All the accident prevention regulations in force in the relative countries.

7.2.1. Normal conditions

Follow the recommendations in the IEC 62271-1 and 62271- 100 Standards. In more detail:

Ambient temperature	
Maximum	+ 40 °C
Average maximum over 24 hours	+ 35 °C
Minimum (according to class – 5), apparatus for indoor installation	– 5°

Humidity
The average value of the relative humidity, measured for a period longer than 24 hours, must not exceed the 95%.
The average value of the pressure of the water vapour, measured for a period longer than 24 hours, must not exceed 2.2 kPa.
The average value of the relative humidity, measured for a period longer than 1 month, must not exceed the 90%.
The average value of the pressure of the water vapour, measured for a period longer than 1 month, must not exceed 1.8 kPa.

Altitude
≤ 1000 m above sea level.

7.2.2. Special conditions

Installations over 1000 m a.s.l.
Possible within the limits permitted by reduction of the dielectric resistance of the air.

Increase in the ambient temperature
Reduction in the rated current.
Encourage heat dissipation with appropriate additional ventilation.

Climate
To avoid the risk of corrosion or other damage in areas:
• with a high level of humidity, and/or
• with rapid and big temperature variations, take appropriate steps (for example, by using suitable electric heaters) to prevent condensation phenomena.

For special installation requirements or other operating conditions, please contact ABB.

The areas involved by the passage of power conductors or auxiliary circuit conductors must be protected against access of any animals which might cause damage or disservices.

7.2.3. Trip curves

The following graphs show the number of closing-opening cycles (No.) allowed, of the vacuum interrupters, according to the breaking capacity (Ia).

Caption (Figs. 8...)
No. Number of closing-opening cycles allowed for the vacuum interrupters.
Ia: Breaking capacity of the vacuum interrupters.

Breaking curves for vacuum interrupters embedded in thermoplastic poles for VD4 High Current:

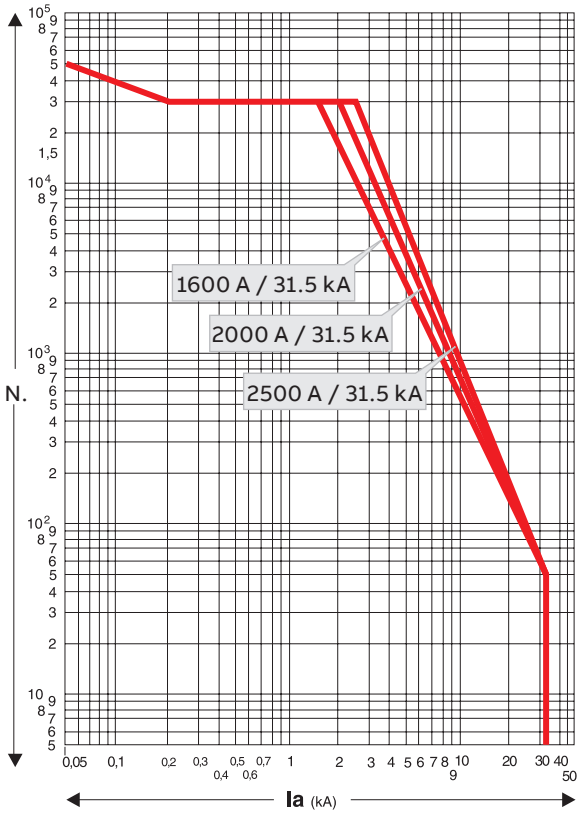

Fig. 8n

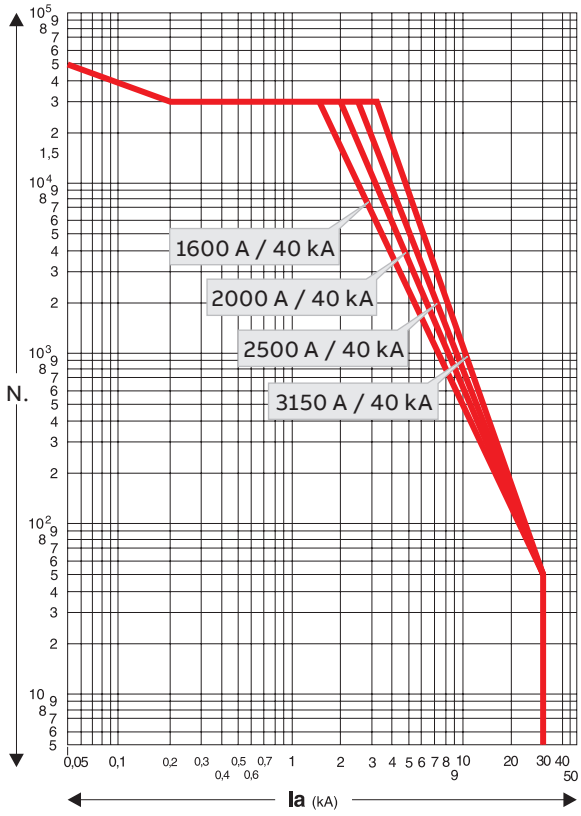

Fig. 8o

7. Installation

7.3. Preliminary operations

- Clean the insulating parts with clean dry cloths.
- Check that the top and bottom terminals are clean and free of any deformation caused by shocks received during transport or storage.

7.4. Installation of fixed circuit breakers

The circuit breaker can be mounted directly on supporting frames to be provided by the customer, or on a special supporting truck (available on request).
The circuit breaker, with supporting truck, must be suitably fixed to the floor of its own compartment by the customer.
The floor surface in correspondence with the truck wheels must be carefully levelled.
A minimum degree of protection (IP2X) must be guaranteed from the front towards live parts.

7.4.1. Mounting the circuit breaker on a truck made by other manufacturers

The VD4 circuit breakers which are not installed on ABB trucks, but on trucks made by the customer, must be fitted with one or two additional auxiliary contacts (activated by the mechanical lock and by the circuit breaker release device) to carry out the function of interrupting the shunt closing release circuit (-MBC) during traverse from isolated and vice versa.
In ABB trucks, this function is carried out by the -BGT1 and -BGT2 auxiliary contacts which cut of the release power supply during and before activation of the mechanical lock of the screw truck racking-in device. This means that the shunt closing release power supply can only by applied at the end of activation of the mechanical lock. In this way it is certain that no electrical impulse can activate the shunt closing release with the circuit breaker in an intermediate position.

7.5. Installation of withdrawable circuit breaker

The withdrawable circuit breakers are preset for use in UniGear ZS1, UniGear ZS2, UniSec switchgear and PowerCube modules.
For racking-in/racking-out of the switchgear, fully insert the lever (1) (fig. 9) in the appropriate seat (2) and work it clockwise for racking-in, and anti-clockwise for racking-out, until the limit switch positions are reached.
Circuit breaker racking-in/-out must be carried out gradually to avoid shocks which may deform the mechanical interlocks and the limit switches.
The torque normally required to carry out racking-in and racking-out is <25 Nm.
This value must not be exceeded. If operations are prevented or difficult, do not force them and check that the operating sequence is correct.

Note
To complete the racking-in/out operation, about 20 rotations of the lever are required for circuit breakers up to 17.5 kV, and about 30 rotations for 24 kV circuit breakers.

When the circuit breaker has reached the isolated for test/ isolated position, it can be considered racked into the switchgear and, at the same time, earthed by means of the truck wheels.
Withdrawable circuit breakers of the same version, and therefore with the same dimensions, are interchangeable.
However, when, for example, different electrical accessory fittings are provided, a different code for the plug of the auxiliary circuits does not allow incorrect combinations between panels and circuit breakers.
For the circuit breaker installation operations, also refer to the technical documentation of the above-mentioned switchgear.

- **The racking-in/-out operations must always be carried out with the circuit breaker open.**
- **When putting into service for the first time, it is advisable to charge the circuit breaker operating mechanisms manually so as not to overload the auxiliary power suply circuit.**

7.5.1. Circuit breakers with withdrawable motorized truck

Carry out the racking-in/racking-out test of the motorized truck in the same way as for a manual truck, following the instructions below:

- Rack the circuit breaker into the switchgear in the open and isolated position, with the power supply to the motor circuit cut off and with the enclosure door closed.
- Insert the manual racking-in lever (1) in the special coupling (2) Fig. 9, and take the motorized truck to about half its run between the isolated for test and the connected position. The torque needed to carry out truck handling is < 25 Nm.
- In the case of accidental inversion of the truck motor power supply polarity, this operation allows a possible error in direction to be dealt with without any damage. Verification checks:
  a) motor rotation clockwise during circuit breaker racking-in.
  b) motor rotation anticlockwise during circuit breaker racking-out.
- Remove the manual lever (1) from the coupling (2) Fig. 9
- Supply the truck motor circuit.
- Activate the control for the electrical racking-in operation. When racking-in has taken place, check correct changeover of the relative auxiliary contact.
- On completion, activate the control for the electrical racking-out operation. When racking-out has taken place, check correct changeover of the relative auxiliary contact.
- In the case of a motor fault during a racking-in or rackingout operation, in an emergency the truck can be taken to the end of its run manually, after first cutting off the power supply to the motor power supply circuit and then, using the manual lever, work in the same way as with the manual truck.

Note
The clutch has to mechanically disconnect the motor to operate the truck by manual lever in the right way. To do it, perform one turn by manual lever in the opposite direction compared to the last motorized truck movement, before to operate by manual lever in the needed direction.

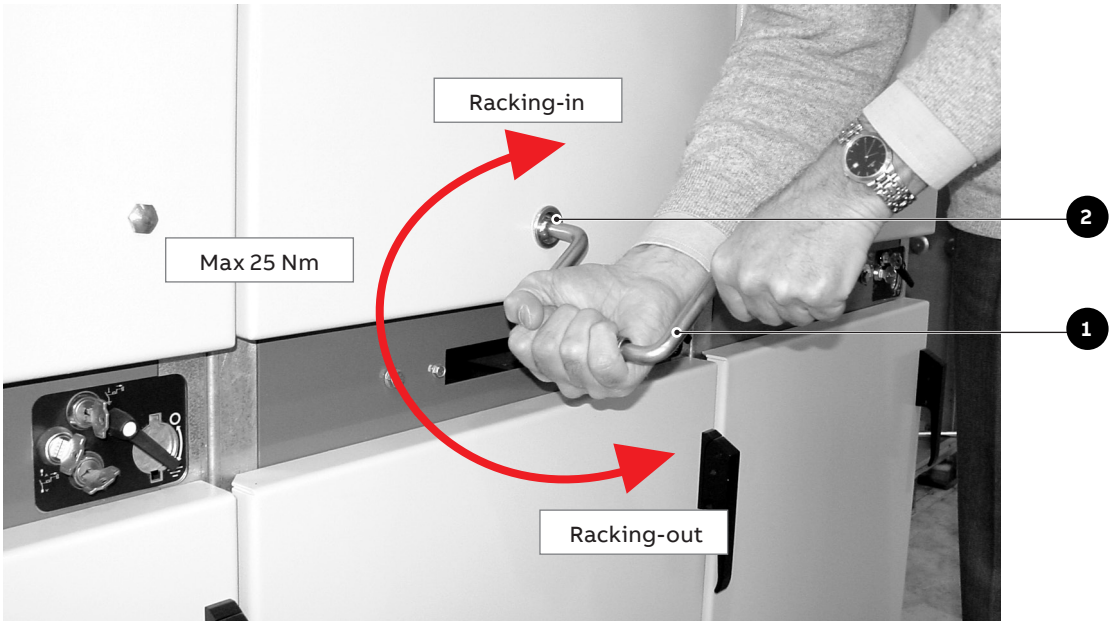

Fig. 9

7. Installation

7.6. Power circuit connections of fixed circuit breakers

7.6.1. General recommendations

- Select the cross-section of the conductors according to the service current and the short-circuit current of the installation.
- Prepare special pole insulators, near the terminals of the fixed circuit breaker or of the enclosure, sized according to the electrodynamic forces deriving from the short-circuit current of the installation.

7.6.2. Assembly of the connections

- Check that the contact surfaces of the connections are flat, and are free of any burrs, traces of oxidation or deformation caused by drilling or impacts received.
- According to the conductor material and the surface treatment used, carry out the operations indicated in table T1 on the contact surface of the conductor.

Assembly procedure

- Put the connections in contact with the circuit breaker terminals, taking care to avoid mechanical stresses (traction / compression) on, for example, the conducting busbars on the terminals.
- Interpose a spring washer and a flat washer between the head of the bolt and the connection.
- It is advisable to use bolts according to DIN class 8.8 Standards, also referring to what is indicated in table T2.
- In the case of cable connections, strictly follow the manufacturer's instructions to make the terminals.

T1

Bare copper
• Clean with a fine file or emery cloth.
• Tighten fully and cover the contact surfaces with 5RX Moly type grease

Copper or silver-plated aluminium
• Clean with a rough dry cloth.
• Only in the case of obstinate traces of oxidation, clean with a very fine grain emery cloth taking care not to remove the surface layer.
• If necessary, restore the surface treatment.

Bare aluminium
• Clean with a metal brush or emery cloth.
• Cover the contact surfaces again immediately with neutral grease
• Insert the copper-aluminium bimetal with surfaces shined (copper side in contact with the terminal; aluminium side in contact with the connection) between the aluminium connection and the copper terminal.

T2

Bolt	**Recommended tightening torque (1)**	
	Without lubricant	With lubricant (2)
M6	10.5 Nm	4.5 Nm
M8	26 Nm	10 Nm
M10	50 Nm	20 Nm
M12	86 Nm	40 Nm
M16	200 Nm	80 Nm

(1) The nominal tightening torque is based on a friction coefficient of the thread of 0.14 (distributed value the thread is subjected to which, in some cases, is not negligible). The nominal tightening torque with lubricant is according to the DIN 43673 Standards.

(2) Oil or grease. The thread and surfaces in contact with the lubricated heads. Take into account the deviations from the general Standards table (for example, for systems in contact or terminals) as foreseen in the specific technical documentation. The thread and surfaces in contact with the heads of bolts must be slightly oiled or greased, so as to obtain a correct nominal tightening torque.

7.7. Earthing

For the fixed version circuit breaker, carry out earthing by means of the special screw marked with the relative symbol.
Clean and degrease the area around the screw to a diameter of about 30 mm and, on completion of assembly, cover the joint again with Vaseline grease.
Use a conductor (busbar or braid) with a cross-section conforming to the Standards in force.

7.8. Connection of the auxiliary circuits

Note: the minimum cross-section of the wires used for the auxiliary circuits must not be less than the one used for the internal cabling. Furthermore, they must be insulated for 3 kV of test.

7.8.1. Fixed circuit breaker

The customer can choose between two types of auxiliary circuit connections in the circuit breaker. The first type is supplied as the standard version. In this case, the auxiliary contacts must be disassembled from the structure of the circuit breaker, since their terminals cannot be directly accessed (fig. 10) (consult the installation manual). Part of the wiring is made during the production phase for the second type. This means that the customer can wire up by directly accessing the terminal boxes in the front part of the circuit breaker. In this case, the wiring operation is much faster and immediate.

To prevent the cabling wires outside the circuit breaker (carried out by the customer) from accidentally coming into contact with moving parts and therefore undergoing damage to the insulation, it is recommended to fix the wires as shown in fig. 10a.
In both types of connection, the wires must pass through connection (2) while outside the circuit breaker, the cables must be screened by an appropriate sort of metallic protection (tube, duct, ...), which must be earthed.

7.8.2. Withdrawable circuit breakers

The auxiliary circuits of withdrawable circuit breakers are fully cabled in the factory as far as the connector (fig. 11).
For the external connections, refer to the electric wiring diagram of the switchgear.

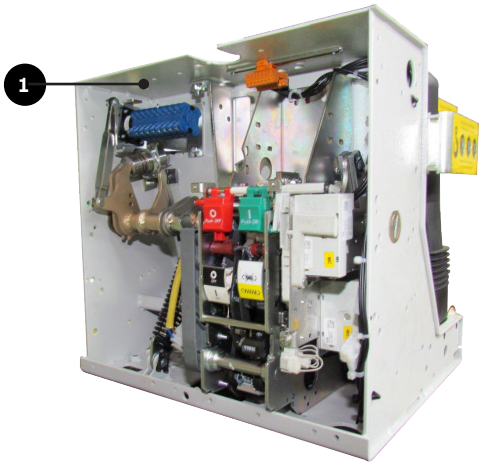

Fig. 10

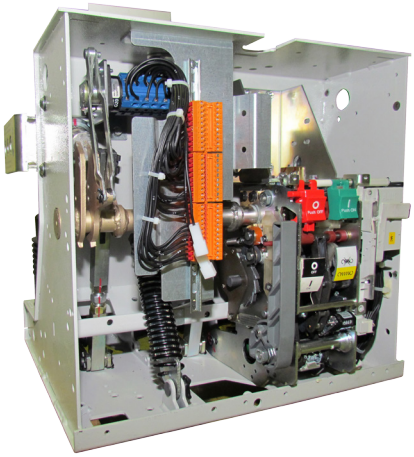

Fig. 10a

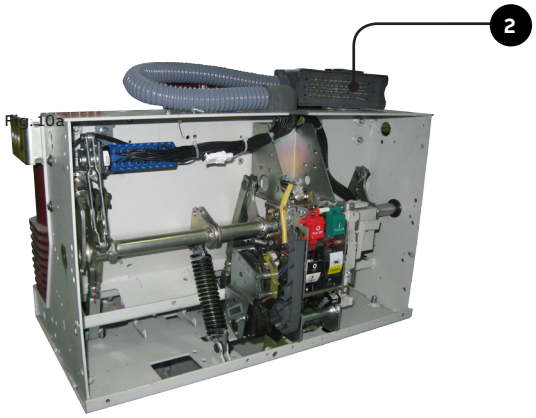

Fig. 11

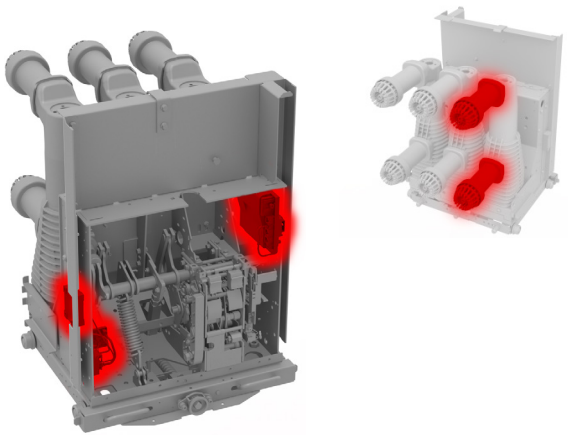

Fig. 12 VD4 evo with sensors

7. Installation

7.9. Sensors installation

Please refer to manual 2RDA044114 for sensor configuration.

7.9.1. Installation of CMU

Detailed instructions for installing CMU are available in 1VCD601733R0001

7.9.2. Installation of Serial Hub

Detailed instructions for installing Serial Hub are available in 1VCD601734R0001

7.9.3. Installation of Temperature Sensor

Detailed instructions for installing Temperature Sensor are available in 1VCD601730R0001

7.9.4. Installation of Angle Sensor

Detailed instructions for installing Angle Sensor are available in 1VCD601731R0001

8. Putting into service

8.1. General procedures

All the operations regarding putting into service must be carried out by ABB personnel or by suitably qualified customer personnel with in-depth knowledge of the apparatus and of the installation.
Should the operations be prevented, do not force the mechanical interlocks and check that the operating sequence is correct.
The operating forces which can be applied for racking-in withdrawable circuit breakers are indicated in paragraph 7.5.

Before putting the circuit breaker into service, carry out the following operations:

- check tightness of the power connections to the circuit breaker terminals;
- establish the setting of the primary electronic overcurrent release (if provided);
- check that the value of the power supply voltage of the auxiliary circuits is between 85% and 110% of the rated voltage of the electrical accessories;
- check that no foreign bodies, such as bits of packing, have got into the moving parts;
- check that there is a sufficient exchange of air in the installation place to avoid overtemperatures;
- also carry out the checks indicated in table T3.

Detailed instruction for putting sensors and CMU into service are available in 2RDA044114

8. Putting into service

T3

ITEM	INSPECTED	PROCEDURE	POSITIVE CHECK
1	Insulation resistance.	**Medium voltage circuit**	
		With a 2500 V megger, measure the insulation resistance between the phases and the exposed conductive part of the circuit.	The insulation resistance should be at least 50 Mohm and in any case constant over time.
		Auxiliary circuits	
		With a 500 V megger (if the apparatus installed allows this), measure the insulation resistance between the auxiliary circuits and the exposed conductive part.	The insulation resistance should be a few Mohm and in any case constant over time.
2	Auxiliary circuits.	Check that the connections to the control circuit are correct: proceed at the relative power supply.	Operations and signals normal.
3	Manual operating mechanism.	Carry out a few closing and opening operations (see cap. 6). N.B. Supply the undervoltage release and the locking magnet on the operating mechanism at the relative rated voltage (if provided).	The operations and relative signals take place normally.
4	Motor operator (if provided).	Supply the spring charging geared motor at the relative rated voltage.	The spring is charged normally. The signals are normal. With the spring charged, the geared motor stops.
		Carry out a few closing and opening operations.N.B. Supply the undervoltage release and the locking magnet on the operating mechanism at the relative rated voltage (if provided).	The geared motor recharges the spring after each closing operation.
5	Undervoltage release (if provided).	Supply the undervoltage release at the relative rated voltage and carry out the circuit breaker closing operation.	The circuit breaker closes normally. The signals are normal.
		Cut off power to the release.	The circuit breaker opens. The signalling changes over.
6	Shunt opening release and additional shunt opening release (if provided).	Close the circuit breaker and supply the shunt opening release at the relative rated voltage.	The circuit breaker opens normally. The signals are normal.
7	Shunt closing release (if provided).	Open the circuit breaker and supply the shunt closing release at the relative rated voltage.	The circuit breaker opens normally. The signals are normal
8	Key lock (if provided).	Open the circuit breaker, keep the opening pushbutton depressed, then turn the key and remove it from the housing. Attempt the circuit breaker closing operation.	Neither manual nor electrical closing takes place.
		Put the key back in and turn it 90°. Carry out the closing operation.	Both electrical and manual closing take place normally; in this position the key cannot be removed.
9	Locking electromagnet (-RLE1) (if provided).	With the circuit breaker open, spring charged and locking electromagnet not supplied, attempt circuit breaker closing both manually and electrically.	Closing is not possible.
10	Auxiliary contacts in the operating mechanism.	Insert the auxiliary contacts in suitable signalling circuits. Carry out a few closing and opening operations.	Signals take place normally.
11	Locking electromagnet on the truck circuit breaker (-RLE2) (if provided).	With the circuit breaker open, in the isolated for test position and the locking electromagnet not supplied, attempt racking-in of the circuit breaker.	Racking-in is not possible.
		Supply the locking electromagnet and carry out the racking-in operation.	Racking-in takes place correctly.
12	Auxiliary transmitted contacts for signalling circuit breaker racked-in, isolated (UniGear switchgear or PowerCube modules).	Insert the auxiliary contacts in suitable signalling circuits. With the circuit breaker racked into the enclosure, carry out a few traverse operations from the isolated for test position to the connected position. Take the circuit breaker to the racked-out position.	The signals due to the relative operations take place normally.
13	CMU and Sensors	Perform 5O & 5C to check if the CMU and Sensors are communicating.	Curves on dashboard as per the standard.

9. Maintenance

The maintenance operations are aimed at keeping the apparatus in good working condition for as long as possible.
In accordance with what is specified in the IEC 61208 / DIN 31 051 Standards, the following operations must be carried out.

Inspection:	Finding out the actual conditions
Overhauling:	Measures to be taken to maintain the specific conditions
Repairs:	Measures to be taken to restore the specific conditions.

9.1. General

ABB Advises you to refer to the SWAPs maintenance program to get a customized maintenance plan according to your specific environmental and operational conditions. Use the QR code below to access the SWAPs webpage and related creation tool.

Vacuum interruption does not produce any harmful effects even when there are frequent interruptions at the rated and short-circuit current.
The interventions during service and their aim are determined by the ambient conditions, by the sequence of operations and by the short-circuit interruptions.

Note
Respect the following Standards for maintenance work:
the relative specifications given in the chapter on “Standards and Specifications”;
– work safety regulations in the chapter on “Putting into service and operations”;
– standards and specifications of the country where the apparatus is installed.

The maintenance operations must only be carried out by trained personnel and who follow all the safety regulations.
Furthermore, it is advisable to call on ABB personnel, at least in cases for checking the performances in service and for repairs.
Cut the power supply off and put the apparatus under safe conditions during the maintenance operations.

Before carrying out any operations, check that the circuit breaker is open, with the spring discharged and that it is not supplied (medium voltage circuit and auxiliary circuits).

9.1.1. Operating life expectancy

The operating life expectancy for the VD4 circuit breakers is as follows:

- vacuum interrupters: up to 30.000 operations, according to their type (see par. 7.2.3. Trip curves);
- switching device, actuator and transmission system: up to 30.000 operations, under normal operating conditions, according to the type of circuit breaker and with regular
- with operations correctly executed it is possible to carry outup to 1000 racking-out/in operations (as prescribed in theIEC 60271-200 Standards);
- with operations correctly executed it is possible to carry out up to 500 racking-out/in operations (as prescribed in the IEEE/ANSI C37.20.2 Standards);
- the data regarding the operating life are basically applicable to all the components which cannot be directly affected by operator activity. The manually operated components (moving parts of isolatable parts, etc.) can vary their behaviour.

9. Maintenance

9.2. Inspections and functionality tests

9.2.1. Interruption devices in general

- Check the conditions of the interruption devices with regular inspections.
- Inspection at fixed intervals can be avoided when the apparatus is permanently under the control of qualified personnel.
- The checks must, first of all, include visual inspection to check for any contamination, traces of corrosion or electrical discharge phenomena.
- Carry out more frequent inspections when there are unusual operating conditions (including severe climatic conditions) and in the case of environmental pollution (e.g. high level of contamination or an atmosphere with aggressive agents).
- Visual inspection of the isolating contacts. It is recommended to turn the contact system alternately in order to keep the internal surface of the contact areas clean. The contact areas must be cleaned when there are signs of overheating (discoloured surface) (also see Repairs).

- In the case of abnormal conditions, take suitable overhauling measures (see Overhauling par.).

9.2.2. Stored energy operating mechanism

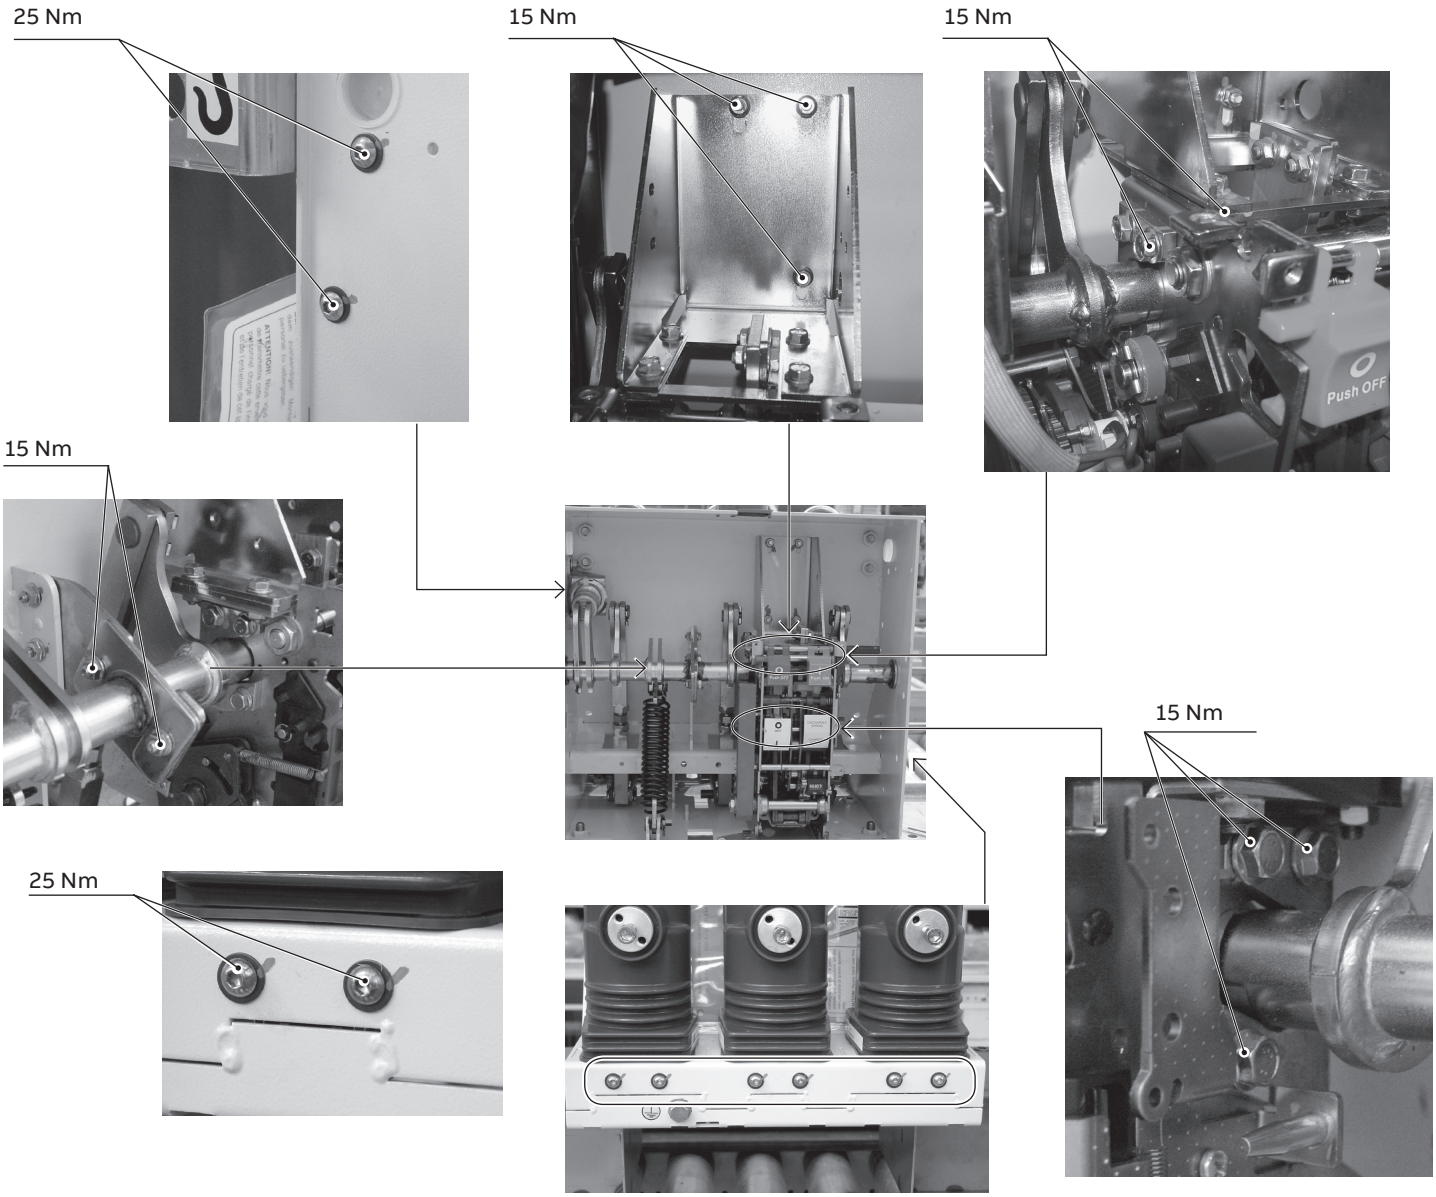
Carry out the functional test of the operating mechanism after 5.000 operations or during ordinary maintenance operations as specified in par. 9.2.1. and service the release devices at least every 5 years (see par. 9.3.2.).
Before doing the test, open the circuit breaker and carry out the following operations:

- in the case of withdrawable circuit breakers, take the circuit breaker to the isolated for test position
- in the case of fixed circuit breakers: cut off the power supply to the medium voltage circuit.

Note
Insulate the work area and make it safe, following the safety regulations specified in the IEC/DIN VDE Standards.

Functional test

- With the circuit breaker not connected to the load, carry out a few opening and closing operations.
- If foreseen, cut the power supply to the spring charging motor off. Discharge the spring by closing and opening the circuit breaker by means of the closing and opening pushbuttons.
- Visually inspect the lubrication conditions of the tulip isolating contacts, of the sliding surfaces, etc.
- Check correct electrical and mechanical operation of the various devices, with particular attention to the interlocks.
- The screws and nuts are tightened in the factory and correct tightening is marked with a collared sign. No further tightening operations are foreseen during the operating life of the circuit breaker. However, following any maintenance interventions, should it be necessary to re-tighten the screws or nuts, it is recommended to always replace the screws and nuts and to keep to the values indicated in fig. 12.



9.2.3. Circuit breaker pole

No other check except what has already been specified in par. 9.2.1. is necessary.

9.2.4. Withdrawable assembly (truck and circuit-breaker)

Visually inspect the components, especially those which may be damaged by incorrect operations (also see table in chap. 8).
Visually inspect the isolating contacts and that all the contact elements are clean, especially in cases where signs of overheating are found (also see par. 9.4.).
Visually inspect and carry out the functional tests of the locks, checking their correct operation and activation without abnormal force – maximum 25 N (also see table in chap. 8).

Checking tightness of the screws

EL Twin actuator - 50 kA

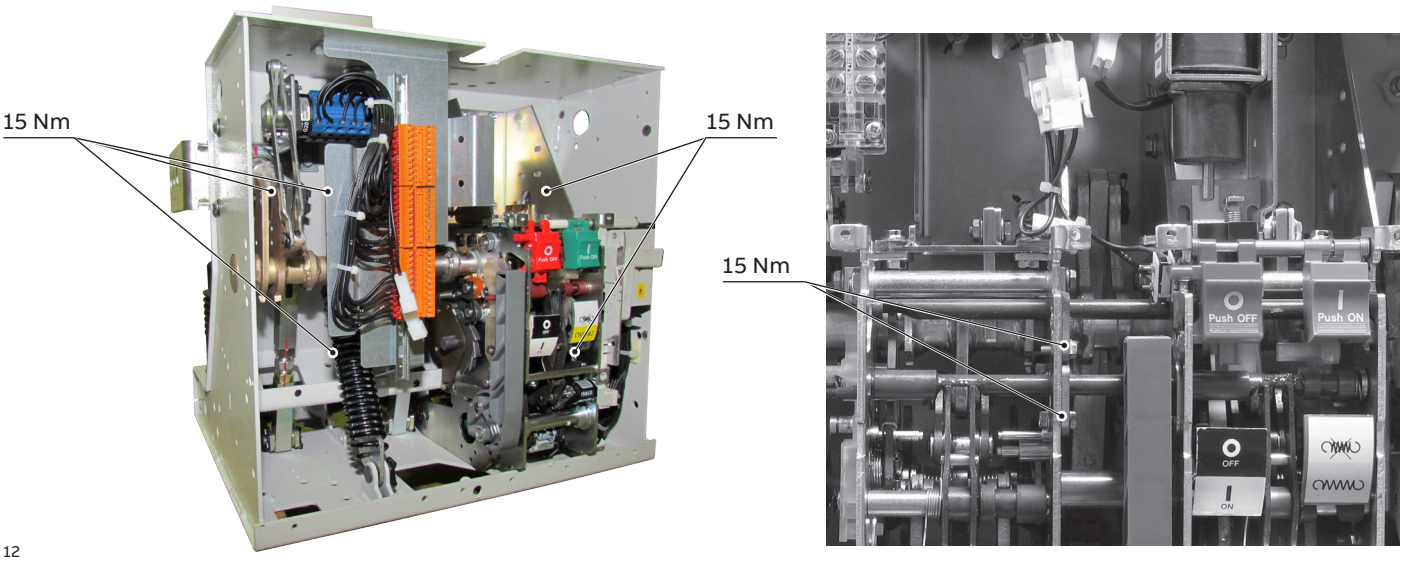


Fig. 12

9. Maintenance

9.3. Overhauling

9.3.1. Interruption devices in general

Should it have been necessary to clean the devices during the inspections, according to what is specified in par. 9.2.1., use the following procedure:

- insulate the work ar ea and make it safe, following the safety regulations specified in the IEC/DIN VDE Standards;
- general cleaning of the surfaces:
  - dry and eliminate light deposits of dirt with a soft dry cloth;
  - more resistant deposits of dirt can be removed using slightly alkaline domestic type detergent or Rivolta BWR 210 type detergent;
- cleaning insulating surfaces and conductive parts.

After cleaning, rinse thoroughly with clean water and dry carefully.

Note
Only use detergents without halogens and never 1.1.1-trichloroethane, trichloroethylene or carbon tetrachloride!

9.3.2. Tripping device: actuator and transmission system

Circuit breakers up to 17.5 kV, 1250 A, 31.5 kA and up to 24 kV, 2500 A, 25 kA

To ensure correct operation of the circuit breaker, inspection and maintenance of the tripping devices is recommended every 10.000 operations. For this purpose, please contact the ABB Service office.
Complete replacement of the actuator, shock absorber and of the other transmission system parts (shaft, main levers, safety rings, etc.) must be carried out after 30.000 operations.

IEEE circuit breakers 15kV up to 2000A, 40kA

To ensure correct operation of the circuit breaker, inspection and maintenance of the tripping devices must be carried out every 2.000 operations. For this purpose, please contact the ABB Service office.
Replacement of spring charging motor (-MAS) must be carried out every 5.000 operations.
Complete replacement of the shock absorber and of the other parts of the transmission system (shaft, main levers, safety rings, etc.) must be carried out every 10.000 operations.

Circuit breakers up to 17.5 kV, 40 kA and 24 kV, 31.5 kA

To ensure correct operation of the circuit breaker, inspection and maintenance of the tripping devices is recommended every 5.000 operations. For this purpose, please contact the ABB Service office.
Complete replacement of the actuator must be carried out every 10.000 operations.
Complete replacement of the shock absorber and of the other transmission system parts (shaft, main levers, safety rings, etc.) must be carried out after 30.000 operations.

Circuit breakers up to 17.5 kV, 3150 A , 40 kA and 36/40.5 kV

To ensure correct operation of the circuit breaker, inspection and maintenance of the tripping devices must be carried out every 5.000 operations. For this purpose, please contact the ABB Service office.
Complete replacement of the shock absorber and of the other part of the transmission system (shaft, main levers, safety rings, etc.) must be carried out after 10.000 operations.

Circuit breakers up to 17.5 kV, 50 kA and EL twin actuator

To ensure correct operation of the circuit breaker, inspection and maintenance of the tripping devices must be carried out every 5.000 operations. For this purpose, please contact ABB Service.
Complete replacement of the shock-absorber and of the other parts of the transmission system (shaft, main levers, safety rings, etc.) must be carried out every 10.000 operations.

Note
Dismantling and replacement of the operating mechanism (trip box) can only be carried out by ABB personnel or by skilled and specially trained personnel, particularly for the necessary adjustments.

Details regarding overhauling

- When foreseen, cut of the power supply to the spring charging motor and manually discharge the operating mechanism spring by closing and opening the circuit breaker.
- Replace the parts subjected to mechanical str ess or stress due to particular environmental conditions, (contact and ABB service centre).
- Consult maintenance instruction manual 1VCP000558 for further details.

Note
These operations can only be carried out by ABB personnel or by skilled and specially trained personnel.

9.3.3. Circuit breaker pole

The circuit breaker pole and relative vacuum interrupter are maintenance-free until the maximum number of electrical operations for the type of interrupter is reached (see par. 7.2.3. Trip curves). The operating life of the vacuum interrupter is defined by the sum of the ultimate currents corresponding to the specific type of interrupter in accordance with what is indicated in the graphs of par. 7.2.3. Trip curves: when the sum of the ultimate currents is reached, the whole pole must be replaced.

Note
Dismantling and replacement of the pole can only be carried out by ABB personnel or by skilled and specially trained personnel, particularly for the necessary adjustments.

To carry out the interrupter test without dismantling the circuit breaker pole, use:

- the VIDAR vacuum tester, made by the company Programma Electric GmbH, Bad Homberg v.d.H.

To check vacuum tightness of the interrupter, the following test values must be set on the VIDAR tester:

Rated voltage of the circuit breaker	d.c. test voltage
12 kV	40 kV
17.5 kV	40 kV
24 kV - 36 kV - 40.5 kV	60 kV

CMU and Sensors The expected life expectancy for CMU and sensors is 10 years. After 10 years please get in touch with ABB Service for the replacement.
For VD4 evo customers can replace the sensors themselves without any intervention from ABB Service.
Detailed instructions for installing the sensors is available .Please see section.7 -Installation for more details.
ABB shall provide the software updates from time to time.

The test must always be carried out with the circuit breaker open with the contacts at the nominal distance.

Procedure for testing the degree of vacuum of the interrupter of the circuit breaker poles:

- **turn the power supply off and make the working area safe by following the safety regulations specified in the IEC/ DIN VDE Standards;**
- **open the circuit breaker;**
- **earth a terminal of each circuit breaker pole;**
- **connect the earth terminal of the VIDAR tester to the circuit breaker structure;**
- **connect the high voltage terminal of the VIDAR tester to the terminal of the circuit breaker pole not connected to earth (L1 phase) and carry out the test. Repeat the test for phases L2 and L3.**

Note
The tester connection cables can produce an indication due to the capacitive effect. In this case the cables must not be removed.

9.4. Repairs

Replacement of spare parts and accessories must only be carried out by ABB personnel or suitably qualified and specially trained personnel.
Always work with the circuit breaker open and locked so that it cannot be closed again, with the work area insulated and made safe.
The operating mechanism spring must be discharged.
All power supply sources must be disconnected and made safe against any reclosing during removal and installation work.

Should maintenance be carried out by the customer's personnel, responsibility for the interventions remains with the customer.
The replacement of parts not included in the "List of spare parts/accessories" (par. 12.1.) must only be carried out by ABB personnel. In particular:

- **complete pole with bushings/ connections**
- **actuator and transmission system**
- **closing spring set**
- **opening spring**
- **shock-absorber.**

10. Application of the X-ray emission Standards

One of the physical properties of vacuum insulation is the possibility of X-ray emission when the interrupter contacts are open.
The specific tests carried out at the PTB laboratories (Physikalisch-Technische Bundesanstalt, in Brunswick - Germany) show that local emission at a distance of 10 cm from the interrupter or pole surface, does not exceed 1 μSv/h.

It follows that:

- at the rated service voltage the use of vacuum interrupters is absolutely safe;
- application of the withstand voltage at power frequency, according to the IEC 62271-100 and VDE 0670 Standards, is safe;
- application of a voltage higher than the withstand voltage at power frequency or of a test voltage in direct current, specified in the IEC and VDE Standards, cannot be used;
- limitation of the above-mentioned local phenomena, with interrupters with open contacts, depends on keeping the specific distance between the contacts.
  This condition is intrinsically guaranteed by correct operation of the operating mechanism and by the adjustments of the transmission system.

11. Spare parts and accessories

All assembly operations of spare parts/ accessories must be carried out following the instructions enclosed with the spare parts, by ABB personnel or by suitably qualified customer personnel with in-depth knowledge of the apparatus (IEC 60694) and of all the Standards aimed at carrying out these interventions in safe conditions. Should the maintenance be carried out by the customer's personnel, responsibility for the interventions remains with the customer. Before carrying out any operation, always make sure that the circuit breaker is open, the spring discharged and that it is not energised (medium voltage circuit and auxiliary circuits).

To order circuit breaker spare parts/accessories, refer to the ordering sales codes indicated in the technical catalogue and always state the following:
- type of circuit breaker
- rated voltage of the circuit breaker
- rated normal current of the circuit breaker
- breaking capacity of the circuit breaker
- serial number of the circuit breaker
- rated voltage of any electrical spare parts.

For availability and to order spare parts, please contact our Service office.

11.1. List of spare parts

- Shunt opening release
- Additional shunt opening release
- Undervoltage release
- Contact for signalling undervoltage release energised/deenergised
- Time delay device for undervoltage release
- Mechanical override for undervoltage release
- Shunt closing release
- Spring charging geared motor with electrical signalling of spring charged
- Contact signalling protection circuit breaker of the geared motor open/closed
- Contact signalling closing spring charged/ discharged
- Transient contact with momentary closing during circuit breaker opening
- Circuit breaker auxiliary contacts
- Locking electromagnet on the operating mechanism
- Position contact of the withdrawable truck
- Contacts signalling connected/isolated
- Opening solenoid
- Key lock in open position
- Isolation interlock with the door
- Protection for opening pushbutton
- Protection for closing pushbutton
- Locking electromagnet on the withdrawable truck
- Set of six tulip contacts
- CMU (for VD4 evo only)
- Temperature sensor with Smart Arm (for VD4 evo only)
- Angle sensor (for VD4 evo only)

12. Electric circuit diagrams

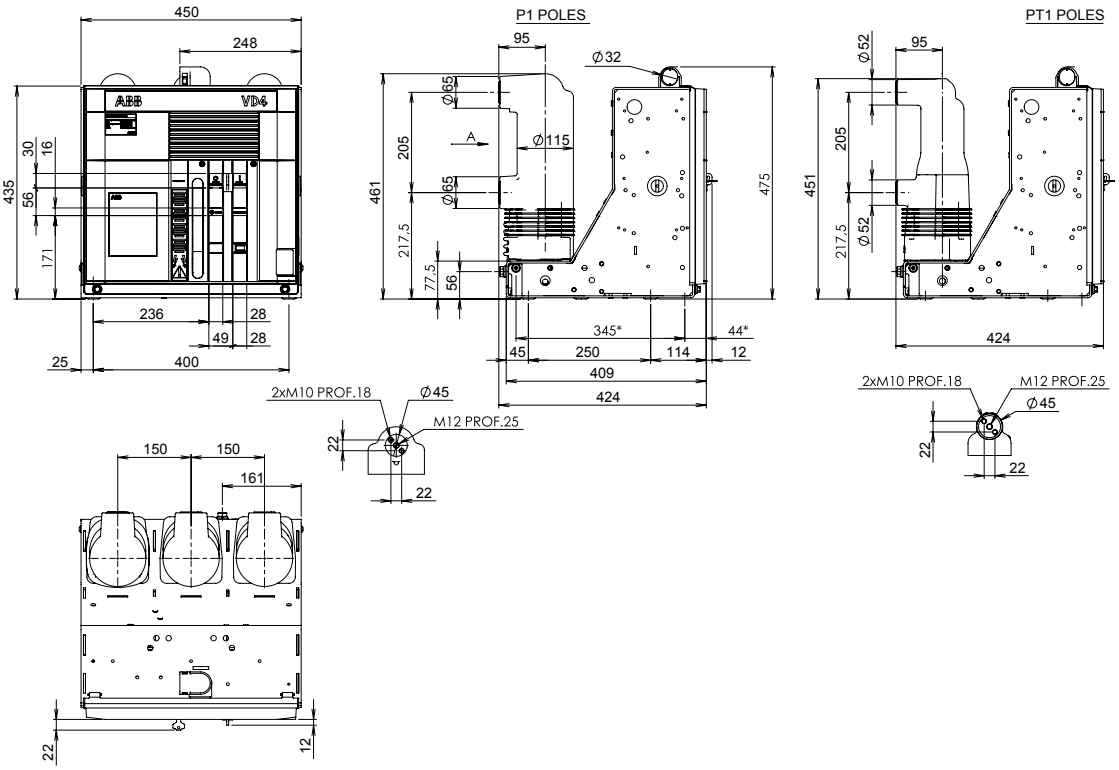
The standard VD4 circuit breaker electric circuit diagrams are as follows:

Free standing version:
- 1VCD400151: Fixed circuit breakers
- 1VCD400152: Fixed circuit breakers with 64-pole connector
- 1VCD400153: Fixed circuit breakers with 58-pole connector
- 1VCD400154: Fixed circuit breakers with truck

Withdrawable version
- 1VCD400155: Withdrawable circuit breakers
- 1VCD400156: Withdrawable motorized circuit breakers
- 1VCD400158 Withdrawable circuit breakers for ZS8.4 switchgear VD4/ZS8, ZT8 and Z8 with circuit breaker
- 1VCD400159: Withdrawable circuit breakers for ZS8.4 switchgear with VD4/ZS8, ZT8 and Z8 circuit breaker with motorized truck

50kA version
- 1VCD400166: Fixed circuit breakers 50 kA
- 1VCD400167: Withdrawable circuit breakers 50 kA
- 1VCD400168: Withdrawable circuit breakers 50 kA with motorized truck.

Each circuit breaker is always provided with the standard electric diagram or with a specific diagram in the case of a circuit breaker with non-standard cabling.



Free standing version VD4 evo 40 kA:
- 1VCD400316: Fixed circuit breakers

Withdrawable version VD4 evo 40 kA:

14. Product quality and environmental protection

The apparatus are produced in compliance with the requirements of international standards for the quality management system and environmental management system. In these fields, the excellent level is proved by quality certificates according to ISO 9001 and by the EMS according to ISO 14 001.

End of life of product

The ABB company is committed to complying with the relevant legal and other requirements for environment protection according to the ISO 14 001 standard.
The duty of company is to facilitate subsequent recycling or disposal at the end of product life. During disposal of the product, it is always necessary to act in accordance with local legal requirements in force.

Methods of disposal

Disposal can either be carried out thermally in an incineration plant or by storing on a waste site.

Raw material	Recommended method of disposal
Metal material (Fe, Cu, Al, Ag, Zn, W, others)	Separation and recycling
Thermoplasts	Recycling or disposal
Epoxy resin	Separation of metal material and the disposal of rest
Rubber	Disposal
Oil as dielectric (transformer oil)	Draining from equipment and further recycling or disposal
Packing material – wood	Recycling or disposal

DISTRIBUTION SOLUTIONS

PowerCube type PB

Pre-assembled modules, enclosures and L-frames for medium voltage switchgears

—

ABB PowerCube, A brick to build your solution.

Medium voltage preassembled units to be used as components for primary distribution air-insulated switchgears, from enclosures to modules with complete apparatus and cable access compartments. A flexible portfolio of solutions for panel builders and OEMs to design their own customized panel configurations. Maximize your added value, depending on the needs and specific requirements, with flexibility in hosting different types of apparatus and quenching techniques to fulfill customer specifications.

1. General characteristics

PowerCube module type PB/M

PowerCube enclosure type PB/E

PowerCube L-frame type PB/F

Scan o Tap on QR code
to visit PowerCube website

General information

PowerCube modules can be used to develop and assemble metalclad medium voltage air-insulated switchgear with the same rated current values as the enclosure.
The rated currents of the enclosures refer to versions tested in ABB UniSafe switchgear.
Use of the 4000 A PB3 enclosure allows a switchgear with the same rated current to be made so long as a suitable fan is installed in the rear part of the switchgear itself (consult ABB for further details).
PowerCube units type PB are available in three different versions: PB/M, PB/E and PB/F or PB/FL.
PB/M: complete module that also includes the cable access cubicle, which can also be pre-engineered to house the withdrawable TV compartment.
PB/E: enclosure without cable access compartment thus unable to house the withdrawable VT which, being smaller in size, is more flexible and suitable for creating double-deck switchgear.
PB/F: L-frame without door and cable access compartment thus unable to house the withdrawable VT cell or truck, which, being smaller in size, is more flexible and suitable for creating double-deck switchgear.
PB/FL: it is a compact version of PB/F which does not allow usage of the earthing switch
PowerCube modules are pre-assembled and tested in the factory. They can be used to make switchgear conforming to Standards IEC 62271-200, IEC 62271-1.

They are available with the following specifications:

Rated voltage (kV)	... 17.5	24
Rated current (A)	... 4000	... 2500
Rated short-time withstand current of main circuit (kA)	... 40 x 3s	... 31.5 x 3s
	... 50 x 1s	

The following apparatus can be installed in PowerCube modules:

- series VD4, VM1 and VD4-G vacuum circuit breakers
- series ConVac vacuum contactors

All the switching operations are carried out from the front of the module/enclosure.

Protection class

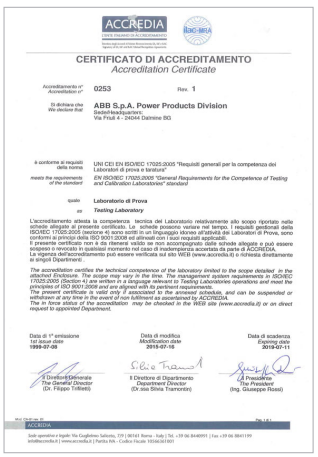
PowerCube PB/M and PB/E units can guarantee a degree of protection IP4X according IEC 60529 from front and with door closed.
The degree of protection from top, bottom, left and right side is dependent on complete panel design and therefore at customer care, this is in general applicable to PB/F and PB/FL units as are open L-frames

Interlocks

The PowerCube module is equipped with interlocks in order to prevent incorrect operations that could put the operators' safety at risk and compromise the efficiency and reliability of the actual equipment. These interlocks inhibit the following operations:

- closing of the circuit-breaker unless the connected or isolated positions are reached.
- rack-out of the closed circuit-breaker.
- rack-in of the closed circuit-breaker
- door opening if the circuit-breaker is in rack-in position or halfway between rack-in and isolated position.
- rack-in of the circuit-breaker when the compartment door is open
- manual opening of the shutters.

Moreover, if the unit is equipped with an earthing switch:



- closing of the earthing switch if the circuit-breaker is in rack-in position or halfway between rack-in and isolated position
- rack-in of the circuit-breaker with the earthing switch closed.
- opening of the feeder compartment door with the earthing switch open (PowerCube PB/M module only)
- opening of the earthing switch with the feeder compartment door open (PowerCube PB/M module only).

Note: some of the above mentioned interlocks are available on request or only available for certain versions.

2. Available types and apparatus

Circuit breakers

Note: see relevant apparatus catalogue for rating and versions suitable for PB untis

VD4 series vacuum circuit breaker.

Scan o Tap on QR code to visit ABB VD4 website.

VM1 series vacuum circuit breaker

Scan o Tap on QR code to visit ABB VM1 website.

VD4G series Vacuum circuit breaker.

Scan o Tap on QR code to visit ABB VD4G website.

PowerCube Units can be equipped with VD4, VM1 and VD4G series withdrawable vacuum circuit-breakers.
The circuit breakers are fitted with a truck which allows their racking-in and out of the switchgear with the door closed.
They have a compact and light structure which ensures great sturdiness and excellent mechanical reliability.
The operating mechanism and poles are fixed to the metal structure which also acts as a support for the moving contact actuation kinematics

Series VD4, VM1 and VD4G vacuum circuit-breakers
The VD4, VD4G and VM1 circuit breakers use vacuum as interruption and insulating medium.
Thanks to the advanced techniques used for their manufacturing, the vacuum circuit breakers ensure high performances under all service conditions.
The vacuum interrupters are embedded in thermoplastic or epoxy resin poles.
This construction protect the vacuum interrupters which are unaffected by shocks, humidity and environmental pollution.
The circuit breaker poles, constitute the interrupting part, they are sealed for life pressure systems (IEC 62271-100 Standards) and maintenance-free.
The VD4 and VD4G circuit breakers use a mechanical type of operating mechanism while VM1 circuit breakers use an operating mechanism with a magnetic actuator.
VD4G circuit breakers are designed to meet the most demanding plant requirements for generator applications as for IEEE C37.013 and the new revision of IEC/IEEE 62271-C37-013 standards (dual logo).

Series ConVac vacuum contactor

Scan o Tap on QR code to visit ABB ConVac website.

Series ConVac vacuum contactors

ConVac series withdrawable contactors are used in PowerCube PB1 Units up to 12 kV. The contactors are suitable for controlling a.c. devices that need to a considerable number of operations with an extremely low chopping current.

The Contactor is characterized by a monostable linear actuator and available in two basic configuration, Electrical latching and mechanical latching. Close operation is always performed supplying the multi-voltage electronic feeded which reduce automatically power consumption after the close operation without the need of added resistances.

In electrically latched units, when auxiliary power supply is not present, open operation is guaranteed by springs. In mechanically latched units, after the closing operation is performed, the power supply is removed and a mechanical device lock the contactor in close position until a trip coil is energized. When this happen the mechanical lock disengage and the contactor open by springs.

The contactor is suitable to install both DIN and BS fuses (type to be specified at order stage) with different lenghts.

ConVac contactors are also characterized by an extreme flexibility in term of configuration, for instance it is possible for the customer to switch from electrical to mechanical latching, or to change contactor auxiliary voltage level, without ABB intervention by means of a simple kit. This allow to optimize and reduce spare contactors units and spare parts management and to fast adapt to changes in specifications.

2. Available types and apparatus

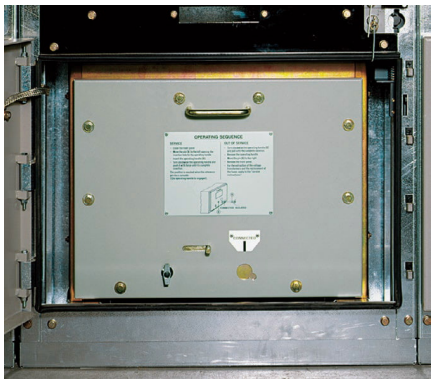
PB/TM PB1/MWL

VT trucks

PTT/W is the VT truck used in PB/T measuring unit (see table 1).
VT truck is supplied without voltage transformers (separately available from ABB)
ABB Voltage Transformers suitable for these units are:

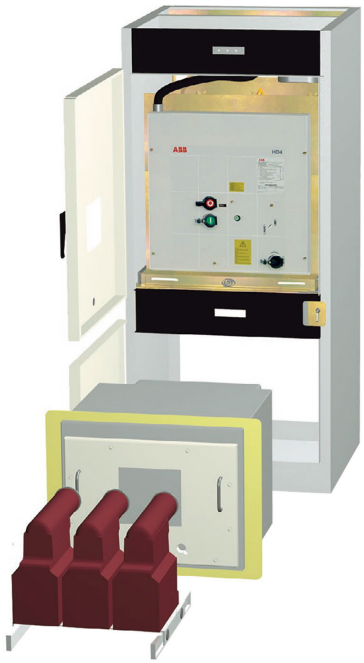
- ABB TJP-F 4.0 (12 kV)
- ABB TJP-F 5.0 (17,5 kV)
- ABB TJP 6.0 (24 kV)

PTT/WL is the VT truck used in PB1/MWL measuring unit (see table 2).
VT truck is supplied without voltage transformers (separately available from ABB)
ABB Voltage Transformers suitable for these units are:



- ABB TJP-F 4.0 (12 kV)
- ABB TJP-F 5.0 (17,5 kV)

Tab. 1 – VT trucks for PB/TM, PB/TE and PB/TF



kV	Isc/ Icw (kA)	Dimensions	Truck type	PowerCube
12 17.5	16 20 25 31.5	W=600 mm (panel width) P=150 mm (pole distance VT)	PTT1/W	PB1/TM PB1/TE PB1/TF
12 17.5	40 50	W=750 mm (panel width) P=210 mm (pole distance VT)	PTT2/W	PB2/TM PB2/TE PB2/TF
24	16 20 25 31.5	W=750 mm (panel width) P=210 mm (pole distance VT)	PTT4/W	PB4/TM PB4/TE PB4/TF

Tab. 2 – VT trucks for PB/MWL

kV	Isc/ Icw (kA)	Dimensions	Truck type	PowerCube
12 17.5	16 20 25 31.5	W=600 mm (panel width) P=160 mm (pole distance VT)	PTT1/WL	PB1/MWL

TV cell

VT Cell

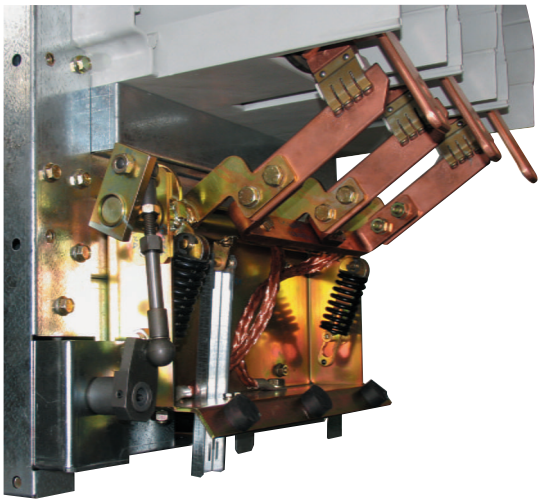
TV-F and TV-W are cells for VT placed in PB/M and PB/RM cable compartment

VT truck is fit inside the cell without voltage transformers (separately available from ABB)

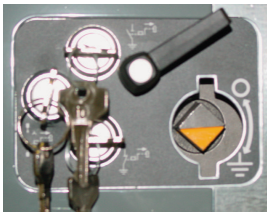
ABB Voltage Transformers suitable for these units are:

- ABB TJP 4.3 (12 kV)
- ABB TJP 5.3 (17,5 kV)
- ABB TJP 6.3 (24 kV)

The voltage transformers are are protected by fuses. The fuses can be replaced when the switchgear is in service since the fuse compartment is segregated from the other compartments by metal partitions.

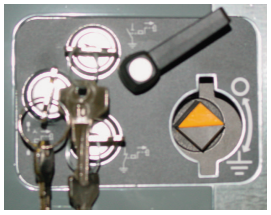


Tab. 3 – VT trucks for PB/M - PB/RM



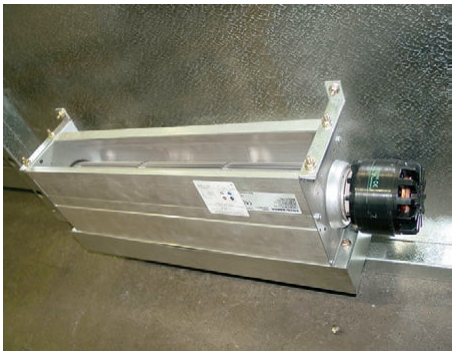
kV	Isc/ Icw (kA)	Dimensions	Cell type	PowerCube
12 17.5	16 20 25 31.5	W=750 mm (panel width) W=1000 mm (panel width) P=150 mm (pole distance VT)	Type F	PB2/M PB2/RM PB3/M PB3/RM
24	16 20 25 31.5	W=750 mm (panel width) W=1000 mm (panel width) P=200 mm (pole distance VT)	Type/W	PB4/M PB4/RM PB5/M PB5/RM

3. Main components



Earth switches

PowerCube units type PB can be equipped with an earthing switch. The earthing switch possesses short-circuit making capacity. On request, the opening and closing operations can be inhibited by means of key locks. The earthing switch is operated from the front of the module by means of a manual operation appropriately interlocked with the circuit-breaker's position.
Not available on PB/FL



Earthing switch closed

Earthing switch open

Indication of the earthing switch (open/closed) visible from the front of the enclosure.

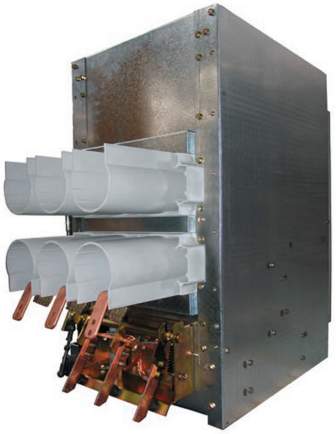
A fan for forced ventilation is pre-installed in PB3 units size 3600 A and PB5 units size 2500 A. To reach 4000A with PB3 a second fan (in the picture) shall be installed, according with ABB prescriptions, in the rear of the panel (at the customer's charge).

Monoblocks and shutters

The spout consist of an insulated monoblock containing the upper and lower power connections of the Circuit breaker or contactor compartment.
Branches for busbars connection are from upper monoblock while connections towards the cable compartment are from the lower one.
The metallic shutters are automatically actuated when the circuit-breaker moves from the test/isolated position to the connected position and vice versa.
They are always equipped with a fail-safe safety device to prevent them from being manually open by an operator when the apparatus compartment is empty. Shutters can be locked by means of padlocks. (optional).

Insulating monoblocks with contacts for rated current up to 2500 A.

Insulating monoblocks with contacts for rated current of up to 4000 A.



Segregating shutters with metal partitions

Notes for use of PowerCube Units type PB

- **PowerCube Units type PB1 ... PB5** are recommended for incoming, outgoing and bus-tie panels.

Example of a PowerCube Unit type PB1 ... PB5 (front and rear views)

- **PowerCube Units type PB1/R ... PB5/R** are recommended for riser, metering and direct busbar incoming panels.

Example of a PowerCube Unit type PB1/R ... PB5/R (front and rear views)

Tab. 4 - PowerCube units without apparatus (PB/RM, PB/RE)

(1) On earthing switch, if requested.
(2) VT Cell not available

3. Main components

Accessories

1a Signalling contacts for circuit-breaker/ contactor in connected/isolated position

Standard fitting is 10 contacts (5 normally open and 5 normally closed in change-over configuration) to signal connected position and another ten to signal the isolated position. A second group of 10 contacts is available on request for both signals. Not available on PB/F - PB/FL.

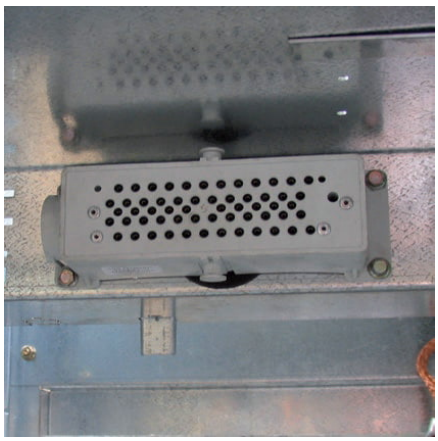
1b Anti-racking-in lock for circuit-breakers / contactors with a rated current lower than the cubicle or for apparatus not envisaged for the cubicle itself



Consists of a code on the socket that prevents the plug from being inserted if the rated current of the apparatus is incompatible with the one of the PowerCube.

In order to work correctly, this lock requires a counterpart on the circuit-breaker or contactor, a combination of a coding on the apparatus plug and the locking magnet on the truck (-RL2).

The plug cannot be removed when the apparatus is in connected position or halfway between rack-in and isolated position.

Not available on PB/F - PB/FL.

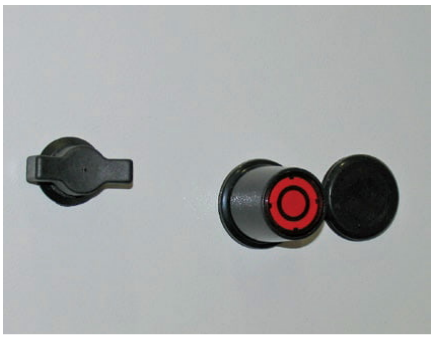
8 Voltage signalling lamps (VDIS)

These lamps indicate presence of primary voltage. VDIS can be pre-assembled on request on PB/M modules with the appropriate presetting while for PB/E, PB/F and PB/FL units, they can be supplied loose and assembled by the customer in the low voltage compartment.
VPIS can receive the signal from post insulators with capacitive dividers, by combi-sensors or by current transformers.

9 Opening or closing operations with the door closed



This accessory is available on request for circuit-breakers and contactors; available options are as below.
VD4 and VD4-G circuit breakers:
- open push-button.
- open and close push-buttons.

VM1, VSC and mechanically latched ConVac:
- Slot to operate with emergency open rod (provided with the apparatus).

This accessory requires different and specific doors for the different type of apparatus.
This accessory is not available for PB/F and PB/FL units.
This accessory is not available for:
- 50 kA circuit breakers.
- PB/F and PB/FL units

3. Main components

14 Earthing switch operating lever
Standard fitting if Earthing switch is required: 1 lever on each order confirmation or on each group of enclosures for each position of the order confirmation.
Extra levers are supplied on request as accessories.
Not available for PB/FL

16 Circuit-breaker lifting and transporting unit
Allows the withdrawable apparatus to be safely lifted to plug it into the PowerCube unit.
Available options are:
a) Plate for lifting trolley
b) Lifting trolley
c) Complete kit (plate installed on trolley).

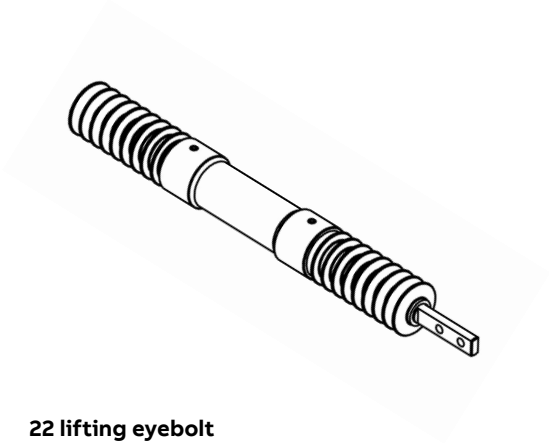
20 Key locks for the earthing truck



It is used to inhibit the rack-in operation of the Earthing truck. Two locks are supplied:
One lock for earthing truck to earth busbars (truck with upper phases)
one lock earthing truck to earth cables (truck with lower phases).
Both key locks can be installed in the same enclosure. Not available for PB/F and PB/FL

-XF3	Connector for the forced front ventilation circuits

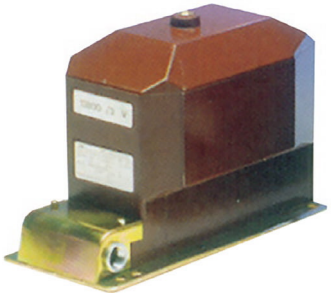
Figure	Description
Fig. 1	Electrical signalling contacts for switch in plugged-in position (see note C)
Fig. 3	Electrical signalling contacts for switch in isolated position (see note C)
Fig. 20	Circuit of electromechanical lock on earth switch closing operation: the operation is only permitted with coil -RL3 energized
Fig. 21	First pack of auxiliary contacts of the earth switch (see note B)
Fig. 22	Second pack of auxiliary contacts of the earth switch (see note B)
Fig. 23	Circuit of electromechanical door opening lock: opening is only permitted with coil -RL3 energized
Fig. 41	Forced front ventilation circuit
Fig. 43	Forced front and rear ventilation circuit

Notes

A) The switchgear comes solely equipped with the specific applications in the order confirmation

B) The auxiliary contacts -BE are supplied in the position indicated in the diagram. However, the user can easily convert them from make contacts to break contacts or vice versa.

C) Position contacts -BT4 and BT5 are switch contacts. This means that the make contact and the break contact belonging to the same position contact cannot be powered with different voltage values.



D) When fig. 23 is required, the contact -BT5 (terminals 51-52-53-54) of fig. 3 is not available
Symbols (in compliance with Standards IEC 60617 and CEI EN 60617)

E) The fans must activate when at least one phase exceeds the following thresholds for 60 seconds:
- UniSafe 12-17.5 kV 3600 A = 3000 A (front fan)
- UniSafe 12-17.5 kV 4000 A = 3000 A (front fan) and 3600 A (rear fan)
- UniSafe 24 kV 2500 A = 2250 A (front fan).

The fans must disconnect when the current of all three phases is lower than the following values for 300 seconds:
- UniSafe 12-17.5 kV 3600 A = 2900 A (front fan)
- UniSafe 12-17.5 kV 4000 A = 2900 A (front fan) and 3500 A (rear fan)
- UniSafe 24 kV 2500 A = 2150 A (front fan).

6. Switchgear completion

Voltage transformers

The voltage transformers are insulated in resin and are used for powering measuring devices and protections. They are available for fixed assembly or for istallation on withdrawable trolleys.
They conform to standard IEC 60044-2.
The dimensions normally comply with Standard DIN 42600,
while the transformers designed for installation on withdrawable trolleys are the dedicated type.
These transformers can have one or two poles and possess performance and accuracy classes that suit the functional requirements of the instruments to which they are connected.
When they are installed on withdrawable trolleys, they are equipped with medium voltage protection fuses. The fuses can be replaced whilst the switchgear is in service.

Current transformers

The current transformers are insulated in resin and are used for powering measuring devices and protections. These transformers can have a wound core or bushing bar with one or more cores and come with performance and accuracy classes that suit the requirements of the installation.
They conform to standard IEC 60044-1.
The dimensions normally comply with standard DIN 42600.
The current transformers can also be supplied with a capacitive socket for connection to voltage signalling lamps.

Measuring sensors (for applications with microprocessor protection units)

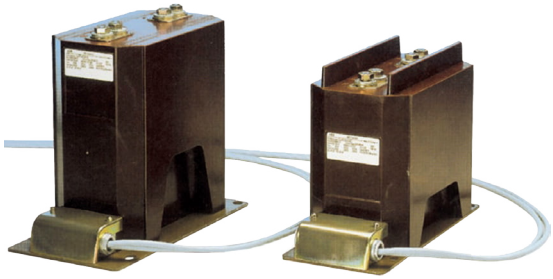


ABB KEDCD voltage-current combi-sensors

Use of digital technologies for electrical protection and measuring instruments has deeply modified the performance that transformers must provide.
The analog input levels of the instruments have become significantly lower than those of conventional systems.
This is why ABB has introduced a new range of sensors that meets the specifications of the new generation instruments in an optimal way.
The switchgear can be equipped with up to 24 kV ABB KEVCD Block Type sensors.
The current sensors comply with standards IEC 60044-8 (CDV), while the voltage sensors comply with standard IEC 60044-7.
The dimensions normally comply with standard DIN 42600 Narrow Type.
The resin casing can house current sensors and voltage sensors at the same time, or just the current sensor. A capacitive divider is also installed for connection to the voltage signalling lamps.
ABB multifunction units and measuring sensors comply with accuracy class CI.1.

6. Switchgear completion

Current sensor

The current sensor consists of a Rogowski coil without ferromagnetic core, thus unaffected by saturation phenomena. If a core is formed by a uniform winding over a non-magnetic closed core with a constant section, the voltage indiced in the secondary circuit will be directly proportional to the variations in the let-through current. This voltage must be integrated in order to obtain a signal proportional to the current provided. The multifunction devices accomplish this function and use the signal obtained for both the measurements and protections.

Main features of the current sensors

- Linear response over the entire measuring range;
- no saturation;
- no hysteresis;
- one single instrument for both protections and measurements;
- high accuracy class;
- high degree of immunity to electromagnetic disturbances;
- the output signal is a voltage (150 mV) proportional to the current variation over time. The current measurement is obtained by integrating the signal;
- two single coils cover the range from 0 to 3200 rated A;
- the winding can remain open even when the switchgear is under service conditions.

Scan o Tap on QR code to visit ABB instrument transformers and sensors website

Voltage sensor

The voltage sensor consists of a resistive divider through which the signal is taken. This sensor is also the non-saturable type and gives a linear response for the entire measuring range.
The output signal is a voltage directly proportional to the primary voltage. The resistive element consists of a bar of ceramic material. Voltage sensors are used at the same time to make measurements and energize the protections.

Main features of the voltage sensors

- Linear response over the entire measuring range;
- no saturation;
- no ferroresonance;
- one single instrument for both protections and measurements;
- high accuracy class;
- high degree of immunity to electromagnetic disturbances;
- the output signal is a voltage directly proportional to the primary voltage;
- the division ratio is 10000/1;
- one single divider covers the range from 0 to 24 rated kV.

6. Switchgear completion

REF 601 switchgear protection device

ABB can also supply the following components to complete the switchgear.
Please consult ABB for further details.

Relay REF 601 is a device that protects against overcurrents, with tripping curves in compliance with standard IEC 255-3. It protects against overload (51), instantaneous and delayed short-circuits (50-51), instantaneous and delayed homopolar earth faults (50N and 51N). It also detects the magnetizing current of a threephase transformer to prevent it from tripping in an untimely way when a transformer switches in (68). elay REF 601 must be energized in order to function.
The REF 601 relay can operate with up to 3 inputs from current sensors of the Rogowsky coil type and an input from an external toroidal current transformer. 4 rated current values can be entered via the keyboard: 40, 80, 250, 1250 A.
If the circuit-breaker is equipped with 3 current sensors, the 50N and 51N protection functions are accomplished with the vector sum of the phase currents. On the other hand, the external toroidal current transformer must be installed for the 50N and 51N functions if 2 current sensors are used. The external toroidal transformer can have either an openable or closed core and any transformer ratio, so long as there is 1 A secondary current.

Specific features of the REF 601 relay:
- Accurate interventions
- Wide setting ranges
- Single and contemporaneous adjustment of the three phases
- No limitation (due to the current sensors) to the rated breaking capacity or to the short-time withstand current of the circuit-breaker
- Local electric operating buttons
- 5 separate indicators: “relay operating”, “relay at tripping threshold”, “relay tripped”, “relay tripped due to phase over-current”, “relay tripped due to earth fault over-current”
- Interface consisting of an LCD display and by “arrow”, “enter” and “esc” keys for user-friendly browsing among the “measuring”, “data recording”, “event recording”, “settings”, “configuration” and “test” menus
- Three user levels: “Operator” (display only, free access), “configurator” (same as the previous level, but with the ability to enter the protection parameters and, if applicable, the communication parameters - access limited by a password), “administrator” (same as the previous level but with the ability to enter the passwords and configure the settings according to the device - access limited by a password)
- Continuous display of the current in the most loaded phase and the earth current
- Recording of the values of the currents that caused the device to trip
- Storage of the number of openings caused by the device
- Event recording (storage of the previously described parameters in the last 5 tripping actions of the device) in a non-volatile memory
- On request, version with RS485 serial link, 4 wires - MODBUS RTU full duplex protocol
- 24…240 V AC/DC multi-voltage feeder.

Relay REF 601 is also available in a specific version, in accordance with standard CEI 0-16 (for the Italian market), with reference to the point where MV energy is delivered to the distribution user.

Relion® protection and control relays

The Relion® product family offers the widest range of products for the protection, control, measurement and supervision of power systems for IEC and ANSI applications – from generation and interconnected transmission grids over primary distribution to secondary distribution kiosks.

The Relion® protection relays are deeply rooted in ABB's vast experience of developing successful protection and control relays. These relays have been developed during many years and are built on the experience gathered from wide ranging application and functionality requirements of ABB's customers globally.
To ensure interoperable and future-proof solutions, Relion® products have been designed to implement the core values of the IEC 61850 standard.

The genuine implementation of the IEC 61850 substation modelling and communication standard covers both vertical and horizontal information exchange between protection relays and external systems.
The protection and control IED manager PCM600 provides versatile functionality throughout the life cycle of all Relion® protection and control relays. PCM600 is IEC 61850 compliant, which ensures smooth engineering of the relays and enables information exchange with other IEC 61850 compliant tools.
With these products, you benefit from ABB's leading-edge technology, global application knowledge and experienced support network.
The Relion technology is leading the way and setting the future trends in the field of protection and control systems.

Power and productivity
for a better world™

For your safety!

- Make sure that the room is suitable for the installation of electrical apparatus.
- Make sure that all the installation, putting into service and maintenance operations are carried out by skilled personnel with in-depth knowledge of the apparatus.
- Make sure that all the installation, service and maintenance operations comply with standard and legal requirements for constructing the installations in accordance with the regulations for safety in the workplace.
- Strictly follow this instruction manual.
- Make sure that the ratings are not exceeded while the apparatus is in service.
- Pay the utmost attention to the notes shown in the manual by the following symbol:

- Make sure that the personnel working on the apparatus have this manual to hand and all the information required for correct intervention.

Responsible behaviour safeguards your own and others' safety!

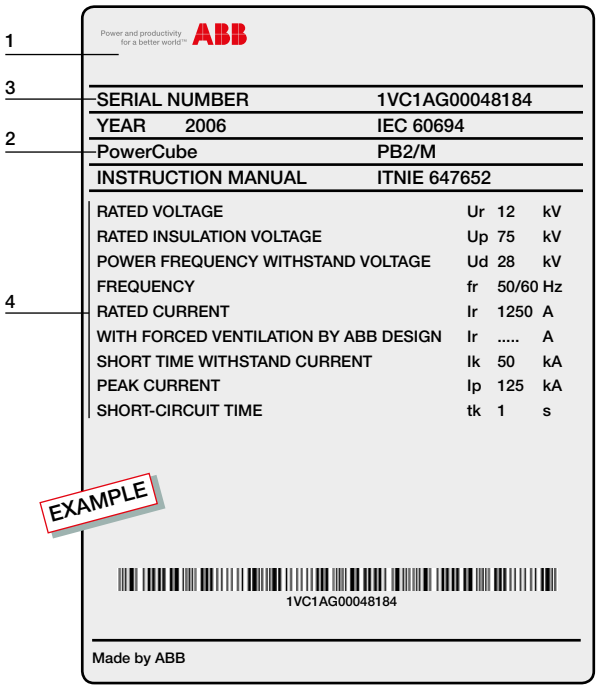
For any requests, place contact the ABB Assistance Service.

Introduction

The instructions in this manual refer to standardised PowerCube type medium voltage modules.
The instructions applicable to both the PowerCube PB/M modules and to the PowerCube PB/E enclosures will refer to these as PowerCube “Units”.
For correct use of the apparatus, please read the manual carefully.
PowerCube modules are designed for a large number of installation configurations.
However, they do allow further technical and constructional modifications to satisfy special installation requirements.
Consequently, the information given below may sometimes not contain instructions concerning special configurations requested by the customer.
Apart from to the manual, it is therefore always necessary to consult the latest technical documentation (circuit and wiring diagrams, foundation plans, any protection coordination studies, etc.), especially regarding any variants requested in relation to the standardised configurations.
For maintenance use only original spare parts. For any further information, refer to Technical Catalogue 1VCP000091.
For instructions regarding the apparatus (circuit-breakers, contactors …), refer to the relative instruction booklets.

1. Packing and transport

Follow the symbols and instructions shown on the packing carefully



The PowerCube modules are shipped complete with trucks (voltage transformers) inserted in the relative compartments, except where otherwise agree with
the customer.
Each module is packed according to the shipping and storage requirements of the customer.
Each module is protected by a plastic cover to prevent any water entering during the loading and unloading stages and to keep it free of dust during storage.
The vehicle to be used to transport must have a loading platform not higher than 1.5 m from the ground so as to come within the maximum height of 4 metres. The loading platform must be slip-proof with a high friction coefficient.
The modules must be placed on the transport vehicle platform back-to-back and transversely, placing materials between them suitable for absorbing any compression and to avoid any direct contact between the surfaces of the various groups.
Special longitudinal members must be placed on the platform to space each module and prevent it moving either longitudinally or transversely.
The modules must be anchored to the structure of the vehicle with ropes, so that there is not deformation and to prevent tilting on bends or in the case of sudden stops.
The transport vehicle must also have a tarpaulin cover over the whole load.
The resting points of the lifting means must have a specific capacity to ensure proper weight distribution.
To unload the modules, there must be an area at the same level and with dimensions not less than 3 x 2 m in front of the access to the warehouse or switchboard room.
See paragraph 4 for handling.
Small differences in level can be compensated with temporary structures made using wooden boards.
Unloading must be carried out with the utmost care using suitable lifting equipment.
Special attention must be paid and the specific risks analysed for working in areas with live overhead lines.

2. Control on receipt

- **While handling the unit do not put stress on the insulating parts.**
- **Before performing any operation make sure that the operating device springs are discharged and the apparatus is in the open position.**

On receipt, immediately check the packing and the state of the apparatus.
Open the packing as shown in para. 4., taking care not to damage its materials. Check that no damage has occurred during transport and make sure that the nameplate data (fig. 1) corresponds to what is specified in the ABB order acknowledgement and in the shipping note.
Should any damage or irregularity be found in the supply, immediately notify ABB (directly, through the agent or the supplier) and the carrier who delivered the goods.
Notification of any irregularity, even after receipt, must indicate the module serial number shown on the nameplate located on the module itself.
The modules are only supplied complete with the accessories specified at the time of ordering and confirmed in the order acknowledgement sent by ABB.
The documents enclosed in the shipping packing are:
– adhesive labels showing the addressee and product type;
– this instruction manual;
– the test report;
– the electrical diagram.

2.1. Nameplate data

Caption
1 Trade mark
2 Enclosure type
3 Serial number
4 Electrical characteristics
5 Standards

Fig. 1

3. Storage

- **Please contact ABB in case of special storage conditions.**
- **If the gas pressure of the circuit-breaker (due to the altitude) has been reduced for shipping purposes, the nominal value the SF6 level must be restored (see para. 12.2.2) with SF6 gas in compliance with CEI 10-7 and IEC 60376 Standards.**
- **Gas recovery must be carried out either by our personnel or suitably qualified customer personnel with in-depth knowledge of the apparatus.**

If the apparatus has to be stored before installation, on request suitable packing for the conditions specified can be provided.
On receipt, the module must be unpacked and checked as described in “Control on receipt” (chapter 2), and then put back in the packing again using the original materials.
PowerCube modules must be stored in a dry, dust-free, non-corrosive place, at a temperature ranging from – 5 °C to + 45 °C without significant changes. If this is not possible, store the modules in a well-ventilated room, cover them with tarpaulins or waterproof sheets (e.g.: polyethylene) and supply the anti-condensation heaters to prevent any condensation.
The package contains dehydrating bags that must be replaced every six months.
For special requirements, please contact us.

4. Handling

4.1. Modules/enclosures

Each unit is usually fixed onto a wooden platform.
Handling should preferably be carried out by means of bridge or mobile cranes. Otherwise, use rollers or fork lift trucks.
Weights and dimensions of the various sections are indicated in the shipping documents and on the plant drawings.

4.1.1. Handling

To handle the modules containing the apparatus (circuit-breaker, contactor or service truck), it is compulsory to use the proper lifting eyebolts.

4.1.1.1. Handling with bridge or mobile crane and unpacking

Handling the wood packing

Lifting by means of a crane must be carried out using the circular slings (1) (fig. 2).
The slings must be inserted according to the lifting symbols marked on the crate.
Weight and lifting opening angle must be taken into account when choosing the circular slings.

Unpacking

- Remove the nails and crate lid and sides;
- open the door of the units and loosen the screws fixing the module to the pallet (if present);
- lift the module by means of the crane following the instructions below;
- slide the pallet out from under the unit;
- position the unloading shims;
- lower the unit onto the shims using the crane.

Only use a suitable balance lifting system of the type shown in the picture.

After unpacking it, lift the unit by means of a crane, using the special eyebolts (1) (fig. 3) and the ropes fitted with safety spring catches, following this procedure:
- take hold of the lifting eyebolts by the handle (3);
- insert the hooking irons (5) in the slots (4) made on the side of the unit and marked with self-adhesive labels;
- push the lifting bolts against the module and make them slide upwards until the hooking irons (5) hit the top of the slot (4);
- fully tighten the positioning screw (6);
- hook the rope spring catches to the unit eyebolts and lift.

After installation, remove the eyebolts used for lifting by proceeding in reverse order.

Handling the unit in the wooden crate

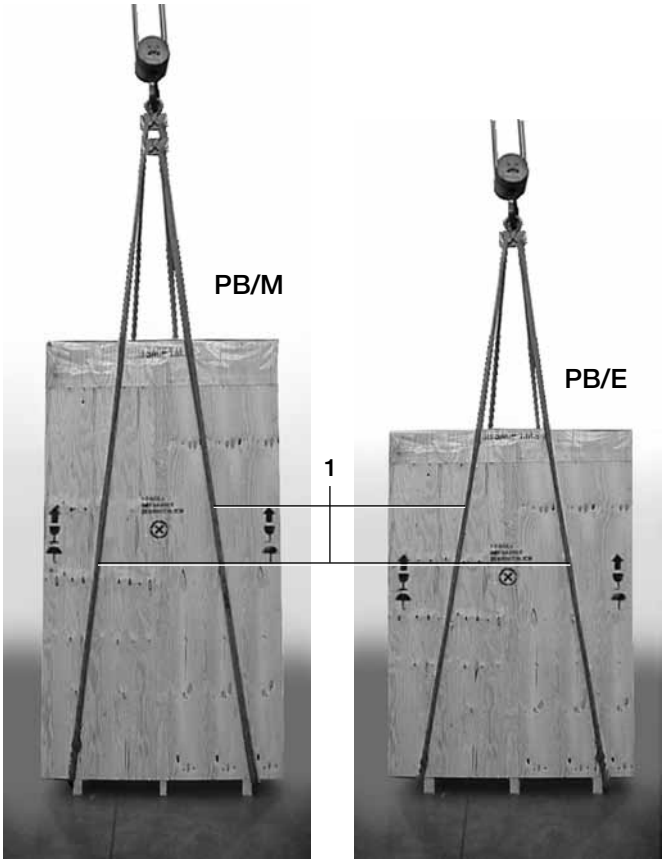


Fig. 2

Module handling

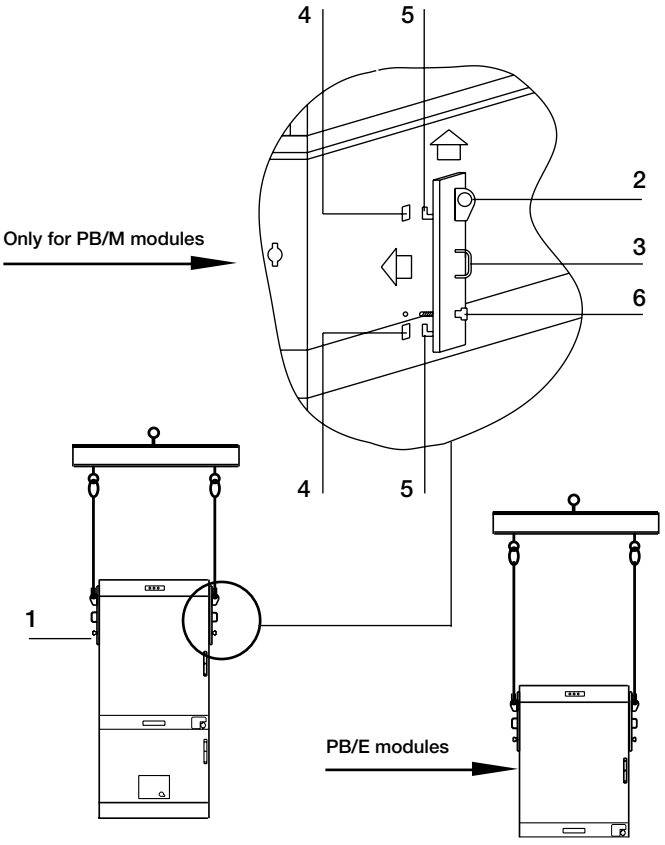

Fig. 3

4.1.1.2. Handling by means of rollers

- **The floor on which the rollers slide must be completely level.**
- **Move the module, avoiding any bumps which might turn it over.**

Lift the unit by means of a bridge or mobile crane or using jacks (fig. 3).
Remove the wooden pallet, loosening the screws fixing it to the switchboard section base.
Put a sturdy metal sheet between the rollers and the base of the units and place the unit on the sliding rollers (fig. 4).

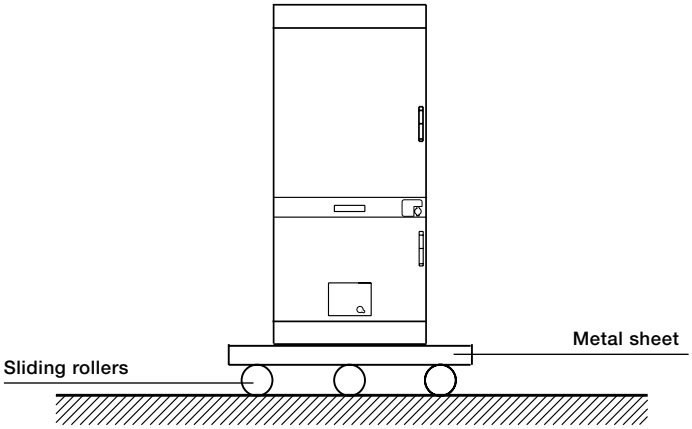

Fig. 4

4.1.1.3. Handling by means of transpallets or fork lift trucks

- **The floor on which the transpallets or fork lift trucks run must be completely**
- **Move the unit, avoiding any bumps which might turn it over.**

For greater stability, only lift the unit enough to allow handling.
Also check levelness of the forks.

Lifting a unit packed in a wooden crate.

4.2. Apparatus

The apparatus can be handled by means of cranes, fork lift trucks or using the special truck provided by ABB.
For each apparatus follow the instructions given in the relative booklet.

Unit handling.

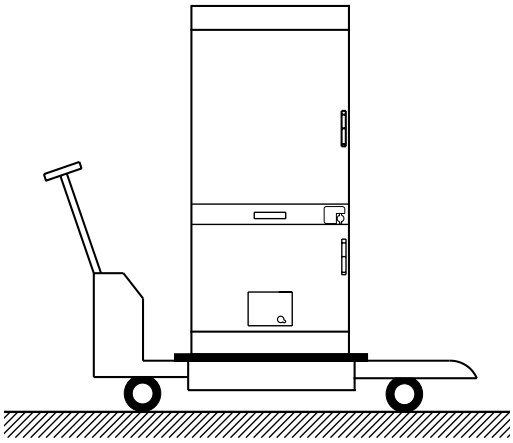

Fig. 5

5. Description

5.1. Unit construction features

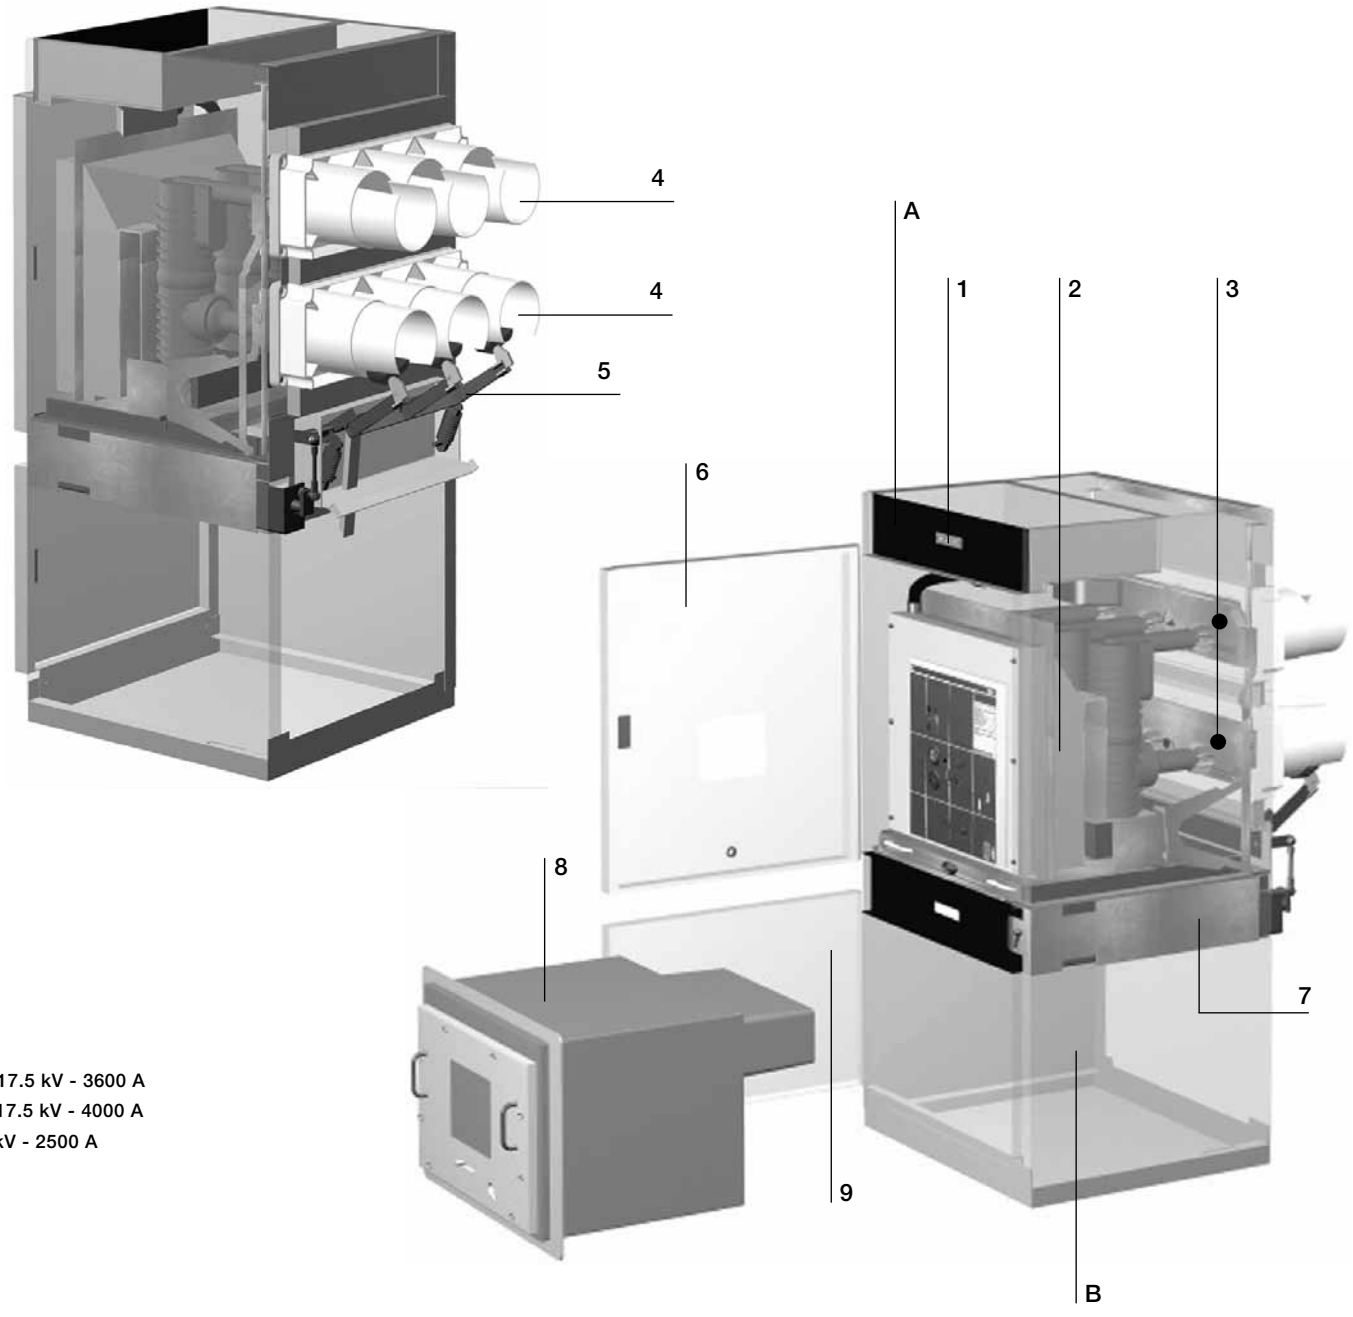
The PowerCube units allow MV metal-clad switchboards with metal enclosure to be built, suitable for indoor installation.
The PowerCube units are pre-assembled and tested in the factory.
The PowerCube units are suitable for all primary distribution requirements with service voltages up to 24 kV and can take on different configurations according to customer requests.
For the instructions regarding the apparatus please refer to the relative manuals.
All normal service operations are carried out from the front of the unit with the doors closed. The doors on the front only need to be opened for maintenance operations and replacement of spare parts.

The circuit-breaker unit can be fitted with withdrawable circuit-breakers or contactors.
The switchgears built up with Power Cube units can be installed against walls since they are fully accessible from the front for the operations, maintenance and installation operations.
The PowerCube units allow arc-proof switchboards to be constructed in compliance with the prescriptions of the IEC 62271 - App. AA Standards, class of access (A) criteria (1 - 5).

The PowerCube units are designed with the following degrees of protection:

Degree of protection with doors open	IP2X
Degree of protection on the external enclosure	IP4X

Each unit (fig. 6) is divided internally into a circuit-breaker compartment and a feeder compartment.



A Circuit-breaker compartment

W = Width of PowerCube unit.
P = Horizontal centre distance between circuit-breaker poles.
U/L = Distance between top and bottom terminal.
H = Distance between bottom terminal and earth.
Ø = Diameter of the contacts in the PowerCube unit monbloc.
(*) The PowerCube units are not prepared for application of the “motorised truck” for VD4 circuit-breakers
(1) 3600 A with fan pre-installed in the PB3 units. For 4000 A it is necessary to install another fan in the back of the switchgear (by the customer).
(2) 2500 A with fan pre-installed in the PB5 units.
(3) Please ask ABB for availability.

(2) For units PB/RE end for PB1/RM, the VT compartment is not available. Construction at customer care.

5.4. Main components

5.4.1. Switchgear

PowerCube units can be equipped with the following switchgear:
– HD4 series SF6 circuit-breaker;
– VD4 and VM1 series vacuum circuit-breaker;
– V-Contact series vacuum contactor;
– operational trucks.
The apparatus is always the withdrawable version, mounted on a truck that allows the following positions in relation to the compartment:

CONNECTED: – main and auxiliary circuits connected;
ISOLATED: – partially isolated with main circuits disconnected and auxiliary circuits (plug connector connected);
– totally isolated with main and auxiliary circuits disconnected, (plug connector withdrawn);
WITHDRAWN: – main and auxiliary circuits disconnected and apparatus racked out of the switchboard.

In the connected and isolated positions the apparatus remains in the unit with the door closed is visible through switchboard inspection window.
The apparatus is equipped with special locks, located on the front crosspiece which allow their hooking into the corresponding slots of the unit. The front hooking crosspiece also allows the connecting/isolating operation, with the door closed, by means of the special operating lever.
A lock prevents truck insertion into the switchboard (for example when the earthing switch is closed).
If the truck is in the indefinite position (between connected and isolated), the lock prevents both mechanical and electrical circuit-breaker closing.
The truck is equipped with a locking magnet which, if deenergised, prevents its operation.
The connector (plug) for connection of the operating mechanism electrical accessories comes out of the front protection of the apparatus.
The strikers for actuating the contacts (connected/isolated) located in the switchboard are fixed in the upper part of the apparatus.
The slides for activating the segregation shutters of the medium voltage contacts are placed on the sides of the apparatus.
Please refer to the relative instruction booklet for further details.

5.4.2. Earthing switch

The earthing switch (1) (fig. 8) with making capacity is placed in the rear part whereas the front houses the operating mechanism (2).
The switch position is indicated in the flange of the operating seat (2).

The certain position of the earthing switch is indicated by the graphic symbols at the operating seat (2). The position of the earthing switch is indicated by the yellow arrow made directly on the operating shaft (5).
For enclosures up to 17 kV and rated current up to 3150 A, or enclosures of 24 kV and rated currents up to 2000 A, the position of the earthing switch can be checked either by means of the indicator (3), located inside the enclosure and visible through the inspection window (4) positioned on the bottom front part of the unit.

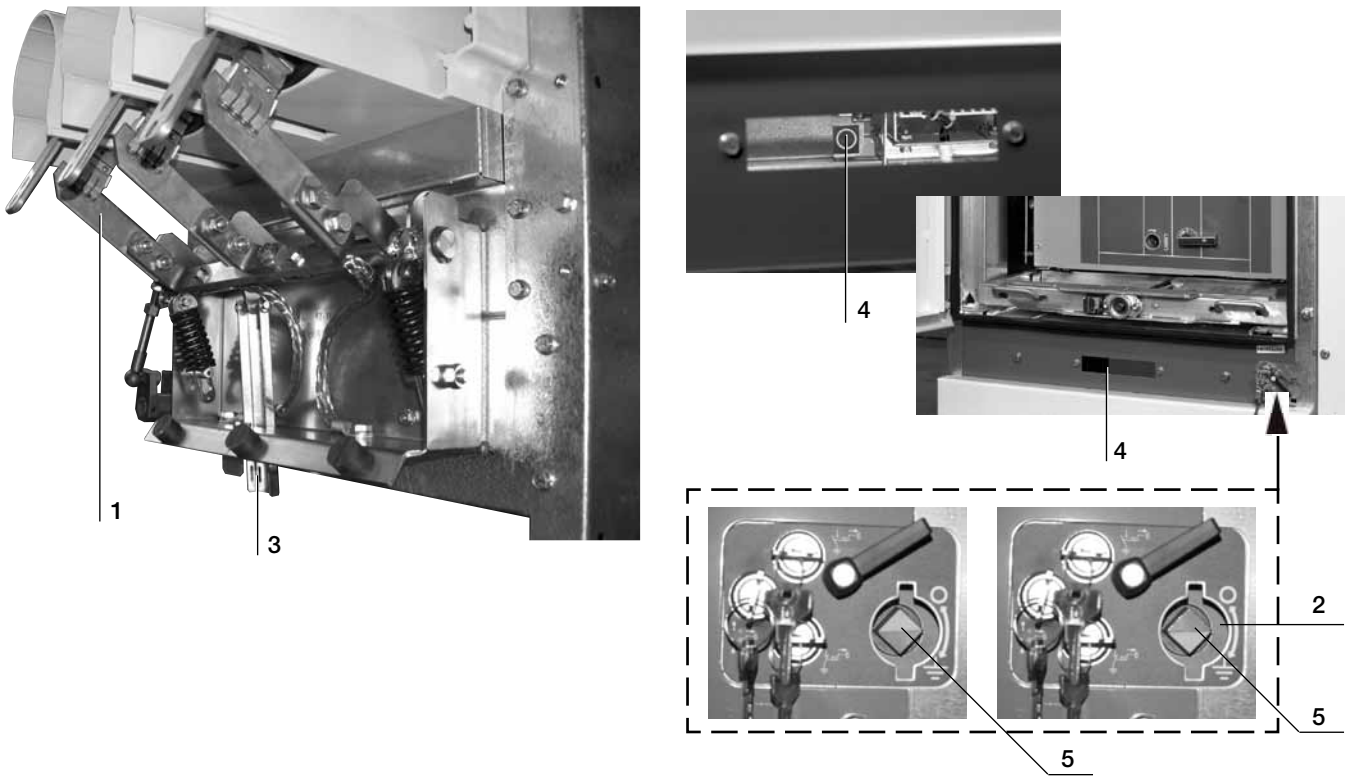

Fig. 8

5.4.3. Module units

5.4.3.1. Circuit-breaker and/or contactor unit

The parallelepiped metal structure is fitted with a front door and operating and control mechanisms on the external front side (fig. 9).
The apparatus must only be isolated and connected with the door closed.
The earthing switch control panel on the lower front part is fitted with:
– the earthing switch operating mechanism seat (10);
– the actuator (9) for operating the shutter (11) of the earthing switch operating mechanism seat;
– key lock with earthing switch open (8);
– key lock with earthing switch closed (12);
– key lock for preventing apparatus racking in (7).
The voltage indicator lamps (4) are mounted in the upper part of the unit (for PB/M only).
The door is fitted with:
– an opening-closing handle (5);
– an inspection window to see the apparatus position (3);
– a coupling (2) for the removable lever for apparatus racking in/ out with the door closed;
– screw for emergency unlock of the door lock (6).

The compartment houses the following components:
– truck guides (15);
– segregating shutters (18) of the fixed isolating contacts inside the monoblocks and the shutter operating mechanisms (16);
– socket for the mobile connector (22);
– mechanical lock (23) for preventing racking out of the auxiliary circuit connector when the circuit-breaker is connected;
– microswitch kinematics (21) for signalling circuit-breaker connected position;
– microswitch kinematics (24) for signalling the apparatus isolated position;
– mechanical lock for preventing either circuit-breaker racking in when the earthing switch is closed or earthing switch closing if the circuit-breaker is connected (27);
– on request, anti-condensation heater (25);
– on request, key lock for the earthing truck fitted with upper bushings (19);
– on request, earthing truck fitted with lower bushings (20);
– lock for preventing insertion of apparatus of different size than foreseen for the compartment (22).
The insulating monoblocks (14) for the power connections are on the rear of the compartment.

5.4.3.2. Feeder unit (PB/M-PB/RM units)

The feeder unit contains the earthing switch and relative auxiliary contacts. It allows access to the cable area working from the front.
The live components can be segregated by means of (fig. 10) earthing switch interlock (22) - in this case the door can only be opened when the earthing switch is closed.

Before accessing the cable terminals, make sure that the earthing switch position indicators (3) fig. 8, visible through the inspection window (4) and (5) fig. 8, visible from the operating seat of the earthing switch, confirm that closing has taken place.

5.4.3.3. VT unit and withdrawable truck (PB/M-PB/RM units)

The voltage transformer unit (fig. 11) consists of an enclosure (fig. 11d) where a withdrawable truck is inserted (fig. 11f), with the transformers on board (53) (fig. 11f) and the relative protection fuses.

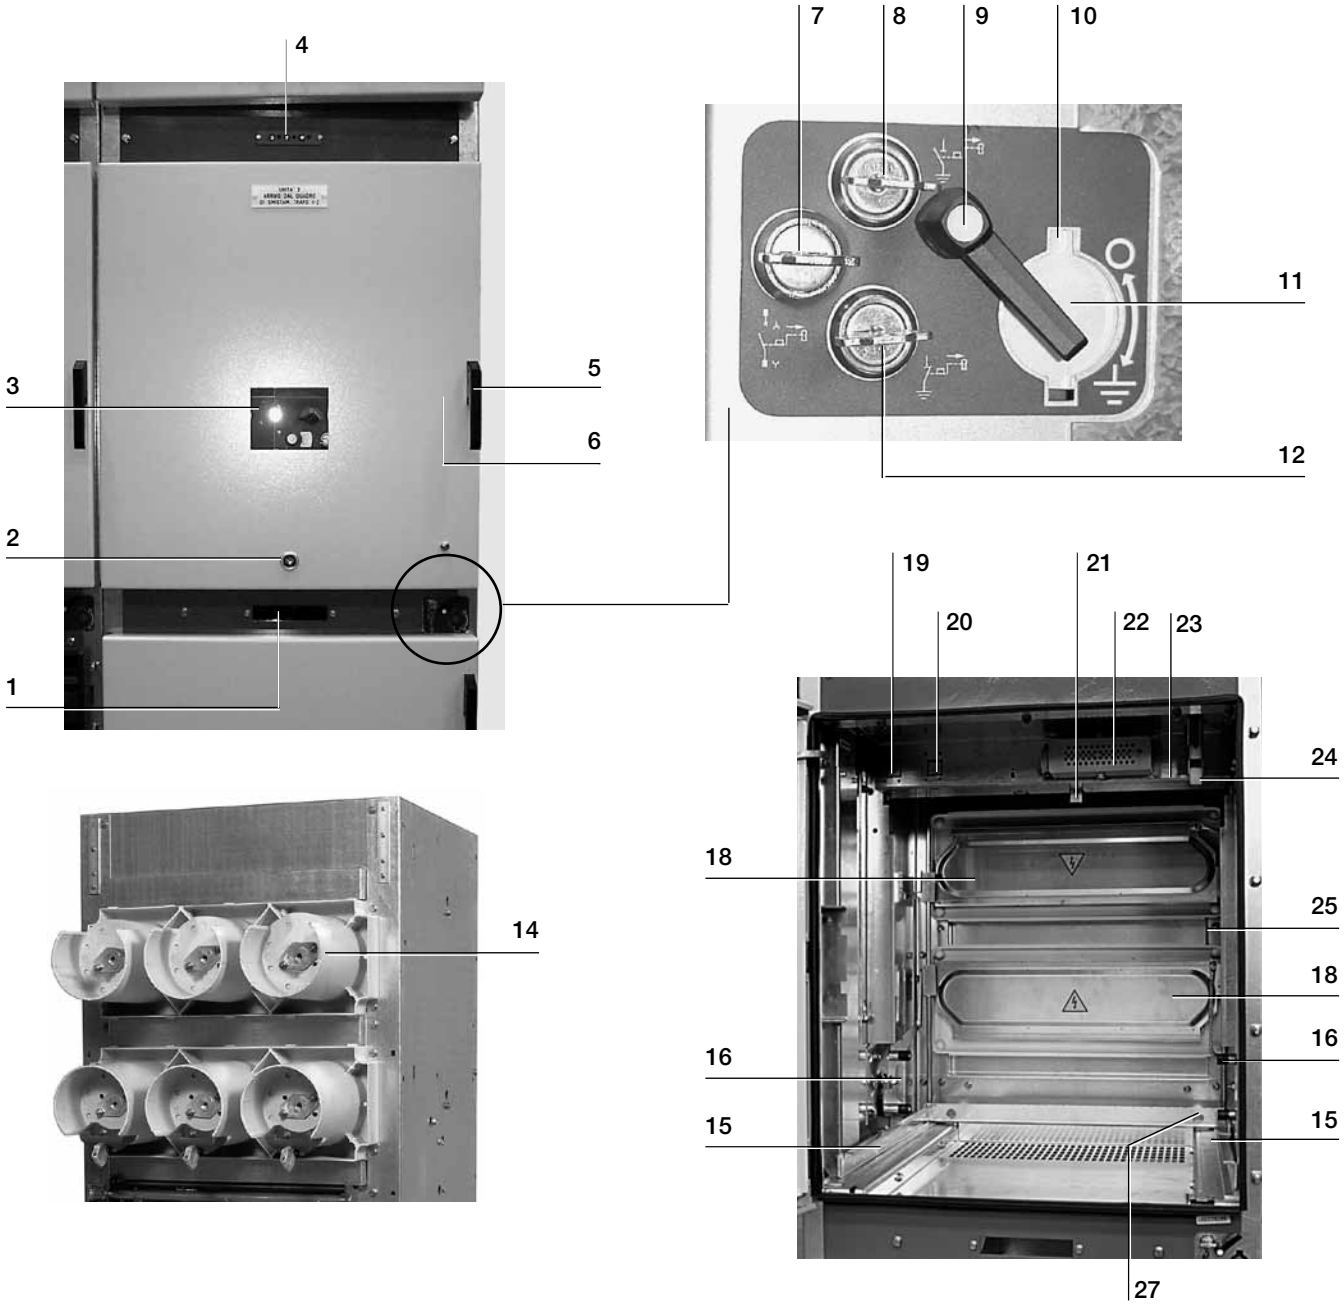

Fig. 9

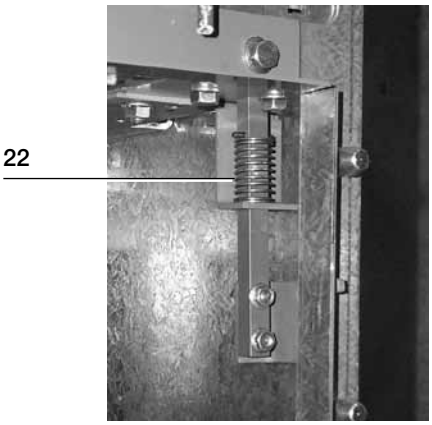

Fig. 10

The withdrawable truck (fig. 11f) can be fully withdrawn from the unit and allows safe fuse replacement.
A special metallic shutter (57) (fig. 11b) prevents contact with the medium voltage terminals when the truck is withdrawn.
The main measurement compartment features are:
– VTs mounted on a withdrawable truck inside the unit
– isolation of the VTs and relative fuses is by means of an operating handle outside the compartment;
– when the VTs are isolated the VT auxiliary circuits are also isolated automatically;
– travel of the VT truck automatically operates the metallic shutter;
– the fuses can be replaced opening the door, after VT isolation and its withdrawal from the compartment;
– the VTs can be replaced only after the truck is withdrawn from the compartment;
– on request, electrical signalling of VT inserted and withdrawn can be supplied.

The VT truck can take up the following positions:

INSERTED:	VT main and auxiliary circuits connected;
ISOLATED:	VT main and auxiliary circuits disconnected. The VT truck remains inside the compartment.
WITHDRAWN:	VT main and auxiliary circuits disconnected: VT truck withdrawn.

The voltage transformers insulated in resin for supplying power to instruments and protection devices, have the performances and precision classes normally provided by instrument transformer manufacturers. VT auxiliary circuits are connected by means of sliding contacts (58) (fig. 11c).
The cable area of wall-standing switchboards can be accessed by withdrawing the whole measurement compartment.

The following components are mounted in the VT compartment:

VT Compartment:

– door (41) (fig. 11a);
– operation sequence plate (42) (fig. 11a);
– operating seat of lever for VT truck racking in/out (43) (fig. 11a);
– truck guides (55) (fig. 11b);
– metallic shutter (57) (fig. 11b) for segregating the isolating contacts inside the monoblocks and segregation actuating kinematics (56) (fig. 11b);
– sliding contacts of the VT auxiliary circuits (58) (fig. 11c);
– contacts for signalling VT truck inserted (60) (fig. 11c);
– contacts for signalling VT truck isolated (61) (fig. 11c).

VT truck:

– actuator of the door closing bolt (45) (fig. 11d);
– operating seat of the racking in/out lever (46) (fig. 11d);
– pin for unlocking the door closing bolt (47) (fig. 11d);
– door closing screws (48) (fig. 11d);
– door locking bolt (50) (fig. 11e);
– pin plate for releasing the door closing bolt (49) (fig. 11e);
– voltage transformers (VTs) (53) (fig. 11f);
– left and right supplementary guides (52) (fig. 11f).

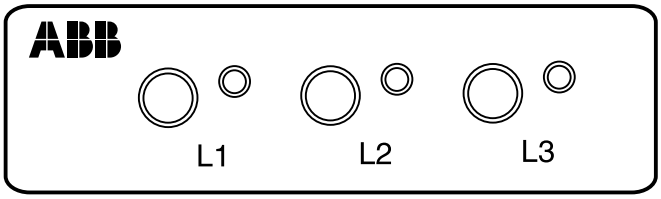
5.4.3.4. Voltage indicator and phase concordance device

- **Just indication of the device is not sufficient to prove that the system is out of service.**
- **Before accessing the indicator connections, make sure that the relative line is disconnected and the cables earthed.**



Voltage indicator

The voltage indicator (fig. 12) consists of capacitive dividers made of capacitors incorporated in insulators or in the CTs. They are connected to a device containing the signalling lamps and the bushings for checking phase concordance. The presence of voltage is indicated by the lamps either flashing or lit continuously.

Phase concordance checking device (on request)

The device consists of electronic apparatus with which phase concordance can be checked using the voltage indicator. The instructions are included in the kit.

Fig. 12

5.5. Interlocks/locks

- **The operations must be carried out using normal operating force (not more than 200 N) only using the special levers.**
  Should the operations be prevented, do not force the mechanical interlocks and check that the operations are correct.
- **The locks can be activated with a maximum force of 400 N, using the special operating tools.**

The locks used in the PowerCube units are mechanical and electrical with microswitches for circuit continuity or interruption.
The mechanical locks are divided into:
– force locks;
– prevention locks;
– electromechanical locks;
– safety locks (padlocks/keys).
PowerCube modules can be equipped with the locks shown in the following table.

Lock description	Apparatus (1)	Apparatus compartment	Feeder compartment PB/M-PB/RM	compartment PB/M-PB/RM
Electric lock to prevent apparatus closing when the truck is not in the connected/isolated position.	■ (fig. 13r - det. 44)			
Mechanical lock to prevent apparatus racking in/out in the closed position.	■			
Mechanical lock which prevents closing the apparatus when the truck is not in the racked-in and isolated positions.	■ (not available for VM1 and eVM1)			
Lock to prevent racking-in apparatus in an enclosure preset for another type or size of apparatus. The lock is located in the connector.	■ (fig. 13a - det. 4)	■ (fig. 13a - det. 4)		
Locking electromagnet on the apparatus truck to prevent racking-in/out without power.	■ (fig. 13r - det. 43)			
Electromechanical lock to prevent door opening if the apparatus is not in the isolated position.		□ (fig. 13c - det. 8)		
Mechanical lock to prevent apparatus racking-in with the door open.	□ (fig. 13q - det. 17)	□ (fig. 13d - det. 17)		■ (fig. 13m - det. 61)
Mechanical interlock with earthing switch: – the apparatus cannot be inserted when the earthing switch is closed; – the earthing switch cannot be closed when the apparatus is inserted or in the intermediate positions between connected and isolated.	■ (fig. 13n - det. 12) (fig. 13r - det. 12) ■ (fig. 13n - det. 60)	■ (fig. 13b - det. 12) ■ (fig. 13b - det. 12)		
Mechanical lock to prevent the manual opening of the shutters when the apparatus is withdrawn. (Fail-Safe).	□ (fig. 13n - det. 3) (fig. 13o - det. 3)	□ (fig. 13b - det. 3)		■ (fig. 11b - det. 56)
Key lock to prevent apparatus insertion. Only when the apparatus is in the isolated position can the lock be operated and the key released thus preventing apparatus insertion.	□ (fig.13n - det. 12) (fig. 13r - det. 12)	□ (fig. 13e - det. 35)		
Key lock with open earthing switch. It can only be operated when the earthing switch is open. The key can only be withdrawn with the lock activated.		□ (fig. 13e - det. 33)		
Key lock with closed earthing switch. It can only be operated when the apparatus is isolated and the earthing switch is closed. The key can only be removed with the lock activated.		□ (fig. 13e - det. 34)		
Padlock on the shutters in the closed position.		□ (fig. 13g - det. 52)		
Key lock to prevent placing the earthing truck in the switchboard.		□ (fig. 13a - det. 19)		
Mechanical lock to prevent the racking out of the auxiliarycircuit connector when the apparatus is connected and during apparatus racking in/out.		■ (fig. 13a - det. 20)		
Padlock for the door handles.		□ (fig. 13h)		
Earthing switch electromechanical lock to prevent earthing switch opening and closing once the coil (BED) is deenergised.		□ (fig. 13i - det. 53)		
Door lock with earthing switch open.			■ (fig. 13f - det. 22)

Coding the plug-socket connector of the auxiliary circuits

Coding the plug-socket connector of the auxiliary circuits allows the apparatus to be electrically combined with its panel.
For example, it only allows apparatus with different rated current to be combined with the panels they are destined for.
The operating mechanism cabling coding pins are inserted in the sockets, and must couple with the corresponding seats of the plug-socket connector.
Coding the plug-socket connector depends on the final configuration of the switchgear and must be carried out by the customer by closing the holes not used with the special plugs, according to the coding enclosed with this manual.

IEC 60470	for the contactor
IEC 60265-1	for the switch-disconnector
CEI EN 60529	degrees of protection for the housings Classification.

6. Instructions for operating the apparatus and operation sequence of the units

- **Do not remove the circuit-breaker covering panels; if necessary, keep a safe distance during apparatus opening and closing operations to avoid any contact with moving parts.**
- **The operations must be carried out with normal activating force (not more than 200 Nm), only using the special tools (see para. 6.1). Should they be prevented, make sure that the operating sequence is correct.**

Fig. 14

6.2. Apparatus racking in/out

- **Should any operation be carried out while the apparatus is withdrawn from the switchboard, pay the utmost attention to the moving parts.**
- **The apparatus must be inserted into the unit only in the open position; its racking in/out must be gradual, so as to safeguard the mechanical interlocks against any deforming impact.**

6.2.1. Apparatus (circuit-breakers and contactors)

The following instructions refer to HD4 circuit-breakers but they are valid for VD4 circuit-breakers and V-Contact contactors as well.

a) Racking in

(1) Switching from circuit-breaker withdrawn to “isolated” position

– lift the apparatus (2) (fig. 15a) and place it on the handling truck (1) (fig. 15a), following the instructions in par. 4.2. “Circuit-breaker handling by means of truck”;
– open the door of the circuit-breaker compartment;
– draw the truck close to the switchboard (fig. 15a);
– insert the hooking bracket (4) (fig. 44b - c), and block the wheels (3) (fig. 15a);
– release the circuit-breaker from the truck by moving the handles (5) at the same time (fig. 15d) towards the circuitbreaker centre axis and at the same time gradually pushing the circuit-breaker handles towards the back of the module until the circuit-breaker locks with the handles (5) (fig. 15e) clicking laterally, inserting themselves into the slots (6) (fig. 15b);
– unlock the wheels (3) (fig. 15a), lift the hooking bracket (4) (fig. 15f) and remove the truck from the switchboard.

Make sure that the handles have tripped sideways (horizontal locks of the truck inserted in the enclosure)

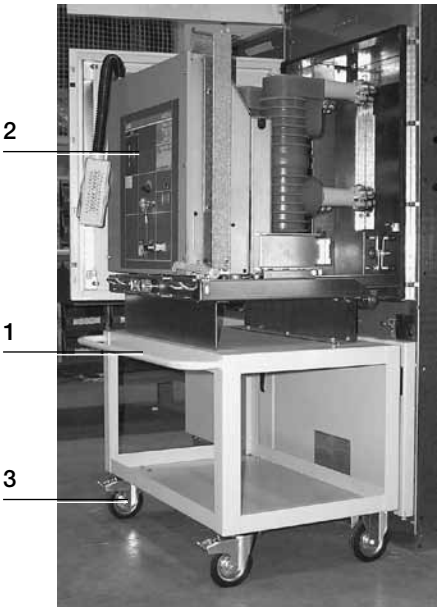

Fig. 15a

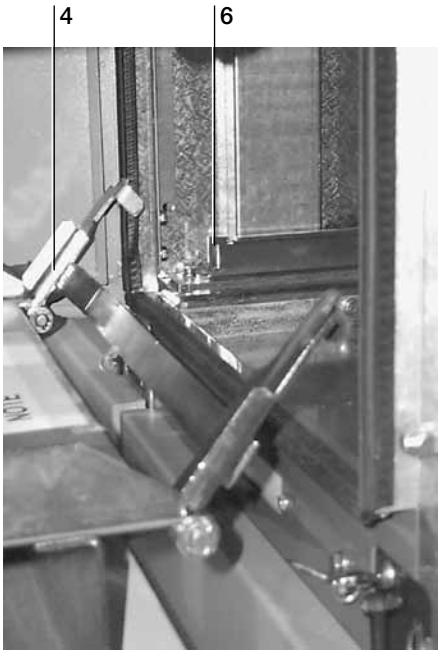

Fig. 15b

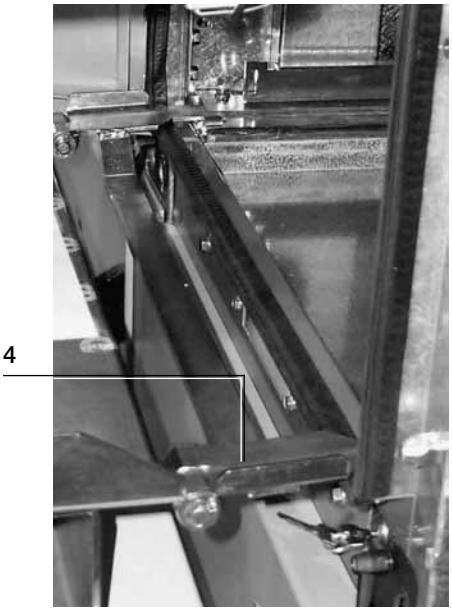

Fig. 15c

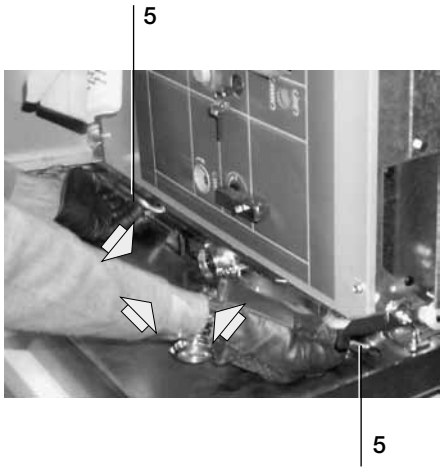

Fig. 15d

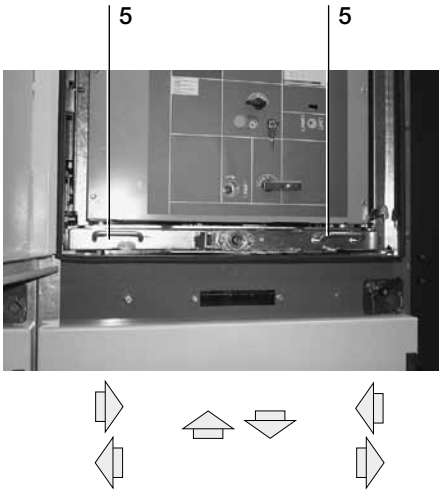

Fig. 15e

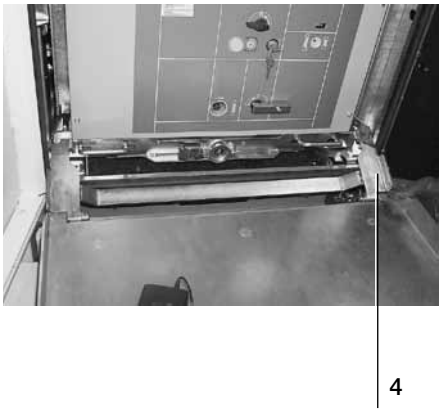

Fig. 15f

(2) Switching from “isolated” to “test” position (connection of auxiliary circuits).

– Insert and hook the mobile connector (1) (fig. 17) in the enclosure fixed socket (2) (fig. 16).

Make sure that the lever (3) (fig. 17) is fully pushed against the connector (1) (fig. 17).

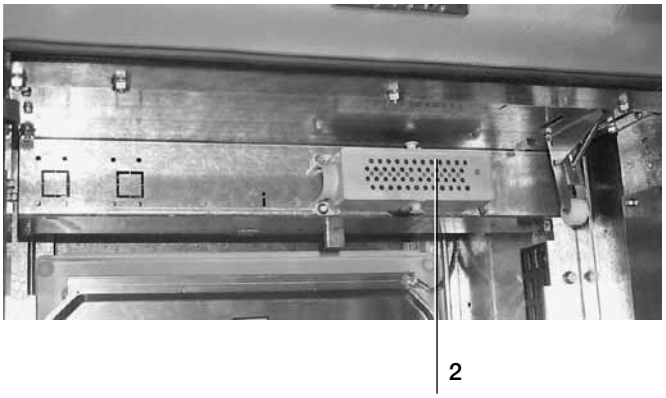

Fig. 16

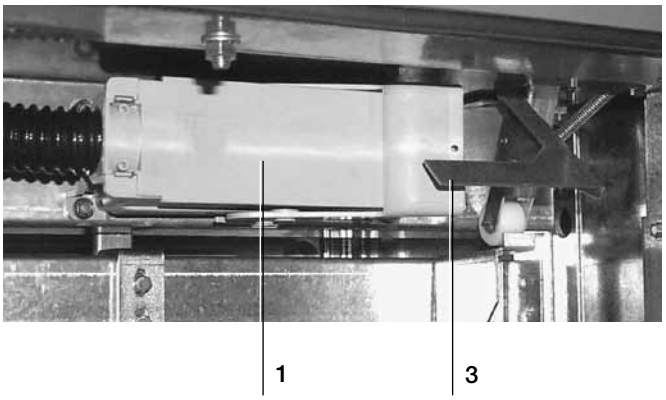

Fig. 17

(3) Switching from “test” to “connected” position (with earthing switch closed) (fig. 18)

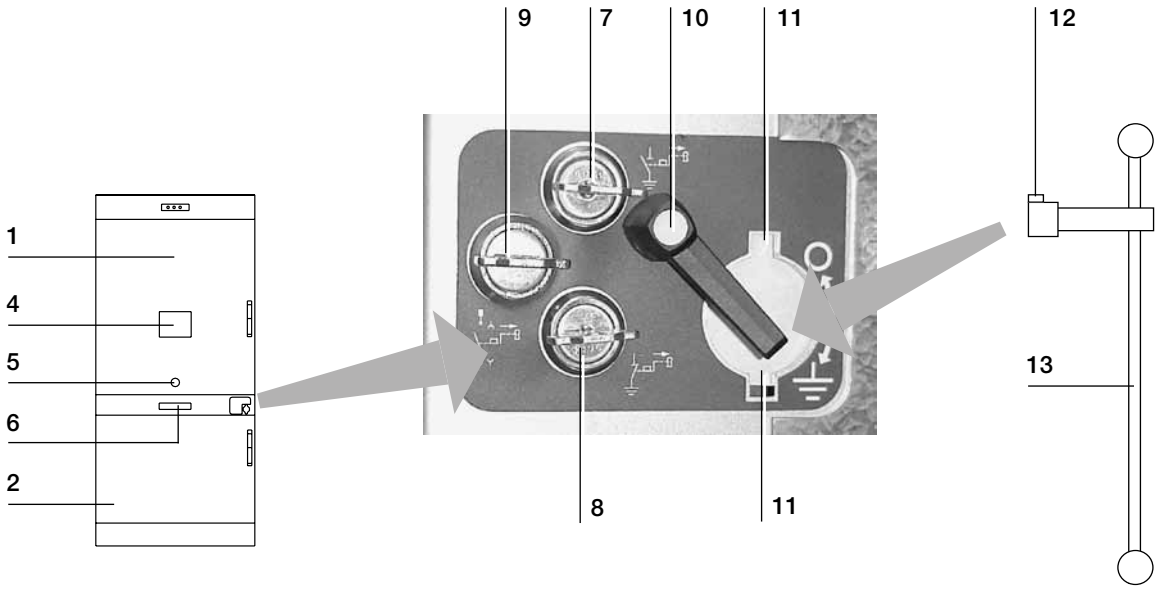
– close the circuit-breaker compartment door (1) pushing the handle downwards;
– close the feeder compartment door (2) pushing the handle downwards;
– make sure that:
  • the locking electromagnet of the earthing switch is energised (if supplied);
  • the key locks (7-8-9) are disabled, if supplied;
– insert operating lever (13) into the seat of the earthing switch making the raised piece (12) coincide with one of the two slots (11);
– open the earthing switch, turning the operating lever anticlockwise (13);
– withdraw the operating lever (13) from the earthing switch seat;
– through the inspection window (6) and/or the operating seat (2 - fig. 8) for version without forced ventilation make sure that the earthing switch is open (indicator in the “O” position);

Make sure that the feeder unit door (2) is locked (PB/M-PB/RM).

– close the cover of the earthing switch seat by turning the actuator (10) clockwise; this operation unlocks the circuit-breaker and trips a lock for preventing insertion of the operating lever into the earthing switch;
– make sure that the locking magnet on the circuit-breaker truck (if supplied) is energised and check that the key lock for preventing insertion (if supplied) is disabled;
– fully insert the operating lever of the circuit-breaker/truck (3) (fig. 14) in the corresponding coupling (5) and turn it clockwise until the circuit-breaker is fully connected;
– through the inspection window (4) make sure that the circuitbreaker is connected.

b) Racking out operation (only with circuit-breaker open)

(1) Switching from “connected” to “isolated for test” position (with circuit-breaker open) (fig. 18)



– through the inspection window (4) make sure that the earthing switch is open (indicator in the “O” position);
– fully insert the circuit-breaker truck/racking in/out lever (3) (fig. 14) in the relative coupling (5 - fig. 18) and turn it anticlockwise until the circuit-breaker stops;
– open the cover of the earthing switch operating seat by turning the actuator anticlockwise (10);
– insert the operating lever (13) in the earthing switch seat making the raised part (12) coincide with one of the two slots (11);
– close the earthing switch turning the operating lever clockwise;
– withdraw the operating lever (13) from the earthing switch seat;
– through the inspection window (6 - fig. 18) (for modules without forced ventilation) and the operating seat (2 - fig. 8) make sure that the earthing switch position indicator is in the “I” position showing closing;
– open the circuit-breaker compartment door (1) pulling the handle upwards.

(2) Switching from “isolated for test” to “isolated” position (auxiliary circuit disconnection)

– unlock the mobile connector (1) (fig. 17) and withdraw the latter from the enclosure fixed socket (2) (fig. 16);

(3) Switching from “isolated” to “withdrawn” position

– draw the truck close to the switchboard (fig. 15a);
– insert the hooking bracket (4) (fig. 15b-c) and block the wheels (3) (fig. 15a);
– move the two handles (5) (fig. 15d) at the same time towards the circuit-breaker centre and by means of the handles gradually pull the circuit-breaker outside on the truck;
– release the handles and continue withdrawal until the circuitbreaker stops (fig. 15a) and the handles trip sideways thus locking the circuit-breaker on the truck;
– unlock the wheels (3) (fig. 15a) and lift the hooking bracket (4) (fig. 15f);
– lift the hooking bracket (4) (fig. 15f) and remove the truck from the switchboard.

Caption of the earthing switch key locks

7 Lock with earthing switch open
8 lock with earthing switch closed
9 lock for preventing circuit-breaker insertion.

Fig. 18

6.2.2. VT unit (PB/M-PB/RM)

Putting the VT truck in and out of service must be carried out with the door closed

a) Racking truck into the unit

– open the unit door pulling the handle (3) (fig. 20m) upwards;
– insert the left and right additional guides (fig. 419a) in the lateral slots as in fig. 19b;
– lift the VT truck front part and insert the front wheels in the additional guides (fig. 19c);
– push the truck backwards, lift the rear part and insert the rear wheels in the additional guide slots (fig. 19d);
– push the truck backwards until it is blocked (fig. 19e);
– remove the left and right additional guides (fig. 19f);
– hook the door (fig. 20a) and insert the door earthing connection;
– tighten the door fixing screws (fig. 20b-fig. 20c);
– move the pin leftwards removing it from the slot of the operating lever (2) (fig. 20d);
– turn the lever of the door locking bolt clockwise (1) (fig. 20d);
– close the compartment door pushing the handle (3) (fig. 20e) downwards.

b) Truck racking out operation (with compartment unit deenergised)

– open the unit door pulling the handle upwards (3) (fig. 20e);
– move the pin rightwards to unlock the closing bolt of the VT truck front door (2) (fig. 20d);
– turn the actuator anticlockwise to lock the door bolt (1) (fig. 20d);
– loosen the door fixing screws (fig. 20b);
– remove the door (fig. 20a);
– insert through the inspection window (6) make sure that the earthing switch position indicator is in the “I” position showing closing; the left and right additional guides (fig. 19a) into the slots (fig. 19b);
– pull the truck outside until it is blocked;
– lift the truck rear part and remove the rear wheels from the additional guides (fig. 19c);
– pull the truck outside until it is blocked;
– lift the VT truck front part and remove the front wheels from the additional guides (fig. 19c);
– remove the left and right additional guides (fig. 19f);
– close the compartment door pushing the handle (3) downwards (fig. 20e).

Note

Use a lifting truck (fig. 20i), always positioning and moving the VT truck in the rotated position indicated in fig. 20m.

6.3. Disabling the apparatus unit door lock

Skilled personnel with suitable knowledge of the apparatus and installation must carry out this operation only in case of emergency.

Should the door lock of the apparatus unit be activated and the switchboard door must be unlocked, loosen the screw (1), insert a 2-3 mm diameter rod in the hole, push the lever (2) and at the same time open the door, pulling the handle upwards.

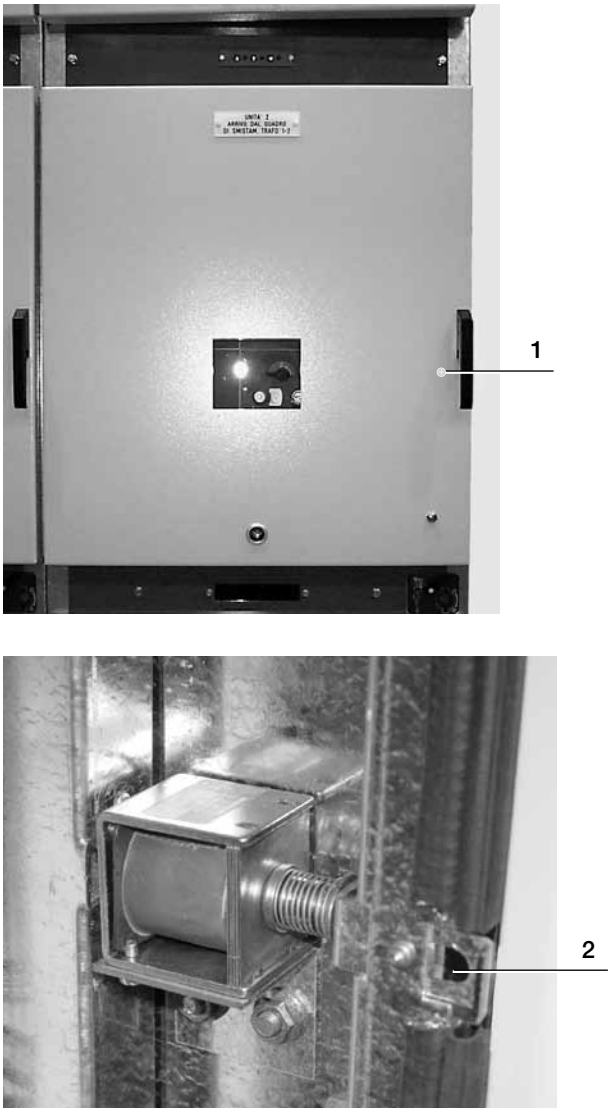

Fig. 21

6.4. Operating the apparatus

6.4.1. Earthing switch

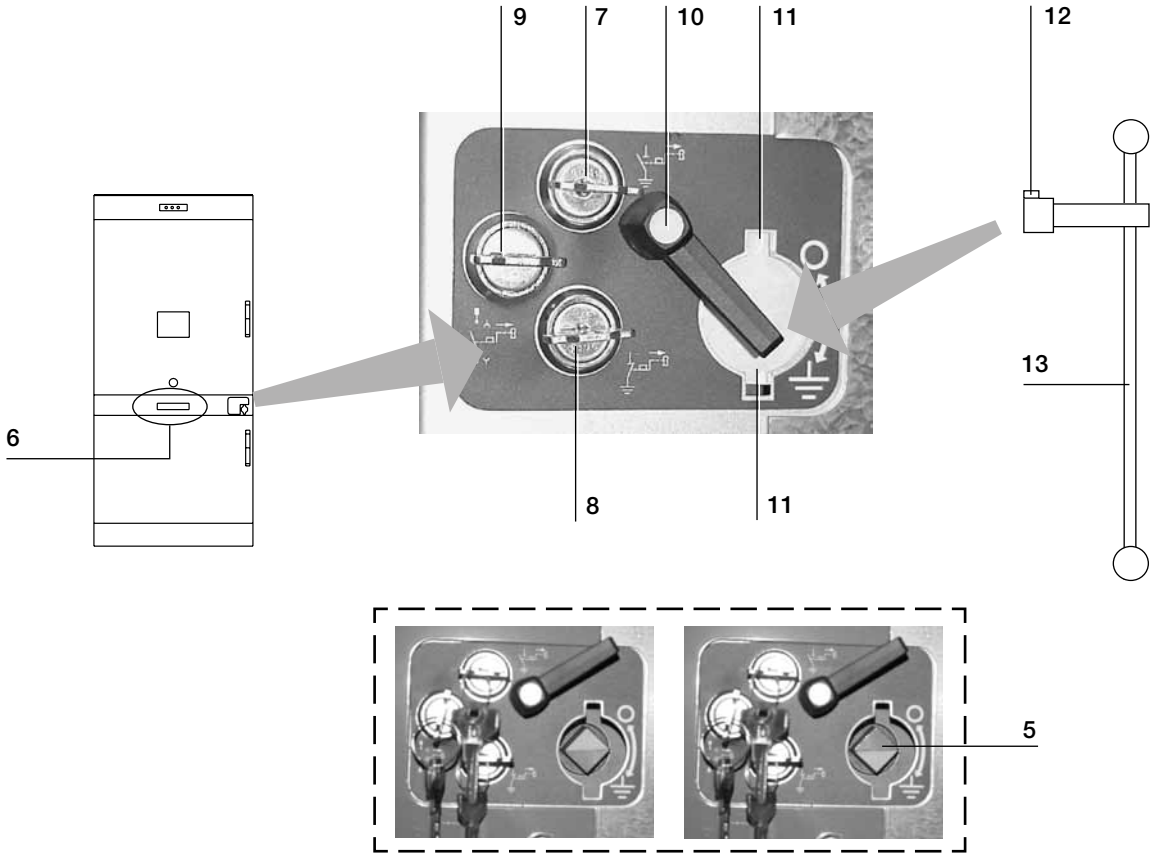
- **Make sure that the earthing switch key locks (if supplied) are disabled and that the electromagnetic lock of the earthing switch (if supplied) is energised.**
- **The earthing switch can only be operated with the circuit-breaker in the isolated or withdrawn position.**
- **Once started, the operations must be completed.**

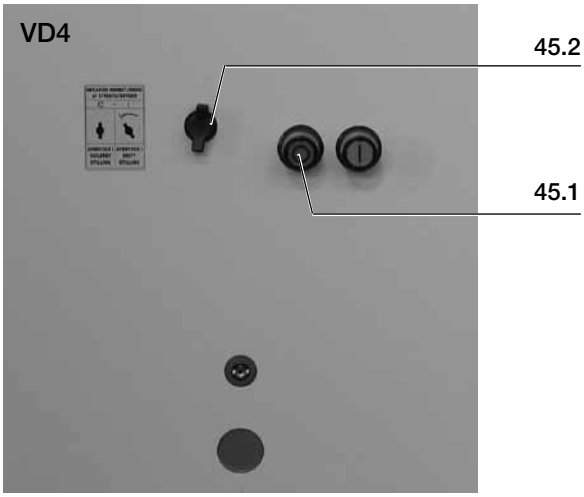
Closing (fig. 22)

– Make sure that the circuit-breaker is either in the isolated or withdrawn position;
– open the cover of the earthing switch operating seat by turning the operating actuator (10) anticlockwise; the earthing switch operating seat is freed;
– insert the operating lever (13) in the earthing switch seat making the raised part (12) coincide with one of the two slots (11);
– close the earthing switch by turning (13) the lever clockwise;
– remove the operating lever;
– check on the operating seat (5) and through the inspection window (6) (version without forced ventilation) that the earthing switch is closed (indicator in the "⏚" position).

Opening

– Insert the operating lever (13) in the earthing switch seat making the raised part (12) coincide with one of the two slots (11);
– open the earthing switch turning the operating lever anticlockwise (13);
– remove the operating lever (13) from the earthing switch seat;
– through the operation seat (5) and the inspection window (6) (version without forced ventilation) make sure that the earthing switch is open (indicator in the "O" position);
– close the cover of the earthing switch turning the actuator (10) clockwise; the circuit-breaker is thus unlocked while a lock for preventing operating lever insertion into the earthing switch is activated.





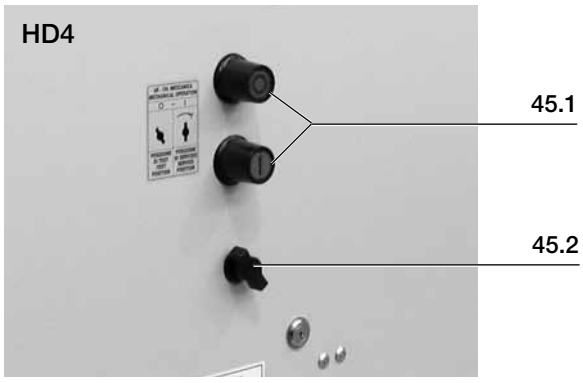


Fig. 22

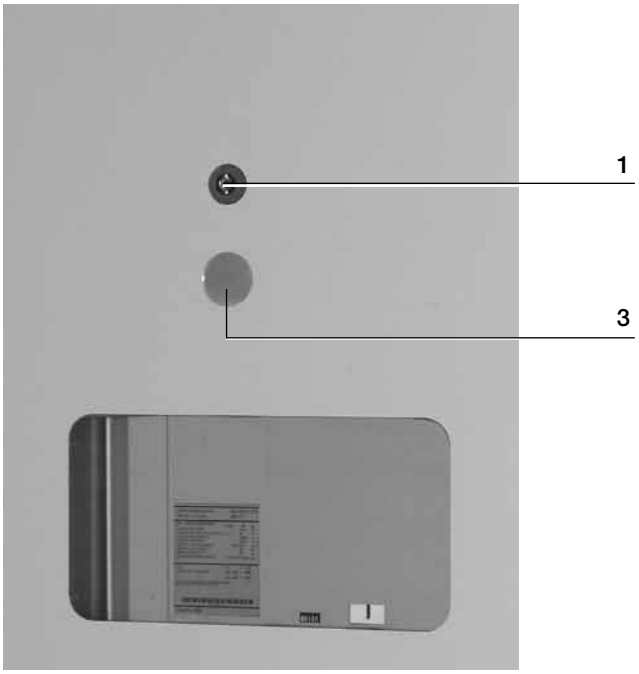
6.4.2. Operation of HD4 - VD4 circuit-breakers with the door closed (application on request) (PB/E)

For operation of the apparatus, please also refer to the relative instruction manuals.
Pushbutton for circuit-breaker opening and closing operation with the door closed (on request). If the circuit-breaker is in the service position, the operation is carried out by rotating the knob 45.2 which takes the extension of operating rod 45.3 into position, allowing the operation by means of pressing the mechanical opening and closing pushbuttons (45.1).



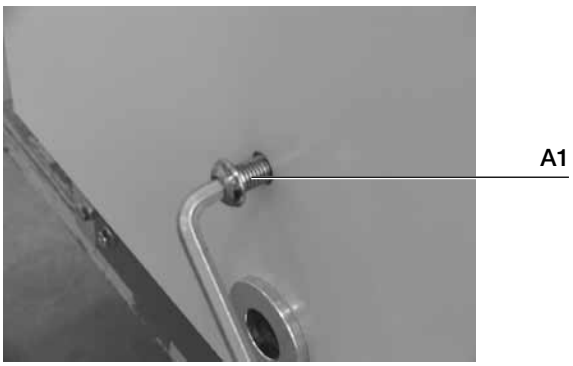
6.4.3. Emergency opening of VM1 circuit-breakers with the door closed

For operation of the apparatus, please also refer to the relative instruction manuals.

Opening due to fault on the auxiliary feeder:
– electrical opening is still possible within the first 200 s;
– after a period of 200 s, manual emergency opening is necessary.

Turn the small handle 1 to free the operating seat; insert operating lever 2 in the special opening so as to insert it in seat 3 and turn lever 2 until the apparatus opens.

Just before reaching the run end, a little resistance on the emergency shaft must be overcome.



6.4.4. Emergency opening of VSC/P contactors with the door closed

For operation of the contactors, please also refer to the relative instruction manuals.
Unscrew screw A1 on the door using an 8 mm socket head wrench or the emergency operating lever of the contactor. Put the screw in a safe place and put the operating lever into the opening left by the screw (A1.1) inserting it in the special opening A2 on the contactor shield.
Turn the lever clockwise until the apparatus opens. Once opening has taken place, withdraw the lever and screw up the dome-headed screw on the door again.

CAUTION!
– Do not screw up the closing screw A1 – this would jeopardise the arc proofing of the door.

6.4.5. VT unit (PB/M-PB/RM)

Putting the VT truck in and out of service must be performed with door closed.

a) Putting into service

– Insert the operating lever (1) (fig. 23b) into the seat (2) (fig. 23a) making the raised piece (2) (fig. 23b) of the lever coincide with the slot (3) (fig. 23a);
– turn the lever clockwise (fig. 23c) and push hard until it is fully inserted;
– from the inserted position, turn the lever anticlockwise until the reference indicators coincide (4) and the operating lever is coupled (fig. 23d);
– make sure that by pulling the handle upwards the door does not open (fig. 23e).

b) Putting out of service

– Turn the lever (1) in fig. 23d clockwise and pull it outwards until the isolated position click;
– withdraw the operating lever (1) (fig. 23b) from the seat (fig. 23a) making the raised piece (2) (fig. 23b) of the lever coincide with the slot (3) (fig. 23a);
– open the door pulling the handle upwards. In this condition the VT truck is isolated and earthed and the VT auxiliary circuits are also isolated.

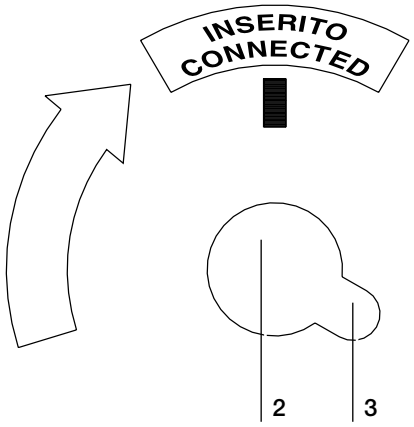


Fig. 23a

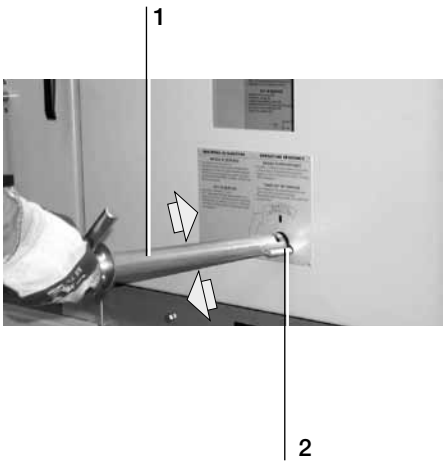

Fig. 23b

Fig. 23c

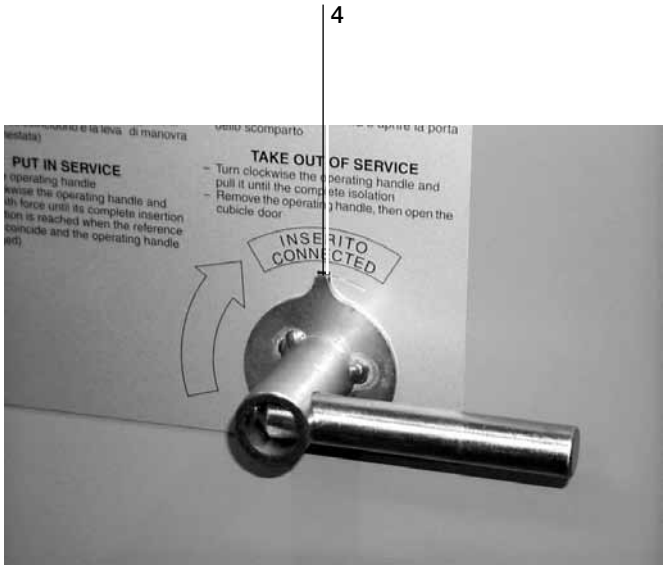

Fig. 23d

Fig. 23e

7. VT fuse replacement (PB/M-PB/RM)

- **All the operations below must only be carried out by qualified and skilled personnel with in-depth knowledge of the apparatus.**
- **Make sure that the rated normal current value of the fuses to be installed is the same as the one shown on the fuse-holder nameplate.**
- **Only use fuses indicated by ABB.**

Procedure

– Open the unit door pulling the handle (3) (fig. 24a) upwards;
– move the pin (2) (fig. 24q) right so as to unlock the closing lock bolt of the VT compartment door;
– turn the actuator of the door locking bolt anticlockwise (1) (fig. 24q);
– loosen the door fixing screws (fig. 24c);
– remove the door (fig. 24d);
– insert the left and right supplementary guides (fig. 24e);
– pull the truck outwards until it is blocked (fig. 24f);
– turn the fuse contact ring nut (fig. 24g) clockwise and remove it;
– remove the fuse and replace it (fig. 24h);
– insert the ring nut and turn it anticlockwise (fig. 24i);
– push the VT truck backwards until it is blocked (fig. 24l);
– remove the left and right supplementary guides (fig. 24m);
– hook the door (fig. 24n) and insert the door earthing connection;
– tighten the door fixing screws (fig. 24o - fig. 24p);
– move the pin leftwards thus freeing the coupling slot of the operating lever (2) (fig. 24q);
– turn the actuator of the door locking bolt clockwise (1) (fig. 24q);
– close the compartment door pushing the handle (3) (fig. 24a) downwards.

8. Installation

8.1. General information

- **Correct installation is of paramount importance. The instructions given by the manufacturer must be thoroughly studied and followed.**
- **Installation must be carried out by skilled personnel with in-depth knowledge of the apparatus.**
- **It is advisable to wear gloves for handling the components.**
- **Before removing the operating mechanism cover make sure that the circuit-breaker is open and the closing springs discharged.**

8.2. Normal installation room conditions

Maximum air temperature	+ 40 °C
Minimum air temperature	– 5 °C
Relative humidity	% ≤ 95
Altitude	≤ 1000

For shipping reasons, the gas pressure in the HD4 circuit-breakers can be reduced. In this case, before putting the apparatus into service recover the pressure using SF6 gas in compliance with the CEI 10-7 - IEC 60376 Standards.
Filling with gas must be carried out by ABB personnel or by suitably qualified customer personnel with indepth knowledge of the apparatus.

For any special conditions, please contact us.
For other installation room characteristics, please refer to the product standards (IEC 60694).
For any special conditions, please contact us.

8.3. Foundations and fixing surface (PB/M-PB/RM)

The floor or the foundation must be strong enough to bear the weight of the module (plus all the apparatus) without any deformation.
The general foundation drawing is shown in fig. 25a.
The switchboard can be fixed (fig. 25b) either to the floor or to special base irons (supplied on request):
– for floor fixing put the expansion and anchoring bolts in the fixing holes;
– special bolt blocks are supplied for base iron fixing. The base irons must be fixed and buried in concrete.

The base of each module is prepared with four fixing holes. For switchgear positioning, the planarity of the fixing surface must be checked, with special attention paid to longitudinal levelling (maximum planarity: 2/1000).

8.3.1. Module fixing systems (fig. 25b)

Fixing with base irons and masonry floor

The base irons, which can be supplied on request, must be installed in the slab before finishing the floor:
– rest the irons on the floor and line them up so that they are parallel and are spaced from each other as shown in the foundation drawing;
– level the irons both longitudinally and transversally;
– fix the base irons in this position with expansion anchor bolts, using the holes provided in the irons;
– complete the flooring so that the base irons extend out at least 0.5 mm from the finished floor surface.

Fixing to floor with anchoring and masonry floor

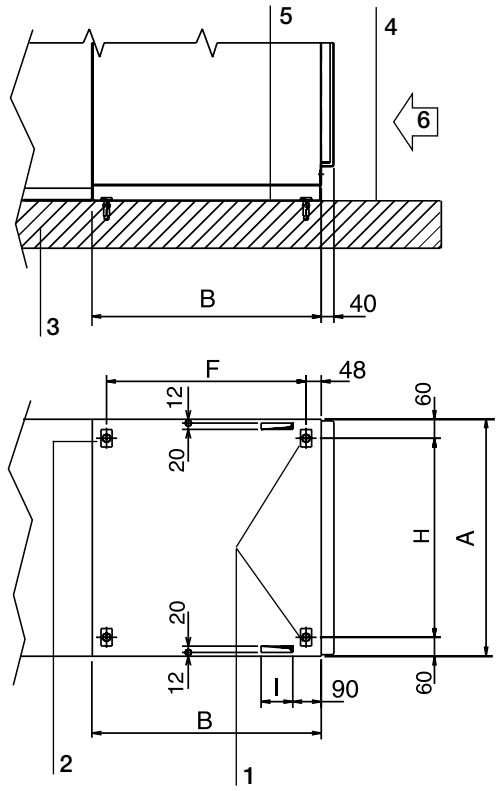
Procedure

– Clean the installation area;
– on the slab, visibly trace the perimeter of all the cubicles making up the switchboard, taking the minimum wall and obstacle clearances into account;
– level the floor both longitudinally and transversally;
– drill the floor at the fixing points foreseen, referring to our slab drilling drawings. To make the holes, use a hammer drill with a Ø = 16 mm bit;
– insert the expansion anchoring bolts in the holes.

Fixing to a floating floor

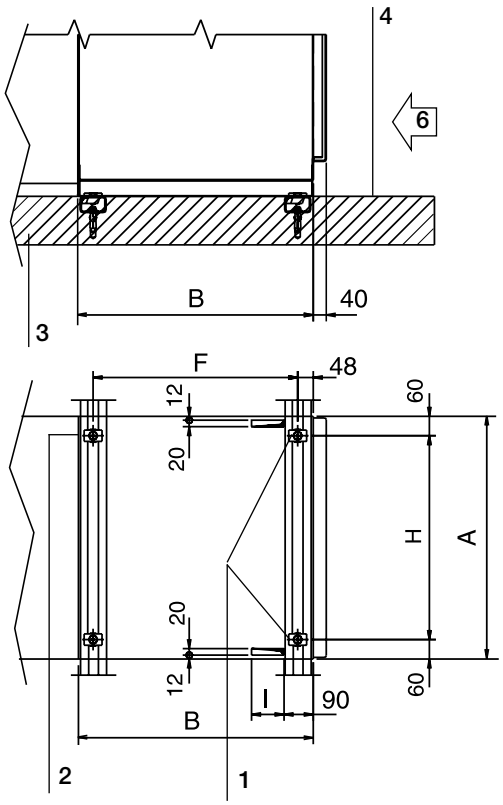
Procedure

– Clean the installation area;
– on the slab, visibly trace the perimeter of all the cubicles making up the switchboard, taking the minimum wall and obstacle clearances into account;
– drill the floor at the fixing points foreseen, referring to our slab drilling drawings. To make the holes, use a drill with a suitable bit for the type of fixing to be made (through or threaded hole).



8.4. Tightening torque

The screw and nut tightening torque values for fixing and coupling switchboards and busbars are given in the table below.



Nut or screw	Tightening torque (Nm)		Key for exhagonal nut or screw
	Acc. 4.8	Acc. 8.8	
M3	0.5	1.2	5.5
M4	1.1	2.7	7
M5	2	5	8
M6	3.7	9	10
M8	9	22	13
M10	18	45	17
M12	30	75	19
M16	75	185	24
M18	104	260	27
M20	148	370	30

Foundations

Version with anchoring bolts

Version with base irons

Module	A	B	F	H	I
12-17.5 kV	600	723	630	480	200
	750	723	630	630	200
	1000	723	630	880	200
24 kV	750	873	770	630	200

8.5. Access from the front to the cable connection area (PB/M)

8.5.1. Access through the feeder unit

Circuit-breaker racking out

Follow the instructions given in para. 6.2.

Dismantling the panels

Disconnect the fan power supply in the case of units with forced ventilation.

Procedure

– Loosen the fixing screws of the front panel (fig. 26a)
– loosen the two fixing screws (right side) of the circuit-breaker compartment panel (fig. 26b)
– loosen the two fixing screws (left side) of the circuit-breaker unit panel (fig. 26c)
– lift and remove the circuit-breaker unit panel (fig. 26d)
– access the cable connection area of the unit (fig. 26e).

8.5.2. Access through the VT unit

Racking the VT truck out

Follow the instructions in para. 6.2.

VT compartment dismantling

– Loosen the fixing screws (right and left side) of the VT unit (fig. 27b-27c);
– move the guides (right and left) against the switchboard walls (fig. 27d);
– loosen the panel fixing screws on the switchboard base (fig. 27e).
– loosen the fixing screws of the VT unit base (fig. 27f-27g);
– withdraw the VT unit as in fig. 27h;
– position the VT unit as in fig. 27i.

8.5.3. Connection of the lower terminals for units with earthing switch (with and without CT).

The PowerCube units are preset for connection of the CTs between the A and C contacts of the lower terminals.
If this is not done, connect contacts A and C to each other using a conductor with the same cross-section as the one in detail C.
In both cases, the connection must be made - by the customer - respecting the geometry indicated in the figure so that the making capacity of the earthing switch is guaranteed.

Caption
A = Lower terminal
B = Insulating support
C = Fixed contact

Fig. 27I

8.6. Hints on constructing switchgear units with 4000 A rated current

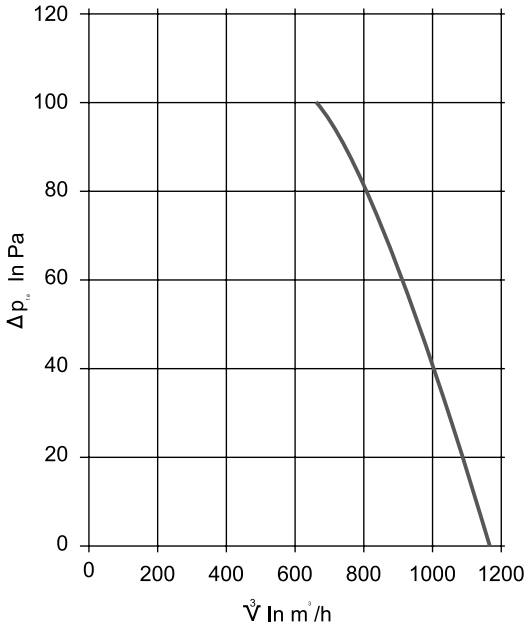
The PowerCube modules are provided for rated currents up to 3600 A, but can also be used to construct switchgear units with rated current up to 4000 A.
This can be done thanks to applying a special fan in the rear part of the unit.
The characteristics of the fan used are listed below. This fan can be ordered as an accessory for the 3600 A enclosure. Assembly is to be carried out by the customer. In any case, certification of the completed switchgear remains the responsibility of the customer.

Fan characteristics

			50 Hz	60 Hz
Frequency	f	Hz	50	60
Rated voltage	U	V	230	230
Power consumption	P_1	W	270	280
Speed	n	min^{-1}	2470	2600
Capacity	C	µF	6	6
Max air volume	V	m^3/h	1180	1240
Minimum pressure			80Pa	80Pa

Performance curve

We suggest putting the fan in the position shown in the figure 28b.



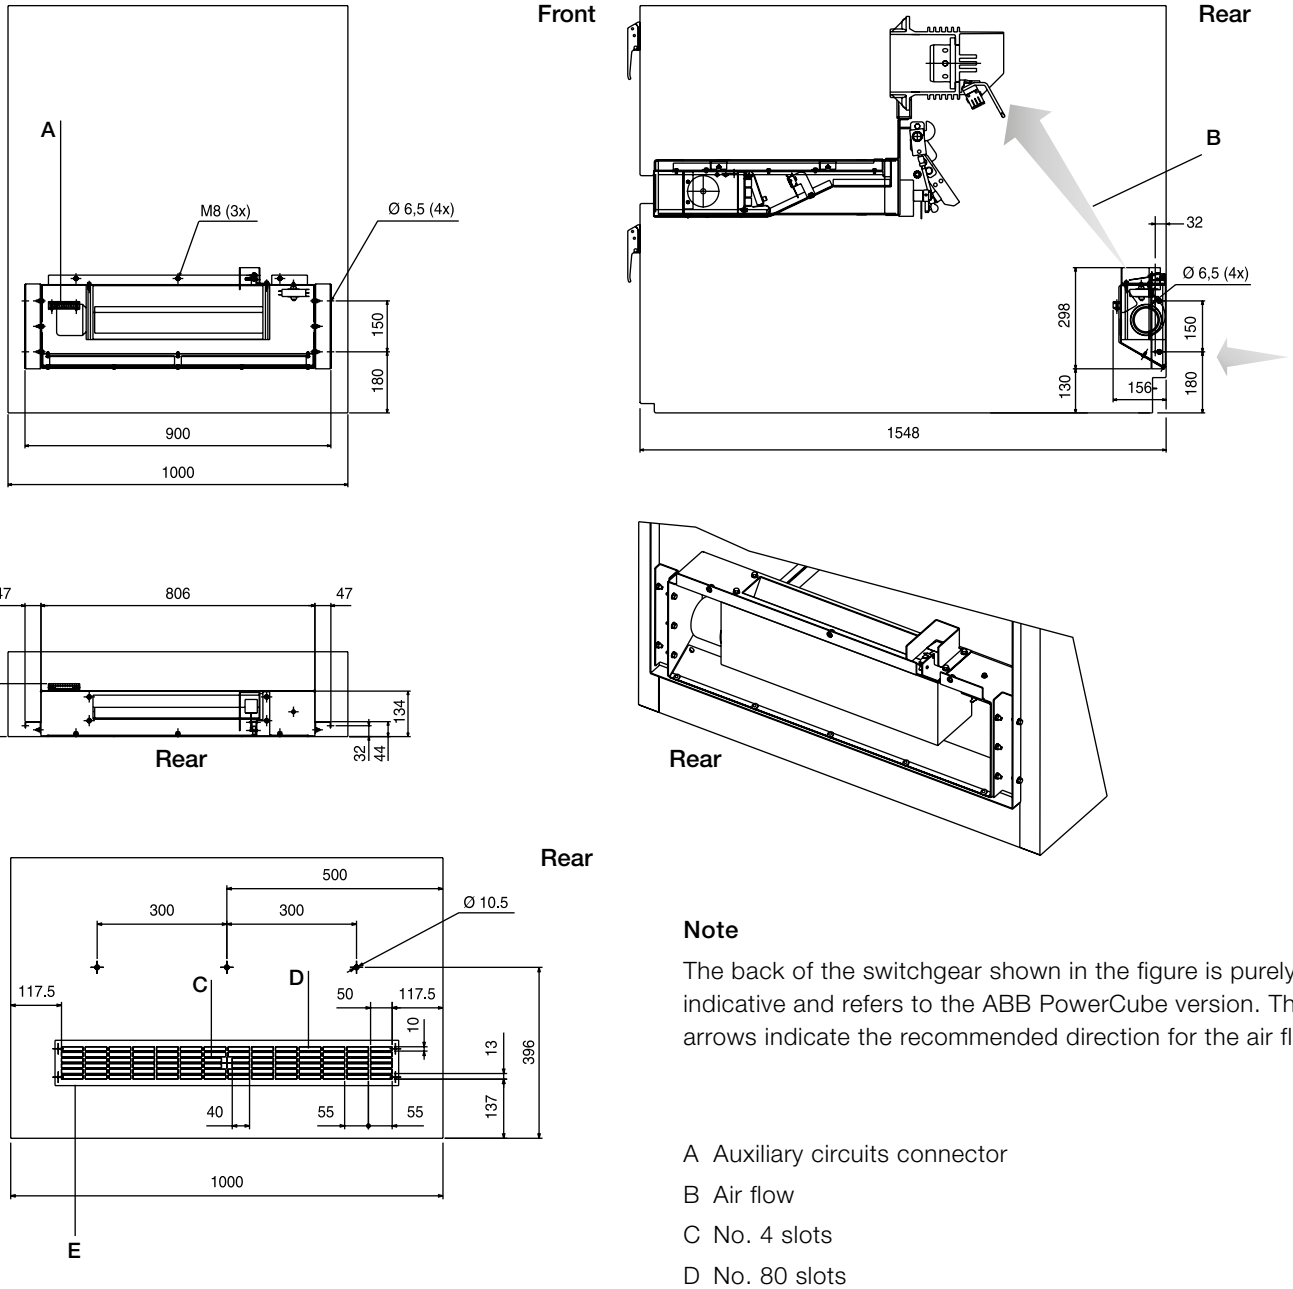


Fig. 28a

Note

The back of the switchgear shown in the figure is purely indicative and refers to the ABB PowerCube version. The arrows indicate the recommended direction for the air flow.

A Auxiliary circuits connector

B Air flow

C No. 4 slots

D No. 80 slots

E Rear sheet steel cut out of the panel

Note

We recommend the following procedures for turning the fans fitted on the PowerCube modules on and off.

PowerCube Modules PB3 12-17 kV / 3600-4000 A

Turning fans on if at least one phase exceeds the following current thresholds:

– 3000 A: delay of 60 s and consequent turning on of just the front fan
– 3600 A: delay of 60 s and consequent turning on of the rear fan as well as the front one

Turning fans off if all the phases drop below the following current thresholds:

– 3500 A: delay of 300 s and consequent turning off of just the rear fan
– 2900 A: delay of 300 s and consequent turning off of the front fan.

PowerCube Modules PB5 24 kV / 2500 A

Turning the fans on if at least one phase exceeds the 2250 A threshold: delay of 60 s and consequent turning on of the front fan.

Turning fans off if all the phases drop below the 2150 A threshold: delay of 300 s and consequent turning off of the front fan.

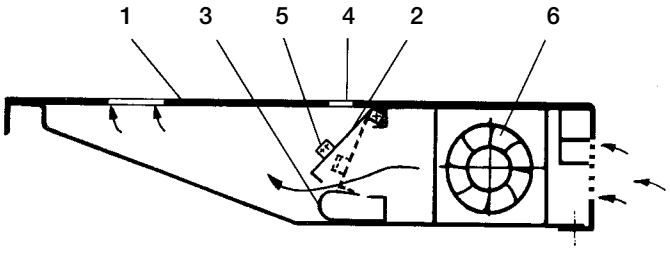
Fig. 28b

9. Putting into service

- **All operations for putting into service must be carried out by skilled personnel.**
- **Should the operations be prevented, do not force the mechanical interlocks but make sure that the operating sequence is correct.**
- **Before opening the door check the apparatus position through the inspection windows.**

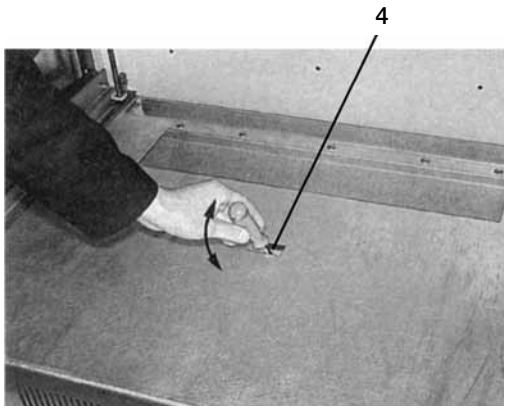
Before putting into service, all the apparatus installed must be checked and tested as prescribed below, bearing in mind that in case of special installation configurations, **the tests indicated in the table may have to be integrated with others which are to be established by the plant technical manager.**

9.1. Preliminary operations



– Make sure there is no evident damage and remove any foreign bodies;
– make sure that the internal metal segregations (if supplied) are present;
– make sure that any insulating barriers or hoods previously removed have been remounted;
– check connection tightness;
– make sure that the sheets have been properly mounted and have not been deformed;
– make sure that all the metallic frame screws have been properly tightened;
– thoroughly clean the sheets and the insulating components by means of brushes and clean, dry cloths. Avoid any compressed air blasts unless they are dry and free of lubricating oil;
– remove dust and dirt from any air vent grids and ventilation ducts;
– for the units with 3600 A and 4000 A circuit-breaker up to 17.5 kV and 2500 A up to 24 kV, check operation of the fan and the free movement of the internal flap (see fig. 29);
– make sure that the vacuum interrupters of the V-Contact contactor and VD4, Vmax, VM1, eVM1 circuit-breaker have not been accidentally damaged, **in case of doubt do not hesitate to contact us;**
– insert the apparatus into the compartments in the isolated position with the apparatus open and insert the auxiliary instrument connectors;
– power the auxiliary circuits;
– make sure that the value of the circuit power supply ranges between 85% and 110% of the apparatus rated voltage value.

If all the above tests have been successful, carry out the inspection and testing procedures indicated in para. 11.2. **Should any problem arise, do not hesitate to contact us.**



9.2. Measurements and tests

Carry out the tests indicated below only after performing the preliminary operations prescribed in para. 9.1.

- **The check is only successful if all the above tests have been passed successfully.**
- **If the inspection gives negative results, do not put the apparatus into service but contact us if necessary.**
- **Only supply the module with circuit-breakers open and doors closed.**

The internal flap is shown in the service position (open).

Fig. 29

Subject of inspection		Procedure	Positive test
1	Insulation resistance.	Main circuit: by means of a 5000 V Megger, measure the insulating resistance between phases as well as between phases and the exposed conductive part.	The insulation resistance value should not be lower than 1000 MΩ and constant in time.
2	Industrial frequency voltage test.	Main circuit: the voltage test is performed after installation in order to check the busbar duct connection insulation. The voltage test value must reach 80% of the test value prescribed for the individual tests (IEC 60271-200)	No electrical discharges should occur.
3	Electrical functionality test.	Supply the auxiliary circuits and perform some operations.	Normal operations and signals.
4	Open/closed control indicator. Operation counter (if supplied).	Put the apparatus in the isolated for test position and perform a few openings and closings.	Normal operations and signals.
5	Apparatus operations.	With the apparatus open, close the enclosure door and perform racking in, carry out a few openings and closings.	Normal operations and signals.
6	Electromechanical door interlock with apparatus in the inserted and intermediate positions (if supplied).	With the door closed, insert the apparatus first partially and then fully.i.	The door must not open after about two handle turns.
		Isolate the truck and try to open the door.	The door opens.
7	Mechanical and electrical lock for preventing apparatus closing in the position between connected and isolated.	Put the truck in the intermediate position between isolated and connected. Attempt contactor closing.	Closing is not possible.
8	Lock for preventing racking in between apparatus with different characteristics.	From the withdrawn position, try to insert the plug into the socket.	Insertion is not possible.
9	Truck locking electromagnet.	De-energise the electromagnet and try to move it using the relevant handle.	The truck does not move.
10	Mechanical lock for preventing apparatus racking in/out when closed.	Put the truck in the isolated position, close the apparatus and try the racking in operation.	The operation is not possible.
11	Key lock for preventing racking in (if supplied).	With the contactor in the isolated position, turn the key 90°	Apparatus racking-in is prevented after about two handle turns. The key can be removed.
12	IEC lock with plug-socket.	With apparatus racked in and in the positions between connected and isolated.	The plug-socket cannot be removed.
13	Shutter mechanical lock when the apparatus is withdrawn (if supplied).	With apparatus withdrawn try to manually move the shutters.	It is not possible to open the shutters.
14	Key lock for preventing earthing truck racking in (if supplied).	Trip the lock turning the key 180° and remove it.	The earthing truck cannot be inserted switching from the withdrawn to the isolated position.
15	Earthing switch (if supplied).	With isolated apparatus, close the earthing switch and re-open it.	The operation is possible. Check that the position signalled on the circuit-breaker front is correct.
		Try to close the earthing switch with the apparatus inserted.	The earthing switch cannot be closed.
		Try to insert the apparatus with isolated apparatus and earthing switch closed.	The operation is prevented after about two handle turns.
		Try to operate the earthing switch with the apparatus in the intermediate position between isolated and connected.	The earthing switch operating lever cannot be inserted.
16	Key lock for earthing switch open (if supplied).	Turn the key 90° with apparatus isolated, earthing switch open and lever withdrawn.	The earthing switch operating lever cannot be inserted.
17	Key lock for earthing switch closed (if supplied).	Turn the key 90° with apparatus isolated, earthing switch closed and lever withdrawn.	The earthing switch operating lever cannot be inserted.
18	Double key lock for earthing switch open and closed (if supplied).	Turn the key 90° with apparatus isolated, earthing switch closed and lever withdrawn.	The earthing switch operating lever cannot be inserted.
19	Earthing switch electromechanical lock (if supplied).	With earthing switch open or closed and lock deenergised.	The earthing switch operations are not possible.
20	Operating pushbuttons with the apparatus door closed (if provided).	For HD4 and VD4, carry out the opening and closing operations using the pushbuttons. For VM1 and contactors carry out the emergency opening operation.	The operations are normal.

After performing the tests, make sure that all normal service conditions are restored.
Check that all the mechanical and electrical locks, (if deenergised to carry out the putting into service tests with switchboard disconnected) have been restored.

10. Periodic checks

- **The periodic checks must be carried out by skilled personnel.**
- **Before carrying out any operation, make sure that the apparatus is open with springs discharged.**
- **Before opening the door check the apparatus and earthing switch positions through the inspection windows.**

10.1. General information

During normal service the modules are maintenance-free. Any possible intervention depends on specific installation aspects such as operation frequency, interrupted current value, power factor and ambient conditions.
As a precaution, the paragraph below shows the inspection programme table with the relevant periodic checks. At least for the first check, it is advisable to follow what is specified in the table.

According to the results obtained, establish the best interval for subsequent operations.
It is advisable to keep a maintenance card and a service book containing all the operations performed along with date, description of possible anomalies, reference to the data needed to identify the apparatus (see chapter 2) etc.
For further information, refer to article 10 of IEC 60694 Standards.
In any case, should there be any problems, do not hesitate to contact us.
It is recommendable to perform an inspection within one year from putting the apparatus into service.

10.2. Inspection programme

Subject of inspection		Time intervals	Procedure
1	Carry out two mechanical closing and opening operations of the apparatus.	3 years and in any case after a time not exceeding the one specified.	Check operation and transmission functionality. The apparatus must work normally without stopping in intermediate positions and the torque applied must not exceed 200 Nm.
2	Visual inspection of insulating parts.	3 years and in any case in relation to the environmental pollution.	Insulating parts must be free from dust, dirt, cracks, traces of surface discharges and damage. Remove any dust and dirt by means of a vacuum cleaner and dry, clean cloths.
3	Auxiliary contacts.	3 years. In any case, refer to the specific manuals of the apparatus.	Check functionality and signals.
4	Auxiliary circuit conductors.	5 years.	Check whether any cabling strap is loose or broken and connection tightness.
5	Interlocks.	3 years.	Check device functionality.
6	Visual inspection of earthing switch contacts.	5 years.	Check that contacts are not deformed, eroded or oxidised. Lubricate the contacts with Molydal EL/5 (Industrial Service) grease or Vaseline.
7	Apparatus springs.	5 years. In any case, refer to the specific manuals of the apparatus.	Check that the seal placed on the spring register is intact.
8	Power connections.	3 years.	The connections must be tight and have no traces of overheating or oxidisation.
9	Insulation resistance measurement.	3 years.	See para. 9.2. (table).

For the routine checks and maintenance of apparatus and protection devices, please refer to the relative instruction manuals.

11. Maintenance operations

- **Maintenance must be carried out either by our personnel or by qualified skilled personnel. Should the customer's personnel be in charge of maintenance, the customer is responsible for any operation performed on the apparatus.**
- **While performing routine checks and maintenance operations, de-energise all the components.**
- **The spare parts shown in the table "List of spare parts/accessories" can only be replaced by our personnel. For the apparatus, consult the relevant manuals.**
- **Use original spare parts only.**

11.1. General information

Thanks to their simple design, PowrBox modules do not require any particular maintenance except for the "Periodic checks" in paragraph 10.
In order to avoid any hazardous deterioration of the insulating level, it is advisable to perform the first inspection six months after putting into service so as to establish the routine check intervals and the maintenance card.
Moreover, it is recommendable to follow the instructions for the single items according to the instruction manuals supplied with the apparatus.
It is advisable to keep a maintenance card and a service book containing all the operations performed along with date, description of possible anomalies, reference to the data needed to identify the apparatus (see chapter 2) etc.
For further information, refer to article 10 of the IEC 60694 Standards.
Should you have any problems, do not hesitate to contact us.
The electrical apparatus is easily affected by ambient conditions and can be damaged by abnormal service conditions.
Dust, heat, humidity, corrosive atmosphere, chemical residues, fumes, vibrations and other elements can influence apparatus and the life of the electrical apparatus.
Especially when combined, these conditions cause premature faults.
The most important rules to follow are:
– keep clean;
– keep dry;
– tighten bolts and connections;
– preserve the mechanical parts from excessive friction.

The instructions concerning the operations to be carried out on the various parts of the module, excluding the apparatus for which the relevant instruction manuals should be referred to.

11.2. Metallic structure

This comprises the supporting construction complete with removable panels, vertical and horizontal segregating sheets, hinges, doors and locks.
These parts can either be galvanised or painted.

Painted parts

The module doors are painted using epoxy powder paints whose minimum thickness is more than 40 µm.

Painting

Any damage, scratches or scrapes caused to the module external paint during installation can be touched up using the paint supplied with the special paint.

Touching up

On request, sufficient paint for touching up after installation can be supplied with the module. For its use follow the paint supplier's instructions. If these are not available, proceed as follows:
– clean the part to be touched up with damp abrasive paper and smooth off the edges of the damaged area;
– prepare the necessary amount of paint adding some catalyst (30% of the paint by weight);
– try the paint on a piece of sheet first and see the result. Any brush marks can be reduced by adding more solvent to the paint, which can be kept in the fridge for about 24 hours before it solidifies.

Cleaning

The painted components can be cleaned using either a cloth with water and soap or a paint solvent when very dirty. In this case, try the solvent on a surface out of sight to make sure it doesn't remove the paint coating.

Galvanised components

The galvanised and passivated components can be cleaned by means of a dry cloth.
Oil and grease can be removed using a cloth soaked in a suitable solvent. To polish the surface, repeat the previous operation.

11.3. Mechanical actuators

The mechanical actuators comprise all the mechanical parts of the module for carrying out the operations, locks and safety devices. The force, prevention and safety locks are all considered mechanical actuators.
The moving components are lubricated and tested while assembling the switchboard. Contact our personnel for mounting any accessories on a switchboard already installed.

The mechanical interlocks must not be ignored, but used properly so as to avoid any hazardous situations.

The mechanical interlocks must reach the final locked/unlocked positions without any intermediate stops.
They must be tested several times to check that they operate perfectly. The operating force required must also be checked.
Always make sure that the mechanical interlock position corresponds with the position of both the part controlled device and with the interlocked apparatus.
If excessive force is required to activate the device it means that the mechanism is prevented from moving.
In this case, please contact us.

12. Accessories and spare parts

- **Either our personnel or qualified skilled customer personnel must mount the spare parts and/or the accessories carefully following the instructions enclosed.**
- **Before performing any operation make sure that all the apparatus is open and de-energised (main circuit and auxiliary circuits).**

To order spare parts or accessories, always specify the serial number of the modules in which the spare parts are to be installed.
For any enquiry about spare part availability and ordering, please contact us.

12.1. Accessories and tools for operations

Standard completion accessories:

The module is usually supplied complete with:
– operating lever for any earthing switches;
– emergency opening lever for VM1circuit-breaker and VSC contactor.
– handle for circuit-breaker racking in/out;
– project diagrams and drawings;
– instructions for installation, service and maintenance;
– auxiliary position contacts (5 isolated changeover contacts plus 5 connected changeover contacts).

Completion items and accessories on request

On request, the module can be completed with supply of the following accessories:
– lifting eyebolts;
– truck for transporting the circuit-breaker out of switchboard;
– auxiliary contacts for signalling earthing switch open/closed (5-10 closing contacts plus 5-10 opening contacts);
– voltage indicators;
– anti-condensation heaters and thermostat (rated voltage values: 110-220 V);
– opening and closing pushbutton for VD4-HD4 circuit-breakers (to be specified at the time of ordering because they cannot be applied afterwards (only for PB/E);
– rear fan;
– electro-mechanical lock on the earthing switch

Other components

– shutter Fail-safe device;
– contact for signalling connected and key lock on earthing truck insertion
– electromechanical interlock on circuit-breaker unit door.

12.2 . Spare parts

For the apparatus, refer to the relative installation, service and maintenance instructions.
The module spare parts normally supplied as a rule are listed in the table below.

Description of spare part	Assembly by the customer
Earthing switch	No
Auxiliary contacts for limit switch inserted	Yes
Auxiliary contacts for limit switch isolated	Yes

DISTRIBUTION SOLUTIONS

V-Contact VSC

Medium voltage vacuum contactors

V-Contact VSC are the motor and capacitor switching solution, suitable for controlling electrical apparatus in industry, service, marine sector, etc.
The V-Contact VSC contactor uses the drive with permanent magnets, widely used, experimented and appreciated in medium voltage circuit breakers.
Thanks to the breaking technique with vacuum interrupters, they can operate in particularly difficult environments.

Table of contents

004–007 **V-Contact VSC: its strengths, your benefits**

008–013 **Description**

014–021 **Contactor selection and ordering**

022–036 **Specific product characteristics**

042–052 **Electric circuit diagram**

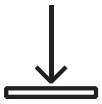
V-Contact VSC:
its strengths, your benefits

Easy to install

Affordable range

Safety and protection

Productivity
Maximizing your output



Continuous operation
- Low chopping current in VI
  – Minimize the risk of switching over voltages and therefore maintenance intervention on your assets
- UV to detect MV loss and stop the motor
  – Increase service continuity thanks to insensibility to voltage dips that would normally lead to a restart of the motor

Easy to install
- Possibility to assemble free standing version in all orthogonal solution
– Have flexibility and the easiest connection and interface with the panel

Speed up your projects
- Free standing version with fuse holder
  – Avoid the study of fuse installation and have guaranteed coordination and functionality
- Technical and license cooperation agreement
  – Rely on ABB technical support to reduce development time

Services and training
- Field application support and analysis
  – Rely on ABB technical support for choosing the best solution fitting your specific application

Efficiency
Optimize your investment

Space saving
- Free standing version with fuse holder
  – Save footprint and overall height compared to a design with external fuse holder

Affordable range
- Higher dielectric performances with G version
  – Save the cost of a circuit breaker with a 12 kV solution valid over 1000 m above the sea level
- Capacitor switch version
  – Have a competitive solution in C2 class
- Technical cooperation agreement
  – Rely on ABB technical support to reduce your investment for your panel design

Energy efficiency
- Low power consumption compared to traditional solutions
  – Reduce the cost of ownership and reduce the overall CO_2 consumption

Reliability
Protecting your assets

Safety and protection
- Embedded control coil continuity
  – Avoid TCS on open coil and closing coil monitoring
- Temperature and capacitor monitoring (on request)
  – Provide “predictive” function as when the capacitor start ageing the warning is sent but contactor is still operative: this allows to program an intervention without LSC
- Guaranteed coordination with fuses
  – Increase your safety: guaranteed coordination with SCPD

Global availability
- ABB by your side
  – Count on a worldwide presence for any support you may need

Description

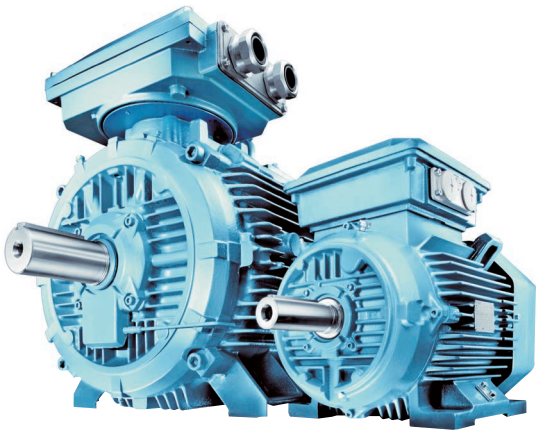
General

The medium voltage V-Contact VSC contactors are apparatus suitable for operating in alternating current and are normally used to control users requiring a high number of hourly operations.
The V-Contact VSC contactor introduces the drive with permanent magnets, already widely used, experimented and appreciated in medium voltage circuit breakers, into the worldwide panorama of medium voltage contactors.
The experience acquired by ABB in the field of medium voltage circuit breakers fitted with drives with “MABS” permanent magnets, has made it possible to develop an optimised version of the actuator (bistable MAC drive) for medium voltage contactors.
The drive with permanent magnets is activated by means of an electronic multi-voltage feeder.
The feeders differ according to the integrated functions and to the auxiliary power supply voltage.
Each feeder is able to take any voltage value within its own operating band.

Versions available
The V-Contact VSC contactors are available in the following versions:

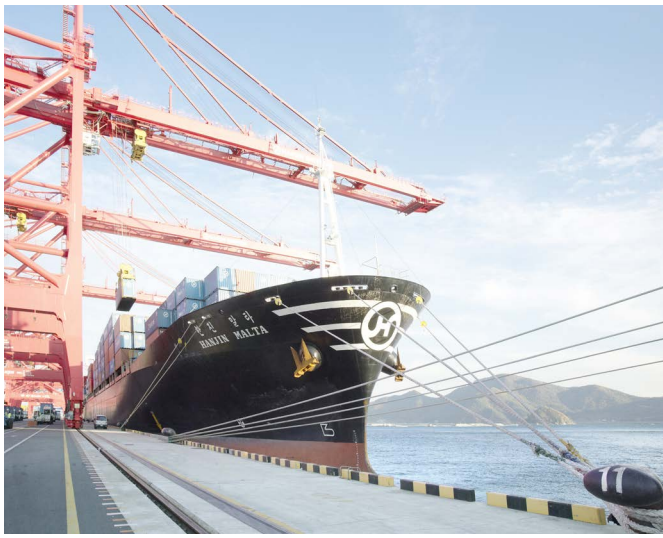
Version	Rated voltage	Type
Fixed	7,2 kV	VSC 7 - VSC 7/F - VSC 7/G
	12 kV	VSC 12 - VSC 12/F - VSC 12/G - VSC S/G - VSC S/F
Withdrawable	7,2 kV	VSC 7/P - VSC 7/PN - VSC 7/PG - VSC 7/PNG
	12 kV	VSC 12/P - VSC 12/PN - VSC 12/PG - VSC S/PG - VSC S/PNG

The withdrawable versions are foreseen for use with UniGear ZS1 and UniSec WBC switchgears, PowerCube units and CBE1 enclosures. For use with the CBE11 enclosures, please contact ABB.
All the contactors mentioned above are available, on request, in one of the two following versions.



- **SCO** (Single Command Operated): closing takes place by supplying auxiliary power to the special input of the multi-voltage feeder. On the other hand, opening takes place when the auxiliary power is either voluntarily cut off (by means of a command) or involuntarily (due to lack of auxiliary power in the installation).
- **DCO** (Double Command Operated): closing takes place by supplying the input of the closing command of the apparatus in an impulsive way. On the other hand, opening takes place when the input of the opening command of the contactor is supplied in an impulsive way.

Fields of application



The V-Contact VSC contactors are suitable for controlling electrical apparatus in industry, in the service sector, in the marine sector, etc. Thanks to the breaking technique with vacuum interrupters, they can operate in particularly difficult environments.
They are suitable for control and protection of motors, transformers, power factor correction banks, switching systems, etc.
Fitted with suitable fuses, they can be used in circuits with fault levels up to 1000 MVA (VSC7 - VSC12).

Compliance with Standards

V-Contact VSC contactors comply with the Standards of the major industrialised countries and in particular with the IEC 62271-106 (2011).

Type approvals

Type approval by Shipping Register DNV, GL, LLRR, ABS, BV.
Before the order check with ABB if applicable to the specific VSC version requested and certificate expiration date

Operating characteristics

- Ambient temperature: – 5 °C ... + 40 °C
- Relative humidity: < 95% (without condensation)
- Altitude: < 1000 m s.l.m.

For other conditions, please contact us.

Main technical characteristics

- Maintenance-free
- Suitable for installation in prefabricated substations and switchgear both of the card (slim line) and traditional type
- High number of operations
- Direct checking of contact wear
- Long electrical and mechanical life
- Remote control
- Multi-voltage feeder
- Bistable drive of the type with permanent magnets.

Description

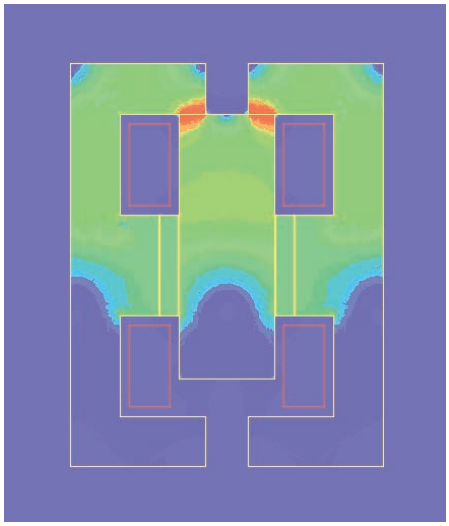


Fig. A - Magnetic circuit in the closed position.

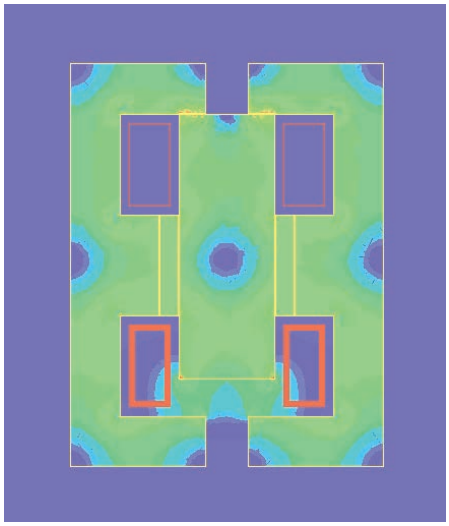

Fig. B - Magnetic circuit with the opening coil supplied.

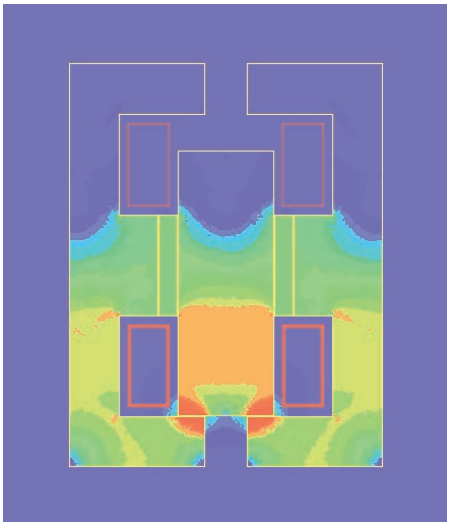

Fig. C - Magnetic circuit in the open position.

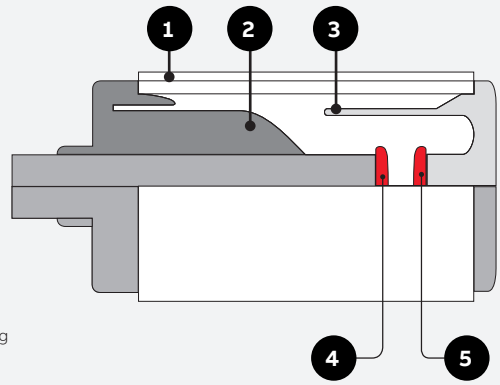

“MAC” magnetic drive

ABB has implemented this technology in the field of contactors on the basis of experience gained in the field of circuit breakers with magnetic drive.
The magnetic drive adapts perfectly to this type of apparatus thanks to its precise and linear travel.
The drive, which is of bistable type, is fitted with an opening and a closing coil.
The two coils - individually energised - allow the drive mobile armature to be moved from one of the two stable positions to the other.
The drive shaft is solid with the mobile armature and held in position in a field generated by two permanent magnets (fig. A).
Energising the coil opposite to the magnetic latching position (fig. A) of the core, the magnetic field is generated (fig. B), which attracts and moves the mobile armature into the opposite position (fig. C).
Every opening and closing operation creates a magnetic field concordant with the one generated by the permanent magnets, with the advantage of keeping the intensity of the field itself constant during service, regardless of the number of operations carried out.

The energy needed for operation is not supplied directly by the auxiliary power supply, but is always “stored” in the capacitor which acts as an energy accumulator, and therefore operation always takes place with constant speeds and times, independently of the divergence of the power supply voltage from the rated value.
The auxiliary power supply has the only aim of keeping the capacitor charged.
Consumption is therefore minimal.
For the reasons indicated above, both for the DCO and for the SCO version it is necessary to supply the auxiliary circuits which recharge the capacitor with a continuous auxiliary power supply.

Technical documentation

For more in-depth technical and application aspects of the VSC contactors, also consult the publication on the REF542plus multi-function control and protection unit - code 1VTA100001.

4. Moving contact
5. Fixed contact

Schematic cross-section of the vacuum interrupter.

Test laboratory

Conforms to the UNI CEI EN ISO/IEC 17025 Standards.

Environmental Management System

Conforms to the ISO 14001 Standards, certified by an external independent organization.

Health and Safety Management System

Conforms to the OHSAS 18001 Standards, certified by an external independent organization.

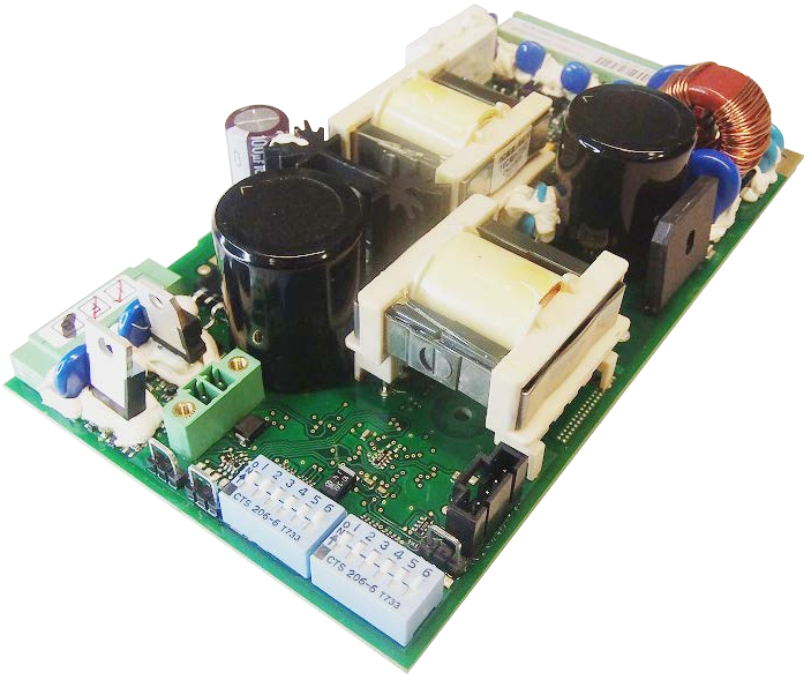
Breaking principle

The main contacts operate inside the vacuum interrupters (the level of vacuum is extremely high: 13 x 10^{-5} Pa).
On opening, there is rapid separation of the fixed and moving contacts in each contactor interrupter.
Overheating of the contacts, generated at the moment they separate, causes formation of metallic vapours which allow the electric arc to be sustained up to the first passage through zero current.
On passage of zero current, cooling of the metallic vapours allows recovery of high dielectric resistance able to withstand high values of the return voltage.

Power rating of electronic device

Supply voltage	Starting (1)	After closing	After opening	Continuous power consumption
	Inrush for 6 sec	Inrush for 1.2 sec	Inrush for 1.2 sec	
24...250 V d.c. 110...250 V a.c.	35 W	25 W	30 W	5 W

(1) This value refers to a discharged capacitor; 42 A are required for 2 ms upon start up.



Description

Control module/feeder

The careful selection of components and precise design make the electronic multi-voltage feeder extremely reliable, immune to electromagnetic interference generated by the surrounding environment and free of emissions able to influence other apparatus in the vicinity.
These characteristics have allowed the V-Contact VSC contactors to pass the electromagnetic compatibility tests (EMC).

As standard, the electronic control module is fitted with:

- a connector with screw terminal box for connection of the auxiliary circuits of the fixed versions
- a signalling contact for controlling the closing and opening coil continuity
- the possibility, only at the time of ordering, of defining the reference Standard for the operating thresholds of the auxiliary voltage (available: IEC - GB)
- a dedicated input for opening the contactor regardless of the functionality of the electronics by means o fan external accessory which directly controls the opening coil.

Technical documentation

3 Feeder

- The contactor has been tested for all the auxiliary operating voltages foreseen, indicated in the table:

Feeder type 1 and 2 V d.c.	Feeder type 3 and 4 V d.c. / V a.c. (50/60 Hz)	
24	110	220
30	120	230
48	125	240
60	127	250
	130	

- The contactor is, however, preset with the operating voltage defined in the order confirmation. The power supply voltage is indicated on the nameplate of the contactor itself. Should it be indispensible to change the power supply voltage, please contact ABB.
- The voltage value tolerances conform to what is defined by the IEC 62271-106 or GB 14808 depending on customer's requirements.
- The card is guaranteed to become operational 15 seconds after the power supply voltage is applied because the card controls functionality during this time interval.
- The feeder is available in either the "Standard" or "Full option" version. Apart from the functions indicated on page 12, the "Full option" version also ensures:
  - control of capacitor operating conditions
  - verification of operating temperature of electronic board

4 Socket/plug with terminal at terminal box

5 Manual emergency opening operation

6 Mechanical Open/Closed indicator

7 Fuseholders (only VSC/F and withdrawable versions).

- The VSC/F or VSC/P contactor is fitted with fuseholders able to hold DIN or BS type fuses according to what the customer requests.
- The fuses must have the dimensions and striker of average type according to DIN 43625 Standards with maximum cartridge size e=442mm and BS 2692 (1975) with maximum cartridge size L=553mm.
- The electrical characteristics must conform to the IEC 282-1 (1974) Standards.
- ABB fuses type CMF-BS cannot be installed on V-Contact VSC contactor.

VSC/P

VSC/PN

- The fuseholder is fitted with a special kinematics mechanism which automatically opens the contactor when even a single fuse blows and prevents contactor closing when even a single fuse is missing.

8 Isolation interlock with the truck (only withdrawable contactor). This prevents isolation or racking-in the contactor into the switchgear if the apparatus is in the closed position, and also prevents contactor closing during the isolation run.

(1) Compulsory for UniGear and UniSec WBC switchgears.
(2) Assembly at a later stage is not possible.

1 Interfacing shafts
These can be used to interface the apparatus with the kinematics of the switchgear to make interlocks and/or signals.
The interfacing shafts are available in two different lengths (A = 22 mm and 70 mm) and can be mounted on one or both sides of the contactor (as indicated in the following table).

Lenght A	22/70 mm	
Position	Feeder side	Capacitor side
VSC 7 400 A - VSC 7/F 400 A	•	•
VSC 12 400 A - VSC 12/F 400 A	–	•

Note: for the utilisation parameters (angles and forces applicable), please refer to the instruction manual.

2 Impulse counter
This is a device which counts the contactor closing cycles.

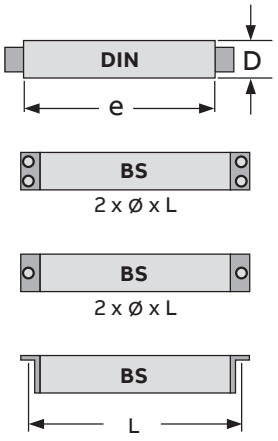
3 Undervoltage function (only available for DCO)

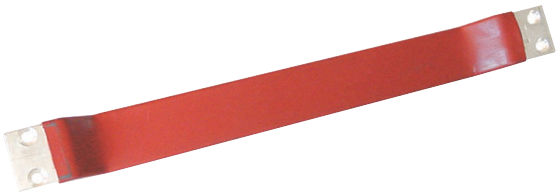
First of its type, the V-Contact VSC contactor is fitted with an undervoltage function with selectable delays of 0; 0,3; 1; 2; 3; 4; 5 s.
This accessory must be specified at the time of order because it cannot be mounted at a later stage.
The undervoltage function cannot be deactivated in boards with the undervoltage function.

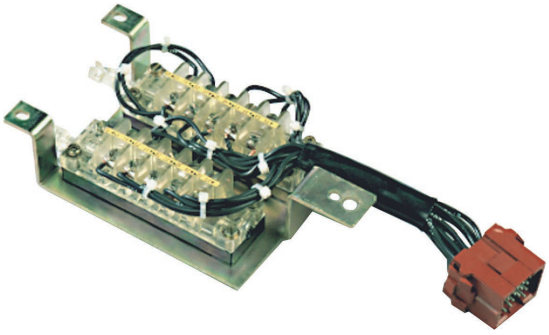


4 Adapter for application of fuses

The kit includes all the accessories needed to adapt and mount three fuses (according to DIN Standards with dimension **e less than 442** mm; according to BS Standards with dimension **L less than 553** mm).
The kit can be installed directly onto the fuseholder supports. The fuses must have dimensions and striker of average type according to DIN 43625 and BS 2692 (1975) Standards.
The electrical characteristics must conform to the IEC 282-1 (1974) Standards.
To select the fuses, see “Conditions of use according to the load” - chapter 3.
The adaptation kits are available in the following types:

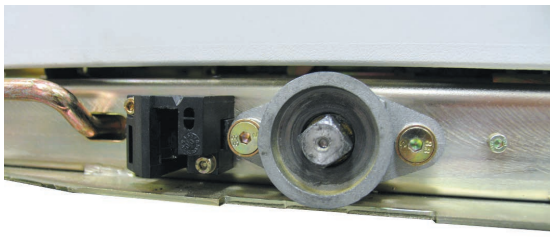
4A For fuses according to DIN Standards with distance **e** = 192 mm
4B For fuses according to DIN Standards with distance **e** = 292 mm
4C For fuses according to BS Standards (2 x 8 x **L** = 235 mm)
4D For fuses according to BS Standards (4 x 10 x **L** = 305 mm)
4E For fuses according to BS Standards (4 x 10 x **L** = 410 mm)
4F For fuses according to BS Standards (4 x 10 x **L** = 454 mm)
4G For fuses in parallel according to BS Standards (4 x 10 x **L** = 410 mm)





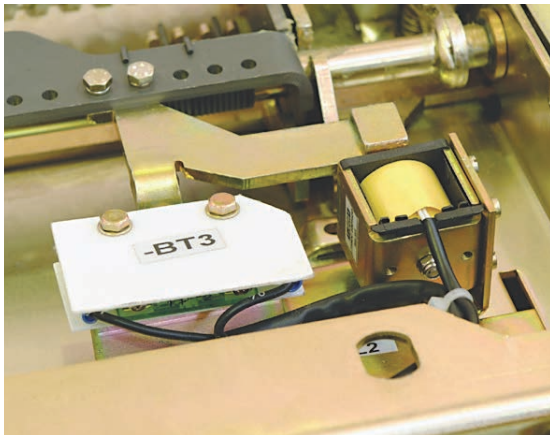
Contactor selection and ordering
Optional accessories

5 Connections alternative to the fuses
The kit includes three flat copper busbars and fixing screws to be installed when the fuses are not needed.
The kit can be installed directly onto the fuseholder supports.

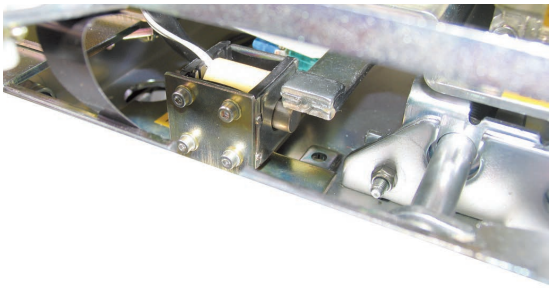


6 Position contacts for connected/isolated position in the withdrawable truck
These signal the position of the truck (accessory not available for V-Contact VSC/PN contactors). The kit includes a set of 10 auxiliary contacts. This accessory must always be requested for contacts to be used in UniGear type ZS1 switchgear if the same application is not already present on the fixed part.
6A Standard diagram
6B Calor Emag diagram.

Electrical characteristics of the contact			
Un	Icu	cosφ	T
220 V~	10 A	0.4	–
220 V~	5 A	0.4	–
220 V–	1 A	–	10 ms



7 Isolation lock
Isolation lock for UniGear and UniSec WBC switchgears and PowerCube units. It prevents the apparatus from being racked-in if the unit door is open.
This lock only works if the door of the switchgear/ enclosure is also fitted with the corresponding lock.
This accessory is not compatible with use in CBE enclosures.

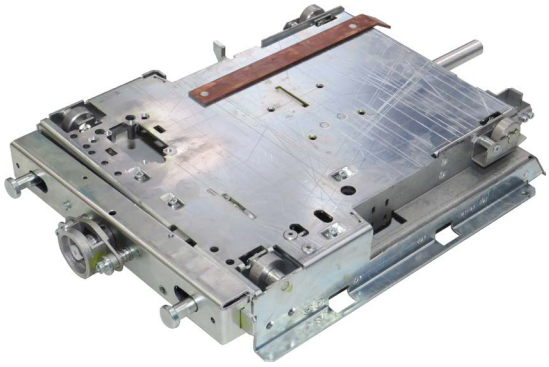


8 Locking magnet in the truck
This only allows the withdrawable contactor to be racked into/out of the enclosure with the electromagnet energised and the contactor open. The table below shows the power supply voltages available.

Un	Un	F	Un	F
24 V –	24 V ~	50 Hz	110 V ~	60 Hz
30 V –	48 V ~	50 Hz	120 V ~	60 Hz
48 V –	60 V ~	50 Hz	127 V ~	60 Hz
60 V –	110 V ~	50 Hz	220 V ~	60 Hz
110 V –	120 V ~	50 Hz	230 V ~	60 Hz
125 V –	127 V ~	50 Hz	240 V ~	60 Hz
220 V –	220 V ~	50 Hz		
	230 V ~	50 Hz		
	240 V ~	50 Hz		

9 Lock for different rated currents (only withdrawable versions)

In the VSC/P contactors, it prevents insertion of the plug-socket and therefore apparatus closing, in a panel provided for a circuit breaker.
This lock, which is compulsory for UniGear and UniSec WBC switchgears, requires the same lock provided on the enclosure / switchgear, and is associated with the presence of the locking magnet on the truck.



10 Motorised truck

Only available for VSC/P for use in UniGear type ZS1 and UniSec WBC switchgears and PowerCube units. This application must be specified at the time of ordering the contactor and cannot be mounted at a later stage.
Not available on VSC/PN.

Characteristics	
Un:	110 / 220V–
Operating limits:	85...110% Un
Rated power (Pn):	40 W

11 Sliding earthing contact

Available on request for VSC/PN.
This application must be specified at the time of ordering the contactor and cannot be mounted at a later stage.

12 ETR (Elecrical Emergency Opening) device

Beside the mechanical opening operation, which is anyway always provided, it is available as accessory on request, the ETR device.
The ETR device (Emergency Trip Release) is an optional accessory that can be provided with the VSC contactor and installed in the switchgear auxiliary compartment.
Purpose of ETR is to give to the customer the opportunity to perform a remote electrical open of the apparatus in emergency conditions.
ETR device is design to provide an additional opportunity to open locally or remotely the contactor for the identified faulty conditions.
In the event of a power loss in the auxiliary circuit, ETR can still be actuated, locally or remotely, within 5 minutes.

Characteristics	
Rated voltage:	110V AC-DC (J1: terminal 1-2) 220V AC-DC (J1: terminal 1-3)
Rated voltage tolerance	75%...1105
Insulation	No isolation from Power supply to input command channel
Common mode overvoltage protection	4 kV
Voltage deep immunity LV and HV	1 min @ 100%
Operational temperature	-5...+40 °C
Minimum diameter of wiring	Ø 1.5mm^2
Start up time	6 MIN
Ready contact	One contact available for customer use

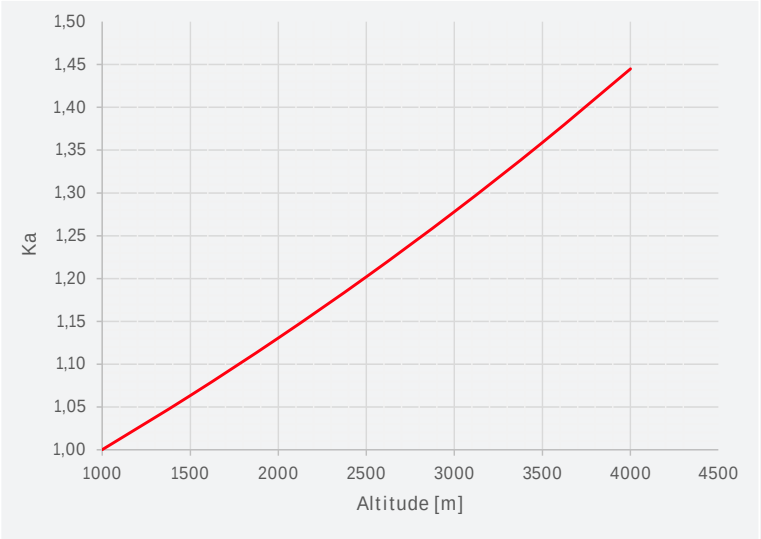
Specific product characteristics

Electromagnetic compatibility

The V-Contact VSC vacuum contactors ensure operation without unwarranted trips when there are interferences caused by electronic apparatus, by atmospheric disturbances or by discharges of electrical type. Moreover they do not produce any interference with electronic apparatus in the vicinity of the apparatus.
The above is in compliance with IEC 62271-1, 62271-106, 61000-6-2, 61000-6-4, Standards, as well as with the EEC 89/336 European Directive regarding electromagnetic compatibility (EMC).

Altitude

It is well-known that the insulating properties of air decrease as the altitude increases.
This phenomenon must always be taken into account during the design stage of insulating parts of equipment which is to be installed over 1000 m above sea level.
In this case a correction coefficient must be applied, which can be taken from the graph drawn up according to the indications given in the IEC 62272-1.
The following example gives a clear interpretation of the indications given above.
For altitude higher than 3000mt please contact ABB.



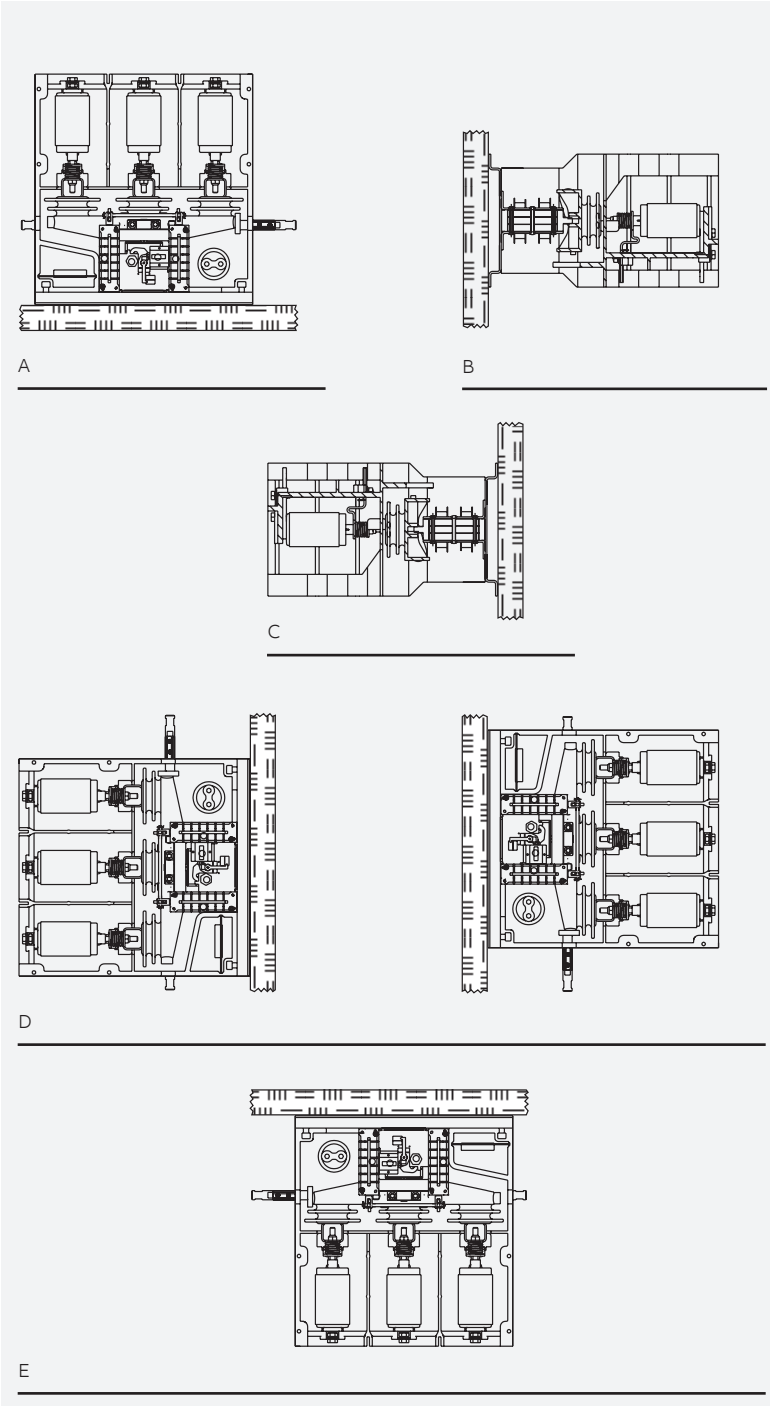
Tropicalisation

V-Contact vacuum contactors are manufactured in compliance with the prescriptions regarding use in hot-humid-saline climates. All the most important metal parts are treated against corrosive factors corresponding to class C in compliance with the UNI 3564-65 Standards.
Galvanization is carried out in compliance with the UNI ISO 2081 Standard, classification code Fe/Zn 12, with thickness of $12x10^{-6}$ m, protected by a layer of conversion mainly consisting of chromates in compliance with the UNI ISO 4520 Standard.
These construction characteristics mean that all the V-Contact VSC series apparatus and their accessories comply with climate graph no. 8 of the IEC 721-2-1 and IEC 68-2-2 (Test B: Dry Heat) / IEC 68-2-30 (Test Db: Damp Heat, cyclic) Standards.

Graph for determining the Ka correction factor according to the altitude

Ka = $e^{mH/8150}$ with m=1
H = altitude in metres
m = value referred to industrial frequency and the atmospheric impulse withstand voltages and those between phase and phase. Defined value for m = 1

Example



- Installation altitude: 2000 m
- Service at a rated voltage of 7 kV
- Withstand voltage at power frequency 20 kV rms
- Impulse withstand voltage 60 kVp
- Ka Factor = 1.13 (see graph).

Taking the above parameters into consideration, the apparatus will have to withstand the following values (under test at zero altitude i.e. at sea level):

- withstand voltage at power frequency equal to:
  - 20 x 1.13; 22,6 kVrms
- impulse withstand voltage equal to:
  - 60 x 1.13 = 67,8 kVp.

From the above, it can be deduced that for installations at an altitude of 2000 m above sea level, with a service voltage of 7 kV, an apparatus with a rated voltage of 12 kV must be provided, as it is characterized by an insulation levels at power frequency of 28 kV rms and an impulse withstand voltage of 75 kVp.

Specific product characteristics

VSC 7 - VSC 12

Installation of fixed contactors

The performance of the contactor remains unaltered in the installation positions indicated:

VSC 7 - VSC 12

A) Floor-mounted with moving contacts at the bottom.
B) Wall-mounted with horizontal moving contacts and terminals at the bottom.
C) Wall-mounted with horizontal moving contacts and terminals at the top.
D) Wall-mounted with horizontal moving contacts with interrupters on the front (or rear) with vertical terminals.
E) Ceiling-mounted with moving contacts at the top.

VSC 7/F - VSC 12/F

A) Floor-mounted with moving contacts at the bottom.

Use of fuses according to the load

Motor control and protection

The motors are supplied in low voltage, normally up to a power of 630 kW. Over the latter power, medium voltage power supply is preferable (from 3 to 12 kV) with the aim of reducing costs and dimensions of all the apparatus which are part of the circuit. The V-Contact can be used for voltages from 2.2 kV up to 12 kV and for motors up to a power of 5000 kW, thanks to the simplicity and sturdiness of the control mechanisms and the long life of the main contacts.

To ensure protection against short-circuit, it is necessary to combine the contactors with appropriate current-limiting fuses. This solution allows the costs of the load-side apparatus (cables, current transformers, busbar and cable anchoring devices, etc.) to be further reduced and to make the user practically independent of any subsequent enlargements of the plant and of the consequent increased in network power.

Motor protection fuses

How to choose motor protection fuses

V-Contact VSC contactors can be used with fuses with dimensions and striker of the medium type in accordance with Standards DIN 43625 and BS 2692 (1975).

The electrical characteristics must conform to Standard IEC 282-1 (1974).

The customer is responsible for choosing a brand of fuse that conforms to the specifications above and for selecting the fuse, which must be done on the basis of the trip curves supplied by the manufacturer and the characteristics of the contactor.

Consult chapter 2 section 4 of this publication for maximum fuse length and availability of adapters for installing fuses that are smaller than the maximum length.

Among the vast array of applicable fuses, ABB has tested two brands of fuses for coordination in class C, in accordance with standard IEC62271-106:

- Fuses to DIN standards: ABB type CMF
- Fuses to BS standards: SIBA type HHBM-BM

Instructions on how to correctly select the fuses tested by ABB are given below.

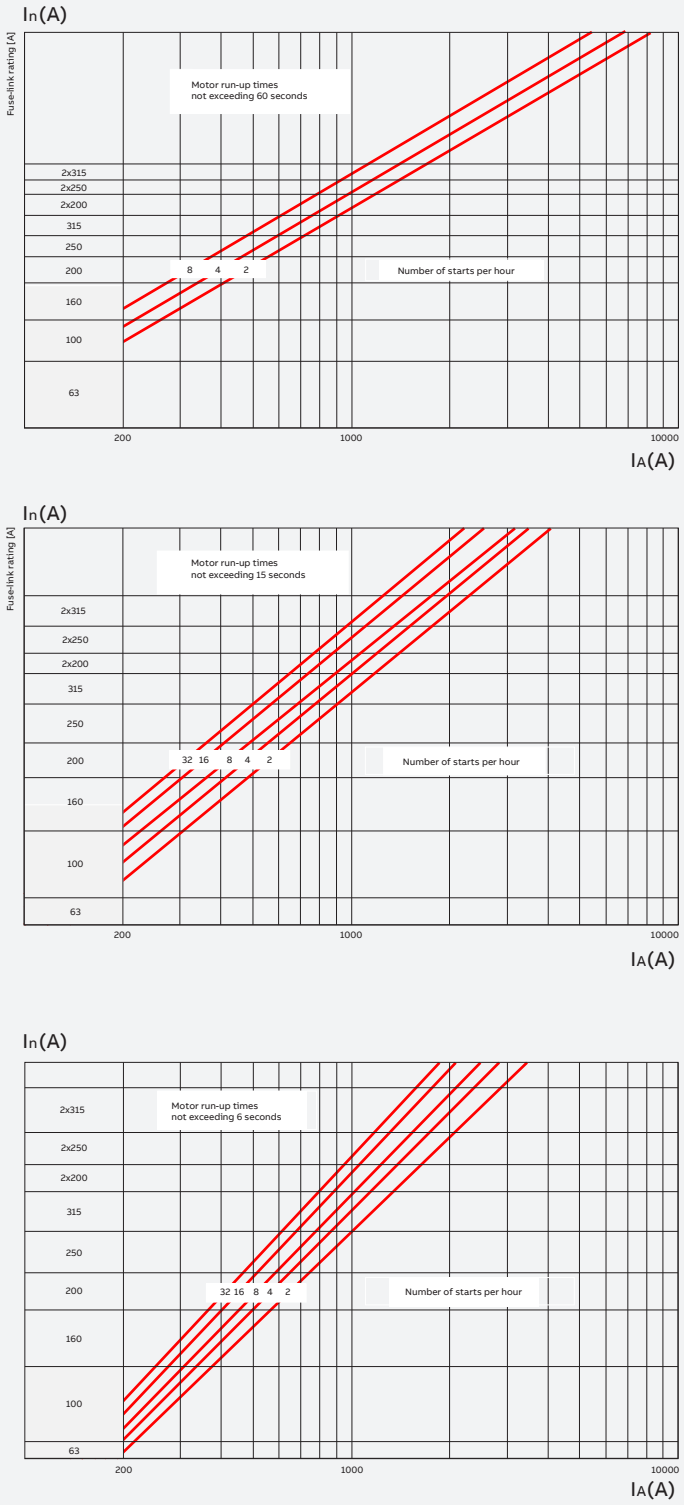
DIN fuses

ABB fuses type CMF for protecting motors must be chosen by assessing the service conditions. Consider the following parameters:

- supply voltage
- starting current
- starting time
- number of starts/hour
- full load current of motor
- short circuit current of installation.

One of the criteria to bear in mind when choosing is trip coordination with the other protection relays so as to adequately protect the contactor, current transformers, cables, the motor itself and all the other equipment in the circuit that could be damaged by prolonged overloads or by specific let-through energy (I2t) that exceeds the withstand rating.

Protection against short-circuit is carried out by the fuses, always selected with a rated current higher than that of the motor to prevent their intervention on start-up. This method of selection does not, however, allow their use as protection against repeated overloads - a function already not guaranteed by them, especially with current values included up to the end of the initial asymptotic stretch of the characteristic curve.



A release with inverse or independent time is therefore always needed for protection against overloads. This protection must be coordinated with the one carried out by the fuse, working so that the release and fuse curves intersect at a point to allow the following:

1) Motor protection against overcurrents due to overloads, single-phase running, blocked rotor and repeated start-ups. Protection entrusted to an indirect relay with inverse or definite time delay trip which acts on the contactor.
2) Protection of the circuit against fault currents, between phases and towards earth, of low value, entrusted to a release with inverse or definite time delay trip, which must only intervene for the short-circuit values which can be interrupted by the contactor.
3) Protection of the circuit against fault currents higher than the breaking capacity of the contactor up to the maximum fault withstand current. Protection entrusted to the fuse.

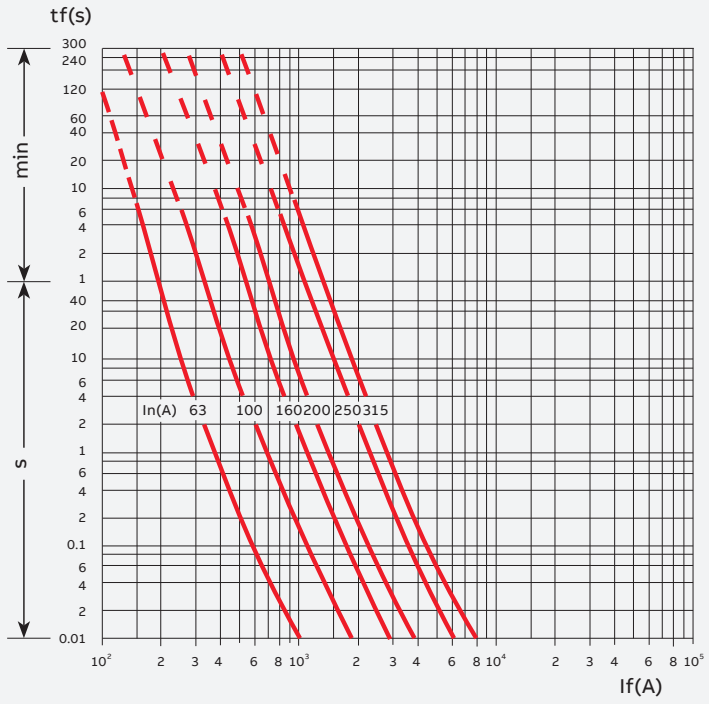
To verify the service conditions, proceed as follows:

- **Rated voltage Un.** This must be equal to or higher than the service voltage of the installation. Check that the level of insulation of the network is higher than the switching overvoltage value generated by the fuses, which for the fuses used by ABB is widely below the limit fixed by the IEC 282-1 Standards.

Specific product characteristics

In = rated current of the fuse
IA = motor start-up current
Nh = number of motor start-ups in one hour
tA = maximum motor start-up time

Fig. A - Fuse selection curves for motor start-up. ABB CMF type fuses.



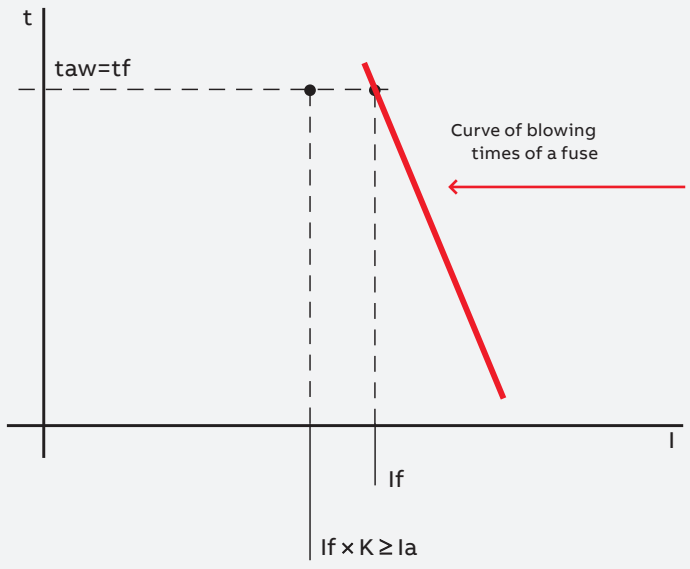
- **Rated current In.** This must be selected by consulting the diagrams indicated in fig. A which refer to the case of starting at regular time intervals, except for the first two start-ups of each hourly cycle which can take place in immediate succession.
  Each diagram refers to a different starting time: 6 s - 15 s - 60 s, respectively.
  In the case of start-ups close together, it must be checked that the starting current does not exceed the value of If x K, where If is the fuse blowing current in correspondence with the starting time of the motor, and K is a minor factor of the unit, a function of the In of the fuse and which can be taken from the table given in figure B.
- **Full load motor current.** The rated current of the fuse must be of a value equal to or higher than 1.33 times the rated current value of full motor load.
  This condition is, in any case, always obtained for motors started at full voltage for which the procedure described for selection of the rated fuse current necessarily imposes values which are always higher than 1.33 In.
- **Short-circuit current.** The short-circuit current limiting curves in fig. C allow the short-circuit current limitation on the load side of the fuses involved in the fault to be appreciated. And this implies smaller sizing of the load side apparatus.

Example of coordination for overload of a fuse-relay with inverse time delay trip

Motor characteristics:		
Pn	=	1000 kW
Un	=	6 kV
I_{start}	≈	5 In = 650 A
T_{start}	=	6 s
No. hourly operations	=	16.

In the curve with starting time of 6 s in fig. A, in correspondence with the 650 A starting current value, the straight line, traced for 16 hourly start-ups, intersects in the range of the 315 A fuse.

In the fuse blowing time curve, it can be noted that the 315 A fuse blows in 6 s (starting time) when it is passed through by a current of 2000 A.



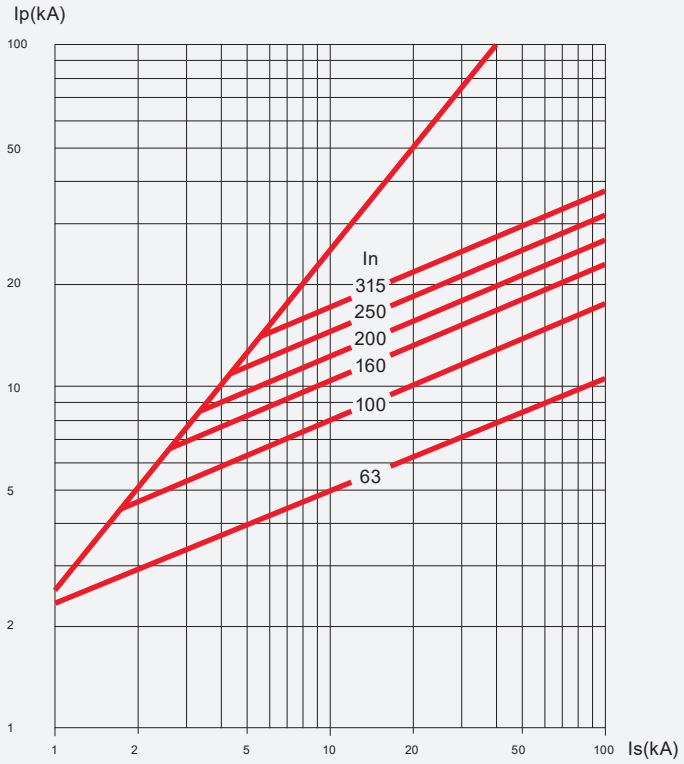


Table for selection of factor K

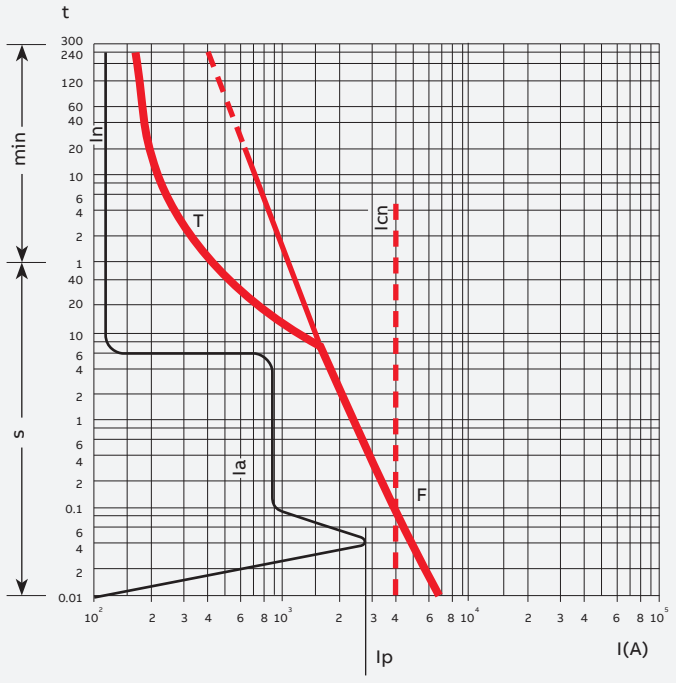
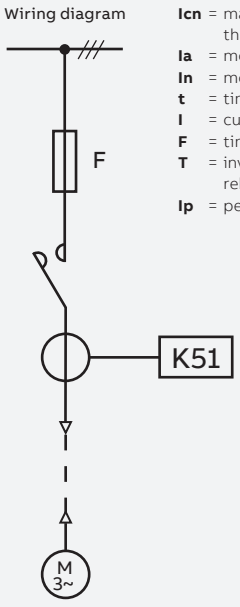
Un [kV]	In [A]					
3.6	63	100	160	200	250	315
7.2	63	100	160	200	250	315
12	63	100	160	200	–	–
K	0.75	0.75	0.7	0.7	0.6	0.6

Fig. B - Curve of fuse blowing times and table for selection of factor K ABB CMF type fuses.

In the table in fig. B, the K coefficient for the 315 A size is 0.6, from which the value If x K = 1200 A is taken, which is higher than the start-up current (650 A), so use of the 315 A fuse is also legitimate in respect of this condition, which regards the possibility of start-ups close together.
By observing the blowing curve of the 315 A fuse, the need to use a relay with inverse time delay trip, or a relay with definite time delay trip for protection against overloads can be noted.
It must be remembered that prolonged overheating, above the temperature foreseen for the class of insulating materials, is harmful and strongly prejudices the life of electric machines.



Specific product characteristics



Is = prospective short-circuit symmetrical current
Ip = current limited by the fuse (peak value)

Fig. C - Short-circuit current limitation curves. ABB CMF type fuses.

Fig. D shows the graph relative to the motor considered in the example.

Icn = maximum short-circuit current in amperes that the contactor can interrupt
Ia = motor start-up current in amperes
In = motor rated current in amperes
t = time in seconds
I = current in amperes
F = time-current characteristic of the 250 A fuse
T = inverse time characteristics of the indirect relay for protection against overloads (K51)
Ip = peak value of the motor connection current

Fig. D - Graph showing the coordination between 250 A ABB CMF fuse and relay with inverse time delay trip.

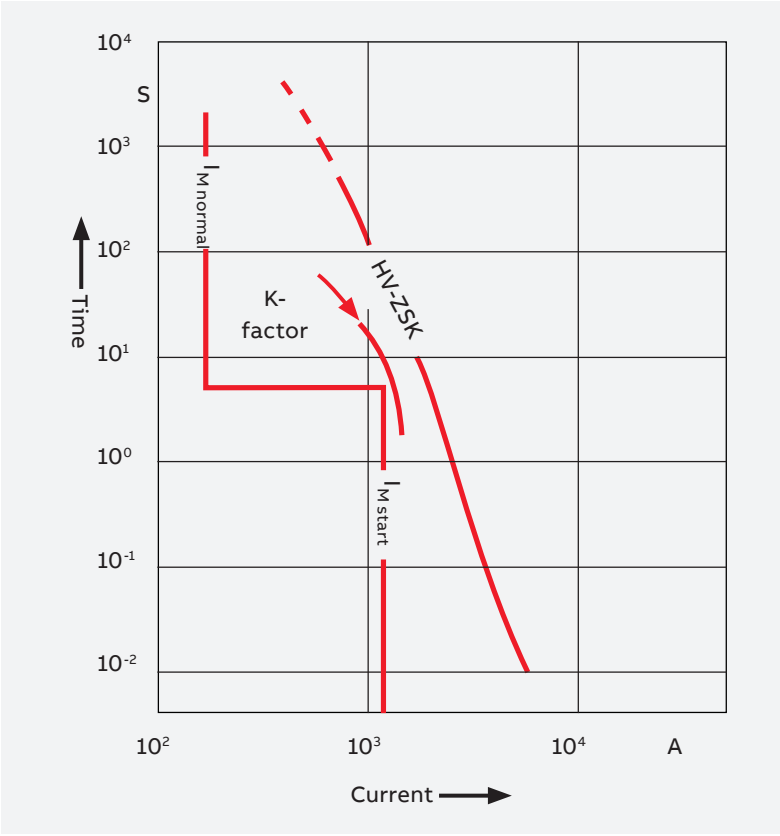


Fig. E - Motor circuit protection as specified in the relevant standards

BS fuses

The HHBM-BM fuse produced by SIBA has been tested.

An important parameter is the magnetic inrush. The magnetic inrush current of a motor is significantly smaller than that of a transformer and of shorter duration, which is due to the fact that there is much less copper and iron in a motor than in a (power-wise) comparable transformer. The main stress criteria applicable to a motor and the accompanying fuse are therefore the starting time t_{start} and the starting current I_{start}. The stress to the fuse is at its maximum when the motor is starting. Consequently, special attention must be paid to these parameters.

The number of starts per hour is determined by the system and shall in any case be specified by the user. The normal operating current must of course also be taken into account for dimensioning. This is required in order to be able to ensure thermal stability in continuous operation. For this, the environmental conditions and the technical data of the switchgear (heat dissipation) need to be considered.

An important requirement for fuses installed in motor circuits is to be highly resistant to repeated motor start-ups. Therefore, the fuse must be designed and dimensioned in order to be insensitive to this type of cyclic stresses.

Depending on the starting frequency, the possible operating current of the fuses decreases as shown in the following table.

It is permissible to have two starts immediately following each other.

Start-up/h	Reduction factor
2	0.59
4	0.53
8	0.48
16	0.43
32	0.39

The diagram shows the motor starting current and the motor starting time.

It is easy to see that the time-current curve of the fuse needs to be on the right-hand side of the motor starting curve, otherwise the fuse would operate and switch-off the current during the run-up period.

The distance between motor and fuse curve represents the safety factor for two consecutive starts. The curve for the K-factor is therefore always within the area limited by the fuse and motor curves.

Specific product characteristics

K-factor

The K-factor (K < 1) is based on the following assumptions:

- Starting time t_{start} < 10 seconds
- Max. 6 starts per hour
- Max. 2 consecutive starts (immediately following each other)

The K-factor is essentially a safety margin for the heat dissipation during consecutive starts.
It can be seen that the factor K is not a constant.
In case of intention to deviate from these assumptions, the fuse manufacturer should be consulted in order to ensure proper fuse selection.
The K- factor is therefore integrated into the selection diagrams with means that the safety factor provided by the fuse standard is already included in order to simplify matters for the user.
HV fuse-links, determined for the protection of motor-circuits, are distinguished by their particular low power-losses.
They also respond relatively slow in the time range between 1 s up to approx. 30 s in order to withstand starting currents repeatedly without changing their characteristic.
Selection diagrams are available for determination of the rated fuse current.
Using the motor starting current, starting time, and starting frequency the rated fuse current can be read out directly.
It is important to use the right diagram fitting to the fuse system selected, because only in this case the K-factor, provided by the fuse standard, is taken into account “automatically.” In the following example the selection diagram (Figure E) represents high-voltage fuses with motor circuit protection characteristics.

Selection in three steps

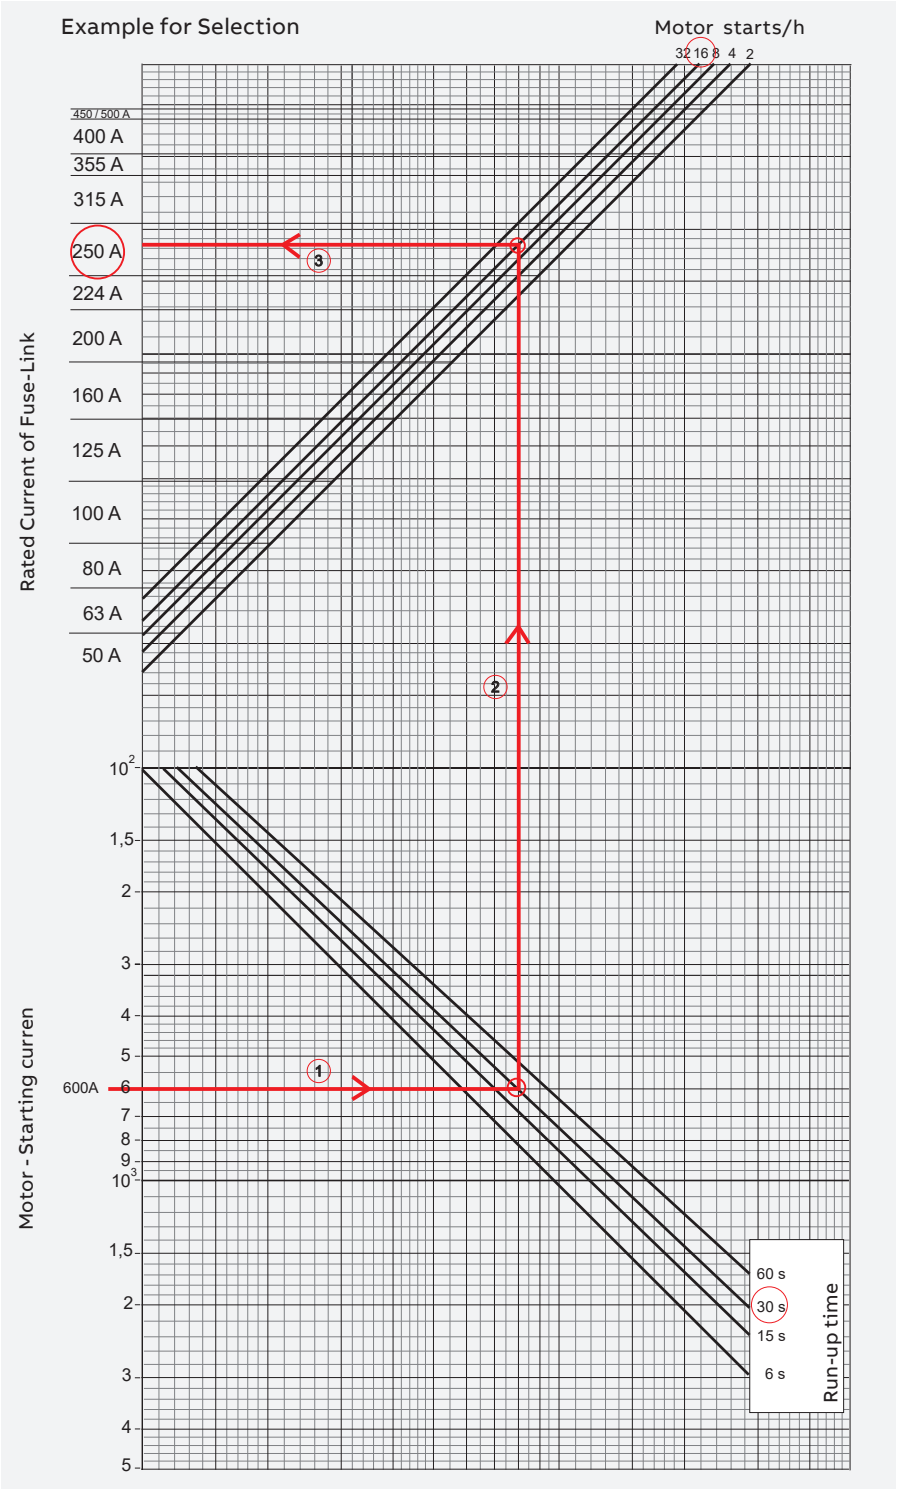
Step 1:

- The following information is required:
- Rated voltage U_r of the system
- Motor data:
  - Rated power P_n of the motor
  - Power factor cosφ
  - Efficiency (η_M)

  or
  - Rated current Ir of the motor
- Maximum starting current I_{start}
- Maximum starting time t_{start}
- Maximum number of starts per hour

For motors reference is made to the mechanical power at the shaft. Therefore, if the rated current Ir of the motor is not indicated, the actual motor current is to be derived from the stated rated power taking into consideration the power factor as well as the efficiency.
This information and additional data will always be indicated by the motor manufacturer because they are essential for design and dimensioning of the system.

Step 2:
The motor starting current is plotted into the selection diagram and the rated fuse current may be read out taking into consideration the starting time and starting frequency (see the example). In limit cases, the next higher nominal fuse current should be chosen, which has the advantage of lower ohmic losses in nominal operation and improved withstand capability in the event of unusual or more frequent starts.



Step 3:
It is mandatory to check whether the rated current of the motor will not lead to inadmissible temperature-rise inside the enclosure. According to actual fuse standards the temperature-rise at the metal contact parts is limited to 75 Kelvin at a maximum ambient temperature of 40 °C. This is required in order to ensure that neither the fuse nor the switchgear is subjected to thermal overload.

Example:

1. Motor data:
- U_r = 7.2 kV
- P_n = 1 100 kW
- cosφ = 0.93
- η_M = 0.95

2. Calculation of rated current Ir of motor:

$$Ir = \frac{P_n}{\sqrt{3} * Ur * \cos\varphi * \eta_M} = \frac{1100\ kW}{\sqrt{3} * 7.2\ kV * 0.93 * 0.95} = 99.84\ A \approx 100\ A$$

3. Additional system data:
- Starting current
  I_{start} = 6 × Ir = 600 A
- Starting time t_{start} = 30 s
- Number of starts/h = 16

Plot into the diagram in Fig. E the starting current of 600 A, go to the right (1) up to the intersection with the 30 s line, then go upwards (2) to the intersection with the 16 starts/h line, then read off 250 A for the rated fuse current on the left (3).
The 7.2 kV – 250 A HV fuse-link is the correct type for this application.

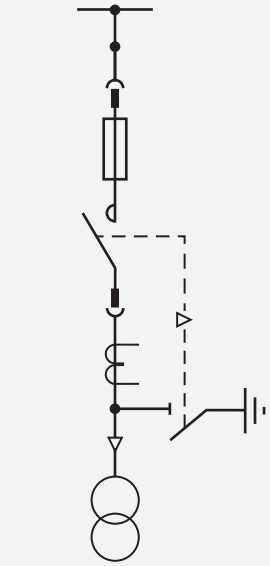
Special conditions:

Consult ABB about the contactor and fuse manufacturer if there are special operating conditions, such as:
- Ambient temperature > 40 °C
- T_{start} time > 60 s
- Number of trips > 32/hour

Specific product characteristics

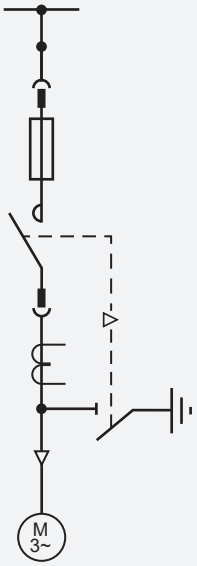
Motor starting

Motor starting poses the problem of the high current consumption on inrush.
In most cases, since these are asynchronous motors, the start-up current can take on the following values:



- asynchronous with simple squirrel cage 4.5 ... 5.5 In
- asynchronous with double squirrel cage 5 ... 7 In
- asynchronous with wound motor: low values, dependent on selection of the starting resistances.

This current cannot be available if the short-circuit power of the network is not sufficiently high and, in any case, can give rise to a drop in voltage for the whole duration of starting, which cannot be tolerated, from the loads derived from the network itself. Normally a voltage drop between 15 and 20% is considered acceptable except for verification needed in the case of special users.



The full voltage start-up condition can be checked analytically and turns out to be possible in most cases.
If the calculations show that the start-up power causes a voltage drop higher than the admissible one, starting with reduced voltage must be used, with consequent reduction in the start-up current. For this purpose, starting with a step-down autotransformer is generally used.
For large motors it may be more convenient to use a transformer, whose sizing can be a little higher than the power required by the motor, dedicated exclusively to the machine: start-up therefore takes place with reduced voltage without the rest of the plant being affected.

By suitably combining different enclosures, with withdrawable contactors appropriately fitted with accessories, any motor starting, control, protection and measurement diagram can be made.

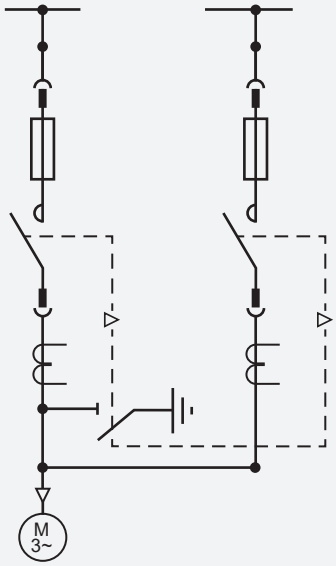


Fig. F shows some typical electric diagrams which can be made with withdrawable contactors.

Specific product characteristics

Transformer protection and fuse selection ([1])

When contactors are used for transformer control and protection, they are fitted with special types of current-limiting fuses which guarantee selectivity with other protection devices and which can take the high transformer connection currents without deterioration.
Unlike what has been seen for motors, in this case protection against overcurrents on the medium voltage side of the transformer is not indispensable since this task is carried out by the protection provided on the low voltage side. The protection on the medium voltage side can be entrusted to the fuse alone, which must be selected taking into account the no-load connection current, which can reach values up to 10 times the rated current for smaller transformers built with orientated crystal core laminations.
The maximum connection current is reached when circuit breaker closing takes place in correspondence with passage through zero of the voltage.
Another result to be guaranteed is protection against faults in the low voltage winding and in the connection stretch from this to the circuit breaker located on the secondary winding, avoiding the use of fuses with rated current which is too high, to be able to ensure tripping within a short time even under these fault conditions.
A rapid check of the short-circuit current at the secondary terminals of the transformer and on the supply side of the circuit breaker on the secondary, if placed at a significant distance, allows the trip time to be verified on the fuse blowing curve.
The table of use given below takes both the required conditions into account, i.e. rated current sufficiently high to prevent unwarranted blowing during the no-load connection phase and, in any case, of a value which guarantees protection of the machine against faults on the low voltage side.

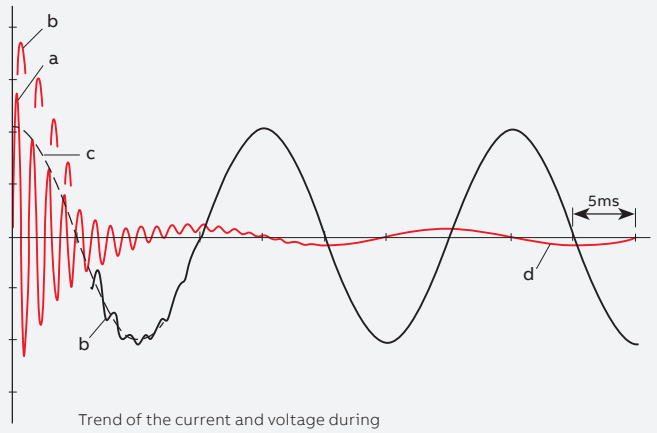
Connection of capacitors

The presence of current transients, which occur during switching-in of a capacitor bank, requires attention during the calculation procedures. In fact, assessment of the size of the phenomenon provides the elements for selecting the switching apparatus suitable for connecting/disconnecting the bank and for guaranteeing its protection in the case of overload.
To make this calculation, the power factor correction installations must be divided into two types:

1) installations with a single three-phase capacitor bank (single bank installations)
2) installations with several three-phase capacitor banks, which can be connected separately (multiple bank installations).

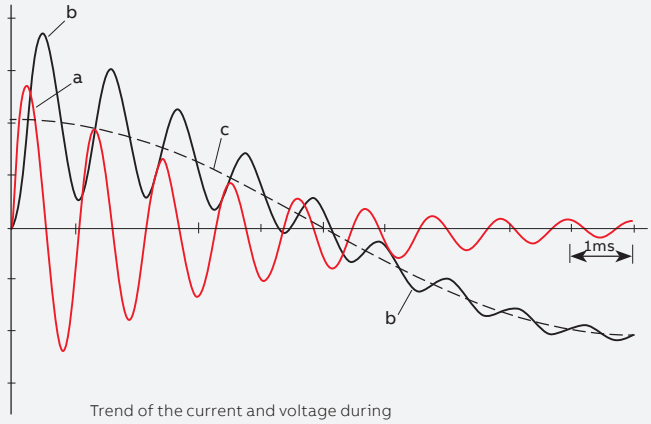
In the first type of installations there is only one type of switching-in transient, called switching-in transient of a single capacitor bank to the network. An example of a typical current transient is shown in fig. A.
In the second type of installations there are two types of switching-in transients:

- on connection of the first capacitor bank there is the switching-in transient of a capacitor bank to the network
- on connection of the other banks there is a switching-in transient of a capacitor bank to the network with other banks already supplied in parallel. In this case, the current transient is the type shown in fig. B.



Selection of contactors suitable for connection of capacitor banks
The CEI 33-7 and IEC 871-1/2 Standards specify that the capacitor banks "... must be able to operate correctly under overload with an effective line current value up to 1.3 In, not taking into account the transients".

([1]) Selection criteria relative to ABB CEF type fuses.



Selection table for fuses for transformers

Rated voltage of the transformer	Rated transformer power [kVA]																		Rated voltage of the fuse
	25	50	75	100	125	160	200	250	315	400	500	630	800	1000	1250	1600	2000	2500	
[kV]	Rated current of fuse CEF [A]																		[kV]

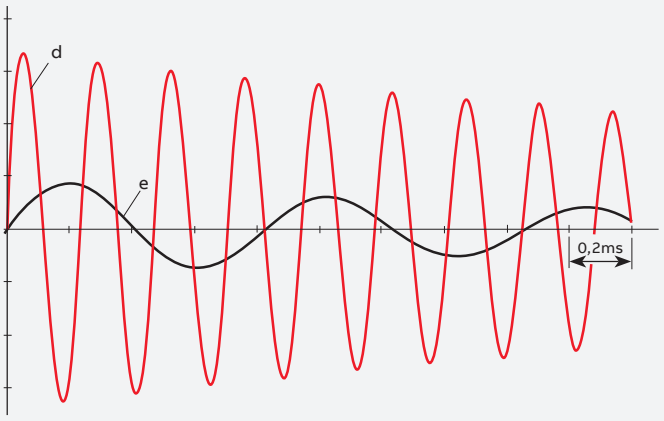
Trend of the current and voltage during and after the switching-in transient.



Trend of the current and voltage during the first 10 ms of the switching-in transient.

a = Transient switching-in current: first peak at 600 A peak and 920 Hz frequency.
b = Transient voltage at the 400 kVAR bank terminals.
c = Power supply phase voltage 10/÷3 = 5.8 kV.
d = Rated bank current at 50 Hz: 23.1 A.

Fig. A - Example of a current transient during connection of a single capacitor bank.

Trend of the current and voltage during the first 2 ms of the switching-in transient.

Trend of the two components of the total current (see graph above).

a = Transient switching-in current: 1800 A peak and 4280 Hz frequency.
b = Transient voltage at the 400 kVAR bank terminals
c = Power supply phase voltage: 10/÷3 = 5.8 kV.
d = Component at 4280 Hz frequency of the transient switching-in current.
e = Component at 1260 Hz frequency of the transient switching-in current.

Fig. B - Example of a current transient during connection of a capacitor bank with another one already supplied with voltage.

Specific product characteristics

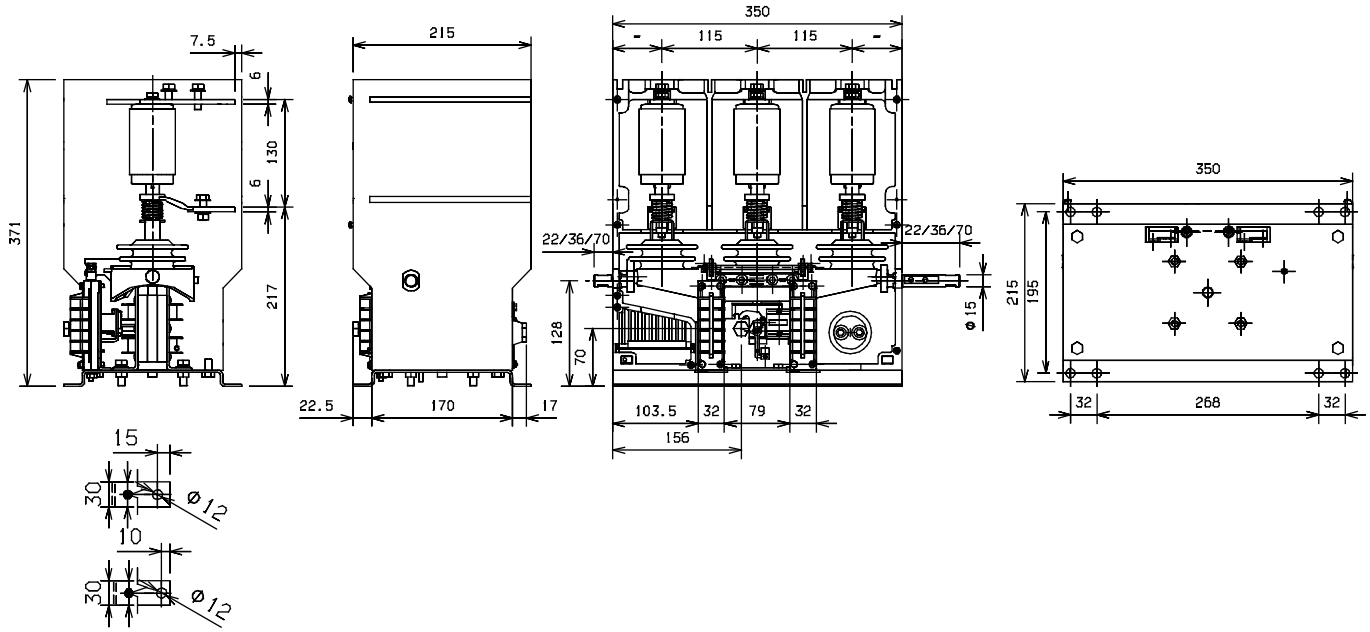
The switching, protection and connection devices must therefore be designed to withstand continuously a current 1.3 times the current there would be at the rated sinusoidal voltage and at the rated frequency.
According to the effective value of the capacity, which may also be 1.10 times the rated value, this current can have a maximum value of 1.3 x 1.10 = 1.43 times the rated current.
It is therefore advisable to select the rated normal current of the contactor for operating the capacitor bank at least equal to 1.43 times the rated current of the bank.
The V-Contact VSC contactors completely fulfil the requirements of the Standards, particularly those regarding connection and disconnection operations of banks and the overvoltages which, in any case, do not exceed three times the peak value of the rated phase voltage of the installation.

Single bank
The parameters of the current transient, peak values and own frequency, which are present in the case of connection of the bank to the network, are usually of notably smaller size than those in the case of multiple banks.

Two or more banks (back-to-back)
In the case of several capacitor banks, it is necessary to make the calculations regarding the installation, considering operation of a single bank with the other capacitor banks already connected. Under these conditions, it is necessary to check that:
- maximum switching-in current does not exceed the value given below (see table);
- switching-in current frequency does not exceed the value given below (see table)..

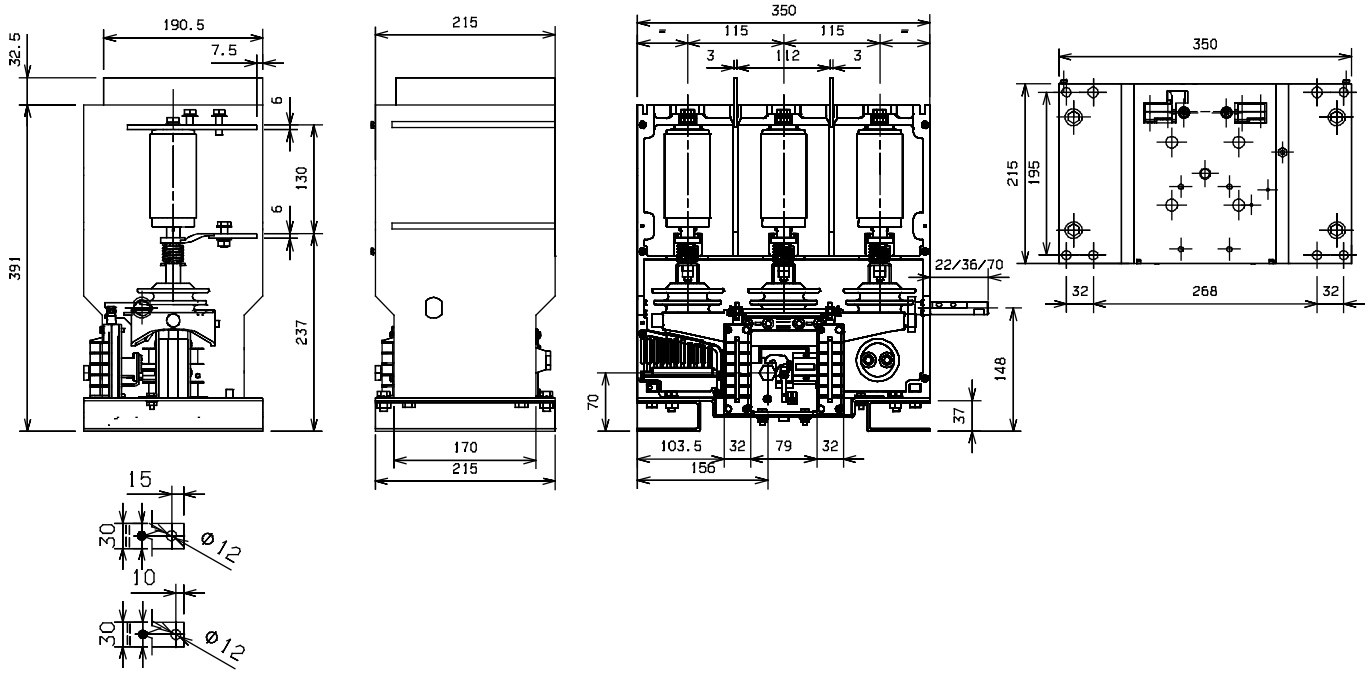
Contactor	Peak current	Maximum switching-in frequency	Ip (ka) x f (Hz)
VSC-S	8 kAp	2.500 Hz	20000

If the maximum switching-in current is lower than 8kA than the switching in frequency can be higher, provided that multiplying the current for the frequency the result is lower than
Ip (kA) x f (Hz) = 8 x 2,500 = 20.000
for instance:
Ip (kA) = 5kA the maximum allowed switching-in frequency become
f (Hz) = 20.000 / 5 = 4.000Hz



This rule is applicable for switching currents lower than 8kAp thet is the maximum value not to be exceeded even if the frequency is lower than 2500Hz.
To calculate the switching-in current and frequency, refer to the ANSI C37.012 Standards or to the IEC 62271-100 Annex H Standards.
If the result of calculation is a switching-in current and frequency higher than the maximum allowed than is necessary to connect air reactors of suitable value in the circuit taking into account also cables connected.
In case of frequent operations with high switching-in frequencies use of reactors is recommended.

Environmental protection programme



The V-Contact VSC contactors are constructed in compliance with the ISO 14000 Standards (Guidelines for environmental management).
The production processes are carried out in compliance with the Standards for environmental protection both in terms of reduction of energy consumption and raw materials and of production of waste. All this is thanks to the environmental management system in the production facility conforming to what is certified by the certifying Organisation.
The minimal environmental impact during the life cycle of the product (LCA - Life Cycle Assessment), is obtained by targeted selection of materials, processes and packing made during the design stage.
The production techniques prepare the products for easy dismantling and easy separation of the components to allow maximum recycling at the end of the useful life cycle of the apparatus.
For this purpose, all the plastic components are marked according to ISO 11469 (2nd ed. 15.05.2000).
When compared with a contactor fitted with a traditional operating mechanism, V-Contact VSC contactors allow an energy saving which prevents emission into the atmosphere of about 7000 kg of carbon dioxide (CO_2).

For your safety!

- Make sure that the installation room (spaces, divisions and ambient) is suitable for the electrical apparatus.
- Check that all the installation, putting into service and maintenance operations are carried out by qualified personnel with suitable knowledge of the apparatus.
- Make sure that the standard and legal prescriptions are complied with during installation, operation and maintenance, so that installations according to the rules of good working practice and safety in the work place are constructed.
- Strictly follow the information given in this instruction manual.
- Check that the rated performance of the apparatus is not exceeded during service.
- Check that the personnel operating the apparatus have this instruction manual to hand as well as the necessary information for correct intervention.
- Pay special attention to the danger notes indicated in the manual by the following symbol:

Responsible behaviour safeguards your own and others' safety!

For any requests, please contact the ABB Assistance Service.

I. Introduction

The instructions in this manual refer to the fixed and withdrawable versions of the VSC series of contactors. For correct use of the product, please read it carefully.

For the electrical and construction characteristics and the overall dimensions of the V-Contact VSC contactors, please also see technical catalogue 1VCP000165.

Like all the apparatus we manufacture, the V-Contact vacuum contactors are designed for different installation configurations. Furthermore, this apparatus allows further technical and construction modifications (at the customer's request) to adapt to special installation requirements. Consequently, this manual may not provide information concerning special configurations of the apparatus.

Apart from this manual, it is therefore always necessary to consult the latest technical documentation (circuit and wiring diagrams, assembly and installation drawings, any protection coordination studies, etc.), especially regarding any variants requested in relation to the standardised configurations.

Only use original spare parts for maintenance operations. The use of non-original spare parts can cause hazardous malfunctions and the apparatus warranty will no longer be valid.

Please refer to the technical sheets of the Kits for correct assembly of the accessories and/or spare parts. For further information, also see the 1VCP000165 technical catalogue of the contactor and the spare parts catalogue.

This manual and all the enclosed drawings must be considered an integral part of the apparatus. They must be easily to hand at all times for revision and reference.

These instructions do not intend to cover all the details, configurations or variants of the apparatus, storage or installation. For this reason, the information given below may sometimes not contain the instructions regarding special configurations. This does not relieve the user from their responsibility for using good technical working practices in application, installation, service and maintenance of the apparatus purchased. Should further information be required, please contact ABB.

WARNING

Dangerous voltages. Risk of death, serious injury to people, damage to the apparatus or other objects.

Before carrying out any maintenance operations, turn the power supply off and earth the apparatus.

Read and understand this instruction manual before installation, service or maintenance of the apparatus.

Maintenance must only be carried out by skilled personnel.

The use of unauthorized spare parts for repairs to the apparatus, modification of the apparatus itself, or tampering by unskilled personnel creates hazardous conditions which may cause death or serious injury to people, or damage to the apparatus or other objects. Carefully follow all the safety instructions given in this manual.

II. Environmental protection programme

The V-Contact VSC vacuum contactors are manufactured in accordance with the ISO 14000 Standards (Guidelines for environmental management). The production processes are carried out in compliance with the Standards for environmental protection in terms of reduction in energy consumption as well as in raw materials and production of waste materials.
All this is thanks to the medium voltage apparatus manufacturing facility environmental management system.

III. Application of the X-ray emission Standards

One of the physical properties of vacuum insulation is the possibility of X-ray emission when the interrupter contacts are open. The tests carried out at the PTB laboratories (Physikalisch-Technische Bundesanstalt, in Brunswick - Germany) show that local emission at a distance of 10 cm from the interrupter or pole surface, does not exceed 1 µSv/h. It follows that:

– at the rated service voltage the use of vacuum interrupters is absolutely safe;
– application of the withstand voltage at power frequency, according to the IEC 62271-1 Standard, is safe;
– application of a voltage higher than the withstand voltage at power frequency or of a direct current test voltage, specified in the IEC Standard, cannot be used;
– limitation of the above-mentioned local phenomena, on interrupters with open contacts, depends on keeping the specified distance between the contacts. This condition is intrinsically guaranteed by correct operation of the drive and by transmission system adjustments.

IV. Safety information

All the installation, putting into service, running and maintenance operations must be carried out by suitably qualified personnel with in-depth knowledge of the apparatus. Make sure that the personnel working on the apparatus have this manual to hand and all the information required for correct intervention.
Strictly follow the information given in this instruction manual. Make sure that during the installation, service and maintenance stages the standard and legal requirements for constructing the installations in accordance with the regulations for safety in the workplace are respected.
Check that the rated performance of the apparatus is not exceeded during service.

V. Qualified personnel

For the purposes of this manual and the product rating plates, a qualified person is intended as a person who:

1) carefully reads the instruction manual all the way through.
2) has in-depth knowledge of the installation, construction and service of the apparatus and knows about the risks connected with any interventions.
3) is qualified and authorised to energise, de-energise, earth and identify the circuits according to the safety procedures and the local regulations in force.
4) is qualified and authorised to put this apparatus into service, and to carry out maintenance and repair operations on it.
5) is trained in correct use of protective equipment, such as rubber gloves, hard hats, protective goggles, face shields, flameproof clothing, etc. according to the safety procedures and the local regulations in force.
6) is trained in first-aid procedures.

VI. Interventions in the field

ABB can provide competent and well-trained personnel for assistance in the field to give technical guidance and consultancy regarding installation, full servicing, repair and maintenance of apparatus.

1. Description

The medium voltage V-Contact VSC contactors are pieces of apparatus suitable for operating in alternating current and are normally used to control users requiring a high number of hourly operations.

The basic contactors consist of:

- moulded polyester resin monobloc containing the vacuum interrupters
- bistable electromagnet actuator
- multi-voltage feeders
- auxiliary contacts
- mechanical status indicator (open/closed)
- manual emergency opening device.

Apart from what is specified for the fixed contactors, the withdrawable contactors also consist of:

- fuseholders preset for DIN or BS fuses (according to the customer's requirements)
- automatic opening device for intervention of even a single fuse
- truck
- lock which prevents closing during the racking-in/out operation.

The V-Contact VSC contactor introduces the drive with permanent magnets - already widely used, experimented and appreciated in medium voltage circuit-breakers - into the worldwide panorama of medium voltage contactors.
The experience acquired by ABB in the field of medium voltage circuit-breakers fitted with drives with "MABS" permanent magnets, has made it possible to develop an optimised version of the actuator (Bistable MAC drive) for medium voltage contactors.

The drive is operated by means of an electronic feeder able to cover all the power supply voltages required by the major international Standards.

1.1. "MAC" magnetic drive

Based on the experience gained in the field of circuit-breakers with magnetic drive, ABB has implemented this technology in the field of contactors.

The magnetic drive adapts perfectly to this type of apparatus thanks to its precise and linear travel.

This means that a simple and direct axial transmission of the movement to the moving contacts of the vacuum interrupter can be realised, with both electrical and mechanical benefits.

The drive, which is of bistable type, is fitted with an opening and a closing coil.

The two coils - individually energised - allow the drive core to be moved from one of the two stable positions to the other.

The drive shaft is solid with an iron core which is immersed and held in position in a field generated by two permanent magnets (fig. A).

Energising the coil opposite to the magnetic latching position (fig. A) of the core, the magnetic field (fig. B) is generated, which attracts and moves the core into the opposite position (fig. C).

Every opening and closing operation creates a magnetic field concordant with the one generated by the permanent magnets, with the advantage, during service, of keeping the intensity of the field itself constant as the number of operations carried out increases.

The energy needed for operation is not supplied directly by the auxiliary power supply, but is always "stored" in the capacitor which acts as an energy accumulator, and therefore operation always takes place with constant speeds and times, regardless of the divergence of the power supply voltage from the rated value.

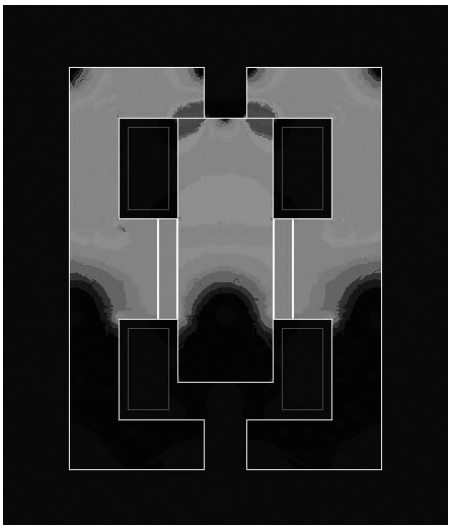

Fig. A
Magnetic circuit in the closed position.

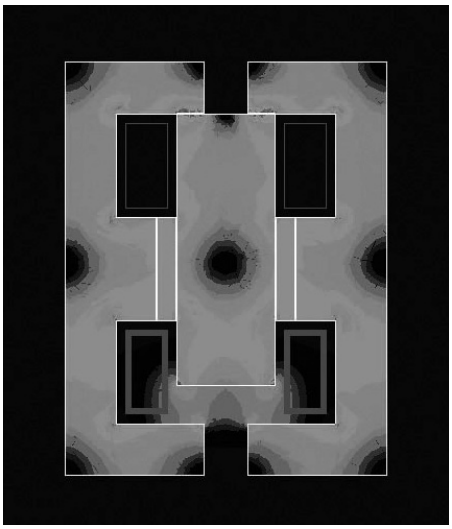

Fig. B
Magnetic circuit with opening coil supplied.

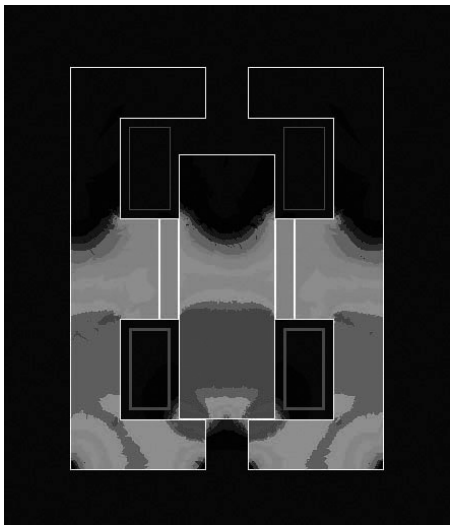

Fig. C
Magnetic circuit in the open position.

The auxiliary power supply only has the aim of keeping the capacitor charged.
Consumption is therefore minimal.

The power required by the electronic device is indicated in the table below:

Power supply voltage	Starting (1)		After closing	After opening	Continuous power consumption
	Inrush for 2 ms	Inrush for 6 sec	Inrush for 1.2 sec	Inrush for 1.2 sec	
24...60 V DC 110...250 V DC 110...250 V AC	42 A (2)	35 W	25 W	30 W	5 W

(1) This value refers to a discharged capacitor.
(2) The value drops to 8 A for voltage values between 24...30V

Supply from voltage transformer or from UPS (Uninterrupted Power System) not available.
Use the ABB S282UC-C3 thermal-magnetic circuit-breaker or an equivalent type to protect the secondary circuits.
After powering, the electronic board takes 15 seconds to perform self-diagnosis and then prepares for normal operation, depending on the configuration. Do not operate the contactor during this phase. Contact DO1 will remain open, signal “not ready” and will only close after self-diagnosis has terminated (“ready” state).

Careful selection of the components and a precise design make the electronic multi-voltage feeder extremely reliable, unaffected by electromagnetic interference generated by the surrounding environment and free of any emissions which may affect other apparatus placed in the vicinity.

These characteristics have made it possible for the V-Contact VSC contactors to pass the electromagnetic compatibility tests (EMC).

1.2. Versions available

The V-Contact VSC are available in:
– fixed version without fuseholder
– fixed versions with fuseholder: VSC/F e VSC/FN.
– four withdrawable versions with fuseholder:
  - VSC/P (IEC) and VSC/PG or VSC-S/PG (IEC/GB-DL) withdrawable versions for UniGear, PowerCube, CBE and PowerBloc with manual or motorized truck
  - VSC/PN (IEC) and VSC/PG or VSC-S/PNG (IEC/GB-DL) both versions withdrawable for UniGear MCC with manual truck.

(1) Overvoltage surge arresters are compulsory between phases and between phase and earth.

1.6. Contactor auxiliary circuits

10 auxiliary contacts (5 normally open and 5 normally closed) are available on the contactor for the customer's use, with the following characteristics.

Auxiliary contacts characteristics		
Rated voltage	24 … 660	V
Rated normal current	10	A
Rated short time current (30 ms, 20 times)	100	A
Rated frequency (for AC only)	50	Hz
Rated insulation voltage (DC)	800	V
Rated insulation voltage (AC)	660	V
Insulation test voltage	2500	V
Number of contacts	5	-
Stroke	6 … 7	mm
Maximum contact resistance	10	mΩ
Storage temperature range	-20 … +120	°C
Operating temperature range	-20 … +70	°C
Emperature rise of contacts	30	K
Breaking capacity (single contact τ = 20 ms, 250 V dc)	250	W
Breaking capacity (single contact τ = 20 ms, 110 V dc)	440	W
Breaking capacity (two contacts in series τ = 20 ms, 250 V dc)	440	W

Characteristics of the contacts of the “Coil Continuity Control” and “Capacity Survey” devices	
Technology	Relay with air-insulated contacts
Breaking characteristics:	
Maximum breaking power	1200 VA (on resistive load)
Maximum breaking voltage	277 V AC, 30 V DC
Maximum breaking current	3 A
Rated current	5 A @ 4 s
Contact characteristics:	
Maximum resistance with contact open	150 mohm (measure of voltage drop 6 V DC 1)
Maximum capacity	1.5 pF
Trip times:	
During closing	5.0 ms
During release	2.0 ms
Insulation:	
Between contacts and coil	3000 V rms (50 Hz / 1 min.)
Between open contacts	750 V rms (50 Hz / 1 min.)
Resistance with contacts open	Min. 103 Mohm at 500 V DC

1.7. Compliance with Standards

V-Contact contactors comply with the Standards of the major industrialised countries and in particular with the following Standards:

– IEC 62271-106 (2011);
– IEC 62271-1 (2007);
– GB/T 14808-2001;
– DL/T 593-2006;
– IEC 60278 replaced by IEC 62271-200;
– IEC 60694 (2002) replaced by IEC 62271-1;
– IEC 60056 (4.104) replaced by IEC 62271-100;
– IEC 60470 replaced by IEC 62271-106.

1.8. Protection against short-circuit

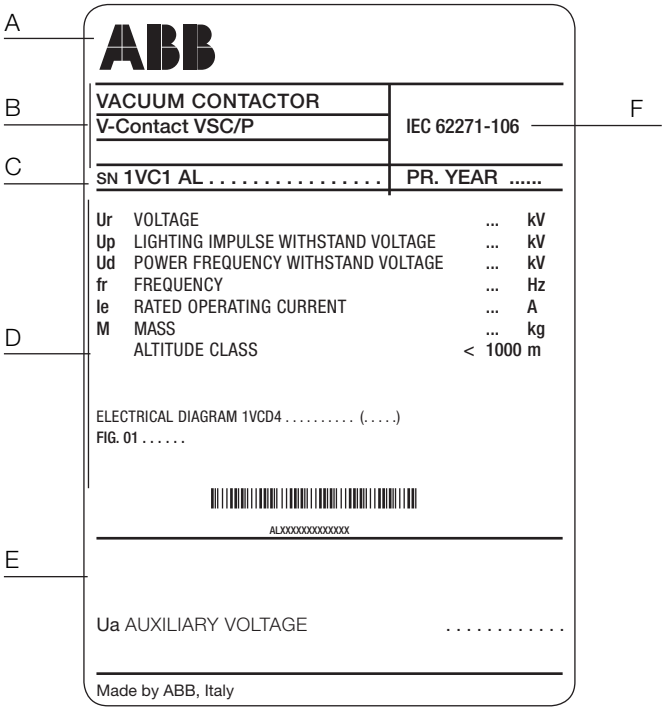
The value of the installation short-circuit current could exceed the breaking capacity of the contactor. The contactor must therefore have adequate protection against short-circuit.

Fuse replacement must only be carried out by qualified personnel.

2. Checking on receipt

During handling, take great care not to stress the insulating parts of the apparatus and the terminals of the contactor.

Any operation carried out on the contactor must be done without the presence of voltage and with the main protection device open: danger of electrocution and/or severe burns.



Make sure that operations are carried out with the main and auxiliary power off.

On receipt, immediately check integrity of the packing and the colour of the “SHOCKWATCH” indicator (Fig. 1) placed on it.
If the “SHOCKWATCH” impact indicator is WHITE, it means that the packing has not received any notable shocks during transport. Open the packing, remove the contactor as indicated below, and check the state of the apparatus and its correspondence with the nameplate data (see fig. 2) with what is specified in the accompanying shipping note and in the order confirmation sent by ABB.
If the “SHOCKWATCH” impact indicator is RED, follow the instructions indicated on the plate.
Opening the packing does not damage its components and it can therefore be re-instated using the original material.
The contactor is shipped in special packing, in the open position.
Each piece of apparatus is protected by a plastic cover to prevent any infiltration of water during the loading and unloading stages and to keep the dust off during storage.
To remove the contactor from the packing, proceed as follows:
– open the plastic bag
– remove the contactor, avoiding any stress to the functional insulating parts and the terminals of the apparatus.
– use the special lifting plates for the withdrawable version
– check the rating plate characteristics to make sure that the performances are suitable for the destined application and that they are those indicated in the order confirmation.

Should any damage or irregularity be noted in the supply on unpacking, notify ABB (directly or through the agent or supplier) as soon as possible and in any case within five days of receipt.
The apparatus is only supplied with the accessories specified at the time of ordering and validated in the order confirmation sent by ABB.
The accompanying documents inserted in the shipping packing are:
– instruction manual (this document)
– test certification
– identification label
– fiscal copy of the shipping advice note
– electric wiring diagram.

Fig. 1

A Trademark
B Type of apparatus
C Serial number
D Characteristics of the apparatus
E Characteristics of the control auxiliaries
F Reference standards

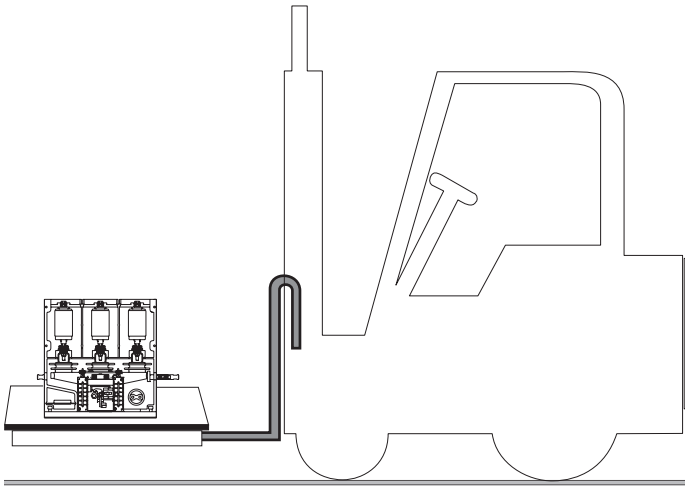
Fig. 2

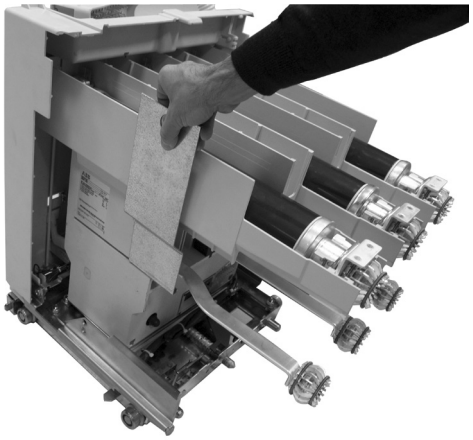
Other documents which are sent prior to shipment of the apparatus are:
– order confirmation
– original shipping advice note
– any drawings or documents referring to special configurations/conditions.

3. Handling

The contactor can be lifted using a lifting truck or a fork-lift truck.
The following precautions must be taken during contactor handling:

1. Keep the contactor in the upright position.
2. Make sure that the load is balanced on the truck or on the transport plate/pallet.
3. Interpose protective material between the contactor and the truck to avoid any damage or scratches.
4. Fix the contactor onto the truck or onto the transport plate/pallet to prevent it moving or tilting over.
5. Avoid excessive speed, sudden starts and stops or sharp changes in direction during contactor handling.
6. Only lift the contactor enough to avoid any obstacles on the floor.
7. Take care to avoid any impacts with structures, other apparatus or with personnel when handling the contactor.
8. Never lift a contactor over an area where there are people.
9. During handling of the apparatus, do not stress the insulating parts and the contactor terminals.





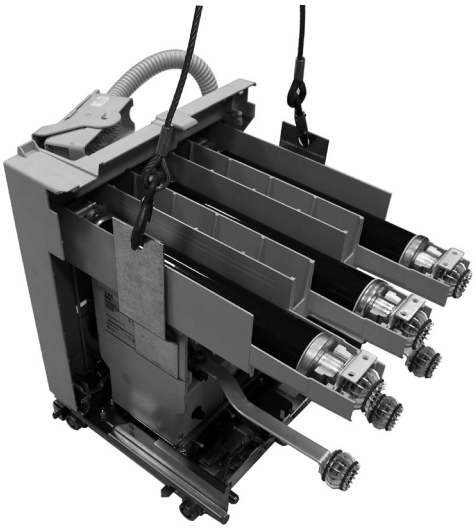


Fig. 3a - Handling using a lifting or fork-lift truck.

3.1. Handling and lifting using a crane

– Insert the lifting plates
– Lift
– After the unpacking and lifting operations, remove the lifting accessories.
  Warning: with lifting tools, it is mandatory to move the contactors not by pulling them, but by pushing them from the screen

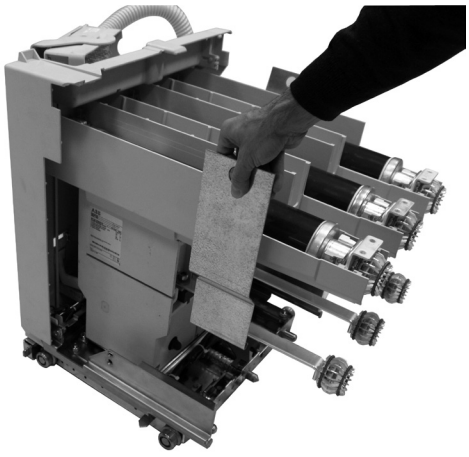

Fig. 3b - Removal of the contactor from the packing and dismantling the lifting tools.

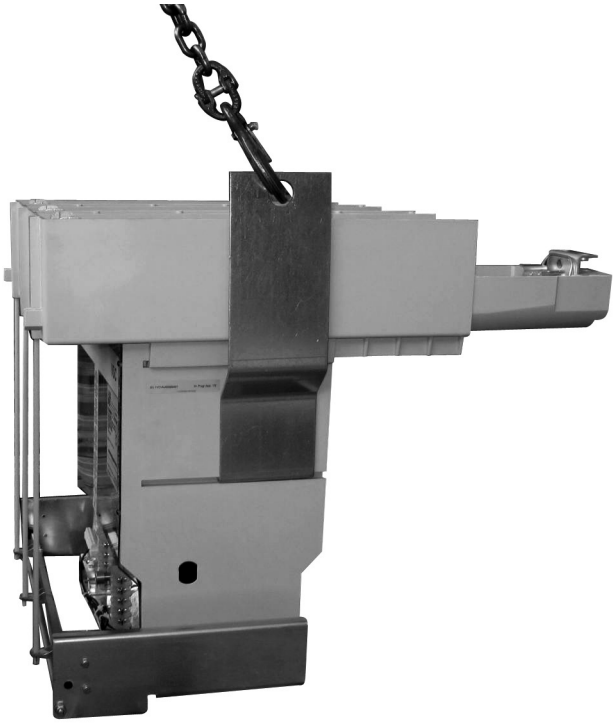

Fig. 3c - Fixed contactor with fuses

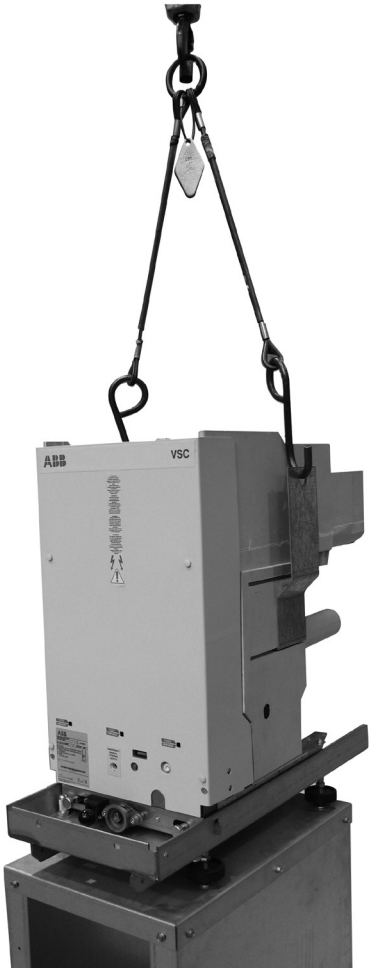

Fig. 3d - Withdrawable contactor

4. Storage

When a period of storage is foreseen, the original packing must be put back. Store the contactor in a dry dust-free area. It must not be left outside or in adverse micro-climatic conditions: if it is left without protection, rust and deterioration of the insulation can occur.
Insert special hygroscopic packets inside the packing, with at least one standard packet per piece of apparatus. Replace the packets approximately every 6 months.

Should the original packing no longer be available and immediate installation is not possible, store in a covered, well-ventilated, dry, dust-free, non-corrosive ambient, with a dry atmosphere, away from any flammable materials and at a temperature between – 5 °C and + 40 °C.
In any case, avoid any accidental impacts or positioning which stresses the structure of the apparatus.

5. Installation

5.1. General

Correct installation is of primary importance. The manufacturer's instructions must be carefully studied and followed. It is good practice to use gloves for handling the pieces during installation.

The areas involved in the passage of power conductors or conductors of auxiliary circuits must be protected against access of any animals which might cause damage or disservices.

The contactor enclosure must be installed in a clean, dry and heated place with good ventilation. It must be easily accessible for cleaning and inspection, and must be levelled, placed on the supporting foundations and securely fixed into position.
When the contactor is connected to a capacitive load, make sure that there is a heating element to keep the humidity down and of suitable size for the compartment where the contactor is installed. The contactor must always be installed associated with a suitable protection device (e.g.: fuses).

The fixed version of the V-Contact VSC contactors must be installed by the customer so as to guarantee a minimum degree of protection of IP2X.

5.2. Installation and operating conditions

The following Standards must be taken into particular consideration during installation and service:
- IEC62271-1/DIN VDE 0101
- VDE 0105: Operation of electrical plants
- DIN VDE 0141: Earthing systems for electrical installations with rated voltage higher than 1 kV
- All the accident prevention regulations in force in the relative countries.

5.3. Normal conditions

Follow the recommendations in the IEC 62271-1 and 62271-106 Standards. In more detail:

Ambient temperature	
Maximum	+ 40 °C
Average maximum over 24 hours	+ 35 °C
Minimum (according to class – 5), apparatus for indoor installation	– 5 °C

Humidity

The average value of the relative humidity, measured for a period longer than 24 hours, must not exceed 95%.
The average value of the water vapour pressure, measured for a period longer than 24 hours, must not exceed 2.2 kPa.
The average value of the relative humidity, measured for a period longer than 1 month, must not exceed 90%.
The average value of the water vapour pressure, measured for a period longer than 1 month, must not exceed 1.8 kPa

Altitude

< 1000 m above sea level.

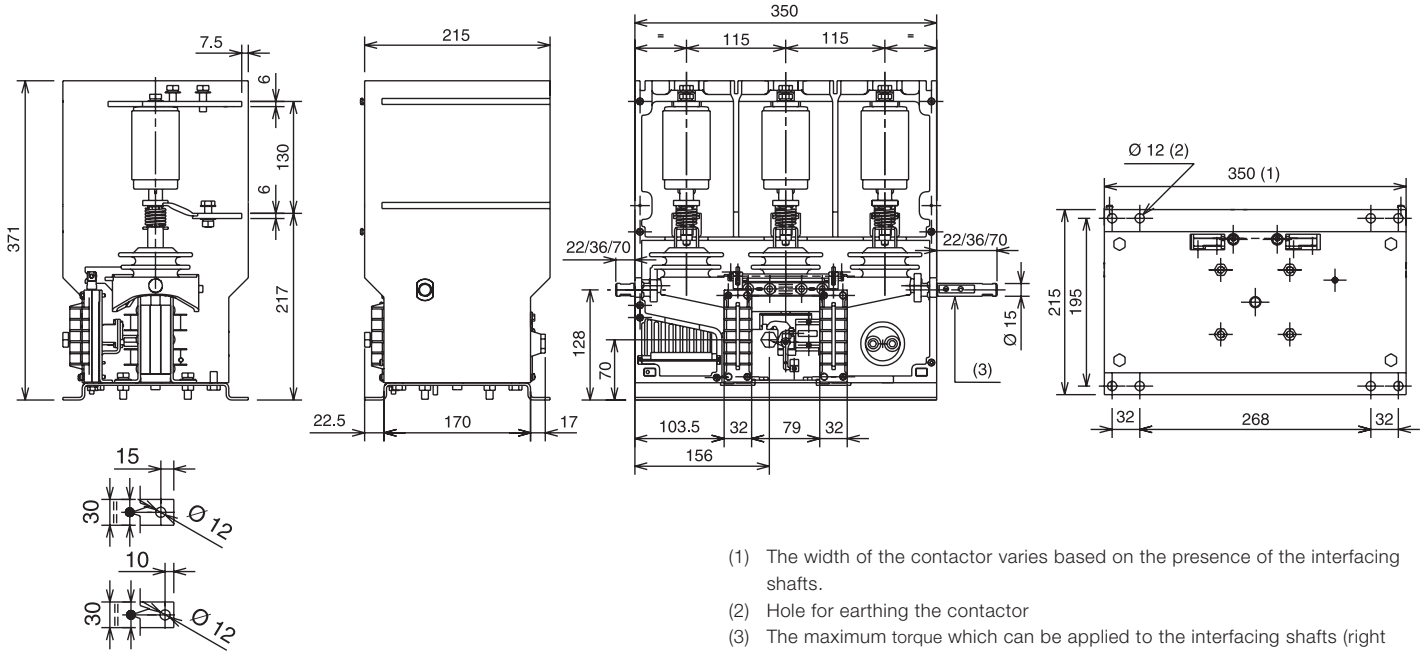
5.4. Special conditions

Installations above 1000 m a.s.l.

Possible within the limits allowed by reduction of the dielectric resistance of air.
For altitudes over 2000 m ask ABB.

Climate - Increase in temperature

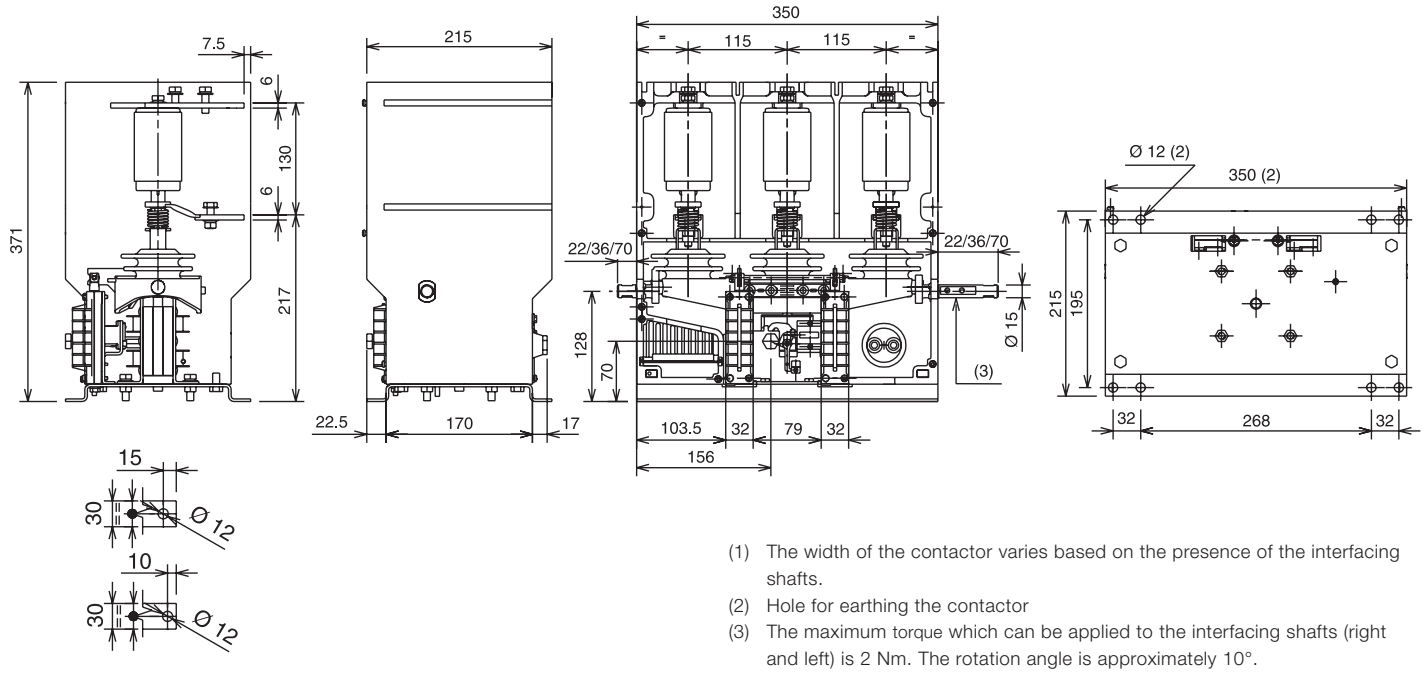
In order to avoid the risk of corrosion or other damage in areas with high humidity and/or rapid large fluctuations in temperature, take appropriate measures (for example, using suitable electric heaters) to prevent any condensation phenomena.



For special installation requirements or other operating conditions, please contact ABB.

5.5. Overall dimensions

5.5.1. VSC fixed contactor



For the overall dimensions and distances between fixing holes, refer to figure 4a.
In any case, avoid stressing the supporting structure of the contactor: if necessary, arrange slots in the fixing area to facilitate correct positioning of the apparatus.
The assembly positions can be selected between the two shown in figure 4b.

VSC7

(1) The width of the contactor varies based on the presence of the interfacing shafts.
(2) Hole for earthing the contactor
(3) The maximum torque which can be applied to the interfacing shafts (right and left) is 2 Nm. The rotation angle is approximately 10°.

VSC12

5.6. Assembly and making the connections

5.6.1. Fixed contactors

WARNING

Dangerous voltages. Risk of death, serious injury to people, damage to the apparatus or other objects.

Remove the power supply, ground and put all the power and control voltage sources under safe conditions before starting the work on this or any other electrical apparauts.
Installation must only be carried out by qualified personnel.

Introduction

Before carrying out any installation operations:

- Test all the power terminals to check that they are not supplied with voltage. Only use high voltage testing equipment approved for checking the voltage on the power terminals. **Do not attempt to measure the high voltage (above 600 volt) with a volt-ohm/meter.**
- Check all the control and secondary circuit terminals with a voltmeter to ensure that all the control and secondary input voltage sources have been turned off.
- Connect the safety earthing to the power terminals after having turned the power supply to the system off and before working on the apparatus.
- Carry out all the operations for turning off the voltage and earthing according to the established safety procedures.

Power circuit

General precautions

– Check that the connections of the fixed contactor or the isolating contacts of the withdrawable contactor are clean and free of any deformation caused by shocks received during transport or storage in the warehouse.
– Select the cross-section of the conductors according to the service current and the short-circuit current of the installation.
– Prepare special pole insulators, near the terminals of the contactor, sized according to the electrodynamic forces deriving from the short-circuit current of the installation and avoid stressing the connections laterally.

Surface treatment of the connections

The connections can either be made of bare copper or bare aluminium. In any case, it is always advisable to silver-plate the contact surfaces. The surface treatment must have a constant and even thickness.

Assembly procedures for fixed contactors

– Check that the contact surfaces of the connections are flat, and are free of any burrs, traces of oxidation or deformation caused by drilling or impacts received.
– Carry out the operations indicated on the contact surface of the conductor (silver-plated copper):
  - clean with a rough dry cloth
  - only in the case of obstinate traces of oxidation, clean with a very fine grain emery cloth taking care not to remove the surface layer
  - if necessary, restore the surface treatment (consult ABB)
  - put the connections in contact with the contactor terminals, taking care to avoid mechanical stresses produced, for example, by the conductor busbars on the terminals themselves.
– Interpose a spring and a flat washer between the head of the bolt and the connection.
– The use of bolts according to DIN class 8.8 Standards is recommended, also referring to what is indicated in the table.
– In the case of cable connections, strictly follow the manufacturer's instructions for making the terminals.

Bolt	Recommended tightening torque (1) Without lubricant
M6	10.5 Nm
M8	23 Nm
M10	50 Nm
M12	86 Nm

(1) The nominal tightening torque is based on a friction coefficient of the thread of 0.14 (distributed value the thread is subjected to which, in some cases, is not negligible). Take into account the deviations from the general Standards table (for example, for contact systems or terminals) as foreseen in the specific technical documentation. The thread and surfaces in contact with the heads of bolts must be slightly oiled or greased, so as to obtain a correct nominal tightening torque.
The tightening torques indicated can only be applied to metal parts.

Earthing and cabling procedures

VSC conforms to level 3 of the IEC 61000-4-x EMC Standards. With regard to medium voltage switchgear, the plants where the VSC contactors are to be installed must conform to the IEC 60694:2002-01 and IEC 62271-1 ed. 1.0 Standards, to ensure adequate electromagnetic immunity. Pay great attention during earthing and cabling operations of the auxiliary circuits. Follow the procedures indicated. For further advice, please contact the ABB Service office.

Grounding

A good connection to earth guarantees correct operation of all the apparatus installed. However, even earthing carried out correctly is not a sufficient measure to ensure a good connection between the VSC control module and earth. In fact, since the control module of the contactor is connected to the metallic base of the VSC by means of a copper connection (Fig. 7), it is always necessary to check that the connection is intact.
Furthermore, earthing must always be carried out between the VSC frame and the main earthing system of the plant.
Use cables with a suitable cross-section and of the minimum length needed.

Connection of metallic structures to exposed conductive parts

In the case of painted parts of the supporting structure, the various parts must always be scraped to eliminate the paint and connected with busbars or copper braids so as to guarantee low inductance connections.
To make a low inductance earthing connection, use cables or busbars with an appropriate cross-section, preferably rectangular. Scrape away the paint of the metallic parts over a sufficiently large area, tighten the fixing screws and cover the connected parts with Vaseline grease.
The length of the earthing cables must be as short as possible. Connection to earth of the parts must guarantee the same electric potential and low impedance.

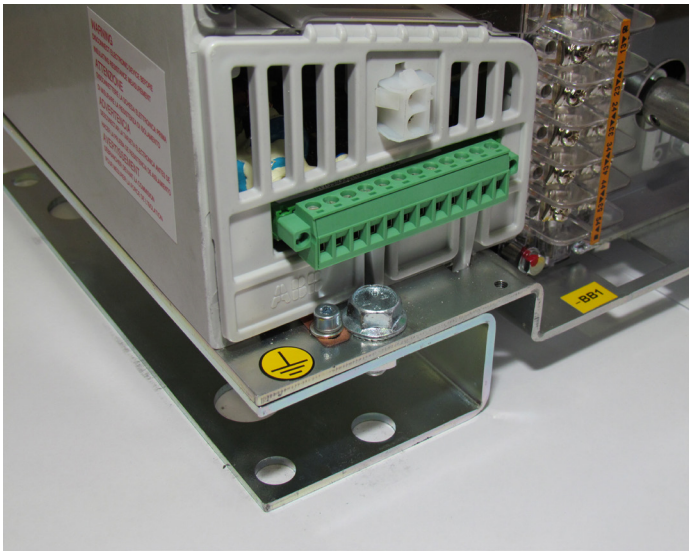

Fig. 7 - Grounding

Figs. 8a - 8b show a grounding operation carried out correctly.

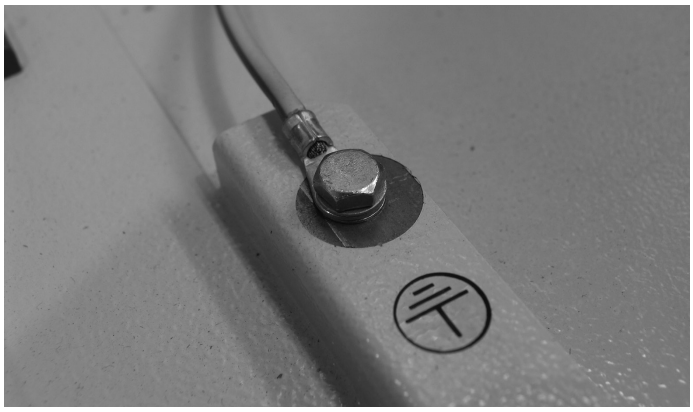

Fig. 8a

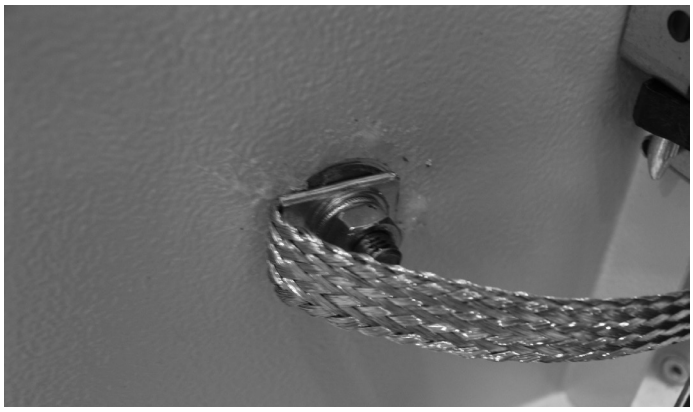

Fig. 8b

Figs. 8c - 8d show a grounding operation not carried out correctly and which, apart from being dangerous, does not guarantee correct operation of the VSC.

Fig. 8c

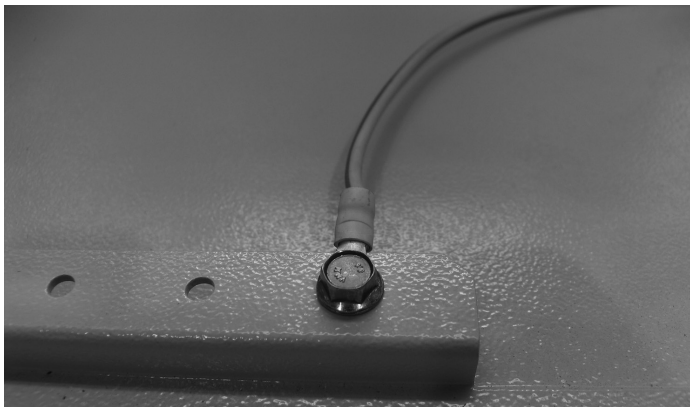

Fig. 8d

Cabling

Make short connections (maximum 1 metre) inside the medium voltage units and avoid positioning them close to the medium voltage busbars.
All long connections must follow paths as close as possible to the metallic frame. The connections must also be fitted with ferrite rings to suppress high frequency interference.
It is good practice to run the cables inside metallic pipes or ducts (earthed at several points) when they are subject to or may be a cause of interference.
Cabling and earthing procedures according to IEC 61000-5-2 Standards: “Technical report: Installation and mitigation guidelines”.

Where possible, the power supply and auxiliary circuit cables must be braided. Their length must be calculated appropriately to prevent any surplus and the maximum length must be:

- 135 m for 24 to 130 V auxiliary voltage
- 400 m for 220 to 250 V auxiliary voltage

Longer lengths require an additional filter for every operating input used (consult ABB).
In any case, any surplus parts of cables must be wound separately and taken into the low voltage apparatus compartment. Always avoid placing them in the vicinity of the medium voltage cables or close to cables which may generate interference or disturbances, such as current or voltage transformer cables or power supply cables.

Connection of the auxiliary circuits

The cables to be used for connection of the auxiliary circuits must have a rated voltage Uo/U of 450/750 V and be insulated for 3 kV test.
Note: before carrying out the test, disconnect the earthing connection of the electronic feeder.
Also remember that the auxiliary circuits must be checked at the maximum voltage of 2 kV for 1 second in accordance with what is prescribed in the Standards.

The cross-section of the connection cables must not be less than 1.5 mm^2.
Connection of the contactor auxiliary circuits must be made by means of the socket with terminal box mounted on the front of the electronic card.
Outside, the wires must run through metallic pipes or ducts suitably earthed.

Connection to be made by the customer (*)

Pins XDB10-1 and XDB10-2 must always be supplied, both in the SCO and DCO version (also see par. 5.8.). The polarity is not important since the internal circuits take both AC or DC signals. For further details, consult the electric circuit diagram enclosed with the apparatus.

N. of pin	Connections	Abbr. of binary outputs/inputs	Meaning of each pin (*)	
			Basic version	"Full option" version
-XDB10-1	Auxiliary power supply	–	Auxiliary power supply AC or DC (pole 1)	Auxiliary power supply AC or DC (pole 1)
-XDB10-2	Auxiliary power supply	–	Auxiliary power supply AC or DC (pole 2)	Auxiliary power supply AC or DC (pole 2)
-XDB10-3	Binary output n° 1	-PFG	Indication of unit ready and coil continuity control (pole 1)	Indication of unit ready and coil continuity control (pole 1)

(*) For availability, ask ABB.

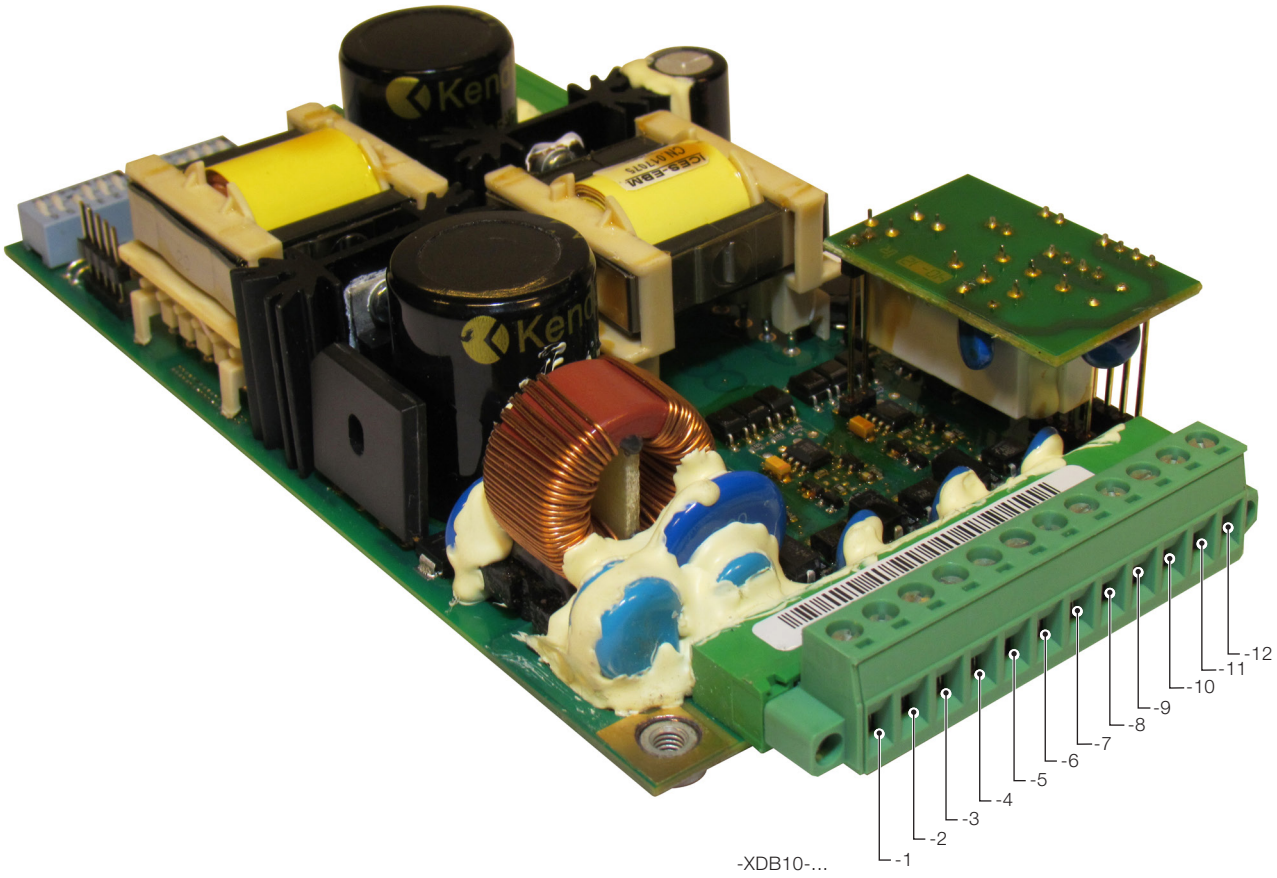

Fig. 9

Checks

After the above-mentioned operations, carry out the following checks:

– check that the connections do not exert any force on the terminals
– check tightness of the connections.

Fig. 10

5.6.2. Withdrawable contactors and enclosures

The withdrawable contactors are used in the UniGear ZS1 type switchgear and in the PowerCube modules. Appropriately fixed together in the configurations defined by the customer, the enclosures build up medium voltage switchgear consisting of various units.

Rules for designing the switchgear

Arc proofing

The ABB enclosures are supplied with a reinforced door, suitable for making arc proof switchgear.

- **The reinforced enclosure alone cannot guarantee arc proofing of the switchgear designed by the customer. To guarantee this, some representative configurations, selected by the customer, must be subjected to the tests according to the prescriptions indicated in the IEC 62271-200 Standards.**
- **For UniGear ZS1 type switchgear, all the door knurls must be tightened to guarantee arc proofing.**

Degree of protection

Limited to the front part, the ABB enclosures guarantee the following degree of protection:
- IP30 on the external housing;
- IP20 inside the switchgear with the door open.

Special versions up to IP41.

The enclosure alone supplied by ABB cannot guarantee the degree of protection of the switchgear designed by the customer. It must undergo the tests according to the prescription indicated in the IEC62271-200 Standards.

Heating

Refer to technical catalogue 1VCP000165 for the rated capacity of the contactors, bearing in mind that apparatus heating is affected by the following variables:
- layout of the enclosures in the switchgear designed by the customer;
- degree of protection (ventilation slats);
- current density of the power supply busbars (busbar duct - branches);
- ambient temperature.

For any needs, please contact ABB Service.

5.6.2.1. Withdrawable VSC/P contactors

The contactors are used for rated voltages from 7.2 to 12 kV, rated normal currents up to 400 A and fault levels up to 1000 MVA (with suitable protection fuses in series with the contactor).
The VSC/P contactor is made up of:
– a three-pole contactor with SCO or DCO function
– mechanical signalling of open/closed
– two pairs of auxiliary contacts signalling open/closed
– feeder able to operate in DC and AC
– a truck on which the supporting structure of the contactor is fixed, consisting of two supports, closed at the front by the protection with characteristics nameplate.
In the top part of the protection there are strikers 30a and 30b (fig. 11) for actuating the enclosure contacts to signal the connected/isolated position.

The pin (34) for locking contactor racking-in with the earthing switch closed on the enclosure, comes out on the right side of the truck.

The crosspiece for hooking up the contactor to the enclosure for operation of the truck is mounted on the front of the truck (3);
– two supports (102) house the slide for actuation of the segregation shutters of the fixed medium voltage contacts of the enclosure and the locking slide of operation of the switch itself with the contactor in the connected position or during the isolation stage;
– when it is not inserted in the socket located on the enclosure, the plug connector for the auxiliary circuits of the contactor must be hooked up to the pin (101);
– mechanical signalling of open/closed (103);
– fuseholder complete with connections for fuses (104);
– input and output tulip isolating contacts (105);
– locks as per par. 5.6.2.2.;
– three current-limiting fuses (supplied on request) with high breaking capacity connected in series to the contactor, with dimensions according to:
  - DIN 43625 Standard with maximum cartridge length e = 442 mm;
  - BS 2692 Standard with maximum centre fixing distance L = 553 mm;
– an impulse counter (supplied on request) which indicates the number of operations carried out by the contactor (106);
– manual emergency opening device (107)
– device for opening when a fuse blows.

5.6.2.2. Description of the locks for withdrawable VSC/P contactors

- Electric lock which prevents the contactor being closed when the truck is not in the racked-in and isolated positions.
- Mechanical lock which prevents the contactor being racked-in and out when it is closed and closing of the contactor when the truck is not in the racked-in and isolated positions.
- Electric lock which prevents closing of the contactor when a fuse is missing or blown.
- Lock which prevents putting a contactor into service in an enclosure preset for a circuit-breaker (*).
- Locking electromagnet on the contactor truck which when there is no voltage, prevents racking-in or racking-out (-RL2).
- Mechanical lock which prevents contactor racking-in if the enclosure door is not closed (requires the same interlock in the fixed part) (108).
- Mechanical interlock with earthing switch placed on the enclosure - with earthing switch closed the contactor cannot be racked-in and with the contactor racked-in or in intermediate positions between racked-in and isolated, it is not possible to close the earthing switch (34).
- Mechanical lock of the shutters when the contactor is racked-out.

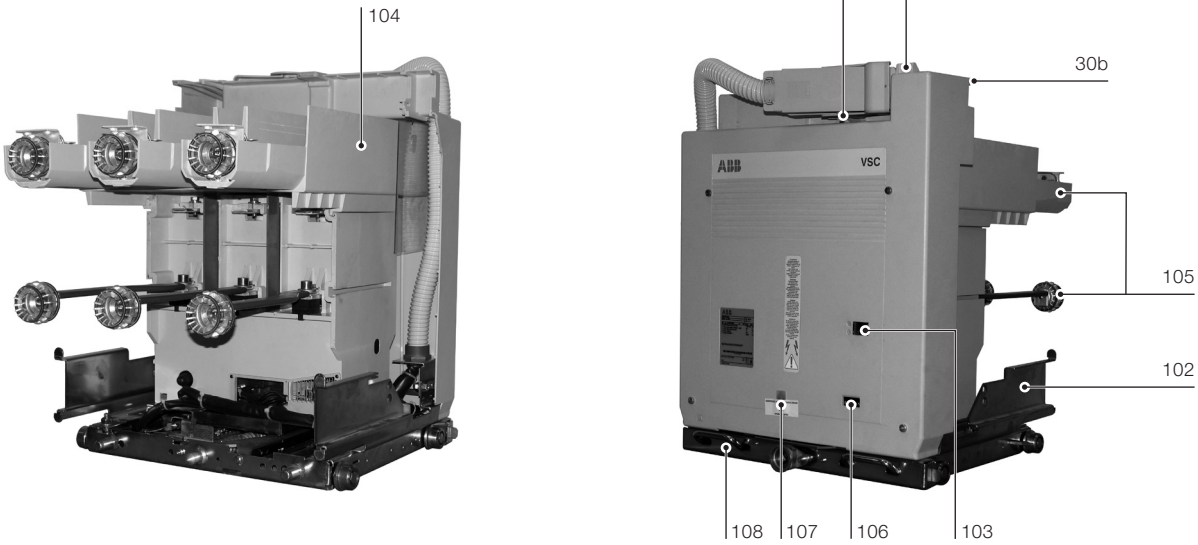

Fig. 11a

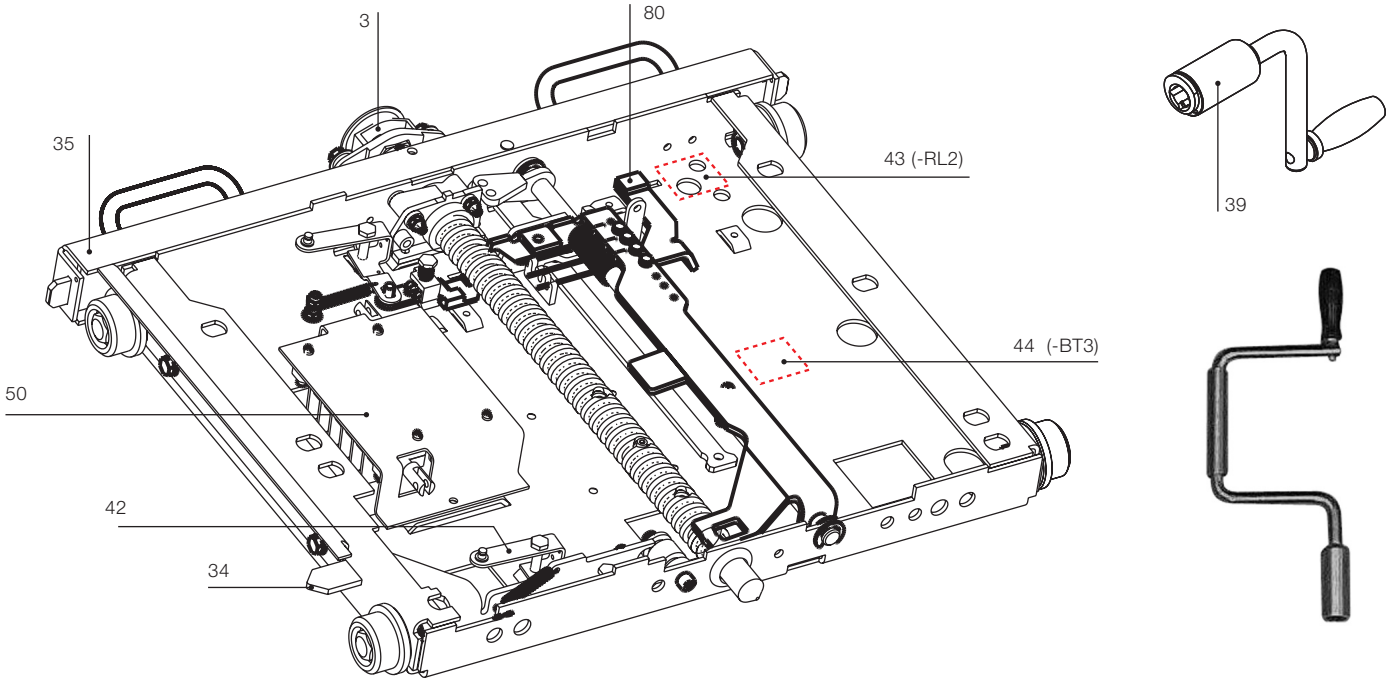

Fig. 11b - Locking devices on the racking-out truck

– Key lock on contactor racking-in - it is only possible to activate the lock and free the key preventing contactor racking-in with the contactor in the isolated position.
– Key lock with earthing switch open - this can only be activated with the earthing switch open. The key can only be removed with the electric lock activated.
– Key lock with earthing switch closed - this can only be activated with the contactor in the isolated position and with the earthing switch closed. The key can only be removed with the lock activated.
– Preset for independent padlocks on the shutters and in the closed and/or open position.
– Electric lock on racking-in and racking-out with the door open (microswitch on the door) of the enclosure connected in series with the locking electromagnet on the contactor truck.
– Key lock on earthing truck racking-in - with the lock activated all the operations with the contactor are possible, but positioning the earthing truck in the isolated position starting from the racked-out position is not allowed.
– Mechanical lock which prevents racking-out of the connector of the auxiliaries when the contactor is racked-in and during racking-in and racking-out.
– Electro-mechanical lock on de-energisation for the earthing switch, which when there is no voltage prevents the earthing switch operations.
– Electro-mechanical lock on the compartment door.

5.6.2.3. VSC/PN and VSC/PNG withdrawable contactors

The VSC/PN contactors are used for rated voltages from 7.2 to 12 kV, rated thermal currents up to 400 A and fault levels up to 1000 MVA (with suitable protection fuses in series with the contactor). In the same way, the VSC/PNG contactor is used for 7.2 kV rated voltage and 400 A rated thermal current.
Both the VSC/PN and the VSC/PNG versions of contactors consist of:
– a three-pole contactor with SCO or DCO operation
– a fuseholder complete with terminals for fuses (121). In the upper part there are strikers 1a, 1b and 1c (fig. 12 - page 29) for activating the enclosure contacts for signalling the connected/test/isolated position
– a mechanical open/closed signalling device (120)
– two pairs of auxiliary contacts signalling open/closed
– feeder able to operate in d.c. and a.c.
– a truck on which the base plate of the contactor is fixed and the front protective screen by means of two supports. At the rear, two pins are positioned on the side walls of the truck for locking contactor racking-in with the earthing switch open on the enclosure, whereas the 45° slides operate the segregation shutters of the medium voltage fixed contacts of the enclosure. The crosspiece for hooking the contactor onto the enclosure for truck operation is mounted on the front of the truck
– the jaw-type input and output isolating contacts (122)
– the locks as per par. 5.6.2.4.
– three current-limiting fuses (supplied on request) with high breaking capacity connected in series with the contactor, with dimensions according to:
  • DIN 43625 Standard with maximum cartridge length e = 442 mm (single cartridge)
  • BS 2692 Standard with maximum fixing distance L = 553 mm (single and/or double cartridge)
– a mechanical operation counter which indicates the number of operations carried out by the contactor (122)
– a manual emergency opening device even when energised with medium voltage (125)
– a device for opening when a fuse blows, with relative fuse blown indication.

5.6.2.4. Description of the locks for VSC/PN and VSC/PNG withdrawable contactors

– Electric lock which prevents the contactor being closed when the truck is not in the “racked-in” (200 mm), “test” (47.5 mm) and “racked-out” (0 mm) positions (-BGT3) (fig. 12a).
– Mechanical lock which prevents the contactor being racked-in and out when it is closed, and contactor closing when the truck is not in the “racked-in”, “test” and “racked-out” positions (1) (fig. 12a).
– Electric lock which prevents contactor closing when a fuse is missing or blown.
– Locking electromagnet on the contactor truck which, when there is no voltage, prevents racking-in or racking-out (-RL2) (fig. 12a).
– Mechanical lock which prevents contactor racking-in if the enclosure door is not closed (requires a reciprocal interlock in the fixed part) (126).
– Mechanical lock for the “test” position (2) (fig. 12a).
– Lock for different currents (5) (fig. 12a).

(*) This lock consists of some pins assembled in the plugs of the auxiliary circuits which, with a suitable code, prevent connection of the plug in the enclosure socket. The lock also foresees compulsory application of the locking magnet in the truck.

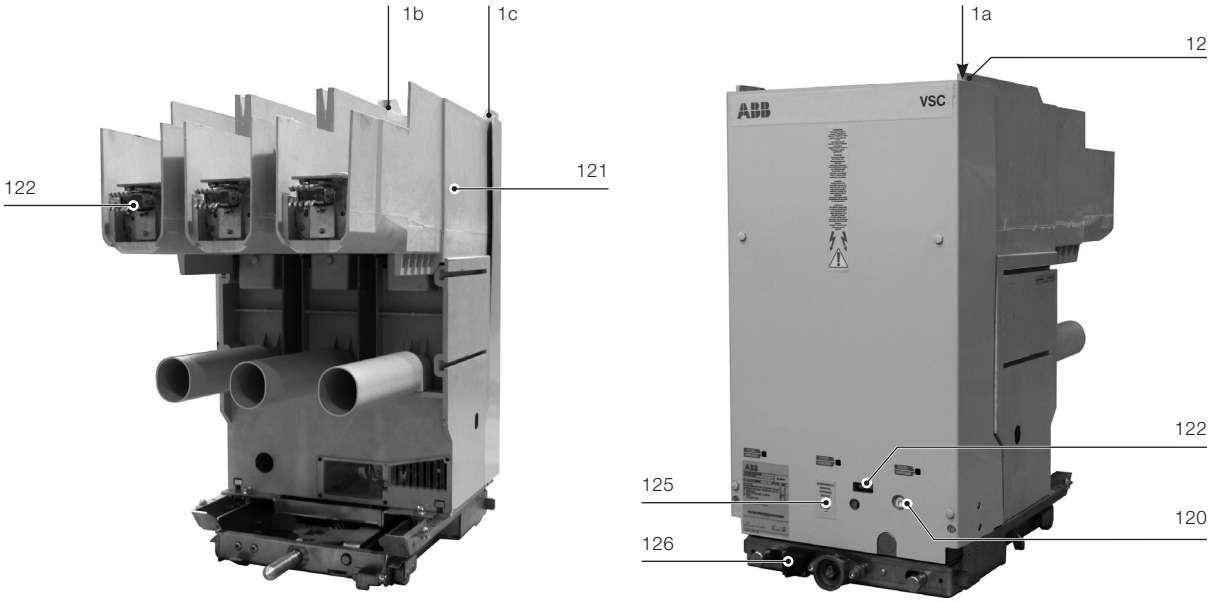

Fig. 12

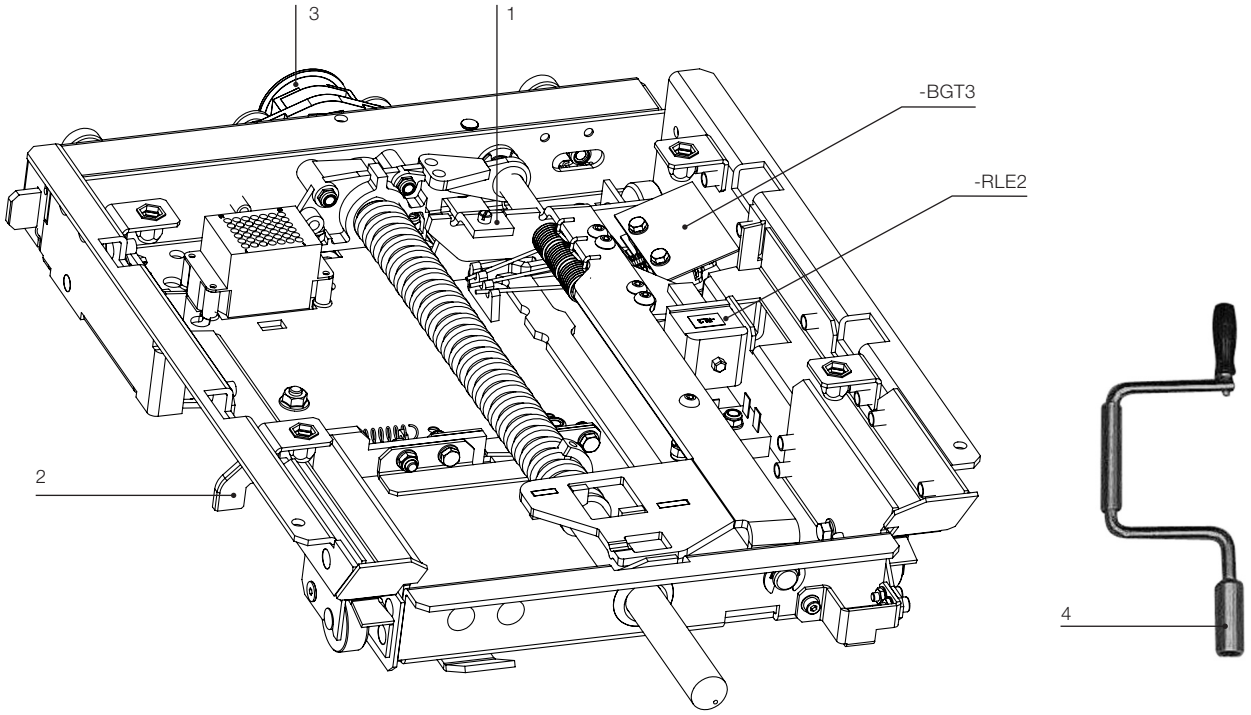

Fig. 12a - Locking devices on withdrawable truck.

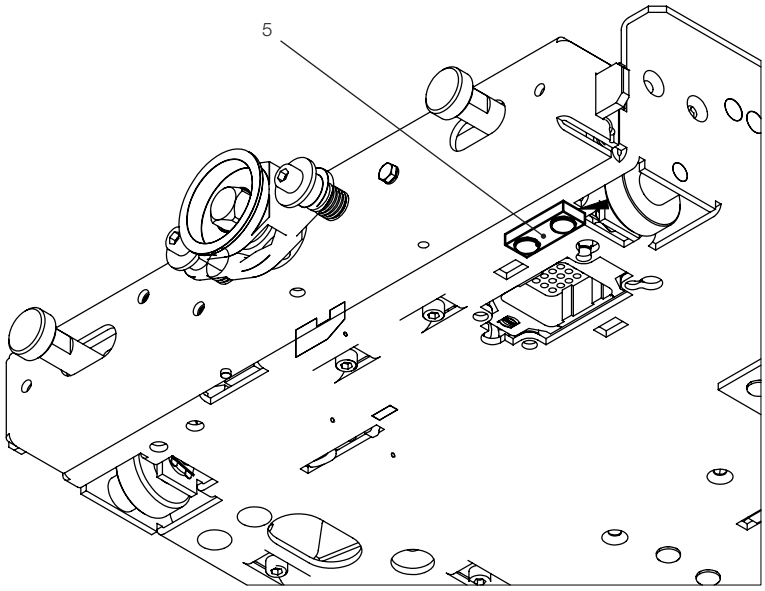

Fig. 12b - Interlocking devices on withdrawable truck.

5.7. Description of the closing and opening operations

The contactor drive operates in two different ways as shown in Table 1.

For the DCO version, further personalisation of the apparatus can be made. In fact – the first of its kind – the V-Contact VSC contactor is fitted (on request) with an undervoltage function (UV) with delays which can be set according to the requirements of the installation.

For a more detailed description of the behaviour of the apparatus according to the version, see table 2.

Supply the contactor with auxiliary voltage and operate it several times electrically. The contactor must carry out the opening and closing operations correctly in accordance with the threshold values defined in the IEC 62271-106 Standards.

TABLE 1

Version	Description	Inputs		
		Closing -XDB10-7, -XDB10-8	Opening -XDB10-9, -XDB10-10	Undervoltage -XDB10-11, -XDB10-12
SCO (Single Command Operated)	This version operates according to the state of the command signal at terminals -XDB10-11 and -XDB10-12. Contactor closing takes place when the voltage applied to terminals -XDB10-11 and -XDB10-12 corresponds with the values indicated in Table 2a	Not used	Not used	Used
DCO (1) (Double Command Operated)	This version operates by means of two independent signals for closing and opening applied to terminals -XDB10-7 and -XDB10-8 for opening and -XDB10-9 and -XDB10-10 for closing. The values of the signals are indicated in Table 2b. Furthermore, on request, automatic delayed opening of the contactor is available in the case of a drop or lack of voltage at terminals -XDB10-11 and -XDB10-12 (configurable delay filter). See Table 2b.	Used	Used	If the undervoltage function is required (2)

(1) The contactor is restarted if the supply voltage of the board drops below 18V for more than 300ms.
(2) The undervoltage with time-delay function is guaranteed with 18V minimum residual voltage.

TABLE 2a

SCO (Single Command Operated) version
Terminals -XDB10-1 and -XDB10-2 must always be supplied at the rated voltage (tolerance: 85% ... 110%)

Closing operation		Power supply, in continuous mode, to the UV input
Opening operation (3)	Release voltage (drop out)	A voltage drop occurs at terminals -XDB10-11 and -XDB10-12 for power supply voltage values between 75% and 10% of the rated voltage.

TABLE 2b

DCO (Double Command Operated) version
Terminals -XDB10-1 and -XDB10-2 must always be supplied at the rated voltage (tolerance: 85% ... 110%)

Closing operation		Supply terminals -XDB10-7 and -XDB10-8 with power. An impulse lasting at least 100 ms is recommended. Note: an impulse lasting a shorter time may also cause contactor closing.
Opening operation	Opening operation (switching)	Supply terminals -XDB10-9 and -XDB10-10 with power. An impulse lasting at least 100 ms is recommended. Note: an impulse lasting a shorter time may also cause contactor closing. In the case of simultaneous power supply of terminals -XDB10-7 and -XDB10-8 and terminals -XDB10-9 and -XDB10-10, the opening command prevails.
	Release voltage (undervoltage)	– Function available on request (UV = Undervoltage). – Opening takes place for voltage values applied to terminals -XDB10-11 and -XDB10-12, between 70% and 35% of the rated voltage (4)

(3) The opening operation is only instantaneous.
(4) The opening operation can be instantaneous or delayed (adjusting the daily by means of the special selectors) a 0.3 - 1 - 2 - 3 - 4 - 5 s. It is set to 0 s by default.

Setting for DCO

UV time (s)	S1-3	S1-4	S1-5
Instantaneous (1)	0	0	0
0.3s	0	0	1
1s	0	1	0
2s	0	1	1
3s	1	0	0
4s	1	0	1
5s	1	1	1

S1-6 → Reserved – (1) See opening time par. 1.3.

5.7.1. Diagnostics

Two types of electronic cards are available, “Basic board” and “Full option”, differing from each other in the diagnostic functions they have available.
Both have:
– coil continuity control connected to the card
– capacitor voltage level control.
The “Full option” card also makes the following available:
– control of the state of capacitor efficiency, which is fundamental for correctly carrying out the opening and closing operations
– checking and indicating the temperature inside the contactor.
The alarms corresponding to the above functions are made available to the user by means of two contacts (3-4 and 5-6) of the -XDB10 terminal box.
The cards periodically carry out the controls without preventing the opening and closing operations.
The table below indicates the functions available.

5.7.3. Coil continuity control (CCC) and temperature monitoring

The unit checks actuator connection continuity so as to reduce the risk of failure to operate following disconnection. It also monitors the temperature of the board to reduce the risk of operating beyond the board’s design limits.
This function is provided for both the basic MAC R2 board and the “full option” version.
The test is performed:
– Every 2 minutes (irrespective of whether the apparatus is in the open or closed condition)
– 15 seconds after starting
– After each operation
The test is not performed:
If the voltage of the external capacitance is less than 75 V (“not ready” signal already given)
If the ambient temperature is less than -30° (“not ready” signal already given)
An alarm signal is given by opening contact DO1 if errors occur.

Basic board - Full option board				
Ready DO1 -XDB10 (3-4)	Continuity control	Capacitor voltage level and VSC internal temperature	Anomaly	No anomaly
	– After each operation – Start-up – Every 12 hours	Continuously	DO1 open	DO1 closed

Full option only				
CBC DO2 -XDB10 (5-6)	Control of state of capacitor efficiency	–	Anomaly	No anomaly
	– Start-up – Every 12 hours	–	DO2 open	DO2 closed

5.7.2. Contactor power supply

The contactor has been tested for all the auxiliary operating voltages foreseen and indicated in the table:

Feeder 1-2 V DC	Feeder 3-4 V DC / V AC (50/60 Hz)	
24	110	220
30	120	230
48	125	240
60	127	250
	130	

The contactor is, however, set with the operating voltage defined in the order confirmation. The power supply voltage is indicated on the contactor rating label.

The tolerances over the voltage values conform to what is defined in the IEC 62271-106 Standard.

5.7.4. Capacitor ageing control (CBC)

The unit supervises bulk capacitor discharging so as to check capacitor life.
The unit supervises main capacitor discharging so as to check capacitor life.
This function is only available for the MAC R2 “full option” version.
The test is performed:
– Every 12 hours when the apparatus is in the open condition.
– 15 seconds after starting.
– Two seconds after each opening operation if the contactor has remained closed for 12 hours.
The test is not performed:
– If the voltage of the external capacitance is less than 75 V (“not ready” signal already given).
– If the ambient temperature is less than -5° (“not ready” signal already given).
The “not ready” state is signalled when the CBC function is being performed and the function has priority over the closing operation.
An alarm signal is given by opening contact DO2 if errors occur.

5.7.2.1 Changing the supply voltage of the contactor (within the reference range)

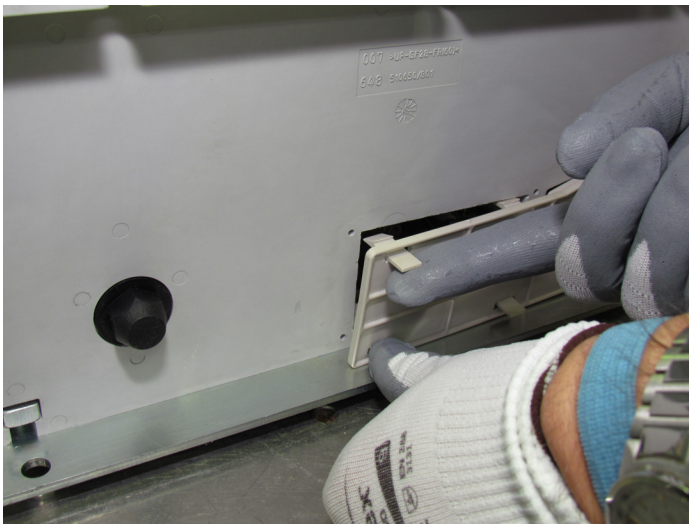

Fig. 13a

Fig. 13b

Fig. 13c

- This operation must be carried out by ABB personnel or by suitably qualified customer personnel with in-depth knowledge of the apparatus (IEC 62271-1, par. 10.4.2.).
- Always check that the apparatus is in the open position before carrying out any activities.
  Check that the medium voltage and auxiliary power supplies have been removed.
  Maintenance of the apparatus must only be carried out with the contactor de-energized, racked-out of the compartment of the enclosure and with the capacitor of the auxiliary circuit discharged. To discharge the capacitor, remove power from the -XDB10 terminal box and connect the mobile two-pole -XDB50 connector to the ABB type CFD device (fig. 13c). Completion of discharging is signalled by the red light going completely off.
- The auxiliary circuit can be configured for all the direct and alternating current voltages within the reference range. To change the voltage value defined during the ordering stage, proceed as follows: 1) remove the rear plastic protection (fig. 13a); 2) access the MAC R2 electronic card (fig. 13b); 3) prepare the dip-switches according to the indications given on the last page of the electric circuit diagram.
- After having set the desired value, the label with the new voltage value must be overlayed the front rating plate of the contactor.

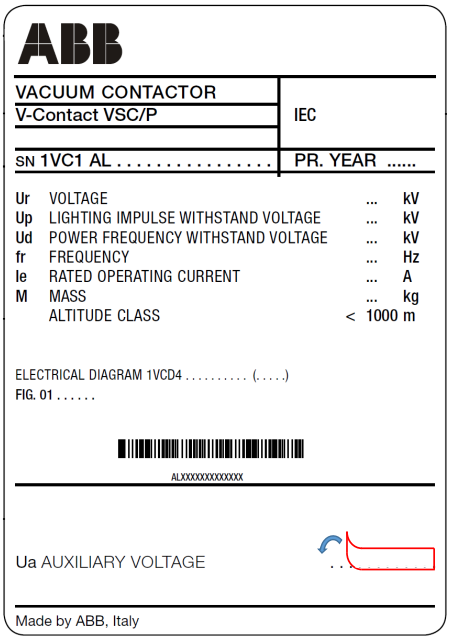

Fig. 13d

- The small plate with the correct voltage value is in the document envelope accompanying the product, along with the electric circuit diagram and this manual.
- Contactor functional check is mandatory after the new voltage setting; the qualified customer's personnel should carry out this check, responsibility for the interventions lies with the customer.

5.8. Emergency opening operation

The contactor is fitted with manual emergency operation which must be carried out by suitably qualified personnel with in-depth knowledge of the apparatus.

The following Standards must be taken into particular consideration during installation and service:

- **IEC 62271-1/DIN VDE 0101**
- **VDE 0105: Operation of electrical plants**
- **DIN VDE 0141: Earthing systems for electrical installations with rated voltage higher than 1 kV**
- **All the accident prevention regulations, in force in the relative countries.**

To manually open the contactor, it is necessary to work on operating part A, consisting of a 8 mm hexagonal-head bolt, working clockwise with a torque of about 20 Nm and at an angle of about 60° (see fig. 14a).
If the contactor (in the fixed version) is placed inside the switchgear, it is necessary to use a transmission made of insulating material of suitable length, which allows safe operation. The transmission device is to be provided by the customer.

For the withdrawable VSC/P contactors placed in UniGear ZS1 switchgear or PowerCube modules and for the withdrawable VSC/PN and VSC/PNG contactors in UniGear MCC switchgear, carry out the emergency operation with the compartment door closed. To carry out the operation, work towards the opening on the compartment door using the special tool provided, fitted on the end with an 8 mm hexagonal spanner. Apply a torque of 20 Nm with an operating angle of about 60° clockwise. The point to operate in is shown by the special plate located on the contactor shield (see detail 1 - fig. 14b and 14c).

For fixed contactors, if the operations are carried out with the medium voltage protection “B” removed, pay great attention to the moving parts.

For withdrawable contactors, do not remove the front shield to carry out the emergency opening operation.

In any case, if auxiliary voltage is present, take special care not to remove the protective shield of the stored energy capacitor and not to touch the capacitor itself in any way.

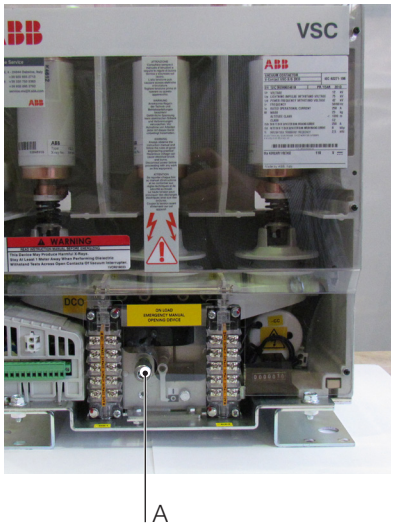

Fig. 14a

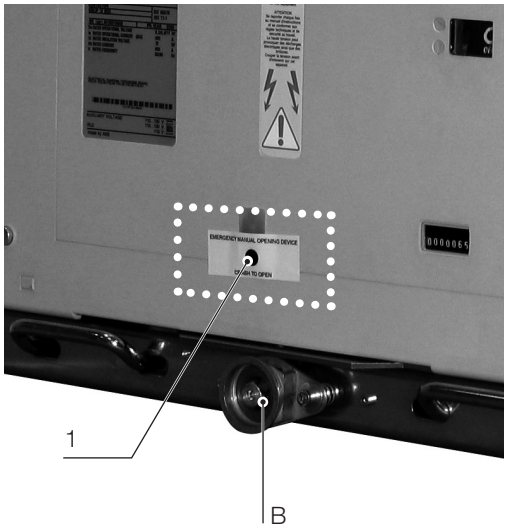

Fig. 14b

Fig. 14c

6. Putting into service

6.1. General procedures

All the operations regarding putting into service must be carried out by ABB personnel or by suitably qualified customer personnel with in-depth knowledge of the apparatus and of the installation.

Before putting the apparatus into service, carry out the following operations as well as those indicated in the table:
- check that the voltage and current applied are within the specified rated values
- check tightness of the power connections of the fixed contactors and integrity of the isolating contacts of the withdrawable contactors
- carefully clean the sheets and insulating parts with brushes and clean dry cloths. Avoid using jets of compressed air
- check the earthing connection of the fixed contactors
- check that no foreign bodies, such as bits of packing, have got into the moving parts
- check that the value of the power supply voltage of the circuits is between 85% and 110% of the rated auxiliary voltage of the apparatus
- check that the contactor vacuum interrupter has not been damaged due to accidental impacts. In case of doubt, carry out the check indicated in paragraph 7.3. Table 4.
- make sure that all the barriers and protective shields are correctly installed
- carry out the inspections indicated in table 3.

On completion of the operations indicated, check that everything is put back in its original position.

The check can only be considered as passed if all the tests indicated have had a positive outcome.
In the case of a negative check, do not put the apparatus into service and, if necessary, contact ABB Service.

TAB. 3

Item inspected	Procedure	Positive check
1 Insulation resistance	Medium voltage circuit With a 2500 V megger, measure the insulation resistance between the phases and the exposed conductive part of the circuit.	The insulation resistance should be at least 50 Mohm.
2 Drive. Open/closed indicator, operation counter (if provided)	Carry out a few closing and opening operations of the contactor.	Operations and signals normal.
3 Auxiliary circuits	Check that the connections to the control circuits are correct: proceed with the relative power supply.	Operations and signals normal.
	With the contactor open, check that the thickness between the body of the contact and the stem is 0.5 mm.	Tighten the fixing screws.
		

6.2. Racking the VSC/P contactor in and out

- **Should operations be carried out with the contactor racked-out of the switchgear, pay great attention to the moving parts.**
- **The contactor must only be racked into the unit in the open position. Racking-in and racking-out must be gradual to avoid shocks which might deform the mechanical interlocks.**

6.2.1. Contactor with manual truck

For the racking-in and racking-out operations of the manual contactor, refer to the following manuals:
– PowerCube PBF fixed part – code: 1VCD600530
– PowerCube PBE and PBM module - code: 647652001
– UniGear ZS1 switchgear – code: 1VLM000363.

6.2.2. VSC/P contactors with motorised withdrawable truck

Carry out the racking-in/out test of the motorised truck in the same way as for a manual truck, following the instructions below:
– Rack the contactor into the switchgear in the open position. Motor power supply circuit de-energized.
– Supply the truck motor circuit with power.
– Activate the command for the electrical racking-in operation. When racking-in has been done, check correct changeover of the relative auxiliary contact.
– Afterwards, activate the command for the electrical racking-out operation. When racking-out has been done, check correct changeover of the relative auxiliary contact.
– In the case of a fault in the motor during a racking-in or racking-out operation, the truck can be taken to the run end manually in an emergency, first cutting off the voltage to the motor power supply circuit and then using the manual lever (Fig. 15) to operate in the same way as for the manual truck.
– Insert the manual racking-in lever (Fig. 15) in the special coupling (B - Fig. 14b).
The torque needed to carry out truck handling is < 25 Nm.
Checks:
a) clockwise rotation of the motor during circuit-breaker racking-in.
b) anti-clockwise rotation of the motor during circuit-breaker racking-out.
– Remove the manual crank.

Note

By means of the chain transmission, truck handling carried out with the manual lever causes rotation of the truck motor rotor which, behaving like a generator, can cause reversal of voltage at the connection terminals. This can damage the permanent magnet of the motor, therefore all the truck racking-in and racking-out operations carried out with the manual lever must be done with the motor circuit de-energized.

Fig. 15

7. Maintenance

Maintenance operations are aimed at ensuring trouble-free operation of the apparatus for the longest possible time.
The following operations must be carried out in accordance with the IEC 61208/DIN 31051 Standards:

Inspection: Assessment of the actual conditions
Servicing: Measures to be taken to maintain the specified conditions
Repairs: Measures to be taken to restore the specified conditions.

Notes

The following rules must be respected for all maintenance operations:

– the relative specifications indicated in the “Standards and specifications” chapter;
– the regulations for safety in the workplace indicated in the “Putting into service and running” chapter;
– the regulations and specifications in the country of installation.

7.1. General

It is good practice to keep a maintenance card and a service book where all the operations carried out can be noted down in detail, together with the date, description of the anomaly and the references of data needed to identify the apparatus, etc. (see chapter 2).
Experience gained in use of the apparatus will allow the optimal time intervals for interventions to be established. In any case, inspection of the apparatus not more than one year after it has been put into service is recommended.
In case of need and for further details, please refer to what is prescribed in article 10.4.2 of the Standard (IEC 62271-1).
In any case, for any problems, please do not hesitate to contact us.

7.2. Handling the MAC-R2 electronic card

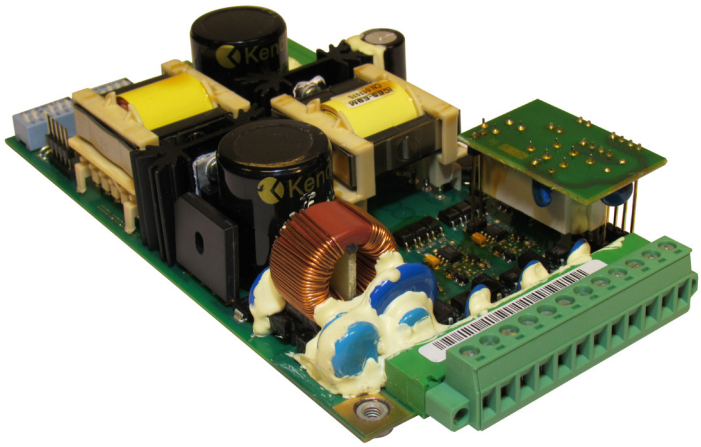
Management of sensitive devices outside protected areas is considered to be “field work” and normally includes product packing, unpacking, installation and maintenance.
In all these cases, handling the devices must be carried out taking care to keep the potential of your hands and that of the work surface earthed, with an equipotential connection to the main grounding branch point.
It is advisable for the operator to wear conductive shoes and overalls and to wear earthed conductive arm bands.
Fig. 13a-13b shows a maintenance kit consisting of an arm band and ground connection, both fitted with a 1 MW integrated resistance.
Using suitable protective means to protect the electronic devices is an indispensable task requiring diligence and attention. Inserting these procedures in the normal service activities allows optimization of resources and underlines their importance.

The main activities which allow an efficient protection system to be maintained are:

- making personnel aware of the problems regarding protection against electrostatic discharges, with reference to the IEC 61340-5-1 Standards (these problems are often unknown or underrated)
- training personnel in correct use of protection equipment and on its perfect working order
- selecting protection materials suitable for the effective production requirements and using them
- marking the protected area and highlighting the presence of sensitive devices so as to attract the attention of operators on correct use of the protection devices
- technicians must always set an example by respecting the rules and using protection devices appropriately

Observe the following basic rules:

- avoid using tools which are unsuitable for removing the electronic cards (e.g. screwdrivers, etc.)
- handling the electronic card during maintenance or replacement operations must be limited to the minimum time possible
- always hold the electronic card at the edges
- avoid touching the components mounted on the card
- pay attention when cables or connectors have to be connected or disconnected
- avoid bending the card while inserting it in its seat or during connector cabling
- avoid damaging the connectors, aligning the pins before connecting the cable



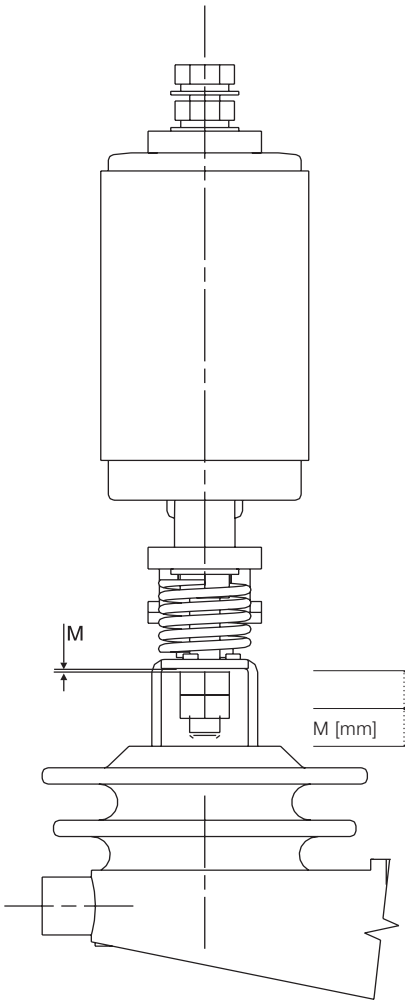


Fig. 16

7.3. Inspection

– Carry out regular inspections to check that the interruption devices are in good condition.
– The checks must include a visual inspection to find any contamination, traces of corrosion or electrical discharge phenomena (according to what is prescribed in table 4.
– When there are unusual service conditions (including adverse climatic conditions) and/or in the case of environmental pollution (e.g. heavy contamination or an atmosphere with aggressive agents), the frequency of inspections must be increased.
– Visual examination of the main contacts. The contact areas must be cleaned if there are signs of overheating (discoloured surface) (also see the paragraph on “Repairs”).

If any anomalous conditions are found, appropriate maintenance measures must be taken (see the “Servicing” paragraph).

	VSC 7	VSC 12 / VSC-S
M [mm]	1.5...2	1.3...1.7

Fig. 17

TABLE 4

Item to be inspected	Interval	Operation to be carried out
1 Insulating parts.	1 year or 50,000 operations.	Visual inspection of the insulating parts. The insulating parts must be free of any accumulation of dust, humidity, dirt (clean), cracks, traces of surface discharges or damage.
2 Structure..	1 year or 50,000 operations.	Visual inspection of the structure and mechanisms. The components must be free of any deformation, accumulation of dust, dirt or damage. The screws, nuts and bolts must be correctly tightened. Avoid touching the ceramic surface.
3 Interrupter.	1 year or 50,000 operations.	Check that the interrupter is free of accumulation of dust, dirt (clean), cracks (replace), traces of surface discharges or damage.
	In case of accidental impacts.	Carry out a voltage test with the contacts open at 15 kV - 50 Hz for one minute. If there is a discharge during the test, the interrupter must be replaced because this type of phenomenon corresponds to deterioration in the degree of vacuum. In case of need, contact ABB Service.
4 Interrupter contacts.	1 year or 50,000 interruptions at the rated current.	Refer to fig. 17. The contact material vaporises from the surfaces during each interruption and condenses elsewhere inside the vacuum interrupter. This is a normal process, and is foreseen by the overrun, or by the wear tolerance. As the contacts wear, the overrun distance “M” decreases. When distance “M”, of any pole, goes below 0.5 mm with the contactor in the closed position, all the sub-assemblies must be replaced. Use a fork-shaped gauge 0.5 mm thick to carry out this measurement. **Caution! Never attempt to adjust the nuts of the vacuum interrupters for any reason whatsoever.** The overrun distance must be checked, but not adjusted.
5 Auxiliary contacts.	1 year or 50,000 operations.	Check correct operation and the signals. Check that there are no burnt or worn contacts (replace).
6 Auxiliary circuit conductors.	1 year or 50,000 operations.	Check whether any cabling straps are loose or broken and check connection tightness. Examine all the wire or cable connections to make sure that none of them are loose and that there is no overheating.
7 Visual inspection of the isolating contacts (withdrawable contactors)	5 years.	The isolating contacts must be free of any deformation or erosion. Lubricate the contact elements with 5RX Moly type grease.

7.4. Servicing

Carry out the checks described below.

Item to be serviced		Interval	Operation to be carried out
1	Contactor.	2 years or 100,000 operations.	Carry out five mechanical closing and opening operations. The contactor must operate regularly without stopping in intermediate positions.
2	Contactor springs.	2 years or 100,000 operations.	Check integrity of the springs.
3	Power connections.	2 years or 100,000 operations.	Check tightness: M8 bolt = 23 Nm; M10 bolt = 33 Nm. Check there are no traces of overheating or oxidation.
4	Earthing contact (fixed contactors)	2 years or 100,000 operations.	Check tightness of the connections.
5	Insulation resistance.	2 years or 100,000 operations.	See par. 6.1.
6	Racked-in/isolated auxiliary contacts in the truck.	2 years or 100,000 operations.	Check that the signals are correct.
	Furthermore provide:	– replacement of the auxiliary contacts after 250,000 operations.	

7.5. Servicing following a short-circuit or overload

General

It is foreseen that the VSC contactor be protected by power fuses and/or by a circuit-breaker. In any case, the value of a short-circuit can exceed the threshold of damage to the vacuum bottles.

After interruption of a short-circuit at the maximum rated MVA of the contactor, put the cause of the fault right, inspect all the apparatus and carry out the repairs or replacements necessary before putting the apparatus back into service.

Make sure that all the spare parts (when required) are suitable for the application.

In case of any doubts, please contact ABB.

Have a complete check of the contactor carried out by ABB personnel after 1,000,000 operations or 10 years of operation.

Contact ABB Service Assistance.

Vacuum interrupters

A dielectric test by itself cannot be confirmation that the interrupters have to be put back into service after a fault. However, if there is no physical sign of stress and if the distance M exceeds a minimum of 0.5 mm, the interrupters can be tested dielectrically as mentioned in point 3 of table 4. Should this test also be positive, it is reasonable to put the interrupters back into service following a fault.

Enclosures

External evidence of deformation of the enclosure is usually indicative of damage inside it. Extensive damage will require replacement of the enclosure parts and of the apparatus contained in it.

Terminals and internal conductors

Replace the damaged parts which show discolouration, melting or damage caused by electric arcs.
Pay special attention to the moving parts.
Carry out the “Checking” procedures indicated in par. 6. of this manual before putting the apparatus back into service.

7.6. Repairs

Replacement with spare parts and accessories must only be carried out by ABB personnel or by suitably qualified personnel with appropriate training.
All the power supply sources must be turned off and the capacitor must be discharged.
Always work with the contactor open, with the work area insulated and made safe.

Should maintenance be carried out by the customer’s personnel, responsibility for the interventions lies with the customer.

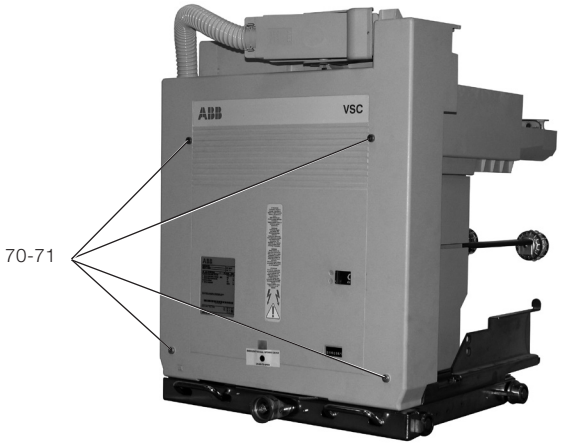

Fig. 18a

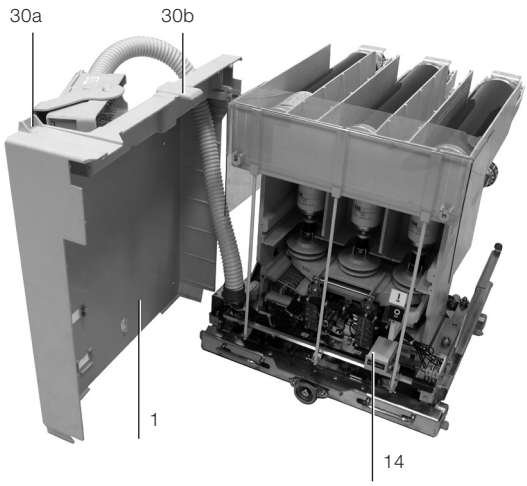

Fig. 18b

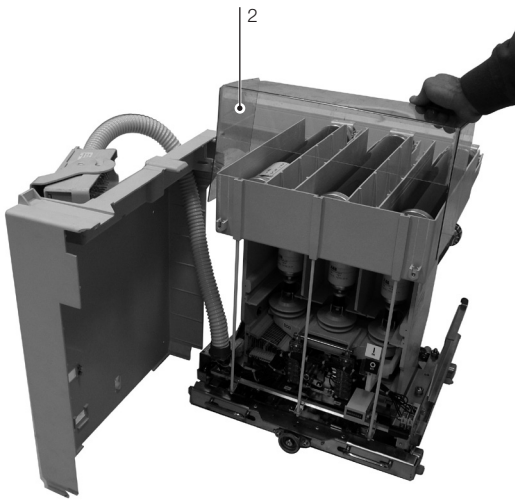

Fig. 18c

7.7. Instructions for dismantling and replacing fuses

7.7.1. General

- **All the operations described below must be carried out by suitably qualified personnel with in-depth knowledge of the apparatus.**
- **Do not rack the contactor out unless the enclosure is securely fixed in the switchgear or to a stable base.**
- **Check that the contactor is open before proceeding with isolation and its racking-out from the enclosure.**
- **Check that the contactor is open before proceeding with replacement of the fuses.**
- **The contactor is preset to house ABB CMF/BS and ABB CEF/BS fuses.**

The fuseholder is preset for installation of fuses with the dimensions and average type of striker according to DIN 43625 (1983) and BS 2692 (1975) Standards and with electrical characteristics according to IEC 282-1 (1974) Standards.
The fuseholder is always fitted with an automatic opening device for a fuse blowing. This device prevents contactor closing when even a single fuse is missing.

7.7.2. Preliminary operations for fuse replacement

a) VSC/P

The contactor must be racked out of the enclosure for replacement of the fuses.
The instructions for the racking-out operations are given in the switchgear/enclosure manuals.
With the contactor racked out of the switchgear, unscrew the four fixing screws of the shield and relative DIN washers (fig. 18a) and position it as in fig. 18b. For 12 kV contactors, remove protection (2) and (fig. 18c) proceed to replace the fuses according to the instructions given in par. 7.8.

b) VSC/PN and VSC/PNG

To replace the fuses it is necessary to rack the contactor out of the enclosure. The instructions for the racking-out operations are given in the switchgear/enclosure manuals, then proceed to replace the fuses according to the instructions given in par. 7.8.

7.8. Replacement of the contactor fuses

Check that the rated normal current of the fuses to be installed corresponds with the value indicated on the nameplate on the rear of the fuseholder.

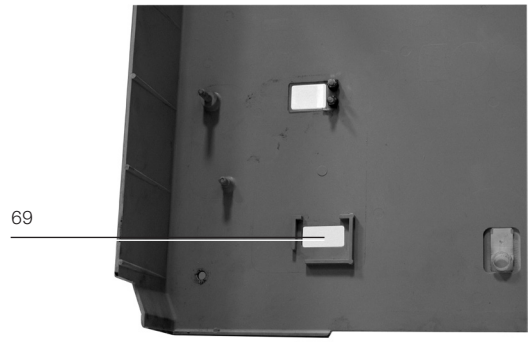

Fig. 18d

Fuses according to DIN Standards

a) Mounting the adapters (fig. 19a)

The fuseholder is designed to take fuses with a length of 442 mm. For smaller sizes, two adapters are required:
– Adapter (45) for fuses with a length of 192 mm (A)
– Adapter (46) for fuses with a length of 292 mm (B).
Select the type of adapter in relation to the type of fuse to be used, and insert it fully over the fuse contact, opposite to the one of the striker.
Tighten the steel band (47) and fully tighten the screw (48).
To dismantle, proceed in reverse order.
The same instructions are given in the Kit sheet put in the adapter packing.

Fig. 18e

b) Dismantling the fuses (fig. 19b)

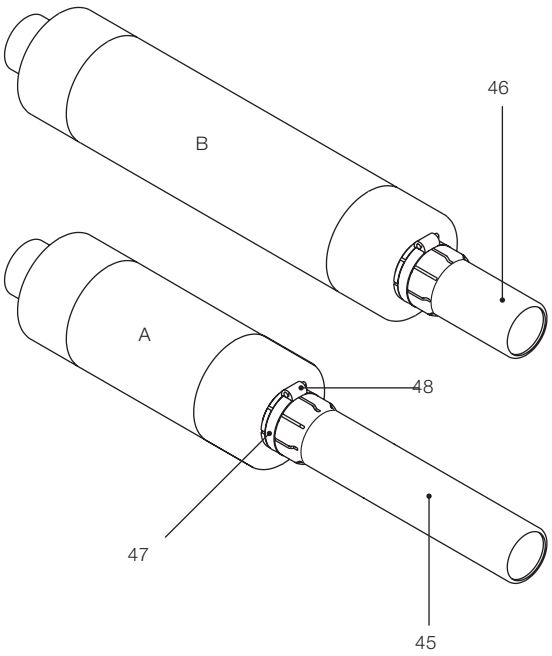
Open the locking rings (49) (fig. 19b) moving them in the direction shown by the arrows using the tool (50), and remove the fuse using the special tool (50).

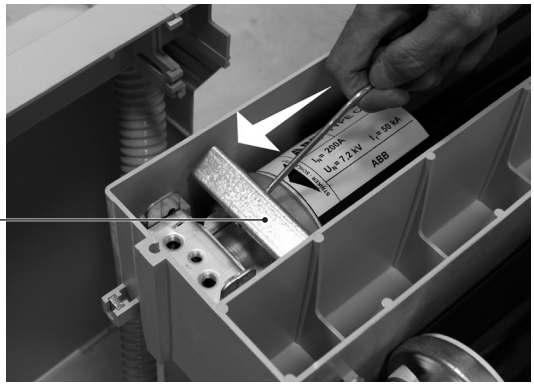
c) Mounting the fuses (fig. 19c)

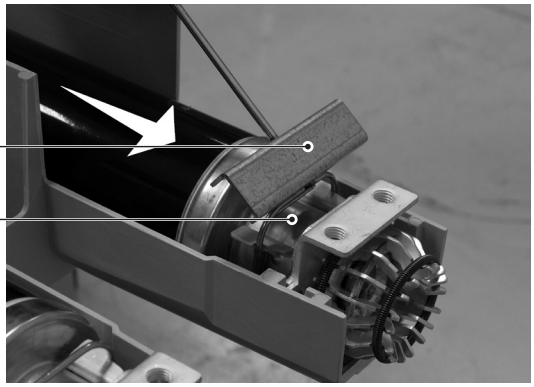
Open the locking rings (49) moving them in the direction shown by the arrows using the tool (50) (fig. 19b), fully insert the fuses with the contacts fitted with striker on the opposite side to the isolating contacts of the contactor. Close the locking rings again, moving them in the opposite direction to the opening one.

Fuses according to BS Standards.

- **Check that the rated normal current of the fuses to be installed corresponds with the value indicated on the nameplate on the rear of the fuseholder.**
- **When tightening the screws, do not force the connections (25 Nm maximum tightening torque).**
- **Fuse mounting and dismantling must only be done with the adapter (if required) already mounted on it.**
- **Only use the material specified, provided by ABB, for assembly.**







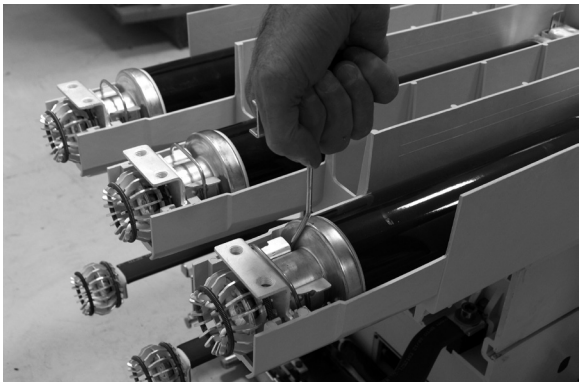


Fig. 19a

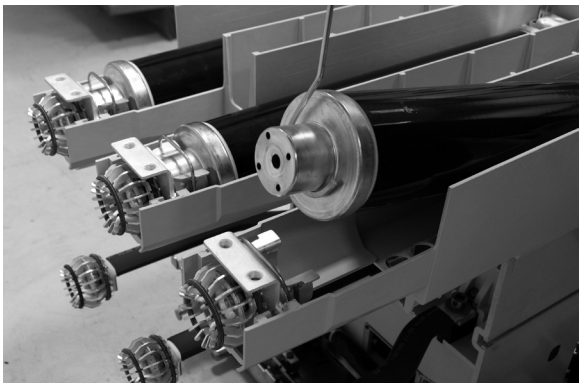

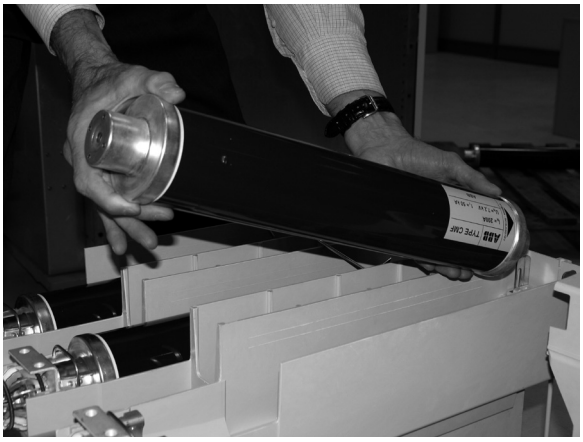

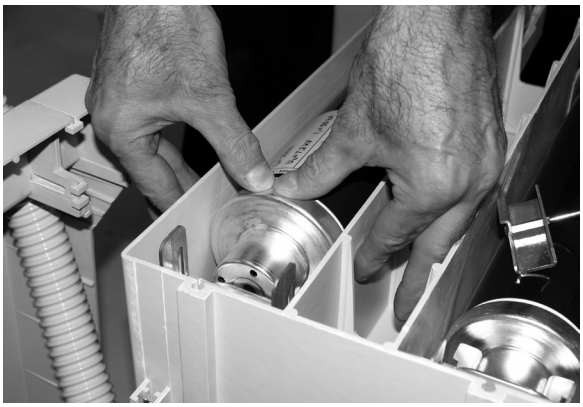

Fig. 19b

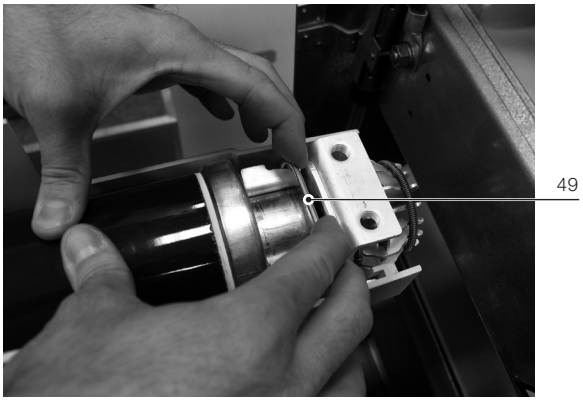

Fig. 19c

a) Mounting the adapters (fig. 20a)

The fuseholder (32) (fig. 20b) is preset to take fuses with fixing centre distance of 553 mm. For smaller sizes, three adapters are needed, as indicated below:

– adapter (51) for fuses with fixing centre distance
  l = 235 mm
– adapter (52) for fuses with fixing centre distance
  l = 305 mm
– adapter (53) for fuses with fixing centre distance
  l = 454 mm.

Select the type of adapter, fix it onto the fuse on the striker side by means of the grub screws (54), the cup springs (55) and the short nuts (58). Mount the adapter with the extension, with the cap facing the striker.

The same instructions are given in the Kit sheet put in the adapter packing.

Only position the grub screws (54) as shown in the drawing.

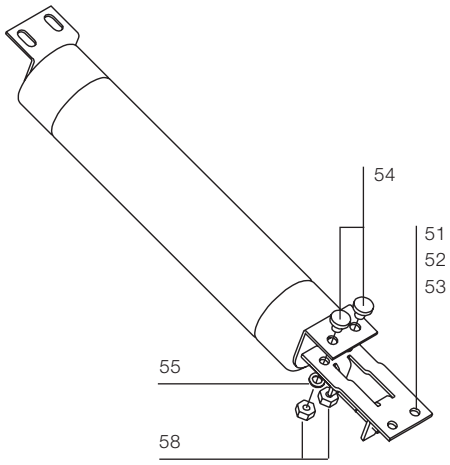

Fig. 20a

b) Mounting the fuses (fig. 20b)

Mount the fuses or the adapter (preassembled as indicated in par. a) with the striker, (indicated by the arrow) facing the opposite side to the one of the contactor tulips and fix them by means of the screws (56) and the spring washers (57).

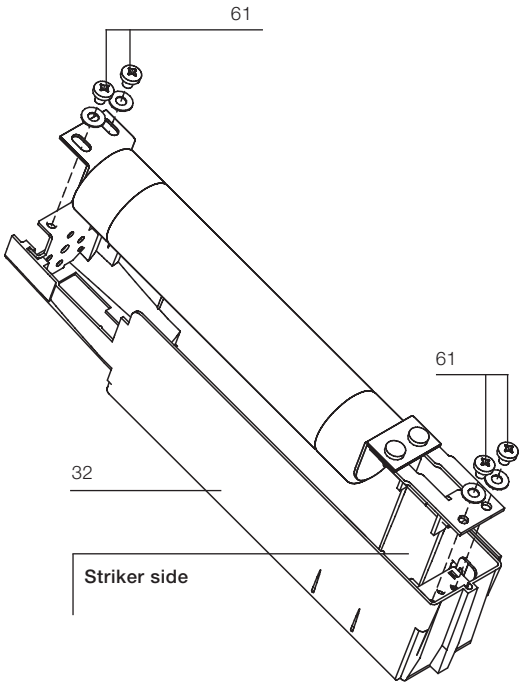

Fig. 20b

c) Dismantling the fuses

To dismantle the fuses and relative adapters, proceed in reverse order to par. b) and a).

d) Assembling and dismantling the VSC/PN and VSC/PNG contactor fuses

It is also possible to use BS fuses with double cartridge connected in parallel in the VSC/PN and VSC/PNG contactors (fig. 20c) and therefore in series with the contactor. The assembly and dismantling operations are the same as what is described in sections a) , b) and c) above, with the only difference being to handle a pair of fuses per phase at the same time (fig. 20c) connected by means of a suitable adapter.

Fig. 20c

7.9. Mounting and dismantling the short-circuit busbar

a) Mounting (fig. 21)

Mount the busbar with the feeler pin (60) on the opposite side to that of the tulips and fix it with the screws (61).

b) Dismantling (fig. 21)

To dismantle, proceed in reverse order.

The same instructions are given in the Kit sheet put in the short-circuit busbar packing.

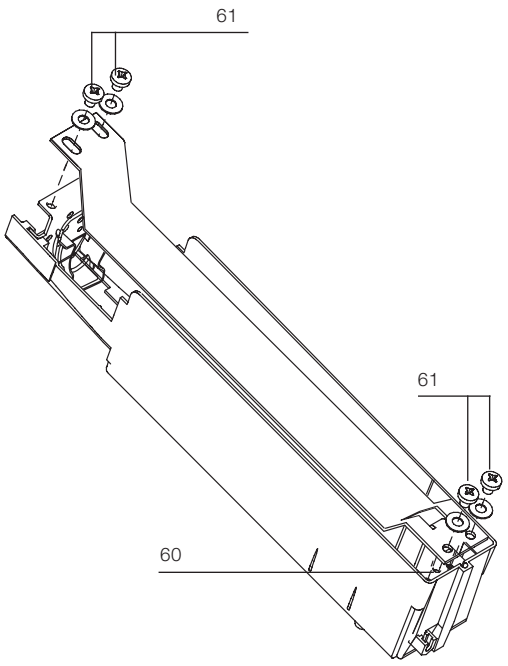

Fig. 21

7.10. Putting the contactor back into service

7.10.1. Mounting the shield and insulating guard (fig. 18)

Reposition the protection (1) (fig. 18b), repeating the operations indicated in par. 7.7.2. in reverse order.
Remount the shield. Check that the impulse counter (14) (fig. 18c) inserts itself into the special seat (69) (fig. 18d) and fix the shield with the screws (70) and DIN washers (71) (fig. 18a).

7.10.2. Checking apparatus functions

Rack the contactor into the enclosure, working as indicated in par. 6.
In the “isolated for test” position, check the correctness and functionality of the contactor “open/closed” signalling by carrying out a few operations.

7.11. Checking the degree of vacuum of the interrupter

This test is not required for normal maintenance. Should it become necessary for extraordinary maintenance, carry out the test on the interrupter without dismantling it from the contactor and use the VIDAR tester, of the Programma Electric GmbH, Bad Homberg v.d.H. company, for the vacuum test.
To check the vacuum air tightness of the interrupter, prepare the following VIDAR tester test values:

Contactor rated voltage	DC test voltage
7.2 kV	16 kV
12 kV	22.5 kV

The test must always be carried out with the contactor open, with the contacts at the nominal distance.
Procedure for testing the vacuum of the interrupter of the contactor poles:

- turn off the power and make the working area safe according to the safety regulations of the IEC/DIN VDE standards;
- open the contactor;
- ground a terminal of each contactor pole;
- connect the ground terminal of the VIDAR tester to the structure of the contactor (grounding point of the contactor);
- connect the high voltage terminal of the VIDAR tester to the terminal not connected to ground of the contactor pole (phase L1) and carry out the test. Repeat the test for phases L2 and L3.

The tester connection cables can produce an indication due to capacitive effect. In this case, the cables must not be removed.

8. Spare parts and accessories

To order contactor spare parts/accessories, refer to technical catalogue 1VCP000165 and always state the following:
– type of contactor
– rated voltage of the contactor
– rated normal current of the contactor
– serial number of the contactor
– rated voltage and frequency of any electrical spare parts.

For availability and to order spare parts, please contact ABB Service.

8.1. List of spare parts

– Vacuum interrupter assembly (replacement to be carried out by ABB)
– MAC-R2 electronic card
– Auxiliary contacts (5 normally open and/or 5 normally closed)
– Capacitor
– Interfacing shaft (only fixed contactors)
– 12 kV insulation partitions (only fixed contactors)
– Actuator assembly (replacement to be carried out by ABB).
– Operation counter
– Fuses
– Adapters for fuses
– Fuseholders (replacement to be carried out by ABB)
– Tulip and jaw-type isolating contacts
– Locking magnet in the truck
– Microswitches.

9. Product quality and environmental protection

The pieces of apparatus are produced in compliance with the requirements of the international standards regarding quality and environmental management systems. In these fields, the excellent level is proved by availability of the ISO 9001 and ISO 14001 certificates.

End of product life

ABB is committed to respecting the requirements and laws for protection of the environment laid down according to the ISO 14001 Standard.

ABB offers its competency and collaboration in facilitating recycling and disposal of the products at the end of their life. It is always necessary to act in compliance with the local regulations in force for disposal of the products.

Methods of disposal

Disposal can either be carried out with thermal treatment in an incineration plant or by storage in special areas

Material	Recommended method of disposal
Metals (Fe, Cu, Al, Ag, Zn, W, others)	Separation and recycling
Thermoplasts	Recycling or disposal
Epoxy resin	Separation of metal parts and disposal of resin parts
Rubber	Disposal
Dielectric oil (oil for transformers)	Recovery and recycling or disposal
Wood for packing	Recycling or disposal
Aluminium foil for packing	Recycling or disposal

Disclaimer

The data, examples and diagrams in this manual are included solely for the concept or product description and are not to be deemed as a statement of guaranteed properties. All persons responsible for applying the equipment addressed in this manual must satisfy themselves that each intended application is suitable and acceptable, including that any applicable safety or other operational requirements are complied with. In particular, any risks in applications where a system failure and/or product failure would create a risk for harm to property or persons (including but not limited to personal injuries or death) shall be the sole responsibility of the person or entity applying the equipment, and those so responsible are hereby requested to ensure that all measures are taken to exclude or mitigate such risks.

This product has been designed to be connected and communicate data and information via a network interface which should be connected to a secure network. It is the sole responsibility of the person or entity responsible for network administration to ensure a secure connection to the network and to take the necessary measures (such as, but not limited to, installation of firewalls, application of authentication measures, encryption of data, installation of anti virus programs, etc.) to protect the product and the network, its system and interface included, against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. ABB is not liable for any such damages and/or losses.

This document has been carefully checked by ABB but deviations cannot be completely ruled out. In case any errors are detected, the reader is kindly requested to notify the manufacturer. Other than under explicit contractual commitments, in no event shall ABB be responsible or liable for any loss or damage resulting from the use of this manual or the application of the equipment.

In case of discrepancies between the English and any other language version, the wording of the English version shall prevail.

Conformity

This product complies with the directive of the Council of the European Communities on the approximation of the laws of the Member States relating to electromagnetic compatibility (EMC Directive 2014/30/EU) and concerning electrical equipment for use within specified voltage limits (Low-voltage directive 2014/35/EU). This conformity is the result of tests conducted by the third party testing laboratory Intertek in accordance with the product standard EN 60255-26 for the EMC directive, and with the product standards EN 60255-1 and EN 60255-27 for the low voltage directive. The product is designed in accordance with the international standards of the IEC 60255 series.

Safety information

Dangerous voltages can occur on the connectors, even though the auxiliary voltage has been disconnected.

Non-observance can result in death, personal injury or substantial property damage.

Only a competent electrician is allowed to carry out the electrical installation.

National and local electrical safety regulations must always be followed.

The frame of the protection relay has to be carefully earthed.

The protection relay contains components which are sensitive to electrostatic discharge. Unnecessary touching of electronic components must therefore be avoided.

Whenever changes are made in the protection relay, measures should be taken to avoid inadvertent tripping.

1 Introduction

1.1 This manual

The engineering manual contains instructions on how to engineer the protection relays using the different tools in PCM600. The manual provides instructions on how to set up a PCM600 project and insert relays to the project structure. The manual also recommends a sequence for engineering of protection and control functions, LHMI functions as well as communication engineering for IEC 61850 and other supported protocols.

1.2 Intended audience

This manual addresses system and project engineers involved in the engineering process of a project, and installation and commissioning personnel, who use technical data during engineering, installation and commissioning, and in normal service.

The system engineer must have a thorough knowledge of the application, protection and control equipment and the configured functional logic in the relays. The installation and commissioning personnel must have a basic knowledge of handling electronic equipment.

1.3 Product documentation

1.3.1 Product documentation set

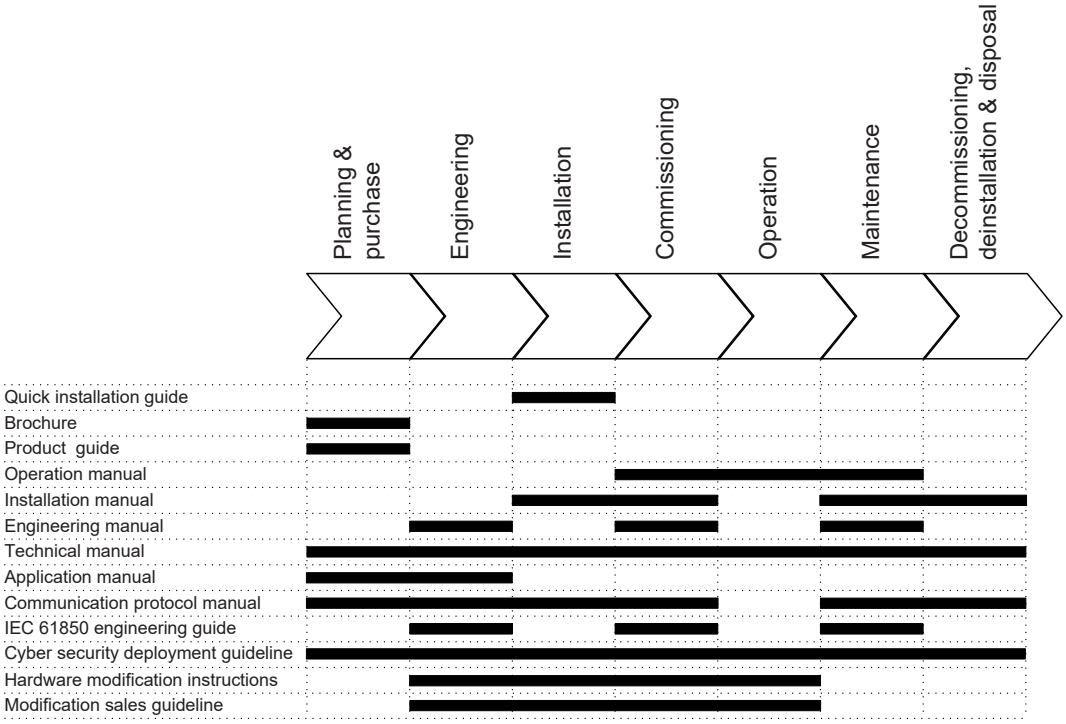

Figure 1: The intended use of documents during the product life cycle

1.3.2 Document revision history

Document revision/ date	Product connectivity level	History
A/2019-05-08	PCL1	First release
B/2020-02-13	PCL2	Content updated to correspond to the product connectivity level
C/2020-12-09	PCL3	Content updated to correspond to the product connectivity level
D/2023-02-13	PCL4	Content updated to correspond to the product connectivity level

1.3.3 Related documentation

Name of the document	Document ID
TISSUES Implementation Conformance Statement (TICS) for the IEC 61850 interface in REX640	1MRS759027
Protocol Implementation extra Information for Testing (PIXIT) for the IEC 61850 interface in REX640	1MRS759030
Protocol Implementation extra Information for Testing (PIXIT) for the IEC 61850 9–2LE interface in REX640	1MRS759037
Protocol Implementation Conformance Statement (PICS) for the IEC 61850 interface in REX640	1MRS759029
IEC 61850 Ed2 Model Implementation Conformance Statement (MICS) for REX640	1MRS759028

1.4 Symbols and conventions

1.4.1 Symbols

The caution icon indicates important information or warning related to the concept discussed in the text. It might indicate the presence of a hazard which could result in corruption of software or damage to equipment or property.

The information icon alerts the reader of important facts and conditions.

The tip icon indicates advice on, for example, how to design your project or how to use a certain function.

Although warning hazards are related to personal injury, it is necessary to understand that under certain operational conditions, operation of damaged equipment may result in degraded process performance leading to personal injury or death. Therefore, comply fully with all warning and caution notices.

1.4.2 Document conventions

A particular convention may not be used in this manual.

- Abbreviations and acronyms are spelled out in the glossary. The glossary also contains definitions of important terms.
- Menu paths are presented in bold.

  Select **Main menu** > **Settings**.
- Parameter names are shown in italics.

  The function can be enabled and disabled with the *Operation* setting
- Parameter values are indicated with quotation marks.

  The corresponding parameter values are "On" and "Off".
- Input/output messages and monitored data names are shown in Courier font.

  When the function starts, the `START` output is set to TRUE.
- Values of quantities are expressed with a number and an SI unit. The corresponding imperial units may be given in parentheses.
- This document assumes that the parameter setting visibility is "Advanced".

1.4.3 Functions, codes and symbols

Table 1: Functions included in the relay

Function	IEC 61850	IEC 60617	ANSI
Protection			
Distance protection	DSTPDIS	Z<	21P,21N
Local acceleration logic	DSTPLAL	LAL	21LAL
Scheme communication logic	DSOCPSCH	CL	85 21SCHLGC
Current reversal and weak-end infeed logic	CRWPSCH	CLCRW	85 21CREV,WEI
Communication logic for residual overcurrent	RESCPSCH	CLN	85 67G/N SCHLGC
Current reversal and weak-end infeed logic for residual overcurrent	RCRWPSCH	CLCRWN	85 67G/N CREV,WEI
Power swing detection	DSTRPSB	Zpsb	68
Line differential protection with inzone power transformer	LNPLDF	3Id/I>	87L
Binary signal transfer	BSTGAPC	BST	BST
Switch-onto-fault protection	CVPSOF	CVPSOF	SOTF
Three-phase non- directional overcurrent protection, low stage	PHLPTOC	3I>	51P-1
Three-phase non- directional overcurrent protection, high stage	PHHPTOC	3I>>	51P-2
Three-phase non- directional overcurrent protection, instantaneous stage	PHIPTOC	3I>>>	50P
Three-phase directional overcurrent protection, low stage	DPHLPDOC	3I>->	67P/51P-1
Three-phase directional overcurrent protection, high stage	DPHHPDOC	3I>>->	67P/51P-2
Non-directional earth-fault protection, low stage	EFLPTOC	Io>	51G/51N-1
Non-directional earth-fault protection, high stage	EFHPTOC	Io>>	51N-2
Non-directional earth-fault protection, instantaneous stage	EFIPTOC	Io>>>	50G/50N
Directional earth-fault protection, low stage	DEFLPDEF	Io>->	67G/N-1 51G/N-1
Directional earth-fault protection, high stage	DEFHPDEF	Io>>->	67G/N-1 51G/N-2
Three-phase power directional element	DPSRDIR	I1 ->	67P-TC
Neutral power directional element	DNZSRDIR	I2->,Io->	67N-TC
Admittance-based earth-fault protection	EFPADM	Yo>->	21YN
Multifrequency admittance-based earth-fault protection	MFADPSDE	Io>->Y	67NYH
Wattmetric-based earth-fault protection	WPWDE	Po>->	32N
Transient/intermittent earth-fault protection	INTRPTEF	Io>->IEF	67NTEF/NIEF
Harmonics-based earth-fault protection	HAEFPTOC	Io>HA	51NH
Touch voltage based earth-fault current protection	IFPTOC	IF>/UT>	46SNQ/59N
Negative-sequence overcurrent protection	NSPTOC	I2>M	46M

Table continues on the next page

Function	IEC 61850	IEC 60617	ANSI
Phase discontinuity protection	PDNSPTOC	I2/I1>	46PD
Residual overvoltage protection	ROVPTOV	Uo>	59G/59N
Three-phase undervoltage protection	PHPTUV	3U<	27
Three-phase overvoltage variation protection	PHVPTOV	3Urms>	59.S1
Three-phase overvoltage protection	PHPTOV	3U>	59
Positive-sequence overvoltage protection	PSPTOV	U1>	59PS
Positive-sequence undervoltage protection	PSPTUV	U1<	27PS
Negative-sequence overvoltage protection	NSPTOV	U2>	47,59NS
Frequency protection	FRPFRQ	f>/f<,df/dt	81
Three-phase voltage-dependent overcurrent protection	PHPVOC	3I(U)>	51V
Overexcitation protection	OEPVPH	U/f>	24
Three-phase thermal protection for feeders, cables and distribution transformers	T1PTTR	3Ith>F	49F
Three-phase thermal overload protection, two time constants	T2PTTR	3Ith>T/G/C	49T/G/C
Three-phase overload protection for shunt capacitor banks	COLPTOC	3I>3I<	51,37,86C
Current unbalance protection for shunt capacitor banks	CUBPTOC	dI>C	60N
Three-phase current unbalance protection for shunt capacitor banks	HCUBPTOC	3dI>C	60P
Shunt capacitor bank switching resonance protection, current based	SRCPTOC	TD>	55ITHD
Compensated neutral unbalance voltage protection	CNUPTOV	CNU>	59NU
Directional negative- sequence overcurrent protection	DNSPDOC	I2>->	67Q
Low-voltage ride- through protection	LVRTPTUV	UU	27RT
Voltage vector shift protection	VVSPPAM	VS	78VS
Directional reactive power undervoltage protection	DQPTUV	Q>-> ,3U<	32Q,27
Reverse power/ directional overpower protection	DOPPDPR	P>/Q>	32R/32O
Underpower protection	DUPPDPR	P<	32U
Three-phase under impedance protection	UZPDIS	ZZ	21G
Directional negative sequence impedance protection	DNZPDIS	Z2->	Z2Q
Three-phase under excitation protection	UEXPDIS	X<	40
Third harmonic-based stator earth-fault protection	H3EFPSEF	dUo>/Uo3H	64TN
Rotor earth-fault protection (injection method)	MREFPTOC	Io>R	64R
Generator shaft leakage current	GSLPTOC	I>,GS	38, 51
Thermal overload protection for rotors	RPTTR	3Ith>R	49R
High-impedance or flux-balance based differential protection	MHZPDIF	3dIHi>M	87HIM
Out-of-step protection with double blinders	OOSRPSB	OOS	78PS
Negative-sequence overcurrent protection for machines	MNSPTOC	I2>M	46M

Constant FALSE	FALSE	FALSE	FALSE
Constant TRUE	TRUE	TRUE	TRUE

2 Relay engineering process

PCM600 is used for various tasks in the protection relay engineering process.

- Relay engineering management
  - Organizing the bay protection relays in the structure of the substation by defining voltage levels and bays below the substation. PCM600 manages the project.
  - Configuring the protection relay functions (for example, protection and control functions) by using Application Configuration.
  - Configuring the parameters and setting values for the protection relay and for the process functions by using Parameter Setting.
  - Configuring LHMI pages, drawing single-line diagrams and making links to dynamic process values by using Graphical Display Editor. The single-line diagrams are displayed on the LHMI and the WHMI on the bay protection relay.
  - Configuring connections between the application configuration function blocks and physical hardware inputs and outputs by using Signal Matrix or Application Configuration.
  - Configuring the events shown on the LHMI using HMI Event Filtering.
- Communication management
  - IEC 61850 station communication engineering is done using the internal IEC 61850 Configuration tool or the separate IET600. PCM600 interacts with IET600 by importing and exporting SCL files.
  - Configuring the GOOSE receiving data connections to the protection relay's application configuration function blocks by using the Application Configuration tool and the Signal Matrix tool.
  - Configuring protocol data mapping for Modbus, DNP3, IEC 60870-5-103 or IEC 60870-5-104 with the Communication Management tool.
  - Configuring the sampled values (process bus) between the devices using Application Configuration, IEC 61850 Configuration and Signal Matrix.
  - Configuring Ethernet ports and other network settings using Ethernet Configuration.
- Record management
  - Generating overviews of the available disturbance recordings in all connected protection relays by using Disturbance Handling.
  - Manually reading the recording files (in the COMTRADE format) from the protection relays by using Disturbance Handling or automatically by using PCM600 Scheduler.
  - Managing recording files with Disturbance Handling.
  - Creating overview reports for fast evaluation of the recording file content by using Disturbance Handling.
  - Reading fault records from the protection relay, saving records to a PC and clearing old records with Fault Record.
  - Reading load profile records from the protection relay, saving records to a PC and clearing old records using Load Profile.
- Service management

- Monitoring the selected signals of a protection relay for commissioning or service purposes by using Application Configuration, Parameter Setting and Event Viewer (including security logs)

There are also additional functions for managing projects and organizing user rights.

- PCM600 user management
  - Organizing users regarding their rights, profiles and passwords to use different tools and functions in the tools.
  - Defining allowed activities for user profiles to use tools in PCM600.
- Relay user management
  - Supporting user account management and role-based access control
  - Using IED Users for local user accounts and Account Management for central account management

Once the engineering of the protection relay is finished, the results must be written to the protection relay.

The connection between the physical IED and PCM600 is established via an Ethernet link on the HMI or LAN port of the protection relay.

2.1 Monitoring and control system structure

The monitoring and control system can be divided into three main parts which require specific engineering and configuration.

- Bay level devices
- Station communication
- Station level devices

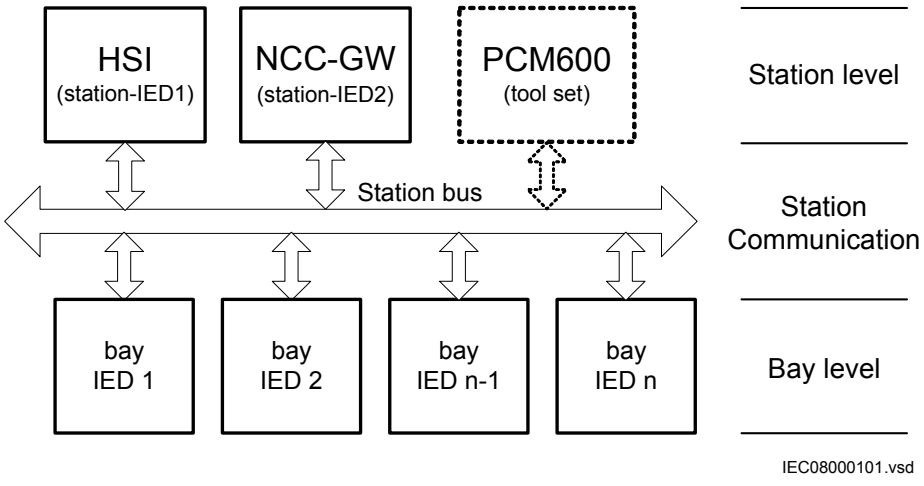

Figure 2: Principle structure of a monitoring and control system for a substation

A plant structure is used to identify each device in its location within the substation organization. The plant structure is a logical image of the substation and the bays within the substation. The device organization may differ from the structure of the primary equipment in the substation.

In PCM600 it is possible to set up a hierarchical structure of five levels for the device identification.

- Project
- Substation = name of the substation
- Voltage level = identifies to which grid type or part the device belongs in the substation
- Bay = bay within the voltage level
- IED = selection of the IED that is used in the bay; several IEDs can be inserted in a bay, for example, one control device and two protection relays

2.2 Default configuration

The protection relay contains a default configuration when delivered. The default configuration contains a simple application configuration and an LHMI configuration which can be used as a basis when the actual application configuration is created for the protection relay installation. The default configuration does not have output relays connected in the application configuration, so the relay and its configuration must not be used in installation as they are; modification of the application configuration is always required before commissioning.

The default configuration is available for IEC 61850 Edition 2 only, though the relay supports the IEC 61850 Edition 1 as well. For instructions on how to enable Edition 1 for the relay, see chapter IED insertion.

2.3 Workflow

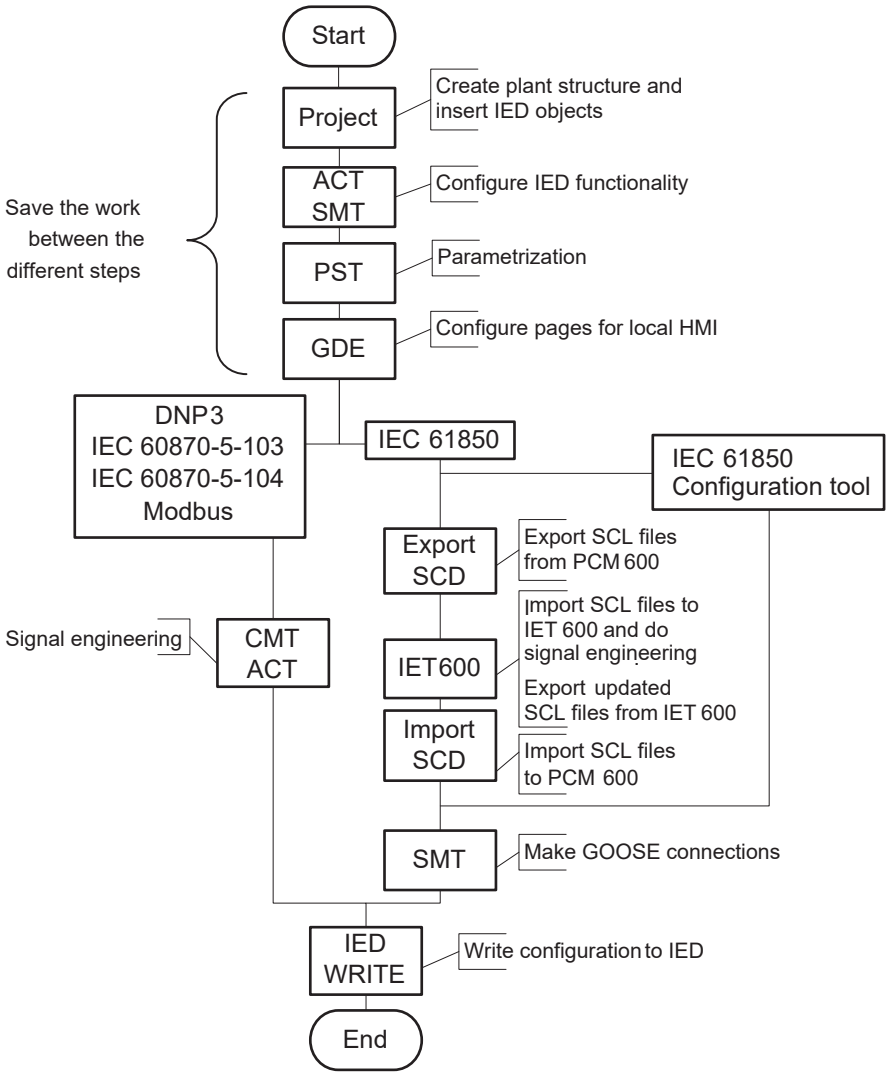

Figure 3: Protection relay engineering workflow proposal based on practical experience and dependencies of the steps

It is possible to follow a different sequence based on the information available at the start of the project. This means that several iterations may be needed to complete the project.

PCM600 project setup

- The plant structure is built according to the substation structure.
- To add a protection relay to a project, a suitable connectivity package is needed. Protection relays can be added either while connected or disconnected or through other means such as an IED template.
- IED objects are uniquely named within the PCM600 project.

Application configuration in the Application Configuration tool

- Protection and control functions can be configured as needed.

- The configuration made in Application Configuration is saved to make the interfaces and signals available for other engineering tools within PCM600, for example, for Parameter Setting.

Parameter setting and configuration in the Parameter Setting tool

- The setting values are checked and adjusted with the Parameter Setting tool.

HMI engineering in Graphical Display Editor

- It is possible to create new pages, configure pages by adding widgets, set page visibility to different user categories, create single-line diagrams (shown on the LHMI and the WHMI) and symbols, and to provide language translations for the LHMI elements.

Communication protocol engineering

- The communication engineering details are protocol-dependent.
- The connectivity package creates the IEC 61850 configuration for vertical communication automatically and it is often directly suitable for IEC 61850 client configuration. Either IEC 61850 Configuration tool or IET600 is needed for configuring horizontal and vertical communication.
- The Communication Management tool is used for other protocols; for example Modbus.

The protection relay restarts automatically when writing a relay configuration where changes have been made. It is not possible to communicate with the protection relay during restart.

3 PCM600

Protection and Control IED Manager PCM600 offers all the necessary functionality to work throughout all stages of the protection relay's life cycle.

- Planning
- Engineering
- Commissioning
- Operation and disturbance handling
- Functional analysis

The whole substation configuration can be controlled and different tasks and functions can be performed with the individual tool components. PCM600 can operate with many different topologies, depending on the project needs.

PCM600 is used to conduct complete engineering and configuration activities needed for the bay-level protection relays.

Connectivity packages are separate software packages that provide type and version information to PCM600 and assist the tool with communications.

PCM600 communicates with devices over Ethernet using either IEC 61850 or the FTP/FTPS protocols. This communication allows PCM600 to configure and monitor the devices. In addition to IEC 61850, the devices have optional communication protocols and hardware to connect to station engineering tools. PCM600 provides the ability to export the configuration of the devices or an entire substation in a standard file format which enables station engineering in separate IEC 61850 system configuration tools.

A PC with PCM600 can be connected to any Relion protection relay within a station by using the Ethernet connection. The connection can also be used for service and maintenance purposes and to handle disturbance records from the protection relays.

The modern protection relays are designed using the concept of the IEC 61850 standard. This is mainly visible in how functions within the protection relay are modelled and how the protection relay is represented in the substation. The list of logical nodes available in the protection relay reflects the IEC 61850 parameter list. The logical nodes follow the structure and rules defined in part 7 of the standard.

The communication protocol engineering is a separate task and an addition to the engineering of protection and control functions.

As PCM600 can be used for different purposes throughout the protection relay life cycle, a set of tools is available for different applications.

The applications can be organized into groups.

- Relay engineering
- Communication engineering
- Record management
- Device monitoring and diagnostic
- User management

For more information, see the PCM600 documentation.

3.1 Connectivity packages

A connectivity package is a software component that consists of executable code and data which enable system tools to communicate with a protection relay. Connectivity packages are used to create configuration structures in PCM600. The latest PCM600 and connectivity packages are backward compatible with older protection relay versions.

A connectivity package includes all the data which is used to describe the protection relay. For example, it contains a list of the existing parameters, data format used, units, setting range, access rights and visibility of the parameters. In addition, it contains code which allows the software packages that use the connectivity package to properly communicate with the protection relay.

3.2 PCM600 and relay connectivity package version

- Protection and Control IED Manager PCM600 Ver. 2.12 or later
- REX640 Connectivity Package Ver. 1.3.0 or later

Download connectivity packages from the ABB Web site *www.abb.com/mediumvoltage* or directly with Update Manager in PCM600.

3.2.1 Installing connectivity packages

- Install connectivity packages either by running the installer which can be downloaded on the ABB Web site or by using Update Manager when a network connection is available.

Download connectivity packages from the ABB Web site *www.abb.com/mediumvoltage* or directly with Update Manager in PCM600.

3.2.1.1 Installing connectivity packages by using the connectivity package installer

1. Close PCM600.
2. Run the connectivity package installer.
   - ABB IED Connectivity Package REX640 Ver. n.msi
   - ABB IED Connectivity Package REX640 Ver. n. User Documentation.msi (optional)

   (n = version number)

3. Follow the steps in the connectivity package installation wizard.

3.2.1.2 Installing connectivity packages by using Update Manager

1. In PCM600, click **Help** and select **Update Manager**.
   Run Update Manager with administrator rights.

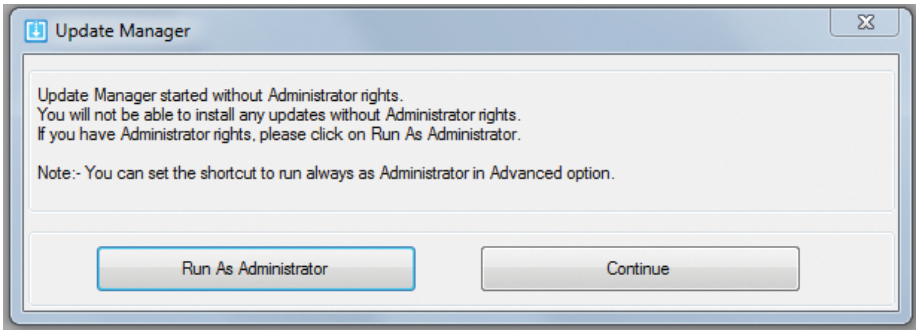

Figure 4: Running Update Manager as an administrator

2. Select **Get Connectivity Packages** from the menu on the left column.
3. Select all the required connectivity packages.
4. Click **Download and Install**.
   The status bar shows the installation status.

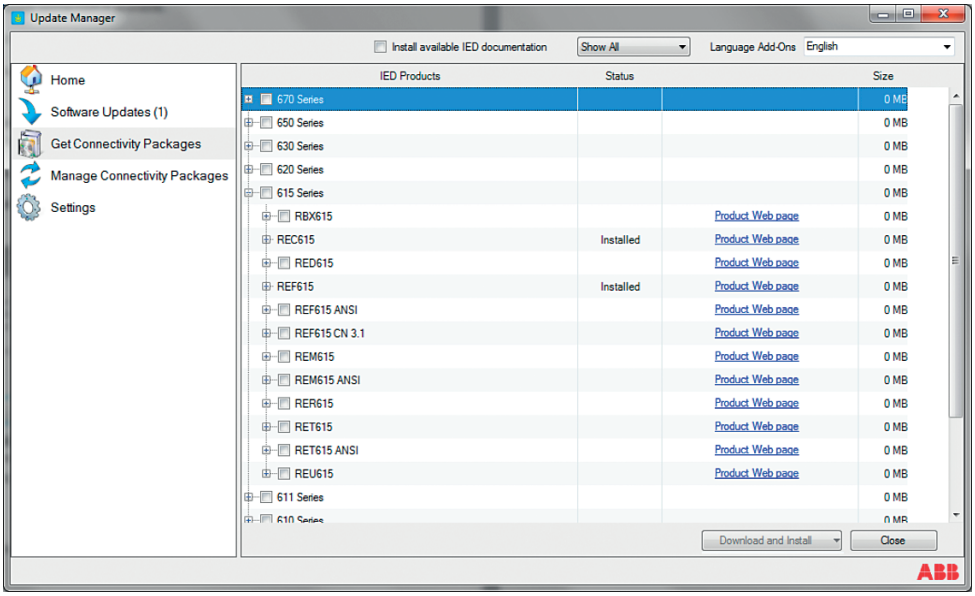

Figure 5: Selecting the connectivity packages

3.2.2 Activating connectivity packages

The relay connectivity package has to be installed before it can be activated in Update Manager.

1. Select **Manage Connectivity Packages** from the menu on the left column to access the installed connectivity packages.
2. Browse the tree structure to find the correct product.
3. Select the connectivity package version from the drop-down list beside the product name.

Always use the latest version of the connectivity package.

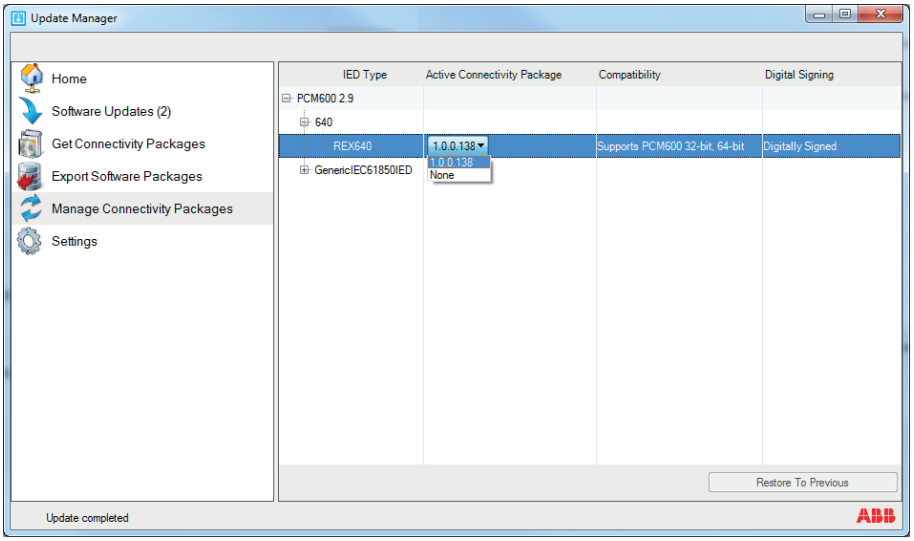

Figure 6: Selecting the connectivity package versions

PCM600 recognizes the installed connectivity packages during start-up, and the corresponding IED types are available in PCM600 when starting a new project.

3.3 PCM600 projects

A typical project in PCM600 contains a plant structure including one or several IED objects, where each IED object contains the engineering data created or modified using the different PCM600 tools.

Several projects can be created and managed by PCM600, but only one project can be active at a time.

Regardless of the protocol used in installation for each project, it is possible to have Edition1 and Edition2 relays configured in the same PCM600 project. The PCM600 project's SCL edition is the highest SCL edition relay in the project. If IEC 61850 is not used for station bus, either version can be applied. The protection relay's IEC 61850 version is by default Edition 2.

With PCM600, it is possible to do various tasks.

- Open existing projects
- Import projects
- Create new projects
- Export projects

- Delete projects
- Rename projects
- Copy and paste projects

The extension of the exported project file is .pcmp. The files are only used for exporting and importing projects between PCM600s.

3.4 Technical key

Both a physical IED and an IED object in PCM600 have a technical key. The technical key in the protection relay and PCM600 must be the same, otherwise it is not possible to download a configuration.

Each IED in a PCM600 project and in an entire substation must have a unique technical key. Therefore, it is not possible to set the same technical key for several IEDs in the same PCM600 project.

The protection relay is delivered with a factory default technical key. The validation of the technical keys between PCM600 and the protection relay does not occur if the protection relay contains the factory default technical key.

The technical key property in PCM600 corresponds to the IED name attribute in SCL files. Avoid changing the IED name attribute outside PCM600, because data in PCM600 may get lost when importing the SCL files.

When writing a configuration to the protection relay, PCM600 checks for a mismatch between the IED object and the physical IED technical key. The technical key can be read from the protection relay and updated to PCM600, or the PCM600 technical key can be written to the protection relay. Alternatively, a user-defined technical key can be defined.

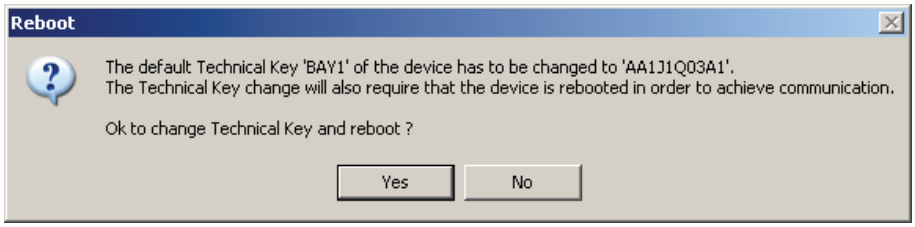

Figure 7: Reboot suggestion

Ensure that the IED object in PCM600 has the same IP address as the physical IED to be connected through the technical key.

Change the technical key for an IED object in the **Object Properties** dialog box in PCM600.

3.4.1 IEC 61850 naming conventions for an IED

The IEC 61850 naming conventions to identify an IED are valid only when the IEC 61850 standard is used for station bus communication. According to IEC 61850-6, the SCL model allows two kinds of project designations in the object properties: a technical key and a user-oriented textual designation.

- The technical key is used in engineering drawings and for signal identifications. This is contained in the attribute name as an identification of each object. If the value is used as a reference to an object, it is contained in an attribute name starting with a string denoting the reference target object type and ending with the string *Name*. The technical key is used within SCL for referencing other objects. The name is a relative identification within a hierarchy of objects. The maximum length of the technical key is 28 characters for Edition 1 and 60 characters for Edition 2.
- User-oriented textual designation is contained in the *desc* attribute. Attributes are not allowed to contain carriage return, line feed, tab, greater than, less than, double quotes or ampersand characters. The semantics of *desc* must also be relative within an object hierarchy. The maximum length is 100.

PCM600 supports both possibilities. The two signal designations are available per object in Object Properties for all the hierarchical levels beginning with the station as the highest level.

The technical key is automatically generated based on the rules and type specifications of IEC 61346 and the extended definitions assigned for substations by a technical committee. The technical key is shown in the Object Properties dialog box under SCL Technical Key or Technical Key.

- The station is predefined by “AA1" where 1 is the index. To get the real station name that is used, it is possible to rename the SCL Technical Key for the station as the name used by the project. To minimize the word length, a short form should be used because this name is also used in the transmitted messages to identify the events, for example.
- The voltage level. In *Figure 8* it is 20 kV and J1 is selected from the list below SCL Technical Key in the Object Properties dialog box.
- The bay and the IED are appended with the coding defined in the IEC 61346 standard and the substation definition lists. In the example, the bay SCL Technical Key part is Q03 and IED is A1.

The user-oriented textual designation is visible in the Plant structure view for each object. It is the name given by default or changed by with the Rename function.

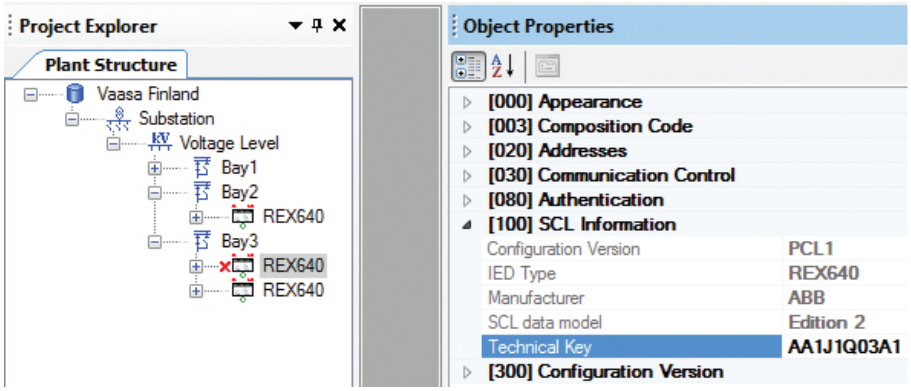

Figure 8: IEC 61850 signal designation concept in PCM600

The created technical key for the full path name of the IED would be: AA1J1Q03A1.

- AA1 = substation in the project
- J1 = voltage level from 20 to 30 kV
- Q03 = third bay in the voltage level
- A1 = first IED in bay Q03

3.4.2 Setting technical key

The maximum length of the technical key is 28 characters for Edition 1 and 60 characters for Edition 2.

1. In the **Plant Structure** view, right-click the IED and select **Set Technical Key in IED**.

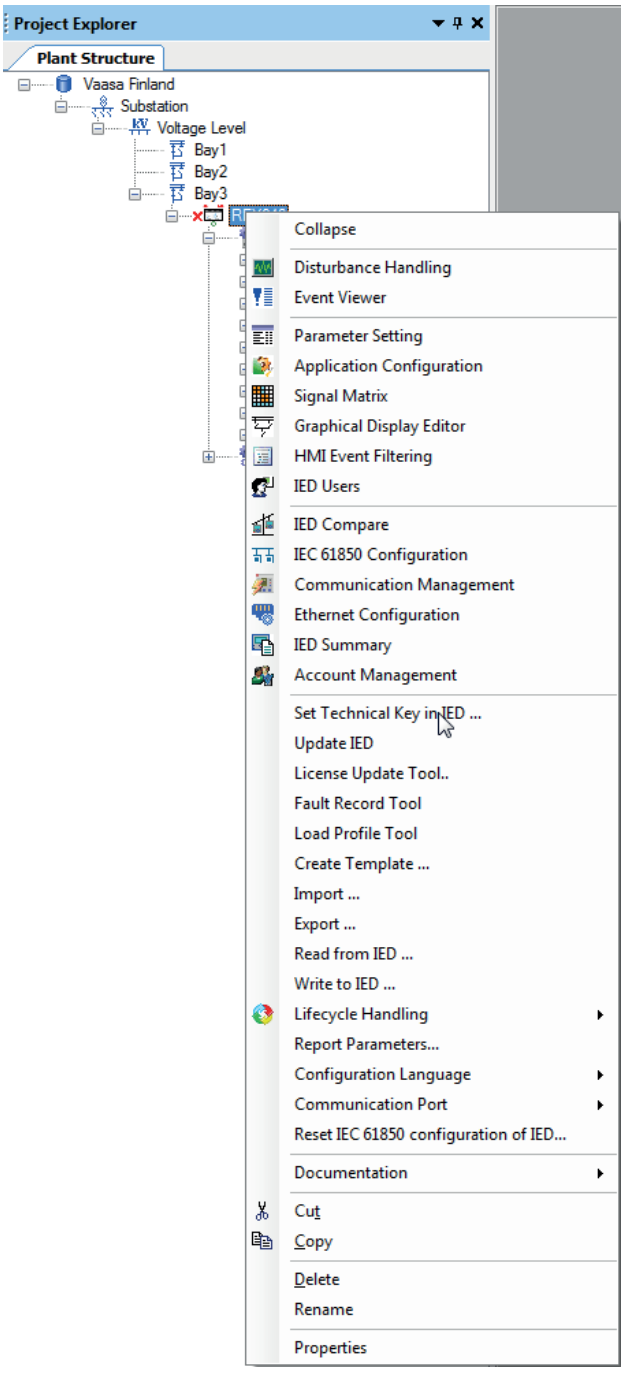

Figure 9: PCM600: Setting the technical key on the IED level

A dialog box opens to inform about the technical key concept.

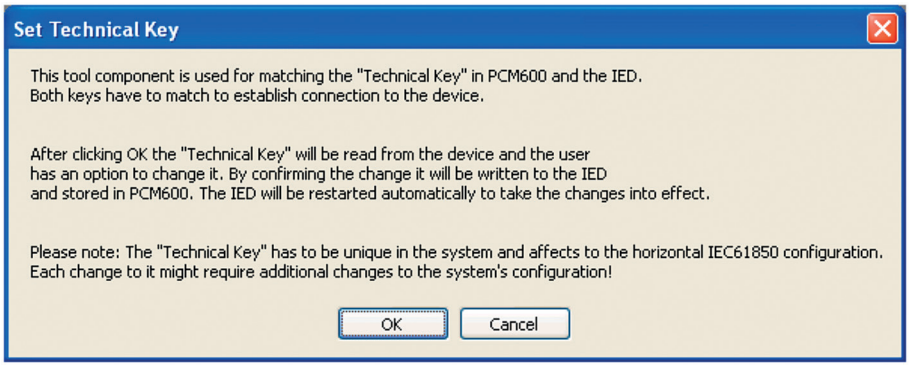

Figure 10: Technical key information

2. Click **OK**.

   The technical key is read from the IED and the **Set Technical Key** dialog box opens.

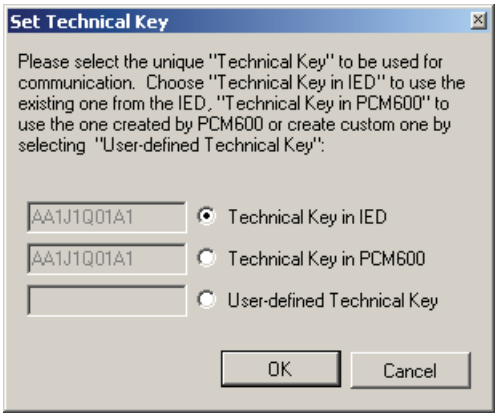

Figure 11: Setting the technical key

3. In the **Set Technical Key** dialog box, select the technical key to be used. There are three alternatives.
   - Use the technical key in the IED
   - Use the technical key defined for the IED object in PCM600
   - Set a user-defined technical key, which changes the technical key for both the physical IED and IED object in PCM600
4. Click **OK** to confirm the selection.

   It is not possible to set a user-defined name or select **Technical key in IED** if the value is already given to another IED object in the PCM600 project. An error message is displayed if this happens.

3.5 Communication between PCM600 and the protection relay

The communication between the protection relay and PCM600 is independent of the used communication protocol within the substation or to the NCC.

All communication is done over Ethernet using either IEC 61850 or the FTP/FTPS protocol.

When an Ethernet-based station protocol is used, the same Ethernet port and IP address can be used for PCM600 communication.

Two basic variants have to be considered for the connection between PCM600 and the protection relay.

- Direct point-to-point link between PCM600 and service port X1.2 on the protection relay's LHMI or, if an LHMI is not used, the HMI port X0 of the communication module
- Indirect link via station LAN or remotely via network

1. If needed, the IP address for the protection relay is set.
2. A PC or workstation is set up for a direct link (point-to-point), or the PC or workstation is connected to the LAN/WAN network.
3. The protection relays' IP addresses in the PCM600 project are configured to match the IP addresses of the physical IEDs.
4. Technical keys of the IEDs in the PCM600 project are configured to match the technical keys of the physical IEDs.

For successful protection relay engineering and usage, the workstation firewall TCP and UDP port configurations should be checked, especially for IEC 61850 and FTP. Other protocols are not used for engineering or they are optional.

3.5.1 Setting up IP addresses

The IP address and the corresponding subnet mask can be set via LHMI for the Ethernet interface in the protection relay. Each Ethernet interface has a default factory IP address when the protection relay is delivered. The configured Ethernet interface IP address is preserved if the communication card is replaced.

1. Set the IP address for the protection relay's rear port and the corresponding subnet mask via the LHMI paths **Configuration** > **Communication** > **Ethernet** > **Network1 address** and **Configuration** > **Communication** > **Ethernet** > **Network2 address**.

   Only the Network1 interface is enabled by default. See the cyber security deployment guideline for more information.

   Table 2: Default IP addresses for the LAN port interfaces and the corresponding subnet masks

Interface	IP address	Subnet mask	Default mode
Network1	192.168.2.10	255.255.255.0	Enabled
Network2	192.168.3.10	255.255.255.0	Disabled

When using redundant Ethernet (HSR or PRP), configure all devices in the network before connecting cables to ports LAN A and LAN B. Avoid using the LAN A or LAN B ports on redundant communication modules while changing the *Switch mode* parameter.

3.6 IED Update

The firmware update tool is used for updating the following:

- IED firmware
- HW module firmware
- LHMI firmware and application
- License in case of Modifications Sales related update

The tool can also be used for adding or replacing IED languages. Update packages are provided by Customer Support.

The update tool can be used either locally or remotely.

Separate update packages are needed for updating the communication card, the LHMI and license and default configuration files. If the new communication card firmware, LHMI firmware or application need new IED firmware, it is updated at the same time, otherwise a second update with the same package is needed to update the IED firmware.

3.6.1 Prerequisites for local and remote updates

Local update

- It is recommended to use the LHMI's service port X1.2 or, if an LHMI is not used, the HMI port X0 of the communication module. The IED should be removed from the network especially with redundant network topologies (HSR or PRP).

Remote update

- Communication should be secured either by setting up a VPN connection or by enabling secure communication in the IED via LHMI (**Configuration** > **Communication** > **Protocols** > **Network1**FTP or **Configuration** > **Communication** > **Protocols** > **Network2** > **FTP**).
- Remote update can be enabled in the IED either via the LHMI (**Configuration** > **Authorization** > **Security** > **Remote Update**) or by an administrator in Parameter Setting in PCM600 (**IED Configuration** > **Configuration** > **Authorization** > **Remote Update**. If the IED is in local control mode, remote update proceeds only after a confirmation is received from the user.
- Remote update can be disabled manually after the update.
- Remote update only works when the IED is connected from the Ethernet interface connector of the communication module with a custom IP address.
- Remote update via a network gateway can be assigned either to Network 1 or Network 2.

3.6.2 Updating firmware or language

1. Select the update mode.
   - Firmware
   - Language
2. Select the update package and click **Next**.

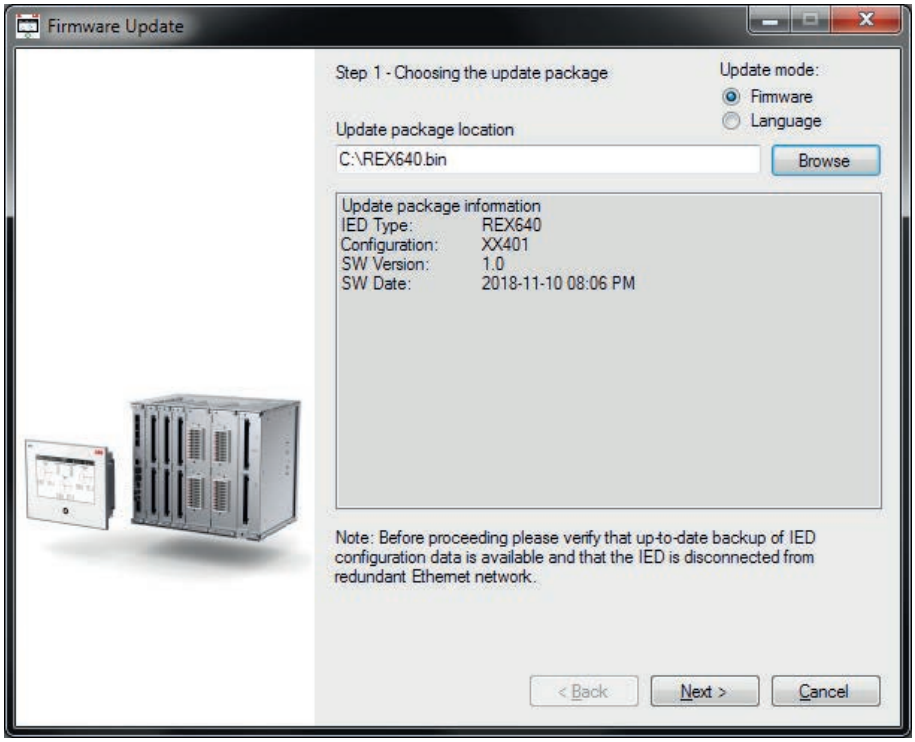

Figure 12: Choosing the update mode and package

3. Select the relay to be updated and click **Next**.

   Currently only one relay can be selected.

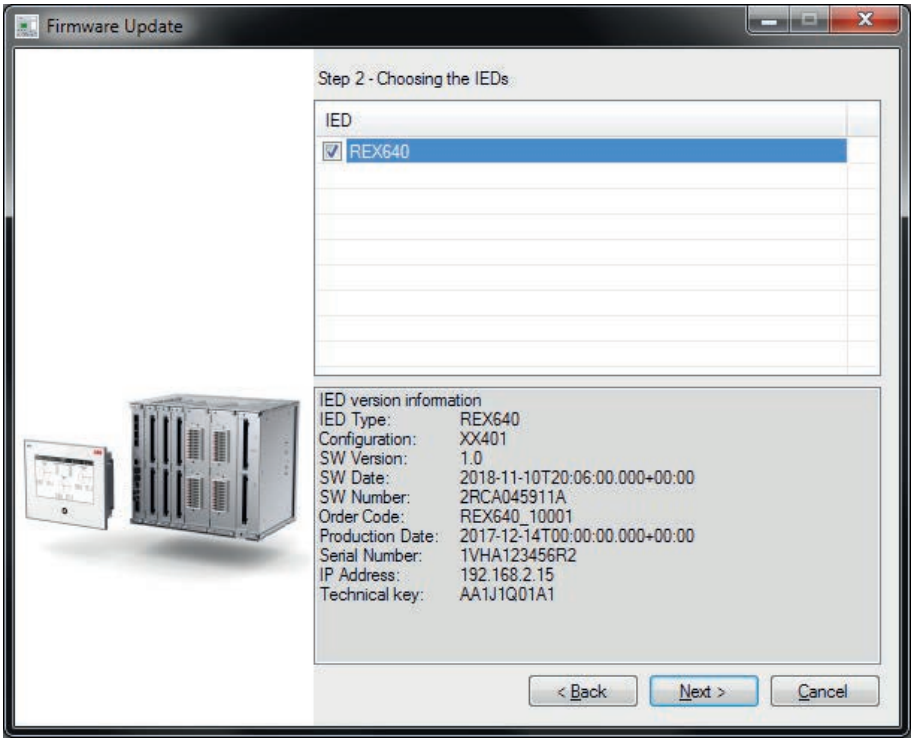

Figure 13: Choosing the relay for the update

4. If required, clear the life cycle handling indication by selecting the **Clear Lifecycle Handling indication on Local HMI after update** check box.

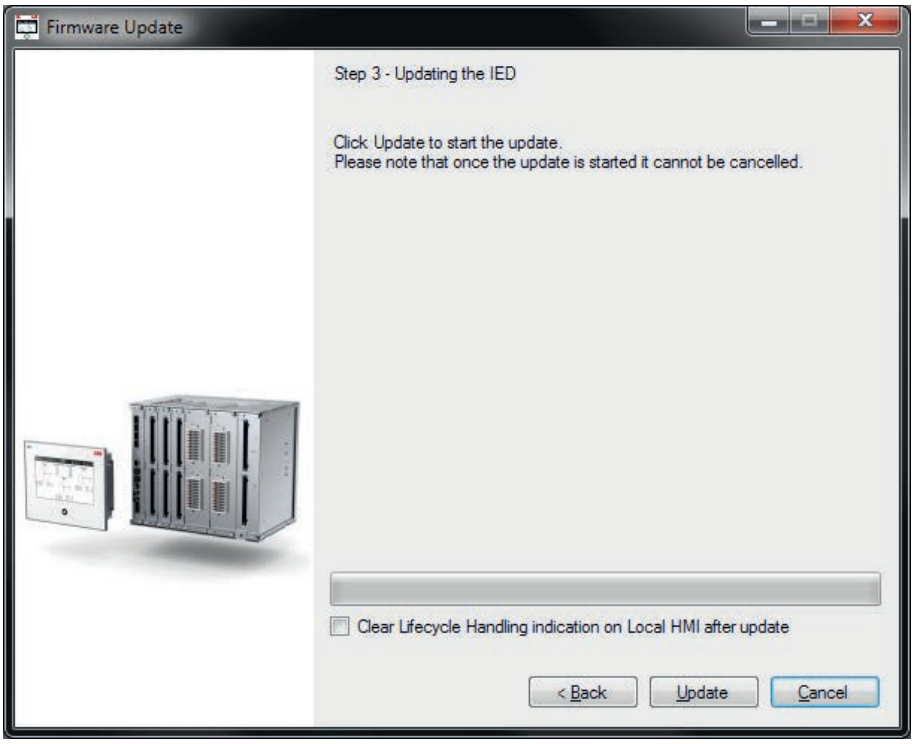

Figure 14: Clearing lifecycle handling indication

5. When updating remotely, wait for 30 seconds for the local user confirmation before proceeding with the update.
   - The local user can cancel the update via the LHMI by pressing Cancel Update during the 30-second window.
   - IED use is allowed after the update is completed successfully.

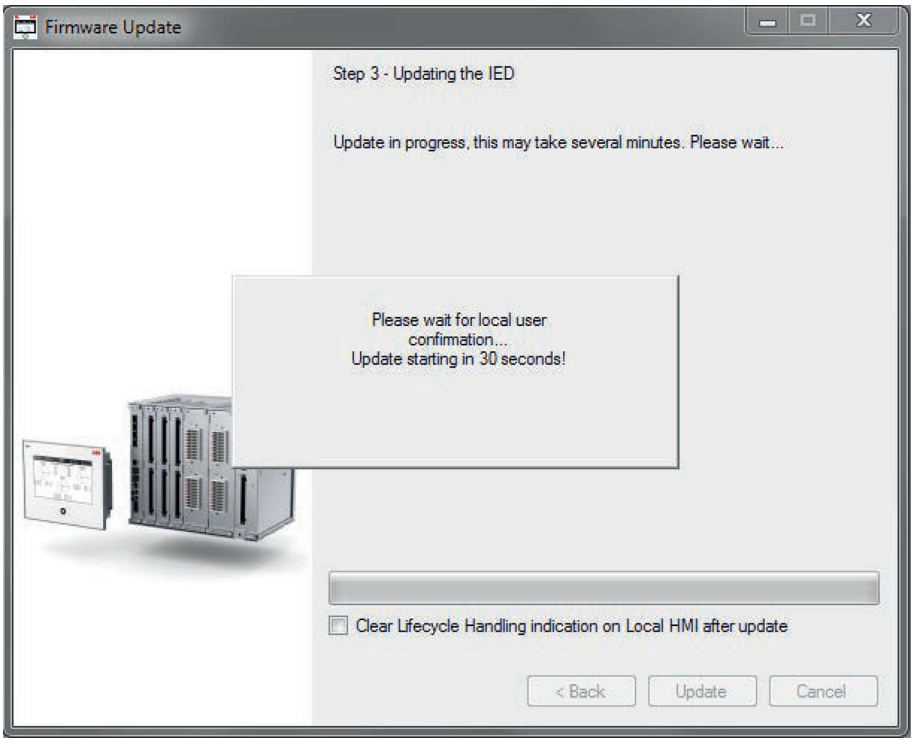

Figure 15: Waiting for local user confirmation with remote update

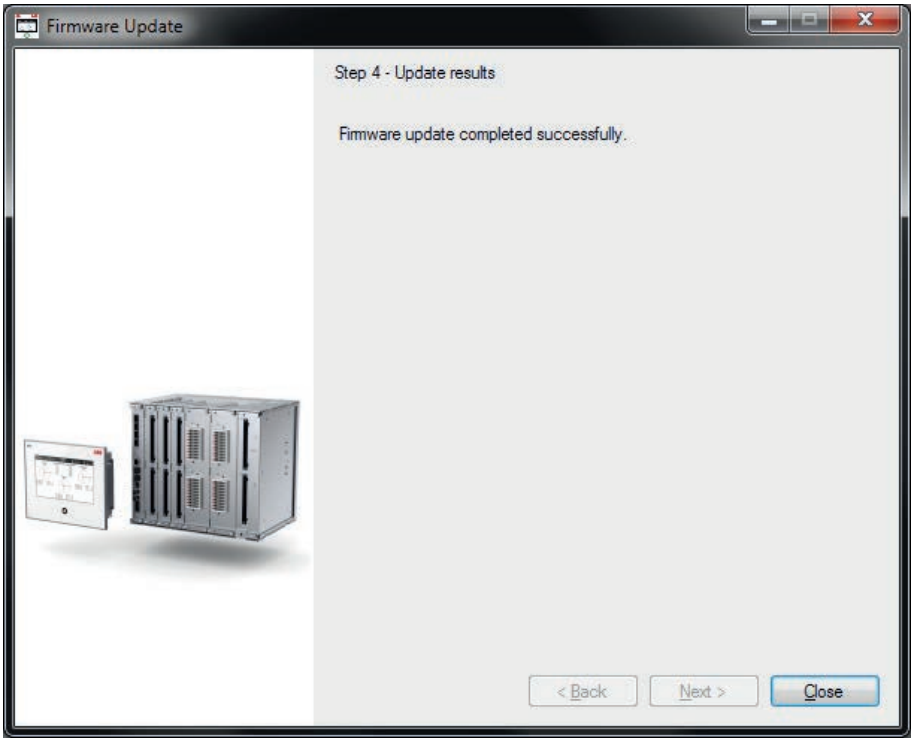

Figure 16: Completing the update

4 Setting up a project

4.1 Creating a new project

1. Start PCM600.
2. To see the projects that are available in the PCM databases, click **File** and select **Open** > **Manage Project** on the menu bar.
3. In the **Open** > **Manage Project** window, click **Projects on my computer**.
4. Click **New Project**.
5. If there are projects or object tools open, a confirmation dialog box opens.

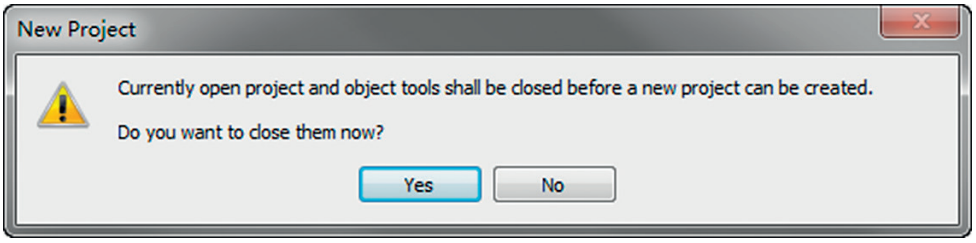

Figure 17: Confirming project and object tool closing

6. In the **Create New Project** dialog box, fill in the project name and optional description.
   - In the **Project Name** box, type a unique name for the project.
   - In the **Description** box, type a description of the project.

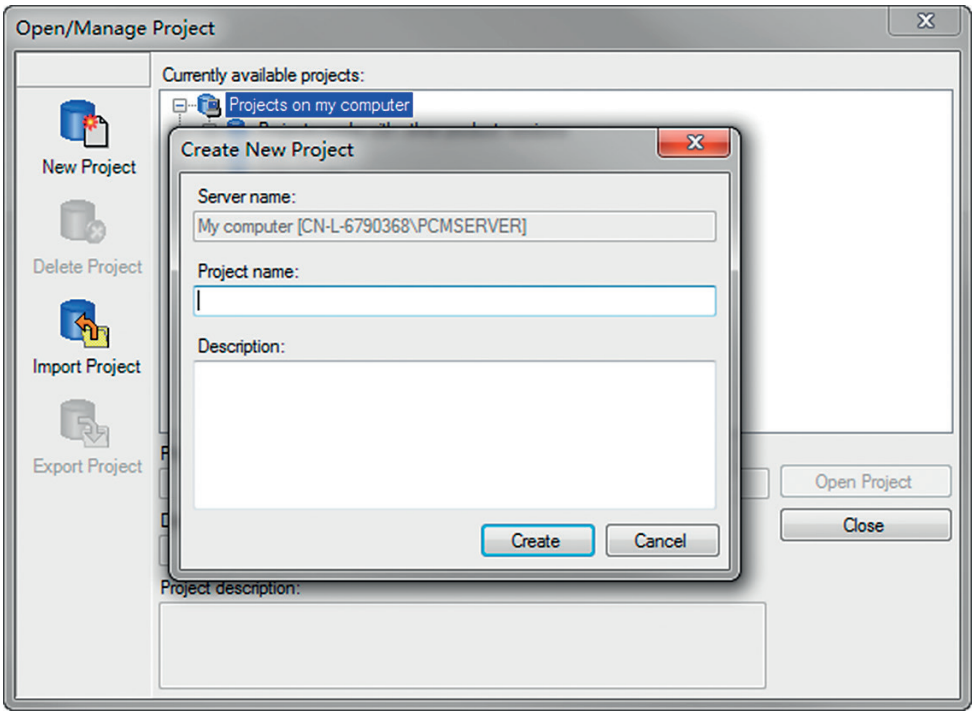

Figure 18: Creating a new project

7. Click **Create**.

PCM600 sets up a new project that is listed under **Projects on my computer**.

4.2 Building plant structure

1. Create a new plant structure in one of the alternative ways.
   - Right-click the **Plant Structure** view, point to **New** and select **Create from Template**.
   - Right-click the **Plant Structure** view, point to **New**, select **General** and select either **IED Group** or **Substation**.
2. On the **View** menu, select **Object Types**.

3. Select the needed elements and drag them into the plant structure.

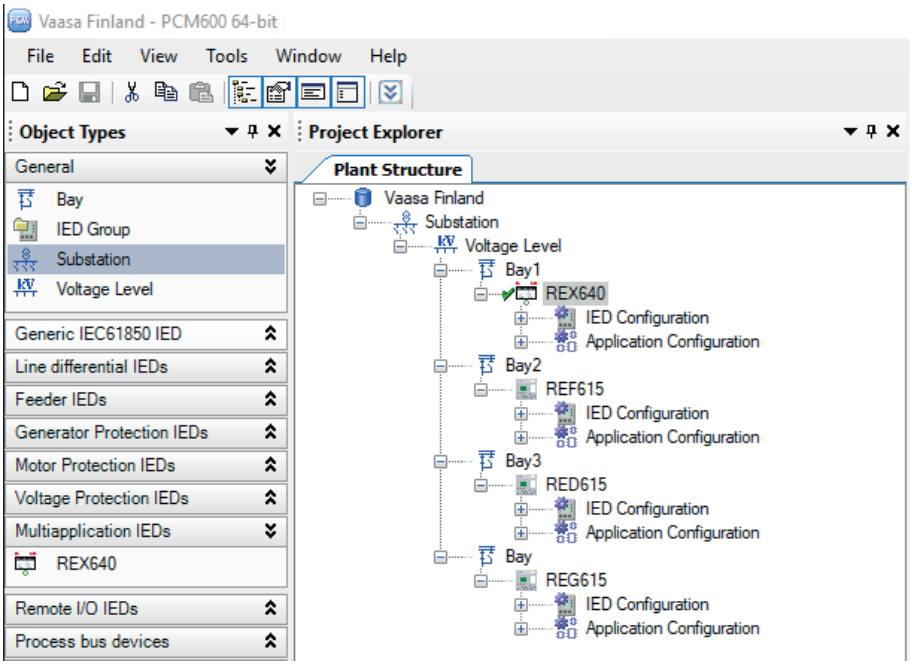

Figure 19: Project with IEDs placed but not renamed

4. Rename each level in the structure by the names or identifications used in the grid.

   Use one of the alternative ways.

   - Right-click the level and select **Rename**.
   - Rename the levels in the **Object Properties** view.

4.3 IED insertion

The context menu or the **Object Types** view shows the available IEDs that can be inserted on the bay level of the plant structure according to the installed connectivity package.

It is possible to do various tasks in the plant structure.

- Insert either an offline or an online IED
- Import a template IED that is available in the template library as a .pcmt file
- Import a preconfigured IED available as a .pcmi file

PCM600 uses two kinds of IED files: .pcmt and .pcmi. Both files include the complete IED configuration but their usage differs. The .pcmt files are always accessed through the PCM600 template manager while the .pcmi files are meant for sharing the IED instances between different PCM600 users enabling quick import and export from the plant structure context menu.

4.3.1 Inserting an IED in online mode

To set up an IED online, the protection relay must be connected to PCM600.

When the protection relay is connected to PCM600, PCM600 can read the composition code directly from the relay. It is possible to read the full configuration from the relay by using the Read from IED function.

1. In the **Plant Structure** view, right-click the bay, point to **New**, point to the relay application area such as **Multiapplication IEDs** and select the protection relay type to be inserted.

Alternatively, drag an IED from the **Object Types** view to the bay level.

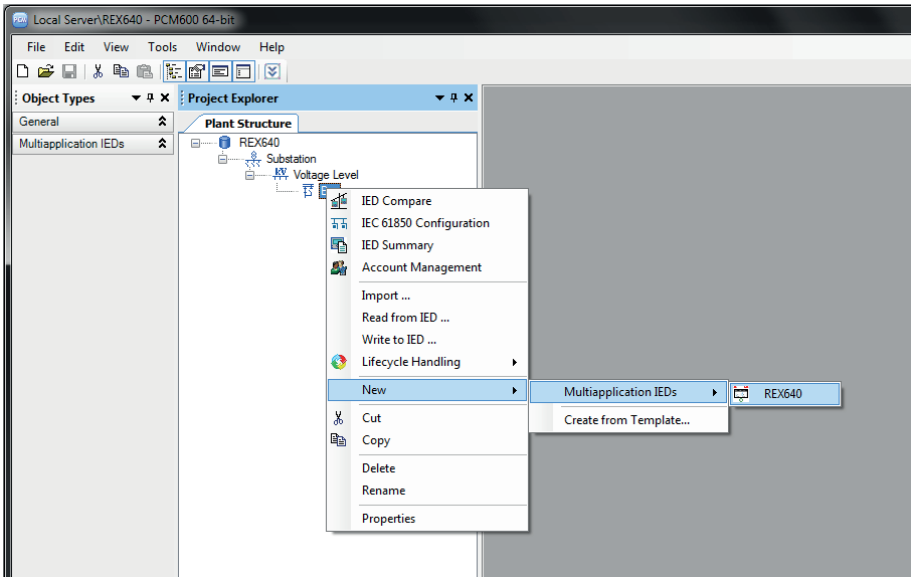

Figure 20: Selecting the protection relay type

2. On the **Configuration mode selection** page, select **Online Configuration** and click **Next**.

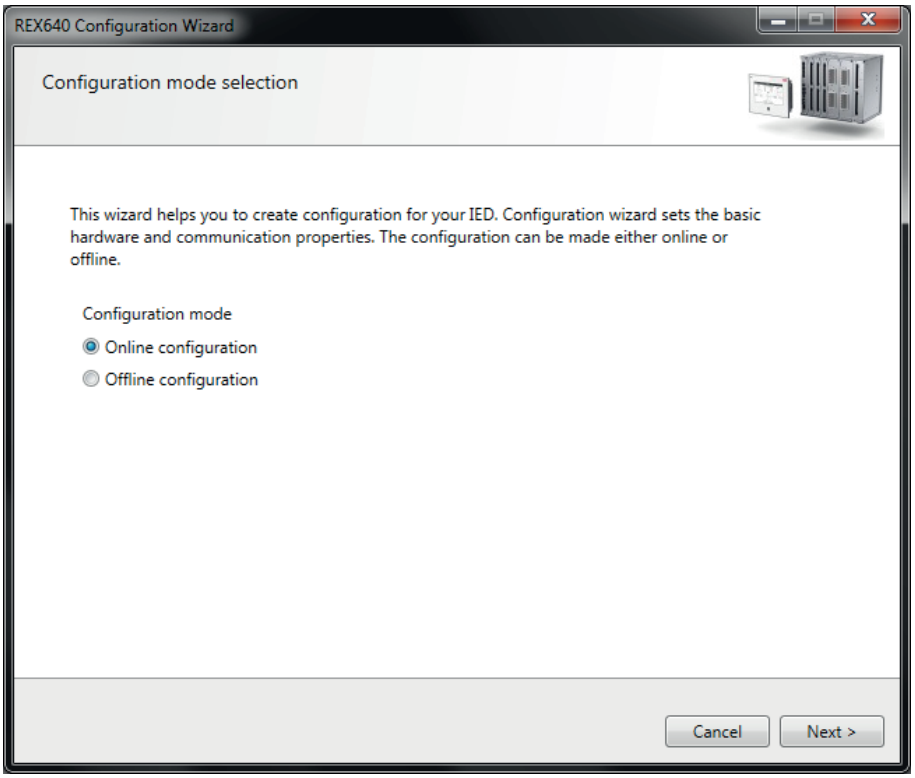

Figure 21: Selecting the configuration mode

3. On the **Communication protocol** page, select the communication protocol from the **IED Protocol** list and click **Next**.

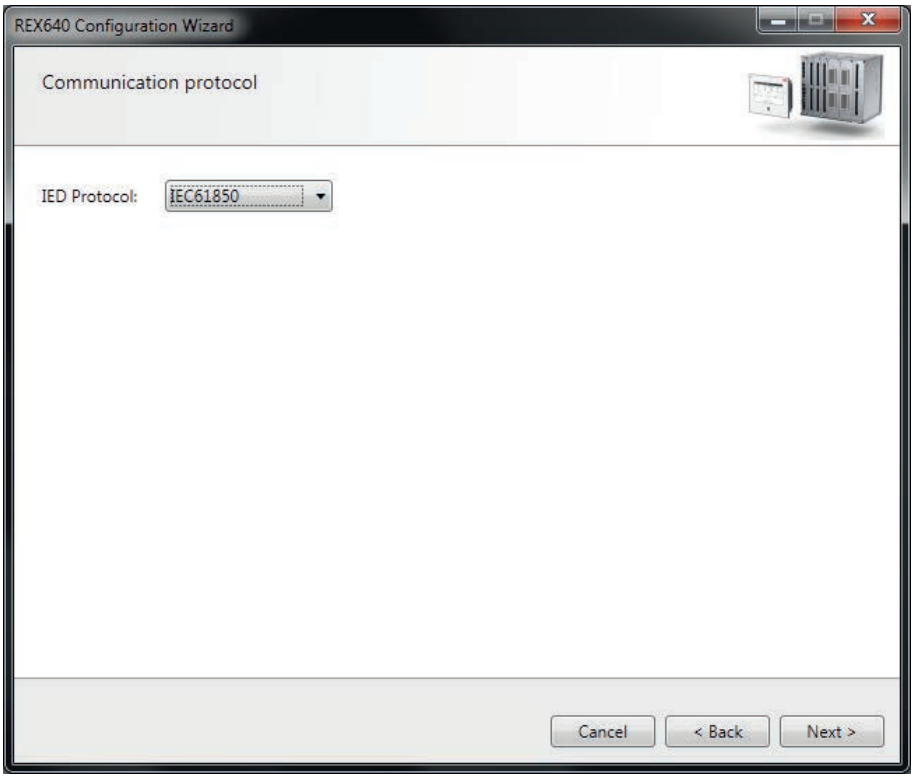

Figure 22: Selecting the communication protocol

4. On the **IEC61850 communication protocol** page, select the port from the **Port** list.
   - If the LAN port is selected, type the correct IP address (of the physical protection relay to be configured) to the **IP address** box.

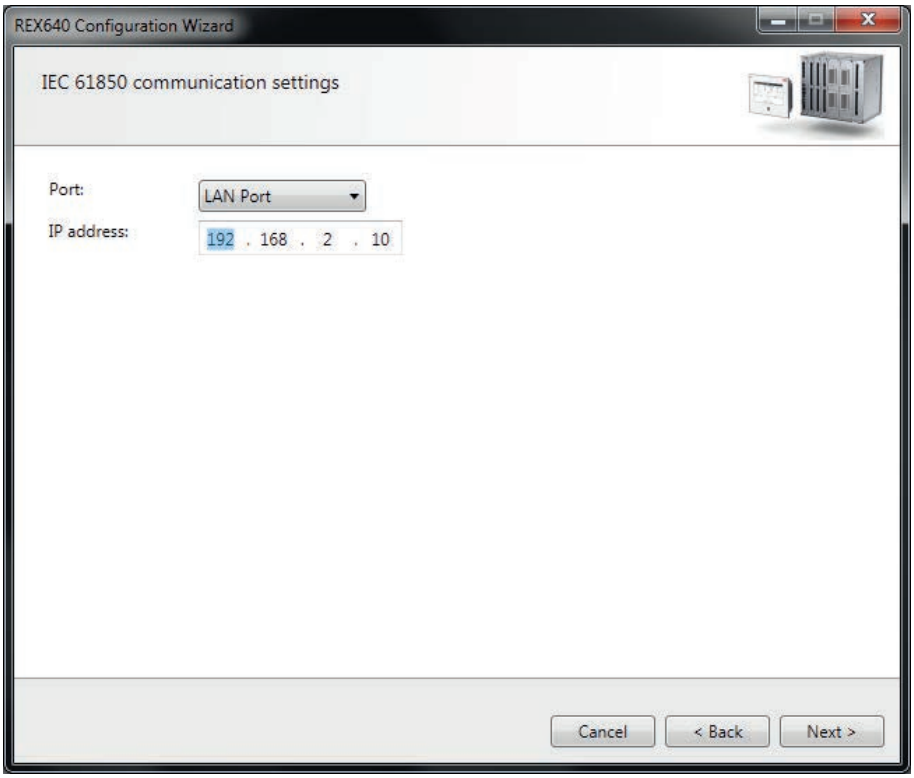

Figure 23: Selecting the communication port and IP address

Communication configuration is now defined.

5. Click **Next** to scan/read the composition code of the protection relay.
6. On the **Composition code detection** page, click **Next**.

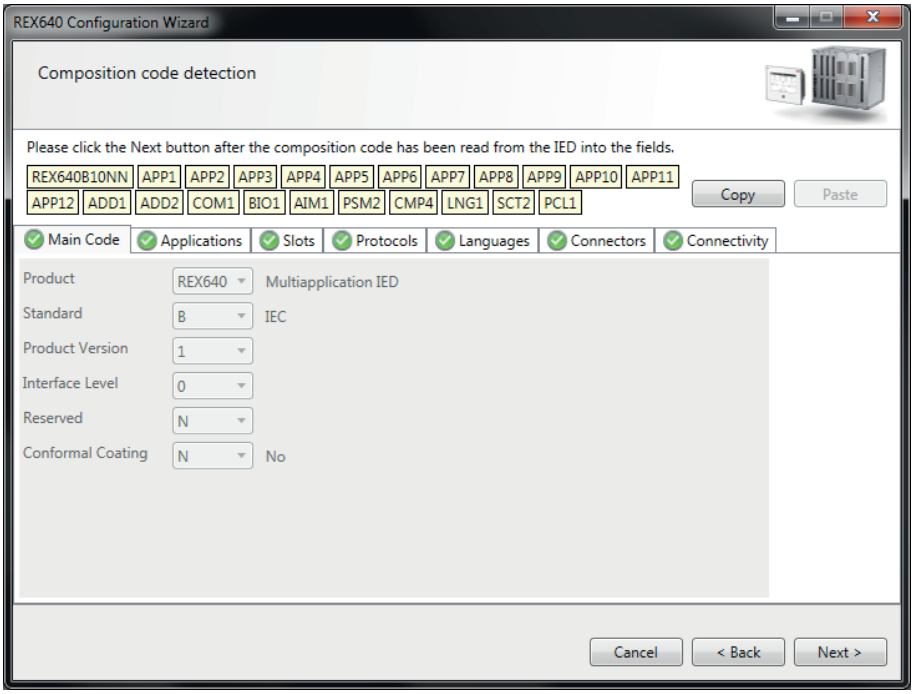

Figure 24: Detecting the composition code

7. On the **Configuration selection** page, select the configuration type and click **Next**.
   - Select **Empty Configuration** to create an empty configuration.
   - Select **Import configuration from file (PCMI/PCMT)** to import any existing example configuration.

     Click **Browse** to select the .pcmi or .pcmt file that has the example configuration.
   - Select **Default configuration (available only for IEC 61850 Edition 2)** to generate a default configuration.

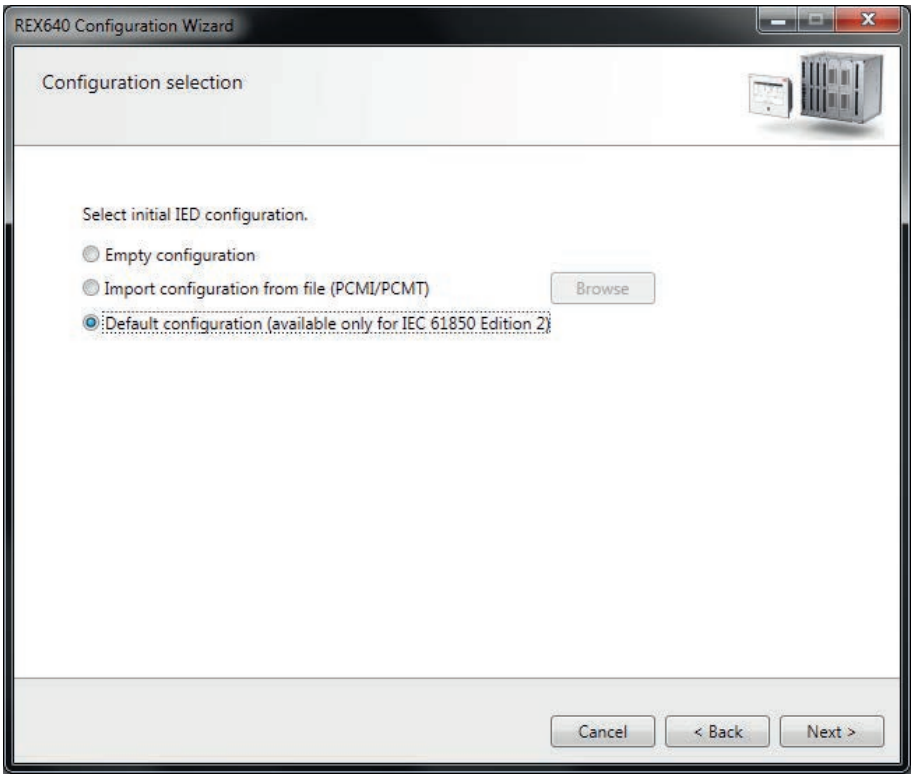

Figure 25: Selecting the configuration type

If a default configuration is selected, the next page is skipped as default configuration is only supported for the IEC 61850 Edition 2 IEDs. To configure an IEC 61850 Edition 1 IED, select empty or example configuration and make the proper selections on the next page.

8. On the **Version Selection** page, select the IEC 61850 version and click **Next**.

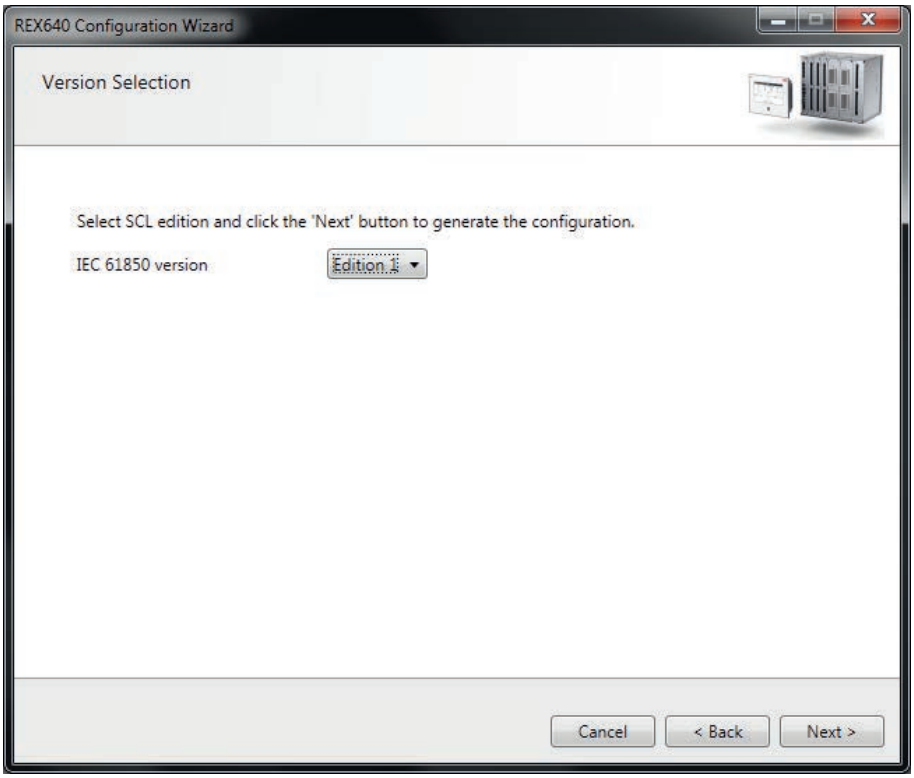

Figure 26: Selecting the IEC 61850 version

Regardless of the protocol used in the installation for each project, it is possible to have Edition1 and Edition2 relays configured in the same PCM600 project. The PCM600 project's SCL edition is the highest SCL edition relay in the project.

9. On the **Summary** page, click **Finish** to confirm the configuration and insert the IED.

   The **Summary** page shows the protection relay's IED type, IP address and the selected composition code.

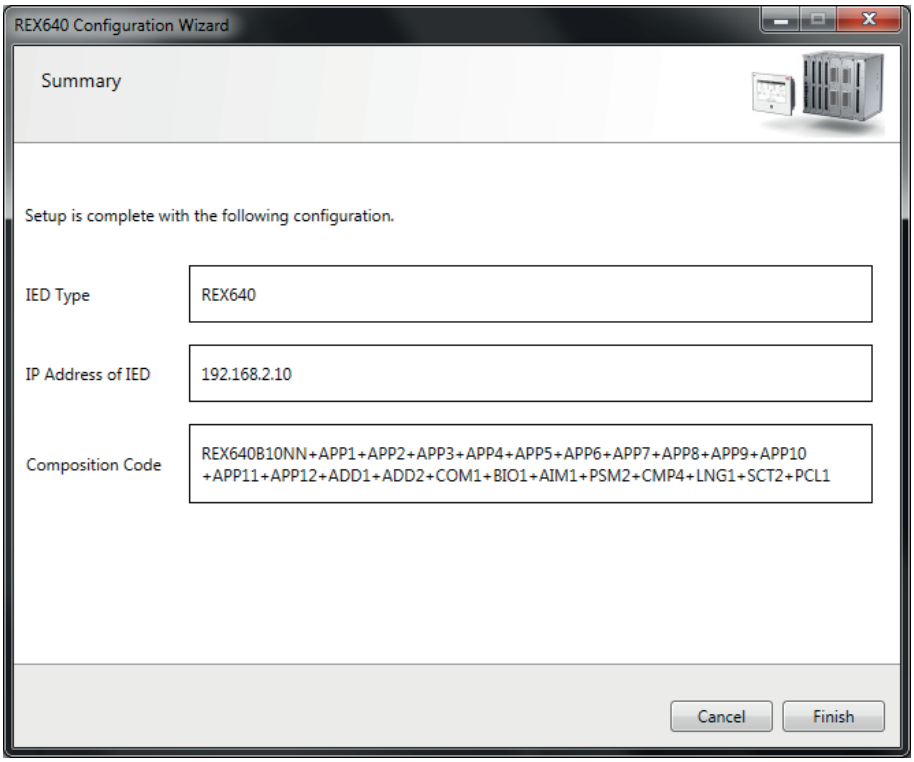

Figure 27: Confirming the configuration

If an error is shown on the **Summary** page, it is not possible to go back and make modifications. If an error is detected, cancel the insertion by clicking **Cancel** and insert the IED again.

4.3.2 Inserting an IED in offline mode

When the protection relay is not available or is not connected to PCM600, engineering can be done offline. The offline configuration in PCM600 can be written to the protection relay later when it is connected.

Working in the offline mode has an advantage over the online mode because the preparation for the configuration can be started even though the protection relay is not available.

1. In the **Plant Structure** view, right-click the bay, point to **New**, point to the relay application area such as **Multiapplication IEDs** and select the protection relay type to be inserted.

   Alternatively, drag an IED from the **Object Types** view to the bay level.

2. On the **Configuration mode selection** page, select **Offline configuration** and click **Next**.

   Setting up an IED in the offline mode is similar to the online mode; however, with the offline mode it is not necessary to type the correct IP address in the **IP address** box.

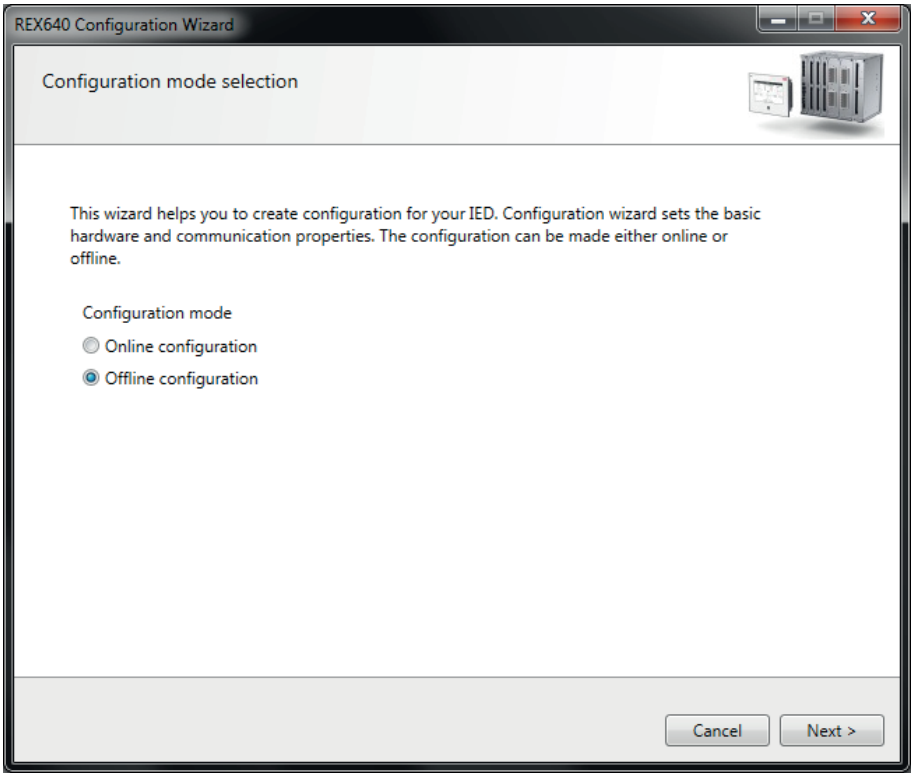

Figure 28: Selecting the configuration mode

3. On the **Composition code selection** page, select the correct composition codes and click **Next**.

   Ensure that the composition code is correct. PCM600 verifies that the composition code matches the relay. If the composition code digits related to the configuration, I/O or version do not match the relay, PCM600 does not allow writing the configuration to the relay. If other digits in the composition code do not match, PCM600 informs about the mismatch with a dialog box.

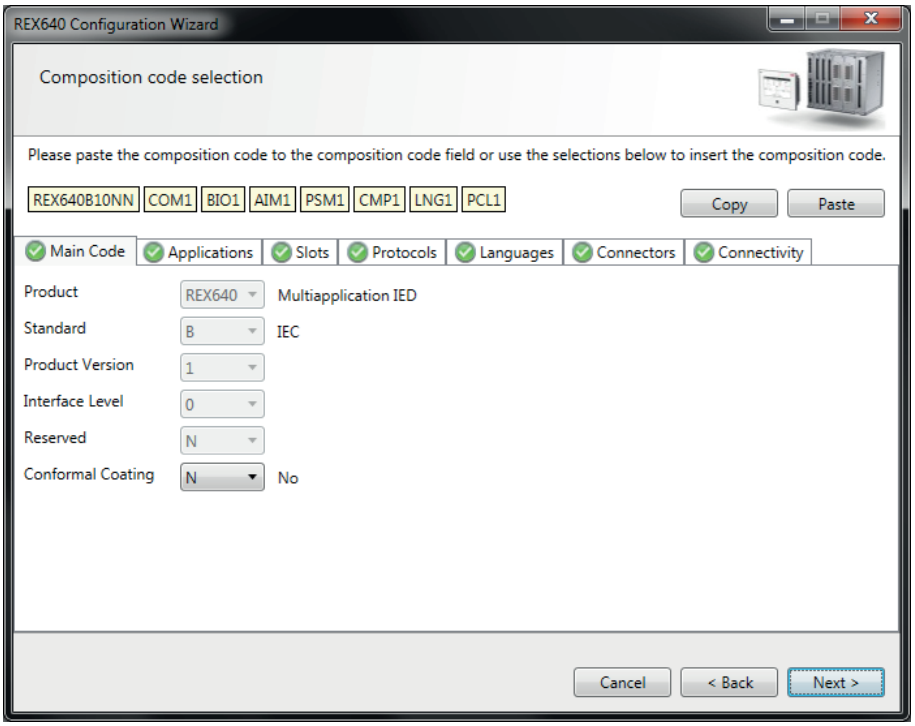

Figure 29: Selecting the composition code

4. On the **Configuration Selection Page**, select the configuration type and click **Next**.

   - Select **Empty configuration** to create an empty configuration.
   - Select **Import configuration from file (PCMI/PCMT)** to import an example configuration.

     Click **Browse** to select the .pcmi/.pcmt file that has the example configuration.
   - Select **Default configuration (available only for IEC 61850 Edition 2)** to generate a default configuration.

     If a default configuration is selected, the next page is skipped as default configuration is only supported for the IEC 61850 Edition 2 IEDs. To configure an IEC 61850 Edition 1 IED, select empty or example configuration and make the proper selection on the next page.

5. On the **Version Selection page**, select the IEC 61850 version and click **Next** to generate the functions.

6. The **Summary** page shows the summary of the IED type, IP address and the selected composition code. Click **Finish** to confirm the configuration and conduct the insertion.

4.3.3 Inserting an IED from the template directory

IED templates can be used to replicate IEDs with the same order code in PCM600 projects. The template includes an IED application configuration, graphical display configuration (single-line diagram), communication protocol mappings and parameters. An IED in the plant structure can be exported as a template (.pcmt file). The template library can be built from all the exported IED templates.

It is also possible to insert an IED from the template library to create a new IED in the plant structure. After a template IED has been imported, *IP address* and *Caption* in IED's **Object Properties** and *Technical Key* of the physical IED have to be changed.

1. In the **Plant Structure** view, select the bay or IED group, right-click, point to **New** and select **Create from template**.
2. In the **Create New Object from Template** dialog box, select the IED under **Available Object Types**.

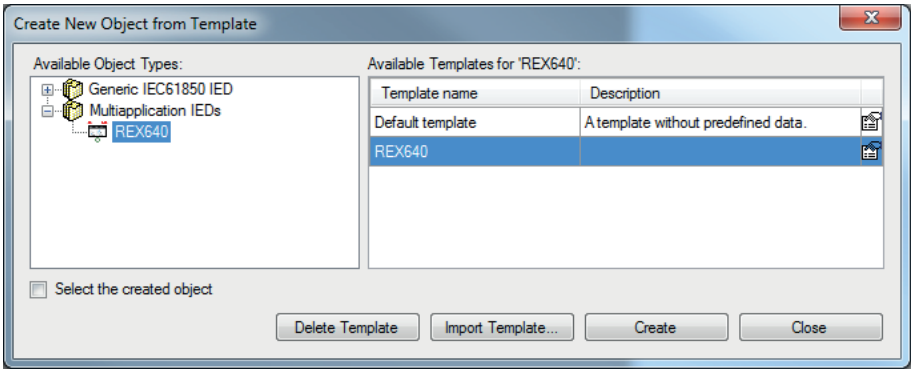

Figure 30: PCM600: Selecting an IED from the template library

3. Click the icon on the rightmost column in the list of available templates.

4. In the **Template Properties** dialog box, verify the template information and click **Close**.

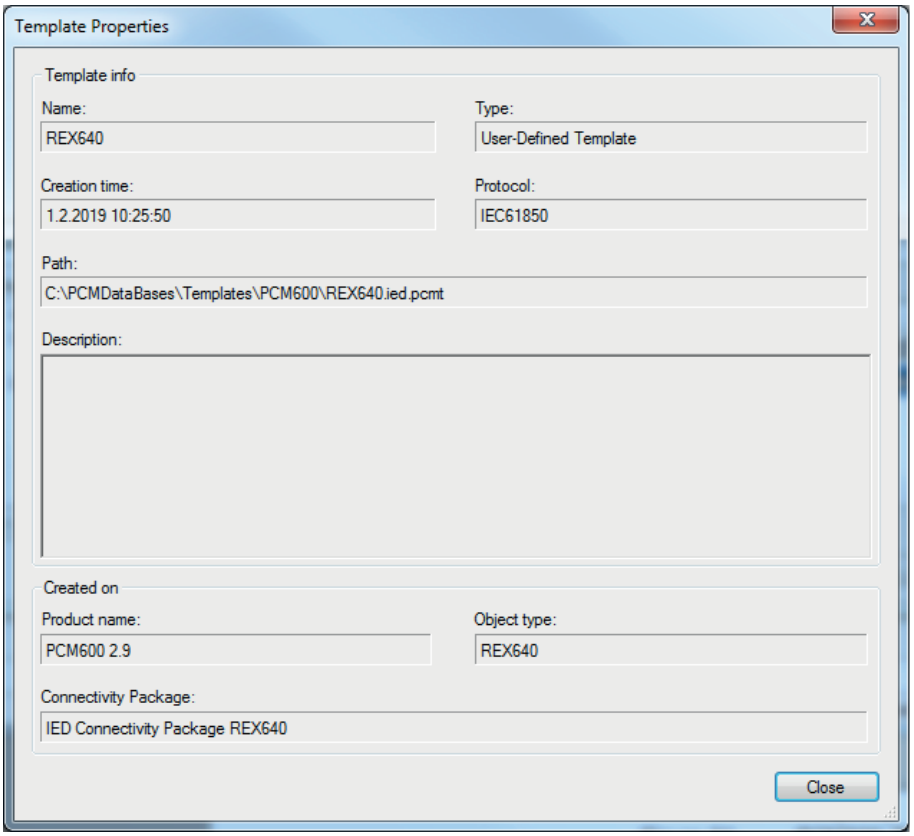

Figure 31: PCM600: Template information

5. In the **Create New Object from Template** dialog box, delete, import or create a template by clicking the corresponding button.
   - To delete the selected template, click **Delete Template**.
   - To import a template from the selection window, click **Import Template**.
   - To insert the selected IED to the bay, click **Create**.

   It is possible to insert more than one IED from the **Create New Object from Template** dialog box. The dialog box remains open until **Close** is clicked.

6. Click **Close** when finished.

4.3.4 Inserting an IED by importing a .pcmi file

1. In the **Plant Structure** view, right-click the bay and select **Import**.

A .pcmi file can be imported only when the bay is selected in the plant structure.

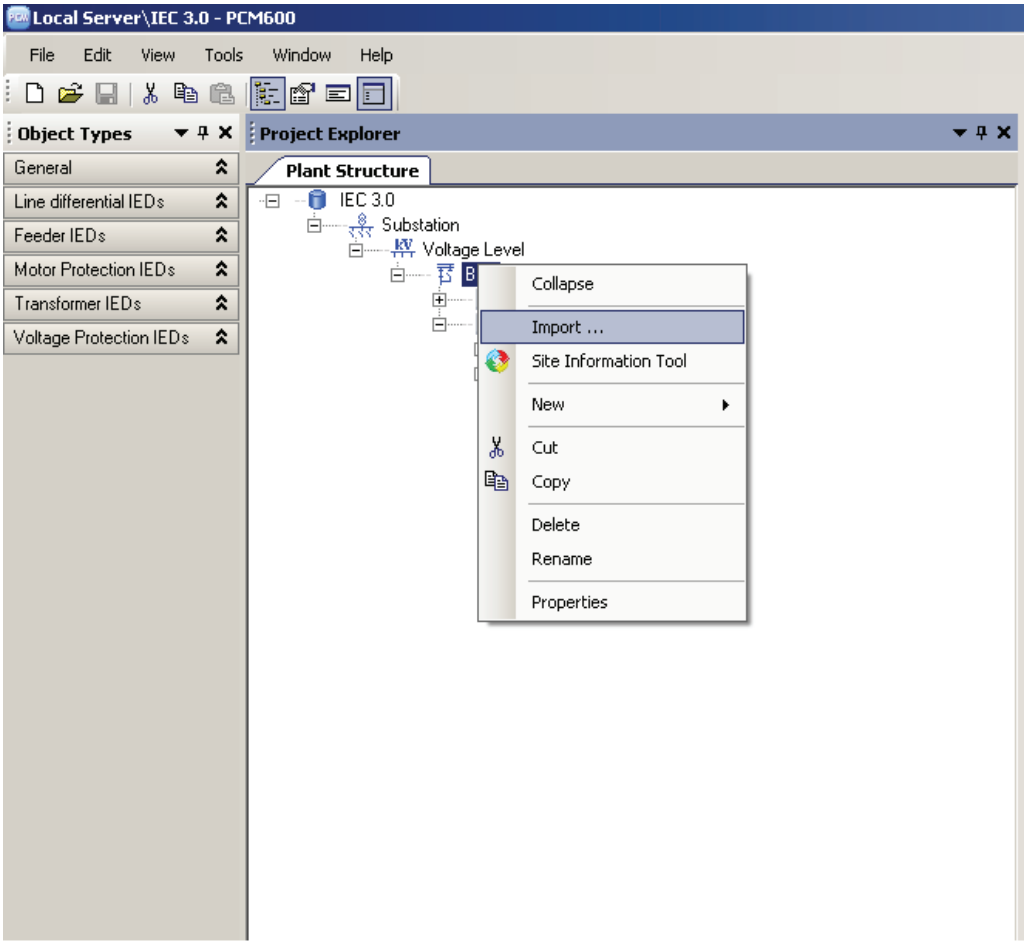

Figure 32: Importing IED configuration

2. In the **Import** dialog box, select the .pcmi file to be imported and click **Open**. After importing, the IED object is created in the plant structure.

After the .pcmi file has been imported, the IP address, the name and the technical key of the physical IED have to be changed.

4.4 Setting IED's IP address in a project

The IP address and subnet mask of the IED object in PCM600 must match the HMI and LAN ports of the protection relay (physical IED) to which the PC is connected. The IP address of the protection relay can only be set via the LHMI or Parameter Setting in PCM600. The PC and protection relay need to be on the same subnet.

There are two ways to set the IP address of an IED object in PCM600: on the first page of the wizard when including a new IED into a project or in the IP address box of the IED's Object Properties pane.

Choosing between the two ways depends on when the IP address is set. Typing the IP address via the IED's Object Properties pane is possible at any time while entering it via the configuration wizard can only be done when inserting the IED in online or offline mode.

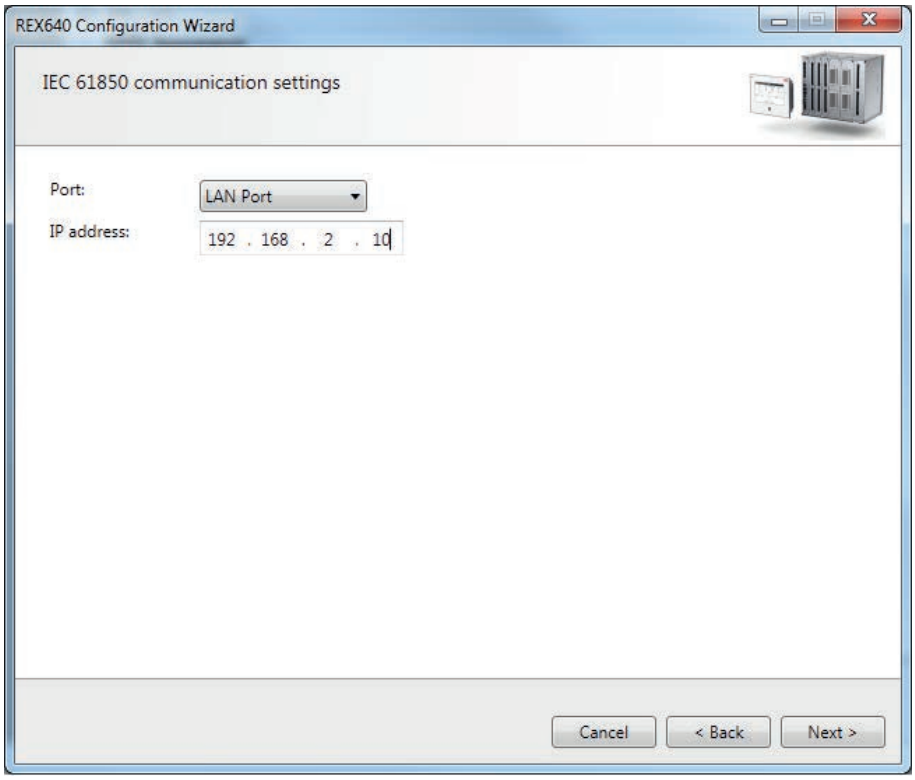

Figure 33: Alternative 1: Setting the IP address on the first wizard page

1. In the **Plant Structure** view, select the IED whose IP address must be entered.
2. On the **View** menu, select **Object Properties**.

3. In the **Object Properties** pane, type the IP address in the **IP Address** box.

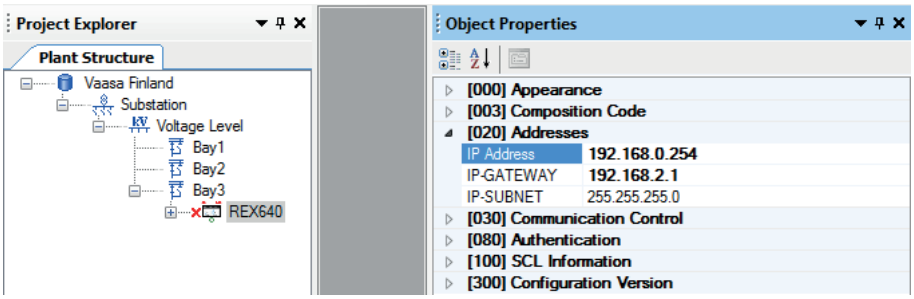

Figure 34: Alternative 2: Setting the IP address in the IED's Object Properties pane

4.5 Using the Web HMI

Connection to WHMI can be established using different communication card ports or the LHMI service port. WHMI is disabled by default and can be enabled with a setting parameter. As only secure communication is supported for the WHMI, it must be accessed from a Web browser using the HTTPS protocol. Three simultaneous LHMI and WHMI sessions are supported.

1. To enable the WHMI, select **Configuration** > **HMI** > **Web HMI mode** and set the parameter to "On".
2. Reboot the relay for the change to take effect.
3. Log in with the proper user rights to use the WHMI.

   If the WHMI is accessed through the LHMI service port, use the corresponding IP address of the relay communication port. The IP address can be obtained via the Engineer pages. Tap the relay's name on the LHMI menu bar to open the Relay address dialog box.

To establish a remote WHMI connection to the protection relay, contact the network administrator to check the company rules for IP and remote connections.

HTTPS is enabled for all ports by default. To disable the HTTPS for station ports, select **Communication** > **Protocols** > **Network1** > **HTTPS** or **Communication** > **Protocols** > **Network2** > **HTTPS** and set the parameter to "Off". HTTPS is always enabled for the X0/HMI port.

The WHMI write access can be limited with the parameter HTTPS write access in **Configuration** > **Authorization** > **Network1** or **Configuration** > **Authorization** > **Network2**.

Disable the Web browser proxy settings or make an exception to the proxy rules to allow the protection relay's WHMI connection, for example, by including the relay's

IP address in **Internet Options** > **Connections** > **LAN Settings** > **Advanced** > **Exceptions**.

4.6 Relay user management

The user account management and role-based access control in the protection relay have been handled as specified in IEC 62351-8. The relay supports both local user account and central account management. For information on how to set up user account management, see user management in the cyber security deployment guideline.

4.7 PCM600 project's IEC 61850 version identification

The IEC 61850 version of a PCM600 project can be identified from the Object Properties pane of the project.

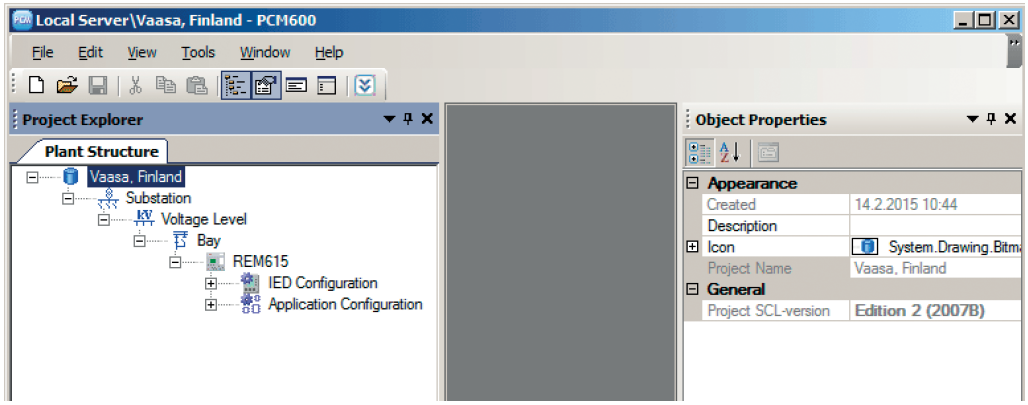

Figure 35: Project's IEC 61850 version

To change IEC 61850 version Edition 1 of an IED to Edition 2, the configuration has to be written to the IED from a PCM600 project that has IEC 61850 version Edition 2. A dialog box notifies of the version difference.

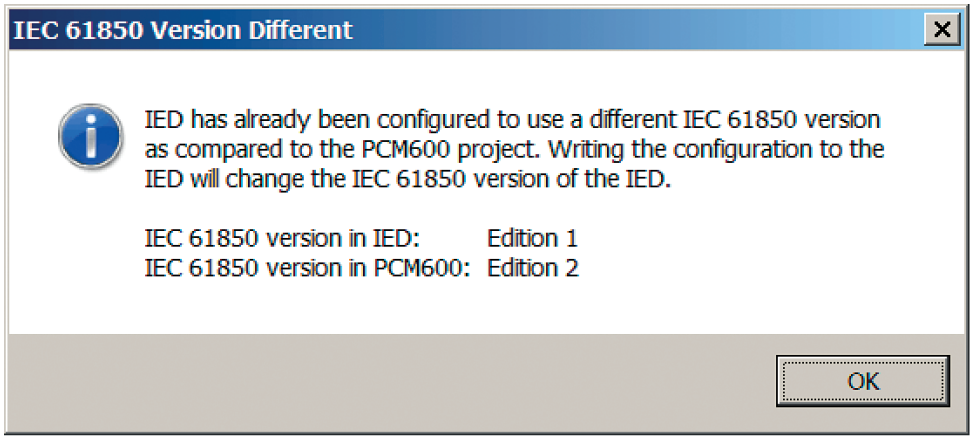

Figure 36: IEC 61850 version change

5 Protection and control engineering

5.1 Application Configuration

Application Configuration is used to modify an application configuration for a protection relay and is based on IEC 61131-3 Function Block Diagrams.

The function blocks are dedicated to different functions such as control related, protection related, monitoring or communication functions. For more information on the function blocks, see the technical manual.

Most function blocks are mapped as logical nodes according to the IEC 61850 standard. See the IEC 61850 parameter list for more information.

If a function block is removed with Application Configuration, the function-related data disappears from the menus as well as from the IEC 61850 data model, with the exception of some basic function blocks, which are mandatory and thus cannot be removed from the relay configuration by removing them from Application Configuration. The mandatory function blocks are: ETHLDEV1, ETHLDEV2, FTPLPRT1, GNRLLTIM1, GNRLLTMS1, GSAL1, GSELPRT1, HMILCCH1, HMILDEV1, HTTPLPRT1, LDEV1, LEDPTRC1, LINF1, LLN0, LPHD1, MMSLPRT1, RCHLCCH1, SA2LINF1, SBBIGGIO1, SBBOGGIO1, SBLINF1, SCHLCCH1, SCHLCCH2, SCHLCCH3, SCHLCCH6, SFAIGGIO1, SFLINF1, SGBOGGIO1 and SGLINF1.

Some of the protocol-related LPRT function blocks contain outputs which can be used to monitor protocol status. For example, the `CHLIV` output can be used to monitor if protocol-related messages are received from the client. However, all function blocks do not have outputs as they may just be visual objects to indicate protocol support when the sheet is printed out. This applies also to the PKIGSAL and LDEV function blocks. Security related function block GSAL has the `DOS_ALARM` and `DOS_WARNING` outputs for indicating denial of service warning and alarm event.

Other function blocks are not mapped as logical nodes; for example, logical gates.

The basic features of Application Configuration include the ability to organize a configuration into several MainApplications as well as providing different application programming features.

- Organizing an application configuration
  - Organizing an application configuration into a number of logical parts (MainApplication)
  - Organizing a MainApplication over a number of pages
- Features for programming an application configuration
- Inserting function blocks, making connections and creating variables
- Including the hardware I/O channels directly in the application configuration
- Calculating the execution order automatically by clicking Calculate execution order on the toolbar
- Documenting the application configuration, for example, by making printouts
- Saving application configurations as templates in an application library to reuse them in other protection relays. Function blocks and the related logic can be

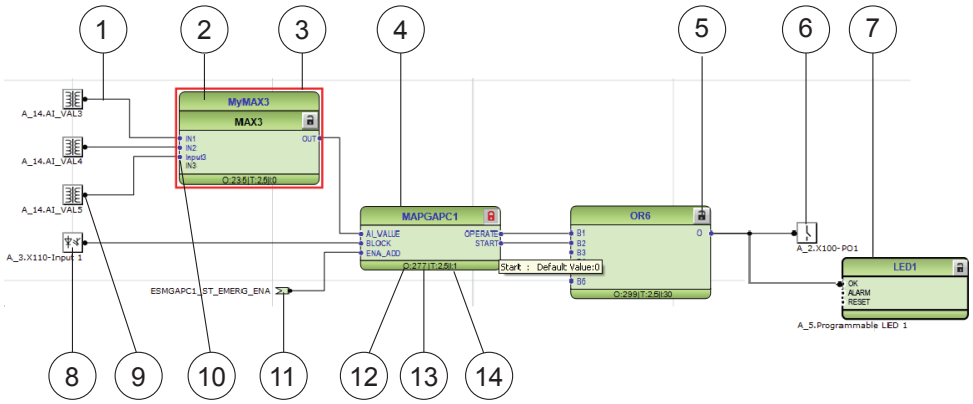
fully or partially reused depending on the functionality available in the other protection relay.

- Validating the application configuration during the configuration process on demand and while writing the application configuration to the protection relay

For instructions on how to perform the different tasks in PCM600, see PCM600 online help.

5.1.1 Function blocks

Function blocks are the main elements of an application configuration. They are designed for a various number of functions and organized into groups according to type. The different function block types are shown in the Object Types view. Function block data can be modified with Application Configuration in PCM600.



- User-defined names can be given for function blocks and signals.

Signals that have a user-defined name created with Application Configuration are visible in Parameter Setting in PCM600 only if the relay configuration is written to the protection relay and read back to PCM600. Otherwise, only the default signal name is shown in Parameter Setting.

Restart the relay to ensure that all user-defined names for the disturbance recorder's Channel id texts are updated on the LHMI, WHMI and Parameter Setting menus.

If possible, set the user-defined name to a signal before connecting the signal to other function blocks.

- IEC 61850, ANSI or IEC 60617 symbol standard can be set.
- IEC or ANSI naming style can be set.
- Function blocks can be locked.
- Visibility for execution order, cycle time and instance number can be set.
- Signals can be managed.
- Boolean inputs and outputs can be inverted.

1 Connections

11 User-defined input variable
12 Execution order
13 Cycle time
14 Instance number

Figure 37: Application Configuration: function block overview

5.1.2 Signals and signal management

The function block has a set of input and output signals. The placement of function block signals is from left to right. Input signals are placed on the left and output signals on the right.

Function blocks can contain more signals than needed in an application part. Unused signals can be hidden to get a clear picture.

Signals are located up and down on both sides of the middle position. When there is space left, some signals may be moved up or down for better visibility and connection routing.

Boolean input and output signals may need to be inverted to fulfil the logic. The Application Configuration tool supports the adding of inversion logic to a binary signal.

All input signals have a default value that is used when the signals are not connected in the configuration.

The input signal on glue logic function blocks can be inverted only if a glue logic function block with lower execution order in the same cycle time is available. Similarly, the output signal can only be inverted if a glue logic function block with higher execution order in the same cycle time is available. Up to two input signals and two output signals can be inverted for glue logic blocks in the same cycle time.

5.1.3 Function block execution parameters

Three function block execution parameters influence the runtime execution of the function block within the application configuration.

- Execution order
- Cycle time
- Instance number

When a new function block is inserted, these parameters are shown in the Function Block Instance dialog box in Application Configuration. The three parameters are selectable or not selectable depending on the function block type. The cycle time is predefined to one value. The instance number is a counter for the total possible number of function blocks of that type used within the application configuration.

Execution Order and *Instance Number* are a combination that is predefined within a product. It is possible to select a pair out of the list.

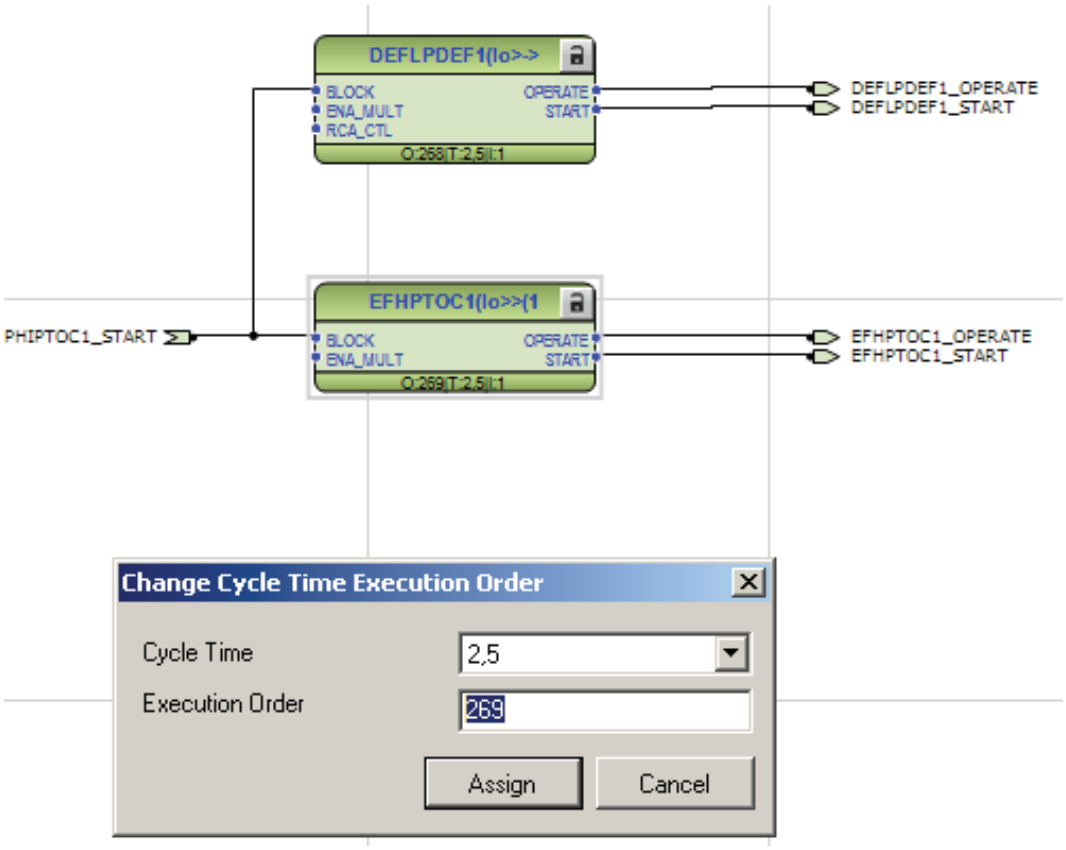

Figure 38: Application Configuration tool: an example of function block organization parameters

Cycle Time is automatically set and it cannot be modified.

To automatically calculate the execution order, click **Calculate Execution Order** on the tool bar.

5.1.4 Execution order and feedback loops

It is possible to draw a multi-layer configuration logic that contains feedback loops with the Application Configuration tool. The execution order of logic functions is calculated automatically in the Application Configuration tool, but it can also be set manually. If the automatically calculated value causes the function to be executed one task cycle time after the other logic functions in the same loop, the execution order number can be set manually to prevent delays, for example, in output activation.

To perceive accurate time stamps from binary input signals to function blocks, direct logic connection should be used in the Application Configuration tool. Due to the internal execution order, time stamps may not be accurate if an additional logic is used to connect priority signals to function blocks.

Figure 39 shows a simple situation where the execution order causes one cycle time delay if the NOT gate is executed in the order determined by the automatic calculation.

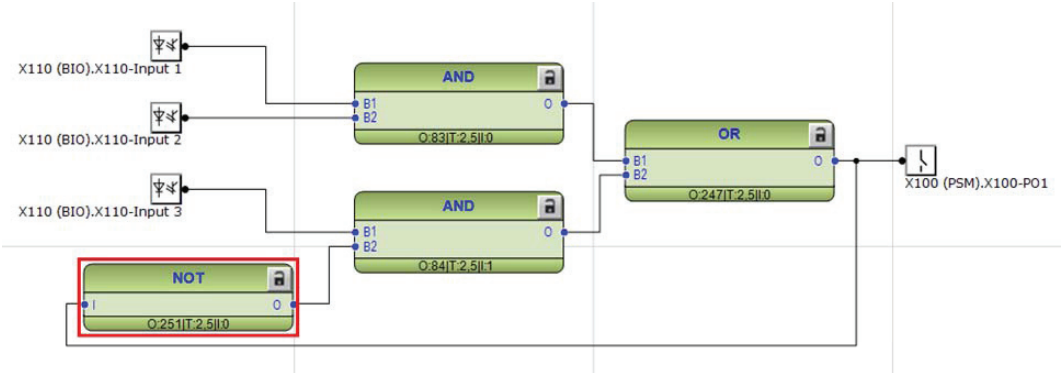

Figure 39: Feedback loop situation with automatically calculated execution orders

By setting a smaller execution number than in the AND port to where the NOT port is connected, it is possible to fix the execution order of all functions in a loop so that they are handled in the same task.

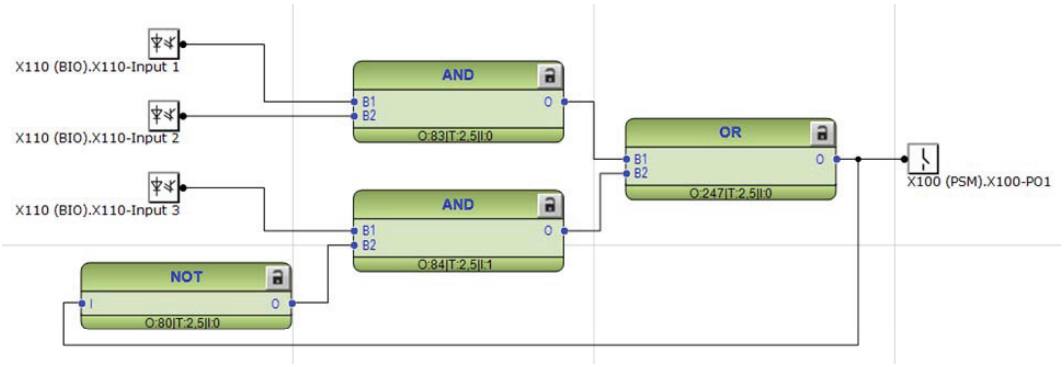

Figure 40: Feedback loop situation with manually fixed execution order for NOT port

The execution number can be changed by right-clicking the function and selecting Change CycleTime ExecOrder.

After manually defining the execution number, the function is excluded from the automatic execution order calculation. The function can be included back to the automatic calculation by right-clicking the function and selecting Include FB in calculation.

5.1.5 Connections and variables

A connection is the link or "wire" between function block outputs and inputs.

Connections can be made in two ways.

- Dragging a line between two signals
- Linking two signals by using variables

It is possible to search and replace variable names in Application Configuration tool.

Connect the variables to a destination, for example to a function block or a hardware output channel. The connectivity package automatically

removes the orphan variables which are not connected to any destination.

Connect at least one analog input signal from AIM or SMVRCV.

Connection validation

A connection is only useful or even possible between two signals of the same base attribute type.

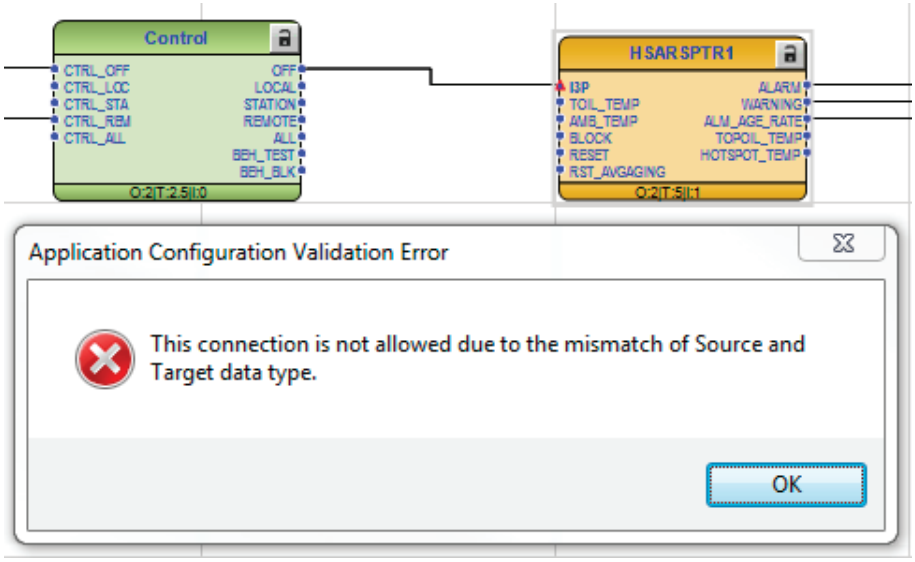

Figure 41: Application Configuration tool: an error message of a signal mismatch for a connection

5.1.6 Hardware channels

Hardware channels can be connected only to a function block input or output. A hardware connection can be established with Application Configuration or Signal Matrix.

When a hardware channel is connected, a graphical symbol appears in Application Configuration. The connection is also indicated in Signal Matrix with a cross mark. All hardware channels are always visible in Signal Matrix.

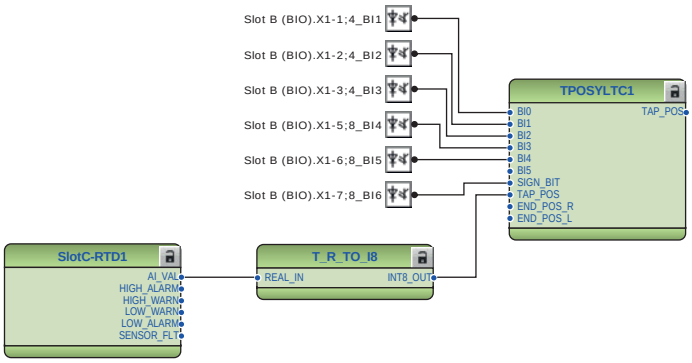

Figure 42: Application Configuration: HW signal channels

There are three types of supported hardware channels.

- Binary input channels
- Binary output channels
- Analog input channels

Hardware binary input channels may have multiple connections. A hardware binary output channel is taken from the list of available channels when a new channel is requested. This prevents using the same hardware binary output channel twice.

5.1.6.1 Hardware channel configuration

Instead of pre-configured I/O channel connections to pre-processing function blocks, user-customized configurations can be used. There are some rules which must be followed to create a working configuration. Application Configuration automatically checks if configuration is valid and results are shown in the output pane. See the technical manual for the minimum I/O requirement per application function block.

Example 1

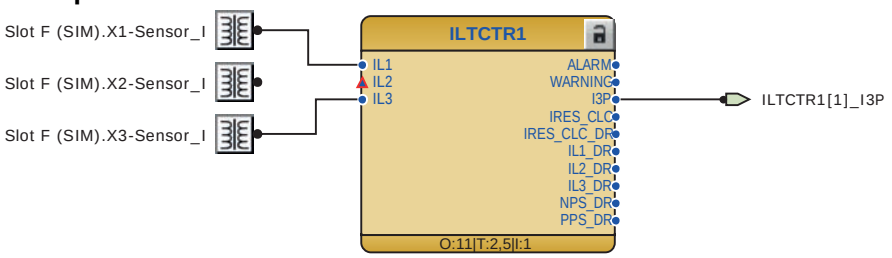

Figure 43: Missing required input connection for output

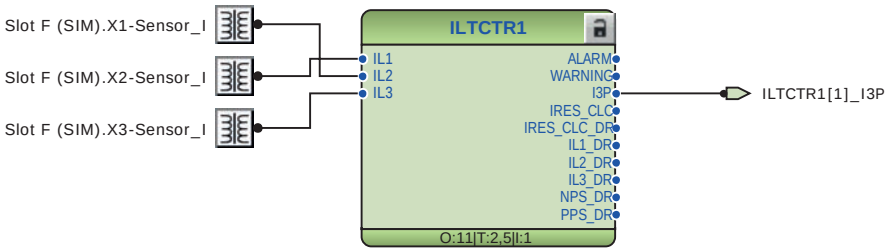

Figure 44: All required input connections configured for output

In *Figure 43*, the output connection requires more input channels to be connected. *Figure 44* has correction for *Figure 43* where all required inputs are configured and the input order is according to installation.

When an output is not connected to any function block, Application Configuration considers the configuration valid. Check validation warnings from the output pane for possible missing connections. Once the output is connected, the complete configuration is validated again.

Example 2

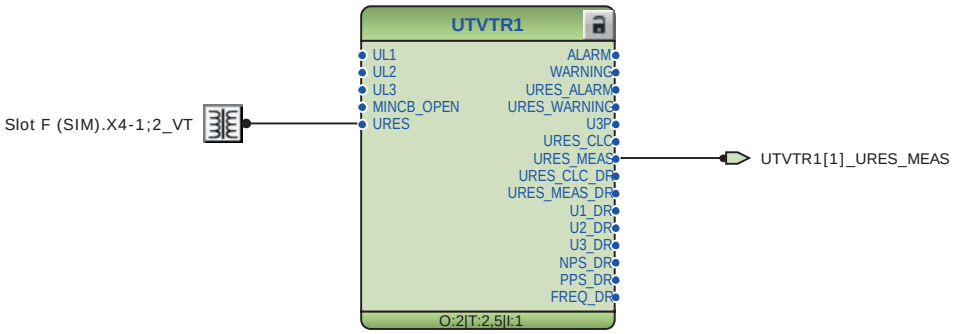

Figure 45: Output connection requiring only one input

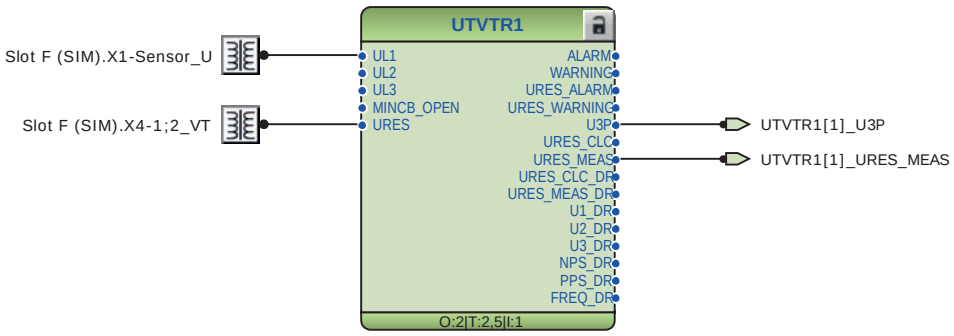

Figure 46: Two output connections requiring two inputs

UTVTR ULx inputs can be used as one-, two- or three-phase connection. The ACT blocks connected to `U3P` may further demand two- or three-phase connection. `URES` input must be connected if `URES_MEAS` output is used. *Figure 45* illustrates the use case of only residual voltage being used in UTVTR1. *Figure 46* illustrates a case where one residual voltage and one phase voltage are sufficient.

Example 3

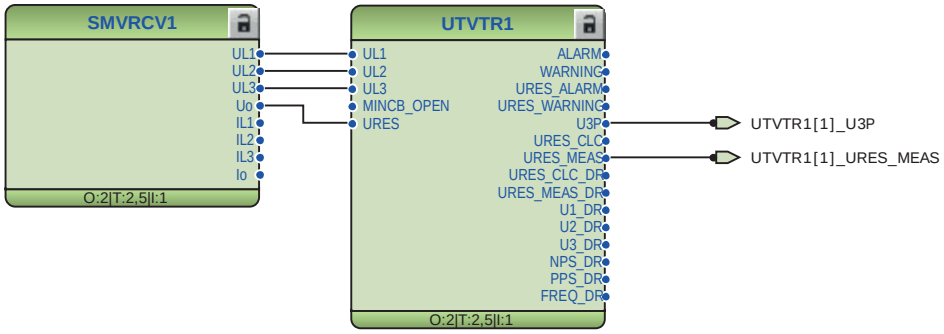

Figure 47: Remote samples as input connections

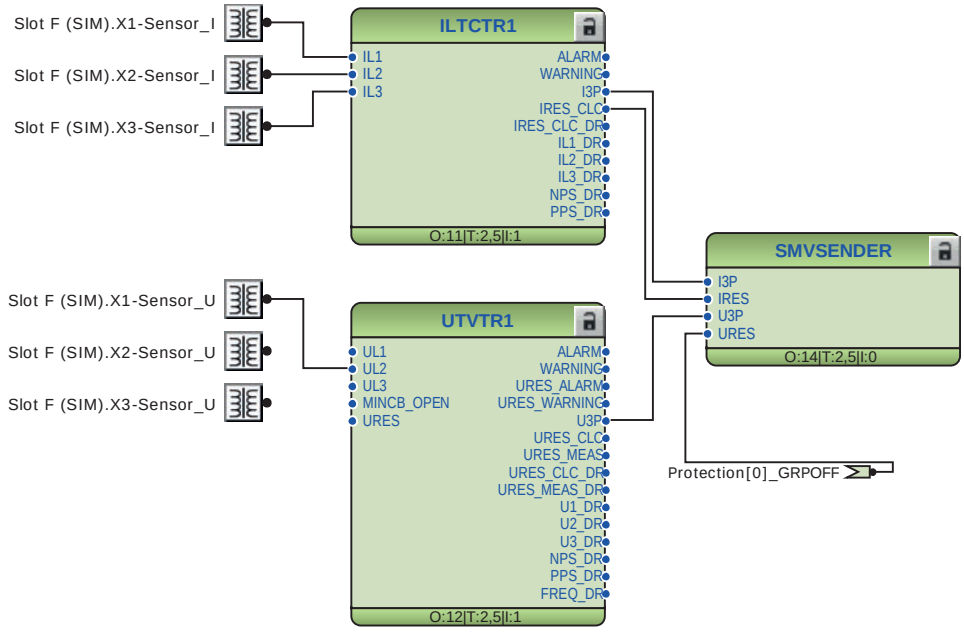

Figure 48: Local inputs sent out as remote samples

Instead of local hardware inputs in *Figure 47*, remote samples can be used by local function blocks. Remote samples sender can also be configured as described in *Figure 48*, where GRP_OFF is used to indicate that channel is not available locally. See the technical manual for details about GRP_OFF.

TVTR and TCTR function blocks accept analog channels connected only either from local or remote, that is, local and remote channels cannot be mixed within a TVTR/TCTR function block.

It is not possible to forward the received remote analog channels.

An analog input can only be connected to one function block. Triplets (for example, U3P and I3P) should be used instead in the application to connect analog inputs to other function blocks.

Example 4

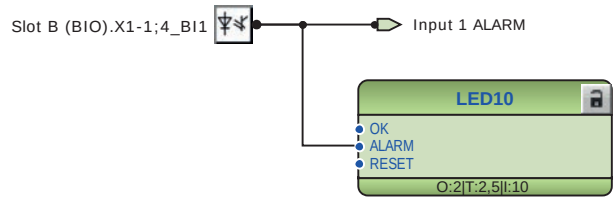

Figure 49: Hardware binary input channel shared by function blocks

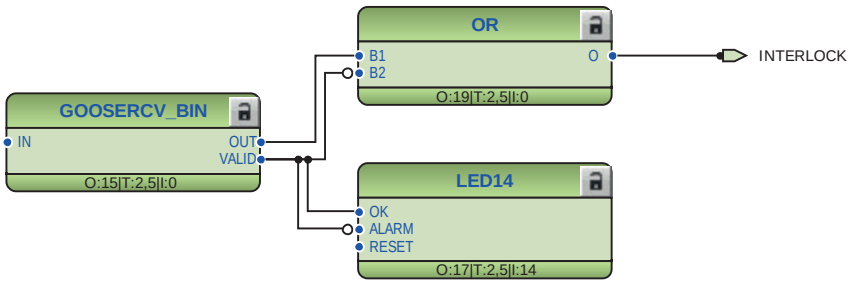

Figure 50: GOOSE input shared by function blocks

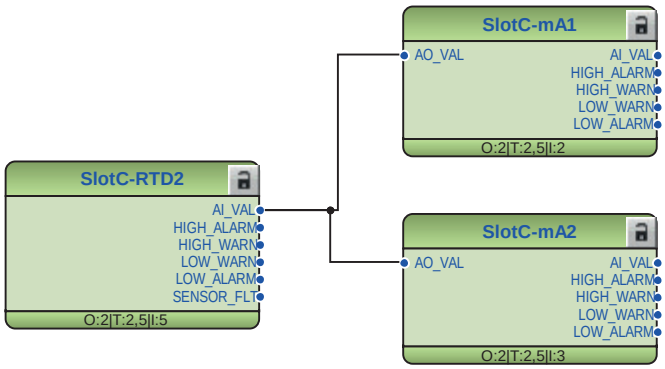

Figure 51: RTD input shared by function blocks

GOOSE, RTD and binary inputs can be shared by multiple function blocks.

5.1.7 Online monitoring

Online monitoring enables the continuous monitoring of the signal or channel values in the configuration. In the Online monitoring mode, the configuration cannot be edited in the Application Configuration tool.

Online monitoring can be started by clicking the Work online button in the toolbar. If the application configurations in the IED and PCM600 are the same, the online monitoring starts. The online monitoring ends and the tool returns to the configuration mode if the Work Offline button is clicked.

Online monitoring cannot be started if the application configurations in IED and PCM600 are different.

In some cases when the function block input is directly mapped to the function block output, the input is internally forced to the correct value

depending on the function block's settings. This function block design is present in control blocks, setting group handling and tap changer.

5.1.8 Validation

Validation checks the application configuration for errors based on the rules that govern the application creation at three different times.

- During the logic creation, while making a connection or placing a function block
- On demand by starting the validation
- When writing the application configuration to the protection relay

5.1.8.1 Validation when creating application configuration

Certain conditions require the validation to be made when creating the application configuration.

- A connection between two input or two output signals is not possible
- A connection between two different data types is not possible: for example, from a binary output to an analog input

5.1.8.2 Validation on demand

The validity of an application configuration can be checked by clicking **Validate Configuration** in the toolbar. The Application Configuration tool checks the application configuration for formal correctness. The found problems are divided into warnings and errors.

- Warnings, marked with a yellow warning icon
  - Example: a variable connected to an output signal that is not connected
  - Example: if an output from a higher execution order function is connected to the inputs of a lower execution order function
- Errors, marked with a red circle with a cross
  - Example: unconnected hardware output

Warnings do not prevent writing to the protection relay. However, errors must be corrected before writing the application configuration to the protection relay. The application configuration can be saved and the Application Configuration tool can be closed with open errors, but the application configuration cannot be written to the protection relay.

These problems are listed in the **Output** view under the **Application Configuration** tab. Double-clicking the error or warning row navigates to the **MainApplication** > **Page** > **Area**, where the problem was identified.

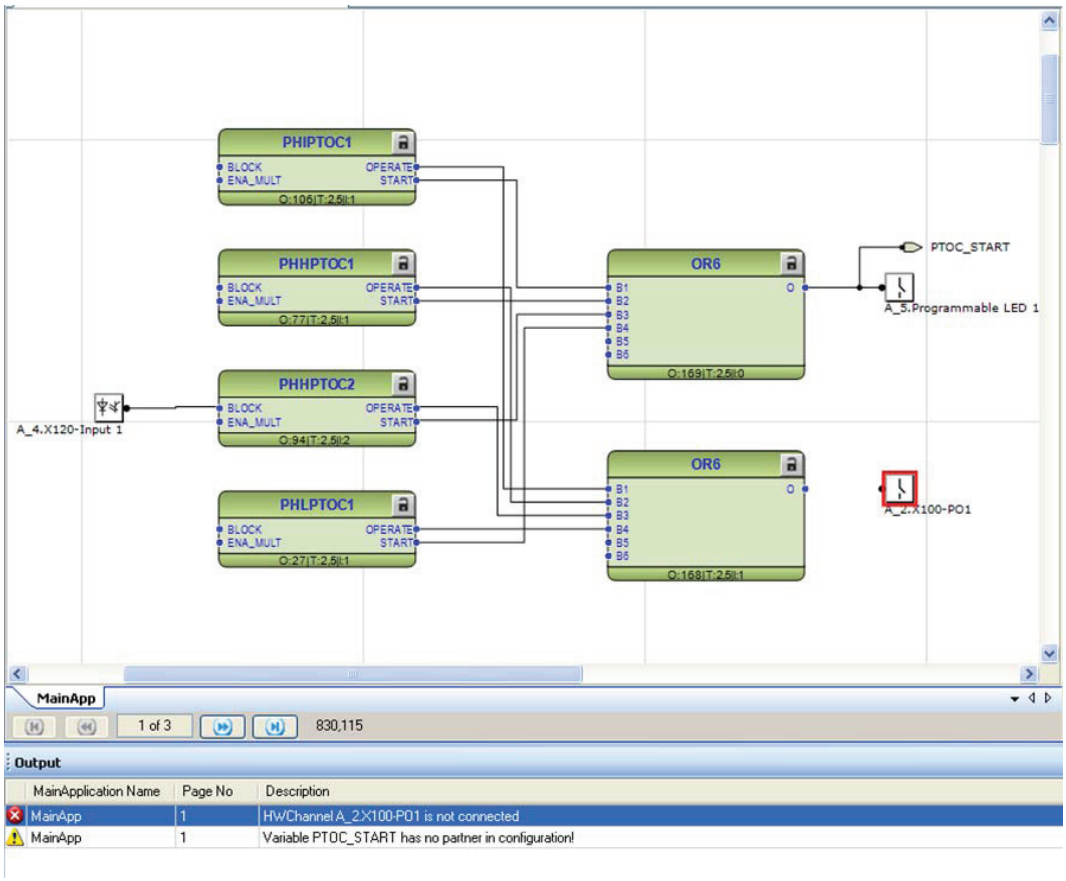

Figure 52: Application Configuration tool: validation on demand

5.1.8.3 Validation when writing to protection relay

When writing the application configuration to the protection relay, an automatic validation is performed. Errors abort the writing.

5.1.9 Configuration load calculation

The connectivity package calculates an estimated application configuration load every time it is saved in Application Configuration or written to the IED. This functionality prevents too complex configurations from being used and possibly risking IED protection functionality.

Calculation results are divided into two different sections: OK and Error. At 100 percent, PCM600 can give either an OK or an error message because the connectivity package rounds the actual limit to the closest percentage. If the calculation result is above 100 percent, PCM600 always gives an error message and prevents writing the configuration to the IED as the configuration is too large for the IED to handle. The configuration is written to the IED if the result is below the error range.

The calculation result is visible only in PCM600 output window on the Logging tab.

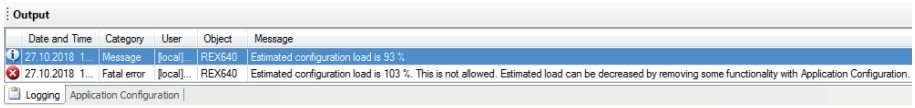

Figure 53: Configuration load result: an example of different messages shown in PCM600

5.2 Parameter Setting

Configuration and setting parameters can be changed with LHMI, WHMI or with the Parameter Setting tool in PCM600.

Some parameters are only visible in the Parameter Setting tool and some only on the LHMI.

The Write to IED command from PCM600 to the protection relay overwrites any parameter changes made with the HMI.

All parameters displayed in the parameter list can be sorted into two groups.

- Configuration parameters
- Setting parameters

5.2.1 Configuration parameter

The configuration parameter specifies the operation mode of an application function or of the protection relay. These are basic configurations that are normally configured only once and then not modified again. The protection relay configures itself during start-up according to the given configuration parameter values.

5.2.2 Setting parameter

Setting parameter (short form: “setting”) is a parameter that can be changed in the protection relay at runtime.

5.2.3 Setting group

Nearly all settings used by the protection relay for protection application functions are organized into a group of settings. Up to six setting groups can be configured with different values.

The protection relay supports the selection of a setting group at runtime.

5.2.4 Parameter import and export

The parameter export and import function can be used, for example, when the protection relay's parameters are set using the WHMI instead of PCM600. The relay

settings engineered with PCM600 can be exported to XRIO files and imported to the WHMI, which can be used to write the settings to the protection relays. The WHMI can also be used to read the relay setting parameters and to export those to files, which can be used by PCM600.

The setting export and import are sensitive to the protection relay's content. Settings are exported and imported for one protection relay at a time. The export files of a protection relay can be exchanged between PCM600, WHMI and the actual physical IED. To avoid errors and to efficiently manage the setting export and import, for example, in a substation with several protection relays, ensure that the names of the export files identify the protection relay to which the file should be imported.

The parameter import and export functionality is available via the File menu when the Parameter Setting tool is open.

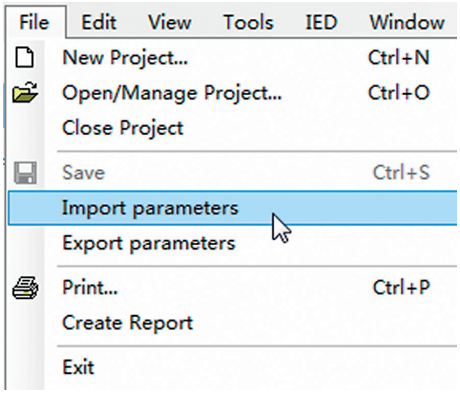

Figure 54: Parameter import and export

5.2.5 Parameter organization

The organization of parameters into a tree structure can be seen in the **Plant Structure** by expanding the setting tree.

5.3 Configure Autosynchronization

Manual configuration of the autosynchronization scheme in PCM600 is time-consuming and complex in case the system contains both generator circuit breakers and non-generator circuit breakers, that is, non-source circuit breakers. Configure Autosynchronization in PCM600 can be used to simplify the configuration process. The autosynchronization scheme for a given project can be configured via user-understandable terminologies regarding the system to understand the network topology.

The relay supports synchronizing of GCBs and NSCBs, such as grid connection or bus coupler circuit breakers, by providing dedicated function blocks to perform the synchronization process.

- ASGCSYN is used for GCB synchronization.
- ASNSCSYN is used for NSCB synchronization.

- ASCGAPC is a coordination function that handles the control request and allows communication among the relays connected to the autosynchronization system.

Configure Autosynchronization generates a configuration with IEC61850-8-1 GOOSE engineering, function block parameters in Parameter Setting and relevant connections in Application Configuration for ASGCSYN, ASNSCSYN and ASCGAPC. Further, the tool displays the configured network topology as an SLD preview.

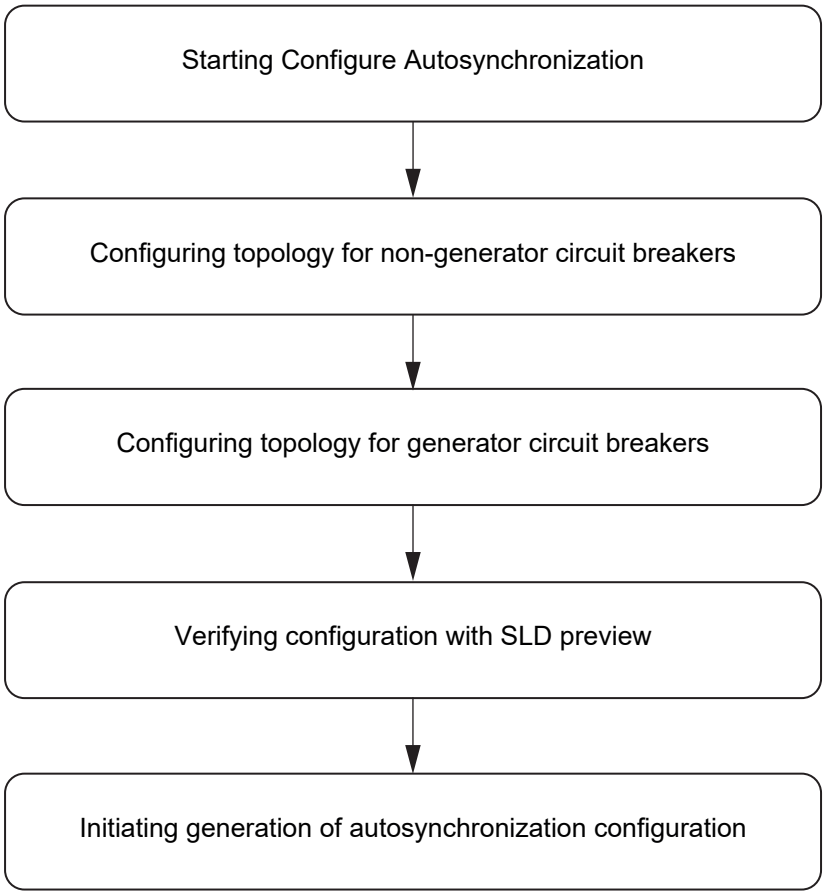

Figure 55: Simple engineering flow for Configure Autosynchronization

After using Configure Autosynchronization, manually handle the connections for voltage measurements, inputs and outputs to ASGCSYN, ASNSCSYN and ASCGAPC in Application Configuration. For functional details, see the technical and application manuals.

5.3.1 Example case

Figure 56 presents a 11 kV network with a generator, grid connection, bus sectionalizers, local power generation and two feeder loads to illustrate a more realistic application. The target is to create a complete autosynchronization system were each of the breakers, except for CB1 and CB2, are capable of performing synchronized closing. The system is continuously aware of the relevant primary objects' switching status as well as the availability of the generator. Depending on which circuit breaker is selected for synchronization, the system checks the conditions and proceeds only if the selected circuit breaker is viable. As the feeder relays do not have any dependency on the autosynchronization system, they are not

explained further in this example. This example case is used in the selections made in the following chapters.

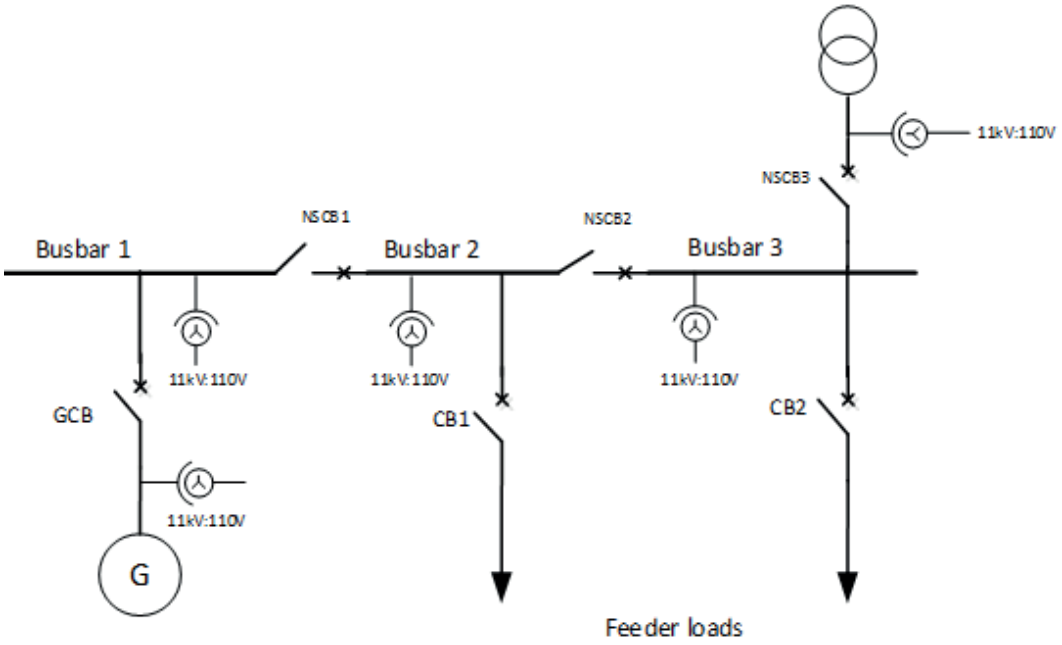

Figure 56: Example case for the autosynchronization scheme

Figure 57 presents the terminology used in a typical topology for different busbar arrangements containing an NSCB. It only depicts the logical connections and does not represent any primary network.

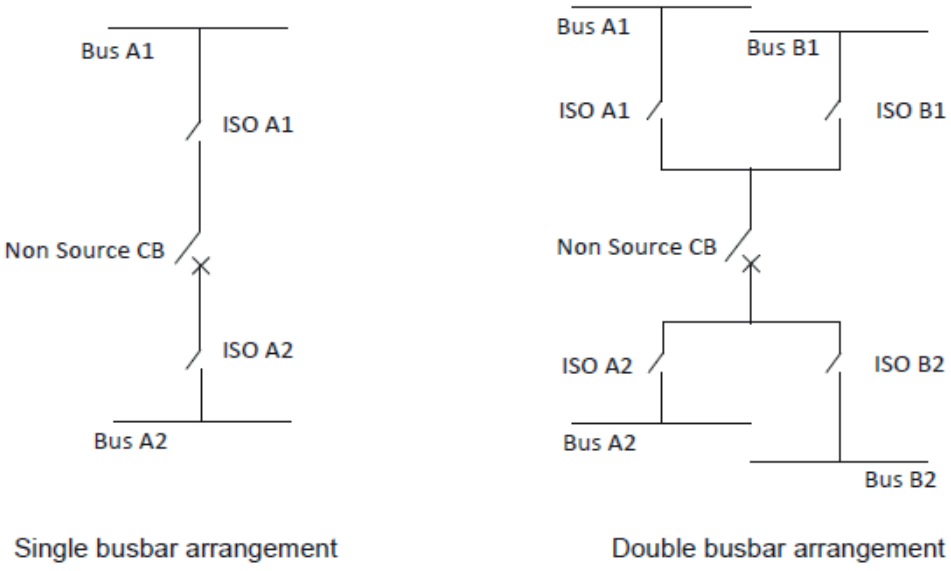

Figure 57: Terminology used in a typical topology containing a non-generator circuit breaker

Figure 58 presents the terminology used in a typical topology for different busbar arrangements containing a GCB. It only depicts the logical connections and does not represent any primary network.

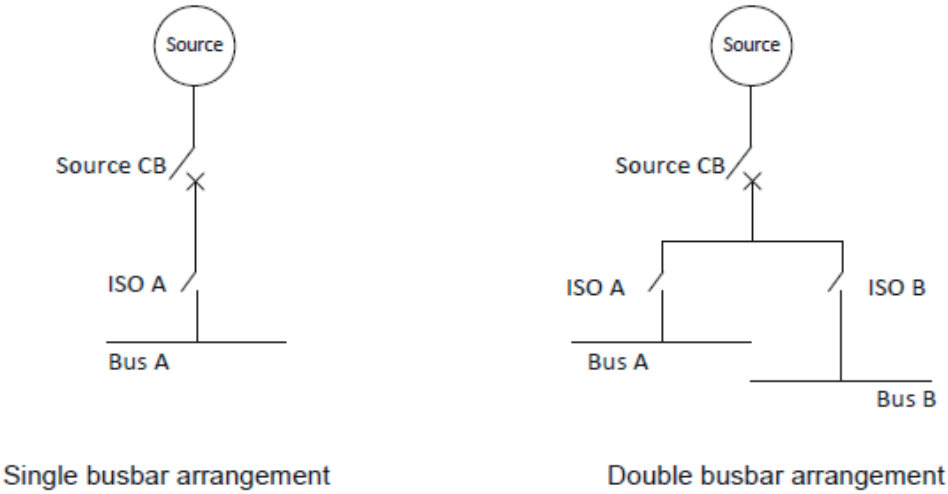

Figure 58: Terminology used in a topology containing a generator circuit breaker

5.3.2 Configuring autosynchronization scheme

If Autosynchronization Configuration has already been used to successfully generate an autosynchronization configuration, relaunching the tool loads the previously made configuration to the respective pages. Any existing connections in Application Configuration or settings in Parameter Setting made to ASGCSYN, ASNSCSYN or ASCGAPC must be reconfigured as they are removed from the configurations of the respective relays after relaunching Autosynchronization Configuration.

1. In the **Plant Structure**, right-click **Substation** or **IED Group** and select **Configure Autosynchronization**.

   Configure Autosynchronization can be opened only if there are at least two relays in the PCM600 project: one with the Generator autosynchronizer application package and the other with the Network autosynchronizer application package. No other tools should be open in PCM600.

2. On **Welcome Page** , click **Next** to configure first the topology for NSCBs and then for GCBs.
3. On the **Non-generator Configuration** page, configure the topology by adding, removing or clearing NSCBs.

   The page displays the relays from the PCM600 project setup that support the Network autosynchronizer application package. It is possible to synchronize up to 17 NSCBs in the configuration.

   - **IED Name**: Shows a list of relays with non-generator capabilities that can be selected and added to the configuration
   - **IP Address**: Shows the IP address of the selected non-generator (read only)
   - **Non-generator CB ID**: Shows an autogenerated non-generator circuit breaker ID to identify the breaker in the SLD preview controlled by the relay (read only)
   - **Breakers**: Used to specify the number of breakers a relay can control

- **Bus A1**: Used to specify the Bus A1 value for a non-generator in a single bus system
- **Bus A2**: Used to specify the Bus A2 value for a non-generator in a single bus system
- **Bus B1**: Used to specify the Bus B1 value for a non-generator in a double bus system
- **Bus B2**: Used to specify the Bus B2 value for a non-generator in a double bus system

Bus A1 and Bus A2 are mandatory to configure for non-generators. Use unique values in Bus A1, Bus A2, Bus B1 and Bus B2 for a given non-generator.

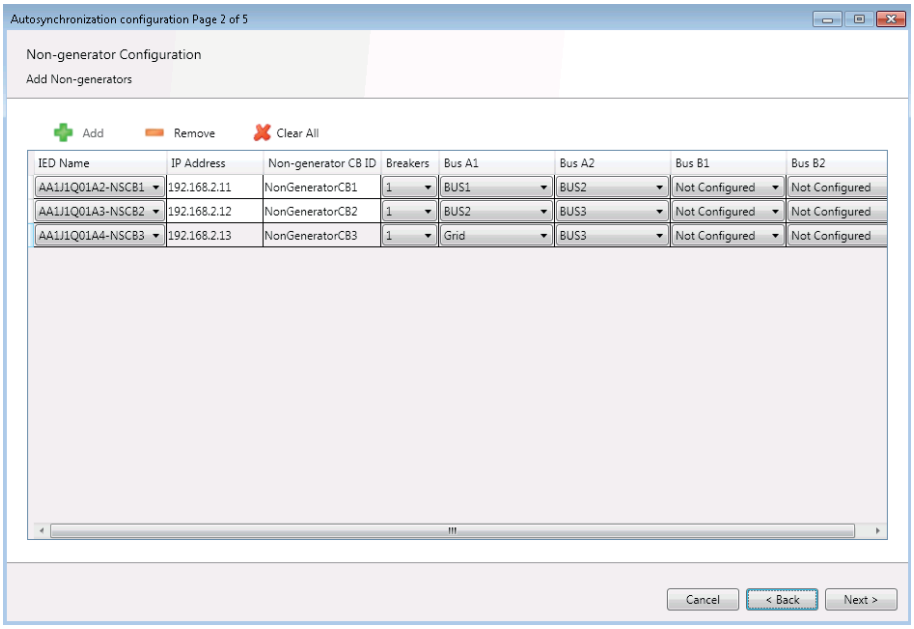

Figure 59: Configuring the topology for non-generator circuit breakers

4. Correct any invalid selections highlighted in yellow to be able to proceed and click **Next**.

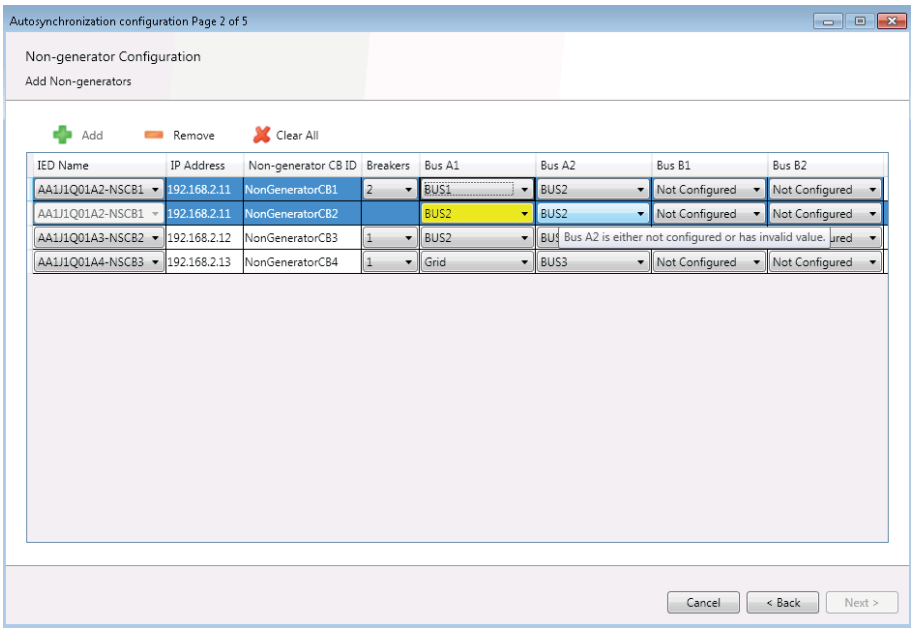

Figure 60: Correcting invalid non-generator circuit breaker selections

5. On the **Generator Configuration** page, configure the topology by adding, removing or clearing GCBs.

   The page displays the relays from the PCM600 project setup that support the Generator autosynchronizer application package. It is possible to synchronize up to eight GCBs to the configuration.

   - **IED Name**: Shows a list of relays with generator capabilities that can be selected and added to the configuration
   - **IP Address**: Shows the IP address of the selected generator (read only)
   - **Generator Name**: Used to specify a user-defined name for the generator
   - **Bus A**: Used to specify the Bus A value for a generator in a single bus system
   - **Bus B**: Used to specify the Bus B value for a generator in a double bus system

   Bus A and Generator Name are mandatory to configure for generators. Use unique values in Bus A and Bus B for a given generator.

   The value in Generator Name is later shown in the SLD preview and the REX640 LHMI dialog where the synchronization for NSCBs is initiated. The generator name can be modified in this field only.

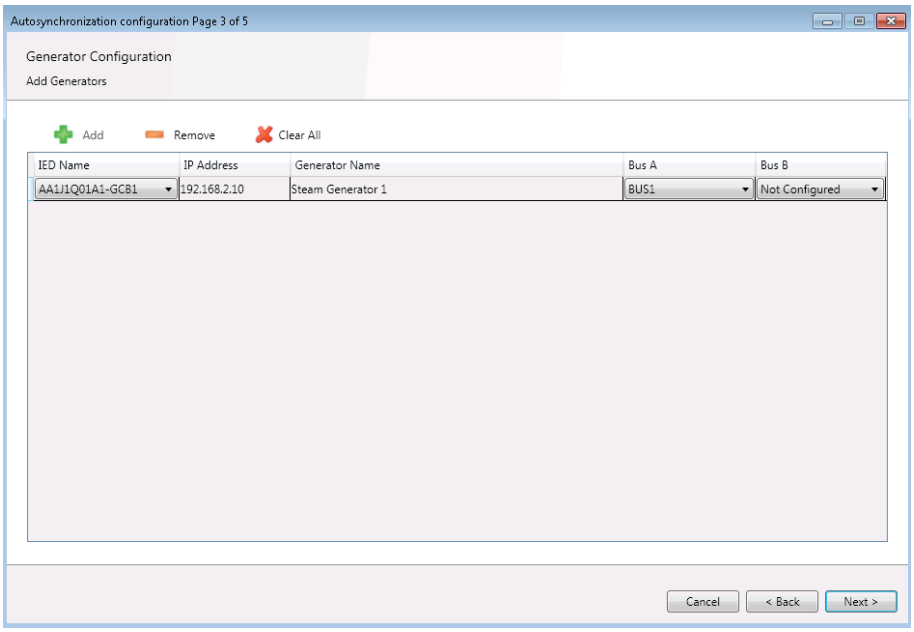

Figure 61: Configuring the topology for generator circuit breakers

6. Correct any invalid selections highlighted in yellow to be able to proceed and click **Next**.

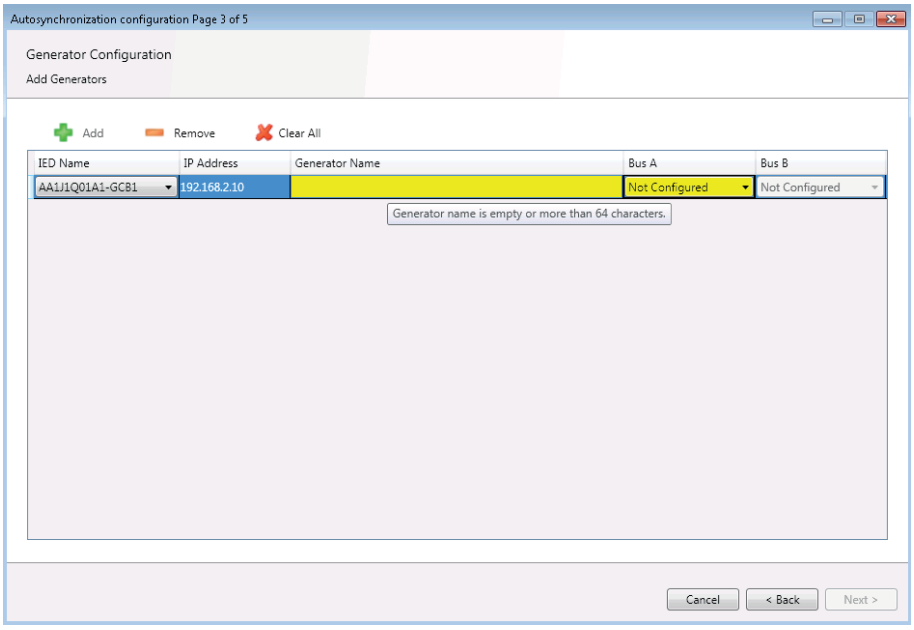

Figure 62: Correcting invalid generator circuit breaker selections

7. On **Summary Page**, verify the configuration with the SLD preview and click **Next**.

   The page shows an SLD based on the network topology entered in the previous pages and a report regarding the configuration changes made along with their impact on the relays. *Figure 63* shows a part of the page which displays the SLD generated based on the case presented in the *Chapter 5.3.1 Example case*.

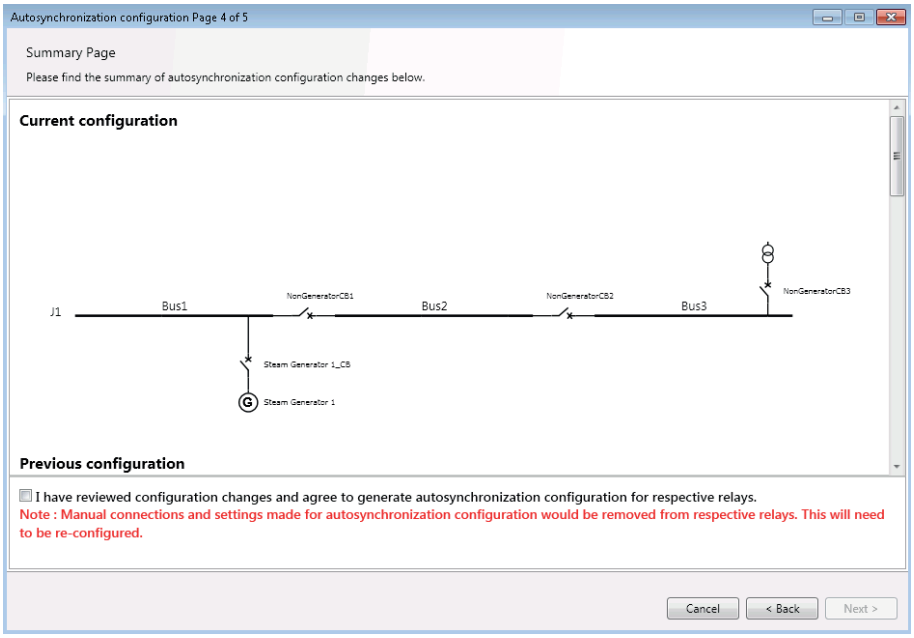

Figure 63: SLD preview for the example case

If the SLD preview is compressed and not properly visible, double-click the SLD to open the preview in a separate dialog with zoom buttons and scroll bars.

The autosynchronization configuration for ASGCSYN, ASNSCSYN and ASCGAPC is modified in Application Configuration, Parameter Setting and GOOSE engineering.

8. Verify the configuration made against the SLD preview and click **Next** to initiate the generation of autosynchronization configuration for the respective relays.

In case Autosynchronization Configuration has already been used to complete the configuration, the impact of configuration changes for each relay is shown on Summary Page. Review the configuration changes by comparing the SLDs of the current and previous configurations before initiating the configuration generation.

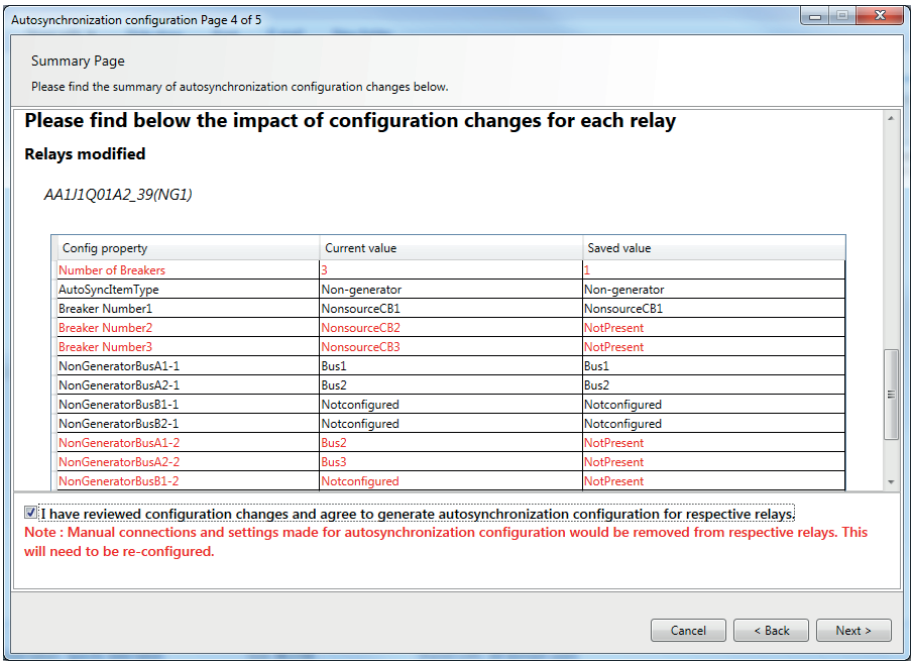

Figure 64: Reviewing configuration changes

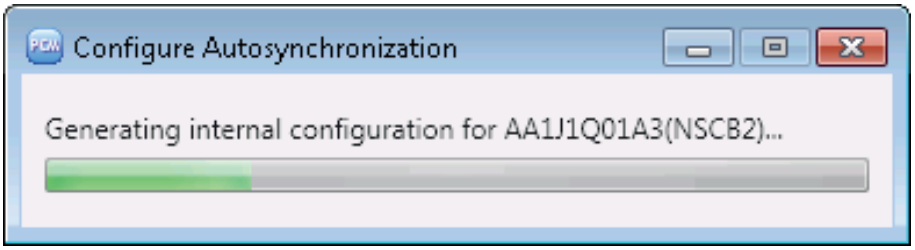

Figure 65: Generating configuration

9. On **Finish Page**, click **Finish** to close the tool.

   The page displays the configuration created as an SLD and the status of the autosynchronization configuration generation.

   Figure 66: Finish Page

5.3.3 Finalizing of generated autosynchronization configuration

Configure Autosynchronization generates a partial configuration in Application Configuration and Parameter Setting and a complete GOOSE engineering for the

function blocks ASGCSYN, ASNSCSYN and ASCGAPC. The remaining connections for voltage measurements and other inputs and outputs need to be handled manually in PCM600.

For functional details, see the technical and application manuals.

With reference to the example given in the *Chapter 5.3.1 Example case* chapter, the following figures show the partial configuration generated by the tool in PCM600.

Figure 67 shows the Application Configuration view of the relay controlling NSCB1. Similar connections are also generated for the other relays. The connections for the function blocks shown in the figure should be completed next.

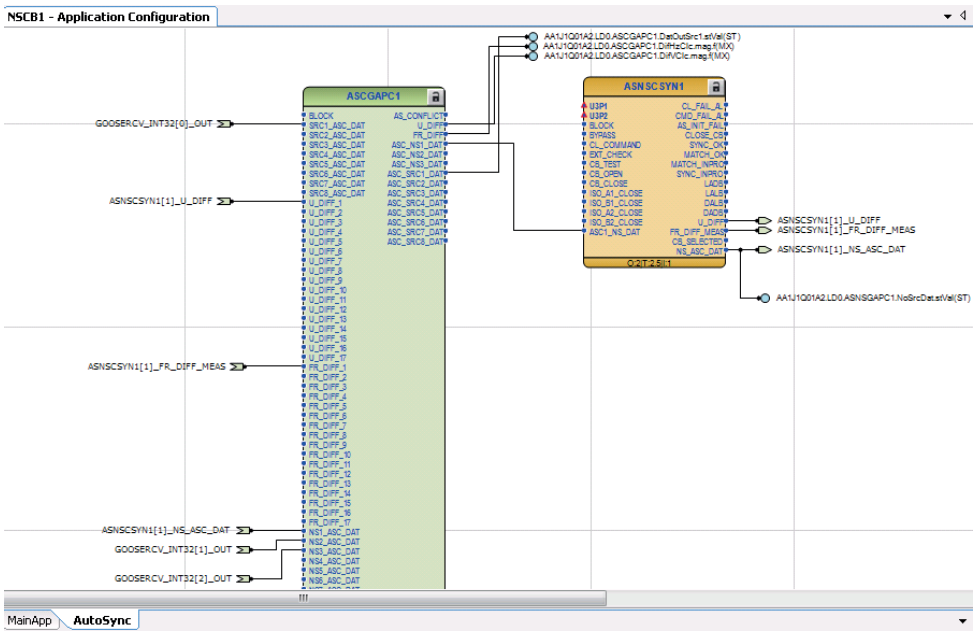

Figure 67: Application Configuration view of relay controlling NSCB1

Figure 68 shows part of the Parameter Setting view of ASCGAPC of the relay controlling NSCB1. Similar settings are also made for ASCGAPC in other relays. The other settings for ASGCSYN, ASNSCSYN and ASCGAPC should be checked and modified, if needed.

NSCB1 - Parameter Setting

Group / Parameter Name	IED Value	PC Value	Unit	Min	Max
Operation		on			
ASC CB Num1		Non source CB 1			
ASC CB Num2		Not Configured			
ASC CB Num3		Not Configured			
Max matching time		60000	ms	100	6000000
Central PMS present		No			
Double busbar		False			
Setting Group 1					
Number of sources		1		1	8
Number of NonSrc CB		3		1	17
Src1 bus A Num		Bus 1			
Src1 bus B Num		Not Configured			
NonSrc1 bus A1 Num		Bus 1			
NonSrc1 bus A2 Num		Bus 2			
NonSrc1 bus B1 Num		Not Configured			
NonSrc1 bus B2 Num		Not Configured			
NonSrc2 bus A1 Num		Bus 2			
NonSrc2 bus A2 Num		Bus 3			
NonSrc2 bus B1 Num		Not Configured			
NonSrc2 bus B2 Num		Not Configured			
NonSrc3 bus A1 Num		Grid			
NonSrc3 bus A2 Num		Bus 3			

Figure 68: Partial Parameter Setting view of ASCGAPC in the relay controlling NSCB1

Figure 69 shows the GOOSE data sets generated by the tool containing all the entries required to be exchanged among the relays for the autosynchronization process. No further user actions are required regarding the GOOSE engineering for the autosynchronization process. However, GOOSE data exchange for any other logic or scheme may be handled manually.

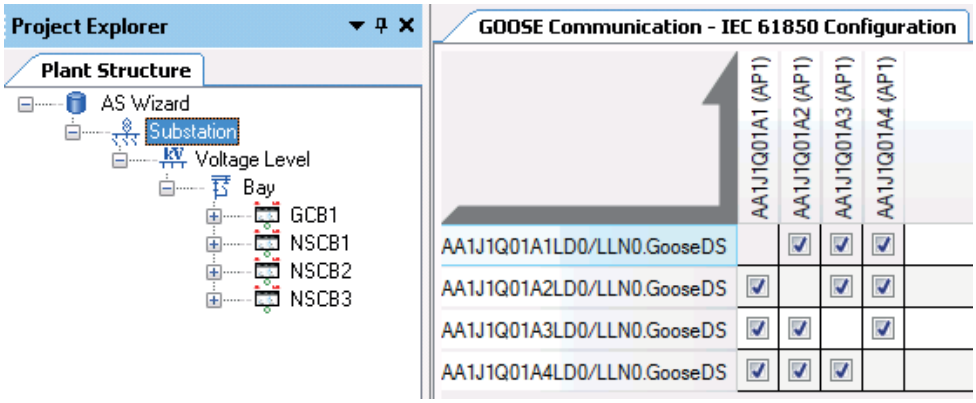

Figure 69: GOOSE data sets in IEC 61850 Configuration

5.4 Signal Matrix

Signal Matrix is used to make cross-references between the physical I/O signals, function blocks and SMV and for the GOOSE signal input engineering.

Application Configuration is used for adding or removing function blocks, for example, GOOSE receiving function blocks.

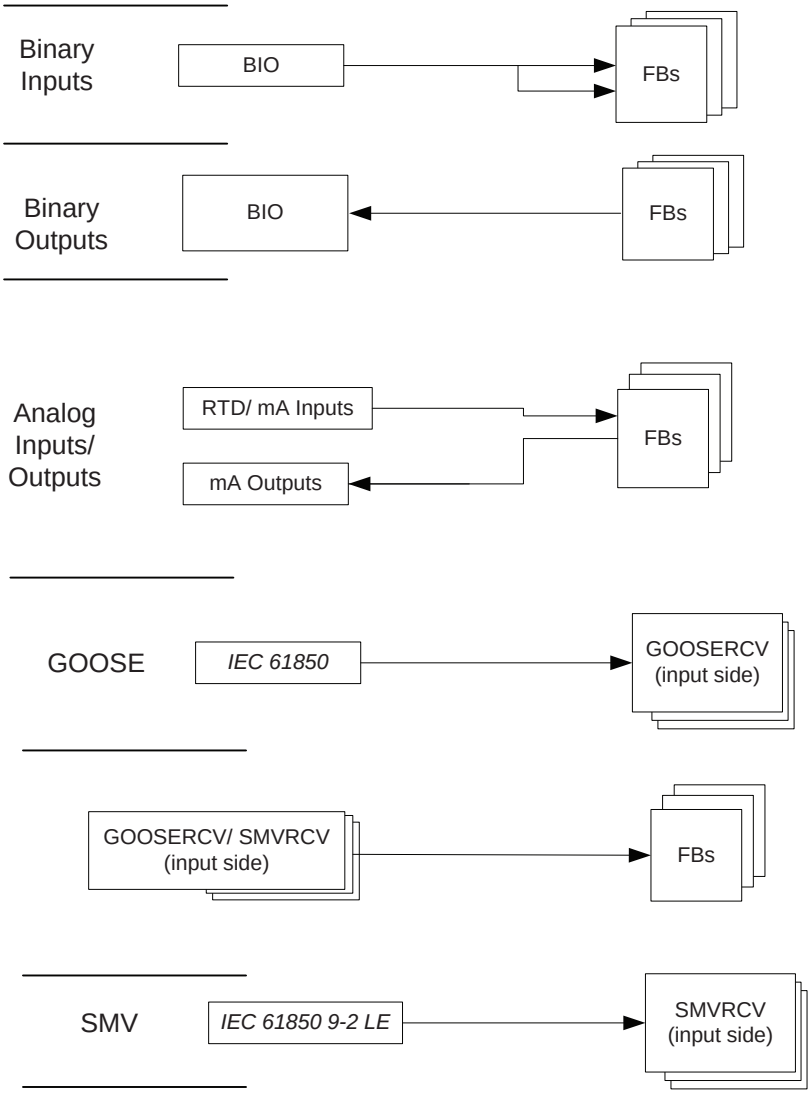

Figure 70: Signal Matrix: operation principles

A binary input channel can be connected to one or more function block inputs. If a binary input channel is connected to several different function blocks in the Application Configuration tool, the connection appears as glue logic in Signal Matrix.

A binary output channel can only be activated from one function block output. If it is activated from more than one function block output, the glue logic has to be used.

Glue logic means inserting a logical gate (OR and AND blocks) between the binary input and the function blocks or between the function blocks and the binary output channel. This can be engineered with the Signal Matrix.

Connections made with Signal Matrix are automatically shown in Application Configuration.

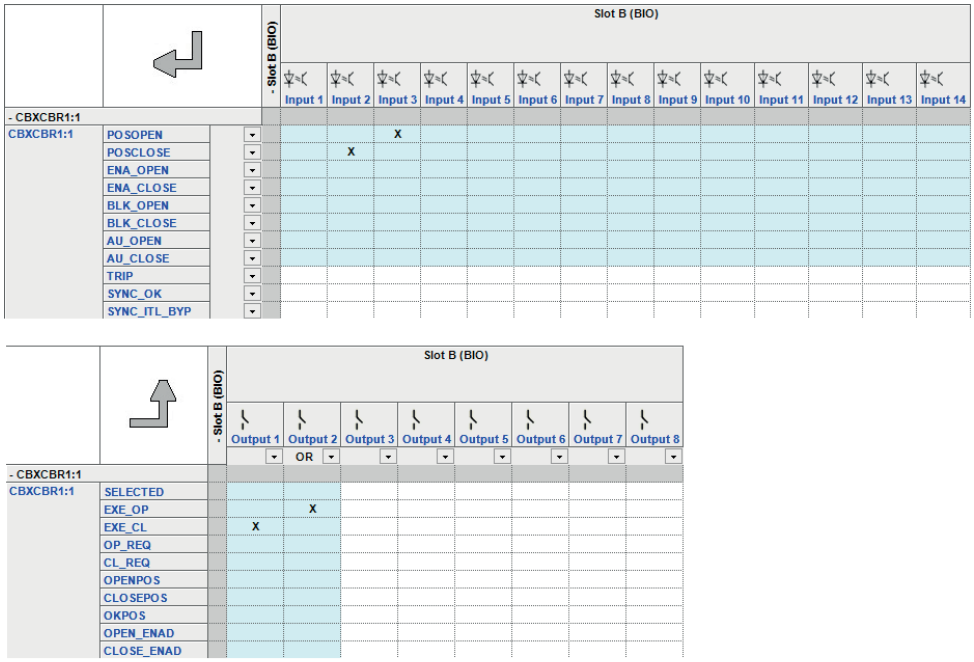

Figure 71: Signal Matrix: a connection between binary input channels to binary input signals

Each SMVRCV block used in Application Configuration needs to be connected to the desired SMV stream in Signal Matrix. Connections need to be one-to-one and unconnected SMVRCV blocks are not allowed.

Signal Matrix has a separate sheet for each possible combination.

- Binary inputs
- Binary outputs
- Analog inputs
- GOOSE
- SMV

5.5 Load Profile tool

Load Profile tool is used for reading load profile records of COMTRADE format from a protection relay, clearing old records and viewing records via an external COMTRADE viewer. The default viewer included with PCM600 is Wavewin, but a third-party viewer can be used.

5.5.1 Opening and closing Load Profile tool

- To open the Load Profile tool, right-click an IED in the PCM600 project tree and select **Load Profile Tool**.
- To close the Load Profile tool, click Close in the tool. The Load Profile tool runs in the same process as PCM600 but in a separate window. Multiple instances of the tool can be run at the same time. Any open tool instances are closed without confirmation when PCM600 is closed.

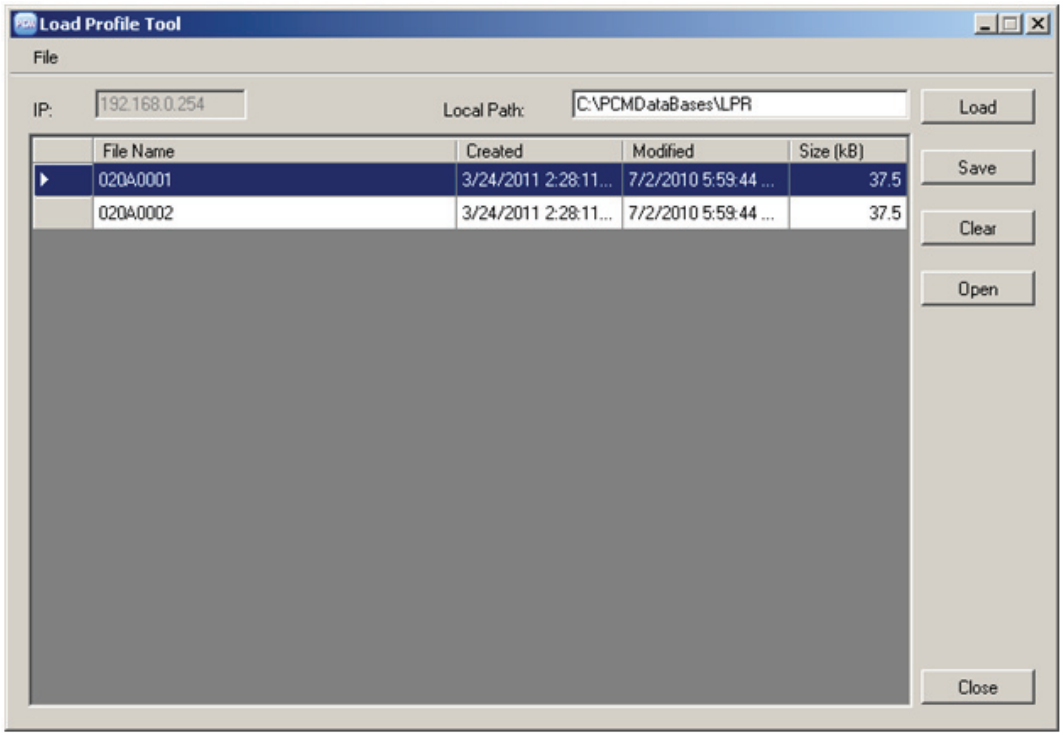

Figure 72: Load Profile tool

By default, the Load Profile tool uses the `\PCMDataBases\LPR` directory as a saving target directory.

5.5.2 Load Profile tool user interface

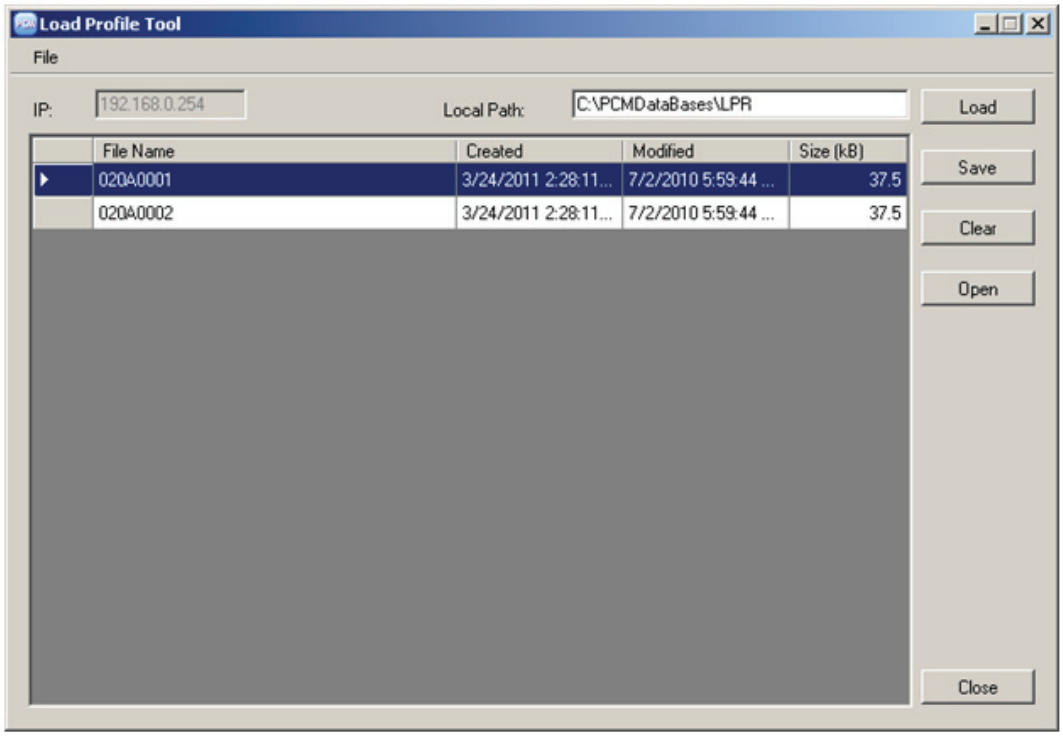

Figure 73: Load Profile tool interface

Table 3: Available actions on the user interface

Action	Description
Local Path	Default local path (`C:\PCMDataBases\LPR`) is the location from which the records are shown on the Load Profile tool. It is also the default path for saving records. The location where the records are saved can be changed in the Local Path field. The grid of the Load Profile tool shows only the records in the default local path including any unsaved records in `C:\Temp\Load\Profile Tool`. Therefore records can be saved at a user-specified location on the local machine but those records are not visible in the grid of the Load Profile tool.
Load	Clicking Load downloads all available records from `C:\LDP\COMTRADE` directory in the protection relay to a temporary folder `C:\Temp\Load-ProfileTool` on the local machine. In this temporary folder, the target file name is constant, and loading again overwrites the file. An unsaved record is deleted when the tool is closed.
Save	Clicking **Save** moves the records to the default or specified local path, **Load** transfers the records to a temporary folder. Each load profile record comprises two files with file extensions .dat and .cfg. Clicking **Save** adds a time stamp to the file names and moves the two files pertaining to the record to the default or specified folder. Saving another record creates a new record in addition to the old ones.
Clear	Clicking **Clear** clears the record from either the Load Profile tool or protection relay or both. Before deleting the records, a confirmation dialog box is shown.

Table continues on the next page

Action	Description
Open	Clicking **Open** opens any selected record to be viewed in Wavewin, provided that this external software is installed. Additionally, any record row can be double-clicked to view that record.
Sort	Record rows can be sorted by any column by clicking the column header.
Close	Clicking **Close** closes the tool instance. All open tool instances are closed when PCM600 is closed.
File	All the actions are also available on the **File** menu.

5.5.3 Information fields

The **IP** box shows the IP address of the selected IED and the **Local Path** box shows the selected location for reading or viewing records.

The record grid shows the name, creation time, modification time and size of each record. The times and dates shown in the grid are the times when the files have been read rather than the original date stamps in the device.

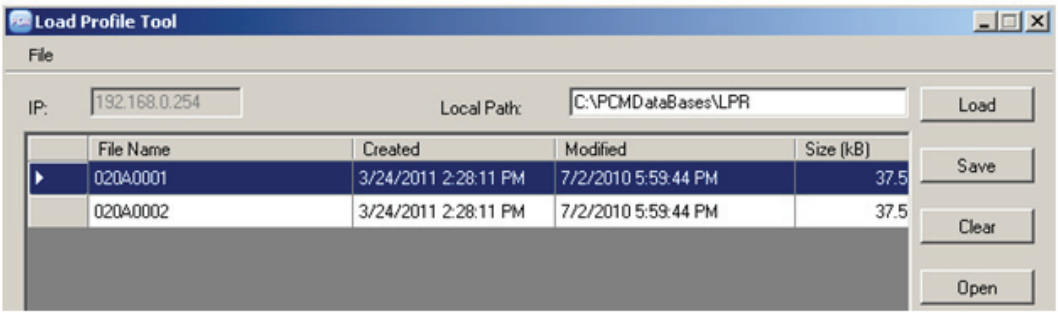

Figure 74: Information fields

5.6 Fault Record tool

The Fault Record tool is used for reading the fault records from the protection relay. The tool makes analyzing the fault records easier by showing them separately in their own user control components. It also includes save, copy and clear functions where all the fault records are saved or copied in text format for later viewing or cleared from the protection relay or the tool.

The fault record is saved to a local PC with the default name `FaultRecords.txt`. Rename the file before saving it to avoid overriding the old record.

5.6.1 Opening and closing Fault Record tool

- To open the Fault Record tool, right-click an IED node in the PCM600 project tree and select **Fault Record Tool**.

- To close the Fault Record tool, click the **Close** button in the tool.

  The Fault Record tool runs in the same process as PCM600 but in a separate window. Multiple instances of the tool can be run at the same time. Any open tool instances are closed without confirmation when PCM600 is closed.

The main functionality is divided into three parts: reading the fault record parameters from the protection relay, displaying their names, values and units on the user interface and saving them to a text file. It is also possible to clear all the fault records from both the tool and the protection relay and copy the fault records either individually or all at once to a word processor.

5.6.2 Fault Record tool interface

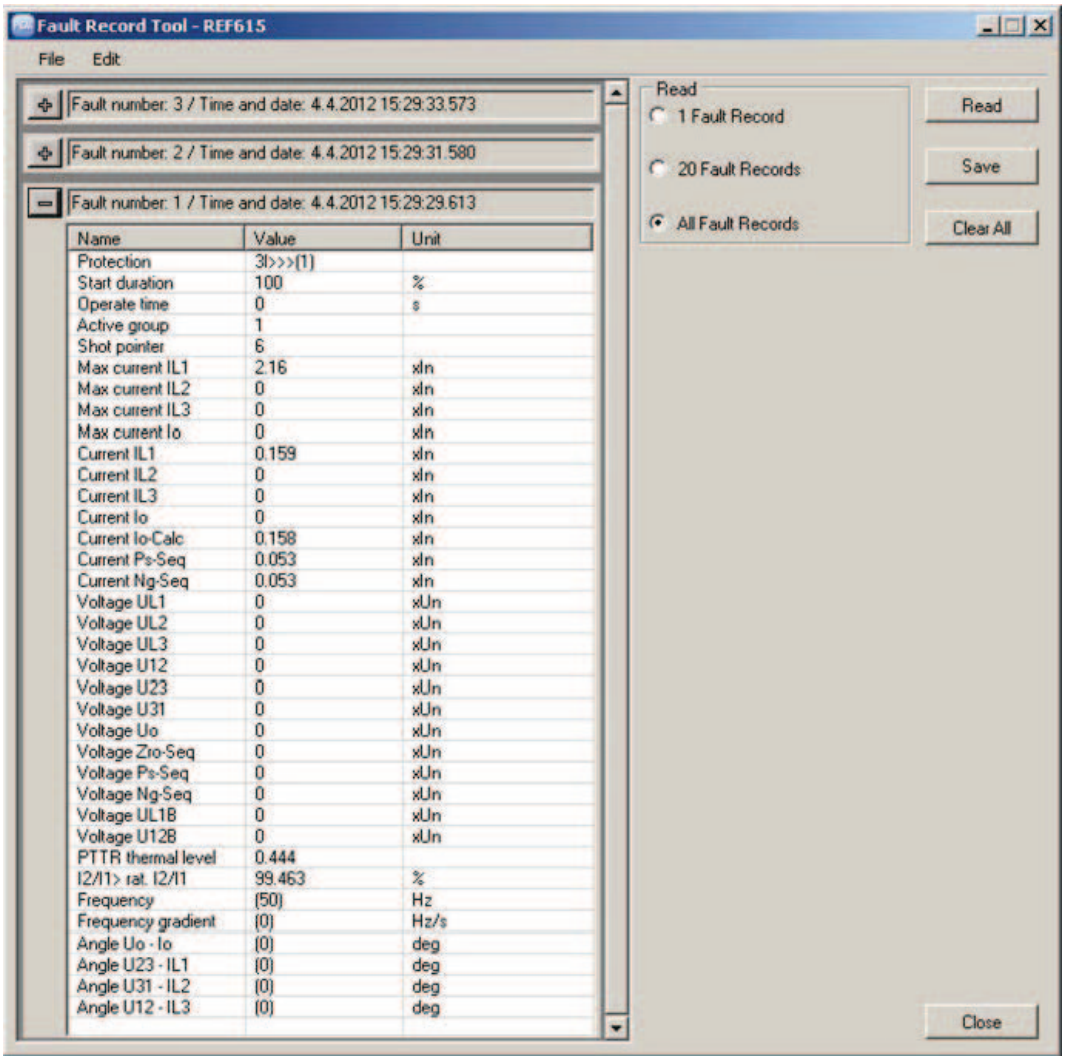

Figure 75: Fault record tool

Table 4: Available actions on the user interface

Action	Description
Read	Clicking **Read** reads all available fault records from the protection relay into the tool. One fault record, 20 fault records or all fault records can be read. The **Read** button opens up a progress bar to indicate an ongoing read operation. Clicking **Cancel** on the Read progress bar cancels the read operation. On operation completion, the available fault records are shown in the record grid. Click the **+** icon to expand and view record details. Clicking the **+** icon expands the record details for viewing.
Save	Clicking **Save** saves the fault records on the local machine as .txt file.
Clear	A record can be cleared from the Fault Record tool, the protection relay or both. Before deleting the records, a confirmation dialog box is shown.
Close	Clicking **Close** closes this instance of the Fault Record tool. All open instances are closed when PCM600 is closed.
File	**File** menu for **Save** and **Exit** actions.
Edit	**Copy All** in the **Edit** menu allows to copy all the fault records which can then be pasted to a word processor and saved on the local machine without having to save the records as a .txt file. Additionally the user can select any particular fault record and right-click to copy the selected record.

5.7 IED Compare

IED Compare is used to compare the IED configurations of two IEDs of the same type. It generates a text report which lists the differences between the IED configurations. IED Compare provides an option to compare an IED configuration stored in PCM600, IED or .pcmi file. IED Compare can compare certain types of IED configurations and parameters.

- Application configuration
- Display configuration
- GOOSE receive configuration
- Parameters

Application comparison also compares the system function blocks.

Display comparison compares the LHMI page configurations.

Detailed instructions are shown in PCM600 documentation.

5.7.1 Starting IED Compare

- Start **IED Compare** in the shortcut menu in plant structure.
  a) In the PCM600 plant structure, right-click **Substation**, **Voltage level**, **Bay** or **IED**.
  b) Select **IED Compare**.
- Start **IED Compare** from the PCM600 main menu.
  a) Select **Substation**, **Voltage level**, **Bay** or **IED** in the PCM600 plant structure.
  b) On the PCM600 menu bar, point to **Tools** and select **IED Compare**.

5.7.2 IED Compare tool interface

The comparison report shows differences in the configuration of two IEDs. Hardware, application, display, GOOSE and parameter configuration differences are grouped and listed under the corresponding headings.

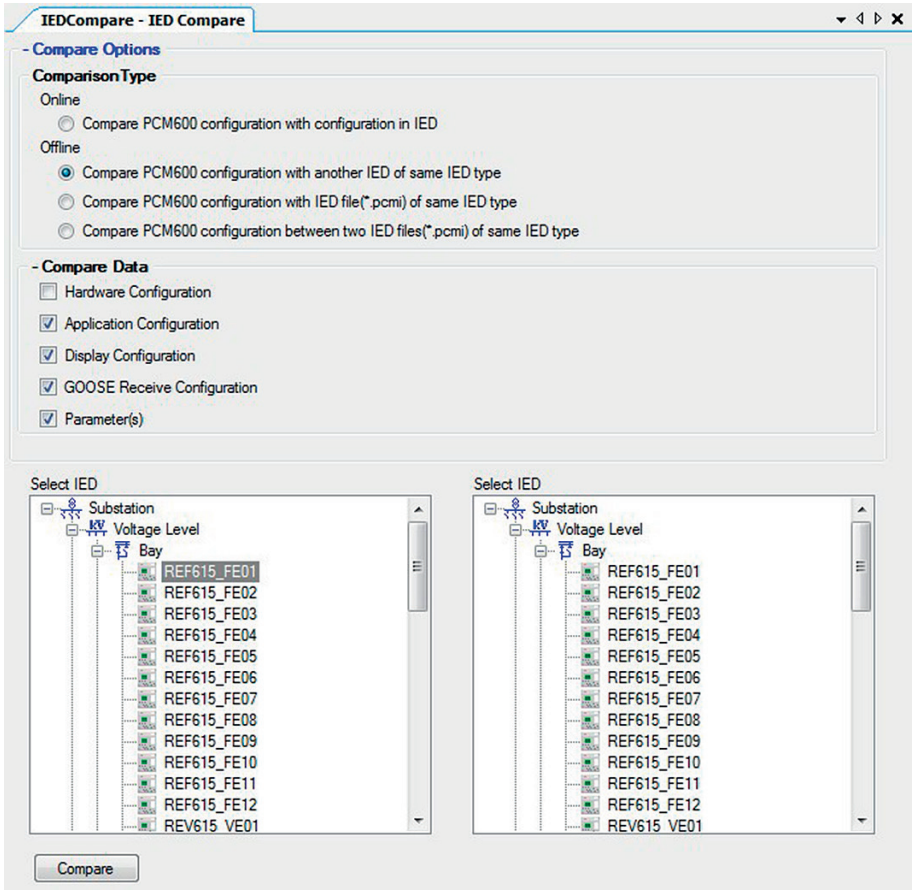

Figure 76: Compare options

Each configuration group can be expanded or collapsed by clicking the plus (+) or minus (-) button next to it in the result grid.

The reports must be read from left to right row-wise.

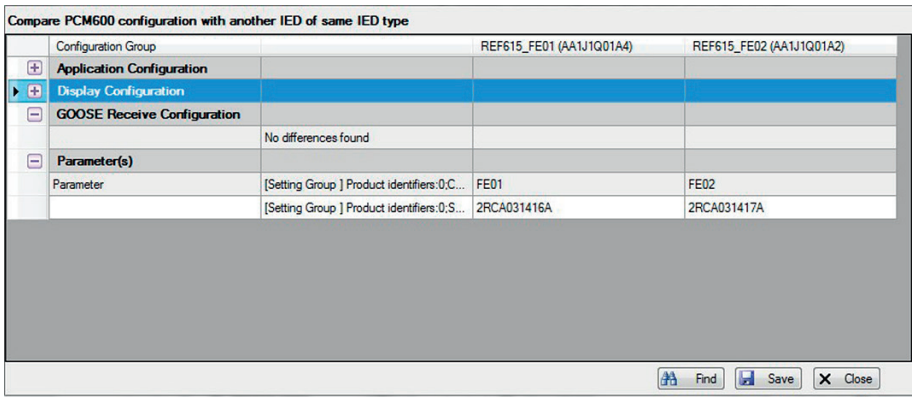

Figure 77: Compare report

Table 5: Acronyms used in a report

Acronym	Description
DA	Data attribute
DO	Data object
IED	Intelligent electronic device
LN	Logical node
SIG	Signal

5.8 Protection and control blocking examples

Test mode is selected through one common parameter via the HMI path **Tests** > **IED test**. By default, *Test mode* can only be set locally through LHMI. *Test mode* is also available via IEC 61850 communication (LD0.LLN0.Mod).

Table 6: Test mode

Test mode	Description	Protection BEH_BLK
Normal mode	Normal operation	FALSE
IED blocked	Protection working as in Normal mode but ACT configuration can be used to block physical outputs to process. Control function commands are blocked.	TRUE
IED test	Protection working as in Normal mode but protection functions work in parallel with test parameters.	FALSE
IED test and blocked	Protection working as in Normal mode but protection functions work in parallel with test parameters. ACT configuration can be used to block physical outputs to process. Control function commands are blocked.	TRUE

The mode of all logical nodes located under the CTRL logical device is set with *Control mode*. *Control mode* is selected via the HMI or PCM600 path **Configuration** > **Control** > **General**. By default, *Control mode* can only be set

locally through LHMI. *Control mode* inherits its value from *Test mode* but *Control mode* "On", "Blocked" and "Off" can also be independently set. *Control mode* is also available via IEC 61850 communication (CTRL.LLN0.Mod).

Table 7: Control mode

Control mode	Description	Control BEH_BLK
On	Normal operation	FALSE
Blocked	Control function commands blocked	TRUE
Off	Control functions disabled	FALSE

According to IEC 61850, the physical outputs to process should be blocked when the device is set to blocked or test blocked mode. The blocking logic must be implemented in the ACT configuration. In the protection blocking example the main trip from TRPPTRC1 is blocked, and in the control blocking example CBXCBR1 is blocked. Both comply with IEC 61850. In real applications some PTRCs might also be used for signalling purposes (GOOSE) and blocking and interlocking via I/O.

5.8.1 Protection blocking example

The physical outputs to process can be blocked with "IED blocked" and "IED test and blocked" modes. If physical outputs need to be blocked, the application configuration must block the signals or the function blocks that affect primary apparatuses. The blocking scheme needs to use the `BEH_BLK` output of the PROTECTION function block.

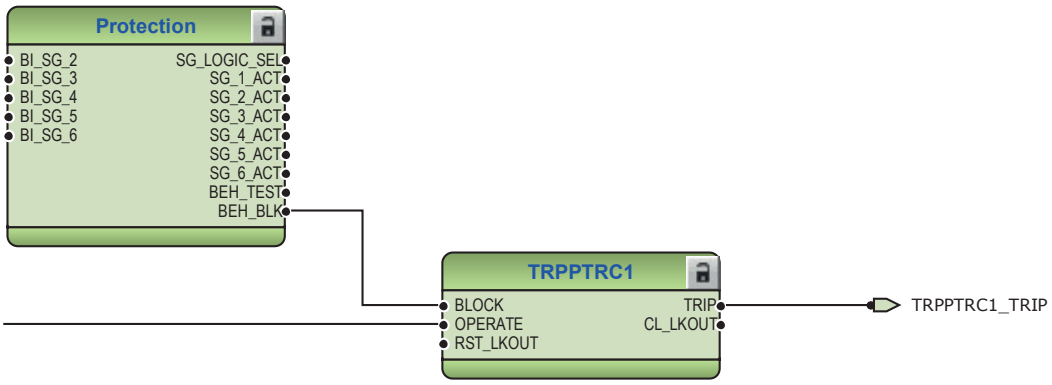

Figure 78: Master trip TRPPTRC blocked using Protection function block `BEH_BLK` output

5.8.2 Control blocking example

The physical outputs to process can be blocked with "Blocked" mode. If physical outputs need to be blocked, the application configuration must block signals or function blocks that affect primary apparatuses. Blocking scheme needs to use `BEH_BLK` output of CONTROL function block.

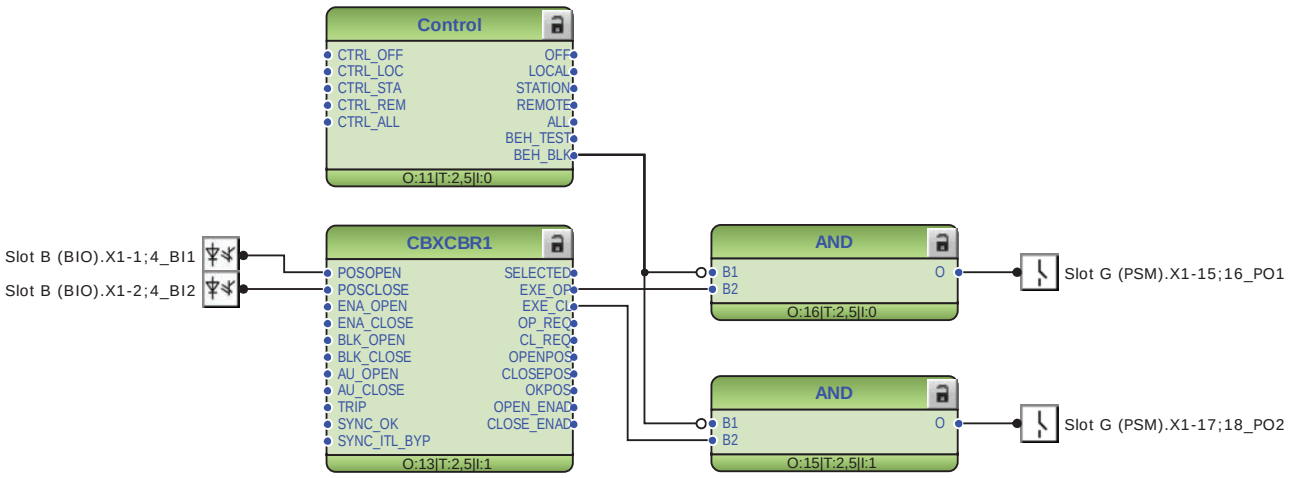

Figure 79: Circuit breaker control CBXCBR1 blocked using Protection function block BEH_BLK output

6 HMI engineering

6.1 Graphical Display Editor

Graphical Display Editor is used to configure the protection relay's HMI pages.

Graphical Display Editor can be used to create new pages, configure pages by adding widgets, set page visibility to different user categories, create single-line diagrams and symbols and provide language translations.

6.1.1 Creating complete local HMI page configuration

- Configure the protection relay functions such as protection, measurements and control functions with Application Configuration. The configuration made in Application Configuration can be saved to make the interfaces and signals available for other engineering tools within PCM600 such as Parameter Setting or Graphical Display Editor.
- Make connections between the application configuration function blocks and physical hardware inputs and outputs by using Signal Matrix or Application Configuration.
- Configure HMI pages by using Graphical Display Editor. Create new pages, configure the pages by adding widgets, set page visibility to different user categories, create single-line diagrams shown on the LHMI and WHMI and symbols, and provide language translations for the added LHMI elements.

  1. To configure the single-line diagram, check if any new symbols are required in addition to the default symbols in SLD Editor. Use Symbol Editor to create the missing symbols.
  2. Use SLD Editor to create a single-line diagram. Add bus bars, symbols and texts and create links between the symbols. Link the dynamic symbols to the corresponding function blocks in the application configuration. The function blocks control the objects represented by symbols on the HMI. Add 10 SLD pages at the maximum.
  3. Use Page Organizer to configure the main screen of HMI and to create main pages and linked pages by using the predefined ABB built-in pages and template pages. Set also the page visibility to Basic or Advanced access rights and define unique page names.
  4. Use Page Editor to configure the main and linked pages and, for example, to add widgets.
  5. Use Language Translation to translate the configuration data text into different languages. Configuration data includes widget properties, page properties and symbol captions. If needed, add a new language from the list of languages supported by the relay and set the translated text for the language for available configuration.
  6. Save the configuration.
  7. Preview the configuration before writing it to the relay.
  8. Write the configuration to the relay.

6.1.2 Creating complete switchgear HMI configuration

- Configure HMI pages for all the relays that are intended to be connected to the SHMI. These steps are described separately.
- Configure bay overview for each relay by using Graphical Display Editor. Create SHMI pages, configure SLDViewPort or Image widgets, and create single-line diagrams shown on the SHMI navigation page.
  1. To configure a single-line diagram for the bay overview, create a single-line diagram in Switchgear HMI SLD Editor. Create an SHMI page in Page Organizer, add an SLDViewPort widget to the SHMI page, and select the previously drawn SHMI SLD to be shown.
  2. To configure an image for the bay overview, create an SHMI page in Page Organizer. Add an Image widget to the SHMI page, and select the image to be shown in the bay overview.
  3. Save the configuration and write the bay overview configuration to the relay.
  4. Close Graphical Display Editor.
- Create an SHMI object in the plant structure.
- Start Switchgear HMI Configuration from the SHMI object to configure the navigation page for the SHMI.
  1. Set the substation name, voltage level and switchgear name according to the project requirements.
  2. Ensure that all bay overviews under the Switchgear HMI Navigation Page Configuration section are presented as intended in the SHMI navigation page. The order of bays can be changed and any bay overviews unintended for the SHMI can be moved to the Unallocated bays overview section.
  3. Preview the navigation page to ensure that the result is correct.
- Set up a connection to the relays through a station network so that all the relays are reachable.
- Write the SHMI configuration to all allocated relays.

6.1.3 ABB built-in pages

The ABB built-in pages contain information and functionality which are common to most of the applications. Widget properties are usually fixed on these pages but some, such as measurement page and phasors page contents, can be modified.

6.1.3.1 Measurements page

The Measurements page contains two configurable measurement lists. The buttons at the bottom of the page are used to navigate to other measurement-related pages: **Phasors**, **Load Profile**, **Harmonics** and **Temperatures**.

Only the **Measurements** and **Phasors** pages are user-configurable.

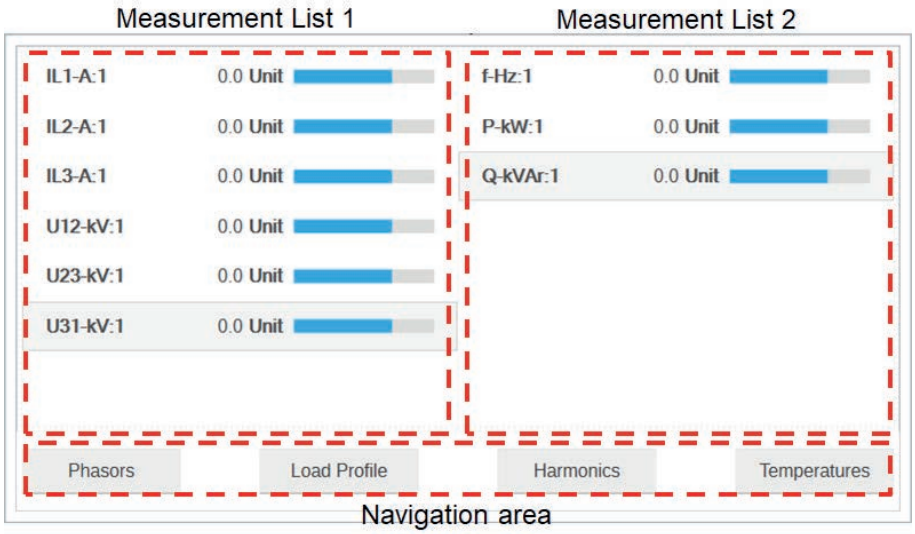

Figure 80: Measurements page

The **Measurements** page configuration data is also used by the WHMI, that is, even if the LHMI is not used with the relay, if the measurements need to be seen on the WHMI, the **Measurements** page configuration must be created in Graphical Display Editor.

Adding and removing measurements

1. In Page Editor, select the **Measurements** page and then select a measurement list by clicking it.
2. In the **Object Properties** pane, click **...** on the **listId** row to browse the available signals.

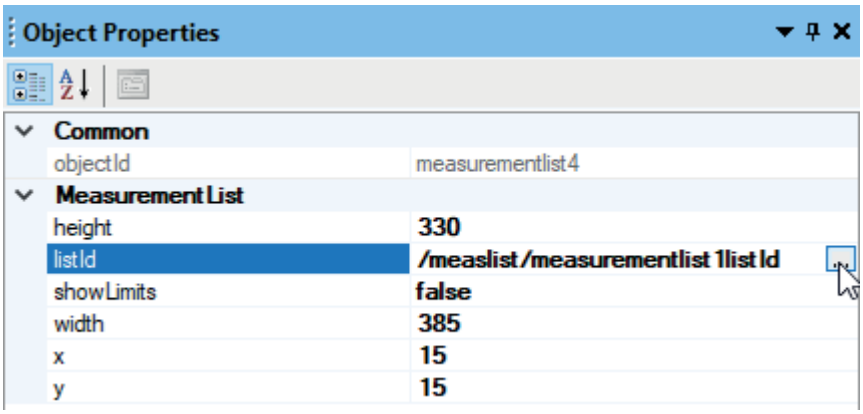

Figure 81: Accessing the signals

3. In the **Signal Group Selection** dialog, select check boxes to add the required signals or clear them to remove any unused signals.

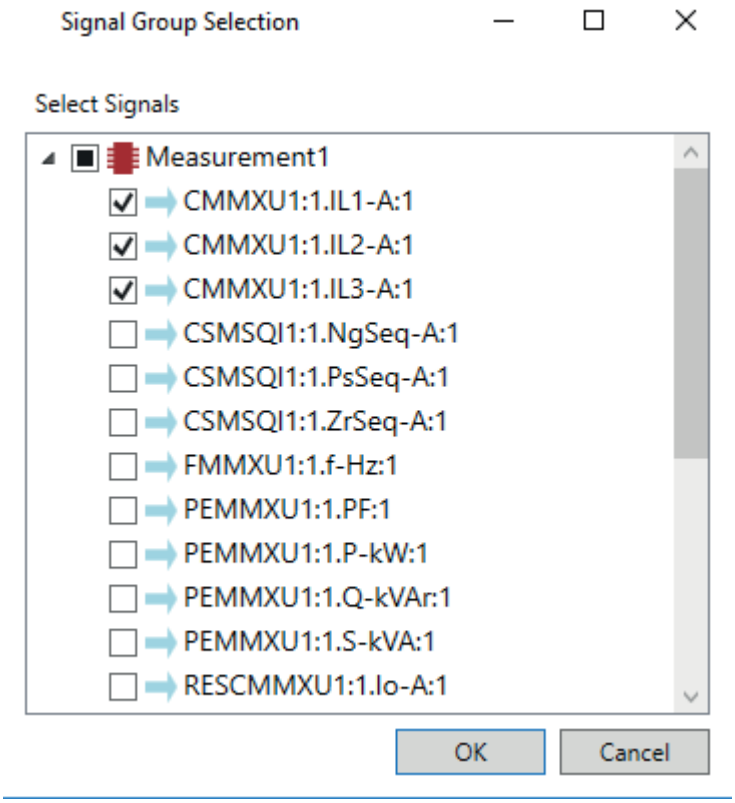

Figure 82: Selecting signals

4. Click **OK**.

Configuring measurement items

The measurement limits, scaling and order can be independently configured in the Object Properties pane.

Click a measurement to select the measurement item. Then click the same item again to select the measurement list.

- Set the measurement properties.

  If the property value is set to "Automatic", the LHMI uses the value defined by the data model.

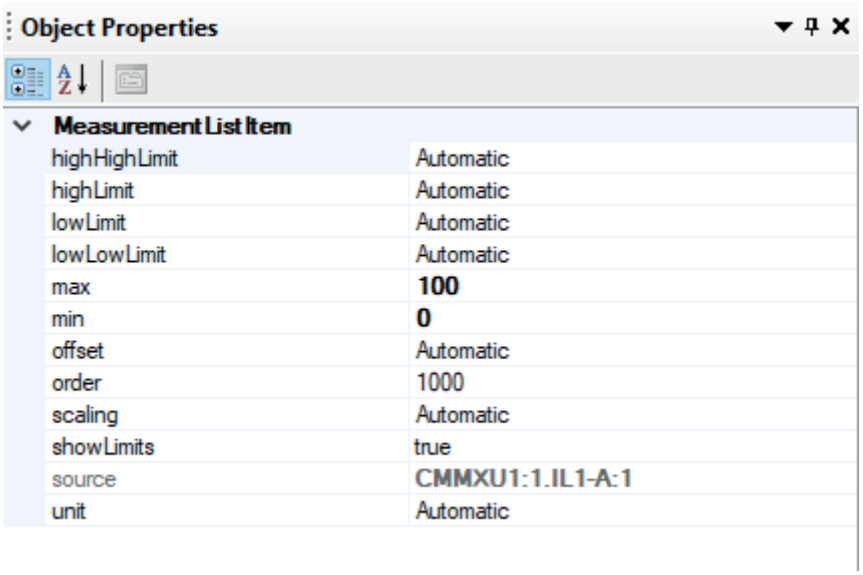

Figure 83: Configuring measurement items

- Apply custom scaling, if needed.
  1. In the **scaling** box, define the correct value which is a coefficient applied to the measurement value. The supported scaling is linear: new_value = read_measurement_value × scaling_property + offset_property.
  2. In the **offset** box, define the offset value.
  3. In the **unit** box, define the unit (string).
  4. Adjust the other limit properties to better fit the scaled measurement value.
- In the **order** box, define custom order for the measurements, if needed. The smaller the order property, the higher the measurement's position in the measurement list.

  By default, all measurement list items are arranged in alphabetical order. Modifying the order property overrides the default behavior.

6.1.3.2 Phasors page

By default, the Phasors page template available in Page Organizer contains an empty Custom signal group. Measurements can be added to the Custom signal group or new signal groups can be added and removed by opening the **Phasors** page in Page Editor.

Opening Signal Grouping Editor

1. In Page Editor, open the **Phasors** page.
2. Click  in the lower-right corner of the Phasors page.

   The **Signal Grouping Editor** dialog opens.

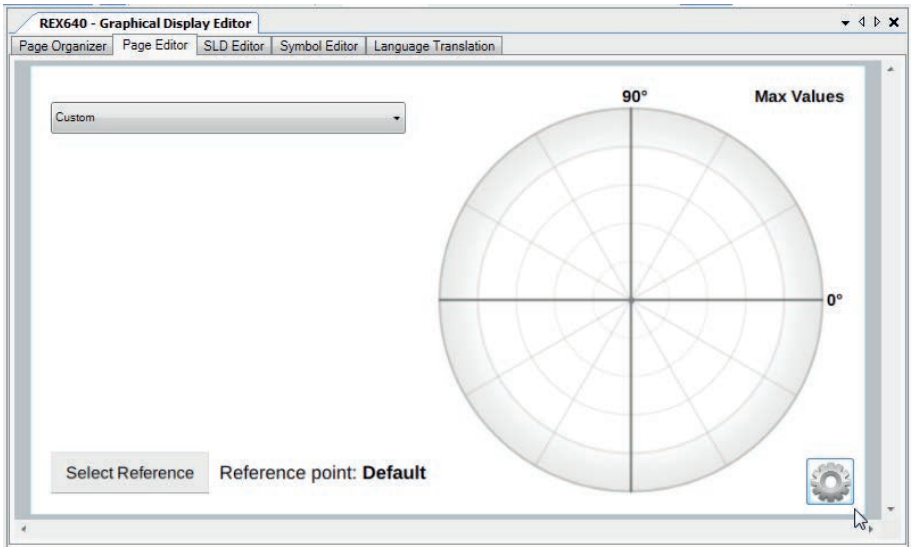

Figure 84: Opening Signal Grouping Editor

Adding and removing signal groups

- Add a new signal group.
  1. In **Signal Grouping Editor** dialog, click **Add**.
  2. In **Enter Group Name** dialog, type the signal group name.
  3. Click **OK**.

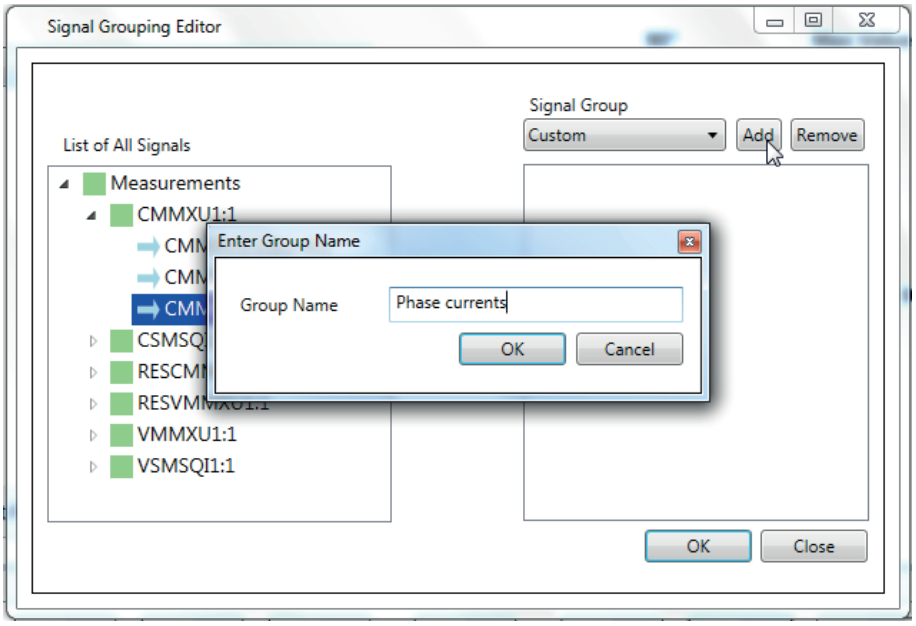

Figure 85: Adding a signal group

- Remove an existing signal group.
  1. In **Signal Grouping Editor** dialog, select a group from the **Signal Group** drop-down list.
  2. Click **Remove**.

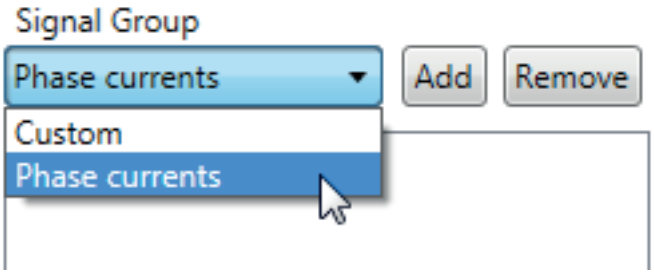

Figure 86: Removing a signal group

Adding and removing signals

- Add new signals.
  1. In **Signal Grouping Editor** dialog, select a group from the **Signal Group** drop-down list.
  2. In List of All Signals list, select the required signals and click .

     Add seven signals at the maximum to a single group.
  3. Click **OK**.

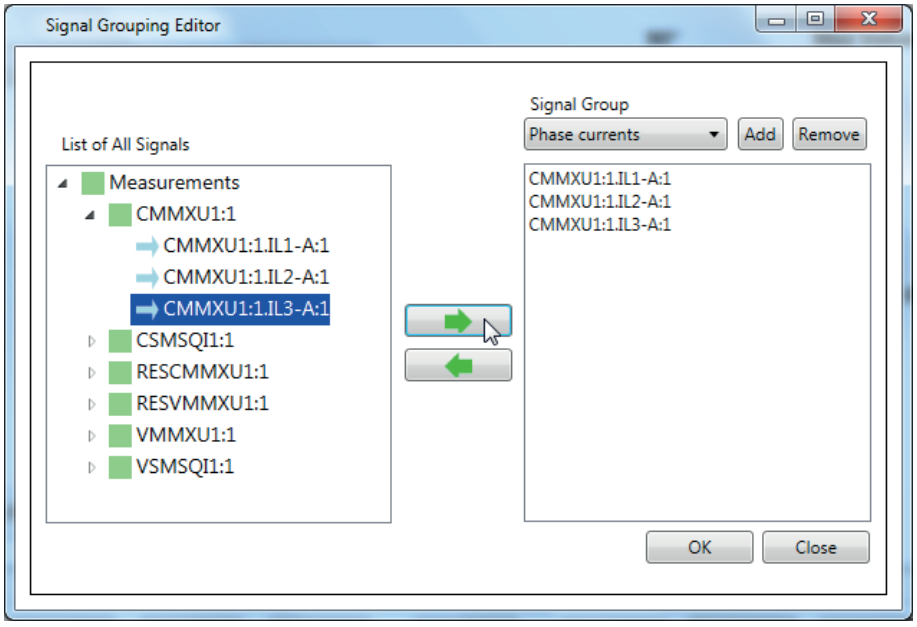

Figure 87: Adding a signal

- Remove existing signals.
  1. In **Signal Grouping Editor** dialog, select a group from the **Signal Group** drop-down list.
  2. Select the required signals and click .
  3. Click **OK**.

6.1.4 Page Organizer

Page Organizer is used for configuring the main screen of LHMI by creating main pages, linked pages and switchgear HMI pages. Pages can be added, removed or reordered in Page Organizer and, for example, their visibility can be set to "Basic" or "Advanced". These access rights are mapped to user roles with User Management in PCM600 and the pages are filtered based on the mapping. The selection "Basic" or "Advanced" is not applicable to the WHMI. SHMI pages are used on the navigation page of the SHMI.

In the Add Page dialog, some of the pages in the ABB Built-in Pages category are marked with a padlock symbol. They are locked and cannot be modified in Page Editor. If such a page should be modified, it can be enabled by first saving it as a template.

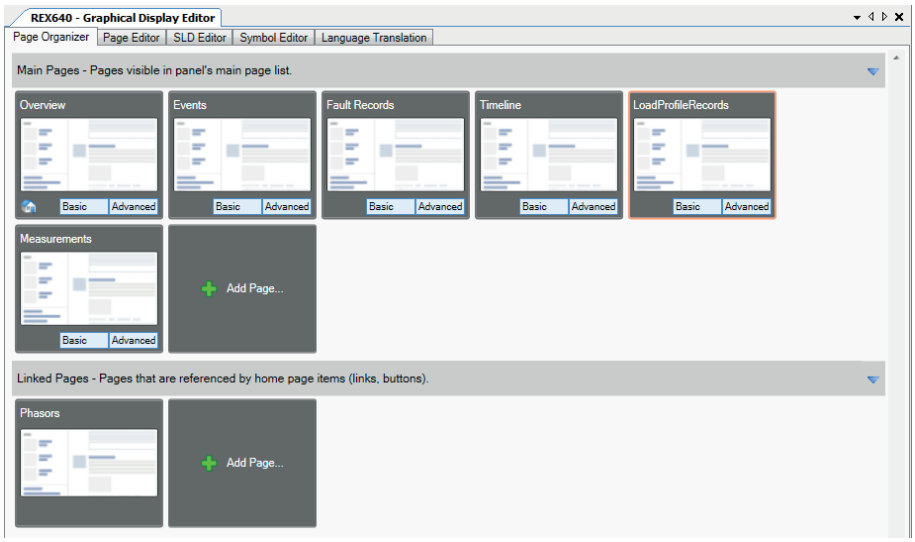

Figure 88: Page Organizer

6.1.4.1 Main pages and linked pages

Main pages can be navigated using the Home button on the LHMI. The main page visibility is bound to access rights. Linked pages are pages which are linked from other pages; they can be opened from a main page when a button is tapped. Depending on the selected role, linked pages are shown under the main page area.

Both the main pages and the linked pages are defined in Page Organizer.

6.1.4.2 Templates

Templates allow replicating the same configuration with less effort. New pages can be created by selecting a template page so that the new page becomes a new instance of the template page. Templates also contain empty pages.

In Page Organizer, the ABB built-in pages are seen as page templates. Both ABB built-in pages and template pages require unique names.

6.1.4.3 Creating pages

The relay supports 10 main pages, 20 linked pages and 2 SHMI pages at the maximum.

1. In Page Organizer, create new pages in one of the alternative ways.
   - Under **Main Pages**, click **Add Page** to create a main page.
   - Under **Linked Pages**, click **Add Page** to create a linked page.

Change the page type (main or linked) by dragging the page from one area to the other.

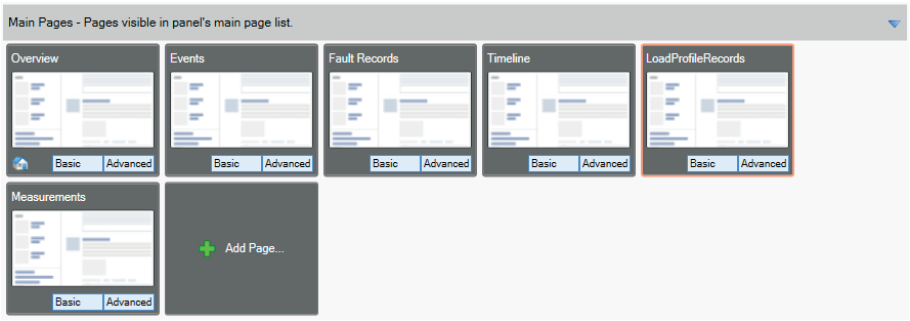

Figure 89: Adding pages

2. In the **Add Page** dialog, select a predefined ABB built-in page or a template page and click **Add**.

Define unique names for all main, linked and SHMI pages regardless of their type.

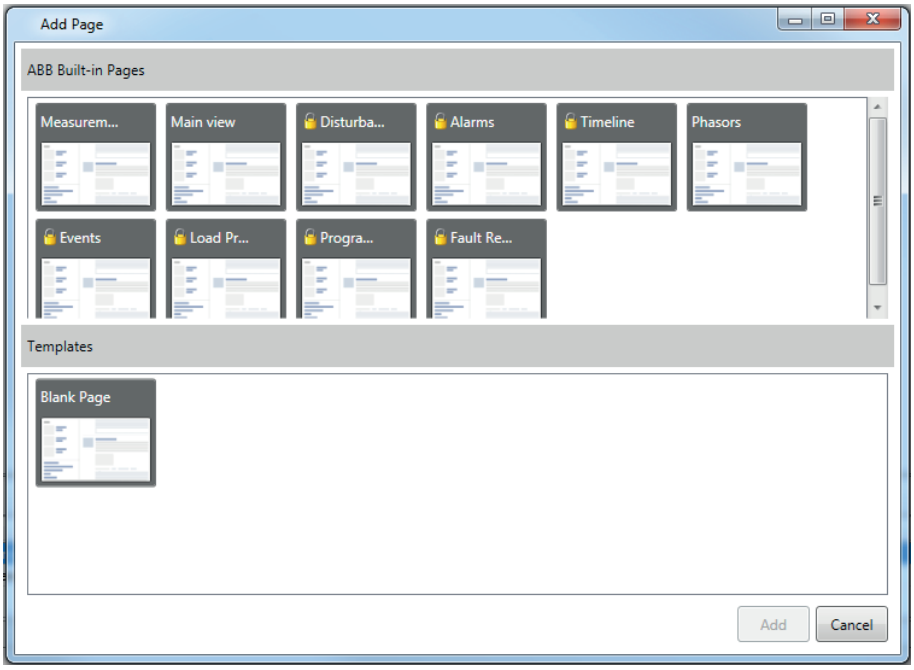

Figure 90: Using ABB built-in pages or templates

6.1.4.4 Changing page order

- In Page Organizer, change the order of the pages by dragging a page to the required place.
- Pages can also be dragged from **Main Pages** to **Linked Pages** and vice versa.

6.1.4.5 Creating templates

When a template is created out of an existing page, it becomes available under the Templates section in the Add Page dialog. Templates allow replicating the same configuration with less effort.

Save pages as templates in one of the alternative ways.

- Click **Options** in the upper-right corner of the page and select **Save as Template** from the shortcut menu.
- Right-click the page and click **Save as Template**.

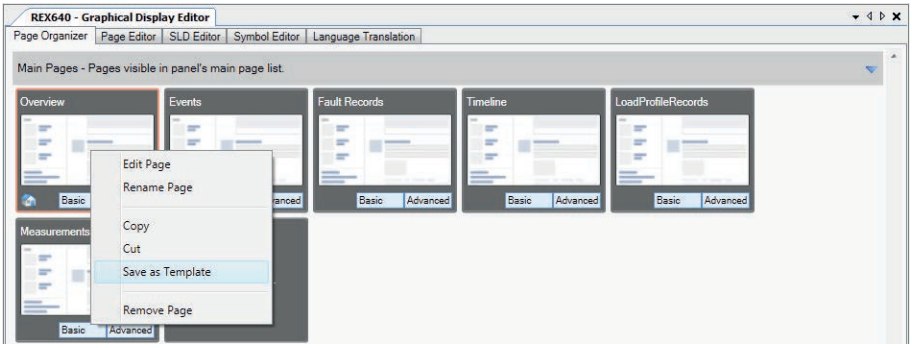

Figure 91: Saving templates

6.1.5 Switchgear HMI Page Editor

Switchgear HMI Page Editor is used to configure the bay overview shown on the SHMI navigation page. SHMI pages can be configured by adding widgets that are the building blocks for configuring the bay overview. All the supported widgets are populated in the Object Types pane.

Page Browser is shown at the bottom of Switchgear HMI Page Editor. It displays all editable SHMI pages that are available in the Page Organizer. When a page is clicked, it opens in Page Editor. Page templates are not shown in Page Browser.

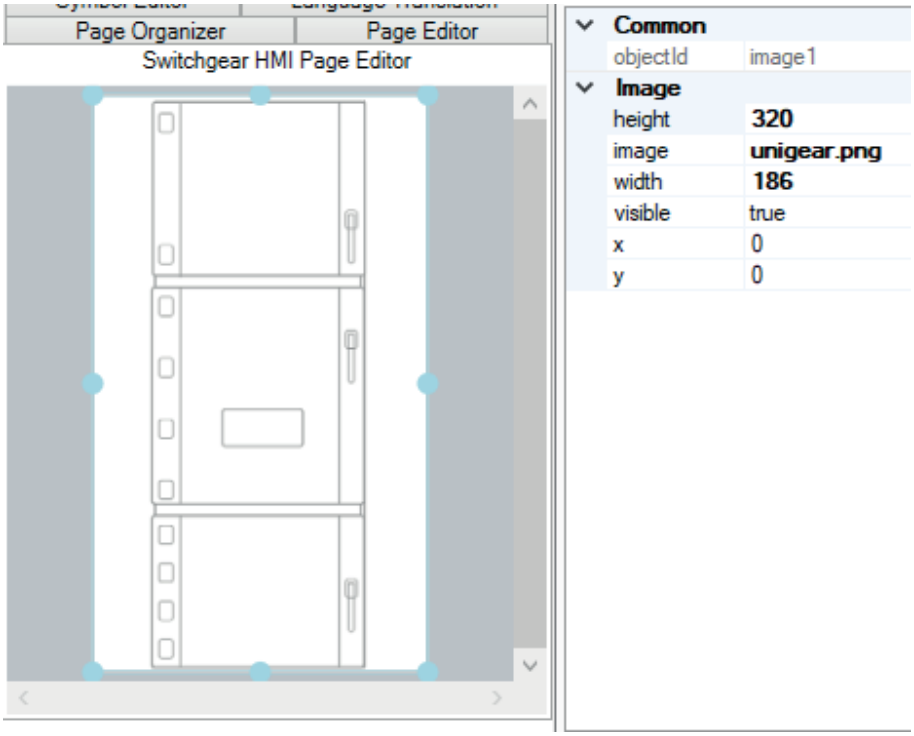

Figure 92: Page with Image widget

6.1.5.1 Adding widgets

- Add a widget to the page by dragging it from the **Object Types** pane.

- Set the widget properties.

Adding SLDViewPort

The SLDViewPort widget displays the single-line diagram configured in Switchgear HMI SLD Editor. The single-line diagram is shown on the bay overview area of the SHMI navigation page.

1. Drag the **SLDViewPort** widget from the **Object Types** pane to the page.
2. In **Object Properties**, select the required page from the **page** drop-down list.

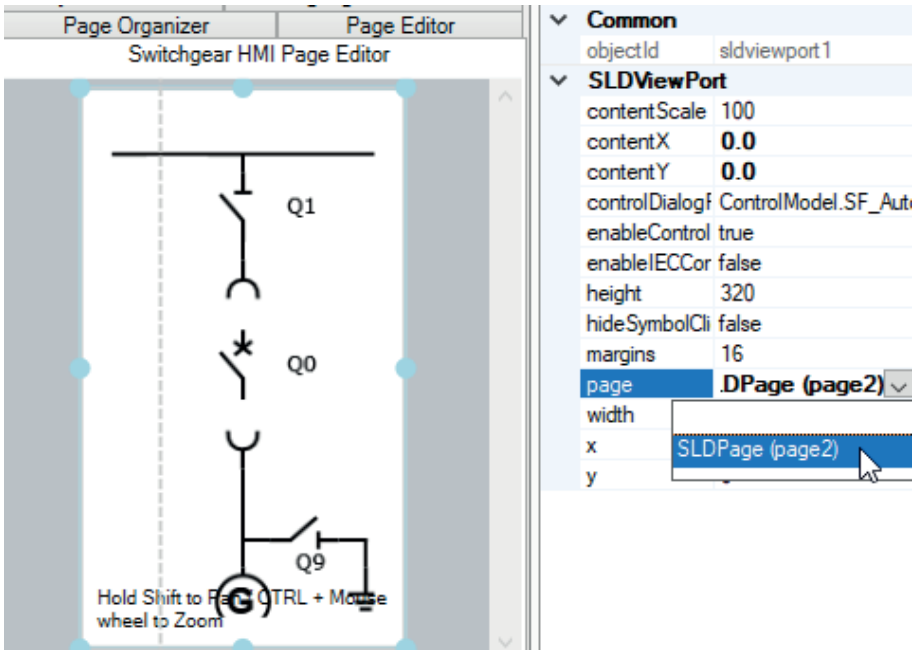

Figure 93: Configuring the SLDViewPort widget

Adding Image

The Image widget displays a custom image on the bay overview area of the SHMI navigation page.

1. Drag the **Image** widget from the **Object Types** pane to the page.
2. In **Object Properties**, select the required image from the file selection dialog.

Slicing of a photo or a static SLD picture for multiple bays should be done in a separate editor application. Maximum size of the picture is 186 × 320 pixels.

6.1.6 Page Editor

Page Editor is used for configuring pages. Pages can be configured, for example, by adding widgets that are the building blocks of the LHMI configuration or by creating a single-line diagram.

Any graphical object drawn on the LHMI page is a widget. All the supported widgets are populated in the Object Types pane.

Page Browser is shown at the bottom of Page Editor. It displays all editable pages selected for the Main Pages and Linked Pages categories in Page Organizer. When a page is clicked, it opens in Page Editor. Page templates are not shown in Page Browser.

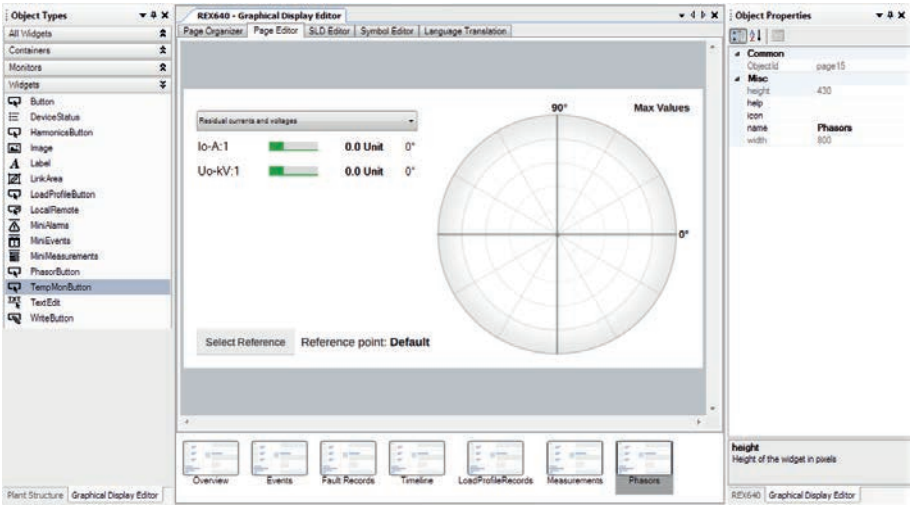

Figure 94: Page with phasors

6.1.6.1 Adding widgets

- Add a widget to the page by dragging it from the **Object Types** pane.
- Set the widget properties.

Adding SLDViewPort

The SLDViewPort widget displays the single-line diagram configured in SLD Editor.

1. Drag the **SLDViewPort** widget from the **Object Types** pane to the page.
2. In **Object Properties**, select the required page from the **page** drop-down list.

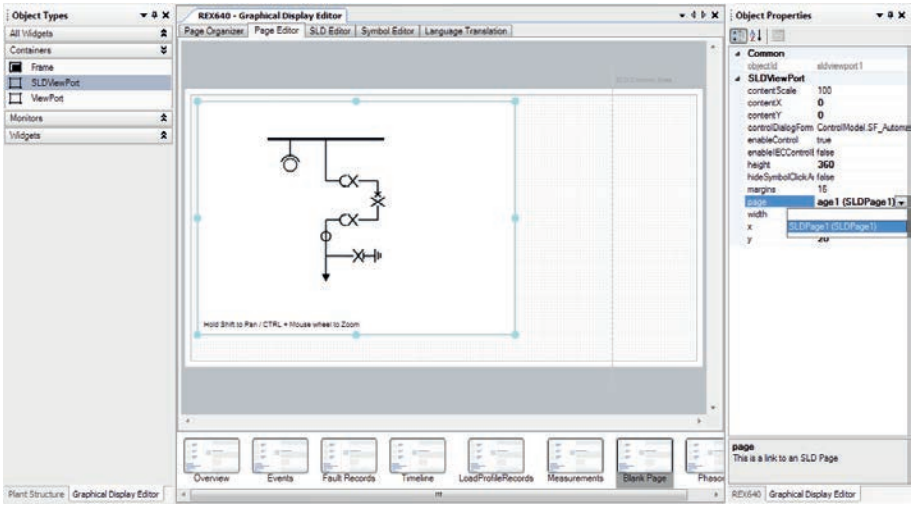

Figure 95: Configuring the SLDViewPort widget

Adding ViewPort

The ViewPort widget displays the contents of a page.

1. Drag the **ViewPort** widget from the **Object Types** pane to the page.
2. In **Object Properties**, select the required page from the **page** drop-down list.

6.1.6.2 Configuring pages

- Add new widgets by dragging them from **Object Types** to the page.
- Resize the selected widgets in one of the alternative ways.
  - Click and hold any resize point on the edge or corner of the widget and drag the mouse to resize the widget.
  - Change the width and height properties of the widget in the **Object Properties** pane.
- Set the properties of the selected widget by modifying the values in the **Object properties** pane.

  Once widgets are placed on the HMI page, some of them (Monitors) can be linked to the corresponding function block in the application configuration by using the source property. The values are updated by the protection relay either periodically (measurement) or in case of an event.

  Some of the widget properties can be in an automatic mode. When the property is in the automatic mode, the values are set automatically by the protection relay's LHMI. If a value is specified for an automatic property, the LHMI displays the specified value.

  Some of the widget properties cannot be edited as they are read-only values.

- Group or ungroup multiple widgets regardless of their type.

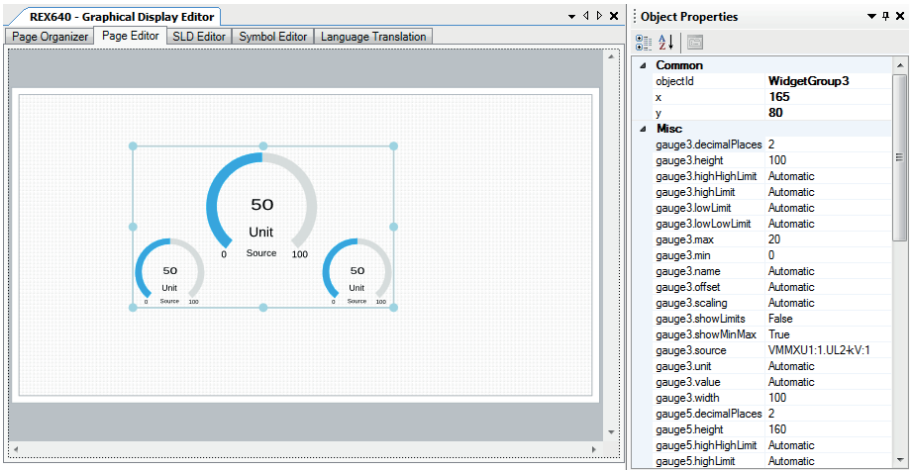

Figure 96: Grouping widgets

When a group is created, all the individual widget properties such as the widget name followed by the dot and the property name, are shown in the Object Properties pane. Only properties x and y are common for all the widgets in the group.

The widget group property naming (aliases), visibility and read-only can be modified.

The grouped widgets can be ungrouped by right-clicking the group and selecting **Ungroup**.

- Bind the widget property values to the same or to another widget property values or to signal values from the application configuration function.

  It is possible to specify simple if...else conditions. The property values are then changed based on those conditions.

  For example, the LED color can be changed to red if the signal value is high or to green if button2 is checked. Otherwise the LED color is yellow.

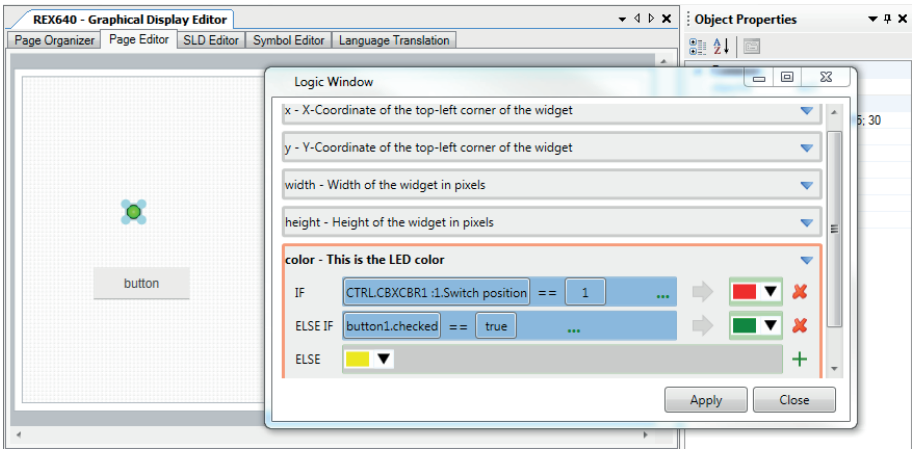

Figure 97: Binding property data

6.1.7 Symbol Editor

Symbol Editor is used to create symbols for a single-line diagram. It has different drawing tools available such as line, rectangle and ellipse to draw the symbols.

6.1.7.1 Symbols

Symbols are used in the single-line diagram. Each symbol has at least one state that represents the graphics of a symbol at different positions.

Symbol Editor supports three types of symbol standards. New symbols can only be created under the custom standard.

- ANSI
- IEC
- Custom

Symbor Editor can be used to create dynamic symbols that have different states corresponding to the different signal values supported by the symbol. For example, the symbol states of a breaker (open, close, intermediate and faulty) can be illustrated in Symbol Editor with the help of drawing tools such as line, rectangle, ellipse, curve or polyline. The symbol State value should match the signal Enum value. On the LHMI the symbols are displayed according to the signal value and the matching symbol state value. One of the states is always the default state. Symbols used in SLD Editor show the default state graphics.

There are several options for the symbol size: 1x1 (normal size), 1x2 (height is doubled), 2x1(width is doubled) and 2x2 (both the height and width are doubled).

Custom symbols can be exported from the Graphical Display Editor and reused in other projects.

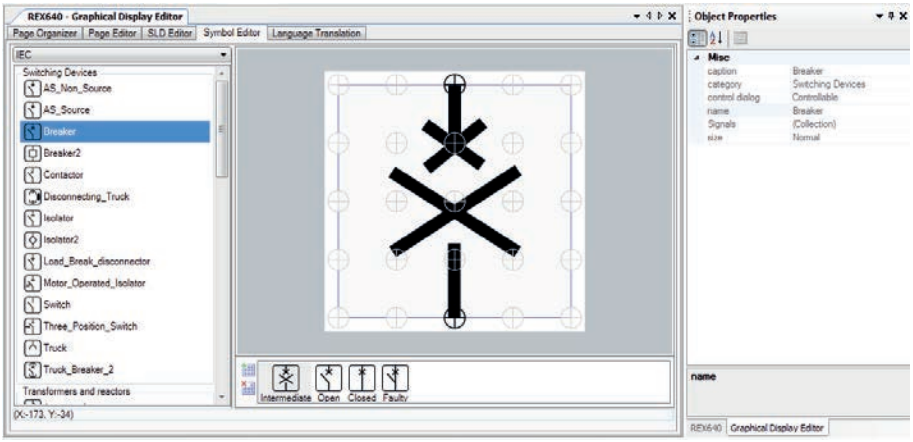

Figure 98: Symbol Editor

6.1.7.2 Creating custom symbols

New symbols can only be created under the custom standard. The available options are the category, size and states. At least one state should be selected when creating any symbol.

Before creating a new custom symbol, check that the states and category required for the new symbol are available by default. Otherwise, it may be necessary to create new states or categories.

1. Create a new symbol in one of the alternative ways.
   - On the menu bar, point to **Graphical Display Editor**, point to **Symbol Editor** and select **Create Symbol**.
   - Right-click the symbol library and click **Create Symbol**.
   - On the toolbar, click .

2. In the **Create Symbol** dialog, specify a name, category, size and states and click **Create**.

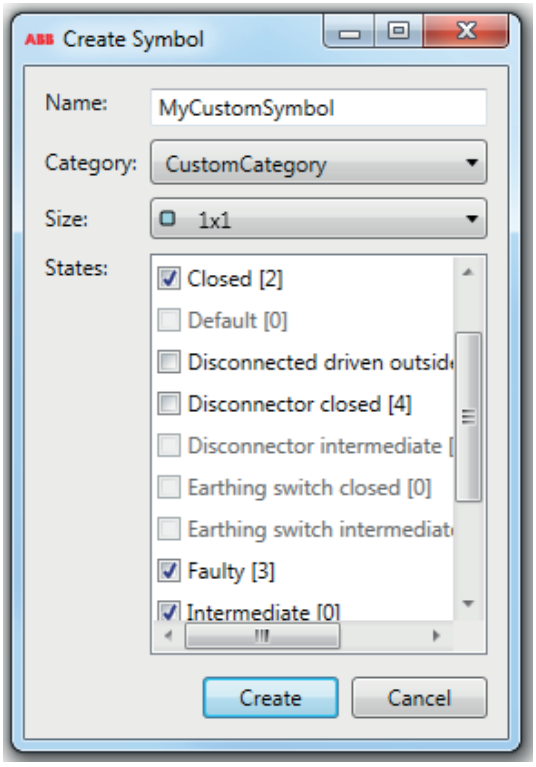

Figure 99: Creating a new symbol

The new symbol becomes available in Symbol Editor with the states selected for drawing. Different drawing tools such as line, rectangle and ellipse can be used to draw the graphics for the different states.

3. Select the symbol state to be used as the default and set **is default** to **True** in the **Object Properties** pane.

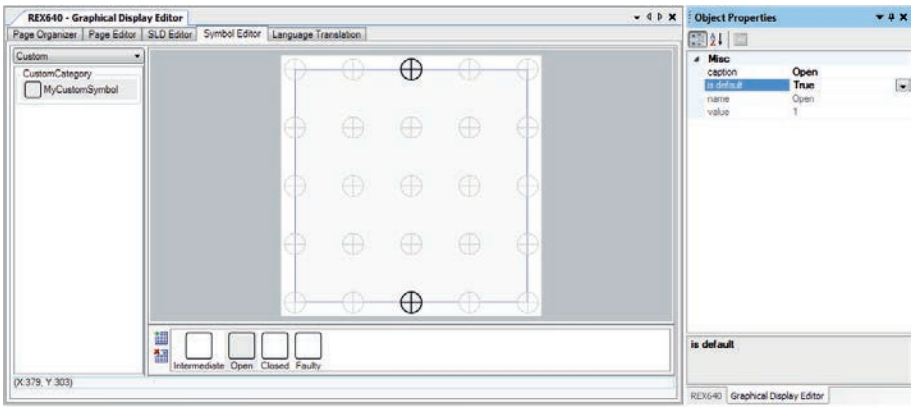

Figure 100: Setting the default state

4. Select the signals that should be connectable in SLD Editor via the symbol's Signals property.

a) On the menu bar, point to **Graphical Display Editor**, point to **Symbol Editor**, point to **Symbol** and select **Object Properties**.

b) Select **Signals property** and click **...**.

c) In the **Signals Selection** dialog, use  and  to add or remove signals and click **OK**.

The connectable signal types for symbols are shown on the left side of the Signal Selection dialog. Any signal type can be moved from the left side to the right side and vice versa. These signal types are used to connect to the symbol if the instance is available in the configuration.

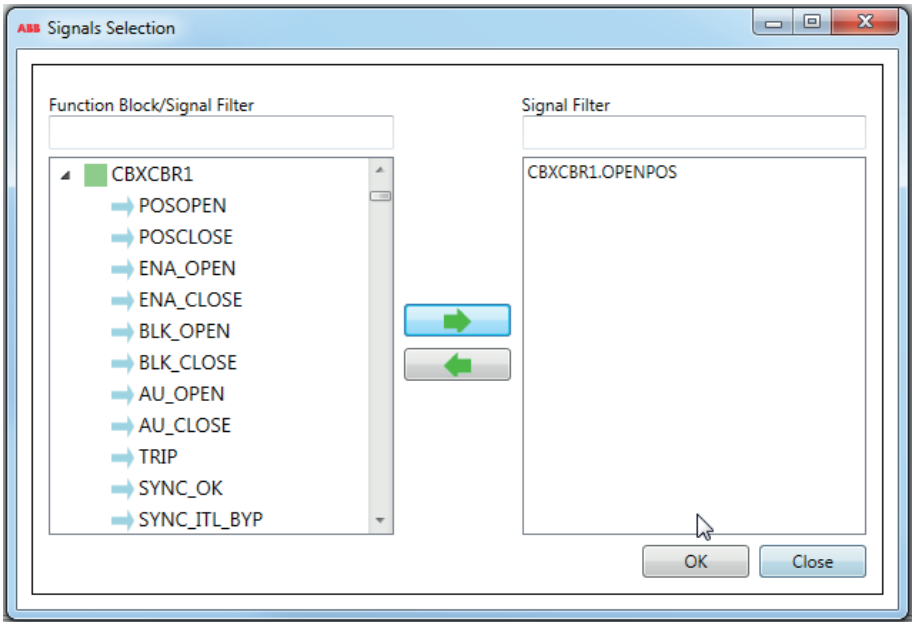

Figure 101: Selecting the signals for a symbol

d) If the symbol is of control type, select the correct value in the **control dialog** drop-down list.

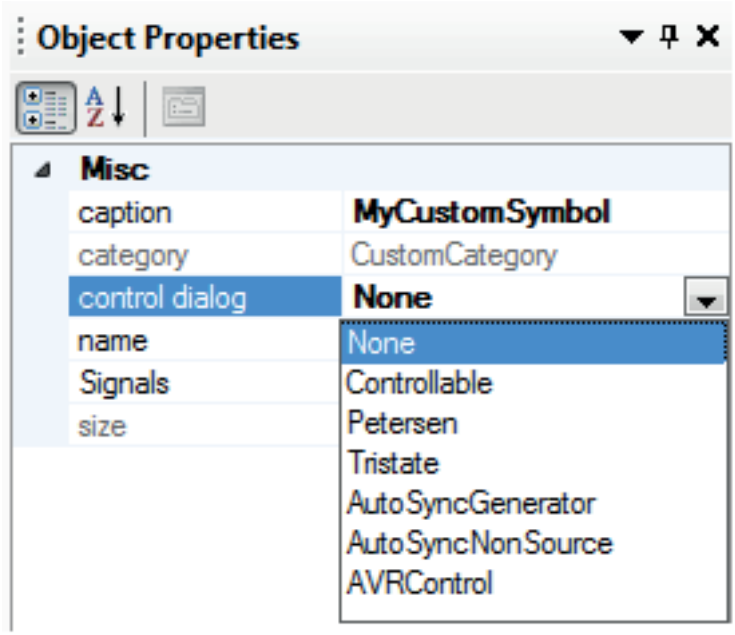

Figure 102: Selecting the control dialog type

5. Save the symbol to make it available in SLD Editor.

6.1.7.3 Creating categories

1. Create a new category in one of the alternative ways.
   - On the menu bar, point to **Graphical Display Editor**, point to **Symbol Editor** and select **Create Category**.
   - Right-click the symbol library and click **Create Category**.
   - On the toolbar, click .

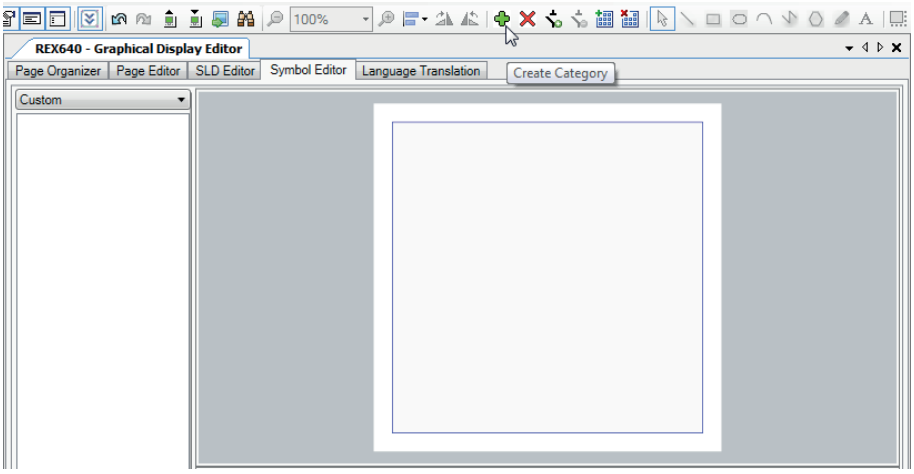

Figure 103: Creating a category

2. In the **Create Category** dialog, specify a name and click **Create**.

6.1.7.4 Creating states

The symbol can have different states that represent the graphics for the symbol. The symbol graphics are different for each state. The state is selected when creating a new symbol.

1. Create a new state in one of the alternative ways.
   - On the menu bar, point to **Graphical Display Editor**, point to **Symbol Editor** and select **Create State**.
   - On the toolbar, click .
2. In the **Create State** dialog, select **Create new state**.

3. Specify a name and numeric value and click **Create**.

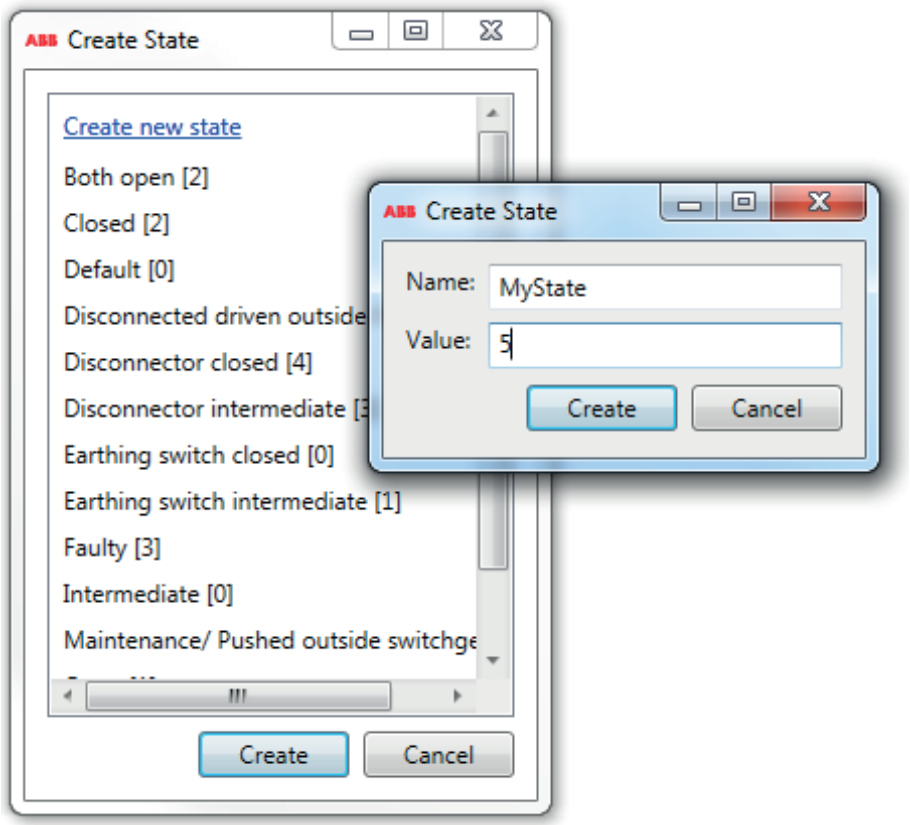

Figure 104: Creating a state

6.1.8 SLD Editors

SLD editors are used to create single-line diagrams. In SLD editors, bus bars, symbols and text can be added from the object type window and links can be created between symbols. Graphical Display Editor has two separate editors.

- SLD Editor is used to draw single-line diagrams that are used on the normal HMI pages.
- Switchgear HMI SLD Editor is used to draw a single-line diagram that is used on the bay overview area of the SHMI.

Once the symbols are placed on the SLD page, they must be linked in Application Configuration to the corresponding function block that protects or controls the object represented by the symbol. The values are updated by the protection relay either periodically (measurement) or in case of an event.

Single-line diagrams support both ANSI and IEC standards. Single-line diagrams created in ANSI can be changed to IEC and vice versa by changing the symbol standard in PCM600. Custom symbols can be used in both ANSI and IEC standards. In the object type window, symbols are grouped by their category.

The single-line diagram created in SLD Editor can be used on the main pages with a special widget called SLDViewPort. The widget is available under the Container group and its page property populates the list of SLD pages. The single-line

diagram size can be selected from the Object Properties pane. In ViewPort the single-line diagram can be zoomed and paned on the LHMI.

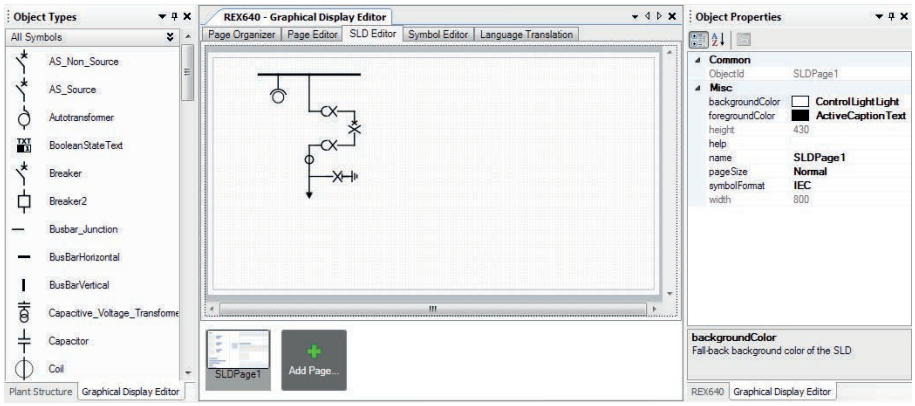

Figure 105: SLD Editor

All SLD pages are shown at the bottom of SLD Editor. When a page is clicked, it opens in SLD Editor. New SLD pages can be added by clicking the Add Page button. To remove an SLD page, right-click the SLD page and select the Remove Page option in the context menu.

The relay supports a maximum of 10 SLD pages.

SLD Page Editor is used for various tasks.

- Adding static text
- Adding measurands
- Adding bus bars
- Adding symbols to the display page
- Drawing lines (creating links)

6.1.8.1 Adding bus bars

1. In SLD Editor, drag a **BusBarHorizontal** or **BusBarVertical** object from the **Object Types** pane to the page view.

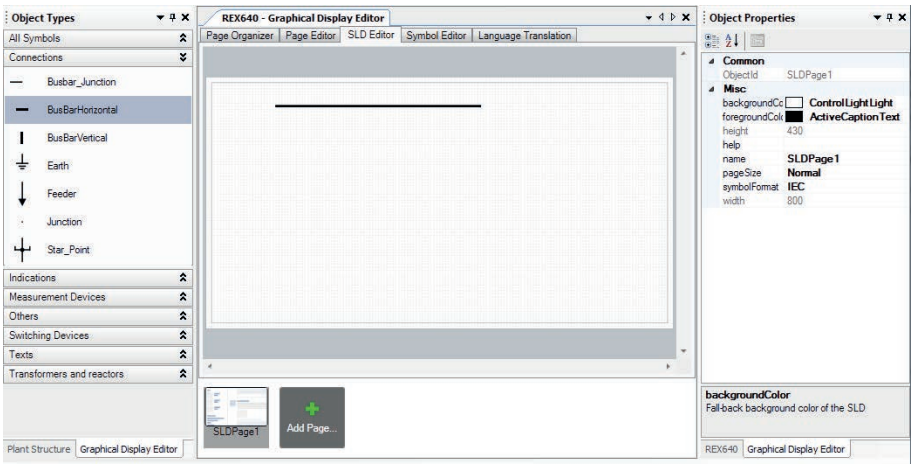

Figure 106: Adding a bus bar

2. Select the left or right connection point and drag it to increase the size of the bus bar.

6.1.8.2 Managing bus bar coloring

Bus bar coloring is used to assign a color to a bus bar or links. New bus bar color groups can be created and each color group can have one or more logic conditions; each logic condition is associated with one color.

Apply the bus bar coloring

1. Right-click anywhere on the page and select **Show Bus Bar Coloring**.
2. In the **SLD Logic Window** dialog, click **+** to add a new color group or **x** to remove an existing color group.
3. Expand any color group and click **+** to add **IF** and **ELSE** conditions and **x** to remove them.
4. Click **...** to add another **And** condition inline. Click **And** to change or remove the condition.
5. To add a value for a condition, click **Value Button**, select any signal value or widget property value and press ENTER.
6. Select any color from the drop-down list.
7. Select **Color Group** and click on any bus bar to apply the coloring.

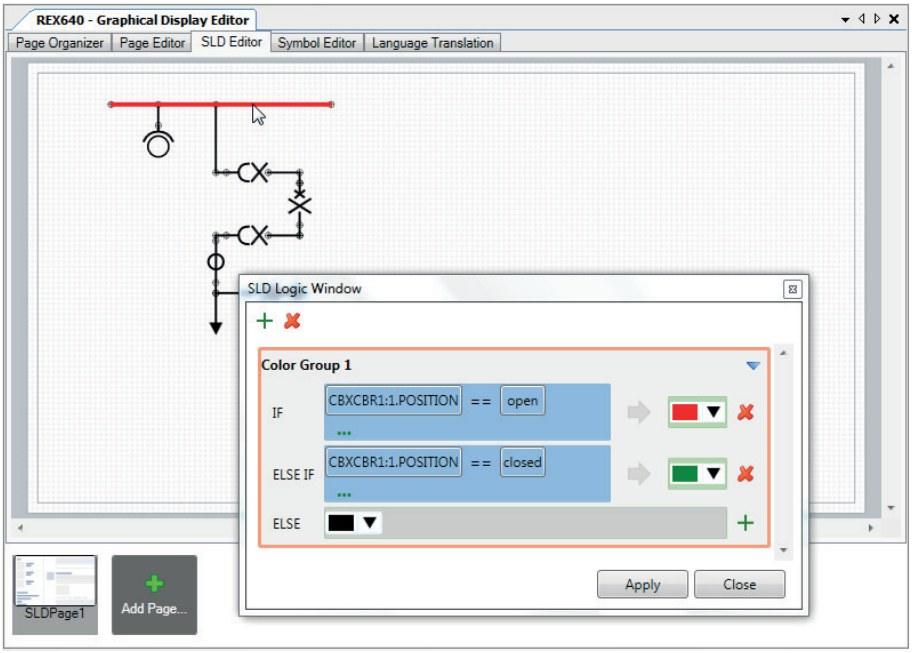

Figure 107: Managing bus bar coloring

Remove the bus bar coloring

1. Right-click anywhere on the page and select **Show Bus Bar Coloring**.
2. Select any color group and click the bus bar to remove the bus bar coloring.

Bus bar coloring example based on the CBXCBR position value

If the CBXCBR position is open, all the bus bars and links associated with the “Color Group1” group should be displayed in red color. If the CBXCBR position is closed, it should be indicated in green color. Otherwise the color is black.

```
IF CBXCBR1:1. POSITION== open THEN Line Color is Red ELSE
CBXCBR1:1. POSITION== closed THEN Line Color is Green ELSE Line
Color is black.
```

Right-click anywhere on the page and select **Highlight Conditional Bus Bar** to show bus bars that have the coloring applied.

6.1.8.3 Adding symbols to an SLD page

1. In SLD Editor, prepare the body of the single-line diagram by placing symbols to the wanted positions on the page view.
2. Drag the apparatus or transformer symbols to the SLD Editor view.
3. Drag the connection symbols.
4. Place the junction points.

5. Connect the symbols where necessary by drawing lines between the symbols' source and destination ports.

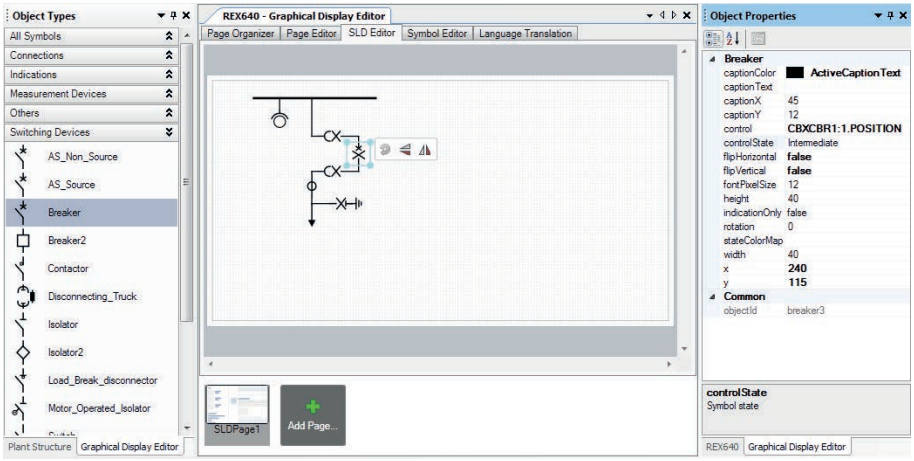

Figure 108: Adding symbols to an SLD page

6. In the **Object Properties** pane, set the symbol properties.
   - Use the **x** and **y** coordinates to adjust the placement of symbols in the single-line diagram.
   - Use **controlState** to define the default state of the symbol to be displayed in the view.
   - Use **indicationOnly** to define if the symbol is controllable (true = status only; false = controllable).
   - Use **control** to link the symbol to the function block in the application configuration that protects or controls the object.
   - Use **stateColorMap** to specify colors for the different states of the symbol.

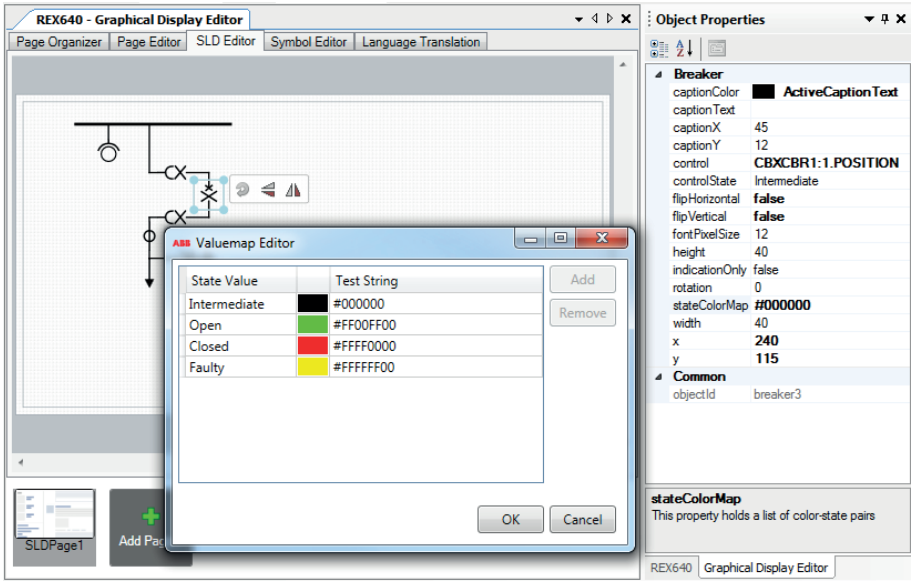

Figure 109: Setting colors for the different symbol states

If custom symbols have been used in the SLD configuration and then deleted, the symbol graphics show an error and all the related connections are removed from the configuration.

6.1.8.4 Creating SLD pages

1. On the Graphical Display Editor toolbar, select the symbol standard from the drop-down list.
   - IEC
   - ANSI
2. Ensure that the **Snap to grid** and **Show grid** functions are available. These are the default and recommended settings when designing a single-line diagram.
3. Place the primary equipment on the single-line diagram approximately in the wanted position.

   If required, rotate the symbols using the Rotate Left or Rotate Right functions.

4. Consider the necessary symbol connections, that is, links.
   a) Click on the source port and click on the desired position to add a connection point.
   b) Draw a perpendicular line by moving the mouse while pressing SHIFT and clicking on the target port.
5. Connect the symbols where necessary.
   a) Move the mouse pointer over the symbol's connection ports.

      The connection ports of all symbols are activated.
   b) Drag the connection from the source connection port and drop it in the target connection port.

      A connection line between the source and target connection ports is drawn.

      Alternatively, click on the source port and then click once at the target port to create the connection. Move the mouse pointer on the nearest connection port to ensure the target port. A “+” sign appears.
   c) Right-click or press ESC to cancel the connection creation.

   Once a link has been used to connect the symbols, the link follows the symbol when it is moved to a new position or when it is rotated.
6. Move the mouse pointer away from the symbol's port for all the connection ports of the symbols to become deactivated.
7. Select a symbol and modify its properties in the **Object Properties** pane.

   The symbol name can also be changed by double-clicking the symbol.

8. In the **Object Properties** pane, use control to relate dynamic symbols to their source data.

6.1.9 Language Translation

Language Translation is used to translate widget properties, page properties and symbol captions into different languages. All the translatable properties, that is, text properties, are displayed on the language translation tab.

With Language Translation the users can add a new language from the list of languages supported by the IED and set the translated text for the language. Once the translations are written to the IED they can be displayed on the LHMI based on the language selected.

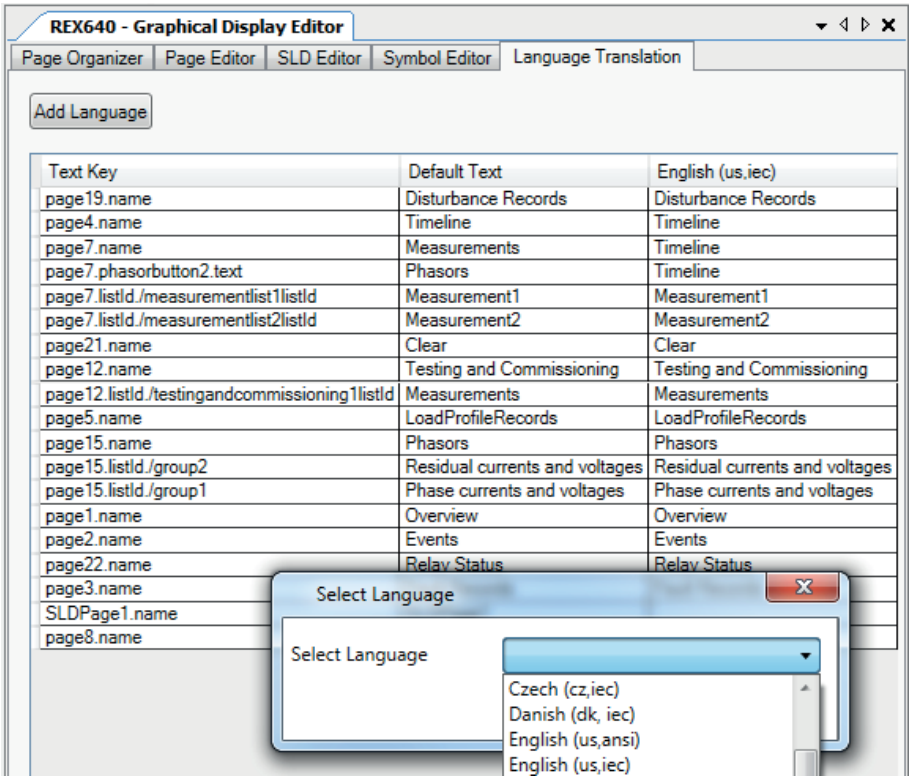

Figure 110: Language selection

New languages can be added by clicking the **Add Language** button, selecting any available language and clicking the **OK** button. The options Language 1...10 can be used to specify a custom language.

PCM600 shows all the languages supported by the IED. When adding a new language and writing it to the IED, it must be ensured that the corresponding language binary is loaded in the IED and that the corresponding language pack for the connectivity package is installed in the PC.

A warning message is displayed by the tool if the language binary is not loaded in the IED.

6.1.10 Saving, reading and writing configuration to IED

1. Save the LHMI configuration in one of the alternative ways.
   - On the **File** menu, select **Save**.
   - Click the **Save** button on the toolbar.
   - Press CTRL+S.

2. To write the configuration to the IED, click the **Write to IED** button on the toolbar.

   This action must be confirmed before it is carried out, because it overwrites the IED's existing display configuration. The writing operation can take a few seconds or minutes to complete.

3. To read the configuration from the IED, click the **Read from IED** button on the toolbar.

6.1.11 Previewing configuration

After the pages have been configured, the configuration can be previewed with a soft LHMI before it is written to the IED. The soft LHMI is a Windows version of the actual LHMI.

To launch the soft LHMI and to preview the configuration, click the **Show Preview** button.

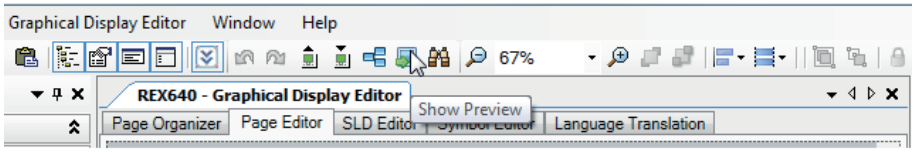

Figure 111: Launching the LHMI preview

6.1.12 Using HMI Client

REX640 HMI Client can be launched from PCM600. It connects to REX640 via selected Communication Port and shows HMI view that is identical to actual physical HMI.

HMI client can’t be paired with the REX640 and control operations are not possible.

1. Select context menu on the top of REX640 in plant structure using right click.
2. Select **Browse with HMI** > **HMI Client**. When connection is established “No pages configured for the current user” is shown.
3. Click **LOGIN** on and enter credentials.

4. HMI Client is showing the configured HMI pages.

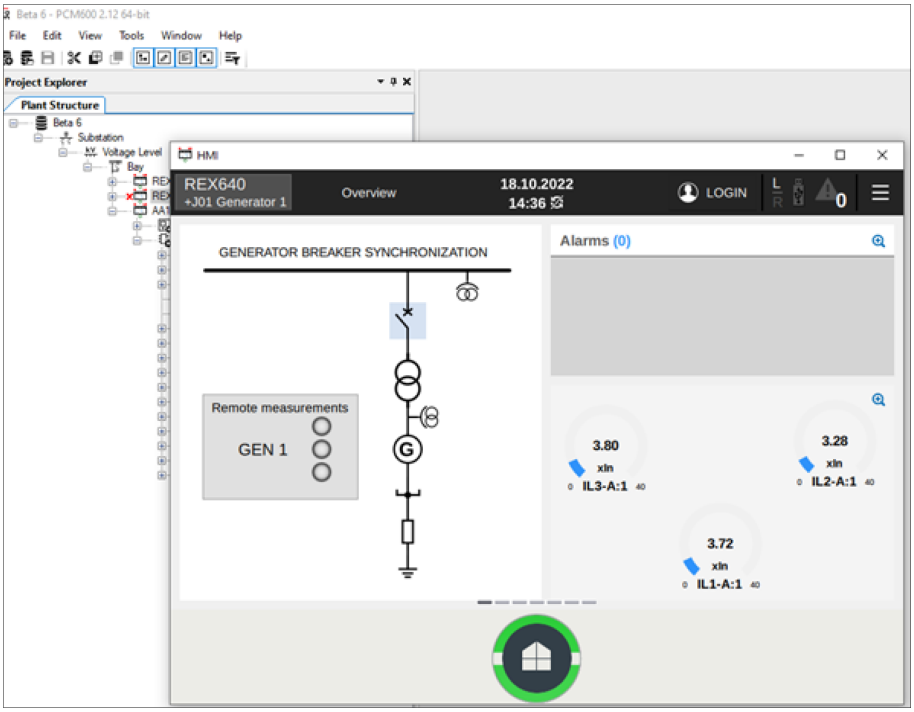

Figure 112: HMI Client

6.1.13 GDE configuration export and import

The GDE configuration can be exported and then imported to any other IED.

6.1.13.1 Exporting GDE configuration

1. On the **File** menu, point to **Display Editor Template** and select **Export**.

2. In the **GDE Export** dialog, select the pages, SLD pages, custom symbols and translations to be exported.

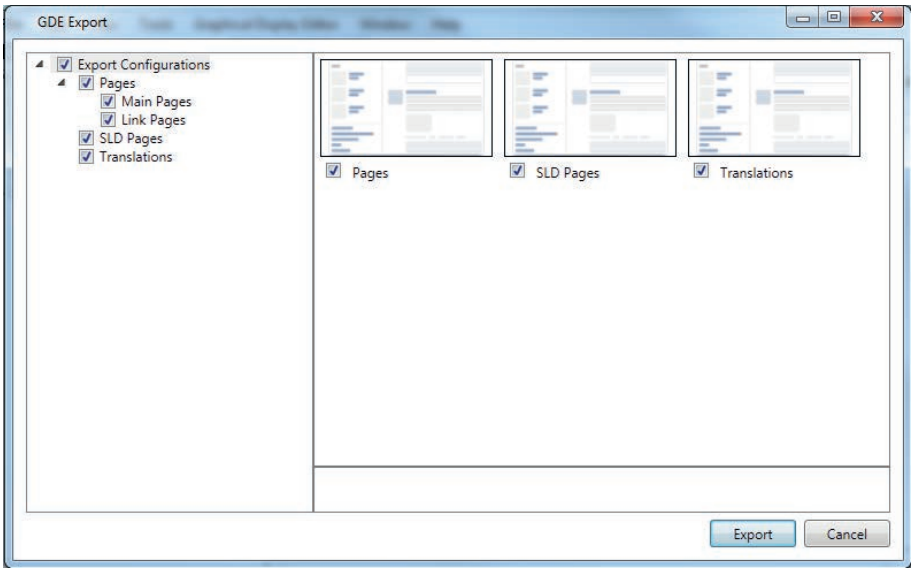

Figure 113: Selecting objects for export

3. Click **Export**.

   The selected items are exported in .pgdep format.

   If the configuration contains custom symbols that are not selected, a warning dialog is displayed.
4. Select the location to save the template and click **Save**.

6.1.13.2 Importing GDE configuration

1. On the **File** menu, point to **Display Editor Template** and select **Import**.
2. Click **Browse** to select any previously exported template file in .pgdep format and click **Open**.
3. In the **GDE Import** dialog, select the pages, SLD pages, custom symbols and translations to be imported.
   - Items present in the current configuration have a green border.
   - Items present in the current configuration with differences have a red border.
   - Items not present in the current configuration (new items) have a blue border.

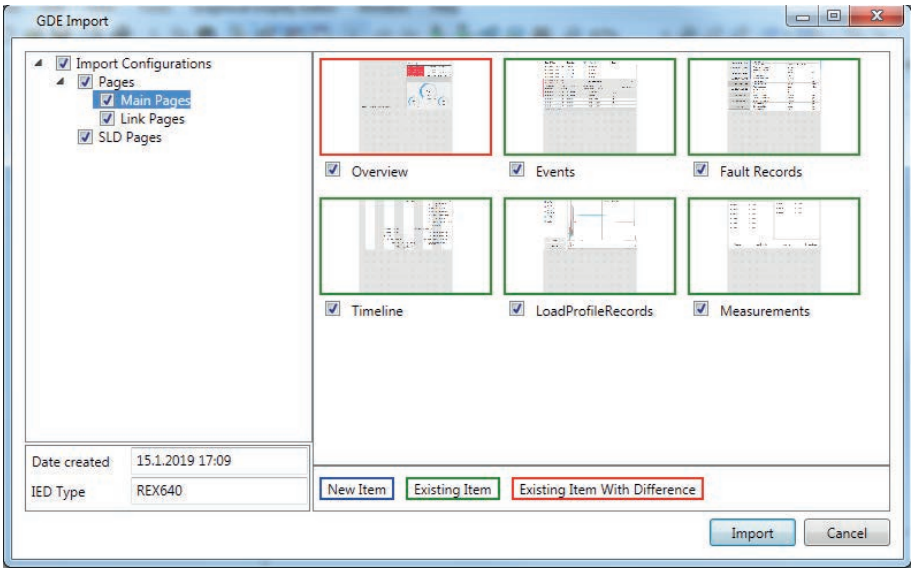

Figure 114: Selecting objects for import

4. Click **Import**.

   All page names must be unique. If a page is imported with a name that is used by an existing page, a confirmation dialog is displayed. The options are to overwrite the existing page, to create a new page with a different name or to cancel the import.

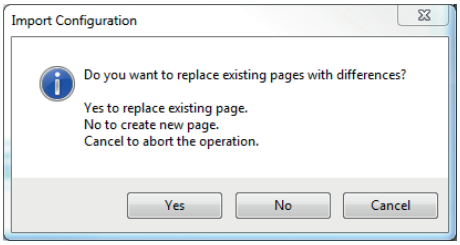

Figure 115: Confirming action after name conflict

6.2 Switchgear HMI Configuration

Switchgear HMI Configuration is used to configure the SHMI navigation page after the bay overview area has been configured for each relay using Graphical Display Editor.

6.2.1 Configuring switchgear HMI navigation page

A maximum of 20 REX640 relays can be connected to one SHMI.

1. In the Plant Structure, right-click a substation, a voltage level or a bay and point to **New**, point to **General** and select **SHMI** to create an SHMI object.

   Each SHMI object represents one SHMI in the installation.
2. Right-click the SHMI object and select **Switchgear HMI Configuration**.
3. Define **Substation Name**, **Voltage Level** and **Switchgear Name** to be shown on the SHMI navigation page.
4. Drag the bay overviews to change their order, to allocate them for the SHMI or to remove them from the SHMI.

   All relays that support the SHMI are visible in the tool, and 20 relays are automatically assigned to the SHMI. The unallocated bay overviews are available to be assigned for other SHMIs in the project.

Figure 116: Allocating bay overviews to the switchgear HMI

5. Click **Preview** to test the result on the SHMI.
6. Click **Write** to write the SHMI configuration to all allocated relays.

Ensure that a connection is made to the relays through a station network. All relays should be reachable in the network when the SHMI configuration is written to the relays.

6.3 HMI Event Filtering

HMI Event Filtering is a tool that helps in configuring the visibility of the events shown on the IED's LHMI and WHMI. This tool does not modify the actual events on the protocol level.

The event visibility is modified in the event tree view. The events in the tree view are structured in the same way as the functions in the PCM600 plant structure.

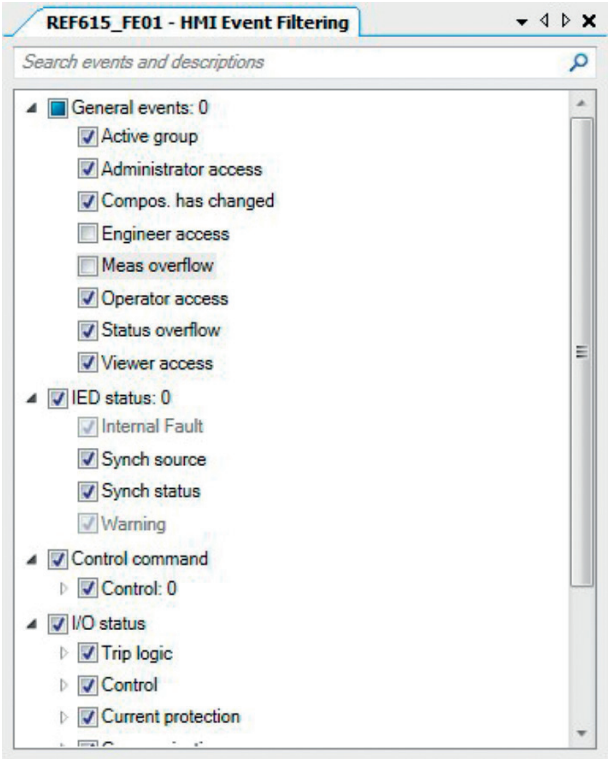

Figure 117: HMI Event Filtering interface

6.3.1 Starting HMI Event Filtering

Start HMI Event Filtering in one of the alternative ways.

- Right-click an IED and select **HMI Event Filtering**.
- On the **Tools** menu, click **HMI Event Filtering**.

6.3.2 Setting visibility of HMI events

The event tree view is used to modify the visibility of the events shown on the LHMI and WHMI. Events in the tree view are structured similarly to the functions in the PCM600 plant structure.

1. Browse the event tree for the event.

   Event nodes in the tree have more detailed description in the tool tip.

2. Select or clear the check box next to the event name to specify its visibility.

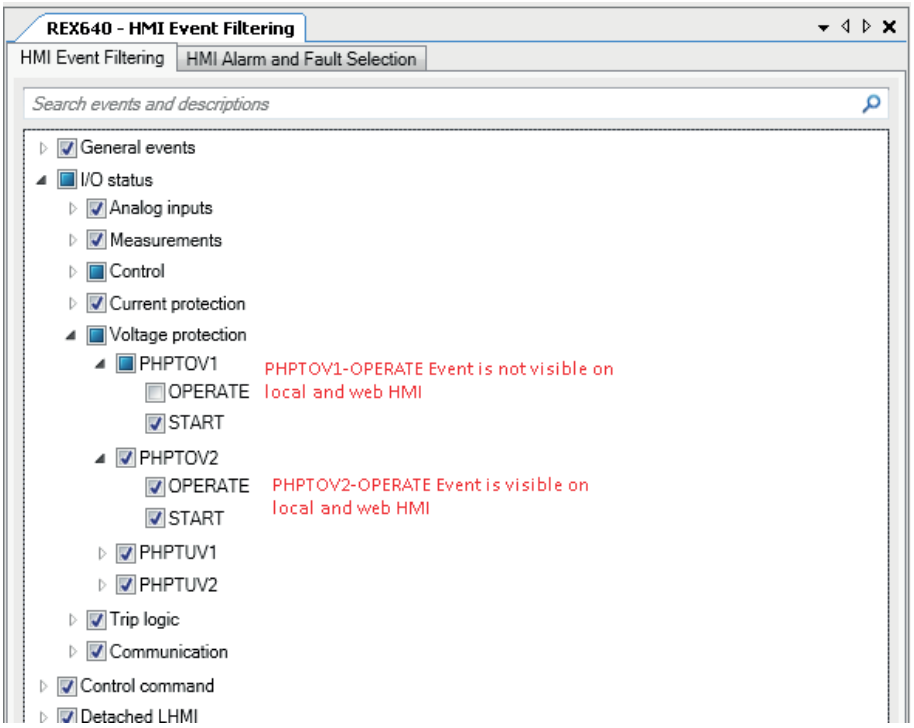

Figure 118: Setting visibility of the HMI events

The event is visible on both LHMI and WHMI only when the check box is selected.

Select the check box of the parent node in the event tree view to modify the HMI visibility for multiple events.

Some events in the event tree are read-only and cannot be modified. The read-only events appear dimmed on the user interface.

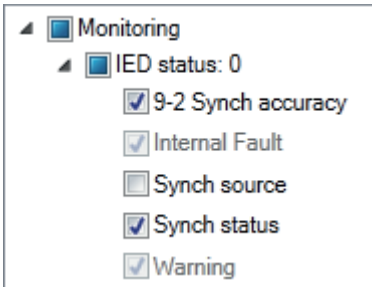

Figure 119: Read-only events are dimmed

6.3.3 Saving event filter configuration

Save the event filter configuration in one of the alternative ways.

- On the **File** menu, select **Save**.

- Click **Save** on the toolbar.

  The **Save** button on the toolbar is activated when the configuration is modified.

6.4 User defined names

PCM600 has a feature to set user defined names for signals, function blocks and hardware channels. Functions and signals where setting user defined name is supported are having blue color in application configuration tool. These user defined names are used in different PCM600 tool components and on HMI to ease identification of function or signal usage.

In PCM600 Application Configuration tool user defined name can be set by selecting *Set User Defined Name* from context menu, or by editing *User Defined Name* property in *Object Properties* pane.

User defined names are not shown on REX640 HMI and Web HMI by default. User must enable them by setting parameter **Configuration** > **HMI** > **User defined name**.

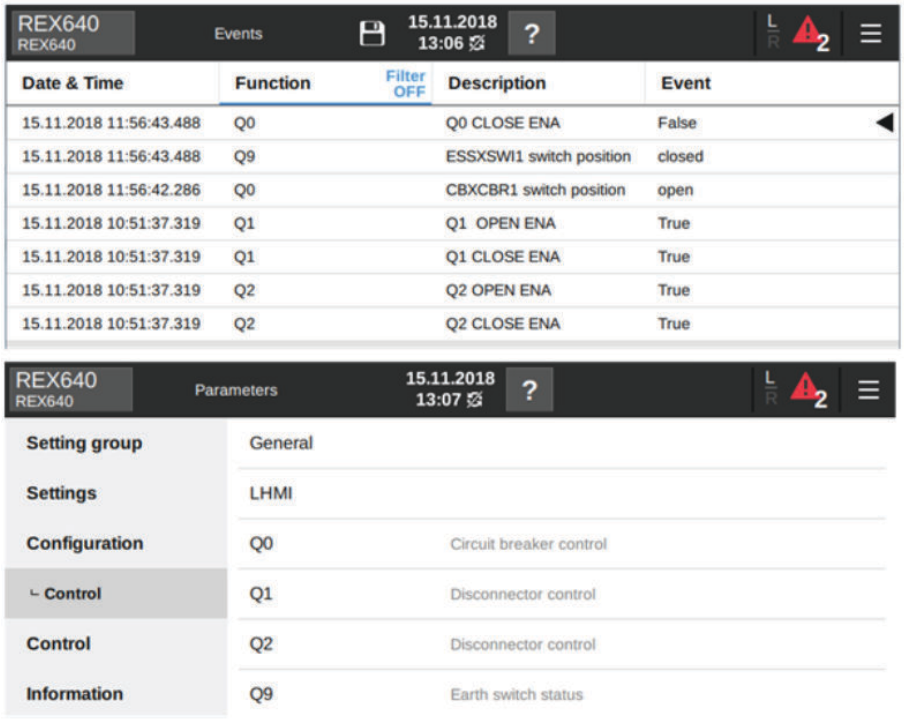

Figure 120: Example how user defined names are shown in events view and menu structure

6.5 Alarm configuration

The HMI supports two alarm handling approaches.

- Alarm list
- Programmable LEDs

The alarm list approach uses event configuration to elevate an event to an alarm. The programmable LEDs approach is similar to the traditional programmable LEDs where instead of a physical LED, a virtual LED user interface element is used.

Programmable LEDs have three different presentation methods in the user interface.

- Programmable LEDs page
- Virtual Alarm LED widget
- Alarm Annunciator full-page widget

Programmable LEDs page is available in ABB Built-in Pages category in the Page Organizer. Programmable LEDs page automatically shows configured LEDs and alarm texts. Page has buttons for clearing LEDs and resetting trips.

Virtual Alarm LED widget is single programmable LED. It can be added on any operator page on HMI and it shows status and alarm text for configured LED. There are also button widgets available for clearing LEDs and resetting trips.

Alarm annunciator is full page widget where user configures up to 64 alarms. Alarms are presented in groups containing up to 16 alarms each.

6.5.1 Alarm list

HMI Event Filtering in PCM600 is used to configure the event visibility on the LHMI and WHMI. Any visible event can be configured as an alarm. See *Chapter 6.3.2 Setting visibility of HMI events*.

6.5.1.1 Elevating events to alarms

Alarm configuration is done in the HMI Alarm and Fault Selection view. Any visible events can be elevated to an alarm or priority alarm. An alarm configuration text can also be added to describe the alarm context.

Events can be grouped into a fault (group of selected events) on the LHMI and WHMI event list. Grouping of events as a fault starts when any of the events selected in the Fault column is activated and ends when all the events selected in the Fault column are deactivated.

The group of selected events is shown as a Fault Events row on the event list. Each event is visible by expanding this row.

1. Browse the **HMI Alarm and Fault Selection** view to find the event to be configured as an alarm.

   The event rows in the data grid view have more detailed description in the tool tip.

2. Select or clear the check box in the **Alarm** column to elevate an event to an alarm.

   The event is visible as an alarm on both LHMI and WHMI only when the check box is selected.

3. Select or clear the check box in the **Priority** column to elevate an event to a priority alarm.

   When the check box is selected, the event is visible as a priority alarm on both LHMI and WHMI. The priority alarm is always the topmost in the alarm list. If the check box is cleared, the event is visible as a normal alarm on both LHMI and WHMI if the alarm check box is selected.

4. Select or clear the check box in the **Fault** column to create an event group on the HMI event list.

   When the check box is selected, the event in question (if activated) is included in a fault.

5. In the **Alarm Configuration Text** column, write some text to describe an alarm context.

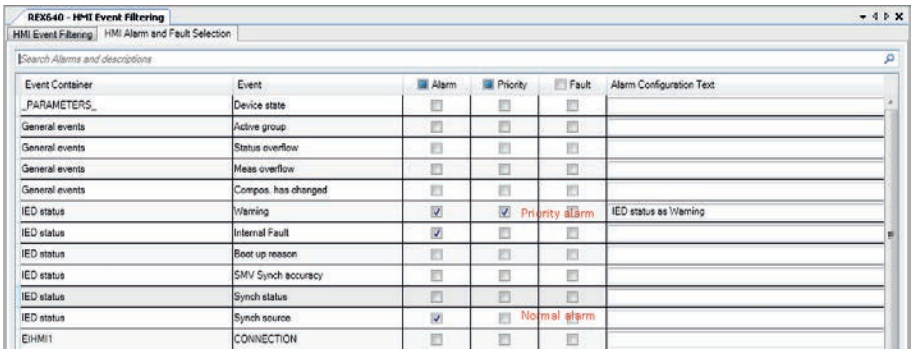

Figure 121: Elevating events to alarms

The alarm configuration text can be specified only if an event is elevated to an alarm.

Select the check box in the column header of a column in the data grid view to modify the alarm configuration, priority or fault selection of all events.

6.5.1.2 Searching for events and alarms

In HMI Event Filtering, locate an event or alarm in the event filtering or alarm selection views in one of the alternative ways.

- Use the predefined search strings.
- Type a search string manually.

6.5.1.3 Saving HMI alarm and fault selection

Save the HMI alarm and fault selection in one of the alternative ways.

- On the **File** menu, select **Save**.
- Click **Save** on the toolbar.

  The **Save** button on the toolbar is activated when the configuration is modified.

6.5.2 Virtual programmable LEDs

6.5.2.1 Configuring LEDs in application configuration

Three steps must be completed to enable programmable LEDs in the relay's HMI.

1. Instantiate LED functions in application configuration and connect the `OK` and `ALARM` signals in application configuration.

2. Configure LED description texts in **Parameter Setting**. Parameters are in **IED Configuration** > **Configuration** > **Programmable LEDs**.
3. Clear all events elevated as alarms in **HMI Event Filtering** so that the HMI Home button LED can follow the programmable LED state instead of the alarm list.

6.5.2.2 Configuring Programmable LEDs page

1. Open **Page Organizer** in Graphical Display Editor.
2. Select **Add Page...** on **Main Pages** section.
3. Select **Programmable LEDs** from **ABB Built-in Pages** section.
4. Select **Add** to insert programmable LED page to operator pages.

6.5.2.3 Configuring Virtual Alarm LED widget

1. Open **Page Editor** in Graphical Display Editor.
2. Drag and drop **VirtualAlarmLed** widget on the page.
3. Keep LED widget active and select **LED1...LED66** in Object Properties pane's source property.

6.5.2.4 Configuring Alarm Annunciator page

1. Open **Page Organizer** in Graphical Display Editor.
2. Select **Add Page...** on **Main Pages** section.
3. Select **Blank Page** from **Templates** section.
4. Open **Page Editor**, and drag and drop **Alarm Annunciator** widget on the empty page.
5. Select  in the lower-right corner of the alarm annunciator page to open function grouping editor.
6. Select **Add** to create new group.
7. Activate one of the created groups and select **Local HMI/LEDx** in the list of available functions.

8. Select  to add LED to alarm group.

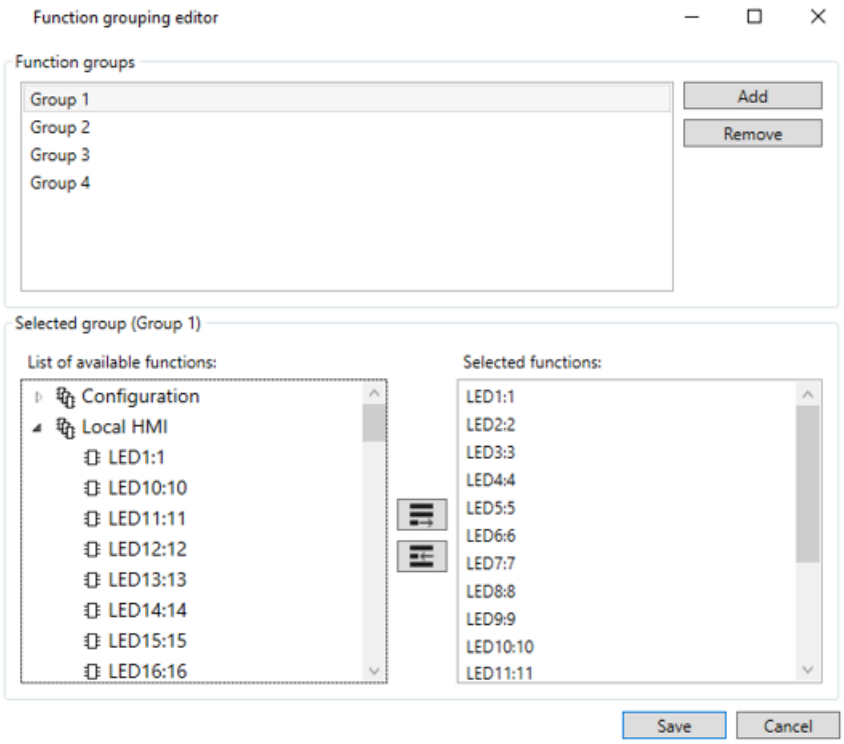

Figure 122: Function grouping editor and 4 configured groups

9. Select **Save** to close the editor.
10. Activate **Short description** area for one of the LEDs and type description that is always visible on the annunciator page.

    Description can be split on three lines.

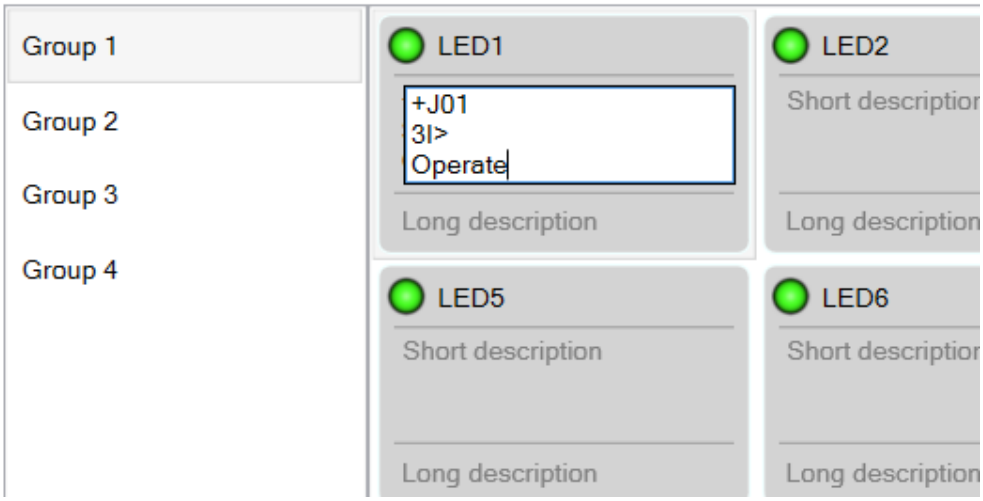

Figure 123: Editor for short description in the alarm annunciator page

11. Activate **Long description** for one of the LEDs and type description that becomes visible when alarm is tapped on HMI page.

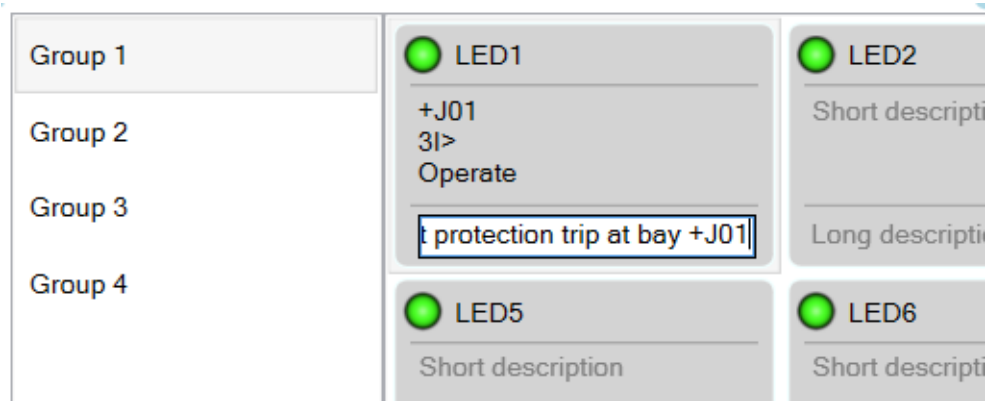

Figure 124: Editor for long description in the alarm annunciator page

7 IEC 61850 communication engineering

7.1 IEC 61850 protocol references and pre-conditions

To engineer the IEC 61850 protocol interface for the protection relay, the following additional manuals or knowledge of their contents is required.

- Knowledge of the IEC 61850 engineering process as described in the IEC 61850 standard
- The technical manual describes the function blocks defined as logical nodes
- IEC 61850 engineering guide
- IEC 61850 conformance documents for the protection relay to be engineered
- IEC 61850 parameter list

7.2 IEC 61850 interface

For more information on the implementation of IEC 61850 in protection relays, see IEC 61850 engineering guide and conformance documents.

7.2.1 IEC 61850 interface in the protection relay

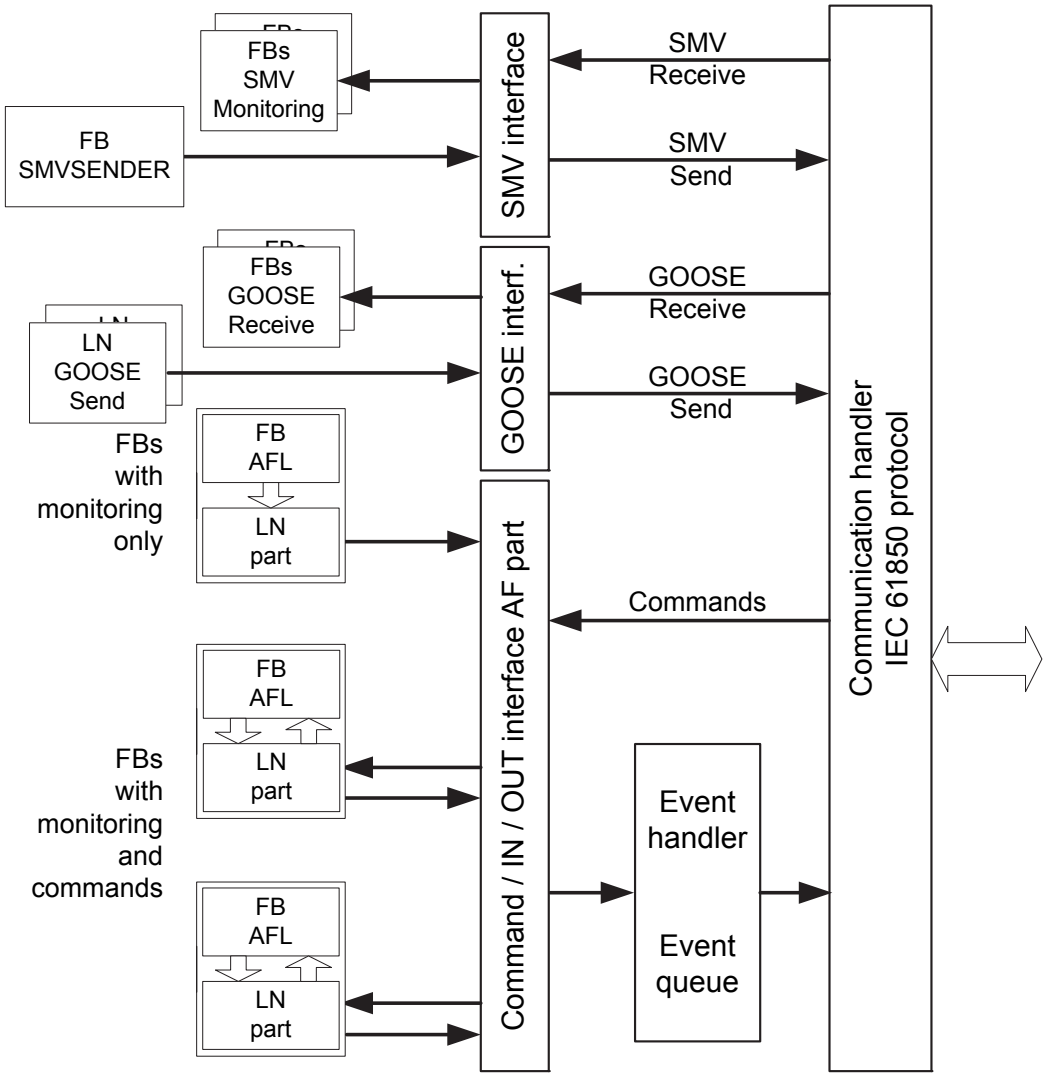

Figure 125: IEC 61850 communication interface principle

IEC 61850 provides a method for identifying all signals that belong to a function. These signals are identified through the logical nodes representing the functions. All signal information for relay parameters, settings, control and monitoring are available in logical nodes.

Whenever a function block is instantiated in Application Configuration, PCM600 automatically generates the corresponding logical node data.

7.2.1.1 GOOSE data exchange

The IEC 61850 protocol supports a method to directly exchange data between two or more devices (IEDs). This method is described in the IEC 61850-7-2 clause 15.

The concept is based on sending a multicast over Ethernet. The receiver detects the telegram by its multicast destination address and application identifier, and decodes the telegram for further processing by the application.

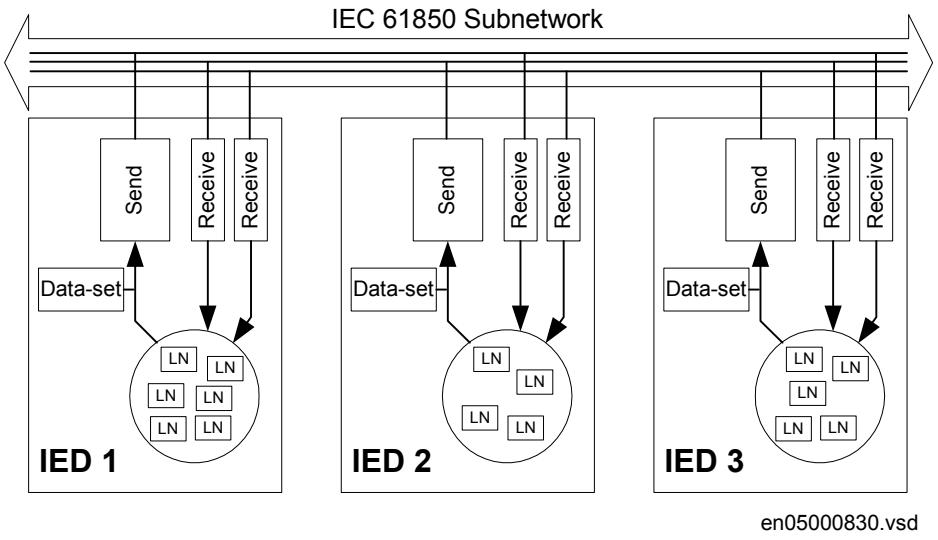

Figure 126: IEC 61850: Horizontal communication principle, an example of three IEDs where each IED communicates with all others

When a GOOSE message is to sent, it is defined by configuring the data set with the defined trigger option and GoCB. This engineering process is done in a station configuration tool, for example, IEC 61850 Configuration tool or IET600. The task involves configuring lists with the signal, value and quality (data attributes or data objects) that belong to the GOOSE message data set.

In the opposite direction, the standard only defines the IED as a receiver of a GOOSE message. How the GOOSE input signals are handled must be defined in the device's application configuration. The SCL data generated by the IEC 61850 Configuration tool or IET600 (or any other station configuration tool) contains the GOOSE data sets as input data. The input data must be connected to a GOOSE receive function blocks in the Signal Matrix tool.

In the opposite direction, the standard only defines the IED as a receiver of a GOOSE message. How the GOOSE input signals are handled must be defined in the device's application configuration. The SCL data generated by the IEC 61850 Configuration tool or IET600 (or any other station configuration tool) contains the GOOSE data sets as input data. The input data must be connected to a GOOSE receive function block in Signal Matrix.

7.2.2 Function view for IEC 61850 in PCM600

The IED design is directly based on IEC 61850. Thus, the function blocks in PCM600 use IEC 61850 logical node naming for function blocks. This relation is automatically handled by the PCM600 tools.

In the IED, the IEC 61850 data for each function instance is available in the data model, even when the function is not used in the application. This means that it is not necessary to handle any instance information for the functions regarding IEC 61850.

7.2.3 Station configuration description file types

The IEC 61850 standard defines SCL file types in the engineering sequence. These files have a different definition, which is explained in IEC 61850-6. Three of the file types are used in the IED's engineering process.

- ICD = IED capability description

  Capability description of the IED in logical nodes and their data. No information about, for example, the communication configuration is included.

  An IED is already extended by default data sets and report control blocks. They are predefined by ABB. Changes or additional data sets, for example, are handled with IEC 61850 Configuration tool or IET600.

- SCD = Station configuration description

  A complete configuration description of all IEDs in a station and the full engineering of the process signals and communication structure is included. This includes all the needed data sets and control blocks.

- CID = Configured IED description

  The CID file contains the information needed for configuring one specific IED. The CID file contains the complete configuration description of the IED: the configured IED name, communication part, data sets and all control blocks.

- IID = Instantiated IED description

  The IID file contains a complete IED configuration, like the CID file. The IID file can include references to other devices which are not present in the file. The IID file is meant for transferring configuration data from the IED configuration tool to a system configuration tool.

7.3 IEC 61850 engineering process

The IEC 61850 standard defines how information is communicated in a substation. The information communication can be divided into different parts.

- Description of the substation part, including the used logical nodes
- Description of the IEDs with their logical nodes
- Description of the communication network
- Description of the engineering process

When exporting an SCL file from PCM600, the tool builds a default substation structure and creates default data sets and control blocks for vertical communication between the substation client and IEDs. For more information, see the IEC 61850 standards.

In the following example, it is assumed that PCM600 and IET600 are used as the system configuration tools. Another option is to use IEC 61850 Configuration tool or Application Configuration in PCM600. In that case, the SCL file export and import (steps 1 and 3) are not needed. For more information on the GOOSE engineering

in IEC 61850 Configuration tool and Application Configuration, see the IEC 61850 engineering guide.

1. SCL files are exported from PCM600. In this case, a SCD file. It is also possible to export other SCL file types.
2. Horizontal and vertical communication is configured using the station configuration tool, for example, IEC 61850 Configuration tool or IET600.
3. SCL files are imported to a PCM600 project. In this case, it is the updated SCD file.

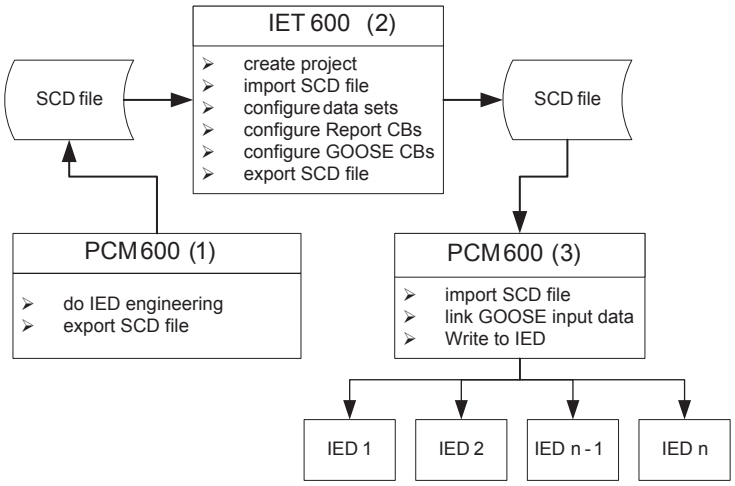

Figure 127: IEC 61850: signal engineering procedure flow when a complete station is exported as a SCD file

7.3.1 Exporting SCL files from PCM600

A pre-condition for exporting SCL files from PCM600 is that all IEDs in the project must be engineered in PCM600. The IEDs require a unique name and IP addresses and they must be set according to the project definitions. IED configurations must be finalized as far as possible before starting the IEC 61850 configuration part.

7.3.1.1 Exporting SCD files

1. In the **Plant Structure** view, right-click the substation and select **Export**.

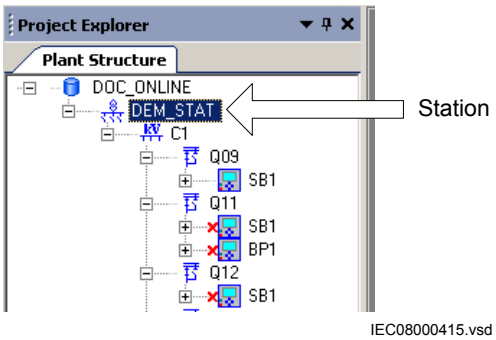

Figure 128: IEC 61850: selecting the substation

2. In the **Export** dialog box, select the location to store the file and name it.

3. Click **Save**.
4. In the **SCL Export Options** dialog box, click **Advanced** to change the SCL file version if required by the receiving configuration tool.

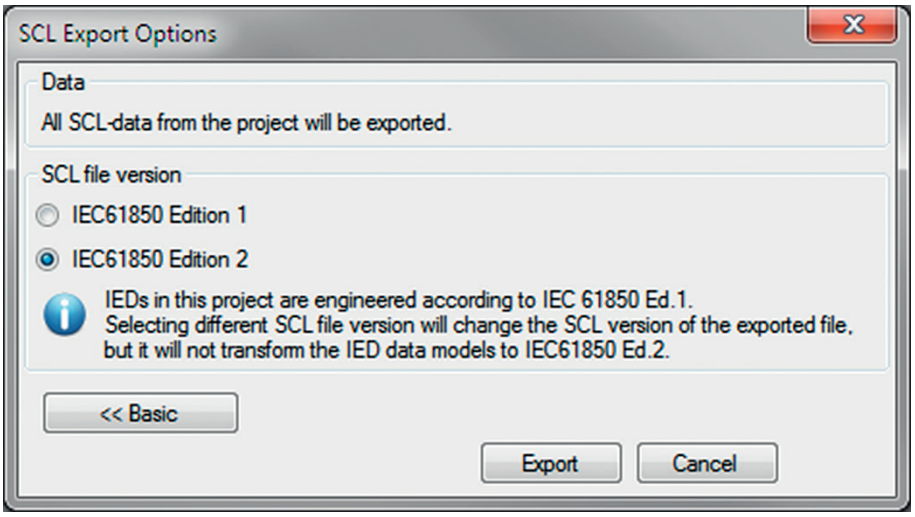

Figure 129: Selecting the SCL file version

5. Click **Export** to generate the SCD file.

   A progress window shows the ongoing export of the station.

7.3.1.2 Exporting ICD or CID files

1. Select the IED in the **Plant Structure** view.
2. Right-click the IED and select **Export**.
3. In the **Export** dialog box, from the **Save as type** list, select the type of file to export.
   - Configured IED description (.cid) for the IEC 61850 structure as needed for the IED at runtime
   - IED capability description (.icd) for the IEC 61850 structure

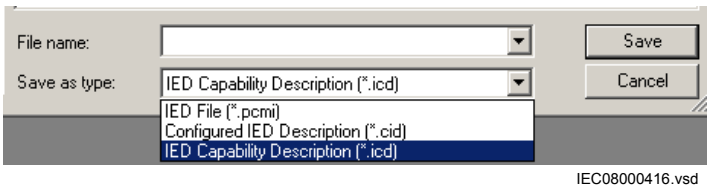

Figure 130: IEC 61850: Selecting the IED file type for export

4. Click **Save**.

5. In the **SCL Export Options** dialog box, select the export options.

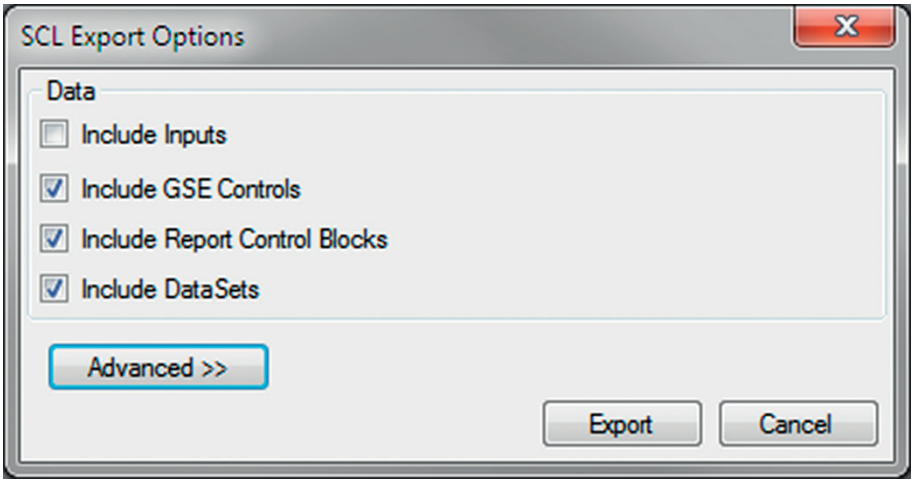

Figure 131: IEC 61850: Selecting the export options

6. Click **Advanced** to change the SCL file version if required by the receiving configuration tool.

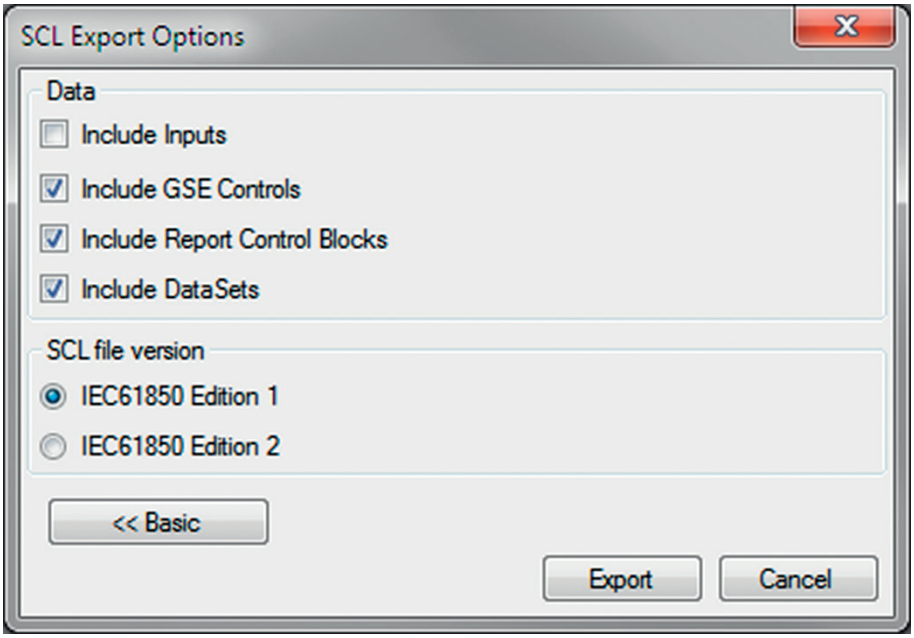

Figure 132: Selecting the SCL file version

7. Click **Export**.

7.3.2 Engineering vertical and horizontal communication

For IEC 61850 engineering a separate system configuration tool needs to be used with PCM600. The recommended tool for smaller projects is the IEC 61850 Configuration tool. For larger projects it is recommended to use IET600, which is available as a standalone tool.

1. Create a project in IET600. [1]

2. Import the SCD file created by PCM600. [1]
3. Conduct vertical communication engineering (monitoring direction).
   a) Check the default data sets.
   b) Configure the default data sets.

      Data sets meant for vertical reporting can only contain data on the data object level, not on the data attribute level.

      The data set for GOOSE can contain signals on the data attribute or data object level. Data object level GOOSE entries can only be received of the following CDC types: SPS, SPC, ACD, ACT, DPS, DPC, INC, INS, ENC and ENS.

   c) Configure additional **Report Control Blocks** when needed for each data set used for vertical communication.
   d) Link the IED clients to the **Report Control Blocks**.

      Up to five report clients can be configured.

4. Conduct horizontal communication engineering.
   a) Configure GOOSE control blocks for each data set configured for GOOSE messages.

      One data can be included in the GOOSE data set only once.

   b) Define the client IEDs for each GOOSE control block.
   c) Link the IEDs to the GOOSE control block that must receive the GOOSE control block.
5. Export the updated SCD file. [1]

   All data sets, **Report Control Blocks** and GOOSE control blocks must be located in LLN0.

7.3.3 Importing SCL files to PCM600

The IED engineering tool must be able to receive an SCD file or an ICD file as an import to receive the engineered communication extensions, for example, for the different IEDs.

To be able to import an SCD file at station level, the option IED 61850 configuration engineering mode enabled has to be cleared in PCM600.

1. On the **Tools** menu, select **Options** and click **IEC 61850 Configuration**.

[1] Applicable when using IET600

2. On the **Engineering** tab, clear the option **IED 61850 configuration engineering mode enabled** and click **OK**.

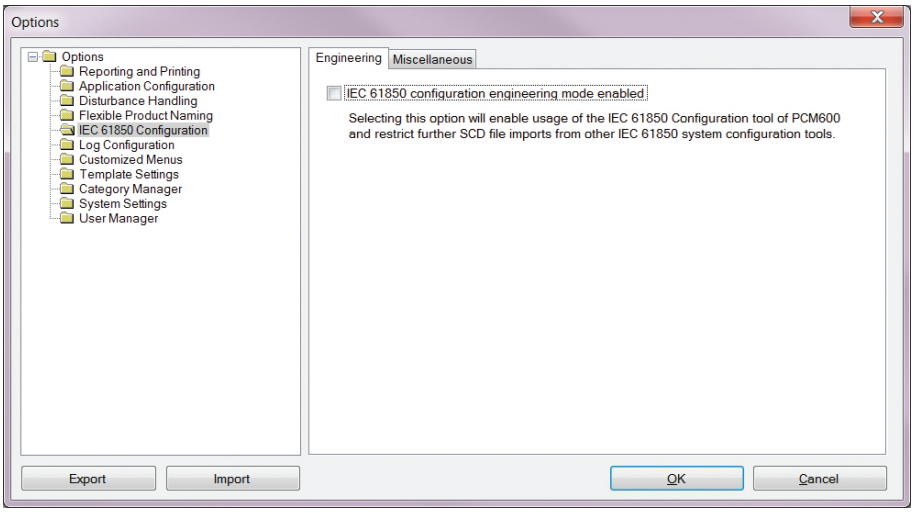

Figure 133: Enabling SCD file import at station level

If the IED 61850 configuration engineering mode is enabled, SCD files cannot be imported and an error message is shown.

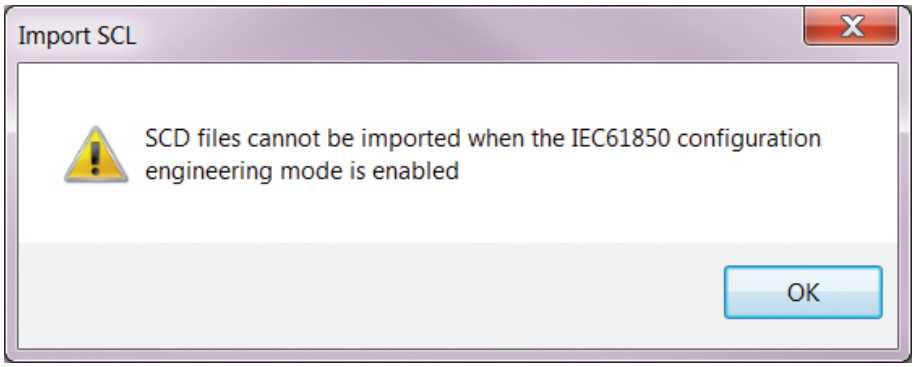

Figure 134: Error message when SCD files cannot be imported

7.3.3.1 Importing SCD files

To be able to import an SCD file at substation level, the option IED 61850 configuration engineering mode enabled has to be cleared in PCM600.

1. In the **Plant Structure** view, right-click the substation and select **Import**.
2. On the **Import** dialog box, select the file to be imported.
3. In the **SCL Import Options** dialog box, select how to handle the file during the import.

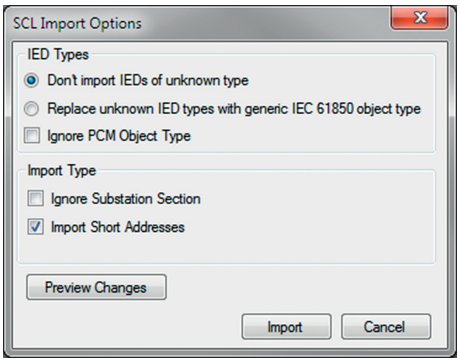

Figure 135: SCL Import Options

- Click **Don't import IEDs of unknown type** to protect the existing IEDs in case the SCD file does not match the original configuration in PCM600.
- Click **Replace unknown** if the file includes additional IEDs that are needed. The IED of type “Generic IEC 61850 IED” is used to integrate this kind of IEDs into the plant structure, for example.
- Click **Ignore PCM Object Type** to update the IED object(s) in PCM600 from the IED type(s) in the SCD file, whether or not the IED type(s) in the SCD file matches the IED object(s) in PCM600. This option can be used, for example, when third party IEDs are included in the system and the SCD file sends GOOSE messages to ABB IEDs included in the project.
- Click **Ignore Substation Section** to not import the SSD file part of the SCD file.

4. Click **Import** when the file definition has been completed.
   A progress view displays the importing procedure.
5. Make connections from the sending IEDs to the receiving function blocks with the Signal Matrix.

   Make connections between the signals that the server is send and the function blocks on the receiver's side.

6. Write the configuration to the IED.

   In the **Plant Structure** view, select the IED, right-click and select **Write to IED**.

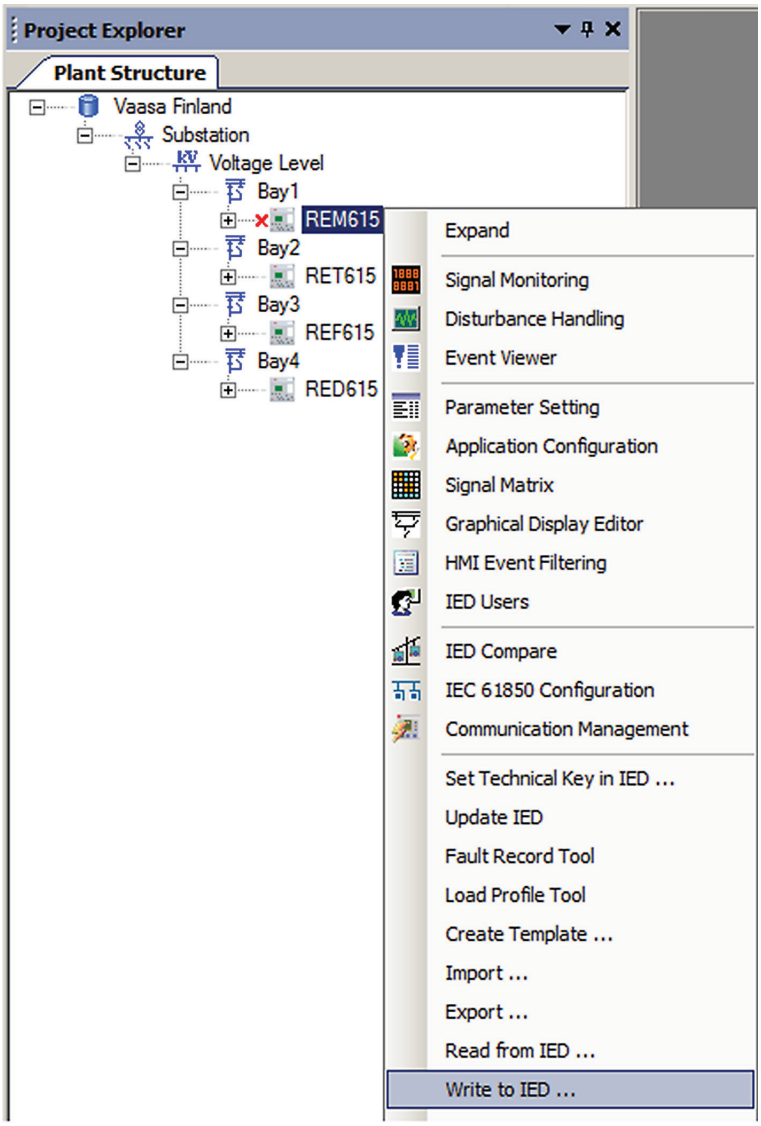

Figure 136: Write to IED menu

The engineered data is written to the IED when executing a common *Write to IED operation*.

7.3.3.2 Importing ICD or CID files

1. Select an existing IED.
2. From the **Files of type** list, select the IEC 61850 file type to be imported (ICD or CID).
3. In the **SCL Import Option** dialog box, select how the file is to be handled during the import.

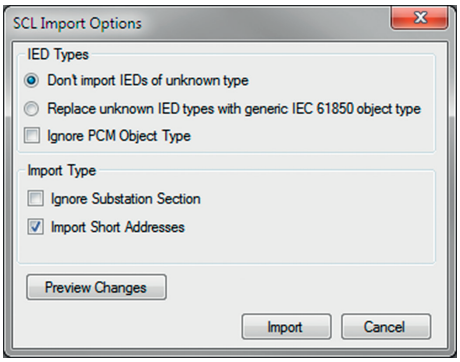

Figure 137: SCL Import Options

- **Don't import** protects the existing IEDs if the SCD file does not match the original configuration in PCM600.
- **Replace unknown** can be used when the file includes additional IEDs that are needed. The IED of type “Generic IEC 61850 IED” is used to integrate this kind of IEDs into, for example, the plant structure.
- **Ignore PCM Object Type** updates the IED objects in PCM600 from the IED types in the SCD file, whether or not the IED types in the SCD file match the IED objects in PM600.
- **Ignore Substation Section** does not import the SSD file part of the SCD file.

4. Click **Import** when the definition has been completed.
   A progress view displays the importing procedure.

7.3.4 Writing communication configuration to IED

IEC 61850 communication depends on the proper communication configuration in all IEDs that communicate via IEC 61850.

It is possible to make a configuration change in one IED, without affecting the horizontal communication (GOOSE or IEC 61850-9-2 LE) engineering between IEDs. For example, when the Application Configuration tool configuration is changed, but no changes are done to the instantiation or deletion of functions that represent a logical node.

When a changed configuration is written to the IED, the horizontal communication configuration needs to be updated.

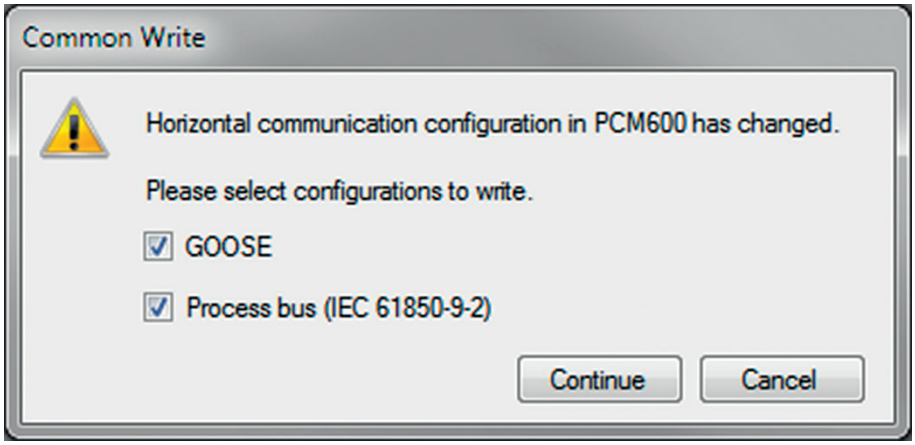

Figure 138: Updating the communication configuration in the IED with the configuration made in PCM600

1. Select which configuration part to include in writing.
   - Select **GOOSE** to update the GOOSE configuration part in the IED.
   - Select **Process bus (IEC 61850-9-2)** to update the IEC 61850-9-2 configuration part in the IED.

     The options can be left unselected. In this case, other parts of the configuration are updated.
2. Select whether or not to update the configuration.
   - Click **Continue** to update the selected communication configuration parts in the IED.
   - Click **Cancel** to cancel the writing operation.

8 Flexible product naming

8.1 IEC 61850 Structure Mapping

IEC 61850 Structure Mapping is used to manage the IED's data model as required. This is done by mapping the data model to the customer-specific data model. IEC 61850 Structure Mapping is available only in FPN projects in PCM600. A PCM600 project can be converted into an FPN project by importing an FPN SCD file into it. FPN is supported for both IEC 61850 Edition 1 and IEC 61850 Edition 2.

FPN allows the use of standardized, predefined and IED vendor independent templates for building and maintaining substations. See the PCM600 documentation for more information about FPN.

8.1.1 User interface

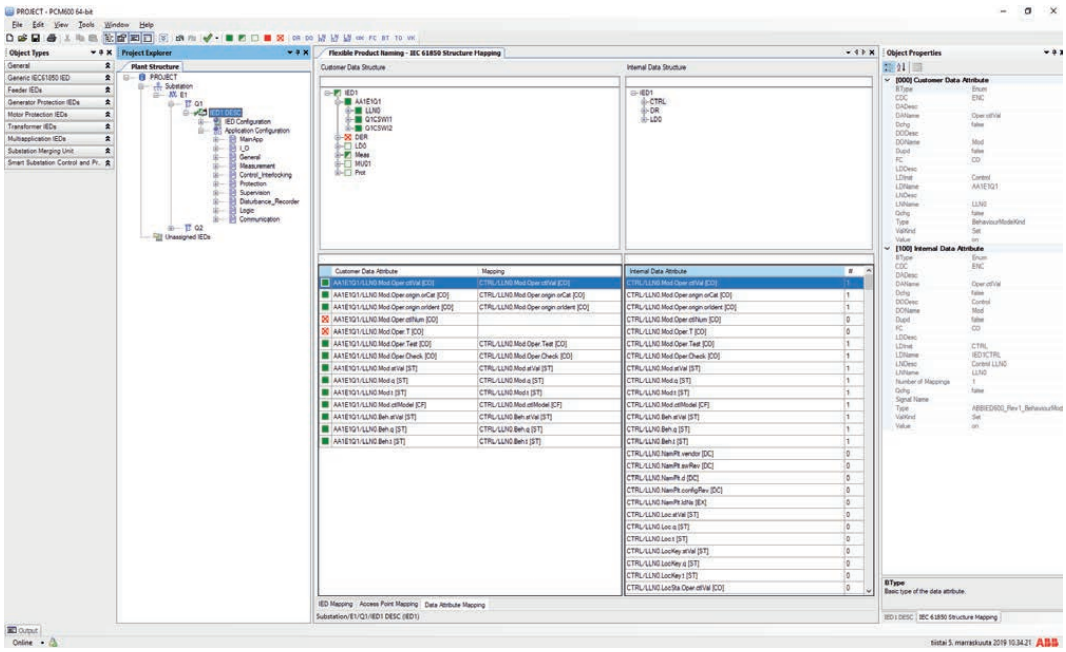

Figure 139: IEC 61850 Structure Mapping

Plant structure

The data tree displays the FPN IEDs under substation and internal IEDs under unassigned IEDs.

IEC 61850 structure mapping

The IEC 61850 structure mapping list displays the FPN objects based on the current selection in the plant structure. The list may display either IEDs or data attributes.

The FPN object's name is displayed in the column on the left and the mapped PCM600 internal object name is displayed in the column on the right. The customer data structure and attributes are on the left, and the internal data structure and attributes are on the right.

Object properties

The Object Properties pane displays the properties of the objects selected in the FPN mappings and Internal Data Attribute lists.

8.1.2 IED and signal naming convention

The names used for the internal objects can be defined to be either the names used in PCM600 or the names in the internal IEC 61850 model.

To change the naming convention, select the PCM600 naming style in use from **Options**.

8.2 Importing substation configuration description file

The SCD file can be imported only at the substation level.

1. On the **Tools** menu, click **Options**.
   a) Select **Flexible Product Naming**. In the **General** tab, select **Import as Flexible Product Naming SCD option enabled**.
   b) Select **IEC 61850 Configuration**. In the **Engineering** tab, clear the **IEC 61850 configuration engineering model enabled** check box.
   c) Click **OK**.

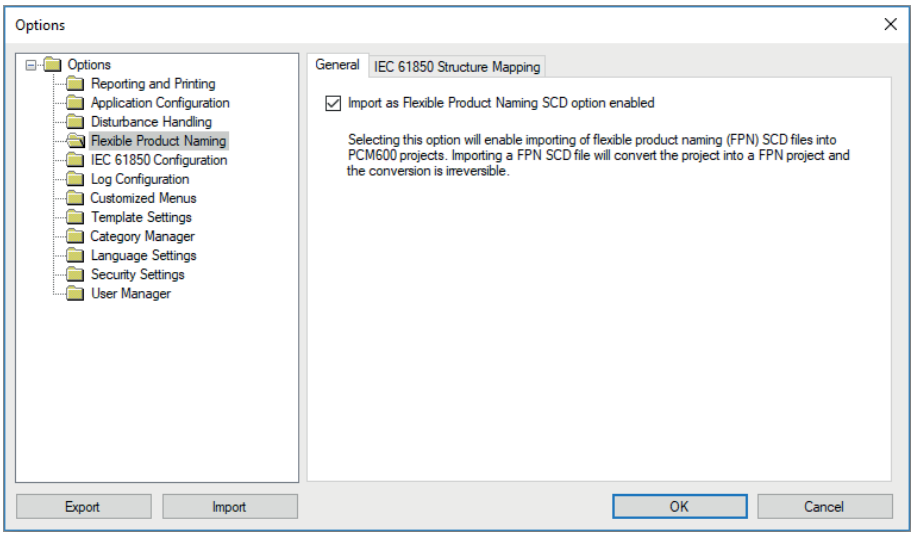

Figure 140: Enabling the FPN option

2. Right-click a substation level, and then click **Import**.
3. Browse and select the SCD file.
4. Click **Open** to open the file.

5. Select **Import as Flexible Product Naming SCD**.

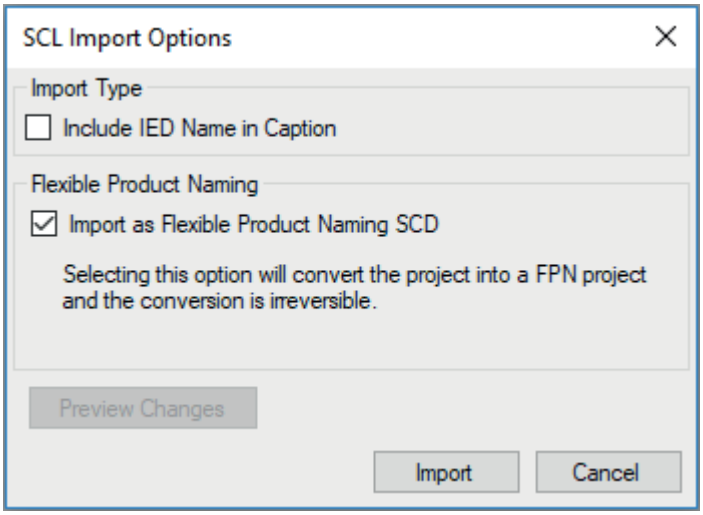

Figure 141: Importing as Flexible Product Naming SCD

The imported SCD file changes the substation structure. The internal IED from the original substation structure is replaced and pushed to the unassigned IEDs folder.

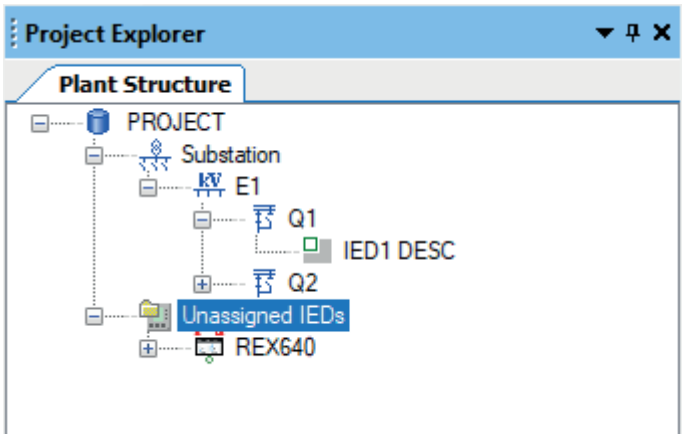

Figure 142: Unassigned IEDs

6. Drag the unassigned IED over the internal IED.

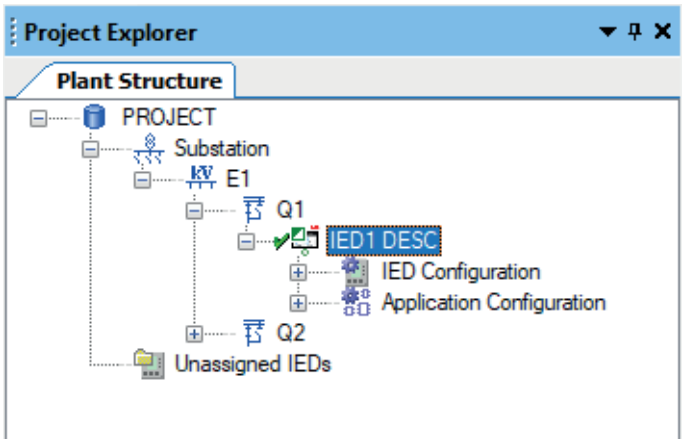

Figure 143: Assigned IED

Importing the FPN SCD file converts the project into an FPN project. The conversion is irreversible.

FPN projects do not support configuring GOOSE with Application Configuration.

8.3 Starting IEC 61850 Structure Mapping

The tool can be started from any node from the substation to IED level.

1. Right-click one of the IEDs and point to **Flexible Product Naming**.

2. Click **IEC 61850 Structure Mapping**.

   The FPN object's name is displayed in the column on the left and the name of the mapped PCM600 internal object is displayed in the column on the right.

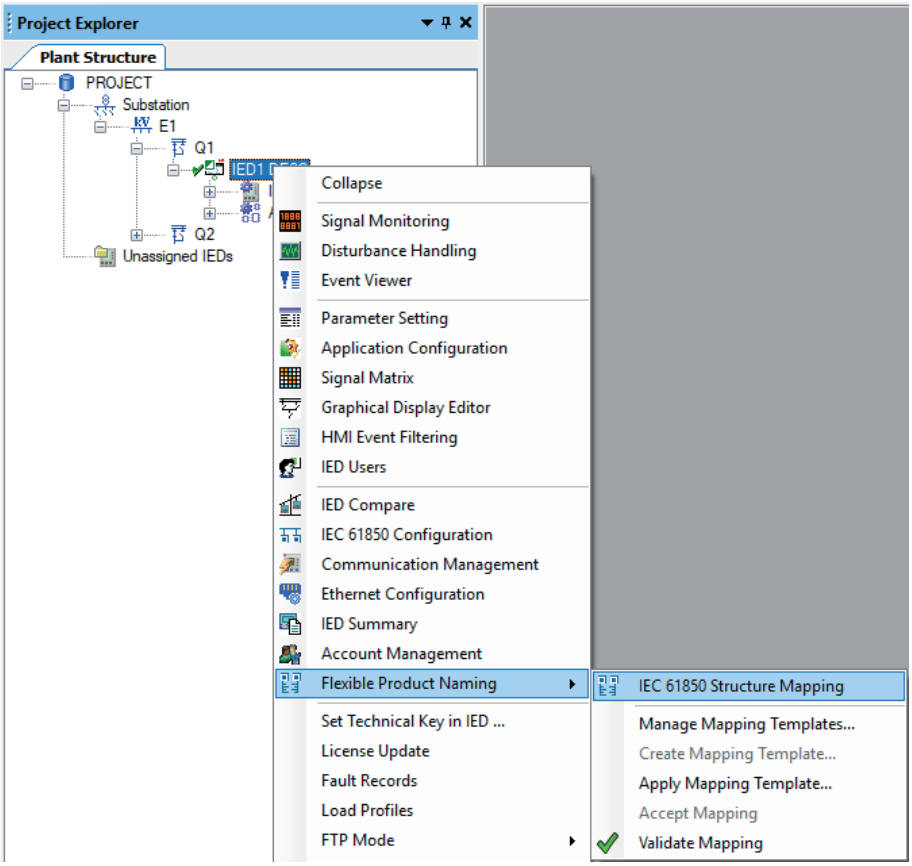

Figure 144: Flexible product naming tool

8.4 IEC 61850 structure mapping

8.4.1 IED mapping

The first step in the IEC 61850 structure mapping is to map the real IEDs to the customer-specific IEDs. IED mapping means that each server IED in the FPN model is mapped with a corresponding IED in the internal PCM600 model, that is, the real device in the substation. A server IED is an IED that has an access point containing a server. IED mapping does not map the data attributes between the IEDs unless the data attribute mapping is complete. IED mapping can be done in the PCM600 plant structure and in IEC 61850 Structure Mapping.

8.4.1.1 Mapping IED in PCM600 plant structure

- To map the IED in the plant structure, drag a PCM600 IED from the Unassigned IEDs group onto an FPN IED in the substation.

  IED mapping status is indicated visually in the plant structure.
- To remove an IED mapping from the plant structure, drag a mapped FPN IED onto the Unassigned IEDs group.

  The removed mapping is indicated visually in the plant structure. The PCM600 internal IED, with which the FPN IED was mapped, appears back in the Unassigned IEDs group if it is not mapped with any FPN IEDs.

8.4.1.2 IED mapping in IEC 61850 Structure Mapping

IED mapping

The tool displays all FPN IEDs and all PCM600 IEDs in separate lists. Mapping is done by dragging the PCM600 IED on the right-hand side to an FPN IED on the lefthand side. The tool indicates the mapping status visually. The mapping needs to be saved to apply it.

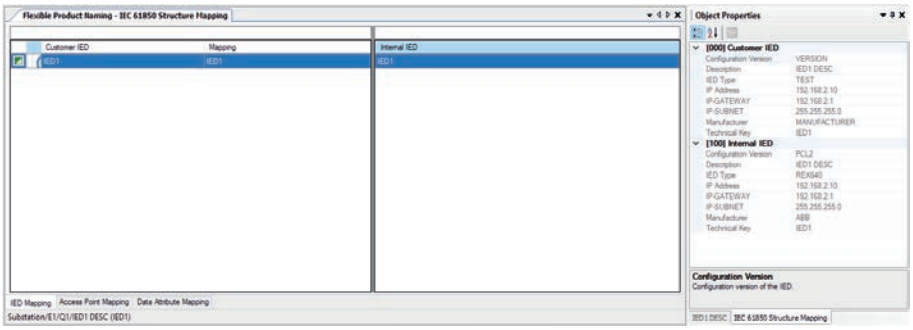

Figure 145: Mapping of IEDs in IEC 61850 Structure Mapping

Removing IED mapping

Removing IED mapping is done in IEC 61850 Structure Mapping by right-clicking the mapping and selecting the context menu option or pressing the DELETE key. The tool indicates the mapping status visually. The change must be saved.

Access point mapping

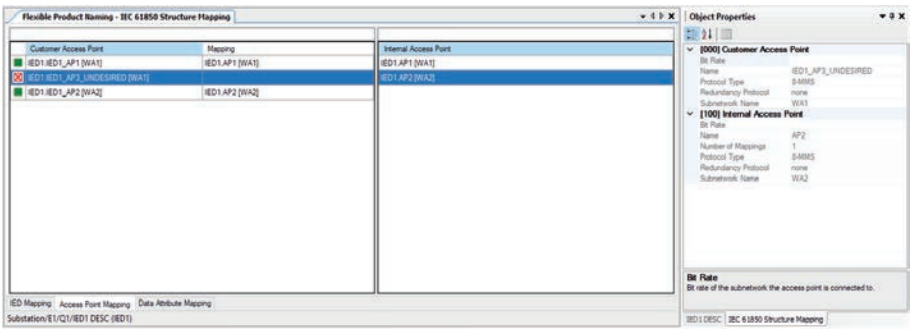

Figure 146: Access point mapping

Access point mapping defines the relations between REX640 internal access points and customer access points.

In the above example, REX640 access point AP1 is in subnetwork WA1, while access point AP2 is in subnetwork WA2. The configuration is created using Ethernet configuration.

The network configuration must be correct before the flexible product mapping is started.

REX640 supports one access point for data model. Second access point AP2 is based on the ServerAt concept and has the same data model in different IP addresses.

The REX640 access points are mapped to FPN project's access points IED1_AP1 and IED_AP2. The third access point IED1_AP2_UNDESIRED is excluded from the mapping since it does not have a network interface.

Data tree view

The data tree view consists of customer data structure in the column on the left and the name of the mapped PCM600 internal data structure in the column on the right.

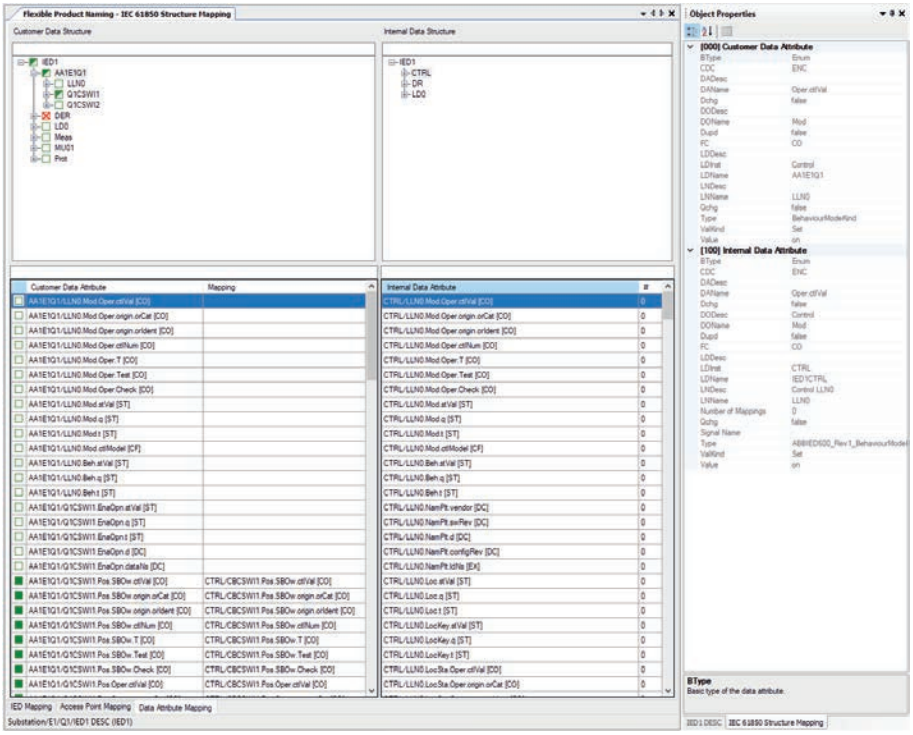

Figure 147: Data tree view

Data attribute list view

The data attribute list view consists of customer data attributes in the column on the left and the PCM600 internal data attributes in the column on the right.

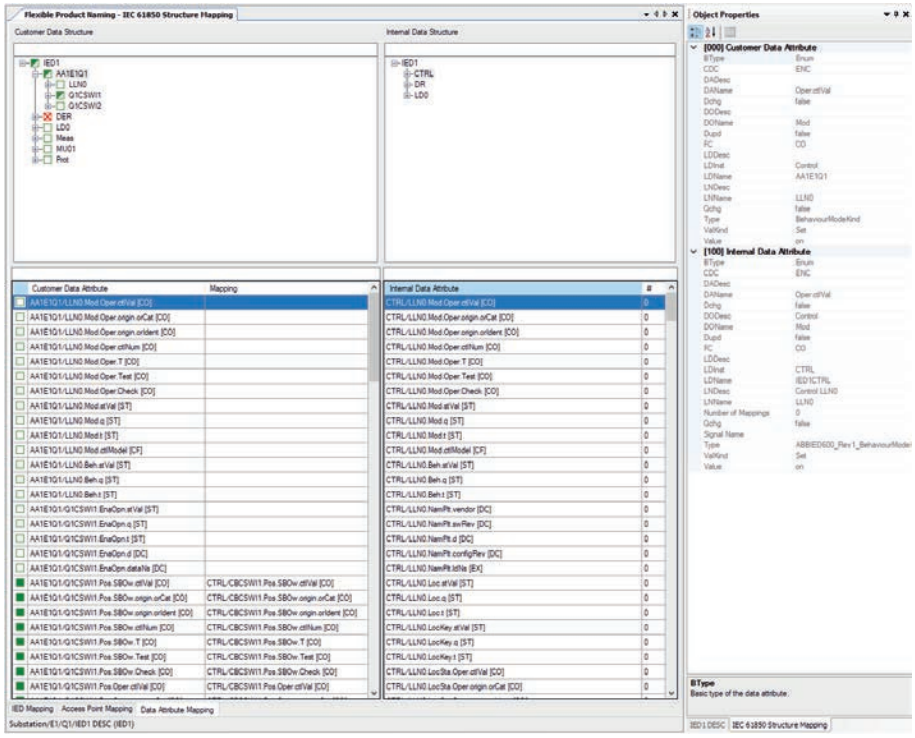

Figure 148: Data attribute list view

Filters

The displayed objects can be filtered using the filtering options on the quick access toolbar.

Figure 149: Filters

Free text filter

The objects are filtered by free text, showing all the objects with a certain name in both Data Structure level and Data Attribute level.

Show/hide objects by status

The objects are filtered by status, showing only the selected objects in Data Structure level and Data Attribute level.

Enable and disable type filters

Objects in the FPN can be filtered using additional filtering options available in the quick access menu.

8.4.2 Data attribute mapping

Data attribute mapping means that each FPN data attribute in the FPN model is mapped to a corresponding data attribute in the internal PCM600 model, that is, the real device in the substation.

The mapping status is indicated visually. It can be seen what FPN data attribute is mapped to what PCM600 internal data attribute and how many FPN data attributes are mapped to a PCM600 internal data attribute.

Data attribute mapping is complete when all data attributes of the FPN IED, which are not excluded from the mappings, are mapped to a PCM600 internal data attribute. Data attribute mapping must be complete to be able to write to IED.

Data attribute mapping is broken if any of the mapped data attributes - FPN or PCM600 internal - does not exist in the SCL database.

Table 8: Visual indication of the mapping status

Icon	Description
	Completely mapped
	Not mapped
	Broken mapping
	Partially mapped
	Excluded from mappings

All data attributes in the FPN model must be mapped or excluded, otherwise write to IED fails.

8.4.2.1 Mapping data attribute level

IEC 61850 Structure Mapping displays the FPN data attributes and PCM600 internal data attributes in separate lists.

- To map data attributes, drag the FPN data attribute onto a PCM600 internal data attribute.
- Remove a data attribute mapping in one of the alternative ways.
  - Right-click the mapping and select the remove option.
  - Select the mapping and press the DELETE key.

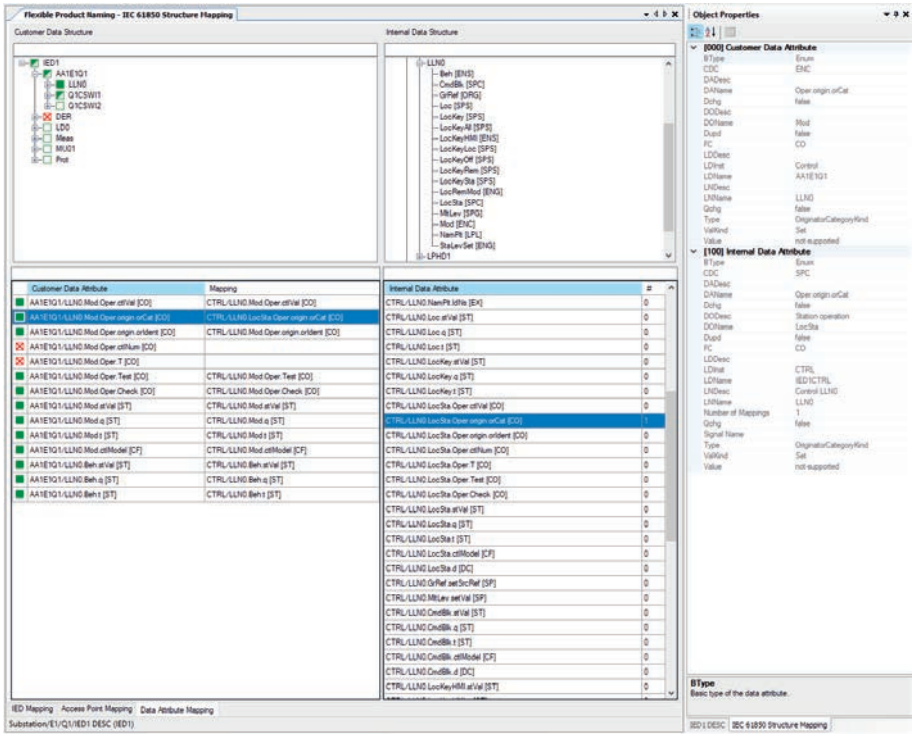

Figure 150: Data attribute level mapping

8.4.2.2 Mapping data object level

Create data attribute mapping on the data object level in one of the alternative ways.

- Drag a data object from the customer data structure onto a data object in the internal data structure.
- Drag a data object from the internal data structure onto a data object in the customer data structure.

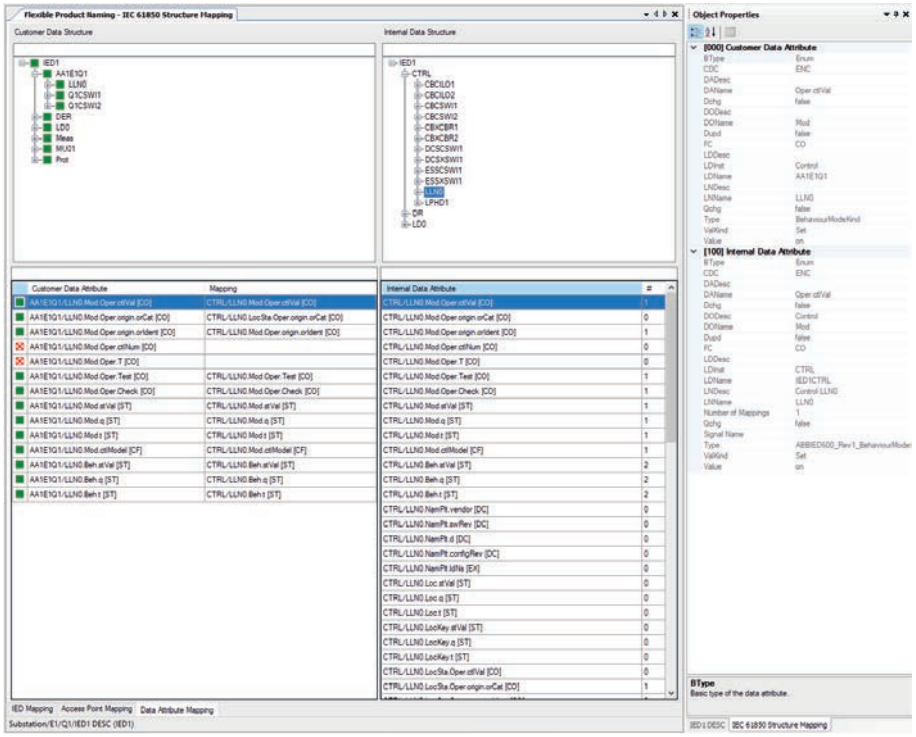

Figure 151: Completed data object mapping

8.4.2.3 Mapping logical node level

Create data attribute mapping on the logical node level in one of the alternative ways.

- Drag a logical node from the customer data structure onto a logical node in the internal data structure.
- Drag a logical node from the internal data structure onto a logical node in the customer data structure.

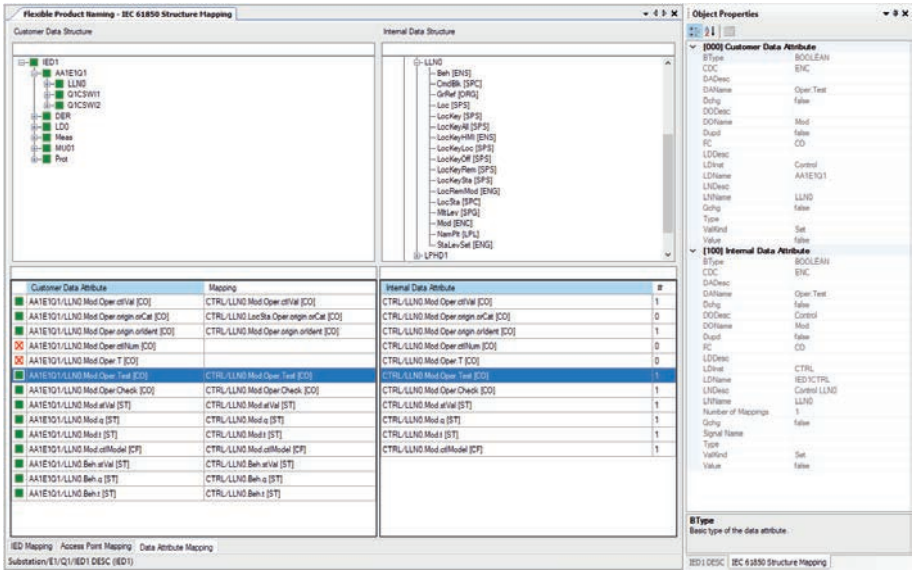

Figure 152: Logical node level mapping

8.4.2.4 Excluding data attributes from mapping

Exclude the data attributes in one of the alternative ways.

- Select the data attributes to exclude, right-click and select **Exclude Items**.

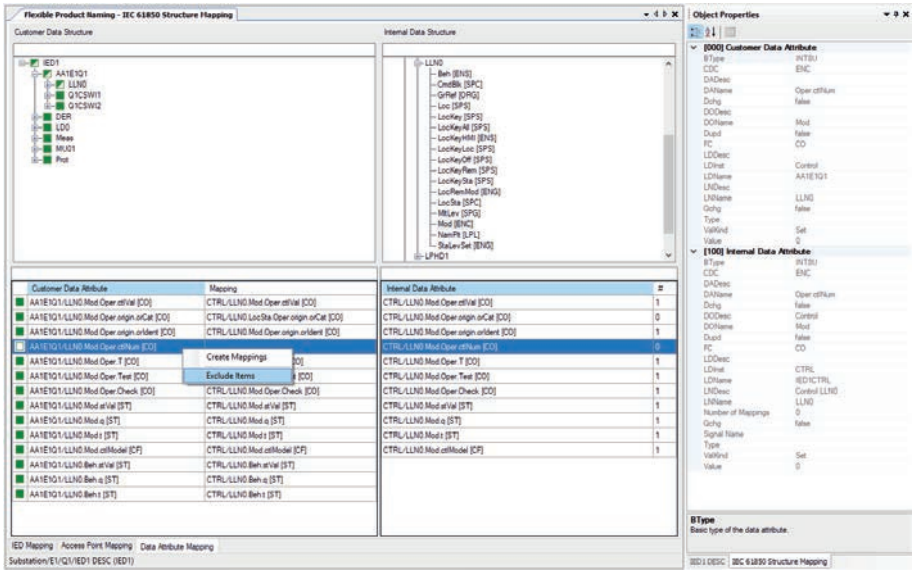

Figure 153: Excluding data attributes from mapping

- Exclude all unmapped data attributes from the data object at once by right-clicking the data object and selecting **Exclude Data Attributes**.

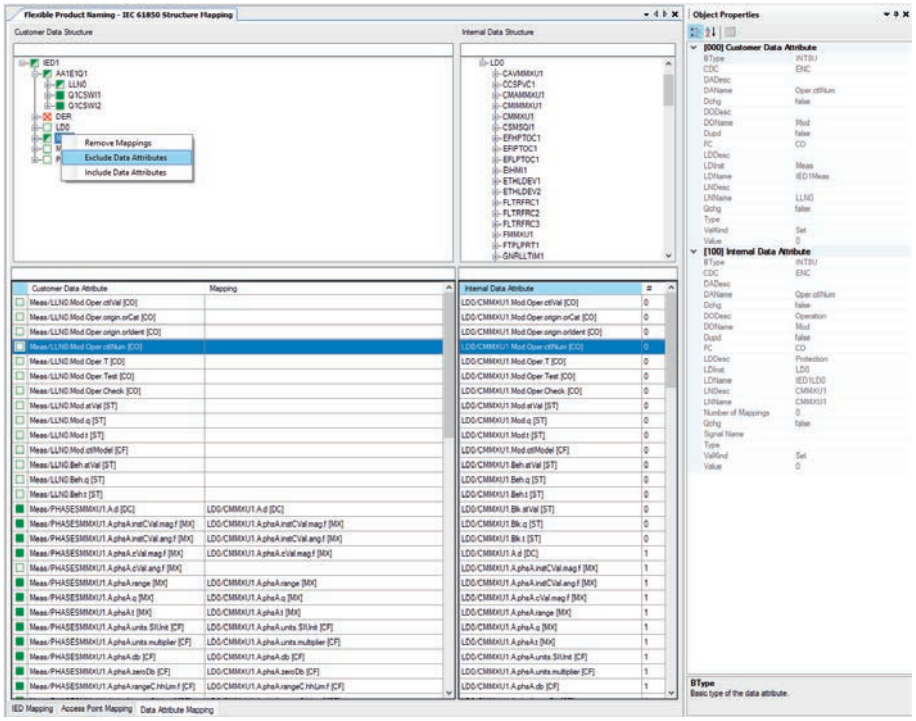

Figure 154: Excluding data attributes from mapping

The data attributes that are excluded from the mapping are not excluded from the model. Excluded mappings are ignored when determining if an IED mapping is complete.

It is crucial to set a value to the excluded data attributes before initiating the mapping.

8.5 Setting data attribute value

Edit the **Value** field in the **Object Properties** pane.

- For enum type of data attributes, select the value from the list of available values.
- For numeric and string type of data attributes, type the value in the **Value** field.

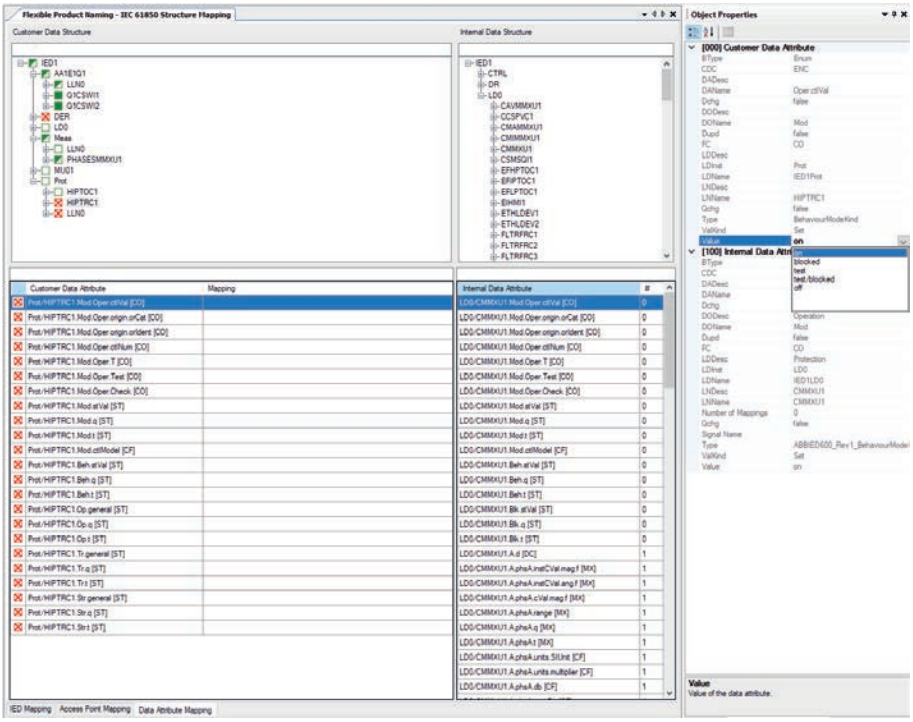

Figure 155: Setting the data attribute value

A value cannot be set for all data attributes types. For example, quality and timestamp values cannot be edited.

8.6 Validation

Once the FPN mapping is complete, all mapping can be validated in three ways using the validate options available on the toolbar.

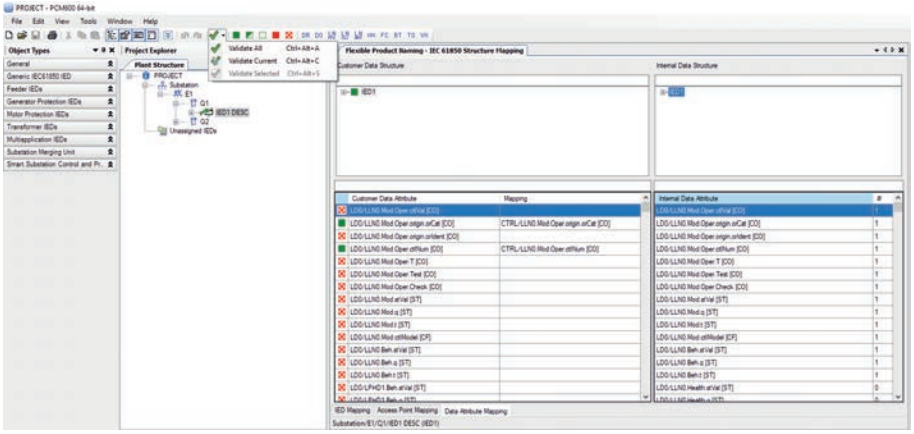

Figure 156: Validate mapping

8.7 Template creation

It is possible to create a template of an IED's data attribute mapping and store it for reuse. The template contains the description of the data attribute mapping of two IED SCL models.

All mapping templates created in PCM600 are stored in a template library. The template library is not specific to a certain PCM600 project, but it is common for all projects. Templates in the library can be managed in several ways.

- Delete selected templates
- Export templates: One or multiple template files can be exported.
- Import templates: One or multiple template files can be imported. If a template being imported already exists in the library, the user is asked whether to overwrite the existing one.
- Export project's templates: When a PCM600 project is exported, all templates used in the project are automatically included in the exported .pcmp file.
- Import project's templates: When a PCM600 project is imported, all templates included in the imported .pcmp file are automatically imported into the template library. If a template being imported already exists in the library, it overwrites the template in the library.

The mapping templates are also used by IET600 to translate the internal data references in the signal library to the FPN references, because IET600 needs to know what template to use to resolve the internal data references.

Create a template for each IED mapping.

8.7.1 Mapping template creation

Data attribute mapping templates can be created from mapped IEDs. If the template is created from an incompletely mapped IED, a dialog box is shown. The user can select an option to not show the dialog box again. The dialog box can be activated afterwards from the PCM600's Options menu.

The template can be created either from IEC 61850 Structure Mapping or from the PCM600 plant structure. The required template information must be filled in before it can be created.

8.7.2 Applying of a mapping template to IED

The template can be selected from a list of available templates. The FPN IED must be mapped with a PCM600 internal IED before the template can be applied.

The template can be applied either in IEC 61850 Structure Mapping or in the PCM600 plant structure. In IEC 61850 Structure Mapping, the template can be applied to one or several IEDs at once. In the plant structure, the template can be applied on one IED at a time by right-clicking an IED, or on all IEDs under a bay by right-clicking the bay.

8.7.3 Exporting FPN templates

1. Right-click the PCM600 plant structure.
2. Point to **Flexible Product Naming** and select **Manage Mapping Templates**.
3. Select the templates to export and click **Export**.

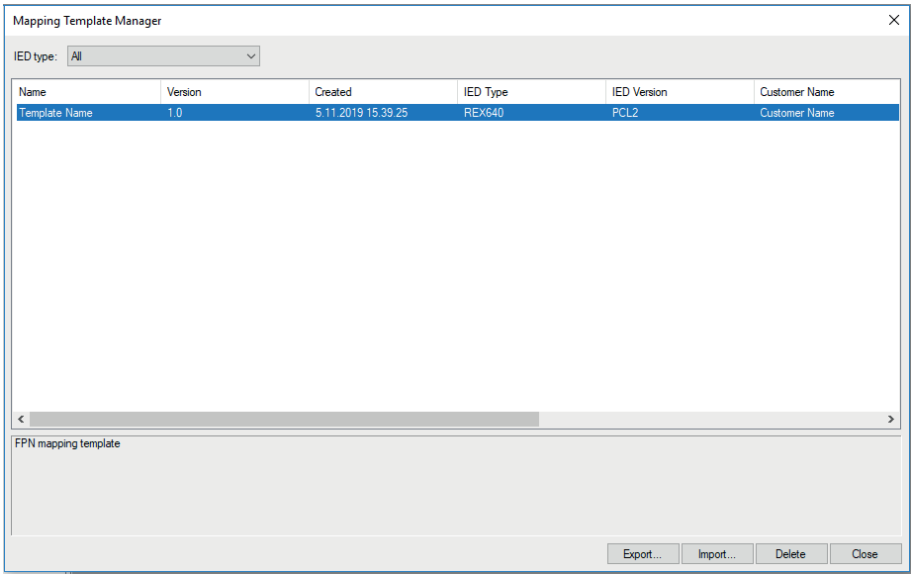

Figure 157: Exporting FPN templates

4. Select the folder where to export the templates and click **OK**.

8.7.4 Reporting and printing

The report consists of a cross-reference list of the IED and data attribute mappings, that is, a table of all FPN objects together with the PCM600 internal objects they are mapped with.

Parameter	Customer IED	Internal IED
Technical Key	IED1	IED1
Description	IED1 DESC	IED1 DESC
IED Type	TEST	TEST
Configuration Version	VERSION	VERSION
Manufacturer	MANUFACTURER	MANUFACTURER
IP Address	192.168.2.10	192.168.2.10
IP-GATEWAY	192.168.2.1	192.168.2.1
IP-SUBNET	255.255.255.0	255.255.255.0
Voltage Level	E1 (E1)	E1 (E1)
Bay	Q1 (Q1)	Q1 (Q1)

Conformity

This product complies with following directive and regulations.

Directives of the European parliament and of the council:

- Electromagnetic compatibility (EMC) Directive 2014/30/EU
- Low-voltage Directive 2014/35/EU
- RoHS Directive 2011/65/EU
- RoHS Directive (EU) 2015/863 amending Annex II

UK legislations:

- Electromagnetic Compatibility Regulations 2016
- Electrical Equipment (Safety) Regulations 2016
- The Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment Regulations 2012

These conformities are the result of tests conducted by the third-party testing in accordance with the product standard EN / BS EN 60255-26 for the EMC directive / regulation, and with the product standards EN / BS EN 60255-1 and EN / BS EN 60255-27 for the low voltage directive / safety regulation.

The product is designed in accordance with the international standards of the IEC 60255 series.

1. Description

REX640 is a powerful all-in-one protection and control relay for use in advanced power distribution and generation applications with unmatched flexibility available during the complete life cycle of the device – from ordering of the device, through testing and commissioning to upgrading the functionality of the modular software and hardware as application requirements change.

REX640 is available in two different case widths: a narrow case offering five module slots and a standard case offering seven module slots. Software options are identical for both case sizes.

The modular design of both hardware and software elements facilitates the coverage of any comprehensive protection application requirement that may arise during the complete life cycle of the relay and substation.

REX640 makes modification and upgrading easy and pushes the limits of what can be achieved with a single device.

2. Application packages

REX640 offers comprehensive base functionality. However, it is possible to further adapt the product to meet special installation needs by including any number of the available optional application packages into a single REX640 relay. For the selected application packages, the functionality can be extended by including the related add-on package. The REX640 connectivity package guides the engineer in optimizing the application configuration and its performance.

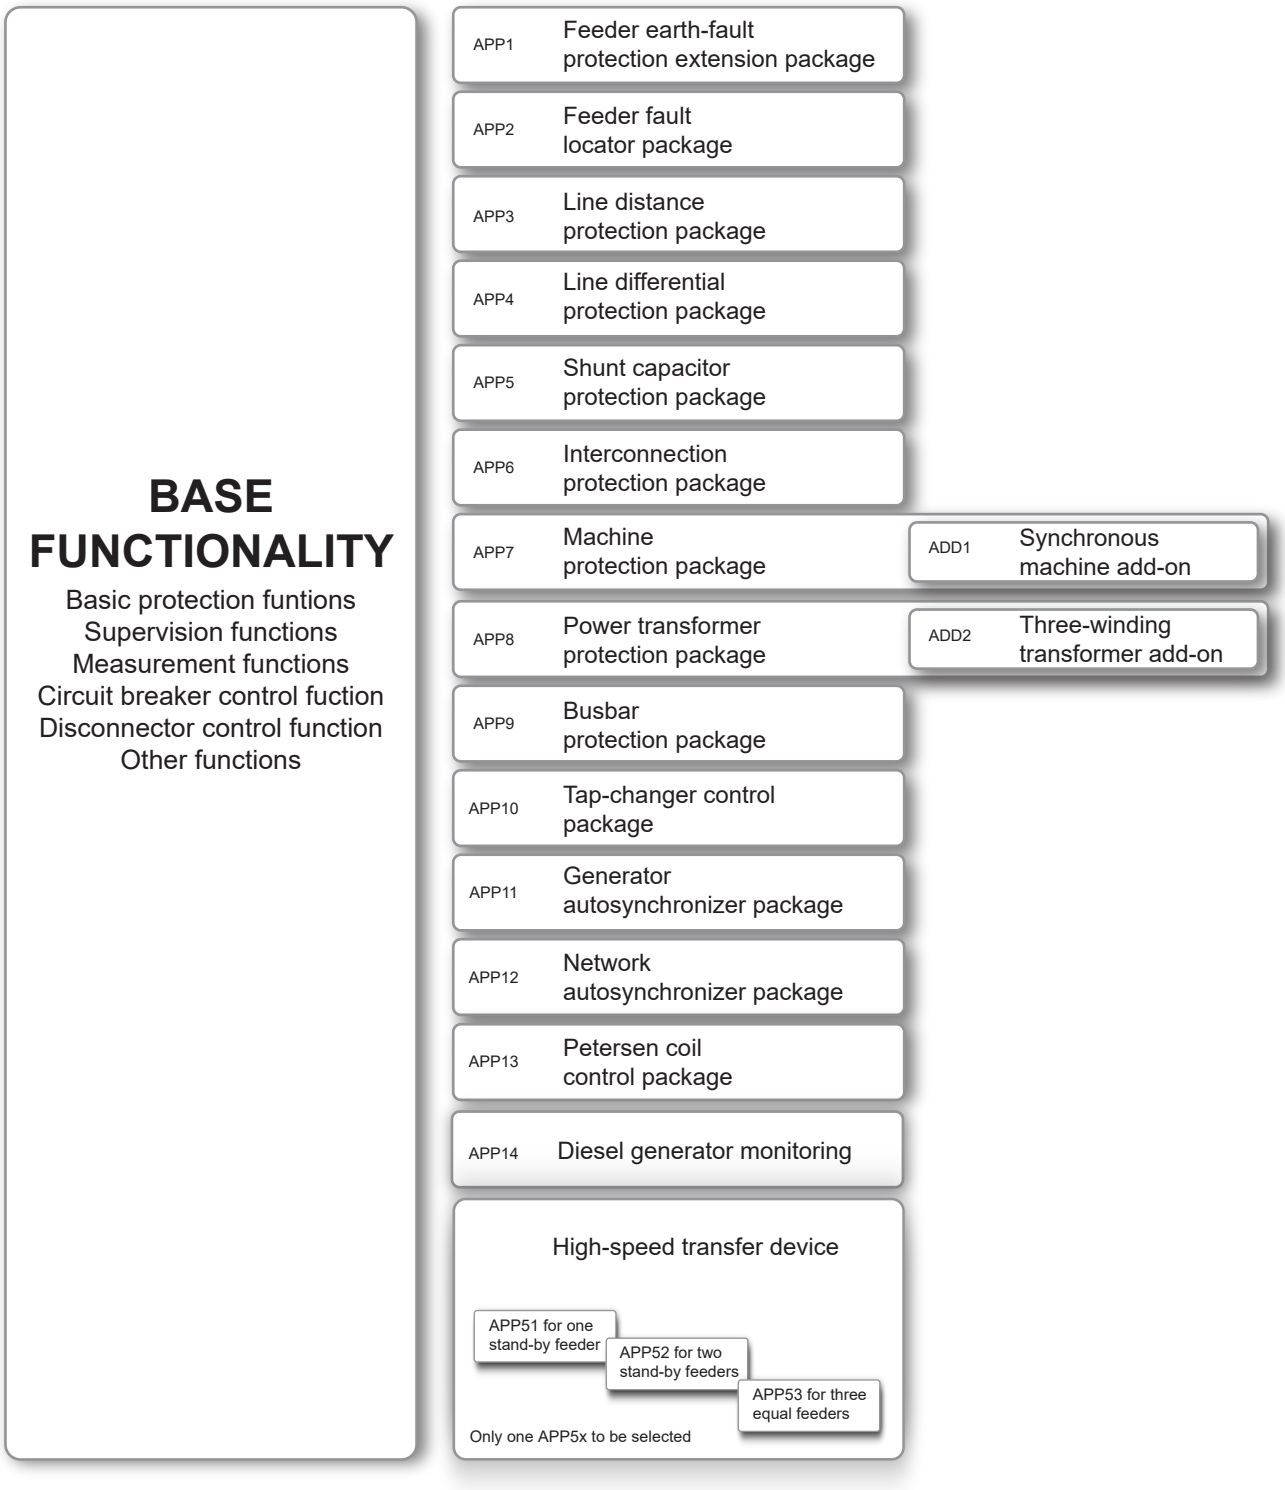

Figure 1: REX640 base and optional functionality

3. Relay hardware

The relay has mandatory and optional slots. A mandatory slot always contains a module but an optional slot may be empty, depending on the composition variant ordered.

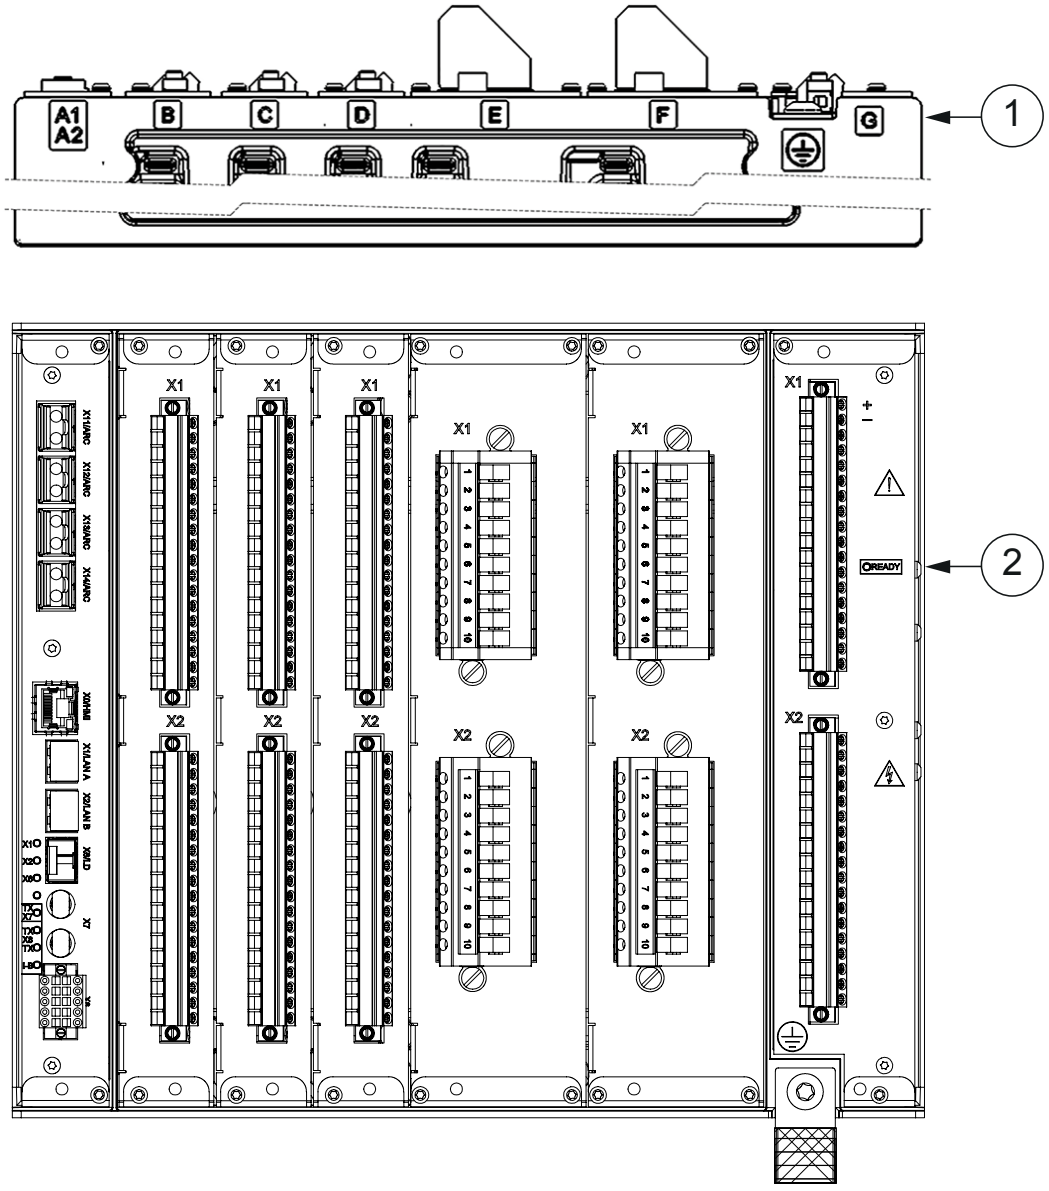

Table 1: Module slots

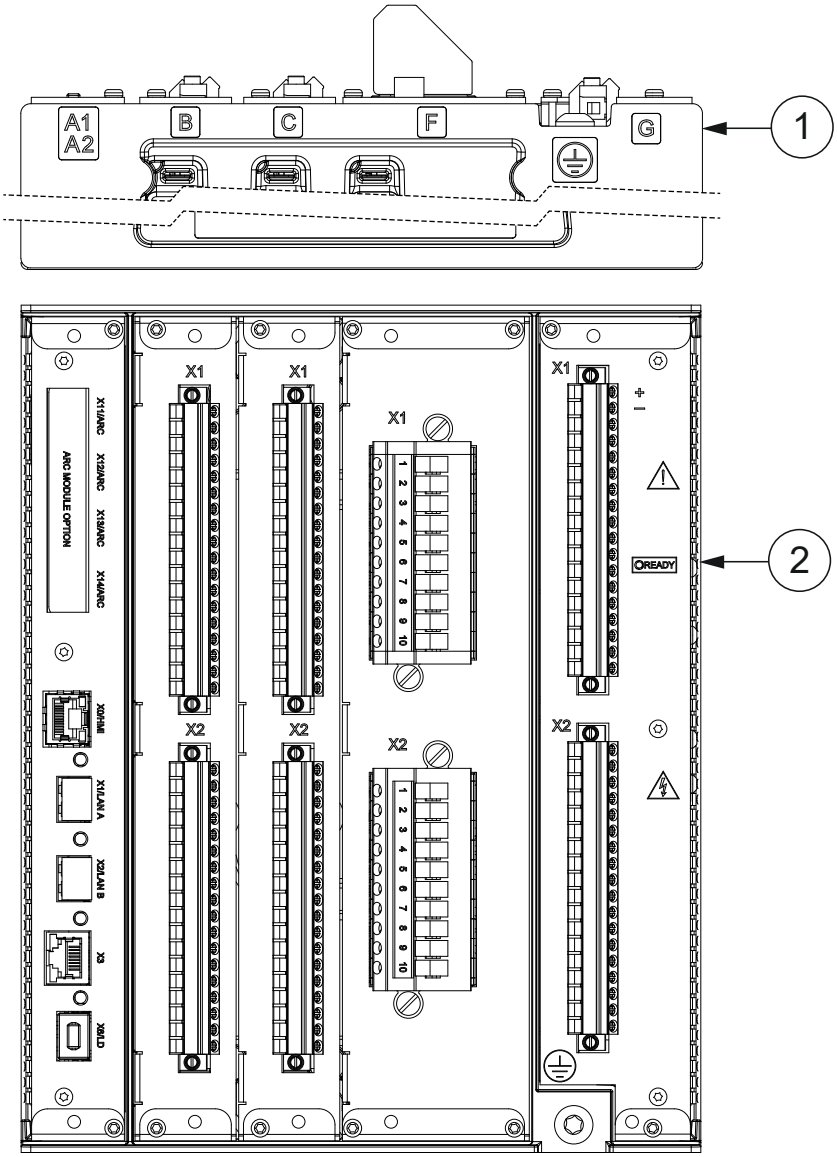
Module	Standard case							
	Slot A1	Slot A2	Slot B	Slot C	Slot D	Slot E	Slot F	Slot G
	Narrow case							
	Slot A1	Slot A2	Slot B	Slot C	------	------	Slot F	Slot G
ARC1001	o							
COM1001		●						
COM1002		●						
COM1003		●						
COM1004		●						
COM1005		●						
BIO1001			●	o	o			
BIO1002			●	o	o			
BIO1003						o		
BIO1004						o		
RTD1001				o	o			
RTD1002				o	o			
AIM1001						o	●	
AIM1002						o	●	
SIM1901						o	●	
SIM1902						o	●	
PSM1001								●
PSM1002								●
PSM1003								●

● = Mandatory to have one of the allocated modules in the slot



o = Optional to have one of the allocated modules in the slot. The population (order) of the modules in the optional slots depends on the composition variant ordered.

The REX640 relay can also be ordered as a conformal coated variant. Visit ABB Relays-Online *https://relays.protection-control.abb* for more information about the product and assistance in ordering.

Table 2: Module description

Module	Description
ARC1001	4 × ARC sensor inputs (lense, loop or mixed)
COM1001	1 × RJ-45 (LHMI port) + 3 × RJ-45 + 1 × LD-SFP[1]
COM1002	1 × RJ-45 (LHMI port) + 2 × LC + 1 × RJ-45 + 1 × LD-SFP

Table continues on the next page

[1] Line distance/line differential protection communication + binary signal transfer, optical multi-mode or single-mode LC small form-factor pluggable transceiver (SFP)

Module	Description
COM1003	1 × RJ-45 (LHMI port) + 3 × LC + 1 × LD-SFP
COM1004	1 × RJ-45 (LHMI port) + 2 × RJ-45 + 1 × LD-SFP + 1 × RS-485/IRIG-B + 1 × FO UART
COM1005	1 × RJ-45 (LHMI port) + 2 × LC + 1 × LD-SFP + 1 × RS-485/IRIG-B + 1 × FO UART
BIO1001/ BIO1003	14 × BI + 8 × SO
BIO1002/ BIO1004	6 × SPO + 2 × SPO (TCS) + 9 × BI
RTD1001	10 × RTD channels + 2 × mA channels (input/output)
RTD1002	3 x RTD channels + 6 x mA channels (input or output) + 12 x BI
AIM1001	4 x CT (1/5A) + 1 x CT (0.2/1A for residual current only) + 5 x VT
AIM1002	6 x CT (1/5A) + 4 x VT
SIM1901	3 x combi sensor inputs (RJ-45, IEC 60044) + 1 x CT (0.2/1A for residual current only) + 1 x VT
SIM1902	3 x combi sensor inputs (RJ-45, IEC 61869) + 1 x CT (0.2/1A for residual current only) + 1 x VT
PSM1001	24...60 VDC, 3 × PO (TCS) + 2 × PO + 3 × SO + 2 × SSO
PSM1002	48...250 VDC / 100...240 VAC, 3 × PO (TCS) + 2 × PO + 3 × SO + 2 × SSO
PSM1003	110/125 VDC (77...150 VDC), 3 × PO (TCS) + 2 × PO + 3 × SO + 2 × SSO

PO = Power Output

SO = Signal Output

SPO = Static Power Output

SSO = Static Signal Output

The relay has a nonvolatile memory which does not need any periodical maintenance. The nonvolatile memory stores all events, recordings and logs to a memory which retains data if the relay loses its auxiliary supply.

4. Human-machine interface

REX640 offers different possibilities for creating a humanmachine interface.

- Local HMI (LHMI)
- Switchgear HMI (SHMI)
- Web HMI (WHMI)

The optimum HMI solution can be freely selected. The considerations can cover, for example, the physical installation location, frequency of usage or operators' preference.

LHMI can be connected directly to a dedicated port on the relay's communication module. If a longer distance between the relay and the LHMI is required, the LHMI can be connected into the station Ethernet communication network. In both cases, an LHMI is dedicated to a certain relay and only one LHMI can be connected to one relay.

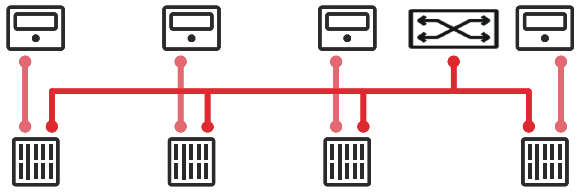

Figure 4: Local HMIs connected directly to the relays

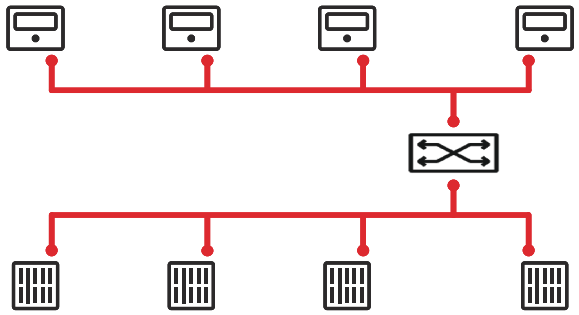

Figure 5: Local HMIs connected to the relays via a communication network

SHMI can be connected into a station Ethernet communication network. A single SHMI can serve up to 20 relays. The SHMI provides switchgear level status information as well as an access point to the LHMI level relay information. LHMI and SHMI panels cannot be connected simultaneously to the same relay.

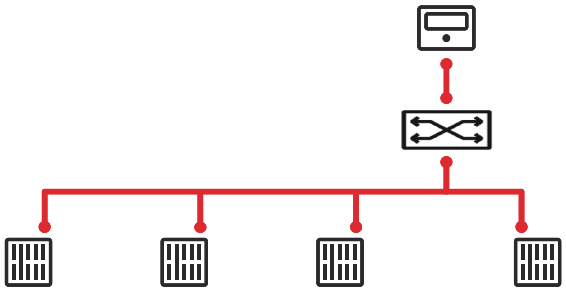

Figure 6: Switchgear HMI connected to the relays

The REX640 relays are fully operational even without any connection to a physical HMI. The relays include a Web server enabling access by the WHMI. The Web server is disabled by default and must be enabled by a parameter change. The WHMI can also be used even if the relay is connected to a physical HMI.

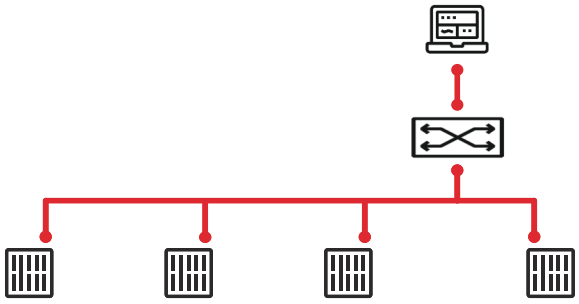

Figure 7: Web HMI connected to the relays

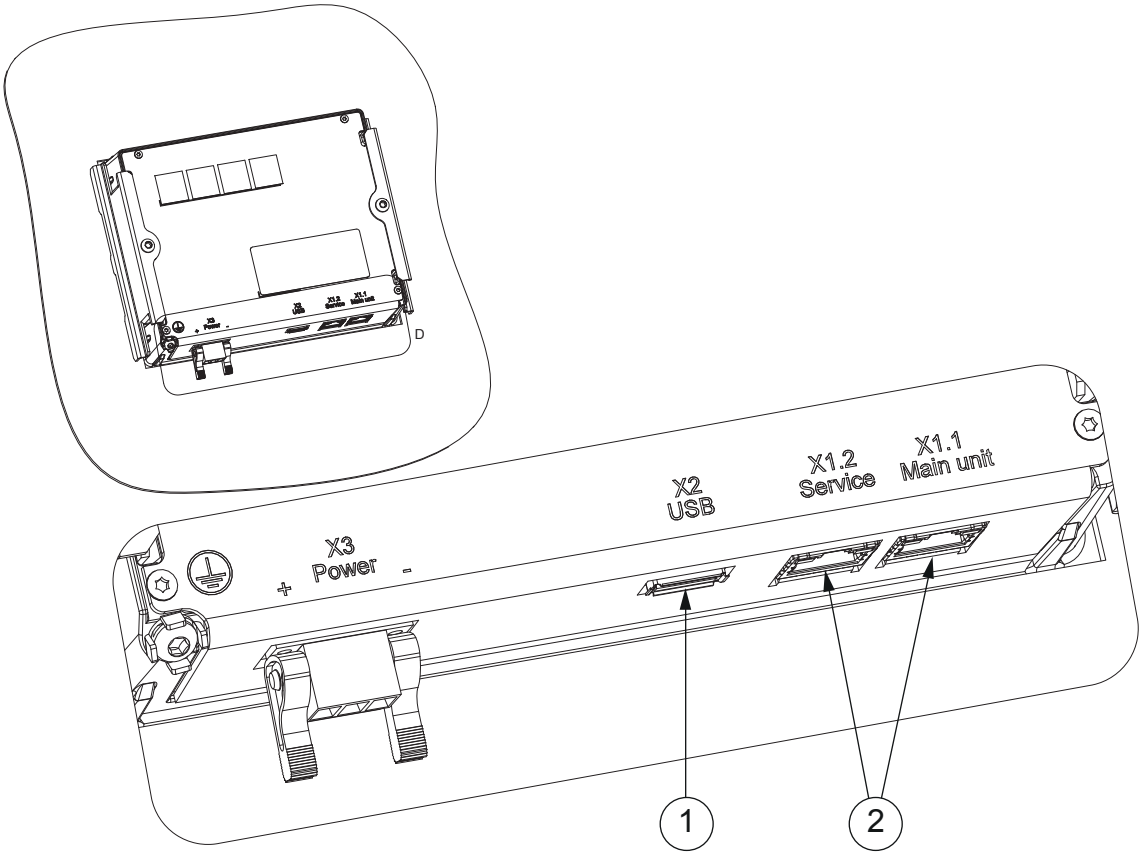

Figure 8: HMI connectors

1 USB port

2 RJ-45 ports

The main unit port X1.1 is used to connect the LHMI directly to the relay. In case of a remotely installed LHMI or SHMI, the connector X1.1 is used for Ethernet switch connection. The service port X1.2 is used for PCM600 or WHMI connection. The USB port X2 is used for inserting a USB memory stick to enable data retrieval from the relay.

5. Local HMI

The LHMI uses rugged 7-inch high resolution color screen with capacitive touch sensing technology. The user interface has been carefully designed to offer the best situational awareness to the user. Visualization of the primary process measurements, events, alarms and switching objects' statuses makes the local interaction with the relay extremely easy and self-evident. The LHMI provides a control point for the selected primary devices via pop-up operator dialogs.

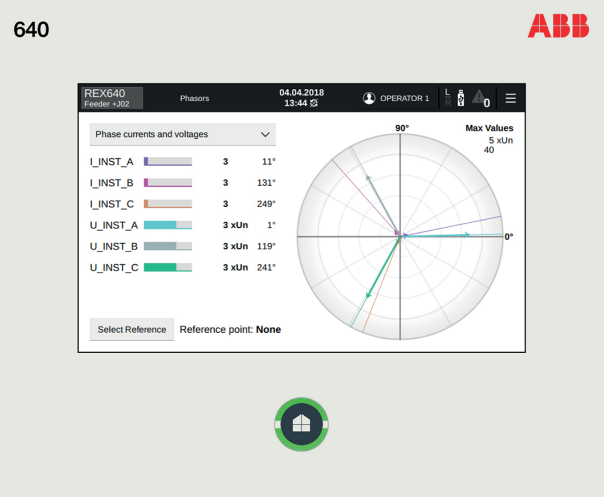

Figure 9: Phasor presentation of measurements as an example of local HMI pages

Additionally, the LHMI supports the engineer during the relay's testing, commissioning and troubleshooting activities. The information, traditionally accessible through different paths within the menu structure, is provided in collectively grouped and visualized format.

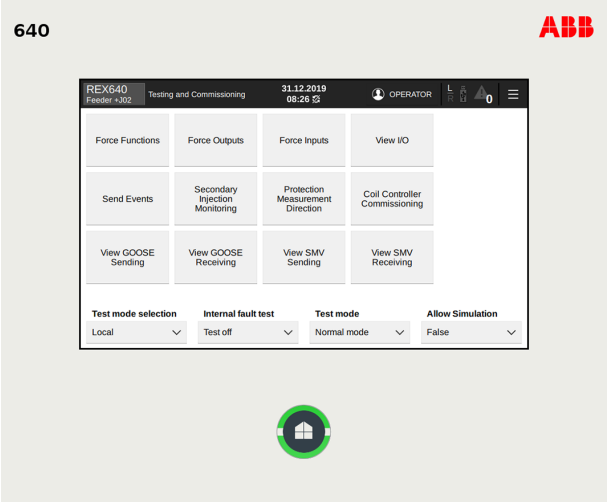

Figure 10: Test and commissioning support in the local HMI

The Home button at the bottom of the LHMI indicates the relay's status at a glance. In normal situations, the Home button shows a steady green light. Any other situation that requires the operator's attention is indicated with a flashing light, a red light or a combination of these.

The LHMI presents pages in two categories: the Operator pages and the Engineer pages. The Operator pages include the ones which are typically required as a part of an operator's normal activities, such as a single-line diagram, controls, measurements, events, alarms, and so on. The Engineer's pages include specifically designed pages supporting relay parametrization, troubleshooting, testing and commissioning activities.

The Operator pages can be used as such or customized according to the project's requirements using Graphical Display Editor (GDE) within the PCM600 software tool. The Engineer pages are fixed and cannot be customized.

The Operator pages can be scrolled either by tapping the Home button or by swiping the actual pages. The Engineer pages are accessible by touching the upper horizontal section of the screen.

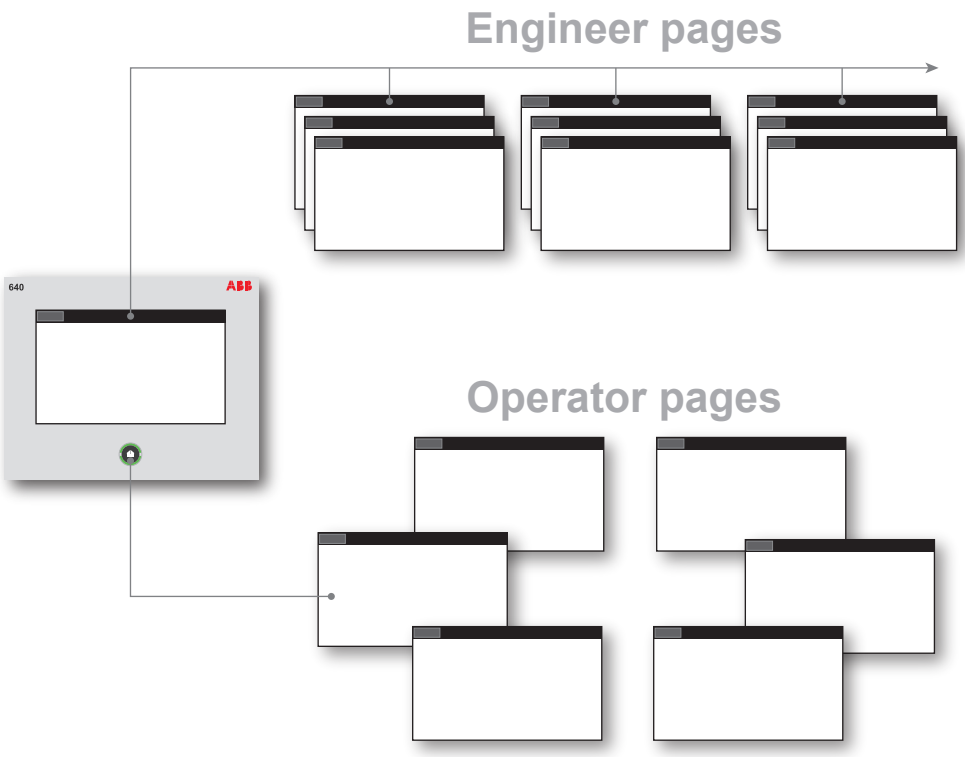

Figure 11: Local HMI pages

The LHMI is an accessory for the relay which is fully operational even without the LHMI. The relay communication card has a dedicated port where the LHMI is connected using an RJ-45 connector and a CAT6 S/FTP cable. The LHMI can be connected to the relay also via station communication network if a longer distance is required between the relay and the LHMI.

Additionally, the LHMI contains one Ethernet service port with an RJ-45 connector and one USB port. The service port can be used for the PCM600 connection or for WHMI connection. Data transfer to a USB memory is enabled via the USB port. By default the USB port is disabled and has to be taken into use with a specific parameter.

REX640 can be used as a centralized alarm annunciator. 66pcs of programmable LED functions are available within the graphical application configuration. The LED functions can be controlled by any physical input, GOOSE based or relay's internal binary signal. The Graphical Display Editor (GDE) tool component in PCM600 offers ready made pages for alarm visualization covering 64 alarm channels.

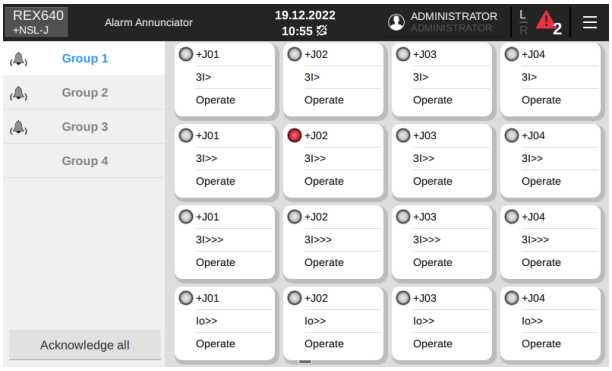

Figure 12: Alarm annunciator visualization on HMI

6. Switchgear HMI

The SHMI uses the same rugged 7-inch high resolution color screen with capacitive touch sensing technology as the LHMI. The user interface has been carefully designed to offer the best situational awareness to the user. SHMI navigation page provides an overview of the complete switchgear lineup. Four switchgear panels can be shown simultaneously on the navigation page, and the other panels can be

seen by tapping the SHMI panel Home button or by swiping the screen. A single SHMI can support up to 20 relays, and an installation can include several non-overlapping SHMI panels.

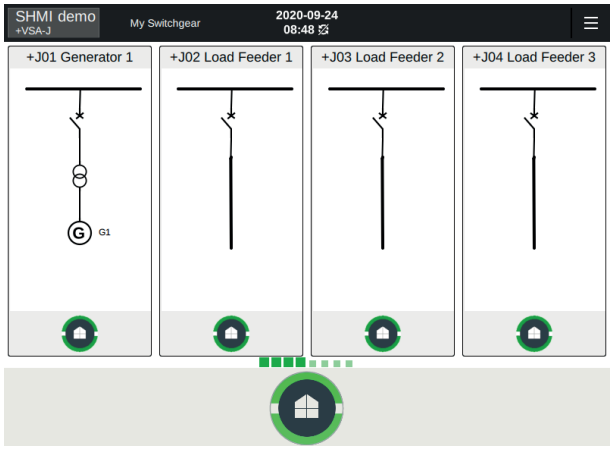

Figure 13: Switchgear HMI navigation page

On the navigation page, each switchgear panel can be represented by a dynamic single-line diagram, static figure or even by a photo of the actual panel. The panel-wise representation includes a virtual home button indicating the status of the relay within the panel. The SHMI's physical Home button indicates the common status of the complete switchgear lineup. After tapping on selected switchgear panel on the navigation page, the SHMI connects to the relay. When the connection is established, the SHMI provides all the same features as the LHMI.

If the switchgear lineup on the navigation page is presented by a dynamic single-line diagram, the actual primary switching device's actual positions are shown. To control a primary object, the panel must first be selected from the navigation page. When the SHMI is connected to the selected relay, the control can be carried out in a similar manner as with the LHMI.

SHMI automatically stores backups of the connected relays' configurations. If a relay needs to be replaced with a spare relay that has at least same capabilities as the original one, the relay configuration and parameters can be restored from the SHMI panel.

7. Application

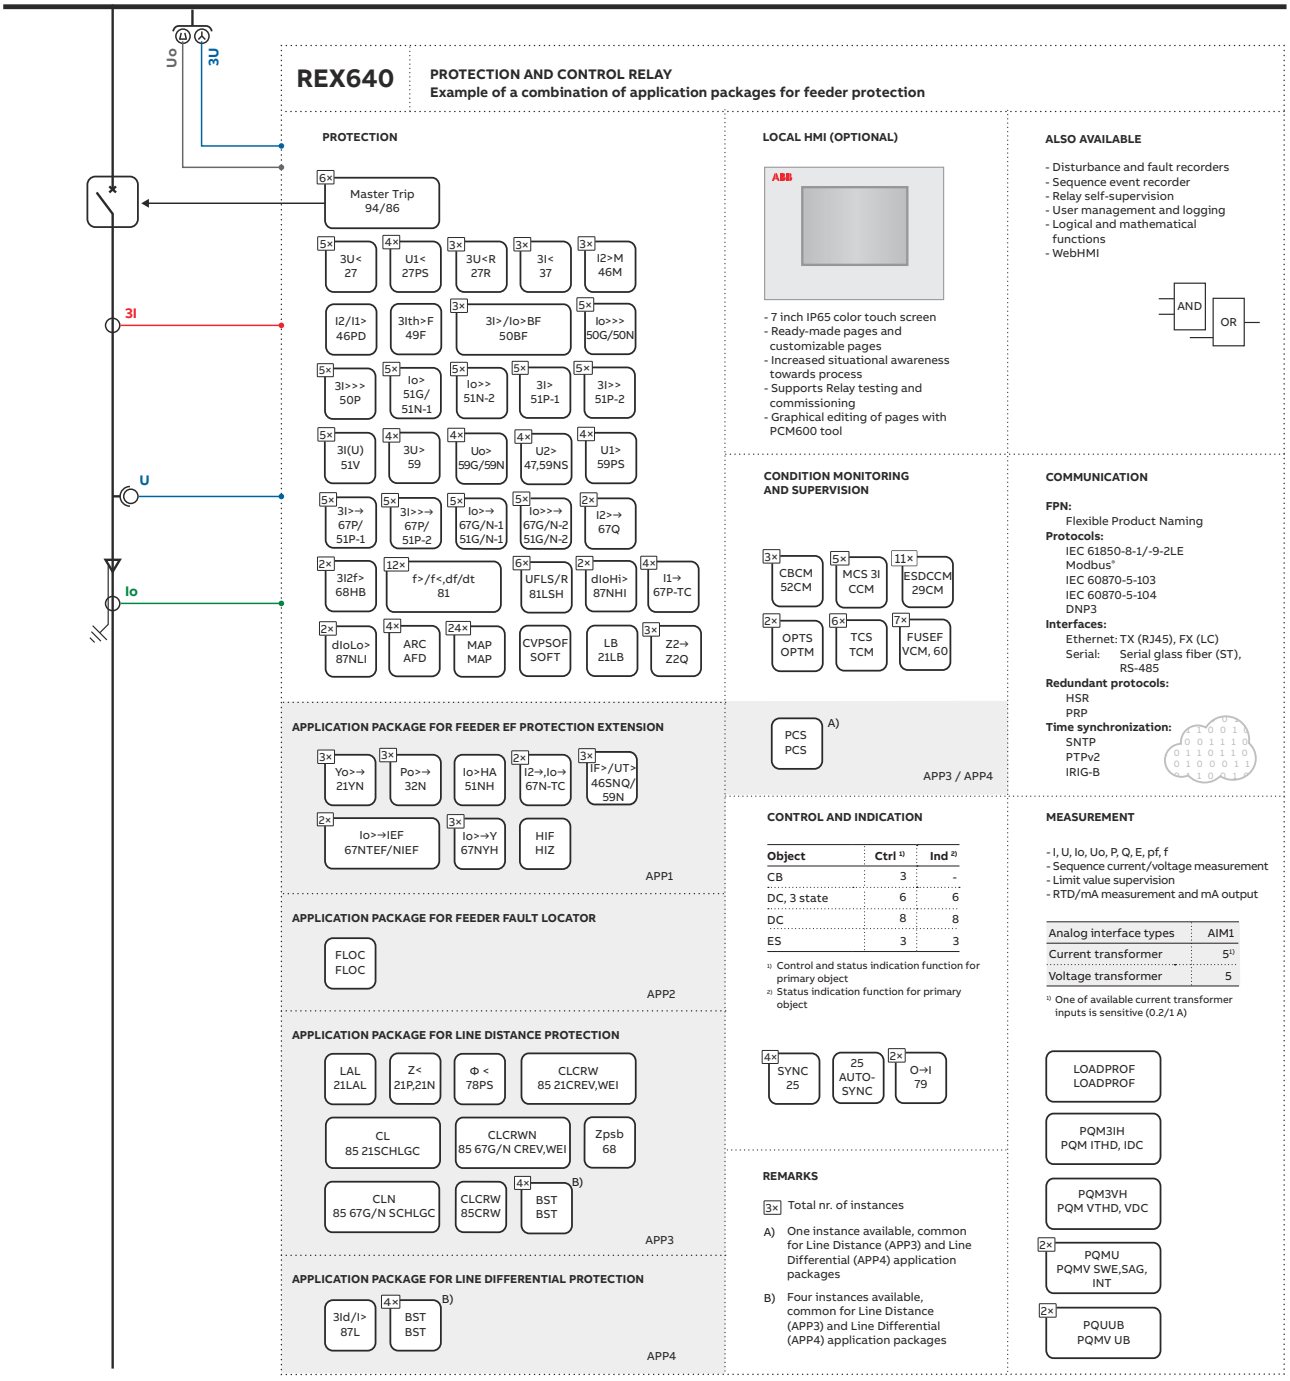

Figure 14: Feeder application

Figure 14 presents REX640 in a feeder application. The base functionality is enhanced with application packages providing both line distance and line differential protections. To provide additional protection against earth faults along the feeder, an additional application package has been selected. Conventional measuring transformers are used in the example case. The AIM1 analog input card provides the best match for them with

five voltage and five current inputs, one being a sensitive input.

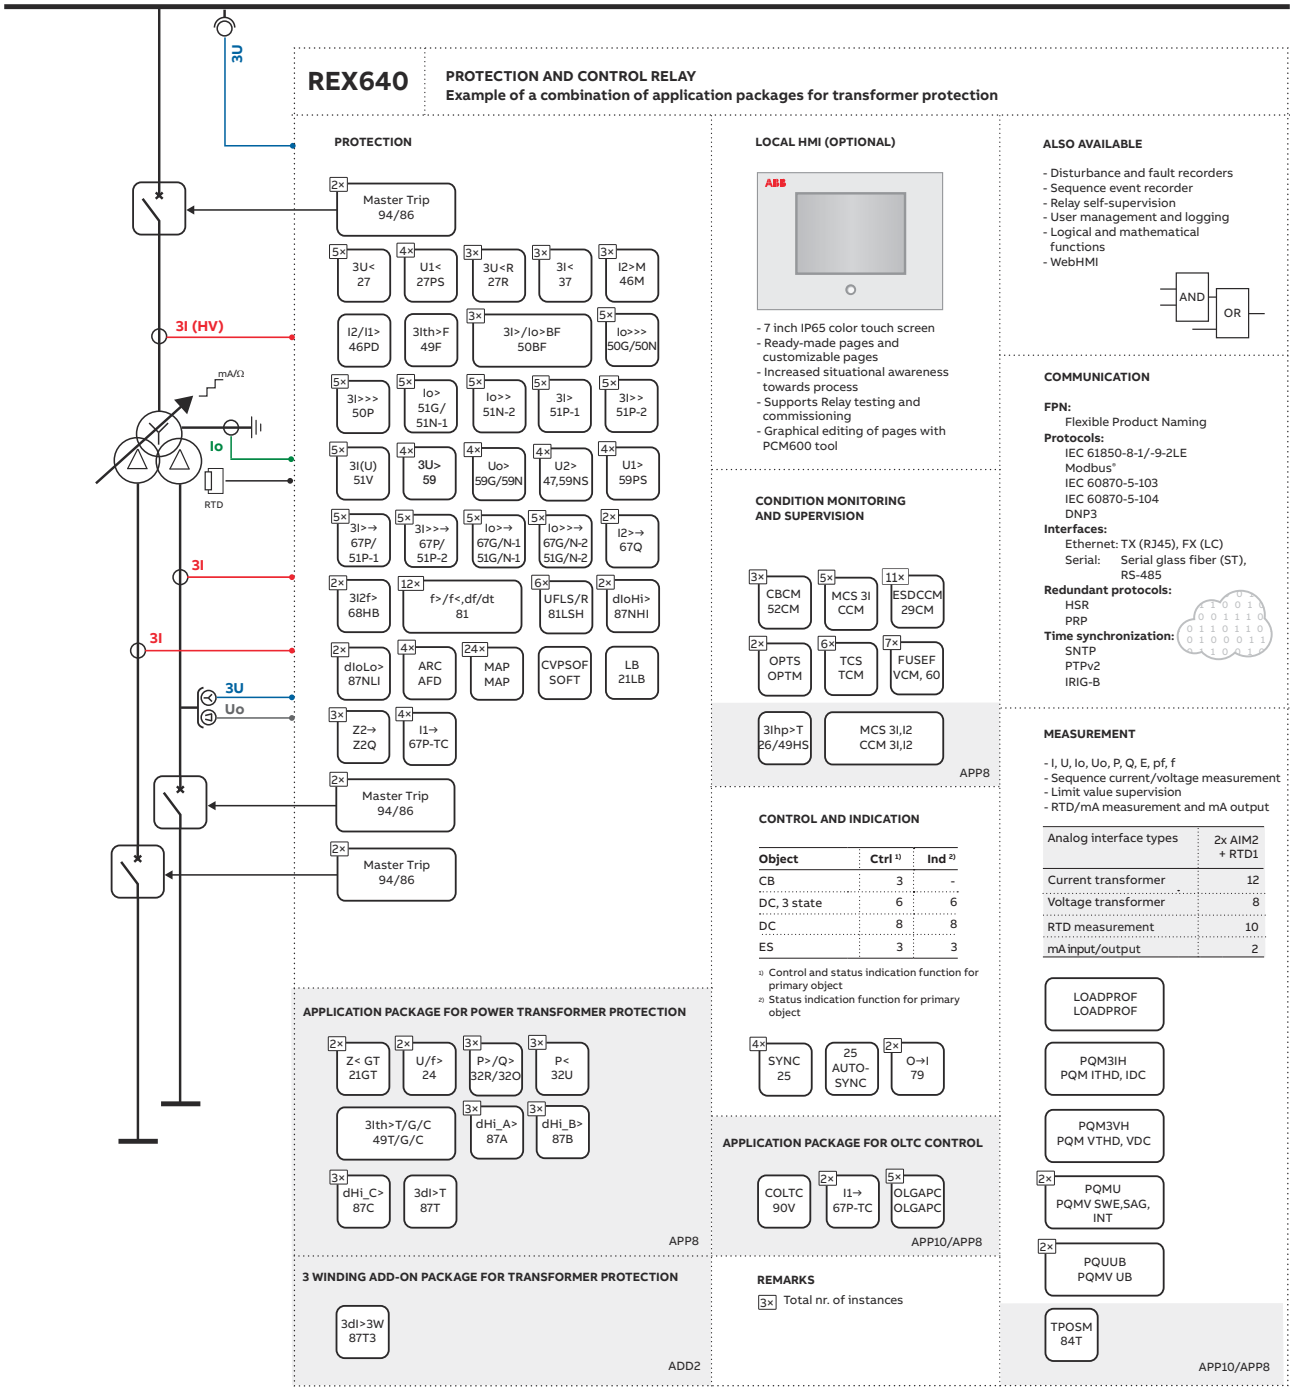

Figure 15: Transformer application

Figure 15 presents REX640 in a three-winding power transformer application. The base functionality is enhanced with a power transformer application package and the related three-winding add-on package. In the example case, REX640 also manages the on-load tap changer's manual and automatic control. For this purpose, the application package for OLTC control has been selected as well. Best match for current and voltage measurement can be managed by selecting two AIM2 cards for the relay. This combination

offers 12 current and 8 voltage channels to be freely allocated for the relay functionalities. The OLTC control function requires information on the tap-changer's actual position. To be able to provide this information, the relay is equipped with an RTD card which can measure the OLTC position either as a resistance value or as an mA signal.

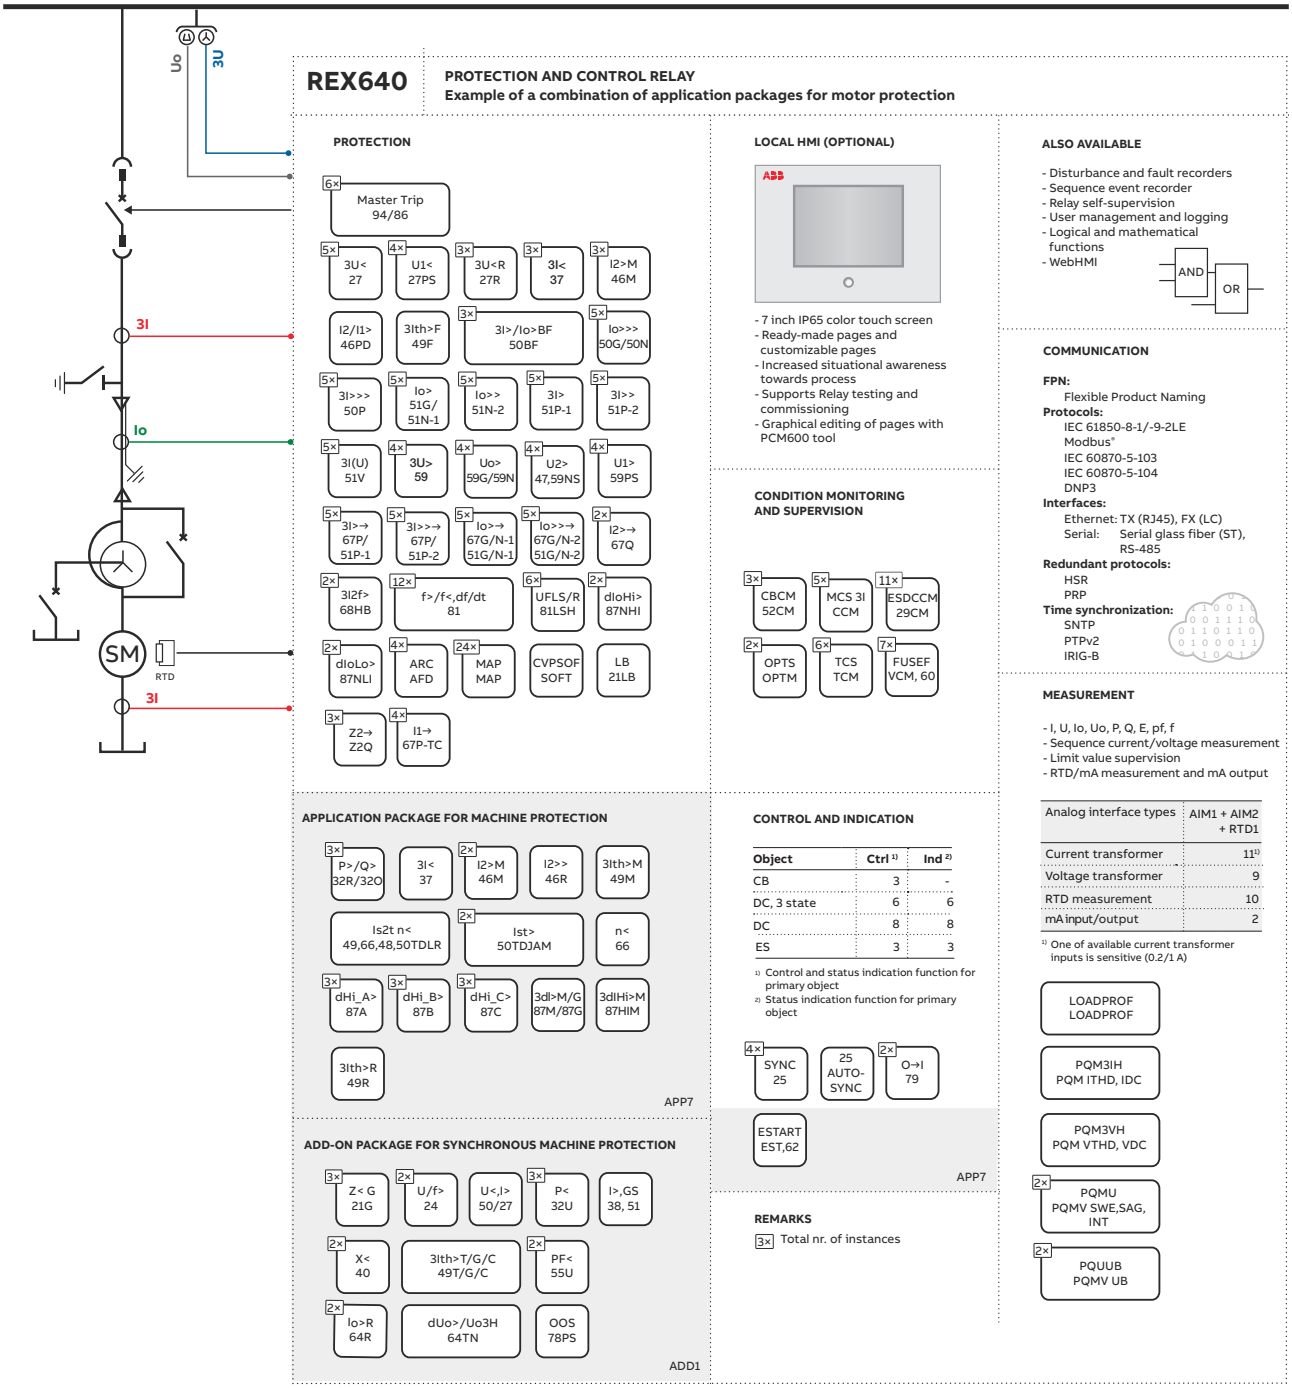

Figure 16: Motor application

Figure 16 presents REX640 in a synchronous motor application. The base functionality is enhanced with a machine protection application package and the related synchronous machine add-on package. Best match for current and voltage measurement can be managed by selecting both AIM1 and AIM2 cards for the relay. This combination offers 11 current and 9 voltage channels to be freely allocated for the relay functionalities. The

stator winding temperatures are monitored via the temperature sensors in the motor. These sensors are connected to the RTD card within the relay.

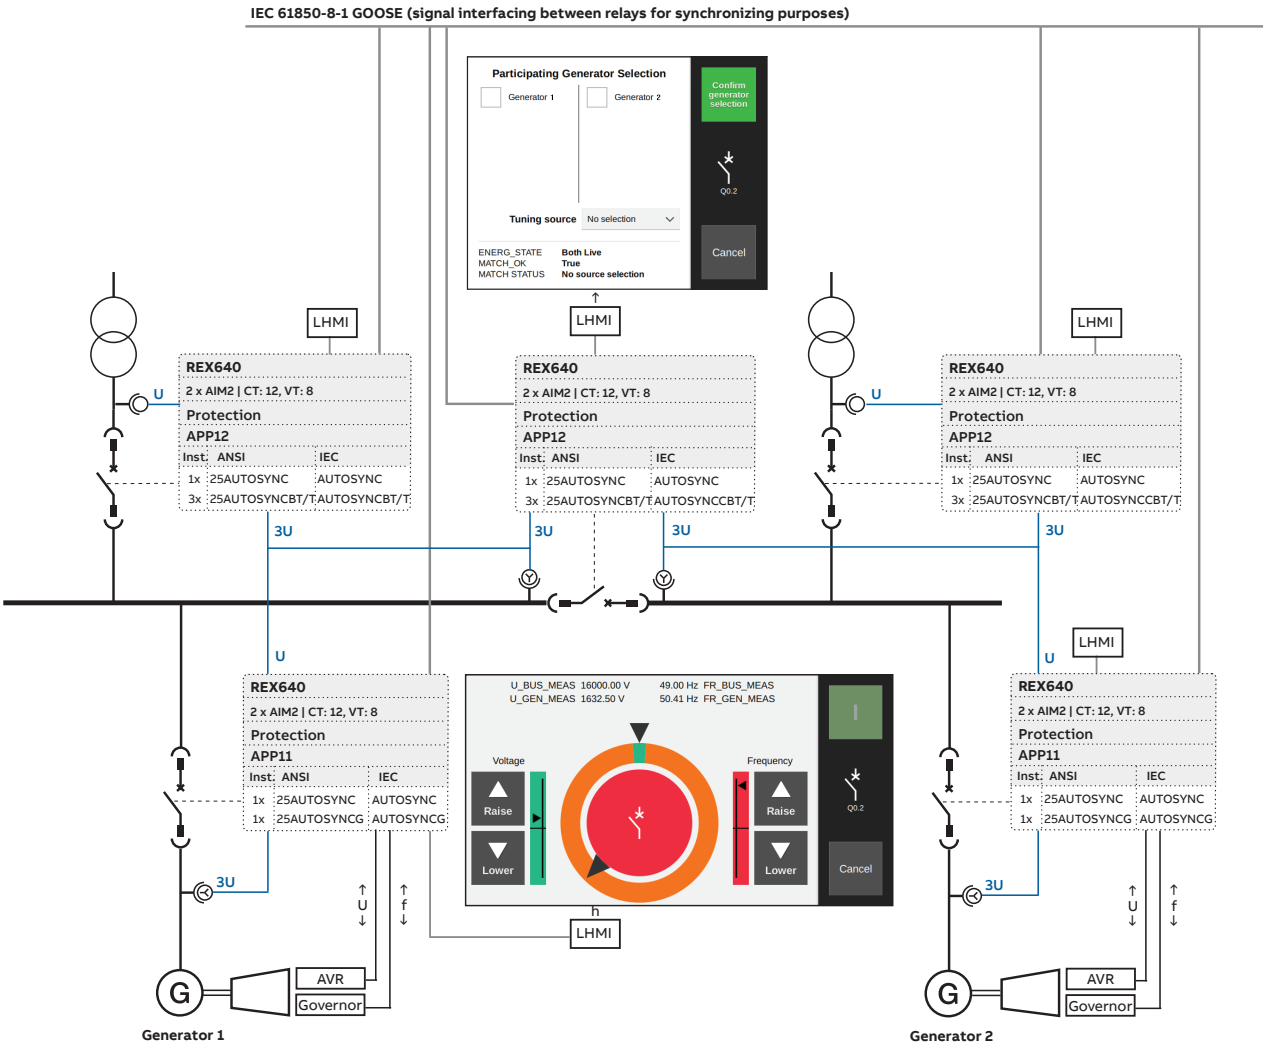

Figure 17: Autosynchronizer application

In addition to conventional protection, control, measurement and supervision duties, REX640 can perform both generator (APP11) and non-generator (APP12) circuit breaker synchronizing. Successful synchronization of two alternating power sources can be done by matching their voltage, frequency, phase sequence and phase angle. The circuit breaker (CB) connects the two sources after a period of CB closing time from the instant of a given close command. Hence, all the conditions of synchronization need to be met at the instant of CB close operation for successful synchronization.

Each REX640, being part of the overall synchronizing scheme, contains its own synchronizer function. When a generator CB is to be synchronized, the related REX640 controls the generator's voltage, frequency and angle difference by requesting the generator's AVR and prime mover's governor to change the set-points accordingly. The generator circuit breaker synchronizing does not require information exchange between other REX640 relays within the scheme.

When a non-generator CB is to be synchronized, all the REX640 relays within the scheme exchange information between themselves in order to identify suitable generator(s) for the voltage and frequency matching. Once the generators are identified and selected, the REX640 related to the circuit breaker to be synchronized sends a request to the selected

generator(s) REX640 for the required voltage and frequency corrections. When the voltage, frequency and the angle difference across the CB under synchronization are within the set limits, REX640 closes the circuit breaker. The information exchange between the REX640s takes place using IEC 61850-8-1 binary and analog GOOSE signaling over Ethernet.

The LHMI panels of REX640 can be used as local user interface for circuit breaker synchronization. The upper-level remote control systems like SCADA, DCS or PMS can interact with the synchronizing scheme using MMS or Modbus protocols. The REX640-based synchronizing scheme supports manual, semi-manual and automatic synchronizing modes.

When the synchronizing scheme includes both generator and non-generator CBs, the maximum size of the supported system is eight generator and 17 non-generator CBs.

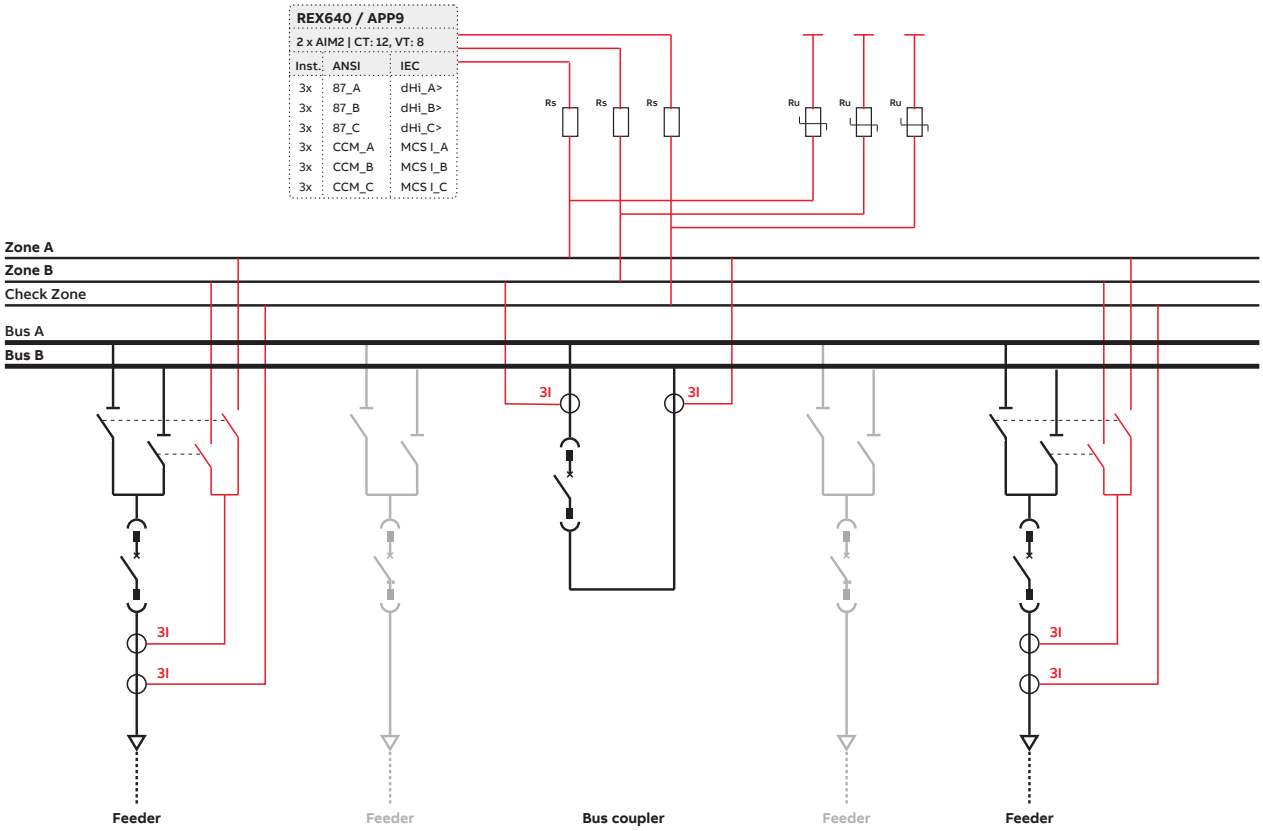

Figure 18: Busbar protection application

Figure 18 presents REX640 in a phase-dedicated highimpedance busbar protection application for a double busbar switchgear. The relay's base functionality is enhanced with the busbar protection application package (APP9). The two AIM2 cards in the relay provide a total of 12 current channels. In the example, 9 out of the 12 current channels are used to create three busbar protection zones. Zones A and B provide selective protection for Bus A and Bus B, respectively. The third zone, called check zone, covers both busbars. The check zone works as the final trip release condition for the selective zones; it provides security against false trip commands initiated by the selective zones, for example, due to a fault within the disconnector's auxiliary switch circuitry. The current transformers' secondary buswires for the three protection zones are supervised by dedicated functions within the relay.

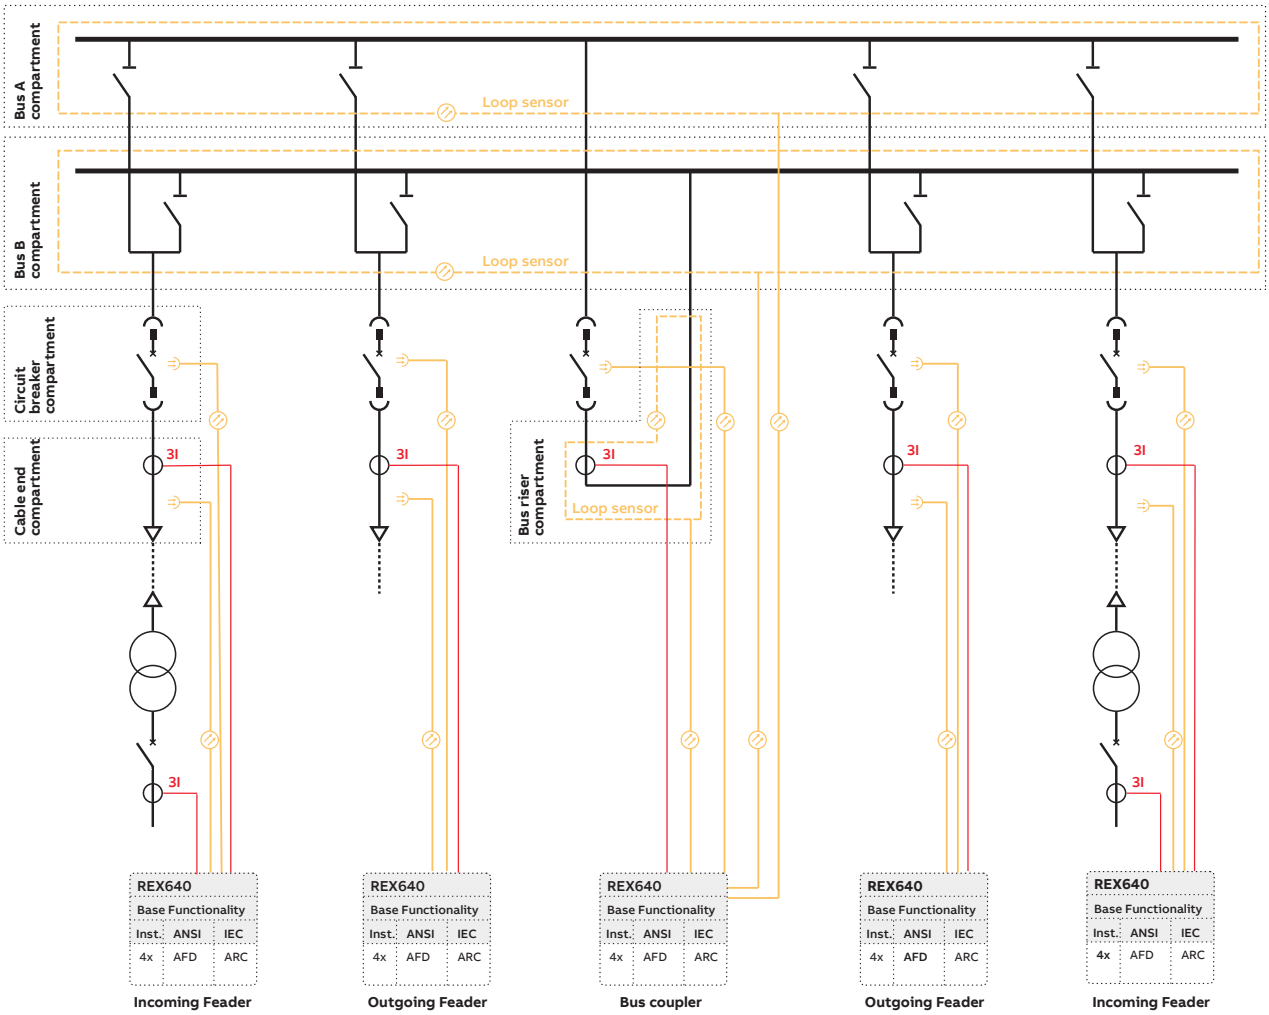

Figure 19: Arc flash protection application

Figure 19 presents an installation-wide arc flash protection scheme for a double busbar switchgear. REX640 protection relays are equipped with arc flash sensor card. The card supports a maximum of four pieces of either loop or lens sensors or a combination thereof. By using suitable sensor combinations for different bays, we can build up a selective arc flash protection scheme for the complete switchgear. The selective operation of the arc flash protection scheme limits the power outage caused by the arc fault to the smallest possible section of the switchgear. The arc flash protection operation is not dependent on light detection only; it is also supervised by arc fault current measurement. Since the arc flash protection operation should be as fast as possible, the use of static power outputs for tripping circuits is highly recommended. The functional condition of the arc flash sensor is continuously supervised and if a problem is detected, an alarm is triggered; this applies to both loop and lens sensors.

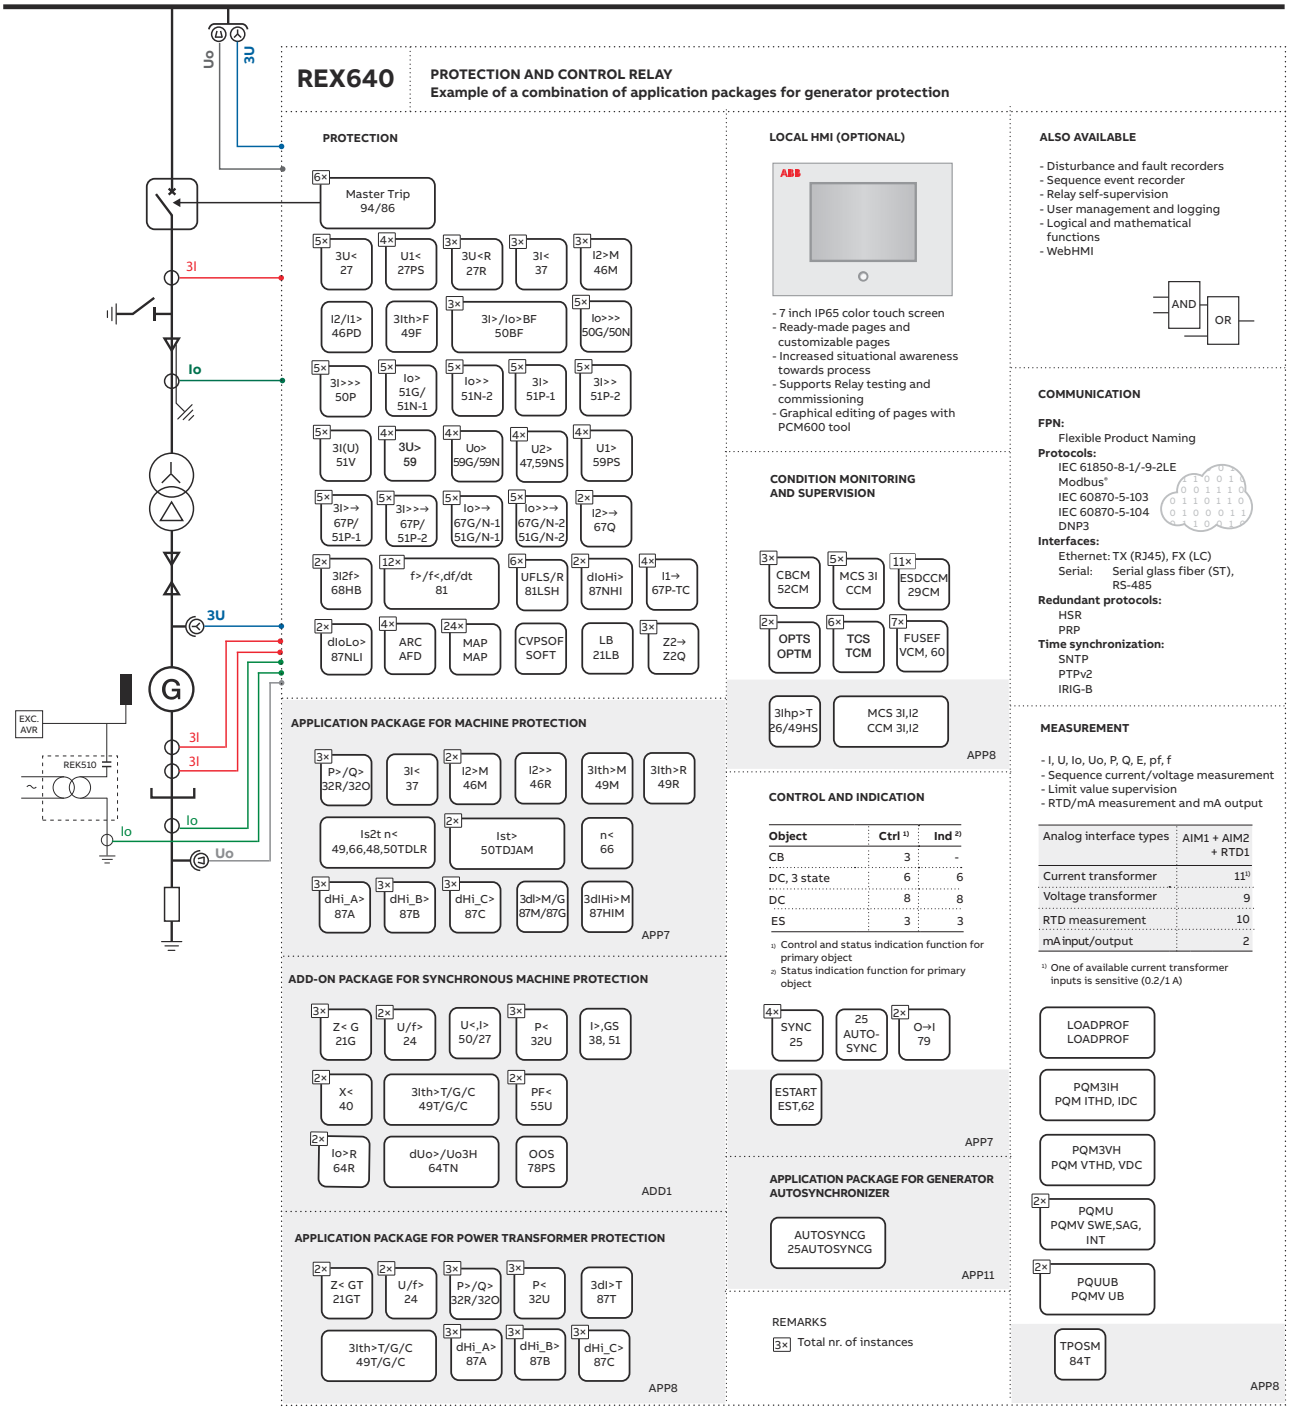

Figure 20: Generator application

Figure 20 presents REX640 in a synchronous generator application including a block transformer. The base functionality is enhanced with the machine protection and transformer protection application packages. The synchronous machine add-on package supports the related protection functions for a synchronous generator. Generator autosynchronizer application packages support the generator's synchronized connection into the busbars, in both manual and auto modes. The relay's LHMI works as the local operator interface for controlling the autosynchronizing sequence. An external injection device (REK 510) enables the generator's excitation circuit supervision against earth faults. Best match for

current and voltage measurement needs can be managed by selecting both AIM1 and AIM2 cards for the relay. This combination offers 11 current and 9 voltage channels to be freely allocated to the functionalities in the relay. The generator's stator winding temperatures are monitored using RTD sensors.

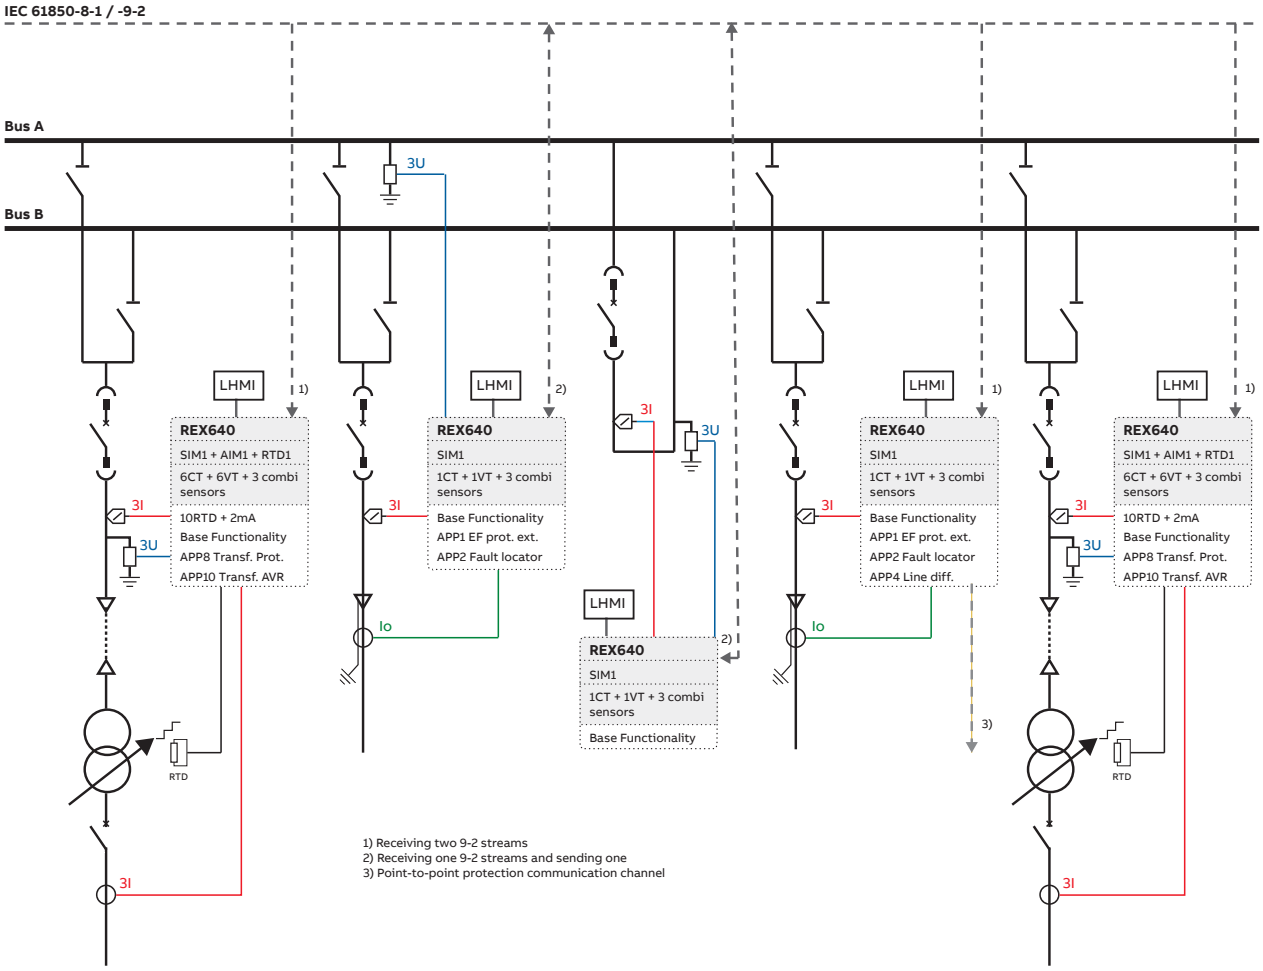

Figure 21: Digital switchgear application

REX640 is perfectly aligned with the needs of digital switchgear. Sensors are used for the local phase current and voltage measurements, apart from the high-voltage side current measurement used for power transformer protection, which is carried out by conventional current transformers. For the outgoing cable feeders, the earth-fault protection uses core balance current transformers. The Bus A voltage is measured by the relay in panel +J2, whereas the Bus B voltage is measured by the relay in panel +J3. Both relays send the measured bus voltages to the Ethernet bus as sampled measured values (SMV) according to IEC 61850-9-2 LE. Depending on the type of the feeder, it receives either one or two SMV streams. The feeders receiving two SMV streams automatically switch between the streams based on the position of the busbar disconnectors. All interlocking signals between the panels use binary GOOSE messaging according to IEC 61850-8-1. The incoming power transformer feeders measure also the cable side voltages to enable automatic voltage regulation (tap changer control) and synchronizing check functionality for circuit breaker closing.

8. Supported ABB solutions

The REX640 protection relay together with the ABB Ability Electrification Monitoring and Control ZEE600 constitutes a genuine IEC

61850 solution for reliable power distribution in utility and industrial power systems. To facilitate the system engineering, ABB's relays are supplied with connectivity packages. The connectivity packages include a compilation of software and relay-specific information, including single-line diagram templates and a full relay data model. The data model includes event and parameter lists. With the connectivity packages, the relays can be readily configured using PCM600 and integrated with the ZEE600.

REX640 offers native support for IEC 61850 Edition 2.1 including binary and analog horizontal GOOSE messaging. In addition, a process bus enabling sending and receiving of sampled values of analog currents and voltages is supported.

Unlike the traditional hardwired, inter-device signaling, peer-to-peer communication over a switched Ethernet LAN offers an advanced and versatile platform for power system protection. Among the distinctive features of the protection system approach, enabled by the full implementation of the IEC 61850 substation automation standard, are fast communication capability, continuous supervision of the protection and communication system's integrity, and flexible reconfiguration and upgrades. This protection relay series is able to optimally use the interoperability provided by the IEC 61850 Edition 2.1 features.

At substation level, ZEE600 uses the data content of the bay level devices to enhance the substation level functionality.

ZEE600 features a Web browser-based HMI, which provides a customizable graphical display for visualizing single-line mimic diagrams for switchgear bay solutions. Substation devices and processes can also be remotely accessed through the Web HMI, which improves personnel safety.

In addition, ZEE600 can be used as a local data warehouse for the substation's technical documentation and for the network data collected by the devices. The collected network data facilitates extensive reporting and analyzing of network fault situations by using the data historian and event handling features of ZEE600. The historical data can be used for accurate monitoring of process and equipment performance, using calculations based on both real-time and historical values. A better understanding of the process dynamics is achieved by combining time-based process measurements with production and maintenance events.

ZEE600 can also function as a gateway and provide seamless connectivity between the substation devices and network-level control and management systems.

9. Control

REX640 integrates functionality for controlling objects such as circuit breakers, disconnectors, earthing switches, on-load tap changers and Petersen coils via the LHMI or by means of remote controls. The relay includes three circuit breaker control blocks. In addition, the relay features 14 disconnector control blocks intended for the motor-operated control of disconnectors or a circuit breaker truck and three control blocks intended for the motor-operated control of the earthing switch. Furthermore, the relay includes eight additional disconnector position indication blocks and three earthing switch position indication blocks that can be used with disconnectors and earthing switches that are only manually controlled.

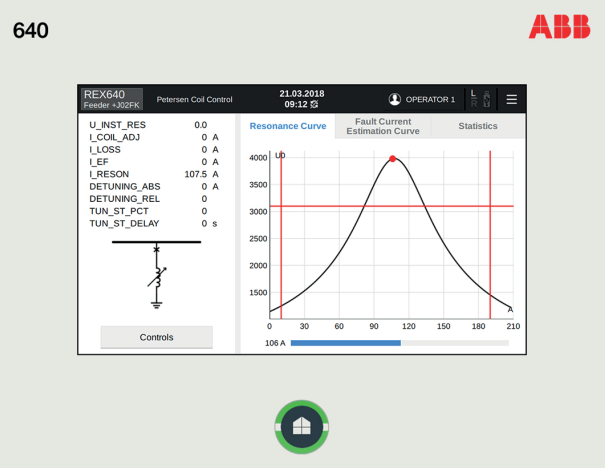

Figure 22: Petersen Coil control page

The touch screen LHMI supports a single-line diagram with control points and position indication for the relevant primary devices. Interlocking schemes required by the application are configured using Signal Matrix or Application Configuration in PCM600.

REX640 includes two autoreclosing functions, each with up to five programmable autoreclosing shots of desired type and duration. A load-shedding function performs load shedding based on underfrequency and the rate of change of the frequency.

To validate correct closing conditions for a circuit breaker, REX640 contains a synchrocheck function. For installations including synchronous generators, REX640 introduces a synchronizer that actively controls the generator's voltage and frequency in order to reach a synchronous situation across the circuit breaker. The synchronizer functionality is available for a generator circuit breaker as well as for a nongenerator (network) circuit breaker. A complete installationwide synchronizing system can be built using the REX640 relays. The maximum size of the synchronizing system is eight generator breakers and 17 non-generator breakers.

Synchronization of a generator circuit breaker can be implemented using a single REX640 relay including the ASGCSYN function block. The relay interfaces the external measurement and control circuitry via hardwired binary and analog signals. The excitation and prime mover control signals are based on pulse commands, either with fixed or variable length. The synchronizer function block has three different function modes: manual, semi-automatic and automatic. In each of these modes, the LHMI acts as the local user interface. The LHMI includes the necessary command, indication and measurement features for each of the modes, thus rendering the conventional dedicated synchronizing panel unnecessary.

REX640 also supports systems in which non-generator circuit breakers are synchronized. The prerequisite is that all the feeders within the system are equipped with REX640 relays. The generator relays have to contain the ASGCSYN function block and all the non-generator relays need to contain the ASNSCSYN function block. In addition, all the REX640 relays have to contain the coordinator function block ASCGAPC. The role of ASCGAPC is to model the system primary circuit connection state to involve the correct generators for the synchronization of a non-generator breaker and to interact between the ASGCSYN and ASNSCSYN function blocks. The information exchange between ASCGAPC, ASGCSYN and ASNSCSYN is carried out via binary and analog GOOSE signalling as per IEC 61850-8-1. The LHMI dedicated to the relay (breaker) works as the local user interface for a nongenerator breaker synchronizing. The available synchronizing modes are "automatic" and "semi-automatic". A manual synchronization of the non-generator breaker can be carried out as a back-up solution in situations where the communication system (IEC 61850-8-1) is not available. This requires operator actions from two LHMIs, namely from the LHMI of the concerned non-generator breaker and the LHMI of the manually selected generator relay.

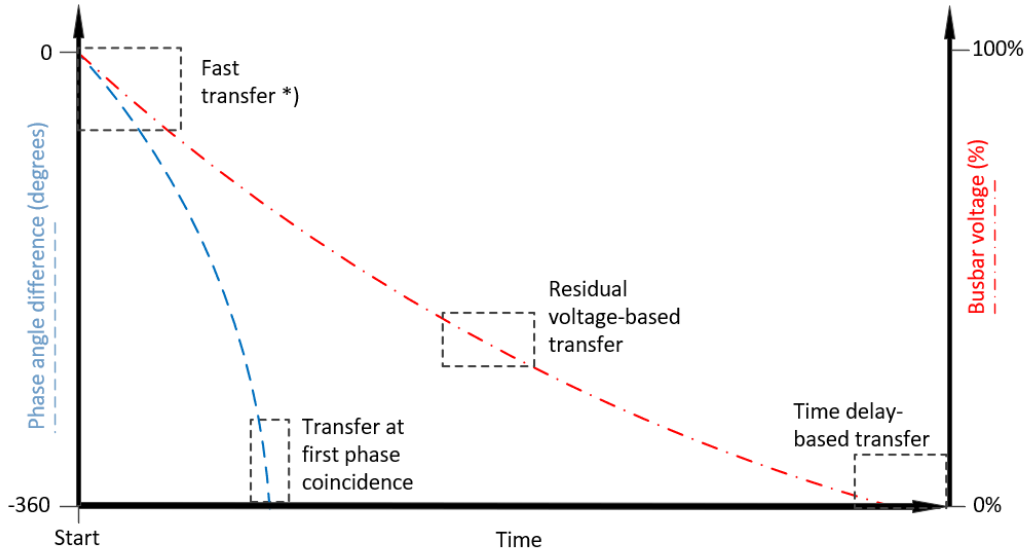
10. High-speed transfer device (HSTD)

REX640 can perform automatic high-speed transfer functionality utilizing APP51 or APP52 or APP53 application packages. In the industry the functionality is also referred as high-speed busbar transfer (HSBT), motor bus transfer (MBT), high-speed motor bus transfer (HSMBT) and automatic bus transfer (ABT).

The high-speed transfer is typically required in processes where the electrical supply for the critical system parts must be secured by connecting alternative (stand-by) feeder online. Such processes are typically be found in petrochemical, pharmaceutical, semiconductor manufacturing industries and in electrical power generation plants. Common feature for these examples is that there are motors fed by the switchgear, these motors will back-feed the busbar once the grid connection is lost. The declining busbar voltage and frequency must be considered carefully to determine the correct closing moment for the alternative feeder.

The supported transfer modes are:

- Fast transfer
- Transfer at first phase coincidence
- Residual voltage-based transfer
- Time delay-based transfer



The fast transfer mode can be further divided into simultaneous and sequential circuit breaker control schemes. Selection of the transfer mode takes place dynamically considering the set parameters and the prevailing network conditions. Typically, the fast transfer mode is the preferred one, but in case the network conditions do not allow this mode to be executed, the next one would be

the first phase coincident mode followed by residual and time delayed modes.

The triggering of transfer functionality can happen internally in the REX640 by the HSABTC transfer function, or it can be based on external triggering signal, or it can be manually initiated.

In addition to necessary voltage measurements, the REX640 can be connected to measure main and alternative feeders phase currents. The current measurements are necessary only if the automatic circuit breaker travel time calculation is based on current measurement, instead of circuit breaker position information.

While engineering a REX640 based HSTD scheme, couple of hardware related performance issues must be considered to enable the fast transfer and transfer at first phase coincident operation modes. The static power output module(s) in REX640 must be used for circuit breaker controls within the scheme. The closing delay of the involved circuit breakers must be less than 100 ms.

*) The fast transfer mode offers two circuit breaker control schemes; simultaneous and sequential (break-before-make).

Figure 23: Conceptual overview of transfer modes

Each of the APP51, APP52 and APP53 application packages support all the different transfer modes. The difference between the packages is in the number of actual transfer functions (HSABTC) instances, resulting higher scheme flexibility and increase in the number of supported circuit breakers.

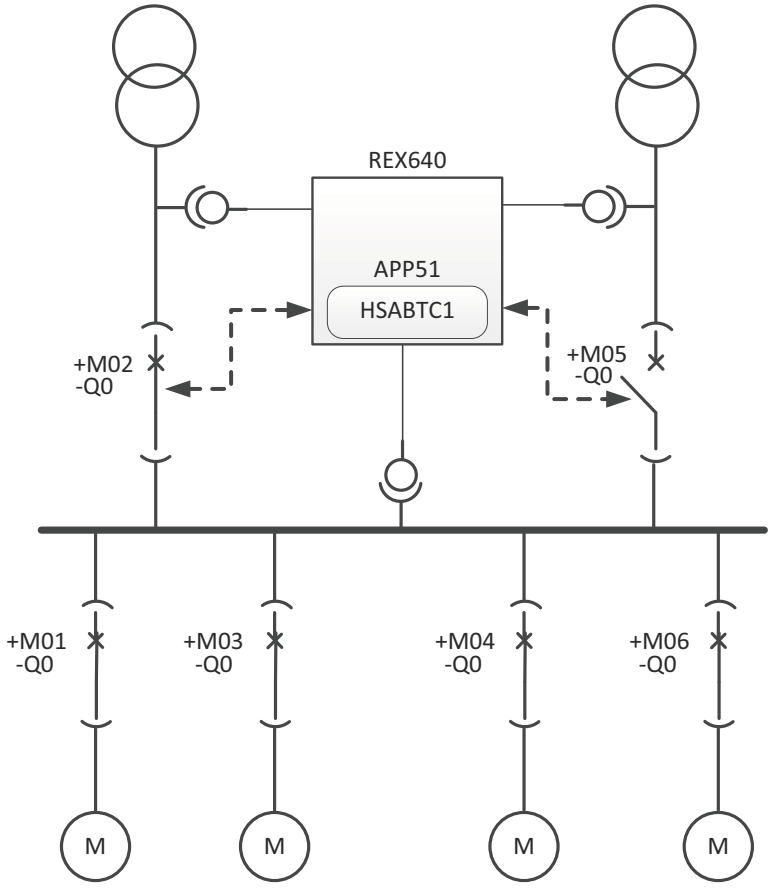


Figure 24: Example case in using APP51

In the above example the motor control switchgear is supplied by two incoming feeders +M02 and +M05. Under normal conditions the switchgear is supplied by +M02 feeder only, whereas the feeder +M05 works as the stand-by feeder. In case the HSTD functionality is triggered by supply disturbances in the +M02 feeder, the REX640 will automatically transfer the supply over to +M05 feeder. Once the +M02 feeder is available again, the transfer back to the original configuration can be initiated manually. Cases where the feeder +M05 works as the main feeder and the +M02 as the stand-by feeder, are supported as well.

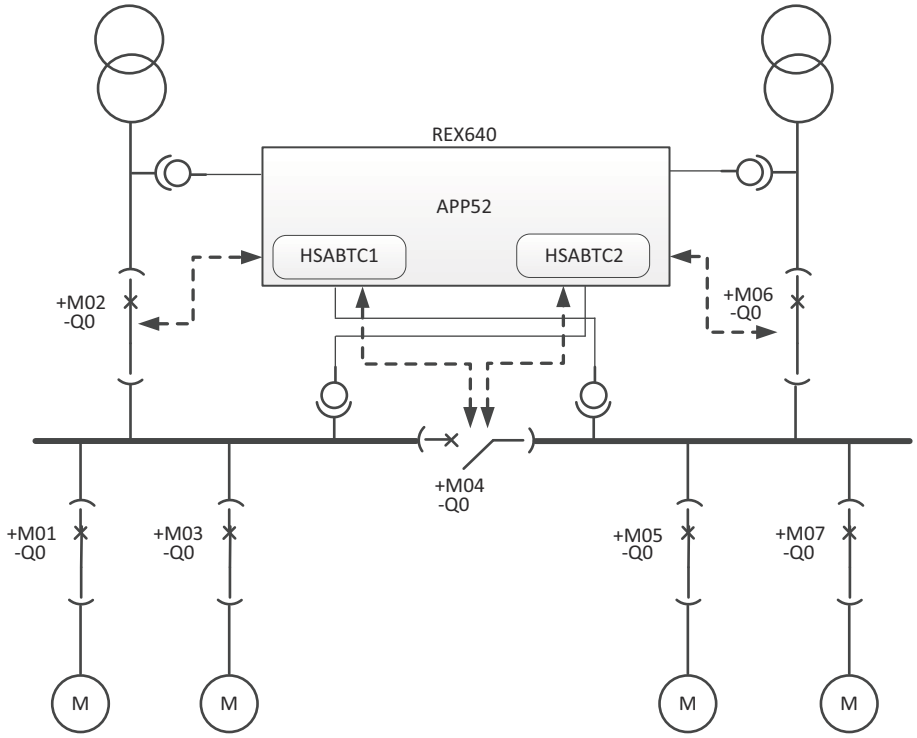

Figure 25: Example case in using APP52

In the above example the motor control switchgear is supplied by two incoming feeders +M02 and +M06. Under normal conditions both the incoming feeders are closed, while the bus-sectionalizer +M04 remains open. In case the HSTD functionality is triggered by supply disturbances in either of the incoming feeders, +M02 or +M06, the REX640 will automatically transfer the concerned bus-section supply to the healthy incoming feeder by closing the bus-sectionalizer +M04 circuit breaker. Once the failed incoming feeder is available again, the transfer back to the original configuration can be initiated manually.

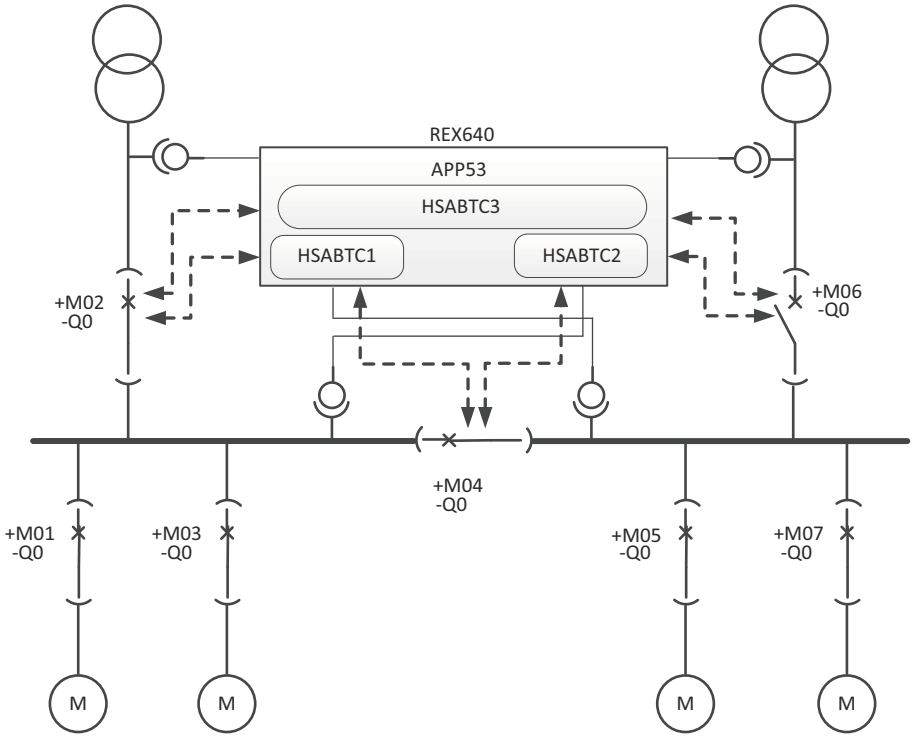

Figure 26: Example case in using APP53

The above example of utilizing APP53 application package is very similar to the earlier presented APP52 example case. However, the third instance of HSABTC function enables higher flexibility with the transfer scheme. Let us consider a situation where the switchgear is supplied by one incoming feeder, let's say +M02, and the bus-sectionalizer +M04 is closed. Let us further assume that the other incoming feeder +M06 is available, even though not closed.
In case supply disturbances are recognized with the +M02 incoming feeder, the HSTD functionality resulting a transfer from +M02 incoming feeder to +M06 incoming feeder can be initiated. Manually triggered configuration changes between the incoming feeders and the bus-sectionalizer are fully supported.

11. Arc flash protection

The arc flash protection is available on the optional hardware module. The module supports connection of up to four sensors. The sensors can be of lens or loop types, or a free mixture. Both sensor types are supervised against sensor failure. Fast tripping increases staff safety and limits material damage, therefore it is recommended to use static power outputs (SPO) instead of normal power outputs (PO). This typically decreases the total operating time with 4..6 ms compared to the normal power outputs.

12. Power transformer differential protection

The relay offers low-impedance differential protection for two-winding (two restraints) and three-winding (three restraints) power transformers. The power transformer protection application package includes the protection for a two-winding power transformer. If support for three-winding power transformer is needed, the corresponding

protection add-on package can be selected. Both low-impedance differential functions feature three-phase multi-slope stabilized stages and an instantaneous stage to provide fast and selective protection against short circuits, winding interturn faults and bushing flash-overs. A second harmonic restraint with advanced waveform-based blocking ensures stability at transformer energization. The fifth harmonic based blocking and unblocking limits stabilize the protection performance in moderate overexcitation situations. In case of three-winding differential protection, the connection group phase shift matching can be done with 0.1 degree resolution supporting cycloconverter applications. If the tap-changer position information is available, it is possible to further increase the protection sensitivity by compensating the tap-changer position error within the measured differential current.

The power transformer protection application package also includes high-impedance differential functions for a phasesegregated protection scheme. If this scheme is applied, the related current transformers have to be correctly selected and the necessary secondary circuit components, external to the relay, defined.

13. Measurements

The base functionality of the REX640 relay contains a number of basic measurement functions for current, voltage, frequency, symmetrical components of currents and voltages, power, power factor and energy. These measurement functions can be freely connected to the measured secondary quantities available in the relay. The relay can also measure various analog signals via RTD and mA inputs. All these measurements can be used within the relay configuration for additional logics. The measurements are available locally on the HMI and can be accessed remotely via communication. The information is also accessible via WHMI.

The relay is also provided with a load profile recorder. The load profile feature stores the selected load measurement data captured periodically (demand interval). The records can be viewed on the LHMI and are available in COMTRADE format.

14. Power quality

In the EN standards, power quality is defined through the characteristics of the supply voltage. Transients, shortduration and long-duration voltage variations and unbalance and waveform distortions are the key characteristics describing power quality. The distortion monitoring functions are used for monitoring the current total demand distortion and the voltage total harmonic distortion.

Power quality monitoring is an essential service that utilities can provide for their industrial and key customers. A monitoring system can provide information about system disturbances and their possible causes. It can also detect problem conditions throughout the system before they cause customer complaints, equipment malfunctions and even equipment damage or failure. Power quality problems are not limited to the utility side of the system. In fact, the majority of power quality problems are localized within customer facilities. Thus, power quality monitoring is not only an effective customer service strategy but also a way to protect a utility's reputation for quality power and service.

The protection relay has the following power quality monitoring functions.

- Voltage variation
- Voltage unbalance
- Current harmonics
- Voltage harmonics

The voltage unbalance and voltage variation functions are used for measuring short-duration voltage variations and monitoring voltage unbalance conditions in power transmission and distribution networks.

The voltage and current harmonics functions provide a method for monitoring the power quality by means of the current waveform distortion and voltage waveform distortion. The functions provide selectable short-term 3- or 60- or 300–second sliding average and a long-term demand for total demand distortion (TDD) and total harmonic distortion (THD). The phase-specific harmonic content is measured for voltages and currents, as well as DC component and fundamental content. The dedicated harmonics measurement page in the LHMI presents the measurements in a userfriendly manner.

15. Fault locator

The relay features an optional impedance-measuring fault location function suitable for locating short circuits in radial distribution systems. Earth faults can be located in effectively and low-resistance earthed networks, as well as in compensated networks. When the fault current magnitude is at least of the same order of magnitude or higher than the load current, earth faults can also be located in isolated neutral distribution networks. The fault location function identifies the type of the fault and then calculates the distance to the fault point. The calculations provide information on the fault resistance value and accuracy of the estimated distance to the fault point.

16. Disturbance recorder

The relay is provided with a disturbance recorder featuring up to 24 analog and 64 binary signal channels. The analog channels can be set to record either the waveform or the trend of the currents and voltages measured.

The analog channels can be set to trigger the recording function when the measured value falls below or exceeds the set values. The binary signal channels can be set to start a recording either on the rising or the falling edge of the binary signal or on both.

The binary channels can be set to record external or internal relay signals, for example, the start or trip signals of the relay stages, or external blocking or control signals. The recorded information is stored in a nonvolatile memory in COMTRADE format and can be uploaded for subsequent fault analysis.

17. Event log

To collect sequence-of-events information, the relay has a nonvolatile memory capable of storing 1024 events with the associated time stamps. The event log facilitates detailed pre- and post-fault analyses of feeder faults and disturbances. The considerable capacity to process and store data and events in the relay supports the growing information demand of future network configurations.

The sequence-of-events information can be accessed either via the LHMI or remotely via the communication interface of the relay. The information can also be accessed locally or remotely using the Web HMI.

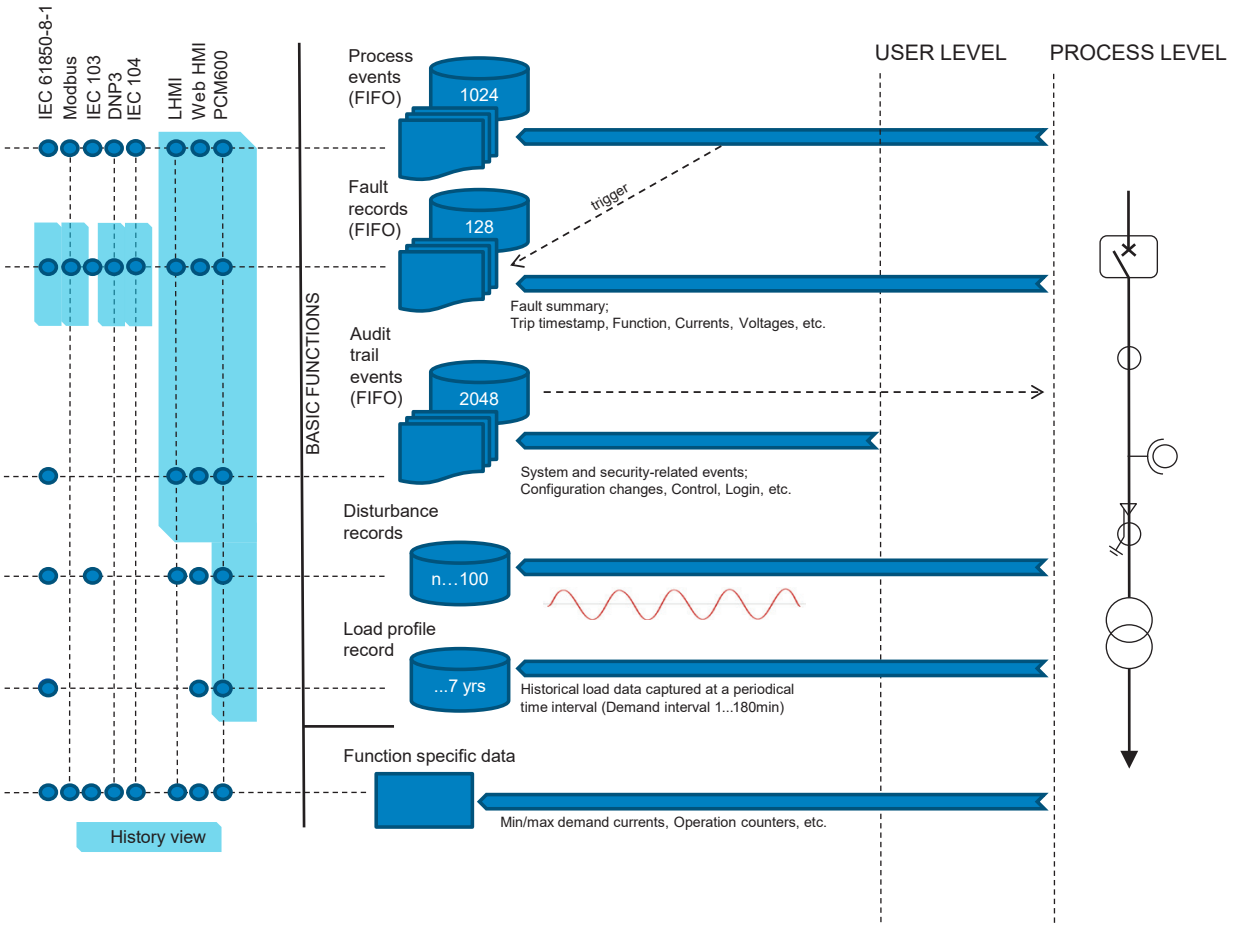

Figure 27: Event recording

18. Recorded data

The relay can store the records of the latest 128 fault events. The records can be used to analyze the power system events. Each record includes, for example, current, voltage and angle values and a time stamp. The fault recording can be triggered by the start or the trip signal of a protection block, or by both. The available measurement modes include DFT, RMS and peak-to-peak. Fault records store relay measurement values when any protection function starts. In addition, the maximum demand current with time stamp is separately recorded. The records are stored in the nonvolatile memory.

19. Load profile

The load profile recorder stores the historical load data captured periodically (demand interval). Up to 12 load quantities can be selected for recording and storing in the nonvolatile memory. The recordable quantities include currents, voltages, power and power factor values. The recording time depends on a settable demand interval parameter and the amount of quantities selected. The quantities' type and amount to be recorded are determined in the application configuration. The recorded quantities are stored in the COMTRADE format.

20. Trip circuit supervision

The trip circuit supervision continuously monitors the availability and operability of the trip circuit. It provides opencircuit monitoring both when the circuit breaker is in closed and

in open position. It also detects loss of circuit-breaker control voltage.

21. Self-supervision

The relay's built-in self-supervision system continuously monitors the state of the relay hardware and the operation of the relay software. Any fault or malfunction detected is used for alerting the operator.

A permanent relay fault blocks the protection functions to prevent incorrect operation.

22. Access control and cybersecurity

Cybersecurity measures are implemented to secure safe operation of the protection and control functions. The relay supports these measures with configuration hardening capabilities, encrypted communication, Ethernet filter and rate limiter, security event logging and user access control.

The relay supports role-based user authentication and authorization with individual user accounts as defined in IEC 62351-8. All user activity is logged as security events to an audit trail in a nonvolatile memory and sent as messages to the SysLog server. The nonvolatile memory does not need battery backup or regular component exchange to maintain the memory storage. File transfer and Web HMI use communication encryption protecting the data in transit. Also, the communication link between the relay configuration tool PCM600 and the relay is encrypted. All rear communication ports and optional protocol services can be activated according to the required system setup.

User accounts can be managed by PCM600 or centrally. A central account management is an authentication infrastructure that offers a secure solution for enforcing access control to relays and other systems within a substation. This incorporates management of user accounts, roles and certificates and the distribution of such, a procedure completely transparent to the user. The central server handling user accounts can be, for example, an Active Directory (AD) server such as Windows AD.

The relay supports full Public Key Infrastructure as defined by IEC 62351-9. With this, the user can ensure that the certificates used in secured communication are from a userapproved provider instead of device self-signed certificates.

23. Station communication

Operational information and controls are available through a wide range of communication protocols including IEC 61850 Edition 2.1, IEC 61850-9-2 LE, IEC 60870-5-103, IEC 60870-5-104, Modbus® and DNP3. The Profibus DPV1 communication protocol is supported via the protocol converter SPA-ZC 302. Full communication capabilities, forexample, horizontal communication between the relays, are only enabled by IEC 61850.

The relay provides the possibility for a second IP address and a second subnetwork when the communication modules with three Ethernet ports (COM1001...1003) are used. However, only one IP network can be used as the default route. Using two IP addresses, communication networks can be separated based on the dominant user's needs. For example, one IP address can serve the dispatchers and the other one can serve the service engineers' needs.

The IEC 61850 protocol is a core part of the relay as the protection and control application is fully based on standard modelling. The relay supports Edition 2.1 and Edition 1 versions of the standard. With Edition 2.1 support, the relay has the latest functionality modelling for substation applications and the best interoperability for modern substations. The relay supports flexible product naming (FPN) facilitating the mapping of relay's IEC 61850 data model to a customer defined IEC 61850 data model.

The IEC 61850 communication implementation supports monitoring and control functions. Additionally, parameter settings, disturbance recordings and fault records can be accessed using the IEC 61850 protocol. Disturbance recordings are available to any Ethernet-based application in the standard COMTRADE file format. The relay supports simultaneous event reporting to five different clients on the station bus.

The relay can send binary and analog signals to other devices using the IEC 61850-8-1 GOOSE (Generic Object Oriented Substation Event) profile. Binary GOOSE messaging

can, for example, be used for protection and interlocking-based protection schemes. The relay meets the GOOSE performance requirements for tripping applications in distribution substations, as defined by the IEC 61850 standard (class P1, <3 ms data exchange between the devices). The relay also supports the sending and receiving of analog values using GOOSE messaging. Analog GOOSE messaging enables easy transfer of analog measurement values over the station bus, thus facilitating, for example, the sending of measurement values between the relays when controlling transformers running in parallel.

The relay also supports IEC 61850 process bus concept by sending and receiving sampled values of currents and voltages. With this functionality the galvanic interpanel wiring can be replaced with Ethernet communication. The analog values are transferred as sampled values using the IEC 61850-9-2 LE protocol. REX640 supports publishing of one and subscribing of four sampled value streams. The intended application for sampled values are current-based differential protection functions or sharing the voltage values with the relays that have voltage-based protection or supervision functions. The relay can receive up to four sampled value streams and totally 16 measurements can be connected into the protection relay application.

Relays with process bus based applications use IEEE 1588 edition 2 for high-accuracy time synchronization.

For redundant Ethernet communication in station bus, the relay offers either two optical or two galvanic Ethernet network interfaces.

An optional third port with optical or galvanic Ethernet network interface is also available. The relay also provides an optional fiber-optic port for dedicated protection communication which can be used for up to 50 km distances depending on the selected fiber transceiver. The intended teleprotection applications for this port are line differential and line distance protection communication or binary signal transfer. The optional third Ethernet interface provides connectivity for any other Ethernet device to an IEC 61850 station bus inside a switchgear bay, for example connection of a remote I/O. Ethernet network redundancy can be achieved using the high-availability seamless redundancy (HSR) protocol or the parallel redundancy protocol (PRP), or with a self-healing ring using RSTP in the managed switches. Ethernet redundancy can be applied to the Ethernet-based IEC 61850, Modbus and DNP3 protocols.

The IEC 61850 standard specifies network redundancy which improves the system availability for the substation communication. The network redundancy is based on two complementary protocols defined in the IEC 62439-3 standard: PRP and HSR protocols. Both protocols are able to overcome a failure of a link or switch with a zero switchover time. In both protocols, each network node has two identical Ethernet ports dedicated for one network connection.

The protocols rely on the duplication of all transmitted information and provide a zero switchover time if the links or switches fail, thus fulfilling all the stringent real-time requirements of substation automation.

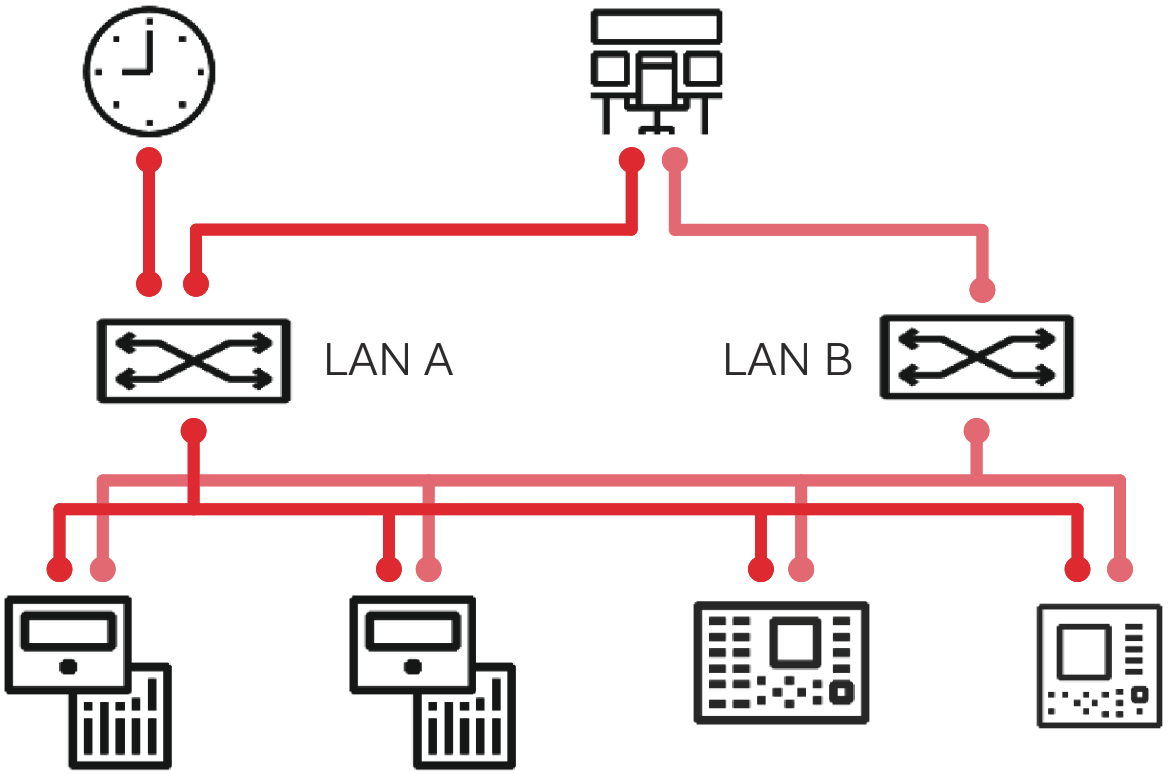

Figure 28: Parallel redundancy protocol (PRP) solution

In PRP, each network node is attached to two independent networks operated in parallel. The networks are completely separated to ensure failure independence and can have different topologies. As the networks operate in parallel, they provide zero-time recovery and continuous checking of redundancy to avoid failures.

HSR applies the PRP principle of parallel operation to a single ring. For each message sent, the node sends two frames, one through each port. Both frames circulate in opposite directions over the ring. Every node forwards the frames it receives from one port to another to reach the next node. When the originating sender node receives the frame it sent, the sender node discards the frame to avoid loops. The HSR ring supports the connection of up to 30 relays. If more than 30 relays are to be connected, it is recommended to split the network into several rings to guarantee the performance for real-time applications.

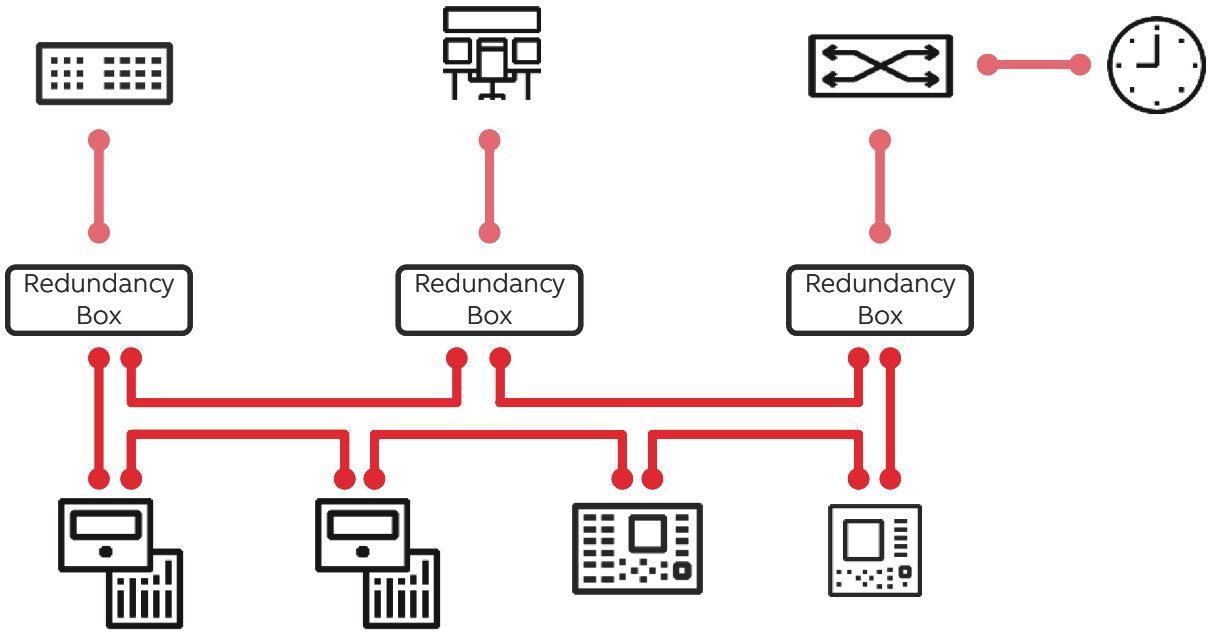

Figure 29: High-availability seamless redundancy (HSR) solution

The relay can be connected to Ethernet-based communication systems in a station bus using the RJ-45 connector (100Base-TX) or the multimode fiber optic LC connector (100Base-FX). A dedicated protection communication port uses a pluggable multimode or single mode fiber optic LC connector (100Base-FX). If connection to a serial bus is required, the RS-485 or fiber-optic serial communication ports can be used.

Modbus implementation supports RTU, ASCII and TCP modes. Besides standard Modbus functionality, the relay supports retrieval of time-stamped events, changing the active setting group and uploading of the latest fault records. If a Modbus TCP connection is used, five clients can be connected to the relay simultaneously. Further, Modbus serial and Modbus TCP can be used in parallel, and, if required, both IEC 61850 and Modbus can be run simultaneously.

The IEC 60870-5-103 implementation supports two parallel serial bus connections to two different masters. Besides basic standard functionality, the relay supports changing of the active setting group and uploading of disturbance recordings in IEC 60870-5-103 format. Further, IEC 60870-5-103 can be used at the same time with the IEC 61850 protocol.

Table 3: Time synchronization methods supported by the relay

Methods	Time-stamping resolution
SNTP (Simple network time protocol) [2]	1 ms
IRIG-B (Inter-Range Instrumentation Group - Time Code Format B) [3]	4 µs
PTPv2 (IEEE 1588) with Power profile (IEEE Std C37.238-2011) and Utility profile (IEC 61850-9-3)	4 µs [4]

[2] Ethernet-based
[3] With special time synchronization wiring
[4] Required especially in process bus applications

DNP3 supports both serial and TCP modes for the connection of up to five masters. Changing the active setting and reading fault records are supported. DNP serial and DNP TCP can be used in parallel. If required, both IEC 61850 and DNP can be run simultaneously.

The relay supports Profibus DPV1 with support of SPA-ZC 302 Profibus adapter. If Profibus is required, the relay must be ordered with Modbus serial options. Modbus implementation includes SPA protocol emulation functionality. This functionality enables connection to SPA-ZC 302.

When the relay uses the RS-485 bus for the serial communication, both two- and four-wire connections are supported. Termination and pull-up/down resistors can be configured with DIP switch on the communication card so that external resistors are not needed.

PTPv2 features:

- PTPv2 Power profile and PTPv2 Utility profile
- Receive (slave): 1-step/2-step
- Transmit (master): 1-step
- Layer 2 mapping
- Peer-to-peer delay calculation and monitoring
- Multicast operation
- Ordinary Clock with Best Master Clock algorithm
- One-step Transparent Clock for Ethernet ring topology
- Slave-only mode

The required accuracy of the grandmaster clock is +/-1 µs to guarantee performance of protection applications. The relay can work as a backup master clock per BMC algorithm if the external primary grandmaster clock is not available for short term.

In addition, the relay supports time synchronization via Modbus, DNP3 and IEC 60870-5-103 serial communication protocols.

Table 4: Supported station communication interfaces and protocols

	Ethernet		Serial	
Interfaces/Protocols	**100BASE-TX RJ-45**	**100BASE-FX LC**	**RS-485**	**Fiber optic ST**

IEC 60870-5-103	-	-	●	●
IEC 60870-5-104	●	●	-	-

● = Supported

24. Protection communication and supervision

The protection communication between the relays is enabled by means of a dedicated fiber optic communication channel; 1310 nm multimode or single-mode fibers with LC connectors are used. The communication link transfers analog and binary information between line ends for line differential, line distance and transfer trip functions. No external devices, such as GPS clocks, are needed for the line differential protection communication. Additionally, the link can be used to transfer any freely selectable binary data between line ends. In total, 16 binary signals can be transferred between two REX640 protection relays.

Each REX640 communication card variant contains an SFP rack for dedicated point-to-

point protection communication via an SFP plug-in module. Three variants of SFP plug-in modules can be selected. The variants support optical communication for distances typically up to 2 km (multimode), 20 km (single-mode) and 50 km (single-mode). The SFP plugin unit can be ordered together with the relay or later on when the need to establish the link arises. The line differential protection can be realized between two REX640 relays or between REX640 and RED615 relays. If the line differential protection is to be realized between REX640 and RED615 relays, the SFP plug-in module has to match the RED615 communication card variant. Additionally, the RED615 relay version must be Ver.5.0 FP1 or later and phase current measurements should be realized with conventional current transformers that have 1 A as the nominal secondary current.

The protection communication supervision continuously monitors the protection communication link. The line differential protection function can be blocked if severe interference in the communication link, risking the correct operation of the function, is detected. If the interference persists, an alarm signal is triggered indicating permanent failure in the protection communication.

Communication module COM1003 gives the possibility to assign the third optical Ethernet communication port (interlink port) as an extra dedicated point-to-point protection communication channel. The second channel can transfer up to 16 additional binary signals between two REX640 relays, or alternatively eight additional binary signals between one REX640 and one RED615 relay. Analogue signals, needed for line differential protection, are transferred via the first protection communication channel only. This feature becomes handy in cases where REX640 relays are used in protection and control schemes for ring type RMU installations where a single REX640 must be able transfer binary signals to two different directions within the ring. Both protection communication channels are supervised.

25. Technical data

25.1 Dimensions of the relay

Table 5: Dimensions of the relay

Description		Value
Width (standard case)		304.0 mm (11.9685 in)
Width (narrow case)		212.4 mm (8.3622 in)
Height		264.8 mm (10.4252 in)
Depth	With compression type CT/VT connectors	242.2 mm (9.5354 in)
	With ring lug type CT/VT connectors	254.1 mm (10.0039 in)
	With grounding bar	274.0 mm (10.7874 in)
Weight box (standard case)		6.9...8.8 kg (15.2...19.4 lb)
Weight box (narrow case)		7.0 kg (15.4 lb)

25.2 Dimensions of the HMI

Table 6: Dimensions of the HMI

Description	Value
Width	212.5 mm (8.3661 in)
Height	177.5 mm (6.9882 in)
Depth	57.6 mm (2.2677 in)
Weight	1.6 kg (3.5 lb)
Display element size	Seven inches
Display element resolution	800 x 480 pixels

25.3 Power supply for the relay

Table 7: Power supply for the relay

Description	PSM1001	PSM1002	PSM1003
Nominal auxiliary voltage U_n	24, 30, 48, 60 V DC	100, 110, 120, 220, 240 V AC, 50 and 60 Hz	110, 125 V DC
		48, 60, 110, 125, 220, 250 V DC	
Maximum interruption time in the auxiliary DC voltage without resetting the relay	50 ms at U_n		
Auxiliary voltage variation	50...120% of U_n (12...72 V DC)	55...110% of U_n (55...264 V AC)	70...120% of U_n (77...150 V DC)
		80...120% of U_n (38.4...300 V DC)	
Start-up threshold	16 V DC (24 V DC × 67%)		77 V DC (110 V DC × 70%)
Burden of auxiliary voltage supply under quiescent (P_q)/ operating condition	DC <18.0 W (nominal)/<25.0 W (max.)	DC <20.0 W (nominal)/<25.0 W (max.)	DC <17.0 W (nominal)/<25.0 W (max.)
		AC <20.0 W (nominal)/<25.0 W (max.)	
Ripple in the DC auxiliary voltage	Max 15% of the DC value (at frequency of 100 Hz)		
Fuse type	T8A/250 V	T4A/250 V	
Permissible frequency band	50/60Hz +-10%		

25.4 Power supply for the HMI

Table 8: Power supply for the HMI

Description	Value
Nominal auxiliary voltage U_n	100, 110, 120, 220, 240 V AC, 50 and 60 Hz
	24, 48, 60, 110, 125, 220, 250 V DC
Auxiliary voltage variation	38...110% of U_n (38...264 V AC)
	80...120% of U_n (19.2...300 V DC)
Start-up threshold	19.2 V DC (24 V DC × 80%)
Burden of auxiliary voltage supply under quiescent (Pq)/operating condition	DC <6.0 W (nominal)/<14.0 W (max.) AC <7.0 W (nominal)/<12.0 W (max.)
Ripple in the DC auxiliary voltage	Max 15% of the DC value (at frequency of 100 Hz)
Fuse type	T3.15A/250V

25.5 Energizing inputs

Table 9: Energizing inputs

Description		Value	
Rated frequency		50/60 Hz	
Current inputs	Rated current, I_n	0.2/1 A	1/5 A [5]
	Thermal withstand capability Continuously	4 A	20 A
	Thermal withstand capability For 1 s	100 A	500 A
	Dynamic current withstand Half-wave value	250 A	1250 A
	Input impedance	<100 mΩ	<20 mΩ
Voltage inputs	Rated voltage	57...240 V AC	
	Voltage withstand Continuous	288 V AC	
	Voltage withstand For 10 s	360 V AC	
	Burden at rated voltages 100V, 110V and 120V	<0.05VA	
	Burden at rated voltage > 120V	<0.20VA	

[5] Residual current and/or phase current

25.6 Energizing inputs (sensors)

Table 10: Table 9: Energizing Inputs (SIM1901)

Description		Value
Current sensor input	Rated current voltage	75 mV ... 9000 mV [6]
	Continuous voltage withstand	125 V
	Input impedance at 50/60Hz	2...3 MΩ [7]
Voltage sensor input	Rated secondary voltage	346 mV…1733 mV [8]
	Continuous voltage withstand	50 V
	Input impedance at 50/60Hz	3 MΩ

Table 11: Energizing Inputs (SIM1902)

Description		Value
Current sensor input	Rated current voltage	75 mV ... 9000 mV [9]
	Continuous voltage withstand	125 V
	Input impedance at 50/60Hz	2 MΩ
Voltage sensor input	Rated secondary voltage	346 mV…2339 mV [10]
	Continuous voltage withstand	50 V
	Input impedance at 50/60Hz	2 MΩ 50 pF

25.7 Binary inputs

Table 12: Binary inputs

Description	Value
Operating range	±20% of the rated voltage
Rated voltage	24...250 V DC
Current drain	1.6...1.9 mA
Power consumption	31.0...570.0 mW

Table continues on the next page

[6] Equals the current range of 40 … 4000 A with 80A, 3mV/Hz Rogowski
[7] Depending on the used nominal current (hardware gain)
[8] Covers 6 kV … 30 kV sensors with division ratio of 10 000:1. Secondary voltages 600mV/√3 … 3 V / √3. Range up to 2 x Rated.
[9] Equals the current range of 40 … 4000 A with 80A, 3mV/Hz Rogowski
[10] Covers 6 kV … 40.5 kV sensors with division ratio of 10 000:1. Secondary voltages 600mV/√3 … 4.05V / √3. Range up to 2 x Rated.

Description	Value
Threshold voltage	16...176 V DC
Ripple in the DC auxiliary voltage	Max 15% of the DC value (at frequency of 100 Hz)
Wetting current	220 mA, impulse period 5ms 0...120 mA[11], impulse period 8ms

25.8 RTD/mA inputs and mA outputs

Table 13: RTD/mA inputs and mA outputs

Description		Value	
RTD inputs	Supported RTD sensors	100 Ω platinum	TCR 0.00385 (DIN 43760)
		250 Ω platinum	TCR 0.00385
		100 Ω nickel	TCR 0.00618 (DIN 43760)
		120 Ω nickel	TCR 0.00618
		250 Ω nickel	TCR 0.00618
	Supported resistance range	0...4 kΩ	
	Maximum lead resistance (three-wire measurement)	100 Ω per lead	
	Isolation	2 kV (inputs to protective earth)	
	Response time	<1 s	
	RTD/resistance sensing current	<1 mA rms	
	Operation accuracy	Resistance	Temperature
		± 2.0% or ±1 Ω	±1°C
mA inputs	Supported current range	±0...20 mA	
	Current input impedance	44 Ω ±0.1%	
	Operation accuracy	±0.5% or ±0.01 mA	
mA outputs	Supported current range	±0...20 mA	
	Maximum loop impedance	700 Ω	
	Operation accuracy	±0.1 mA	

[11] Adjustable only in RTD1002 module

25.9 Signal outputs and IRF output

Table 14: Signal outputs and IRF output

Description	Value
Rated voltage	250 V AC/DC
Maximum continuous burden (resistive load, AC)	1250 VA
Continuous contact carry	5 A
Make and carry for 3.0 s	10 A
Make and carry 0.5 s	15 A
Breaking capacity when the control-circuit time constant L/R<40 ms, at 48/110/220 V DC	1 A/0.25 A/0.15 A
Minimum contact load	10 mA at 5 V AC/DC

25.10 Single-pole power output relays

Table 15: Single-pole power output relays

Description	Value
Rated voltage	250 V AC/DC
Maximum continuous burden (resistive load, AC)	2000 VA
Continuous contact carry	8 A
Make and carry for 3.0 s	15 A
Make and carry for 0.5 s	30 A
Breaking capacity when the control-circuit time constant L/R<40 ms, at 48/110/220 V DC	5 A/3 A/1 A
Minimum contact load	100 mA at 24 V AC/DC

25.11 Static signal output (SSO) relays

Table 16: Static signal output (SSO) relays

Description	Value
Rated voltage	250 V AC/DC
Maximum continuous burden (resistive load, AC)	250 VA
Continuous contact carry	1 A
Make and carry for 3.0 s	5 A

Table continues on the next page

Description	Value
Breaking capacity when the control-circuit time constant L/R<40 ms, at 110 V DC	0.25 A
Minimum load current	1 mA
Maximum operation frequency at 50% duty cycle	10 Hz

25.12 Double-pole power output relays with TCS function

Table 17: Double-pole power output relays with TCS function

Description	Value
Rated voltage	250 V AC/DC
Maximum continuous burden (resistive load, AC)	2000 VA
Continuous contact carry	8 A
Make and carry for 3.0 s	15 A
Make and carry for 0.5 s	30 A
Breaking capacity when the control-circuit time constant L/R<40 ms, at 48/110/220 V DC (two contacts connected in series)	5 A/3 A/1 A
Minimum contact load	100 mA at 24 V AC/DC
Trip-circuit supervision (TCS) Control voltage range	20...250 V AC/DC
Trip-circuit supervision (TCS) Current drain through the supervision circuit	~1.5 mA
Trip-circuit supervision (TCS) Minimum voltage over the TCS contact	20 V AC/DC (15...20 V)

25.13 Static power output (SPO) relays

Table 18: Static power output (SPO) relays

Description	Value
Rated voltage	250 V AC/DC
Maximum continuous burden (resistive load, AC)	2000 VA
Continuous contact carry	5 A, 60 s 5 A continuous (one output active at a time per module) 1 A continuous (multiple outputs simultaneously active in the same module)

Table continues on the next page

Description	Value
Make and carry for 0.2 s	30 A
Breaking capacity when the control-circuit time constant L/R<40 ms, at 48/110/220 V DC two contacts connected in series	16 A/6 A/3 A
Minimum load current	1 mA
Trip-circuit supervision (TCS) SP06 and SP08 Control voltage range	20...250 V DC
Trip-circuit supervision (TCS) SP06 and SP08 Current drain through the supervision circuit	~1.5 mA
Trip-circuit supervision (TCS) SP06 and SP08 Minimum voltage over the TCS contact	20 V DC
SP05 and SP07 Current drain through the circuit	~3 mA

25.14 Serial interface

Table 19: Serial interface

Type	Connector
Screw terminal X8	10-pin 2-row connector
Serial port X7	Optical ST-connector

25.15 USB interface, HMI

Table 20: USB interface, HMI

Type	Description
USB	Hi-Speed USB Type A

25.16 Ethernet interfaces (connectors X0, X1, X2 and X3)

Table 21: Ethernet interfaces (connectors X0, X1, X2 and X3)

Connector	Media	Reach [12]	Rate	Wavelength	Permitted path attenuation [13]
RJ-45	CAT 6 S/FTP	100 m	100 mbits/s	-	–
LC	MM 62.5/125 or 50/125 µm glass fiber core	2 km	100 mbits/s	1300 nm	<8 dB

25.17 Protection communication link (connector X6)

Table 22: Protection communication link (connector X6)

Connector	Part number [14]	Fiber type	Reach [15]	Wavelength	Permitted path attenuation [16]
LC (SFP)	2RCA045621	MM 62.5/125 or 50/125 µm	2 km	1310 nm	<8 dB
LC (SFP)	2RCA045622	SM 9/125 µm	20 km	1310 nm	<13 dB
LC (SFP)	2RCA045623	SM 9/125 µm	50 km	1310 nm	<26 dB

25.18 IRIG-B (connector X8)

Table 23: IRIG-B (connector X8)

Description	Value
IRIG time code format	B004, B005 [17]
Isolation	500V 1 min
Modulation	Unmodulated
Logic level	5 V TTL
Current consumption	<1.0 mA
Power consumption	<0.5 W

12 Maximum length depends on the cable attenuation and quality, the amount of splices and connectors in the path
13 Maximum allowed attenuation caused by connectors and cable together
14 Only these ABB verified SFP modules are supported in the protection communication link (port X6 in the communication module).
15 Maximum length depends on the cable attenuation and quality, the amount of splices and connectors in the path
16 Maximum allowed attenuation caused by connectors and cable together
17 According to the 200-04 IRIG standard

25.19 Lens sensor and optical fiber for arc protection

Table 24: Lens sensor and optical fiber for arc protection

Description	Value
Normal service temperature range of the lens	-40...+100°C
Maximum service temperature range of the lens, max 1 h	+140°C
Minimum permissible bending radius of the connection fiber	100 mm
Arc sensor loop maximum attenuation	25dB

25.20 Degree of protection of the protection relay

Table 25: Degree of protection of the protection relay

Description	Value
Front/connector side	IP 20 (with ring-lug signal connectors IP 00 or IP 10 depending on wiring)
Top and bottom	IP 30
Rear	IP 40

25.21 Degree of protection of the HMI

Table 26: Degree of protection of the HMI

Description	Value
Front	IP 54
Other sides	IP 20

25.22 Environmental conditions

Table 27: Environmental conditions

Description	Value
Operating temperature range	-25...+55ºC (continuous)
Short-time service temperature range	-40...+85ºC (<16 h) [18, 19]

Table continues on the next page

[18] Degradation in MTBF and HMI performance outside the temperature range of -25...+55 ºC
[19] For relays with an LC communication interface the maximum operating temperature is +70 ºC

Description	Value
Relative humidity	Up to 95%, non-condensing
Atmospheric pressure	86...106 kPa
Altitude	Up to 2000 m
Transport and storage temperature range	-40...+85ºC

25.23 Electromagnetic compatibility tests

Table 28: Electromagnetic compatibility tests

Description	Type test value	Reference
1 MHz/100 kHz burst disturbance test Common mode	2.5 kV	IEC 61000-4-18 IEC 60255-26 IEEE C37.90.1-2012
1 MHz/100 kHz burst disturbance test Differential mode	2.5 kV	
3 MHz, 10 MHz and 30 MHz burst disturbance test Common mode	2.5 kV	IEC 61000-4-18 IEC 60255-26
Electrostatic discharge test Contact discharge	8 kV	IEC 61000-4-2 IEC 60255-26 IEEE C37.90.3-2001
Electrostatic discharge test Air discharge	15 kV	
Radio frequency interference test	10 V (rms) f = 150 kHz...80 MHz 10 V/m (rms) f = 80...2700 MHz 20 V/m (rms) f = 80...1000 MHz	IEC 61000-4-6 IEC 60255-26 IEC 61000-4-3 IEC 60255-26 IEEE C37.90.2-2004
Fast transient disturbance test Communication	2 kV	IEC 61000-4-4 IEC 60255-26 IEEE C37.90.1-2012
Fast transient disturbance test Other ports	4 kV	
Surge immunity test Communication	1 kV, line-to-earth	IEC 61000-4-5 IEC 60255-26
Surge immunity test Other ports	4 kV, line-to-earth 2 kV, line-to-line

Damped oscillatory magnetic field immunity test 1 MHz	400 transients/s	
Voltage dips and short interruptions	0%/50 ms Criterion A 40%/200 ms Criterion C 70%/500 ms Criterion C 0%/5000 ms Criterion C	IEC 61000-4-11 IEC 61000-4-29 IEC 60255-26
Power frequency immunity test Common mode	Binary inputs only 300 V rms	IEC 61000-4-16 IEC 60255-26, class A
Power frequency immunity test Differential mode	Binary inputs only 150 V rms	
Emission tests Conducted 0.15...0.50 MHz	<79 dB (µV) quasi peak <66 dB (µV) average	IEC 60255-26 CISPR 11 CISPR 32
Emission tests Conducted 0.5...30 MHz	<73 dB (µV) quasi peak <60 dB (µV) average	
Emission tests Radiated 30...230 MHz	<40 dB (µV/m) quasi peak, measured at 10 m distance	
Emission tests Radiated 230...1000 MHz	<47 dB (µV/m) quasi peak, measured at 10 m distance	
Emission tests Radiated 1…3 GHz	<76 dB (µV/m) peak <56 dB (µV/m) average, measured at 3 m distance	
Emission tests Radiated 3…6 GHz	<80 dB (µV/m) peak <60 dB (µV/m) average, measured at 3 m distance	

25.24 Safety-related tests

Table 29: Safety-related tests

Description	Type test value	Reference
Overvoltage category	III	IEC 60255-27
Pollution degree	2	IEC 60255-27
Insulation class	Class I	IEC 60255-27
Dielectric tests	500 V, 50 Hz, 1 min, RS-485 and IRIG-B 820 V, 50 Hz, 1 min, mA inputs / mA outputs of RTD1002, sensor inputs of SIM1902 1 kV, 50 Hz, 1 min, across open contacts 1.5 kV, 50 Hz, 1 min, Ethernet RJ-45 2 kV, 50 Hz, 1 min, all other isolated circuits	IEC 60255-27
Impulse voltage test	1 kV, 1.2/50 µs, 0.5 J, RS-485 and IRIG-B 1.5 kV, 1.2/50 µs, 0.5 J, mA inputs / mA outputs of RTD1002, sensor inputs of SIM1902 2.4 kV, 1.2/50 µs, 0.5 J, Ethernet RJ-45 5 kV, 1.2/50 µs, 0.5 J, all other isolated circuits	IEC 60255-27
Insulation resistance measurements	>100 MΩ, 500 V DC	IEC 60255-27
Protective bonding resistance	<0.1 Ω, 4 A, 60 s	IEC 60255-27
Maximum temperature of parts and materials	Tested	IEC 60255-27
Flammability of insulating materials, components and fire enclosures	Evaluated / Tested	IEC 60255-27
Single-fault condition	Tested	IEC 60255-27

25.25 Mechanical tests

Table 30: Mechanical tests

Description	Requirement	Reference
Vibration tests (sinusoidal)	Class 2	IEC 60068-2-6 (test Fc) IEC 60255-21-1
Shock and bump test	Class 2	IEC 60068-2-27 (test Ea shock) IEC 60068-2-29 (test Eb bump) IEC 60255-21-2
Seismic test	Class 2	IEC 60255-21-3

25.26 Environmental tests

Table 31: Environmental tests

Description	Type test value	Reference
Dry heat test	• 96 h at +55°C • 16 h at +85°C [20]	IEC 60068-2-2
Dry cold test	• 96 h at -25°C • 16 h at -40°C	IEC 60068-2-1
Damp heat test	• 6 cycles (12 h + 12 h) at +25…+55°C, humidity >93%	IEC 60068-2-30
Change of temperature test	• 5 cycles (3 h + 3 h) at -25...+55°C	IEC60068-2-14
Storage test	• 96 h at -40°C • 96 h at +85°C	IEC 60068-2-1 IEC 60068-2-2
Damp heat steady state	10 days at +40°C, humidity 93%	IEC 60255-1 IEC 60068-2-78

25.27 Product safety

Table 32: Product safety

Description	Reference
LV directive	2014/35/EU
Standard	EN 60255-27 (2014) EN 60255-1 (2009)
UL listed (E-file: E225502)	UL508

25.28 EMC compliance

Table 33: EMC compliance

Description	Reference
EMC directive	2014/30/EU
Standard	EN 60255-26 (2013)

[20] For relays with an LC communication interface the maximum operating temperature is +70°C

25.29 RoHS compliance

Table 34: RoHS compliance

Description
Complies with RoHS Directive 2011/65/EU

25.30 Protection functions

25.30.1 Distance protection (DSTPDIS)

Table 35: Distance protection (DSTPDIS)

Characteristic	Value
Operation accuracy	At the frequency f = f_n
	Current: ±1.5% of the set value or ±0.002 × I_n Voltage: ±1.5% of the set value or ±0.002 × U_n Impedance: ±2.5% of the set value or ±0.05 Ω Phase angle: ±2°
Shortest operate time [21] SIR [22]: 0.1...50	25 ms
Transient overreach SIR = 0.1...50	<8.5%
Reset time	Typically 45 ms
Reset ratio	Typically 0.96/1.04
Operate time accuracy	±1.0% of the set value or ±20 ms

[21] Measured with static power output (SPO)
[22] SIR = Source impedance ratio

25.30.2 Distance protection (DSTPDIS) main settings

Table 36: Distance protection (DSTPDIS) main settings

Operation mode	DEFxPDEF	1 = Phase angle 2 = IoSin 3 = IoCos 4 = Phase angle 80 5 = Phase angle 88	-

25.30.26 Three-phase power directional element (DPSRDIR) main settings

Table 60: Three-phase power directional element (DPSRDIR) main settings

Parameter	Function	Value (Range)	Step
Release delay time	DPSRDIR	0...1000 ms	1
Characteristic angle	DPSRDIR	-179...180°	1
Directional mode	DPSRDIR	1 = Non-directional 2 = Forward 3 = Reverse	-

[43] For further reference, see the Operating characteristics table

25.30.27 Neutral power directional element (DNZSRDIR) main settings

Table 61: Neutral power directional element (DNZSRDIR) main settings

Parameter	Function	Value (Range)	Step
Release delay time	DNZSRDIR	0...1000 ms	10
Directional mode	DNZSRDIR	1 = Non-directional 2 = Forward 3 = Reverse	-
Characteristic angle	DNZSRDIR	-179...180°	1
Pol quantity	DNZSRDIR	3 = Zero seq. volt. 4 = Neg. seq. volt.	-

25.30.28 Load blinder (LBRDOB)

Table 62: Load blinder (LBRDOB)

Characteristic	Value
Operation accuracy	Depending on the frequency of the current measured: f_n
	Current: ±1.5% of the set value or ±0.002 × I_n Voltage: ±1.5% of the set value or ±0.002 × U_n Impedance accuracy: ±3% of the set value (In range load angle<75 deg) ±4.5% of the set value (In range 75 deg<load angle<83 deg) ±8% of the set value (In range load angle>83 deg) Phase angle: ±2°
Reset ratio	Typically 0.96
Operation time [44, 45]	Typically 30 ms
Reset time	Typically 25 ms

[44] f_n= 50Hz, results based on statistical distribution of 1000 measurements
[45] Includes the delay of the signal output contact

25.30.29 Load blinder (LBRDOB) main settings

Table 63: Load blinder (LBRDOB) main settings

Parameter	Function	Value (Range)	Step
Resistive reach Fw	LBRDOB	1.00...6000.00 Ohm	0.01
Resistive reach Rv	LBRDOB	1.00...6000.00 Ohm	0.01
Max impedance angle	LBRDOB	5...85 Deg	1
Min impedance angle	LBRDOB	-85...-5 Deg	1
Directional mode	LBRDOB	1= Non-directional 2= Forward 3= Reverse	-

25.30.30 Admittance-based earth-fault protection (EFPADM)

Table 64: Admittance-based earth-fault protection (EFPADM)

Characteristic	Value		
Operation accuracy [46]	At the frequency f = f_n		
	±1.0% or ±0.01 mS (In range of 0.5...100 mS)		
Start time [47]	Minimum	Typical	Maximum
	56 ms	60 ms	64 ms
Reset time	40 ms		
Operate time accuracy	±1.0% of the set value of ±20 ms		
Suppression of harmonics	-50 dB at f = n × f_n, where n = 2, 3, 4, 5,…		

[46] Uo = 1.0 × U_n

[47] Includes the delay of the signal output contact, results based on statistical distribution of 1000 measurements

25.30.31 Admittance-based earth-fault protection (EFPADM) main settings

Table 65: Admittance-based earth-fault protection (EFPADM) main settings

Parameter	Function	Value (Range)	Step
Voltage start value	EFPADM	0.01...2.00 × U_n	0.01
Directional mode	EFPADM	1 = Non-directional 2 = Forward 3 = Reverse	-
Operation mode	EFPADM	1 = Yo 2 = Go 3 = Bo 4 = Yo, Go 5 = Yo, Bo 6 = Go, Bo 7 = Yo, Go, Bo	-

Conductance reverse	EFPADM	-500.00...500.00 mS	0.01
Susceptance forward	EFPADM	-500.00...500.00 mS	0.01
Susceptance reverse	EFPADM	-500.00...500.00 mS	0.01
Conductance tilt Ang	EFPADM	-30...30°	1
Susceptance tilt Ang	EFPADM	-30...30°	1

25.30.32 Multifrequency admittance-based earth-fault protection (MFADPSDE)

Table 66: Multifrequency admittance-based earth-fault protection (MFADPSDE)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured voltage: f_n ±2 Hz
	±1.5% of the set value or ±0.002 × U_n
Start time [48]	Typically 35 ms
Reset time	Typically 40 ms
Operate time accuracy	±1.0% of the set value or ±20 ms

[48] Includes the delay of the signal output contact, results based on statistical distribution of 1000 measurements

25.30.33 Multifrequency admittance-based earth-fault protection (MFADPSDE) main settings

Table 67: Multifrequency admittance-based earth-fault protection (MFADPSDE) main settings

Parameter	Function	Value (Range)	Step
Directional mode	MFADPSDE	2 = Forward 3 = Reverse	-
Voltage start value	MFADPSDE	0.01...1.00 × U_n	0.01
Operate delay time	MFADPSDE	60...1200000 ms	10
Operating quantity	MFADPSDE	1 = Adaptive 2 = Amplitude 3 = Resistive	-
Min operate current	MFADPSDE	0.005...5.000 × I_n	0.001
Operation mode	MFADPSDE	1 = Intermittent EF 2 = Transient EF 3 = General EF 4 = Alarming EF	-
Peak counter limit	MFADPSDE	2...20	1

25.30.34 Touch voltage based earth-fault current protection IFPTOC (ANSI 46SNQ/59N)

Table 68: Touch voltage based earth-fault current protection IFPTOC (ANSI 46SNQ/59N)

Characteristics	Value
Operation accuracy	Depending on the frequency of the measured current f_n ±2 Hz
	Earth-fault current and touch voltage: ±1% of the set value or ±0.005 × I_n for I_F^{est} Accuracy of U_{EPR}^{est} follows I_F^{est} accuracy. Residual voltage: ±1.5% of the set value or ±0.002 × U_n Residual current: ±1.5% of the set value or ±0.002 × I_n (at currents ≤10 x I_n, when Uo is nominal) ±5.0% of the set value (at currents > 10 x I_n)
Start time [49]	Typically 30 ms
Reset time	<30 ms
Reset ratio	Typically 0.96
Retardation time	<50 ms
Operate time accuracy	±1.0% of the set value or ±20 ms (DT) ±3% of the theoretical value or ±40 ms (IDMT)

[49] Measured with static signal output (SSO)

25.30.35 Touch voltage based earth-fault current protection IFPTOC (ANSI 46SNQ/59N) main settings

Table 69: Touch voltage based earth-fault current protection IFPTOC (ANSI 46SNQ/59N) main settings

25.30.36 Wattmetric-based earth-fault protection (WPWDE)

Table 70: Wattmetric-based earth-fault protection (WPWDE)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	Current and voltage: ±1.5% of the set value or ±0.002 × I_n Power: ±3% of the set value or ±0.002 × P_n
Start time [50, 51]	Typically 63 ms
Reset time	Typically 40 ms
Reset ratio	Typically 0.96
Operate time accuracy in definite time mode	±1.0% of the set value or ±20 ms
Operate time accuracy in IDMT mode	±5.0% of the set value or ±20 ms
Suppression of harmonics	-50 dB at f = n × f_n, where n = 2,3,4,5,…

25.30.37 Wattmetric-based earth-fault protection (WPWDE) main settings

Table 71: Wattmetric-based earth-fault protection (WPWDE) main settings

Parameter	Function	Value (Range)	Step
Directional mode	WPWDE	2 = Forward 3 = Reverse	-
Current start value	WPWDE	0.010...5.000 × I_n	0.001
Voltage start value	WPWDE	0.010...1.000 × U_n	0.001
Power start value	WPWDE	0.003...1.000 × S_n	0.001
Reference power	WPWDE	0.050...1.000 × S_n	0.001
Characteristic angle	WPWDE	-179...180°	1
Time multiplier	WPWDE	0.025...2.000	0.005
Operating curve type [52]	WPWDE	Definite or inverse time Curve type: 5, 15, 20	
Operate delay time	WPWDE	60...300000 ms	10
Min operate current	WPWDE	0.010. 1.000 × I_n	0.001
Min operate voltage	WPWDE	0.01. 1.00 × U_n	0.01

[50] Io varied during the test, U_o = 1.0 × U_n = phase to earth voltage during earth fault in compensated or un-earthed network, the residual power value before fault = 0.0 pu, f_n = 50 Hz, results based on statistical distribution of 1000 measurements
[51] Includes the delay of the signal output contact
[52] For further reference, see the Operating characteristics table

25.30.38 Transient/intermittent earth-fault protection (INTRPTEF)

Table 72: Transient/intermittent earth-fault protection (INTRPTEF)

Characteristic	Value
Operation accuracy (Uo criteria with transient protection)	Depending on the frequency of the measured current: f_n ±2 Hz
	±1.5% of the set value or ±0.002 × Uo
Operate time accuracy	±1.0% of the set value or ±20 ms
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5

25.30.39 Transient/intermittent earth-fault protection (INTRPTEF) main settings

Table 73: Transient/intermittent earth-fault protection (INTRPTEF) main settings

Parameter	Function	Value (Range)	Step
Directional mode	INTRPTEF	1 = Non-directional 2 = Forward 3 = Reverse	-
Operate delay time	INTRPTEF	40...1200000 ms	10
Voltage start value	INTRPTEF	0.05...0.50 × U_n	0.01
Operation mode	INTRPTEF	1 = Intermittent EF 2 = Transient EF	-
Peak counter limit	INTRPTEF	2...20	1
Min operate current	INTRPTEF	0.01. 1.00 × I_n	0.01

25.30.40 Harmonics-based earth-fault protection (HAEFPTOC)

Table 74: Harmonics-based earth-fault protection (HAEFPTOC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	±5% of the set value or ±0.004 × I_n
Start time [53, 54]	Typically 77 ms
Reset time	Typically 40 ms
Reset ratio	Typically 0.96

Table continues on the next page

[53] Fundamental frequency current = 1.0 × I_n, harmonics current before fault = 0.0 × I_n, harmonics fault current 2.0 × *Start value* , results based on statistical distribution of 1000 measurements

[54] Includes the delay of the signal output contact

Characteristic	Value
Operate time accuracy in definite time mode	±1.0% of the set value or ±20 ms
Operate time accuracy in IDMT mode [55]	±5.0% of the set value or ±20 ms
Suppression of harmonics	-50 dB at f = f_n
	-3 dB at f = 13 × f_n

25.30.41 Harmonics-based earth-fault protection (HAEFPTOC) main settings

Table 75: Harmonics-based earth-fault protection (HAEFPTOC) main settings

Parameter	Function	Value (Range)	Step
Start value	HAEFPTOC	0.05. 5.00 × I_n	0.01
Time multiplier	HAEFPTOC	0.025...15.000	0.005
Operate delay time	HAEFPTOC	100...300000 ms	10
Operating curve type [56]	HAEFPTOC	Definite or inverse time Curve type: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 18, 19	
Minimum operate time	HAEFPTOC	100...200000 ms	10

25.30.42 Negative-sequence overcurrent protection (NSPTOC)

Table 76: Negative-sequence overcurrent protection (NSPTOC)

Characteristic		Value		
Operation accuracy		Depending on the frequency of the measured current: f_n ±2 Hz		
		±1.5% of the set value or ±0.002 × I_n		
Start time [57, 58]		Minimum	Typical	Maximum
	I_{Fault} = 2 × set *Start value*	23 ms	26 ms	28 ms
	I_{Fault}= 10 × set *Start value*	15 ms	18 ms	20 ms
Reset time		Typically 40 ms		
Reset ratio		Typically 0.96		
Retardation time		<35 ms		

Table continues on the next page

[55] Maximum *Start value* = 2.5 × I_n, *Start value* multiples in range of 2...20
[56] For further reference, see the Operation characteristics table
[57] Negative sequence current before fault = 0.0, f_n = 50 Hz, results based on statistical distribution of 1000 measurements
[58] Includes the delay of the signal output contact

Characteristic	Value
Operate time accuracy in definite time mode	±1.0% of the set value or ±20 ms
Operate time accuracy in inverse time mode	±5.0% of the theoretical value or ±20 ms [59]
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…

25.30.43 Negative-sequence overcurrent protection (NSPTOC) main settings

Table 77: Negative-sequence overcurrent protection (NSPTOC) main settings

Parameter	Function	Value (Range)	Step
Start value	NSPTOC	0.01...5.00 × I_n	0.01
Time multiplier	NSPTOC	0.025...15.000	0.005
Operate delay time	NSPTOC	40...200000 ms	10
Operating curve type [60]	NSPTOC	Definite or inverse time Curve type: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 18, 19	

25.30.44 Phase discontinuity protection (PDNSPTOC)

Table 78: Phase discontinuity protection (PDNSPTOC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	±2% of the set value
Start time	<70 ms
Reset time	Typically 40 ms
Reset ratio	Typically 0.96
Retardation time	<35 ms
Operate time accuracy in definite time mode	±1.0% of the set value or ±20 ms
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…

[59] Maximum *Start value* = 2.5 × I_n, *Start value* multiples in range of 1.5...20
[60] For further reference, see the Operation characteristics table

25.30.45 Phase discontinuity protection (PDNSPTOC) main settings

Table 79: Phase discontinuity protection (PDNSPTOC) main settings

Parameter	Function	Value (Range)	Step
Start value	PDNSPTOC	10...100%	1
Operate delay time	PDNSPTOC	100...30000 ms	1
Min phase current	PDNSPTOC	0.05...0.30 × I_n	0.01

25.30.46 Residual overvoltage protection (ROVPTOV)

Table 80: Residual overvoltage protection (ROVPTOV)

Characteristic		Value		
Operation accuracy		Depending on the frequency of the measured voltage: f_n ±2 Hz		
		±1.5% of the set value or ±0.002 × U_n		
Start time [61, 62]	U_{Fault} = 2 × set *Start value*	Minimum	Typical	Maximum
		48 ms	51 ms	54 ms
Reset time		Typically 40 ms		
Reset ratio		Typically 0.96		
Retardation time		<35 ms		
Operate time accuracy in definite time mode		±1.0% of the set value or ±20 ms		
Suppression of harmonics		DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…		

25.30.47 Residual overvoltage protection (ROVPTOV) main settings

Table 81: Residual overvoltage protection (ROVPTOV) main settings

Parameter	Function	Value (Range)	Step
Start value	ROVPTOV	0.010...1.000 × U_n	0.001
Operate delay time	ROVPTOV	40...300000 ms	1

[61] Residual voltage before fault = 0.0 × U_n, f_n = 50 Hz, residual voltage with nominal frequency injected from random phase angle, results based on statistical distribution of 1000 measurements

[62] Includes the delay of the signal output contact

25.30.48 Three-phase undervoltage protection (PHPTUV)

Table 82: PHPTUV Technical data

Characteristic		Value		
Operation accuracy		Depending on the frequency of the voltage measured: f_n ±2 Hz		
		±1.5% of the set value or ±0.002 × U_n		
Start time		Minimum	Typical	Maximum
	U_{Fault} = 0.85 × set *Start value* [63, 64]	17 ms	20 ms	23 ms
	U_{Fault} = 0.85 × set *Start value* [65, 66]	51 ms	55 ms	58 ms
Reset time		Typically 40 ms		
Reset ratio		Depends on the set *Relative hysteresis*		
Retardation time		<35 ms		
Operate time accuracy in definite time mode		±1.0% of the set value or ±20 ms		
Operate time accuracy in inverse time mode		±5.0% of the theoretical value or ±20 ms[67]		
Suppression of harmonics		DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…		

25.30.49 Three-phase undervoltage protection (PHPTUV) main settings

Table 83: Three-phase undervoltage protection (PHPTUV) main settings

Parameter	Function	Value (Range)	Step
Start value	PHPTUV	0.05...1.20 × U_n	0.01
Time multiplier	PHPTUV	0.05...15.00	0.01
Operate delay time	PHPTUV	20...300000 ms	10
Operating curve type[68]	PHPTUV	Definite or inverse time Curve type: 5, 15, 21, 22, 23	

63 *Start value* = 0.97 × U_n, voltage level before fault = 1 × U_n, f_n = 50 Hz, undervoltage in one phase-to-phase voltage injected from random phase angle, results based on statistical distribution of 1000 measurements, includes the delay (≈0ms) of the static signal output (SSO) contact

64 Start time is accelerated when set *Operate delay time* < 60ms. The shorter the set delay, the shorter the start time. Here measurements done for *Operate delay time* = 20ms

65 *Start value* = 0.97 × U_n, voltage level before fault = 1 × U_n, f_n = 50 Hz, undervoltage in one phase-to-phase voltage injected from random phase angle, results based on statistical distribution of 1000 measurements, includes the delay (≈0ms) of the static signal output (SSO) contact

66 Valid when set *Operate delay time* ≥ 60ms or inverse time curve selected

67 Minimum *Start value* = 0.50, *Start value* multiples in range of 0.90...0.20

68 For further reference, see the Operation characteristics table

25.30.50 Three-phase overvoltage variation protection (PHVPTOV)

Table 84: Three-phase overvoltage variation protection (PHVPTOV)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured voltage: f_n
	±1.5% of the set value or ±0.002 × U_n
Reset ratio	Depends on the set *Relative hysteresis*
Operate time accuracy in definite time mode	±1.0% of the set value or ±20 ms

25.30.51 Three-phase overvoltage variation protection (PHVPTOV) main settings

Table 85: Three-phase overvoltage variation protection (PHVPTOV) main settings

Parameter	Function	Value (Range)	Step
Start value	PHVPTOV	0.05...3.00 × U_n	0.01
Time interval	PHVPTOV	1...120 min	1
Num of start phases	PHVPTOV	1 = 1 out of 3 2 = 2 out of 3 3 = 3 out of 3	-
Voltage selection	PHVPTOV	1 = phase-to-earth 2 = phase-to-phase	-

25.30.52 Three-phase overvoltage protection (PHPTOV)

Table 86: Three-phase overvoltage protection (PHPTOV)

Characteristic		Value		
Operation accuracy		Depending on the frequency of the measured voltage: f_n ±2 Hz		
		±1.5% of the set value or ±0.002 × U_n		
Start time [69, 70]		Minimum	Typical	Maximum
	U_{Fault} = 1.1 × set *Start value*	23 ms	27 ms	31 ms
Reset time		Typically 40 ms		
Reset ratio		Depends on the set *Relative hysteresis*		
Retardation time		<35 ms		
Operate time accuracy in definite time mode		±1.0% of the set value or ±20 ms		
Operate time accuracy in inverse time mode		±7.0% of the theoretical value or ±20 ms [71]		
Suppression of harmonics		DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…		

[69] *Start value* = 1.0 × U_n, Voltage before fault = 0.9 × U_n, f_n = 50 Hz, overvoltage in one phase-to-phase with nominal frequency injected from random phase angle, results based on statistical distribution of 1000 measurements

[70] Includes the delay of the signal output contact

[71] Maximum *Start value* = 1.20 × U_n, *Start value* multiples in range of 1.10...2.00

25.30.53 Three-phase overvoltage protection (PHPTOV) main settings

Table 87: Three-phase overvoltage protection (PHPTOV) main settings

Parameter	Function	Value (Range)	Step
Start value	PHPTOV	0.05...1.60 × U_n	0.01
Time multiplier	PHPTOV	0.05...15.00	0.01
Operate delay time	PHPTOV	40...300000 ms	10
Operating curve type [72]	PHPTOV	Definite or inverse time Curve type: 5, 15, 17, 18, 19, 20	

25.30.54 Positive-sequence overvoltage protection (PSPTOV)

Table 88: Positive-sequence overvoltage protection (PSPTOV)

Characteristic		Value		
Operation accuracy		Depending on the frequency of the measured current: f_n ±2 Hz		
		±1.5% of the set value or ±0.002 × U_n		
Start time [73, 74]	U_{Fault} = 1.1 × set *Start value*	Minimum	Typical	Maximum
	U_{Fault} = 2 × set *Start value*	29 ms	32 ms	34 ms
		32 ms	24 ms	26 ms
Reset time		Typically 40 ms		
Reset ratio		Typically 0.96		
Retardation time		<35 ms		
Operate time accuracy in definite time mode		±1.0% of the set value or ±20 ms		
Suppression of harmonics		DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…		

25.30.55 Positive-sequence overvoltage protection (PSPTOV) main settings

Table 89: Positive-sequence overvoltage protection (PSPTOV) main settings

Parameter	Function	Value (Range)	Step
Start value	PSPTOV	0.400...1.600 × U_n	0.001
Operate delay time	PSPTOV	40...120000 ms	10

[72] For further reference, see the Operation characteristics table
[73] Positive-sequence voltage before fault = 0.0 × U_n, f_n = 50 Hz, positive-sequence overvoltage of nominal frequency injected from random phase angle
[74] Measured with static signal output (SSO)

25.30.56 Positive-sequence undervoltage protection (PSPTUV)

Table 90: Positive-sequence undervoltage protection (PSPTUV)

Characteristic		Value		
Operation accuracy		Depending on the frequency of the measured voltage: f_n ±2 Hz		
		±1.5% of the set value or ±0.002 × U_n		
Start time [75, 76]		Minimum	Typical	Maximum
	U_{Fault} = 0.99 × set *Start value*	52 ms	55 ms	58 ms
	U_{Fault} = 0.9 × set *Start value*	44 ms	47 ms	50 ms
Reset time		Typically 40 ms		
Reset ratio		Depends on the set *Relative hysteresis*		
Retardation time		<35 ms		
Operate time accuracy in definite time mode		±1.0% of the set value or ±20 ms		
Suppression of harmonics		DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…		

25.30.57 Positive-sequence undervoltage protection (PSPTUV) main settings

Table 91: Positive-sequence undervoltage protection (PSPTUV) main settings

Parameter	Function	Value (Range)	Step
Start value	PSPTUV	0.010...1.200 × U_n	0.001
Operate delay time	PSPTUV	40...120000 ms	10
Voltage block value	PSPTUV	0.01...1.00 × U_n	0.01

25.30.58 Negative-sequence overvoltage protection (NSPTOV)

Table 92: Negative-sequence overvoltage protection (NSPTOV)

Characteristic		Value		
Operation accuracy		Depending on the frequency of the voltage measured: f_n		
		±1.5% of the set value or ±0.002 × U_n		
Start time [77,78]		Minimum	Typical	Maximum
	U_{Fault} = 1.1 × set *Start value*	33 ms	35 ms	37 ms
	U_{Fault} = 2.0 × set *Start value*	24 ms	26 ms	28 ms
Reset time		Typically 40 ms		
Reset ratio		Typically 0.96		
Retardation time		<35 ms		

Table continues on the next page

75 *Start value* = 1.0 × U_n, positive-sequence voltage before fault = 1.1 × U_n, f_n = 50 Hz, positive sequence undervoltage with nominal frequency injected from random phase angle, results based on statistical distribution of 1000 measurements

76 Includes the delay of the signal output contact

77 Negative-sequence voltage before fault = 0.0 × U_n, f_n = 50 Hz, negative-sequence overvoltage with nominal frequency injected from random phase angle, results based on statistical distribution of 1000 measurements

78 Includes the delay of the signal output contact

Characteristic	Value
Operate time accuracy in definite time mode	±1.0% of the set value or ±20 ms
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…

25.30.59 Negative-sequence overvoltage protection (NSPTOV) main settings

Table 93: Negative-sequence overvoltage protection (NSPTOV) main settings

Parameter	Function	Value (Range)	Step
Start value	NSPTOV	0.010...1.000 × U_n	0.001
Operate delay time	NSPTOV	40...120000 ms	1

25.30.60 Frequency protection (FRPFRQ)

Table 94: Frequency protection (FRPFRQ)

Characteristic		Value
Operation accuracy	f>/f<	±5 mHz
	df/dt	±50 mHz/s (in range |df/dt| <5 Hz/s) ±2.0% of the set value (in range 5 Hz/s < |df/dt| < 15 Hz/s)
Start time	f>/f<	<80 ms[79]
	df/dt	<120 ms
Reset time		<150 ms
Operate time accuracy		±1.0% of the set value or ±30 ms

[79] Applies to sudden frequency change of ≤0.2 Hz or to frequency slope of ≤ 5 Hz/s. When frequency change is outside of these limits, start may be delayed by additional 100 ms to prevent false starts when connecting / disconnecting heavy loads.

25.30.61 Frequency protection (FRPFRQ) main settings

Table 95: Frequency protection (FRPFRQ) main settings

Parameter	Function	Value (Range)	Step
Operation mode	FRPFRQ	1 = Freq< 2 = Freq> 3 = df/dt 4 = Freq< + df/dt 5 = Freq> + df/dt 6 = Freq< OR df/dt 7 = Freq> OR df/dt	-
Start value Freq>	FRPFRQ	0.9000...1.2000 × f_n	0.0001
Start value Freq<	FRPFRQ	0.8000...1.1000 × f_n	0.0001
Start value df/dt	FRPFRQ	-0.2000...0.2000 × f_n/s	0.0001
Operate Tm Freq	FRPFRQ	80...5400000 ms	10
Operate Tm df/dt	FRPFRQ	120...200000 ms	10

25.30.62 Three-phase voltage-dependent overcurrent protection (PHPVOC)

Table 96: Three-phase voltage-dependent overcurrent protection (PHPVOC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current and voltage: f_n ±2 Hz Current: ±1.5% of the set value or ± 0.002 × I_n Voltage: ±1.5% of the set value or ±0.002 × U_n
Start time [80, 81]	Typically 26 ms
Reset time	Typically 40 ms
Reset ratio	Typically 0.96
Operate time accuracy in definite time mode	±1.0% of the set value or ±20 ms
Operate time accuracy in inverse time mode	±5.0% of the set value or ±20 ms
Suppression of harmonics	-50 dB at f = n × f_n, where n = 2, 3, 4, 5,…

80 *Measurement mode* = default, current before fault = 0.0 × I_n, f_n = 50 Hz, fault current in one phase with nominal frequency injected from random phase angle, results based on statistical distribution of 1000 measurements

81 Includes the delay of the signal output contact

25.30.63 Three-phase voltage-dependent overcurrent protection (PHPVOC) main settings

Table 97: Three-phase voltage-dependent overcurrent protection (PHPVOC) main settings

Parameter	Function	Value (Range)	Step
Start value	PHPVOC	0.05...5.00 × I_n	0.01
Start value low	PHPVOC	0.05...1.00 × I_n	0.01
Voltage high limit	PHPVOC	0.01...1.00 × U_n	0.01
Voltage low limit	PHPVOC	0.01...1.00 × U_n	0.01
Start value Mult	PHPVOC	0.8...10.0	0.1
Time multiplier	PHPVOC	0.05...15.00	0.01
Operating curve type [82]	PHPVOC	Definite or inverse time Curve type: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 18, 19	
Operate delay time	PHPVOC	40...200000 ms	10

25.30.64 Accidental energization protection (GAEPVOC)

Table 98: Accidental energization protection (GAEPVOC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current and voltages: f_n ±2 Hz
	Current: ±1.5% of the set value or ± 0.002 × I_n Voltage: ±1.5% of the set value or ±0.002 × U_n
Start time [83, 84]	Typically 20 ms
Reset time	Typically 35 ms
Reset ratio	Typically 0.96
Operate time accuracy	±1.0% of the set value or ±20 ms
Suppression of harmonics	Voltage: -50 dB at f = n × f_n, where n = 2, 3, 4, 5, … Current: No suppression

[82] For further reference, see the Operation characteristics table
[83] Results based on statistical distribution of 1000 measurements
[84] Includes the delay of the signal output contact.

25.30.65 Accidental energization protection (GAEPVOC) main settings

Table 99: Accidental energization protection (GAEPVOC) main settings

Parameter	Function	Value (Range)	Step
Start value	GAEPVOC	0.05...9.00 × I_n	0.01
Arm set voltage	GAEPVOC	0.05...1.00 × U_n	0.01
Disarm set voltage	GAEPVOC	0.50...1.50 × U_n	0.01
Operate delay time	GAEPVOC	20...300000 ms	10
Arm delay time	GAEPVOC	40...300000 ms	10
Disarm delay time	GAEPVOC	40...300000 ms	10
Operation	GAEPVOC	1 = on 5 = off	
Reset delay time	GAEPVOC	0...60000 ms	1

25.30.66 Overexcitation protection (OEPVPH)

Table 100: Overexcitation protection (OEPVPH)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	±3.0% of the set value
Start time [85]	Frequency change: Typically 200 ms
	Voltage change: Typically 40 ms
Reset time	Typically 40 ms
Reset ratio	Typically 0.96
Retardation time	<35 ms
Operate time accuracy in definite-time mode	±1.0% of the set value or ±20 ms
Operate time accuracy in inverse-time mode	±5.0% of the theoretical value or ±50 ms

[85] Includes the delay of the signal output contact

25.30.67 Overexcitation protection (OEPVPH) main settings

Table 101: Overexcitation protection (OEPVPH) main settings

Parameter	Function	Value (Range)	Step
Start value	OEPVPH	100...200%	1
Operating curve type [86]	OEPVPH	Definite or inverse time Curve type: 5, 15, 17, 18, 19, 20	
Time multiplier	OEPVPH	0.1...100.0	0.1
Operate delay time	OEPVPH	200...200000 ms	10
Cooling time	OEPVPH	5...10000 s	1

25.30.68 Three-phase thermal protection for feeders, cables and distribution transformers (T1PTTR)

Table 102: Three-phase thermal protection for feeders, cables and distribution transformers (T1PTTR)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	Current measurement: ±1.5% of the set value or ±0.002 × I_n (at currents in the range of 0.01. 4.00 × I_n)
Operate time accuracy [87]	±2.0% of the theoretical value or ±0.50 s

25.30.69 Three-phase thermal protection for feeders, cables and distribution transformers (T1PTTR) main settings

Table 103: Three-phase thermal protection for feeders, cables and distribution transformers (T1PTTR) main settings

Parameter	Function	Value (Range)	Step
Env temperature Set	T1PTTR	-50...100°C	1
Current reference	T1PTTR	0.05...4.00 × I_n	0.01
Temperature rise	T1PTTR	0.0...200.0°C	0.1
Time constant	T1PTTR	60...60000 s	1
Maximum temperature	T1PTTR	22.0...200.0°C	0.1
Alarm value	T1PTTR	20.0...150.0°C	0.1
Reclose temperature	T1PTTR	20.0...150.0°C	0.1

Table continues on the next page

[86] For further reference, see the Operation characteristics table
[87] Overload current > 1.2 × Operate level temperature

Parameter	Function	Value (Range)	Step
Current multiplier	T1PTTR	1...5	1
Initial temperature	T1PTTR	-50.0. 100.0°C	0.1

25.30.70 Three-phase thermal overload protection, two time constants (T2PTTR)

Table 104: Three-phase thermal overload protection, two time constants (T2PTTR)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	Current measurement: ±1.5% of the set value or ±0.002 x I_n (at currents in the range of 0.01...4.00 x I_n)
Operate time accuracy [88]	±2.0% of the theoretical value or ±0.50 s

25.30.71 Three-phase thermal overload protection, two time constants (T2PTTR) main settings

Table 105: Three-phase thermal overload protection, two time constants (T2PTTR) main settings

Parameter	Function	Value (Range)	Step
Temperature rise	T2PTTR	0.0...200.0°C	0.1
Max temperature	T2PTTR	0.0...200.0°C	0.1
Operate temperature	T2PTTR	80.0...120.0%	0.1
Short time constant	T2PTTR	6...60000 s	1
Weighting factor p	T2PTTR	0.00...1.00	0.01
Current reference	T2PTTR	0.05...4.00 × I_n	0.01
Operation	T2PTTR	1 = on 5 = off	-

25.30.72 Three-phase overload protection for shunt capacitor banks (COLPTOC)

Table 106: Three-phase overload protection for shunt capacitor banks (COLPTOC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: fn ±2 Hz, and no harmonics
	5% of the set value or 0.002 × I_n

Table continues on the next page

[88] Overload current > 1.2 x Operate level temperature

Characteristic	Value
Start time for overload stage [89, 90]	Typically 75 ms
Start time for under current stage [80, 91]	Typically 26 ms
Reset time for overload and alarm stage	Typically 60 ms
Reset ratio	Typically 0.96
Operate time accuracy in definite time mode	1% of the set value or ±20 ms
Operate time accuracy in inverse time mode	10% of the theoretical value or ±20 ms
Suppression of harmonics for under current stage	DFT: -50 dB at f = n × f_n, where n = 2,3,4,5,..

25.30.73 Three-phase overload protection for shunt capacitor banks (COLPTOC) main settings

Table 107: Three-phase overload protection for shunt capacitor banks (COLPTOC) main settings

Parameter	Function	Value (Range)	Step
Start value overload	COLPTOC	0.30 1.50 × I_n	0.01
Alarm start value	COLPTOC	80...120%	1
Start value Un Cur	COLPTOC	0.10 0.70 × I_n	0.01
Time multiplier	COLPTOC	0.05...2.00	0.01
Alarm delay time	COLPTOC	500...6000000 ms	100
Un Cur delay time	COLPTOC	100...120000 ms	100

25.30.74 Current unbalance protection for shunt capacitor banks (CUBPTOC)

Table 108: Current unbalance protection for shunt capacitor banks (CUBPTOC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: fn ±2 Hz
Start time [92, 93]	1.5% of the set value or 0.002 × I_n
	Typically 26 ms
Reset time	Typically 40 ms

Table continues on the next page

89 Harmonics current before fault = 0.5 × I_n, harmonics fault current 1.5 × *Start value*, results based on statistical distribution of 1000 measurements
90 Includes the delay of the signal output contact
91 Harmonics current before fault = 1.2 × I_n, harmonics fault current 0.8 × *Start value*, results based on statistical distribution of 1000 measurements
92 Fundamental frequency current = 1.0 × I_n, current before fault = 0.0 × I_n, fault current = 2.0 × *Start value* , results based on statistical distribution of 1000 measurements
93 Includes the delay of the signal output contact

Characteristic	Value
Reset ratio	Typically 0.96
Operate time accuracy in definite time mode	1% of the theoretical value or ±20 ms
Operate time accuracy in inverse definite minimum time mode	5% of the theoretical value or ±20 ms
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2,3,4,5,..

25.30.75 Current unbalance protection for shunt capacitor banks (CUBPTOC) main settings

Parameter	Function	Value (Range)	Step
Alarm mode	CUBPTOC	1 = Normal 2 = Element counter	-
Start value	CUBPTOC	0.01...1.00 × I_n	0.01
Alarm start value	CUBPTOC	0.01...1.00 × I_n	0.01
Time multiplier	CUBPTOC	0.05...15.00	0.01
Operating curve type [94]	CUBPTOC	Definite or inverse time Curve type: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 18, 19	
Operate delay time	CUBPTOC	50...200000 ms	10
Alarm delay time	CUBPTOC	50...200000 ms	10

25.30.76 Three-phase current unbalance protection for shunt capacitor banks (HCUBPTOC)

Table 109: Three-phase current unbalance protection for shunt capacitor banks (HCUBPTOC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	1.5% of the set value or 0.002 × I_n
Start time [95, 96]	Typically 26 ms
Reset time	Typically 40 ms
Reset ratio	Typically 0.96
Operate time accuracy in definite time mode	1% of the theoretical value or ±20 ms
Operate time accuracy in IDMT mode	5% of the theoretical value or ±20 ms
Suppression of harmonics	DFT: -50 dB at f = n × fn, where n = 2,3,4,5,..

[94] For further reference, see the Operating characteristics table
[95] Fundamental frequency current = 1.0 × I_n, current before fault = 0.0 × I_n, fault current = 2.0 × *Start value* , results based on statistical distribution of 1000 measurements
[96] Includes the delay of the signal output contact

25.30.77 Three-phase current unbalance protection for shunt capacitor banks (HCUBPTOC) main settings

Table 110: Three-phase current unbalance protection for shunt capacitor banks (HCUBPTOC) main settings

Parameter	Function	Value (Range)	Step
Start value	HCUBPTOC	0.01...1.00 × I_n	0.01
Alarm start value	HCUBPTOC	0.01...1.00 × I_n	0.01
Time multiplier	HCUBPTOC	0.05...15.00	0.01
Operating curve type [97]	HCUBPTOC	Definite or inverse time Curve type: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 18, 19	
Operate delay time	HCUBPTOC	40...200000 ms	10
Alarm delay time	HCUBPTOC	40...200000 ms	10

25.30.78 Shunt capacitor bank switching resonance protection, current based (SRCPTOC)

Table 111: Shunt capacitor bank switching resonance protection, current based (SRCPTOC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	Operate value accuracy: ±3% of the set value or ±0.002 × I_n (for 2^{nd} order Harmonics) ±1.5% of the set value or ±0.002 × I_n (for 3^{rd} order < Harmonics < 10^{th} order) ±6% of the set value or ±0.004 × I_n (for Harmonics >= 10^{th} order)
Reset time	Typically 45 ms or maximum 50 ms
Retardation time	Typically 0.96
Retardation time	<35 ms
Operate time accuracy in definite time mode	±1.0% of the set value or ±20 ms
Suppression of harmonics	-50 dB at f = f_n

[97] For further reference, refer to the Operating characteristics table

25.30.79 Shunt capacitor bank switching resonance protection, current based (SRCPTOC) main settings

Table 112: Shunt capacitor bank switching resonance protection, current based (SRCPTOC) main settings

Parameter	Function	Value (Range)	Step
Alarm start value	SRCPTOC	0.03. 0.50 × I_n	0.01
Start value	SRCPTOC	0.03. 0.50 × I_n	0.01
Tuning harmonic Num	SRCPTOC	1...11	1
Operate delay time	SRCPTOC	120...360000 ms	1
Alarm delay time	SRCPTOC	120...360000 ms	1

25.30.80 Compensated neutral unbalance voltage protection (CNUPTOV)

Table 113: Compensated neutral unbalance voltage protection (CNUPTOV)

Characteristic		Value
Operation accuracy		Depending on the frequency of the measured voltage: f_n ±2 Hz
		±1.5% of the set value or ±0.002 × U_n
Start time [98, 99]	U_{Fault} = 1.1 × set Start value	Typically 75 ms
Reset time		Typically 40 ms
Reset ratio		Typically 0.96
Retardation time		<35 ms
Operate time accuracy		±1.0% of the set value or ±20 ms
Suppression of harmonics		DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,...

25.30.81 Compensated neutral unbalance voltage protection (CNUPTOV) main settings

Table 114: Compensated neutral unbalance voltage protection (CNUPTOV) main settings

Parameter	Function	Value (Range)	Step
Start value	CNUPTOV	0.01...1.00 × U_n	0.01
Operate delay time	CNUPTOV	100...300000 ms	100

98 Start value = 0.1 × U_n, Voltage before fault = 0.9 × U_n, f_n = 50 Hz, overvoltage in one phase-to-earth with nominal frequency injected from random phase angle, results based on statistical distribution of 1000 measurements

99 Measured with static signal output (SSO)

25.30.82 Directional negative-sequence overcurrent protection (DNSPDOC)

Table 115: Directional negative-sequence overcurrent protection (DNSPDOC)

Characteristic		Value		
Operation accuracy		Depending on the frequency of the measured current: f_n ±2 Hz		
		Current: ±1.5% of the set value or ±0.002 × I_n Voltage: ±1.5% of the set value or ±0.002 × U_n Phase angle: ±2°		
Start time [100, 101]	I_{Fault} = 2 × set *Start value*	Minimum	Typical	Maximum
		31 ms	34 ms	37 ms
Reset time		Typically 40 ms		
Reset ratio		Typically 0.96		
Retardation time		<35 ms		
Operate time accuracy in definite time mode		±1.0% of the set value or ±20 ms		
Suppression of harmonics		RMS: No suppression DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,… Peak-to-Peak: No suppression		

25.30.83 Directional negative-sequence overcurrent protection (DNSPDOC) main settings

Table 116: Directional negative-sequence overcurrent protection (DNSPDOC) main settings

Parameter	Function	Value (Range)	Step
Start value	DNSPDOC	0.05...5.00 × I_n	0.01
Directional mode	DNSPDOC	1 = Non-directional 2 = Forward 3 = Reverse	-
Operate delay time	DNSPDOC	40...300000 ms	10
Characteristic angle	DNSPDOC	-179...180°	1

100 Measurement mode NPS, NPS current before fault = 0.0 × I_n, f_n = 50 Hz, fault NPS current with nominal frequency injected from random phase angle, results based on statistical distribution of 1000 measurements

101 Measured with static signal output (SSO)

25.30.84 Low-voltage ride-through protection (LVRTPTUV)

Table 117: Low-voltage ride-through protection (LVRTPTUV)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured voltage: f_n ±2 Hz
	±1.5% of the set value or ±0.002 × U_n
Start time [102, 103]	Typically 40 ms
Reset time	Based on maximum value of *Recovery time* setting
Operate time accuracy	±1.0% of the set value or ±20 ms
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…

25.30.85 Low-voltage ride-through protection (LVRTPTUV) main settings

Table 118: Low-voltage ride-through protection (LVRTPTUV) main settings

Parameter	Function	Value (Range)	Step
Voltage start value	LVRTPTUV	0.05. 1.20 × U_n	0.01
Num of start phases	LVRTPTUV	4 = Exactly 1 of 3 5 = Exactly 2 of 3 6 = Exactly 3 of 3	-
Voltage selection	LVRTPTUV	1 = Highest Ph-to-E 2 = Lowest Ph-to-E 3 = Highest Ph-to-Ph 4 = Lowest Ph-to-Ph 5 = Positive Seq	-
Active coordinates	LVRTPTUV	1...10	1
Voltage level 1	LVRTPTUV	0.00 1.20 xU_n	0.01
Voltage level 2	LVRTPTUV	0.00 1.20 xU_n	0.01
Voltage level 3	LVRTPTUV	0.00 1.20 xU_n	0.01
Voltage level 4	LVRTPTUV	0.00 1.20 xU_n	0.01

25.30.86 Voltage vector shift protection (VVSPPAM)

Table 119: Voltage vector shift protection (VVSPPAM)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured voltage: f_n ±1 Hz
	±1°
Operate time [104, 105]	Typically 53 ms

25.30.87 Voltage vector shift protection (VVSPPAM) main settings

Table 120: Voltage vector shift protection (VVSPPAM) main settings

Parameter	Function	Value (Range)	Step
Start value	VVSPPAM	2.0...30.0°	0.1
Over Volt Blk value	VVSPPAM	0.40 1.50 × U_n	0.01
Under Volt Blk value	VVSPPAM	0.15. 1.00 × U_n	0.01
Phase supervision	VVSPPAM	7 = Ph A + B + C 8 = Pos sequence	-

[104] f_n = 50 Hz, results based on statistical distribution of 1000 measurements
[105] Includes the delay of the signal output contact

25.30.88 Directional reactive power undervoltage protection (DQPTUV)

Table 121: Directional reactive power undervoltage protection (DQPTUV)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current and voltage: f_n ±2 Hz Reactive power range |PF| <0.71
	Power: ±3.0% or ±0.002 × Q_n Voltage: ±1.5% of the set value or ±0.002 × U_n
Start time [106, 107]	Typically 46 ms
Reset time	<50 ms
Reset ratio	Typically 0.96
Operate time accuracy	±1.0% of the set value or ±20 ms
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…

25.30.89 Directional reactive power undervoltage protection (DQPTUV) main settings

Table 122: Directional reactive power undervoltage protection (DQPTUV) main settings

Parameter	Function	Value (Range)	Step
Voltage start value	DQPTUV	0.20 1.20 × U_n	0.01
Operate delay time	DQPTUV	100...300000 ms	10
Min reactive power	DQPTUV	0.01. 0.50 × S_n	0.01
Min Ps Seq current	DQPTUV	0.02. 0.20 × I_n	0.01
Pwr sector reduction	DQPTUV	0...10°	1

106 *Start value* = 0.05 × S_n, reactive power before fault = 0.8 × *Start value*, reactive power overshoot 2 times, results based on statistical distribution of 1000 measurements

107 Includes the delay of the signal output contact

25.30.90 Reverse power/directional overpower protection (DOPPDPR)

Table 123: Reverse power/directional overpower protection (DOPPDPR)

Characteristic	Value
Operation accuracy [108]	Depending on the frequency of the measured current and voltage: $f = f_n \pm 2$ Hz
	Power measurement accuracy ±3% of the set value or ±0.002 × S_n Phase angle: ±2°
Start time [109, 110]	Typically 45 ms
Reset time	Typically 30 ms
Reset ratio	Typically 0.94
Operate time accuracy	±1.0% of the set value of ±20 ms
Suppression of harmonics	-50 dB at f = n × f_n, where n = 2, 3, 4, 5,…

25.30.91 Reverse power/directional overpower protection (DOPPDPR) main settings

Table 124: Reverse power/directional overpower protection (DOPPDPR) main settings

Parameter	Function	Value (Range)	Step
Start value	DOPPDPR	0.01...2.00 × S_n	0.01
Operate delay time	DOPPDPR	40...300000 ms	10
Directional mode	DOPPDPR	2 = Forward 3 = Reverse	-
Power angle	DOPPDPR	-90...90°	1

25.30.92 Underpower protection (DUPPDPR)

Table 125: Underpower protection (DUPPDPR)

Characteristic	Value
Operation accuracy [111]	Depending on the frequency of the measured current and voltage: $f_n \pm 2$ Hz
	Power measurement accuracy ±3% of the set value or ±0.002 × S_n Phase angle: ±2°

Table continues on the next page

108 *Measurement mode* = “Pos Seq” (default)
109 U = U_n, f_n = 50 Hz, results based on statistical distribution of 1000 measurements
110 Includes the delay of the signal output contact
111 *Measurement mode* = “Pos Seq” (default)

Characteristic	Value
Start time [112, 113]	Typically 45 ms
Reset time	Typically 30 ms
Reset ratio	Typically 1.04
Operate time accuracy	±1.0% of the set value of ±20 ms
Suppression of harmonics	-50 dB at f = n × f_n, where n = 2, 3, 4, 5,…

25.30.93 Underpower protection (DUPPDPR) main settings

Table 126: Underpower protection (DUPPDPR) main settings

Parameter	Function	Value (Range)	Step
Start value	DUPPDPR	0.01. 2.00 × S_n	0.01
Operate delay time	DUPPDPR	40...300000 ms	10
Pol reversal	DUPPDPR	0 = False 1 = True	-
Disable time	DUPPDPR	0...60000 ms	1000

25.30.94 Three-phase underimpedance protection (UZPDIS)

Table 127: Three-phase underimpedance protection (UZPDIS)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current and voltage: f_n ±2 Hz
	±3.0% of the set value or ±0.2 %Zb
Start time [114, 115]	Typically 50 ms
Reset time	Typically 40 ms
Reset ratio	Typically 1.04
Retardation time	<40 ms
Operate time accuracy	±1.0% of the set value or ±20 ms

25.30.95 Three-phase underimpedance protection (UZPDIS) main settings

Table 128: Three-phase underimpedance protection (UZPDIS) main settings

Parameter	Function	Value (Range)	Step
Percentage reach	UZPDIS	1...6000% Z_n	1
Operate delay time	UZPDIS	40...200000 ms	10

112 U = U_n, f_n = 50 Hz, results based on statistical distribution of 1000 measurements
113 Includes the delay of the signal output contact
114 f_n = 50 Hz, results based on statistical distribution of 1000 measurements
115 Includes the delay of the signal output contact

25.30.96 Three-phase underexcitation protection (UEXPDIS)

Table 129: Three-phase underexcitation protection (UEXPDIS)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current and voltage: $f = f_n \pm 2$ Hz
	±3.0% of the set value or ±0.2% Zb
Start time [116, 117]	Typically 45 ms
Reset time	Typically 30 ms
Reset ratio	Typically 1.04
Retardation time	Total retardation time when the impedance returns from the operating circle <40 ms
Operate time accuracy	±1.0% of the set value or ±20 ms
Suppression of harmonics	-50 dB at $f = n \times f_n$, where n = 2, 3, 4, 5,…

25.30.97 Three-phase underexcitation protection (UEXPDIS) main settings

Table 130: Three-phase underexcitation protection (UEXPDIS) main settings

Parameter	Function	Value (Range)	Step
Diameter	UEXPDIS	1...6000 $\%Z_n$	1
Offset	UEXPDIS	-1000...1000 $\%Z_n$	1
Displacement	UEXPDIS	-1000...1000 $\%Z_n$	1
Operate delay time	UEXPDIS	60...200000 ms	10
External Los Det Ena	UEXPDIS	0 = Disable 1 = Enable	-

25.30.98 Third harmonic-based stator earth-fault protection (H3EFPSEF)

Table 131: Third harmonic-based stator earth-fault protection (H3EFPSEF)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured voltage: $f_n \pm 2$ Hz
	±5% of the set value or $\pm 0.004 \times U_n$
Start time [118, 119]	Typically 35 ms
Reset time	Typically 35 ms

Table continues on the next page

116 f_n= 50Hz, results based on statistical distribution of 1000 measurements
117 Includes the delay of the signal output contact
118 f_n = 50 Hz, results based on statistical distribution of 1000 measurements
119 Includes the delay of the signal output contact

Characteristic	Value
Reset ratio	Typically 0.96 (differential mode) Typically 1.04 (under voltage mode)
Operate time accuracy	±1.0% of the set value of ±20 ms

25.30.99 Third harmonic-based stator earth-fault protection (H3EFPSEF) main settings

Table 132: Third harmonic-based stator earth-fault protection (H3EFPSEF) main settings

Parameter	Function	Value (Range)	Step
Beta	H3EFPSEF	0.50...10.00	0.01
Voltage N 3.H Lim	H3EFPSEF	0.005. 0.200 × U_n	0.001
Operate delay time	H3EFPSEF	20...300000 ms	10
Voltage selection	H3EFPSEF	1 = No voltage 2 = Measured Uo 3 = Calculated Uo 4 = Phase A 5 = Phase B 6 = Phase C	-
CB open factor	H3EFPSEF	1.00...10.00	0.01

25.30.100 Rotor earth-fault protection, injection method (MREFPTOC)

Table 133: Rotor earth-fault protection, injection method (MREFPTOC)

Characteristic		Value		
Operation accuracy		Depending on the frequency of the current measured: f_n ±2 Hz		
		±1.5% of the set value or ±0.002 × I_n		
Start time [120, 121]	I_{Fault} = 1.2 × set *Start value*	Minimum	Typical	Maximum
		30 ms	34 ms	38 ms
Reset time		<50 ms		
Reset ratio		Typically 0.96		
Retardation time		<50 ms		
Operate time accuracy		±1.0% of the set value of ±20 ms		
Suppression of harmonics		-50 dB at f = n × fn, where n = 2, 3, 4, 5,…		

120 Current before fault = 0.0 × I_n, f_n = 50 Hz, earth-fault current with nominal frequency injected from random phase angle, results based on statistical distribution of 1000 measurements

121 Includes the delay of the signal output contact

25.30.101 Rotor earth-fault protection, injection method (MREFPTOC) main settings

Table 134: Rotor earth-fault protection, injection method (MREFPTOC) main settings

Parameter	Function	Value (Range)	Step
Operate start value	MREFPTOC	0.010...2.000 × I_n	0.001
Alarm start value	MREFPTOC	0.010...2.000 × I_n	0.001
Operate delay time	MREFPTOC	40...20000 ms	1
Alarm delay time	MREFPTOC	40...200000 ms	1

25.30.102 High-impedance or flux-balance based differential protection (MHZPDIF)

Table 135: High-impedance or flux-balance based differential protection (MHZPDIF)

Characteristic		Value		
Operation accuracy		Depending on the frequency of the measured current: f_n ±2 Hz		
		±1.5% of the set value or 0.002 × I_n		
Start time [122, 123]	I_{Fault} = 2.0 × set *Start Value* (one phase fault)	Minimum	Typical	Maximum
		13 ms	17 ms	21 ms
	I_{Fault} = 2.0 × set *Start Value* (three phases fault)	11 ms	14 ms	17 ms
Reset time		<40 ms		
Reset ratio		Typically 0.96		
Retardation time		<35 ms		
Operate time accuracy in definite time mode		±1.0% of the set value of ±20 ms		

25.30.103 High-impedance or flux-balance based differential protection (MHZPDIF) main settings

Table 136: High-impedance or flux-balance based differential protection (MHZPDIF) main settings

Parameter	Function	Value (Range)	Step
Operate value	MHZPDIF	0.5...50.0 %I_n	0.1
Minimum operate time	MHZPDIF	20...300000 ms	10

122 Measurement mode = “Peak-to-Peak”, current before fault = 0.0 × I_n, f_n = 50 Hz, fault current with nominal frequency injected from random phase angle, results based on statistical distribution of 1000 measurements

123 Includes the delay of the signal output contact

25.30.104 Out-of-step protection with double blinders (OOSRPSB)

Table 137: Out-of-step protection with double blinders (OOSRPSB)

Characteristic	Value
Impedance reach	Depending on the frequency of the measured current and voltage: f_n
	±2 Hz
	±3.0% of the reach value or ±0.2% of $U_n/(\sqrt{3} * I_n)$
Reset time	±1.0% of the set value or ±40 ms
Operate time accuracy	±1.0% of the set value or ±20 ms
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5...

25.30.105 Out-of-step protection (OOSRPSB) main settings

Table 138: Out-of-step protection (OOSRPSB) main settings

Parameter	Function	Value (Range)	Step
Oos operate mode	OOSRPSB	1 = Way in 2 = Way out 2 = Way out 3 = Adaptive	-
Forward reach	OOSRPSB	0.00...6000.00 Ω	0.01
Reverse reach	OOSRPSB	0.00...6000.00 Ω	0.01
Inner blinder R	OOSRPSB	1.00...6000.00 Ω	0.01
Outer blinder R	OOSRPSB	1.01...10000.00 Ω	0.01
Impedance angle	OOSRPSB	10.0...90.0°	0.1
Swing time	OOSRPSB	20...300000 ms	10
Zone 1 reach	OOSRPSB	1...100%	1
Operate delay time	OOSRPSB	20...60000 ms	10

25.30.106 Negative-sequence overcurrent protection for machines (MNSPTOC)

Table 139: Negative-sequence overcurrent protection for machines (MNSPTOC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n
	±1.5% of the set value or ±0.002 × I_n

Table continues on the next page

Characteristic		Value		
Start time [124, 125]		Minimum	Typical	Maximum
	I_{Fault} = 2.0 × set *Start value*	23	25 ms	28 ms
Reset time		Typically 40 ms		
Reset ratio		Typically 0.96		
Retardation time		<35 ms		
Operate time accuracy in definite time mode		±1.0% of the set value or ±20 ms		
Operate time accuracy in inverse time mode		±5.0% of the theoretical value or ±20 ms [126]		
Suppression of harmonics		DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…		

25.30.107 Negative-sequence overcurrent protection for machines (MNSPTOC) main settings

Table 140: Negative-sequence overcurrent protection for machines (MNSPTOC) main settings

Parameter	Function	Value (Range)	Step
Start value	MNSPTOC	0.01. 0.50 × I_n	0.01
Operating curve type	MNSPTOC	Definite or inverse time Curve type: 5, 15, 17, 18	
Operate delay time	MNSPTOC	100...120000 ms	10
Operation	MNSPTOC	1 = on 5 = off	-
Cooling time	MNSPTOC	5...7200 s	1

25.30.108 Loss of phase, undercurrent (PHPTUC)

Table 141: Loss of phase, undercurrent (PHPTUC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	±1.5% of the set value or ±0.002 × I_n
Start time	Typically <55 ms
Reset time	<40 ms
Reset ratio	Typically 1.04
Retardation time	<35 ms
Operate time accuracy in definite time mode	mode ±1.0% of the set value or ±20 ms

[124] Negative-sequence current before = 0.0, f_n = 50 Hz, results based on statistical distribution of 1000 measurements
[125] Includes the delay of the signal output contact
[126] *Start value* multiples in range of 1.10...5.00

25.30.109 Loss of phase, undercurrent (PHPTUC) main settings

Table 142: Loss of phase, undercurrent (PHPTUC) main settings

Parameter	Function	Value (Range)	Step
Current block value	PHPTUC	0.00...0.50 × I_n	0.01
Start value	PHPTUC	0.01...1.00 × I_n	0.01
Operate delay time	PHPTUC	50...200000 ms	10

25.30.110 Loss of load supervision (LOFLPTUC)

Table 143: Loss of load supervision (LOFLPTUC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	±1.5% of the set value or ±0.002 × I_n
Start time	Typically 300 ms
Reset time	Typically 40 ms
Reset ratio	Typically 1.04
Retardation time	<35 ms
Operate time accuracy in definite time mode	±1.0% of the set value or ±20 ms

25.30.111 Loss of load supervision (LOFLPTUC) main settings

Table 144: Loss of load supervision (LOFLPTUC) main settings

Parameter	Function	Value (Range)	Step
Start value low	LOFLPTUC	0.01. 0.50 × I n	0.01
Start value high	LOFLPTUC	0.01. 1.00 × I n	0.01
Operate delay time	LOFLPTUC	400...600000 ms	10
Operation	LOFLPTUC	1 = on 5 = off	-

25.30.112 Motor load jam protection (JAMPTOC)

Table 145: Motor load jam protection (JAMPTOC)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	±1.5% of the set value or ±0.002 × I_n
Reset time	Typically 40 ms
Reset ratio	Typically 0.96
Retardation time	<35 ms
Operate time accuracy in definite time mode	±1.0% of the set value or ±20 ms

25.30.113 Motor load jam protection (JAMPTOC) main settings

Table 146: Motor load jam protection (JAMPTOC) main settings

Parameter	Function	Value (Range)	Step
Operation	JAMPTOC	1 = on 5 = off	-
Start value	JAMPTOC	0.10...10.00 × I_n	0.01
Operate delay time	JAMPTOC	100...120000 ms	10

25.30.114 Motor start-up supervision (STTPMSU)

Table 147: Motor start-up supervision (STTPMSU)

Characteristic		Value		
Operation accuracy		Depending on the frequency of the measured current: f_n ±2 Hz		
		±1.5% of the set value or ±0.002 × I_n		
Start time [127, 128]		Minimum	Typical	Maximum
	I_{Fault} = 1.1 × set *Start detection A*	27 ms	30 ms	34 ms
Operate time accuracy		±1.0% of the set value or ±20 ms		
Reset ratio		Typically 0.90		

25.30.115 Motor start-up supervision (STTPMSU) main settings

Table 148: Motor start-up supervision (STTPMSU) main settings

Parameter	Function	Value (Range)	Step
Motor start-up A	STTPMSU	1.0 10.0 × I_n	0.1
Motor start-up time	STTPMSU	1...80 s	1
Lock rotor time	STTPMSU	2...120 s	1
Operation	STTPMSU	1 = on 5 = off	-
Operation mode	STTPMSU	1 = IIt 2 = IIt, CB 3 = IIt + stall 4 = IIt + stall, CB	-
Restart inhibit time	STTPMSU	0...250 min	1

127 Current before = 0.0 × I_n, f_n = 50 Hz, overcurrent in one phase, results based on statistical distribution of 1000 measurements

128 Includes the delay of the signal output contact

25.30.116 MSCPMRI Group settings (Basic)

Table 149: MSCPMRI Group settings (Basic)

Parameter	Function	Value (Range)	Step
Warm start level	MSCPMRI	20.0...100.0%	0.1
Max Num cold start	MSCPMRI	1...10	1
Max Num warm start	MSCPMRI	1...10	1

25.30.117 Phase reversal protection (PREVPTOC)

Table 150: Phase reversal protection (PREVPTOC)

Characteristic		Value		
Operation accuracy		Depending on the frequency of the measured current: f_n ±2 Hz		
		±1.5% of the set value or ±0.002 × I_n		
Start time [129, 130]		Minimum	Typical	Maximum
	I_{Fault} = 2.0 × set *Start value*	23 ms	25 ms	28 ms
Reset time		Typically 40 ms		
Reset ratio		Typically 0.96		
Retardation time		<35 ms		
Operate time accuracy in definite time mode		±1.0% of the set value or ±20 ms		
Suppression of harmonics		DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…		

25.30.118 Phase reversal protection (PREVPTOC) main settings

Table 151: Phase reversal protection (PREVPTOC) main settings

Parameter	Function	Value (Range)	Step
Start value	PREVPTOC	0.05. 1.00 x I_n	0.01
Operate delay time	PREVPTOC	100...60000 ms	10
Operation	PREVPTOC	1 = on 5 = off	-

129 Negative-sequence current before = 0.0, f_n = 50 Hz, results based on statistical distribution of 1000 measurements

130 Includes the delay of the signal output contact

25.30.119 Thermal overload protection for motors (MPTTR)

Table 152: Thermal overload protection for motors (MPTTR)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	Current measurement: ±1.5% of the set value or ±0.002 × I_n (at currents in the range of 0.01...4.00 × I_n)
Operate time accuracy [131]	±2.0% of the theoretical value or ±0.50 s

25.30.120 Thermal overload protection for motors (MPTTR) main settings

Table 153: Thermal overload protection for motors (MPTTR) main settings

Parameter	Function	Value (Range)	Step
Overload factor	MPTTR	1.00...1.20	0.01
Alarm thermal value	MPTTR	50.0...100.0%	0.1
Restart thermal Val	MPTTR	20.0...80.0%	0.1
Weighting factor p	MPTTR	20.0...100.0%	0.1
Time constant normal	MPTTR	80...4000 s	1
Time constant start	MPTTR	80...4000 s	1
Env temperature mode	MPTTR	1 = FLC Only 2 = Use input 3 = Set Amb Temp	-
Env temperature Set	MPTTR	-20.0...70.0°C	0.1
Operation	MPTTR	1 = on 5 = off	-

25.30.121 Thermal overload protection for rotors (RPTTR)

Table 154: Thermal overload protection for rotors (RPTTR)

Characteristics	Value
Operation accuracy	Depending on the frequency of the measured current fn ±2 Hz
	Current measurement ±1.5% of the set value or ±0.002 x I_n (at currents in the range of ≤4.00 x I_n)
Operate time accuracy	±2.0% of the theoretical value or ±0.50 s

[131] Overload current > 1.2 × Operate level temperature

25.30.122 Thermal overload protection for rotors (RPTTR) main settings

Table 155: Thermal overload protection for rotors (RPTTR) main settings

Parameter	Function	Value (Range)	Step
Time constant normal	RPTTR	80...10000 s	1
Time constant start	RPTTR	80...10000 s	1
Time constant stop	RPTTR	80...60000 s	1
Alarm value	RPTTR	50.0...100.0 %	0.1
Restart thermal Val	RPTTR	20.0...80.0 %	0.1
Weighting factor p	RPTTR	20.0...100.0 %	0.1
Overload factor	RPTTR	1.00...1.20	0.01
Env temperature Set	RPTTR	-20.0...70.0 °C	0.1
Env temperature mode	RPTTR	1=FLC Only 2=Use input 3=Set Amb Temp	
Motor synchronous speed	RPTTR	125...3600	1
Motor nominal speed	RPTTR	100...3599	1

25.30.123 Directional negative sequence impedance protection (DNZPDIS)

Table 156: DNZPDIS Technical data

Characteristics	Value
Operation accuracy	At the frequency f = f_n
	±3% of the set value or ±0.05 Ω (When $\|\angle Z_2 - \angle RCA\|$ is outside 80 to 100 degree)
Start time [132, 133, 134]	<75 ms
Operate time accuracy[135]	±1.0% of the set value or ±20 ms
Reset ratio	0.96
Reset time	Typically 30 ms

[132] Results based on statistical distribution of 1000 measurements
[133] Measured with static signal output (SSO)
[134] During fault, Z_2= 2.0 × *Ng Seq impedance Rv/Fw*
[135] During fault, Z_2= 2.0 × *Ng Seq impedance Rv/Fw*

25.30.124 Directional negative sequence impedance protection (DNZPDIS) main settings

Table 157: Directional negative sequence impedance protection (DNZPDIS) main settings

Parameter	Function	Value (Range)	Step
Direction mode	DNZPDIS	1=Non-directional 2=Forward 3=Reverse	
Operate delay time	DNZPDIS	60...300000 ms	10
Ng Seq impedance Fw	DNZPDIS	0.01...3000.00 ohm	0.01
Ng Seq impedance Rv	DNZPDIS	-3000...-0.01 ohm	0.01
Characteristic angle	DNZPDIS	1...90 deg	1

25.30.125 Power swing detection (DSTRPSB)

Table 158: Power swing detection (DSTRPSB)

Characteristic	Value
Operation accuracy	At the frequency f = fn
	Current: ±1.5% of the set value or ±0.002 × I_n Impedance: ±3% of the set value or ±0.05 Ω Phase angle: ±2°
Reset ratio	Typically 0.96/1.04
Operate time accuracy[136]	± 1.0% of the set value or 20 ms

25.30.126 Power swing detection (DSTRPSB) main settings

Table 159: Power swing detection (DSTRPSB) main settings

Parameter	Function	Value (Range)	Step
Swing time	DSTRPSB	20...300000 ms	10
Inner R1	DSTRPSB	0.01...5999.99 ohm	0.01
Inner X1	DSTRPSB	0.01...5999.99 ohm	0.01
Inner X1 reverse	DSTRPSB	0.01...5999.99 ohm	0.01
Inner Min Ris Rch	DSTRPSB	0.01...5999.99 ohm	0.01

Maximum Syn time	SECRSYN	100...6000000 ms	10
Energizing time	SECRSYN	100...60000 ms	10
Closing time of CB	SECRSYN	40...250 ms	10

25.31.10 Tap changer control with voltage regulator (OL5ATCC)

Table 199: Tap changer control with voltage regulator (OL5ATCC)

Characteristic	Value
Operation accuracy [154]	Depending on the frequency of the measured current: fn ±2 Hz
	Differential voltage U_d = ±0.5% of the measured value or ±0.005 × U_n (in measured voltages <2.0 × U_n) Operation value = ±1.5% of the U_d for Us = 1.0 × U_n
Operate time accuracy in definite time mode [155]	+4.0%/-0% of the set value
Operate time accuracy in inverse time mode [138]	+8.5%/-0% of the set value (at theoretical B in range of 1.1…5.0) Also note fixed minimum operate time (IDMT) 1 s
Reset ratio for control operation	Typically 0.80 (1.20)
Reset ratio for analog based blockings (except run back raise voltage blocking)	Typically 0.96 (1.04)

25.31.11 Tap changer control with voltage regulator (OL5ATCC) main settings

Table 200: Tap changer control with voltage regulator (OL5ATCC) main settings

Parameter	Function	Value (Range)	Step
LDC enable	OL5ATCC	0 = False 1 = True	-
Parallel mode	OL5ATCC	2 = Master 3 = Follower 5 = NRP 7 = MCC -1 = Input control -2 = Command	-
Band center voltage	OL5ATCC	0.000...2.000 × U_n	0.001
Line drop V Ris	OL5ATCC	0.0...25.0%	0.1
Line drop V React	OL5ATCC	0.0...25.0%	0.1
Band reduction	OL5ATCC	0.00...9.00 %U_n	0.01
Stability factor	OL5ATCC	0.0...70.0%	0.1
Rv Pwr flow allowed	OL5ATCC	0 = False 1 = True	-

25.33 Measurement functions

25.33.1 Three-phase current measurement (CMMXU)

Table 225: Three-phase current measurement (CMMXU)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f_n ±2 Hz
	±0.5% or ±0.002 × I_n
	(at currents in the range of 0.01...4.00 × I_n)
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…
	RMS: No suppression

25.33.2 Sequence current measurement (CSMSQI)

Table 226: Sequence current measurement (CSMSQI)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured current: f/f_n = ±2 Hz
	±1.0% or ±0.002 × I_n
	at currents in the range of 0.01...4.00 × I_n
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…

25.33.3 Residual current measurement (RESCMMXU)

Table 227: Residual current measurement (RESCMMXU)

Characteristic	Value
Operation accuracy	Depending on the frequency of the current measured: f/f_n = ±2 Hz
	±0.5% or ±0.002 × I_n
	at currents in the range of 0.01...4.00 × I_n
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…
	RMS: No suppression

25.33.4 Three-phase voltage measurement (VMMXU)

Table 228: Three-phase voltage measurement (VMMXU)

Characteristic	Value
Operation accuracy	Depending on the frequency of the voltage measured: f_n ±2 Hz At voltages in range 0.01…1.15 × U_n
	±0.5% or ±0.002 × U_n
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,… RMS: No suppression

25.33.5 Phase voltage measurement (VPHMMXU)

Table 229: VPHMMXU Technical data

Characteristic	Value
Operation accuracy	Depending on the frequency of the voltage measured: f_n ±2 Hz At voltages in range 0.01…1.15 × U_n
	±0.5 % or ±0.002 × U_n
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,… RMS: No suppression

25.33.6 Single-phase voltage measurement (VAMMXU)

Table 230: Single-phase voltage measurement (VAMMXU)

Characteristic	Value
Operation accuracy	Depending on the frequency of the voltage measured: f_n ±2 Hz At voltages in range 0.01…1.15 × U_n
	±0.5% or ±0.002 × U_n
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,… RMS: No suppression

25.33.7 Residual voltage measurement (RESVMMXU)

Table 231: Residual voltage measurement (RESVMMXU)

Characteristic	Value
Operation accuracy	Depending on the frequency of the measured voltage: f/f_n = ±2 Hz
	±0.5% or ±0.002 × U_n
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…
	RMS: No suppression

25.33.8 Sequence voltage measurement (VSMSQI)

Table 232: Sequence voltage measurement (VSMSQI)

Characteristic	Value
Operation accuracy	Depending on the frequency of the voltage measured: f_n ±2 Hz
	At voltages in range 0.01…1.15 × U_n
	±1.0% or ±0.002 × U_n
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…

25.33.9 Three-phase power and energy measurement (PEMMXU)

Table 233: Three-phase power and energy measurement (PEMMXU)

Characteristic	Value
Operation accuracy [172]	At all three currents in range 0.10…1.20 × In At all three voltages in range 0.50…1.15 × U_n At the frequency f_n ±1 Hz
	±1.5% for apparent power S
	±1.5% for active power P and active energy [173]
	±1.5% for reactive power Q and reactive energy [174]
	±0.015 for power factor
Suppression of harmonics	DFT: -50 dB at f = n × f_n, where n = 2, 3, 4, 5,…

[172] *Measurement mode* = "Pos Seq" (default)
[173] |PF| >0.5 which equals |cosϕ| >0.5
[174] |PF| <0.86 which equals |sinϕ| >0.5

25.33.10 Frequency measurement (FMMXU)

Table 234: Frequency measurement (FMMXU)

Characteristic	Value
Operation accuracy	±5 mHz (in measurement range 35...75 Hz)

25.33.11 Tap changer position indication (TPOSYLTC)

Table 235: Tap changer position indication (TPOSYLTC)

Characteristic	Value
Response time for binary inputs	Typically 100 ms

25.34 Power quality functions

25.34.1 Current total demand, harmonic distortion, DC component (TDD, THD, DC) and individual harmonics (CHMHAI)

Table 236: Current total demand, harmonic distortion, DC component (TDD, THD, DC) and individual harmonics (CHMHAI)

Characteristic	Value
Operation accuracy [175]	±3.0% or ±0.2

25.34.2 Current total demand, harmonic distortion, DC component (TDD, THD, DC) and individual harmonics (CHMHAI) main settings

Table 237: Current total demand, harmonic distortion, DC component (TDD, THD, DC) and individual harmonics (CHMHAI) main settings

Parameter	Function	Value (Range)	Step
Sliding interval	CHMHAI	1 = 3 seconds 2 = 1 minute 3 = 5 minutes	-
Reference Cur Sel	CHMHAI	0 = fundamental 2 = absolute	-
Demand current	CHMHAI	0.10...1.00 × I_n	0.01

[175] Nominal frequency 50 Hz. Harmonics in the range 0…0.21 × fundamental amplitude

25.34.3 Voltage total harmonic distortion, DC component (THD, DC) and individual harmonics (VHMHAI)

Table 238: Voltage total harmonic distortion, DC component (THD, DC) and individual harmonics (VHMHAI)

Characteristic	Value
Operation accuracy [176]	±3.0% or ±0.2

25.34.4 Voltage total harmonic distortion, DC component (THD, DC) and individual harmonics (VHMHAI) main settings

Table 239: Voltage total harmonic distortion, DC component (THD, DC) and individual harmonics (VHMHAI) main settings

Parameter	Function	Value (Range)	Step
Sliding interval	VHMHAI	1 = 3 seconds 2 = 1 minute 3 = 5 minutes	-

25.34.5 Voltage variation (PHQVVR)

Table 240: Voltage variation (PHQVVR)

Characteristic	Value
Operation accuracy	±1.5% of the set value or ±0.2% of reference voltage
Reset ratio	Typically 0.96 (Swell), 1.04 (Dip, Interruption)

25.34.6 Voltage variation (PHQVVR) main settings

Table 241: Voltage variation (PHQVVR) main settings

Parameter	Function	Value (Range)	Step
Voltage dip set 1	PHQVVR	10.0...100.0%	0.1
Voltage dip set 2	PHQVVR	10.0...100.0%	0.1
Voltage dip set 3	PHQVVR	10.0...100.0%	0.1
Voltage swell set 1	PHQVVR	100.0...140.0%	0.1
Voltage swell set 2	PHQVVR	100.0...140.0%	0.1
Voltage swell set 3	PHQVVR	100.0...140.0%	0.1
Voltage Int set	PHQVVR	0.0...100.0%	0.1
VVa Dur Max	PHQVVR	100...3600000 ms	100

[176] Nominal frequency 50 Hz. Harmonics in the range 0…0.21 × fundamental amplitude

25.34.7 Voltage unbalance (VSQVUB)

Table 242: Voltage unbalance (VSQVUB)

Characteristic	Value
Operation accuracy	±1.5% of the set value or ±0.002 × U_n
Reset ratio	Typically 0.96

25.34.8 Voltage unbalance (VSQVUB) main settings

Table 243: Voltage unbalance (VSQVUB) main settings

Parameter	Function	Value (Range)	Step
Operation	VSQVUB	1 = on 5 = off	-
Unb detection method	VSQVUB	1 = Neg Seq 2 = Zero Seq 3 = Neg to Pos Seq 4 = Zero to Pos Seq 5 = Ph vectors Comp	-

25.35 Logging functions

25.35.1 Disturbance recorder, common functionality (RDRE) main settings

Table 244: Disturbance recorder, common functionality (RDRE) main settings

Parameter	function	Value (Range)	Step
Record length	RDRE	10...500 cycles	1
Pre-trg length	RDRE	0...100%	1
Operation mode	RDRE	1 = Overwrite 2 = Saturation	-
Storage rate	RDRE	32, 16, 8 samples per fundamental cycle	-

25.36 Other functionality

25.36.1 Pulse timer, eight channels (PTGAPC)

Table 245: Pulse timer, eight channels (PTGAPC)

Characteristic	Value
Operate time accuracy	±1.0% of the set value or ±20 ms

25.36.2 Time delay off, eight channels (TOFPAGC)

Table 246: Time delay off, eight channels (TOFPAGC)

Characteristic	Value
Operate time accuracy	±1.0% of the set value or ±20 ms

25.36.3 Time delay on, eight channels (TONGAPC)

Table 247: Time delay on, eight channels (TONGAPC)

Characteristic	Value
Operate time accuracy	±1.0% of the set value or ±20 ms

26. Mounting methods

With appropriate mounting accessories, the protection relay can be rack mounted, wall mounted, roof mounted or door mounted. The LHMI can be mounted either on a door or a surface, or in a tilted position (25°) using special accessories. It is also possible to rack mount or door mount the protection relay together with the LHMI.

Mounting options for the relay:

- Rack mounting
- Rack mounting with the LHMI
- Rack mounting with the LHMI including a provision for the RTXP 24 test switch
- Wall mounting
- Roof mounting
- Door mounting
- Door mounting with the LHMI

Mounting options for the HMI:

- Rack mounting
- Door mounting
- Mounting in a 25° tilt

27. Selection and ordering data

Relays-Online a Next-Generation Order Number Tool, supports order code creation for ABB Distribution Automation IEC products with emphasis on, but not exclusively for the Relion product family. Relays-Online is an easy to use, online tool always containing the latest product information. The complete order code can be created with detailed specification and the result can be printed and mailed. Registration is recommended.

28. Modification Sales

Modification Sales is a concept that provides modification support for already delivered relays. Under Modification Sales it is possible to modify both the hardware and software capabilities of the existing relay. The same options are available as when a new relay variant is configured and ordered from the factory: it is possible to add new hardware modules into empty slots, change the type of the existing modules within the slots or add software functions by adding application and, if necessary, add-on packages. If it is needed to use the possibilities provided by the Modification Sales concept, please contact your local ABB unit. The information that is requested by ABB is a) Relay serial number, b) Relay order code and c) The requested modification, separately stated for each relay.

Modification Sales is based on license handling within the relay. Modifying the relay without proper new license from ABB puts the relay in internal relay failure mode.

29. Accessories and ordering data

Table 248: HMI

Item	Order number
LHMI (including mounting bracket kit)	2RCA033008A0001

30. Tools

The protection relay is delivered with the correct protection and control functionality included but it needs some engineering to fit in the needed application. The default parameter setting values can be changed from the HMI, the Web browser-based user interface (WHMI) or Protection and Control IED Manager PCM600 in combination with the relayspecific connectivity package.

PCM600 offers extensive relay configuration functions. For example, the setting parameters, relay application, graphical display and IEC 61850 communication, including horizontal GOOSE communication, can be modified with PCM600.

The REX640 relay's LHMI pages can be customized and shared between devices with a dedicated Display Editor which offers intuitive graphical drawing tools with editable symbols for single-line diagrams. In addition, it is possible to create personalized views for every supported application. The page access can be customized for every user to enable simple operational usage for all user levels.

When the WHMI is used, the protection relay can be accessed from any of the relay's access points, including the Ethernet connection on the LHMI. For security reasons, the WHMI is disabled by default, but it can be enabled via the LHMI. The WHMI functionality can be limited to read-only access.

Table 253: Tools

Description	Version
PCM600	2.12 HF3 or later
Web browser	Microsoft Edge, Google Chrome and Mozilla Firefox
REX640 connectivity package	1.3.2 or later

The relay connectivity package is a collection of software and specific relay information which enables system products and tools to connect and interact with the protection relay. The connectivity packages reduce the risk of errors in system integration, minimizing device configuration and setup times.

Further, the connectivity package for REX640 includes a flexible update tool for adding one additional LHMI language and new functionalities to the protection relay. The flexible modification support of the relay enables adding new protection functionalities whenever the protection and control needs are changing.

31. Module diagrams

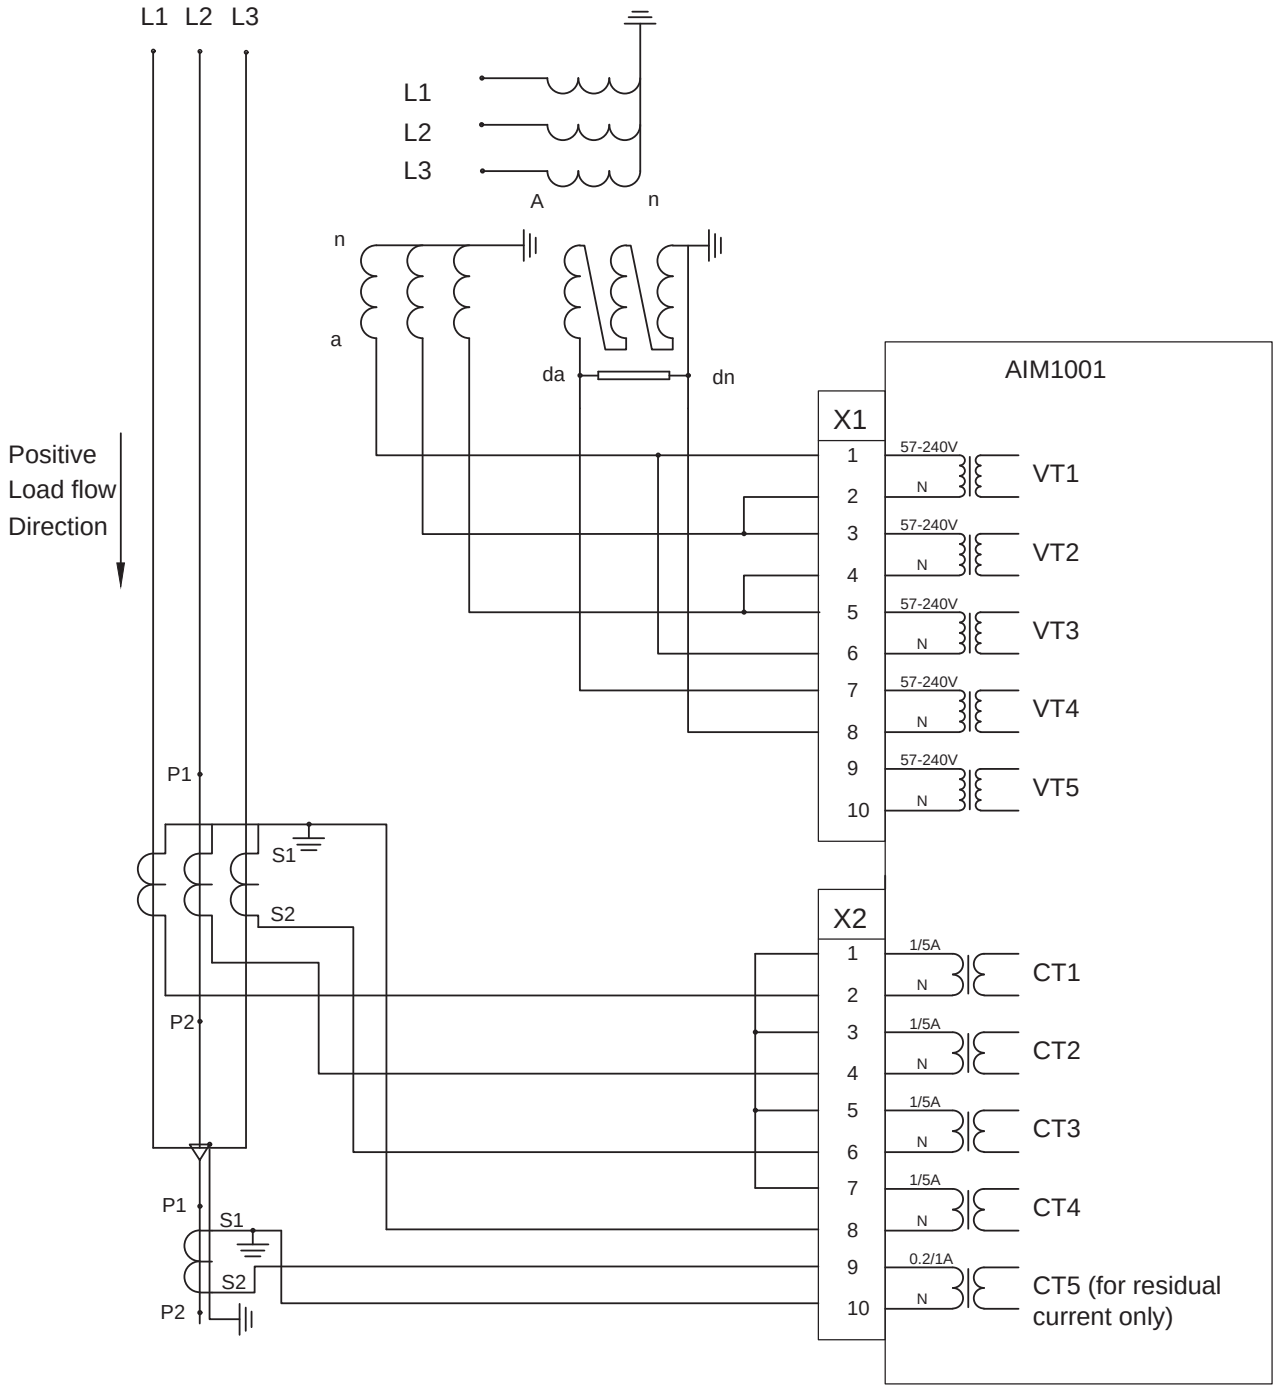

Figure 31: AIM1001 module

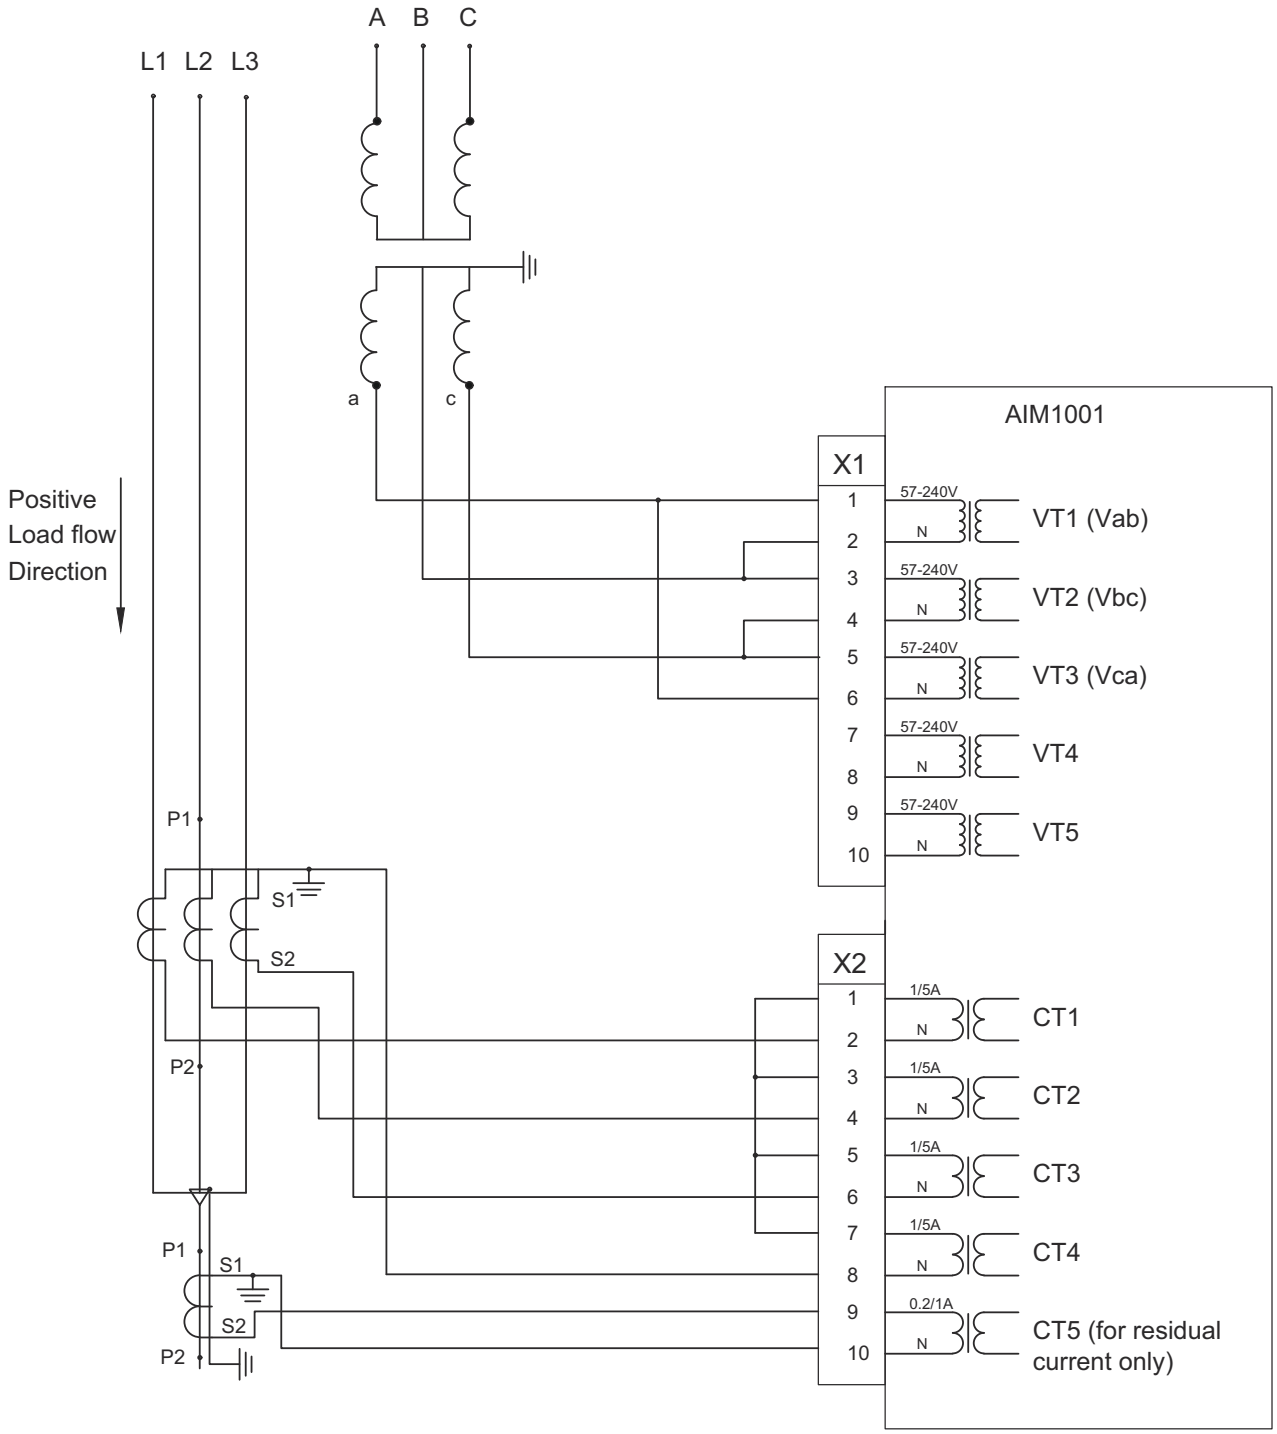

Figure 32: AIM1001 module (two phase-to-phase VTs)

The two phase-to-phase VT connection is often referred as “open delta” (ANSI) or as “V” (IEC) connection. The relay measures all three phase-to-phase voltages using only two primary VTs.

The relay will calculate the phase-to-ground voltages internally, with the assumption that the three-phase system is balanced, i.e. residual voltage is zero.

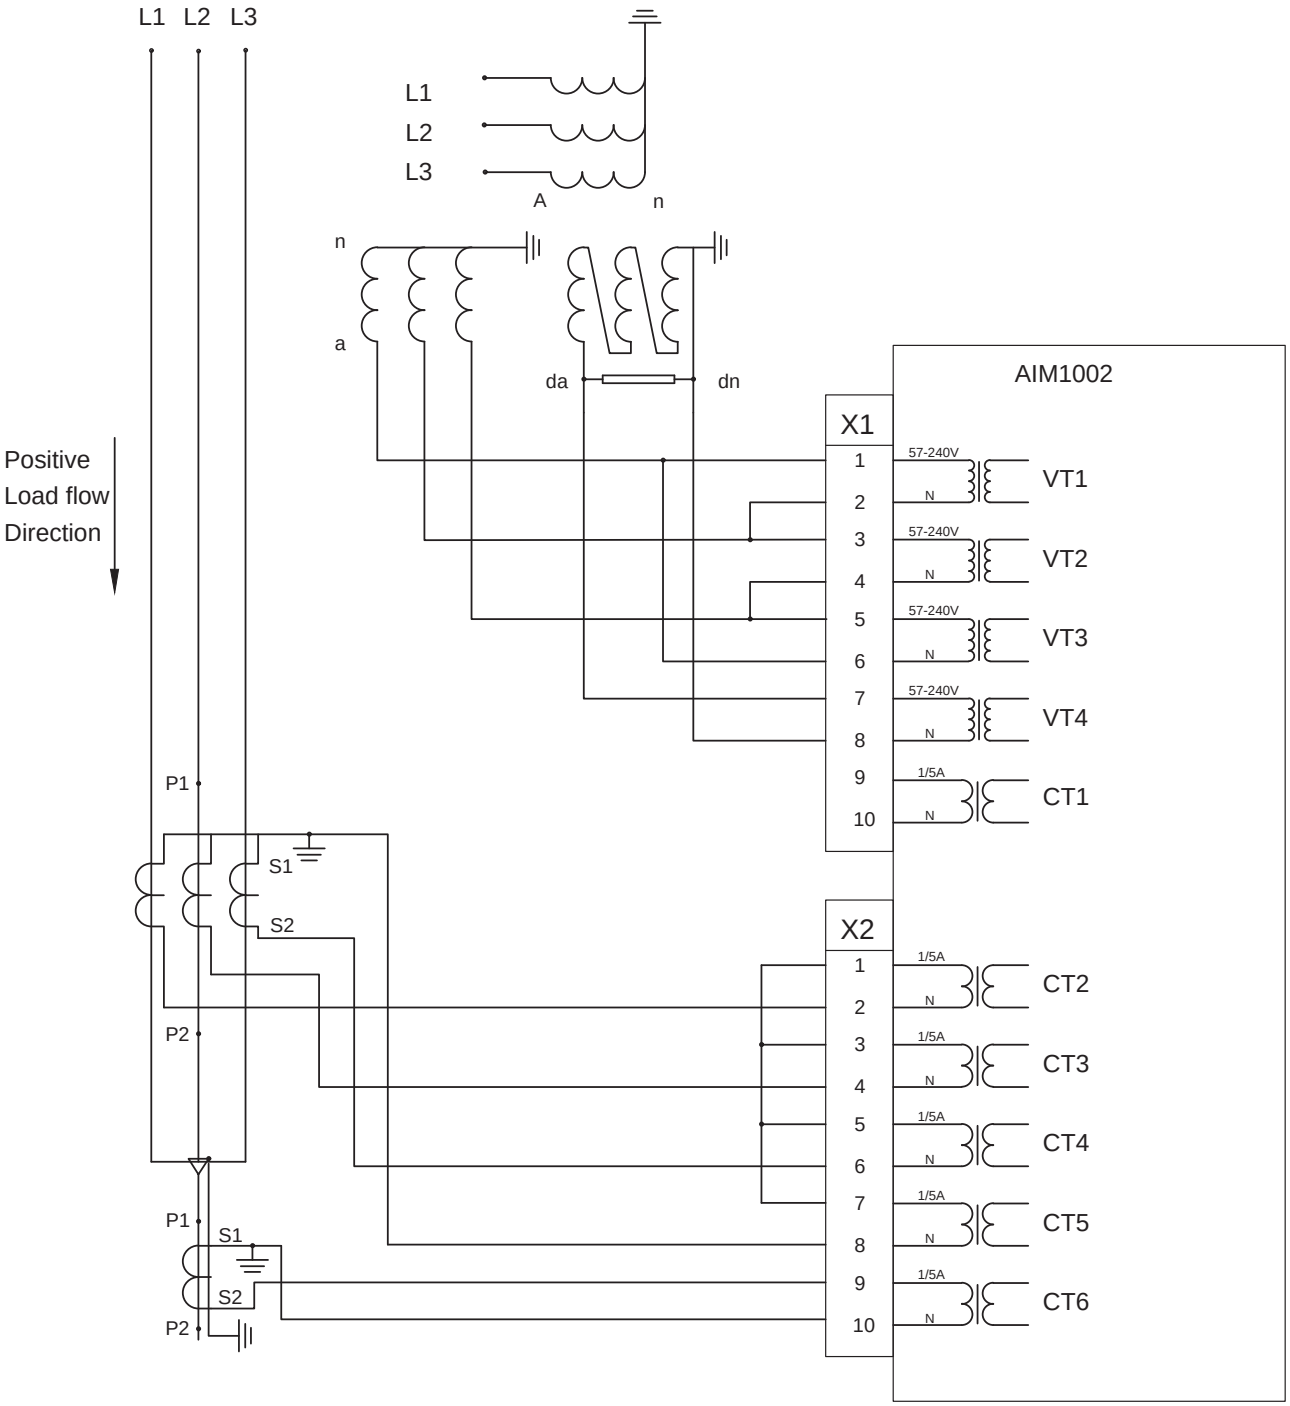

Figure 33: AIM1002 module

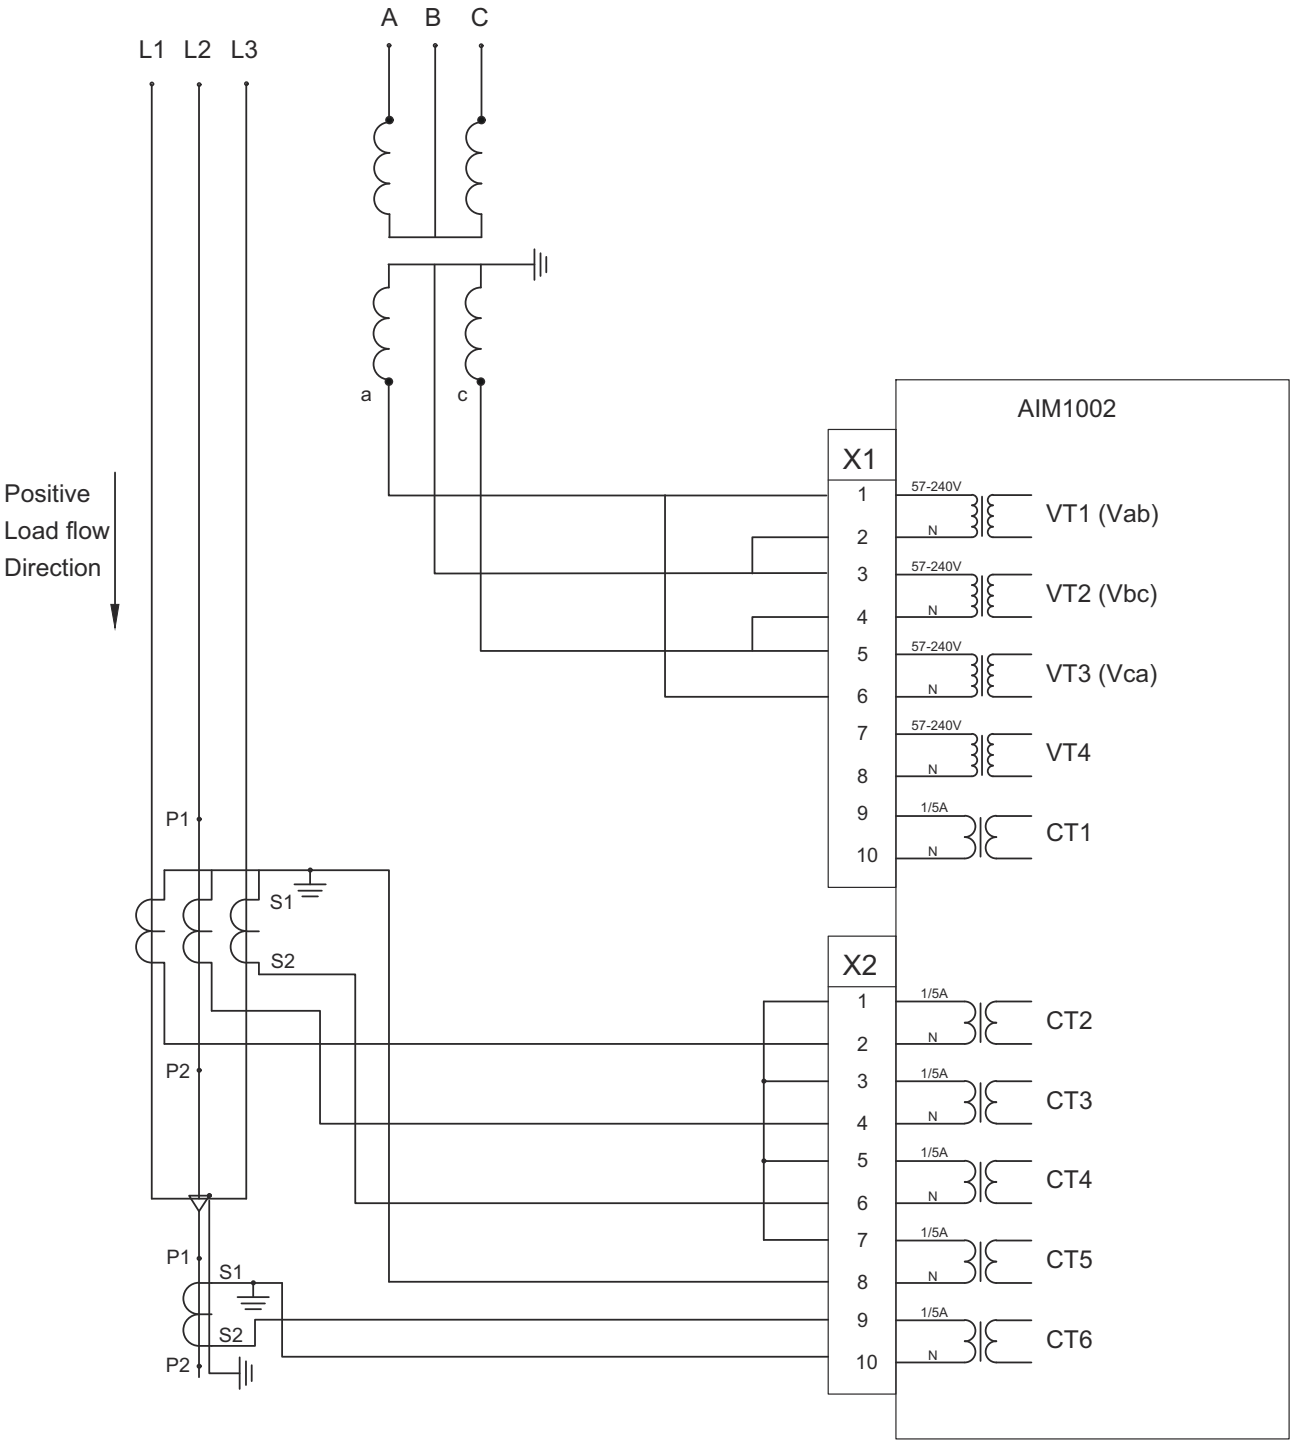

Figure 34: AIM1002 module (two phase-to-phase VTs)

The two phase-to-phase VT connection is often referred as “open delta” (ANSI) or as “V” (IEC) connection. The relay measures all three phase-to-phase voltages using only two primary VTs.

The relay will calculate the phase-to-ground voltages internally, with the assumption that the three-phase system is balanced, i.e. residual voltage is zero.

32. Certificates

DNV GL has issued an IEC 61850 Edition 2 with Amendment 1 Certificate Level A1 for REX640 Protection and Control relay. Certificate number: 10358145-DSO 22-3007.

Additional certificates can be found on the *product page*.

33. References

The *www.abb.com/substationautomation* portal provides information on the entire range of distribution automation products and services.

The latest relevant information on the REX640 protection and control relay is found on the *product page*. Scroll down the page to find and download the related documentation.

34. Functions, codes and symbols

Table 255: Functions included in the relay

Function	IEC 61850	IEC 60617	ANSI
Protection			
Distance protection	DSTPDIS	Z<	21P,21N
Local acceleration logic	DSTPLAL	LAL	21LAL
Scheme communication logic	DSOCPSCH	CL	85 21SCHLGC
Current reversal and weak-end infeed logic	CRWPSCH	CLCRW	85 21CREV,WEI
Communication logic for residual overcurrent	RESCPSCH	CLN	85 67G/N SCHLGC
Current reversal and weak-end infeed logic for residual overcurrent	RCRWPSCH	CLCRWN	85 67G/N CREV,WEI
Power swing detection	DSTRPSB	Zpsb	68
Line differential protection with inzone power transformer	LNPLDF	3Id/I>	87L
Binary signal transfer	BSTGAPC	BST	BST
Switch-onto-fault protection	CVPSOF	CVPSOF	SOTF

Boolean to integer 32- bit conversion	T_B16_TO_I32	T_B16_TO_I32	T_B16_TO_I32

Table continues on the next page

Function	IEC 61850	IEC 60617	ANSI
Integer 32-bit to boolean conversion	T_I32_TO_B16	T_I32_TO_B16	T_I32_TO_B16
Integer 32-bit to real conversion	T_I32_TO_R	T_I32_TO_R	T_I32_TO_R
Real to integer 8-bit conversion	T_R_TO_I8	T_R_TO_I8	T_R_TO_I8
Real to integer 32-bit conversion	T_R_TO_I32	T_R_TO_I32	T_R_TO_I32
Constant FALSE	FALSE	FALSE	FALSE
Constant TRUE	TRUE	TRUE	TRUE

35. Contents of application packages

REX640 offers comprehensive base functionality. However, it is possible to further adapt the product to meet special installation needs by including any number of the available optional application packages into a single REX640 relay. For the selected application packages, the functionality can be extended by including the related add-on package. The REX640 connectivity package guides the engineer in optimizing the application configuration and its performance.

Table 256: Application packages

Description	ID
Feeder earth-fault protection extension package	APP1
Feeder fault locator package	APP2
Line distance protection package	APP3
Line differential protection package	APP4
Shunt capacitor protection package	APP5
Interconnection protection package	APP6
Machine protection package	APP7
Power transformer protection package	APP8
Busbar protection package	APP9
OLTC control package	APP10
Generator autosynchronizer package	APP11
Network autosynchronizer package	APP12
Petersen coil control package	APP13
DG-set monitoring package	APP14
HSTD for one stand-by feeder	APP51
HSTD for two stand-by feeders	APP52
HSTD for three equal feeders	APP53
Synchronous machine add-on	ADD1
3-winding transformer add-on	ADD2

Disclaimer

The data, examples and diagrams in this manual are included solely for the concept or product description and are not to be deemed as a statement of guaranteed properties. All persons responsible for applying the equipment addressed in this manual must satisfy themselves that each intended application is suitable and acceptable, including that any applicable safety or other operational requirements are complied with. In particular, any risks in applications where a system failure and/or product failure would create a risk for harm to property or persons (including but not limited to personal injuries or death) shall be the sole responsibility of the person or entity applying the equipment, and those so responsible are hereby requested to ensure that all measures are taken to exclude or mitigate such risks.

This product has been designed to be connected and communicate data and information via a network interface which should be connected to a secure network. It is the sole responsibility of the person or entity responsible for network administration to ensure a secure connection to the network and to take the necessary measures (such as, but not limited to, installation of firewalls, application of authentication measures, encryption of data, installation of antivirus programs, etc.) to protect the product and the network, its system and interface included, against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. ABB is not liable for any such damages and/or losses.

This document has been carefully checked by ABB but deviations cannot be completely ruled out. In case any errors are detected, the reader is kindly requested to notify the manufacturer. Other than under explicit contractual commitments, in no event shall ABB be responsible or liable for any loss or damage resulting from the use of this manual or the application of the equipment.

In case of discrepancies between the English and any other language version, the wording of the English version shall prevail.

Conformity

This product complies with the directive of the Council of the European Communities on the approximation of the laws of the Member States relating to electromagnetic compatibility (EMC Directive 2014/30/EU) and concerning electrical equipment for use within specified voltage limits (Low-voltage directive 2014/35/EU). This conformity is the result of tests conducted by the third party testing laboratory Intertek in accordance with the product standard EN 60255-26 for the EMC directive, and with the product standards EN 60255-1 and EN 60255-27 for the low voltage directive. The product is designed in accordance with the international standards of the IEC 60255 series.

3.9.3 Analog channel configuration....145
3.9.4 Signals....146
3.9.5 Settings....146
3.9.6 Monitored data....147
3.10 Nonvolatile memory....156
3.11 Analog measurement channels....156
3.12 Sensor inputs for currents and voltages....157
3.13 Binary inputs....160
3.13.1 Binary input threshold voltage....161
3.13.2 Threshold hysteresis....161
3.13.3 Binary input filter time....161
3.13.4 Binary input inversion....162
3.13.5 Oscillation suppression....162

3.14 Binary outputs....163
3.14.1 Power output contacts....163
3.14.2 Signal output contacts....166
3.15 RTD/mA inputs/mA outputs....169
3.15.1 Function blocks....169
3.15.2 Functionality....169
3.15.3 Operation principle....170
3.15.4 Application....174
3.15.5 RTD/mA input/mA output connection....180
3.15.6 Signals....185
3.15.7 Settings....186
3.15.8 Monitored data....188
3.16 SMV function blocks....188
3.16.1 SMV stream sender (IEC 61850-9-2LE) SMVSENDER....188
3.16.2 SMV stream receiver (IEC 61850-9-2LE) SMVRCV....190
3.17 Preprocessing blocks....191
3.17.1 Phase current preprocessing ILTCTR....191
3.17.2 Residual current preprocessing RESTCTR....194
3.17.3 Phase and residual voltage preprocessing UTVTR....197
3.17.4 Residual current preprocessing, current measured as voltage RESUTCTR....203
3.18 GOOSE function blocks....204
3.18.1 Received GOOSE binary information GOOSERCV_BIN....206
3.18.2 Received GOOSE double binary information GOOSERCV_DP....207
3.18.3 Received GOOSE measured value information GOOSERCV_MV....208
3.18.4 Received GOOSE 8-bit integer value information GOOSERCV_INT8....209
3.18.5 Received GOOSE 32-bit integer value information GOOSERCV_INT32....210
3.18.6 Received GOOSE interlocking information GOOSERCV_INTL....211
3.18.7 Received GOOSE measured value (phasor) information GOOSERCV_CMV....212
3.18.8 Received GOOSE enumerator value information GOOSERCV_ENUM....213
3.19 Type conversion function blocks....213
3.19.1 Good signal quality QTY_GOOD....213
3.19.2 Bad signal quality QTY_BAD....214
3.19.3 Received GOOSE test mode QTY_GOOSE_TEST....215
3.19.4 GOOSE communication quality QTY_GOOSE_COMM....215
3.19.5 GOOSE data health T_HEALTH....216
3.19.6 Fault direction evaluation T_DIR....218
3.19.7 Fault direction evaluation T_DIR_FWD....219
3.19.8 Fault direction evaluation T_DIR_REV....220
3.19.9 Enumerator to boolean conversion T_TCMD....221
3.19.10 32-bit integer to binary command conversion T_TCMD_BIN....222
3.19.11 Binary command to 32-bit integer conversion T_BIN_TCMD....223
3.19.12 Integer 32-bit to real conversion T_I32_TO_R....224
3.19.13 Real to integer 8-bit conversion T_R_TO_I8....225
3.19.14 Real to integer 32-bit conversion T_R_TO_I32....226

3.19.15 Integer 32-bit switch selector SWITCHI32 227
3.19.16 Integer 32-bit to boolean conversion T_I32_TO_B16 228
3.19.17 Boolean to integer 32-bit conversion T_B16_TO_I32 229
3.19.18 Integer 8-bit to integer 32-bit conversion T_I8_TO_I32 230
3.20 Configurable logic blocks 231
3.20.1 Minimum pulse timer 231
3.20.2 Pulse timer, eight channels PTGAPC (ANSI 62PT) 235
3.20.3 Daily timer DTMGAPC (ANSI DTM) 237
3.20.4 Calendar function CALGAPC (ANSI CAL) 241
3.20.5 Time delay off, eight channels TOFGAPC (ANSI 62TOF) 244
3.20.6 Time delay on, eight channels TONGAPC (ANSI 62TON) 246
3.20.7 SR flip-flop, eight channels, nonvolatile SRGAPC (ANSI SR) 249
3.20.8 Boolean value event creation MVGAPC (ANSI MV) 251
3.20.9 Integer value event creation MVI4GAPC (ANSI MVI4) 253
3.20.10 Analog value event creation with scaling SCA4GAPC (ANSI SCA4) 254
3.20.11 16 settable real values SETRGAPC 255
3.20.12 16 settable 32-bit integer values SETI32GAPC 257
3.20.13 Generic control points SPCGAPC (ANSI SPCG) 259
3.20.14 Pulse counter for energy measurement PCGAPC 265
3.20.15 Hotline tag HLTGAPC 271
3.20.16 Voltage switch VMSWI (ANSI VSWI) 274
3.20.17 Current switch CMSWI 278
3.20.18 Generic up-down counter UDFCNT 281
3.20.19 Current sum CMSUM (ANSI CSUM) 283
3.20.20 Transformer data combiner OLGAPC 285
3.20.21 Controllable gate, 8 channels GATEGAPC 287
3.21 Standard logic operators 289
3.21.1 OR gate with two inputs OR, six inputs OR6 and twenty inputs OR20 289
3.21.2 AND gate with two inputs AND, six inputs AND6 and twenty inputs AND20 291
3.21.3 XOR gate with two inputs XOR 293
3.21.4 NOT gate NOT 293
3.21.5 Rising edge detector R_TRIG 294
3.21.6 Falling edge detector F_TRIG 295
3.21.7 Switching device status decoder CLOSE position T_POS_CL, OPEN position T_POS_OP and OK status T_POS_OK 296
3.21.8 SR flip-flop, volatile SR 297
3.21.9 RS flip-flop, volatile RS 298
3.22 Mathematical operators 299
3.22.1 Real addition ADDR 299
3.22.2 Real division DIVR 300
3.22.3 Real multiplication MULR 301
3.22.4 Real subtraction SUBR 302
3.22.5 Real equal comparator EQR 302
3.22.6 Real not equal comparator NER 304

3.22.7 Real greater than or equal comparator GER....305
3.22.8 Real less than or equal comparator LER....306
3.22.9 Real maximum value selector MAX3R....307
3.22.10 Real minimum value selector MIN3R....308
3.22.11 Real switch selector SWITCHR....309
3.22.12 Integer 32-bit switch selector SWITCHI32....310
3.23 Factory settings restoration....310
3.24 Load profile LDPRLRC (ANSI LOADPROF)....311

3.26.3 Operation principle....320
3.26.4 Application....321
3.26.5 Signals....322
3.26.6 Settings....322
3.26.7 Monitored data....322
3.27 HMI Ethernet channel supervision HMILCCH....323
3.27.1 Function block....323
3.27.2 Functionality....323
3.27.3 Signals....323
3.27.4 Settings....324
3.27.5 Monitored data....324
3.28 Line differential communication port supervision SCHLCCH6....324
3.28.1 Function block....324
3.28.2 Functionality....324
3.28.3 Signals....324
3.28.4 Monitored data....325
3.28.5 Diagnostics....325

4 Protection functions....326

4.1 Three-phase current protection....326
4.1.1 Three-phase non-directional overcurrent protection PHxPTOC (ANSI 51P-1, 51P-2, 50P)....326

4.1.2 Three-phase directional overcurrent protection DPHxPDOC (ANSI 67P/51P-1, 67P/51P-2)....344
4.1.3 Three-phase voltage-dependent overcurrent protection PHPVOC (ANSI 51V)..... 369
4.1.4 Accidental energization protection GAEPVOC (ANSI 27/50)....378
4.1.5 Three-phase thermal protection for feeders, cables and distribution transformers T1PTTR (ANSI 49F)....383
4.1.6 Three-phase thermal overload protection, two time constants T2PTTR (ANSI 49T/G/C)....389
4.1.7 Motor load jam protection JAMPTOC (ANSI 50TDJAM)....398
4.1.8 Loss of load supervision LOFLPTUC (ANSI 37)....402
4.1.9 Loss of phase, undercurrent PHPTUC (ANSI 37)....405
4.1.10 Thermal overload protection for motors MPTTR (ANSI 49M)....410
4.1.11 Thermal overload protection for rotors RPTTR (ANSI 49R)....423
4.1.12 Generator shaft current leakage protection GSLPTOC (ANSI 38,51)....435
4.2 Earth-fault protection....440
4.2.1 Non-directional earth-fault protection EFxPTOC (ANSI 51G/51N-1, 51G/51N-2, 50G/50N)....440
4.2.2 Directional earth-fault protection DEFxPDEF (ANSI 67G/N-1 51G/N-1, 67G/N-1 51G/N-2)....451
4.2.3 Transient-intermittent earth-fault protection INTRPTEF (ANSI 67NTEF/NIEF)....482
4.2.4 Admittance-based earth-fault protection EFPADM (ANSI 21NY)....490
4.2.5 Rotor earth-fault protection, injection method MREFPTOC (ANSI 64R)....515
4.2.6 Harmonics-based earth-fault protection HAEFPTOC (ANSI 51NH)....521
4.2.7 Wattmetric-based earth-fault protection WPWDE (ANSI 32N)....529
4.2.8 Third harmonic based stator earth-fault protection H3EFPSEF (ANSI 64TN)....541
4.2.9 Multifrequency admittance-based earth-fault protection MFADPSDE (ANSI 67NYH)....553
4.2.10 Touch voltage based earth-fault current protection IFPTOC (ANSI 46SNQ/59N). 582
4.3 Differential protection....643
4.3.1 Line differential protection with in-zone power transformer LNPLDF (ANSI 87L) 643
4.3.2 Stabilized and instantaneous differential protection for two-winding transformers TR2PTDF (ANSI 87T)....680
4.3.3 Stabilized and instantaneous differential protection for two- or three-winding transformers TR3PTDF (ANSI 87T3)....716
4.3.4 Numerically stabilized low-impedance restricted earth-fault protection LREFPNDF (ANSI 87NLI)....748
4.3.5 High-impedance based restricted earth-fault protection HREFPDIF (ANSI 87NHI)....759
4.3.6 High-impedance differential protection HIxPDIF (ANSI 87_A, 87_B, 87_C)....772
4.3.7 Stabilized and instantaneous differential protection for machines MPDIF (ANSI 87M/87G)....788
4.3.8 High-impedance or flux-balance based differential protection MHZPDIF (ANSI 87HIM)....806
4.4 Unbalance protection....819

4.4.1 Negative-sequence overcurrent protection NSPTOC (ANSI 46M) 819
4.4.2 Directional negative-sequence overcurrent protection DNSPDOC (ANSI 67Q) 825
4.4.3 Phase discontinuity protection PDNSPTOC (ANSI 46PD) 832
4.4.4 Phase reversal protection PREVPTOC (ANSI 46R) 837
4.4.5 Negative-sequence overcurrent protection for machines MNSPTOC (ANSI 46M) 841
4.5 Voltage protection 850
4.5.1 Three-phase overvoltage protection PHPTOV (ANSI 59) 850
4.5.2 Three-phase undervoltage protection PHPTUV (ANSI 27) 858
4.5.3 Residual overvoltage protection ROVPTOV (ANSI 59G/ 59N) 866
4.5.4 Positive-sequence overvoltage protection PSPTOV (ANSI 59PS) 870
4.5.5 Negative-sequence overvoltage protection NSPTOV (ANSI 59NS) 875
4.5.6 Positive-sequence undervoltage protection PSPTUV (ANSI 27PS) 879
4.5.7 Overexcitation protection OEPVPH (ANSI 24) 884
4.5.8 Low-voltage ride-through protection LVRTPTUV (ANSI 27RT) 900
4.5.9 Voltage vector shift protection VVSPPAM (ANSI 78VS) 908
4.5.10 Three-phase overvoltage variation protection PHVPTOV (ANSI 59.S1) 913
4.6 Frequency protection 920
4.6.1 Frequency protection FRPFRQ (ANSI 81) 920
4.6.2 Load-shedding and restoration LSHDPFRQ (ANSI 81LSH) 928
4.7 Impedance protection 940
4.7.1 Distance protection DSTPDIS (ANSI 21P, 21N) 940
4.7.2 Out of step OOSRPSB (ANSI 78PS) 1005
4.7.3 Three-phase underexcitation protection UEXPDIS (ANSI 40) 1015
4.7.4 Three-phase underimpedance protection UZPDIS (ANSI 21G) 1026
4.7.5 Directional negative sequence impedance protection DNZPDIS (ANSI Z2Q) 1038
4.7.6 Power swing detection DSTRPSB (ANSI 68) 1046
4.8 Power protection 1055
4.8.1 Underpower protection DUPPDPR (ANSI 32U) 1055
4.8.2 Reverse power-directional overpower protection DOPPDPR (ANSI 32R/32O) 1062
4.8.3 Directional reactive power undervoltage protection DQPTUV (ANSI 32Q,27) 1071
4.8.4 Underpower factor protection MPUPF (ANSI 55U) 1078
4.9 Arc protection ARCSARC (ANSI AFD) 1085
4.9.1 Identification 1085
4.9.2 Function block 1085
4.9.3 Functionality 1085
4.9.4 Analog channel configuration 1085
4.9.5 Operation principle 1086
4.9.6 Application 1087
4.9.7 Signals 1091
4.9.8 ARCSARC Settings 1092
4.9.9 ARCSARC Monitored data 1092
4.9.10 Technical data 1093
4.10 Motor start-up supervision STTPMSU (ANSI 49,66,48,50TDLR) 1093
4.10.1 Identification 1093

4.10.2 Function block ... 1093

5.14 Three-phase power directional element DPSRDIR (ANSI 67P-TC)....1281
5.14.1 Identification....1281
5.14.2 Function block....1281
5.14.3 Functionality....1281
5.14.4 Analog channel configuration....1282

5.14.5 Operation principle....1282
5.14.6 Application....1284
5.14.7 Signals....1284
5.14.8 DPSRDIR Settings....1284
5.14.9 DPSRDIR Monitored data....1285
5.15 Neutral power directional element DNZSRDIR (ANSI 67N-TC)....1285
5.15.1 Identification....1285
5.15.2 Function block....1286
5.15.3 Functionality....1286
5.15.4 Analog channel configuration....1286
5.15.5 Operation principle....1287
5.15.6 Application....1292
5.15.7 Signals....1292
5.15.8 DNZSRDIR Settings....1293
5.15.9 DNZSRDIR Monitored data....1294
5.16 Load blinder LBRDOB (ANSI 21LB)....1294
5.16.1 Identification....1294
5.16.2 Function block....1294
5.16.3 Functionality....1294
5.16.4 Analog channel configuration....1295
5.16.5 Operation principle....1295
5.16.6 Application....1297
5.16.7 Signals....1299
5.16.8 Settings....1299
5.16.9 Monitored data....1300
5.16.10 Technical data....1300

6 Supervision functions....1302

6.1 Trip circuit supervision TCSSCBR (ANSI TCM)....1302
6.1.1 Identification....1302
6.1.2 Function block....1302
6.1.3 Functionality....1302
6.1.4 Operation principle....1302
6.1.5 Application....1303
6.1.6 Signals....1309
6.1.7 TCSSCBR Settings....1310
6.1.8 TCSSCBR Monitored data....1310
6.2 Current circuit supervision CCSPVC (ANSI CCM)....1310
6.2.1 Identification....1310
6.2.2 Function block....1310
6.2.3 Functionality....1310
6.2.4 Analog channel configuration....1311
6.2.5 Operation principle....1311
6.2.6 Application....1313

6.2.7 Signals....1317
6.2.8 CCSPVC Settings....1318
6.2.9 CCSPVC Monitored data....1318
6.2.10 Technical data....1318
6.2.11 Technical revision history....1318
6.3 Current transformer supervision for high-impedance protection scheme HZCCxSPVC (ANSI CCM_A, CCM_B, CCM_C)....1319
6.3.1 Identification....1319
6.3.2 Function block....1319
6.3.3 Functionality....1319
6.3.4 Analog channel configuration....1320
6.3.5 Operation principle....1320
6.3.6 Measuring modes....1321
6.3.7 Application....1322
6.3.8 Signals....1323
6.3.9 Settings....1324
6.3.10 Monitored data....1325
6.3.11 Technical data....1326
6.4 Protection communication supervision PCSITPC (ANSI PCS)....1326
6.4.1 Identification....1326
6.4.2 Function block....1327
6.4.3 Functionality....1327
6.4.4 Operation principle....1327
6.4.5 Application....1328
6.4.6 Signals....1330
6.4.7 PCSITPC Settings....1330
6.4.8 PCSITPC Monitored data....1330
6.5 Fuse failure supervision SEQSPVC (ANSI VCM, 60)....1331
6.5.1 Identification....1331
6.5.2 Function block....1331
6.5.3 Functionality....1331
6.5.4 Analog channel configuration....1331
6.5.5 Operation principle....1332
6.5.6 Application....1335
6.5.7 Signals....1336
6.5.8 SEQSPVC Settings....1337
6.5.9 SEQSPVC Monitored data....1338
6.5.10 Technical data....1338
6.6 Runtime counter for machines and devices MDSOPT (ANSI OPTM)....1339
6.6.1 Identification....1339
6.6.2 Function block....1339
6.6.3 Functionality....1339
6.6.4 Operation principle....1339
6.6.5 Application....1340

6.6.6 Signals....1340
6.6.7 MDSOPT Settings....1341
6.6.8 MDSOPT Monitored data....1342
6.6.9 Technical data....1342
6.7 Motor start counter MSCPMRI (ANSI 66)....1342
6.7.1 Identification....1342
6.7.2 Function block....1342
6.7.3 Functionality....1342
6.7.4 Operation principle....1343
6.7.5 Application....1344
6.7.6 Signals....1344
6.7.7 MSCPMRI Settings....1345
6.7.8 MSCPMRI Monitored data....1346
6.8 Three-phase remanent undervoltage supervision MSVPR (ANSI 27R)....1346
6.8.1 Identification....1346
6.8.2 Function block....1346
6.8.3 Functionality....1346
6.8.4 Analog channel configuration....1347
6.8.5 Operation principle....1347
6.8.6 Application....1348
6.8.7 Signals....1350
6.8.8 MSVPR Settings....1350
6.8.9 MSVPR Monitored data....1351
6.8.10 Technical data....1351
6.9 Current circuit supervision for transformers CTSRCTF (ANSI CCM 3I,I2)....1352
6.9.1 Identification....1352
6.9.2 Function block....1352
6.9.3 Functionality....1352
6.9.4 Analog channel configuration....1353
6.9.5 Operation principle....1353
6.9.6 Application....1355
6.9.7 Signals....1356
6.9.8 CTSRCTF Settings....1357
6.9.9 CTSRCTF Monitored data....1357
6.9.10 Technical data....1358

7 Condition monitoring functions....1359

7.1 Circuit-breaker condition monitoring SSCBR (ANSI 52CM)....1359
7.1.1 Identification....1359
7.1.2 Function block....1359
7.1.3 Functionality....1359
7.1.4 Analog input configuration....1359
7.1.5 Operation principle....1360
7.1.6 Application....1369

7.1.7 Signals....1371
7.1.8 SSCBR Settings....1373
7.1.9 SSCBR Monitored data....1375
7.1.10 Technical data....1375
7.2 Motor controlled earthing switch and disconnector supervision ESDCSSWI (ANSI 29CM)....1376
7.2.1 Identification....1376
7.2.2 Function block....1376
7.2.3 Functionality....1376
7.2.4 Operation principle....1376
7.2.5 Application....1380
7.2.6 Signals....1380
7.2.7 ESDCSSWI Settings....1381
7.2.8 ESDCSSWI Monitored data....1382
7.2.9 Technical data....1382
7.3 Hot-spot and insulation ageing rate monitoring for transformers HSARSPTR (ANSI 26/49HS)....1382
7.3.1 Identification....1382
7.3.2 Function block....1383
7.3.3 Functionality....1383
7.3.4 Analog channel configuration....1383
7.3.5 Operation principle....1384
7.3.6 Application....1391
7.3.7 Signals....1394
7.3.8 HSARSPTR Settings....1395
7.3.9 HSARSPTR Monitored data....1397
7.3.10 Technical data....1397
7.4 Cable fault detection RCFD (ANSI CFD)....1398
7.4.1 Identification....1398
7.4.2 Function block....1398
7.4.3 Functionality....1398
7.4.4 Analog input configuration....1398
7.4.5 Operation principle....1399
7.4.6 Application....1400
7.4.7 Signals....1400
7.4.8 RCFD Settings....1401
7.4.9 RCFD Monitored data....1401
7.4.10 Technical data....1403
7.5 Diesel generator monitoring and protection DGMGAPC (ANSI 32/40G)....1403
7.5.1 Identification....1403
7.5.2 Function block....1403
7.5.3 Functionality....1404
7.5.4 Analog channel configuration....1405
7.5.5 Operation principle....1405
7.5.6 Application....1418

7.5.7 Signals....1420
7.5.8 Settings....1423
7.5.9 DGMGAPC Monitored data....1430
7.5.10 Technical data....1432

8 Measurement functions....1433

8.1 Basic measurements....1433
8.1.1 Functions....1433
8.1.2 Measurement functionality....1433
8.1.3 Measurement function applications....1442
8.1.4 Three-phase current measurement CMMXU (ANSI IA, IB, IC)....1442
8.1.5 Three-phase voltage measurement VMMXU (ANSI VA, VB, VC)....1447
8.1.6 Phase voltage measurement VPHMMXU....1453
8.1.7 Single-phase voltage measurement VAMMXU (ANSI V_A)....1458
8.1.8 Residual current measurement RESCMMXU (ANSI IG)....1462
8.1.9 Residual voltage measurement RESVMMXU (ANSI VG/VN)....1465
8.1.10 Frequency measurement FMMXU (ANSI f)....1468
8.1.11 Sequence current measurement CSMSQI (ANSI I1, I2, I0)....1470
8.1.12 Sequence voltage measurement VSMSQI (ANSI V1, V2, V0)....1476
8.1.13 Three-phase power and energy measurement PEMMXU (ANSI P, E)....1481
8.2 Disturbance recorder, common functionality RDRE (ANSI DFR)....1486
8.2.1 Identification....1486
8.2.2 Function block....1486
8.2.3 Functionality....1487
8.2.4 Configuration....1492
8.2.5 Application....1493
8.2.6 Signals....1493
8.2.7 Settings....1493
8.2.8 Monitored data....1494
8.3 Disturbance recorder, analog channels 1...24 A1RADR and A2RADR....1495
8.3.1 Function block....1495
8.3.2 Signals....1495
8.3.3 Settings....1496
8.4 Disturbance recorder, binary channels 1...64 B1RBDR and B2RBDR....1496
8.4.1 Function block....1496
8.4.2 Signals....1497
8.4.3 Settings....1497
8.5 Tap changer position indication TPOSYLTC (ANSI 84T)....1498
8.5.1 Identification....1498
8.5.2 Function block....1498
8.5.3 Functionality....1498
8.5.4 Operation principle....1499
8.5.5 Application....1501
8.5.6 Signals....1502

8.5.7 TPOSYLTC Settings....1503
8.5.8 TPOSYLTC Monitored data....1503
8.5.9 Technical data....1504

9 Control functions....1505

9.1 Circuit breaker control CBXCBR, Disconnector control DCXSWI and Earthing switch control ESXSWI (ANSI 52, 29DS, 29GS)....1505
9.1.1 Identification....1505
9.1.2 Function block....1505
9.1.3 Functionality....1506
9.1.4 Operation principle....1506
9.1.5 Application....1511
9.1.6 Signals....1512
9.1.7 Settings....1515
9.1.8 Monitored data....1518
9.1.9 Technical revision history....1518
9.2 Three-state disconnector control P3SXSWI (ANSI 29DS/GS)....1520
9.2.1 Identification....1520
9.2.2 Function block....1520
9.2.3 Functionality....1520
9.2.4 Operation principle....1521
9.2.5 Application....1529
9.2.6 Signals....1531
9.2.7 P3SXSWI Settings....1534
9.2.8 P3SXSWI Monitored data....1535
9.2.9 Technical revision history....1535
9.3 Three-state disconnector position indication P3SSXSWI (ANSI 29DS/GS)....1536
9.3.1 Identification....1536
9.3.2 Function block....1536
9.3.3 Functionality....1536
9.3.4 Operation principle....1536
9.3.5 Application....1537
9.3.6 Signals....1537
9.3.7 P3SSXSWI Settings....1538
9.3.8 P3SSXSWI Monitored data....1539
9.4 Disconnector position indicator DCSXSWI and Earthing switch position indication ESSXSWI (ANSI 29DS, 29GS)....1539
9.4.1 Identification....1539
9.4.2 Function block....1539
9.4.3 Functionality....1540
9.4.4 Operation principle....1540

1 Introduction

1.1 This manual

The technical manual contains application and functionality descriptions and lists function blocks, logic diagrams, input and output signals, setting parameters and technical data sorted per function. The manual can be used as a technical reference during the engineering phase, installation and commissioning phase, and during normal service.

1.2 Intended audience

This manual addresses system engineers and installation and commissioning personnel, who use technical data during engineering, installation and commissioning, and in normal service.

The system engineer must have a thorough knowledge of protection systems, protection equipment, protection functions and the configured functional logic in the protection relays. The installation and commissioning personnel must have a basic knowledge in handling electronic equipment.

1.3 Product documentation

1.3.1 Product documentation set

1.4 Symbols and conventions

1.4.1 Symbols

The electrical warning icon indicates the presence of a hazard which could result in electrical shock.

The warning icon indicates the presence of a hazard which could result in personal injury.

The caution icon indicates important information or warning related to the concept discussed in the text. It might indicate the presence of a hazard which could result in corruption of software or damage to equipment or property.

The information icon alerts the reader of important facts and conditions.

The tip icon indicates advice on, for example, how to design your project or how to use a certain function.

Although warning hazards are related to personal injury, it is necessary to understand that under certain operational conditions, operation of damaged equipment may result in degraded process performance leading to personal injury or death. Therefore, comply fully with all warning and caution notices.

1.4.2 Document conventions

A particular convention may not be used in this manual.

- Abbreviations and acronyms are spelled out in the glossary. The glossary also contains definitions of important terms.
- Menu paths are presented in bold.

  Select **Main menu** > **Settings**.
- Parameter names are shown in italics.

  The function can be enabled and disabled with the *Operation* setting
- Parameter values are indicated with quotation marks.

  The corresponding parameter values are "On" and "Off".
- Input/output messages and monitored data names are shown in Courier font.

  When the function starts, the `START` output is set to TRUE.
- Values of quantities are expressed with a number and an SI unit. The corresponding imperial units may be given in parentheses.
- This document assumes that the parameter setting visibility is "Advanced".
- Protective earthing is indicated in figures with the symbol ⏚.

1.4.3 Functions, codes and symbols

Table 1: Functions included in the relay

Function	IEC 61850	IEC 60617	ANSI
Protection			
Distance protection	DSTPDIS	Z<	21P,21N
Local acceleration logic	DSTPLAL	LAL	21LAL
Scheme communication logic	DSOCPSCH	CL	85 21SCHLGC
Current reversal and weak-end infeed logic	CRWPSCH	CLCRW	85 21CREV,WEI
Communication logic for residual overcurrent	RESCPSCH	CLN	85 67G/N SCHLGC
Current reversal and weak-end infeed logic for residual overcurrent	RCRWPSCH	CLCRWN	85 67G/N CREV,WEI
Power swing detection	DSTRPSB	Zpsb	68
Line differential protection with inzone power transformer	LNPLDF	3Id/I>	87L
Binary signal transfer	BSTGAPC	BST	BST
Switch-onto-fault protection	CVPSOF	CVPSOF	SOTF
Three-phase non- directional overcurrent protection, low stage	PHLPTOC	3I>	51P-1
Three-phase non- directional overcurrent protection, high stage	PHHPTOC	3I>>	51P-2
Three-phase non- directional overcurrent protection, instantaneous stage	PHIPTOC	3I>>>	50P
Three-phase directional overcurrent protection, low stage	DPHLPDOC	3I>->	67P/51P-1
Three-phase directional overcurrent protection, high stage	DPHHPDOC	3I>>->	67P/51P-2
Non-directional earth-fault protection, low stage	EFLPTOC	Io>	51G/51N-1
Non-directional earth-fault protection, high stage	EFHPTOC	Io>>	51N-2
Non-directional earth-fault protection, instantaneous stage	EFIPTOC	Io>>>	50G/50N
Directional earth-fault protection, low stage	DEFLPDEF	Io>->	67G/N-1 51G/N-1
Directional earth-fault protection, high stage	DEFHPDEF	Io>>->	67G/N-1 51G/N-2
Three-phase power directional element	DPSRDIR	I1 ->	67P-TC
Neutral power directional element	DNZSRDIR	I2->,Io->	67N-TC
Admittance-based earth-fault protection	EFPADM	Yo>->	21YN
Multifrequency admittance-based earth-fault protection	MFADPSDE	Io>->Y	67NYH
Wattmetric-based earth-fault protection	WPWDE	Po>->	32N
Transient/intermittent earth-fault protection	INTRPTEF	Io>->IEF	67NTEF/NIEF
Harmonics-based earth-fault protection	HAEFPTOC	Io>HA	51NH
Touch voltage based earth-fault current protection	IFPTOC	IF>/UT>	46SNQ/59N
Negative-sequence overcurrent protection	NSPTOC	I2>M	46M

Table continues on the next page

Function	IEC 61850	IEC 60617	ANSI
Phase discontinuity protection	PDNSPTOC	I2/I1>	46PD
Residual overvoltage protection	ROVPTOV	Uo>	59G/59N
Three-phase undervoltage protection	PHPTUV	3U<	27
Three-phase overvoltage variation protection	PHVPTOV	3Urms>	59.S1
Three-phase overvoltage protection	PHPTOV	3U>	59
Positive-sequence overvoltage protection	PSPTOV	U1>	59PS
Positive-sequence undervoltage protection	PSPTUV	U1<	27PS
Negative-sequence overvoltage protection	NSPTOV	U2>	47,59NS
Frequency protection	FRPFRQ	f>/f<,df/dt	81
Three-phase voltage-dependent overcurrent protection	PHPVOC	3I(U)>	51V
Overexcitation protection	OEPVPH	U/f>	24
Three-phase thermal protection for feeders, cables and distribution transformers	T1PTTR	3Ith>F	49F
Three-phase thermal overload protection, two time constants	T2PTTR	3Ith>T/G/C	49T/G/C
Three-phase overload protection for shunt capacitor banks	COLPTOC	3I>3I<	51,37,86C
Current unbalance protection for shunt capacitor banks	CUBPTOC	dI>C	60N
Three-phase current unbalance protection for shunt capacitor banks	HCUBPTOC	3dI>C	60P
Shunt capacitor bank switching resonance protection, current based	SRCPTOC	TD>	55ITHD
Compensated neutral unbalance voltage protection	CNUPTOV	CNU>	59NU
Directional negative- sequence overcurrent protection	DNSPDOC	I2>->	67Q
Low-voltage ride- through protection	LVRTPTUV	UU	27RT
Voltage vector shift protection	VVSPPAM	VS	78VS
Directional reactive power undervoltage protection	DQPTUV	Q>-> ,3U<	32Q,27
Reverse power/ directional overpower protection	DOPPDPR	P>/Q>	32R/32O
Underpower protection	DUPPDPR	P<	32U
Three-phase under impedance protection	UZPDIS	ZZ	21G
Directional negative sequence impedance protection	DNZPDIS	Z2->	Z2Q
Three-phase under excitation protection	UEXPDIS	X<	40
Third harmonic-based stator earth-fault protection	H3EFPSEF	dUo>/Uo3H	64TN
Rotor earth-fault protection (injection method)	MREFPTOC	Io>R	64R
Generator shaft leakage current	GSLPTOC	I>,GS	38, 51
Thermal overload protection for rotors	RPTTR	3Ith>R	49R
High-impedance or flux-balance based differential protection	MHZPDIF	3dIHi>M	87HIM
Out-of-step protection with double blinders	OOSRPSB	OOS	78PS
Negative-sequence overcurrent protection for machines	MNSPTOC	I2>M	46M

Table continues on the next page

Function	IEC 61850	IEC 60617	ANSI
Loss of phase, undercurrent	PHPTUC	3I<	37
Loss of load supervision	LOFLPTUC	3I<	37

Integer 32-bit to real conversion	T_I32_TO_R	T_I32_TO_R	T_I32_TO_R
Real to integer 8-bit conversion	T_R_TO_I8	T_R_TO_I8	T_R_TO_I8
Real to integer 32-bit conversion	T_R_TO_I32	T_R_TO_I32	T_R_TO_I32
Constant FALSE	FALSE	FALSE	FALSE
Constant TRUE	TRUE	TRUE	TRUE

2 REX640 overview

2.1 Overview

REX640 is a powerful all-in-one protection and control relay for use in advanced power distribution and generation applications with unmatched flexibility available during the complete life cycle of the device – from ordering of the device, through testing and commissioning to upgrading the functionality of the modular software and hardware as application requirements change.

The modular design of both hardware and software elements facilitates the coverage of any comprehensive protection application requirement that may arise during the complete life cycle of the relay and substation.

REX640 makes modification and upgrading easy and pushes the limits of what can be achieved with a single device.

2.1.1 PCM600 and relay connectivity package version

- Protection and Control IED Manager PCM600 Ver. 2.12 or later
- REX640 Connectivity Package Ver. 1.3.0 or later

Download connectivity packages from the ABB Web site *www.abb.com/mediumvoltage* or directly with Update Manager in PCM600.

2.2 Relay hardware

The relay includes a Ready LED on the power supply module that indicates the relay's status. In normal situations, the Ready LED has a steady green light. Any other situation that requires the operator’s attention is indicated with a flashing light.

The relay has mandatory and optional slots. A mandatory slot always contains a module but an optional slot may be empty, depending on the composition variant ordered.

Table 2: Module slots

Module	Slot A1	Slot A2	Slot B	Slot C	Slot D	Slot E	Slot F	Slot G
ARC1001	o							
COM1001		•						
COM1002		•						
COM1003		•						

Table continues on the next page

Module	Slot A1	Slot A2	Slot B	Slot C	Slot D	Slot E	Slot F	Slot G
COM1004		●						
COM1005		●						
BIO1001			●	o	o			
BIO1002			●	o	o			
BIO1003						o		
BIO1004						o		
RTD1001				o	o			
RTD1002				o	o			
AIM1001						o	●	
AIM1002						o	●	
SIM1901						o	●	
SIM1902						o	●	
PSM1001								●
PSM1002								●
PSM1003								●

● = Mandatory to have one of the allocated modules in the slot

o = Optional to have one of the allocated modules in the slot. The population (order) of the modules in the optional slots depends on the composition variant ordered.

In case the relay and the HMI will be exposed to harsh environmental conditions; like high humidity, chemicals or other corrosive agents, we recommend using the conformal coated versions of both. Contact the nearest ABB sales representative for more information regarding the ordering data.

2 Ready LED

Table 3: Module description

Module	Description
ARC1001	4 × ARC sensor inputs (lense, loop or mixed)
COM1001	1 × RJ-45 (LHMI port) + 3 × RJ-45 + 1 × LD-SFP [1]
COM1002	1 × RJ-45 (LHMI port) + 2 × LC + 1 × RJ-45 + 1 × LD-SFP
COM1003	1 × RJ-45 (LHMI port) + 3 × LC + 1 × LD-SFP
COM1004	1 × RJ-45 (LHMI port) + 2 × RJ-45 + 1 × LD-SFP + 1 × RS-485/IRIG-B + 1 × FO UART

Table continues on the next page

[1] Line distance/line differential protection communication + binary signal transfer, optical multi-mode or single-mode LC small form-factor pluggable transceiver (SFP)

Module	Description
COM1005	1 × RJ-45 (LHMI port) + 2 × LC + 1 × LD-SFP + 1 × RS-485/IRIG-B + 1 × FO UART
BIO1001/ BIO1003	14 × BI + 8 × SO
BIO1002/ BIO1004	6 × SPO + 2 × SPO (TCS) + 9 × BI
RTD1001	10 × RTD channels + 2 × mA channels (input/output)
RTD1002	3 × RTD channels + 6 × mA channels (input/output) + 12 x BI
AIM1001	4 × CT + 1 × CT (sensitive, for residual current only) + 5 × VT
AIM1002	6 × CT + 4 × VT
SIM1901	3 × combi sensor inputs (RJ-45) + 1 × CT (sensitive, for residual current only) + 1 × VT
SIM1902	3 × combi sensor inputs (RJ-45) + 1 × CT (sensitive, for residual current only) + 1 × VT
PSM1001	24...60 VDC, 3 × PO (TCS) + 2 × PO + 3 × SO + 2 × SSO
PSM1002	48...250 VDC / 100...240 VAC, 3 × PO (TCS) + 2 × PO + 3 × SO + 2 × SSO
PSM1003	110/125 VDC (77...150 VDC), 3 × PO (TCS) + 2 × PO + 3 × SO + 2 × SSO

PO = Power Output
SO = Signal Output
SPO = Static Power Output
SSO = Static Signal Output

The relay has a nonvolatile memory which does not need any periodical maintenance. The nonvolatile memory stores all events, recordings and logs to a memory which retains data if the relay loses its auxiliary supply.

2.3 Local HMI

The LHMI is used for setting, monitoring and controlling the protection relay and the related process. It comprises a 7-inch color screen with capacitive touch sensing and a Home button at the bottom of the LHMI.

The LHMI must be paired with the protection relay to enable all the functionalities in it. See the operation manual for the pairing procedure.

The LHMI is an accessory for the relay which is fully operational even without the LHMI.

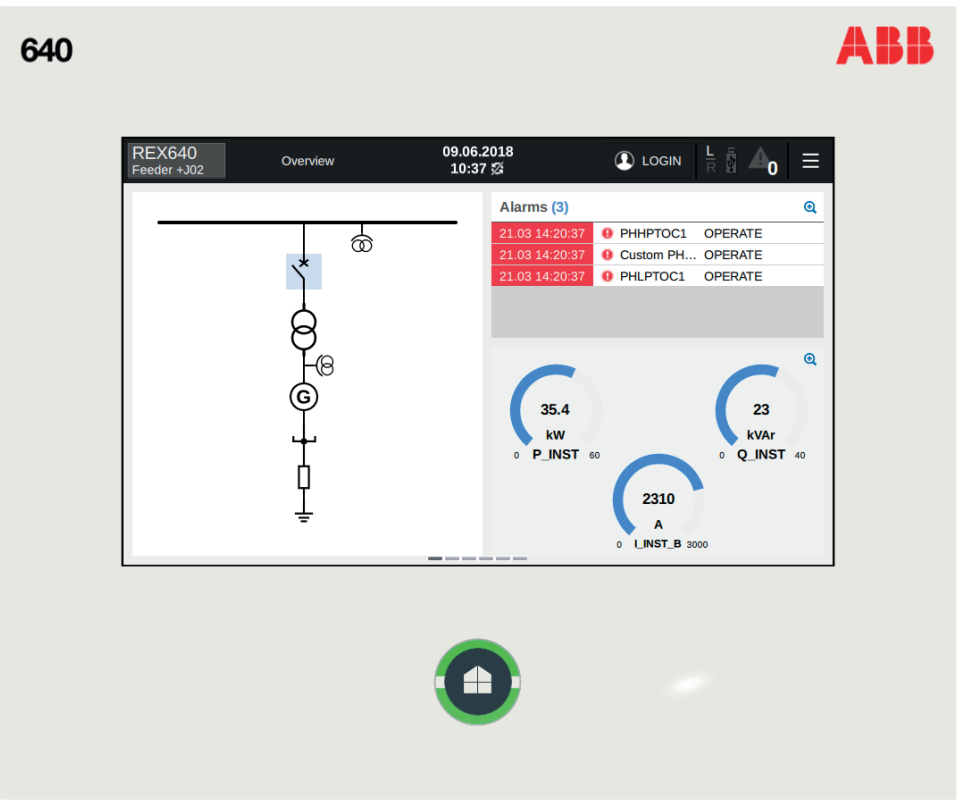

Figure 3: Example of a local HMI page

The LHMI presents pages in two categories.

- Operator pages are typically required as a part of an operator's normal activities, such as a single-line diagram, controls, measurements, events or alarms
- Engineer pages are specifically designed pages supporting relay parametrization, troubleshooting, testing and commissioning activities

The Operator pages can be scrolled either by pressing the Home button or by swiping the actual pages. The Engineer pages are accessible by tapping the menu button in the menu bar on the top of the LHMI display.

The Home button indicates the relay's status at a glance. In normal situations, the Home button shows a steady green light. Any other situation that requires the operator's attention is indicated with a flashing light, a red light or a combination of these.

Table 4: Power supply module Ready LED and local HMI Home button LED

State	Power supply module Ready LED	LHMI Home button	Alarm acknowledged
Relay under normal operation and LHMI connected	Steady green	Steady green	N/A
Relay's IRF activated, but communicates with LHMI	High frequency blinking green [1]	High frequency blinking red [1]	N/A

Table continues on the next page

[1] High frequency = 3 Hz

State	Power supply module Ready LED	LHMI Home button	Alarm acknowledged
Communication lost between Relay and LHMI, but no IRF	Steady green	High frequency blinking green [1]	N/A
LHMI not running normally or in start-up initialization phase	Steady green	High frequency blinking green [1]	N/A
Process related alarm active	Steady green	Low frequency blinking red [2]	No
Process related alarm active	Steady green	Steady red	Yes
Process related alarm has been active earlier, but is not any more active.	Steady green	Low frequency blinking red [2]	No
Process related alarm has been active earlier, but is not any more active.	Steady green	Steady green	Yes
Relay set to Test Mode	Low frequency blinking green [2]	High frequency blinking green [2]	No

The Operator pages can be used as such or customized according to the project's requirements using Graphical Display Editor in PCM600. The Engineer pages are fixed and cannot be customized.

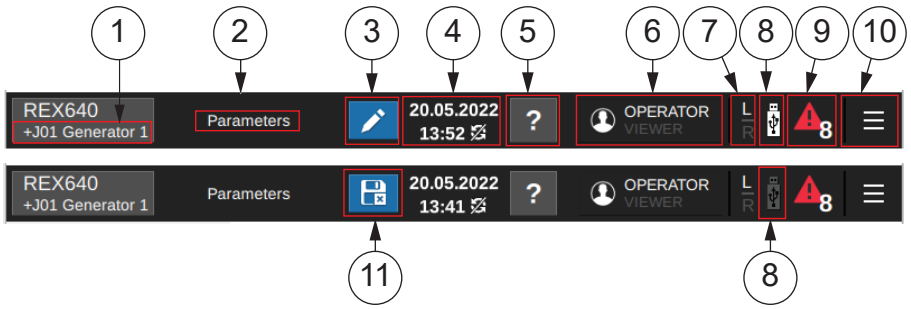

Figure 4: Menu bar elements

1 Bay name for the relay

2 Page name

3 Edit mode active (parameter editing)

4 Date, time and time synchronization status

5 Page help (visible if help is available for the page)

6 Login button/logged in user indication

7 Local/remote indication

8 USB memory not connected/connected (visible only if USB port is enabled)

9 Number of active alarms

10 Menu button for Engineer pages

11 Store or reject changed parameters indication

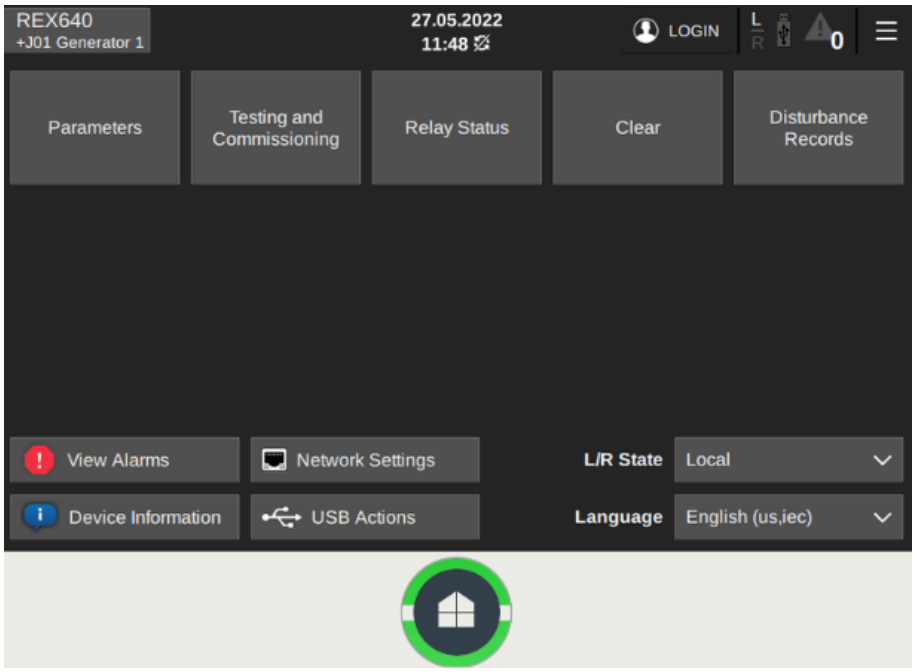

Figure 5: Engineer pages menu

2.4 Switchgear HMI

The SHMI is used for setting, monitoring and controlling up to 20 REX640 protection relays and the related processes. It comprises a 7-inch color screen with capacitive touch sensing and a Home button at the bottom of the SHMI. All features of standard HMI are also available in the SHMI.

The SHMI is an accessory for the relay which is fully operational even without the SHMI.

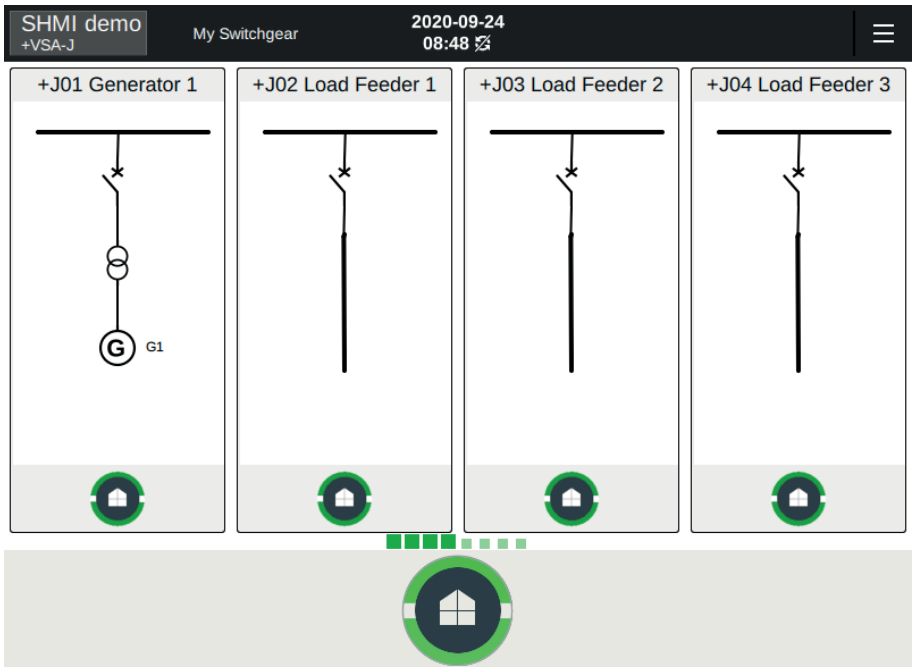

Figure 6: Example of a switchgear HMI navigation page

The SHMI has a navigation page which presents the physical switchgear lineup installation and indicates the status of each REX640 within the system. The area presenting a single switchgear bay has a small user-configurable bay overview section and a virtual Home button showing the status of the connected relay. By tapping the selected bay overview area, the SHMI connects with the related REX640 and works as normal LHMI for that relay.

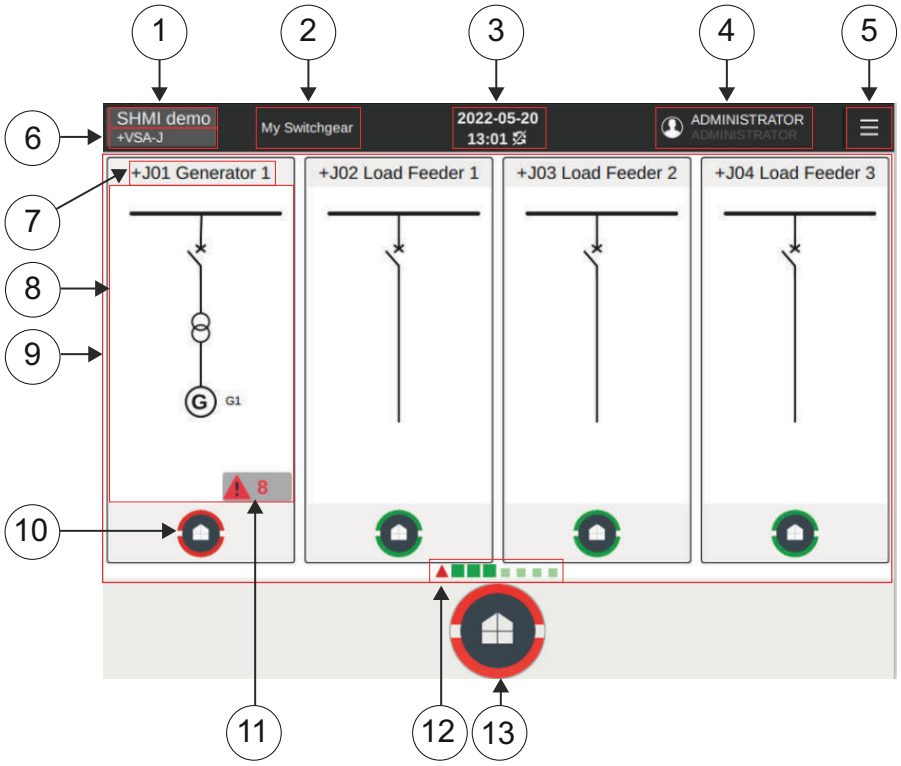

Figure 7: Navigation page elements

1 User-defined substation name

2 User-defined name for the switchgear or sub-part of switchgear lineup controlled by the SHMI

3 Date, time and time synchronization status

4 Logout button and authentication status

5 Menu button

6 User-defined voltage level name

7 User defined bay name and voltage level extension

8 Bay overview area showing static or dynamic information for a bay and functioning as a navigation point to launch the HMI view for the respective relay, user-defined content

9 SHMI navigation page

10 Virtual Home button representing the status of the respective relay's physical Home button

11 Number of active alarms

12 Panel lineup overview showing the current status of all connected relays and the current position of navigation page

13 SHMI's physical Home button

2.4.1 Bay overview area

Bay overview area consists either of a static picture or a dynamic SLD. They are configured with Graphical Display Editor in PCM600. One relay can have two overview pages.

Static picture may be, for example, a drawing or a photo of switchgear lineup. Maximum size of the picture is 186 × 320 px.

SLD does not support control operations. The following features are available.

- Static symbols such as connections, measurement devices, transformers and reactors
- Dynamic status for switching devices, but no control operations
- Dynamic and static text objects
  - Boolean state text
  - Integer state text
  - Label (translation not supported)
  - Numeric value
  - String value
- Custom symbols
- Busbar coloring

2.4.2 Physical and virtual Home buttons

On the SHMI navigation page, the virtual Home button shows the status of each relay as it would be shown with the physical Home button on a normal LHMI panel. In normal situations, the virtual Home button shows a steady green light. All other situations in which the relay requires operator's attention are indicated with a flashing light, a red light or a combination of these.

SHMI's physical Home button has two operation modes.

- On the SHMI navigation page, the Home button indicates the combined status of all connected relays. If multiple relays have different statuses, the Home button shows the indication with the highest priority.
- On the HMI view, the Home button indicates the status of the respective relay as described in *Figure 3*.

2.4.3 Navigation

Navigation page is the default view for the SHMI. The navigation page shows bay overviews areas which are lined up to represent the actual panel installations. The navigation page can be scrolled by swiping the screen horizontally or by pressing the physical Home button to move the page from left to right one bay overview at a time.

Bay overview area is the configured view for one relay. It may show static or dynamic information but all control operations are disabled. The whole bay overview area works as a navigation point to the relay's HMI view. Tapping this area opens the HMI view of the respective relay.

Panel lineup overview shows the position of the navigation page by highlighting the visible bay overviews. It also shows the status of all connected relays and helps in

identifying which relay requires operator's attention when the bay overview is not visible on the navigation page.

When the HMI view is opened for a relay, the SHMI works exactly like a normal HMI. All the same features are available, and the Home button switches between the configured home pages and indicates the alarm status for the respective relay.

Navigation area on the top left corner of the HMI view is used to navigate back to the SHMI's navigation page. The navigation area shows the bay name on the button to identify which relay's HMI is open.

2.5 Physical ports

The relay communication module has a dedicated port where the LHMI is connected using an RJ-45 connector and a CAT 6 S/FTP galvanic cable. The HMI can be connected to the relay also via station communication network if a longer distance is required between the relay and the HMI. For more information, see the installation manual.

Additionally, the HMI contains one Ethernet service port with an RJ-45 connector and one USB port. The service port can be used for the PCM600 connection or for WHMI connection. Data transfer to a USB stick is enabled via the USB port. By default the USB port is disabled and has to be taken into use with a specific parameter.

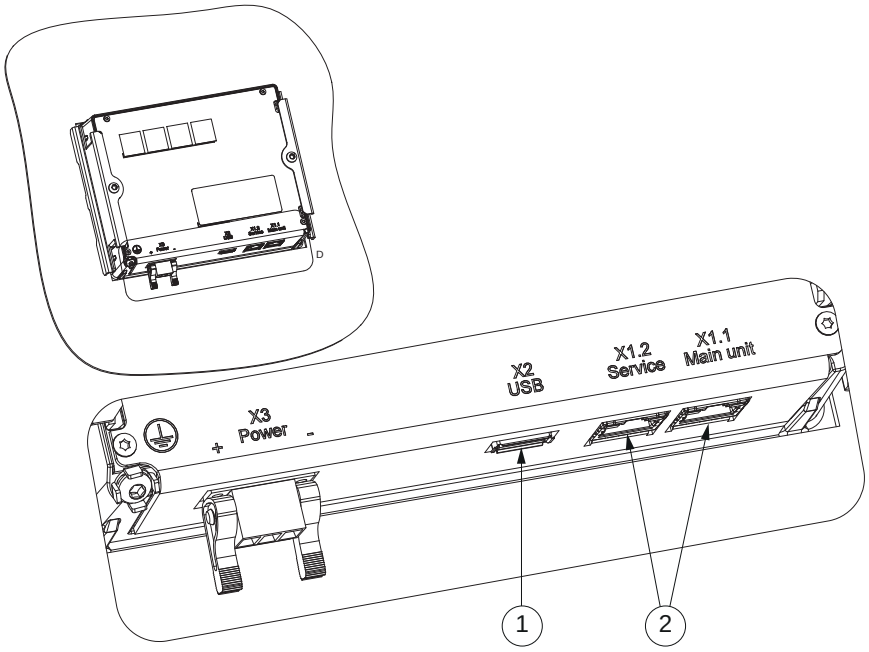

Figure 8: Local HMI connectors

1 USB port

2 RJ-45 ports

2.6 Web HMI

The WHMI allows secure access to the protection relay via a Web browser. The WHMI is verified with Google Chrome, Mozilla Firefox and Microsoft Edge.

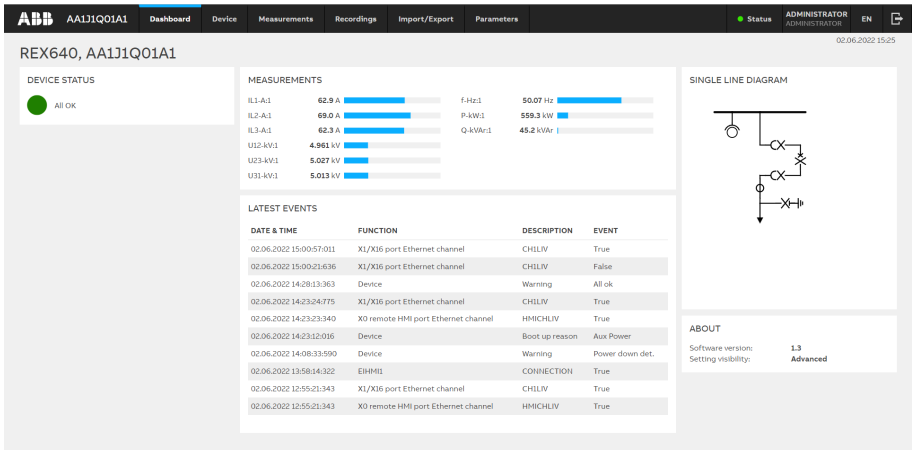

Figure 9: Example view of the Web HMI

WHMI offers several functions. The menu tree structure on the WHMI is almost identical to the one on the LHMI.

Table 6: Web HMI main groups and submenus

Main groups	Submenus	Description
Dashboard		Used to see an overview of the protection relay including status, measurements, single-line diagram and latest events
Device	Monitoring Information Self-supervision Single Line Diagram Clear Change Password About	Used to navigate to monitoring, information, self-supervision, single-line diagram or clear pages
Measurements	Measurements Phasor Diagrams	Used to navigate to the measurements or phasor diagrams
Recordings	Events Disturbance records Fault records Load Profile Record Alarm List	Used to view the events, disturbance records, fault records, load profile records and alarms
Import/Export	Report Summary Import/Export Set-tings Parameter List	Used to export a parameter list or a report summary, and to import and export settings

Table continues on the next page

Main groups	Submenus	Description
Parameters		Used to view the menu tree structure for the protection relay's setting parameters
Language selection		Used to change the language
Logout		Used to end the session

The WHMI can be accessed locally and remotely.

- Locally by connecting the laptop to the protection relay
- Remotely over LAN/WAN

2.7 User authorization

The user management for the protection relay can be handled in two possible ways. Only one user management way can be enabled in the protection relay at a time.

For more information, see the cyber security deployment guideline.

2.7.1 Local user account management

Four factory default user accounts (VIEWER, OPERATOR, ENGINEER and ADMINISTRATOR) have been predefined for the LHMI and the WHMI, each with different rights and default passwords. The roles for these user accounts are the same as the username. Additional user accounts can be added for the protection relay.

IED Users in PCM600 is used to manage the user accounts. Each protection relay supports eight fixed roles and 50 user accounts belonging to any one of these roles. Each user account can be mapped to a maximum of eight roles.

The factory default passwords can be changed with Administrator user rights or by the users themselves. Relay user passwords can be changed using the LHMI, IED Users in PCM600 or the WHMI. Only Administrator can create user accounts and update the roles-to-rights mapping. Administrator can also reset the passwords of the users.

User authorization is disabled by default for the LHMI and can be enabled with the *Local override* parameter via the menu path **Configuration** > **Authorization** > **Passwords**. WHMI always requires authentication. Changes in user management settings do not cause the protection relay to reboot. The changes are taken into use immediately after committing the changed settings.

2.7.2 Central account management

The user accounts and roles can be created and authenticated centrally in a CAM server. CAM needs to be activated in the protection relay from Account Management in PCM600.

A CAM server can be an Active Directory (AD) server such as Windows AD. There can also be a secondary or redundant CAM server configured which can act as a backup CAM server if the primary CAM server is not accessible.

The protection relay is the CAM client and can maintain its own replica database of the user accounts and roles configured in the CAM server. This CAM replica database acts as a backup authentication mechanism if primary and secondary CAM servers are not accessible from the protection relay.

Each protection relay supports eight roles and 50 user accounts in the CAM replica database. Each user account can be mapped to a maximum of eight roles.

For more information on user management and security logging, see the cyber security deployment guideline.

For user authorization for PCM600, see the PCM600 documentation.

2.8 Station communication

Operational information and controls are available through a wide range of communication protocols including IEC 61850 Edition 2, IEC 61850-9-2 LE, IEC 60870-5-103, IEC 60870-5-104, Modbus® and DNP3. Full communication capabilities, for example, horizontal communication between the relays, are only enabled by IEC 61850.

The relay provides the possibility for a second IP address and a second subnetwork when the communication modules with three Ethernet ports (COM1001...1003) are used. However, only one IP network can be used as the default route. Using two IP addresses, communication networks can be separated based on the dominant user's needs. For example, one IP address can serve the dispatchers and the other one can serve the service engineers' needs.

The IEC 61850 protocol is a core part of the relay as the protection and control application is fully based on standard modelling. The relay supports Edition 2 and Edition 1 versions of the standard. With Edition 2 support, the relay has the latest functionality modelling for substation applications and the best interoperability for modern substations. The relay supports flexible product naming (FPN) facilitating the mapping of relay's IEC 61850 data model to a customer defined IEC 61850 data model.

2.9 Modification Sales

Modification Sales is a concept that provides modification support for already delivered relays. Under Modification Sales it is possible to modify both the hardware and software capabilities of the existing relay. The same options are available as when a new relay variant is configured and ordered from the factory: it is possible to add new hardware modules into empty slots, change the type of the existing modules within the slots or add software functions by adding application and, if necessary, add-on packages. If it is needed to use the possibilities provided by the Modification Sales concept, please contact your local ABB unit.

3 Basic functions

3.1 General parameters

3.1.1 Authorization settings

Table 7: Non group settings

Parameter	Values (Range)	Unit	Step	Default	Description
Remote Update	0=Disable 1=Enable			0=Disable	Remote update
Thumbprint				0	ClientThumb Print
Remote override	0=False 1=True			1=True	Disable authority
Local override	0=False 1=True			1=True	Disable authority
Clear AD userlist	0=False 1=True			0=False	Clear Active Directory user list
FTP write access	0=Off 1=On			1=On	FTP write access
MMS write access	0=Off 1=On			1=On	MMS write access
HTTPS write access	0=Off 1=On			1=On	HTTPS write access
FTP write access	0=Off 1=On			1=On	FTP write access
MMS write access	0=Off 1=On			1=On	MMS write access
HTTPS write access	0=Off 1=On			1=On	HTTPS write access
FTP write access	0=Off 1=On			1=On	FTP write access
MMS write access	0=Off 1=On			1=On	MMS write access

3.1.2 Binary input settings

Table 8: Binary input settings

Parameter	Values (Range)	Unit	Step	Default	Description
Slot specific threshold	0=False 1=True			0=False	Use slot specific binary input voltage threshold
Slot specific hysteresis	0=False 1=True			0=False	Use slot specific binary input voltage hysteresis
Input threshold voltage	16...176	Vdc	2	16	Global binary input threshold for all slots
Input threshold hysteresis	10...50	%	2	10	Global binary input hysteresis for all slots
Input osc. level	2...50	events/s	1	30	Binary input oscillation suppression threshold
Input osc. hyst	2...50	events/s	1	10	Binary input oscillation suppression hysteresis

3.1.3 Network1 address settings

Table 9: Non group settings

Parameter	Values (Range)	Unit	Step	Default	Description
IP address				192.168.2.10	IP address for Network1
Subnet mask				255.255.255.0	Subnet mask for Network1
Default gateway				192.168.2.1	Default gateway for Network1
Mac address				XX-XX-XX-XX-XX-XX	Mac address for Network1

3.1.4 Network2 address settings

Table 10: Non group settings

Parameter	Values (Range)	Unit	Step	Default	Description
Enable	0=False 1=True			0=False	Enable Network2 IP address
IP address				192.168.3.10	IP address for Network2
Subnet mask				255.255.255.0	Subnet mask for Network2
Default gateway				0.0.0.0	Default gateway for Network2 (only in-use if NW1 GW = 0.0.0.0)
Mac address				XX-XX-XX-XX-XX-XX	Mac address for Network2

3.1.5 HMI port address settings

Table 11: Non group settings

Parameter	Values (Range)	Unit	Step	Default	Description
IP address				192.168.0.254	IP address for front port (fixed)
Mac address				XX-XX-XX-XX-XX-XX	Mac address for front port

3.1.6 System settings

Table 12: Non group settings

Parameter	Values (Range)	Unit	Step	Default	Description
Rated frequency	1=50Hz 2=60Hz			1=50Hz	Rated frequency of the network
Phase rotation	1=ABC 2=ACB			1=ABC	Phase rotation order
Blocking mode	1=Freeze timer 2=Block all 3=Block OPERATE output			1=Freeze timer	Behaviour for function BLOCK inputs
Bay name				REX640	Bay name in system
IDMT Sat point	10...50	I/I>	1	50	Overcurrent IDMT saturation point
Frequency adaptivity	0=Disable 1=Enable			0=Disable	Enabling frequency adaptivity
SMV Max Delay	0=2/2 ms 1=3/3 ms 2=5/4 ms 3=6/5 ms 4=7/6 ms			1=3/3 ms	SMV Maximum allowed delay
Test mode selection	1=Local 2=Local+Remote, maintenance 3=Local+Remote, all levels 4=Binary input			1=Local	Authority for remote activation of test mode

3.1.7 HMI Settings

Table 13: Non group settings

Parameter	Values (Range)	Unit	Step	Default	Description
FB naming convention	1=IEC61850 2=IEC60617 3=ANSI			1=IEC61850	FB naming convention used in IED
Backlight timeout[1]	1...60	min	1	3	LHMI backlight timeout
Web HMI mode	0=Off 1=On			0=Off	Web HMI functionality
HMI timeout	1...60	min	1	3	HMI login timeout
SLD symbol format	1=IEC 2=ANSI			1=IEC	Single Line Diagram symbol format
Setting visibility	1=Basic 2=Advanced			2=Advanced	Setting visibility for HMI
User defined name	0=Disabled 1=Enabled			false	Configuration of User defined name

3.1.8 HMI control settings

Confirmation dialog

If the parameter *Breaker operation* in **Configuration** > **Control** > **HMI** is set to "After confirmation", a confirmation dialog box opens after tapping the control button. The confirmation dialog box has a progress bar indicating the *Select timeout* set for the controllable object. If the *Control mode* setting of a control function is set to "sbo-with-enhanced-security", the confirmation dialog box always opens regardless of the *Breaker operation* setting value.

Delayed close

If the parameter *Close delay* mode in **Configuration** > **Control** > **LHMI** is set to "In use", a timer is started after tapping the close button and accepting the possible confirmation dialog. Close operation is performed only after the timer reaches zero. Remaining time is displayed on top of close button, user can cancel the operation during countdown by tapping the Cancel button. The delay can be configured by *Close delay* in **Configuration** > **Control** > **LHMI**.

Table 14: HMI control settings

Parameter	Values	Unit	Step	Default	Description
Close delay mode	1=In use 2=Not in use			2=Not in use	Delayed operation when closing circuit breakers, disconnec-

Table continues on the next page

[1] SHMI has separate backlight timeout setting that is used while in switchgear view. The SHMI setting can be accessed from SHMI settings page, that is available while in SHMI's switchgear page.

Parameter	Values	Unit	Step	Default	Description
					tors and earthing switches from HMI
Close delay	5…900	s	1	60	Operation delay for *Close delay* mode
Breaker operation	0=After confirmation 1=Without confirmation			0=After confirmation	Enable or disable confirmation dialog before operating circuit breakers, disconnectors and earthing switches from HMI

3.1.9 IEC 103 Settings

Table 15: Non group settings

Parameter	Values (Range)	Unit	Step	Default	Description
Operation	1=on 5=off			5=off	Selects if this protocol instance is enabled or disabled
Serial port	1=COM 1 2=COM 2			1=COM 1	COM port
Address	1...255		1	1	Unit address
Start delay	0...20	char	1	4	Start frame delay in chars
End delay	0...20	char	1	4	End frame delay in chars

3.1.16 IEC 61850-8-1 MMS settings

Table 22: Non group settings

Parameter	Values (Range)	Unit	Step	Default	Description
Unit mode	1=Primary 0=Nominal 2=Primary-Nominal			0=Nominal	IEC 61850-8-1 unit mode
MMS	0=Off 1=On			1=On	MMS communication mode
MMS	0=Off			1=On	MMS communication mode

Table continues on the next page

Parameter	Values (Range)	Unit	Step	Default	Description
	1=On				
MMS	0=Off 1=On			1=On	MMS communication mode

3.1.17 MODBUS Settings

Table 23: Non group settings

Parameter	Values (Range)	Unit	Step	Default	Description
Operation	1=on 5=off			5=off	Enable or disable this protocol instance
Port	1=COM 1 2=COM 2 3=Ethernet - TCP 1			3=Ethernet - TCP 1	Port selection for this protocol instance. Select between serial and Ethernet based communication.
Mapping selection	1...2		1	1	Chooses which mapping scheme will be used for this protocol instance.
Address	1...254		1	1	Unit address
Link mode	1=RTU 2=ASCII			1=RTU	Selects between ASCII and RTU mode. For TCP, this should always be RTU.
TCP port	1...65535		1	502	Defines the listening port for the Modbus TCP server. Default = 502.
Parity	0=none 1=odd 2=even			2=even	Parity for the serial connection.
Start delay	0...20		1	4	Start delay in character times for serial connection
End delay	0...20		1	4	End delay in character times for serial connections
CRC order	0=Hi-Lo 1=Lo-Hi			0=Hi-Lo	Selects between normal or swapped byte order for checksum for serial connection. Default: Hi-Lo.
Client IP				0.0.0.0	Sets the IP address of the client. If set to zero, connection from any client is accepted.
Write authority	0=Read only 1=Disable 0x write 2=Full access			2=Full access	Selects the control authority scheme
Time format	0=UTC 1=Local			1=Local	Selects between UTC and local time for events and timestamps.

Table continues on the next page

Parameter	Values (Range)	Unit	Step	Default	Description
Event ID selection	0=Address 1=UID			0=Address	Selects whether the events are reported using the MB address or the UID number.
Event buffering	0=Keep oldest 1=Keep newest			0=Keep oldest	Selects whether the oldest or newest events are kept in the case of event buffer overflow.
Event backoff	1...500		1	200	Defines how many events have to be read after event buffer overflow to allow new events to be buffered. Applicable in "Keep oldest" mode only.
ControlStructPWd 1				****	Password for control operations using Control Struct mechanism, which is available on 4x memory area.
ControlStructPWd 2				****	Password for control operations using Control Struct mechanism, which is available on 4x memory area.
ControlStructPWd 3				****	Password for control operations using Control Struct mechanism, which is available on 4x memory area.
ControlStructPWd 4				****	Password for control operations using Control Struct mechanism, which is available on 4x memory area.
ControlStructPWd 5				****	Password for control operations using Control Struct mechanism, which is available on 4x memory area.
ControlStructPWd 6				****	Password for control operations using Control Struct mechanism, which is available on 4x memory area.
ControlStructPWd 7				****	Password for control operations using Control Struct mechanism, which is available on 4x memory area.
ControlStructPWd 8				****	Password for control operations using Control Struct mechanism, which is available on 4x memory area.
Prtl Customization	0...2147483647		1	0	Customization parameter. Please, refer to the protocol manual.

3.1.18 MODBUS Monitored data

Table 24: Monitored data

Name	Type	Values (Range)	Unit	Description
Customization Mode	Enum	0=Off/Normal 1=By Parameter 2=By File		Protocol Customization Mode
Reset counters	BOOLEAN	0=False 1=True		Reset counters
Received frames	INT32	-1...2147483646		Number of received frames
Transmitted frames	INT32	-1...2147483646		Number of transmitted frames
Transmitted exc A	INT32	-1...2147483646		Number of transmitted exception responses 01 and 02
Transmitted exc B	INT32	-1...2147483646		Number of transmitted exception responses 03
Checksum errors	INT32	-1...2147483646		Number of checksum errors
CnReject no sockets	INT32	-1...2147483646		Number of rejected connections due to no sockets available
CnReject unregistered	INT32	-1...2147483646		Connection rejected due to unregistered client

3.1.19 DNP 3.0 Settings

Table 25: Non group settings

Parameter	Values (Range)	Unit	Step	Default	Description
Operation	1=on 5=off			5=off	Operation Off / On
Port	1=COM 1 2=COM 2 3=Ethernet - TCP 1 4=Ethernet TCP+UDP 1 5=Ethernet - UDP 1			3=Ethernet - TCP 1	Communication interface selection
Unit address	0...65519		1	1	DNP unit address
Master address	0...65519		1	3	DNP master and UR address
Mapping select	1...2		1	1	Mapping select
ClientIP				0.0.0.0	IP address of client
TCP port	20000...65535		1	20000	TCP Port used on ethernet communication
UDP Rx Port	1...65535		1	20000	UDP Port for accepting data from client/master
UDP Tx Port Ini	1...65535		1	20000	UDP Port for initial NULL response to client/master

Table continues on the next page

Parameter	Values (Range)	Unit	Step	Default	Description
UDP Tx Port	0...65535		1	0	UDP Destination Port for client/master
Client control authority	0=No clients 1=Reg. clients 2=All clients			2=All clients	0=no client controls allowed; 1=Controls allowed by registered clients; 2=Controls allowed by all clients
Link keep-alive	0...1000000	s	1	0	Link keep-alive interval for DNP
Validate master addr	1=Disable 2=Enable			1=Disable	Validate master address on receive
Self address	1=Disable 2=Enable			2=Enable	Support self address query function
Need time interval	0...65535	min	1	30	Period to set IIN need time bit
Time format	0=UTC 1=Local			1=Local	UTC or local. Coordinate with master.
CROB select timeout	1...65535	s	1	10	Control Relay Output Block select timeout
Data link confirm	0=Never 1=Only Multiframe 2=Always			0=Never	Data link confirm mode
Data link confirm TO	100...65535	ms	1	3000	Data link confirm timeout
Data link retries	0...65535		1	3	Data link retries count
Data link Rx to Tx delay	0...255	ms	1	0	Turnaround transmission delay
Data link inter char delay	0...20	char	1	4	Inter character delay for incoming messages
App layer confirm	1=Disable 2=Enable			1=Disable	Application layer confirm mode
App/UR confirm TO	100...65535	ms	1	5000	Application layer confirm and UR timeout
App layer fragment	256...2048	bytes	1	2048	Application layer fragment size
UR mode	1=Disable 2=Enable			1=Disable	Unsolicited responses mode
UR retries	0...65535		1	3	Unsolicited retries before switching to UR offline mode
UR retry delay	0...65535	ms	1	5000	Additional delay kept after App/UR confirm TO before sending new unsolicited retry
UR offline interval	0...65535	min	1	15	Unsolicited offline interval
UR Class 1 Min events	0...999		1	2	Min number of class 1 events to generate UR
UR Class 1 TO	0...65535	ms	1	50	Max holding time for class 1 events to generate UR

Table continues on the next page

Parameter	Values (Range)	Unit	Step	Default	Description
UR Class 2 Min events	0...999		1	2	Min number of class 2 events to generate UR
UR Class 2 TO	0...65535	ms	1	50	Max holding time for class 2 events to generate UR
UR Class 3 Min events	0...999		1	2	Min number of class 3 events to generate UR
UR Class 3 TO	0...65535	ms	1	50	Max holding time for class 3 events to generate UR
Legacy master UR	1=Disable 2=Enable			1=Disable	Legacy DNP master unsolicited mode support. When enabled relay does not send initial unsolicited message.
Legacy master SBO	1=Disable 2=Enable			1=Disable	Legacy DNP Master SBO sequence number relax enable

Input osc. level	2...50	events/s	1	30	Binary input oscillation suppression threshold
Input osc. hyst	2...50	events/s	1	10	Binary input oscillation suppression hysteresis

3.2 Communication

The protection relay supports a range of communication protocols including IEC 61850, IEC 61850-9-2 LE, IEC 60870-5-103, IEC 60870-5-104, Modbus® and DNP3. Profibus DPV1 communication protocol is supported by using the protocol converter SPA-ZC 302. Operational information and controls are available through these protocols. However, some communication functionality, for example, horizontal communication between the protection relays, is only enabled by the IEC 61850 communication protocol.

One full IEC 61850-9-2 LE stream containing both voltages and currents can be sent. Receiving of up to four SMV streams is supported with a total of maximum 16 channels. The channels are freely configurable with the possibility to engineer SMV stream redundancy using the voltage and current switch functions with either another SMV stream or local measurements. The SMV stream quality along with other Application Configuration logic can be used for switching between measurement sources.

The IEC 61850 communication implementation supports all monitoring and control functions. Additionally, parameter settings, disturbance recordings and fault records can be accessed using the IEC 61850 protocol. Disturbance recordings are available to any Ethernet-based application in the IEC 60255-24 standard COMTRADE file format. The protection relay can send and receive binary signals from other devices (so-called horizontal communication) using the IEC 61850-8-1 GOOSE profile, where the highest performance class with a total transmission time of 3 ms is supported. Furthermore, the protection relay supports sending and receiving of analog values using GOOSE messaging. The protection relay meets the GOOSE performance requirements for tripping applications in distribution substations, as defined by the IEC 61850 standard.

The protection relay can support five simultaneous clients. If PCM600 reserves one client connection, only four client connections are left, for example, for IEC 61850 and Modbus.

All communication connectors are placed on integrated optional communication modules. The protection relay can be connected to Ethernet-based communication systems via the RJ-45 connector (100Base-TX) or the fiber-optic LC connector (100Base-FX).

The LHMI has two RJ-45 connectors. One is for connecting the LHMI to the protection relay main unit and the second is a service port which is used for connecting the LHMI and a computer. This computer can be, for example, a laptop with the PCM600 engineering tool or a browser for WHMI.

An optional serial interface is available for RS-485 communication.

3.2.1 Ethernet addresses for HMI

There is a DHCP server available at X0 port that can provide an IP address and a netmask for one client. The service port on the LHMI has a DHCP server that can also serve one client. To use WHMI or PCM600, a PC can be connected either directly to X0 port or to the LHMI's service port. In both cases, the PC can use the DHCP client to receive the IP address automatically.

If the LHMI is connected to the relay through the station network, the service port still offers the DHCP server even if the LHMI's main unit port uses a static address. The LHMI device functions as a router between the PC and the protection relay.

Main unit's X0 port IP address can also be changed to avoid conflicts with other network addresses. Parameter is located under Configuration/Communication/Ethernet/HMI address. Subnet mask for X0 IP address is always 255.255.255.0 and cannot be changed.

3.2.2 Self-healing Ethernet ring

The protection relay supports a self-healing ring solution for small installations. For the correct operation of self-healing ring topology, the network topology must be a ring. It is essential that the external switches in the network support the RSTP protocol and that it is enabled in the switches. Otherwise, connecting the ring topology can cause problems to the network.

The protection relay itself does not support link-down detection or RSTP. The ring recovery process is based on the aging of the MAC addresses and the link-up/linkdown events can cause temporary breaks in communication. For a better performance of the self-healing ring, it is recommended that the external switch furthest from the protection relay loop is assigned as the root switch (bridge priority = 0) and the bridge priority increases towards the protection relay ring. The end links of the protection relay loop can be attached to the same external switch or to two adjacent external switches. If two adjacent external switches are connected to the relay loop, the point-to-point Ethernet link connecting these two switches should be prioritized by setting higher RSTP priority (lower setting value for port priority). This ensures that most of the network traffic that is not meant for the relays flows between the Ethernet switches.

The self-healing ring solution supports the connection of up to 30 protection relays. However, the HSR or PRP network is recommended to ensure redundant and proper functionality.

Self-healing is not recommended for time-critical applications using IEC 61850-9-2 and PTP due to longer recovery time. Instead, HSR/PRP is recommended to ensure reliable performance.

3.2.3 Ethernet redundancy

IEC 61850 specifies a network redundancy scheme that improves the system availability for substation communication. It is based on two complementary protocols defined in the IEC 62439-3:2012 standard: parallel redundancy protocol PRP and high-availability seamless redundancy HSR protocol. Both protocols rely on the duplication of all transmitted information via two Ethernet ports for one logical network connection. Therefore, both are able to overcome the failure of a link or switch with a zero-switchover time, thus fulfilling the most demanding real-time application requirements for the substation automation.

Ethernet network redundancy can be achieved using HSR or PRP and it is applied to all services using the Ethernet/TCP network.

PRP specifies that each device is connected in parallel to two local area networks. HSR applies the PRP principle to rings and to the rings of rings to achieve cost-effective redundancy. Thus, each device incorporates a switch element that forwards frames from port to port.

IEC 62439-3:2012 cancels and replaces the first edition published in 2010. These standard versions are also referred to as IEC 62439-3 Edition 1 and IEC 62439-3 Edition 2. The protection relay supports IEC 62439-3:2016 (Edition 3) and IEC 62439-3:2012 and it is not compatible with IEC 62439-3:2010.

PRP

Each PRP node, called a double attached node with PRP (DAN), is attached to two independent LANs operated in parallel. These parallel networks in PRP are called LAN A and LAN B. The networks are completely separated to ensure failure independence, and they can have different topologies. Both networks operate in parallel, thus providing zero-time recovery and continuous checking of redundancy to avoid communication failures. Non-PRP nodes, called single attached nodes (SANs), are either attached to one network only (and can therefore communicate only with DANs and SANs attached to the same network), or are attached through a redundancy box, a device that behaves like a DAN.

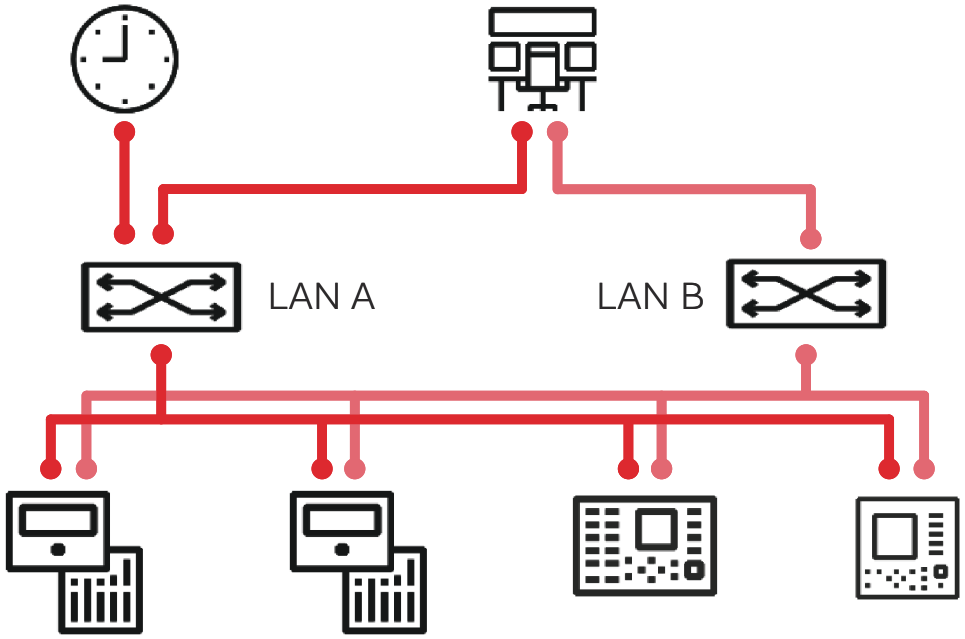

Figure 10: Parallel redundancy protocol solution

In case a laptop or a PC workstation is connected as a non-PRP node to one of the PRP networks, LAN A or LAN B, it is recommended to use a redundancy box device or an Ethernet switch with similar functionality between the PRP network and SAN to remove additional PRP information from the Ethernet frames. In some cases, default PC workstation adapters are not able to handle the maximum-length Ethernet frames with the PRP trailer.

There are different alternative ways to connect a laptop or a workstation as SAN to a PRP network.

- Via an external redundancy box (RedBox) or a switch capable of connecting to PRP and normal networks
- By connecting the node directly to LAN A or LAN B as SAN
- By connecting the node to the protection relay's interlink port

HSR

HSR applies the PRP principle of parallel operation to a single ring, treating the two directions as two virtual LANs. For each frame sent, a node, DAN, sends two frames, one over each port. Both frames circulate in opposite directions over the ring and each node forwards the frames it receives, from one port to the other. When the originating node receives a frame sent to itself, it discards that to avoid loops; therefore, no ring protocol is needed. Individually attached nodes, SANs, such as laptops and printers, must be attached through a “redundancy box” that acts as a ring element. For example, a REX640 protection relay with HSR support can be used as a redundancy box.

Each protection relay has a 50-µs store-and-forward delay. To fulfil the performance requirements for fast horizontal communication for protection applications using GOOSE and SMV, the ring size is limited to 30 protection relays.

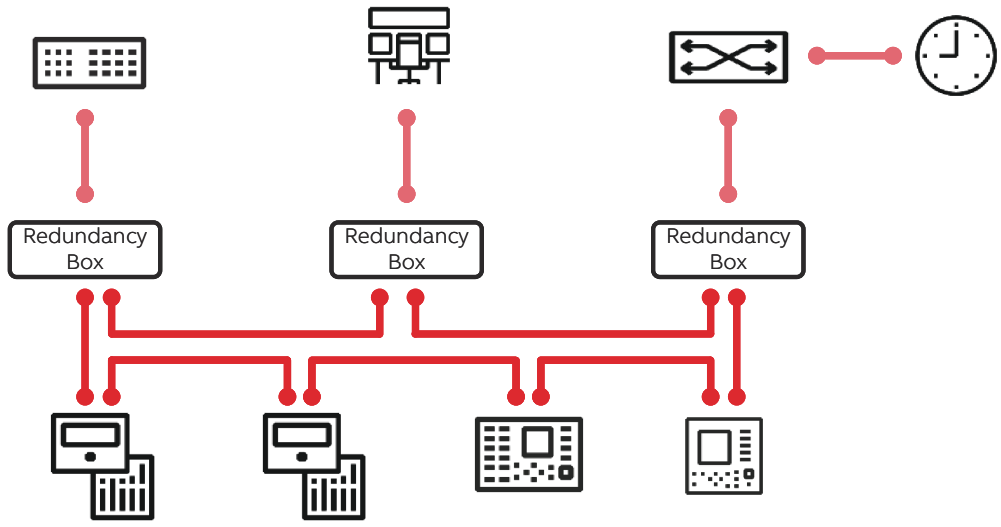

Figure 11: High-availability seamless redundancy solution

3.2.3.1 Interlink port

In the relay redundant COM module, the port without LAN-A/LAN-B tag is so called interlink-port. This port can be used to connect a device directly to the relay. Mainly this port should be used to connect a single point-to-point device, such as RIO600. Although it is possible, it not recommended to connect big amount of devices behind the interlink port, thus making the relay act as a hub between two network segments. The relay should preferrably act as a network end-device, and not as a hub for network traffic.

3.2.4 Process bus

Process bus IEC 61850-9-2 defines the transmission of Sampled Measured Values within the substation automation system. International Users Group created a guideline IEC 61850-9-2 LE that defines an application profile of IEC 61850-9-2 to facilitate implementation and enable interoperability. Process bus is used for distributing process data from the primary circuit to all process bus compatible devices in the local network in a real-time manner. The data can then be processed by any protection relay to perform different protection, automation and control functions.

Redundant SMV streams are also supported by using the voltage (VMSWI) and current (CMSWI) function blocks. Automatic switching to the backup SMV stream can be configured in Application Configuration using SMV quality and/or other logic.

UniGear Digital switchgear concept relies on the process bus together with current and voltage sensors. The process bus enables several advantages for the UniGear Digital like simplicity with reduced wiring, flexibility with data availability to all devices, improved diagnostics and longer maintenance cycles.

With process bus the galvanic interpanel wiring for sharing busbar voltage value can be replaced with Ethernet communication. Transmitting measurement samples

over process bus brings also higher error detection because the signal transmission is automatically supervised. Additional contribution to the higher availability is the possibility to use redundant Ethernet network for transmitting SMV signals.

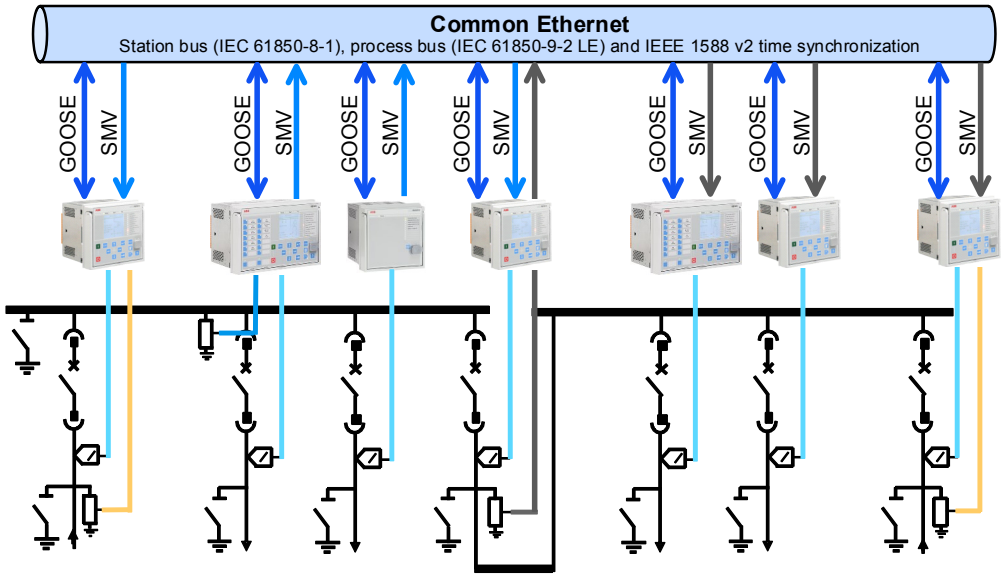

Figure 12: Process bus application of voltage sharing and synchrocheck

REX640 supports IEC 61850 process bus with sampled values of analog currents and voltages. The measured values are transferred as sampled values using the IEC 61850-9-2 LE protocol which uses the same physical Ethernet network as the IEC 61850-8-1 station bus. One example application is sharing the measured busbar voltage from one or several REX640 relays with the other REX640 relays. This can be done even for a double busbar switchgear installation using automatic 9-2 stream selection based on the bus disconnectors' physical position.

REX640 protection relays with process bus based applications use IEEE 1588 v2 Precision Time Protocol (PTP) according to IEEE C37.238-2011 or IEC 61850-9-3 profiles for high accuracy time synchronization. With IEEE 1588 v2, the cabling infrastructure requirement is reduced by allowing time synchronization information to be transported over the same Ethernet network as the data communications.

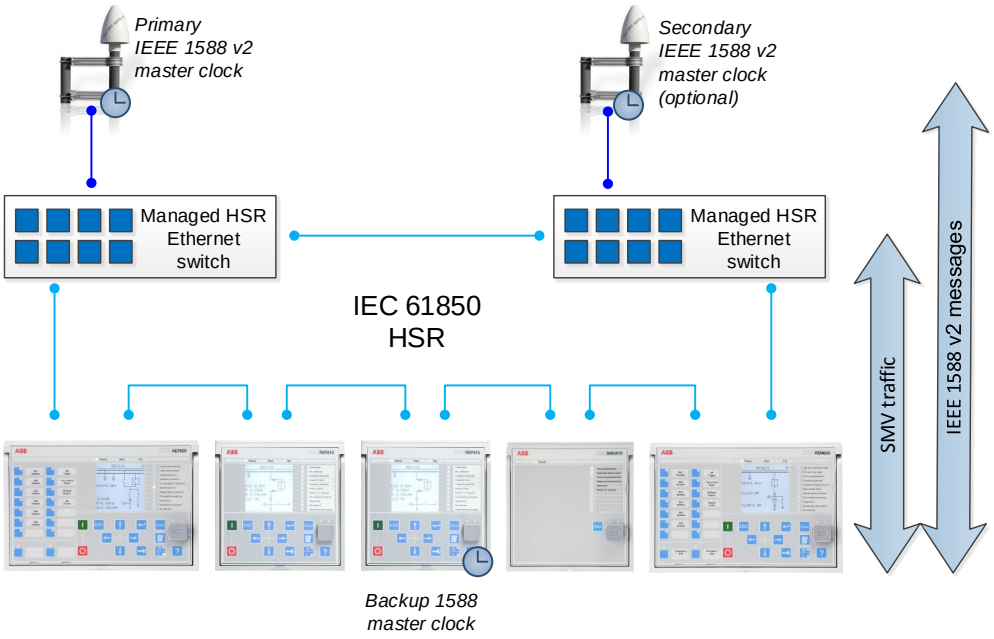

Figure 13: Example network topology with process bus, redundancy and IEEE 1588 v2 time synchronization

3.2.5 Secure communication

The protection relay supports secure communication for WHMI and file transfer protocol using Transport Layer Security protocol. The WHMI must be connected from a Web browser using the HTTPS protocol. File transfer client must use explicit FTPS.

3.2.6 Communication services control

3.2.6.1 Ethernet ports

The protection relay allows the use of a secondary IP address for the station ports on the communication modules COM1001...COM1003. This secondary IP network is assigned to a single Ethernet port and can be used to make separate networks for different communication protocols or, for example, a separate service network for configuration purposes. Multicast station/bus communication, such as IEC 61850-9-2 LE sampled values and GOOSE, is only supported on the Network 1 interface. The parameters for setting the secondary IP network are located under **Configuration** > **Communication** > **Ethernet** > **Network 2 address**.

Table 35: Secondary IP address parameters

Parameter	Options	Description
Configuration/Communication/Ethernet/Network 2 address/ Enable	False (default)	Network 2 disabled
	TRUE	Network 2 enabled
Configuration/Communication/Ethernet/Network 2 address/IP address	0.0.0.0	IP address for Network 2
Configuration/Communication/Ethernet/Network 2 address/IP address	0.0.0.0	Subnet address for Network 2
Configuration/Communication/Ethernet/Network 2 address/MAC address	xx-xx-xx-xx-xx-xx	MAC address for Network 2

The IP address for Network 2 is disabled by default settings, and all Ethernet ports are assigned to the same IP address used in the Network 1 address menu **Configuration** > **Communication** > **Ethernet** > **Network 1**. If Network 2 is taken into use by the setting Enable="True" (requires reboot), the interlink port X3 of the COM module is assigned to this second network, using the IP address and subnet parameters in the Network 2 address menu **Configuration** > **Communication** > **Ethernet** > **Network 2 address**.

If the Network 2 interface is enabled, PTP time synchronization and SMV/GOOSE multicast are disabled for that port.

The secondary IP setting must not collide with the primary Network 1 IP address or LHMI IP address, otherwise the secondary IP address is not taken into use.

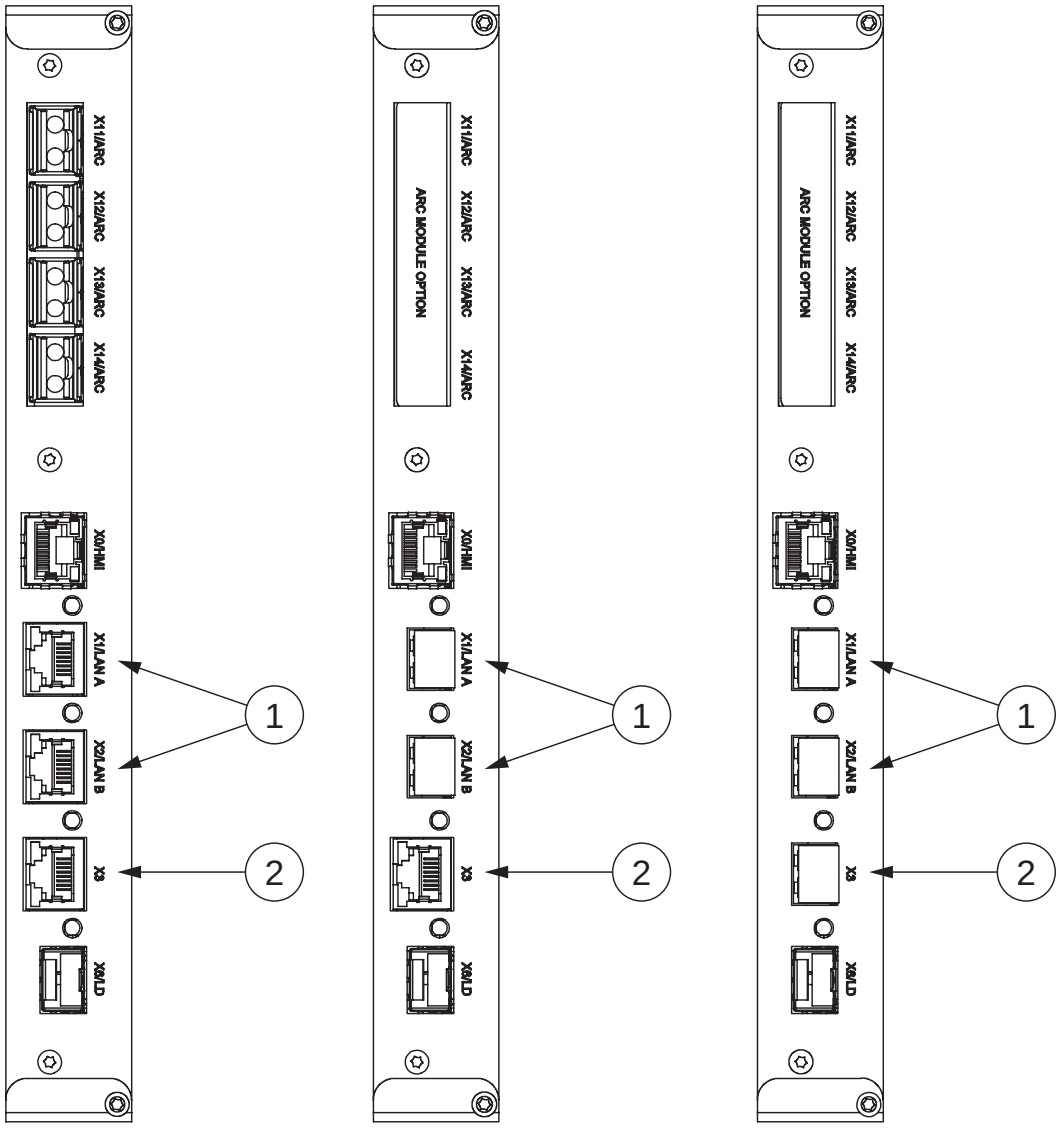

Figure 14: Ethernet modes with Network 1 and Network 2

1 Network 1

2 Network 1 / Network 2

3.2.6.2 Protocol control

It is possible to allow or block different protocols for different network interfaces in the protection relay using the parameters in **Configuration** > **Communication** > **Protocols** > **Network1**, **Configuration** > **Communication** > **Protocols** > **Network2** and **Configuration** > **Communication** > **Protocols** > **HMI Port**.

All protocols are allowed for each network by default, and can be separately disabled.

Table 36: Protocol control in the protection relay

Parameter	Options	Description
Configuration/Communication/Protocols/Network1/FTP	Off	Denies FTP and FTPS
	On	Allows FTP and FTPS
	Secure (Default)	Allows FTPS only
Configuration/Communication/Protocols/Network2/FTP	Off	Denies FTP and FTPS
	On	Allows FTP and FTPS
	Secure (Default)	Allows FTPS only
Configuration/Communication/Protocols/HMI Port/FTP	Off	Denies FTP and FTPS
	On	Allows FTP and FTPS
	Secure (Default)	Allows FTPS only
Configuration/Communication/Protocols/Network1/HTTPS	Off	Denies HTTPS
	On (Default)	Allows HTTPS
Configuration/Communication/Protocols/Network2/HTTPS	Off	Denies HTTPS
	On (Default)	Allows HTTPS
Configuration/Communication/Protocols/Network1/MMS	Off	Denies IEC 61850 MMS
	On (Default)	Allows IEC 61850 MMS
Configuration/Communication/Protocols/Network2/MMS	Off	Denies IEC 61850 MMS
	On (Default)	Allows IEC 61850 MMS
Configuration/Communication/Protocols/HMI Port/MMS	Off	Denies IEC 61850 MMS
	On (Default)	Allows IEC 61850 MMS
Configuration/Communication/Protocols/Network1/DNP	Off	Denies DNP3
	On (Default)	Allows DNP3
Configuration/Communication/Protocols/Network2/DNP	Off	Denies DNP3
	On (Default)	Allows DNP3
Configuration/Communication/Protocols/Network1/Modbus	Off	Denies Modbus
	On (Default)	Allows Modbus
Configuration/Communication/Protocols/Network2/Modbus	Off	Denies Modbus
	On (Default)	Allows Modbus
Configuration/Communication/Protocols/Network1/ IEC-60870-5-104	Off	Denies IEC 60870-5-104
	On (Default)	Allows IEC 60870-5-104
Configuration/Communication/Protocols/Network2/ IEC-60870-5-104	Off	Denies IEC 60870-5-104
	On (Default)	Allows IEC 60870-5-104

3.2.6.3 Protocol write access rights

Write access rights are configurable for FTP, MMS, and HTTPS protocols in **Configuration** > **Authorization**. The write access parameters are used to narrow down services that allow setting changes on different network interfaces. Disabling the FTP and IEC 61850 MMS write access on Network 1 and 2 prevents the user from updating the configuration to the protection relay from PCM600. Disabling the HTTPS write access prevents the user from writing setting changes from WHMI.

Table 37: Protocol write access in the protection relay

Parameter	Options	Description
Configuration/Authorization/Network1/FTP write access	Off	FTP write access denied for Network 1
	On (Default)	FTP write access allowed for Network 1
Configuration/Authorization/Network1/MMS write access	Off	IEC 61850 MMS write access denied for Network 1
	On (Default)	IEC 61850 MMS write access allowed for Network 1
Configuration/Authorization/Network1/HTTPS write access	Off	HTTPS write access denied for Network 1
	On (Default)	HTTPS write access allowed for Network 1
Configuration/Authorization/Network2/FTP write access	Off	FTP write access denied for Network 2
	On (Default)	FTP write access allowed for Network 2
Configuration/Authorization/Network2/MMS write access	Off	IEC 61850 MMS write access denied for Network 2
	On (Default)	IEC 61850 MMS write access allowed for Network 2
Configuration/Authorization/Network2/HTTPS write access	Off	HTTPS write access denied for Network 2
	On (Default)	HTTPS write access allowed for Network 2
Configuration/Authorization/HMI/FTP write access	Off	FTP write access denied for the HMI port
	On (Default)	FTP write access allowed for the HMI port
Configuration/Authorization/HMI/MMS write access	Off	IEC 61850 MMS write access denied for the HMI port
	On (Default)	IEC 61850 MMS write access allowed for the HMI port

PCM600 is using FTP or FTPS protocol to communicate with the protection relay. If the FTP write access is disabled for a network PCM600 functionality is limited to support read operations only from Disturbance handling, Event viewer and Parameter Setting.

Enabling Network 2 IP address requires additional configuration in PCM600 to define IEC 61580 subnetworks. This configuration is done via Ethernet Configuration and IEC 61850 Configuration in PCM600.

3.2.7 Serial port supervision SERLCCH

3.2.7.1 Function block

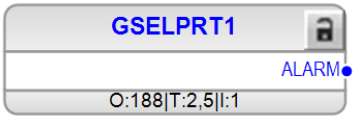

Figure 15: Function block

3.2.7.2 Functionality

The function block represents the IEC61850 GOOSE communication monitoring and diagnostics in the relay. Function block includes the GOOSE diagnostic counters that can be accessed via HMI, and ALARM output.

ALARM output indicates if overall GOOSE communication status is good or not. If ALARM output status is “False”, all GOOSE inputs are receiving data within the timeout limits. If the output is “True”, there is an issue (e.g. timeout or decoding), with one or more of GOOSE inputs in the relay.

For more information on the GOOSE configuration and monitoring refer to the IEC61850 engineering manual.

3.2.8 Serial port supervision SERLCCH

3.2.8.1 Function block

Figure 16: Function block

3.2.8.2 Functionality

The serial port supervision function SERLCCH represents one serial communication port driver. Depending on the hardware configuration, the protection relay can be equipped with two UART-based serial communication ports. The communication ports can be both galvanic (RS-485) or one port could be fiber-optic. The protection relay uses the ports for serial communication protocol links.

Serial communication drivers are identified in the device configuration as COM1 and COM2, which correspond to function blocks SERLCCH1 and SERLCCH2, respectively. Each COM port driver has its own setting parameters on the HMI under **Configuration** > **Communication** > **COMn (n=1,2)**.

Output LNKxLIV is active (TRUE) whenever characters are received on the serial interface. Output CHxLIV is active (TRUE) while complete link frames are received. Both outputs go to FALSE state after 15 seconds of inactivity on the port.

3.2.9 Assigning of a serial communication protocol to a COM serial port

The settings of the serial communication protocol instance include a setting parameter, called either *Port* or *Serial port*, which is used to select the COM1 or COM2 setting.

Since not all serial protocol standards allow changes in link parameters, all link setting parameters are not found in the COMn settings. Additional link setting parameters are found in the setting parameter list of the used serial protocol.

3.2.10 Physical locations of the serial channels

The physical location of the COM1 and COM2 drivers depends on the link mode used which, in turn, depends on the used communication hardware option. Serial channels can be found on communication boards COM1004...COM1005.

- X7 is the fiber-optic interface. Only driver COM2 can be configured into fiber-optic mode.
- X8 is the RS-485/IRIG-B interface. Both drivers COM1 and COM2 can be configured to this interface: COM1 and COM2 can act as two RS-485 2-wire links or, alternatively, COM1 can act as one single RS-485 4-wire link. Both ports are galvanically isolated serial communication ports.

Table 38: Connector X8 signals

Pin No	Pin name	Description	Alternative
1	GND	EARTH	
2	GNDC	GND connected to earth via 1nF capacitor	
3	NC		
4	IRIG-B -	ISOL2_GND	
5	IRIG-B +		
6	ISOL_GND	RS485 GND	
7	RS485 B1/-	2-wire - , COM1	4-wire TX pair, COM1
8	RS485 A1/+	2-wire + , COM1	4-wire TX pair, COM1
9	RS485 B2/-	2-wire - , COM2	4-wire RX pair, COM1
10	RS485 A2/+	2-wire + , COM2	4-wire RX pair, COM1

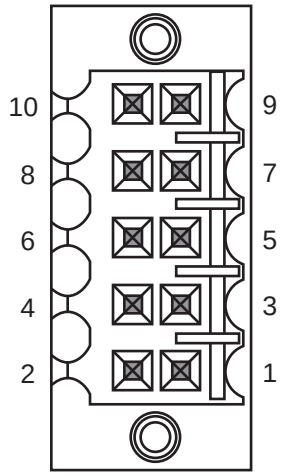

Figure 17: X8 connector pinout for socket on communication board

Table 39: LED configuration (COM1004...COM1005)

LED	Description
X1	X1 LANA
X2	X2 LANB
X6	X6 LD
X7 TX	FO-UART
X8 TX	RS-485/COM2
X8 TX	RS-485/COM1
IRIG-B	IRIG-B

3.2.11 RS-485 bias and termination settings

A 6 x DIP switch is located on the COM1004...COM1005 cards. The COM card needs to be pulled out from the relay case to access the switch. See *Figure 18* for the location of the switch. RS-485 biasing and termination settings are possible through this switch. If the switch is in “OFF” position, bias and termination are disabled and in “ON” position, they are enabled.

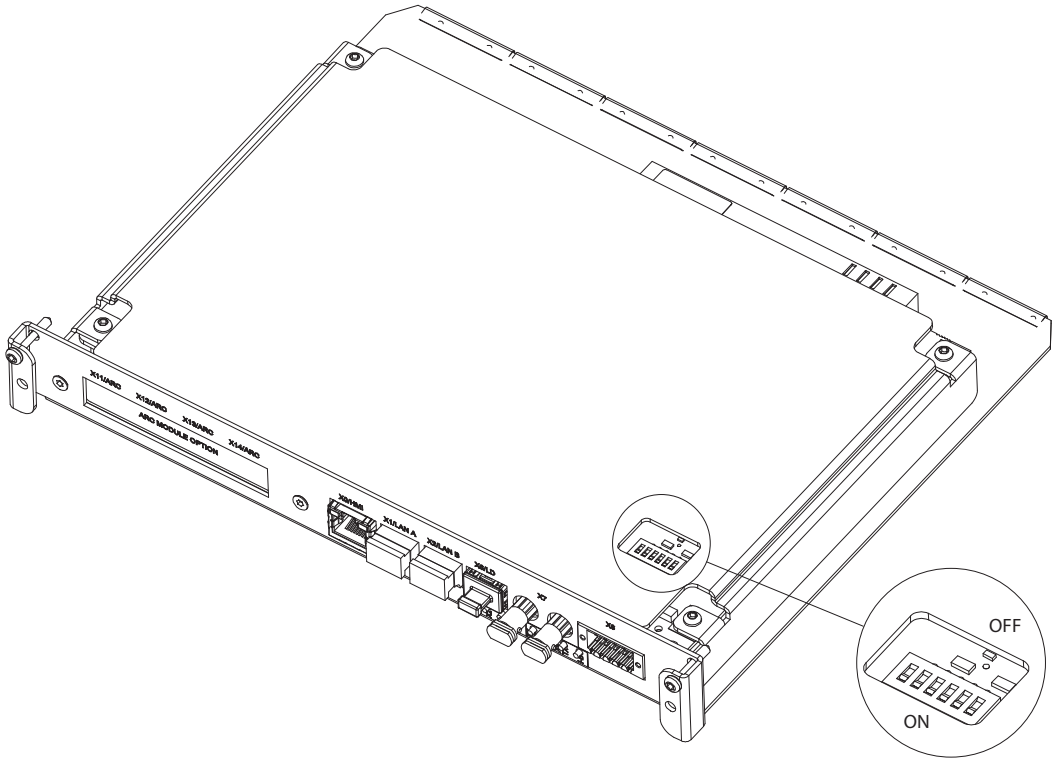

Figure 18: DIP switches on the COM1004...COM1005 cards

Table 40: Bias and termination DIP switch

Switch	Signal	X8 pin	Type
1	RS485_A1/+	8	Bias
2	RS485_A1/+ RS485_B1/-		Bus termination
3	RS485_B1/-	7	Bias
4	RS485_A2/+	10	Bias
5	RS485_A2/+ RS485_B2/-		Bus termination
6	RS485_B2/-	9	Bias

3.2.12 Serial link diagnostics and monitoring

Serial communication diagnostics and monitoring is divided between the serial link driver and the serial communication protocol. The lower-level physical and protocol-independent aspects of the UART-based serial communication are monitored in the serial link driver. Diagnostic counters and monitoring values are located on the HMI under **Monitoring** > **Communication** > **COMn** (n= 1,2,...).

Depending on the communication protocol, the serial driver software receives single characters or complete protocol frames, based on the frame start/stop characters or on link frame timing.

Table 41: Setting parameters

Parameter	Description
Fiber mode	Defines the fiber-optic mode used. Setting "No fiber" is the same as galvanic mode.
Serial mode	Used for galvanic RS-485 modes 2- or 4-wire. This setting is relevant only if Fiber mode is set to "No fiber".
Baudrate	Communication speed used.

Table 42: Diagnostic counters and indications

Counters	Description
Characters received	Counts all incoming non-erroneous characters. This counter operates regardless of whether the serial driver is set to detect a whole protocol link frame or just separate characters.
Frames received	Counts all protocol-specific non-erroneous frames received. Protocol-specific frames can be based on timing (for example, Modbus RTU) or on special start and stop characters (for example, Modbus ASCII).
Frames discarded	Counts all protocol-specific erroneous frames received. If the driver detects an error while receiving a frame, the whole frame is automatically discarded. This also means that the protocol in question never receives a faulty link frame from the driver. When this counter is incremented, one of the detailed error counters (Parity, Overrun, Framing) can also be incremented.
Frames transmitted	Counts all protocol-specific frames transmitted from the COM channel.
Collisions	Counts the number of transmission collisions that have occurred. Used in RS-485 mode by some protocols where transmissions could collide with reception. For example, DNP3 unsolicited reporting mode.
Parity errors	Counts the number of parity errors detected in characters received.
Overrun errors	Counts the number of overrun errors detected in characters received.
Framing errors	Counts the number of framing errors detected in characters received.
Link status	In write direction: By writing value 1 to this parameter, all the diagnostic counters are reset to 0.
Link status	In monitoring direction: If the driver instance is in use by any communication protocol, the monitoring value shows value 1. Otherwise, the value is 0.

3.2.13 Modbus protocol MBSLPRT

3.2.13.1 Function block

Figure 19: Function block

3.2.13.2 Functionality

The function block represents a Modbus server protocol instance in the protection relay. Function block settings include communication interface assignment for the instance, that is, Ethernet/TCP or serial.

A Modbus server protocol instance is activated if the function block instance is added to the application configuration. The setting *Operation* should be "On" and setting *Port* should have the communication interface assignment.

The STATUS output of the function block is active if Modbus client requests have been received on the communication interface within 15 seconds.

By default no Modbus data is mapped to the protocol interface. Protocol data has to be created using Communication Management in PCM600. There are two mapping sets, “Mapping 1” and “Mapping 2”, and either can be used. Setting parameter *Mapping selection* points to the mapping set used. Several Modbus protocol instances can point to the same mapping set.

For more information on the Modbus server protocol, see the Modbus communication protocol manual.

3.2.14 DNP3 protocol DNPLPRT

3.2.14.1 Function block

Figure 20: Function block

3.2.14.2 Functionality

The function block represents one DNP3 server protocol instance in the protection relay. Function block settings include communication interface assignment for the instance, that is, Ethernet/TCP(+UDP) or serial.

Over Ethernet/TCP, the protocol optionally supports secure authentication with symmetric keys. The implementation follows the IEC 62351-5 security standard specification as well as the descriptions in DNP3 standard part 7, IP-networking chapter "Secure authentication".

A DNP3 server protocol instance is activated if the function block instance is added to the application configuration. The setting *Operation* should be "On" and setting *Port* should have the communication interface assignment.

The STATUS output of the function block is active if DNP3 client requests or DNP3 supervision messages have been received on the communication interface within an interval defined by the link keep-alive parameter.

By default no DNP3 data is mapped to the protocol interface. Protocol data has to be created using Communication Management in PCM600. There are two mapping sets, “Mapping 1” and “Mapping 2”, and either can be used. Setting parameter *Mapping selection* points to the mapping set used. Several DNP3 protocol instances can point to the same mapping set.

For more information on the DNP3 server protocol, see the DNP3 communication protocol manual.

3.2.15 IEC 60870-5-103 protocol I3CLPRT

3.2.15.1 Function block

Figure 21: Function block

3.2.15.2 Functionality

The function block represents one IEC 60870-5-103 server protocol instance in the protection relay. Function block settings include communication interface assignment for the instance, that is, serial communication port 1 or 2.

An IEC 60870-5-103 server protocol instance is activated if the function block instance is added to the application configuration. The setting *Operation* should be "On" and setting *Serial port* should have the communication interface assignment.

The STATUS output of the function block is active if IEC 60870-5-103 client requests have been received on the communication interface within 15 seconds.

The function block input EC_FRZ relates to possible ASDU 205 (mostly energy) counters defined in the protection relay. Activation of the EC_FRZ input freezes and captures the current ASDU 205 counter values and sends them to the IEC 60870-5-103 client. Several options for the activation exist.

1. EC_FRZ object exists as a control object in the IEC 60870-5-103 data model, and can be written from the client.
2. EC_FRZ physical input can be activated from an internal or external timer application signal.

By default most IEC 60870-5-103 data is pre-mapped to the protocol interface. However, protocol data can be deleted, added and modified using Communication Management in PCM600.

For more information on the IEC 60870-5-103 server protocol, see the IEC 60870-5-103 communication protocol manual.

3.2.16 IEC 60870-5-104 protocol I5CLPRT

3.2.16.1 Function block

Figure 22: Function block

3.2.16.2 Functionality

The function block represents one IEC 60870-5-104 TCP/IP server protocol instance in the protection relay.

An IEC 60870-5-104 server protocol instance is activated if the function block instance is added to the application configuration. The setting *Operation* should be "On".

The protocol optionally supports secure authentication version with symmetric keys. The implementation follows the IEC 62351-5 security standard specification and the descriptions in the pro-tocol standard part IEC 60870-5-7 “Transmission procedures, extension for secure communica-tion”. **Functionality is limited to single user mode only**.

The `STATUS` output of the function block is active if IEC 60870-5-104 client activity is noticed on the communication interface within 15 seconds.

The function block input `IT_FRZ` relates to the IEC 610870-5-104 integration totals counter objects defined in the protection relay. The `IT_FRZ` input can be configured for external counter freezing.

By default no IEC 60870-5-104 data objects are mapped to the protocol instance. Protocol data can be added and modified using Communication Management in PCM600.

For more information on the IEC 60870-5-104 server protocol, see the IEC 60870-5-104 communication protocol manual.

3.3 Self-supervision

The protection relay's extensive self-supervision system continuously supervises the relay’s software, hardware and certain external circuits. It handles the run-time fault situation and informs the user about a fault via the LHMI, the relay's main unit power module Ready LED and through the communication channels. The target of the self-supervision is to safeguard the relay’s reliability by increasing both dependability and security. The dependability can be described as the relay’s ability to operate when required. The security can be described as the relay scheme’s ability to refrain from operating when not required. The dependability is increased by letting the system operators know about the problem, giving them a chance to take the necessary actions as soon as possible. The security is increased by

preventing the relay from making false decisions, such as issuing false control commands.

There are two types of fault indications.

- Internal faults
- Warnings

Warnings are indications of less severe situations which can also be caused by external reasons, for example, in case the RTD sensor measurement circuit is not complete.

On the LHMI, the self-supervision status is available as an advanced page under Relay Status page. The self-supervision status is indicated with Internal Fault, Warning and All OK LEDs. In normal operation, All OK LED is lit. The selfsupervision also controls the status of IRF output relay. The IRF output relay is energized under normal conditions and de-energized under internal fault conditions.

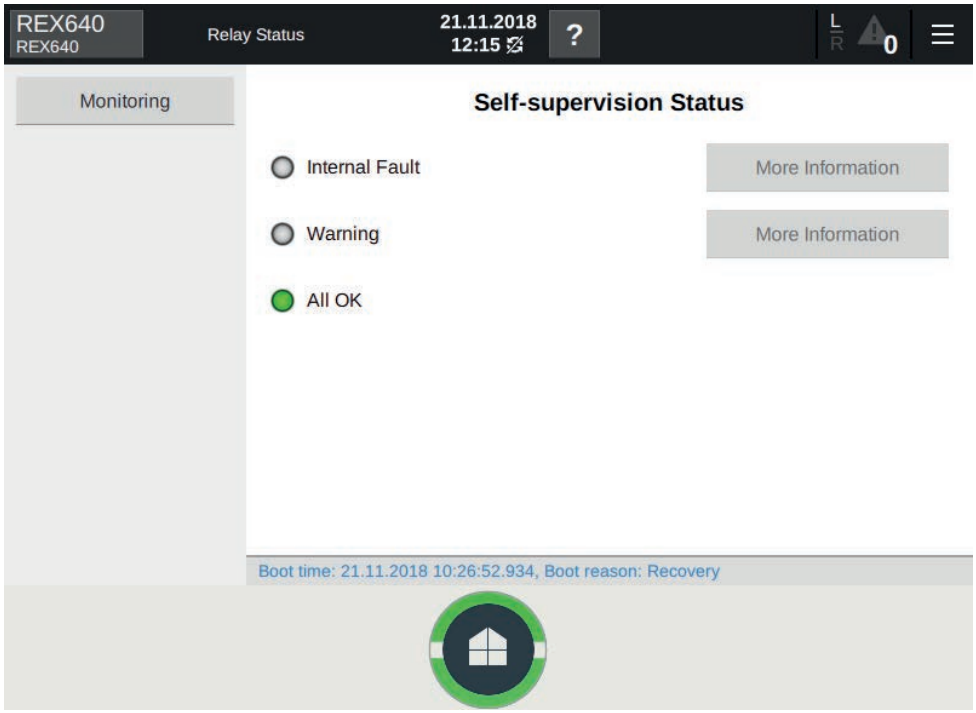

Figure 23: Relay self-supervision status on local HMI

On the WHMI, the self-supervision status is available under Device menu. The top right LED indicates the relay status.

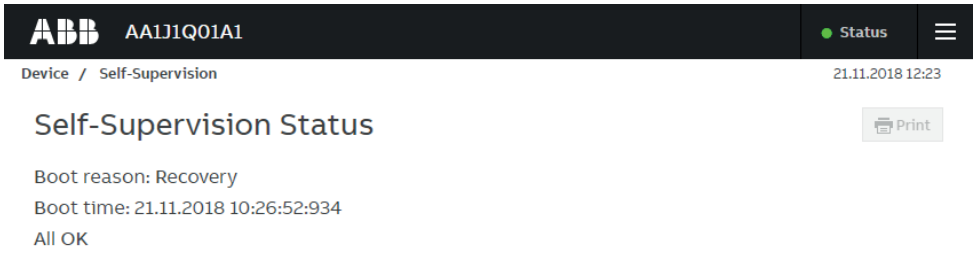

Figure 24: Relay self-supervision status on Web HMI

In addition, the last boot reason and time are shown on both LHMI and WHMI.

3.3.1 Internal faults

When an internal relay fault is detected, the relay protection operation is disabled, the self-supervision output relay is de-energized, and the change-over contact is released. In the main unit, the main indication of an internal fault is a flashing green Ready LED behind the power module, and on the HMI, a rapidly flashing red Home button.

Different actions are taken depending on the severity of the internal fault. In case of a temporary fault, the protection relay tries to recover from the situation by restarting. The restart procedure includes two stages; when the relay detects a fault, it restarts itself in a few seconds after the fault occurrence. If the relay did not recover after the first restart, or the fault reoccurs during the next 60 minutes, the second restart is delayed for 10 minutes. In case of a permanent fault, the protection relay stays in the internal fault mode. All output relays are de-energized and contacts are released for the internal fault. The protection relay continues to perform internal tests during the fault situation. If the internal fault disappears, the fault indication LEDs stop flashing and the protection relay returns to the normal service state.

One possible cause for an internal fault situation is a so-called soft error. The soft error is a probabilistic phenomenon which is rare in a single device, statistically not happening more often than once in a relay's lifetime. No hardware failures are expected and a full recovery from the soft error is possible by a self-supervision controlled restart of the relay.

The self-supervision signal output operates on the closed-circuit principle. Under normal conditions, the IRF output relay is energized and the contact gap 3-5 is closed. If the auxiliary power supply fails or an internal fault is detected, the IRF output relay is de-energized and the contact gap 3-5 opens.

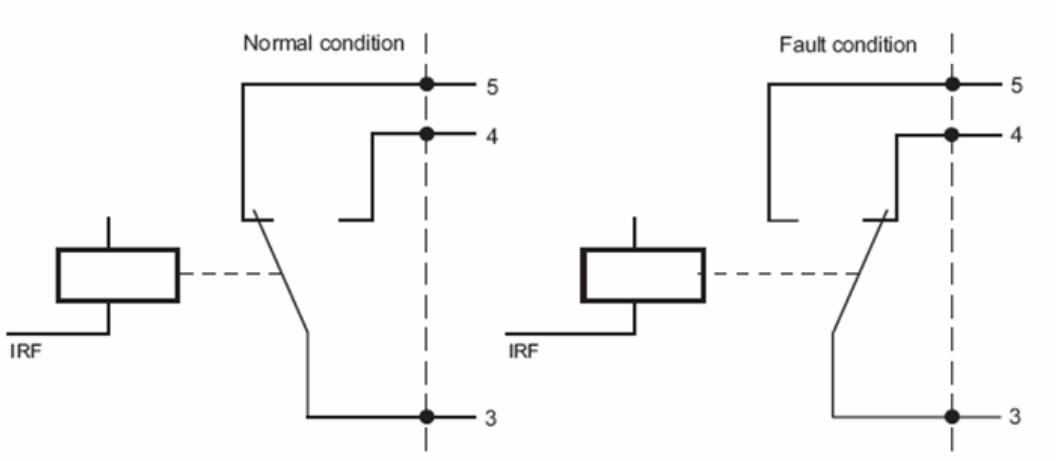

Figure 25: Output contact

The internal fault code indicates the type of internal relay fault. When a fault appears, the code must be recorded so that it can be reported to ABB customer service.

More details about the active internal fault are found on the Relay Status page. On the LHMI, the internal fault state is indicated with a red LED. More information about the fault and recovery options can be accessed by tapping More Information.

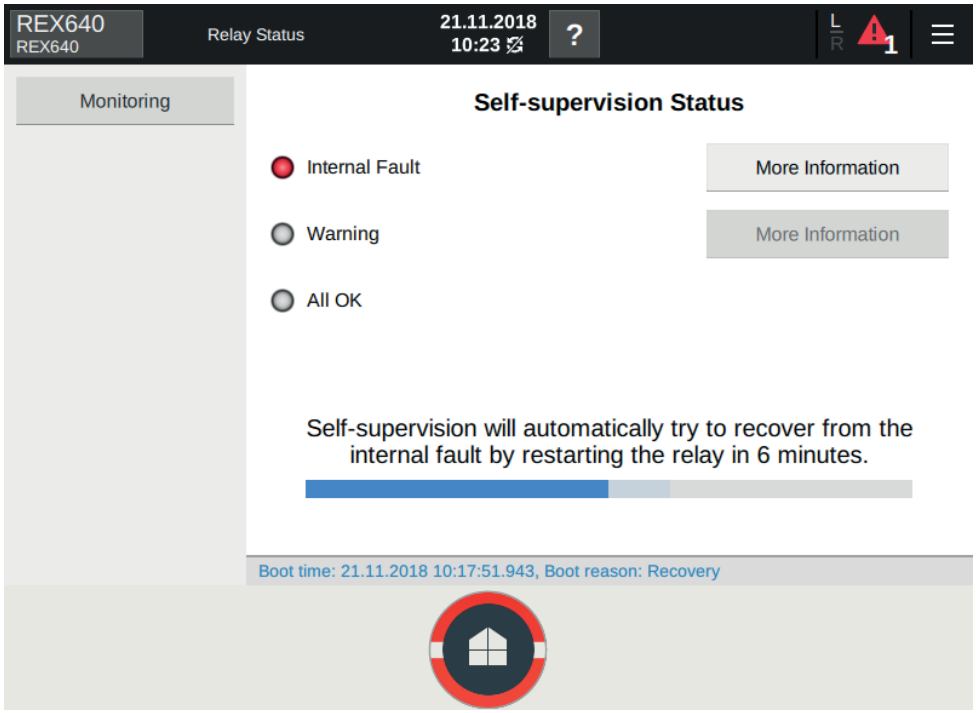

Figure 26: Internal fault state indicated with red LED

More Information shows all active faults and the corresponding fault codes. In addition, a recovery procedure is described.

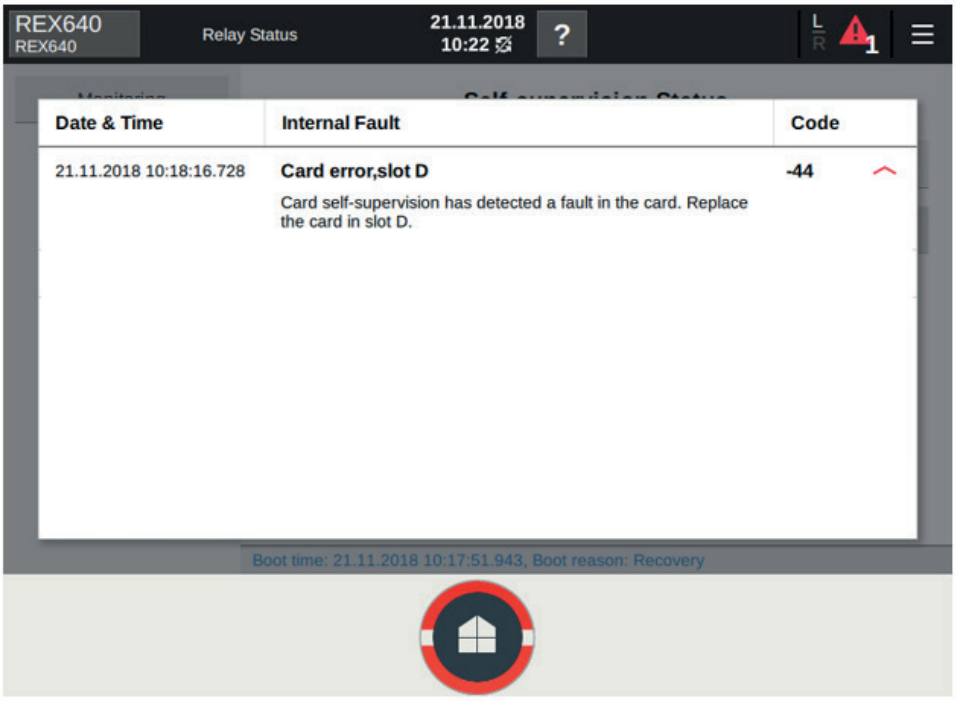

Figure 27: More information about the fault

On the WHMI, internal fault information is shown under Self-Supervision Status.

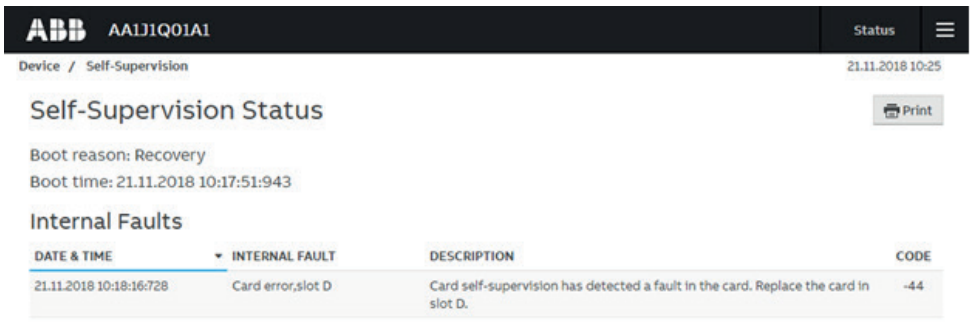

Figure 28: Internal fault information on Web HMI

Table 43: Internal fault indications and codes

Fault indication	Fault code	Additional information	Fast self-recovery attempt	Slow 10min self-recovery (# of attempts)	Immediate IRF-mode	Action in permanent fault state
Internal Fault System error	2	Start up error: HW/SW mismatch	No	No	Yes	If relay SW has just been updated, redo it. If not recovered, contact your nearest ABB representative to check the next possible corrective action.
Internal Fault System error	2	Start up or runtime error: Data bus error, CPU module	Yes	Yes (3)	No	Restart the relay. If recovered by restarting, continue relay normal operation. If not recover by restarting, replace the relay, most probably hardware failure in CPU module.
Internal Fault System error	2	Start up error: SCL file missing	No	No	Yes	Do factory restore or rewrite configuration using PCM600.
Internal Fault System error	2	Start up error: Missing order number	No	No	Yes	Do factory restore. If not recovered, contact your nearest ABB representative to check the next possible corrective action.
Internal Fault System error	2	Start up error: FPGA HW error, CPU module	Yes	Yes (3)	No	Restart the relay. If recovered by restarting, continue relay normal operation. If not recover by restarting, replace the relay, most probably hardware failure in CPU module.
Internal Fault System error	2	Start up error: FPGA image corrupted, CPU module	Yes	Yes (3)	No	Restart the relay or if relay SW has just been updated, redo it. If recovered by restarting, continue relay normal operation. If not recovered by restarting or redoing SW update, replace the relay, most probably hardware failure in CPU module.
Internal Fault System error	2	Runtime error: CPU internal fault	Yes	Yes (3)	No	Restart the relay. If recovered by restarting, continue relay normal operation. If not recover by restart-

License error	-62	Runtime error: Product license error, license file is not found or is wrong	No	No	Yes	If SW update under Modification Sales has been carried out, redo the update. If not recovered, contact your nearest ABB representative to check the next possible corrective action.

3.3.2 Warnings

In case of a warning, the protection relay continues to operate except for those protection functions affected by the fault. The main unit status LED remains lit as during normal operation. If the device warning event is configured as alarms, the LHMI Home button flashes red.

If a warning appears, record the name and code so that it can be provided to ABB customer service. See the operation manual for more information on reading internal log files from the relay.

On the LHMI, an active warning is indicated with a yellow LED. More information about the warning and recovery options can be accessed by tapping More Information.

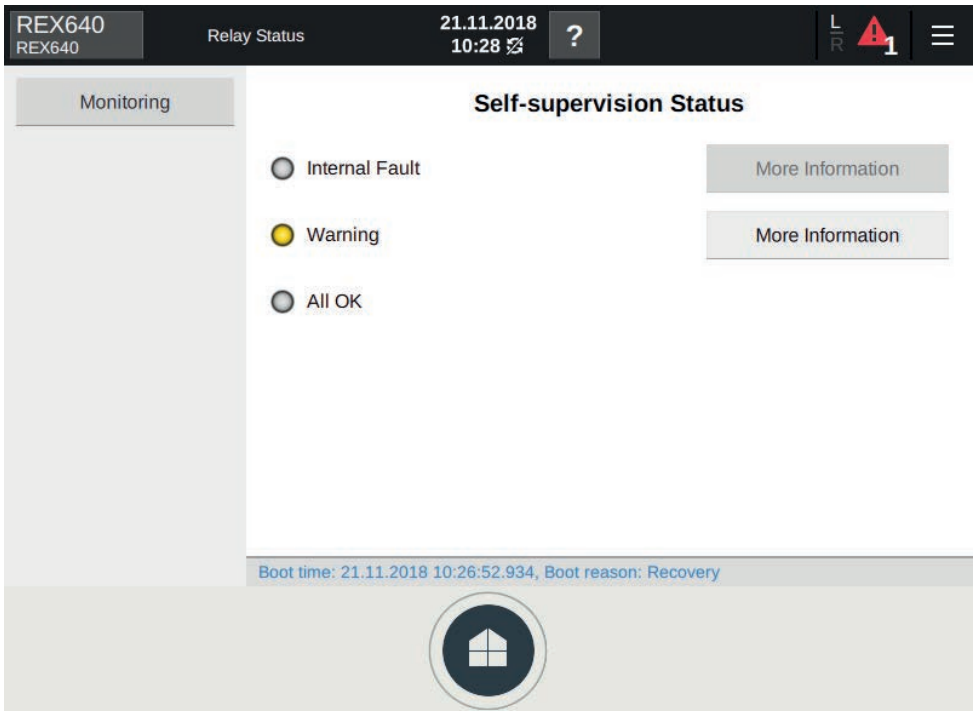

Figure 29: Active warning on local HMI

More information shows all active warnings and corresponding fault codes. In addition, a recovery procedure is described.

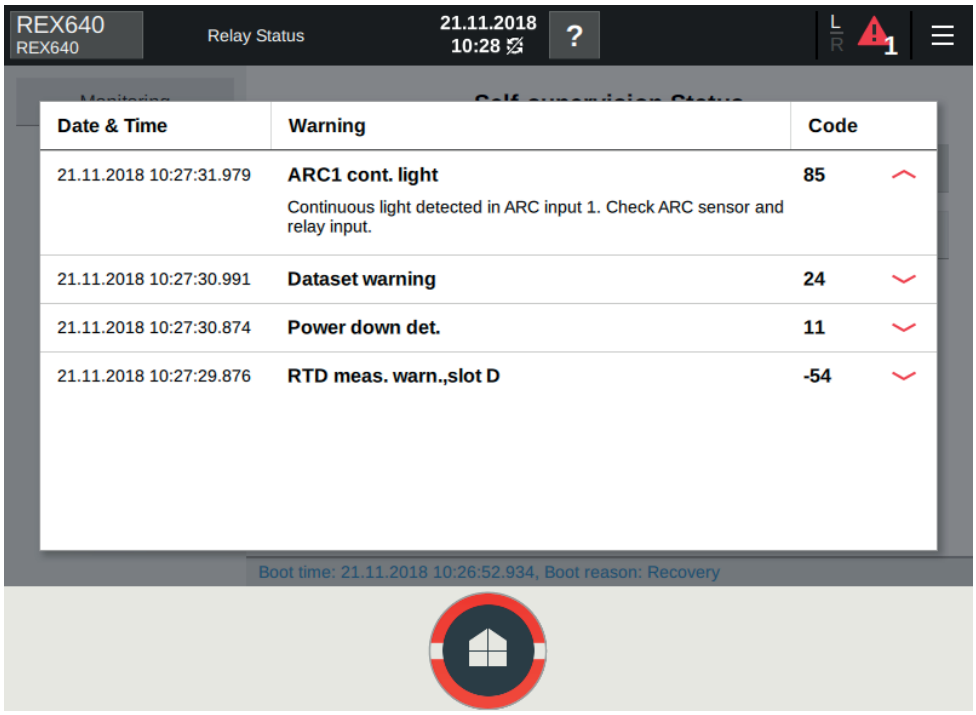

Figure 30: More information about the warning

The warning alarm is only displayed when configured in PCM600 event filtering.

Table 44: Warning indications and codes

Warning indication	Warning code	Additional information
Watchdog reset	10	A watchdog reset has occurred.
Power down det.	11	The auxiliary supply voltage has dropped too low.
DNP3 warning	22	Error in the DNP3 communication.
Dataset warning	24	Error in the Data set(s).
Report cont. warning	25	Error in the Report control block(s).
GOOSE contr. warning	26	Error in the GOOSE control block(s).

mA output warn.,slot C	–20	Temporary error occurred in RTD module located in slot C.

3.3.3 Power supply module Ready LED and HMI Home button LED

Both power supply module Ready LED and LHMI Home button LED visualize the self-supervision state of the relay. *Table 45* shows how these states are indicated.

Table 45: Power supply module Ready LED and local HMI Home button LED

State	Power supply module Ready LED	LHMI Home button	Alarm acknowledged
Relay under normal operation and LHMI connected	Steady green	Steady green	N/A
Relay's IRF activated, but communicates with LHMI	HF blinking green	HF blinking red	N/A
Communication lost between Relay and LHMI, but no IRF	Steady green	HF blinking green	N/A
LHMI not running normally or in start-up initialization phase	Steady green	HF blinking green	N/A
Process related alarm active	Steady green	LF blinking red	No
Process related alarm active	Steady green	Steady red	Yes
Process related alarm has been active earlier, but is not any more active	Steady green	LF blinking red	No

Table continues on the next page

State	Power supply module Ready LED	LHMI Home button	Alarm acknowledged
Process related alarm has been active earlier, but is not any more active	Steady green	Steady green	Yes
Relay set to Test Mode	LF blinking green	LF blinking green	No

The physical SHMI Home button has two operation modes.

- On the SHMI's navigation page, the Home button indicates the combined status of all connected relays. If multiple relays have different statuses, the Home button shows the indication with the highest priority.
- On the HMI view, the Home button indicates the status of the respective relay as described in *Table 45*.

3.3.4 Fail-safe principle for relay protection

The relay behavior during an internal fault situation has to be considered when engineering trip circuits under the fail-safe principle. The considerations discussed and examples given are mainly based on the need of protection scheme reliability.

The reliability need can be divided into two subparts: dependability and security. The dependability can be described as the protection scheme's ability to operate when required. The security can be described as the protection scheme's ability to refrain from operating when not required. The protection scheme fail-safe principle is typically related to satisfying these two performance criteria. Depending on the requirements set to the electricity distribution process, one of the criteria may get more attention than the other. However, in some industrial electricity distribution networks, the main (productization) process is so dependent on reliable electricity supply that both criteria are addressed equally.

The examples presented focus on the relay's protection role in the fail-safe circuitry using traditional hardwiring. If communication between the relays, or to an upper level system, is a part of the fail-safe functionality, it must be also be a part of the circuitry.

3.3.4.1 Motor feeder

The target is to prevent the motor from running uncontrollably and to secure the emergency stop circuit functionality.

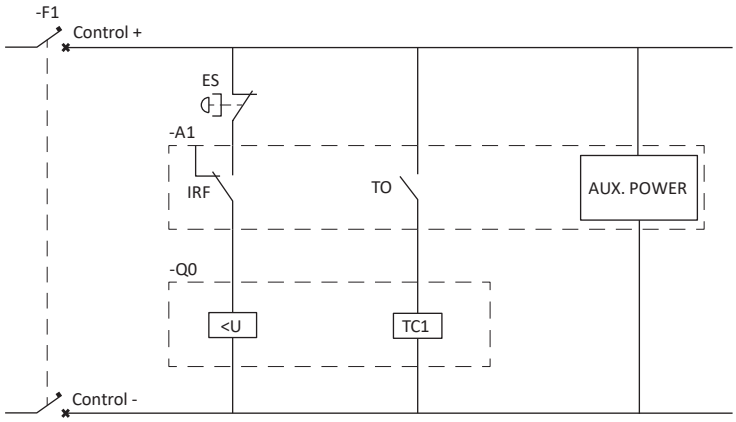

Figure 31: Motor feeder fail-safe trip circuit principle, example 1

A1	Protection relay
ES	Emergency stop
Q0	Circuit breaker (CB)
TO	Protection relay trip output
IRF	Internal relay fault indication
<U	CB undervoltage trip coil
TC1	CB trip coil 1
DCS	Distributed process control system
F1	Miniature circuit breaker

In example 1, the fail-safe approach aims at securing motor shutdown via an emergency switch and in case the control voltage disappears. In case of a temporary internal relay fault, the circuit breaker is immediately tripped before the relay recovers from the situation. In case the IRF output relay is directly connected to the undervoltage trip coil circuit, the output's performance figures (make and break values) must be checked.

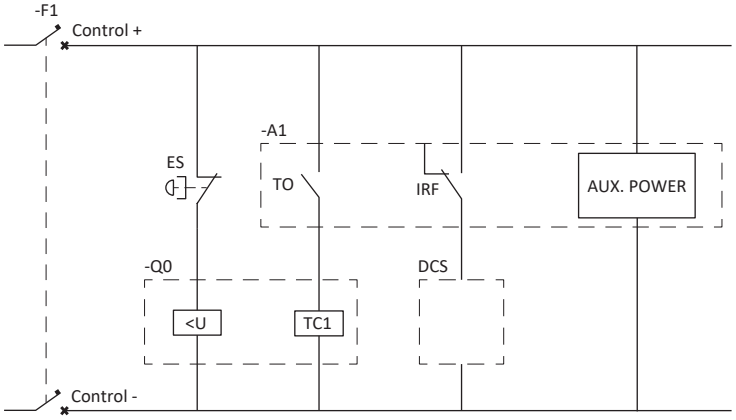

Figure 32: Motor feeder fail-safe trip circuit principle, example 2

A1	Protection relay
ES	Emergency stop
Q0	Circuit breaker (CB)

Table continues on the next page

TO	Protection relay trip output
IRF	Internal relay fault indication
<U	CB undervoltage trip coil
TC1	CB trip coil 1
DCS	Distributed process control system
F1	Miniature circuit breaker

In example 2, the fail-safe approach aims at securing motor shutdown via an emergency switch and in case the control voltage disappears. In case of internal relay fault, the necessary actions must be initiated by the process operators or by the control system.

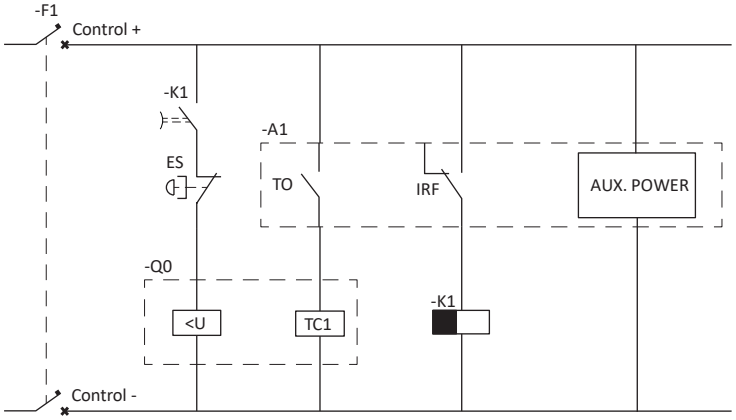

Figure 33: Motor feeder fail-safe trip circuit principle, example 3

A1	Protection relay
ES	Emergency stop
Q0	Circuit breaker (CB)
TO	Protection relay trip output
IRF	Internal relay fault indication
<U	CB undervoltage trip coil
TC1	CB trip coil 1
K1	OFF delay time relay
F1	Miniature circuit breaker

In example 3, the fail-safe approach aims at securing motor shutdown via an emergency switch and in case the control voltage disappears. In case of internal relay fault, the circuit breaker is tripped via an undervoltage coil after a preset time delay. The additional time delay allows the relay to recover from the internal fault situation without tripping the circuit breaker.

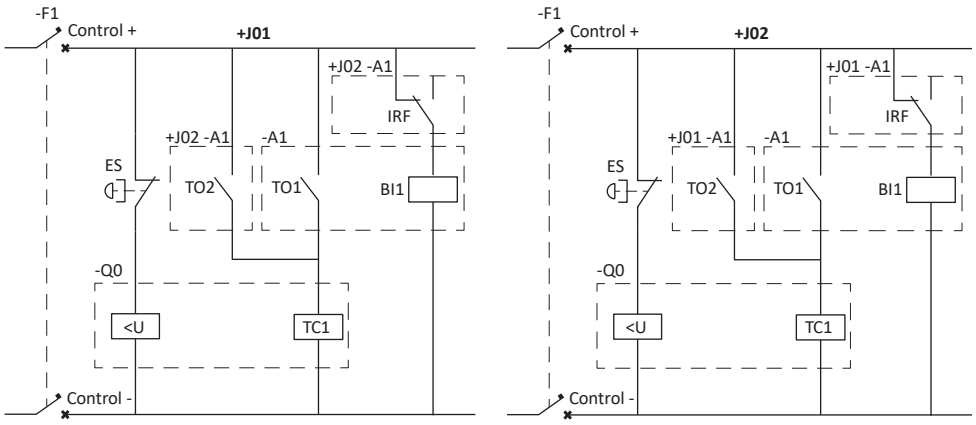

Figure 34: Motor feeder fail-safe trip circuit principle, example 4

J01	Feeder #1 panel
J02	Feeder #2 panel
ES	Emergency stop
Q0	Circuit breaker
TO1	Relay trip output #1
TO2	Relay trip output #2
IRF	Relay internal fault indication
BI1	Relay binary input #1
<U	CB undervoltage trip coil
TC1	CB trip coil 1
F1	Miniature circuit breaker

In example 4, the fail-safe approach aims at securing motor shutdown via an emergency switch and in case the control voltage disappears. The adjacent panels provide backup for each other in internal relay fault situations. In case of an internal relay fault, the situation is noticed by the relay in the adjacent panel and the circuit breaker in the panel with the faulty relay is tripped after a preset time delay. The additional time delay allows the relay to recover from the internal fault situation without tripping the circuit breaker.

3.3.4.2 Other critical feeders

The examples given for motor feeders can be applied for other types of feeders as well. The following examples are for critical feeders in which the protection system dependability, security or both are the drivers.

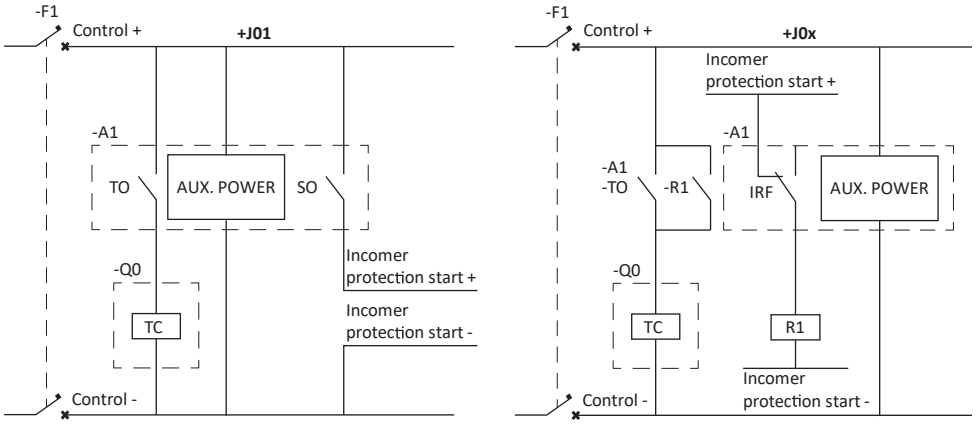

Figure 35: Redundant protection fail-safe principle, example 1

J01	Incomer feeder panel
J0x	Load feeder panels
Q0	Circuit breaker (CB)
TO	Relay trip output
SO	Relay start output
A1	Protection relay
R1	Auxiliary relay
TC	CB trip coil
F1	Miniature circuit breaker

In example 1, the fail-safe approach aims at securing circuit breaker tripping even if a relay fails. The incomer panel relay indicates the start of selected protection functions. This start signal is distributed to all load feeder panels. If a relay in the load feeder panel indicates an IRF status, the start signal of the incomer panel relay results in circuit breaker tripping. This approach offers basic protection for a load feeder while the actual protection relay performs a self-supervision controlled restart sequence.

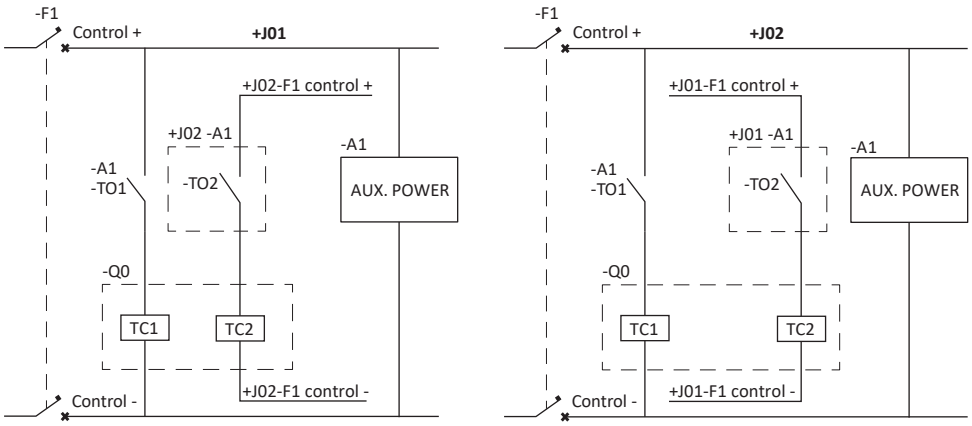

Figure 36: Redundant protection fail-safe principle, example 2

J01	Feeder #1 panel
J02	Feeder #2 panel
Q0	Circuit breaker (CB)
TO1	Relay trip output #1
TO2	Relay trip output #2
A1	Protection relay
TC1	CB trip coil 1
TC2	CB trip coil 2
F1	Miniature circuit breaker

In example 2, the fail-safe approach aims at securing circuit breaker tripping even if a relay fails. A relay in a panel measures also the adjacent panel's currents (and voltages) and receives the necessary primary device's position information. In other words, the relay in a panel functions as a backup relay for the adjacent panel. This approach allows service continuation while the failed relay is waiting for spare parts or a complete replacement. The backup protection features provided by the adjacent panel's relay do not necessarily fully match the features available in the main relay.

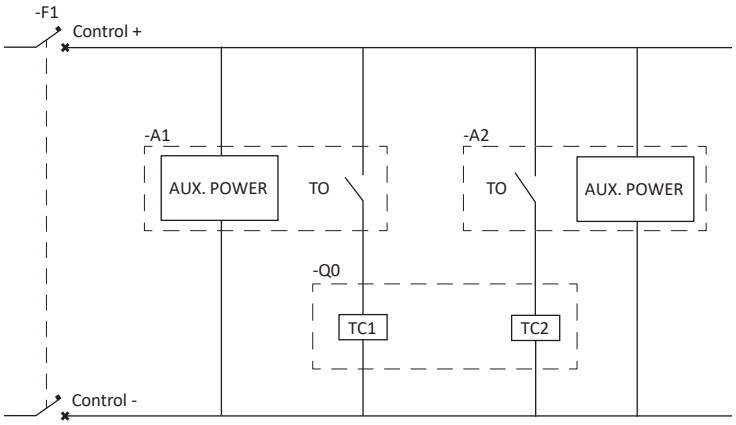

Figure 37: Redundant protection fail-safe principle, example 3

Q0	Circuit breaker (CB)
A1	Protection relay #1
A2	Protection relay #2
TO	Protection relay trip output
TC1	CB trip coil 1
TC2	CB trip coil 2
F1	Miniature circuit breaker

In example 3, the fail-safe approach aims at securing circuit breaker tripping even if one of the redundant relays fails. The scheme is often referred to as the 1-outof- 2 approach. This approach allows service continuation while the failed relay is waiting for spare parts or a complete replacement. The redundancy in this example covers relays and circuit breaker tripping coils but it can be expanded to auxiliary power supplies (two station batteries and isolated distribution), cabling, circuit breaker failure protection, and so on. Another variant of this approach is to have a main relay and a backup relay instead of two fully redundant relays. The backup relay does not

have all the features of the main relay, mainly containing a minimum acceptable set of protection functions.

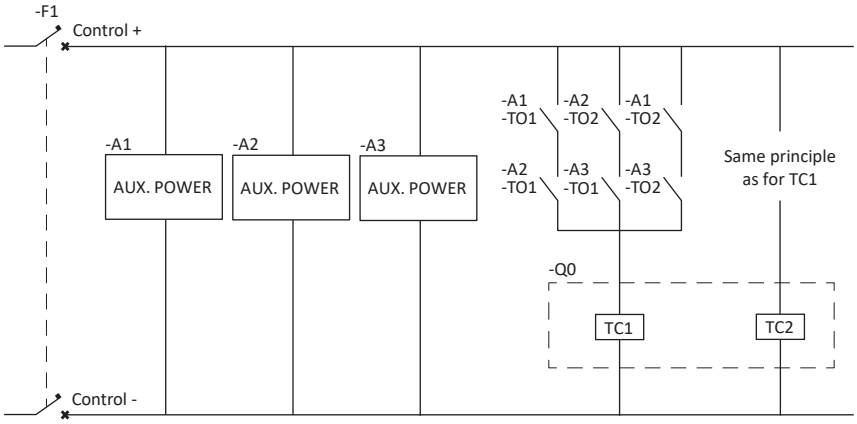

Figure 38: Redundant protection fail-safe principle, example 4

Q0	Circuit breaker (CB)
A1	Protection relay #1
A2	Protection relay #2
A3	Protection relay #3
TO#	Protection relay trip output
TC1	CB trip coil 1
TC2	CB trip coil 2
F1	Miniature circuit breaker

In example 4, the fail-safe approach aims at securing circuit breaker tripping even if one of the redundant relays fails and, in addition, no single relay alone can cause the circuit breaker tripping. The scheme is often referred to as the 2-out-of-3 approach. This approach allows service continuation while the failed relay is waiting for spare parts or a complete replacement. The redundancy in this example covers relays and circuit breaker tripping coils but it can be expanded to auxiliary power supplies (two station batteries and isolated distribution), cabling, circuit breaker failure protection, and so on. All three relays are similar with the same protection functions. This principle is used in cases where the primary process requires absolute dependability and security from the supplying feeder protection.

3.4 LED indication control LEDPTRC

3.4.1 Function block

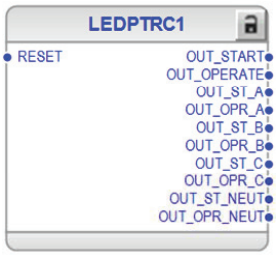

Figure 39: Function block

3.4.2 Functionality

The protection relay includes a global conditioning function LEDPTRC that is used to control the virtual Start and Trip indication LEDs.

LED indication control should never be used for tripping purposes. There is a separate trip logic function TRPPTRC available in the relay configuration.

LED indication control is preconfigured in a such way that all the protection function general start and operate signals are combined with this function (available as output signals `OUT_START` and `OUT_OPERATE`). These signals are internally connected to Device Status on WHMI Dashboard and the Device Status widget on the LHMI if the widget has been instantiated in the LHMI engineering phase. LEDPTRC collects and combines phase information from different protection functions (available as output signals `OUT_ST_A /_B /_C` and `OUT_OPR_A /_B /_C`). There is also combined earth fault information collected from all the earth-fault functions available in the relay configuration (available as output signals `OUT_ST_NEUT` and `OUT_OPR_NEUT`).

3.5 Individual virtual LED control LED

3.5.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE identification
Individual virtual LED control	LED	LED	LED

3.5.2 Function block

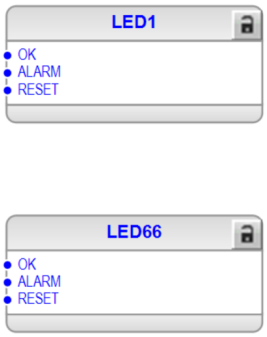

Figure 40: Function block

3.5.3 Functionality

The virtual, programmable LEDs are visible on the Programmable LEDs page in LHMI and on the WHMI dashboard.

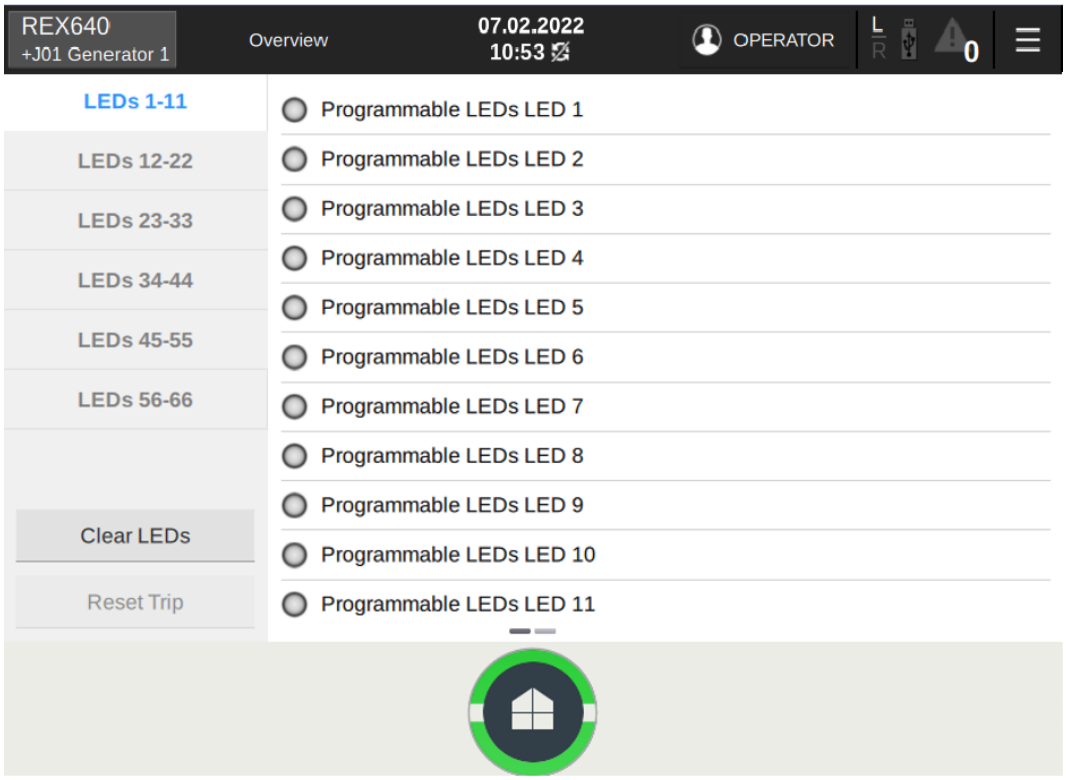

Figure 41: Programmable LEDs page in LHMI

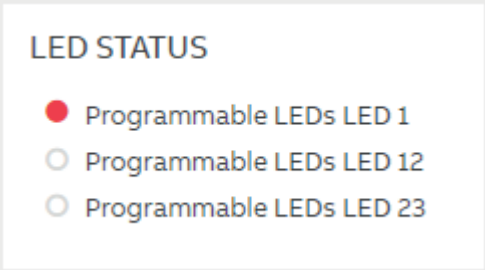

Figure 42: Programmable LEDs status in WHMI

Programmable LEDs are available only when at least one LED has been instantiated and the OK or ALARM signal is connected in Application Configuration in PCM600.

All the programmable LEDs on the protection relay's HMI have two colors, green and red. For each LED, the different colors are individually controllable.

Each LED has two control inputs, ALARM and OK. The color setting is common for all the LEDs. It is controlled with the *Alarm colour* setting, the default value being "Red". The OK input corresponds to the color that is available, with the default value being "Green".

Changing the *Alarm colour* setting to "Green" changes the color behavior of the OK inputs to red.

The ALARM input has a higher priority than the OK input. When a LED is in the alarming state, a bell symbol is shown on the LHMI next to the title of the Programmable LEDs page.

Each LED is seen in Application Configuration as an individual function block. Each LED has a user-editable description text for event description. The state ("None", "OK", "Alarm") of each LED can also be read under a common monitored data view for programmable LEDs.

The LED status also provides a means for resetting the individual LED via communication. The LED can also be reset from configuration with the RESET input.

The resetting and clearing function for all LEDs is available at the left side of the Programmable LEDs page and under the **Clear** menu.

The menu structure for the programmable LEDs is presented in *Figure 43*. The common color selection setting *Alarm colour* for all ALARM inputs is in the **General** menu, while the LED-specific settings are under the LED-specific menu nodes.

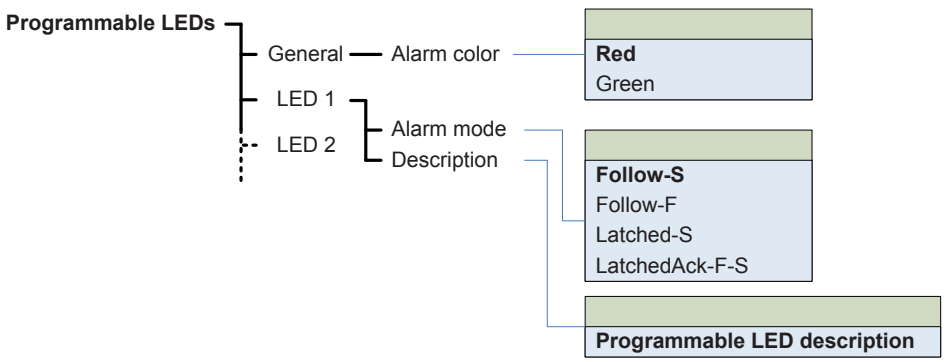

Figure 43: Menu structure

Alarm mode alternatives

The ALARM input behavior can be selected with the alarm mode settings from the alternatives "Follow-S", "Follow-F", "Latched-S" and "LatchedAck-F-S". The OK input behavior is always according to "Follow-S". The alarm input latched modes can be cleared with the reset input in the application logic.

Figure 44: Symbols used in the sequence diagrams

"Follow-S": Follow Signal, ON

In this mode ALARM follows the input signal value, Non-latched.

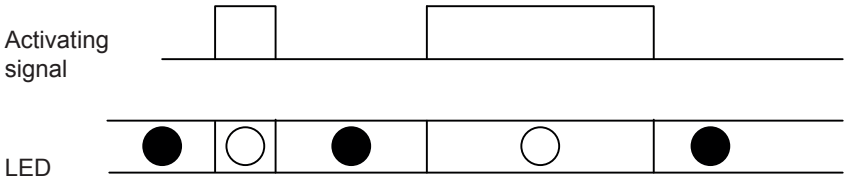

Figure 45: Operating sequence "Follow-S"

"Follow-F": Follow Signal, Flashing

Similar to "Follow-S", but instead the LED is flashing when the input is active, Non-latched.

"Latched-S": Latched, ON

This mode is a latched function. At the activation of the input signal, the alarm shows a steady light. After acknowledgement by the local operator pressing any key on the keypad, the alarm disappears.

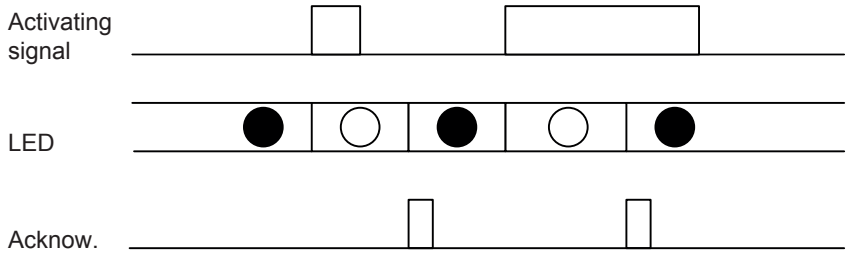

Figure 46: Operating sequence "Latched-S"

"LatchedAck-F-S": Latched, Flashing-ON

This mode is a latched function. At the activation of the input signal, the alarm starts flashing. After acknowledgement, the alarm disappears if the signal is not present and gives a steady light if the signal is present.

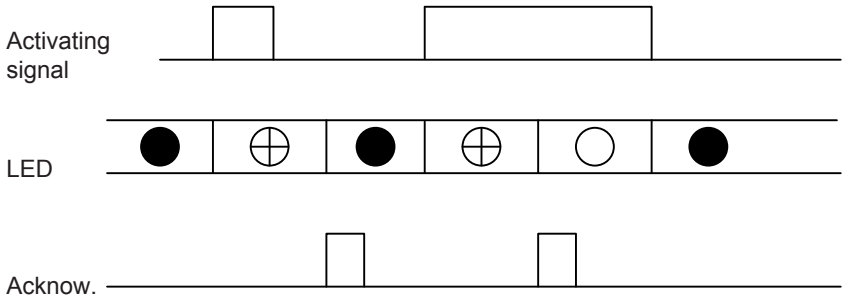

Figure 47: Operating sequence "LatchedAck-F-S"

3.5.4 Signals

3.6 Time synchronization

3.6.1 Time master supervision GNRLLTMS

3.6.1.1 Function block

Figure 48: Function block

3.6.1.2 Functionality

The protection relay has a disciplined RTC in hardware with a resolution of one nanosecond. The clock can be either free-running or synchronized to an external source. The RTC is used to time-stamp events, recorded data, disturbance recordings, sampled measured values and various other system services.

The protection relay supports SNTP, IRIG-B, IEEE 1588 v2, DNP3, Modbus, IEC 60870-5-101/104, IEC 60870-5-103 and line differential communication to synchronize the RTC. IEEE 1588 v2 with a GNSS grandmaster clock and IRIG-B provide the accuracy of ±1 µs. The accuracy is ±1 ms with SNTP.

Real-time clock at power off

During power off, the system time is kept in a separate capacitor-backed RTC. This RTC provides a millisecond resolution and digital temperature compensation for the crystal oscillator. Typical accuracy is 5 ppm which means the time may drift maximum 0.5 seconds per day. This RTC runs on a stored charge in a supercapacitor at least for 48 hours. After the capacitor has been discharged, the time is lost.

Real-time clock at power-up

At startup, the initial system time is recovered from the capacitor-backed RTC or set to 01-01-2010 if the RTC time was lost. The clock is free-running until the selected synchronization source becomes available. The first synchronization message sets the time to an accurate value and later synchronization messages additionally discipline the clock so that the time drift between synchronization messages is minimized. If the synchronization source is lost, the drift can be 0.25 ppm if the external clock source was a high-quality clock and the surrounding temperature is constant.

The setting *Synch source* determines the method for synchronizing the RTC. If it is set to "None", the clock is free-running and the settings *Date* and *Time* can be used to set the time manually. In this mode the typical accuracy is 5 ppm and the time may drift maximum 0.5 seconds per day.

Other setting values activate a communication protocol that provides the time synchronization. Only one synchronization method can be active at a time. Both IEEE 1588 v2 and SNTP provide time master backup functionality.

Connect at least one measurement channel in Application Configuration in PCM600 either from the hardware (AIM or SIM) or from SMVRCV to ensure that the time system works correctly.

Line differential communication

When using line differential communication between the protection relays, the time synchronization messages can be received from the other line end protection relay within the protection telegrams. The protection relay begins to synchronize its RTC with the remote end protection relay's time if the "Line differential" time synchronization source is selected. This does not affect the protection synchronization used in the line differential protection or the selection of the remote end protection relay's time synchronization method. It is expected that the remote end protection relay has another time synchronization source activated and therefore operates as a time gateway. Line differential time synchronization is available only for X6 port.

GNRLLTMS supervision functionality depends on the synchronization source. This means that the GNRLLTMS supervision signal values and their combinations have different meanings depending on the used synchronization source.

SNTP

The relay can use one of two SNTP servers, the primary or the secondary server. The primary server is mainly in use, whereas the secondary server is used if the primary server cannot be reached or a KoD response is received. While using the secondary SNTP server, the relay tries to switch back to the primary server on every third SNTP request attempt. If both SNTP servers are offline, event time stamps have the time invalid status.

If one SNTP server is used, it is recommended to set *IP SNTP secondary* as "0.0.0.0". This disables the server redundancy scheme and prevents the IED from attempting to access a non-existing secondary server.

The time is requested from the SNTP server every 60 seconds. Supported SNTP versions are 3 and 4. SNTP requires a high-performance server to meet the performance expectations.

IEEE 1588v2

The protection relay's 1588 precision time protocol synchronization complies with the IEEE C37.238-2011 and IEC 61850-9-3 profiles, which are interoperable with IEEE 1588 v2. The protection relay is an ordinary clock which can operate either in slave-only and slave or master mode. According to the supported profiles, the frame format used is IEEE 802.3 Ethernet frames with 0x88F7 Ethertype as the communication service and the delay mechanism is P2P. For both profiles, the TLVs required are included in the announce frame (IEEE C37.238-2011: Organization extension and Alternate time offset indicator TLVs, IEC 61850-9-3: Alternate time offset indicator TLV).

Time synchronization with IEEE 1588 v2 creates many possible scenarios since it is a dynamic synchronization method whereby the current master is determined with the BMC algorithm. GNRLLTMS outputs reflect this status. When IEEE 1588 v2 is used as a time synchronization source, the device stores the grandmasters in priority order according to the BMC algorithm. When the grandmaster clock is lost, an alarm and a warning are activated based on the stored grandmasters' list. The alarm is activated when there are no clocks with capabilities equivalent to primary or secondary grandmaster clocks. The warning is activated when a primary grandmaster clock is not available. The grandmaster list can be Section 3 1MRS759142 E Basic functions 132 REX640 Technical Manual cleared using the *Clear clock* list setting, for example, if the grandmaster clocks need to be replaced. The setting af-fects only the alarm and warning states.

If the current master is not within the 1 µs accuracy, `ALARM` is set to TRUE. If the current master is not the saved primary master, `WARNING` is set to TRUE. The `EXTCLKMSTR` output indicates if the ordinary clock is a slave to an external master.

Since the list is updated via the current primary master in the network, it is possible to lower the current grandmaster's priority to a point where another clock takes the role and the priority value in the list for the original master is no longer updated. This means that there is a discrepancy between the list and the device. Consequently, the GNRLLTMS warning status becomes TRUE as the saved primary master is no longer considered connected. The list logic can be reset to clear the clock list.

When IEEE 1588 v2 time synchronization is used, the recommended maximum num-ber of network hops from the grandmaster is 15 to ensure that the total inaccuracy stays within 1 µs. The grandmaster and each switch on the path must comply with the performance requirements set by the selected profile.

The protection relay is an ordinary clock which can operate either in slave-only and slave or master mode.

IRIG-B

IRIG-B time synchronization requires IRIG-B format B00x and IRIG-B time code extensions according to IEEE Std C37.118.1TM-2011. The extensions are defined by Annex D.

The synchronization time in IRIG-B can be either UTC time or local time. As no reboot is necessary, the time synchronization starts immediately after the IRIG-B synchronization source is selected and the IRIG-B signal source is connected. GNRLLTMS signals reflect the signal status from the IRIG-B master.

IRIG-B time synchronization requires a COM module with an `IRIG-B` input.

DNP3, Modbus, IEC 60870-5-101/104 and IEC 60870-5-103

For legacy protocols as synchronization source, a timeout can be set by *Time Syn Src Tmm* (minutes). This setting defines the maximum interval required by the protocol master sending the time synchronization commands. If a time synchronization command has not been received from the protocol master during this period, bad synchronization status is raised for the protection relay.

Legacy protocols as time synchronization sources do not offer the best accuracy. For better accuracy PTP, SNTP or IRIG-B time synchronization is recommended.

3.6.1.3 Signals

Table 50: GNRLLTMS Output signals

Name	Type	Description
ALARM	BOOLEAN	Alarm status for clock synchronization Always FALSE with *Synch source* set to "None".
WARNING	BOOLEAN	Warning status for clock synchronization Always FALSE with *Synch source* set to "None".
EXTCLKMSTR	BOOLEAN	Status of the protection relay's clock synchronization Always FALSE with *Synch source* set to "None".

Table 51: SNTP Output signals

Name	Type	Description
ALARM	BOOLEAN	Alarm status for clock synchronization TRUE if the connection to both primary and secondary SNTP servers has been lost. FALSE if the connection to the secondary SNTP server is detected.
WARNING	BOOLEAN	Warning status for clock synchronization TRUE if the connection to SNTP primary server has been lost. Otherwise FALSE.
EXTCLKMSTR	BOOLEAN	Status of the protection relay's clock synchronization. TRUE if the protection relay has been synchronized by an SNTP server.

Name	Type	Description
		FALSE if the clock has not been synchronized by an SNTP server.

Table 52: IEEE 1588v2 Output signals

Name	Type	Description
ALARM	BOOLEAN	Alarm status for clock synchronization. TRUE if the current master's accuracy is not within 1µs or priority1 is bigger than that of first secondary's. Also TRUE if the external master was lost and the protection relay itself acts as a master. Otherwise FALSE.
WARNING	BOOLEAN	Warning status for clock synchronization. TRUE if a previously connected and stored primary master has been lost. Otherwise FALSE.
EXTCLKMSTR	BOOLEAN	Status of the protection relay's clock synchronization. TRUE if the protection relay has been synchronized by an external master. FALSE if the clock has not been synchronized by an external master.

Table 53: IRIG-B Output signals

Name	Type	Description
ALARM	BOOLEAN	Alarm status for clock synchronization. TRUE if the signal has been lost for a minute. Otherwise FALSE.
WARNING	BOOLEAN	Warning status for clock synchronization. TRUE if the signal connection is lost. FALSE if the relay is synchronized to an IRIG-B master.
EXTCLKMSTR	BOOLEAN	Status of the protection relay's clock synchronization. TRUE if the protection relay has been synchronized to an IRIG-B master. Otherwise FALSE.

Table 54: DNP3, Modbus, IEC 60870-5-101/104 and IEC 60870-5-103 Output signals

Name	Type	Description
ALARM	BOOLEAN	Alarm status for clock synchronization. TRUE if the clock has not been synchronized by the master.

Table continues on the next page

Name	Type	Description
		FALSE if the clock has been synchronized by the master.
WARNING	BOOLEAN	Warning status for clock synchronization. TRUE if the clock has not been synchronized by the master. FALSE if the clock has been synchronized by the master.
EXTCLKMSTR	BOOLEAN	Status of the protection relay's clock synchronization. TRUE if the protection relay has been synchronized by an external master. FALSE if the clock has not been synchronized by an external master.

Table 55: Line differential Output signals

Name	Type	Description
ALARM	BOOLEAN	Alarm status for clock synchronization. TRUE if the LD connection has been lost.
WARNING	BOOLEAN	Warning status for clock synchronization. TRUE if the LD connection has been lost.
EXTCLKMSTR	BOOLEAN	Status of the protection relay's clock synchronization. TRUE if the clock has been synchronized to the LD partner.

3.7 Generic protection control PROTECTION

3.7.1 Function block

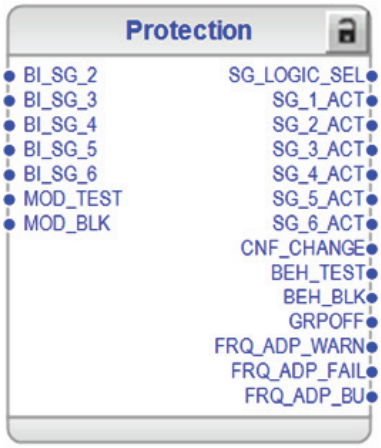

Figure 49: Function block

3.7.2 Functionality

3.7.2.1 Setting group control

The protection relay supports six setting groups. Each setting group contains parameters categorized as group settings inside application functions. The customer can change the active setting group at run time.

The active setting group can be changed by a parameter or via binary inputs depending on the mode selected with the **Configuration** > **Setting Group** > **SG operation mode** setting.

The default value of all inputs is FALSE, which makes it possible to use only the required number of inputs and leave the rest disconnected. The setting group selection is not dependent on the `SG_x_ACT` outputs.

Table 62: Optional operation modes for setting group selection

SG operation mode	Description
Operator (Default)	Setting group can be changed with the setting Settings/Setting group/Active group. Value of the SG_LOGIC_SEL output is FALSE.
Logic mode 1	Setting group can be changed with binary inputs (BI_SG_2...BI_SG_6). The highest TRUE binary input defines the active setting group. Value of the SG_LOGIC_SEL output is TRUE.
Logic mode 2	Setting group can be changed with binary inputs where BI_SG_4 is used for selecting setting groups 1–3 or 4–6. When binary input BI_SG_4 is FALSE, setting groups 1–3 are selected with binary inputs BI_SG_2 and BI_SG_3. When binary input BI_SG_4 is TRUE, setting groups 4–6 are selected with binary inputs BI_SG_5 and BI_SG_6. Value of the SG_LOGIC_SEL output is TRUE.

For example, six setting groups can be controlled with three binary inputs. *SG operation mode* is set to "Logic mode 2" and inputs BI_SG_2 and BI_SG_5 are connected together the same way as inputs BI_SG_3 and BI_SG_6.

Table 63: SG operation mode = "Logic mode 1"

Input					
BI_SG_2	**BI_SG_3**	**BI_SG_4**	**BI_SG_5**	**BI_SG_6**	**Active group**
FALSE	FALSE	FALSE	FALSE	FALSE	1
TRUE	FALSE	FALSE	FALSE	FALSE	2
any	TRUE	FALSE	FALSE	FALSE	3
any	any	TRUE	FALSE	FALSE	4
any	any	any	TRUE	FALSE	5
any	any	any	any	TRUE	6

Table 64: SG operation mode = "Logic mode 2"

Input					
BI_SG_2	**BI_SG_3**	**BI_SG_4**	**BI_SG_5**	**BI_SG_6**	**Active group**
FALSE	FALSE	FALSE	any	any	1
TRUE	FALSE	FALSE	any	any	2
any	TRUE	FALSE	any	any	3
any	any	TRUE	FALSE	FALSE	4
any	any	TRUE	TRUE	FALSE	5
any	any	TRUE	any	TRUE	6

Setting group 1 can be copied to any other or all groups from HMI (Copy group 1).

3.7.2.2 Test mode

The function has two outputs, BEH_TST and BEH_BLK, which are activated in test mode according to *Table 65*.

Table 65: Test mode

Test mode	Description	Protection BEH_BLK	Protection BEH_TST
Normal mode	Normal operation	FALSE	FALSE
IED blocked	Protection works as in “Normal mode” but the ACT configuration can be used to block physical outputs to process. Control function commands are blocked.	TRUE	FALSE
IED test	Protection works as in “Normal mode” but protection functions work in parallel with test parameters.	FALSE	TRUE
IED test and blocked	Protection works as in “Normal mode” but protection functions work in parallel with the test parameter. The ACT configuration can be used to block physical outputs to process. Control function command is blocked.	TRUE	TRUE

For more information, see the Test mode section in this manual.

3.7.2.3 Frequency adaptivity

The FRQ_ADP_WARN output is active when full adaptation to the actual frequency is not reached or guaranteed. The FRQ_ADP_FAIL output is active when no frequency source has sufficient amplitude and the nominal frequency window size is used in measurements. The FRQ_ADP_BU output is active when the backup adaptivity frequency source is active.

When switching from the main frequency source to the backup frequency source, there is an interval of 200 ms where the last known frequency is used to determine the measurement window size. During this period, FRQ_ADP_WARN is activated. This also happens when no frequency source has sufficient amplitude and the last frequency is held for 3 s before activating output FRQ_ADP_FAIL.

3.7.2.4 Special function block outputs

The function block has a few outputs dedicated for special purposes.

Table 66: Special function block outputs

Output	Description
CNF_CHANGE	Any setting change in the protection relay activates this output for a short period of time (100...200 ms).
GRPOFF	Some application function blocks do now allow unconnected analog inputs. In such a case, `GRPOFF` must be connected to such an input.
DEV_WARN	A protection relay's internal warning activates this output. For more information, see Warnings under the Self-supervision section.

3.7.3 Signals

Table 67: PROTECTION Input signals

Name	Type	Default	Description
BI_SG2	BOOLEAN	0	Setting group 2 is active
BI_SG3	BOOLEAN	0	Setting group 3 is active
BI_SG4	BOOLEAN	0	Setting group 4 is active
BI_SG5	BOOLEAN	0	Setting group 5 is active
BI_SG6	BOOLEAN	0	Setting group 6 is active
MOD_TEST	BOOLEAN	0	Activation of test mode
MOD_BLK	BOOLEAN	0	Block test mode

Table 68: PROTECTION Output signals

Name	Type	Description
SG_LOGIC_SEL	BOOLEAN	Logic selection for setting group
SG_1_ACT	BOOLEAN	Setting group 1 is active
SG_2_ACT	BOOLEAN	Setting group 2 is active
SG_3_ACT	BOOLEAN	Setting group 3 is active
SG_4_ACT	BOOLEAN	Setting group 4 is active
SG_5_ACT	BOOLEAN	Setting group 5 is active
SG_6_ACT	BOOLEAN	Setting group 6 is active
CNF_CHANGE	BOOLEAN	Active after any setting change
BEH_TEST	BOOLEAN	Logical device LD0 test status
BEH_BLK	BOOLEAN	Logical device LD0 block status

Table continues on the next page

Name	Type	Description
GRPOFF	Group signal	Group off signal for function blocks
DEV_WARN	BOOLEAN	Protection relay internal warning
FRQ_ADP_WARN	BOOLEAN	Frequency adaptivity warning
FRQ_ADP_FAIL	BOOLEAN	Frequency adaptivity status fail
FRQ_ADP_BU	BOOLEAN	Main frequency adaptivity source

3.7.4 Settings

Table 69: PROTECTION Settings

Parameter	Values (Range)	Unit	Step	Default	Description
SG operation mode	1=Operator 2=Logic mode 1 3=Logic mode 2			1=Operator	Operation mode for setting group change

3.8 Local/Remote control CONTROL

3.8.1 Function block

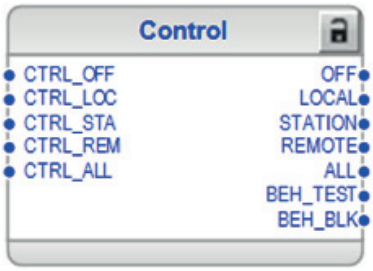

Figure 50: Function block

3.8.2 Functionality

Local/Remote control is by default realized through the R/L button on the front panel. The control via binary input can be enabled by setting the value of the *LR control* setting to "Binary input". The binary input control requires that the CONTROL function is instantiated in the product configuration.

Local/Remote control supports multilevel access for control operations in substations according to the IEC 61850 standard. Multilevel control access with separate station control access level is not supported by other protocols than IEC 61850.

The actual Local/Remote control state is evaluated by the priority scheme on the function block inputs. If more than one input is active, the input with the highest priority is selected. The priority order is “off”, “local”, “station”, “remote”, “all”.

The actual state is reflected on the CONTROL function outputs. Only one output is active at a time.

Table 70: Truth table for CONTROL

Input					Output
CTRL_OFF	**CTRL_LOC**	**CTRL_STA**	**CTRL_REM**	**CTRL_ALL**	
TRUE	N/A	N/A	N/A	N/A	OFF = TRUE
FALSE	TRUE	N/A	N/A	N/A	LOCAL = TRUE
FALSE	FALSE	TRUE	N/A	N/A	STATION = TRUE
FALSE	FALSE	FALSE	TRUE	TRUE	REMOTE = TRUE
FALSE	FALSE	FALSE	FALSE	TRUE	ALL = TRUE
FALSE	FALSE	FALSE	FALSE	FALSE	OFF = TRUE

3.8.3 L/R control access

Four different Local/Remote control access scenarios are possible depending on the selected station authority level: “L,R”, “L,R,L+R”, “L,S,R” and “L, S, S+R, L+S, L+S+R”. If control commands need to be allowed from multiple levels, multilevel access can be used. Multilevel access is possible only by using the station authority levels “L,R,L+R” and “L, S, S+R, L+S, L+S+R”. Multilevel access status is available from IEC 61850 data object CTRL.LLN0.MltLev.

Control access selection is made with R/L button or CONTROL function block and IEC 61850 data object CTRL.LLN0.LocSta. When writing CTRL.LLN0.LocSta IEC 61850 data object, IEC 61850 command originator category station must be used by the client, and remote IEC 61850 control access must be allowed by the relay station authority. CTRL.LLN0.LocSta data object value is retained in the nonvolatile memory. The present control status can be monitored in the HMI or PCM600 via **Monitoring** > **Control command** with the *LR state* parameter or from the IEC 61850 data object CTRL.LLN0. LocKeyHMI.

IEC 61850 command originator category is always set by the IEC 61850 client. The relay supports station and remote IEC 61850 command originator categories, depending on the selected station authority level.

3.8.4 Station authority level “L,R"

Relay default station authority level is “L,R”. In this scenario only local or remote control access is allowed. Control access with IEC61850 command originator category station is interpreted as remote access. There is no multilevel access

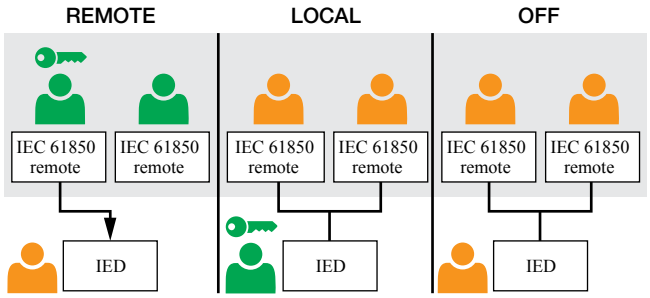

Figure 51: Station authority is "L,R"

When station authority level "L,R" is used, control access can be selected using R/L button or CONTROL function block. IEC 61850 data object CTRL.LLN0.LocSta and CONTROL function block inputs `CTRL_STA` and `CTRL_ALL` are not applicable for this station authority level.

Table 71: Station authority level "L,R" using R/L button

L/R control		L/R control status		Control access	
R/L button	**CTRL.LLN0.LocSta**	**CTRL.LLN0.MltLev**	**L/R state CTRL.LLN0.LocKey HMI**	**Local user**	**IEC 61850 client [1]**
Local	N/A	FALSE	1	x	
Remote	N/A	FALSE	2		x
Off	N/A	FALSE	0		

Table 72: Station authority "L,R" using CONTROL function block

L/R control		L/R control status		Control access	
Control FB input	**CTRL.LLN0.LocSta**	**CTRL.LLN0.MltLev**	**L/R state CTRL.LLN0.LocKey HMI**	**Local user**	**IEC 61850 client [2]**
CTRL_OFF	N/A	FALSE	0		
CTRL_LOC	N/A	FALSE	1	x	
CTRL_STA	N/A	FALSE	0		
CTRL_REM	N/A	FALSE	2		x
CTRL_ALL	N/A	FALSE	0		

[1] Client IEC 61850 command originator category check is not performed.
[2] Client IEC 61850 command originator category check is not performed.

3.8.5 Station authority level "L,R,L+R"

Station authority level "L,R, L+R" adds multilevel access support. Control access can also be simultaneously permitted from local or remote location. Simultaneous local or remote control operation is not allowed as one client and location at time can access controllable objects and they remain reserved until the previously started control operation is first completed by the client. Control access with IEC61850 originator category station is interpreted as remote access.

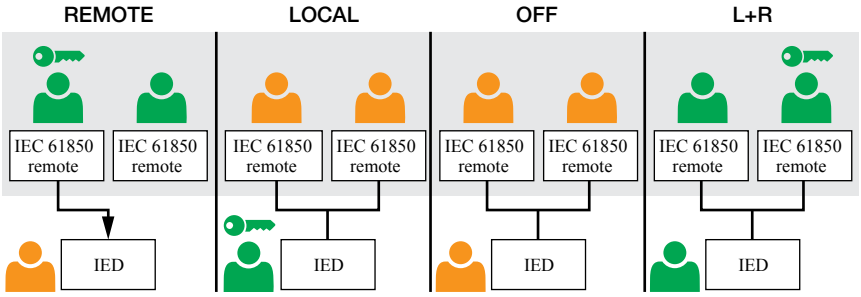

Figure 52: Station authority is "L,R,L+R"

When station authority level "L,R, L+R" is used, the control access can be selected using R/L button or CONTROL function block. IEC 61850 data object CTRL.LLN0.LocSta and CONTROL function block input `CTRL_STA` are not applicable for this station authority level.

Table 73: Station authority level "L,R,L+R" using R/L button

L/R Control		L/R Control status		Control access	
R/L button	**CTRL.LLN0.LocSta**	**CTRL.LLN0.MltLev**	**L/R state CTRL.LLN0.LocKey HMI**	**Local user**	**IEC 61850 client[1]**
Local	N/A	FALSE	1	x	
Remote	N/A	FALSE	2		x
Local + Remote	N/A	TRUE	4	x	x
Off	N/A	FALSE	0		

Table 74: Station authority "L,R,L+R" using CONTROL function block

L/R Control		L/R Control status		Control access	
Control FB input	**CTRL.LLN0.LocSta**	**CTRL.LLN0.MltLev**	**L/R state CTRL.LLN0.LocKey HMI**	**Local user**	**IEC 61850 client[2]**
CTRL_OFF	N/A	FALSE	0		
CTRL_LOC	N/A	FALSE	1	x	
CTRL_STA	N/A	FALSE	0		
CTRL_REM	N/A	FALSE	2		x
CTRL_ALL	N/A	TRUE	4	x	x

[1] Client IEC 61850 command originator category check is not performed.
[2] Client IEC 61850 command originator category check is not performed.

3.8.6 Station authority level "L,S,R"

Station authority level "L,S,R" adds station control access. In this level IEC 61850 command originator category validation is performed to distinguish control commands with IEC 61850 command originator category set to “Remote” or “Station”. There is no multilevel access.

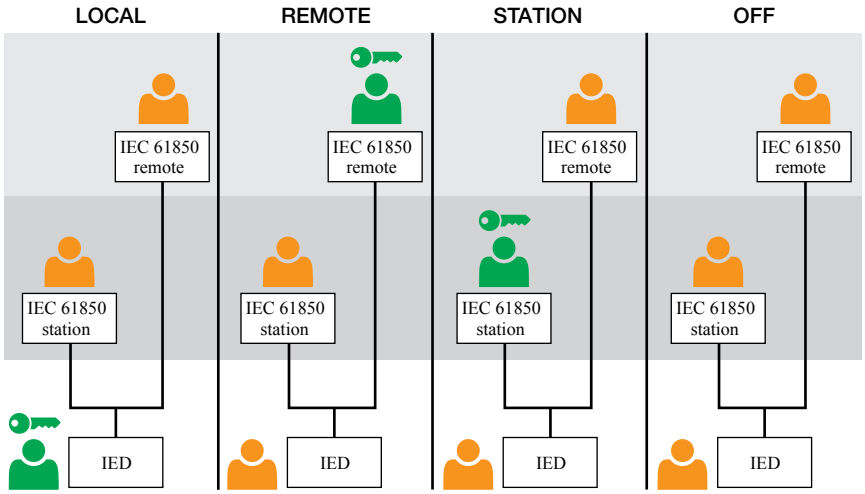

Figure 53: Station authority is “"L,S,R"

When the station authority level “L,S,R” is used, the control access can be selected using R/L button or CONTROL function block. IEC 61850 data object CTRL.LLN0.LocSta and CONTROL function block input `CTRL_STA` are applicable for this station authority level.

Station control access can be reserved by using R/L button or CONTROL function block together with IEC 61850 data object CTRL.LLN0.LocSta

Table 75: Station authority level “L,S,R” using R/L button

L/R Control		L/R Control status		Control access		
R/L button	**CTRL.LLN0.LocSta**[1]	**CTRL.LLN0.MltLev**	**L/R state CTRL.LLN0.LocKeyHMI**	**Local user**	**IEC 61850 client**[2]	**IEC 61850 client**[3]
Local	FALSE	FALSE	1	x		
Remote	FALSE	FALSE	2		x	
Remote	TRUE	FALSE	3			x
Off	FALSE	FALSE	0			

[1] Station client reserves the control operating by writing controllable point LocSta.
[2] Client IEC 61850 command originator category is remote.
[3] Client IEC 61850 command originator category is station.

Table 76: Station authority level “L,S,R” using CONTROL function block

L/R Control		L/R Control status		Control access		
R/L button	CTRL.LLN0.LocSta[4]	CTRL.LLN0.MltLev	L/R state CTRL.LLN0.LocKeyHMI	Local user	IEC 61850 client[5]	IEC 61850 client[6]
CTRL_OFF	FALSE	FALSE	0			
CTRL_LOC	FALSE	FALSE	1	x		
CTRL_STA	TRUE	FALSE	3			
CTRL_REM[7]	TRUE	FALSE	3			x
CTRL_REM	FALSE	FALSE	2		x	
CTRL_ALL	FALSE	FALSE	0			

3.8.7 Station authority level “L,S,S+R,L+S,L+S+R”

Station authority level "L,S,S+R,L+S,L+S+R" adds station control access together with several different multilevel access scenarios. Control access can also be simultaneously permitted from local, station or remote location. Simultaneous local, station or remote control operation is not allowed as one client and location at time can access controllable objects and they remain reserved until the previously started control operation is first completed by the client.

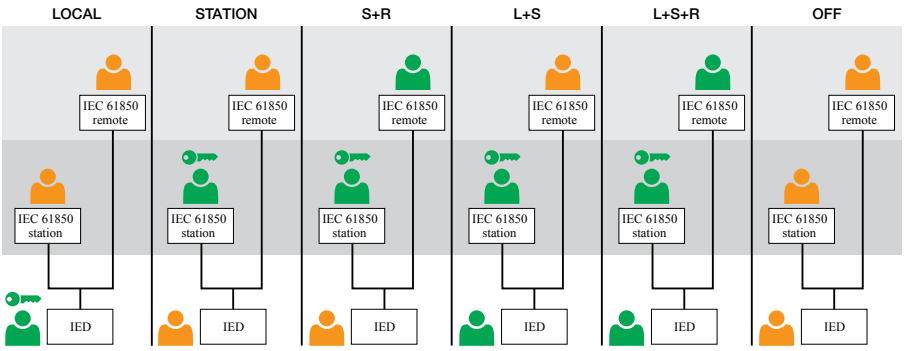

Figure 54: Station authority is “L,S,S+R,L+S,L+S+R”

When station authority level “L,S,S+R,L+S,L+S+R” is used, control access can be selected using R/L button or CONTROL function block. IEC 61850 data object CTRL.LLN0.LocSta and CONTROL function block input `CTRL_STA` are applicable for this station authority level.

“Station” and “Local + Station” control access can be reserved by using R/L button or CONTROL function block in combination with IEC 61850 data object CTRL.LLN0.LocSta.

4 Station client reserves the control operating by writing controllable point LocSta.
5 Client IEC 61850 command originator category is remote.
6 Client IEC 61850 command originator category is station.
7 CTRL_STA unconnected in application configuration. Station client reserves the control operating by writing controllable point LocSta.

Table 77: Station authority level "L,S,S+R,L+S,L+S+R" using R/L button

L/R Control		L/R Control status		Control access		
R/L button	CTRL.LLN0.LocSta[1]	CTRL.LLN0.MltLev	L/R state CTRL.LLN0.LocKeyHMI	Local user	IEC 61850 client[2]	IEC 61850 client[3]
Local	FALSE	FALSE	1	x		
Remote	FALSE	TRUE	7		x	x
Remote	TRUE	FALSE	3			x
Local + Remote	FALSE	TRUE	6	x	x	x
Local + Remote	TRUE	TRUE	5	x		x
Off	FALSE	FALSE	0			

Table 78: Station authority level "L,S,S+R,L+S,L+S+R" using CONTROL function block

L/R Control		L/R Control status		Control access		
R/L button	CTRL.LLN0.LocSta[4]	CTRL.LLN0.MltLev	L/R state CTRL.LLN0.LocKeyHMI	Local user	IEC 61850 client[5]	IEC 61850 client[6]
CTRL_OFF	FALSE	FALSE	0			
CTRL_LOC	FALSE	FALSE	1	x		
CTRL_STA	FALSE	FALSE	3			x

CTRL_REM	FALSE	TRUE	7		x	x
CTRL_ALL	FALSE	TRUE	6	x	x	x
CTRL_ALL [7]	TRUE	TRUE	5	x		x

3.8.8 Control mode

The function has two outputs BEH_TST and BEH_BLK which are activated in test mode according to *Table 79*.

Table 79: Control mode

Control mode	Description	Control BEH_BLK
On	Normal operation	FALSE
Blocked	Control function commands blocked	TRUE
Off	Control functions disabled	FALSE

For more information, see the Test mode chapter in this manual.

1 Station client reserves the control operating by writing controllable point LocSta.
2 Client IEC 61850 command originator category is remote.
3 Client IEC 61850 command originator category is station.
4 Station client reserves the control operating by writing controllable point LocSta.
5 Client IEC 61850 command originator category is remote.
6 Client IEC 61850 command originator category is station.
7 CTRL_STA unconnected in application configuration. Station client reserves the control operating by writing controllable point LocSta.

3.8.9 Signals

Table 80: CONTROL Input signals

Name	Type	Default	Description
CTRL_OFF	BOOLEAN	0	Control input OFF
CTRL_LOC	BOOLEAN	0	Control input Local
CTRL_STA	BOOLEAN	0	Control input Station
CTRL_REM	BOOLEAN	0	Control input Remote
CTRL_ALL	BOOLEAN	0	Control input All

Table 81: CONTROL Output signals

Name	Type	Description
OFF	BOOLEAN	Control output OFF
LOCAL	BOOLEAN	Control output Local
STATION	BOOLEAN	Control output Station
REMOTE	BOOLEAN	Control output Remote
ALL	BOOLEAN	Control output All
BEH_BLK	BOOLEAN	Logical device CTRL block status
BEH_TST	BOOLEAN	Logical device CTRL test status

3.8.10 Settings

Table 82: Non group settings

Parameter	Values (Range)	Unit	Step	Default	Description
LR control	1=LR key 2=Binary input			1=LR key	LR control through LR key or binary input
Station authority	1=L,R 2=L,S,R 3=L,R,L+R 4=L,S,S+R,L+S,L +S+R			1=L,R	Control command originator category usage
Control mode	1=On 2=Blocked 5=Off			1=On	Enabling and disabling control

3.8.11 Monitored data

Table 83: Monitored data

3.9 Fault recorder FLTRFRC (ANSI FR)

3.9.1 Function block

Figure 55: Function block

3.9.2 Functionality

The protection relay has the capacity to store the records of the latest 128 fault events. Fault records include fundamental or RMS current values. The records enable the user to analyze recent power system events. Each fault record (FLTRFRC) is marked with an up-counting fault number and a time stamp that is taken from the beginning of the fault.

The fault recording period begins from the start event of any protection function connected to the START input and ends if any protection function connected to the OPERATE input trips or the start is restored before the operate event. If a start is restored without an operate event, the start duration shows the protection function that has started first. The TRIG input can be used to start the fault recording period with, for example, binary input.

If *Start duration* has the value "100%", it indicates that a protection function has operated during the fault; if none of the protection functions has operated, *Start duration* always shows values less than 100%.

The fault recorded data *Protection* (rec. set 1 or rec. set 2) and *Start duration* are from the same protection function. The fault recorded data operate time shows the time of the actual fault period. This value is the time difference between the activation of the internal start and operate signals. The actual operate time also includes the starting time and the delay of the output relay. The fault recorded data Breaker clear time is the time difference between the internal operate signal and the activation of the CB_CLRD input.

If some functions in the relay application are sensitive to start frequently, it might be advisable to set the setting parameter Trig mode to "From operate". Then only faults that cause an operate event trigger a new fault recording.

The fault-related current, voltage, frequency, angle values, shot pointer and the active setting group number are taken from the moment of the operate event, or from the beginning of the fault if only a start event occurs during the fault. The maximum current value collects the maximum fault currents during the fault. If frequency cannot be measured, nominal frequency is used for frequency and zero for frequency gradient and validity is set accordingly.

The measuring mode for phase current and residual current values can be selected with the *A measurement mode* setting parameter.

For a detailed description of the measurement modes, see *Chapter 11.6 Measurement modes* in this manual.

3.9.3 Analog channel configuration

FLTRFRC has twelve analog group inputs which must be properly configured. All inputs can be connected to GRPOFF.

Table 84: Analog inputs

Input	Description
I3P1 [1]	Three-phase currents
I3P2 [1]	Three-phase currents
I3P3 [1]	Three-phase currents
IRES1 [1]	Residual current (measured or calculated)
IRES2 [1]	Residual current (measured or calculated)
IRES3 [1]	Residual current (measured or calculated)
U3P1 [1]	Three-phase voltages
U3P2 [1]	Three-phase voltages
U3P3 [1]	Three-phase voltages
URES1 [1]	Residual voltage (measured or calculated)
URES2 [1]	Residual voltage (measured or calculated)
URES3 [1]	Residual voltage (measured or calculated)

See the preprocessing function blocks in this document for the possible signal sources. The GRPOFF signal is available in the function block called Protection.

There are a few special conditions which must be noted with the configuration.

[1] Can be connected to GRPOFF

Table 85: Special conditions

Condition	Description
URES1 connected to the calculated residual voltage	The function requires that all three voltage channels are connected to UTVTR. Setting *VT connection* must be "Wye" in that particular UTVTR.
URES2 connected to the calculated residual voltage	The function requires that all three voltage channels are connected to UTVTR. Setting *VT connection* must be "Wye" in that particular UTVTR.
URES3 connected to the calculated residual voltage	The function requires that all three voltage channels are connected to UTVTR. Setting *VT connection* must be "Wye" in that particular UTVTR.

3.9.4 Signals

3.9.4.1 FLTRFRC Input signals

Table 86: FLTRFRC Input signals

Name	Type	Default	Description

The recorded differential and bias currents as well as the maximum differential and bias currents are provided by LNPLDF1, MPDIF1, TR2PTDF1 or TR3PTDF1. If the configuration contains more than one of these functions, only the currents from the function first found on the list are recorded.

3.10 Nonvolatile memory

The relay does not include any battery backup power. If the auxiliary power is lost, critical information such as relay configuration and settings, events, disturbance recordings and other critical data are saved to the relay's nonvolatile memory. The relay's real-time clock keeps running via a 48-hour capacitor backup.

- Up to 1024 events are stored. The stored events are visible in HMI and Event viewer tool in PCM600.
- Recorded data
  - Fault records (up to 128)
  - Maximum demands
- Circuit breaker condition monitoring
- Latched alarm and trip LEDs' statuses
- Trip circuit lockout
- Counter values

3.11 Analog measurement channels

The maximum number of physical analog measurement channels is 20. This can be achieved with two analog input modules. The protection relay also supports up to 16 SMV channels in four separate 9-2 streams. In addition to the local or 9-2 channels, a certain number of numerical channels is always calculated from physical measurements. This number also depends on the connection type of the TVTR function block.

Table 90: TVTR/TCTR connection types and numerical channels

Connection type	Function block	Physical channels	Numerical channels
ULx × 1	ULxTVTR	1	0
URES	ULxTVTR	1	0
ULx × 2 (Wye/Delta)	ULxTVTR	2	4
ULx × 2 + URES (Wye/Delta)	ULxTVTR	3	4
ULx × 3 (Delta)	ULxTVTR	3	3
ULx × 3 (Wye)	ULxTVTR	3	4
ILx × 3	ILxTCTR	3	1
IRES	RESxTCTR	1	0
ILx × 6	CMSUM	6	4

The maximum number of measurement channels is 64. This can be calculated by adding physical and numerical channels together.

In REX640 relays, the UTVTR functions automatically calculate missing signals if enough information is available. If measured Uo is needed for calculations but it is not provided, it is assumed to be zero. *Table 91* shows possible voltage connections and outcome of the UTVTR function. A three-phase current connection in the ILTCTR function always provides a calculated Io channel.

Table 91: Calculated voltages for different connection types

Voltage connection	Phase-to-phase voltages (Ph-Ph)	Phase-to-neutral voltages (Ph-n)	Residual voltage Uo
3 × ph-n	yes, calculated	yes	yes, calculated
3 × ph-n + Uo	yes, calculated	yes	yes
2 × ph-n	yes, calculated [1]	yes, missing ph-n calculated [1]	no
2 × ph-n + Uo	yes, calculated	yes, missing ph-n calculated	yes
3 × ph-ph	yes	yes, calculated [1]	no
3 × ph-ph + Uo	yes	yes, calculated	yes
2 × ph-ph	yes, missing ph-ph calculated	yes, calculated [1]	no
2 × ph-ph + Uo	yes, missing ph-ph calculated	yes, calculated	yes

3.12 Sensor inputs for currents and voltages

This chapter gives short examples on how to define the correct parameters for sensor measurement interfaces.

Sensors can have correction factors, measured and verified by the sensor manufacturer, to increase the measurement accuracy. Correction factors are recommended to be set to the relay. Two types of correction factors are available for voltage and current (Rogowski) sensors. The Amplitude correction factor is named *Amplitude corr. A(B/C)* and Angle correction factor is named *Angle corr A(B/C)*. These correction factors can be found on the Sensor's rating plate and/or sensor routine test protocol. If the correction factors are not available, contact the sensor manufacturer for more information.

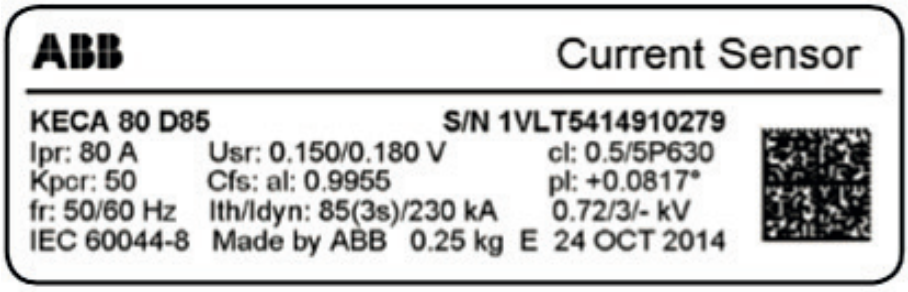

Figure 56: Example of ABB Rogowski current sensor KECA 80 D85 rating plate

Current (Rogowski) sensor setting example

In this example, an 80 A/0.150 V at 50 Hz (0.180 V at 60 Hz) sensor, such as the example shown in *Figure 56*, is used in a 50 Hz electrical network. The application has a 150 A nominal current (In) corresponding to the protected object's nominal current. The application nominal current is set to Rogowski

[1] Uo assumed zero.

sensor setting *Primary current*. Taken from the sensor's technical data, this example sensor can be used with up to 4000 A application nominal current. As the Rogowski sensor is linear and does not saturate, the 80 A/0.150 V at 50 Hz sensor also works as a 150 A/0.28125 V at 50 Hz sensor. When defining another primary value for the sensor, also the nominal voltage has to be redefined to maintain the same transformation ratio. However, the setting in the protection relay (*Rated Secondary Value*) is not in V but in mV/Hz, which makes the same setting *Rated Secondary Value* valid for both 50 and 60 Hz nominal frequency.

$$RSV = \frac{\frac{I_n}{I_{pr}} \times K_r}{f_n}$$

(Equation 1)

RSV	*Rated Secondary Value* in mV/Hz
I_n	Application nominal current
I_{pr}	Sensor-rated primary current
f_n	Network nominal frequency
K_r	Sensor-rated voltage at the rated current in mV

In this example, the value is as calculated using the equation.

$$\frac{\frac{150A}{80A} \times 150mV}{50Hz} = 5.625\frac{mV}{Hz}$$

(Equation 2)

With this information, the protection relay's current (Rogowski) sensor settings can be set.

Table 92: Example setting values for current (Rogowski) sensor

Setting	Value
Primary current	150 A
Rated secondary value	5.625 mV/Hz

When considering setting values for current sensor interfaces and for protection functions utilizing these measurements, it should be noted that the sensor measurement inputs in the relay have limits for linear behavior. When this limit is exceeded, the input starts to saturate. The saturation is reflected to the protection functions connected to the sensor inputs. To ensure that the related protection functions operate correctly, the start value setting for protection functions utilizing either instantaneous or definite minimum time characteristics must not exceed the linear measurement range. Furthermore, the effect on protection functions utilizing inverse time characteristics should be considered. The upper limit of the linear measurement range depends on the selected application nominal current and the type of the current sensor used. *Table 93* shows the limits for an 80A/150mV 50Hz sensor.

Table 93: Application nominal current relation to the upper limit of linear measurement range

Application nominal current (I_n)	Rated secondary value with 80A / 0.150 V at 50 Hz (0.180 V at 60 Hz)	Upper limit of linear measurement range
40...800 A	1.500...30.000 mV/Hz	60 × I_n
800...1250 A	30.000...46.875 mV/Hz	60...40 × I_n
1250...2500 A	46.875...93.750 mV/Hz	40...20 × I_n
2500...4000 A	93.750...150.000 mV/Hz	20...12.5 × I_n

Table 93 shows the upper limits of the linear measurement range based on a certain range in application nominal current. The linear measurement limit for a given application nominal current can be derived from the values stated in the table with a simple proportion equation. For example, the upper limit for linear measurement for 3000 A application nominal current would be 17.5 xIn.

It can also be calculated from *Table 93* that with the stated sensor the relay input can linearly measure up to 50 kA (RMS) short circuit currents.

Rogowski sensor and overcurrent protection setting evaluation example

A 20 kV utility substation with a single busbar switchgear rated up to 40 kA shortcircuit currents has one incomer and 20 outgoing feeder relays using 80 A/0.150 V at 50 Hz Rogowski current sensors with rating plate values similar to *Figure 56*. For the incomer panel, electrical system designer has evaluated the application nominal current to be 1250 A. Customer specification for these protection relays defines normal instantaneous and time-delayed overcurrent and earth-fault protection functions. Overcurrent protection requires functions to be settable up to 20 xIn.

The sensor setting *Primary current* is set to be the same as the evaluated application nominal current 1250 A. According to the sensor's technical data, the application nominal current matches the sensor's capability which is up to 4000 A.

The setting *Rated secondary value* is calculated by using *Equation 1*.

$$\frac{\frac{1250A}{80A} \cdot 150mV}{50Hz} = 46.875 \frac{mV}{Hz}$$

(Equation 3)

From *Table 93* it is seen that with the 1250 A application nominal current value, the maximum setting for overcurrent protection is 40 xIn. This covers the customer specification requirements for overcurrent settings of up to 20 xIn.

Voltage sensor setting example

The voltage sensor is based on the resistive divider or capacitive divider principle. Therefore, the voltage is linear throughout the whole measuring range. The output signal is a voltage, directly proportional to the primary

voltage. For the voltage sensor, all parameters are readable directly from its rating plate and/or sensor routine test protocol, and conversions are not needed.

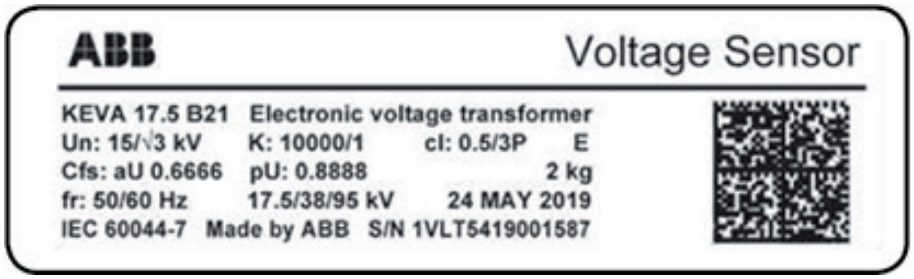

Figure 57: Example of ABB voltage sensor KEVA 17.5 B21 rating plate

In this example the system phase-to-phase voltage rating is 10 kV. Thus, the *Primary voltage* parameter is set to 10 kV. For protection relays with sensor measurement support, the *Voltage input type* is set to "Voltage sensor". The VT connection parameter is set to the "WYE" type. The division ratio for ABB voltage sensors is most often 10000:1. Thus, the *Division ratio* parameter is usually set to "10000". The primary voltage is proportionally divided by this division ratio.

Table 94: Example setting values for voltage sensor

Setting	Value
Primary voltage	10 kV
VT connection	Wye
Voltage input type	3=Voltage sensor
Division ratio	10000

3.13 Binary inputs

The binary inputs are mainly assembled in groups of three inputs that have one common connection. The binary inputs are bipolar so the common connection can be tied to ground or to supply voltage. Input groups are isolated from each other and from the secondary side. In addition, there can be groups with only one input. For more information, see *Chapter 13.1 Module diagrams* in this manual.

In harsh industrial environments binary inputs are exposed to contamination. This causes a thin film of insulating sulfidation, oxidation, or contaminates on the surface of the contacts. Film must be removed to establish circuit continuity. Binary inputs have an oxide-burn feature to create a high wetting current impulse to burn off oxidation layer when the threshold is reached. Input wetting current is reduced to a steady-state current when oxide-burn is completed.

In BIO1001 and BIO1003 modules oxide-burn feature can be disabled only on binary input 14 to use it as pulse counter input. The pulse counter input is enabled by setting the parameter *Input 14 counter-mode* in **Configuration** > **I/O modules** > **Slot #** > **Input filtering**. When enabled, the pulse counter input has dedicated *Input*

counter threshold voltage and *Input counter threshold hysteresis* settings. Oxide-burn feature cannot be disabled in BIO1002 & BIO1004.

In RTD1002 module wetting current can be adjusted by setting the parameter *Input oxide burn A* in **Configuration** > **I/O modules** > **Slot #** > **Input filtering**. This parameter is common for all binary inputs in the module.

3.13.1 Binary input threshold voltage

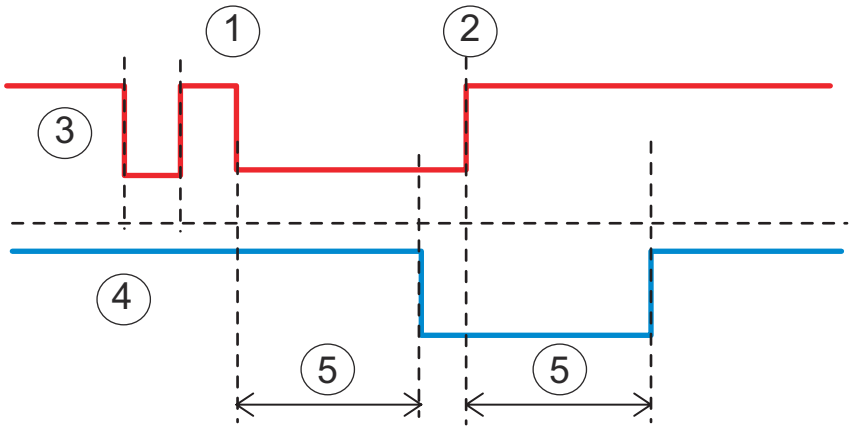
The parameter *Input threshold voltage* is used to set the threshold level of the binary inputs. *Input threshold voltage* determines the voltage level for the activation of the inputs. The threshold can be set for every module or slot specifically depending on the *Slot specific threshold* setting.

Table 95: Input threshold voltage parameters

Parameter	Values	Default
Slot specific threshold	0=False 1=True	0=False
Input threshold voltage	16…176 V	16 V

3.13.2 Threshold hysteresis

Threshold hysteresis is used to determine the deactivation threshold for the binary inputs in case of voltage drops in the auxiliary voltage supply. Threshold hysteresis value determines how low the deactivation voltage is compared to the activation voltage as a percentage. Hysteresis can be set for every module or slot specifically depending on the *Slot specific hysteresis* setting.



Binary inputs always deactivate when the voltage level drops below 14 V.

Table 96: Threshold hysteresis parameters

Parameter	Values	Default
Slot specific hysteresis	0=False 1=True	0=False
Input threshold hysteresis	10…50 %	10 %

3.13.3 Binary input filter time

The filter time eliminates debounces and short disturbances on a binary input. The filter time is set for each binary input of the protection relay.

1 t_0
2 t_1
3 Input signal
4 Filtered input signal
5 Filter time

Figure 58: Binary input filtering

At the beginning, the input signal is at the high state, the short low state is filtered and no input state change is detected. The low state starting from the time t_0 exceeds the filter time, which means that the change in the input state is detected and the time tag attached to the input change is t_0. The high state starting from t_1 is detected and the time tag t_1 is attached.

Each binary input has a filter time parameter *"Input # filter"*, where # is the number of the binary input of the module in question (for example *"Input 1 filter"*).

Table 97: Input filter parameter values

Parameter	Values	Default
Input # filter time	5...1000 ms	5 ms

3.13.4 Binary input inversion

The parameter *Input # invert* is used to invert a binary input.

Table 98: Binary input states

Control voltage	Input # invert	State of binary input
No	0	FALSE (0)
Yes	0	TRUE (1)
No	1	TRUE (1)
Yes	1	FALSE (0)

When a binary input is inverted, the state of the input is TRUE (1) when no control voltage is applied to its terminals. Accordingly, the input state is FALSE (0) when a control voltage is applied to the terminals of the binary input.

3.13.5 Oscillation suppression

Oscillation suppression is used to reduce the load from the system when a binary input starts oscillating. A binary input is regarded as oscillating if the number of valid state changes (= number of events after filtering) during one second is equal to or greater than the set oscillation level value. During oscillation, the binary input is blocked (the status is invalid) and an event is generated. The state of the input will not change when it is blocked, that is, its state depends on the condition before blocking.

The binary input is regarded as non-oscillating if the number of valid state changes during one second is less than the set oscillation level value minus the set oscillation hysteresis value. Note that the oscillation hysteresis must be set lower than the oscillation level to enable the input to be restored from oscillation. When the input returns to a non-oscillating state, the binary input is deblocked (the status is valid) and an event is generated.

Table 99: Oscillation parameters

Parameter	Value	Default
Input osc. level	2...50 events/s	30 events/s
Input osc. hyst	2...50 events/s	10 events/s

3.14 Binary outputs

The protection relay provides a number of binary outputs used for tripping, executing local or remote control actions of a breaker or a disconnector, and for connecting the protection relay to external annunciation equipment for indicating, signalling and recording.

Power output contacts are used when the current rating requirements of the contacts are high, for example, for controlling a breaker, such as energizing the breaker trip and closing coils.

The contacts used for external signalling, recording and indicating, the signal outputs, need to adjust to smaller currents, but they can require a minimum current (burden) to ensure a guaranteed operation.

The protection relay provides both power output and signal output contacts. To guarantee proper operation, the type of the contacts used are chosen based on the operating and reset time, continuous current rating, make and carry for short time, breaking rate and minimum connected burden. A combination of series or parallel contacts can also be used for special applications. When appropriate, a signal output can also be used to energize an external trip relay, which in turn can be confiugred to energize the breaker trip or close coils.

Using an external trip relay can require an external trip circuit supervision relay. It can also require wiring a separate trip relay contact back to the protection relay for breaker failure protection function.

All contacts are freely programmable, except the internal fault output IRF.

3.14.1 Power output contacts

Power output contacts are normally used for energizing the breaker closing coil and trip coil, external high burden lockout or trip relays.

3.14.1.1 Dual single-pole power outputs POSP1 and POSP2

Dual (series-connected) single-pole (normally open/form A) power output contacts POSP1 and POSP2 are rated for continuous current of 8 A. The contacts are normally used for closing circuit breakers and energizing high burden trip relays. They can be arranged to trip the circuit breakers when the trip circuit supervision is not available or when external trip circuit supervision relay is provided.

The power outputs are included in the power supply module in slot G.

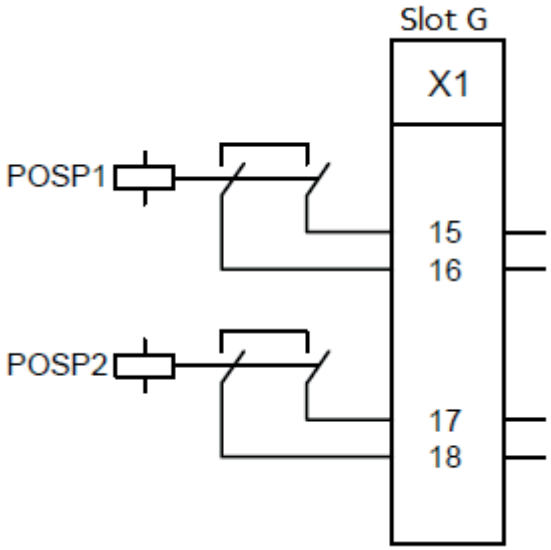


Figure 59: Dual single-pole power outputs in power supply module

3.14.1.2 Double-pole power outputs PODP1, PODP2 and PODP3 with trip circuit supervision

The power outputs PODP1, PODP2 and PODP3 are double-pole normally open/form A power outputs with trip circuit supervision. The trip circuit supervision hardware includes constant current generator to provide trip circuit supervision (TCS) current and TCS input that can be connected to the TCS function with Application Configuration in PCM600. See Trip circuit supervision TCSSCBR function for TCS connections.

When the two poles of the contacts are connected in series, they have the same technical specification as POSP1/POSP2 for breaking duty. Contacts PODP1, PODP2 and PODP3 are usually used for energizing the breaker trip coils.

The power outputs are included in the power supply module in slot G.

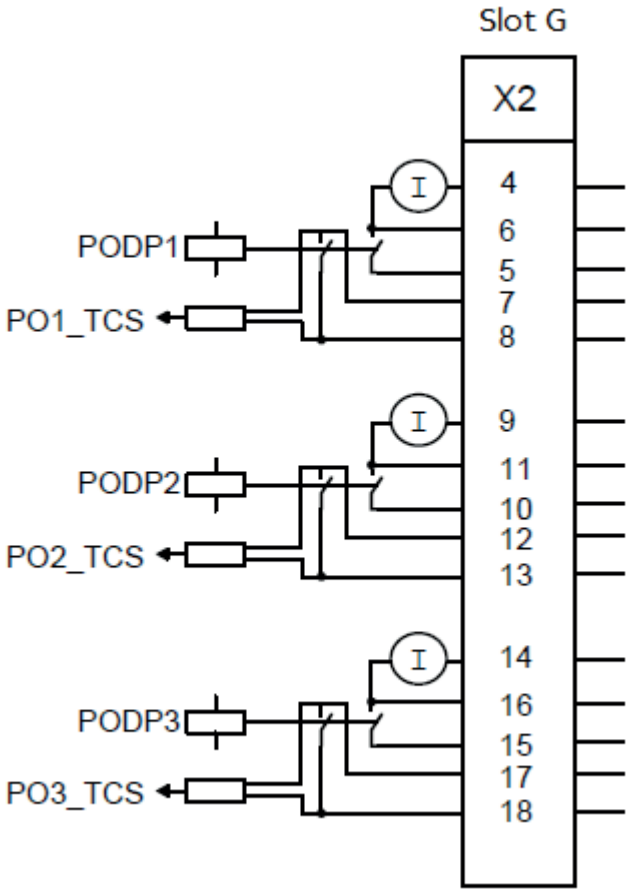

Figure 60: Double-pole power outputs with trip circuit supervision in power supply module

3.14.1.3 Static power outputs SPO1...SPO8

The outputs are normally used in applications that require fast relay output contact activation time to achieve fast opening of a breaker, such as, arc-protection or breaker failure protection, where fast operation is required either to minimize fault effects to the equipment or to avoid a fault to expand to a larger area. With the static power outputs, the total time from the application to the relay output contact activation is 4...6 ms shorter than when using output contacts with conventional mechanical output relays.

SPO5 and SPO7 are equipped with constant current generator to provide trip circuit supervision (TCS) current. SPO6 and SPO8 are equipped with TCS input that can be connected to the TCS function with Application Configuration in PCM600. See Trip circuit supervision TCSSCBR function for TCS connections.

The static power outputs are included in BIO1002 and BIO1004 modules.

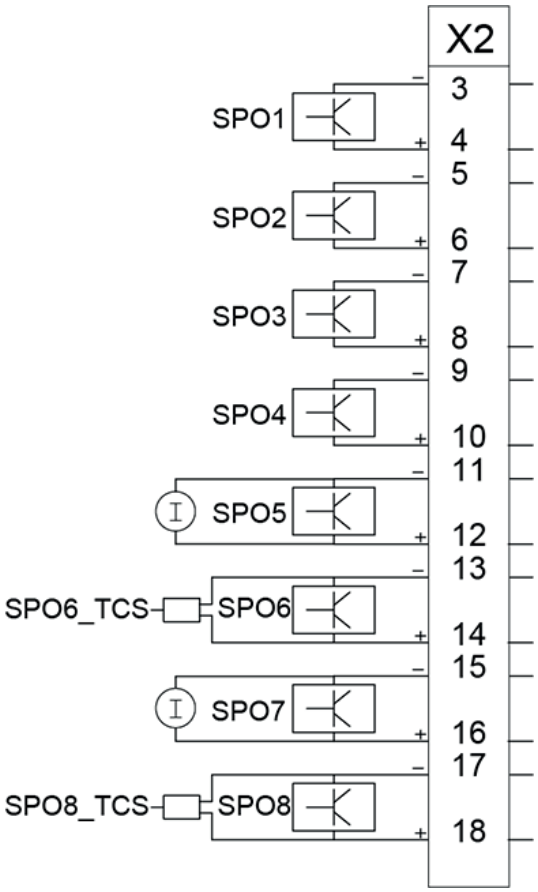

Figure 61: Static power outputs SPO1...SPO8

3.14.2 Signal output contacts

Signal output contacts are single-pole, single (normally open/form A or change-over/form C) signal output contacts (SO1, SO2,...) or parallel connected dual contacts.

The signal output contacts are used for energizing, for example, external low burden trip relays, auxiliary relays, annunciators and LEDs.

A single signal contact is rated for a continuous current of 5 A. It has a make and carry for 0.5 seconds at 15 A.

When two contacts are connected in parallel, the relay is of a different design. It has the make and carry rating of 30 A for 0.5 seconds. This can be applied for energizing breaker close coil and tripping coil. Due to the limited breaking capacity, a breaker auxiliary contact can be required to break the circuit.

Static signal outputs (SSO1, SSO2) are light-duty fast binary signal outputs and can also be used as pulse outputs.

Figure 62: Signal outputs in power supply module

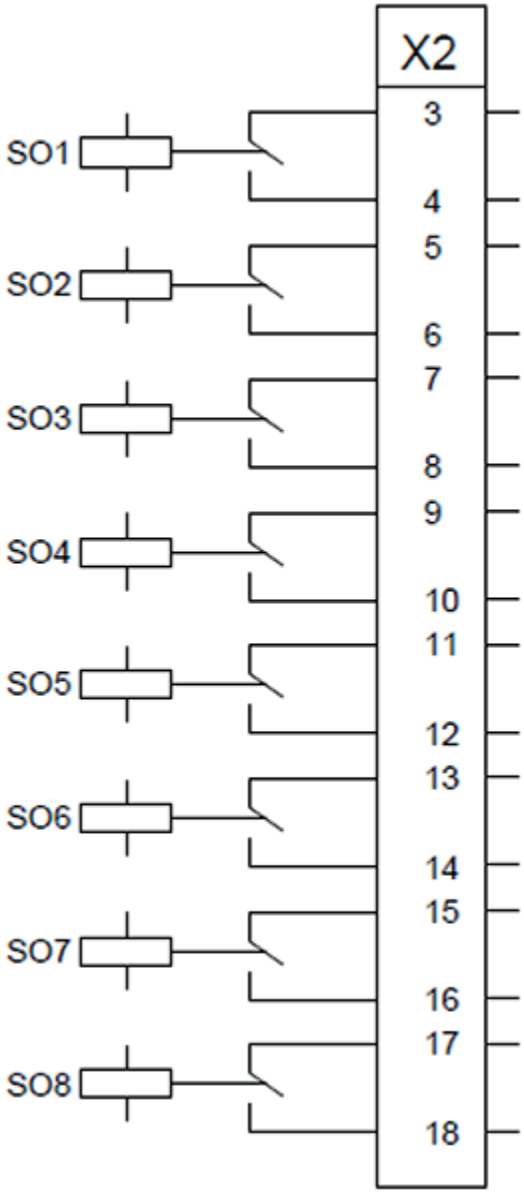

Figure 63: Signal outputs in BIO1001 and BIO1003 modules

3.14.2.1 Internal fault signal output IRF

The internal fault signal output (change-over/form C) IRF is a single contact included in the power supply module of the protection relay in slot G.

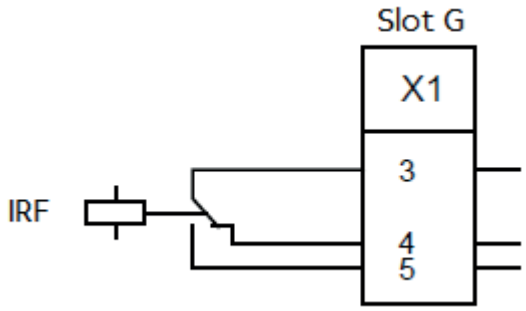

Figure 64: Internal fault signal output IRF

3.15 RTD/mA inputs/mA outputs

3.15.1 Function blocks

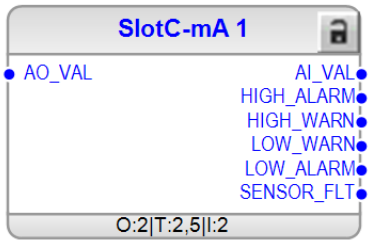

Figure 65: Function block for mA channel

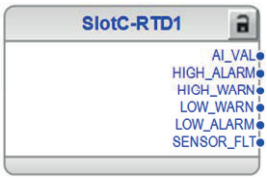

Figure 66: Function block for RTD channel

3.15.2 Functionality

The Slot#-mA#/RTD# function is an interface function between the relay's mA/RTD hardware channels. The function is split into separate function blocks for each hardware channel.

The mA function block works as an interface for the mA current channel. The channel can be defined either as a measuring input or a controllable output.

The RTD function block works as an interface for the RTD measuring channel that supports various types of RTD sensors.

Both function blocks have limit supervision alarm outputs and an output for sensor fault.

3.15.3 Operation principle

The operation of Slot#-mA#/RTD# can be described with a module diagram that illustrates a single input-output combination of the actual function block. All the modules in the diagram are explained in the next sections.

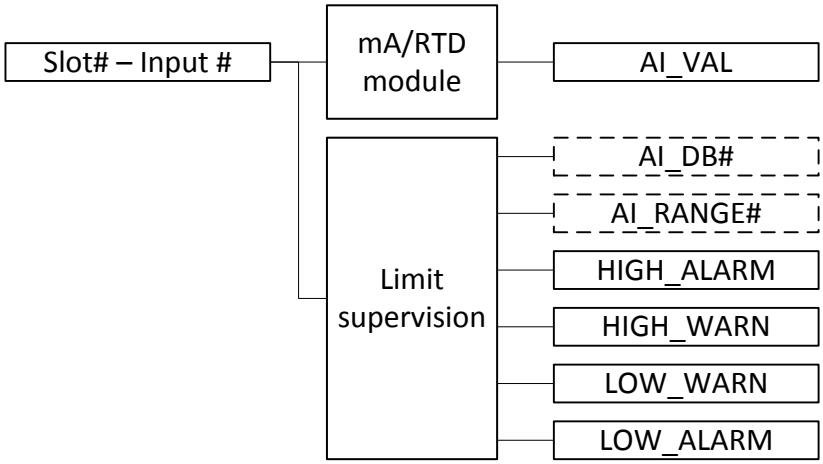

Figure 67: Functional module diagram for input mode

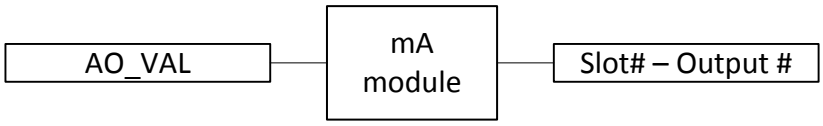

Figure 68: Functional module diagram for output mode

mA modules

mA current channels are used for input current measurement or output current control in the range of -20…20 mA (DC current). The channels are configured for particular input or output signal types by using channel-specific settings. When Input 1 is activated with setting "-20…20mA", the Output 1 mode is blocked. If Output 2 mode is activated with setting "-20…20mA", the Input 2 mode is blocked. When a channel is configured as an output, the alarm outputs are deactivated.

RTD modules

RTD channels are used for resistance measurements and they are only input channels. The inputs are configured for a particular input signal type by using the channel-specific *Input mode* setting. The default mode for each channel is "Not in use" which means that the channel is not sampled and the output value quality is set accordingly.

All the channels are independent mA/RTD channels with separated protection, filtering, reference, A/D-conversion and isolation. Thus, the RTD group is isolated from mA channels.

The RTD inputs measure resistance in the range of 0...4000 Ω. All inputs are calibrated and the calibration factors are stored on the module in nonvolatile memory. The calibration circuitry monitors the RTD channels continuously and reports the circuitry break of any channel.

The RTD inputs have separate setting values for value update interval. The settings are: "No delay", "10 ms delay", "50 ms delay" and "100 ms delay". Between the update intervals the RTD input constantly returns the last valid value before updating to the new value after the interval time expires.

3.15.3.1 Input mode

Table 100: Analog input modes for the mA inputs

Input mode	Description
Not in use	Default selection when the corresponding input is not used.
–20...20 mA	The analog input covers the range of –20...20 mA. The input can be used in a narrower range by setting *Input minimum* and *Input maximum*. Settings *Value minimum* and *Value maximum* are used to scale the output within the appropriate range. The output unit is selected with the set *Value unit*.

Table 101: Analog input modes for the RTD inputs

Input mode	Description
Not in use	Default selection when the corresponding input is not used.
Resistance	Freely settable resistance input. *Input minimum* and *Input maximum* define the resistive input range. The corresponding output can be scaled based on *Value minimum* and *Value maximum*. The output unit is selected with the set *Value unit*.
Pt 100	The input is expected to be the selected temperature sensor. The set *Value unit* should be set to degrees Celsius. The expected input range is –40...200°C. However, the output can be scaled to a narrower output range by setting *Value minimum* and *Value maximum*.
Pt 250	
Ni 100	
Ni 120	
Ni 250	

Selection of value unit format

Each input has an independent *Value unit* setting that is used to select the unit for the channel value representation. The default value for the *Value unit* setting is "Dimensionless". The *Input minimum*, *Input maximum*, *Value maximum* and *Value minimum* settings have to be adjusted according to the input channel and if *Value unit* is changed.

When the RTD channel input is used for the temperature sensor type, the *Value unit* setting needs to be changed to "Degrees Celsius". When *Value unit* is set to "Degrees Celsius", linear scaling is not applied but the default range (–40…200°C) can be decreased with the *Value maximum* and *Value minimum* settings.

When the DC milliampere signal is connected to the mA channel and the application requires a linear scaling of the input range, the *Value unit* setting value has to be set to "Dimensionless" so that the input range can be linearly scaled with the settings Input minimum and Input maximum to *Value minimum* and *Value maximum*. When milliampere is used as a value unit, *Value unit* has to be "Ampere". When *Value unit* is set to "Ampere", the default range (–20…20 mA) can be decreased with the *Value maximum* and *Value minimum* settings.

When a resistance type signal is connected to the RTD channel and the application requires a linear scaling of the input range, the *Value unit* setting value has to be set to "Dimensionless" so that the input range can be linearly scaled with the settings *Input minimum* and *Input maximum* to *Value minimum* and *Value maximum*. When resistance is used as a value unit, *Value unit* has to be "Ohm". When *Value unit* is set to "Ohm", the default range (0...4000 Ω) can be decreased with the *Value maximum* and *Value minimum* settings.

RTD temperature vs. resistance

The resistance values of temperature sensors at specified temperatures are given in *Table 102*.

Table 102: Temperature vs. resistance

Temp °C	Platinum TCR 0.00385		Nickel TCR 0.00618		
	Pt 100	Pt 250	Ni 100	Ni 120	Ni 250
–40	84.28	210.70	79.13	94.96	197.83
–30	88.22	220.56	84.15	100.97	210.36

200	175.86	439.64	240.66	288.79	601.65

Self-supervision

Each input contains functionality to monitor the input measurement chain. The circuitry monitors the RTD channels continuously and reports a circuitry break of any enabled input channel. If the measured input value is outside the limits, the minimum/maximum value is shown in the corresponding output. The quality of the corresponding output is set accordingly, and the fault is reported at SENSOR_FLT to indicate misbehavior in the mA/RTD input.

Table 103: Limits for the mA/RTD inputs

mA/RTD input	Limit value
RTD temperature, high	> 200°C
RTD temperature, low	< –40°C
mA current, high	> 24 mA
mA current, low	< –24 mA
Resistance, high	> 4000 Ω
Resistance, low	Not defined [1]

When necessary, the valid measuring range may be narrower than the default of the selected measuring range. A narrower range can be defined with the *Value minimum* and *Value maximum* settings.

RTD input supervision

RTD sensor currents are measured continuously at a fixed rate. The delay between the RTD current/connectivity checks is about 10s at a maximum (if all 10 RTD channels are active). If the RTD current is not within ±5% of the expected current, the measurement is considered to be invalid, and the channel is discarded until a valid current is obtained.

The expected currents are 1 mA for RTD sensors and 0.21 mA for pure resistance. While the quality of the invalid input is set accordingly, a warning is also provided on the **Relay Status** page of LHMI/WHMI. The invalid signal is deactivated as soon as the corresponding input signal is within the valid range.

Delay for SENSOR_FLT activation depends on the connected sensor type, amount of connected channels and RTD module type. The maximum delay is 10 seconds.

mA input supervision

The current limit for mA input supervision is defined by parameter *Sensor fault level*. Value must be below *Input minimum* parameter. SENSOR_FLT is activated, and measurement quality is set bad when measured current is below set limit. The supervision is disabled if *Sensor fault level* is set to 0 mA.

3.15.3.2 Output mode

A measurement value from another function, mA input or RTD input can be represented by the mA output. The mA output scaling principle is otherwise similar

[1] Low limit is not defined for the resistance input. In practice the low limit is 0 because the resistance cannot be negative.

to the input scaling but there is also a possibility to use up to four different knee points. To be able to cover a wide range of input units, the input settings used for scaling are dimensionless. The output range of the mA output is selected with parameters *Value maximum* and *Value minimum* and the selected number of knee points with parameter *Num of knee points*. Depending on the amount of *Num of knee points*, the knee point settings *Input knee point 1-4* and *Value knee point 1-4* are visible.

Table 104: Analog output modes for the mA outputs

Output mode	Description
Not in use	Default selection when the corresponding output is not used.
–20...20 mA	Analog output can operate in the range of –20...20 mA. The output can be used in a narrower range by setting *Value minimum* and *Value maximum*.

3.15.4 Application

The general function block can be used in REX640 relays that are equipped with an RTD/analog module.

The function can be applied to various applications, for example, to measure temperature, pressure or flow.

3.15.4.1 Input scaling

Each mA/RTD input can be scaled linearly by constructing a separate scaling curve for each input. The curve consists of two points where the x-axis of the curve illustrates a range selected for the input and the y-axis is the scaled absolute value of the input. The input scaling is enabled only when mA or resistance input is used.

When the scaling is enabled, the settings *Value maximum* and *Value minimum* affect the scaled range. The range of the scaled input is defined with the settings *Input minimum* and *Input maximum*.

Scaling example 1

The function is used with a Pt100 temperature sensor. Predefined scaling can be selected when *Input mode* is set to "Pt100".

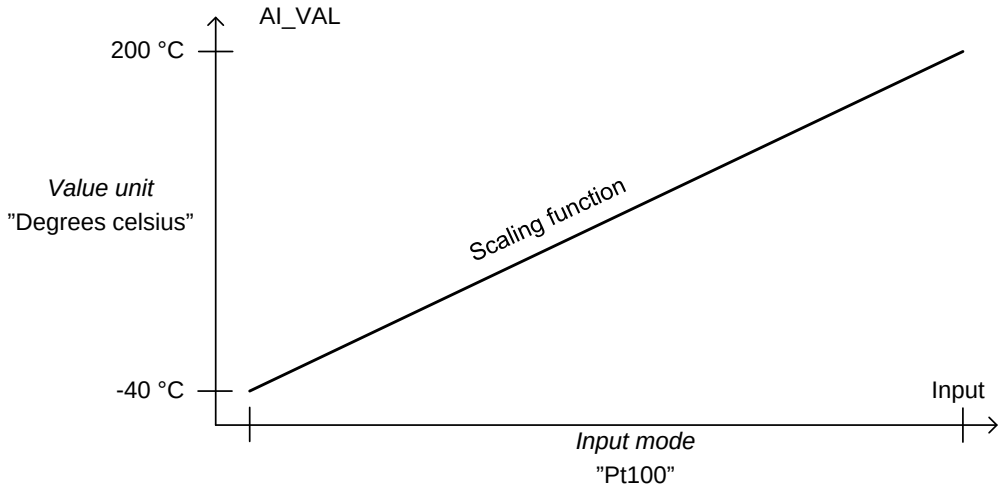

Figure 69: Pt100 scaling function

Scaling example 2

Input mode is set to –20...20 mA that is used for tap position information fed from the tap changer. The tap positions are between –36...36. Thus, the scaling setting *Value minimum* is set to "–36" and *Value maximum* is set to "36". These settings apply the input scaling to the output. In the tap position case, the *Value unit* should be set to "Dimensionless".

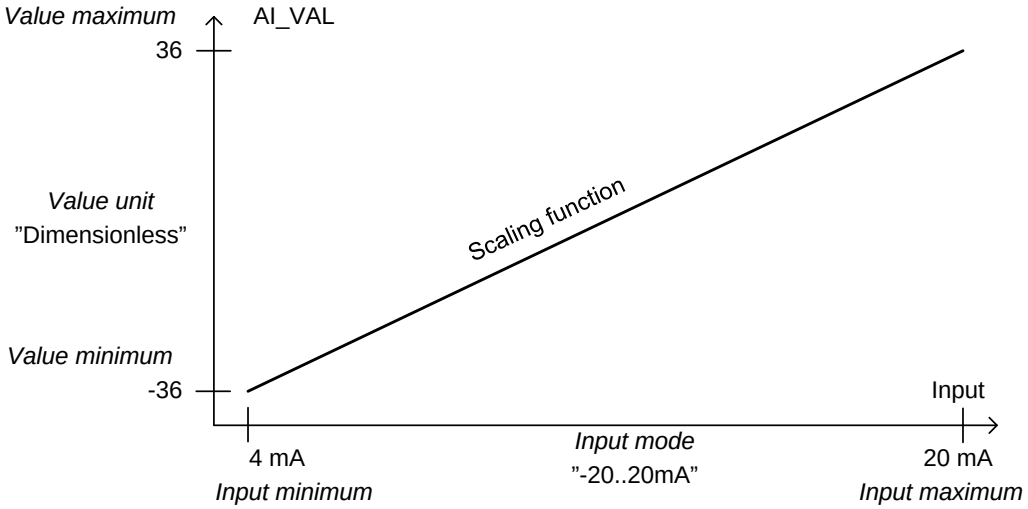

Figure 70: Tap changer position from mA input

Scaling example 3

When *Input mode* is set to "Resistance", the output can be scaled as desired. For example, the desired function output is a ratio in a function of resistance. If the input resistance varies between 100...1600 ohms, *Input minimum* is set to "100" and *Input maximum* is set to "1600". As the wanted output should be in percents, the setting *Value unit* is set to "Dimensionless". When *Input mode* is set to "Resistance", output scaling is enabled. Thus, *Value minimum* is set to "0" and *Value maximum* is set to "100". These settings allow the input values to be scaled as a ratio of the resistance range.

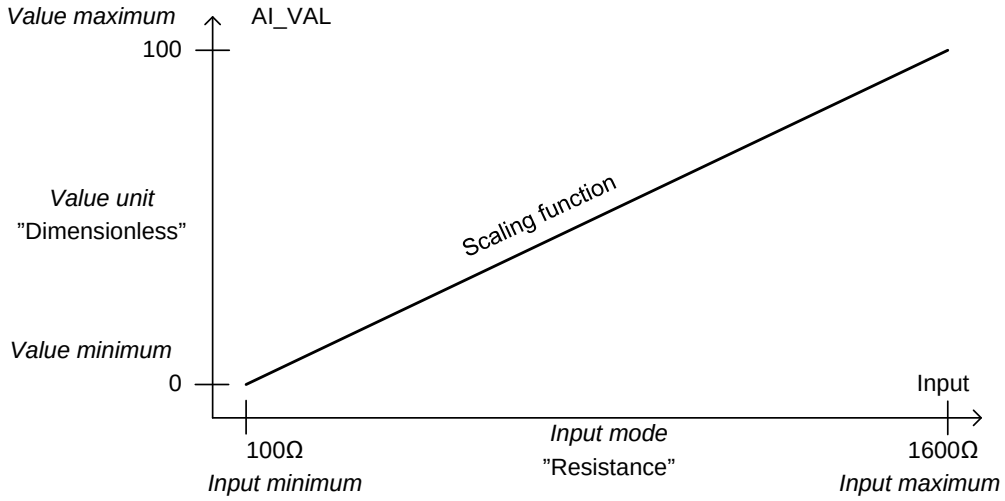

Figure 71: Output as a ratio of the resistance range

The output scaling function:

$$k = \frac{Input\ maximum - Input\ minimum}{Value\ maximum - Value\ minimum}$$

(Equation 4)

$$f = -k \cdot Value\ minimum + Input\ minimum$$

(Equation 5)

$$AI_VAL = \frac{Input - f}{k}$$

(Equation 6)

3.15.4.2 Limit value supervision

All the measurement inputs have individual limit supervision modules that operate similarly as in the measurement functions. The measured values are compared against their set value limits. The limit supervision outputs are `HIGH_ALARM`, `HIGH_WARN`, `LOW_WARN` and `LOW_ALARM`.

When an output is scaled, *Value maximum* and *Value minimum* are the range limits to which the output value is limited or scaled. Hysteresis is added to the range limit values so that the output value is allowed to slightly exceed or go below the limit value before being treated as out of range.

The pre-defined hysteresis values are set based on the set *Value unit*.

Table 105: Pre-defined hysteresis values based on Value unit

Value unit	Hysteresis
Dimensionless	Based on the scaling function [1]
Ampere	0.1 mA

Table continues on the next page

Value unit	Hysteresis
Degrees Celsius	0.5°C
Ohm	2 Ω

$$Hysteresis \cdot \left| \frac{Value\ maximum - Value\ minimum}{Input\ maximum - Input\ minimum} \right|$$

(Equation 7)

Example

Ampere input –20…20 mA is scaled to tap position information 0...36. The actual hysteresis for limit supervision is 0.18.

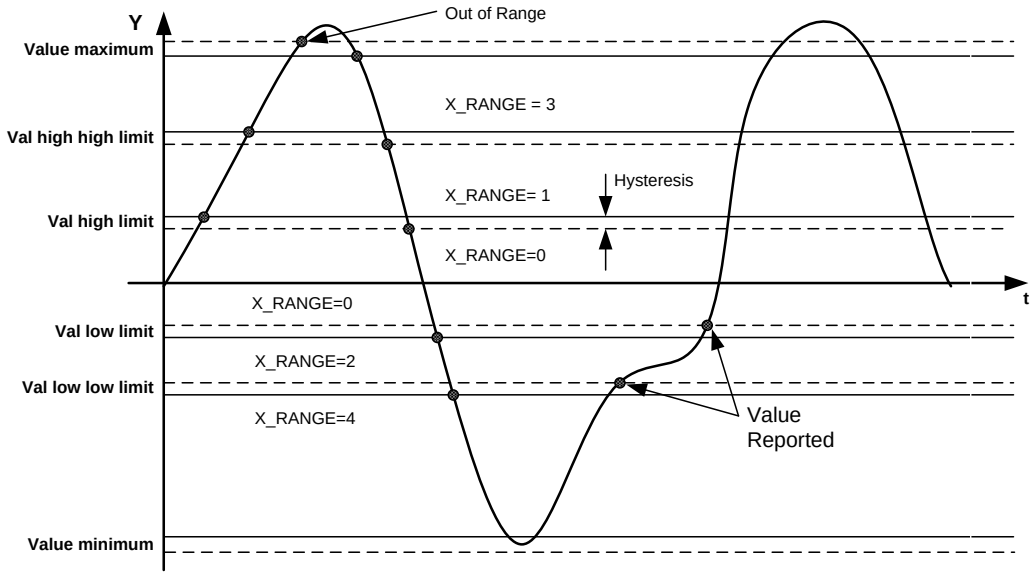

Figure 72: Limit value supervision

3.15.4.3 Deadband supervision

This is the same functionality as in measurement functions.

3.15.4.4 Output scaling

The mA outputs are scaled linearly by constructing linear scaling curves for each output.

Value maximum and *Value minimum* affect the scaled output range. The range of the scaled input is defined with the settings *Input minimum* and *Input maximum*. Depending on setting *Num of knee points*, the output can be scaled with up to five

[1] When the input is scaled to the "Dimensionless" output, the additional hysteresis is added the initial table value.

linear curves. The knee points are defined by parameters *Input knee point 1-4* and *Value knee point 1-4*.

Example 1: VMMXU1 to mA output

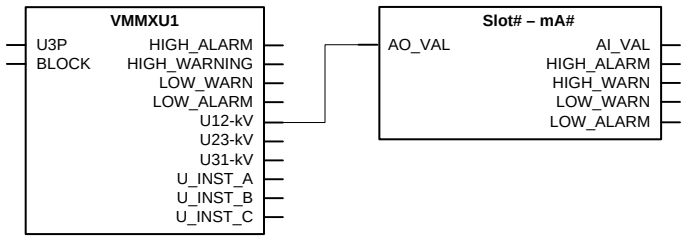

Figure 73: Application example for VMMXU1 to mA output

The measured phase-to-phase voltage from VMMXU is connected to AO_VAL. *Input maximum* value is set to "24" (kV) and *Input minimum* value is set to "18" (kV). The input unit is not significant as long as the value range is in the same scale. *Value maximum* is set to "20" mA and *Value minimum* to "4" mA. *Num of knee points* is set to "0".

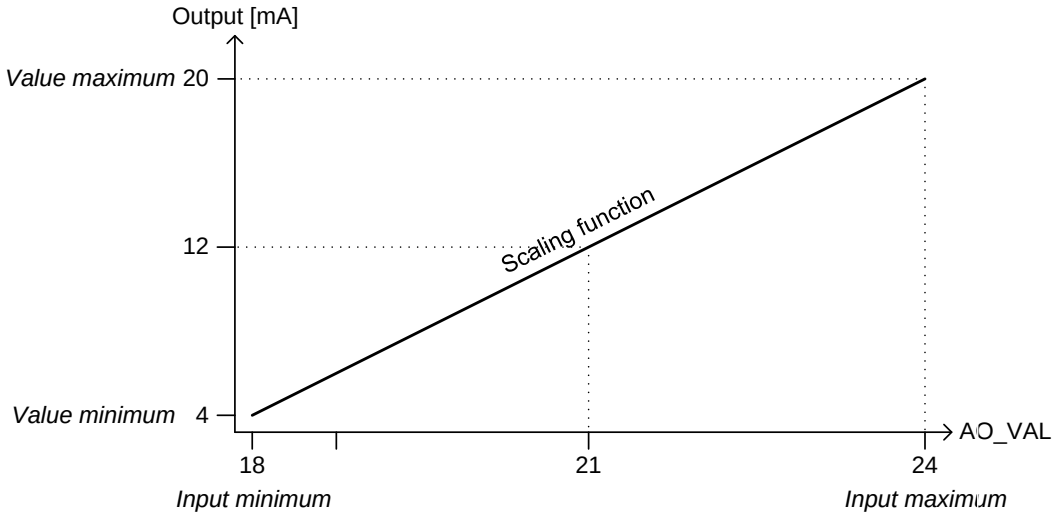

Figure 74: Scaling of AO_VAL to mA output

Example 2: mA input to mA output

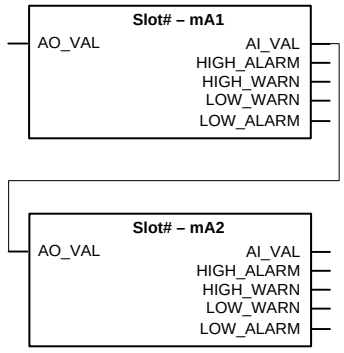

Figure 75: Application example for mA input to mA output

mA current is measured at channel 1. AI_VAL from measuring channel 1 is connected to AO_VAL of output channel 2. *Input maximum* is set to "20" (mA) and *Input minimum* to "–20" (mA). *Value maximum* is set to "20" mA and *Value minimum* is set to "0" mA. *Num of knee points* is set to "2".

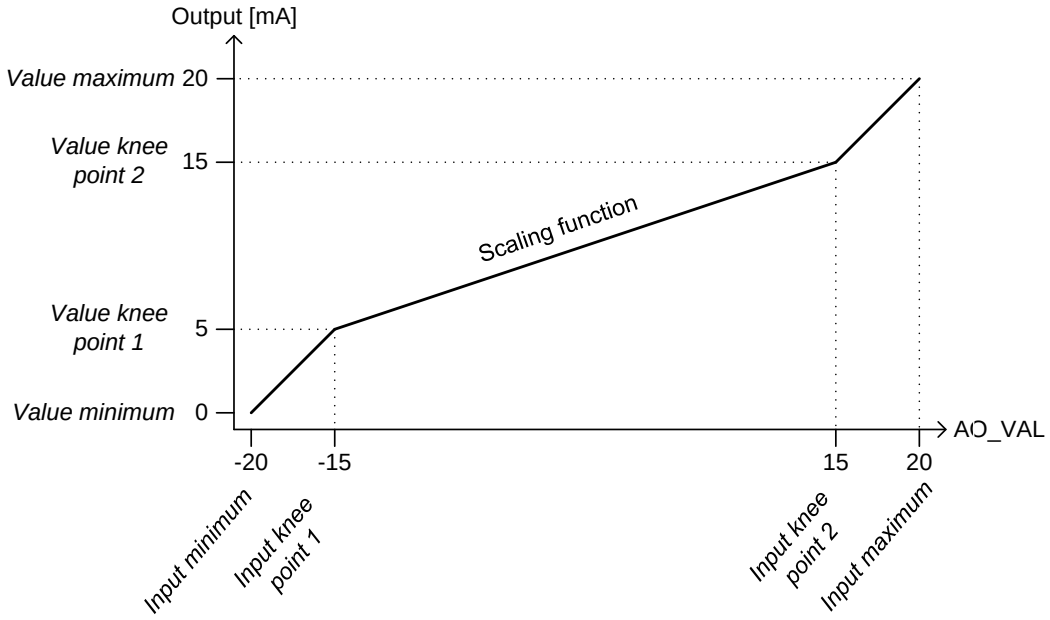

Figure 76: Scaling of AO_VAL to mA output with two knee points

Example 3: RTD input to mA output

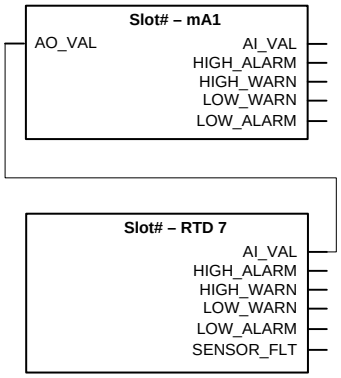

Figure 77: Application example for RTD input to mA output

Tap position is measured by the RTD channel 7. AI_VAL from channel 7 is connected to AO_VAL of channel 1. *Input maximum* is set to "160" (ohm) and *Input minimum* to "10" (ohm). *Value maximum* is set to "20" mA and *Value minimum* is set to "4" mA. *Num of knee points* is set to "4".

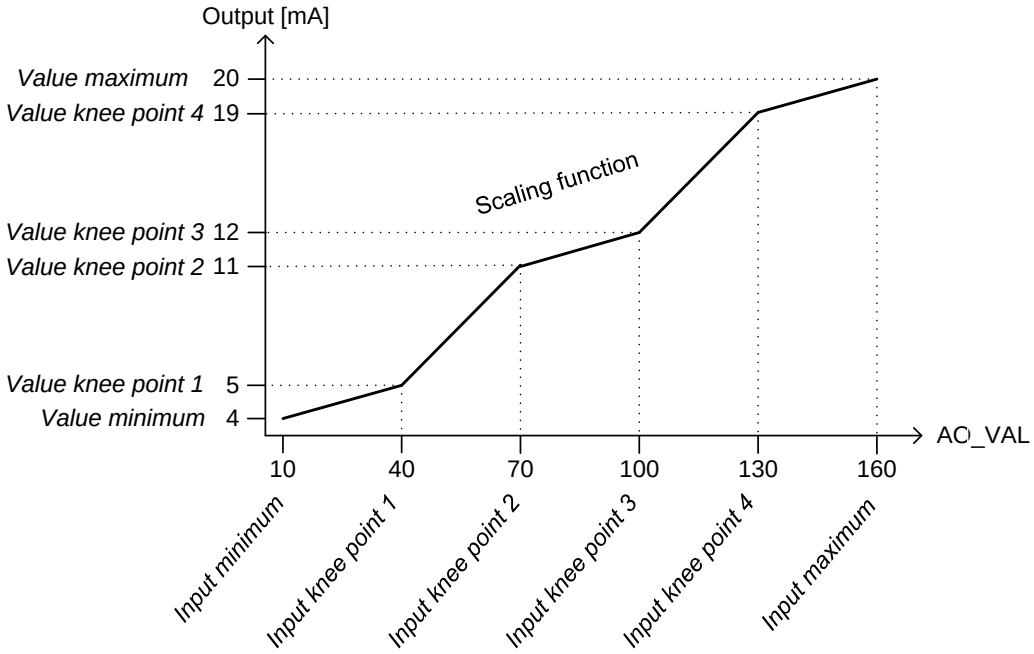

Figure 78: Scaling of AO_VAL to mA output with four knee points

Incorrect knee point values against the minimum and maximum values and a too narrow interval between the knee point values can cause inaccuracy to the output scaling function. Use increasing linearity and a value interval >1.0 for most accurate results.

3.15.5 RTD/mA input/mA output connection

RTD inputs can be used with a 2-wire or 3-wire connection with common ground. When using the 3-wire connection, it is important that all three wires connecting the sensor are symmetrical, that is, the wires are of the same type and length. Thus the wire resistance is automatically compensated.

RTD/mA card variants

The available variants of RTD cards are 10RTD/2mA and 3RTD/6mA. The features are similar in both cards.

10RTD/2mA card

This card accepts two milliampere inputs and ten inputs from the RTD sensors. The inputs 1 and 2 are used for current measurement, whereas inputs from 3 to 12 are used for resistance type of measurements.

3RTD/6mA card

This card accepts six milliampere inputs and three inputs from the RTD sensors. The inputs from 1 to 6 are used for current measurement, whereas inputs from 7 to 9 are used for resistance type of measurements.

3.16 SMV function blocks

SMV function blocks are used in the process bus applications with the IEC 61850-9-2 LE protocol. Function blocks represent the sending of the sampled measured values of analog currents and voltages and the receiving of the sampled values of analog currents and voltages.

3.16.1 SMV stream sender (IEC 61850-9-2LE) SMVSENDER

3.16.1.1 Function block

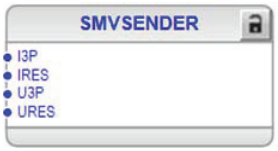

Figure 86: Function block

3.16.1.2 Functionality

The SMV stream sender (IEC 61850-9-2LE) function SMVSENDER is used for activating the SMV sending functionality. It adds/removes the sampled value control block and the related data set into/from the sending device's configuration. It has only input signals.

SMVSENDER can be disabled with the *Operation* setting value “off”. Toggling SMVSENDER “on” or “off” can be done from the LHMI. When disabled, the sending of the sample values is disabled.

3.16.1.3 Settings

Phase current preprocessing	ILTCTR	ILTCTR	ILTCTR

3.17.1.2 Function block

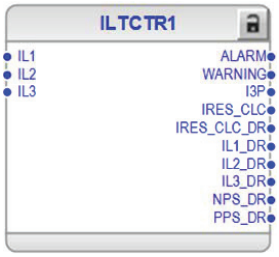

Figure 88: Function block

3.17.1.3 Functionality

The phase current preprocessing function ILTCTR is used for setting up the three phase current measurement channels. The input channels for ILTCTR are either physical hardware or IEC 61850-9-2 sampled value channels. The output `I3P` channel of ILTCTR can be connected to different applications which require 3 phase current and positive- and negative-sequence current. The output `IRES_CLC` can be connected to functions using the calculated residual current.

The current transducer selection can be made by setting *Current input type* to "Current trafo" for conventional CT or to "Current sensor" for current sensor type.

The sensor's or the CT's primary rated current can be set using *Primary current* setting. The setting *Secondary current* defines the nominal current of the CT's secondary winding. This is used as a reference to scale the measurements accordingly. These settings also affect the scaling of the calculated residual current.

Current magnitude correction of an external CT can be made using settings *Amplitude Corr A*, *Amplitude Corr B* and *Amplitude Corr C*.

Current angle correction of an external CT can be made using settings *Angle Corr A*, *Angle Corr B* and *Angle Corr C*.

Rated secondary Val setting defines the ratio for sensor use. This value multiplied by the *Rated frequency* setting (under **Configuration** > **System**) gives the sensor's nominal voltage corresponding to the sensors' primary rated current.

Reverse polarity setting is used to reverse the polarity of phase CTs.

The WARNING output in the receiver is activated if the synchronization accuracy of the sender or the receiver is worse than 4 µs. The output remains on for 10 seconds after the synchronization accuracy returns within limits.

The ALARM in the receiver is activated if the synchronization accuracy of the sender or the receiver is not within tolerances. The output is held on for 10 seconds after the synchronization accuracy returns within limits. If the effect on protection is negligible, the WARNING or ALARM output is not activated.

The *SMV Max Delay* setting defines how long the receiver waits for the SMV frames before activating the ALARM output. This setting can be accessed via **Configuration** > **System**. Waiting for the SMV frames delays the local measurements of the receiver to keep them correctly time aligned. The *SMV Max Delay* values include sampling, processing and network delay.

Frequency adaptive measurements for a three-phase current can be activated with the setting *Frequency adaptivity*. Three selections are provided.

Table 117: Frequency adaptivity setting for three-phase current measurement

Setting value	Description
Disable	Frequency adaptive measurements are disabled for this ILTCTR. Measurements are fixed to nominal frequency defined with **Configuration** > **System** > **Rated frequency**.
Enable	Frequency adaptive measurements are enabled. In this case, the estimated network frequency is defined by another preprocessing block.
Backup frequency source	Frequency adaptive measurements are enabled. If the main frequency source cannot determine the network frequency, the currents of the preprocessing block determine the network frequency.

All three phases must be always connected.

ILTCTR setting *Frequency adaptivity* is visible only if the system setting **Configuration** > **System** > **Frequency adaptivity** is set to "Enable".

3.17.1.4 Signals

ILTCTR Input signals

Table 118: ILTCTR Input signals

Name	Type	Default	Description

3.17.2 Residual current preprocessing RESTCTR

3.17.2.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Residual current preprocessing	RESTCTR	RESTCTR	RESTCTR

3.17.2.2 Function block

Figure 89: Function block

3.17.2.3 Functionality

The residual current preprocessing function RESTCTR is used for setting up the residual current measurement channels. Input channels for RESTCTR are either physical hardware or IEC 61850-9-2 sampled value channels. The output `IRES_MEAS` channel of RESTCTR can be connected to different applications which require measured residual current.

The current transducer selection can be made by setting *Current input type* to "Current trafo" for conventional CT or to "Current sensor" for current sensor type.

The residual CTs' primary rated current can be set using *Primary current* setting. The setting *Secondary current* defines the nominal current of the CT's secondary winding. This is used as a reference to scale measurements accordingly.

Residual current magnitude correction of an external CT can be made using the *Amplitude Corr* setting.

Residual current angle correction of an external CT can be made using the *Angle correction setting*.

Rated secondary Val (RSV) setting in combination with *Primary current* setting defines the ratio for sensor use. See *Chapter 3.12 Sensor inputs for currents and voltages* in this manual for further details.

Rated secondary Val should be set to same value in all RESTCTR instances which are configured to sensor measurement.

The *Reverse polarity* setting is used to reverse the polarity of the residual CT.

The WARNING output in the receiver is activated if the synchronization accuracy of the sender or the receiver is worse than 4 µs. The output is held on for 10 seconds after the synchronization accuracy returns within limits.

The ALARM in the receiver is activated if the synchronization accuracy of the sender or the receiver is not within tolerances. The output is held on for 10 seconds after the synchronization accuracy returns within limits. If the effect on protection is negligible, the WARNING or ALARM outputs are not activated.

The *SMV Max Delay* setting defines how long the receiver waits for the SMV frames before activating the ALARM output. This setting can be accessed via **Configuration** > **System**. Waiting for the SMV frames also delays the local measurements of the receiver to keep them correctly time aligned. The *SMV Max Delay* values include sampling, processing and network delay.

Frequency adaptive measurements for residual current can be activated with the setting *Frequency adaptivity*. Two selections are provided.

Table 122: Frequency adaptivity setting for residual current measurement

Setting value	Description
Disable	Frequency adaptive measurements are disabled for this RESTCTR. Measurements are fixed to nominal frequency defined with **Configuration** > **System** > **Rated frequency**.
Enable	Frequency adaptive measurements are enabled. In this case, the estimated network frequency is defined by another preprocessing block.

RESTCTR setting *Frequency adaptivity* is visible only if system setting **Configuration** > **System** > **Frequency adaptivity** is set to "Enable".

3.17.3 Phase and residual voltage preprocessing UTVTR

3.17.3.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Phase and residual voltage preprocessing	UTVTR	UTVTR	UTVTR

3.17.3.2 Function block

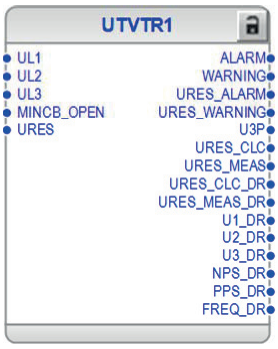

Figure 90: Function block

3.17.3.3 Functionality

The phase and residual voltage preprocessing function UTVTR is used for setting up the three phase voltage measurement channels and residual voltage measurement. The input channels for UTVTR are either physical hardware or IEC 61850-9-2 sampled value channels.

The output channel U3P of UTVTR can be connected to different applications which require phase voltage, positive and negative sequence.

Outputs URES_MEAS and URES_CLC can be connected to different applications which require measured residual voltage or calculated residual voltage (from phase voltages), respectively.

If only two phase-to-earth/phase-to-phase voltages are available, then the third phase-to-earth/phase-to-phase voltage can be calculated without URES input connected (assumed to be zero in that case). Positive- and negative-sequence components are also calculated using these voltages. The accuracy of the calculated phase-to-earth values is affected if the actual residual voltage is not zero.

If an application function requires only the frequency value, output U3P of UTVTR still needs to be connected since the frequency is calculated from the voltage.

The voltage transducer selection can be made by setting *Voltage input type* to "Voltage trafo" for conventional VT or to "Voltage sensor" for voltage sensor type.

The sensor's or the VTs' primary rated voltage can be set using *Primary voltage* setting. The setting *Secondary voltage* defines the nominal voltage of the VT's secondary winding. This is used as a reference to scale the measurements accordingly.

Division ratio setting defines the ratio for sensor use.

The division ratio for ABB voltage sensors is typically 10000:1. Thus, the Division ratio setting is usually set to "10000". For more information on Division ratio, see *Chapter 3.12 Sensor inputs for currents and voltages*.

The Voltage (Uo) residual voltage settings are also used for scaling the calculated residual voltage in comparison to the measured residual voltage.

The Voltage (Uo) settings must be set for output URES_MEAS and URES_CLC scaling. If the residual voltage is not connected to UTVTR, Voltage (Uo) settings must be set only for the calculated residual voltage URES_CLC scaling.

If the residual voltage is not connected to UTVTR, the **Voltage (Uo)** > **Primary voltage** cannot be set smaller than 1/√3 times **Voltage (3U)** > **Primary voltage**.

Voltage magnitude correction can be made using settings *Amplitude Corr A*, *Amplitude Corr B* and *Amplitude Corr C* for an external three-phase VT and *Amplitude Corr* setting for an external residual VT.

Voltage angle correction can be made using settings *Angle Corr A*, *Angle Corr B* and *Angle Corr C* for an external three-phase VT and *Angle correction* setting for an external residual VT.

The VT connection can be set using *VT connection*. For three phase-to-earth voltage measurements, *VT connection* can be set to "Wye", and for three phase-to-phase voltage measurements, *VT connection* can be set to "Delta".

The MINCB_OPEN input signal is connected through a relay binary input to the NC auxiliary contact of the MCB protecting the VT secondary circuit. The MINCB_OPEN signal receives information about the MCB open state. When MINCB_OPEN is active, the outputs ALARM and WARNING are activated.

The MCB open state does not affect IEC 61850-9-2 sampled value quality information.

The WARNING and URES_WARNING outputs in the receiver are activated if the synchronization accuracy of the sender or the receiver is worse than 4 µs. The outputs remain on for 10 seconds after the synchronization accuracy returns within limits.

ALARM and URES_ALARM in the receiver are activated if the synchronization accuracy of the sender or the receiver is not within tolerances. The outputs remain on for 10 seconds after the synchronization accuracy returns within limits. If the effect on protection is negligible, the WARNING, URES_WARNING, ALARM or URES_ALARM outputs are not activated.

The *SMV Max Delay* setting defines how long the receiver waits for the SMV frames before activating the ALARM and URES_ALARM outputs. This setting can be accessed via **Configuration** > **System**. Waiting for the SMV frames delays the local measurements of the receiver to keep them correctly time aligned. The *SMV Max Delay* values include sampling, processing and network delay.

Outputs WARNING and URES_WARNING are always internally active whenever outputs ALARM and URES_ALARM, respectively, are active.

The receiver activates the WARNING, URES_WARNING, ALARM and URES_ALARM outputs if any of the quality bits, except for the derived bit, is activated. When the receiver is in the test mode, it accepts SMV frames with test bit without activating the WARNING, URES_WARNING, ALARM and URES_ALARM outputs.

Frequency adaptive measurements for three-phase voltages can be activated with the setting *Frequency adaptivity*. Four selections are provided.

Table 127: Frequency adaptivity setting for three-phase voltage measurement

Setting value	Description
Disable	Frequency adaptive measurements are disabled for this UTVTR. Measurements are fixed to nominal frequency defined with **Configuration** > **System** > **Rated frequency**.
Enable	Frequency adaptive measurements are enabled. In this case, the estimated network frequency is defined by another preprocessing block.
Main frequency source	Frequency adaptive measurements are enabled and other preprocessing blocks follow the network frequency defined by this preprocessing block.
Backup frequency source	Frequency adaptive measurements are enabled. If the main frequency source cannot determine the network frequency, the voltages of this preprocessing block determine the network frequency.

All three phases must to be connected if the main or backup frequency source is selected.

Frequency adaptive measurements for residual voltage can be activated with the setting *Frequency adaptivity*. Two selections are provided.

Table 128: Frequency adaptivity setting for residual voltage measurement

Setting value	Description
Disable	Frequency adaptive measurements are disabled for this UTVTR. Measurements are fixed to nominal frequency defined with **Configuration** > **System** > **Rated frequency**.
Enable	Frequency adaptive measurements are enabled. In this case, the estimated network frequency is defined by another preprocessing block.

UTVTR setting *Frequency adaptivity* is visible only if system setting **Configuration** > **System** > **Frequency adaptivity** is set to "Enable".

3.17.3.4 Residual voltage scaling

Calculated U_0 is scaled to the same level as measured U_0. The scaling is determined by the ratio of ULTVTR primary voltage and RESTVTR primary voltage within one UTVTR instance. The assumption is open-delta U_0 measurement type.

Typical markings of an open-delta U_0 transformer in a 20 kV network can be: **20kV/sqrt(3) :100V/sqrt(3) :100V/3**. In case of a solid earth fault, this transformer gives 100 V output which corresponds to 11.547 kV. If ULTVTR primary voltage is set to 20 kV and RESTVTR primary voltage is set to 11.547 kV when this transformer is used, URES_CLC and URES_MEAS output equal amplitude.

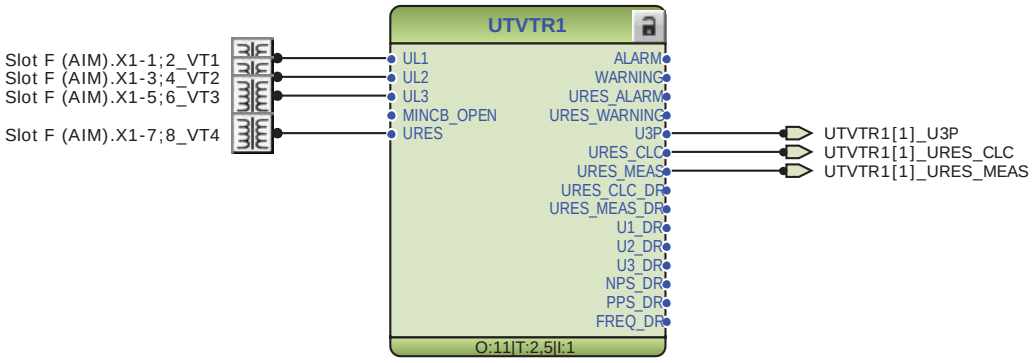

Figure 91: UTVTR1 configured with both measured and calculated U0

The VT connection mode must be "WYE".

In this case, ROVPTOV1 and ROVPTOV2 in *Figure 92* can both use the same U_0 reference level in their settings. URES_CLC and URES_MEAS in *Figure 91* are scaled to the same level.

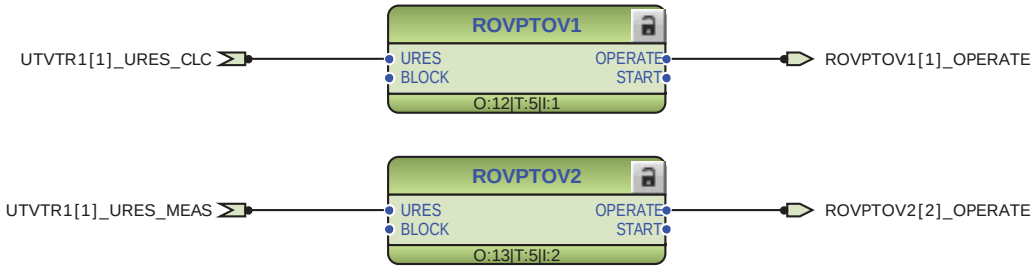

Figure 92: Two ROVPTOV instances, one using calculated U0 and the other measured U0

3.17.4 Residual current preprocessing, current measured as voltage RESUTCTR

3.17.4.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE identification
Residual current preprocessing, current measured as voltage	RESUTCTR	Io(U)	Io(U)

3.17.4.2 Function block

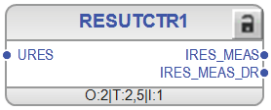

Figure 93: Function block

3.17.4.3 Functionality

The preprocessing block RESUTCTR is used for setting up the residual current measurement when the current is measured as voltage and the measured signal is wired via VT channel.

Input channel for RESUTCTR can be physical hardware voltage channel only.

The output *IRES_MEAS* channel of the RESUTCTR can be connected to only GSLPTOC which optionally can use this special way of current measurement.

The residual primary rated current can be set using *Primary current* setting. The setting *Secondary voltage* defines the nominal voltage of the measuring arrangement. This is used as a reference to scale the measurements accordingly.

Residual current magnitude correction of an external measuring arrangement can be made using *Amplitude Corr* setting.

Residual current angle correction of an external measuring arrangement can be made using *Angle Correction* setting.

Reverse polarity setting is used to reverse the polarity of residual CT.

Purpose of the outputs `IRES_MEAS` and `IRES_MEAS_DR` are described in the Outputs table.

Frequency adaptivity functionality is enabled by first enabling the main *Frequency adaptivity* setting under System parameter settings (**Configuration** > **System** > **Frequency adaptivity**), then by setting RESUTCTR *Frequency adaptivity* mode to “Enable”.

3.18 GOOSE function blocks

GOOSE function blocks are used for connecting incoming GOOSE data to application. They support BOOLEAN, Dbpos, Enum, FLOAT32, INT8 and INT32 data types.

Common signals

The VALID output indicates the validity of received GOOSE data, which means in case of valid, that the GOOSE communication is working and received data quality bits (if configured) indicate good process data. Invalid status is caused either by

bad data quality bits or GOOSE communication failure. See IEC 61850 engineering guide for details.

The OUT output passes the received GOOSE value for the application. Default value (0) is used if VALID output indicates invalid status. The IN input is defined in the GOOSE configuration and can always be seen in SMT sheet.

Settings

The GOOSE function blocks do not have any parameters available in LHMI or PCM600.

3.19 Type conversion function blocks

3.19.1 Good signal quality QTY_GOOD

3.19.1.1 Function block

Figure 102: Function block

3.19.1.2 Functionality

The good signal quality function QTY_GOOD evaluates the quality bits of the input signal and passes it as a Boolean signal for the application.

The IN input can be connected to any logic application signal (except preprocessing block). Due to application logic quality bit propagation, each (simple and even combined) signal has quality which can be evaluated.

The OUT output indicates quality good of the input signal. Input signals that have no quality bits set or only test bit is set, will indicate quality good status.

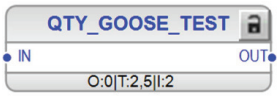

Figure 104: Function block

3.19.3.2 Functionality

The GOOSE test mode function QTY_GOOSE_TEST determines whether test mode is used between two relays communicating over GOOSE. The conditions needed for enabling the test mode differ in both editions 1 and 2 of the IEC 61850 standard. For more information, see the IEC 61850 engineering guide.

The IN input can be connected to any GOOSE application logic output signal, for example, GOOSERCV_BIN.

The OUT output indicates the test mode status of the GOOSE function block. When the output is in the true (1) state, the GOOSE test mode is active. The value false (0) indicates that the test mode is not in use.

3.19.3.3 Signals

Table 159: QTY_GOOSE_TEST Input signals

Name	Type	Default	Description
IN	Any	0	Input signal

OUT	BOOLEAN	Output signal

3.19.4 GOOSE communication quality QTY_GOOSE_COMM

3.19.4.1 Function block

Figure 105: Function block

3.19.4.2 Functionality

The GOOSE communication quality function QTY_GOOSE_COMM evaluates the peer device communication status from the quality bits of the input signal and passes it as a Boolean signal to the application.

The IN input can be connected to any GOOSE application logic output signal, for example, GOOSERCV_BIN.

The COMMVALID output indicates the communication status of the GOOSE function block. When the output is in the true (1) state, the GOOSE communication is active. The value false (0) indicates communication timeout.

3.19.4.3 Signals

3.19.5 GOOSE data health T_HEALTH

3.19.5.1 Function block

Figure 106: Function block

3.19.5.2 Functionality

The GOOSE data health function T_HEALTH evaluates enumerated data of “Health” data attribute. This function block can only be used with GOOSE.

The IN input can be connected to GOOSERCV_ENUM function block, which is receiving the LD0.LLN0.Health.stVal data attribute sent by another device.

The outputs OK, WARNING and ALARM are extracted from the enumerated input value. Only one of the outputs can be active at a time. In case the GOOSERCV_ENUM function block does not receive the value from the sending device or it is invalid, the default value (0) is used and the ALARM is activated in the T_HEALTH function block.

3.19.5.3 Signals

3.20 Configurable logic blocks

3.20.1 Minimum pulse timer

3.20.1.1 Minimum pulse timer, two channels TPGAPC (ANSI 62TP)

Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Minimum pulse timer, two channels	TPGAPC	TP	62TP

Function block

Figure 120: Function block

Functionality

The minimum pulse timer, two channels, function TPGAPC contains two independent timers. The function has a settable pulse length (in milliseconds). The timers are used for setting the minimum pulse length for example, the signal outputs. Once the input is activated, the output is set for a specific duration using the *Pulse time* setting. Both timers use the same setting parameter.

3.20.3 Daily timer DTMGAPC (ANSI DTM)

3.20.3.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Daily timer	DTMGAPC	DTM	DTM

3.20.3.2 Function block

Figure 128: Function block

3.20.3.3 Functionality

The daily timer function DTMGAPC is used to activate or deactivate its output at the set time of the day. It is possible to set a different activation or deactivation time separately for each day of the week.

3.20.3.4 Operation principle

The function can be enabled and disabled with the *Operation* setting. The corresponding parameter values are "on" and "off".

The operation of DTMGAPC can be described with a module diagram. All the modules in the diagram are explained in the next sections.

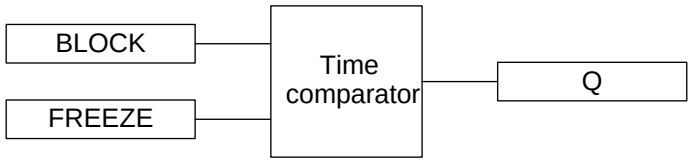

Figure 129: Functional module diagram

Time comparator

This module compares the current day and time with the activation hour and minute defined with the settings *xxx Act hour* and *xxx Act Mn*, respectively. When the time of the day reaches the set activation time, output Q is activated and remains active for the duration defined by the setting *xxx off delay*.

The output remains active until the next day if the value for *xxx off delay* is set so that it results into rollover of the day.

Different activation and deactivation times can be set for all days of the week. The activation and deactivation can also be disabled for a specific day. For example, if the activation or deactivation is not needed on Sundays, the setting *Sunday Act enable* can be set as "False".

Activation of the BLOCK input deactivates the function output whereas the activation of the FREEZE input freezes the output. The BLOCK input always has a higher priority than the FREEZE input.

3.20.3.5 Application

DTMGAPC is useful in applications that require signal activation and deactivation at a specific time of the day. Different activation times and duration can be set for

different days of the week. For example, if the signal should be active on Mondays between 7:15 and 16:00, the *Monday Act enable* setting should be "True", *Monday Act hour* should be "7", *Monday Act Mn* should be "15", and *Monday off delay* should be "525" minutes. The behavior of output Q is illustrated in *Figure 130*.

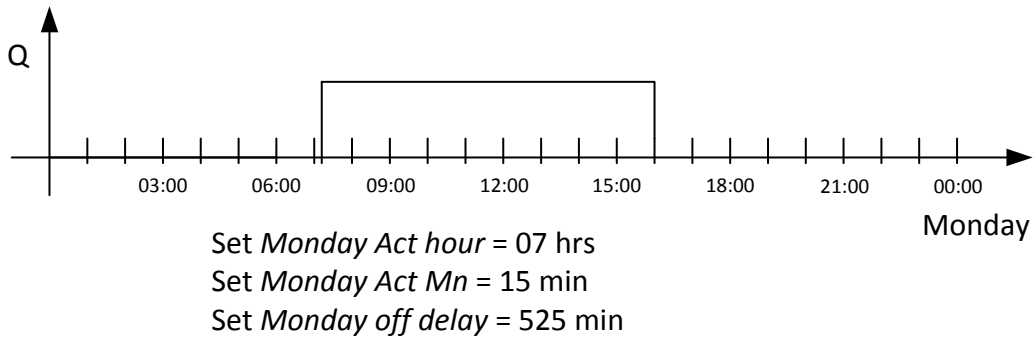

Figure 130: Example setting values for output Q activation

Calendar function	CALGAPC	CAL	CAL

3.20.4.2 Function block

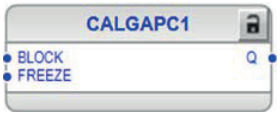

Figure 131: Function block

3.20.4.3 Functionality

The calendar function CALGAPC is used to activate a function output at a set activation date of the calendar year. The output remains activated till the set deactivation date of the calendar year.

3.20.4.4 Operation principle

The function can be enabled and disabled with the *Operation* setting. The corresponding parameter values are "on" and "off".

The operation of CALGAPC can be described with a module diagram.

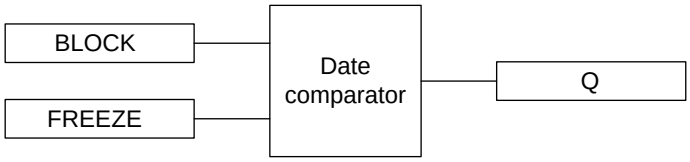

Figure 132: Functional module diagram

Date comparator

This module compares the current date (excluding the calendar year) with the set activation and deactivation date and month settings. If the system date and month

are the same or greater than *Activation day* and *Activation month* settings, output Q is activated and remains active till the date reaches the set *Deactivation day* and *Deactivation month* settings.

Activation of the BLOCK input deactivates the function output whereas the activation of the FREEZE input freezes the output. The BLOCK input always has a higher priority than the FREEZE input.

The module automatically handles the leap day and different month lengths.

- The function output remains active during the leap day if the leap day falls within the set activation period.
- If the set *Activation day* is not a valid date (for example, 31st April), then the output does not activate.
- If the set *Deactivation day* is not a valid date (for example, 31st April), then the last date of the month is considered.

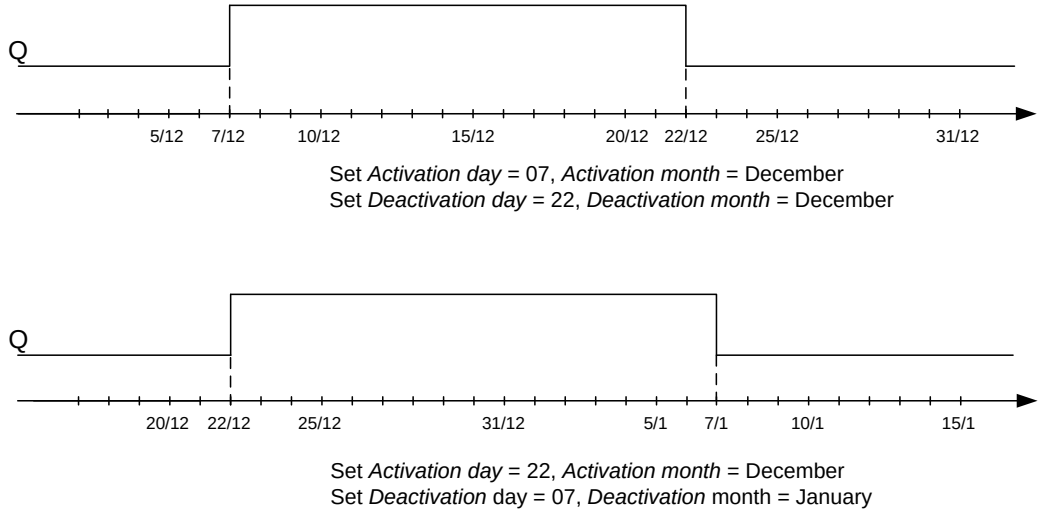

Figure 133: Examples of how output Q is activated for different settings

3.20.4.5 Application

The function activates an output for a specific set duration of the calendar year.

Consider an application where the output of the daily timer function DTMGAPC needs to be activated only for specific days of the calendar year. The output of CALGAPC can be connected to the BLOCK input of DTMGAPC (using NOT gate) so that DTMGAPC activates only for the duration defined by CALGAPC.

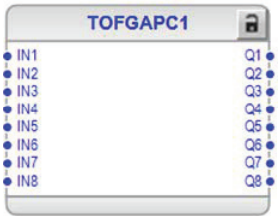

Figure 135: Function block

3.20.5.3 Functionality

The time delay off, eight channels, function TOFGAPC can be used, for example, for a drop-off-delayed output related to the input signal. The function contains eight independent timers. There is a settable delay in the timer. Once the input is activated, the output is set immediately. When the input is cleared, the output stays on until the time set with the *Off delay time* setting has elapsed.

3.20.7 SR flip-flop, eight channels, nonvolatile SRGAPC (ANSI SR)

3.20.7.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
SR flip-flop, eight channels, nonvolatile	SRGAPC	SR	SR

3.20.7.2 Function block

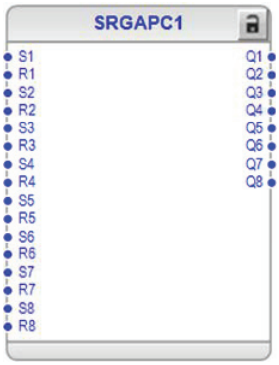

Figure 139: Function block

3.20.7.3 Functionality

The SR flip-flop, eight channels, nonvolatile function SRGAPC is a simple SR flip-flop with a memory that can be set or that can reset an output from the S# or R# inputs, respectively. The function contains eight independent set-reset flip-flop latches where the SET input has the higher priority over the RESET input. The status of each Q# output is retained in the nonvolatile memory. The individual reset for each Q# output is available on the LHMI or through tool via communication.

3.20.10 Analog value event creation with scaling SCA4GAPC (ANSI SCA4)

3.20.10.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Analog value event creation with scaling	SCA4GAPC	SCA4	SCA4

3.20.10.2 Function block

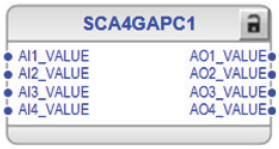

Figure 142: Function block

3.20.10.3 Functionality

The analog value event creation with scaling function SCA4GAPC is used for scaling the analog value. It allows creating events from analog values.

The analog value received via the `AIn_VALUE` input is scaled with the *Scale ratio n* setting. The scaled value is available on the `AOn_VALUE` output.

Analog input range is from –10000.0 to 10000.0.

Analog output range is from –2000000.0 to 2000000.0.

If the value of the `AIn_VALUE` input exceeds the analog input range, `AOn_VALUE` is set to 0.0.

If the result of AIn_VALUE multiplied by the Scale ratio n setting exceeds the analog output range, AOn_VALUE shows the minimum or maximum value, according to analog value range.

3.20.10.4 Signals

3.20.13 Generic control points SPCGAPC (ANSI SPCG)

3.20.13.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Generic control points	SPCGAPC	SPC	SPCG

3.20.13.2 Function block

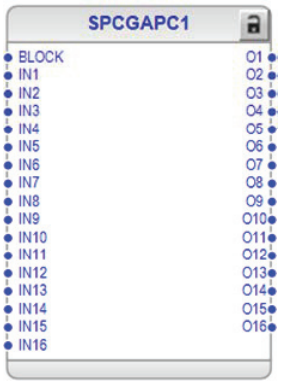

Figure 145: Function block

3.20.13.3 Functionality

The generic control points function SPCGAPC contains 16 independent control points. SPCGAPC offers the capability to activate its outputs through a local or remote control. The local control request can be issued through the buttons in the single-line diagram or via inputs and the remote control request through communication. The rising edge of the input signal is interpreted as a control request, and the output operation is triggered. When remote control requests are used the control points behaves as persistent.

The *Loc Rem restriction* setting is used for enabling or disabling the restriction for SPCGAPC to follow the R/L button state. If *Loc Rem restriction* is "True", as it is by default, the local or remote control operations are accepted according to the R/L button state.

Each of the 16 generic control point outputs has the *Operation mode*, *Pulse length* and *Description* setting. If *Operation mode* is "Toggle", the output state is toggled for every control request received. If Operation mode is "Pulsed", the output pulse of a preset duration (the *Pulse length* setting) is generated for every control request received. The *Description* setting can be used for storing information on the actual use of the control point in application, for instance.

For example, if the *Operation mode* is "Toggle", the output O# is initially “False”. The rising edge in IN# sets O# to “True”. The falling edge of IN# has no effect. Next rising edge of IN# sets O# to “False”.

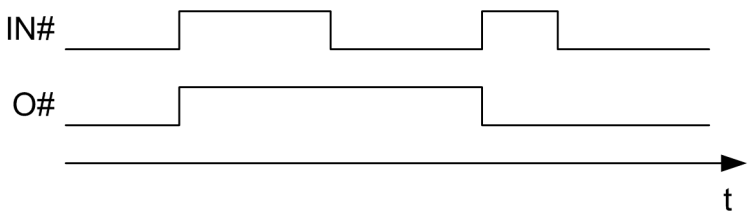

Figure 146: Operation in "Toggle" mode

The BLOCK input can be used for blocking the functionality of the outputs. The operation of the BLOCK input depends on the Operation mode setting. If Operation mode is "Toggle", the output state freezes and cannot be changed while the BLOCK

input is active. If *Operation mode* is "Pulsed", the activation of the BLOCK input resets the outputs to the "False" state and further control requests are ignored while the BLOCK input is active.

From the remote communication point of view SPCGAPC toggled operation mode is always working as persistent mode. The output O# follows the value written to the input IN#.

3.20.13.4 Signals

Table 247: SPCGAPC Input signals

Name	Type	Default	Description

3.20.14 Pulse counter for energy measurement PCGAPC

3.20.14.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Pulse counter for energy measurement	PCGAPC	PCGAPC	PCGAPC

3.20.14.2 Function block

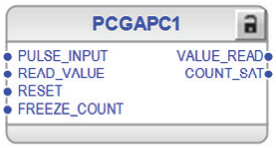

Figure 147: Function block

3.20.14.3 Functionality

The pulse counter for energy measurement function PCGAPC counts externally generated binary pulses, for example, pulses coming from an external energy meter, for the calculation of energy consumption values. The pulses are captured by the binary input module and read by PCGAPC. The number of pulses in the counter is then reported via the station bus to the automation system or read via the station monitoring system as a service value. The scaled value is also available over IEC 61850 communication.

The pulses are captured by the binary input module and read by PCGAPC with a frequency of up to 40 Hz. PCGAPC can also be used as a general-purpose counter.

3.20.14.4 Operation principle

The function can be enabled and disabled with the *Operation* setting. The corresponding parameter values are "on" and "off".

The operation of PCGAPC can be described with a module diagram. All the modules in the diagram are explained in the next sections.

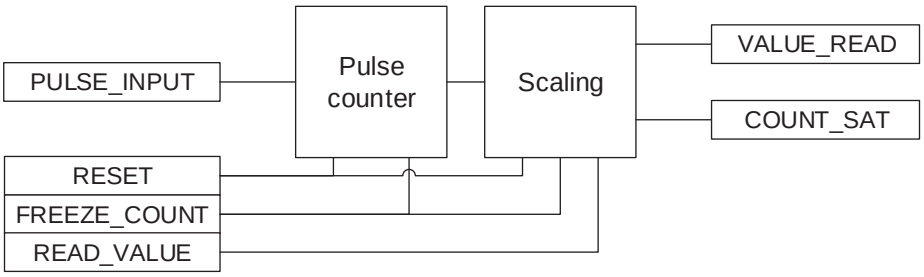

Figure 148: Functional module diagram

Pulse counter

This module counts the number of pulses available at PULSE_INPUT. The count value is incremented depending upon *Count criteria* setting.

Table 250: Relation between setting Count criteria and count value behavior

Count criteria values	PULSE_INPUT count value
Rising edge	Count value is incremented on the rising edge of PULSE_INPUT.
Falling edge	Count value is incremented on the falling edge of PULSE_INPUT.
On change	Count value is incremented each time a rising edge or falling edge is available at PULSE_INPUT.
Freeze	Counting is frozen.

The count value is available at COUNT_VALUE in the Monitored data view and is stored in a nonvolatile memory. This output is updated cyclically and sent to the station HMI over various communication protocols, depending on the Reporting interval setting. The start of *Reporting interval* corresponds to the start of the function operation in the protection relay.

Binary output `VALUE_READ` activates for a fixed 200 ms each time the reporting timer completes its cycle. It is also possible to update COUNT_VALUE before completion of *Reporting interval* and make it available for communication by providing a minimum 1-second-long pulse at `READ_VALUE` input. Besides COUNT_VALUE activation, `READ_VALUE` also activates output `VALUE_READ` for 200 ms.

The activation of RESET resets COUNT_VALUE to zero. Activation of FREEZE_COUNT freezes further counting.

Changing *Count criteria* does not reset COUNT_VALUE.

Scaling

This module scales the count value available at COUNT_VALUE. The scaling depends on the *Unit selection* setting. When the function is used for general-purpose counting, *Unit selection* is set as "Count" and the count value is multiplied by the *Pulse quantity* setting to calculate the scaled value.

When using this function for energy measurement, *Unit selection* is set accordingly, that is, real, active or apparent energy and the count value is divided by *Impulse ratio* to calculate the scaled value. The prefix for unit of *Impulse ratio* is defined by setting *Impulse ratio prefix*.

The energy meter defines the impulse ratio (also known as meter constant), that is, it indicates the number of pulses the meter generated per kWh (or MWh). *Impulse ratio* must be set based on the energy meter used.

For example, if the impulse ratio is 100 impulses / MWh, set *Impulse ratio* as 100 and *Impulse ratio prefix* as Mega.

If the impulse ratio is 800 impulses / KWh, set *Impulse ratio* as 800 and *Impulse ratio prefix* as Kilo.

The scaled value is available at SCALED_VALUE in the Monitored data view. This output is updated cyclically and sent to the station HMI over various communication protocols depending on *Reporting interval* setting. The start of *Reporting interval* corresponds to the start of the function operation in the protection relay.

The activation of RESET resets SCALED_VALUE to zero.

If *Pulse quantity*, *Impulse ratio* or *Impulse ratio prefix* is changed in between, SCALED_VALUE is updated immediately based on the new setting.

Binary output VALUE_READ activates for a fixed 200 ms each time the reporting timer completes its cycle.

It is also possible to update SCALED_VALUE before completion of *Reporting interval* and make it available for communication by providing a pulse at READ_VALUE input. The pulse width should be greater than 1 s. Besides updating SCALED_VALUE, the READ_VALUE activation also activates output VALUE_READ for 200 ms.

Activation of FREEZE_COUNT input immediately updates SCALED_VALUE output with a pulse at VALUE_READ output.

Output COUNT_SAT activates when either SCALED_VALUE or COUNT_VALUE exceeds the count range and it is not possible to count further.

Figure 149 and *Figure 150* explain PCGAPC operation.

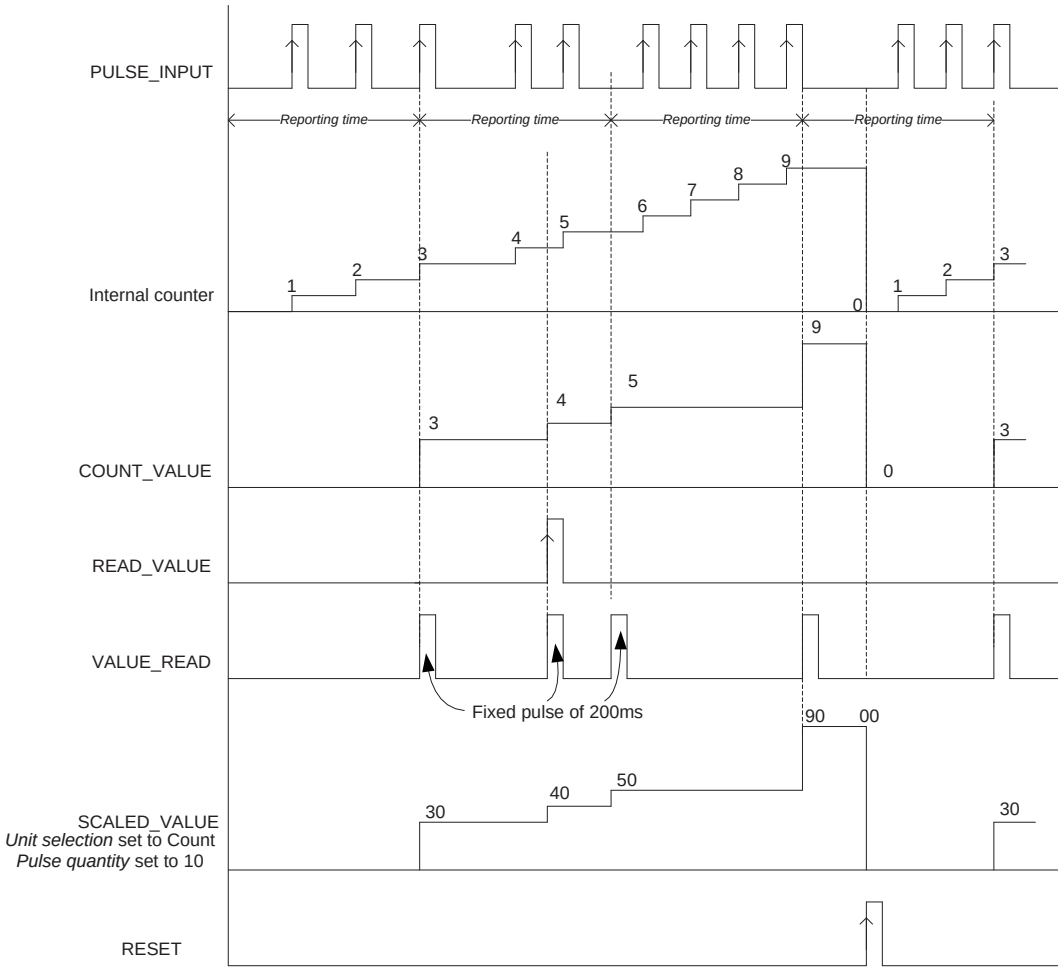

Figure 149: PCGAPC operation

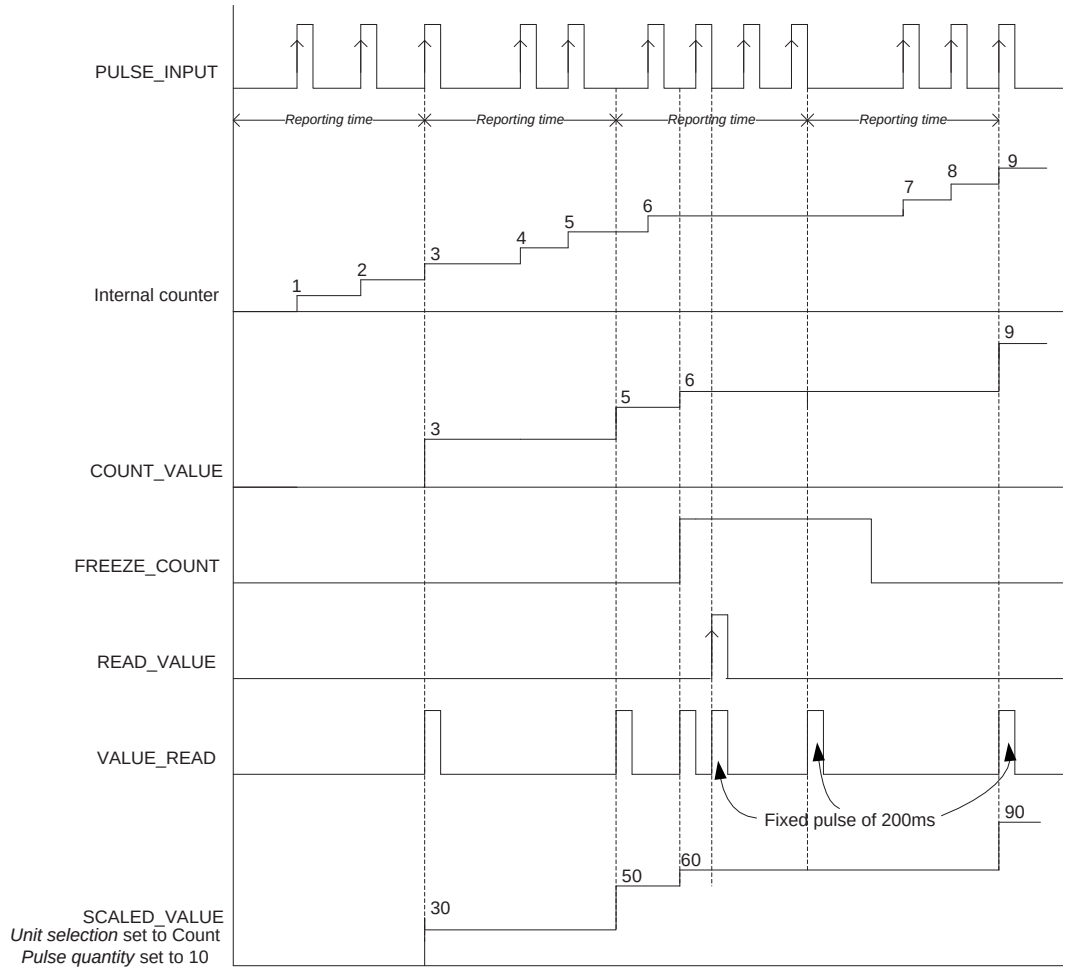

Figure 150: Behavior of FREEZE_COUNT input

3.20.14.5 Application

PCGAPC counts externally generated binary pulses, for example, pulses coming from an external energy meter, for the calculation of energy consumption values. The pulses are captured by the binary input module and read by PCGAPC with a frequency of up to 40 Hz. The number of pulses in the counter is then reported via the station bus to the substation automation system or read via the station monitoring system as a service value. When using IEC 61850, a scaled service value is available over the station bus.

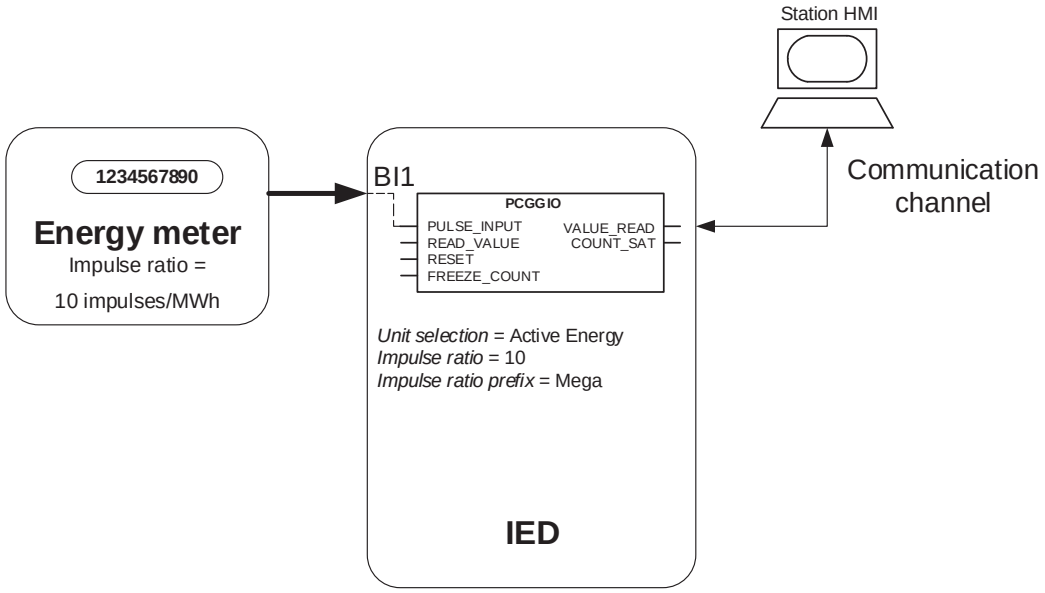

Figure 151: Typical application of PCGAPC

PCGAPC can also be used as a general-purpose counter.

3.20.14.6 Signals

PCGAPC Input signals

Table 251: PCGAPC Input signals

Name	Type	Default	Description
PULSE_INPUT	BOOLEAN	0=False	Connect binary input channel for counting
READ_VALUE	BOOLEAN	0=False	Initiates an additional pulse counter reading
RESET	BOOLEAN	0=False	Resets pulse counter value
FREEZE_COUNT	BOOLEAN	0=False	Freeze counting of pulse available at input

PCGAPC Output signals

Table 252: PCGAPC Output signals

Name	Type	Description
VALUE_READ	BOOLEAN	Scaled value is updated
COUNT_SAT	BOOLEAN	Counter reaches saturation limit and cannot count further

3.20.14.7 PCGAPC Settings

Table 253: PCGAPC Non group settings (Basic)

Parameter	Values (Range)	Unit	Step	Default	Description
Operation	1=on 5=off			1=on	Operation Off / On
Count criteria	1=Freeze 2=Rising edge 3=Falling edge 4=On change			2=Rising edge	Pulse counter criteria
Unit selection	1=Count 71=Apparent energy 72=Active energy 73=Reactive energy			1=Count	Measured quantity for SCALED_VALUE output
Impulse ratio	1...9999		1	1	Energy meter constant
Impulse ratio prefix	0=No prefix 3=k 6=M			0=No prefix	Prefix for unit of impulse ratio
Pulse quantity	0.0001...90000.0000		0.0001	1.0000	Factor to be multiplied with COUNT_VALUE
Reporting interval	0=1 minute 1=5 minutes 2=10 minutes 3=15 minutes 4=30 minutes 5=60 minutes 6=180 minutes			0=1 minute	Reporting interval for counter value

3.20.15 Hotline tag HLTGAPC

3.20.15.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Hotline tag	HLTGAPC	HLTGAPC	HLTGAPC

3.20.15.2 Function block

Figure 152: Function block

3.20.15.3 Functionality

The hotline tag function HLTGAPC is used to block all reclosing of the breaker, from both local and remote sources, when activated. When the function is activated locally, it can only be reset locally. If activated remotely, it can be reset depending on the *Remote tag mode* setting.

3.20.15.4 Operation principle

The function can be enabled and disabled with the *Operation* setting. The corresponding parameter values are "on" and "off". When the *Operation* setting is changed from "off" to "on", the monitored variable TAG_SOURCE is set to “None” and saved to a nonvolatile memory.

When the *Operation* setting is "on" and a reboot occurs, the TAG_SOURCE variable is read from the nonvolatile memory.

The operation of HLTGAPC can be described with a module diagram. All the modules in the diagram are explained in the next sections.

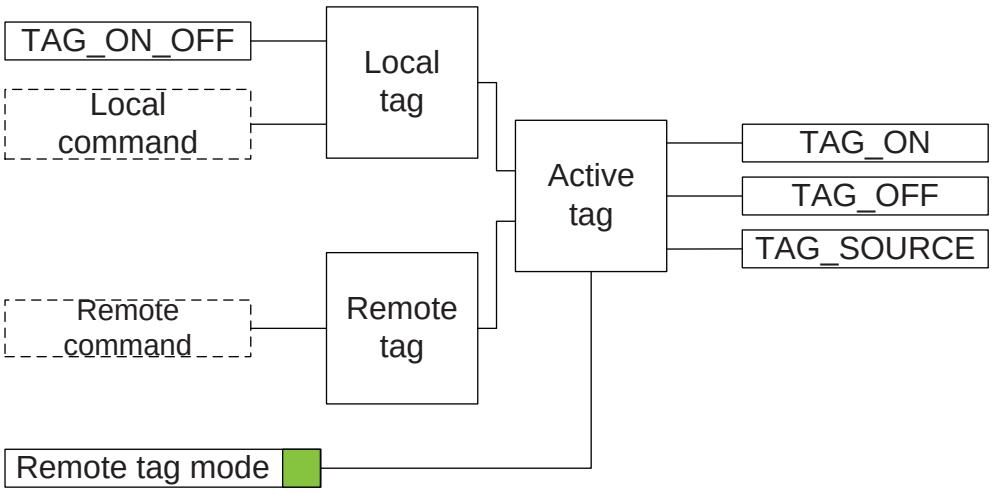

Figure 153: Functional module diagram

Local tag

Local tag is activated or deactivated on rising edge detection of `TAG_ON_OFF` input or with a local command from the LHMI when the protection relay is in local mode.

If a rising edge tag is detected locally, and the status of the nonvolatile variable TAG_SOURCE is “None”, the tag is locally activated. TAG_SOURCE changes to “Local” while TAG_ON is set to TRUE and TAG_OFF to FALSE.

If a rising edge tag is detected locally, and the status of TAG_SOURCE is “Local”, the tag is locally deactivated. TAG_SOURCE changes to “None” while TAG_ON is set to FALSE and TAG_OFF to TRUE.

When TAG_SOURCE is “Remote” and the *Remote tag mode* setting is "Untag Rem only", all local commands are prohibited. However, when the *Remote tag mode* setting is "Untag Loc or Rem", deactivation can be done locally.

Remote tag

Remote tag is activated or deactivated on rising edge detection through a communication channel in remote mode.

If a rising edge tag is detected remotely, and the status of the nonvolatile variable TAG_SOURCE is “None”, the tag is remotely activated. TAG_SOURCE changes to “Remote” while TAG_ON is set to TRUE and TAG_OFF to FALSE.

If a rising edge tag is detected remotely, and the status of TAG_SOURCE is “Remote”, the tag is remotely deactivated. TAG_SOURCE changes to “None” while TAG_ON is set to FALSE and TAG_OFF to TRUE.

If TAG_SOURCE is “Local”, remote commands are always prohibited.

3.20.15.5 Application

HLTGAPC is used to prevent the protection relay from reclosing and re-energizing a feeder where maintenance is performed. While HLTGAPC is active, no reclosing is allowed regardless of whether it is initiated through a protection trip, requested locally through the LHMI, or remotely through a communications command.

In order to operate correctly, HLTGAPC must be properly configured with Application Configuration. The TAG_ON and TAG_OFF outputs are connected where they can block or enable any reclosing that is configured. Typically, TAG_ON can be used on a recloser function block to inhibit reclosing and TAG_OFF can be used on a circuit breaker function block to enable closing.

A LED or a button on the LHMI can be used to indicate that the HLTGAPC condition is active. HLTGAPC can be activated, and the panel tagged, from the LHMI or from a remote communications command. The protection relay retains the original source (local or remote) of HLTGAPC and allows HLTGAPC to be deactivated only from the same source. That is, a locally initiated HLTGAPC can only be deactivated locally and a remotely initiated HLTGAPC can only be deactivated remotely. An exception to this rule allowing remotely initiated HLTGAPC commands to be deactivated locally can be made by changing the *Remote tag mode* setting from the default "Untag Rem only" to "Untag Loc or Rem". It is not possible to allow locally initiated HLTGAPC to be deactivated remotely.

As an alternative to using a button to activate HLTGAPC locally, the function can be activated from the Control menu of the LHMI.

The HLTGAPC status and the original source of the function are retained if power is removed and restored or through any other re-initialization of the protection relay. The HLTGAPC condition prior to the protection relay's reboot is automatically restored after the protection relay re-initializes.

The tag activation, deactivation and status information can be configured through the Graphical Display Editor (GDE).

3.20.15.6 Signals

HLTGAPC Input signals

3.20.16 Voltage switch VMSWI (ANSI VSWI)

3.20.16.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Voltage switch	VMSWI	VSWI	VSWI

3.20.16.2 Function block

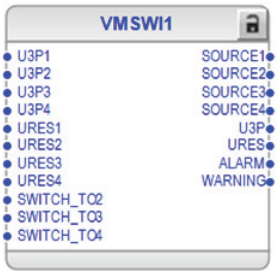

Figure 154: Function block

3.20.16.3 Functionality

The voltage switch function VMSWI performs the switching function between up to four voltage groups (Bus1, Bus 2, Bus 3 and Bus 4).

Residual voltage input can be optional and depends of the application configuration. The switching operation can also be associated with the residual voltage if available.

The calculated components U+, U- and U_0 and the calculated P2P / P2E (depending of the wye/delta mode) are switch-controlled as well.

3.20.16.4 Analog channel configuration

VMSWI has eight analog group inputs which must be properly configured. All inputs can be connected to GRPOFF.

Table 259: Analog inputs

Input	Description
U3P1 [1]	Three-phase voltages
U3P2 [1]	Three-phase voltages
U3P3 [1]	Three-phase voltages
U3P4 [1]	Three-phase voltages
URES1 [1]	Residual voltage (measured or calculated)
URES2 [1]	Residual voltage (measured or calculated)

Table continues on the next page

[1] Can be connected to GRPOFF

Input	Description
URES3 [1]	Residual voltage (measured or calculated)
URES4 [1]	Residual voltage (measured or calculated)

See the preprocessing function blocks in this document for the possible signal sources. The GRPOFF signal is available in the function block called Protection.

There are a few special conditions which must be noted with the configuration.

Table 260: Special conditions

Condition	Description
U3P1/U3P2/U3P3/U3P4 connected to real measurements	The function requires that at least one voltage channel is connected. The function requires that all the U3Px that are connected to real source must be capable of providing (at least) the same data that the default source U3P1 is capable of. E.g. if the source UTVTR conneted to U3P1 has two inputs (e.g. UL1, UL2) connected then others need to also have at least two inputs connected (e.g. UL1, UL2 or UL2, UL3 or UL3, UL1).
URES1/URES2/URES3/URES4 calculated	The function requires that all three voltage channels are connected to calculate the residual voltage. Setting *VT connection* must be "Wye" in that particular UTVTR.

3.20.16.5 Operation principle

The function can be enabled and disabled with the *Operation* setting. The corresponding parameter values are "on" and "off".

For this function, the setting is hidden and fixed to "on".

The switch logic depends on inputs SWITCH_TO2, SWITCH_TO3 and SWITCH_TO4. Source 1 is selected as default and switching is done on increased priority.

GRPOFF signal must be connected to unused voltage inputs. GRPOFF signal is available as output from the Protection function block.

Table 261: Switching operation

Control input signals			Outputs					
SWITCH_TO2	SWITCH_TO3	SWITCH_TO4	SOURCE1	SOURCE2	SOURCE3	SOURCE4	Source for U3P	Source for URES
FALSE	FALSE	FALSE	TRUE	FALSE	FALSE	FALSE	U3P1	URES1
TRUE	FALSE	FALSE	FALSE	TRUE	FALSE	FALSE	U3P2	URES2
x [1]	TRUE	FALSE	FALSE	FALSE	TRUE	FALSE	U3P3	URES3
x [1]	x [1]	TRUE	FALSE	FALSE	FALSE	TRUE	U3P4	URES4

[1] No difference

If the numbers of channels connected to U3P1...U3P4 and URES1...URES4 does not match with the number of connected SWITCH_TOx inputs, the configuration of the function fails.

Outputs ALARM and URES_ALARM indicate bad quality data of system measurements for selected U3P and URES, respectively.

Outputs WARNING and URES_WARNING indicate questionable quality data of system measurements for selected U3P and URES, respectively.

Depending on the connected U3P channels to the voltage switch, the *Primary voltage* settings between the source U3P must match. Respectively, depending on the connected URES channels, the *Primary voltage* settings between the source URES must match. Setting validation for the primary voltages fails unless they are all stored simultaneously to the protection relay.

IRES2 [1]	Residual current (measured or calculated)
IRES3 [1]	Residual current (measured or calculated)
IRES4 [1]	Residual current (measured or calculated)

See the preprocessing function blocks in this document for the possible signal sources. The GRPOFF signal is available in the function block called Protection.

3.20.17.5 Operation principle

The function can be enabled and disabled with the *Operation* setting. The corresponding parameter values are "on" and "off".

For this function, the setting is hidden and fixed to "on".

The switch logic depends on inputs SWITCH_TO2, SWITCH_TO3 and SWITCH_TO4. Source 1 is selected as default and switching is done on increased priority.

GRPOFF signal must be connected to unused current inputs. GRPOFF signal is available as output from the Protection function block.

Table 266: Switching operation

Control input signals			Outputs					
SWITCH_TO 2	SWITCH_TO 3	SWITCH_TO 4	SOURCE1	SOURCE2	SOURCE3	SOURCE4	Source for I3P	Source for IRES
FALSE	FALSE	FALSE	TRUE	FALSE	FALSE	FALSE	I3P1	IRES1
TRUE	FALSE	FALSE	FALSE	TRUE	FALSE	FALSE	I3P2	IRES2
x [1]	TRUE	FALSE	FALSE	FALSE	TRUE	FALSE	I3P3	IRES3
x [1]	x [1]	TRUE	FALSE	FALSE	FALSE	TRUE	I3P4	IRES4

If the numbers of channels connected to I3P1...I3P4 and IRES1...IRES4 does not match with the number of connected SWITCH_TOx inputs, the configuration of the function fails.

Outputs ALARM and IRES_ALARM indicate bad quality data of system measurements for selected I3P and IRES, respectively.

Outputs WARNING and IRES_WARNING indicate questionable quality data of system measurements for selected I3P and IRES, respectively.

[1] Can be connected to GRPOFF
[1] No difference

Depending on the connected I3P channels to the current switch, the *Primary current* settings between the source `I3P` must match. Depending on the connected IRES channels, the *Primary current* settings between the source `IRES` must match. Setting validation for the primary current fails unless they are all stored simultaneously to the protection relay.

3.20.18 Generic up-down counter UDFCNT

3.20.18.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Generic up-down counter	UDFCNT	UDCNT	UDCNT

3.20.18.2 Function block

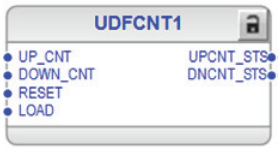

Figure 156: Function block

3.20.18.3 Functionality

The Generic up-down counter function UDFCNT counts up or down for each positive edge of the corresponding inputs. The counter value output can be reset to zero or preset to some other value if required.

The function provides up-count and down-count status outputs, which specify the relation of the counter value to a loaded preset value and to zero respectively.

3.20.18.4 Operation principle

The function can be enabled and disabled with the *Operation* setting. The corresponding parameter values are "On" and "Off".

The operation of UDFCNT can be described with a module diagram. All the modules in the diagram are explained in the next sections.

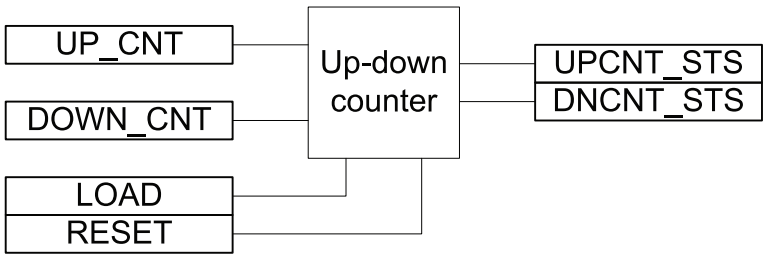

Figure 157: Functional module diagram

Up-down counter

Each rising edge of the UP_CNT input increments the counter value CNT_VAL by one and each rising edge of the DOWN_CNT input decrements the CNT_VAL by one. If there is a rising edge at both the inputs UP_CNT and DOWN_CNT, the counter value CNT_VAL is unchanged. The CNT_VAL is available in the monitored data view.

The counter value CNT_VAL is stored in a nonvolatile memory. The range of the counter is 0...+2147483647. The count of CNT_VAL saturates at the final value of 2147483647, that is, no further increment is possible.

The value of the setting *Counter load value* is loaded into counter value CNT_VAL either when the LOAD input is set to "True" or when the *Load Counter* is set to "Load" in the LHMI. Until the LOAD input is "True", it prevents all further counting.

The function also provides status outputs UPCNT_STS and DNCNT_STS. The UPCNT_STS is set to "True" when the CNT_VAL is greater than or equal to the setting Counter load value. DNCNT_STS is set to "True" when the CNT_VAL is zero.

The RESET input is used for resetting the function. When this input is set to "True" or when *Reset counter* is set to "reset", the CNT_VAL is forced to zero.

3.20.18.5 Signals

Table 270: UDFCNT Input signals

Name	Type	Default	Description

3.20.19 Current sum CMSUM (ANSI CSUM)

3.20.19.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Current sum	CMSUM	CSUM	CSUM

3.20.19.2 Function block

Figure 158: Function block

3.20.19.3 Functionality

The current sum function CMSUM is a phase-by-phase specific summing function for two current triplets. Output `I3P` can be used as normal current input for the application functions using current. Different measurement modes (DFT, RMS, Peak-to-peak) are supported. Also, positive, negative and zero-sequence components are calculated for the summed currents. Output `IRES` provides the calculated residual current based on the summed currents.

Example configuration:

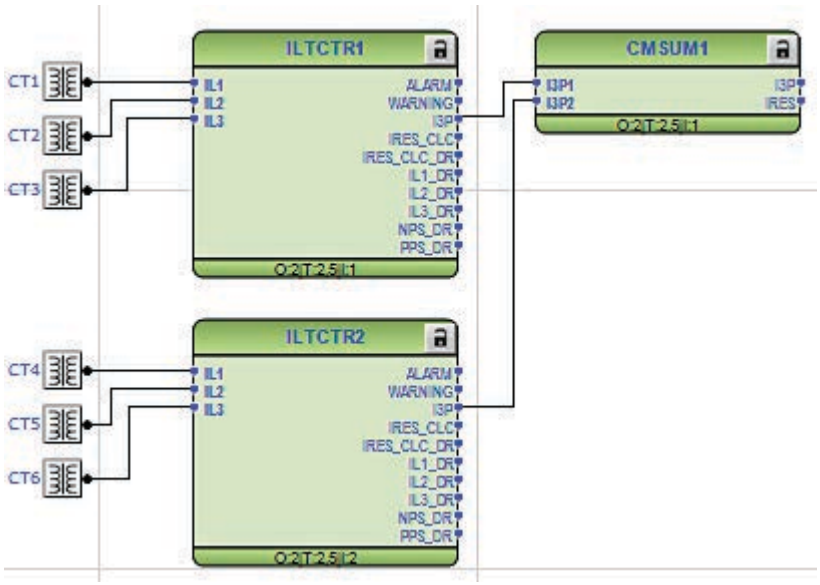

Figure 159: Current summing configuration

3.20.19.4 Analog channel configuration

CMSUM has two analog group inputs which must be properly configured, that is, both of the ILTCTR function blocks connected to these inputs must have the same primary current setting value.

Table 274: Analog inputs

Input	Description
I3P1	Three-phase currents
I3P2	Three-phase currents

See the preprocessing function blocks in this document for the possible signal sources.

3.20.20 Transformer data combiner OLGAPC

3.20.20.1 Identification

Function description	IEC 61850 identification	IEC 60617 identification	ANSI/IEEE C37.2 device number
Transformer data combiner	OLGAPC	OLGAPC	OLGAPC

3.20.20.2 Function block

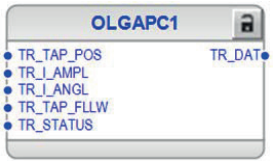

Figure 160: Function block

3.20.20.3 Functionality

The transformer data combiner function OLGAPC is intended for the voltage regulator function OL5ATCC.

3.20.20.4 Operation principle

The function of OLGAPC is to collect data from a parallel transformer via GOOSE communication. The `TR_DAT` output, which contains the combined input data, is connected to the OL5ATCC function block.

3.20.20.5 Application

See the application example in *Figure 161*.

3.21 Standard logic operators

3.21.1 OR gate with two inputs OR, six inputs OR6 and twenty inputs OR20

3.21.1.1 Function block

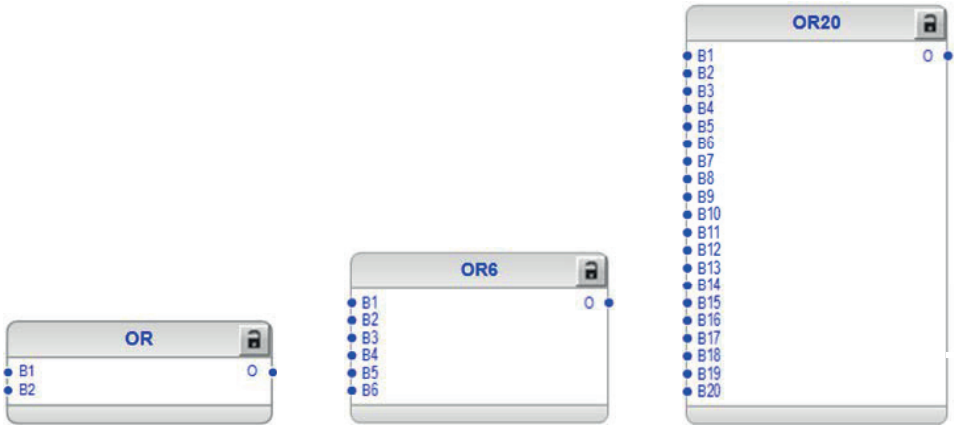

Figure 163: Function block

3.21.1.2 Functionality

OR, OR6 and OR20 are used to form general combinatory expressions with boolean variables.

The O output is activated when at least one input has the value TRUE. The default value of all inputs is FALSE, which makes it possible to use only the required number of inputs and leave the rest disconnected.

OR has two inputs, OR6 six and OR20 twenty inputs.

3.21.7 Switching device status decoder CLOSE position T_POS_CL, OPEN position T_POS_OP and OK status T_POS_OK

3.21.7.1 Function block

Figure 169: Function blocks

3.21.7.2 Functionality

The circuit breaker position information can be communicated with the IEC 61850 GOOSE messages. The position information is a double binary data type which is fed to the POS input.

T_POS_CL and T_POS_OP are used for extracting the circuit breaker status information. Respectively, T_POS_OK is used to validate the intermediate or faulty breaker position.

Table 302: Cross reference between circuit breaker position and function block output

Circuit breaker position	Output of the function block		
	T_POS_CL	T_POS_OP	T_POS_OK
Intermediate '00'	FALSE	FALSE	FALSE
Close '01'	TRUE	FALSE	TRUE
Open '10'	FALSE	TRUE	TRUE
Faulty '11'	TRUE	TRUE	FALSE

3.22 Mathematical operators

3.22.1 Real addition ADDR

3.22.1.1 Function block

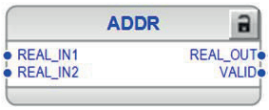

Figure 172: Function block

3.22.1.2 Functionality

The real addition function ADDR adds the inputs `REAL_IN1` and `REAL_IN2` together. ADDR executes the equation

`REAL_OUT = REAL_IN1 + REAL_IN2`

[1] Keep state/no change

If the value of the sum is outside the range, then the output quality is set as bad and VALID is set to FALSE. The minimum negative sum value is restricted to –2097152.000 and the maximum positive sum value is restricted to 2097152.000.

3.22.1.3 Signals

Table 315: ADDR Input signals

Name	Type	Default	Description
