2000	CRC error in delay-related diagnosis information	The CRC code of delay-related diagnosis information is not correct.	Temporary communication error
1000	CRC error in communication data	The CRC code of SCS Link Transmission data is not correct.	Temporary communication error, or SCS Link Transmission builder definition may contain [Type] error.
0400	Equalization error of delay-related diagnosis information	Communication for acquiring delay-related diagnosis information stopped.	Communication was interrupted or the sender station is stopped.
0100	Address error	Illegal station number	The application may contain errors, or the setting in the database is inconsistent with the setting of dipswitches.
0040	Transmission delay occurred	Communication was updated later than the transmission delay timeout time.	Communication delay

Continues on the next page

Table 2.1-5 Message No. 4133 - Cause Code List (Table continued)

Code (hexa-decimal)	Errors	Description	Presumed Cause
0020	Time diagnosis error of the sender	Time diagnosis error occurred in the sender, so that this date/time may not be correct.	Time diagnosis error of the sender
0010	Time diagnosis error of the receiver	Time diagnosis error occurred in the receiver, so that this date/time may not be correct.	Time diagnosis error of the receiver
0008	Illegal scan cycle	The detected scan cycle is an illegal value 0.	Internal error

No.4134

Message name Information of a diagnosis error recovery in the received data of SCS Link Transmission.

Printing example SCS0101 SCS Link Transmission Receive Recover Stn(SCS)=05

Meaning The diagnosed reception error of SCS link transmission has been recovered. The source station number (such as 05) and the station type (SCS in the above example) are indicated in the message text. The station type indicated in the message is the same station type defined on the SCS Link Transmission builder.

(This is a recovery message of No. 4133.)

Cause The following causes may be considered.

- Recovery of the sender station
- Recovery of the communication path
- The errors in the SCS Link Transmission definition have been removed.

Remark SCS Link Transmission

No.4135

Message name SCS Link Transmission data lock

Printing example SCS0101 SCS Link Transmission Data Locked Stn(SCS)=02

Meaning The reception/transmission data for SCS Link Transmission (in the above example, data received from station 2) were locked. The (SCS) in the message text indicates the station type defined on the SCS Link Transmission builder.

Remark Forcing function, SCS Link Transmission

Note Be sure to cancel the lock of the station that was locked.

No.4136

Message name Cancellation of SCS Link Transmission data lock

Printing example SCS0101 SCS Link Transmission Data Unlocked Stn(SCS)=02

Meaning The lock of reception/transmission data for SCS Link Transmission (in the above example, data received from station 2) was cancelled. The (SCS) in the message text indicates the station type defined on the SCS Link Transmission builder.

Remark Forcing function, SCS Link Transmission

No.4137

Message name Number of Locked Stations in SCS Link Transmission Exceeded

Printing example SCS0101 Number of Locks about SCS Link Transmission Exceeds the Limit = 3

Meaning The number of locked stations exceeded the limit (3 in the above example), which is defined in SYS_FORCE_ LT FB as the number of stations allowed for forcing.

Cause Operation from the SENG to lock too many stations.

Action Cancel SCS Link Transmission locks for some SCS.

Remark Forcing function, SCS Link Transmission, SYS_FORCE_LT FB

Note You should not lock stations beyond the limit.

No.4138

Message name Recovery from exceeded number of locked stations in SCS Link Transmission

Printing example SCS0101 Number of Locks about SCS Link Transmission Within the Limit = 3

Meaning The number of locked stations fell within the limit (3 in the above example), which is defined in SYS_FORCE_ LT FB as the number of stations allowed for forcing. (This is the recovery message of No.4137.)

Cause Operation from the SENG.

Remark Forcing function, SCS Link Transmission, SYS_FORCE_LT FB

No.4139

Message name Inter-SCS Safety Communication data lock

Printing example SCS0101 Inter-SCS Safety Communication Data Locked Dom=01 Stn=02

Meaning The Inter-SCS Safety Communication data received from a producer SCS (in the above example, station 2 in domain 1) were locked.

The message for a lock of the local station (data produced by the station are locked) is also output in the same format, showing its own domain number and station number.

Remark Forcing function, Inter-SCS Safety Communication

Note Be sure to cancel the lock of the station that was locked.

No.4140

Message name Cancellation of Inter-SCS Safety Communication data lock

Printing example SCS0101 Inter-SCS Safety Communication Data Unlocked Dom=01 Stn=02

Meaning The lock of Inter-SCS Safety Communication data received from a producer SCS (in the above example, station 2 in domain 1) was cancelled.

The message of cancellation for the lock of local station (data produced by the station are locked) is also output in the same format, showing its own domain number and station number.

Remark Forcing function, Inter-SCS Safety Communication

No.4141

Message name Number of locked stations in Inter-SCS Safety Communication exceeded

Printing example SCS0101 Number of Locks about Inter-SCS Safety Communication Exceeds the Limit = 3

Meaning The number of locked stations exceeded the limit (3 in the above example), which is defined in SYS_FORCE_ BD FB as the number of stations allowed for forcing.

Cause Operation from the SENG to lock too many stations

Action Cancel Inter-SCS Safety Communication locks for some SCS.

Remark Forcing function, Inter-SCS Safety Communication, SYS_FORCE_BD FB

Note You should not lock stations beyond the limit.

No.4142

Message name Recovery from exceeded number of locked stations in Inter-SCS Safety Communication

Printing example SCS0101 Number of Locks about Inter-SCS Safety Communication Within the Limit = 3

Meaning The number of locked stations fell within the limit (3 in the above example), which is defined in SYS_FORCE_ BD FB as the number of stations allowed for forcing. (This is the recovery message of No.4141.)

Cause Operation from the SENG

Remark Forcing function, Inter-SCS Safety Communication, SYS_FORCE_BD FB

No.4143

Message name Start of automatic scan period extension

Printing example SCS0101 Scan Period Extended from the Original Scan Period 100ms to 200ms

Meaning Automatic extension of the scan period of the application logic execution started. (In the above example, the original scan period of 100 ms was extended to 200 ms.)

Cause The application caused heavy load on the SCS.

Remark SYS_SCANEXT FB, automatic scan period extension

No.4144

Message name Cancellation of automatic scan period extension

Printing example SCS0101 Scan Period Recovered to the Original Scan Period 100ms

Meaning Automatic extension of the scan period of the application logic execution is cancelled. (In the above example, the scan period recovered to its original period of 100 ms.)

Cause The load on the SCS caused by the application was reduced.

Remark SYS_SCANEXT FB, automatic scan period extension

No.4145

Message name Abnormal calculation occurred

Printing example 1 SCS0101 Calculation Error (XXXXXX) Program=PG01

Printing example 2 SCS0101 Calculation Error (XXXXXX) Program=PG01 FU/FB=UFB01

Meaning Abnormal calculation occurred in the application logic.

XXXXXX indicates the type of abnormal calculation. The types are as follows:

Div by Zero :	Division by zero
Access to the Outside of Array :	Access to the outside of an array
FPU Overflow :	Overflow in the floating-point calculation
Cast Overflow :	Overflow in casting

At “Program=”, the name of the program (POU name) where the abnormal calculation occurred is indicated. If the abnormal calculation occurred in a user-defined FU/FB, the POU name of that FU/FB is indicated at “FU/FB=.”

Cause Error in the application

Remark SYS_CERR FB

No.4146

Message name Recovery from abnormal calculation

Printing example 1 SCS0101 Calculation Recover (XXXXXX) Program=PG01

Printing example 2 SCS0101 Calculation Recover (XXXXXX) Program=PG01 FU/FB=UFB01

Meaning Indicates a recovery from the abnormal calculation occurred in the application logic.

XXXXXX indicates the type of abnormal calculation. The types are as follows:

Div by Zero :	Division by zero
Access to the Outside of Array :	Access to the outside of an array
FPU Overflow :	Overflow in the floating-point calculation
Cast Overflow :	Overflow in casting

At “Program=”, the name of the program (POU name) where the abnormal calculation occurred is indicated. If the abnormal calculation occurred in a user-defined FU/FB, the POU name of that FU/FB is indicated at “FU/FB=.”

Cause The error in the application was corrected.

Remark SYS_CERR FB

No.4151

Message name Information of retainable data initialization

Printing example SCS0101 Retain Data Initialized

Meaning Retainable data have been initialized.

Cause

- Database with different CRC codes or generation time was offline-downloaded to the SCS.

- NVRAM (nonvolatile memory) has been initialized.

Action Set the setting values of the external communication function blocks with data retaining function again.

Remark Data retaining function, external communication function blocks with data retaining function (ECWR_B, ECWR_I, ECWR_R), ACCUM FB, AGA_R FB

No.4152

Message name Online change of scan period

Printing example SCS0101 Scan Period Changed to 200ms

Meaning The scan period of the application logic was changed by online change download.

Cause Operation from the SENG

Remark Online change download

No.4153

Message name Information of Inter-SCS Safety Communication data lock time-up

Printing example SCS0101 Inter-SCS Safety Communication Data Lock Elapsed the Specified Period = 08:00:00

Meaning Inter-SCS Safety Communication lock exceeded the time limit (8 hours in the above example) specified in SYS_FORCE_BD FB.

Action Check whether all Inter-SCS Safety Communication locks have been cancelled and cancel unnecessary locks.

Remark Forcing function, Inter-SCS Safety Communication, SYS_FORCE_BD FB

No.4154

Message name Information of forced cancellation of Inter-SCS Safety Communication data locks

Printing example SCS0101 All Inter-SCS Safety Communication Data Unlocked.

Meaning Locks of all the Inter-SCS Safety Communication data (reception/transmission) in the station were forcibly cancelled.

Cause Locks of all the Inter-SCS Safety Communication data were cancelled by using the SYS_FORCE_BD FB.

Remark Forcing function, Inter-SCS Safety Communication, SYS_FORCE_BD FB

No.4155

Message name Information of SCS Link Transmission status change.

Printing example SCS0101 SCS Link Transmission Data Status Set to TRUE Old=FALSE Stn(SCS)=03

Meaning The data status of SCS Link Transmission (such as from station 03) has been changed (For an example, changed from FALSE to TRUE). The (SCS) in the message text indicates the station type defined on the SCS Link Transmission builder.

Remark Forcing function

No.4156

Message name Information of SCS Link Transmission definition change

Printing example SCS0101 SCS Link Transmission Definition Changed

Meaning SCS Link Transmission definitions were changed by online change download.

Cause Online change download was executed from the SENG.

No.4157

Message name Information of SCS Link Transmission wiring change

Printing example SCS0101 SCS Link Transmission Wiring Changed

Meaning SCS Link Transmission wirings were changed by online change download.

Cause Online change download was executed from the SENG.

No.4158

Message name Information of SCS Link Transmission lock time-up

Printing example SCS0101 SCS Link Transmission Data Lock Elapsed the Specified Period = 08:00:00

Meaning SCS Link Transmission lock continued exceeding the time limit (8 hours in the above example) specified in SYS_FORCE_LT FB.

Action Check whether all SCS Link Transmission locks have been cancelled, and cancel unnecessary locks.

Remark Forcing function, SCS Link Transmission, SYS_FORCE_LT FB

No.4159

Message name Information of forced cancellation of SCS Link Transmission locks

Printing example SCS0101 All SCS Link Transmission Data Unlocked

Meaning Locks of all the locked SCS Link Transmission were forcibly cancelled.

Cause Locks of all SCS Link Transmission were cancelled by operation using SYS_FORCE_LT FB.

Remark Forcing function, SCS Link Transmission, SYS_FORCE_LT FB

No.4160

Message name Invalid password for Manual Operation FB

Printing example SCS0101 TAG001 Specified Invalid Password

Meaning The password string specified for Manual Operation FB (MOB_21, MOB_11, MOA) from the HIS is invalid.

Cause The password entered from the HIS and the password set in Manual Operation FB did not match.

Action	Enter the correct password for Manual Operation FB again.
Remark	Manual Operation FB (MOB_21, MOB_11, MOA)

No.4161

Message name	Information of Output IOM Shutdown
Printing example 1	SCS0101 All Output IOM Shutdown
Meaning 1	All output channels in the station were shut down by SYS_ALLSD.
Printing example 2	SCS0101 IOM Output Shutdown N-IO NODE 01 UNIT 01 SLOT 02
Meaning 2	The specified N-IO output module was shut down by SYS_N_IOSD. The location of the N-IO output module (N-IO node 1, unit 1, slot 2 in the above example) is also included in the message.
Printing example 3	SCS0101 Output IOM Shutdown NODE 01 SLOT 02
Meaning 3	The specified FIO output module was shut down by SYS_IOSD. The location of the output module (FIO node 1, slot 2 in the above example) is included in the message.
Remark	SYS_ALLSD, SYS_IOSD, SYS_N_IOSD

No.4162

Message name	Information of communication I/O definition change
Printing example 1	SCS0101 Communication Definition Changed
Printing example 2	SCS0101 Safety Subsystem Communication Definition Changed
Meaning	The communication I/O definitions of the communication module were changed by online change download.
Cause	Online change download was executed from the SENG.
Remark	Subsystem communication, safety subsystem communication

No.4163

Message name	Information of communication I/O wiring change
Printing example 1	SCS0101 Communication I/O Wiring Changed
Printing example 2	SCS0101 Safety Subsystem Communication I/O Wiring Changed
Meaning	The communication I/O wirings were changed by online change download.
Cause	Online change download was executed from the SENG.
Remark	Subsystem communication, safety subsystem communication

No.4164

Message name	Information of disabling security level change
Printing example	SCS0101 Security Levels Change Disabled
Meaning	The security level change of the SCS by a password-authenticated operation performed from SENG is disabled.
Remark	SYS_SEC_CTL FB

No.4165

Message name Information of enabling security level change

Printing example SCS0101 Security Levels Change Enabled

Meaning The security level change of the SCS by a password-authenticated operation performed from SENG is enabled.

Remark SYS_SEC_CTL FB

No.4166

Message name Information of communication module lock time-up

Printing example SCS0101 Communication Module Lock Elapsed the Specified Period = 08:00:00

Meaning The communication module lock continued exceeding the time limit (8 hours in the above example) specified in SYS_FORCE_SC FB.

Action Check whether all communication module locks have been cancelled, and cancel unnecessary locks.

Remark Forcing function, subsystem communication, SYS_FORCE_SC FB

No.4167

Message name Information of forced cancellation of communication module locks

Printing example SCS0101 All Communication Modules Unlocked

Meaning Locks of all communication modules were forcibly cancelled.

Cause Locks of all communication modules were cancelled by operation using SYS_FORCE_SC FB.

Remark Forcing function, subsystem communication, SYS_FORCE_SC FB

No.4168

Message name Information of tag name change by online change download

Printing example SCS0101 Online Change Download Tag Name = TAG001 Changed

Meaning The tag name (TAG001 in the above example) of FB was changed by online change download.

Cause Online change download was executed from the SENG.

Remark Password FB (PASSWD), override FB (OVR_B, OVR_I, OVR_R, OVR_IB, OVR_IR, GOV_B, and GOV_IB), manual operation FB (MOB_21, MOB_11, MOB_RS, and MOA), and FB for fire and gas devices (HSDTR and GASDTR)

No.4169

Message name NVRAM diagnosis error

Printing example SCS0101 RIGHT NVRAM Diagnosis Error

Meaning An error was detected during diagnosis of NVRAM (nonvolatile memory) in a CPU module (right side in the above example).

Cause NVRAM may be faulty.

Action Replace the applicable CPU module.

No.4170

Message name Flash memory diagnosis error

Printing example SCS0101 RIGHT Flash Memory Diagnosis Error

Meaning An error was detected during self-diagnosis of flash memory in a CPU module (right side in the above example).

Cause Part of data stored in flash memory was destroyed, or flash memory may be faulty.

Action If the SCS is in a single CPU module configuration, the SCS will not be able to start when this CPU restarts next time. It is necessary to change the CPU module right away.

If the SCS is configured with redundant CPU modules, the control will switch to the other module after detecting this error, and the module where the error occurs is restarted as a standby module.

If the error is caused by damage to the data in the flash memory, data in the control side will be copied to the standby module where the error occurs, and that module will then recover from abnormal to normal status.

If the error is caused by the physical damage of the flash memory, this system alarm will occur even after the damaged CPU is switched to standby. Under this circumstance, it is necessary to change the damaged CPU module.

No.4172

Message name Information of resource change by online change download

Printing example SCS0101 Online Change Download Resource Changed (Total POU=10)

Meaning The resource was changed by online change download. The resource defines total number of POU (10 in the above example).

Cause Online change download was executed from the SENG.

Action Check and confirm that the total number of POU indicated in this message is equal to the total number of POU indicated by Database Validity Check Tool.

No.4173

Message name Completion of writing to flash memory

Printing example SCS0101 Writing XXXXXX to Flash Memory Succeeded

Meaning Writing to flash memory in a CPU module was normally completed.

XXXXXX: Indicates the data written. The items of the data are as follows.

Security Password :	Security password
System Database :	System database
Integration Database :	Integration database
Variable Database :	Variable database
Difference Data :	Difference data

Cause When online change download from SENG to SCS was executed or the password was changed, data was normally written to flash memory.

No.4174

Message name Failed to write to flash memory

Printing example SCS0101 Writing XXXXX to Flash Memory Error

Meaning Write data error was detected during check at flash memory write in a CPU module.

XXXXXX: Indicates the data attempted to be written. The items of the data are as follows.

Security Password :	Security password
System Database :	System database
Integration Database :	Integration database
Variable Database :	Variable database
Difference Data :	Difference data

Cause Flash memory may be faulty.

Action If the SCS is in a single CPU module configuration, the CPU module continues the operation even if this error occurs. However, the SCS will not start properly when this CPU module restarts next time. It is necessary to change the CPU module as soon as possible.

On a dual-redundant CPU module configuration SCS, if this writing error to flush memory occurs on one of the CPU modules, the CPU module will be failed and operation is continued with the other CPU module. It is necessary to change the failed CPU module right away. If writing to the flash memories in both CPU modules fails, the SCS will not be able to start when the CPU restarts. Under this circumstance, it is necessary to change both CPU modules right away.

Remark Flash memory diagnosis

No.4175

Message name Failed to update external communication data

Printing example SCS0101 External Data Refresh Failed

Meaning The SCS has failed to update external communication data. This data is referenced in communications with CENTUM stations and Modbus, so when this error occurs, data will not be updated in those stations.

Cause The CPU processing time allocated for the external communication function processing was not sufficient. As a result, processing to update the external communication data is not performed.

Action Reduce the communication load on the SCS. If this error occurs regularly, review the balance between the application logic amount and the scan period.

No.4177

Message name Information of SCS security level change

Printing example SCS0101 Security Level Changed to 1

Meaning The security level of the SCS was changed (1 in the above example).

Cause The security level of the SCS was changed. The security level can be changed from the SENG or SYS_SECURE FB.

Note Be sure to revert the security level to “2.”

No.4178

Message name Information of security level time-up

Printing example SCS0101 Security Level = 1 Elapsed the Specified Period = 08:00:00

Meaning The security level is set to “1” for the duration exceeding the time limit (8 hours in the above example) specified in SYS_SECURE FB.

Cause The security level has not been reverted.

Action Revert the security level to “2.”

Remark SYS_SECURE FB

Note When the security level is “0,” the message is not generated.

No.4179

Message name Information of communication I/O module output enable operation

Printing example SCS0101 Communication Modules Output Enabled

Meaning The communication modules are enabled for output.

Remark I/O Channel Status dialog box, SYS_STAT_SC FB

Note This message is irrelevant to enabling the output of output modules. You can be notified of the output enable operation for output modules by Message No. 4181.

No.4180

Message name Information of password change

Printing example SCS0101 Security Level = 1 Password was Changed

Meaning The password for the SCS security level (1 in the above example) was changed.

Cause The password was changed from the SENG.

Note The message of No. 4173 is also generated after this alarm.

No.4181

Message name Information of output enable operation

Printing example SCS0101 Output Enabled

Meaning The output enable operation for the SCS was performed from the SENG.

When all the output module’s output channels go into “output-enabled” state, the SCS’s operating mode changes to “Running.”

Remark I/O Channels Status dialog box, SYS_STAT_FB

No.4182

Message name Information of FIO output module start operation

Printing example SCS0101 IOM Started NODE 01 SLOT 02

Meaning An FIO output module (FIO node 1, slot 2 in the above example) was started from the SENG.

Remark SCS State Management window

No.4183

Message name Request to upload SOE to SENG

Printing example SCS0101 SOE Save Request

Meaning This notification prompts to upload the event information collected on the SCS to SENG.

Cause This message is generated every time 12,000 events have occurred on the SCS.

Action Start SOE Viewer on SENG and upload events from SCS.

Remark SOER function

Note This system alarm is generated even if SOE Viewer is started periodically. Events can be uploaded from the SCS by starting SOE Viewer and displaying the latest event.

No.4184

Message name Notification on saving SOE trip signal file in SCS

Printing example SCS0101 SOE Trip Signal File No.= 01 Saved

Meaning The SOE trip signal file (No. 01 in the above example) was saved in SCS.

Action Start SOE Viewer on SENG and upload the events in the file.

Remark SOER function

Note When uploading the events is complete, the trip signal files need to be reset. Up to two trip signal files can be held in the SCS. The trip signal files can be reset by starting the Message Cache Tool and initializing the trip information.

No.4185

Message name Information of variable value change

Printing example 1 SCS0101 Variable Set to 10.0 Old = 5.0 Variable = VAR001

Printing example 2 SCS0101 Variable Set to TRUE Old = FALSE Variable = VAR001 NODE 1 SLOT 2

Printing example 3 SCS0101 Variable Set to TRUE Old = FALSE Variable = VAR001 N-IO NODE 01 UNIT 01 SLOT 02 CH 03

Printing example 4 SCS0101 Variable Set to TRUE Old = FALSE Variable = VAR001 NODE 1 SLOT 2 CH 3

Printing example 5 SCS0101 Variable Set to TRUE Old = FALSE Variable = VAR001 Stn=02 No=025

Meaning The value of the variable (VAR001 in the above example) was changed from the SENG. For a communication I/O, a variable corresponds to the communication module location (FIO node 1, slot 2 in printing example 2) is also included in the message. For an I/O variable, the channel location corresponding to the variable (N-IO node 1, unit 1, slot 2, channel 3 in printing example 3, and FIO node 1, slot 2, channel 3 in printing example 4) is also included in the message.

The VAR001 in the above printing example 5 is the instance name of the function block that accesses the data of SCS Link Transmission. The related station number and bit number are also printed.

Remark Forcing function

No.4186

Message name Information of lock time-up

Printing example SCS0101 Lock Elapsed the Specified Period = 08:00:00

Meaning Lock continued exceeding the time limit (8 hours in the above example) specified in SYS_FORCE FB.

Action Check whether all locks have been cancelled, and cancel unnecessary locks.

Remark Forcing function, SYS_FORCE FB

No.4187

Message name Information of forced cancellation of locks

Printing example SCS0101 All Variables Unlocked

Meaning Locks of all variables were forcibly cancelled.

Cause Locks of all variables were cancelled by operation using SYS_FORCE FB.

Remark Forcing function, SYS_FORCE FB

No.4188

Message name Start of online change download

Printing example SCS0101 Online Change Download (System Database) Start

Meaning Online change download to the system database was started.

Remark Download function

No.4189

Message name Completion of online change download

Printing example SCS0101 Online Change Download (System Database) Complete

Meaning Online change download to the system database was normally completed.

Remark Download function

No.4190

Message name Online change download error

Printing example SCS0101 Online Change Download (System Database) Error = 5340-0001

Meaning Online change download to the system database ended with an error.

Cause/Action Causes and actions vary depending on the error code.

Table 2.1-6 Message No. 4190 - Error Causes and Actions

Error code	Cause	Action
5340-****	The security level stays “2.”	Set the security level to “1” and then execute online change download again.
Others	Internal error	Record the message content and report to Yokogawa’s service department.

No.4191

Message name Completion of I/O definition rewriting

Printing example 1 SCS0101 IOM Definition Changed N-IO NODE 01 UNIT 01 SLOT 02

Meaning 1 I/O definition was changed by online change download to the system database. The location of the I/O module (N-IO node 1, unit 1, slot 2 in the example) is also included in the message.

If the numbers following "SLOT" and "UNIT" are 00, it means that the node definition information has been changed. The node definition information is changed when you do the following:

- Change comments of the node
- Operation such as addition and deletion of the I/O modules including addition/deletion of the node

If only the number following "SLOT" is 00, it means that the unit definition information has been changed. The unit definition information is changed when you do the following:

- Change base plates
- Operation such as addition and deletion of the I/O modules

Printing example 2 SCS0101 IOM Definition Changed NODE 01 SLOT 02

Meaning 2 I/O definition was changed by online change download to the system database. The location of the I/O module (FIO node 1, slot 2 in the example) is also included in the message.

If the number following "SLOT" is 00, it means that the node definition information has been changed. The node definition information is changed when you do the following:

- Change comments of the node
- Add or delete I/O modules of the node
- Change slots of the I/O modules of the node
- Change the model of the I/O modules of the node

No.4192

Message name Information of override state time-up

Printing example SCS0101 Override Elapsed the Specified Period = 08:00:00

Meaning Override continued exceeding the time limit (8 hours in the above example) specified in SYS_OVR FB.

Action Check whether overrides were released, and release unnecessary overrides.

Remark SYS_OVR FB

No.4193

Message name Information of forced release of all overrides

Printing example SCS0101 All Overrides Released

Meaning The overrides for all variables were forcibly released.

Cause The overrides for all variables were forcibly released by operation using SYS_OVR FB.

Remark SYS_OVR FB

No.4194

Message name Information of override enabled state time-up

Printing example SCS0101 Enabled OVR FB Elapsed the Specified Period = 08:00:00

Meaning The override enabled state continued exceeding the time limit (8 hours in the above example) specified in SYS_OVR FB.

Cause Check override FB in the override enabled state, and release unnecessary override enabled state.

Remark SYS_OVR FB

No.4195

Message name Information of communication I/O data status change

Printing example SCS0101 Communication Data Status Set to TRUE Old = FALSE NODE 01 SLOT 02 Definition 001

Meaning The value of data status of communication I/O (FIO node 1, slot 2, communication definition 1 in the above example) was changed (from FALSE to TRUE in the above example) from the SENG.

Remark Forcing function

No.4196

Message name Invalid password for PASSWD FB

Printing example SCS0101 TAG001 PASSWD FB Specified Invalid Password

Meaning The password string specified for PASSWD FB from the HIS is invalid.

Cause The password entered from the HIS and the password set in PASSWD FB did not match.

Action Specify the correct password for PASSWD FB and enter it again.

Remark PASSWD FB

No.4197

Message name Information on active PASSWD FB time-up

Printing example SCS0101 Activated PASSWD FB Elapsed the Specified Period = 10:00:00

Meaning PASSWD FB has been active exceeding the time limit (10 hours in the above example) specified in SYS_PSWD.

Action Deactivate PASSWD FB that is not required to be active.

Remark SYS_PSWD FB

No.4198

Message name Information on forced reset of PASSWD FB

Printing example SCS0101 All PASSWD FB Reset to OFF

Meaning The outputs of all active PASSWD FBs were forcibly set to OFF.

Cause The outputs of all active PASSWD FBs were forcibly inactivated (reset to OFF) by operation using SYS_PSWD FB.

Remark SYS_PSWD FB

No.4199

Message name Override communication error

Printing example SCS0101 TAG001 Override Communication Error (Instance = OVR001)

Meaning Despite an attempt to operate override on the FB OVR001 (in the above example) with the tag name TAG001 (in the above example) from HIS, communication error has occurred.

Cause A temporary communication error occurred, and the SCS detected the problem of the communication data.

Action Execute override operation again.

Remark Override FB

No.4201

Message name Information of node maintenance port enable operation

Printing example SCS0101 NODE Maintenance Port Enable N-IO NODE 01

Meaning An operation to enable the maintenance port of the N-IO node (1 in the above example) of the safety control station (station name = SCS0101) was performed.

No.4202

Message name Information of node maintenance port disable operation

Printing example SCS0101 NODE Maintenance Port Disable N-IO NODE 01

Meaning An operation to disable the maintenance port of the N-IO node (1 in the above example) of the safety control station (station name = SCS0101) was performed.

No.4203

Message name Information of node maintenance port disable operation for all N-IO nodes

Printing example SCS0101 NODE Maintenance Port Disable All N-IO NODE

Meaning An operation to disable the maintenance ports of all N-IO nodes of the safety control station (station name = SCS0101) was performed.

No.4205

Message name Information of node maintenance port enabled state

Printing example SCS0101 NODE Maintenance Port Enabled N-IO NODE 01

Meaning The maintenance port of the N-IO node (1 in the above example) of the safety control station (station name = SCS0101) was enabled.

No.4206

Message name Information of node maintenance port disabled state

Printing example SCS0101 NODE Maintenance Port Disabled N-IO NODE 01

Meaning The maintenance port of the N-IO node (1 in the above example) of the safety control station (station name = SCS0101) was disabled.

No.4207

Message name Information of HSDTR FB or GASDTR FB reset operation

Printing example 1 SCS0101 TAG001 Reset Requested (Reset ID = 1)

Meaning 1 An operation to reset the HSDTR FB or GASDTR FB that corresponds to the tag name (TAG001 in the above example) was performed from HIS. For a reset operation for GASDTR FB, information in the parentheses “(Reset ID = 1)” is not displayed.

Printing example 2 SCS0101 DTR001 Reset Requested (Reset ID = 1)

Meaning 2 An operation to reset HSDTR FB or GASDTR FB (DTR001 in the above example) was performed from an external switch. For a reset operation for GASDTR FB, information in the parentheses “(Reset ID = 1)” is not displayed.

Remark HSDTR FB, GASDTR FB

No.4208

Message name Communication error in HSDTR FB or GASDTR FB reset operation

Printing example SCS0101 TAG001 Reset Request Communication Error

Meaning An operation to reset the HSDTR FB or GASDTR FB that corresponds to the tag name (TAG001 in the above example) was performed from HIS, but resulted in a communication error.

Cause A temporary communication error occurred, and the SCS detected the problem of the communication data.

Action Perform the reset operation again.

Remark HSDTR FB, GASDTR FB

No.4209

Message name Safety subsystem communication error

Printing example SCS0101 SS-SCOM Error FIO NODE 01 SLOT 01 PORT 01 CG01 Code=5A01

Meaning An error occurred in the indicated fire and gas communication (in the above example, FIO node 1, slot 1, port 1, communication group name CG01).

Communication group name is a name that is set in the Communication Group column of the Safety Communication I/O Editor.

Cause This message is generated when the following errors are detected: Check the error codes for more detail.

- Failure of fire and gas devices, such as gas detectors (GS01)
- The safety control station received abnormal safety data from a fire and gas device.
- The fire and gas device could not receive safety data from the safety control station properly.
- Response to a request from the safety control station to the fire and gas device could not be received.
- Initialization of fire and gas communication started due to online change downloading for the SCS.

Action Take an action based on the error message. Message No.4211 may be generated at the same time. If generated, also take action for No.4211.

Remark Safety subsystem communication

Note If a recovery message is not generated even after removing the possible cause of the error, the alarm is active for another cause. Check the cause of error in the IOM Report, and remove it.

Error code The error code represents the type of error. The following table describes the error codes.

Table 2.1-7 Message No. 4209 - Error Code List

Code (hexa-decimal)	Error	Cause	Action
5A01	A fire and gas device failed.	A fire and gas device failed.	Replace the fire and gas device.
5A02	A problem occurred in the fire and gas communication path, and the safety control station received bad safety data from the fire and gas device.	The safety layer of the fire and gas device is not operating properly.	Contact the manufacturer of the fire and gas device.

Continues on the next page

Table 2.1-7 Message No. 4209 - Error Code List (Table continued)

Code (hexa-decimal)	Error	Cause	Action
5A03	A problem occurred in the fire and gas communication path, and the fire and gas device could not receive safety data from the safety control station.	• A problem occurred in the communication path between the safety control station and fire and gas device. • There is an error in the PROFIsafe setting of ProSafe-RS or the fire and gas device.	• Check the communication path between the safety control station and fire and gas device. • Check the PROFIsafe setting of ProSafe-RS or the fire and gas device. • If a message No.4211 is generated at the same time, the cause may be an abnormality in the communication path. Refer to the action for message No.4211 as well.
5A04	A problem occurred in the fire and gas communication path, and the response to a request from the safety control station to the fire and gas device could not be received.	• A problem occurred in the communication path between the safety control station and fire and gas device. • There is an error in the PROFIsafe setting of ProSafe-RS or the fire and gas device. • The safety layer of the fire and gas device is not operating properly.	• Check the communication path between the safety control station and fire and gas device. • Check the PROFIsafe setting of ProSafe-RS or the fire and gas device. • Contact the manufacturer of the fire and gas device.
5A05	The safety control station started initialization of fire and gas communication.	Online change download was performed for the safety control station after changing definitions regarding fire and gas communication.	If the recovery alarm is not generated even after the expected PROFIsafe initialization time has elapsed, check the error code in the IOM Report and take an action based on the error code.

No.4210

Message name Recovery from safety subsystem communication error

Printing example SCS0101 SS-SCOM Recover FIO NODE 01 SLOT 01 PORT 01 CG01

Meaning Fire and gas communication error has been recovered. (This is a recovery message for No. 4209.)

Remark Safety subsystem communication

No.4211

Message name Safety subsystem communication path error

Printing example SCS0101 SS-SCPATH Error FIO NODE 01 SLOT 01 PORT 01 CG01 Code=A3B0

Meaning An error occurred in the communication path between the indicated fire and gas communication module and the safety subsystem device (in the above example, FIO node 1, slot 1, port 1, communication group name CG01).

Communication group name is a name that is set in the Communication Group column of the Safety Communication I/O Editor.

Cause This message is generated when the following errors are detected:

- Error in the definition information downloaded in the fire and gas communication module
- Error in the communication with PROFINET IO-Device
- Error in Field Wireless Management Station (YFGW410)
- Error in Field Wireless Access Point (YFGW510)

Action Take an action based on the error message. Message No.4209 may be generated at the same time. If generated, also take action for No.4209.

Remark Safety subsystem communication

Note If a recovery message is not generated even after removing the possible cause of the error, the alarm is active for another cause. Check the cause of error in the IOM Report, and remove it.

Error code The error code represents the type of error. The table explains each error code and the action you can take to fix the error.

Table 2.1-8 Message No. 4211 - Error Code List

Code (hexa-decimal)	Error	Cause	Action
A393	BAD_BY_DEVICE received from PROFINET IO-Device	Error occurred in PROFINET IO-Device.	Refer to the manual of PROFINET IO-Device.
A394	BAD_BY_SLOT received from PROFINET IO-Device	Error occurred in PROFINET IO-Device.	Refer to the manual of PROFINET IO-Device. This error code is not reported when the PROFINET IO-Device is YFGW410.
A395	BAD_BY_SUBSLOT received from PROFINET IO-Device	When the PROFINET IO-Device is YFGW410, possible causes are as follows: • GS01 has not joined the wireless network, or GS01 is not sending data to YFGW410. • There is an error in the PROFINET setting of ProSafe-RS or YFGW410. When the PROFINET IO-Device is not YFGW410: • Refer to the manual of PROFINET IO-Device.	Take the following actions when the PROFINET IO-Device is YFGW410: • Refer to the manual of YFGW410. • Check the PROFINET setting of ProSafe-RS or YFGW410. When the PROFINET IO-Device is not YFGW410: • Refer to the manual of PROFINET IO-Device.
A396	Status other than BAD_BY_DEVICE, BAD_BY_SLOT, and BAD_BY_SUBSLOT received from PROFINET IO-Device	• Error occurred in S2LP131. • A problem occurred in the communication path between S2LP131 and PROFINET IO-Device. • Error occurred in PROFINET IO-Device.	• Replace the S2LP131. • Check the communication path between S2LP131 and PROFINET IO-Device. • Refer to the manual of PROFINET IO-Device.
A3B0	No response from PROFINET IO-Device	• A problem occurred in the communication path between S2LP131 and PROFINET IO-Device. • There is an error in the PROFINET setting of ProSafe-RS or PROFINET IO-Device.	• Check the communication path between S2LP131 and PROFINET IO-Device. • Check the PROFINET setting of PROFINET IO-Device.

Continues on the next page

Table 2.1-8 Message No. 4211 - Error Code List (Table continued)

Code (hexa-decimal)	Error	Cause	Action
A3B7	Invalid data type set in Safety Communication I/O Editor	Invalid data type is set in the Data Type column of the Safety Communication I/O Editor.	Check the data type that is set in the Data Type column of the Safety Communication I/O Editor.
A3E9	YFGW410 control right switchover	Error occurred in the active YFGW410 of redundant YFGW410.	Check the previously active YFGW410, which is now in the standby state. Note that, for a control right switchover, a recovery message is generated after two seconds.
A3EA	Error in the GW1 system of YFGW410	Error occurred in the GW1 system of YFGW410.	Check the YFGW410 for the GW1 system. For the action to be taken for YFGW410, refer to the manual or YFGW410.
A3EB	Error in the GW2 system of YFGW410	Error occurred in the GW2 system of YFGW410.	Check the YFGW410 for the GW2 system. For the action to be taken for YFGW410, refer to the manual or YFGW410.
A3EC	Unstable active/standby state of YFGW410	Error occurred in redundant YFGW410.	Check the YFGW410. For the action to be taken for YFGW410, refer to the manual or YFGW410.
A3F0	YFGW510 error	• YFGW510 failed. • A problem occurred in the communication path between YFGW510 and YFGW410. • There is an error in the YFGW510 setting.	• Replace the YFGW510. • Check the communication path between YFGW510 and YFGW410. • Refer to the manual of YFGW510.

No.4212

Message name Recovery from safety subsystem communication path error

Printing example SCS0101 SS-SCPATH Recover FIO NODE 01 SLOT 01 PORT 01 CG01

Meaning The communication between the indicated fire and gas communication module and the safety subsystem device recovered. (This is a recovery message for No. 4211.)

Remark Safety subsystem communication

No.4213

Message name Safety subsystem communication I/O lock

Printing example SCS0101 Safety Subsystem Communication I/O Locked NODE 01 SLOT 02 CG01

Meaning Specified fire and gas communication I/O (in the above example, FIO node 1, slot 2, communication group name CG01) was locked by operation from the SENG. Communication group name is a name that is set in the Communication Group column of the Safety Communication I/O Editor.

Remark Forcing function, safety subsystem communication

Note Be sure to unlock the safety subsystem communication I/O definition that was locked.

No.4214

Message name Cancellation of safety subsystem communication I/O lock

Printing example SCS0101 Safety Subsystem Communication I/O Unlocked NODE 01 SLOT 02 CG01

Meaning Specified fire and gas communication I/O (in the above example, FIO node 1, slot 2, communication group name CG01) was unlocked by operation from the SENG.

Communication group name is a name that is set in the Communication Group column of the Safety Communication I/O Editor.

Remark Forcing function, safety subsystem communication

No.4215

Message name Number of safety subsystem communication I/O locks exceeded

Printing example SCS0101 Number of Locks about Safety Subsystem Communication I/O Exceeds the Limit = 3

Meaning The total number of locked safety subsystem communication I/O exceeded the limit count (3 in the above example) specified in SYS_FORCE_SF FB.

Cause This is an operation from the SENG. The number of locks is too many.

Action Unlock some safety subsystem communication I/O.

Remark Forcing function, safety subsystem communication, SYS_FORCE_SF FB

Note Unlock safety subsystem communication I/O within the limit count.

No.4216

Message name Recovery from exceeded number of safety subsystem communication I/O locks

Printing example SCS0101 Number of Locks about Safety Subsystem Communication I/O Within the Limit = 3

Meaning The total number of locked safety subsystem communication I/O fell below the limit count (3 in the above example) specified in SYS_FORCE_SF FB. (This is a recovery message for No. 4215.)

Cause This is an operation from the SENG.

Remark Forcing function, safety subsystem communication, SYS_FORCE_SF FB

No.4217

Message name Safety subsystem communication I/O data status change

Printing example SCS0101 Safety Subsystem Communication I/O Status Set to TRUE Old = FALSE NODE 01 SLOT 02 CG01

Meaning Data status value of fire and gas communication I/O (in the above example, FIO node 1, slot 2, communication group name CG01) was changed from the SENG. (Changed from FALSE to TRUE in the above example.)

Communication group name is a name that is set in the Communication Group column of the Safety Communication I/O Editor.

Remark Forcing function, safety subsystem communication

No.4219

Message name Safety subsystem communication I/O lock time-up

Printing example SCS0101 Safety Subsystem Communication I/O Lock Elapsed the Specified Period = 08:00:00

Meaning Fire and gas communication I/O lock continued exceeding the time limit (8 hours in the above example) specified in SYS_FORCE_SF FB.

Action Check whether all fire and gas communication I/O locks have been canceled, and cancel unnecessary locks.

Remark Forcing function, safety subsystem communication, SYS_FORCE_SF FB

No.4220

Message name Forcible cancellation of all safety subsystem communication I/O locks

Printing example SCS0101 All Safety Subsystem Communication I/O Unlocked

Meaning Locks of all safety subsystem communication I/O were forcibly canceled.

Cause Locks of all safety subsystem communication I/O were canceled by operation using SYS_FORCE_SF FB.

Remark Forcing function, safety subsystem communication, SYS_FORCE_SF FB

No.4221

Message name Alarm for the operation data reset switch of CPU module

Printing example SCS0101 RIGHT Operation Data Reset Switch Alarm

Meaning The operation data reset switch of the CPU module (right side in the above example) in the safety control station (station name = SCS0101) remains in “RESET” status.

Cause The operation data reset switch is in “RESET” status.

Action Change the status of operation data reset switch to “HOLD”.

No.4222

Message name Recovery from alarm for the operation data reset switch of CPU module

Printing example SCS0101 RIGHT Operation Data Reset Switch Recover

Meaning The operation data reset switch of the CPU module (right side in the above example) in the safety control station (station name = SCS0101) became in “HOLD” status. (This is a recovery message of No.4221.)

3. Details of Output Messages in Common with CENTUM

This section describes the details of output messages used in common with CENTUM.

3.1 Safety Control Station Error Occurrence and Recovery Messages (Message Numbers 0001 through 0094)

This section describes the messages relating to errors that occur on the safety control station. There are messages relating to occurrences of errors and recoveries from errors.

No.0001

Message name Reset start of safety control station

Printing example SCS0101 RIGHT Manual Reset Start

Meaning A CPU module (right side in the above example) of the safety control station (station name = SCS0101) was reset and started.

Cause Start operation from the SENG or from the front switch of the CPU module

No.0003

Message name Safety control station automatic reset start

Printing example SCS0101 RIGHT Automatic Reset Start

Meaning An error occurred in the displayed CPU module (right side in the above example) of the safety control station (station name=SCS0101), which caused the safety control station to be automatically reset started.

Cause CPU module is faulty.

No.0005

Message name Power ON initial cold start of safety control station

Printing example SCS0101 Power ON (Cold Start)

Meaning The safety control station (station name = SCS0101) performed the initial cold start processing after it was powered ON.

Cause Recovery from power failure

Note The safety control station always performs the initial cold start processing after recovery from power failure.

No.0009

Message name Transfer of control right of safety control station

Printing example SCS0101 Control Transfer

Meaning A transfer of control right occurred in the redundant safety control station (station name = SCS0101).

Cause

- The CPU module on one side was stopped.
- An error occurred in the CPU module on one side.

Action The CPU module on the standby side takes over control. Replace the CPU module that was stopped.

No.0011

Message name Fail information of safety control station

Printing example SCS0101 RIGHT Fail (xxxxxxxx Code= yyyy yyyy yyyy yyyy)

Meaning A CPU module (right side in the above example) of the safety control station (station name = SCS0101) failed.

Cause The causes are indicated by “causes (xxxxxxxx)” and a code. For more information, see the table.

Action If the CPU module that stopped is operating normally after automatic restart, continue operation. If the CPU module that stopped does not recover after automatic restart, replace the CPU module.

Table 3.1-1 Message No. 0011 - Causes

Item	Causes xxxxxxxx	Code (hex 16 digits) yyyy yyyy yyyy yyyy	Description	Auto restart
CPU module stopped	SW STOP	-	Stop by operation of the front switch of the CPU module	No
	V STOP		Stop instruction via control bus	No
	DC FAIL	-	Stop due to power failure	No
		(*1)	Transient error detection	Yes
	CPU DOWN	(*1)	An error occurred during CPU module error check.	Yes
	SELF-STOP		Stop after software detected an error	No
	UN-KNOWN		Stop due to unknown cause	No
	RESTART		Restart after software detected an error	Yes

*1: Refer to the table “Cause and Solution for Each Code.”

Table 3.1-2 Cause and Solution for Each Code

Code (hex 16 digits) yyyy yyyy yyyy yyyy	Cause	Solution
0001 yyyy 0001 00yy	This message occurs when there is a mismatch between the outputs of the two main processors in the processor module.	If this error message is displayed, report the display contents of causes (xxxxxxxx) and the code to Yokogawa’s service department. If the processor module restarts and returns to normal after issuing this alarm, continue to use the module.
0001 yyyy 0002 y000	This message occurs when there is no output from one main processor when comparing the output between two main processors in the processor module.	
0100 yyyy 0000 2000 0001 yyyy 0000 A000	This message occurs when a transient error due to a soft error is detected in the processor module.	
0000 5090 yyyy yyyy	Division by zero occurred when running the application logic.	Check to see if the application logic contains division by zero or not, and correct the application logic if it contains.
0000 5091 yyyy yyyy	The application logic is trying to access an array datum beyond the scope of the array.	Check the application and find out which logic program is accessing the out-of-range array data and correct the error.

Continues on the next page

Table 3.1-2 Cause and Solution for Each Code (Table continued)

Code (hex 16 digits) yyyy yyyy yyyy yyyy	Cause	Solution
0000 50A9 yyyy yyyy	The database inconsistence is detected. It may be caused by restarting the SCS without releasing the brake point.	Run offline downloading.
4000 3BF1 0255 8082 (*1)	The firmware (Revision F4) in the CPU module is too old to support the system with Optical ESB Bus Repeater modules.	For a system that contains Optical ESB Bus Repeater modules, the firmware of CPU with the proper revision number should be used.
4000 3BF1 yyyy yyyy	An error has been detected in the I/O unit of the CPU module. SCSV1-S : There may be a failure in the I/O unit of the CPU module. SCSP2-S, SCSP3-S, SCSL2-S: There may be a failure in the I/O unit of the CPU module or the I/O communication is posing heavy load on the CPU.	If one of the redundant CPU modules has stopped, message No. 0787 is generated at the same time. Refer to the explanation of message No. 0787.
0000 5010 yyyy yyyy	The CPU model and station model are inconsistent.	Match the CPU model and station model with each other.
FFFF 000B 0000 000F	The calculation in a running application overflowed.	Check the application and find out what caused the calculation overflow and then modify it.
Others	Others	If this error message is displayed, report the display contents of causes (xxxxxxxx) and the code to Yokogawa's service department.

*1: This code is not generated in SCSP2-S, SCSP3-S, and SCSL2-S.

No.0013

Message name AC power supply failure of safety control station

Printing example SCS0101 AC Fail (Time 05.02.01 18:45)

Meaning AC power of the safety control station (station name = SCS0101) failed and was then recovered. The date and time indicated are when the power failed. This message is output after the power is recovered.

Cause The voltage of AC power supply dropped, or a power failure occurred.

Note The SCS has been initialized and then started.

No.0015

Message name Self-diagnosis error of clock inside CPU module

Printing example SCS0101 RTC Diagnose Error Code=0001

Meaning An error was detected during self-diagnosis of the clock inside the safety control station (station name = SCS0101).

Code=0001: Check pattern mismatch

Code=0002: Inappropriate date/time value

Code=0003: Date/time not updated

Action Replace the CPU module.

No.0017

Message name ROM checksum error of CPU module

Printing example SCS0101 RIGHT ROM Sum Check Error

Meaning A ROM checksum error was detected in the indicated CPU module (right side in the above example) of the safety control station (station name = SCS0101).

Action Replace the CPU module.

No.0021

Message name Internal task error of safety control station

Printing example SCS0101 Internal Error TASK=TSK1 Code=100 Error=1000 - E0F0

Meaning An error state was detected during the execution of a task (TSK1 in the above example) in the safety control station (station name = SCS0101). “TASK”, “Code” and “Error” indicate detailed error information.

Cause This is a software problem.

Action Report the message content to Yokogawa’s service department.

No.0023

Message name Mapping block fatal error

Printing example SCS0101 Block TAG001 Return Error 8E04 and stop

Meaning An execution disabled error was detected during the execution of a mapping block (TAG001 in the above example) in the safety control station (station name = SCS0101).

Cause There is a problem in the integration DB. “Error” indicates detailed error information.

Action Report the message content to Yokogawa’s service department.

No.0025

Message name Function control word error

Printing example SCS0101 No Block Control Word for Block Type=1804

Meaning The internal program that corresponds to the block type code of the safety control station (station name = SCS0101) does not exist. “Type” indicates detailed internal information.

Cause This is an internal error at task initialization.

Action Report the message content to Yokogawa’s service department.

No.0027

Message name Mapping block record information error

Printing example SCS0101 TAG001 Block Bad Record No = 3

Meaning There is a bad record in the mapping block (TAG001 in the above example) of the safety control station. “No” indicates the bad record number in the database.

Cause The mapping block and the record block number do not match.

Action Report the block type and record number where an error occurred to Yokogawa's service department.

Note Do not perform online change download after this alarm occurred.

No.0033

Message name Online downloading abnormal end

Printing example SCS0101 Online Download Error Code=9402 - 0000

Meaning Online change download of the safety control station (station name = SCS0101) ended with an error. "Error Code" indicates detailed internal information.

Cause/Action Perform the appropriate action based on the cause that is indicated for the detailed error codes.

Table 3.1-3 Message No. 0033 - Error Code List

Code	Error Contents	Cause	Action
9402 9403 9404 9405	Online change downloading abnormal end	The SCS was reset and started during online change download.	Execute offline download.
Others	Internal error	Internal error	Report the display content of the code to Yokogawa's service department.

No.0041

Message name Safety control station fan alarm

Printing example SCS0101 Fan (SCU N1) Alarm

Meaning A cooling fan of the safety control station (station name = SCS0101) is abnormal. One of the following items is displayed in the parentheses in the above example.

SCU N1: Left side fan

SCU N2: Right side fan

Cause The cooling fan stopped or its revolution is abnormal.

Action Replace the failed fan unit.

Remark HKU function

No.0042

Message name Recovery from safety control station fan alarm

Printing example SCS0101 Fan(SCU N1) Recover

Meaning The cooling fan of the safety control station (station name = SCS0101) recovered. The content in the parentheses in the above example is the same as message No. 0041. (This is a recovery message of No. 0041.)

Remark HKU function

No.0043

Message name Safety control station temperature alarm

Printing example SCS0101 Temperature(RIGHT BATTERY) Alarm

Meaning This is a temperature rise alarm of the safety control station (station name = SCS0101). One of the following items is displayed in the parentheses in the above example.

RIGHT BATTERY:	Battery of the right side CPU module
LEFT BATTERY:	Battery of the left side CPU module
AIR IN:	Air inlet
AIR OUT:	Air outlet

Cause The CPU module temperature exceeded the specified value.

Action After checking the operation of the cooling fans, report to Yokogawa's service department as necessary.

Remark HKU function

No.0044

Message name Recovery from safety control station temperature alarm

Printing example SCS0101 Temperature(RIGHT BATTERY) Recover

Meaning The temperature of the safety control station (station name = SCS0101) recovered normally. The content in the parentheses in the above example is the same as message No. 0043. (This is a recovery message of No. 0043.)

Remark HKU function

No.0045

Message name Power supply module alarm of safety control station

Printing example SCS0101 RIGHT PSU Alarm

Meaning The power supply module of a CPU node (right side in the above example) of the safety control station (station name = SCS0101) is abnormal.

Cause Power supply module failure

Action Replace the applicable power supply module.

No.0046

Message name Recovery from power supply module alarm of safety control station

Printing example SCS0101 RIGHT PSU Recover

Meaning The power supply module of a CPU node (right side in the above example) of the safety control station (station name = SCS0101) recovered normally. (This is a recovery message of No. 0045.)

No.0047

Message name Battery alarm of CPU module

Printing example SCS0101 RIGHT Battery Alarm

Meaning An error occurred on the battery of the CPU module (right side in the above example) in the safety control station (station name = SCS0101.)

Cause If the CPU module has a battery ON/OFF switch, the battery failed or the switch was turned “OFF.” If the CPU module does not have a battery ON/OFF switch, the battery failed.

Action If the CPU module has a battery ON/OFF switch, check that the switch is turned “ON.” If the above message is generated even though the switch is “ON”, replace the battery.

If the CPU module does not have a battery ON/OFF switch, replace the battery.

Remark HKU function

No.0048

Message name Recovery from battery alarm of CPU module

Printing example SCS0101 RIGHT Battery Recover

Meaning A battery of the CPU module (right side in the above example) of the safety control station (station name = SCS0101) recovered normally. (This is a recovery message of No. 0047.)

Remark HKU function

No.0053

Message name Safety control station cabinet temperature alarm

Printing example SCS0101 Temperature Alarm N-IO NODE 01 Temp(HI)

Meaning The temperature in the cabinet storing N-IO node 1 of the safety control station (station name = SCS0101) is out of the normal range. One of the following items is displayed in the parentheses in the above example.

HI: High Alarm

LO: Low Alarm

Action After checking the cooling fans of the applicable cabinet, report to Yokogawa’s service department as necessary.

No.0054

Message name Recovery from safety control station cabinet temperature alarm

Printing example SCS0101 Temperature Recover N-IO NODE 01 Temp(HI)

Meaning The temperature in the cabinet of the safety control station recovered normally. The content in the parentheses in the above example is the same as message No. 0053. (This is a recovery message of No. 0053.)

No.0055

Message name Information of same frame reception in online change download communication

Printing example SCS0101 Received Same Online Download Frame Code=1 Frame=3

Meaning The same communication frame was received twice during the execution of online change download. “Code” and “Frame” indicate detailed internal information.

Action Execute online change download again.

No.0057

Message name Information of online change download error

Printing example SCS0101 Online Download Error Call Code=9601 - 0000 Data=91,0,0,0

Meaning An error occurred during the execution of online change download of the safety control station (station name = SCS0101). “Code” and “Data” indicate detailed internal information.

Cause This error occurs if error data cannot be saved on the safety control station side.

Action It is necessary to determine an action to take based on the “Code” and “Data” information. Report the display contents of “Code” and “Data” to Yokogawa’s service department.

Note Do not execute online change download after this alarm occurred.

No.0059

Message name Information of recovery from node power failure

Printing example 1 SCS0101 N-IO NODE Power On N-IO NODE 02

Printing example 2 SCS0101 FIO NODE Power On FIO NODE 02

Meaning A node (2 in the above example) of the safety control station (station name = SCS0101) recovered from power failure.

No.0063

Message name ESB bus error

Printing example SCS0101 FIO-BUS Fail FIO BUS No.1

Meaning An error occurred on one side (No. 1 in the above example) of the ESB buses of the safety control station (station name = SCS0101).

With the SCSP3 and SCSL2, this message does not appear.

Cause This is an ESB bus error on one side.

Action ESB Bus Interface module, ESB bus coupler module, or ESB bus failure may be considered as an error cause. Take appropriate action in the following:

- Check to see if the ESB bus cables are connected correctly. Check for incorrect connection or bad connection of the cables, or check the terminators of the bus.
- Check to see if one ESB Bus Interface module is causing a bus error of the entire buses according to the following procedure.

  Pull out the ESB bus connector of each ESB Bus Interface module that connects to the corresponding bus, one by one, from the node.

Wait for two to three seconds, and if “Recover” is not printed, insert the ESB bus connector again, and pull the bus connector of the next node.

If “Recover” is printed, the bus connector of the ESB Bus Interface module that was pull out at that time is faulty, so replace that module.

- If no recovery was made even after the bus connectors of all nodes were pulled out, the ESB bus coupler module may be faulty. In such a case, replace the ESB bus coupler module.
- If no recovery was still made, press the [START/STOP] button on the CPU module’s front panel on the control side twice, and switch the control right of the CPU module. Replace the CPU module after restarting.

If the bus does not recover even after these operations, the error may be related to the ESB bus cable (T-shape connector and so on). Replace the ESB bus cable.

Note This message is generated if all safety node units become abnormal.

This message is also generated if all safety node units become abnormal in a system configuration that includes the Optical ESB Bus Repeater module. However, if all safety node units directly connected to ESB bus coupler module without going through the Optical Repeater module become abnormal in this system configuration, this message is not generated so long as any safety node unit connected via the Optical Repeater module is normal.

No.0064

Message name Normal recovery of ESB bus

Printing example SCS0101 FIO-BUS Recover FIO BUS No.1

Meaning The ESB bus indicated in the message recovered normally. (This is a recovery message of No. 0063.)

No.0065

Message name Failure of N-ESB bus module or ESB Bus Interface module

Printing example 1 SCS0101 NBS Fail N-IO NODE 02 NBS RIGHT

Meaning 1 An error occurred in an N-ESB bus module (right side in the above example) of an N-IO node (2 in the above example) of the safety control station (station name = SCS0101).

Cause 1 One of the following causes may be considered.

- N-ESB bus module is faulty.
- Connection route to the N-ESB bus module has problem.
- For the N-I/O nodes that are connected via Optical ESB Bus Repeater modules, the Optical ESB Bus Repeater module related hardware such as ESB Bus Repeater module or Fiber-optic cable is faulty.

Action 1 Replace the N-ESB bus module and check to see if the problem is resolved. If not, other locations may be abnormal. If all N-IO nodes connected to the N-ESB bus of the same system are abnormal, the N-ESB bus coupler module or N-ESB bus cable may be faulty. If all the N-IO nodes routed through the Optical ESB Bus Repeater related devices become abnormal, the Optical ESB Bus Repeater module or Fiber-optic cable may be faulty. Moreover, if the Optical ESB Bus Repeater modules are mounted in the unit for mounting the Optical ESB Bus Repeater modules, the error may be caused by the failure of a power supply module of the unit for mounting the Optical ESB Bus Repeater

modules. Identify the abnormal location from the message, LED ON status, etc., and replace the applicable device.

Printing example 2 SCS0101 SBS Fail FIO NODE 02 SBS RIGHT

Meaning 2 An error occurred in an ESB Bus Interface module (right side in the above example) of an FIO node (2 in the above example) of the safety control station (station name = SCS0101).

Cause 2 One of the following causes may be considered.

- ESB Bus Interface module becomes abnormal.
- Connection route to the ESB Bus Interface module becomes abnormal.
- For the safety node units that are connected via Optical ESB Bus Repeater modules, the Optical ESB Bus Repeater related module related hardware (Optical ESB Bus Repeater module, Fiber-optic cable, etc.) is faulty.

Action 2 If no ESB bus error message is output, the ESB Bus Interface module may be faulty. Replace the applicable ESB Bus Interface module. If all the safety node units routed through the Optical ESB Bus Repeater related devices become abnormal and all the safety node units routed through such Optical Repeater become abnormal, error may have occurred in the Optical ESB Bus Repeater module or Fiber-optic cable. Moreover, if the Optical ESB Bus Repeater modules are mounted in the unit for mounting the Optical ESB Bus Repeater modules, the error may be caused by the failure of a power supply module of the unit for mounting the Optical ESB Bus Repeater modules. Identify the abnormal location from the message, LED ON status, etc., and replace the applicable device.

If all nodes connected to the SCSP3 and SCSL2 (except for the N-IO nodes connected via the N-ESB bus) are abnormal, the ESB Bus Interface module, ESB bus coupler module, or ESB bus may be faulty. Execute the action under No. 0063.

No.0066

Message name Normal recovery of N-ESB bus module or ESB Bus Interface module of node

Printing example 1 SCS0101 NBS Recover N-IO NODE 02 NBS RIGHT

Meaning 1 An N-ESB bus module (right side in the above example) of an N-IO node (2 in the above example) of the safety control station (station name = SCS0101) recovered normally. (This is a recovery message of No. 0065.)

Printing example 2 SCS0101 SBS Recover FIO NODE 02 SBS RIGHT

Meaning 2 An ESB Bus Interface module (right side in the above example) of an FIO node (2 in the above example) of the safety control station (station name = SCS0101) recovered normally. (This is a recovery message of No. 0065.)

No.0067

Message name Failure of power supply of node

Printing example 1 SCS0101 PSU Fail N-IO NODE 02 PSU 1 (POWER OFF)

Meaning 1 An error occurred in a power supply unit (1 in the above example) of an N-IO node (2 in the above example) of the safety control station (station name = SCS0101). One of the following items is displayed in the parentheses in the above printing example 1.

POWER OFF: The power supply unit stopped functioning.

OVERVOLTAGE: The output voltage of the power supply unit is too high.

Cause 1 Faulty power supply unit of the node interface unit

Action 1 The actions corresponding to the items shown in ( ) are as follows:

POWER OFF:	The power supply of the applicable node interface unit may be faulty or the power feed system may be faulty. Check the condition of the power supply unit of the applicable node interface unit and the power feed system.
OVER-VOLTAGE:	Power supply unit of the applicable node interface unit is faulty. Replace the power supply unit.

Printing example 2 SCS0101 PSU Fail FIO NODE 02 PSU RIGHT

Meaning 2 An error occurred in a power supply module (right side in the above example) of an FIO node (2 in the above example) of the safety control station (station name = SCS0101).

Cause 2 Faulty power supply module of the FIO node

Action 2 Replace the power supply module of the applicable node.

Note 2 If I/O module or N-ESB bus coupler module is defined to the CPU node, this message is generated as FIO node 1 when an error occurs in a PSU for the CPU node.

No.0068

Message name Normal recovery of power supply of a node

Printing example 1 SCS0101 PSU Recover N-IO NODE 02 PSU 1 (POWER OFF)

Meaning 1 The power supply unit of the node interface unit of the N-IO node indicated in the message (2 in the above example) recovered normally. The content in the parentheses in printing example 1 is the same as message No. 0067. (This is a recovery message of No. 0067.)

Printing example 2 SCS0101 PSU Recover FIO NODE 02 PSU RIGHT

Meaning 2 The power supply module of the FIO node indicated in the message (2 in the above example) recovered normally. (This is a recovery message of No. 0067.)

No.0069

Message name Error before database download to I/O module

Printing example SCS0101 IOM Download Error = A701

Meaning Database download to the I/O module (IOM) can not be started.

Cause/Action The cause and action vary depending on the content of the error.

- A701

  This message occurs when attempting to download to an IOM while another IOM download is still running. Only one IOM download can be performed at one time, so please wait for the other IOM download to complete before running an IOM download operation again.

- A72C

  Automatic IOM download to a standby side I/O module is running. This error occurs if IOM download to the same I/O module is manually execu-

ted from the SENG or online change download is executed to make changes in I/O parameter settings while automatic IOM download is running.

- 5135

  This message occurs when attempting to download to an IOM even though it is running normally.

- Others

  Report the error display content to Yokogawa's service department.

No.0073

Message name Error in the F-SB bus connecting the N-IO I/O unit and node interface unit

Printing example SCS0101 IOM-BUS Error N-IO NODE 01 UNIT 01 BUS No.01

Meaning An error occurred in the F-SB bus connecting the N-IO I/O unit (1 in the above example) of N-IO node 1 of the safety control station (station name = SCS0101) and the node interface unit.

Action The F-SB bus may be faulty. Check to see if the F-SB bus is connected properly. Check the F-SB bus for incorrect connection, bad connection, etc.

No.0074

Message name Normal recovery of the F-SB bus connecting the N-IO I/O unit and node interface

Printing example SCS0101 IOM-BUS Recover N-IO NODE 01 UNIT 01 BUS No.01

Meaning The F-SB bus connecting the N-IO I/O unit (1 in the above example) of N-IO node 1 of the safety control station (station name = SCS0101) and the node interface unit recovered from a communication error (this is a recovery message of No. 0073).

No.0081

Message name Failure of I/O module

Printing example 1 SCS0101 IOM Fail N-IO NODE 01 UNIT 01 SLOT 01 Code = 5101

Printing example 2 SCS0101 IOM Fail FIO NODE 01 SLOT 01 Code = 5101

Meaning An error occurred in the I/O module or N-ESB bus coupler module. The message includes the module position (N-IO node 1, unit 1, slot 1 in printing example 1; FIO node 1 (CPU node), slot 1 in printing example 2).

Cause Refer to the error code descriptions.

Action Replace the applicable I/O module.

Table 3.1-4 Message No. 0081 - AIO/DIO Module and N-ESB bus coupler module Errors

Error code	Description of error
5101	The communication between the CPU and an I/O module or the CPU and an N-ESB bus coupler module encountered a no-response error. This error is caused either by an abnormality of the module or the communication route to the module.

Continues on the next page

Table 3.1-4 Message No. 0081 - AIO/DIO Module and N-ESB bus coupler module Errors (Table continued)

Error code	Description of error
5102	The model of the I/O module or N-ESB bus coupler module defined on the SENG does not match the model of the module that is actually mounted. Check the model of the module.
5103	The setting information defined on the SENG and the I/O module setting information do not match. Execute IOM download.
5104	A hardware error of the I/O module was detected. Check detailed error causes in the IOM Report.
5105	A setting error of the I/O module. Check detailed error causes in the IOM Report (field side connector disconnection, field power supply/wiring problem, etc.)
5106	The I/O module recovered from an error state. Check detailed error causes in the IOM Report.
5107	The error that actuated the output shutoff switch occurred. Check detailed error causes in the IOM Report. When this error occurred, start the I/O module after recovering from the error.
5108, 5109, 5111, 5112, 5113, 511D, 511E	A communication data check error was detected between the CPU and the I/O module. A failure of the I/O module or a problem of the communication path up to the I/O module may be the cause. Error codes 5108, 5109, 511D, and 511E are displayed only for N-IO.
5114, 5115	An error was detected in the redundant control part of the I/O module. Replace the I/O module. However, when two I/O modules in single configuration are changed to dual-redundant configuration and online change download is performed, this error may be detected if a connector cable is plugged to only one of the two modules. In this case, plug the connector cables to both modules. Recovery from this error is notified with system alarm message No.0082 “Normal recovery of I/O module”, and there is no need to replace the I/O modules.
5116, 5117	An I/O module error was detected. Replace the I/O module.
5118	An SCS internal error (SCS database error) was detected.

Table 3.1-5 Error Details of Message No.0081 – Errors on ALR111/ALR121/ALE111 Modbus Slave and ALE111 DNP3 Slave

Error Code	Cause/Action
C580	The communication between CPU and I/O modules encounters a no-response error. This error may be caused by the I/O module abnormality, communication route abnormality or an abnormality other than C581 to C583 depicted.
C581	The communication program is not downloaded to the communication module. Run IOM download.
C582	The communication program in the communication module is not the program for Modbus slave communication/DNP3 slave function. Run IOM download.
C583	The physically installed communication module shows a different model name from the communication module defined in SENG. Check the model of the communication module.

Table 3.1-6 Message No.0081 - ALR111/ALR121/ALE111 Subsystem Communication and S2LP131 Safety Subsystem Communication Errors

Error Code	Cause/Action
A33D	No response from the communication module due to communication module abnormality. Replace the communication module.
A33E	Error occurred in the communication route between CPU and node.
C581	The communication program is not downloaded to the communication module. Run IOM download.

Continues on the next page

Table 3.1-6 Message No.0081 - ALR111/ALR121/ALE111 Subsystem Communication and S2LP131 Safety Subsystem Communication Errors (Table continued)

Error Code	Cause/Action
C582	The communication program in the communication module is not the program for the communication defined in SENG. Run IOM download.
C583	The physically installed communication module shows a different model name from the communication module defined in SENG. Check the model of the communication module.
C585	Error is found by self-diagnosis. Replace the communication module.
C58A	The PROFINET definition defined by PROFINET Configurator and the PROFINET definition in the fire and gas communication module do not match. Run IOM download to the communication module.
C58D	An error was detected in the communication board of the fire and gas communication module. Replace the communication module.
C58E	A device with the same IP address as a communication module exists in the same subnet. After resolving the duplicate IP address, execute IOM download to the communication module.
C598	The communication module is reset due to online change download or IOM download.
C599	Downloading to database.
C59A	Downloading communication program.
C5C1	Error found after resetting the communication module. Replace the communication module.
C5C6	Failed to download the communication program. Waiting time for shifting to the downloading mode of the communication program exceeded the time limit. Start IOM download again.
C5C7	Failed to download the communication program. Processing time for downloading the communication program exceeded the time limit. Start IOM download again.
C5E2	Communication module encountered an error and stopped. Replace the communication module.

No.0082

Message name Normal recovery of I/O module

Printing example 1 SCS0101 IOM Recover N-IO NODE 01 UNIT 01 SLOT 01

Printing example 2 SCS0101 IOM Recover FIO NODE 01 SLOT 01

Meaning The I/O module or N-ESB bus coupler module recovered normally. The message includes the module position (N-IO node 1, unit 1, slot 1 in printing example 1; FIO node 1, slot 1 in printing example 2). (This is a recovery message of No. 0081.)

No.0083

Message name I/O module database error occurred

Printing example 1 SCS0101 IOM Configuration Error N-IO NODE 01 UNIT 01 SLOT 01

Printing example 2 SCS0101 IOM Configuration Error FIO NODE 01 SLOT 01

Meaning An error occurred in the I/O module database. The message includes the I/O module position (N-IO node 1, unit 1, slot 1 in printing example 1; FIO node 1, slot 1 in printing example 2).

Cause The database on the I/O module and the database on the SCS do not match. The following causes may be considered.

- IOM download has not been executed.
- IOM failure.

Action If this error occurred after replacing a module or at startup, the database might not have been downloaded to the I/O module. Execute IOM download.

If this error occurred during I/O module operation, the I/O module may be faulty. Replace the I/O module.

No.0085

Message name I/O module communication error occurred

Printing example 1 SCS0101 IOM Communication Error N-IO NODE 01 UNIT 01 SLOT 01 BUS No.01 RIGHT

Meaning 1 A communication error occurred on bus 1 between the right-side node interface unit and the I/O module mounted in slot 1 of unit 1 of N-IO node 1 of the safety control station (station name = SCS0101). (If this error occurs on both buses, an IOM Failure state will result.)

Cause 1 The node interface unit or its base plate may be faulty. If the message is generated for both the right side and left side, either communication interface of the I/O module may be faulty.

Action 1 Replace the applicable node interface unit or its base plate. If the message is generated for both the right side and left side, be sure to replace the applicable I/O module.

Printing example 2 SCS0101 IOM Communication Error FIO NODE 01 SLOT 01 RIGHT

Meaning 2 An error occurred in one of the SB buses (right side in the above example). An error occurred when accessing the I/O module mounted in slot 1 of FIO node 1 in the safety control station (station name = SCS0101).

Cause 2 If this error occurred on all input modules within the same FIO node, an I/O module may be faulty, or the backboard bus of the FIO node may be faulty. Or, an ESB bus (right side in the above example) or an ESB Bus Interface module (right side in the above example) may be faulty, or they may not be connected properly.

Action 2 Report to Yokogawa's service department.

No.0086

Message name Recovery from I/O module communication error

Printing example 1 SCS0101 IOM Communication Recover N-IO NODE 01 UNIT 01 SLOT 01 BUS No.01 RIGHT

Meaning 1 The communication on bus 1 between the right-side node interface unit and the I/O module mounted in slot 1 of unit 1 of N-IO node 1 of the safety control station (station name = SCS0101) recovered. (This is a recovery message of No. 0085.)

Printing example 2 SCS0101 IOM Communication Recover FIO NODE 01 SLOT 01 RIGHT

Meaning 2 Communication recovered from the error with the I/O module mounted in slot 1 of FIO node 1 of the safety control station (station name = SCS0101). (This is a recovery message of No. 0085.)

No.0087

Message name Node error occurred

Printing example 1 SCS0101 NODE Fail N-IO NODE 02

Meaning 1 An error occurred in N-IO node 2 of the safety control station (station name = SCS0101).

Cause 1 One of the following causes may be considered.

- A power failure occurred in the N-IO node, or both of the two N-ESB buses are faulty.
- Both N-ESB bus modules are faulty.
- For the N-I/O nodes connected via Optical ESB Bus Repeater modules, the Optical ESB Bus Repeater related hardware such as Optical ESB Bus Repeater module or Fiber-optic cable is faulty.

Printing example 2 SCS0101 NODE Fail FIO NODE 02

Meaning 2 An error occurred in FIO node 2 of the safety control station (station name = SCS0101).

Cause 2 One of the following causes may be considered.

- A power failure occurred in the safety node unit, or both of the two ESB buses are faulty.
- Both ESB Bus Interface modules are faulty.
- For the safety node units connected via Optical ESB Bus Repeater modules, the Optical ESB Bus Repeater related hardware such as Optical ESB Bus Repeater module or Fiber-optic cable is faulty.

Action Report to Yokogawa's service department.

No.0088

Message name Normal recovery of node

Printing example 1 SCS0101 NODE Recover N-IO NODE 02

Printing example 2 SCS0101 NODE Recover FIO NODE 02

Meaning The node indicated in the message recovered normally. (This is a recovery message of No. 0087.)

No.0089

Message name Subsystem communication error

Printing example SCS0101 SS-COM Error FIO NODE 01 SLOT 01 PORT 01 STN001 Code= A3B0

Meaning A communication error occurred between the indicated communication module and the subsystem.

Cause/Action The error details can be found in the instruction manuals of the connected subsystem. See the manuals for error details.

Or, take an action based on the error message.

Table 3.1-7 Message No. 0089 - Errors from Use of ALR111, ALR121

Code	Error	Cause/Action
A391	Driver Busy	Occurs when sending or receiving.
A392	Communication Line Busy	This message occurs when carrier detection fails due to the CD signal line has been ON for more than the transmission enable monitoring time (*1).
A393	Communication Line Not Ready	This message occurs when, at the time of transmission, the CS signal line or DR signal line has been OFF for more than the transmission enable monitoring time.(*1)
A394	Data size is too large for sending.	
A395	The port for sending is not declared.	
A397	Underrun	
A398	Interval of characters became timeout	This message occurs when the interval of characters exceeds the specified time.
A399	Reception buffer overflow	
A39A	Reception parity error	
A39B	Reception overrun	
A39C	Reception frame error	
A39D	Number of characters beyond range	
A39F	Other errors	
A3B0 to A3FF	Reserved for subsystems	For more information, see the instruction manuals of subsystems.

*1: The transmission-watching timer monitors the waiting time of the transmission line become ready for transmission. When RS is sent, and the waiting time for transmission exceeds the specified time period, the transmission becomes error. The transmission waiting time is normally set to 1000 ms.
The conditions for transmission are as follows:
- CD line off (When CD check is enabled)
- CS (CTS) line on
- DR line on (When DR check is enabled)

Table 3.1-8 Message No. 0089 - Errors from Use of ALE111

Code	Error
A309	Incorrect descriptor for designated socket.
A30D	Unauthorized access
A30E	Socket descriptor address specified in the created socket function is not correct.
A316	Arguments of the function are incorrect
A320	Connection is shutdown when transmitting to the connected socket.
A324	Connection process is in progress following a non-blocking connect request. The connection process will complete after a while.
A325	The previous non-block connect is not completed.
A328	The data size is too large to be sent.
A329	Socket and protocol are not consistent.
A32B	The specified protocol is not supported.
A32D	The function is not supported by the designated socket.
A330	The specified address is already occupied.
A331	0 is specified to the port number.
A333	Cannot reach network from this host.

Continues on the next page

Table 3.1-8 Message No. 0089 - Errors from Use of ALE111 (Table continued)

Code	Error
A335	Connected destination severed the connection.
A338	The socket is already connected
A339	The socket is not connected
A33C	Timeout before connection is established
A33D	Connection is denied by destination.
A3B0 to A3FF	Reserved for each subsystem. For more information, see the instruction manuals of subsystems.

Remark Subsystem communication

No.0090

Message name Subsystem communication recovered

Printing example SCS0101 SS-COM Recover FIO NODE 01 SLOT 01 PORT 01 STN001

Meaning The communication between the indicated communication module and the subsystem recovered from the error.

Remark Subsystem communication

No.0093

Message name CPU node's housekeeping unit error

Printing example SCS0101 RIGHT HKU Error Code=0001

Meaning The CPU node's housekeeping unit of the safety control station (station name = SCS0101) is faulty. "Code" indicates detailed internal information.

Action Report to Yokogawa's service department.

Remark HKU function

No.0094

Message name Normal recovery of CPU node's housekeeping unit

Printing example SCS0101 RIGHT HKU Recover Code=0001

Meaning The CPU node's housekeeping unit of the safety control station (station name = SCS0101) recovered normally. (This is a recovery message of No. 0093.)

Remark HKU function

3.2 Safety Control Station Status Change Related Messages (Message Numbers 0425 through 0480)

This section describes the messages relating to status changes of the safety control station.

No.0425

Message name Start of online upgrade

Printing example SCS0101 Online Upgrade Start

Meaning An online upgrade has been started.

Cause An operation was performed by the online upgrade tool.

Remark Online upgrade function

No.0426

Message name Normal completion of online upgrade

Printing example SCS0101 Online Upgrade Complete

Meaning The online upgrade completed properly.

Cause An operation was performed by the online upgrade tool.

Remark Online upgrade function

No.0427

Message name Online upgrade error

Printing example SCS0101 Online Upgrade Error CODE = 1234 DET = 1234

Meaning The online upgrade ended with an error.

Cause An operation was performed by the online upgrade tool.

Remark Online upgrade function

No.0447

Message name Node maintenance port enabled notification

Printing example SCS0101 N-IO NODE Maintenance Port Enabled

Meaning The maintenance port of the N-IO node of the safety control station (station name = SCS0101) became enabled and the security level of the N-IO node is lowered.

Action When the operation via the maintenance port is finished, access the maintenance port setting for the N-IO from the NIU maintenance port setting tool and disable the port.

No.0448

Message name Node maintenance port disabled notification

Printing example SCS0101 N-IO NODE Maintenance Port Disabled

Meaning The maintenance port of the N-IO node of the safety control station (station name = SCS0101) became disabled.

No.0450

Message name Copy program and database on control side of safety control station to stand-by side

Printing example SCS0101 Copy

Meaning The copying of the program and database on the control side of the safety control station to the standby side has been started.

Cause This message is displayed when the CPU module on the standby side of the safety control station (station name = SCS0101) was started.

No.0451

Message name Information of switching of control side of safety control station

Printing example SCS0101 RIGHT Control

Meaning The CPU module on the right or left side (right side in the above example) of the safety control station (station name = SCS0101) has been set to the control side.

No.0452

Message name Information of switching of standby side of safety control station

Printing example SCS0101 LEFT Stand-By

Meaning The CPU module on the right or left side (left side in the above example) of the safety control station (station name = SCS0101) has been set to the standby side.

No.0455

Message name Node maintenance notification

Printing example SCS0101 NODE Maintenance N-IO NODE 01

Meaning An N-IO node (1 in the above example) of the safety control station (station name = SCS0101) entered the maintenance mode.

Action To cancel the maintenance mode, perform a cancellation operation by using the maintenance tool that is connected to the N-ESB bus module of the applicable node, or unplug the USB cable connecting the maintenance tool.

No.0456

Message name Node maintenance cancellation notification

Printing example SCS0101 NODE Maintenance Release N-IO NODE 01

Meaning The maintenance mode of an N-IO node (1 in the above example) of the safety control station (station name = SCS0101) was canceled.

No.0459

Message name Information of I/O module service side

Printing example 1 SCS0101 IOM In Service N-IO NODE 01 UNIT 01 SLOT 01

Printing example 2 SCS0101 IOM In Service FIO NODE 01 SLOT 01

Meaning One of the redundant I/O modules (N-IO node 1, unit 1, slot 1 in printing example 1; FIO node 1, slot 1 in printing example 2) gained the control right.

No.0460

Message name Information of I/O module out service

Printing example 1 SCS0101 IOM Out Service N-IO NODE 01 UNIT 01 SLOT 01

Printing example 2 SCS0101 IOM Out Service FIO NODE 01 SLOT 01

Meaning One of the redundant I/O modules (N-IO node 1, unit 1, slot 1 in printing example 1; FIO node 1, slot 1 in printing example 2) switched to the standby side or stopped.

No.0471

Message name Normal completion of online change download

Printing example SCS0101 Online Download (Integration Database) Complete

Meaning Online change download to the safety control station has normally been completed.

No.0474

Message name Information of tag list duplicate error

Printing example SCS0101 Tag Duplication Error Tag = TAG001

Meaning A duplicate tag list name exists in the same safety control station.

Action Report to Yokogawa's service department.

No.0475

Message name Start of database download to I/O module

Printing example 1 SCS0101 IOM Download Start N-IO NODE 01 UNIT 01 SLOT 01

In the case of automatic IOM download:

SCS0101 Automatic IOM Download Start N-IO NODE 01 UNIT 01 SLOT 01

Printing example 2 SCS0101 IOM Download Start FIO NODE 01 SLOT 01

In the case of automatic IOM download:

SCS0101 Automatic IOM Download Start FIO NODE 01 SLOT 02

Meaning Database download to the I/O module indicated in the message has been started.

No.0476

Message name Normal completion of database download to I/O module

Printing example 1 SCS0101 IOM Download Complete N-IO NODE 01 UNIT 01 SLOT 01

In the case of automatic IOM download:

SCS0101 Automatic IOM Download Complete N-IO NODE 01 UNIT 01 SLOT 01

Printing example 2 SCS0101 IOM Download Complete FIO NODE 01 SLOT 01

In the case of automatic IOM download:

SCS0101 Automatic IOM Download Complete FIO NODE 01 SLOT 02

Meaning Database download to the I/O module indicated in the message has normally been completed.

No.0477

Message name Database download error to I/O module

Printing example 1 SCS0101 IOM Download Error N-IO NODE 01 UNIT 01 SLOT 01 Error= xxxx

In the case of automatic IOM download:

SCS0101 Automatic IOM Download Error N-IO NODE 01 UNIT 01 SLOT 01 Error= xxxx

Printing example 2 SCS0101 IOM Download Error FIO NODE 01 SLOT 01 Error= xxxx

In the case of automatic IOM download:

SCS0101 Automatic IOM Download Error FIO NODE 01 SLOT 02 Error= xxxx

Meaning An error occurred during database download to the I/O module indicated in the message. “xxxx” indicates an error code.

Cause/Action The error codes are described below. If an error occurs, remove the cause, and execute IOM download again.

If an error other than the following errors occurred, replace the I/O module and execute IOM download again. If other error occurred again, report details to Yokogawa’s service department.

- Error codes for I/O modules other than ALR111, ALR121, ALE111, and S2LP131.

  A701: Downloading for the I/O module is currently being executed.

  3B1B: The I/O module is faulty.

  CFxx: An error was returned from the I/O module.

  CF10: The type of the I/O module does not match.

- Error codes for ALR111, ALR121, ALE111, and S2LP131

  A33D: The CPU module cannot communicate with the communication module.

  A33E: There is an error or fault in the communication path between the CPU module and the communication module. (Node failure, etc.)

  A731: Simultaneous downloading of multiple communication programs was attempted. Multiple communication programs cannot be added by one online change download. If you try to add them simultaneously, A731 error occurs when downloading is attempted

for the second and subsequent programs. If the error occurs, perform IOM download to the communication module for which the downloading failed from the SCS State Management Window after the online change download is finished.

No.0480

Message name Heavy load on periodical processing

Printing example SCS0101 Too Heavy Load

Meaning The processing time of External Communication Function of the safety control station has exceeded the four times the scan period that is specified for External Communication Function.

Cause The load on the safety control station is too heavy.

Action Correct the application and reduce the load on the safety control station.

3.3 Safety Control Station Related Messages (Message Numbers 0727 through 0787)

This section describes other messages relating to the safety control station.

No.0727

Message name Block mode recovery error information

Printing example SCS0101 Block Mode Change Error Block=TAG001 Code=9601-0000

TAG001: Tag name

9601-0000: Error code

Meaning Block mode recovery failed at the end of downloading.

Action Report the error code to Yokogawa's Service department.

No.0743

Message name Self-diagnostic SEN-BUS Failure

Printing example SCS0101 SEN-BUS Alarm SEN-BUS No.1

Meaning The SEN-BUS in question has failed.

Cause There is a failure in the SEN-BUS in the CPU node or the CPU module mounted.

Action Replace the CPU node or the CPU module mounted.

No.0744

Message name Self-diagnostic SEN-BUS Recovery

Printing example SCS0101 SEN-BUS Recover SEN-BUS No.1

Meaning The SEN-BUS in question has returned to normal. (This is a recovery message of No. 0743.)

No.0749

Message name Self-diagnosis detected an I/O Error

Printing example 1 SCS0101 N-IO Self Diag Error N-IO CODE = 00005119 DET = 00000000

Printing example 2 SCS0101 FIO Self Diag Error FIO CODE = 00005119 DET = 00000000

Meaning I/O error was detected during self-diagnosis.

Cause/Action The action varies depending on the Code and DET. Contact Yokogawa service department with the contents of CODE and DET.

The following describes the contents of CODE and DET.

Table 3.3-1 Message No. 0749 - CODE and DET List

CODE/DET	Errors
CODE = 00005119	An error was detected in the redundant control unit. Switching is not performed even if an error occurred on the control side. Replace the I/O module.
CODE = 00005171	The I/O module does not support the function that is intended to use. Fire and Gas device resetting function: Uses modules prior to SAI143 style S4 Use a supported I/O module. Refer to the IOM Model in the IOM Report to find out the style of the I/O module.
CODE = 00005172	A memory error in I/O module was detected. If the I/O module recovers to normal after this alarm is generated, continue to use the module.
DET = nnss0000	A detail code of CODE = 00005119 and CODE = 00005171. nnss indicates the installation position of the FIO I/O module in error. nn is a node number, and ss is a slot number. All of which are in hexadecimal.
DET = nnus0000	A detail code of CODE = 00005119 and CODE = 00005172. nnus indicates the installation position of the N-IO I/O module in error. nn is a node number, u is a unit number, and s is a slot number. All of which are in hexadecimal.
CODE = 0000511B	An error was detected in the I/O unit of the CPU module.
DET = 0000 Y48x	A detail code of CODE = 0000511B. Y = 0 indicates an error in the right CPU module, and Y = 8 indicates an error in the left CPU module.

No.0750

Message name I/O Recovery from the error detected by self-diagnosis

Printing example 1 SCS0101 N-IO Self Diag Recover N-IO CODE = 00000000 DET = 00000000

Printing example 2 SCS0101 FIO Self Diag Recover FIO CODE = 00000000 DET = 00000000

Meaning Recovery from I/O error detected by self-diagnosis. (This is a recovery message of No. 0749.)

No.0751

Message name Time self-diagnostic testing error

Printing example SCS0101 RIGHT Time Self Diag Error Code=00030021

Meaning A clock error is detected by self-diagnosis while the CPU of either redundant or non-redundant is running.

Cause VEHICLE clock, RTC or GPS clock trouble

Action Replace the CPU module.

No.0753

Message name Communication Overload

Printing example SCS0101 Communication Overload

Meaning Communication load to safety control station exceeded the limit.

Cause There were many communication demands from the operation and monitoring function window or application programs to the safety control station.

Action If the windows for the indicated safety control station are displayed on the CENTUM HIS, the windows need to be closed. Modifying the application programs may also reduce the communication load to the safety control station.

No.0767

Message name	ESB bus error on either bus
Printing example 1	SCS0101 N-IO-BUS Fail N-IO RIGHT BUS No.01
Meaning 1	An error occurred in the communication on bus 1 from the right-side bus interface (IO controller in the CPU module or the N-ESB bus coupler module) of the N-IO of the safety control station (station name = SCS0101). (Communication with all nodes on the bus 1 side became abnormal.) For SCSP3, "N-IO" is shown as in printing example 1. "N-IO" is also shown when only FIO nodes are used in the SCSP3.
Cause 1	Since an error occurred only in one CPU module, the IO controller in the CPU module, backboard of the CPU node, or N-ESB bus coupler module may be faulty.
Action 1	Replace the CPU module, CPU node, or N-ESB bus coupler module.
Printing example 2	SCS0101 FIO-BUS Fail FIO RIGHT BUS No.1
Meaning 2	A communication error (bus1 in the above example) occurred in standby side CPU module (right side in the above example) of the safety control station (station name = SCS0101). (Communication with all FIO nodes on bus 1 side became abnormal.)
Cause 2	The CPU module, backboard of the CPU node, or ESB bus coupler module may be faulty.
Action 2	Replace the CPU module, CPU node, or ESB bus coupler module.

No.0768

Message name	Recovery from ESB bus error on either bus
Printing example 1	SCS0101 N-IO-BUS Recover N-IO RIGHT BUS No.01
Meaning 1	The communication on bus 1 from the right-side bus interface of the N-IO of the safety control station (station name = SCS0101) recovered. For SCSP3, "N-IO" is shown as in printing example 1. "N-IO" is also shown when only FIO nodes are used in the SCSP3. (This is a recovery message of No. 0767.)
Printing example 2	SCS0101 FIO-BUS Recover FIO RIGHT BUS No.1
Meaning 2	A communication error (bus1 in the above example) in standby side CPU module (right side in the above example) of the safety control station (station name = SCS0101) recovered. (This is a recovery message of No. 0767.)

No.0769

Message name	Error in the diagnosis of the safety control station cabinet by external equipment
Printing example	SCS0101 External Equipment Error N-IO NODE 01
Meaning	An error was detected in the diagnosis, by external equipment, of the cabinet storing N-IO node 1 of the safety control station (station name = SCS0101).
Action	Check the type of error through, for example, the display of the external equipment for the applicable cabinet, and then take an action according to the error. For details, check the manual of the applicable external equipment.

No.0770

Message name Recovery from error in the diagnosis of the safety control station cabinet by external equipment

Printing example SCS0101 External Equipment Recover N-IO NODE 01

Meaning An error detected in the diagnosis, by external equipment, of the cabinet storing N-IO node 1 of the safety control station (station name = SCS0101) recovered (this is a recovery message of No. 0769).

No.0787

Message name Self-diagnosis detected I/O error in CPU module

Printing example SCS0101 I/O Diagnosis Error IO RIGHT CODE=02518000 00000000

Meaning A self-diagnosis error occurred in a CPU module (right side in the above example) of the safety control station (station name = SCS0101).

Cause/Action Perform the appropriate action based on the cause that is indicated for the detailed error codes.

Table 3.3-2 Message No. 0787 - Error Code Detail

CODE(hexadecimal, 16 digits)		Factor	
Error code (Upper 8 digits)	Error detail (Lower 8 digits)		
0251 8000	0000 0000	A CPU module error was detected.	Replace the CPU module.
0255 8082	0000 0270 (*1)	This code indicates that the revision of the firmware (F4) in the CPU module is obsolete for the system configured with Optical ESB Bus Repeater modules.	If a system contains Optical ESB Bus Repeater module, the proper revision of CPU should be used.
xxxx0471	xxxx xxxx	SCSP2-S, SCSP3-S, SCSL2-S: An error was detected in the I/O operation and monitoring diagnosis of the CPU. The CPU module have failed or the load in the I/O communication band is too heavy.	If many I/O modules are installed on the ESB bus extended with optical cables, estimate the I/O communication band and check the validity.
xxxx0313	xxxx xxxx	SCSP2-S, SCSP3-S, SCSL2-S: The I/O function part of the CPU may be faulty.	Replace the CPU module.

*1: This code is not generated in SCSP2-S, SCSP3-S, and SCSL2-S.

3.4 Fieldbus Messages (Message Numbers 3401 through 3408)

This section describes the fieldbus-related messages.

"Detail" in the printing examples of Message No. 3401 and No. 3403 shows detailed information of a fieldbus device alert in hexadecimal notation. Plant Resource Manager (PRM) can show text strings representing the expanded versions of Detail information.

The fieldbus-related messages are displayed in the historical report window on the CENTUM HIS.

No.3401

Message name HART device event notification

Printing example SCS0101 HART NODE 01 UNIT 01 SLOT 01 CH 01 Event Device=0123456789 Detail=xxx

Meaning A status change was detected from the HART device (device ID = 0123456789) that is connected to channel 1 of slot 1 of unit 1 of N-IO node 1 of the safety control station (station name = SCS0101) and notified.

Action Check the detailed condition of the HART device through PRM, FieldMate, or a handy terminal.

No.3403

Message name IOM detected a HART device status change

Printing example SCS0101 HART NODE 01 UNIT 01 SLOT 01 CH 01 Device Status Changed Device=0123456789 Detail=xxx

Meaning The IOM detected a status change in the HART device (device ID = 0123456789) that is connected to channel 1 of slot 1 of unit 1 of N-IO node 1 of the safety control station (station name = SCS0101).

Action Check the detailed condition of the HART device through PRM, FieldMate, or a handy terminal.

Remarks This message is generated for status changes including the HART communication errors that are detected by the HART device.

No.3405

Message name Communication error when acquiring HART device status (No response)

Printing example SCS0101 HART NODE 01 UNIT 01 SLOT 01 CH 01 Device Status Communication Error (No Response) Device=0123456789

Meaning When acquiring the status of the HART device (device ID = 0123456789) that is connected to channel 1 of the I/O module installed in slot 1 of unit 1 of N-IO node 1 of the safety control station (station name = SCS0101), no response (time-out) occurred in the communication between the HART device and the analog digital I/O module.

Cause No response is received from the HART device due to one of the following causes:

- Disconnected cable
- Effect of noise

- The range of the received signal is low.
- Output current from the analog digital I/O module is outside the HART communication enable range supported by the HART device.

Action Check the HART device, communication route between the HART device and analog digital I/O module, or I/O parameter settings (tight shut/full open output settings, etc.)

Remarks If no problem is found in the communication route from the HART device to the analog digital I/O module, the HART circuit in the analog digital I/O module may be faulty. Depending on the faulty location in the HART circuit, the control right over the analog digital I/O module may not switch even in a redundant configuration. In this case, switch the module control right by using the IOM control right switching tool and check if the communication recovers. If the communication recovered to normal, the HART circuit in the standby module is likely faulty, so replace the module.

No.3407

Message name Communication error when acquiring HART device status

Printing example SCS0101 HART NODE 01 UNIT 01 SLOT 01 CH 01 Device Status Communication Error Device=0123456789 Code=XXX

Meaning A communication error occurred when acquiring the status of the HART device (device ID = 0123456789) connected to the analog digital I/O module mounted in slot 1 of unit 1 of N-IO node 1 of the safety control station (station name = SCS0101).

Cause The HART device or the communication route between the HART device and the analog digital I/O module likely encountered a problem.

Action Take an action based on the cause associated with the detailed error code.

Remarks If no problem is found in the communication route from the HART device to the analog digital I/O module, the HART circuit in the analog digital I/O module may be faulty. Depending on the faulty location in the HART circuit, the control right over the analog digital I/O module may not switch even in a redundant configuration. In this case, switch the module control right by using the IOM control right switching tool and check if the communication recovers. If the communication recovered to normal, the HART circuit in the standby module is likely faulty, so replace the module.

Table 3.4-1 Detailed Error Codes (D6xx)

Code (Hex.)	Meaning	Cause	Action
D643	Cannot transmit or receive due to incorrect frames on the HART line.	Possibly caused by an inconsistent device on the HART line or by effect of noise.	Check the HART device or the communication route between the HART device and analog digital I/O module.
D644	A framing error or an overrun error occurred when receiving one byte.	Possibly caused by effect of noise.	Check the HART device or the communication route between the HART device and analog digital I/O module.
D645	A parity error occurred when receiving one byte.	Possibly caused by effect of noise.	Check the HART device or the communication route between the HART device and analog digital I/O module.

Continues on the next page

Table 3.4-1 Detailed Error Codes (D6xx) (Table continued)

Code (Hex.)	Meaning	Cause	Action
D648	Delimiter error	Possibly caused by effect of noise.	Check the HART device or the communication route between the HART device and analog digital I/O module.
D649	The length of the received frame does not match the given frame length. Or, a character-gap timeout occurred.	This error occurs when the device discontinues transmission, and thus possibly caused by the device.	Check the detailed condition of the HART device through PRM, FieldMate, or a handy terminal.
D64A	A checksum error was found in the received frame.	Possibly caused by effect of noise.	Check the communication route between the HART device and analog digital I/O module.
D64D	Unexpected response	Possibly caused by the device.	Check the detailed condition of the applicable HART device using the PRM, FieldMate or handy terminal.
D64F	Other errors	Error other than D643 to D64D. Possibly caused by the device.	Check the HART device or the communication route between the HART device and analog digital I/O module.
D6CD	A frame of unexpected size was received during status acquisition from the HART device.	The HART device has the specification of the version that is not supported by the analog digital I/O module.	Enable event notification on the HART device, or change the I/O parameter settings so as to disable communication for HART device status acquisition.(*1)

*1: You must take action based on whether the HART device supports event notification. For whether or not Event Notification for the applicable HART device is supported, check the specification of the HART device or vendor of the HART device.

No.3408

Message name Normal recovery of HART device status acquisition communication

Printing example SCS0101 HART NODE 01 UNIT 01 SLOT 01 CH 01 Device Status Communication Recover Device=0123456789

Meaning Communication between the HART device (device ID = 0123456789) connected to channel 1 of the analog digital I/O module installed in slot 1 of unit 1 of N-IO node 1 of the safety control station (station name = SCS0101) and analog digital I/O module recovered normally when acquiring the status of the HART device.

Appendix 1. Alarm Class

The following table shows the alarm class that is added to each Diagnostic Information Message.

Table Appendix 1-1 Alarm Class

Message number	Message name	Alarm class
0001	Reset start of safety control station	2
0003	Safety control station automatic reset start	2
0005	Power ON initial cold start of safety control station	2
0009	Transfer of control right of safety control station	2
0011	Fail information of safety control station	2
0013	AC power supply failure of safety control station	2
0015	Self-diagnosis error of clock inside CPU module	2
0017	ROM checksum error of CPU module	2
0021	Internal task error of safety control station	2
0023	Mapping block fatal error	2
0025	Function control word error	2
0027	Mapping block record information error	2
0033	Online downloading abnormal end	2
0041	Safety control station fan alarm	2
0042	Recovery from safety control station fan alarm	3
0043	Safety control station temperature alarm	2
0044	Recovery from safety control station temperature alarm	3
0045	Power supply module alarm of safety control station	2
0046	Recovery from power supply module alarm of safety control station	3
0047	Battery alarm of CPU module	2
0048	Recovery from battery alarm of CPU module	3
0053	Safety control station cabinet temperature alarm	2
0054	Recovery from safety control station cabinet temperature alarm	3
0055	Information of same frame reception in online change download communication	2
0057	Information of online change download error	2
0059	Information of recovery from node power failure	1
0063	ESB bus error	1, or 2
0064	Normal recovery of ESB bus	3
0065	Failure of N-ESB bus module or ESB Bus Interface module	2
0066	Normal recovery of N-ESB bus module or ESB Bus Interface module of node	3
0067	Failure of power supply of node	2
0068	Normal recovery of power supply of a node	3
0069	Error before database download to I/O module	1, or 2

Continues on the next page

Table Appendix 1-1 Alarm Class (Table continued)

Message number	Message name	Alarm class
0073	Error in the F-SB bus connecting the N-IO I/O unit and node interface unit	2
0074	Normal recovery of the F-SB bus connecting the N-IO I/O unit and node interface	3
0081	Failure of I/O module	1, or 2
0082	Normal recovery of I/O module	3
0083	I/O module database error occurred	2
0085	I/O module communication error occurred	2
0086	Recovery from I/O module communication error	3
0087	Node error occurred	1
0088	Normal recovery of node	3
0089	Subsystem communication error	2
0090	Subsystem communication recovered	3
0093	CPU node's housekeeping unit error	2
0094	Normal recovery of CPU node's housekeeping unit	3
0425	Start of online upgrade	4
0426	Normal completion of online upgrade	4
0427	Online upgrade error	2
0447	Node maintenance port enabled notification	2
0448	Node maintenance port disabled notification	3
0450	Copy program and database on control side of safety control station to standby side	4
0451	Information of switching of control side of safety control station	4
0452	Information of switching of standby side of safety control station	4
0455	Node maintenance notification	4
0456	Node maintenance cancellation notification	4
0459	Information of I/O module service side	4
0460	Information of I/O module out service	4
0471	Normal completion of online change download	4
0474	Information of tag list duplicate error	2
0475	Start of database download to I/O module	4
0476	Normal completion of database download to I/O module	4
0477	Database download error to I/O module	2
0480	Heavy load on periodical processing	4
0727	Block mode recovery error information	2
0743	Self-diagnostic SEN-BUS Failure	2
0744	Self-diagnostic SEN-BUS Recovery	3
0749	Self-diagnosis detected an I/O Error	1, or 2
0750	I/O Recovery from the error detected by self-diagnosis	3
0751	Time self-diagnostic testing error	1

Revision Information

Title : Messages Reference Manual

Manual No. : IM 32P02B10-01EN

Dec. 2023/9th Edition/R4.10 or later

Introduction	Updated descriptions.

Jan. 2022/8th Edition/R4.07

No.0749	Updated descriptions.

Feb. 2021/7th Edition/R4.06

No.0011, No.0063, No.0065, No.0066, No.0081, No.0082, No.0085, No.0087, No.0749, No.0767, No.0787, No.4125, No. 4211	Updated descriptions.

Dec. 2019/6th Edition/R4.05

Introduction	Updated descriptions about registered trademarks and trademarks.
No.0047, No.0787	Updated descriptions.
No.0425 to No.0427, No.4221, No.4222	Added.
No.4151	Updated descriptions.
Appendix 1	Added No.0425 to No.0427, No.4221, and No.4222.

Aug. 2018/5th Edition/R4.04

Introduction	Updated description of registered trademarks of YOKOGAWA.

Oct. 2017/4th Edition/R4.03.10

No.4131, No.4132, No.4162, No.4163, No.0477, No.0081	Updated descriptions.
No.4209 to No.4217, No.4219, No.4220	Added.
Appendix 1	Added No.4209 to No.4217, No.4219, and No.4220.

May 2017/3rd Edition/R4.03

Introduction	Deleted Windows Vista from explanation of trademarks.
No.4126, No.0749	Updated descriptions.
No.4207, No.4208	Added.
Appendix 1	Added No.4207 and No.4208.

Oct. 2016/2nd Edition/R4.02

Introduction	Updated descriptions in "■ Safety, Protection, and Modification of the Product," "■ Symbols," and "■ Trademark Acknowledgments." Added a new term in "■ Full Names and Simplified Terms."
No.3405, No.3407, No.4125	Updated descriptions.

Dec. 2015/1st Edition/R4.01

Newly published.

User's Manual

ProSafe-RS
ProSafe-RS Lite

Engineer's Reference Manual

IM 32P04B10-01EN

YOKOGAWA
Yokogawa Electric Corporation

IM 32P04B10-01EN
9th Edition

Introduction

This manual explains the tools and functions used when engineering ProSafe-RS. This manual primarily explains the functions and operation of Automation Design Suite. Usage and precautions for tool used when creating applications run on SCS are described in the format of a reference. In order to look up the details of functions related to engineering and maintenance, you can read the corresponding chapters for necessary information.

If you are using the Field Commissioning Support Package, replace “FieldMate Validator” in the User's Manual with “Field Commissioning Support Package.”

This manual consists of the following parts:

- Part A - Overview of Automation Design Suite
  This section explains the purpose of use along with an overview of functions of Automation Design Suite.
- Part B - Basic operations of Automation Design Organizer
  This section explains the roles and basic operations of Automation Design Organizer.
- Part C - Automation Design Server administration functions and history management
  This section explains the functions for management of Automation Design servers and Automation Design projects, Safety I/O Editor of Automation Design Organizer, IOM Definition Editor, SCS Manager, builders, tools groups such as SCS Maintenance Support Tool, the functions for recording and managing the changes applied to the generation manager along with when and by whom such changes were applied, and the function for checking this history information.
- Part D - ModPack change management
  This section explains the functions for preparing backups of SCS Projects, saving the Revision history of SCS Projects, recording the history of users using SENG functions, and managing SCS master projects.
- Part E - Access Control/Operation History Management functions
  This section explains the functions for recording and browsing the operation history of SENG software and the functions for user-based restrictions of operations of SENG software.
- Part F - Tools and functions used with engineering of ProSafe-RS
  This manual explains the tools and functions used when performing engineering.

Safety Precautions for Use

Safety, Protection, and Modification of the Product

- To protect the system controlled by the Product and the Product itself and to ensure safe operation, please observe the safety precautions described in this Manual. Yokogawa Electric Corporation ("YOKOGAWA") assumes no liability for safety if users fail to observe the safety precautions and instructions when operating the Product.
- If the Product is used in a manner not specified in the User's Manuals, the protection provided by the Product may be impaired.
- If any protection or safety circuit is required for the system controlled by the Product or for the Product itself, please install it externally.
- Be sure to confirm the specifications and required settings of the devices that are used in combination with the Product by referring to the instruction manual or other documents of the devices.
- Use only spare parts that are approved by YOKOGAWA when replacing parts or consumables of the Product.
- Do not use the Product and its accessories such as power cords on devices that are not approved by YOKOGAWA. Do not use the Product and its accessories for any purpose other than those intended by YOKOGAWA.
- Modification of the Product is strictly prohibited.
- The following symbols are used in the Product and User's Manuals to indicate the accompanying safety precautions:

Indicates that caution is required. This symbol for the Product indicates the possibility of dangers such as electric shock on personnel and equipment, and also indicates that the user must refer to the User's Manuals for necessary actions. In the User's Manuals, this symbol is used together with a word "CAUTION" or "WARNING" at the locations where precautions for avoiding dangers are described.

<French> Signale qu'il faut faire preuve de prudence. Ce symbole pour le produit signale la possibilité d'un danger pour le personnel et l'équipement comme un choc électrique, et signale également que l'utilisateur doit se référer au Manuel de l'utilisateur afin de prendre les mesures nécessaires. Dans le Manuel de l'utilisateur, ce symbole est utilisé conjointement avec la mention «CAUTION» ou «WARNING» aux endroits où sont décrites les précautions pour éviter les dangers.

Indicates that caution is required for hot surface. Note that the devices with this symbol become hot. The risk of burn injury or some damages exists if the devices are touched or contacted.

<French> Signale qu'il faut faire preuve de prudence avec la surface brûlante. Les appareils sur lesquels est apposé ce symbole risquent de devenir brûlants. Tout contact physique ou matériel avec ces appareils risque de provoquer des brûlures ou des dommages.

Identifies a protective conductor terminal. Before using the Product, you must ground the protective conductor terminal to avoid electric shock.

Identifies a functional grounding terminal. A terminal marked "FG" also has the same function. This terminal is used for grounding other than protective grounding. Before using the Product, you must ground this terminal.

Indicates an AC supply.

Indicates a DC supply.

| Indicates that a component such as a power supply switch is turned ON.

○ Indicates that a component such as a power supply switch is turned OFF.

Notes on Handling User's Manuals

- Hand over the User's Manuals to your end users so that they can keep the User's Manuals on hand for convenient reference.
- Thoroughly read and understand the information in the User's Manuals before using the Product.
- For the avoidance of doubt, the purpose of the User's Manuals is not to warrant that the Product is suitable for any particular purpose but to describe the functional details of the Product.
- Contents of the User's Manuals are subject to change without notice.
- Every effort has been made to ensure the accuracy of contents in the User's Manuals. However, should you have any questions or find any errors, contact us or your local distributor. The User's Manuals with unordered or missing pages will be replaced.

Warning and Disclaimer

- Except as specified in the warranty terms, YOKOGAWA shall not provide any warranty for the Product.
- YOKOGAWA shall not be liable for any indirect or consequential loss incurred by either using or not being able to use the Product.

Notes on Software

- YOKOGAWA makes no warranties, either expressed or implied, with respect to the Software Product's merchantability or suitability for any particular purpose, except as specified in the warranty terms.
- Purchase the appropriate number of licenses of the Software Product according to the number of computers to be used.
- No copy of the Software Product may be made for any purpose other than backup; otherwise, it is deemed as an infringement of YOKOGAWA's Intellectual Property rights.
- Keep the software medium of the Software Product in a safe place.
- No reverse engineering, reverse compiling, reverse assembling, or converting the Software Product to human-readable format may be performed for the Software Product.
- No part of the Software Product may be transferred, converted, or sublet for use by any third-party, without prior written consent from YOKOGAWA.

Documentation Conventions

Symbols

The following symbols are used in the User's Manuals.

 WARNING	Indicates precautions to avoid a danger that may lead to death or severe injury.
 CAUTION	Indicates precautions to avoid a danger that may lead to minor or moderate injury or property damage.
IMPORTANT	Indicates important information required to understand operations or functions.
TIP	Indicates additional information.
	Indicates referenced content. In online manuals, you can view the referenced content by clicking the links that are in green text. However, this action does not apply to the links that are in black text.

Typographical Conventions

The following typographical conventions are used throughout the User's Manuals.

Commonly Used Conventions throughout the User's Manuals

- Δ Mark
  Indicates that a space must be entered between character strings.
  Example:

  ```
  .ALΔPIC010Δ-SC
  ```

- Character string enclosed by braces { }
  Indicates character strings that may be omitted.

  Example:

  ```
  .PRΔTAG{Δ.sheet name}
  ```

Conventions Used to Show Key or Button Operations

- Characters enclosed by brackets [ ]
  When characters are enclosed by brackets in the description of a key or button operation, it indicates a key on the keyboard, a button name in a window, or an item in a list box displayed in a window.

  Example:

  To alter the function, press the [ESC] key.

Conventions of a User-defined Folder

- User-defined folder name enclosed by parenthesis ( )
  User definable path is written in a pair of parentheses.

  Example:

  ```
  (RS Project Folder)\SCS0101
  ```

If the RS Project Folder is `C:\MYRSPJT`, the above path becomes `C:\MYRSPJTSCS0101`.

Drawing Conventions

Drawings used in the User's Manuals may be partially emphasized, simplified, or omitted for the convenience of description.

Drawings of windows may be slightly different from the actual screenshots with different settings or fonts. The difference does not hamper the understanding of basic functionalities and operation and monitoring tasks.

Explanation of Hardware and Software Behaviors in the User's Manuals

In the User's Manuals, system behaviors are explained assuming that the latest versions of YOKOGAWA software and hardware at the time of publication of the User's Manuals are installed.
If additional precise information about the safety of legacy versions of software or hardware is required, a link to the corresponding explanation is provided. Please refer to the information according to your system.

Definitions of Node and Module Terms

In the User's Manuals, nodes and modules are referred to by using collective terms, another terms, or abbreviations based on the following definitions:

- Definitions of nodes
  - Node: A node is a collective term for an FIO node and an N-IO node.
  - FIO node: This is a collective term for a safety control unit, a safety node unit, and a unit for optical ESB bus repeater module.
  - CPU node: This is another term for a safety control unit. The abbreviation of safety control unit is SCU.
  - I/O node: This is another term for a safety node unit. The abbreviation of safety node unit is SNU.
  - N-IO node: This is a collective term for a node interface unit and an N-IO I/O unit. The abbreviation of node interface unit is NIU.
- Definitions of modules
  - I/O module: This is a collective term for an FIO I/O module and an N-IO I/O module.
  - FIO I/O module: This is a collective term for an analog I/O module and a digital I/O module for FIO, and a communication module.
  - N-IO I/O module: This is a collective term for the modules that can be mounted on an N-IO I/O unit.
  - AIO/DIO module: This is a collective term for an analog I/O module, a digital I/O module, and a universal type I/O module.
  - Analog I/O module: This is a collective term for an analog input module and an analog output module.
  - Digital I/O module: This is a collective term for a digital input module and a digital output module.
  - Universal type I/O module: This is a collective term for the I/O modules for which the channel signal category can be changed by software.

- Input module: This is a collective term for an analog input module, digital input module, and a universal type I/O module with defined input channels.
- Output module: This is a collective term for an analog output module, digital output module, and a universal type I/O module with defined output channels.
- Communication module: This is a collective term for a serial communication module, an Ethernet communication module, and a fire and gas communication module.

Full Names and Simplified Terms

In the User's Manuals, simplified terms listed in the following table are used.

Table Info-1 Full Names and Simplified Terms

Full Name	Simplified Term
Automation Design Suite	AD Suite
Automation Design Organizer	AD Organizer
Automation Design Server	AD Server
Automation Design project	AD project
Automation Design Master Database	ADMDB
Automation Design Suite Administration Tool	ADS Administration Tool
iDefine for ProSafe-RS	iDefine
Modification Package	ModPack
SCSV1-S (SCS supporting the SSC10S/SSC10D safety control units)	SCSV1
SCSP1-S (SCS supporting the SSC50S/SSC50D safety control units)	SCSP1
SCSP2-S (SCS supporting the SSC60S/SSC60D safety control units)	SCSP2
SCSP3-S (SCS supporting the S2SC70S/S2SC70D safety control units)	SCSP3
SCSL2-S (SCS supporting the L1SC70S/L1SC70D safety control units)	SCSL2
SCSU1-S (SCS supporting the SSC57S/SSC57D safety control units)	SCSU1

A. Overview of Automation Design Suite

This section provides an overview of Automation Design Suite.

A1. Software configuration of AD Suite and storage of engineering data

AD Suite is an engineering environment that is designed for developing and maintaining the entire instrumentation system inclusive of safety instruments.

Software configuration of AD Suite

The following figure shows the software configuration of AD Suite.

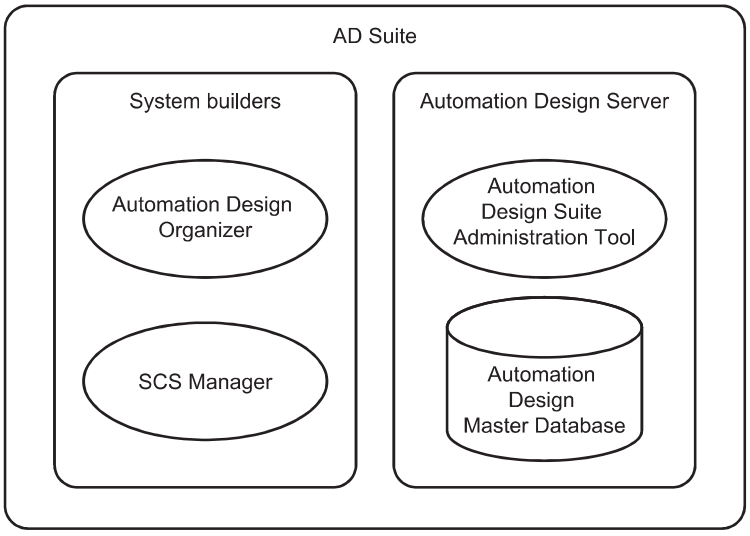

Figure A1-1 Software configuration of AD Suite

Safety system generation function

This function is used for the actual engineering of ProSafe-RS.

- Automation Design Organizer
  Automation Design Organizer (hereinafter referred to as AD Organizer) is an engineering software that uses a safety I/O list for safety systems. With this software it is possible to edit the safety I/O list and define the IOM. You can also export the safety I/O list to FieldMate Validator and import the safety I/O list which have been corrected by FieldMate Validator.

  After exporting the safety I/O list and IOM definition information for iDefine, which is an external engineering tool, and import them to iDefine, you can create application logic with iDefine. The engineering data that was created by using iDefine can be imported to AD Organizer and reflected in SCS projects.

TIP

Application logics that were created by using iDefine can be tested in iDefine. In addition, the SCS project to which the engineering data has been reflected can be connected with the logic simulator, SCS simulator, or the target SCS through the iDefine Test Manager of AD Organizer.

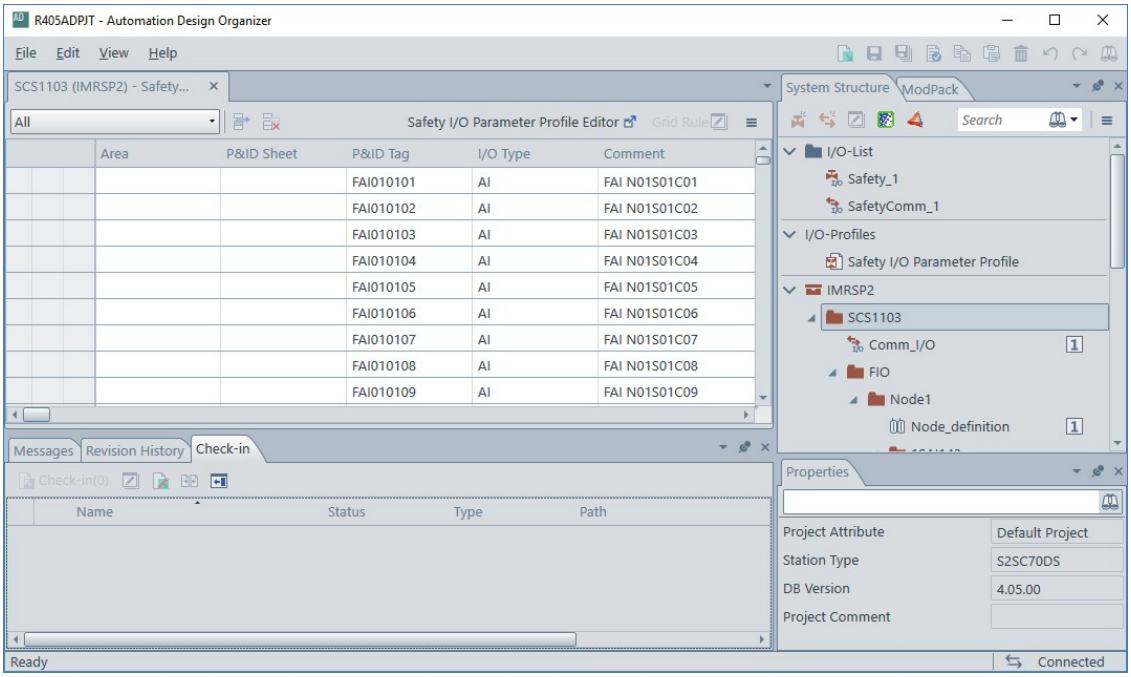

Figure A1-2 AD Organizer

- SCS Manager
  SCS Manager is a group of engineering software which defines items in regard to SCS projects. From the launcher menu, various engineering functions such as builders, SCS related tools, and SCS Maintenance Support Tool can be launched.

  The button to start up the SCS Manager is provided in the system structure navigator of AD Organizer. Select the SCS and click the button to open the target SCS project from the SCS Manager.

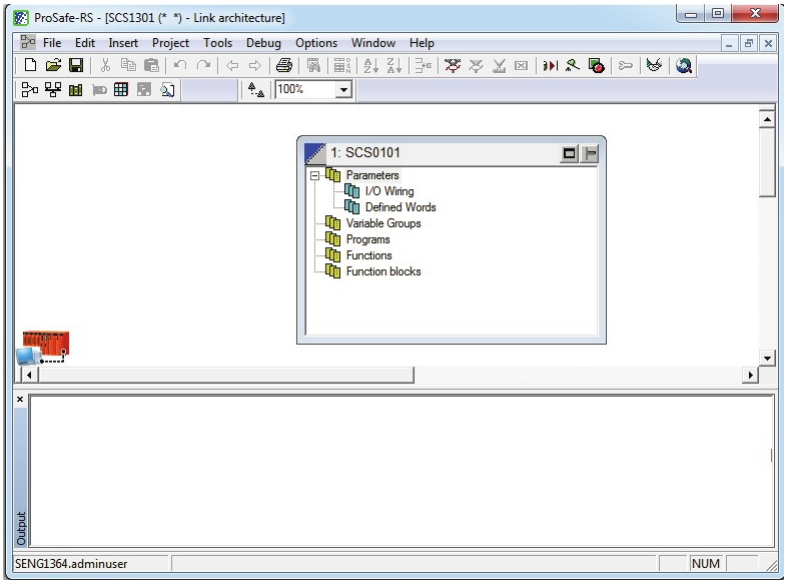

Figure A1-3 SCS Manager

Automation Design Server

Automation Design Server (AD Server) is a data server that manages the engineering data.

- Automation Design Master Database
  The Automation Design Master Database (ADMDB) is a database on which all engineering data is saved. This database also provides a function for history management of the engineering data.

- Automation Design Server Administration Tool
  Automation Design Server Administration Tool (ADS Administration Tool) is the software for management of AD Server.

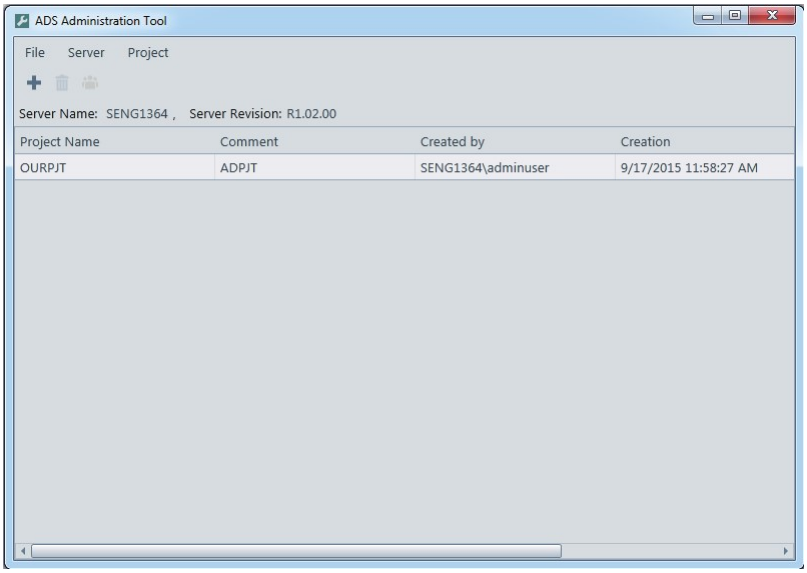

Figure A1-4 ADS Administration Tool

Storage of engineering data

Engineering data that is created or edited with the safety system generation functions is stored in the following projects.

- Automation Design project
  Automation Design projects (AD project) store the engineering data that is edited with AD Organizer. AD projects are created in the ADMDB on AD Server. Multiple AD projects can be created in the ADMDB.
- RS project
  RS projects are data folders for ProSafe-RS projects. These are created using a function provided with Windows. When RS projects that have been created are registered with an AD project, the content engineered by using SCS Manager is retained in the ADMDB making it possible to reference information such as the station configuration and revision history from AD Organizer.

  SCS projects are registered in folders under an RS project.

TIP

Multiple RS projects can be registered to a single AD project.

- SCS project
  In SCS projects, the engineering data that is edited with the builders of SCS Manager based on the safety I/O list and IOM information is stored. SCS projects are saved on a SCS database and the ADMDB.

TIP

SCS projects that have been duplicated with the copy operation in Windows cannot be registered on the ADMDB. Adding the SCS project from System Structure Navigator also causes an error. A copy of an SCS project can be created by exporting the SCS and importing the project upon changing the SCS name. A copy of an SCS project can be registered on the ADMDB by using System Structure Navigator.

The following figure shows the relationship between AD Organizer, SCS Manager, AD projects, RS projects, and SCS projects.

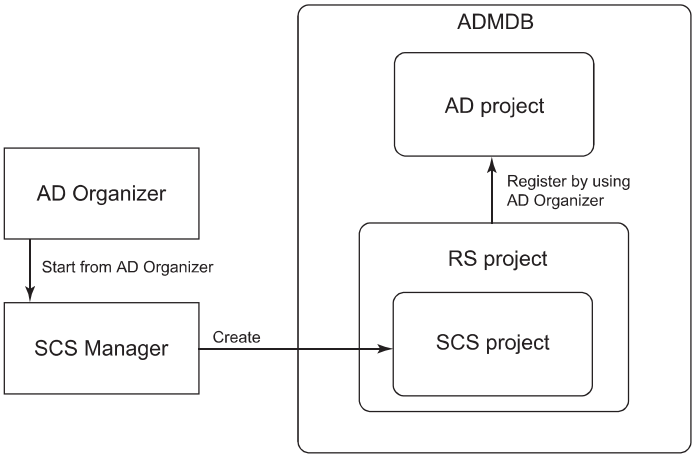

Figure A1-5 Flow of engineering data

AD projects are created using ADS Administration Tool.

RS projects are created by creating RS project folders using the explorer function provided with Windows. RS projects are registered to an AD project by using AD Organizer.

When an RS project is registered in an AD project by using AD Organizer, SCS projects created with SCS Manager can also be modified by using AD Organizer as SCS projects in the RS project folder are registered at the same time.

The revision history of SCS projects is stored in the AD project in which the SCS projects are registered.

For the ADMDB, which stores AD projects, you can use the ADS Administration Tool to specify the folder to place the ADMDB and configure access control to AD Server.

● Safety system generation functions and connection to AD Server

SCS projects are connected to the AD projects on AD Server through builders, which are part of the safety system generation functions. For this reason, the safety system generation functions must be connected to the AD Server when they are used.

Terminology

The following table shows terms used with AD Suite.

Table A1-1 Terms used with AD Suite

No.	Terminology	Description
1	Automation Design Suite (AD Suite)	Indicates the entire engineering environment of ProSafe-RS R4.
2	Automation Design Organizer (AD Organizer)	Engineering software that serves a central role in engineering that uses a safety I/O list.
3	Automation Design Server (AD Server)	A server that manages the engineering data of AD Suite.
4	Automation Design Master Database (ADMDB)	A database on which the engineering data and history of AD Suite is saved. ADMDB is stored in the AD Server.
5	Automation Design project (AD project)	A group of engineering data. The engineering data of AD Suite is managed for each AD project.

Continues on the next page

Table A1-1 Terms used with AD Suite (Table continued)

No.	Terminology	Description
6	Automation Design Server Administration Tool (ADS Administration Tool)	A tool for management of AD Server. This tool can be used to manage AD Server and AD projects and assign operation rights in relation to ModPacks, and so on. With management of AD Server, you can back up and restore the ADMDB. With management of AD projects, you can create AD projects, export and import project data, and configure access control of AD projects.
7	Builder	A generic term for the group of builders that are launched from SCS Manager.
8	Safety I/O list	Data created from plant information as information to use with safety applications. This data is used to create I/O variables. This list handles I/O such as AIO and DIO for ProSafe-RS.
9	Safety communication I/O list	Data created from plant information as information to use with safety applications. This data is used to create communication I/O data. This list handles the I/O of subsystem communication and fire and gas communication for ProSafe-RS.
10	IOM definition	A definition for I/O modules.
11	RS project	RS project folders are created by using the explorer function provided with Windows. These are referred to as RS projects. These are groups of data that store the engineering data that has been edited with a builder or AD Organizer and data that has been converted by RS generation. RS projects registered to an AD project are subject to being saved with the history management function. History management can be updated in units of RS projects.
12	System project	A generic term for RS Projects of ProSafe-RS and VP Projects of CENTUM VP.
13	SCS project	SCS projects are engineering data that has been edited with the builders of SCS Manager and AD Organizer based on the safety I/O list and IOM information.
14	SCS Manager	A collective term for the engineering applications of ProSafe-RS. This is the main window used to define SCS projects. I/O Parameter Builder and I/O Wiring View become display-only when performing I/O list engineering.
15	Safety system generation function	This function is used for the actual engineering of ProSafe-RS.
16	I/O list engineering	I/O list engineering is an engineering method which uses the I/O List Engineering Package and incorporates a safety I/O list into AD Organizer.
17	RS original engineering	RS original engineering is an engineering method that does not use the I/O List Engineering Package. The engineering tools of SCS Manager are used. If an RS project that includes SCS project is registered with AD Server, the history management function of AD Suite can be used.
18	History management	A function that manages the revision history of engineering data.
19	Change management	A function that supports management of the processes of changing engineering data.
20	RS generation	A function that converts the engineering data of AD Organizer into SCS projects.

Continues on the next page

Table A1-1 Terms used with AD Suite (Table continued)

No.	Terminology	Description
21	ModPack	A package that contains a set of information that is related to a certain change is called a Modification Package (ModPack).

A2. Overview of AD Suite functions

This section provides an overview of AD Suite functions.

AD Suite has the following main functions:

Basic functions

The basic functions of AD Suite are as follows.

- History management
  This function saves, to the ADMDB on AD Server, the SCS project files that have been updated through a build or by editing with builders or tools that are started from SCS Manager

  The user specifies whether to start or stop the history function. This function is used when editing with SCS Manager and when processing the reflection of Generation Manager of the build of an SCS project.

  The following functions can be used even without the Access Control / Operation History Management packages:

  - Viewing the history in the Revision History window in AD Organizer.
  - Displaying differences between two files saved as history in the Revision History window in AD Organizer. SCS Manager and various builders are launched in the read-only mode and the differences are displayed in red.
- Management of AD Server and AD projects
  - Location setting of the ADMDB
  - Controlling access to AD projects

ModPack change management

ModPack change management is a function of Change Management Package. This function requests changes of engineering data and manages the actual revision history.

The changes applied to engineering data are managed by associating sets of information referred to as ModPacks with the revision history.

A2.1 Basic functions

This section explains the basic function of AD Suite while providing an overview of the functions.

The basic functions of AD Suite can be used with ProSafe-RS R4.01.00 and later versions. If you use only the basic functions of AD Suite, engineering is performed from SCS Manager.

The basic functions have the following functions:

- History management
- Management of AD Server and AD projects
  - Location setting of the ADMDB
  - Management of access to AD projects

The following figure illustrates the basic functions.

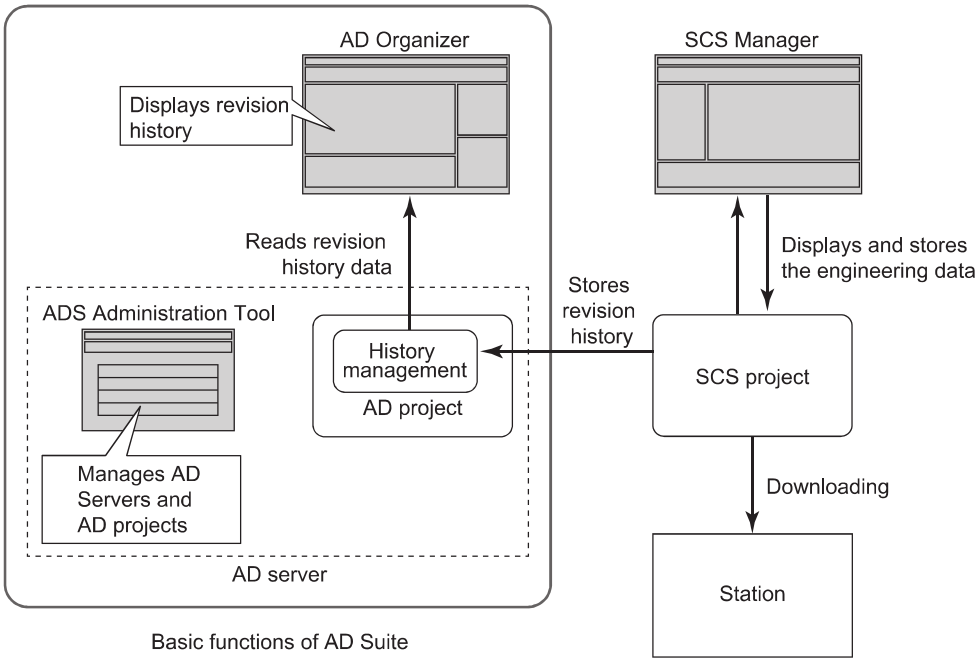

Figure A2.1-1 Basic functions

History management

History management stores the revision history of SCS projects. Whenever a file of an SCS project is updated, the revision history is automatically saved with the history management of AD Server. The revision history that has been saved with the history management can be displayed in AD Organizer.

Management of AD Server and AD projects

AD Server and AD projects are managed with ADS Administration Tool.

This tool comprises functions such as backing up and restoring the ADMDB, creating AD projects, exporting and importing AD project data, setting the location of the ADMDB, and configuring access control to AD Server.

A2.2 ModPack change management

This section provides and overview of the function of ModPack change management.

ModPack change management manages the process of modifying engineering data. The modification process is managed by editing a ModPack, which keeps records of the activities of implementing the change.

ModPack is short for Modification Package which is a set of information that is related to a certain change. A single ModPack can contain various information such as an ID for identifying the change, a status which indicates the status of the change, the user in charge of each change, the locations of the changes to be made, the results of changes, testing methods, and test results. For this reason, those in charge of each change can proceed with the tasks of applying such changes based on the ModPack that has been assigned to them.

ModPack change management can be used in cases both when performing I/O list engineering and when performing RS original engineering.

Change Management Package is required for ModPack Change management.

The following figure illustrates ModPack change management.

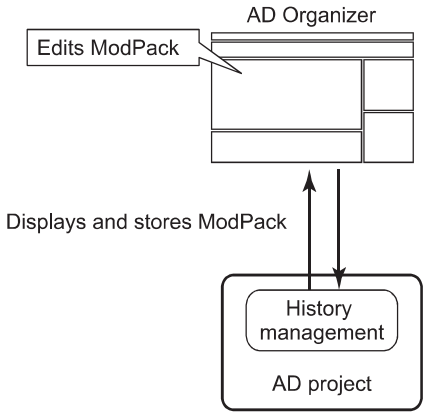

Figure A2.2-1 ModPack change management

A3. Examples of system configuration

This section provides examples of the system configuration of ProSafe-RS inclusive of AD Suite.

The following figure shows an example of the minimum system configuration of ProSafe-RS.

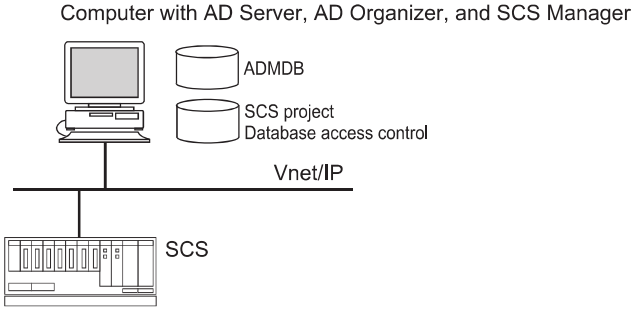

Figure A3-1 Example of minimum system configuration

One or multiple AD projects can be defined with AD Server. Multiple RS projects can be registered to a single AD project. All RS projects corresponding to a station to which the licenses of the same licensed project are assigned must be registered with a single AD project.

The following figure shows an example of a system configuration in which AD Server and AD Organizer are installed on different computers.

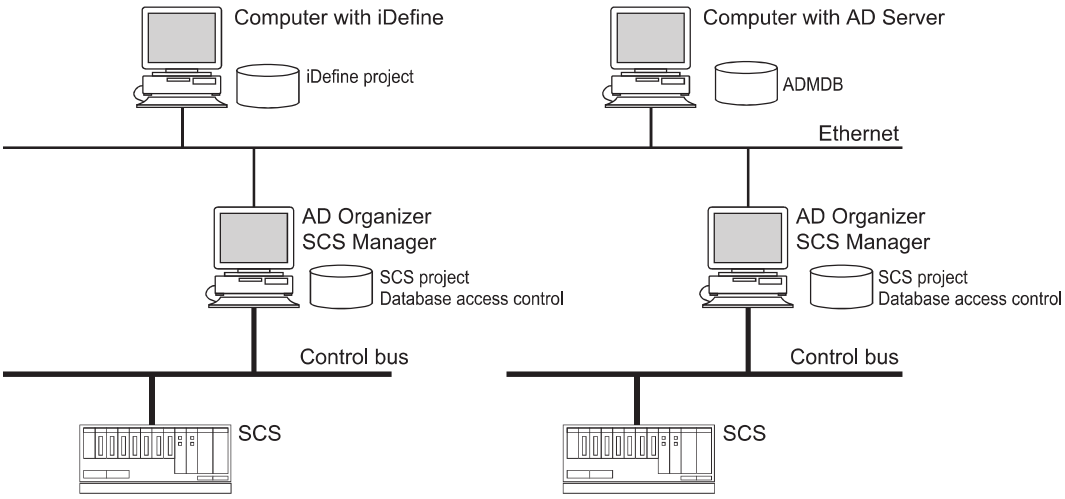

Figure A3-2 Example of a system configuration in which AD Server and AD Organizer are installed on different computers

The following figure shows an example of a system configuration in which CENTUM VP and ProSafe-RS coexist.

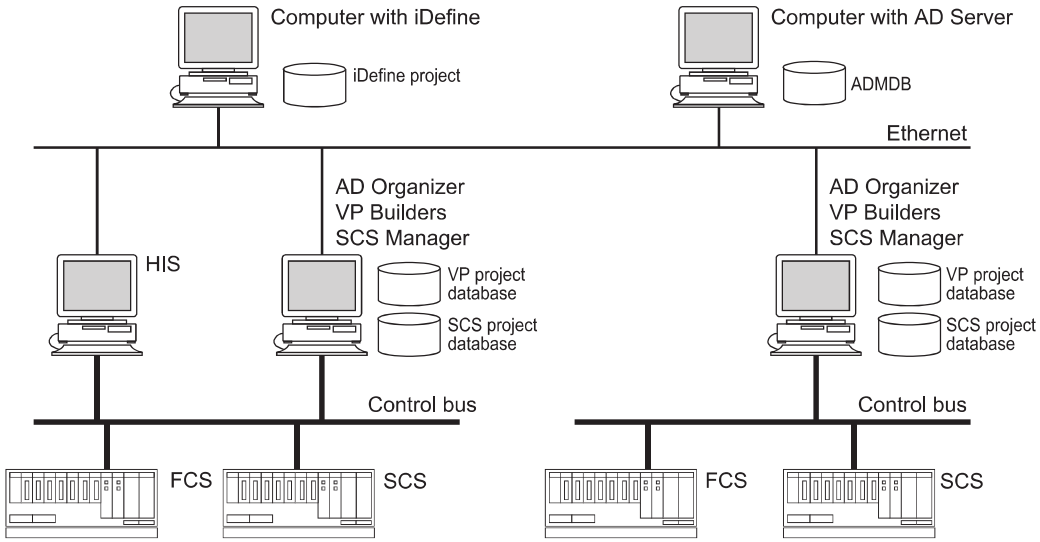

Figure A3-3 Example of a system configuration in which CENTUM VP and ProSafe-RS coexist

With AD Suite, the basic functions of CENTUM VP engineering and the safety system engineering and maintenance functions of ProSafe-RS can coexist on a single computer. As a minimum configuration, in addition to these, you can setup a configuration in which an engineering server function coexists as well.

Also, multiple VP projects and multiple RS projects can be registered to a single AD project.

TIP

iDefine can be installed on the computer on which SCS Manager and AD Organizer have been installed. iDefine and VP Builder cannot coexist on a single computer.

A4. Application capacity of AD Suite

The following show the application capacity of AD Suite.

Table A4-1 Application capacity

Item	Limit
RS project	32
SCS projects in a single RS project	100
P&ID Groups (*1)	100
Safety I/O parameter profile	1000

*1: P&ID Group is a name of a safety I/O list or safety communication I/O list. The name is specified when you create the safety I/O list or safety communication I/O list with System Structure Navigator.

B. Basic operations of Automation Design Organizer

This section describes the basic operations of Automation Design Organizer (hereinafter referred to as AD Organizer).

B1. Software used with I/O list engineering

Software used with I/O list engineering consists of AD Organizer and SCS Manager. You can also integrate with the external engineering tool iDefine.

The following list shows the functions of AD Organizer:

- I/O design
  Function for creating and editing the following lists
  - Safety I/O list
  - Safety communication I/O list
  - IOM definition
- I/O parameter profile
  Function for creating and editing safety I/O parameter profiles
- History management function
  Function for managing modification activities with ModPacks

iDefine has the following functions:

- FSM functionality
  Supports the Functional Safety Management as part of the safety lifecycle as stipulated in IEC61508 and IEC61511.
- Creating application logics
  Creates application logics by using the safety I/O list that was created in AD Organizer.
- Testing application logics
  Tests the application logics that were created.
- Creating documents
  Turns the application logics that were created and test results into documents.

TIP

- The I/O List Engineering Package is required to perform I/O list engineering.
- You can perform engineering by integrating the external engineering tool iDefine with AD Organizer. To use the external engineering tool iDefine, the I/O List Engineering Package and the iDefine Interface Package are required.
- The Change Management Package is required to use ModPacks.

B2. Starting and ending AD Organizer

This section describes how to start and end AD Organizer.

Starting AD Organizer

Follow these steps to start AD Organizer:

1. Log on as a user that has the access rights to add RS projects.
2. Start AD Organizer.
   When AD Organizer is started for the first time, the Select AD Project dialog box appears.
3. Select the computer name or IP address of the computer with AD Server, and click [Connect].
   AD projects that are created in AD Server appear.

TIP

If you want to set a port number, type a single-byte colon ":" and the port number after the computer name or the IP address.

4. Select the AD project and click [Open].

Behavior when AD Organizer fails to connect to AD Server

AD Organizer must be connected to AD Server when it is used. If AD Organizer fails to connect to AD Server, the system behaves as follows:

- When AD Organizer fails to connect to AD Server when it is started, a dialog box for selecting the AD project to connect to is displayed and the system will urge connection to a different AD Server.
- In cases when the connection with AD Server is discontinued after AD Organizer has been started, most functions of AD Organizer cannot be used. In such case, "Disconnected" is indicated as the AD Server connection status in the status bar area. After the connection with AD Server has been restored, the functions can be normally used. In such case, in the menu bar of AD Organizer, select [View] > [Update] and update the window display.

Ending AD Organizer

Follow these steps to end AD Organizer:

1. Click the [Exit] button in AD Organizer.
   The Exit dialog box appears.
2. Click the [OK] button.
   AD Organizer ends.

IMPORTANT

If iDefine or PROFINET Configurator that was started by AD Organizer is operating, a dialog box appears and AD Organizer cannot be ended.

B3. Window layout of AD Organizer

The following figure shows the window layout of AD Organizer:

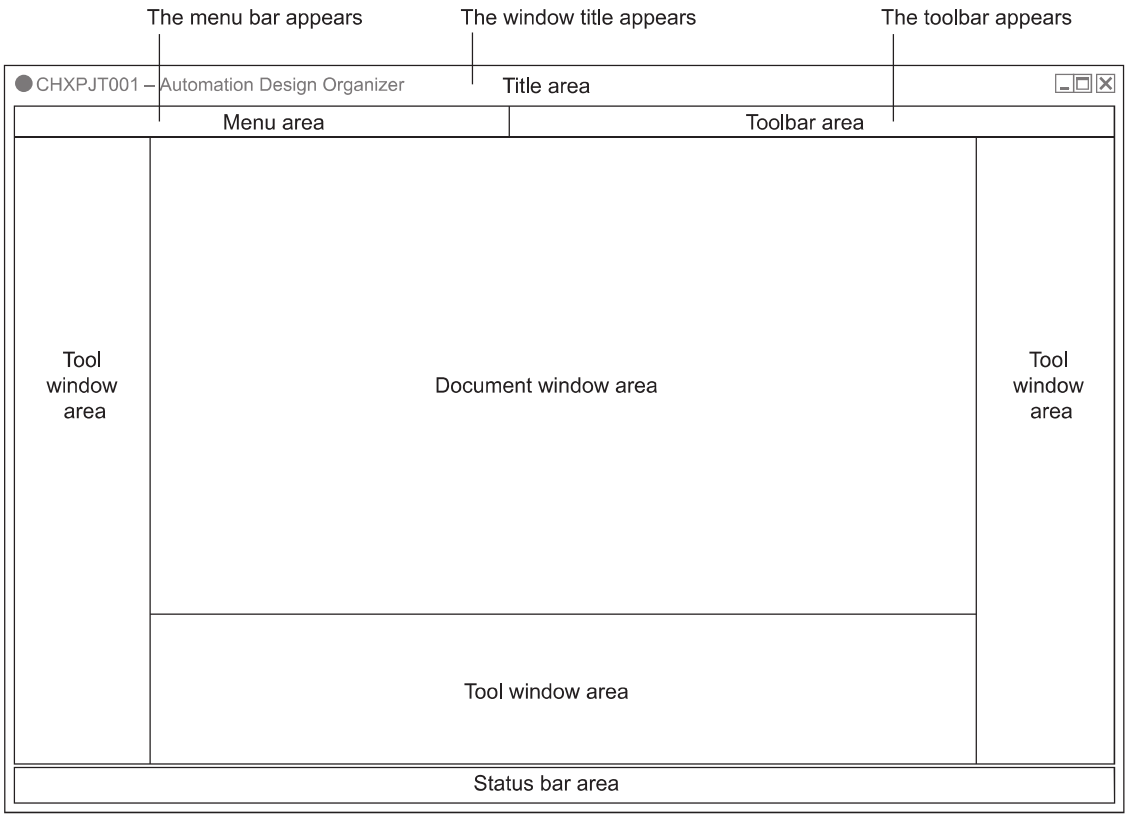

Figure B3-1 Window layout of AD Organizer

Default layout of window layout

The following figure and table show the default layout of the window layout of AD Organizer:

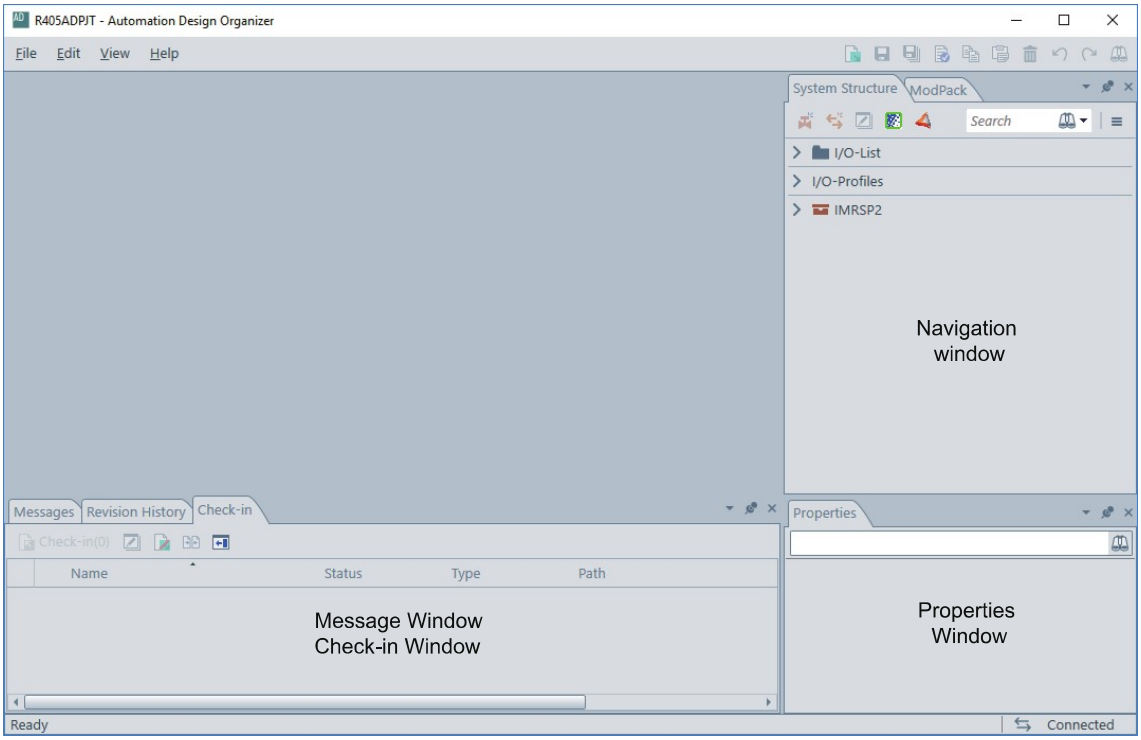

Figure B3-2 Default layout of window layout

Table B3-1 Display positions and window names of the default layout

Display position	Window name	Remarks
Top-right tool window area	Navigation window	The navigator shown as follows is open. • System Structure Navigator • ModPack Navigator
Bottom-right tool window area	Properties window	-
Bottom-center tool window area	Message window Check-in window	-
Document window area	There is nothing displayed	-

The left tool window area is not displayed in the default layout. This will be displayed when the window is moved to the left tool window area.

■ Changing the window layout

The user can change the window layout from the default state. New windows can be opened, the positions of windows can be changed, and windows can be made to float.

SEE ALSO For more information about floating windows, refer to:

"■ Floating a window" on page B3-13

■ Returning the window layout to the default layout

Follow these steps to return the window layout to the default layout.

- In the menu bar, select [View] > [Reset default layout].

B3.1 Tool window area

The following windows are displayed in the tool window area:

- Navigation window
  - System Structure Navigator
  - ModPack Navigator
- Properties window
- Message window
- Revision History window
- Check-in window

B3.1.1 Navigation window

In the navigation window, files and folders are shown as a list in a folder tree.

Double-clicking on a file displayed in the tree displays the file in the document window area.

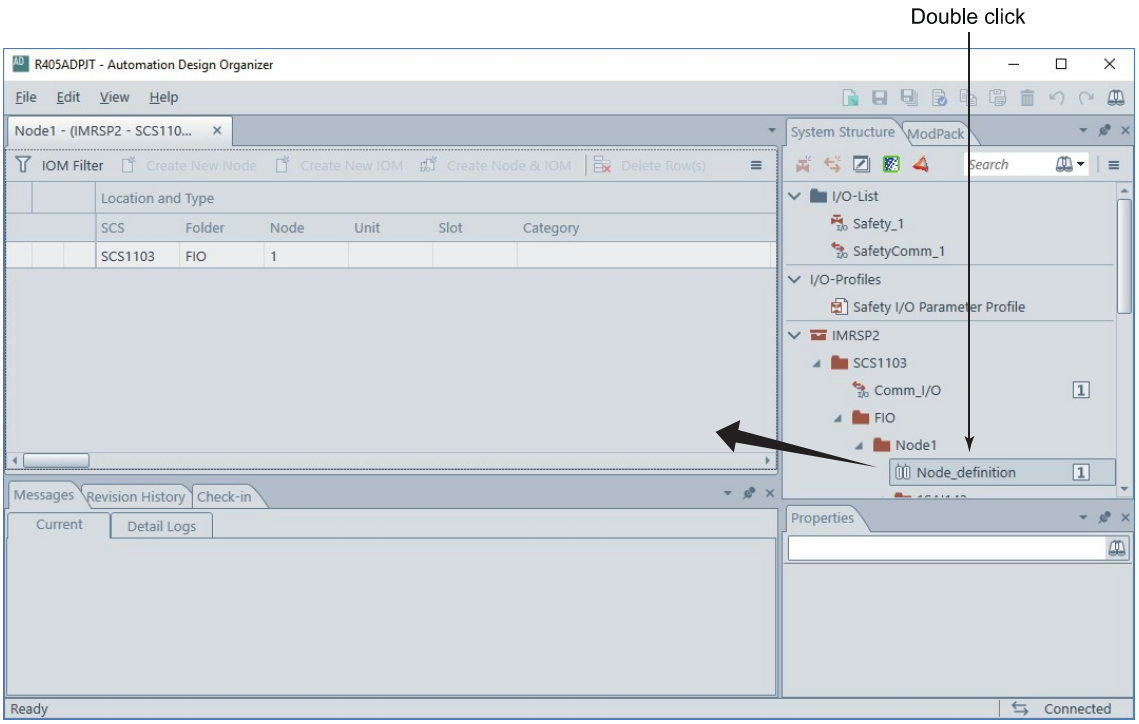

Figure B3.1.1-1 Screen development from the navigation window

The Navigation window consists of the following types:

- System Structure Navigator
- ModPack Navigator

These navigation windows, when first started, are bundled and displayed as tabs in the tool window area on the right side of the document window area.

System Structure Navigator

The following items are displayed in System Structure Navigator.

- Safety I/O list
- Safety communication I/O list
- Node definition
- IOM definition
- Safety I/O parameter profile
- iDefine Configuration folder

The following figure shows System Structure Navigator.

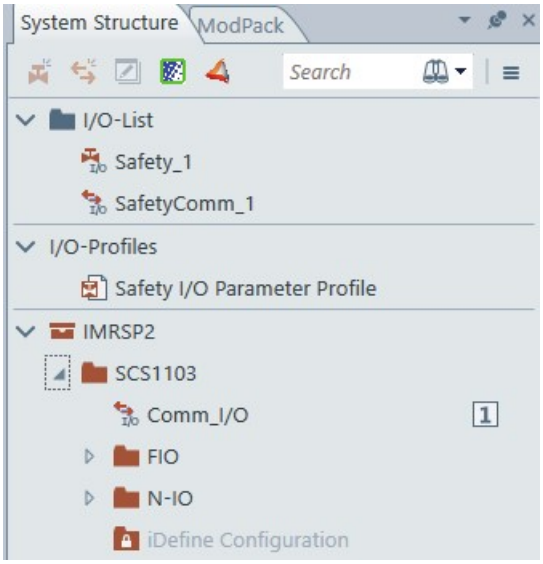

Figure B3.1.1-2 System Structure Navigator

TIP

- An icon resembling a key is displayed for folders that cannot be viewed with AD Organizer, SCS projects that are created with a setting for not performing the I/O list engineering, and the iDefine Configuration folder while the names thereof appear dimmed.
- An icon with an exclamation point appears for SCS projects under the following conditions:
  - An entire SCS project folder has been deleted for an SCS project that was created with I/O list engineering.
  - After an SCS project under the RS project folder registered in an AD project has been deleted, an SCS project of an different station type has been created with the same domain number and station number.

Perform the following operation to display the closed System Structure Navigator again.

- From the menu bar, select [View] > [System Structure Navigator].

ModPack Navigator

In ModPack Navigator, ModPacks are listed for each status.

TIP

The Change Management Package is required in order to use ModPacks.

The following figure shows ModPack Navigator.

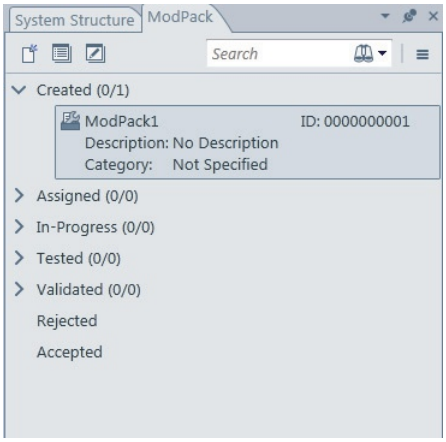

Figure B3.1.1-3 ModPack Navigator

Perform the following operation to display the closed ModPack Navigator again.

- From the menu bar, select [View] > [ModPack Navigator].

Display in the navigation window

In the navigation window, the following icons are shown:

- Check-out icon
  Indicates that files are currently checked-out.
- Work status icon
  Indicates that an RS generation is required.

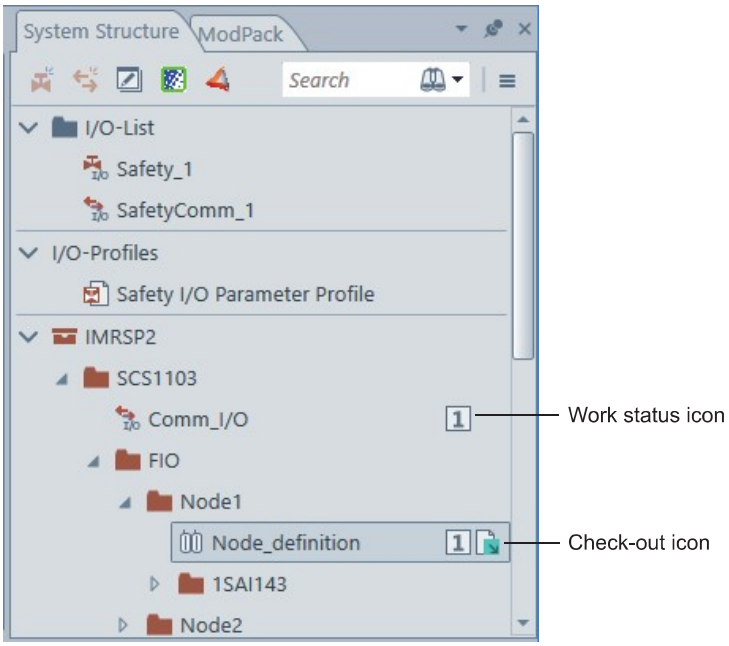

Figure B3.1.1-4 Display example of icons in the navigation window

SEE ALSO

For more information about check-out, refer to:

"■ File management with check-out and check-in" on page B4-3

For more information about RS generation, refer to:

D4., "Overview of RS generation" in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

B3.1.2 Properties window

The Properties window displays the properties of files and folders selected in the navigation window.

Properties which can be changed can be edited in the Properties window.

The following figure shows the Properties window.

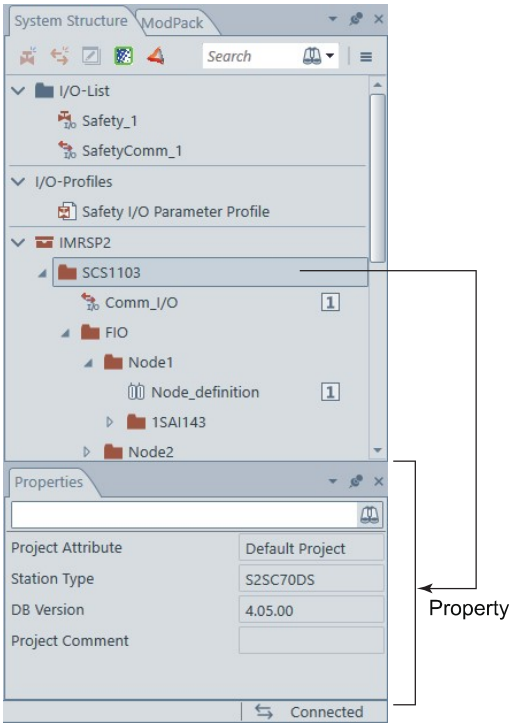

Figure B3.1.2-1 Properties window

Perform the following operation to display the Properties window:

- From the menu bar, select [View] > [Properties Window].

TIP

If an iDefine configuration node is selected, iDefine Project and the Build Revision are shown in the Properties window.

B3.1.3 Message window

The Message Window displays the progress and results of processing in the form of text.

The following figure shows the Message Window.

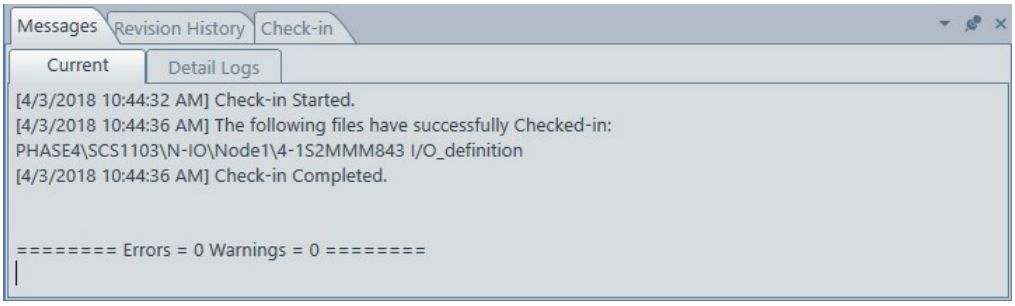

Figure B3.1.3-1 Message window

Perform the following operation to display the closed Message Window again.

- From the menu bar, select [View] > [Message Window].

B3.1.4 Revision History window

The Revision History window displays the revision history of files and information regarding labels.

The following figure shows the Revision History window.

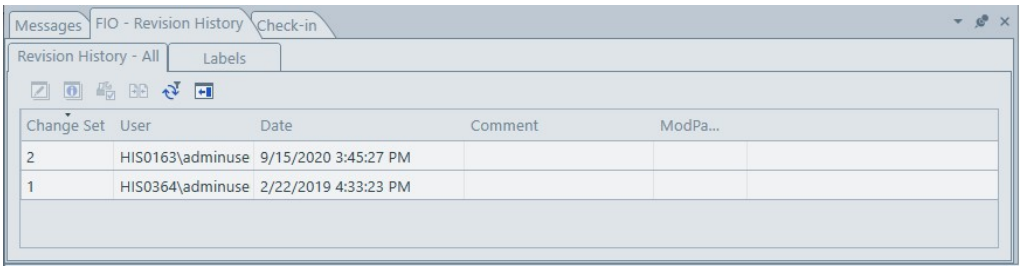

Figure B3.1.4-1 Revision History window

Perform the following operation to display the Revision History window:

- From the menu bar, select [View] > [Revision History Window].

SEE ALSO For more information about the items displayed in the Revision History window, refer to:

C2.9.1, “Displaying the Revision History window” on page C2-19

B3.1.5 Work Status List window

In the Work Status List window, a work file list is displayed. Also, from the Work Status List window, a work file list can be exported.

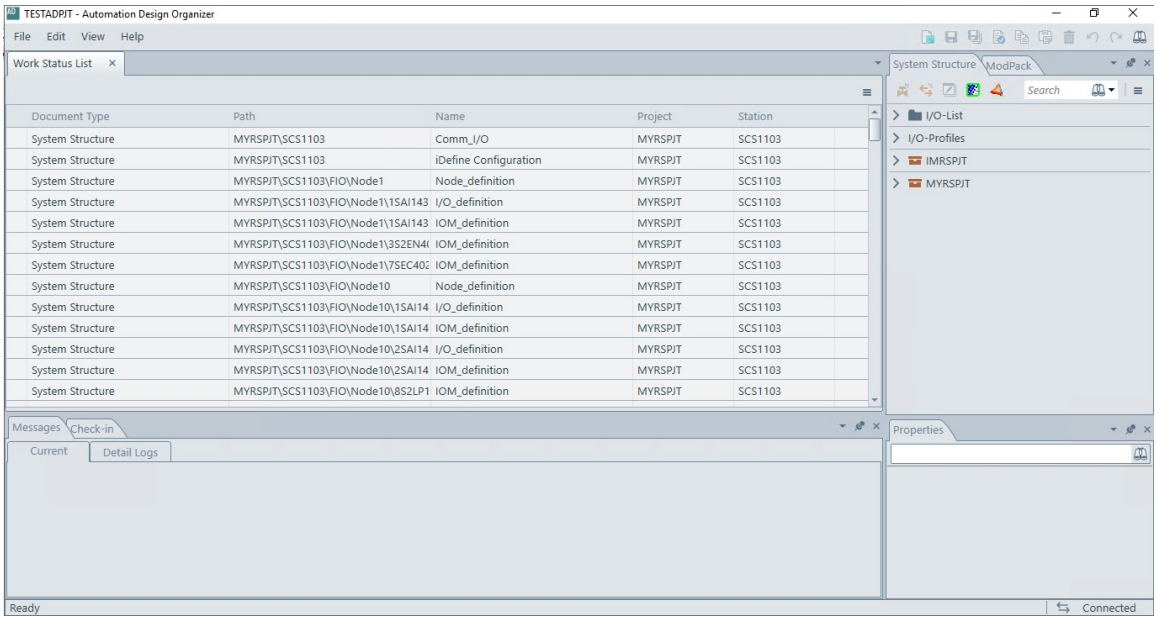

Figure B3.1.5-1 Work Status List window

Displaying the Work Status List window

Perform this step to display the Work Status List window:

- From the menu bar of AD Organizer, select [View] > [Work Status List Window].

Exporting a work file list

Follow these steps to export a work file list:

1. In the Work Status List window, click the Sub menu button and select [Export].
   The Choose a folder dialog box appears.
2. Select the folder to which you want to export the file and click [OK].
   The contents displayed in the Work Status List window are exported as a CSV file.

Format of the exported files

Exported files are created in the following format:

- File format
  CSV format
- Extension
  csv
- File name
  The file name will be as follows:

  `yyyy-MM-dd-hh-mm_WorkStatusList.csv`

  yyyy, MM, dd, hh, and mm indicate year, month, day, hour, and minute, respectively.

  Example: `2020-11-30-17-15_WorkStatusList.csv`

B3.1.6 Check-in window

The Check-in window displays a list of the files that are checked-in.

You can perform the following operations in the Check-in window:

- Check-in
- Discard Check-out
- Start the editor
- Compare with the latest of the server

The following figure shows the Check-in window:

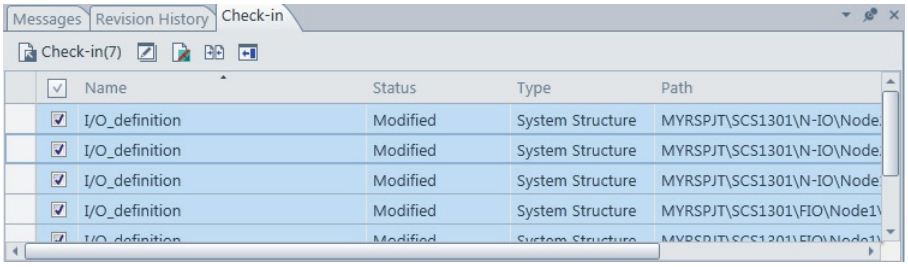

Figure B3.1.6-1 Check-in window

Perform the following operation to display the Check-in window:

- From the menu bar, select [View] > [Check-in Window].
  When a check-in is successful, a new Change Set ID is automatically generated sequentially.

SEE ALSO

For more information about Change Set ID, refer to:

"■ Saving of Change Sets" on page C2-16

For more information about check-in operation, refer to:

"■ Checking in manually" on page B4-9

For more information about check-in cancellation operation, refer to:

"■ Discarding a check-out" on page B4-5

For more information about procedures of operations for comparing files, refer to:

"■ Displaying comparisons with the Check-in window" on page B3-15

■ Items displayed in the Check-in window

The following table shows the items displayed in the Check-in window.

Table B3.1.6-1 Items displayed in the Check-in window

Item	Description	Remarks
Name	File name	-
Status	File status	There are the following types: • Modified • Not Modify
Type	File type	There are the following types: • System Structure • ModPack • Grid Rule
Path	Tier level of tree display	-

Continues on the next page

Table B3.1.6-1 Items displayed in the Check-in window (Table continued)

Item	Description	Remarks
Modified Date	Date and time of the last modification	-

B3.1.7 Operation in the tool window area

This section describes the operation of the tool window area.

Displaying the sub menu

Clicking on the Sub menu button in the top right of the window displays a sub menu.

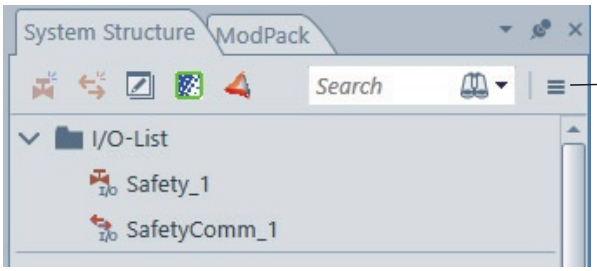

Figure B3.1.7-1 Sub menu button

Floating a window

Perform the following operation to switch the screen of the tool window area to a floating window:

- Right-click on the tab and select [Float].

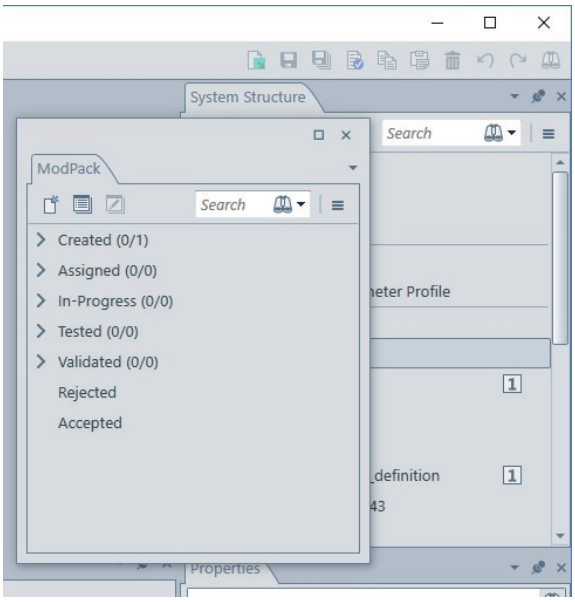

Figure B3.1.7-2 Floating window

Docking a floating window

Follow these steps to dock a floating window:

1. You can drag the floating window and move it above the window you wish to dock the floating window to.
   The region of the window you wish to dock the floating window to is displayed in white.
2. You can drop the floating window in the region displayed in white.

Automatically hiding a window

Perform the following operation to automatically hide a window:

- In the top right of the window, click [Auto Hide].

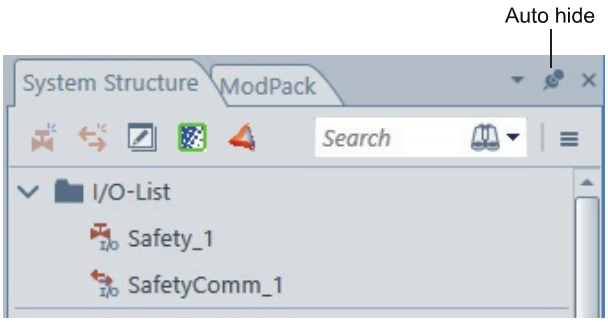

Figure B3.1.7-3 Auto hide

Windows from which the focus is removed are automatically hidden. As an example, the following figure shows the state where the navigation window is hidden.

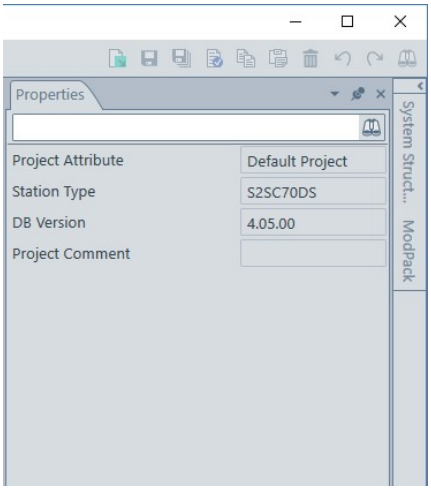

Figure B3.1.7-4 State where the navigation window is hidden

Moving the cursor above the window name at the edge of the screen displays the hidden window.

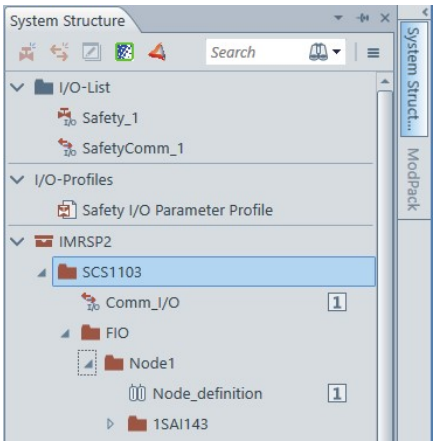

Figure B3.1.7-5 State where a hidden window is displayed

TIP

To cancel this behavior, click [Auto Hide] in the top right of the window.

B3.1.8 Compare the details of engineering data

The following files can be compared in the Check-in window and the Revision History window:

- Comparing the file currently checked out and the file saved to the ADMDB
  The file currently checked out and the latest file saved to the ADMDB can be compared on the local computer.

  The editor window of the latest file saved to the ADMDB appears on the left side, while the editor window of the file currently checked out appears on the right side of the comparison screen. You can edit the file currently checked out.

- Comparing files saved at two points in the past
  In the Revision History window, you can select and compare files saved at two different points.

  Alternately, when only one file is selected in the Revision History window, if the file currently checked out exists on the local computer, the comparison will be between the selected file and the currently checked out file. If no file is currently checked out, the selected file is compared against the latest file saved to the ADMDB.

  The editor window of the older file appears on the left side, while the editor window of the newer file appears on the right side of the comparison screen. If the newer file is currently checked out, you can edit the file.

TIP

To select a file in the Revision History window, select Revision History on the Revision History tab sheet or select Label on the Label tab sheet.

Displaying comparisons with the Revision History window

Follow these steps to display comparisons with the Revision History window:

1. Display the Revision History in the Revision History window.
2. Select the files to compare.
   You can select one or two files. To select the second file, select the file while holding down the [Ctrl] key.
3. Click the [Comparison] tool button.
   The results of the comparison are displayed.

Displaying comparisons with the Check-in window

The file being edited against the latest file checked-in on AD Server can be compared in order to confirm the changes.

Follow these steps to display comparisons with the Check-in window:

1. You can click and select the file you wish to compare in the Check-in window.
2. In the toolbar of the Check-in window, click [Compare with latest server copy].
   The results of the comparison are displayed in the Document window area.

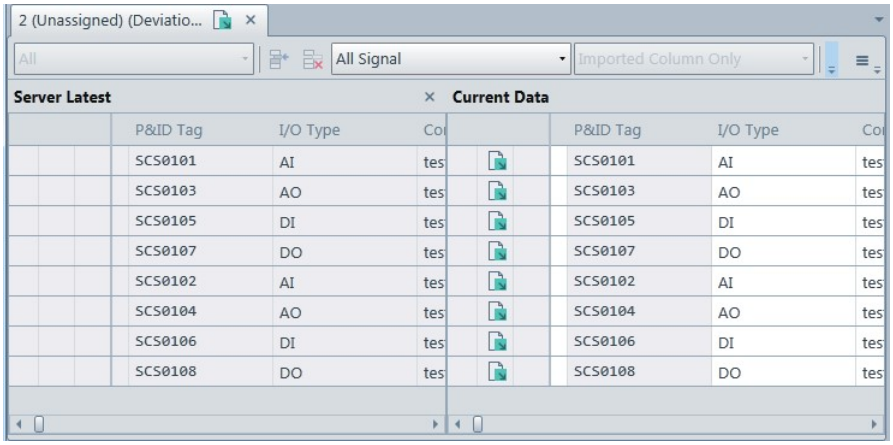

Figure B3.1.8-1 Example of comparison results

B3.2 Document window area

Windows for editing and browsing are displayed as tabs in the document window area. The following shows the windows that are used in each step.

- I/O design
  - Safety I/O Editor
  - Safety Communication I/O Editor
  - IOM Definition Editor
  - Safety I/O Parameter Profile Editor
- Change management
  - ModPack Editor

TIP

A maximum of 10 files can be displayed for editing in the document window area.

B3.2.1 Display and operations of the document window area

This section describes the display and operations of the document window area.

Status display of the tabs

This section describes the status display of the tabs.

Checked-out status

As shown in the following, files that are checked-out are marked with a checked-out status icon in the tabs:

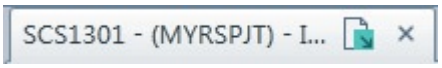

Figure B3.2.1-1 Tab of a file currently checked out

State where changes have not been saved

Tabs of files for which changes made with editing have not been saved are marked with an asterisk (*) before the file name.

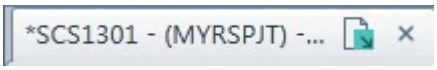

Figure B3.2.1-2 Tab of a file for which changes have not been saved

Operating the tabs

This section describes how to operate the tabs in the document window area.

Operations for floating, docking, and displaying the sub menu are the same as those for the tool window area.

Tab groups

The display of multiple files can be switched with tab operations in the document window. These multiple files for which the display can be switched by using tab operations are referred to as tab groups. The following tab groups contain two files:

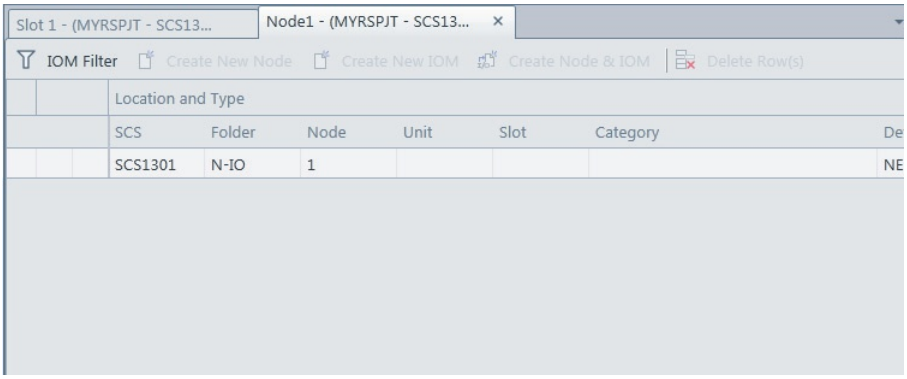

Figure B3.2.1-3 Tab group

Selecting a file to edit from the list of file names

To change the file subject to editing, you can click the tab of the file you wish to edit.

When many tabs are displayed, only a part of the file names may be displayed. In such case, follow these steps to select the file you wish to edit:

1. You can click on the triangular symbol located on the right edge of the tab section.
   A list of the file names belonging to the same tab groups are displayed in the drop-down list.

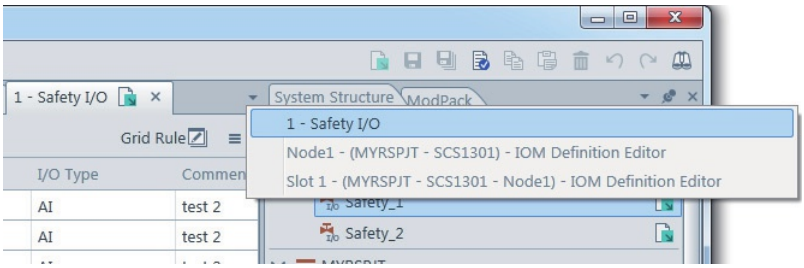

Figure B3.2.1-4 Displaying the list of file names

2. Select the file you wish to edit from the drop-down list.
   The selected file is displayed.

Splitting the document window

You can horizontally or vertically split the document window to display multiple files next to each other.

TIP

You cannot split the display of a single file.

You can perform one of the following operations to split the display of the document window:

- Right-click on the tab and select [New Horizontal Tab Group].
  The document window is split horizontally and a new tab group is created on the bottom. The tab on which you right-clicked moves to the new tab group.

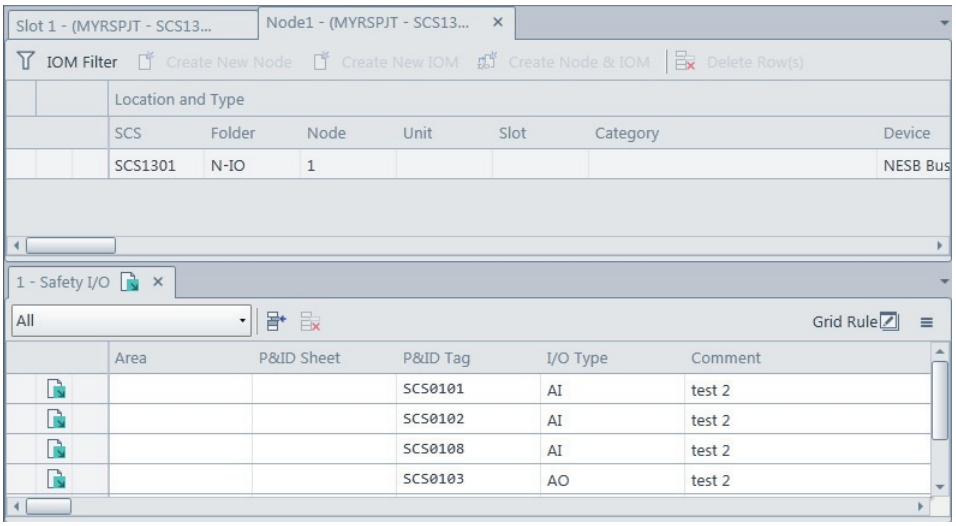

Figure B3.2.1-5 Horizontally split document window

- Right-click on the tab and select [New Vertical Tab Group].
  The document window is split vertically and a new tab group is created on the right. The tab on which you right-clicked moves to the new tab group.

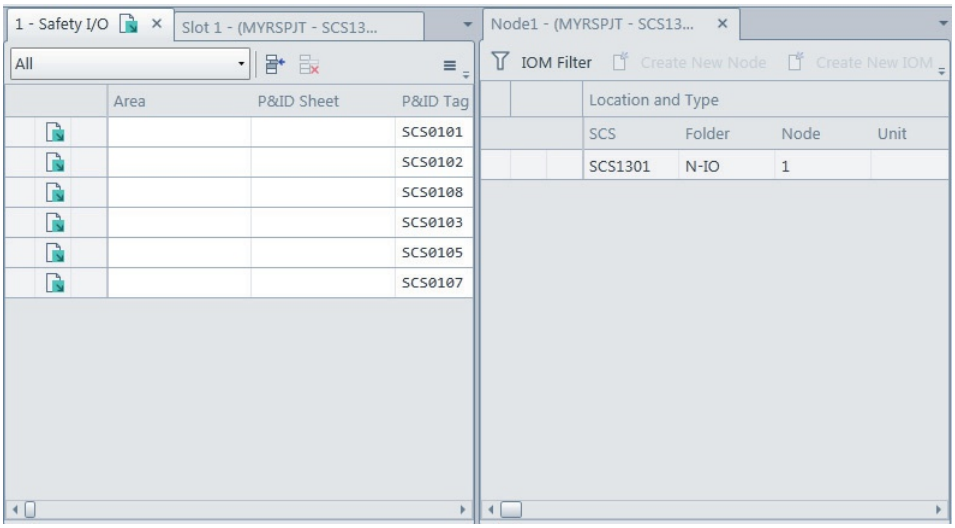

Figure B3.2.1-6 Vertically split document window

TIP

- When splitting the display into more than two, the direction in which the displays are split cannot be mixed. For example, when the display is first split horizontally, you cannot choose an operation other than [New Horizontal Tab Group].
- If two or more files are not included in the tab group before the display is split, right-clicking does not display [New Vertical Tab Group] or [New Horizontal Tab Group].

Moving to a different tab group

To move a tab to a different tab group, perform one of the following operations:

- Right-click on the tab and select [Move to Next Tab Group].
  The selected tab moves to the next tab group.
- Right-click on the tab and select [Move to Previous Tab Group].
  The selected tab moves to the previous tab group.

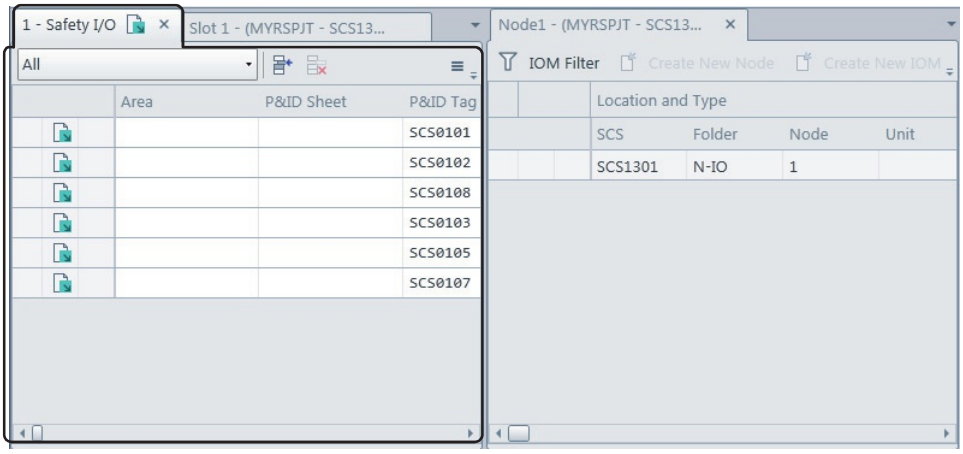

Figure B3.2.1-7 Before the operation for moving the tab group

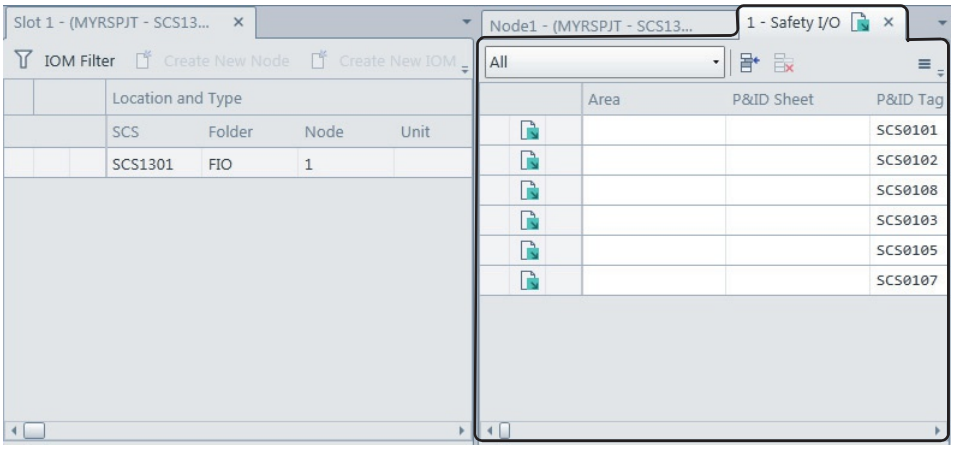

Figure B3.2.1-8 After the operation for moving the tab group

Deleting a tab group

A tab group is deleted when the number of tabs belong to that tab group becomes zero.

To delete a tab group, perform one of the following operations:

- You can move all of the tabs belonging to the tab group you wish to delete to a different tab group.
- You can close all of the tabs belonging to the tab group you wish to delete.

B3.3 Status bar area

In the status bar area, the status of connection with AD Server is displayed in the following manner:

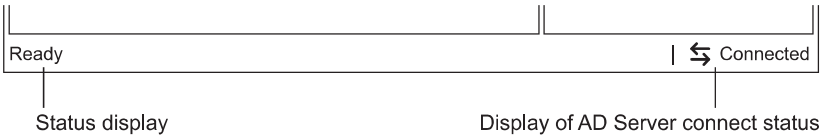

Figure B3.3-1 Status bar area

- Connected
  AD Organizer is connected to AD Server.
- Not connected
  AD Organizer is not connected to AD Server.
- Busy
  AD Organizer is connected to AD Server but is performing another process.

B4. Operating AD Organizer

This section describes the common operations of AD Organizer.

B4.1 Modifying an AD project subject to editing

Follow these steps to modify an AD project with AD Organizer:

1. In the menu bar of AD Organizer, select [File] > [Change AD project].
   The Select AD Project dialog box appears.

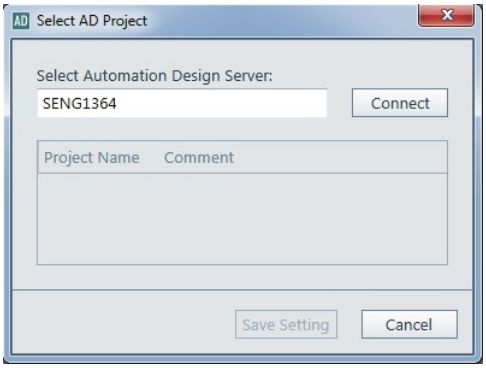

Figure B4.1-1 Select AD Project dialog box

2. Select the computer name or IP address of the computer with AD server, and click [Connect].
   AD projects that are created in AD Server appear.

TIP

If you want to set a port number, type a colon : and the port number after the computer name or the IP address.

3. Click the AD project you wish to edit.
4. Click [Save Setting].
5. Restart AD Organizer.
   The AD project subject to editing is modified.

TIP

The AD project you wish to edit is not modified until AD Organizer is restarted.

B4.2 Editing a file with AD Organizer

To edit a file with AD Organizer, you can perform operations in the order to check-out, edit, save, and check-in.

TIP

How to create a new file differs depending on the file you wish to create.

File management with check-out and check-in

In AD Organizer, multiple users can simultaneously work on a single AD project. However, simultaneous editing of a single file by multiple users is prohibited. The system of check-out and check-in is used to ensure that a single file is edited by only a single user.

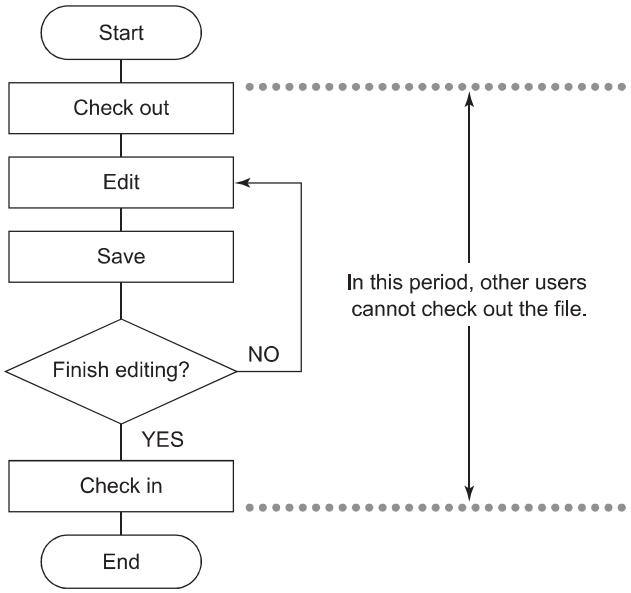

Figure B4.2-1 Flow of file editing using check-out and check-in

Check-out

To edit a file, check-out the file with AD Organizer.

- Files that are not checked-out cannot be edited.
- Files that are checked-out can be edited by only the user that has checked-out the file.
- Other users are not able to check-out this file until the checked-out file is checked-in or until the checked-out status is discarded.

Save

Edited files are saved on the computer running AD Organizer. Simply saving the file does not store the edited file in the AD project. The checked-out status of the file will also be continued.

Check-in

Operating a check-in stores the file saved on the computer running AD Organizer in the AD project on AD Server.

IMPORTANT

Only the checked-in files are subject to RS generation. After completing an edit, you must perform a check-in.

Also when referencing files generated with another editor or window, only the files that have been checked-in are subject to such referencing. Referencing cannot be run when the file subject to the referencing is checked-out.

● Recording check-in information in a ModPack

Instructions and results regarding modification tasks can be recorded in a ModPack.

As results of modification tasks, the check-in information of the file at the time of check-in can be recorded in a ModPack.

SEE ALSO For more information about ModPack, refer to:

D., “ModPack change management” on page D-1

For more information about how to associate change tasks to a ModPack, refer to:

“■ Procedure for modification of objects that are handled by AD Organizer” on page D2-7

■ Manual check-out/check-in and automatic check-out/check-in

Check-out and check-in operations can be performed either manually or automatically. By default, manual check-out/check-in is selected.

TIP This manual explains assuming manual check-in and manual check-out. If you have set up automatic check-out, you will not see the Check-out dialog box, which confirms your check-out. If automatic check-in is not set, check-in operation is required.

Perform this step to switch between manual and automatic check-out/check-in:

- On the menu bar in AD Organizer, select [File] > [Auto Check-Out / Check-In].
  The automatic check-out/check-in is selected. Each time this operation is repeated, check-out/check-in is switched between manual and automatic. When the automatic check-out/check-in is selected, a check mark is added to the [Auto Check-Out / Check-In] menu.

TIP Check-out and check-in cannot be in different operating modes.

SEE ALSO For more information about details of check-out, refer to:

B4.2.1, “Check-out” on page B4-5

For more information about details of check-in, refer to:

B4.2.4, “Check-in” on page B4-9

■ Groups of check-out and check-in

Normally, check-out and check-in are performed in units of files. However, files can be grouped and check-out and check-in can be performed in units of such groups.

B4.2.1 Check-out

This section describes how to check out files and discard the check-out. The check-out method can be selected either manually or automatically check out depending on the settings. By default, manual check-out is selected.

■ Checking out manually

Perform one of the following steps to check out files manually:

- You can right-click on the file you wish to check-out in the navigation window and select [Check-out].
- When the file you wish to check-out is displayed in the document window area, you can click the [Check-out] button on the toolbar.
- By editing a file that has not been checked out, the "Check-out" dialog box appears. Click [Yes] in the "Check-out" dialog box to perform the check-out.

Files that have been checked-out are added to the list in the Check-in window.

TIP

With the following operation, check-out and check-in are automatically run and the data of AD Server is updated.

Table B4.2.1-1 Operations with which check-out and check-in are automatically run

Window name	Operation
System Structure Navigator	Creating and deleting a safety I/O list Creating and deleting a safety communication I/O list
ModPack Navigator	Creating and deleting a ModPack
Properties Window	Modifying properties
Safety I/O Editor Safety Communication I/O Editor IOM Definition Editor	Creating and deleting the following items in relation to System Structure Navigator • Node folder • Node • I/O module folder • I/O module
Revision History window	Assigning a ModPack Editing the check-in comment.

■ Checking out automatically

When the automatic check-out/check-in is selected, you can check out files without the check-out operation. This applies to all the AD Organizer editors.

SEE ALSO

For more information about how to switch between manual and automatic check-out, refer to:

"■ Manual check-out/check-in and automatic check-out/check-in" on page B4-4

■ Discarding a check-out

Follow these steps to discard the check-out of individual files:

1. From the list of files in the Check-in window, select the check box of the file for which you want to discard the check-out.
2. On the toolbar of the Check-in window, click [Discard Check-out].
   The Discard dialog box appears.

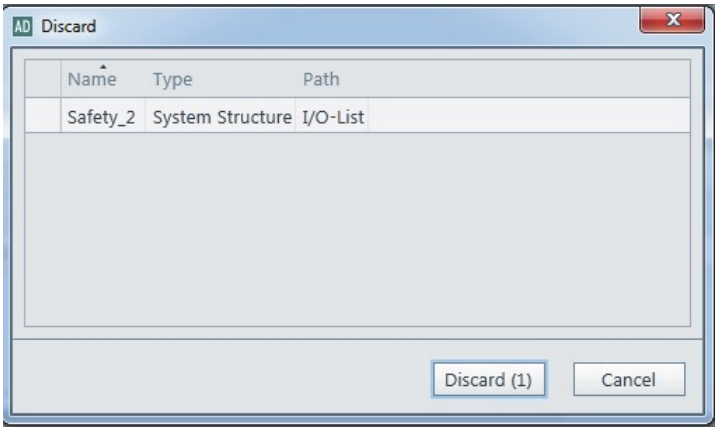

Figure B4.2.1-1 Discard dialog box

TIP

On the [Discard] button, the number of files for which you will discard the check-out is displayed in the brackets. This display example indicates that there is one file for which the checked-out is being discarded.

3. Click [Discard].
   The check-out is discarded and the content edited after the check-out are discarded.

SEE ALSO

For more information about how to cancel the checked-out status of files that are checked out by a certain user all at once, refer to:

C1.2.5, “Forcibly canceling the checked-out status of currently checked-out files” on page C1-44

B4.2.2 Edit

To edit a file that has been checked-out, perform one of the following operations:

- From the list of files in the Check-in window, you can select the file you wish to edit and click [Launch Editor] in the toolbar of the Check-in window.
- In the navigation window, double-click on the file you wish to edit.

TIP If a file that has already been opened with AD Organizer is specified, that window is displayed.

Tasks to perform after the file has been opened differ depending on the file being edited.

Undoing the last editing action

To undo the last editing action, click the [Undo] button on the toolbar. To cancel the undo operation, click the [Redo] button on the toolbar.

TIP Clicking [View] > [Update] initializes the record of operations and makes it impossible to click the [Undo] button.

Checking the validity of a file

Files that have been created or edited by using AD Organizer can be checked for non-configured cells, formats, ranges, duplexing, whether the P&ID tag is unique within the P&ID group, and whether items such as the type of node for every slot are appropriate.

You can check whether these items in the iDefine-config file that was imported by using AD Organizer follow the naming convention rules. The iDefine-config file is a file that was generated from the data that was engineered by using iDefine.

- Variable name
- Variable comment
- Variable group name
- Settings for defined words (Word, Equivalent, Comment)
- POU name
- FU and FB parameter name
- FU and FB parameter comment
- FU and FB parameter short name
- Tag name and variable name for the Tag Name Builder

Follow this step to check the validity of a file being edited:

- On the toolbar, click [Validity Check].

TIP If the file has not been saved after editing, the Save confirmation dialog box appears before the validity check.

The results of the validity check are displayed in the Message window.

When an error is returned with the validity check, you can correct the file by following the message that is displayed.

B4.2.3 Save

This section describes how to save a single file that is currently being edited and how to save all files that have been modified.

Saving a file being edited

To save a file being edited, perform the following operation:

- On the toolbar, click [Save].
  The file will be saved after the validity check is performed.

TIP Files for which an error is returned with the validity check are not saved.

Save all files that have been modified

Follow these steps to save all files in the document window area that have been modified.

1. On the toolbar, click [Save All].
   A dialog box to confirm the save appears.
2. Click [Yes].
   All files that have been modified are saved after a validity check is performed.

TIP Files for which an error is returned with the validity check are not saved.

B4.2.4 Check-in

The Check-in Window is where you can check in files. By setting the check-in method, you can select to check in manually or automatically. By default, manual check-in is selected.

TIP

Files that have not been saved are saved before the check-in.

Prior to check-in, a validity check is performed with the files being checked-in. Files for which an error are returned with the validity check are not checked-in.

When checking in to an SCS project created with I/O list engineering, check in upon placing labels on the safety I/O list, safety communication I/O list, and IOM information.

After check-out, the safety I/O list, safety communication I/O list, and IOM information can be returned by AD Organizer based on these labels.

SEE ALSO

For more information about how to set labels, refer to:

C2.8, “Setting labels” on page C2-17

Checking in manually

Follow these steps to perform a check-in manually:

1. When the Check-in window is not displayed, select [View] > [Check-in Window] from the menu bar.
2. On the Check-in window, you can select the check boxes of the files you wish to check-in.
3. Click the [Check-in] button.

TIP

On the [Check-in] button in the Check-in Window and the [Check-in] button in the Check-in dialog box, the number of files to be checked in is displayed in parentheses. This display example indicates that there are two files which are being checked-in.

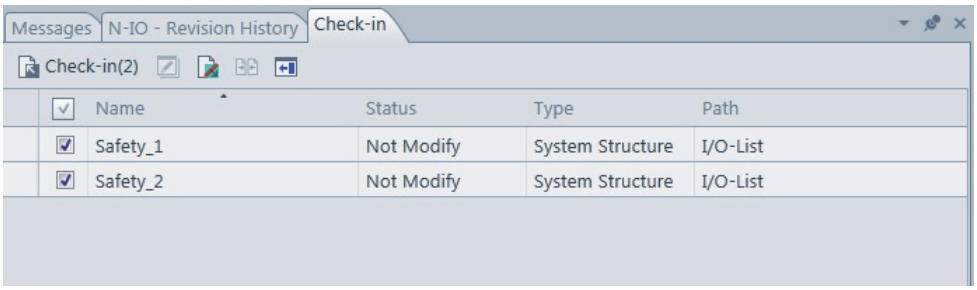

Figure B4.2.4-1 The [Check-in] button in the Check-in window

The Check-in dialog box appears.

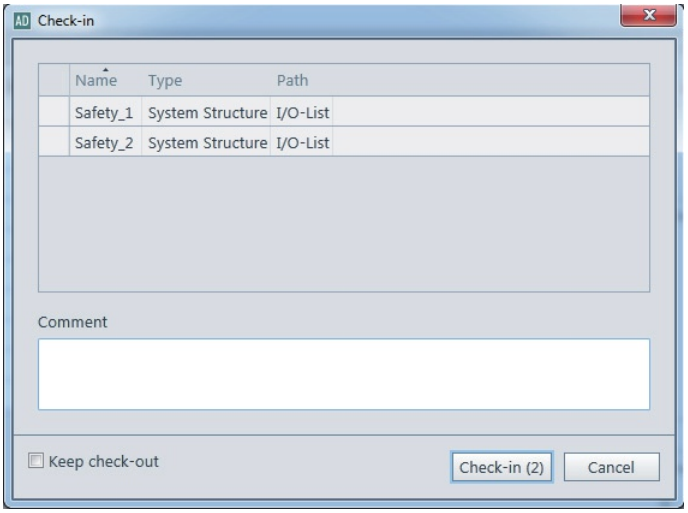

Figure B4.2.4-2 Check-in dialog box

4. Enter a comment.
5. If you wish to continue editing the file after checking in, select the [Keep check-out] check box.
   The file will be checked-out automatically after the check-in, so that you can continue editing of the file.
6. Click the [Check-in] button.
   The check-in is run.

TIP The information of a check-in that has been run can be viewed in the Revision History window.

Checking in automatically

If automatic check-out/check-in is selected, the file is automatically checked in when you save it. The following editors support automatic check-in.

- Safety I/O Editor
- Safety Communication I/O Editor
- IOM Definition Editor

B4.3 Changing the data display method of AD Organizer

By changing the display of AD Organizer, you can find data more easily. This section describes how to find data and how to sort or filter data.

B4.3.1 Performing a search

This section describes how to perform a search with AD Organizer.

Performing a search with the navigation window

This section describes how to perform a search with the navigation window.

Searching for a file name or folder name with the navigation window

Perform the following operations to search for a file name or folder name with the navigation window.

- Enter the name to search for in the search field at the top of the navigation window and press the Enter key.
  If file names or folder names include the search term in its name, the file name or folder names are highlighted as shown in the following figure:

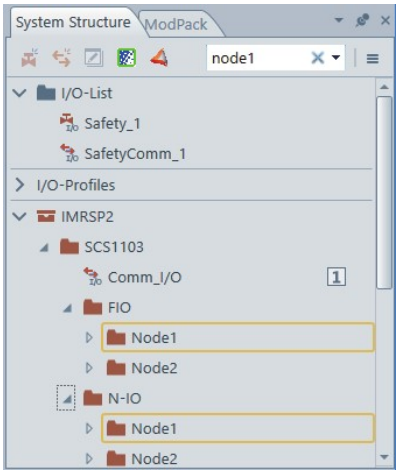

Figure B4.3.1-1 When search results are displayed

If file names or folder names that include the search term in its name exist under the folder and are not expanded, the folder containing the subject of the search is highlighted as shown in the following figure:

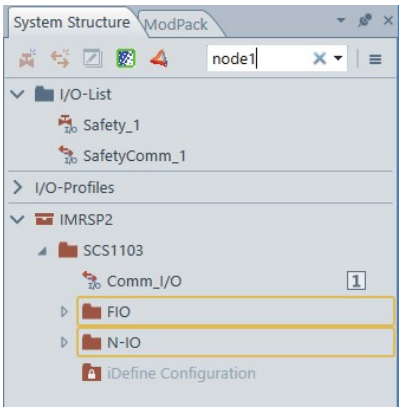

Figure B4.3.1-2 When search results are hidden under a folder

Searching for definition contents with the navigation window

P&ID Tag and I/O Tag can be specified as a search target with System Structure Navigator. The scope of search is the following editors and files:

Table B4.3.1-1 Search scope

Target editor name	Target file name
Safety I/O Editor Safety Communication I/O Editor	Safety_{P&ID Group} SafetyComm_{P&ID Group} Comm_I/O I/O_definition

Perform this step to run the search:

- Enter the search target such as P&ID tag in the search field at the top of the System Structure Navigator and press the [Enter] key.
  Files that include the search target are highlighted as shown in the following figure:

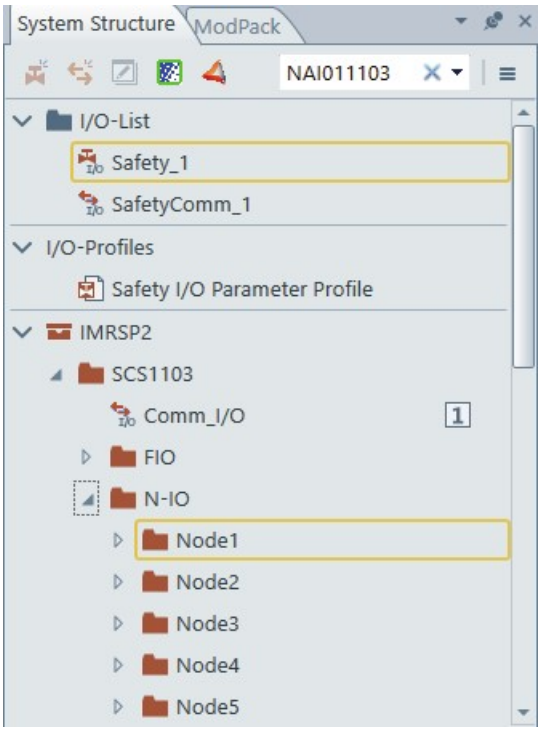

Figure B4.3.1-3 Search results

Searching for a property name in the Properties window

Perform the following operation to search for a property name in the Property window.

- In the search field at the top of the Property window, you can enter the property name you wish to search.
  A search is performed and candidates are displayed every time a character is entered.

Searching for a file being edited in the document window area

Follow these steps to search for a file being edited in the document window area.

1. Click the document window area.
2. On the toolbar, click [Search in Editor].
   The Search in Editor dialog box appears.

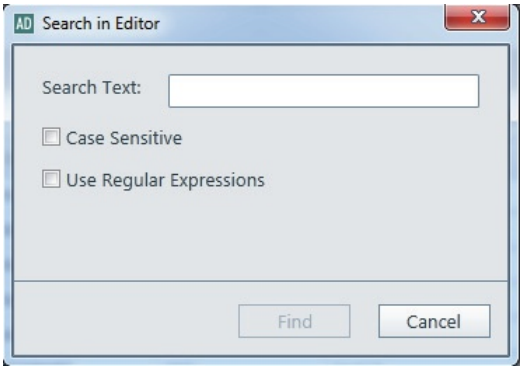

Figure B4.3.1-4 Search in Editor dialog box

3. Select the [Case Sensitive] check box to perform a case-sensitive search.
4. Select the [Use Regular Expressions] check box to use official wording for the search term.
5. Enter the search term in the search dialog and click the [Find] button.
   The search results are displayed.

● Elements of official wording

Elements of regular expression usable are as follows:

- .: It matches any one character.
- [Character group]: It matches any one character included in the bracket.
- \bstring: Look for a word that starts with the specified string.
- string\b: Look for a word that ends with the specified string.
- \bstring\b: Look for a word that matches the specified string.
- [First character - last character]: It matches any of a character in the range of the first character to the last character.
- [^character group]: It matches one character that is not included in the bracket.
- {m,n}: Check that the previously specified element occurs in a range of the minimum m times to the maximum n times.
- {m,}: Check that the previously specified element occurs at the minimum m times.
- {n,}: Check that the previously specified element occurs at the maximum n times.

TIP When you specify "." or "\" as a character, add "\" in front.

■ Searching for a column by column name on the editor

For the following editors, you can search for a column by column heading:

- Safety I/O Editor
- Safety Communication I/O Editor

Follow these steps to search for a column:

1. Right-click on any location of editor and select [Find Column].
   The sub menu appears.
2. Enter a column title to search in the sub menu.
   Matched candidates appear in a list every time the title is entered.
3. Fix the column title to search.

The screen is scrolled to the corresponding column title position, and the background color of title is displayed in yellow.

TIP

- Columns set to hide by a filtering function are not search targets.
- If you want to search for a user-defined column that has an alias name set, the column title to search is the alias name.

B4.3.2 Sorting rows by a specified column

You can sort the rows by a value of one column or by values of multiple columns.

Sorting by a single column

Perform this step to sort the rows by the values of a specified column:

- Click a column heading.
  Each time the column heading is clicked, the order of rows switches to ascending order, descending order, and unsorted status.

Sorting by multiple columns

For the following editors, you can sort the order of rows by multiple columns:

- Safety I/O Editor
- Safety Communication I/O Editor

Follow these steps to sort the rows by specifying multiple columns:

1. Click a heading of any one column.
2. Click a heading of another column while pressing the [Shift] key. You can combine up to ten columns.

TIP

- The sort order is displayed with numbers in the column heading.
- Each time you click the column heading for sorting while pressing [Shift] key, the order of rows switches between ascending and descending order.
- If you click the column heading for sorting without pressing [Shift] key, the rows are sorted by a single column.
- If the editor is in a comparison mode, only the right view (current data) is sorted.
- To reset the sort, click the [Sub menu] button and select [Reset to default display setting].
- Sorted status is not maintained. When you exit the editor and restart it, the display returns to the default status.

B4.3.3 Displaying filtered data

Rows can be filtered by using the Filter icon in the column heading or selecting cells. In the Filter setting dialog box, you can select the check boxes of the column values to be displayed or specify conditions for displaying.

Filtering by using the Filter icon in the column heading

Follow these steps to filter rows by using the Filter icon in the column heading:

1. Click the Filter icon in the column heading.
   The Filter setting dialog box appears.

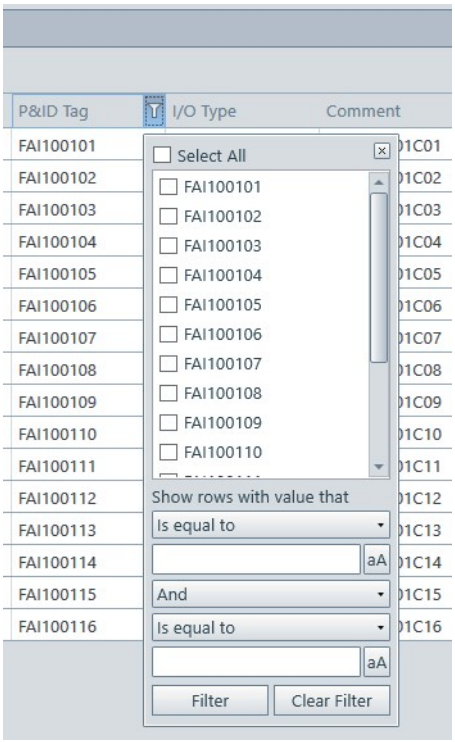

Figure B4.3.3-1 Filter setting dialog box

2. Select the filtering targets.
3. Select the types of filter.
4. Enter the values, and click [Filter].

TIP

When the display of rows is being filtered, the Filter icon is displayed in the heading line.

To remove the filter, click the Filter icon to display the Filter setting dialog box and click [Clear].

Filter setting dialog box

The Filter setting dialog box is displayed when you perform the filtering operation. You can select the check boxes of the values to be displayed or specify conditions for displaying.

TIP

If you specify both of check boxes and conditions, the rows that satisfy both conditions appear.

1. To select values by the check boxes, select the check boxes of the values that you want to display and clear the check boxes of the values that you do not want to display from the displayed list.

TIP If the number of selectable values exceeds 1000, this list is not displayed.

2. To set a filter by using conditions, perform these steps:
   a. From the drop-down list, select conditions.
      You can use the following conditions:
      - Is equal to
      - Is not equal to
      - Starts with
      - Ends with
      - Contains
      - Does not contain
      - Is contained in
      - Is not contained in
      - Is empty
      - Is not empty
      - Is less than
      - Is less than or equal to
      - Is greater than
      - Is greater than or equal to
      - Is null
      - Is not null

   b. If you need to specify a value, enter the value in the text box.
   c. If you want to distinguish between upper case and lower case letters for the entered value, click [aA] shown next to the text box.
      Case Sensitive and Not Case Sensitive are switched.

      When the color of [aA] is dark, it is in Case Sensitive status.
   d. Up to two conditions can be specified. When you specify the second condition, select the relationship of two conditions from the drop-down list.
      You can use the following relational expressions:
      - And
      - Or

   e. If you need the second condition, set it in the same way as the first condition.
3. Click [Filter].
   Display of rows is filtered.

Filtering rows by a value of selected cell

For the following editors, you can filter the rows by values:

- Safety I/O Editor
- Safety Communication I/O Editor

There are the following two types of filters:

- [Filter by Selection]

- [Filter Excluding Selection]

Perform this step to filter the rows by a value:

1. Select a cell. You can also specify multiple cells. Right-click on the selected cell and select a type of filter.
   Rows are filtered according to your designation.

TIP

- The value of the selected cell and the type of filter are reflected in the Filter setting dialog box.
- To remove the filter, right-click the cell and select [Remove Column Filter].

B4.3.4 Operating the columns

This section describes the column operations that are common to editors.

Changing the position of a column

Perform this step to change the position of a column:

- Drag the header of the column you want to change and drop it to a desired position.

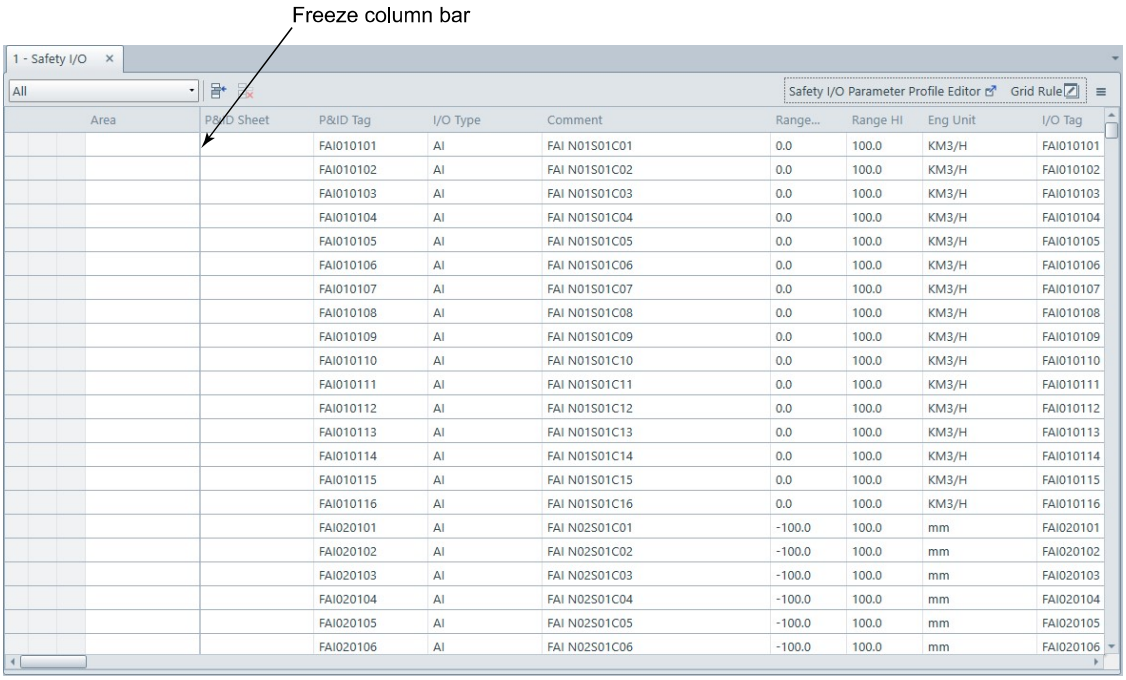
TIP

- With this operation, the position of the column is retained. If you close the table format window and open it again, the column is displayed in the changed position.
- Column View scrolls automatically while dragging the column header to the left most/ right most of the Row Area.

Freezing columns to prevent them from scrolling during horizontal scroll

In the following editors, you can freeze columns to prevent them from scrolling during horizontal scroll.

- Safety I/O Editor
- Safety Communication I/O Editor
- Safety I/O Parameter Profile Editor

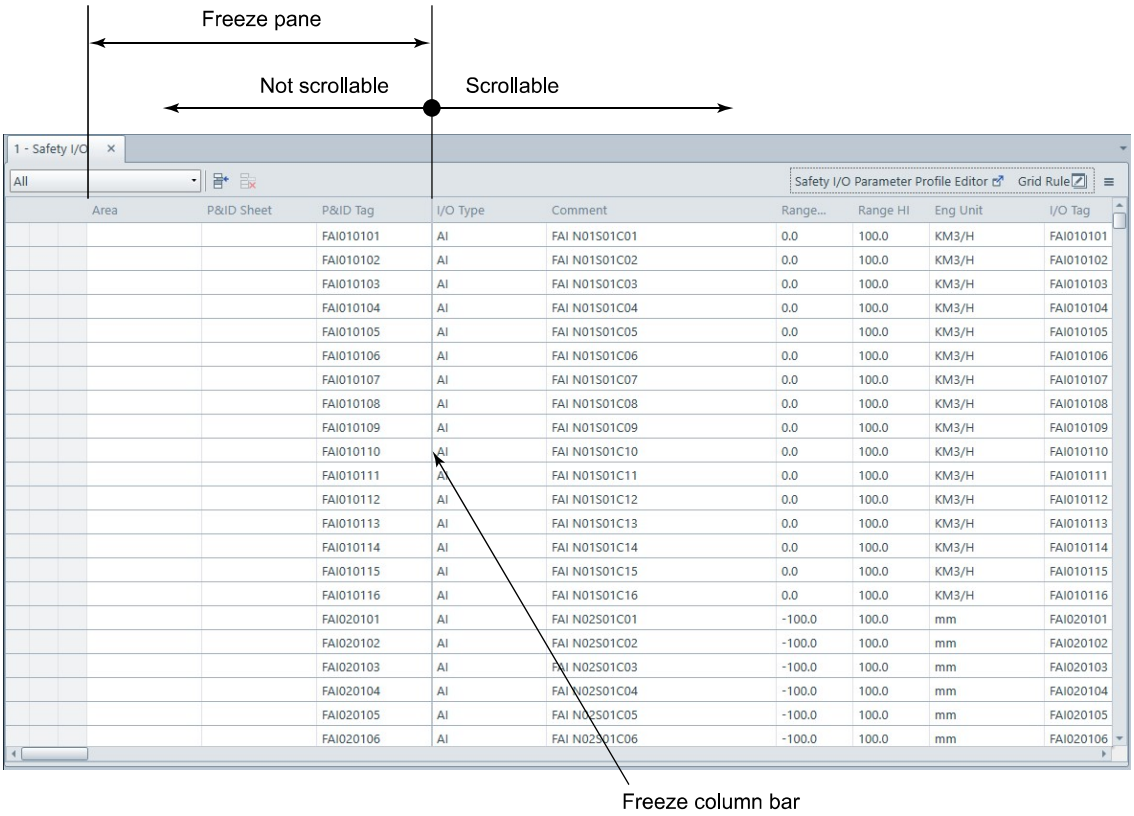


You can freeze columns by using one of the following two methods:

- Drag the freeze column bar to the right of the column you want to freeze
- Right-click the column header you want to freeze and select from the menu

Freezing columns by dragging the freeze column bar

Perform this step to freeze columns by dragging the freeze column bar to prevent it from scrolling during horizontal scroll.



- Drag the freeze column bar on the left side of the screen and drop it on the right of the column you want to freeze.

Area	P&ID Sheet	P&ID Tag	I/O Type	Comment	Range...	Range HI	Eng Unit	I/O Tag

		FAI020106	AI	FAI N02S01C06	-100.0	100.0	mm	FAI020106

Figure B4.3.4-2 After dragging the freeze column bar

TIP

To unfreeze columns, drag the freeze column bar and drop it on the left end. The freeze column bar moves to the right side of a column that is always fixed, such as the Checked-out Status and Modification Status columns. You cannot move the freeze column bar to the left of the always-fixed column.

Freezing a column by selecting the right-click menu of the column header

Perform this step to freeze a column by selecting the right-click menu of the column header to prevent it from scrolling during horizontal scroll:

- Right-click the header of a column you want to freeze and select [Send to Freeze Pane]. The column moves to the leftmost of the freeze pane.

Unfreezing columns

You can unfreeze columns in the freeze pane. Perform this step to unfreeze columns:

- Right-click any column header in the freeze pane and select [Unfreeze Pane]. All columns in the freeze pane will be unfrozen and the freeze column bar will return to its default position.

TIP

Unfreeze operation does not restore columns to their previous positions.

B4.4 Overview of grid rule definitions

By defining grid rules, you can convert the data defined with Safety I/O Editor or Safety Communication I/O Editor in bulk and also perform a consistency check of the data in bulk.

You can use the Grid Rule Editor to define the batch conversion rule and the consistency check rule.

A maximum of 1000 grid rules can be defined.

Grid Rule Editor

Grid rules are defined in the Grid Rule Editor. In the Define Rule window expanded from the Grid Rule Editor, you can define individual grid rules for each editor. In the Common Grid Rules dialog expanded from the Grid Rule Editor, you can define common grid rules . The following figure shows the Grid Rule Editor used to define grid rules.

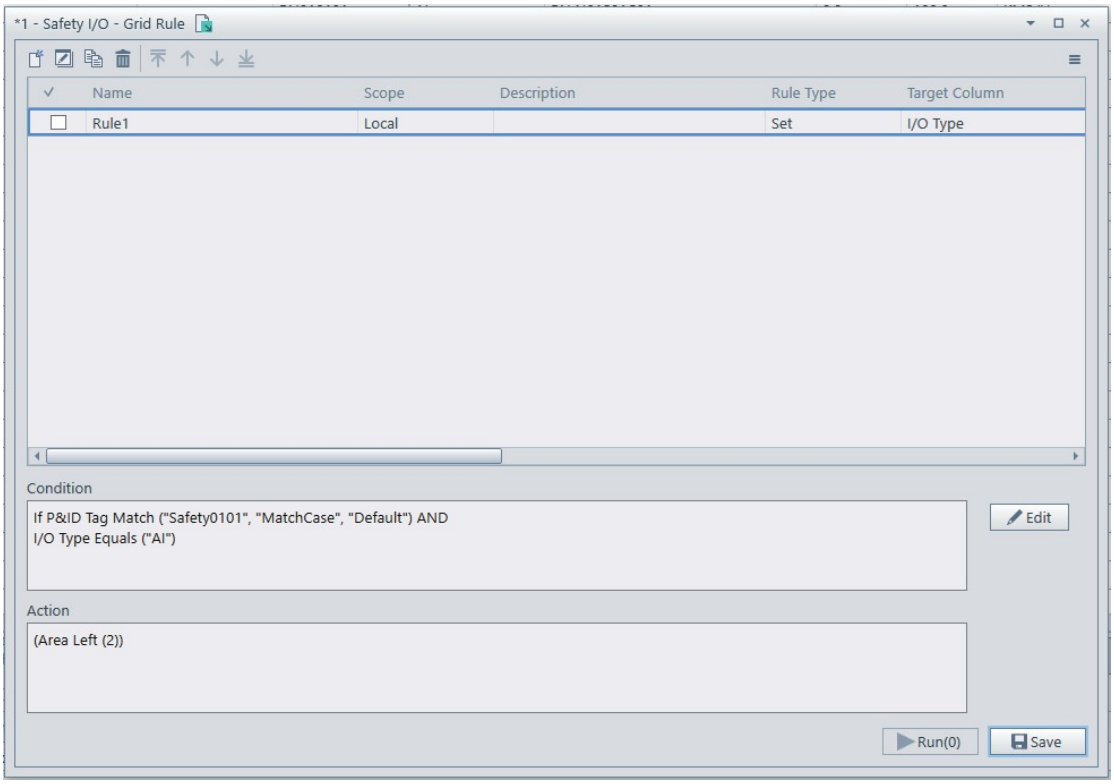

Figure B4.4-1 Grid Rule Editor

Grid Rule Editor display items

The following table shows the items displayed in the Grid Rule Editor.

Table B4.4-1 Grid Rule Editor display items

Display item name	Description
Name	Rule definition name

Continues on the next page

Table B4.4-1 Grid Rule Editor display items (Table continued)

Display item name	Description
Scope	The scope of the grid rule. Global or Local is displayed. • Global Common grid rules used in the Safety I/O Editor and common grid rules used in the Safety Communication I/O Editor. They are applicable to all the P&ID groups. Common grid rules are defined in the Common Grid Rule dialog box. • Local Grid rules other than Global. They are applicable only in the same P&ID group. These grid rules are defined in the Grid Rule Editor for each I/O list.
Description	Rule comment
Rule Type	Rule type
Target Column	Definition item name in which rule is applied
Condition	Application criteria definition for the rule
Action	Batch conversion or consistency check definition that is applied when the conditions are met
Format	Data format that is set in the format results
Created by	User created initially
Editor	Updated user name

Defining grid rules for each I/O list

Follow these steps to define grid rules for each I/O list.

1. On the toolbar of the Grid Rule Editor, click the [New] button.
   A dialog box appears to confirm the check-out.

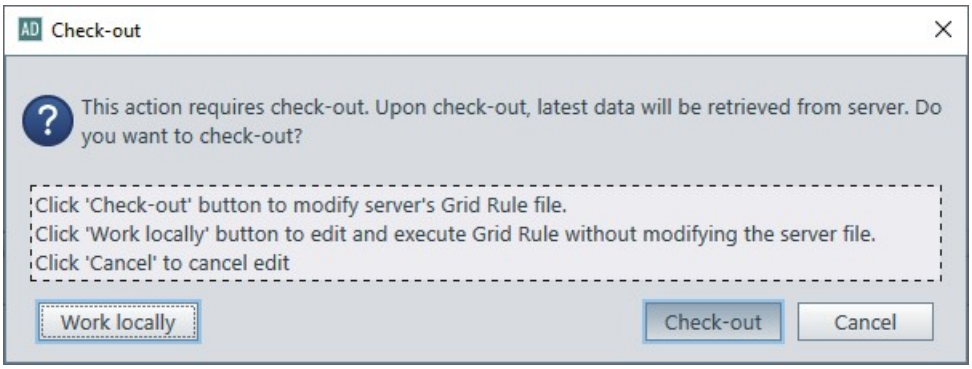

Figure B4.4-2 Check-out confirmation dialog box

2. To check out and define grid rules, click [Check-out]. If you want to define in local mode without checking out, click [Work locally].
   The Define Rule Window appears when you click [Check-out] or [Work locally].

TIP

- In local mode, you can define and execute the grid rules, but you cannot save them. If you want to save the grid rules defined in local mode, export the rules and save them locally.
- By selecting a row in the Grid Rule Editor and clicking [Edit], you can change the definition of the defined grid rule.

3. In the Define Rule Window, define grid rules.
   The rules that you defined in the Define Rule window appear in the list of the Grid Rule Editor.

SEE ALSO For more information about defining common grid rules, refer to:

"■ Defining common grid rules" on page B4-31

Define Rule window definition items

The grid rules execute the set actions according to the set conditions for the defined data and perform batch conversion or consistency check for the data.

You can define the conditions and actions in the Define Rule window.

The following table shows the definition items of the Define Rule window.

Table B4.4-2 Definition items of the Define Rule window

Definition item	Description
Name	Define rule definition name.
Description	Define rule definition comment.
Rule Type	Select set or check. • Check: Consistency check for the defined data. • Set: Data value change for the defined data.
Target Column	Specify definition item in which the rule is applied.
Format Result	While selecting Set for the Rule Type, it specifies the conversion format in the case of numeric data type. Specification is not required if the data type is string.
Condition	Defines the conditions for executing batch conversion or consistency check.
Action	Defines the actions that are executed as per the conditions.

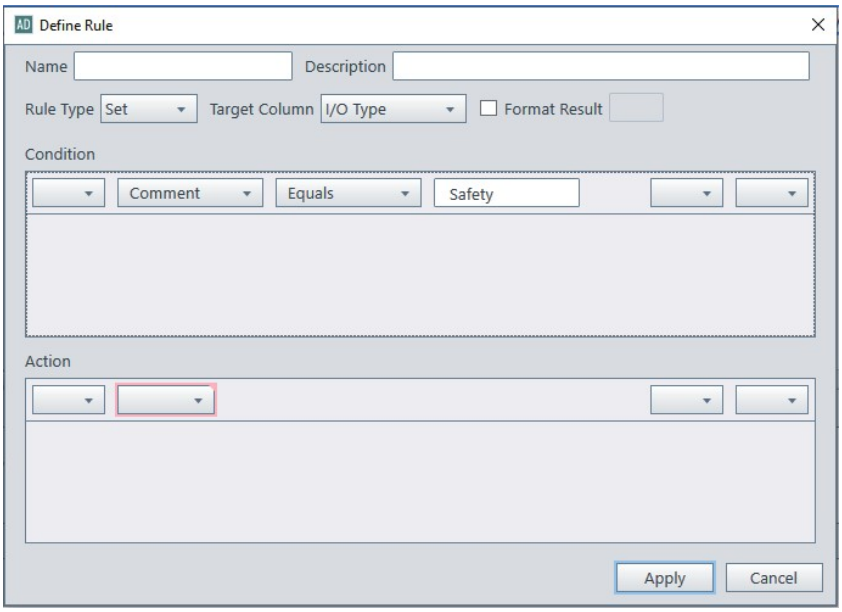

Figure B4.4-3 Define Rule window

Format Result

The following table shows the data conversion format to be specified when Format Result is selected.

Table B4.4-3 Data conversion format

Data conversion format	Description
Fn	The data is converted to the specified number of decimal digits. n: Specifies the number of digits in the range of 0 to 9 If the value n is less than the actual number of decimal digits, the value is rounded off. However, if the value n is more than the actual number of decimal digits, 0 is added.
Yn	Displays the data with the specified number of digits. n: Specifies the number of digits in the range of 1 to 9 If the value n is less than the actual number, the value is rounded off. However, if the value n is more than the actual number, 0 is added.
Xn	The data is converted to a hexadecimal value with the specified number of digits. n: Specifies the number of digits in the range of 1 to 9

The following table shows an example of data conversion.

Table B4.4-4 Example of data conversion

Data before conversion	Data conversion format	Conversion results
123.456	F0	123
123.54	F0	124
123.456	F1	123.5
123.456	F2	123.46
123.456	F4	123.4560
- 123.456	F4	- 123.4560
123.456	F9	123.456000000
123.56	Y1	124
123.456	Y3	123
123.456	Y4	123.5
- 123.0001	Y6	- 123.000
123.456	Y9	123.456000
123	X1	7B
123	X6	00007B

Condition

You can set the condition definition required to execute the rules.

You need to define the criteria in conditions to filter the target for batch editing or check. Each row of conditions corresponds to a single criteria. You can connect multiple rows by using AND/OR, and add priority for determining the criteria within parentheses to create a single condition.

The condition definition has the following items as shown in the table.

Table B4.4-5 Defining conditions

Item	Description
Start parentheses	Sets the priority rank for executing the conditions.
Column name	A definition item name that is displayed in the editor

Continues on the next page

Table B4.4-5 Defining conditions (Table continued)

Item	Description
Relational operator	• Equal to the specified value: The condition is satisfied if the definition item value that is set in the column name field matches the value that is set in the parameter field. • Not equal to the specified value: The condition is satisfied if the definition item value that is set in the column name field does not match the value that is set in the parameter field. • Specified cell is blank: The condition is satisfied if the definition item value that is set in the column name field is blank. • Specified cell is not blank: The condition is satisfied if the definition item value that is set in the column name field is not blank. • Contains the specified value: The condition is satisfied if the definition item value that is set in the column name field contains the value that is set in the parameter field. • Does not contain the specified value: The condition is satisfied if the definition item value that is set in the column name field does not contain the value that is set in the parameter field. • Higher than specified value: The condition is satisfied if the definition item value that is set in the column name field exceeds the value that is set in the parameter field. • Lower than specified value: The condition is satisfied if the definition item value that is set in the column name field is less than the value that is set in the parameter field. • Match: The condition is satisfied if the definition item value that is set in the column name field is as per the format of the regular expression that is set in the parameter field.
Parameter	A decimal or a hexadecimal value that is required for the relation operator, or data in string format • Decimal number: A number from -999999999 to 1000000000 can be set. The number of decimal places can be set up to 10 digits. • Hexadecimal number: A value from -0xFFFFFFFFF to xFFFFFFFFF can be set. • String format: Up to 1000 characters can be set.
Match Case Type Options	If you select Match as a relational operator, specify whether the search string is case sensitive or not. You can select either Match Case or Ignore Case.
Match Text Type Options	If you select Regular Expression for this option, you can include certain meta characters in your search string.
Closing parentheses	Sets the priority rank for executing the conditions.
AND/OR operator	A logical operator to combine multiple conditions • AND: Signifies that both the conditions need to be met. • OR: Signifies that either of the conditions need to be met.

The following figure shows an example of conditions that are specified to check whether the P&ID Tag is defined as `Safety0101`.

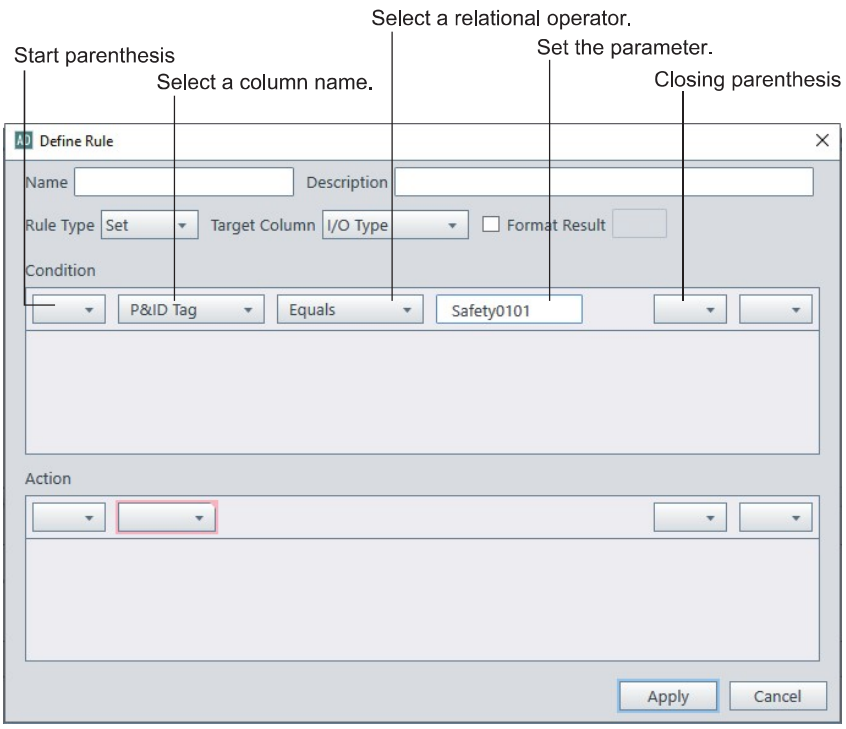

Figure B4.4-4 Condition definition example No.1

A maximum of 20 conditions can be defined under multiple conditions.
The following shows an example of multiple condition definitions.

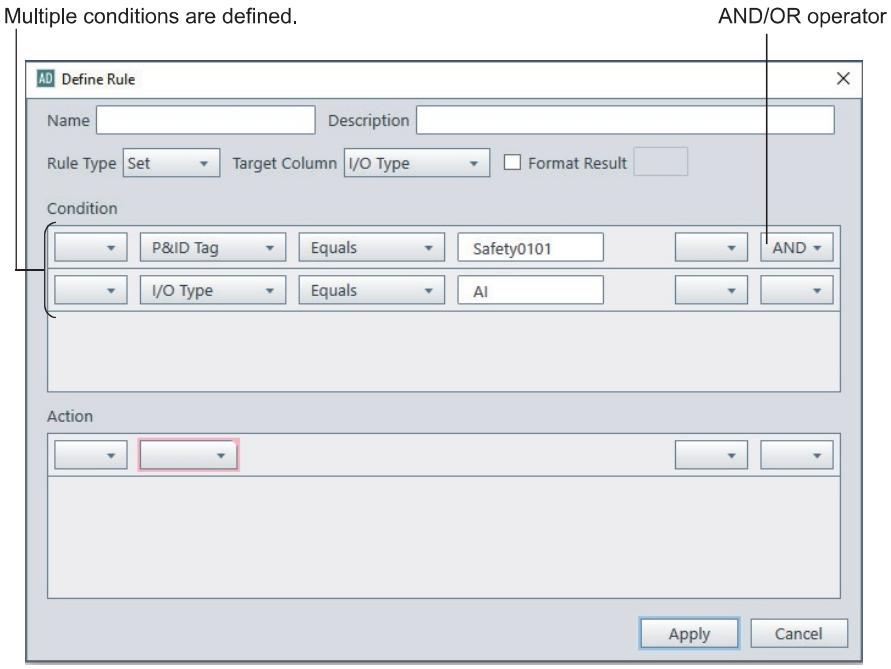

Figure B4.4-5 Condition definition example No.2

SEE ALSO For more information about use examples of regular expression, refer to:

"● Use examples of regular expression" on page B4-35

Action

You can set the action definitions that need to be executed as per the conditions. The action definition differs depending on whether Set or Check is set in the Rule Type.

For the action to be executed for set, you need to define the editing specifications required to perform bulk editing for the Target Column. Each row of action corresponds to a single editing specification. You can connect multiple rows and add priority for determining the criteria within parentheses to create a single run formula. The action definition for set is created by using the following items.

Table B4.4-6 Defining actions for set

Item	Description
Start parentheses	Sets the priority rank for executing the action.
Type of operation target	You can select either column name, string, or number. If [String] is selected, any string can be set as the action target. If [Number] is selected, any number can be set as the action target.
Column name	If Column Name is selected in operation target type, the definition item name that is displayed in the editor appears
Action operator	If Column Name is selected in the operation target type, the operators that can be used are displayed. • Left: Acquires the specified number of characters from the beginning of the string. The number of characters is specified in the parameter column. • Right: Acquires the specified number of characters from the end of the string. The number of characters is specified in the parameter column. • Mid: Acquires the specified number of characters from the specified start position. The start position and number of characters are specified in the parameter column. • Length: Acquires the string length. • Pad Left: Inserts a blank at the beginning of the string to make the string of the specified length. The string length is specified in the parameter column. • Pad Right: Inserts a blank at the end of the string to make the string of the specified length. The string length is specified in the parameter column. • Trim: Deletes any blank in the string. • Trim Left: Deletes the blank at the beginning of the string. • Trim Right: Deletes the blank at the end of the string. • To Upper: Converts the string to upper case characters. • To Lower: Converts the string to lower case characters. • Get: Replaces the Find string with the Replace string. The Find string and the Replace string are specified in the parameter column. • SQRT: Requests the square root of the definition item value that is set in the column name field.
Parameter	Sets the required parameters for using the action operators.
String options for Get operator	If you select Get as an action operator, specify whether the replacement string is case sensitive or not. You can select either Match Case or Ignore Case.
Regular Expression options for Get operator	If you select Regular Expression for this option, you can include certain meta characters in your replacement string.
Closing parentheses	Sets the priority rank for executing the action.
Operator	• Append: Combines multiple action results related to the string. • +: Adds multiple action results related to the value. • -: Subtracts multiple action results related to the value. • *: Multiplies multiple action results related to the value. • /: Divides multiple action results related to the value. It can be set if the definition item value is a decimal.

You can define up to 20 actions.

The following shows an example of action definitions.

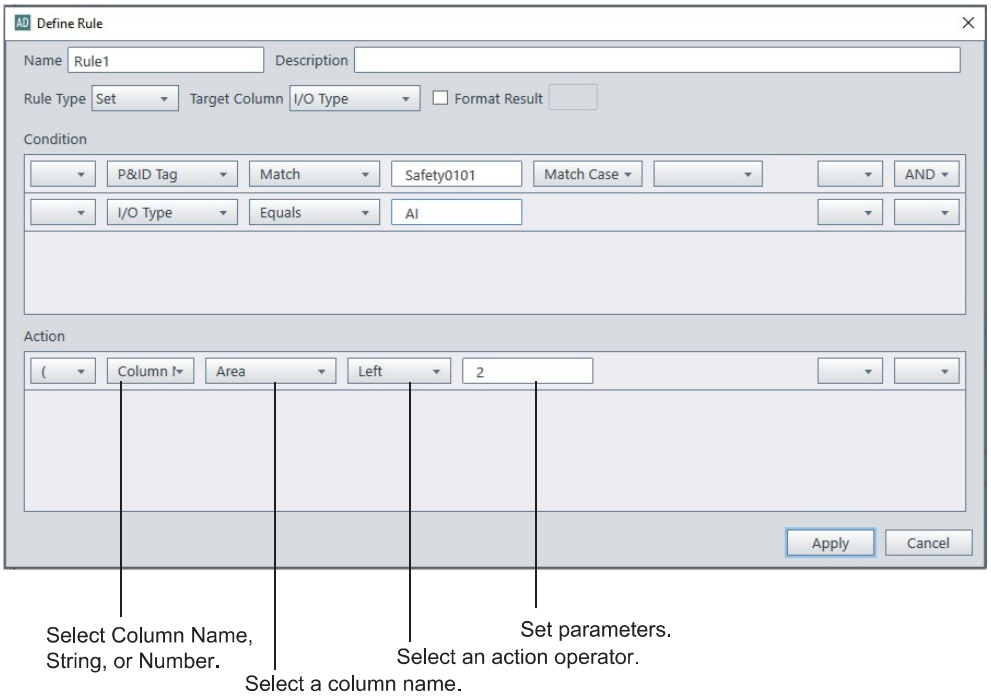

Figure B4.4-6 Example of action definition

For the action to be executed for check, you need to define the conditions required to check the Target Column. Each row of action corresponds to a single editing specification. You can connect multiple rows and add priority for determining the criteria within parentheses to create a single run formula. The action for check is comprised of the following items.

Table B4.4-7 Defining actions for check

Item	Description
Start parentheses	Sets the priority rank for executing the conditions.
Column name	A definition item name that is displayed in the editor
Relational operator	• Equal to the specified value: The condition is satisfied if the definition item value that is set in the column name field matches the value that is set in the parameter field. • Not equal to the specified value: The condition is satisfied if the definition item value that is set in the column name field does not match the value that is set in the parameter field. • Specified cell is blank: The condition is satisfied if the definition item value that is set in the column name field is blank. • Specified cell is not blank: The condition is satisfied if the definition item value that is set in the column name field is not blank. • Contains the specified value: The condition is satisfied if the definition item value that is set in the column name field contains the value that is set in the parameter field. • Does not contain the specified value: The condition is satisfied if the definition item value that is set in the column name field does not contain the value that is set in the parameter field. • Higher than specified value: The condition is satisfied if the definition item value that is set in the column name field exceeds the value that is set in the parameter field. • Lower than specified value: The condition is satisfied if the definition item value that is set in the column name field is less than the value that is set in the parameter field. • Match: The condition is satisfied if the definition item value that is set in the column name field is as per the format of the regular expression that is set in the parameter field.

Continues on the next page

Table B4.4-7 Defining actions for check (Table continued)

Item	Description
Parameter	A decimal or a hexadecimal value that is required for the relation operator, or data in string format • Decimal number: A number from -999999999 to 1000000000 can be set. The number of decimal places can be set up to 10 digits. • Hexadecimal number: A value from -0xFFFFFFFFF to xFFFFFFFFF can be set. • String format: Up to 1000 characters can be set.
Match Case Type Options	If you select “Match” as a relational operator, specify whether the search string is case sensitive or not. You can select either Match Case or Ignore Case.
Match Text Type Options	If you select Regular Expression for this option, you can include certain meta characters in your search string.
Closing parentheses	Sets the priority rank for executing the conditions.
AND/OR operator	A logical operator to combine multiple conditions • AND: Signifies that both the conditions need to be met. • OR: Signifies that either of the conditions need to be met.

TIP

The relational operators that can be used are the same as the operators that can be used for condition.

SEE ALSO

For more information about use examples of regular expression, refer to:

“● Use examples of regular expression” on page B4-35

Defining common grid rules

Follow these steps to define common grid rules in the Safety I/O Editor or in the Communication I/O Editor:

1. On the toolbar of the Grid Rule Editor, click the [Common Grid Rule] button.
   A dialog box appears to confirm the check-out.

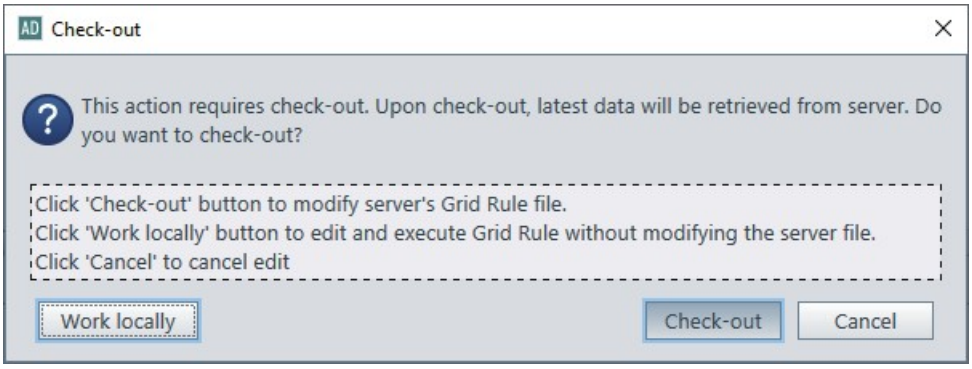

Figure B4.4-7 Check-out confirmation dialog box

2. To check out and define common grid rules, click [Check-out]. If you want to define in local mode without checking out, click [Work locally].
   The Common Grid Rule dialog box appears when you click [Check-out] or [Work locally].

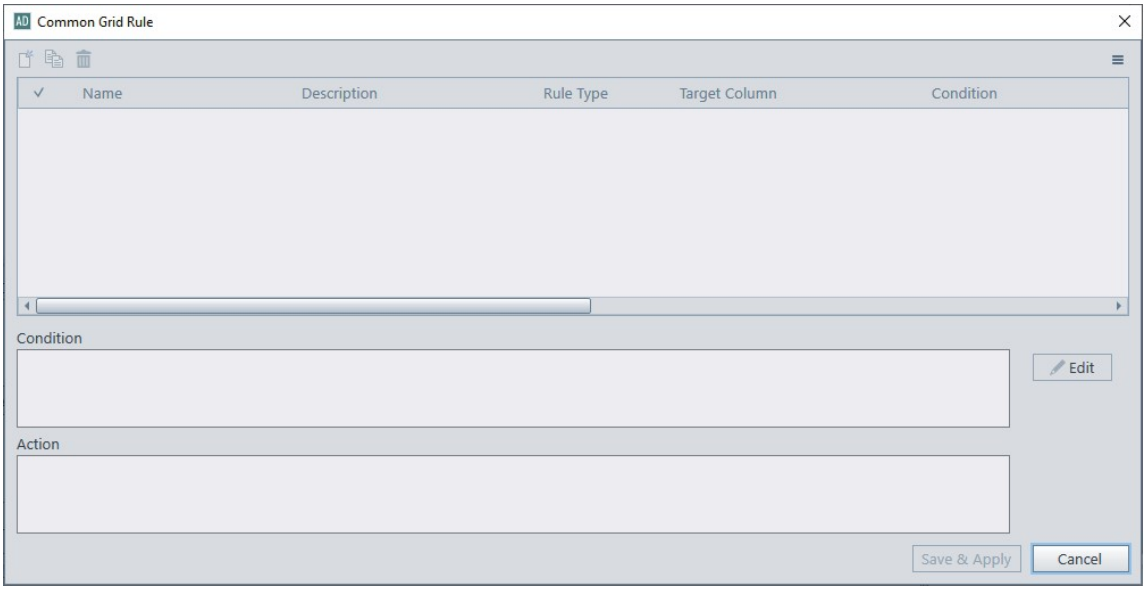

Figure B4.4-8 Common Grid Rule dialog box

TIP

- In local mode, you can define and execute the common grid rules, but you cannot save them. If you want to save the common grid rules defined in local mode, export the rules and save them locally.
- By selecting a row in the Common Grid Rule dialog box and clicking [Edit], you can change the definition of the defined common grid rule.

3. In the Common Grid Rule dialog box, click [New].
   The Define Rule Window appears.
4. In the Define Rule Window, define conditions and actions.
   In the Grid Rule Editor, a list of rules defined in the Define Rule Window is displayed.

TIP

The definitions for the common grid rules are the same as the definitions for the grid rules for each I/O list.

Specifying common grid rules

Specify whether the created common grid rule is used or not for each P&ID group.

Perform this step in the Grid Rule Editor of the P&ID group where you want to use the common grid rule.

1. On the toolbar of the Grid Rule Editor, click the [Common Grid Rule] button.
   The Common Grid Rule dialog box appears.

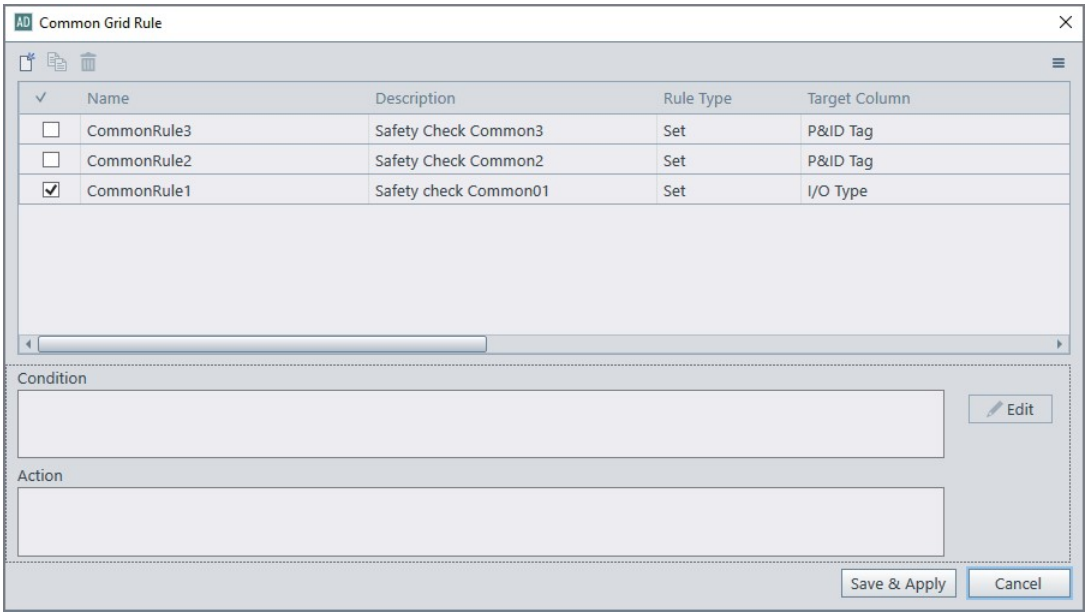

Figure B4.4-9 Common Grid Rule dialog box

2. Select the check boxes for the common grid rules you want to use. Clear the check boxes for the common grid rules you do not use.

3. Click the [Save & Apply] button.
   The Common Grid Rule dialog box closes.

   The common grid rules you use appear on the Grid Rule Editor. The common grid rules you do not use are deleted from the Grid Rule Editor.

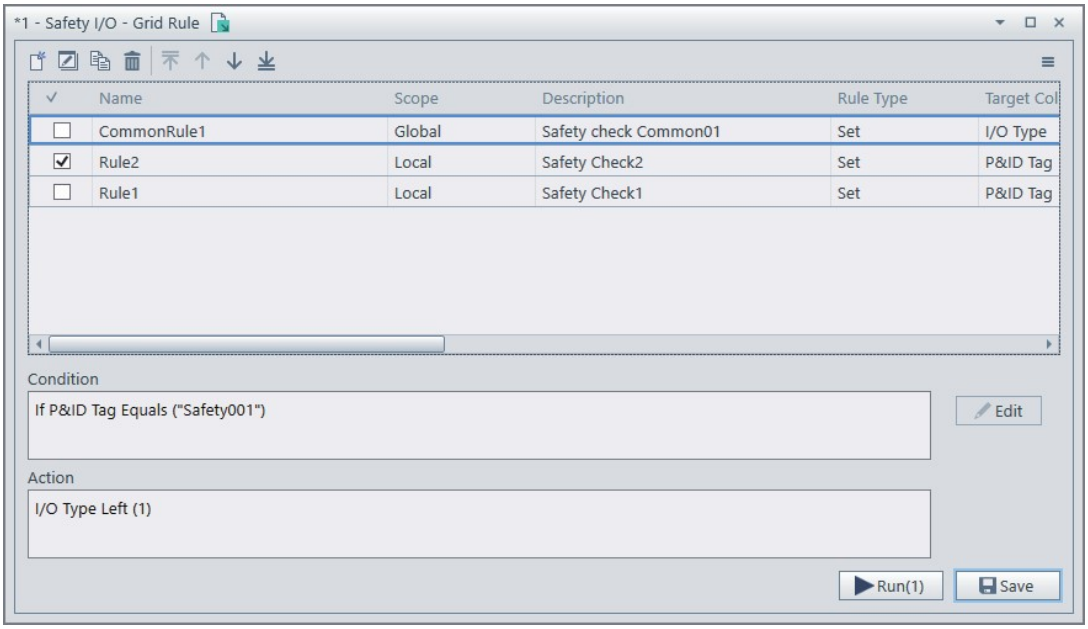

Figure B4.4-10 Grid Rule Editor

4. Click the [Save] button in the Grid Rule Editor.
   The changes are saved.

Clearing use of common grid rules in the Grid Rule Editor

Perform this step in the Grid Rule Editor of the P&ID group where you want to clear use of the common grid rules.

1. Select a common grid rule you want to clear use.
   The selected common grid rule is surrounded by a blue frame.
2. Click the Delete button on the toolbar.
   The selected common grid rule is deleted from the Grid Rule Editor.

TIP

It just clears use of the common grid rule. The common grid rule itself is not deleted.

3. Click the [Save] button.
   The changes are saved.

Deleting common grid rules in the Common Grid Rule dialog box

Perform this step in the Common Grid Rule dialog box to delete common grid rules.

1. On the toolbar of the Grid Rule Editor, click the [Common Grid Rule] button.
   The Common Grid Rule dialog box appears.
2. Select a common grid rule you want to delete.
   The selected common grid rule is surrounded by a blue frame.
3. Click the Delete button on the toolbar.
   The selected common grid rule is deleted.
4. Click the [Save & Apply] button.
   The Common Grid Rule dialog box closes.

   If the deleted common grid rule is displayed in the Grid Rule Editor, it will be deleted from the Grid Rule Editor.
5. Click the [Save] button in the Grid Rule Editor.
   The changes are saved.

Regular expressions that can be used in grid rules and their use examples

If you select Regular Expression for Match Text Type Options, you can include meta characters in your search string or replacement string.

Available major meta characters

The following table describes the major meta characters that are available when you select Regular Expression for Match Text Type Options.

Table B4.4-8 Available major meta characters

Meta character	Meaning
[x]	Character Classes Any one of the specified characters
[x-y]	Specify character range Any single character in the specified range
[^x]	Characters other than the specified character “x”
|	Logical OR of patterns
()	Group patterns

Continues on the next page

Table B4.4-8 Available major meta characters (Table continued)

Meta character	Meaning
^	Head of line
$	End of line
.	Any single character except line feed
*	Repeat the previous character zero or more times
+	Repeat the previous character one or more times
?	The previous character appears zero or one time
\	Escape character (escape sequence)

Use examples of regular expression

The following tables describe the use examples of regular expression when you select Regular Expression for Match Text Type Options.

Table B4.4-9 Use examples of regular expression for Match set values

Setting value	Reference value	Result
[FS]CS	FCS	Match
	SCS	Match
TAG[0-1]	TAG1	Match
	TAG3	Not match
TAG[^XY]	TAG0	Match
	TAGX	Not match
TAG1|TAG2	TAG1	Match
	TAG2	Match
TAG([0-1]|[X-Y])	TAG1	Match
	TAGX	Match

TAG01\.	TAG01	TAG01.	TAG01

Starting the Grid Rule Editor

You can start the Grid Rule Editor by selecting the [Grid Rule] button of the target editor for the grid rules.

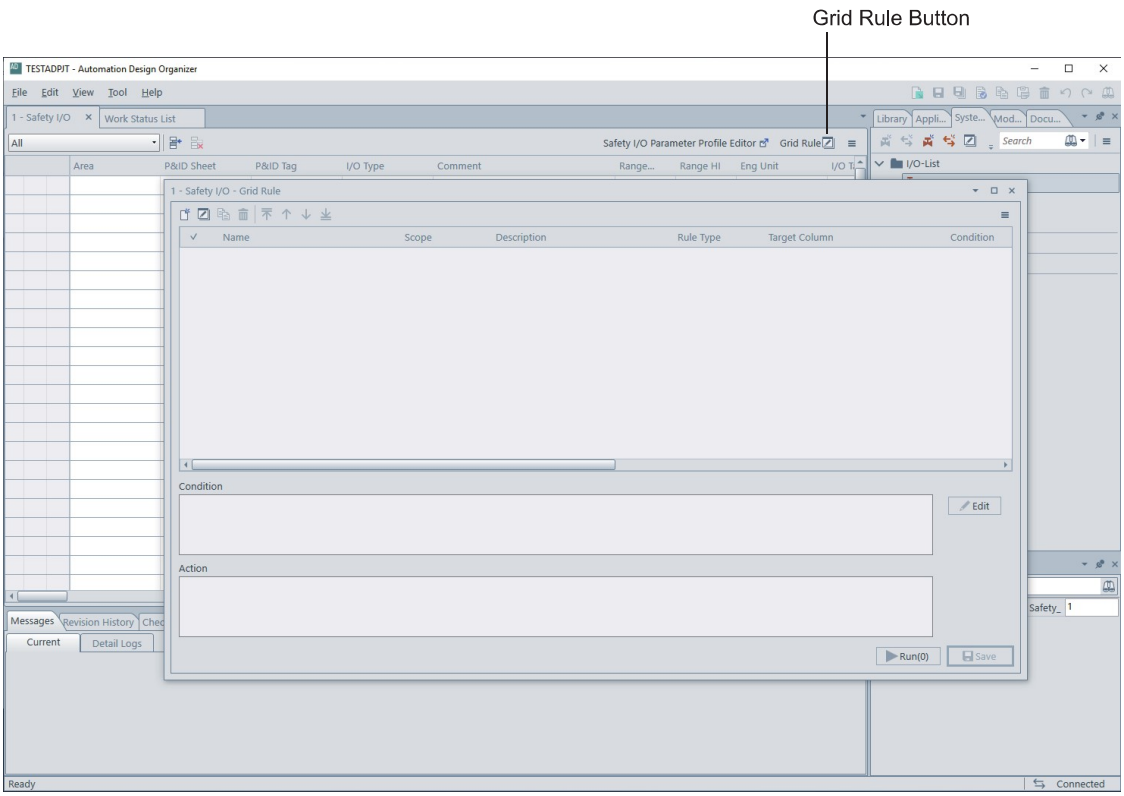

Figure B4.4-11 [Grid Rule] button

Operating the Grid Rule Editor

You can change the run sequence and the rule definition of the created grid rules, and copy or delete the rules.

Changing the rule execution sequence

When multiple rules are selected and run, the rules are executed in the sequence from top to bottom in the Grid Rule Editor.

To change the run sequence of the rule, you need to perform the following operation.

- Select the rules whose run sequence needs to be changed, and click the [Move to Top] / [Move Up] / [Move Down] / [Move to Bottom] buttons that are found on the Grid Rule Editor.

Changing the rule definition

- To change an already defined rule, you need to select one row of the rule that is displayed in the Grid Rule Editor by using the mouse, and double-click on this row.
  The Define Rule window appears, and the rules can be changed.

Deleting rules

- To delete a defined rule, you need to use the mouse to select one row from the Grid Rule Editor, and click the [Delete] button on the tool bar.
  The selected rule is deleted.

Duplicating rules

- To duplicate a defined rule, use the mouse to select one row from the Grid Rule Editor, and click the [Duplicate] button on the tool bar.
  The rule is duplicated.

Running grid rules

1. To run the rules defined in the Define Rule window, select the respective check boxes on the left side of the Grid Rule Editor, and click [Run].
   When a [Set] rule type grid rule is executed, the data of cells that match the conditions will be changed.

   When a [Check] rule type grid rule is executed, the cells that match the conditions are highlighted. The data in the cell will not be changed.

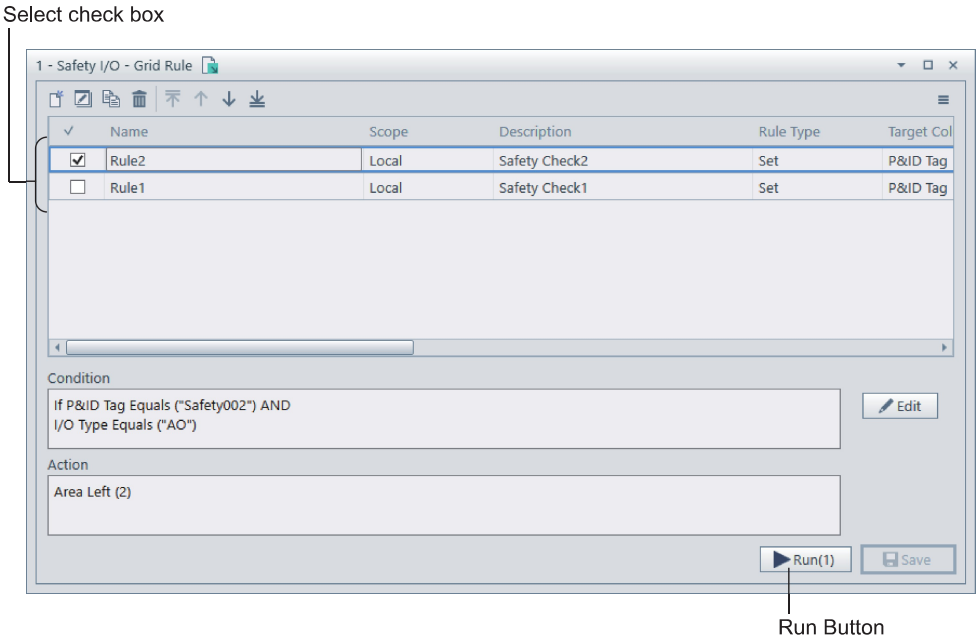

Figure B4.4-12 Run

TIP

- When a grid rule with rule type [Set] is executed, the relevant files are not checked out automatically.
- When a grid rule with rule type [Set] is executed, up to 10 columns can be changed at the same time.

Exporting grid rules

The grid rules that are defined by each user can be exported and saved to the computer. Follow these steps to export grid rules:

1. Select the grid rules that need to be exported in the Grid Rule Editor.
2. Select [Export] from the sub menu of the Grid Rule Editor.
   A selection dialog box appears to choose the save location.
3. Specify the folder to which the rules need to be exported, and click [OK].

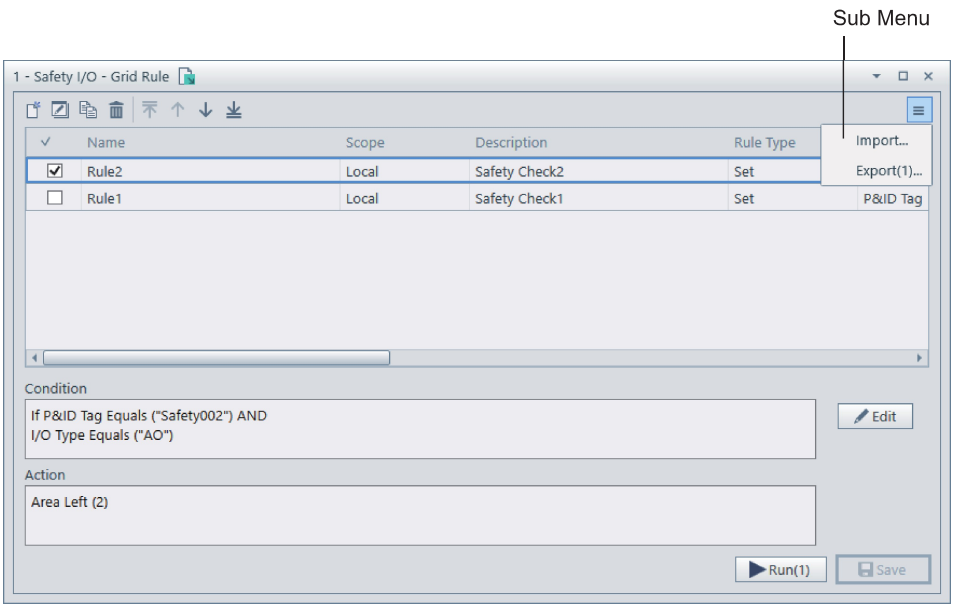

Figure B4.4-13 Tools menu

TIP

When the filter function is used, the export menu will turn gray, and export operation cannot be performed.

Importing grid rules

The grid rules that are exported and saved can be imported. Follow these steps to import grid rules:

1. Select [Import] from the sub menu of the Grid Rule Editor.
   A selection dialog box appears to choose the source.
2. Specify the XML file in which the grid rules to be imported are defined, and click the [OK] button.
   The imported grid rules is added in the last row of the Grid Rule Editor.

TIP

- You cannot import grid rules of a different editor.
- When the filter function is used, the import menu will turn gray, and export operation cannot be performed.

Saving the grid rules and performing check-in

The grid rules that are defined in the Grid Rule Editor can be stored in the AD project by saving and checking-in the grid rules.

Saving grid rules

- To save grid rules, click the [Save] button in the Grid Rule Editor.
  The edited grid rules are saved.

Performing check-in of the grid rules

- You can check in the edited grid rules by using the Check-in window.

C. Automation Design Server administration functions and history management

This section describes the management of AD Server and AD projects that use Automation Design Suite Administration Tool (hereinafter referred to as "ADS Administration Tool") as well as history management for AD Suite.

C1. AD Server administration functions

Administration functions of AD Server consist of management of AD Server and AD projects.

AD Server management includes functions such as backing up, restoring, and setting the location of the ADMDB.

AD project management includes functions such as creating AD projects, exporting and importing project data, and configuring access control settings.

C1.1 Tools for management of AD Server and AD projects

Use ADS Administration Tool for management of AD Server and AD projects. ADS Administration Tool runs on a computer with AD Server. To use ADS Administration Tool, the user must have the proper access rights.

Functions of ADS Administration Tool

ADS Administration Tool provides AD Server management functions and AD project management functions.

Functions for management of AD Server are as follows:

- Communication setting of the AD server and encryption setting of the ADMDB
- Backing up and restoring the ADMDB
- Viewing the history of backup and export operations
- Location setting of the ADMDB

Functions for management of AD projects are as follows:

- Creating and deleting AD projects
- Modifying properties of AD projects
- Controlling access to AD projects
- Exporting and importing AD project databases
- Prohibiting and permitting modification of AD project data
- Forcibly canceling the checked-out status of currently checked-out AD project files

Access rights for use of ADS Administration Tool

An Access Right in accordance with the IT security model is required in order to use each function of ADS Administration Tool. If the IT security model is the Standard model or the Strengthened model, log on to a computer with AD Server by using an account that belongs to either of the following groups:

- ADS_MANAGER group
- ADS_MANAGER_LCL group

In addition to the ADMDB backup and AD project export functions, ADS Administration Tool has a function to back up RS projects and SCS projects. To activate this function, you must log on to a computer with AD Server by using an account that belongs to all of the following groups. However, the CTM_MAINTENANCE group can be excluded if the AD Server to which ProSafe-RS is connecting is not used by CENTUM VP.

- ADS_MANAGER group or ADS_MANAGER_LCL group
- PSF_MAINTENANCE group
- CTM_MAINTENANCE group

Starting ADS Administration Tool

- To start ADS Administration Tool, from your desktop, select [Start] > [All Programs] > [YOKOGAWA AD Suite] > [ADS Administration Tool].
  ADS Administration Tool launches.

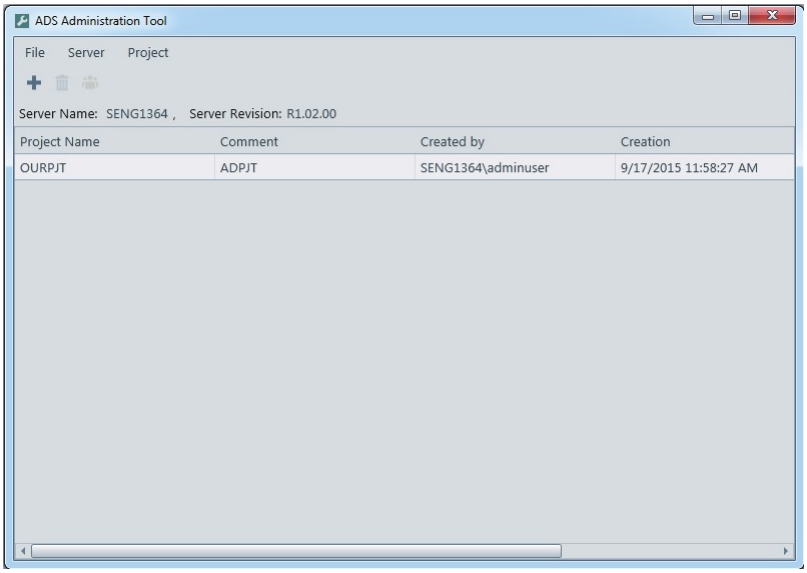

Figure C1.1-1 ADS Administration Tool

Activating the system project backup function

When backing up ADMDB and when exporting an AD project, by default the system is configured to automatically perform a backup of all system projects prior to Server Backup.

Follow these steps to activate the system project backup function:

1. Start the ADS Administration Tool.
   If any one of the following conditions is met, the Activation setting for System Project Backup Function dialog box may appear.
   - AD server license has been distributed.
   - CENTUM VP or ProSafe-RS has been upgraded on a computer where the AD server is installed.
   - CENTUM VP and ProSafe-RS have been installed on a same computer.

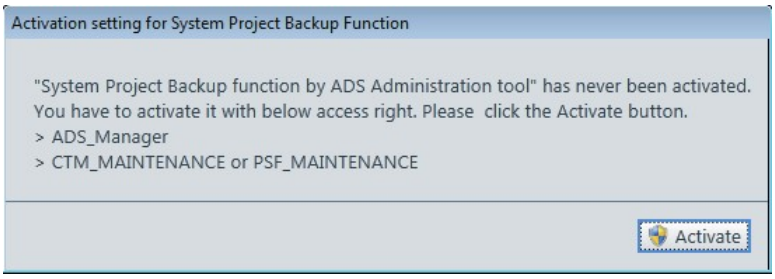

Figure C1.1-2 Activation setting for System Project Backup Function dialog box

2. Click the [Activate] button.

TIP

When you start the ADS Administration Tool again after activation has failed, the Activation setting for System Project Backup Function dialog box appears again.

IMPORTANT

- After activating the system project backup function, change the initial password of PSF_PROCESS. If you change the password before activating the system project back-up function, the [Backup System Projects prior to AD Project Export] check box in the ADS Administration Tool appears dimmed. In that case, change the initial password of PSF_PROCESS after activating the system project backup function.
- When changing the password, ensure that the same password is set in the entire system.

SEE ALSO For more information about changing the password for a user account, refer to:

6.11, “Other Utility Programs” in ProSafe-RS Security Guide (IM 32P01C70-01EN)

C1.1.1 Communication setting of the AD Server and Encryption setting of the ADMDB

The Communication setting of the AD server and the Encryption setting of the ADMDB are set in the Option Setting dialog box of ADS Administration Tool.

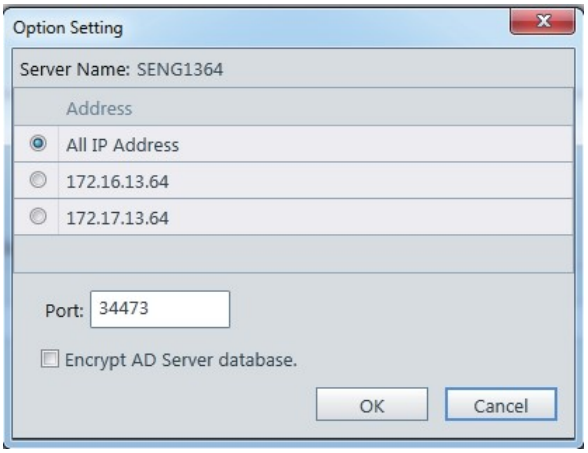

Figure C1.1.1-1 Option Setting dialog box

IMPORTANT

After changing the Option setting, restart the computer with AD Server.

C1.1.2 Changing the Communication setting of the AD Server and the Encryption setting of the ADMDB

Two AD Server options are available: one for setting up communication and the other one for setting up ADMDB encryption.

Setting communication

If the computer with AD Server has multiple network interface cards installed in it, you can set which network interface card is used and change the communication port used by AD Organizer to communicate with AD Server. You can change the communication setting by using the Option Setting dialog box of ADS Administration Tool.

TIP

After changing the communication setup, restart the computer with AD Server.

IMPORTANT

If the computer with AD Server is connected to the control bus, the control bus network interface also appears in the Option Setting dialog box. However, you must be aware that AD Organizer and AD Server cannot communicate with each other through the control bus.

In the standard setting, the IP address of the control bus network interface is as follows:

172.16.<domain number>.<station number>

Changing the Communication setting

Follow these steps to change the communication setting of AD Server.

1. From the menu of ADS Administration Tool, select [Server] > [Option Setting].
   The Option Setting dialog box appears.
2. From the IP address list, select the radio button of the network interface card to be used.
   Selecting [All IP Address] enables all Network Interface Cards (NIC) installed on the computer to communicate with AD Server.
3. Change the port number, if necessary.
4. In the Option Setting dialog box, click [OK].
   The AD Server Restart Confirmation dialog box appears.
5. Restart the computer with AD Server.

Encryption setting of the ADMDB

You can set whether or not to encrypt the ADMDB by using Encrypting File System. The default setting is no encryption.

Encryption of the ADMDB can be run during an engineering process. Encryption can also be run while files currently being checked out are remaining.

In cases when the encryption setting has been changed, encryption processing runs the next time the computer is started and AD Server doesn't start until this processing is completed.

TIP

- After changing the ADMDB encryption setting, restart the computer with AD Server. When the computer is restarted, the encrypting or decrypting process is performed.
- Encrypting or decrypting the ADMDB requires some time.

Setting up encryption of the ADMDB

Follow these steps to configure encryption of the ADMDB.

1. From the menu of ADS Administration Tool, select [Server] > [Option Setting].
   The Option Setting dialog box appears.
2. Select the [Encrypt AD Server database] check box.
3. In the Option Setting dialog box, click [OK].
   The Encryption Time Message dialog box appears.
4. Click the [OK] button.
5. Restart the computer with AD Server.

TIP

An encrypted ADMDB can be decrypted. To decrypt the database, clear the check box in step 2 and perform step 3 onward.

C1.1.3 ADMDB location setting

You can specify a folder where the ADMDB for AD Server is placed. A folder named ChronusENG is created under the specified folder.

By default, the ADMDB is created in the system drive on the computer for AD Server.

However, when the space available on the system drive is insufficient or when the size of the ADMDB expands along with the processes of engineering tasks and the available space becomes insufficient, the ADMDB cannot be placed on this drive.

Accordingly, you must place the ADMDB in a folder with enough available space which is other than the location set by default.

You must not change the location of the ADMDB by using the explorer function of Windows.

Operation of AD Server after changing the folder of the ADMDB

After changing the location, AD Server operates using the data of the ADMDB that exists in the folder after the change. If the ADMDB does not exist on the folder after the change, the ADMDB is newly created.

To continue using the data of the ADMDB from before the change of location, you must manually perform operations to move the data of the ADMDB from the folder before the change to the folder after the change.

Data subject to the ADMDB location setting function

The following data included in the ADMDB is subject to this function.

- Engineering data and list information of AD projects
- Information regarding the history of backup and export operations of the ADMDB

Option setting information of AD Server not included in the ADMDB is not subject to this function.

Execution timing of the ADMDB location setting

The timings at which changing of the folder for the ADMDB can be implemented are as follows:

- When ADS Administration Tool of AD Server is started for the first time
  Location setting is required when ADS Administration Tool is started for the first time after installation of AD Server.
- At any timing chosen by the user
  While AD Server is in operation, the ADMDB location setting can be run at any timing chosen by the user.

ADMDB Location Setting window

When ADS Administration Tool is started for the first time, the following dialog box is displayed.

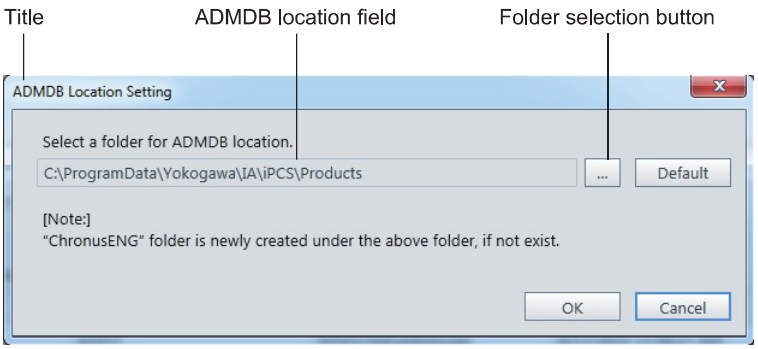

Figure C1.1.3-1 ADMDB Location Setting dialog box

Items displayed in the ADMDB Location Setting dialog box

Table C1.1.3-1 Items displayed in the ADMDB Location Setting dialog box

Displayed item	Description
ADMDB location field	The path of the folder in which the ADMDB is placed is displayed. Up to 100 characters can be configured for this item.
Folder selection button	Clicking this button displays a folder selection dialog with which the folder in which to place the ADMDB can be selected. When this item is not configured, the default settings are applied.
Default	Clicking this button displays the path of the default location in the ADMDB location field.

TIP

Pressing the ESC key cancels the settings and closes the screen without executing the settings.

Tasks before and after running the ADMDB location setting

The following window is displayed when running the ADMDB location setting at any timing chosen by the user.

Perform operations according to the precautions displayed in the window.

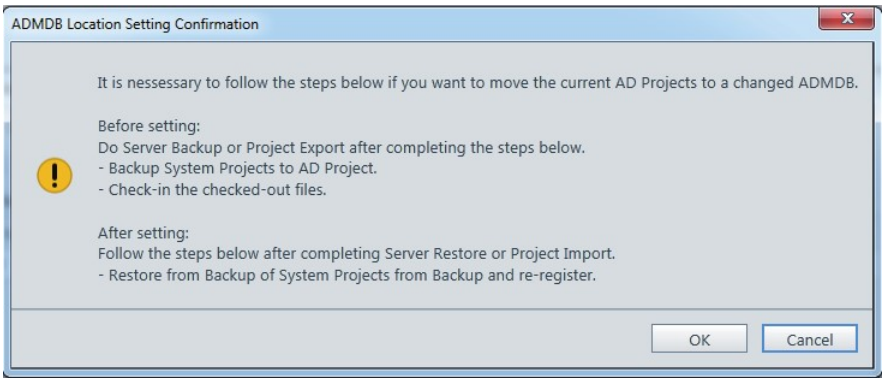

Figure C1.1.3-2 Precautions for ADMDB location setting

Server processing and status of the ADMDB at the time of the ADMDB location setting

This section describes the flow of the ADMDB location setting, server processing, and the statuses of the ADMDB before and after changing the location setting.

ADMDB location setting when ADS Administration Tool is started for the first time

The following table shows the flow of operations when changing the folder of the ADMDB the first time ADS Administration Tool is started, server processing, and the status of the new ADMDB.

Table C1.1.3-2 Flow of change of location when ADS Administration Tool is started for the first time

Order	Flow	User operations	Processing of AD Server	The ADMDB in the new location
1	ADMDB location setting	ADMDB location setting change request with ADS Administration Tool	Change the ADMDB location setting	A folder (ChronusENG folder) for the ADMDB is created under the folder specified by the user
2	IT security setting	Set access rights for the ADMDB folder by running the IT security tool	-	Access rights are set for the ADMDB folder
3	Starting AD Server and creating the ADMDB	Restarting the computer	Starting AD Server and creating the ADMDB in a new location	An empty ADMDB is created
4	Project registration (Creation of new projects)	AD project creation request with ADS Administration Tool	Executing creation of the AD project	The AD project is created

ADMDB location setting during operation

The following table shows the flow of operations when changing the folder of the ADMDB during operation with ADS Administration Tool, server processing, and the status of the new ADMDB.

Table C1.1.3-3 Flow of the ADMDB location setting during operation

Order	Flow	User operations	Processing of AD Server	The ADMDB in the new location
1	Backing up existing AD projects	Requesting a server backup with ADS Administration Tool	Acquiring a backup from the ADMDB before the change and creating a backup file	-
2	ADMDB location setting	ADMDB location setting change request with ADS Administration Tool	Change the ADMDB location setting	A folder (ChronusENG folder) for the ADMDB is created under the folder specified by the user
3	IT security setting	Set access rights for the ADMDB folder by running the IT security tool	-	Access rights are set for the ADMDB folder
4	Starting AD Server and creating the ADMDB	Restarting the computer	Creating the ADMDB in a new location	An empty ADMDB is created
5	Project registration (Re-registration of an existing project)	Requesting a server restoration with ADS Administration Tool	Executing a server restoration by using the backup file	The ADMDB is restored

Backing up existing AD projects

A server backup of the AD project is implemented.

The AD projects within the ADMDB of the former location are not automatically transferred to the ADMDB of the new location. For this reason, when it is necessary to transfer such AD projects, you must execute a server backup in advance.

You do not need to implement this operation if it is not necessary to transfer the AD projects.

TIP

When individually transferring AD projects, implement a project export instead of a server backup.

ADMDB location setting

The AD Server receiving a location setting request restarts after creating a folder for the ADMDB in the specified location.

The name of the folder for the ADMDB is ChronusENG.

However, if a folder for the ADMDB already exists in the new location, the folder is not newly created and the existing ADMDB is loaded after being restarted. At this time, if AD projects exist on the ADMDB, these AD projects are loaded.

TIP

Running a location setting restarts AD Server. Along with such, connections with ADS Administration Tool and each connected client are disconnected. For this reason, after restarting AD Server, ADS Administration Tool and each of the clients need to be reconnected.

IT security setting

You can run the IT security setting tool to set access rights for the ADMDB folder in the new location. The details of the access rights to be set are the same as the default ADMDB folder.

If the strengthened model has been selected, the ADMDB folder in the new location is registered with the software restriction policies.

A folder once registered with the software restriction policies cannot be deleted using the IT security tool. For this reason, when the user has changed the location again, the user must delete the old folder from the software restriction policies by themselves.

To delete the old folder, select and delete the applicable folder from Additional Rules under Software Restriction Policies of the local group policy editor shown in the following figure.

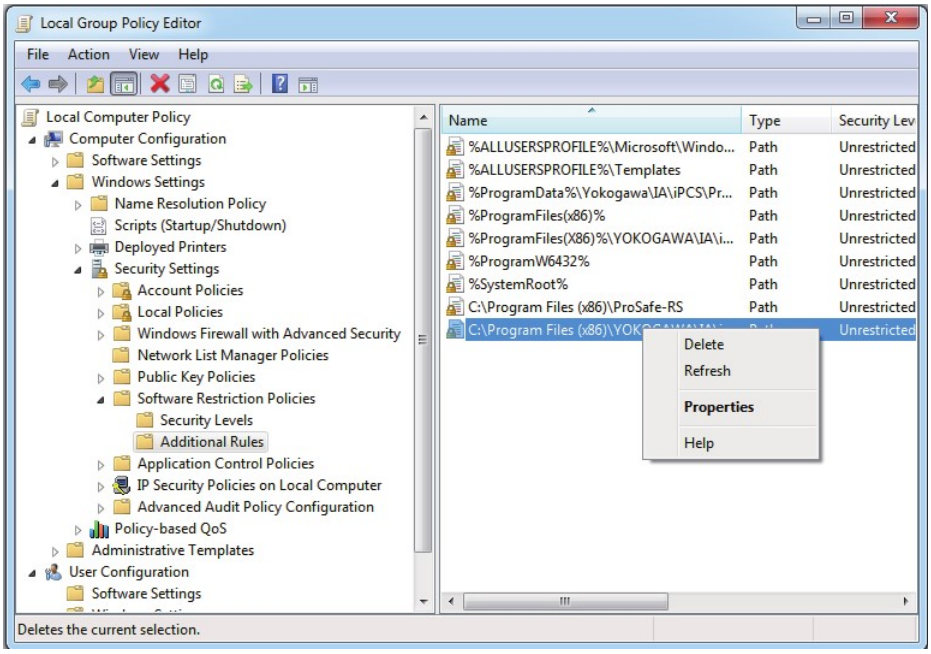

Figure C1.1.3-3 Example of canceling the registration of software restriction policies

Applicable folders are displayed as shown in the following figure.

"user specified folder name"/ChronusENG/Data/Projects

If the folder has been moved from the default location to another location, the previously mentioned "user specified folder name" subject to the deletion is the default location.

You must restart the computer after running the IT security tool.

Starting AD Server and creating the ADMDB

Restarting the computer starts AD Server. At this time, AD Server creates the ADMDB within the folder in the new location.

The user can create a new AD project using ADS Administration Tool or register an AD project. When newly creating an AD project, the AD project can be created by suing the AD project management function. When re-registering an existing AD project, restore the backup file created prior to the operation for changing the location.

Project registration

The user can create a new AD project using ADS Administration Tool or register an existing AD project.

- When newly creating an AD project
  You can create an AD project by using the AD project management function.
- When re-registering an existing AD project
  If you wish to continue using the same AD project from before the change of location, run a restoration of the backup file created at Backing up existing AD projects in the flow or run an import of the export file.

Precautions when transferring an existing AD project to the ADMDB in a new location

Precautions for transferring the engineering data of an existing AD project and continuing engineering with the new ADMDB are as follows:

Precautions prior to implementation of location setting

You must cancel the checked-out status of all files before obtaining a backup of the AD project to transfer.

The altered content of files that are checked-out when running server backup and project export are not transferred to the new ADMDB. You must check-in all edited details in advance.

Precautions after implementation of location setting and RS project registration

Similar to when running a normal server restoration or project import, you must re-register RS projects to the AD project that has been transferred.

Drives and types of folders in which the ADMDB can be placed

The drives and folders which can be specified in the ADMDB location setting are folders under the local drive.

IMPORTANT

You must not specify a folder under the following folders: When the following folders are specified, there is the possibility of subjects of setting with the IT security tool being duplicated and such setting not being implemented properly.

- Hidden folder
- Program Files folder (`C:\Program Files`, `C:\Program Files (x86)`)
- Program Data folder (`C:\ProgramData`)
- Installation folders of other coexisting YOKOGAWA products (example: `C:\CENTUMVP`)
- Network drive folders (not capable of IT security setting)

Database encryption at the time of the change of location

At the time of location setting, the encryption setting of the ADMDB that exists in the new location is inherited. The encryption setting of the ADMDB in the former location is not reflected to the destination of the change.

If the ADMDB does not exist in the new location, the ADMDB is created in a state where encryption is disabled.

Relation between the server backup function and the restoration function

The server backup function and the restoration function are implemented in relation to the location of the ADMDB changed with ADMDB location setting.

For example, changing the location after obtaining a backup and implementing a restoration after this restores the file in the most recently configured location. The setting at the time the backup was made is not taken into consideration.

The ADMDB location setting is not included in the information that is backed-up or restored.

Exclusive control of access to the ADMDB during processing of the location setting

All access to the ADMDB is restricted during the processing of the location setting. Accessing the ADMDB returns an error.

Further, location setting operations cannot be performed during processing of access to the ADMDB. Running a location setting during processing of access to the ADMDB displays an error dialog and cancels the location setting.

Handling of the data of the ADMDB before the change of location

Engineering data included in the ADMDB in the location prior to the change is maintained even when the location setting is changed. For this reason, the original ADMDB can be used again by returning the location setting to its original setting.

C1.1.4 Setting the location of the ADMDB

This section describes how to change or return to the default location the folder in which the ADMDB is placed at a timing of choice for a reason such as the server capacity becoming insufficient during operation of a project or when ADS Administration Tool is started for the first time.

Setting the location of the ADMDB when ADS Administration Tool is started for the first time

After installing AD Server, you can specify the folder in which to create the ADMDB when ADS Administration Tool is started for the first time.

1. Start ADS Administration Tool.
   The ADMDB Location Setting dialog box appears.

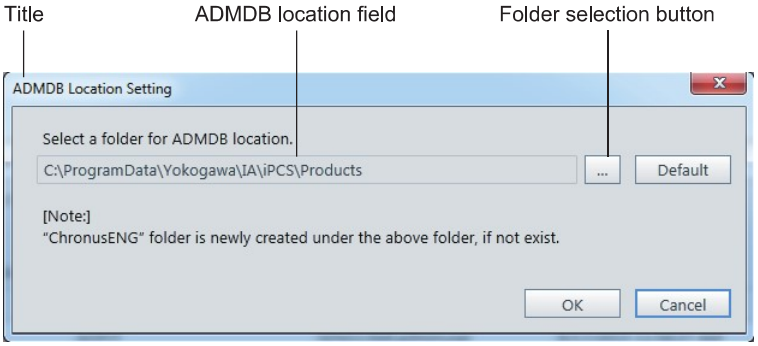

Figure C1.1.4-1 ADMDB Location Setting dialog box

2. Click the folder selection button to select the folder in which the ADMDB is placed.
   The selected folder path appears in the ADMDB location field.

TIP

- Click [Default] to configure the default setting as the folder in which the ADMDB is placed.
- The file path must be 100 characters or less.
- Specifying a folder in which the ADMDB does not exist newly creates an ADMDB.

3. Click the [OK] button.
   ADS Administration Tool closes.
4. Start the IT Security Tool and configure the IT security settings to the values that were set when ProSafe-RS was installed.
5. Restart the computer.

SEE ALSO For more information about IT security settings, refer to:

- 6.9, “Viewing the Information Configured by the IT Security Tool” in ProSafe-RS Security Guide (IM 32P01C70-01EN)
- B3.6, “Configuring IT Security Settings” in Installation Guide (IM 32P01C50-01EN)

Setting the location of the ADMDB at a timing of choice

Follow these steps to change the folder in which the ADMDB is placed at a timing of choice:

1. From the menu bar of ADS Administration Tool, select [Server] > [ADMDB Location Setting].
   A dialog box showing the details which should be implemented before and after changing the location of the folder is displayed.

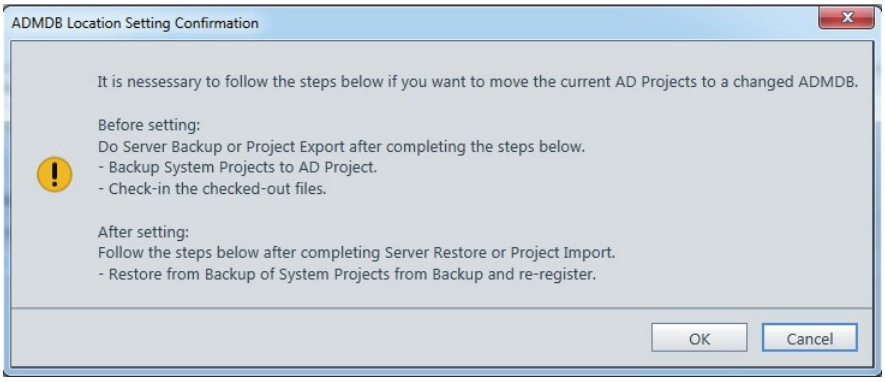

Figure C1.1.4-2 Details of processing before and after the ADMDB location setting

2. Confirm the details displayed in the dialog box.
   Once closed, the details of the dialog box cannot be confirmed during the tasks of changing the folder.
3. If tasks prior to the change of location have not been implemented, you can click the [Cancel] button and start again from Step 1 after implementing the tasks prior to the change of location. If tasks prior to the change of location have been implemented, you can click [OK].
   A dialog box for selecting the folder appears.
4. Click the folder selection button to select the folder in which the ADMDB is placed.
   The selected folder path is displayed in the ADMDB location field.

TIP

Click [Default] to return the folder in which the ADMDB is placed to the default setting.

The file path must be 100 characters or less.

5. Click the [OK] button.
   A dialog box for suggesting a restart and IT security setting appears.

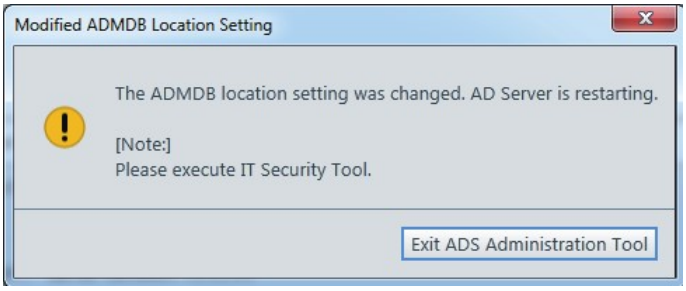

Figure C1.1.4-3 Messages after change of location

6. Click [Exit ADS Administration Tool].
   ADS Administration Tool closes.
7. Start the IT Security Tool and configure the IT security settings to the values that were set when ProSafe-RS was installed.
8. Restart the computer.
   An empty ADMDB is created in the new location.

TIP

If a ChronusENG folder is already created in the new location and an ADMDB exists in it, that ADMDB is read after the computer is restarted. If the ADMDB contains any AD project, that AD project is also read at the same time.

9. If any AD Server options were set before changing the location, set the AD Server options again.

10. Start the ADS Administration Tool and register the AD project. To register the project, perform one of the following operations:
    - Create a new AD project.
    - Restore the backed-up ADMDB.
    - Import an exported AD project.
11. Start AD Organizer and register the RS project with the AD project. To register the project, perform one of the following operations:
    - If you have created a new AD project, register the RS projects with the AD project.
    - If you have restored an ADMDB or imported an AD project, restore the backed up RS projects from the AD project.

TIP

- The AD Server and AD Organizer is disconnected when you change the ADMDB location. After changing the ADMDB location, reconnect to the AD Server.
- After moving an existing AD project to a new location, it is recommended that you delete the AD project from the old location.

SEE ALSO

For more information about how to back up and restore the ADMDB, refer to:

C1.1.7, “Backing up and restoring the ADMDB” on page C1-20

For more information about how to export and import the AD projects, refer to:

C1.2.3, “Export and import AD projects” on page C1-38

For more information about IT security settings, refer to:

- 6.9, “Viewing the Information Configured by the IT Security Tool” in ProSafe-RS Security Guide (IM 32P01C70-01EN)
- B3.6, “Configuring IT Security Settings” in Installation Guide (IM 32P01C50-01EN)

For more information about option settings of the ADMDB, refer to:

C1.1.2, “Changing the Communication setting of the AD Server and the Encryption setting of the ADMDB” on page C1-6

For more information about how to create and delete the AD projects, refer to:

C1.2.1, “Creating and deleting AD projects” on page C1-28

For more information about how to register RS projects in the AD project, refer to:

C1.2.3, “Registering RS projects in the AD project” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

For more information about how to restore RS projects from the AD project, refer to:

“■ Restoring RS projects” on page C1-18

C1.1.5 Backing up and restoring RS projects

You need to restore the RS projects from the AD project after restoring the ADMDB that has been backed up or importing the AD project.

● Backing up RS projects

Running a backup of RS projects copies all files under the RS project folder to the ADMDB. However, version management data and operation histories of RS projects and SCS project data is not subject to the backup of RS projects.

Backup data of RS projects can be made subject to backup of the ADMDB or export of AD projects. For this reason, you need to back up RS projects before backing up the ADMDB or exporting the AD projects.

● Restoring RS projects

You need to restore the RS project from the AD project after restoring the ADMDB or importing the AD project.

Restoring a backed up RS project with a different name creates a copy of the RS projects and configures a test environment.

Re-registering the data of an RS project restored with the same name by using System Structure Navigator reflects the restored content onto the ADMDB.

TIP

- When transferring an AD project to another environment, implement re-registration in order to associate the AD project to the RS projects again. More specifically, you can restore the RS projects from the AD project, specify this project data, and operate registration of the RS projects.
- Data of RS projects restored with a different name cannot be re-registered. They are handled as data of RS projects for new registration.

SEE ALSO

For more information about How to activate the system project backup function, refer to:

"■ Activating the system project backup function" on page C1-3

■ Backing up RS projects

Follow these steps to back up an RS project.

- How to use the system project backup function of the ADS Administration Tool
- How to use the backup function of the System Structure Navigator in AD Organizer

When backing up ADMDB or when exporting an AD project, backup can be performed automatically in advance by using the system project backup function of the ADS Administration Tool.

Follow these steps to backup an RS project by using the System Structure Navigator in AD Organizer.

1. Run System Structure Navigator in AD Organizer and select the RS projects to create a backup for.
2. In the sub menu of System Structure Navigator, select [Back up].
   A confirmation dialog box appears.
3. Click [Yes].
   An RS project can be made subject to backup of the ADMDB or export of an AD project so that backup of the RS project is automatically performed upon each execution.

   Backup starts.

SEE ALSO For more information about Procedures for automatically backing up an RS project when backing up ADMDB, refer to:

"■ Backing up the ADMDB" on page C1-22

For more information about Procedures for automatically backing up an RS project when exporting an AD project, refer to:

"■ Exporting an AD project database" on page C1-39

■ Restoring RS projects

Follow these steps to restore RS projects from the AD project after restoring the ADMDB or importing the AD project. If RS projects having the same name already exist in the restoration destination, an error dialog box is displayed and the restoration cannot be completed.

1. In AD Organizer, open System Structure Navigator.
2. In the System Structure Navigator, select an RS project that you want to restore.
3. In the sub menu of System Structure Navigator, select [Restore from Back up].
   The System Project Restore dialog box appears.

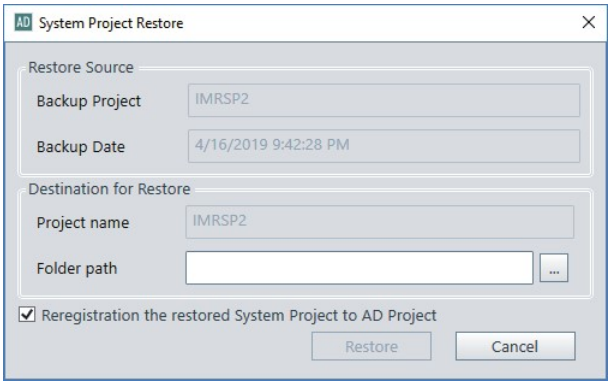

Figure C1.1.5-1 System Project Restore dialog box

4. Select the [Reregister the restored System Project to AD Project] check box if necessary.
   When you select this check box, the restored RS projects are reregistered with AD project.

TIP If you have changed the project name of RS project you want to restore, the check box cannot be selected.

5. To change the RS project to restore, you can input a new project name and folder path.
6. Click the [Restore] button.
   Restoration starts.
   If you have selected the [Reregister the restored System Project to AD Project] check box, RS project is registered with AD project when the restoration is completed.
7. If you have not selected the [Reregister the restored System Project to AD Project] check box, register the restored RS project with AD project.

SEE ALSO For more information about registering RS projects in the AD project, refer to:

C1.2.3, "Registering RS projects in the AD project" in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

C1.1.6 Backing up and restoring Library projects

Library projects under RS project folders can be made subject to backup, restoration, export, and import of ADS Administration Tool by registering the corresponding RS projects to AD project.

Library projects which are not under RS project folders can be made subject to backup/restoration and export/import of ADS Administration Tool by registration using AD Organizer with operation similar to that of RS projects.

When the name of the Library project you are trying to register is not in accordance with the naming rules for RS projects, the Library project cannot be registered with AD Organizer. For this reason, you can create a folder in accordance with the naming rules for RS projects on a level above such Library project and then register this folder. We recommend setting the file name as USERLIB

C1.1.7 Backing up and restoring the ADMDB

You can back up or restore the ADMDB.

Operations related to the AD project cannot be performed using other software while the ADMDB is being backed up. Also, you cannot back up an AD project that is in use with other software.

■ Backing up the ADMDB

Back up the ADMDB in the Server Backup dialog box of ADS Administration Tool.

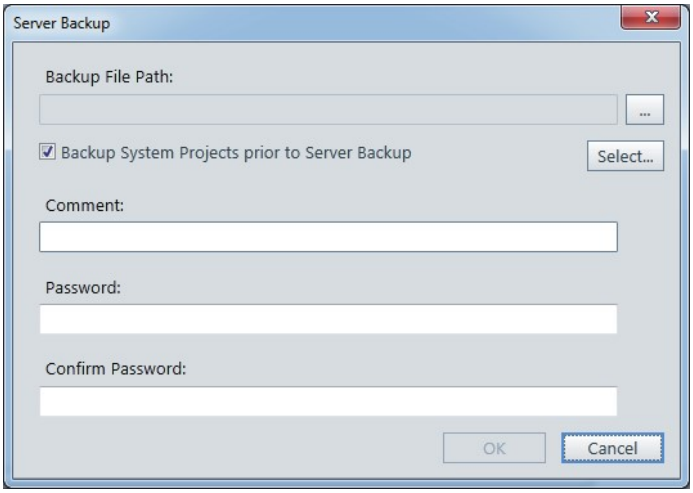

Figure C1.1.7-1 Server Backup dialog box

Activating the system project backup function by using the ADS Administration Tool activates the "[Backup System Projects prior to Server Backup]" check box. The check box is deactivated when activation of the system project backup function fails.

Clearing the "[Backup System Projects prior to Server Backup]" check box deactivates the system project backup function.

Backing up the ADMDB includes all data in the database.

TIP

- You cannot back up only a part of ADMDB data.
- If a data modification request is received from AD Organizer while the ADMDB is being backed up, the data modification request from AD Organizer results in an error or you must wait until the backup is complete.
- Running a backup when the AD project file is being checked-out by another user automatically cancels the checked-out status from the backed up project. For this reason, the checked-out status is not inherited by restoring the backup data.

SEE ALSO

For more information about How to activate the system project backup function, refer to:

"■ Activating the system project backup function" on page C1-3

● Backup password

When you back up the ADMDB, you are asked to enter a password. This password is required when you restore the ADMDB.

● Items set in the Server Backup dialog box

The following table shows the items set in the Server Backup dialog box and their explanations.

Table C1.1.7-1 Items set in the Server Backup dialog box

Setting items	Description
Backup File Path	Specify the folder to output the backup file to. The file path can contain up to 180 characters. The backup file is saved to this folder. When the size of the backup file exceeds 100 MB, the file is automatically split into and saved as multiple files.
Backup System Projects prior to Server Backup	Select the check box to backup system projects prior to backup of the ADMDB or clear the check box not to backup system projects. By default, it is selected. Selecting the check box activates the Select button.
Comment	Enter a comment. The text appears in the Server Restoration dialog box when restoring the database. The maximum number of characters is 128.
Password	Enter a 1 to 8-character length password that is required when restoring the database. You can use single-byte alphanumeric characters, under score (_), hyphen (-), and period. The password is case-sensitive.
Confirm password	Enter the password again to confirm.

Items set in the System Project Selection dialog box

System Project is a general term for RS Projects of ProSafe-RS and VP Projects of CENTUM VP.

IMPORTANT

If a system project has not been backed up prior to backing up the ADMDB, when restoring the ADMDB, a database inconsistency will occur between the ADMDB and system project.

System projects must be backed up prior to backing up the ADMDB.

As activating the system project backup function activates the "[Backup System Projects prior to Server Backup]" check box, system projects will be automatically backed up prior to backing up the ADMDB.

By selecting the "Backup System Projects prior to Server Backup" check box and clicking the Select button, the System Project Selection dialog box appears.

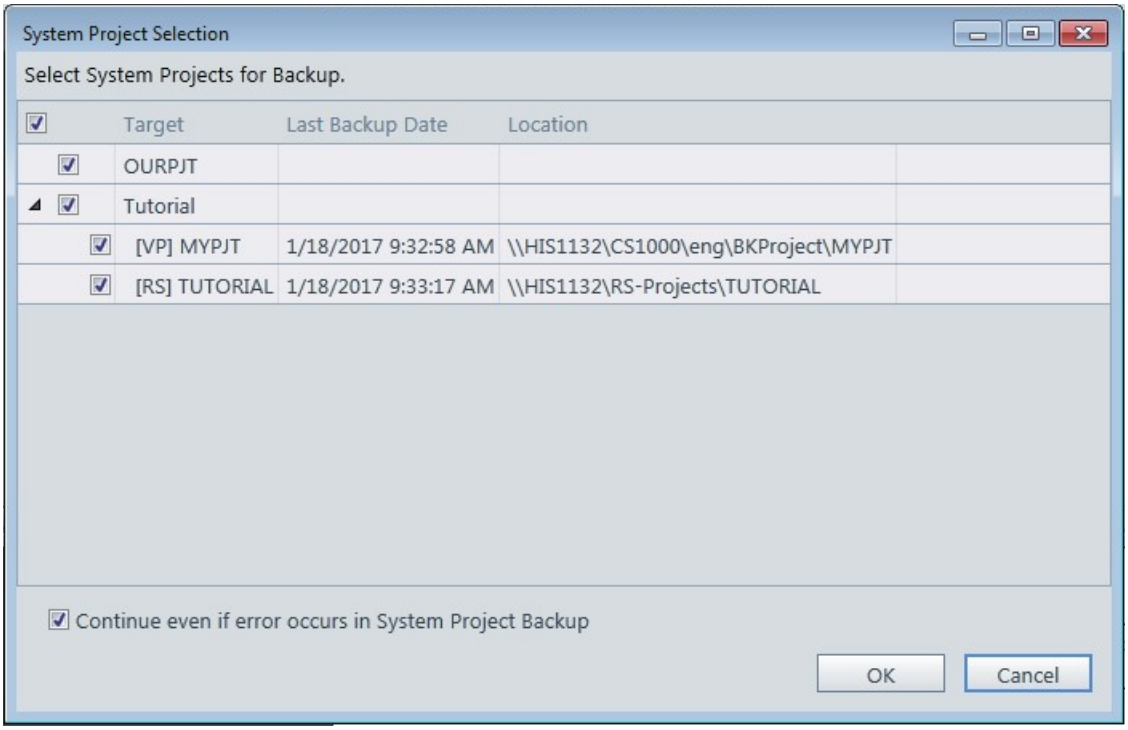

Figure C1.1.7-2 System Project Selection dialog box

The following table explains the items set in the System Project Selection dialog box.

TIP

The system project backup function is equivalent to the backup function of the System Structure Navigator in AD Organizer.

Table C1.1.7-2 Items set in the System Project Selection dialog box

Setting items	Description
Select System Projects for Backup.	In the System Project Selection dialog box, select the projects to backup to the server. By default, all check boxes are selected. A greater number of projects subject to backup will require more time to complete the backup. Check boxes for projects that do not need to be backed up can be cleared.
Continue even if error occurs in System Project Backup	Select whether to skip the backup of certain projects that cannot be accessed and proceed to backup of the next project or to stop the backup process when backing up system projects. There is no need to set this item if only a single system project is being backed up.

IMPORTANT

If a backup is performed by skipping errors when backing up multiple system projects, be sure to separately backup the system projects that have been skipped. Results of the backup are displayed as a message in the Backup Process window.

Backing up the ADMDB

Follow these steps to back up the ADMDB:

1. From the menu of ADS Administration Tool, select [Server] > [Backup File Path].
   The Backup Confirmation dialog box appears.
2. Click [OK].

The Server Backup dialog box appears.

3. Select the [Backup System Projects prior to Server Backup] check box.
   The [Select] button is activated.
4. Click [Select].
   The System Project Selection dialog box appears.
5. Select the system projects to backup.
6. Perform one of the following operations for the setting of the [Continue even if error occurs in System Project Backup] check box:
   - Select the check box if you wish to continue the process.
     When a certain projects of the system projects subject to backup cannot be accessed, skip the backup of such projects and proceed to backup of the next project.
   - Clear the check box if you wish to stop the process.
7. Click [OK].
8. In the Server Backup dialog box, specify [Backup File Path] and enter [Comment] and [Password].
9. In the Server Backup dialog box, click [OK].
   Backup starts and the Server Backup Progress window appears.

   If server backup is successful, a file with the following name will be generated in the output destination folder. The content displayed in the Server Backup Progress window will be saved in this file.

   `Operation.log`

TIP In the message area within the Server Backup Progress window, select [Copy] from the context menu to copy the message to the clipboard.

Restore the ADMDB

You can restore the backed-up ADMDB. Restore the ADMDB from the Server Restoration dialog box in ADS Administration Tool.

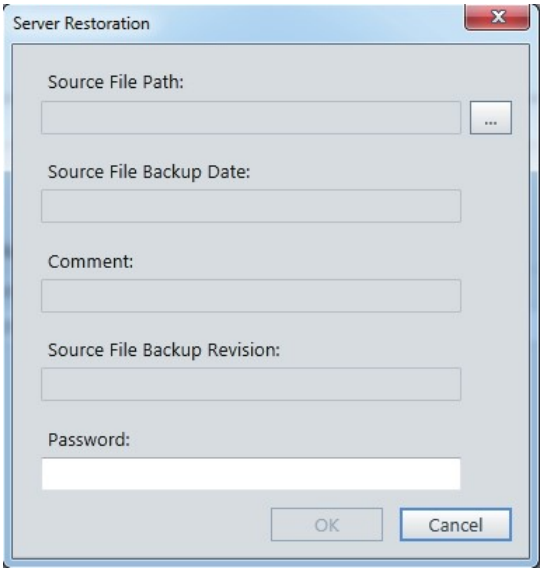

Figure C1.1.7-3 Server Restoration dialog box

Restoration replaces the ADMDB at the destination of the restoration with the restored ADMDB. The AD Server where the database is restored to must have the definitions of the Windows users and user groups used in the AD Server from which the database was backed

up. To restore the database, it is necessary to enter the password entered at the time of back-up.

IMPORTANT

After restoring the ADMDB, you must also restore the system projects and Library projects by using AD Organizer.

Not restoring the system projects and Library projects leads to inconsistencies between the AD project database and system project database.

TIP

- You cannot restore the ADMDB while it is being updated.
- Encryption of the restored ADMDB depends on the encryption setting on the computer where the ADMDB is restored regardless of the encryption setting on the computer where the backup ADMDB is stored.
- The location setting of the ADMDB is not subject to the backup. For this reason, when the locations of the ADMDB differ between backup and restoration, a restoration runs in relation to the location of the ADMDB at the time of restoration.

Restoring the backed-up ADMDB

Follow these steps to restore the backed up ADMDB:

1. From the menu of ADS Administration Tool, select [Server] > [Restore].
   The Server Restoration dialog box appears.
2. In the Server Restoration dialog box, click [OK].
   The Server Restoration dialog box appears.
3. In the Server Restoration dialog box, click the file selection button and select the folder you wish to restore.
   In the Server Restoration dialog box, the path of the file to be restored appears under [Source File Path].
4. Under [Password] in the Server Restoration dialog box, enter the password that was entered at the time of backup.
5. In the Server Restoration dialog box, click [OK].
6. If any AD Server setting information or AD project exists at the destination to restore the database to, a confirmation dialog box appears. Place a check in [Yes, I want to restore.] and click [OK].
   Restoration of the ADMDB starts, and the Server Restore Progress dialog box appears.

   If no AD Server setting information or AD project exists on the destination computer, restoration of the ADMDB starts and the Server Restore Progress dialog box appears.
7. When restoration of the ADMDB is complete, restore the RS projects by using AD Organizer.

TIP

If you have restored the ADMDB on a computer that is not the one where the backup was made, review the communication setup of AD Server.

When moving AD Server by restoring the ADMDB on a different computer or when changing the IP address of AD Server

Follow these steps to move AD Server by restoring the ADMDB on a different computer or to change the IP address of AD Server:

1. If you want to move AD Server to a different computer, restore the backed-up ADMDB on the destination computer. If you want to change the IP address of AD Server, change the IP address.
2. Check the communication setting of AD Server.
3. Start AD Organizer.
   The Select AD Project dialog box appears.
4. In the Select AD Project dialog box, specify AD Server and select the AD projects.
5. If you are restoring the ADMDB, restore the RS projects and Library projects by using AD Organizer.
6. Open System Structure Navigator in AD Organizer and start Revision History Utility.
7. After Revision History Utility is started, close Revision History Utility without doing anything.
   The internal data for retaining the AD Server address is updated with this operation.

C1.1.8 Viewing the history of backup and export operations

You can view the back up history of the ADMDB and export history of AD projects.

Viewing the history

You can view the history of backup and export operations through the Backup/Export History dialog box.

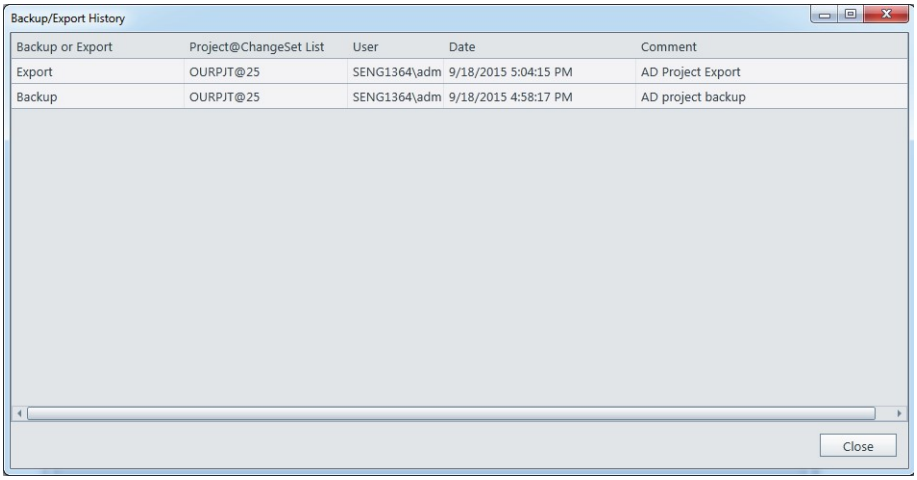

Figure C1.1.8-1 Backup/Export History dialog box

Items displayed in the Backup/Export History dialog box

The following table shows the items displayed in the Backup/Export History dialog box.

Table C1.1.8-1 Items displayed in the Backup/Export History dialog box

Item	Description
Backup or Export	"Backup" or "Export" is displayed.
Project@Change Set List	"AD project name@Change Set ID" is displayed. If two or more AD projects had been registered in the ADMDB when the ADMDB was backed up, the AD projects are listed with a comma in between.
User	The name of the user who executed the backup or export is displayed.
Date	The date and time of backup or export execution is displayed.
Comment	The comment that was set at the time of backup or export is displayed.

Viewing the history of backup and export operations

Follow this step to view the history of backup and export operations:

- From the [File] menu of ADS Administration Tool, select [Backup/Export History].

C1.2 Management of AD projects

The following AD project management tasks can be performed by using ADS Administration Tool:

- Creating and deleting AD projects
- Modifying properties of AD projects
- Controlling access to AD projects
- Export and import AD projects
- Prohibiting and permitting modification of AD project data
- Forcibly canceling the checked-out status of currently checked-out AD project files

C1.2.1 Creating and deleting AD projects

You can create or delete AD projects on or from AD Server.

Creating AD projects

You can create an AD project on AD Server. An AD project can be created with the Project Creation dialog box of ADS Administration Tool.

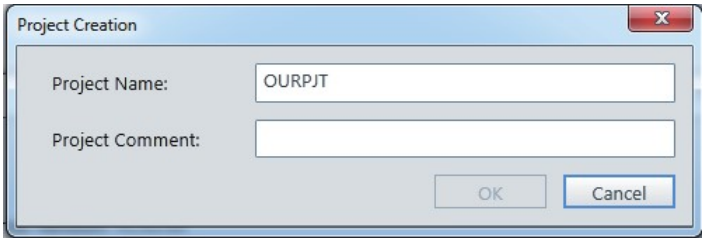

Figure C1.2.1-1 Project Creation dialog box

The following table shows the items set in the Project Creation dialog box and their explanations.

Table C1.2.1-1 Items set in the Project Creation dialog box

Setting items	Description
Project Name	Enter an AD project name using up to 50 single-byte alphanumeric characters and "_" (underscore). The first character must be an alphabetic character. The default project name is OURPJT.
Project Comment	Enter a comment of the AD project using up to 128 characters.

Creating an AD project

Follow these steps to create an AD project:

1. Click [Create Project] button in the ADS Administration Tool.
   The Project Creation dialog box appears.
2. In the Project Creation dialog box, you can enter the project name and project comment and then click [OK].
   The AD project is created. The created project appears in the list of ADS Administration Tool.

Deleting an AD project

You can delete any AD project that is created on AD Server. When deleting an AD project, you are required to confirm the deletion.

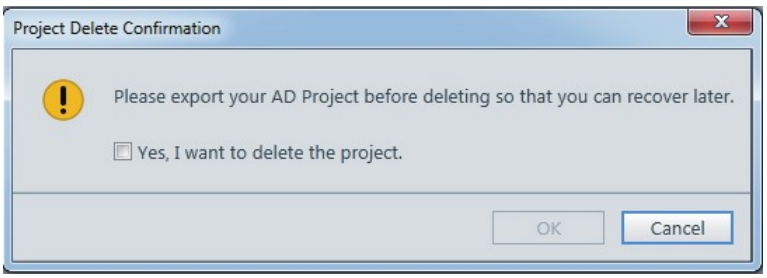

Figure C1.2.1-2 Project Delete Confirmation

IMPORTANT

When deleting an AD project, you must first unregister the RS projects that are registered in the AD project and then delete the AD project.

If you delete an AD project without unregistering the RS projects, you can no longer perform operations on the RS projects such as registering or deleting the RS projects.

If you have deleted an AD project without unregistering the RS projects, contact YOKOGAWA Service.

Deleting an AD project

Follow these steps to delete an AD project:

1. In AD Organizer, unregister the RS projects registered with the AD project that you want to delete.
2. In ADS Administration Tool, select the project you want to delete.
3. On the toolbar, click [Delete Project] button.
   The Project Delete Confirmation dialog box appears.
4. In the Project Delete Confirmation dialog box, place a check in the check box for [Yes, I want to delete the project.] and click [OK].

Modifying properties of AD projects

Modify the Project Name and Project Comment of an AD project in the Project Property dialog box of ADS Administration Tool.

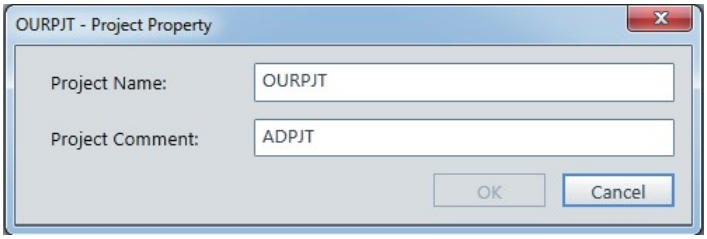

Figure C1.2.1-3 Project Property dialog box

Modifying the properties of AD projects

Follow these steps to modify the Project Name and Project Comment of AD projects:

1. In ADS Administration Tool, select the project whose properties you wish to modify.
2. From the menu bar of ADS Administration Tool, select [Project] > [Properties].
   The Project Property dialog box appears.
3. Enter the project name and project comment and then click [OK].

C1.2.2 Controlling access to AD projects

After creating an AD project, you can manage the users who access the AD project and define access control.

Configure access control of AD projects for all users who will be performing engineering and/or maintenance of ProSafe-RS.

IMPORTANT

Before you configure the access control, close all AD Organizers that connect to the AD project for which you are configuring.

If the IT security model is set to Standard model or Strengthened model, configure access control of AD projects for all users belonging to the following groups:

- PSF_ENGINEER
- PSF_ENGINEER_LCL
- PSF_MAINTENANCE
- PSF_MAINTENANCE_LCL

Setting user security for AD projects

You can use the Access Permission Definition dialog box to set user security. Follow these steps to display the Access Permission Definition dialog box:

- On the toolbar of ADS Administration Tool, click [Access Control] button.
  The Access Permission Definition dialog box appears.

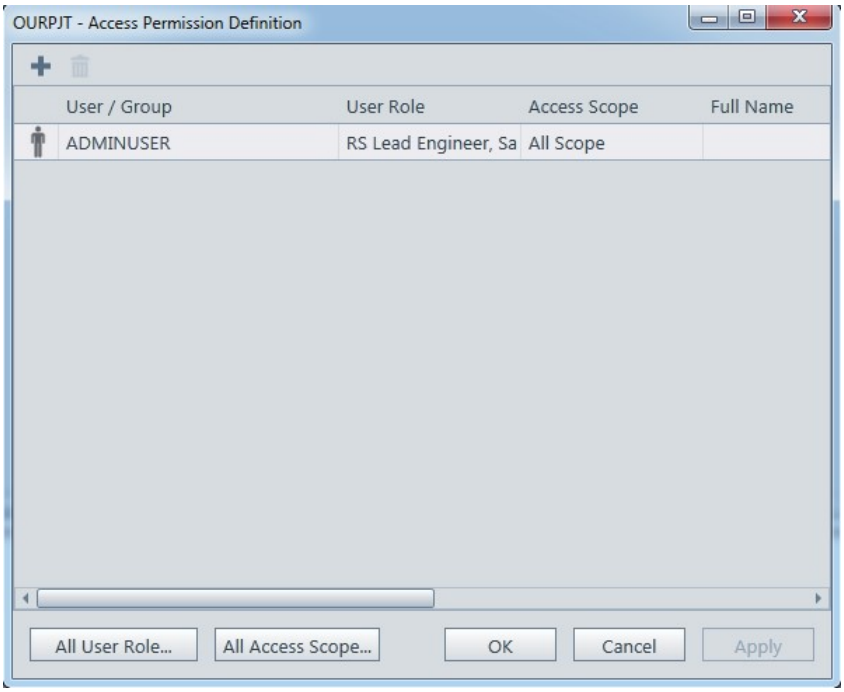

Figure C1.2.2-1 Access Permission Definition dialog box

User management and authentication

The user name and password of the currently logged-on Windows user are authenticated against the computer running AD Organizer by using a function provided with Windows.

Operation of ADS Administration Tool when the computer name and the domain name of AD Server are the same

If the name of the computer with AD Server is identical to the name of the domain to which the computer belongs, the user who tries to access AD Server from AD Organizer is regarded as a local user even if the user is a member of the domain.

The computer name of AD Server must be different from the name of the domain to which the user belongs.

Correspondence when settings of the Windows user are changed

When you change Windows user settings, such as the password or the group to which a user belongs, the change may not be reflected immediately. In such case, log off from the computer where AD Organizer is installed and log on again. Logging off and on is not required on the computer with AD Server. If you are a domain user, you must implement the log off and on operation twice.

Access control

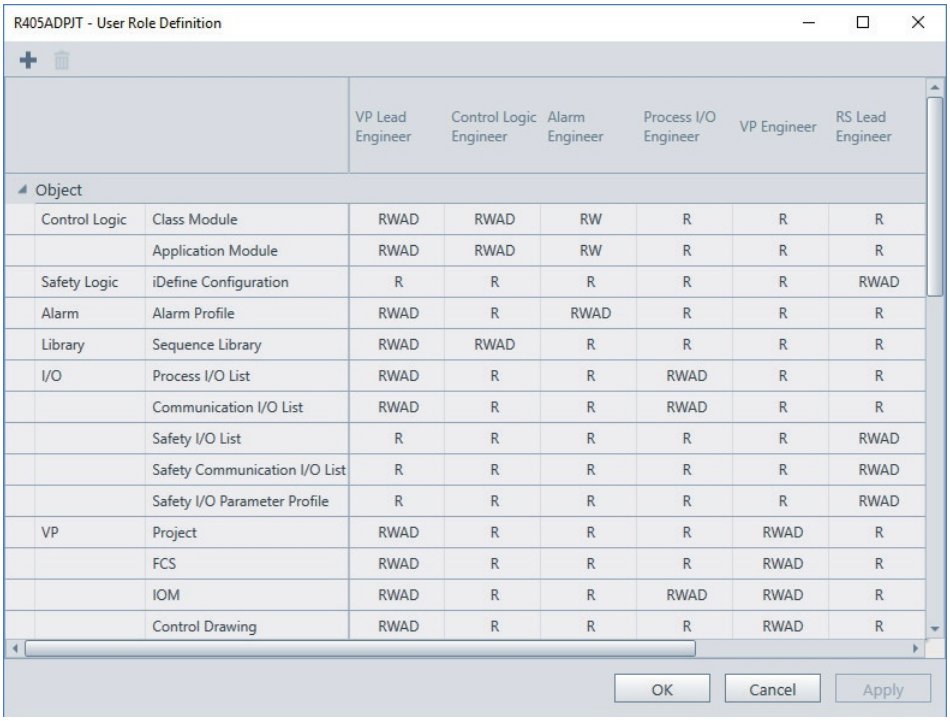
Access of each user can be controlled for individual files and functions of an AD project. Access permission is granted to Windows users or groups. Access permission is a right which combines one or multiple user roles and one access scope.

Defining user roles

User roles are the definition of the access permissions that are appropriate for the user roles of ProSafe-RS.

The following shows types of access permissions.

- Access permissions on objects
  Access permissions that define reference, modification, creation, and deletion of data
- Access permissions on functions
  Access permissions that define acceptability of running functions



There are the following types of user roles:

- System definition user role
  Is a user role prepared to start with. You cannot change its settings.

  The system definition user roles of ProSafe-RS are as follows.
  - RS Lead Engineer
  - Safety Logic Engineer
  - Safety I/O Engineer
  - iDefine Engineer
  - RS Engineer
- Customizable user role
  Is a user role defined by user using the ADS Administration Tool.

  You can set access permissions on objects and functions.

The following figure shows examples of the User Role Definition dialog box.

		VP Lead Engineer	Control Logic Engineer	Alarm Engineer	Process I/O Engineer	VP Engineer	RS Lead Engineer
Object							
Control Logic	Class Module	RWAD	RWAD	RW	R	R	R
	Application Module	RWAD	RWAD	RW	R	R	R
Safety Logic	iDefine Configuration	R	R	R	R	R	RWAD
Alarm	Alarm Profile	RWAD	R	RWAD	R	R	R
Library	Sequence Library	RWAD	RWAD	R	R	R	R
I/O	Process I/O List	RWAD	R	R	RWAD	R	R
	Communication I/O List	RWAD	R	R	RWAD	R	R
	Safety I/O List	R	R	R	R	R	RWAD
	Safety Communication I/O List	R	R	R	R	R	RWAD
	Safety I/O Parameter Profile	R	R	R	R	R	RWAD
VP	Project	RWAD	R	R	R	RWAD	R
	FCS	RWAD	R	R	R	RWAD	R
	IOM	RWAD	R	R	RWAD	RWAD	R
	Control Drawing	RWAD	R	R	R	RWAD	R

Figure C1.2.2-2 Examples of the User Role Definition dialog box appear.

Access permissions on objects

The following table shows the access permissions on objects.

Table C1.2.2-1 List of access permissions on objects

Access permissions	Description
R	Able to reference the content of the applicable object
RW	Able to reference and change the content of the applicable object
RWA	Able to reference, change, and create the content of the applicable object
RWAD	Able to reference, change, create, and delete the content of the applicable object

The following table shows the types of data on which access permissions can be defined and the operations for defining them.

Table C1.2.2-2 Types of data on which access permissions can be defined

Data type		Applicable folder or applicable file and permitted operations	Editor used
I/O	Safety I/O List	Creating, editing, and deleting a safety I/O list Creating, editing, deleting, and applying grid rules	Safety I/O Editor
	Safety Communication I/O List	Creating, editing, and deleting a safety communication I/O list Creating, editing, deleting, and applying grid rules	Safety Communication I/O Editor
	Safety I/O Parameter Profile	Editing a safety I/O parameter profile	Safety I/O Parameter Profile Editor
Safety Logic	iDefine Configuration	Importing an iDefine-config file	System Structure Navigator

Continues on the next page

Table C1.2.2-2 Types of data on which access permissions can be defined (Table continued)

Data type		Applicable folder or applicable file and permitted operations	Editor used
RS	Project	The following operations are permitted in relation to the RS project folder of System Structure Navigator and the initial folders or initial files under the project folder. • Registering and unregistering an RS project • Backing up and restoring RS projects • Editing the comments of RS projects	System Structure Navigator
	SCS	The following operations are permitted in relation to the SCS folder of System Structure Navigator and the initial folders or initial files under the SCS folder. • Creating an SCS by importing an SCS • Deleting an SCS • Exporting a ProSafe-RS I/O file • Importing an iDefine-config file	System Structure Navigator
	IOM	The following operations are permitted in relation to the N-IO folder, F-IO folder, and subordinate folders or files of System Structure Navigator. • Adding a Node and IOM • Deleting a Node and IOM • Editing a Node and IOM	IOM Definition Editor

TIP

Operations with SCS Manager and operations with Generation Manager are not applicable to object access permissions.

Access permissions on functions

The following table shows the types of functions on which access permissions can be defined and the operations for defining them.

Table C1.2.2-3 Types of functions on which access permissions can be defined and permitted operations

Function type		Permitted operations
Document	Document	Creation, deletion, and reference of documents (*1)
ModPack	Creation	ModPack Creation
	Closing	ModPack Closing
	Reopen	ModPack Reopen
	Management	ModPack Management
	Implementation	ModPack Implementation
Revision History	Re-assign ModPack	Changing ModPack IDs in the existing revision history
	Modify Comment	Changing check-in comments in the existing revision history
	Set Label	Setting labels
	Delete Label	Deleting existing labels
	Change Label	Changing the comments of existing labels
	Utility	Running Revision History Utility

*1: When access is not permitted, documents can be referenced only.

Defining custom user roles

Rights can be added by using the Access Permission Definition dialog box. Follow these steps to define custom user roles.

1. In ADS Administration Tool, select the AD project for which you want to apply access control, and then click [Access Control] button.
   The Access Permission Definition dialog box appears.
2. Click [All User Role] button.
   The User Role Definition dialog box appears. By default, only the System definition user role appears.
3. Right-click the mouse in a blank space inside the user role list display area and select [Add User Role].
   The Add User Role Definition dialog box appears.
4. Enter a user role name consisting of up to 20 characters.
   A user role name can contain single-byte alphanumeric characters, single-byte space, and single-byte period.
5. Click the [OK] button.
   A column for a new user role is added to the User Role Definition dialog box. By default, all access rights are added.
6. Change the access rights on [objects] and [functions].
   Click the right edge of the cell to display the drop-down list.
7. In the User Role Definition dialog box, click [OK] button.

Access scope definition

Access scope is the access permissions to the files and folders at the levels under an AD project in AD Server.

Access permissions can be defined on the following folders and files shown in the System Structure Navigator.

- Safety I/O files and safety communication I/O files under the I/O List folder
- Safety I/O parameter profile file under the I/O-Profiles folder
- Folders and files under the RS project folder

The following figure shows an example of the screen for defining the access scope.

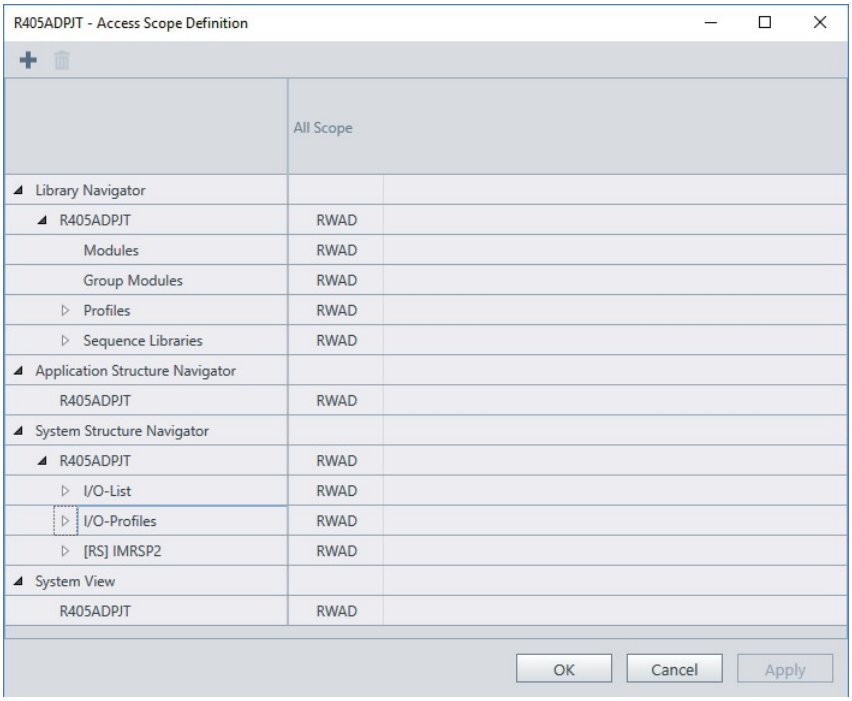


Figure C1.2.2-3 Example of screen for defining an access scope

The following shows types of access rights for an access scope.

Table C1.2.2-4 List of access rights for an access scope

Access right	Description
R	The content of applicable folders and applicable files can be referenced
RW	The content of applicable folders and applicable files can be referenced and altered However, the right to change the folder is the right to change the folder name and properties.
RWA	The content of applicable folders and applicable files can be referenced, altered, and created However, files cannot be created.
RWAD	The content of applicable folders and applicable files can be referenced, altered, created, and deleted

An access scope named All Scope is provided in advance. When this access scope is used, the access permission for folders and files on all tier levels of the AD project is RWAD.

Defining an access scope

Follow these steps to define an access scope:

1. Select the Project in the ADS Administration Tool, and then click [Access Control] button.
   The Access Permission Definition dialog box appears.
2. In the Access Permission Definition dialog box, click [All Access Scope].
   The Access Scope Definition dialog box appears.
3. Right-click the mouse in a blank space inside the access scope list display area and select [Add Access Scope].
   The Add Access Scope dialog box appears.
4. Enter an access scope name consisting of up to 20 characters.
   An access scope name can contain single-byte alphanumeric characters, single-byte space and single-byte period.

5. Click the [OK] button.
   A column for a new access scope is added to the Access Scope Definition dialog box.
6. Define access rights for every folder or file.
   The same rights as those constituting All Scope are defined by default. Access rights can be selected from the drop-down list.

   Selecting [Inheritance of Access Permission] from the drop-down list defines, for all folders and files under the folder, the same right as that applied to the selected folder.
7. In the Access Scope Definition dialog box, click [OK].

IMPORTANT

If you click [OK] or [Apply] in the Access Scope Definition dialog box while check-in is being performed by other user, your operation on access scope definition may fail with a warning message. If this happens, wait until the check-in is complete and then click [OK] or [Apply] in the Access Scope Definition dialog box.

Editing user roles and access scopes

Follow these steps to change the name of, delete, or duplicate a user role or access scope:

TIP Added user roles and access scopes can be edited. The user roles and access scopes prepared by default can not be edited.

- Right-click the name of the user role or the name of the access scope you wish to rename, delete, or duplicate and make a selection from amongst the displayed items.
  - To rename, select [Edit User Role Name] or [Edit Access Scope Name].
  - To delete, select [Delete User Role] or [Delete Access Scope].
  - To duplicate the item, select [Duplicate User Role] or [Duplicate Access Scope].

Access permissions when the AD server is upgraded

- User roles and access permissions when the AD server is upgraded to R4.03.10 or later
  Safety communication I/O list is added as a subject of user roles. Safety Communication I/O List is added as an object in the User Role Definition dialog box.

  Access permissions for user roles in relation to the safety communication I/O list are assigned as follows:
  - RWAD is assigned to RS Lead Engineer and Safety I/O Engineer.
  - R is assigned to system definition user roles other than RS Lead Engineer and Safety I/O Engineer.
  - R is assigned to custom user roles.

  In addition, the safety communication I/O definition is automatically added as a subject of the access scope. Specifically, the safety communication I/O definition is added below the SCS project.
- User roles and access permissions when the AD server is upgraded to R4.05 or later
  Safety I/O parameter profile is added as an object controlled by user roles. Safety I/O parameter profile is added as an object in the User Role Definition dialog box.

  Access permissions for user roles in relation to the safety I/O parameter profile are assigned as follows:
  - RWAD is assigned to RS Lead Engineer and Safety I/O Engineer.

- R is assigned to system definition user roles other than RS Lead Engineer and Safety I/O Engineer.
- R is assigned to custom user roles.

In addition, safety I/O parameter profile is automatically added as an object of the access scope. Specifically, I/O-Profiles is added below the AD project and the safety I/O parameter profile definition is added below the I/O-Profiles.

Setting access right for Windows users

Follow these steps to set Access Right for a Windows user or group.

1. In ADS Administration Tool, select the project for which you want to apply access control.
2. Display the Access Permission Definition dialog box.
3. Right-click the mouse in a blank space inside the list display area of the Access Permission Definition dialog box and select [Add User].
   A line to add a user is added in the Access Permission Definition dialog box.
4. Enter a Windows user name or group name consisting of up to 36 characters.
   - To register a local user or local group, enter a user name or group name.
   - To register a domain user or domain group, enter a name in the following format: `domain name\user name`, or `domain name\group name`
   - For a standard or strengthened IT security model, specify users that belong to the PSF_ENGINEER group.

   You can also preregister a user not yet registered to Windows. In this case, enter a name according to the Windows naming rules.
5. Select a desired user role from the drop-down list.
   You can select multiple user roles. VP Lead Engineer and RS Lead Engineer are selected by default.
6. Select a desired access scope from the drop-down list.
   You can select only one access scope. [All Scope] is selected by default.
7. In the Access Permission Definition dialog box, click [OK].

TIP

- To change a user name, select the cell containing the user name and change the name.
- To delete a user, select the user name and then click [Delete User] button.

C1.2.3 Export and import AD projects

You can export and import AD projects. By exporting an AD project and then importing it, you can create a copy of the AD project.

With the default export settings, system projects are automatically backed up before an AD project is exported. This setting is activated by activating the system project backup function.

An AD project in the process of backup cannot be operated using other software. Also, back-up cannot be performed for an AD project that is in use with other software.

SEE ALSO For more information about How to activate the system project backup function, refer to:

"■ Activating the system project backup function" on page C1-3

■ Export AD projects

The export of an AD project can be implemented through the Project Export dialog box of the ADS Administration Tool.

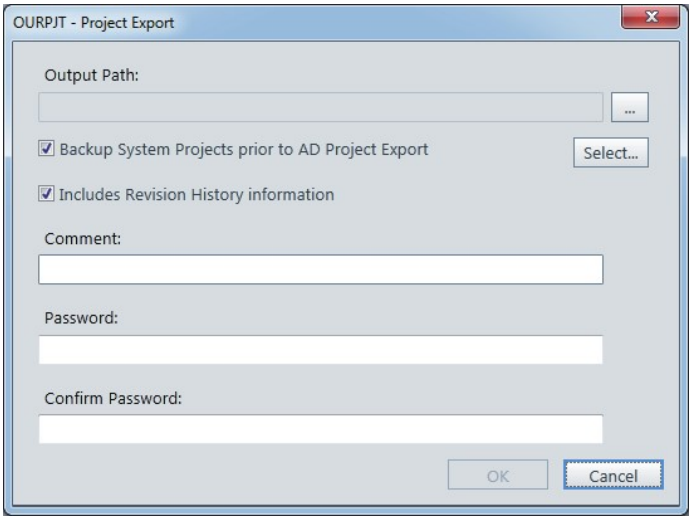

Figure C1.2.3-1 Project Export dialog box

Activating the system project backup function activates the [Backup System Projects prior to AD Project Export] check box. The check box is deactivated when activation of the system project backup function fails.

Clearing the [Backup System Projects prior to AD Project Export] check box deactivates the system project backup function.

When exporting an AD project, you can select whether to export only the latest data and whether to include revision history information together. When only the latest data is exported, only a check-in log of the latest files appears in the Revision History Window at the destination to which the database is imported.

TIP

- When exporting an AD project, you cannot export only a part of the history.
- If you export an AD project while other user is checking in files, the export fails with an error message. You must export after check-in is complete.
- If any files are checked out when you export an AD project, the export is executed with the checked-out status of the files discarded. Therefore, the checked-out status is not inherited when importing the exported AD project.

Export password

You need to enter a password to export the database. This password is used when importing the database.

Items set in the Project Export dialog box

The following table shows the items set in the Project Export dialog box and their explanations.

Table C1.2.3-1 Items set in the Project Export dialog box

Setting items	Description
Output Path	Specify the folder to which the file is exported. The file path can contain up to 180 characters.
Backup System Projects prior to AD Project Export	Select whether to backup system projects before exporting an AD project. By default, it is selected. Selecting the check box activates the Select button. System projects with access rights to PSF_PROCESS are subject to selection for backup.
Includes Revision History information	Specify whether or not to include the history information in the export file. Selecting the check box includes all revision history information in the export file. The check box is selected by default.
Comment	Enter a comment, if necessary. The text appears in the Project Import dialog box when importing the database. The maximum number of characters is 128.
Password	Enter a 1 to 8-character length password that is required when importing the database. You can use single-byte alphanumeric characters, under score (_), hyphen (-), and period. The password is case-sensitive.
Confirm Password	Enter the password again to confirm.

SEE ALSO For more information about Items set in the System Project Selection dialog box, refer to:

"● Items set in the System Project Selection dialog box" on page C1-21

Exporting an AD project database

Follow these steps to export an AD project:

1. In ADS Administration Tool, select the AD project you want to export.
2. From the menu bar of ADS Administration Tool, select [Project] > [Export].
   The Project Export Confirmation dialog box appears.
3. In the Project Export Confirmation dialog box, click [OK].
4. Select the [Backup System Projects prior to AD Project Export] check box.
   The [Select] button is activated.
5. Click [Select].
   The System Project Selection dialog box appears.
6. Select the system projects to backup.
7. Perform one of the following operations for the setting of the [Continue even if error occurs in System Project Backup] check box:
   - Select the check box if you wish to continue the process.
     When a certain projects of the system projects subject to backup cannot be accessed, skip the backup of such projects and proceed to backup of the next project.

- Clear the check box if you wish to stop the process.

8. Click [OK].
9. In the Project Export dialog box, specify [Output Path], and enter the information for [Comment] and [Password]. To include the revision history information in the export file, select the [Includes Revision History information] check box.
10. In the Project Export dialog box, click [OK].
    Export of the AD project starts and the Server Backup Progress window appears.

    If export of the AD project is successful, a file with the following name will be generated in the output destination folder. The content displayed in the Server Backup Progress window will be saved in this file.

    `Operation.log`

TIP

In the message area displayed within the Server Backup Progress window, select [Copy] from the context menu to copy the message to the clipboard.

Import AD projects

You can import an exported AD project. An AD project can be imported through the Project Import dialog box of ADS Administration Tool.

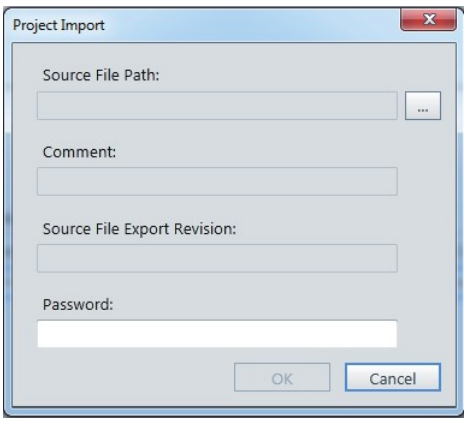

Figure C1.2.3-2 Project Import dialog box

The AD project is imported separately from any AD project that already exists on the computer where you import the AD project. If a project of the same name exists at the import destination, the dialog box for changing the project name appears at the time of import.

The AD Server to import the database to must have the definitions of the Windows users and user groups used in the AD Server from which the database was exported. When performing the import, enter the password entered at the time of export.

IMPORTANT

After importing the AD project, you must also restore the RS project by using AD Organizer. Not restoring the RS projects will cause inconsistencies between the AD project database and the RS project database.

TIP

Encryption of the imported AD project database depends on the encryption setting on the computer to which the database is imported, regardless of the encryption setting on the computer from which you exported the database.

Importing an AD project database

Follow these steps to import an exported AD project:

1. From the menu bar of ADS Administration Tool, select [Project] > [Import].
   The Project Import Confirmation dialog box appears.
2. In the Project Import Confirmation dialog box, click [OK].
   The Project Import dialog box appears.
3. In the Project Import dialog box, click the folder selection button and select the folder you wish to import.
   The path of the file to be imported appears under [Source File Path] in the Project Import dialog box.
4. Under [Password] in the Project Import dialog box, enter the password entered at the time of export.
5. In the Project Import dialog box, click [OK].
6. If an AD project of the same name exists at the import destination, the Project Name Change dialog box appears. In the Project Name Change dialog box, change the project name and click [OK].
   Import of the AD project starts and the Project Import Progress dialog box appears.

   If no AD project of the same name exists at the import destination, import of the AD project starts, and the Project Import Progress dialog box appears.
7. When the import is complete, restore the RS projects by using AD Organizer.
8. After selecting the applicable RS projects from System Structure Navigator of AD Organizer, select [Register System Project] from the sub menu.
   The RS projects are re-registered to the ADMDB.

C1.2.4 Prohibiting and permitting modification of AD project data

You can prohibit modification of AD project data. Data is "frozen" while its modification is prohibited. When a frozen AD project is activated, the prohibition of data modification is canceled. Whether a given project is frozen or active can be checked by using ADS Administration Tool.

Modifying frozen data

While frozen, the following operations are prohibited:

- Check-in and check-out of all data in the AD project.
- RS generation
- Operation of each builder started from SCS Manager

However, the following operations still can be performed while frozen.

- Referencing data
- Discarding the checked-out of data in the AD project
- Deleting an AD project

Purpose of prohibiting AD project data modifications

Freeze an AD project to prohibit, for a specific period, modification of the data of an active AD project whose software is to be modified.

For example, you may want to export active AD project data and modify it at a different location as part of plant reconstruction, etc., and then import the data to an active AD project at the plant site to reflect the changes. If you don't want the data of the active AD project at the plant site to be modified after the project data is exported until it is imported, freeze the AD project.

Prohibiting AD project data modifications

You can prohibit modification of AD project data. Data is "frozen" while its modification is prohibited. While frozen, check-in and check-out of all of the data of the corresponding AD project, RS generation, and SCS Manager operations are prohibited. However, you can still reference the data, cancel the checked-out status, or delete the project. Follow these steps to prohibit modification of AD project data:

1. In ADS Administration Tool, select the project whose data you wish to prohibit modification of.
2. From the menu bar of ADS Administration Tool, select [Project] > [Freeze/Activate]. The Freeze/Activate dialog box appears.
3. In the Freeze/Activate dialog box, click [OK].

TIP

When exporting an active AD project from a local plant to a different location and then importing and returning the project to the local plant after engineering in the different location, the imported project is reflected on the active project. If the project is frozen, modification of the imported project can be prohibited.

Canceling the prohibition of AD project data modifications

Follow these steps to cancel the prohibition for modification of the data of a frozen AD project.

1. In ADS Administration Tool, select the project for which you wish to cancel the prohibition of modification.

2. From the menu bar of ADS Administration Tool, select [Project] > [Freeze/Activate]. The Freeze/Activate dialog box appears.
3. In the Freeze/Activate dialog box, click [OK].

C1.2.5 Forcibly canceling the checked-out status of currently checked-out files

You can forcibly cancel the checked-out status of a file currently checked out. You may use this function to cancel the checked-out status of a file that remains checked out for some reason.

You can forcibly cancel the checked-out status of the files that are checked out by a certain user at a time.

The Discard Check-out dialog box of ADS Administration Tool is used to forcibly cancel the checked-out status. The Discard Check-out dialog box shows a list of files currently checked out under the applicable project.

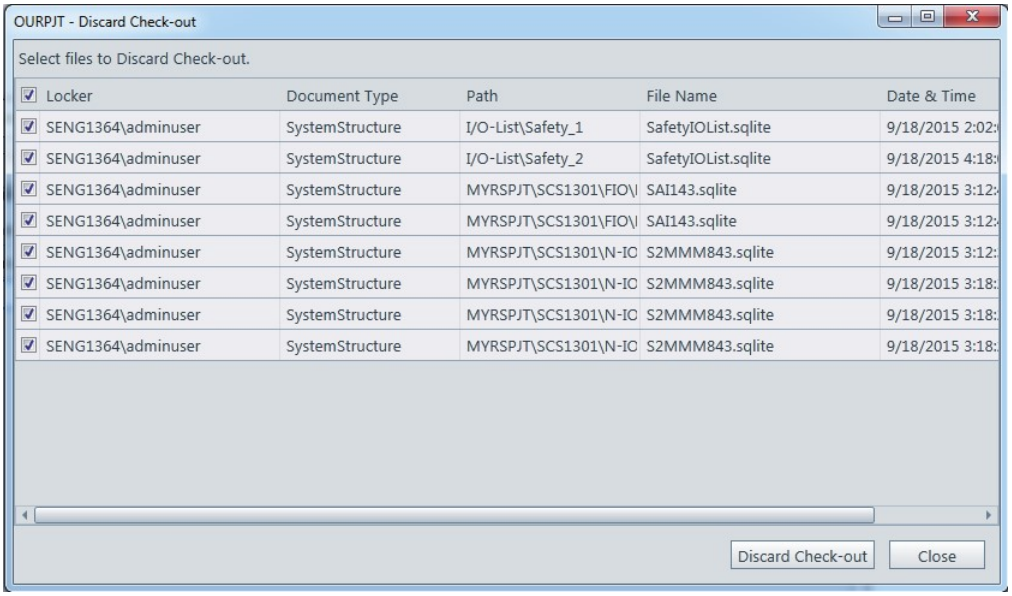

Figure C1.2.5-1 Discard Check-out dialog box

Forcibly canceling the checked-out status of a file currently checked out

Follow these steps to forcibly cancel the checked-out status of a file currently checked out:

1. In ADS Administration Tool, select the project for which you wish to cancel the checked-out status.
2. From the menu bar of ADS Administration Tool, select [Project] > [Discard Check-out]. The Discard Check-out dialog box appears.
3. In the Discard Check-out dialog box, click the file for which you wish to cancel the checked-out status.
4. In the Discard Check-out dialog box, click [Discard Check-out].

C2. History management

In an environment where the Engineering Server Function has been activated, the history management function is provided.

The subjects of history management are Safety I/O Editor, Safety Communication I/O Editor, and IOM Definition Editor of AD Organizer, SCS Manager, builders, tools such as the SCS Maintenance Support Tool, and Generation Manager.

The history management function is a function which records and manages the information of what kind of changes were along with when and by whom the changes were made and enables the checking of such history information.

Only SCS Manager is used with engineering in an environment in which only Engineering Server Function and Safety System Engineering and Maintenance Function package are activated. The revision history of all builders and editors are stored on AD Server and this revision history can be displayed in the history window of AD Organizer.

TIP

The history management function is a function which is different from the Access Control / Operation History Management functions. Even without the Access Control / Operation History Management packages, the following can be performed by using the history management function.

- Viewing the history in the Revision History window in AD Organizer.
- Displaying differences between two files saved as history in the Revision History window in AD Organizer. The display method consists of starting SCS Manager or builders in the read-only mode and displaying the differences in red.

C2.1 Overview of history management

The operation history management manages the following files in the ADMDB:

- Files of SCS projects that were updated by Generation Manager, as well as those edited by SCS Manager, builders, or other tools
- iDefine-config file imported by using AD Organizer

Furthermore, a group of subjects that were checked-out and changed by using the editors of AD Organizer can be checked-in as a Change Set and saved on the ADMDB. You can associate a Change Set with a ModPack.

You can view the history of editing by SCS Manager, builders, other tools, and the history of revision by Generation Manager through the Operation History Database Viewer and the Modification File Viewer. You can view the history of revisions that were made by using the editors of AD Organizer through the Revision history window.

The timings at which the history of changes are saved when using the history management function are as follows:

- Upon editing with SCS Manager
- Upon reflections and builds of Generation Manager
- Upon check-in of subjects of change by using Safety I/O Editor, Safety Communication I/O Editor, and IOM Definition Editor
- When checking-in the iDefine-config file

History management of SCS Manager, builders, tools, and Generation Manager consists of the following functions:

- Modification file saving function
  Files of SCS project newly created or successfully overwritten are saved on the ADMDB of AD Server.
- Operation logging function
  Information on operation with SCS Manager, builders, and tools are recorded on the ADMDB.
- Start and stop functions
  The user can specify whether to start or stop the revision history function.
- Updating function
  This function matches the files of the ADMDB to the files of SCS Manager when there are differences between the SCS project files of SCS Manager and the SCS project files of the ADMDB.
- Saving of Change Sets
  A group of files that were checked in at the same time are grouped as one set. This grouped set of files is referred to as a Change Set. Changed sets are stored in the Automation Design Master Database (ADMDB).

  When checking-in data that was edited by using the Safety I/O Editor, Safety Communication I/O Editor, and IOM Definition Editor or the iDefine-config file that was created by using iDefine, the check-in is run for the data or file that you selected. Check-in can be run at the same time for multiple subjects of change. Groups of files checked in at the same time are grouped as one Change Set and a Change Set ID is automatically assigned. You can associate a Change Set ID with a ModPack.
- Setting labels
- Displaying the revision history

C2.2 Modification file saving function

The modification file saving function is a function which saves the setting file of an updated SCS project on the ADMDB. This save operation is referred to as a check-in. There are no operations for explicitly saving the file on the ADMDB. The following are timings at which the file is saved:

- When the file is saved with SCS Manager, builders, or tools
- When the file is updated with the import function

At the same time as when the file is saved, this operation information and the name of the user running the operation are recorded on the ADMDB.

The following shows the user names which are recorded:

- Windows login user name when operations have been performed with SCS Manager or AD Organizer started from the Start menu
- HIS user name when operations have been performed with Revision History Utility of AD Organizer started from the tool button toolbox of the browser bar in HIS with Integration with CENTUM

The files subject to the modification file saving function are the setting file of the SCS project and the setting file of the library.

The projects subject to the modification file saving function are the RS projects registered to an AD project. RS projects are subject to this function regardless of whether the SCS project included in the RS project has specified I/O list engineering. When the registration of an RS project with an AD project is canceled, the history management function of such RS project ends.

With the modification file saving function, files are saved with all project attributes.

The project attributes include current project, default project and user-defined project.

All files subject to the modification file saving function are saved when a new SCS project is created, upon check-out with Version Control Tool, upon restoration of the Master database, and upon running the test project creation tool.

TIP

When the operation for opening an SCS project is performed with SCS Manager after an update of the software of ProSafe-RS, the SCS project files of SCS Manager are updated. After the operation for opening each individual SCS project, running the update function saves the files on the ADMDB.

C2.2.1 Operation history of SCS Manager, builders, and tools

With operations of SCS Manager, builders, and tools, the modification file is saved on the ADMDB.

Timings of save

The following table shows the timings at which the modification files are saved on the ADMDB as a result of the operations of each builder inclusive of SCS Manager.

Table C2.2.1-1 Timings at which modified files are saved

No	Type of builder or editor name	Timing at which the modified data is saved	Remarks
1	SCS Manager SCS Constant Builder I/O Parameter Builder Communication I/O Builder SCS Link Transmission Builder Modbus Address Builder DNP3 Communication Builder Tag Builder Alarm Priority Builder Alarm Processing Table Builder	Upon successful Save operation (*1)	The timing at which modified data is saved when an SCS project is newly created is the same as when OK is clicked with SCS project Property. When Save Project or Save Library Dependency of SCS Manager is clicked, Resource Properties, Configuration Property, Library Dependency, Connection Property, Binding, and External Binding are saved. When Path of Library of Library Dependencies is pointing to the LIBRARY folder of its own SCS, the file of the library is saved on the ADMDB.
2	Test Project Creating Tool	When SCS project creation is successful	Only in cases when the RS projects at the SCS project creation destination are subject to the revision history.
3	Version Control Tool	When check-out is successful	-
4	SCS Master DB Recover	When restoration is successful	-
5	SCS Manager (Build)	When a build is started	When Path of Library of Library Dependencies is pointing to the LIBRARY folder of its own SCS, the files of the library to which changes were applied are saved as subjects on the ADMDB.
6	SCS Manager (Revision Update)	When a revision update is successful	SCS projects of older versions are not registered with AD Server. Upon a successful revision update, similar to when an SCS project is newly created, all applicable files are saved on the ADMDB.

*1: Operation that differs from the Access control / Operation history management functions.

Operation information recorded together with the modification files

The following table shows the operation information that is recorded on the ADMDB together when the modification files are saved.

Table C2.2.1-2 Operation information recorded together with the saving of the modification files

No	Type of builder or editor name	Operation information		
		Program name	Operation name	Subject of operation
1	SCS Manager SCS Constant Builder I/O Parameter Builder Communication I/O Builder SCS Link Transmission Builder Modbus Address Builder DNP3 Communication Builder Tag Name Builder Alarm Priority Builder Alarm Processing Table Builder	Builder name	Create Project Save Project Save external binding list Save POU Save Dictionary Save I/O wiring Change SCS project Properties Save dependencies Import Save Builder	SCS project name (example: SCS0101) In the case of a library, the SCS project name
2	Test Project Creating Tool	Builder name	Create Project	SCS project name
3	Version Control Tool	Builder name	Check Out	SCS project name
4	SCS Master database recovery	Builder name	Restore Master Database	SCS project name
5	SCS Manager (Build)	Builder name	Build Project	SCS project name
6	SCS Manager (Revision Update)	Builder name	Create Project	SCS project name

C2.2.2 Operation history of Generation Manager

With operations of Generation Manager, the modification file is saved on the ADMDB.

Timings to save and files to be saved

The timing at which the modification file generated due to the reflection of Generation Manager is saved on the ADMDB and the files subject to the save are as follows:

- Timing at which the modified data is saved: When a reflection is successful
- Files to be saved: Files subject to reflection

Operation information recorded together with the modification files

The operation information that is recorded on the ADMDB together when the modification files are saved are as follows:

- Program name: Generation Manager
- Operation name: Reflection or Build
- Subject of operation: SCS project name

Operation information is recorded with a character sequence having the following configuration:

(Program name) + (,) + (single-byte space) + (operation name) + (,) + (single-byte space) + (subject of operation)

C2.2.3 Operation history of Revision History Utility

With operations of Revision History Utility, the modification file can be saved on the ADMDB.

Timings to save and files to be saved

The following table shows the timings at which the files are saved on the ADMDB due to operations of Revision History Utility and the files subject to the save.

Table C2.2.3-1 Timings at which files are saved and the files subject to the save

Function	Timing at which the modified data is saved	Information to be saved	Remarks
Start	When processing of a start is successful	Files in which there is a difference between the SCS projects of the ADMDB and SCS Manager	This processing of a start is also run when RS projects are registered with an AD project.
Stop	-	-	No files are saved.
Update	When processing of an update is successful	Files in which there is a difference between the SCS projects of the ADMDB and SCS Manager	-

Operation information of Revision History Utility

The following table shows the operation information that is recorded on the ADMDB together when the modification files are saved.

Table C2.2.3-2 Operation information recorded together with the saving of the modification files

Function	Operation information			Remarks
	Program name	Operation name	Subject of operation	
Start	Revision History Utility	Start Revision History	RS project name	Operation history is recorded even in cases when files are not saved with this operation.
Stop	Revision History Utility	Stop Revision History	RS project name	Operation history is recorded although files are not saved with this operation.
Update	Revision History Utility	Update Revision History	RS project name	Operation history is recorded although files are not saved with this operation.

Operation information is recorded with a character sequence having the following configuration:

(Program name) + (,) + (single-byte space) + (operation name) + (,) + (single-byte space) + (subject of operation)

C2.3 Operation logging function

With the modification file saving function, apart from the operation information that is recorded at the same time as the modified file, when the following operations are successful, such operation information is recorded on the ADMDB. The setting file of the SCS project is not changed.

- Build
- Offline download
- Online change download
- Master database off-line download
- IOM download

The following table shows the operation information that is saved on the ADMDB as a result of the operations using SCS Manager or SCS Maintenance Support Tool.

Table C2.3-1 Operation information recorded with the operation logging function

Function	Operation information		
	Program name	Operation name	Subject of operation
Build	SCS Manager	Build Project	SCS project name
Offline download	SCS Manager	Off-line Download	SCS project name
Online change download	SCS Manager	On-line Change Download	SCS project name
Master database off-line download	SCS Manager	Master Database Off-line Download	SCS project name
IOM download	SCS State Management Window	IOM Download	SCS project name

Operation information is recorded with a character sequence having the following configuration:

(Program name) + (,) + (single-byte space) + (operation name) + (,) + (single-byte space) + (subject of operation)

C2.4 Start/Stop function

You can specify whether to start or stop the history management function.

The history management function starts saving the history from when the RS project is registered to an AD project.

Start or stop can be specified in units of RS projects. You cannot specify whether to start or stop the function at the same time for multiple RS projects.

Only the Windows users who satisfy all of the following conditions can run the start/stop function:

- The user has the RWAD right for all categories under the corresponding RS project
- The user belongs to the following User Role with Access Right settings for the RS project of AD Server
  Revision History Utility of Revision History

The start/stop function can be specified with Revision History Utility.

Between the processes run after start or stop is specified, you cannot run operations that lead to new creation, modification, or deletion of files within the corresponding RS project.

Example:

Operations such as the creating of a new SCS project, modification of properties, and overwritten saving / downloading with a builder

The update function is run when revision history is started.

C2.5 Updating function

The updating function resolves differences in cases when there are differences between the setting file of the SCS project of SCS Manager and the setting file of the SCS project recorded on the ADMDB. Such difference between these files are generated upon failure of saving modified files on the ADMDB. In other words, this function saves on the ADMDB the setting file for which a save has failed and equalizes the ADMDB.

The updating function can be run from Revision History Utility.

The updating function can be run in units of RS project. You cannot run updates at the same time for multiple RS projects.

The update process can only be run for RS projects that are running revision history function.

Only the Windows users who satisfy all of the following conditions can run the updating function:

- The user has the RWAD right for all categories under the corresponding RS project
- The user belongs to the following User Role with Access Control settings for AD Server Revision History Utility of Revision History

At the same time as when the files with a difference are saved on the ADMDB, the name of the user running the operation is recorded on the ADMDB. The user name to be recorded are as follows:

- Windows login user name when operations have been performed with Revision History Utility of AD Organizer started from the Start menu
- HIS user name when operations have been performed with Revision History Utility of AD Organizer started from the tool button toolbox of the browser bar of HIS in an environment of Integration with CENTUM

During an update process, you cannot run operations that lead to new creation, modification, or deletion of files within the corresponding RS project.
Example:

Processes such as the creating of a new SCS project, modification of properties, and overwritten saving and downloading with a builder

C2.6 Operations of the revision history function

This section describes how to operate the Revision History Utility window when using the history management function along with precautions in regard to operations of SCS Manager and Generation Manager

C2.6.1 Window of Revision History Utility

Revision History Utility can be used to start, stop, and updates history management.

The following figure shows the Revision History Utility dialog box.

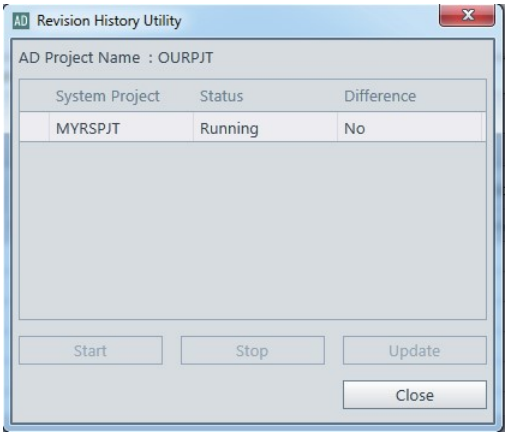

Figure C2.6.1-1 Revision History Utility dialog box.

The following figure shows items displayed on the Revision History Utility dialog box.

Table C2.6.1-1 Items displayed on the Revision History Utility

Displayed item	Description	Remarks
System project	The names of RS projects that are registered with an AD project and accessible from a computer on which the Revision History Utility screen has been started are displayed.	-
Status	The status of history management is displayed. Running: History management is running. Stopped: History management is stopped.	-
Difference	Whether or not there are differences between the files of AD Server and SCS Manager that are generated due to modification file saving errors is displayed. Yes: When there may be a file that could not be saved to the ADMDB No: When there are no files that could not be saved to the ADMDB	If this status is Yes, successfully running Start or Update changes the status to No.
Start	History management is run. This button is active when all of the following conditions are satisfied: The button is grayed-out in all other cases. • The line of the applicable System project has been selected (However, you cannot select multiple lines) • The Status of the selected System project is Stopped	-
Stop	History management is stopped. This button is active when all of the following conditions are satisfied: The button is grayed-out in all other cases. • The line of the applicable System project has been selected (However, you cannot select multiple lines) • The Status of the selected System project is Running	-

Continues on the next page

Table C2.6.1-1 Items displayed on the Revision History Utility (Table continued)

Displayed item	Description	Remarks
Update	An update is run. This button is active when all of the following conditions are satisfied: The button is grayed-out in all other cases. • The line of the applicable System project has been selected (However, you cannot select multiple lines) • The Status of the selected System project is Running	-

C2.6.2 Operations of the Revision History Utility window

1. In AD Organizer, start System Structure Navigator.
2. In the sub menu, select [ProSafe-RS] > [Revision History Utility].
   The Revision History Utility dialog box appears.
3. Perform the following operations according to your purpose.
   - To start history management, select the stopped RS project and click [Start].
   - To stop history management, select the running RS project and click [Stop].
   - To update history management, select the running RS project and click [Update].

   When history management is updated, the differences are resolved and the display of differences changes to No.

C2.6.3 Precautions regarding operation of SCS Manager and Generation Manager

Performing an operation for newly creating, modifying, or deleting a file during processing after clicking Start, Stop, or Update in Revision History Utility returns an error.

For example, performing the operation of such as creating a new SCS project, overwriting and saving with a builder, or modifying properties during processing returns an error.

C2.7 History management using the editors of AD Organizer

The history management function that uses Safety I/O Editor, Safety Communication I/O Editor, and IOM Editor started from AD Organizer consists of the following functions:

Saving of Change Sets

In I/O list engineering that uses AD Organizer, files checked in at the same time are grouped as one set. This grouped set of files is referred to as a Change Set.

With RS original engineering, at the time of download or overwritten saving, builder files subject to such are saved to the RS project. The applicable builder files are also saved to the ADMDB as a Change Set.

A unique number is assigned to each Change Set. This number is referred to as a "Change Set ID". Change Set IDs are automatically assigned by AD Server. You can associate a Change Set with a ModPack.

Setting labels

The user can set a desired string as a label for the latest of the chronologically saved files on AD Server. You can search for files having the same label in the Check-in window.

Displaying the revision history

Saved Change Sets and labels can be displayed in the Revision History Window of AD Organizer.

C2.8 Setting labels

Labels can be attached to a single or multiple files. Labels can be attached at any time to any files subject to the check-in or check-out functions. Set labels in the tree view of System Structure Navigator of AD Organizer.

Labels can be set in either ways: set labels for all folders and files displayed in the tree view at once, or set labels for specific folders and files individually. Set labels can be searched for by using the filtering function or by sorting labels according to each item in the Revision History window.

Setting labels all at once

Follow these steps to set labels all at once:

1. From AD Organizer, display System Structure Navigator.
   You can set labels for folders or files shown in the tree view of System Structure Navigator.
2. In the sub menu of AD Organizer, select [Add Label to all].
   The Label dialog box appears.
3. In the Label dialog box, enter a label name and label comment.
   A label name can contain up to 100 double-byte or single-byte characters, while a label comment can contain up to 1,000 double-byte or single-byte characters.
4. In the Label dialog box, click [OK].
   A label is set for each of the folders and files shown in the tree view of System Structure Navigator.

Setting labels individually

Follow these steps to set labels individually:

1. In the tree view of System Structure Navigator, select the folder or file you wish to set a label to.
2. In the sub menu of AD Organizer, select [Add Label].
   The Label dialog box appears.
3. Enter a label name and label comment.
   A label name can contain up to 100 double-byte or single-byte characters, while a label comment can contain up to 1,000 double-byte or single-byte characters.
4. Click the [OK] button.
   A label is set to the folder or file selected in the tree view of System Structure navigator.

C2.9 Displaying the revision history and labels

You can view the revision history and labels in the Revision History window. You can perform the following tasks in the Revision History window:

- Display a list and the details of Change Sets
- Display a list and the details of labels, modify labels, and delete labels
- Display engineering data associated with Change Sets
- Associate ModPacks with Change Sets
- Compare the details of engineering data

C2.9.1 Displaying the Revision History window

The Revision History window consists of the Revision History tab sheet and Labels tab sheet. In the Revision History tab sheet, you can call up the dialog box for displaying a list and the details of revision history. In the Label tab sheet, you can call up the dialog box for displaying a list view and the detail of labels. You can also change and delete labels. When the Revision History window appears, the Revision History tab sheet also appears by default.

How to display the Revision History window

Follow these steps to display the Revision History window:

1. Start AD Organizer.
2. In the navigator of AD Organizer, select a folder or file and then select [View Revision History] from the right-click menu.

TIP

If you select a folder that is editable with builders in System Structure Navigator, the Revision History dialog box appears. In the Revision History dialog box, you can specify the names of folders and files that are editable with builders. The Revision History window shows the revision history of the folders and files that you specified in this dialog box.

Note that the folder names and file names you specify in the Revision History dialog box are case-sensitive.

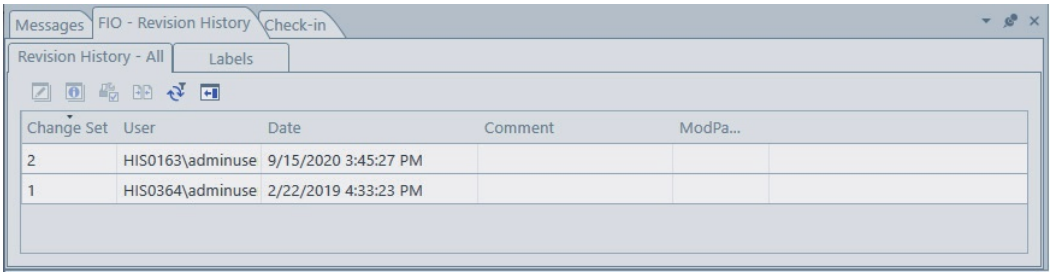

Figure C2.9.1-1 Revision History window (Revision History tab sheet)

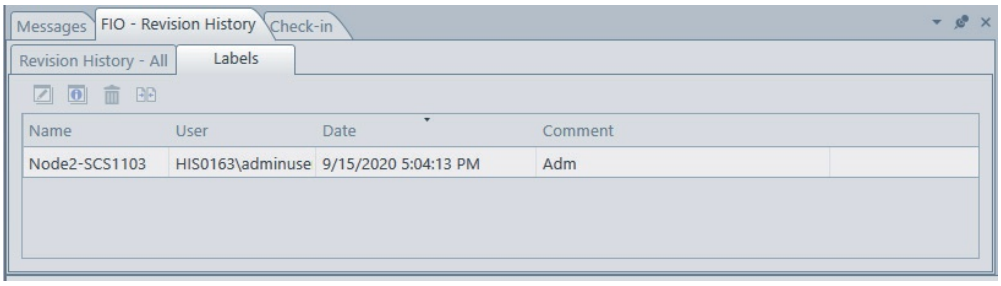

Figure C2.9.1-2 Revision History window (Labels tab sheet)

Filtering Change Sets displayed on the Revision History tab

By default, latest 100 Change Sets are displayed on the Revision History tab. You can filter Change Sets to be displayed on the Revision History tab in the following two ways.

- Filter by ranges of Change Sets
- Filter by dates of Change Sets

Filtering by specifying a range of Change Sets

Follow these steps to specify the range of Change Sets to be displayed on the Revision History tab:

1. On the toolbar, click [Specify Range].
   The Specify Range dialog box appears.

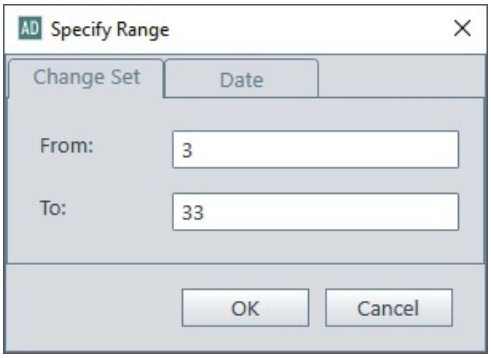

Figure C2.9.1-3 Specify Range dialog box (Change Set tab)

2. Select the [Change Set] tab.

TIP

By default, the Change Set tab is selected.

3. Enter the range of the Change Sets to be displayed, and click [OK].

● Filtering by dates of Change Sets

Follow these steps to specify the date of Change Sets to be displayed on the Revision History tab:

1. On the toolbar, click [Specify Range].
   The Specify Range dialog box appears.
2. Click the [Date] tab.

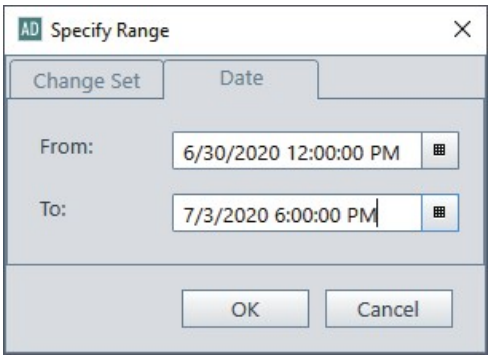

Figure C2.9.1-4 Specify Range dialog box (Date tab)

3. Enter the date range of the Change Sets to be displayed, and click [OK].

■ Items displayed on the Revision History tab sheet

The following table shows the items displayed on the Revision History tab sheet of the Revision History window.

Table C2.9.1-1 Items displayed on the Revision History tab sheet of the Revision History window

Item	Description	Remarks
Change Set	The Change Set ID is displayed.	
User	The name of the user who checked in is displayed.	
Date	The date and time of check-in is displayed.	

Continues on the next page

Table C2.9.1-1 Items displayed on the Revision History tab sheet of the Revision History window (Table continued)

Item	Description	Remarks
Comment	The check-in comment is displayed.	
ModPack ID	The ModPack ID of the ModPack associated with the Change Set is displayed.	Association with ModPack is performed at the time of check-in. You can also perform an association of ModPack to a Change Set in the Revision History window.

Items displayed on the Label tab sheet

The following table shows the items displayed on the Label tab sheet of the Revision History window.

Table C2.9.1-2 Items displayed on the Label tab sheet of the Revision History window

Item	Description
Name	The label name is displayed.
User	The name of the user who set the label is displayed.
Date	The date and time at which the label was set is displayed.
Comment	The label comment is displayed.

C2.9.2 Displaying the detailed information of a change set

You can display the detail information of a Change Set in the Change Set Detail dialog box brought up from the Revision History window.

In the Change Set Detail dialog box, you can display the information of individual files constituting the Change Set and modify the check-in comment.

How to display the detailed information of a change set

Follow these steps to display the detailed information of a Change Set:

1. On the [Revision History] tab sheet of the Revision History window, select the Change Set you want to display the details of.
2. In the Revision History window, click the [Details] button.
   The Change Set Detail dialog box appears.

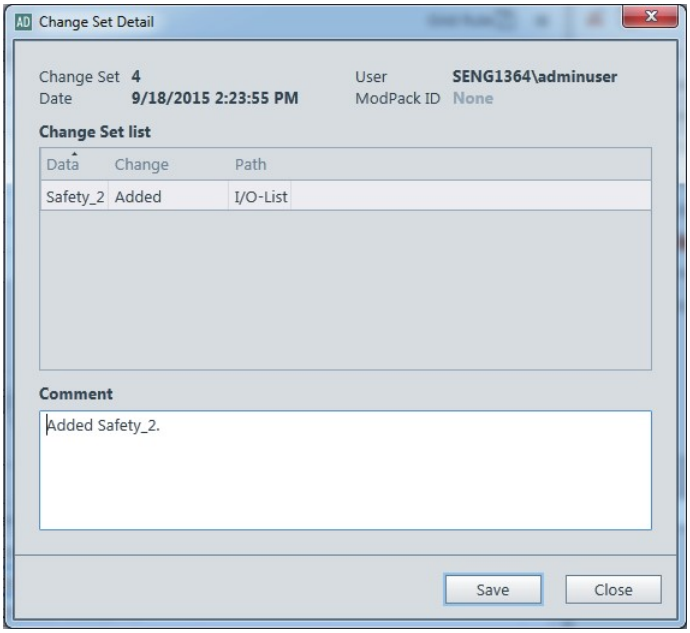

Figure C2.9.2-1 Change Set Detail dialog box

Items displayed in the Change Set Detail dialog box

The following table shows the items displayed in the Change Set Detail dialog box.

Table C2.9.2-1 Items displayed in the Change Set Detail dialog box

Item	Description	Remarks
Change Set	The Change Set ID is displayed.	-
User	The name of the user who checked in is displayed.	-
Date	The date and time of check-in is displayed.	-
ModPack ID	The ModPack ID of the ModPack associated with this Change Set is displayed.	Clicking the ModPack ID opens the ModPack corresponding to the ModPack ID.
Data	The names of individual files constituting the Change Set are displayed.	Selecting a file and selecting [Launch Editor] from the right-click menu starts the editor for editing the file. You can also select [View Revision History] from the right-click menu to display the revision history of the file.

Continues on the next page

Table C2.9.2-1 Items displayed in the Change Set Detail dialog box (Table continued)

Item	Description	Remarks
Change	The type of change is displayed. Added, Modified or Deleted is displayed.	-
Path	The file path is displayed.	-
Comment	The check-in comment is displayed.	You can change the check-in comment. After editing the check-in comment, you can click [Save] to save the edited check-in comment.

C2.9.3 Displaying a list view and detail view of files

You can display the list view of files in the file list pane of the Revision History window. When the Revision History window appears, files under the folder selected in the navigator are listed. You can also filter the list of displayed files.

Displaying the file list pane

Perform this step to display the file list pane in the Revision History window:

- On the toolbar in the Revision History window, click [File List Pane].
  The file history pane appears in the Revision History window.

TIP

- Repeat this operation to show and hide the file list pane.
- The files in the list are displayed in order of check-in date and file path.

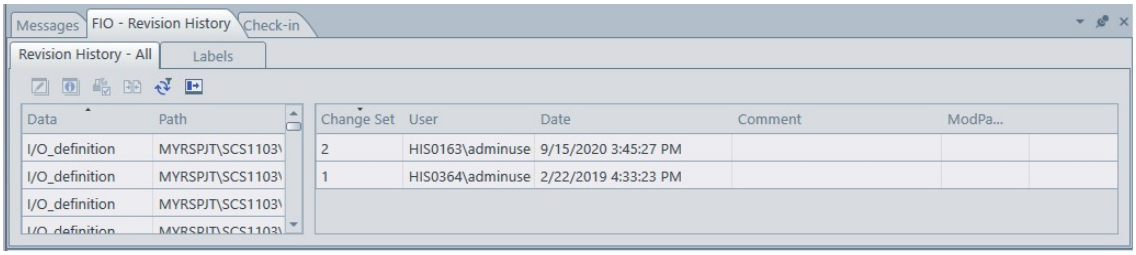

Figure C2.9.3-1 Revision History window showing the file list pane

Filtering Change Sets by selecting a file

You can select a file in the file list pane to display only the Change Sets that include the file. Follow these steps to select a file and filter Change Sets.

- Select a file in the file list pane.
  Only Change Sets that include the selected file are displayed in the Revision History window. If the selected file is not included in any Change Set, no Change Set is displayed.

Clearing a filter that applies to Change Sets

Follow these steps to clear a filter that applies to Change Sets.

- Select the file in the file list pane while holding down the [Ctrl] key.

C2.9.4 Displaying the detailed information of a label

You can display the detailed information of a label in the Label Detail dialog box brought up from the Revision History window.

In the Label Detail dialog box, you can display a list of the files and folders to which the selected label is set and also change the label comment.

How to display the detailed information of a label

Follow these steps to display the detailed information of a label:

1. On the [Labels] tab sheet of the Revision History window, select the label you want to display the details of.
2. In the Revision History window, click the [Details] button.
   The Label Detail dialog box appears.

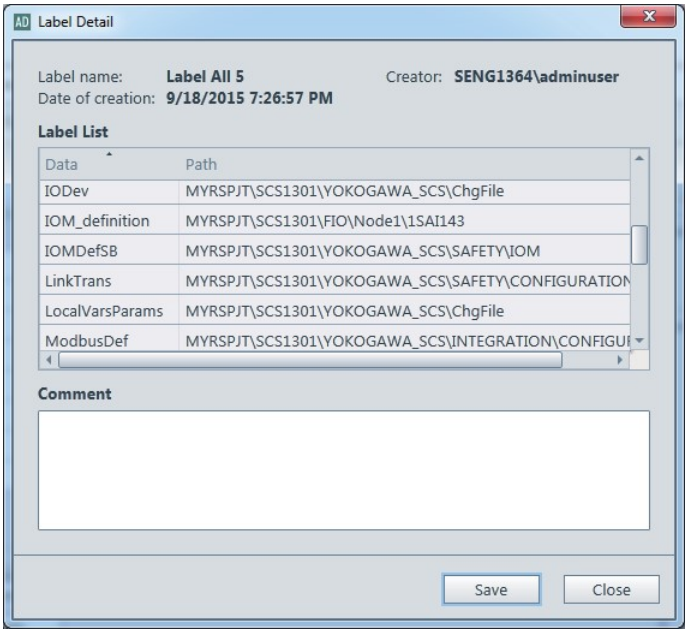

Figure C2.9.4-1 Label Detail dialog box

Items displayed in the Label Detail dialog box

The following table shows the items displayed in the Label Detail dialog box.

Table C2.9.4-1 Items displayed in the Label Detail dialog box

Item	Description	Remarks
Label name	The label name is displayed.	
Creator	The name of the user who set the label is displayed.	
Date of creation	The date and time at which the label was set is displayed.	
Data	The names of the folders and files to which the selected label is set are displayed.	Selecting a file and selecting [Launch Editor] from the right-click menu starts the editor for editing the file. You can also select [View Revision History] from the right-click menu to display the revision history of the file.
Path	The folder or file path is displayed.	

Continues on the next page

Table C2.9.4-1 Items displayed in the Label Detail dialog box (Table continued)

Item	Description	Remarks
Comment	The label comment is displayed.	You can change the label comment. After editing the label comment, click [Save] to save the edited label comment.

C2.9.5 Associating ModPacks with Change Sets

You can associate a ModPack with any of the Change Sets displayed on the [Revision History] tab sheet of the Revision History window.

TIP

The Change Management Package is required in order to use ModPacks.

Follow these steps to associate a ModPack with a Change Set:

1. From amongst the [Revision History] tab sheets in the Revision History window, select the Change Set you wish to associate with a ModPack.
2. In the Revision History window, click the [Assign ModPack] button.
   The Associate ModPack dialog box appears.

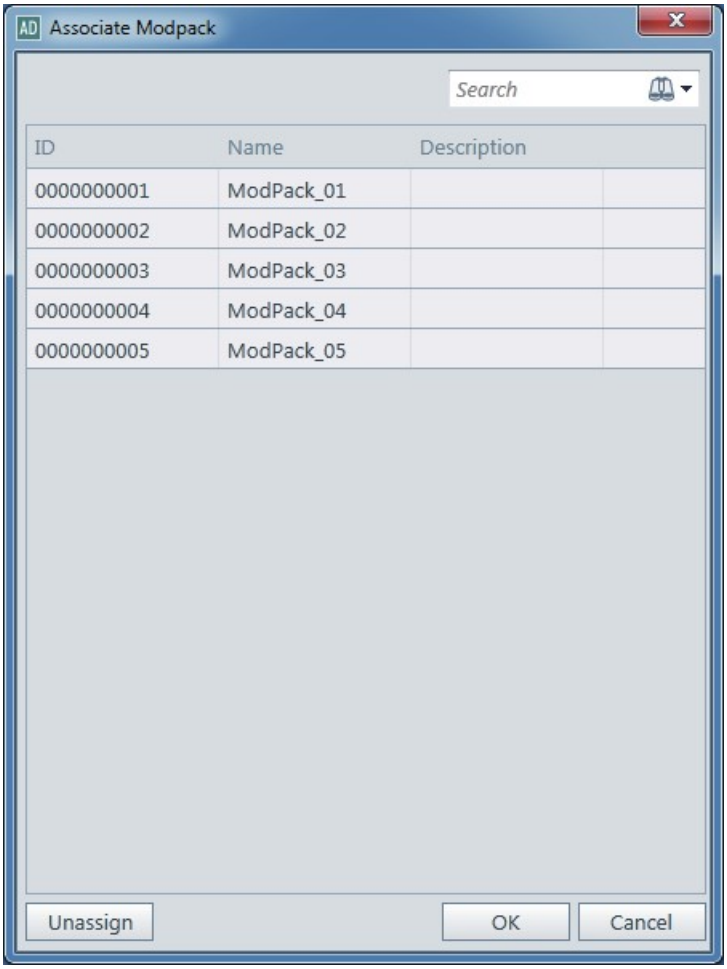

Figure C2.9.5-1 Associate ModPack dialog box

3. In the ModPack list view area, select the ModPack to associate and then click [OK].
   The ModPack ID of the associated ModPack appears on the Revision History tab of the Revision History window.

TIP

- You can only select one ModPack in the Associate ModPack dialog box.
- To cancel association with the ModPack, click [Unassign] button in the Associate ModPack dialog box.

D. ModPack change management

This section describes ModPack-based change management.

Change Management Package is required for ModPack Change management.

D1. Overview of ModPack change management

Your project may be subject to work involving changes during engineering work or at the final stage of engineering.

Using Change Management Package will allow you to use a ModPack to manage various changes applied during engineering work or at the final stage of engineering.

Change management comprises the request for change being registered, the extent of impact due to the change being determined, being able to confirm that changes are only applied in relation to the extent of impact, and finally retaining a history of the changes.

Change management using a ModPack

A package that contains a set of information that is related to a change is called a ModPack.

By managing changes with a ModPack, you can also keep records of the planning, implementation, and testing of the changes. A ModPack contains various information such as an ID for identifying the change, status of the change, users who implement the change, assets to be modified, assets actually modified, and test procedures. You can also attach, to a ModPack, files containing information such as test results.

When a project receives a request for change, you create a ModPack before implementing the change. In the ModPack, you register the information such as the users who implement the change, assets to be modified, and test procedures. The registered engineers implement the change based on this ModPack.

The items registered in a ModPack can be referenced and edited using ModPack Editor.

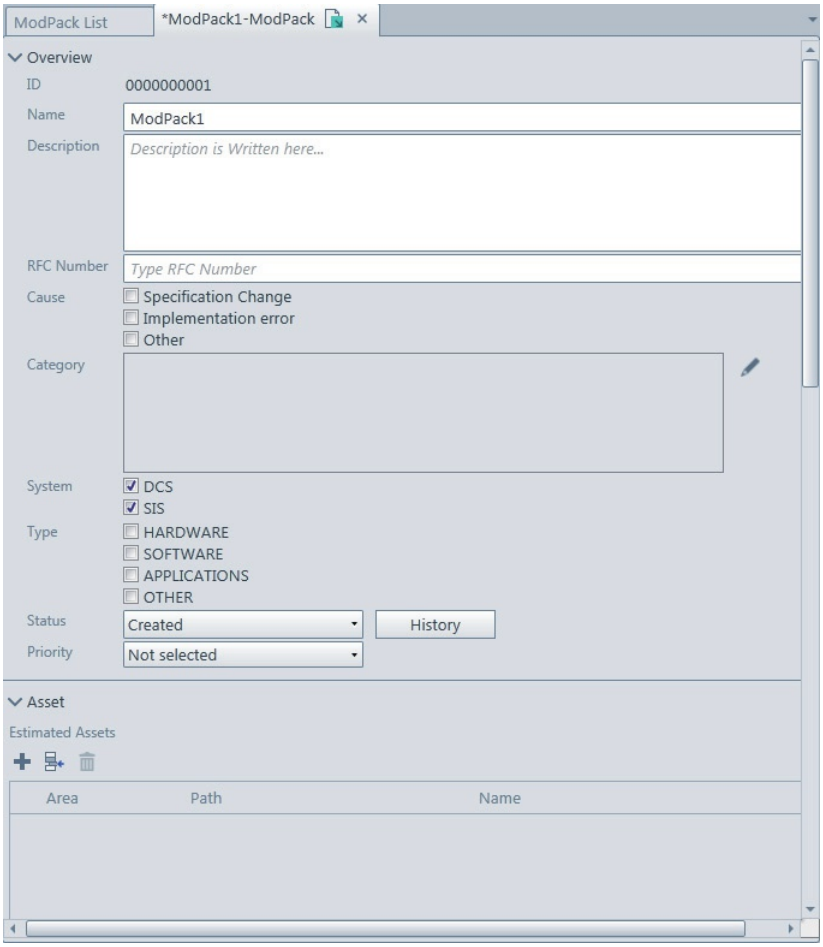

Figure D1-1 Example of ModPack Editor display

TIP

You can also associate a Change Set on iDefine data with a ModPack.

You can associate a Change Set on the iDefine-config file with a ModPack in the Operation History Management window or the Check-in window. You can also associate a Change Set on the selected FB with an instance name with a ModPack in the Operation History Management window.

ModPack access rights

The rights are further broken down for each ModPack operation. The operation rights according to each operation can be assigned.

D1.1 Workflow for handling a change

The following figure shows the workflow for handling a change in engineering using AD Suite.

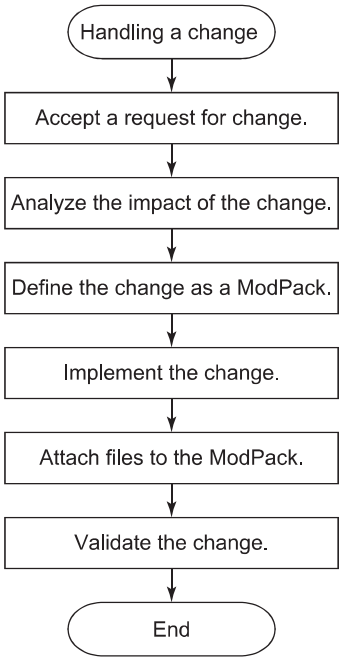

Figure D1.1-1 Workflow for handling a change

Accepting a request for change

Examine the change that is requested. If the request is reasonable, accept the request. The accepted change can be managed with the RFC (Request For Change) number of a ModPack. Enter the RFC number if necessary.

Analyzing the extent of impact by the change

The engineers are to examine the impact due to the change of settings such as tags and ranges in order to investigate the extent of impact. If the request is reasonable, accept the request. The accepted change can be managed with the RFC number of a ModPack.

Defining the change as a ModPack

Create a ModPack and define information about the change, such as the assets to be modified, users who implement the change, and test procedures for the ModPack. Hereafter, proceed with the change process based on this ModPack.

Implementing the change

The user manually performs the change. The implementation of the change can be associated with a ModPack at the time of check-in.

If the subject of the change is a file being changed from a builder of SCS Manager, check-in is automatically performed, without using the Check-in window, at the timing when the changes are saved on the builder. In such case, the ModPack can be associated afterwards with the subject of the change which is displayed in the History window.

After implementing the change, test the modified application.

Attaching files to the ModPack

Files that contain test results or other information can be attached to a ModPack. With these attachments, you can keep records of the test results related to this change.

Validating the change

After the implementation and testing of the change is finished, the user in charge of change management validates the change. If the change is regarded as valid, get an approval from the person who requested the change.

D1.2 Windows that are used in change management

The following three windows or editor are used in change management:

- ModPack Navigator
- ModPack List window
- ModPack Editor

D1.2.1 ModPack Navigator

ModPack Navigator lists ModPacks. ModPack Navigator displays ModPacks based on the role of the logged on user.

Opening ModPack Navigator

- From the AD Organizer, select [View] > [ModPack Navigator].
  ModPack Navigator is displayed.

Window layout of ModPack Navigator

In ModPack Navigator, ModPacks are listed for each status.

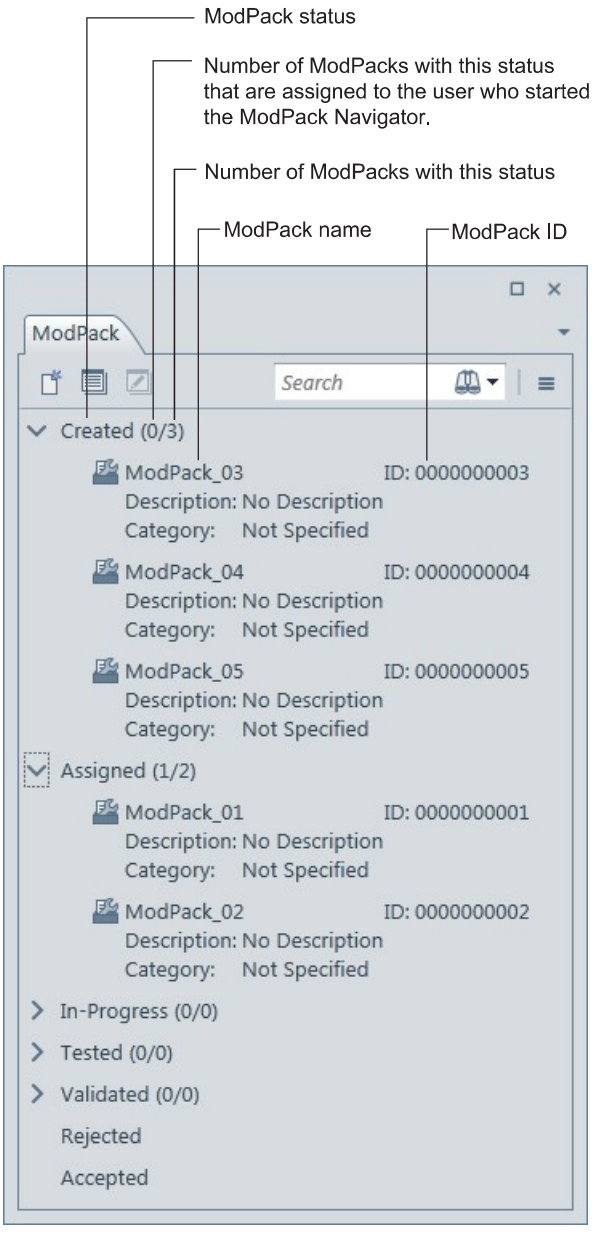

Figure D1.2.1-1 Window layout of ModPack Navigator

ModPack status

The following figure shows the ModPack status. ModPack Navigator categorizes ModPacks into these statuses and lists them.

Table D1.2.1-1 ModPack status

Status	Description
Created	The initial status of newly created ModPacks. ModPacks are automatically placed in this status when created.
Assigned	Indicates that the users who implement the change are already assigned to the ModPack. Multiple users can be assigned to a ModPack. The user who manages ModPacks sets this status manually.
In-Progress	Indicates that the change is being implemented. The user who implements the change of this ModPack sets this status manually.
Tested	Indicates that the testing of the modified assets is finished. The user who implements the change of this ModPack sets this status manually.
Validated	Indicates that the change was validated by the user who manages ModPacks. The user who manages ModPacks checks the validity of the change and, if there is no problem, sets this status manually.
Rejected (*1)	Indicates that the change was not implemented for certain reason. The user who manages ModPacks sets this status manually.
Accepted (*1)	Indicates that the change was accepted by the person who requested the change. After the change is accepted, the user who manages ModPacks sets this status manually.

*1: The ModPack statuses Accepted and Rejected are used in pair. ModPacks whose status is set to Accepted or Rejected no longer appear in ModPack Navigator. However, they still appear in the ModPack List window.

D1.2.2 ModPack List window

The ModPack List window displays the ModPacks that are listed in ModPack Navigator in a table format. You can open the ModPack List window from ModPack Navigator.

TIP

You cannot display two or more ModPack List windows at a time. If you try to open another ModPack List window while a ModPack List window is displayed, the currently displayed ModPack List window closes and a new ModPack List window opens.

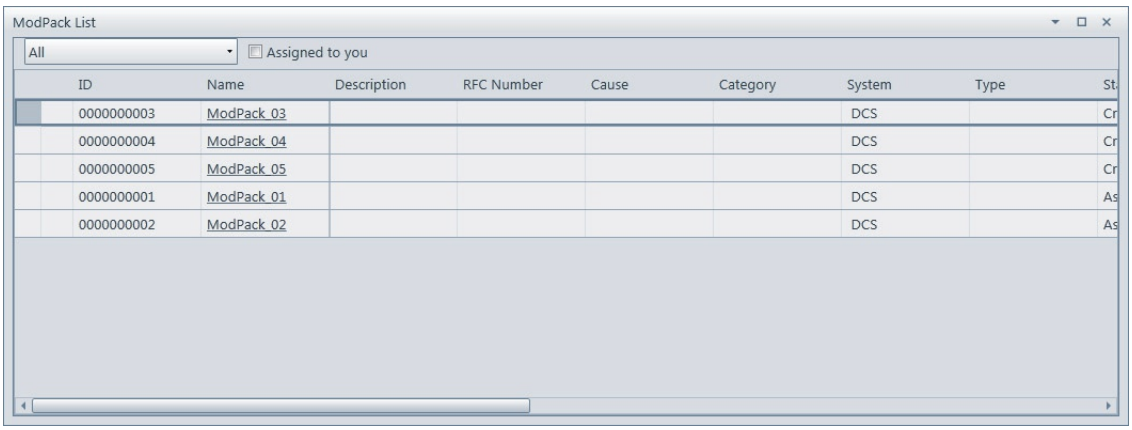

Figure D1.2.2-1 Example of ModPack List window display

Opening a ModPack List window

- To open a ModPack List window, double-click a ModPack status in ModPack Navigator. A ModPack List window opens, showing only the ModPacks with the status that you double-clicked.

D1.2.3 ModPack Editor

Use ModPack Editor when editing a ModPack. You can start ModPack Editor from ModPack Navigator or a ModPack List window.

Starting ModPack Editor

- Perform either of the following operations to start ModPack Editor:
  - In ModPack Navigator, double-click the ModPack.
  - In the ModPack List window, click a ModPack name.

Window layout of ModPack Editor

ModPack Editor consists of the following areas:

- Overview area
- Asset area
- Assignment area
- Implementation area
- Test area
- Attachment file area

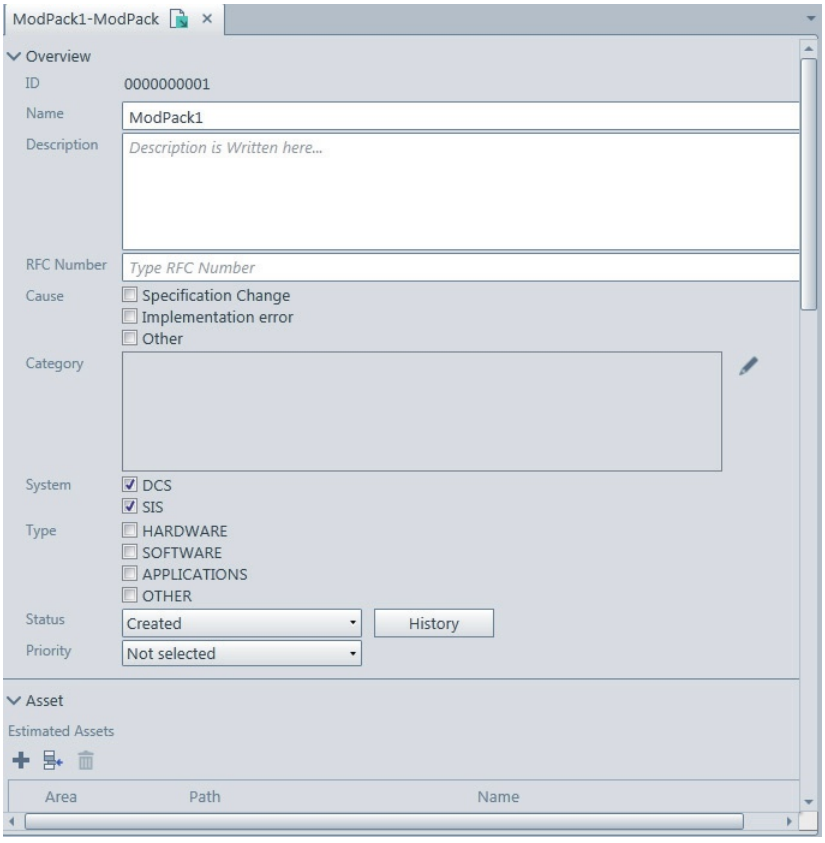

Figure D1.2.3-1 Example of ModPack Editor display

Overview area

The Overview area displays the basic information of the ModPack, such as the ID, RFC number, and status.

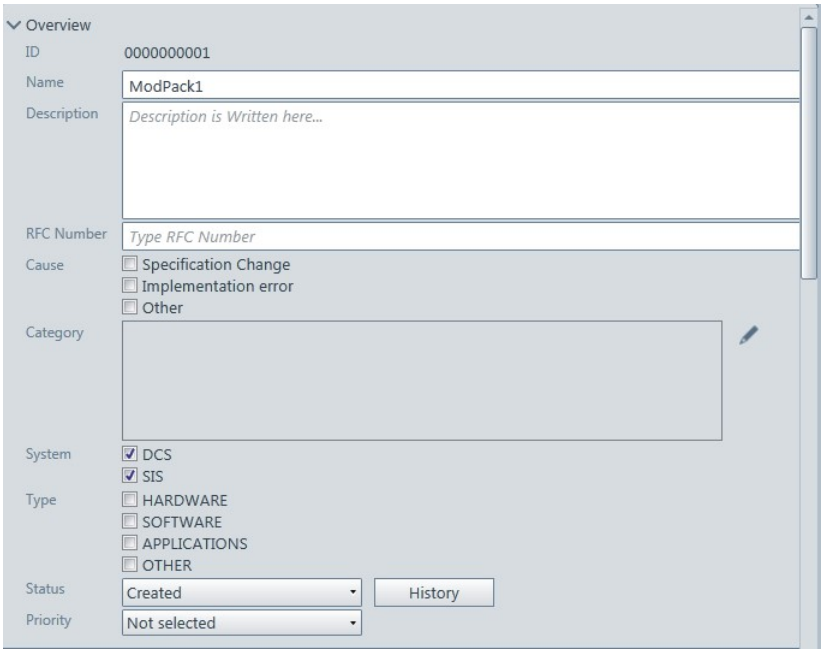

Figure D1.2.3-2 Overview area

The following table describes the items that are displayed in the Overview area.

Table D1.2.3-1 Items displayed in the Overview area

Item	Description
ID	The number that identifies the ModPack. An ID is automatically assigned by the system when the ModPack is created. Users cannot edit IDs.
Name	The name of the ModPack. Only the users with the ModPack Creation or ModPack Reopen right can enter this item. Duplicate names are allowed. Entry of Name is mandatory. The name that is entered here also appears in the Check-in window. Up to 50 characters can be entered for the name.
Description	A summary of the ModPack. The description entered here also appears in the Check-in window. Up to 1000 characters can be entered for the description.
RFC Number	The number for managing change requests. Only the users with the ModPack Creation or ModPack Reopen right can enter this item. Up to 50 characters can be entered for the RFC number.
Cause	Select the cause of change with check boxes. Multiple items can be selected. The following three choices are provided for Cause: • Specification Change • Implementation error • Others

Continues on the next page

Table D1.2.3-1 Items displayed in the Overview area (Table continued)

Item	Description
Category	The type and category of the change. Select the category in the Category dialog box. Multiple items can be selected. Only the users with the ModPack Creation or ModPack Reopen right can edit this item. The following choices are provided in the Category dialog box: • Instrument range • Parameters (set point, control, and so on) • Tag property (description, alarm priority, other attributes) • Control design information, graphics, subsystem communication I/F, and software I/O (PLC package) • Cable schedules, Junction box, and so on • P&ID • Safety logic • Tag addition/deletion • Document modification • Hardware version update/replacement • Software version update/replacement • System migration
System	The system that is to be changed. Use the check boxes to select the following subjects. • DCS • SIS
Type	The type of the change. Use the check boxes to select one or more of the following modifications. • Hardware • Software • Application • Others
Status	The status of the ModPack. Select a status from the drop-down list. Clicking the [History] button displays the status change history.
Priority	The priority of the change. Select the following priority level from the drop-down list. • Critical • High • Medium • Low

Asset area

The Asset area consists of an Estimated Assets list that displays the subjects of the change in the stage of estimates and an Actual Assets list that displays the subjects that have actually been changed. In the Estimated Assets list, users can register and view the assets that are candidates for modification. In the Actual Assets list, users can register and view the assets that were actually modified.

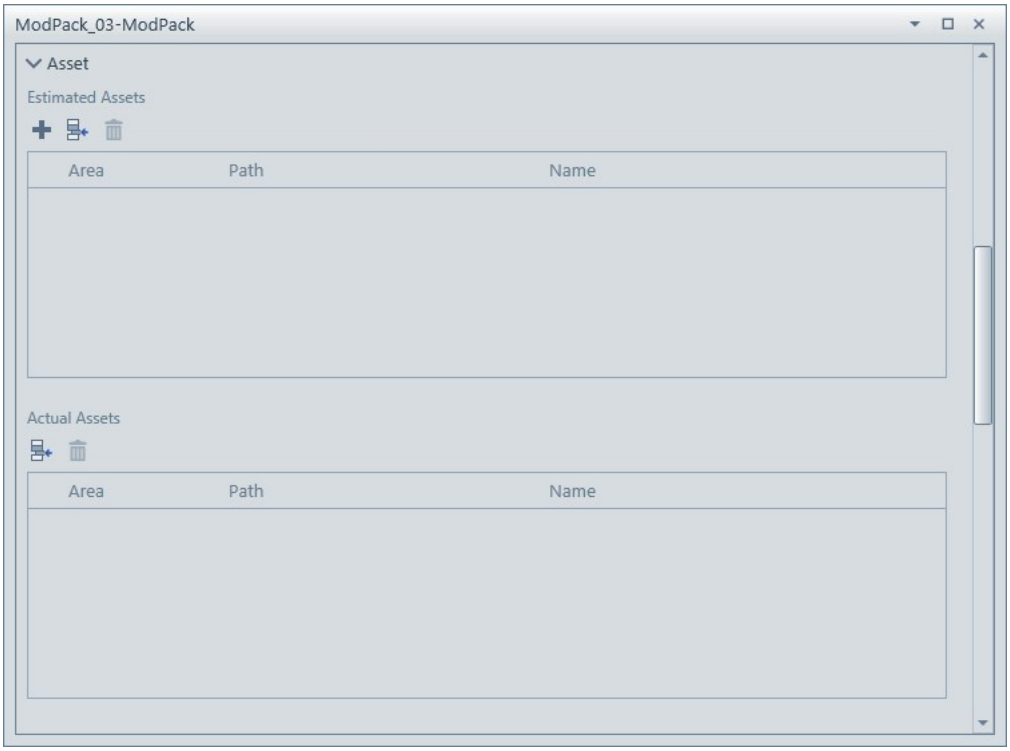

Figure D1.2.3-3 Asset area

Estimated Assets

The Estimated Assets list is where the user registers the assets to be modified. The following table describes the items that are displayed in the Estimated Assets list. Up to 1000 objects can be selected for modification.

Table D1.2.3-2 Items displayed in the Estimated Assets list

Item	Description
Area	The area of the assets to be modified. The user can select from the following four areas in the list: • Library • Application Structure • System configuration • Document The user can also type in an area with the keyboard. Up to 20 characters can be entered for the area.
Path	The path to the object to be modified. If the user selects an area, the paths to the objects, which are displayed in the relevant navigators, appear in the list. If the user typed in the area, the user must type in the paths as well. Up to 100 characters can be entered for the path.
Name	The name of the object to be modified. The names of the selected objects are automatically entered. If the user typed in the area, the user must type in the names as well. Up to 100 characters can be entered for the name.

Actual Assets

The Actual Assets list is where users can view the objects that were actually modified. When the user checks in a modification-completed object, specifying association with the ModPack, the object appears in the Actual Assets list. Manual entry of data is also possible in the Actual Assets list.

TIP

- Objects that are not registered as Estimated Assets can also be displayed in the Actual Assets list if they are associated with the ModPack when they are checked in.
- Paths in the Actual Assets list are displayed in a format that is different from the paths in the Estimated Assets list. The paths in the Actual Assets list are the same as those appear in the Check-in window.

Assignment area

The Assignment area is where the users or groups who modify the estimated assets are assigned. Names of the users or groups that are assigned to the ModPack are listed. Up to 100 users and user groups in total can be assigned to one ModPack.

When a users or a user who belongs to a group that was assigned here starts ModPack Navigator, only the ModPacks that are assigned to the user are displayed. However, if a user with the ModPack Management right starts ModPack Navigator, all ModPacks are displayed.

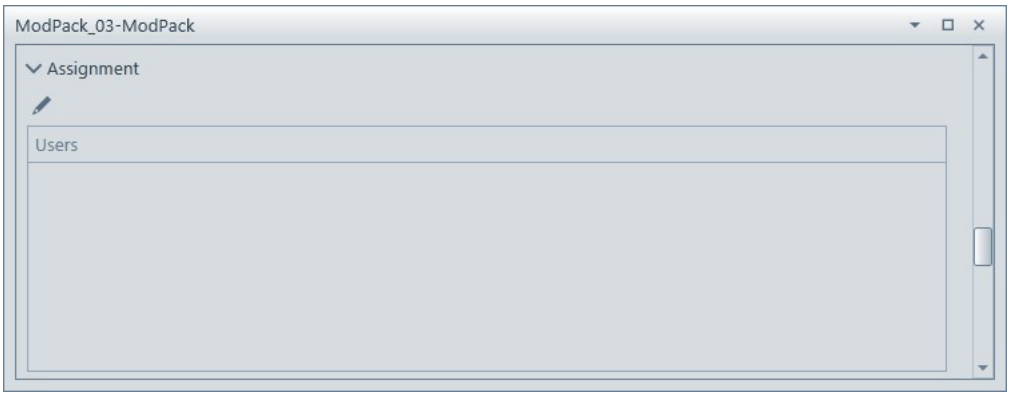

Figure D1.2.3-4 Assignment area

SEE ALSO For more information about how to assign the users who implement the change, refer to:

D2.4, “Assigning the users who implement the change” on page D2-6

Implementation area

The Implementation area is where descriptions related to implementation of the change, such as procedures for implementing the change, are entered. Up to 65536 characters can be entered.

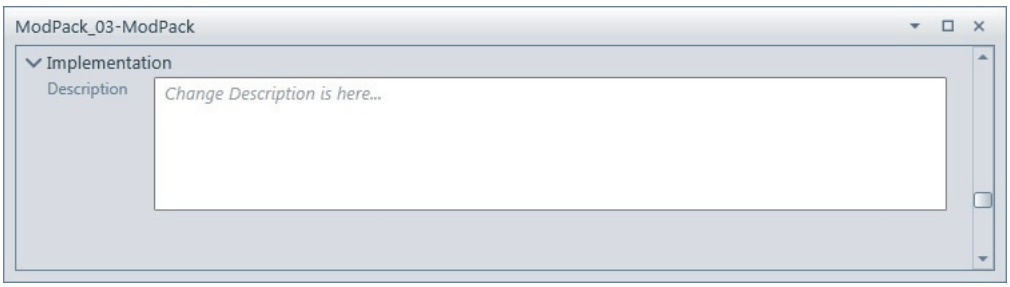

Figure D1.2.3-5 Implementation area

Test area

The Test area is where descriptions such as test procedures are entered. Up to 65536 characters can be entered.

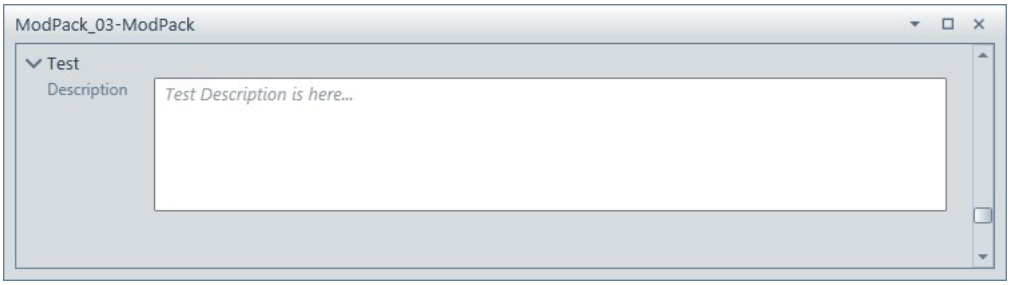

Figure D1.2.3-6 Test area

Attachment file area

The Attachment file area is where the user can attach files containing, for example, test results to the ModPack.

- File format of attachments
  Any file format is allowed.
- Maximum number of attachments
  100 files per ModPack
- Maximum size of an attachment
  100 MB
- Total size of all attachments
  100 MB per ModPack

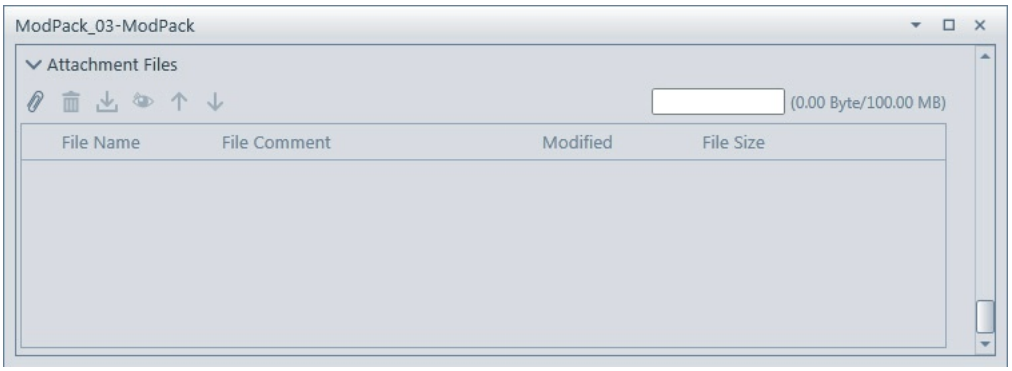

Figure D1.2.3-7 Attachment file area

SEE ALSO For more information about how to attach files in the Attachment file area, refer to:

D2.7, “Attaching files” on page D2-11

D1.3 Access control on ModPack operation

To be able to perform various operations in ModPack Editor, users must have the right to do the operation. It is possible to assign the rights appropriately to the users who work with ModPack Editor. In ModPack Editor, users are allowed to perform operations according to the right that is assigned to the users.

TIP

If ModPack Editor is run by a user who has no rights, ModPack Editor opens in read-only mode.

Relationship between ModPack Editor operations and access rights

ModPack Editor operations are functionally categorized. To perform a certain operation, the user must have the right to perform the operation.

ModPack operation categories

ModPack operations are categorized as follows:

- Create ModPacks
- Change ModPack status to Accepted or Rejected
- Change ModPack status from Accepted or Rejected to another status
- View all ModPacks in ModPack Navigator
- Enter Name, RFC Number, Category, and user assignments in ModPack Editor
- Register actual assets in ModPack Editor
- Enter items other than Name, RFC Number, Category, and user assignments in ModPack Editor
- Associate changes implemented in the past with a ModPack in the Revision History window.

ModPack access rights

ModPack access rights are as follows:

- ModPack Creation
- ModPack Closing
- ModPack Reopen
- ModPack Management
- ModPack Implementation
- Revision History Re-assign ModPack

ModPack access rights and permitted operations

The following table shows the ModPack access rights and the corresponding permitted operations.

Table D1.3-1 Correspondence between ModPack access rights and permitted operations

Access right	Category of operation (*1)							
	Create ModPacks	Change ModPack status to Accepted or Rejected	Change ModPack status from Accepted or Rejected to another status	Enter Name, RFC Number, Category, and user assignments in ModPack Editor	Register actual assets in ModPack Editor	Enter items other than Name, RFC Number, Category, and user assignments in ModPack Editor	Associate changes implemented in the past with ModPacks in the Revision History window	Remarks
ModPack Creation	Yes	-	-	Yes	Yes	Yes	-	
ModPack Closing	-	Yes	-	-	Yes	Yes	-	
ModPack Reopen	-	-	Yes	Yes	Yes	Yes	-	
ModPack Management	-	-	-	-	-	-	-	(*2)
ModPack Implementation	-	-	-	-	Yes	Yes	-	(*2)
Revision History Re-assign ModPack	-	-	-	-	Yes	-	Yes	

*1: Yes: The operation can be performed by a user with this right or this right is required to perform the operation.
- : The operation cannot be performed by a user with this right.

*2: Users who have the ModPack Implementation right but do not have the ModPack Management right can view only the ModPacks that are assigned to them. To enable a user to view all ModPacks, you must grant the user the ModPack Management right as well.

Assigning access rights

Access rights to ModPacks can be assigned to users or user groups. Access rights to ModPacks are assigned by using ADS Administration Tool.

SEE ALSO For more information about how to assign access rights, refer to:

C1.2.2, “Controlling access to AD projects” on page C1-30

D2. Operating ModPack change management

Before starting implementation of a change, the user in charge of change management creates a new ModPack. For the ModPack created, the user configures the basic information and assets to be modified and assigns the users who implement the change. The users who implement the change then proceed with the change process based on the ModPack.

D2.1 Creating ModPacks

ModPack creation is a task that should be done by the user in charge of change management. To be able to create ModPacks, the user must have the ModPack Create right. The status of a newly created ModPack is automatically set to Created.

Creating a ModPack

Follow these steps to create a ModPack:

1. Open ModPack Navigator.
2. In ModPack Navigator, click the [New ModPack] button.
   A new ModPack is created in the Created folder.
3. Enter the name of the ModPack.

D2.2 Configuring the basic information

Each ModPack has the following basic information items. The user configures these basic information items of the ModPack that is created.

- Description
- RFC Number
- Cause
- Category
- System
- Type
- Status
- Priority

Configuring basic information items

You need to open the ModPack before you can configure the basic information. Follow these steps to configure the basic information:

1. In ModPack Navigator, double-click the ModPack to open it.
   ModPack Editor starts.

TIP

If the ModPack List window is open, you can also start ModPack Editor by clicking the ModPack name in the ModPack List window.

2. Click the [Check-out] button in AD Organizer to check out the ModPack that you opened.
3. In ModPack Editor, enter the basic information items.

TIP

- You can specify Category in the Category dialog box that is opened by clicking the [Add Category] button.
- Change the status as necessary.

4. Click the [Save] button in AD Organizer.
   The ModPack is saved.
5. Check in the ModPack in the Check-in window.

D2.3 Registering the assets to be modified

The user registers the assets to be modified in the Asset area of ModPack Editor.

Registering the assets to be modified

Assets to be registered can be selected in the Estimated Asset dialog box. However, for assets that cannot be selected in the Estimated Asset dialog box, such as hardware objects, the user must enter them manually in the Estimated Assets list of the Asset area.

Selecting the assets to be modified in the Estimated Asset dialog box

Follow these steps to register the assets to be modified in the Estimated Asset dialog box:

1. Open the ModPack in which you register assets to be modified.
   ModPack Editor starts.
2. Click the [Check-out] button in AD Organizer to check out the ModPack that you opened.
3. In the Asset area, click the [Add Estimated Asset] button in the Estimated Assets list.
   The Estimated Asset dialog box appears.

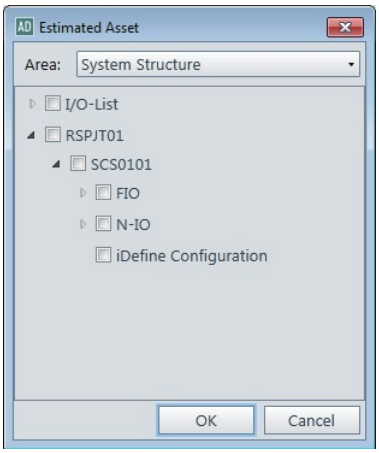

Figure D2.3-1 Estimated Asset dialog box

4. From the [Area:] list box in the Estimated Asset dialog box, select the area for modification.
   Items are hierarchically displayed based on the area that you have selected. You can select from among the following areas:
   - Library
   - Application Structure
   - System configuration
   - Document
5. Select the check boxes of the items that you want to register for modification.
6. Click [OK] in the Estimated Asset dialog box.
   The selected items are displayed in the Estimated Assets list in the Asset area of ModPack Editor.
7. Click the [Save] button in AD Organizer.
   The ModPack is saved.
8. Check in the ModPack in the Check-in window.

Entering the assets to be modified manually

Follow these steps to register the assets to be modified by manual entry:

1. Open the ModPack in which you register assets to be modified.
   ModPack Editor starts.
2. Click the [Check-out] button in AD Organizer to check out the ModPack that you opened.
3. In the Asset area, click the [Add Assets Manually] button in the Estimated Assets list.
   A new row is added to the Estimated Assets list in the Asset area.
4. In each cell in the row that you have added, enter information about the modified asset.
5. Click the [Save] button in AD Organizer.
   The ModPack is saved.
6. Check in the ModPack in the Check-in window.

SEE ALSO For more information about check-in operation, refer to:

"■ Checking in manually" on page B4-9

D2.4 Assigning the users who implement the change

The users who will implement the change are assigned in the Assignment area of ModPack Editor. Once a user is assigned, the ModPack status is set to Assigned.

Follow these steps to assign the users who implement the change:

1. Open the ModPack to which you assign users.
   ModPack Editor starts.
2. Click the [Check-out] button in AD Organizer to check out the ModPack that you opened.
3. In the Assignment area, click the [Assign Engineer] button.
   The Assign Member(s) dialog box appears.

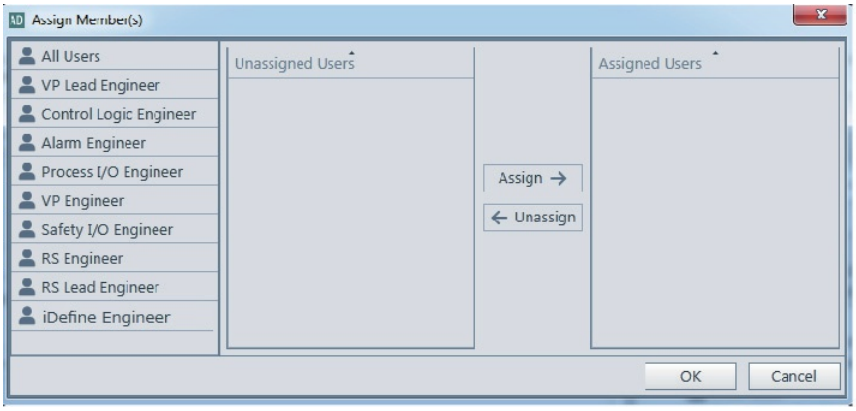

Figure D2.4-1 Assign Member(s) dialog box

4. In the Assign Member(s) dialog box, select a user role.
   The users who have been assigned with the role are listed.
5. Select users in the Unassigned Users section and click the [Assign] button.
   The selected users are added to the Assigned Users section.
6. If you need to delete users that are already assigned, select the users in the Assigned Users section and click the [Unassign] button.
   The users that you have deleted move to the Unassigned Users section.
7. Click the [OK] button in the Assign Member(s) dialog box.
   The users that you have assigned appear in the Assignment area of ModPack Editor.
8. Click the [Save] button in AD Organizer.
   The ModPack is saved.
9. Check in the ModPack in the Check-in window.

SEE ALSO For more information about check-in operation, refer to:

"■ Checking in manually" on page B4-9

D2.5 Implementing the change

The user who implements the change starts the implementation by changing the ModPack status to In-Progress.

The users who implement the change modify the estimated assets by using their respective editors. When all required modification is finished, the actually modified assets should be associated with the ModPack. Modifications can be divided into the following three types:

- Procedure for modification of objects that are handled by AD Organizer
- Procedure for modification by SCS Manager builders
- Other modifications (Example: change in hardware)

Procedure for modification of objects that are handled by AD Organizer

In the modification process for objects that are handled by AD Organizer, you specify a ModPack to be associated when you check in the object after modification. You do not need to specify a ModPack that is not to be associated

Follow these steps to modify an object that is handled by AD Organizer:

1. Start the editor for editing the object and modify the object.
2. In the Check-in window, select the check boxes of the files that have been modified and click the [ModPack Relation] button.
   The list of ModPacks that are assigned to the logged on user appears in the Check-in window.

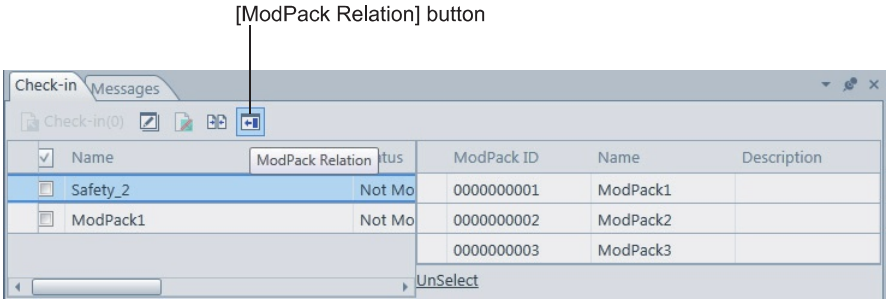

Figure D2.5-1 Check-in window

3. From the ModPack list, select the ModPack to be associated.
4. Click the [Check-in] button on the toolbar.
   The Check-in dialog box appears and the associated ModPack appears in the center of the dialog box.
5. In the Check-in dialog box, click [Check-in] button.
   Once associated with a ModPack, the modification is displayed in the Asset area of ModPack Editor as an actual asset.

Procedure for modification by SCS Manager builders

Follow these steps to associate a change that uses SCS Manager builders with a ModPack:

1. From SCS Manager, start the builder for the asset and modify the asset.
2. After you finish the modification, save or download the asset.
   The modified asset is stored in the Automation Design Master Database (ADMDB).
3. Open the Revision History window.

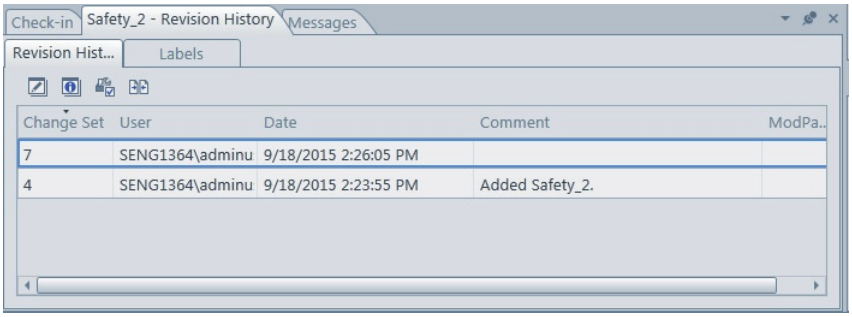

Figure D2.5-2 Revision History window

4. In the Revision History window, click the [ModPack Relation] button.
   The Associate ModPack dialog box appears.

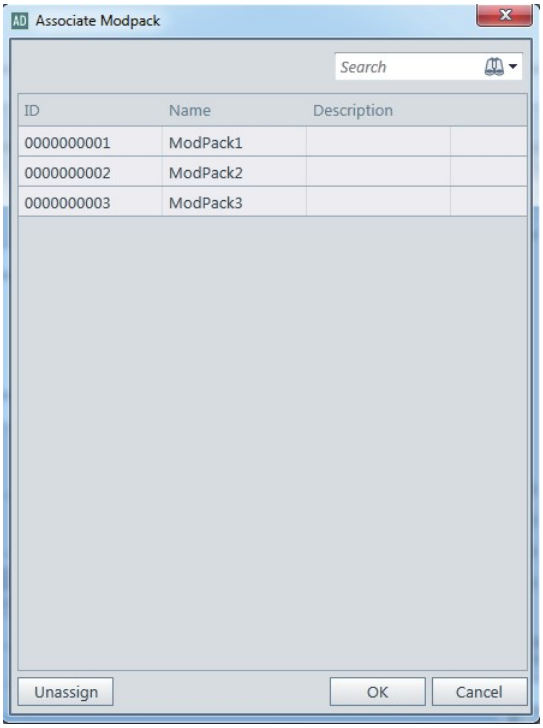

Figure D2.5-3 Associate ModPack dialog box

5. Select the ModPack to be associated and click [OK].
   Once associated with a ModPack, the modification is displayed in the Asset area as an actual asset.

TIP

- You can only select one ModPack in the Associate ModPack dialog box.
- To cancel association with the ModPack, click [Unassign] in the Associate ModPack dialog box.

Procedure for other modifications

Other modification here refers to modification of assets that were entered manually in the Estimated Assets list at the stage of estimating the change. For example, change in hardware falls in this category.

Because other modifications are out of the scope of management by AD Organizer, association with ModPacks must be manually implemented by a user. Follow these steps to associate other changes with a ModPack:

1. Open the ModPack to be associated with the modification.
   ModPack Editor starts.

2. Click the [Check-out] button in AD Organizer to check out the ModPack that you opened.
3. In the Asset area, click the [Add Actual Asset] button in the Actual Assets list.
   A new row is added to the Actual Assets list in the Asset area.
4. In each cell in the row that you have added, enter information about the modified asset.
5. Click the [Save] button in AD Organizer.
   The ModPack is saved.
6. Check in the ModPack in the Check-in window.

SEE ALSO For more information about check-in operation, refer to:

"■ Checking in manually" on page B4-9

D2.6 Testing the modified application

The users test the modified application according to the procedures written in the Test area of ModPack Editor to verify, for example, that the modified software works correctly. After the testing is finished, the user changes the ModPack status to Tested.

You can test the operation of ProSafe-RS application by using the test function.

SEE ALSO For more information about the test function, refer to:

1., “Overview of the test function” in Test Function Guide (IM 32P04B30-01EN)

D2.7 Attaching files

Files that contain test results or other information can be attached to a ModPack. Attached files are listed in the Attachment file area of ModPack Editor.

■ Attaching files

Follow these steps to attach files to a ModPack:

1. Open the ModPack to which you attach files.
   ModPack Editor starts.
2. Click the [Check-out] button in AD Organizer to check out the ModPack that you opened.
3. In the Attachment file area of ModPack Editor, click the [Add] button.
   The Choose a file dialog box appears.
4. In the Choose a file dialog box, specify the file to be attached and click [OK].
   The file that you have specified appears in the Attachment file area of ModPack Editor.
5. Click the [Save] button in AD Organizer.
   The ModPack is saved.
6. Check in the ModPack in the Check-in window.

SEE ALSO For more information about check-in operation, refer to:

"■ Checking in manually" on page B4-9

■ Handling attached files

Users can delete, save in a local computer, or sort or view files that are attached to a ModPack.

- In ModPack Editor, select the Attachment file you wish to operate and click the [Delete] button, [Save] button, [Move up] button, [Move down] button, or [View] button.

D2.8 Validating the change

After the implementation and testing of the change is finished, the user in charge of change management validates the change. After validating the change, the user changes the ModPack status to Validated. Finally, get an approval from the person who requested the change and change the ModPack status to Accepted.

■ Changing the ModPack status

Follow these steps to change the ModPack status:

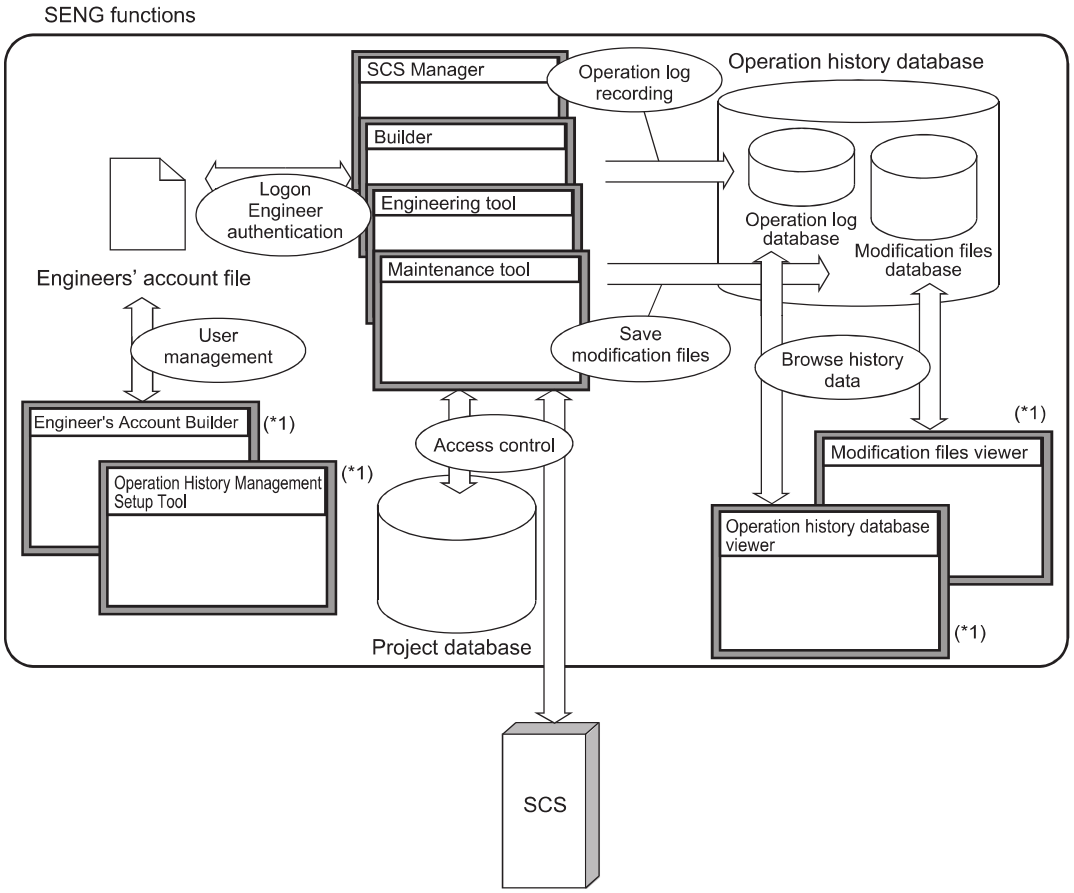
1. Open the ModPack that you change the status.
   ModPack Editor starts.
2. Click the [Check-out] button in AD Organizer to check out the ModPack that you opened.
3. In the Overview area of ModPack Editor, select the status from the [Status] list.
4. Click the [Save] button in AD Organizer.
   The ModPack is saved.
5. Check in the ModPack in the Check-in window.

SEE ALSO For more information about check-in operation, refer to:

"■ Checking in manually" on page B4-9

E. Access Control/Operation History Management functions

This section describes the Access Control / Operation History Management functions.



The Access Control/Operation History Management functions provide user-based restrictions to functions of the SENG software and to record or view the operation history of operations in the SENG software.

The Access Control / Operation History Management functions are made up of the following functions.

- User management
  Manage users (referred to as "engineers" in the following sections) working with SCS Manager and SCS Maintenance Support Tool.
- Logon / Engineer Authentication
  Logon is a function that prompts the engineer to enter an engineer name and password when starting a SENG function. Engineer Authentication is a function that prompts the engineer to enter a password when executing a specific operation after Logon. The user can select the configuration whether or not to perform Engineer Authentication.
- Access Control
  A function for specifying whether individual engineers have the authority to perform an operation and to control whether or not the operation is available to perform based on that specification.
- Record Operation History
  A function for recording operation information in the form of a history when an engineer has performed that operation.
- View Operation History
  A function for displaying and printing operation histories stored in the History Management Database in order to view them.

E1. Configuration

The following figure shows the overall configuration of the Access Control / Operation History Management functions.

*1: These tools are included in the RS4E5170 Access Control and Operation History Management Package.

Figure E1-1 Overall configuration of the Access Control/Operation History Management functions

Operating environment

- Hardware
  It is recommended that the hard disk of the PC on which the History Management Database is located has at least 100 GB of free space. It is recommended that you provide an auxiliary memory device to back up the History Management Database.

TIP

The size of the History Management Database will increase by up to around 10 MB during a single download. 100 GB of free space therefore equates to 10000 downloads (1000 downloads per SCS if you have 10 SCSs.)

- Software
  In addition to Safety System Engineering and Maintenance Function, the following package is required on the SENG where you apply the access control and operation history management functions:

  RS4E5170 Access Control and Operation History Management Package

  The package is not required on PCs that are only for registering the History Management Database.

If the number of connections to the PC on which the History Management Database is installed is five or more, use a server OS on this PC.

System configuration

The following figure shows an example of a system configuration using the Access Control / Operation History Management functions.

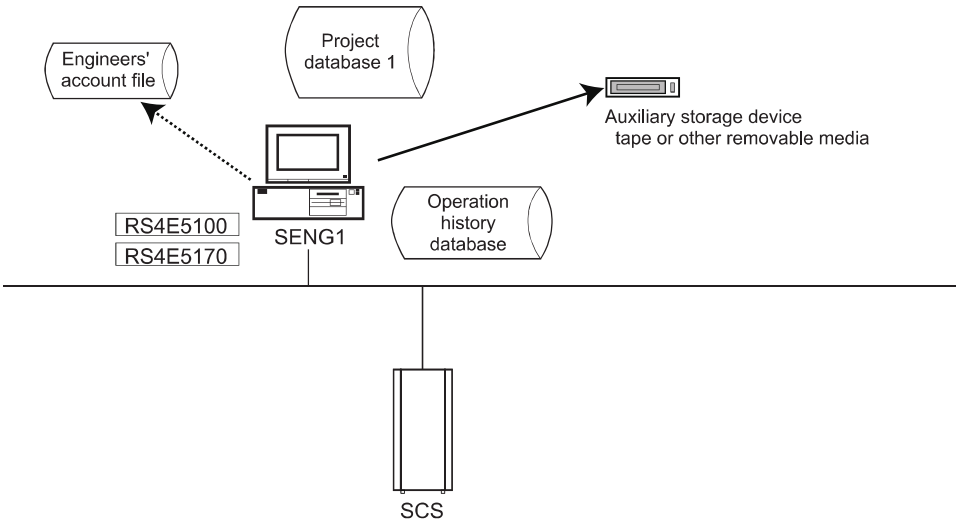


Figure E1-2 Example of a minimum configuration

The following figure shows an example in which the functions are deployed on multiple SENGs. The History Management database is located on a dedicated PC. The engineer registration information is also located on the dedicated History Management PC so that it is referenced commonly by multiple SENGs, and set as shared.

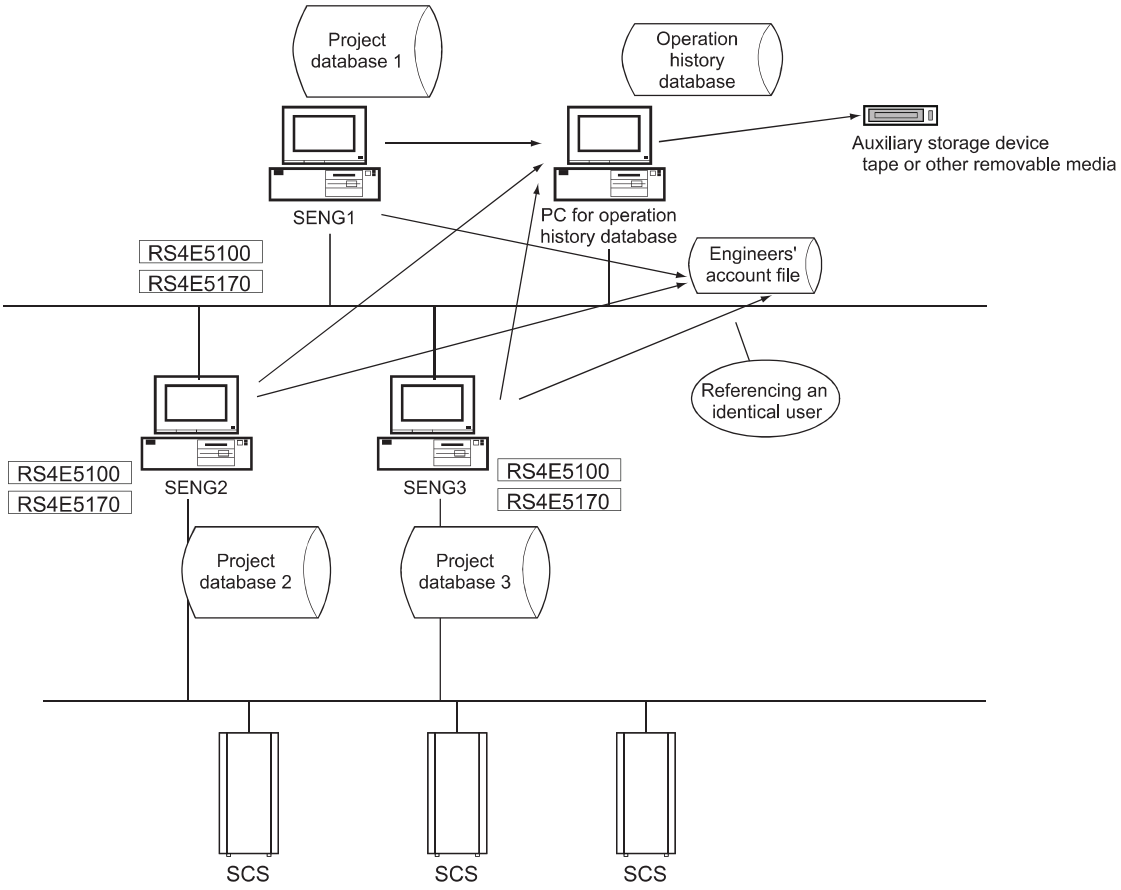

Figure E1-3 Example of use on multiple SENGs

IMPORTANT

When using the Windows authentication mode, ensure that the system to which Domain management or Combination management is applied consists of a single Windows domain in order to unify user management and passwords on all terminals. Otherwise, a security loophole is created.

Guidelines for the locations of the Engineer Registration file and History Management Database

Ensure that the locations of the Engineer Registration File and History Management Database specified in the Operation History Management Settings Tool are fully secure.

Make sure that these folders are not inadvertently opened in Explorer. It is recommended that you set access permissions that give access to no one but administrators and engineers.

- If the PC on which the History Management Database is located does not have a server OS installed on it, make sure that the number of PCs accessing the disks on that PC is no more than four. To perform History Management functions from five or more SENGs, locate the History Management Database on a PC with a server OS installed on it.
- For the PC where the History Management Database is located, you must create the folder for placing the database before applying the IT security tool.
- If the PC where the History Management Database is located does not have a server OS installed on it, ensure that, as a rule, the CENTUM project database is not located on that PC.

The storing of history data in the History Management Database and the clearing of the History Management Database may fail if the History Management Database and the CENTUM project database are on the same PC.

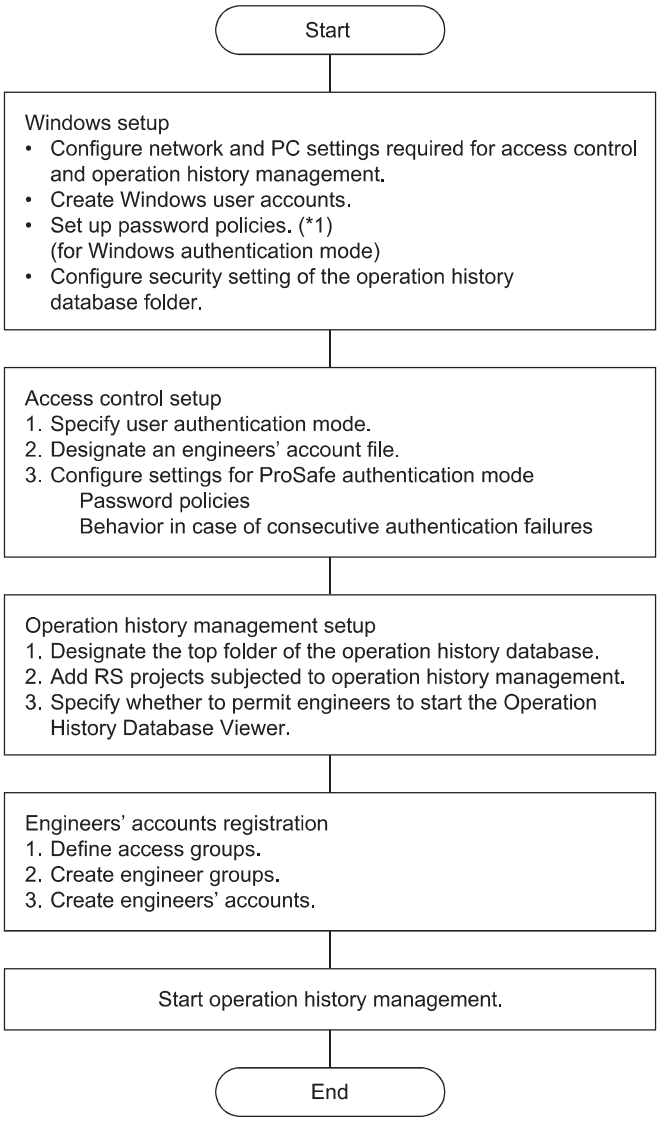
TIP

- If the storage of history data fails during the operation to start History Management, cancel and perform the start operation again.
- If clearing of the History Management Database fails, perform the clear operation again.

Combined use with Product Security functions

The Access Control / Operation History Management functions are additional to the Product Security functions provided as standard in ProSafe-RS. They are functionally independent, and can therefore be used in combination. However, if you use the Access Control / Operation History Management functions, the password entry function in the SCS Maintenance Support Tool is suppressed.

When using the Access Control / Operation History Management functions in combination with the Product Security functions, configure the Product Security settings as follows.



- Project password
  The project password gives permissions to users for opening and viewing the project (except when the project is set to allow Read Only opening). When you need to restrict some registered engineers' access to view the project, manage the project by applying a project password (set not to allow Read Only opening) and circulating it only to engineers who are allowed to view the project.
- POU password
  The POU password gives permissions to users for opening and viewing specific POU. When you need to restrict some registered engineers' access to open and view the particular POU, manage the project by applying a password to the POU and circulating it only to engineers who are allowed to view the project.
- SCS security level password
  An SCS security level password is a separate password for each SCS that is independent of the SENG users, and provides a system for determining whether execution is possible on the SCS. Ensure that an SCS security level password is always set.
- SCS Maintenance Support Tool password
  The password entry function in the SCS Maintenance Support Tool is suppressed when the Access Control / Operation History Management functions are being run. Log on is necessary in Logon / Engineer authentication function instead. Use the password for the SCS Maintenance Support Tool when you are not running the Access Control / Operation History Management functions.

Access Control/Operation History Management procedure

Before you start the first operation, the Access Control/Operation History Management functions need to be set up by an administrator. The following settings are configured, using mainly the Operation History Management Settings Tool.

- Specify the authentication mode
- Register the engineer
- Set the password policy
- Specify whether or not to implement Engineer Authentication
- Specify the path for the History Management Database
- Start / stop History Management

The task sequence is as follows:

*1: You can set password policies any time before operation history management is started.

Figure E1-4 Access Control/Operation History Management sequence

Executing Operation History Management

Engineers must first log on when starting an operation with a SENG function. Enter an engineer name and password as a logon operation. If the engineer name and password are entered correctly, subsequent SENG operations can be executed. If the engineer chooses Cancel, the operation cannot be executed. After logon, the following processes are executed whenever an engineer performs an operation managed with History Management.

- Access Right Check
  The system checks whether the engineer who has logged on has the access right to perform the operation in question. If the engineer has access right, he/she can perform the operation. If the engineer does not have access right, an error occurs and he/she cannot perform the operation.
- Engineer Authentication (only if the option "Do not require engineer authentication on individual operations" is unchecked)
  When an engineer executes an operation, he/she enters the engineer password under which he/she is logged on and an optional comment. If the engineer enters the correct password, he/she can execute the operation. If the engineer chooses Cancel, the operation cannot be executed.

- Store Operation History
  Once the operation is complete, a history log is recorded for the operation and a modification file is saved based on the type of operation (the modification file is only saved if the option "Do not save modification files" is unchecked.)

The engineering procedures carried out by engineers after History Management is started are the same as the ones when History Management is not being run except for these procedures.

Operation History Management process flow

The History Management process flow is shown in the following figure.

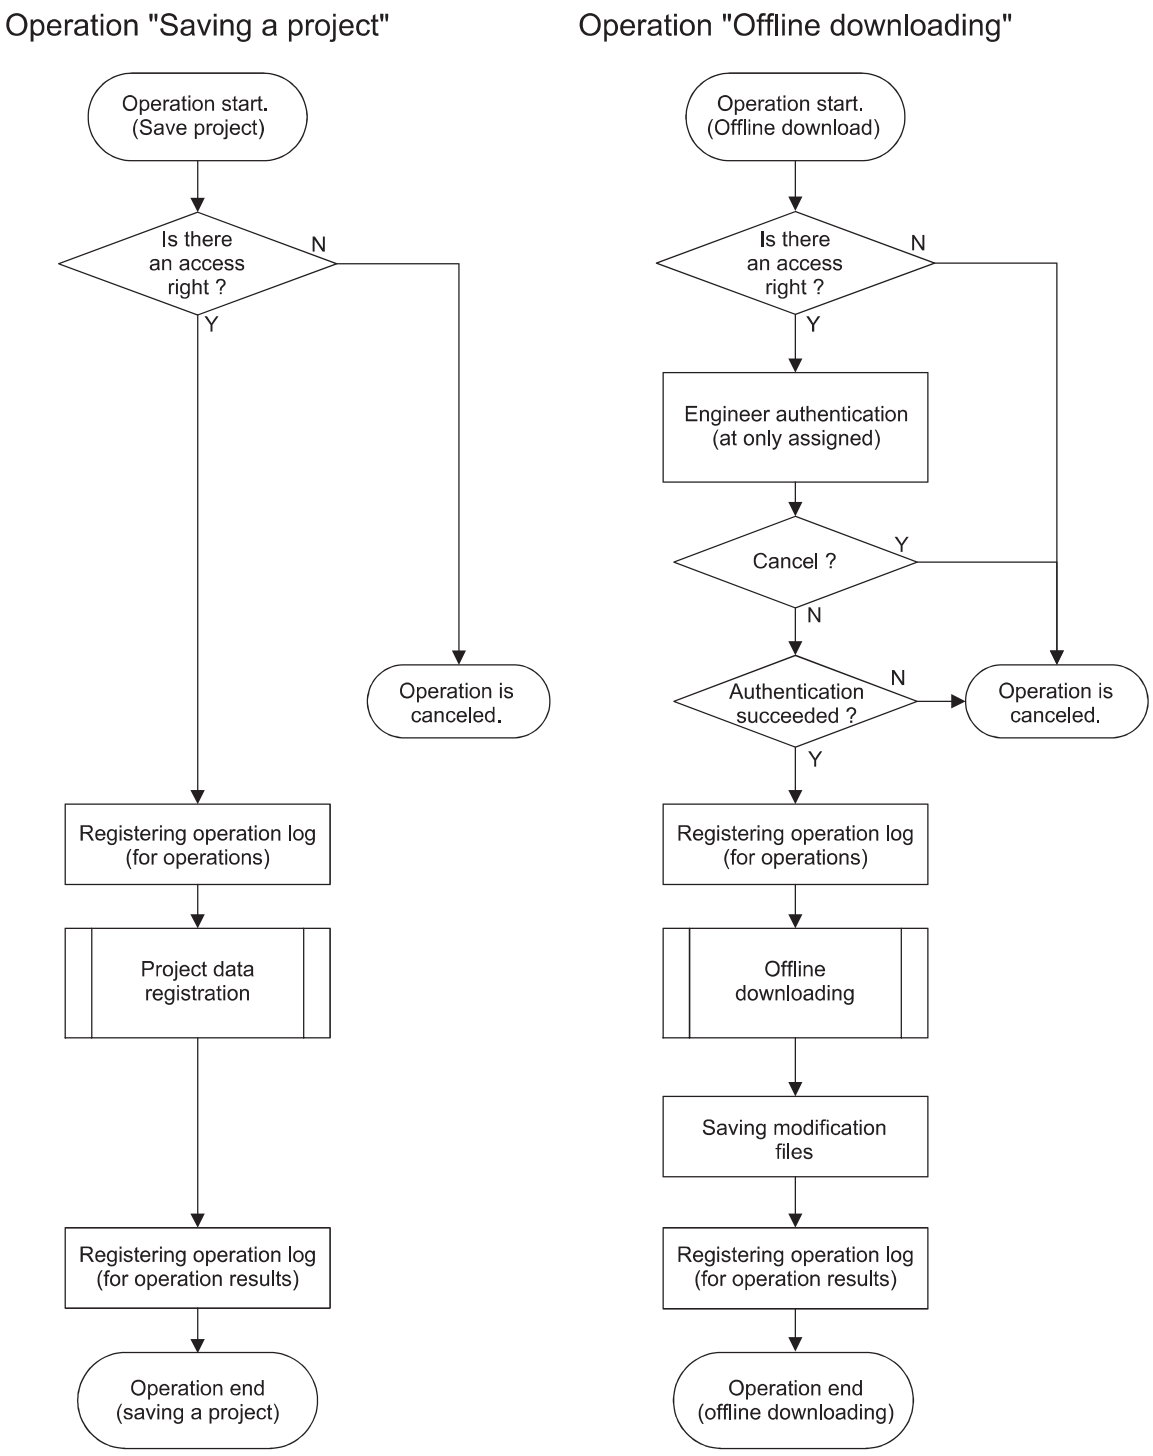


Figure E1-5 Example of a history management process flow

Access right

With the SENG Access Control and Operation History Management functions, access rights for project databases and access rights for SCS/SCS simulators are handled. These access rights are further broken down into categories.

SEE ALSO For more information about setting access rights, refer to:

E2.2.3, “Registering engineers” on page E2-19

For more information about categories of access rights, refer to:

E2.5.2, “Access rights category list” on page E2-72

E2. Access Control/Operation History Management function

ProSafe-RS access control/operation history management is one of the functions related to ProSafe-RS security. To use this function, the Access Control and Operation History Management Package is required.

The basic security functions of ProSafe-RS provide password protection for project databases and for certain operations that affect SCS. On the other hand, the access control/operation history management function controls security for individual SENG users.

E2.1 Overview of Access Control/Operation History Management

This section describes an overview of access control/operation history management.

Access Control

ProSafe-RS access control consists of "log-on/engineer authentication" and "access right check."

Log-on/engineer authentication is performed to confirm the engineer performing operations on SENG. The Authentication dialog box appears for certain operations and if the entered engineer name and password do not match the registered ones, the user cannot log on to SENG or cannot perform the certain engineering operations.

When an engineer attempts to perform an engineering operation, the access right checking function checks whether or not the engineer has the right to perform that operation, and if not, prohibits that operation. Operations by an unauthorized engineer can be thereby prevented.

Operation History Management

In ProSafe-RS operation history management, each operation performed by an engineer on SENG is recorded in an operation log file. Additionally, when a download to SCS is performed, information of changed project data (modification files) is saved. The operation logs and modification files are saved to a database specified in advance, and can be browsed using dedicated viewers. This allows you to keep track of "who," "when," "what " and "how" a change was made.

Roles of engineers and the administrator

There are two types of users in systems where access control/operation history management is used: "administrator of access control/operation history management" and "engineer." In this chapter, the "administrator of access control/operation history management" is simply called an "administrator."

SEE ALSO For more information about windows user groups to which the administrator and engineers should belong, refer to:

"■ Windows User Groups to which Administrators and Engineers Belong" in B4.6, "Setup when Using the Access Control and Operation History Management Package" in Installation Guide (IM 32P01C50-01EN)

Role of the administrator

The administrator is in charge of all the tasks related to access control and operation history management shown as follows.

- Managing networks and PCs
- Setting up access control/operation history management
- Starting/stopping operation history management
- Managing operation history database capacity
- Browsing operation history data

Role of engineers

SENG users other than the administrator are engineers.

Engineers are responsible for engineering and maintenance tasks, but they cannot execute operations if they do not have the rights. The following operations are added.

- Performing log-on operation when starting use of SENG function
- Entering password when performing certain operations
- Browsing history data (if permitted by Operation History Management Setup Tool)

E2.1.1 Overview of access control for engineers

The access control function restricts the operations by which engineers access project databases and SCS.

Units of access control

Access control is performed per PC. An engineers' account file which defines engineers, engineer groups and access rights is specified for each PC. If one common engineers' account file is specified for multiple PCs, the same access control can be performed for multiple PCs.

Access rights of engineers

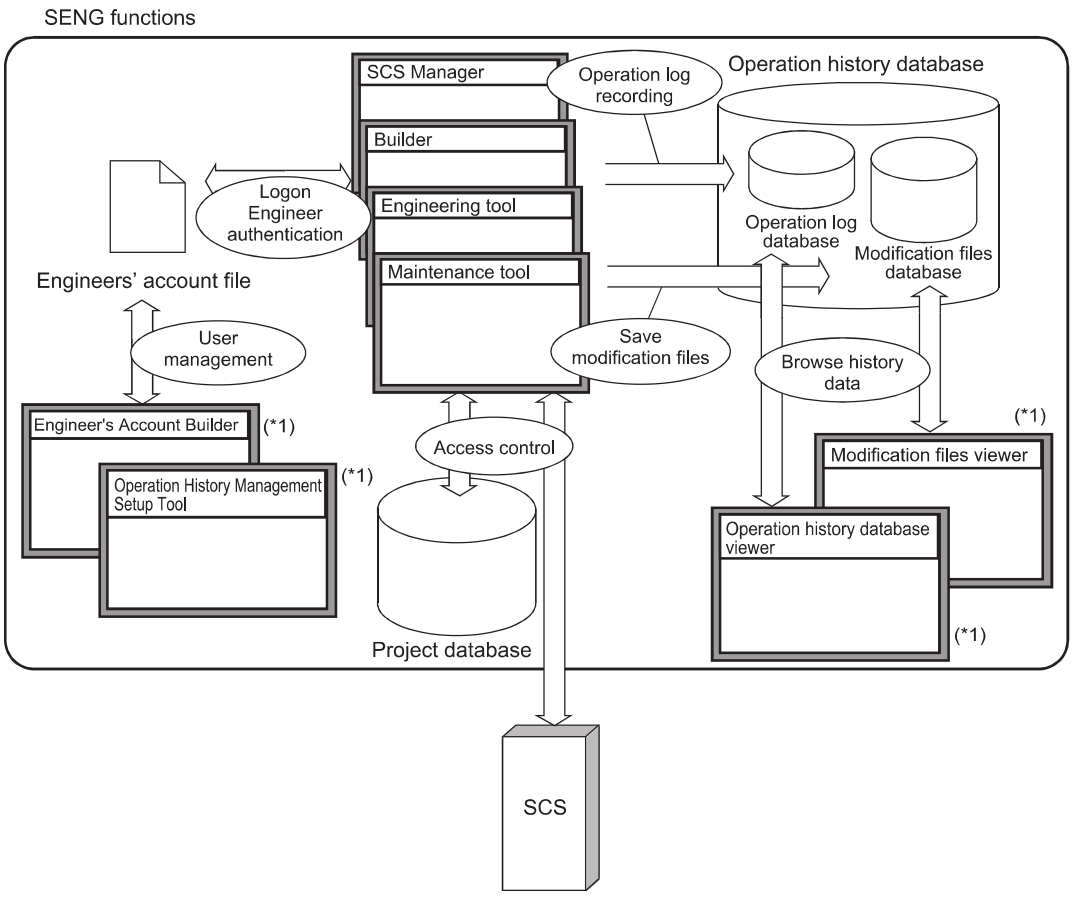
An engineer needs to belong to an engineer group, and his/her engineer name and password need to be registered. An engineer belonging to a certain engineer group can perform engineering operations and maintenance operations within the rights granted to that group.

The rights of an engineer group are set by the following two kinds of settings.

- Access rights that are set for each operation category
- Range of enabled access rights

For example, rights are enabled or disabled for operations classified in categories such as new project creation, general settings, create/modify POU and downloading. Furthermore, the range of enabled access rights granted is set in RS project/SCS project units.

ProSafe authentication mode and Windows authentication mode



There are two types of user authentication available in ProSafe-RS.

ProSafe authentication mode uses engineer accounts that are independent from Windows user accounts, and applies the passwords and password policies that are set for ProSafe-RS.

Windows authentication mode uses Windows user accounts as the engineer accounts. When performing user management in Windows authentication mode, Windows user accounts to be used as engineers must be registered. In Windows authentication mode, the passwords and password policies of Windows users are applied to engineers.

E2.1.2 Structure of Access Control/Operation History Management function

The following figure shows the overall structure of the access control/operation history management function.

*1: These tools are included in the RS4E5170 Access Control and Operation History Management Package.

Figure E2.1.2-1 Structure of the Access Control/Operation History Management function

A summary of the components and their mutual relationships are described as follows.

Operation History Management Setup Tool

This is a tool for setting up access control/operation history management.

It performs primarily the following settings.

- Specification of engineers' account file
- Specification of user authentication mode (ProSafe authentication mode or Windows authentication mode)
- Specification of top folder of operation history database
- Setting of password policies in ProSafe authentication mode
- Starting/stopping of operation history management

Engineers' Account Builder

This is a builder for registering engineer names and setting up access rights for engineers.

- Registering engineer names
  When in ProSafe authentication mode, any engineer names can be registered. When in Windows authentication mode, engineer names that are already registered as Windows user names should be registered.
- Creating engineer groups
  You can create engineer groups, which are the units in which access rights to project databases and SCS are specified. The access rights an engineer has are determined by assigning the engineer to an engineer group.

Engineers' Account file

This is the file that contains engineer account information and the access rights information set for engineers. It is specified for each SENG on which engineering is performed. The information set in the Engineers' Account Builder are saved to this file.

Operation History Database

This is the database that stores operation history information (operation logs and modification files). It is generated for each RS project in the location specified in the Operation History Management Setup Tool.

Operation History Database Viewer

This is a viewer for browsing operation history information (operation logs) saved in the operation history database.

It can display all operation logs or a filtered list, and can export operation logs to a file in CSV format. From this viewer, you can start up the Modification Files Viewer.

Modification Files Viewer

This is a viewer for browsing modification files saved in the operation history database.

If modification files corresponding to an operation log are browsed, it is possible to check the modification contents of the project data modified by that operation. Also, the differences between modification files corresponding to an operation log at any two points in time can be displayed.

SCS Manager, Builders, Engineering Tools and Maintenance Tools

Logon/engineer authentication, access control by rights checking and operation history management are performed for engineers' operations performed by using these programs and tools.

E2.1.3 Access Control/Operation History Management target operation list

The operations that are the targets of access control/operation history management are as follows.

"Yes" indicates that the process such as Log-on/Engineer Authentication or Access Rights Check is executed, and an empty box indicates that the process is not executed.

Table E2.1.3-1 Access Control/Operation History Management target operations

Operation Name	Log-on/Engineer Authentication	Access Rights Check	Operation Log Recording	Save modification files (*1)
Start SCS Manager	Yes (log on)		Yes (*2)	
Close SCS Manager			Yes (*2)	
Create new SCS project		Yes	Yes	Yes
Open SCS project			Yes	Yes (when upgrading)
Save project		Yes	Yes	
Import by SCS Manager		Yes	Yes	Yes
Save dictionary		Yes	Yes	
Save I/O wiring		Yes	Yes	
Save binding list		Yes	Yes	
Save library dependencies		Yes	Yes	
Open POU			Yes	
Save POU		Yes	Yes	
Open by builder			Yes	
Save by builder		Yes	Yes	
Change SCS project properties		Yes	Yes	
Build		Yes	Yes	Yes (user-defined projects only)
Clean		Yes	Yes	
Save analyzer's results		Yes	Yes	
Start document generator			Yes	
Start master database restoring function	Yes (log on)		Yes (*2)	
Close master database restoring function			Yes (*2)	
Restore master database		Yes	Yes	Yes
Start version control tool	Yes (log on)		Yes (*2)	
Close version control tool			Yes (*2)	
Check in to version control		Yes	Yes	
Check out from version control		Yes	Yes (if the checked out project is a target of operation history management)	Yes (if the checked out project is a target of operation history management)

Continues on the next page

Table E2.1.3-1 Access Control/Operation History Management target operations (Table continued)

Operation Name	Log-on/Engineer Authentication	Access Rights Check	Operation Log Recording	Save modification files (*1)
Offline download	Yes (engineer authentication) (*3)	Yes	Yes	Yes
Master database offline download	Yes (engineer authentication) (*3)	Yes	Yes	
Online change download	Yes (engineer authentication) (*3)	Yes	Yes	Yes
Restart SCS	Yes (engineer authentication) (*3)	Yes	Yes	
Save operation marks		Yes	Yes	
Download operation marks		Yes	Yes	
Start debug mode		Yes	Yes	
Exit debug mode			Yes	
Start logic simulation		Yes	Yes	
Close logic simulation			Yes	
Start test function		Yes	Yes	
Update test database		Yes	Yes	
Database validity check		Yes	Yes	
Repair database		Yes	Yes	
Start SCS Status Overview window	Yes (logon) (*4) (only when started from Start menu)		Yes (*2)	
Close SCS Status Overview window			Yes (*2)	
Start SCS State Management window			Yes	
Close SCS State Management window			Yes	
Change SCS security level		Yes	Yes	
Change security level password	Yes (engineer authentication) (*3)	Yes	Yes	
Lock		Yes	Yes	
Unlock		Yes	Yes	
Set values		Yes	Yes	
Enable output	Yes (engineer authentication) (*3)	Yes	Yes	
Start output module	Yes (engineer authentication) (*3)	Yes	Yes	
IOM download	Yes (engineer authentication) (*3)	Yes	Yes	

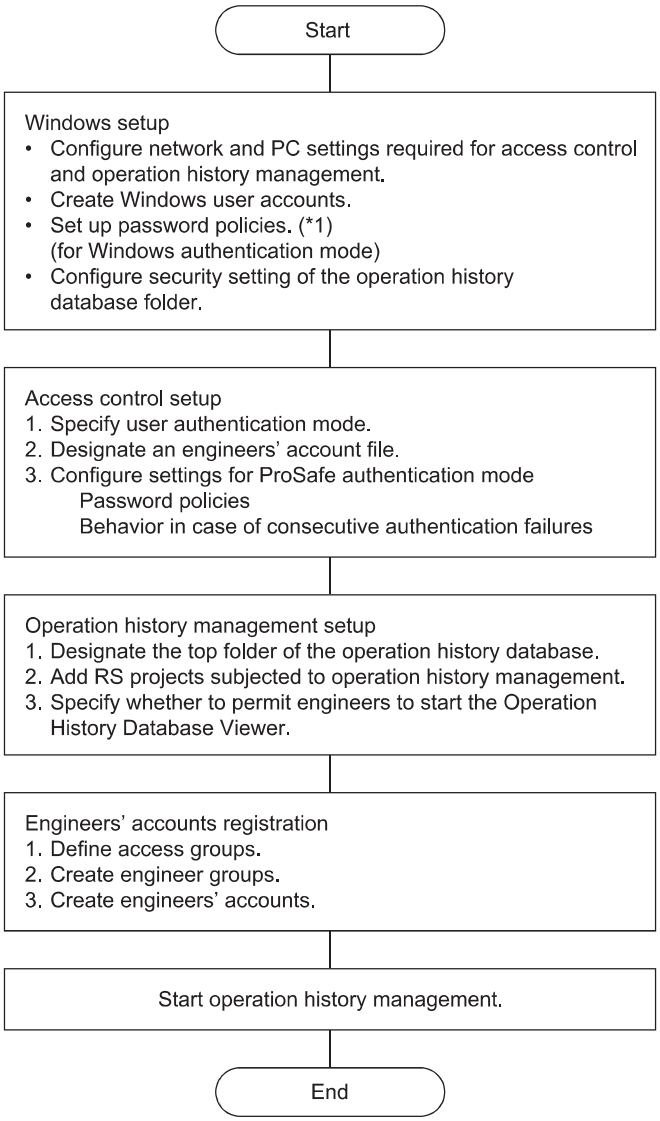
Continues on the next page

Table E2.1.3-1 Access Control/Operation History Management target operations (Table continued)

Operation Name	Log-on/Engineer Authentication	Access Rights Check	Operation Log Recording	Save modification files (*1)
NIU maintenance port setting	Yes (engineer authentication) (*3)	Yes	Yes	
Time setting		Yes (*5)	Yes (*2)	
Acknowledge/delete diagnostic information messages		Yes (*5)	Yes	
Change SCS Maintenance Support Tool settings		Yes (*5)	Yes (*2)	
Start IOM Control Right Switching Tool	Yes (log on)		Yes (*2)	
Close IOM Control Right Switching Tool			Yes (*2)	
Switch IOM control right		Yes	Yes	
Start Message Cache Tool	Yes (log on)(*4)		Yes (*2)	
Close Message Cache Tool			Yes (*2)	
Operate Message Cache Tool		Yes (*6)	Yes (trip information initialization)	
Pause message acquisition		Yes (*5)	Yes (*2)	
Resume message acquisition		Yes (*5)	Yes (*2)	
Start operation history management (operation by administrator)			Yes (*7)	Yes
Stop operation history management (operation by administrator)			Yes (*7)	
Exceeded number of authentications			Yes (*2)	
Local user logon in domain environment			Yes (*2)	
Record a comment (operation by administrator)			Yes (*2)	

*1: Saved if "Do not save in modification files" check box is not selected in Operation History Management Tool.
*2: Not recorded in operation log database for each SCS project, but recorded in common operation log database.
*3: Performed if "Do not require engineer authentication on individual operations" check box is not selected in Operation History Management Tool.
*4: Enter engineer name and password instead of entering password of SCS Maintenance Support Tool in standard security function.
*5: Whether or not to enable access rights is decided regardless of the range of enabled access rights that are granted to Engineers by using the Engineers' Account Builder.
*6: Whether or not to enable access rights for trip information initialization is decided depending on the range of enabled access rights that are granted to Engineers by using the Engineers' Account Builder. Whether or not to enable access rights for other operations is decided regardless of the range of enabled access rights that are granted to Engineers by using the Engineers' Account Builder.
*7: Recorded both in operation log database for each SCS project and in common operation log database.

E2.2 Setting up Access Control/Operation History Management



Setup of access control/operation history management is performed using the Operation History Management Setup Tool and the Engineers' Account Builder after setting up the network and PCs.

This section shows the flow of setup operations, and describes the setup procedures performed using the Operation History Management Setup Tool and the Engineers' Account Builder.

Flow of setup operations

The administrator first sets up the network and computers, and checks that the required Windows user accounts have been created. When performing user management in Windows authentication mode, register the Windows user accounts to be used for the engineers. Also, security is set to folders where the operation history database is located. After that, set up the access control/operation history management function on an SENG having a license for Access Control and Operation History Management Package.

The following figure shows the work flow.

*1: You can set password policies any time before operation history management is started.

Figure E2.2-1 Setting up Access Control/Operation History Management

E2.2.1 Settings for access control

On the Access Control tab sheet of the Operation History Management Setup Tool, perform common settings for access control.

After setup has been performed on the Access Control tab sheet and engineers have been registered in the Engineers' Account Builder, rights checking and log-on/engineer authentication are started when [OK] or [Apply] is clicked on the Operation History Management Setup Tool.

Starting the Operation History Management Setup Tool

The Operation History Management Setup Tool can be started by administrators only.

1. Start the Operation History Management Setup Tool.

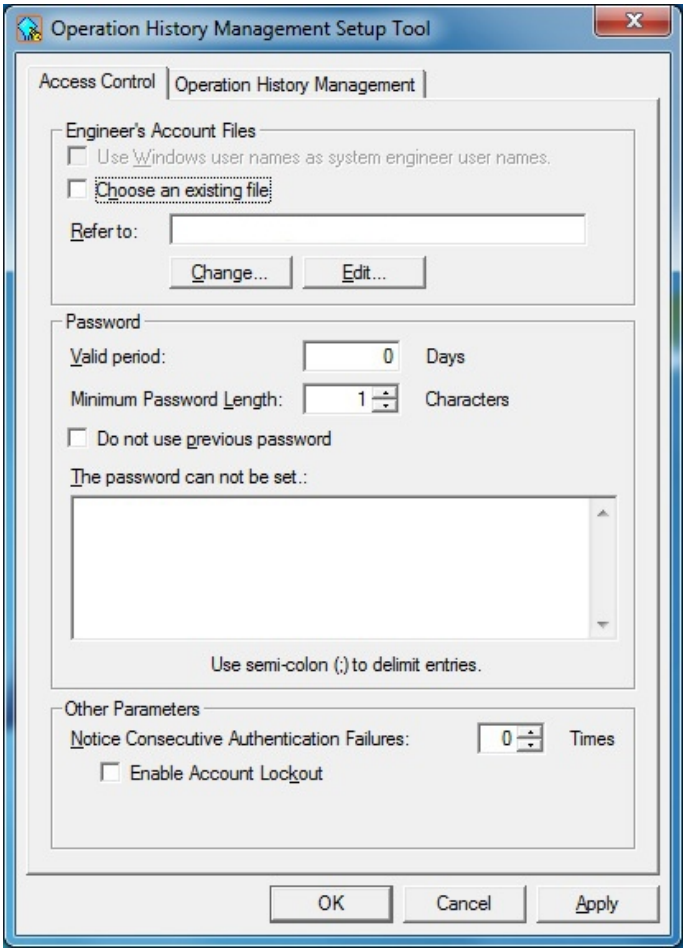


Figure E2.2.1-1 Operation History Management Startup Tool (Access Control tab sheet)

Specifying the user authentication mode

Specify whether to use ProSafe authentication mode or Windows authentication mode. Windows authentication mode can be used when the standard model security is set on the SENG PC and cannot be used when the legacy model security is set. The default setting is ProSafe authentication mode.

1. Perform the following setting on the Access Control tab sheet of the Operation History Management Setup Tool.
   - To use Windows authentication mode, select the "Use Windows user names as system engineer names" check box.

- To use ProSafe authentication mode, clear the "Use Windows user names as system engineer names" check box.

When the [OK] or [Apply] button is clicked, the setting becomes valid.

In Windows authentication mode, "Windows Authentication Mode" is displayed in the title bar of the Engineers' Account Builder. If you change from ProSafe authentication mode to Windows authentication mode, the set values of items in the categories of "Password" and "Other Parameters" are cleared.

Specifying an Engineers' Account file

The engineers' account file is the file that contains the engineers' account information edited in the Engineers' Account Builder and the access rights information set for engineers. This file is specified for each SENG PC.

After an engineers' account file is specified, the Engineers' Account Builder can be started up to register engineers and set access rights.

When creating a new engineers' account file

To create a new engineers' account file, perform the following procedure.

1. On the Access Control tab sheet of the Operation History Management Setup Tool, clear the "Choose an existing file" check box.
2. In "Refer to:", specify the folder where the engineers' account file is to be saved.

Thereafter, the default engineers' account file is created in the specified folder when the [OK] or [Apply] button is clicked.

When using an existing engineers' account file

In a system that uses multiple SENGs to allow multiple SENGs to use the same engineer names, engineer groups and access control settings such as rights, specify the existing engineers' account file on each SENG so that multiple SENGs can reference the same file.

To specify the existing engineers' account file, perform the following procedure.

1. On the Access Control tab sheet of the Operation History Management Setup Tool, select the "Choose an existing file" check box.
2. Click the [Change] button.
   The dialog box for selecting a file appears.
3. In the File Selection dialog box, specify the engineers' account file (SengSecurity.sva) to be used, and click [OK].
   The path to the engineers' account file appears in the "Refer to:" box.

Settings required when ProSafe authentication mode is selected

If you have selected ProSafe authentication mode on the Access Control tab sheet, set the password policies and the behavior when authentication fails consecutively.

Setting the password policy

To set the password policy for ProSafe authentication mode, perform the following procedure.

1. In the "Valid period" box on the Access Control tab sheet, specify the number of days passwords are valid. If 0 is specified, the valid period is unlimited. The default value is 0.
2. In the "Minimum password length" box, specify the minimum number of characters that can be registered as a password. Integers from 1 to 32 may be specified. The default value is 1.

3. To prohibit use of a password that is the same as a previously set password when a password is changed, select the "Do not use previous password" check box. By default, this is not prohibited (check box is empty).

4. If there are character strings that you wish to prohibit as passwords, enter them in the "The password can not be set" box. Setting strings that someone could easily guess can prevent the SENG from being improperly used. To specify multiple strings, separate them by semicolons. Up to 2048 single-byte characters can be specified. Nothing is specified by default.

Setting up the behavior in case of consecutive authentication failures

To set up the behavior of the system when authentication fails in ProSafe authentication mode, set the following items.

- Notice Consecutive Authentication Failures
  If a wrong password is entered consecutive times when logging onto SENG or performing engineer authentication, it can be regarded as an attempt at improper access, and can be recorded as an authentication error in the operation log. The number of times a wrong password is entered is specified, and when authentication fails consecutively the specified number of times, an authentication error occurs. If 0 is specified, an authentication error does not occur. The default value is 0.

- Enable Account Lockout
  When authentication fails consecutive times, that engineer can be locked out. Since the locked-out engineer cannot perform log-on or engineer authentication, he/she cannot perform engineering work. By default, the lockout function is disabled.

To set up the behavior in case of consecutive authentication failures, perform the following procedure.

1. To log authentication errors, specify the number of consecutive times the wrong password in the "Notice Consecutive Authentication Failures" box of the Access Control tab sheet. Specify 0 if you do not wish to log the errors.

2. To use the lockout function, select the "Enable Account Lockout" check box, and set the "Notice Consecutive Authentication Failures" to 1 or more.

TIP

If the lockout function is changed to disabled, the lockout of previously locked-out engineers is released.

Settings required when Windows authentication mode is selected

If you have selected Windows authentication mode, set the password policies and the behavior in case of consecutive authentication failures in Windows.

E2.2.2 Setup related to Operation History Management

Operation history management is performed in RS project units. To perform setup related to operation history management, perform the following settings.

Set the following items as PC settings.

- Top folder of operation history database
- Permission to start the Operation History Database Viewer

Add the RS projects for which operation history management is to be performed, and set the following items for each project.

- Free disk space when backup warning is displayed
- Whether or not to save modification files
- Whether or not to perform engineer authentication

IMPORTANT

A project for which operation history management is performed and the operation history database are associated with each other. If not correctly associated, operation history management will not work. If the project database is moved or an SCS project is added or deleted, promptly perform the required operations on the Operation History Management tab sheet.

SEE ALSO For more information about tasks required after adding, moving or deleting a project database, refer to:

"■ Tasks required after adding, moving or deleting a project database" on page E2-47

■ Specifying top folder of Operation History Database

The top folder of the operation history database is done during the procedure for adding RS projects for which operation history management is to be performed.

■ Adding an RS project for history management

To perform operation history management for a certain RS project, add it as a target of operation history management. Perform this according to the following procedure.

1. In the Operation History Management Setup Tool, display the Operation History Management tab sheet.

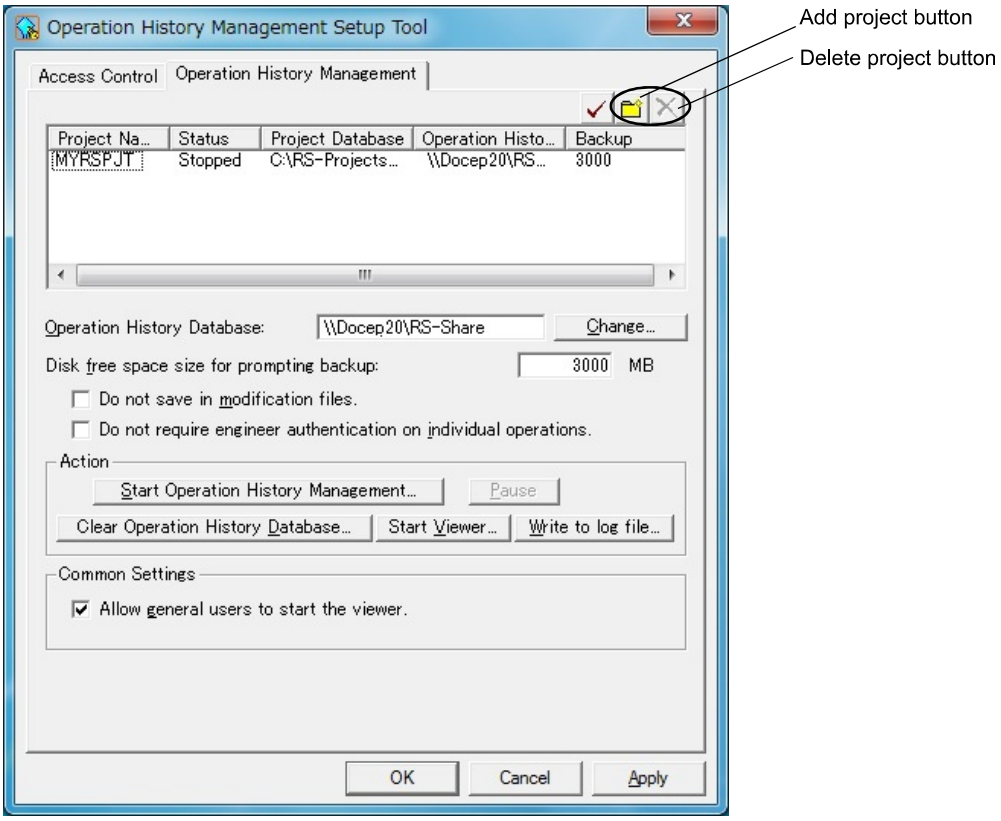

Figure E2.2.2-1 Operation History Management Setup Tool (Operation History Management tab sheet)

2. Click the Add Project button on the top right of the Operation History Management tab sheet.
   The following dialog box appears.

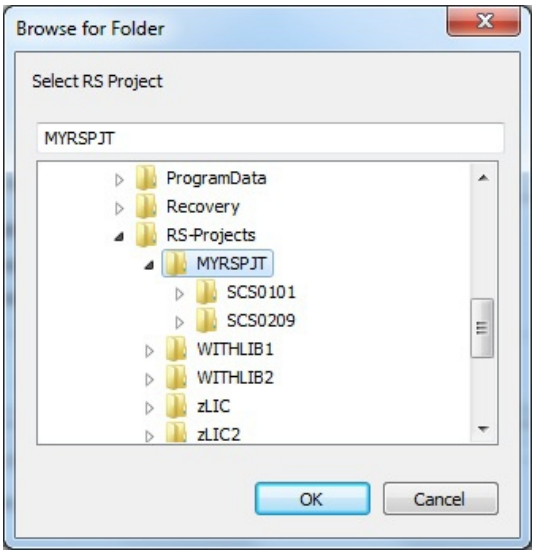

Figure E2.2.2-2 Project Selection dialog box

3. Select the folder of the RS project and click [OK].
   The selected RS project name appears in the list.

TIP

When performing operation history management on multiple PCs, use the same method of referencing the project on each PC. (Whether to reference by a network drive or in UNC format. If by a network drive, use the same drive name.)

A dialog box for selecting the top folder of the operation history database appears.

4. When adding an RS project for the first time, select the top folder of the operation history database, and click [OK].

IMPORTANT

When adding a second RS project or thereafter, the dialog box for selecting the top folder of the operation history database appears. If there is no need to change the top folder location, click [OK] in the dialog box as is.

TIP

The same operation history database folder cannot be specified for another RS project of the same name in a different location. An error message appears if there is such a duplication.

5. Specify the empty disk space for prompting backup of the operation history database. Select the RS project in the list and enter in units of MB in the "Disk free space size for prompting backup" box. The default value is 3000 MB.

IMPORTANT

As modification files accumulate in the operation history database, the amount of free disk space gradually decreases. When the remaining free space almost reaches to the specified free disk space, a dialog box appears to alert low disk space. When the remaining free space becomes lower than the specified free disk space, a dialog box appears to prompt backup and further operations to log the operation history can not be performed. When an alert dialog box appears, you should be ready to backup.

6. If you do not wish to save modification files in the operation history database, select the "Do not save in modification files" check box. By default, modification files are saved.
7. If you do not wish to perform engineer authentication (password input) for individual operations, select the "Do not require engineer authentication on individual operations" check box. By default, engineering authentication is required.

TIP

When the "Do not require engineer authentication on individual operations" check box is selected, password input is required only at logon.

Deleting an RS project from the targets of Operation History Management

To delete an RS project for which operation history management is being performed from the targets of operation history management, perform the following procedure.

1. In the list on the Operation History Management tab sheet, click the project you wish to delete.
2. Click the Delete Project button on the top right of the tab sheet.
3. In the confirmation dialog box, click [OK].
   The RS project is deleted from the list, and operation history management of the RS project stops.

The data in the operation history data base is not deleted when an RS project is deleted.

Permission to start Operation History Database Viewer

By default, only administrators can browse the operation history database.

To also enable general engineers to browse the operation history database, perform the following settings.

1. On the Operation History Management tab sheet, select the "Allow general users to start the viewer" check box.

When this is set, general engineers can start the Operation History Database Viewer. As a result, they can also start the Modification Files Viewer.

E2.2.3 Registering engineers

This section first describes the mechanism of engineer registration including initial engineers' access rights setup and shows examples of settings. The operations for registering an engineer using the Engineers' Account Builder are described next.

Flow of engineer registration operations

Engineer registration operations are performed using the Engineers' Account Builder. The contents set by the Engineers' Account Builder are saved in the engineers' account file.

To perform engineer registration operations, perform the following procedure.

1. Determine the policy for access control. (Determine the contents to be set by builder.)
2. Define access groups.
3. Create engineer groups.
4. Register each engineer's account, and assign it to an engineer group.

Steps 1 through 3 are required when using access control/operation history management for the first time. After use has begun, perform only engineer account registration for the engineer registration operations.

Determining policies for access control

Before you start working with the Engineers' Account Builder, determine the policies for access control.

- Access groups required in the system and their definition contents (determine the rights of assumed users while referring to the default access groups)
- Engineer group names to be created
- Which access group rights to grant to each engineer group
- Range of RS projects/SCS projects that each engineer group is responsible for
- Which engineer group to assign engineers to

Relationship between engineers, engineer groups and access groups

Access control in ProSafe-RS sets the access rights of engineers by assigning engineers to user groups called "engineer groups."

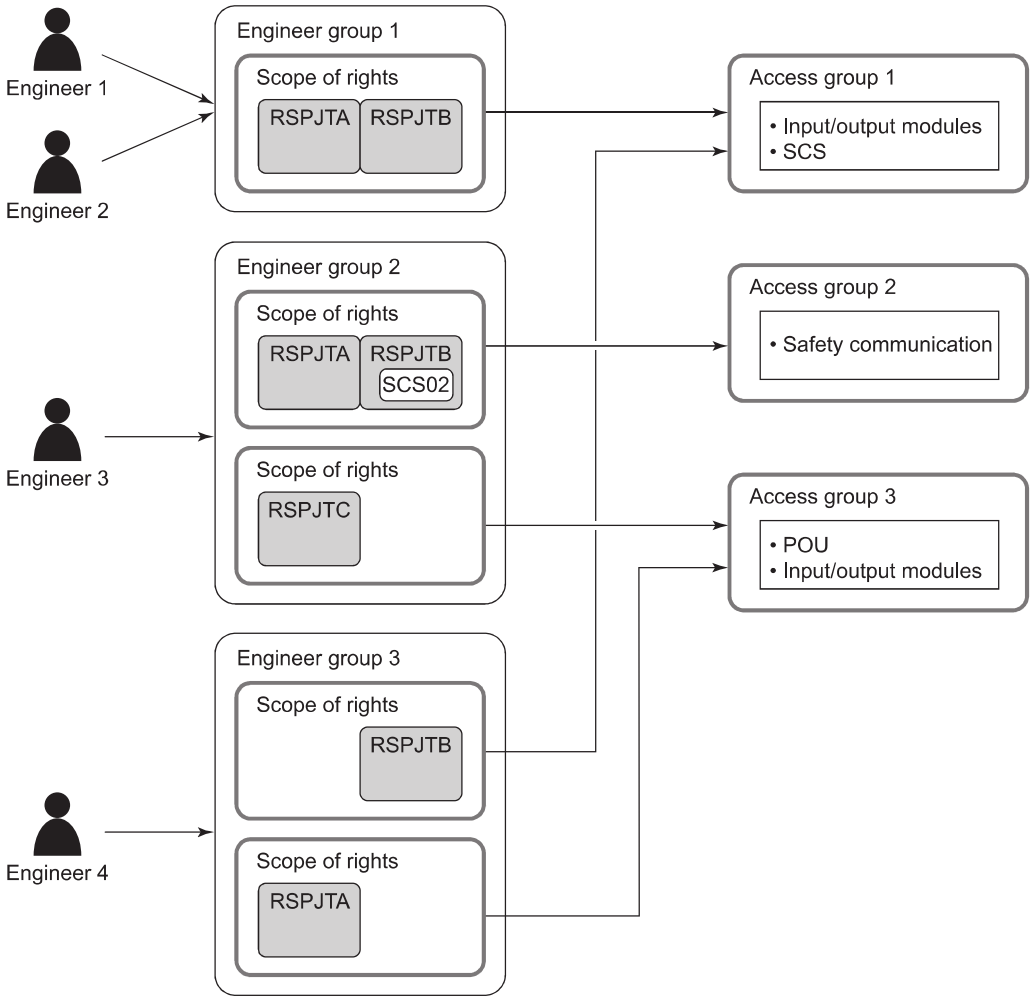

Figure E2.2.3-1 Relationship between engineers, engineer groups and access groups

One engineer may belong to one engineer group. For each engineer group, the access rights to project databases and/or SCS and the range of RS projects/SCS projects for which those rights are enabled are specified.

Access rights are set by assigning an "access group" to each engineer group. An access group is a combination of rights to execute various operations that access project databases or SCS, and needs to be predefined for the assumed user types.

Types of access rights

There are access rights for project databases and access rights for SCS/SCS simulators. These access rights are further broken down into categories.

If an engineer has access rights of a certain category, that engineer can execute the operations that pertain to that category. If he does not have access rights, he cannot execute those operations.

<Example>

- If an engineer has access rights for the Project Creation category, he can execute operations to create new SCS projects in the SCS Manager.
- If an engineer has access rights for any of the categories General Settings, POU, I/O, Safety Communication, External Communication, CENTUM Alarm Definition, Offline Download, Online Change Download and SCS Simulator, the engineer can execute the operations of build, acknowledgement by analyzers and database validity check.

SEE ALSO For more information about categories of access rights, refer to:

E2.5.2, “Access rights category list” on page E2-72

Default access groups

Default access groups are predefined in the Engineers' Account Builder.

The default access groups are ALL, which provides access rights for all categories, NONE, which provides no access rights for any categories, and Operator1, Operator2, Engineer1, Engineer2, Maintenance1 and Maintenance2, which provide typical operator, engineer and maintenance rights.

Access rights can be set up efficiently by editing these access groups. The access rights settings of each access group are as follows.

Category	ALL	NONE	Operator1	Operator2	Engineer1	Engineer2	Maintenance1	Maintenance2
Project Creation	Y					Y		
General Settings	Y					Y		
POU	Y				Y	Y		
I/O	Y				Y	Y		
Safety communication	Y					Y		
External communication	Y				Y	Y		
CENTUM Alarm Definition	Y					Y		
Version Control Tool (Check-in)	Y				Y	Y		
Version Control Tool (Check-out)	Y					Y		
Master Database Restore	Y				Y	Y		
Offline Download	Y					Y		
Online Change Download	Y				Y	Y		
Operation Mark Save	Y			Y	Y	Y	Y	Y
SCS Simulator	Y				Y	Y		
Debug	Y			Y	Y	Y		Y
Forcing	Y				Y	Y		Y
Maintenance	Y				Y	Y	Y	Y
Diagnosis Acknowledgment	Y				Y	Y	Y	Y
Message Cache	Y					Y		Y

Y: Right is granted. Blank: Right is not granted.

Figure E2.2.3-2 Default access groups

Example of adding an access group

To set up rights other than those of the default access groups, create a new access group. For example, for a certain engineer group, you may wish to add download rights to the rights of the default access group Operator2. In this case, first, copy the Operator2 access group to create a new access group named PowerOperator. Then, set the categories Offline Download and Online Change Download to Yes.

Category	PowerOperator
Project Creation	
General Settings	
POU	
I/O	
Safety communication	
External communication	
CENTUM Alarm Definition	
Version Control Tool (Check-in)	
Version Control Tool (Check-out)	
Master Database Restore	
Offline Download	Y
Online Change Download	Y
Operation Mark Save	Y
SCS Simulator	
Debug	Y
Forcing	
Maintenance	
Diagnosis Acknowledgment	
Message Cache	

Y: Right is granted. Blank: Right is not granted.

Figure E2.2.3-3 Example of adding an access group

Default engineer groups

The engineer groups shown in the following table are predefined in the Engineers' Account Builder.

Table E2.2.3-1 Default engineer groups

Engineer Group	Access Group	RS PJT Range	SCS PJT Range	Exclude RS PJT	Exclude SCS PJT
DEFGRP	ALL	*			
NONEGRP	NONE				
OPE1GRP	Operator1	*			
OPE2GRP	Operator2	*			
ENG1GRP	Engineer1	*			
ENG2GRP	Engineer2	*			
MNT1GRP	Maintenance1	*			
MNT2GRP	Maintenance2	*			

For example, access group ALL is assigned to DEFGRP for all RS projects. Access group NONE is assigned to NONEGRP for all RS projects. Engineers belonging to DEFGRP can perform all operations on all SCS projects in all RS projects. Engineers belonging to NONEGRP can only reference files in all SCS projects in all RS projects. They cannot change, create or delete files, and cannot perform operations on SCS.

The default engineer group settings are as follows.

Range of enabled access rights

Assign an access group to each engineer group, and set the range of enabled access rights. This section describes specification of the range of enabled access rights.

Setting the range of enabled access rights

By setting the following items on the Engineer Group tab sheet of the Engineers' Account Builder, the range of RS projects and SCS projects for which rights defined by the access group are enabled is specified.

- RS project range (RS PJT Range)
  Enter the RS project names for which rights specified by the access group are enabled. If "*" is specified, the rights will be enabled for all RS projects.
- SCS project range (SCS PJT Range)
  If you wish to enable rights specified by the access group only for certain SCS projects within the specified RS project range, enter the SCS project name (SCSddss or library project name). If the section is blank, rights are enabled for all SCS projects included in the specified RS project range.
- RS project exclusion range (Exclude RS PJT)
  Two types of specification may be performed for this item.
  1. If there is an RS project that you wish to exclude among the RS projects specified by the RS project range, enter that RS project name. If the section is blank, there is no exclusion range.

     For example, if "*" is specified in the "RS PJT Range" section and "MYRSPJT" is entered in the "Exclude RS PJT" section, rights specified by the access group are enabled in all RS projects except MYRSPJT.
  2. When you specify any SCS that you wish to exclude in the "Exclude SCS PJT" cell, specify the RS project to which that SCS belongs.
- SCS project exclusion range (Exclude SCS PJT)
  If there is an SCS project you wish to exclude among those included in the RS projects specified as the enabled range, enter that SCS project name (SCSddss or library project name). In this case, set the RS project to which that SCS project belongs in the "Exclude RS PJT" cell.

  If the "Exclude SCS PJT" cell is blank, the exclusion range is not set.

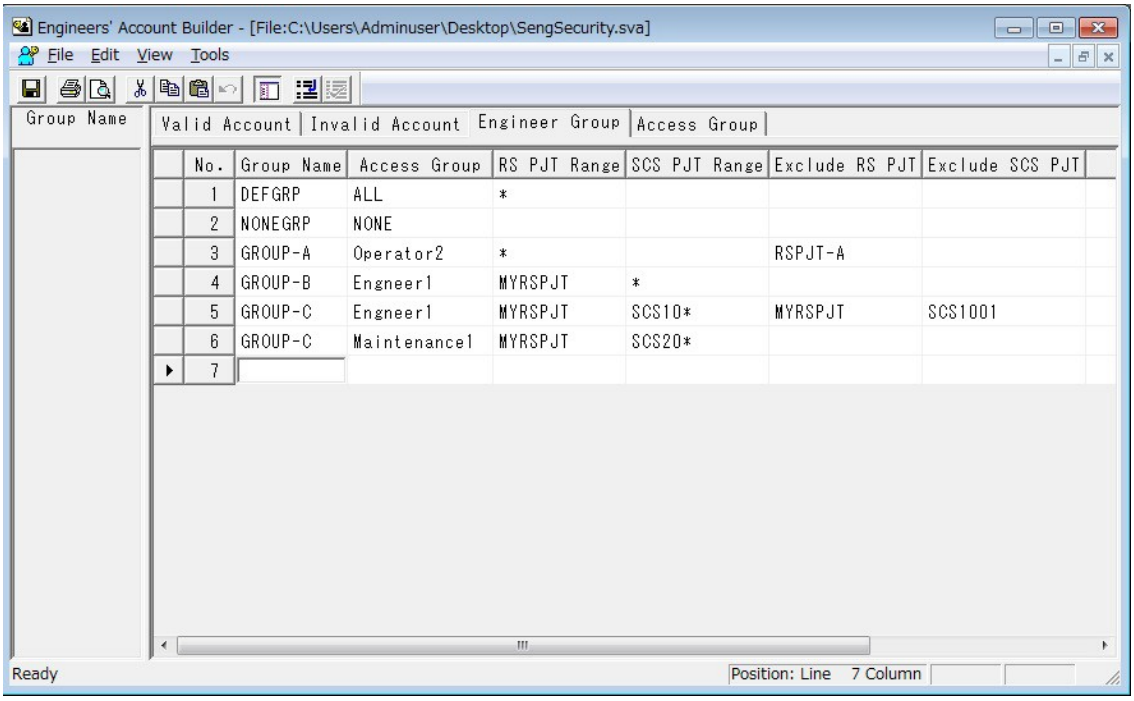

Figure E2.2.3-4 Engineer group tab sheet

Input rules for specifying the range of enabled access rights

The input rules for the "RS PJT Range," "SCS PJT Range," "Exclude RS PJT" and "Exclude SCS PJT" columns are as follows.

- When multiple items are entered in one cell, they are to be separated by commas.
- When "*" is specified, all RS projects or SCS projects are specified.

  (In SCS PJT Range, this is the same as a blank cell.)
- A wildcard "*" may be used only at the end of an RS/SCS project name.
  For example, if "MYRS*" is entered, all RS projects that begin with MYRS are specified.

  If "SCS10*" is entered, all SCS projects that begin with SCS10 are specified.

  "*" cannot be used in the middle of a project name, as in "MY*PJT" or "SCS*16".
- "RS PJT Range" and "Exclude RS PJT" may be up to 50 characters each.
  "SCS PJT Range" and "Exclude SCS PJT" may be up to 200 characters each. However, the total of the character strings specified in the four columns that define the range of enabled access rights on one line must be up to 250 characters.
- If a range of rights cannot be specified on one line, it may be specified by creating multiple lines with the same engineer group name. The range of rights in this case encompasses all ranges specified on all lines (logical OR). When an exclusion range is set on a certain line, the ranges on the other lines are not excluded.

Specifying the range of enabled access rights in SCS project units

To specify access rights ranges in SCS project units, the range of enabled access rights can be set by a combination of "RS PJT Range" and "SCS PJT Range," and the range of rights exclusion can be set by a combination of "Exclude RS PJT" and "Exclude SCS PJT." These settings may be blank but obey the following rules.

Table E2.2.3-2 Combinations of range of enabled access rights specifications

RS PJT Range (*1)	SCS PJT Range (*1)	Range of Enabled Access Rights That Is Set
-	-	Rights are not granted.
-	Specified	Setting prohibited (results in error when saved in Builder.)
Specified	-	Rights are granted for all SCS projects included in the specified RS project.
Specified	Specified	Rights are granted for the specified SCS project, among the SCS projects included in the specified RS project.

*1: -: Range is not specified and column is left blank.

Table E2.2.3-3 Combinations of range of rights exclusion specifications

Exclude RS PJT Range (*1)	Exclude SCS PJT (*1)	Range of Rights Exclusions That Is Set
-	-	There is no range of rights exclusion.
-	Specified	Setting prohibited (results in error when saved in Builder.)
Specified	-	Rights are disabled for all SCS projects included in the RS project specified by Exclude RS PJT.
Specified	Specified	Rights are disabled for the specified SCS project, among the SCS projects included in the RS project specified by Exclude RS PJT.

*1: -: Range is not specified and column is left blank.

Examples for engineer group assignment

Examples of engineer groups settings in the following system configuration are shown.

Table E2.2.3-4 Example for system configuration

RS Project Name	SCS Project Configuration
RSPJT-A	SCS0101-SCS0116
RSPJT-B	SCS1001-SCS1032
RSPJT-C	SCS2001-SCS2064

Example 1: Specifying RS project ranges

Table E2.2.3-5 Engineer group assignment example (1)

Engineer Group	Access Group	RS PJT Range	SCS PJT Range	Exclude RS PJT	Exclude SCS PJT
ENG	Engineer1	RSPJT-A	*		
MAINTE	Maintenance2	RSPJT-A	SCS011*		
OPR1	PowerOperator	*	*	RSPJT-A	

When set as shown above, the rights that each engineer group has are as follows.

- Engineers belonging to the engineer group ENG have the rights of Engineer1 for all SCS projects of the RS project RSPJT-A.
- Engineers belonging to the engineer group MAINTE have the rights of Maintenance2 for the SCS projects from SCS0110 to SCS016 of the RS project RSPJT-A.
- Engineers belonging to the engineer group OPR1 have the rights of PowerOperator for all RS projects except RSPJT-A.

Example 2: Excluding a certain SCS project

Table E2.2.3-6 Engineer group assignment example (2)

Engineer Group	Access Group	RS PJT Range	SCS PJT Range	Exclude RS PJT	Exclude SCS PJT
ENG 1	Engineer	RSPJT-A	*	RSPJT-A	SCS0101, SCS0105

When set as shown above, engineers belonging to the engineer group ENG1 have the rights of Engineer for SCS projects other than SCS0101 and SCS0105 among the SCS projects of RS project RSPJT-A. In this case, "Exclude RS PJT" specifies the location of the excluded SCS project.

Example 3: Specifying a range of enabled rights on multiple lines

A range of enabled rights can be specified on multiple lines.

Table E2.2.3-7 Engineer group assignment example (3)

Engineer Group	No.	Access Group	RS PJT Range	SCS PJT Range	Exclude RS PJT	Exclude SCS PJT
ENG 1	1	Engineer	RSPJT-A	*		
	2	Engineer	RSPJT-B	*	RSPJT-B	SCS1001

The resulting range of enabled rights of engineer group ENG1 is as follows.

Table E2.2.3-8 Rights of ENG1

RS Project	SCS Project	Result due to 1 (*1)	Result due to 2 (*1)	Granted rights
RSPJT-A	SCS0101-SCS0116	Yes	No	Engineer
RSPJT-B	SCS1001	No	No	No
	SCS1002-SCS1032	No	Yes	Engineer
RSPJT-C	SCS2001-SCS2064	No	No	No

*1: Yes: Rights are granted.
No: Rights are not granted.

Starting the Engineers' Account Builder

The Engineers' Account Builder starts up from the Operation History Management Setup Tool. Before starting it, the engineers' account file must be specified.

1. Start the Operation History Management Setup Tool.
   The Operation History Management Tool is started, and the Access Control tab appears.
2. In the "Refer to:" box, check that the path to the engineers' account file is displayed, and click the [Edit] button.
   The Engineers' Account Builder starts up.

SEE ALSO For more information about how to register an engineer registration file, refer to:

"■ Specifying an Engineers' Account file" on page E2-13

Defining access groups

To set up access rights for engineer groups, access groups must be defined in advance.

Creation of a new access group can be performed efficiently by copying a default access group or another existing access group and then editing its contents.

SEE ALSO For more information about default access groups, refer to:

"■ Default access groups" on page E2-21

Adding access groups

To add access groups, perform the following procedure.

1. Start the Engineers' Account Builder, and display the Access Group tab sheet.

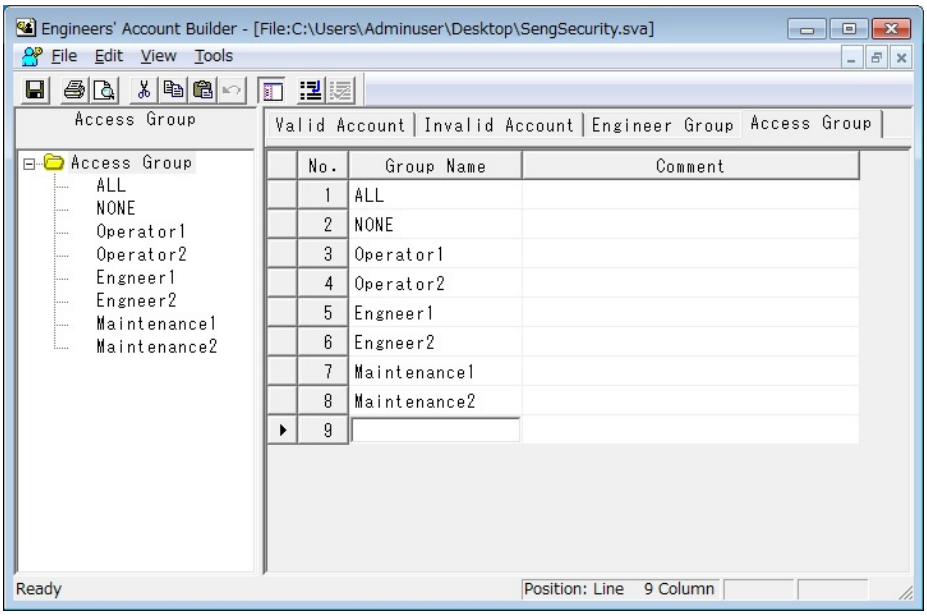

Figure E2.2.3-5 Engineers' Account Builder (Access Group tab sheet: Access Group list)

The currently defined access groups are listed.

TIP Among the access groups, ALL, NONE, Operator1, Operator2, Engineer1, Engineer2, Maintenance1 and Maintenance2 are default access groups predefined in the Builder.

2. Add a new access group to the end of the list. To create a copy of an access group that is already defined, perform the following operations.
   a. In the list, right-click the line of the access group you wish to copy, and select [Copy] from the pop-up menu. Alternatively, select a line, then select [Edit] > [Copy] from the menu bar.
   b. Right-click the blank line at the end of the list, and select [Paste] from the pop-up menu. Alternatively, select a blank line, then select [Edit] > [Paste] from the menu bar.

TIP Access groups may not only be added on the last line, but may be inserted between existing lines as well. To insert a line, select the position where you wish to insert a line in the list, and select [Edit] > [Insert Line] from the menu bar. Alternatively, select [Insert Line] from the right-click menu.

3. On the added access group line, enter the access group name and a comment.
   An access group name may be up to 16 single-byte characters. A comment may be up to 32 single-byte characters or 16 double-byte characters.

After that, set the access rights for the added access group.

Setting the rights of access groups

1. In the tree display of the Access Group tab sheet, select an access group.
   The contents of the access rights settings are listed on the right.

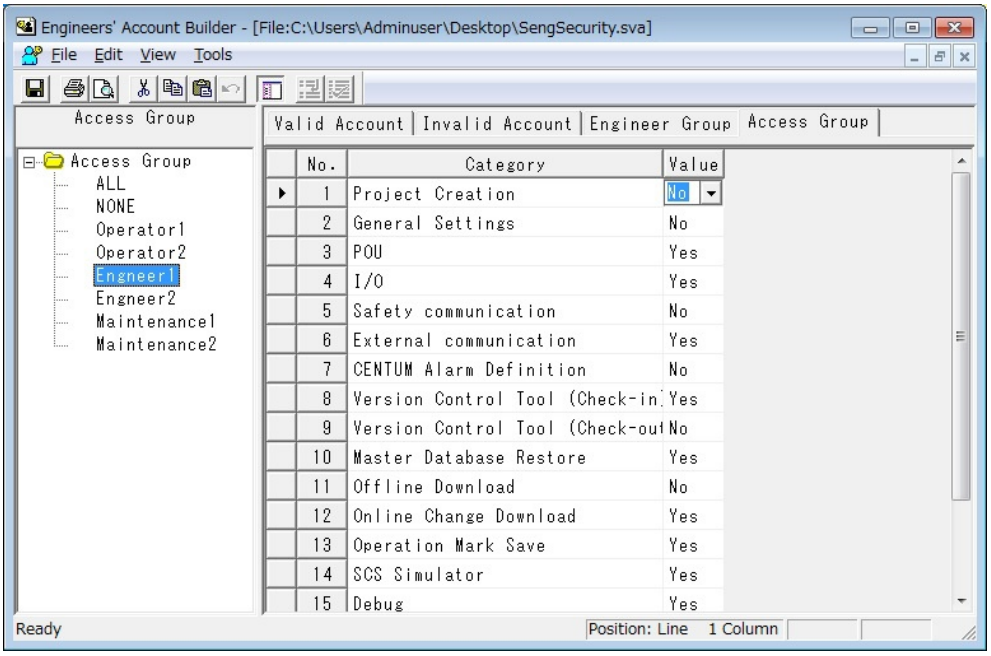

Figure E2.2.3-6 Engineers' Account Builder (Access Group tab sheet:Individual Access Group)

2. Click on the "Value" cell of each category, and select [Yes] (has rights) or [No] (does not have rights).

TIP

When the mouse pointer is placed on a category name in the list, the operations included in that category are displayed in a tooltip.

SEE ALSO

For more information about categories of access rights, refer to:

E2.5.2, “Access rights category list” on page E2-72

Deleting access groups

To delete an unnecessary access group, perform the following procedure. However, access groups that are assigned to any engineer group cannot be deleted.

1. In the tree display of the Access Group tab sheet, select the [Access Group] folder.
   Access groups are listed on the right.
2. Select the line of the access group you wish to delete, and from the right-click menu, select [Delete Line]. Alternatively, select [Edit] > [Delete Line] from the menu bar.

Saving access group definition contents

Once all of the required settings have been entered on the Access Group tab sheet, save the contents that were set.

1. From the menu bar, select [File] > [Save]. Alternatively, click the "Save" button on the toolbar.
   The new definition contents are saved to the engineers' account file.

TIP

If an access group name has been changed and that access group is assigned to an engineer group, the new access group name will be reflected in the registered information of the engineer group to which the access group is assigned.

Creating engineer groups

Once the access groups required in the system are defined, create the engineer groups. For each engineer group, assign an access group and set the range of enabled access rights defined by the access group.

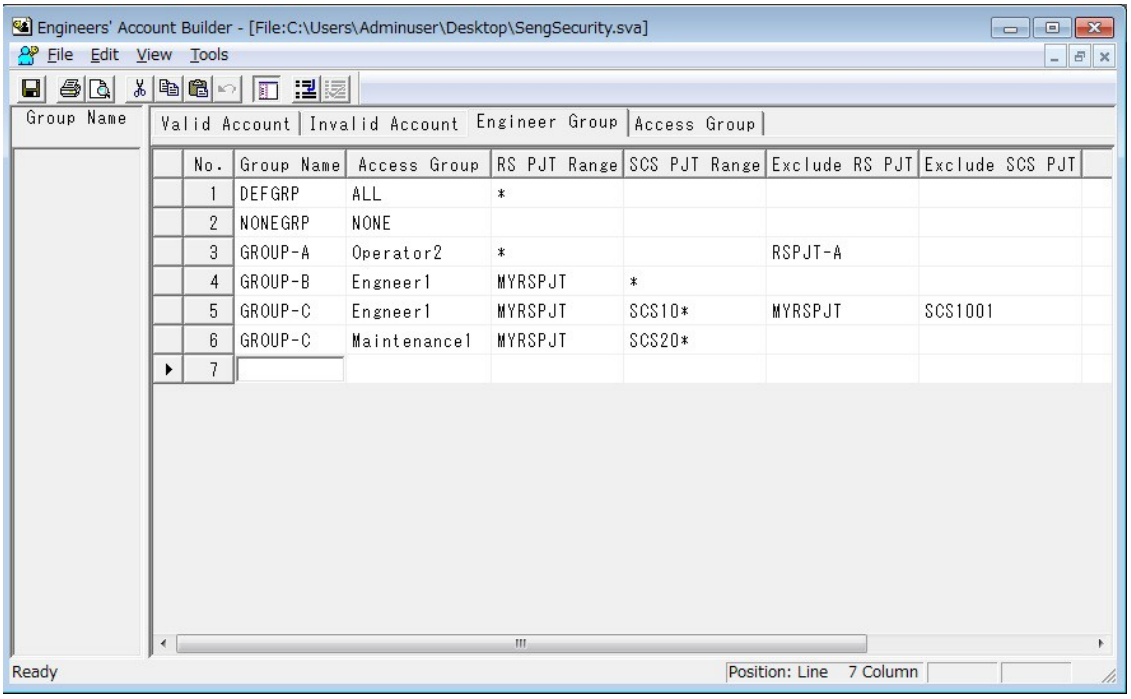

Figure E2.2.3-7 Engineer Group tab sheet

To create engineer groups, perform the following procedure.

1. Start the Engineers' Account Builder, and display the Engineer Group tab sheet.

TIP

The engineer groups DEFGRP and NONEGRP displayed in the list are the default engineer groups.

2. Click inside a cell in the "Group Name" column, and enter an engineer group name. Engineer group names may be up to 8 alphanumeric characters (not case sensitive).
3. In the combo box in the "Access Group" column, select or enter the access group you wish to assign to that engineer group.

TIP

Multiple access groups may be assigned to the same engineer group. In this case, create multiple lines with the same engineer group name, and specify different access groups on each line.

To insert a line between existing lines, right-click the position where you wish to insert it, and select [Insert Line] from the right-click menu. Alternatively, select [Edit] > [Insert Line] from the menu bar.

4. Set "RS PJT Range," "SCS PJT Range," "Exclude RS PJT" and "Exclude SCS PJT," and specify the range of enabled rights.
5. Enter comments for the engineer group if necessary. A comment may be up to 32 single-byte characters or 16 double-byte characters.
6. Similarly, create all required engineer groups.

7. Select [Save] from the [File] menu or click the "Save" button on the toolbar.
   The entered contents are saved in the engineers' account file.

After the required engineer groups are set up, engineers can be registered.

SEE ALSO For more information about items for specifying the range of enabled access rights, refer to:

"■ Range of enabled access rights" on page E2-23

For more information about examples of engineer group settings, refer to:

"■ Examples for engineer group assignment" on page E2-25

■ Registering an engineer's account

Once the access groups and engineer groups required in the system have been defined, engineers can be registered.

- An engineer name that is already registered or an engineer name that was registered and then deleted after a password was set cannot be specified. If such an engineer name is specified, an error dialog box will appear when you try to save the contents.
- Engineer names that were deleted in the past can be confirmed on the Invalid Account tab sheet.
- In Windows, upper-case and lower-case letters can be used, but in Windows authentication mode, in which the same names as Windows user names are used as engineer names, ProSafe-RS does not distinguish between upper case and lower case letters.

To register an engineer, perform the following procedure.

1. Start the Engineers' Account Builder, and display the Valid Account tab sheet.

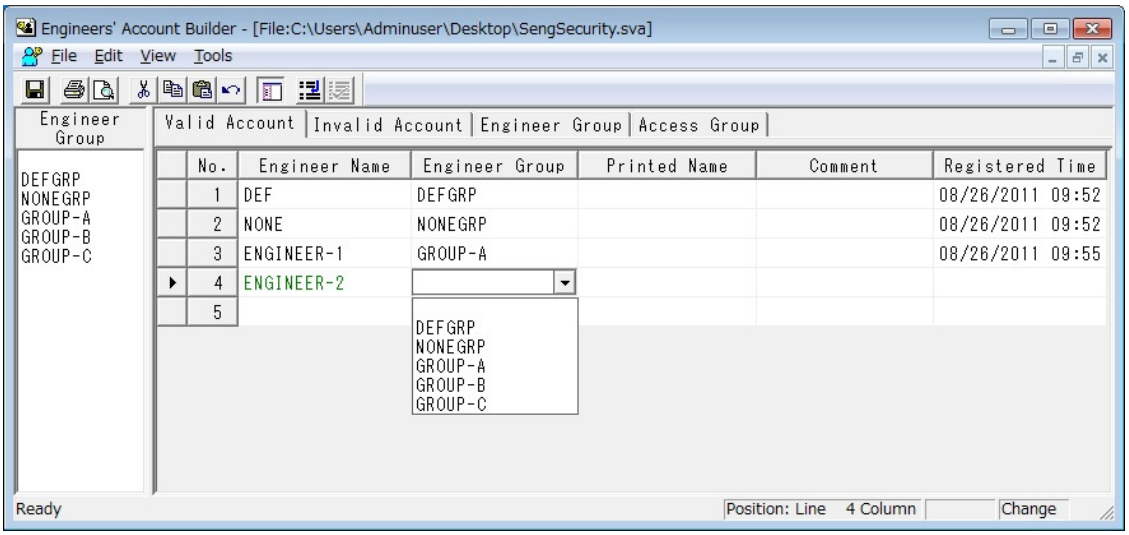

Figure E2.2.3-8 Engineers' Account Builder (Valid Account tab)

The Valid Account tab displays a list of currently registered engineers.

2. Enter the engineer name in the "Engineer Name" column on a blank line.
   Up to 16 alphanumeric characters and ASCII symbols can be specified.
   - Only uppercase characters can be used.
   - The following ASCII symbols and space characters can be used:
     ! # $ % ( ) - . ^ _ { | } ~
   - Hyphens (-) and underscores (_) may be used except as the first character.

- Names ending with a period (.) is not allowed.
- The ASCII symbols that can be used as the first characters are the following: ^ _ { | } ~

IMPORTANT

When using Windows authentication mode, make sure that the pertinent Windows user names follow the above naming rules.

3. Specify the engineer group in the "Engineer Group" column. Select an engineer group from the registered engineer group names displayed in the drop-down list.
4. In the "Printed Name" column, enter the name of the person who uses the engineer name.
   Up to 64 single-byte characters or 32 double-byte characters can be specified.
5. Enter comments in the "Comment" column.
   Up to 32 single-byte characters or 16 double-byte characters can be specified.
6. Enter all engineers in the same way.

TIP

To delete a line from the Valid Account tab sheet, select the line you wish to delete, and select [Delete Line] from the [Edit] menu.

7. For Windows authentication mode, check whether the entered engineer names exist as Windows users.
   a. From the menu bar, select [Tools] > [Check user names]. Alternatively, click the "Check user names" button in the toolbar.
      If there is an engineer name that does not exist as a Windows user, it is output in the message display area.
   b. If you wish to register an engineer name that does not exist as a Windows user, create a Windows user account of that name.
8. From the menu bar, select [File] > [Save], or click the "Save" button in the toolbar.
   The newly registered contents are saved in the engineers' account file, and the time at which the engineer was registered is displayed in the "Registered Time" column.

A password is not yet set for the newly registered engineer. The first time the engineer logs onto SENG, a dialog box for setting a password appears, and a password should be set there.

TIP

Users for local authentication:

When the system is used in a domain environment and Windows authentication mode is used, you need to create users for local authentication in order to enable log-on to SENG in an emergency situation such as when the domain controller has failed.

A user name starting with an underscore (_) is handled as a local authentication user and, for a Windows authentication, the user is authenticated on the local computer regardless of whether domain management or workgroup management is applied.

Local authentication users are not for use in normal situations. If someone attempts to log on with this user name while the domain controller is accessible, a warning message is displayed and the following message is recorded in the operation log.

Local Authentication Detected User=_xxxxxxxx

This is because there may be a problem in security if a local user account, which is for emergency use, is used while user authentication is available on the domain.

Checking invalid engineer accounts

An engineer name that was once registered and deleted after a password was set cannot be registered again. You can check such engineer names on the Invalid Account tab sheet.

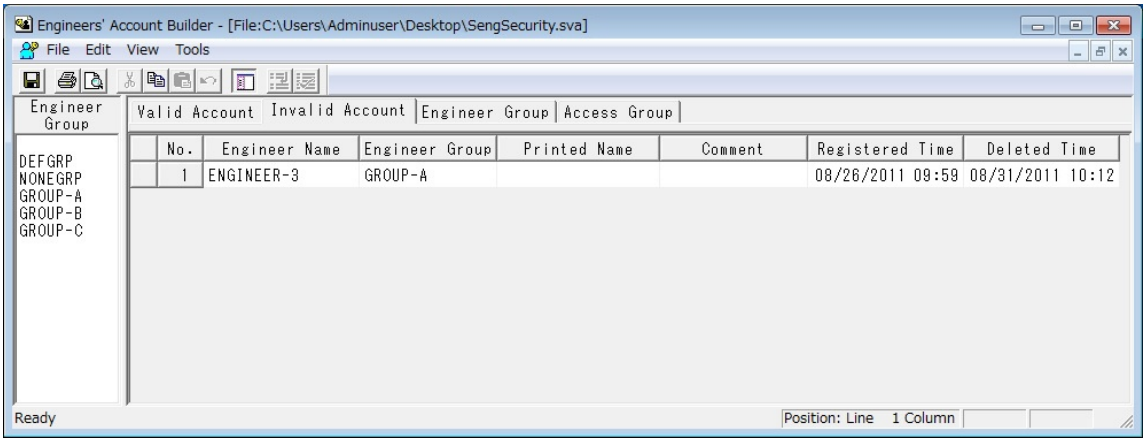

Figure E2.2.3-9 Engineers' Account Builder (Invalid Account tab sheet)

The Invalid Account tab sheet displays a list of deleted engineers. Only browsing is possible on this tab sheet, and editing cannot be performed. In addition to the information at the time of account registration, the time at which the engineer was deleted is displayed in the "Deleted Time" column.

Printing the contents set in Engineers' Account Builder

To print the contents set in the Engineers' Account Builder, perform either of the following operations.

- From the menu bar, select [File] > [Print].
- Click the "Print" button on the toolbar.

The engineer's account file name is printed in the header, and the date/time and page number are printed in the footer.

E2.2.4 Starting Operation History Management

Once the settings required for operation history management have been completed, start operation history management. Operation history management can be started in RS project units.

To start operation history management, perform the following procedure.

1. In the Operation History Management Setup Tool, display the Operation History Management tab sheet.
2. From the list, select the RS project for which you wish to begin operation history management.
3. Click the [Start Operation History Management] button.
   A dialog box for confirming start of operation history management appears.

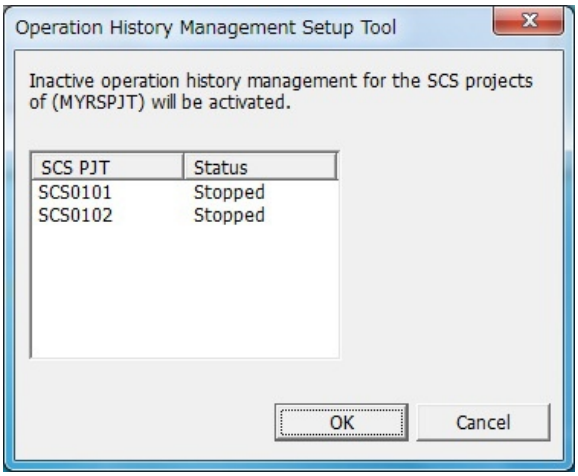

Figure E2.2.4-1 Operation History Management Start Confirmation dialog box

4. Click [OK].
   Saving of operation logs and modification files to the operation history database begins, and the operation history management start operation is logged.

TIP

- The [Start Operation History Management] button can be used when the status of the selected RS project is "Stopped" or "******". "******" means that the status of operation history management is "Running" for some SCS projects and "Stopped" for the other SCS projects that belong to the RS project.
- When operation history management is started, the newest RS project database is copied to the operation history database. For this reason, if the project database and the operation history database have become inconsistent with each other, the consistency can be recovered by starting operation history management.

E2.2.5 Window configuration of Engineers' Account Builder

This section describes the window configuration of the Engineers' Account Builder.

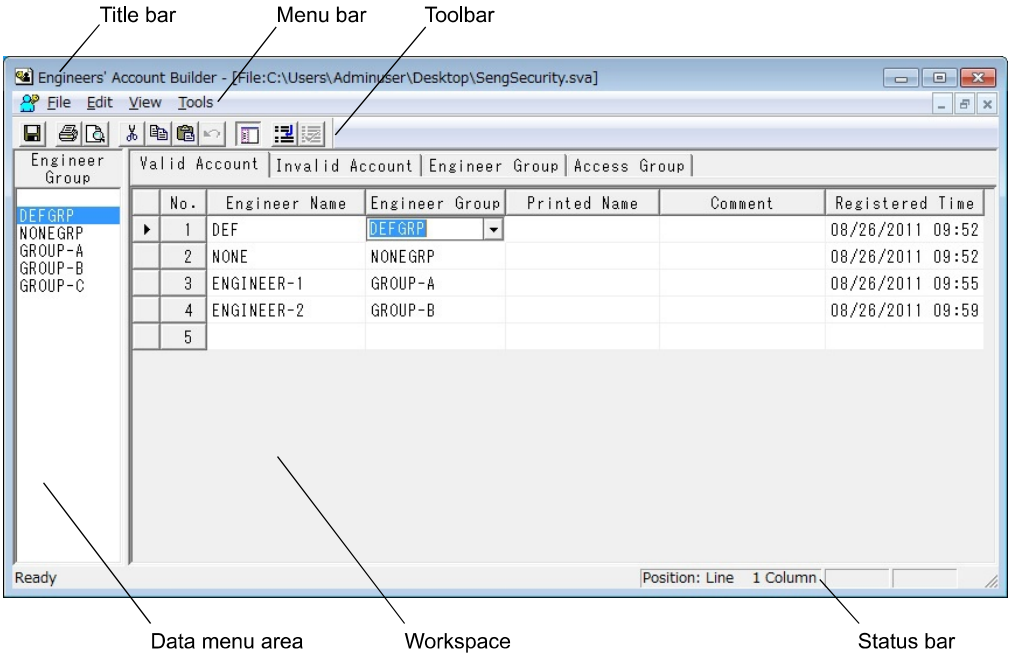

Figure E2.2.5-1 Window configuration of Engineers' Account Builder

The following tabs can be displayed in the workspace.

- Valid Account tab: Sets up engineer accounts.
- Invalid Account tab: Displays invalid engineer accounts.
- Engineer Group tab: Sets up engineer groups.
- Access Group tab: Sets up access groups.

Menu bar

This section describes the following menu bar items.

- [File] menu
- [Edit] menu
- [Tool] menu

Table E2.2.5-1 File menu

Menu Item	Description
Save	Save the contents set in the Builder into the engineers' account file.
Properties	Display the property information of the file.
Print Preview	Display the print image.
Print	Print the set contents.
Exit Builder	Close the Engineers' Account Builder.

Table E2.2.5-2 Edit menu

Menu Item	Description
Undo	Cancel the previously performed edit operation.
Cut	Delete the selected character string and copy it onto the clipboard.
Copy	Copy the selected character string onto the clipboard.
Paste	Insert the character string stored on the clipboard.
Clear	Clear the character string of the selected field.
Select All	Select all cells.
Deselect All	Cancel selected status.
Insert Line	Insert a line before the selected line.
Delete Line	Delete the selected line.
Find	Search for a character string in the set data.
Replace	Replace a character string of the set data.
Release Lockout Account	Release lockout (can be selected only in ProSafe authentication mode).
Reset Password	Reset the password (can be selected only in ProSafe authentication mode).

Table E2.2.5-3 Tool menu

Menu Item	Description
Options	Specify options.
Check User Names	Check engineer names (can be selected only in Windows authentication mode).

Toolbar

The functions of each button on the toolbar are as follows.

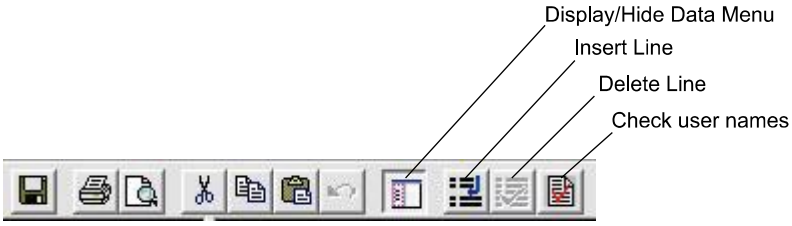

Figure E2.2.5-2 Toolbar buttons and names

Table E2.2.5-4 Functions of toolbar

Name	Description
Display/Hide Data Menu	Shows or hides the data menu area
Insert Line	Inserts a line before the selected line
Delete Line	Deletes the selected line
Check User Names	Performs engineer name check (available only in Windows authentication mode)

E2.3 Operations of SENG that use Access Control/Operation History Management

This section describes the operations of engineers and the operations of administrators in a system that uses access control/operation history management.

SEE ALSO For more information about operations that are subject to access control / operation history management, refer to:

E2.1.3, “Access Control/Operation History Management target operation list” on page E2-7

E2.3.1 Engineer operations under access control

In systems where access control/operation history management is used, when an engineer operates the SCS Manager, the various builders, the Engineering Tool or the SCS Maintenance Support Tool, logon/engineer authentication and rights checking are performed for operation control and operations are logged.

This section describes the following access control-related operations, which are performed when an engineer uses SENG.

- Logging on to SENG function
- Engineer authentication
- Operation control by rights checking
- Changing a password

Logging on to SENG function

Logon is performed to check that the engineer who attempts to start SENG operations is a registered engineer.

After starting SENG, when any of the following programs is started, a Logon dialog box appears, and the engineer name and password are requested.

- SCS Manager
- SCS Status Overview window (only when started from the Start menu)
- IOM Control Right Switching Tool
- Master Database Restoring Function
- Version Control Tool
- Message Cache Tool

TIP

After logging on to any of the above programs, logon is not required when starting any other program. In this case, a confirmation dialog box appears, showing the currently logged on engineer.

Logon operations are as follows.

1. Perform operations to start a program that requires logon.
   The Logon dialog box appears.

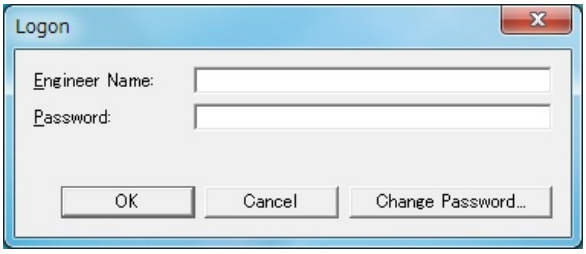

Figure E2.3.1-1 Logon dialog box (ProSafe authentication mode)

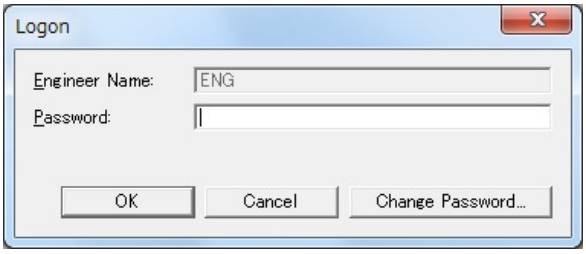

Figure E2.3.1-2 Logon dialog box (Windows authentication mode)

In the case of Windows authentication mode, the user name logged on to Windows as an engineer is displayed in gray, and cannot be changed.

2. In the case of ProSafe authentication mode, enter the engineer name and password, and click [OK]. In the case of Windows authentication mode, enter the password for the Windows user, and click [OK].
   If the engineer name and password match the registered information, the program is started.

Once work using SENG is finished, log out by closing all programs that require logon when started.

● Logon operation immediately after engineer registration

In ProSafe authentication mode, when an engineer logs on for the first time after being registered, no password is set for the engineer. In this case, perform the following operations.

1. In the Logon dialog box, enter the engineer name and click [OK].
   A dialog box that prompts password registration appears.
2. Click [OK].
   In the Password Change dialog box that appears, set a password.

   You can use up to 63 alphanumeric characters and ASCII symbols for a password.

   - Passwords are case sensitive.
   - The following ASCII symbols and space characters can be used:

     ! " # $ % & ' ( ) * + , - . / : ; < = > ? @ [\ ] ^ _ { | } ~

     However, semicolons (;) are not allowed in ProSafe authentication mode.
   - In ProSafe authentication mode, passwords need to follow the password policies set with the Operation History Management Setup Tool.
   - In Windows authentication mode, passwords need to follow the password policies set for Windows.

■ Engineer authentication

Engineer authentication is performed to confirm the engineer who attempts an SENG operation that affects an actual SCS. The operation cannot be executed unless the password of the engineer logged on is entered. The operations that require engineer authentication are as follows.

- Offline Download
- Master Offline Download
- Online Change Download
- SCS Restart
- SCS Security Level Password Change
- Output Enable Operation

- Output Module Start
- IOM Download

The engineer authentication operations are as follows.

1. When any of the above operations is performed, the Engineer Authentication dialog box appears.

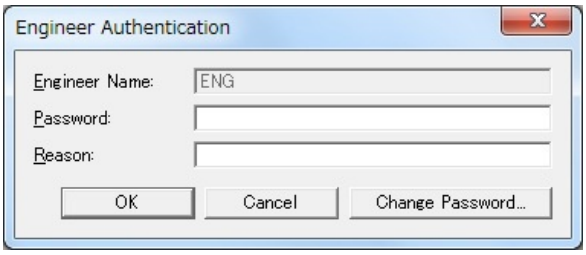

Figure E2.3.1-3 Engineer Authentication dialog box

   The name of the engineer logged on is displayed in gray in the engineer name box.

2. Enter the password and the reason for performing the operation, and click [OK].

If the engineer name and password match the registered information, the operation is executed. The "Reason" character string that was entered is recorded in the operation log.

Operations when Log-on/Engineer authentication fails

If log-on/engineer authentication fails consecutively the set number of times, an error message is displayed and an authentication error is recorded in the operation log. The behavior after an authentication error has occurred is as follows.

- If the lockout function is enabled, the engineer is locked out. The Log-on/Engineer Authentication dialog box appears even after lockout, but authentication will not succeed for the locked-out engineer name. An authentication error is not generated in this case. To release lockout, ask the administrator.
- If the lockout function is disabled, an authentication error is recorded each time the engineer enters the wrong password. If the correct password is entered, authentication is successful.

SEE ALSO For more information about setting a lockout due to an authentication failure, refer to:

"■ Settings required when ProSafe authentication mode is selected" on page E2-13

For more information about how to release a locked-out engineer, refer to:

"■ Releasing a locked-out engineer" on page E2-42

Operation control by rights checking

When an engineer attempts to perform an operation on a project database or SCS, if the engineer does not have the right to perform that operation, a warning dialog box appears and that operation cannot be performed. Or, the relevant menu may be grayed out to disable the operation.

Also, when a project is opened in SCS Manager, the following warning dialog box appears, according to the rights of the engineer.

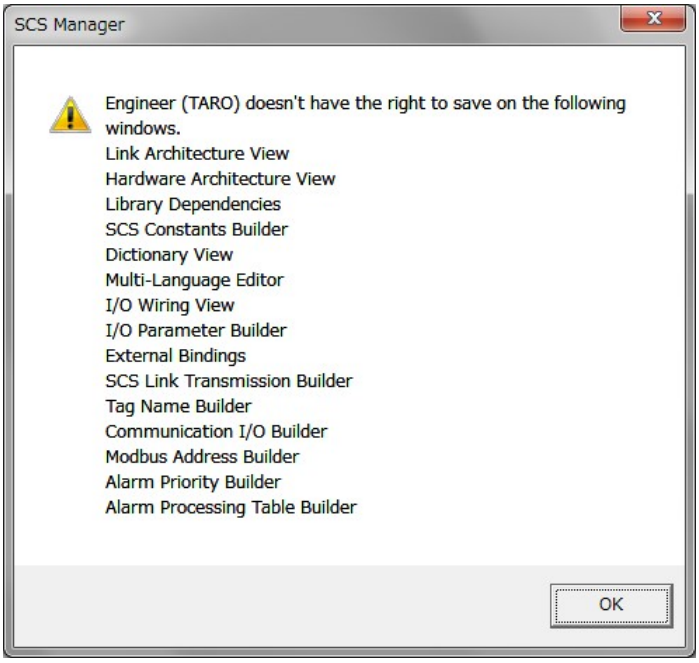

Figure E2.3.1-4 Warning dialog box when project is opened (example where all items are displayed)

Changing a password

To change the password for logon and engineer authentication, perform the following procedure.

1. Perform an operation that requires logon or engineer authentication.
   The Logon dialog box or Engineer Authentication dialog box appears.
2. Enter the engineer name and password, and click [Change Password].
   The Password Change dialog box appears.

   If the entered engineer name and password are incorrect, it results in an authentication error and the password cannot be changed.
3. Enter the new password in "New Password:" and "Confirm New Password:", and click [OK].

TIP

- If a valid period for passwords has been set, a warning dialog box appears if an operation that requires logon or engineer authentication is performed within 14 days before the end of the valid period. Change the password ahead of time.
- If the valid period for passwords has passed, the Password Change dialog box appears. Set a new password. If the password is not changed, logon/engineer authentication will fail.

SEE ALSO

For more information about characters that can be used in the password, refer to:

"● Logon operation immediately after engineer registration" on page E2-38

For more information about structuring the operation history database , refer to:

E2.5.1, "Operation history database structure" on page E2-71

E2.3.2 Operations performed by administrators

This section describes the operations performed by administrators in a system that uses access control/operation history management.

Checking the operating status of Operation History Management of each project

On the Operation History Management tab of the Operation History Management Setup Tool, it can be confirmed whether operation history management is running for each project.

To confirm the operating status of operation history management, perform the following procedure.

1. Start the Operation History Management Setup Tool.
   The Operation History Management Setup Tool starts.
2. Display the Operation History Management tab sheet, and confirm the operation history management status of RS projects in the "Status" column of the project list.

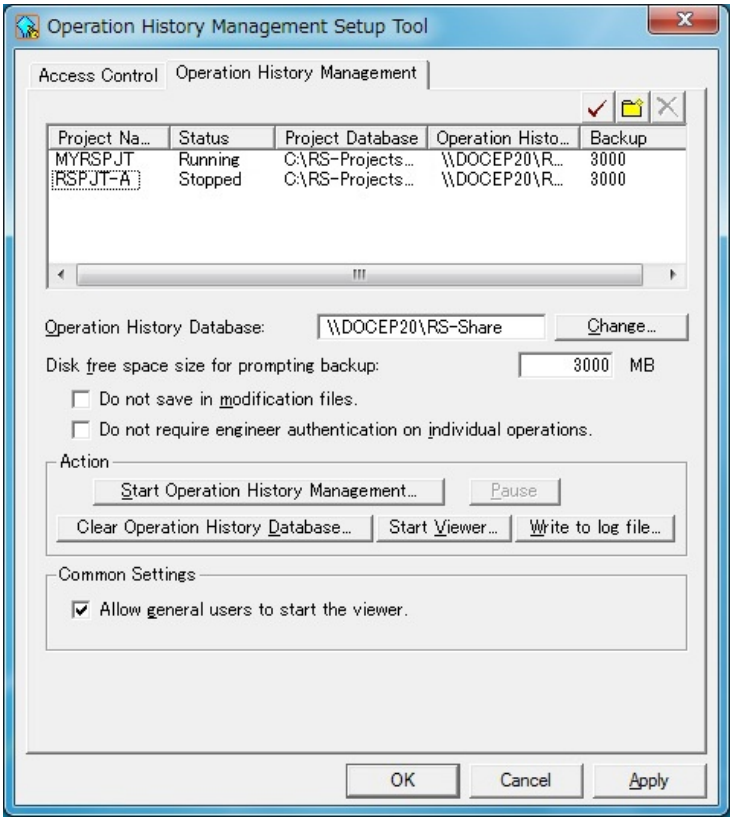

Figure E2.3.2-1 Operation History Management tab sheet

3. Except when the display in the Status column is "Running," confirm whether or not operation history management is running for each SCS project included in the RS project.
   a. Select an RS project on the project list and right-click.
   b. From the displayed pop-up menu, select [Display Details].
      The detailed statuses of the SCS projects appears.

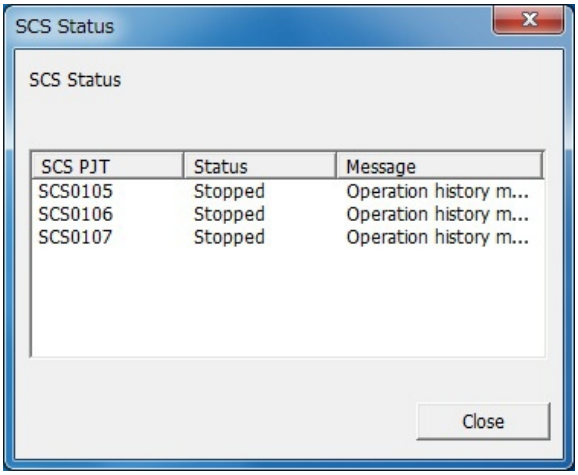

Figure E2.3.2-2 Detailed status display of SCS projects

● Operation History Management statuses of RS projects

The operation history management statuses of RS projects displayed on the Operation History Management tab of the Operation History Management Setup Tool are shown in the following table.

Table E2.3.2-1 Operation History Management statuses of RS projects

Status	Description
Running	The operation history management function is running for all SCS projects belonging to the RS project.
******	• Of the SCS projects belonging to the RS project, the operation history management function is running for some SCS projects and stopped for other SCS projects. (*1) • The RS project does not exist.
Stopped	The operation history management function has not been started or is stopped for all SCS projects belonging to the RS project.

*1: Even if operation history management was started in a batch for the RS project, subsequent actions of copying SCS project and adding it to RS project will result in a mix of SCS projects, some with operation history management running and some with operation history management not running.
When a SCS project is newly generated and added to a RS project, the RS project in the state of running allows the added SCS project to run.

● Messages displayed in the SCS Detailed Status dialog box

In the SCS Detailed Status dialog box, the following two types of messages are displayed in the Message column of SCS projects whose status is "Stopped."

Table E2.3.2-2 Messages displayed in the SCS Detailed Status dialog box

Message	Description
Inconsistent with the operation history database.	Inconsistent with the operation history database. In this case, to recover consistency, start operation history management for the RS project that includes this SCS.
Operation history management is not set up.	Operation history management has not been started.

■ Releasing a locked-out engineer

An engineer who has failed in logon or engineer authentication consecutively the set number of times is locked out. The administrator releases locked-out engineers as necessary.

In ProSafe authentication mode

Lockout is released on the Valid Account tab sheet of the Engineers' Account Builder.

On the Valid Account tab sheet, an asterisk (*) is displayed next to the names of locked-out engineers, and the setting contents of those engineers cannot be changed.

To release locked-out engineers, perform the following procedure.

1. Start the Operation History Management Setup Tool.
2. Click the [Edit] button on the Access Control tab sheet.
   The Engineers' Account Builder is started.
3. On the Valid Account tab sheet, select the line of the engineer you wish to release from lockout. Multiple lines can be selected.
4. From the [Edit] menu, select [Release Lockout Account].
5. A dialog box appears to confirm lockout release, beginning at the top, for locked-out engineers among the selected engineers. To release lockout, click [OK].

When lockout is released, the asterisk next to the engineer name is deleted, and the contents of that line can be changed.

In Windows authentication mode

When in Windows authentication mode, release locked-out users by management tools on the Windows side. Note that in the Engineers' Account Builder, an asterisk (*) is not displayed next to locked-out engineers.

Resetting a password

This section describes the procedure for resetting an engineer's password when in ProSafe authentication mode. When in Windows authentication mode, reset the password using management tools on the Windows side.

1. Start the Operation History Management Setup Tool.
2. Click the [Edit] button on the Access Control tab sheet.
   The Engineers' Account Builder is started.
3. In the Valid Account tab sheet, select the line of the engineer whose password you wish to reset (multiple lines may be selected).
4. From the menu bar, select [Edit] > [Reset Password].
   A dialog box appears to confirm password reset, beginning at the top for the selected engineers.
5. To reset the password, click [OK].

Writing comments to Operation log files

Log entries of any character strings may be written to the operation log files of a specified project. The written comments may be viewed as operation logs in the Operation History Database Viewer.

To write a comment to an operation log file, perform the following procedure.

1. Start the Operation History Management Setup Tool, and display the Operation History Management tab sheet.
2. Select an RS project from the list and click the [Write to log file] button.
   The following dialog box appears.

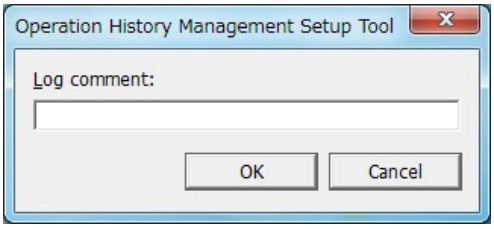

Figure E2.3.2-3 Log Writing dialog box

3. Enter a comment.
   A comment may be up to 64 single-byte characters or 32 double-byte characters.
4. Click [OK].
   The comment is written to the operation log file.

Backing up

Creating a backup copy of operation history database has to be performed manually.

IMPORTANT

Browsing a backup copy of operation history database also requires a backup copy of the target RS project for the operation history management. You must perform backup both of them. Please note that you will no longer be able to browse the contents in the operation history database of a SCS project once you delete the SCS project in RS project. When you wish to delete a SCS project, ensure to make a backup copy of the relative RS project so that you can browse the backup copy of the operation history database later.

Steps to backup

1. Using Windows Explorer, create backup copies of the top folder and all its subfolders of the operation history database into an auxiliary storage device. This operation allows you to backup the entire operation log database and modification file database.
2. Stop the operation history management.
3. Delete modification file database by means of the operation history setup tool. Since the operation log database remains untouched, the entire operation logs can be shown in the viewer.
4. Create a backup copy of the target RS project for the operation history management into an auxiliary storage device.
5. Restart the operation history management.

Operations when warning message prompting backup appears

When you perform an operation that causes saving of modification files or operation log, a warning message prompting backup of the operation history database may appear. If such message appears, make a backup of the operation history database, and delete the operation history management data saved in SENG.

Normally, free disk space can be secured by deleting only the modification files in the operation history database. By the following procedure, only the modification files are deleted, so you can still view all operation logs in the viewer after the deletion.

When a warning message prompting backup is displayed, perform the following procedure.

1. Using Windows Explorer, copy the top folder and all its subfolders of the operation history database to an auxiliary storage device.

By so doing, the entire operation log database and modification file database are backed up.

2. Start the Operation History Management Setup Tool, and display the Operation History Management tab sheet.
3. For each RS project, perform the following steps to stop operation history management, delete modification files, and then resume operation history management.
   a. Select an RS project on the project list and click the [Pause] button.
      Operation history management of the selected RS project stops.
   b. Click the [Clear Operation History Database] button.
      The following dialog box appears.

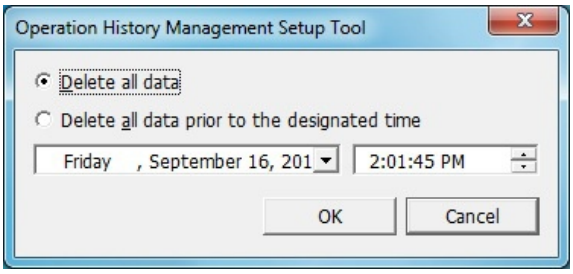

Figure E2.3.2-4 Delete Operation History Database dialog box

   c. To delete all modification files, select "Delete all data." To delete only the modification files prior to a specified time, select "Delete all data prior to the designated time," and enter the date and time.
   d. Click [OK].
      The selected modification files of the RS project are deleted.
   e. Click the [Start Operation History Management] button to resume operation history management of the RS project.
4. Repeat the above procedure, and delete the modification files for all RS projects.

SEE ALSO For more information about how to browse the data of a backed-up operation history database, refer to:

E2.4.3, “Steps to browse backed-up operation history database” on page E2-67

Initializing the Operation History Database

The procedure for initializing the operation history database and starting operation history management with a new operation history database in the same location will be described. By this procedure, all operation log files and modification files accumulated on the PC are deleted.

To initialize the operation history database and restart operation history management, perform the following procedure.

1. Start the Operation History Management Setup Tool, and display the Operation History Management tab sheet.
2. Select the RS project from the project list and click the [Pause] button.
   Operation history management of the selected RS project stops.
3. Similarly, stop operation history management of all RS projects.
4. To make a backup, using Windows Explorer, copy the top folder of the operation history database and all its subfolders to an auxiliary storage device.
5. Using Windows Explorer, delete all folders and files under the top folder of the operation history database of the RS project for which operation history management was stopped.

6. On the Operation History Management tab sheet, select the RS project, and click the [Start Operation History Management] button to restart operation history management.
7. Similarly, restart operation history management of all RS projects.

After operation history management is restarted, the serial numbers of the operation logs start at one.

■ Adding an engineer

To add an engineer, register the engineer's account on the Valid Account tab sheet of the Engineers' Account Builder.

SEE ALSO For more information about how to register the account of an engineer, refer to:

"■ Registering an engineer's account" on page E2-30

■ Deleting an engineer

Deletion of engineers is performed on the Valid Account tab sheet of the Engineers' Account Builder.

To delete engineers, perform the following procedure.

1. Start the Operation History Management Setup Tool.
2. Click the [Edit] button on the Access Control tab sheet.
   The Engineers' Account Builder is started.
3. On the Valid Account tab sheet, select the line of the engineer name you wish to delete, and select [Delete Line] from the [Edit] menu.
   The selected line is deleted.
4. Select [Save] from the [File] menu.
   The changed contents are saved in the engineers' account file, and the deleted engineer's account becomes invalid.

IMPORTANT

If you delete a registered engineer for whom a password is already set, that engineer name is deleted from the table on the Valid Account tab, and is added to the Invalid Account tab. It cannot be completely deleted from the database. An engineer name of this type cannot be registered again.

■ Changing an engineer's rights

To change the rights of a registered engineer, the following operations may be required.

- Change the engineer group to which the engineer belongs.
- Change the access group assigned to the engineer group.
- Change the range/exclusion range of RS projects/SCS projects assigned to the engineer group.
- Change the access group definitions.

Perform these operations in accordance with the rights to be changed.

SEE ALSO For more information about how to change the above settings in order to change the rights of an engineer, refer to:

E2.2.3, "Registering engineers" on page E2-19

Operations when inconsistency is detected between project and operation history database

When the Operation History Management tab sheet of the Operation History Management Setup Tool is displayed, consistency between the project and operation history database is checked. If an inconsistency is detected, the following message is displayed.

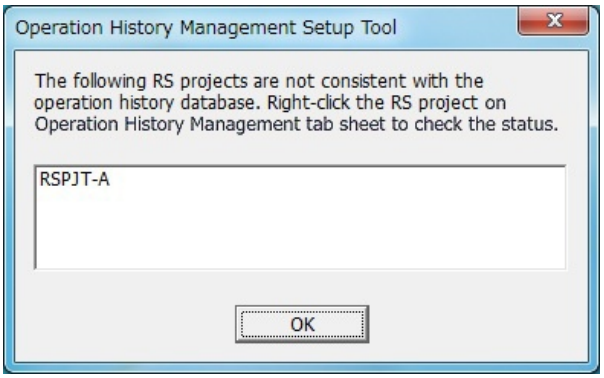

Figure E2.3.2-5 Message when inconsistency detected (Example)

Perform the following procedure to resolve the database inconsistency.

1. On the Operation History Management tab sheet, check the status of the RS projects displayed in the preceding message and the detailed status of their SCS projects.
2. Select an applicable RS project on the project list and click the [Start Operation History Management] button.

TIP

If the [Start Operation History Management] button is grayed out and disabled, click the [Pause] button to stop operation history management of the selected RS project, and then click the [Start Operation History Management] button.

SEE ALSO

For more information about checking the status of an RS project and the detailed status of the SCS, refer to:

"■ Checking the operating status of Operation History Management of each project" on page E2-41

Tasks required after adding, moving or deleting a project database

When the database of a project that is the target of operation history management is moved, or when an SCS project is added or deleted, the project database and the operation history database become inconsistent with each other. Also, operation history management is not executed for the added or moved SCS project.

IMPORTANT

A project for which operation history management is performed and the operation history database must be associated with each other. If not correctly associated, operation history management will not work. The following operations must be performed after adding, moving or deleting a project database.

For operation history management to be executed correctly, the following operations are required on the Operation History Management tab sheet of the Operation History Management Setup Tool.

- If an RS project was added

After adding the added RS project as a target of operation history management and performing the required setup, start operation history management.

- If an RS project for which operation history management was already being executed was moved
  After temporarily deleting the RS project as a target of operation history management and then adding it anew and performing the required setup, start operation history management.
- If an RS project was deleted
  Delete the deleted RS project as a target of operation history management.
- If an SCS project was added, moved or deleted
  For an RS project for which operation history management was already being executed, after an SCS project has been added, moved or deleted, stop operation history management of the RS project that includes that SCS project, and then start operation history management again.

SEE ALSO For more information about how to add or delete an RS project as a subject of operation history management and settings related to the operation history management, refer to:

E2.2.2, “Setup related to Operation History Management” on page E2-15

For more information about how to stop or start operation history management, refer to:

“■ Stopping/Resuming Operation History Management” on page E2-49

■ Tasks required after changing user authentication mode

This section describes the operations required after changing the user authentication mode. Note that the engineer's account information does not change if the user authentication mode is changed.

● When changed from ProSafe authentication mode to Windows authentication mode

The Windows password policy and user lockout settings are applied. The status of a user who has been locked out is not inherited.

- Execute an engineer name check to clear out the names that are not registered in Windows, and set up accounts if necessary.
- Since passwords are not inherited, set up passwords in Windows.
- If you wish the status of locked out users to continue, set this up in management tools on the Windows side.

● When changed from Windows authentication mode to ProSafe authentication mode

Password policy and user lockout settings must be set anew on the ProSafe-RS side. The status of a user who has been locked out is not inherited.

- In the operation history management setup tool, perform password policy and user lockout settings.
- Set a password when your are prompted to when logging onto the SENG function for the first time.

SEE ALSO For more information about how to set up password policies and user lockout unique to ProSafe-RS, refer to:

“■ Settings required when ProSafe authentication mode is selected” on page E2-13

Checking engineer names in Windows authentication mode

In Windows authentication mode, engineer names registered on the builder must be registered as Windows users.

To check whether or not a registered engineer name exists as a Windows user, perform the following procedure.

1. Start the Operation History Management Setup Tool.
2. Click the [Edit] button on the Access Control tab sheet.
   The Engineers' Account Builder is started.
3. From the start menu, select [Tools] > [Check user names].
   Engineer names that do not exist as Windows users are output in the message display area.

If there is a user name that does not exist, create a user account in Windows.

Stopping/Resuming Operation History Management

You must stop history management before backing up or deleting the operation history database, and resume it after you finish the task. Operation history management can be stopped/resumed for each RS project individually.

Stopping Operation History Management

1. Start the Operation History Management Setup Tool, and display the Operation History Management tab sheet.
2. On the project list, select the RS project for which you wish to stop operation history management and click the [Pause] button, and then click [OK].

After the stopping operation log is recorded, saving of the operation logs and modification files stops.

Resuming Operation History Management

The operations are the same as starting operation history management.

1. In the project list of the Operation History Management tab sheet, select the RS project for which operation history management is to be resumed, and click the [Start Operation History Management] button.
2. In the confirmation dialog box, click [OK].

Saving of operation logs and modification files to the operation history database begins, and the operation history management start operation is logged.

Steps to update at PC failures

Updating a PC where Operation History Management function is running

When you wish to replace a PC where operation history management is performed due to PC failures, register operation history database of the relative RS project on the restored PC by means of the operation history setup tool and then restart the operation history management.

Updating a PC where operation history database is implemented

When you wish to replace a PC where operation history database is implemented due to PC failures, create a shared folder "RS-Share" in the replacement PC, perform IT security tool and then perform the following steps to start operation history management by means of operation history setup tool in a PC where operation history management function runs.

- When you wish to create new operation history database:
  1. If operation history management is being performed for an RS project, you need to remove its registration.
  2. Register the location of RS project and operation history database again.
  3. Start operation history management.
- When you wish to use a backup copy of the operation history database:
  1. If operation history management is being performed for an RS project, you need to remove its registration.
  2. Restore the operation history database to the original location.
  3. Register the location of RS project and operation history database again.
  4. Start operation history management.

E2.4 Browsing operation history data

Operation history data such as operation logs and modification files saved in the operation history database can be browsed in the Operation History Database Viewer and Modification Files Viewer.

IMPORTANT

By default, only administrators can browse operation history data. To also enable general engineers to browse operation history data, perform the following settings in the Operation History Management Setup Tool.

SEE ALSO For more information about how to allow browsing of operation history data by general engineers, refer to:

"■ Permission to start Operation History Database Viewer" on page E2-17

■ Functions of Operation History Database Viewer

The Operation History Database Viewer is for browsing operation logs in the operation history database, and has the following functions.

- List display of operation logs
- Searching of operation logs
- Sorting of operation logs
- Displaying details of operation logs
- Printing of operation logs
- Exporting of operation log lists to CSV files
- Startup of the Modification Files Viewer

■ Functions of Modification Files Viewer

The Modification Files Viewer is a viewer for browsing modification files in the operation history database, and has the following functions.

- Displaying the modification files database tree
- Searching modification files
- Acquiring modification files
- Displaying the contents of modification files
- Displaying differences of modification files
- Printing modification files

E2.4.1 Browsing and printing operation logs

This section describes how to browse and print operation logs saved in the operation history database in the Operation History Database Viewer, and information recorded in operation logs.

Starting the Operation History Database Viewer

The Operation History Database Viewer can be started up from the Windows Start menu or from the Operation History Management Setup Tool.

Startup from the Windows Start menu

A general engineer can start up by this method only when the "Allow general users to start the viewer" check box is selected in the Operation History Management Tool.

1. Start the Operation History Database Viewer.
   The Project Selection dialog box appears.

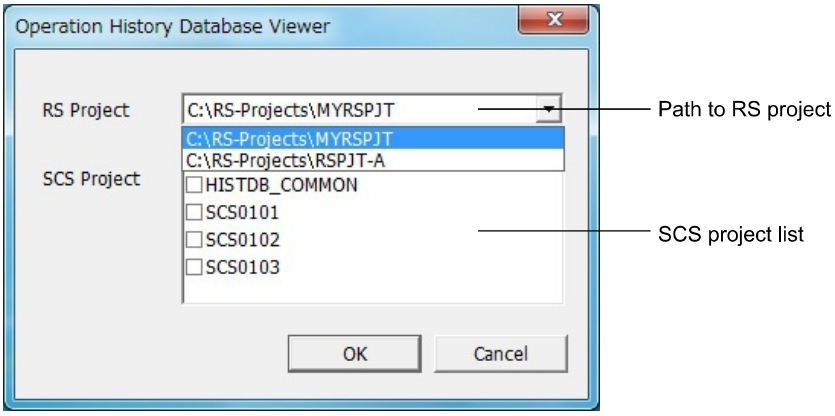

Figure E2.4.1-1 Project Selection dialog box (If started from Windows Start menu)

2. From the "RS Project" drop-down list, select the path of the RS project.
3. In the "SCS Project" box, a list of the SCS projects of the selected RS project and "HISTDB_COMMON" (common operation log) are displayed. Select the check box of the item for which you wish to display the operation log. Multiple check boxes may be selected.

TIP

The common operation log is an operation log of the operations that do not depend on the RS project or SCS project, among the operations performed by SENG. For example, startup of the SCS Manager or startup of the SCS Status Overview window apply to the common operation log.

4. Click [OK].
   The Operation History Database Viewer is started, and the operation logs are displayed as a list.

Starting up from the Operation History Management Setup Tool (administrator only)

Because the Operation History Management Setup Tool can be started up only by administrators, general engineers cannot use this method.

1. Start the Operation History Management Setup Tool.
   The Operation History Management Setup Tool starts.
2. Display the Operation History Management tab.
3. Select an RS project from the RS project list and click the [Start Viewer] button.
   The Project Selection dialog box appears.

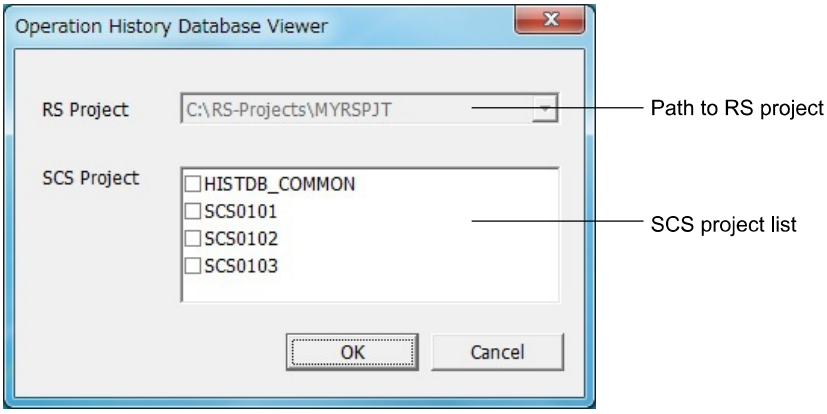

Figure E2.4.1-2 Project Selection dialog box (If started from Operation History Management Setup Tool)

4. In the "SCS Project" box, a list of the SCS projects of the selected RS project and "HISTDB_COMMON" (common operation log) are displayed. Select the check box of the item for which you wish to display the operation log. Multiple check boxes may be selected.

5. Click [OK].
   The Operation History Database Viewer is started, and the operation logs are displayed as a list.

Browsing operation logs

When the Operation History Database Viewer is started, the operation logs of the RS projects/SCS projects specified at startup are listed. If multiple SCS projects have been specified, multiple windows open, one for each SCS project.

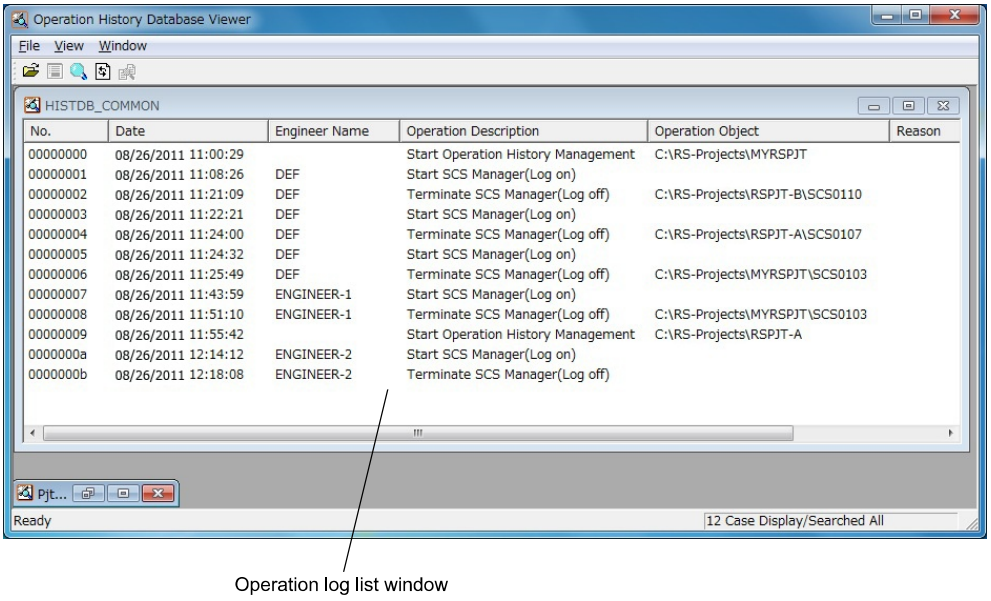

Figure E2.4.1-3 Operation History Database Viewer

SEE ALSO For more information about information recorded in the operation log, refer to:

E2.5.3, “Information recorded in operation logs” on page E2-76

Specifying SCS projects and displaying operation logs

To display a list of operation logs of another SCS project after the Operation History Database Viewer has been started up, perform the following procedure.

1. From the menu bar, select [File] > [Open], or click [Open] button on the toolbar.
   The Project Selection dialog box appears.
2. From the "RS Project" drop-down list, select the path of the RS project.
3. In "SCS Project:", select the check box of the SCS project for which you wish to display the operation log.
4. Click [OK].
   A new window opens, and the operation log of the specified SCS project appears.

Displaying properties

The following information can be displayed for operation logs displayed in the active window in the Operation History Database Viewer.

- SCS project path name
- Path to the top folder of the operation history database
- Date and time of the oldest log
- Date and time of the newest log
- Number of logs

1. Make the window in which you wish to display properties active, and select [Properties] on the [File] menu.

Specifying the number and range of operation logs to be displayed

To specify the number and range of operation logs to be displayed, perform the following procedure.

1. From the menu bar of the Operation History Database Viewer, select [View] > [Settings] or click [Settings] in the toolbar.
   The Display Settings dialog box appears.
2. On the Display tab, specify the maximum number of displayed items and the position to start the search.
   Up to 65535 can be entered as the maximum number of displayed items. (Set value when viewer is started for the first time: 1000.) When "Newest First" is selected as the search direction, results are displayed starting from the newest, and when "Oldest First" is selected, results are displayed starting from the oldest until the maximum number to display the operation logs specified here. (Set value when viewer is started for the first time: Newest First.)

Operation log filtered display

Filter conditions can be set in the Display Settings dialog box so that only operation logs that match the conditions are displayed. When multiple conditions are set, only operation logs that match all conditions are displayed. Note that when the viewer is started, no filters are set.

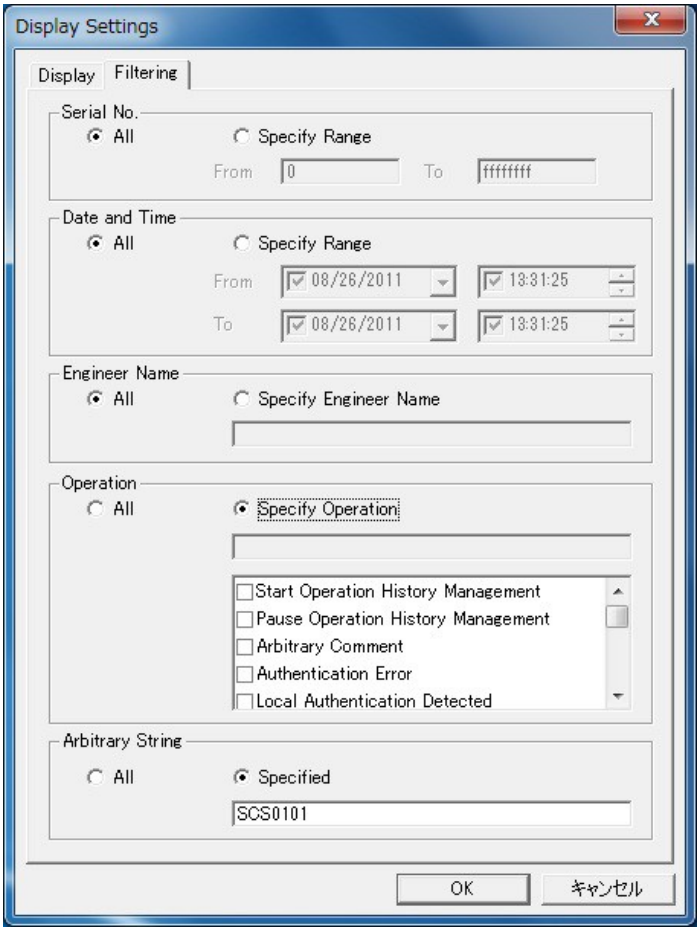

Figure E2.4.1-4 Display Settings dialog box (Filtering tab sheet)

The conditions that can be specified are shown in the following table.

Table E2.4.1-1 Filtered display conditions

Filter Condition	Description
Serial number	A range of serial numbers (8-digit hexadecimal numbers) can be specified. When a range is specified, specification of either the lowest number or the highest number can be omitted.
Date and time	A range of dates and times can be specified. When a range is specified, specification of either the earliest date or the latest date can be omitted.
Engineer name	When specifying multiple items, separate them by a space.
Operation description	Multiple operations can be selected by check boxes.
Arbitrary string	Any character string can be specified. Wildcards may not be used. When the specified character string is contained in any of the following items in an operation log, that operation log is considered to have matched the condition. Computer name, engineer name, font, program name, object of operation, reason (serial number, date/time and result of operation are not search targets).

To display filtered operation logs, perform the following procedure.

1. From the menu bar, select [View] > [Settings], or click Settings button in the tool bar.
   The Display Settings dialog box appears.
2. Set up the filter conditions on the Filtering tab
3. Click [OK].
   The search begins, and a list of operation logs that match all filter conditions appears.

TIP

During search, the Searching dialog box is displayed. When [Cancel] is clicked, the search results up to that point are displayed.

At the point when all operation logs in the operation history database have been searched, or the number of operation log search results has reached the maximum number of displayed items specified as a display condition, the search ends and the search results are displayed.

At this time, if all operation logs in the operation history database have been searched, the following is displayed on the bottom right of the Operation History Database Viewer.

"874 Case Display/Searched All"

If the maximum number of displayed items (1000) has been reached and there are still unsearched operation logs remaining, the following is displayed.

"1000 Case Display/Not Searched All"

Updating the display

To update the operation log list display, select [View] > [Update] from the menu bar. Alternatively, click [Update] on the toolbar.

The operation logs are searched again under the conditions set in the Display Settings dialog box, and the display is updated.

Sorting operation logs

Click an header item in the operation log list.

The operation logs currently displayed are sorted in the order of that item.

Each time the header item is clicked, the sorted list switches between ascending and descending orders.

Displaying operation log details

To display the detailed contents of the operation log, double-click an operation log. Alternatively, right-click an operation log, and select [Details] from the pop-up menu.

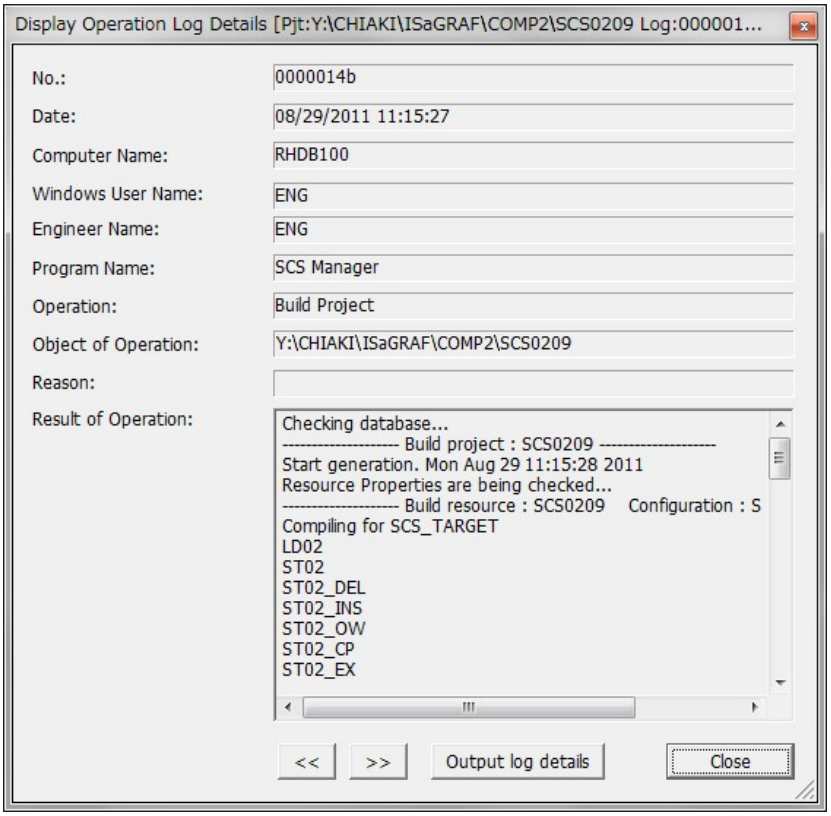

Figure E2.4.1-5 Display example of operation log detail display dialog box

The Operation Log Detail Display dialog box appears.

When [>>] is clicked, the details of the next operation log are displayed.

When [<<] is clicked, the details of the previous operation log are displayed.

When [Output log details] is clicked, the detailed information of the operation log is output to a file.

Saving operation logs to a file

The list of operation logs displayed in the viewer and detailed information can be saved to a file.

Outputting operation log list to a file

Perform this procedure to output the operation log list displayed in the viewer to a CSV text file.

1. From the menu bar, select [File] > [Export] > [Output log overview].
   The File Selection dialog box appears.
2. In the File Selection dialog box, specify the save destination file path, and click [Save].
   An example of output is shown as follows.

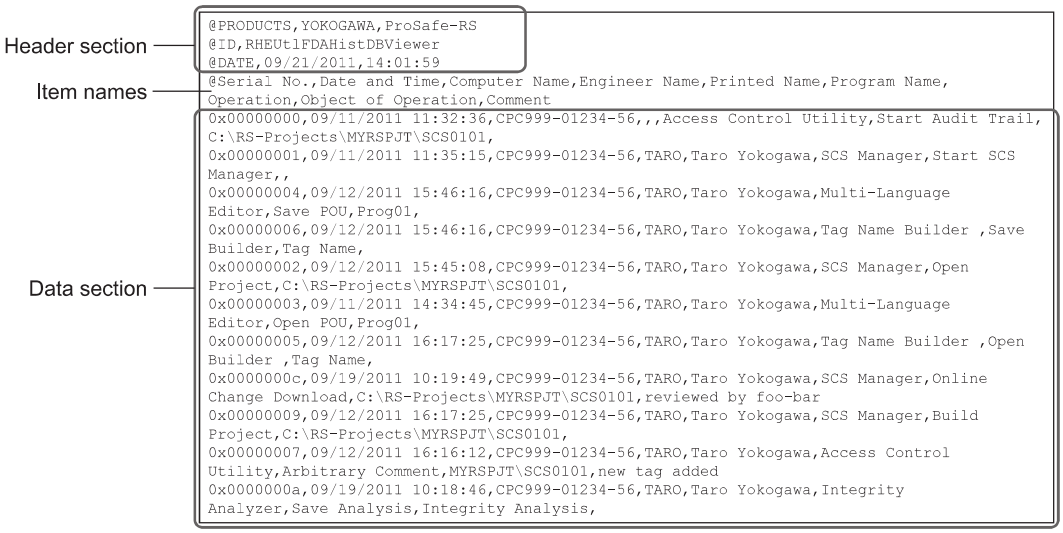

Figure E2.4.1-6 Example of operation log list output

Outputting operation log detailed information to a file

Detailed information of operation logs can be output in .rtf format or .txt format.

This section describes how to output the detailed information of all the listed operation logs.

1. Display a list of operation logs. If multiple windows that display operation logs have been opened, activate the window of the operation log you wish to output.
2. From the [File] menu, select [Export] > [Output log details].
   The File Selection dialog box appears.
3. Specify the file name and file format (.rtf or .txt) of the output destination, and click [OK].
   The detailed information of all the displayed operation logs is output to the file in the same order as the list display.

Printing operation logs

This section describes how to print the contents of the operation log list and detailed information.

Printing an operation log list

1. Display a list of operation logs. If multiple windows that display operation logs have been opened, activate the window of the operation log you wish to print.
2. Choose [Print] from the [File] menu.
   The Print dialog box appears.
3. Specify the printer in the Print dialog box, and click [OK].
   The contents displayed in the Operation Log List Display window are printed.

Printing detailed information of operation logs

To print detailed information of operation logs, output the detailed information data to a file in .rtf format or .txt format, and print them using the general print function.

E2.4.2 Browsing and printing modification files

This section describes how to browse and print modification files saved in the operation history database in the Modification Files Viewer.

Overview of Modification Files Viewer

In the Modification Files Viewer, you can look into the saved modification files from the following viewpoints.

- Modification files associated with a certain operation log
- By type of modification file

By searching for modification files by operation log serial number, modification files associated with a specific operation log can be found. Modification files are stored by type in folders in the database, and by selecting a folder in the tree display, modification files of the same type saved up to that point can be displayed in a list.

The modification file contents can be browsed in the following two formats.

- Detailed display
- Detailed difference display

When a modification file is opened in the Modification Files Viewer, a builder or the Multi-language Editor starts up in "viewer mode" according to the type of the modification file, and the contents are displayed. In viewer mode, the contents of files cannot be edited or saved. For modification files that cannot be displayed in a builder or the Multi-language editor, a dedicated viewer is started up.

About modification files

Modification files are the files that store information that was changed in a project database when an engineer executed an operation.

One or multiple modification files can correspond to one operation corresponding to a certain operation log (that is, serial number). There are also operations for which no corresponding modification file exists.

Modification files list

The types of modification files are as follows:

Table E2.4.2-1 Types of modification files

Data Hierarchy	Type	Description	Content Display Tool (*1)
Project	ProjectProp	Project properties information	Dedicated viewer
	DefinedWords	Defined words information	Dedicated viewer
Configuration	ConfigurationProp	Configuration properties information	Dedicated viewer
	SCSProjectProp	SCS project properties information	Dedicated viewer
	StnDef	SCS Constants Builder definition information	SCS Constants Builder

Continues on the next page

Table E2.4.2-1 Types of modification files (Table continued)

Data Hierarchy	Type	Description	Content Display Tool (*1)
Resource	ResourceProp	Resource properties information	Dedicated viewer
	GlobalVariables	Global variables information	Dedicated viewer
	IODev	I/O module information	Dedicated viewer
	IOMDefSB	I/O parameters	I/O Parameter Builder
	CommIO	Communicaiton I/O definition information	Communication I/O Builder
	ModbusDef	Modbus address definition information	Modbus Address Builder
	DNP3Def	DNP3 communication definition information	DNP3 Communication Builder
	LinkTrans	Link transmission definition information	Link Transmission Builder
	Binding	Binding information	Dedicated viewer
	Tag	Tag name definition information	Tag Name Builder
	AlmPri	Alarm priority level definition information	Alarm Priority Builder
	AlmTbl	Alarm processing table definition information	Alarm Processing Table Builder
	ResourceContent	POU list information/POU property information	Dedicated viewer
	LocalVarsParams	Local variables/parameters information	Dedicated viewer
POU	Source	POU logic information	Multi-language Editor

*1: The tool started up when the file contents are displayed in Modification Files Viewer. The builder and Multi-language Editor are started up in viewer mode.

Timing of saving modification files

Modification files are normally saved at the point when a download operation has succeeded.

The operation by which modification files are saved and the types of saved modification files are shown as follows.

Table E2.4.2-2 Operation by which modification files are saved

Operation Name	Type of Saved Modification File	Remarks
Create New Project	All modification files.	
Open Project	Modification files added by upgrading.	Saved when first opened after upgrading if any files have been added by upgrading.
Import SCS Manager	Modification files corresponding to modified information.	
Build	Modification files corresponding to modified information.	Saved only for user-defined projects.
Offline Download	Modification files corresponding to modified information.	
Online Change Download	Modification files corresponding to modified information.	
Master Database Restoring	All modification files.	
Version Control Check Out	All modification files.	Saved only when check-out destination is a target of operation history management.

Continues on the next page

Table E2.4.2-2 Operation by which modification files are saved (Table continued)

Operation Name	Type of Saved Modification File	Remarks
Start Operation History Management	When operation history management is started for the first time: All modification files. Otherwise: Modification files corresponding to modified information.	

TIP

- If you do not wish to save modification files, select the "Do not save in modification files" check box on the History Management tab of the Operation History Management Setup Tool. By default, modification files are saved.
- If you perform saving in a builder without making any modifications or if you set, change, or delete the password of a POU, the operation is also considered as a modification and saved as a modification file.

Browsing modification files

This section describes operations for starting the Modification Files Viewer and browsing modification files. The Modification Files Viewer is started up from the Operation History Database Viewer.

Starting the Modification Files Viewer

To browse modification files, perform the following procedure.

1. Select one operation log in the operation history database.
2. From the menu bar, select [View] > [View Modification Files]. Alternatively, click [Start Modification Files Viewer] button on the toolbar.
3. When the dialog box for entering the project password appears, enter the project password and click [OK].
   The Modification Files Viewer starts.

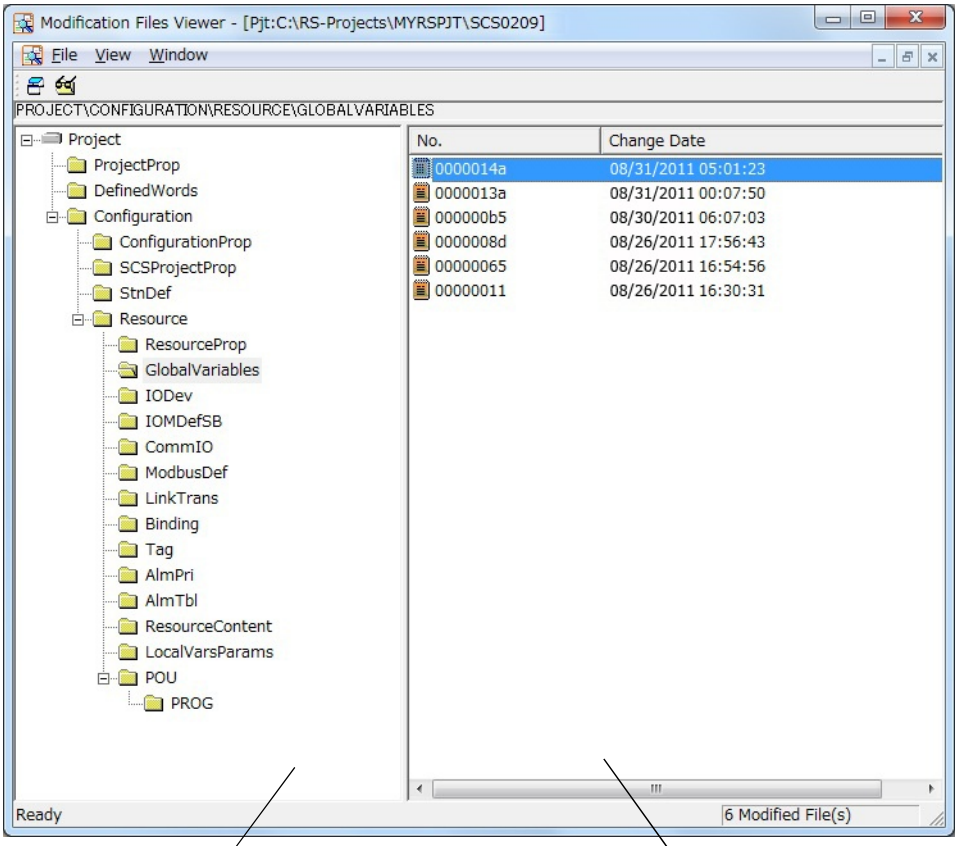

Figure E2.4.2-1 Modification Files Viewer

TIP

- In the tree display when the Modification Files Viewer starts, the focus is on the folder of the modification files corresponding to the selected operation log. If there are multiple modification files corresponding to that operation log (serial number), the focus is on the modification file found first. If there are no modification files corresponding to that operation log, it is started without the tree view being expanded.
- If the wrong password is entered in the dialog box for entering the project password, the Password Input dialog box appears up to two times.

Listing modification files by type

In the left pane of the Modification Files Viewer, the contents of the modification files database are displayed in a tree. Modification files are stored by type in each folder. Modification files of POUs deleted during the course of engineering are also retained.

1. To display a list of modification files by type, select the folder of the targeted modification files in the tree display.
   In the right pane, all modification files of the selected type are displayed in a list.

The display contents are as follows.

- Icon
  Indicates whether the modification file is a builder file, other modification file or POU source.
- Serial number
  This is the serial number of the operation log corresponding to the operation associated with the modification file.
- Change date

TIP

Each time the heading [No.] or [Change Date] is clicked, the modification file list display in the Modification Files Viewer switches between ascending and descending order. When the viewer is started, the list is displayed in descending order by serial number (No.).

SEE ALSO

For more information about types of modification files, refer to:

"● Modification files list" on page E2-59

● Searching modification files

Modification files can be searched by the serial number of the operation log.

1. From the menu bar, select [View] > [Find]. Alternatively, click [Find] on the toolbar.
   A Search dialog box appears.

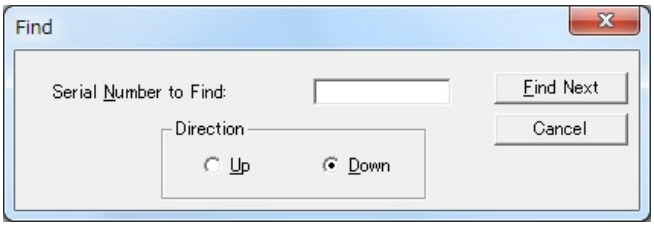

Figure E2.4.2-2 Search dialog box

2. Specify the serial number and search direction.
3. Click [Find Next].
   If a relevant file is found, the folder of this modification file becomes selected in the tree display. All modification files associated with the specified serial number can be searched by repeatedly clicking [Find Next].

● Displaying the contents of modification files

If SCS Manager is running, the contents of files cannot be displayed. Perform the display operation after confirming that SCS Manager is not running. Password input is required when displaying a modification file of a POU for which a password was set when the modification file was last saved.

To display the contents of a modification file, perform the following procedure.

1. In the Modification Files Viewer, display the files whose contents you wish to display in the list display.
2. In the list display of the Modification Files Viewer, double-click the modification file. Alternatively, select a file, right-click, and select [Details] from the pop-up menu.
3. When the dialog box for entering the POU password appears, enter the POU password and click [OK].
   The corresponding builder or the Multi-language Editor is started, or the dedicated viewer is started, and the contents are displayed.

   An example when displayed in the dedicated viewer is as follows.

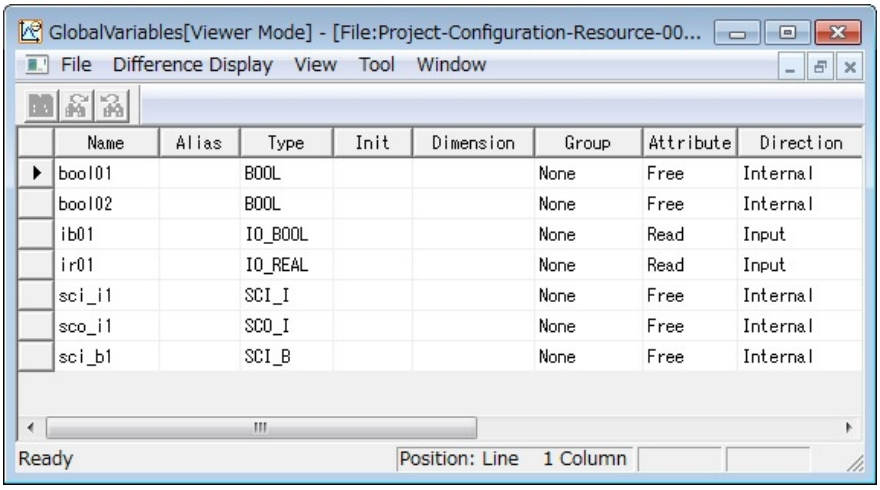

Figure E2.4.2-3 Dedicated viewer example (Global Variables)

SEE ALSO For more information about builders, multi-language editor, and dedicated viewers corresponding to the type of modification file, refer to:

"● Modification files list" on page E2-59

● Displaying differences of two modification files

This section describes the procedure for displaying the differences of two modification files of the same type.

Differences cannot be displayed if the SCS Manager is running. Perform the display operation after checking that the SCS Manager is not running. Password input is required to display a modification file of a POU for which a password was set when the modification file was last saved.

1. In the tree display of the modification file viewer, select the folder of the modification file of the type for which you wish to display the differences.
   A list of modification files appears in the right pane.
2. Double-click a modification file in the modification file list display, and display the contents of the file.
3. If the dialog box for POU password input appears, enter the password of that POU and click [OK].
   The corresponding builder or the Multi-language Editor starts up in viewer mode, and the contents appear.
4. Similarly, display the contents of another modification file.
5. Click [Start Difference Display] button on the toolbar. Alternatively, from the menu bar, select [Difference Display] > [Start Difference Display].
   The windows of the two files are aligned, and items or objects containing differences are displayed in red.

An example of the display when POU modification files have been selected is as follows.

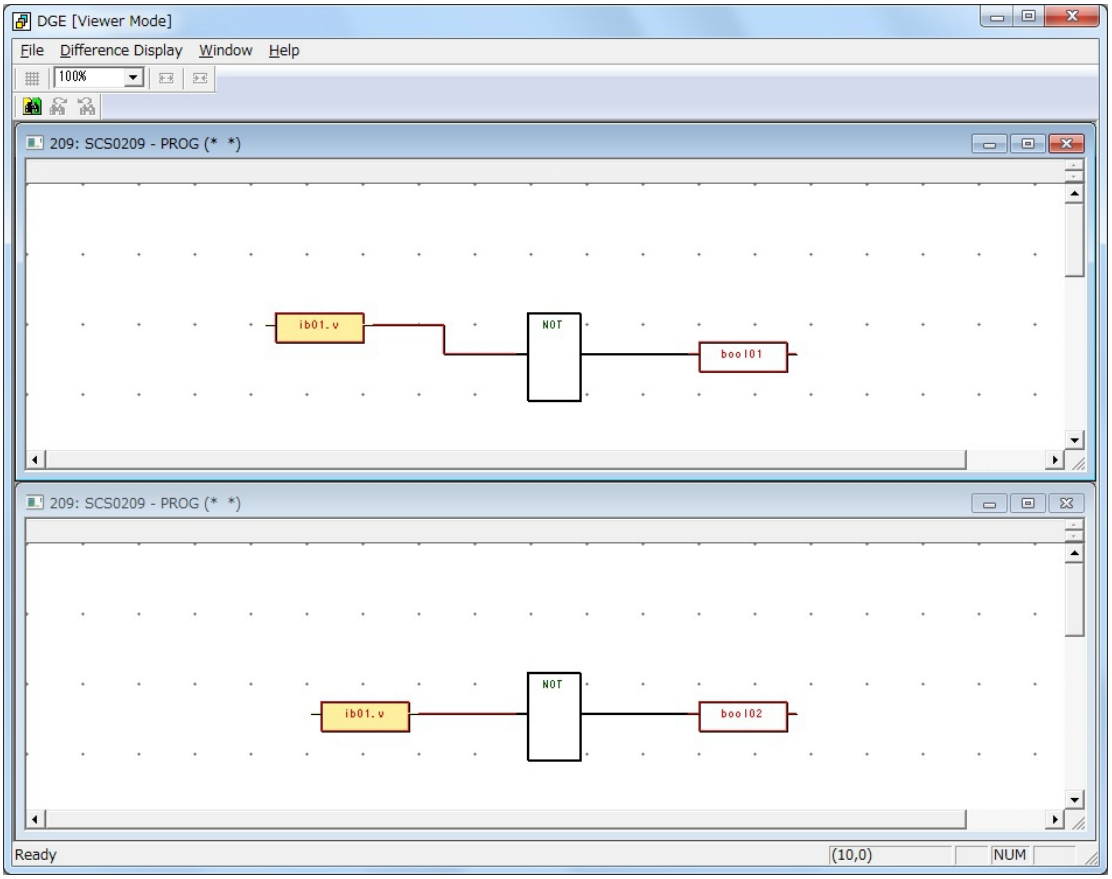

Figure E2.4.2-4 Example of detailed difference display (for POU modification files)

When difference display is executed, the two windows come out with the first difference selected. If the item or object selected in one window does not exist in the other window, nothing is selected.

TIP

In builders or a viewer that is dedicated to viewer mode, order of the data in a document window will be sorted according to the data order in the active document window when difference display is executed in a spreadsheet type window such as tag name builder. Consequently, choosing different active window makes the order of displayed data different when you execute difference display.

The selected state (focus) on the difference can be moved to the next or previous difference by the following operations.

- Each time [Find Next] button on the toolbar is clicked, the focus shifts to the next difference.
- Each time [Find Previous] button on the toolbar is clicked, the focus shifts to the previous difference.

The same focus shifts occur when [Difference Display] > [Find Next] or [Find Previous] is selected from the menu bar. For a builder with multiple tabs, the tab also switches.

TIP

The units of differences in the Multi-language Editor depend on the type of the diagram as follows.

- FBD: Object (variable, function block, link, text comment)
- LD: Rung
- ST: Line

Differences that have no effect on logic operations, such as the position or shape of an object, are also displayed as differences.

Acquiring modification files

Some modification files can be acquired as temporary files of the Builder (file extension .sva) into the specified folder by the specified name. The acquired temporary files can be imported to their corresponding builders. Files that can be acquired are shown in the following table.

Table E2.4.2-3 Modification files that can be acquired

Type of Modification File	Corresponding Builder
StnDef (*1)	SCS Constants Builder
IOMDefSB	I/O Parameter Builder
CommIO	Communication I/O Builder
LinkTrans	SCS Link Transmission Builder
ModbusDef	Modbus Address Builder
DNP3Def	DNP3 Communication Builder
Tag	Tag Name Builder
AlmPri	Alarm Priority Builder
AlmTbl	Alarm Processing Table Builder

*1: Two files, those with "-s" or "-i" appended to the base of the specified file name, are acquired.

To acquire modification files, perform the following procedure.

1. In the list display of the Modification Files Viewer, select one modification file.
2. From the menu bar, select [File] > [Acquire]. Alternatively, right-click and select [Acquire] from the pop-up menu.
   The File Selection dialog box appears.
3. Specify the folder where the modification file is to be saved and the file name, and click [Save].
   The modification file is saved in the specified folder.

Printing modification files

This section describes the operations for printing the contents of modification files and operations for printing the differences between two selected modification files. Since printing cannot be performed while the SCS Manager is running, print after closing the SCS Manager.

Printing the contents of modification files

1. In the list display of the Modification Files Viewer, select a modification file.
2. From the menu bar, select [File] > [Print].
   The Print dialog box appears.
3. Click the [OK] button.
   Printing begins.

Printing differences between two modification files

1. In the list display of the Modification Files Viewer, select two modification files.
2. From the menu bar, select [File] > [Print].
   The Print dialog box appears.
3. Click [OK].
   Printing begins.

E2.4.3 Steps to browse backed-up operation history database

When you try to browse the contents of backed-up operation history database, perform following steps in a PC where operation history management function is performed.

TIP

Use the following backup copies to browse the contents of backed-up operation history database.

- Backup copy of the operation history database that you wish to browse.
- Backup copy of RS project that possesses the SCS project you wish to browse.

1. Prepare a folder where operation history database and RS project to be restored in a PC or in a file server under the share name “RS-Share”.
   a. When you first use the shared folder “RS-Share”, perform appropriate IT security settings.
   b. Create a folder for restoration under the shared folder “RS-Share”.
2. Restore the backup copy of operation history database into the folder created at the above step.
3. Restore the backup copy of RS project into the folder created at the above step.
4. Register the restored RS project and the restored operation history database by means of operation history setup tool.
5. Start operation history management of the registered operation history database. Log of this manipulation to start operation history management can be ignored.
6. Specify the restored operation history database to open operation history database viewer.

SEE ALSO

For more information about how to browse the operation log and modification files, refer to:

- E2.4.1, “Browsing and printing operation logs” on page E2-52
- E2.4.2, “Browsing and printing modification files” on page E2-59

E2.4.4 Lists of Viewer Tool buttons

The functions of the buttons on the toolbar of the Operation History Database Viewer, Modification Files Viewer and Builder in viewer mode are as follows.

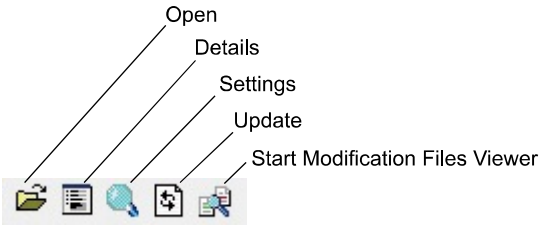

Figure E2.4.4-1 Toolbar buttons and names (Operation History Database Viewer)

Table E2.4.4-1 Toolbar buttons (Operation History Database Viewer)

Name	Description
Open	Specify the SCS project and display the list of operation logs. Same as [Open] of the [File] menu.
Details	Display detailed information of the operation log. Enabled only when one operation log has been selected. Same as [Details] of the [View] menu.
Settings	Set the display conditions for the list of operation logs. Same as [Settings] of the [View] menu.
Update	Update the display of the list of operation logs according to the latest display conditions. Same as [Update] of the [View] menu.
Start Modification Files Viewer	Start the Modification Files Viewer. Enabled only when one operation log has been selected. Same as [View Modification Files] of the [View] menu.

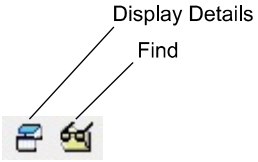

Figure E2.4.4-2 Toolbar buttons and names (Modification Files Viewer)

Table E2.4.4-2 Toolbar buttons (Modification Files Viewer)

Name	Description
Display Details	Display the contents of modification files. Enabled only when one modification file has been selected. Same as [Display Details] of the [View] menu.
Find	Searches for modification files by serial number of operation log. Same as [Find] of the [View] menu.

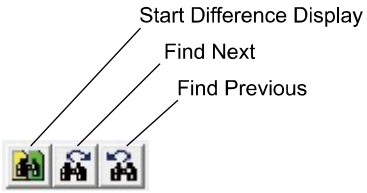

Figure E2.4.4-3 Toolbar buttons and names (Builder in viewer mode)

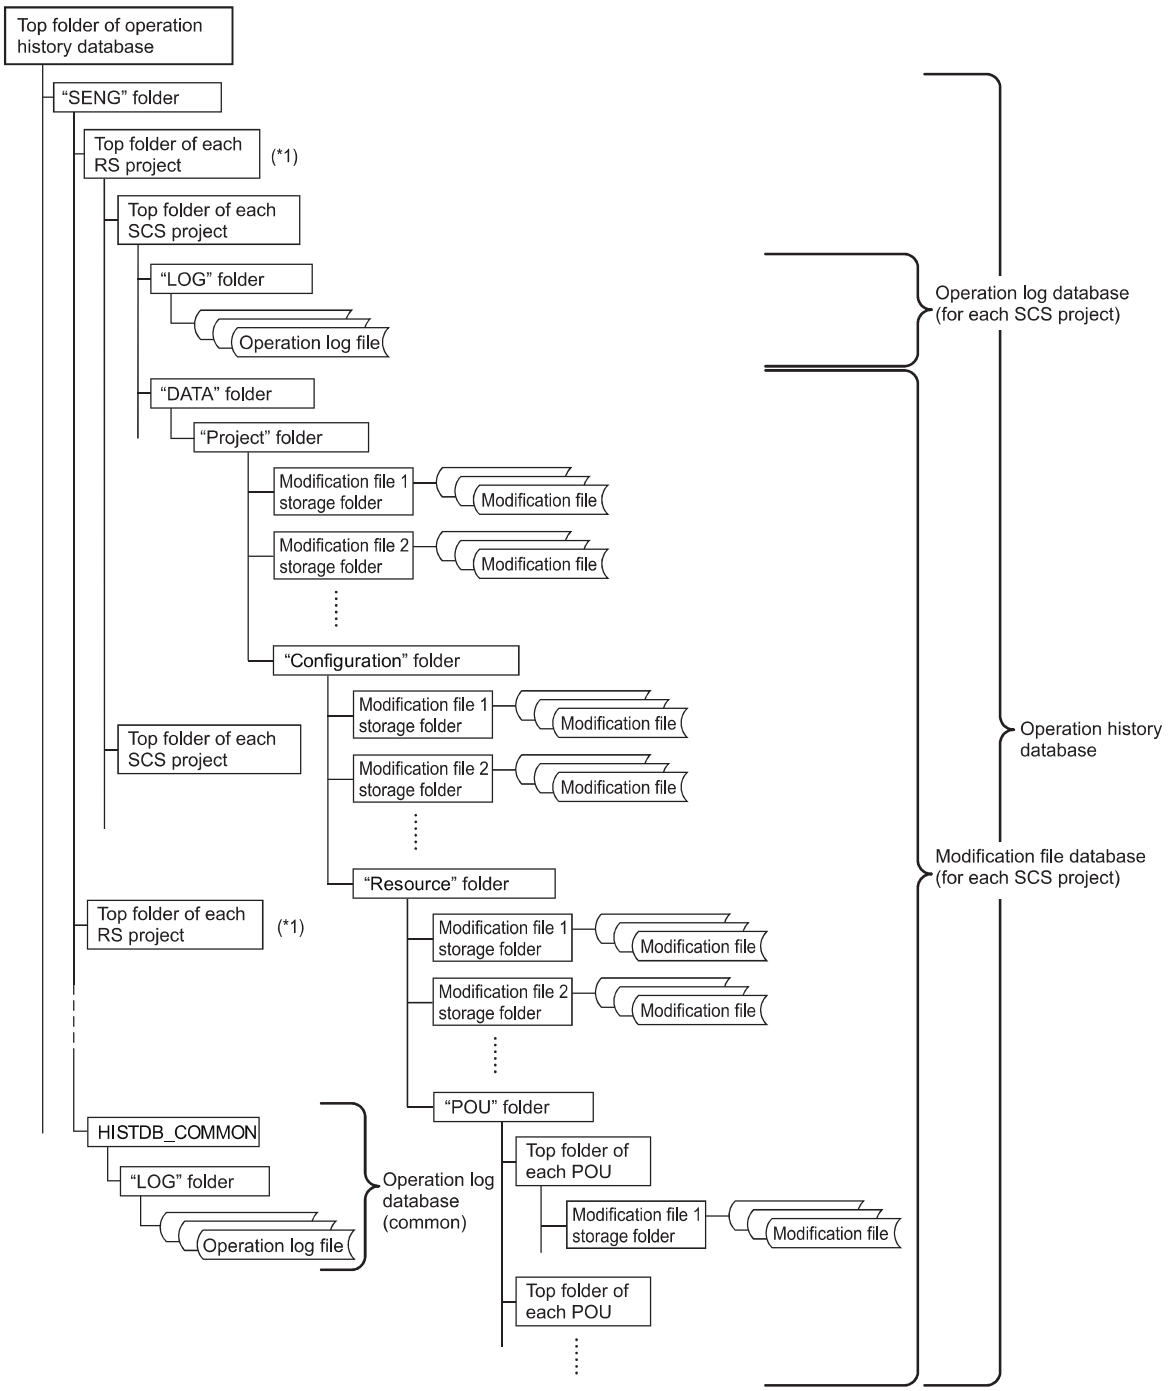
Table E2.4.4-3 Toolbar buttons (Builder in viewer mode)

Name	Description
Start Difference Display	Display the differences between two modification files. Enabled only when the contents of two modification files are displayed. Same as [Start Difference Display] of the [Difference Display] menu.
Find Next	Move focus to the next difference in the difference display. Same as [Find Next] of the [Difference Display] menu.
Find Previous	Move focus to the previous difference in the difference display. Same as [Find Previous] of the [Difference Display] menu.



E2.5 Detailed information of Access Control/ Operation History Management

This section describes the detailed information pertaining to access control and operation history management.

E2.5.1 Operation history database structure

The operation history database is generated for each RS project in the location specified in the Operation History Management Setup Tool. The operation history database of each RS project consists of the operation log database and modification files database of each SCS project. The operation log of operations common to all RS projects, such as SCS Manager startup, is recorded in the common operation log database. Modification files are stored by type below the folder of the modification file type name.

The folder structure of the operation history database is shown in the following figure.

*1: The folder name is the same as the RS project name.
*2: The folder name is the same as the SCS project name.

Figure E2.5.1-1 Operation history database structure

E2.5.2 Access rights category list

The following table shows a list of access right categories.

Table E2.5.2-1 Access rights categories (access rights to project database)

Category	Operation Description	Operation Program Tool
Project Creation	Creation of new SCS projects/libraries	SCS Manager
General Settings	Change of project properties, project descriptions Change of configuration names, configuration properties, configuration descriptions Change of connection properties (IP addresses) Change of resource names, resource properties, resource descriptions Change of POU properties, POU descriptions Addition, deletion or name change of POU Addition, deletion or change of variable groups Clean Build Addition, deletion or change of library dependencies Import by SCS Manager (*1)	SCS Manager
	Change of SCS project properties	SCS Project Properties
	Change of SCS constants definitions	SCS Constants Builder
	Acknowledgement by analyzer	Integrity Analyzer, Cross Reference Analyzer
	Database validity check Repair database	Database Validity Check Tool
POU	Change of POU logic Addition, deletion or change of defined words Addition, deletion or change of variables Addition, deletion or change of parameters Build Import by SCS Manager (*1)	SCS Manager
	Acknowledgement by analyzer	Integrity Analyzer, Cross Reference Analyzer
	Database validity check Repair database	Database Validity Check Tool
I/O	Addition, deletion or change of I/O devices Addition, deletion or change of I/O wiring Build Import by SCS Manager(*1)	SCS Manager
	Change of I/O parameter definitions	I/O Parameter Builder
	Acknowledgement by analyzer	Integrity Analyzer, Cross Reference Analyzer
	Database validity check Repair database	Database Validity Check Tool

Continues on the next page

Table E2.5.2-1 Access rights categories (access rights to project database) (Table continued)

Category	Operation Description	Operation Program Tool
Safety Communication	Addition, deletion or change of external bindings Build	SCS Manager
	Change of SCS link transmission definitions	SCS Link Transmission Builder
	Acknowledgement by analyzer	Integrity Analyzer, Cross Reference Analyzer
	Database validity check Repair database	Database Validity Check Tool
External Communication	Change of tag name definitions	Tag Name Builder
	Change of communication I/O definitions	Communication I/O Builder
	Change of modbus address definitions	Modbus Address Builder
	Change of DNP3 communication definitions	DNP3 Communication Builder
	Build	SCS Manager
	Acknowledgement by analyzer	Integrity Analyzer, Cross Reference Analyzer
	Database validity check Repair database	Database Validity Check Tool
CENTUM Alarm Definition	Change of alarm priority definitions	Alarm Priority Builder
	Change of alarm processing table definitions	Alarm Processing Table Builder
	Build	SCS Manager
	Acknowledgement by analyzer	Integrity Analyzer, Cross Reference Analyzer
	Database validity check Repair database	Database Validity Check Tool
Version Control Check In	Version control check in	Version Control Tool
Version Control Check Out	Version control check out	Version Control Tool
Master Database Restore	Restoration of master database	Master Database Restoring Function

*1: The SCS Manager import operation and the reflection operation with RS Generation Manager during implementation of I/O list engineering can be performed only when the user has access rights for the General Setting, POU, and I/O categories.

Table E2.5.2-2 Access rights categories (access rights to SCS)

Category	Operation Description	Operation Program/ Tool
Offline Download	Build	SCS Manager
	Master database offline download	Master Database Off-line Download
	SCS restart	Restart SCS
	SCS security level setting, password change	Set SCS Security Level
	Acknowledgement by analyzer	Integrity Analyzer, Cross Reference Analyzer
	Database validity check Repair database	Database Validity Check Tool
Online Change Download	Build	SCS Manager
	Download operation marks	Download Operation Marks
	SCS security level setting, password change	Set SCS Security Level
	Acknowledgement by analyzer	Integrity Analyzer, Cross Reference Analyzer
	Database validity check Repair database	Database Validity Check Tool
Operation Mark Save	Save operation marks	Save Operation Marks
SCS Simulator	Start test function	SCS Test Function
	Update test database	Update Test Database
	Build	SCS Manager
	SCS security level setting, password change	Set SCS Security Level
	Acknowledgement by analyzer	Integrity Analyzer, Cross Reference Analyzer
	Database validity check Repair database	Database Validity Check Tool
Debug	Start logic simulation, start debug mode	SCS Manager
Forcing	Forcing (lock, unlock, value setting)	SCS Manager I/O Lock Window, Communication I/O Lock Window, SCS Link Transmission Lock Window, Inter-SCS Communication Lock Window
	SCS security level setting, password change	Set SCS Security Level
Maintenance	Output enable operation, output module start, IOM download, time setting, NIU maintenance port setting	SCS State Management Window
	Confirm display fonts, colors and messages, set and change deletion operation method	Setup Tool
	IOM control right switching	I/O Control Right Switching Tool

Continues on the next page

Table E2.5.2-2 Access rights categories (access rights to SCS) (Table continued)

Category	Operation Description	Operation Program/ Tool
Diagnosis Acknowledgment	Acknowledgment and deletion of diagnostic information message	Diagnostic Information
Message Cache	Operations such as setting up message collection, initializing trip information in SCS, saving or deleting cache data Stopping and starting of automatic message acquisition	Message Cache Tool

E2.5.3 Information recorded in operation logs

The following information is recorded in one operation log.

Table E2.5.3-1 Structure of operation logs

	Item	Description
1	Serial number (*1)	Unique identifier corresponding to one operation (8-digit hexadecimal number).
2	Date/time (*1)	Date and time the operation was executed.
3	Computer name	SENG PC name on which the operation was executed.
4	Windows user name	Windows user name at the time the operation was executed.
5	Engineer name (*1)	Name of the engineer who executed the operation.
6	Name	Name of the person corresponding to the engineer who executed the operation. (Character string entry in "Printed Name" field of Engineers' Account Builder)
7	Program name	Name of the program that executed the operation.
8	Operation name (*1)	Executed operation.
9	Object of operation(*1)	Target of executed operation.
10	Reason (*1)	Character string (1 line) input as "Reason" in Engineer Authentication dialog box.
11	Result of operation	Contents output to the message area as the result of operation (multiple lines).

*1: These items are displayed in the operation log list of the Operation History Database Viewer. Other items can be browsed on the detailed information display.

Operation log information lists

Here, the information recorded in operation logs is listed by operation type.

The following are the notes on the items omitted in the following tables.

- "Serial Number," "Date/Time" and "Computer Name" are always recorded in every operation log entry.
- For the operations for which engineer names are recorded, the name of the person corresponding to the engineer name is always recorded in "Name."
- In "Reason," the content entered in the "Reason" field of the Engineer Authentication dialog box is recorded.
- In "Result of Operation," the contents displayed in the message area of SCS Manager, builder, or tool are recorded.

Table E2.5.3-2 Operation log information list (Operations on project database)

Operation Name	Item	Description
Start SCS Manager (recorded in common operation log database)	Engineer Name	Engineer who executed the operation
	Program Name	SCS Manager
	Operation Name	Start SCS Manager (Log on)
	Object of Operation	-

Table E2.5.3-4 Operation log recorded information list (operations related to Access Control/Operation History Management) (Table continued)

Operation Name	Item	Description
Stop operation history management (recorded in common and each SCS projects' operation log databases)	Engineer Name	-
	Program Name	Operation History Management Setup Tool
	Operation Name	Pause Operation History Management
	Object of Operation	RS Project Path Name Example: C:\RS-Projects\MYRSPJT
Exceeded number of authentications (recorded in common operation log database)	Engineer Name	Engineer name entered for logon or engineer authentication
	Program Name	Name of the program for which logon or engineer authentication was attempted
	Operation Name	Authentication Error
	Object of Operation	-
Local user logon in domain environment (recorded in common operation log database)	Engineer Name	Logged-on engineer name
	Program Name	Logged-on program name
	Operation Name	Local Authentication Detected
	Object of Operation	-
Record a comment (operation by administrator) (recorded in common operation log database)	Engineer Name	-
	Program Name	Operation History Management Setup Tool
	Operation Name	Arbitrary Comment
	Object of Operation	RS Project Path Name Example: C:\RS-Projects\MYRSPJT

F. Tools and functions used with engineering of ProSafe-RS

Tools and functions such as the following can be used when engineering ProSafe-RS.

- SCS Information Dialog
  Used when looking up the capacities or numbers of Program Organization Units (POUs) or variables used in the SCS project. Whether or not the number of logical I/O points in use are within the range of licenses possessed can also be looked up.
- Self Documentation
  Used when printing the content of an SCS project as a document.
- Database Validity Check Tool
  Used to check the mutual validity of the work database, the master database, and the SCS database that has been downloaded onto an SCS.
- Master Database Restoring function
  Used to restore a SCS project being edited to its original state when it was last downloaded.
- Version Control Tool
  Used to manage the history of changes made to SCS projects not registered with an AD project.
- Project Comparing Tool
  Used to display or print the difference between two specified SCS projects.
- Online Monitoring
  Used when monitoring the application logic executed on the SCS.
- Forcing
  Used when changing the values of I/O modules, variables. or FB parameters while they are locked. Dedicated locking windows are used to perform Forcing.
- Software Configuration Viewer
  Used to look up information in regard to software installed on SENG.
- Builder Environment Tool
  Used to customize builders installed on SENG.

F1. Display SCS information

The SCS information including the number of POUs used in the SCS project and the quantity and capacity of variables can be displayed.

This section explains the contents displayed in the SCS Information dialog box.

Overview of SCS information

The number of POUs used in the SCS project and the quantity and capacity of variables are displayed as SCS information. The maximum capacity and the maximum quantity of the variables, and the usage ratio against the maximum capacity in the working database and in the master database are also displayed. Before displaying the SCS information, the SCS project needs to be built.

Call SCS Information dialog box

1. Choose [Engineering] from [Tools] menu of SCS Manager.
   so as to display the Engineering Launcher menu.
2. On Engineering Launcher menu, choose [SCS Information]
   so as to display the SCS Information dialog box.

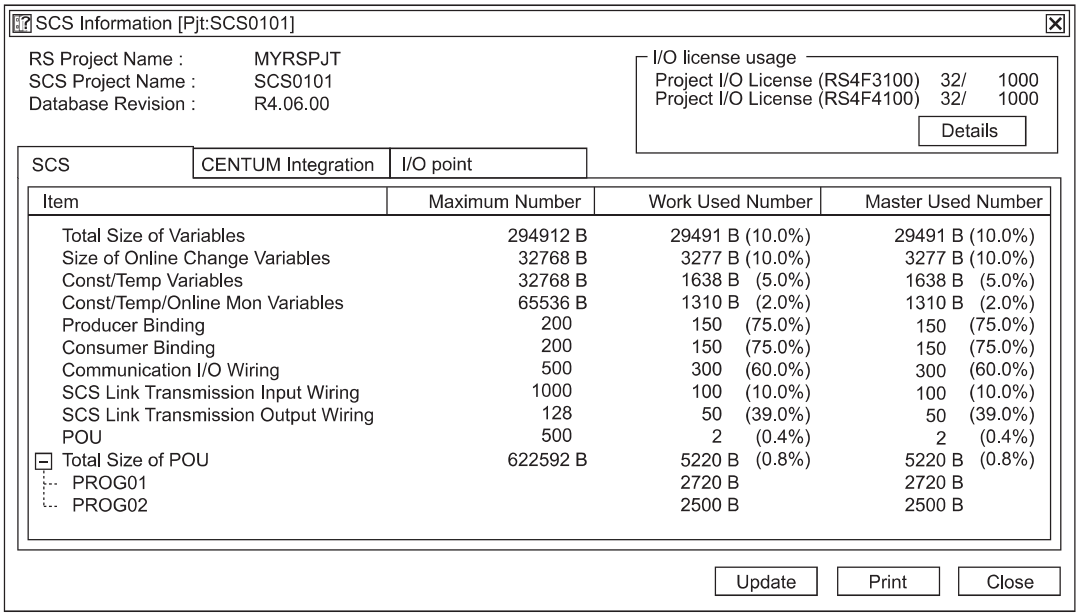

Figure F1-1 SCS Information dialog box

Elements in SCS Information dialog box

The following information is displayed for the selected SCS. The dialog box includes the SCS tab sheet and CENTUM Integration tab sheet. If the CI Server Integration Package is activated, the tab sheets will be SCS and CI Server Integration.

- The corresponding RS project name and the SCS project name
- The revision number of the SCS project database
- The usages of variables and POUs in the SCS project
- Usage status of I/O licenses
- The usage of variables in the case of a CENTUM integration or CI Server integration structure

Moreover, the displayed contents can be updated and can be printed out.

IMPORTANT

Performing a build reflects the latest information onto this dialog. To check correct information, check the details after performing a build.

SCS information items

The following values are shown for each item.

- Maximum Number
  The maximum number for each item that you can define in a SCS.
- Usage in Work Database
  The quantity or number used for the item in the SCS project which is under engineering. The percentage of the maximum is also shown.
- Usage in Master Database
  The quantity or number used for the item in the SCS project which is downloaded to the SCS. The percentage of the maximum is also shown.

The SCS tab shows the following items.

Table F1-1 Items on SCS tab

Item	Description
Total Size of Variables (*1)	Total size of variables after finishing the offline download. Excludes constants and temporary variables.(*2)
Size of Online Change Variables	Size of variables added by online change downloading.
Const/Temp Variables	Total size of all the constants and temporary variables currently in use. Includes those added by an online change download. (*2)
Const/Temp/Online Mon Variables	Total size of constants, temporary variables, and monitoring variables. Includes those added by an online change download. (*2)(*3)
Producer Binding	Number of binding variables on the producing side defined in all producer groups
Consumer Binding	Number of binding variables on the consuming side defined in all consumer groups
Communication I/O wiring	Number of variables defined in the Communication I/O Wiring on Communication I/O Builder
Safety Subsystem Communication I/O Wiring	Number of variables defined in the Safety Subsystem Communication I/O Wiring on Communication I/O Builder. The maximum value is fixed.
SCS Link Transmission Input Wiring	Number of SCS Link Transmission input variables defined on “Data Wiring Definition” of SCS Link Transmission Builder.
SCS Link Transmission Output Wiring	Number of SCS Link Transmission output variables defined on “Data Wiring Definition” of SCS Link Transmission Builder.
DNP3 communication FB (*4)	Total number of instances of the DNP3 communication FBs that are assigned to DNP3 data. Includes those instances that are created inside of the user defined FBs.
AGA FB (*4)	Number of AGA FB (AGA_3, AGA_7) instances. Includes those created as parameters of user defined FBs.
AGA Report FB (*4)	Number of AGA_R FB instances. Includes those created as parameters of user defined FBs.

Continues on the next page

Table F1-1 Items on SCS tab (Table continued)

Item	Description
Retain Data (*4)	Number of bytes used for retain data. Depends on the number of FB (AGA_R, ACCUM, ECWR_B, ECWR_I, ECWR_R) instances that use the retain function.
POU	Number of created POUs
Total Size of POU (*1)(*5)	Total size of POU usage

*1: If the SCS project is built after being edited, the usage in the working database is displayed.
*2: The temporary variables are the variables generated temporarily for executing the POU.
*3: The monitoring variables are the variables for monitoring the POU statuses.
*4: Displayed only for SCSU1.
*5: When clicking the [+] button on the left side, the name and size of each POU will be displayed.

Precautions when building

In SCS, the size of the area for variables used in the application logic differs depending on its station type.

Table F1-2 Size of the area for variables used in the application logic

Station type	Size of the area for variables used in the application logic
SSC10/SSC50/SSC57	384 KB (393216 B)
SSC60/S2SC70/L1SC70	1536 KB (1572864 B)

In the area for variables used in the application logic, if the size of the variable-defined area in use may become too large to reserve the specified size of the area for online changes after the next offline download, the following warning message appears when building.

```
The total size of variables in use is aa.aKB (cc.c%).
The user variables area of on-line changes may not be reserved after the next off
-line download is completed.
```

Also, if the area for online change is not reserved, the following error message appears and the build fails.

```
The total size of variables in use exceeded the maximum value. :the size in use a
a.aKB: the maximum size bb.bKB
```

TIP

aa.a, bb.b, and cc.c displayed in the error message or the warning message denote numerical values.

To avoid generation of warnings and errors, consider additional variables in further online changes, reduce the setting value of one or both of “Size of Online Change Variables (User variable size)” and “Constant/temporary variable size (Memory size for temporary variables)” in the resource properties of SCS Manager, and perform a clean build and offline download.

The warning or the error is not generated if the value displayed in the SCS Information dialog box satisfies the following formula.

(Work Used Number of “Total Size of Variables” (1)) + (Maximum Number of “Size of Online Change Variables” (2)) × 4 + (Maximum Number of “Const/Temp Variables” (3)) ≤ (size of the area for variables used in the application logic)

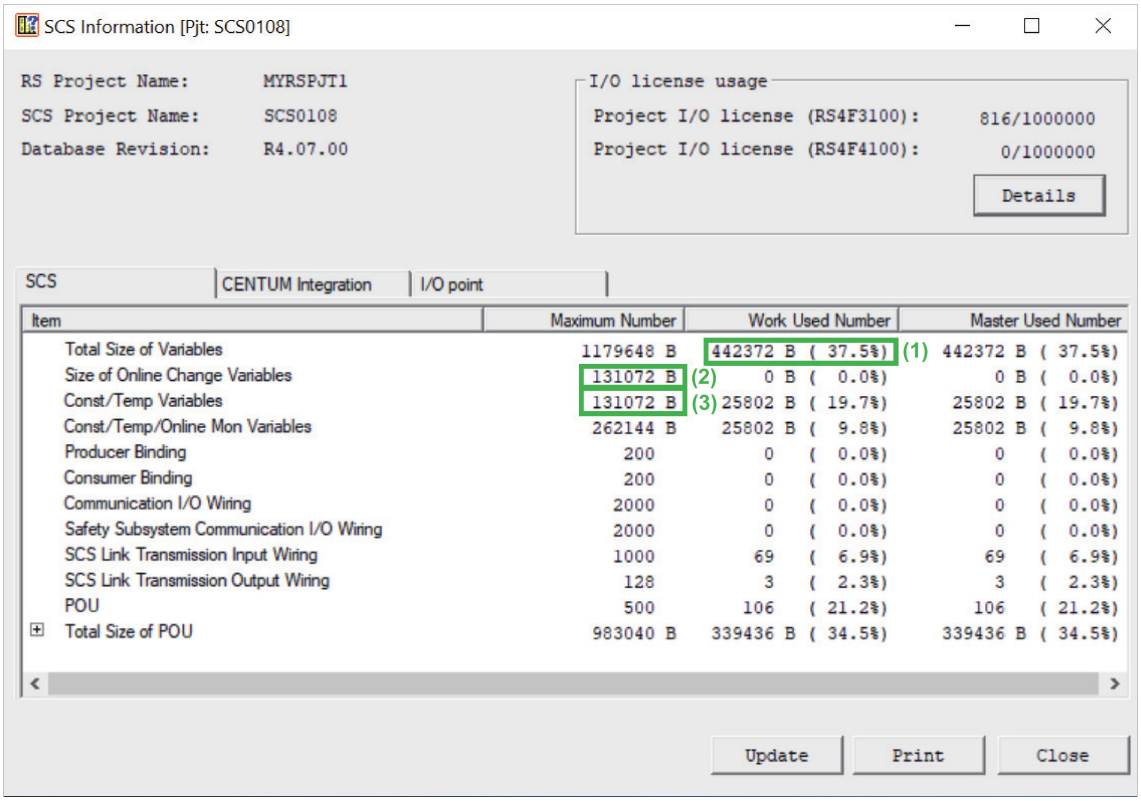

Figure F1-2 SCS Information dialog box

The Work Used Number of “Total Size of Variables” (1) is the size of variables used when performing offline download (excluding constant/temporary variables).

The Maximum Number of “Size of Online Change Variables” (2) is the size set in “Size of Online Change Variables (User variable size)” in the resource properties of SCS Manager.

The Maximum Number of “Const/Temp Variables” (3) is the size set in “Constant/temporary variable size (Memory size for temporary variables)” in the resource properties of SCS Manager.

Checking the usage status of I/O licenses

The current usage status of I/O licenses can be checked from the following:

- I/O license usage section
  - This section shows the number of logical I/O points in use with all SCSs and the number of logical I/O points provided. The numbers are displayed separately for SIL3 license (RS4F3100) and SIL2 license (RSF4100).
  - One license of a project I/O license is equivalent to 100 logical I/O points. The number of project I/O licenses in possession is the displayed number of logical I/O points possessed divided by 100.
  - Clicking Details displays the I/O license usage dialog box, which shows the number of logical I/O points in use for each station.
- I/O point tab
  The following values of each item are displayed on the I/O point tab.
  - Category
    Displayed in the categories of safety I/O, communication I/O, and total. Regarding communication I/O, the total value for subsystem communication I/O wiring and safety subsystem communication I/O wiring is displayed.
  - Number of I/O

The number of physical I/O points of the target SCS is displayed.

- Number of logical I/O
  The number of logical I/O points of the target SCS is displayed.

I/O license usage dialog box

I/O license usage dialog box shows the following information:

- Number of owned licenses section
  - This section shows the number of logical I/O points in use with all SCSs included in the license project and the number of logical I/O points provided, separately for SIL3 license (RS4F3100) and SIL2 license (RSF4100).
  - One license of a project I/O license is equivalent to 100 logical I/O points. The number of owned project I/O licenses is the displayed number of provided logical I/O points divided by 100.
- Station
  Displays the SCSs subject to I/O metered licensing in the license project.
- License
  Displays the project I/O license used for each SCS.
- Number of logical I/O
  Displays the number of logical I/O points for each SCS.

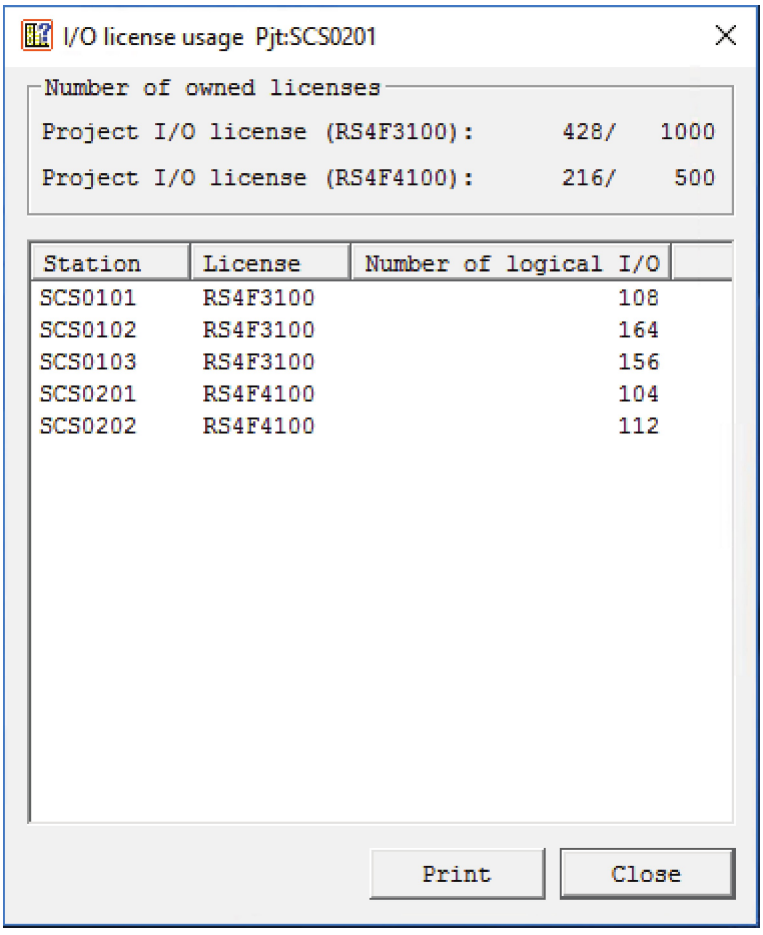

Figure F1-3 I/O license usage dialog box

Counting the logical I/O points

The items subject to the count of the logical I/O points are safety I/O (AI, AO, DI, DO) and the communication I/O of subsystem communication modules and fire and gas communication modules.

Logical I/O points are counted in the following manner. Decimal values of all of the totaled logical I/O points are rounded down.

For AIO/DIO modules, one terminal corresponds to one logical I/O point.

For subsystem communication modules, the number of data points multiplied by 0.25 corresponds to one logical I/O point. The number of data points is counted in the following manner in accordance with the data type. However, data is counted when the data has been defined with Communication I/O Builder and the communication module has also been defined.

- With 32-bit analog data, two words are counted as one point of data.
- With 16-bit analog data, one word is counted as one point of data.
- With digital data, one word is counted as 16 points of data.
- With SLSEVENT data, 24 words are counted as 24 points of data.

For fire and gas communication modules, the number of data points multiplied by 0.25 corresponds to one logical I/O point. The number of data points is counted in the following manner. However, data is counted when the data has been defined with Safety Communication I/O Editor and the communication module has also been defined.

The security information contained in the communication definitions of PROFINET and PROFIsafe is not wired as signals. Therefore, the security information is not subject to the count of logical I/O points.

- With unsigned8, two words are counted as one point of data. 1 x 0.25 = 0.25
- With float32, two words are counted as one point of data. 1 x 0.25 = 0.25
- With unsigned16, two words are counted as one point of data. 1 x 0.25 = 0.25
- With unsigned32, two words are counted as one point of data. 1 x 0.25 = 0.25

Example:

GS01_SAFE_RS is configured of unsigned8 (2 words), float32 (2 words), and security information (4 words). Because security information is not counted, the data of unsigned8 (2 words) and float32 (2 words) is counted as the number of logical I/O points.

Total number of logical I/O points for GS01_SAFE_RS = 0.25 + 0.25 = 0.5

Example:

DIAG_STATUS is configured of unsigned32 (2 words).

Total number of logical I/O points for DIAG_STATUS = 0.25

Example:

GW_STATUS, BBR_STATUS, and BATTERY_LIFE are each configured of unsigned16 (2 words).

Total number of logical I/O points for GW_STATUS, BBR_STATUS, and BATTERY_LIFE each = 0.25

The SCSs for which the logical I/O points are counted are SCSP1, SCSP2, SCSP3, SCSL2, and SCSU1.

Logical I/O points are counted in the following conditions.

- All SCS projects included in all RS projects registered with the same AD Project are subject to the count
- All SCSs registered with the same AD Project are registered to the same license project

- The project I/O license in possession is properly reflected onto the license project

These conditions properly being reflected, the SCS being registered with the license project and the RS project, and the RS project being registered with the AD project are prerequisites.

Information displayed in the case of CENTUM integration structure or CI Server integration structure

On the CENTUM Integration tab or CI Server Integration tab, the usages of the tagged variables will be displayed by types.

If integration with CENTUM or CI Server is not established, the usages will be displayed with 0s.

Table F1-3 Items on CENTUM Integration tab

Item			Remarks
Station Common Tag	IO_BOOL		
	BOOL Tag	BOOL	
		ECW_B	
		ECWR_B	Displayed only for SCSU1.
	REAL, INT Tag	DINT	
		ECW_I	
		ECWR_I	Displayed only for SCSU1.
		ECW_R	
		ECWR_R	Displayed only for SCSU1.

F2. Self Document

This chapter describes the Self Document Function.

Outline of Self Document function

Self Document is a function of printing applications as documents.

Self Document enables the following things.

Selecting print data

Source files of work databases in an SCS project can be printed. All contents of the definitions or any parts can be selected.

The following table shows an outline of data which can be printed.

Table F2-1 Data to be printed

Data to be printed	Details of Definition
Cover	
Table of Contents	
SCS project information(*1)	Data defined with SCS Manager (Project/Configuration/Resource/Properties of each project)
SCS constant data	Data defined with SCS Constants Builder
I/O parameter data	Data defined with I/O Parameter Builder or AD Organizer
Subsystem communication I/O information (*2)	Data defined with Communication I/O Builder
SCS Link Transmission data	Data defined with SCS Link Transmission Builder
Global variable data	Data defined with SCS Manager (Global variable data)
Binding data	Data defined with SCS Manager (Binding data)
Modbus address information(*3)	Data defined with Modbus Address Builder
DNP3 communication definition information (*4)	Data defined with DNP3 Communication Builder
Tag name information (*5)	Data defined with Tag Name Builder
Alarm priority information(*5)	Data defined with Alarm Priority Builder
Alarm processing table information(*5)	Data defined with Alarm Processing Table Builder
POU data	• Data defined with SCS Manager • Data defined with Multi-Language Editor

*1: It includes the data concerning the CENTUM connection function.
*2: This is the data concerning the subsystem communication.
*3: This is the data concerning the open interface.
*4: Printable only when the version of SCSU1 is R3.02.20 or later.
*5: This is the data concerning the CENTUM connection function.

Customizing what to print

The content to print can be customized as follows:

- Cover and contents pages can be created.
- Headers and footers can be created.
- Page numbers can be included.
- Font types can be specified.

- Paper orientation (landscape or portrait) for FBD and LD can be specified.

Confirming preview

Printing images can be confirmed.

Selecting printer

A printer directly connected to SENG and connected via networks can be used.

Precautions for using self documents

Save files which are being edited before printing the application.

Self-documentation

Self-documentation is a function that allows printing applications out as documents. Use Document Generator to print documents.

TIP

In ProSafe-RS R2.02, self-documentation related behavior has been changed. If compatibility is important, you can choose the behavior before R2.02. In this document, the behavior before R2.02 is called "backward-compatible mode" and described separately.

Purposes of self-documentation

In order to compare the application logic prior to modification and the application logic after the modification, the applications can be printed out with self-documentation. The consistency between the contents displayed on the windows and the contents in the printouts can also be confirmed. The self-documentation function is independent of SCS Manager and each builder; it is thus possible to double-check that the applications have been created as intended.

By comparing the printout prior modification and the printout after modification, the result of the modification can be checked to confirm that the modification is properly performed.

Printing objects

Self-documentation prints out the source files of the work database in an SCS project. It is possible to select all the definitions or any part of them.

The printed objects are shown below.

- SCS project information (*1)
- SCS constants
- I/O parameters
- Communication I/O (*2)
- SCS Link Transmission
- Modbus address (*3)
- DNP3 communication
- Tag name (*4)
- Alarm priority (*4)
- Alarm processing table (*4)
- Variables cross reference index (*5)
- POU

*1: Including information related to integration with CENTUM

*2: Information related to connection with subsystems
*3: Information related to Modbus slave communication
*4: Information related to integration with CENTUM
*5: Not printed in backward-compatible mode

Customizing print settings

The contents that are printed by using the Self-documentation function can be customized for each SCS project. The customization function of R2.02 or later is different from that of a revision before R2.02.

IMPORTANT

The most preferable paper setting for printing the self-documentations is A3 size paper with landscape orientation. Therefore, you need to set the paper size to A3 and change the orientation to Landscape.

The printed information can be customized as follows.

- A cover page can be added
- A header or footer can be printed
- A page number can be printed
- Margin setting
- Font can be specified
- The printing orientation of the FBD and the LD (portrait or landscape) can be specified (*1)

*1: If the printer settings are already the A3 size paper with landscape orientation, these settings are not necessary.

Checking print preview

It is possible to check the printed image in advance.

Print target printer

It is possible to print out to a printer directly connected to the SENG or a printer connected via a network.

Relationship with SCS Manager and Builders

The relationship between self-documentation function and engineering functions (SCS Manager and builders) is illustrated below.

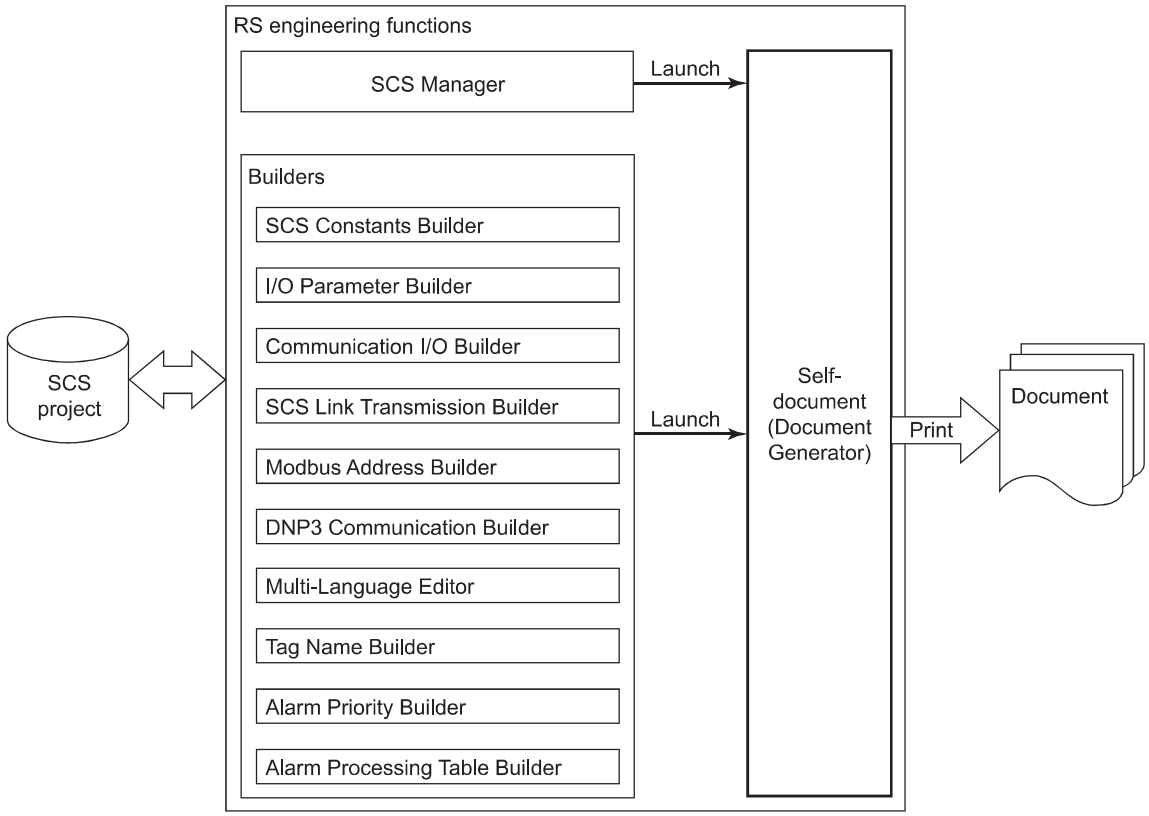

Figure F2-1 Relationship Between the Self-documentation Function and Engineering Functions

The self-documentation function is launched from SCS Manager or from any of the builders.

It allows printing definitions of SCS projects edited and saved in SCS Manager or each builder as documents.

TIP Definitions of CENTUM projects should be printed out with the self-documentation function of CENTUM.

Selecting printing mode

You can select the mode of printing by selecting the [Enhanced printing style] check box in the Customize dialog box, which is opened from the [Option] menu of SCS Manager. If the check box is cleared, self-documentation runs in backward-compatible mode and behaves the same as before R2.02.

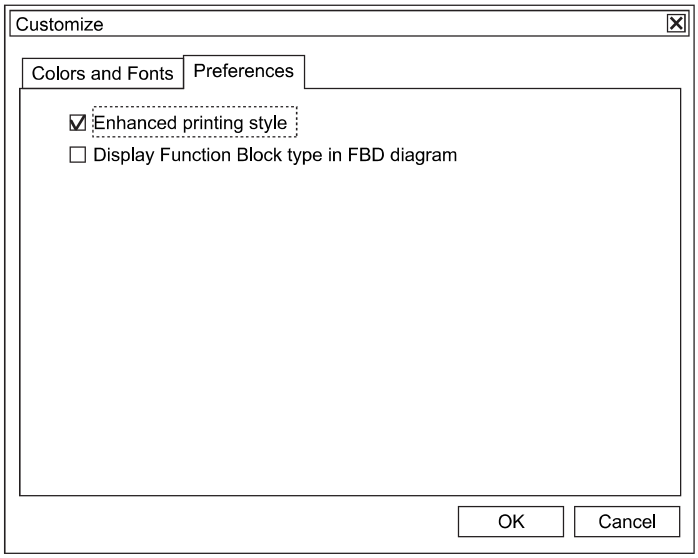

Figure F2-2 Customize dialog box

F2.1 Document Generator

Document Generator is the user interface of the self-documentation tool.

How to launch Document Generator

Document Generator can be launched by either one of the following operations.

- From the SCS Manager menu bar, select [File] > [Print], or click the "Print" button on the toolbar.
- From the menu bar of each builder, select [File] > [Print], or click the "Print" button on the toolbar.

Document Generator window structure

Figure F2.1-1 Document Generator window

Tabs

The window is composed of the following three tabs.

- "Table" tab: Select printing target

- "Options" tab: Customize print settings
- "Preview" tab: Preview printed information

If you click [Print] button in the Document Generator window, the Print dialog box appears. Select a printer and specify page settings such as paper size in the Print dialog box; then click [OK] button to start printing.

On Print dialog box, the range of pages to be printed can be set on [Page Range].

The relationship between the displayed tab and the specification method of page ranges that can be specified is shown below.

Table F2.1-1 Relationship between tabs and page ranges that can be specified

Tabs	[All]	[Current page]	[Pages] (*1)	[Sections] (*2)
Table	Specification allowed		Specification allowed	Specification allowed
Options	Specification allowed		Specification allowed	Specification allowed
Preview	Specification allowed	Specification allowed	Specification allowed	Specification allowed

*1: The printout page range can be specified with hyphen (-) or the pages can be separated by commas (,).
*2: The printout section range can be specified with hyphen (-) or the sections can be separated by commas (,).

SEE ALSO For more information about details of the "Table" tab sheet, refer to:

F2.2, “Selection of printing targets” on page F2-9

For more information about details of the "Options" tab sheet, refer to:

F2.3, “Customizing print settings” on page F2-14

For more information about details of the "Preview" tab sheet, refer to:

F2.6, “Confirmation by print preview” on page F2-34

Procedure of printing operations

The procedure of printing operations when using Document Generator is explained below.

1. Specify the printing targets in the "Table" tab.
2. Customize the print settings in the "Options" tab.
3. Click [Page Setup] and make printer settings in the Page Setup dialog box.
4. Display a print preview and check the printed information in the "Preview" tab.
5. Click [Print] button to print.

Page Setup dialog box

When you print using Document Generator, you can make printer settings in the Page Setup dialog box started from [Page Setup] on the [File] menu of SCS Manager. However, you cannot use the Page Setup dialog box in backward-compatible mode. The settings you have made in the Page Setup dialog box are reflected in the initial settings of Print dialog box of Document Generator. You can preview the image of the printout based on the settings of the Page Setup dialog box. Therefore, if you specify the printer usually used for printing in the Page Setup dialog box beforehand, the preview and printed results match. The settings in the Page Setup dialog box can be made for each computer. However, in the Page Setup dialog box, you cannot set Page Range.

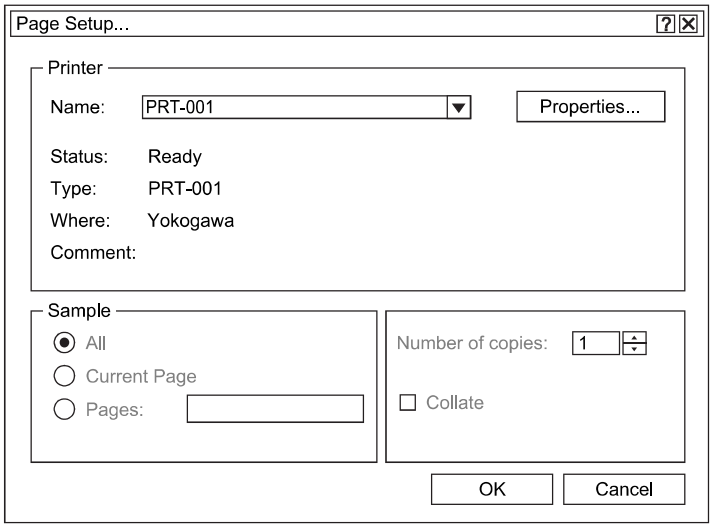

Figure F2.1-2 Page Setup dialog box

F2.2 Selection of printing targets

Select the printing targets in the "Table" tab of Document Generator.

Table tab

Figure F2.2-1 Table tab of Document Generator

Selecting printing targets in the Table tab

In the "Table" tab, you can select the definition items to be printed by Document Generator. Click the +/- buttons placed at the left edge of each item displayed in the tree view to display definition items and select the check boxes next to each definition you wish to print. For definition items that are selected in their check boxes, their data in the following table are printed.

Table F2.2-1 Printing objects

5.X	Tag names	Tagged variables cross reference index	(*3)

*1: Chapter and section numbers vary depending on the selected printing objects. If the item selected as printing object contains no content, nothing is printed. X means a serial number starting at 1. The start page for print can be changed.
*2: Definition item names in tree are printed as the title character strings of chapters and sections (except for the cover page).
*3: For library project, the tree view is not displayed. Moreover, the Print command is not valid.
*4: Displayed in the tree view if the PC has a license for CENTUM VP Integration Engineering Package.
*5: Description of each POU is also printed.

Outputting Variables Cross Reference Index

To print variables cross reference information, click the [Table] tab in Document Generator, and select [Variable cross reference index] or select from among the individual items of [Hardware I/O], [Global Variables], [Tag Names] that are shown under [Variable cross reference index].

In variables cross reference index, information on which variables are used by which POU is listed. The following information can be output.

Table F2.2-2 Information output as variables cross reference index

Definition item name in tree	Global variables (instance)	Local variables	FB parameters
Hardware I/O (I/O variables in IO_BOOL and IO_REAL)	Output	Output	Not output
Global variables (in BOOL/DINT/REAL)	Output	Not output	Not output
Tag Names (*1)	Output	Output	Output

*1: All the variables, FB instances, and parameters to which a tag name is assigned are output. However, ANNs are output even if tag names are not assigned.

Each report contains the following data.

- Name:
  For parameters, name is output with the FB instance name. For example, "FB1.Param." If the scope of a variable is set to Local, name is output with the POU name. For example, "Var1@POU" is output.
- Type:
  Type name such as ANN and BOOL is output.
- Direction:
  Input, Output or Internal is output.
- Tag Name:
  For ANN, %AN element name is also output.

- Sheet Number:
  Sheet number is output in the format "POU name - page number."

TIP

No matter whether you have selected POU as the data to be printed or not, cross reference information is printed for all POUs. Regardless of the actual setting of [New page for each item] in the [Options] tab of Document Generator, documents are printed with a page break inserted at the end of each POU.

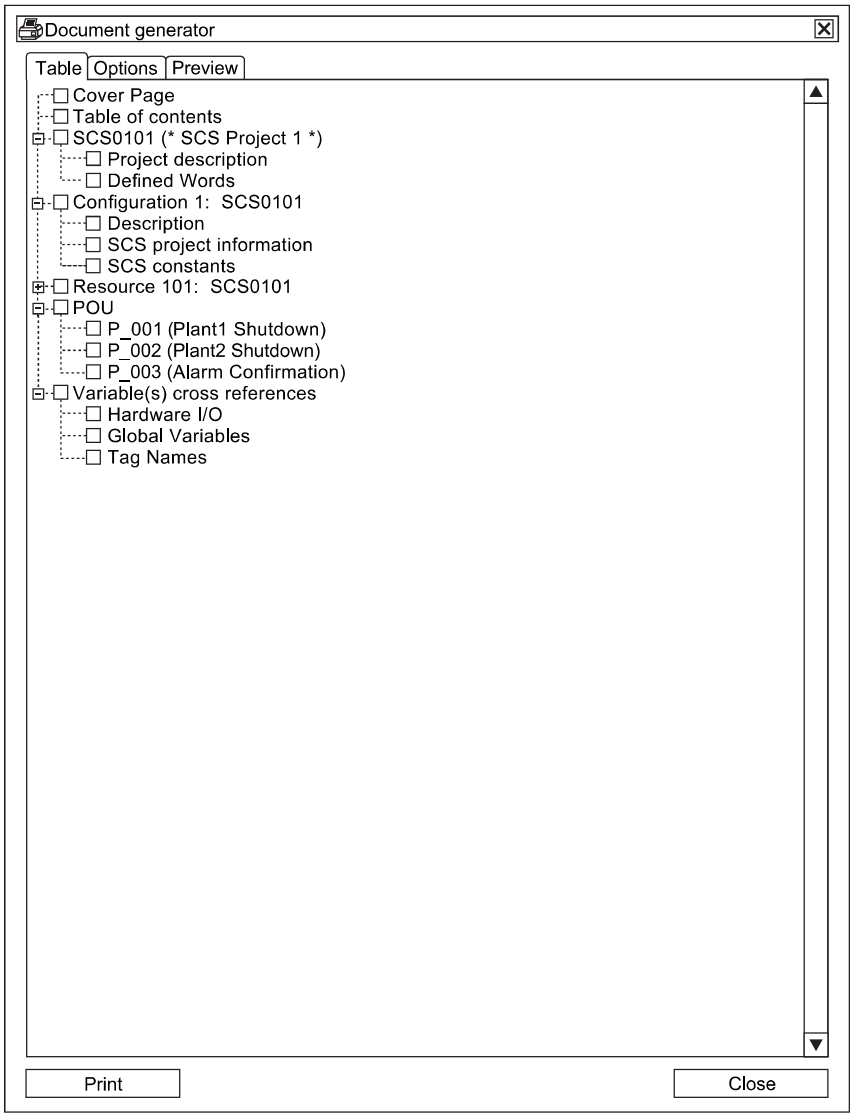

Figure F2.2-2 Variable Cross Reference Index window

F2.3 Customizing print settings

You can customize the information to be printed in the Options tab of Document Generator.

F2.3.1 Customizable print settings

To customize, click a button in each group box in the Options tab of Document Generator.

Options tab

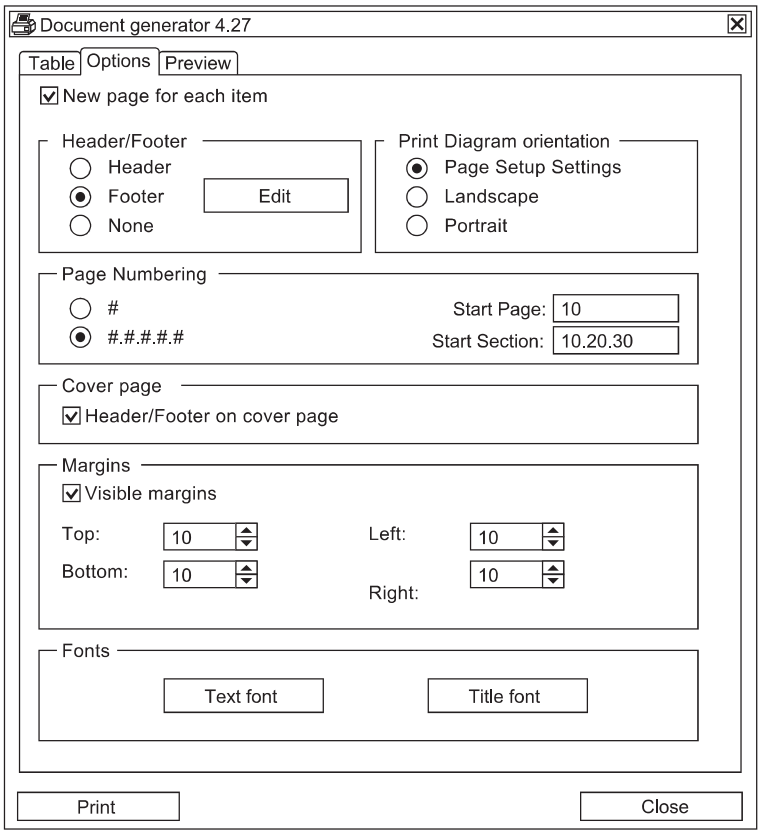

Figure F2.3.1-1 Options tab page

The components of the tab are explained in the following sections.

New page for each item

Select this check box to start a new page for each printed item. If [Landscape] is selected at "Print Diagram orientation", FBD and LD begin on a new page even if the [New page for each item] check box is not selected.

IMPORTANT

If you print after you change print settings in either the Options tab in Document Generator or the Print dialog box shown when you click the Print button in Document Generator, page breaks may be inserted in places different from those that you see on the screen.

Print diagram orientation

Select one of the three options, and the documents will be printed as specified.

- Page Setup Settings
  FBD and LD are also printed according to the settings in the Page Setup dialog box or Print dialog box.
- Landscape

FBD and LD are printed in landscape orientation regardless of the settings in the Page Setup dialog box or Print dialog box. Other print items are printed according to the settings in the Page Setup dialog box or Print dialog box.

- Portrait
  FBD and LD are printed in portrait orientation regardless of the settings in the Page Setup dialog box or Print dialog box. Other print items are printed according to the settings in the Page Setup dialog box or Print dialog box.

Header/Footer

You can make settings for a header or footer. You can select to print a header (at the top of the page) or a footer (at the bottom of the page) or not to print any of them. Click [Edit] button and the dialog box for editing Header/Footer appears.

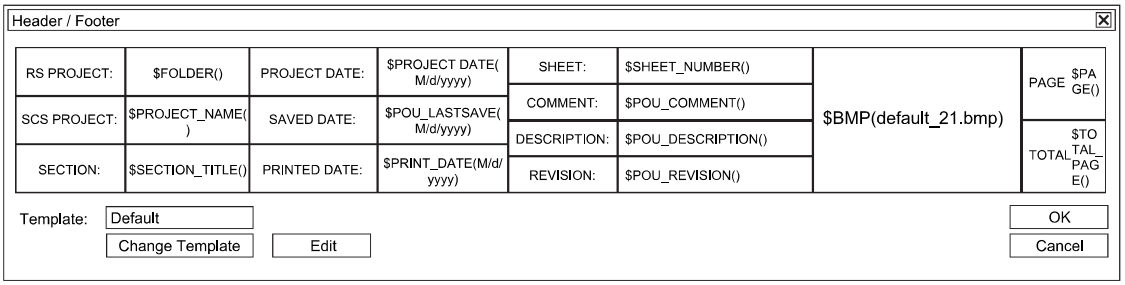

Figure F2.3.1-2 Dialog Box for editing Header/Footer

In the dialog box for editing Header/Footer, you can customize the following.

- Select a Header/Footer template.
- Change print properties of a Header/Footer template.

SEE ALSO For more information about details on customizing the header/footer, refer to:

F2.3.2, “Editing header and footer” on page F2-19

Page numbering

Specify the format of the page numbers printed in the header or footer, and the page number for the first page.
Use either of the following page number formats.

- [#]
  Page numbers are printed using the format of "Page 'page number'" (serial number). Serial numbers are assigned to pages starting from the first page. Specify the page number from which printing is to be started by entering it in [Start Page:].
- [#.#.#.#.#]
  Page numbers are printed using the format of "Page 'section/chapter number' - 'page number'" (section format). Serial numbers are assigned to pages starting from the first page for each chapter/section. Specify the section number from which printing is to be started by entering it in [Start Section:]. Note that the cover page and the table of contents are always numbered from page 1 (i).
  - The page numbers for the cover page and table of contents are printed using Roman numerals (i, ii, iii, iv, ...).
  - Each chapter after that (project data, configuration data, resource data, POU data, variable cross reference index data) is numbered in the format "Chapter- page number" or "Chapter. Section- page number."

TIP

If you want to reprint a part of the project so as to replace the old printouts after the contents of the whole SCS project were printed out, follow the procedure below:

1. In the Table tab, choose the items to be printed.
2. In the Options tab, choose [#.#.#.#.#.] at Page Numbering.
3. In [Start Section], specify the chapter and section numbers for the items you want to reprint.
4. Click [Print]. The Print dialog box appears.
5. In the Print dialog box, select [All] for [Page Range:]. Then only the specified part of the project will be printed out.

Cover page

Specify the format of the cover page.
If you check the [Header/Footer on cover page], header or footer is printed on the cover page in the format specified in the [Header/Footer] section.

Margins

Specify the printing margins of each page. The printing margins are the offsets at the top/bottom/left/right sides of the page from the perimeter of the maximum printable area.

- "Visible Margins"
  Specify whether or not to print the printing margin frame. If you select the check box, a frame showing the printing margins is printed on each page.
- "Top", "Bottom", "Left", "Right"
  Specify the margin width for the top, button, left and right margin in units of mm, respectively.

Fonts

Specify the font used in printing. The specified font is used for texts except for those shown in FBD and LD windows.

- [Text font] button
  Click the [Text font] button to show the Text Font dialog box. The font selected in this dialog box is used for texts except for those shown in FBD and LD windows (including table of contents and chapter titles and section titles).
- [Title font] button
  Click the [Title font] button to show the Title Font dialog box. The font selected in this dialog box is used for the cover page.

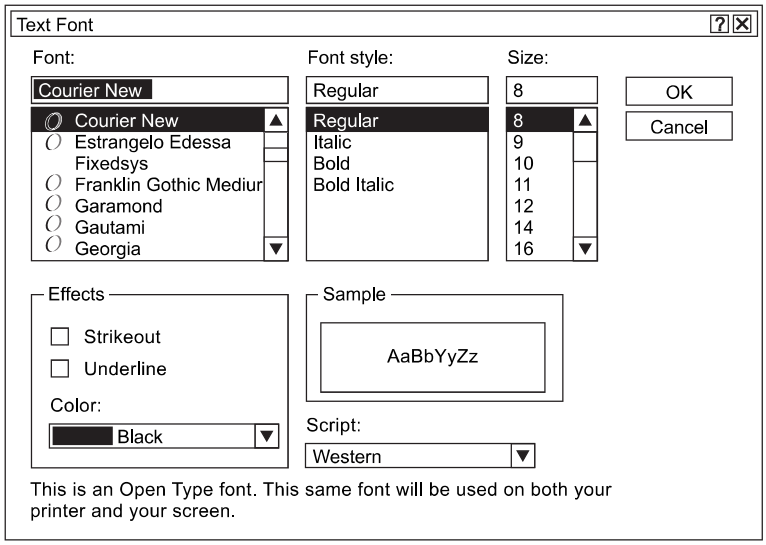

Figure F2.3.1-3 Text Font dialog box

[Font style], [Effects] and [Script] settings are invalid.

IMPORTANT

The self-documentation function prints data in the files saved by SCS Manager and builders. For this reason, if you attempt to save files while the self-documentation is running, incorrect information may be printed or the printing process may fail. In such cases, run the self-documentation again after completing saving the files.

F2.3.2 Editing header and footer

To customize Header/Footer, start the Header/Footer dialog box by clicking the [Edit] button in the [Header/Footer] group box in the [Options] tab in Document Generator.

Selecting a Header/Footer template

The following 8 types of Header/Footer templates are provided. You can select the one you like.

Table F2.3.2-1 Template list

Templates	Remarks
Default	Default template
Template_1	-
Template_2	-
Template_3	-
Template_4	-
Template_5	-
Template_A	Equivalent to Format A in backward-compatible mode
Template_B	Equivalent to Format B in backward-compatible mode

Follow the steps below to select a Header/Footer template.

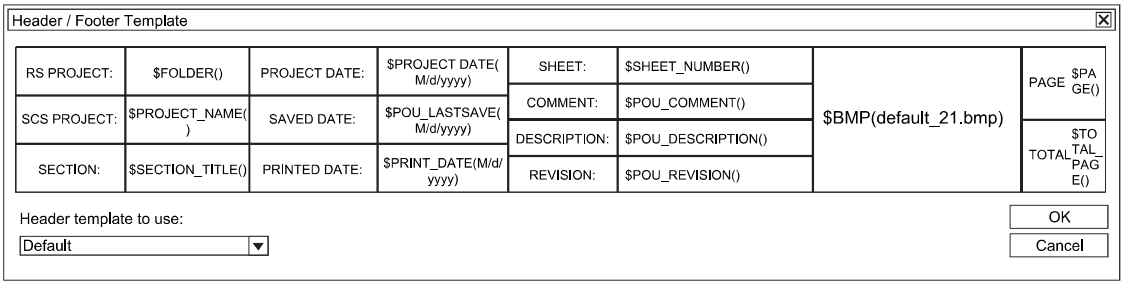

Figure F2.3.2-1 Template Selection dialog box

1. In the Header/Footer dialog box, click the [Change Template] button to open the Template selection dialog box.
2. In the list box in the Template selection dialog box, select a template you want to use. A preview of the selected template appears.
3. In the Template selection dialog box, click the [OK] button and the selected template is applied.
   Click [Cancel] to cancel your selection and the Template selection dialog box closes.

   Name of the selected template appears in the Header/Footer dialog box, and a preview of the template is shown.
4. In Header/Footer dialog box, click the [OK] button and the Header/Footer of the selected template is used in printing.
   If you click the [Cancel] button, Header/Footer is not changed. The [OK] button in the Header/Footer dialog box becomes valid only after you click the [OK] button in the Template selection dialog box in step 3.

Editing Header/Footer properties

To edit Header/Footer print properties, open the Change Print Items dialog box and follow the steps below.

1. In the Header/Footer dialog box, click the [Edit] button to show the Change Print Items dialog box.
2. In the Change Print Items dialog box, edit Header/Footer properties.
3. Click the [OK] button in the Change Print Items dialog box, and the changes you make in the dialog box are applied.
   If you want to cancel the changes, click the [Cancel] button.

   Result of your editing is shown in a preview in the Header/Footer dialog box. In the area where nothing is to be printed, the area number is shown.
4. In the Header/Footer dialog box, click the [OK] button, and the edited Header/Footer are used in printing.
   If you click the [Cancel] button, Header/Footer is not changed. The [OK] button in the Header/Footer dialog box becomes valid only after you click the [OK] button in the Change Print Items dialog box in step 3.

IMPORTANT

If you re-select a template after changing Header/Footer print properties, the changes are undone.

Change Print Items dialog box

To change the Header/Footer print properties, use the Change Print Items dialog box. One of the following is printable in the template Header/Footer area.

- Macro
- Fixed character strings (blank strings are allowed)
- Combination of macro and fixed character strings
- Bitmaps

If character strings are printed, you can specify font size (4 point to 72 point) of the character strings. Font is fixed to the one specified in [Title font] in the Options tab in Document Generator.

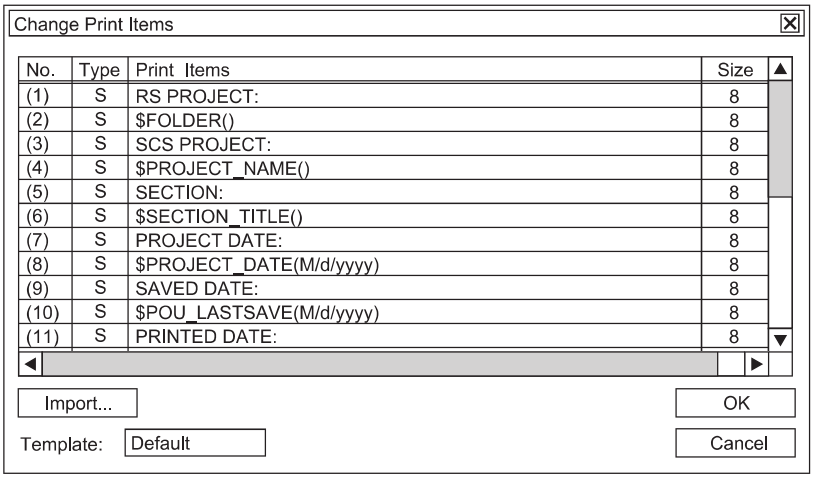

Figure F2.3.2-2 Change Print Items dialog box

The following section describes components of the Change Print Items dialog box.

No.

Shows the area number for a print item in a template. If no print item is specified, this number is shown in a preview.

Type

Shows the type of a print item.

- S: character string (Macro, fixed character strings, or combination of both)
- B: Bitmap

Print item

Specify the details for a print item. Settings are different depending on whether the "type" is S (character string) or B (bitmap).
When "type" is S (string): Displays the character string to be printed (macro, fixed string, or a combination of these).

- Click on a line with the left-button of your mouse and you can edit the character string in it.
- Select a line and right-click your mouse, and the following pop-up menu appears.

  Cut : cuts the selected character string.

  Copy : copies the selected character string.

  Paste : pastes the cut or copied character string.

  Delete : deletes the selected character string.

  If you select $FOLDER( ) or one of the commands listed below it, the corresponding macro is inserted at the point where the mouse cursor is blinking. After inserting, you can edit the character string.

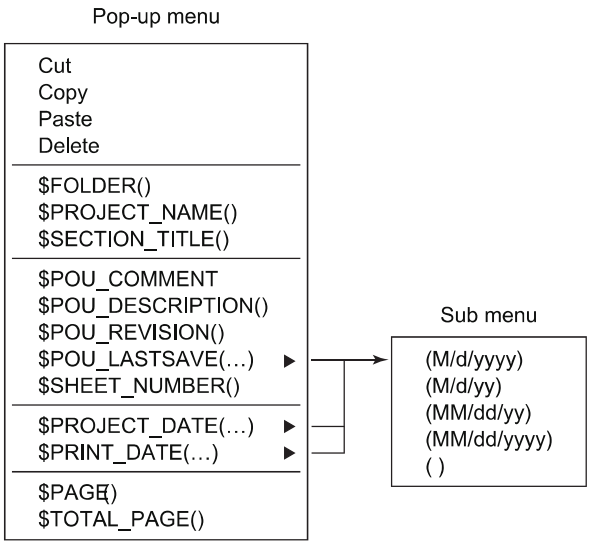

Figure F2.3.2-3 Pop-up menu and sub menu

When "type" is B (bitmap): Bitmap file name. Specify a .bmp file under the following folder.

`{Project folder}\YOKOGAWA_SCS\SELDOC\`

- Click a file name with the left button on your mouse, and you can edit it.
- Left-click the mouse and click the […] button that appears, and a file selection dialog box appears. Select a file.

Size

Font size (point) of character strings for an item of Type S (character string). Type an integer from 4 to 72 or select a size from the combo box.

Template

The name of the currently selected template is shown.

Editing Header/Footer

You can edit the Header/Footer of the selected template. The items that can be printed in the Header/Footer are macro (character string), fixed character strings, and a combination of macro and fixed character strings, and bitmap.

For example, if you specify "$PROJECT_NAME()," the actual SCS project name (or library name) is printed.

If you specify the combination of a fixed character string "Page" and macro "$PAGE" by entering "Page$PAGE()," page number will be printed in the format such as "Page 4.1-1."

If you specify one of the macros listed below or one of these macros combined with a fixed character string, the printing will come out only on the POU source pages. On the other pages, nothing is printed.

"$POU_COMMENT( )", "$POU_DESCRIPTION( )", "$POU_REVISION( )", "$POU_LASTSAVE(format)", "$SHEET_NUMBER( )"

$POU_COMMENT( )

Comment of the POU shown in the page

Example:

First Comment

$POU_DESCRIPTION( )

Description of POU shown in the page

Example:

First description

$POU_REVISION( )

Revision comment of the POU shown in the page

POU revision comment is entered and displayed in the POU Properties dialog box. The entered comment is printed as the POU revision comment in the position where this macro is specified.

Example:

First Revision

$POU_LASTSAVE(format)

Date when the shown POU is last saved or imported. Same as the "Date Modified" shown in Windows Explorer. You can specify the output format of the date by entering the format in the parenthesis of this macro as shown below.

- The following alphabets in the format stand for Year/Month/date.
- Characters other than the alphabets that stand for Year/Month/date are output as they are.
- If you want to output the alphabets that stand for Year/Month/date, enclose them with single quotation marks (').

Table F2.3.2-2 Rules for Date Format Specification

d	date
dd	date. For one digit number, 0 is filled in the tenths place.
M	Month (numeral)
MM	Month (numeral). For one digit number, 0 is filled in the tenths place.
MMM	Month (abbreviated character string). Example: Jan
MMMM	Month (character string). Example: January
y	year (last two digits). The zero for the tens place is not output.
yy	year (last two digits). The zero for the tens place is output.
yyyy	Year (western calendar)

Example format
$POU_LASTSAVE(MMM-d) Apr-6

$SHEET_NUMBER( )

Sheet number. It consists of POU name and POU page number ("POU name - page number"). If a diagram is printed over two pages or more, the first page has the page number 1, the second page, 2 and so on.

Example:

POU_A-1

$PROJECT_DATE(format)

Project date.

Project date is entered and displayed in the Project Properties dialog box. The entered value is printed in the position where this macro is specified as the project date. Like the $POU_LASTSAVE, you can specify the format.

- **$PRINT_DATE(format)**

Date of printing. The date when the document is printed. Like the $POU_LASTSAVE, you can specify the format.

- **$PAGE( )**

Page number or page number with section number. Page numbers are printed according to the setting of [Page Numbering] in Document Generator.

- If [#] (serial number format) is specified for [Page Numbering], serial number is used for page number.
  Example:
  7
- If [#.#.#.#.#.#] (section format) is specified for [Page Numbering], the page number is a combination of section number and page number within the section.
  Example:
  4.1-1

- **$TOTAL_PAGE( )**

Total number of pages to be printed. Same as the total number of pages that is printed when [#/ total number of pages] is selected for [Page Numbering] in Document Generator in backward-compatible mode (that is, [Enhanced printing style] in the Customize dialog box is set to OFF).

Example:

23

- **$PROJECT_NAME( )**

SCS project name or library name

Example:

SCS0101 or LIBRARY1

- **$FOLDER( )**

Folder name (=RS Project name) where the project is stored.

Example:

MYRSPJT

- **$SECTION_TITLE( )**

The character string "Project" for a chapter on Project. The character string "Configuration" for a chapter on configuration. The character string "Resource" for a section on Resource. The character string "POU" for a section on POU.

Example:

Configuration

Importing Header/Footer from another project

In the Change Print Items dialog box, the Header/Footer of another project can be imported. You can use the same Header/Footer as that used in another project in a new project by using Import function.

1. Select in advance, the same template as the Header/Footer of another project you want to import.
2. Click the [Import…] button.
   Folder selection dialog box appears.
3. Select SCS project or library folder, and click the [OK] button.
   The print properties of the project are reflected to the selected template of the new project. If bitmaps are included in the Header/Footer template of the selected project, the bitmap file is copied in the predefined folder of the new project (`{Project folder}\YOKOGAWA_SCS\SELDOC\`)

IMPORTANT

- If the Header/Footer template of the selected project does not exist or the template in the new project is different, a message box appears and import is not executed. If the template of the new project differs from that of the selected project, the name of the template specified in the project the system failed to import is shown, select the same template for the new project and import again.
- If a bitmap file of the same name already exists in the folder of the new project (`{Project folder}\YOKOGAWA_SCS\SELDOC\`), a dialog box appears asking you if it is all right to overwrite the bitmap file. If you click the [OK] button for all bitmap files to be imported, the import proceeds. If you click the [Cancel] button for any of them, import is not executed.

F2.4 Selection of printing targets (Backward-compatible mode)

Select the printing targets in the "Table" tab of Document Generator.

Table tab

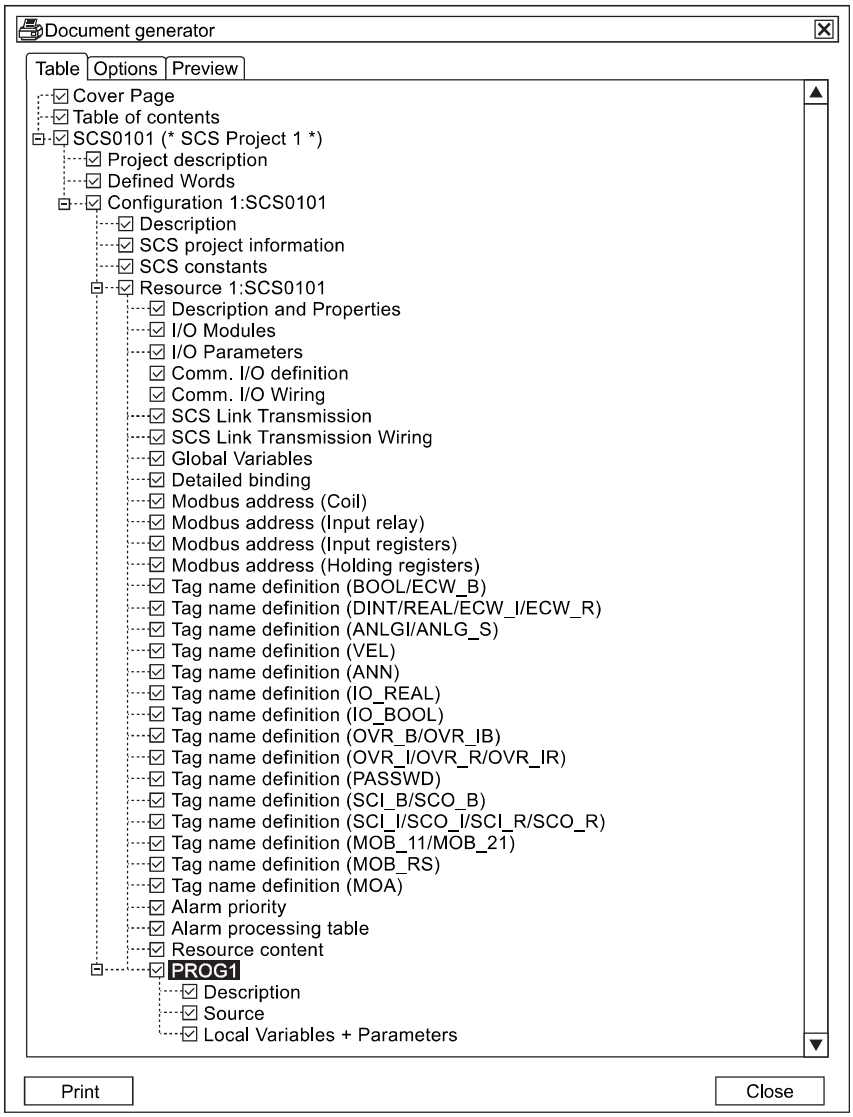

Figure F2.4-1 Table tab of Document Generator

Selecting printing targets in the Table tab

In the "Table" tab, you can select the definition items to be printed by Document Generator. Click the +/- buttons placed at the left edge of each item displayed in the tree view to display definition items and select the check boxes next to each definition you wish to print. For definition items that are selected in their check boxes, their data in the following table are printed.

Table F2.4-1 Printing objects (for compatible mode)

Chapter/ section Number (*1)	Definition item name in tree (*2)	Printed data	Remarks
	Cover Page	Cover page	-
	Table of contents	Table of contents	-
1	(Project name)	SCS project name	-
1.1	Project description	Comment for SCS project	-
1.2	Defined words	Defined words	-
1.3	(Configuration name)	Configuration name and comment	-
1.3.1	Description	Description for configuration	-
1.3.2	SCS project information	SCS project information	The CENTUM project top folder is printed when CENTUM is connected to the system. For a library project, only the version number is printed.
1.3.3	SCS constants	SCS constant definition	(*3)
1.3.4	(Resource name)	Resource name and comment	-
1.3.4.X	Description and Properties	Description for resource	-
1.3.4.X	I/O Modules	Node and input/output module information	(*3)
1.3.4.X	I/O Parameters	Input/output module information (wiring information and parameters)	(*3)
1.3.4.X	Comm. I/O definition	Subsystem communication I/Os	(*3)
1.3.4.X	Comm. I/O wiring	Subsystem communication I/O wirings	(*3)
1.3.4.X	Fire and gas communication definition	Fire and gas communication definition information	(*3)
1.3.4.X	Fire and gas communication wiring	Fire and gas communication wiring information	(*3)
1.3.4.X	SCS Link Transmission	SCS Link Transmission definition	(*3)
1.3.4.X	SCS Link Transmission Wiring	SCS Link Transmission data wirings	(*3)
1.3.4.X	Global Variables	List of global variables	
1.3.4.X	Detailed binding	Binding information	(*3)
1.3.4.X	Modbus address (Coil)	Modbus address information	(*3)
1.3.4.X	Modbus address (Input relay)		
1.3.4.X	Modbus address (Input registers)		
1.3.4.X	Modbus address (Holding registers)		

Continues on the next page

Table F2.4-1 Printing objects (for compatible mode) (Table continued)

Chapter/ section Number (*1)	Definition item name in tree (*2)	Printed data	Remarks
1.3.4.X	DNP3 communication (Parameters)	DNP3 communication	It can be printed for the SCS projects of SCSU1 that are created by the software version R3.02.20 or later.
1.3.4.X	DNP3 communication (Binary Input)		
1.3.4.X	DNP3 communication (Binary Output)		
1.3.4.X	DNP3 communication (Binary Counter)		
1.3.4.X	DNP3 communication (Analog Input)		
1.3.4.X	DNP3 communication (Analog Output)		
1.3.4.X	Tag name definition (BOOL/ ECW_B)	Tag name definition	(*3) It can only be printed for a system with CENTUM integration structure. (*4)
1.3.4.X	Tag name definition (DINT/ REAL/ECW_I/ECW_R)		
1.3.4.X	Tag name definition (ANLGI/ ANLG_S)		
1.3.4.X	Tag name definition (VEL)		
1.3.4.X	Tag name definition (ANN)		
1.3.4.X	Tag name definition (IO_REAL)		
1.3.4.X	Tag name definition (IO_BOOL)		
1.3.4.X	Tag name definition (GOV_B/ GOV_IB/OVR_B/OVR_IB)		
1.3.4.X	Tag name definition (OVR_I/ OVR_R/OVR_IR)		
1.3.4.X	Tag name definition (PASSWD)		
1.3.4.X	Tag name definition (SCI_B/ SCO_B)		
1.3.4.X	Tag name definition (SCI_I/ SCO_I/ SCI_R/SCO_R)		
1.3.4.X	Tag name definition (MOB_11/ MOB_21)		
1.3.4.X	Tag name definition (MOB_RS)		
1.3.4.X	Tag name definition (MOA)		
1.3.4.X	Alarm priority	Alarm priority	(*3) It can be printed only for a system with CENTUM integration structure. (*4)
1.3.4.X	Alarm processing table	Alarm processing table	
1.3.4.X	Resource content	POU list	-
1.3.4.X	(POU)	POU name	One POU corresponds to one item.
1.3.4.X.X	Description	Description for POU	-

Continues on the next page

Table F2.4-1 Printing objects (for compatible mode) (Table continued)

Chapter/ section Number (*1)	Definition item name in tree (*2)	Printed data	Remarks
1.3.4.X.X	Source	FBD/LD/ST	-
1.3.4.X.X	Local Variables + Parameters	List of local variables and parameters	-

*1: Chapter and section numbers vary depending on the selected printing objects. If the item selected as printing object contains no content, nothing is printed. X means a serial number starting at 1. The start page for print can be changed.
*2: Definition item names in tree are printed as the title character strings of chapters and sections (except for the cover page).
*3: For library project, the tree view is not displayed. Moreover, the Print command is not valid.
*4: Not displayed in the tree view if the PC does not have a license for CENTUM VP Integration Engineering Package.

SEE ALSO For more information about the method for changing the start page for print, refer to:

"● Page numbering" on page F2-32

F2.5 Customizing print settings (backward-compatible mode)

You can customize the information to be printed in the Options tab of Document Generator.

In ProSafe-RS R2.02, self-documentation related behavior has been changed. If compatibility is important, you can choose the behavior in before R2.02. In this document, the behavior in before R2.02 is called "backward-compatible mode."

Options tab

This section explains how to customize printing in backwards-compatible mode.

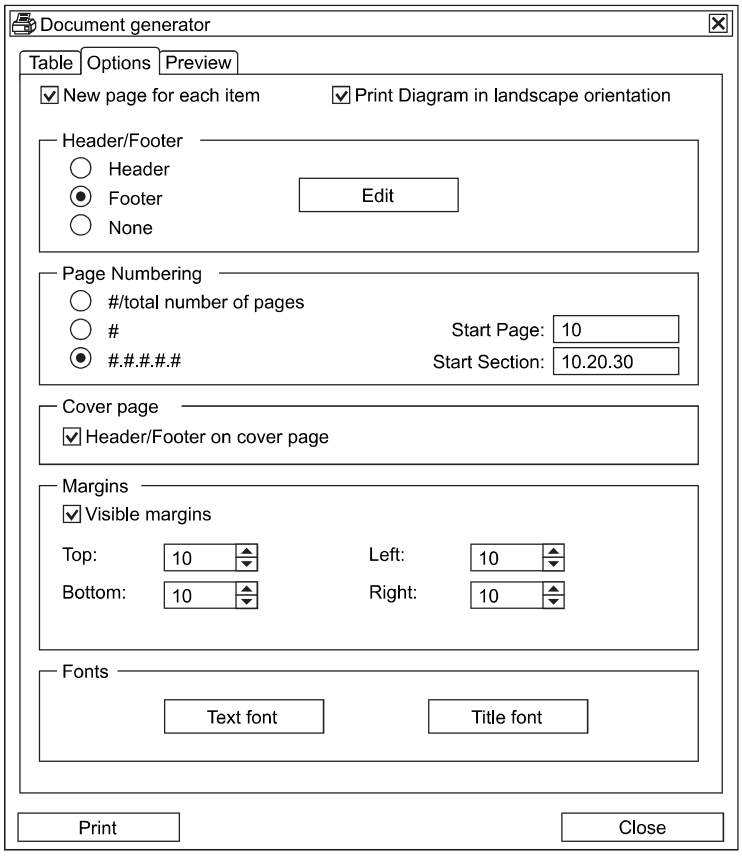

Figure F2.5-1 Options tab of Document Generator

The components of the tab are explained in the following sections.

New page for each item

Select this check box to start a new page for each printed item. If the [Print Diagram in landscape orientation] check box is selected, the FBD and the LD begin on a new page even if the [New page for each item] check box is not selected.

Print diagram in landscape orientation

If you select this check box, the FBD and the LD are printed in horizontal (landscape) orientation regardless of the default setting of the printer and specification in the Print dialog box. Other printing items follow the default settings of the printer and specifications in the Print dialog box.

Header/Footer

You can make settings for a header or footer. Select to print either the header (at the top of the page) or footer (at the bottom of the page) or not to print both. Click [Edit] button. The following dialog box appears, where you can edit the header or footer.

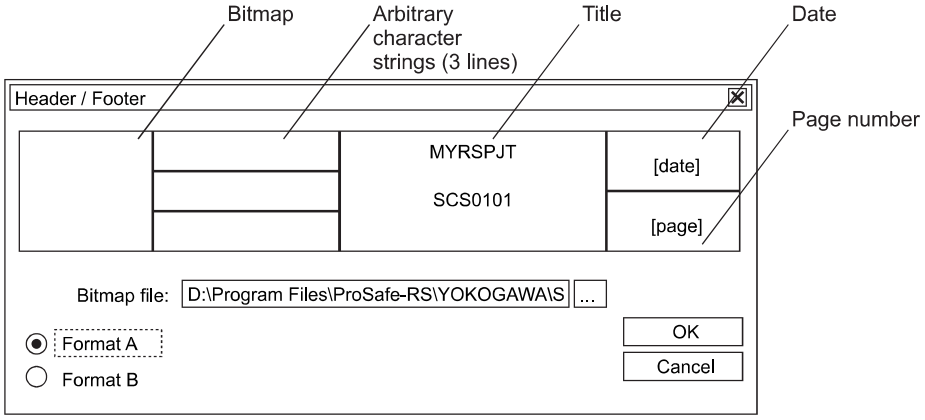

Figure F2.5-2 Header/Footer dialog box (Format A)

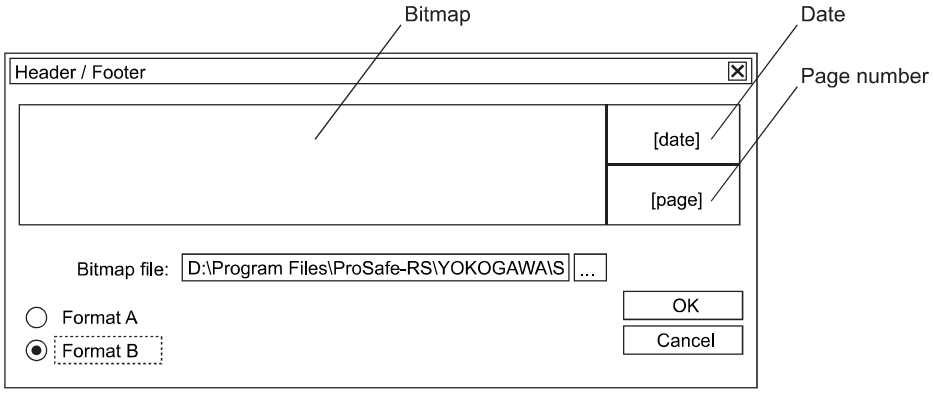

Figure F2.5-3 Header/Footer dialog box (Format B)

In the Header/Footer dialog box, check the header or footer and click [OK] button. Set the specified header or footer to be printed on each page.

There are two types of formats for the header or footer. Specify either [Format A] or [Format B].

Specify the printed items as shown below.

- Bitmap (formats A and B)
  Specify the path name of the bitmap file you want to use in the [Bitmap file:] field. It is also possible to click [...] button to select a path name using the "Open" dialog box.
- Arbitrary character strings (only for format A)
  It is possible to enter a character string directly in each of the three lines. The character strings entered are printed in the header or footer.
- Title (only for format A)
  This is the same character string as the title string. The following information is printed. These strings are also printed on the cover page.

  First line: Cannot be edited (RS project name)

  Second line: Can be edited (default: SCS project name)

  Third line: Can be edited (default: explanation of the project)
- Date (formats A and B)

The date on which the printing was done is printed out. The date format follows the default format of the locale selected in "Regional Options" of the Windows.

- Page numbers (formats A and B)
  The page numbers are printed. The format of page numbers used is the format selected in the "Options" tab.

Page numbering

Specify the format of the page numbers printed in the header or footer, and the page number for the first page.
Use either of the following page number formats.

- [# / total number of pages]
  Page numbers are printed using the format of "page number/total number of pages" (serial number along with the total number of pages). Serial numbers are assigned to pages starting from the first page.
- [#]
  Page numbers are printed using the format of "Page 'page number'" (serial number). Serial numbers are assigned to pages starting from the first page. Specify the page number from which printing is to be started by entering it in [Start Page:].
- [#.#.#.#.#]
  Page numbers are printed using the format of "chapter number.section number.page number" (section format). Serial numbers are assigned to pages starting from the first page for each chapter/section. Specify the section number from which printing is to be started by entering it in [Start Section:]. Note that the cover page and the table of contents are always numbered from page 1 (i).
  - The page numbers for the cover page and table of contents are printed using Roman numerals (i, ii, iii, iv, ...).
  - The project information is printed using the "9.9" format.
  - The configuration information is printed using the "9.9.9" format.
  - The resource information is printed using the "9.9.9.9" format.
  - The POU information is printed using the "9.9.9.9.9" format.
  - The information in lower hierarchy than POU is printed using the "9.9.9.9.9.9" format.

TIP

If you want to reprint a part of the project so as to replace the old printouts after the contents of the whole SCS project were printed out, follow the procedure below:

1. In the Table tab, choose the items to be printed.
2. In the Options tab, choose [#.#.#.#.#.] at Page Numbering.
3. In [Start Section], specify the chapter and section numbers for the items you want to reprint.
4. Click [Print]. The Print dialog box appears.
5. In the Print dialog box, select [All] for [Page Range:]. Then only the specified part of the project will be printed out.

Cover page

Specify the format of the cover page.
If you check the [Header/Footer on cover page], header or footer is printed on the cover page in the format specified in the [Header/Footer] section.

Margins

Specify the printing margins of each page. The printing margins are the offsets at the top/bottom/left/right sides of the page from the perimeter of the maximum printable area.

- "Visible Margins"
  Specify whether or not to print the printing margin frame. If you select the check box, a frame showing the printing margins is printed on each page.
- "Top", "Bottom", "Left", "Right"
  Specify the margin width for the top, button, left and right margin in units of mm, respectively.

Fonts

Specify the font used in printing. The font specification applies to text used for information displayed except for the FBD, the LD and the ST of Multi-Language Editor.

- "Text font"
  Click [Text font] button to display the Text font dialog box. The font selected in this dialog box is used as the font for the table of contents and titles of chapters and sections.
- "Title font"
  Click [Title font] button to display the Title font dialog box. The font selected in this dialog box is used as the font for the cover page.

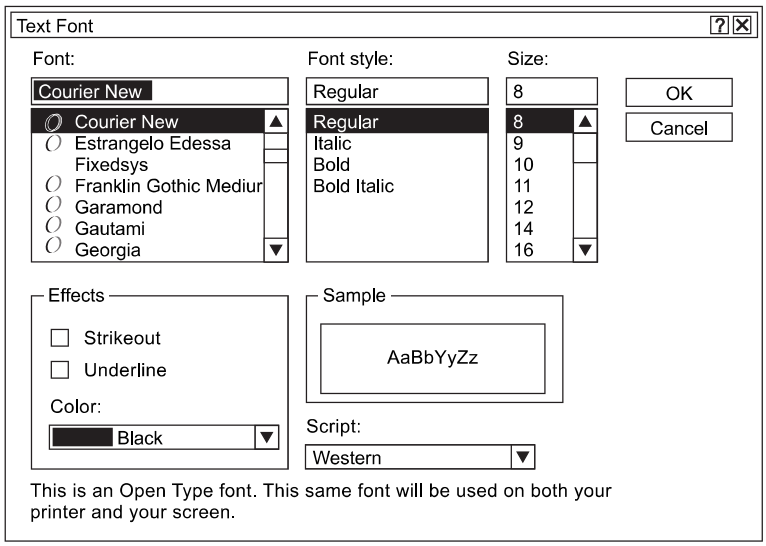

Figure F2.5-4 Text Font dialog box

TIP

[Font style], [Effects] and [Script] settings are invalid.

IMPORTANT

The self-documentation function prints data in the files saved by SCS Manager and builders. For this reason, if you attempt to save files while the self-documentation is running, incorrect information may be printed or the printing process may fail. In such cases, run the self-documentation again after completing saving the files.

F2.6 Confirmation by print preview

A preview of the information to be printed can be displayed in the "Preview" tab of Document Generator. All the pages selected as printing targets in the "Table" tab are displayed in the "Preview" tab reflecting the result of customization in the "Options" tab. Each page of the printing results can be displayed by scrolling through the pages.

TIP

When you print using Document Generator, you can make print settings in the Page Setup dialog box started from File menu in SCS Manager. However, you cannot use the Page Setup dialog box in backward-compatible mode. A preview is shown with the printer settings made here. Therefore, if you specify the printer usually used for printing in the Page Setup dialog box beforehand, the preview and printed results match. The settings in the Page Setup dialog box can be made for each computer. However, in the Page Setup dialog box, you cannot set Page Range.

F3. Database Validity Check Tool

Database Validity Check Tool checks the mutual validity of the work database, the master database and the SCS database in the SCS. It checks whether or not the generation time and CRC (Cyclic Redundancy Checksum) of the databases match.

This chapter explains the window functions and operations of Database Validity Check Tool.

Relationship among Inter-database checks

The figure below illustrates the relationship of mutual validation of the work database, the master database and the SCS database within an SCS.

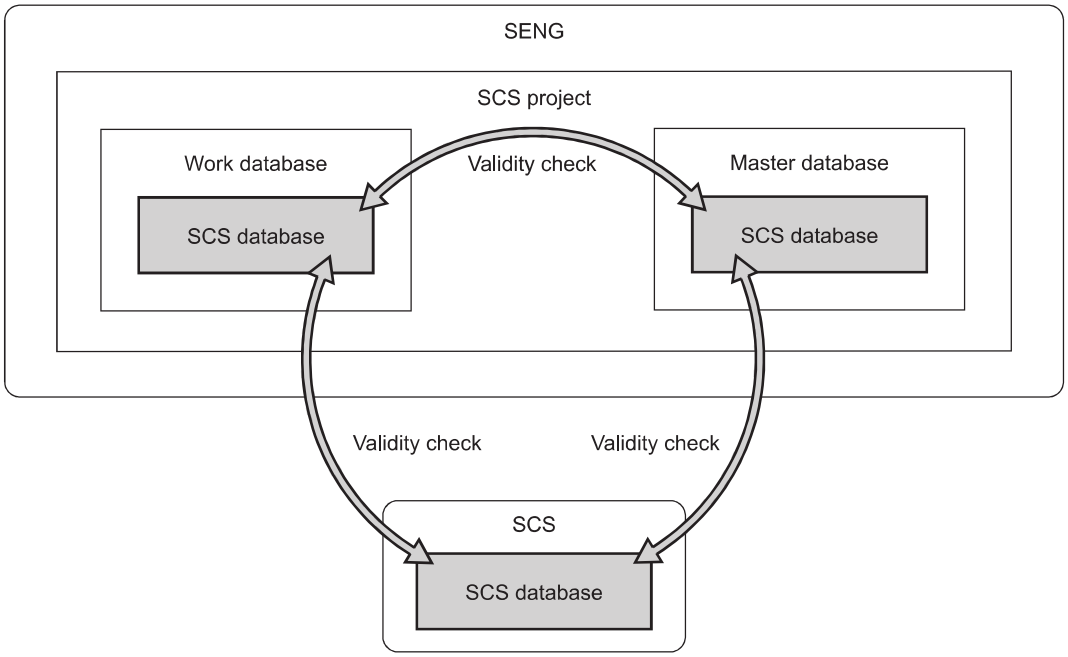

Figure F3-1 Inter-database check

The generation time and CRC information are acquired for each of the following databases from the work database, the master database and the SCS database within an SCS:

- POU DB
- Variable DB
- System DB (database for safety system)
- Integration DB (database for connecting CENTUM and external devices)

TIP The source files of the work database and the source files of the master database are not compared.

Repair database

If an online change download is interrupted or discontinued, database mismatch often occurs between SCS and SENG. While the database does not match between SCS and SENG, online change download attempts fail.

The database repairing function makes the database match between SCS and SENG, enabling you to run the discontinued online change download again.

Database Validity Check Tool of R3.02.10 or later provides the database repairing function. You can use the database repairing function only when the database does not match between SCS and SENG.

An example case of database repair is as follows:

1. If a communication error occurs during offline download or online change download, the master database on the SENG may fail to be updated although the database on the SCS is updated. As a result, the database does not match between the SCS and SENG after the communication error and online change download is discontinued. With non-matching databases between SCS and SENG, online change download attempts fail.
2. The database repairing function overwrites the master database with the contents of the work database to match the database between SCS and SENG. When the master database is repaired successfully, the display in the Check Result List is refreshed.

TIP

Until the master database is repaired, the SCS project remains read only and cannot be edited or built. Restoration of the master database and master database offline download are also disabled.

3. After the master database is repaired, you can run the interrupted online change download and master database offline download again. You can read/write, edit, and build the SCS project. You can also use the Master Database Restoring Function.

SEE ALSO

For more information about Master database off-line download, refer to:

I4.4, “Master database offline download” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

For more information about Master Database Restoring function, refer to:

F4., “Master Database Restoring Function” on page F4-1

Launching Database Validity Check Tool

1. Choose [Engineering] from [Tools] menu of SCS Manager.
   The Engineering Launcher menu appears.
2. Select [Database Validity Check] from the Engineering launcher menu.
   Database Validity Check Tool launches and the Database Validity Check Tool window appears.

Database Validity Check Tool window structure

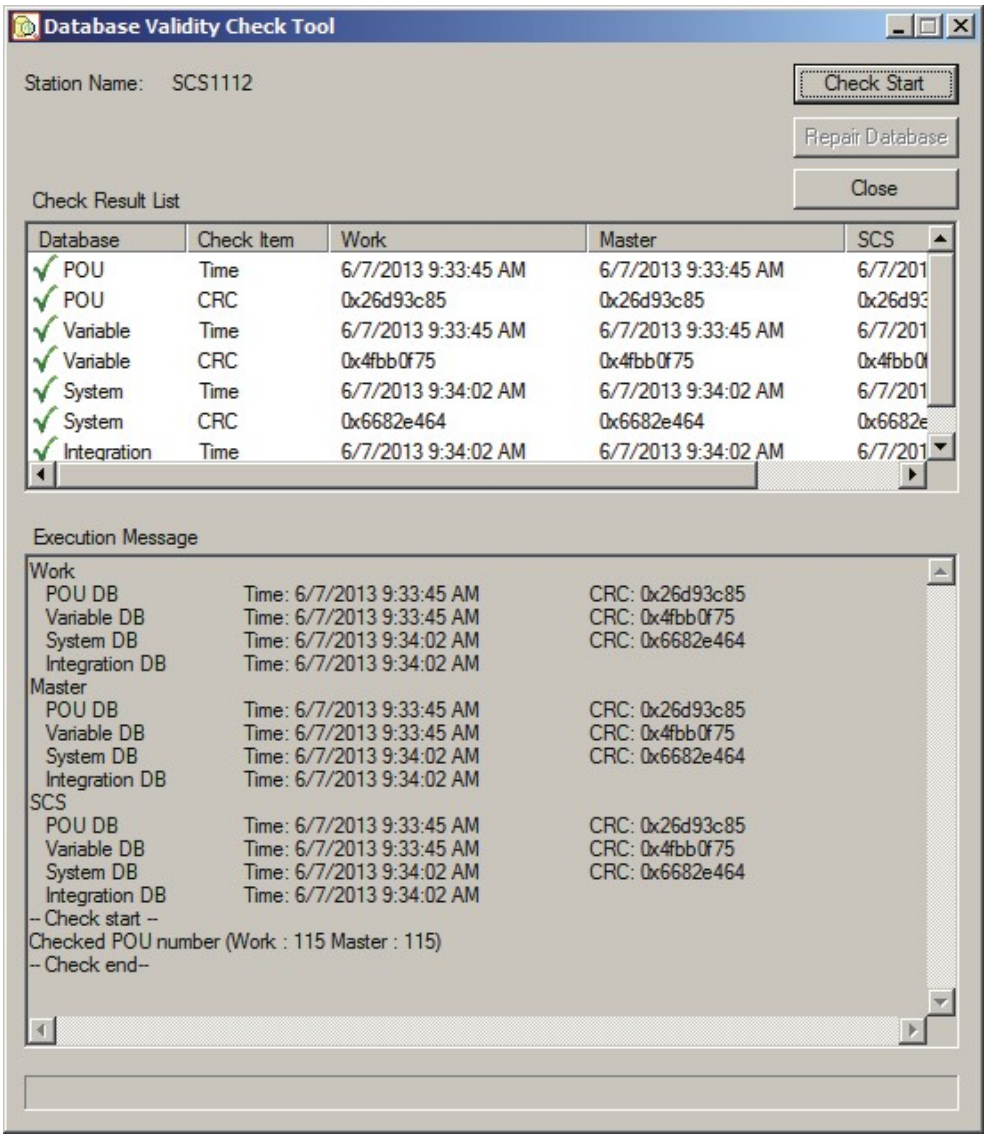

Figure F3-2 Database Validity Check Tool window

The components of the window are explained in the following sections.

Station name

The station name of the SCS in question is displayed.

Check result list

The results of checking the database validity are displayed in a list.

Items displayed in the check result list are explained below.

Table F3-1 Items displayed in check result list

Item name	Display
Database	Displays an icon indicating the results of checking the database validity along with the database name (POU DB, Variable DB, System DB, Integration DB)

Continues on the next page

Table F3-1 Items displayed in check result list (Table continued)

Item name	Display
Check Item	Displays whether the validity is checked based on the generation time or CRC
Work	Displays the generation time and CRC of the work database
Master	Displays the generation time and CRC of the master database. The master database is generated and the master information is displayed when you download the work database to the SCS.
SCS	Displays the generation time and CRC of the SCS database within the SCS. Displayed when the SCS is connected.

Types of icons

The following three colors are used for the icons displayed in the [Database] column, depending on whether the SCS database matches the work database and master database or not.

Table F3-2 Types of icons

Icon (color)	Description
(green)	The work database, the master database and the SCS database all match.
(blue)	The contents of the work database, the master database and the SCS database all match.
(yellow)	The work database and the master database do not match. This result occurs if you performed a build operation to generate the work database but have not performed download. When required, you can perform online change download or offline download to download the work database to the SCS. If you want discard the work database, you can use Master Database Restoring Function to duplicate the master database into the work database.
(red)	The master database and the SCS database do not match. Online change download cannot be performed. Perform either offline download or master database offline download to update the SCS database so that it matches with the master database.

IMPORTANT

The Variable DB is not downloaded to SCS if an On-line change download is performed with an application for which the definition details of its variables have not been changed. For this reason, the time of the Variable DB of the Work database and the CRC are not reflected onto the SCS. If this happens, the icon indicating the check result is shown in blue and the following message appears.

Example:

```
The content of the definition is corresponding though the time and CRC of V
ariable DB is not corresponding between work and master.
```

SEE ALSO

For more information about Offline download, refer to:

C7., “Offline download to the target SCS” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

For more information about Online change download, refer to:

E1.1, “Online change download” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

For more information about Master database off-line download, refer to:

I4.4, “Master database offline download” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

For more information about Master Database Restoring function, refer to:

F4., “Master Database Restoring Function” on page F4-1

Checking database validity

- Click the [Check Start] button in the Database Validity Check Tool window.
  Database validity check starts.

  During the check, the progress is displayed in the progress bar at the bottom of the window.

Execution messages

Execution messages generated during checking are displayed.

The information shown in the execution message area can be copied and used as information for reports.

There are following three types of operation messages.

- Error messages notifying processing errors
- Information acquired during checking
- Checking result

Example of error messages notifying processing errors and action to take

If you start database validity check while the target SCS project is being built or downloaded, an error message like the one shown in the following figure is displayed. Wait until the build or downloading is completed and start the check again.

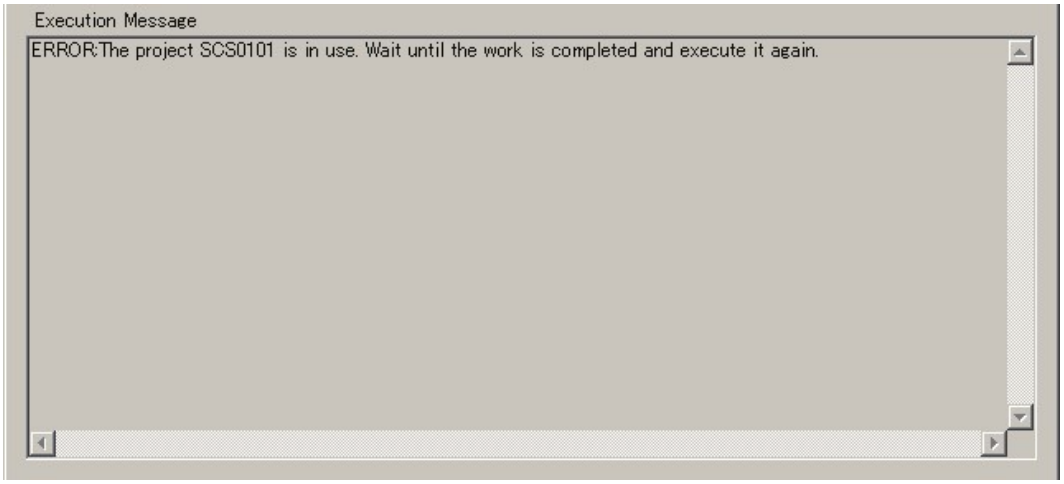

Figure F3-3 Example of error messages

Example of information acquired during checking

The generation time and CRC information are displayed for the work database, the master database and the SCS database within the SCS.

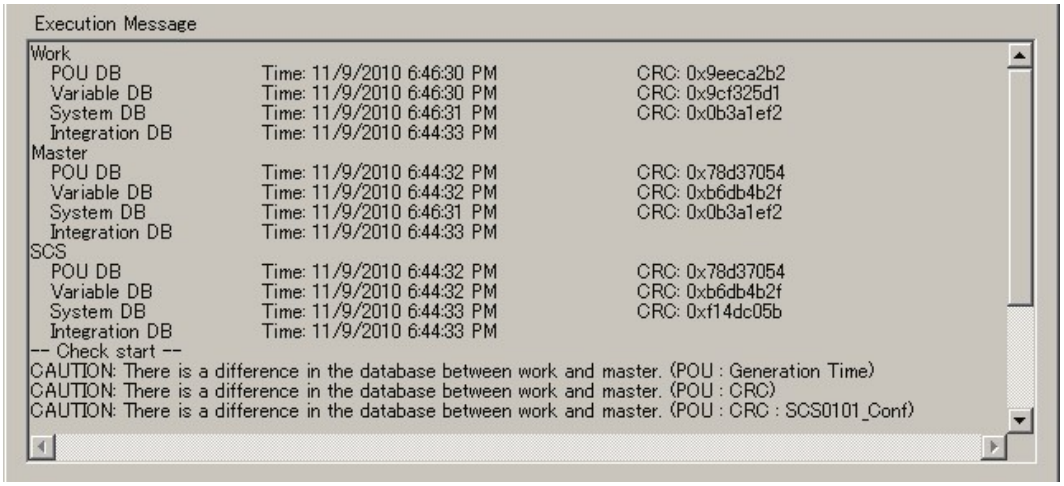

Figure F3-4 Example of information acquired during checking

Example of checking result and displayed contents

The result after comparing the SCS database in SCS, the work database and the master database will be displayed.

- Comparing the generation time and CRC of the databases.
- If CRC discrepancies are found among the POUs of databases, the POU name and the resource configuration file name (<SCSProjectName>_Conf) will be displayed.
- "IMPORTANT" indicates the discrepancy between the SCS settings in SCS and in the master database corresponding to the red icons in the check result list.
- "CAUTION" indicates the discrepancy between the SCS settings in work database and in the master database corresponding to the yellow icons in the check result list.
- Indicates the number of compared POUs.

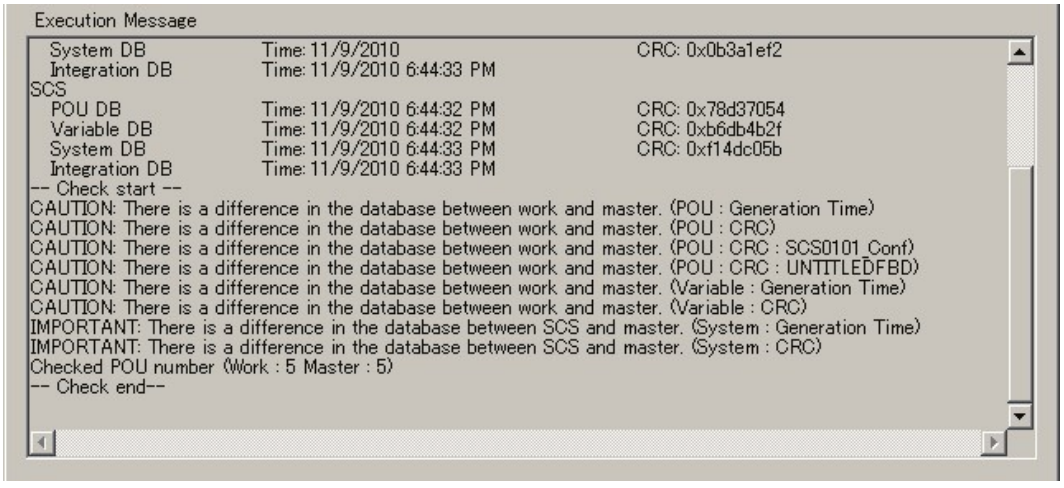

Figure F3-5 Example of checking result

Repairing the database that does not match

- Click the [Repair Database] button in the Database Validity Check Tool window.
  The master database is overwritten with the contents of the work database. "Check Result List" indicates that the master database and the SCS database match.

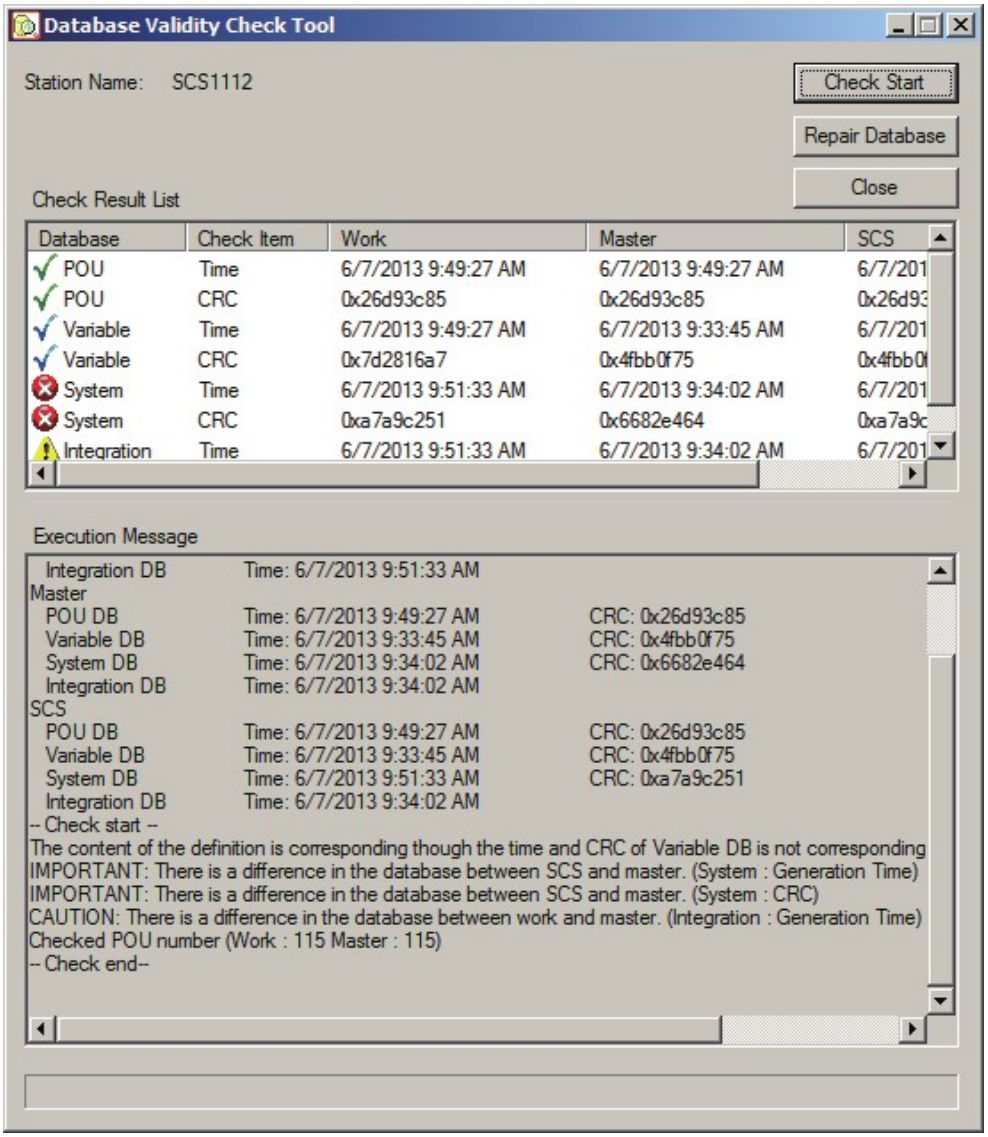

Figure F3-6 Database Validity Check Tool window

Exiting Database Validity Check Tool

- Click the [Close] button in the Database Validity Check Tool window.
  The button is disabled during checking.

  The Database Validity Check Tool is exited.

F4. Master Database Restoring Function

Master Database Restoring function is a tool to restore the edited SCS project to the last downloaded state. This function may be used mainly in cases when an edit, for which an On-line change download cannot be performed, is made by mistake to an SCS project. If an edit, for which an On-line change download cannot be performed, has been made, using this tool restores the SCS project to its most recently downloaded state. As a result, you can continue to perform the online change from the application in its most recently downloaded state.

This section explains the operations involved in restoring the master database.

TIP

In the case of an SCS project selecting I/O list engineering with version R4.03.00 or earlier, after restoring the Master Database using the Master Database Restoring function, restore the safety I/O list and IOM information in AD Organizer to the contents labeled at the time of the previous download.

How to start the tool and differences in behavior

You can start Master Database Restoring Function Tool from the start menu or from AD Organizer.

If you start this tool from AD Organizer and perform restoration of an SCS project, the data of I/O list engineering will also be restored automatically. If you start the tool from the Start menu, the data of I/O list engineering will not be restored automatically.

When you start this tool from the Start menu, the following message appears:

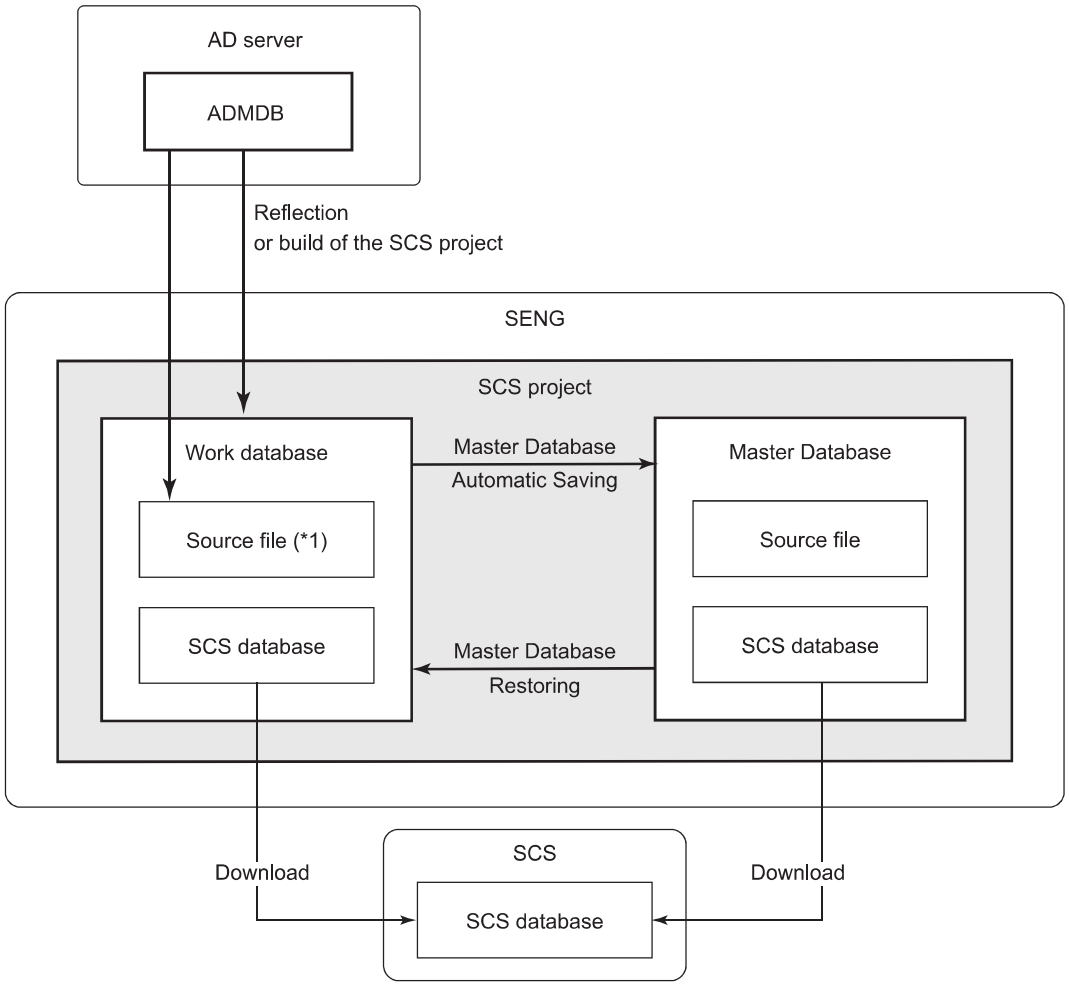
> When this tool is started from the Windows Start Menu, the I/O List Engineering data recovery to AD Suite is not performed automatically. To automatically restore I/O List Engineering data to AD Suite, please specify the SCS station node on System Structure Navigator in AD Organizer and launch this tool from context menu.

In order to link the SCS project backup/restoration function with the I/O list engineered data, access rights that allow execution of SCS import in AD Organizer is required.

Follow these steps to start the tool from AD Organizer:

1. Start AD Organizer.
2. Select the SCS project of your choice in the System Structure Navigator, and from the context menu, select [Master DB Restoring Function Tool].
   The window of the Master DB Restoring Function Tool appears.

SEE ALSO



For more information about access rights in I/O list engineering, refer to:

C1.2.2, “Controlling access to AD projects” on page C1-30

Overview of Master Database Restoring Function

The engineering data required for operating ProSafe-RS is stored as the work database of an SCS project in the SENG, and the SCS database within this work database is subsequently downloaded to the SCS by user operation. Once downloaded, the work database is stored as the master database.

The information of an SCS project includes the work database in the SENG, the master database in the same SENG and the SCS database within the SCS. Immediately after downloading, the two source files and three SCS databases contain the same data; that is, the source files and SCS databases are consistent.

*1: The source file includes the safety I/O list and IOM information.

Figure F4-1 Database configuration

If you do not perform download after engineering (saving data created in a builder in the work database), the data in the work database and other databases will not match.

Master Database Restoring Function is a tool to discard the information in the work database and restore the work database with the information in the master database. So that the engineering data (in the work database) can match the engineering data in the master database.

Note that Database Validity Check Tool is used to check that the data in each database matches.

TIP

In addition to starting Master Database Restoring Function Tool from the Start menu, you can also start this tool from AD Organizer. However, if you start this tool from the Start menu when the master database contains I/O list engineered data, the I/O list engineered data on the AD Server will not be restored even if the restoration process is performed. If you start the tool from AD Organizer, the I/O list engineered data will also be restored automatically when you perform the restoration process.

SEE ALSO

For more information about details of the Database Validity Check Tool, refer to:

F3., “Database Validity Check Tool” on page F3-1

Work database restoration timing

It is possible to use Master Database Restoring Function to restore the data of the master database in the work database at any time. However, the SCS project that has been opened by the SCS Manager or the Multi-Language Editor cannot be restored. Likewise, when the Master Database Restoring Function is used, the SCS Manager and Multi-Language Editor cannot be used.

Restoration target file

The master database of an SCS is stored in located below the top folder of each SCS project.

It is possible to use Master Database Restoring Function to restore the work database based on all the files.

IMPORTANT

Do not add, delete or change folders and files in layers below the top folder of the SCS project using Windows Explorer.

Master Database Restoring Function window structure

By starting SCS master DB recover, the following window appears.

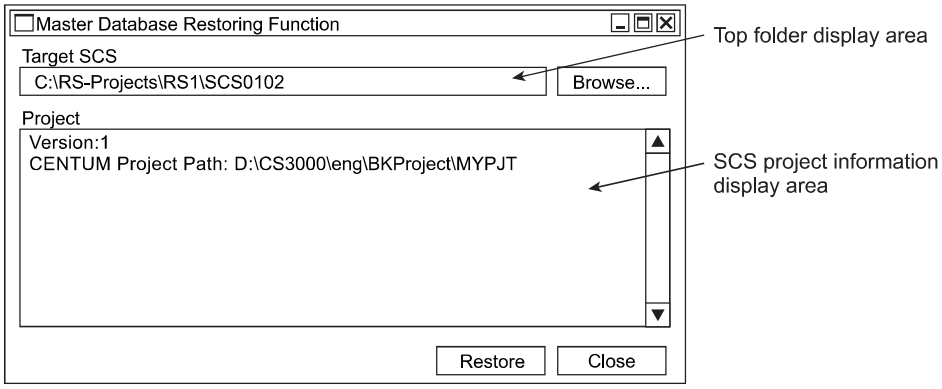


Figure F4-2 Master Database Restoring Function window

When started from AD Organizer, the display will be as follows:

- The name of the AD project subject to restoration appears on the title bar.
- The path of the target SCS project appears in the SCS project information display area, and the project becomes uneditable.
- The Browse button is disabled.

SEE ALSO For more information about how to start the Master Database Restoring Function, refer to:

"ProSafe-RS and ProSafe-RS Lite applications that can start from Start menu" in Read Me First (IM 32P01A30-01EN)

Top folder display area

The path to the top folder of the SCS project, which is the restoration destination of the master database, is displayed in this field.

To change the target project, enter the path to the desired project folder directly in the field of the top folder display area, or select a folder in the folder selection dialog box displayed by clicking [Browse] button.

However, when Master Database Restoring Function is started from AD Organizer, the top folder SCS is fixed. You cannot edit this folder path. The Browse button is disabled.

SCS Project Information display area

This area displays information about the target SCS project.

When the SCS project subject to restoration includes data of I/O list engineering, [ADS] appears in the SCS project information display area.

Example: Version:1 [ADS]

Master database restoration operation

1. Specify the path to the top folder of the SCS project, which is the restoration destination of the master database, in the top folder display area.
2. Check the information displayed in the SCS project information display area.
3. Click [Restore] button.
   The Status Display dialog box appears and the restoration process starts.

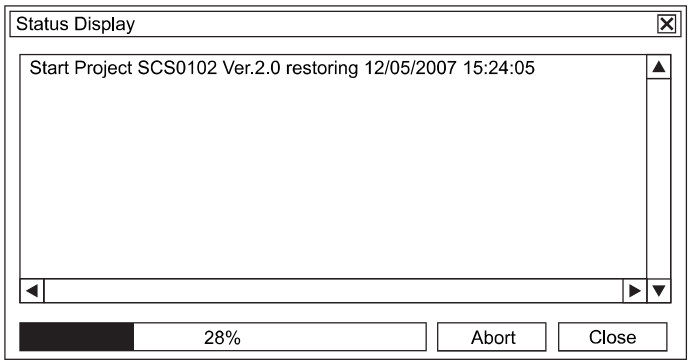

Figure F4-3 Status Display dialog box

The information displayed in the Status Display dialog box is as follows:

- Restoration start date/time
- Restoration completion date/time
- Warnings and errors
- Numbers of warnings and errors

4. Click [Close] button when Restore is completed.
   The Status Display dialog box closes.
5. Click [Close] in the Master Database Restoring Function window to end Master Database Restoring Function.

TIP

- In order to stop the restoration during the processing, click [Abort] button. The restoration processing that has been carried out so far is discarded and the work database returns to the status before the restoration processing operation.
- To select information displayed in the Status Display dialog box, select [Select All] from the pop-up menu opened by right-clicking. Select [Copy] to copy the information.

SEE ALSO For more information about precautions for restoring an SCS project that contains the safety I/O list to which the Safety I/O parameter profile is assigned by using Master Database Restoring function, refer to:

"■ Restoring SCS projects by Version Control Tool and Master Database Restoring function" in D1.5.11, "Precautions for importing and restoring SCS projects including safety I/O parameters" in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

Operations after restoring an SCS project by using the Master Database Restoring Function when performing I/O list engineering

This section describes the operations for an SCS project that was engineered by I/O list engineering with a revision earlier than R4.03.10. In this case, you must manually restore the details defined with the system structure navigator in AD Organizer.

TIP When downloading data to SCS with SENG R4.03.10 or later, data of I/O list engineering is included in the master database of the SCS project. When you perform the restoration process by using Master Database Restoring function started from AD Organizer, the data of I/O list engineering is also automatically restored at the same timing.

When [ADS] is displayed in the SCS project information area, it indicates that the data of I/O list engineering is included in the target SCS project.

The subjects of manual restoration are as follows:

- Safety I/O list
- Node definition
- IOM definition

After engineering by using iDefine, the following data are also restored:

- POU, variables, and tag information that were created in iDefine

IMPORTANT

The engineering data that was created by using iDefine must be restored so that it is consistent with the data that was restored by using the Master Database Restoring Function. As such, we recommend that you create a backup of the iDefine-config file when you import it to AD Organizer.

In iDefine, it is possible for multiple SCS to share one module, so it may be necessary to modify the data manually depending on the changes made.

Follow these steps to manually restore the definition details of System Structure Navigator.

1. From the context menu of the target SCS in System Structure Navigator in AD Organizer, select [Display revision history].
   The Revision History dialog box appears.
2. Select [All] and click [View].
   The Revision History window appears.
3. On the tab sheet for labels in the Revision History window, search for the label corresponding to the modified data.
   The following labels are attached to the files when a download is performed.
   `SCS project name-Download-(date)`
4. Select the label and click [Details].
   The Label Detail dialog box appears.
5. From the list in the Label Detail dialog box, search for the following files, select each file, and select [Launch Editor] from the context menu:

- I/O_definition
- Node_definition
- IOM_definition

6. Extract data from each file. Perform all of the following operations when extracting data. There is no specific order for performing these operations.
   - In order to export the data of I/O_definition, select [Export] from the sub menu of Safety I/O Editor.
   - In order to export the content of IOM Definition, select [Export] from the sub menu of IOM Definition Editor.
7. From the system structure navigator in AD Organizer, select the files under the I/O-List folder and start Safety I/O Editor.
8. Import the data of I/O_definition that was exported from Safety I/O Editor in the step 6.
9. Select the targeted SCS and start IOM Definition Editor.
   a. If the structure of nodes, IOM, ESB bus coupler module, or N-ESB bus coupler module is different from the structure that is defined in the master database, make the structure same as the one defined in the master database.
   b. By using IOM Definition Editor, import the files that were exported from IOM Definition Editor in the step 6.
10. Select the targeted SCS and select [RS Generation Manager] from the context menu. Generation Manager will start.
11. After selecting the [RS project name] and [SCS project name], click [Reflection]. The reflection process will be run.
12. Using the project comparing tool, compare the Work database created with the above steps against the Work database of the version at the origin of the check-out controlled with the Version Control Tool to check that the data of AD Organizer has been correctly restored.

F5. Version control

The Version Control Tool manages the history of changes of SCS projects and assists the user with system updating tasks. This section describes how to use the Version Control Tool.

Version Control Tool is used for the following purposes.

SEE ALSO For more information about differences in behavior depending on how to start Version Control Tool, refer to:

"■ How to start the tool and differences in behavior" on page F5-2

■ Version control of project data

Save (check-in) engineering data at a project milestone or at the end of engineering in different hard disks.

When checking in to an SCS project created with I/O list engineering, check in upon placing labels on the safety I/O list and IOM information of AD Organizer.

Labels of the following name are automatically added when checking in with the Version Control Tool.

```
SCS project name-Version
```

Version is the Version number specified by the user with the version control tool.

When checking out, return the safety I/O list and IOM information with AD Organizer based on these labels.

SEE ALSO For more information about how to set labels, refer to:

C2.8, "Setting labels" on page C2-17

■ Backing up project data

Checked-in data can be used as backup data. Checked-in project data can be checked out and restored.

■ Engineering and replacing the revised project with large-scale changes

When making large-scale changes to an SCS project, it is a good idea to perform engineering tasks on temporarily copied project data, rather than editing the active project data directly; this way, the active project data can be replaced with the new project data at the end of engineering.

F5.1 Main window of Version Control Tool

This section explains the components of the main window of Version Control Tool.

How to start the tool and differences in behavior

If a check-in folder has not been specified, the Select Checkin Folder dialog box appears automatically when the Version Control Tool is started.

You can start the Version Control Tool from the start menu or from AD Organizer.

If you start this tool from AD Organizer and perform a checkout when data of I/O list engineering is included in the SCS project, the data of I/O list engineering on the AD Server will also be restored automatically at the same timing as the checkout.

In addition, you cannot perform SCS project registration tasks for other than the SCS projects specified with AD Organizer. However, if none of the SCS projects specified in AD Organizer has been registered, you can register any SCS projects when you start the Version Control Tool.

When you start this tool from the Start menu, the following message appears:

> When this tool is started from the Windows Start Menu, the I/O List Engineering data recovery to AD Suite is not performed automatically. To automatically restore I/O List Engineering data to AD Suite, please specify the SCS station node on System Structure Navigator in AD Organizer and launch this tool from context menu.

Follow these steps to start the tool from AD Organizer:

1. Start AD Organizer.
2. Select the SCS project of your choice in the System Structure Navigator, and from the context menu, select [Version Control Tool].
   The window of the Version Control Tool appears.

SEE ALSO For more information about SCS project registration tasks, refer to:

F5.2, “Registration of SCS projects for version control” on page F5-7

Version Control Tool window

When you start Version Control Tool, the following window appears.

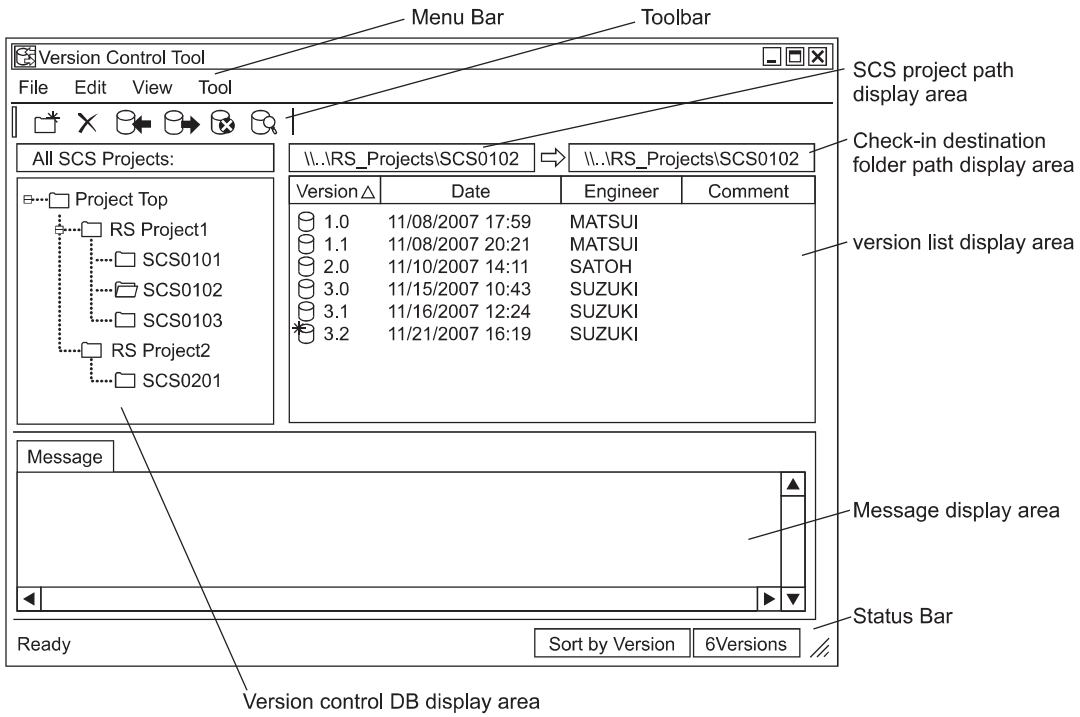

Figure F5.1-1 Version Control Tool window

When started from AD Organizer, the display will be as follows:

- The name of the AD project subject to version control appears on the title bar.
- When the applicable SCS project displayed in the version list display area includes the data of I/O list engineering, [ADS] appears to the right of the version number.

The components of the window are explained in the following sections.

Menu bar

The menu bar provides the following menus.

- File menu
- Edit menu
- View menu
- Tool menu

The menu items of each menu are explained below.

Table F5.1-1 File menu

Menu item	Description
Register Project (*1)	Starts new version control of an SCS project
Delete Version/Project (*1)	Deletes specified versions ,SCS projects or RS projects from the check-in folder
Print Preview	Displays print preview.
Print	Displays the print dialog box for printing purposes.
Exit Version Control Tool	Closes Version Control Tool

*1: Disabled when Version Control Tool is started from AD Organizer.

Table F5.1-2 Edit menu

Menu item	Description
Checkin	Checks in the selected SCS project to the specified check-in folder
Checkout	Checks out the selected version to the specified folder
Abort	Stops a check-out or check-in operation in progress
Select All	Selects all versions
Deselect All	Deselects all versions

Table F5.1-3 View menu

Menu item	Description
Detail	Displays a dialog box that displays detailed information of the selected version
Order of Display	Selects a display order for the version list display area. The selectable display orders are in order of version, date and engineer name.
Toolbar	Specifies whether or not to show the tool bar
Status Bar	Determines whether or not to display the status bar
Message Display Area	Specifies whether or not to show the message display area

Table F5.1-4 Tool menu

Menu item	Description
Change Checkin Folder	Displays a dialog box for changing the top path of the check-in folder
Change Target Project Folder (*1)	Changes the top path of an SCS project to be the target of version control. This menu item can only be selected when an SCS project is selected in the version control DB display area.
Option	Sets the operating environment of the tool and displays the option dialog box.

*1: Disabled when Version Control Tool is started from AD Organizer.

Toolbar

The toolbar provides the following buttons.

Table F5.1-5 Toolbar buttons

Button	Name	Description
	Register SCS Project	Same as [Register Project] in the [File] menu
	Delete Version/Project	Same as [Delete Version/Project] in the [File] menu
	Checkin	Same as [Checkin] in the [Edit] menu
	Checkout	Same as [Checkout] in the [Edit] menu
	Abort	Same as [Abort] in the [Edit] menu
	Detail	Same as [Detail] in the [View] menu

Version Control DB display area

The version control DB display area displays RS projects and SCS projects in the check-in folders specified by engineers in a tree structure.

The displayed folder structure is limited down to the level of SCS projects; folders in lower layers are not displayed.

When Version Control Tool is started from AD Organizer, only the applicable SCS projects are displayed.

When Version Control Tool is started from the Start menu, all SCS projects subject to control are displayed.

SCS Project Path display area

If you select an SCS project in the version control DB display area, the path to the top folder of the SCS project to be checked-in is displayed in this area.

Check-in destination folder path display area

This area displays the folder path of the check-in destination (check-in folder) for the SCS project selected in the version control DB display area.

Version list display area

This area displays a list of versions corresponding to the SCS project selected in the version control DB display area. When the applicable SCS project includes the data of I/O list engineering, [ADS] appears to the right of the version number.

You can select multiple versions.

If you double-click a version, the Detail dialog box appears and shows the detailed information about the selected version.

The following information is displayed in the version list display area:

- Version
- Date (Check-in time and date)
- Engineer
- Comment

If you click a column title other than Comment once, the list is sorted according to the selected item in the ascending order. If you click once again, the list is sorted in the descending order.

An icon indicating the version is displayed at the left edge of the list. The icon for the latest version has a different shape than other icons. Note that the latest version is judged from the check-in date, rather than the version number, and the icon is displayed accordingly.

SEE ALSO For more information about Detail dialog box, refer to:

"■ Display of information related to versions" on page F5-19

Message display area

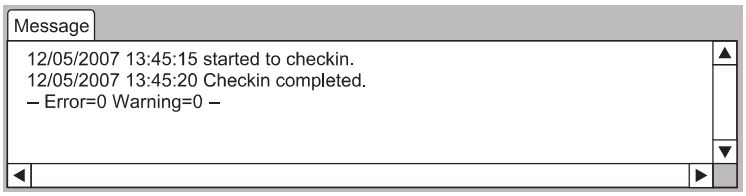

Figure F5.1-2 Message display area

The message display area displays messages generated at check-in, check-out, deletion, etc.

TIP Right click the mouse to show a pop-up menu. Choosing [Copy] from the menu may copy the messages.

Status bar

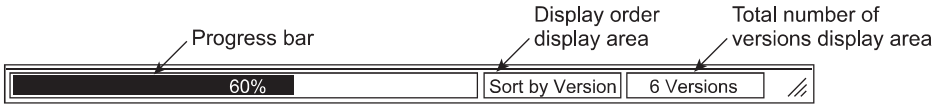

Figure F5.1-3 Status bar

The status bar contains the following display areas.

- Progress bar
  At check-in, check-out and deletion, the progress bar appears and displays the processing percentage. If the progress bar is not displayed, hints for the tool appear according to the mouse cursor position.
- Display order display area
  This area displays the display order chosen in the version list display area.
- Total number of versions display area
  This area displays the total number of displayed versions.

F5.2 Registration of SCS projects for version control

If version control is performed for an SCS project for the first time, the project must be registered. Once registered, the project is displayed and can be selected in the tree list of the version control DB display area.

When Version Control Tool is started from AD Organizer, you cannot perform SCS project registration tasks for other than the specified SCS project. However, when none of the SCS projects specified in AD Organizer has been registered, the Select SCS Project dialog box appears when you start the tool, and you can register any SCS projects.

1. In the Version Control Tool window, select [File] > [Register Project]. Alternatively, click [Register SCS Project] on the toolbar.
   The Select SCS Project dialog box appears.

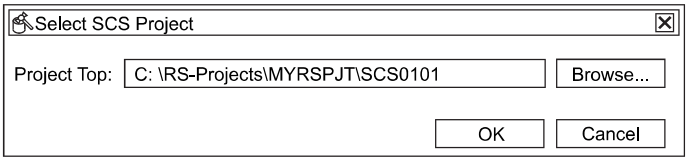

Figure F5.2-1 Select SCS Project dialog box

2. Specify the top folder of the SCS project for which you want to perform version control. In order to change the top folder, enter the path to the desired folder directly in the field or select it in the folder selection dialog box displayed by clicking [Browse] button.
3. Click [OK].
   The top folder of the SCS project is displayed in the SCS project path display area.

IMPORTANT

You can specify the top folder path to SCS project in the format for local drives, not necessarily in the Universal Naming Convention (UNC). But before you use the local drive format, you must specify "Folder sharing" as a user with administrator privilege. "Folder sharing" enables you to check-in folders to local drives.

TIP

An error dialog box appears if the specified folder does not exist, the top folder of an SCS project that is already registered for version control is specified, or a folder that is not the top folder of an SCS project is specified.

Folder sharing

When a SCS project is registered, the upper level folder of the RS project folder needs to be specified as a shared folder.
An example below shows how to specify a folder as a shared folder. In this example, the folder named RS-Projects is specified as the shared folder.

Figure F5.2-2 Example of shared folder specification

1. Open Windows Explorer, right click on RS-Projects folder and then choose [Properties] from the pop-up menu. The Properties dialog box will be displayed.
2. Display "Sharing" tab and click [Advanced Sharing].

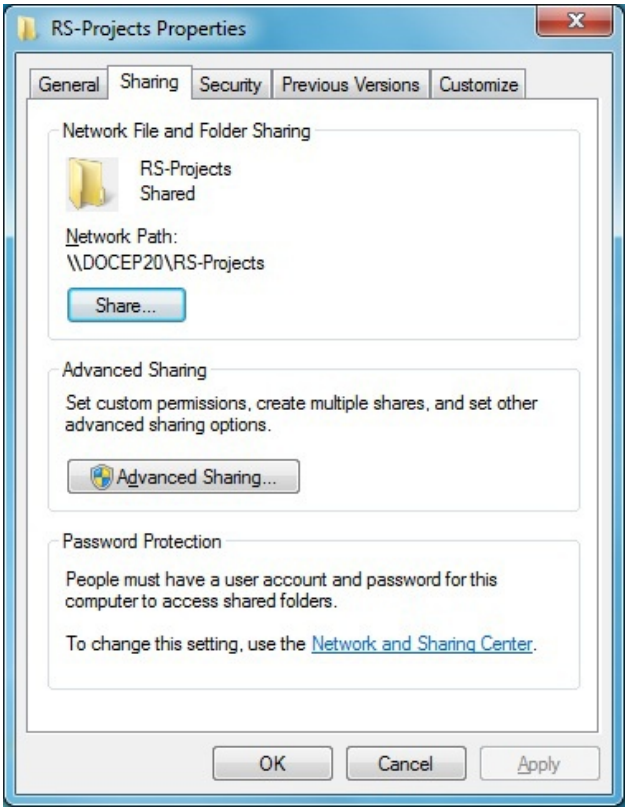

Figure F5.2-3 Sharing tab

Advanced Sharing dialog box appears.

3. Check the [Share this Folder] option and click [Permissions] button.

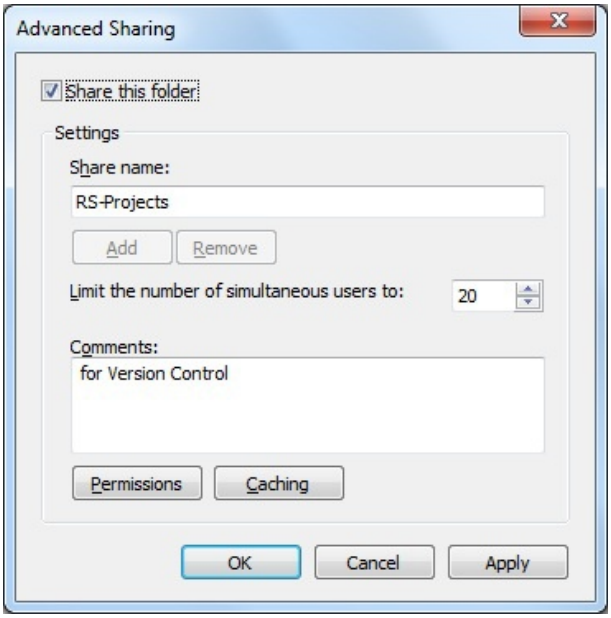

Figure F5.2-4 Advanced Sharing dialog box

Permission dialog box appears.

4. Check all the check boxes in [Allow] column of "Permissions for Everyone" and then click [OK].

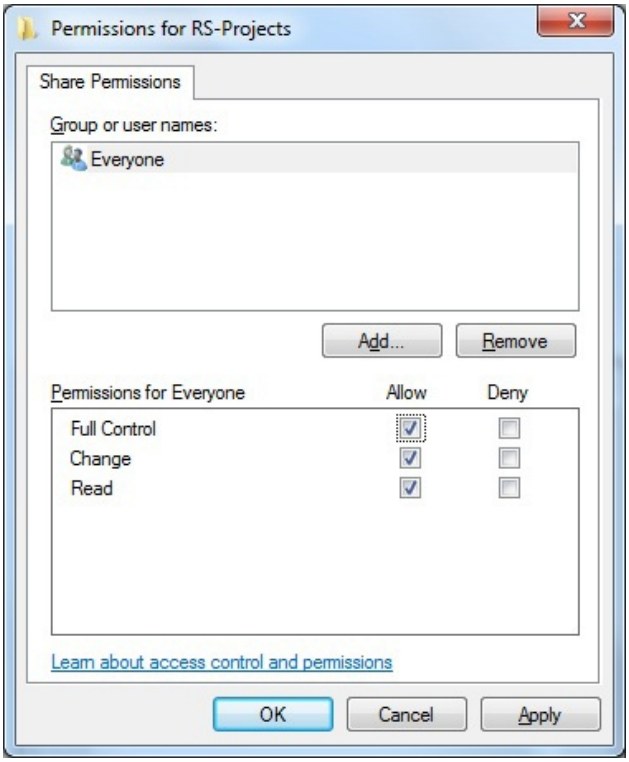

Figure F5.2-5 Permissions dialog box

RS-Projects folder becomes a shared folder.

F5.3 Checking in project data

When you check in an SCS project, the project data of the SCS project is saved in the check-in folder. At this point, a version number is assigned to the project data and the data is controlled according to this number.

Check-in timing

Project data can be checked in at any point.

However, when an SCS project to be checked in is being edited in SCS Manager, Multi-Language Editor, or any of the builders, it cannot be checked in or out with Version Control Tool. In addition, the SCS project cannot be edited with SCS Manager, Multi-Language Editor, or any of the builders while Version Control Tool is performing the check-in and check-out operation.

When the folder of the applicable SCS project includes data of I/O list engineering, the I/O list engineering data files are checked in together. The timing at which the data of I/O list engineering is registered to the SCS project is when the reflection process is implemented using RS generation manager.

Structure of check-in destination folder

The user can select any location for the top folder of the check-in destination, but the folder structure below the top folder is determined automatically.

IMPORTANT

- Do not use Windows Explorer to add, delete or modify the folders or files under the SCS project top folder, except for coping the library.
- Do not edit checked-in project data directly with SCS Manager.
- Do not operate on checked-in project data with Master Database Restoring Function.

Note that, in advance, the top folder of the check-in destination must be given a shared name "RS-Share" and its security must be strengthened by running the IT Security Tool.

SEE ALSO

For more information about strengthening security when placing the check-in destination folder on a SENG PC, refer to:

"■ Strengthening the Security of the Project Database on SENG PC" in B4.2, "Settings of Project Database Folder" in Installation Guide (IM 32P01C50-01EN)

For more information about strengthening security when placing the check-in destination folder on a file server, refer to:

"■ Strengthening the Security of Version Control Tool's Check-in Folder" in B4.2, "Settings of Project Database Folder" in Installation Guide (IM 32P01C50-01EN)

Specification of check-in destination folder

1. Start the Version Control Tool.
   If a check-in folder has not been specified, the Select Checkin Folder dialog box appears automatically.

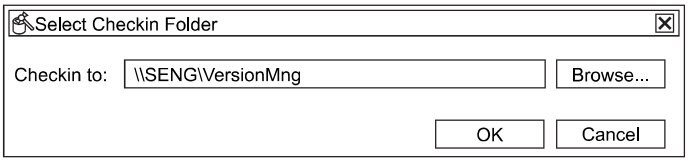

Figure F5.3-1 Select Checkin Folder dialog box

2. Specify a check-in folder.
   In order to change the check-in folder, enter the path to the desired folder directly in the field or select it in the folder selection dialog box displayed by clicking [Browse] button.

IMPORTANT

To prevent from the hardware abnormality, it is recommended to specify a folder in a disk different from the disk where SCS projects are saved.

3. Click [OK].
   The check-in folder is specified and the focus is returned to the window of the Version Control Tool.

   The structure of the specified folder is displayed in the version control DB display area.

Check-in operation

It is possible to check in project data at any point.

1. Select an SCS project to be checked-in in the version control DB display area.

TIP If the SCS project you want to check in is not displayed, register the SCS project for version control in advance following the procedure in "Registration of SCS Projects for Version Control."

2. Click [Checkin] button in the toolbar of the Version Control Tool window or select [Checkin] from the [Edit] menu;
   the Checkin dialog box appears.

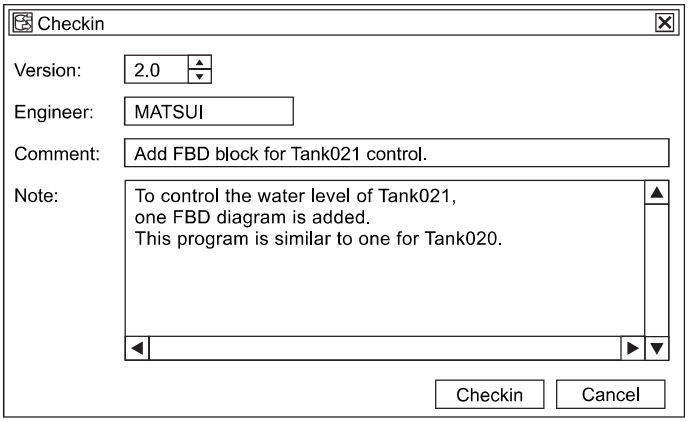

Figure F5.3-2 Checkin dialog box

3. Set version information and other items recorded in the version information file.
   The items that should be set in the Checkin dialog box are shown below.

Table F5.3-1 Setting items in the Checkin dialog box

Item displayed	Description
Version	Version number. Directly enter a number or make a selection from the spin box. The version number cannot be changed after check-in (*1)
Engineer	Enter the name of an engineer who performs check-in within 16 uppercase alphanumeric characters. An error dialog box appears if the field is left blank.
Comment	Enter any comment using up to 64 characters.
Note	Enter a more detailed description than in [Comment].

*1: If it is absolutely necessary to change the version number after check-in, delete the version you checked in and check in the data again with the correct version number. Note that the check-in date/time changes.

The rules for setting version numbers are explained below.

Table F5.3-2 Version input rules

Item	Description
Format	Up to 8 characters and 2 decimal points can be entered. A minus sign can also be specified. Example: 1, 1.0, 1.01, -1.0, -1.01, -1.10
Default value	1.0 for the first check-in. The least significant digit of the latest version is incremented for 2nd check-in and onward. Example: 2 if the latest version is 1 Example: 1.1 if the latest version is 1.0 Example: 1.02 if the latest version is 1.01 Example: 1.11 if the latest version is 1.10 Example: -2 if the latest version is -1
Input check	An error dialog box appears in the following cases. If the format is erroneous If the version number already exists If the number is smaller than the latest version number of the existing version (*1), a warning dialog box appears.

*1: In case of version numbers with minus signs, the absolute value of the input is checked, i.e., excluding the minus sign, For example, a warning dialog box appears if you enter -1 after -2.

4. Click [Checkin] button.
   The saving processing starts. At this point, a message indicating the saving status is displayed in the message display area and the saving status is shown in the progress bar.

   The following information is displayed in the message display area.

   - Check-in start date/time
   - Check-in completion date/time
   - Warnings and errors
   - Numbers of warnings and errors

TIP

During the check-in processing, [Abort] of the [Edit] menu and the [Abort] button of the toolbar are enabled; by selecting either of these, it is possible to stop the processing in the middle. If you select this menu item or button, the check-in processing is stopped and the files checked out until then are discarded.

IMPORTANT

When I/O list engineering is being performed and there is data being edited in AD Organizer, be sure to check in to the Version Control Tool after successfully completing the reflection process with Generation Manager or the build process of the SCS project.

SEE ALSO

For more information about reflection processes and SCS build processes, refer to:

D4., “Overview of RS generation” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

F5.4 Checking out project data

The checked-in project data can be retrieved (checked out) to a folder under the top folder of the SCS project or any other folder. The checked-out folders and files can be edited.

IMPORTANT

If you check out project data immediately below the SCS project top folder, the existing SCS project is cleared and the project data is replaced with the new version.

Check-out operation

Checked-in project data can be checked out at any point.

When Version Control Tool is started from the Start menu, the data of I/O list engineering on the AD Server will not be restored automatically even if you specify an SCS project having a project name with [ADS]. When Version Control Tool is started from AD Organizer, you can automatically restore the data of I/O list engineering.

1. Select the SCS project to be checked out and the version from the version control DB display area and the version list display area, respectively.
2. Click [Checkout] in the toolbar or select [Edit] > [Checkout].
   The Checkout dialog box appears.

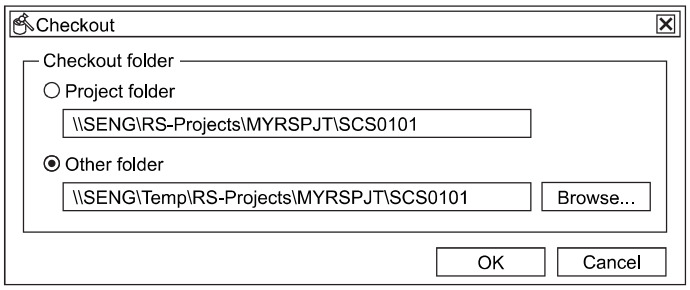

Figure F5.4-1 Checkout dialog box

   If you have started Version Control Tool from AD Organizer, only the Project folder option is enabled in the Checkout dialog box.

3. Select the location where the data should be checked out to, immediately below the top folder of the registered SCS project folder, or any other folder.
   To specify the SCS project top folder, select [Project folder]. The path name of the SCS project top folder cannot be changed.

   To specify any other folder, select [Other folder]. Enter the path to the desired folder directly or select it from the folder selection dialog box displayed by clicking [Browse] button.

IMPORTANT

If the folder for the checked-out data is UNC type, the folder should not be a shared folder. Create a new folder under the shared folder. Specify the newly created folder as the destination for check out. It is recommended to set the folder one level upper than the RS project folder as the shared folder.

   The check-out processing is different depending on whether the check-out destination is set to the SCS project top folder or any other folder. The differences in processing are explained below.

- SCS project top folder
  All the files below the specified folder are cleared before check-out processing when the user clicks [Yes] button in the confirmation dialog box.

  The structure of the folders under the SCS project top folder should match the structure of the checked-in folders. Moreover, the structure of the files after checking-out should be the same as the structure of the checked-in files.

- Other folder
  Files below the specified folder are not cleared before check-out. This causes the folder structure at the specified folder and below to be merged with the checked-in folder structure. Moreover, the file structure after check-out is also merged with the checked-in file structure; files with the same names are overwritten.

  However, if a user-defined folder is used as the SCS project folder, it behaves the same as for the SCS project top folder.

TIP

- In order to reflect the data that has been checked out onto the SCS project currently being engineered, select the directory directly under the SCS project top folder. When the engineering method is I/O list engineering, also be sure to restore the details defined with AD Organizer.
- An error dialog box appears if you specify the SCS project top folder and the specified folder does not exist.
- If you specify the project folder, it is checked that the specified folder is an SCS project folder. If it is not, an error dialog box appears.
- If you select any other folder and the specified path does not exist, a confirmation dialog box appears, asking whether or not to create it. If you click OK, a new folder is created.
  In this case, the created folder remains even if you abort check-out processing in the middle.

4. Click [OK] button.
   A confirmation dialog box appears.
5. Click [Yes] button in the confirmation dialog box.
   Check-out processing is performed and the target folder and all files below the target folder are copied to the destination. At this point, the message display area displays the check-out status. The status bar displays the progress status with the progress bar.

   The following information is displayed in the message display area.

   - Check-out start date/time
   - Check-out completion date/time
   - Warnings and errors
   - Numbers of warnings and errors

TIP

During the check-out processing, Abort in the Edit menu and Abort on the toolbar are enabled; by selecting either of these, it is possible to stop the processing in the middle. If you select this menu item or button, check-out processing is stopped and the files checked out until then are discarded.

SEE ALSO

For more information about precautions for restoring an SCS project that contains the safety I/O list to which the Safety I/O parameter profile is assigned by using Version Control Tool, refer to:

"■ Restoring SCS projects by Version Control Tool and Master Database Restoring function" in D1.5.11, "Precautions for importing and restoring SCS projects including safety I/O parameters" in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

■ Operations after checking out an SCS project by using the Version Control Tool when performing I/O list engineering

This section describes the operations for an SCS project that was engineered by I/O list engineering with a revision earlier than R4.03.10.

Once an SCS project created with I/O list engineering has been checked out by using the version control tool, it is necessary to manually restore the details defined with System Structure Navigator in AD Organizer.

TIP

When performing the check-in process with SENG R4.03.10 or later, data of I/O list engineering will be included in the SCS project checked in. When you perform the check-out process by using Version Control Tool started from AD Organizer, the data of I/O list engineering will also automatically be restored at the same timing.

When [ADS] is displayed in the SCS project information area, this indicates that the data of I/O list engineering is included in the applicable SCS project.

The subjects of manual restoration are as follows:

- Safety I/O list
- Node definition
- IOM definition

After engineering by using iDefine, the following data are also restored:

- POU, variables, and tag information that were created in iDefine

IMPORTANT

The engineering data that was created by using iDefine must be modified so that it is consistent with the data that was checked-out by using the Version Control Tool. As such, we recommend that you create a backup of the iDefine-config file.

In iDefine, it is possible for multiple SCS to share one module, so it may be necessary to modify the data manually depending on the changes made.

Follow these steps to manually restore the definition details of System Structure Navigator.

1. From the context menu of the target SCS in System Structure Navigator in AD Organizer, select [Display revision history].
   The Revision History dialog box appears.
2. Select [All] and click [View].
   The Revision History window appears.
3. On the tab sheet for labels in the Revision History window, search for the label corresponding to the modified data.
   The following labels are attached to the files when they are checked in.
   `SCS project name-Version`

   Version is the Version number specified by the user with Version Control Tool.
4. Select the label and click [Details].
   The Label Detail dialog box appears.
5. From the list in the Label Detail dialog box, search for the following files, select each file, and select [Launch Editor] from the context menu:
   - I/O_definition
   - Node_definition
   - IOM_definition

   Data form the past is displayed.
6. Extract data from each file. Perform all of the following operations when extracting data. There is no specific order for performing these operations.

- In order to export the data of I/O_definition, select [Export] from the sub menu of Safety I/O Editor.
- In order to export the content of IOM Definition, select [Export] from the sub menu of IOM Definition Editor.

7. From the system structure navigator in AD Organizer, select the files under the I/O-List folder and start Safety I/O Editor.
8. Import the data of I/O_definition that was exported from Safety I/O Editor in the step 6.
9. Select the targeted SCS and start IOM Definition Editor.
   a. If the structure of nodes, IOM, ESB bus coupler module, or N-ESB bus coupler module is different from the previous structure, make the definitions same as the previous ones.
   b. By using IOM Definition Editor, import the files that were exported from IOM Definition Editor in the step 6.
10. Select the targeted SCS and select [RS Generation Manager] from the context menu. Generation Manager will start.
11. After selecting the [RS project name] and [SCS project name], click [Reflection]. The reflection process will be run.
12. Using the project comparing tool, compare the Work database created with the above steps against the Work database of the version at the origin of the check-out controlled with the Version Control Tool to check that the data of AD Organizer has been correctly restored.

F5.5 Deleting of versions

Checked-in projects data can be deleted at any point. It is also possible to delete multiple versions at one time. Be aware, however, that the project data of a once deleted version cannot be restored.

Version deletion operation

Checked-in project data can be deleted at any point.

1. Select the target version in the version list display area.
   Multiple versions can be selected at the same time.
2. Click "Delete Version/Project" button of the toolbar or select [Delete Version/Project] from the [File] menu;
   the Version Control tool dialog box appears.

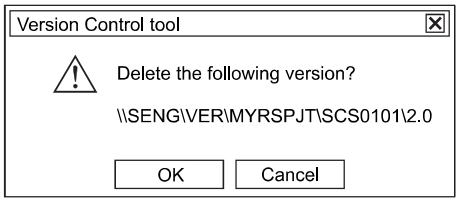

Figure F5.5-1 Version Control Tool dialog box

3. Click [OK].
   All the target folders and files below the folders are deleted. At this point, the deletion status is displayed in the message display area and the processing status is displayed in the status bar with the progress bar.

   The deleted versions are no longer displayed in the version list display area.

   The following information is displayed in the message display area.

   - Deletion start date/time
   - Deletion completion date/time
   - Warnings and errors
   - Numbers of warnings and errors

F5.6 Deleting all check-in data related to a project

Checked-in projects data stored in the version control database is deleted for each SCS project or RS project.

Check-in data project deletion

Check-in project data stored in the version control database is deleted for each SCS project or RS project.

1. Select an SCS project or RS project in the version control DB display area.
2. Click [Delete Version/Project] button in the toolbar or select [Delete Version/Project] in the [File] menu;
   the Version Control tool dialog box appears.

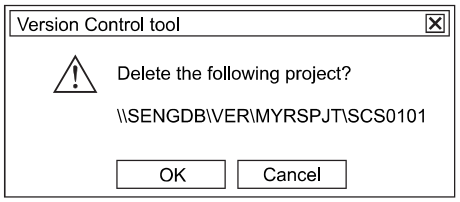

Figure F5.6-1 Version Control Tool dialog box

3. Click [OK] button.
   The deletion process is executed and the entire folder of the corresponding SCS project or RS project is deleted from the version control database. At this point, the deletion status is displayed in the message display area and the processing status is displayed in the status bar with the progress bar.

   The deleted project is no longer displayed in the version control DB display area.

   The following information is displayed in the message display area.

   - Deletion start date/time
   - Deletion completion date/time
   - Warnings and errors
   - Numbers of warnings and errors

F5.7 Viewing version information

At check-in, not only the version number, but also comments and other kinds of version information are recorded together with the data to be checked in. The version information can be viewed in the Detail dialog box.

Moreover, check-in states in the past are displayed in the version list display area. It is possible to change the sorting order and filter versions to be displayed in the version list display area.

SEE ALSO For more information about changing the sorting order in the version list display area, refer to:

"■ Version Control Tool window" on page F5-2

■ Display of information related to versions

Detailed information of the selected version is displayed in the Detail dialog box.

● Displaying the Detail dialog box

The Detail dialog box is displayed by performing either one of the following operations.

- Select [Detail] in the [View] menu.
- Select the [Detail] button in the tool bar.
- Select [Detail] in the pop-up menu displayed by clicking the right mouse button in the version list display area.
- Double-click in the version list display area.

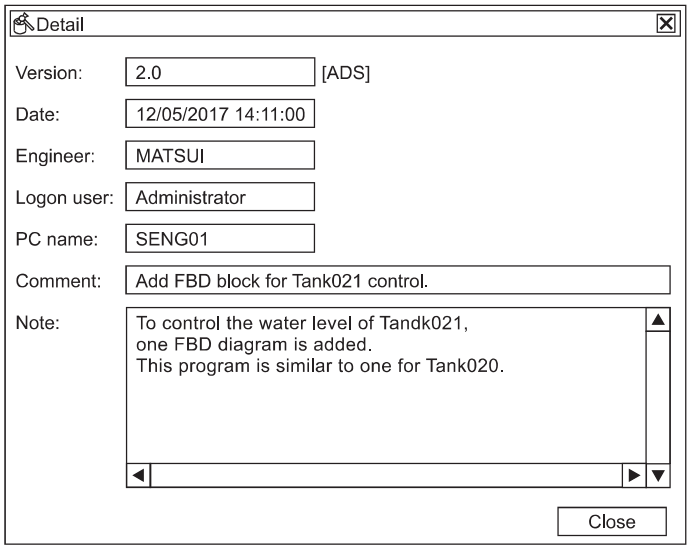

Figure F5.7-1 Detail dialog box

The Detail dialog box shows the following information items related to the selected version.

Table F5.7-1 Information displayed in the Detail dialog box

Item	Description
Version	Version number (*1)
Date	Date and time
Engineer	Engineer name
Logon user	Logon user name

Continues on the next page

Table F5.7-1 Information displayed in the Detail dialog box (Table continued)

Item	Description
PC name	PC name
Comment	Comment
Note	Description

*1: When the applicable SCS project includes the data of I/O list engineering, [ADS] appears to the right of the text box.

Filtering version list

Every time data is checked in, new check-in information is added; the version list may eventually contain too many lines. In this case, it is possible to filter the list such that versions that do not need to be viewed are not listed. The filtering settings are made in the Option dialog box.

Displaying the Option dialog box

Select [Option] from the [Tool] menu.
The Option dialog box appears.

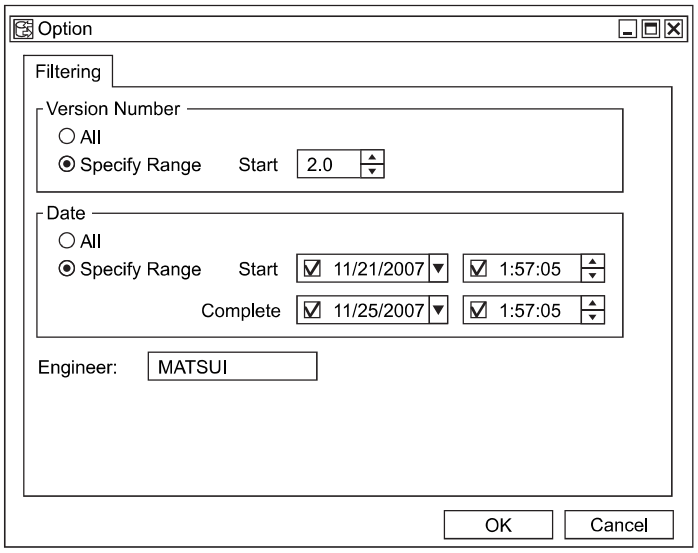

Figure F5.7-2 Option dialog box

Specification of filtering items

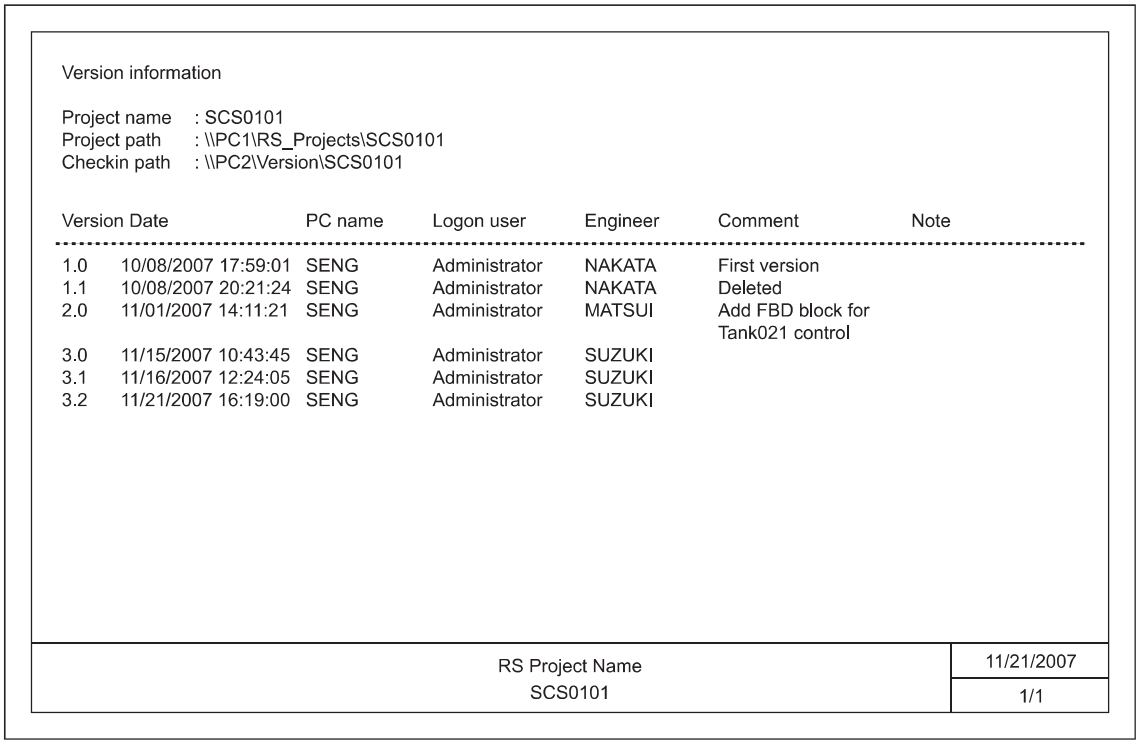
The following filtering items can be specified in the Option dialog box. When filtering items are set, the list only displays project data satisfying all the conditions below.

Table F5.7-2 Filtering items

Item	Description
Version Number	The specified version number and onwards can be displayed. Select a version number in the spin box or enter the version number directly.
Date	Only versions that were checked-in during a certain period can be displayed. In order to specify this item, select a period to be displayed in the calendar control and spin box or enter the period directly.
Engineer	Only versions checked in by a specific engineer can be displayed. In order to specify this item, enter an engineer name directly in the text box.

Specify filtering items and click [OK] button.

The version list display area is updated and the list is shown according to the specified filtering conditions.



F5.8 Printing version information

It is possible to print the version information of the SCS project displayed in the version list display area.

The version list displayed in the version list display area can be sorted or filtered. The version information is printed in the landscape orientation on A3 size paper according to the display in the version list display area.

Printing example

Choose [Print] from [File] menu. The SCS Project Version Information can be printed out. A sample of printout is shown as follows:

Version information

Project name : SCS0101
Project path : \\PC1\RS_Projects\SCS0101
Checkin path : \\PC2\Version\SCS0101

Version	Date	PC name	Logon user	Engineer	Comment	Note
1.0	10/08/2007 17:59:01	SENG	Administrator	NAKATA	First version	
1.1	10/08/2007 20:21:24	SENG	Administrator	NAKATA	Deleted	
2.0	11/01/2007 14:11:21	SENG	Administrator	MATSUI	Add FBD block for Tank021 control	
3.0	11/15/2007 10:43:45	SENG	Administrator	SUZUKI		
3.1	11/16/2007 12:24:05	SENG	Administrator	SUZUKI		
3.2	11/21/2007 16:19:00	SENG	Administrator	SUZUKI		

RS Project Name
SCS0101

11/21/2007
1/1

Figure F5.8-1 Printing example

F5.9 Changing the top path of a check-in folder

If the capacity of the disk used for version control becomes insufficient or the disk crashes, secure new disk space for version control in a new disk location.

At this point, it is necessary to change the check-in path maintained in each SENG to the path of the newly set disk space. The top path of a check-in folder is changed in the Select Check-in Folder dialog box.

Changing check-in folder top path

1. Select [Change Checkin Folder] from the [Tool] menu
   The Select Checkin Folder dialog box appears.

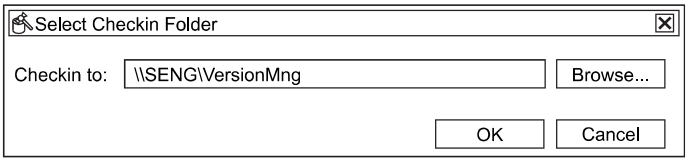


Figure F5.9-1 Select Checkin Folder dialog box

2. Specify the check-in folder.
   To change the check-in folder, enter the path to the folder directly or select it from the folder selection dialog box displayed by clicking [Browse] button.

TIP

An error dialog box appears if the specified folder does not exist.

3. Click [OK].
   The check-in folder is specified. The structure of the specified folder is displayed in the version control DB display area.

F6. Project Comparing Tool

The Project Comparing Tool is a tool for detecting, displaying and printing differences between two specified SCS projects.

F6.1 Overview of project comparison

Using the Project Comparing Tool, you can check the differences between two projects, which is useful in such a case when you have created a similar project using the data of an existing SCS project. It is recommended to print the detected differences and use them for checking at your desk. If no differences were detected, it can be considered that the two projects are the same.

Comparable project data

With the Project Comparing Tool, the data of any two SCS projects can be compared. The following three types of project data are comparable, and you can specify any combination of these project data.

- Project work database
- Project master database
- Project saved by version control tool
  (work database and master database)

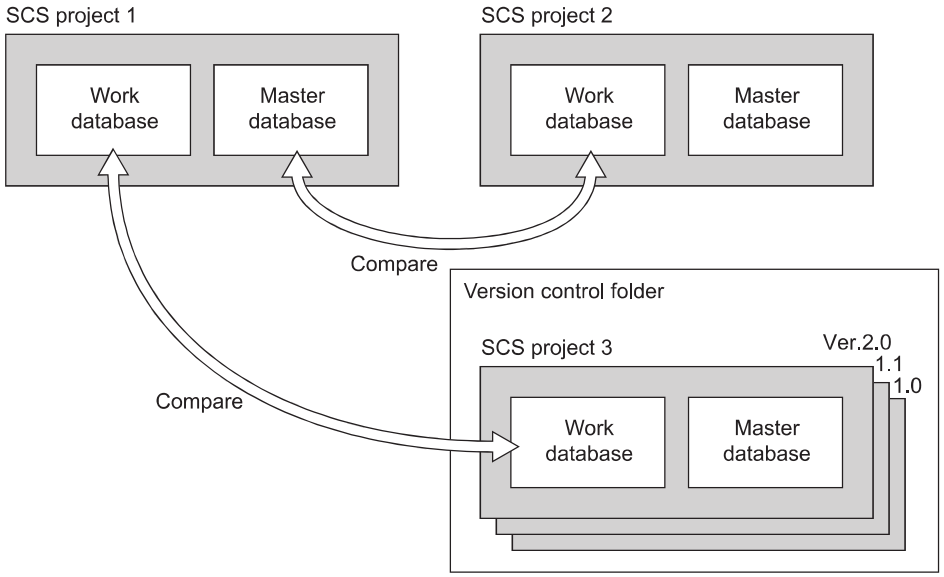

Figure F6.1-1 Comparison of project data by Project Comparing Tool

F6.2 Window configuration of Project Comparing Tool

This section describes the window configuration of the Project Comparing Tool.

The following figure shows an example of the display after project comparison is executed.

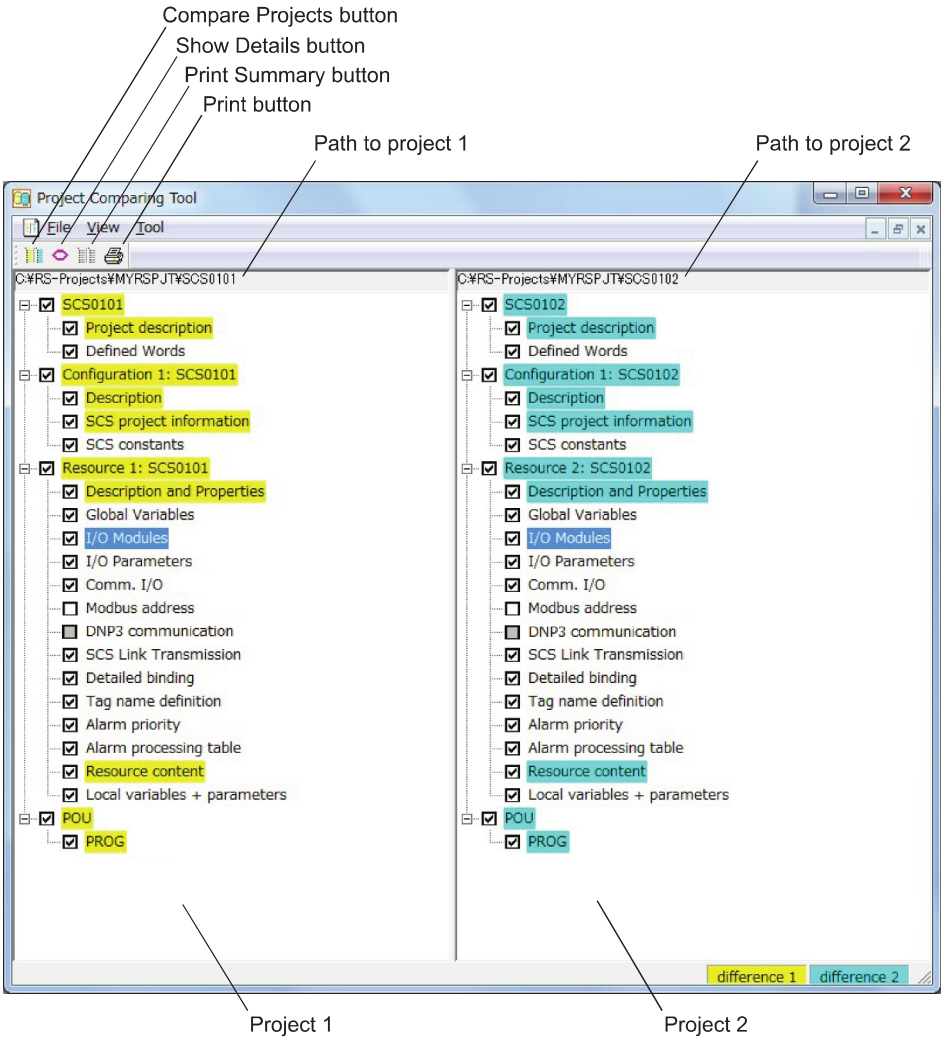

Figure F6.2-1 Window of Project Comparing Tool

When the SCS project subject to comparison includes engineering data created with AD Organizer, ADS appears to the right of the SCS project name.

SEE ALSO For more information about display example, refer to:

"■ Comparing projects" on page F6-6

■ Compared items list display

When two projects that you wish to compare are specified, the data items of each project are displayed in a tree view in the left and right panes. Above each tree, the path of the project is displayed. When comparison is executed, data of the items with their check box selected are compared, and the items where any difference was detected are marked with yellow (Project 1) and cyan (Project 2).

Also, among the items where any difference was detected, those items for which detailed information is to be displayed or printed may also be selected by check boxes.

The following table lists the data items compared by the Project Comparing Tool.

Table F6.2-1 Compared items list

Item		Remarks
Station	Project description	-
	Defined words	-
Configuration	Description	-
	SCS project information	-
	SCS constants	Items set in the SCS Constants Builder
Resource	Description and properties	-
	Global variables	Among the variables defined in the dictionary, those that are global
	I/O modules	-
	I/O parameters	Items set in the I/O Parameter Builder
	Comm. I/O	Items set in the Communication I/O Builder
	Modbus address	Items set in the Modbus Address Builder
	DNP3 communication	Items set in DNP3 Communication Builder
	SCS Link Transmission	Items set in the SCS Link Transmission Builder
	Detailed binding	-
	Tag name definition	Items set in the Tag Name Builder
	Alarm priority	Items set in the Alarm Priority Builder
	Alarm processing table	Items displayed in the Alarm Processing Table Builder
	Resource content	List of user-defined groups and POUs
	Local variables + parameters	Among the variables defined in the dictionary, local variables of the POU
POU	POU name	Logic defined in Multi-language Editor

For items other than POUs, the same items are displayed in the left and right panes.

The POU display order is as follows:

- Project 1: The order of execution.
- Project 2: The order in which matches with a POU name of Project 1 are found. However, POUs that do not exist in Project 1 are added at the end.

Menu bar

The menu bar provides the following menus

- [File] menu
- [View] menu
- [Tool] menu

The menu items of each menu are explained below.

Table F6.2-2 File menu

Menu Item	Description
Compare Projects	Start comparison of the items for which the check box is selected.
Select Projects Paths	Call the dialog box for setting the paths of SCS projects to be compared.
Print Summary	Print a summary of the comparison results.
Print	Print the detailed differences of the items for which the check box is selected.
Exit Project Comparing Tool	Close the Project Comparing Tool.

Table F6.2-3 View menu

Menu Item	Description
Toolbar	Switch between show and hide the toolbar.
Status Bar	Switch between show and hide the status bar.

Table F6.2-4 Tool menu

Menu Item	Description
Show Details	Display the detailed differences of the items for which the check box is selected.
Select Items	Call the dialog box for batch selection of check boxes.

Toolbar

The toolbar provides the following buttons.

Table F6.2-5 Toolbar buttons

Name	Description
Compare Projects	Start comparison of the items for which the check box is selected.
Show details	Display the detailed differences of the items for which the check box is selected.
Print summary	Print a summary of the comparison results.
Print	Print the detailed differences of the items for which the check box is selected.

F6.3 Comparing two SCS projects

This section describes the procedure for comparing two specified SCS projects and the procedure for printing a summary of the comparison results.

About designation of projects

To designate two SCS projects for comparison, you need to specify the path to the top folder of the SCS projects. If you want to specify the master database of the SCS project, you can specify by selecting the "Master" check box.

To specify a version-controlled project, you need to specify the path to the folder of the version number under the check-in folder. In this case as well, by selecting the "Master" check box, the master database of the specified project will be the target of comparison.

Example:

To compare the data of version number 1.3 of the SCS project SCS0101 which is saved in the check-in folder `\\SENG_DB_PC\VER\MYRSPJT`, specify the path as follows.

```
\\SENG_DB_PC\VER\MYRSPJT\SCS0101\1.3
```

SEE ALSO For more information about version-controlled project databases, refer to:

F5., “Version control” on page F5-1

Comparing projects

IMPORTANT

- Before using the Project Comparing Tool, close SCS Manager. The Project Comparing Tool and the SCS Manager cannot be used at the same time.
- An SCS project that is opened by the SCS Manager on another SENG cannot be compared.

Follow these steps to run a comparison of projects.

1. Start Project Comparing Tool.
   A dialog box for specifying the top paths of the two SCS projects to be compared appears.

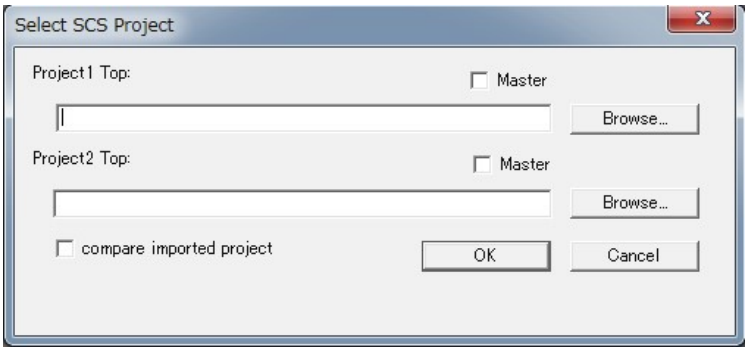

Figure F6.3-1 Select SCS Project dialog box

In the dialog box, the contents specified in the previous project comparison are displayed.

2. For Project1 Top and Project2 Top, specify the path to the top folder of each SCS project.
   a. Click [Browse] and select the top folder of the SCS project, or enter the path directly.
   b. When specifying the master database of the specified SCS project, select the "[Master]" check box. When specifying a work database, leave the "[Master]" check box clear.
3. To compare one project with another project re-created by importing that entire project, select the "[compare imported project]" check box in the select project dialog box. Normally, when comparing a project before changes against the project after changes, leave the "[compare imported project]" check box clear.
4. Click [OK].
   If a password has been set in the project, a dialog box for entering the password appears.
5. Enter the password, and click [OK].

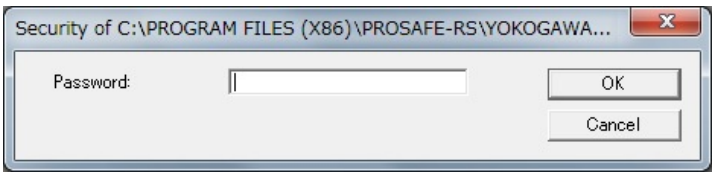

Figure F6.3-2 Project Password Input dialog box (Project 1)

A list of defined items of the two projects appears. All of the check boxes of the items are clear.

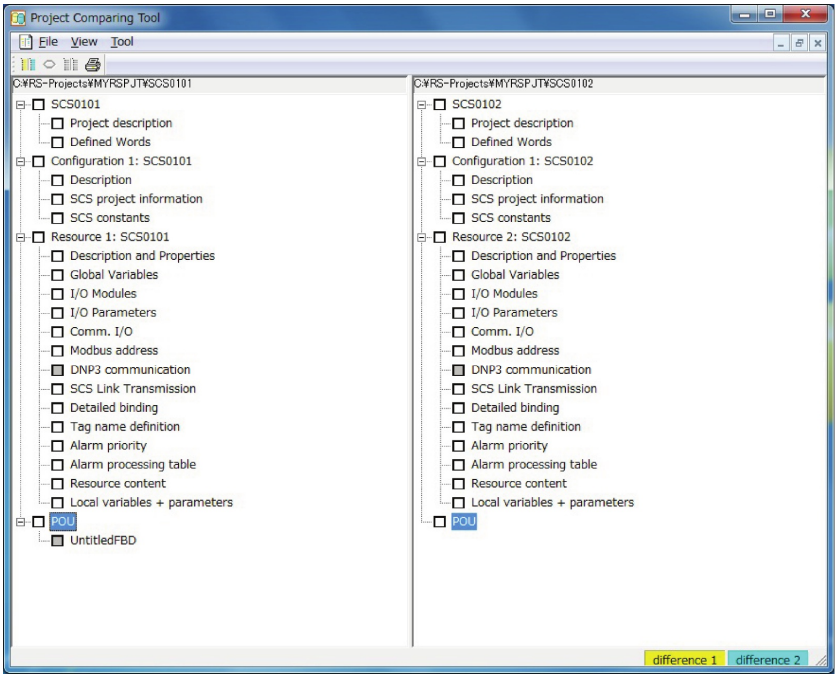

Figure F6.3-3 Project Comparing Tool (at start-up)

TIP

An error message appears in the following cases:

- The specified folder is not an SCS project folder.
- The specified path does not exist.
- The specified SCS project is opened on the SCS Manager of another SENG.
- The password entered is not correct.

Note that if the wrong password is entered three times consecutively, the process is discontinued, and it returns to the Select SCS Project dialog box.

6. Select the check boxes of items in which you want to detect differences.
   When a check box is selected on the tree on either the left or right, the check box of the same item is selected on the other tree.

TIP

- You can select all items at once in this way: From the menu bar, select[Tool] > [Select items]In the dialog box that appears, select [Select All].

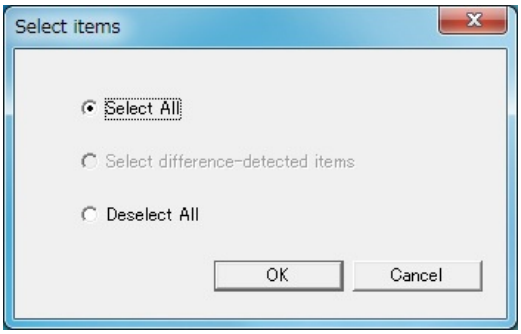

Figure F6.3-4 Select items dialog box

- Check boxes of the items that exist in only one of the projects are displayed in gray and cannot be selected for comparison.

7. From the menu bar, select [File] > [Compare Projects] to start the project comparison.
   A progress bar is displayed during difference detection.

When the comparison is finished, difference-detected items are marked in yellow on Project 1 and in cyan on Project 2. For items in which any difference was detected, the top-level item name is also marked, so that it is easy to see where there are differences even when the tree is collapsed.
When the SCS project subject to comparison has a difference of having or not having engineering data created with AD Organizer, the background color of the SCS station node will not be changed.

Executing project comparison for the second time and thereafter

To perform another SCS project comparison after a project comparison was executed after the Project Comparing Tool was started up, perform the following procedure.

1. From the menu bar, select [File] > [Select projects paths].
   The Select SCS Project dialog box appears.
2. Specify the paths to the SCS projects to be compared, and perform the compare operation.

Printing a project comparison results summary

A summary of the differences detected by executing a project comparison can be printed.

To print a summary of project comparison results, perform the following procedure.

1. With the comparison results displayed in the window of the Project Comparing Tool, select [File] > [Print summary] from the menu bar.
   The comparison results are printed.

An example of a printed summary of project comparison results is shown in the following figure.

```
Project Compare Result Summary  [Time:2017/02/27 10:00:00]
[for comparing imported project]
Project1: C:\RS-Projects\Ti\ToolCompare\RSPJT1\SCS1105          Ver:0.1  ProjectDate:2017/02/11
Project2: C:\RS-Projects\Ti\ToolCompare\RSPJT3\SCS1105[Master]  Ver:1.0  ProjectDate:2017/02/17

Project1                                                  Project2
* SCS1105                                                 * SCS1105
  * Project description                Not Changed          * Project description
  * Defined words                      Not Changed          * Defined words

```

Figure F6.3-5 Example of printed summary of comparison results

Information printed in project comparison results summary

The following information is printed in the header:

- Time: Time that summary was printed
- [for comparing imported project]: Printed when the compare imported project check box is selected in the Select SCS Project dialog box.
- Project 1, Project 2: Paths to compared project data
  In the case of a master database, [Master] is printed.
- Ver: Version number
  Version number set by Version Control Tool. This item remains blank for non version-controlled projects.
- Project Date: Project date (date set in project properties)

For the items that were compared, an asterisk (*) is printed, and the following information is printed in the center column:

- Changed: There is a difference
- Not Changed: There is no difference
- Deleted: Item that exists only in Project 1
- Added: Item that exists only in Project 2
- ----------: Item that was not compared

F6.4 Checking contents of detected differences

After project data comparison has been executed, the detailed contents of detected differences can be displayed and printed.

If a password is set for POUs, password input is required.

Displaying detailed differences

Differences are displayed in a Difference Display window for each selected item. Although multiple windows can be displayed at a time, only one POU Difference Display window can be displayed. For this reason, if another POU is selected while a certain POU's differences are displayed, the previously opened window will close.

Display procedure for items other than POUs for which a password is set

To display detailed differences, perform the following procedure.

1. From the tree view where project comparison results are displayed, click one item name for which you wish to see the detailed differences.
2. From the menu bar, select [Tool] > [Show details].
   The Difference Display window of the selected item appears.

Display procedure for POUs for which a password is set

Password input is required when displaying the detailed differences of a POU for which a password is set. The input POU password is stored, and is saved until the path to the project is changed in the Select Project dialog box. For this reason, password input is not required when displaying the detailed differences of a certain POU after displaying the detailed differences of the same POU using the correct password.

To display the detailed differences of a POU for which a password was set, perform the following procedure.

1. From the project comparison results display, click the POU name for which you wish to see the detailed differences.
2. From the menu bar, select [Tool] > [Show details].
   A dialog box for entering the POU password of Project 1 appears.

Figure F6.4-1 POU Password Input dialog box (Project 1)

3. Enter the POU password.
4. Click [OK].
   If release of password protection is successful, a dialog for entering the POU password of Project 2 appears.

   If the wrong password is entered three times consecutively, the process is discontinued.

TIP

- After the process is discontinued, if that POU is selected again and the [Show details] command is executed, the password input dialog box appears.
- When [Cancel] or [Skip] is clicked in the Password Input dialog box, the display of detailed differences is discontinued.

5. Similarly, input the POU password for Project 2 and click [OK].
   If release of password protection is successful, the Difference Display window of the selected POU appears.

Difference Display window

Differences are displayed in a window of the engineering function, such as builders, that is started up in "viewer mode." Only browsing is enabled in this window. The definitions cannot be edited or downloaded.

In the Difference Display window, the definitions of Project 1 are displayed on the top pane and those of Project 2 are displayed on the bottom pane, with the differences displayed in red. The toolbar has "Find Next" and "Find Previous" buttons. When either button is clicked, a difference is selected and highlighted. The highlight moves to the next or previous difference each time the button is clicked.

The following figure is an example of the display when a POU is selected.

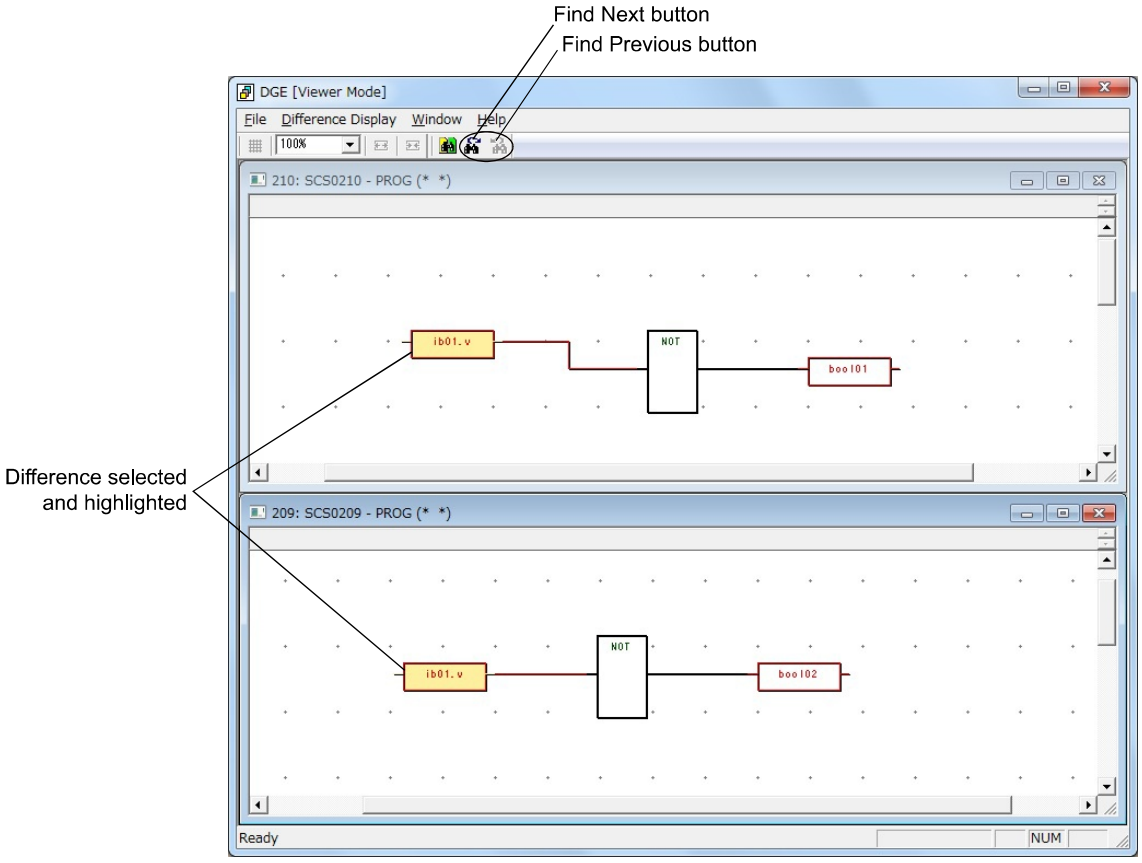

Figure F6.4-2 Example of detailed difference display when a POU is selected

Differences in the positions or shapes of graphics in POU diagrams are also displayed as differences.

The following figure is an example of the display when an item other than a POU is selected.

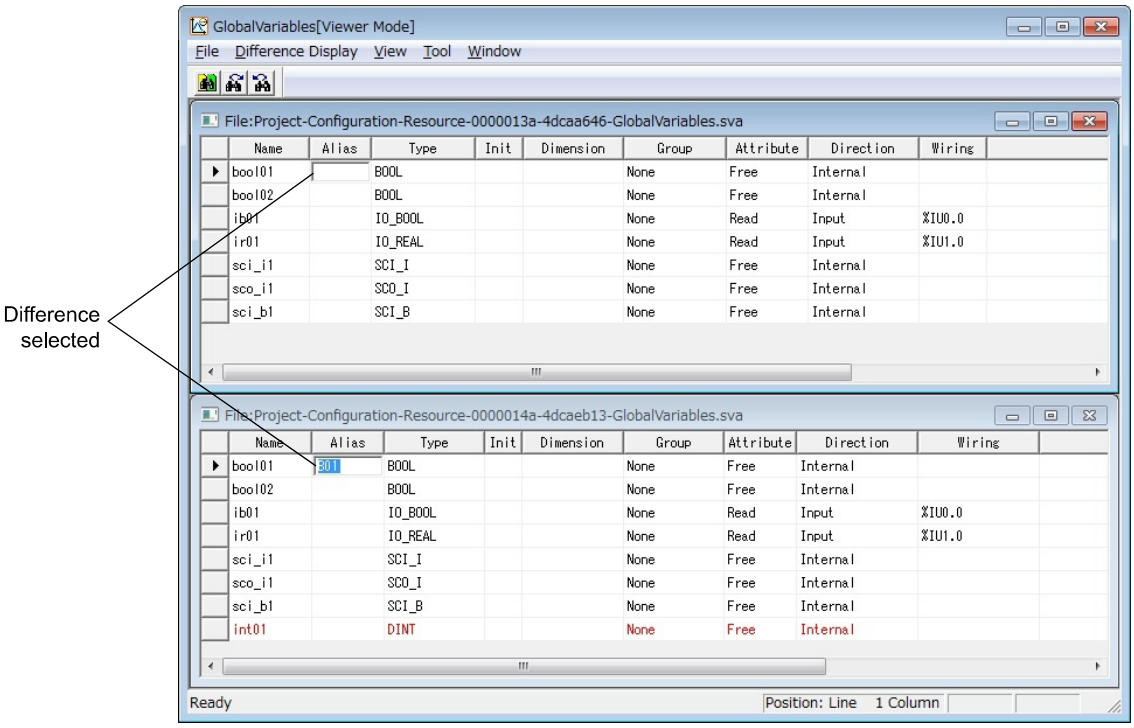

Figure F6.4-3 Example of detailed difference display when an item other than a POU is selected

Printing detailed differences

This section describes the procedure for printing the details of detected differences after a project comparison. Password input is required when printing the information for a POU that has a password.

Perform the following procedure to print detailed differences.

1. From the project comparison results display, select the check box of the item for which you wish to print the detailed differences.
   To select all the check boxes of the items where differences were detected, select [Tool] > [Select Items] from the menu bar; in the displayed dialog box, select "Select difference-detected items."
2. From the menu bar, select [File] > [Print].
   The Start Print dialog box appears.
3. Click [OK] to start printing.
   - When password-set POUs are not selected, differences are printed for all selected items, and the process ends.
   - If any password-set POU is selected, a dialog box for entering the POU password appears. Proceed with the following procedure.
4. Perform any of the following operations in the dialog box for entering the POU password.
   - To print, enter the POU password and click [OK].
   - To print the next POU without printing the current POU, click [Skip].
   - To discontinue the printing process, click [Cancel].

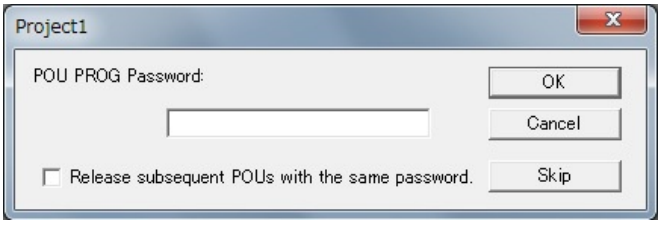

Figure F6.4-4 POU Password Input dialog box (Project 1)

TIP

- When the "Release subsequent POUs with the same password" check box is selected, the password input dialog will not appear for subsequent POUs with the same password.

  Note that passwords for POUs of Project 1 and POUs of Project 2 are handled separately.
- If the wrong password is entered three times consecutively, the process is discontinued and moves to the printing for the next POU.

If release of POU password protection for Project 1 is successful, the POU password input dialog box for Project 2 appears.

5. Enter the POU password for Project 2.
   The differences of the POU are printed.

When the differences of all selected items have been printed, the process ends.

If there are POUs that failed to release password protection or skipped POUs, a warning dialog box that displays a list of those POUs appears when the printing is finished.

Print format of differences

The definition contents of Project 1 and Project 2 are alternately printed for each item. The differences are surrounded with a box, and are printed in red if printed in color.

The printing format is in accordance with the settings for self-documentation. Chapter numbers are the same as when printing by self-documentation, with page numbers in order when printed.

SEE ALSO

For more information about printing format of self documents, refer to:

"■ Self-documentation" on page F2-2

F7. Online monitoring

This function is used to monitor the application logic executed on the SCS.

It updates and displays the currently running program, values of variables that were assigned to function blocks, and condition status at regular intervals regardless of the SCS security level, as follows:

- Displays values of input/output variables and internal variables
- Displays BOOL-type variables and BOOL signal lines in different colors according to values. The user can customize the colors used for TRUE/FALSE
- Displays whether a variable is locked or not

The online monitoring function can be divided into the following four categories based on the display method:

- FBD Status Display
  FBD windows of Multi-Language Editor
- LD Status Display
  LD windows of Multi-Language Editor
- ST Status Display
  ST windows of Multi-Language Editor
- Variable Value List Display
  I/O Lock Window

  SCS Link Transmission Lock Window

  Inter-SCS Communication Lock Window

  Communication I/O Lock Window

  Dictionary View

  Spy List

When iDefine is used, you can use the online monitoring function by connecting to ProSafe-RS from iDefine through the iDefine Test Manager.

SEE ALSO

For more information about I/O Lock Window, refer to:

F8.8.1, “I/O Lock window” on page F8-31

For more information about SCS Link Transmission Lock Window, refer to:

F8.9, “SCS Link Transmission Lock window” on page F8-44

For more information about Inter-SCS Communication Lock Window, refer to:

F8.10, “Inter-SCS Communication Lock window” on page F8-55

For more information about Communication I/O Lock Window, refer to:

F8.11, “Communication I/O Lock window” on page F8-69

Starting the window for online monitoring

Lock windows can be launched while SCS Manager is in the editing mode or debug mode. In the case of online monitoring-related windows other than lock windows, online monitoring is enabled when SCS Manager enters the logic simulation mode or debug mode.

To switch to logic simulation mode, select [Simulation] from the SCS Manager [Debug] menu. To enter the debug mode, select [Debug] from the [Debug] menu of SCS Manager.

Online monitoring and security

Whether you can perform forcing on online monitoring related windows differs, depending on the security level of the SCS. In addition to the security settings for the database, the ability to view the POU also depends on whether a password has been set in the POU or not.

Relationship with SCS security levels

On online monitoring related windows, you can perform online monitoring at any SCS security level.

- Use windows related to online monitoring at security Level 2 to monitor the application logic status without changing values of variables and other data inadvertently.
- Lower the security level and use the forcing function to specify variables in the online monitoring window.

Relationship with database security

On the Online Monitoring related windows, the POU can always be accessed in read-only mode regardless if the SCS project and the library are in read-only mode or protected by a password. The accessibilities of the POU vary with password protection. How POU can be accessed is shown as follows:

- When accessing a POU without password protection, the POU can be opened in read-only mode.
- When accessing a POU with password protection, password entry is required for the first time opening the POU, and the POU will be opened in read-only mode. From the second time, the POU will be opened in read-only mode without prompting for password.
- When accessing a POU with password protection, the POU cannot be opened unless the password is properly entered.

F8. Forcing function

The forcing function enables you to fix a variable (lock a variable) and forcibly modify the value. Specifically, you can lock the variables in an application logic, channel input and output values of the I/O module, and the data of SCS link transmission, inter-SCS safety communication, subsystem communication, and safety subsystem communication.

Run the forcing function in the following windows:

- I/O Lock Window
- SCS Link Transmission Lock Window
- Inter-SCS Communication Lock Window
- Communication I/O Lock Window
- Multi-Language Editor (FBD)
- Multi-Language Editor (LD)
- Dictionary View
- Spy List window

IMPORTANT

- To execute the forcing function, it is necessary to set the SCS security level to Level 1 or 0.
- The forcing function can be used in the target test, the SCS simulation test and the logic simulation test. However, the I/O Lock Window, SCS Link Transmission Window, Inter-SCS Communication Lock Window, and Communication I/O Lock Window cannot be started for the logic simulation test.

When iDefine is used, you can use the forcing function by connecting to ProSafe-RS from iDefine through the iDefine Test Manager of AD Organizer. The conditions to use the forcing function and the actions that can and cannot be done from iDefine are described as follows:

- To execute the forcing function from iDefine, you must set the SCS security level to 0.
- From iDefine, the forcing function can be applied only on the following variables:
  - I/O variables that were defined using the Safety I/O Editor and imported to iDefine.
  - Variables that were defined using iDefine
- You can lock the I/O modules in SCS from iDefine.
- You cannot force the SCS link transmission data, inter-SCS safety communication data, and subsystem communication from iDefine. Instead, you must use SCS Link Transmission Lock window, the Inter-SCS Communication Lock window and the Communication I/O Lock window respectively.

SEE ALSO For more information about Forcing from iDefine, refer to:

4., "PROSAFE-RS IO MODULE" in iDefine User Guide (Yokogawa Extensions) (PR12002-MAN-980_01)

Applications of the forcing function

The forcing function is used in SCS maintenance and application debugging.

In application debugging, the forcing function is used for the following purposes:

- Setting the variable and the function block parameter values for debugging the application logic
- Locking Input/Output Modules
- Locking Input/Output Channels for the Purpose of Wiring Tests
- Locking for the purpose of inter-SCS safety communication tests (producing or consuming sides)
- Forcing during debugging of the application logic that uses subsystem communication and safety subsystem communication
- Disconnect I/O during maintenance of a communication module
- Disconnect I/O during maintenance of a PROFINET IO-Device connected to the fire and gas communication module

In SCS maintenance, the forcing function is used for the following purposes:

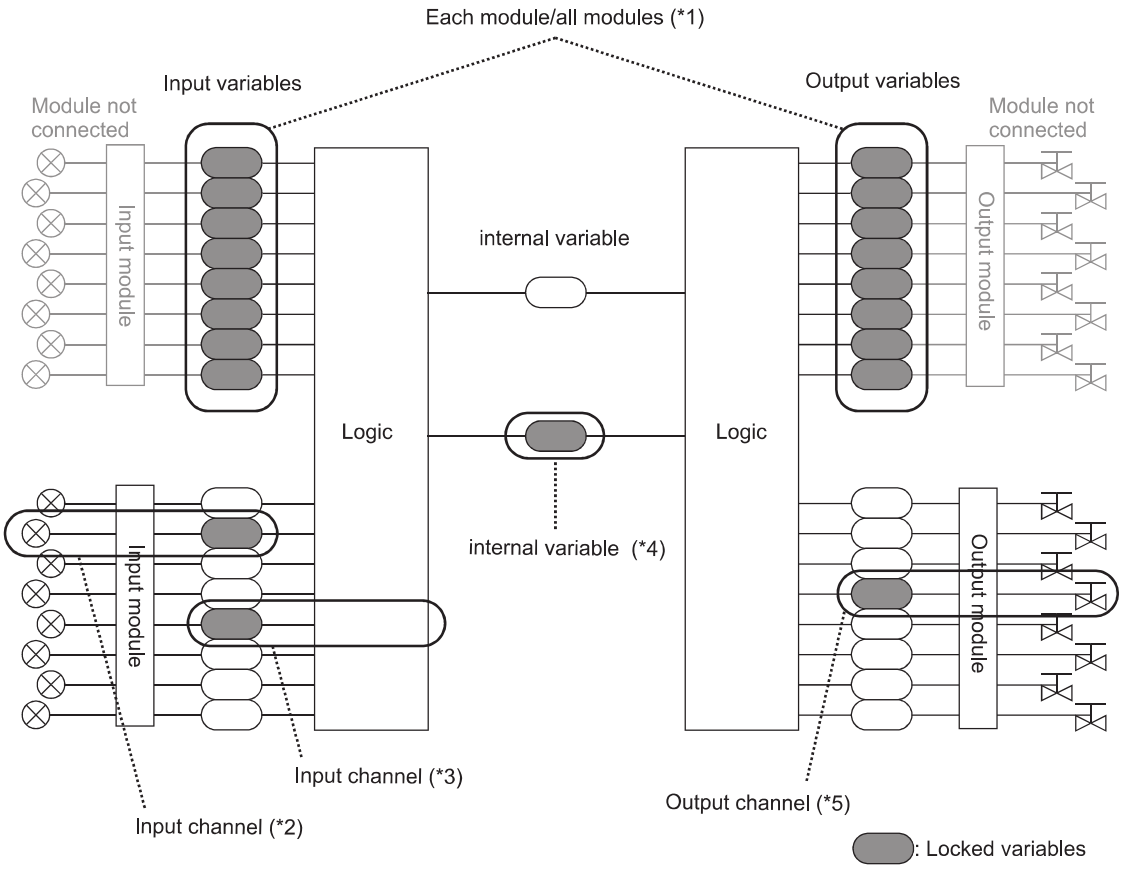
- Locking I/O variables for all channels of each input/output module if the required input/output module is not available or the field wiring has not been completed
- Locking I/O variables for all channels of each AIO/DIO module when channels of the AIO/DIO module are faulty and the module has to be replaced
- Locking input/output modules to prevent nuisance tripping during online modification of input/output modules
- Locking input/output channels for maintenance
- Locking input/output channels to prevent nuisance tripping during online modification of application logic
- Locking function blocks on the producing or consuming sides to prevent nuisance tripping due to error occurrence in inter-SCS safety communication during online change download and offline download

The forcing function can be used in target tests, SCS simulation tests and logic simulation tests. However, the I/O Lock Window, SCS Link Transmission Lock Window and Communication I/O Lock Window cannot be used for the logic simulation tests.

Debugging application logic

If you lock variables, you can change values such as input data and function block parameter. As a result, debugging application logic can be performed on different conditions.

Locking Input/Output modules



Variables can be locked for all channels of each input/output module if the required input/output module is not available or the field wiring has not been completed, thereby preventing the application logic from being influenced by input data and data status changes of input/output channels.

It is also possible to lock all the variables of multiple input/output modules in one operation.

Locking Input/Output channels for the purpose of wiring tests

By locking input variables, it is possible to conduct wiring tests on the input side (field wiring/device) without transmitting changes of values of the input channels and conditions on the input side to the logic side. The actual input values can be checked in the I/O Lock window.

Similarly, by locking output variables, it is possible to conduct wiring tests on the output side without transmitting changes of the values of the logic side to the output channels. In this case, the operation on the output side can be checked by changing the values of the locked output variables.

*1: Disconnection of AIO/DIO module
*2: Input field wiring test
*3: Logic debugging by changing input data
*4: Logic debugging by changing internal variable
*5: Output field wiring test

Figure F8-1 Applications of the forcing function

● Locking for debugging Inter-SCS safety communication

It is possible to lock and set values for function blocks using the Inter-SCS Communication Lock Window in order to debug inter-SCS safety communication applications. By locking either the producing or consuming side function blocks and setting values for individual function blocks, it is possible to change the execution conditions of application logics for debugging.

■ System function blocks related to the locking function

The locking units will differ depending on the target of the Forcing. The locking status can be managed with a system function block. System function blocks related to the locking function are shown in the table below.

Table F8-1 System function blocks related to the subjects of forcing

Target	Unit of locking	Related System function blocks	Precaution at locking
I/O channels of AIO/DIO modules (*1)	Each channel, or each module	SYS_FORCE • If the total number of locked variables exceeds the pre-defined limit, this function block can issue a diagnostic information message to notify the user. • If the duration of locking exceeds the pre-defined time limit, this function block allows generating a diagnostic information message to notify the user. • It is possible to unlock all locked variables.	If I/O variables are locked, even when an error occurs in the corresponding channel of the I/O device, the error will not be relayed to the logic.(*2)
Variables in application logic (*1)	Each variable		In the case of SCSP2/ SCSP3/SCSL2, if you lock internal variables, the CPU load (execution time) increases compared to the status where no internal variables are locked.
Subsystem communication data (*3)	Each module	SYS_FORCE_SC (*4) • If the duration of locking exceeds the pre-defined time limit, this function block allows generating a diagnostic information message to notify the user. • It is possible to unlock all locked variables. It is also possible to cancel the lock status of variables that are deleted by online change while being locked.	If subsystem communication is locked, even when an error occurs in the data status, it is not notified to the logic.
Safety subsystem communication data (*5)	Each communication definition (each PROFINET module)	SYS_FORCE_SF (*4) • Subsystem communication data and I/O variables are not included in communication definitions. • You can use the forcing function to force an unlocking of all locked communication I/O definitions. • When the state of there being one or more locked communication definitions continues for more than the specified monitoring time, a diagnostic information message is issued and notified to the user. This diagnostic information message is resent every time the specified amount of monitoring time passes. • A diagnostic information message is notified when the maximum number of communication definitions that can be locked at the same time is exceeded. When returning to the maximum number of less, a diagnostic information message for recovery is notified.	When safety subsystem communication is locked, even when an error occurs in the data status, it is not notified to the logic.

Continues on the next page

Table F8-1 System function blocks related to the subjects of forcing (Table continued)

Target	Unit of locking	Related System function blocks	Precaution at locking
Inter-SCS safety communication data (*3)	Each SCS	SYS_FORCE_BD • If the total number of stations whose inter-SCS safety communication data is locked exceeds the pre-defined limit, this function block can issue a diagnostic information message to notify the user. • If the duration of locking inter-SCS safety communication data exceeds the pre-defined time limit, this function block can issue a diagnostic information message to notify the user. • It is possible to unlock all locked producer FBs and consumer FBs. The locked status of a producer FB or consumer FB that has been deleted while being locked can be canceled through an online change.	If inter-SCS safety communication data is locked, even when an error occurs in the data status, it is not notified to the logic.
SCS link transmission data (*3)	Each SCS	SYS_FORCE_LT • If the total number of stations whose SCS link transmission data is locked exceeds the pre-defined limit, this function block can issue a diagnostic information message to notify the user. • If the duration of locking SCS link transmission data exceeds the pre-defined time limit, this function block can issue a diagnostic information message to notify the user. • It is possible to unlock all locked link transmission data. The locked status of link transmission data that has been deleted while being locked can be canceled through an online change.	If SCS link transmission data is locked, even when an error occurs in the data status, it is not notified to the logic.

*1: Forcing can also be run from iDefine.
*2: Diagnostic information messages notifying abnormality are generated, however. Some system function blocks detect errors without being affected by locking.
*3: Forcing cannot be run from iDefine.
*4: Only whether or not subsystem communication data is locked is detected. The number of locks is not counted.
*5: Controls the forcing status of safety communication I/O definitions.

SEE ALSO For more information about CPU load when internal variables are locked with SCSP2/SCSP3/SCSL2, refer to:

A7.3, “Locking of internal variables and performance in SCSP3/SCSL2/SCSP2” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

F8.1 Variable locking

It is possible to fix (lock) values of I/O variables and internal variables of the application logic to constant values, regardless of the input values from the actual input devices and application operation results.

This section describes the behavior of the input variables, the output variables and the internal variables when they are locked, as well as the behavior of the system function blocks during locking.

Overview of variable locking

All variables of the application logic have two values: a value written from the input side and a value read from the output side. Normally, the value on the output side is constantly overwritten with the value on the input side during the execution of the application logic. For this reason, the value written to the variable and the value read from the variable match each other.

The locking function is a function to stop overwriting values on the output side with values on the input side. As a result, the values maintained on the output side are used regardless of the values from the input side.

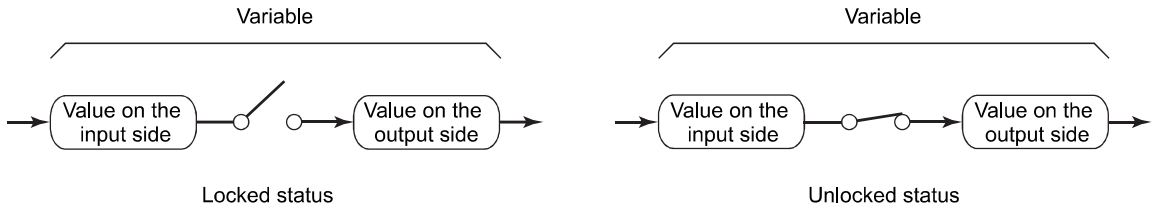


Figure F8.1-1 Overview of the locking function

In the case of an input variable, the value on the input side is the input from the input channel and is called physical data. The value of an input variable on the output side is read by the application logic and is called logical data.

An input variable consists of input data and data status.

In the case of an output variable, the value of the input side is the result of application logic processing and is called logical data.

The value of the output side of an output variable is the output to the output channel and is called physical data. An output variable also consists of output data and data status, in the same way as an input variable.

CAUTION

- When unlocking I/O variables, make sure to check the logical data and physical data of I/O data and data status. Check that there will be no adverse effects of unlocking on the system, such as a value changing abruptly after canceling the lock, causing nuisance tripping. Physical data cannot be referenced from iDefine. If you have locked the I/O data from iDefine, pay extra attention when you unlock it.
- While the forcing function is executed, the system's safety functions are disabled. If you use the forcing function for the purpose of maintenance after starting the actual operation, quit the forcing function immediately after the completion of system maintenance and enable the system's safety functions so that they operate normally. At the completion of a target test or when quitting SCS Manager during a target test, a dialog box appears to call attention to locked variables. In this case, display a list of the locked variables using the I/O Lock window or other means and cancel the lock status of these variables.

Locking input variables

If an input variable is locked, the value of the input variable will no longer be overwritten with the value input from the input channel. The input data and data status from the input channel and those from the input variable are separated.

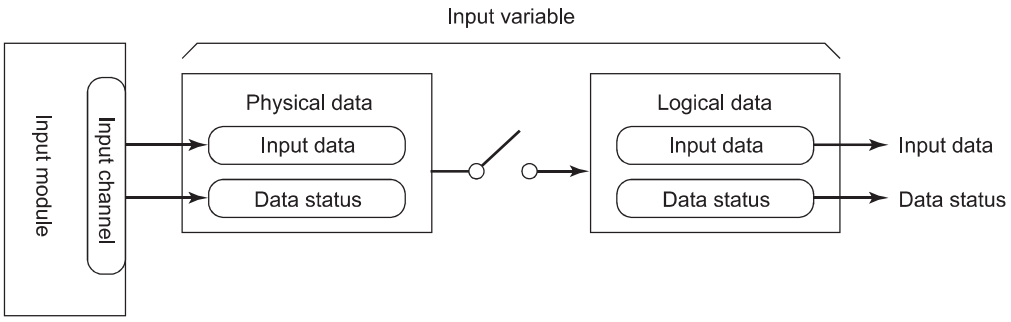

Figure F8.1-2 Locking input variables

If an input variable is locked, its logical data will no longer be overwritten with the value of the physical data. The value of the logical data matches the value of the physical data at the time of locking for both the input data and data status. The locked variable values can be changed after the lock operation.

Unlocking input variables

When the lock status of an input variable is canceled, the logical data will be overwritten with the value of the physical data again. Since input data values used by the application logic may change abruptly or the data status may change, caution is required not to adversely influence the operation of the application. For this reason, before canceling a lock, make sure to check that input data and data status match for physical data and logical data; if they are different, make sure that there will be no adverse effect on the application when unlocking.

Operations at input channel errors

While an input variable is locked, the data status of the input channel is disconnected. For this reason, even if an error occurs in the channel, the error cannot be detected by observing the data status of the input variable. Note that a diagnostic information message is notified at failure of the channel as well as its recovery from an error, regardless of whether or not the input channel is locked.

Notification of operation result via diagnostic information messages

If an input variable is locked or unlocked, the operation performed and the results of the operation are notified as a diagnostic information message.

Locking output variables

If an output variable is locked, the value of the output variable will no longer be overwritten with the value set by the application logic. The output channel and application logic are disconnected.

For output variables, the data status flows in the opposite direction of the output data.

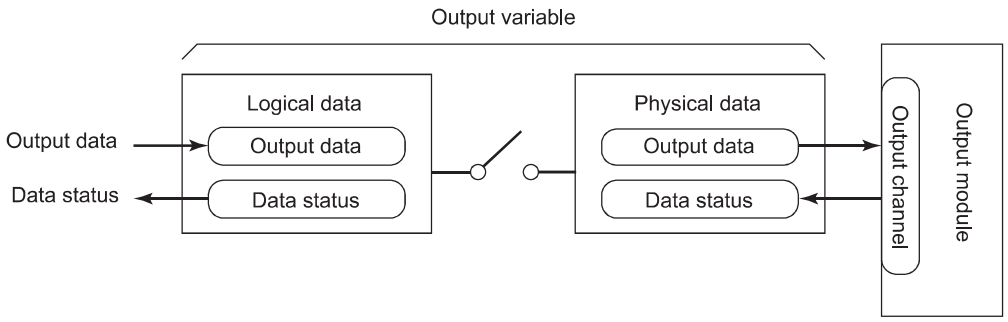

Figure F8.1-3 Locking output variables

If an output variable is locked, its values are fixed as follows.

- As for the output data, its physical data will no longer be overwritten with the value of the logical data. The value of the physical data matches the value of the logical data at the time of locking.
- As for the data status, the logical data status will no longer be overwritten with the value of the physical data status. The value of the logical data status matches the value of the physical data status at the time of locking.

Unlocking output variables

When the lock status of an output variable is canceled, the physical data will be overwritten with the value of the logical data again for the output data, and the logical data status will be overwritten with the value of the physical data status again. When the lock status is canceled, the output data values overwritten with the application logic may change or the data status used in the application logic may change. Thus, caution is required not to adversely influence the output to the field and the operation of the application. For this reason, before releasing a lock, make sure that the output data and data status of the physical data and logical data are consistent; if they are not, make sure that there will be no inadvertent affect to the applications when releasing the lock.

Operations at output channel errors

While an output variable is locked, the data status of the output channel is disconnected. For this reason, even if an error occurs in the channel, the error cannot be detected by observing the data status of the output variable. Note that a diagnostic information message is notified at the time of failure of the channel as well as its recovery from an error, regardless of whether or not the output channel is locked.

Notification of operation result via diagnostic information messages

If an output variable is locked or unlocked, the operation performed and the results of the operation are notified as a diagnostic information message.

Locking internal variables

If an internal variable is locked, it will no longer be overwritten by an input value or an application. If an array used in a ST (Structured Text) statement is locked, all the elements of the array will be locked.

In the case of SCSP2/SCSP3/SCSL2, an internal variable can be locked only when [Yes] is set for Extend Scan Period Automatically and [Enable] is set for Locking of Internal Variables in SCS Constants Builder. Note that if any internal variable is locked, the processing time of the application logic becomes longer.

In the case of internal variables, the value on the input side is called physical data and the value on the output side is called logical data.

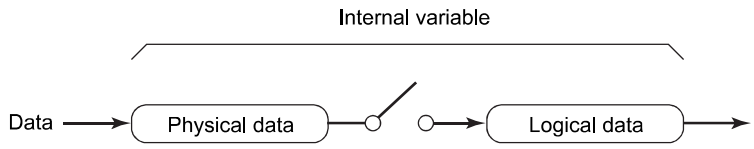

Figure F8.1-4 Locking internal variables

If an internal variable is locked, its logical data will no longer be overwritten with the value of the physical data. The value obtained by reading the internal variable is fixed with the value of logical data. The value of the logical data matches the value of the physical data when locked.

Unlocking internal variables

When the lock status of an internal variable is canceled, the logical data will be overwritten with the value of the physical data again. For an array, all the elements of the array will be unlocked. Since the data value overwritten with the application logic may change, caution is required not to adversely influence the operation of the application. For this reason, before canceling a lock, make sure to check that the data match for physical data and logical data; if they are different, make sure that there will be no adverse effect on the application when unlocking.

Notification of operation result via diagnostic information messages

If an internal variable is locked or unlocked, the operation performed and the results of the operation are notified as a diagnostic information message.

Operations of system function blocks during locking

System function blocks are divided into two types: those to which the actual status is notified regardless of the lock status of a variable, and those to which no module and channel errors are notified while a variable is locked.

- Function blocks to which the actual status is notified regardless of the lock status
  SYS_IOMDSP, SYS_DIAG, SYS_ALRDSP, SYS_OUTEN, SYS_ESBINF, SYS_NODEINF, SYS_N_OUTEN, SYS_N_IOMDSP, SYS_N_NODEINF, SYS_PSUDSP, SYS_CH_OUTEN
- Function blocks to which no module and channel errors are notified during locking

F8.2 Variable value setting

It is possible to set values for I/O variables and internal variables while they are locked. For a locked array, user can set values to the variables for each array element one by one. Values of variables can be set in the I/O Lock window, Multi-Language Editor and Dictionary View.

If a value is set for a variable while it is locked, the value is fixed to the set value. If you try to change the value of a variable while it is not locked, an error occurs and the value cannot be changed. However, the internal variables and the values for the parameters of the function block can be set without setting a lock only when the security level of SCS is Level 0.

This section describes operations performed when a value is set for each type of variable, namely, the input variable, output variable and internal variable.

Setting values for input variables

In the case of input variables, the variable setting function sets the values of both input data and data status to the corresponding values of the logical data.

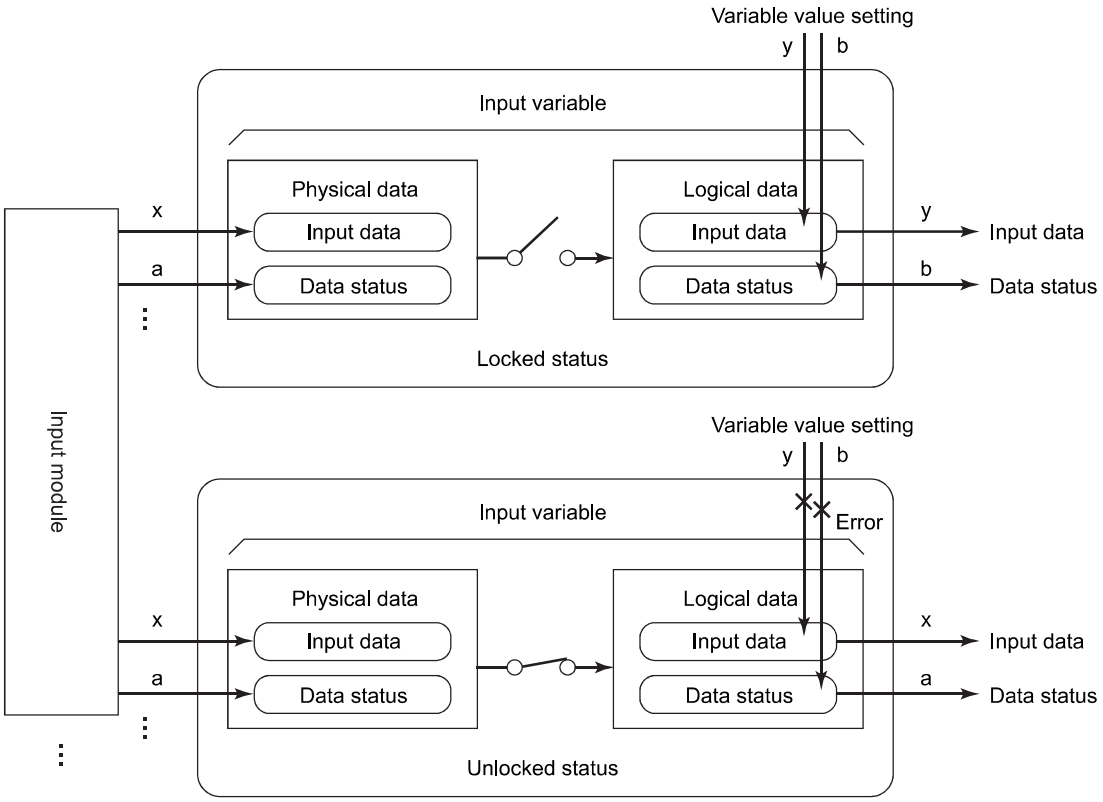

Figure F8.2-1 Setting values for input variables

- If a variable is locked
  The physical data is always updated with the value actually input from the input channel. The value of the logical data, on the other hand, is fixed to the set value because the physical data and the logical data are disconnected. In the application logic, the value fixed for the logical data is used, rather than the actual input value.
- If a variable is not locked
  When changing the data status or data value, an error will occur and the value cannot be changed.

Setting values for output variables

In the case of output variables, the variable setting function sets the value of the output data to the value of the physical data and the value of the data status to the logical data status.

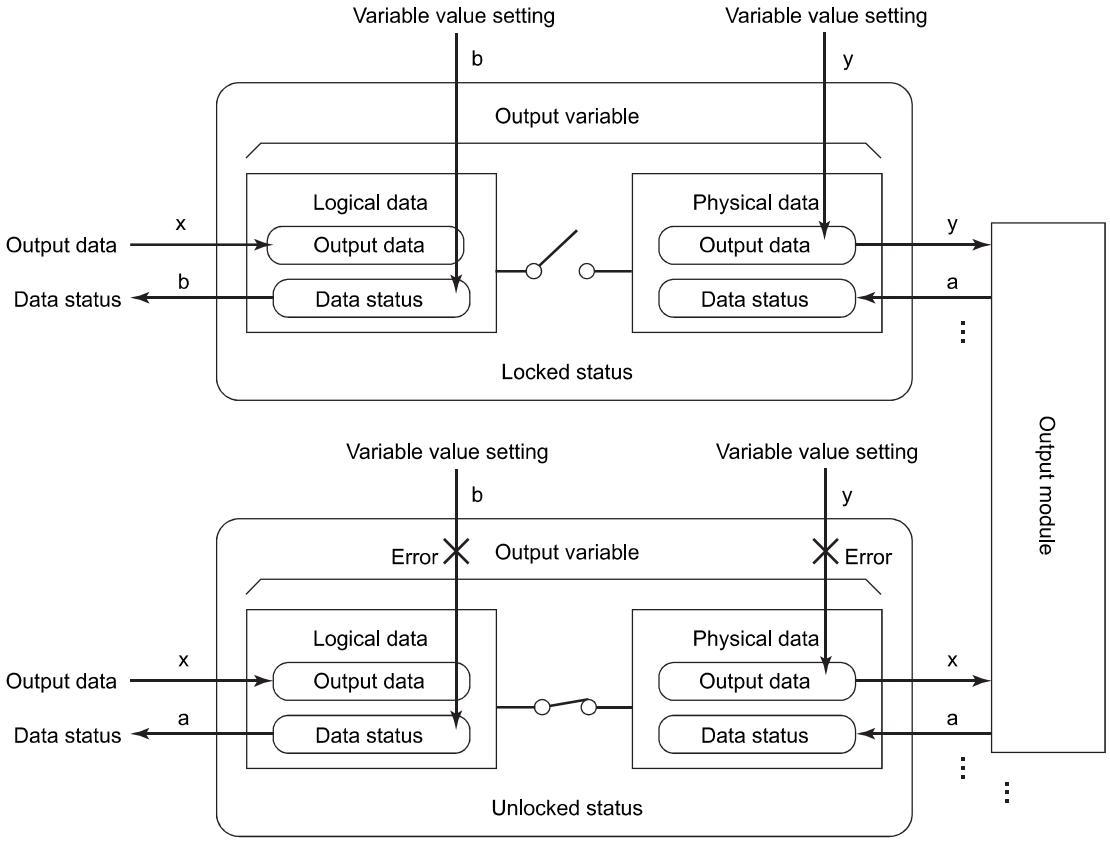

Figure F8.2-2 Setting values for output variables

- If a variable is locked
  The logical output data is always updated with the value calculated by the application logic. The value of the physical data, on the other hand, is fixed to the set value because the physical data and the logical data are disconnected. The value fixed for the physical data is actually output to the output channel. Note that only values in a range of -17.19 to 118.75 (%) can be set for the output variables that are connected to AO channels. Any attempt to set a value outside this range results in an error.

  The physical data status is always updated with the value actually input from the output channel. The value of logical data status, on the other hand, is fixed to the set value because the physical data and the logical data are disconnected. In the application logic, the value fixed for the logical data is used, rather than the actual input value.

- If a variable is not locked
  When changing the data status or data value, an error will occur and the value cannot be changed.

Value setting operation upon output channel error

In the case of an output channel error, the SCS locks the physical output data to the fail-safe value and the output is placed in the Output Disable status. Therefore, even if you lock the output variable corresponding to the error channel and set a desired physical data value using the variable setting function, the set value will be automatically overwritten by the fail-safe value.
Once the output channel returns to normal, you can set a desired physical data value.

If the I/O Parameter for specifying the output value at fault is set as follows, you can lock the output variable corresponding to the output channel error and set a desired value for the physical data:

- DO module: Output Value in Detecting Error or Output Processing at Fault is set to [Hold].
- AO module: Output Processing at Fault is set to [Hold].

SEE ALSO For more information about I/O Parameter related to the output value at fault, refer to:

"● Output value at fault" in "■ Overview of system operations at occurrence of fatal errors and major errors" in G2., "Operations and recovery procedures during the SCS error occurrence" in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

Setting values for internal variables

In the case of internal variables, the variable setting function sets a value for logical data.

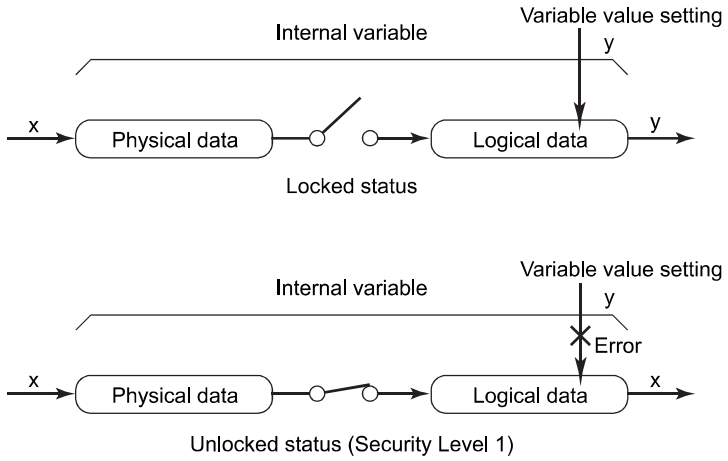

Figure F8.2-3 Setting values for internal variables

- If a variable is locked
  The physical data is always updated with the value written from application logic. The logical data, on the other hand, is fixed to the set value because the physical data and the logical data are disconnected. The value set for the logical data can be obtained by reading the value of the variable.
- If a variable is not locked
  When the SCS security level is Level 1, an attempt to set a value will result in an error, the value cannot be changed. While, if the SCS security level is Level 0, setting a value will not trigger any error. However, since the values of the internal variables in the logic are constantly overwritten by newer values, lock the variables before setting values.

Notification of operation result via diagnostic information messages

If a variable value is set, the operation performed and the results of the operation are notified as a diagnostic information message.

F8.3 Forcing function block parameters

The function block parameters can be forced for debugging the applications. The ranges can be forced in the user-defined function block is different from the other function blocks (hereinafter referred to as standard function blocks). Moreover, the range for the user-defined function blocks varies depending on whether the instance name is assigned or not.

Forcing user-defined function block parameters

For a user-defined function block, if the SCS security level is below Level 1 and the instance parameters are locked, the data values can be changed.

- On Multi-Language Editor, when a user-defined function block is selected and opened from a program POU, the function block window can be displayed. On the window, any selected parameter can be locked and the data value can be changed.
- The locks applied to the parameters, same as the I/O variables and the internal variables, cannot be released from the Multi-language Editor. However, the locks can be released from Dictionary View.
- In the program POU, if an instance in the user-defined function block is not assigned with an instance name, the parameter of the instance cannot be locked and the data value cannot be changed either.

However, if the SCS security level is Level 0, the data value can be changed anyway regardless if the parameter is locked or not.

Forcing standard function block parameters

When the SCS security level is Level 0, the function block parameters can be changed if the parameter is not locked.

- Only the parameter values of the standard function blocks that the instances are assigned with instance names can be changed.
- The parameter values of the standard function blocks can be changed from Dictionary View, but cannot be changed from Multi-Language Editor.

Moreover, when the SCS security level is Level 1, the parameter values of the standard function block cannot be changed. And the standard function block parameters cannot be locked regardless security levels.

Forcing scope and function block type

The following table shows what parameters of different type of function blocks can be forced.

Table F8.3-1 Forcing scope and function block type

Type	FB with Instance Name				FB without Instance Name			
	Target/SCS simulator		Logic simulator		Target/SCS simulator		Logic simulator	
	MLE (*1)	DIC (*2), iDefine (*3)	MLE (*1)	DIC (*2), iDefine (*3)	MLE (*1)	DIC (*2), iDefine (*3)	MLE (*1)	DIC (*2), iDefine (*3)
Basic data type Parameters of User-Defined FB	(*4)	(*5)	(*4)	(*5)	(*6)	(*7)	(*8)	(*7)
User-Defined Parameters of User-Defined FB in another user-defined FB (Local Parameters with Defined Names)	(*4)	(*5)	(*4)	(*5)	(*6)	(*7)	(*8)	(*7)

Continues on the next page

Table F8.3-1 Forcing scope and function block type (Table continued)

Type	FB with Instance Name				FB without Instance Name			
	Target/SCS simulator		Logic simulator		Target/SCS simulator		Logic simulator	
	MLE (*1)	DIC (*2), iDefine (*3)	MLE (*1)	DIC (*2), iDefine (*3)	MLE (*1)	DIC (*2), iDefine (*3)	MLE (*1)	DIC (*2), iDefine (*3)
User-Defined Parameters of User-Defined FB in another user-defined FB (Local Parameters without Defined Names)	(*6)	(*7)	(*8)	(*7)	(*6)	(*7)	(*8)	(*7)
User-Defined Parameters of Standard FB in another user-defined FB (Parameters with Defined Names)	(*7)	(*6)	(*7)	(*8)	(*7)	(*7)	(*7)	(*7)
User-Defined Parameters of Standard FB in another user-defined FB (Parameters without Defined Names)	(*7)	(*7)	(*7)	(*7)	(*7)	(*7)	(*7)	(*7)
Parameters of Standard FB	(*7)	(*6)	(*7)	(*8)	(*7)	(*7)	(*7)	(*7)

*1: MLE: Multi-Language Editor
*2: DIC: Dictionary View
*3: The SCS security level must be set to 0.
*4: Allowed to lock and set data but not unlock.
*5: Allowed to lock, unlock and set data
*6: Allowed to set data only when SCS Security level is Level 0.
*7: Not allowed to lock, unlock and set data.
*8: Allowed to set data only.

TIP

When using a forcing function for a parameter without name or an instance without instance name, the variable name column of the diagnostic information message will indicate its internal name assigned in the SCS Manager.

F8.4 Forcing of SCS link transmission data

Forcing of SCS link transmission data can be performed from the SCS Link Transmission Lock window of the SENG. The forcing function does not distinguish the SCS link transmission safety communication and SCS global switch communication.

Forcing of SCS link transmission data can be performed when the SCS security level is 1 or lower.

TIP

Forcing of SCS link transmission data can be performed only from the SCS Link Transmission Lock window. Forcing (lock operation, viewing lock status, setting values) cannot be performed by selecting link transmission-related function blocks in Dictionary View.

Function configuration of SCS link transmission data locking/unlocking

The relationship between data configuration, lock/unlock operation, and output enable operation regarding SCS link transmission data within an SCS is shown below.

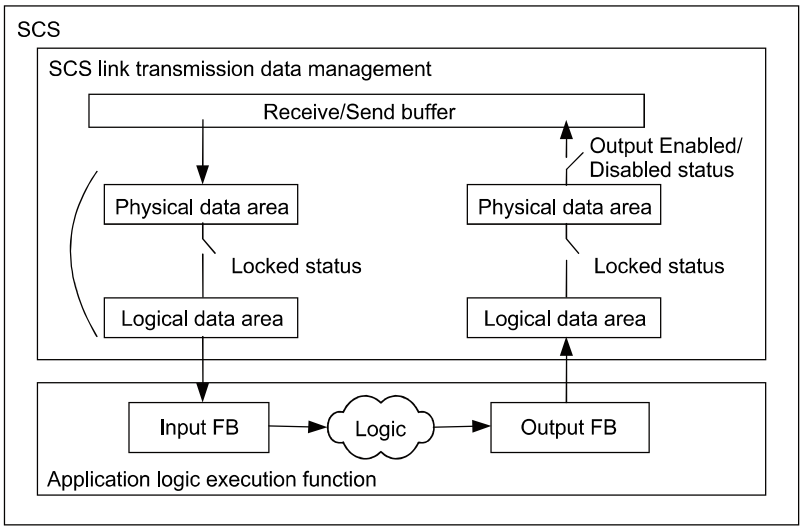

Figure F8.4-1 SCS link transmission data locking/unlocking

- SCS link transmission data has logical data and physical data, like I/O variables. These data can be referenced from the SCS Link Transmission Lock window.
- If the SCS link transmission is locked, logical data of the receive data and physical data of the send data can be set to any value from the SCS Link Transmission Lock window.

Locking SCS link transmission data

- It is possible to lock link transmission data of each station individually.
- When the local station is selected and locked, the send data will be locked. None of the output FB data values will be set to the physical data. The SCS sends the current value of physical data to other stations.
- If a receiving station is selected and locked, data from the applicable station (data value and data status) will be set only to the physical data but not to the logical data.

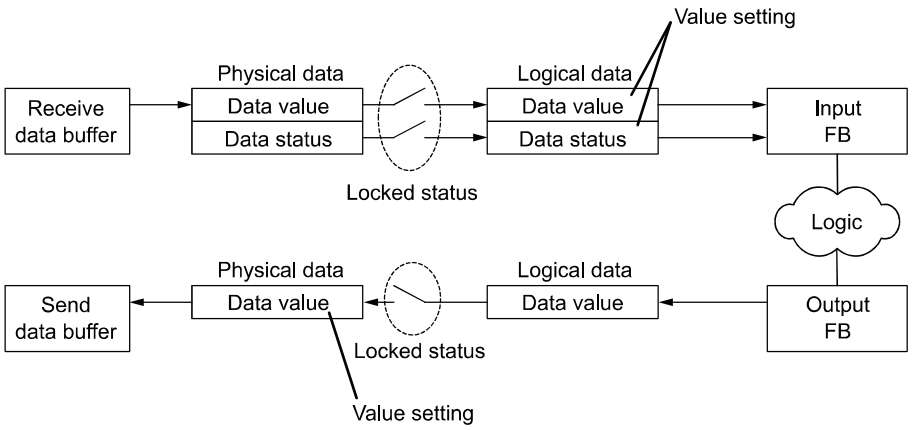

Figure F8.4-2 Forcing of SCS link transmission data

SCS link transmission data value setting

- Setting the value of locked data can be performed for each data item.
- Value setting is possible only for data whose wiring to the SCS link transmission function block is defined.
- A data status can be set for the receive data. However, this will be common for all data of the receiving station. The status cannot be changed for individual data item setting.

TIP

In the Output Disable status, data will not be sent even when the send data is locked and the data value is set. If the output enable operation is performed in the locked status, the set data will be sent.

Management of SCS link transmission lock status

- The SCS link transmission function manages not the number of locked data items, but the number of stations set by the local SCS as targets of link transmission lock.
- When the receive data from a target station is locked, it will be counted in the number of locked stations regardless of whether it is SCS or FCS.
- If the link transmission receive definition of a data from locked receiving station is changed from [Yes] to [No] in SCS Link Transmission Builder and downloaded to the SCS, the number of locked stations is decremented.
- The number of SCS link transmission lock target stations is displayed in the SCS operation status display of SCS maintenance support tool and HIS. It can also be referenced with application logic using a system function block.

System function block that manages locked status of SCS link transmission

- Using the system function block (SYS_FORCE_LT) in an application logic allows you to unlock all SCS link transmission data as well as to monitor elapsed time of locked status.
- The locked status of SCS link transmission data is managed separately from locked input/output modules or variables. Locking the SCS link transmission data does not affect the SYS_FORCE or SYS_FORCE_SC system function blocks.

Locked status notification by diagnostic information messages

The SCS link transmission function sends a diagnostic information message with lock/unlock operation. Checking the diagnostic information message allows you to see which station's data has been locked/unlocked.

Using forcing during SCS maintenance

When the SCS link transmission send data is affected by online change of the application, lock the local station before performing the online change download operation. This can prevent generation of false trips at the receiving side station. When the online change download is complete, confirm that the data to be sent is valid in the SCS Link Transmission Lock window, and then unlock the station.

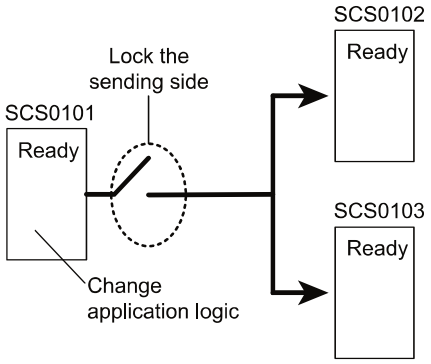

Figure F8.4-3 Locking SCS link transmission during online change

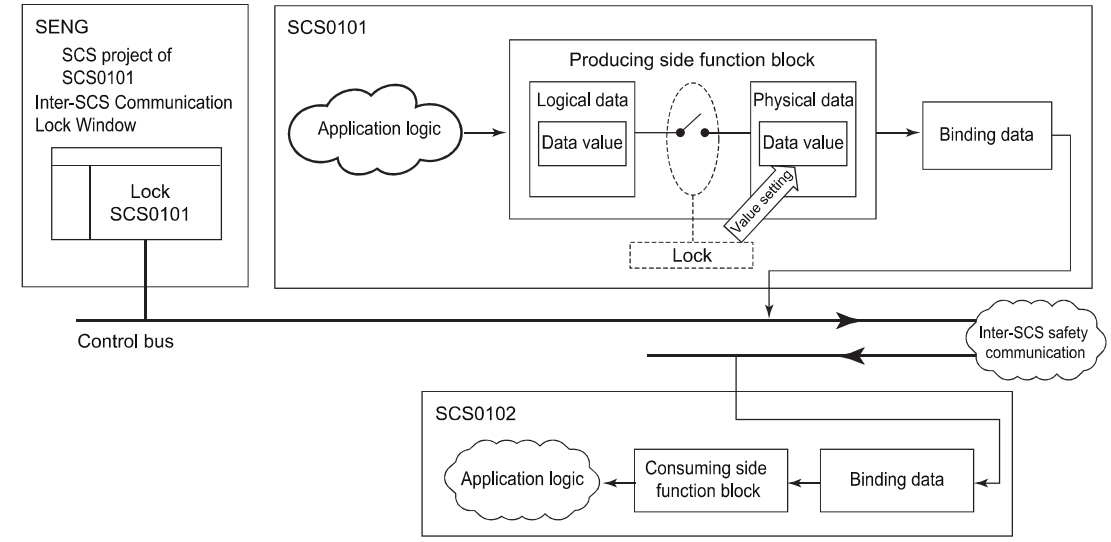
F8.5 Forcing of Inter-SCS safety communication

It is possible to force inter-SCS safety communication data from the Inter-SCS Communication Lock window of SENG. Inter-SCS safety communication data can be forced when the SCS security level is 1 or 0.

IMPORTANT



Forcing of inter-SCS safety communication data can be performed only from the Inter-SCS Communication Lock Window. Do not perform forcing operations (lock operation, referencing lock status, value setting) on function blocks related to inter-SCS safety communication from the Dictionary View. Performing lock operation from the Dictionary View causes a communication error.

Overview of forcing of Inter-SCS safety communication data

- Forcing of inter-SCS safety communication data can be performed only from the Inter-SCS Communication Lock Window.
- It is possible to force outputs from function blocks on the producing side and the consuming side of inter-SCS safety communication.
- By locking the local SCS, all the data to be sent by the local SCS is locked at the same time. It is not possible to lock specific receiving stations selectively.
- Data received by consumer inter-SCS safety communication function blocks of the local SCS can be locked collectively for the selected producing SCSs.
- Values can be set only for inter-SCS safety communication function blocks of locked stations. Data values can be set for the producer function blocks. For the consumer function blocks, data values and status can be set. Value settings can be performed for individual inter-SCS safety communication function blocks. In SCS simulation tests, it is possible to set values for multiple function blocks at the same time.

The overview of forcing of inter-SCS safety communication is shown below.

Example: Function blocks on the producing side

Example: Function blocks on the consuming side

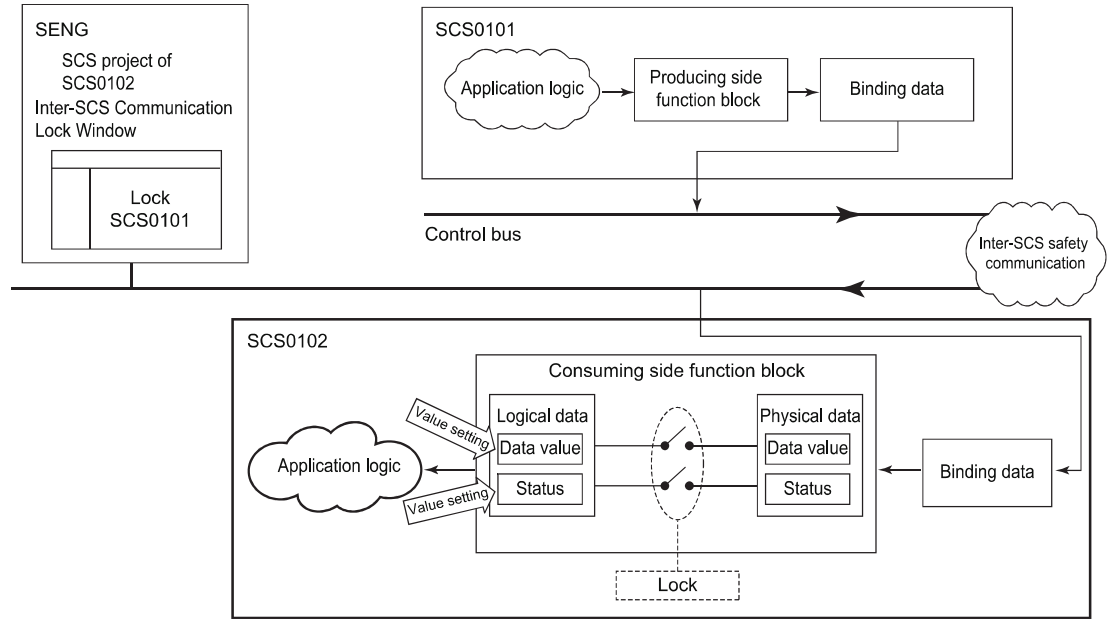


Figure F8.5-1 Overview of forcing of Inter-SCS safety communication

Locking and value setting on function blocks on the producing side

Select and lock the local SCS in the Inter-SCS Communication Lock Window to lock all function blocks on the producing side of the local SCS.

Locking function blocks on the producing side

If a function block on the producing side is locked, the value of the IN parameter is not written to PD (Physical Data), but written only to LD (Logical Data). The OUT parameter outputs the PD value. Thus, the value before locking is output to the binding variable while the function block is locked.

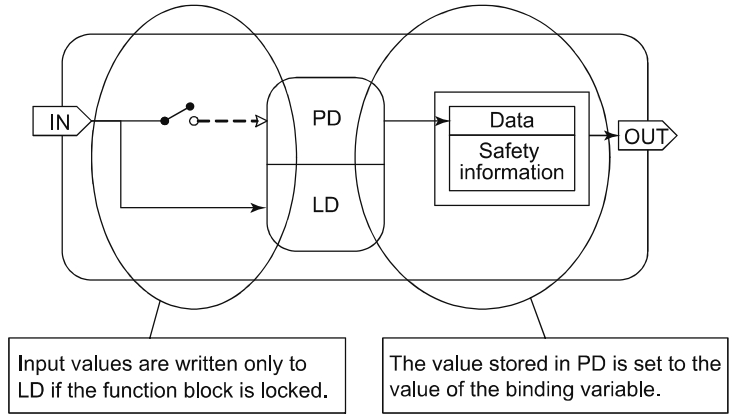

Figure F8.5-2 Locking function blocks on the producing side

● Value setting on function blocks on the producing side

If a value is written to a locked function block on the producing side from the Inter-SCS Communication Lock Window, the value of PD (Physical Data) of the function block on the producing side is overwritten with the specified value and output from the OUT parameter, which is then written to the binding variable. It is not possible to overwrite the data for guaranteeing the communication quality ("Safety information" in "Figure Locking Function Blocks on the Producing side") via value setting.

When the value setting succeeds, the diagnostic information message (No. 4185) is output, and you can check the values before and after the change.

■ Locking and value setting on function block on the consuming side

If you select and lock the SCS sending to the local SCS from the Inter-SCS Communication Lock Window, the consumer function blocks in the local SCS that correspond to the locked SCS are locked.

● Locking function blocks on the consuming side

If a function block on the consuming side is locked, the value of the IN parameter connected to the binding variable is not written to LD (Logical Data), but written to PD (Physical Data). The OUT and NR parameters output the LD value. Thus, the value before locking is output from the OUT and NR parameters while the function block is locked.

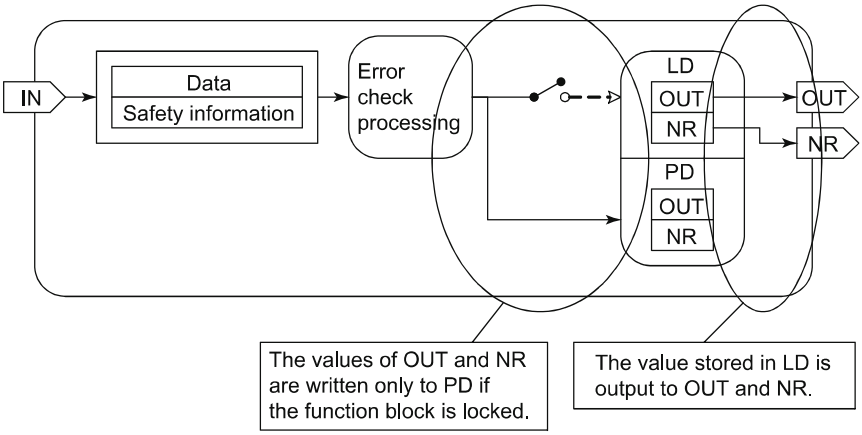

Figure F8.5-3 Locking function blocks on the consuming side

If a function block on the consuming side is locked, only the status of LD (Logical Data) is passed to the application logic that is connected to the function block on the consuming side. For this reason, if an error occurs on the communication path while the function block is locked, it is not possible to detect the error with the application logic. Note that errors on the

communication path detected by the function block on the consuming side are notified via diagnostic information messages even while the function block is locked. The error status is output correctly from CMER of the SYS_DIAG function block.

Value setting on function blocks on the consuming side

If a value is written to a locked function block on the consuming side from the Inter-SCS Communication Lock Window, the value of LD (Logical Data) of the function block on the consuming side is overwritten with the specified value and output from the OUT and NR parameters.

When the value setting succeeds, the diagnostic information message (No. 4185) is output, and you can check the values before and after the change.

F8.6 Forcing function for subsystem communication data

This section describes the Forcing function for subsystem communication data.

Overview

- You can use the Forcing function for subsystem communication data from the Communication I/O Lock Window. You cannot use the Forcing function from the Dictionary View and Multi Language Editor.
- You can use the Forcing function when the SCS security level is 1 or less.
- Communication with subsystems will continue even after subsystem communication data is locked.
- It is not possible to lock a given set of communication data. All data of a module or all input data or output data of a module will be locked simultaneously.
- Data status values are changed for each communication definition. Data values are changed for each communication data item.
- Forcing functions for subsystem communication data and the I/O variables are built upon different structures.
- Communication data of the SLSEVENT data type can be defined for communication modules that are used in connection with the ProSafe-SLS communication function, but such communication data constitute special data that is used for acquiring events and are not wired to the subsystem communication function blocks. Accordingly, communication data of the SLSEVENT data type are not displayed in the Communication Data List View and thus are not applicable to be locked or allowed their values to be set.
- If the communication module (model: ALR121) that is used for communication with ProSafe-SLS is locked, events are the only information that remains unlocked. All of the data, except for events, are locked.

Data flow under the forcing function

- Communication I/O data include logical data and physical data, just like I/O variables. Both logical data and physical data can be referenced from an SENG.
- When subsystem communication data is locked, the communication I/O data management function cuts off the flow of logical data and physical data. If communication input data is locked, inputs from subsystems will not reach the application logic. If communication output data is locked, outputs from the application logic will not reach subsystems.
- Values set in the communication input data through the Forcing function are input to the application logic, and values set to communication output data through the Forcing function are output to the subsystem.

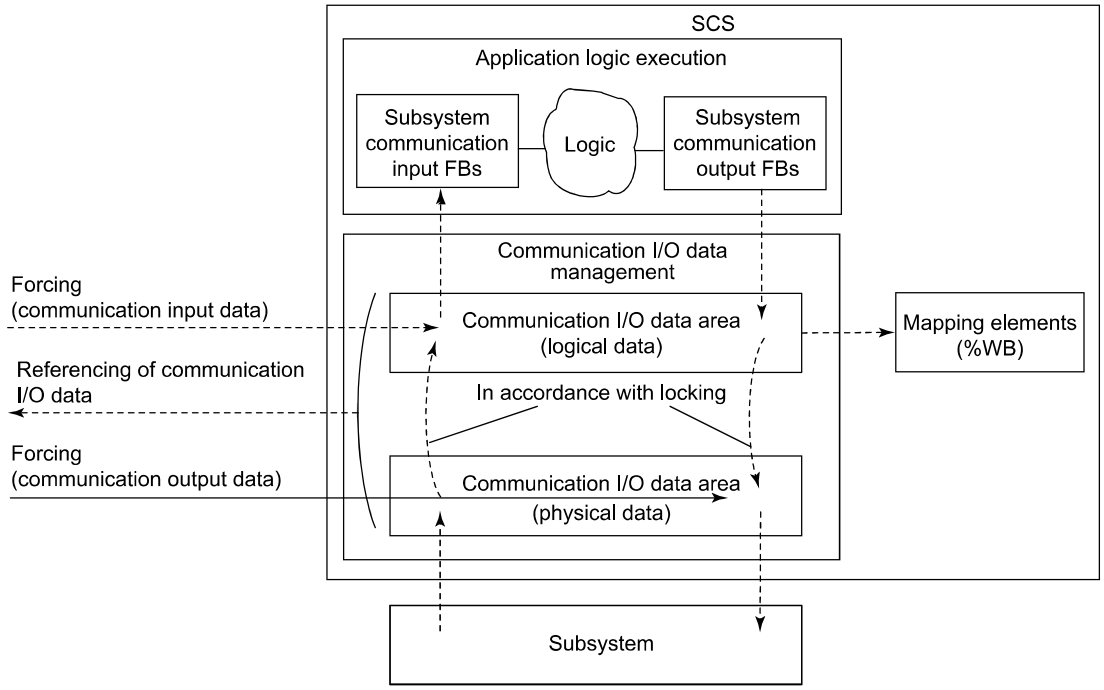

Figure F8.6-1 Communication I/O data management and forcing function

Locking subsystem communication data

Subsystem communication data can be locked or unlocked based on the following units: All subsystem communication data in each scope will be locked or unlocked.

Table F8.6-1 Subsystem communication data locking unit and range

Locking unit	Scope
All subsystem communication module inputs/outputs	All I/O data of a specified module
All subsystem communication module inputs	All input data of a specified module
All subsystem communication module outputs	All output data of a specified module

- Lock operation is performed in the Communication I/O Lock window.
- When the subsystem communication module is locked, refreshing of inputs to the application logic and outputs from the application logic will stop and the previous values will be retained.
- Locking and unlocking will both generate a diagnostic information message.
- All outputs of a module can be locked, even for a subsystem communication module for which no output communications have been defined. As long as subsystem communication outputs are locked before an online change download, output data will be locked even when output communication definitions are added, via the online change, to the module with no output communication definitions. The same applies to inputs.

SCS operations while subsystem communication data is locked

The following table shows how the SCS operates when subsystem communication data is locked.

Table F8.6-2 SCS operations while subsystem communication data is locked

What is locked	Subsystem communication I/O FBs	Subsystem communication
Subsystem communication inputs	The values immediately before locking are retained for data values and data statuses.	Communication is not affected.
Subsystem communication outputs	The values immediately before locking are retained for data statuses.	The values immediately before locking are used as the output values to subsystems.

Setting subsystem communication data values

- Set data values and status after subsystem communication data is locked. If subsystem communication data is not locked when data values and status are set, an error will occur.
- A data value can be set for each communication data item.
- A data status can be set for each communication definition. Changing a data status will affect all communication data in the same communication definition, so check the potential impact thoroughly before changing a data status.
- When a value is set, a diagnostic information message will be notified.

TIP

Communication data corresponds to the wired subsystem communication I/O FBs. Just like I/O variables, subsystem communication I/O FBs consist of data values and statuses. Unlike I/O variables, however, data statuses of subsystem communication I/O FBs indicate the statuses of communication with subsystems. "Communication definition" is a unit of communication between the subsystem communication module and a subsystem. A "communication definition" is a block of data of the same data type specified by the "Size," among the data included in the "Buffer" assigned to each communication module specified by the "Program Name" in the Communication I/O Builder.

Table F8.6-3 Setting subsystem communication data values

Setting target	Subsystem communication I/O FBs	Subsystem communication
Subsystem communication inputs	The values set in the Communication I/O Lock window are reflected in data values and statuses.	Communication is not affected.
Subsystem communication outputs	The data statuses set in the Communication I/O Lock window are output from subsystem communication output FBs.	The data values set in the Communication I/O Lock window are used as the output value to subsystems.

Management of subsystem communication data lock status

- By using the SYS_FORCE_SC function block, the lock status of subsystem communication data can be handled in the application logic.
- The SYS_FORCE_SC function block detects a lock timeout of subsystem communication data and forcibly unlocks subsystem communication data.
- Locking of subsystem communication data does not affect the lock management of I/O variables and internal variables. It does not affect the SYS_FORCE function block.
- Only whether or not subsystem communication data is locked is detected. The number of locks is not counted.

F8.7 Forcing function for safety subsystem communication data

Overview

You can force safety subsystem communication data in units of signals (individual integers, floating-point data).

You can use the Forcing function when the SCS security level is 1 or less.

Data flow under the forcing function

- Safety communication I/O data include logical data and physical data, just like I/O variables. Both logical data and physical data can be referenced from an SENG.
- When safety subsystem communication data is locked, the safety communication I/O data management function cuts off the flow of logical data and physical data. If safety communication input data is locked, inputs from subsystems will not reach the application logic.
- Values set in the safety communication input data through the Forcing function are input to the application logic.

Locking safety subsystem communication data

You can lock the data in units of communication definitions (PROFINET modules) or in units of IOM.

The module refers to the parameter name of PROFINET.

- Locking in units of communication definitions
  When locking or unlocking in units of communication definitions, the SCS alerts a system alarm to notify that the corresponding communication definition has been locked or unlocked.
- Locking in units of IOM
  When locking or unlocking in units of IOM, the SCS alerts a system alarm to notify that the corresponding IOM has been locked or unlocked.

Locking unit

You can lock or unlock data in units of S2LP131 or communication definitions. The following table shows the scope of locking or unlocking.

Table F8.7-1 Locking unit and scope of locking

Locking unit	Scope
S2LP131	All data of the specified S2LP131
Communication definition (*1)	All data of the specified communication definition (integer type, floating-point type)

*1: Up to 20 communication definitions can be locked and unlocked at one locking operation. If you try to lock or unlock more than 20 definitions at a time, an error occurs in the Communication I/O Lock Window and the lock or unlock operation is invalidated. Therefore, when there are more than 20 communication definitions to be locked or unlocked, repeat the lock or unlock operation for 20 or less definitions several times.

Behavior of safety subsystem communication I/O while locked

The following table shows the behavior of Safety communication and Non-Safety communication via safety subsystem communication I/O when safety subsystem communication data is locked.

Table F8.7-2 Behavior of safety subsystem communication I/O while locked

Type of communication	Behavior of FB	PROFINET communication with YFGW410	PROFIsafe communication with GS01
Safety communication	The values immediately before locking are retained for data values and data statuses.	Continued.	Continued.
Non-Safety communication	The values immediately before locking are retained for data values and data statuses.	Continued.	Not applicable

Precautions when performing an SCS online download

Lock S2LP131 prior to executing an SCS online download. Not locking can cause the following events to occur and lead to an unnecessary shutdown of the plant.

- The status of the logic data for Safety and Non-Safety data acquired via S2LP131 will be an error.
- When an existing communication definition number is changed, the locked status of the existing communication definition may change and become unlocked.

Locking behavior in relation to a communication definition added with an online download

When adding a communication definition to safety subsystem communication with an SCS online download, the locking status of the communication definition added with the online download will differ depending on the locking status of the S2LP131 to which the communication definition is added.

Table F8.7-3 Relationship between the locking status and a communication definition added with an online download

Locking status of S2LP131	Status of added communication definition	Behavior of FB
All inputs are locked, or all communication definitions are locked	Locked	The FB references the indefinite value of the locked logical data. By adding the FB after forcing the logical data, the forcibly set value is input to the FB.
Other than the above (not all inputs are locked, or some of the communication definitions are locked)	Unlocked	The initial value of the physical data is reflected onto the logical data and the FB references that logical data.

Setting values to safety subsystem communication data

The value for data and the data status can be set. When a value is set to an unlocked S2LP131 or communication definition, an error will occur.

- Alerting of alarm
  When a value is set, the SCS alerts a system alarm message.

  The status of a communication definition is common amongst identical communication definitions. For this reason, in the case of a communication definition that has multiple signals assigned, when the status of one signal is changed, the status of other signals are also changed. A system alarm indicating that a change has been made is alerted when the status is changed.
- Data subject to value setting
  The data value can be set in units of signals with both Safety and Non-Safety data. The subjects of value setting are integer data and floating-point data.

- Setting and reflection of the data status
  A value for the data status can be set for each communication definition with both Safety and Non-Safety data. Changes of the data status are reflected onto every data status having the same communication definition.

SEE ALSO For more information about safety subsystem communication data handling FB, refer to:

11.5, “SYS_FORCE_SF (safety subsystem communication I/O forcing status management)” in POU Reference Manual (IM 32P03B20-01EN)

Behavior of safety subsystem communication I/O after forcing

I/O behavior of safety subsystem communication after forcing differs depending on the type of communication. The following table shows the types of communication and FB behavior, PROFINET communication with YFGW410, and PROFIsafe communication with GS01.

Table F8.7-4 Behavior of safety subsystem communication I/O after forcing

Type of communication	Behavior of FB	PROFINET communication with YFGW410	PROFIsafe communication with GS01
Safety communication	The values set in the Communication I/O Lock window are reflected as data values and various statuses.	Continued.	Does not affect PROFIsafe communication.
Non-Safety communication	The values set in the Communication I/O Lock window are reflected as data values and data statuses.	Continued.	Not applicable

Management of safety subsystem communication data lock status

You can monitor the forcing status of S2LP131 by using the SYS_FORCE_SF function block. In addition, you can monitor the number of locks for safety subsystem communication definitions, detect exceeded locking status monitoring times, and force unlocking.

Locking of safety subsystem communication I/O does not affect the lock management of I/O variables, subsystem communication I/O data, and internal variables. It does not affect the SYS_FORCE function block and SYS_FORCE_SC function block.

F8.8 Windows used for forcing of I/O variables

Operations of forcing the input/output variables are mainly performed on the I/O Lock Window. You can perform the following operations on the I/O Lock Window.

- Locking and unlocking all channels of multiple AIO/DIO modules
  Lock all modules to prevent nuisance tripping caused by online modifications after the completion of input/output wiring, or to perform maintenance of AIO/DIO modules including replacement .
- Locking and unlocking one input/output channel
  Perform this operation to conduct wiring tests.
- Setting variable values

In addition to the I/O Lock Window, you can also perform forcing operations for the indicated variables and parameters from the following windows:

- Dictionary View
  - All variables including internal variables
  - Parameters in some of function blocks
- Multi-Language Editor
  - Variables used in FBD, LD and ST (if Spy List window is open)
  - Parameters in the User-Defined function blocks

Furthermore, in debug mode and in logic simulation mode, a Spy List window will be shown at the lower part of SCS Manager and Multi-Language Editor, where the following forcing operation can be performed.

- Forcing the variables used in FBD, LD and ST.

A variable locked in a certain window can be unlocked in another window. Similarly, a variable locked in an SENG can be unlocked in another SENG at a different time. However, if you want to unlock variables in Multi-Language Editor, open the Spy List window. You can unlock a variable only when physical value and logical value of the variable are indicated.

SEE ALSO

For more information about Dictionary View, refer to:

"Dictionary View" in "Workbench" in the Workbench User's Guide

For more information about Multi-Language Editor, refer to:

"Multi-Language Editor" in "Workbench," "Language Editor" in the Workbench User's Guide.

Spy List window

In debug mode and in logic simulation mode, a Spy List window will be shown at the lower part of SCS Manager and Multi-Language Editor. On the Spy List window, locking statuses of variables, values of logical and physical data are displayed. After opening the variable dialog box from the Spy List window, the values of the variables used in FBD, LD and ST can be set.

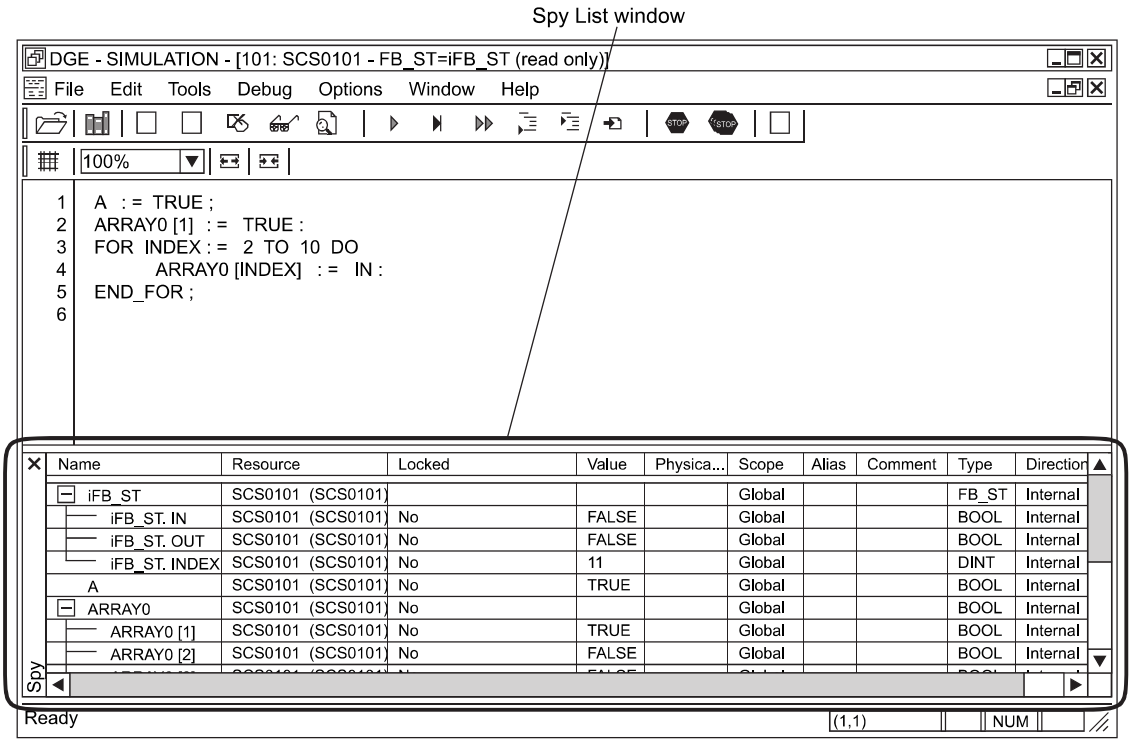

Figure F8.8-1 Spy List window

If you select a function block parameter using Multi-Language Editor, all the parameters for the function block instances that contain the selected parameter will be displayed in the Spy List window. In Multi-Language Editor, when you select a global variable or a local variable, the variable is displayed in the Spy List window. When you are using a global array variable or a local array variable, if one array element is selected (such as ARRAY0[1] in the previous figure), all the elements of the array appear in the Spy List window.

When debugging an ST in Multi-Language Editor, follow these steps to add a variable to the Spy List window.

1. Click [INDEX] in the previous figure.
   All of the parameters for the function block instance that contains that parameter are displayed in the Spy List window.
2. Click the global variable or local variable (such as A in the previous figure).
   The variable is displayed in the Spy List window.

When debugging an FBD/LD in Multi-Language Editor, follow these steps to add a variable to the Spy List window.

1. In the FBD/LD, click the variable.
2. You can run any of the following commands.
   - Right-click and select [Spy Selection] on the displayed menu.
   - On the [Debug] menu, select [Spy Selection].
   - Click the [Spy Selection] tool button.

   The variable is displayed in the Spy List window.

If you want to display only the variables of particular POUs in the Spy List window, you can save the relevant set of variables to a file and display them by reading from that file; thus you can display particular sets of variables by switching between the saved files.

IMPORTANT

It is important that you do not operate the variable of another scope accidentally because multiple variables in different scopes may have the identical name.

The Spy List window may be restarted with previously displayed state. The action is as follows:

- If the debug mode or the logic simulation mode is terminated while the Spy List window is opened, the Spy List window will restart right after the debug mode or the logic simulation mode restarts.
- Under the debug mode or the logic simulation mode, if the Multi-Language Editor is terminated while the Spy List window is opened, the Spy List window will restart after the Multi-Language Editor restarts.
- When starting the Spy List window, it will display the previously displayed variables. When switching SCS projects, the previously displayed variables of that project will be displayed on the Spy List window.

Value setting can be performed in the Value setting dialog box in the same way as in Dictionary View.

SEE ALSO

For more information about Spy List operating procedures, refer to:

"Spying Variables" in "Debug/Simulate" in "Debug" in the Workbench User's Guide

For more information about Dictionary View operations, refer to:

"Write/Lock/Unlock" in "Debug/Simulate" in "Workbench," "Debug" in the Workbench User's Guide

F8.8.1 I/O Lock window

In the I/O Lock Window, you can perform locking and unlocking operations for individual input/output modules and/or input/output channels (input/output variables). Also you can set values to Input/Output variables. The I/O Lock Window allows operation on AIO/DIO modules. In this section, "input/output modules" refers to AIO/DIO modules.

In SCS Simulator of SCS Test Functions, multiple I/O variables can be set all together. Therefore, the initial values of all channels of I/O modules and the testing patterns can be set all together.

How to call up the I/O Lock window

1. Check if the SCS security level is 0 or 1 using the SCS security level operation function.
2. Put the SCS Manager into Debug mode or Editing mode.
   To change to Debug mode, choose [Debug] from [Debug] menu or click [Debug] button on the toolbar.
3. Select [Maintenance] from the [Tools] menu of SCS Manager.
   The Maintenance Launcher menu appears.
4. Select [I/O Lock Window] from the Maintenance Launcher menu.
   The I/O Lock Window appears.

IMPORTANT

- It is not possible to start multiple I/O Lock Windows at the same time, for neither the same SCS project nor different SCS projects.
- The I/O Lock Window cannot be called up while Build or Download is running.
- If you try to execute online change downloading, offline downloading, master offline downloading, or restarting of SCS while the I/O Lock Window is open, an error message is displayed and the downloading or restarting will not be executed.

How to exit the I/O Lock window

To exit the I/O Lock Window, choose [Exit] from [File] menu.

IMPORTANT

- When exiting the I/O Lock Window, if a locked variable exists, a dialog box will be displayed for confirmation. It is necessary to open the I/O Lock Window to unlock the locked variables.
- If the SCS Manager is closed or a different SCS project is opened, the I/O Lock Window will be forcibly closed.

I/O Lock window structure

The I/O Lock Window contains the following components.

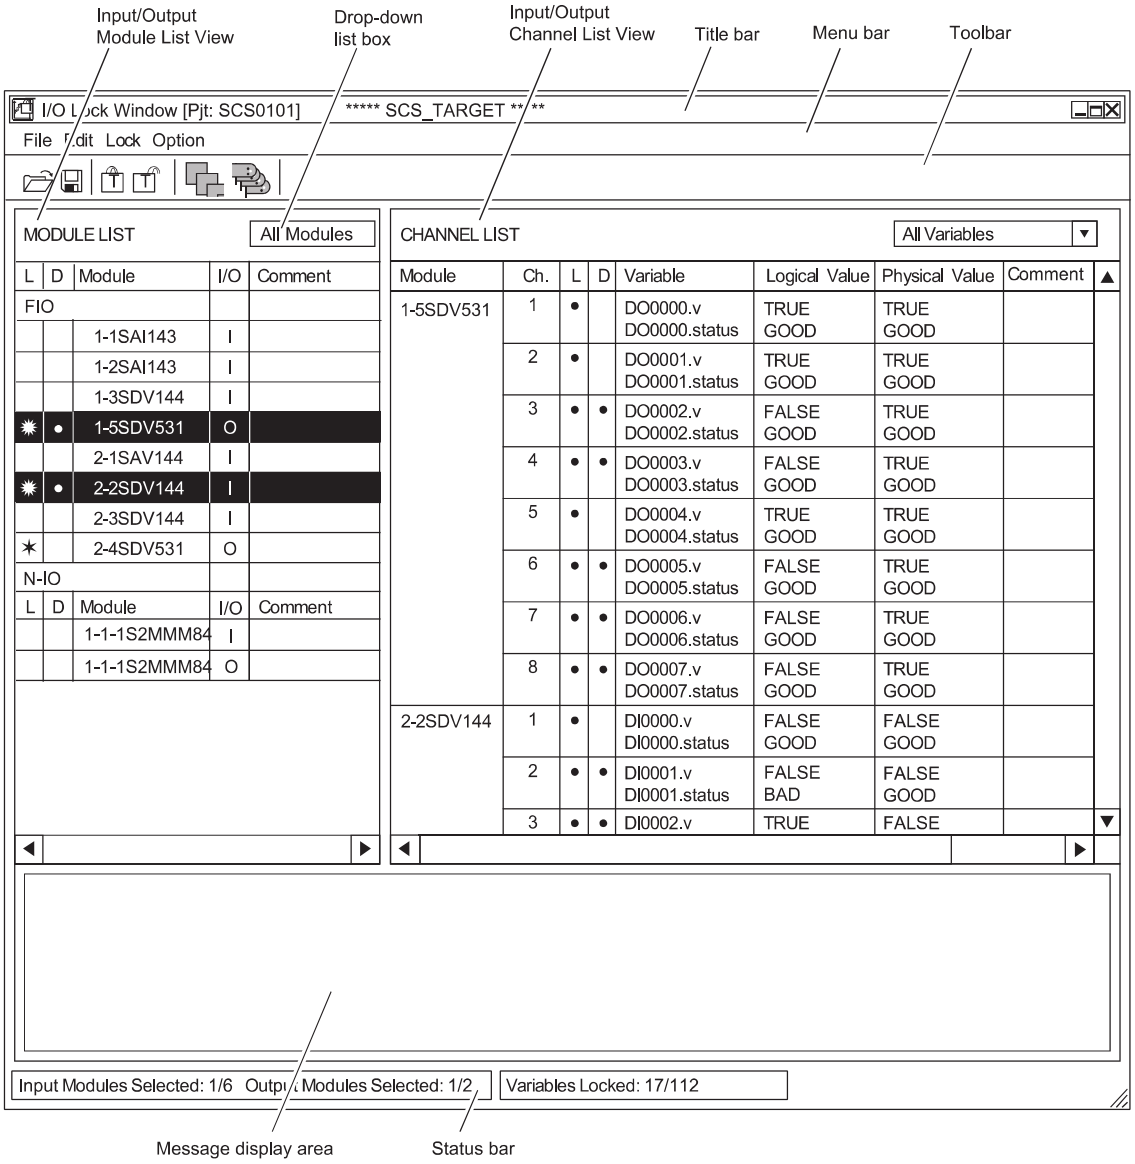

Figure F8.8.1-1 I/O Lock window

The components in the window are explained next.

Title bar

On the title bar, besides window name and project name, the SCS status is also displayed.

- SCS_TARGET: Indicates communication with the SCS.
- SCS_SIMULATOR: Indicates communication with the SCS simulator.
- <Non>: Indicates the SCS is not running.

For logic simulation test, "SIMULATION" will be displayed in the position of SCS status.

Menu bar

The following menus are provided on the menu bar:

- [File] Menu
- [Edit] Menu

- [Lock] Menu
- [Option] Menu

The menu items provided on each menu are explained as follows.

Table F8.8.1-1 File menu

Menu item	Description
Import Values...(*1)	Imports the values of the I/O variables from a file for setting all together.
Export Values...(*1)	Exports the values of the I/O variables to a file for setting all together.
Exit	Exits from the I/O Lock Window.

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Table F8.8.1-2 Edit menu

Menu item	Description
Cut (*1)	Deletes the selected character string and copies it onto the clipboard.
Copy (*1)	Copies the selected character string onto the clipboard.
Paste (*1)	Inserts the character string stored in the clipboard.
Delete (*1)	Deletes the selected character string.
Select All	Selects all displayed modules (same action as pressing the [Ctrl] key and [A] key together).

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Table F8.8.1-3 Lock menu

Menu item	Description
Lock Modules	Locks all modules selected.
Unlock Modules	Unlocks all modules selected.
Set Values (*1)	Sets multiple I/O variables together.

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Table F8.8.1-4 Option menu

Menu item			Description
Numerical Display	REAL	1.234E+12	Exponential notation
		12.34567	Displays 5 decimal places.
		123.4567	Displays 4 decimal places.
		1234.567	Displays 3 decimal places.
		12345.67	Displays 2 decimal places.
		123456.7	Displays 1 decimal places.
Data Acquiring Mode	All Modules		Changes data acquiring mode to "All Modules" mode.
	Selected Modules		Changes data acquiring mode to "Selected Modules" mode.

Toolbar

The following buttons are provided on the toolbar.

Table F8.8.1-5 Toolbar buttons

Button	Description
(*1)	Imports the values of the I/O variables from a file for setting together. (Same action as [Import Values] on the [File] menu.)
(*1)	Exports the values of the I/O variables to a file for setting all together. (Same action as [Export Values] on the [File] menu.)
	Locks all modules selected (same action as [Lock Modules] on the [Lock] menu).
	Unlocks all modules selected (same action as [Unlock Modules] on the [Lock] menu).
(*1)	Sets multiple I/O variables together (same action as [Set Values] on the [Lock] menu).
(All Modules) (Selected Modules)	Same action as the [Data Acquiring Mode] task on [Option] menu. Toggles between [All Modules] mode and [Selected Modules] mode.

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Data acquisition modes

When getting data values and data statuses of channels from SCS, the acquisition mode can be selected.

- ALL Modules Mode
  Sequentially retrieves the data values and data statuses from all channels of the input/output modules defined in the SCS project.
- Selected Modules Mode
  Sequentially retrieves the data values and data statuses of channels from the I/O modules selected on the I/O Module List View.

  The text of "Updating Selected Modules" is displayed on the I/O Module List View and on the I/O Channel List View.

I/O Module List view

This view displays a list of input/output modules that are defined in the currently open SCS project. The following modules, which do not have any input/output channels, are not displayed.

- ESB bus coupler module (SEC402, SEC401, L1EC402, L1EC401)
- Serial communication module (ALR111, ALR121)
- Ethernet communication module (ALE111)
- N-ESB bus coupler module (S2EN402, S2EN404)

If an input/output module is in dual-redundant configuration, only the module allocated to the odd slot is displayed regardless of which module is operating.

The following table lists the items displayed in the I/O Module List View.

Table F8.8.1-6 Items displayed in the I/O Module List view

Item name	Display
L	Shows locking status of an input/output module
D	Shows consistency or inconsistency of the logical data and physical data of channels of an input/output module
Module	The I/O module name ("node number - slot number" for an FIO and "node number - unit number - slot number" for an N-IO) will be added to the beginning.

Continues on the next page

Table F8.8.1-6 Items displayed in the I/O Module List view (Table continued)

Item name	Display
I/O	Signal direction of an I/O module ("I" for input and "O" for output. In the case of a universal-type module, when both the input channel and the output channel can be configured, module names having the same node number, unit number, and slot number is displayed in two rows together with an "I" for input and an "O" for output.)
Comment	Comments entered for an input/output module

Lock status of Input/Output modules

Displays the locking statuses of the channels according to I/O modules.

Table F8.8.1-7 Display of lock status

Display	Meaning
(No symbol)	No channel is locked.
✶ (yellow)	Some channels are locked.
✹ (red)	All channels are locked.
? (black)	Unable to communicate with SCS.

Data consistency or inconsistency of Input/Output module channels

Data of digital inputs/outputs is considered to be inconsistent if the values of the logical data and physical data of the data value or data status are not same.

Data of analog inputs/outputs is considered to be inconsistent if the logical data status and the physical data status are not same.

Table F8.8.1-8 Consistency and inconsistency

Display	Meaning
(No symbol)	All channels are consistent.
● (yellow)	Some channels are inconsistent.
⦿ (red)	All channels are inconsistent.
? (black)	Unable to communicate with SCS.

The action for updating the display of the consistency and inconsistency of the input/output module data varies with data acquisition mode.

- ALL Modules Mode
  Sequentially gets the data values and data statuses of all channels from all the input/output modules defined in the SCS project and update them in the up-down order as their displays.
- Selected Modules Mode
  Sequentially gets the data values and data statuses of channels from the input/output modules selected on I/O Module List View and update them in the up-down order as their displays. The statuses of the unselected modules are indicated with (?) in "D" column.

Filtering

It is possible to filter and display input/output modules using a drop-down list box.

Table F8.8.1-9 Drop-down list box of the I/O Module List view

Menu item	Operation
All Modules	Both input modules and output modules are shown.

Continues on the next page

Table F8.8.1-9 Drop-down list box of the I/O Module List view (Table continued)

Menu item	Operation
Input Modules	Only input modules are shown.
Output Modules	Only output modules are shown.

Pop-up menu

Click the right mouse button on the I/O Module List View to display the pop-up menu.

The menu item in the pop-up menu is shown as follows.

Table F8.8.1-10 Pop-up menu of the I/O Module List view

Menu item	Description
Select All	Selects all displayed modules (same function as pressing the [Ctrl] key and [A] key together).

I/O Channel List view

This view displays information of each channel for input/output modules selected in the I/O Module List View. Channels to which no variable is assigned are not shown in the I/O Channel List View. If multiple channels of S2MMM843 are bundled for a high current output of DO, only the channel with the smallest channel number is displayed.

Table F8.8.1-11 Items displayed in the I/O Channel List view

Item name	Display
Module	Name of an input/output module
Ch.	Channel number (1 to 8, or 1 to 16)
L	Channel lock status
D	Channel data consistency or inconsistency
Variable	Name of an input/output variable that is wired (data value, data status)
Logical Value	Logical data of data value and data status, respectively
Physical Value	Physical data of data value and data status, respectively
Set Value (*1)	Set value of data value and data status, respectively
Comment	Comment entered for the input/output variable

*1: Displayed and editable only when the SCS project target name is SCS_SIMULATOR.

Channel lock status

Displays channel locking status.

Table F8.8.1-12 Display of lock status

Display	Meaning
(No symbol)	The channel is unlocked.
✶ (red)	The channel is locked.
? (black)	Unable to communicate with SCS.

Data consistency or inconsistency of channel

Data of digital inputs/outputs is considered to be inconsistent if the values of the logical data and physical data of the data value or data status are not same.

Data of analog inputs/outputs is considered to be inconsistent if the logical data status and the physical data status are not same.

Table F8.8.1-13 Consistency and inconsistency

Display	Meaning
(No symbol)	Data is consistent.
● (red)	Data is inconsistent.
? (black)	Unable to communicate with SCS.

Logical data and physical data

A BOOL-type data value is displayed as either [TRUE] or [FALSE]. A REAL-type data value is displayed using the display format selected from the [Option] menu.

Data status is displayed as either [GOOD] or [BAD]. If the data status is BAD, the background color is displayed in yellow. [******] is displayed if communication with SCS is disabled.

REAL-type data is displayed along with the engineering unit symbol. The displayed engineering unit symbol depends on the module type and the settings specified in I/O Parameter Builder. At this time, if the unit is %, the value is normalized to 0 to 100%. For other units, the data is the physical quantity.

Updating displays of logical data, physical data and Match/Mismatch of channel data

The action for updating the displays of the matching and mismatching of the channels as well as the logical data and physical data varies with the data acquisition mode.

- ALL Modules Mode
  Sequentially retrieves the data values and data statuses of all channels from all the input/output modules defined in the SCS project. The displays will be updated right after the data acquisition for the channels displayed in the I/O Channel List View is completed.
- Selected Modules Mode
  Sequentially retrieves the data values and data statuses of channels from the input/output modules selected in the I/O Module List View. The displays will be updated right after the data acquisition for the channels displayed in the I/O Channel List View is completed.

Filtering

It is possible to filter the input/output channels to be displayed using a drop-down list box.

Table F8.8.1-14 Drop-down list box of the I/O Channel List view

Item	Operation
All Variables	Information about all channels wired to input/output variables for input/output modules selected in the I/O Module List View is displayed.
Locked Variables	Information about all locked channels wired to input/output variables for input/output modules selected in the I/O Module List View is displayed.
Unlocked Variables	Information about all unlocked channels wired to input/output variables for input/output modules selected in the I/O Module List View is displayed.

Pop-up menu

Only when the SCS project target name is SCS_SIMULATOR, click the right mouse button on the I/O Channel List View to display a pop-up menu.

The items on the pop-up menu are as follows:

Table F8.8.1-15 Items on pop-up menu in the I/O Channel List view

Items	Description
Cut	Same as the [Cut] command on the [Edit] menu.

Continues on the next page

Table F8.8.1-15 Items on pop-up menu in the I/O Channel List view (Table continued)

Items		Description
Copy		Same as the [Copy] command on the [Edit] menu.
Paste		Same as the [Paste] command on the [Edit] menu.
Delete		Same as the [Delete] command on the [Edit] menu.
Select All		Same as the [Select All] command on the [Edit] menu.
Input Values ►	Set .v=TRUE	Sets the data of Set Value to TRUE.
	Set .v=FALSE	Sets the data of Set Value to FALSE.
	Clear .v	Clears the data of Set Value.
	Set .status=GOOD	Sets the data status of Set Value to GOOD.
	Set .status=BAD	Sets the data status of Set Value to BAD.
	Clear .status	Clears the data status of Set Value.

Message display area

The results of locking, unlocking and setting operations are displayed as messages. The last displayed message is cleared at each operation.

Status bar

The status bar shows the following information about the input/output modules displayed in the I/O Module List View.

- Input Modules Selected: Number of selected input modules/Number of all input modules
- Output Modules Selected: Number of selected output modules/Number of all output modules
- Variables Locked: Number of locked input/output variables/Number of all input/output variables

F8.8.2 Locking and unlocking all variables of I/O module

On I/O Lock Window, all I/O variables of an I/O module can be locked and unlocked together. This section explains the operating procedures.

Selection of Input/Output modules

You can select any number of input/output modules in the I/O Module List View.

- Select [All Modules] in the drop-down list box to display all input/output modules.
- Select [Input Modules] in the drop-down list box to display all input modules. Universal-type modules for which an input channel is defined are also displayed.
- Select [Output Modules] in the drop-down list box to display all output modules. Universal-type modules for which an output channel is defined are also displayed.

The following operation displays the information of channels in I/O Channel List View.

- Click an input/output module name, the information regarding the channels of the module at the clicked line is displayed.
- To select an input/output module, click the name of the first module and then click the name of the last module while holding down the [Shift] key on the keyboard. The information regarding the channels of the selected modules is displayed.
- Click an input/output module while pressing the [Ctrl] key, the information regarding the channels of the module at the clicked line is added to the current displays.
- Selecting [Select All] from the pop-up menu in I/O Module List View displays the information of channels for all I/O modules that are displayed in I/O Module List View.

Locking all Input/Output modules

With this operation, you can lock all input/output variables wired to each channel of the selected input/output modules in a batch.
If some of the input/output variables of the selected input/output modules have already been locked, they will be kept locked even if you lock all modules.

The procedure is as follows:

1. Select the input/output modules you want to lock in a batch in the I/O Module List View.
2. Check the differences between the data value and data status of the logical data and physical data of each channel of the selected input/output modules in the I/O Channel List View to confirm that locking will not cause any problem.
3. Select [Lock Modules] on the [Lock] menu. Alternatively, click the [Lock] button on the toolbar.
   The confirmation dialog box appears. Click the [OK] button to perform a lock operation. All selected input/output modules are locked.

   Click the [Cancel] button to cancel the operation.

Unlocking all Input/Output modules

Using this operation, you can unlock all I/O variables wired to each channel of the selected I/O modules in a batch.
If the selected I/O modules contain some unlocked I/O variables, those variables will be kept unlocked even if you unlock all modules.

The procedure is as follows:

1. Select the input/output modules you want to unlock in a batch in the I/O Module List View.

2. Check the differences between the data value and data status of the logical data and physical data of each channel of the selected input/output modules in the I/O Channel List View to confirm that unlocking will not cause any problem.
3. Select [Unlock Modules] on the [Lock] menu. Or click the [Unlock] button on the toolbar.
4. When a confirmation dialog box is displayed, click [OK] so as to unlock all the communication data of the selected station. Clicking [Cancel] will cancel the unlocking.
5. If there are discrepancies between the logical data and physical data of any of the channels of the input/output modules to be unlocked, the dialog box for reconfirmation appears. Click the [OK] button to perform the unlock operation. All selected input/output modules are unlocked.
   Click the [Cancel] button if you want to cancel the operation.

F8.8.3 Set I/O variables of I/O modules

On I/O Lock Window, the I/O variables can be set one by one or can be set all together per I/O module. In SCS Simulator of SCS Test Functions, it is possible to set multiple I/O variables together per I/O module.

This section explains the operating procedures.

Setting each variable value

For each variable, the data value and data status can be set.

IMPORTANT

Setting values to variables cannot be executed while Build or Download is running.

In the I/O Channel List View, double-click anywhere between the channel field and the physical data field on a certain row to open the Write STATUS dialog box for the data value or data status of the I/O variable at the row.

When you open the Variables dialog box, the logical data and physical data default values are displayed. Either logical data or physical data is displayed, depending on whether the input/output variables are locked or unlocked. When displaying data values, the engineering unit symbols are displayed at the end of the data values for REAL variables. At this time, if the unit is %, the value is normalized to 0 to 100%. For other units, the data is the physical quantity.

- For BOOL Data
  When the dialog box is opened, the logical data or the physical data will be displayed with either [TRUE] or [FALSE] button pressed.
- For Data Status
  When the dialog box is opened, the logical data will be displayed with either [GOOD] or [BAD] data status button pressed.

The following table shows whether logical or physical data are displayed for the initial value of the selected I/O variable, data and data status respectively.

Table F8.8.3-1 Initial values on Write STATUS dialog box

Data Value (.v) and Data Status (.status)	Locked	Unlocked
Input Variable Data Value (.v)	Logical	Logical
Input Variable Data Status (.status)	Logical	Logical
Output Variable Data Value (.v)	Physical	Logical
Output Variable Data Status (.status)	Logical	Logical

The above can be set on the Write STATUS dialog box.

SEE ALSO For more information about procedure for setting values using the variables dialog box, refer to:

"Write/Lock/Unlock" in "Debug/Simulate" in "Workbench," "Debug" in the Workbench User's Guide

Set multiple I/O variables together

Using the SCS Simulator, you can set multiple I/O variables together.

The following operations can be performed on the locked I/O variables among the I/O variables wired to the I/O channels of the selected I/O modules.

- Set values to I/O variables.

- Save the set values for the I/O variables in a file.
- Read values from a file and set them to I/O variables.

Note that the number of I/O variables set at a time should be 700 or less. If more variables are set at a time, some of the system alarm messages informing the data setting or data status setting may not be transmitted.

Enter the values to be set to I/O variables

The value of a variable can be entered to the "Set Value" item on I/O Channel List View.

The value can be entered by any of the following operations. After entering the values, you need to set all the values to the I/O variables.

- Enter a Value Directly
  On I/O Channel List View, click Set Value item on the row of the channel that you want to enter the value for. By clicking the data value or data status, they can be entered directly.

  For BOOL type data, each click will move among TRUE, FALSE and a space (non specified) for selections.
- Edit Values for Channels
  From [Edit] menu or from the pop-up menu after a right click, you can use [Cut], [Copy], [Paste] and [Del] commands to edit the "Set Value" items of multiple channels.
- Enter a value by clicking [Input Values] on the pop-up menu
  Right clicking on the I/O Channel List View, a pop-up menu will be displayed. Using [Input Values] on the pop-up menu, the data values and data status for "Set Value" items can be set.

  For example, if you want to set data status of all channels to BAD, you can use [Select All] command on the pop-up menu to select "Set Value" items of all channels, and then you can choose [Set.STS=BAD] of the [Input Values] from the pop-up menu.

Set the values to multiple I/O variables

For the selected I/O modules, the locked I/O variables among the wired I/O variables can be set all together to the values defined in the "Set Value" items on the I/O Channel List View.

IMPORTANT

Setting values to variables cannot be executed while Build or Download is running.

The procedure is as follows:

1. On I/O Module List View, choose a module that you want to set values for.
2. Choose [Set Values] from the [Lock] menu or click [Set Values] button on the toolbar so as to display Set Values dialog box.
3. Click [OK] to set values. The values are set to all the wired and locked I/O variables. You can cancel the setting by clicking [Cancel].

Export the setting values to a file

The values for "Set Value" items of the I/O variables can be exported to a file.
The procedure is as follows:

1. Choose [Export Values] from the [File] menu, or click the [Export Values] button on the toolbar so as to display a dialog box for selecting files.
2. Specify a CSV file name and then click [Save]. The data values and data statuses for the channels assigned with the variables of the I/O modules on the I/O Module List View will be exported.

IMPORTANT

Do not edit the exported file if you want to import the file later.

Import the setting values from a file

The values for "Set Value" items of the I/O variables can be imported from a file.

IMPORTANT

Do not import any file other than the file exported from I/O Lock Window.

The procedure is as follows:

1. Choose [Import Values] from the [File] menu, or click the [Import Values] button on the toolbar so as to display a dialog box for selecting files.
2. Choose the CSV file that contains the setting values and then click [Open]. The channels assigned with the variables of the I/O modules on the I/O Module List View will be displayed with the imported data values and data statuses.

F8.9 SCS Link Transmission Lock window

On SCS Link Transmission Lock Window, the communication data of SCS Link transmission can be locked or unlocked. Also you can set values to SCS Link transmission data.

In SCS Simulator of SCS Test Functions, it is possible to set values to multiple communication data together. Therefore, the initial values of communication data and testing patterns can be defined all together.

How to call up the SCS Link Transmission Lock window

1. Check if the SCS security level is 0 or 1 using the SCS security level operation function.
2. Put the SCS Manager into Debug mode or Editing mode. To change to Debug mode, choose [Debug] from [Debug] menu or click [Debug] button on the toolbar.
3. Select [Maintenance] from the [Tools] menu of SCS Manager.
   The Maintenance Launcher menu appears.
4. Select [SCS Link Transmission Lock Window] from the Maintenance Launcher menu.
   The SCS Link Transmission Lock Window appears.

IMPORTANT

- It is not possible to start multiple SCS Link Transmission Lock Windows at the same time, for neither the same SCS project nor different SCS projects.
- The SCS Link Transmission Lock Window cannot be called while Build or Download is running.

SEE ALSO For more information about functions for operating SCS security levels, refer to:

B3., “Security of SCS” in ProSafe-RS User’s Guide (IM 32P01B10-01EN)

How to exit the SCS Link Transmission Lock window

To exit the SCS Link Transmission Lock Window, choose [Exit] from [File] menu.

IMPORTANT

- When exiting the SCS Link Transmission Lock Window, if the locked variables exist, a dialog box will be displayed for confirmation. It is necessary to reopen the SCS Link Transmission Lock Window to unlock the locked variables.
- If the online change download is performed and completed while the SCS Link Transmission Lock Window is not closed, an error of database inconsistency may occur. Under this circumstance, a message for restarting SCS Link Transmission Lock Window will be displayed. You need to follow the message to restart it.
- If the SCS Manager is closed or a different SCS project is opened, the SCS Link Transmission Lock Window will be forcibly closed.

SCS Link Transmission Lock window structure

The SCS Link Transmission Lock Window contains the following components.

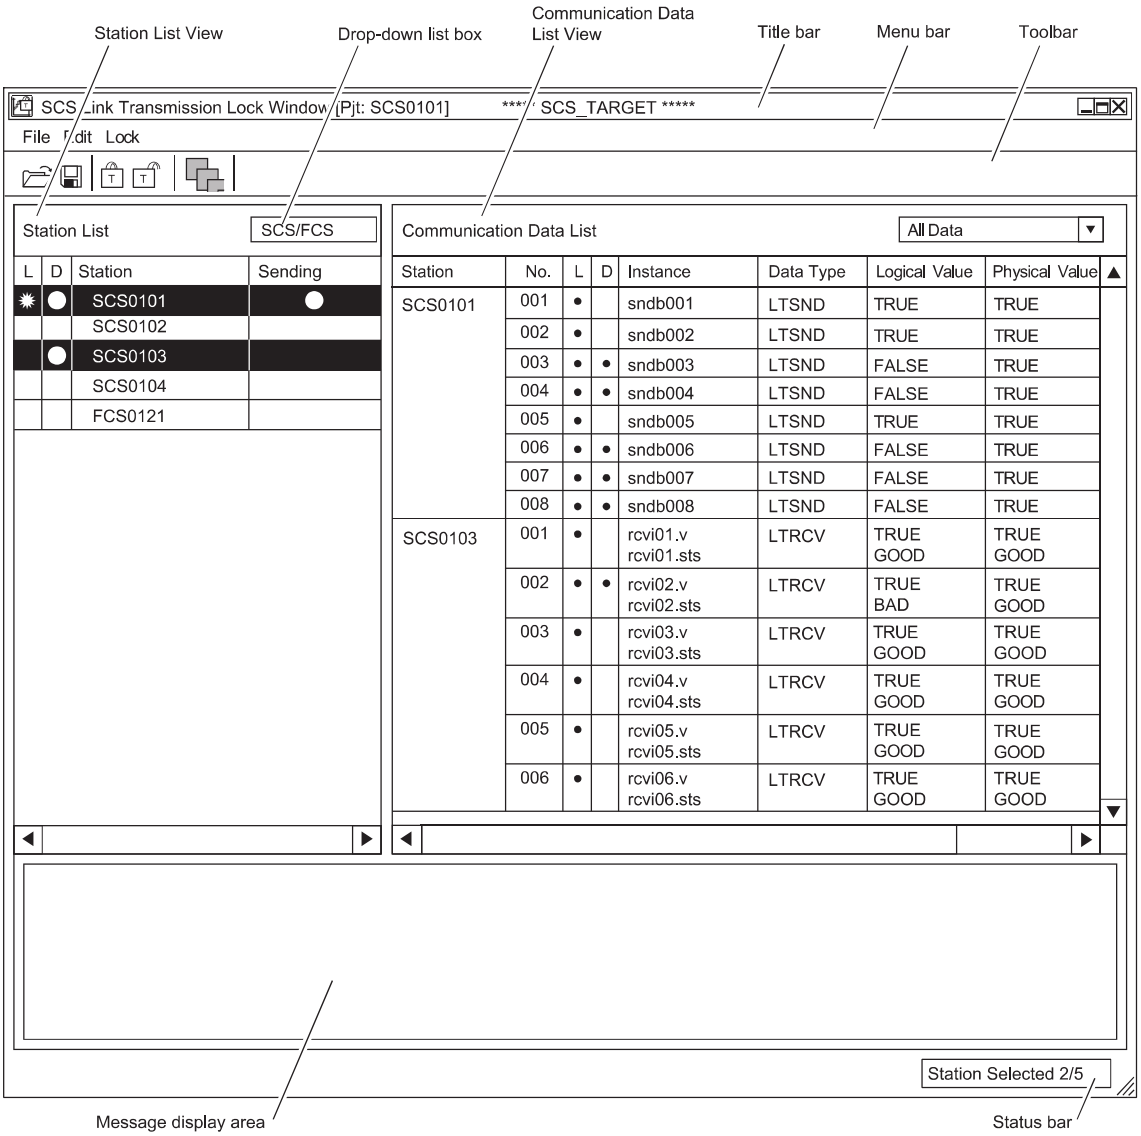

Figure F8.9-1 SCS Link Transmission Lock window

Title bar

On the title bar, besides window name and project name, the SCS status is also displayed.

- SCS_TARGET: Indicates communication with the SCS.
- SCS_SIMULATOR: Indicates communication with the SCS simulator.
- <Non>: Indicates the SCS is not running.

For logic simulation test, "SIMULATION" will be displayed in the position of SCS status.

Menu bar

The following menus are provided on the menu bar:

- [File] Menu
- [Edit] Menu
- [Lock] Menu

The menu items provided on each menu are explained as follows.

Table F8.9-1 File menu

Menu item	Description
Import Values...(*1)	Imports from a file the values that are used to set communication data.
Export Values... (*1)	Exports to a file the values that were used to set communication data.
Exit	Exits from the SCS Link Transmission Lock Window.

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Table F8.9-2 Edit menu

Menu item	Description
Cut (*1)	Deletes the selected character string and copies it onto the clipboard.
Copy (*1)	Copies the selected character string onto the clipboard.
Paste (*1)	Inserts the character string stored in the clipboard.
Delete (*1)	Deletes the selected character string.
Select All	Selects all displayed modules (same action as pressing the [Ctrl] key and [A] key together).

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Table F8.9-3 Lock menu

Menu item	Description
Lock Communication Data	Locks communication data of a station.
Unlock Communication Data	Unlocks communication data of a station.
Set Values (*1)	Collectively sets values of communication data.

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Toolbar

The following buttons are provided on the toolbar.

Table F8.9-4 Toolbar buttons

Button	Description
 (*1)	Imports from a file the values that are used to set communication data. This is the same as selecting [File] - [Import Values] from the menu bar.
 (*1)	Exports to a file the values that were used to set communication data. This is the same as selecting [File] - [Export Values] from the menu bar.
	Locks all communication data of a station. Same as choosing [Lock Communication Data] from [Lock] menu.
	Unlocks all communication data of a station. Same as choosing [Unlock Communication Data] from [Lock] menu.
 (*1)	Sets all communication data values. Same as choosing [Set Values] from [Lock] menu.

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Station List view

Lists local station and other stations communicating with local station.

The following items are shown on the Station List View.

Table F8.9-5 Items on Station List view

Item	Description
L	Shows the communication data locking status of the station.
D	Shows the communication data consistency or inconsistency of the station.
Station	Station name
Sending	Indicates whether the local station is sending.

Communication data locking status of stations

The communication data locking statuses of stations are displayed.

Table F8.9-6 Display of lock status

Item	Description
(No symbol)	No communication data is locked.
✹ (red)	All communication data are locked.
? (black)	SENG is unable to communicate with the station.

Communication data consistency of stations

It is regarded as inconsistent if any of the logical data and physical data of data values or data status are not the same.

Table F8.9-7 Consistency of communication data

Item	Description
(No symbol)	All communication data are consistent.
● (yellow)	Some communication data are inconsistent.
⦿ (red)	All communication data are inconsistent.
? (black)	SENG is unable to communicate with the station.

Output status of the local station

The output status of the local station is displayed.

Table F8.9-8 Output status of local station

Display	Description
● (green)	Output of the local station is enabled.
☒ (red)	Output of the local station is disabled.
? (black)	SENG cannot communicate with the local station.
(Blank)	Other station.

Filtering

The display can be filtered according to station type using the drop-down list box.

Table F8.9-9 Drop-down list box

Menu item	Description
SCS/FCS	All stations are shown.
SCS	SCS stations including local station are shown.
FCS	FCS, GSGW and APCS stations are shown.

Pop-up menu

Click the right mouse button on the Station List View to display the pop-up menu.

The menu item in the pop-up menu is shown as follows.

Table F8.9-10 Pop-up menu

Menu item	Description
Select All	Selects all displayed stations (same as choosing [Select All] from the [Edit] menu).

Communication Data List view

Displays the SCS Link Transmission data information for the station selected on the Station List View. The communication data that are not wired with the SCS Link Transmission function block will not be displayed.

Table F8.9-11 Items on Communication Data List view

Item	Description
Station	Station number
No.	Bit number (The number assigned on SCS Link Transmission Builder)
L	Communication data lock status
D	Communication data consistency or inconsistency
Instance	Instance name of the wired SCS Link Transmission function block
Data Type	Function block name
Logical Value	Logical data of data value and data status, respectively
Physical Value	Physical data of data value and data status, respectively
Set value (*1)	Set value of data value and data status, respectively
Comment	Comment entered for the SCS Link Transmission function block

*1: Displayed and editable only when the SCS project target name is SCS_SIMULATOR.

Communication data locking status

Displays the communication data locking status.

Table F8.9-12 Locking status

Item	Description
(No symbol)	The communication data is unlocked.
✶ (red)	The communication data is locked.
? (black)	SENG is unable to communicate with the station.

Communication data consistency

It is regarded as inconsistent if any of the logical data and physical data for data values or data statuses are not the same.

Table F8.9-13 Consistency of communication data

Item	Description
(No symbol)	The communication data is consistent.
● (red)	The communication data is inconsistent.
? (black)	SENG is unable to communicate with the station.

Logical data and physical data

The data value is displayed as either [TRUE] or [FALSE].

Data status is displayed as either [GOOD] or [BAD]. If the data status is BAD, the background color is displayed in yellow. [******] is displayed if communication with the station is disabled. However, the Link Transmission Data Output function block (LTSND) in the local station does not have data status.

Filtering

The displayed communication data can be filtered using the drop-down list box.

Table F8.9-14 Drop-down list box on the Communication Data List view

Menu Item	Description
All Data	Displays information of all communication data
Locked Data	Displays information of locked communication data
Unlocked Data	Displays information of unlocked communication data

Pop-up menu

Only when the SCS project target name is SCS_SIMULATOR, click the right mouse button on the Communication Data List View may display a pop-up menu.

The items on the pop-up menu are as follows:

Table F8.9-15 Items on pop-up menu in the Communication Data List view

Items		Description
Cut		Same as the [Cut] command on the [Edit] menu.
Copy		Same as the [Copy] command on the [Edit] menu.
Paste		Same as the [Paste] command on the [Edit] menu.
Delete		Same as the [Delete] command on the [Edit] menu.
Select All		Same as the [Select All] command on the [Edit] menu.
Input Values ►	Set .V=TRUE	Sets the data value in the Set Value cells to TRUE.
	Set .V=FALSE	Sets the data of Set Value to FALSE.
	Clear .V	Clears the data value in the Set Value cells.
	Set .STS=GOOD	Sets the data status of Set Value to GOOD.
	Set .STS=BAD	Sets the data status of Set Value to BAD.
	Clear .STS	Clears the data status of Set Value.

Selecting communication data

Only when the SCS project target name is SCS_SIMULATOR, the communication data can be selected on the Communication Data List View.

- Clicking a communication data while pressing the [Shift] key on the keyboard, the communication data can be selected.
- Clicking a communication data while pressing the [Ctrl] key on the keyboard, the communication data of the line can be selected.
- Choosing [Select All] from pop-up menu, all communication data can be selected.

Message display area

The results of locking, unlocking and setting operations are displayed as messages. The last displayed message is cleared at each operation.

Status bar

The status bar shows the following information about the stations displayed in the Station List View.

- Station Selected: Number of selected stations/Number of all stations

F8.9.1 Locking and unlocking all SCS link transmission data of a station

On SCS Link Transmission window, all SCS Link Transmission data of a station can be locked and unlocked together. This section explains the operating procedures.

Selecting station

Choose a station on the Station List View. With the following operations, the communication data information can be displayed on the Communication Data List View.

- You can display the communication data of the station by clicking on a station name.
- To select a consecutive group of stations, click the name of the first station and then click the name of the last station while holding down the [Shift] key on the keyboard. The communication data of the selected stations appears.
- If you click a station name while holding down the [Ctrl] key on your keyboard, the communication data of the station on the clicked line is added to the current display.

Locking communication data of a station

The communication data of SCS Link Transmission can be locked together for a selected station.
The procedure is as follows:

1. Choose a station for locking the communication data on the Station List View.
2. Check the discrepancies of the data values and data status between the logical communication data and physical communication data on the Communication Data List View, and make sure that the discrepancies are acceptable when locking the data.
3. Choose [Lock Communication Data] from [Lock] menu or click [Lock] button on the toolbar.
4. When a confirmation dialog box is displayed, click the [OK] button so as to lock all the communication data of the selected station.
   Clicking [Cancel] will cancel the locking.

Unlocking communication data of a station

The communication data of SCS Link Transmission can be unlocked together for a selected station.
The procedure is as follows:

1. Choose a station for unlocking the communication data on the Station List View.
2. Check the discrepancies of the data values and data status between the logical communication data and physical communication data on the Communication Data List View, and make sure that the discrepancies are acceptable when unlocking the data.
3. Choose [Unlock Communication Data] from [Lock] menu or click the [Unlock] button on the toolbar.
4. When a confirmation dialog box is displayed, click [OK] so as to unlock all the communication data of the selected station. Clicking [Cancel] will cancel the unlocking.
5. If inconsistency between any logical data and physical data exists, a reconfirmation dialog box will be displayed. Click the [OK] button on this dialog box to unlock all the communication data together.
   Clicking [Cancel] will cancel the unlocking.

F8.9.2 Set values of SCS link transmission data

On SCS Link Transmission Lock Window, communication data values of a locked station can be set one by one or all together per station.

The collective setting of communication data values on a station-by-station basis is possible when using the SCS Simulator during testing.

This section explains the operating procedures.

Set value to each communication data

The value can be set to each communication data.

However, the data status can only be set to all the data of the station. All the data in the station will use the defined data status.

IMPORTANT

Setting values to communication data cannot be executed while Build or Download is running.

On the Communication Data List View, double-clicking somewhere between No. and a physical data, a Write Data Value dialog box for that line of communication data will be displayed.

In the dialog box, the initial data values and data status of the selected data will be displayed, and setting data values on this dialog box is allowed.

- For Data Value
  When Write Data Value dialog box is opened, the logical data or the physical data will be displayed with either TRUE or FALSE button pressed.
- For Data Status
  When Write Data Value dialog box is opened, the logical data will be displayed with either GOOD or BAD button pressed.

The initial communication data values and data statuses of the logical data and physical data are shown as follows:

Table F8.9.2-1 Initial data on Write Data Value dialog box

Data Value (.v) and Data Status (.status)	Locked	Unlocked
Value of Received Communication Data (.v)	Logical	Logical
Status of Received Communication Data (.status)	Logical	Logical
Value of Sent Communication Data (.v)	Physical	Logical

The above can be set on the Write Data Value dialog box.

SEE ALSO For more information about procedure for setting values using the setting of values dialog box, refer to:

"Write/Lock/Unlock" in "Debug/Simulate" in "Workbench," "Debug" in the Workbench User's Guide

Set values to multiple items of communication data together

Using the SCS Simulator, you can set values to multiple communication data items together. The following operations can be performed on the SCS Link Transmission communication data of the selected station.

- Set values to the communication data.
- Save the set values for the communication data in a file.

- Read values form a file and set them to the communication data.

Note that the number of communication data values set at a time should be 700 or less. If more data values are set at a time, some of the system alarm messages informing the data setting or data status setting may not be transmitted.

Enter the values to be set to communication data

The values can be entered in the [Set Value] cells on the Communication Data List View. The value can be entered by any of the following operations. After entering the values, you need to set all the values to the communication data.

- Enter a Value Directly
  In the Communication Data List View, click the [Set Value] cell on the line of the communication data that you want to enter the value for. By clicking the data value or data status, they can be entered directly.

  For setting data, each click will move among TRUE, FALSE and a space (non specified) for selections.

- Edit Multiple Data Values
  From [Edit] menu or from the right-click menu, you can use [Cut], [Copy], [Paste] and [Del] commands to edit the values of consecutive [Set Value] cells.

- Enter Values Using [Input Values] on Pop-up Menu
  Right clicking on the Communication Data List View, a pop-up menu will be displayed. Using the [Input Values] command on the pop-up menu, you can enter data values or data status in the [Set Value] cells.

  For example, if you want to set all communication data to FALSE, use the [Select All] command on the pop-up menu to select all [Set Value] cells, and then choose [Input Values] - [Set.V=FALSE] on the pop-up menu.

Set values to all communication data

For the selected station, the values in the [Set Value] cells on the Communication Data List View can be set together to the communication data.

IMPORTANT

Setting values to communication data cannot be executed while Build or Download is running.

The procedure is as follows:

1. On the Station List View, choose a station that you want to set values for.
2. Choose [Set Values] from the [Lock] menu or click [Set Values] button on the toolbar so as to display Set Values dialog box.
3. Click [OK]. All the values entered in the [Set Value] cells will be set to the communication data. If no values are entered, the communication data will not be defined with values. You can cancel the setting by clicking [Cancel].

Export the setting values to a file

The values of the communication data in the [Set Value] cells can be exported to a file. The procedure is as follows:

1. Choose [Export Values] from the [File] menu, or click the [Export Values] button on the toolbar so as to display a dialog box for selecting files.
2. Specify a CSV file name and then click [Save]. The communication data values and data statuses of all the stations displayed in the Station List View are exported to the file.

IMPORTANT

Do not edit the exported file if you want to import the file later.

Import the setting values from a file

The values of communication data for [Set Value] cells can be imported from a file.

IMPORTANT

Do not import any file other than the file exported from SCS Link Transmission Lock Window.

The procedure is as follows:

1. Choose [Import Values] from the [File] menu, or click the [Import Values] button on the toolbar so as to display a dialog box for selecting files.
2. Choose the CSV file that contains the setting values and then click [Open]. The communication data values and data statuses for all the stations displayed on the Station List View are read from the file and displayed in the [Set Value] cells.

F8.10 Inter-SCS Communication Lock window

On the Inter-SCS Communication Lock Window, the communication data of inter-SCS safety communication can be locked or unlocked. You can also set data values to inter-SCS safety communication FBs.

In SCS Simulator of SCS Test Functions, it is possible to set values to multiple communication data together. Therefore, the initial values of communication data and testing patterns can be defined all together.

How to call up the Inter-SCS Communication Lock window

1. Check if the SCS security level is 0 or 1 using the SCS security level operation function.
2. Put the SCS Manager into Debug mode or Editing mode. To change to Debug mode, choose [Debug] from [Debug] menu or click [Debug] button on the toolbar.
3. Select [Maintenance] from the [Tools] menu of SCS Manager. The Maintenance Launcher menu appears.
4. Select [Inter-SCS Communication Lock Window] from the Maintenance Launcher menu. The Inter-SCS Communication Lock Window appears.

IMPORTANT

- The Inter-SCS Communication Lock Window cannot be launched while Build or Download is running on SCS Manager.
- It is not possible to start multiple Inter-SCS Communication Lock Windows at the same time, for neither the same SCS project nor different SCS projects.
- If the SCS Manager is closed or a different SCS project is opened, the Inter-SCS Communication Lock Window will be forcibly closed.
- If you try to execute online change downloading, offline downloading, master offline downloading, or restarting of SCS while the Inter-SCS Communication Lock Window is opened, an error message is displayed and the downloading or restarting will not be executed.

SEE ALSO For more information about functions for operating SCS security levels, refer to:

B3., “Security of SCS” in ProSafe-RS User’s Guide (IM 32P01B10-01EN)

How to exit the Inter-SCS Communication Lock window

To exit the Inter-SCS Communication Lock Window, choose [Exit] from [File] menu.
When exiting the Inter-SCS Communication Lock Window, if any locked inter-SCS safety communication FBs exist, a dialog box will be displayed for confirmation. Clicking [OK] will close the Inter-SCS Communication Lock Window.

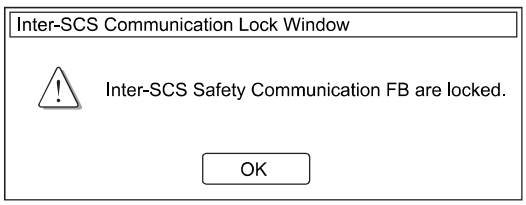

Figure F8.10-1 Confirmation dialog box

To unlock the locked inter-SCS safety communication FBs, it is necessary to launch the Inter-SCS Communication Lock Window again and unlock them.

Inter-SCS Communication Lock window structure

The Inter-SCS Communication Lock Window contains the following components.

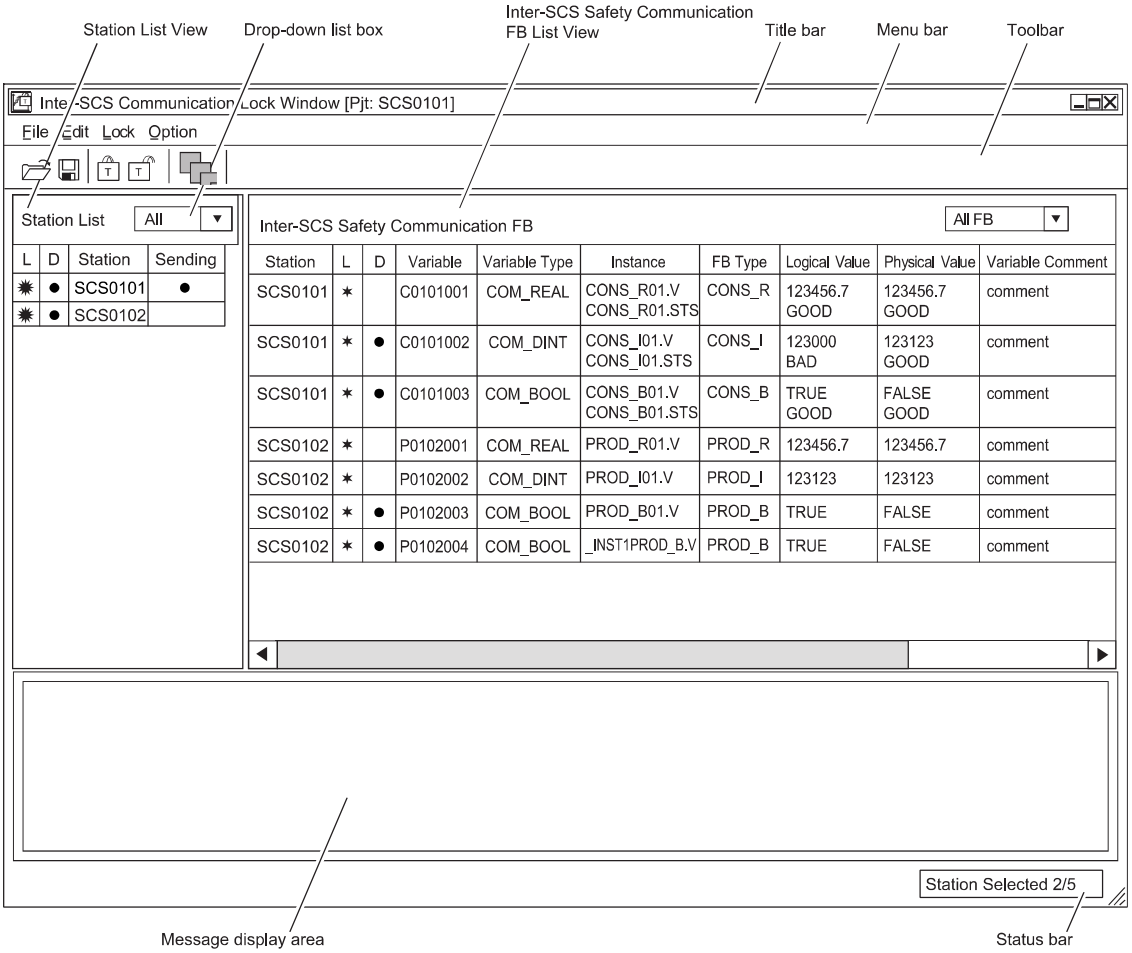

Figure F8.10-2 Inter-SCS Communication Lock window

Title bar

On the title bar, besides window name and project name, the SCS status is also displayed.

- SCS_TARGET: Indicates communication with the SCS.
- SCS_SIMULATOR: Indicates communication with the SCS simulator.
- <No display>: Indicates that the SCS is not running.

During logic simulation test, "SIMULATION" will be displayed in the position of SCS status.

Menu bar

The following menus are provided on the menu bar:

- [File] Menu
- [Edit] Menu
- [Lock] Menu

- [Option] Menu

The menu items provided on each menu are explained as follows.

Table F8.10-1 File menu

Menu item	Description
Import Values... (*1)	Imports from a file the values to be collectively set to inter-SCS safety communication FBs.
Export Values... (*1)	Exports to a file the values collectively set to inter-SCS safety communication FBs.
Exit	Exits from the Inter-SCS Communication Lock Window.

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Table F8.10-2 Edit menu

Menu item	Description
Cut (*1)	Deletes the selected character string and copies it onto the clipboard.
Copy (*1)	Copies the selected character string onto the clipboard.
Paste (*1)	Inserts the character string stored in the clipboard.
Delete (*1)	Deletes the selected character string.
Select All	Selects all displayed modules (same action as pressing the [Ctrl] key and [A] key together).

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Table F8.10-3 Lock menu

Menu item	Description
Lock Inter-SCS Safety Communication FB	Locks all inter-SCS safety communication FBs associated with the selected station.
Unlock Inter-SCS Safety Communication FB	Unlocks all inter-SCS safety communication FBs associated with the selected station.
Set Values (*1)	Collectively sets values to inter-SCS safety communication FBs.

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Table F8.10-4 Option menu

Menu item			Description
Numerical Display	INT	Decimal	Decimal expression
		Hexa-Decimal	Hexadecimal expression
	REAL	1.234E+12	Exponential notation
		12.34567	Displays 5 decimal places.
		123.4567	Displays 4 decimal places.
		1234.567	Displays 3 decimal places.
		12345.67	Displays 2 decimal places.
		123456.7	Displays 1 decimal places.

Toolbar

The following buttons are provided on the toolbar.

Table F8.10-5 Toolbar buttons

Button	Description
(*1)	Imports from a file the values to be collectively set to inter-SCS safety communication FBs (same as selecting [File] - [Import Values] from the menu bar).
(*1)	Exports to a file the values collectively set to inter-SCS safety communication FBs (same as selecting [File] - [Export Values] from the menu bar).
	Locks all inter-SCS safety communication FBs associated with the selected station (same as choosing [Lock Communication Data] from the [Lock] menu).
	Unlocks all inter-SCS safety communication FBs associated with the selected station (same as choosing [Unlock Communication Data] from the [Lock] menu).
(*1)	Sets all values of inter-SCS safety communication FBs together (same as choosing [Set Values] from the [Lock] menu).

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Station List view

This view displays a list of local station and other stations performing inter-SCS safety communication with the local station.

The following items are shown on the Station List View.

Table F8.10-6 Items on Station List view

Item	Display
L	Lock status of inter-SCS safety communication FBs of the station
D	Data consistency of inter-SCS safety communication FBs of the station
Station	Station name
Sending	Whether the local station is sending

Lock status of Inter-SCS safety communication FBs of stations

The lock status of inter-SCS safety communication FBs is displayed for each station.

Table F8.10-7 Lock status

Display	Meaning
(Blank)	No inter-SCS safety communication FBs is locked.
✹ (red)	All inter-SCS safety communication FBs are locked.
? (black)	SENG cannot communicate with the station.

Data consistency of Inter-SCS safety communication FBs of stations

It is regarded as inconsistent if any of the logical data and physical data of data values or data status are not the same. In the case of REAL-type data, however, it is regarded as inconsistent only if the logical data and physical data of data status are not the same.

Table F8.10-8 Data consistency

Display	Meaning
(Blank)	All inter-SCS safety communication FB data are consistent.
● (yellow)	Some inter-SCS safety communication FB data are inconsistent.
⦿ (red)	All inter-SCS safety communication FB data are inconsistent.
? (black)	SENG cannot communicate with the station.

Output status of the local station

The output status of the local station is displayed.

Table F8.10-9 Output status of local station

Display	Description
● (green)	Output of the local station is enabled.
☒ (red)	Output of the local station is disabled.
? (black)	SENG cannot communicate with the local station.
(Blank)	Other station.

Filtering

The display can be filtered according to the role of the station using the drop-down list box.

Table F8.10-10 Filter menu items in drop-down list box

Menu item	Displayed Stations
ALL	All stations
PROD	SCSs for which producer inter-SCS safety communication FBs are defined in the SCS project
CONS	SCSs sending to the consumer inter-SCS safety communication FBs in the SCS project

Pop-up menu

Click the right mouse button on the Station List View to display the pop-up menu.

The menu item in the pop-up menu is shown as follows.

Table F8.10-11 Pop-up menu

Menu item	Description
Select All	Selects all displayed stations (same as choosing [Select All] from the [Edit] menu).

Inter-SCS safety communication FB list view

This view displays information of inter-SCS safety communication FBs associated with the station selected on the Station List View. Among inter-SCS safety communication FBs used in programs, those directly connected to binding variables are displayed.

Table F8.10-12 Items displayed in the Inter-SCS safety communication FB list view

Item name	Description
Station	Station name
L	Lock status of the inter-SCS safety communication FB
D	Data consistency of the inter-SCS safety communication FB
Variable	Binding variable
Variable Type	Type of binding variable
Instance	Instance name of the inter-SCS safety communication FB
FB Type	Type of the inter-SCS safety communication FB
Logical Value	Logical data of data value and data status
Physical Value	Physical data of data value and data status

Continues on the next page

Table F8.10-12 Items displayed in the Inter-SCS safety communication FB list view (Table continued)

Item name	Description
Set value (*1)	Setting values of data value and data status
Variable Comment	Comment of the binding variable

*1: Displayed and editable only when the target name of the SCS project is SCS_SIMULATOR.

Station name

For producer inter-SCS safety communication FBs, the station name of the local station is displayed.

For consumer inter-SCS safety communication FBs, the station name of the sending station is displayed.

Lock status of Inter-SCS safety communication FB

The lock status of inter-SCS safety communication FB is displayed.

Table F8.10-13 Display of lock status

Display	Meaning
(Blank)	Not locked
✶ (red)	Locked
? (black)	SENG cannot communicate with the station.

TIP

The lock status is only shown in the Inter-SCS Communication Lock Window. It cannot be viewed on Dictionary View of the Workbench.

Data consistency of Inter-SCS safety communication FBs

It is regarded as inconsistent if any of the logical data and physical data of data values or data status are not the same. In the case of REAL-type data, however, it is regarded as inconsistent if the logical data and physical data of data status are not the same.

Table F8.10-14 Data consistency of Inter-SCS safety communication FB

Display	Meaning
(Blank)	Consistent
● (red)	Inconsistent
? (black)	SENG cannot communicate with the station.

Binding variable

Binding variables directly connected to inter-SCS safety communication FBs are displayed.

Instance name of Inter-SCS safety communication FB

"Instance name.V" and "instance name.STS" are displayed (V refers to data, while STS refers to data status). However, producer inter-SCS safety communication FBs do not have data status.

TIP

If an inter-SCS safety communication FB does not have an instance name, an instance name automatically generated by the system is displayed.

Table F8.10-15 Examples of automatically generated instance names

FB type	Automatically generated instance name	Remark
CONS_B	__INSTnCONS_B (For FBD) __LCFBCONS_Bn (For LD)	n is a number given by the system.
CONS_I	__INSTnCONS_I (For FBD) __LCFBCONS_In (For LD)	
CONS_R	__INSTnCONS_R (For FBD) __LCFBCONS_Rn (For LD)	
PROD_B	__INSTnPROD_B (For FBD) __LCFBPROD_Bn (For LD)	
PROD_I	__INSTnPROD_I (For FBD) __LCFBPROD_In (For LD)	
PROD_R	__INSTnPROD_R (For FBD) __LCFBPROD_Rn (For LD)	

Logical data and physical data

A BOOL-type data value is displayed as either [TRUE] or [FALSE].

A DINT- or REAL-type data value is displayed using the format selected from the [Option] menu.

Data status is displayed as either [GOOD] or [BAD]. If the data status is BAD, the background color is displayed in yellow. [******] is displayed if communication with the station is disabled. However, producer inter-SCS safety communication FBs do not have data status.

TIP

- Inter-SCS safety communication FBs used as parameters are not displayed in the Inter-SCS Communication Lock Window, and forcing cannot be performed on them.
- Binding variables are displayed only when they are directly connected to inter-SCS safety communication FBs and also set in the binding list.
- If multiple consumer inter-SCS safety communication FBs are connected to a single binding variable, the same binding variable is displayed with each of the consumer inter-SCS safety communication FBs.
- If multiple binding variables are connected to a single producer inter-SCS safety communication FB, the same FB is displayed with each of the binding variables.
- Only the Inter-SCS Communication Lock Window shows both logical and physical data values.

Filtering

It is possible to filter the inter-SCS safety communication FBs to be displayed using the drop-down list box.

Table F8.10-16 Drop-down list box menu of the Inter-SCS safety communication FB list view

Item	Displayed FB
All FB	Information of all inter-SCS safety communication FBs
Locked FB	Information of locked inter-SCS safety communication FBs
Unlock FB	Information of unlocked inter-SCS safety communication FBs

Pop-up menu

If the target name of the SCS project is SCS_SIMULATOR, clicking the right mouse button in the Inter-SCS Safety Communication FB List View displays a pop-up menu.

The items on the pop-up menu are as follows:

Table F8.10-17 Items on pop-up menu in the Inter-SCS safety communication FB list view

Items		Description
Cut		Same as the [Cut] command on the [Edit] menu.
Copy		Same as the [Copy] command on the [Edit] menu.
Paste		Same as the [Paste] command on the [Edit] menu.
Delete		Same as the [Delete] command on the [Edit] menu.
Select All		Same as the [Select All] command on the [Edit] menu.
Input Values ►	Set .V=TRUE	Sets the data value in the Set Value cells to TRUE.
	Set .V=FALSE	Sets the data of Set Value to FALSE.
	Clear .V	Clears the data value in the Set Value cells.
	Set .STS=GOOD	Sets the data status of Set Value to GOOD.
	Set .STS=BAD	Sets the data status of Set Value to BAD.
	Clear .STS	Clears the data status of Set Value.

Selecting Inter-SCS safety communication FB

If the SCS project target name is SCS_SIMULATOR, you can select the [Set Value] column of inter-SCS safety communication FBs to set values.

- By clicking the [Set Value] column of an inter-SCS safety communication FB while pressing the [Shift] key of the keyboard, the selection range of inter-SCS safety communication FBs can be widened.
- By clicking the [Set Value] column of an inter-SCS safety communication FB while pressing the [Ctrl] key of the keyboard, multiple inter-SCS safety communication FBs of the clicked lines can be selected.
- By selecting [Select All] from the pop-up menu, the [Set Value] column of all inter-SCS safety communication FBs can be selected.

Message display area

The results of locking, unlocking and value setting operations are displayed as messages. The previously displayed message is cleared at each operation. Displayed messages are stored in the log.

Status bar

The status bar shows the number of stations displayed in the Station List View in the following format.

- Station Selected: Number of selected stations/Number of all stations

F8.10.1 Locking and unlocking all Inter-SCS safety communication FBs associated with a station

On Inter-SCS Communication Lock Window, all inter-SCS safety communication FBs associated with a station can be locked or unlocked together. This section explains the operating procedures.

Selecting station

Choose one or more stations in the Station List View. With the following operations, the information of inter-SCS safety communication FBs is displayed in the Inter-SCS Safety Communication FB List View.

- If you simply click a station name, the information of the inter-SCS safety communication FBs associated with the station is appears.
- To select a consecutive group of stations, click the name of the first station and then click the name of the last station while holding down the [Shift] key on the keyboard. The information of the inter-SCS safety communication FBs associated with the selected stations appears.
- If you click a station name while holding down the [Ctrl] key on your keyboard, the information of the inter-SCS safety communication FBs associated with the station on the line is displayed in addition to the currently displayed information.

Locking Inter-SCS safety communication FBs of a station

All the inter-SCS safety communication FBs associated with a selected station can be locked together.

IMPORTANT

The inter-SCS safety communication FBs cannot be locked while Build or Download is running.

The procedure is as follows:

1. Choose a station for locking the communication data on the Station List View.
2. In the Inter-SCS Safety Communication FB List View, check the discrepancies between the logical data and physical data of the inter-SCS safety communication FBs' data values and data status, and make sure that the discrepancies are acceptable when locking the data.
3. Choose [Lock Inter-SCS Safety Communication FB] from the [Lock] menu or click [Lock] button on the toolbar.
4. On the confirmation dialog box displayed, click [OK] so as to lock all the inter-SCS safety communication FBs associated with the selected station.
   Clicking [Cancel] will cancel the locking.

IMPORTANT

Always use the Inter-SCS Communication Lock Window to lock inter-SCS safety communication FBs. An error occurs if you lock binding variables of inter-SCS safety communication FBs from Dictionary View or Multi-Language Editor.

Unlocking Inter-SCS safety communication FBs of a station

All the inter-SCS safety communication FBs associated with a selected station can be unlocked together.

IMPORTANT

The inter-SCS safety communication FBs cannot be unlocked while Build or Download is running.

The procedure is as follows:

1. Choose a station to be unlocked in the Station List View.
2. In the Inter-SCS Safety Communication FB List View, check the discrepancies between the logical data and physical data of the inter-SCS safety communication FBs' data values and data status, and make sure that the discrepancies are acceptable when unlocking the data.
3. Choose [Unlock Inter-SCS Safety Communication FB] from the [Lock] menu or click the [Unlock] button on the toolbar.
4. On the confirmation dialog box displayed, click [OK] to unlock; or click [Cancel] if you want to cancel.
5. If any inconsistency between logical data and physical data exists in the FBs to be unlocked, a reconfirmation dialog box will be displayed. In the case of REAL-type data, the reconfirmation dialog box will not be displayed even if inconsistency between data values exists. Click [OK] to unlock.
   All the inter-SCS safety communication FBs associated with the selected station are unlocked.
   Click [Cancel] if you want to cancel the unlocking.

F8.10.2 Set values of Inter-SCS safety communication FBs

On Inter-SCS Communication Lock Window, data values can be set for individual inter-SCS safety communication FBs or for all inter-SCS safety communication FBs together on a station-by-station basis.

The collective setting on a station-by-station basis is possible when using the SCS Simulator during testing.

This section explains the operating procedures.

Set value to each Inter-SCS safety communication FB

Data values and data status can be set for each inter-SCS safety communication FB of the station whose inter-SCS safety communication FBs are locked.

IMPORTANT

You cannot set values to inter-SCS safety communication FBs while Build or Download is running.

In the Inter-SCS Safety Communication FB List View, double-clicking in a cell between L column and Physical Value column on any line will open a dialog box for setting data values or data status of the inter-SCS safety communication FB for that line.

If you double-click the area showing the data value, the Write Data Value dialog box appears. If you double-click the area showing the data status, the Write Data Status dialog box appears.

In these dialog boxes, a data value or data status is set for an individual inter-SCS safety communication FB.

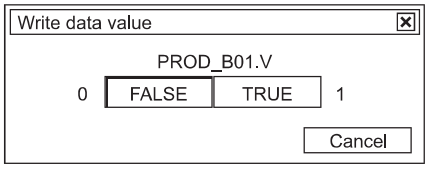

Figure F8.10.2-1 Write Data Value dialog box (BOOL-type data)

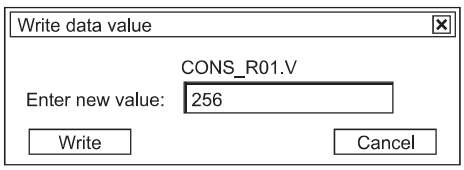

Figure F8.10.2-2 Write Data Value dialog box (REAL/INT-type data)

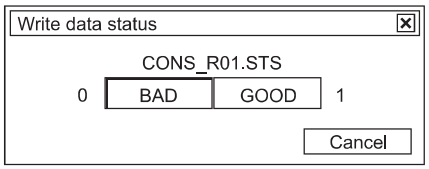

Figure F8.10.2-3 Write Data Status dialog box

For BOOL-type data, the Write Data Value dialog box or Write Data Status dialog box will be opened, showing the button corresponding to the current value pressed.

The Write Data Value dialog box for REAL/INT-type data will be opened, showing the current data value.

Whether logical data or physical data is displayed in the dialog box is determined according to which data value is settable. If a value can be set for logical data, logical data is displayed. If a value can be set for physical data, physical data is displayed. The following table shows the data displayed in the dialog box.

Table F8.10.2-1 Data displayed on Write data value/Write data status dialog box

Data Value (.v) and Data Status (.status)	Locked	Unlocked
Data value of consumer inter-SCS safety communication FB (.v)	Logical data	Logical data
Data status of consumer inter-SCS safety communication FB (.status)	Logical data	Logical data
Data value of producer inter-SCS safety communication FB (.v)	Physical data	Logical data

Value setting operations on the Write Data Value/Status dialog box are the same as on Dictionary View.

SEE ALSO For more information about procedure for setting values using the "Write data value" dialog box, refer to:

"Write/Lock/Unlock" in "Debug/Simulate" in "Workbench," "Debug" in the Workbench User's Guide

Set values to multiple Inter-SCS safety communication FBs together

Using the SCS Simulator, you can set values to multiple inter-SCS Safety Communication FBs together.
The following operations can be performed collectively on the data values and data status of inter-SCS Safety Communication FBs of the selected station. (Setting of data status is only possible for consumer inter-SCS safety communication FBs.)

- Set values to inter-SCS safety communication FBs.
- Save the setting values for inter-SCS safety communication FBs in a file.
- Read values from a file and set them to inter-SCS safety communication FBs.

Enter the values to be set to Inter-SCS safety communication FBs

The values can be entered in the [Set Value] cells of the Inter-SCS Safety Communication FB List View.
The value can be entered by any of the following operations. After entering the values, you need to write them to the inter-SCS safety communication FBs.

- Enter a Value Directly
  In the Inter-SCS Safety Communication FB List View, click the [Set Value] cell on the line of the inter-SCS safety communication FB you want to enter the value for. By specifically clicking the data value or data status, they can be entered directly.

  In the case of BOOL-type data, each click will move among TRUE, FALSE, and a space (not specified) for selection.

  In the case of DINT/REAL-type data, values can be directly entered using your keyboard.
- Edit Multiple Data Values
  From [Edit] menu or from the right-click menu, you can use [Cut], [Copy], [Paste] and [Del] commands to edit the values of consecutive [Set Value] cells.
- Enter Values Using [Input Values] on Pop-up Menu
  Right clicking in the Inter-SCS Safety Communication FB List View will display a pop-up menu. Using the [Input Values] command on the pop-up menu, you can enter data values or data status in the [Set Value] cells.

  For example, if you want to specify FALSE for BOOL-type data values in all inter-SCS safety communication FBs, on the pop-up menu, click [Select All] to select the Set Value

items for all data. Next, on the pop-up menu, click [Input Values] and select [Set.V=FALSE].

Set values to all Inter-SCS safety communication FBs

All the values in the [Set Value] cells in the Inter-SCS Safety Communication FB List View can be set together to the inter-SCS safety communication FBs associated with the selected station.

IMPORTANT

Setting values to all the inter-SCS safety communication FBs cannot be executed while Build or Download is running.

The procedure is as follows:

1. In the Station List View, choose a station you want to set values for.
2. Choose [Set Values] from the [Lock] menu or click the [Set Values] button on the toolbar. A dialog box appears, asking you whether or not to execute setting values.
3. Click [OK]. All the values entered in the [Set Value] cells will be set to the communication data. If no values are entered (blank), values will not be set to the corresponding inter-SCS safety communication FBs.
   You can cancel the setting by clicking [Cancel].

Export the setting values to a file

The values for inter-SCS safety communication FBs in the [Set Value] cells can be exported to a file.
The procedure is as follows:

1. Choose [Export Values] from the [File] menu, or click the [Export Values] button on the toolbar so as to display a dialog box for selecting files.
2. Specify a CSV file name and then click [Save]. The inter-SCS safety communication FBs' data values and data statuses of all the stations displayed in the Station List View will be exported to the file.

IMPORTANT

Do not edit the exported file if you want to import the file later.

Import the setting values from a file

The values of inter-SCS safety communication FBs for [Set Value] cells can be imported from a file.

IMPORTANT

Do not import any file other than the file exported from Inter-SCS Communication Lock Window.

The procedure is as follows:

1. Choose [Import Values] from the [File] menu, or click the [Import Values] button on the toolbar so as to display a dialog box for selecting files.

2. Choose the CSV file that contains the setting values and then click [Open]. The data values and data statuses of inter-SCS safety communication FBs for all the stations displayed in the Station list View are read from the file and displayed in the [Set Value] cells.

F8.11 Communication I/O Lock window

This section gives an overview of the Communication I/O Lock window.

The Communication I/O Lock window is used to change or lock input from or output to subsystems by using the Forcing function. The modules subject to these functions are ALR111M, ALR121M, and ALE111M.

The Communication I/O Lock window is also used to lock subsystem communication I/O. The applicable I/O module is S2LP131.

In SCS Simulation test, it is possible to set values to multiple communication data together. Therefore, the initial values of communication data and testing patterns can be defined all together.

The Communication I/O Lock window is used to perform the following tasks:

- Debug the application logic that uses subsystem communication or safety subsystem communication
- Disconnect I/O during maintenance of a subsystem communication module or fire and gas communication module
- Lock communication I/O related to subsystem communication data or safety subsystem communication data during online change download

Positioning of the Communication I/O Lock window

The Communication I/O Lock window is one of the windows used mainly for maintenance purposes. The Communication I/O Lock window is launched from SCS Manager.

The positioning of the Communication I/O Lock window is as follows:

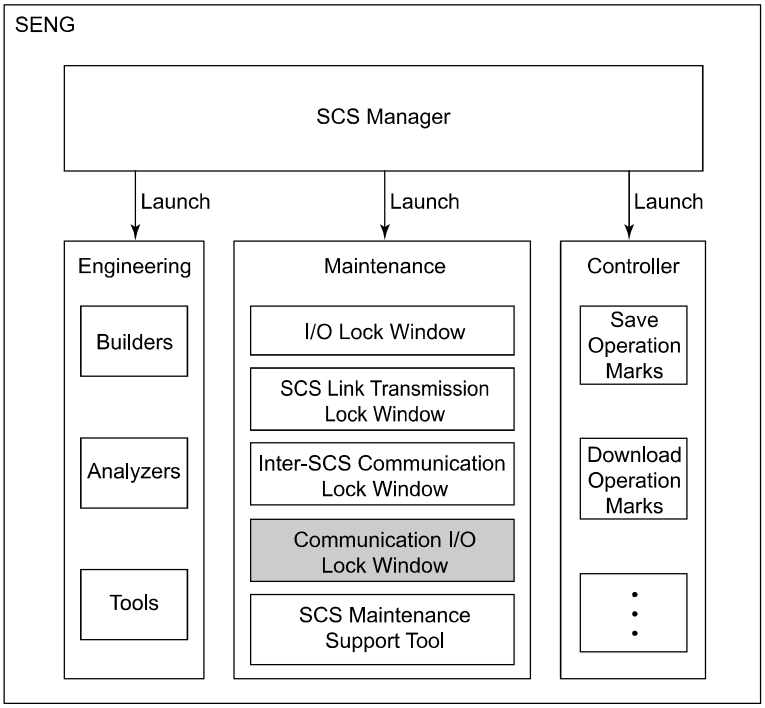

Figure F8.11-1 Positioning of Communication I/O Lock window in SENG

The following figure shows the relationship between the Communication I/O Lock Window and the Forcing function for SCS:

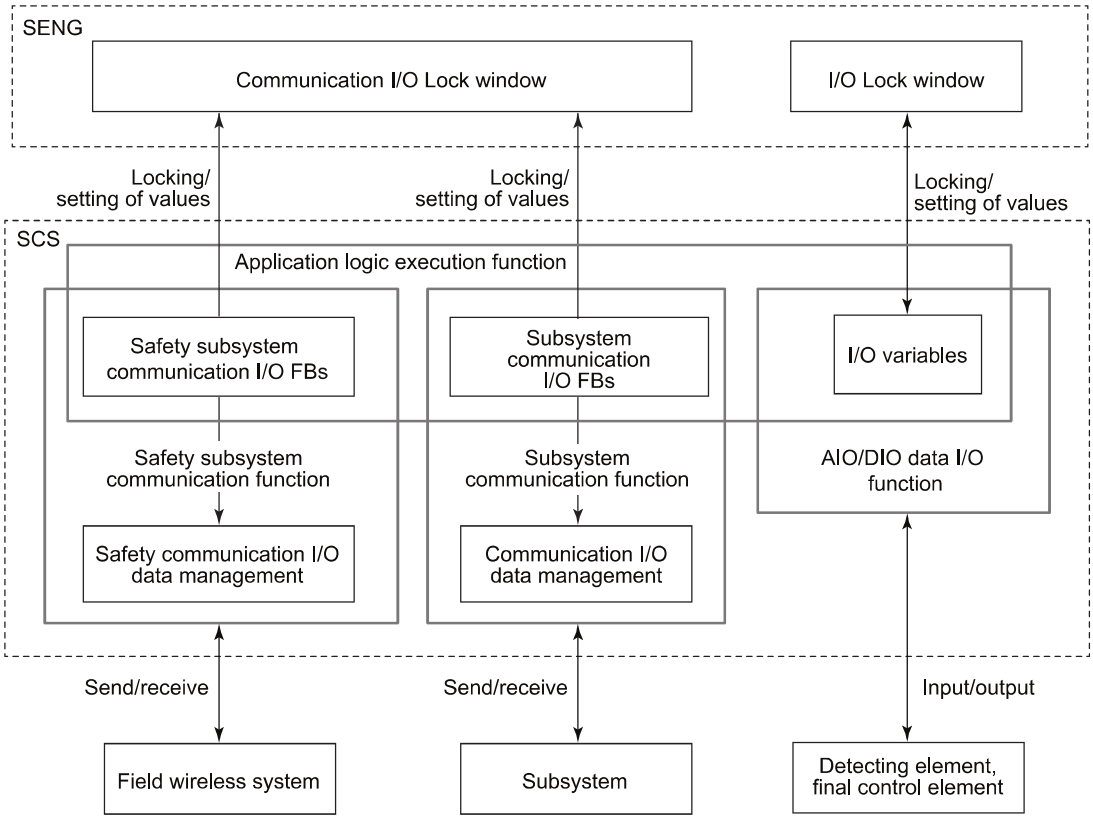

Figure F8.11-2 Relationship between the SCS, subsystem, and safety subsystem

Functions of the Communication I/O Lock window

Locking and unlocking

The I/O of subsystem communication data and safety subsystem communication data can be locked or unlocked. The lock status is also displayed for locked data.

Subsystem communication modules can be locked or unlocked in the following units.

- Lock or unlock all input data in a communication module
- Lock or unlock all output data in a communication module
- Lock or unlock all input/output data in a communication module

Fire and gas communication modules can be unlocked in the following units.

- Lock or unlock all inputs of a fire and gas communication module
- Lock or unlock each communication definition (PROFINET module) connected to a fire and gas communication module

Setting of values

Values can be set when the input or output data of subsystem communication and safety subsystem communication is locked. Logical data and physical data are displayed for each value.

A data value can be set for each communication data item. A data status can be set for each communication definition.

When the SCS project target name is SCS_SIMULATOR, it is possible to set values to multiple communication data together.

Start the Communication I/O Lock window

1. Check if the SCS security level is 0 or 1 using the SCS security level operation function.
2. Put the SCS Manager into Debug mode or Editing mode.
   To change to Debug mode, choose [Debug] from [Debug] menu or click [Debug] button on the toolbar.
3. Select [Maintenance] from the [Tools] menu of SCS Manager.
   The Maintenance Launcher menu appears.
4. Select [Communication I/O Lock Window] from the Maintenance Launcher menu.
   The Communication I/O Lock window appears.

IMPORTANT

- The Communication I/O Lock window cannot be started while Build or Download is running in SCS Manager.
- Multiple Communication I/O Lock windows cannot be launched simultaneously regardless of whether or not the windows are for the same SCS project or different SCS projects.
- The Communication I/O Lock window will be forcibly closed when SCS Manager is closed or a different SCS project is opened.

Exit the Communication I/O Lock window

To exit the Communication I/O Lock window, on the [File] menu, select [Exit].
When you try to exit the Communication I/O Lock window, a confirmation dialog box appears if any communication module, fire and gas communication module, or safety subsystem communication input is locked. Click [OK] to close the Communication I/O Lock window.

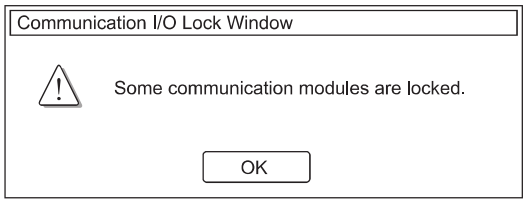

Figure F8.11-3 Confirmation dialog box

To unlock the applicable communication module, start the Communication I/O Lock window again and perform the necessary operation.

IMPORTANT

If you commenced an online change download when the Communication I/O Lock window is open, close the Communication I/O Lock window after the online change download is completed.

If the Communication I/O Lock window remains open after completion of an online change download in which the database related to subsystem communication or safety subsystem communication is changed, a database discrepancy error may occur when the displayed data is refreshed subsequently. When this error occurs, a message prompting you to re-open the Communication I/O Lock window will be displayed.

F8.11.1 Structure of the Communication I/O Lock window

This section describes the window structure and components of the Communication I/O Lock window.

The screen configuration of the Communication I/O Lock window differs between the subsystem communication mode and the safety subsystem communication mode.

The mode can be switched from the Mode menu.

The window configuration of the Communication I/O Lock window is as follows:

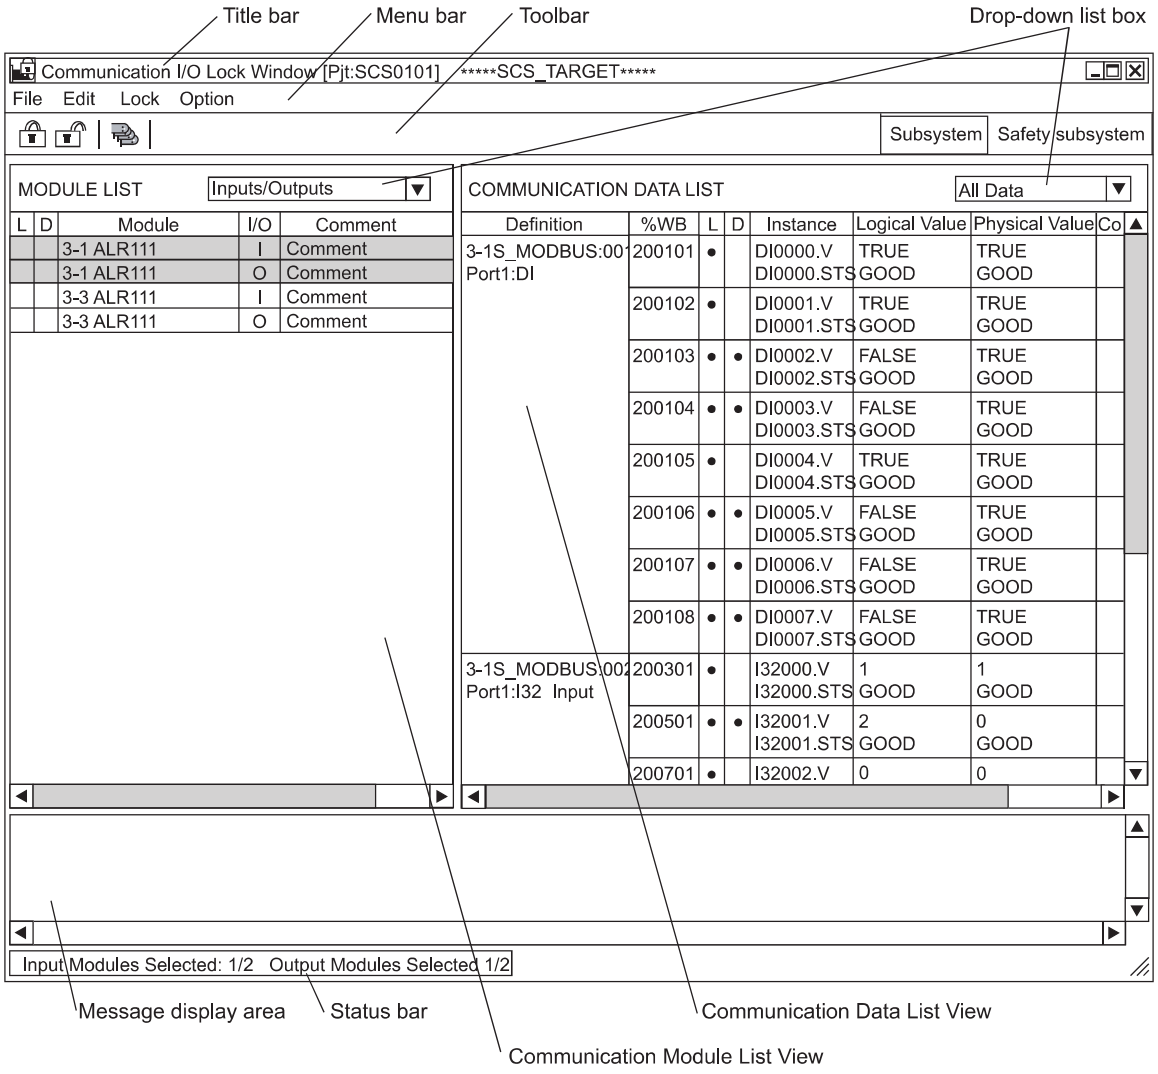

Figure F8.11.1-1 Communication I/O Lock window for the subsystem communication mode

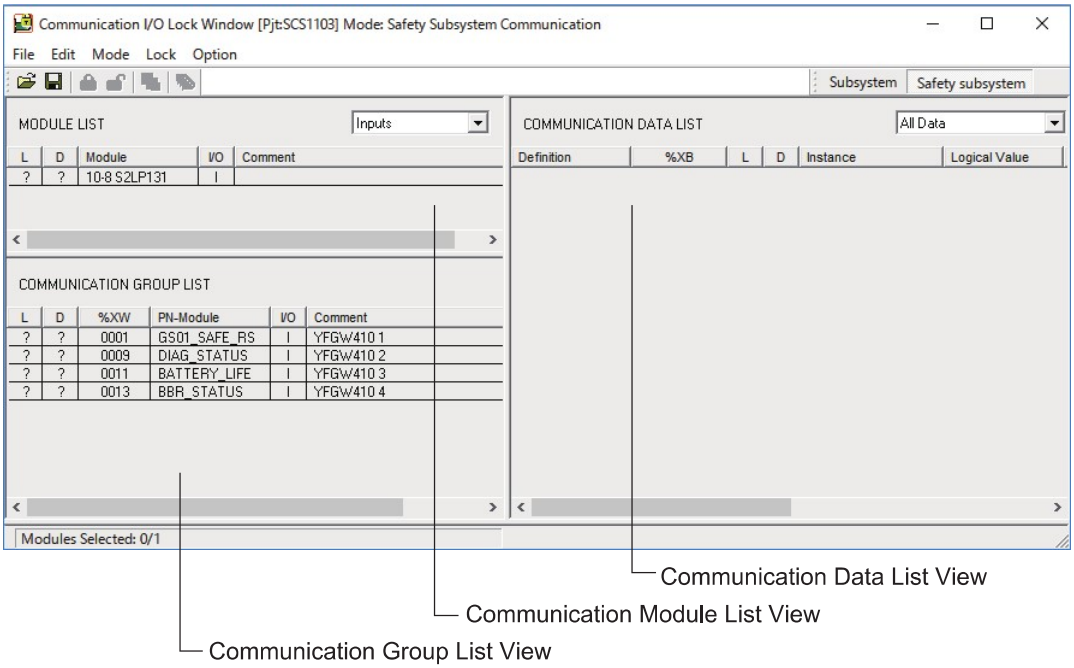

Figure F8.11.1-2 Communication I/O Lock window for the safety subsystem communication mode

The following section explains the elements that make up the window.

Title bar

The status of the SCS is displayed as follows:

- SCS_TARGET
- SCS_SIMULATOR
- (No display)

For logic simulation test, "SIMULATION" will be displayed in the position of SCS status.

The mode is displayed as follows:

Mode: xxxxxxx

Menu bar

The following menus are provided on the menu bar:

- File menu
- Edit menu
- Mode menu
  The Mode menu is available only for SCS of type S2SC70/L1SC70 which is engineered by I/O list engineering.
- Lock menu
- Option menu

The following menu items are provided on each menu:

Table F8.11.1-1 File menu

Menu item	Description
Import Values...(*1)	Imports the values for setting all together to communication data from a file.

Continues on the next page

Table F8.11.1-1 File menu (Table continued)

Menu item	Description
Export Values...(*1)	Exports the values for setting all together to communication data to a file.
Exit	Exits from the Communication I/O Lock window.

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Table F8.11.1-2 Edit menu

Menu item	Description
Cut(*1)	Cut
Copy(*1)	Copy
Paste(*1)	Paste
Delete(*1)	Delete
Select All	Select All (the same as pressing the [Ctrl] key + the [A] key on the keyboard)

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Table F8.11.1-3 Mode menu

Menu item	Description
Subsystem Communication	Switches to the subsystem communication screen.
Safety Subsystem Communication	Switches to the safety subsystem communication screen.

Table F8.11.1-4 Lock menu

Menu item	Description
Lock Modules	Locks all modules selected.
Unlock Modules	Unlocks all modules selected.
Set Values(*1)	Sets all values of communication data.

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Table F8.11.1-5 Option menu

Menu item			Description
Numerical Display	INT	Decimal	Decimal expression(*1)
		Hexadecimal	Displays in hexadecimal number format.
	REAL	1.234E+12	Exponential notation
		12.34567	Displays 5 decimal places.
		123.4567	Displays 4 decimal places.
		1234.567	Displays 3 decimal places.
		12345.67	Displays 2 decimal places.
		123456.7	Displays 1 decimal places.
Data Acquiring Mode	All Modules		Changes data acquiring mode to "All Modules" mode
	Selected Modules		Changes data acquiring mode to "Selected Modules" mode

*1: A negative sign is added if the value of a signed integer is negative.

Toolbar

The following buttons are provided on the toolbar:

Table F8.11.1-6 Toolbar buttons

Button	Description
(*1)	Imports the values for setting all together to communication data from a file. Same as choosing [Import Values] from [File] menu.
(*1)	Exports the values for setting all together to communication data to a file. Same as choosing [Export Values] from [File] menu.
	Locks all modules selected. Same as choosing [Lock Modules] from [Lock] menu.
	Unlocks all modules selected. Same as choosing [Unlock Modules] from [Lock] menu.
(*1)	Sets all values of communication data. Same as choosing [Set Values] from [Lock] menu.
(All Modules) (Selected Modules)	Switch data acquisition modes (same as the [Data Acquiring] on the [Option] menu. Switches between [All Modules] and [Selected Modules])
[Subsystem] (displayed on right edge as a string)	Switching to the subsystem communication mode Enabled with I/O list engineering, when the SCS type is S2SC70/ L1SC70 (similar to [Subsystem Communication] in the [Mode] menu)
[Safety Subsystem] (displayed on right edge as a string)	Switching to the safety subsystem communication mode Enabled with I/O list engineering, when the SCS type is S2SC70 (similar to [Safety Subsystem Communication] in the [Mode] menu)

*1: Displayed only when the SCS project target name is SCS_SIMULATOR.

Data acquisition mode

The data acquisition mode is used when acquiring data values and statuses from an SCS.

- "All modules" mode
  Communication data corresponding to the communication definitions of all subsystem communication modules defined in the applicable SCS project will be acquired sequentially.
- "Selected modules" mode
  Communication data corresponding to the communication definitions of the subsystem communication modules selected in the Communication Module List View will be acquired sequentially.

  While data is acquired, "Updating Selected Modules" is displayed in the Communication Module List View and Communication Data List View.

Communication Module List view

The Communication Module List view displays a list of communication modules defined in the current SCS project opened with SCS Manager. However, Modbus slave modules are excluded. The following communication modules are displayed:

Table F8.11.1-7 Displayed communication modules

Mode	Module model name	Display method
Subsystem communication mode	ALR111M ALR121M ALE111M	Displayed in the form of the following two lines for each module: • A line indicating the input communication definition • A line indicating the output communication definition This view always shows two lines even when there are no communication definitions or a subsystem communication FB is not specified for a communication definition.

Continues on the next page

Table F8.11.1-7 Displayed communication modules (Table continued)

Mode	Module model name	Display method
Safety subsystem communication mode	S2LP131	A single line indicating the input communication definition is displayed for each module. This is displayed even when there are no communication definitions or a fire and gas communication FB is not specified for a communication definition.

When the subsystem communication module is used in a dual-redundant configuration, information of the module in the odd-number slot is displayed regardless of which module is currently operating. Note, however, that the L and D fields show the corresponding statuses of the module on the control side.

The following items are displayed in the Communication module list view:

Table F8.11.1-8 Items displayed in Communication Module List view

Item	Description
L	Lock status of communication data for the communication module
D	Consistency/discrepancy of logical data and physical data of communication data for the communication module
Module	Communication module name (with node number (n) and slot number (s))
I/O	Signal direction of the communication module ([I]: input, [O]: output)
Comment	Comments for the communication module

Lock status of communication data for the communication module

Table F8.11.1-9 Lock status display (L field)

LED	Meaning
(No symbol)	None of the communication data is locked.
✶(yellow)	Part of the communication data is locked
✹ (red)	All communication data are locked.
? (black)	Communication with the SCS is disabled.

Consistency/discrepancy of logical data and physical data of communication data for the communication module

Discrete inputs and outputs are deemed to have "discrepancy" if the logical data and physical data of the data value or data status are different.

Analog inputs and outputs are deemed to have "discrepancy" if the logical data and physical data of the data status are different.

Table F8.11.1-10 Data consistency/discrepancy display (D field)

Display	Meaning
(No symbol)	All communication data are consistent.
● (yellow)	Some communication data have discrepancy.
⦿ (red)	All communication data have discrepancy.
? (black)	Communication with the SCS is disabled.

The consistency/discrepancy display of communication data for each communication module varies depending on the data acquisition mode.

- When the data acquisition mode is "All Modules"

Data corresponding to all communication modules defined in the applicable SCS project will be refreshed and displayed sequentially.

- When the data acquisition mode is "Selected Modules"
  Data corresponding to the communication modules selected in the Communication Module List View will be refreshed and displayed sequentially. A "?" symbol will be shown in the D field for communication modules that are not selected.

Filtering

Using a drop-down list box, communication module I/O can be filtered based on input/output. Only Inputs can be selected in the safety subsystem communication mode.

Table F8.11.1-11 Drop-down list box in Communication Module List view

Menu item	Operation
Inputs/Outputs	Both the input and output lines of communication definitions are displayed.
Inputs	Only the input lines of communication definitions are displayed.
Outputs	Only the output lines of communication definitions are displayed.

Pop-up menu

Click the right mouse button on the Communication Module List View to display the pop-up menu.
The following menu items are displayed in the pop-up menu:

Table F8.11.1-12 Pop-up menu in Communication Module List View

Menu item	Description
Select All	Selects all displayed modules. Same as choosing [Select All] from [Edit] menu and same action as pressing the [Ctrl] key and [A] key together.

Communication group list view

In the safety subsystem communication mode, lists are displayed to the number of PROFINET modules displayed in the Fire and Gas Comm. I/O Definition tab of Communication I/O Builder. A list is displayed for every fire and gas communication module that is connected.

This list view is not displayed in the subsystem communication mode.

The following table shows the items that are displayed in the communication group list view.

Table F8.11.1-13 Items displayed in the communication group list view

Item name	Displayed content	Meaning
L	Lock status of the communication data for the PROFINET module	The displays and meanings are the same as in the communication module list view.
D	PROFINET module communication data consistency	The displays and meanings are the same as in the communication module list view.
%XW	Element number	The element number of the corresponding PROFINET module.
PN-Module	PROFINET module name	The module name displayed here is that which is defined in the column for Module Name on the Safety Subsystem Comm. I/O Definition tab of Communication I/O Builder.

Continues on the next page

Table F8.11.1-13 Items displayed in the communication group list view (Table continued)

Item name	Displayed content	Meaning
I/O	PROFINET module signal direction	The displays and meanings are the same as in the communication module list view.
Comment	Comments for the PROFINET module	The comment defined in the column for Comment on the Safety Subsystem Comm. I/O Definition tab of Communication I/O Builder is displayed. This is based on the Device Tag for the signal definition in Safety Communication I/O Editor of AD Organizer.

Communication Data List view

The information of communication data wired to subsystem communication I/O FB or safety subsystem communication I/O FB is displayed for the communication modules selected in the Communication Module List view.

When the communication input line of a communication module is selected in the Communication Module List View, information of the communication data corresponding to the applicable input communication definition will be displayed.

When the communication output line of a communication module is selected in the Communication Module List View, information of the communication data corresponding to the applicable output communication definition will be displayed.

With S_SLSMOD, the subsystem communication program for the ProSafe-SLS communication function, communication data of the SLSEVENT data type can be defined. However, SLSEVENT is special data for event collection and cannot be wired to the subsystem communication function blocks. Accordingly, communication data of SLSEVENT data type are not displayed in the Communication Data List View and thus not locked or allow values to be set.

Table F8.11.1-14 Items displayed in Communication Data List view

Item	Description
Definition	Communication definition
%WB, or %XB	Element number
L	Lock status of communication data
D	Consistency/discrepancy of communication data
Instance	Instance name of the wired subsystem communication I/O FB
Logical Value	Logical data of data value and data status
Physical Value	Physical data of data value and data status
Set Value(*1)	Set value of data value and data status, respectively
Comment	Comment for the subsystem communication I/O FB

*1: Displayed and editable only when the SCS project target name is SCS_SIMULATOR.

Communication definition

The display items of the communication definition of the subsystem communication are as follows:

```
n-sConnectionDevice:c
Portp:DataType
```

Table F8.11.1-15 Display items of the communication definition of the subsystem communication

Item	Description
n	Node number
s	Slot number
ConnectionDevice	Communication program name S_MODBUS: For RTU mode Modbus communication S_MODTCP: For Modbus/TCP S_SLSMOD: For ProSafe-SLS communication
c	Communication definition number
p	Port number
DataType	Data type DI: Discrete input DO: Discrete output I16 Input: Analog input (16-bit signed integer) I32 Input: Analog input (32-bit signed integer) U16 Input: Analog input (16-bit unsigned integer) R32 Input: Analog input (32-bit floating) I16 Output: Analog output (16-bit signed integer) I32 Output: Analog output (32-bit signed integer) U16 Output: Analog output (16-bit unsigned integer) R32 Output: Analog output (32-bit floating)

TIP

Communication definition numbers specify communication definitions defined in one subsystem communication module. A "communication definition" is a block of data of the same data type specified by the "Size," among the data included in the "Buffer" assigned to each communication module specified by the "Program Name" in the Communication I/O Builder. Communication definition numbers are sequential numbers (starting from 1) assigned for each subsystem communication module.

The display items of the communication definition of the safety subsystem communication are as follows:

```
n-sConnectionDevice:AlarmInfo
DataType
```

Table F8.11.1-16 Display items of the communication definition of the safety subsystem communication

Item	Description
n	Node number
s	Slot number
ConnectionDevice	Communication program name S_FGCOM: For fire and gas communication
AlarmInfo	String of alarm information
DataType	Data type I8 Input: Analog input (8-bit signed integer) I16 Input: Analog input (16-bit signed integer) I32 Input: Analog input (32-bit signed integer) U8 Input: Analog input (8-bit unsigned integer) U16 Input: Analog input (16-bit unsigned integer) U32 Input: Analog input (32-bit unsigned integer) R32 Input: Analog input (32-bit floating)

Element number

- When %WBnnnnbb, nnnn is 2001 through 3000, bb is 01 through 16
- When %XBnnnnbb, nnnn is 0001 through 4000, bb is 01

Lock status of communication data

Table F8.11.1-17 Lock status display (L field)

LED	Meaning
(No symbol)	Communication data is not locked.
✶ (red)	Communication data is locked.
? (black)	Communication with the SCS is disabled.

Consistency/discrepancy of communication data

Discrete inputs and outputs are deemed to have "discrepancy" if the logical data and physical data of the data value or data status are different.

Analog inputs and outputs are deemed to have "discrepancy" if the logical data and physical data of the data status are different.

Table F8.11.1-18 Communication data consistency/discrepancy display (of D field)

Display	Meaning
(No symbol)	Communication data is consistent.
● (red)	Communication data has discrepancy.
? (black)	Communication with the SCS is disabled.

Instance name

The instance name of the subsystem communication I/O FB wired to %WB or the fire and gas communication I/O FB wired to %XB is displayed. The display and meaning of the instance name is as follows:

V: Data value

STS: Status

Logical data and physical data

For BOOL-type data, "TRUE" or "FALSE" is displayed. DINT-type data and REAL-type data are shown in the display format specified in the [Option] menu. The data status is displayed as either "GOOD" or "BAD". If communication with the SCS is disabled, "******" is shown.

Refreshing of communication data consistency/discrepancy, logical data and physical data display

How the consistency or discrepancy of each communication data is displayed, and how data values and statuses of logical data and physical data is refreshed, depend on the data acquisition mode.

- When the data acquisition mode is "All Modules"
  Data will be acquired sequentially from the communication definitions of all subsystem communication modules and fire and gas communication modules defined in the applicable SCS project. The display of the Communication Data List View will be refreshed once communication data is acquired.
- When the data acquisition mode is "Selected Modules"
  Data will be acquired sequentially from the communication definitions of the communication modules selected in the Communication Module List View. If only communication module inputs are selected, data will be acquired only from the input communication definitions. If only communication module outputs are selected, data will be acquired only from the output communication definitions. The display of the Communication Data List View will be refreshed once communication data is acquired.

Filtering

The communication data to be displayed can be filtered using the drop-down list box.

Table F8.11.1-19 Drop-down list box of Communication Data List view

Item	Operation
All Data	Information of all communication data is displayed.
Locked Data	Only information of locked communication data is displayed.
Unlocked Data	Only information of unlocked communication data is displayed.

Pop-up menu

Click the right mouse button on the Communication Data List View to display a pop-up menu. However, this is available only when the SCS project target name is SCS_SIMULATOR. The following menu items are displayed in the pop-up menu:

Table F8.11.1-20 Items on pop-up menu in the Communication Data List View

Menu item		Description
Cut		Same as [Cut] command on [Edit] menu.
Copy		Same as [Copy] command on [Edit] menu.
Paste		Same as [Paste] command on [Edit] menu.
Delete		Same as [Delete] command on [Edit] menu.
Select All		Same as [Select All] command on [Edit] menu.
Input Values ▶	Set .V=TRUE	Sets the data of Set Value to TRUE (only for DI/DO).
	Set .V=FALSE	Sets the data of Set Value to FALSE (only for DI/DO).
	Clear .V	Clears the data of Set Value.
	Set .STS=GOOD	Sets the data status of Set Value to GOOD.
	Set .STS=BAD	Sets the data status of Set Value to BAD.
	Clear .STS	Clears the data status of Set Value.

Selecting communication data

If the SCS project target name is SCS_SIMULATOR, you can select any communication data in the Communication Data List View.

- Clicking a communication data while pressing the [Shift] key on the keyboard, the communication data of the continuous lines can be selected.
- Clicking a communication data while pressing the [Ctrl] key on the keyboard, the communication data of the separated lines can be selected.
- Choosing [Select All] from pop-up menu, all communication data can be selected.

Message display area

The results of all data locking operations, all data unlocking operations and Forcing function operations are displayed as messages. The displayed messages are cleared each time a new operation is executed.

Status bar

The status bar shows the following information relating to the subsystem communication modules shown in the Communication Module List View.

- Input Selected: Number of selected input lines/number of all input lines
- Output Selected: Number of selected output lines/number of all output lines

F8.11.2 Operations in the Communication I/O Lock window

The following operations can be performed in the Communication I/O Lock window:

- Lock all input data and/or all output data for each subsystem communication module
- Unlock all input data and/or all output data for each subsystem communication module
- Set data values and data status for locked data
- Set all input data and/or all output data for each subsystem communication module (only in SCS Simulation Test).
- Lock or unlock all inputs of a fire and gas communication module
- Lock or unlock each communication definition (PROFINET module) connected to a fire and gas communication module

Performing an all lock or all unlock operation by selecting input and output of a given module will lock or unlock all subsystem communication data of the module.

You can also specify locked data and set values individually. A data value (V) is set for each communication data item, while a data status value (STS) is set for each communication definition.

In SCS Simulation Test, you can set values all together to the communication data for the communication modules.

IMPORTANT

- None of the previously mentioned operations can be executed during a build or download.
- If you select more than 20 PROFINET modules in the communication group list and try to perform an all lock or all unlock operation, an error will result.

Selection of communication modules and communication groups

A desired communication module can be selected in the Communication Module List view.

A desired communication group can be selected in the Communication Group List view.

- Selecting [Inputs/Outputs] in the drop-down list box will display communication definitions for all inputs and outputs.
- Selecting [Inputs] in the drop-down list box will display communication definitions for all inputs.
- Selecting [Outputs] in the drop-down list box will display communication definitions for all outputs.

When the following operations are performed, communication data is displayed in the Communication Data List view:

- Clicking an input line or output line of a communication module or communication group without pressing the [Shift] key or [Ctrl] key on the keyboard will display the communication data for the communication definitions of the communication module or communication group of the clicked line.
- Clicking an input line or output line of a communication module or communication group while holding down the [Shift] key on the keyboard will display the communication data for the communication definitions of the communication modules or communication groups of the lines between the line previously clicked (without holding down the [Shift] key) and the line clicked this time.

- Clicking an input line or output line of a communication module or communication group while holding down the [Ctrl] key on the keyboard will display the communication data for the communication definitions of the communication module or communication group of the clicked line, in addition to the communication data currently shown.
- Selecting [Select All] in the pop-up menu on the Communication List view will display communication data for the communication definitions of all communication modules currently shown in the Communication Module List view.

Locking all I/O of communication modules

Communication modules can be locked in the following units.

- All inputs of a communication module
- All outputs of a communication module
- All inputs and outputs of a communication module
  Inputs and outputs are specified at the same time.
- All inputs of a fire and gas communication module
- Lock of each PROFINET module connected to a fire and gas communication module
  A PROFINET module corresponds to a communication definition.

1. In the Communication Module List view, select the communication modules you want to perform "all lock" for.
2. In the Communication Data List view, check for discrepancy between the logical data and physical data of each data value and status of the selected subsystem communication module to confirm that locking will not cause any problems.
3. From the menu bar, select [Lock] > [Lock Modules]. Alternatively, click the [Lock] button on the toolbar.
   If you have selected more than 20 PROFINET modules in step 1, an error dialog box appears and the I/O of the modules will not be locked.

   If you have selected 20 or less PROFINET modules, a confirmation dialog box appears.
4. To execute the operation, click [OK].
   The selected inputs or outputs are locked at a time.

Unlocking all I/O of communication modules

This function unlocks all of the selected communication modules in a batch.

1. In the Communication Module List view, select the communication modules you want to perform "all unlock" for.
2. In the Communication Data List view, check for discrepancy between the logical data and physical data of each data value and status of the selected subsystem communication module to confirm that unlocking will not cause any problems.
3. From the menu bar, select [Lock] > [Unlock Modules]. Alternatively, click the [Unlock] button on the toolbar.
   If you have selected more than 20 PROFINET modules in step 1, an error dialog box appears and the I/O of the modules will not be unlocked.

   If you have selected 20 or less PROFINET modules, a confirmation dialog box appears.
4. To execute the operation, click [OK].
   The selected inputs or outputs are unlocked at a time if there is no discrepancy between the logical data and physical data for the communication data of the communication definitions of the target modules.

A reconfirmation dialog box appears if there is any discrepancy between the logical data and physical data for the communication data of the communication definitions of the target modules.

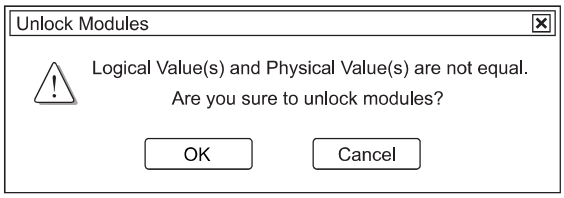

Figure F8.11.2-1 Unlock reconfirmation dialog box

5. Click [OK] to perform the unlock. To cancel the operation, click [Cancel].

Set value to each communication data

For each communication data, the value of data and data status can be set.

IMPORTANT

Setting values to communication data cannot be executed while Build or Download is running.

Double-clicking any field between "%WB" and "Physical Value" for locked data in the Communication Data List View will display the dialog box in which you can set the data value or status of the communication data in the clicked line.

If the upper part of the line showing a data value is double-clicked, the Write data value dialog box appears. If the lower part of the line showing a data status is double-clicked, the Write data status dialog box appears.

Set values in these dialog boxes. A data value is set for each communication data item, while a data status is set for each communication definition. Once a data status value is set, the value will be reflected in all data statuses within the same communication definition.

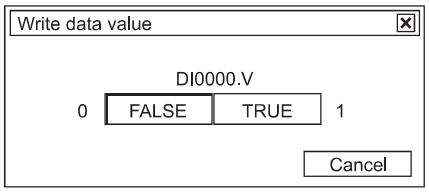

Figure F8.11.2-2 Write Data Value dialog box (discrete input/output)

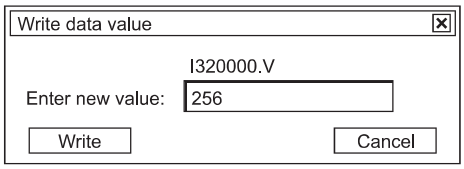

Figure F8.11.2-3 Write Data Value dialog box (analog input/output)

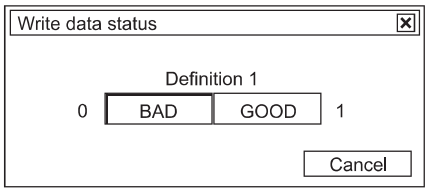

Figure F8.11.2-4 Write Data Status dialog box

When the Write data value dialog box or Write data status dialog box opens for a discrete input or output, the button corresponding to the current value is already selected.

With an analog input or output, the current value is displayed when the Write data value dialog box opens.

Whether logical data or physical data is displayed is determined based on which of the two values can be set at the time. Logical data is displayed if the logical data can be set, and physical data is displayed if the physical data can be set. The following table shows the default display for the dialog box.

Table F8.11.2-1 Initial displays of Write Data Value dialog box

Data	Initial display	
	Locked	Not locked
Input communication data: Data value	Logical data	Logical data
Input communication definition: Data status	Logical data	Logical data
Output communication data: Data value	Physical data	Logical data
Output communication definition: Data status	Logical data	Logical data

Set values to multiple items of communication data together

Using the SCS Simulator, you can set values to multiple communication data items together. The following batch operations can be performed for the communication data from the communication module selected in the Communication Module List View.

- Set values to the communication data.
- Save the set values for the communication data in a file.
- Read values form a file and set them to the communication data.

Note that the number of communication data values set at a time should be 700 or less. If more data values are set at a time, some of the system alarm messages informing the data setting or data status setting may not be transmitted.

Enter the values to be set to communication data

The values can be entered to the "Set Value" items on Communication data list view.
The value can be entered using any of the following operations. After entering the values, you need to set all the values to the communication data.

- Enter a Value Directly
  On Communication Data List View, click "Set Value" items on the line of the communication data that you want to enter the value for. By clicking the data value or data status, they can be entered directly.

  For BOOL type data, each click switches between TRUE, FALSE, and empty (nothing specified).

  For DINT or REAL type data, values can be entered directly from the keyboard.
- Edit multiple data values
  From [Edit] menu or from the pop-up menu after a right clicking, you can use [Cut], [Copy], [Paste] and [Del] commands to edit the values of multiple "Set Value" items.
- Entering values using [Input Values][Input values] on the pop-up menu.
  Right clicking on the Communication Data List View, a pop-up menu will be displayed. Using [Input Values] item on the pop-up menu, the data values and data status for "Set Value" items can be defined.

  For example, if you want to set all communication data to FALSE, you can use [Select All] command on the pop-up menu to select all "Set Value" items, and then you can choose [Set .V=FALSE] of the [Input Values] from the pop-up menu.

Set values to multiple communication data

For the selected communication modules, the values of "Set Value" items on the Communication Data List View can be set together to the communication data.

IMPORTANT

Setting values to communication data cannot be executed while Build or Download is running.

The procedure is as follows:

1. On Communication Module List View, choose a communication module that you want to set the values for.
2. Choose [Set Values] from [Lock] menu or click [Set Values] button on the toolbar so as to display Set Values dialog box.
3. Click [OK] for setting values.
   All the values entered in the "Set Value" items will be set to the communication data. If no values are entered, the communication data will not be changed.
   Click [Cancel] to cancel the operation.

Export the setting values to a file

The values for "Set Value" items of the communication data can be exported to a file.
The procedure is as follows:

1. Choose [Export Values] from [File] menu, or click the [Save (Export Values)] button on the toolbar
   so as to display a dialog box for selecting files.
2. Specify the CSV file for saving the setting values and then click [Save].
   The communication data values and data statuses for all the communication modules on the Communication Module List View will be exported to the file.

IMPORTANT

Do not edit the exported file if you want to import the file later.

Import the setting values from a file

The values for "Set Value" items of the communication data can be imported from a file.

IMPORTANT

Do not import any file other than the file exported from Communication I/O Lock window.

The procedure is as follows:

1. Choose [Import Values] from [File] menu, click the [Open (Import Values)] button on the toolbar
   so as to display a dialog box for selecting files.
2. Choose the CSV file that contains the setting values and then click [Open].
   The communication data values and data statuses of all the communication modules on the Communication Module List View will be displayed with the data values and data statuses imported from the file.

If the values of data statuses differ among communication data in the same communication definition in the CSV file, a warning message is displayed and the data status value of the first communication data in the same communication definition is set to all the communication data within the same communication definition.

F9. Software Configuration Viewer

Software Configuration Viewer is a tool that displays information related to the ProSafe-RS software installed on a PC. Software Configuration Viewer has the following functions.

- Displaying the system release number
- Displaying user names and company name
- Displaying the ID number (System ID license number)
- Displaying intellectual property rights, copyrights and registered trademarks included in the ProSafe-RS software
- Displaying the package names and number of licenses
- Displaying installation logs
- Displaying the program revisions
- Displaying registry information
- Printing information displayed in Software Configuration Viewer

SEE ALSO For more information about Starting Software Configuration Viewer, refer to:

"ProSafe-RS and ProSafe-RS Lite applications that can start from Start menu" in Read Me First (IM 32P01A30-01EN)

Tabs of Software Configuration Viewer

Software Configuration Viewer contains the following tabs.

- All
- Install Log
- Program Information
- Registry

IMPORTANT

The Registry tab is displayed only when you have logged on as an administrative user. It is not displayed when you have logged on as a non-administrative user.

Functions of the tabs in Software Configuration Viewer are explained as follows.

All tab

The All tab displays the following items.

- System release number
- User names and company name
- System ID license number
- Intellectual property rights, copyrights and registered trademarks included in the ProSafe-RS software

Install Log tab

The Install Log tab displays the history of installation tasks.

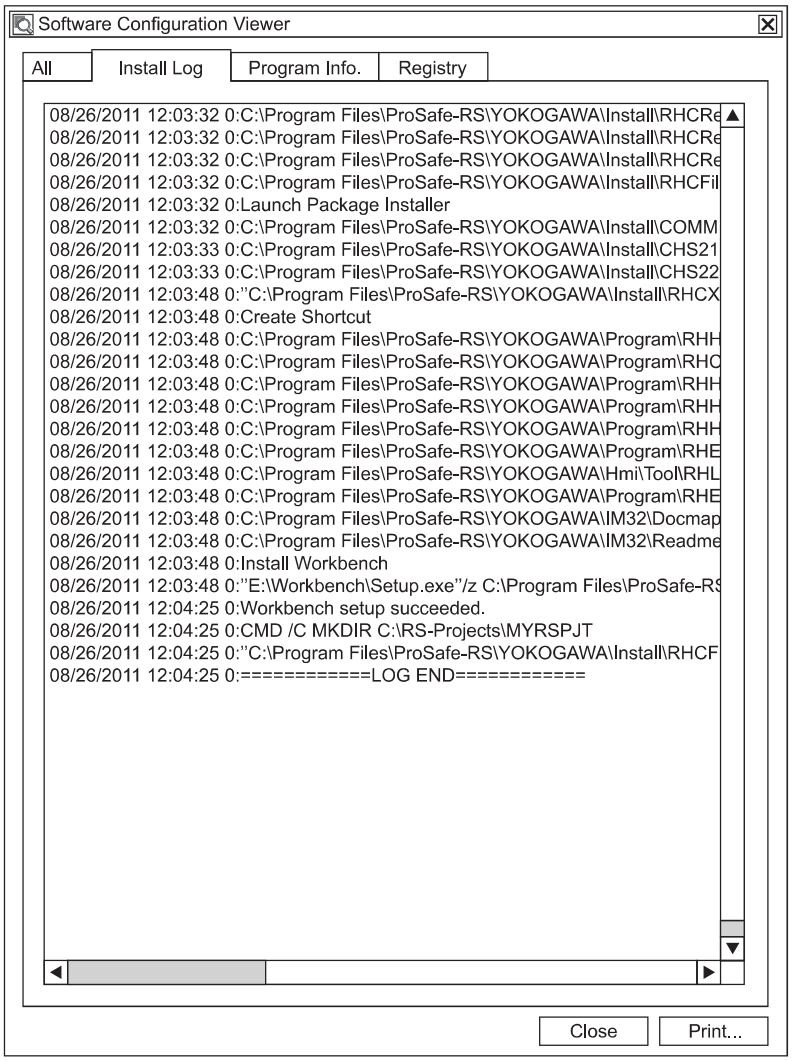

Figure F9-1 Example of Install Log tab

Program Info. tab

The "Program Info." tab displays the detailed information of the ProSafe-RS software installed in the PC. It displays the version information and creation dates of executable modules (*.exe), drivers (*.sys) and libraries (*.dll) of the ProSafe-RS software.

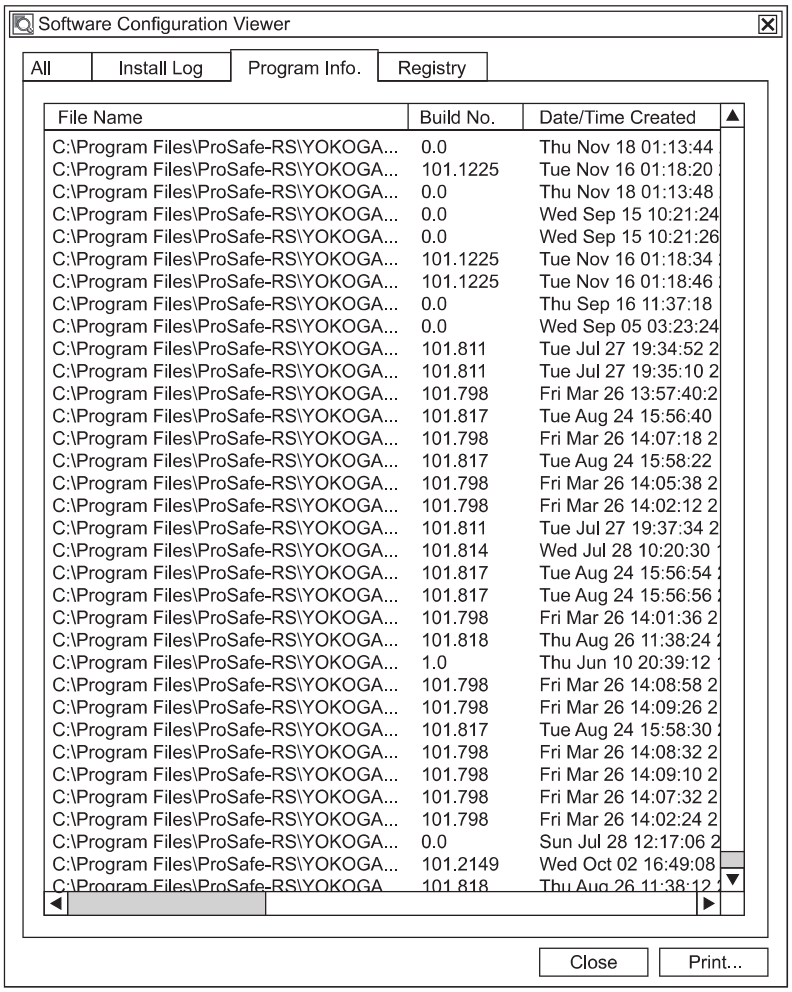

Figure F9-2 Example of Program Info. tab

The information about the Workbench and Multi-Language Editor is not available in "Program Info.". The following section explains how to display detailed information for Workbench and Multi-Language Editor.

1. In Workbench, select [Help] > [About].
   The About dialog box appears.
2. Click the [Info].
   Detailed information regarding Workbench and Multi-Language Editor is displayed.

Registry tab

The Registry tab displays names and values of registry entries set or used by the ProSafe-RS software.

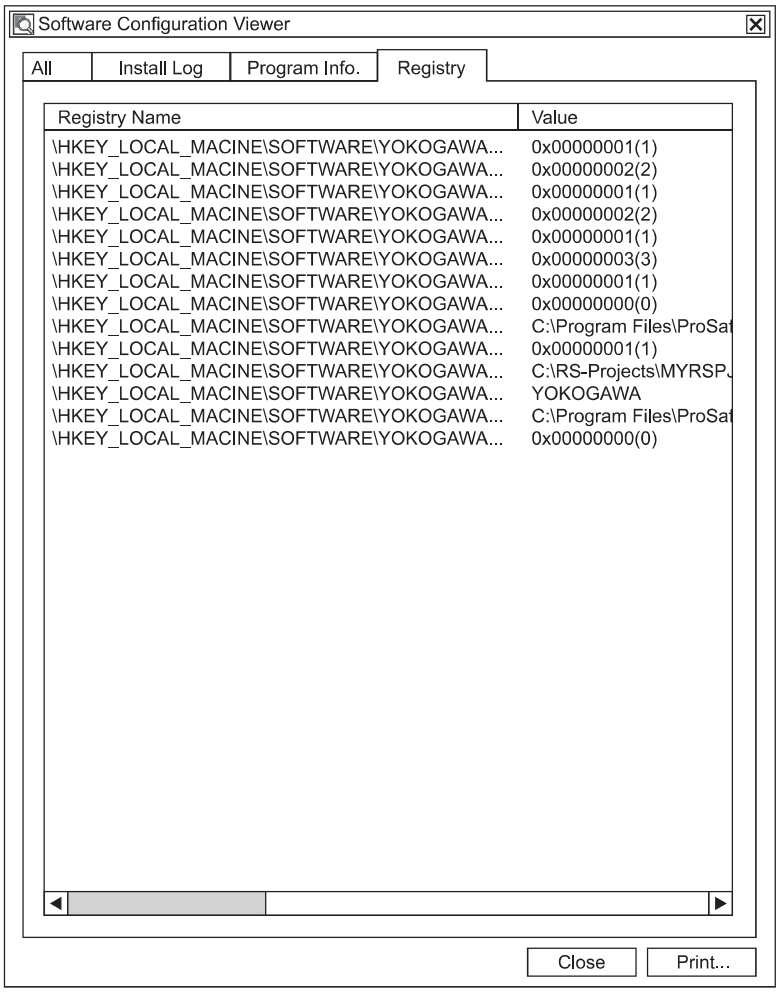

Figure F9-3 Example of Registry tab

IMPORTANT

The Registry tab is displayed only when you have logged on as an administrative user. It is not displayed when you have logged on as a non-administrative user.

Printing displayed information

It is possible to printout the information displayed in a tab through a printer by clicking the [Print] button on the tab.
The displayed information can be printed out with the following steps.

1. Click the [Print] button
   so as to open Create Report dialog box.

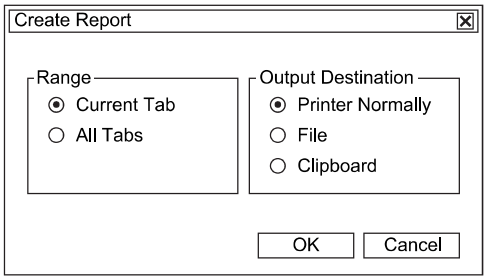

Figure F9-4 Create Report dialog box

2. Select one of the options in the "Range" section.
   By default, [Current Tab] is selected.
   - If you select [Current Tab], only the information displayed in the currently displayed tab is printed out.
   - If you select "All Tabs," the information displayed in all of the tabs is printed out in sequence.
     If you select [All Tabs], the information of the "Registry" tab will be printed out even if the current login user does not have the Administrator privilege.
3. Select one of the options in the "Output Destination" section.
   By default, [Printer Normally] is selected.
   - If you select [Printer Normally], the information is printed out through the default printer of the PC. On each page, the date and time of printing and a sequential page number starting from 1 are added as the header and footer respectively.
   - If you select [File], the Windows standard "Save As" dialog box will appear. Specify the file name and saving destination and save the information. The default file name and extension are "rssoft.txt."
   - If you select [Clipboard], the information will be copied to the clipboard. Then it is possible to paste the information into another application for editing.
4. If you selected [Printer Normally] or [Clipboard] for "Output Destination", click the [OK] button on the Create Report dialog box.
   Printing to the specified destination is started.

F10. Builder Environment Tool

Builder Environment Tool can be used for configuring builder font and other builder environment settings. This section describes how to use the Environment Setting window.

Target builders of Builder Environment Tool

This tool is used as required when customizing builder operations. The use of this tool is not mandatory. The target builders of this tool are shown below.

- SCS Constants Builder
- I/O Parameter Builder
- Tag Name Builder
- Alarm Priority Builder
- Alarm Processing Table Builder
- Modbus Address Builder
- Communication I/O Builder
- DNP3 Communication Builder

Note that settings made in this tool are not applied to SCS Manager and Multi-Language Editor.

Displaying Builder Environment Tool

Builder Environment Tool is opened by selecting [Environment Setting] in the [Tools] menu of each of the builders.
When the Environment Setting window is displayed, the builders of this tool cannot be operated on.

Click [OK] button to reflect the setting when starting up a builder.

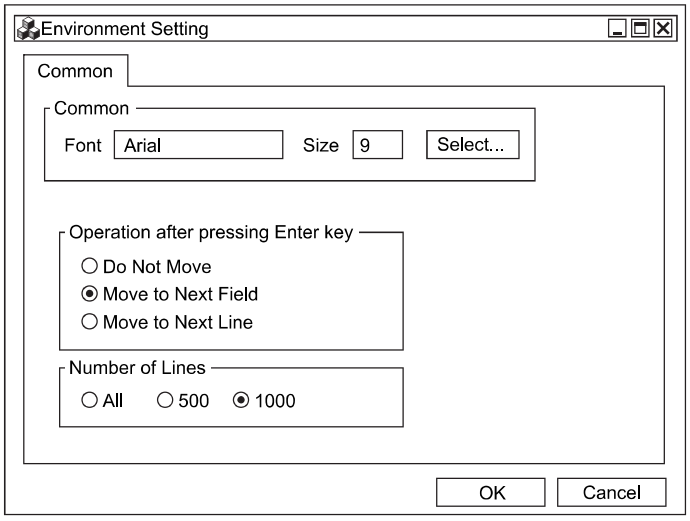

Figure F10-1 Environment Setting window

Common

This section allows setting font type and size for character strings displayed in the workspace. Click [Select] to display the following Font selection dialog box. Select a font type from [Font] and [Script], and specify the size as well. Note that [Font style] cannot be specified with this dialog box.

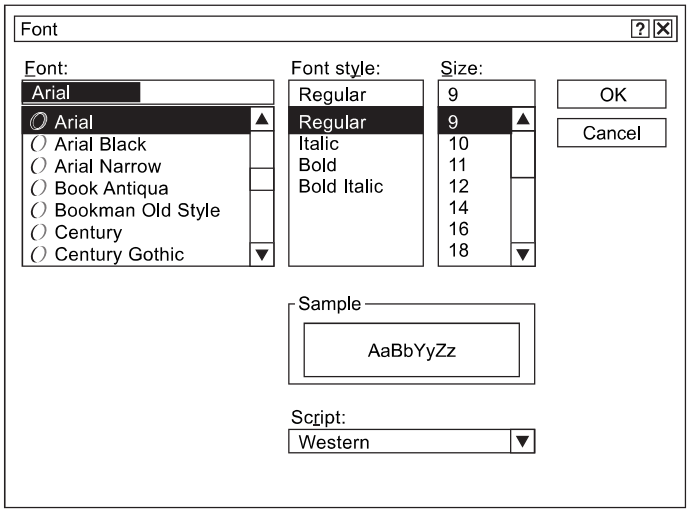

Figure F10-2 Font Selection dialog box

Operation after pressing Enter key

In this section, it is possible to specify the destination field that the cursor jumps to when the [Enter] key is pressed in spread-sheet type windows.

Table F10-1 Destination of the cursor

Item	Description
Do Not Move	Do not move the cursor
Move to Next Field	Move the cursor to the next field
Move to Next Line	Move the cursor to the next line

Number of lines

In this section, it is possible to specify the maximum number of lines that can be displayed in the document window. This setting is applied to Comm. I/O Wiring Tab of Communication I/O Builder and Modbus Address Builder.

If [All] is selected, the maximum number of displayed lines of the builder will be set as the maximum number of lines for each tab. If another value is specified, the value is set as the maximum number of displayed lines. If more lines than the maximum number of displayed lines are to be displayed, a page switch button is displayed on the upper part of the tab.

For example, if 1000 is specified for the maximum number of display lines in a tab that displays 4000 lines, four page switch buttons are displayed.

The default value is 1000.

Revision information

Title : Engineering Reference Manual

Manual No. : IM 32P04B10-01EN

Nov. 2022/9th Edition/R4.08 or later

F1	Added precautions when building.

Jan. 2022/8th Edition/R4.07

C1.1	Added descriptions of password change.
F8.7	Updated the reference of POU Reference Manual.

Feb. 2021/7th Edition/R4.06

Introduction	Added description of Full Names and Simplified Terms.
B3.1.5	Added descriptions of Work Status List window.
B4.2	Added descriptions of automatic check-out/check-in.
B4.3.4	Added column operations.
B4.4	Added descriptions of the common grid rule function, Match Case Type Options, and Match Text Type Options. Changed the number of condition and action definitions to 20. Changed the number of columns that can be changed simultaneously at grid rule execution to 10 columns. Added regular expression usage examples.
C2.9.1	Added descriptions of filtering by range and dates of Change Sets.
C2.9.3	Added descriptions of how to display a list view and detail view of files.
F1, F8	Added SCSL2 to station type.
F8.8.1	Added L1EC402 and L1EC401ESB to the model name of ESB bus coupler module.
F8.11	Added L1SC70 to SCS type.

Dec. 2019/6th Edition/R4.05

Introduction	Updated the description of registered trademarks and trademarks.
A1	Updated the term definitions of I/O list engineering and RS original engineering.
A4, B1, B3.1.1, B3.2, C1.2.2	Added descriptions of the Safety I/O parameter profile.
B4.3	Added descriptions related to the change of display method of AD Organizer.
B4.3.1	Updated descriptions of the search function of AD Organizer.
B4.3.2	Added descriptions of the sort function of AD Organizer.
B4.3.3	Added descriptions of the filter function of AD Organizer.
C1.1.5	Updated descriptions of restoring RS projects.
C1.2.2	Updated descriptions of user roles and access scopes.
F4	Updated descriptions of the procedures for using Master Database Restoring function.
F5.4	Updated descriptions of the procedures for using Version Control Tool.

Aug. 2018/5th Edition/R4.04

Introduction	Updated the description of registered trademarks of YOKOGAWA.

A1	Changed explanations due to changing the SCS Manager start-up method.
A1, B3.1.1, B3.1.2, B3.1.6, B4.3, B4.4	Updated the figure due to adding the SCS Manager start-up button.

Oct. 2017/4th Edition/R4.03.10

Introduction	Added the fire and gas communication module to the description of a term.
A4	Updated application capacity of AD Suite.
B3.1.1, B3.2, B4.2.1, C1.2.2, C2, F1	Added Safety Communication I/O Editor.
B4.4	Added descriptions of grid rule definitions.
C1.2.2	Added descriptions of access rights when the AD server is upgraded.
F1	Updated descriptions to support Safety Communication I/O Editor, and added items displayed on the CENTUM Integration tab.
F2.2, F2.4	Added fire and gas communication definitions and the wiring information as printing targets.
F4, F5	Added descriptions of how to start the tool and differences in behavior.
F5.3, F5.4	Updated descriptions of checking in and checking out project data.
F5.7	Added descriptions of version information.
F6.2, F6.3	Added descriptions of the display of Project Comparing Tool.
F8	Added and updated descriptions of the forcing function. Added new function blocks.
F8.7	Added forcing functions for safety subsystem communication data.
F8.11	Added and updated descriptions of the Communication I/O Lock window.

May 2017/3rd Edition/R4.03

Introduction	Deleted "Windows Vista" from the description of trademarks.
A3	Changed examples of system configurations.
C1.1.7	Changed explanations for ADMDB backup settings and procedures.
C1.2.3	Changed explanations for AD project export settings and procedures.
F6.3	Changed explanations for procedures and adding setting items of the Project comparing tool and changed explanations for examples of printouts.

Oct. 2016/2nd Edition/R4.02

Entire manual	Changed the symbols that indicate warning and caution.
Introduction	Updated descriptions in "■ Safety, Protection, and Modification of the Product," "■ Symbols," and "■ Trademark Acknowledgments." Added a new term in "■ Full Names and Simplified Terms."
A1, B1, B3.1.1, B4.2.2, C1.2.2, C2.1, D1, F2, F5.4, F7, F8, F8.1, F8.3	Added explanations on iDefine
Part B to Part D	Updated screen captures related to iDefine.
C2.8	Updated explanations on label configurations.
D2.5	Changed the title.
D2.7	Added explanations on the test function.

F2 Added explanations on AD Organizer.

Attachment 9.10 Test Function Guide

IM32P03B30-01EN

General Specifications

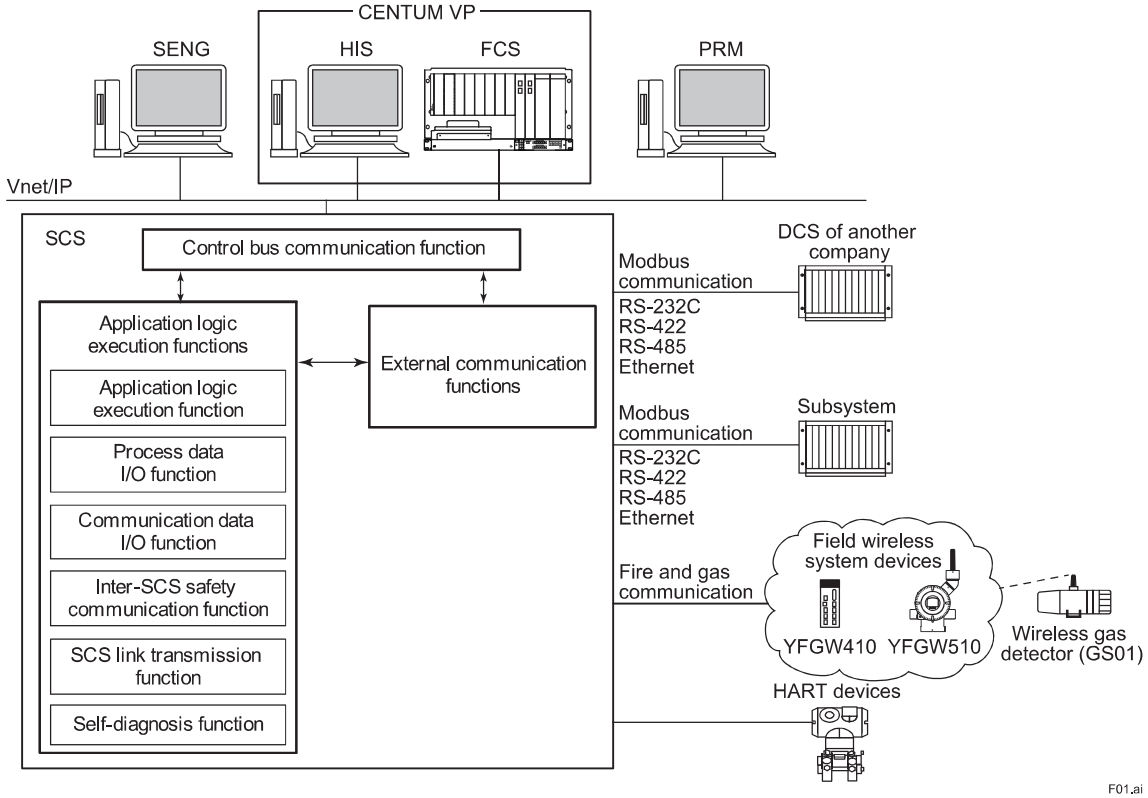
GS 32P03B30-01EN

Model RS4F1500
Safety Control Function (for S2SC70☐)
Model RS4F1505
Safety Control Function for SCS Simulator
(for S2SC70☐)

ProSafe-RS

■ GENERAL

*Safety Control Function is a software package that works on a Safety Control Station (SCS). (*1) The Safety Control Function is to monitor a plant and ensure its safe operation. This software package performs preset safety operations whenever safety control is required.*
RS4F1500 Safety Control Function (for S2SC70☐) is applied to S2SC70☐ Safety Control Unit (for Vnet/IP, N-IO/FIO, Rack Mountable Type). The test functions can be performed by using RS4F1500, or under the virtual test environment where the SCS is not connected, RS4F1505 Safety Control Function for SCS Simulator (for S2SC70☐) can also be used.



*1: The SCS is composed of a safety control unit, N-IO nodes, and safety node units.

■ FUNCTIONAL SPECIFICATIONS

The following describes the configuration and functions of the package are described as follows:

● Configuration of RS4F1500 Safety Control Function

The functions of the package can be divided into two groups: one is an application logic execution functions group and the other is an external connection functions group.

Application Logic Execution Functions

The following functions compose of the main part of the package that monitors the plant and ensures its safe operation, and performs preset safety operations once an abnormality occurs.

- Application logic execution function
- Process data I/O function
- Communication data I/O function (Subsystem communication function)
- Inter-SCS safety communication function
- SCS link transmission function
- Self-diagnosis function

YOKOGAWA

Yokogawa Electric Corporation
2-9-32, Nakacho, Musashino-shi, Tokyo, 180-8750 Japan

GS 32P03B30-01EN
©Copyright Nov. 2015 (YK)
4th Edition July 24, 2018 (YK)

External Communication Functions

This function group, which performs communications between the application logic execution functions and non-SCS equipment, is composed of the following functions:

- CENTUM VP integration function
- Modbus communication function
- Fire and gas communication function
- Sequence of events recorder (SOER) function
- Diagnosis information collection function
- PRM-supported HART on-demand communication

● Application Logic Execution Functions

Details of Application logic execution function, Process data I/O function, Inter-SCS safety communication function, and SCS link transmission function are given below.

Application logic execution function

Application logics are described by using the Function Block Diagram (FBD), the Ladder Diagram (LD), or Structured Text (ST) compliant to the IEC 61131-3 standard.

The following table shows the functions and function blocks used in the FBD. Some of the elements from LD can also be used to describe FBD.

Table Safety Functions (FU) (1/2)

Function	Details
ABS	Gives the absolute (positive) value of a real value
SQRT	Calculates the square root of a real value
+ADD	+, meaning “addition”
× MUL	×, meaning “multiplication”
–SUB	–, meaning “subtraction”
/ DIV	/, meaning “division”
SHL	Make the bits of an integer shift to the left. Shift is made on 32 bits. Zero is used to replace lowest bit.
SHR	Make the bits of an integer shift to the right. Shift is made on 32 bits. Highest bit is copied at each shift.
ROL	Make the bits of an integer rotate to the left. Rotation is made on 32 bits.
ROR	Make the bits of an integer rotate to the right. Rotation is made on 32 bits.
AND	AND
OR	OR
XOR	Exclusive disjunction (exclusive OR)
NOT	Negation
SEL	Selects one of two input values (INTEGER)
SEL_R	Selects one of two input values (REAL)
SEL_T	Selects one of two input values (TIME)
MAX	Selects the larger of two input values (INTEGER)
MIN	Selects the smaller of two input values (INTEGER)
LIMIT	Limits the range of the input values to output (INTEGER)
MUX4	Selects one of four input values (INTEGER)
MUX8	Selects one of eight input values (INTEGER)
MUXBOOL4	Selects one of four input values (BOOL)
MUXBOOL8	Selects one of eight input values (BOOL)
MUXREAL4	Selects one of four input values (REAL)
MUXREAL8	Selects one of eight input values (REAL)
GT	>, meaning “greater than”
GE	>=, meaning “greater than or equal to”
EQ	=, meaning “equal”
LE	<=, meaning “less than or equal to”
LT	<, meaning “less than”
NE	≠, meaning “unequal”
SCALER	Converts a 0-100 % range of input values into a normalized range for outputting

All Rights Reserved. Copyright © 2015, Yokogawa Electric Corporation

Table Safety Functions (FU) (2/2)

Function	Details
1GAIN	Assignment
IB_TO_V	Converts IO_BOOL-type input to data value
IB_TO_S	Converts IO_BOOL-type input to data status
IR_TO_V	Converts IO_REAL-type input to data value
IR_TO_S	Converts IO_REAL-type input to data status

Table Interference-free (*1) Functions (FU)

Function	Details
ANY_TO_BOOL	Converts to BOOL-type
ANY_TO_DINT	Converts to INTEGER-type
ANY_TO_REAL	Converts to REAL-type
ANY_TO_TIME	Converts to TIME-type
POW	Performs power calculation
POWE	Performs calculation of exponential function with base e
ACOS	Calculates the Arc cosine of a real value
ASIN	Calculates the Arc sine of a real value
ATAN	Calculates the Arc tangent of a real value
COS	Calculates the Cosine of a real value
SIN	Calculates the Sine of a real value
TAN	Calculates the Tangent of a real value
LOG	Calculates the Common logarithm of a real value
LOGE	Calculates the Natural logarithm of a real value
MOD	Calculates the Modulo of an integer value

*1: Functions not affecting the safety loop

Table Safety Function Blocks (FB) (1/3)

Function block	Details
SR	Set dominant bistable
RS	Reset dominant bistable
R_TRIG	Detects a rising edge
F_TRIG	Detects a falling edge
CTU	Count up counter
CTD	Count down counter
CTUD	Count up/down counter
TP	Pulse timer which outputs pulses for a specified duration after rising edge detection
TON	On-delay timer
TOF	Off-delay timer
REPEATTIMER	Alternates TRUE and FALSE outputs at specified intervals
FILTER	First-order lag filter
FILTER_S	First-order lag filter with data status analysis capability
ANLG1OO2D	1oo2D analog voter
ANLGVOTER	3-input analog voter (IO_REAL)
BOOLVOTER	3-input BOOL voter (IO_BOOL)
ANLG_S (*1)	Outputs high/low alarm with scale conversion (with data status input)

*1: When the ProSafe-RS system is integrated with CENTUM VP, these function blocks can be used by the HIS of CENTUM VP.

All Rights Reserved. Copyright © 2015, Yokogawa Electric Corporation

Table Safety Function Blocks (FB) (2/3)

Function block	Details
ANLGI (*1)	Outputs high/low alarm with scale conversion
VEL (*1)	Detects the velocity limit exceeded
SYS_STAT	Manages the SCS status
SYS_FORCE	Manages forcing
SYS_DIAG	Outputs diagnosis information
SYS_SECURE	Manages Security level
SYS_SEC_CTL	Protects Security level
SYS_IOALLST	Detects fault in all I/O channels
SYS_NODEST	All I/O Channels of FIO Node Status Indicator
SYS_N_NODEST	All I/O Channels of N-IO Node Status Indicator
SYS_OUTST	FIO Output Module 8 Channels Indicator
SYS_OUTST16	FIO Output Module 16 Channels Indicator
SYS_INST	FIO Input Module Status Indicator
SYS_CHST	Status Indicator of FIO Module Channel
SYS_N_IOST16	N-IO I/O Module 16 Channels Indicator
SYS_CERR	Indicates computation errors
SYS_SCANEXT	Indicates the extension of scan period
SYS_OVR	Manages override function blocks
SYS_PSWD	Manages password function blocks
SYS_OUTEN	FIO Output Module Output Status Indicator
SYS_N_OUTEN	N-IO I/O Module Output Status Indicator
SYS_ALLSD	Shuts down Station output
SYS_IOSD	FIO Output Module Output Shutdown
SYS_N_IOSD	N-IO I/O Module Output Shutdown
SYS_FORCE_BD	Manages forcing of inter-SCS safety communication data
SYS_FORCE_LT	Manages forcing of SCS Link Transmission
SYS_LTSTS	Indicates SCS Link Transmission reception status
GOV_B (*1)	Grouping overrides from HIS (BOOL)
GOV_IB (*1)	Grouping overrides from HIS (IO_BOOL)
OVR_B (*1)	Overrides from HIS (BOOL)
OVR_I (*1)	Overrides from HIS (INTEGER)
OVR_R (*1)	Overrides from HIS (REAL)
OVR_IB (*1)	Overrides from HIS (IO_BOOL)
OVR_IR (*1)	Overrides from HIS (IO_REAL)
PASSWD (*1)	Manipulates BOOL-type data using password from HIS
MOB_11 (*1)	Data manual operation with two-position answerback (BOOL)
MOB_21 (*1)	Data manual operation with three-position answerback (BOOL)
MOB_RS (*1)	Auto-reset data manual operation (BOOL)
MOA (*1)	Analog-type data manual operation
CONS_B	Receives data on consumer side for inter-SCS safety communication (BOOL)
CONS_I	Receives data on consumer side for inter-SCS safety communication (INTEGER)
CONS_R	Receives data on consumer side for inter-SCS safety communication(REAL)
PROD_B	Transmits data on producer side for inter-SCS safety communication (BOOL)
PROD_I	Transmits data on producer side for inter-SCS safety communication (INTEGER)

*1: When the ProSafe-RS system is integrated with CENTUM VP, these function blocks can be used by the HIS of CENTUM VP.

All Rights Reserved. Copyright © 2015, Yokogawa Electric Corporation

Table Safety Function Blocks (FB) (3/3)

Function block	Details
PROD_R	Transmits data on producer side for inter-SCS safety communication (REAL)
B_TO_IB	Converts data values and status to IO_BOOL-type outputs
R_TO_IR	Converts data values and status to IO_REAL-type outputs
LTRCV	Receives Safety Link Transmission data
LTSND	Sends Link Transmission data
ANN_FUP (*1)	Detects the first-up alarm and transmits the annunciator message
FUP_RST	Resets the first-up alarm annunciator
HSDTR (*1) (*2)	Outputs high alarm of smoke and heat detector with scale conversion (with reset function)
GASDTR (*1) (*2)	Outputs high/low alarm of gas and flame detector with scale conversion (with reset function)
PSI_I (*3)	Fire and gas communication input (INTEGER)
PSI_R (*3)	Fire and gas communication input (REAL)
SCS_FORCE_SF (*3)	Manages forcing of fire and gas communication data

*1: When the ProSafe-RS system is integrated with CENTUM VP, these function blocks can be operated and monitored by the HIS of CENTUM VP.
*2: Supported by ProSafe-RS R4.03.00 or later.
*3: Supported by ProSafe-RS R4.03.10 or later.

Table Interference-free (*1) Function Blocks (FB) (1/2)

Function block	Details
ANN (*2)	Transmits annunciator message
SYS_SCAN	Outputs application logic execution time and percentage of CPU idle time
SYS_IOMDSP	FIO Module Status Indicator
SYS_N_IOMDSP	N-IO Module Status Indicator
SYS_NODEINF	FIO Node Status Indicator
SYS_N_NODEINF	N-IO Node Status Indicator
SYS_ESBINF	Outputs ESB bus status
SYS_NETST	Outputs Control bus status
SYS_ALRDSP	Outputs status of subsystem communication modules
SYS_ALARM	Outputs alarm transmission status
SYS_TIME	Outputs SCS clock information
SYS_FORCE_SC	Manages forcing of subsystem communication data
SYS_STAT_SC	Indicates output enable operation in subsystem communication
SOE_B	BOOL-type data SOER
SOE_I	INTEGER-type data SOER
SOE_R	REAL-type data SOER
ECW_B (*2)	Sets data of a BOOL-type variable from an external device
ECW_I (*2)	Sets data of a INTEGER-type variable from an external device
ECW_R (*2)	Sets data of a REAL-type variable from an external device
AVERAGE	Calculates the average of a specified duration
LIM_ALRM	Hysteresis on a real value for high and low limits
SCI_B (*2)	Input from subsystem (BOOL)
SCI_I (*2)	Input from subsystem (INTEGER)
SCI_R (*2)	Input from subsystem (REAL)
SCO_B (*2)	Output to subsystem (BOOL)
SCO_I (*2)	Output to subsystem (INTEGER)

*1: Functions not affecting the safety loop.
*2: When the ProSafe-RS system is integrated with CENTUM VP, these function blocks can be used by the HIS of CENTUM VP.

All Rights Reserved. Copyright © 2015, Yokogawa Electric Corporation

Table Interference-free (*1) Function Blocks (FB) (2/2)

Function block	Details
SCO_R (*2)	Output to subsystem (REAL)
LTFCS	Receives Interference-free Link Transmission data
SYS_SETTIME	Sets the SCS time
SYS_PSUDSP	PSU Status Indicator
PNI_I (*3)	PROFINET communication input (INTEGER)
PNI_R (*3)	PROFINET communication input (REAL)

*1: Functions not affecting the safety loop.
*2: When the ProSafe-RS system is integrated with CENTUM VP, these function blocks can be used by the HIS of CENTUM VP.
*3: Supported by ProSafe-RS R4.03.10 or later.

Table Ladder Elements

Ladder	Details
Direct Contact	Direct contact
Inverted Contact	Inverted contact
Contact with Rising Edge Detection	Contact with rising edge detection
Contact with Falling Edge Detection	Contact with falling edge detection
Direct Coil	Direct coil
Inverted Coil	Inverted coil
SET Coil	SET coil
RESET Coil	RESET coil
Coil with Rising Edge Detection	Coil with rising edge detection
Coil with Falling Edge Detection	Coil with falling edge detection

Scan period of Application Logic Execution Function

50 milliseconds – 1 second (by the unit of 10 – milliseconds within these ranges)

Process Data I/O Function

For process data I/O function, analog I/O modules and digital I/O modules are used. The table below shows the I/O modules that SCSs can employ.

Table I/O Modules

Model	Module Name
SAI143	Analog input module (4 to 20 mA, 16-channel, module isolation)
SAV144	Analog input module (1 to 5 V/1 to 10 V, 16-channel, module isolation)
SAT145	TC/mV input Output (16-channel, isolated channels)
SAR145	RTD input module (16-channel, isolated channels)
SAI533	Analog output module (4 to 20 mA, 8-channel, module isolation)
SDV144	Digital input module (16-channel, dry contact, module isolation)
SDV521	Digital output module (4-channel, 24 V DC/2 A, module isolation)
SDV526	Digital output module (4-channel, 100-120 V AC, module isolation)
SDV531	Digital output module (8-channel, 24 V DC, module isolation)
SDV53A	Digital output module (8-channel, 48 V DC, module isolation)
SDV541	Digital output module (16-channel, 24 V DC, module isolation)
S2MMM843	Analog Digital I/O Module (for N-IO) (16-channel, module isolation)
S2MDV843 (*1)	Digital I/O module (for N-IO) (16-channel, module isolation)

*1: Supported by ProSafe-RS R4.03.00 or later.

All Rights Reserved. Copyright © 2015, Yokogawa Electric Corporation

Table Safety Subsystem Communication Modules

Model	Module Name
S2LP131 (*1)	Fire and Gas communication module (1-port)

*1: Supported by ProSafe-RS R4.03.10 or later.

Table Interference-free (*1) Communication Modules

Model	Module Name
ALR111	Serial communication module (RS-232C, 2-port)
ALR121	Serial communication module (RS-422/RS-485, 2-port)
ALE111	Ethernet communication module (1-port)

*1: I/O modules that do not affect the safety loops

Inter-SCS Safety Communication Function

When the inter-SCS safety communication function is employed, a safety loop up to SIL 3 (Safety Integrity Level) can be configured among multiple SCSs via the Vnet/IP. This function ensures authenticity, quality, appropriate sequence, and timelines of the data.

Communication Specifications:

- An SCS is capable of communication up to 16 SCSs. (*1)
- Up to 200 data items can be transmitted per SCS.
- Up to 200 data items can be received per SCS.

*1: In case the SCS performs bi-directional communications or a multiple communications, the number of SCSs becomes less than 16.

For the compatibility of Inter-SCS safety communication by the release numbers of the system programs, refer to the GS “ProSafe-RS Safety Instrumented System Overview (for Vnet/IP)” (GS 32P01B10-01EN).

SCS Link Transmission

Two types of SCS link transmissions are available - SCS Link Transmission Safety Communication and SCS Global Switch Communication.
The SCS Link Transmission Safety Communication is the SIL 3-supported safety communication function to simultaneously transmits data to multiple number of SCSs in a periodic interval. It also receives the data transmitted by other stations and refers them by the application logic.
The SCS Global Switch Communication enables to refer the data transmitted between the SCS and the FCS.
This function is interference-free.

Communication Specifications:

- Communication range: Within to the same domain
- Control bus: Vnet/IP
- Number of communicable stations: Maximum 63
  (The number of stations that can be referred to, depend on the CPU and communication loadings)
- Transmission cycle: 100 ms fixed

Transmission Data Reference/Setting:

- Number of input function block definition: Max. 1000 per SCS
- Number of output function block definition: Max. 128 per SCS
- The number of assignments per receiving station is not limited

Software Requirements:

SCS program: R4.01.00 or later
FCS system program: R3.08.50 or later

All Rights Reserved. Copyright © 2015, Yokogawa Electric Corporation

● External Connection Functions

The CENTUM VP integration function, Modbus communication, sequence of events recorder (SOER), and diagnosis information collection functions are described below:

Scan period of External Connection Function

1 or 2 seconds.

CENTUM VP Integration Function

The SCS can be monitored by CENTUM VP's human interface station (HIS) using the tag name interface in the same way as control tags. When the tag name is defined using the CENTUM VP integration function, the HIS is enabled not only to monitor the SCS but also to perform maintenance override. Annunciator messages assigned with priority levels can be sent from the SCS.

As for the types of SCS data and function blocks to assign tag names, refer to the GS "CENTUM VP Integration Package" (GS 32P04D10-01EN).

Modbus Communication Function

The SCS communicates with external equipment such as sequencers via the Modbus protocol. The SCS acts as the Modbus master which enables to read and write external equipment data. The external equipment also acts as the Modbus master which enables to read and write the SCS data. Connecting with the Modbus communication module is interference-free. ALR121 serial communication module supports ProSafe-SLS communication function which extends the Modbus communication function.

For more details, refer to the GS "ALR111/ALR121 Serial Communication Module" (GS 32P06K50-01EN) or "ALE111 Ethernet Communication Module" (GS 32P06K51-01EN).

Modbus communication function / Communication module	SCS acts as a Modbus master	SCS acts as a Modbus slave
Serial communication module	X	X
Ethernet communication module	X	X

X: Supported

Fire and Gas Communication Function (*1)

SCS acquire the data of wireless gas detector (GS01) using the fire and gas communication function via S2LP131 fire and gas communication module mounted on SCS and field wireless system comply with the ISA100.11a standards. Safety subsystem communication function handles a safety data used in a safety loop and a non-safety data used in an interference-free function. For details of fire and gas communication module, field wireless system, and wireless gas detector, refer to the GS "S2LP131 Fire and gas Communication Module" (GS 32P06K52-01EN).

*1: Supported by ProSafe-RS R4.03.10 or later.

All Rights Reserved. Copyright © 2015, Yokogawa Electric Corporation

● Sequence of Events Recorder (SOER) Function

The SOER function is composed of event collection sub-function, event storage sub-function, and time synchronization sub-functions. When an SOE viewer is used on the CENTUM VP's HIS, the event information can be displayed on the HIS.

- Event collection and storage sub-function
  Event information is collected and stored in a digital input module or a CPU module of an SCS. (*1)
  Time stamp resolution of events collected by a digital input module is 1 ms. (*2)
  Other events are collected by a CPU module by the SCS's scan period as the time stamp resolution.
- Objective event information
  The SCSs collects the following event information when defined by the user definition.

*1: Digital Input Module is a general term of SDV144 Digital Input Module and the channels of defined for digital input by S2MDV843 Digital Input/Output Module or S2MMM843 Analog Digital Input/Output Module.

*2: When utilizing a I.S. barrier for DI, the barrier's delay time is added on to its response time. For details, refer to the I.S. barrier for DI specifications provided by the vendor.

Information to be collected	Trigger for event collection and location for collection
Digital input	Changes in the data value input into the digital input module trigger to collect events. The SOE collection can be enabled or disabled by the channel. (*1) (*3)
Digital output	Changes in the data value output to the digital output module trigger CPU to collect events. The SOE collection can be enabled or disabled by the channel. (*2) (*3)
Analog input	The analog input function block determines the level of the data value to collect events. (*4)
Application logic variable	Each of the SOE event collection function blocks for BOOL-type, INTEGER-type, and REAL-type collects events. (*4)

*1: When the digital input module is dual-redundant, the module with control authority collects events.
*2: When the status of output channel is abnormal (the data status is BAD), no events are collected.
*3: Channel comments (a string composed of a maximum of 32 single-byte characters or 16 double-byte characters) needs to be defined.
*4: A sequential event identifier (a string composed of maximum of 32 single-byte characters or 16 double-byte characters) needs to be defined for the input terminal ID of a function block. Analog output events are to be collected by a function block for SOE event collection for constants.

- Storage of Event Information
  Event information is stored in an event information file in an SCS. Such event information can be seen from multiple SOE viewers.
  Two kinds of event information files are provided – an event log file and a trip signal file. The event log file contains collected event data. The trip signal file contains events before and after a trip signal specified by a user.

Table Event Information File Specification

	Event log file (*1)	Trip signal file (*2)(*3)
Number of events	Max. 15000 events	Max. 1500 events (500 before signal generation and 1000 after signal generation)
Number of files	Max. 1	Max. 2

*1: A diagnosis information message is sent to the user at occurrence of every 12000 events.
*2: Upon completion of collecting trip signal file, a diagnosis information message is sent to a user.
*3: In case the number of events does not reach 1000 in 30 minutes after the trip signal is generated, a trip signal file creation is terminated and a diagnosis information message is sent to a user.

Diagnosis Information Collection Function

An SCS sends a diagnosis information message when an abnormal condition is detected, and the message is stored in the memory of the SCS as the diagnostic information. The message contains the time, location, type, and other information of the abnormality. The SCS can store up to 5000 pieces of information.

PRM-supported HART On-demand Communication

On-demand communication with a HART device is implemented by Plant Resource Manager (PRM) which sends a HART command, and then receives a response from the HART device via the SCS. Analog input/output modules with HART function (SAI143-H and SAI533-H) and Analog Digital I/O modules (S2MMM843) serve as communication relays.

Enhancement of HART function

In the communication among wired-HART devices using Analog Digital I/O Modules (S2MMM843), HART 7 the latest protocol is supported, which enables the S2MMM843 to receive event notification (notifications of change in HART 7 device status).

● Test Function

The test function supports performance tests of the user-made applications. Three test modes are available: “target test” employs the actual systems in operation; “virtual test” (SCS simulation test) uses the SCS simulator; and “logic simulation test” uses the logic simulator.

The CENTUM VP test functions and ProSafe-RS test functions constitute the virtual test environment. For details of the CENTUM VP test functions, refer to the GS of CENTUM VP “Test Function” (GS 33J10D50-01EN). Under the virtual test environment, either RS4F1500 safety control function (for S2SC70☐) or RS4F1505 safety control function for SCS simulator (for S2SC70☐) can be used. (*1)

*1: CENTUM VP R6.02 or later is required.

SCS Simulator

The SCS simulator activates the SCS system software that works on the SCS on a computer. Communications with virtual HIS, with FCS simulator, and safety communications among the SCSs can be performed just by the computer.
For operator training, Exatif (*1) DCS interface for training simulator can be used.

*1: Exatif is a product of Omega Simulation Co., Ltd. For the details of its function, refer to the General Specification (GS) issued by Omega Simulation Co., Ltd.

● Connecting to Plant Training System (using Exatif Package)

The Vnet/IP interface to constitute the environment for plant training simulator is supported.

In order to stabilize the performance for longer hours than using it as a test function, configuring the simulator with a following system configuration is required.

For more details, please refer to the GS of CENTUM VP “Expanded Test Functions, FCS Simulator Package, HIS Simulator Package” (GS 33J10D60-01EN).

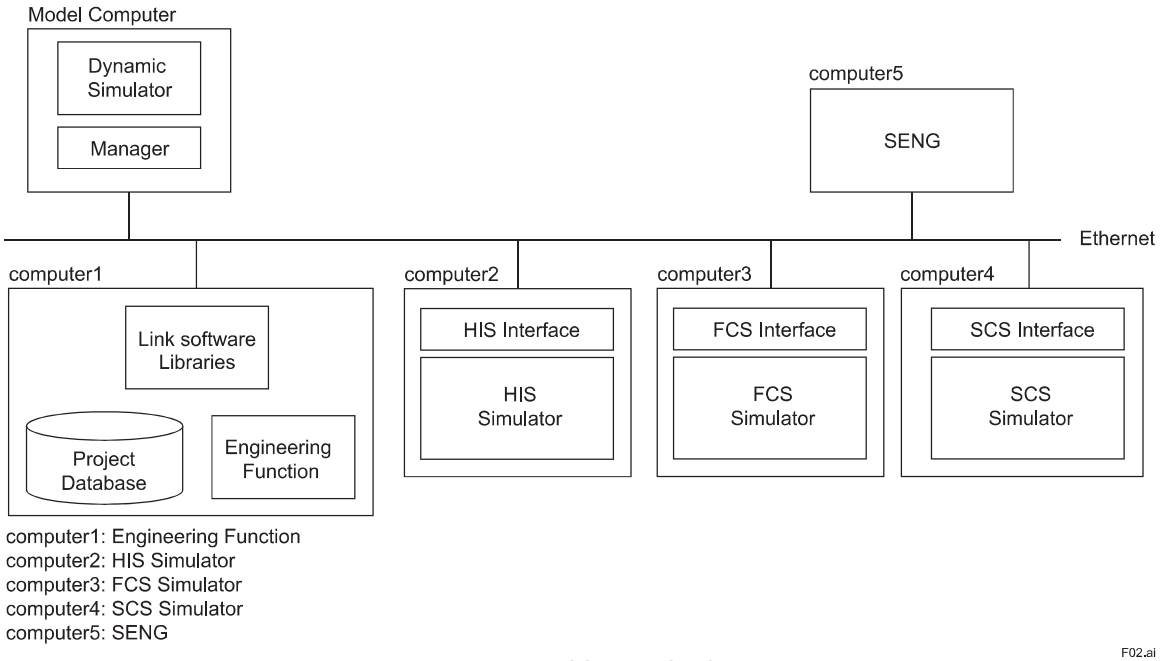

Figure Example of System Configuration

Table Software Packages required for the Plant Training System

Product	Package	computer1	computer2	computer3	computer4	computer5
ProSafe-RS	RS4F1505 Safety Control Function for SCS Simulator (for S2SC70☐) (*1)	—	—	—	X	—
	RS4E5100 Automation Design Suite (AD Suite), Safety System Engineering and Maintenance Function	—	—	—	—	X
	RS4E5600 CENTUM VP Integration Package	—	—	—	—	X
CENTUM VP (*2)	VP6H1100 Standard Operation and Monitoring Function	—	X	—	—	— (*3)
	VP6E5100 Standard Engineering Function	X	—	—	—	—
	VP6E5420 Test Function (*4)	X	—	—	—	—
	VP6E5425 Expanded Test Function	X	—	—	—	—
	VP6E5426 FCS Simulator Package (*5)	—	—	X	X	—
	VP6E5427 HIS Simulator Package	—	X	—	—	— (*3)
	VP6F1☐05 Control Function for FCS Simulator (*6)	—	—	X	—	—
Plant training system (*7)	Exatif	X				—

X: Required —: Not Required

*1: When using multiple SCS simulators, RS4F1505s of the number same as the SCS simulators are required. RS4F1500 safety control function can be also used.
*2: CENTUM VP R6.02 or later is required.
*3: In order to launch the SCS maintenance support tool, this package must be installed in the computer5.
*4: Including the FCS simulator and HIS simulator.
*5: Including the SCS simulator.
*6: When using multiple FCS simulators, VP6F1☐05s of the number same as the FCS simulators are required. VP6F1☐00 control function can be also used.
*7: Installing this package on each computer is required.

■ APPLICATION CAPACITY

A term “application capacity” refers to the capacity to execute SCS’s safety control functions. The application capacity for an SCS differs by the selection of ESB bus coupler modules of SEC401 or SEC402. The same rule applies when calculating the maximum application capacity when RS4F1505 Safety Control Function for SCS Simulator under a virtual test environment.

Table Application Capacity

Category	Item	Maximum capacity
I/O-related items	Number of safety node units	13 (*1)
	Number of N-IO nodes	32
	Number of communication modules (S2LP131) (*2)	8
	Number of communication modules (ALE111/ALR121)	6 (2 modules as slaves and 4 modules as masters)
	Number of I/O points	1500 (*1) (*3)
	Number of subsystem communication data items	2000 (maximum communication data items per SCS) (*4)
	Number of safety subsystem communication I/O data items (*2)	2000 (maximum communication data items in S2LP131 per SCS)
Application logic	Number of POUs (*5)	500
	Number of variables	1500 I/O variables (*3) 4500 internal variables (*3)
Inter-SCS Safety Communication	Number of produced data	200
	Number of consumed data	200
SCS Link Transmission	Number of transmitted data	128
	Number of received data	1000
CENTUM VP integration function	Number of analog input blocks	total 2700
	Number of velocity alarm blocks	
	Number of override blocks	
	Number of password blocks	
	Manual operation function block	
	Number of subsystem communication I/O blocks	2000 (*6)
	Number of safety subsystem communication I/O blocks	2000
	Number of annunciators	2000

*1: The maximum capacity of the SEC401 is up to 9 units of safety node units and 1000 I/O points.
*2: Supported by ProSafe-RS R4.03.10 or later.
*3: The numbers are for reference.
*4: The maximum number of subsystem communication data items per SCS earlier than ProSafe-RS R4.03.10 is up to 500.
*5: POU stands for (Program Organization Unit) representing the programs, user defined function blocks, and user defined functions.
*6: The maximum number of subsystem communication I/O blocks per SCS earlier than ProSafe-RS R4.03.10 is up to 500.

■ OPERATING ENVIRONMENT

RS4F1500 safety control function (for S2SC70□) works on the following safety control units:

S2SC70S, S2SC70D

Introduction

ProSafe-RS is a safety control system that consists of one or more safety control stations (SCS) and a safety engineering PC (SENG). There are two types of SCSs depending on the safety integrity level (SIL): those that support SIL 3 and those that support SIL 2.

This user's manual describes the hardware configuration, installation, wiring, and maintenance of SCS. Of the devices making up SCS, the safety control unit (SCU) is described for the following models:

- For SCSs that support SIL 3
  - S2SC70S/D
  - SSC60S/D
  - SSC50S/D
- For SCSs that support SIL 2
  - L1SC70S/D

For information about SSC10S/D, refer to Safety Control Stations (Hardware) (IM 32Q06C10-31E).

For information about SSC57S/D, refer to Integration with CI Server (IM 32P04D20-01EN).

Structure of this document

This user's manual consists of the following parts:

- Part A
  System configuration of SCS

  This part describes an example of a system configuration of SCS that comprises a safety control unit, safety node units, a unit for optical bus repeater module, and N-IO nodes.
- Part B
  Components of SCS

  This part describes the devices that make up SCS.
- Part C
  Installing and wiring the SCS

  This part describes the installation of devices, ground wiring, power supply wiring, Vnet/IP cable wiring, and various bus wiring.
- Part D
  Signal wiring between SCS and field devices

  This part describes how to install wiring between I/O modules and field devices.
- Part E
  Maintaining the SCS

  This part describes the routine maintenance, parts with defined life spans, and how to replace devices.

Safety Precautions for Use

Safety, Protection, and Modification of the Product

- To protect the system controlled by the Product and the Product itself and to ensure safe operation, please observe the safety precautions described in this Manual. Yokogawa Electric Corporation ("YOKOGAWA") assumes no liability for safety if users fail to observe the safety precautions and instructions when operating the Product.
- If the Product is used in a manner not specified in the User's Manuals, the protection provided by the Product may be impaired.
- If any protection or safety circuit is required for the system controlled by the Product or for the Product itself, please install it externally.
- Be sure to confirm the specifications and required settings of the devices that are used in combination with the Product by referring to the instruction manual or other documents of the devices.
- Use only spare parts that are approved by YOKOGAWA when replacing parts or consumables of the Product.
- Do not use the Product and its accessories such as power cords on devices that are not approved by YOKOGAWA. Do not use the Product and its accessories for any purpose other than those intended by YOKOGAWA.
- Modification of the Product is strictly prohibited.
- The following symbols are used in the Product and User's Manuals to indicate the accompanying safety precautions:

  
  Indicates that caution is required. This symbol for the Product indicates the possibility of dangers such as electric shock on personnel and equipment, and also indicates that the user must refer to the User’s Manuals for necessary actions. In the User’s Manuals, this symbol is used together with a word “CAUTION” or “WARNING” at the locations where precautions for avoiding dangers are described.

  <French> Signale qu’il faut faire preuve de prudence. Ce symbole pour le produit signale la possibilité d’un danger pour le personnel et l’équipement comme un choc électrique, et signale également que l’utilisateur doit se référer au Manuel de l’utilisateur afin de prendre les mesures nécessaires. Dans le Manuel de l’utilisateur, ce symbole est utilisé conjointement avec la mention «CAUTION» ou «WARNING» aux endroits où sont décrites les précautions pour éviter les dangers.

  
  Indicates that caution is required for hot surface. Note that the devices with this symbol become hot. The risk of burn injury or some damages exists if the devices are touched or contacted.

  <French> Signale qu'il faut faire preuve de prudence avec la surface brûlante. Les appareils sur lesquels est apposé ce symbole risquent de devenir brûlants. Tout contact physique ou matériel avec ces appareils risque de provoquer des brûlures ou des dommages.

  
  Identifies a protective conductor terminal. Before using the Product, you must ground the protective conductor terminal to avoid electric shock.

  
  Identifies a functional grounding terminal. A terminal marked "FG" also has the same function. This terminal is used for grounding other than protective grounding. Before using the Product, you must ground this terminal.

  Indicates an AC supply.

  Indicates a DC supply.

I	Indicates that a component such as a power supply switch is turned ON.
◯	Indicates that a component such as a power supply switch is turned OFF.

Notes on Handling User's Manuals

- Hand over the User's Manuals to your end users so that they can keep the User's Manuals on hand for convenient reference.
- Thoroughly read and understand the information in the User's Manuals before using the Product.
- For the avoidance of doubt, the purpose of the User's Manuals is not to warrant that the Product is suitable for any particular purpose but to describe the functional details of the Product.
- Contents of the User's Manuals are subject to change without notice.
- Every effort has been made to ensure the accuracy of contents in the User's Manuals. However, should you have any questions or find any errors, contact us or your local distributor. The User's Manuals with unordered or missing pages will be replaced.

Warning and Disclaimer

- Except as specified in the warranty terms, YOKOGAWA shall not provide any warranty for the Product.
- YOKOGAWA shall not be liable for any indirect or consequential loss incurred by either using or not being able to use the Product.

Notes on Hardware

Appearance and Accessories

Check the following items when you receive the Product:

- Appearance
- Standard accessories

Contact us or your local distributor in the following cases:

- The Product coating is peeling off.
- The Product itself is damaged.
- Any accessories are missing.

If the following label turns dirty and the information on it becomes illegible, or if the label is peeling off, order a new one with the part number T9029BX to replace it.

: Label attached to the Products such as the power supply module.

Model and Suffix Codes

The name plate on the Product indicates the model and suffix codes. Verify the model and suffix codes with those in the General Specifications (GS) to ensure that the Product matches the order specifications. If you have any questions, contact us or your local distributor.

Style Number

For some products, differences in the functions and usage of the product are distinguished by style number. The style number is indicated in the style number field on the name plate of the product.

Documentation Conventions

Symbols

The following symbols are used in the User's Manuals.

 WARNING	Indicates precautions to avoid a danger that may lead to death or severe injury.
 CAUTION	Indicates precautions to avoid a danger that may lead to minor or moderate injury or property damage.
IMPORTANT	Indicates important information required to understand operations or functions.
TIP	Indicates additional information.
SEE ALSO	Indicates referenced content. In online manuals, you can view the referenced content by clicking the links that are in green text. However, this action does not apply to the links that are in black text.

Drawing Conventions

Drawings used in the User's Manuals may be partially emphasized, simplified, or omitted for the convenience of description.

Drawings of windows may be slightly different from the actual screenshots with different settings or fonts. The difference does not hamper the understanding of basic functionalities and operation and monitoring tasks.

Explanation of Hardware and Software Behaviors in the User's Manuals

In the User's Manuals, system behaviors are explained assuming that the latest versions of YOKOGAWA software and hardware at the time of publication of the User's Manuals are installed.
If additional precise information about the safety of legacy versions of software or hardware is required, a link to the corresponding explanation is provided. Please refer to the information according to your system.

Full Names and Simplified Terms

In the User's Manuals, simplified terms listed in the following table are used.

Table Info-1 Full Names and Simplified Terms

Full Name	Simplified Term
Automation Design Suite	AD Suite
Automation Design Organizer	AD Organizer
Automation Design Server	AD Server
Automation Design project	AD project

SCSP3-S (SCS supporting the S2SC70S/S2SC70D safety control units)	SCSP3
SCSL2-S (SCS supporting the L1SC70S/L1SC70D safety control units)	SCSL2
SCSU1-S (SCS supporting the SSC57S/SSC57D safety control units)	SCSU1

Installation and Maintenance Notes

Installation Method

Observe the following guidelines to ensure that devices meet safety and performance requirements:

- Install rack-mountable devices, DIN rail-mountable devices, and wall-mountable devices in a lockable metal cabinet. For information about the standards and conditions required of the cabinet, refer to the descriptions of the standards that the Product conforms to.
- If devices are housed in a cabinet, keep the cabinet door closed during operation.
- Ensure that all the empty slots of the devices are covered with the covers provided. Place an order for the required covers.
- Ensure that all cables are firmly fixed with cable ties.
- Install a dedicated breaker in a readily accessible location in the same room as the system so that it can shut off the power supply when an abnormality occurs. Identify and label the breaker with the name of the protected device connected to it. Never allow the breaker to disconnect the grounding cable that is connected to a protective grounding system. Use this breaker to turn off the power supply for the devices of the system when a device abnormality occurs.

WARNING

Be careful not to drop the device while installing it.

Tightening Torque of Screws

IMPORTANT

The recommended tightening torque for the Product is shown in the following table. However, if the tightening torque of the screw is specified in the User's Manuals, follow the instructions described in the User's Manuals.

Table Info-2 Recommended Tightening Torque

Nominal diameter of a screw	M2.6	M3	M3.5	M4	M5	M6	M8	M10
Recommended tightening torque (N·m)	0.35	0.6	0.8	1.2	2.8	3.0	12.0	24.0

SEE ALSO For more information about Each nominal diameter of a screw for the device that consists of SIL3 certified SCS, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

For more information about Each nominal diameter of a screw for the device that consists of SIL2 certified SCS, refer to:

ProSafe-RS Lite Installation Guidance (TI 32P51J10-01EN)

Power Cable Wiring

WARNING

- Connect the power cables according to the procedure specified in the User's Manuals of the device.
- Power cables must conform to the safety standards of the country where the device is installed.

SEE ALSO For more information about power cables wiring, refer to:

- C2., "Ground wiring and power supply wiring for SCS" on page C2-1
- User's Manuals of each device

Grounding

WARNING

The Product requires the protective grounding defined by the safety standards.

You must ground the Product according to the procedure specified in the User's Manuals to prevent electric shock and to minimize the effect of noise.

SEE ALSO For more information about grounding, refer to:

- C2., "Ground wiring and power supply wiring for SCS" on page C2-1
- User's Manuals of each device

I/O Cable Wiring

CAUTION

Wire I/O cables according to the procedure specified in the User's Manuals.

SEE ALSO For more information about I/O cable wiring, refer to:

D., “Signal wiring between SCS and field devices” on page D-1

For more information about I/O cables wiring, refer to:

User's Manuals of each device

Connected Devices

IMPORTANT

To ensure CSA standard conformity for the entire system of the Product, all the devices connected to the system of the Product should conform to CSA standards.

Maintenance

CAUTION

During maintenance, wear a wrist strap and follow Electrostatic Discharge (ESD) precautions.

IMPORTANT

- The Product maintenance should be performed only by personnel who have undergone specialized training.
- When a device turns dirty, use a vacuum cleaner or a soft dry cloth to clean it.
- If any existing caution label is peeling off, or is dirty and illegible, order a new one with the part number T9029BX to replace it.

SEE ALSO For more information about maintenance, refer to:

- E., “Maintaining the SCS” on page E-1
- User's Manuals of each device

Modules, Cards, Cables, and Connectors

CAUTION

When the power is on, only modules, cards, cables, and connectors that are allowed in the User's Manuals can be replaced, removed, or installed.

SEE ALSO For more information about replacing, and removing or installing modules, cards, cables, and connectors, refer to:

- E., “Maintaining the SCS” on page E-1
- User's Manuals of each device

Batteries

CAUTION

- You must use only YOKOGAWA-designated batteries.
- When replacing batteries while the power supply is on, do not put your hands inside the device to prevent electric shock.
- When mounting or replacing batteries, you must follow the procedure specified in the User's Manuals of the device.

SEE ALSO For more information about battery, refer to:

- “● Battery” on page B4-7
- E3.1, “Replacing the battery of the processor module” on page E3-4

For more information about batteries, refer to:

User's Manuals of each device

Fuses

WARNING

- Turn off the power supply before replacing the fuses.
- Use only YOKOGAWA-designated fuses for replacement.

SEE ALSO For more information about replacing fuses, refer to:

- “■ Replacing fuse for fan power supply unit” on page E3-10
- E3.3, “Replacing the fuse of digital input module” on page E3-12
- E3.4, “Replacing the fuse of terminal boards (for FIO node)” on page E3-13
- E3.6, “Replacing the fuse of relay boards” on page E3-18
- E3.8, “Replacing the fuses of base plate with disconnecting terminals” on page E3-20

For more information about fuses, refer to:

User's Manuals of each device

■ Fan Unit

CAUTION

When replacing the fan unit while the power supply is on, do not put your hands inside the device to prevent electric shock.

SEE ALSO For more information about fan unit, refer to:

- "■ Replacing fan unit" on page E3-9
- User's Manuals of each device

A. System configuration of SCS

This section describes the position and configuration of the safety control station (SCS) in ProSafe-RS. The SCS is connected to a Vnet/IP domain and communicates with other SCSs. There are two types of SCSs depending on the safety integrity level (SIL): those configured with hardware devices that support SIL 3 (such as SCSP3) and those configured with hardware devices that support SIL 2 (such as SCSL2).

The SCS consists of the safety control unit (SCU), safety node units (SNUs), unit for optical ESB repeater module, and N-IO nodes. The SCU, SNU, and unit for optical ESB repeater module are collectively called FIO nodes. An N-IO node consists of a node interface unit and one or more N-IO I/O units.

When connecting the SCU and SNUs, use the ESB bus or optical ESB bus. When connecting the SCU and N-IO nodes, use the ESB bus or optical ESB bus.

The following figure shows an example of a system configuration.

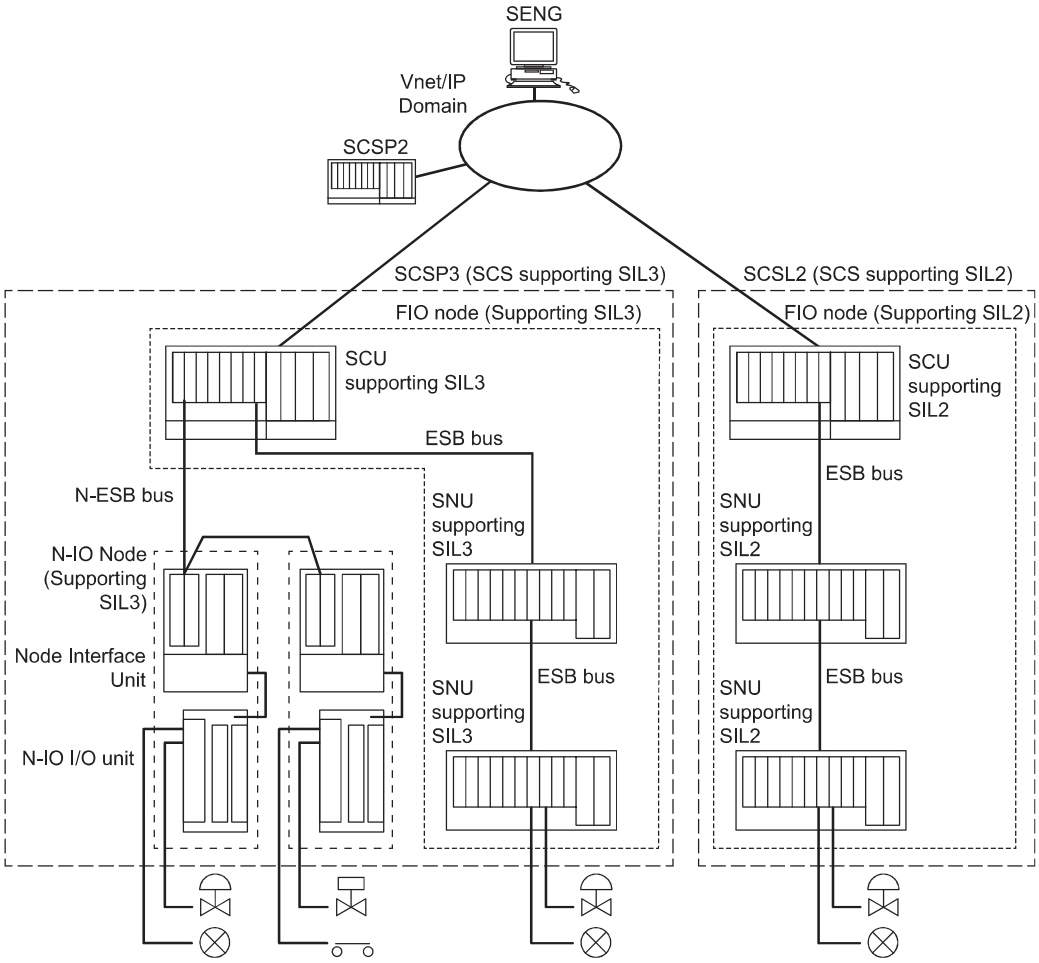

Figure A-1 Example of system configuration

B. Components of SCS

This section describes the components of SCS.

- SCU (FIO node)
- SNU (FIO node)
- Unit for optical bus repeater module (FIO node)
- Devices that make up an FIO node
- N-IO node devices

B1. Configuration of SCU

Processor modules that perform control calculation in the SCS and power supply modules are installed in the SCU. In addition, the SCU has slots for installing FIO I/O modules, N-ESB/ESB bus coupler modules, or optical ESB bus repeater modules.

There are SCUs for SCSs that support SIL 3 and those for SCSs that support SIL 2.

- For SCSs that support SIL 3
  - S2SC70S/D
  - SSC60S/D
  - SSC50S/D
- For SCSs that support SIL 2
  - L1SC70S/D

Each SCU is available in a standard type (ambient temperature: –20 to 40 deg. C) or a wide range temperature type (ambient temperature: –20 to 70 deg. C). A wide range temperature type is configured from a standard type with added node fan units to accommodate a wider ambient temperature range.

Standard type SCU

The following figure shows an example of a duplexed configuration of the standard type SCU.

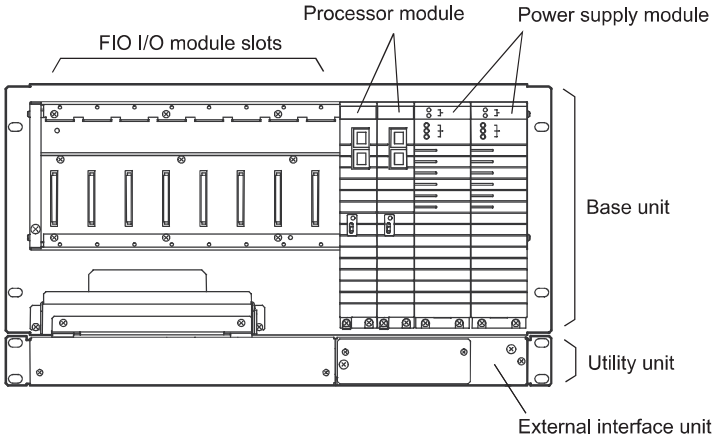

Figure B1-1 Configuration of the standard type SCU

For a single configuration, a processor module is installed in the left slot, and a dummy cover with the following part No. is attached to the right slot:

- SCUs that support SIL 3: T9083VB
- SCUs that support SIL 2: T9085SA

In the FIO I/O module slots, the following modules can also be installed in addition to FIO I/O modules:

- ESB bus coupler module
- Optical ESB bus repeater module
- N-ESB bus coupler module

TIP

N-ESB bus coupler module should be used in S2SC70□.

You must attach a dummy cover to unused FIO I/O module slots. The model names of dummy covers are as follows:

- SCUs that support SIL 3: SDCV01
- SCUs that support SIL 2: L1DCV01

The following tables show the main devices of the standard type SCUs.

Table B1-1 Devices that are installed in S2SC70S-SA/S2SC70D-SA

Name	Model	Specifications	Quantity	
			Single configuration (S2SC70S-SA)	Duplexed configuration (S2SC70D-SA)
Power supply module (*1)	SPW481	Input 100-120 V AC	2	2
	SPW482	Input 220-240 V AC	2	2
	SPW484	Input 24 V DC	2	2
Processor module	S2CP471	-	1	2

*1: One of the following power supply modules is installed: SPW481, SPW482, or SPW484.

Table B1-2 Devices that are installed in S2SC70S-S4/S2SC70D-S4

Name	Model	Specifications	Quantity	
			Single configuration (S2SC70S-S4)	Duplexed configuration (S2SC70D-S4)
Power supply module (*1)	SPW481	Input 100-120 V AC	2	2
	SPW482	Input 220-240 V AC	2	2
	SPW484	Input 24 V DC	2	2
Processor module	SCP461 (*2) (*3)	-	1	2

*1: One of the following power supply modules is installed: SPW481, SPW482, or SPW484.
*2: Use a processor module of style S2 or higher.
*3: Replaceable to S2CP471. If you want to replace, contact YOKOGAWA sales or service agents for replacement.

Table B1-3 Devices that are installed in SSC60S-S/SSC60D-S

Name	Model	Specifications	Quantity	
			Single configuration (SSC60S-S)	Duplexed configuration (SSC60D-S)
Power supply module (*1)	SPW481	Input 100-120 V AC	2	2
	SPW482	Input 220-240 V AC	2	2
	SPW484	Input 24 V DC	2	2
Processor module	SCP461 (*2)	-	1	2

*1: One of the following power supply modules is installed: SPW481, SPW482, or SPW484.
*2: Replaceable to S2CP471. If you want to replace, contact YOKOGAWA sales or service agents for replacement.

Table B1-4 Devices that are installed in SSC50S-S/SSC50D-S

Name	Model	Specifications	Quantity	
			Single configuration (SSC50S-S)	Duplexed configuration (SSC50D-S)
Power supply module (*1)	SPW481	Input 100-120 V AC	2	2
	SPW482	Input 220-240 V AC	2	2
	SPW484	Input 24 V DC	2	2
Processor module	SCP451 (*2)	-	1	2

*1: One of the following power supply modules is installed: SPW481, SPW482, or SPW484.
*2: Use a processor module with firmware revision number (F1) that is 19 or higher.

Table B1-5 Devices that are installed in L1SC70S-S or L1SC70D-S

Name	Model	Specifications	Quantity	
			Single configuration (L1SC70S-S)	Duplexed configuration (L1SC70D-S)
Power supply module (*1)	L1PW481	Input 100-120 V AC	2	2
	L1PW482	Input 220-240 V AC	2	2
	L1PW484	Input 24 V DC	2	2
Processor module	L1CP471	-	1	2

*1: One of the following power supply modules is installed: L1PW481, L1PW482, or L1PW484.

SEE ALSO For more information about restrictions on module installation to SCUs that support SIL 3, refer to:

ProSafe-RS Outline of I/O Modules (for FIO) (GS 32P06K60-01EN)

For more information about restrictions on module installation to SCUs that support SIL 2, refer to:

ProSafe-RS Lite Outline of I/O Modules (GS 32P56K60-01EN)

Wide range temperature type SCU

A wide range temperature type SCU is configured from a standard type SCU with added node fan units to ensure use in a wider ambient temperature range.

The following figure shows an example of a duplexed configuration of a wide range temperature type SCU.

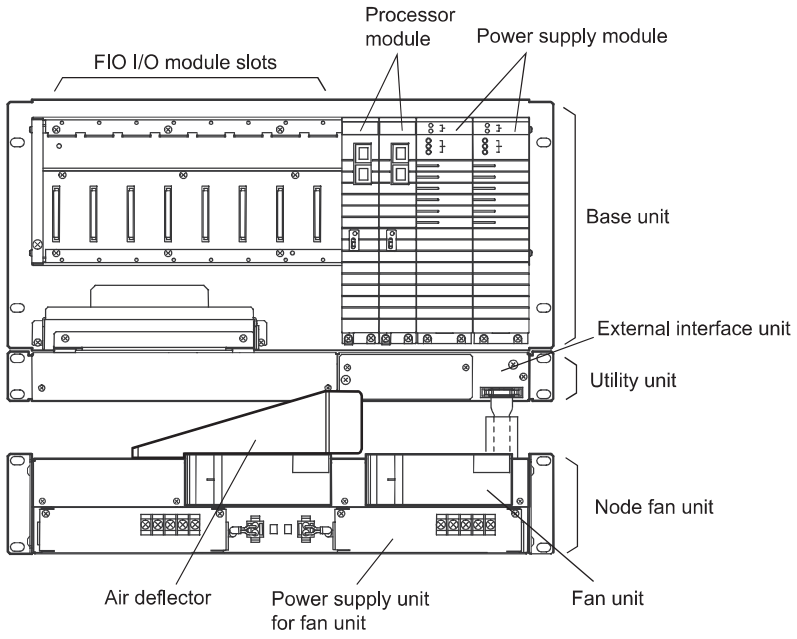

Figure B1-2 Components of the wide range temperature type SCU (example of S2SC70D-FA)

For a single configuration, a processor module is installed in the left slot, and a dummy cover with the following part Nos. is attached to the right slot:

- SCUs that support SIL 3: T9083VB
- SCUs that support SIL 2: T9085SA

In the FIO I/O module slots, you can also install the following modules instead of FIO I/O modules:

- ESB bus coupler module
- Optical ESB bus repeater module
- N-ESB bus coupler module

TIP

N-ESB bus coupler module should be used in S2SC70□.

You must attach a dummy cover to unused FIO I/O module slots. The model names of dummy covers are as follows:

- For SCSs that support SIL 3: SDCV01
- For SCSs that support SIL 2: L1DCV01

The following tables show the main components of the wide range temperature type SCUs.

Table B1-6 Devices that are installed in S2SC70S-FA or S2SC70D-FA

Name	Model/Part	Specifications	Quantity	
			Single configuration (S2SC70S-FA)	Duplexed configuration (S2SC70D-FA)
Power supply module (*1)	SPW481	Input 100-120 V AC	2	2
	SPW482	Input 220-240 V AC	2	2
	SPW484	Input 24 V DC	2	2

*1: One of the following power supply modules is installed: SPW481, SPW482, or SPW484.
*2: Use a processor module with firmware revision number (F1) that is 19 or higher.
*3: Either one of the following power supply units is installed for the fan: S9159FA or S9160FA.

Table B1-10 Devices that are installed in L1SC70S-F or L1SC70D-F

Name	Model/Part	Specifications	Quantity	
			Single configuration (L1SC70S-F)	Duplexed configuration (L1SC70D-F)
Power supply module (*1)	L1PW481	Input 100-120 V AC	2	2
	L1PW482	Input 220-240 V AC	2	2
	L1PW484	Input 24 V DC	2	2
Processor module	L1CP471	-	1	2
Power supply unit for the fan (*2)	S9159FA	Input 100-120, 220-240 V AC	2	2
	S9160FA	Input 24 V DC	2	2
Fan unit	AIP602	-	2	2
Air deflector	T9085JZ	-	1	1

*1: One of the following power supply modules is installed: L1PW481, L1PW482, or L1PW484.
*2: Either one of the following power supply units is installed for the fan: S9159FA or S9160FA.

SEE ALSO

For more information about restrictions on module installation to SCUs that support SIL 3, refer to:

ProSafe-RS Outline of I/O Modules (for FIO) (GS 32P06K60-01EN)

For more information about restrictions on module installation to SCUs that support SIL 2, refer to:

ProSafe-RS Lite Outline of I/O Modules (GS 32P56K60-01EN)

B2. Configuration of SNU

SNU sends and receives field device signals through an FIO I/O module and communicates with the SCU through ESB bus or optical ESB bus.

The SNU models are as follows:

- For SCSs that support SIL 3: SNB10D
- For SCSs that support SIL 2: L1NB10D

The following figure shows the configuration of SNU.

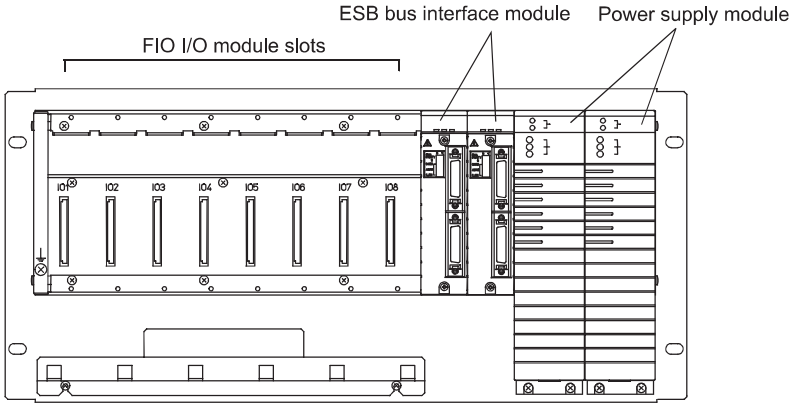

Figure B2-1 Configuration of SNU

In the FIO I/O module slots, you can also install optical ESB bus repeater modules instead of FIO I/O modules. You must attach a dummy cover to unused FIO I/O module slots. The model names of dummy covers are as follows:

- For SCSs that support SIL 3: SDCV01
- For SCSs that support SIL 2: L1DCV01

The following table describes the devices that are installed in SNU.

Table B2-1 Devices that are installed in SNB10D

Name	Model	Specifications	Quantity
Power supply module (*1)	SPW481	100 to 120 V AC input	2
	SPW482	220 to 240 V AC input	2
	SPW484	24 V DC input	2
ESB bus interface module	SSB401	-	2

*1: One of the following power supply modules is installed: SPW481, SPW482, or SPW484.

Table B2-2 Devices that are installed in L1NB10D

Name	Model	Specifications	Quantity
Power supply module (*1)	L1PW481	100 to 120 V AC input	2
	L1PW482	220 to 240 V AC input	2
	L1PW484	24 V DC input	2
ESB bus interface module	L1SB401	-	2

*1: One of the following power supply modules is installed: L1PW481, L1PW482, or L1PW484.

SEE ALSO

For more information about restrictions on module installation to SNUs that support SIL 3, refer to:

ProSafe-RS Outline of I/O Modules (for FIO) (GS 32P06K60-01EN)

For more information about restrictions on module installation to SNUs that support SIL 2, refer to:

ProSafe-RS Lite Outline of I/O Modules (GS 32P56K60-01EN)

B3. Configuration of unit for optical bus repeater module

The unit for optical ESB bus repeater module is used to install the optical ESB bus repeater module.

The SNU models are as follows:

- For SCSs that support SIL 3: SNT10D
- For SCSs that support SIL 2: L1NT10D

The following figure shows the configuration of the unit for optical ESB bus repeater module.

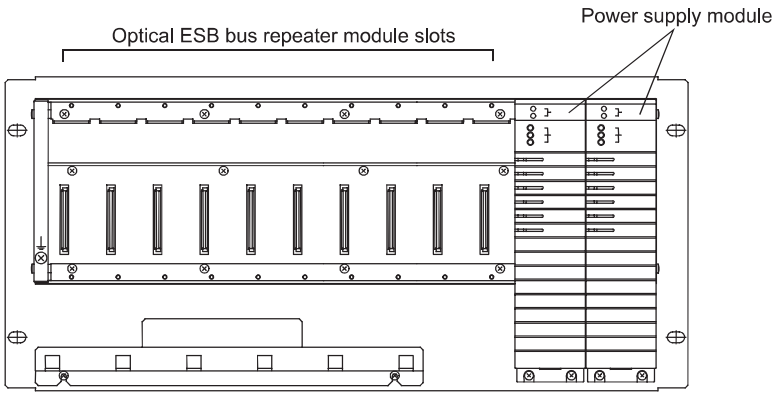

Figure B3-1 Configuration of unit for optical bus repeater module

You must attach a dummy cover to unused optical ESB bus repeater module slots. The model names of dummy covers are as follows:

- For SCSs that support SIL 3: SDCV01
- For SCSs that support SIL 2: L1DCV01

The following table describes the devices that are installed in the unit for optical bus repeater module.

Table B3-1 Devices that are installed in SNT10D

Name	Model	Specifications	Quantity
Power supply module (*1)	SPW481	100 to 120 V AC input	2
	SPW482	220 to 240 V AC input	2
	SPW484	24 V DC input	2

*1: One of the following power supply modules is installed: SPW481, SPW482, or SPW484.

Table B3-2 Devices that are installed in L1NT10D

Name	Model	Specifications	Quantity
Power supply module (*1)	L1PW481	100 to 120 V AC input	2
	L1PW482	220 to 240 V AC input	2
	L1PW484	24 V DC input	2

*1: One of the following power supply modules is installed: L1PW481, L1PW482, or L1PW484.

SEE ALSO

For more information about restrictions on installation of optical ESB bus repeater modules that support SIL 3, refer to:

ProSafe-RS Optical ESB Bus Repeater Module (GS 32Q06L15-31E and GS 32Q06L16-31E)

For more information about restrictions on installation of optical ESB bus repeater modules that support SIL 2, refer to:

ProSafe-RS Lite Optical ESB Bus Repeater Module (GS 32P56L15-01EN and GS 32P56L16-01EN)

B4. FIO node devices

This section describes the devices that constitute an FIO node.

- Power supply module
- Processor module
- ESB bus coupler module
- ESB bus interface module
- Optical ESB bus repeater module
- N-ESB bus coupler module
- FIO I/O modules and their peripherals
  - Analog I/O module
  - Digital I/O module
  - Communication module
  - Pressure clamp terminal block
  - Connector cover for MIL cable
  - Terminal board
  - Relay board
- External interface unit
- Node fan unit

B4.1 Power supply module

The power supply module is installed in the SCU, SNU, or unit for optical bus repeater module and supplies power to the modules in the unit.

There are power supply modules for SCSs that support SIL 3 and those that support SIL 2.

- For SCSs that support SIL 3
  - SPW481: 100-120 V AC input power supply module
  - SPW482: 220-240 V AC input power supply module
  - SPW484: 24 V DC input power supply module
- For SCSs that support SIL 2
  - L1PW481: 100-120 V AC input power supply module
  - L1PW482: 220-240 V AC input power supply module
  - L1PW484: 24 V DC input power supply module

Elements on the power supply module

The following figure shows the elements on the power supply module. Power input terminals are behind the front cover.

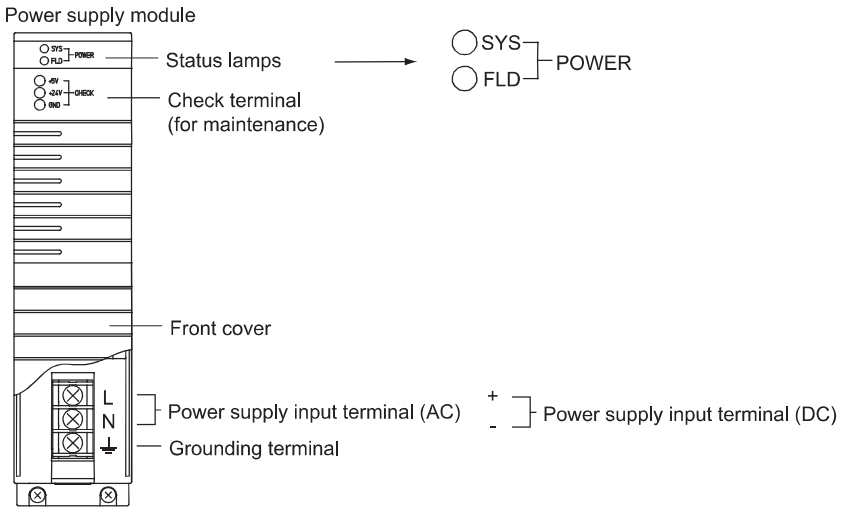

Figure B4.1-1 Power supply module

Status lamps

The power supply module has the following status lamps:

- SYS
  The lamp turns on when the output is +5 V; otherwise, the lamp turns off.
- FLD
  The lamp turns on when the output is +24 V; otherwise, the lamp turns off.

Power input terminals

The power supply module receives power through the power input terminals. You must prepare power cables separately.

SEE ALSO For more information about ground wiring and power supply wiring of the power supply module, refer to:

C2.1, “Ground wiring and power supply wiring of the power supply module” on page C2-2

B4.2 Processor module

The processor module is installed in the SCU and performs control calculations.

There are processor modules for SCUs that support SIL 3 and those that support SIL 2.

- For SCUs that support SIL 3
  - S2CP471: for S2SC70□ and SSC60□
  - SCP461 (style S2 or higher): for S2SC70□-□4 and SSC60□
  - SCP461 (style S1): for SSC60□
  - SCP451: for SSC50□
- For SCUs that support SIL 2
  - L1CP471: for L1SC70□

TIP SCP461 is replaceable to S2CP471. If you want to replace, contact YOKOGAWA sales or service agents for replacement.

Elements on the processor module

The following figures show the elements on the processor modules.

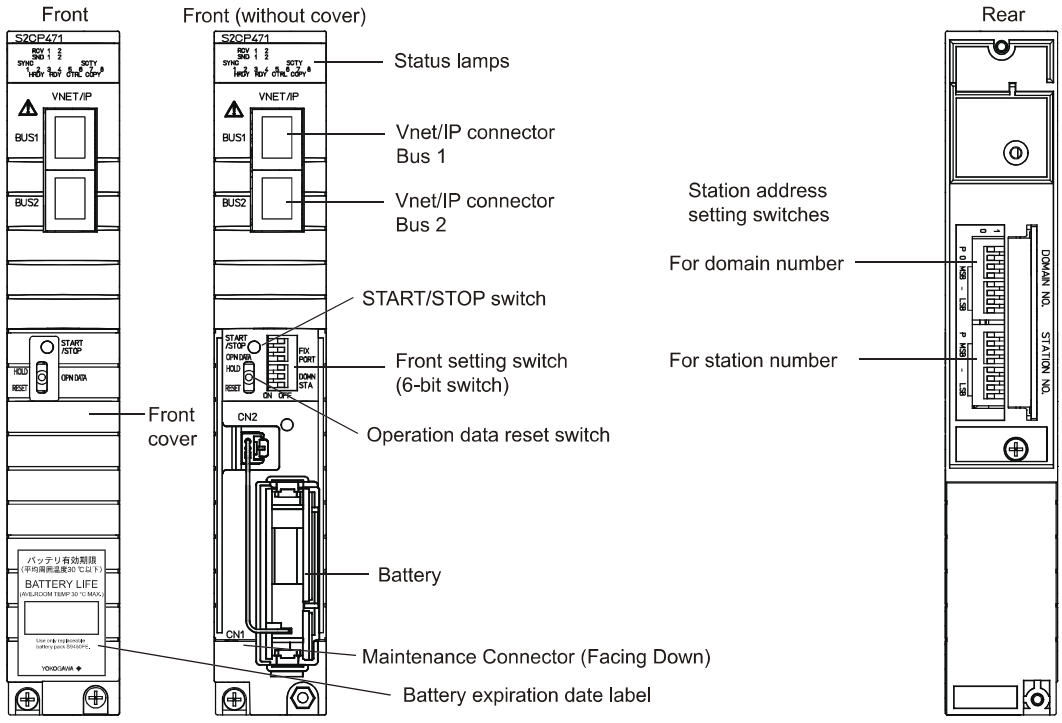

Figure B4.2-1 S2CP471/L1CP471 (The figure shows an example of S2CP471.)

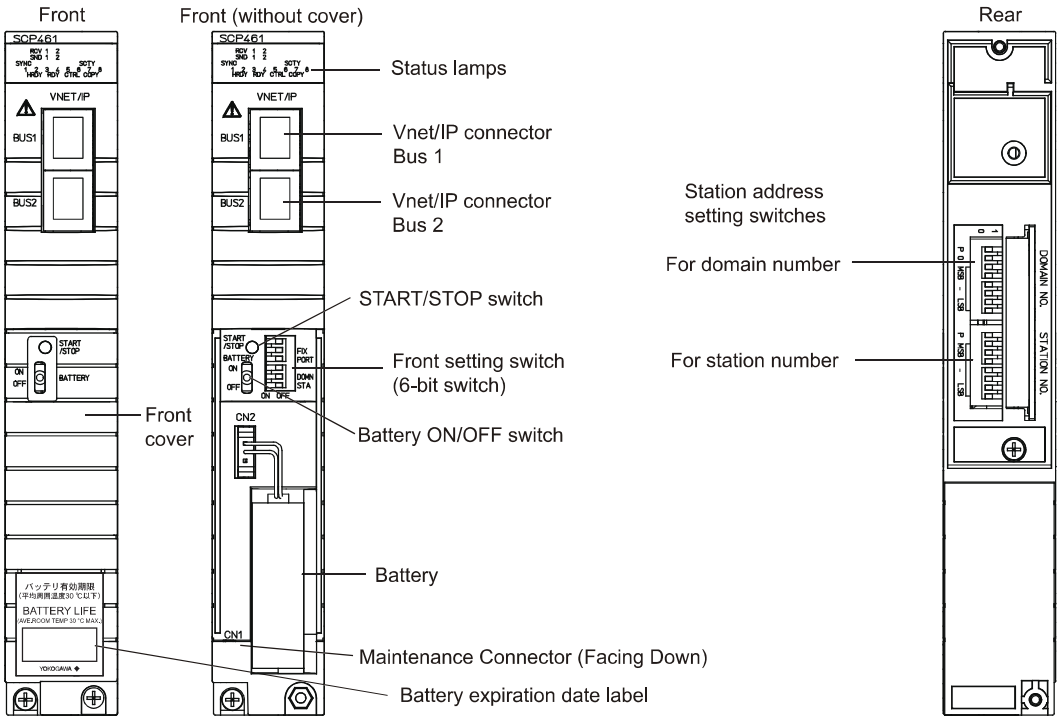

Figure B4.2-2 SCP461

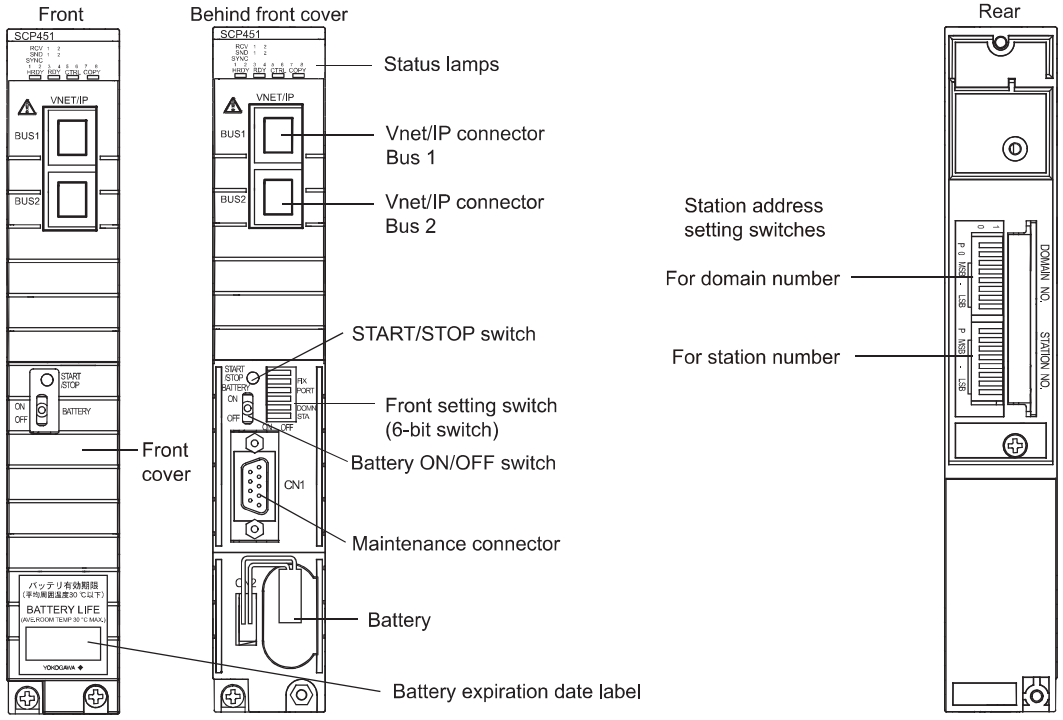

Figure B4.2-3 SCP451

The front setting switches and battery of the processor module are provided behind the front cover. The setting switches for the domain number and station number are provided in the rear of the module, so you must remove the module from the base unit when you configure the switches.

Status lamps

The following figure shows the status lamps of the processor module.

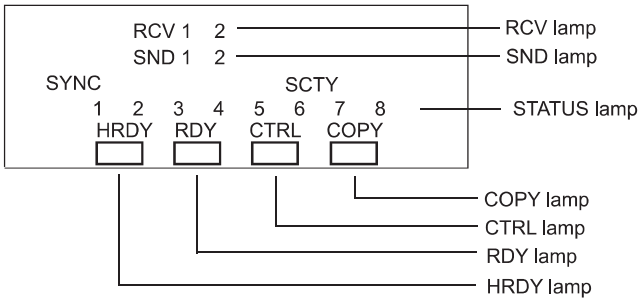

Figure B4.2-4 Status lamps of the processor module

- HRDY
  The processor module diagnoses itself. When the processor module hardware is functioning normally, this lamp turns on; otherwise, the lamp turns off.
- RDY
  This lamp turns on when both the hardware and software are functioning normally; otherwise, the lamp turns off.
- CTRL
  This lamp turns on when the processor module is controlling and turns off when the module is standby in dual-redundant configuration or stopped controlling.
- COPY
  In dual-redundant configuration, this lamp turns on when program copy is running and turns off when program copy is completed. When the standby processor module is replaced in dual-redundant configuration or when the module starts from a stopped state, the program in the active processor module is automatically copied to the standby processor module.
- RCV
  These lamps indicate Vnet/IP communication status. 1 indicates the status of Vnet/IP bus 1 while 2 indicates the status of Vnet/IP bus 2. The lamp flashes when the module is receiving; otherwise, the lamp turns off.
- SND
  These lamps indicate Vnet/IP communication status. 1 indicates the status of Vnet/IP bus 1 while 2 indicates the status of Vnet/IP bus 2. The lamp flashes when the module is sending; otherwise, the lamp turns off.
- SYNC
  This lamp indicates the status of synchronization with the Vnet/IP network time. The lamp turns on when synchronized; otherwise, the lamp turns off.
- SCTY
  This lamp turns on when the security level of the SCS is an online level and turns off otherwise.
- STATUS (1, 2, 3, 4, 5, 6, 7, 8)
  These lamps indicate the status of the processor module. Usually, the lamps indicate an operating mode or error status. However, they indicate the status of the domain number or station number setting switches, depending on the front switch setting.
  - When the DOMN switch is set to ON: Status of the domain number setting switches
  - When the STA switch is set to ON: Status of the station number setting switches

Battery

Even if the power is not supplied to processor modules for example in a power outage, batteries helps to maintain the management information of the modules. The maintained management information varies depending on the type of modules.

- S2CP471 or L1CP471: Real time data of the real time clock (RTC)
- SCP461 or SCP451: Operation data and the real time data of RTC

TIP

- S2CP471/L1CP471 stores the operation data in the non-volatile memory (NVRAM) and stores application programs in the flash memory, so both of them are not initialized in the event of a power outage.
- SCP461 or SCP451 stores application programs in the flash memory and they are not initialized in the event of a power outage.

CAUTION

Use batteries specified by Yokogawa Electric.

A label indicating the expiration date of the battery is attached on the lower part of the processor module front cover.

This expiration date is valid when the ambient temperature is less than 30 degree Celsius.

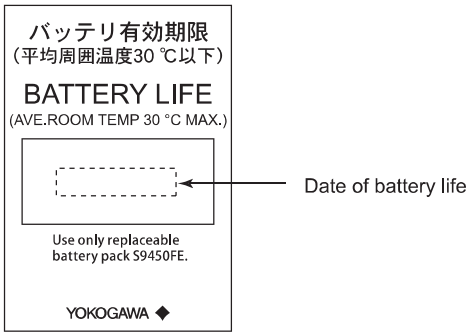

Figure B4.2-5 Example of the battery expiration date label

SEE ALSO For more information about how to replace the battery, refer to:

E3.1, “Replacing the battery of the processor module” on page E3-4

Front switches of the processor module

The following figure shows the switches in the front of the processor module.

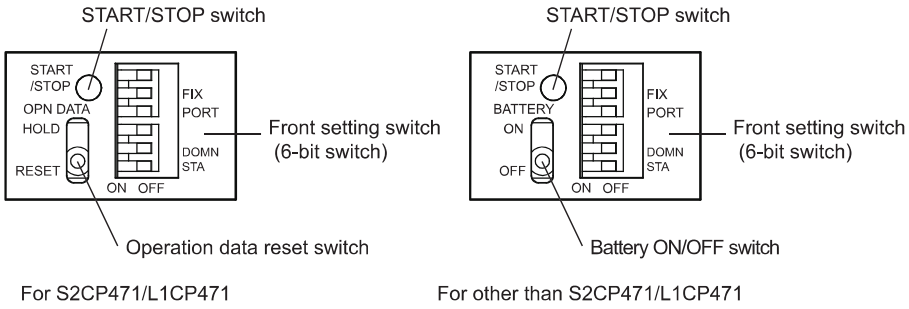

Figure B4.2-6 Front switches of the processor module

IMPORTANT

Note that the operation data reset switch of S2CP471/L1CP471 and the battery ON/OFF switch of other processor modules have the same appearance but different functions.

- START/STOP switch
  This switch is used for maintenance. If this switch is pressed when the processor module is operating, the CPU of the module is stopped forcibly. If this switch is pressed when the processor module is not operating, the CPU restarts.

  This switch is located inside a hole next to the START/STOP sign. Gently push the switch by using a slender non-conductive bar with a diameter of 1 to 2 mm.
- Operation data reset switch (for S2CP471/L1CP471)
  This switch initializes the operation data that is stored in NVRAM when the processor module is turned on.
  - HOLD: The operation data is maintained. Select this position during normal operation.
  - RESET: The operation data is initialized. When the HRDY lamp of the processor module is lit, turn the switch to the HOLD position.
- Battery ON/OFF switch (for SCP461 or SCP451)
  This switch selects whether or not to maintain the module management information (the operation data of NVRAM and the real time data of RTC) while the power is not supplied to processor modules for example in a power outage.
  - ON: The module information is maintained. Select this position during normal operation.
  - OFF: The module information is initialized.
- Front setting switches
  - DOMN: Set to OFF during normal operation. When set to ON, the STATUS lamps indicate the status of the domain number setting switches.
  - STA: Set to OFF during normal operation. When set to ON, the STATUS lamps indicate the status of the station number setting switches.
  - Switches other than above: Set to OFF.

The following figure is an example of STATUS lamp indication when the station number 5 (10000101) is set and the STA switch in the front is set to ON.

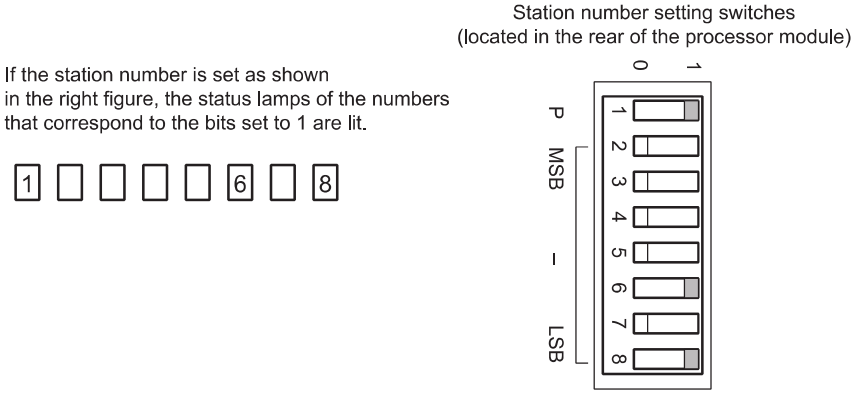

Figure B4.2-7 STATUS lamp indication when station number 5 is set

The following table describes the indication on the STATUS lamps when both DOMN and STA switches are set to OFF.

Table B4.2-1 STATUS lamp indication

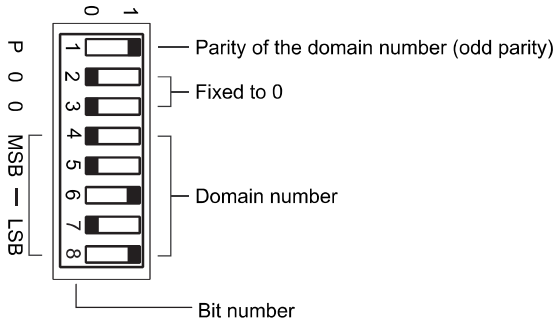
STATUS lamps	Display	Description
1, 2	Operating Mode	• Running mode: 1 and 2 on • Waiting mode: 1 off, 2 on • Others: 1 and 2 off
3	Security level	Turns on when the security level is 2 (*1) and turns off otherwise.
4	SCS error status(*2)	Turns off when the system has an error and turns on otherwise.
5, 6, 7	Unused	Always on
8	Writing to flash memories	Turns off during writing and turns on otherwise.

*1: Security level 0 corresponds to offline level and security levels 1 and 2 correspond to online level.
*2: This lamp may be linked to the SYS_DIAG output.

SEE ALSO For more information about SYS_DIAG function block, refer to:

11.7, “SYS_DIAG (diagnostic information output)” in POU Reference Manual (IM 32P03B20-01EN)

For more information about the negotiation setting on the Vnet/IP interface card, refer to:



“■ Setting Up the Vnet/IP Interface Card” in B3.1, “Setting Up the Hardware” in Installation Guide (IM 32P01C50-01EN)

Station address setting switches: For domain numbers

A domain stands for a range of stations in a network connected by control bus. You can set the domain number in the range from 1 to 31. To set a required domain number, configure the switches as shown in the tables.

- Setting the switches
  0: In the orientation shown in the following figure, the switch is slid to the left.
  1: In the orientation shown in the following figure, the switch is slid to the right.

Bits 2 and 3 must always be set to 0.

MSB: Most Significant Bit
LSB: Least Significant Bit

Figure B4.2-8 Station address setting switches: For domain numbers

Table B4.2-2 Domain number and switch positions (1/2)

Domain number	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

B4.3 ESB bus coupler module

The ESB bus coupler module is installed in the SCU and communicates with the ESB bus interface module in the SNU.

There are ESB bus coupler modules for SCSs that support SIL 3 and those that support SIL 2.

- For SCSs that support SIL 3: SEC401/SEC402
- For SCSs that support SIL 2: L1EC401/L1EC402

SEC401/L1EC401 has one ESB bus port while SEC402/L1EC402 has two ESB bus ports. The ESB bus coupler module is always used in dual-redundant configuration.

Elements on the ESB bus coupler module

The following figure shows the elements on the ESB bus module.

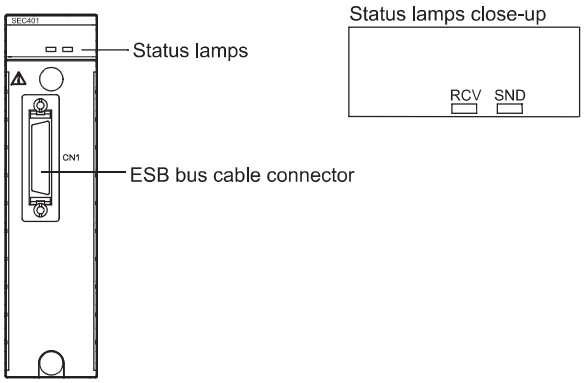

Figure B4.3-1 ESB bus coupler module (1 port)

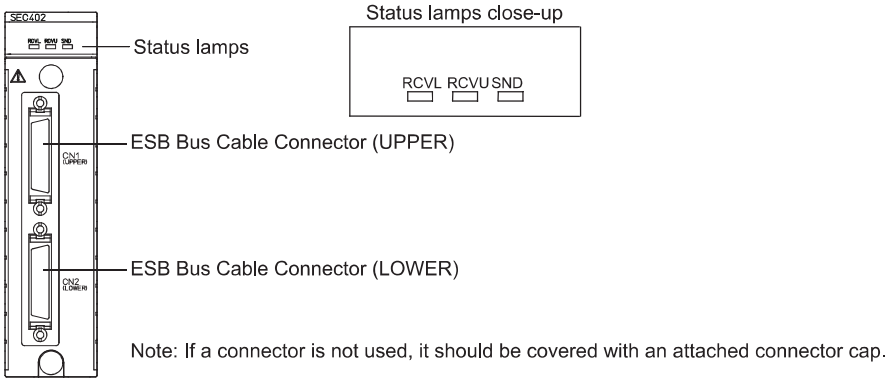

Figure B4.3-2 ESB bus coupler module (2 ports)

Status lamps (SEC401/L1EC401)

The status lamps indicate the device status as follows:

- RCV
  The lamp turns on when the module is receiving; otherwise, the lamp turns off.
- SND
  The lamp turns on when the module is sending; otherwise, the lamp turns off.

Status lamps (SEC402/L1EC402)

The status lamps indicate the device status as follows:

- RCVL
  The lamp turns on when the module is receiving through the ESB bus cable connector (LOWER); otherwise, the lamp turns off.
- RCVU
  The lamp turns on when the module is receiving through the ESB bus cable connector (UPPER); otherwise, the lamp turns off.
- SND
  The lamp turns on when the module is sending through the ESB bus cable connector (LOWER or UPPER); otherwise, the lamp turns off.

ESB bus cable connector

This connector is used to connect the ESB bus cable (Model: YCB301). Because the ESB bus coupler module comes at one end of the ESB bus, the module has a terminating resistor inside.

B4.4 ESB bus interface module

The ESB bus interface module is installed in SNU and communicates with the ESB bus coupler module in the SCU.

There are ESB bus interface modules for SCSs that support SIL 3 and those that support SIL 2.

- For SCSs that support SIL 3: SSB401
- For SCSs that support SIL 2: L1SB401

The ESB bus coupler module is always used in dual-redundant configuration.

Elements on the ESB bus interface module

The following figure shows the elements on the ESB bus interface module.

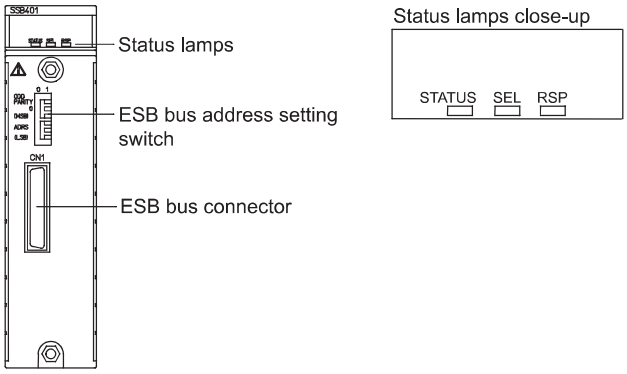

Figure B4.4-1 ESB bus interface module

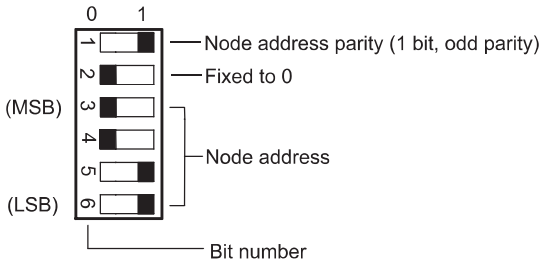
Status lamps

The status lamps indicate the device status as follows:

- STATUS
  The lamp turns on when the module is normal; otherwise, the lamp turns off.
- SEL
  The lamp turns on when the module is sending data to an I/O module; otherwise, the lamp turns off.
- RSP
  The lamp turns on when the module is receiving data from an I/O module; otherwise, the lamp turns off.



ESB bus address setting switches

When multiple SNUs are connected to the ESB bus, you can select an SNU to be accessed by setting the node number with these switches. For SCSP1, set the node number in the range of 2 to 10. For SCSP2/SCSP3/SCSL2, set the node number in the range of 2 to 14. Node number 1 is assigned to the SCU.

To set a required node number, configure the switches as shown in the table.

- Setting the switches
  0: In the orientation shown in the following figure, the switch is slid to the left.

  1: In the orientation shown in the following figure, the switch is slid to the right.

MSB : Most Significant Bit
LSB : Least Significant Bit

Figure B4.4-2 ESB bus address setting switches

Table B4.4-1 ESB bus address and switch positions

Node number	2	3	4	5	6	7	8	9	10	11	12	13	14
Bit 1	0	1	0	1	1	0	0	1	1	0	1	0	0
Bit 2	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit 3	0	0	0	0	0	0	1	1	1	1	1	1	1
Bit 4	0	0	1	1	1	1	0	0	0	0	1	1	1
Bit 5	1	1	0	0	1	1	0	0	1	1	0	0	1
Bit 6	0	1	0	1	0	1	0	1	0	1	0	1	0

ESB bus connector

This connector is used to connect the connector unit for ESB bus.

Connect the ESB bus cable (YCB301) to the connector unit for ESB bus. If the module comes at the end of the ESB bus, connect the ESB bus cable to the connector unit with terminator for ESB bus.

The following figure shows the connector unit for ESB bus and the connector unit with terminator for ESB bus.

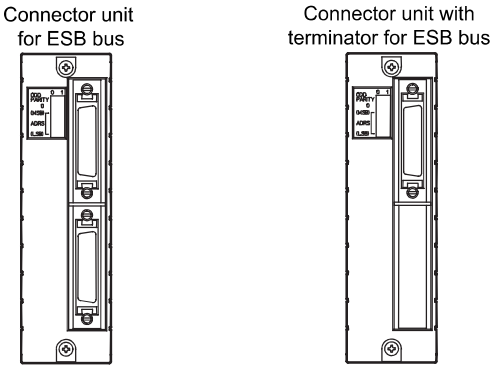


Figure B4.4-3 Connector unit for ESB bus

B4.5 Optical ESB bus repeater module

The optical ESB bus repeater module converts electric signals to optical signals, extending the transmission distance. The optical ESB bus repeater modules are installed in the SCU, SNU, and unit for optical bus repeater module. The unit where the module can be installed depends on the module type (master or slave).

There are optical ESB bus repeater modules for SCSs that support SIL 3 and those that support SIL 2. The optical ESB bus repeater module is always used in dual-redundant configuration. The following table describes the types of optical ESB bus repeater modules.

Table B4.5-1 Types of optical ESB bus repeater modules

Model	Name	Description
For SCSs that support SIL 3 • SNT401 • SNT411 For SCSs that support SIL 2 • L1NT401 • L1NT411	Optical ESB bus repeater master module	• Mountable units: SCU SNU Unit for optical bus repeater module
		• Module types: With ESB bus branch connector With ESB bus terminator
		• Maximum transmission distance of fiber-optic cables(*1) 5 km: SNT401/L1NT401 50 km: SNT411/L1NT411(*2)
For SCSs that support SIL 3 • SNT501 • SNT511 For SCSs that support SIL 2 • L1NT501 • L1NT511	Optical ESB bus repeater slave module	• Mountable units: SNU Unit for optical bus repeater module
		• Module types: With ESB bus terminator
		• Maximum transmission distance of fiber-optic cables(*1) 5 km: SNT501/L1NT501 50 km: SNT511/L1NT511(*2)

*1: The maximum transmission distance is 50 km even if repeated for two times by the optical ESB bus repeater modules.
*2: The minimum distance is 5 km.

Elements on the optical ESB bus repeater module

The following figure shows the elements on the optical ESB bus repeater modules.

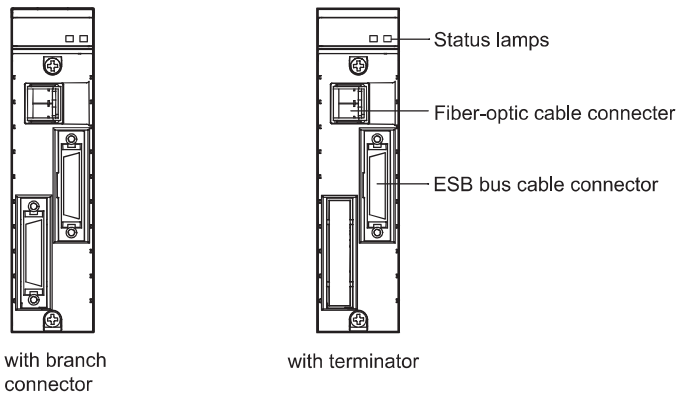

Figure B4.5-1 Optical ESB bus repeater module

Status lamps

The following figure shows the status lamps of the optical ESB bus repeater module.

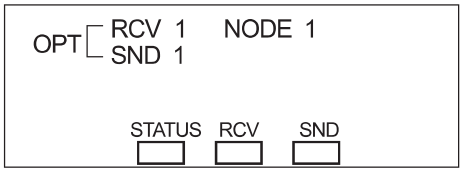

Figure B4.5-2 Status lamps

The status lamps indicate the device status as follows:

- STATUS
  The lamp turns on when the module is normal; otherwise, the lamp turns off.
- RCV
  The lamp turns on when the module is receiving electrical signal. Otherwise, the lamp turns off.
- SND
  The lamp turns on when the module is sending electrical signal. Otherwise, the lamp turns off.
- OPT RCV
  The figure “1” lamp turns on when the module is receiving optical signal. Otherwise, the lamp turns off.
- OPT SND
  The figure “1” lamp turns on when the module is sending optical signal. Otherwise, the lamp turns off.
- NODE
  This lamp indicates the operation mode setting. The figure “1” lamp turns on when bit 1 of the unit type setting switch is set to "1." Otherwise, the lamp turns off.

Fiber-Optic cable connector

This connector is used to connect the fiber-optic cable.

SEE ALSO For more information about the specifications of fiber-optic cables, refer to:

- ProSafe-RS Installation Guidance (TI 32P01J10-01EN)
- ProSafe-RS Lite Installation Guidance (TI 32P51J10-01EN)

ESB bus cable connector

This connector is used to connect the ESB bus cable (Model: YCB301).

The optical ESB bus repeater slave module is always at the end of the ESB bus, so a connector unit with ESB bus terminator is provided.

Unit type setting switch

Set this switch according to the type of the unit where the optical ESB bus repeater module is installed. When you change the switch setting, you must remove the connector unit for ESB bus.

The following figure shows the unit type setting switch.

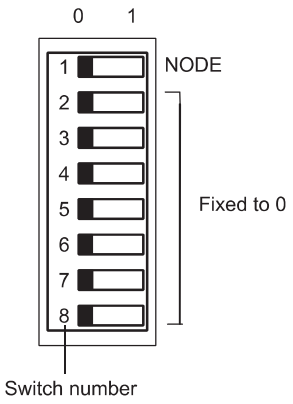

Figure B4.5-3 Unit type setting switch

- Switch 1
  Set to 0 if you install the module to the unit for optical bus repeater module. Set to 1 if you install the module to SCU or SNU.
- Switches 2 to 5
  Always set to 0.
- Switches 6 to 8
  Set to 0 during normal operation. These switches are used for maintenance.

B4.6 N-ESB bus coupler module

The N-ESB bus coupler module (Model: S2EN402, S2EN404) is installed in the SCU and communicates with the N-ESB bus modules (Model: S2EN501) in N-IO nodes. S2EN402 has two N-ESB bus ports, whereas S2EN404 has four N-ESB bus ports. The N-ESB bus coupler module can be used in SCSP3.

The N-ESB bus coupler module is always used in dual-redundant configuration.

Elements on the N-ESB bus coupler module

The following figures show the elements on the N-ESB bus coupler modules.

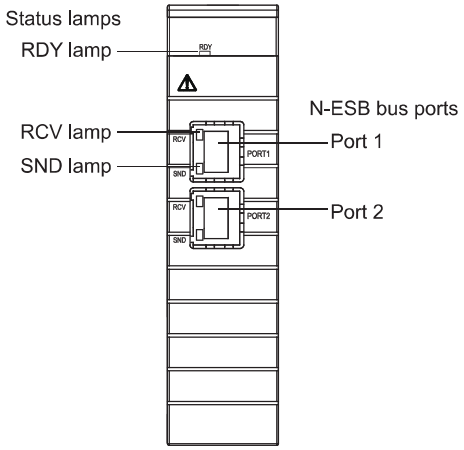

Figure B4.6-1 S2EN402

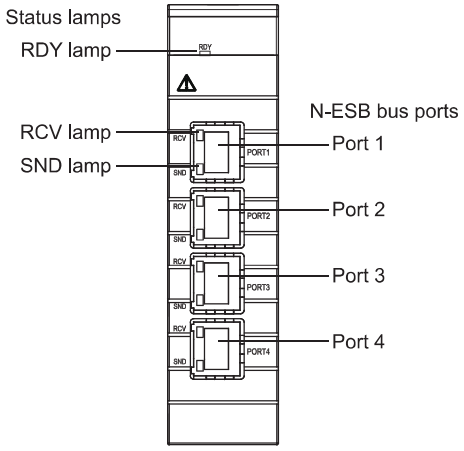

Figure B4.6-2 S2EN404

Status lamps

The N-ESB bus coupler module has the following status lamps.

- RDY
  The lamp turns on when the module is normal; otherwise, the lamp turns off.
- RCV
  The lamp turns on when the module is receiving; otherwise, the lamp turns off. The RCV lamp is provided for each port.
- SND

The lamp turns on when the module is sending; otherwise, the lamp turns off. The SND lamp is provided for each port.

- **N-ESB bus ports**

  Cables for N-ESB bus are connected to these ports. For unused ports, put the cover that came with the module.

B4.7 FIO I/O modules and their peripherals

The following types of FIO I/O modules are available:

- Analog I/O modules
- Digital I/O modules
- Communication modules

Peripherals for the FIO I/O modules are as follows:

- Pressure clamp terminal block
- Connector cover for MIL cable
- Terminal board
- Relay board

SEE ALSO

For more information about restrictions on FIO I/O module installation to SCSs that support SIL 3, refer to:

ProSafe-RS Outline of I/O Modules (for FIO) (GS 32P06K60-01EN)

For more information about restrictions on FIO I/O module installation to SCSs that support SIL 2, refer to:

ProSafe-RS Lite Outline of I/O Modules (GS 32P56K60-01EN)

B4.7.1 Analog I/O modules

An analog input module receives analog signals and converts them into internal data of SCU. An analog output module converts the internal data of SCU into analog signals and outputs them. There are analog I/O modules for SCSs that support SIL 3 and those that support SIL 2.

- For SCSs that support SIL 3
  - SAI143: Analog input module (4 to 20 mA input, 16 channels, module isolation)
  - SAV144: Analog input module (1 to 5 V DC/1 to 10 V DC input, 16 channels, module isolation)
  - SAT145: TC/mV input module (16 channels, isolated channels)
  - SAR145: RTD input module (16 channels, isolated channels)
  - SAI533 : Analog output module (4 to 20 mA output, 8 channels, module isolation)
- For SCSs that support SIL 2
  - L1AI143: Analog input module (4 to 20 mA input, 16 channels, module isolation)
  - L1AV144: Analog input module (1 to 5 V DC/1 to 10 V DC input, 16 channels, module isolation)
  - L1AT145: TC/mV input module (16 channels, isolated channels)
  - L1AR145: RTD input module (16 channels, isolated channels)
  - L1AI533: Analog output module (4 to 20 mA output, 8 channels, module isolation)

Elements on the analog I/O modules

An analog I/O module and field devices are connected through a pressure clamp terminal block, MIL cable, or signal cable. The available connection methods differ for each module.

The following figure shows the elements on the module that supports connection through pressure clamp terminals and a MIL cable and the module that has a signal cable interface adapter.

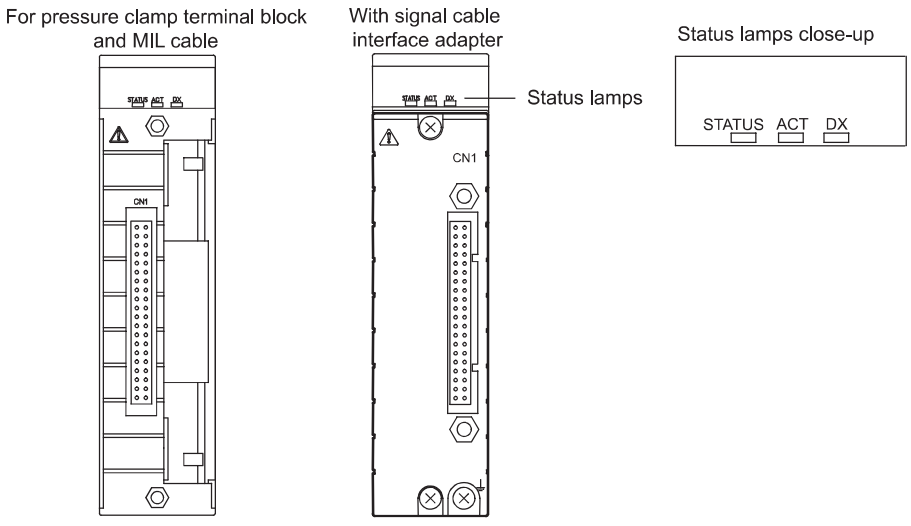

Figure B4.7.1-1 Analog I/O modules

SEE ALSO For more information about pressure clamp terminal blocks, refer to:

B4.7.4, “Pressure clamp terminal blocks” on page B4-31

For more information about the connector cover for MIL cable, refer to:

B4.7.5, “Connector cover for MIL cable” on page B4-32

For more information about how to connect analog I/O modules and field devices, refer to:

D1.1, “Types of FIO I/O module signal connection” on page D1-2

Status lamps

The status lamps indicate the device status as follows:

- STATUS
  On: Hardware normal

  Off: Other than the above
- ACT
  On: Operating

  Off: Stopped operating, or standby in dual-redundant configuration

TIP SAI143 (style S4 or later) and L1AI143 can reset the error detection status of smoke and heat detectors. The ACT lamp is off while SAI143/L1AI143 is resetting the error detection status of detectors.

- DX
  On: In dual-redundant configuration

  Off: Other than the above

SEE ALSO For more information about the function to reset the error detection status of Smoke and Heat Detector by SAI143 (style S4 or later) and L1AI143, refer to:

A3.4.1, “Device reset function with FIO” in Engineering Guide Vol. 2 (IM 32P01C20-01EN)

Setting pins of the current input module

In the case of current input module (Model: SAI143/L1AI143), there is an option to select whether to supply power to the transmitter for each channel by using the setting pins, depending on the type of the transmitter. The following figure shows the right side view of the current input module and the jumper positions on the setting pins when supplying power (2-wire) and not supplying power (4-wire) to the transmitter.

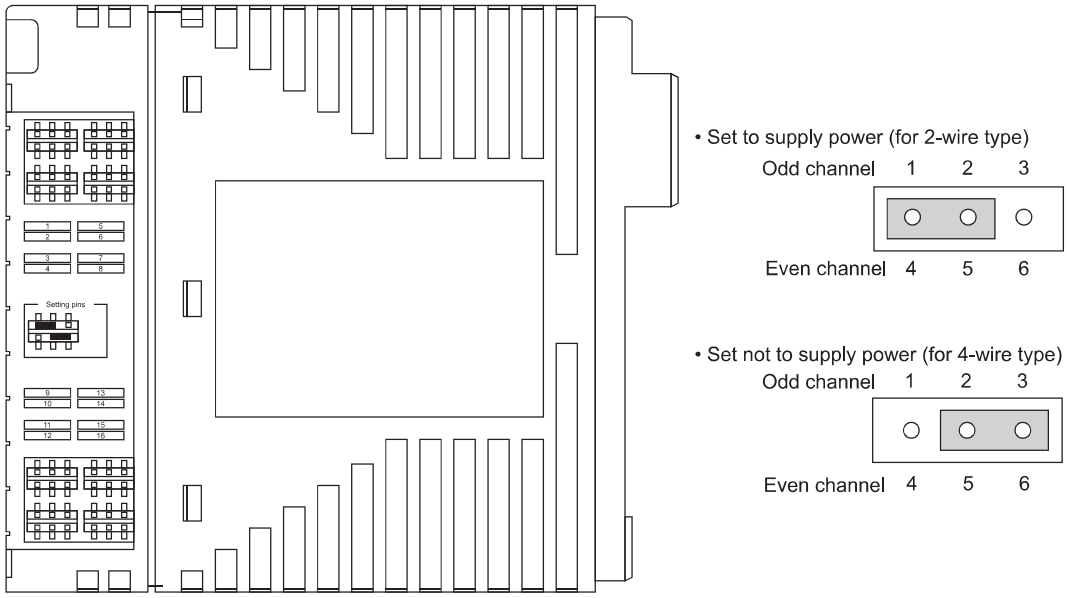

Figure B4.7.1-2 Setting pins of the current input module

The following figure shows the relationship between the setting pins and channel numbers. The factory-set default is “Yes”, meaning supply power to a 2-wire type transmitter.

Display of setting pins	Setting pin	Power supply to transmitter		Remarks	Setting pin	Power supply to transmitter		Remarks
		Yes (2-wire)	No (4-wire)	Channel No.		Yes (2-wire)	No (4-wire)	Channel No.
S1 to S16 1 2 3 4 5 6	S1	1 2	2 3	1	S5	1 2	2 3	5
	S2	4 5	5 6	2	S6	4 5	5 6	6
	S3	1 2	2 3	3	S7	1 2	2 3	7
	S4	4 5	5 6	4	S8	4 5	5 6	8
	S9	1 2	2 3	9	S13	1 2	2 3	13
	S10	4 5	5 6	10	S14	4 5	5 6	14
	S11	1 2	2 3	11	S15	1 2	2 3	15
	S12	4 5	5 6	12	S16	4 5	5 6	16

Figure B4.7.1-3 Setting pins of the current input module

B4.7.2 Digital I/O modules

A digital input module receives digital (discrete) signals and converts them into internal data of SCU. A digital output module converts the internal data of SCU into digital (discrete) signals and outputs them.

There are digital I/O modules for SCSs that support SIL 3 and those that support SIL 2.

- For SCSs that support SIL 3
  - SDV144: Digital input module (16 channels, module isolation)
  - SDV521: Digital output module (24 V DC/2 A, 4 channels, module isolation)
  - SDV526: Digital output module (100-120 V AC, 4 channels, module isolation)
  - SDV531: Digital output module (8 channels, module isolation)
  - SDV53A: Digital output module (48 V DC, 8 channels, module isolation)
  - SDV541: Digital output module (16 channels, module isolation)
- For SCSs that support SIL 2
  - L1DV144: Digital input module (16 channels, module isolation)
  - L1DV521: Digital output module (24 V DC/2 A, 4 channels, module isolation)
  - L1DV526: Digital output module (100 to 120 V AC, 4 channels, module isolation)
  - L1DV531: Digital output module (8 channels, module isolation)
  - L1DV53A: Digital output module (48 V DC, 8 channels, module isolation)
  - L1DV541: Digital output module (16 channels, module isolation)

Elements on the digital I/O modules

A digital I/O module and field devices are connected through a pressure clamp terminal block, MIL cable, or signal cable. The available connection methods differ for each module.

The following figure shows the elements on the module that supports connection through pressure clamp terminals and a MIL cable and the module that has a signal cable interface adapter.

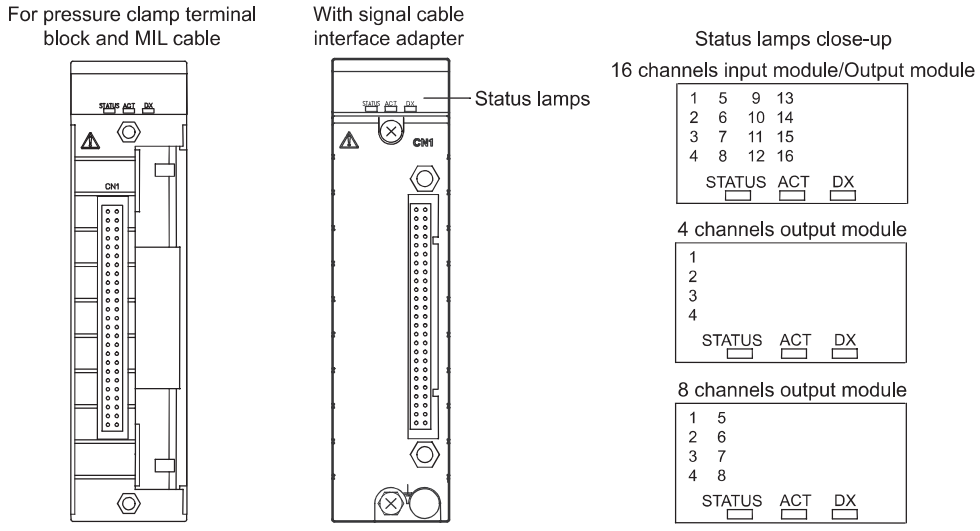

Figure B4.7.2-1 Digital I/O modules

SEE ALSO For more information about pressure clamp terminal blocks, refer to:

B4.7.4, “Pressure clamp terminal blocks” on page B4-31

For more information about the connector cover for MIL cable, refer to:

B4.7.5, “Connector cover for MIL cable” on page B4-32

For more information about how to connect analog I/O modules and field devices, refer to:

D1.1, “Types of FIO I/O module signal connection” on page D1-2

Status lamps

The status lamps indicate the device status as follows:

- STATUS
  The lamp turns on when the hardware is functioning normally; otherwise, the lamp turns off.
- ACT
  The lamp turns on when the module is operating and turns off when the module is stand-by in dual-redundant configuration or not operating.
- DX
  The lamp turns on when the module is in dual-redundant configuration; otherwise, the lamp turns off.
- Channel numbers
  The lamp turns on when the input or output on the channel is ON; otherwise the lamp turns off.

Behavior of SDV531/L1DV531 on short-circuit error

When a short-circuit occurs on the field side, SDV531 and L1DV531 behave as follows:

- SDV531 (other than SDV531-S13) and L1DV531
  When a short circuit occurs on the field side, only the output on the relevant channel becomes OFF. When the failure on the field side is resolved, the output channel can be recovered by performing the Output Enable Operation for that channel. Then, the recovered channel outputs the application logic value. The channel continues to output the failsafe value until the Output Enable Operation is performed.
- SDV531-S13
  The Output Shutoff Switch is activated by a short circuit on the field side, and the output on all channels of the module becomes OFF. When the failure on the field side is resolved, the outputs can be recovered by starting the output module from the SCS Status Management Window and performing the Output Enable Operation. Then, the recovered channels output the application logic value. All the outputs remain OFF until the Output Enable Operation is performed.

B4.7.3 Communication modules

Communication modules are used for communication between the SCS and external devices. The communication modules support Modbus slave communication, subsystem communication, and safety subsystem communication.

The following types of communication modules are available:

- ALR111: Serial communication module (RS-232C, 2 ports)
- ALR121: Serial communication module (RS-422/RS-485, 2 ports)
- ALE111: Ethernet communication module
- S2LP131: Fire and gas communication module

ALR111, ALR121, and ALE111 can be used with SCSs that support SIL 3 and those that support SIL 2. S2LP131 can be used in SCSP3 (SCS supporting SIL 3 which is configured with S2SC70□).

IMPORTANT

When using ALE111, you must use the style S1 module with unit revision U:2 or later. The unit revision is indicated on the top of the module. However, the unit revision is not indicated if it is U:0.

TIP

The fire and gas communication mode communicates with YFGW410. YFGW410 is called a PROFINET IO-device.

Elements on the serial communication module

The following figure shows the elements on the serial communication modules.

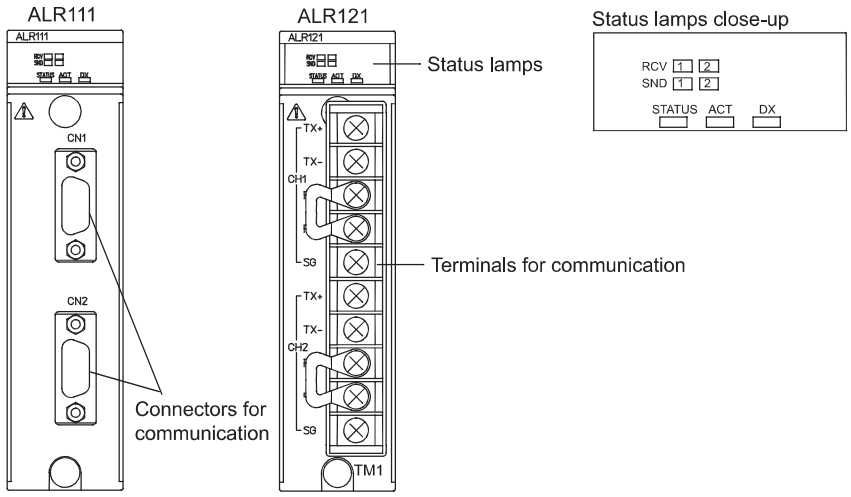

Figure B4.7.3-1 Serial communication module

Status lamps

The status lamps indicate the device status as follows:

- STATUS
  On: Hardware normal

  Off: Other than the above

- ACT
  On: Operating

  Off: Standby in dual-redundant configuration, or not operating
- DX
  On: Normal in dual-redundant configuration

  Off: Error in dual-redundant configuration, or operating in non-redundant configuration
- RCV-1
  On: CH1 is receiving data

  Off: Other than the above
- SND-1
  On: CH1 is sending data

  Off: Other than the above
- RCV-2
  On: CH2 is receiving data

  Off: Other than the above
- SND-2
  On: CH2 is sending data

  Off: Other than the above

Elements on the Ethernet communication module

The following figure shows the elements on the Ethernet communication module.

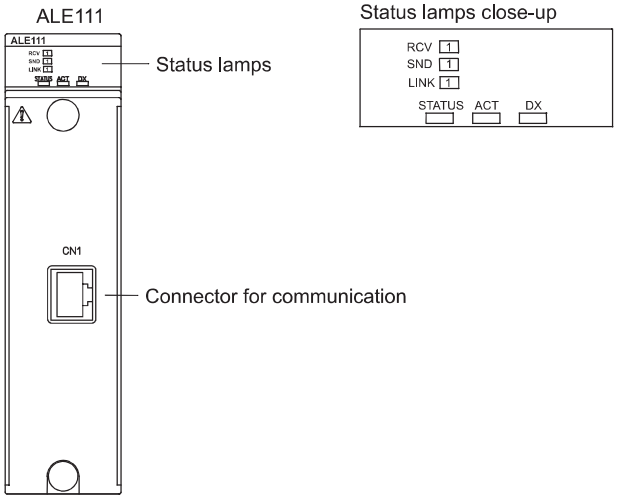

Figure B4.7.3-2 Ethernet communication module

Status lamps

The status lamps indicate the device status as follows:

- STATUS
  On: Hardware normal

  Off: Other than the above
- ACT
  On: Operating

  Off: Standby in dual-redundant configuration, or not operating

- DX
  On: Normal in dual-redundant configuration

  Off: Error in dual-redundant configuration, or operating in non-redundant configuration
- RCV
  On: Receiving data

  Off: Other than the above
- SND
  On: Sending data

  Off: Other than the above
- LINK
  On: Link is established

  Off: Other than the above

Elements on the fire and gas communication module

The following figure shows the elements on the fire and gas communication module.

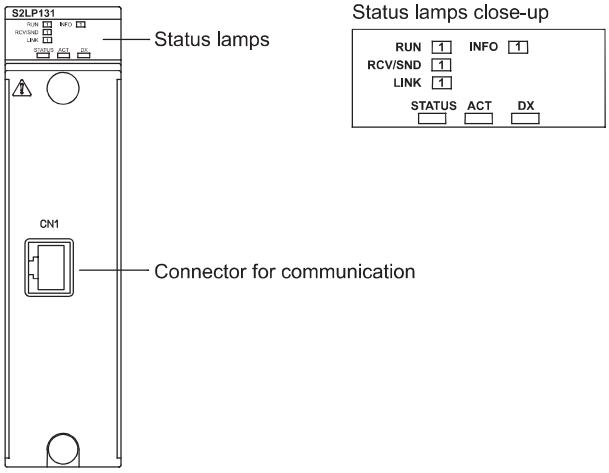

Figure B4.7.3-3 Fire and gas communication module

Status lamps

The status lamps indicate the device status as follows:

- STATUS
  On: Hardware normal

  Off: Other than the above
- ACT
  On: Operating

  Off: Other than the above
- DX
  Always off
- RUN
  On: Communicating normally

  Off: Other than the above
- RCV/SND
  Flashing: Sending or receiving data

Off: Other than the above

- LINK
  On: Link is normal

  Off: Other than the above

- INFO
  On: Configuration information that matches the configuration of the PROFINET IO-device connected to S2LP131 is not loaded on S2LP131. (*1)

  Flashing: Duplicate address between S2LP131 and PROFINET IO-device. (*2)

  Off: Configuration information that matches the configuration of the PROFINET IO-device connected to S2LP131 is loaded on S2LP131.

*1: If YFGW410 is used as a PROFINET IO-device, the lamp does not turn on although the configuration information that matches the configuration is not loaded.
*2: If YFGW410 is used as a PROFINET IO-device, the lamp does not flash although the address duplicates.

SEE ALSO For more information about configuration of S2LP131, refer to:

E1.5, “Engineering for fire and gas communication” in Engineering Guide Vol. 2 (IM 32P01C20-01EN)

B4.7.4 Pressure clamp terminal blocks

The pressure clamp terminal block is used to connect the signal cables of field devices directly to the I/O module. There are pressure clamp terminal blocks for SCSs that support SIL 3 and those that support SIL 2.

- For SCSs that support SIL 3
  - STA4S: Pressure clamp terminal block for analog I/O
  - STB4S: Pressure clamp terminal block for digital I/O
  - STA4D: Dual-redundant pressure clamp terminal block for analog I/O
  - STB4D: Dual-redundant pressure clamp terminal block for digital I/O
- For SCSs that support SIL 2
  - L1TA4S: Pressure clamp terminal block for analog I/O
  - L1TB4S: Pressure clamp terminal block for digital I/O
  - L1TA4D: Dual-redundant pressure clamp terminal block for analog I/O
  - L1TB4D: Dual-redundant pressure clamp terminal block for digital I/O

The following figure shows the appearance of the pressure clamp terminal blocks for single and dual-redundant configurations. The pressure clamp terminal blocks for analog I/O and digital I/O are functionally different but have the same appearance.

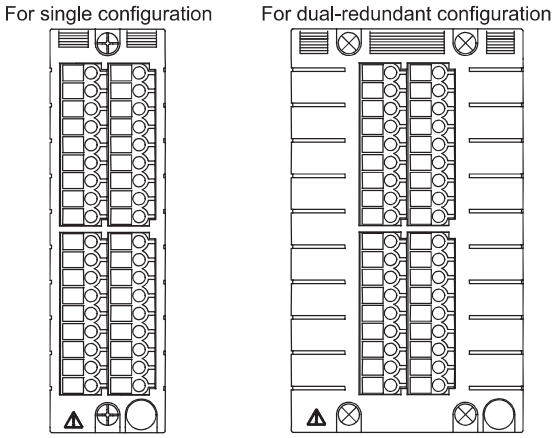

Figure B4.7.4-1 Pressure clamp terminal blocks

B4.7.5 Connector cover for MIL cable

A connector cover for MIL cable over the I/O modules is used to connect the MIL cable to the connector securely. There are connector covers for MIL cable for SCSs that support SIL 3 and those that support SIL 2.

- For SCSs that support SIL 3
  - SCCC01: For flat ribbon cables
  - SCCC02: For discrete wire cables (DI, DO cables)
- For SCSs that support SIL 2
  - L1CCC01: For flat ribbon cables
  - L1CCC02: For discrete wire cables (DI, DO cables)

The following figure shows the appearance of the connector cover for MIL cable.

Figure B4.7.5-1 Example of a connector cover for MIL cable (flat ribbon cables)

B4.7.6 Terminal boards (for FIO node)

The terminal boards are used to pass field device signals to I/O modules. Terminal boards can be used with SCSs that support SIL 3 and those that support SIL 2. All models support the single and dual-redundant configurations of I/O modules.

Table B4.7.6-1 Types of rack mountable terminal boards

Terminal board	Name	Connectable I/O module	
		For SCSs that support SIL 3	For SCSs that support SIL 2
SEA4D	Terminal board for analog I/O (single and dual-redundant)	SAI143, SAI533, SAV144	L1AI143, L1AI533, L1AV144
SED2D	Terminal board for digital I/O (single and dual-redundant)	SDV521	L1DV521
SED3D	Terminal board for digital output (single and dual-redundant)	SDV53A	L1DV53A
SED4D	Terminal board for digital I/O (single and dual-redundant)	SDV144, SDV531, SDV541	L1DV144, L1DV531, L1DV541
SWD2D	Terminal board for digital output (single and dual-redundant)	SDV526	L1DV526

Table B4.7.6-2 Types of DIN rail mountable terminal boards

Terminal board	Name	Connectable I/O module	
		For SCSs that support SIL 3	For SCSs that support SIL 2
SBA4D	Terminal board for analog I/O (single and dual-redundant)	SAI143, SAI533, SAV144	L1AI143, L1AI533, L1AV144
SBT4D	Terminal board for TC/mV (single and dual-redundant)	SAT145	L1AT145
SBR4D	Terminal board for RTD input (single and dual-redundant)	SAR145	L1AR145
SBD2D	Terminal board for digital output (single and dual-redundant)	SDV521	L1DV521
SBD3D	Terminal board for digital output (single and dual-redundant)	SDV531, SDV53A	L1DV531, L1DV53A
SBD4D	Terminal board for digital I/O (single and dual-redundant)	SDV144, SDV541	L1DV144, L1DV541
S1BB4D	Terminal board for analog input (3-wire, single and dual-redundant)	SAI143	L1AI143

Elements on rack mountable terminal boards

The following figures show the elements on the rack mountable terminal boards.

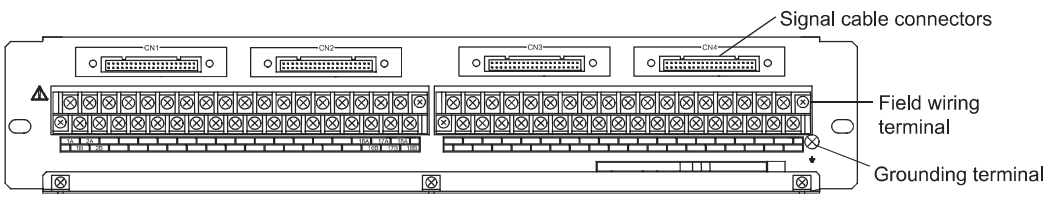

Figure B4.7.6-1 SEA4D

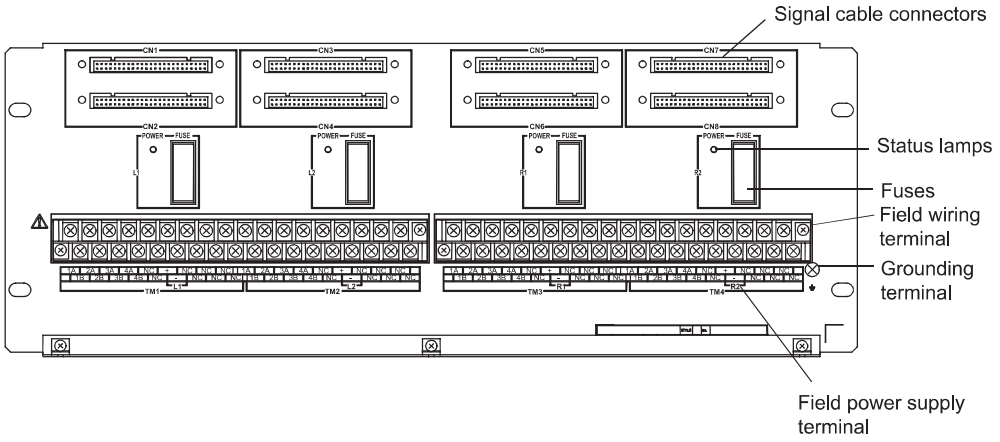

Figure B4.7.6-2 SED2D

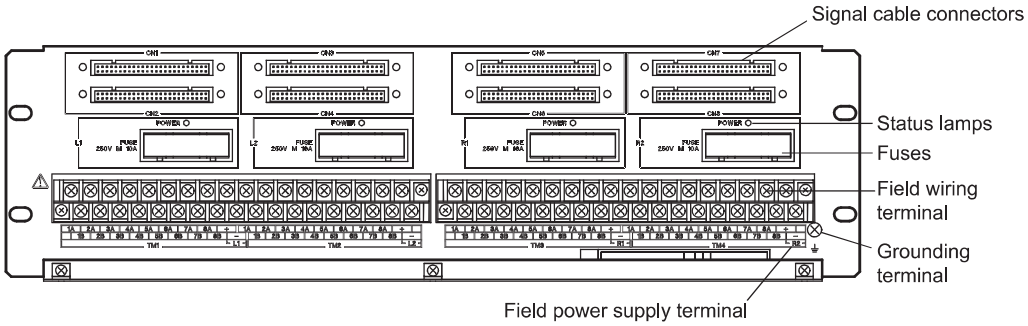

Figure B4.7.6-3 SED3D

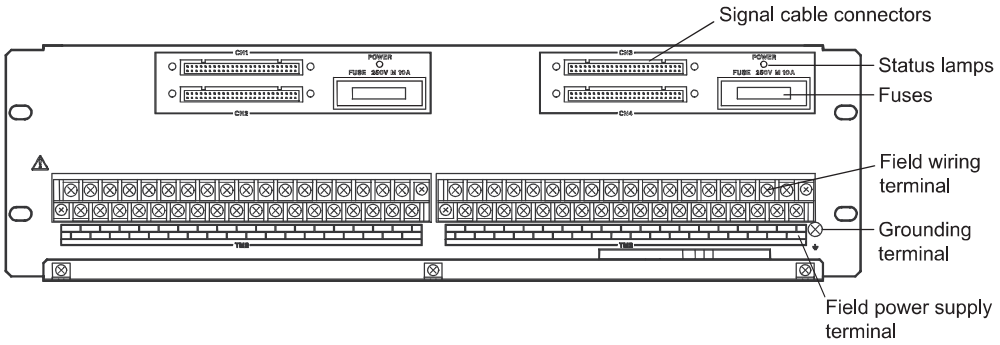

Figure B4.7.6-4 SED4D

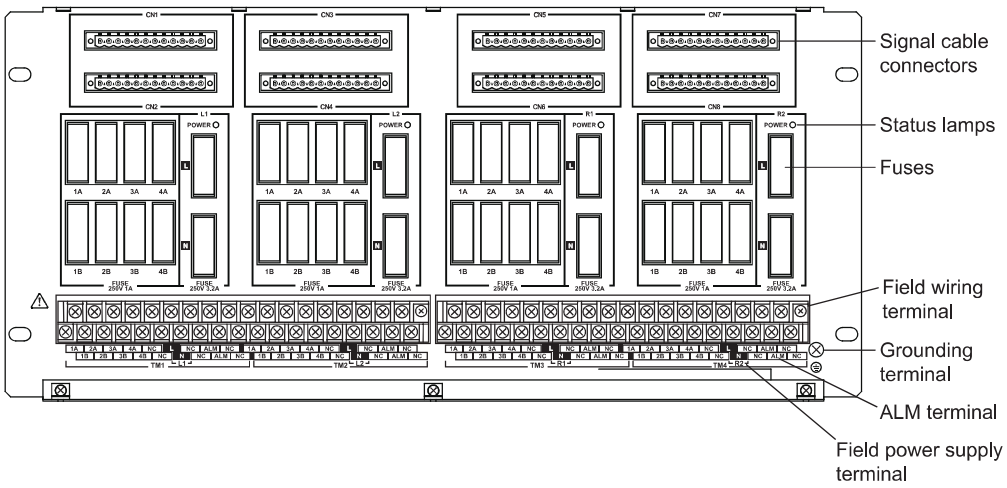

Figure B4.7.6-5 SWD2D

Status lamps

SED2D, SED3D, SED4D, and SWD2D have status lamps.

The status lamps indicate the device status as follows:

- POWER
  The lamp turns on when the field power is supplied and also the fuse is not blown; otherwise, the lamp turns off.

ALM terminals

SWD2D has ALM terminals. Each of the terminal groups TM1 to TM4 has a pair of ALM terminals for sending a contact signal when fuse is blown. When any fuse (1A to 4A, 1B to 4B, L and N) of a terminal group is blown, the contact of the ALM terminals becomes closed.

When the external relays are connected, a surge absorber should be used for inhibiting the noises.

SEE ALSO For more information about the alarm terminals of SWD2D, refer to:

- ProSafe-RS Field Device Connection (for FIO) (GS 32Q06J10-31E)
- ProSafe-RS Lite Field Device Connection (GS 32P56J10-01EN)

Elements on DIN rail mountable terminal boards

The following figures show the elements on DIN rail mountable terminal boards.

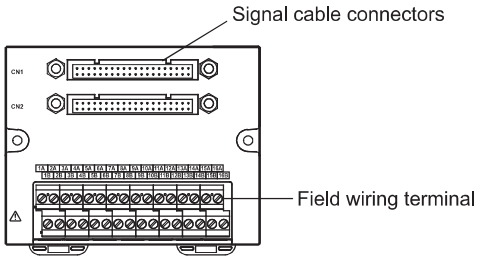

Figure B4.7.6-6 SBA4D

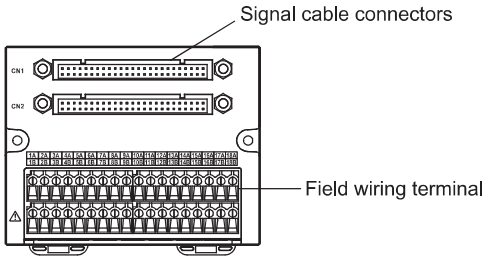

Figure B4.7.6-7 SBT4D

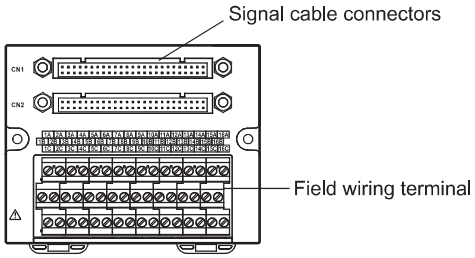

Figure B4.7.6-8 SBR4D

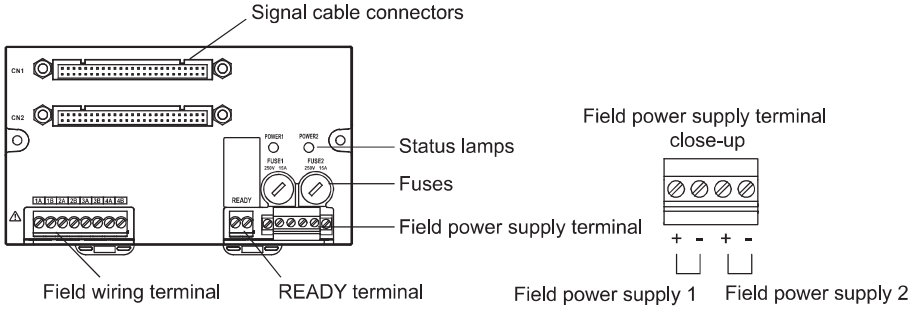

Figure B4.7.6-9 SBD2D

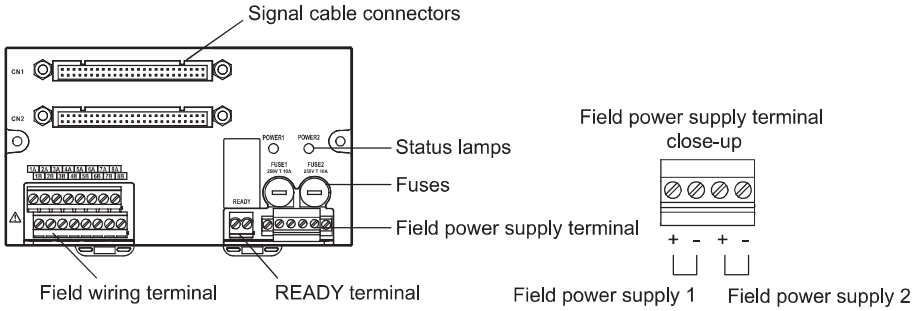

Figure B4.7.6-10 SBD3D

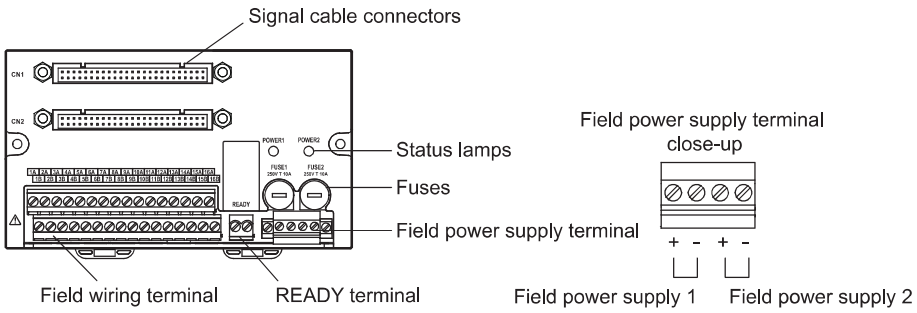

Figure B4.7.6-11 SBD4D

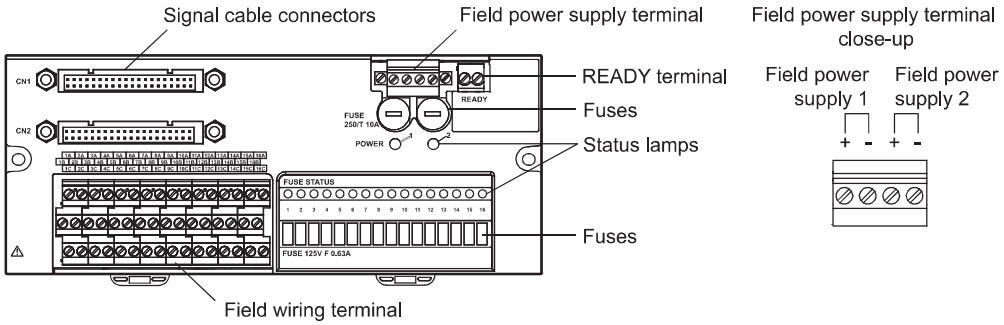

Figure B4.7.6-12 S1BB4D

Status lamps

SBD2D, SBD3D, SBD4D, and S1BB4D have status lamps.

The status lamps indicate the device status as follows:

- POWER1
  The lamp turns on when field power 1 is supplied and also fuse 1 is not blown; otherwise, the lamp turns off.
- POWER2
  The lamp turns on when field power 2 is supplied and also fuse 2 is not blown; otherwise, the lamp turns off.
- FUSE STATUS
  This lamp is provided for each channel of S1BB4D. The lamp turns on when the fuse is normal; otherwise, the lamp turns off. If this lamp is off, power is not supplied to the field device.

READY terminals

SBD2D, SBD3D, SBD4D, and S1BB4D have READY terminals. The contact between the READY terminals becomes closed when field powers 1 and 2 are supplied and also the two fuses are not blown. Otherwise, the contact between the READY terminals is open.

If an external relay is used, a surge absorber should be used for noise prevention.

B4.7.7 Relay boards

The output voltage of a digital output module is applied to the relay coils on the relay board to produce relay contact signals. Relay boards can be used with SCSs that support SIL 3 and those that support SIL 2.

The following table describes the available models of rack mountable relay boards. The relay output status can be read back by connecting the digital input module (SDV144/L1DV144).

Table B4.7.7-1 Types of 19-inch rack mountable relay boards

Relay board	Name	Connectable I/O module	
		For SCSs that support SIL 3	For SCSs that support SIL 2
SRM53D	Relay board (8 x 2 dry contact outputs)	SDV531	L1DV531
		SDV144 (readback)	L1DV144 (readback)
SRM54D	Relay board (16 x 1 dry contact outputs)	SDV541	L1DV541
		SDV144 (readback)	L1DV144 (readback)

The following table describes the available model of DIN rail mountable relay board.

Table B4.7.7-2 Types of DIN rail mountable relay boards

Relay board	Name	Connectable I/O module	
		For SCSs that support SIL 3	For SCSs that support SIL 2
SBM54D	Relay board for digital output	SDV541	L1DV541

Elements on rack mountable relay boards

The following figure shows the elements on SRM53D.

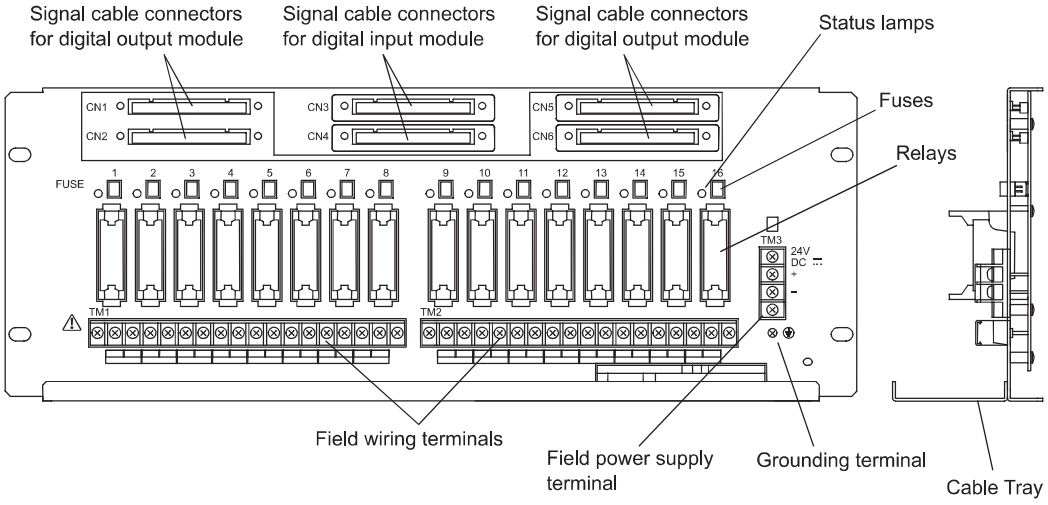

Figure B4.7.7-1 SRM53D (with cable tray)

The following figure shows the elements on SRM54D.

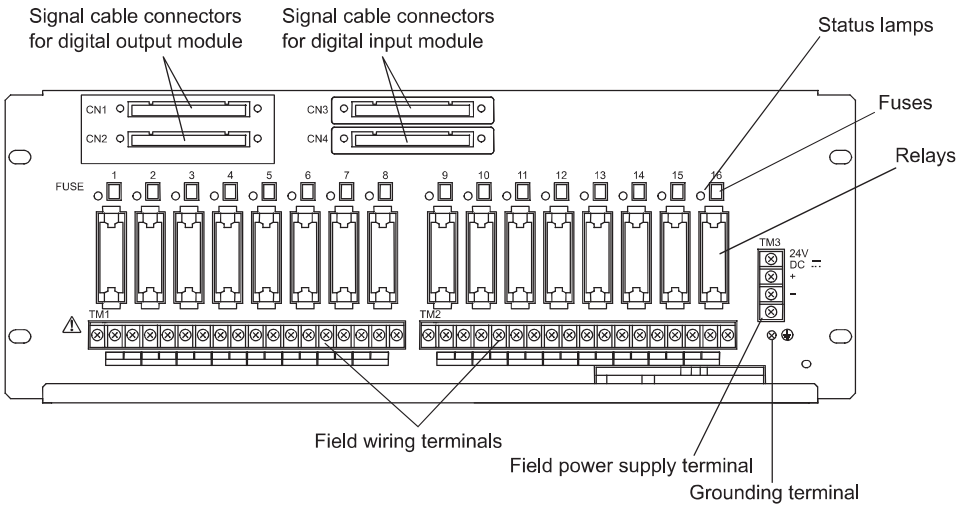

Figure B4.7.7-2 SRM54D

● Status lamps

The status lamps indicate the device status as follows:

- Status lamps (1 to 16)
  The lamp turns on when the signal from the digital output module is ON; otherwise, the lamp turns off.

SEE ALSO For more information about the status lamps of SRM53D, refer to:

"● Signal connection between SRM53D and digital I/O modules" on page D1-34

For more information about the status lamps of SRM54D, refer to:

"● Signal connection between the SRM54D and digital I/O modules" on page D1-37

■ Elements on DIN rail mountable relay boards

The following figure shows the elements on SBM54D.

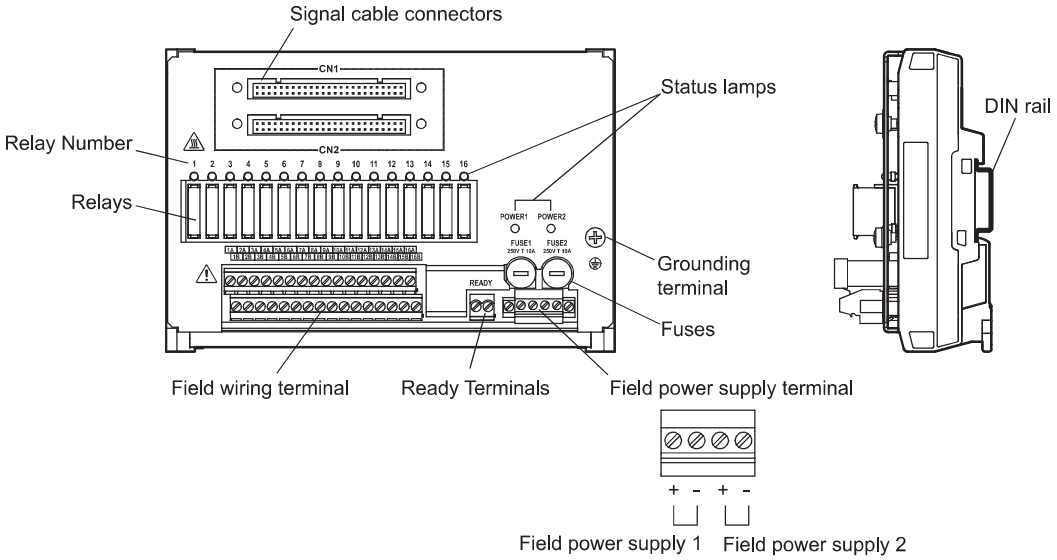

Figure B4.7.7-3 SBM54D

Status lamps

The status lamps indicate the device status as follows:

- POWER1
  The lamp turns on when field power 1 is supplied and also fuse 1 is not blown; otherwise, the lamp turns off.
- POWER2
  The lamp turns on when field power 2 is supplied and also fuse 2 is not blown; otherwise, the lamp turns off.
- Status lamps (1 to 16)
  The lamp turns on when the signal from the digital output module is ON; otherwise, the lamp turns off.

SEE ALSO For more information about status lamps, refer to:

"● Signal connections between SBM54D and digital I/O modules" on page D1-39

READY terminals

The contact between the READY terminals becomes closed when field powers 1 and 2 are supplied and also the two fuses are not blown. Otherwise, the contact between the READY terminals is open.

If an external relay is connected to the terminals, a surge absorber must be connected for noise prevention.

B4.8 External interface unit

The external interface unit is one of the units that constitute the SCU and transmits temperature signals and fan control signals to the processor module.

The external interface units are available in two types: one for standard type SCU and the other for wide range temperature type SCU.

Elements on the external interface unit

The following figure shows the elements on the external interface units for standard type SCU and wide range temperature type SCU.

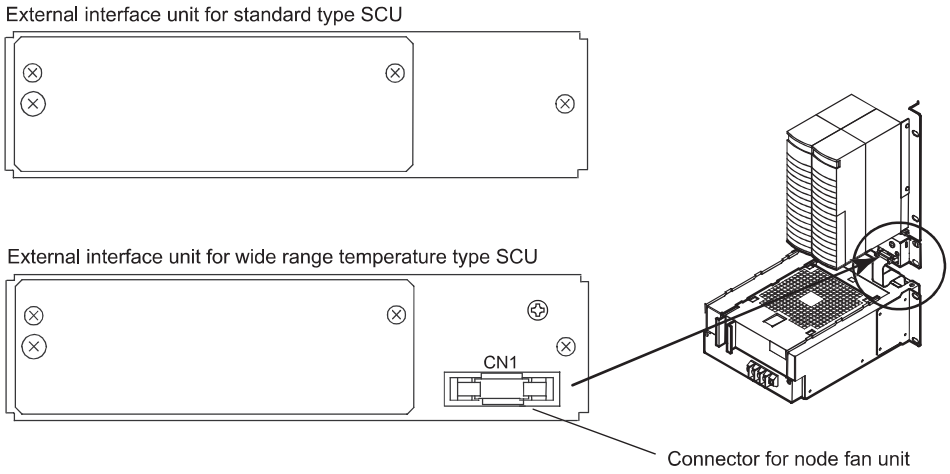

Figure B4.8-1 External interface unit

External interface unit for standard type safety control unit

The external interface unit for standard type SCU has a built-in temperature sensor (thermometer) for monitoring the ambient temperature of the SCU. The sensor signals are converted into the temperature information by the HKU (House Keeping Unit) function in the processor module. When the ambient temperature abnormality occurs it can be monitored through the SCS status management window on SENG, using the SCS maintenance Support Tools.

SEE ALSO For more information about the SCS State Management window, refer to:

H1.2, “SCS State Management window” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

External interface unit for wide range temperature type safety control unit

The external interface unit for wide range temperature type SCU is used when connecting node fan units to the SCU. Same as the external interface unit for standard type SCU, a temperature sensor is built-in.

The following signals that indicate the status of fans are passed to the HKU function in the processor module:

- Fan speed signal
- Fan speed control signal

B4.9 Node fan unit

The wide range temperature type SCU has a node fan unit. These fan units reduce the temperature increase to prevent malfunctions and the component fatigues that may be caused by the high temperature.

■ Configuration of the node fan unit

The following figure shows the configuration of the node fan unit.

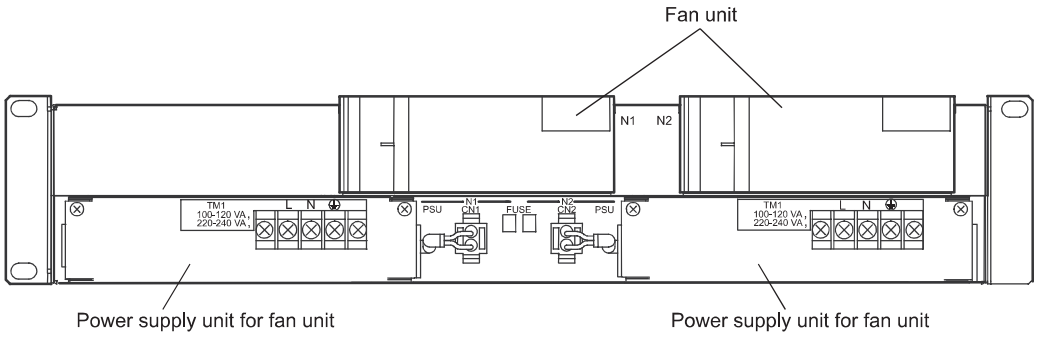

Figure B4.9-1 Node fan unit

● Fan unit

The fan revolution varies with the ambient temperature for two levels. When the ambient temperature is higher than 35 degree C, or when the other fan is abnormal, the fan revolves at high speed. When a fan revolves at an abnormally very low speed, the abnormality can be monitored through the SCS status management window on SENG.

The following figure shows the appearance of the fan unit.

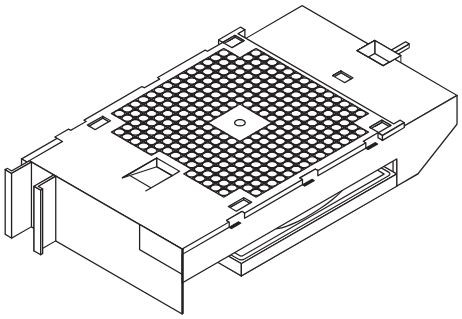

Figure B4.9-2 Fan unit

SEE ALSO For more information about replacing the fan unit, refer to:

"■ Replacing fan unit" on page E3-9

● Power supply unit for fan unit

The power supply unit for fan unit receives the designated power supply through the power input terminals and produces 12 V DC for running the fan. The left and right power supply units for fan unit supply power to the left and right fan units, respectively.

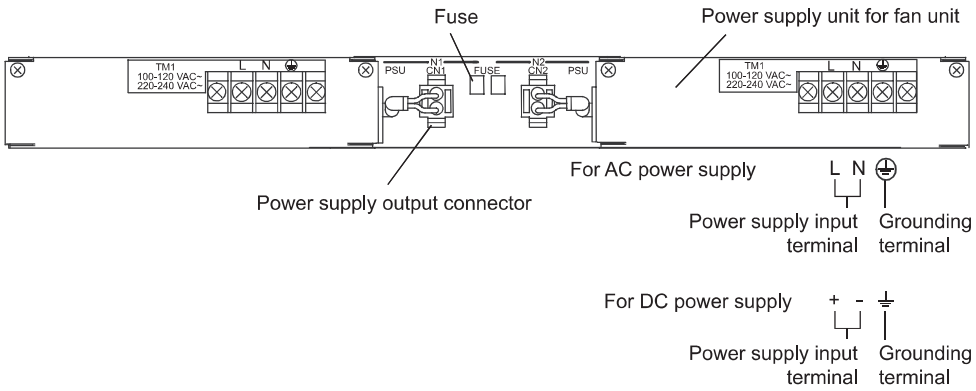

Figure B4.9-3 Power supply unit for fan unit

SEE ALSO For more information about replacing the power supply unit for fans, refer to:

"■ Replacing power supply unit for fan unit" on page E3-11

● Fuse for fan power supply unit

A fuse is used for protecting the power supply unit for fan unit.

SEE ALSO For more information about replacing the fuse for fan power supply unit, refer to:

"■ Replacing fuse for fan power supply unit" on page E3-10

B5. N-IO node devices

This section describes the devices that constitute an N-IO node. The node interface unit and the N-IO I/O unit, which are components of an N-IO node, consist of a base plate and devices that are mounted on the base plate. N-IO nodes can be used in SCSP3.

- Node interface unit
  - Base plate for node interface unit
  - Power supply unit
  - N-ESB bus module
- N-IO I/O unit
  - Base plate
  - N-IO I/O module
  - Intrinsic safety barrier
- Terminal board
- Cables
  - F-SB bus cable
  - Power supply cable for base plates

TIP

For legal conformity in some regions, a generic name called “system model name” is given to a specific set of products that make up an N-IO I/O unit. There are following system model names:

- S2ZN1D
- S2ZN4D
- S2ZN5D

SEE ALSO

For more information about Products that constitute an S2ZN1D, S2ZN4D, or S2ZN5D, refer to:

- ProSafe-RS Base Plate (for N-IO) (GS 32P06K20-01EN)
- ProSafe-RS Base Plates for Barrier (for N-IO) (GS 32P06P10-01EN)

B5.1 Node interface unit

The node interface unit (Model: S2NN30D) passes the field device signals that the N-IO I/O units received to the SCU and passes the signals from the SCU to the N-IO I/O unit. The node interface unit also distributes the power that is supplied by the power supply unit to the N-IO I/O units.

Configuration of the node interface unit

The node interface unit consists of the following components:

- Base plate for node interface unit
- Power supply unit
- N-ESB bus module

The following figure shows the configuration of the node interface unit.

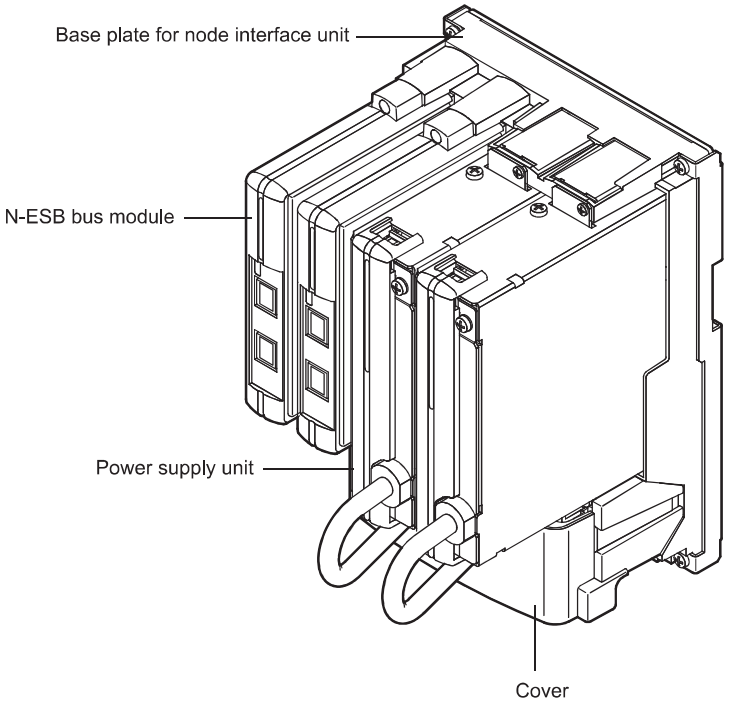

Figure B5.1-1 Node interface unit

Cover

A cover for protecting wiring connectors and terminals is provided.

Follow these steps to remove and attach the cover:

- Removing the cover
  1. Pinch the bottom-right part of the cover as shown in the figure, move it outward so that the cover expands. The hook on the cover leaves the groove of the base plate for node interface unit.
  2. Remove the cover toward you.
- Attaching the cover
  Put back the cover along the guide. Ensure that the wiring does not touch the cover.

The following figure shows how to remove and attach the cover.

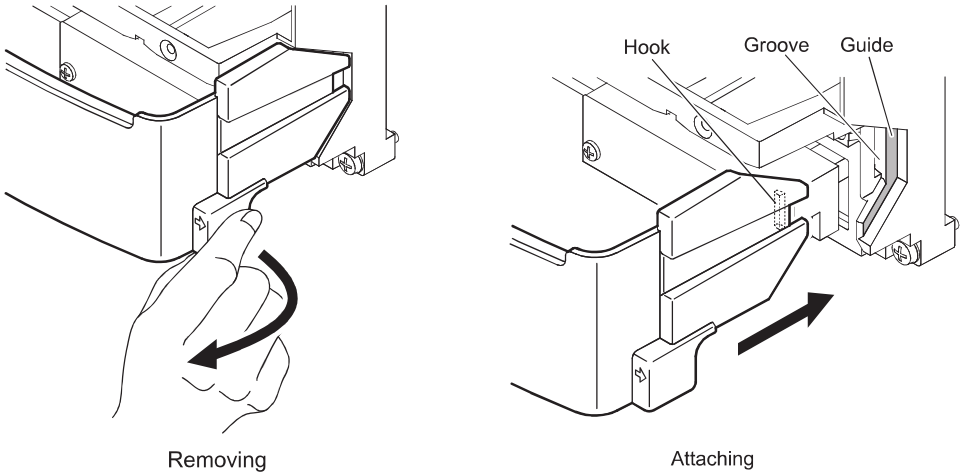

Figure B5.1-2 Removing and attaching the cover

B5.2 Base plate for node interface unit

The base plate for node interface unit is the base plate where you mount power supply units and N-ESB bus modules.

Elements on the base plate for node interface unit

The following figure shows the elements on the base plate for node interface unit.

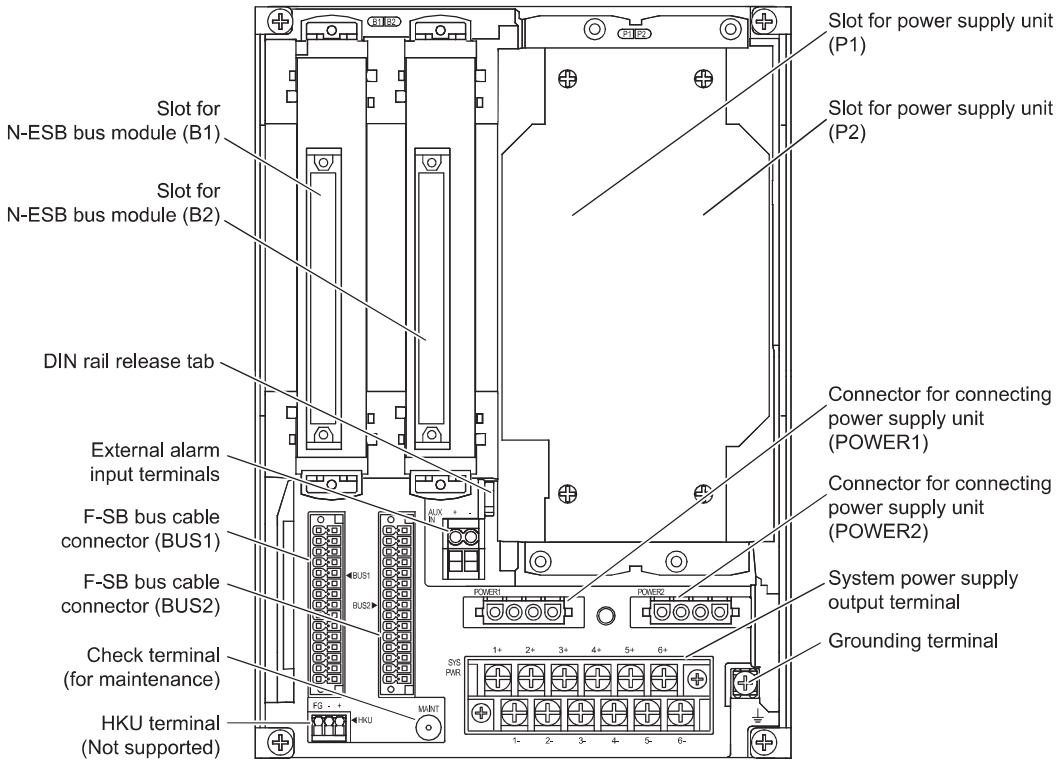

Figure B5.2-1 Base plate for node interface unit (DIN rail mountable type)

External alarm input terminals

These terminals are provided for connecting a voltage input signal from an external device. The terminals are pressure clamp terminals.

SEE ALSO For more information about signal wiring of the external alarm input terminals, refer to:

D3., “Signal connection of the external alarm input terminals of the node interface unit” on page D3-1

For more information about the software setting for the external alarm input terminals, refer to:

Appendix 1.1, “Setting items for nodes” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

Connectors for connecting power supply unit

To the connectors for connecting power supply unit, connect only the device specified by YOKOGAWA.

B5.3 Power supply unit

The power supply unit supplies power to the node interface unit and N-IO I/O units. The power supply units are mounted in pair on a base plate for node interface unit.

The following power supply units are available:

- S2PW503: 24 V DC output power supply unit (120 W output, 100-240 V AC input)
- S2PW504: 24 V DC output power supply unit (120 W output, 24 V DC input)

Elements on the power supply unit

The following figure shows the elements on the power supply unit.

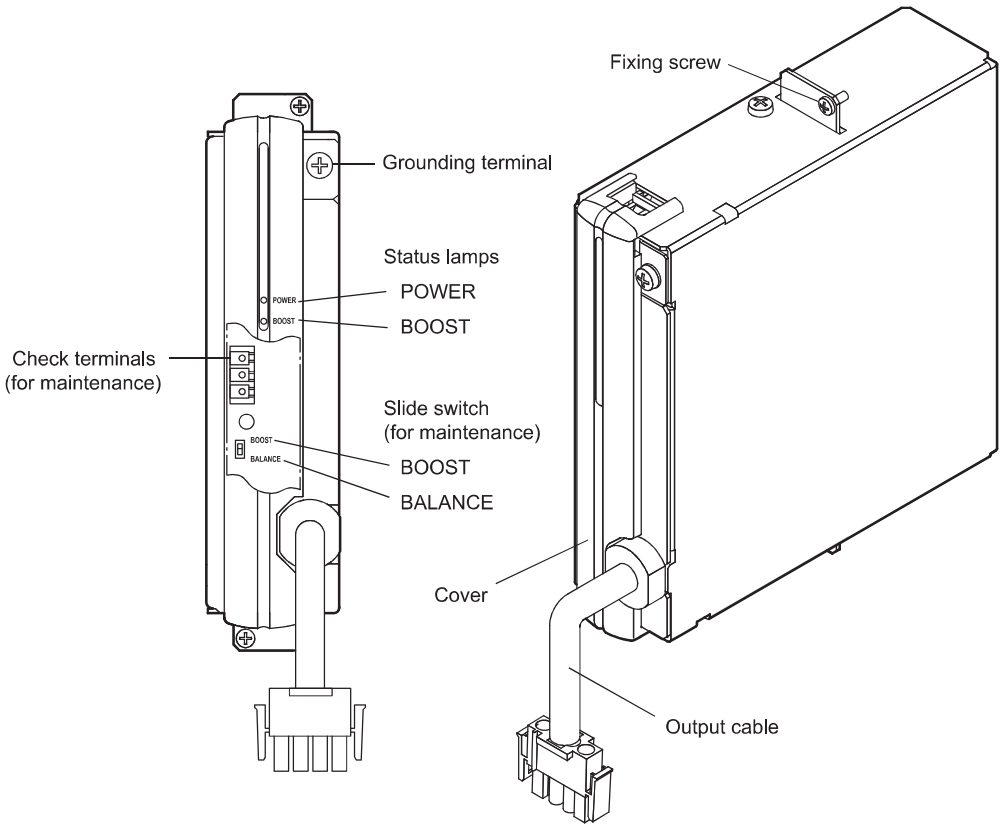

Figure B5.3-1 Power supply unit

Status lamps

Each lamp indicates the device status as follows:

- POWER
  This lamp is on while the power is applied.
- BOOST
  This lamp is for maintenance. The lamp is off during normal operation.

Slide switch

Set this switch to the BALANCE position during normal operation. This switch is for maintenance.

B5.4 N-ESB bus module

The N-ESB bus module (Model: S2EN501) communicates with the SCU through N-ESB bus or optical ESB bus. The N-ESB bus modules are mounted in pair on a base plate for node interface unit.

Elements on the N-ESB bus module

The N-ESB/optical ESB ports have different shapes, depending on the type of the bus to be connected. The following figure shows the elements on the N-ESB bus modules.

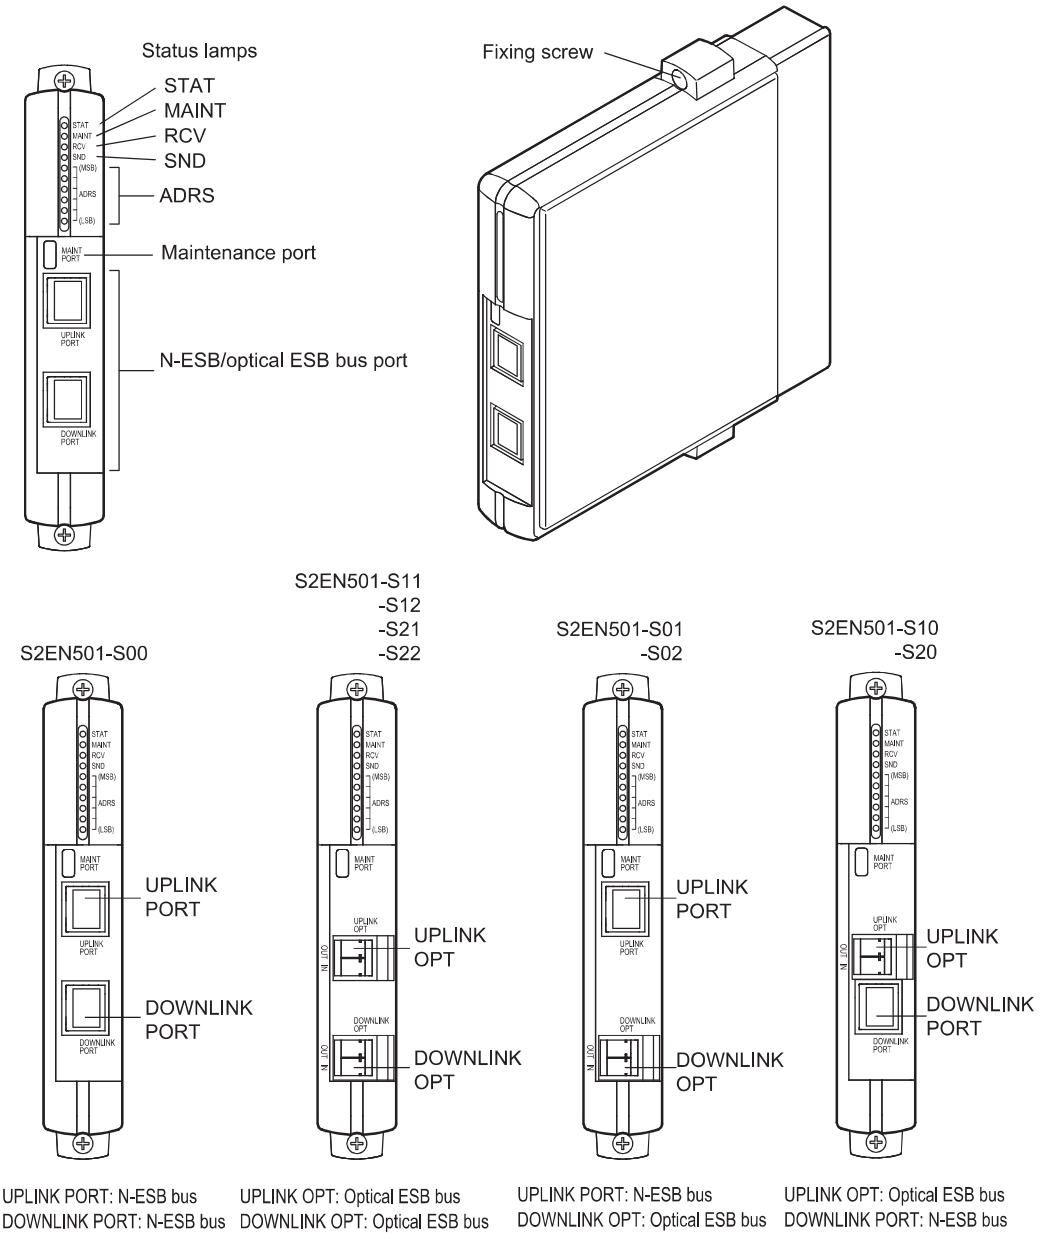

Figure B5.4-1 N-ESB bus module

Status lamps

Each lamp indicates the device status as follows:

- STAT
  The lamp turns on when the hardware is functioning normally; otherwise, the lamp turns off.
- MAINT
  The lamp turns on in maintenance mode; otherwise, the lamp turns off.
- RCV
  The lamp turns on when the module is receiving; otherwise, the lamp turns off.
- SND
  The lamp turns on when the module is sending response frames for a signal addressed to the module; otherwise, the lamp turns off.
- ADRS
  These lamps indicate the node number in 6-bit binary code.

  The following table shows the correspondence between the node number and the lamp status.

Table B5.4-1 Node number and lamp status

ADRS	Node number(*1)							
	1	2	3	...	16	...	31	32
MSB(*2)	○	○	○		○		○	●
|	○	○	○		●		●	○
|	○	○	○	...	○	...	●	○
|	○	○	○		○		●	○
|	○	●	●		○		●	○
LSB(*3)	●	○	●		○		●	○

*1: The symbols denote the lamp status as follows:
●: On
○: Off
*2: Most significant bit
*3: Least significant bit

TIP

The ADRS lamps are all off when the node number is not set.

Maintenance port

The maintenance port is used to set the node number of the N-IO node. This is a micro USB port. When the port is not used, put the cover that came with the module.

IMPORTANT

You must set the node number of the N-IO node before you connect the bus cables.

SEE ALSO

For more information about the node number setting of N-IO nodes, refer to:

F2.1.1, “Using the Node Number Setting Tool” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

N-ESB bus/optical ESB bus ports

To these ports, you connect N-ESB or optical ESB bus cables in a daisy chain.

- UP LINK PORT/OPT
  Connect the cable to the SCU or to the N-IO node or SNU that is closer to the SCU in the daisy chain.

- DOWN LINK PORT/OPT
  Connect the cable to the N-IO node or SNU that is farther from the SCU in the daisy chain.

For unused ports, put the cover that came with the module.

B5.5 Base plates

The base plate for N-IO I/O unit is where you can mount N-IO I/O modules to connect up to 16 I/O signals.

The following types of base plates are available:

- Base plate with disconnecting terminals
- Base plate for barrier

B5.5.1 Base plate with disconnecting terminals

The base plate with disconnecting terminals (Model: S2BN1D) is where you can mount N-IO I/O modules to connect up to 16 I/O signals. To the base plate with disconnecting terminals, you can connect a field power supply that supplies power to the field devices.

The base plate with disconnecting terminals comes in the terminal type (S2BN1D-□1□□□ or S2BN1D-□2□□□) and the connector type (S2BN1D-□9□□□). You can use the terminal type when you connect I/O signals directly and you can use the connector type when you connect I/O signals through a terminal board.

Elements on the base plate with disconnecting terminals: Terminal type

The following figure shows the elements on the terminal type of base plate with disconnecting terminals.

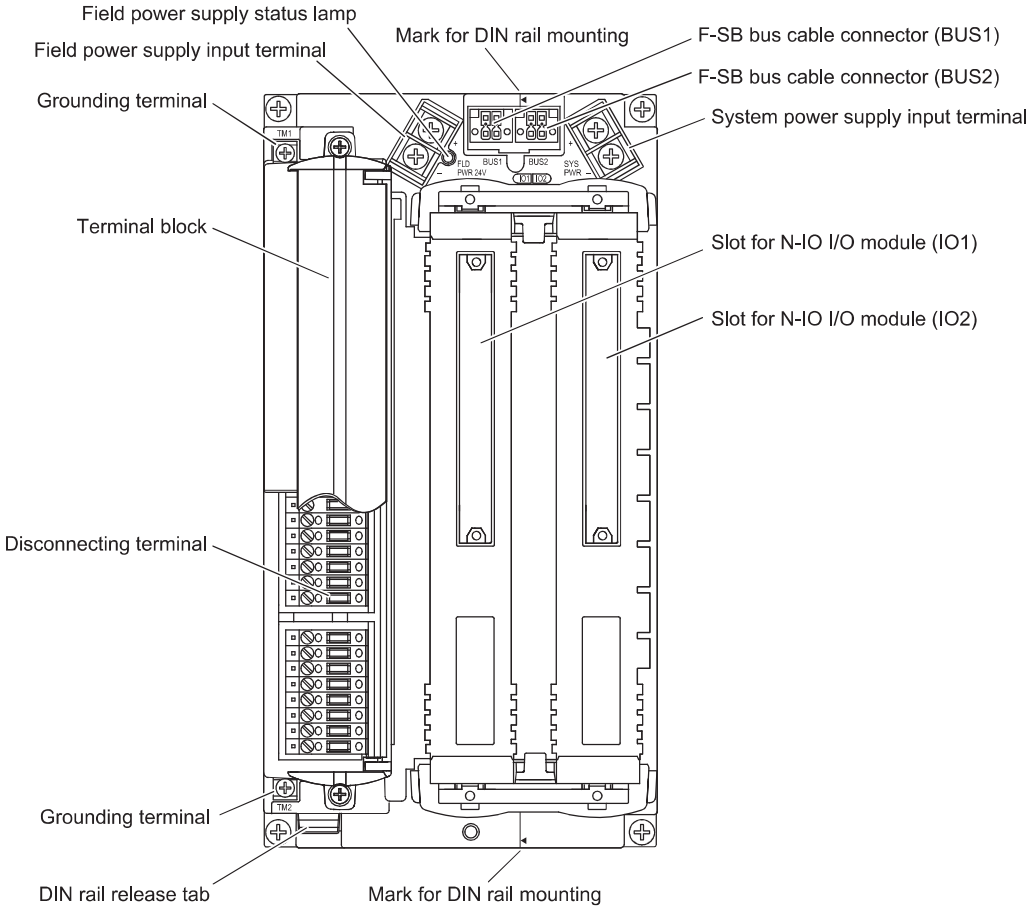

Figure B5.5.1-1 Base plate with disconnecting terminals (DIN rail mountable and terminal type)

The terminal block may be either pressure clamp terminal type or spring clamp terminal type. The terminal block has a cover. Because the terminal block is detachable from the base plate, you can detach it when you perform wiring works.

You must mount a dummy cover for I/O module (Model: S2DCV02) to unused N-IO I/O module slots.

SEE ALSO For more information about Signal connection to the base plate with disconnecting terminal, refer to:

D2.1, “Signal connection to the base plate with disconnecting terminals” on page D2-5

Disconnecting terminals

Disconnecting terminals are used to facilitate disconnecting and connecting of the signal cables between field devices and the N-IO I/O module. By disconnecting terminals, the N-IO I/O module can be protected from any overvoltage that may occur when maintaining field devices or performing wiring work.

- Tab is pulled out: The signal wire is disconnected.
- Tab is pressed in: The signal wire is connected.

During normal operation, all tabs should be pressed in. Pull out the tab when disconnection is required. Tabs of unused channels should be pressed in.

IMPORTANT

Do not disconnect the signal cables by using disconnecting terminals while the status of the digital output signal (DO) is ON.

When you pull out the tabs, use the dedicated tool (TZ 0306704 from Phoenix Contact Corporation).

The following figure shows the pulled out or pressed in disconnecting terminals.

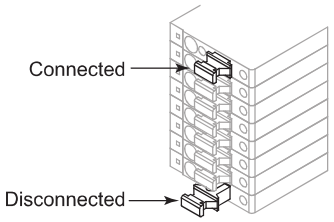

Figure B5.5.1-2 Disconnecting terminals

System power supply input terminals

To the system power supply input terminals, connect only the device specified by YOKOGAWA.

Field power supply status lamp

The lamp turns on when the field power is supplied; otherwise, the lamp turns off.

Elements on the base plate with disconnecting terminals: Connector type

The following figure shows the elements on the connector type of base plate with disconnecting terminals.

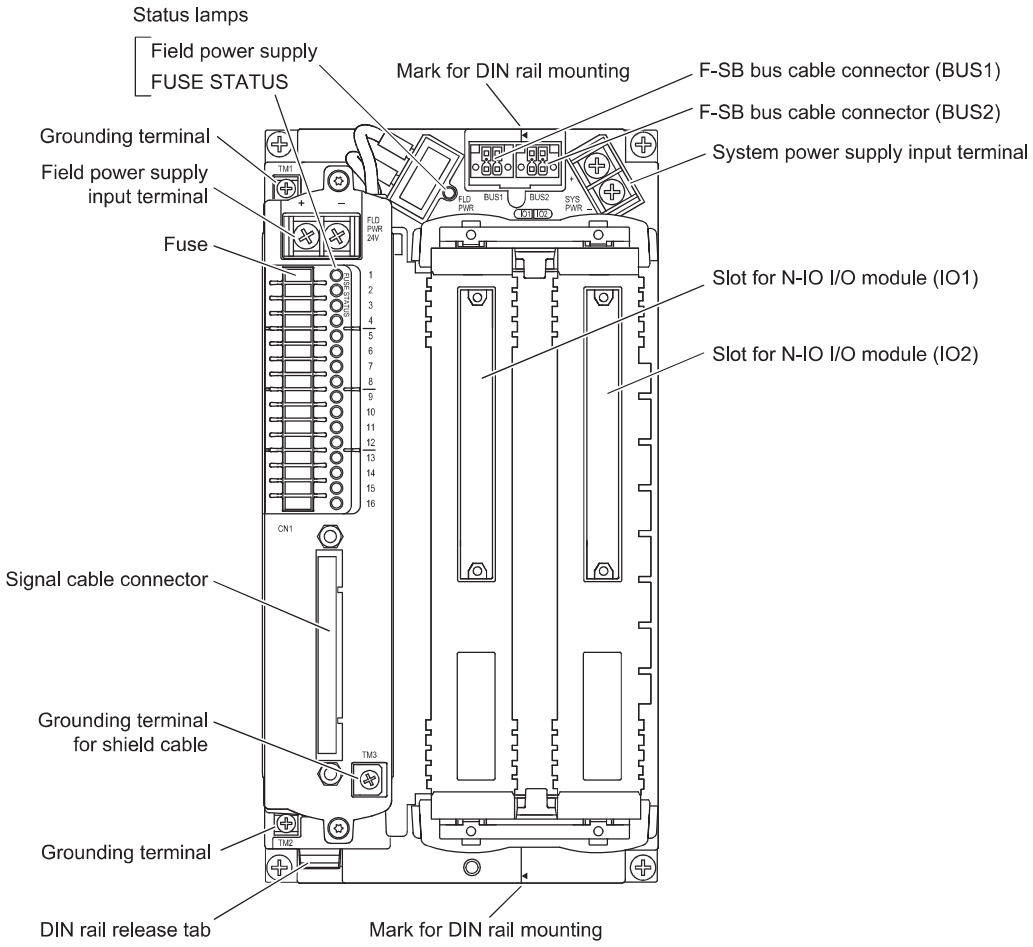

Figure B5.5.1-3 Base plate with disconnecting terminals (DIN rail mountable and connector type)

You must mount a dummy cover for I/O module (Model: S2DCV02) to unused N-IO I/O module slots.

Do not remove the cover next to the field power supply status lamp.

SEE ALSO For more information about Signal connection to the base plate with disconnecting terminal, refer to:

D2.1, “Signal connection to the base plate with disconnecting terminals” on page D2-5

System power supply input terminals

To the system power supply input terminals, connect only the device specified by YOKOGAWA.

Status lamps

Each lamp indicates the device status as follows:

- Field power supply
  The lamp turns on when the field power is supplied; otherwise, the lamp turns off.
- FUSE STATUS
  This lamp is checked when a 3-wire current input device is used.

  The lamp turns on if the fuse blows while the field power is supplied; otherwise, the lamp turns off.

TIP If a device except for 3-wire current input is used, FUSE STATUS lamp is always off.

Signal cable connector

You must connect dedicated signal cables (Model: AKB331, AKB651) to the signal cable connector.

SEE ALSO For more information about the signal cable specifications, refer to:

- ProSafe-RS/ProSafe-RS Lite Cables (GS 32Q06M10-31E)
- ProSafe-RS Base Plate (for N-IO) (GS 32P06K20-01EN)

B5.5.2 Base plate for barrier

The base plate for barrier (Model: S2BN4D, S2BN5D) is where you can mount N-IO I/O modules and intrinsic safety barriers to connect up to 16 I/O signals.

For each I/O signal channel, mount an intrinsic safety barrier that you selected according to the type of the signal.

You need to connect a power supply to the base plate for barrier to supply power to the intrinsic safety barriers.

The following table lists the different types of base plates for barrier.

Table B5.5.2-1 Different types of base plates for barrier

Model	Position of intrinsic safety wiring terminals	Position of intrinsic safety wiring
S2BN4D-10□C0	Intrinsic safety barrier	Left on the base plate
S2BN4D-10□D0	Intrinsic safety barrier	Right on the base plate
S2BN5D-121C0	Base plates	Left on the base plate
S2BN5D-121D0	Base plates	Right on the base plate

Elements on the base plate for barrier: S2BN4D

The following figure shows the elements on the base plate for barrier S2BN4D.

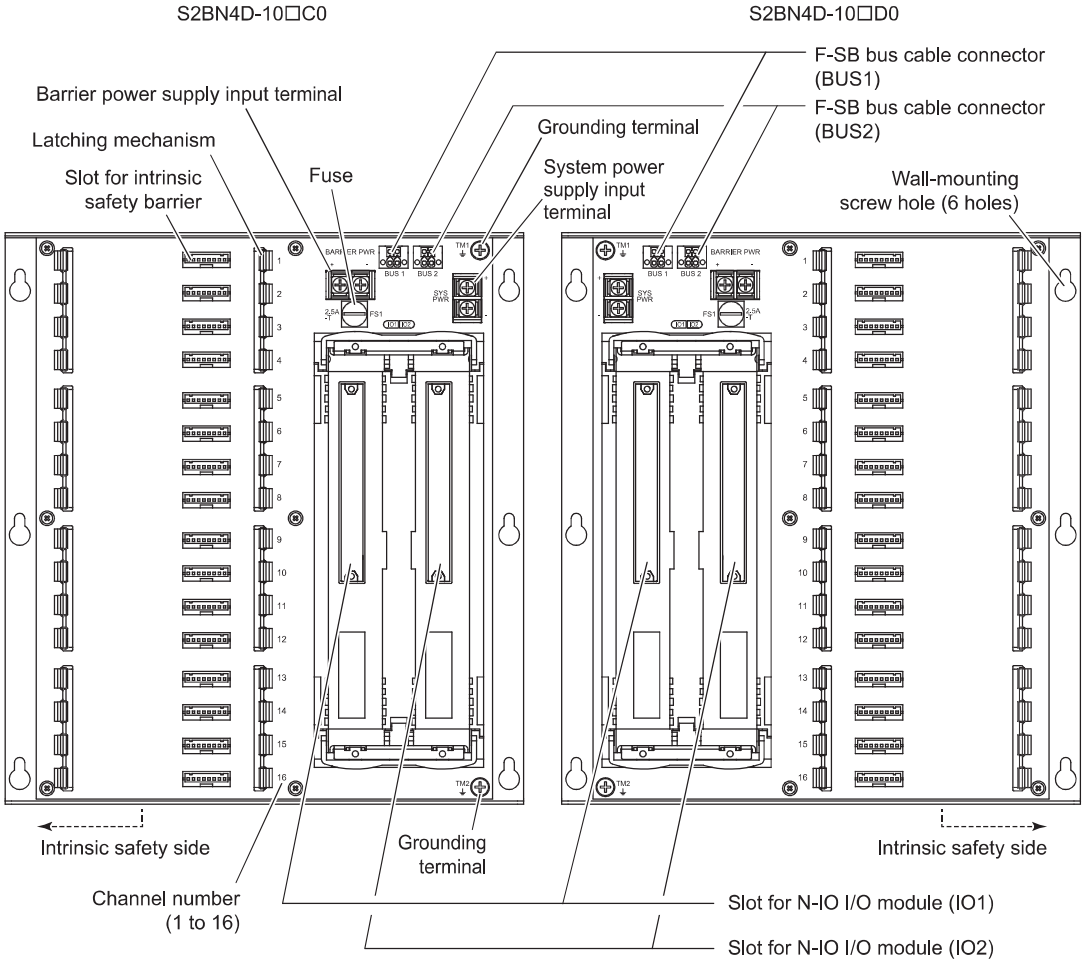

Figure B5.5.2-1 Base plate for barrier S2BN4D

The wiring from the intrinsic safety barriers to the field devices becomes intrinsic safety wiring. S2BN4D-10□C0 has intrinsic safety wiring on the left side of the mounted barriers, while S2BN4D-10□D0 has intrinsic safety wiring on the right side. These base plates do not have signal terminals because signal terminals are provided on intrinsic safety barriers.

You must mount a dummy cover for I/O module (Model: S2DCV02) to unused N-IO I/O module slots.

SEE ALSO For more information about signal connection to S2BN4D, refer to:

D2.2, “Signal connections of the base plate for barrier: S2BN4D” on page D2-9

System power supply input terminals

To the system power supply input terminals, connect only the device specified by YOKOGAWA.

Elements on the base plate for barrier: S2BN5D

The following figure shows the elements on the base plate for barrier S2BN5D.

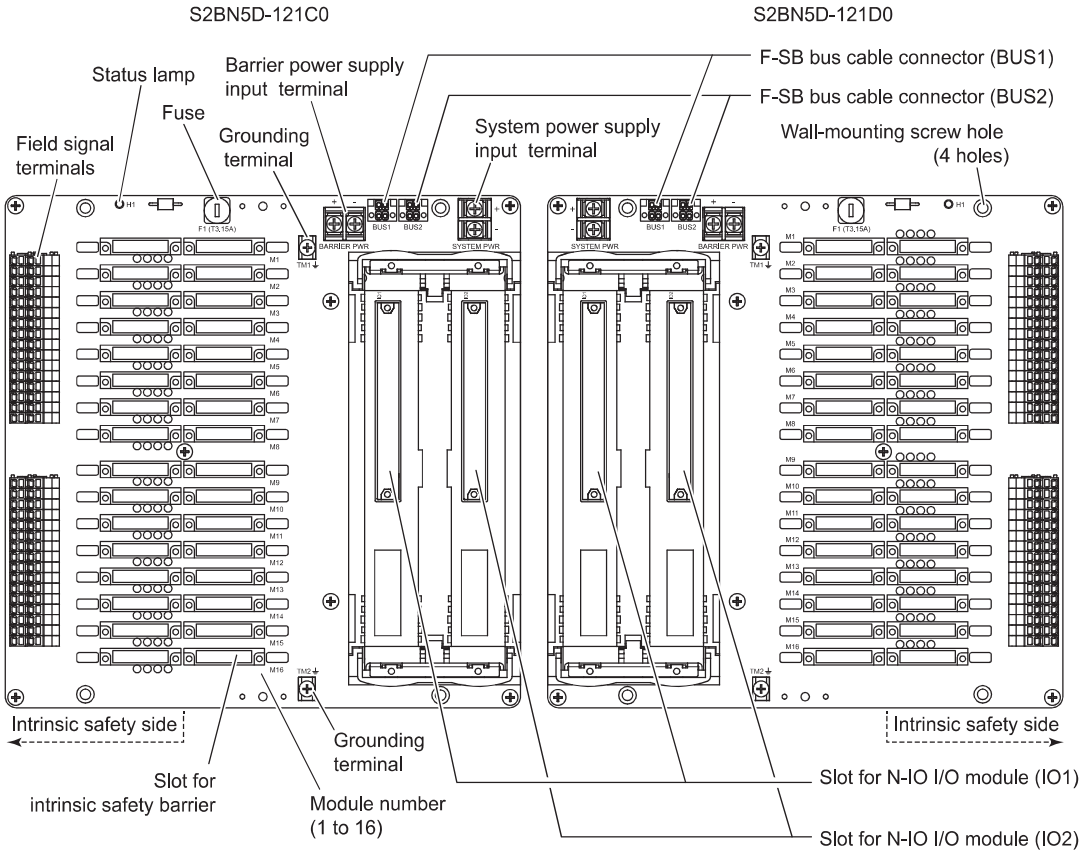

Figure B5.5.2-2 Base plate for barrier S2BN5D

The wiring from the intrinsic safety barriers to the field devices becomes intrinsic safety wiring. S2BN5D-121C0 has signal terminals for connection to the field devices in the left of the base plate, while S2BN5D-121D0 has the signal terminals in the right. The signal terminals for connection to the field devices are spring clamp terminals.

You must mount a dummy cover for I/O module (Model: S2DCV02) to unused N-IO I/O module slots.

SEE ALSO For more information about signal connection to S2BN5D, refer to:

D2.3, “Signal connections to the base plate for barriers: S2BN5D” on page D2-10

System power supply input terminals

To the system power supply input terminals, connect only the device specified by YOKOGAWA.

Status lamp

The lamp turns on when the barrier power is supplied and also the fuse is not blown; otherwise, the lamp turns off.

B5.6 N-IO I/O module

The N-IO I/O module converts process input signals from field devices into internal data of the SCU and also converts the internal data of the SCU into process output signals and sends them to the field devices. The signal category is defined for each channel.

The N-IO I/O module is mounted on a base plate with disconnecting terminals or a base plate for barrier.

The following types of N-IO I/O modules are available:

Table B5.6-1 Types of N-IO I/O modules

Model	Name	Settable signal category
S2MMM843	Analog digital I/O module	Analog input, analog output, digital input, digital output
S2MDV843	Digital I/O module	Digital input, digital output

Elements on the N-IO I/O module

The following figure shows the elements on the N-IO I/O module.

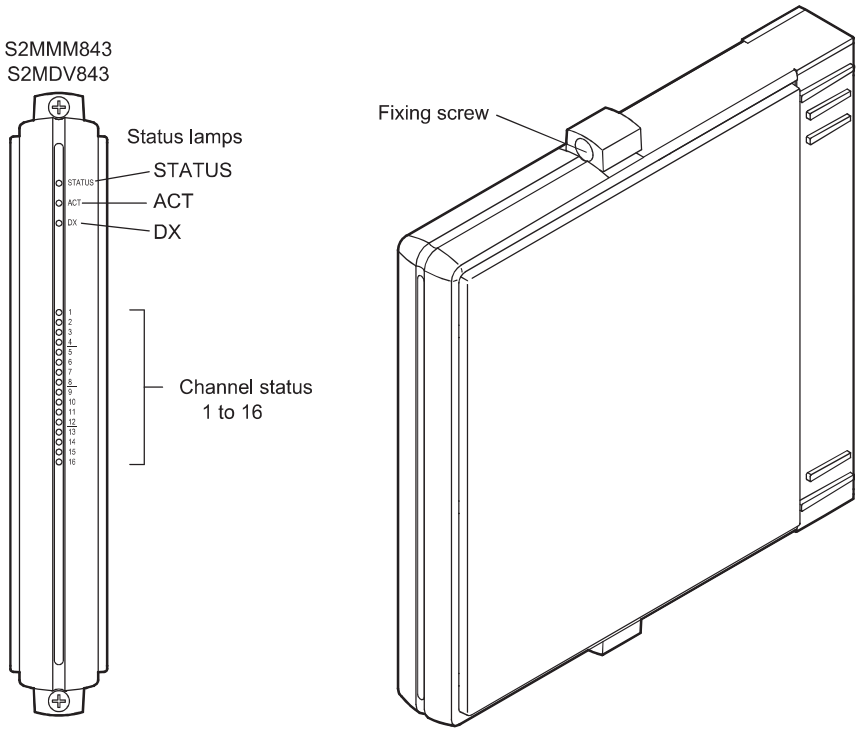

Figure B5.6-1 N-IO I/O module

Status lamps

Each lamp indicates the device status as follows:

- STATUS
  On: Hardware normal

  Flashing: In non-redundant configuration, a channel failure occurred. In dual-redundant configuration, a channel failure occurred while the standby module has a hardware error.

  Off: Hardware error
- ACT
  On: In dual-redundant or non-redundant configuration, the module is operating.

Off: In non-redundant configuration, the module stopped operation. In dual-redundant configuration, the module is standby or stopped operation.

- DX
  On: The module is in dual-redundant configuration.

  Off: The module is in non-redundant configuration.

- Channel status
  Error in the wiring to the field device or the on/off status of digital input (DI) or digital output (DO) is indicated for each channel.

  On: DI or DO signal is ON in non-redundant module or active module in dual-redundant configuration, without wiring error.

  Flashing: Wiring error in non-redundant module or active module in dual-redundant configuration

  Off: Other than above

TIP

The channel status lamps flash at a frequency of 2 Hz. If the DI or DO signal turns on and off at a cycle near this frequency, you cannot discriminate it from the flashing that indicates a wiring error. For this reason, you must check the I/O module report from the status display view on SENG.

B5.7 Intrinsic safety barriers

Intrinsic safety barriers are mounted on a base plate for barrier and electrically isolate intrinsic safety circuits from non-intrinsic safety circuits.

For each channel of the N-IO I/O module, use an appropriate intrinsic safety barrier based on the type of the I/O signal.

SEE ALSO For more information about the signal types and specifications of intrinsic safety barriers, refer to:

ProSafe-RS Baseplates for Barrier (for N-IO) (GS 32P06P10-01EN)

B5.8 Terminal board (for N-IO node)

The terminal board for analog digital I/O (Model: A2BM4) relays signals of field devices to N-IO I/O unit.

The following figure shows the appearance of the terminal board for analog digital I/O.

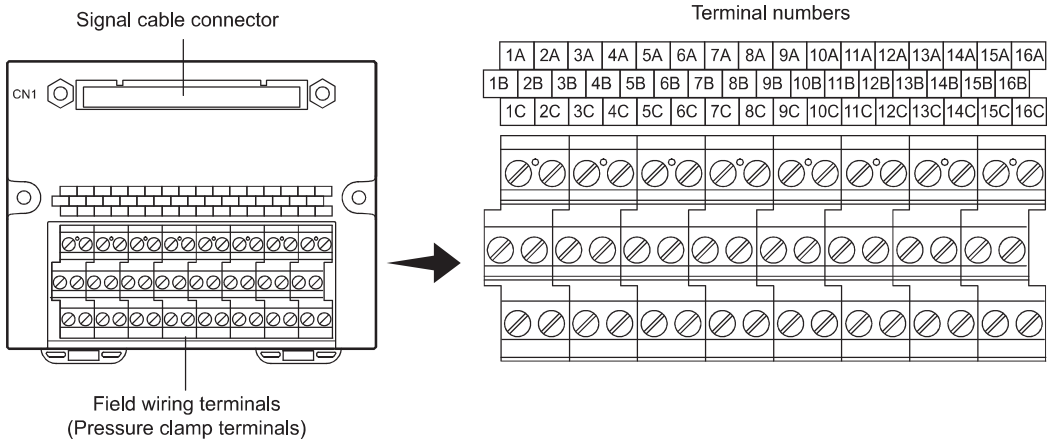

Figure B5.8-1 Terminal board for analog digital I/O

B5.9 N-IO node cables

This section describes the cables that are used in an N-IO node.

- F-SB bus cable
- Power supply cable for base plates

F-SB bus cable

The F-SB bus cable (Model: S2KLF10) is a dedicated cable assembly that is used to connect multiple N-IO I/O units to a node interface unit. At each cable end on the N-IO I/O unit side, a unit number is indicated on a tag, showing to which unit it should be connected. The following figure shows the appearance of the F-SB bus cable.

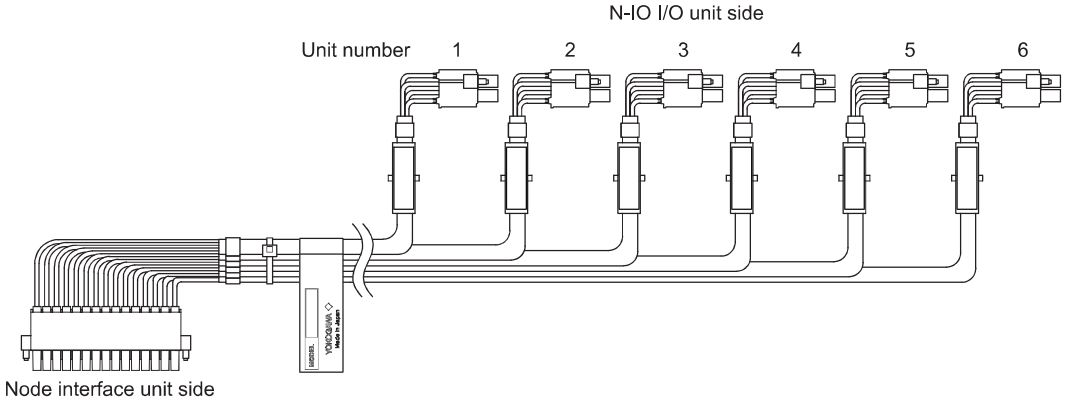

Figure B5.9-1 Appearance of F-SB bus cable

Power supply cable for base plates

The power supply cable for base plates (Model: S2KPB10) is a dedicated cable that is connected between a node interface unit and an N-IO I/O unit. Connect the red cable to the plus terminal and the blue cable to the minus terminal.

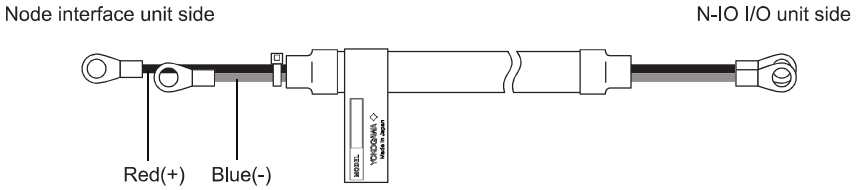

Figure B5.9-2 Appearance of the power supply cable for base plates

B6. Other devices

This section describes the following SCS device:

- Wiring check adapter

B6.1 Wiring check adapter for digital input

The wiring check adapter to detect open circuits or short circuits in the field wiring is used for the digital input (DI) channels of the FIO digital input module and the N-IO I/O module.

The following models of wiring check adapters are available:

- SCB100: For open circuit detection
  By connecting this adapter in parallel with the field device switch, an open circuit can be detected while the DI channel is receiving an OFF signal.
- SCB110: For short circuit detection
  By connecting this adapter in series with the field device switch, short circuits with the power line or other channels can be detected while the DI channel is receiving an ON signal.

In order to detect open circuits or short circuits, you must also enable the diagnostic feature of the DI channel in addition to installing the wiring check adapters.

SEE ALSO For more information about Diagnostic function of DI channel, refer to:

Appendix 1.3.4, “Settings for the DI channel” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

Appearance of the wiring check adapter

The following figure shows the appearance of SCB100 and SCB110.

Figure B6.1-1 External view of SCB100/SCB110 wiring check adapter

Usage of wiring check adapter

The following figure shows how the wiring check adapter is connected. DCn and INn of the digital input module (SDV144/L1DV144), and nA and nB of N-IO I/O modules (S2MMM843 and S2MDV843) are signal names of the n-th channel.

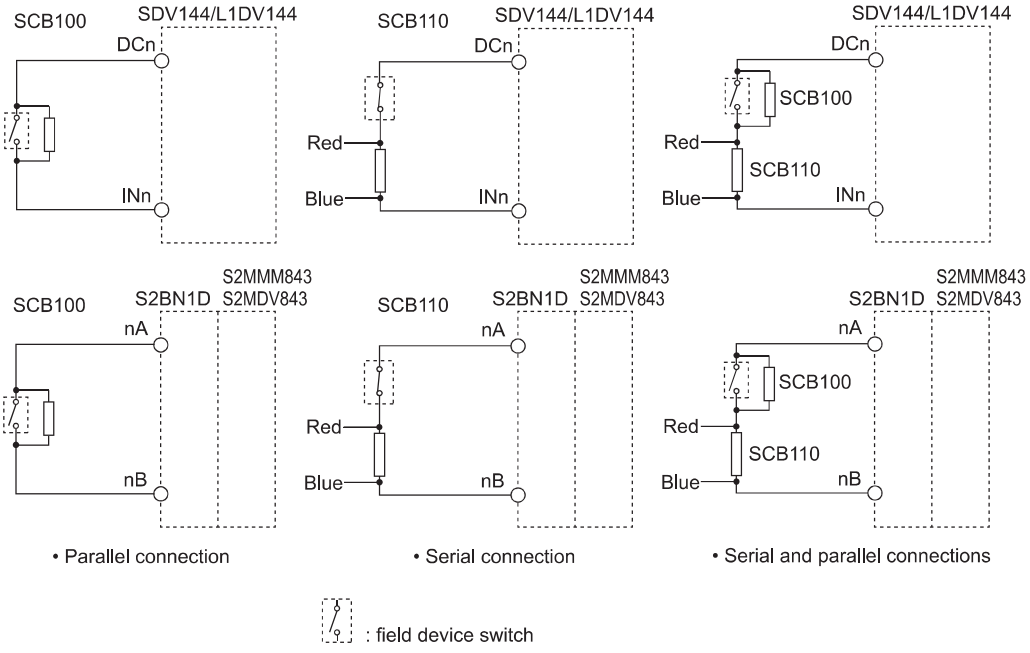

Figure B6.1-2 Usage of wiring check adapter

IMPORTANT

Do not stress the wiring check adapter.

SCB110 has a polarity. It does not work properly if you install it wrongly.

SEE ALSO For more information about I/O channel number of SDV144/L1DV144, refer to:

- "■ SED4D signal cable connection" on page D1-28
- "■ SBD4D signal cable connection" on page D1-32
- "■ Input terminal numbers and signal names of SDV144/L1DV144" on page D1-23

C. Installing and wiring the SCS

This section describes how to install and wire SCS components.

- Installing the SCS
- Grounding and power supply wiring of SCS
- Bus cable wiring of SCS

C1. Installing the SCS

This section describes how to install the following SCS devices:

- FIO nodes (SCU, SNU, and unit for optical ESB bus repeater module)
- Terminal boards and relay boards (for FIO node)
- Node interface unit (for N-IO node)
- N-IO I/O unit (for N-IO node)
- Terminal board (for N-IO node)
- Field power supply unit

SEE ALSO

For more information about the heat-radiating space, the space for maintenance work, and the device installation environment for SCSs that support SIL 3, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

For more information about the heat-radiating space, the space for maintenance work, and the device installation environment for SCSs that support SIL 2, refer to:

ProSafe-RS Lite Installation Guidance (TI 32P51J10-01EN)

C1.1 Installing an FIO node

This section describes how to mount SCU, SNU, and unit for optical bus repeater module onto a rack.

Mounting/removing an FIO node on/from a rack

CAUTION

You must attach insulating bushings to isolate SCU, SNU, and unit for optical bus repeater module from the rack. When you install the devices with insulating bushings attached on a rack or instrument panel, do not keep the devices hung on loose screws in an unstable state. Too much force may apply to the insulating bushings and cause damaged or broken insulating bushings.

The following figure shows an example of installing a rack mountable device. Insulating bushings are supplied with the device.

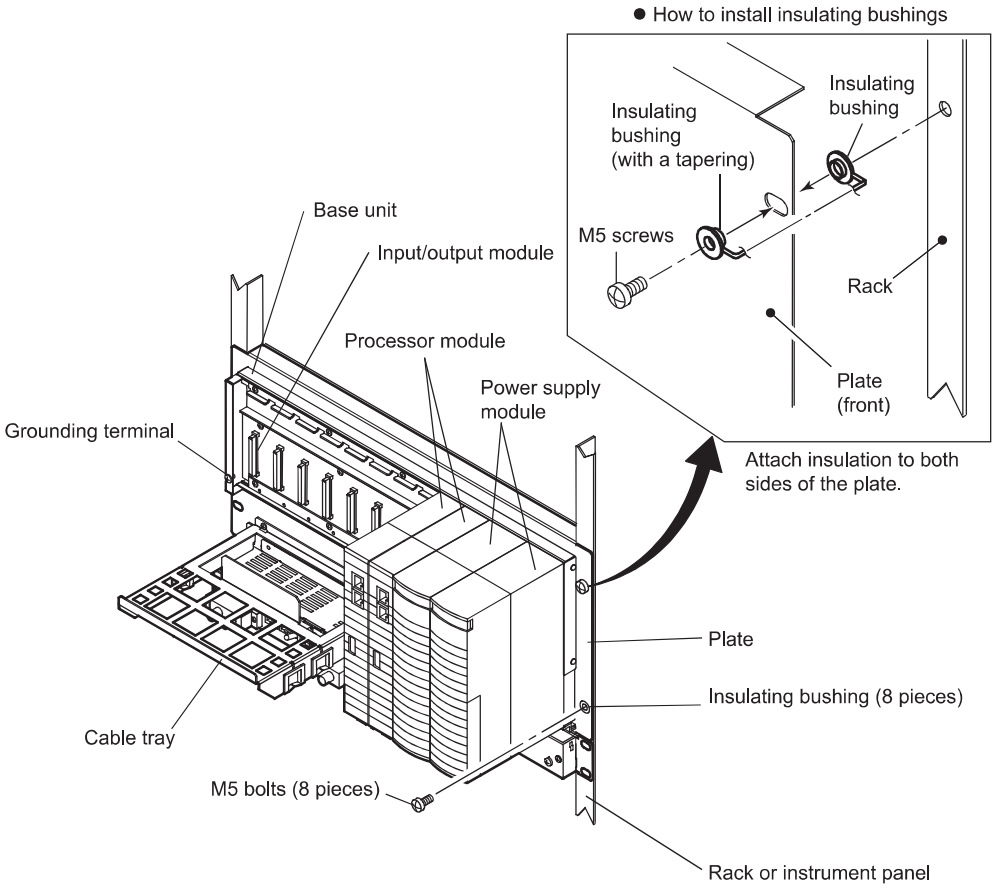

Figure C1.1-1 Example of mounting on a rack (example of standard type SCU)

Follow these steps to mount a rack mountable device on a rack:

1. Fasten a pair of insulating bushings together to each of the screw holes on the plate of the rack mountable device. Ensure that the insulating bushing that has a tapering comes on the front side of the plate.

2. Mount the device by tightening the M5 screws. The number of screws varies depending on the device you are mounting.
3. Check that the device is electrically insulated from the rack.

Follow this step when you remove a rack mountable device from a rack:

- Hold the device by hand and unscrew the M5 screws to remove the device.

Attaching the air deflector

S2SC70□-FA/L1SC70□-FA come with an air deflector. Follow these steps to attach the air deflector to the fan unit:

1. Remove the fan unit on the left side of the node fan unit.
2. On the removed fan unit, place the air deflector and insert its locking claws into the left and right mounting holes on the fan unit.

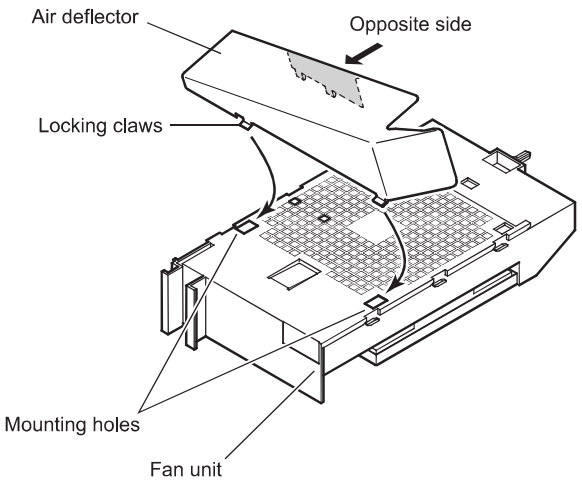

Figure C1.1-2 Attaching the air deflector

3. Insert the locking claws into the fan unit, pressing the opposite side of the air deflector with your fingers.
4. Mount the fan unit into the node fan unit.

TIP

If you can visually confirm that the locking claws of the air deflector are properly inserted into the left fan unit, you do not have to remove the fan unit from the node fan unit.

SEE ALSO

For more information about mounting or removing the fan unit, refer to:

"■ Replacing fan unit" on page E3-9

C1.2 Installing terminal boards and relay boards (for FIO node)

Rack mountable type and DIN rail mountable type terminal boards and relay boards are available.

The installation method depends on the mounting type and whether it is a terminal board or relay board:

- Rack mountable terminal board: Mounting on a rack
- Rack mountable relay board: Mounting on a rack or wall
- DIN rail mountable terminal board: Mounting on a DIN rail or wall
- DIN rail mountable relay board: Mounting on a DIN rail

SEE ALSO

For more information about types of terminal boards, refer to:

B4.7.6, “Terminal boards (for FIO node)” on page B4-33

For more information about types of relay boards, refer to:

B4.7.7, “Relay boards” on page B4-38

For more information about securing the cable area for terminal boards/relay boards, refer to:

ProSafe-RS/ProSafe-RS Lite Terminal Board/Relay Board (GS 32Q06L20-31E)

C1.2.1 Installing a rack mountable terminal/relay board

This section describes how to mount a terminal board or relay board on a rack and how to mount a relay board on a wall.

Mounting and removing a rack mountable terminal board/relay board

The following figure shows an example of how to mount a terminal/relay board on a rack.

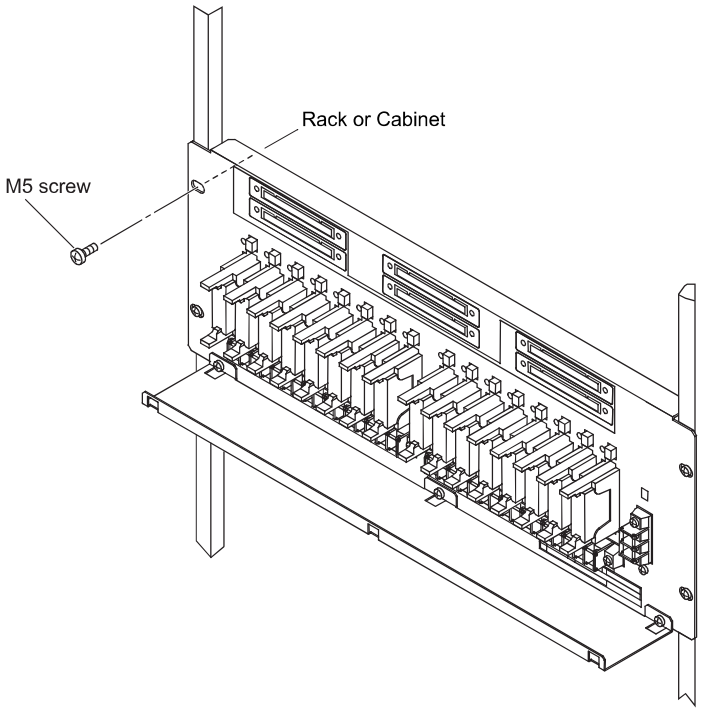

Figure C1.2.1-1 Mounting on a rack (SRM53D)

Follow this step to mount a terminal/relay board on a rack:

- Mount the device by tightening the M5 screws. The number of screws varies from device to device.

Follow this step to remove a terminal/relay board from a rack:

- Hold the device by hand and unscrew the M5 screws to remove the device.

SEE ALSO For more information about appearance of terminal boards and relay boards, refer to:

ProSafe-RS/ProSafe-RS Lite Terminal Board/Relay Board (GS 32Q06L20-31E)

Mounting/removing a rack mountable relay board on/from a wall

If the wall-mounting option is specified when a rack mountable relay board is ordered, wall-mounting fittings are supplied with the relay board.

The following figure shows how to mount a relay board on a wall.

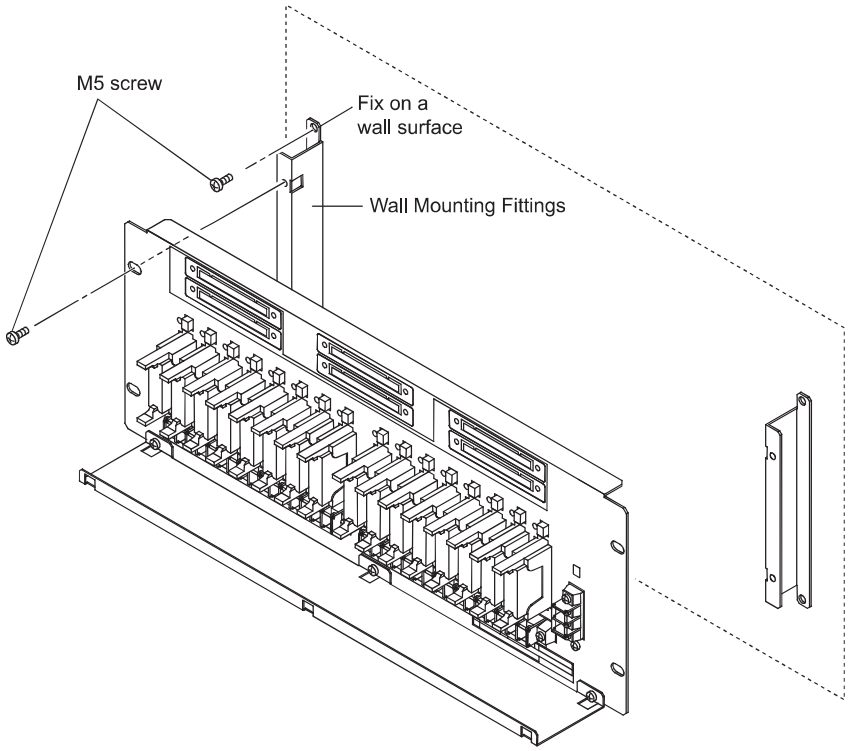

Figure C1.2.1-2 Mounting a rack mountable relay board on a wall

Follow these steps to mount a relay board on a wall:

1. Fix the wall-mounting fittings on the wall by tightening the M5 screws, two each on the left and right sides.
2. Mount the device on the wall by tightening four M5 screws.

Follow this step to remove a relay board from a wall:

- Hold the device by hand and unscrew the four M5 screws to remove the device.

SEE ALSO For more information about the mounting dimensions, screw locations, and number of screws for mounting relay boards on a wall, refer to:

ProSafe-RS/ProSafe-RS Lite Terminal Board/Relay Board (GS 32Q06L20-31E)

C1.2.2 Installing a DIN rail mountable terminal/relay board

This section describes how to mount a terminal board or relay board on a DIN rail and how to mount a terminal board on a wall.

Mounting and removing a DIN rail mountable terminal board

This section describes how to mount/remove a terminal board on/from a DIN rail.

Use a DIN rail that meets the TH35-7.5 in IEC 60715 and EN 50022.

IMPORTANT

In the back of a DIN rail mountable terminal board, there are two bumps (projections). When installing, make sure these bumps do not contact the screw tops on the DIN rail.

Mounting a terminal board on a DIN rail

1. As shown in the following figure, insert one side of the unit (the side without the latches) onto the DIN rail.

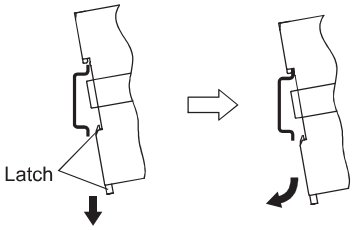

Figure C1.2.2-1 Mounting onto a DIN rail (1/2)

2. Push the unit in until you hear a clicking sound from the latches.

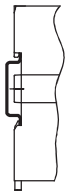

Figure C1.2.2-2 Mounting onto a DIN rail (2/2)

IMPORTANT

If the latches do not click onto the DIN rail easily, do not force them. Use a screwdriver to pull the latches from the outside while sliding the unit in.

Removing a terminal board from a DIN rail

Follow these steps to remove a terminal board from a DIN rail:

1. Use a flathead screwdriver to release the two DIN rail installation latches.

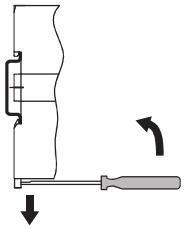

Figure C1.2.2-3 Uninstalling from a DIN rail (1/3)

2. The end with the latches becomes loose.

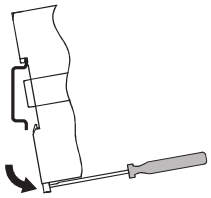

Figure C1.2.2-4 Uninstalling from a DIN rail (2/3)

3. Remove the terminal board from the end without latches.

Figure C1.2.2-5 Uninstalling from a DIN rail (3/3)

IMPORTANT

Do not forcefully rotate the terminal board when removing it.

- **Fasteners**

When installing a terminal board onto a DIN rail, you can use fasteners to hold it in place. These fasteners are not supplied and should be purchased separately. Mount the device on the DIN rail first and then secure it in place with the fasteners. To remove the device, take the fasteners off and then remove the device from the DIN rail.

Mounting and removing a DIN rail mountable relay board

This section describes how to mount/remove a relay board on/from a DIN rail.

Use a DIN rail that meets the TH35-7.5 in IEC 60715 and EN 50022.

CAUTION

The DIN rail mountable relay board (Model: SBM54D) may be hot, so you must be careful.

Mounting a relay board on a DIN rail

Follow these steps to mount a relay board on a DIN rail:

1. Tilt the relay board, lifting the bottom part of the relay board up towards you, and hook Groove a of the three attachments with the upper part of the DIN rail.

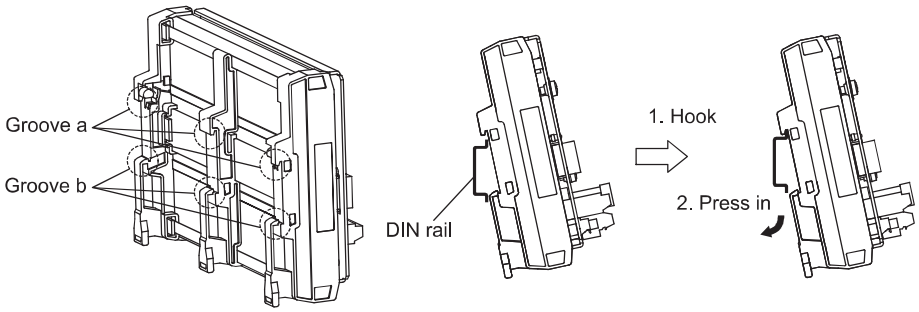

Figure C1.2.2-6 Mounting onto a DIN rail (1/2)

2. Push the tilted relay board until it becomes vertical.
   The lower part of the DIN rail fits into Groove b of the attachments. The following figure shows the relay board that is mounted on the DIN rail.

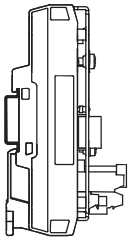

Figure C1.2.2-7 Mounting onto a DIN rail (2/2)

Removing a relay board from a DIN rail

Follow these steps to remove a relay board from a DIN rail:

1. Place your finger into the gap at the back of the relay board and push part A in the following figure in the direction shown in the figure.
   The hook on part B in the figure moves downward and a gap is created between the bottom of the DIN rail and groove b.
2. Gently pull the bottom of the relay board forward.
   The attachment separates from the DIN rail.
3. Repeat this procedure to detach the three attachments in order and remove the relay board.

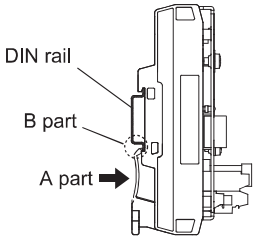

Figure C1.2.2-8 Removing from a DIN rail

Fasteners

When installing onto a DIN rail, you can use fasteners to hold it in place. These fasteners are not supplied and should be purchased separately. Mount the device on the DIN rail first and then secure it in place with the fasteners. To remove the device, take the fasteners off and then remove the device from the DIN rail.

Mounting/removing a DIN rail mountable terminal board on/from a wall

Follow this step to mount a terminal board on a wall:

- Mount the device on the wall by tightening two M4 screws.

IMPORTANT

The tightening torque of the screws should be approximately 0.8 N·m.

Follow this step to remove a terminal board from a wall:

- Hold by hand the device that you want to remove and unscrew the two M4 screws to remove the device.

SEE ALSO

For more information about the mounting dimensions, screw specifications, and space for cabling required to mount DIN rail mountable terminal boards on the wall, refer to:

ProSafe-RS/ProSafe-RS Lite Terminal Board/Relay Board (GS 32Q06L20-31E)

C1.2.3 Precautions when installing a DIN rail mountable terminal/relay board

This section describes the precautions when installing a DIN rail mountable terminal board or relay board.

Terminal/relay board installation orientations

Install a terminal board or relay board in the orientations shown in the following figure.

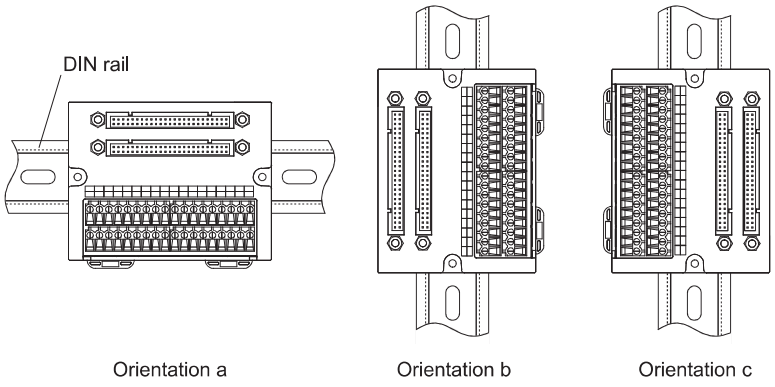

Figure C1.2.3-1 Terminal/relay board installation orientations (example of mounting SBT4D on a DIN rail)

IMPORTANT

When installing SBD2D in orientation b or c, the following conditions must be met:

- When the ambient temperature is less than 60 deg. C, the total current of the loads of all channels must be lower than the specified limit (8 A).
- When the ambient temperature is at 70 deg. C, the total current of the loads of all channels must be lower than 6 A.
- When the ambient temperature is between 60 deg. C and 70 deg. C, more precise calculation for current limit can be figured out by reducing 0.2 A from 8 A for each deg. C increase from 60 deg. C.

Precautions when installing SBT4D

SBT4D has a temperature sensor for reference junction compensation. To maintain reference junction compensation accuracy, the terminal board must not be affected by ambient heat. When installing a heat source nearby, install the heat source above the terminal board and terminal board wiring. If you must install the heat source next to or below the terminal board, install a heat shield.

IMPORTANT

The reference junction compensation is accurate when the ambient temperature is stable. If the ambient temperature changes, the measurements of the reference junction compensation accuracy will be incorrect until the temperature becomes stable again.

C1.3 Installing the node interface unit

The node interface unit that is used for N-IO nodes can be mounted either on a DIN rail or on a wall with screws. When you install the node interface unit, you must remove its cover first. Install the node interface unit, considering the space for maintenance work.

TIP

In the figures used in the installation procedures of the node interface unit, an empty node interface unit is shown.

SEE ALSO

For more information about removing the cover of the node interface unit, refer to:

"● Cover" on page B5-2

For more information about installation such as the information about space for maintenance works, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

Mounting the node interface unit on a DIN rail

The following figure shows how to mount the node interface unit on a DIN rail.

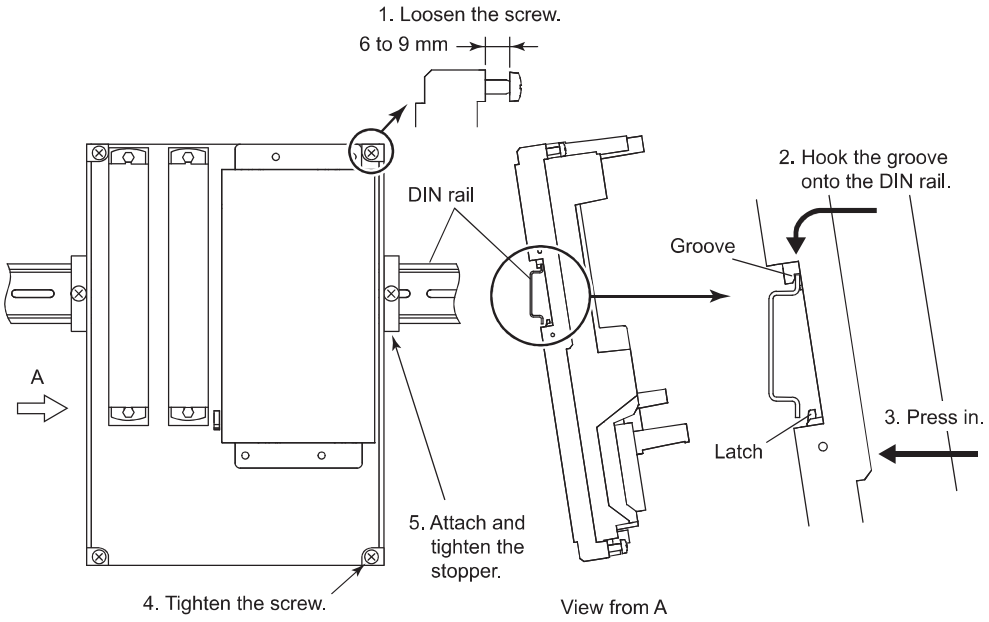

Figure C1.3-1 Mounting the node interface unit on a DIN rail

Follow these steps to mount the node interface unit on a DIN rail:

1. Loosen the four M4 screws on the node interface unit until the screw heads are 6 to 9 mm away from the bracket. Be careful not to loosen them further, or the screws may drop out of the holes.
2. Engage the upper groove in the back of the node interface unit with the top of the DIN rail.
3. Press the lower part of the node interface unit until the latch catches the DIN rail.
4. Tighten the four M4 screws on the node interface unit. Make sure that the node interface unit is fixed on the DIN rail.

IMPORTANT

The tightening torque of the screws should be 0.8 to 1.0 N·m.

5. Attach a DIN rail stopper on both sides of the node interface unit.

SEE ALSO For more information about DIN rail specifications, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

Removing the node interface unit from a DIN rail

The following figure shows how to remove the node interface unit from a DIN rail.

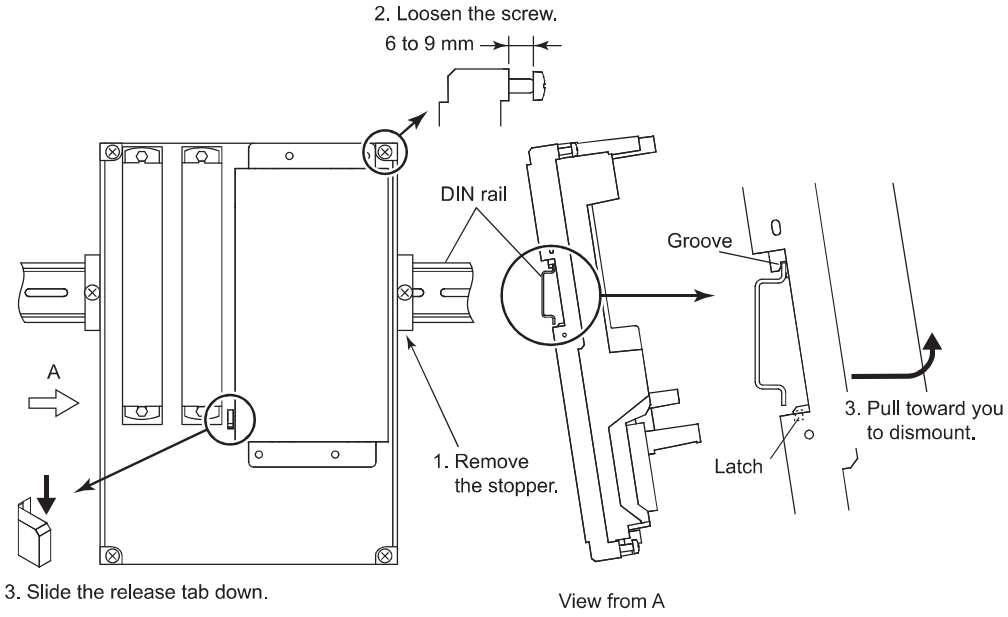

Figure C1.3-2 Removing the node interface unit from a DIN rail

Follow these steps to remove the node interface unit from a DIN rail:

1. Remove the DIN rail stoppers on both sides of the node interface unit.
2. Loosen the four M4 screws on the node interface unit until the screw heads are 6 to 9 mm away from the bracket. Be careful not to loosen them further, or the screws may drop out of the holes.
3. While pressing down the release tab by using a flat-blade screwdriver, pull the lower part of the node interface unit toward you to remove it.

Mounting/removing the node interface unit on/from a wall

Follow this step to mount the node interface unit on a wall:

- Mount the node interface unit on the wall by tightening the four M4 screws.

IMPORTANT

The tightening torque of the screws should be 0.8 to 1.0 N·m.

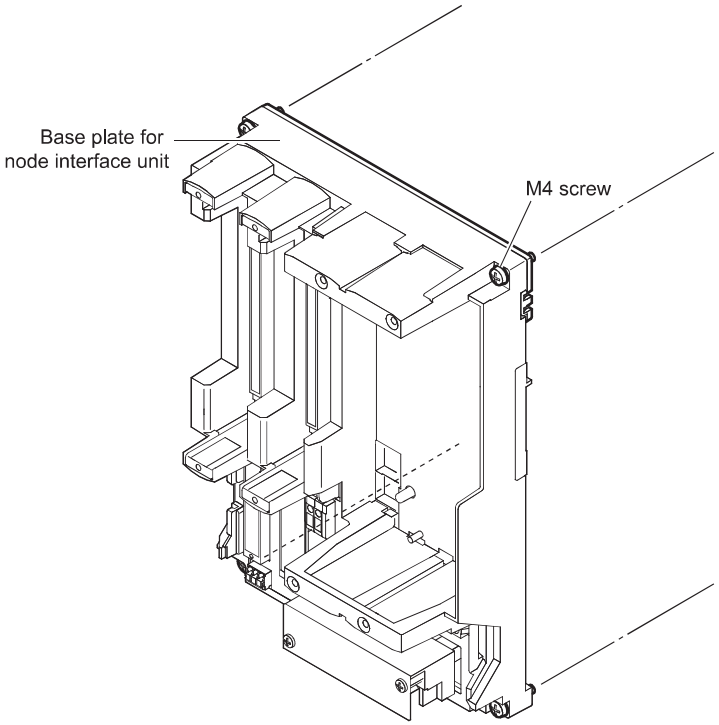

Figure C1.3-3 Mounting the node interface unit on a wall

Follow this step to remove the node interface unit from a wall:

- Holding the node interface unit by hand, unscrew the four fixing M4 screws and remove the node interface unit.

SEE ALSO For more information about the mounting dimensions, refer to:

ProSafe-RS Node Interface Units (for N-IO) (GS 32P06F20-01EN)

C1.4 Installing the N-IO I/O unit

This section describes the installation of the devices that constitute an N-IO I/O unit.

- Base plate
  - Base plate with disconnecting terminals
  - Base plate for barrier
- N-IO I/O module
- Intrinsic safety barrier
- Terminal block

When you install a base plate, you must consider the space for maintenance work.

TIP

This section describes how the base plate is installed when no modules are mounted on it.

SEE ALSO

For more information about securing space for maintenance works, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

C1.4.1 Installing the base plate with disconnecting terminals

The base plate with disconnecting terminals is available in two types: DIN rail mountable type and wall mountale type. This section describes the mounting and removing procedures for each type.

Mounting the base plate with disconnecting terminals on a DIN rail

The following figure shows how to mount the base plate with disconnecting terminals on a DIN rail.

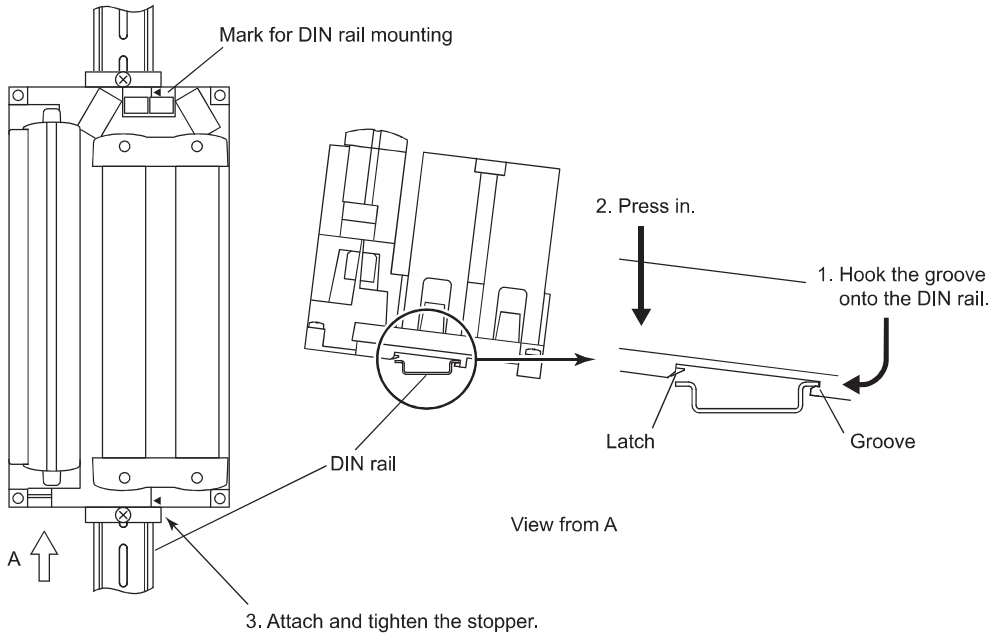

Figure C1.4.1-1 Mounting the base plate with disconnecting terminals on a DIN rail

Follow these steps to mount the base plate with disconnecting terminals on a DIN rail:

1. Engage the right-hand groove in the back of the base plate with disconnecting terminals with the DIN rail.
2. Press the left part of the base plate until the latch catches the DIN rail.
3. Attach the DIN rail stoppers on the top and bottom of the base plate with disconnecting terminals.
   However, if you mount multiple base plates, attach only one stopper between base plates.
4. Make sure that the base plate with disconnecting terminals is fixed on the DIN rail.

SEE ALSO For more information about DIN rail specifications, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

Removing the base plate with disconnecting terminals from a DIN rail

The following figure shows how to remove the base plate with disconnecting terminals from a DIN rail.

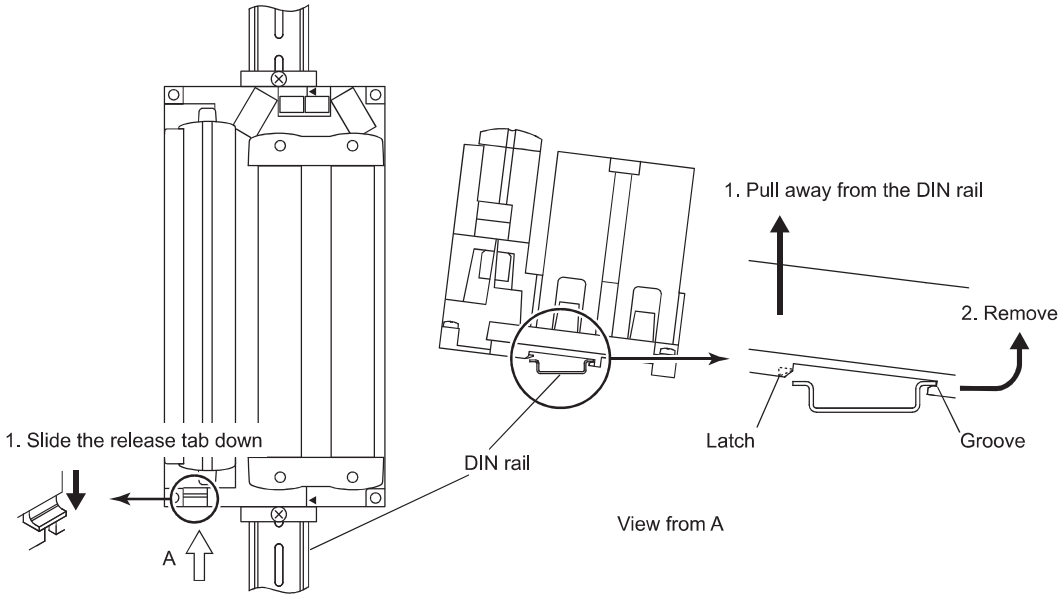

Figure C1.4.1-2 Removing the base plate with disconnecting terminals from a DIN rail

Follow these steps to remove the base plate with disconnecting terminals from a DIN rail:

1. Hold down the release tab at the bottom of the base plate with disconnecting terminals by using a Phillips screwdriver and pull the left end of the base plate away from the DIN rail.
2. Move the base plate with disconnecting terminals to the right and remove it.

Mounting/removing the base plate with disconnecting terminals on/from a wall

Follow this step to mount the base plate with disconnecting terminals on a wall:

- Mount the base plate with disconnecting terminals on the wall by tightening the four M4 screws.

IMPORTANT

The tightening torque of the screws should be 0.8 to 1.0 N·m.

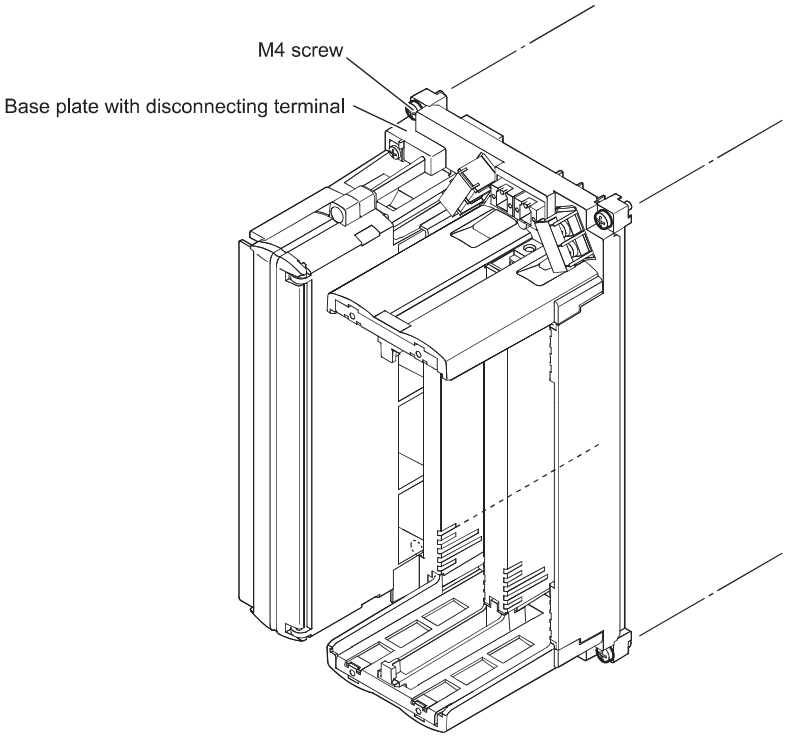

Figure C1.4.1-3 Mounting the base plate with disconnecting terminals on a wall

Follow this step to remove the base plate with disconnecting terminals from a wall:

- Hold the base plate with disconnecting terminals by hand and unscrew the four M4 screws to remove the base plate.

C1.4.2 Installing the base plate for barrier

This section describes the installation of the base plate for barrier.

Mounting and removing the base plate for barrier (Model: S2BN4D)

The base plate for barrier S2BN4D is mounted on a wall when it is used. To ensure single point grounding of the base plate, use insulated supporters when mounting it.

The following figure shows how to mount the base plate for barrier S2BN4D on a wall.

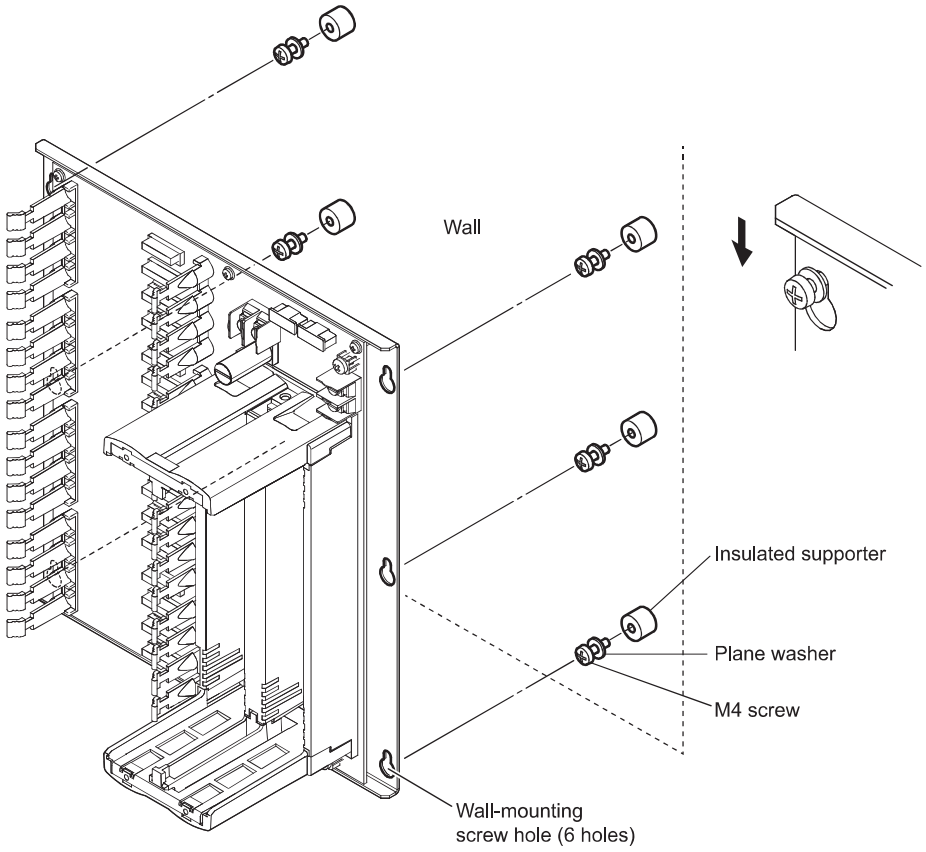

Figure C1.4.2-1 Mounting S2BN4D on a wall

IMPORTANT

When you mount S2BN4D, use M4 screws with the length suited for the insulated supporter and flat washers with a 9 mm or less external diameter. The thickness of the S2BN4D around the mounting screw holes is 1.6 mm.

Follow these steps to mount the base plate for barrier S2BN4D on a wall:

1. Fit the six M4 screws for mounting into the hole of the insulated supporters that are fixed on the wall.
2. Pass the screws that you have placed on the wall through the six wall-mounting screw holes of the base plate, and slightly shift the base plate downward so that the screws fit into the narrow part of the holes.
3. Mount the base plate for barrier on the insulated supporters by tightening the six M4 screws.

Follow these steps to remove the base plate for barrier from a wall:

1. Loosen the six M4 screws. You must only loosen the screws without removing them from the insulated supporters.
2. In reverse of the mounting procedure, slightly shift the base plate upward and remove the base plate by releasing it from the screws.

SEE ALSO For more information about the screw mounting dimensions for S2BN4D, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

Mounting and removing the base plate for barrier (Model: S2BN5D)

Follow this step to mount S2BN5D on a wall:

- Mount the base plate for barrier on the wall by tightening the four M4 screws.

IMPORTANT

Prepare M4 screws that meet the following conditions:

- When washers are used
  - Screw with a length of 18 mm or more
  - Plane washer with a diameter of 8 mm or less
- When washers are not used
  - Screw with a length of 16 mm or more

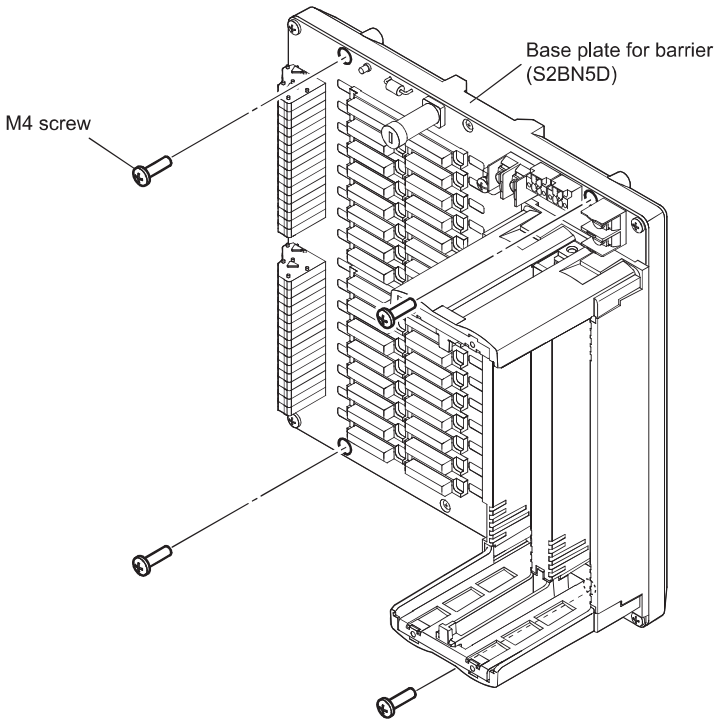

Figure C1.4.2-2 Mounting S2BN5D on a wall (without washers)

Follow this step to remove S2BN5D from a wall:

- Hold the base plate for barrier by hand and unscrew the four M4 screws.

SEE ALSO For more information about the screw mounting dimensions for S2BN5D, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

C1.4.3 Mounting N-IO I/O module

This section describes how to mount/remove the N-IO I/O module onto/from a base plate.

Mounting and removing the N-IO I/O module

Follow this step to mount an N-IO I/O module onto a base plate:

- Mount the N-IO I/O module on the base plate by tightening the two M3 screws.

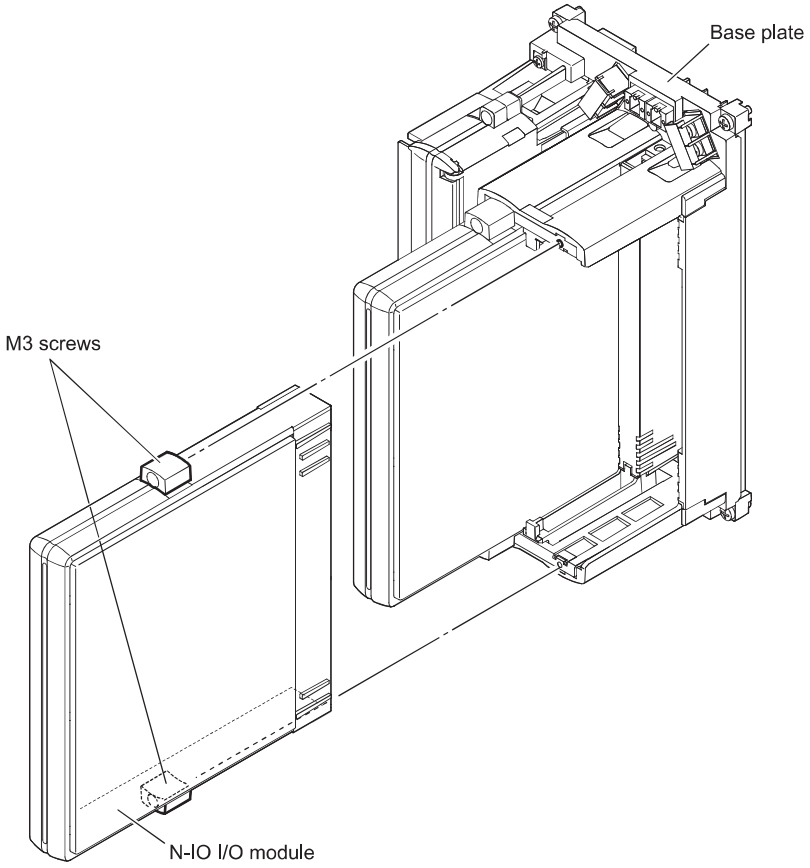

Figure C1.4.3-1 Example of mounting N-IO I/O module

Follow this step to remove an N-IO I/O module from a base plate:

- Loosen the two M3 screws and remove the N-IO I/O module.

CAUTION

Be aware that the modules may be hot.

Mounting and removing a dummy cover for I/O module

You must attach a dummy cover (Model: S2DCV02) to unused N-IO I/O module slots.

Follow these steps to mount a dummy cover on the N-IO I/O module slot:

1. Engage the dummy cover with the bottom edge of the N-IO I/O module slot.
2. Press the top of the dummy cover in the direction shown in the figure.

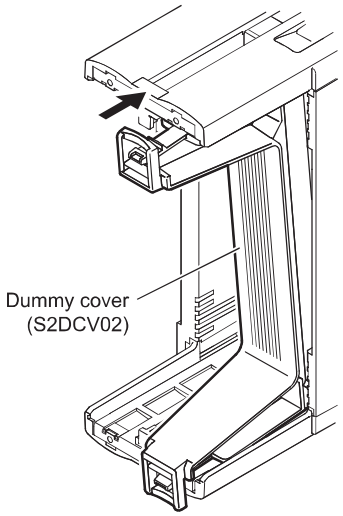

Figure C1.4.3-2 Mounting a dummy cover

Follow these steps to remove a dummy cover from the N-IO I/O module slot:

1. Press down the claw at the top of the dummy cover.
2. Remove the dummy cover from the slot.

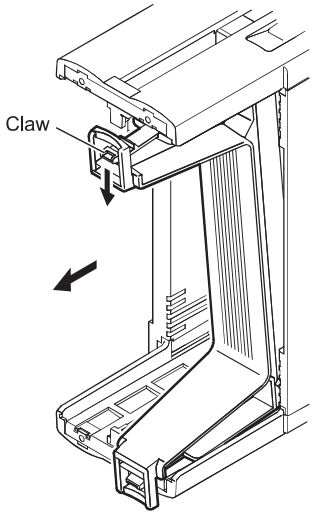

Figure C1.4.3-3 Removing a dummy cover

C1.4.4 Mounting intrinsic safety barriers

This section describes how to mount/remove intrinsic safety barriers.

Mounting intrinsic safety barriers: S2BN4D

This section describes how to mount/remove intrinsic safety barriers onto/from the base plate for barrier S2BN4D.

Mounting an intrinsic safety barrier onto S2BN4D

The following figure shows how to mount an intrinsic safety barrier onto the base plate for barrier S2BN4D.

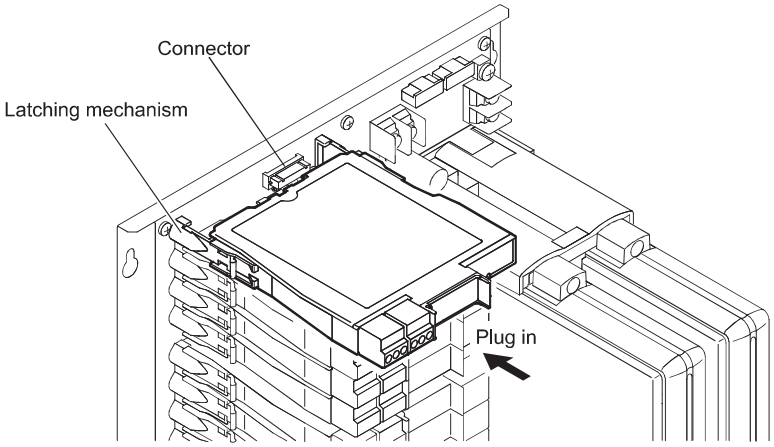

Figure C1.4.4-1 Mounting an intrinsic safety barrier onto S2BN4D

Follow these steps to mount an intrinsic safety barrier onto the base plate for barrier S2BN4D:

1. Confirm the channel on which you mount an intrinsic safety barrier.
2. Insert the barrier into the latching mechanism of the base plate.
3. Connect the connector of the barrier to the connector of the base plate.

Removing an intrinsic safety barrier from S2BN4D

The following figure shows how to remove an intrinsic safety barrier from the base plate for barrier S2BN4D.

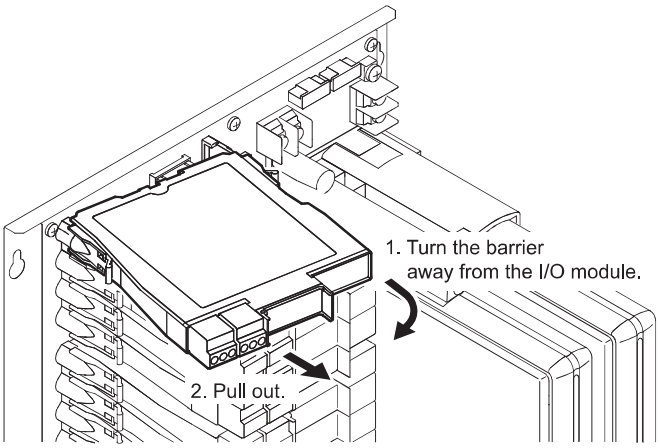

Figure C1.4.4-2 Removing an intrinsic safety barrier from S2BN4D

Follow these steps to remove an intrinsic safety barrier from the base plate for barrier S2BN4D:

1. To release the barrier from the latching mechanism, turn the barrier as shown in the figure so that the part closer to the N-IO I/O module comes toward you. If it is difficult to turn the barrier, turn the barrier while expanding the latching mechanism on the N-IO I/O module side.
   The barrier is disconnected from the connector.
2. Pull out the barrier to remove it from the base plate.

Mounting intrinsic safety barriers: S2BN5D

This section describes how to mount/remove intrinsic safety barriers onto/from the base plate for barrier S2BN5D.

Mounting an intrinsic safety barrier onto S2BN5D

The following figure shows how to mount an intrinsic safety barrier onto the base plate for barrier S2BN5D.

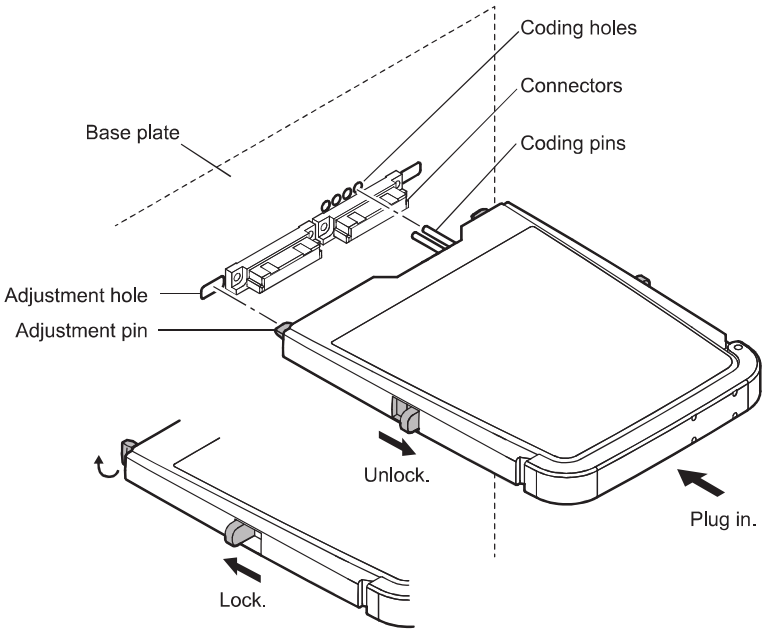

Figure C1.4.4-3 Mounting an intrinsic safety barrier onto S2BN5D

Follow these steps to mount an intrinsic safety barrier onto the base plate for barrier S2BN5D:

1. Confirm the module number on the base plate where you mount an intrinsic safety barrier.
2. Slide the tabs on both sides of the barrier toward you to set them in the UNLOCK position.
3. Carefully press the barrier perpendicularly to the base plate so that the barrier is plugged into the connector of the base plate.
   When you plug the barrier, fit the adjustment pins of the barrier to the adjustment holes that are located on both sides of the connectors on the base plate.
4. Slide the tabs on both sides of the barrier toward the base plate to set them in the LOCK position.
   The adjustment pins of the barrier rotate, fixing the barrier on the base plate.

Removing an intrinsic safety barrier from S2BN5D

The following figure shows how to remove an intrinsic safety barrier from the base plate for barrier S2BN5D.

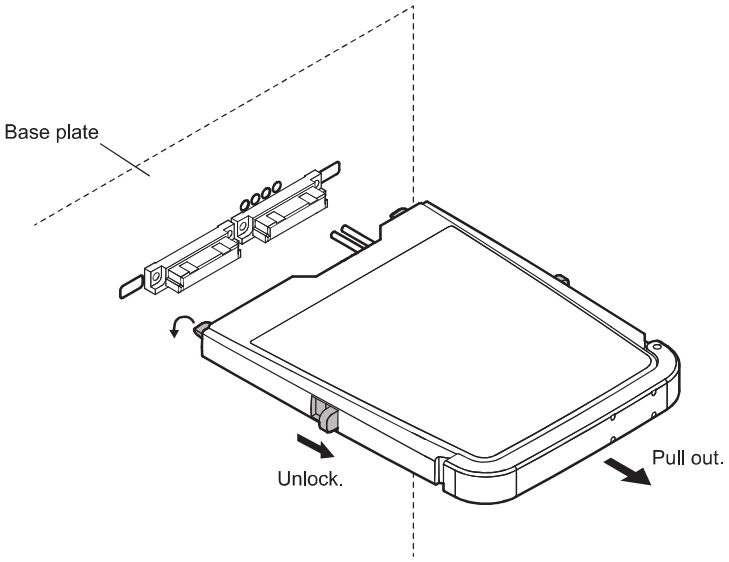

Figure C1.4.4-4 Removing an intrinsic safety barrier from S2BN5D

Follow these steps to remove an intrinsic safety barrier from the base plate for barrier S2BN5D:

1. Slide the red tabs on both sides of the barrier toward you to set them in the UNLOCK position.
2. Pull out the barrier horizontally from the connector of the base plate.

C1.4.5 Mounting the terminal block

Follow this step to mount the terminal block onto a base plate:

- Mount the terminal block onto the base plate by tightening the two M3 screws.

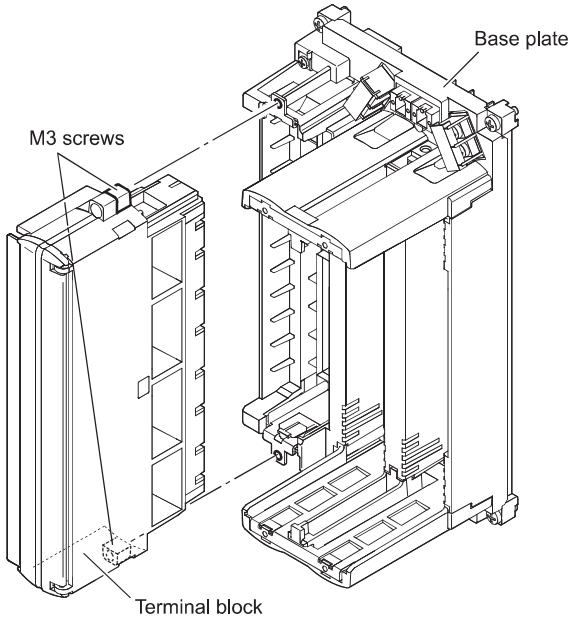

Figure C1.4.5-1 Mounting the terminal block

Follow this step to remove the terminal block from a base plate:

- Loosen the two M3 screws and remove the terminal block.

C1.5 Installing the terminal board (for N-IO node)

You can mount a terminal board on a DIN rail or on a wall. The terminal board must be oriented as instructed here when you mount it on either a DIN rail and a wall.

The following figures show an example of orientation when a terminal board is mounted on a DIN rail.

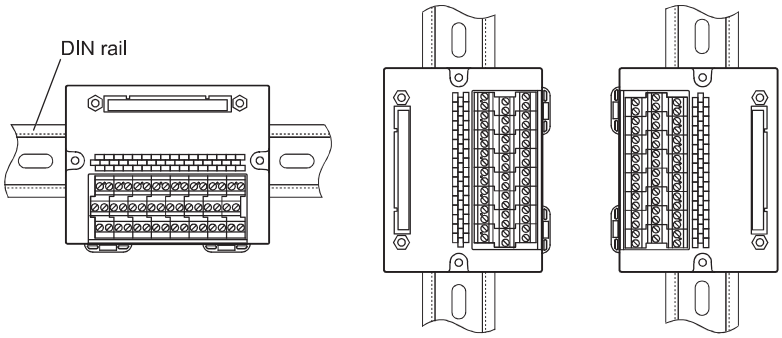

Figure C1.5-1 Orientation of terminal board to mount

When you mount a terminal board, you must consider sufficient clearance around it for maintenance works.

SEE ALSO For more information about securing space for maintenance works, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

■ Mounting/removing a terminal board on/from a DIN rail

You can mount a terminal board on a DIN rail or remove it from a DIN rail with the same procedures as the procedures for a DIN rail mountable terminal board for FIO node.

SEE ALSO For more information about mounting/removing a terminal board on/from a DIN rail, refer to:

"■ Mounting and removing a DIN rail mountable terminal board" on page C1-7

For more information about the specifications and installation of DIN rails, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

■ Mounting/removing a terminal board on/from a wall

You can mount a terminal board on a wall or remove it from a wall with the same procedures as the procedures for a DIN rail mountable terminal board for FIO node.

SEE ALSO For more information about mounting/removing a terminal board on/from a wall, refer to:

"■ Mounting/removing a DIN rail mountable terminal board on/from a wall" on page C1-10

For more information about the mounting dimensions, refer to:

ProSafe-RS Terminal Boards (for N-IO) (GS 32P06L20-01EN)

For more information about the specifications for wall mount screw, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

C1.6 Installing the field power supply unit

The power supply unit for CENTUM VP (Model: A2PW50□/DN) can be used as a field power supply that is connected to the base plate of ProSafe-RS.

The following figure shows how to mount A2PW50□/DN on a DIN rail.

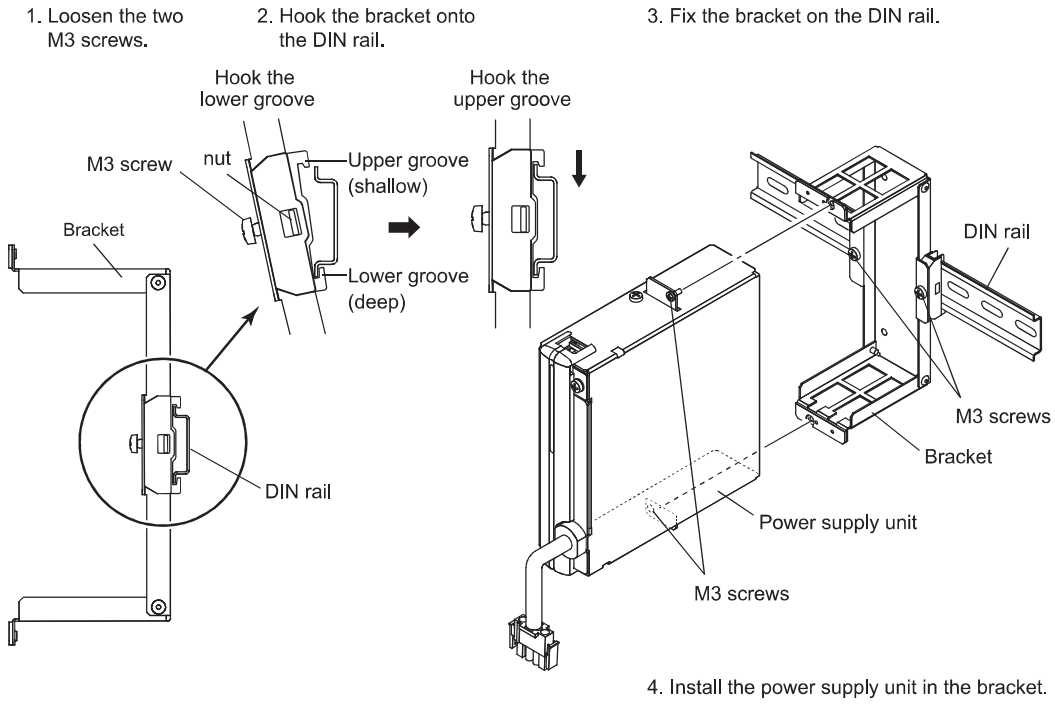

Figure C1.6-1 Mounting A2PW50□/DN on a DIN rail

Follow these steps to mount the power supply unit on a DIN rail:

1. Loosen the two M3 screws of the bracket.
   You must only loosen the screws without removing them from the nut.
2. Hook the bracket onto the DIN rail as shown in the figure.
3. Tighten the two M3 screws of the bracket to fix the bracket on the DIN rail.
4. Install the power supply unit in the bracket by tightening the two M3 screws on the power supply unit.

C2. Ground wiring and power supply wiring for SCS

This section describes the ground wiring and power supply wiring of the following SCS devices:

- Power supply module
- power supply unit for fan unit
- FIO node, terminal board/relay board
- Node interface unit
- N-IO I/O unit

WARNING

- Turn off the power supply source, and be sure that no electricity is flowing into the power cable to be connected before starting the work.
- Provide a separate switch or breaker for turning on/off the power.

CAUTION

The power cable must be wired through a conduit at the entrance of the instrument panel for the following reasons:

- To prevent the power cable from being damaged through direct contact with the metal plate.
- To prevent an excessive load being applied to the power supply connection terminals due to the weight of the cable itself.

IMPORTANT

Wire the power cable by keeping a minimum distance of 1 cm from other signal wiring.

C2.1 Ground wiring and power supply wiring of the power supply module

The following figure shows the power supply terminals and grounding terminal of the power supply module that is installed in the SCU, SNU, or unit for optical bus repeater module.

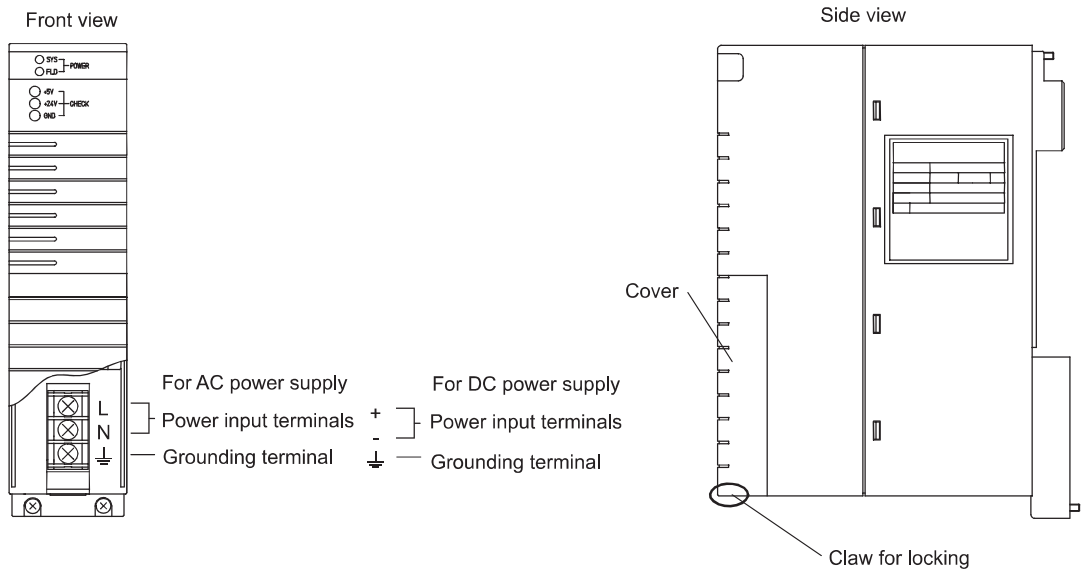

Figure C2.1-1 Power supply terminals and grounding terminal of the power supply module

Follow these steps to connect the power supply cable to the power supply module. The power supply cable should be purchased separately.

1. Find a claw at the lower side of the protective cover (marked with a circle in the figure). Push the claw upward to unlock it and gently pull the protective cover toward you. The protective cover is removed.
2. Connect the power cable to the power input terminals. Connect the grounding cable to the grounding terminal. The screw of the terminal is an M4 screw.
3. Put back the protective cover after the wiring is completed.

SEE ALSO For more information about power supply wiring and ground wiring cables and cable termination, refer to:

- ProSafe-RS Installation Guidance (TI 32P01J10-01EN)
- ProSafe-RS Lite Installation Guidance (TI 32P51J10-01EN)

C2.2 Connecting the power cable to the power supply unit for fan unit

Power supply units for fan unit are provided in the left and right of the node fan unit. Connect a power cable to each of the power supply units. The following figure shows the power input terminals and grounding terminal of the power supply unit for fan unit.

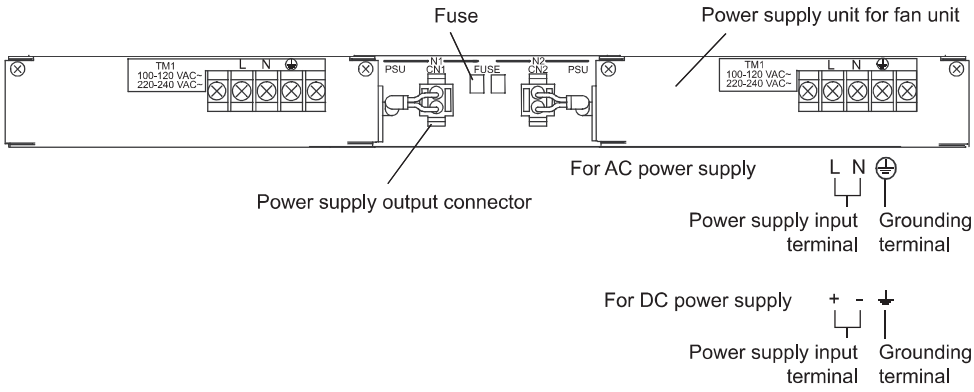

Figure C2.2-1 Power input terminals and grounding terminal of the power supply unit for fan unit

Follow these steps to connect the power cable to the power supply unit for fan unit:

1. Remove the protective cover of the power supply module.
2. Connect the power cable to the power input terminals and the grounding cable to the grounding terminal. The screw of the terminal is an M4 screw.
3. After the connection is completed, put back the protective cover.

SEE ALSO For more information about power supply wiring and ground wiring cables and cable termination, refer to:

- ProSafe-RS Installation Guidance (TI 32P01J10-01EN)
- ProSafe-RS Lite Installation Guidance (TI 32P51J10-01EN)

C2.3 Connecting the field power supply cable to a DIN rail mountable terminal board/relay board (for FIO node)

CAUTION

You can use dual field power supply. Before connecting the power supply, check the positive and negative polarity.

Follow this step to connect the field power supply cable to a DIN rail mountable terminal board or relay board:

- Confirming the cable polarity, insert the cable to the pressure clamp terminal and tighten the screw.

IMPORTANT

The tightening torque of the screws should be 0.5 to 0.6 N·m.

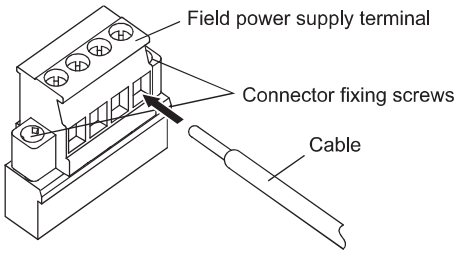

Figure C2.3-1 Connecting the field power supply cable

TIP

By loosening the connector fixing screws, you can detach the field power input terminals from the body and connect the power cable.

SEE ALSO

For more information about Cable termination, refer to:

"■ Signal connections to a DIN rail mountable terminal board/relay board" on page D1-9

C2.4 Ground wiring of the FIO node devices

To prevent effects of external noise, grounding terminals must be grounded to the protective grounding system: The following devices have a grounding terminal:

- SCU
- SNU
- Unit for optical bus repeater module
- Rack mountable terminal board
- Rack mountable relay board
- DIN rail mountable relay board

Ground wiring

Use the grounding terminals to ground the devices. The screw of the grounding terminal is an M4 screw.
Pull down the grounding wire through the tray and from the right side of the rack.

- Ground the grounding terminal to the protective grounding system.
- Use cables with a nominal conductor cross-sectional area of 2.0 mm^2 or more.

IMPORTANT

You must ground the devices individually without connecting their grounding terminals to each other.

The following figure shows an example of the ground wiring of SCU.

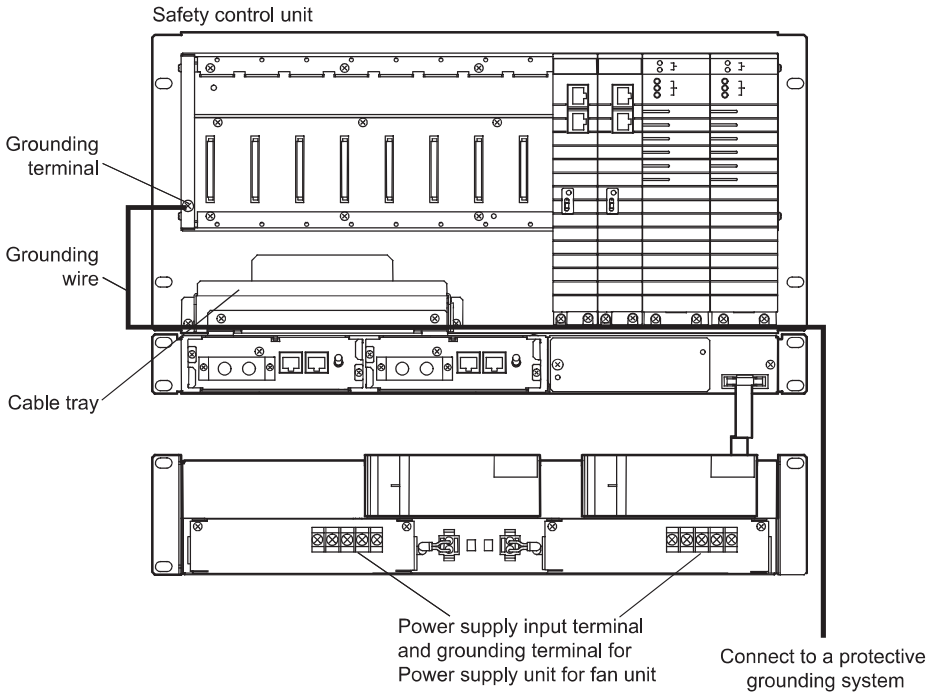

Figure C2.4-1 Ground wiring of SCU

The following figure shows an example of the ground wiring of SNU.

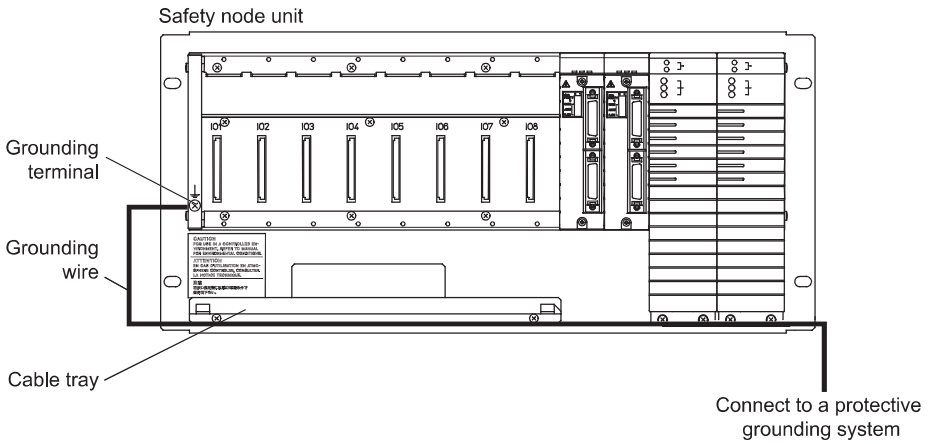

Figure C2.4-2 Ground wiring of SNU

The following figure shows an example of ground wiring of the unit for optical bus repeater module.

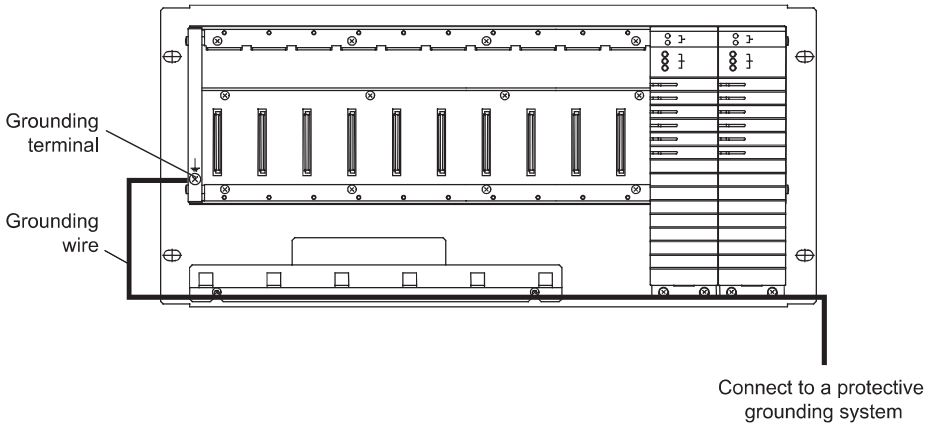

Figure C2.4-3 Ground wiring of the unit for optical bus repeater module

The following figure shows an example of the ground wiring of a rack mountable terminal board.

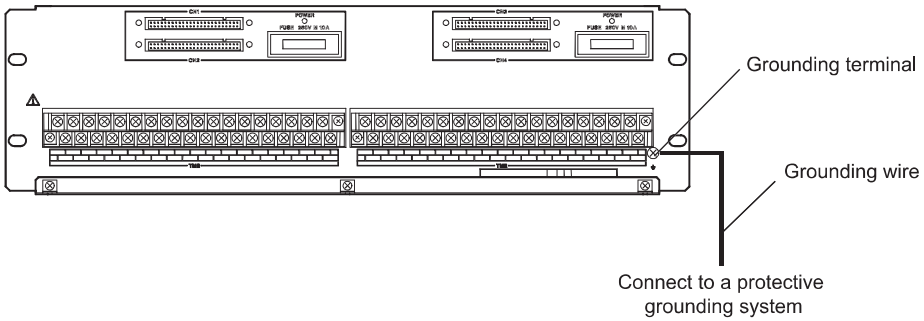

Figure C2.4-4 Ground wiring of a rack mountable terminal board

The following figure shows an example of the ground wiring of a rack mountable relay board.

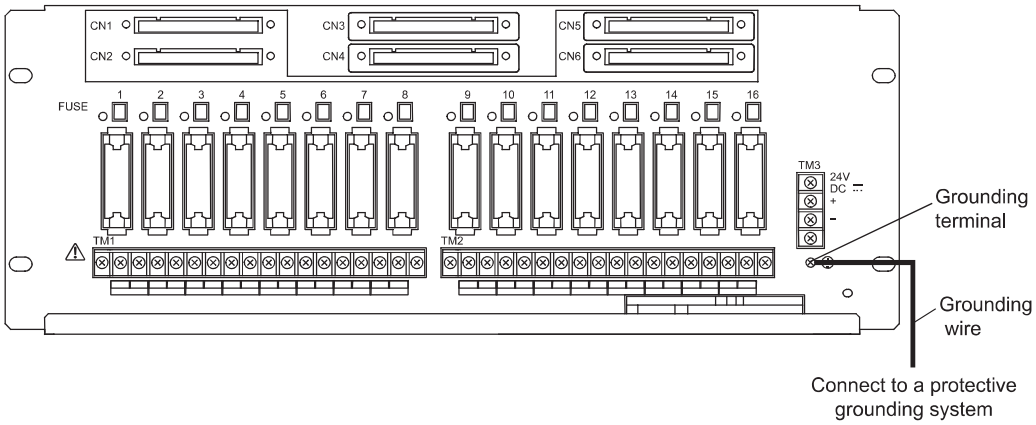

Figure C2.4-5 Ground wiring of a rack mountable relay board

The following figure shows an example of the ground wiring of a DIN rail mountable relay board.

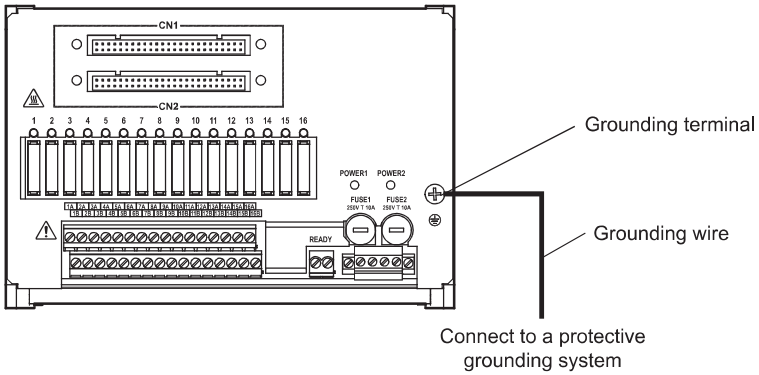

Figure C2.4-6 Ground wiring of a DIN rail mountable relay board

SEE ALSO

For more information about ground wiring cables and cable termination, refer to:

- ProSafe-RS Installation Guidance (TI 32P01J10-01EN)
- ProSafe-RS Lite Installation Guidance (TI 32P51J10-01EN)

C2.5 Ground and power supply wiring of the node interface unit

This section describes the ground wiring and power supply wiring of the components of the node interface unit.

- Ground wiring of the base plate for node interface unit
- Ground wiring and power supply wiring of the power supply unit

C2.5.1 Ground wiring of the base plate for node interface unit

Connect the grounding terminal of the base plate for node interface unit to the protective grounding system. The screw of the grounding terminal is an M4 screw.

Remove the cover of the node interface unit before you connect the cable, and put it back after you finished the connection.

Use cables with a nominal conductor cross-sectional area of 2.0 mm^2 or more.

SEE ALSO

For more information about the grounding terminal of the base plate for node interface unit, refer to:

"■ Elements on the base plate for node interface unit" on page B5-4

For more information about removing and attaching the cover of the node interface unit, refer to:

"● Cover" on page B5-2

For more information about ground wiring cables and cable termination, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

C2.5.2 Ground and power supply wiring of the power supply unit

This section describes the ground and power supply wiring of the power supply unit.

The cables should be purchased separately. For ground wiring and power supply wiring, use cables with the following nominal conductor cross-sectional areas:

- Grounding cable: 1.25 to 2.0 mm^2
- Power supply cable: 1.25 mm^2

SEE ALSO For more information about examples of conforming power supply wiring and ground wiring cables and cable termination, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

Ground wiring of the power supply unit

Prepare an appropriate cable and ground the grounding terminal of the power supply unit to the protective grounding system. The screw of the grounding terminal is an M4 screw. Use the screw that came with the product.

Power supply wiring of the power supply unit

IMPORTANT

When you connect cables to pressure clamp terminals, use a flat-blade screwdriver that conforms to the DIN 5264B standard having a thickness at the tip of 0.6 mm and a body shaft diameter of 3.5 mm.

Follow these steps to install the wiring by using the cables that you prepare:

1. Release the lower claw of the cover.
2. Lift the cover up to release the upper claw of the cover.
   The cover leaves the power supply unit.
   The following figure shows how to remove the cover.

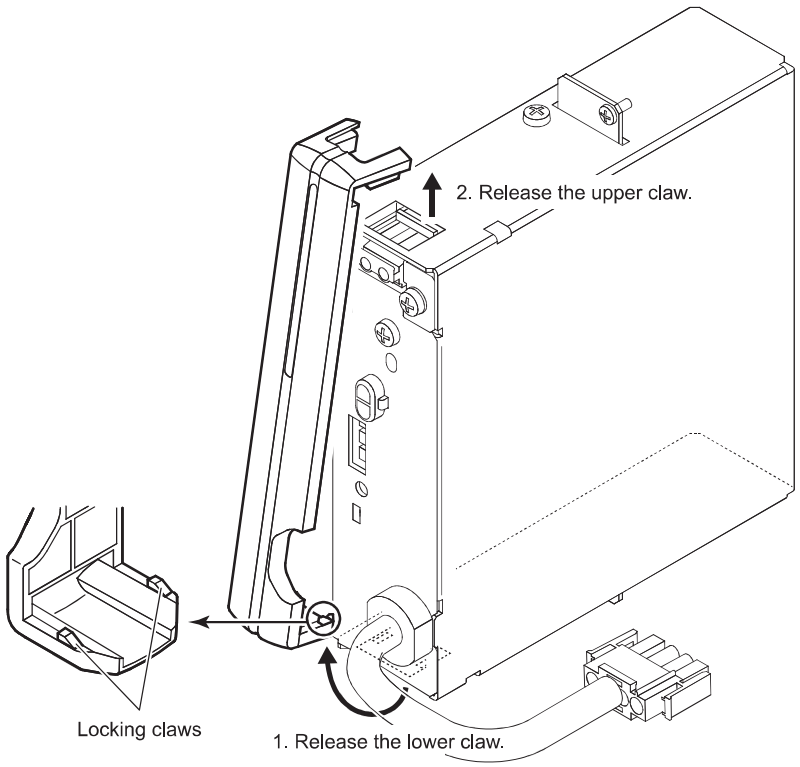

Figure C2.5.2-1 Removing the cover

3. Insert the power supply cables to the pressure clamp terminals and tighten the screws.

IMPORTANT

The tightening torque of the screws should be 0.5 N·m.

The following figure shows how to install the power cable.

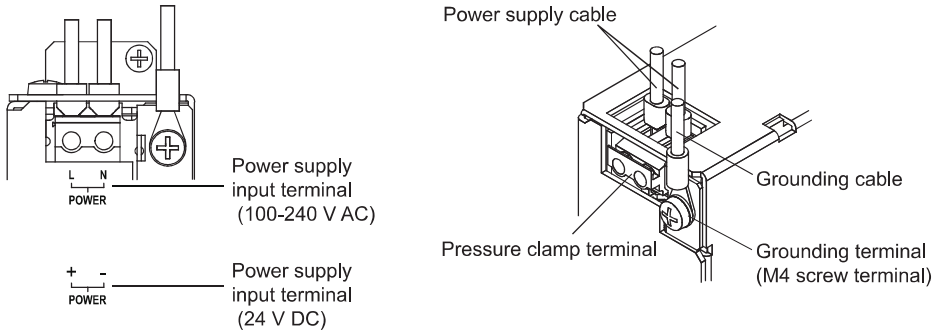

Figure C2.5.2-2 Connecting the power cables

4. Hook the upper claw of the cover over the groove at the top of the power supply unit.
5. Press the lower end of the cover until the claw fits into the groove in the bottom of the power supply unit.
6. Connect the cables to the power supply source.

Ensure that the power cables do not touch the case.

Output wiring of the power supply unit

The following figure shows the output cable wiring of the power supply unit.

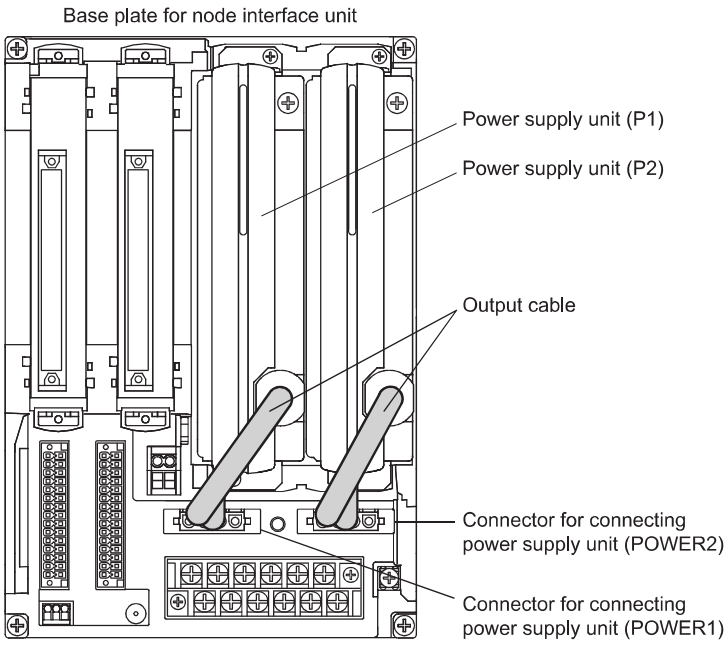

Figure C2.5.2-3 Output wiring of the power supply unit

Follow these steps to connect the output cable of the power supply unit:

1. Remove the cover of the node interface unit.
2. Connect the output cable of the power supply unit to the connector for connecting power supply unit on the base plate for node interface unit.
3. Attach the cover of the node interface unit.

SEE ALSO For more information about removing and attaching the cover of the node interface unit, refer to:

"● Cover" on page B5-2

C2.6 Ground and power supply wiring of the N-IO I/O unit

This section describes the ground wiring and power supply wiring of the base plate for N-IO I/O unit.

- Ground wiring
- System power supply wiring
- Field power supply or barrier power supply wiring

Ground wiring of base plates

The following figure shows an example of ground wiring of base plates.

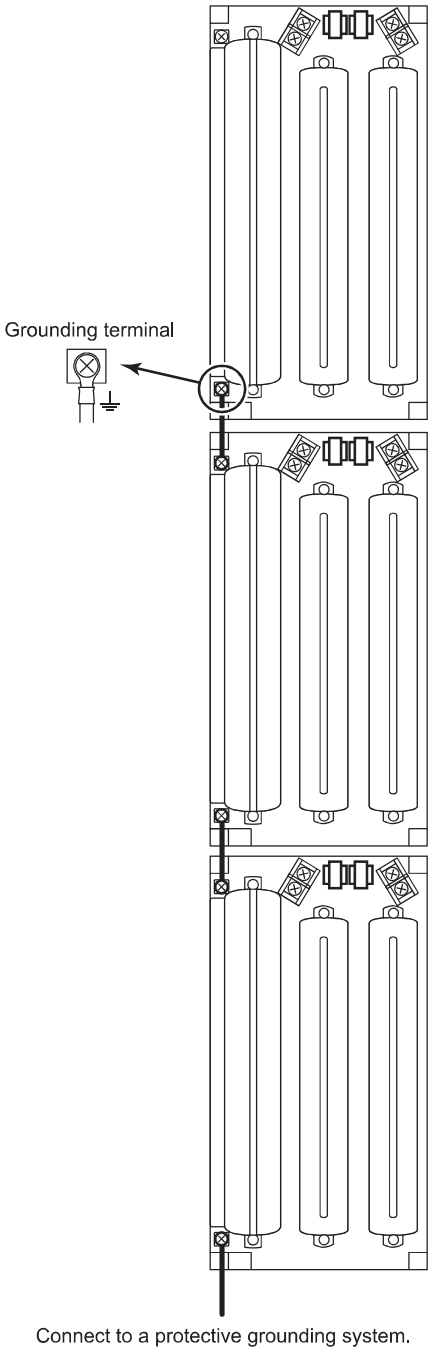

Figure C2.6-1 Ground wiring of base plates

Ground any one of the grounding terminals that are provided at the top and bottom of each base plate to the protective grounding system. The screw of the grounding terminal of the base plate with disconnecting terminals is an M3 screw. The screw of the grounding terminal of the base plates for barrier S2BN4D and S2BN5D is an M4 screw.

IMPORTANT

For S2BN4D, the tightening torque of the screws should be 0.81 to 0.99 N·m.

If the base plates are installed adjacently, connect the grounding terminals of the neighboring base plates by using the provided grounding cable and ground the top or bottom base plate to the protective grounding system.

SEE ALSO For more information about ground wiring cables and cable termination, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

System power supply wiring

For system power supply wiring, use the power cable for base plates (Model: S2KPB10).

The following figure shows the system power supply wiring.

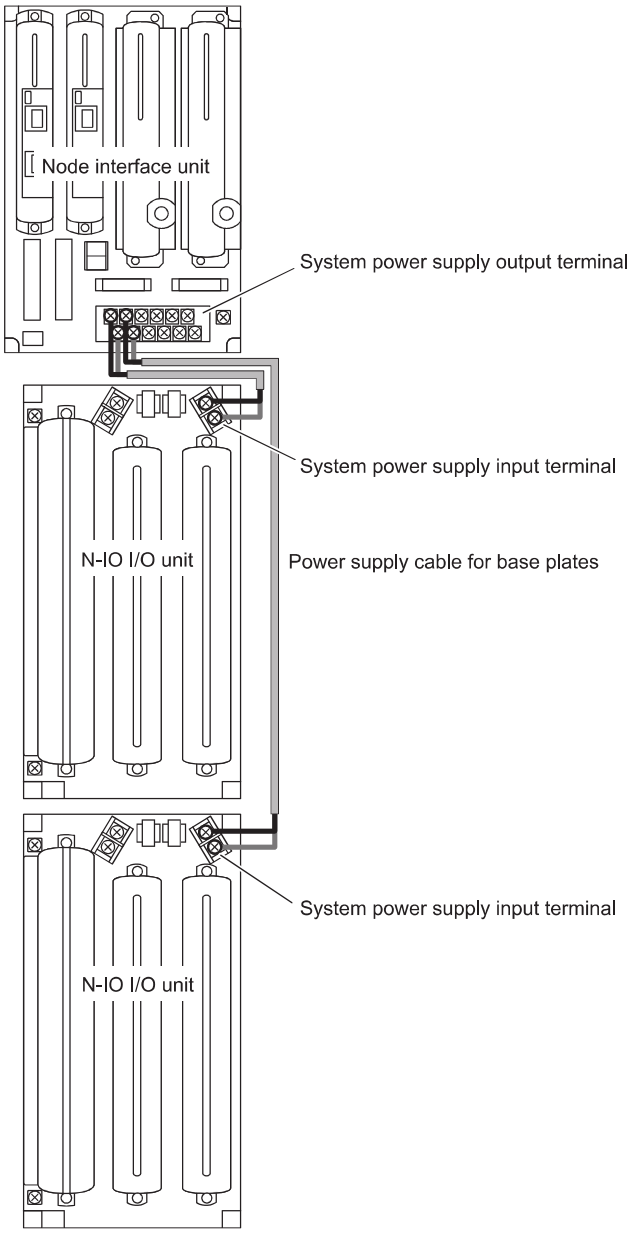

Figure C2.6-2 Example of system power supply wiring

Follow these steps to install system power supply wiring:

1. Remove the cover of the node interface unit.
2. Confirming the cable polarity, connect the node interface unit and the N-IO I/O units by using the power cables for base plates. The screws of the connecting terminals are M4 screws.
3. Attach the cover of the node interface unit.

SEE ALSO For more information about removing and attaching the cover of the node interface unit, refer to:

"● Cover" on page B5-2

Field power supply or barrier power supply wiring

CAUTION

When you connect a field power supply or a barrier power supply, provide a fuse or a circuit breaker in an appropriate location.

You can use the same procedure to install wiring for field power supply and barrier power supply.

The following figure shows an example of the field power supply wiring.

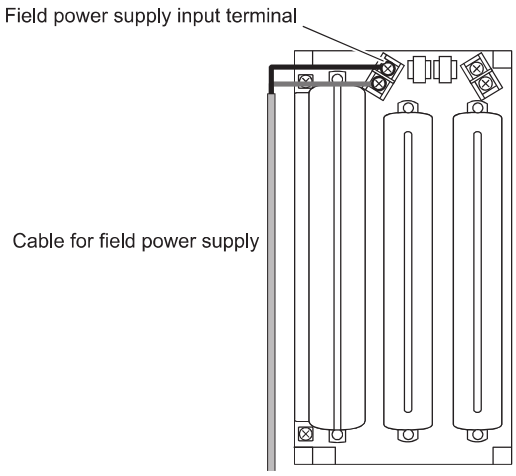

Figure C2.6-3 Example of field power supply wiring

Confirming the cable polarity, connect the power cable to the field power input terminals or barrier power input terminals that are provided on the base plate. The cable polarity is indicated on the base plate. The screw of the terminal is an M4 screw.

SEE ALSO For more information about Cable termination, refer to:

"● Cable termination for signal wiring" on page D1-9

For more information about the specifications of field power supply or barrier power supply cables, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

C3. Bus cable wiring of SCS

This section describes how to wire the following bus cables:

- Cables for Vnet/IP
- ESB bus cables
- Cables for optical ESB bus
- Cables for N-ESB bus
- F-SB bus cables

IMPORTANT

To reduce the mechanical stress on the cables and connectors, fix the cables to the rack in the cabinet or other suitable places.

C3.1 Connecting cables for Vnet/IP

The section explains how to connect the cables for Vnet/IP.

IMPORTANT

When you connect the cables for Vnet/IP to the processor modules of the SCU, note the following:

- For each SCU, connect "Layer 2 switch for Bus 1 to the BUS1 connector of the processor module" and connect "Layer 2 switch for Bus 2 to the BUS2 connector of the processor module."
- Before connecting the cable, remove the processor module from the SCU.

The following figure shows an example where a safety engineering PC (SENG) and an SCU are connected on Vnet/IP.

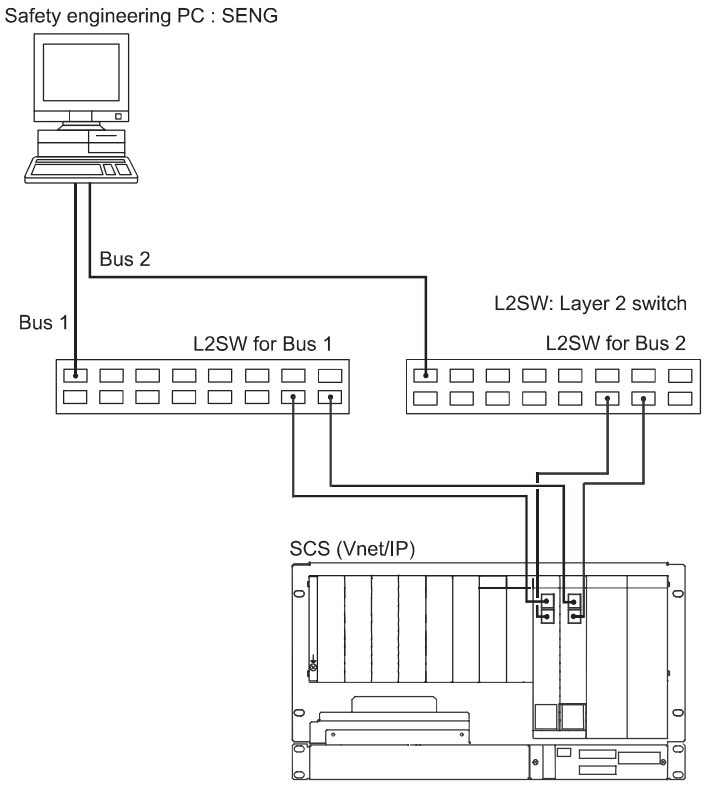

Figure C3.1-1 Example of Vnet/IP cable connection

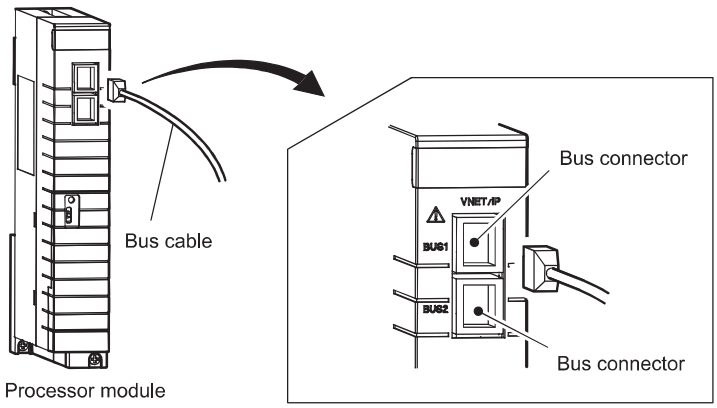
Follow one of these steps to connect cables for Vnet/IP:

- When turning the power on:
  Connect the cables to the processor module, and then turn on the power.
- When removing the processor module while the system is running:
  Remove the processor module with the cables connected to it.
- When mounting the processor module while the system is running:
  Connect the cables to the processor module, and then mount the module.



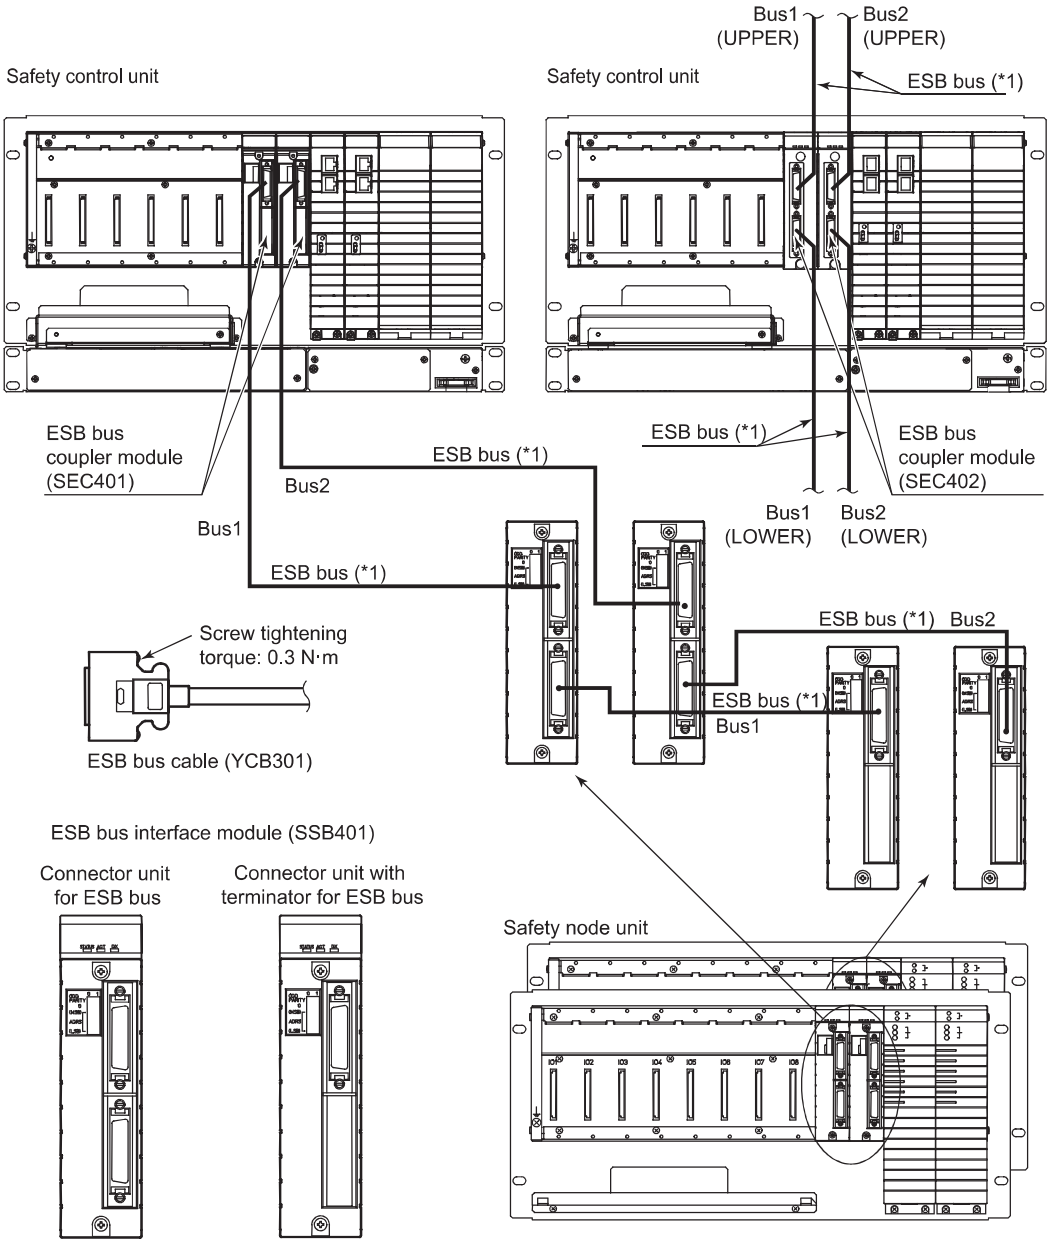


Figure C3.1-2 Connecting cables for Vnet/IP

C3.2 Connecting ESB bus cables

The communication bus that is used to connect the SCU and SNUs is called ESB bus.

ESB bus must be terminated at the module that is connected to each end of the ESB bus. The ESB bus coupler module in the SCU is always at one end of the ESB bus and has a connector unit with terminator for ESB bus. In the SNU at the other end of the ESB bus, install an ESB bus interface module that has a connector unit with terminator for ESB bus. In the SNUs that are not at the end of the ESB bus, install an ESB bus interface module that has a connector unit for ESB bus without a terminator. The following figure shows an example of an ESB bus connection in an SCS that supports SIL 3.

*1: Total transmission distance of ESB bus1 and ESB bus2 is less than 10 m each.

Figure C3.2-1 ESB bus connection in an SCS that supports SIL 3

C3.3 Connecting optical ESB bus cables (FIO node)

The transmission distance can be extended by connecting the SCU, SNUs, and the unit for optical bus repeater module with the optical ESB bus repeater module mounted onto each using optical ESB bus.

Star type and chain type connections are available for optical ESB bus connection.

CAUTION

The optical ESB bus repeater modules are class 1 laser products which comply with the requirements of IEC 60825-1. These modules comply with 21 CFR 1040.10 and 1040.11 except for deviations pursuant to Laser Notice No. 50, dated June 24, 2007.

Figure C3.3-1 Label of class 1 laser product

SEE ALSO

For more information about the fiber-optic cable transmission distance of the optical ESB bus repeater modules for SCSs that support SIL 3, refer to:

ProSafe-RS Optical ESB Bus Repeater Module (GS 32Q06L15-31E and GS 32Q06L16-31E)

For more information about the fiber-optic cable transmission distance of the optical ESB bus repeater modules for SCSs that support SIL 2, refer to:

ProSafe-RS Lite Optical ESB Bus Repeater Module (GS 32P56L15-01EN and GS 32P56L16-01EN)

Termination of ESB bus on the master and slave sides

On the master side and slave side of the optical ESB bus of the FIO node, ESB bus is connected. ESB bus must be terminated at the module that is connected to each end of the ESB bus. The following modules are used at the ends of ESB bus for termination:

- ESB bus coupler module
  ESB bus coupler modules have built-in terminators. They can be used directly.
- ESB bus interface module
  Available in two types: module with ESB bus terminator and module with ESB bus branch connector. For termination, use the module with ESB bus terminator.
- Optical ESB bus repeater master module
  Available in two types: module with ESB bus terminator and module with ESB bus branch connector. For termination, use the module with ESB bus terminator.
- Optical ESB bus repeater slave module
  This module has a terminator for ESB bus, so you can use it as is.

Star type connection

In star type connection, SNUs and the unit for optical bus repeater module are connected using fiber-optic cables. Both ends of the ESB bus must be terminated. The following figure shows an example of a star type connection in an SCS that supports SIL 3.

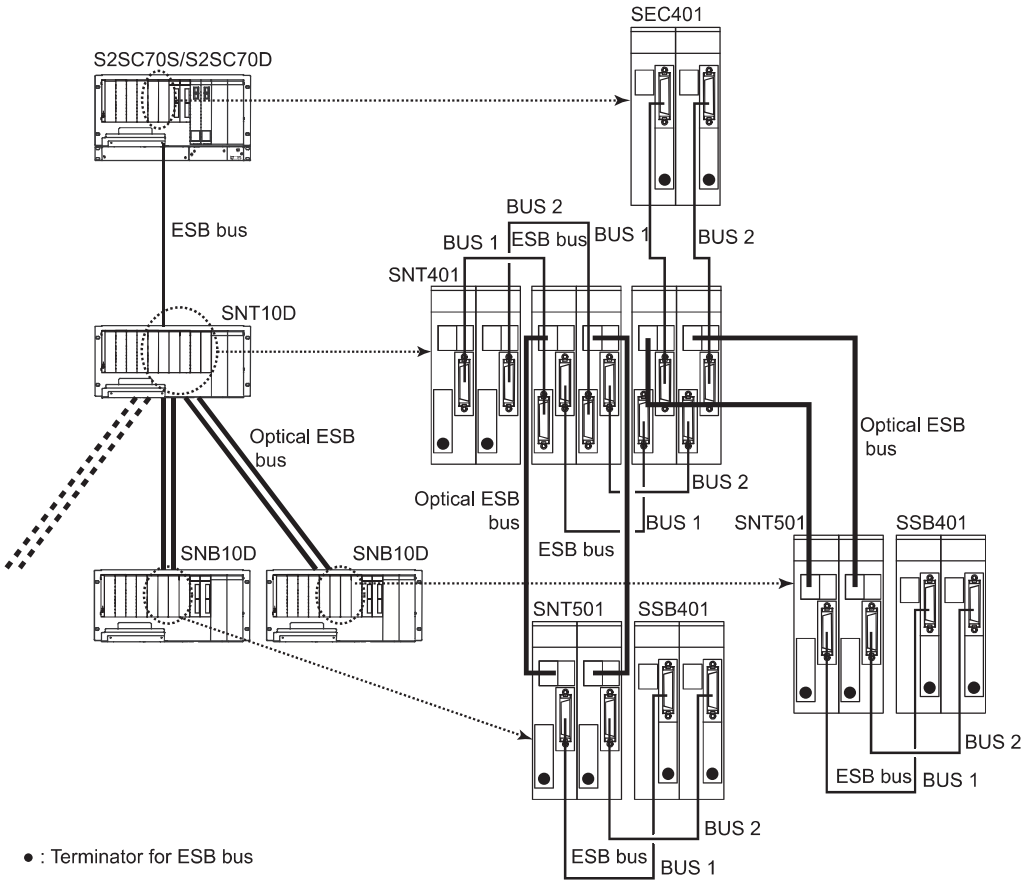

Figure C3.3-2 Star type connection in an SCS that supports SIL 3

At the top level, mount the ESB bus coupler module (SEC401) in the SCU, mount the optical ESB bus repeater master module (SNT401) in the unit for optical bus repeater module (SNT10D), and connect them with the ESB bus. Mount the ESB bus interface module (SSB401) and the optical ESB bus repeater slave module (SNT501) onto the lowest-level safety node unit (SNB10D) and connect with the ESB bus.

For the modules at the end of ESB bus, use a module with ESB bus terminator.

Connect the optical ESB bus repeater modules (SNT401 and SNT501) with fiber-optic cables.

Chain type connection

For the chain type connection, two methods are available: using SCU and SNU and using SCU and unit for optical bus repeater module.

Using SCU and SNU

In this method, the SCU and SNUs mounted with optical ESB bus repeater modules are connected using fiber-optic cables. Both ends of the ESB bus must be terminated at each level. The following figure shows an example of a chain type connection in an SCS that supports SIL 3.

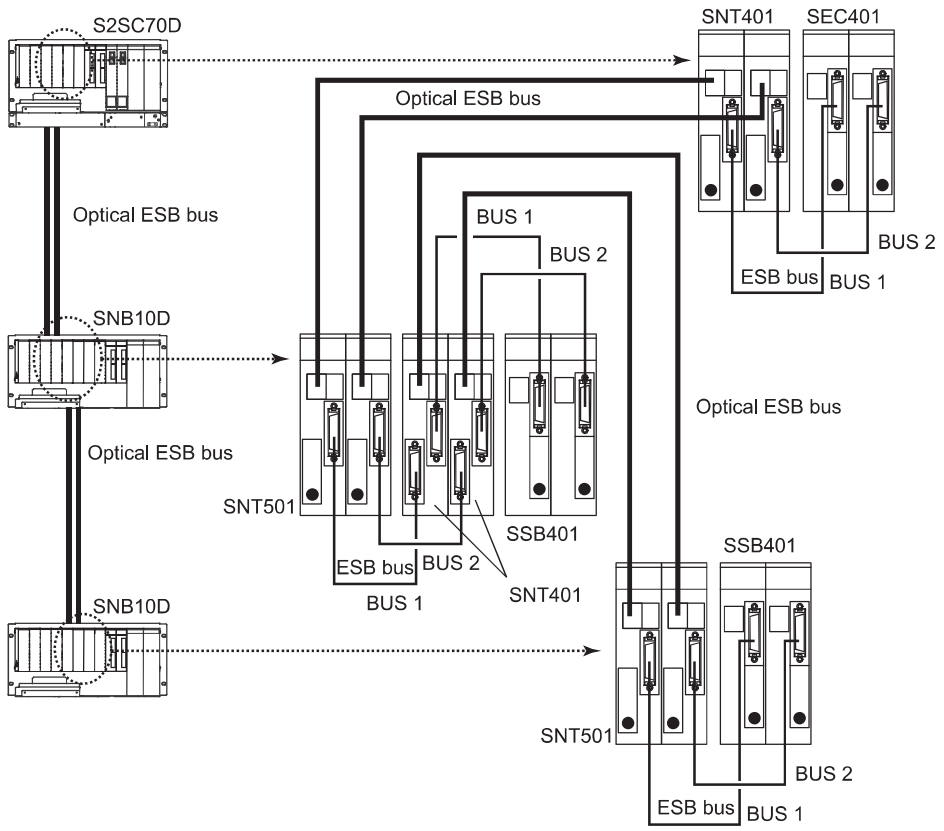

Figure C3.3-3 Chain type connection in an SCS that supports SIL 3: Using SCU and SNU

At the top level, mount the ESB bus coupler module (SEC401) and the optical ESB bus repeater master module (SNT401) in the SCU, and connect them with the ESB bus. At the next level, mount the ESB bus interface module (SSB401), optical ESB bus repeater master module (SNT401), and optical ESB bus repeater slave module (SNT501) in the SNU (SNB10D), and connect the modules with the ESB bus. At the lowest level, mount the ESB bus interface module (SSB401) and optical ESB bus repeater slave module (SNT501) in the SNU (SNB10D), and connect the modules with the ESB bus.

For the modules at the end of ESB bus, use a module with ESB bus terminator.

Connect the optical ESB bus repeater modules (SNT401 and SNT501) with fiber-optic cables.

● Using unit for optical bus repeater module

In this method, the unit for optical bus repeater module loaded with optical ESB bus repeater modules is connected to the SCU and SNU. Both ends of the ESB bus must be terminated at each level. The following figure shows an example of a chain type connection where the units for optical bus repeater module are used in an SCS that supports SIL 3.

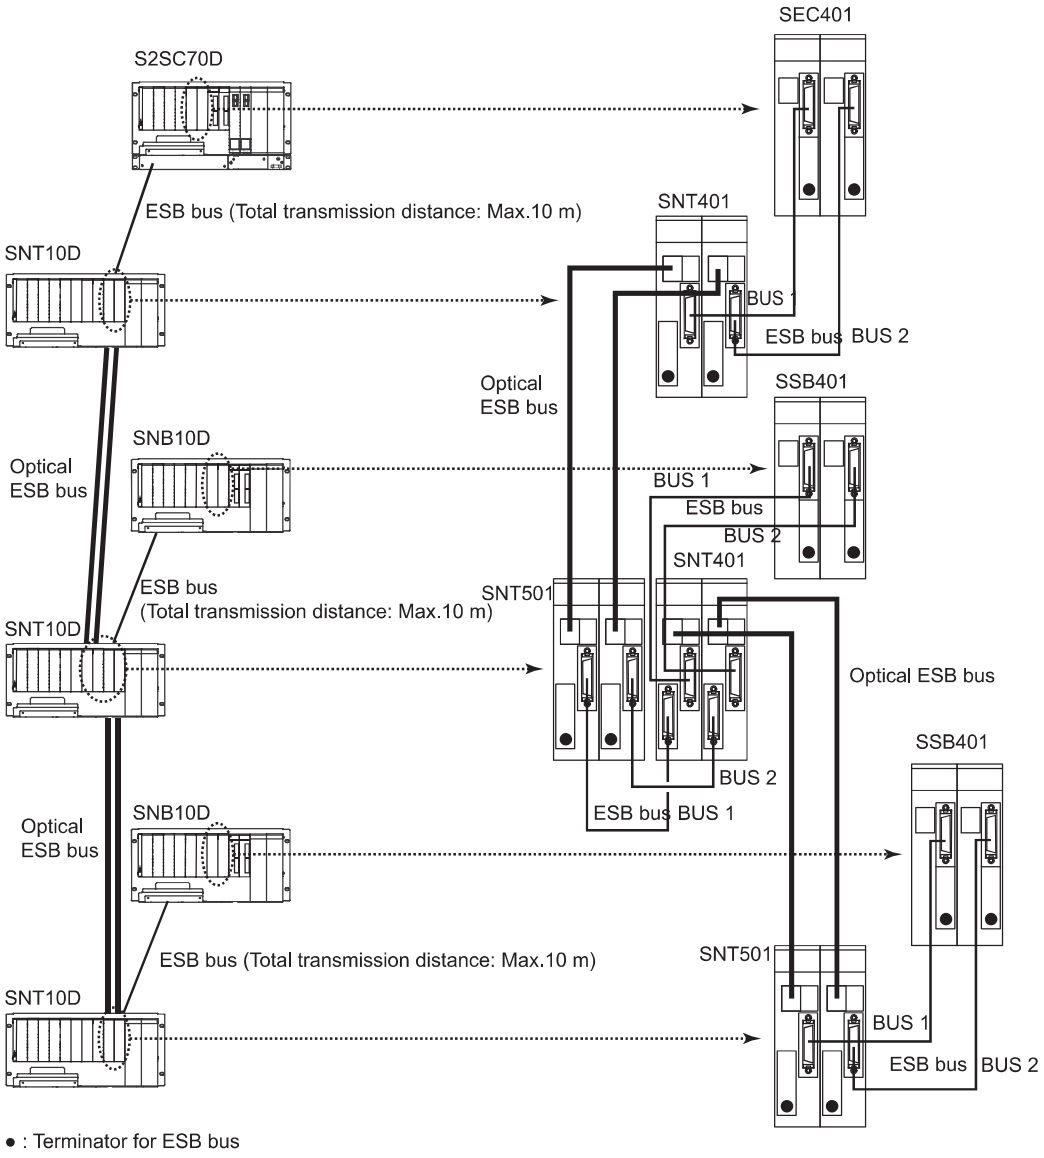

Figure C3.3-4 Chain type connection in an SCS that supports SIL 3: Using unit for optical bus repeater module

At the top level, mount the ESB bus coupler module (SEC401) in the SCU, mount the optical ESB bus repeater master module (SNT401) in the unit for optical bus repeater module (SNT10D), and connect them with the ESB bus. At the next level, mount the ESB bus interface module (SSB401) in the SNU (SNB10D), mount the optical ESB bus repeater master module (SNT401) and the optical ESB bus repeater slave module (SNT501) in the unit for optical bus repeater module (SNT10D), and connect them with the ESB bus. At the lowest level, mount the ESB bus interface module (SSB401) in the SNU (SNB10D), mount the optical ESB bus repeater slave module (SNT501) in the unit for optical bus repeater module (SNT10D), and connect them with the ESB bus.

For the modules at the end of ESB bus, use a module with ESB bus terminator.

Connect the optical ESB bus repeater modules with fiber-optic cables.

The number and location of optical ESB bus repeater modules that can be mounted in each unit

The connectable number of optical ESB bus repeater modules and their location are determined by each unit.

IMPORTANT

Note the following points when using optical ESB bus repeater modules.

- The optical ESB bus repeater master module and the optical ESB bus repeater slave module both connected to ESB bus1 must be mounted on the odd-numbered slots. The Optical ESB bus repeater master module and the optical ESB bus repeater slave module both connected to ESB bus2 must be mounted on the even-numbered slots.
- Be sure to put a dummy cover (SDCV01) on each slot with no module.

SEE ALSO

For more information about restrictions on installation of optical ESB bus repeater modules to SCSs that support SIL 3, refer to:

ProSafe-RS Optical ESB Bus Repeater Module (GS 32Q06L15-31E and GS 32Q06L16-31E)

For more information about restrictions on installation of optical ESB bus repeater modules to SCSs that support SIL 2, refer to:

ProSafe-RS Lite Optical ESB Bus Repeater Module (GS 32P56L15-01EN and GS 32P56L16-01EN)

SCU

The following figure shows the slots of SCU to which optical ESB bus repeater modules can be mounted.

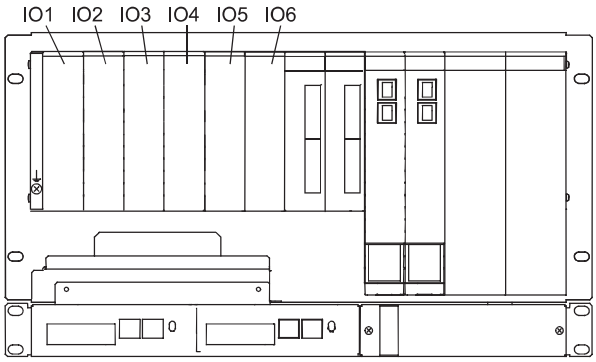

Figure C3.3-5 Slots of SCU to which optical ESB bus repeater modules can be mounted

You can mount the modules to slots IO1 to IO6. Use an odd-number slot and the next even-number slot together.

SNU

The following figure shows the slots of SNU to which optical ESB bus repeater modules can be mounted.

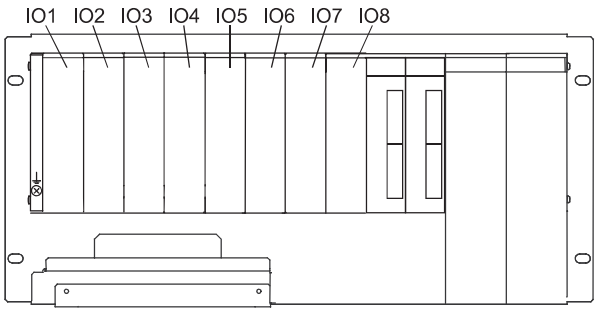

Figure C3.3-6 Slots of SNU to which optical ESB bus repeater modules can be mounted

You can mount the modules to slots IO1 to IO8. Use an odd-number slot and the next even-number slot together.

Unit for optical bus repeater module

The following figure shows the slots of the unit for optical bus repeater module to which optical ESB bus repeater modules can be mounted.

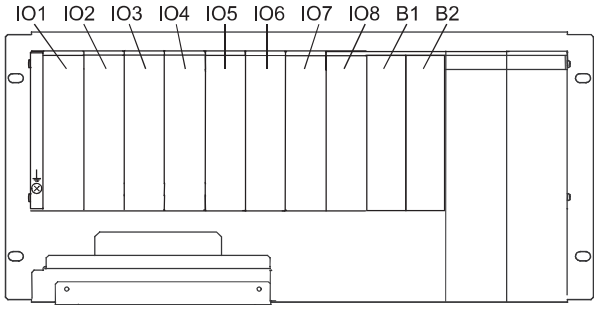

Figure C3.3-7 Slots of the unit for optical bus repeater module to which optical ESB bus repeater modules can be mounted

You can mount the modules to slots IO1 to IO8, B1, and B2. Use an odd-number slot and the next even-number slot together.

C3.4 Connecting N-ESB bus cables

This section describes the N-ESB bus cable connection between the SCU and an N-IO node and between N-IO nodes.

IMPORTANT

You must set the node number of the N-IO node first before you connect the bus cables.

SEE ALSO

For more information about the models of N-ESB bus module that can be connected to N-ESB bus, refer to:

"■ Elements on the N-ESB bus module" on page B5-6

For more information about setting the node number of an N-IO node, refer to:

F2.1.1, "Using the Node Number Setting Tool" in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

■ Connecting N-ESB bus cables between SCU and N-IO node

The following figure shows an example of N-ESB bus cable connection between the SCU and an N-IO node.

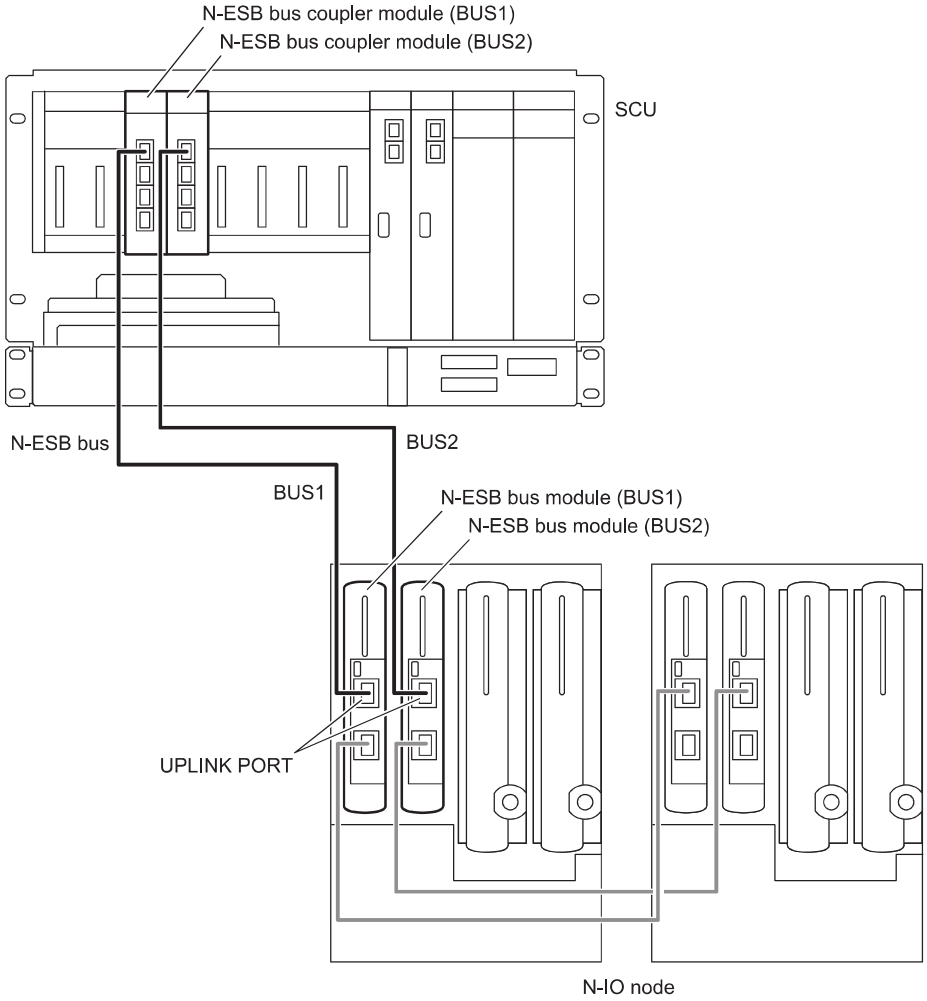

Figure C3.4-1 Example of N-ESB bus cable connection between SCU and N-IO node

Using N-ESB bus cables, connect the N-ESB bus coupler module (BUS1) and the N-ESB bus module (BUS1) and connect the N-ESB bus coupler module (BUS2) and the N-ESB bus module (BUS2).

The N-ESB bus cables must be installed so that they run over the base plate for node interface unit. Ensure that stress is not applied to the N-ESB bus cables and connectors.

SEE ALSO For more information about the specifications of N-ESB bus cables, refer to:

ProSafe-RS Safety Instrumented System Overview (for Vnet/IP) (GS 32P01B10-01EN)

Connecting N-ESB bus cables between N-IO nodes

The following figure shows an example of N-ESB bus cable connection between N-IO nodes.

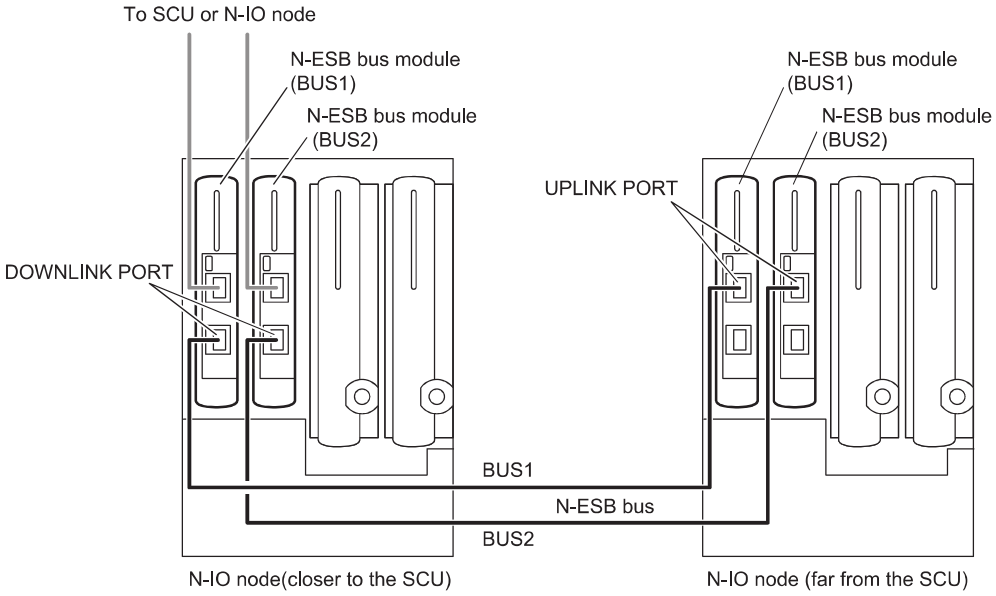

Figure C3.4-2 Example of N-ESB bus cable connection between N-IO nodes

Using N-ESB bus cables, connect between N-ESB bus modules (BUS1) and between N-ESB bus modules (BUS2) of neighboring N-IO nodes. Connect the DOWNLINK PORT of the N-IO node that is closer to the SCU to the UPLINK PORT of the N-IO node that is far from the SCU.

The N-ESB bus cables must be installed so that they run over the base plate for node interface unit. Ensure that stress is not applied to the N-ESB bus cables and connectors.

SEE ALSO For more information about the specifications of N-ESB bus cables, refer to:

ProSafe-RS Safety Instrumented System Overview (for Vnet/IP) (GS 32P01B10-01EN)

C3.5 Connecting optical ESB bus cables (N-IO node)

This section describes the following optical ESB bus cable connections:

- Connection between an N-IO node and an FIO node (including SCU) that is connected on the UPLINK port (SCU side)
- Connection between an N-IO node and an FIO node that is connected on the DOWN-LINK port (the side opposite SCU)
- Connection between N-IO nodes

CAUTION

The optical ESB bus repeater modules and N-ESB bus modules are class 1 laser products which comply with the requirements of IEC 60825-1. These modules comply with 21 CFR 1040.10 and 1040.11 except for deviations pursuant to Laser Notice No. 50, dated June 24, 2007.

Figure C3.5-1 Label of class 1 laser product

IMPORTANT

You must set the node number of the N-IO node first before you connect the bus cables.

SEE ALSO For more information about the models of N-ESB bus module that can be connected to N-ESB bus, refer to:

"■ Elements on the N-ESB bus module" on page B5-6

For more information about setting the node number of an N-IO node, refer to:

F2.1.1, "Using the Node Number Setting Tool" in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

■ Connecting optical ESB bus cables between an N-IO node and an FIO node that is connected on the UPLINK port

When connecting an N-IO node and an FIO node (including the SCU) that is connected on the UPLINK port (SCU side), connect the optical ESB bus repeater master module in the FIO node to the N-ESB bus module in the N-IO node. The following figure shows an example when connecting the SCU.

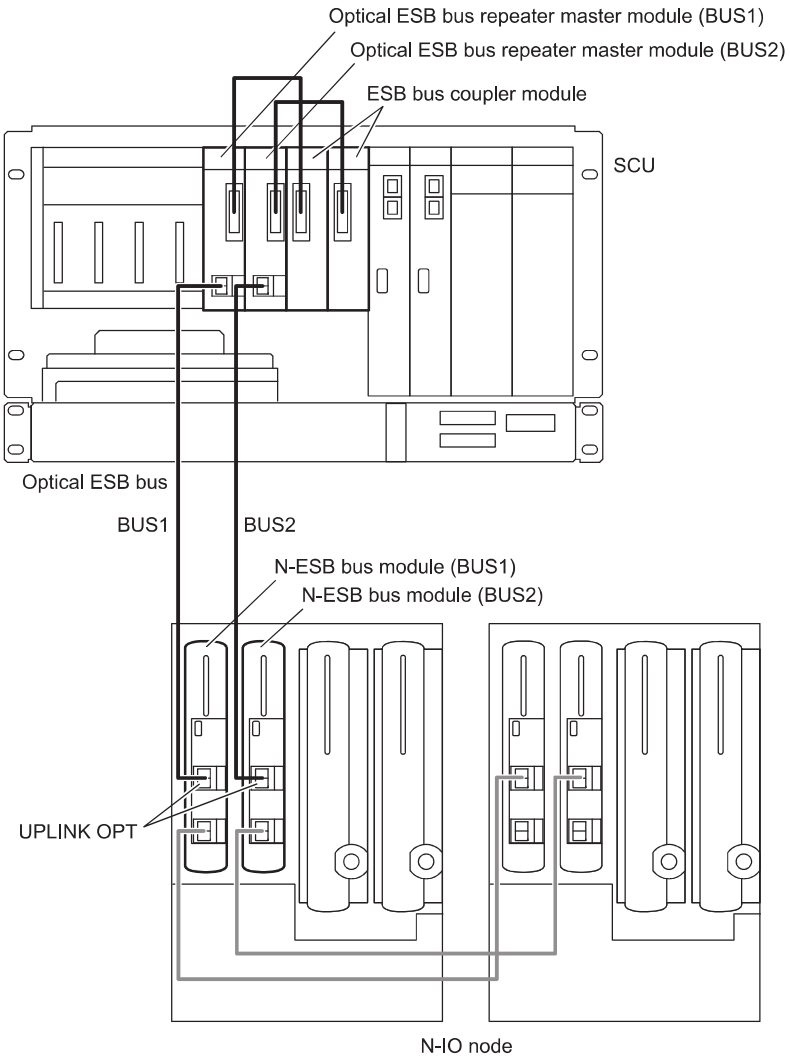

Figure C3.5-2 Example of optical ESB bus cable connection between SCU and N-IO node

Using fiber-optic cables, connect the optical ESB bus repeater master module (BUS1) and the N-ESB bus module (BUS1), and connect the optical ESB bus repeater master module (BUS2) and the N-ESB bus module (BUS2).

The fiber-optic cables must be installed so that they run over the base plate for node interface unit. Ensure that stress is not applied to the fiber-optic cables and connectors.

SEE ALSO For more information about the specifications of fiber-optic cables, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

For more information about the connectable combinations of the N-ESB bus module and optical ESB bus repeater modules, refer to:

ProSafe-RS Optical ESB Bus Repeater Module (GS 32Q06L15-31E and GS 32Q06L16-31E)

Connecting optical ESB bus cables between an N-IO node and an FIO node that is connected on the DOWNLINK port

When connecting an N-IO node and an FIO node that is connected on the DOWNLINK port (the side opposite SCU), connect the N-ESB bus module in the N-IO node to the optical ESB

bus repeater slave module in the FIO node. The following figure shows an example of connection between an N-IO node and SNU.

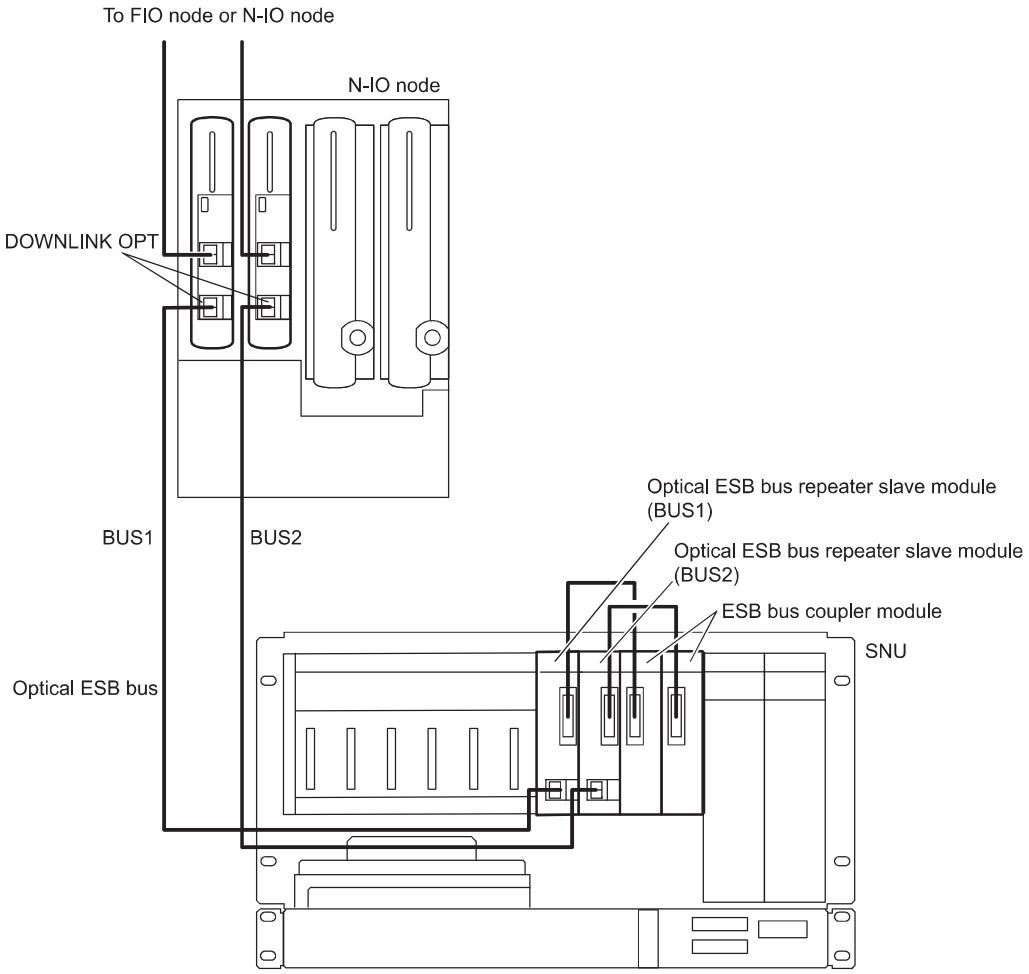

Figure C3.5-3 Example of optical ESB bus cable connection between N-IO node and SNU

Using fiber-optic cables, connect the N-ESB bus module (BUS1) and the optical ESB bus repeater slave module (BUS1), and connect the N-ESB bus module (BUS2) and the optical ESB bus repeater slave module (BUS2).

The fiber-optic cables must be installed so that they run over the base plate for node interface unit. Ensure that stress is not applied to the fiber-optic cables and connectors.

SEE ALSO For more information about the specifications of fiber-optic cables, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

For more information about the connectable combinations of the N-ESB bus module and optical ESB bus repeater modules, refer to:

ProSafe-RS Optical ESB Bus Repeater Module (GS 32Q06L15-31E and GS 32Q06L16-31E)

Connecting optical ESB bus cables between N-IO nodes

The following figure shows an example of optical ESB bus cable connection between N-IO nodes.

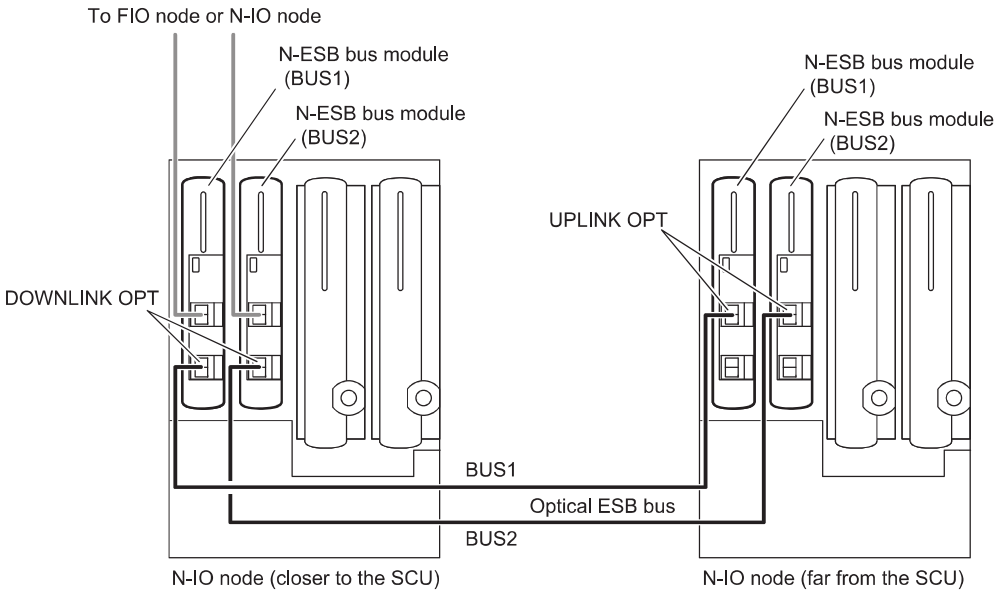

Figure C3.5-4 Example of optical ESB bus cable connection between N-IO nodes

Using fiber-optic cables, connect between N-ESB bus modules (BUS1) and between N-ESB bus modules (BUS2) of neighboring N-IO nodes. Connect the DOWNLINK OPT of the N-IO node that is closer to the SCU to the UPLINK OPT of the N-IO node that is farther from the SCU.

The fiber-optic cables must be installed so that they run over the base plate for node interface unit. Ensure that stress is not applied to the fiber-optic cables and connectors.

SEE ALSO For more information about the specifications of fiber-optic cables, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

C3.6 Connecting F-SB bus cables

IMPORTANT

- When you connect the F-SB bus cable to N-IO I/O units, match the unit number of the N-IO I/O unit and the unit number that is indicated on the cable.
- When you tighten the connector fixing screws of the F-SB bus cable, use a flat-blade screwdriver that conforms to the DIN 5264B standard having a thickness at the tip of 0.4 mm and a body shaft diameter of 2.5 mm.

The following figure shows an example of connection between the node interface unit and N-IO I/O units.

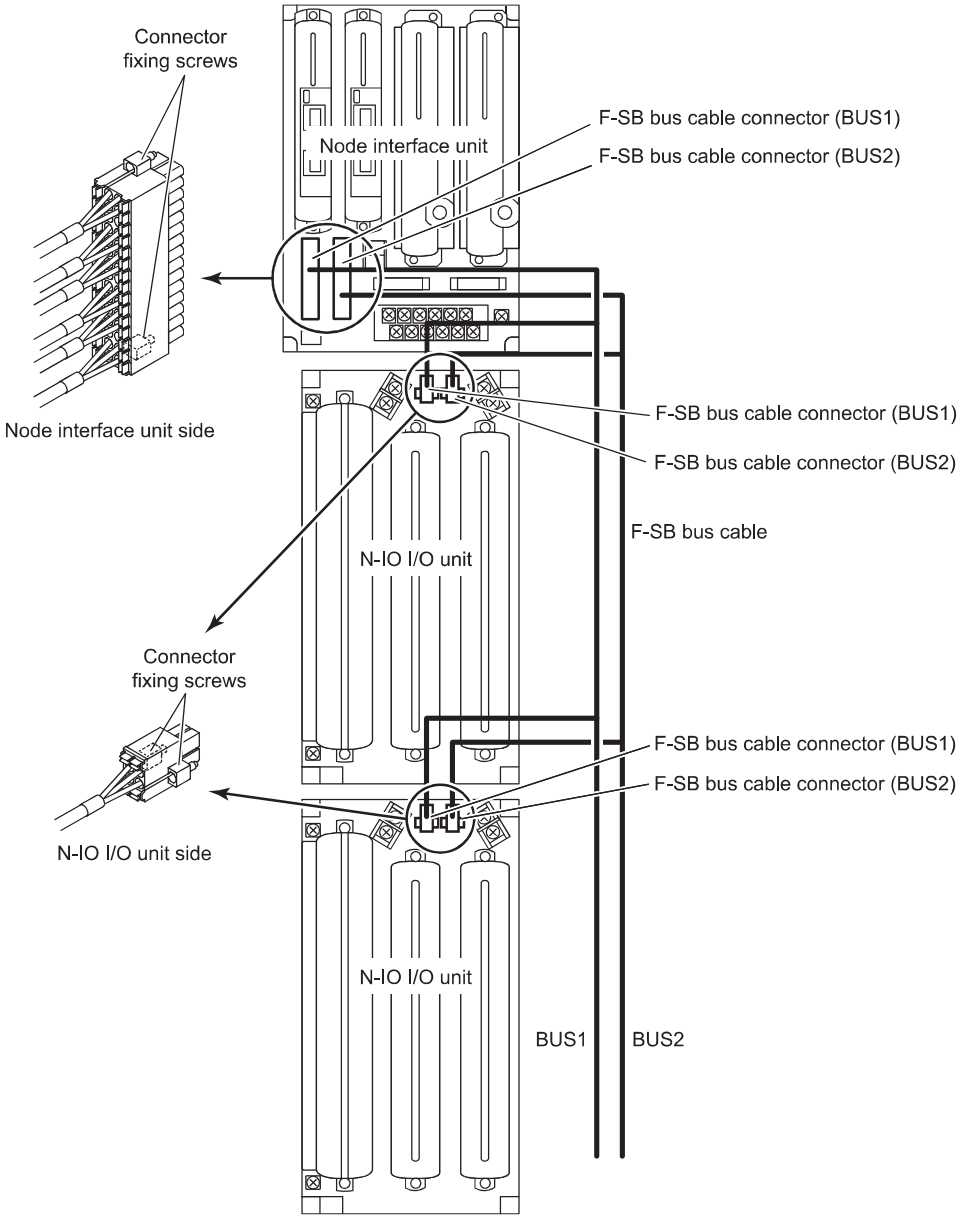

Figure C3.6-1 Example of connection between the node interface unit and N-IO I/O units

Follow these steps to connect the node interface unit and N-IO I/O units by using F-SB bus cables (Model: S2KLF10):

1. Remove the cover of the node interface unit.
2. Using F-SB bus cables, connect the F-SB bus connector (BUS1) of the base plate for node interface unit and the F-SB bus connector (BUS1) of each base plate for N-IO I/O, and do the same for BUS2.
3. Tighten the fixing screws of the connectors.

IMPORTANT

The tightening torque of the screws should be 0.2 to 0.3 N·m.

4. Attach the cover of the node interface unit.

SEE ALSO

For more information about removing and attaching the cover of the node interface unit, refer to:

"● Cover" on page B5-2

For more information about the F-SB bus cable and N-IO I/O unit numbers, refer to:

"■ F-SB bus cable" on page B5-21

D. Signal wiring between SCS and field devices

This section describes the signal wiring between I/O modules and the field devices. I/O modules include FIO I/O modules and N-IO I/O modules.

IMPORTANT

To reduce the mechanical stress on the cables and connectors, fix the cables to the rack in the cabinet or other suitable places.

D1. Signal wiring between FIO I/O modules and field devices

This section describes the signal wiring between FIO I/O modules and the field devices. The following types of FIO I/O modules are available:

- Analog I/O module
- Digital I/O module
- Communication module

D1.1 Types of FIO I/O module signal connection

Signal cables of field devices can be connected to FIO I/O modules in the following ways, depending on whether the wiring space needs to be reduced, whether the instrumentation style needs to be unified, or other circumstances:

- Connection by using pressure clamp terminals
  Signal cables of the field device are directly connected to the pressure clamp terminal block of the I/O module.
- Connection by using MIL connectors
  The connector of field device signal cable is directly connected to the MIL connector of the I/O module.
- Connection through a terminal board
  Signal cables of the field devices are connected to a terminal board, and the terminal board is connected to the I/O module with signal cable interface adapter by using a dedicated signal cable.
- Connection through a relay board
  The output signals from a digital output module are received by a relay board and transmitted to the field devices as contact output signals.

The following figure shows the signal cable connection by pressure clamp terminal block, MIL connector, and terminal board.

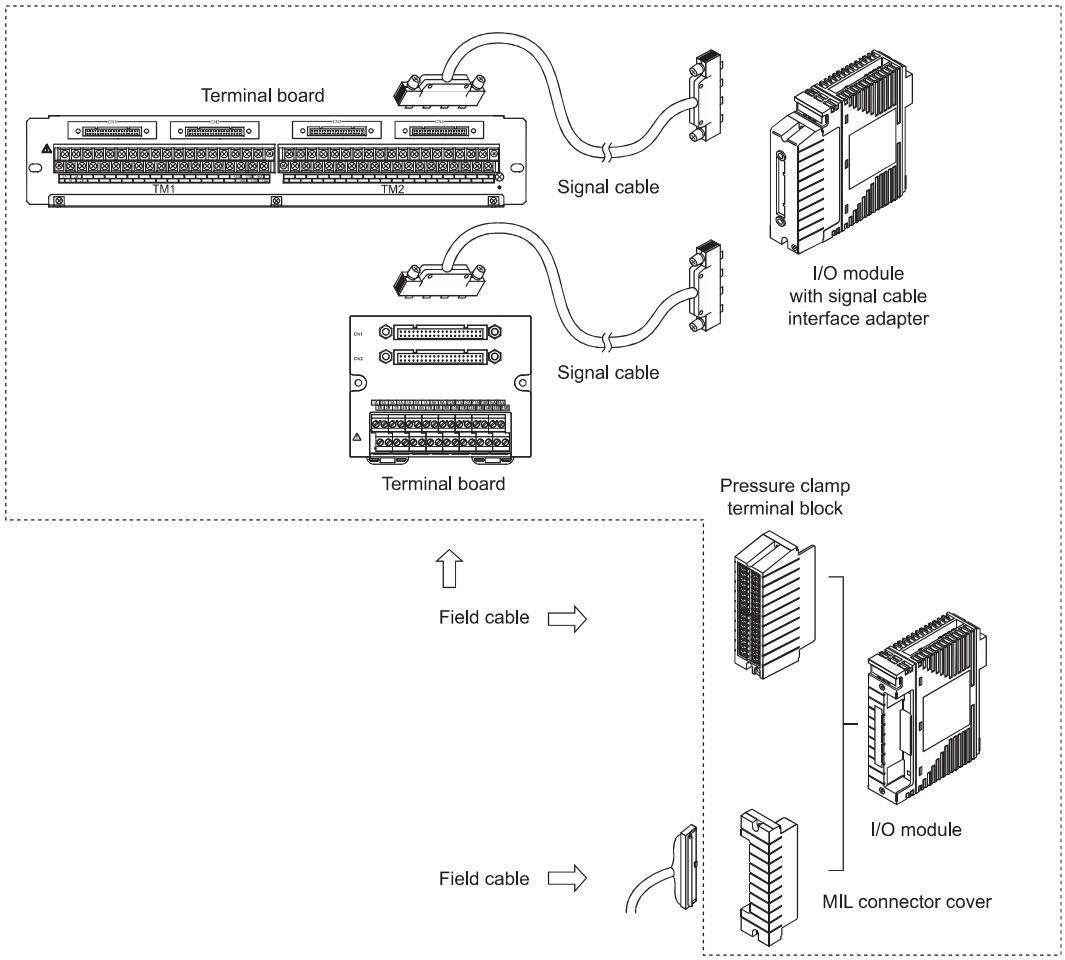

Figure D1.1-1 Examples of connection through a terminal board, pressure clamp terminal block, and MIL connector

The following figure shows the signal cable connection through a relay board.

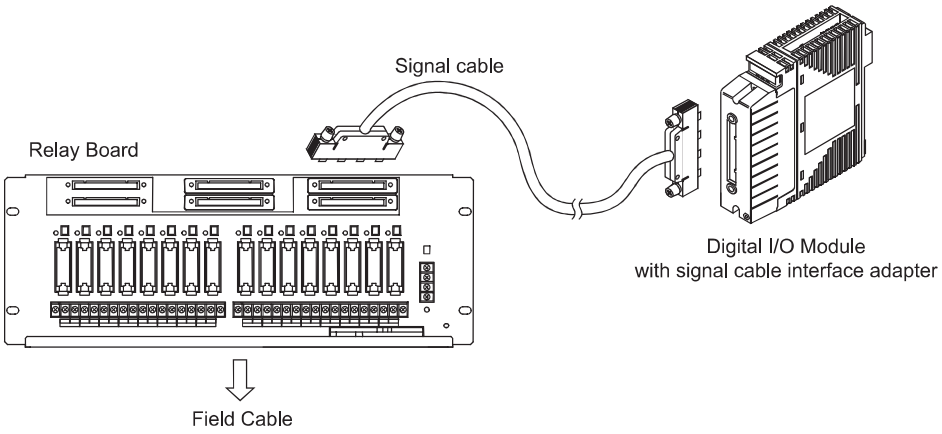

Figure D1.1-2 Example of connection through a relay board

SEE ALSO

For more information about the combinations of I/O modules for SCSs that support SIL 3 and terminal blocks, etc., refer to:

ProSafe-RS Outline of I/O Modules (for FIO) (GS 32P06K60-01EN)

For more information about the combinations of I/O modules for SCSs that support SIL 2 and terminal blocks, etc., refer to:

ProSafe-RS Lite Outline of I/O Modules (GS 32P56K60-01EN)

D1.1.1 Signal connections to the pressure clamp terminal block

This section describes the signal connections to the pressure clamp terminal block.

Cables for signal wiring

For signal wiring to pressure clamp terminal blocks, you can use the following nominal cross sectional area cables.

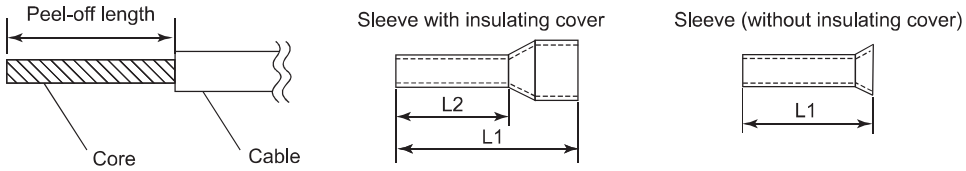
- With sleeve: 0.5 to 1.5 mm^2 (AWG20-16)
- Without sleeve: 0.5 to 2 mm^2 (AWG20-14)

SEE ALSO For more information about examples of compatible cable lines for signal wiring, refer to:

- ProSafe-RS Installation Guidance (TI 32P01J10-01EN)
- ProSafe-RS Lite Installation Guidance (TI 32P51J10-01EN)

Cable termination

IMPORTANT



- Use sleeves that conform to the following DIN standards.
  - Sleeves without insulating cover: DIN 46 228/1
  - Sleeves with insulating cover: DIN 46 228/4
- Use sleeves and a tool that are of the same make and match the thickness of the wire.
- Insert the cables deep into the terminals and make sure they are securely installed.

On the cables for pressure clamp terminals, you must perform the following terminations:

- When using a sleeve
  At the cable end, peel off the coating and attach a sleeve. The following table shows the sleeve dimensions.

Table D1.1.1-1 Sleeve dimension

Cable thickness (mm^2)	When using a sleeve with insulating cover			When using a sleeve (without insulating cover)	
	Peel-off length (mm)	Sleeve dimension (mm)		Peel-off length (mm)	Sleeve dimension (mm)
		L1	L2		L1
0.5	12	16	10	10	10
0.75	12	16	10	10	10
1.0	12	16	10	10	10
1.25 to 1.5	12	16	10	10	10

- When not using a sleeve
  The peel-off length should be 11 mm.

Signal connections to the pressure clamp terminal block

Insert the cables deep into the pressure clamp terminals and tighten the screws.

IMPORTANT

- When you connect cables to pressure clamp terminals, use a flat-blade screwdriver that conforms to the DIN 5264B standard having a thickness at the tip of 0.6 mm and a body shaft diameter of 3.5 mm.
- The tightening torque of the screws should be approximately 0.5 N·m.
- Fasten the cables securely to cable clamps, etc., so that the cables do not weigh on the terminals.

D1.1.2 Signal connections to the MIL connectors

For MIL connectors, connect the MIL cables directly to the I/O modules.

To prevent the MIL cable from being disconnected, a cable connector cover is required separately.

The types of connector covers for MIL cables are as follows:

- SCCC01/L1CCC01: For flat ribbon cables
- SCCC02/L1CCC02: For discrete wire cables (DI, DO cables)

The following figure shows how to install the connector cover.

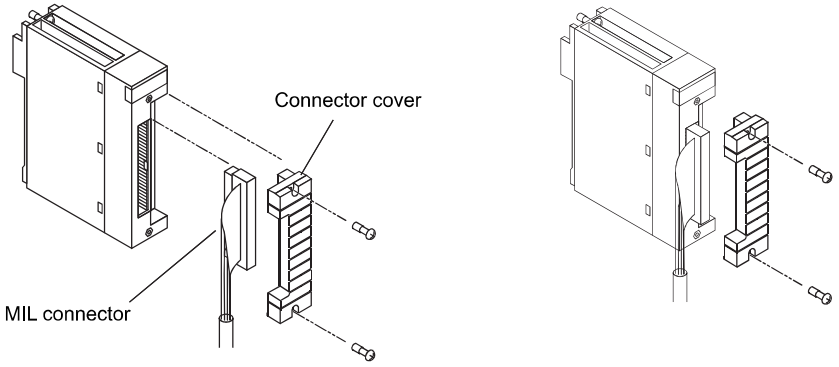


Figure D1.1.2-1 MIL cable connection

When the MIL cable has a shield lead wire, this wire needs to be fastened to the screw at the lower part of the MIL cable connector cover.

The following figure shows how to connect the shield wire.

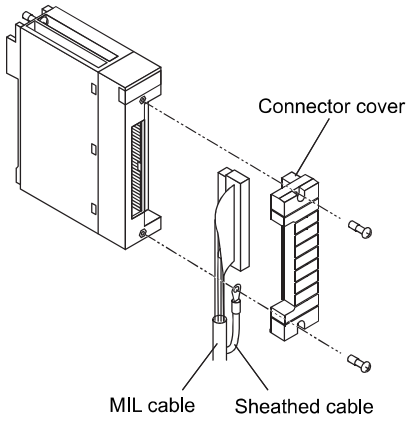

Figure D1.1.2-2 Connecting the shield lead wires of the MIL cable

D1.1.3 Signal connections to the terminal board/relay board

This section describes the signal connections through a terminal board or relay board. The signal cables of the field devices are connected to the terminal board or relay board. The terminal board or relay board and an I/O module with a signal cable interface adapter are connected by using a dedicated signal cable.

Connecting an I/O module with a terminal board/relay board

The following figure shows the components of the I/O modules with a signal cable interface adapter. In the signal cable that is dedicated to connecting the I/O modules with the terminal board/relay board, there is a pin (as a option) to prevent incorrect insertion. You can connect the signal cable shield wire to the ground terminal on the front part of the I/O module. Then you can connect the connector on the opposite side of the signal cable to the terminal board/relay board.

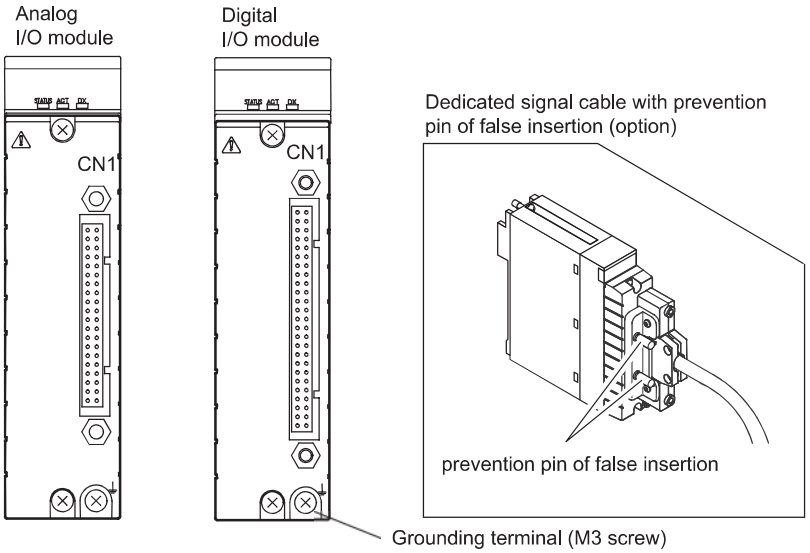

Figure D1.1.3-1 Input/Output modules connected via signal cable interface adapters

Types of signal cables for I/O modules

The following figure shows the shapes of the signal cables that are dedicated for connecting I/O modules to the terminal board or relay board.

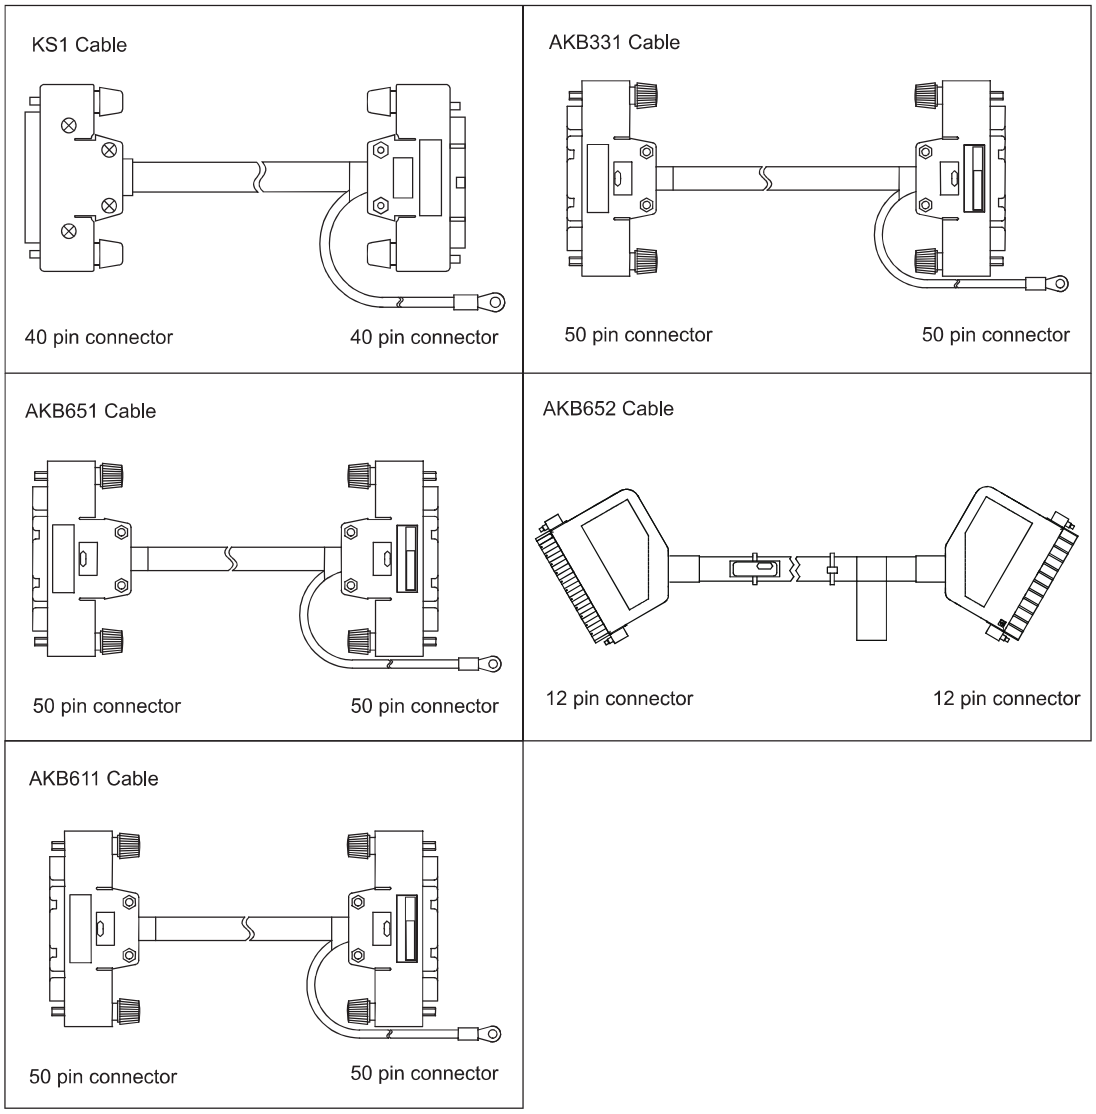

Figure D1.1.3-2 Type of signal cable

Signal connections to a rack mountable terminal board/relay board

You can connect the signal cable of the field devices to the field wiring terminals of the terminal board/relay board by fastening it with an M4 screw.

IMPORTANT

- On unused connectors, put the provided connector caps for dust prevention and connector pin protection.
- Connect the signal wires ensuring that the insulation covers of adjacent ring terminals do not overlap.

SEE ALSO For more information about examples of compatible cable lines for signal wiring, refer to:

- ProSafe-RS Installation Guidance (TI 32P01J10-01EN)
- ProSafe-RS Lite Installation Guidance (TI 32P51J10-01EN)

Cable termination for signal wiring

Use ring terminals with insulating sleeve at the ends of the wires. The ring terminals and crimping tool should be from the same vendor.

The following figure shows the dimensions of the ring terminal.

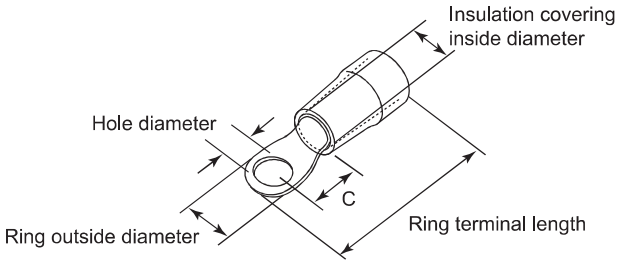

Figure D1.1.3-3 Ring terminal

Table D1.1.3-1 Ring terminal dimensions

Nominal cross sectional area (mm^2)	Screw (mm)	Hole diameter (mm)	Ring outside diameter (mm)	Ring terminal length (mm)	Insulation covering inside diameter (mm)	Dimension "C" (mm)	Remarks
1.25(*1)	4	4.3 or more	8.2 or less	About 21	3.6 or more	7.0 or more	
2.0(*2)	4	4.3 or more	8.7 or less	About 21	4.3 or more	7.1 or more	
5.5(*3)	4	4.3 or more	8.7 or less	About 25	5.8 or more	5.9 or more	Only SED2D

*1: This type of ring terminals are mainly applied for the cables in the range of 0.25 to 1.65 mm^2. It is necessary to check the specifications from the vender to select the appropriate terminals.

*2: This type of ring terminals are mainly applied for the cables in the range of 1.0 to 2.6 mm^2. It is necessary to check the specifications from the vender to select the appropriate terminals.

*3: This type of ring terminals are mainly applied for the cables in the range of 2.6 to 6.6 mm^2. It is necessary to check the specifications from the vender to select the appropriate terminals.

Signal connections to a DIN rail mountable terminal board/relay board

Connect the signal cables from the field devices to the pressure clamp terminals for field wiring on the terminal/relay board.

IMPORTANT

On unused connectors, put the provided connector caps for dust prevention and connector pin protection.

Cables for signal wiring

For signal wiring to the pressure clamp terminal, you can use the following nominal cross sectional area cables:

- 0.5 to 2.5 mm^2 (AWG 20 to 14)

SEE ALSO For more information about examples of compatible cable lines for signal wiring, refer to:

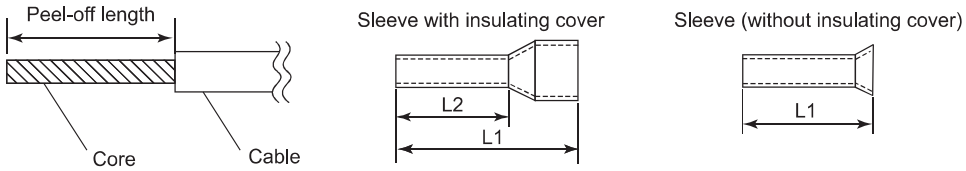
- ProSafe-RS Installation Guidance (TI 32P01J10-01EN)
- ProSafe-RS Lite Installation Guidance (TI 32P51J10-01EN)

For more information about the signal wiring cables for SBT4D, refer to:

"■ Cables for signal wiring" on page D1-4

Cable termination for signal wiring

IMPORTANT



- Use sleeves that conform to the following DIN standards.
  - Sleeves without insulating cover: DIN 46 228/1
  - Sleeves with insulating cover: DIN 46 228/4
- Use sleeves and a tool that are of the same make and match the thickness of the wire.
- Insert the cables deep into the terminals and make sure they are securely installed.

On the cables for pressure clamp terminals, you must perform the following terminations:

- When using a sleeve
  At the cable end, peel off the coating and attach a sleeve. The following table shows the sleeve dimensions.

Table D1.1.3-2 Sleeve dimensions

Cable thickness (mm^2)	When using a sleeve with insulating cover			When using a sleeve (without insulating cover)	
	Peel-off length (mm)	Sleeve dimension (mm)		Peel-off length (mm)	Sleeve dimension (mm)
		L1	L2		L1
0.5	10	14	8	6	6
0.75	10	14	8	6	6
1.0	10	14	8	6	6
1.5	10	14	8	7	7
2.5	10	14	8	7	7

- When not using a sleeve
  The peel-off length should be 7 mm.

SEE ALSO For more information about Cable termination for the SBT4D signal wiring, refer to:

"■ Cable termination" on page D1-4

Connecting cables for signal wiring

Insert the cables deep into the pressure clamp terminals and tighten the screws.

IMPORTANT

- The tightening torque of the screws should be 0.5 to 0.6 N·m.
- When you connect cables to pressure clamp terminals, use a flat-blade screwdriver that conforms to the DIN 5264B standard having a thickness at the tip of 0.6 mm and a body shaft diameter of 3.5 mm.
- Fasten the cables securely to cable clamps, etc., so that the cables do not weigh on the terminals.

D1.2 Signal cable connection to analog Input/ Output modules

This section describes the signal connections of analog I/O modules.

The following table shows how to connect an analog I/O module to a field device.

Table D1.2-1 Connecting an analog I/O module with a field device

Analog input/output module (type)	Method of connection with field devices (*1)		
	Pressure clamp terminal	Terminal board	MIL cable
SAI143/L1AI143	Yes	Yes	Yes
SAV144/L1AV144	Yes	Yes	Yes
SAT145/L1AT145	-	Yes	-
SAR145/L1AR145	-	Yes	-
SAI533/L1AI533	Yes	Yes	Yes

*1: Yes: Connection possible

D1.2.1 Terminal numbers and signal names of pressure clamp terminal blocks and the MIL connector of analog I/O modules

This section describes terminal numbers and signal names of pressure clamp terminal blocks and the MIL connector of analog I/O modules.

The following figure shows the terminal number layout of a pressure clamp terminal block.

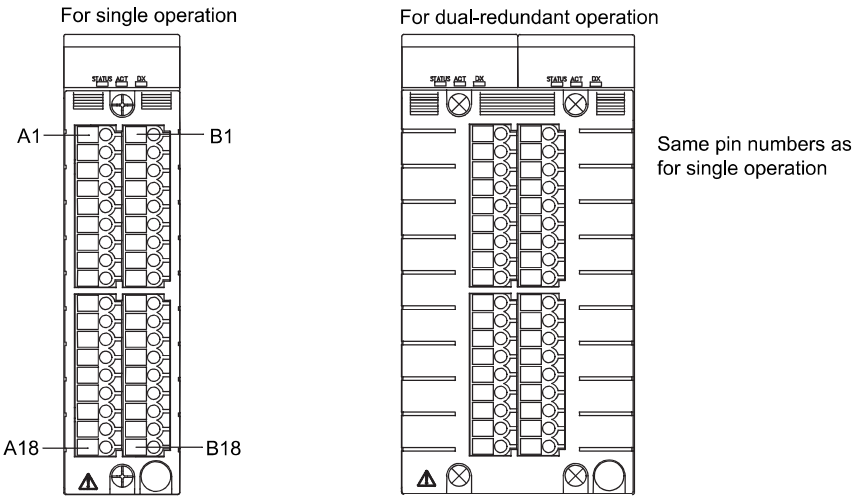

Figure D1.2.1-1 Terminal number layout of a pressure clamp terminal block

The terminal numbers of a pressure clamp terminal block are arranged in the order from A1, A2 and so on until A18 starting from the top of the left column and from B1, B2 and so on until B18 from the top of the right column with the terminal block on the front. The terminal number layout of a dual-redundant type pressure clamp terminal is the same.

The following figure shows the layout of the terminal numbers of the MIL connector.

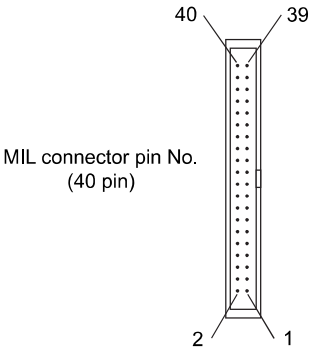

Figure D1.2.1-2 Terminal number layout of the MIL connector

Input terminal numbers and signal names of SAI143/L1AI143

The following figure shows the terminal numbers of the pressure clamp terminal block of SAI143/L1AI143, and the pin numbers and signal names of the MIL connector.

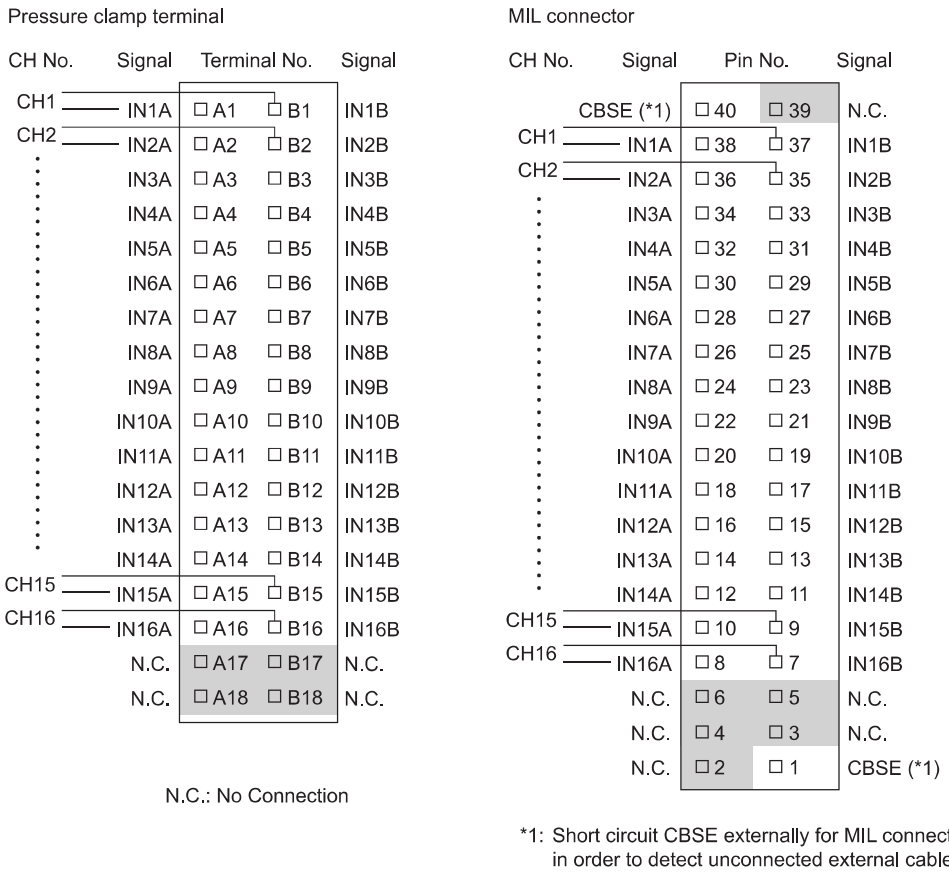

Figure D1.2.1-3 SAI143/L1AI143 signal connection

The following table shows the type of signals that are connected to SAI143/L1AI143 and their corresponding setting pins.

Table D1.2.1-1 Type of signals that are connected to SAI143/L1AI143 and their corresponding setting pins

Type of field devices	Signal name (*1)	Signal types	SAI143/L1AI143 setting pins
2-wire type	IN□A	2-wire transmitter input +	2-wire type
	IN□B	2-wire transmitter input –	
4-wire type	IN□A	4-wire current input –	4-wire type
	IN□B	4-wire current input +	
3-wire type	IN□A	3-wire current input – / external power supply –	
	IN□B	3-wire current input +	

*1: □: 1 to 16

Signal cable connections of SAI143/L1AI143

The following figure shows the signal cable connections of SAI143/L1AI143.

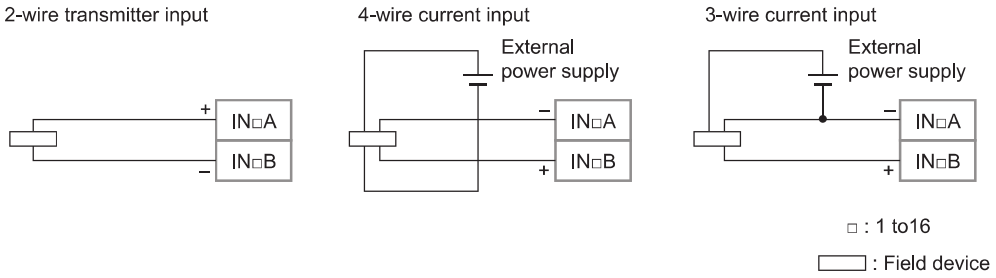

Figure D1.2.1-4 SAI143/L1AI143 signal connection

You must purchase the external power supply separately.

If the power is turned off or an error occurs in SAI143/L1AI143, the current input loop becomes open. Do not share the current signal with any other signal-receiving instrument.

SEE ALSO For more information about the setting pins of SAI143/L1AI143, refer to:

"■ Setting pins of the current input module" on page B4-23

■ Input terminal numbers and signal names of SAV144/L1AV144

The following figure shows the terminal numbers of the pressure clamp terminal block of SAV144/L1AV144, and the pin numbers and signal names of the MIL connector.

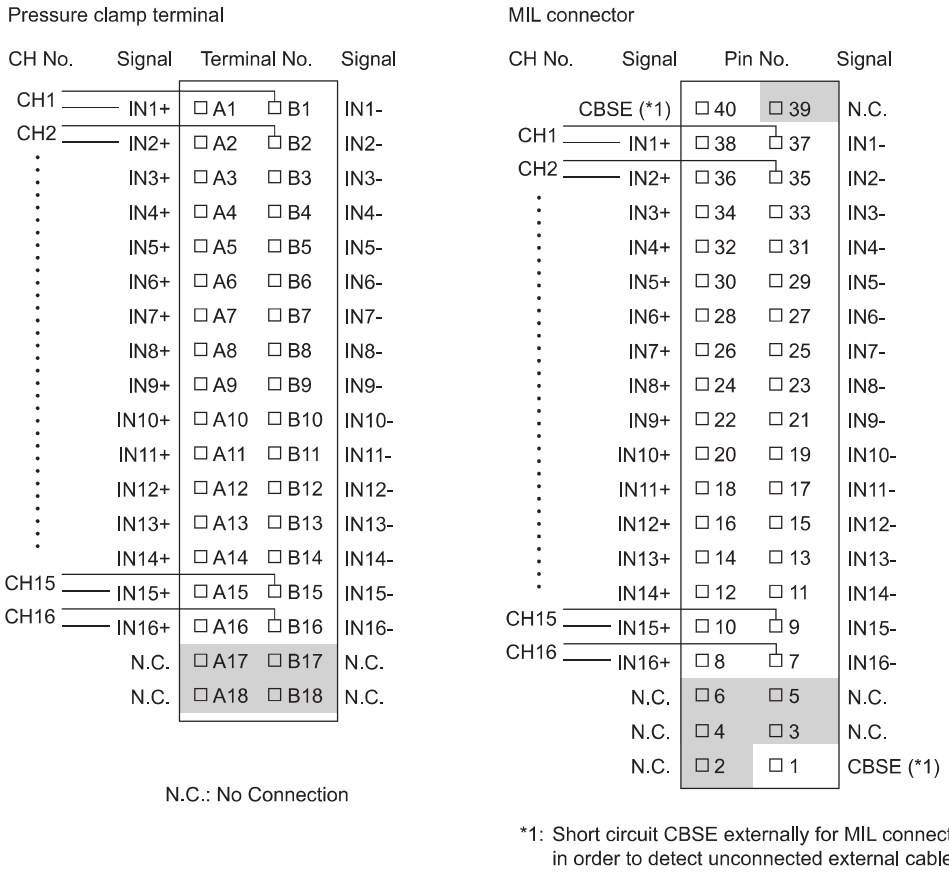

Figure D1.2.1-5 SAV144/L1AV144 signal connection

Output terminal numbers and signal names of SAI533/L1AI533

The following figure shows the terminal numbers of the pressure clamp terminal block of SAI533/L1AI533, and the pin numbers and signal names of the MIL connector.

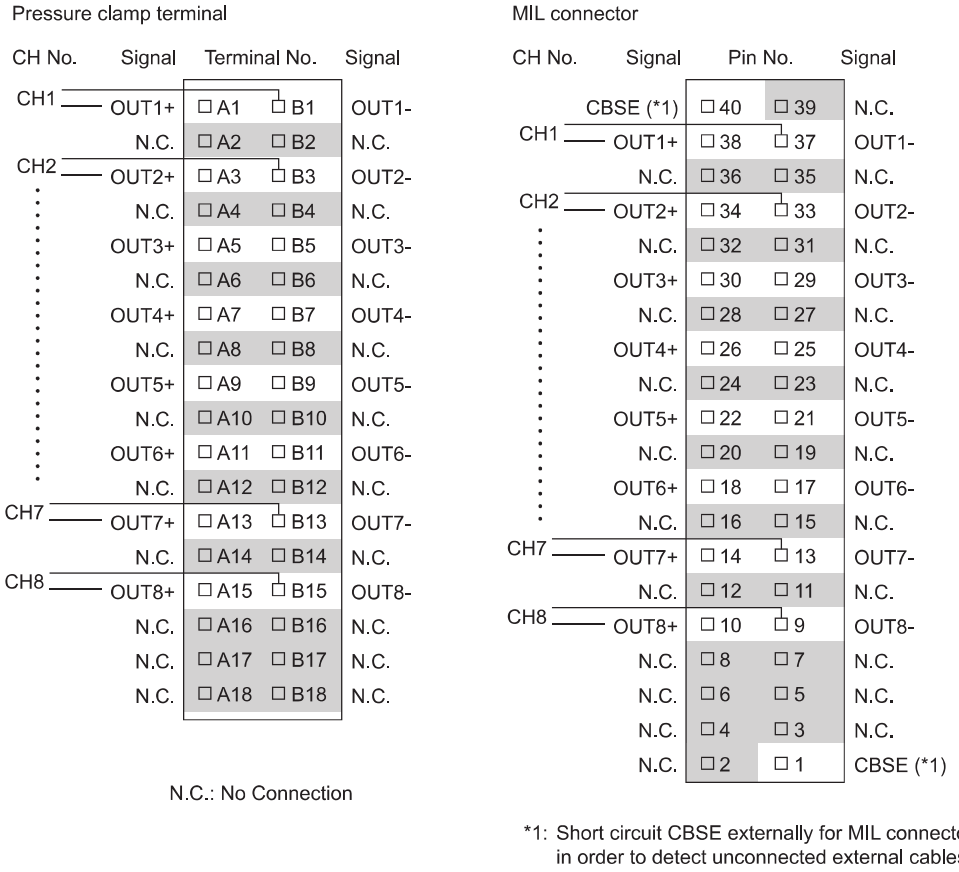

Figure D1.2.1-6 SAI533/L1AI533 signal connection

D1.2.2 Terminal numbers and signal names of the terminal board for analog I/O modules

This section describes the terminal numbers and signal names of terminal boards for analog I/O modules. The following table shows the modules that you can connect to the terminal board.

Table D1.2.2-1 Relationship between terminal boards and analog I/O modules

Terminal board	Connectable analog I/O module	
	For SCSs that support SIL 3	For SCSs that support SIL 2
SEA4D	SAI143, SAV144, SAI533	L1AI143, L1AV144, L1AI533
SBA4D	SAI143, SAV144, SAI533	L1AI143, L1AV144, L1AI533
SBT4D	SAT145	L1AT145
SBR4D	SAR145	L1AR145
S1BB4D	SAI143	L1AI143

Signal cable connections of the SEA4D

SEA4D has two sets of 16 channels of field wiring terminals. I/O modules in non-redundant or dual-redundant configuration can be connected. For a non-redundant configuration, you can connect CN1 or CN3 to a module through a signal cable. For a dual-redundant configuration, you can connect CN1 and CN2 or CN3 and CN4 to a module through a signal cable.

The following figure shows the connectors for signal cables and field wiring terminals of SEA4D.

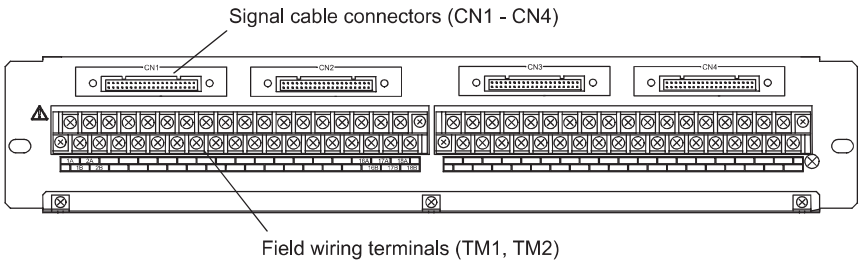

Figure D1.2.2-1 SEA4D terminal board

Terminal numbers and signal names when connecting SAI143/L1AI143

The following figure shows the terminal numbers and signal names of the terminal board when connecting SAI143/L1AI143.

Signal Name	IN1A	IN2A	IN3A	IN4A	IN5A	IN6A	IN7A	IN8A	IN9A	IN10A	IN11A	IN12A	IN13A	IN14A	IN15A	IN16A	N.C.	N.C.

D1.3.1 Terminal numbers and signal names of pressure clamp terminal blocks and the MIL connector of digital I/O modules

This section describes the terminal numbers and signal names of pressure clamp terminal blocks and the MIL connector of digital I/O modules.

The following figure shows the terminal number layout of a pressure clamp terminal.

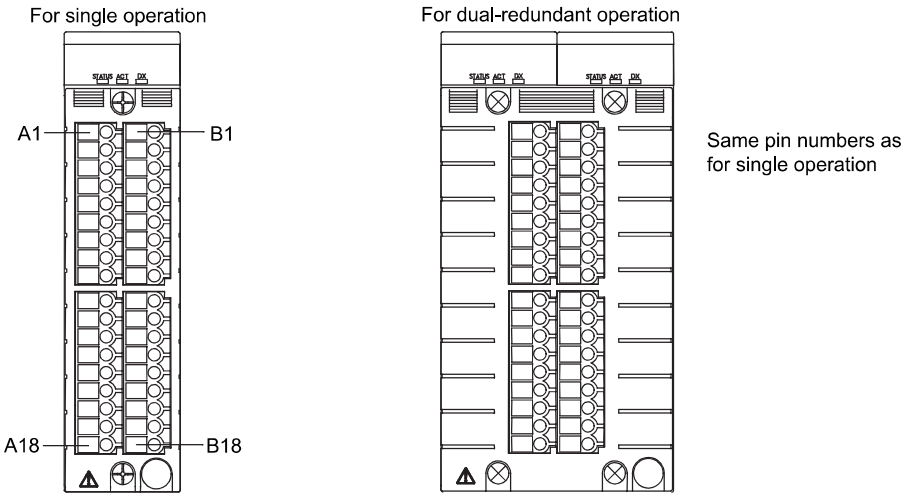

Figure D1.3.1-1 Terminal number layout of a pressure clamp terminal

The terminal numbers of a pressure clamp terminal block are arranged in the order from A1, A2 and so on until A18 starting from the top of the left column and from B1, B2 and so on until B18 from the top of the right column with the terminal block on the front. The terminal number layout of a dual-redundant type pressure clamp terminal is the same.

The following figure shows the layout of the terminal numbers of the MIL connector.

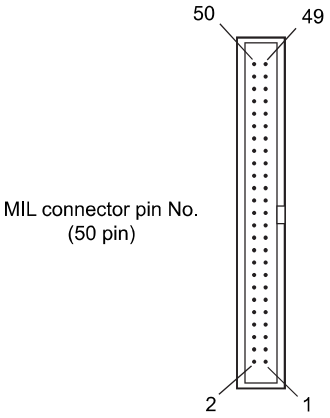

Figure D1.3.1-2 Terminal number layout of the MIL connector

Input terminal numbers and signal names of SDV144/L1DV144

The following figure shows the pressure clamp terminal numbers, MIL connector pin numbers, and signal names of SDV144/L1DV144.

SBD4D	SDV144, SDV541	L1DV144, L1DV541

Signal cable connection of SED2D

SED2D has four sets of 4 channels of field wiring terminals. You can connect to an output module with a non-redundant or dual-redundant configuration. For a non-redundant configuration, you can connect CN1, CN3, CN5, or CN7 to a module through a signal cable. For a dual-redundant configuration, you can connect CN1 and CN2, CN3 and CN4, CN5 and CN6, or CN7 and CN8 to a module through a signal cable.

The following figure shows the connectors for signal cables and field wiring terminals of SED2D.

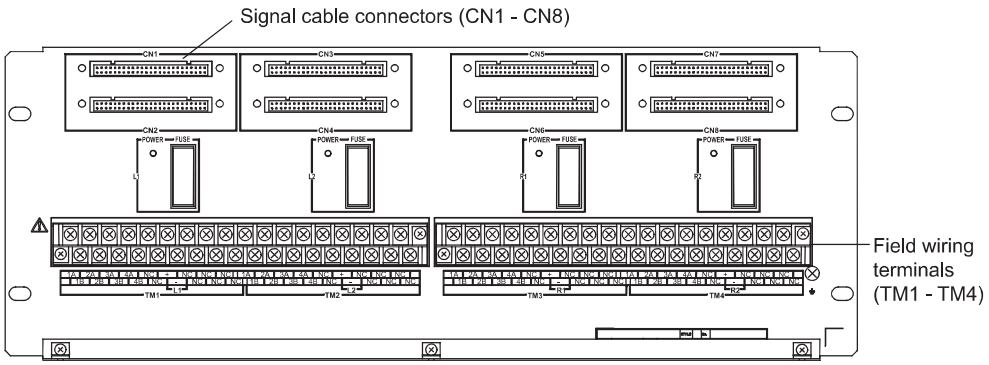

Figure D1.3.2-1 SED2D terminal board

Terminal numbers and signal names when connecting SDV521/L1DV521

The following figure shows the terminal numbers and signal names of the terminal board when connecting SDV521/L1DV521.

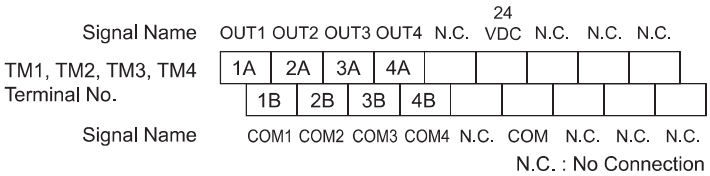

Figure D1.3.2-2 Terminal numbers and signal names when connecting SDV521/L1DV521

Signal cable connection of SED3D

SED3D has four sets of 8 channels of field wiring terminals. You can connect to an output module with a non-redundant or dual-redundant configuration. A non-redundant module should be connected to CN1, CN3, CN5, or CN7 by using a signal cable. A redundant pair of modules should be connected to CN1 and CN2, CN3 and CN4, CN5 and CN6, or CN7 and CN8 by using signal cables.

The following figure shows the connectors for signal cables and field wiring terminals of SED3D.

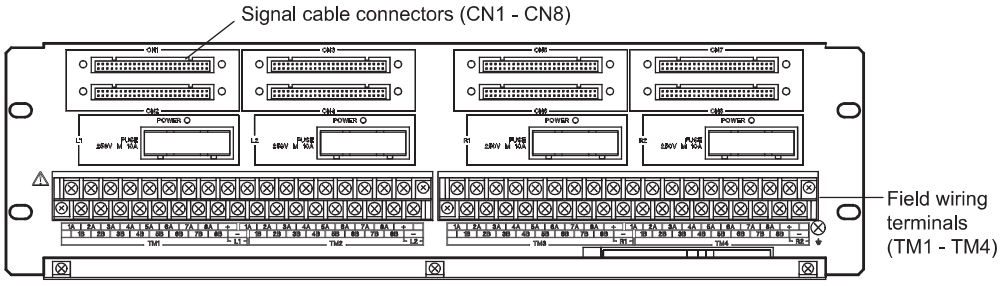

Figure D1.3.2-3 SED3D terminal board

Terminal numbers and signal names when connecting SDV53A/L1DV53A

The following figure shows the terminal numbers and signal names of the terminal board when connecting SDV53A/L1DV53A. You must connect a 48 V DC power supply between the 48 V DC and COM terminals.

Signal Name	OUT1	OUT2	OUT3	OUT4	OUT5	OUT6	OUT7	OUT8	48 V DC

Figure D1.3.2-4 Terminal numbers and signal names when connecting SDV53A/L1DV53A

SED4D signal cable connection

SED4D has two sets of 16 channels of field wiring terminals. I/O modules in non-redundant or dual-redundant configuration can be connected. A non-redundant module should be connected to CN1 or CN3 by using a signal cable. A redundant pair of modules should be connected to CN1 and CN2, or CN3 and CN4 by using signal cables.

The following figure shows the connectors for signal cables and field wiring terminals of SED4D.

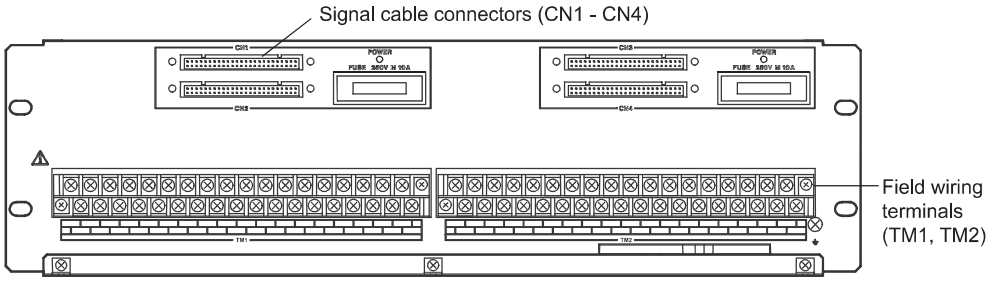

Figure D1.3.2-5 SED4D terminal board

Terminal numbers and signal names when connecting SDV144/L1DV144

The following figure shows the terminal numbers and signal names of the terminal board when connecting SDV144/L1DV144. You must connect a 24 V DC power supply between the 24 V DC and COM terminals.

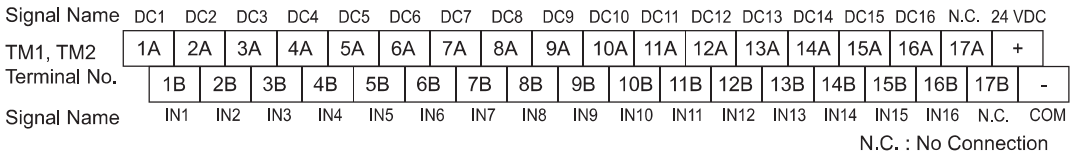

Figure D1.3.2-6 Terminal numbers and signal names when connecting SDV144/L1DV144

Terminal numbers and signal names when connecting SDV531/L1DV531

The following figure shows the terminal numbers and signal names of the terminal board when connecting SDV531/L1DV531. You must connect a 24 V DC power supply between the 24 V DC and COM terminals.

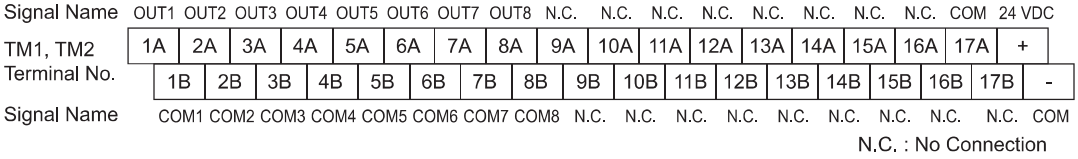

Figure D1.3.2-7 Terminal numbers and signal names when connecting SDV531/L1DV531

Terminal numbers and signal names when connecting SDV541/L1DV541

The following figure shows the terminal numbers and signal names of the terminal board when connecting SDV541/L1DV541. You must connect a 24 V DC power supply between the 24 V DC and COM terminals.

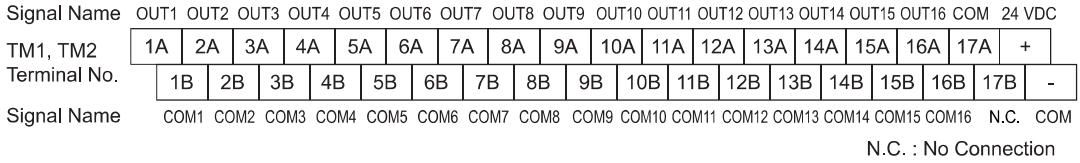

Figure D1.3.2-8 Terminal numbers and signal names when connecting SDV541/L1DV541

Signal cable connection of SWD2D

SWD2D has four sets of 4 channels of field wiring terminals. You can connect to an output module with a non-redundant or dual-redundant configuration. A non-redundant module should be connected to CN1, CN3, CN5, or CN7 by using a signal cable. A redundant pair of modules should be connected to CN1 and CN2, CN3 and CN4, CN5 and CN6, or CN7 and CN8 by using signal cables.

The following figure shows the connectors for signal cables and field wiring terminals of SWD2D.

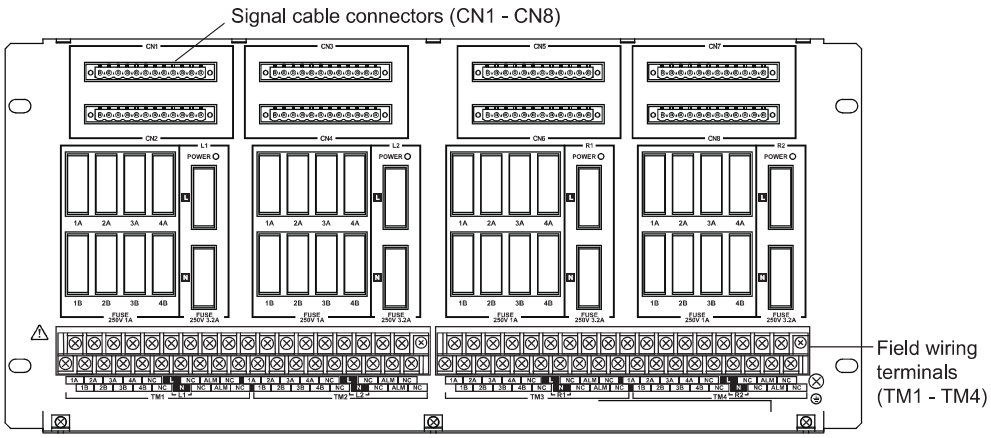

Figure D1.3.2-9 SWD2D terminal board

Terminal numbers and signal names when connecting SDV526/L1DV526

The following figure shows the terminal numbers and signal names of the terminal board when connecting SDV526/L1DV526.

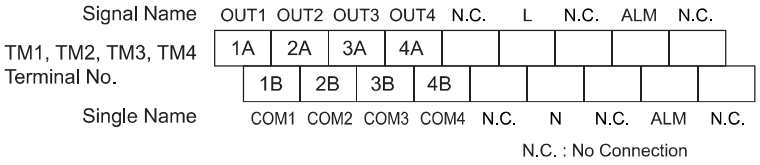

Figure D1.3.2-10 Terminal numbers and signal names when connecting SDV526/L1DV526

You must connect an external power supply between the L and N terminals.

WARNING

Before you connect cables to the terminals, turn off the external power supply and check with a tester that the electricity is not flowing through the cables.

You must connect a 24V DC power supply between the 24V DC and COM terminals.

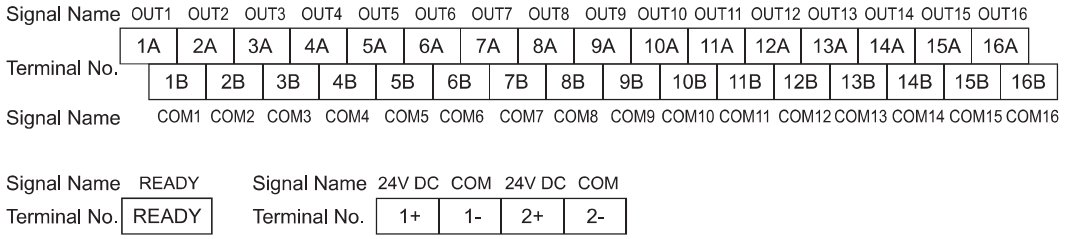

Figure D1.3.2-18 Terminal numbers and signal names when connecting SDV541/L1DV541

D1.3.3 Relay board terminal numbers and signal names

This section describes the terminal numbers and signal names on relay boards.

Signal cable connection of SRM53D

SRM53D receives signals from two pairs of redundant 8-channel digital output modules and sends contact output signals to the field devices. The actual relay output status can be read back by connecting a 16-channel digital input module.

SRM53D terminal numbers and signal names

CAUTION

- Connect a 24 V DC power supply to the "+" and "-" terminals in TM3.
- After completing the power supply wiring, put back the protective cover for the terminals.
- Provide mediate switches or breakers in the power supply wiring so that the power supply for each relay board can be shutoff individually during maintenance.

The following figure shows the connectors and terminals of SRM53D.

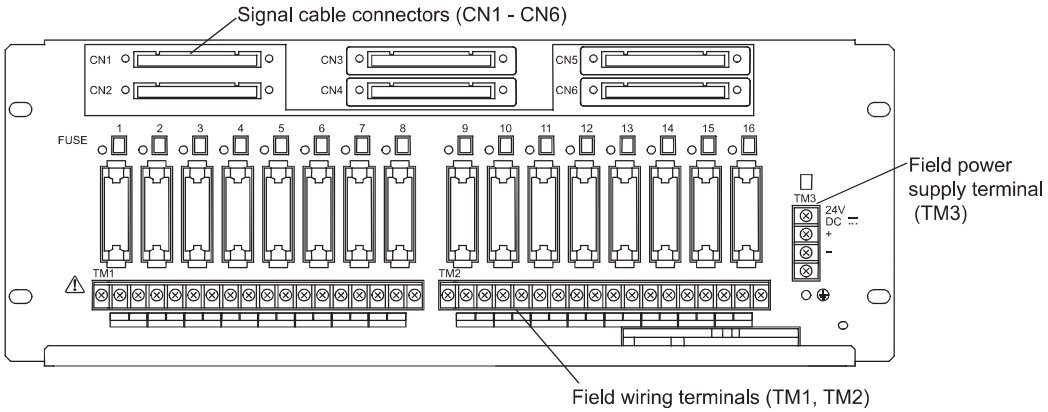

Figure D1.3.3-1 SRM53D relay board

The following figure shows the terminal numbers and signal names of SRM53D.

TM1	Signal Name	OUT1		OUT2		OUT3		OUT4		OUT5		OUT6		OUT7		OUT8

*1: The relay number is the number printed on the SRM53D metal body above each relay.

The following table shows the statuses of digital output (DO) modules, status lamps, field wiring terminals, and digital input (DI) modules.

Table D1.3.3-3 Statuses of DO modules, status lamps, and DI modules

DO module output status (*1)	Status lamp	Field wiring terminal status	DI module input status(*1)
OFF	OFF (*2)	OFF (Open)	ON (Close)
ON	ON	ON (Close)	OFF (Open)

*1: The output contacts are A type (NO: Normally Open), while the contacts for DI modules are B type (NC: Normally Close).
*2: If the ON pulse diagnosis for SDV531/L1DV531 is enabled and the output status is set to OFF, the LED goes ON for each ON pulse output.

IMPORTANT

When SDV144/L1DV144 is connected to SRM53D, Detect Disconnection and Detect Short Circuit should be set to "No" on I/O Parameter Builder.

SEE ALSO For more information about settings on I/O Parameter Builder, refer to:

Appendix 1.3.4, “Settings for the DI channel” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

Signal cable connection of SRM54D

SRM54D receives signals from a 16-channel digital output module and sends contact output signals to the external devices. The actual relay output status can be read back by connecting a 16-channel digital input module.

SRM54D terminal numbers and signal names

CAUTION

- Connect a 24 V DC power supply to the "+" and "-" terminals in TM3.
- After completing the power supply wiring, put back the protective cover for the terminals.
- Provide mediate switches or breakers in the power supply wiring so that the power supply for each relay board can be shutoff individually during maintenance.

The following figure shows the connectors and terminals of SRM54D.

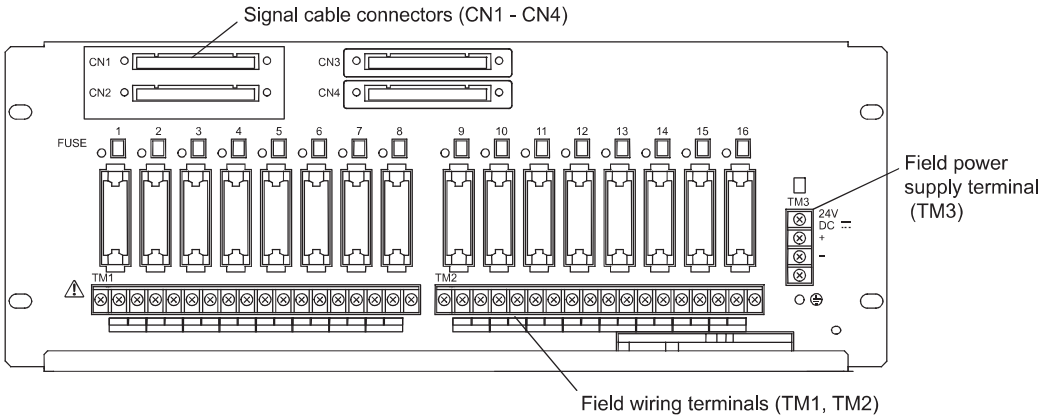

Figure D1.3.3-3 SRM54D relay board

The following figure shows the terminal numbers and signal names of SRM54D.

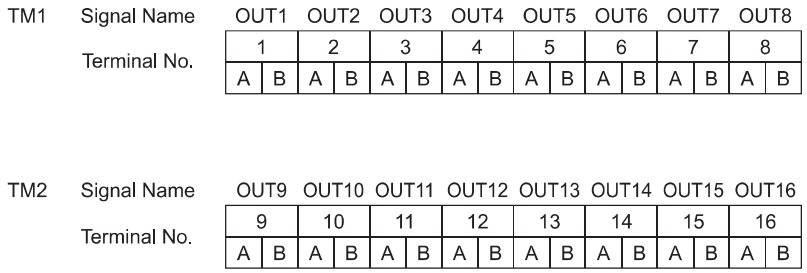

Figure D1.3.3-4 SRM54D terminal numbers and signal names

Signal connection between the SRM54D and digital I/O modules

The following table shows the relation between the digital I/O module connector numbers and the connected field wiring terminal numbers.

Table D1.3.3-4 Connector numbers and connected field wiring terminal numbers

16	16A/16B	ch16	ch16

*1: The relay number is the number printed on the SRM54D metal body above each relay.

The following table shows the statuses of SDV541/L1DV541 outputs, channel status lamps, and field wiring terminals.

Table D1.3.3-9 Statuses of SDV541/L1DV541 outputs, channel status lamps, and field wiring terminals

SDV541/L1DV541 output status	Channel status display lamp	Field wiring terminal status
OFF	OFF	OFF (Open)
ON	ON	ON (Close)

IMPORTANT

When SDV541/L1DV541 is connected to SBM54D, Detect Disconnection, Pulse Test (OFF), and Pulse Test (ON) should be set to "No" on I/O Parameter Builder.

SEE ALSO For more information about settings on I/O Parameter Builder, refer to:

Appendix 1.3.5, “Settings for the DO channel” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

Protecting the contact when an inductive load is connected to the contact output

When connecting an inductive load to the contact output, you must connect a protection circuit in parallel with the load. In general, a diode is used as a protection circuit for DC power supply and a series-connected CR is used as a protection circuit for AC power supply.

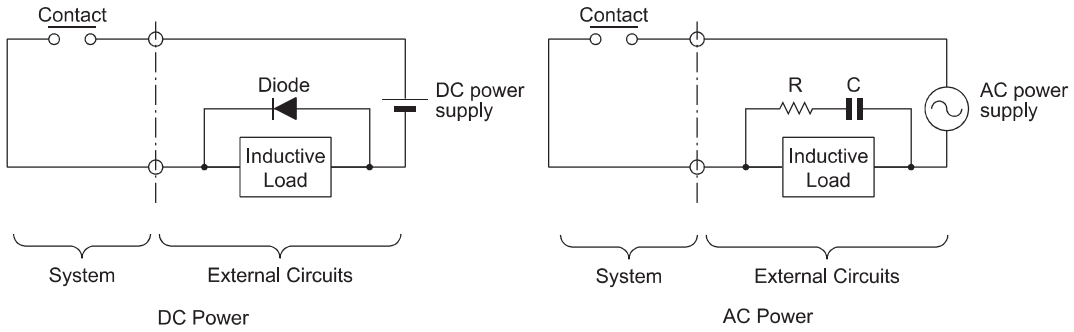

Figure D1.3.3-7 Example of connecting a protection circuit

D1.4 Connection of communication modules

This section describes how to connect communication modules to external devices. The communication modules support Modbus slave communication, subsystem communication, and safety subsystem communication. In Modbus slave communication, an external device acts as the master and SCS acts as a slave. In subsystem communication and safety subsystem communication, SCS acts as the master and external devices act as slaves.

The following communication modules are available:

- ALR111: Serial communication module (RS-232C)
- ALR121: Serial communication module (RS-422/RS-485)
- ALE111: Ethernet communication module
- S2LP131: Fire and gas communication module

D1.4.1 Connection of the serial communication module (RS-232C)

This section describes how to connect the communication cable of the serial communication module (RS-232C) (Model: ALR111).

The following figure shows the communication connectors.

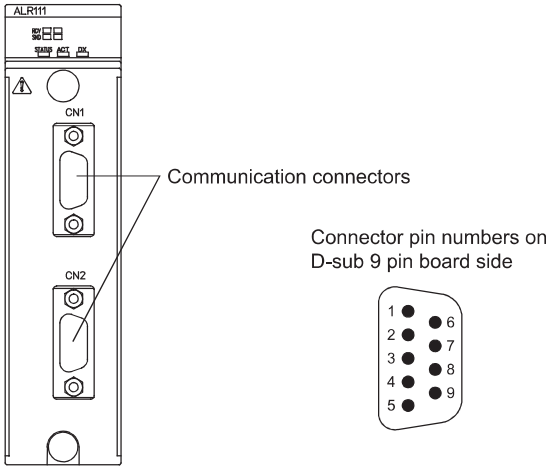

Figure D1.4.1-1 ALR111

The following table shows the pin numbers and signal names of the communication connectors.

Table D1.4.1-1 Pin numbers and signal names of the RS-232C communication connector

CN1 and CN2 pin numbers	Abbrev.	Signal name	Signal direction at the ALR111 side
1	CD	Carrier Detect	Input
2	RD	Receive Data	Input
3	SD	Send Data	Output
4	ER	Equipment Ready	Output
5	SG	Signal Ground	Signal ground
6	DR	Data Set Ready	Input
7	RS	Request to Send	Output
8	CS	Clear to Send	Input
9	-	N.C.	-

Connecting external devices to ALR111

It is recommended to relay through a modem when you connect to the ALR111 and the external device. If the distance between the ALR111 and the external device is less than 15 meters, you can connect to the external device directly. If the distance is more than 15 meters, you must relay through a modem. The methods of connecting to the external device are as follows:

- Connection with modem
- Connecting to the external device by using the RS-232C D-sub 25-pin connector (direct connection)
- Connecting to the external device by using the RS-232C D-sub 9-pin connector (direct connection)

Connection with modem

The following figure shows an example of the cable connections when connecting the ALR111 to the external device through a modem. The length of the RS-232C cable between the ALR111 and the model should be less than 15 meters. You must connect the FG of the modem to the protective grounding system.

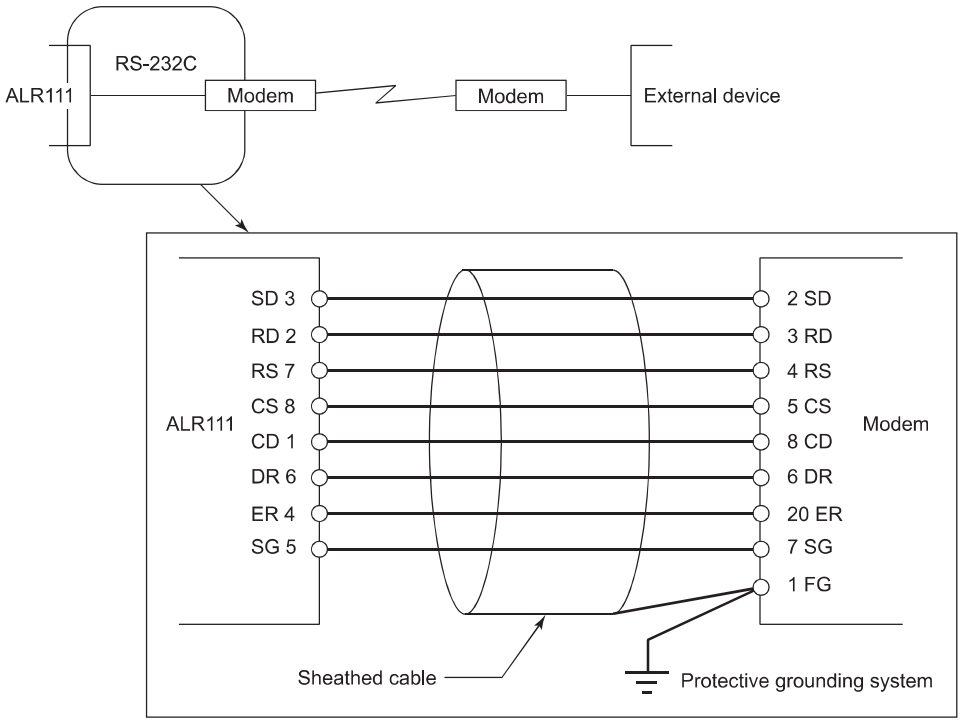

Figure D1.4.1-2 Cable connection when the ALR111 and the external device are connected using modems

Directly connecting to the external device with the RS-232C D-sub 25-pin connector

The following figure shows an example of the cable connections when directly connecting the ALR111 and the external device with the RS-232C D-sub 25-pin connector. The RS-232C cable should be less than 15 meters. If the cable is longer than 15 meters, you must connect through a modem.

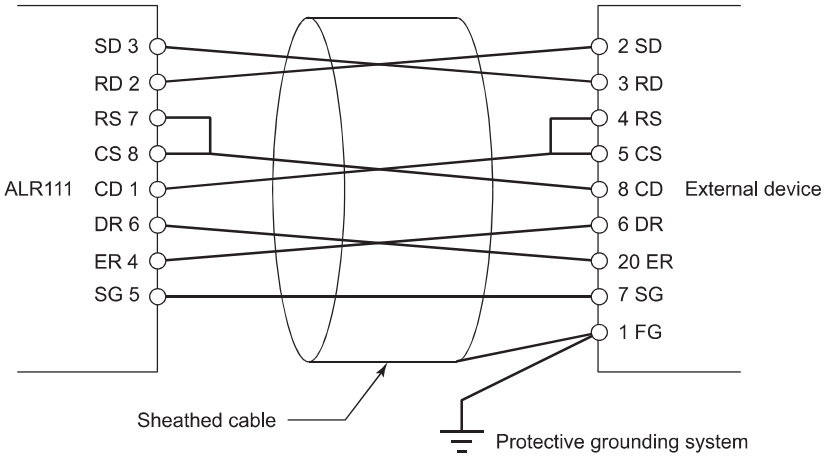

Figure D1.4.1-3 Cable connection when directly connecting the ALR111 and the external device (RS-232C D-sub 25-pin)

Directly connecting to the external device with the RS-232C D-sub 9-pin connector

The following figure shows an example of the cable connections when directly connecting the ALR111 and the external device with the RS-232C D-sub 9-pin connector. The RS-232C cable should be less than 15 meters when directly connecting the ALR111 to the external device. If the cable is longer than 15 meters, you must connect through a modem.

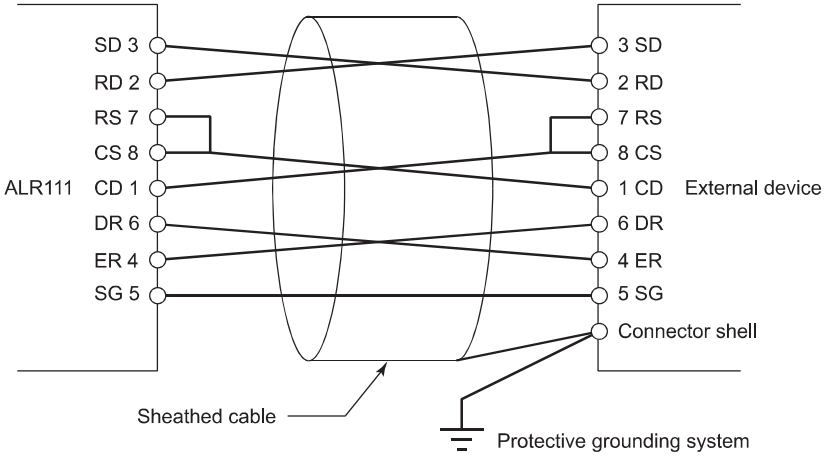

Figure D1.4.1-4 Cable connection when directly connecting the ALR111 and the external device (RS-232C D-sub 9-pin)

RS-232C communication module cables

The following table and figure show the RS-232C communication cables that are provided by our company.

Table D1.4.1-2 List of communication cables

Model	Cable Name	Remarks
AKB131	RS-232C Modem cable	Between the ALR111 and the modem (for RS circuit insulation) (9-25pin)
AKB132	RS-232C Null modem cable	Between the ALR111 and the RS-232C device (for RS circuit insulation) (9-25pin)
AKB135	RS-232C Modem cable	Between ALR111 to modem (9-25pin)
AKB136	RS-232C Null modem cable	Between ALR111 to RS-232C equipment (9-25pin)

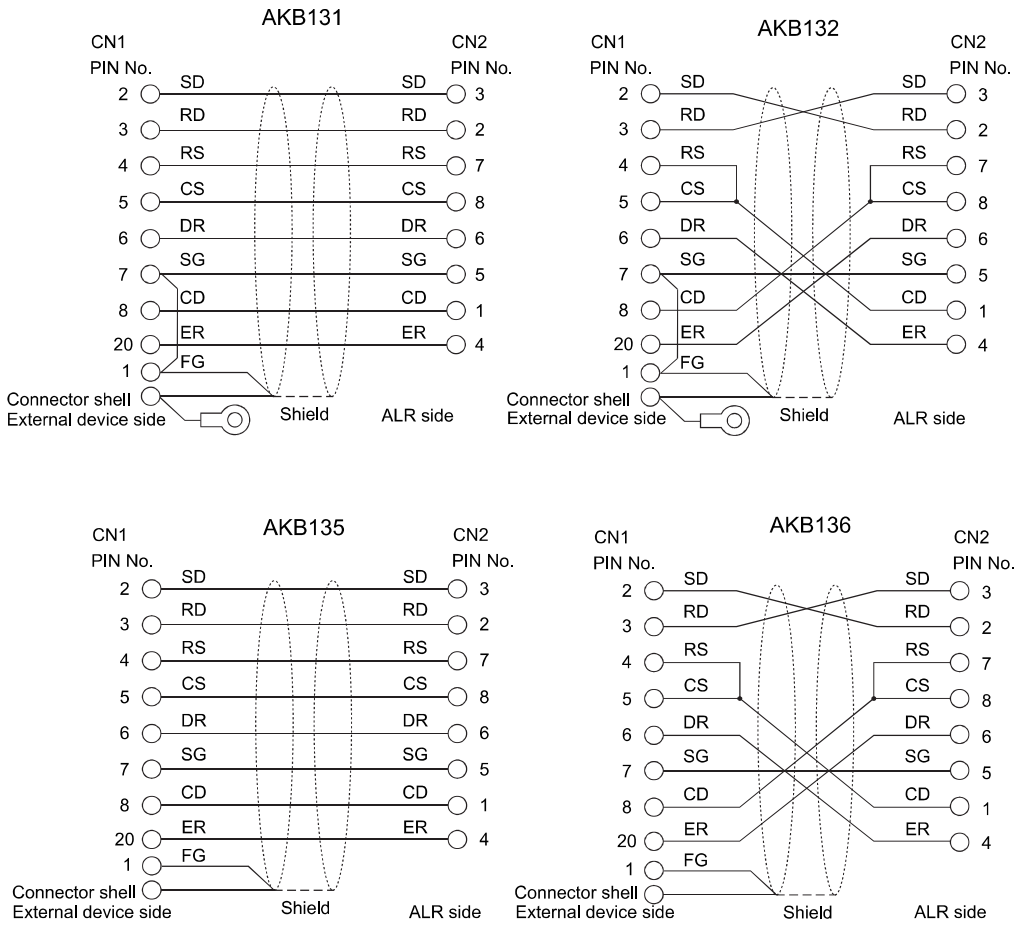

Figure D1.4.1-5 Internal connection of the RS-232C interface cable

FG connection of the RS-232C communication

IMPORTANT

The ALR111 isolates the RS-232C interface circuit. To improve noise resistance, the following requirements must be satisfied:

- On the external device side, connect the FG to the protective grounding system.
- Connect the FG to the SG of the RS-232C circuit (pin No. 7 for D-sub25, and pin No. 5 for D-sub9) at the external device.
- Ground the cable shielding wires at the external device side.
- If you use a cable that is not supplied by YOKOGAWA, the cable must be a twisted pair cable in which a signal wire and SG are paired.

The following figure shows an example of an FG connection.

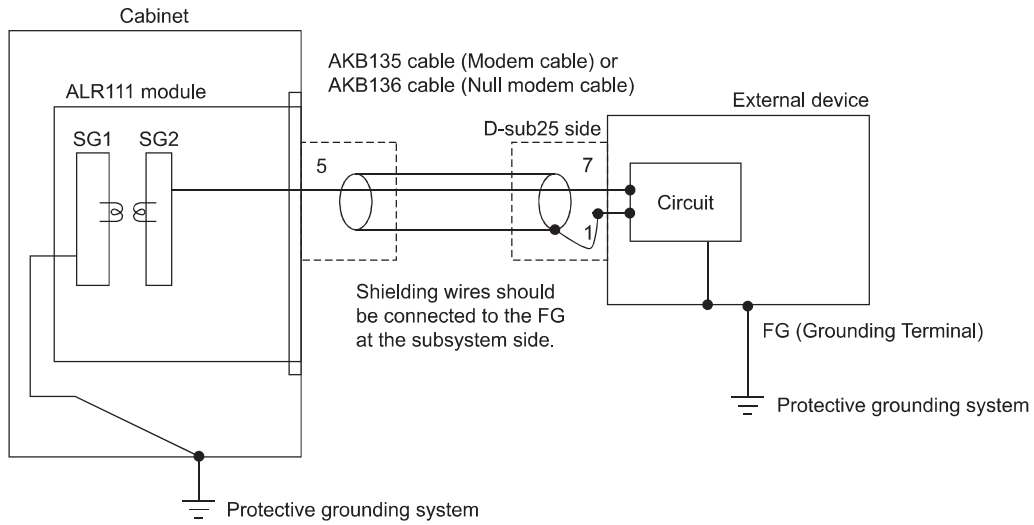

Figure D1.4.1-6 FG connection

When there is a short circuit on the external device side that uses a jumper pin on the FG and SG, you must short the circuit. The following figure shows an example of a short circuit that uses a jumper pin (J1).

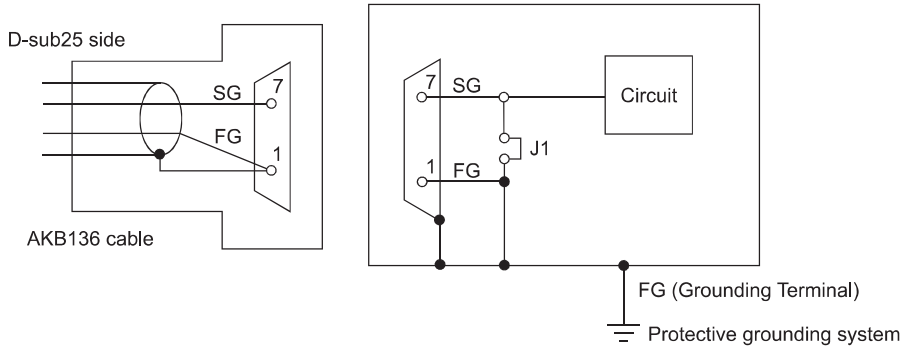

Figure D1.4.1-7 Example of a configuration with a jumper pin

FG connections that uses AKB131 and AKB132 cables

When the external device insulates the RS-232C communication circuit, communication circuits at both the ALR111 and external device are floating, and thereby lowering noise resistance severely. To prevent this, use an AKB131 or AKB132 cable.

You must forcibly connect pin No. 1 (for the frame ground) and pin No. 7 (for the signal ground) together at the external device side. When pin No. 1 (FG) is open at the external device, you must connect the cable shield to the FG terminal of the external device.

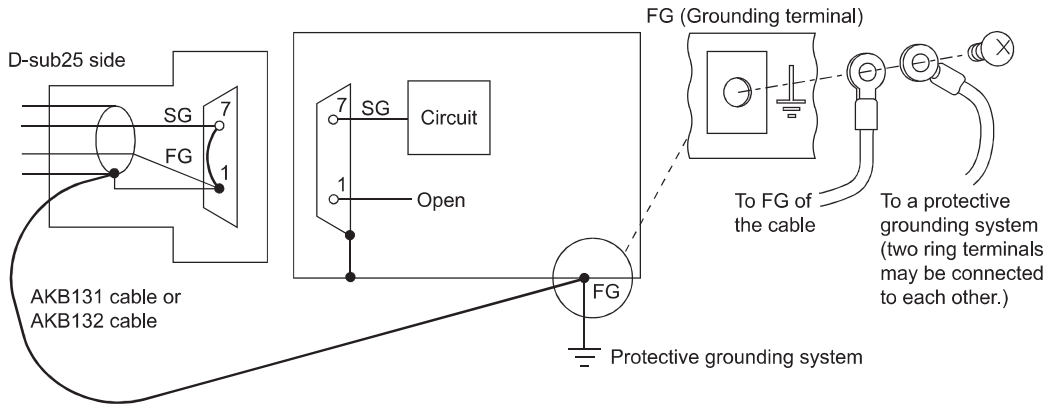

Figure D1.4.1-8 Cable connection for insulated communications circuit

D1.4.2 Connection of the serial communication module (RS-422/RS-485)

This section describes how to connect the communication cable of the serial communication module (RS-422/RS-485) (Model: ALR121).

The following figure shows the communication terminals.

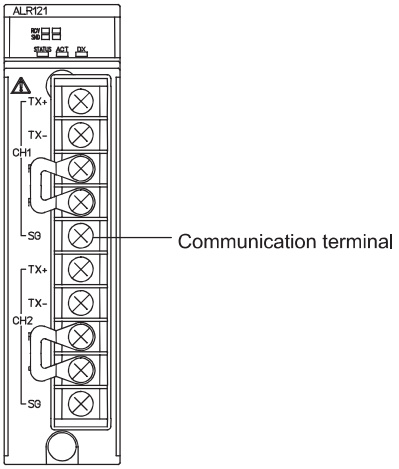

Figure D1.4.2-1 ALR121

The following table shows the terminal names and signal names of the communication terminals.

Table D1.4.2-1 RS-422/RS-485 interface terminal block placement

Terminal name	Signal name	Remarks
TX+	Send Data	Transmitting data (non-inverted)
TX-	Send Data	Transmitting data (inverted)
RX+	Receive Data	Receiving data (non-inverted)
RX-	Receive Data	Receiving data (inverted)
SG	Signal Ground	Signal ground

SEE ALSO

For more information about connections for each external device model when connecting to the ALR121, refer to:

The instruction manuals of the external devices

System configuration of ALR121 and external devices

When the external device acts as the master, 1 to 1 connections for a single ALR121 unit and 1 to n connections for multiple ALR121 units are available.

When the ALR121 acts as the master, 1 to 1 connections for a single external device unit and 1 to n connections for multiple external device units are available.

The maximum value for n is 32.

The following figure shows an example of the system configuration of the ALR121 and the external device.

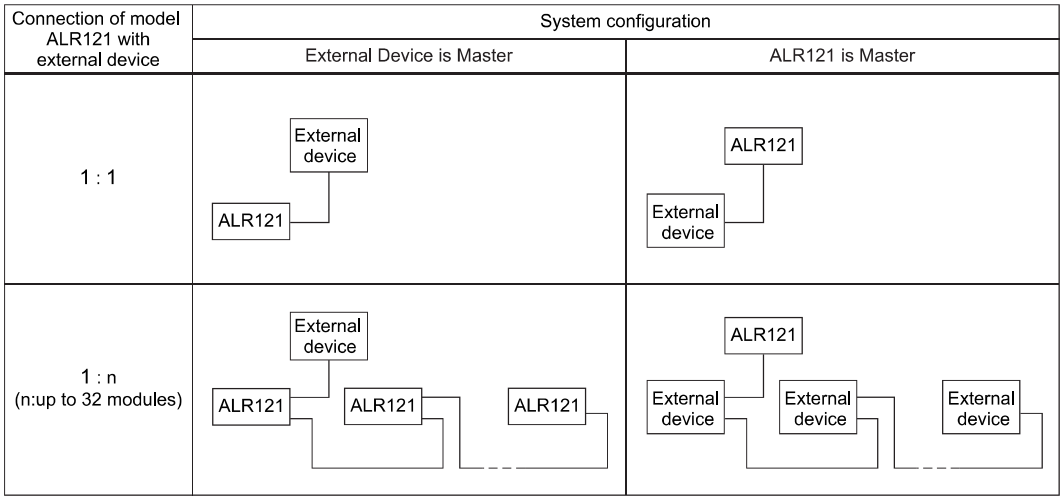

Figure D1.4.2-2 System configuration when connecting external device with model ALR121

RS-422/RS-485 communication cables

The following table shows the RS-422/RS-485 communication cables that are provided by YOKOGAWA.

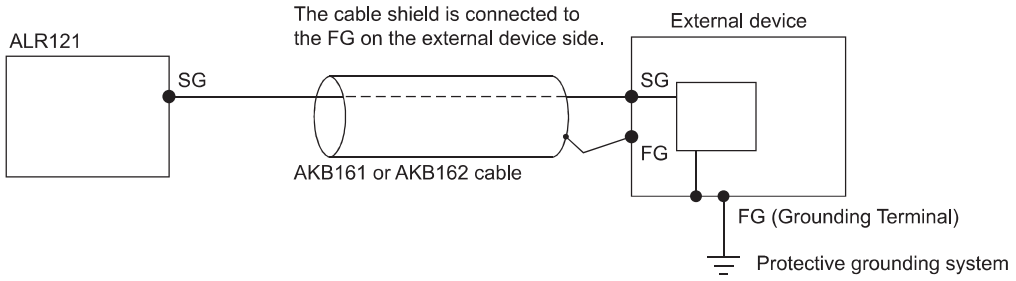
Table D1.4.2-2 RS-422/RS-485 communication cables

Model	Cable Name	Remarks
AKB161	RS-422/RS-485 cable	Between the ALR (M4 terminal) and the external device (M3 terminal)
AKB162	RS-422/RS-485 cable	Between the ALR (M4 terminal) and the external device (M4 terminal)

FG connection of the RS-422/RS-485 communication cable

You must connect the FG to the protective grounding system on the external device side. You must connect the cable shield to the FG at the external device side. FG terminals are not available on the ALR121.

The following figure shows an example of an FG connection.



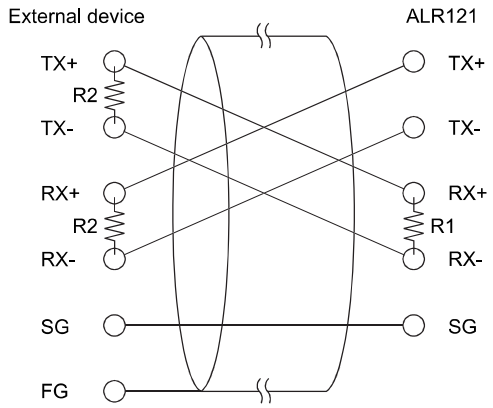


Figure D1.4.2-3 FG connection

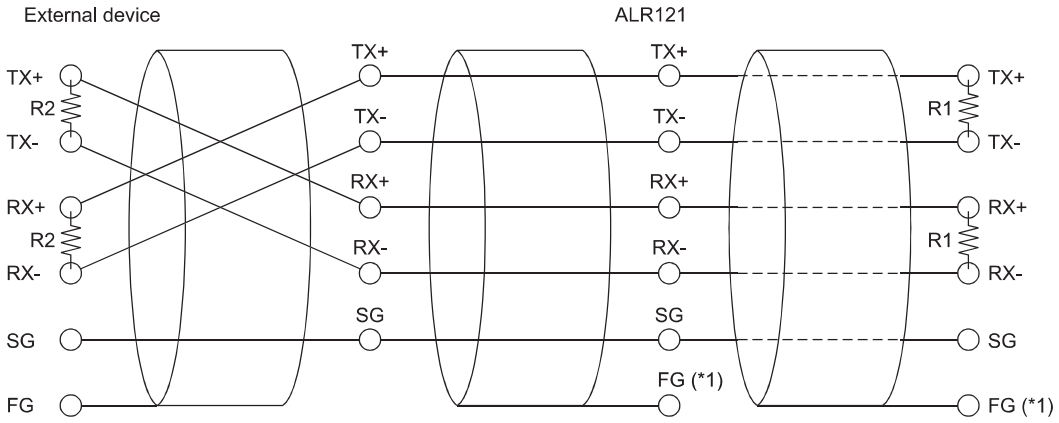
Signal connections when the external device acts as the master

When the external device acts as the master, 1 to 1 connections for a single ALR121 unit and 1 to n connections for multiple ALR121 units are available. These connections are in four-wire type.

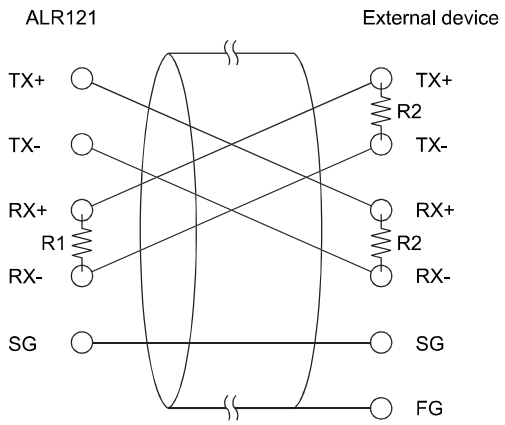


The following figure shows the 1 to 1 connection in four-wire type.

R1: Termination resistance of 120 ohm
R2: According to the instruction on the external device side

Figure D1.4.2-4 1 to 1 connection in 4-wire type

The following figure shows the 1 to n connection in four-wire type.

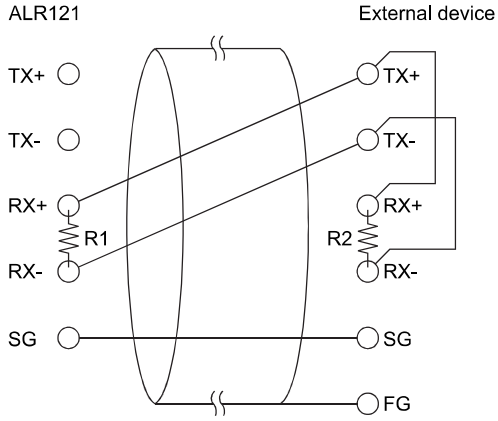


R1: Termination resistance of 120 ohm
R2: According to the instruction on the external device side
*1: Connect to the grounding terminal(FG) of the unit where ALR121 installed

Figure D1.4.2-5 1 to n connection in a four-wire type

Signal connections when the ALR121 acts as the master

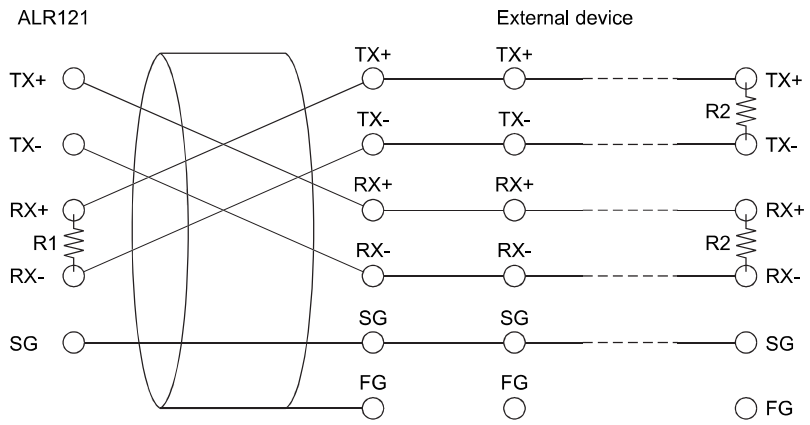
When the ALR121 acts as the master, 1 to 1 connections for a single external device unit and 1 to n connections for multiple external device units are available. Four-wire and two-wire connections are supported.



The following figure shows how to do a 1 to 1 connection in a four-wire type.

R1: Termination resistance of 120 ohm
R2: According to the instruction on the subsystem side

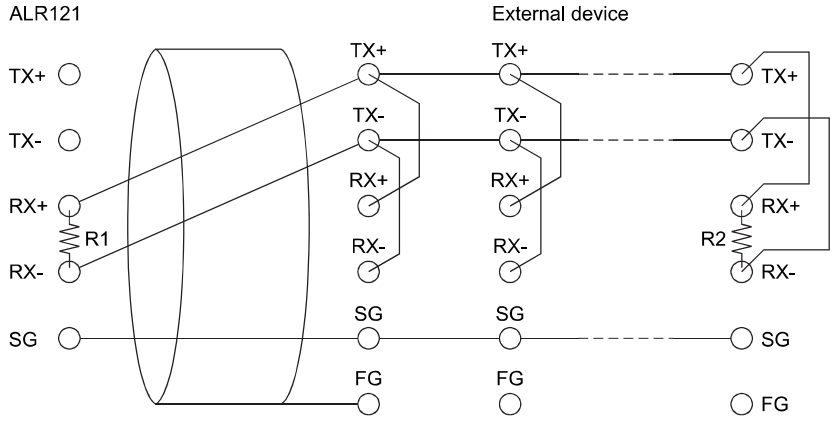
Figure D1.4.2-6 1 to 1 connection in 4-wire type



The following figure shows how to do a 1 to 1 connection in a two-wire type.

R1: Termination resistance of 120 ohm
R2: According to the instruction on the subsystem side

Figure D1.4.2-7 1 to 1 connection in a 2-wire type



The following figure shows how to do a 1 to n connection in a four-wire type.

R1: Termination resistance of 120 ohm
R2: According to the instruction on the subsystem side

Figure D1.4.2-8 1 to n connection in a four-wire type

The following figure shows how to do a 1 to n connection in a two-wire type.

R1: Termination resistance of 120 ohm
R2: According to the instruction on the subsystem side

Figure D1.4.2-9 1 to n connection in a two-wire type

D1.4.3 Signal connection of the Ethernet communication module

The signal connection of the Ethernet communication modules (model name: ALE111) uses 10BASE-T twisted-pair cables. The communication connector type is RJ-45.

The following figure shows the position of the communication connector.

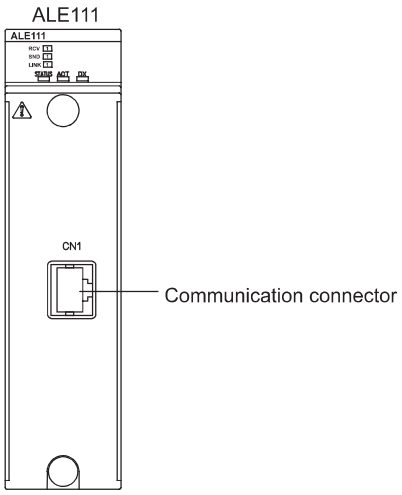


Figure D1.4.3-1 Ethernet communication module

D1.4.4 Connection of the fire and gas communication module

For signal connection of the fire and gas communication module (Model: S2LP131), use a PROFINET-compliant cable and connector. The communication connector type is RJ-45.

The following figure shows the position of the communication connector.

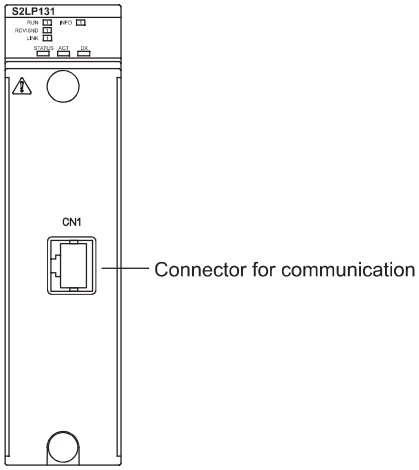

Figure D1.4.4-1 Fire and gas communication module

SEE ALSO For more information about the cable specifications, refer to:

ProSafe-RS Fire and Gas Communication Module (GS 32P06K52-01EN)

D2. Signal wiring between an N-IO I/O unit and field devices

This section describes the signal wiring between the N-IO I/O unit and field devices. Signal connection is available by directly connecting signal cables of field device to the base plate for N-IO I/O unit or by connecting through a terminal board.

If you want to connect directly, connect the signal cables to the terminal block of the base plate or to the signal terminals of barriers.

If you want to connect through a terminal board, use a dedicated signal cable to connect a connector type of base plate with disconnecting terminals with a terminal board and connect the signal cables with field wiring terminals of the terminal board.

SEE ALSO For more information about the electrical specifications of signals, refer to:

ProSafe-RS I/O Module (for N-IO) (GS 32P06K30-01EN, GS 32P06K31-01EN)

Connecting a base plate and a terminal board

When you connect a connector type of base plate with disconnecting terminals with a terminal board, you must use dedicated cables (Model: AKB331, AKB651). Connect the shield cable of the signal cable to the grounding terminal for shield cable on the base plate.

The following figure shows the connection of a base plate and a terminal board.

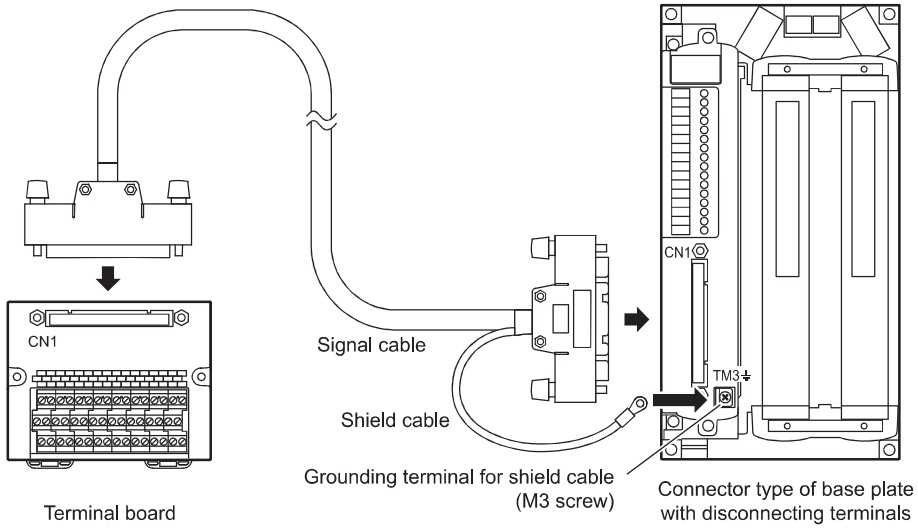

Figure D2-1 Connecting a base plate and a terminal board

SEE ALSO For more information about the signal cable specifications, refer to:

- ProSafe-RS/ProSafe-RS Lite Cables (GS 32Q06M10-31E)
- ProSafe-RS Base Plate (for N-IO) (GS 32P06K20-01EN)

Connecting to a base plate

Follow these steps to connect a signal cable to a connector type of base plate with disconnecting terminals:

1. Insert the signal cable to the signal cable connector of a base plate and tighten it with two screws on the cable.

2. Connect the shield cable to the grounding terminal for shield cable on a base plate.
   An M3 screw is used for the grounding terminal.

Connecting to a terminal board

Follow this step to connect a signal cable to a terminal board.

- Insert the signal cable to the signal cable connector of a terminal board and tighten it with two screws on the cable.

Signal wiring cables

Recommended cable thickness is 0.5 to 2.5 mm^2. When spring clamp terminals are used with sleeves, the cable thickness should be 1.5 mm^2 at maximum.

SEE ALSO For more information about examples of compatible lines for signal wiring, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

Cable termination

IMPORTANT

- Use sleeves that conform to the following DIN standards.
  - Sleeves without insulating cover: DIN 46 228/1
  - Sleeves with insulating cover: DIN 46 228/4
- Use sleeves and a tool that are of the same make and match the thickness of the wire.
- Insert the cables deep into the terminals and make sure they are securely installed.
- Fasten the cables securely to cable clamps or the like so that the terminals do not need to carry the weight of the cables.

At the end of the signal cables to the base plate, provide the following cable termination:

- When using a sleeve
  At the cable end, peel off the coating and attach a sleeve. The sleeve dimensions differ depending on the cable thickness. You must provide cable termination according to the following figure and table:

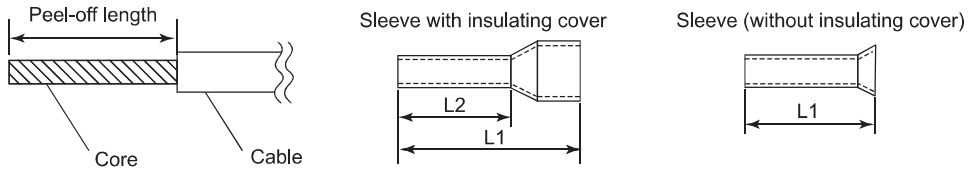

Figure D2-2 Cable termination (for pressure clamp terminals)

Table D2-1 Sleeve dimensions

Cable thickness (mm^2)	When using a sleeve with insulating cover			When using a sleeve (without insulating cover)	
	Peel-off length (mm)	Sleeve dimensions (mm)		Peel-off length (mm)	Sleeve dimensions (mm)
		L1	L2		L1
0.5	10	14	8	6	6

Continues on the next page

Table D2-1 Sleeve dimensions (Table continued)

Cable thickness (mm^2)	When using a sleeve with insulating cover			When using a sleeve (without insulating cover)	
	Peel-off length (mm)	Sleeve dimensions (mm)		Peel-off length (mm)	Sleeve dimensions (mm)
		L1	L2		L1
0.75	10	14	8	6	6
1.0	10	14	8	6	6
1.5	10	14	8	7	7
2.5	10	14	8	7	7

- When not using a sleeve
  The peel-off length should be 8 mm for pressure clamp terminals and 7 mm for spring clamp terminals. The peel-off length should be 7 mm for a terminal board (for N-IO).

TIP

It is recommended to use a sleeve when you connect a cable with a thickness smaller than 1 mm^2 to a spring clamp terminal.

Connecting to pressure clamp terminals

IMPORTANT

- When you connect cables to pressure clamp terminals, use a flat-blade screwdriver that conforms to the DIN 5264B standard having a thickness at the tip of 0.6 mm and a body shaft diameter of 3.5 mm.
- Do not overstress the pressure clamp terminals with a tool such as a driver.
- The screw tightening torque of the pressure clamp terminals should be 0.5 to 0.6 N·m.
- Fasten the cables securely to cable clamps or the like so that the terminals do not need to carry the weight of the cables.

Follow these steps to connect cables to pressure clamp terminals:

1. Insert the cables to the pressure clamp terminals and tighten the screws.
2. Pull the cable gently to check that it is fixed securely.

TIP

The terminal type of base plate with disconnecting terminals has a cover on its terminal block. Close the cover during operation.

Connecting to spring clamp terminals

IMPORTANT

Fasten the cables securely to cable clamps or the like so that the terminals do not need to carry the weight of the cables.

Follow these steps to connect cables to spring clamp terminals:

1. Expand the spring clamp terminal by using a flat-blade screwdriver.
2. Insert a cable without pulling out the screwdriver.

3. Pull out the flat-blade screwdriver.
4. Pull the cable gently to check that it is fixed securely.

TIP

The terminal type of base plate with disconnecting terminals has a cover on its terminal block. Close the cover during operation.

D2.1 Signal connection to the base plate with disconnecting terminals

For signal connections to the base plate with disconnecting terminals (Model: S2BN1D), you must connect analog or digital I/O signals to the connection terminal on a base plate or a terminal board and configure the signal types by using the software.

For a terminal type base plate, connect the signal cables of field devices to the terminal blocks of a base plate. You cannot connect signals that use a terminal C because the terminal blocks do not have a terminal C. The following figure shows the terminal numbers of the terminal block.

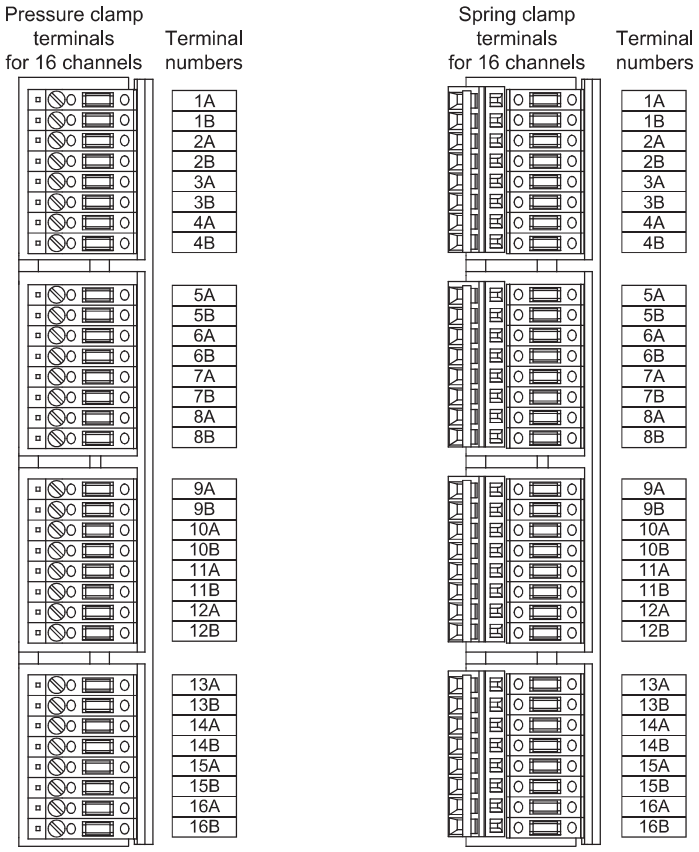

Figure D2.1-1 Terminal numbers of the terminal block

For a connector type base plate, use a dedicated signal cable to connect the base plate to a terminal board and connect the signal cables to field wiring terminals of the terminal board. The following figure shows the field wiring terminals of a terminal board.

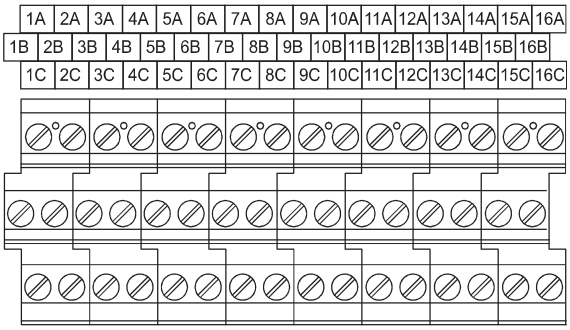

Figure D2.1-2 Field wiring terminals of a terminal board.

The following table shows the relationship between signal types and terminal numbers of channels.

Table D2.1-1 Terminal numbers and signal types

Configuration	Terminal number (*1)	Signal type (*2)(*3) (*4)(*5)			
Analog input Analog output	□A	2-wire transmitter input +	4-wire current input +	Current output +	3-wire current input +
	□B	2-wire transmitter input -	4-wire current input -	Current output -	3-wire current input -
	□C	NC	NC	NC	3-wire power supply +
Digital input Digital output	□A	Dry contact input +	Voltage output +	-	-
	□B	Dry contact input -	Voltage output -	-	-
	□C	NC	NC	-	-

*1: □: 1 to 16
*2: NC: Not to be connected
*3: For 3-wire current input, you must connect the field power supply to the base plate and specify 4-wire as the connection type by using the software.
*4: For voltage output, you must connect the field power supply to the base plate.
*5: -: Not applicable

Signal connections of analog I/O signals

The following figure shows the connection of an analog I/O signal.

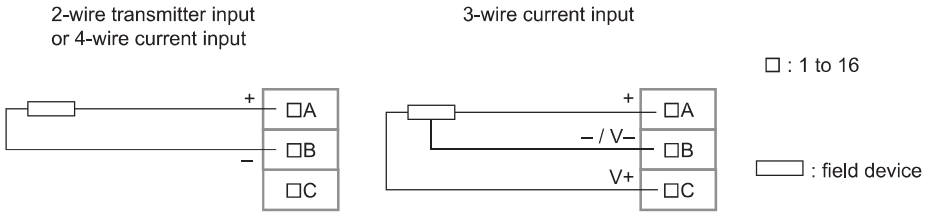

Figure D2.1-3 Connecting an analog I/O signal

You can use 3-wire current input for a connector type base plate. For 3-wire current input, you must connect the field power supply to the base plate and specify 4-wire as the connection type by using the software.

Signal connections of digital input signals

The following figure shows the connection of a digital input signal.

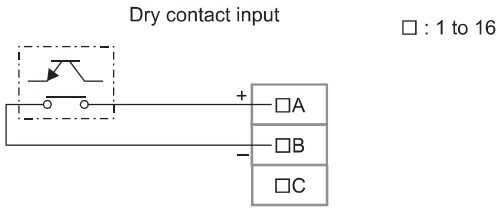

Figure D2.1-4 Connecting a digital input signal

Signal connections of digital output signals

The following figure shows the connection of a digital output signal. You must connect the field power supply to the base plate.

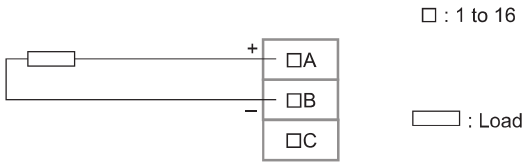

Figure D2.1-5 Connecting a digital output signal

CAUTION

If you connect an inductive load to the base plate in which S2MMM843 or S2MDV843 of style S1 is installed, you must connect a diode in parallel with the load to protect the contact.

The following figure shows an example of signal connection for high current output where an external terminal block is used. You can connect 2 or 3 channels in parallel.

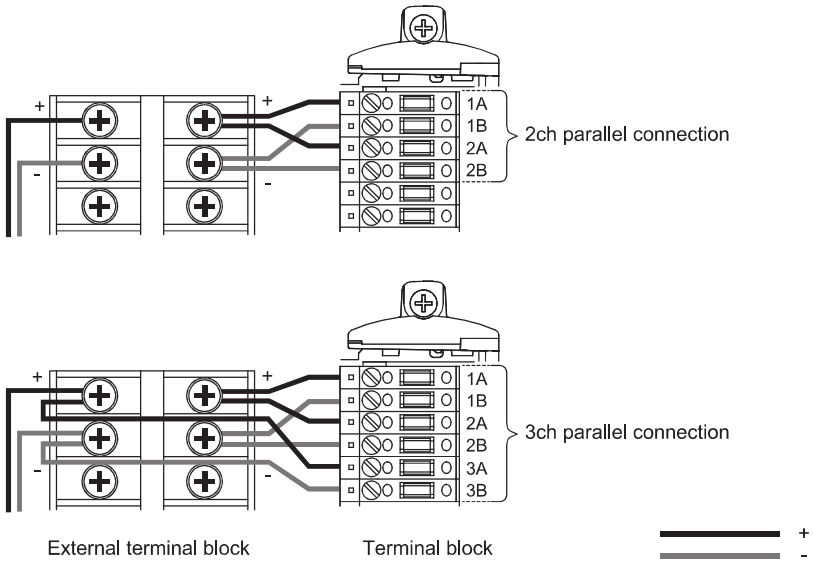

Figure D2.1-6 Example of signal connection when using the high current output function

SEE ALSO

For more information about connecting diodes when using an inductive load, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

For more information about settings on the I/O Parameter Builder when using high current output function, refer to:

"■ Changing the signal category of channels (only for universal type I/O modules)" in E1.6, "Precautions for online change download of N-IO" in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

For more information about signal connections when using high current output function, refer to:

ProSafe-RS Installation Guidance (TI 32P01J10-01EN)

D2.2 Signal connections of the base plate for barrier: S2BN4D

CAUTION

The signal wiring to the field devices that is intrinsic safety circuits must be installed so that they are electrically separated from the wiring of non-intrinsic safety circuits, including the in-cabinet wiring. You must install the wiring according to the IEC 60079-14 standards or the requirements for explosion-proof wiring of the country where the system is used.

There are no signal terminals installed in the base plate for barrier (Model: S2BN4D). Signal terminals are installed in the intrinsic safety barriers.

SEE ALSO For more information about type of intrinsic safety barrier, refer to:

Base Plates for Barrier (for N-IO) (GS 32P06P10-01EN)

D2.3 Signal connections to the base plate for barriers: S2BN5D

CAUTION

The signal wiring to the field devices that is intrinsic safety circuits must be installed so that they are electrically separated from the wiring of non-intrinsic safety circuits, including the in-cabinet wiring. You must install the wiring according to the IEC 60079-14 standards or the requirements for explosion-proof wiring of the country where the system is used.

The following figure shows the signal terminal numbers of S2BN5D.

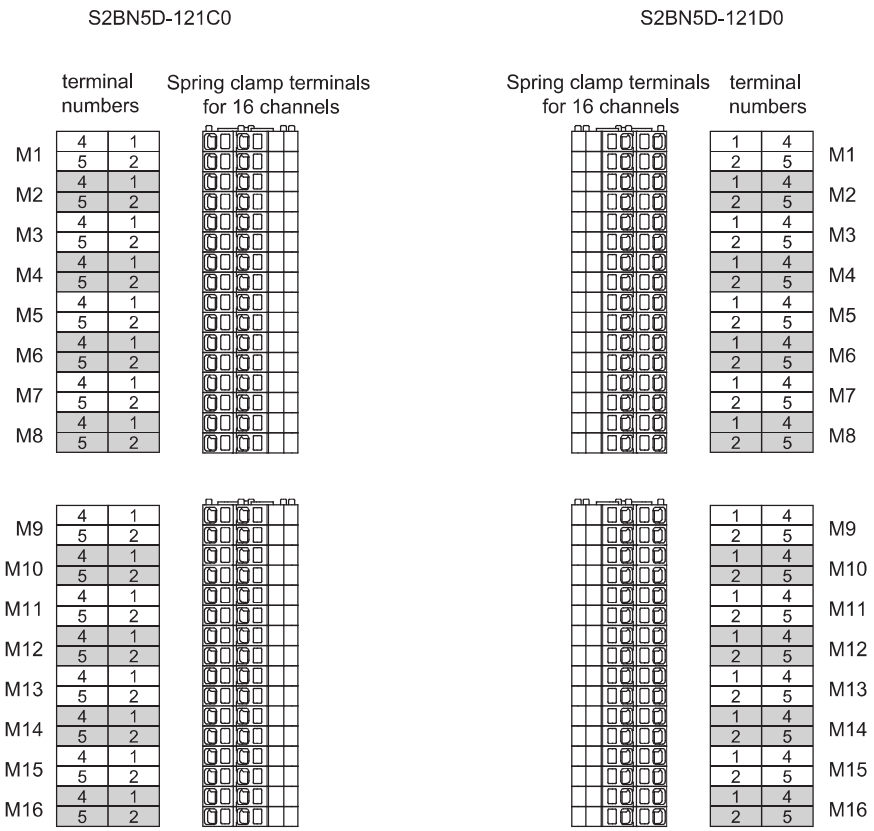

Figure D2.3-1 Signal terminal numbers of S2BN5D

In signal connections to the base plate for barriers (model name: S2BN5D), signal cables must be connected to different terminals depending on the type of signals. To prevent damage to devices, you must connect signal cables to the appropriate terminals depending on the type of signals.

The following table shows the relationship between signal types and terminal numbers of channels.

Table D2.3-1 Terminal numbers and signal types

Intrinsic safety barriers	Terminal number	Signal type(*1)					
For analog input	1	Two-wire transmitter input +	Current input +	---	---	---	---
	2	---	---	---	---	---	---
	4	Two-wire transmitter input -	---	---	---	---	---
	5	---	Current input -	---	---	---	---
For analog output	1	Analog output +	---	---	---	---	---
	2	---	---	---	---	---	---
	4	Analog output -	---	---	---	---	---
	5	---	---	---	---	---	---
For digital input	1	Digital input +	---	---	---	---	---
	2	---	---	---	---	---	---
	4	Digital input -	---	---	---	---	---
	5	---	---	---	---	---	---
For digital output	1	Digital output +	---	---	---	---	---
	2	---	---	---	---	---	---
	4	Digital output -	---	---	---	---	---
	5	---	---	---	---	---	---
For temperature input	1	RJC connection	---	RTD four-wire type current source +	RTD three-wire type current source +	RTD two-wire type current source +	Skid resistance current source +
	2	Thermocouple input +	Voltage input +	RTD four-wire type input +	---	---	---
	4	RJC connection	---	RTD four-wire type current source -	RTD three-wire type current source -	RTD two-wire type current source -	Skid resistance current source -
	5	Thermocouple input -	Voltage input -	RTD four-wire type input -	RTD three-wire type input -	---	Skid resistance input -

*1: "- - -" denotes that the terminal is not used. Do not connect any signal to it.

SEE ALSO For more information about type of intrinsic safety barrier, refer to:

Base Plates for Barrier (for N-IO) (GS 32P06P10-01EN)

D3. Signal connection of the external alarm input terminals of the node interface unit

The external alarm input terminals that are provided on the base plate for node interface unit are pressure clamp terminals. For the signal wiring, use cables with a nominal cross-sectional area of 0.5 to 2.5 mm^2.

SEE ALSO For more information about the specifications of the signal for the external alarm input, refer to:

ProSafe-RS Node Interface Unit (for N-IO) (GS 32P06F20-01EN)

Cable termination

IMPORTANT

- Use sleeves that conform to the following DIN standards:
  - Sleeves without insulating cover: DIN 46 228/1
  - Sleeves with insulating cover: DIN 46 228/4
- Use sleeves and a tool from the same manufacturer that match the thickness of the wire.
- Insert the cables deep into the terminals and make sure they are securely installed.

At the end of the signal cables to the base plate, provide the following cable termination:

- When using a sleeve
  At the cable end, peel off the coating and attach a sleeve. The sleeve dimensions differ depending on the cable thickness. You must provide cable termination according to the following figure and table:

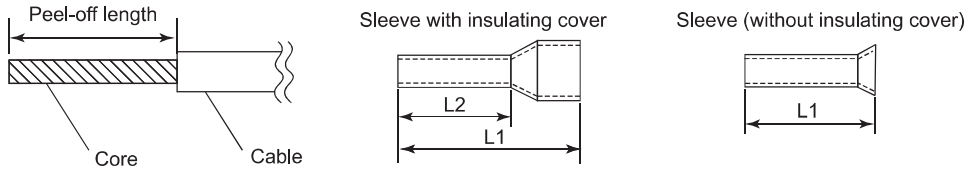

Figure D3-1 Cable termination

Table D3-1 Sleeve dimensions

Cable thickness (mm^2)	When using a sleeve with insulating cover			When using a sleeve (without insulating cover)	
	Peel-off length (mm)	Sleeve dimensions (mm)		Peel-off length (mm)	Sleeve dimensions (mm)
		L1	L2		L1
0.5	10	14	8	6	6
0.75	10	14	8	6	6
1.0	10	14	8	6	6
1.5	10	14	8	7	7
2.5	11	14	8	7	7

- When not using a sleeve
  The peel-off length should be 8 mm.

Connecting to pressure clamp terminals

IMPORTANT

- When you connect cables to pressure clamp terminals, use a flat-blade screwdriver that conforms to the DIN 5264B standard having a thickness at the tip of 0.6 mm and a body shaft diameter of 3.5 mm.
- The screw tightening torque of the pressure clamp terminals should be 0.4 to 0.5 N·m.

Follow these steps to connect cables to pressure clamp terminals:

1. Confirming the cable polarity, insert the cable to the pressure clamp terminal and tighten the screw.
2. Pull the cable gently to check that it is fixed securely.

E. Maintaining the SCS

This section describes the following maintenance work for the SCS:

- Routine maintenance
- Parts with defined life spans and replacement parts
- Replacing the component devices

CAUTION

- When the power is on, do not install or remove any devices, cables, or connectors unless it is clearly stated in this manual that you are allowed to do so.
- When performing maintenance work, wear a wrist strap to take measure against electrostatic discharge (ESD).

IMPORTANT

If dust or dirt is found on the devices, clean them with a vacuum cleaner or dry soft cloth. If the stain is tough and cannot be removed easily, wipe it with soft cloth soaked in water or mild soap water after wringing it tightly.

E1. Precautions during maintenance work

This section describes the precautions that you must take during maintenance work.

Precautions against static electricity during maintenance work

When performing maintenance work, observe the following precautions to prevent electrostatic interference.

- When storing or carrying maintenance parts, be sure to enclose them in an antistatic bag.

TIP For shipment, these parts are enclosed in an antistatic bag labeled with precautions against electrostatic charge.

- During maintenance work, wear a wrist strap with a 1 M ohm grounding resistor. Connect the wrist strap to the grounding terminal or unpainted part of the grounded frame.
- When working on a bench, place the parts or device on a conductive sheet that is grounded through a 1 M ohm resistor. While you work, you must wear a wrist strap. Keep away any plastic and other materials that can easily be charged from the work bench.
- Do not touch any maintenance parts without using a wrist strap or conductive sheet.
- During the maintenance work for S2CP471/L1CP471 on a conductive sheet, remove the battery. During the maintenance work for SCP461 or SCP451, turn off the battery ON/OFF switch or remove the battery.

The following figure shows an example of using a wrist strap and conductive sheet.

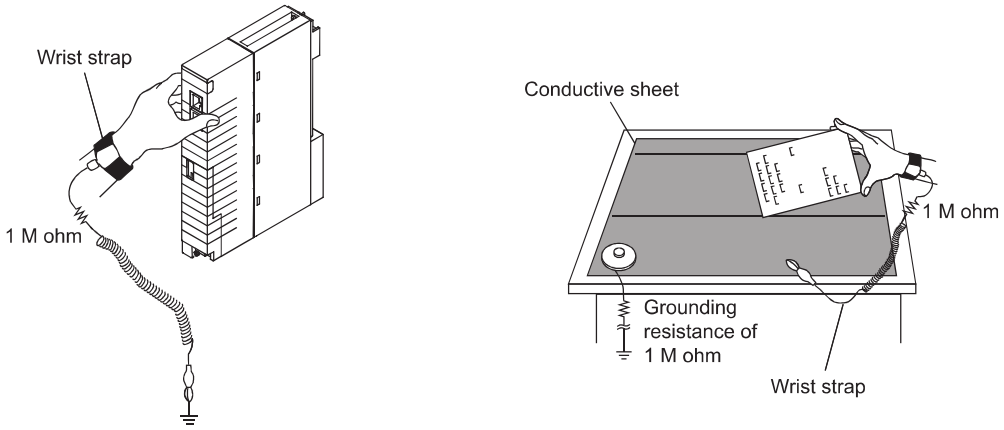

Figure E1-1 Example of using a wrist strap and conductive sheet

Precautions when maintaining node units that are connected on N-ESB bus or optical ESB bus

In the following explanation, N-IO nodes, safety node unit (SNU), and unit for optical ESB bus repeater module are collectively called node units.

- The N-ESB bus modules that are mounted on an N-IO node have the function to relay communications on the N-ESB bus or optical ESB bus. If both N-ESB bus modules fail or power to the N-ESB bus modules fails, not only the N-IO node but also the node units that are connected under that N-IO node become unable to communicate with the SCU. Therefore, you must be careful when you turn off the power to the N-IO nodes.

- If both optical ESB bus repeater modules, which are mounted on an SNU or a unit for optical ESB bus repeater module, fail or power to the optical ESB bus repeater modules fails, not only the node unit but also the node units that are connected under that node unit become unable to communicate with the SCU. Therefore, you must be careful when you turn off the power to the SNUs or units for optical ESB bus repeater module.
- If an error occurs on one of the paired power supply modules that are mounted on a unit for optical ESB bus repeater module, a notification is provided as an error of an ESB bus interface module that is mounted on a lower-level node unit of this node unit.

SEE ALSO

For more information about behaviors when an error occurs on one of the paired power supply modules of a unit for optical ESB bus repeater module, refer to:

G2.2.7, “Actions taken at error occurrence for optical ESB bus repeater devices” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

E2. Routine maintenance

You can perform routine maintenance by visually checking the status lamps of the equipment or by checking the SCS State Management window.

SEE ALSO For more information about the SCS State Management window, refer to:

H1.2, “SCS State Management window” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

Inspection by checking status lamps

The following table describes the status lamps that you can refer to in order to determine normal or error status of the devices.

Table E2-1 Status lamps and operating status of the devices

Device	Lamp	Redundancy setting	Normal	Error	Remarks
Power supply module	SYS	-	On	Off	Indicates the status of +5 V output.
	FLD	-	On	Off	Indicates the status of +24 V output.
Processor module	HRDY	-	On	Off	Indicates the hardware status.
	RDY	-	On	Off	Indicates the status of hardware and software.
	CTRL	Redundant	On (active module) Off (standby module)	Off (active module) (*1)	Indicates the control status.
		Non-redundant	On	Off	
ESB bus interface module	STATUS	-	On	Off	Indicates the hardware status.
Optical ESB bus repeater module	STATUS	-	On	Off	Indicates the hardware status.
N-ESB bus coupler module	RDY	-	On	Off	Indicates the hardware status.
FIO I/O module	STATUS	-	On	Off	Indicates the hardware status.
	ACT	Redundant	On (active module) Off (standby module)	Off (active module) (*2)	Indicates the operating status. (*3)
		Non-redundant	On	Off	

Continues on the next page

Table E2-1 Status lamps and operating status of the devices (Table continued)

Device	Lamp	Redundancy setting	Normal	Error	Remarks
Serial communication module Ethernet communication module	STATUS	-	On	Off	Indicates the hardware status.
	ACT	Redundant	On (active module) Off (standby module)	Off (active module) (*2)	Indicates the operating status.
		Non-redundant	On	Off	
	DX	Redundant	On	Off	Indicates the status in dual-redundant configuration. The lamp is always off in single configuration.
	LINK	-	On	Off	Indicates the link status.
Fire and gas communication module	STATUS	-	On	Off	Indicates the hardware status.
	ACT	-	On	Off	Indicates the operating status.
	RUN	-	On	Off	Indicates the communication status.
	LINK	-	On	Off	Indicates the link status.
	INFO	-	Off	On or flashing	Indicates the communication setting status.
Power supply unit (N-IO)	POWER	-	On	Off	-
N-ESB bus module	STAT	-	On	Off	Indicates the hardware status.
Base plate with disconnecting terminals	FUSE STATUS	-	Off	On	Indicates the fuse status.
N-IO I/O module	STATUS	-	On	Flashing or off	Indicates the hardware status.
	Channel status (for DIO)	-	On (active module, when DIO is on) Off (active module, when DIO is off) Off (standby module)	Flashing (*4)	Indicates the on/off status or wiring error for each channel.

*1: The CTRL lamp goes off when an error occurs in the active module. The standby module takes over to become the active module.
*2: The ACT lamp goes off when an error occurs in the active module. The standby module takes over to become the active module.
*3: The ACT lamp turns off while the current input module (SAI143 style S4 or later/L1AI143) is resetting the error detection status of Smoke and Heat Detector.
*4: When a wiring error is detected, the corresponding channel status lamp flashes.

SEE ALSO

For more information about the descriptions related to status lamps of the devices, refer to:

- B4., “FIO node devices” on page B4-1
- B5., “N-IO node devices” on page B5-1

For more information about the function to reset the error detection status of Smoke and Heat Detector by the current input module (SAI143 style S4 or later/L1AI143), refer to:

A3.4.1, “Device reset function with FIO” in Engineering Guide Vol. 2 (IM 32P01C20-01EN)

E3. Parts with defined life spans and replacement parts of SCS

The SCS has parts with defined life spans that must be replaced periodically and replacement parts such as fuses.

The parts with defined life spans that can be replaced by the customer are available as spare parts or consumables. Purchase and replace them as necessary.

IMPORTANT

Precautions for parts with defined life spans

- The term “parts with defined life spans” refers to parts that are expected to wear out or break down within 10 years from initial use under normal conditions of use. Therefore, parts with expected life spans of 10 years or more are excluded here.
- The recommended replacement cycle is the cycle estimated for preventive maintenance. It provides no guarantee against the accidental failures.
- The recommended replacement cycle is merely a reference, and varies depending on the usage conditions.
- The recommended replacement cycle is subject to change according to actual field results.

Periodic replacement parts with defined life spans

The following tables describe the recommended replacement cycles of the parts with defined life spans.

Table E3-1 Recommended replacement cycles of parts with defined life spans for FIO nodes (excluding relay boards)

Part name	Part number	Recommended replacement cycle	Replacement by user	Remarks
Power supply module (100-120 V AC)	SPW481/ L1PW481	8 years	Yes	At the average ambient temperature (*1) of 40 deg. C or lower
Power supply module (220-240 V AC)	SPW482/ L1PW482	8 years	Yes	At the average ambient temperature (*1)of 40 deg. C or lower
Power supply module (24 V DC)	SPW484/ L1PW484	8 years	Yes	At the average ambient temperature (*1)of 40 deg. C or lower
Battery (for S2CP471 or L1CP471)	S9450FE	3 years (*2)	Yes	At the average ambient temperature of 30 deg. C or lower
		1.5 years (*2)	Yes	At the average ambient temperature of 50 deg. C or lower
		1 year (*2)	Yes	At the average ambient temperature of 70 deg. C or lower
Battery (for SCP461 or SCP451)	S9185FA	3 years (*2)	Yes	At the average ambient temperature of 30 deg. C or lower
		1.5 years (*2)	Yes	At the average ambient temperature of 40 deg. C or lower
		9 months (*2)	Yes	At the average ambient temperature of 50 deg. C or lower

Continues on the next page

Table E3-1 Recommended replacement cycles of parts with defined life spans for FIO nodes (excluding relay boards) (Table continued)

Part name	Part number	Recommended replacement cycle	Replacement by user	Remarks
Aluminum electrolytic capacitor (in a power supply module)	-	8 years	No (*3)	For SPW48□/L1PW48□ At the average ambient temperature of 40 deg. C or lower
Fuse (in a power supply module)	-	8 years	No (*3)	For SPW48□/L1PW48□
Fan unit	AIP602	4 years	Yes	At the average ambient temperature of 60 deg. C or lower
Power supply unit for fan unit	S9159FA	8 years	Yes	100-120 V AC, 220-240 V AC At the average ambient temperature of 40 deg. C or lower
	S9160FA	8 years	Yes	24 V DC At the average ambient temperature of 40 deg. C or lower
Optical ESB bus repeater module (Style S1 only)(*4)	SNT401	4 years	Yes	This cycle assumes the use in G3 environments.
	SNT501			
	L1NT401			
	L1NT501			
	L1NT411			
	L1NT511			
Optical ESB bus repeater module (Style S1 and S2)(*5)	SNT411	4 years	Yes	This cycle assumes the use in G3 environments.
	SNT511			

*1: The ambient temperature when the FIO node is installed in a cabinet is the temperature inside the cabinet, not outside the cabinet.
*2: The replacement cycle for batteries includes the period during which the batteries remain unused.
*3: Parts indicated by a "No" in the "Replacement by user" column cannot be replaced by the user, so please contact YOKOGAWA sales or service agents to request replacement work.
*4: Not applicable to styles S2 and later.
*5: Not applicable to styles S3 and later.

Table E3-2 Recommended replacement cycles of parts with defined life spans for N-IO nodes

Part name	Model	Recommended replacement cycle	Replace-ment by user	Remarks
Power supply unit (100-240 V AC input)	S2PW503	8 years	Yes	At the average ambient temperature (*1) of 40 deg. C or lower
Power supply unit (24 V DC input)	S2PW504	8 years	Yes	At the average ambient temperature (*1)of 40 deg. C or lower
N-ESB bus module (Style S1 only)(*2)	S2EN501-S1□□□□	4 years	Yes	This cycle assumes the use in G3 environments.
	S2EN501-S2□□□□			
	S2EN501-S□1□□□			
	S2EN501-S□2□□□			

*1: The ambient temperature when the N-IO node is installed in a cabinet is the temperature inside the cabinet, not outside the cabinet.
*2: Not applicable to styles S2 and later.

The relays that are used in relay boards have defined service lives. The following table shows the switching service lives of relays.

Table E3-3 Switching service lives of relays used in relay boards

Model	Style number	Part number	Switching service life	Remarks
SRM53D	S1 and later	A1772MR	100000 times on/off	-
SRM54D				
SBM54D	S1, S2	A1589MR	100000 times on/off	4 A with a resistive load
	S3 and later	A1893MR	100000 times on/off	3 A with a resistive load
			75000 times on/off	4 A with a resistive load

E3.1 Replacing the battery of the processor module

This section describes replacement of battery placed in the processor module.

CAUTION

- Use only the battery specified by Yokogawa Electric Corporation.
- Wear a wrist strap when handling a battery.

IMPORTANT

- Replace the battery before the validity period expires.
- Order a new battery at least one month before the validity period expires.
- Do not short-circuit the battery terminals.
- Do not heat the battery or throw the battery in a fire. The problems of leaking, overheating or breaking may occur.
- Do not disassemble or modify the battery.
- Do not use the battery to the products other than YOKOGAWA designated devices.
- When discarding the battery, you must handle it very carefully to avoid polluting environment.

SEE ALSO For more information about the processor modules, refer to:

B4.2, “Processor module” on page B4-4

Battery expiration date label

You can check the expiration date of the battery on the label that is affixed to the front cover of the processor module. Keep in mind that the average ambient temperature affects the battery life.

The following figure shows the battery life label.

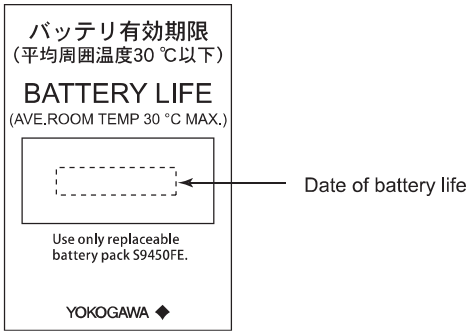

Figure E3.1-1 Example of the battery expiration date label

SEE ALSO For more information about battery replacement, refer to:

"■ Periodic replacement parts with defined life spans" on page E3-1

■ Replacing the S2CP471 or L1CP471 battery

This section describes the replacement of the S2CP471 or L1CP471 battery.

The following figure shows the processor module with the battery removed.

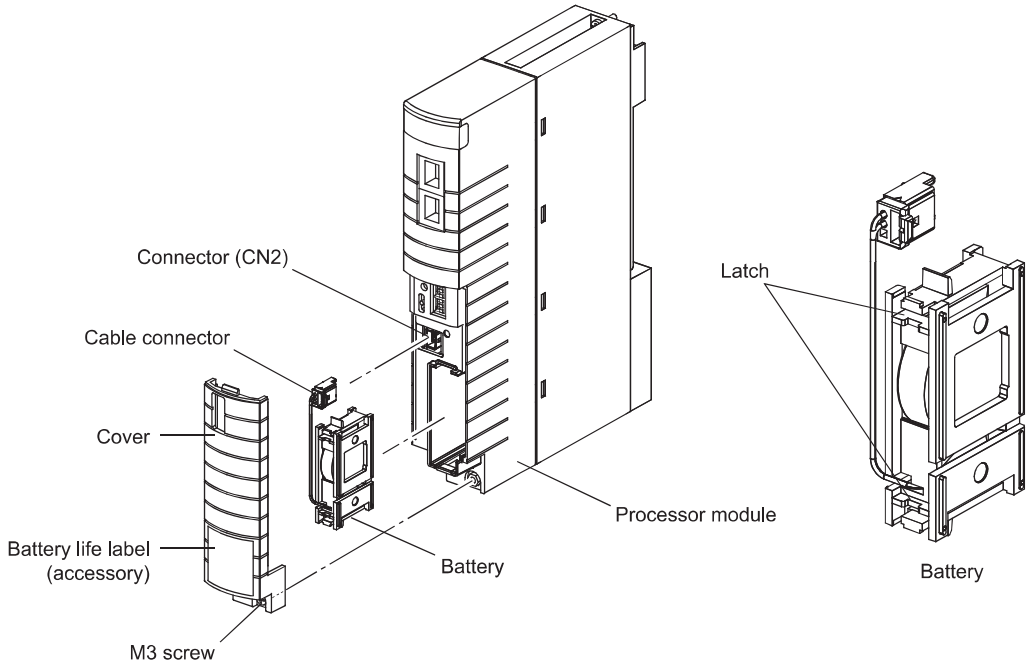

Figure E3.1-2 Processor module with the battery removed

● Removing the battery

IMPORTANT

If you want to maintain the real time data of RTC, you must leave the power to the SCU turned on while you replace the battery. If you remove the battery while the power is turned off, the real time data is initialized.

Follow these steps to remove the battery from the processor module:

1. Loosen the M3 screw that fixes the front cover of the module and remove the cover.
2. Disconnect the cable connector of the battery from the CN2 connector of the module.
3. Squeeze two latches on upper and lower side of the battery together with your thumb and fingers, and pull the battery from the module.

TIP

The following explanation is about the EU Battery Directive/Regulation and the UK Battery Regulation, and only valid in the EEA and the UK. The batteries are used in the processor modules. When you remove batteries from the processor modules, you must dispose the batteries in accordance with the domestic law concerning waste battery disposal. Take a right action on waste batteries, because the collection system in the EEA and the UK on waste batteries are regulated.

Battery type: Carbon monofluoride lithium batteries

Figure E3.1-3 The symbol marked on battery

The symbol on the battery means that the battery must be separately collected as regulated by the EU Battery Directive/Regulation or the UK Battery Regulation.

Installing the battery

Follow these steps to install the battery in the processor module:

1. Push the new battery until it is fully seated on the module.
2. Connect the cable connector of the battery to the CN2 connector of the module. Insert the connector plug securely, ensuring that the plug is properly oriented.
3. Put the front cover back and fix it with the M3 screw.

IMPORTANT

The tightening torque of the screws should be approximately 0.5 N·m.

4. Stick the battery life label that came with the battery to the front cover.

Replacing the SCP461 or SCP451 battery

This section describes replacement of the SCP461 or SCP451 battery.

The following figure shows SCP461 with the battery removed.

The battery of SCP451 is housed horizontally in the module.

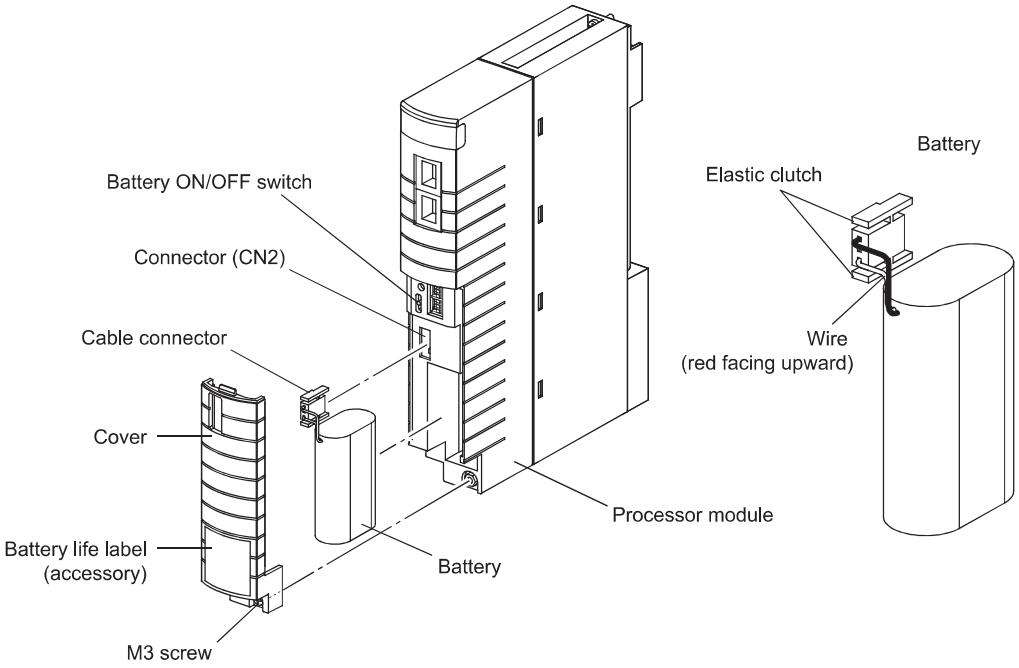

Figure E3.1-4 SCP461 with the battery removed

Removing the battery

IMPORTANT

If you want to save the management information of the processor module, you must leave the power to the SCU turned on while you replace the battery. If you turn off the battery ON/OFF switch while the power is turned off, the management information of the module (the operation data of NVRAM and the real time data of RTC) is lost.

Follow these steps to remove the battery from the processor module:

1. Set the battery ON/OFF switch to the OFF position. A non-conductive stick should be used to set the switch.
2. Loosen the M3 screw that fixes the front cover of the module and remove the cover.
3. Disconnect the cable connector of the battery from the CN2 connector of the module. The battery cable connector has a self-locking elastic clip. When pulling out the connector, you must push the clip to unlock it.
4. Pull out the battery to remove it from the module.

TIP

The following explanation is about the EU Battery Directive/Regulation and the UK Battery Regulation, and only valid in the EEA and the UK. The batteries are used in the processor modules. When you remove batteries from the processor modules, you must dispose the batteries in accordance with the domestic law concerning waste battery disposal. Take a right action on waste batteries, because the collection system in the EEA and the UK on waste batteries are regulated.

Battery type: Lithium Thionyl Chloride Batteries

Figure E3.1-5 The symbol marked on battery

The symbol on the battery means that the battery must be separately collected as regulated by the EU Battery Directive/Regulation or the UK Battery Regulation.

Installing the battery

Follow these steps to install the battery in the processor module:

1. Place the new battery to the specified position on the module.
2. Connect the cable connector of the battery to the CN2 connector of the module. Insert the connector plug securely, ensuring that the plug is properly oriented.
3. Put the front cover back and fix it with the M3 screw.

IMPORTANT

The tightening torque of the screws should be approximately 0.5 N·m.

4. Set the battery ON/OFF switch to the ON position. A non-conductive stick should be used to set the switch.
5. Stick the battery life label that came with the battery to the front cover.

E3.2 Replacing the parts of the node fan unit

The wide range temperature type SCU has a node fan unit. This section describes how to replace components of the node fan unit.

- Fan unit
- Fuse for fan power supply unit
- Power supply unit for fan unit

Replacing fan unit

IMPORTANT

You can replace the fan units without stopping the system. In this case, you must replace the fan units one by one so as not to remove both units at the same time. You must insert the fan unit slowly, making sure that there is no impact on the fan unit. Always replace the fan unit as a whole.

The following figure shows the node fan unit with one fan unit removed.

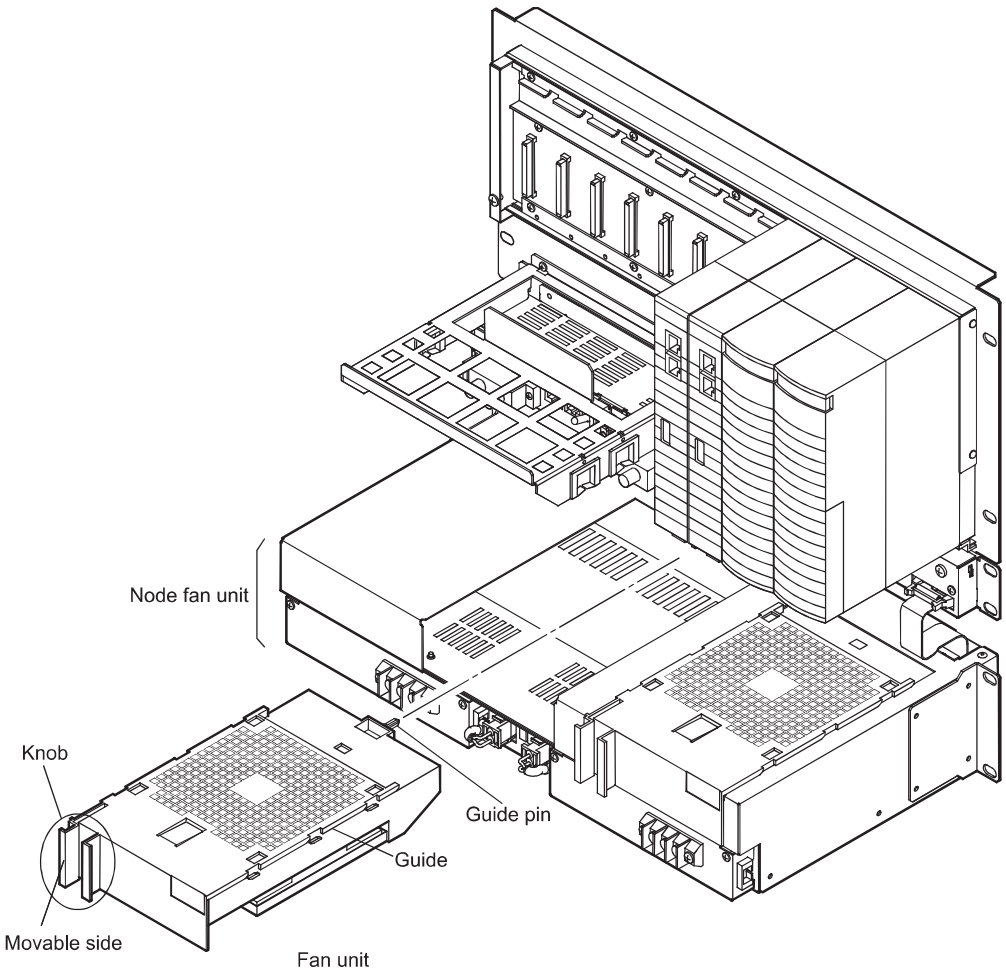

Figure E3.2-1 Replacing a fan unit (an example of SCU without an air deflector)

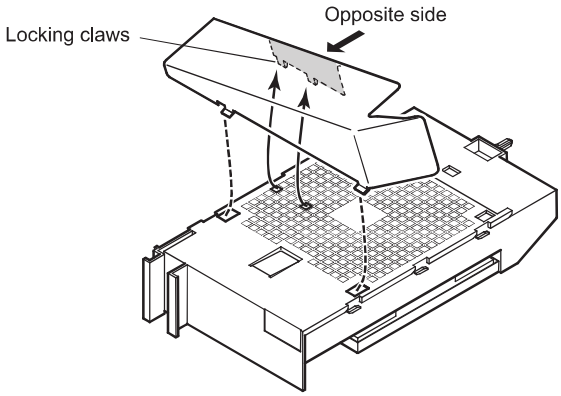
Follow these steps to replace a fan unit:

1. Pinch the knob with your thumb and index finger and unlock the movable side.
2. Pull the fan unit toward you. The fan unit is removed.
3. If the air deflector is not attached to the fan unit, go to the step 5. If the air deflector is attached, disengage the rear locking claws by pressing the opposite side of the air deflector with your fingers, and lift the air deflector to disengage the front locking claws.



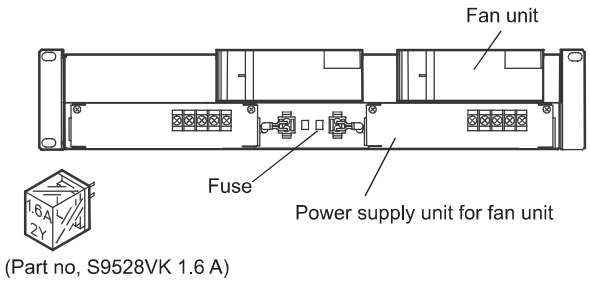


Figure E3.2-2 Detaching the air deflector

4. Insert the right and left front locking claws of the air deflector into the new fan unit, and press the opposite side of the air deflector with your fingers to fasten it to the fan unit.
5. Match the guide of the fan unit to the rail of the node fan unit.
6. Insert the fan unit slowly, making sure that there is no impact on the fan unit, until the connectors of the fan unit and the node fan unit are connected.
7. Check if the fan is rotating properly.

Replacing fuse for fan power supply unit

This section describes how to replace the fuse for fan power supply unit. You can replace the fuse without stopping the system.

The following figure shows the location of the fuse for fan power supply unit.

(Part no, S9528VK 1.6 A)

Figure E3.2-3 Fuse for fan power supply unit

1. Remove the fuse. If the fuse is hard to remove by hand, use a radio pliers and pull it out toward you.
2. Make sure that the new fuse has the same nominal current as the one you have removed, and insert the fuse with its imprints facing up.
3. Check if the fan is rotating properly.

Replacing power supply unit for fan unit

The following figure shows the mounting position of the fan power supply unit. The power supply output connector for N1 is located at the right-hand side of the fan power supply unit. On the other hand, the power supply output connector for N2 is located at the left-hand side of the fan power supply unit.

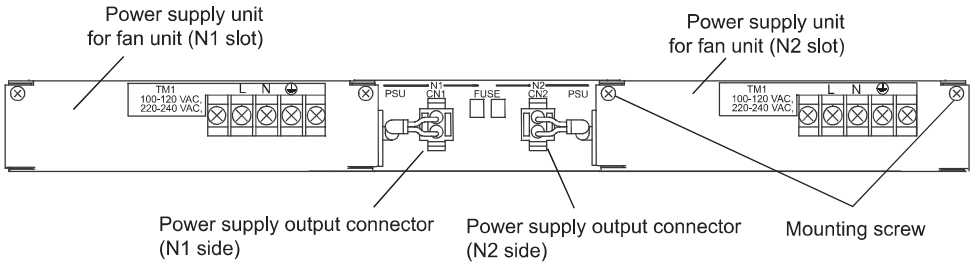

Figure E3.2-4 Power supply unit for fan unit

The following figure shows the output cable wiring of the power supply unit for fans.

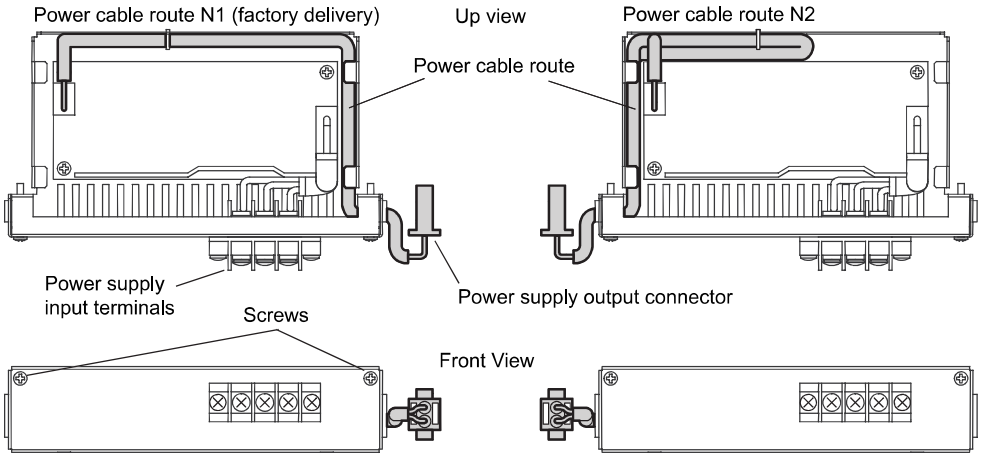

Figure E3.2-5 Power cable route of power supply unit for fan unit

The route of the power cable inside the power supply unit for fans is set to the N1 wiring route (shaded area) at shipment. When replacing the fan power supply unit on the N2 side, you must change the wiring route from N1 to N2.

Follow these steps to replace the fan power supply unit:

1. Disconnect the power supply to the power supply unit for fan unit to be replaced.
2. Remove the power supply output connector from the node fan unit.
3. Remove the screws and pull out the power supply unit.
4. Install a new power supply unit.
5. Connect the power supply output connector to the node fan unit.
6. Supply the power.
7. Check if the fan is rotating properly.

E3.3 Replacing the fuse of digital input module

In order to protect the module from the over current damage caused by short circuit between the input channel and the ground, a fuse is provided in the front of the digital input module (Model: SDV144 style S1, S2, S3). When the fuse is blown up by the short circuit, the fuse can be changed online without pulling the whole module out from its slot.

The following figure shows the location of the fuse.

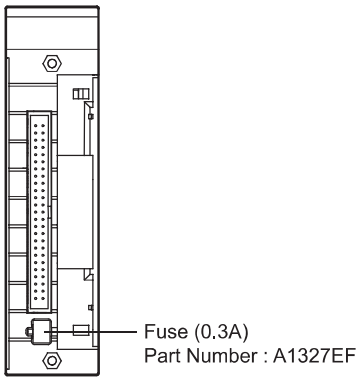

Figure E3.3-1 Front of SDV144 style S1, S2, and S3

IMPORTANT

In the case of dual-redundant modules, if the fuses of both the active and the standby modules are blown, alarm messages for both modules recover even if only one fuse is replaced. However, you must replace both fuses.

Follow these steps to replace the fuse:

1. Make sure that the input terminal does not have short circuit.
2. Disconnect the signal cable from the module.
3. Pull out the fuse to be replaced. Using a long-nose pliers can easily pull out the fuse.
4. Before putting the new fuse, make sure it has the same nominal current as the replaced one.
5. Insert the fuse with the imprints facing up.
6. Connect the signal cable to the module connector, and then check if the module is working properly.

E3.4 Replacing the fuse of terminal boards (for FIO node)

WARNING

- Do not put any tool on the terminal board during maintenance so as to prevent electric shock or other accidents.
- To prevent electric shock, do not insert or remove fuses while voltage is applied or current is being conducted to the terminals. If you must insert or remove fuses while electrified, contact YOKOGAWA sales or service agents.

IMPORTANT

Parts must be purchased and replaced in accordance with the laws and regulations of each country or region.

The following table describes the fuses for replacement for terminal boards.

Table E3.4-1 Fuses for replacement for terminal boards

Model	Style number	Part number	Remarks
SED2D	S1 and later	A1583EF	250 V/15 A
SED3D SED4D	S1 and later	A1618EF or A1034EF	250 V/10 A
SWD2D	S1 and later	S9536VK	250 V/3.2 A
		S9533VK	250 V/1 A
SBD2D	S1	A1602EF	250V/15A
	S2 and later	S9504VK	250V/15A
SBD3D	S1 and later	A1603EF	250V/10A
SBD4D	S1 and later	A1603EF	250V/10A
S1BB4D	S1 and later	A1603EF	250V/10A
		S9117FE	125V/0.63A

Replacing the fuse in the DIN rail terminal board

This section describes the replacement of fuse in SBD2D, SBD3D, SBD4D, and S1BB4D.

Follow these steps to remove the fuse:

1. Insert a flathead screwdriver into the groove in the fuse holder cap.
2. Turn the screwdriver anti-clockwise.
   The fuse holder cap comes out.
3. Remove the fuse from the fuse holder cap.

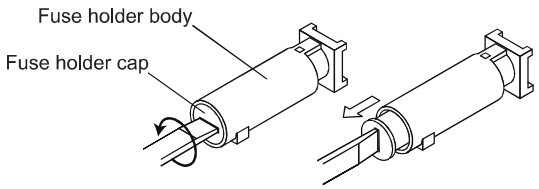

Figure E3.4-1 Removing a fuse

Follow these steps to install the fuse:

1. Insert a fuse into the fuse holder cap.
2. Insert the fuse holder cap into the fuse holder.
3. Press the fuse holder cap into the fuse holder while rotating it clockwise with a flathead screwdriver.

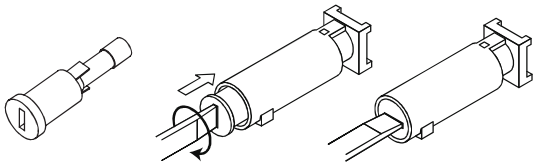

Figure E3.4-2 Installing a fuse

E3.5 Replacing the relays on relay boards

CAUTION

- Do not put any tool into the relay board during maintenance so as to prevent electric shock or other abnormalities.
- To prevent electric shock, do not insert or remove relays while voltage is applied or current is being conducted to the terminals. If you must insert or remove relays while electrified, contact YOKOGAWA sales or service agents.
- Be aware that the relay may be hot.

SEE ALSO For more information about Relay for relay board replacement, refer to:

"■ Periodic replacement parts with defined life spans" on page E3-1

■ Removing a relay of SBM54D (style S3 or later)

For SBM54D of style S3 or later, use a dedicated relay removal tool to remove relays.

IMPORTANT

After using the relay removal tool about 50 times, you need to replace it with a new one. The part number of the tool is T9084SX.

Follow these steps to remove a relay:

1. With the levers of the relay removal tool tilted inside, put the tool deeply on the relay so as to fully cover it.

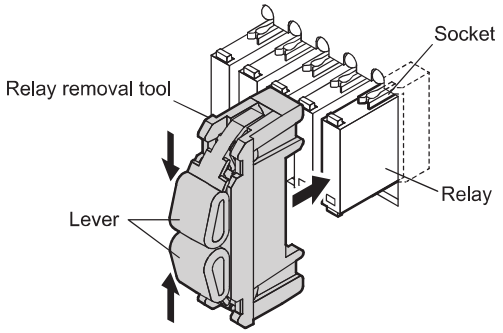

Figure E3.5-1 Placing the relay removal tool

2. Pinch the upper and lower levers with your fingers and open them outward, applying force evenly. The relay leaves the socket.

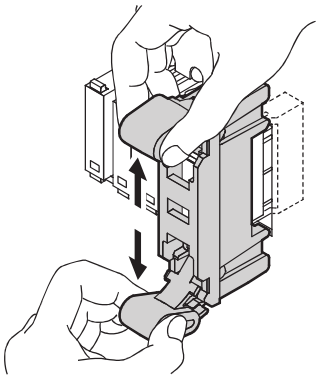

Figure E3.5-2 Removing a relay from the socket - 1

3. With the levers opened, pull out the tool and the relay together.

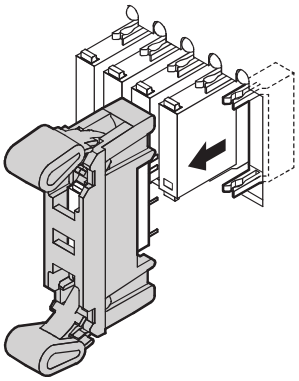

Figure E3.5-3 Removing a relay from the socket - 2

4. Tilt the levers inside to release the relay from the tool.

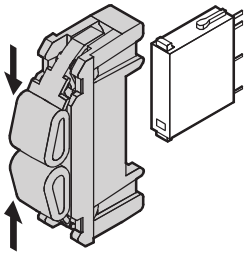

Figure E3.5-4 Releasing the relay from the tool

Installing a relay of SBM54D (style S3 or later)

Fit the pins of the relay to the holes on the socket, and insert the relay all the way seated.

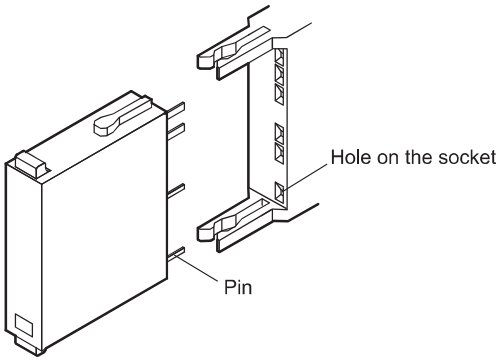

Figure E3.5-5 Installing a relay

E3.6 Replacing the fuse of relay boards

CAUTION

- Do not put any tool into the relay board during maintenance so as to prevent electric shock or other accidents.
- To prevent electric shock, do not insert or remove fuses while voltage is applied or current is being conducted to the terminals. If you must insert or remove fuses while electrified, contact YOKOGAWA sales or service agents.

The following table describes the fuses for replacement for relay boards.

Table E3.6-1 Fuses for replacement for relay boards

Model	Style number	Part number	Remarks
SRM53D SRM54D	S1 and later	A1327EF	125 V/0.3 A, 16 pcs
SBM54D	S1 and later	A1603EF	250 V/10 A, 2 pcs

SEE ALSO For more information about replacing fuses in SBM54D, refer to:

"■ Replacing the fuse in the DIN rail terminal board" on page E3-13

E3.7 Replacing the fuses of the base plate for barrier

CAUTION

To prevent electric shock, do not insert or remove fuses while voltage is applied or current is being conducted to the terminals. If you must insert or remove fuses while electrified, contact the service department of YOKOGAWA.

The following table describes the fuses for replacement for base plates for barrier.

Table E3.7-1 Fuses for replacement for base plates for barrier

Model	Style number	Part number	Remarks
S2BN4D	S1 and later	A1559EF	250 V/2.5 A
S2BN5D	S1 and later	A1624EF	250 V/3.15 A

E3.8 Replacing the fuses of base plate with disconnecting terminals

CAUTION

- Do not put any tool into the base plate during maintenance so as to prevent electric shock or other accidents.
- To prevent electric shock, do not insert or remove fuses while voltage is applied or current is being conducted to the terminals. If you must insert or remove fuses while electrified, contact YOKOGAWA sales or service agents.

IMPORTANT

Parts must be purchased and replaced in accordance with the laws and regulations of each country or region.

Fuses rated for 2A (Part number: A1643EF) are installed in a connector type base plate with disconnecting terminals.

The following figure shows the replacement of a fuse.

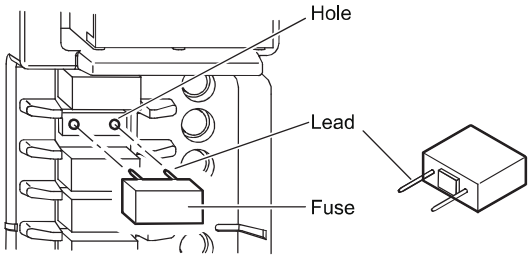

Figure E3.8-1 Replacing a fuse

Follow these steps to replace a fuse:

1. Hold the right and left ends of fuse with a tool and pull the fuse straight out.
   The portion of tool that touches the fuse must be made of non-conductive material.
2. Hold the right and left ends of new fuse with the tool and push the leads of the fuse straight into the holes.

E4. Replacing FIO node components

This section describes how to replace the FIO node components. The dual-redundant module can be removed and installed without disconnecting the power supply for the SCU, SNU, and the unit for optical ESB bus repeater module.

- Power Supply Module
- Processor Module
- ESB Bus Coupler Module
- N-ESB bus coupler module
- ESB Bus Interface Module
- Optical ESB Bus Repeater Module
- FIO I/O module
- SNU

CAUTION

Before replacing a device in dual-redundant configuration, you must make sure that the other device is working normally.

SEE ALSO

For more information about replacing the V net coupler unit, refer to:

Safety Control Stations (Hardware) (IM 32Q06C10-31E)

E4.1 Replacing power supply module

WARNING

Switch off the power supply before removing the power supply modules, and make sure that the status lamps of the power supply module are off.

The following figure shows replacement of the power supply module.

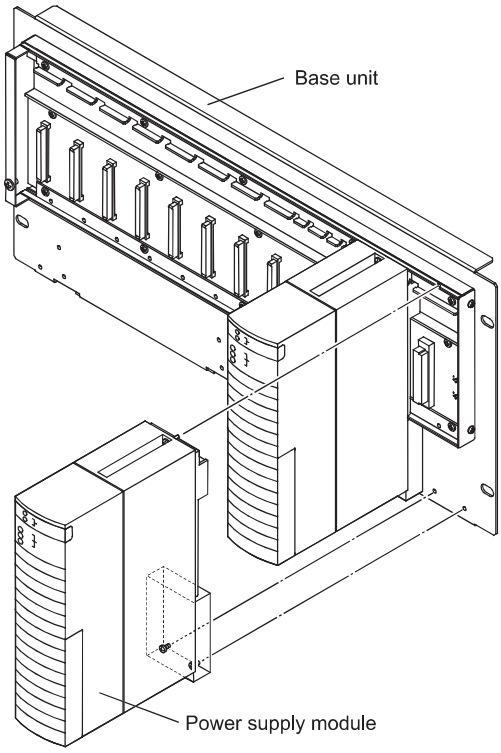

Figure E4.1-1 Replacing power supply module

TIP

You must use dual-redundant configuration for the power supply module of the SNU in the ProSafe-RS. You must observe the following note if the processor module of the SCU or at least one of the processor modules of the dual-redundant safety control unit is as follows:

SCP451 of unit version "U:4" or earlier

If an error occurs and only one of the paired modules powers up, or a power failure occurs on one module, and you have no choice but to continue in the non-redundant state, the diagnostic information message (No.0065) for the ESB bus interface module (SSB401) error might be generated for that node. After about one second the system recovers. This phenomenon occurs very rarely and it does not indicate the abnormality of SSB401 module and the related ESB bus and devices. It does not harm communication either.

Prevention:

The power supply modules should be kept in dual-redundant configuration.

Restoration:

If the abnormality indication disappears in a second, there is no need to do anything about it.

If one of the paired power supply modules fails, the failed module should be replaced as soon as possible so as to return to the normal state (dual-redundant power supply configuration).

Removing a power supply module

Follow these steps to remove the power supply module:

1. Stop the power supply of the module to be replaced.
2. Disconnect the power cable from the power supply input terminals.
3. Loosen the three M3 screws and remove the power supply module.

Installing a power supply module

Follow these steps to install the power supply module:

1. Mount the power supply module on the base unit by tightening the three M3 screws.

IMPORTANT

The tightening torque of the screws should be approximately 0.5 N·m.

2. Connect the power cable to the power supply input terminals.
3. Turn on the power supply.
   The status lamps of the power supply module turn on.

E4.2 Replacing processor module

This section describes how to replace the processor module.

IMPORTANT

If you want to replace SCP461 to S2CP471, contact YOKOGAWA sales or service agents for replacement instead of doing it yourself.

The following figure shows replacement of the processor module.

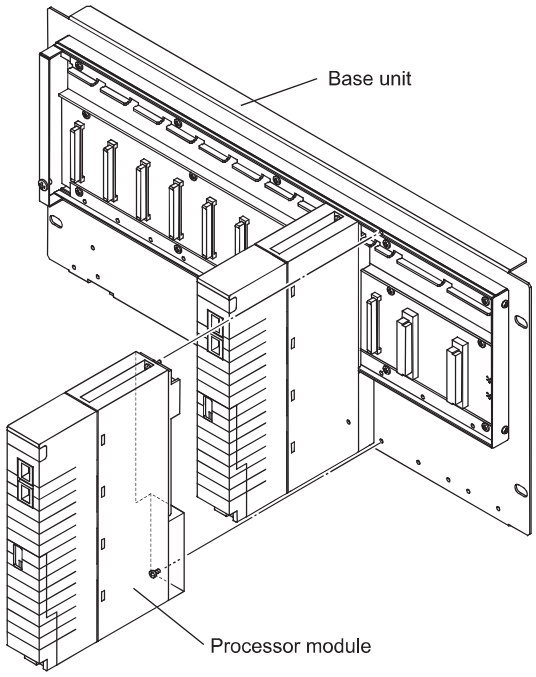

Figure E4.2-1 Replacing processor module

SEE ALSO For more information about disconnecting the cables for Vnet/IP, refer to:

C3.1, “Connecting cables for Vnet/IP” on page C3-2

For more information about front lamps of the processor module, refer to:

“● Status lamps” on page B4-6

For more information about master database offline download, refer to:

I4.4, “Master database offline download” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

For more information about operating condition of S2CP471 and mountable SCU, refer to:

ProSafe-RS Processor Module (for SSC60 and S2SC70), Processor Module Upgrade Kit (for SSC60 and S2SC70) (GS 32P06D20-01EN)

Removing a processor module

IMPORTANT

When you remove the processor module while the system is running, you should not disconnect the cables for Vnet/IP from the processor module.

Follow these steps to remove the processor module:

1. Make sure that the RDY lamp on the processor module to be removed is turned off. If the RDY lamp is turned on, push the START/STOP switch to turn it off.
2. Loosen the two M3 screws that fix the processor module, and remove it.
3. Disconnect the cables for BUS1 and BUS2 from the front of the processor module. There is no need to disconnect the cables from the Layer2 Switch.

Precautions when replacing the processor module with one that was used in another system

When replacing the processor module with a processor module that was used in another system, you must clear the configuration information in the module, depending on the system configuration of the system where the module will be used.

- For ProSafe-RS system integrated with CENTUM
  There is no need to clear the configuration information in the module.
- For ProSafe-RS stand-alone system
  Before installing the processor module, you must clear the configuration information in the module. Follow these steps to clear the configuration information:
  1. Set the domain number setting switches of the processor module as follows:

Table E4.2-1 Setting of the domain number setting switches

Bit 1	Parity	1
Bit 2		1
Bit 3		0
Bit 4	MSB	0
Bit 5		0
Bit 6		0
Bit 7		0
Bit 8	LSB	1

  2. Set the station number setting switches of the processor module as follows:

Table E4.2-2 Setting of the station number setting switches

Bit 1	Parity	0
Bit 2	MSB	0
Bit 3		0
Bit 4		0
Bit 5		0

Continues on the next page

Table E4.2-2 Setting of the station number setting switches (Table continued)

Bit 6		0
Bit 7		0
Bit 8	LSB	1

3. Make sure that the setting switches in the front of the processor module are all set to the OFF position.

Table E4.2-3 Setting of the front setting switches

Bit 6		OFF
Bit 5	FIX	OFF
Bit 4	PORT	OFF
Bit 3		OFF
Bit 2	DOMN	OFF
Bit 1	STA	OFF

4. Without connecting the cables for Bus1 and Bus2, install the processor module to the base unit.
5. Push the START/STOP switch on the processor module immediately, and make sure that the HRDY lamp is OFF.
6. Keep the processor module at this status for about a minute.
7. Remove the processor module from the base unit.

SEE ALSO For more information about the setting switches, refer to:

"■ Elements on the processor module" on page B4-4

■ Installing a processor module

This section describes how to install a processor module.

● Installing S2CP471 or L1CP471

Follow these steps to install S2CP471 or L1CP471:

1. Make sure that the domain number and station number settings and the front setting switches on the processor module to be installed are the same as those set on the module that you removed.
2. Set the operation data reset switch to the RESET position.
3. Connect the cables to both ports of BUS1 and BUS2. There is no need to turn off the power of the Layer2 Switch.
4. Mount the processor module on the base unit by tightening the two M3 screws.

IMPORTANT

The tightening torque of the screws should be approximately 0.5 N·m.

5. Make sure that the HRDY lamp on the processor module is turned on, and set the operation data reset switch to the HOLD position.

6. Make sure that the process module is working normally by checking the lighting of the status lamps and the SCS State Management window in the SCS Maintenance Support Tool.
   In the diagnostic information window on the SENG, ensure that no diagnostic information message for an error is generated.
7. In the single configuration, perform master database offline download after you install the processor module.
   In the dual-redundant configuration, the program is copied automatically, and the status changes to standby after copying.

Installing SCP461 or SCP451

Follow these steps to install the processor module:

1. Make sure that the domain number and station number settings and the negotiation setting of the front setting switches on the processor module to be installed are the same as those set on the module that you removed.
2. Set the battery ON/OFF switch to the OFF position.
3. Connect the cables to both ports of BUS1 and BUS2. There is no need to turn off the power of the Layer2 Switch.
4. Mount the processor module on the base unit by tightening the two M3 screws.

IMPORTANT

The tightening torque of the screws should be approximately 0.5 N·m.

5. Set the battery ON/OFF switch to the ON position.
6. Make sure that the process module is working normally by checking the lighting of the status lamps and the SCS State Management window in the SCS Maintenance Support Tool.
   In the diagnostic information window on the SENG, ensure that no diagnostic information message for an error is generated.
7. In the single configuration, perform master database offline download after you install the processor module.
   In the dual-redundant configuration, the program is copied automatically, and the status changes to standby after copying.

SEE ALSO For more information about precautions when installing the processor module, refer to:

"■ Precautions when replacing the processor module with one that was used in another system" on page E4-5

E4.3 Replacing ESB bus coupler module

This section describes how to replace the ESB bus coupler module.

Removing an ESB bus coupler module

Follow these steps to remove the ESB bus coupler module:

1. Loosen the two M3 screws and remove the ESB bus coupler module.
2. Loosen the two screws and disconnect the ESB bus cable.

Installing an ESB bus coupler module

Follow these steps to install the ESB bus coupler module:

1. Connect the ESB bus cable to the connector of the ESB bus coupler module and tighten the two screws on the connector.

IMPORTANT

The tightening torque of the cable connector fixing screws should be approximately 0.3 N·m.

2. Install the ESB bus coupler module on the base unit securely by tightening the two M3 screws.

IMPORTANT

The tightening torque of the module fixing screws should be approximately 0.5 N·m.

3. Make sure that the replaced ESB bus coupler module is working properly by checking the SCS State Management window.

E4.4 Replacing the N-ESB bus coupler module

This section describes the replacement of the N-ESB bus coupler module.

Removing an ESB bus coupler module

Follow these steps to remove the N-ESB bus coupler module:

1. Loosen the two M3 screws and remove the N-ESB bus coupler module.
2. Disconnect the N-ESB bus cables.

Installing an N-ESB bus coupler module

Follow these steps to install the N-ESB bus coupler module:

1. Connect the cables for N-ESB bus to the N-ESB bus coupler module.
2. Install the N-ESB bus coupler module on the base unit by tightening the two M3 screws.

IMPORTANT

The tightening torque of the screws should be approximately 0.5 N·m.

3. Make sure that the replaced N-ESB bus coupler module is working properly by checking the SCS State Management window.

E4.5 Replacing ESB bus interface module

This section describes the replacement of the ESB bus interface module.

Removing an ESB bus interface module

Follow these steps to remove the ESB bus interface module.

1. Loosen the two M3 screws and remove the ESB bus interface module.
2. Loosen the two M3 screws and remove the connector unit for ESB bus of the unmounted ESB bus interface module. Do not disconnect the ESB bus cable that is connected to the connector unit for ESB bus.

Installing an ESB bus interface module

Follow these steps to install the ESB bus interface module:

1. Set the ESB bus address of the ESB bus interface module to be the same address as the removed ESB bus interface module.
2. Tighten the two M3 screws to install the connector unit for ESB bus to the ESB bus interface module.

IMPORTANT

The tightening torque of the screws for fixing the connector unit for ESB bus should be approximately 0.5 N·m.

3. Tighten the two M3 screws to install the ESB interface module to the base unit.

IMPORTANT

The tightening torque of the module fixing screws should be approximately 0.5 N·m.

4. Confirm that the replaced ESB bus interface module is working normally by checking the status lamps and the SCS State Management window.

E4.6 Replacing optical ESB bus repeater module

This section explains the replacement of the optical ESB bus repeater module.

Removing an optical ESB bus repeater master module

Follow these steps to remove the optical ESB bus repeater master module:

1. Remove the fiber-optic cable that is connected to the optical ESB bus repeater master module. Cap the cable to prevent dust infiltration.
2. Loosen the two M3 screws and removed optical ESB bus repeater module.
3. Loosen the two M3 screws and remove the connector unit for ESB bus of the unmounted optical ESB bus repeater module. Do not disconnect the ESB bus cable from the connector unit for ESB bus.

Installing an optical ESB bus repeater master module

Follow these steps to install the optical ESB bus repeater master module:

1. Tighten the two M3 screws to install the connector unit for ESB bus to the optical ESB bus repeater master module.

IMPORTANT

The tightening torque of the screws for fixing the connector unit for ESB bus should be approximately 0.5 N·m.

2. Tighten the two M3 screws to install the optical ESB bus repeater master module to the base unit.

IMPORTANT

The tightening torque of the module fixing screws should be approximately 0.5 N·m.

3. Uncap the fiber-optic cable and connect it to the optical ESB bus repeater master module. The fiber-optic cable has an IN end and an OUT end. Confirm that you have connected them correctly.
4. Make sure that the replaced module is working properly by checking the SCS State Management window.

Removing an optical ESB bus repeater slave module

Follow these steps to remove the optical ESB bus repeater slave module.

1. Remove the fiber-optic cable that is connected to the optical ESB bus repeater slave module. Cap the cable to prevent dust infiltration.
2. Loosen the two M3 screws and remove the optical ESB bus repeater slave module.
3. Disconnect the ESB bus cable from the unmounted optical ESB bus repeater slave module by loosening the two screws.

Installing an optical ESB bus repeater slave module

Follow these steps to install the optical ESB bus repeater slave module.

1. Connect the ESB bus cable to the optical ESB bus repeater slave module securely by tightening the two screws on the connector.

IMPORTANT

The tightening torque of the cable fixing screws should be approximately 0.3 N·m.

2. Install the optical ESB bus repeater slave module on the base unit securely by tightening the two M3 screws.

IMPORTANT

The tightening torque of the module fixing screws should be approximately 0.5 N·m.

3. Uncap the fiber-optic cable and connect it to the optical ESB bus repeater slave module. The fiber-optic cable has an IN end and an OUT end. Be sure you connect the correct end.
4. Make sure that the replaced optical ESB bus repeater slave module is working properly by checking the SCS State Management window.

E4.7 Replacing FIO I/O modules

The following procedures are available when replacing an FIO I/O module:

- Replacement procedure for a dual-redundant configuration
- Replacement procedure for a non-redundant configuration

The following figure shows the replacement of an FIO I/O module.

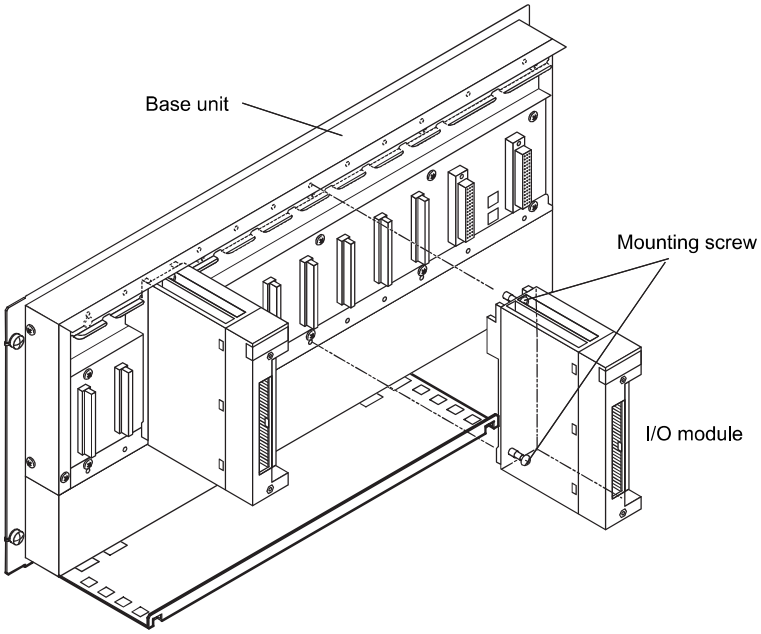

Figure E4.7-1 Replacing FIO I/O modules

SEE ALSO For more information about the behaviors and the recovery procedures when an error occurs, refer to:

G2., "Operations and recovery procedures during the SCS error occurrence" in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

Replacement procedure for a dual-redundant configuration

The procedure for replacing an FIO I/O module differs, depending on whether you replace a standby module or an active module.

When replacing a module on the standby side

Follow these steps to replace the standby module of a redundant pair of FIO I/O modules:

1. Confirm that the status lamps of the pair of redundant I/O modules are as follows:
   - The DX lamps of both modules are ON.
   - The ACT lamp is OFF on the module to be replaced, and ON on the active module.
2. Remove the front cable or the pressure clamp terminal blocks.
3. Loosen the two M3 screws and remove the module.
4. Mount the new module on the base unit securely by tightening the two M3 screws.

IMPORTANT

The tightening torque of the screws should be approximately 0.5 N·m.

5. Perform an IOM download for the replaced module. If Automatic IOM Download is set to [Enable] in the SCS Constants Builder, IOM download is performed automatically.

TIP

If it is not set to download automatically, perform the IOM download from the SCS State Management window of the SCS Maintenance Support Tool.

6. Make sure that the status lamps STATUS and DX of the replaced module are turned on, and the status lamp ACT is turned off.
7. Install the cable or the pressure clamp terminal blocks.
8. Make sure that the replaced module is working properly.

SEE ALSO

For more information about removing and installing the dual-redundant pressure clamp terminal blocks, refer to:

"■ Removing and installing the dual-redundant pressure clamp terminal blocks" on page E4-16

For more information about the SCS Constants Builder, refer to:

C1.2.6, "SCS Constants Builder" in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

● When replacing a module on the active side

CAUTION

Do not remove the cables or terminal blocks on the active modules. If you perform dual-redundant switching by removing the cable or terminal block on the active side, IOP occurs and the relevant loops may be shutdown.

Follow these steps to replace the active module of a redundant pair of FIO I/O modules:

1. From the SENG, use the IOM Control Right Switching Tool and switch the adjacent module into active and the module to be replaced into standby. In this case, set the security level to "1".
2. Confirm that the status lamps of the pair of redundant I/O modules are as follows:
   - The DX lamps of both modules are ON.
   - The ACT lamp is OFF on the module to be replaced, and ON on the active module.
3. Remove the front cable or the pressure clamp terminal blocks.
4. Loosen the two M3 screws and remove the module.
5. Mount the new module on the base unit securely by tightening the two M3 screws.

IMPORTANT

The tightening torque of the screws should be approximately 0.5 N·m.

6. Perform an IOM download for the replaced module. If Automatic IOM Download is set to [Enable] in the SCS Constants Builder, IOM download is performed automatically.

TIP

If it is not set to download automatically, perform the IOM download from the SCS State Management window of the SCS Maintenance Support Tool.

7. Make sure that the status lamps STATUS and DX of the replaced module are turned on, and the status lamp ACT is turned off.
8. Install the cable or the pressure clamp terminal blocks.
9. Make sure that the replaced module is working properly.

SEE ALSO

For more information about removing and installing the dual-redundant pressure clamp terminal blocks, refer to:

"■ Removing and installing the dual-redundant pressure clamp terminal blocks" on page E4-16

For more information about the SCS Constants Builder, refer to:

C1.2.6, "SCS Constants Builder" in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

■ Replacement procedure for a non-redundant configuration

CAUTION

When using the digital output module, do not remove the front cable or the terminal block while the output signal is ON. Sparks may occur in the connectors. Sparks may affect the connection quality.

Follow these steps to replace the FIO I/O module in non-redundant configuration:

1. If you are replacing a digital output module, set the outputs on all channels to OFF.(To set the outputs to OFF, lock the module from the I/O Lock Window or set the output value by application logic.)
2. Separate the front cable or the pressure clamp terminal blocks.
3. Loosen the two M3 screws and remove the module.
4. Tighten the two M3 screws and install the new module to the base unit.

IMPORTANT

The tightening torque of the screws should be approximately 0.5 N·m.

5. For the replaced module, perform IOM downloading from the SCS State Management window of SCS Maintenance Support Tool.
6. Install the cable, the pressure clamp terminal blocks, or the MIL cable.
7. Make sure that the hardware of the replaced module is working properly.

SEE ALSO

For more information about removing and installing the pressure clamp terminal blocks and the cover of the MIL connector, refer to:

"■ Removing and installing the pressure clamp terminal blocks and the cover of the MIL connector" on page E4-17

Removing and installing the dual-redundant pressure clamp terminal blocks

This section describes the removal of the dual-redundant pressure clamp terminal blocks before replacing the I/O module, and installation after the replacement.

The following figure shows the removed dual-redundant pressure clamp terminal blocks.

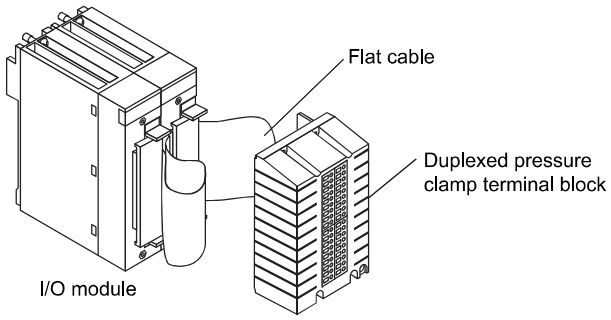

Figure E4.7-2 Connection of dual-redundant connection cables

The following figure shows the removed dual-redundant connecting cables of the dual-redundant pressure clamp terminal blocks.

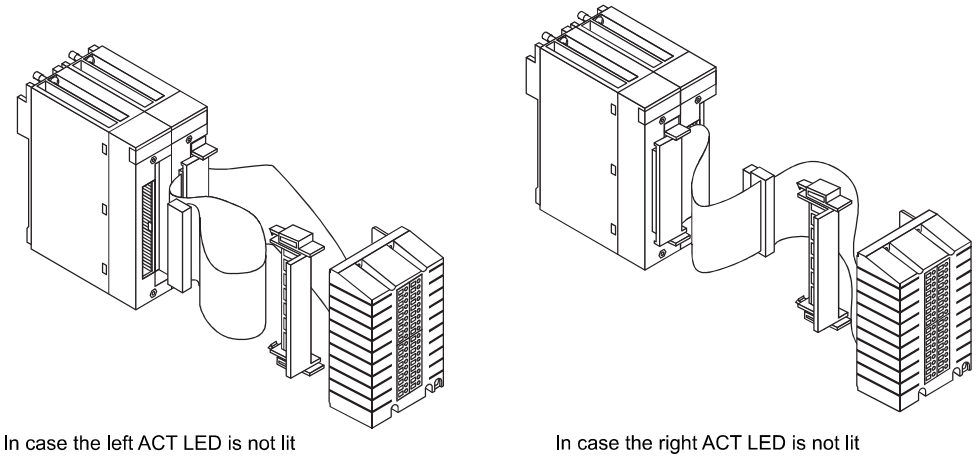

Figure E4.7-3 Removing the dual-redundant connection flat cable

Follow these steps to remove the dual-redundant pressure clamp terminal blocks:

1. Loosen the four M3 screws of the pressure clamp terminal block, and remove while supporting it so as not to apply too much stress to the flat cable.
2. While supporting the pressure clamp terminal blocks, remove the dual-redundant connection flat cable that is connected to the I/O module to be replaced.

Follow these steps to install the dual-redundant pressure clamp terminal blocks:

1. Reinstall the dual-redundant flat cable connector.
2. Install the pressure clamp terminal block by fixing the four M3 screws.

IMPORTANT

The tightening torque of the screws should be approximately 0.5 N·m.

Removing and installing the pressure clamp terminal blocks and the cover of the MIL connector

Follow this step to remove the pressure clamp terminal block or the MIL connector cover:

- Loosen the two M3 screws of the pressure clamp terminal blocks or the MIL connector cover to remove the item.

The following figure shows the I/O modules with the removed pressure clamp terminal block or MIL connector cover.

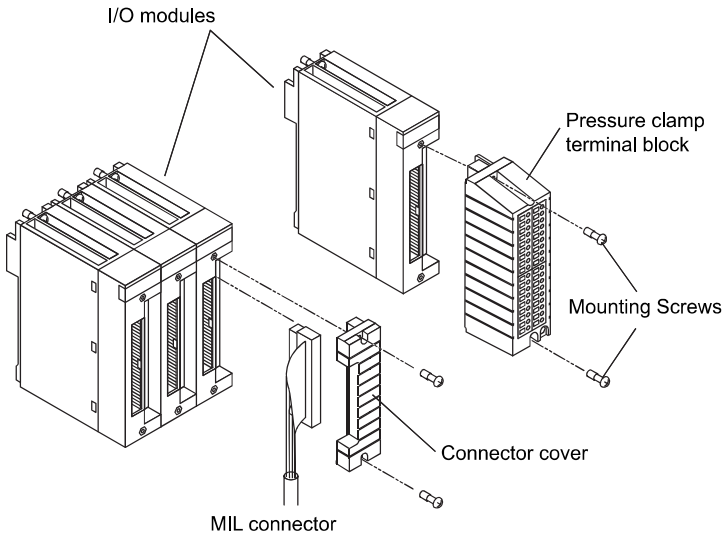

Figure E4.7-4 Removing the terminal block or MIL connector cover

Follow this step to install the pressure clamp terminal block or the MIL connector cover:

- Tighten the two M3 screws to install the pressure clamp terminal blocks or the MIL connector cover to the module.

IMPORTANT

The tightening torque of the screws should be approximately 0.5 N·m.

E4.8 Replacing, adding, and removing the SNU

This section describes the replacement, addition, and removal of the SNU when the SCU is in operation. When replacing the SNU, you must turn its power supply OFF.

E4.8.1 Replacing the SNU

When the SCU is in operation, you must follow these steps to replace the SNU:

1. Check the Bus1 and Bus2 status on the SCS state management window beforehand.
2. Switch off the power supply of the SNU to be replaced.
3. While the ESB bus cable is connected, remove the branch connector unit for ESB bus from the ESB bus interface module for Bus1.
4. Make sure that no error is found in the node units other than the SNU to be replaced by checking in the SCS State Management window.
5. While the ESB bus cable is connected, remove the branch connector unit for ESB bus from the ESB bus interface module for Bus2.
6. Replace the SNU. Make sure that the node address of the ESB bus interface module is correct.
7. Connect the branch connector unit for ESB bus to the ESB bus interface module of the new SNU.
8. Switch on the SNU power supply.
9. Make sure that the replaced SNU is running properly by checking in the SCS State Management window.

E4.8.2 Adding the SNU

This section describes how to add an SNU at the end of the ESB bus.

Follow these steps to add a new SNU when the SCU is in operation:

1. Before the operation, make sure that the status of both Bus1 and Bus2 that are set to dual-redundant is normal by checking in the SCS State Management window.
2. Remove the ESB bus coupler module for Bus1 of the SCU from the base unit by pulling it out toward you. Make sure that the ESB Bus1 is indicated as FAIL, and that the ESB Bus2 is normal.
3. For the existing SNU at the end of the ESB bus, remove the branch connector unit with a built-in terminator for ESB bus from the ESB bus interface module of Bus1 without disconnecting the ESB bus cable.

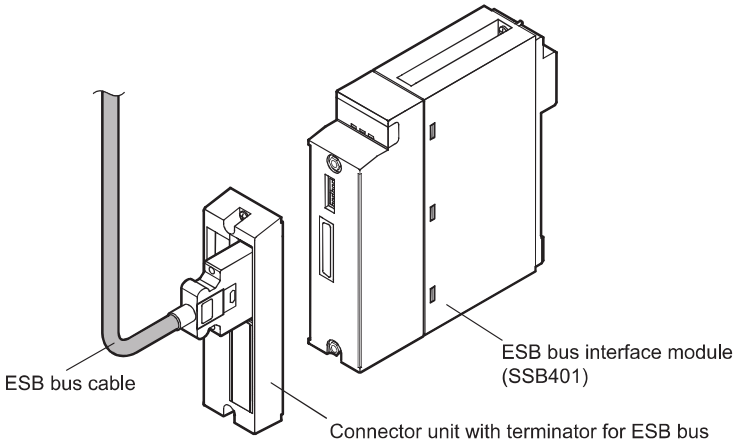

Figure E4.8.2-1 Removing the branch connector unit with a built-in terminator for ESB bus

4. Disconnect the ESB bus cable from the branch connector unit with a built-in terminator for ESB bus that is removed in step 3.
5. Connect the cable that is disconnected in step 4 to a branch connector unit without a terminator for ESB bus. The tightening torque of the screws on the ESB bus cable connector should be approximately 0.3 N·m.
6. Connect the branch connector unit with a built-in terminator for ESB bus that is disconnected in step 4 and the branch connector unit for ESB bus from step 5 with the ESB bus cable.
7. Make sure that the node address of the ESB bus interface module of the newly added SNU is correct.
8. Connect the branch connector unit for ESB bus in step 5 to the ESB bus interface module of the existing SNU.
9. Connect the branch connector unit with a built-in terminator for ESB bus in step 6 to the ESB bus interface module of the newly added SNU.
10. Put back the ESB bus coupler module of Bus 1 that is removed in step 2 to the base unit.
11. On the SCS State Management window, make sure that both ESB buses are working properly.
12. Follow steps 2 to 11 for the ESB Bus2 by reading the instructions for Bus1 as Bus2.
13. Install the I/O modules to the newly added SNU and then turn on the power supply for the newly added SNU.
14. Run online downloading to the I/O modules that are installed in the newly added SNU.

15. Connect the cables or terminal blocks to the I/O modules that are installed in the added newly added SNU.
16. Make sure that all added hardware components are working properly by checking the SCS State Management window.

SEE ALSO For more information about installing I/O modules, refer to:

E4.7, “Replacing FIO I/O modules” on page E4-13

E4.8.3 Removing the SNU

This section describes how to remove the SNU at the end of the ESB bus.

Follow these steps to remove the SNU when the SCU is in operation:

1. Before the operation, make sure that the status of both Bus1 and Bus2 that are set to dual-redundant is normal by checking in the SCS State Management window.
2. Delete (online) all the definitions related to the I/O modules of the SNU to be removed. Deleting the definition of I/O modules of the SNU also deletes the definition of the node.
3. Remove the signal cables or the terminal blocks of the I/O modules to be removed.
4. Remove two fixing screws at the upper part and at the lower part of the I/O module.
5. Pull out the I/O module toward you and remove it from the base unit.
6. Repeat step 3 to step 5 to remove all the I/O modules from the SNU to be removed.
7. Turn off the power supply to the SNU to be removed.
8. Remove the ESB bus coupler module for Bus1 of the SCU from the base unit by pulling it out toward you. Make sure that the ESB Bus1 is indicated as FAIL, and that the ESB Bus2 is normal.
9. For the SNU at the end of the ESB bus that is to be replaced, remove the branch connector unit with a built-in terminator for ESB bus from the ESB bus interface module of Bus1 without disconnecting the ESB bus cable.
10. For the SNU that now comes at the end of the ESB bus, remove the branch connector unit for ESB bus from the ESB bus interface module of Bus1 without disconnecting the ESB bus cable.
11. Disconnect the ESB bus cable from the branch connector unit with a built-in terminator for ESB bus that is removed in step 9.
12. Disconnect the ESB bus cable from the branch connector unit for ESB bus that is removed in step 10.
13. Connect the cable that is disconnected in step 12 to a branch connector unit with a built-in terminator for ESB bus. The tightening torque of the screws on the ESB bus cable connector should be approximately 0.3 N·m.
14. Connect the branch connector unit with a built-in terminator for ESB bus in step 13 to the ESB bus interface module of the SNU that now comes at the end of the ESB bus.
15. Put back the ESB bus coupler module of Bus 1 that is removed in step 8 to the base unit.
16. Make sure that no error is found on the ESB bus by checking in the SCS State Management window.
17. Follow steps 8 to 16 for the ESB Bus2 by reading the instructions for Bus1 as Bus2.

SEE ALSO For more information about installing I/O modules and mounting the terminal blocks, refer to:

E4.7, “Replacing FIO I/O modules” on page E4-13

E5. Replacing N-IO node components

This section describes how to replace the N-IO node components. You can remove and install equipment with dual-redundant configuration without disconnecting the power supply of the SCU.

- Power supply unit
- N-ESB bus module
- N-IO I/O module

CAUTION

- You cannot replace the base plate while the power is supplied to the node interface unit connected to the base plate.
- You cannot add a base plate while the power is supplied to the node interface unit that is going to be connected with the base plate.
- Before replacing a device in dual-redundant configuration, you must make sure that the other device is working normally.

E5.1 Replacing power supply units

WARNING

Before removing a power supply unit, you must shut off the power supply to the unit.

CAUTION

Be aware that the power supply units may be hot.

The following figure shows the replacement of a power supply unit.

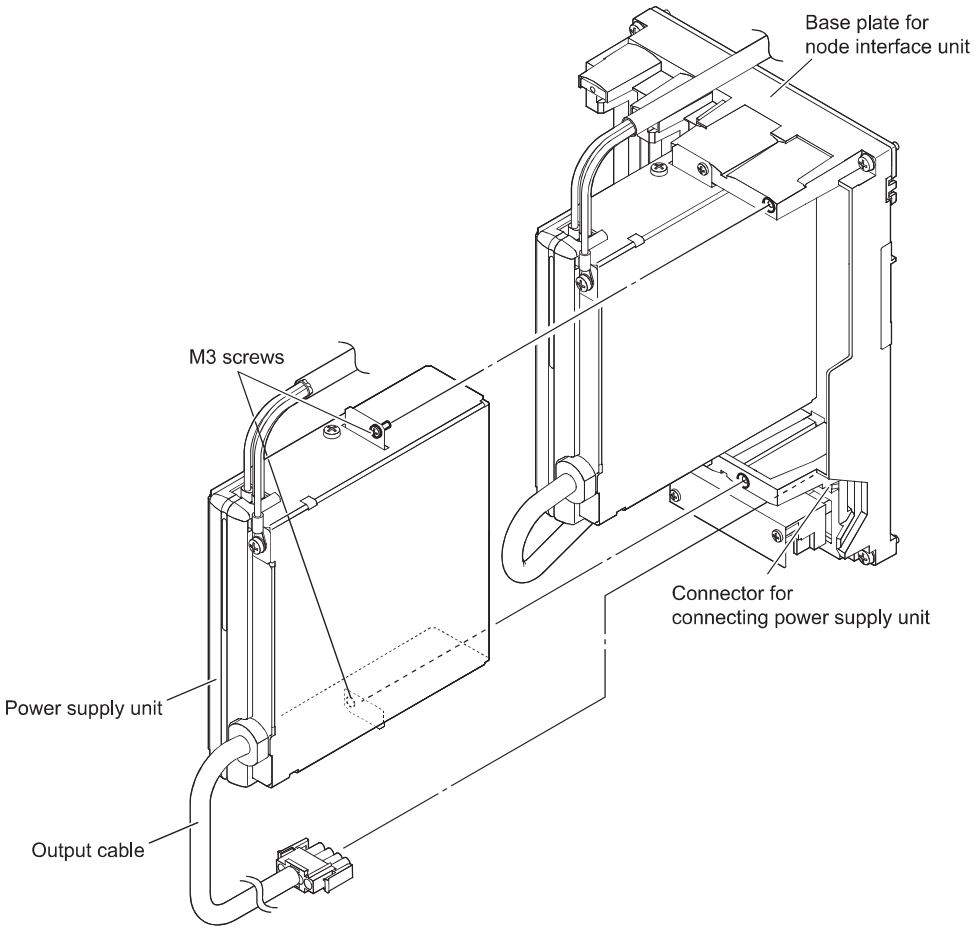

Figure E5.1-1 Replacing power supply units

Follow these steps to replace the power supply unit that has power supply:

1. Before removing a power supply unit, you must shut off the power supply to the unit. The power lamp turns off.
2. Remove the cover of the node interface unit.
3. Disconnect the output cable of the power supply unit from the connector for connecting power supply unit on the base plate for node interface unit.

4. Loosen the two M3 screws and remove the power supply unit.
5. Mount the new power supply unit on the base plate for node interface unit securely by tightening the two M3 screws.
6. Connect the output cable of the power supply unit to the connector for connecting power supply unit on the base plate for node interface unit.
7. Attach the cover of the node interface unit.
8. Supply power to the power supply unit.
   The power lamp turns on.

SEE ALSO For more information about removing and attaching the cover of the node interface unit, refer to:

"● Cover" on page B5-2

E5.2 Replacing N-ESB bus modules

CAUTION

Be aware that the N-ESB bus modules may be hot.

The following figure shows the replacement of an N-ESB bus module.

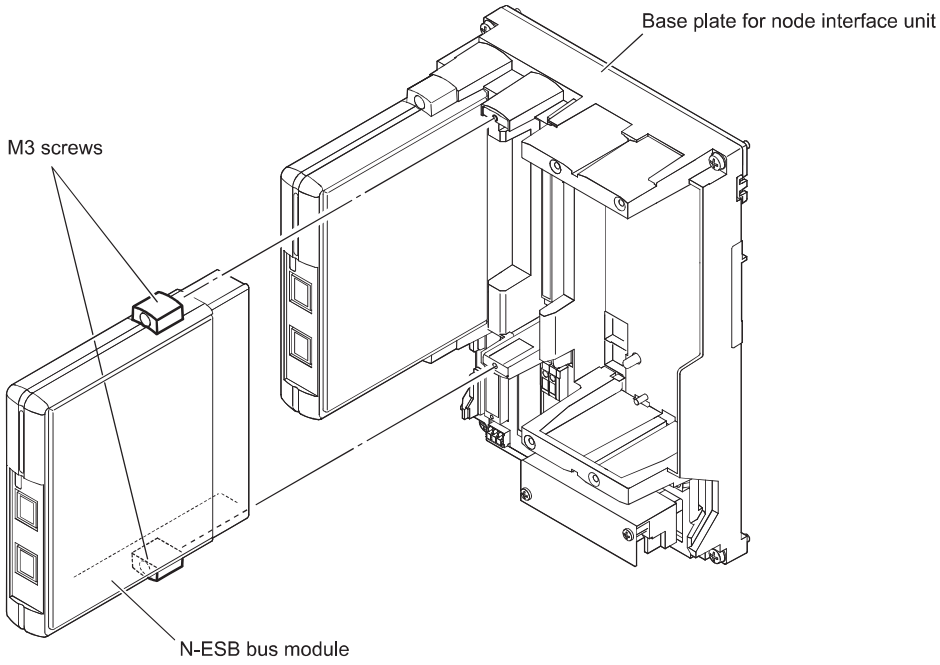

Figure E5.2-1 Replacing N-ESB bus modules

Follow these steps to replace an N-ESB bus module:

1. Disconnect the communication cable from the N-ESB bus module to be replaced.
   If the disconnected cable is a fiber-optic cable, put a cap to keep it away from dust.
2. Loosen the two M3 screws and remove the N-ESB bus module.
3. Mount a new N-ESB bus module on a base plate for node interface unit securely by tightening the two M3 screws.
   The STAT lamp turns on.
4. Make sure that the node number is set correctly.
5. Connect the communication cable to the N-ESB bus module.

TIP

When you mount the new N-ESB bus module, the node number is automatically copied from the other N-ESB bus module.

E5.3 Replacing N-IO I/O modules

The replacement of an N-IO I/O module is explained divided into two cases of dual-redundant configuration and non-redundant configuration.

Replacement procedure for a dual-redundant configuration

The procedure for replacing an N-IO I/O module differs depending on whether you replace a standby module or an active module.

When replacing a module on a standby side

This section describes how to replace the N-IO I/O module on the dual-redundant standby side. The procedure here assumes that the module that has a hardware error is installed in slot 1 of a base plate.

CAUTION

Be aware that the modules may be hot.

Follow these steps to replace a standby module:

1. Confirm that the status lamps of the N-IO I/O module are as follows:

	Slot 1	Slot 2
STATUS	Off	On
ACT	Off	On
DX	On	On

2. Loosen the two M3 screws and remove the module in the slot 1.

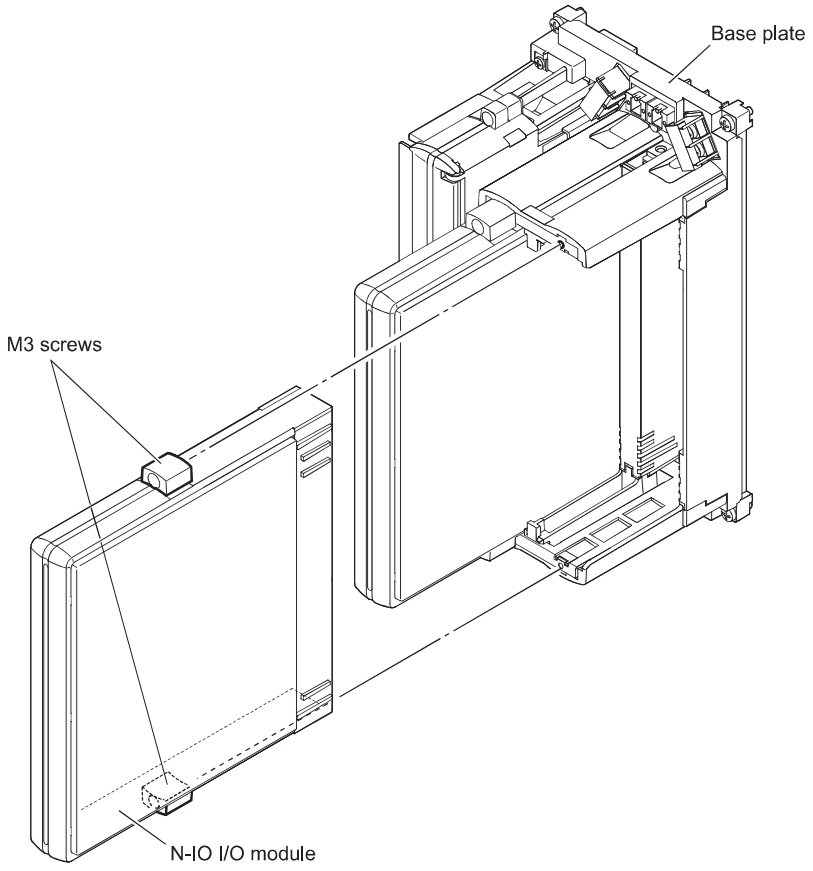

Figure E5.3-1 Example of replacing an N-IO I/O module

3. Tighten the two M3 screws and install the new module in slot 1 of the base plate. The STATUS lamp of the slot 1 module turns on.
4. Download an IOM for the module in the slot 1. If Automatic IOM Download is set to [Enable] in the SCS Constants Builder, IOM download is performed automatically.(*1) When the IOM download is complete and the module starts normally, the module in the slot 1 acts as the standby module.

*1: If it is not set to download automatically, execute the IOM download from the SCS State Management window of the SCS Maintenance Support Tool.

SEE ALSO For more information about the SCS Constants Builder, refer to:

C1.2.6, “SCS Constants Builder” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

When replacing a module on the active side

This section describes how to replace the active module of a redundant pair of N-IO I/O modules. The procedure here assumes that the active module is installed in slot 1 of a base plate.

CAUTION

Be aware that the modules may be hot.

Follow these steps to replace an active module:

1. Confirm that the status lamps of the N-IO I/O module are as follows:

	Slot 1	Slot 2
STATUS	On	On
ACT	On	Off
DX	On	On

2. For the module in slot 1, use the IOM Control Right Switching Tool to make a switchover to the standby module.
   The ACT lamp of the slot 1 module turns off, and the ACT lamp of the slot 2 module turns on.
3. Loosen the two M3 screws and remove the module in the slot 1.
4. Tighten the two M3 screws and install the new module in slot 1 of the base plate.
   The STATUS lamp of the slot 1 module turns on.
5. From the SENG, perform an IOM download for the module in the slot 1. If Automatic IOM Download is set to [Enable] in the SCS Constants Builder, IOM download is performed automatically.(*1)
   When the IOM download is complete and the module starts normally, the module in the slot 1 acts as the standby module.

*1: If it is not set to download automatically, execute the IOM download from the SCS State Management window of the SCS Maintenance Support Tool.

SEE ALSO For more information about the SCS Constants Builder, refer to:

C1.2.6, “SCS Constants Builder” in Engineering Guide Vol. 1 (IM 32P01C10-01EN)

Replacement procedure for a non-redundant configuration

Follow these steps to replace the N-IO I/O module in non-redundant configuration:

1. Confirm that the status lamps of the N-IO I/O module are as follows:

STATUS	Off
ACT	On
DX	Off

2. Loosen the two M3 screws and remove the module.
3. Tighten the two M3 screws and install the new module to the base plate.
   The STATUS lamp turns on.
4. From the SENG, perform an IOM download for the module.
5. Make sure that the hardware of the replaced module is working properly.

E6. Replacing the cables

This section describes how to replace the following cables:

- ESB bus cables
- Cables for optical ESB bus
- Cables for N-ESB bus

E6.1 Replacing ESB bus cables

Follow these steps to replace the ESB bus cable (Model: YCB301):

1. During replacement of ESB bus cables, the corresponding ESB bus becomes error. For an instance, when changing the Bus 1 cable, make sure that the communication to all SNUs and I/O modules on Bus 2 are working properly.
2. Disconnect the ESB bus cable from the ESB bus coupler module or the ESB bus interface module of Bus 1.
3. Exchange the ESB bus cables.
4. Connect the new ESB bus cable to the module. The tightening torque of the screws on the ESB bus cable connector should be 0.3 N·m.
5. Make sure that the replaced hardware is working properly.

E6.2 Replacing fiber-optic cables for optical ESB bus

Follow these steps to replace fiber-optic cables:

1. Disconnect the fiber-optic cable to be replaced from the module. Cap the cable to prevent dust infiltration.
2. Exchange the fiber-optic cables.
3. Uncap the replaced fiber-optic cable and connect it to the original port of the module. The connector for connecting fiber-optic cables has an IN port and an OUT port. Be sure you connect the cable to the correct port.
4. Check the diagnostic information window on the SENG for any errors.

E6.3 Replacing N-ESB bus cables

Follow these steps to replace the N-ESB bus cables:

1. Confirm that communication with all N-IO nodes is performed normally on the ESB bus that is not to be replaced.
2. Disconnect the N-ESB bus cable from the N-ESB bus coupler module or N-ESB bus module.
3. Connect the new cable to the original port of the module.
4. In the diagnostic information window on SENG, confirm that communication is performed normally on the N-ESB bus for which you have replaced the cable.

Revision Information

Title : Hardware User's Guide

Manual No. : IM 32P06C10-01EN

Dec. 2023/9th Edition/R4.10 or later

Introduction	Deleted "■ Requirements for Installation" and "■ Measurement Categories" from "Installation and Maintenance Notes." Deleted "Guidelines for Selecting a Power Supply Unit."
E3	Updated the table of parts with defined life spans.

Jan. 2022/8th Edition/R4.07

Entire manual	Updated descriptions based on a notice of alterations.
E3.1	Added descriptions on waste batteries.

Feb. 2021/7th Edition/R4.06

Introduction	Deleted descriptions of conformity standards.
Entire manual	Added modules for SCSs that support SIL 2.

Dec. 2019/6th Edition/R4.05

Entire manual	Updated descriptions based on a notice of alterations.
Introduction	Updated descriptions of conformity standards. Updated descriptions of registered trademarks.
B1	Added descriptions of S2SC70.
B4.2	Added descriptions of S2CP471.
E3	Added descriptions of life-limited parts.
E3.1	Added descriptions of battery replacement procedure.
E4.3	Added descriptions of S2CP471 replacement procedure.

Aug. 2018/5th Edition/R4.04

Introduction	Updated the description of registered trademarks of YOKOGAWA.
D2.1	Changed the caution for connecting inductive load.

Oct. 2017/4th Edition/R4.03.10

Introduction	Added some standards to the table of standards that the Product conforms to.
B4.7.3, D1.4.4	Added descriptions of the fire and gas communication module.
E2	Added descriptions of inspection by checking status lamps.
E3	Added relays for replacement to the table of parts with defined life spans.
E3.5	Added procedures for replacing relays of relay boards.

May 2017/3rd Edition/R4.03

Entire manual	Added S2MDV843. Changed "Analog digital I/O module" to "N-IO I/O module."
B4.7.1	Added descriptions to the status lamps of analog I/O modules.
B5	Added descriptions of system models.
E2	Added descriptions to inspection by checking status lamps.

Oct. 2016/2nd Edition/R4.02

Entire manual	Changed the symbols that indicate warning and caution.
Introduction	Updated descriptions of requirements for installation.
C1.3	Added descriptions of how to mount/remove the node interface unit on/from a DIN rail.
C1.4.1	Added descriptions of how to mount/remove the base plate with disconnecting terminals on/from a DIN rail.

Dec. 2015/1st Edition/R4.01

Introduction

ProSafe-RS is a safety instrumented system conforming to IEC 61508. This technical information (TI) document introduces various features and functions of the ProSafe-RS.

Document Structure

An overview of the ProSafe-RS system is described in this TI. After reading this TI, go over to read other documents such as General Specifications (GS) or Instruction Manuals (IM) for more details.

This TI consists of five chapters. Chapter 1 discuss about the importance of safety instrumented system, while the remaining chapters will explain the features of ProSafe-RS, system configuration, safety control station, engineering, operation and maintenance.

Reference Documents

Refer to the following document for a system integrated with CENTUM VP.

- Integrated Production Control System CENTUM VP System Overview (General Overview) (TI 33J01A10-01EN)

Target Readership

- Managers who are considering introduction of a new safety instrumented system.
- Instrumentation, power and computer engineers who evaluate for purchasing or installation of ProSafe-RS.

Representation of Drawings

- Drawings in this TI may be emphasized, simplified, or omitted some features for convenience of explanations.
- The screen captures may be slightly modified for the convenience of the better understanding without disturbing the functional understanding or operation and monitoring.

Trademarks

- ProSafe, CENTUM, PRM, STARDOM, FAST/TOOLS, Exaopc, FieldMate, and Vnet/IP are either registered trademarks or trademarks of Yokogawa Electric Corporation.
- Other company and product names appearing in this document are registered trademarks or trademarks of their respective holders.
- TM or ® mark are not used to indicate trademarks or registered trademarks in this document.
- Logos and logo marks are not used in this document.

1. Necessity of Safety Instrumented System

In this chapter, a plant owner's responsibility, the international standards, positioning of a safety instrumented system and safety evaluation scales are explained.

Plant owner's responsibility

During 1970s and 1980s, serious incidents that occurred at petroleum and chemical plants initiated several countries to legislate that "owners of industrial plants where dangerous materials are handled must evaluate possible risks that may occur in the plants."

These legal regulations stipulate that the plant owners are socially responsible in the entire lifecycle, from planning to disposal, to minimize the risks of causing hazards over "human beings, physical assets and environments." In order to fulfill these social responsibilities, the plant owners are expected to identify risk factors of hazardous elements that cause incidents; to analyze and evaluate them; then to reduce the risks to a socially acceptable level.

The international standards of IEC 61508 and IEC 61511 defined procedures of how to identify, analyze and evaluate risks, then implement the risk reduction measures based on legal regulations of several countries.

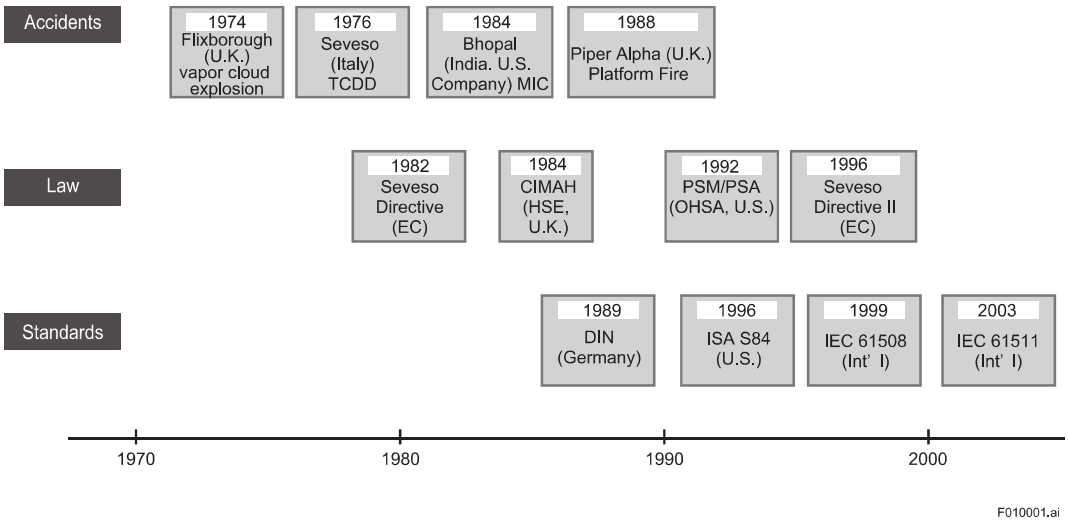

Figure Flow from incidents to standardization

IEC 61508 / IEC 61511 international standards

The IEC 61508 defines the basic safety standard for functional safety for all industries. The IEC 61511 is dedicated for the process industry, in reference to the IEC 61508. These safety standards for functional safety are not established on the premise of “100% accident free,” but with some risks always remain. By converting the risks into numerical value by the globally standardized scale, the necessity and effectiveness of safety measures can be verified.

Positioning of the safety instrumented system in the viewpoint of layer of protection

A “layer of protection” approach is adopted as the basis of securing the plant safety that is to reduce risks by combining independent protection layers with the international standards of the IEC 61511, as shown below. Each protection layer has to be independent from each other, sets quantitative target for reducing risks, and establishes means of achieving these goals.
A safety instrumented system is positioned in the prevention layer for reducing the risk of hazardous event occurrence and the mitigation layer for mitigating the influence of a hazardous incident that has occurred.

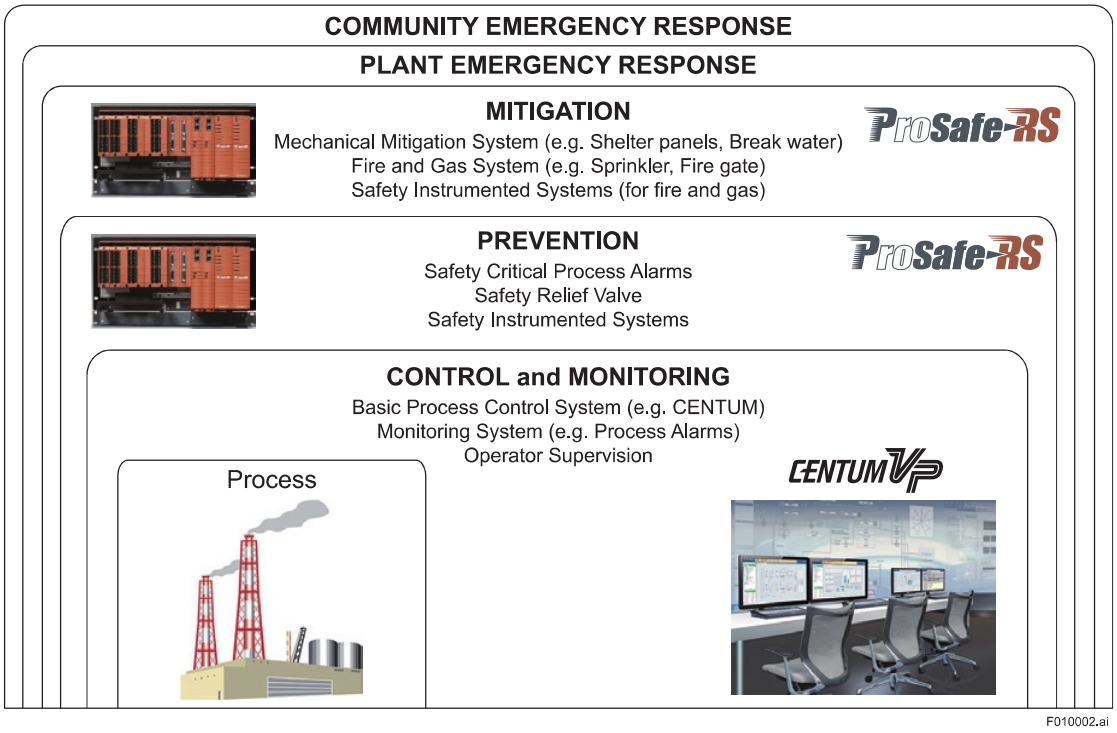

Figure The layer of protection

In order to work out countermeasures for risks based on the layer of protection, risk assessments to the plant must be implemented and essential risk levels inherent in the process must be calculated. (1) In order to reduce the risks to a socially permissible risk level, multiple layers of protection have to be assigned. (2) The figure below shows reducing the risks to the tolerable level by combining external mitigation facilities (e.g. shelter panels, breakwaters, etc.); a process control system (e.g. CENTUM); and a safety instrumented system for emergency shutdown (ESD).

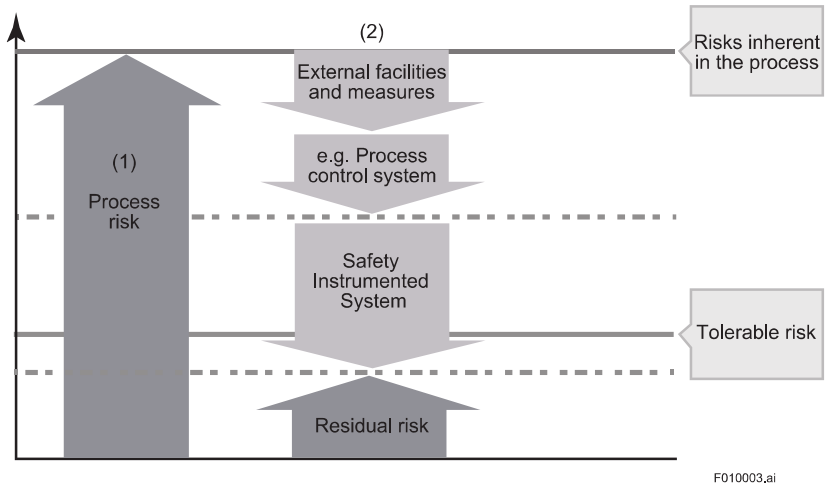

Figure The risk reduction level of the plant

Safety evaluation scales

The IEC 61508 introduces the Safety Integrity Level (SIL) as a method of describing the safety integrity requirements required at each layers of protection. The SIL is classified into four levels according to the value of average Probability of a dangerous Failure on Demand (PFDavg). The PFDavg of manual operation is 1/10 or so, which means a failure may occur out of 10 operation requests and unable to perform its safety operation.

On the other hand, a safety instrumented system reduces the probability of failures as low as possible by enhancing its self-diagnosis function and failure analysis. This means a safety instrumented system with the SIL3 guarantees to perform the operation compared with manual operations.

Table Safety integrity level (SIL)

SIL	PFDavg	Description
4	$\geq 10^{-5}$ to $<10^{-4}$	Frequency of risk occurrence is reduced to the ranges in between 1/10000 and 1/100000 under the current conditions.
3	$\geq 10^{-4}$ to $<10^{-3}$	Frequency of risk occurrence is reduced to the ranges in between 1/1000 and 1/10000 under the current conditions.
2	$\geq 10^{-3}$ to $<10^{-2}$	Frequency of risk occurrence is reduced to the ranges in between 1/100 and 1/1000 under the current conditions.
1	$\geq 10^{-2}$ to $<10^{-1}$	Frequency of risk occurrence is reduced to the ranges in between 1/10 and 1/100 under the current conditions.

2. Features of the ProSafe-RS

This chapter describes about the features of the ProSafe-RS safety instrumented system which conforms to the Safety Integrity Level 3 (SIL3) defined by the IEC 61508.

Achieving SIL3 in single configuration

ProSafe-RS is a safety instrumented system which achieves the SIL3 in a single configuration and its performance is certified by TÜV Rheinland, an external certification organization.

Each of the processor and input/output modules of the ProSafe-RS contain built-in computation matching function and self-diagnostic function, which keeps the modules failure rates to extremely low. The ProSafe-RS flexibly complies with customers' requirements with its single configuration and the SIL3 certification.

Intended application
Safety related and high availability applications such as:

Emergency Shutdown System (ESD), Process Shutdown System (PSD), Burner Management System (BMS), where the safe state is the de-energized state. Fire and Gas System (F&G)applications, where the demand state is the de-energized or the energized state.
The safety control system complies with the requirements of the relevant standards (SIL 3 acc. to IEC 61508 and SILCL 3 acc. to IEC 62061) and can be used in applications up to SIL 3.

Specific requirements
The instructions of the associated Installation and Operating Manual shall be considered.

Valid until 2021-02-04
The issue of this certificate is based upon an examination, whose results are documented in Report No. 968/EZ 196.39/16 dated 2016-02-04.
This certificate is valid only for products which are identical with the product tested. It becomes invalid at any change of the codes and standards forming the basis of testing for the intended application.

F020001.ai

Redundancy achieves higher reliability

ProSafe-RS allows selecting dual-redundant module configurations in order to achieve higher reliability. Since the system already achieves SIL3 with a single configuration, the SIL3 is maintained even when one of the modules fails.

System integration with CENTUM VP

By integrating with the CENTUM VP system, the operation status of the ProSafe-RS are monitored on the CENTUM VP's operation and monitoring screen. ProSafe-RS and CENTUM VP synchronize time, share data, and notify event & alarm in a single step.

Segregating functions of CENTUM VP from ProSafe-RS

International safety standards require that control and safety functions are independent of each other. Even when the ProSafe-RS and the CENTUM VP systems are integrated, the control and the safety functions are securely segregated. The operation of the CENTUM VP has no influence over safety functions of the ProSafe-RS.

Connecting with other systems

The operating status and data of the ProSafe-RS can be referred to by a supervisory computer or Modbus master via an OPC interface (*1), or a Modbus slave communication. Furthermore, the subsystem data such as sequencers can be set or referred by the ProSafe-RS via a Modbus communication.

*1: The OPC is a way of communication among standard applications of Windows OS applied to process control. The OPC enables to send/receive process data among multiple Windows applications.

Security measures

The ProSafe-RS is accredited with the ISASecure Embedded Device Security Assurance (EDSA) of the ISASecurity Compliance Institute (ISCI), an international accreditation organization. The exida, an American accreditation organization certified by the ISASecure EDSA performed the Communication Robustness Test (CRT), the Fabricated Security Assessment (FSA) and the Software Development Security Assessment (SDSA). Then the ISCI evaluated and verified the conformity to the standard. The ISASecure EDSA certification certifies that the ProSafe-RS's controllers have adequate security measures against threats of cyberattacks.

F020002.ai

Figure ISASecure EDSA certification

3. System Configuration of the ProSafe-RS

In this chapter the system configuration of the ProSafe-RS is explained. The ProSafe-RS consists of Safety Control Station (SCS), Safety Engineering Station (SENG), Automation Design Server (AD Server) and others. AD Server is a Database Server which preserve the project data in a system. A minimum configuration system consists of an SCS and a SENG (including an AD Server).

3.1 Typical configuration

The figure below shows an example of the ProSafe-RS system configuration.

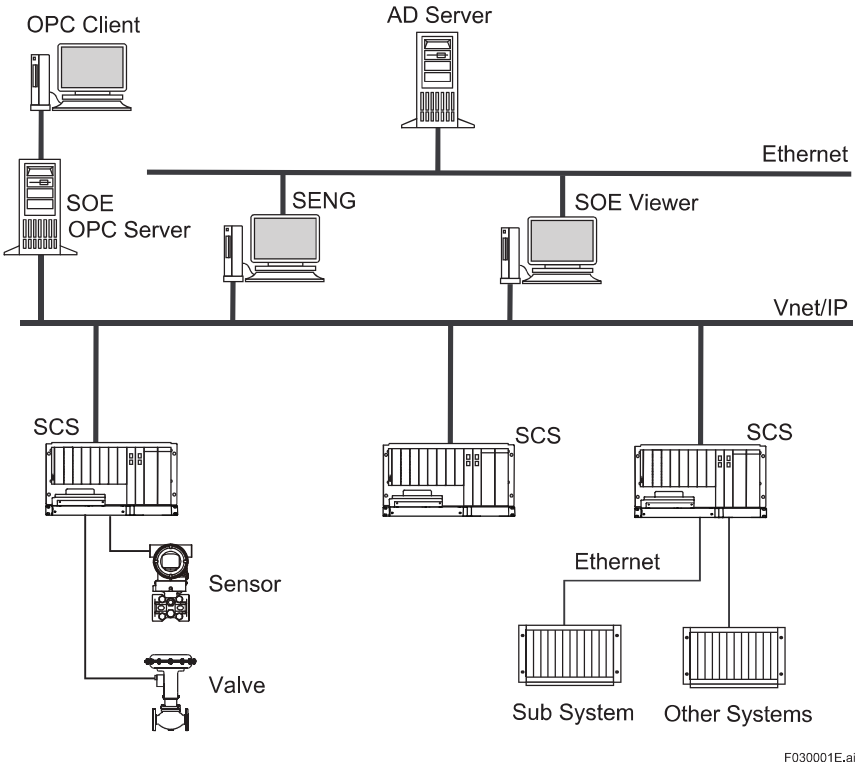

Figure Example of ProSafe-RS system configuration

Safety control station (SCS)

An SCS is a controller to perform safety control of the ProSafe-RS.

Main features

- Executes safety control function
- Receives input datas from field devices
  (e.g. temperature, pressure, flow, ON/OFF status of a switch)
- Transmits output instructions to field devices
  (e.g. open/close of valves, instruction of equipments' ON/OFF)
- Performs inter-station communications
  (e.g. inter-SCS safety communication, SCS link transmission safety communication)
- Communicates with field devices (HART communication)
- Communicates with other systems
  (e.g. Modbus communication)

Safety engineering station (SENG)

The SENG is a computer for performing SCS's engineering and maintenance tasks.

Main features

- Creates and verifies safety control functions (application programs)
- Downloads the created application programs to SCSs
- Monitorings SCSs status
- Receives and displays alarm messages from SCSs

3.2 Integration with the CENTUM VP

The ProSafe-RS and the CENTUM VP systems can be integrated. The figure below shows an example of a system configuration that the ProSafe-RS and the CENTUM VP are integrated.

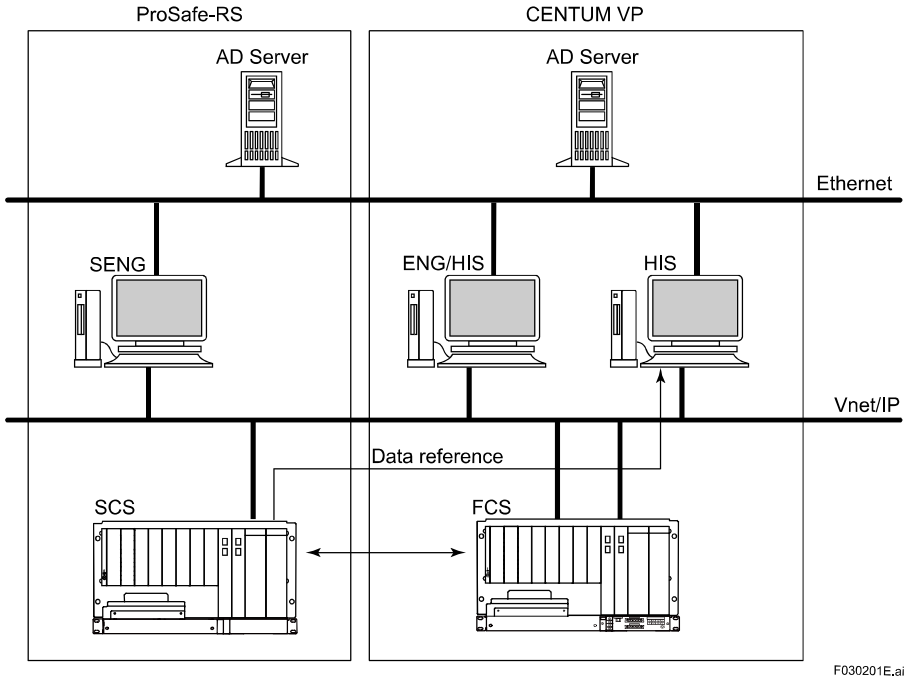

Figure System configuration example of ProSafe-RS integration with CENTUM VP

HIS
An operation and monitoring station of CENTUM VP for operating a plant.

ENG
An engineering station to perform system configuration and maintenance management of the CENTUM VP.

FCS
A controller that controls a process.

- An HIS operates and monitors both FCSs and SCSs.
- The SCS's data can be referred from HISs or FCSs.
- The SENG performs engineering of SCSs and the ENG performs engineering of FCSs and HISs. The engineering of the CENTUM VP integration systems are performed by both the SENG and the ENG. The SENG, ENG and HIS functions can be resided on a single computer or independently installed on different computers.
- The SCS's data setting can be performed from HISs or FCSs; however, the data setting for the SCS is managed with the special security scheme.

System scale

In a ProSafe-RS and CENTUM VP integrated system, the maximum number of station that can be configured is as follows:

- Number of connectable domains: 16
- Number of connectable stations (*1) per domain: 64
- Number of connectable stations: 256

Note: For a Vnet/IP system configuration, refer to General Specifications of “ProSafe-RS Safety Instrumented System Overview (for Vnet/IP)” (GS 32P01B10-01EN).
*1: A station is a generic name for SENG, SCS, ENG, HIS and FCS.

3.3 Communications among stations

"Inter-SCS safety communication," "SCS link transmission safety communication," and "SCS global switch communication" are used for communications among control stations.

Inter-SCS safety communication

The Inter-SCS Safety Communication can be established between an SCS and another SCS (in the same or in the different domain). (*1) Transmission of essential data at the SIL3 level can be performed while maintaining the communication quality.

*1: In order to perform the Inter-SCS safety communication while inter-domain, the integration with CENTUM VP system is needed.

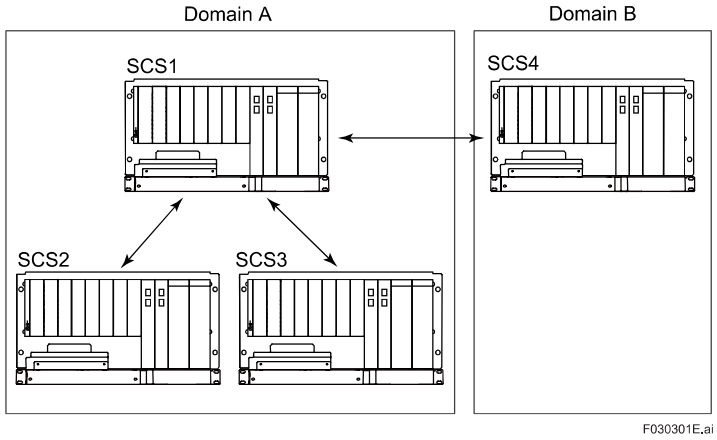

Figure Inter-SCS safety communication

SCS link transmission safety communication

The SCS Link Transmission Safety Communication is a safety communication to concurrently broadcast Boolean data from an SCS to multiple SCSs (in the same domain). By this communication, broadcasting of essential data at the SIL3 level can be performed.

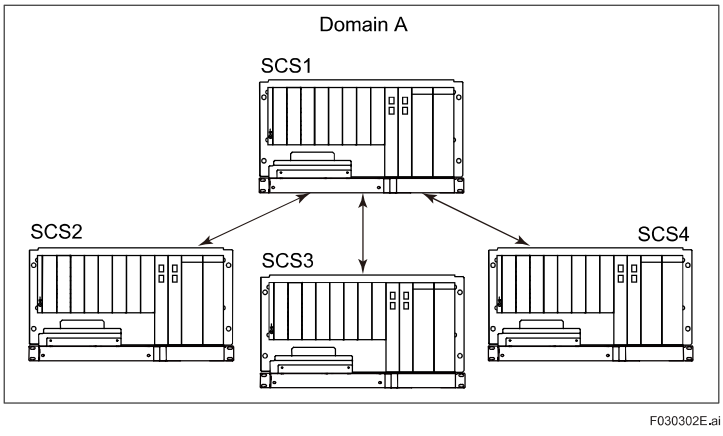

Figure SCS link transmission safety communication

SCS global switch communication

The SCS Global Switch Communication concurrently broadcasts data from an SCS to multiple FCSs, which is an interference-free communication that has no influence over safety control.

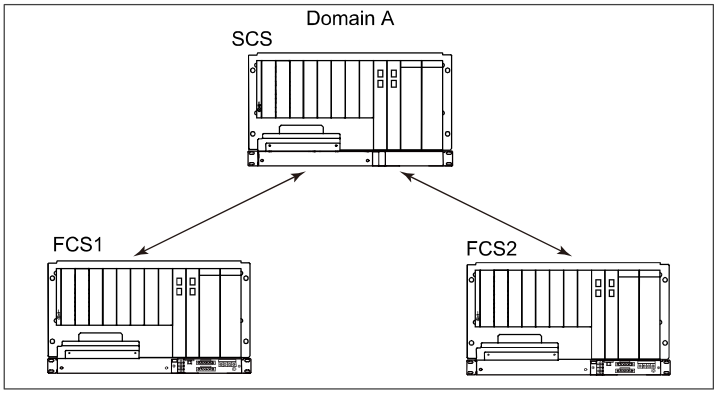

Figure SCS global switch communication

4. Safety Control Station (SCS)

This chapter explains the hardware configuration of a safety control station (SCS) that provides SIL3 in single configuration.

4.1 Hardware configuration of the SCS

The SCS is a safety controller of the ProSafe-RS. The SCS is composed of Safety Control Units (SCU), Safety Node Units (SNU) and N-IO Nodes. (including N-IO field enclosure) N-IO field enclosure is a standardized remote I/O enclosure for outdoor use, in which N-IO nodes are equiped.

The figure below shows an example of a system configuration.

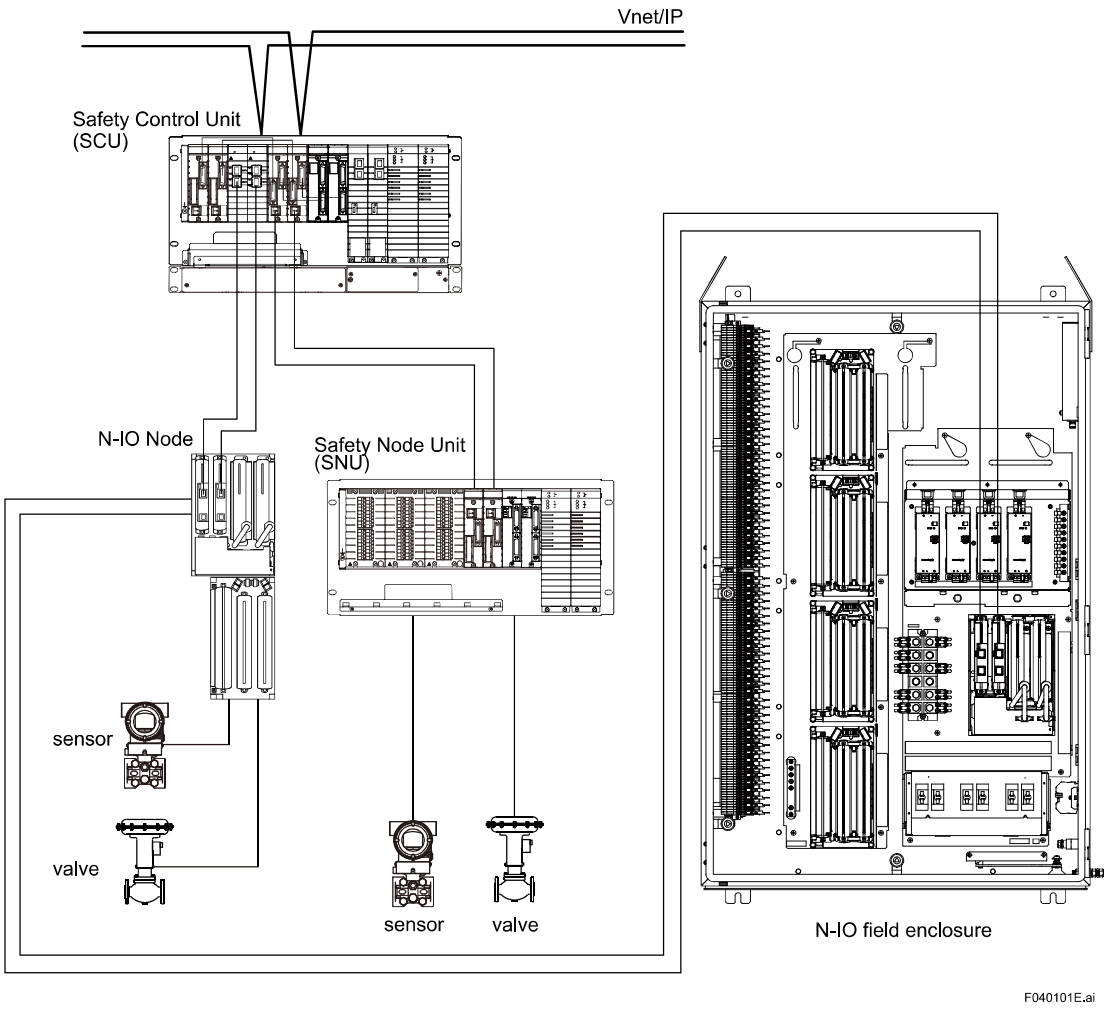

Figure System configuration example of SCS

4.2 Safety control unit (SCU)

Overview

The SCU implements safety control function by executing the application programs downloaded from the SENG. By using the Vnet/IP communication function, inter-station communications can be performed. Input/output modules mounted on SCU perform for input/output of field devices' data.

The input/output modules can be increased by adding safety node units and N-IO nodes.

The following types of the SCU are available.

S2SC70S/D: For large-scale systems or small to medium-scale systems, applicable to N-IO node

SSC60S/D: For large-scale systems or small to medium-scale systems

SSC57S/D: For wide-area systems such as oil and gas production facilities (wellheads) or small to medium-scale systems

SSC50S/D: For small to medium-scale systems

The following figure shows an example of the SCU configuration.

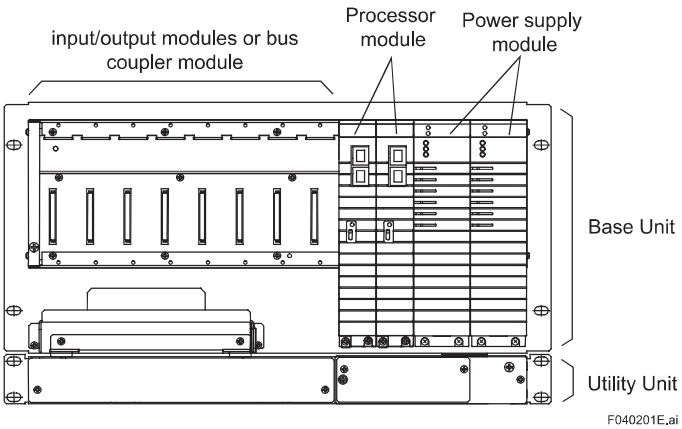

Figure Configuration of safety control unit (S2SC70D)

4.3 N-IO node, N-IO field enclosure, and safety node unit (SNU)

N-IO node

An N-IO node consists of an N-IO node interface units and N-IO Input/Output units. The N-IO node interface unit transmits field device signals received by the N-IO I/O unit to the SCU and the SCU data to field devices via an N-IO I/O unit. Input/output modules can be mounted on the N-IO I/O unit.

The figure below shows an example of N-IO node unit configuration.

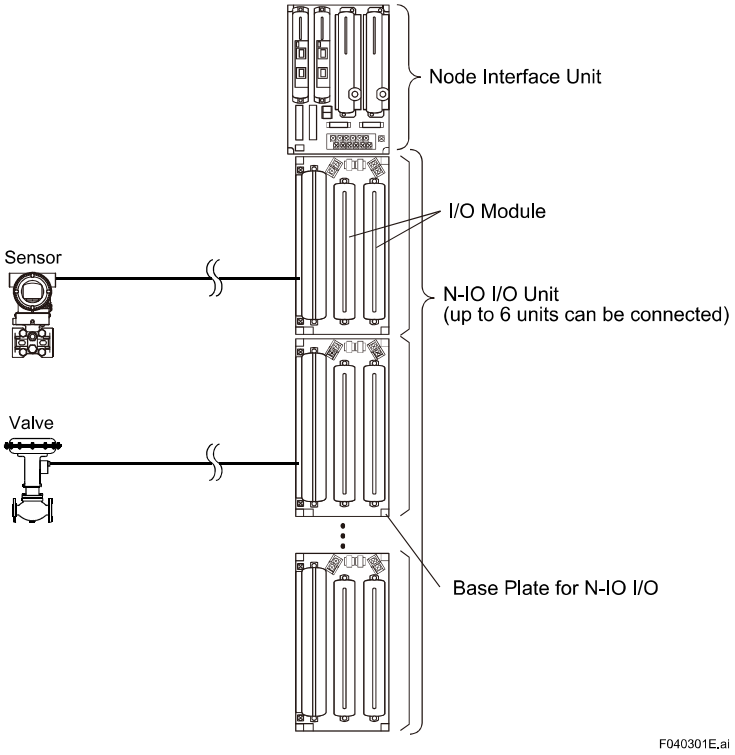

Figure System configuration N-IO node unit

Input/Output modules

AI, AO, DI, or DO signal can be assigned to the input/output modules by the channel by software.

Model	Function	Remarks
Analog Digital Input/Output Module		
S2MMM843	(AI) Analog Input	4-20 mA , HART Communication function, Module isolation
	(AO) Analog Output	4-20 mA , HART Communication function, Module isolation
	(DI) Digital Input	no-voltage contact, Module isolation
	(DO) Digital Output	24 V DC/0.66 A (*1), Module isolation
S2MDV843	(DI) Digital Input	no-voltage contact, Module isolation
	(DO) Digital Output	24 V DC/0.66 A (*1), Module isolation

*1: The maximum load current up to 2 A device can be connected to DO by multiple channels parallel use.

Field wiring

The terminal(s) provided with the N-IO input/output unit is used for wiring directly to field devices.

N-IO field enclosure

N-IO field enclosure is a standardized remote I/O enclosure for outdoor use, which provides the accessories including field power supply units with optimized design. The N-IO field enclosure consists of two components, one is a dedicated enclosure with terminal blocks and the other is a base unit with an N-IO node including field power supply units. It is possible to order the enclosure and the base unit individually.

Safety node unit (SNU)

The input/output modules can be mounted on the SNU, and the SNU transmits analog input signals and contact signals of field devices to the SCU.

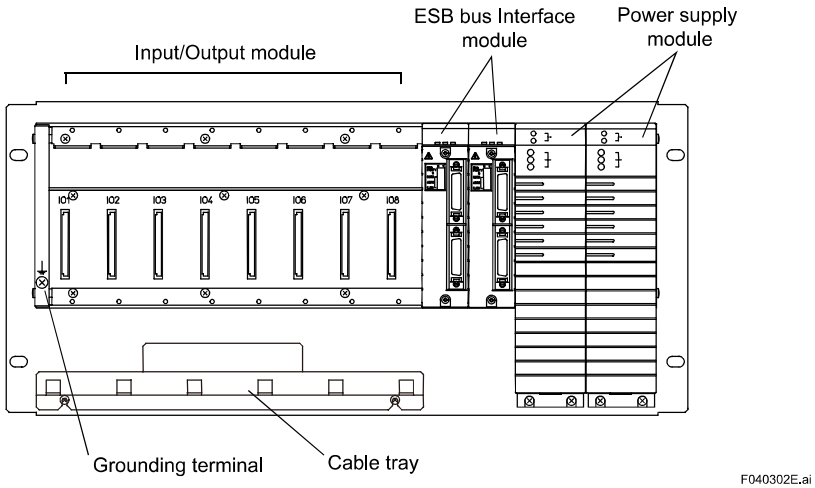

figure Configuration of safety node unit

Input/Output modules

The following table shows the input/output modules available for the ProSafe-RS. The input/output modules can take a dual-redundant configuration in order to improve the availability.

Table

Model	Name	Remarks
Analog Input/Output Modules		
SAI143	Analog input module	4-20mA, Module isolation, HART Communication function
SAV144	Analog input module	1 to 5 V/1 to 10 V, Module isolation
SAT145	TC/mV Input module	Isolated Channels
SAR145	RTD Input Module	Isolated Channels
SAI533	Analog output module	4-20mA, Module isolation, HART Communication function
Digital Input/Output Module		
SDV144	Digital input module	no-voltage contact, Module isolation
SDV521	Digital output module	24 V DC/2 A, Module isolation
SDV526	Digital output module	100-120 V AC, Module isolation
SDV531/SDV541	Digital output module	24 V DC, Module isolation
SDV53A	Digital output module	48 V DC, Module isolation
Communications Module		
ALR111/ALR121	Serial communication module	RS-232C, RS-422/RS-485
ALE111	Ethernet communication module	
S2LP131	Fire and Gas communication module	

Field wiring

For connecting a field device and an input/output module can be done by directly wiring using a pressure clamp terminal block or wiring via a terminal board using a cable-interface. Or, connecting a user-provided MIL cable with an MIL connector terminal block is available.

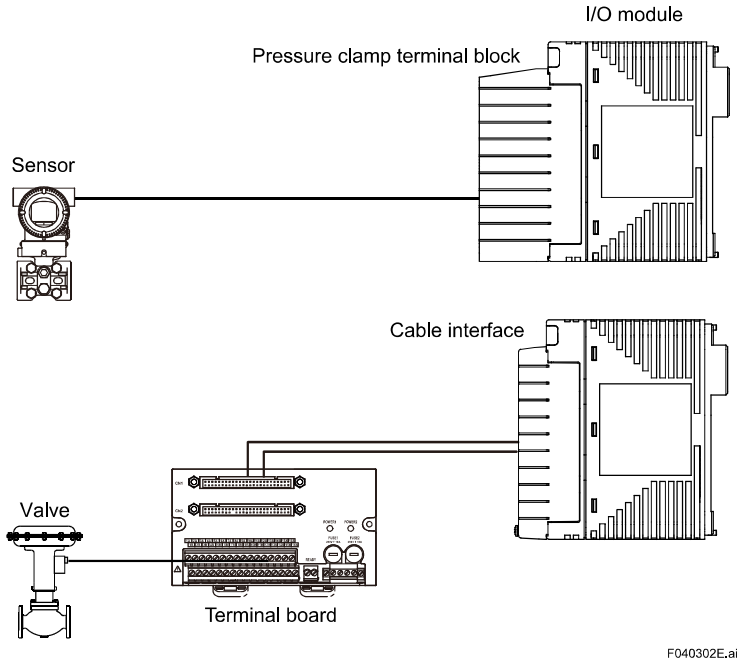

Figure Example of field wiring

5. Engineering and Operation & Maintenance

The engineering and operation & maintenance of the SCS are described in this chapter.

5.1 Engineering

Application logics need to be generated to activate ESD or fire and gas (FAG) protection systems.

Engineering procedure

The procedures of how to create applications to activate ESD or FAG systems as well as how to perform operational tests are as shown in the following figure.

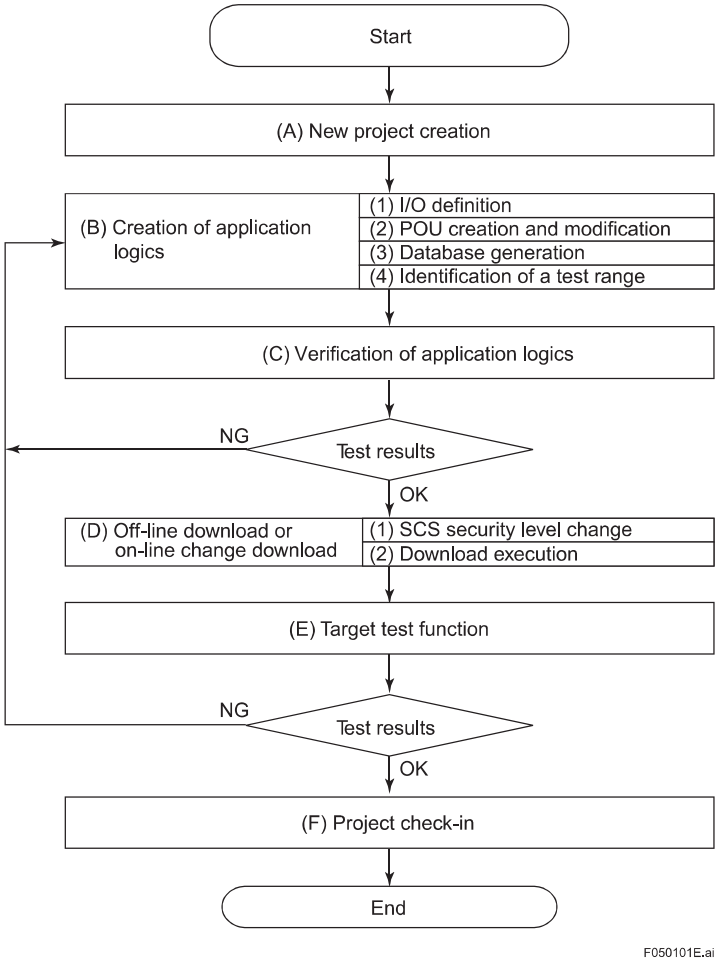

Figure Procedures for creating a ProSafe-RS standard application

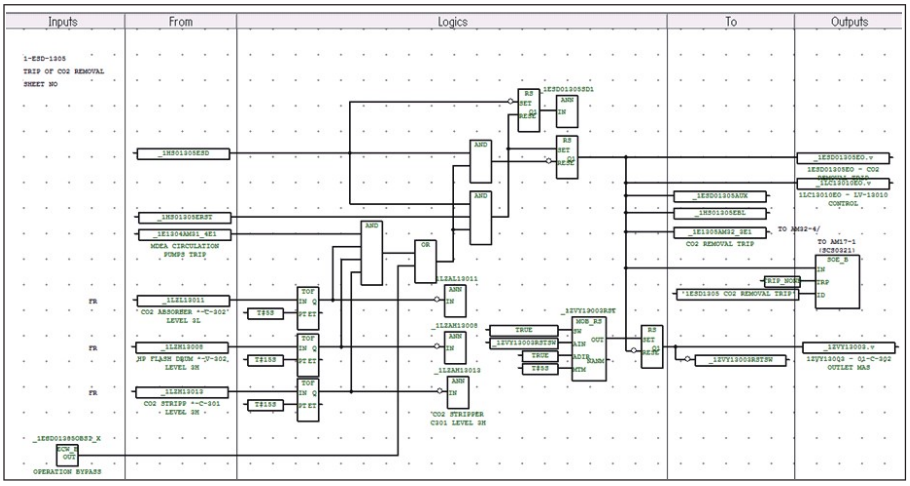
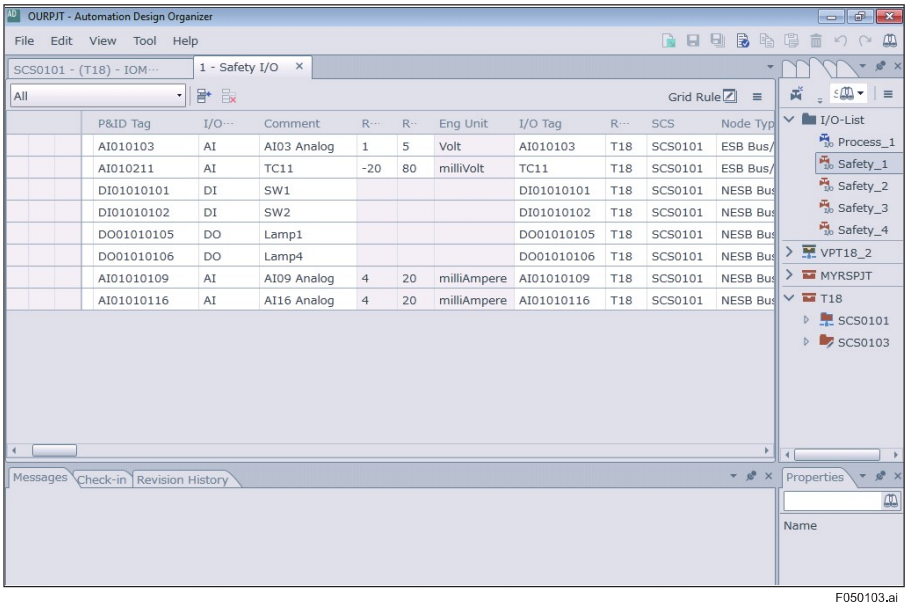


(A) New project creation

Create a new project to manage application logics. Creation of the application logic is enabled only after a creation of a new project.

(B) Creation of application logics



Create an application logic to materialize the designed SCS operation, by using function block diagram (FBD) or ladder diagram (LD) which conform to the IEC 61131-3 international standard.

Use the multi-language editor to create FBD. By connecting boxes of functional units called function blocks (FB) with lines, application logics from input to output can easily be created.

F050102.ai

Figure Example of creation of application logics by using multi-language editor

F050103.ai

Figure Define of I/O

(C) Verification of application logics

The application logic made in step (B) can be verified by using the virtual test function. The virtual test function performs the verification of the application logics on a computer without having an actual SCS. With the virtual test function displays the computation results of the application logics intuitively as TRUE (blue) and FALSE (red) on a screen. The logic simulation test and the SCS simulation test are available for the virtual test.

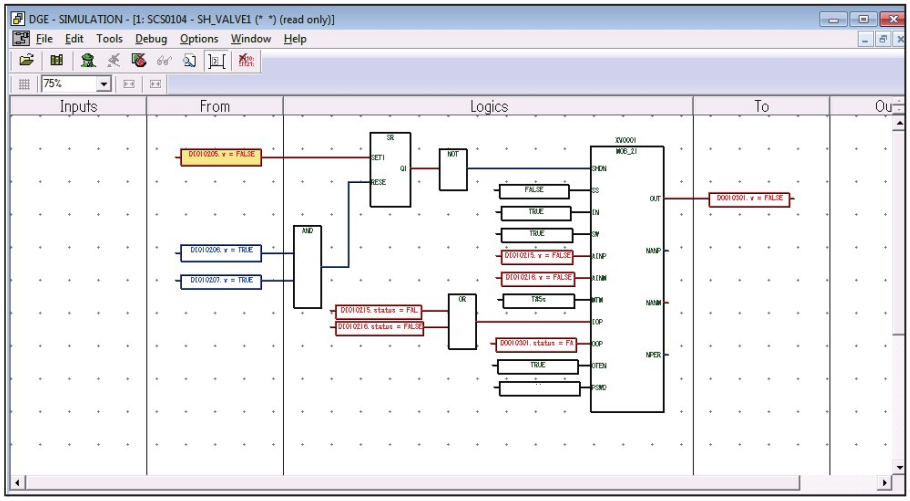


Figure Example of a test window

During the logic simulation test, the SENG executes the application logic using the logic simulator. The SCS security level is disregarded when verifying the application logic of each SCS.

When the SCS simulator on the ENG or the SENG executes application logic during the SCS simulation test, can also be conducted in accordance with the SCS's security level, integrated operation environment with CENTUM VP is required. Alarm confirmation on the HIS window enabled by temporarily overwritng application logic variables using override function of the HIS simulator. And if two or more of the SCS simulators are used, the inter-SCS safety communication test can be performed as well.

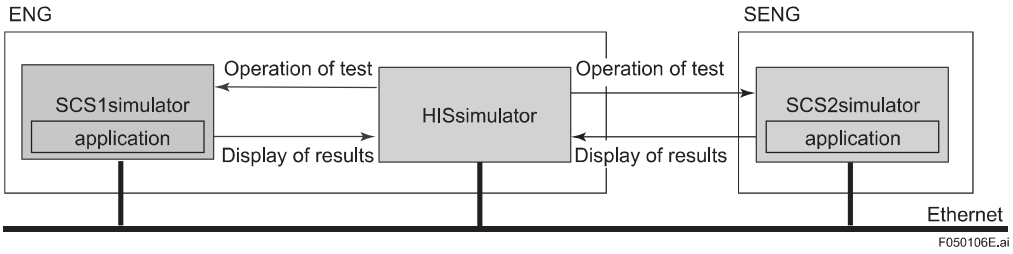

Figure SCS simulation test

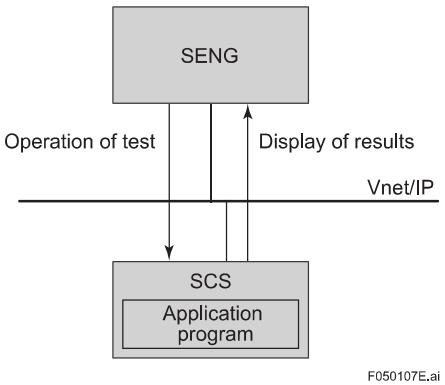
(D) Off-line download or on-line change download

Download the application program verified in Step (C) from SENG to SCSs. An engineer is to compare the application program on the SENG and the data base in the SCS and confirm if the downloading has been correctly executed.

(E) Target test function

The application logic can be verified on the actual SCS using the target test function. The test can also be performed without mounting input/output modules by using the forcing function (see chapter 5.2 Maintenance Functions) and manually simulate input/output signal status. The target test function can be performed in reference to the security level of the SCS.



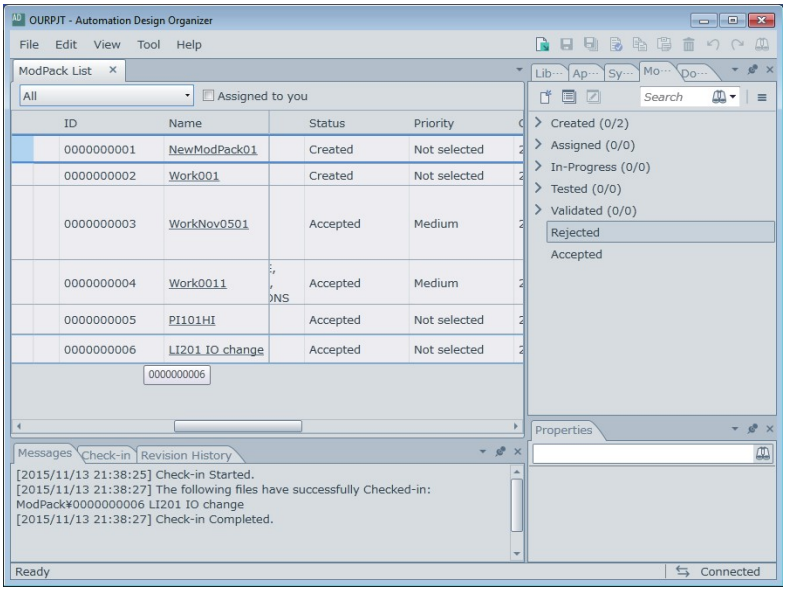


Figure Target test function

(F) Project check-in

Save the projects including the application logics created to the version management database for change management.

Change management function

The change management function an engineering support tool to manage change requirements generated during engineering work. By recording the changes in planning, execution, and testing, overlooking of the changes in the application programs can be prevented.

F050108.ai

Figure Change management function window

5.2 Operation and maintenance of SCS

Status of SCS and its operations in response to the plant's operating conditions and maintenance of the safety system are described in this section.

SCS status and operation

A safety system is expected to run properly and safely to prevent operators without authorities from making erroneous operations. The ProSafe-RS manages the SCS's operation and operational authorities by the operating mode and the SCS security level. The override and alarm window functions permits operation and monitoring of the SCS from CENTUM VP's HIS.

Operating modes

The operating modes indicate the operating statuses of the SCS. Depending on the kinds of operating mode determines how the SCS system program performs.

Table Operating modes

Operating Modes	
Name	**Status**
Stop Mode	The initial state of the SCS
Loading Mode	Downloading a program or database information from the SENG to the SCS.
Initial Mode	Executing diagnosis, database initialization, I/O module booting and others that are needed for starting initialization of the SCS.
Waiting Mode	Waiting for all the output modules to activate.
Running Mode	The SCS is operating normally.

SCS security levels

The SCS security level limits changes made by the operations to the SCS from outside.

Enable or disable of the user operation is controlled by the application logics depending on the defined security level.

Two categories of the security levels are available; one is the On-line level to be used during normal operation of SCS and the other is the Off-line level to be used when offline download is required. The security levels are password protected and only the authorized user with specific privileges can change.

On-line level:

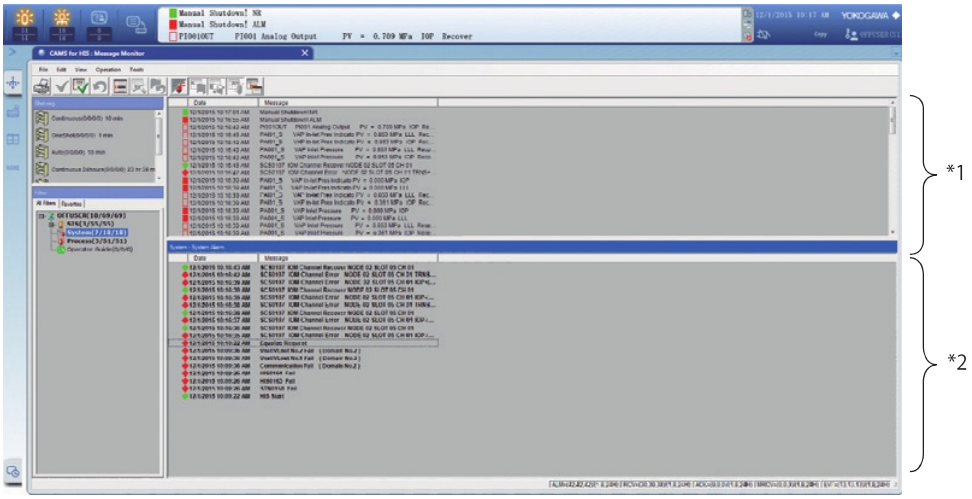
Level 2
The highest security level with which the normal operation of the SCS is executed.

Level 1
The security level is temporarily used by an engineer or a specially authorized user for maintenance of the system and changing applications online.

Off-line level:

Level 0
The security level to be used when off-line download is required.

Operation and monitoring of SCS by HIS (Override and alarm windows)



ProSafe-RS allows CENTUM VP's HIS to control and monitor the SCSs so that the safety instrumented systems perform its functions by knowing the overall plant operation status.

Override

I/O values can be set to a specified value that is different from the actual I/O value by operation from HIS while the system is controlled normally by the SCS. This operation is called override. This override can be created in the application logic using safety function blocks.

Alarm window

The Alarm window is to notify operators essential alarms to sustain the plant safety. By displaying only the SCS alarms extracted from all alarms, operators are able to recognize the important alarms easily.

*1: Alarms that the SCS extracted.
*2: All alarms.

Figure Integrated alarm window

Maintenance functions

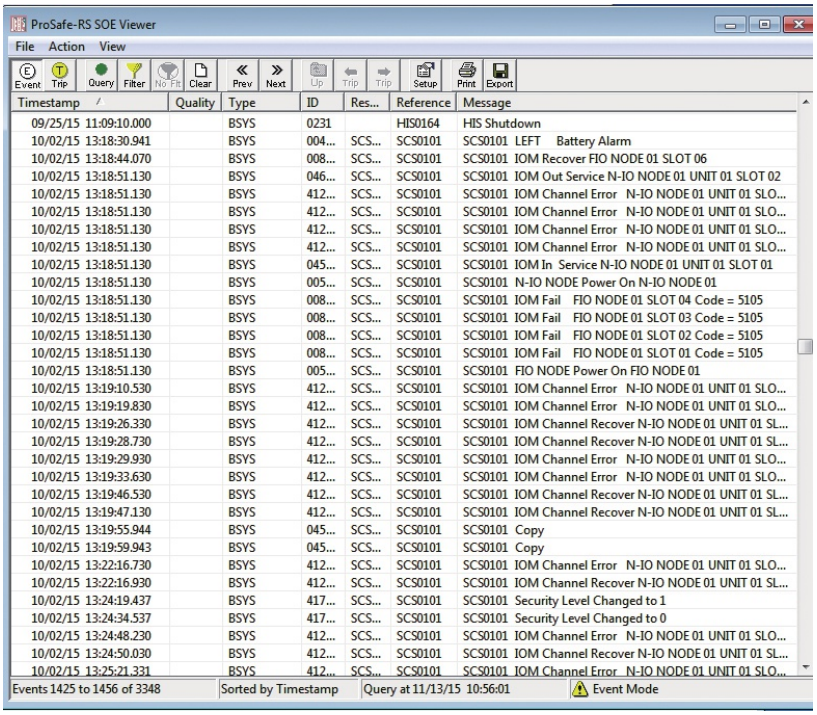
A safety instrumented system is required to have regular maintenance because it has to function without fail when an abnormality occurs. For the maintenance of the ProSafe-RS, maintenance support tools and forcing are provided.

SCS maintenance support tools

The SCS maintenance support tools have been developed for the purpose of simplifying the maintenance of the SCS. Equipped with a user interface to easily spot on a failure section, the function chronologically displays maintenance data necessary for analysis in the form of diagnostic information messages.

The SCS maintenance support tools are as described below:

SCS status display:	Displays the operating status of the SCS
Diagnostic information display:	Displays diagnostic information in the SCS
Online monitoring:	Displays the operating status of the application logic on the SCS
Message cache tool:	Acknowledges the diagnostic information message and accumulation of SOE events
SOE Viewer:	Displays event information stored on the SCS
Setup Tool:	Customizes how to display and use the SCS maintenance support tools.



Forcing

The forcing is a function to fix or forcibly change values of input/output modules and application logic for the purpose of maintenance of the SCS or verification of application logics. Different from the override function, a dedicated user interface is used and creation of an application logic is not required.

5.3 Sequence of events recorder (SOER)

The sequence of events recorder (SOER) is a function to record the events (*1) that the SCS detects. Especially when the safety instrumented system is triggered, the SOER can be utilized for analyzing the causes of the plant's emergency shutdown. The SOER function consists of the event collection, the event storage and the time synchronization functions.

*1: The term an "event" refers to a change to the predefined application logic.

F050301E.ai

Figure SOE Viewer

Event collection

Not only digital inputs (DI) but also changes in digital outputs (DO) and analog inputs (AI) are collected as event information. By using the SOER function blocks with the application logic, changes in application logics can be acquired as event information, which enables to record changes in communication data with other SCSs.

Event storage

A certain volume of event information is stored in the SCS, and a computer for the data storage is not required to be activated all the time. On the other hand, the essential event information before and after the ESD are stored separately.

Introduction

ProSafe-RS is a safety control system aimed at protecting people, environment, and equipment from unexpected accidents or problems at a plant.

This manual describes the requirements for installation (control room size and power supply requirements), storage and transportation, and wiring.

Chapter 1 System Installation Requirements

This chapter describes the engineering specifications that cover the control room design/ environment, power supply system, grounding, noise prevention, corrosive-gas environment compatibility and compliance with marine standards for the ProSafe-RS system.

Chapter 2 Transportation, Storage and Installation

This chapter describes precautions for the transport, unpacking and storage of the ProSafe-RS system. This chapter also describes temperature and humidity changes when temporarily storing the ProSafe-RS system, and how to install cabinets and rack mounted devices.

Chapter 3 Cabling

This chapter describes how to connect power, ground, signal and bus cables to the installed devices, and how to connect optical fiber cables.

Chapter 4 Installation Specifications

This chapter covers the power consumption, power dissipation, in-rush current, and fuse and breaker ratings as well as the parts that need replacement within 10 years. Read this section when deciding the power supply capacity.

Chapter 5 Post-installation Inspection and Environmental Preservation

This chapter describes items that must be checked before turning on power and the precautions to be taken to safeguard the environment after installing the system.

All Rights Reserved Copyright © 2015, Yokogawa Electric Corporation

Safety Precautions

Safety, Protection, and Modification of the Product

- In order to protect the system controlled by the product and the product itself and ensure safe operation, observe the safety precautions described in this Technical Information and the User's Manuals. We assume no liability for safety if users fail to observe these instructions when operating the product.
- If this product is used in a manner not specified in this Technical Information, the protection provided by this product may be impaired.
- If any protection or safety circuit is required for the system controlled by the product or for the product itself, prepare it separately.
- Be sure to use the spare parts approved by Yokogawa Electric Corporation (hereafter simply referred to as YOKOGAWA) when replacing parts or consumables.
- Do not use the accessories (Power supply cord set, etc.) that came with the product for any other products.
- Modification of the product is strictly prohibited.
- The following symbols are used in the product and this Technical Information to indicate that there are precautions for safety:

	Indicates that caution is required. This symbol for the Product indicates the possibility of dangers such as electric shock on personnel and equipment, and also indicates that the user must refer to the User's Manuals for necessary actions. In the User's Manuals, this symbol is used together with a word "CAUTION" or "WARNING" at the locations where precautions for avoiding dangers are described
	Indicates that caution is required for hot surface. Note that the devices with this symbol become hot. The risk of burn injury or some damages exists if the devices are touched or contacted.
	Identifies a protective conductor terminal. Before using the Product, you must ground the protective conductor terminal to avoid electric shock
	Identifies a functional grounding terminal. A terminal marked "FG" also has the same function. This terminal is used for grounding other than protective grounding. Before using the Product, you must ground this terminal.
	Indicates an AC supply.
	Indicates a DC supply.
	Indicates that a component such as a power supply switch is turned ON.
	Indicates that a component such as a power supply switch is turned OFF.

Symbol Marks of this Technical Information

Throughout this Technical Information, you will find several different types of symbols are used to identify different sections of text. This section describes these icons.

WARNING

Indicates precautions to avoid a danger that may lead to death or severe injury.

CAUTION

Indicates precautions to avoid a danger that may lead to minor or moderate injury or property damage.

IMPORTANT

Identifies important information required to understand operations or functions.

TIP

Identifies additional information.

SEE ALSO

Identifies a source to be referred to.

Cautions for Safely Applying the Device

Wiring Power Cable

WARNING

Connect the power cables according to the procedure in this document.

Power cables must conform to the safety standards of the country where the device is installed.

SEE ALSO For Wiring Power Cable, refer to 3.2, “Connecting Power.”

Earth Wiring

WARNING

This equipment requires a protective grounding defined by the safety standard.
Ground the device following the procedure in this document to prevent from electric shock and to minimize the noise.

SEE ALSO For Earth Wiring, refer to 3.3, “Connecting Ground Cable.”

Tightening Torque of Screws

IMPORTANT

The tightening torque that the Product recommends is showed in the following table. However, if the tightening torque of the screw is specified in the User’s Manuals, follow the instructions described in the User’s Manuals.

Table Table of Recommended Tightening Torque

Nominal diameter of a screw	M2.6	M3	M3.5	M4	M5	M6	M8	M10
Recommended tightening torque (N•m)	0.35	0.6	0.8	1.2	2.8	3.0	12.0	24.0

Battery

CAUTION

- Must use Yokogawa designated batteries.
- Mounting and changing batteries must follow the procedure in the hardware instruction manual for each device.
- When changing batteries while the power supply is not shutdown, do not put hands inside of the device since it is danger of electric shock.

Fan Unit

CAUTION

• When changing fan unit while the power supply is not shutdown, be careful not to touch other parts so as to avoid electric shock.

SEE ALSO For Fan Unit, refer to 4, “Installation Specifications, Durability of Parts.”

Wiring I/O Cables

CAUTION

Wiring I/O cables must follow the procedure in this document.

SEE ALSO For Wiring I/O Cables, refer to 3.5, “Connecting Signal Cable.”

Connected Devices

IMPORTANT

To ensure this system’s compliance with the CSA safety standards, all devices connected to this system shall be CSA certified devices.

Fuse Replacement

WARNING

- Be sure to use the specified fuses.
- Switch off the power supply before exchanging the fuses.

Maintenance

CAUTION

- The maintenance work for the devices described in this manual should be performed only by qualified personnel.
- When the device becomes dusty, use a vacuum cleaner or a soft cloth to clean it.
- During maintenance, put up wrist strap, and take other ESD (Electrostatic Discharge) measures.
- If the existing caution label is dirty and illegible, prepare a new label (part number: T9029BX) to replace it.

SEE ALSO For Maintenance, refer to 1.5.2, “Countermeasures against Static Electricity.”

Drawing Conventions

Some drawings may be partially emphasized, simplified, or omitted, for the convenience of description.

Trademark

Trademark Acknowledgment

The names of corporations, organizations, products and logos herein are either registered trademarks or trademarks of Yokogawa Electric Corporation and their respective holders.

3.8.5 F-SB Bus (for N-IO Node) 3-87
4. Installation Specifications 4-1
5. Post-installation Inspection and Environmental Preservation 5-1

1. System Installation Requirements

This section describes installation requirements such as environmental conditions, required space and layout considerations, power consumption, cabling and grounding.

1.1 Control Room Design

Control rooms, in which the system control equipment is to be installed, should be designed in accordance with the following conditions:

General

In designing a control room, ensure adequate floor strength and air conditioning including dust- and moisture-proofing.

SEE ALSO

- 1.1 Control Room Design — Air Conditioner
- 1.2 Control Room Environment — Air Purity
- Applied Standards (Table Installation Environment Specifications)

Floor Strength and Space

The floor should have adequate strength, and you should design the layout in accordance with the weight and size of equipment to be installed.

SEE ALSO

- For the maintenance space required, refer to 2.4, “Servicing Area.”
- For the weight and dimensions of standard equipment, refer to applicable general specifications.

Floor Structure

To prevent damage to cables by operators and maintenance equipment, do not lay cables on the floor.

Lay cables under the floor as follows:

- Provide an “accessible” floor which also facilitates maintenance work.
- Make cable pits under the floor if it is concrete.

Flooding- & Dust-proof Floor

To protect equipment and cables, design a flooding-proof floor.

After the cabling is completed, seal all cable conduits using putty to prevent intrusion of dust, moisture, rats, and insects into the equipment.

Clearance From The Wall and The Floor Surface

There are ventilation holes on the front and rear doors of the cabinets. To ensure good air ventilation and easy maintenance, provide a clearance of at least 1000 mm (including the service areas) from the wall to the front and rear doors of the cabinets. Also make sure the height of the ceiling is at least 2400 mm from the floor.

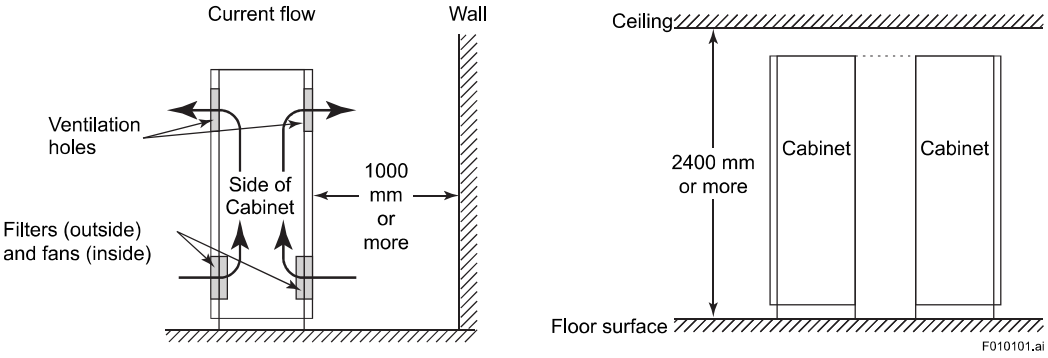

Figure Wall Clearance and Ceiling Height

Illumination

The illumination level around a display unit should be 700 to 1500 lx (target illumination level: 1000 lx). The illumination level inside the control room should be reasonably uniform.

Select proper light fixtures and install them in positions where they don't cause glare on the CRT displays and LCDs.

TIP

REFERENCE (Illumination standards):

For ultra-precision work:	1500 to 3000 lx (illumination level: 2000)
For precision work:	700 to 1500 lx (illumination level: 1000)
For ordinary work:	300 to 700 lx (illumination level: 500)
For non-detail work:	150 to 300 lx (illumination level: 200)
Passages, warehouses:	30 to 150 lx (illumination level: 50 to 100)

(Source: JIS Z9110)

Outlets for Maintenance

Outlets (approx. 1.5 kVA) for measurement devices should be provided near the installed equipment for maintenance.

Telephone

Telephones should be installed for communications with related stations.

Air Conditioner

The air conditioner should be operated according to the conditions below to prevent moisture condensation on the installed equipment.

- Keep changes in temperatures within ±10°C/h.
- Install the air conditioner away from the equipment.
- Install substitute air conditioners to prevent moisture condensation as a result of the temperature rising or falling if an air conditioner fails.
- Set the air conditioner so that its air outlet is not above the equipment (to avoid water dropping on the equipment).

Windows

Close the windows of the control room. If a draft comes in around the windows, seal around the windows.

Opening the window while air conditioning is running may result in condensation forming, or let in dust or corrosive gas, adversely affecting the installed equipment. Windows on the sea side must be closed to keep out salt air.

Install blinds, if necessary, to prevent sunlight reflecting from CRT displays and LCDs.

1.2 Control Room Environment

This section describes environmental conditions of the control room to operate the system safely, and stably over a long period of time.

It is recommended that user have the control room environment assessment. For the assessment, contact Yokogawa if necessary.

Temperature and Humidity Limits

SEE ALSO See "Table of Equipment Installation Specifications" in this section, for the temperatures and humidity limits for operating and storing this equipment.

When bringing the equipment into a location where allowable operating temperature is set from another location where the temperature exceeds the allowable operating range, following precautions are necessary:

- The equipment should reach the ambient temperature according to the requirements for the temperature change rate, keeping it unpacked from its case. At that time, be careful not to let condensation form on the equipment.
- Once the equipment reaches the allowable operating temperature range, leave it for about three hours before operation.

Under normal operation, the rate of change of ambient temperatures should be within 10°C/h. All the equipment should be kept out of direct sunlight.

Condensation

Prevent condensation. If condensation occurs, or its trace is found on the control room, contact Yokogawa.

SEE ALSO See "Section 2.3 Storage" for more information.

Vibration

Vibration in the control room should be limited as follows:

- For vibration frequency up to 8.4 Hz: Limit displacement amplitude to 1.75 mm or less.
- For vibration frequency over 8.4 Hz: Limit acceleration to 4.9 m/s^2 or less.

The following is the relationship of the vibration frequency, displacement amplitude, and acceleration:

Acceleration $(m/s^2) = 4\pi^2 \cdot A \cdot F^2 \cdot 10^{-3}$

A: Displacement amplitude (mm)
F: Frequency (Hz)

F010201.ai

Consult Yokogawa if complex vibrations are involved.

Air Purity

The dust in the control room should be kept below 0.3 mg/m^3. Minimize corrosive gas such as hydrogen sulfide (H_2S), sulfur dioxide (SO_2), chlorine, and conductive dust such as iron powder and carbon.

The allowable content of H_2S, SO_2, or any other corrosive gas varies with temperatures, humidity, or existence of other corrosive gas. Consult Yokogawa if corrosive gas exists.

Magnetic Field

Do not install the CRT near cables with heavy current flowing or in the magnetic field of a power supply. If installed in such locations, the display may be distorted or its colors may be affected by the magnetic fields.

Electric Field Strength (Electric Wave Condition)

For the proper and stable operation of this system, the field electric strength of the location for the equipment should be controlled as following:

10 V/m or less (26 MHz to 1.0 GHz)

10 V/m or less (1.4 to 2.0 GHz)

1 V/m or less (2.0 to 2.7 GHz)

In case of the usage of wireless equipment such as transceiver nearby this system, note as following:

- The door of this system should be closed.
- In case of the usage of transceiver with 10 W or less, the distance from this system should be kept 1 m or more.
- As for the usage of wireless equipment with 1 W or less such as mobile-telephone, PHS, wireless telephone or LAN equipment, the distance should be kept 1 m or more. Attention should be paid to the micro wave radiated from mobile-telephone or PHS even out of usage.

Following formula represents the electric field strength. However, the calculated value requests ideal environment. Worse conditioned environment should be taken into consideration. In case some wireless equipment is used nearby this system, this formula would be useless. The value calculated through this formula should be considered noting other than reference.

$$E=\frac{k\sqrt{P}}{d}$$

E : Electric field strength (V/m)
k : Coefficient (0.45 to 3.35; average 3.0)
P : Radiation power (W)
d : Distance (m)

F010202.ai

Installation Specification

Installation Altitude

N-IO node (*1) (*2) : 3000 m or less
Other than N-IO node : 2000 m or less

Installation category based on IEC 61010-1 (*3)

Category I

- For YOKOGAWA products, category I applies to the devices that receive the electric power not more than 33 V AC, 70 V DC.

Category II

- For YOKOGAWA products, category II applies to the devices that receive the electric power exceeding 33 V AC or 70 V DC.

Pollution degree based on IEC 61010-1: 2 (*4)

*1: For more information about the device, refer to General Specification (GS).
*2: For S2BN4D and S2BN5D, the installation altitude is 2000 m or less.
*3: The installation category, also referred to as an overvoltage category, defines the standard for impulse voltage. The category number from I to IV applies the devices to determine the clearance required by this standard.
Category I applies to the device intended to be connected to a power supply with impulse voltage reduced to the safe level.
Category II applies to the device intended to be supplied from the building wiring.
*4: Pollution degree indicates the adhesion level of foreign matter in a solid, liquid, or gaseous state that can reduce dielectric strength. Degree 2 refers to a pollution level equivalent to the general indoor environment.

SEE ALSO See “Installation Environment Specifications” at the end of this chapter.

Measurement Categories

Regarding the measurement inputs, the following requirements must be satisfied to meet the specifications for the device:

The category of the equipment applies to O (Other) in the following table.

The rated transient overvoltage is 1500 V.

Note: Do not use the equipment for measurements within measurement categories II, III and IV.

Table Measurement category

Applicable Standard IEC/EN 61010-2-030 CAN/CSA-C22.2 No.61010-2-030	Description
O (Other) (*1)	For measurements performed on circuits not directly connected to MAINS.
Measurement category II	For measurements performed on circuits directly connected to the low voltage installation.
Measurement category III	For measurements performed in the building installation.
Measurement category IV	For measurements performed at the source of the low-voltage installation.

*1: Measurement category I defined in IEC/EN 61010-1:2001 and CAN/CSA-C22.2 No.61010-1-04 has been changed to “O (Other)” in IEC/EN 61010-2-030 and CAN/CSA-C22.2 No.61010-2-030.

Conformity Standards

The ProSafe-RS complies with the standards shown below.

IMPORTANT

Different standards are applied according to the types of equipment.

For details, refer to GS 32P01B60-01EN “ProSafe-RS Standards Compliant Models”.

Functional Safety Standards

IEC 61508, IEC 61511-1 and IEC 62061

Programmable Controllers Standards (*1), (*2), (*3)

IEC 61131-2

Application Standards (*1)

EN 54-2 (*2), EN 298 (*3), (*4), EN 50156-1, NFPA 72, NFPA 85, and NFPA86

Safety Standards (*5), (*6), (*7), (*8)

[CSA]
CAN/CSA-C22.2 No.61010-1, CAN/CSA-IEC 61010-2-201, CAN/CSA-C22.2 No.61010-2-030

[CE Marking] Low Voltage Directive

NM EN 60825 1

*1: Except for the case of using S2BN1D, S2BN4D, and S2BN5D in combination with S2MMM843 or S2MDV843 of style S2 or later, a lightning arrester or the like is required to meet this surge immunity standard.
*2: 24 V DC and 48 V DC field power to DI and DO shall not be provided directly from a DC distribution network. The field power supply cable length must be 30 m or less.
*3: Where the system power uses 24 V DC (SPW484), use an external uninterruptible power supply (UPS).
*4: 24 V DC and 48 V DC field power to DI and DO shall not be provided directly from a DC distribution network. The field power supply cable length must be 10 m or less.
*5: For the rack mountable devices, DIN rail mountable devices, and wall mountable devices to meet the Safety Standards and EMC Standards, the devices must be installed in a lockable metal cabinet. The cabinet must conform to IEC/EN/CSA 61010-2-201 or provide degrees of protection IP3X or above and IK09 or above.
*6: ProSafe-RS measurement input corresponds to the measurement category O (Other) based on IEC/EN 61010-2-030 and CAN/CSA-C 22.2 No. 61010-2-030. The measurement category I defined in IEC/EN 61010-1: 2001 and CAN/CSA-C 22.2 No. 61010-1-04 has been changed to O (Other).
*7: For ensuring all the hardware devices to satisfy the safety standards, the dedicated breakers in the power supply distribution board must conform to the following specifications.
[CSA] CSA C22.2 No.5 or UL 489
[CE Marking] EN 60947-1 and EN 60947-3
[EAC Marking, C_e Marking] EN 60947-1 and EN 60947-3
*8: The ground suitable for the power distribution system in the country or region has to be used for protective grounding system.

*1: Except for the case of using S2BN1D, S2BN4D, S2BN5D, S2NN70D, and S2NN60D in combination with S2MMM843 or S2MDV843 of style S2 or later, a lightning arrester or the like is required to meet this surge immunity standard.
*2: 24 V DC and 48 V DC field power to DI and DO shall not be provided directly from a DC distribution network. The field power supply cable length must be 30 m or less.
*3: For the rack mountable devices, DIN rail mountable devices, and wall mountable devices to meet the Safety Standards and EMC Standards, the devices must be installed in a lockable metal cabinet. The cabinet must conform to IEC/EN/CSA 61010-2-201 or provide degrees of protection IP3X or above and IK09 or above.
*4: A Class A hardware device is designed for use in the industrial environment. Please use this device in the industrial environment only.
*5: An external device such as a power unit with harmonic current neutralizer and an active harmonics conditioner must be connected to meet this harmonic current emission standard. See Section 1.3 “Power Supply System”.
*6: The base plate for barrier S2BN4D and S2BN5D conforms to the EMC standards with conditions. For details, refer to GS 32P06P10-01EN “Base Plates for Barrier (for N-IO)”.
*7: Where the system power uses 24 V DC (S2PW504), use an external uninterruptible power supply (UPS).

Standard for Hazardous (Classified) Locations

[ATEX Type “n”]

[IECEx Type “n”]

[Canada (FM) Non-Incendive]

[US (FM) Non-Incendive]

[ECAS-Ex Type “n”]

SEE ALSO For more information about Standard for Hazardous Locations, refer to TI 32S01J30-01E “Explosion Protection (for ProSafe-RS).”

Marine Standards

ABS (American Bureau of Shipping)
BV (Bureau Veritas)
LR (Lloyd's Register)
DNV GL

SEE ALSO For more information about the components which comply with the marine standards and how to install those components, refer to 1.8, "Compliance with Marine Standards."

In relation to the CE Marking, the manufacturer and the authorised representative for ProSafe-RS in the EEA are indicated below:

Manufacturer: YOKOGAWA Electric Corporation
(2-9-32 Nakacho, Musashino-shi, Tokyo 180-8750, Japan.)

Authorised representative in the EEA: Yokogawa Europe B.V.
(Euroweg 2, 3825 HD Amersfoort, The Netherlands.)

Installation Environment Specifications

The following table lists environmental requirements for the installation of the ProSafe-RS System.

SEE ALSO For details on each equipment, refer to the ProSafe-RS general specifications (GS).

Table Installation Environment Specifications (1/2)

Item		Specifications			Remarks
		Safety Control Unit (SCU)	Safety Node Unit, Unit for Optical Bus Repeater Module	N-IO Node (*1)	
Temperature	Normal operation	-20 to 40ºC (*2) (standard type SCU for Vnet/IP)	-20 to 70ºC (*3)	-40 to 70ºC (*4) (*5)	
		-20 to 70ºC (*3) (wide range temperature type SCU for Vnet/IP)			
	Transportation/storage	–40 to 85°C			
Humidity	Normal operation	5 to 95% RH (non-condensing)			5 to 85% RH when the SRM53D/ SRM54D/SBM54D is mounted.
	Transportation/storage	5 to 95% RH (non-condensing)			
Temperature change	During operation	Within ± 10ºC/h			
	Transportation/storage	Within ± 20ºC/h			
Power supply	Voltage range	100 to 120 V AC –15%, +10%			
		220 to 240 V AC –15%, +10%			
		24 V DC: –10% to +20%		24 V DC: –15% to +20%	
	Frequency	50/60 Hz ± 3Hz			
	Distortion factor	10% or less			
	Crest factor	100 V system: 118 V or larger 220 V system : 258 V or larger			
	Momentary failure	20 ms or less (when receiving the rated AC voltage)			
	DC power supply ripple rate	1% p-p maximum			
Withstanding voltage		1500 V AC for 1 minute (for 100-120/220-240 V AC) 500 V AC for 1 minute (for 24 V DC)			Between power & grounding terminals
Insulation resistance		20 M ohms at 500 V DC			Between power & grounding terminals
Grounding		Apply the grounding system which is defined by the rules and standards of the country or the region.			
Dust		Maximum of 0.3 mg/m^3			
Corrosive gas		ANSI/ISA S71.04 G3 (standard)			Excluding SRM53D/ SRM54D/SBM54D

*1: An N-IO node consists of S2NN30D, S2BN1D, S2BN4D, S2BN5D, S2MMM843, S2MDV843, S2KPB10, and S2KLF10.
*2: 0 to 40°C when ALR111-S□1, ALR121-S□1, or ALE111-S□1 is mounted.
*3: 0 to 60°C when ALR111-S□1, ALR121-S□1, or ALE111-S□1 is mounted.
*4: For S2BN4D and S2BN5D, the ambient temperature must be from -20 to 60°C.
*5: When the S2NN30D Node Interface Unit is used with an optical ESB bus with the following specifications at an altitude of 2000 m or higher, the ambient temperature range is -40 to 60°C.

S2NN30D-□□□□□01□□ S2NN30D-□□□□□02□□ S2NN30D-□□□□□10□□
S2NN30D-□□□□□11□□ S2NN30D-□□□□□12□□ S2NN30D-□□□□□20□□
S2NN30D-□□□□□21□□ S2NN30D-□□□□□22□□

For cable connector of Base plate with disconnecting terminal (S2BN1D-□9), the normal operation temperature is -20 to 70°C as the temperature specification of the dedicated cable is applied.

Table Installation Environment Specifications (2/2)

Item		Specifications			Remarks
		Safety Control Unit (SCU)	Safety Node Unit, Unit for Optical Bus Repeater Module	N-IO Node (*1)	
Noise	Electric field	10 V/m maximum (80 MHz to 1 GHz)			
	Static electricity	4 kV or less (direct discharge) 8 kV or less (aerial discharge)			
Vibration	Continuous vibration	Amplitude: 1.75 mm (5 Hz to 9 Hz)		Amplitude: 17.5 mm 5 Hz ≤ f < 8.4 Hz	
		Acceleration: 4.9 m/s^2 (9 Hz to 150 Hz)		Acceleration: 4.9 m/s^2 (8.4 Hz ≤ f < 150 Hz)	
	Non-continuous vibration	Amplitude: 3.5 mm (5 Hz to 9 Hz)		Amplitude: 3.5 mm 5 Hz ≤ f < 8.4 Hz	
		Acceleration: 9.8 m/s^2 (9 Hz to 150 Hz)		Acceleration: 9.8 m/s^2 (8.4 Hz ≤ f < 150 Hz)	
	Seismic	Acceleration: 4.9 m/s^2 or less			
	Transportation	Horizontal: 4.9 m/s^2 or less vertical: 9.8 m/s^2 or less			When packaged
Impact		147 m/s^2, 11 ms			
Altitude (above sea level)		2000 m or less		3000 m or less (*5)	

*1: An N-IO node consists of S2NN30D, S2BN1D, S2BN4D, S2BN5D, S2MMM843, S2MDV843, S2KPB10, and S2KLF10.
*5: When the S2NN30D Node Interface Unit is used with an optical ESB bus with the following specifications at an altitude of 2000 m or higher, the ambient temperature range is -40 to 60°C.
S2NN30D-□□□□□01□□ S2NN30D-□□□□□02□□ S2NN30D-□□□□□10□□
S2NN30D-□□□□□11□□ S2NN30D-□□□□□12□□ S2NN30D-□□□□□20□□
S2NN30D-□□□□□21□□ S2NN30D-□□□□□22□□

SEE ALSO For the level of corrosive gases permitted in an ordinary office, refer to TI 33Q01J20-01E “Guidelines for Installation Environment.”

1.3 Power Supply System

The following conditions should be met:

- **Voltage and frequency fluctuations are within the limits specified for each system component.**
- **Waveform distortion is within limits.**
- **High-frequency noise is not at a level that affects system operation.**
- **Use an UPS (uninterruptible power supply) if necessary.**

AC Power Specification

AC power used for the system must be within the specified rated voltage and the peak value must be greater than the minimum specified (see below). DC power must be within 24 V DC -10%/+20% at the power supply terminals.

IMPORTANT

If the power unit has high output impedance or high wiring impedance, the resulting voltage drop flattens the input voltage wave, forming a distorted waveform with a low peak value (“B” in the chart below).

Even if the effective value of the distorted input voltage wave is the same as that specified for a non-distorted input voltage wave, the voltage across the terminals of the smoothing capacitor in the power circuit may be so low that the system detects power failure. Even if input voltage waves A and B shown below have the same effective value of 100 V AC, wave B will have a lower smoothing capacitor terminal voltage.

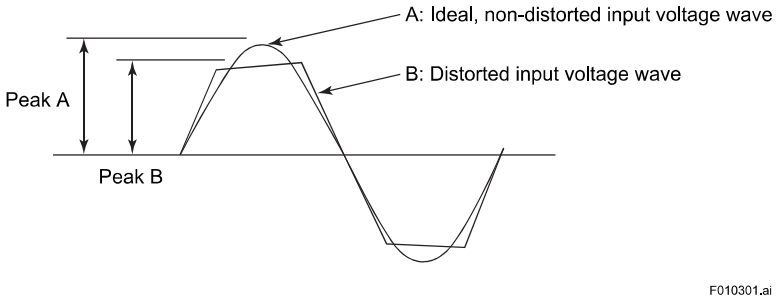

Figure Distorted Input Voltage Waveform

The system operating voltage range is shown below based on the relationship between effective and peak values at the power input terminal of each system. Apply AC power within these ranges to operate the system.

TIP

Average-value rectifying measuring instruments such as general type digital voltmeters and testers cannot measure effective values accurately. Use Yokogawa's digital oscilloscope DL series, power analyzer WT series or equivalent device, which can measure effective values, peak values, and waveform distortion.

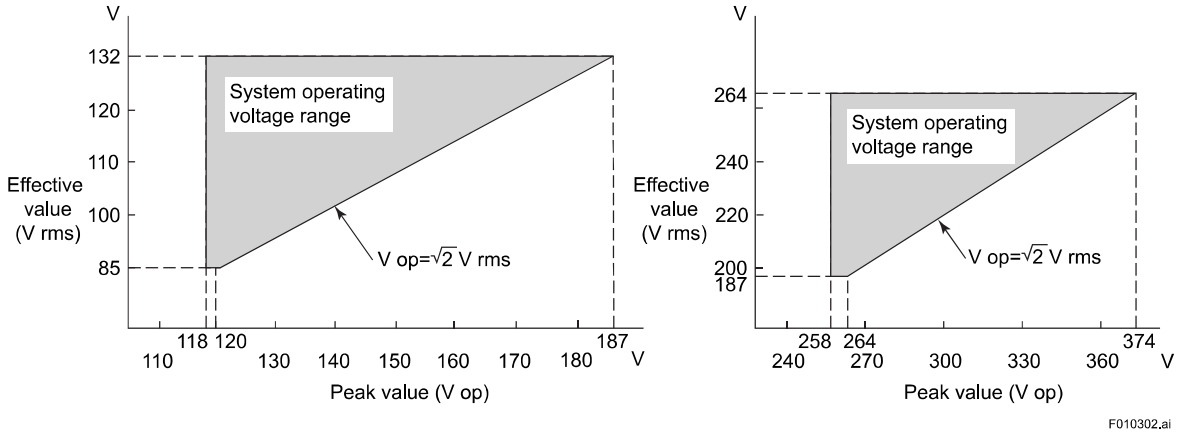

Figure System Operating Voltage Range

The DC stabilized power supply for the ProSafe-RS (except PCs) uses a compact and efficient switching regulator circuit. In this circuit, output voltage cannot be maintained if the energy (terminal potential) of the smoothing capacitor falls below a predetermined value. The circuit monitors the capacitor terminal voltage and regards it as power failure if the voltage falls in the danger zone, causing the system to enter power fail mode (non-detected momentary power failure: up to 20 ms).

Current flows to the capacitor in this circuit when AC input voltage is higher than the capacitor terminal voltage. Since the capacitor is charged by the peak value of the input waveform, it is required that both the effective voltage value and the peak value conform to the specification requirements.

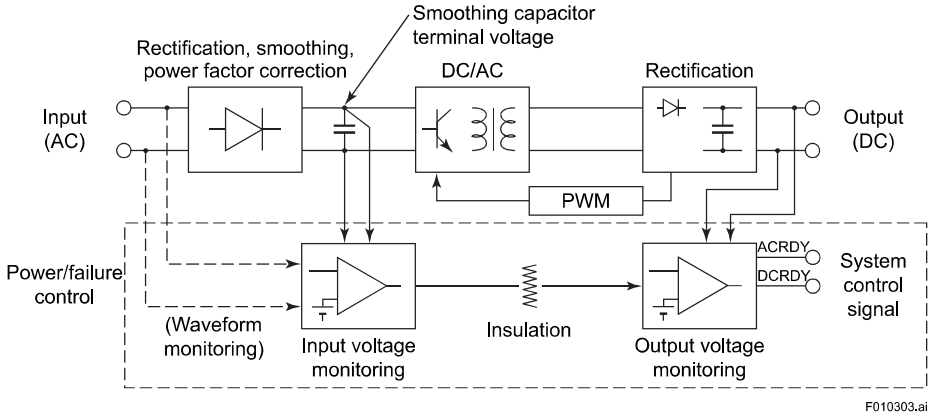

Figure Power Circuit Diagram of Safety Control Unit

Selecting a Power System

The ProSafe-RS system requires a power supply that satisfies power requirements in accordance with EMC regulations. It is recommended that an external power supply unit be used in order to prevent disruptions due to momentary or extended power failure, line noise, or lightening surges, as well as to suppress harmonic current from various devices.

For selection of the power supply unit, consult with a power unit manufacturer taking the following points into consideration.

Source Output Capacity

Take the following items into consideration when consulting with a power unit manufacturer to determine the output capacity.

Power consumption:	Both volt-ampere and watt data should be studied.
Device crest factor:	Ratio of the peak value to the effective value of the device input current.
Device in-rush current:	The method of turning on the power should also be studied.
Backup ready time after failure:	Time period required to backup the devices when power fails.
Reserve capacity:	An extra power capacity should be determined as reserve to meet any device additions.

SEE ALSO

- Electrical Specifications Table for power consumption in Chapter 4
- In-rush Current of Each Component in Chapter 4

Crest factor

The crest factor is the ratio of the peak value to the effective value of the device input current.

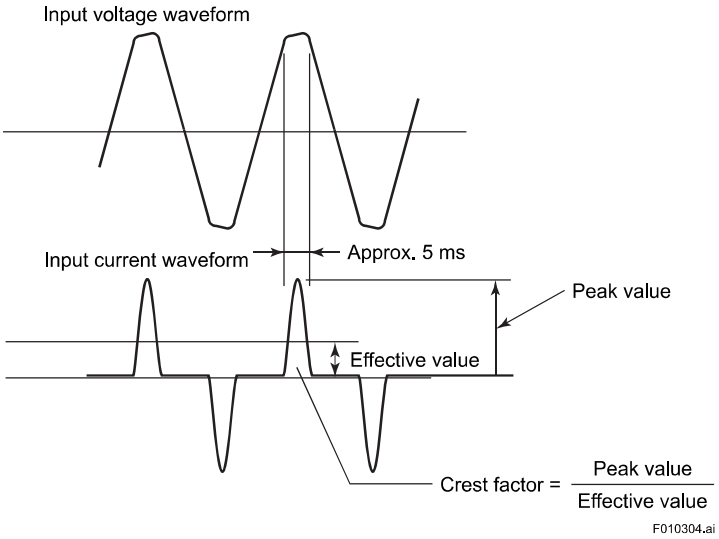

Figure Input Voltage and Input Current Waveforms

Crest factor = Peak value of device input current / Effective value of device input current

The crest factor must be considered for the input current supplied to every device connected to the system when estimating the power output capacity in selecting the power unit.

Approximate device crest factors should be as follows:

100-120 V supply voltage: Crest factor About 3.

220-240 V supply voltage: Crest factor About 6.

Common Method to Determine Power Unit Capacity

The following shows the commonly used method used to determine the power unit capacity taking the crest factor into consideration - the final determination should be made in consultation with a power unit manufacturer:

- If the specification of power unit crest factor (the peak current value allowable for the effective current value) is larger than the above device crest factor, the power unit can be used for up to full rated capacity. However, in-rush current, backup time, reserve capacity, etc., must be separately taken into consideration.
- If the power unit crest factor is smaller than the device crest factor, the power unit capacity needs to be calculated in the expression shown below. In-rush current, backup time, reserve capacity, etc., must be separately taken into consideration.

Power unit output capacity = Total device power consumption x Capacity coefficient

Capacity coefficient = Device crest factor / Power unit crest factor specification

In-Rush Current

When the equipment is turned on, a large in-rush current flows as the capacitor is instantaneously charged and the transformer is excited. When any equipment is turned on, this should not cause any voltage fluctuation that could adversely affect other equipment. Do not turn on all equipment at the same time. Start equipment one by one.

Power may be switched to backup or AC line power if in-rush current activates the overload protection circuit on power-up. After such an overload, select an uninterruptible power unit, with automatic-recovery.

Suppressing Harmonic Current

In order to suppress harmonic current supplied to a low-voltage distribution system, it is necessary to install a power unit or an active harmonic suppressor, such as indicated below, between a device and the distribution system:

- Power unit equipped with the harmonic suppression function (a high power-factor inverter-type uninterruptible power unit, etc.)
- Active harmonic suppressor

In Europe, a power unit should be selected so that harmonic current emissions are within the limits specified by EMC regulations.

The capacity of the harmonic suppression unit should be determined in consultation with a power unit manufacturer in the same manner as the selection of power unit's output capacity previously discussed.

Notes for the field power supply unit of N-IO

As described in GS 32P06K20-01EN "Base Plate (for N-IO)", field power supply (24 V DC) is required when Digital output function of the base plate with disconnecting terminal (Model S2BN1D) is utilized.

When using the node interface unit S2NN30D-□4□□□□□□□ (24 V DC power input type) in combination with S2BN1D and the power supply unit as shown on the left side of the figure below, it is recommended to separate the power supply as shown in right.

This is because the rapid change of the field output load of S2BN1D may causes an influence on 24 V power line, it is worried that the input voltage rating of S2NN30D will not be satisfied.

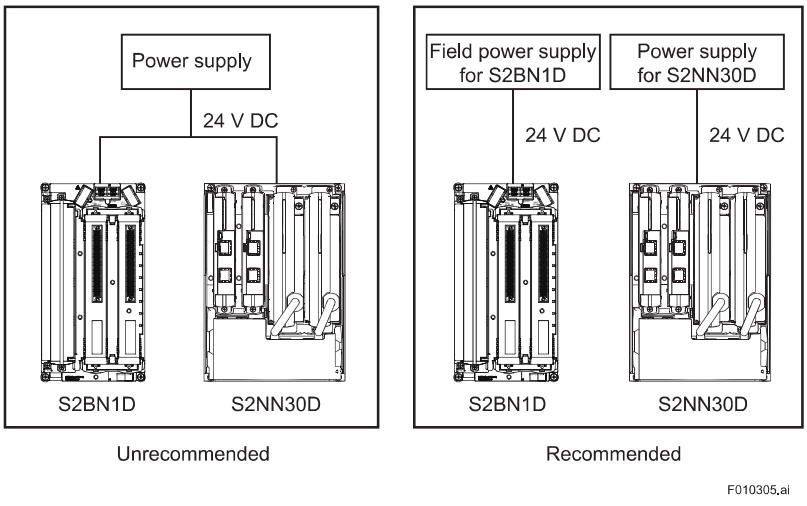

Figure Connection of the field power supply of S2BN1D

Cabling

Observe the following when cabling the power unit to the ProSafe-RS system equipment:

- Protect signal cables from induced noise.
- Protect signal cables from induction from high-voltage power lines.
- Separate the ProSafe-RS system power supply from other equipment power supplies. Use a separate power distribution board.
- Provide a dedicated breaker for each power supply.
- Install breakers and devices in the same room.
- Label the breakers with the name of the connected equipment.
- Install the breakers where they can be easily operated.
- The breaker, must not interrupt connection by wiring to protective grounding system.
- As far as possible install power supply cables and high-voltage power lines in metallic conduits.
- Use shielded cables if metallic conduits cannot be provided.

1.4 Grounding

To avoid electric shocks and minimize the influences of external noise, the installed devices must be grounded to the protective grounding system which complies with the safety standards, the electrical installations standard, and the power distribution system of the country or the region.

As for the protective grounding systems, the meshed grounding systems described in IEC 60364, IEC 62305 and IEC 61000-5-2 can be applied.

A protective device is to be installed in compliance with the rules and regulations, in order to prevent electric shocks caused by a ground fault.

A plug type power cable has to be connected to the receptacle connected to the protective grounding system.

Grounding Circuit

Grounding examples are given below.

If ProSafe-RS systems are housed in a cabinet, the cabinet must be grounded according to the grounding network topology of the building or plant for installation.

In order to connect a cabinet with a protective grounding system, the grounding topology shown in the figures “Grounding connected to a single grounding bus inlet” or “Grounding connected to each grounding bus inlet” can be used.

When providing lightning arresters on power and signal lines, those arresters need to be grounded to the same bus. For details, see Section 1.5, “Noise Countermeasures.”

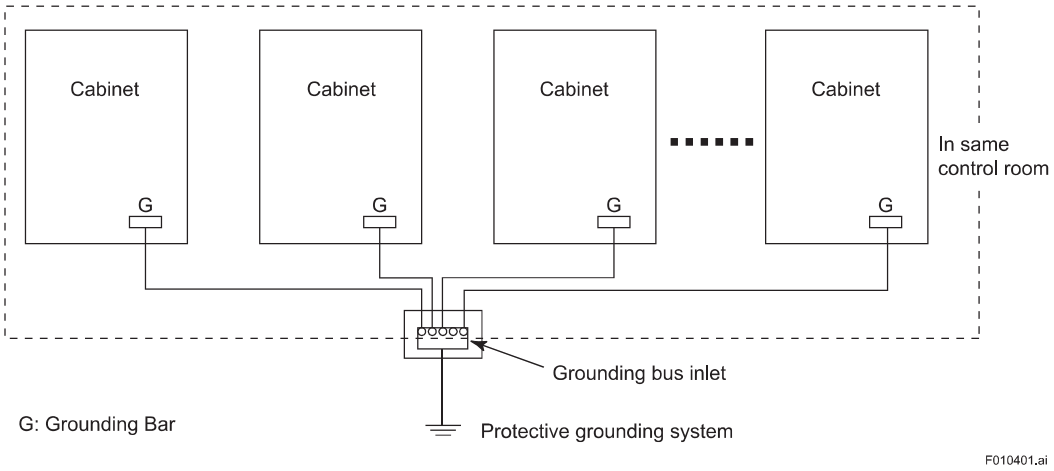

Figure Grounding connected to a single grounding bus inlet

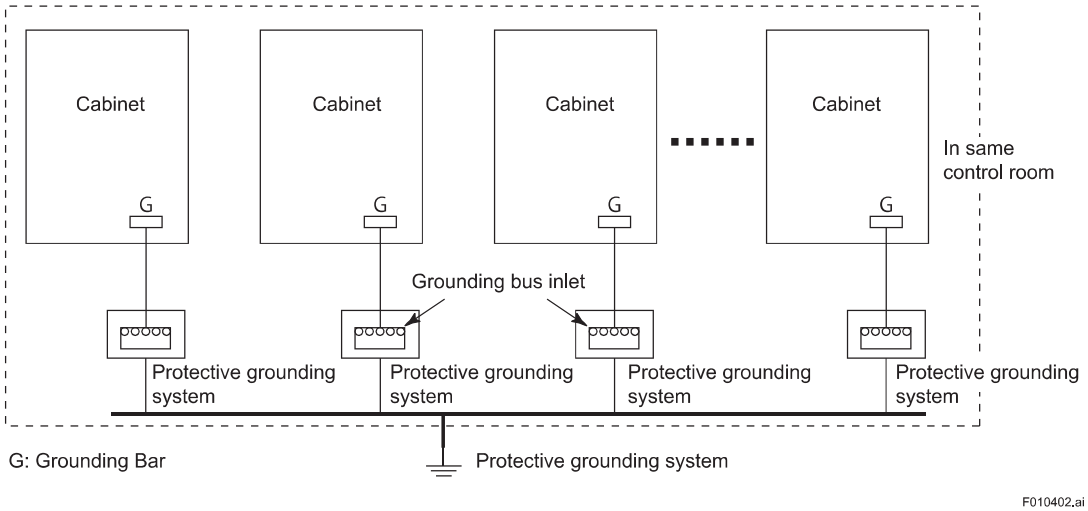

Figure Grounding connected to each grounding bus inlet

Grounding with Other System

Do not connect ProSafe-RS's cabinet with other system cabinets or consoles electrically using bolts or other connection mechanism in order to avoid unexpected electrical connection or interference.

When ProSafe-RS is joining side by side with other system cabinets or consoles, ensure to insert insulating sheets.

The cabinets or consoles other than ProSafe-RS must be insulated from a floor and connect it to a protective grounding system using a different grounding cable.

CENTUM VP can be treated as the ProSafe-RS system in this page.

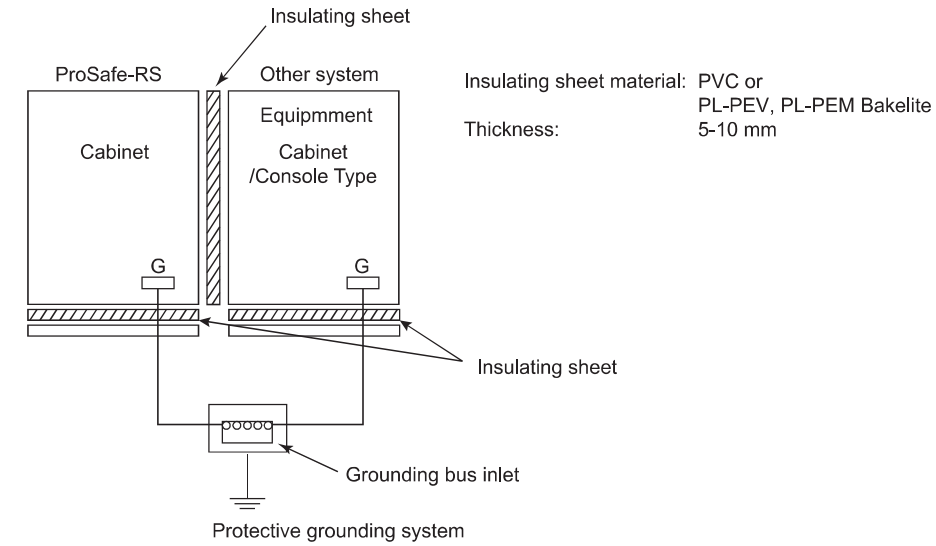

Figure Grounding Using Insulating Sheets

IMPORTANT

Do not install the following systems side-by-side with ProSafe-RS:

- Systems using power supply voltages over 300 V AC.
- Systems with current consumption over 50 A.
- System containing high frequency sources.

1.5 Noise Countermeasures

Noise may be induced by electromagnetic induction, electrostatic induction, or come from radio waves, lightning, inductive loads, static electricity and ground potential differences.

It can be picked up by power, signal and ground cables, and devices. With computerized control systems, noise-induced errors in A/D conversion or in an instruction word may lead to malfunction. Therefore, it is necessary to prevent the noise from being generated or coming too much from the outside.

To prevent noise and electrostatic buildup, take the measures described in this section when deciding cable type, cable routing, and grounding.

1.5.1 Noise Sources and Noise Countermeasures

It is not easy to identify the cause of any noise-triggered errors or failures due to their lack of reproducibility.

To prevent noise generation, it is necessary to consider the installation environments such as the external cable routing, cable types, and grounding.

The following table lists typical noise sources, symptoms of noise problems, and preventive countermeasures:

Table Noise Sources & Countermeasures

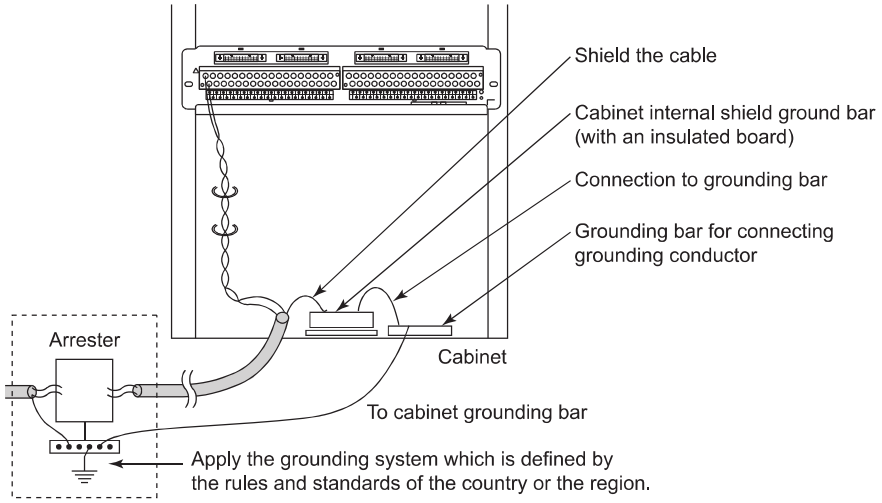
Noise sources	Effects	Countermeasures
Electromagnetic induction (magnetic field)	• CRT display instability, distortion, color shift, color fringing. • Destroys magnetic/flexible disk data.	• Maintain separation from magnetic-field source. • Shield power cables with metallic conduits. • Shield magnetic field using ferromagnetic substance (e.g. Permalloy). Or use LCD. • Use twisted-pair cables.
Electrostatic induction	• Equipment maloperation. • Interference with signals.	• Use shielded signal cables. • Electrically separate power and signal cables using metallic conduits and separators. • Lay power and signal cables which intersect at right angles.
Lightning	• Interference with signals. • Equipment maloperation. • Component damage.	• Lay cables underground. • Use optical fiber cables. • Lay cables as close to ground as possible if the cables cannot be laid underground. • Install and ground arresters on field and system.
Electrostatic discharge	• Equipment maloperation. • Electronic component deterioration, damage. • Paper jam.	• Discharge static electricity from operators. • Provide proper humidity. • Ground equipment properly. • Use antistatic floor material and clothing.
Inductive load open/close	• Spike noise interference to power andsignal lines.	• Add protection circuit for noise caused by inductive load. • Separate laying of cables.
Radio (electric field)	• CRT display disruption. • Equipment maloperation. • Interference with signals.	• Keep at least 1 m away from devices to use a transceiver or a PHS or a cellular phone (max. output is 1W).
Ground potential difference	• Equipment Maloperation (noise imposed on signal lines)	• Avoid multipoint grounding of signal cable.

Grounding with Lightning Arresters

Connect the protective conductor terminals of arresters and ProSare-RS equipment to the grounding pole as shown in the diagram below.

The grounding method must comply with the grounding system defined by rules and standards of the country or the region.

Concatenation grounding a lightning arrester and other equipment may cause high-tension in each equipment by the product of lightning current from arrester and grounding resistance. To prevent from electrification, overall connection should be equipotential including the floor and the case of other equipment.



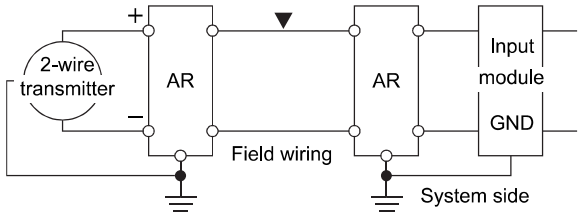


Figure Grounding with Lightning Arresters

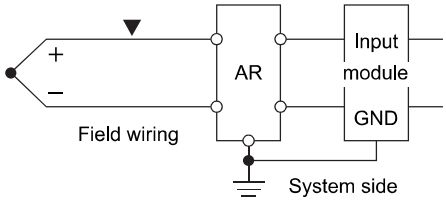
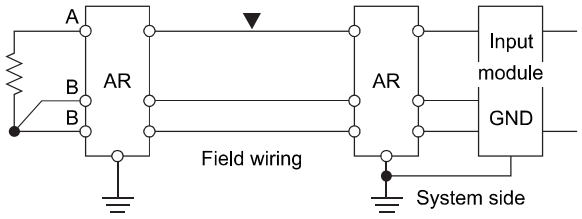
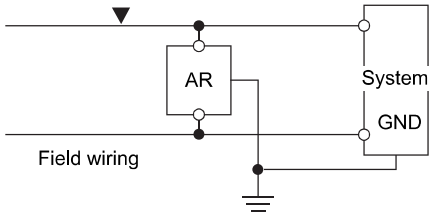


Examples of Arrester

The following shows how to install an arrester as a countermeasure against lightning-Induced noise.



● 2-wire transmitter



● Thermocouple

● Resistance temperature detector

● Power supply

▼: Induced lightning strike point
AR: Arrester

F010502E.ai

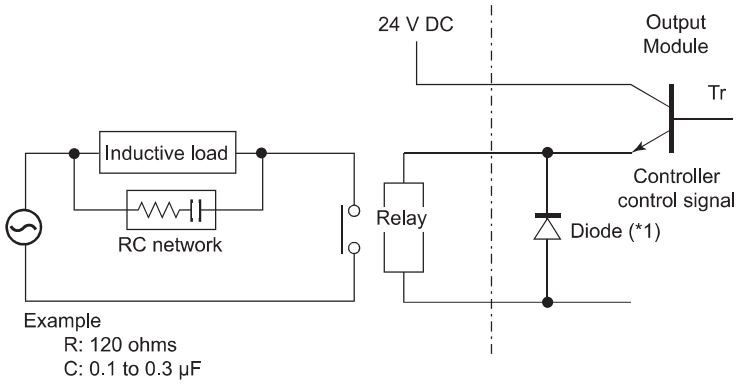


Figure Examples of Arrester Installation

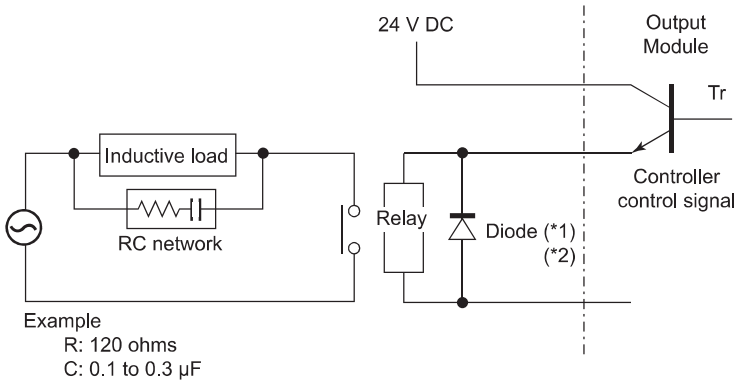
Examples of installing protection circuit for noise caused by inductive load

The following shows how to install RC network and a diode as a countermeasure against noise caused by inductive load :

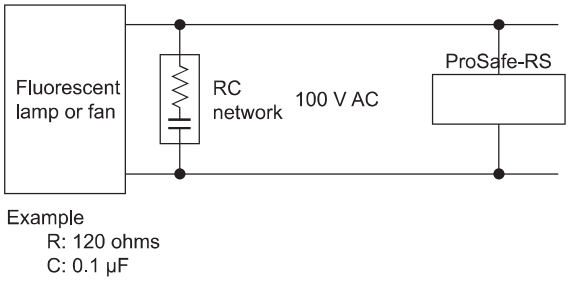
● Relay contact for FIO



The RC network protects relay contacts from noise occurring when inductive loads working under AC operation are turned off.

*1: The diode, which protects the output transistor from noise occurring during on-to-off transition of the relay, is incorporated in the output module except SDV526.

● Relay contact for N-IO



The RC network protects relay contacts from noise occurring when inductive loads working under AC operation are turned off.

*1: The diode protects the output transistor from noise occurring during on-to-off transition of the relay.
*2: S2MMM843 or S2MDV843 of style S2 or later has a built-in diode, so this diode is not required.

● Power supply

The RC network prevents noise-caused equipment failure when a fluorescent lamp or fan is turned on or off.

F010503.ai

Figure Examples of installing protection circuit for noise caused by inductive load

1.5.2 Countermeasures against Static Electricity

Take countermeasures against electrostatic damage when handling cards with semi-conductor IC components, for maintenance or to change settings.

Observe the following to prevent electrostatic damage:

- When storing or carrying maintenance parts, keep them in a conductive bag (when delivered from the factory, they are packed in such bags with labels warning about static electricity).
- When doing maintenance work, wear a wrist strap connected to a ground wire with a grounding resistance of 1 M ohm. Be sure to ground the wrist strap.

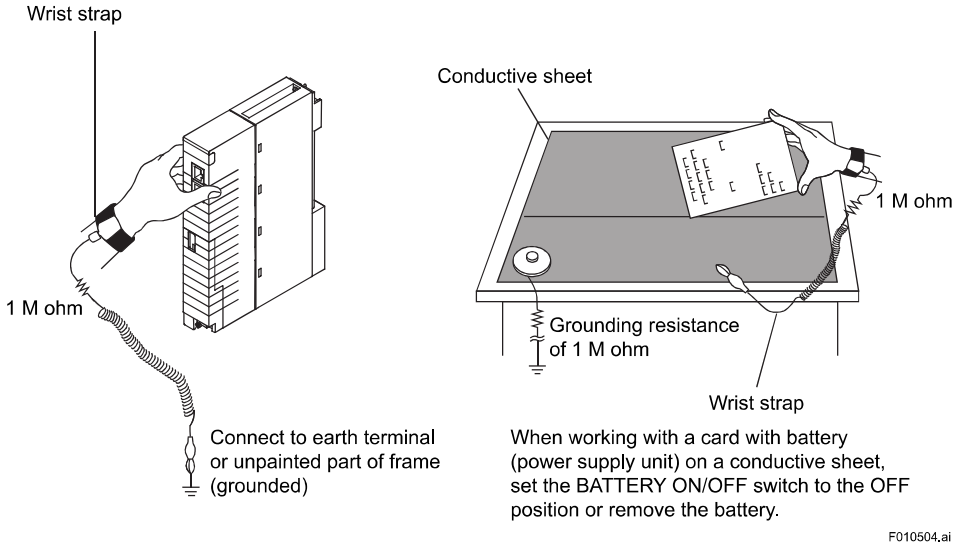


Figure Example of Use of A Wrist Strap and Conductive Sheet

- When working on cards: keep conductive sheets, grounded via a resistance of 1 M ohm, on the work bench. Wear a grounded wrist strap. Remove electrostatic plastics from the work bench.
- Be sure to wear a wrist strap and use a conductive sheet when handling maintenance parts.

1.6 Cabling Requirements

The following requirements must be fulfilled to prevent an equipment malfunction when laying power and signal cables (these are shielded cables unless specified).

Signal cables used for high-voltage, high-frequency signals (inductive load ON/OFF) must be separated from other signal cables.

Separator

To prevent an equipment malfunction, provide a separator between power and signal cables as illustrated below:

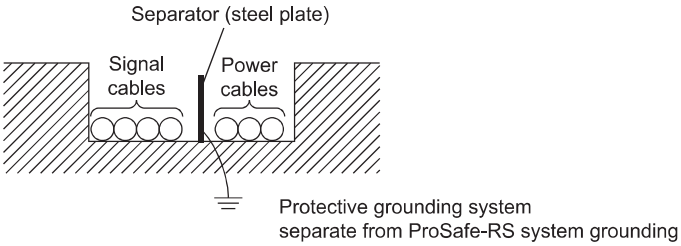

Figure Separator Used in Duct/Pit

Distance between Cables

If a separator cannot be used, keep a distance between signal cables and power cables.

The distances between cables due to operating voltages and currents are shown below.

Table Required Distance between Power & Shielded Signal Cables

Operating	voltage Operating	current Distance
240 V AC max	10 A max	150 mm min
	10 A min	600 mm min
240 V AC min	10 A max	600 mm min
	10 A min	Cannot be laid together

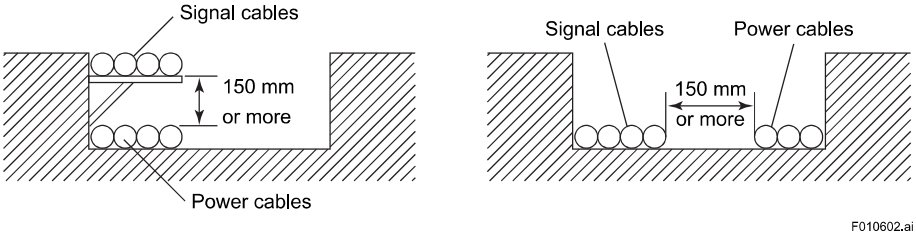

Figure Distance between Cables under Pit/Free-access Floor

Intersecting Cables

With unshielded power cables, place a grounded steel plate with a thickness of at least 1.6 mm over the cables where they intersect with signal cables.

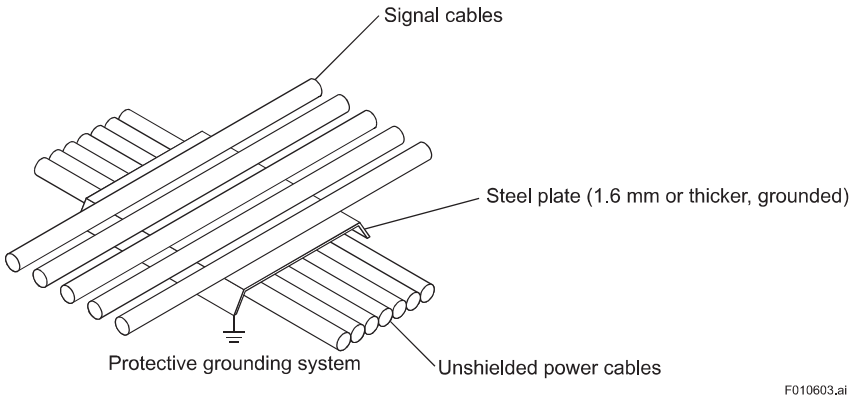

Figure Intersecting Cables under Pit/Free-access Floor

Ambient Temperature

The ambient temperature where signal and bus cables are laid must be within the limits specified for each cable.

Measures against EMI

As a rule, avoid laying the cables on the floor. However, lay them on the floor only if there are no duct and no pit. In that case, it is required to cover them with shield plates or take other measures to suit the EMC Directive.

1.7 Corrosive-gas Environment Compatibility

The ProSafe-RS system complies with the ANSI/ISA G3 environment requirements, allowing use in a corrosive gas-susceptible environment.

G3 Environment-compatible Products

Table G3 Environment-compatible Products (1/2)

No.	Product	Model	Description
1	Node unit	SSC60☐	Safety control unit (rack mountable type, for Vnet/IP)
		SSC50☐	Safety control unit (rack mountable type, for Vnet/IP)
		SSC57☐	Safety control unit (rack mountable type, for Vnet/IP-Upstream)
		S2SC70☐	Safety control unit (rack mountable type)
		SNB10D	Safety node unit (rack mountable type)
2	Input/output module	SAI143-S	Analog input module (4 to 20 mA, 16 channels, Module isolation)
		SAI143-H	Analog input module (4 to 20 mA, 16 channels, Module isolation, HART Communication)
		SAV144	Analog input module (1 to 5 V/1 to 10 V, 16 channels, Module isolation)
		SAI533	Analog output module (4 to 20 mA, 8 channels, Module isolation, HART Communication)
		SAT145	TC/mV Input Module (16 channels, Isolated Channels)
		SAR145	RTD Input Module (16 channels, Isolated Channels)
		SDV144	Digital input module (no-voltage contact, 16 channels, Module isolation)
		SDV521	Digital output module (24 V DC/2 A, 4 channels, Module isolation)
		SDV526	Digital output module (100-120 V AC, 4 channels, Module isolation)
		SDV531	Digital output module (24 V DC, 8 channels, Module isolation)
		SDV53A	Digital output module (48 V DC, 8 channels, Module isolation)
		SDV541	Digital output module (24 V DC, 16 channels, Module isolation)
3	ESB Bus Interface Module	SEC402	ESB Bus Coupler Module (2-port)
		SEC401	ESB Bus Coupler Module
	N-ESB Coupler Module	S2EN402	N-ESB Bus Coupler Module (2-port)
		S2EN404	N-ESB Bus Coupler Module (4-port)
4	Unit for Optical Bus Repeater Module	SNT10D	Unit for Optical Bus Repeater Module
5	Optical ESB Bus Repeater Module	SNT401	Optical ESB Bus Repeater Master Module
		SNT501	Optical ESB Bus Repeater Slave Module
		SNT411	Optical ESB Bus Repeater Master Module 5 km - 50 km
		SNT511	Optical ESB Bus Repeater Slave Module 5 km - 50 km
6	Communication module	ALR111-☐☐1	Serial communication module (RS-232C, 2-port)
		ALR121-☐☐1 ALR121-☐☐B ALR121-☐☐3	Serial communication module (RS-422/RS-485, 2-port)
		ALE111-☐☐1 ALE111-☐☐3	Ethernet communication module
		S2LP131	Fire and gas communication module
7	Wiring check adapter	SCB1☐0	Wiring check adapter for digital input module
8	Power supply bus unit	AEPV7D-☐☐6 AEPV7D-☐☐F	Power Supply Bus Unit, Vertical Type
		AEP7D-☐6 AEP7D-☐F	Primary power supply bus unit

Table G3 Environment-compatible Products (2/2)

No.	Product	Model	Description
9	Terminal Board	A2BM4	Terminal board for analog digital I/O (for N-IO)
		SEA4D	Analog terminal board (Single and Dual-redundant, 16 channels x 2)
		SBA4D	Terminal board for Analog: DIN rail mount type (Single and Dual-redundant, 16 channels x 1)
		SBT4D	Terminal board for TC/mV: DIN rail mount type (Single and Dual-redundant, 16 channels x 1)
		SBR4D	Terminal board for RTD input: DIN rail mount type (Single and Dual-redundant, 16 channels x 1)
		SED2D	Digital terminal board (Single and Dual-redundant, 4 channels x 4)
		SED3D	Digital terminal board (Single and Dual-redundant, 8 channels x 4)
		SED4D	Digital terminal board (Single and Dual-redundant, 16 channels x 2)
		SWD2D	Digital terminal board (Single and Dual-redundant, 100 to 120 V AC, 4 channels x 4)
		SBD2D	Terminal board for Digital output: DIN rail mount type (Single and Dual-redundant, 4 channels x 1, for SDV521)
		SBD3D	Terminal board for Digital output: DIN rail mount type (Single and Dual-redundant, 8 channels x 1, for SDV53□)
		SBD4D	Terminal board for Digital: DIN rail mount type (Single and Dual-redundant, 16 channels x 1, for SDV144/SDV541)
		S1BB4D	Terminal Board for Analog Input, 3-wire: DIN rail mount type
10	Router	AVR10D-□□□□□1	Duplexed V net router
		AW810D-□□□□□6	Wide Area Communication Router
11	Node Interface Unit	S2NN30D	Node Interface Unit (for N-IO)
12	Base Plate	S2BN1D	Base Plate with disconnecting terminal (for N-IO, 16 channels)
		S2BN4D	Base Plate for Barrier (for N-IO, MTL Barrier)
		S2BN5D	Base Plate for Barrier (for N-IO, P+F Barrier)
13	I/O Module	S2MMM843	Analog Digital I/O Module (16 channels, module isolation)
		S2MDV843	Digital I/O Module (16 channels, module isolation)

Outline of G3 Environment Compatibility

The classification of the environment in which the process control equipment is installed is determined by the ANSI/ISA S71.04 “Environmental Conditions for Process Control Systems” standard. The environment having an atmosphere which contains steams and mists (liquids, coded L), dusts (solids, coded S), or corrosive gases (gases, coded G) is classified into four categories according the levels of these substances determined.

The four categories of the corrosive gas environment are defined as follows:

G1 (Mild): A well-controlled environment in which corrosive gas is not the major cause adversely affecting the reliability of plant equipment. The corrosion level on the copper test piece is below 0.03 µm (see note below).

G2 (Moderate): An environment in which corrosive gas can be detected and it could be determined that the gas is the major cause adversely affecting the reliability of plant equipment. The corrosion level on the copper test piece is below 0.1 µm (see note below).

G3 (Harsh): An environment in which corrosive gas is frequently generated to cause corrosion and that it is necessary to provide special measures or employ specially designed or packaged plant equipment. The corrosion level on the copper test piece is below 0.2 µm (see note below).

GX (Severe): A corrosive gas-polluted environment that demands special protective chassis for the plant equipment, specifications of which should be seriously determined by the user and a power unit manufacturer. The corrosion level on the copper test piece is 0.2 µm or more (see note below).

Note: Copper test pieces are used to determine the level of corrosion for the classification of the plant environment.
The test piece is an oxygen-free copper sheet, which is 15 cm^2 in area, 0.635 mm in thickness, 1/2 to 3/4H in hardness. The test piece is placed in the plant site for one month and checked for any change before and after the test to determine the degree of corrosion (see table below). If the test period is shorter than one month, the result is calculated to obtain equivalent data using a expression defined by the standard.

Table Classification of Corrosive-gas Corrosion Levels

Environment category		G1 (Mild)	G2 (Moderate)	G3 (Harsh)	GX (Severe)	
Copper corrosion level		< 300 (< 0.03)	< 1000 (< 0.1)	< 2000 (< 0.2)	≥ 2000 (≥ 0.2)	[Å] ([µm])
Group A	H_2S	< 3	< 10	< 50	≥ 50	[mm^3/m^3]
	SO_2, SO_3	< 10	< 100	< 300	≥ 300	
	Cl_2	< 1	< 2	< 10	≥ 10	
	NOx	< 50	< 125	< 1250	≥ 1250	
Group B	HF	< 1	< 2	< 10	≥ 10	
	NH_3	< 500	< 10000	< 25000	≥ 25000	
	O_3	< 2	< 25	< 100	≥ 100	

Note: The gas density data indicated in the table are for reference only, with the relative humidity of 50% RH or less.
The category goes up one rank higher every time the humidity increases 10% exceeding the 50% RH or over 6% per hour.

The Group-A gases shown in the table may coexist and cause inter-reaction. Inter-reaction factors are not known for the Group-B gases.

1.8 Compliance with Marine Standards

The ProSafe-RS offers compliance with the following marine standards:

- **ABS (American Bureau of Shipping)**
- **BV (Bureau Veritas)**
- **LR (Lloyd's Register), ENV3**
- **DNV GL**

This Section introduces the components of systems which comply with the marine standards, and precautions for installing those components.

Marine Standard-compliant ProSafe-RS Components

The table below shows the ProSafe-RS components which comply with the marine standards.

Table Marine Standard-compliant ProSafe-RS Components (1/3)

Product	Model	Module Type	Description
Node Unit	S2SC70S-F	Safety control Unit (19-inch rack mountable)	Including SCP461, S2CP471, SPW481, SPW482, and SPW484. S2SC70S-S and S2SC70D-S do not comply.
	S2SC70D-F		
	SSC60S-F	Safety control unit (19-inch rack mountable)	Including SCP461, S2CP471, SPW481, SPW482 and SPW484. SSC60S-S and SSC60D-S do not comply.
	SSC60D-F		
	SSC50S	Safety control unit (19-inch rack mountable)	Including SCP451, SPW481, SPW482 and SPW484. (*2) Suffix code "-F" is certified for category ENV3, and "-S" is certified for category ENV2.
	SSC50D		
	SSC57S		
	SSC57D		
	SNB10D	Node unit for dual-redundant ESB bus (19-inch rack mountable)	Including SSB401, SPW481, SPW482 and SPW484.
Node Interface Unit	S2NN30D	Node Interface Unit (for N-IO)	Exclude DIN rail type. Including S2EN501, S2PW503 and S2PW504. S2PW503 and S2PW504 are applicable only when attached to S2NN30D.
Base Plate	S2BN1D	Base plate with disconnecting terminal (for N-IO)	Exclude DIN rail type.
	S2BN4D	Base plate for Barrier (for MTL Barrier)	
	S2BN5D	Base plate for Barrier (for P+F Barrier)	
I/O Module	S2MMM843	Analog digital I/O module	
	S2MDV843	Digital I/O module	
Input/Output Module	SAI143	Analog input module (4 to 20 mA, 16 channels, and module isolation)	(*1) SAI143-H□C does not comply.
	SAV144	Analog input module (1 to 5 V/1 to 10 V and module isolation)	Including SCCC01, STB4D, STB4S and STK4A.
	SAT145	TC/mV input module (16 channels, Isolated Channels)	
	SAR145	RTD input module (16 channels, Isolated Channels)	
	SAI533	Analog output module (4 to 20 mA, 8 channels and module isolation)	(*1)

*1: Including SCCC01, STA4D, STA4S and STK4A.
*2: Except for SSC50□-□□□□1, SSC50□-□□□□2, SSC57□-□□□□1, SSC57□-□□□□2 and SCP451-□1.

Table Marine Standard-compliant ProSafe-RS Components (2/3)

Product	Model	Module Type	Description
Input/Output Module	SDV144	Digital input module (16 channels, contact input and module isolation)	(*2) SDV144-S□C does not comply.
	SDV521	Digital output module (4 channels, 24 V DC/2A, and module isolation)	SDV521-S3C does not comply.
	SDV531	Digital output module (8 channels, 24 V DC, and module isolation)	(*2) SDV531-L complies with Marine Standards from style code S3. SDV531-L□C does not comply.
	SDV53A	Digital output module (8 channels, 48 V DC, and module isolation)	
	SDV541	Digital output module (16 channels, 24 V DC, and module isolation)	(*2) SDV541-S□C does not comply.
	SDCV01	Dummy cover (for I/O modules)	
Wiring Check Adapter	SCB100	Wiring check adapter for digital input	
	SCB110		
Unit for Optical Bus Repeater Module	SNT10D	Unit for optical bus repeater module	Including SPW481, SPW482 and SPW484.
Optical ESB bus repeater module	SNT401	Optical ESB bus repeater master module	
	SNT411	Optical ESB bus repeater master module 5 km to 50 km	
	SNT501	Optical ESB bus repeater slave module	
	SNT511	Optical ESB bus repeater slave module 5 km to 50 km	
ESB Bus Interface Module	SEC402	ESB bus coupler module	
	SEC401		
N-ESB Bus Coupler Module	S2EN402	N-ESB Bus coupler Module (for 2-port)	
	S2EN404	N-ESB Bus coupler Module (for 4-port)	
Cover	S2DCV02	Dummy cover (for N-IO I/O module)	
Communication Module	ALR111	Serial communications module (RS-232C, 2-port)	
	ALR121	Serial communications module (RS-422/RS-485, 2-port)	
	ALE111	Ethernet communication module	
	S2LP131	Fire and Gas Communication Module	
Terminal Board	SEA4D	Analog terminal board (single and dual-redundant, 16 channels x 2)	
	SED2D	Digital terminal board (single and dual-redundant, 4 channels x 4)	
	SED3D	Digital terminal board (single and dual-redundant, 8 channels x 4)	
	SED4D	Digital terminal board (single and dual-redundant, 16 channels x 2)	
	SBT4D	Terminal board for TC/mV: DIN rail mount type (Single and Dual-redundant, 16 channels x 1)	
	A2BM4	Terminal board for analog digital I/O (for N-IO)	

*1: Including SCCC01, STA4D, STA4S and STK4A.
*2: Including SCCC01,SCCC02, STB4D, STB4S and STD4A.

Table Marine Standard-compliant ProSafe-RS Components (3/3)

Product	Model	Module Type	Description
Terminal Board	SBR4D	Terminal board for RTD input: DIN rail mount type (Single and Dual-redundant, 16 channels x 1)	
	SBA4D	Terminal board for Analog: DIN rail mount type (Single and Dual-redundant, 16 channels x 1)	
	SBD2D	Terminal board for Digital output: DIN rail mount type (Single and Dual-redundant, 4 channels x 1, for SDV521)	
	SBD3D	Terminal board for Digital output: DIN rail mount type (Single and Dual-redundant, 8 channels x 1, for SDV53□)	
	SBD4D	Terminal board for Digital: DIN rail mount type (Single and Dual-redundant, 16 channels x 1, for SDV144/SDV541)	
	S1BB4D	Terminal Board for Analog Input, 3-wire: DIN rail mount type	
Relay Board	SRM53D	Relay Board (8 × 2 dry contact output)	
	SRM54D	Relay Board (16 × 1 dry contact output)	
	SBM54D	Relay board for Digital output: DIN rail mount type (Single and Dual-redundant, 16 channels x 1, for SDV541)	
Control Bus Interface	VI702	Control bus interface card	(*3)
V net Router	AVR10D -□□□□□1	Duplexed V net router	AVR10D-□□□□□0 does not comply.
Cable, etc.	YCB301	ESB bus cable	
	AKB651	Signal cable (50 - 50 pins) (for connections between SDV521 and Terminal Board)	When AKB651 is connected to SDV531-L, SDV53A or SDV541, it does not comply.
	AKB331	Signal cable (50 - 50 pins)	
	AKB136	RS-232C null modem cable (9 - 25 pins)	
	AKB161	RS-422/RS-485 cable	
	AKB611	Signal cable (for connections between SAR145 and Terminal Board)	
	KS1	Signal cable (40 - 40 pins)	
	S2KLF10	F-SB bus cable	
	S2KPB10	Power supply cable for Base plate	

*3: Noisecut transformer shall be attached in the power-line cable of SENG.

Precaution on Selecting System Components

When building a system, use components which have already obtained type approval for marine standards. For the SENG and HISs too, use generic computers (including monitors, keyboards, mice, and other peripheral devices) which are accredited by the required marine standards.

Precaution on Installing Components

Each component shall be installed in accordance with its installation guidance. In addition, all components related with S2SC70☐-F, SSC60☐-F, SSC50☐, SSC57☐, SNB10D, SNT10D and SENG shall be installed in a metal cabinet.
Furthermore, the following conditions are indispensable to conform to a marine standard.

- The cabinets including their doors and side panels must be made of a metal.
- Securely connect the cabinet frames and ground bosses on doors and side panels to each other to ensure electric contacts.
- Attach noise suppression devices, such as noise filters and ferrite cores, to the cables connecting each component.

Installation of Power-line Noise Filter

Attach a noise filter on the power line for the following components:

- Safety Control Unit (S2SC70☐-F, SSC60☐-F, SSC50☐,SSC57☐)
- Safety Node Unit (SNB10D)
- Unit for Optical Bus Repeater Module (SNT10D)
- Safety Control PC (SENG) installed control bus interface (VI702)

Power-line for S2SC70☐-F, SSC60☐-F, SSC50☐, SSC57☐, SNB10D, SNT10D and S2NN30D

Attach a noise filter in each power line of SPW48☐, S2PW50☐, FAN and external power supply unit. Alternatively, other devices such as noisecut transformer and insulating transformer can be used if its characteristic of noise-reducing effects is same as the following equipment.

Noise filter and external power supply unit shall be installed in the same cabinet of the connecting terminal board for them.

If digital Input/output modules such as SDV144, SDV521, SDV531, SDV53A and SDV541 are used, use a power supply whose output-ground is insulated for external power supply.

Wiring examples of power cables (a) to (d) are shown below according to the mounting position of the noise filter and the tap.

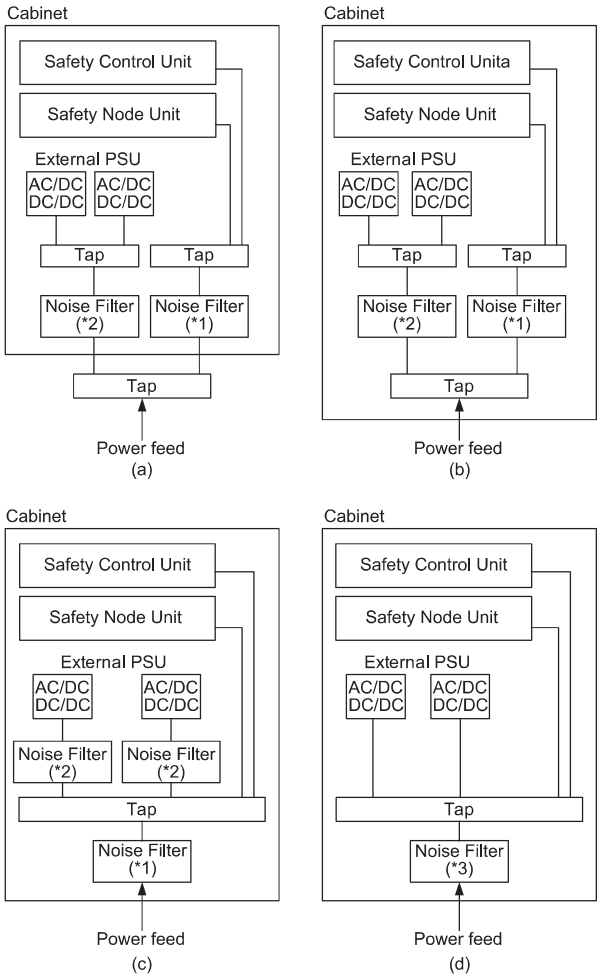

Figure Wiring for power cables

*1: This noise filter is for the power line of SPW48☐, S2PW50☐, and FAN. Refer to "Table Example of a noise filter for the power line of SPW48☐, S2PW50☐, and FAN.".
*2: This noise filter is for the external power supply unit. Regarding necessity of the noise filter, please follow directions on instructions for marine standards of this external power supply unit.
*3: If the noise filter for the external power supply unit is equivalent to the ones of "Table Example of a noise filter for the power line of SPW48☐, S2PW50☐, and FAN.", both noise filters can be shared.

The following table shows example of a noise filter.
Table Example of a noise filter for the power line of SPW48☐, S2PW50☐, and FAN.

Category	Manufacturer	Model no.	Power Source
Noise filter	OKAYA Electric Industries Co., LTD	SUP-P30H-EPR-4	100 - 120 V AC, 220 - 240 V AC (*1)
		SUPH-EX10-ER-6	100 - 120 V AC, 220 - 240 V AC
	COSEL Co., LTD	NBH-20-432	24 V DC (*2)

*1: For S2PW50☐, SUPH-EX10-ER-6 can be used.
*2: For expansion or modification of unit, the existing TDK Lambda PSHN-2020 can also be used.

IMPORTANT

Lay the incoming wires to a noise filter separately from its outgoing wires.
Minimize the wiring to the ground terminals of the noise filters to minimize the impedance.

Power-line for SENG

Noisecut transformer shall be installed in the cabinet and attached in the power-line cable of SENG in case of using VI702.
The following table shows applicable noisecut transformer.

Table Applicable noisecut transformer

Description	Manufacturer	Model
Noisecut Transformer	DENKENSEIKI Research Institute CO., Ltd	NCT-I1 (*1)
	TAMURA Corporation	NRPT-TB0.5 (*2)

*1: Purchase it through distributer.
*2: Sales was terminated. Use NCT-I1 when purchase noisecut transformer newly.

IMPORTANT

Lay the incoming wires to a noisecut transformer separately from its outgoing wires.

Minimize the wiring to the ground terminal of the noisecut transformer to minimize the impedance.

Installation of Ferrite Cores for Vnet/IP

Attach ferrite cores on the power cables, the communication cables and the signal cables. The following table shows the cables to which ferrite cores are to be attached, the models and quantities of the ferrite cores to be attached, and the locations at which they are to be attached. Ferrite core is not required if the component is not listed below. See also the figure following the table for the locations of installation.

Table Cables that Need Ferrite Cores to be Attached to, and Ferrite Core Models and Quantities for Vnet/IP (1/3)

Component		Description	Ferrite Core Model (*1)	Quantity	Location (See the Figures)
Power supply	S2SC70☐-F Power module	AC/DC power cable	ZCAT3035-1330	3	(1)
	SSC60☐-F Power module	AC/DC power cable	ZCAT3035-1330	3	(1)

Figure Locations of Ferrite Core Installation for AVR10D

*1: The marine standard isn't acquired to use S2PW50□ by alone. Please don't use for field power supplies.
*2: This noise filter is for the external power supply unit. Regarding necessity of the noise filter, please follow directions on instructions for marine standards of this external power supply unit.
*3: This ferrite core is for the external power supply unit. Regarding necessity of the ferrite core, please follow directions on instructions for marine standards of this external power supply unit.
⋮⋮ : Ferrite core is not necessary for the mounting positions shown in the dotted line boxes.

Figure Location of Ferrite Core Installation for N-IO (S2NN30D, S2BN1D, and S1BB4D)

Location of Ferrite Cores for Cables

For the following cables, be careful about the locations at which you install ferrite cores:

Power-line cables:

Install ferrite cores on each cable at the nearest possible place to each connector.
In order to prevent the load at the connectors, secure the power-line cables to the cabinet frame or dummy plate using cable ties at the nearest possible place to each ferrite core.

ESB bus cables:

Install ferrite cores on each cable at the nearest possible place to each connector.
In order to prevent the load at the connectors, secure the ESB bus cables to the cabinet frame or dummy plate using cable ties at the nearest possible place to each ferrite core.

Vnet/IP cables:

Install ferrite cores on each cable at the nearest possible place to each connector.
In order to prevent the load at the connectors, secure the Vnet/IP cables to the cabinet frame or dummy plate using cable ties at the nearest possible place to each ferrite core.

Cables connected to analog input/output modules and digital input/output modules:

- Cables Connecting to terminal boards or relay boards
  Install ferrite cores on each cable at the nearest possible place to each connector.
  In order to prevent the load at the connectors, secure the cables to the cabinet frame or dummy plate using cable ties at the nearest possible place to each ferrite core.
- Vinyl insulated cables used with pressure clamp terminals
  Install ferrite cores for all cables. Refer to “Table Cables that Need Ferrite Cores to be Attached to, and Ferrite Core Models and Quantities” for the number of cores.
  It is possible to consolidate multiple cables as per the cable diameter if same ferrite cores are used for both plus (+) and minus (-) lines.

Signal cables connected to terminal boards or relay boards:

Install ferrite cores on each cable at the nearest possible place to each connector.
In order to prevent the load at the connectors, secure the cables to the cabinet frame or dummy plate using cable ties at the nearest possible place to each ferrite core.

Installing Unit Components in Cabinet

Unit components here indicate the S2SC70☐-F, SSC60☐-F, SSC50☐, SSC57☐ and SNB10D node units and SNT10D unit for optical bus repeater modules. When installing these unit components in a cabinet, dummy plates may have to be installed and a gasket may have to be attached to the dummy plates in the following cases:

- There is a large space between unit components.
- There is no space between unit components.
- Unit components are installed unevenly inside the cabinet.

When Leaving a Large Space between Unit Components

When leaving a large space between unit components, install the following dummy plates to board up the spaces. A UNIT equals 44.45 mm high. Depending on the location of the dummy plate, attach an EMI shielding gasket to the dummy plate.

Table Space Sizes and Part Numbers of Dummy Plates

Space Size (UNITs in Height)	Dummy Plate
1	T9082EX
2	T9933VF
3	T9082EY
6	T9082EZ

1 UNIT = 44.45 mm

Specification of EMI shielding gasket: Width 5 mm, Thickness 1 mm

Location to attach EMI shielding gasket:

Attach an EMI shielding gasket onto the bottom surface of the lower bend of a dummy plate as shown below. Where a unit component is installed immediately above a dummy plate, attach an EMI shielding gasket also onto the top surface of the upper bend of the plate. However, for the dummy plate installed at the bottom of the component mounting area, no EMI shielding gasket needs to be attached onto its lower bend.

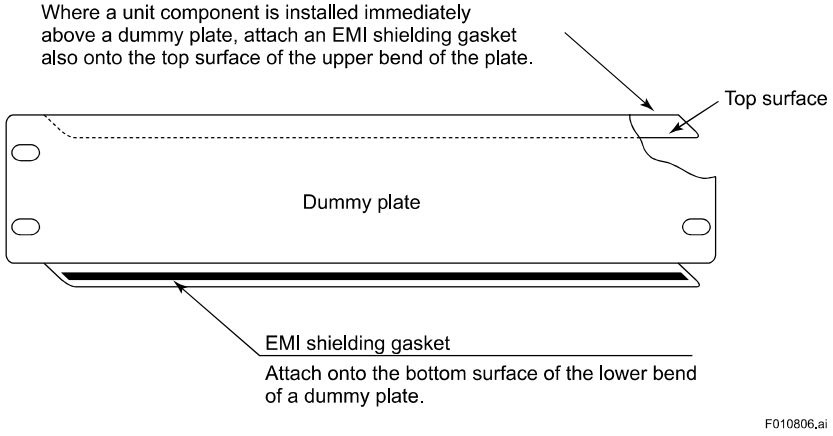

Figure Examples of Installing EMI Shielding Gasket to Dummy Plate

When Installing Unit Components with No Space between Them

When installing two unit components with no space between them, attach an EMI shielding gasket onto the bottom surface of the lower bend of the upper unit. However, for the unit installed at the bottom of the component mounting area, no EMI shielding gasket needs to be attached onto its lower bend.

For the EMI shielding gaskets, use the model introduced in the paragraph under “When Leaving a Large Space between Unit Components.”

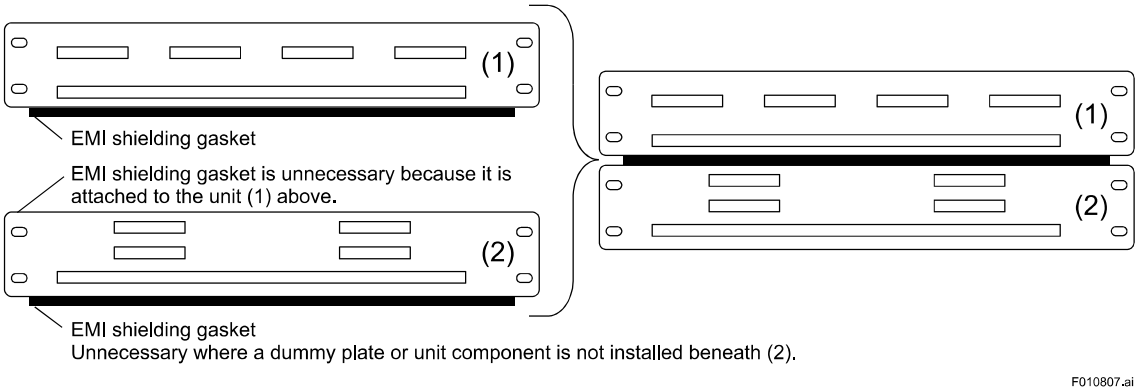

Figure Examples of Installing EMI Shielding Gasket to Unit Component

When Installing Unit Components Unevenly Inside Cabinet

When installing unit components unevenly and gathering them to the upper or lower part of a cabinet, leaving a large space in the cabinet, install dummy plates. Attach an EMI shielding gasket to the dummy plates.

For the EMI shielding gaskets, use the model introduced in the paragraph under “When Leaving a Large Space between Unit Components.”

SEE ALSO For how to attach EMI shielding gaskets, refer to “When Leaving a Large Space between Unit Components.”

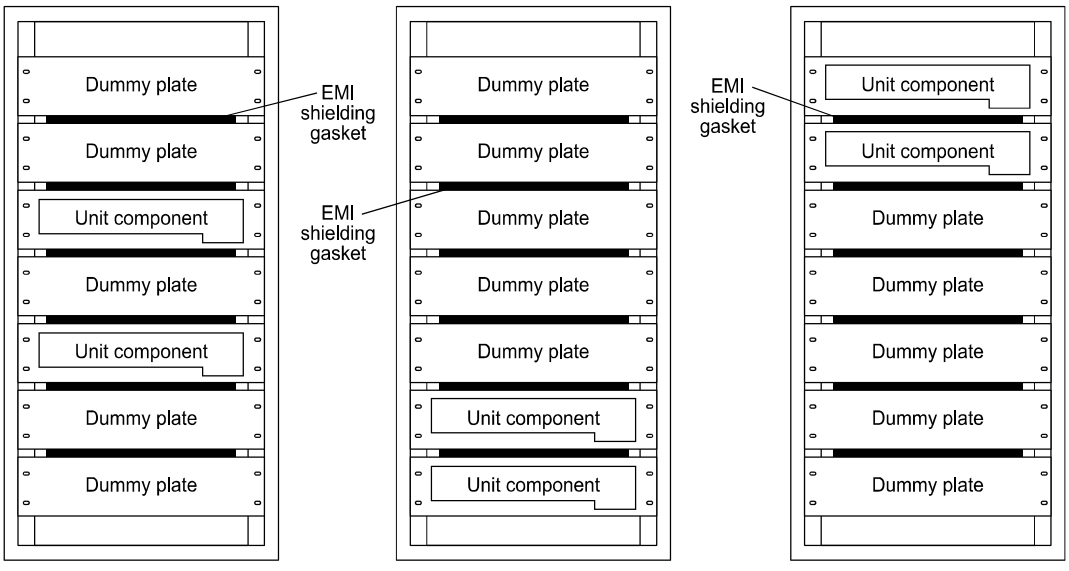

Figure Example of Installing Dummy Plates and EMI Shielding Gaskets in Cabinet

2. Transportation, Storage and Installation

This chapter describes the precautions in transporting, storing, and installing the ProSafe-RS system.

SEE ALSO See Section 1.2, “Control Room Environment” for the environmental requirement for each piece of equipment.

2.1 Precautions for Transportation

This section describes the precautions required to prevent accidents and damage when transporting ProSafe-RS system equipment. These precautions apply when the equipment is contained in our original packing.

Transportation

SEE ALSO For ambient temperature, humidity, vibration and impact, see Section 1.2, “Control Room Environment.”

Loading

- Do not load crates on top of others or turn them on their sides.
- Keep all crates upright.
- Secure loaded crates using ropes, and cover them completely with waterproof coverings.
- Do not load crates outdoors when it is raining.

Don’t Stack Outdoors

Be sure to store cargoes inside a warehouse if they must be stored for some time.

Transportation

Cargoes contain precision instruments. Select a company specializing in the transportation of computers and precision instruments.

Keep all products upright during air transport, freightage, or truck transport. When transporting by track, drive at low speed to avoid vibration and impact. Also, slow down to the limit on a bad road.

Others

Do not transport equipment through areas where there may be corrosive gas, intense electric or magnetic fields.

2.2 Unpacking

In unpacking the received cargoes and equipment, inspect them according to inspection list below. It is recommended to unpack by Yokogawa engineers or in their presence.

Table Inspection List

	Inspection Items	Result		Measures Required
Exterior	• Environment of unpacking location (temperature, humidity, dust)	Suitable	Unsuitable	If unsuitable, select proper location according to specified environmental requirements.
	• Rapid temperature fluctuation (should be within ±10 °C/h)	No	Yes	If yes, do not unpack and wait until the fluctuation remains within ± 10 °C/h.
	• Damage to equipment exterior	No	Yes	If damaged badly, inform Yokogawa.
	• Condensation or its trace on equipment exterior. (*1)	No	Yes	If yes, inform Yokogawa.
Interior	• Loose parts inside equipment.	No	Yes	If yes, remove them and check the surrounding.
	• Damage to equipment interior.	No	Yes	If damaged badly, inform Yokogawa.
	• Condensation or its trace on equipment interior. (*1)	No	Yes	If yes, inform Yokogawa.

*1: Condensation symptoms are as follows:
- Dew patterns on PCBs.
- Printed circuit copper trace is floating off the board.
- Label characters on PCBs are smudged.
- Connectors on PCBs are smudged.
- Dew patterns or traces of droplets are found on cabinet panels.

IMPORTANT

Condensation may cause a fatal system failure in the ProSafe-RS system. Be sure to unpack the equipment indoor under the specified environmental conditions. Strictly observe the allowable temperature fluctuation range of ±10 °C/h. Do not bring the equipment into a heated room straight from the outside in winter. Our warranty does not cover any damage caused by condensation.

2.3 Storage

The delivery date should be determined in accordance with your installation schedule. Avoid storing products more than three months. If long-term storage more than three months cannot be avoided, consult Yokogawa in advance because it is necessary to provide waterproofing, condensation prevention, and dustproofing measures as well as periodical inspections.

Storage Condition

Store products without unpacking. Be sure to confirm that the crate is not damaged. To store them after unpacking, be sure to take the precautions described below.

Location of Storage

Store products in a warehouse or indoor facilities - never in an open-air location.

Storage Environment

- Ambient Temperature for storage: 5 to 40 °C.
- Avoid direct sunlight.
- Prevent condensation.
- Do not store products where corrosive gas or salty air may be present.

SEE ALSO See “Section 1.2 Control Room Environment” for permissible temperature, humidity and temperature fluctuation of storage area.

Storage of Packed Equipment

- Place squared pieces of lumber with a height of 100 mm or higher on the floor. The lumber should be long enough so that more than 100 mm remains outside of the crate on every side.
- Securely place unopened crates on the lumber platform.
- Do not stack crates in piles.
- Make sure to provide good air circulation in the storage area and periodically inspect the crates to keep them under proper conditions.

Storage of Unpacked Equipment

To store unpacked products without power connection, follow the specified environmental requirements. If stored in a non-air-conditioned room, cover them with polyethylene or other sheets for protection against dust and moisture. For moisture-proofing, place a sufficient amount of Silica gel or other desiccating agent inside the covering and inspect its effectiveness from time to time.
When using desiccating agent or corrosion inhibitor etc., please select the appropriate one. Also, please make sure that it does not affect the function and performance of the product before actually using it.

2.4 Servicing Area

Take enough space around equipment for its operation and maintenance service. This servicing area is indicated for each equipment.

The servicing area should be considered in determining the size of installation location. When installing a number of equipment side by side, take the largest service - area between them if different dimensions are indicated for different side of equipment, as indicated below.

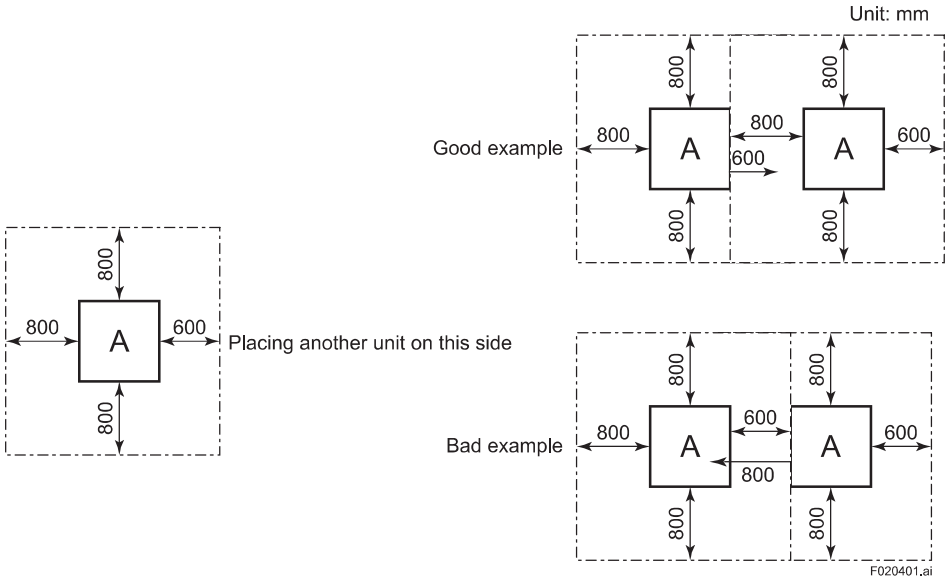

Figure Servicing Area when Installing Units Side-by-side

SEE ALSO For equipment servicing areas, refer to “External Dimensions” (SD).

2.5 Installation

Before installation, be sure that anchor bolts, pedestals, and cable holes are provided according to the customer's system configuration plans. Check that the positions of holes on the floor fit the anchor bolt holes in the channel base of each piece of equipment.

2.5.1 Installation on Floor

The installation method varies with the type of the floor and building.

- After unpacked, be careful not to put any impact until the equipment is fixed to the floor to prevent it from falling to the floor.
- Install devices as specified in the plans. Check the position of front and back panels of the cabinet.
  Avoid physical shock. Never use hammers.
- Fix each equipment to the floor.

The explanation below shows how to fix devices on different types of floors.

Concrete Floor

Clamp the equipment to the floor using anchor bolts. It is recommended to use M12 bolts and 3200 N•cm (320 kgf•cm) tightening torque.

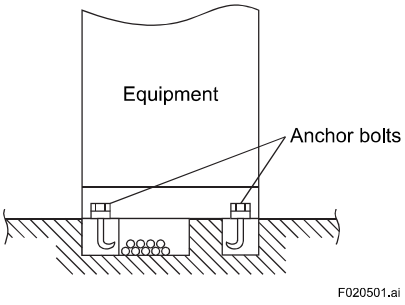

Figure Using Anchor Bolts

Steel Floor

Clamp the equipment to the floor using clamp bolts.

After cabling through the riser duct, fill the duct with rubber sponges and seal the top with putty.

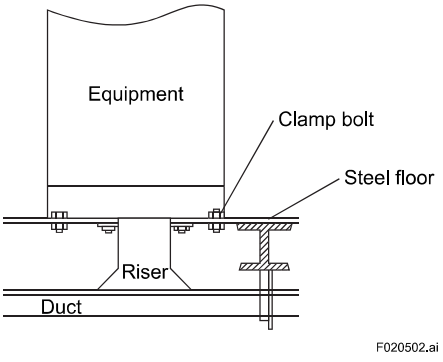

Figure Using Clamp Bolts

"Free-access" Floor

Clamp the equipment to pedestals that are anchored to the base floor.

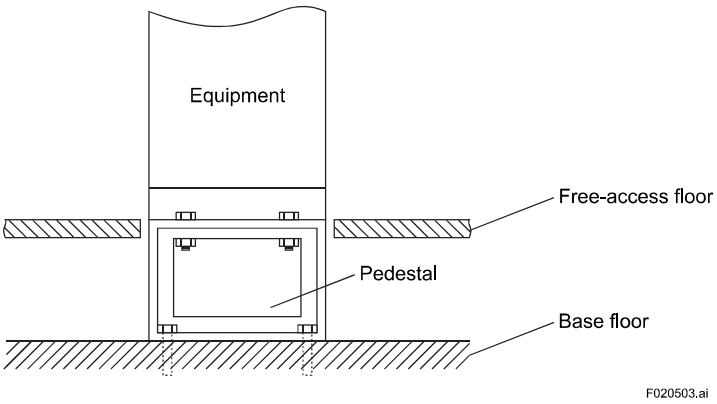

Figure Using Pedestal

In the "free-access" floor, make holes for riser cables to connect to each piece of equipment as follows:

- If one floor tile is removed, be sure to reinforce the opening with an angle frame for floor stability.

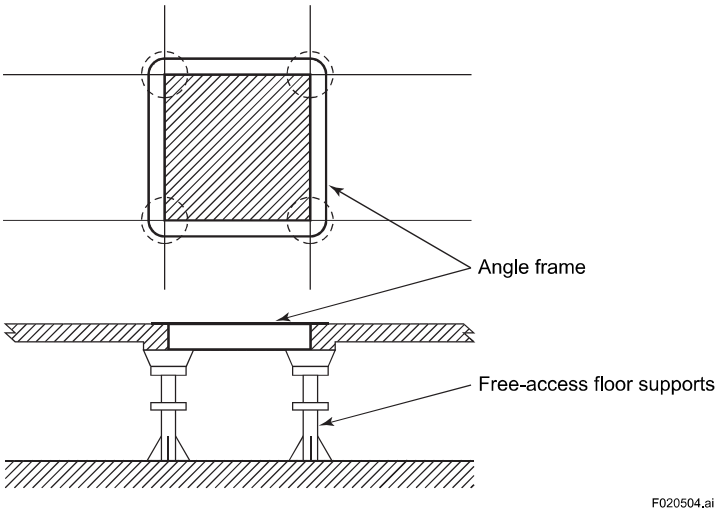

Figure Removing One Floor Tile

- Do not make a holes near the floor supports.
- Do not cut away more than 1/3 of a floor tile.

CAUTION

If a number of neighboring floor tiles are removed, be sure to provide angle frames or pedestals for reinforcement.

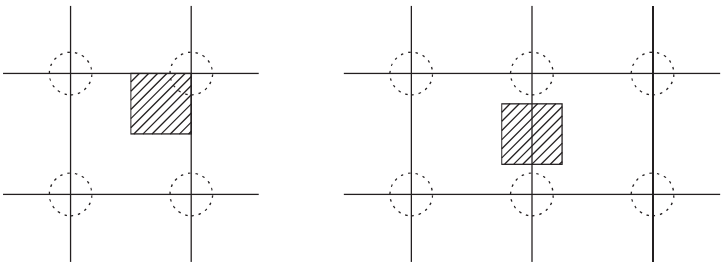

Figure Partially Cutting Floor Tile

Size of Cabling Holes in Floor

For ease of cabling, and for separating power cables from signal cables, it is recommended that you make holes in the floor for cabling that are the maximum size indicated in the floor plans. If the specified maximum size hole cannot be provided due to the floor construction or pit dimensions, the size may be smaller within the range indicated in the plans. If you use the specified minimum size of hole, use flexible cables that can bend inside the channel base.

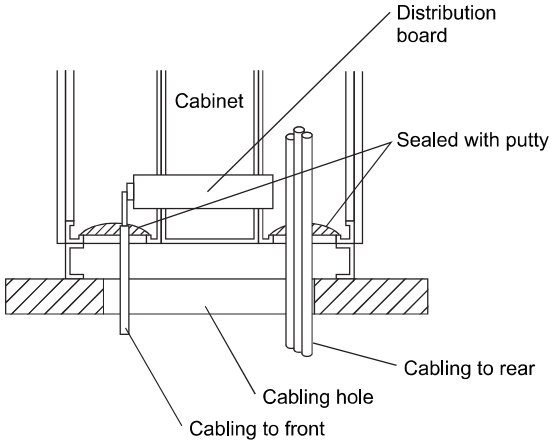

Figure Cabling through Maximum Size Hole

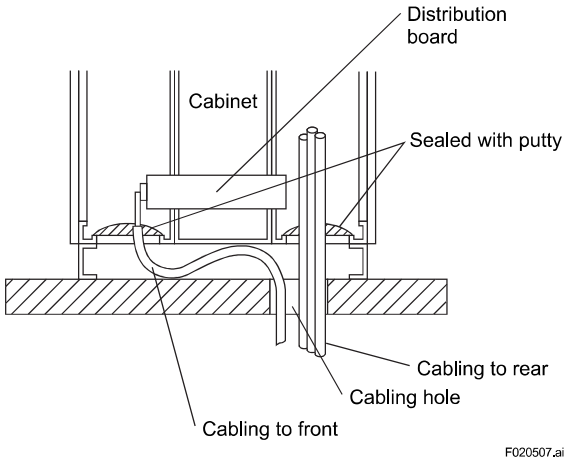

Figure Cabling through Minimum Size Hole

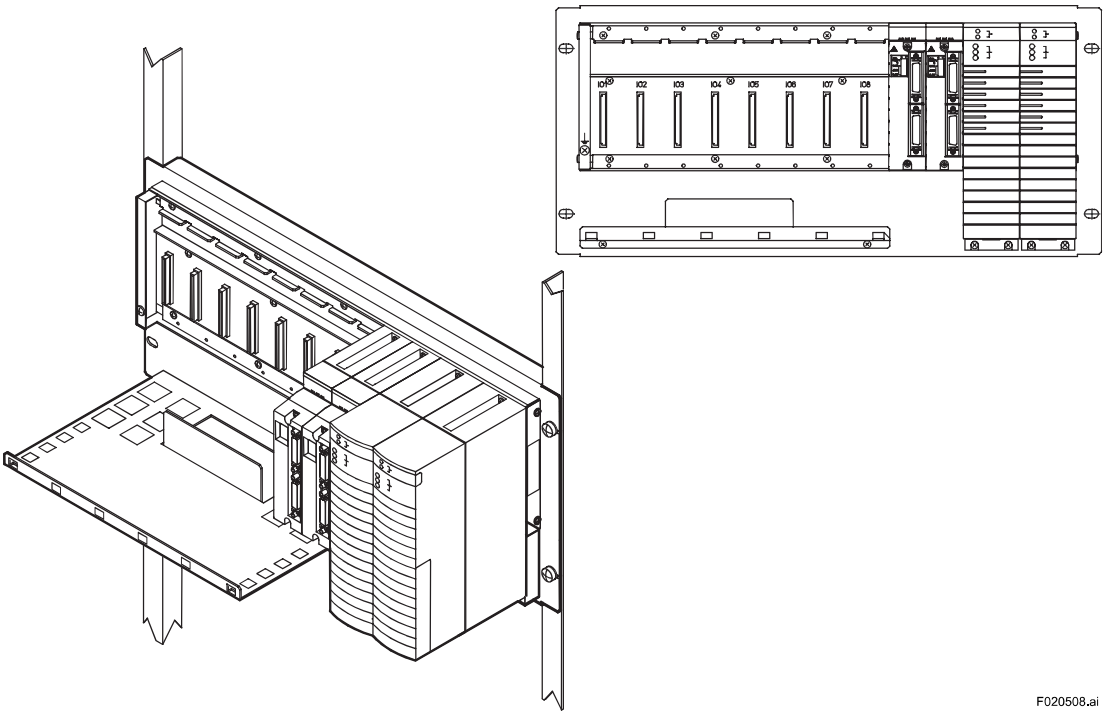
2.5.2 Rack Mounting



Rack-mount devices include:

SSC60S, SSC60D, SSC50S and SSC50D Safety Control Units (for Vnet/IP);
SSC57S and SSC57D Safety Control Unit (for Vnet/IP-Upstream)
S2SC70S and S2SC70D Safety Control Units;
SNB10D Safety Node Unit;
SNT10D Unit for Optical Bus Repeater Module;
SEA4D, SED2D, SED3D, SED4D and SWD2D Terminal Board;
SBA4D, SBD2D, SBD3D, and SBD4D Terminal Board (*1);
SRM53D and SRM54D Relay Board;
SBM54D Relay Board (*1);
AEPV7D Power Supply Bus Unit Vertical Type (*2)
AEP7D Primary Power Supply Bus Unit; and
AVR10D Duplexed V net router.

*1: DIN Rail Mount Type
*2: AEPV7D can not be installed to 19-inch Rack.

IMPORTANT

- To meet the Safety Standards and EMC Standards, the devices must be installed in a lockable metal cabinet. The cabinet must conform to IEC/EN/CSA 61010-2-201 or provide degrees of protection IP3X or above and IK09 or above.
- When installing rack mount devices on the same rack, keep 3-unit spacing (1 unit: 44.45 mm) under a safety control unit. Other units can be installed next to each other with specified condition.
  For more details, see “Providing Space for Heat Radiation”.

F020508.ai

Figure Mounting SNB10D Safety Node Unit

Notes on Installation

CAUTION

For safety during installation, secure an ample working space and work in a team. Be sure to observe the following when installing on a rack or on an instrumentation panel:

Insulation from Rack

The safety control unit or safety node unit or Unit for Optical Bus Repeater Module must be insulated from the rack using insulating bushing to prevent direct contact. Place the bushing on both sides of the plate, as shown in the figure below. Make sure that the rack-mounted equipment is electrically insulated from the rack. Insulating bushing is supplied as an accessory.

When you mount a device with insulating bushing to a rack, please do not leave it in an unstable condition where it is only hooked with loose screws. It may add unnecessary force to an insulating bushing to cause breakage.

Installation Procedure

1. Fasten a pair of insulating bushings together to each of the screw holes on the plate or the bracket on the device. The tapering end of the insulating bushings must come to the front side where a screw enters.
2. Using eight M5 screws to fix the device onto the rack or the panel.

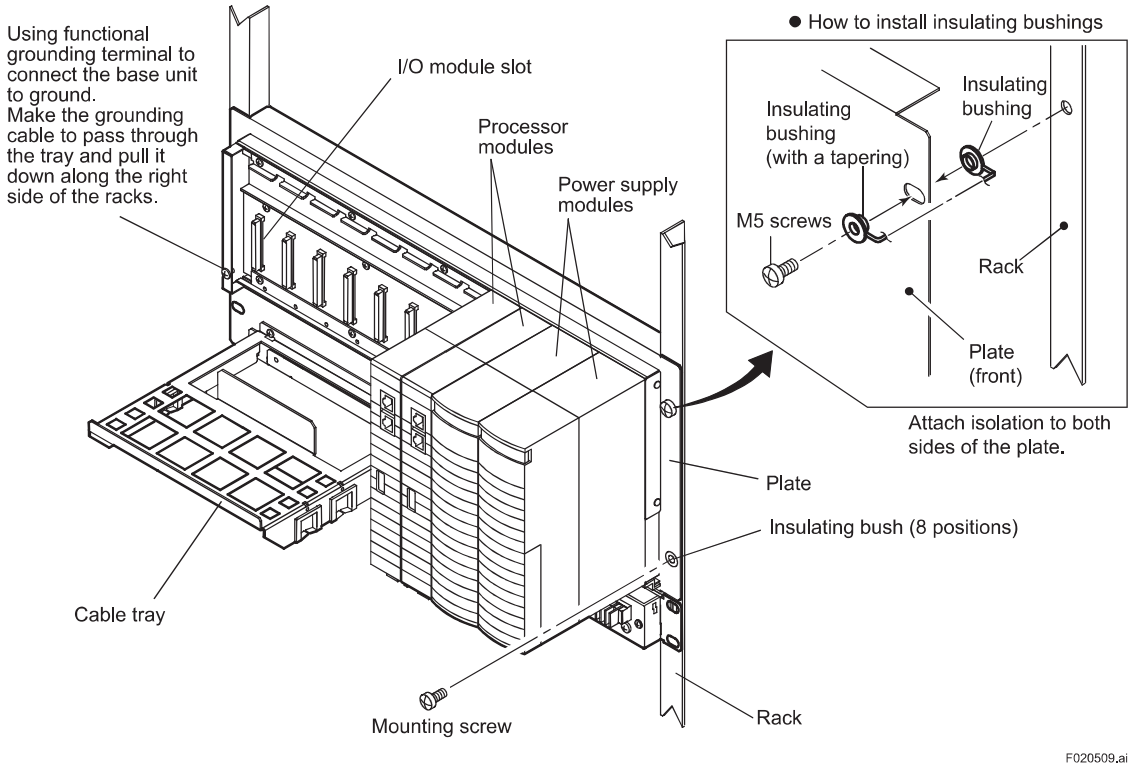


Figure Mounting SSC50D on Rack

IMPORTANT

The safety control unit or safety node unit or Unit for Optical Bus Repeater Module has no power supply switch. It is recommended that an external switch or breaker be provided to turn the power on and off.

CAUTION

If multiple node units are present, connect individual ground wires to terminals on the base units.

Installation Direction

Install the device in the rack with the screws in the vertically correct direction.

Check the installation direction by referring to SD (External Dimensions).

TIP

When the device is supplied with power even if it is temporary, the device must be installed on the rack.

Placing the device on a desk etc. and laying it on its side should be avoided.

The device may become malfunction if the heat radiated from the device cannot be cooled smoothly.

Providing Space for Heat Radiation

Leave space at the top and bottom of rack-mount equipment to permit heat radiation.

- Separate the top of the instrumentation board at least 100 mm away from the ceiling, and cut a ventilation hole of 200 cm2 or larger in the ceiling or install a ventilation fan.
- Keep at least 50 mm between the back of the equipment and the instrumentation panel or wall.
- When installing an 19-inch rack mount devices on the same rack, maintain a 3-unit spacing (1 unit: 44.45 mm) between devices. Above the installed devices, there are a number of openings for ventilation purposes on the trays.
- When putting cables on the trays, make sure that the openings are not blocked so as to ensure the airflow through the ventilation openings.

Providing Area for Servicing

When mounting devices in the 19-inch rack, the mounting plate cut out of instrumentation panel, and so on, leave an area for servicing.

Leave an area for servicing.

- All the work to connect cables to 19-inch rack mountable devices and I/O modules will be performed from the front.
- The work to confirm indicator lamps, configure card settings, and remove/insert cards will be performed from the front.
- The front is the area for wiring and servicing. Leave at least 1000 mm of space at the front.

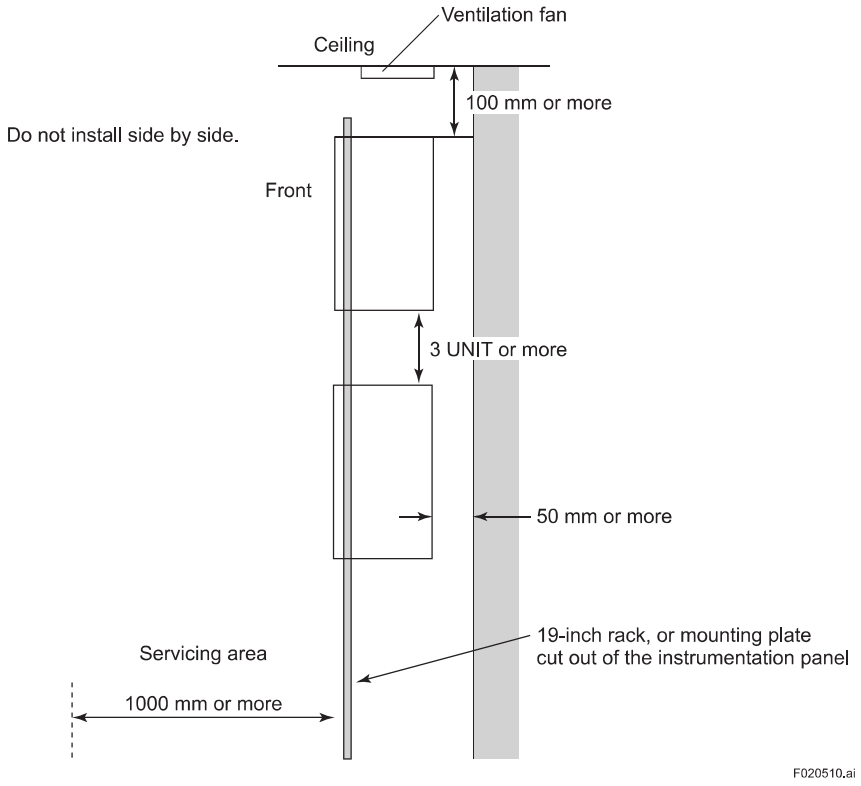

Figure Space Required for Rack-mount Equipment

2.5.3 DIN Rail Mountable Devices

The following devices can be mounted to a DIN rail.

Node interface unit: S2NN30D-□□□0□□□□□
Base plate with disconnecting terminal: S2BN1D-0□□□□
Terminal boards: SBA4D, S1BB4D, SBT4D, SBR4D, SBD2D, SBD3D, SBD4D, A2BM4
Relay boards: SBM54D
Universal conversion board: S1XEU4D

IMPORTANT

Install a DIN rail mountable device inside a metal cabinet.

To meet the Safety Standards and EMC Standards, the devices must be installed in a lockable metal cabinet.

The cabinet must conform to IEC/EN/CSA 61010-2-201 or provide degrees of protection IP3X or above and IK09 or above.

Notes on Installation

CAUTION

For installation, secure ample working space and work in a team for safety.

Providing Space for Heat Dissipation

Leave space at the top and bottom of the device to permit heat dissipation.

- Separate the top of the instrumentation board at least 100 mm away from the ceiling, and cut a ventilation hole of 200 cm2 or larger in the ceiling or install a ventilation fan.
- Do not block the openings (ventilation holes) in the top and bottom surfaces of the device.
- A 1-unit (44.45 mm) or more space shall be provided between the Node Interface Unit and other base plates.

Providing Area for Servicing

Leave an area for servicing.

- All the work to connect cables to DIN rail mountable devices and I/O modules will beperformed from the front.
- The work to confirm indicator lamps, configure card settings, and remove/insert cards will be performed from the front.
- The front is the area for wiring and servicing. Leave at least 1000 mm of space at the front.

Compatible DIN Rail

Table Compatible DIN Rail Symbols (DIN 60715, JIS C 2812, IEC 60715, EN50022)

Cross section shape type symbol	Width - height symbols	Material (chemical symbol)
TH	35-7.5	Fe or Al

Installation of DIN Rail

- Install a DIN rail in a metal mounting plate with screws at 120-mm or less intervals.
- When mounting a DIN rail mountable device to a DIN rail, confirm that the device is securely fixed after the mounting.
- A DIN rail for S2BN1D must be electrically insulated from a cabinet using insulating bushing.

Mounting Space

S2NN30D and S2BN1D require spaces, as shown below, to slide in to the positions when mounting to the DIN rail. Refer to the General Specifications (GS) for the external dimensions.

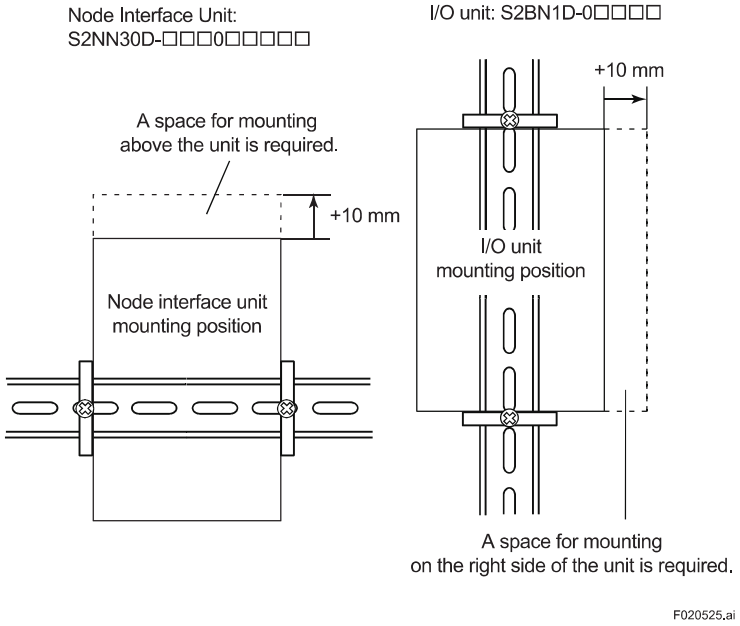

Figure Mounting Space (Front View)

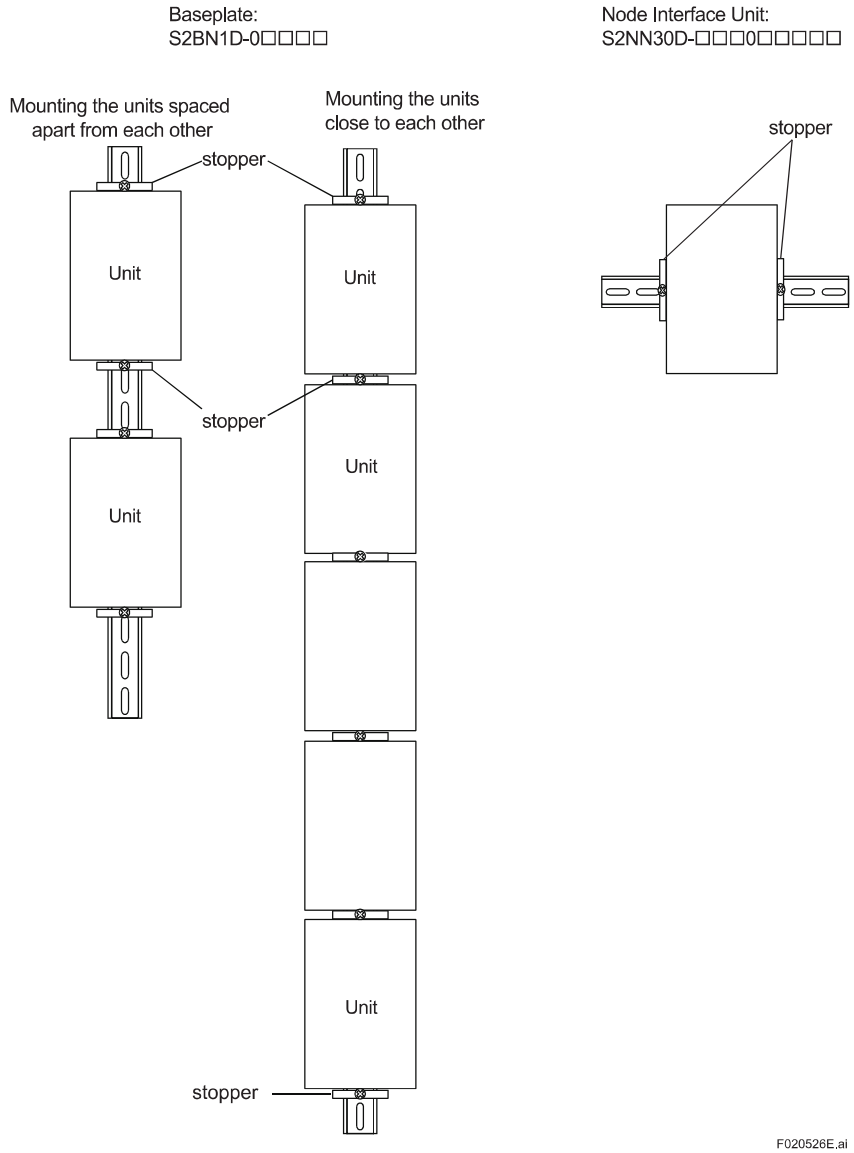
Grounding

Be sure to ground the equipment using the ground terminal of the base plate. Even if there is electrical conduction between the base plate and wall surface via the mounting mechanism, the equipment must be grounded using the functional ground terminal.

Mounting

- When mounting S2BN1D I/O Units vertically on the DIN rail, insert stoppers on top and bottom of each unit. When those I/O units are mounted close by, only one stopper in between two I/O units will do. Another stopper is required for the I/O unit mounted on the top shelf.
- When mounting the units horizontally on the DIN rail, insert stoppers on both sides of the unit.



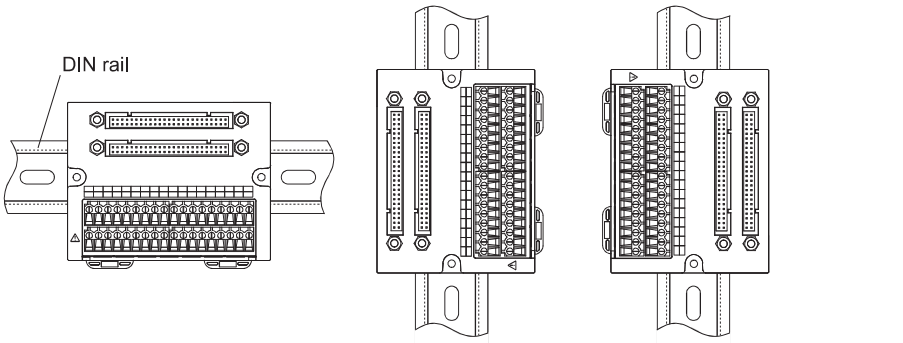


Figure Mounting stopper to the DIN rail

Terminal Board and Relay Board Mounting Directions

Mount a terminal board and a relay board in the directions as shown in the below figure.

When mounting SBD2D in the direction of b or c, the following conditions must be met.

- When the ambient temperature is 60 °C or lower, the total load current of the SBD2D must be kept within the specified value of 8 A or lower.
- When the ambient temperature is at 70 °C, the total load current must be 6 A or lower.
- In case the ambient temperature is in between 60 and 70 °C, reduce the total load current from 8 A maximum by the rate of 0.2 A/°C.

Remarks for Installating to a DIN Rail

On the back of DIN rail mountable terminal board, there are two bumps (projections) for fixing screws on the wall. Be sure not to let mechanical interference happen between these bumps and screw tops from the DIN rail. The height of the shaded areas in the below figures must be kept as 2.5 mm or shorter than the DIN rail surface.

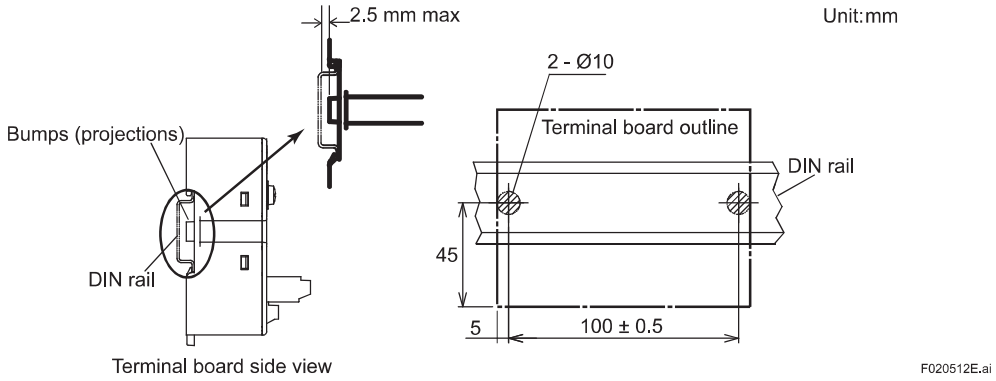

Figure Mounting SBA4D to DIN rail for terminal board

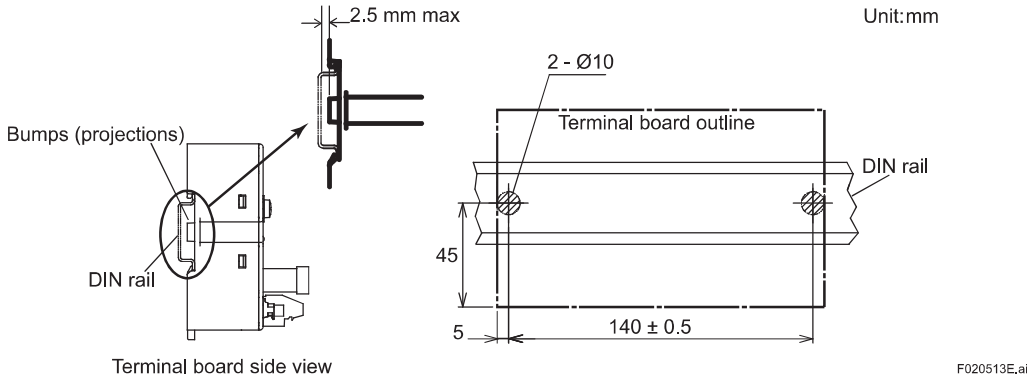

Figure Mounting A2BM4, SBD2D, SBD3D, and SBD4D to DIN rail for terminal board

Cautions of the Power Source for the Loads of SBM54D

In the case of using multiple power sources for the loads of SBM54D, there are cautions of the load voltage.

When the load voltage is different between loads.

All of the load voltages must be in either the range below.

- Load voltages ≤ 100 V
- 50 V < Load voltages ≤ 150 V

Cautions of the Digital Output Module when SBM54D is Used

The functions of disconnection diagnosis, ON pulse diagnosis and OFF pulse diagnosis for SDV541 must be disabled when SBM54D is used.

2.5.4 Wall Mountable Devices

The following devices can be mounted to a wall with screws.

Node interface unit:	S2NN30D-□□□□1□□□□
Base plate with disconnecting terminal:	S2BN1D-1□□□□
Barrier base plate:	S2BN4D-1□□□□
	S2BN5D-1□□□□
Terminal board:	A2BM4

IMPORTANT

Install a wall mountable device inside a metal cabinet.

To meet the Safety Standards and EMC Standards, the devices must be installed in a lockable metal cabinet.

The cabinet must conform to IEC/EN/CSA 61010-2-201 or provide degrees of protection IP3X or above and IK09 or above.

DIN rail specifications:

Notes on Installation

Providing Space for Mounting

S2BN4D need to be slide when this is mounted to a wall. For this reason, provide a space shown in the following figure. Refer to the General Specifications (GS 32P06P10-01EN) for the external dimensions.

Unit: S2BN4D-1□□□□

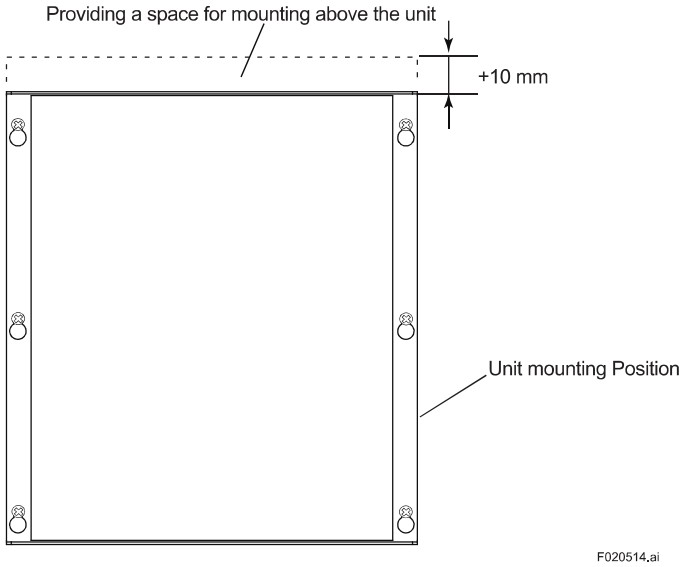

Figure Providing a Space for Mounting (Front View)

Providing Space for Heat Dissipation

Leave space to permit heat dissipation just as for a DIN rail mountable device.

Providing Area for Servicing

Leave an area for servicing just as for a DIN rail mountable device.

Grounding

Be sure to ground the equipment using the functional ground terminal provided on the base plate.

Mounting of Base Plate

- Mount a wall mountable device to a metal mounting plate using screws.
- To ground the S2BN4D at a single point, the back plate of S2BN4D must be insulated from mounting plate.

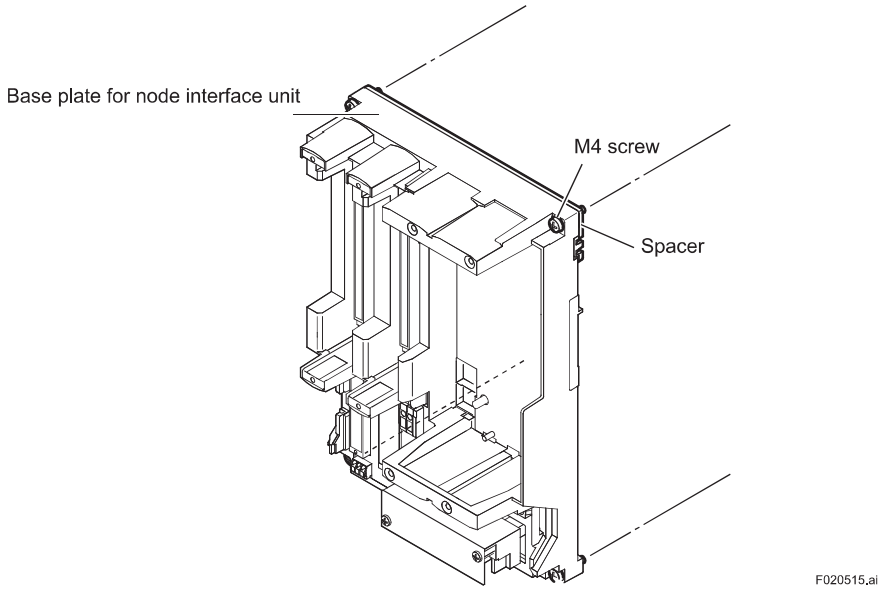

Figure Example of Mounting Node Interface Unit to Wall

Table Screw and Washer for Wall Mounting

Model	Screw diameter	Screw length	Washer Type/Washer Outer diameter	Tightening Torque (N•m)
S2NN30D	M4	Accessory (Retainer screw)		0.8 to 1.0
S2BN1D	M4	Accessory (Retainer screw)		0.8 to 1.0
S2BN4D (*1)	M4	— (*2)	Plane washer / 9 mm or smaller	1.2
S2BN5D	M4	16 mm or longer	(When the washer is not used)	1.2
		18 mm or longer	Plane washer / 8 mm or smaller	

*1: A back plate of S2BN4D is connected to functional grounding terminal. In order to ground at a single point, insulate the back plate from mounting plate using insulated supporter.
*2: The screw length depend on an insulated supporter specification. The screw length is decided using the thickness of the S2BN4D back plate (1.6 mm) and a washer.

SEE ALSO For the screw mounting dimensions for wall mounting, refer to the General Specifications (GS) for the corresponding device.

Remarks for Mounting on a Wall Surface

The following figure shows the screw installation dimensions for a wall mountable terminal board. Installation screws for the terminal board are not supplied and should be purchased separately. You need two installation screws. If you are using binding heads, use M4 screws with a length of at least 10 mm. If you are using screws with washers, use M4 screws with a length of at least 12 mm. The screw tightening torque is approximately 0.8 N·m.

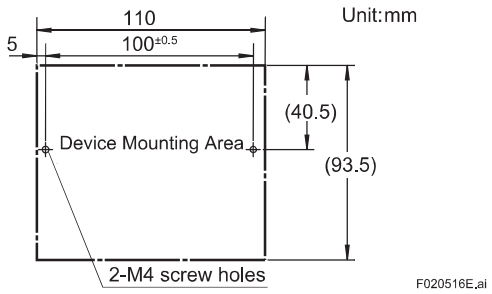

Figure Screw Installation Dimensions for the A2BM4, SBA4D, SBT4D, and SBR4D

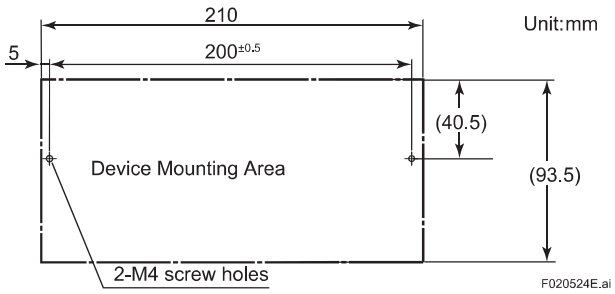

Figure Screw Installation Dimensions for the S1BB4D

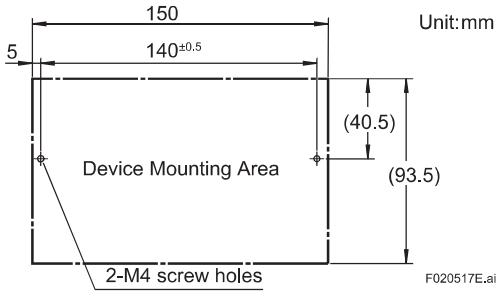

Figure Screw Installation Dimensions for the SBD2D, SBD3D, and SBD4D

Grounding

Ground the equipment at a single point using the functional ground terminal provided on the base plate.

Installation Direction

Mount the device to the wall with the screws in the vertically correct direction. Check the installation direction in General Specifications (GS).

2.5.5 Installation Guideline for Cabinet (FIO)

Installation Guideline for Rittal Cabinet (Up to 11 Nodes)

The following shows examples and notes for installing a safety control unit and up to 10 safety node units in the Rittal TS8 cabinet.

Applicable Cabinet

Rittal TS8 cabinet (W: 800 mm D: 800 mm H: 2000 mm)

Temperature Conditions

- If a safety control unit is equipped with a fan unit, the ambient temperature of the cabinet must be 50°C or lower. If it is not equipped with a fan unit, the ambient temperature of the cabinet must be 30°C or lower.
- Ambient temperature of the safety control unit and safety node units in the cabinet must satisfy the temperature values specified in GS (General Specifications).

Installation Conditions

- Applicable units
  Safety Control Unit S2SC70☐/SSC60☐/SSC50☐/SSC57☐: 1 unit
  Safety Node Unit SNB10D and Unit for Optical ESB Bus Repeater Module SNT10D: Up to 10 units
  Primary Power Supply Bus Unit AEP7D and AEPV7D: Up to 2 units
  Other heat-generating devices must not be installed in the cabinet.
- Fan configuration
  Configuration of door fans, node fans, and roof vent

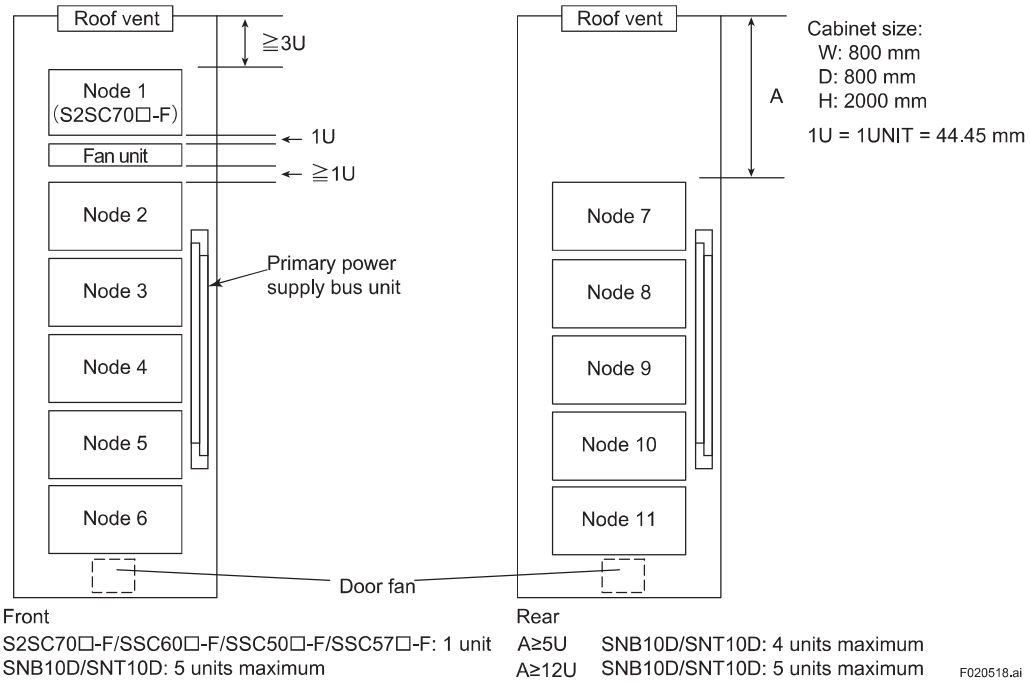

Figure Installation of S2SC70☐/SSC60☐/SSC50☐/SSC57☐ for Rittal cabinet (with Fan Unit)

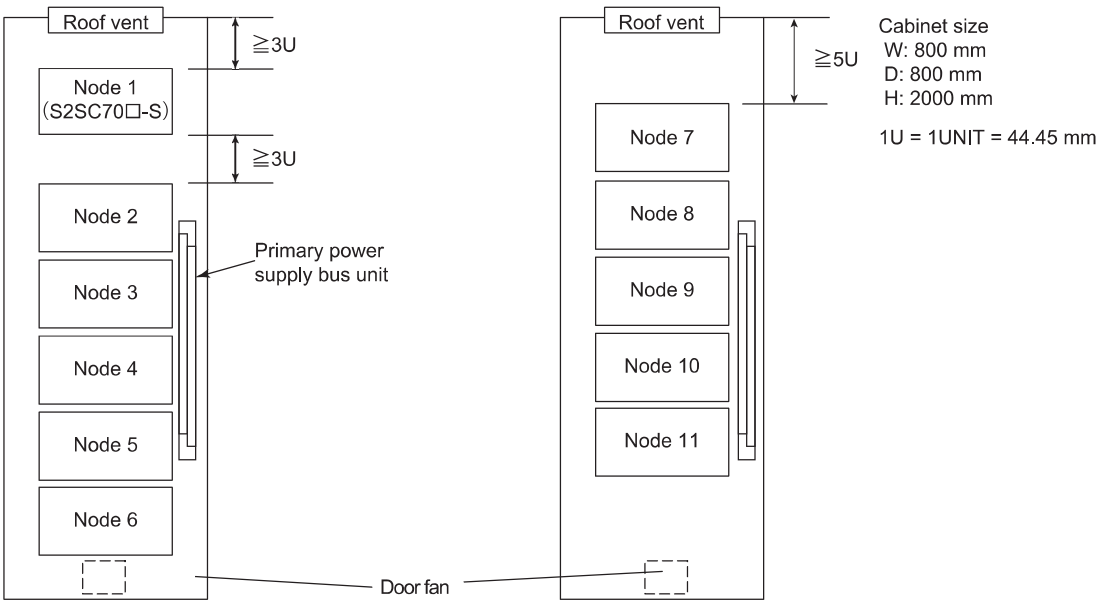

Figure Installation of S2SC70☐/SSC60☐/SSC50☐/SSC57☐ for Rittal cabinet (without Fan Unit)

- Fan specifications
  Door fan (on one side): Maximum air flow rate 230 m^3/h or more
  The roof vent must be larger than the opening area of the door fan.
- I/O module installation restrictions
  Refer to and follow the installation restrictions specified in "■ NODE UNIT MOUNTING RESTRICTIONS" in the "ProSafe-RS Outline of I/O Modules" (GS 32Q06K20-31E).

■ Installation Guideline for Rittal Cabinet (Up to 14 Nodes)

The following shows examples and notes for installing a safety control unit and up to 13 safety node units in the Rittal TS8 cabinet. If the units are installed under the following conditions, the temperature rise in the cabinet compared to the ambient temperature of the cabinet is 10°C or lower.

● Applicable Cabinet

Rittal TS8 cabinet (W: 800 mm D: 800 mm H: 2000 mm)

● Temperature Conditions

- Ambient temperature of the cabinet must be 50°C or lower.
- Ambient temperature of the safety control unit and safety node units in the cabinet must satisfy the temperature values specified in GS (General Specifications).

Installation Conditions

- Applicable units
  Safety Control Unit S2SC70□-F/SSC60□-F: 1 unit
  Safety Node Unit SNB10D and Unit for Optical ESB Bus Repeater Module SNT10D: Up to 13 units
  Primary Power Supply Bus Unit AEP7D and AEPV7D: Up to 2 units
  Other heat-generating devices must not be installed in the cabinet.

- Fan configuration
  There are the following two types of fan configurations.
  Type 1: Configuration of door fans, node fans, and door vents
  Type 2: Configuration of door fans, node fans, and roof vent

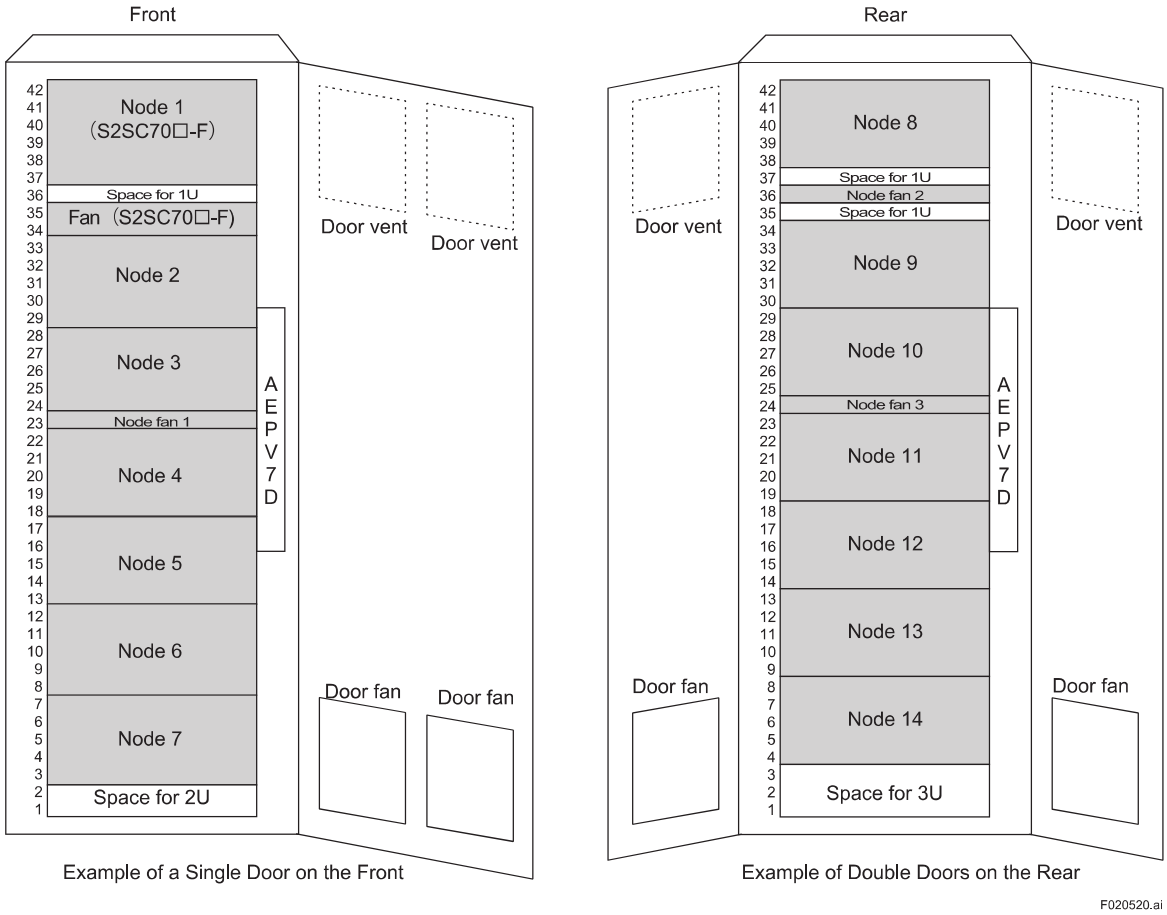

Figure Fan Configuration of Type 1 and Installation Positions in the Cabinet

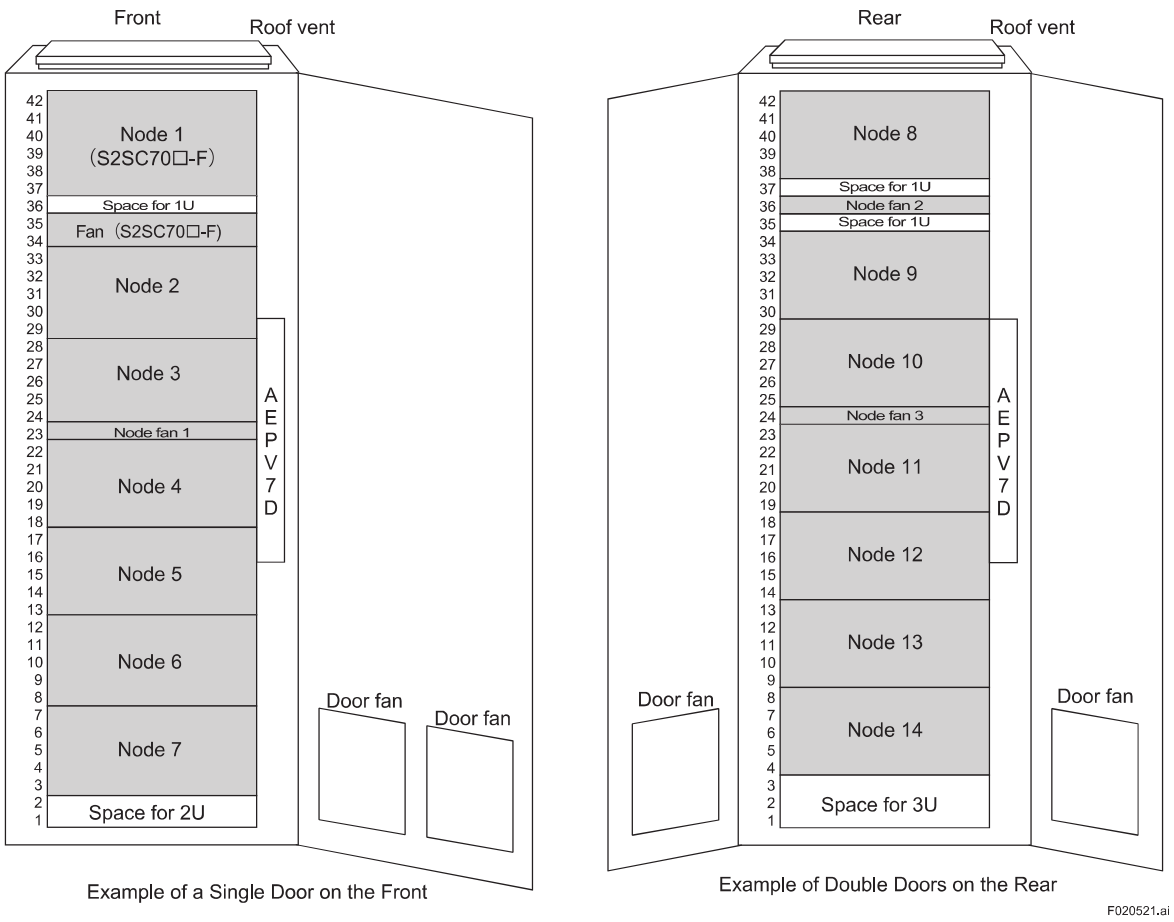

Figure Fan Configuration of Type 2 and Installation Positions in the Cabinet

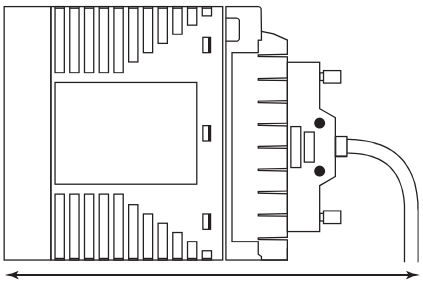
The required number of node fans varies depending on the number of nodes to be installed.

Table Number of Nodes to Be Installed and Need to Install Fans

	Location No. (*1)	7 units on one side	6 units on one side	5 units on one side	4 units on one side
Front	37-42	Node 1 (S2SC70□-F)	Node 1 (S2SC70□-F)	Node 1 (S2SC70□-F)	Node 1 (S2SC70□-F)
	34-35	Fan (S2SC70□-F)	Fan (S2SC70□-F)	Fan (S2SC70□-F)	Fan (S2SC70□-F)
	29-33	Node 2	Node 2	Node 2	Node 2
	24-28	Node 3	Node 3	Node 3	Node 3
	23	Node Fan 1	Node Fan 1	—	—
	18-22	Node 4	Node 4	Node 4	Node 4
	13-17	Node 5	Node 5	Node 5	—
	8-12	Node 6	Node 6	—	—
	3-7	Node 7	—	—	—
Rear	38-42	Node 8	Node 8	Node 8	Node 8
	36	Node Fan 3	Node Fan 2	Node Fan 2	—
	30-34	Node 9	Node 9	Node 9	Node 9
	25-29	Node 10	Node 10	Node 10	Node 10
	24	Node Fan 3	Node Fan 3	—	—
	19-23	Node 11	Node 11	Node11	Node 11
	14-18	Node 12	Node 12	Node 12	—
	9-13	Node 13	Node 13	—	—
	4-8	Node 14	—	—	—

—: Not installed
*1: Location numbers correspond to the installation positions in the figure above.

- Fan specifications
  Door fan (on one side): Maximum air flow rate 210 m^3/h or more
  Node fan: Maximum air flow rate 480 m^3/h or more
  The door vent and roof vent must be larger than the opening area of the door fan.
- I/O module installation restrictions
  Refer to and follow the installation restrictions specified in “■ NODE UNIT MOUNTING RESTRICTIONS” in the “ProSafe-RS Outline of I/O Modules” (GS 32Q06K20-31E).
- Detecting a fan failure
  It is recommended to monitor the rotation of the fans or the temperature in the cabinet to detect a fan failure.

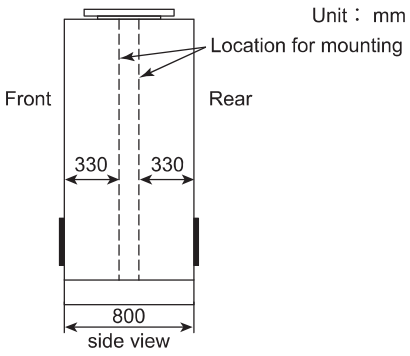


Notes on Installation

Depth of Cabinet

The following table shows the depth from the blunt curb of the signal cable to the edge of the rack, when the signal cable is connected with the I/O module in a cabinet.

Table Depth of cabinet



I/O Module	Depth from the cable blunt curb to the edge of the rack (mm)
SDV144	230
SDV521	290
SDV526	250
SDV531	230
SDV53A	260
SDV541	230

Depth from the blunt curb of the signal cable to the edge of the rack

2.5.6 Installation Guideline for Cabinet (N-IO)

Installation Guideline for Rittal cabinet for N-IO

This section describes examples of the maximum number of N-IO system equipment (except for equipment for RIO System Upgrade) installed in general-purpose cabinets.

The following shows the common specifications to the examples of cabinets for N-IO system that are explained later.

Cabinet Specifications

The following cabinet is assumed to be used.

Table Cabinet Dimensions

W	D	H	Material	Product example
800 mm	800 mm	2000 mm (+100 mm) (*1)	Metal	Rittal TS8808 series

*1: 100 mm is the height of the channel base.

Table Specifications of a cabinet ambient temperature and an air supply / air exhaust port (In case N-IO SCU is included in a cabinet.)

Cabinet ambient temperature	Air supply port	Air flow	Area of an air supply/ air exhaust port (Panel cut of a cabinet)	Product example	Remarks
40 ºC or less	Fan	Door fan 230 m^3/h or more	Air supply port 60000 mm^2 or more Air exhaust port 60000 mm^2 or more	Rittal SK3239 series (Fan)	• Be sure to mount two push-fit door fans on each side in case of a failure. • The air flow and the area in the left show the total value on each side.

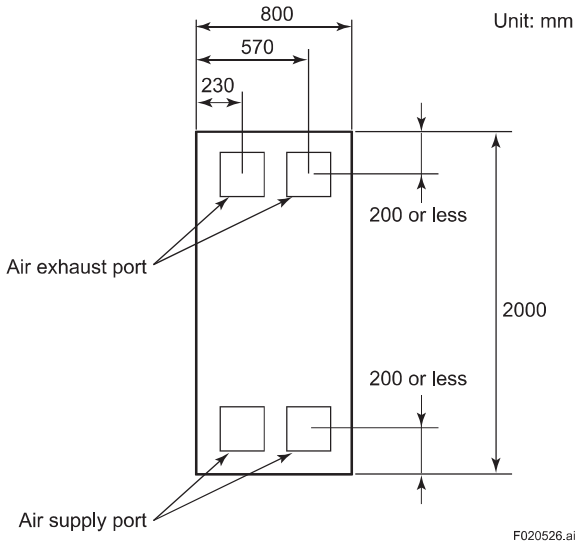
Table Specifications of a cabinet ambient temperature and an air supply / air exhaust port (In case only N-IO nodes (Non-Intrinsic Safety Barrier) are included in a cabinet.)

Cabinet ambient temperature	Air supply port	Air flow	Area of an air supply/ air exhaust port (Panel cut of a cabinet)	Product example	Remarks
50 ºC or less	Fan	Door fan 40 m^3/h or more	Air supply port 16000 mm^2 or more Air exhaust port 60000 mm^2 or more	Rittal SK3237 series (Fan)	• It is recommended to mount two push-fit door fans on each side in case of a failure. • The air flow and the area in the left show the total value on each side.
40 ºC or less	Outlet filter	- (*1)	Air supply port 60000 mm^2 or more Air exhaust port 60000 mm^2 or more	Rittal SK3239.200 (Outlet filter)	• Be sure to mount two outlet filters on each side in case of a failure such as filter clogging.

*1: When not mounting a fan, be sure to secure a ventilation path in the cabinet.

Table Specifications of a cabinet ambient temperature and an air supply / air exhaust port (In case only N-IO nodes (Intrinsic Safety Barrier) are included in a cabinet.)

Cabinet ambient temperature	Air supply port	Air flow	Area of an air supply/ air exhaust port (Panel cut of a cabinet)	Product example	Remarks
50 ºC or less	Fan	Door fan 230 m^3/h or more	Air supply port 60000 mm^2 or more Air exhaust port 60000 mm^2 or more	Rittal SK3239 series (Fan)	• Be sure to mount two or more push-fit door fans on each side in case of a failure. • The air flow and the area in the left show the total value on each side.



Notes

The following shows the common notes to the examples.

- The ventilation for each modules shall not be blocked.
- The mounting plate for mounting the IOBP shall be made of metal, regardless of whether DIN rail or panel mounting.
- A DIN rail shall be made of metal.
- For mounting restrictions other than the above, refer to the General Specifications (GS).

Position of an air supply / air exhaust port

In this mounting example, arrange an air supply / air exhaust port as follows.

Note: This is the dimension from the end face of the cabinet. (Not the dimension from the end face of the cabinet door.)

Figure Position of an air supply/ air exhaust port

Conventions

The following shows the common abbreviations used and their explanations.

Abbreviations	Explanations
SCU	Safety Control Unit
NIU	Node Interface Unit (for N-IO)
IOBP	I/O Base Plate
IOBP_IS	I/O Base Plate for Intrinsic Safety explosion protection
NIO node	Consists of NIU and IOBP/IOBP_IS.
Unit	Unit of 19 inch rack. 1 Unit = 44.45 mm
Side	One of the front and the back of a cabinet. (e.g., side, one side)

Example of Mounting Multiple SCUs for N-IO in a Cabinet

Temperature conditions

In this example, the ambient temperature is assumed to be the following.

Cabinet ambient temperature	40 °C or less

Maximum numbers of units that can be mounted

Type	Model	Number of units that can be mounted per side
SCU	S2SC70D S2SC70S (Except for S2SC70□-S)	Up to 4

Heat-generating devices other than the above shall not be mounted in the cabinet.

Mounting conditions

- SCU shall be mounted with a 3-unit or more space from the top-shelf mounting position of the cabinet.
- A 1-unit or more space shall be provided between the fan unit of a SCU and the SCU on the bottom shelf.
- Devices that block the convective air flow from the fan unit of a SCU or door fans to each module shall not be mounted.

The following shows how to mount multiple SCUs for N-IO in a cabinet:

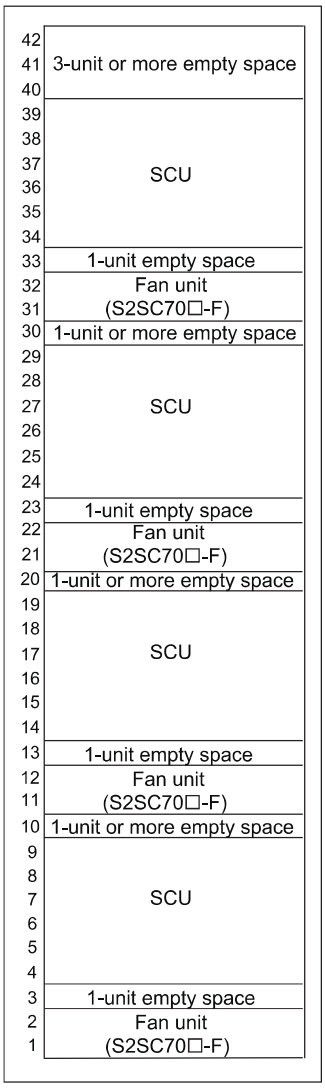


Figure Example of Mounting Multiple SCUs for N-IO in a Cabinet

Example of Mounting an SCU for N-IO and N-IO Nodes in a Cabinet

Temperature conditions

In this example, the ambient temperature is assumed to be the following.

Cabinet ambient temperature	40 °C or less

Maximum numbers of units that can be mounted in case of this example

Type	Model	Number of units that can be mounted per side
SCU	S2SC70S/S2SC70D (Except for S2SC70□-S)	Up to 1
NIU	S2NN30D	Up to 1
IOBP	S2BN1D	Up to 6 (2 rows × 3 shelves)

Heat-generating devices other than the above shall not be mounted in the cabinet.

Mounting conditions

- The SCU on the top shelf shall be mounted with a 100-mm or more space from the cabinet ceiling.
- A 1-unit (= 44.45 mm) or more space shall be provided between NIU and IOBP.
- A circulation fan unit shall be mounted on the shelf below the SCU with a 1-unit space. A 1-unit or more space shall be provided under the circulation fan unit.
- Suitable length of signal cables and power cables should be used.

The following shows how to mount an SCU for N-IO and N-IO nodes in a cabinet:

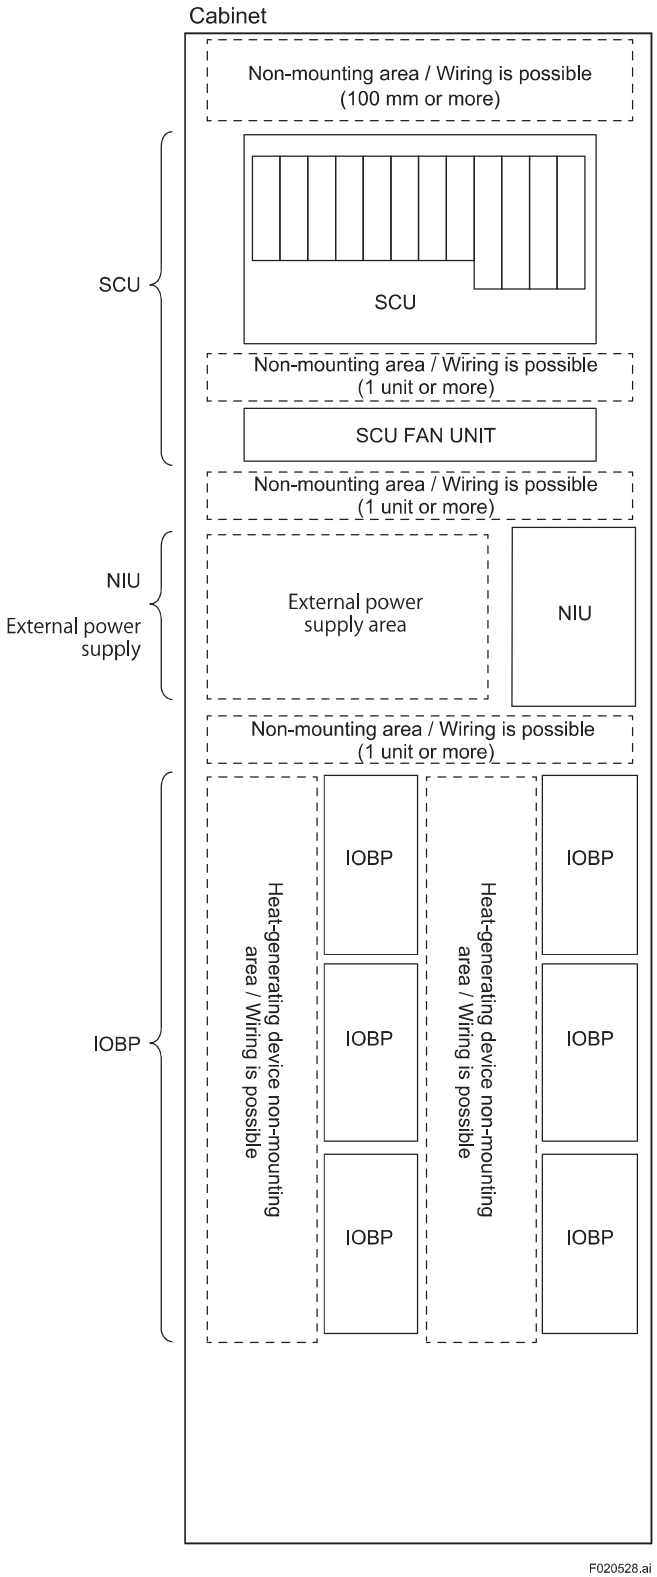

Figure Example of Mounting an SCU for N-IO and N-IO Nodes in a Cabinet

Example of Mounting an SCU for N-IO and N-IO Nodes in a Cabinet (In case of field wiring via terminal board)

Temperature conditions

In this example, the ambient temperature is assumed to be the following.

Cabinet ambient temperature	40 °C or less

Maximum numbers of units that can be mounted in case of this example

Type	Model	Number of units that can be mounted per side
SCU	S2SC70S/S2SC70D (Except for S2SC70□-S)	Up to 1
NIU	S2NN30D	Up to 2
IOBP	S2BN1D	Up to 12 (3 rows × 4 shelves)

Mounting conditions

- The SCU on the top shelf shall be mounted with a 100-mm or more space from the cabinet ceiling.
- A 1-unit (= 44.45 mm) or more space shall be provided between NIU and IOBP.
- A circulation fan unit shall be mounted on the shelf below the SCU with a 1-unit space.

  A 1-unit or more space shall be provided under the circulation fan unit.
- Suitable length of signal cables and power cables should be used.

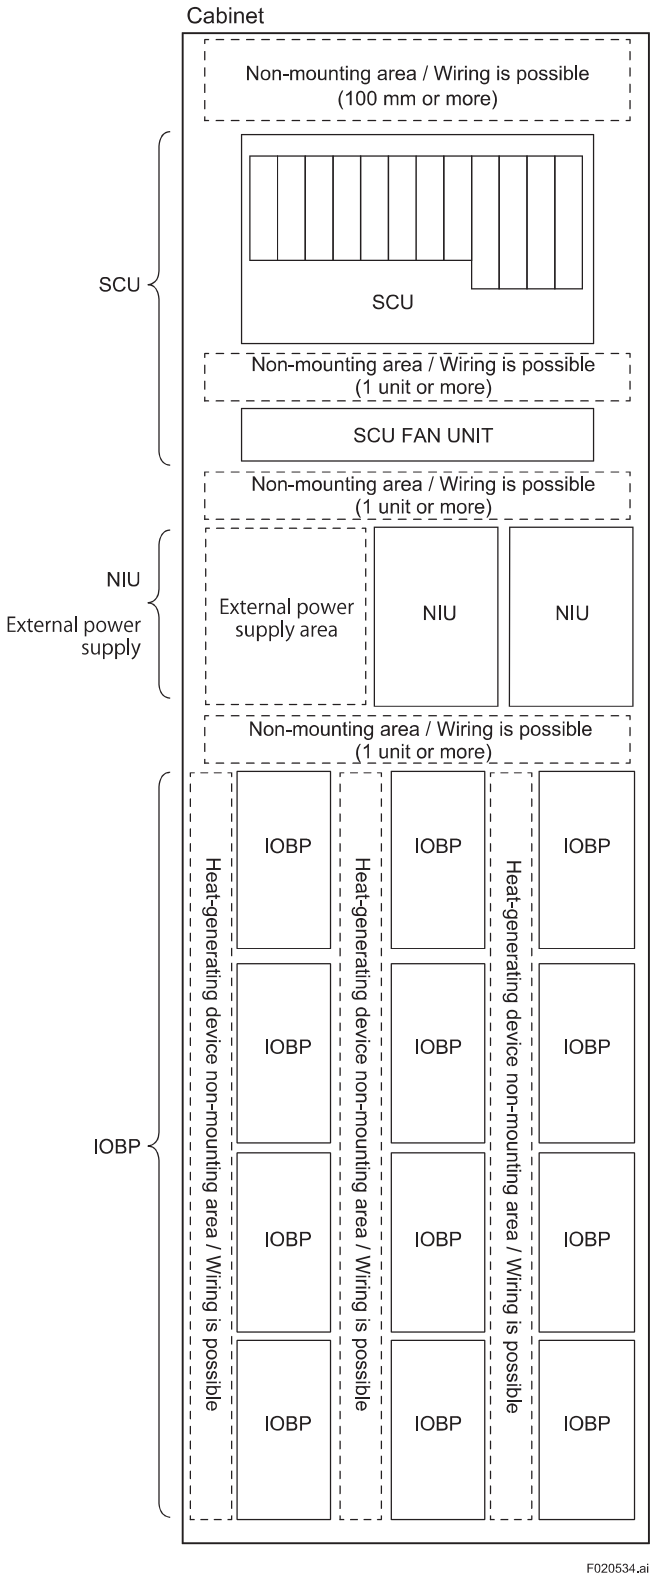

Figure Example of Mounting an SCU for N-IO and N-IO Nodes in a Cabinet (IOBP×3 columns mounted)

Example of Mounting N-IO Nodes (Non-Intrinsic Safety Barrier) in a Cabinet

Temperature conditions

In this example, the ambient temperature is assumed to be the followings.

Cabinet ambient temperature	50 °C or less

Maximum numbers of units that can be mounted in case of this example

Type	Model	Number of units that can be mounted per side
NIU	S2NN30D	Up to 2
IOBP	S2BN1D	Up to 10 (2 rows × 5 shelves)

Heat-generating devices other than the above shall not be mounted in the cabinet.

Mounting conditions

- The NIU shall be mounted with a 100-mm or more space from the cabinet ceiling.
- A 1-unit (= 44.45 mm) or more space shall be provided between NIU and IOBP.
- Suitable length of signal cables and power cables should be used.

The following shows how to mount N-IO nodes (Non-Intrinsic Safety barrier) in a cabinet:

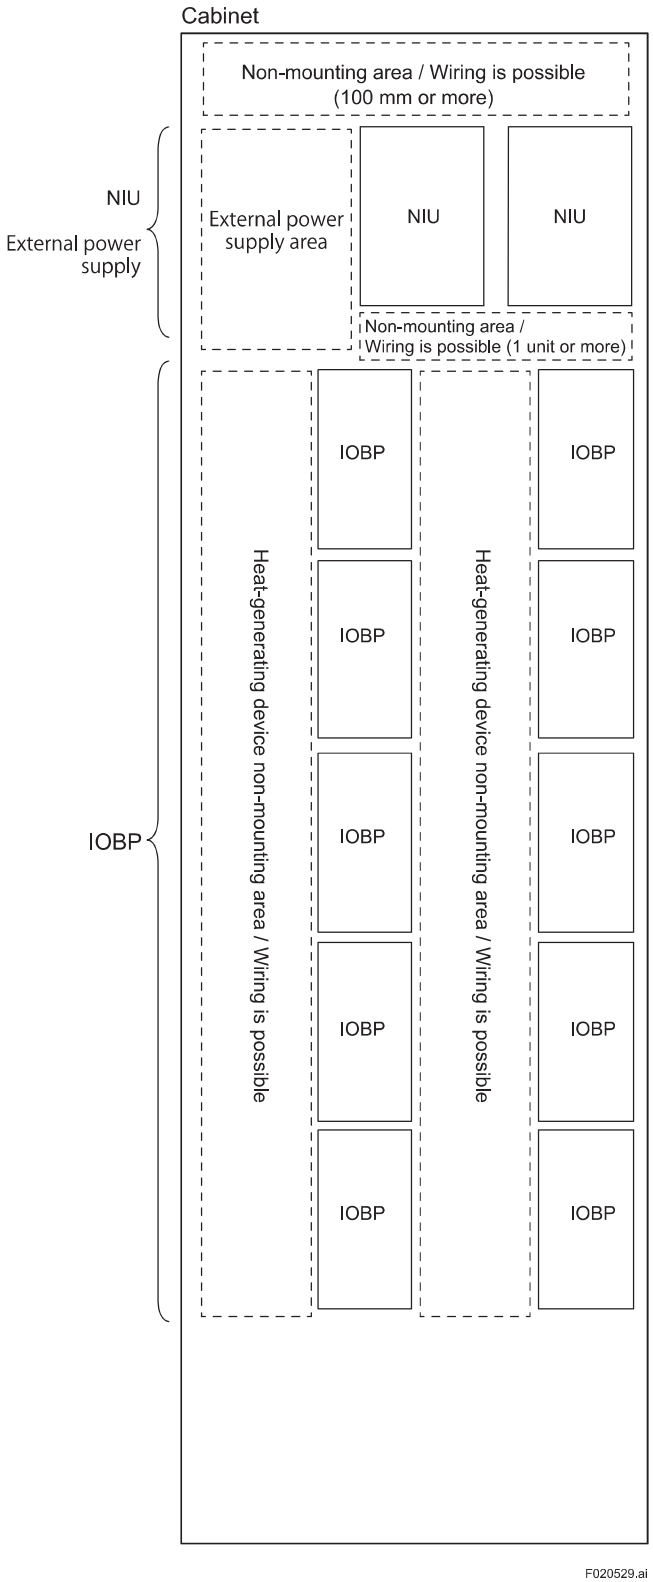

Figure Example of Mounting N-IO Nodes (Non-Intrinsic Safety barrier) in a Cabinet

Example of Mounting N-IO Nodes (Non-Intrinsic Safety Barrier) in a Cabinet (In case of field wiring via terminal board)

Temperature conditions

In this example, the ambient temperature is assumed to be the following.

Cabinet ambient temperature	50 °C or less

Maximum numbers of units that can be mounted in case of this example

Mounting surface of cabinet	Type	Model	Number of units that can be mounted per side
Mounting surface of external power supply	NIU	S2NN30D	Up to 3
	IOBP	S2BN1D	Up to 15 (3 rows x 5 shelves)
Non-mounting surface of external power supply	NIU	S2NN30D	Up to 3
	IOBP	S2BN1D	Up to 18 (3 rows x 6 shelves)

Mounting conditions

- The NIU shall be mounted with a 100-mm or more space from the cabinet ceiling.
- A 1-unit (=44.45 mm) or more space shall be provided between NIU and IOBP.
- When using a DIN rail, be sure to install a DIN rail on the mounting plate. Fixing at the both ends of a DIN rail and not fixing at the middle.
- Suitable length of signal cables and power cables should be used.

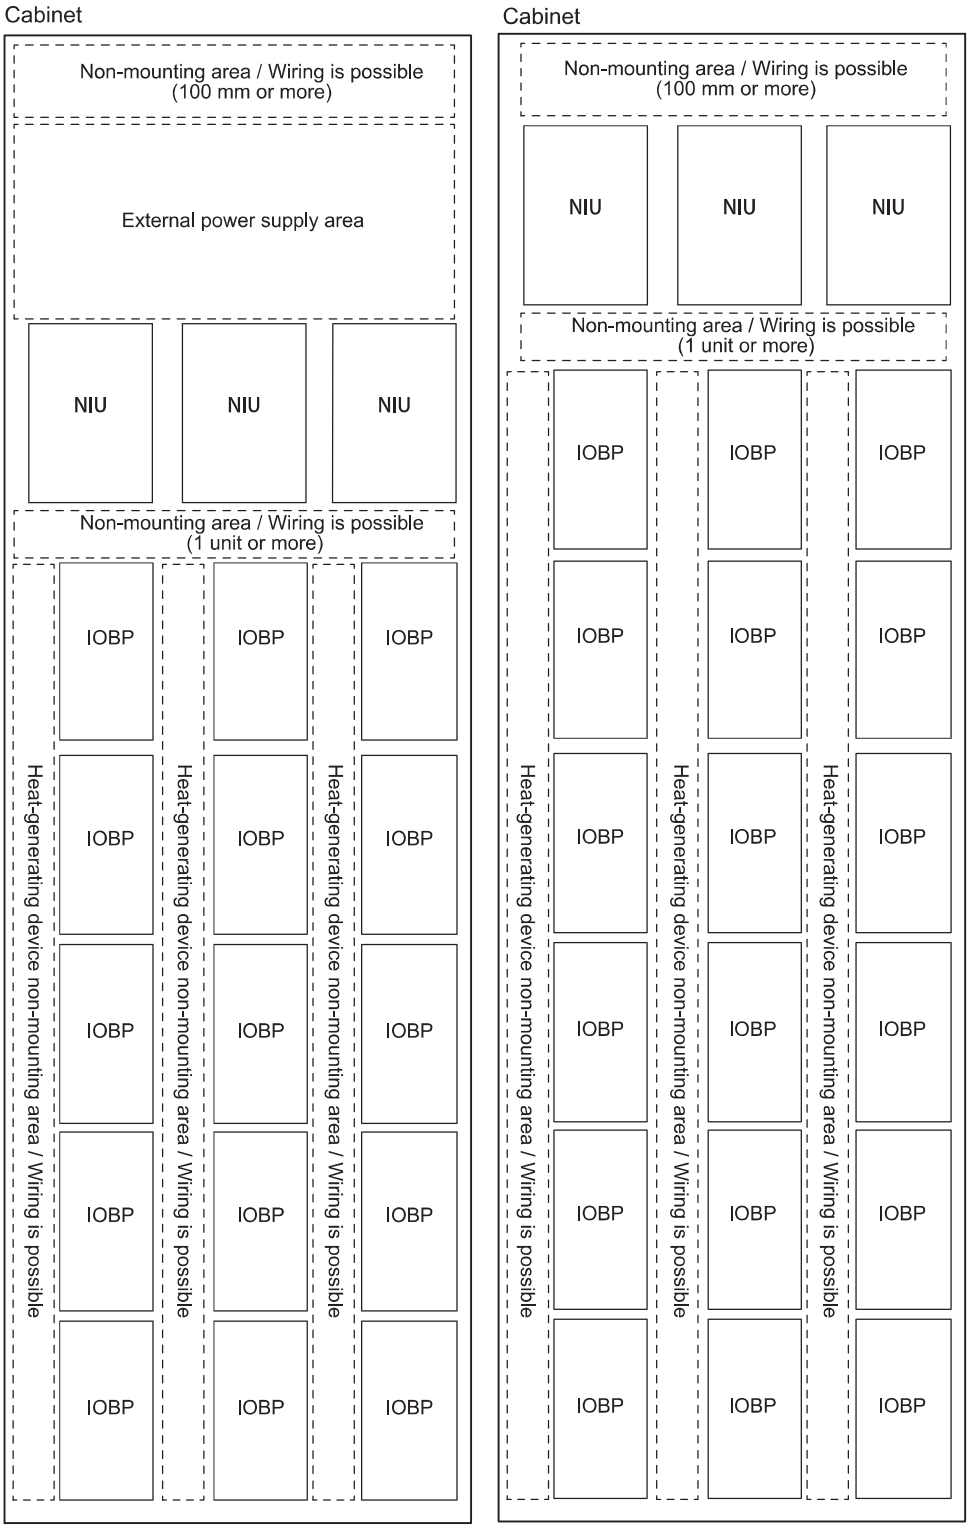

Figure Example of Mounting N-IO Nodes (Non-Intrinsic Safety barrier) in a Cabinet

Example of Mounting N-IO Nodes (Intrinsic Safety Barrier) in a Cabinet

Temperature conditions

In this example, the ambient temperature is assumed to be the followings.

Cabinet ambient temperature	50 °C or less

Maximum numbers of units that can be mounted in case of this example

Type	Model	Number of units that can be mounted per side
NIU	S2NN30D	Up to 2
IOBP_IS	S2BN4D or S2BN5D	Up to 8 (2 rows × 4 shelves) Up to 10 (2 rows × 5 shelves)

Heat-generating devices other than the above shall not be mounted on the same mounting plate.

IOBP cannot be mounted.

Mounting conditions

- The NIU shall be mounted with a 100-mm or more space from the cabinet ceiling.
- A 1-unit (= 44.45 mm) or more space shall be provided between NIU and IOBP_IS.
- Suitable length of signal cables and power cables should be used.
- Mounting the devices in the cabinet should be in line according to the intrinsic safety standard.

The following shows how to mount N-IO nodes (Intrinsic Safety barrier) in a cabinet:

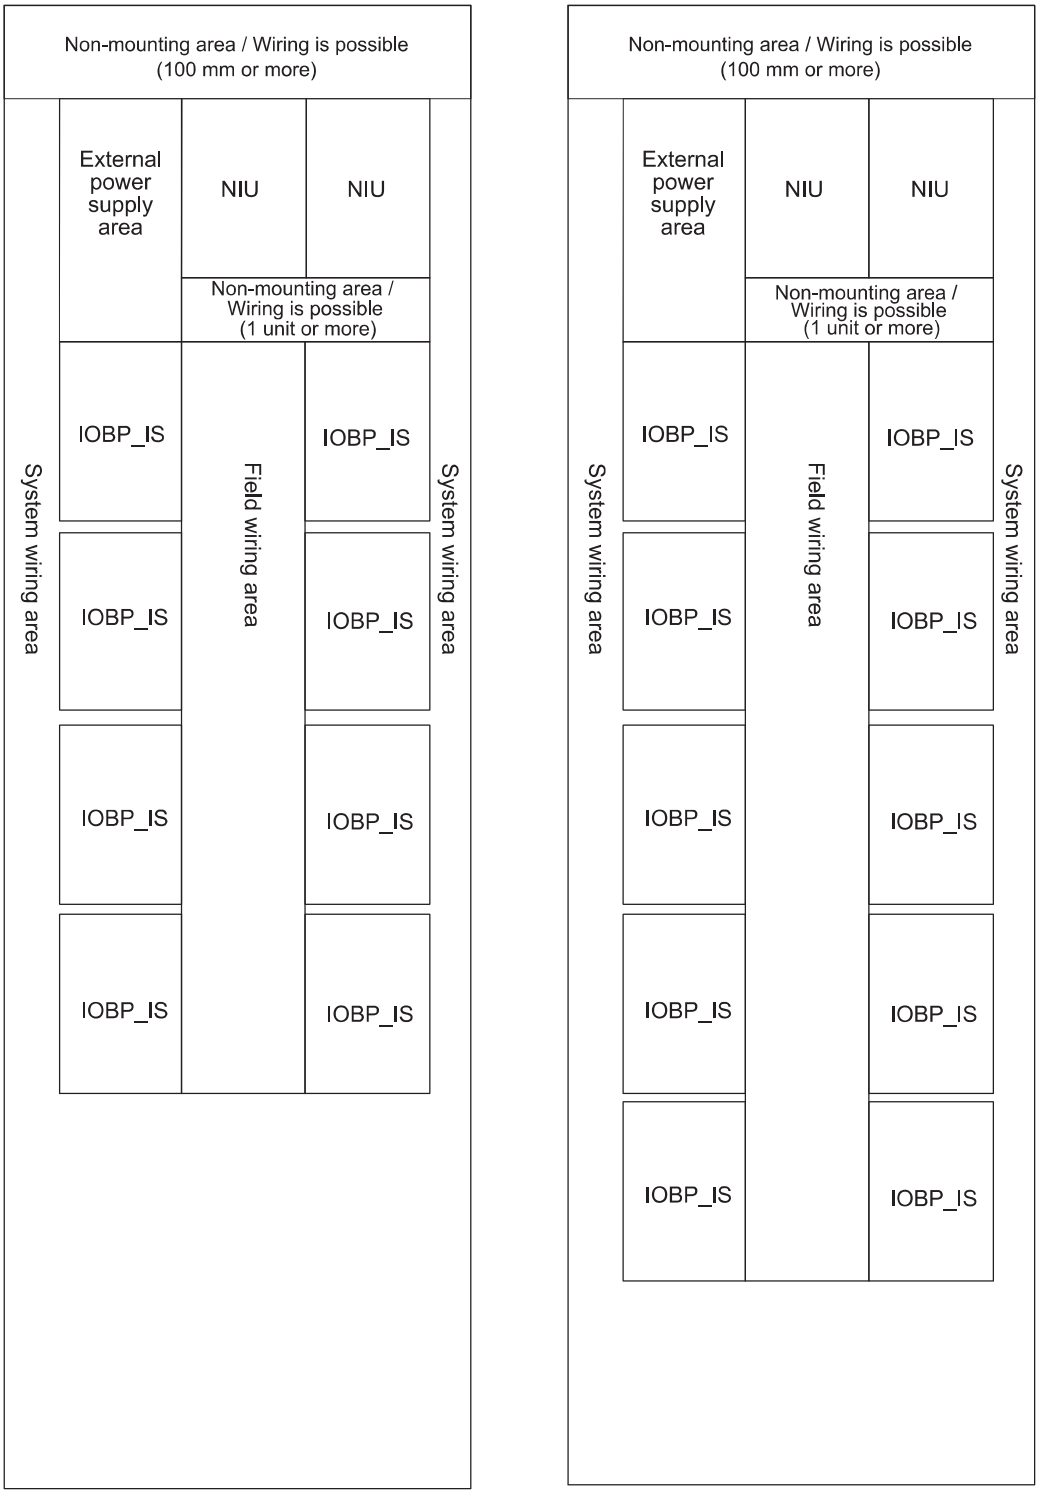

Figure Example of Mounting N-IO Nodes (Intrinsic Safety Barrier) in a Cabinet

Junction Box for N-IO System

This section describes examples of the maximum number of N-IO system equipment (except for equipment for RIO System Upgrade) installed in general-purpose junction boxes.

The following shows the common specifications to the examples of junction boxes for N-IO system that are explained later.

Junction Box Specifications

The following junction box is assumed to be used.

Table Junction Box Dimensions

W	D	H	Material
800 mm	300 mm	1000 mm	Metal

Product examples

Table The area of an air supply/air exhaust port

	Area
Air supply port	—
Air exhaust port	—

—: Not required

Table The requirement of a door fan

	Air flow
Door fan	—

—: Not required

Table Product examples

	Manufacturer	Model
Junction Box	Rittal	AE1180 series

Notes

The following shows the common notes to the examples.

- The ventilation for each system shall not be blocked.
- The mounting plate for mounting the IOBP and IOBP_IS shall be made of metal, regardless of whether DIN rail or panel mounting.
- A DIN rail shall be made of metal.
- For mounting restrictions other than the above, refer to the General Specifications (GS).
- When using a DIN rail, be sure to install a DIN rail on the mounting plate.
  Fixing at the both ends of a DIN rail and not fixing at the middle.

Conventions

The following shows the common abbreviations used and their explanations.

Abbreviations	Explanations
NIU	Node Interface Unit or Base Plate for Node Interface Unit
IOBP	Base Plate
IOBP_IS	Base Plate Intrinsic Safety explosion protection
Unit	Unit of 19 inch rack. 1 Unit = 44.45 mm

Example of Mounting N-IO Nodes (Non-Intrinsic Safety Barrier) in a Junction Box

Temperature conditions

In this example, the ambient temperature is assumed to be the followings.

Junction Box ambient temperature	50 °C or less

Maximum numbers of units that can be mounted

	Type	Model	Number of units that can be mounted per side
Per junction box	NIU	S2NN30D	Up to 1
	IOBP	S2BN1D	Up to 4 (2 rows × 2 shelves)
	Other	Heat-generating device (*1)	heat generation: 40 W or less

*1: The device to be mounted shall be selected from those that have the ambient temperature range of +15 °C or more.

Heat-generating devices other than the above shall not be mounted in the junction box.

In this example, IOBP_IS cannot be mounted.

Mounting conditions

- Mount the NIU on the upper left in the junction box basically.
- Do not mount the IOBP so that its heat-generating part (adaptor or I/O) is located immediately under the N-ESB Bus module (S2EN501). The IOBP may be mounted immediately under the power supply of the NIU (S2PW50x).
- The NIU shall be mounted in the left upper location of the junction box with a 2-unit or more space from the ceiling.
- A 1-unit or more space shall be provided between the NIU and IOBP.
- To mount heat-generating devices other than NIU and IOBP shall be mounted with 30-mm intervals on the right of the NIU on the top shelf. The specifications of the devices shall be observed.

The following shows how to mount N-IO nodes (Non-Intrinsic Safety barrier) in a junction box:

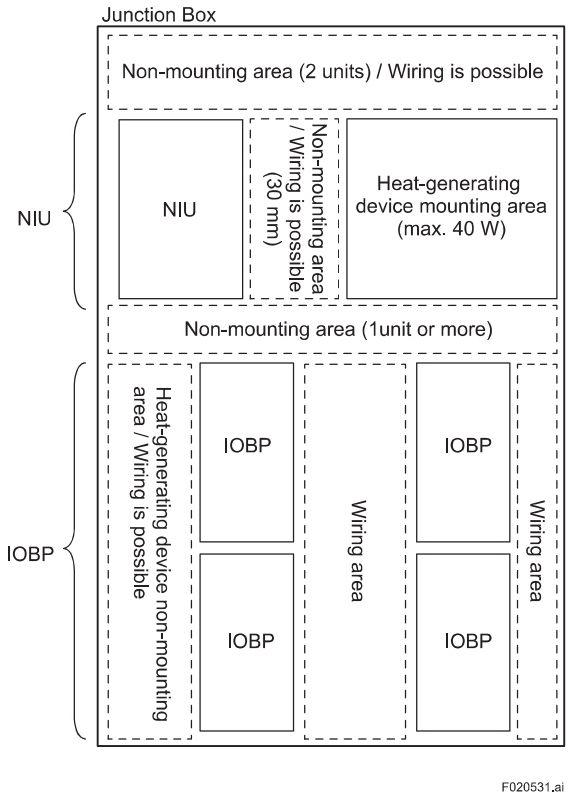

Figure Example of Mounting N-IO Nodes (Non-Intrinsic Safety Barrier) in a Junction Box

Example of Mounting N-IO Nodes (Intrinsic Safety Barrier) in a Junction Box

Temperature conditions

In this example, the ambient temperature is assumed to be the following.

Junction Box ambient temperature	50 °C or less

Maximum numbers of units that can be mounted

	Type	Model	Number of units that can be mounted per side
Per junction box	NIU	S2NN30D	Up to 1
	IOBP_IS	S2BN4D or S2BN5D	Up to 2 (2 rows × 1 shelf)
	Other	Heat-generating device (*1)	heat generation: 20 W or less

*1: The device to be mounted shall be selected from those that have the ambient temperature range of +15 °C or more.

Heat-generating devices other than the above shall not be mounted in the junction box.

In this example, IOBP cannot be mounted.

Mounting conditions

- Do not mount the IOBP_IS so that its heat-generating part (Barrier or I/O) is located immediately under the N-ESB Bus module (S2EN501). The IOBP_IS may be mounted immediately under the power supply of the NIU (S2PW50x).
- The NIU shall be mounted with a 2-unit or more space from the ceiling of the junction box.
- A 2-unit or more space shall be provided between the NIU and IOBP_IS.
- To mount heat-generating devices other than NIU and IOBP_IS shall be mounted with 30-mm intervals on the right of the NIU on the top shelf. The specifications of the devices shall be observed.

The following shows how to mount N-IO nodes (Intrinsic Safety barrier) in a junction box:

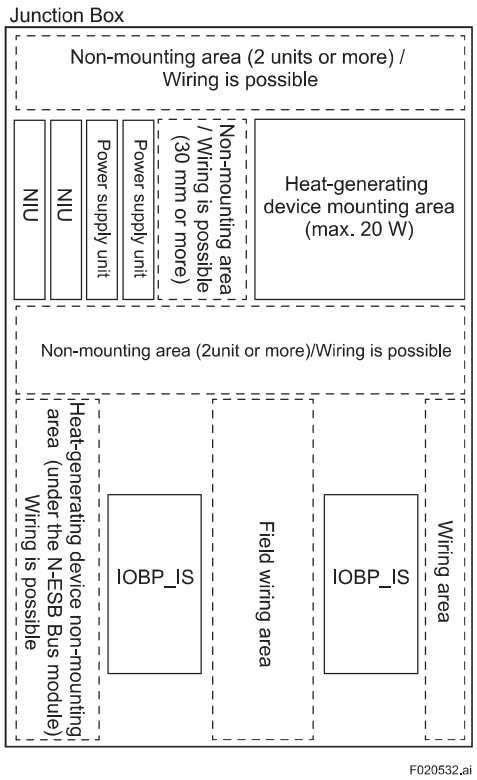

Figure Example of Mounting N-IO Nodes (Intrinsic Safety Barrier) in a Junction Box

CAUTION

The wiring that will be intrinsic safety circuits must be installed so that they are electrically separated from the wiring of non-intrinsic safety circuits, including the in-cabinet wiring. Install the wiring according to the IEC 60079-14 standards or the requirements for explosion-proof wiring of the country where the system is used.

Example of Mounting N-IO Nodes (Mixture of Intrinsic Safety Barrier and Non-Intrinsic Safety Barrier) in a Junction Box

Temperature conditions

In this example, the ambient temperature is assumed to be the following.

Junction Box ambient temperature	50 °C or less

Maximum numbers of units that can be mounted

	Type	Model	Number of units that can be mounted per side
Per junction box	NIU	S2NN30D	Up to 1
	IOBP	S2BN1D	Up to 2 (1 row × 2 shelves)
	IOBP_IS	S2BN4D or S2BN5D	Up to 1 (1 row × 1 shelf)
	Other	Heat-generating device (*1)	heat generation: 20 W or less

*1: The device to be mounted shall be selected from those that have the ambient temperature range of +15 °C or more.

Heat-generating devices other than the above shall not be mounted in the junction box.

Mounting conditions

- Do not mount the IOBP/IOBP_IS so that its heat-generating part (Barrier or I/O) is located immediately under the N-ESB Bus module (S2EN501). The IOBP/IOBP_IS may be mounted immediately under the power supply of the NIU (S2PW50x).
- The NIU shall be mounted with a 2-unit or more space from the ceiling of the junction box.
- A 2-unit or more space shall be provided between the NIU and IOBP/IOBP_IS.
- To mount heat-generating devices other than NIU and IOBP/IOBP_IS shall be mounted with 30-mm intervals on the right of the NIU on the top shelf. The specifications of the devices shall be observed.

The following shows how to mount N-IO nodes (mixture of Intrinsic Safety barrier and Non-Intrinsic Safety barrier) in a junction box:

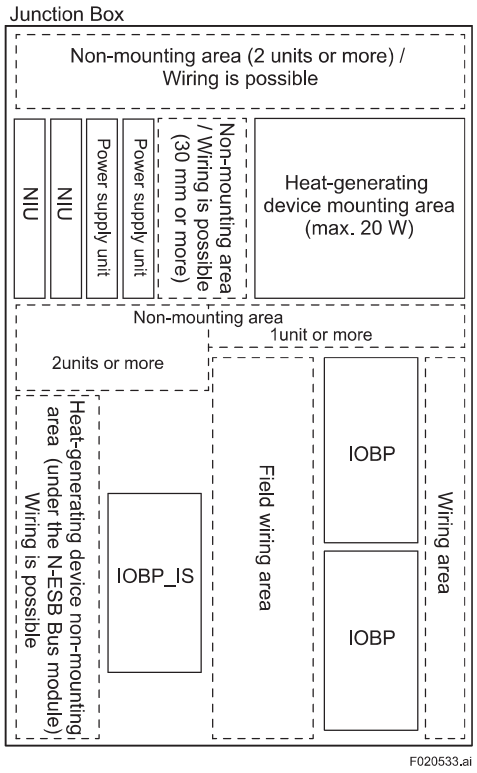

Figure Example of Mounting N-IO Nodes (Mixture of Intrinsic Safety Barrier and Non-Intrinsic Safety Barrier) in a Junction Box

CAUTION

The wiring that will be intrinsic safety circuits must be installed so that they are electrically separated from the wiring of non-intrinsic safety circuits, including the in-cabinet wiring. Install the wiring according to the IEC 60079-14 standards or the requirements for explosion-proof wiring of the country where the system is used.

2.5.7 Desktop Equipment

There are SENG (PCs), general-purpose printers, etc. as the devices used on the desks.

When installing any devices on the desks, take care about the following:

- It should provide a level horizontal surface for the PC or printer.
- A work space should be preserved to connect the cables.
- Support rising cables to prevent their weight from being applied to connectors directly. Keep a space of 100 mm radius or more around the connectors.
- Do not place the desk such as to expose the PC to direct sunlight or high humidity.

2.5.8 Installing Control Network Interface Card

This section describes how to install VI702 Control Network interface card. The card is installed in a PCI Express slot of an SENG PC to connect it to the Control Network.

SEE ALSO

- The steps described below are based on general-purpose PC/AT compatible machines. For details, refer to the manual for the specific PC.
- For the station address setting, refer to the Safety Control Stations (Hardware), IM 32P06C10-01EN or IM 32Q06C10-31E.

Card Installation Procedure

1. Set the station address for the control bus interface card.
2. Turn off the computer and unplug the power cord for safety.
3. Remove the PC cover.
4. Remove the slot cover.
5. Insert the control bus interface card in the slot. Make certain that the card is properly set in the slot.
6. Attach the computer cover.
7. Write the station address on a seal (sticker) and attach it to the front of the PC or in another similarly easy-to-view place.

SEE ALSO

- For the electrostatic protection, refer to 1.5.2, “Countermeasures against Static Electricity.”
- For the control bus connections, refer to 3.7, “Connecting Bus Cable.”

3. Cabling

This section describes how to cable the installed system equipment.

Connecting terminals for power, grounding, and signal cables are shown in figures.

The figures also show how to connect the SENG to field control units, and optical fiber cables to the optical bus repeaters.

3.1 Cables and Terminals

It is recommended that you use flexible, thin, easy-to-bend, twisted-pair cables to connect the terminals of the system equipment. Use solderless (crimp-on) terminals with insulating cover, which have low contact resistance little aging.

Rigid cables make cabling work difficult and exert unnecessary force on the terminals, which may result in system failures.

Cables with the temperature rating of an ambient temperature plus 10 °C or more must be used.

As for the following models, cables with the temperature rating as shown in the below Table must be used.

Table Rating temperature of Cables

Models	Cables	Temperature rating of Cables
SBD2D,SBD3D,SBD4D	Signal Cables (including READY terminal)	An ambient temperature plus 20 °C or more
	Input Power Cables	An ambient temperature plus 30 °C or more
SBM54D	Signal Cables (excluding READY terminal)	An ambient temperature plus 40 °C or more
	Input Power Cables Signal Cables (READY terminal)	An ambient temperature plus 20 °C or more
S1BB4D	Input Power Cables	An ambient temperature plus +30 °C
	Ready terminal	An ambient temperature plus +20 °C
SYEPD4D	Input Power Cables	An ambient temperature plus 30 °C or more
SYEPD5D	Input Power Cables	90 °C or more
AEP7D (100-120 / 220-240 V AC)	Input Power Cables	An ambient temperature plus 30 °C or more
AEP7D (24 VDC)	Input Power Cables	An ambient temperature plus 50 °C or more
AEPV7D (100-120 / 220-240 V AC)	Input Power Cables	An ambient temperature plus 30 °C or more
AEPV7D (24 VDC)	Input Power Cables	An ambient temperature plus 40 °C or more
S2BN1D	Field Power Cables	An ambient temperature plus 20 °C or more
S2BN4D	I/O Cables	An ambient temperature plus 20 °C or more
S2BN5D	Grounding Cables	An ambient temperature plus 20 °C or more
S2PW503/S2PW504	Input Grounding Cables	An ambient temperature plus 30 °C or more
A2BM4	Terminal board	An ambient temperature plus 20 °C or more

Signal Cables

Nominal conductor cross-sectional area:
For FIO Node: 0.75 to 2.00 mm^2
For N-IO Node: 0.75 to 2.50 mm^2 (AWG 20~14)
Sleeve for spring clamp terminals:
0.5 to 1.5 mm^2 (AWG 20~16)
For SED2D: 0.75 to 5.5 mm^2

Example of suitable cables:
600 V polyvinyl chloride insulated wires (IV); IEC 60227-3/JIS C 3307
Polyvinyl chloride insulated wires for electrical apparatus (KIV); IEC 60227-3/JIS C 3316
600 V Grade heat-resistant polyvinyl chloride insulated wires (HIV); IEC 60227-3/JIS C 3317
Heat-resistant PVC wire (UL1015/UL1007)
PVC insulated and PVC sheathed control cables (CVV); JIS C 3401

Alarm and Control Circuit Cables

Nominal conductor cross-sectional area: 0.13 to 2.5 mm^2
Node Interface Unit External Alarm input terminal: 0.5 to 2.5 mm^2 (AWG 20~14)
Other than above: 0.5 to 1.25 mm^2

Example of suitable cables:
600 V polyvinyl chloride insulated wires (IV); EC 60227-3/JIS C 3307
Polyvinyl chloride insulated wires for electrical apparatus (KIV); IEC 60227-3/JIS C 3316
Heat-resistant PVC wire (UL1007)

Power Cables

Nominal conductor cross-sectional area:
For rack-mounted 100-120 V AC /220-240 V AC-driven equipment: 1.25 to 2.0 mm^2
For rack-mounted 24 V DC-driven equipment: Minimum 2.0 mm^2
For N-IO I/O Base plates S2BN1D (Field Power Supply terminal): 3.5 to 5.5 mm^2
For N-IO Barrier Base plates (Barrier Power Supply terminal): 0.5 to 1.5 mm^2
Node Interface Unit: 1.25 mm^2 (AWG 16) Double Insulation structure
For cabinets AC 100-120/220-240 V-driven: Minimum 8.0 mm^2
For cabinets DC 24 V-driven equipment: Minimum 14.0 mm^2

Example of suitable cables:
600 V polyvinyl chloride insulated wires (IV); IEC 60227-3/JIS C 3307
Polyvinyl chloride insulated wires for electrical apparatus (KIV); IEC 60227-3/JIS C 3316

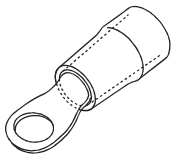
Note: Use cables capable of supplying current required by respective pieces of equipment with low voltage drop.

Grounding Cables

SEE ALSO See Section 1.4, “Grounding,” for wiring of grounding cables connecting grounding bars of different cabinets and/or panels to each other.

Nominal conductor cross-sectional area:
For Node Interface Unit: Minimum 2.0 mm^2 (AWG14)
For N-IO I/O Base plates: Minimum 2.0 mm^2 (AWG14)
For N-IO Barrier Base plates: Minimum 2.0 mm^2 (AWG14)
Grounding cables connecting cabinets
AC 100-120/220-240/V-driven to protective grounding system:
Minimum 5.5 mm^2
Grounding cables connecting cabinets DC 24 V-driven to protective grounding system:
Minimum 8.0 mm^2

Example of suitable cables:
600 V polyvinyl chloride insulated wires (IV); EC 60227-3/JIS C 3307
Polyvinyl chloride insulated wires for electrical apparatus (KIV); IEC 60227-3/JIS C 3316



Cable Terminals

Use the specified solderless terminals and sleeves for pressure clamp terminal on the end of terminal-connected cables, providing low contact resistance, high durability, and low aging.

Solderless Lug

CAUTION

- Be sure to use solderless terminals with insulating sheath.
- Use solderless terminals and crimp tools from the same manufacturer.
- Use appropriate crimp tools meeting the cable size.

F030101.ai

Figure Solderless Terminal with Insulating Sheath

Sleeve for pressure clamp terminal and spring clamp terminal

When connecting the process I/O signal to the pressure clamp terminal of the I/O module, strip the cable coating (without a sleeve) or attach a sleeve to the cable.

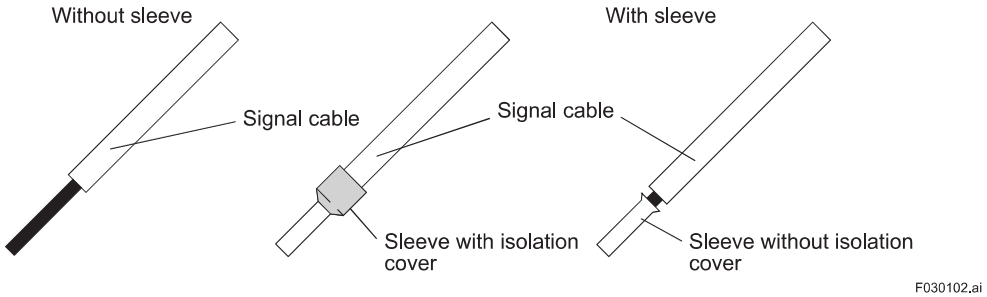


Figure Sleeve for Pressure Clamp Terminal and spring clamp terminal

CAUTION

- Use a sleeve for pressure clamp terminal and a clamp tool from the same manufacturer.
- Use a sleeve for pressure clamp terminal and a clamp tool which suit the cable size.
- Use a sleeve which meet the following DIN standards.
  Sleeve without insulating cover (DIN 46 228/1)
  Sleeve with insulating cover (DIN 46 228/4)

Bending radius of the cable

When connecting a cable to a system instrument, ensure to secure the minimum bending radius of the cable.
The minimum bending radius is either the value shown in the cable manufacturer's specifications or six-fold of the cable conductor diameter, whichever is bigger should be applied.

3.2 Connecting Power

Power is connected either by using a grounding bipolar three-prong plug or by wiring to terminals.

The safety control unit and safety node unit in the ProSafe-RS have no power switch. So, it is recommended that a breaker be installed for each piece of equipment in the same room, for maintenance and safety requirements.

CAUTION

- Lay power cables 1 cm or more away from signal cables.
- Use power and ground cables conforming to the safety standards of each country.

Type and Maximum Length of Power Cables

Formulas are given below for determining the type and the maximum length (m) of branch cables from an indoor low-voltage main line.

- The standard type of cable used (nominal cross sectional area) is equivalent to JIS C 3312.
- Calculate the maximum power cable length from the following conditions as shown in the figure.
  However, the power cable must meet the conditions described as “AC Power Specification” in Section 1.3. The conditions in Section 1.3 always take top priority.

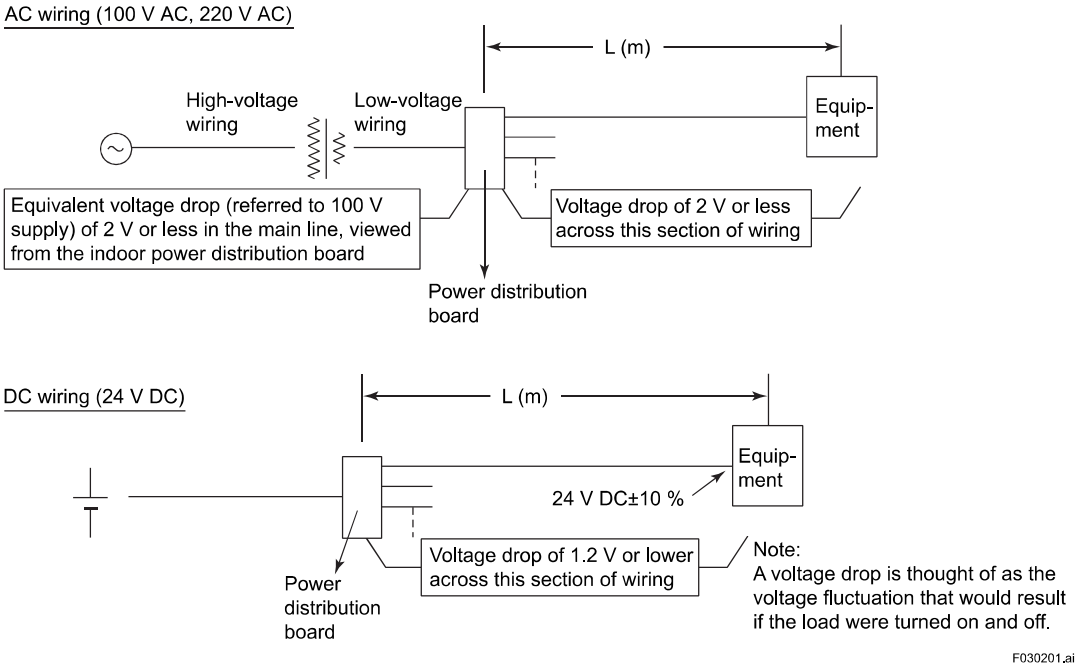

Figure Maximum Cable Length Calculation Conditions

[Maximum power cable length calculation]

Use the following formula to calculate the maximum power cable length:

(a) 100 V AC and 220 V AC models

$$L\,(m) = \frac{\text{Voltage drop across wiring}}{\text{Conductor resistance (ohm/km)} \times \text{(Number of cores)} \times \text{Equipment current consumption}} \times 1000$$

F030202.ai

(b) 24 V DC model

$$L\,(m) = \frac{\text{Voltage drop across wiring}}{\text{Conductor resistance (ohm/km)} \times \text{(Number of cores)} \times \text{Equipment current consumption}} \times 1000$$

F030203.ai

Note: In the formulas above, the voltage drop across wiring is assumed to be 2 V for AC power supplies and 1.2 V for DC power supplies; the number of cores is two; and the conductor resistance is as specified in the table below.

Table Wire Nominal Cross Sectional Areas and Resistances

Wire nominal cross sectional area	5.5 mm^2	8 mm^2	14 mm^2	22 mm^2
Wire conductor resistance	3.37 ohm/km	2.39 ohm/km	1.36 ohm/km	0.82 ohm/km

Power Cable Termination

Cable Termination

Use solderless lugs for power cables (see Figure).

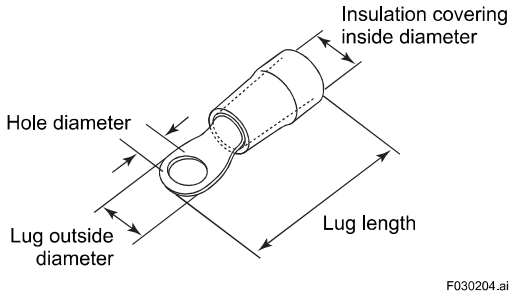

Figure Solderless (crimp-on) Lug

Solderless (crimp-on) Lug Specifications

The solderless lug to use must have the dimensions given in table according to the nominal cross sectional area of the power cable for which the lug is to be used.

Table Solderless Lug Dimensions

Nominal cross sectional area (mm^2)	Screw used (mm)	Hole diameter (mm)	Lug outside diameter (mm)	Lug length (mm)	Insulation covering inside diameter (mm)
1.25	4	4.3 or more	8.2 or less	approx.21	3.6 or more
2.0	4	4.3 or more	8.7 or less	approx.21	4.3 or more
8.0	6	6.3 or more	12.2 or less	approx.41	7.0 or more
5.5	5	5.3 or more	9.7 or less	approx.29	5.9 or more
22.0	8 (hexagon head bolt)	8.3 or more	16.8 or less	approx.50	11.0 or more

CAUTION

- Always use solderless lugs with insulating covering.
- Always use solderless lugs and crimp-on tool manufactured by the same manufacturer.
- The crimp-on tool must be matched to the wire thickness.

Sleeve Terminal Processing

Perform the following terminal processing for the primary power supply input with pressure clamp terminal.

Use a sleeve with insulating cover which meet the DIN 46 228/4.

CAUTION

- Use sleeves and a tool that are from the same manufacturer.
- Use sleeves and a tool that are suitable for the cable thickness.
- Connect the cable properly by inserting the wires all the way into the pressure clamp terminals.

Strip the cable coating at the end of the cable and then attach a sleeve. The sleeve specifications differ depending on the cable thickness. The sleeve specifications are shown in the following table.

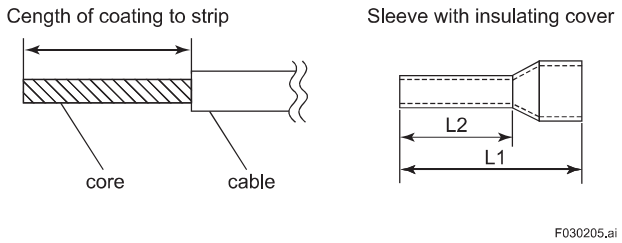

Figure Terminal Processing

Table Cable termination example of Sleeve with Insulating Cover

Nominal crosssectional area (mm^2)	Length to strip (mm)	Sleeve dimensions (mm)	
		L1	L2
1.25 (AWG16)	10	14	8

Power Distribution Boards

Power distribution boards are normally provided by the customer. Figures show examples of AC and DC power distribution boards.

AC Power Distribution Board

The power cables is branched to each unit by way of a circuit breaker.
Each power system uses three terminals (AC and ground: ISO M4 to M6 screws).

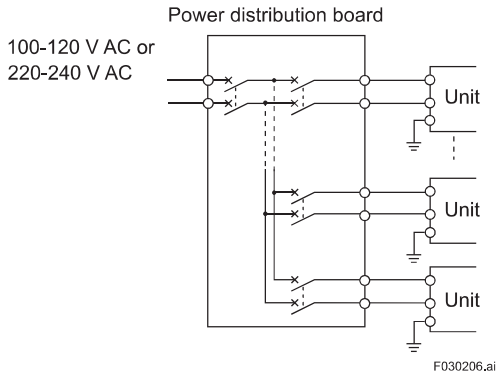

Figure AC Power Distribution Board

24 V DC Power Distribution Board

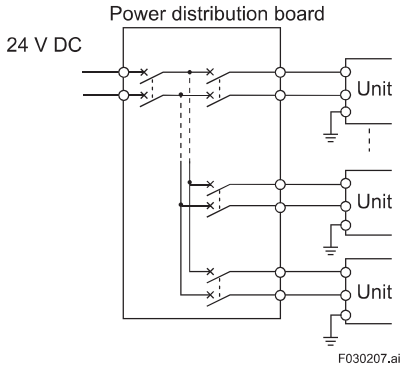

Figure 24 V DC Power Distribution Board

SEE ALSO For equipment grounding, see Section 3.4, “Power and Ground Cabling.”

Terminal Connection

The power supply terminals and the grounding terminals of each equipment are as follows.

Table The power supply terminals and the grounding terminals of each equipment

Category	Model	Power supply Type	Power supply terminal	Grounding terminal	Grounding Type
Field Control Unit	S2SC70S/D	Power Supply Input	M4 Screw	M4 Screw	Functional grounding
	SSC60S/D, SSC50S/D, SSC57S/D	Power Supply Input			
Node unit	SNB10D	Power Supply Input			
Unit	SNT10D	Power Supply Input			
Router	AVR10D	Power Supply Input			
	AW810D	Power Supply Input			
Node Interface Unit	S2NN30D	Power Supply Input	Pressure clamp	M4 Screw	• Functional grounding (24 V DC) • Protective grounding (Other than 24 V DC)
		Base Plate		M4 Screw	Functional grounding
I/O Unit	S2BN1D	Power Supply Input	Dedicated cable model: S2KPB10 (M4 Screw)	M3 Screw	Functional grounding
		Field Power Supply Input	M4 Screw		
	S2BN4D	Power Supply Input	Dedicated cable model: S2KPB10 (M4 Screw)	M4 Screw	Grounding for explosion protection
		Barrier Power Supply Input	M4 Screw		
	S2BN5D	Power Supply Input	Dedicated cable model: S2KPB10 (M4 Screw)	M4 Screw	Grounding for explosion protection
		Barrier Power Supply Input	M4 Screw		
Power supply bus unit	AEPV7D (Style 2 or the future models)	Power Supply Input	M4 Screw	M4 Screw	• Functional grounding (24V DC) • Protective grounding (Other than 24V DC)
		Power Supply Output	Dedicated 5 pins connector		

Conduit Power-cabling

Conduit cabling using cable glands is recommended to lay a power cable at the entrance of the cabinet for the following reasons:

To prevent the power cable from making contact with metallic plates or putting its weight on the power connection terminal.

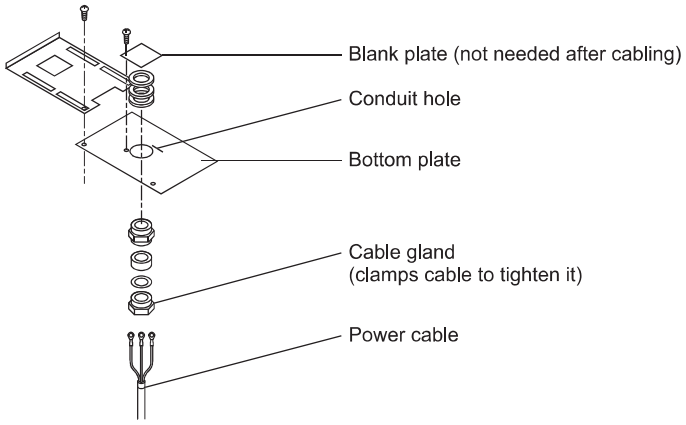

Figure Conduit Hole & Cable Gland

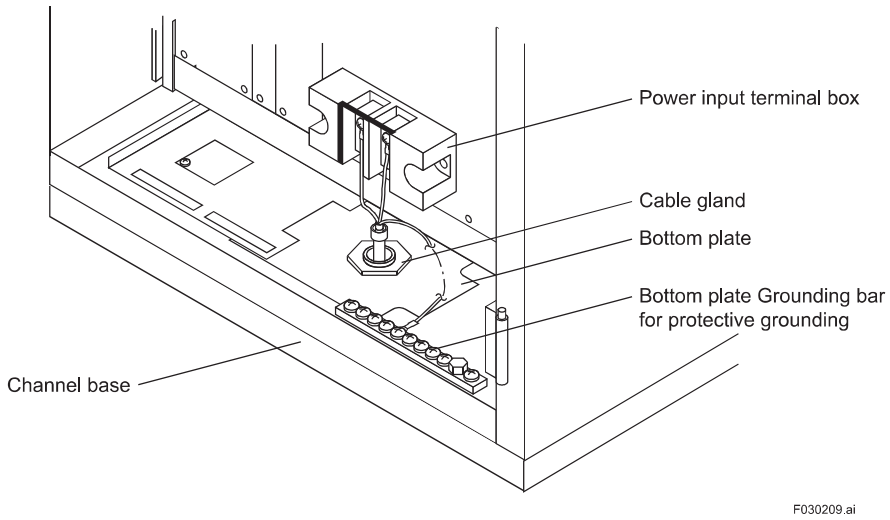

Figure Conduit Cabling

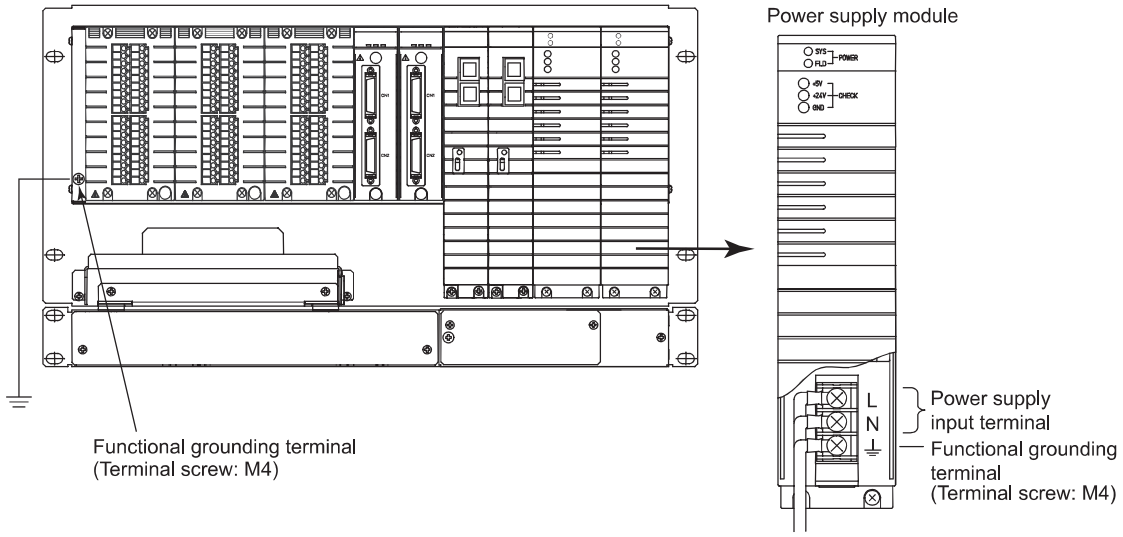
3.3 Connecting Ground Cable

Connect ground cables for the ProSafe-RS as follows:



CAUTION

- Connect the terminal connection type device to the protective conductor terminal.
- Connect a power cable of the plug-in device to a grounded socket. The equipment case is grounded when the power cable is plugged in.

3.4 Power and Ground Cabling

The following figures illustrate how to connect power and grounding cables for ProSafe-RS hardware equipment.

S2SC70S/S2SC70D Safety Control Unit

Note: The same cable connections can be applied to SSC60S/SSC60D/SSC50S/SSC50D/SSC57S/SSC57D.

*1: Keep a space of 3U or more for heat radiation.

Figure 19-inch Rack-mount Devices and Wiring

3.5 Connecting Signal Cable

The terminal blocks or connectors of I/O modules are the interface of the field signals. When connecting the field signals to I/O modules via a dedicated cable and a terminal board, the terminal board becomes the interface of the field signals.

CAUTION

Do not ground the secondary side of the field power supply connected to the digital input module SDV144 style code S1 to S3.

Process I/O Signal Connection

- Power, control bus, and signal cables must be separately laid. Avoid laying them in parallel.
- In case of using multicore cables for field wiring, do not share one multicore cable with I/O modules of different voltage types (i.e. 48 V DC and 24 V DC).
  48 V DC: SDV53A
  24 V DC: SDV144, SDV521, SDV531, SDV541
- The use of group-shielded twisted-pair cables is recommended for analog signal input specifically in order to prevent induction noise. A twisted-pair cable pitch of 50 mm or less should be used and the shielded cables must be grounded.
- The use of twisted-pair cables is also recommended for digital signals.
- The twisted-pair cable has the following advantages over a solid wire:
  - More flexible for easy curving and cabling in limited spaces.
  - With good contact and durable in using a solderless contact.
- Signal cables must be clamped so that their weight does not affect terminals.
- Use solderless lug or pressure clamp terminal contact when process I/O signals are connected with terminals.
- Be careful when laying cables so as not to place excessive force on the cables.
- Field wiring to the each channel of the terminal board shall be connected independently, and shall not be shared with other channels by crossover wiring.

When mixing AI and DO in the same multi-core cable (N-IO I/O Unit)

When mixing analog input (AI) signal and digital output (DO) signal in the same multi-core cable, take the following influence from DO pulse diagnostics or ON/OFF operation into consideration.

- The accuracy for Analog input function may be worse by several tens of µA depending on the type, length of a cable and DO load current.
- A delay may occur in updating the HART event.

Solderless Lug

CAUTION

- Use the solderless contact with an insulation covering.
- Use the solderless contact and crimp tools of the same manufacturer.
- Use correct-size crimp tools according to cable sizes.

Pressure Clamp Terminal

CAUTION

- The ProSafe-RS uses pressure clamp terminals for signal connections to the I/O modules.
- For the cable connection with a sleeve attached, use a sleeve and a clamp tool from the same manufacturer.
- Use a clamp tool suitable for the cable size.
- When the door is attached or detached for cable connection, be sure to then OFF the power of the main unit before connecting or disconnecting a cable.

Spring Clamp Terminal

CAUTION

- The ProSafe-RS uses a spring clamp terminal for signal connection of N-IO.
- For cable connection with a sleeve attached, use a sleeve and a clamp tool from the same manufacturer.
- Use a clamp tool which suits the cable thickness.

Channel Fuse

CAUTION

Due to the short circuit between the input channel of a digital input module and the ground, the protection fuse mounted in front of the module may be blown up. To avoid the blow of the protection fuse, it is recommended to use a fuse (50 mA, fast-blow type) to each input channel. This important notice is applied for digital input module SDV144 style code S1 to S3.

Signal Cable Termination

Solderless Lug

- Solderless lug specifications
  The specifications for solderless lugs are determined by the nominal cross sectional area of the power cable for which lugs are used, lug screws, terminal dimensions, and the like.

Table Solderless Lug Dimensions

Cable nominal cross sectional area (mm^2)	Screw used (mm)	Hole diameter (mm)	Lug outside diameter (mm)	Lug length (mm)	Insulation covering inside diameter (mm)	Dimension "C" (mm)	Remarks
1.25	3.5 (*1)	3.7 or more	6.8 or less	Approx. 21	3.6 or more	4.0 or more	
2.0	3.5 (*1)	3.7 or more	6.8 or less	Approx. 21	3.6 or more	4.0 or more	
1.25	4 (*2)	4.3 or more	8.2 or less	Approx. 21	3.6 or more	7.0 or more	
2.0	4 (*2)	4.3 or more	8.7 or less	Approx. 21	4.3 or more	7.1 or more	
5.5	4 (*2)	4.3 or more	8.7 or less	Approx. 25	5.8 or more	5.9 or more	Only SED2D

*1: Recommended tightening torque is 0.8 N•m.
*2: Recommended tightening torque is 1.2 N•m.

CAUTION

- Always use solderless lugs with insulated covering.
- Always use solderless lugs and crimp-on tool manufactured by the same manufacturer.
- The crimp-on tool must be matched to the wire thickness.

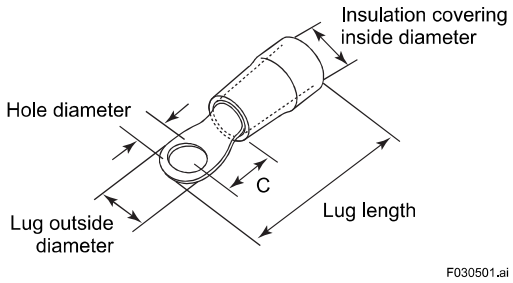

Figure Solderless Lug

Pressure Clamp Terminal (for Pressure Clamp Terminal Block) (for terminal block, terminal board, and relay board)

- Terminal processing
  When connecting the process I/O signal to the pressure clamp terminal of an I/O module, strip the cable coating (without a sleeve) or attach a sleeve to the cable. The following shows the length of the coating stripped for cases when a sleeve is not used and when it is used.

SBT4D, STA4S, STA4D, STB4S, and STB4D

Table Without a sleeve

Cable thickness (mm^2)	Peel-off Length (mm)
0.5 to 2 (AWG20 to 14)	11

When using a sleeve, a cable must have terminal processing in accordance with the instructions of the sleevemanufacturer. Use one of the following sleeves is recommended.

Sleeve without insulating cover (DIN 46 228/1) Sleeve with insulating cover (DIN 46 228/4)

Table With a sleeve

Cable nominal cross sectional area (mm^2)	When using a sleeve with insulating cover			When using a sleeve without insulating cover	
	Peel-off length (mm)	Sleeve dimensions		Peel-off length (mm)	Sleeve dimensions
		Total length (mm)	Contact section length (mm)		Total length (mm)
0.5	12	16	10	10	10
0.75	12	16	10	10	10
1	12	16	10	10	10
1.25 to 1.5	12	16	10	10	10

A2BM4, SBR4D, SBA4D, SBD2D, SBD3D, SBD4D, SBM54D, and S1BB4D

Table Without a sleeve

Cable thickness (mm^2)	Peel-off length (mm)
0.5 to 2.5 (AWG20 to 14)	7

When using a sleeve, a cable must have terminal processing in accordance with the instructions of the sleevemanufacturer. Use one of the following sleeves is recommended.

Sleeve without insulating cover (DIN 46 228/1) Sleeve with insulating cover (DIN 46 228/4)

Table With a sleeve

Cable nominal cross sectional area (mm^2)	When using a sleeve with insulating cover			When using a sleeve without insulating cover	
	Peel-off length (mm)	Sleeve dimensions		Peel-off length (mm)	Sleeve dimensions
		Total length (mm)	Contact section length (mm)		Total length (mm)
0.5	10	14	8	6	6
0.75	10	14	8	6	6
1	10	14	8	6	6
1.25 to 1.5	10	14	8	7	7
2.5	10	14	8	7	7

Pressure Clamp Terminal, Spring Clamp Terminal (for N-IO Node)

At the end of the signal cables to the following applicable interface, provide the following cable termination:

Table Applicable Interface

Products	Models	Interface	Sleeve Normal cross sectional area (mm^2)
Node Interface Unit	S2NN30D	External alarm input terminal	0.5 ~ 2.5
I/O Unit	S2BN1D	I/O signal terminal (pressure clamp terminal)	0.5 ~ 2.5
		I/O signal terminal (spring clamp terminal)	0.5 ~ 1.5
	S2BN5D	I/O signal terminal (spring clamp terminal)	0.5 ~ 1.5

- When using a sleeve
  At the cable end, peel off the coating and attach a sleeve. The specifications of the sleeve differ, depending on the cable thickness. Provide cable termination according to the following figure and tables:

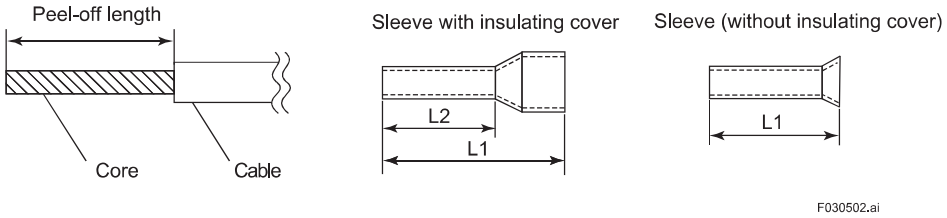

Figure Cable termination (for pressure clamp terminals)

When using a sleeve, a cable must have terminal processing in accordance with the instructions of the sleevemanufacturer. Use one of the following sleeves is recommended.

Sleeve without insulating cover (DIN 46 228/1) Sleeve with insulating cover (DIN 46 228/4)

Table When sleeves with insulating cover are used

Cable nominal cross sectional area (mm^2)	Peel-off length (mm)	Sleeve dimensions (mm)	
		L1	L2
0.5	10	14	8
0.75	10	14	8
1.0	10	14	8
1.5	10	14	8
2.5	10	14	8

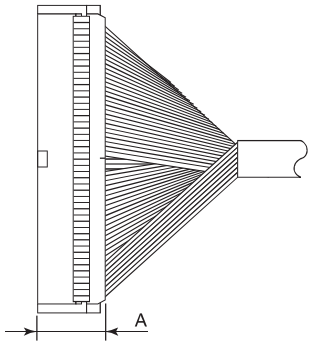
Table When sleeves without insulating cover are used

Cable nominal cross sectional area (mm^2)	Peel-off length (mm)	Sleeve dimensions (mm)
		L1
0.5	6	6
0.75	6	6
1.0	6	6
1.5	7	7
2.5	7	7

- When not using a sleeve

Terminal	Cable nominal cross sectional area (mm^2)	Peel-off length (mm)
pressure clamp terminal	0.5 to 2.5 (AWG20 to 14)	8
spring clamp terminal	0.5 to 2.5 (AWG20 to 14)	7

- For I/O Unit Model S2BN4D
  The pressure clamp terminal is on the MTL I.S. barrier. A cable must be prepared separately. Cable specification of field signal depends on the requirements specification of MTL's I.S. barriers. Refer to the instruction manual of I.S. barriers provided by the vendor.



MIL Connector Cover SCCC0☐

SCCC01 (for flat ribbon cables)

When using the SCCC01, use connectors conforming to the following requirements:

- MIL-C-83503-compliant Connector
- Connector with one pin that prevents improper insertion (both 40- and 50-pin connectors)
- The following dimensions must be satisfied:

  16.5 mm – B ≤ A ≤ 15.8 mm
  where, A = connector height
  B = engagement length

F030503.ai

Note: For the engagement length, contact the connector manufacturer.

SCCC02 (for separate cables)

F030504.ai

Cables and connectors that can be used for the SCCC02 are listed in the table below.

Manufacturer	Manufacturer's Model	Product Name	Remarks
Japan Aviation Electronics Industry, Limited	PS-D4C50N	Socket	
	PS-HD50	Hood	
	PS-SF-C1-1	Contact	AWG24 to AWG22
Hitachi Cable, Ltd.	UL 2464SB 25P x 22AWG	Cable	

Connecting Signal Cables to Terminals (for FIO)

Connecting to Pressure-clamp Terminal

1. Loosen the cable connecting terminal screw.
2. Strip the cable coating (without a sleeve) or attach a sleeve to the cable, then insert the tip of the cable into the connecting section of the pressure clamp terminal.
3. Fasten the screw using the special tool (a screwdriver conforming to the DIN 5264B standard with a tip width of 0.6 mm and a shaft diameter of 3.5 mm) with a fastening torque of 0.5 N·m.

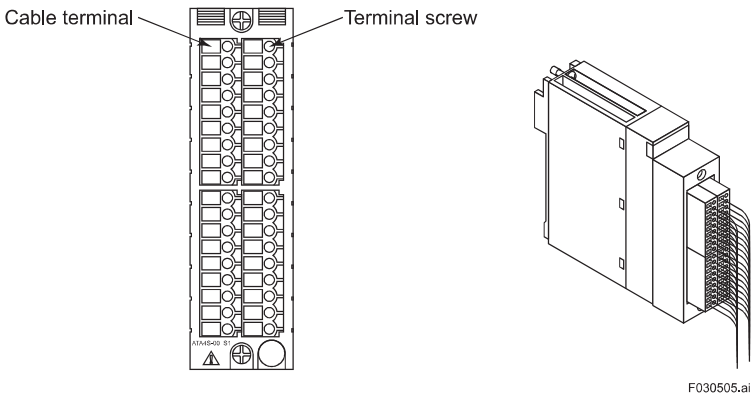


Figure Connecting Signal Cable to Terminal

IMPORTANT

Do not use non-standard signal cables or sleeves. Otherwise improper connection may result.

Be sure to remove the cable sheath just as much as specified, fit the sleeve, and clamp the cable firmly to the terminal.

S2SC70S/S2SC70D/SSC60S/SSC60D/SSC50S/SSC50D/SSC57S/SSC57D and SNB10D Cable Connections

The following shows SNB10D unit cable connections.

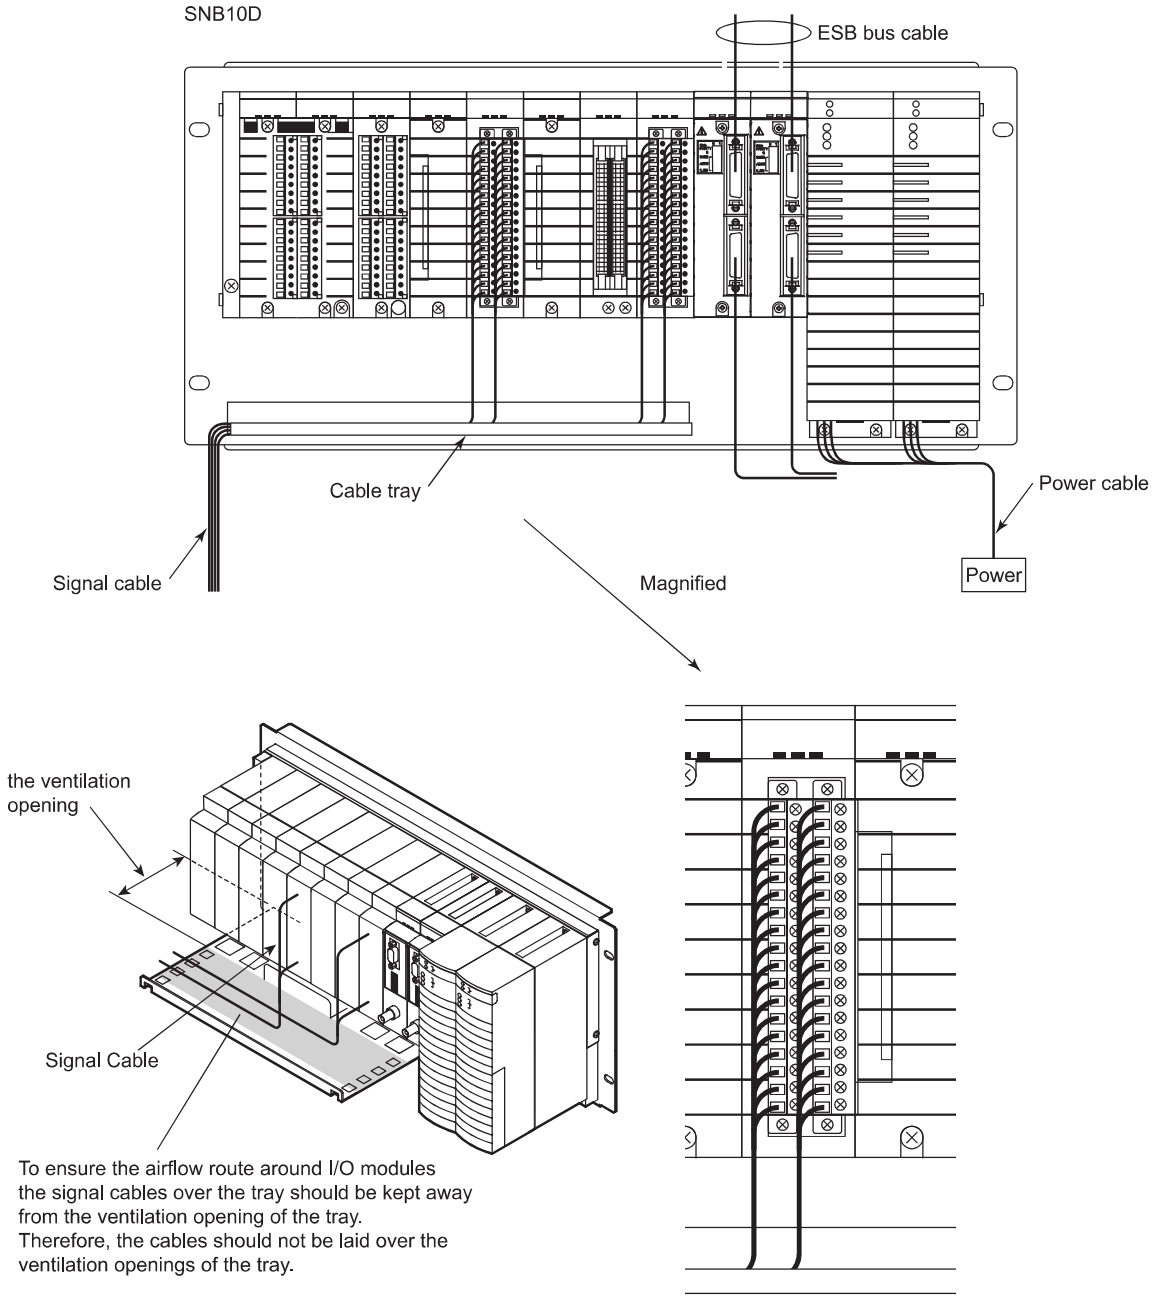

Figure SNB10D Unit Cable Connections

Signal Cabling

IMPORTANT

The signal cable for the top node unit (NU) must be wired at the innermost part in the field control area as the figure shows.

When fixing cables to a clamp, allow enough space so that the cards can be maintained.

Bind the bottom cables to the clamp bar on the channel base.

- Push in the signal cables for the top NU as far as they will go.

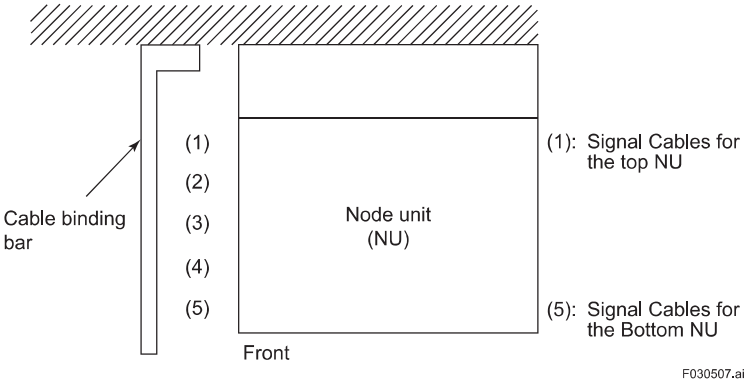

Figure Signal Cabling

I/O Module with Signal Cable Interface Adapter Cabling

When connecting a dedicated cable to an I/O module, ensure to keep the minimum bending radius of the cable.
Place the cable in front of the separator on the cable tray for ventilation.

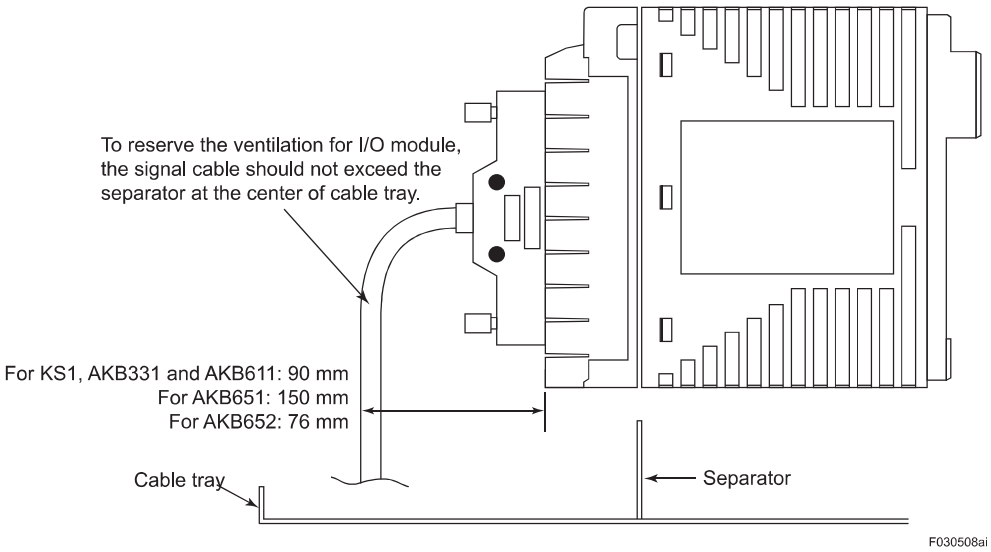

Figure I/O Module with Signal Cable Interface Adapter Cabling

Connecting Signal Cables to Terminals (for N-IO)

Connecting cables to pressure clamp terminals (S2BN1D-□1□□□)

Follow these steps to connect cables to pressure clamp terminals:

1. Open the cover of the terminal block of the base plate for N-IO I/O.
2. Confirming the cable polarity, insert the cable to the pressure clamp terminal. Tighten the screw using the special tool (a screwdriver conforming to the DIN 5264B standard a tip width of 0.6 mm and a shaft diameter of 3.5 mm) with a fastening torque of 0.5 N·m.
3. Pull the cable gently to check that it is fixed securely.
4. Close the cover of the terminal block of the base plate for N-IO I/O.

Connecting cables to spring clamp terminals (S2BN1D-□2□□□)

Follow these steps to connect cables to spring clamp terminals:

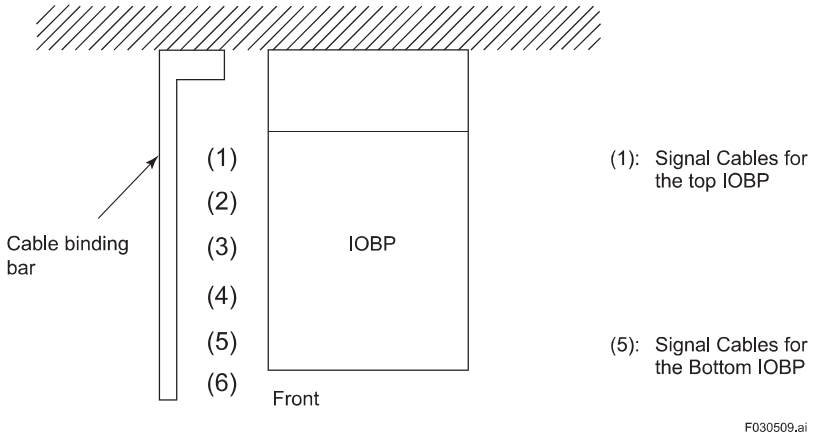
1. Open the cover of the terminal block of the base plate for N-IO I/O.
2. Pressingly expand the spring clamp terminal with a flat-blade screwdriver.
3. Insert a cable without pulling out the screwdriver.
4. Pull out the flat-blade screwdriver.
5. Pull the cable gently to check that it is fixed securely.
6. Close the cover of the terminal block of the base plate for N-IO I/O.

N-IO Signal Cabling

IMPORTANT

The signal cable for the top IOBP must be wired at the innermost part in the field control area as the figure shows.
When fixing cables to a clamp, allow enough space so that the cards can be maintained.

Push in the signal cables for the top IOBP as far as they will go.



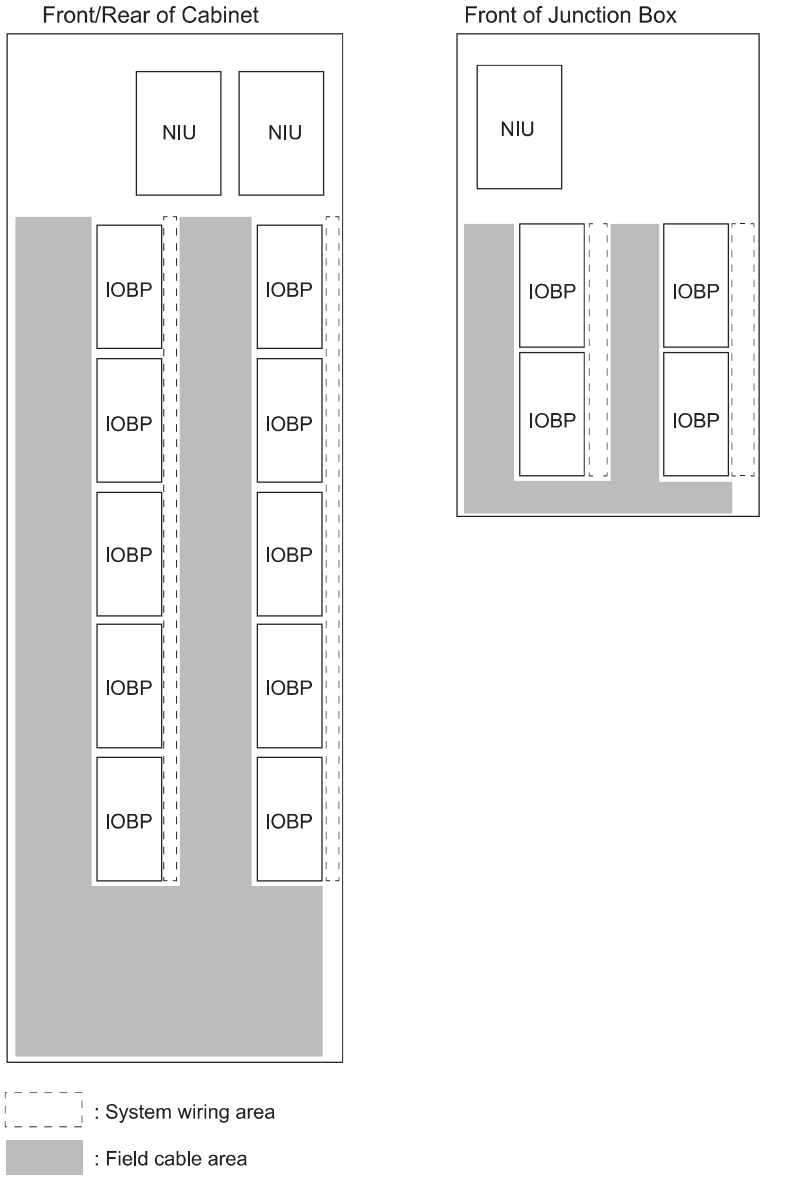


Figure Cabling

Routing Signal Cables (for N-IO)

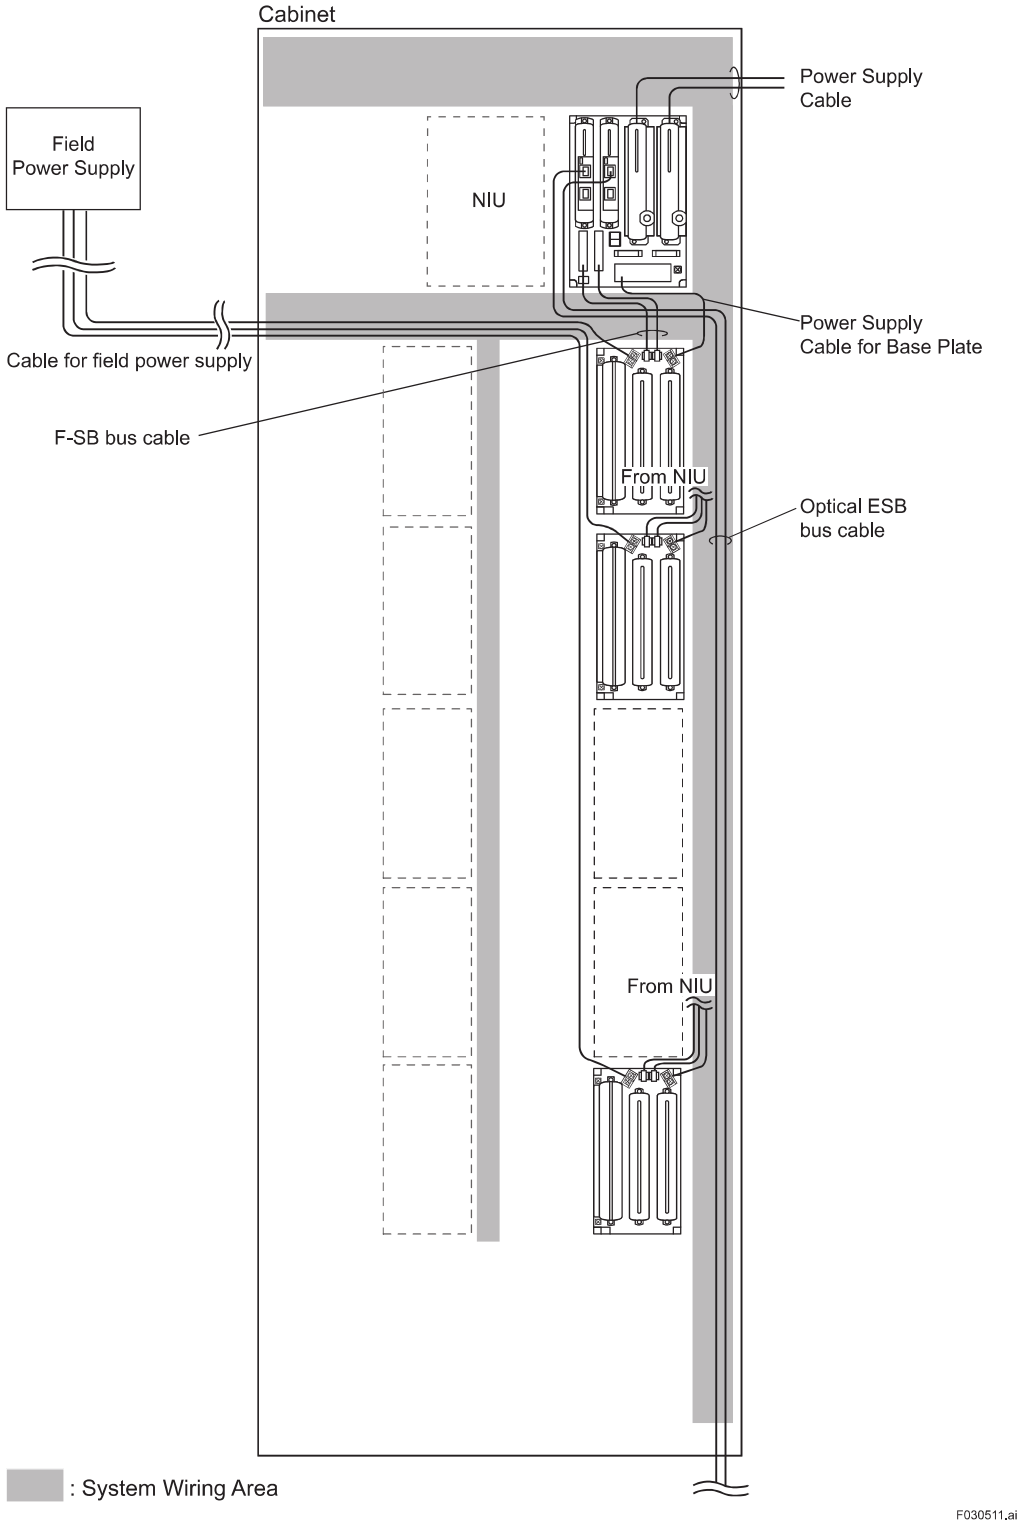
Field Cable Area

Signal cables from the field enter the Cabinet at the bottom and connected to individual IOBP units in the routes shown in Figure below.

NIU: Node Interface Unit
IOBP: N-IO I/O Base Plate

Figure Area for Signal Cable from Field

Example of Node Interface Unit and I/O Unit cable wiring (Cabinet)



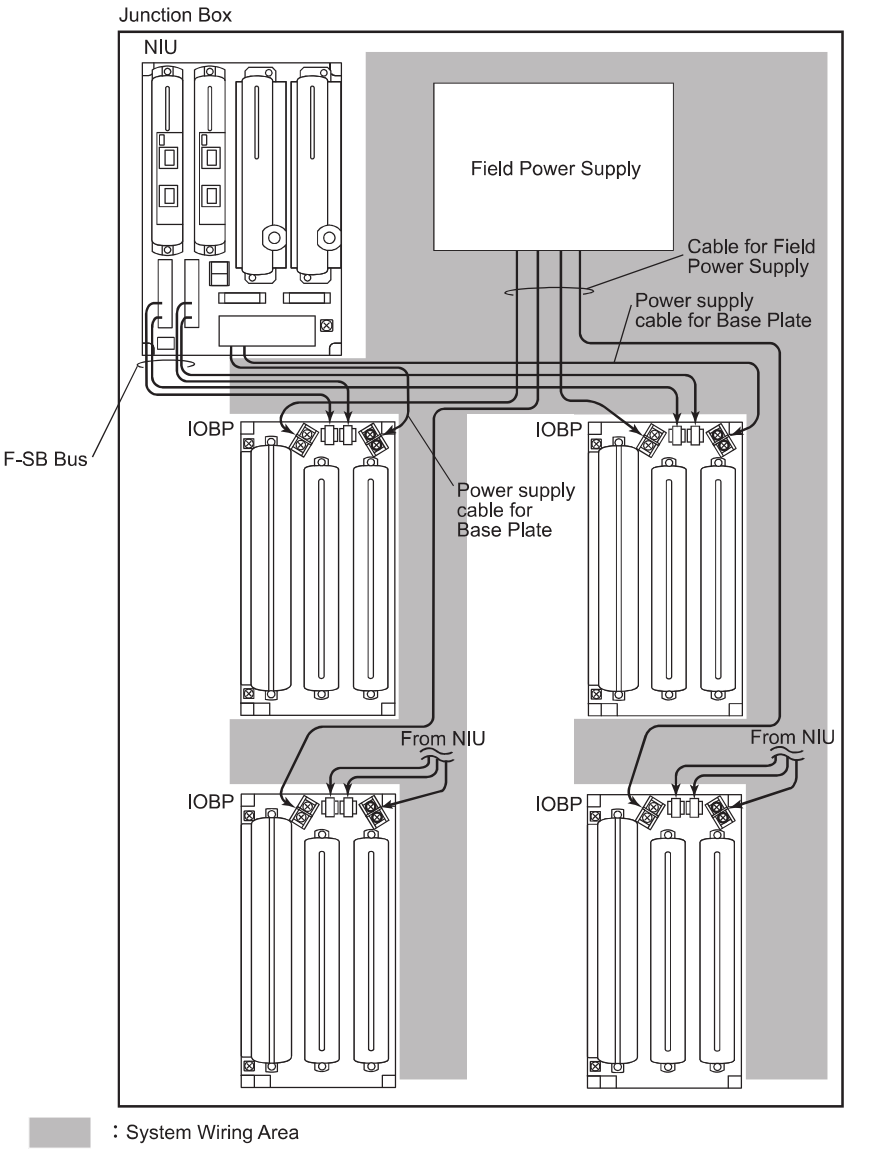


Figure Example of Node Interface Unit and I/O Unit Cable Wiring (Cabinet)

Example of Node Interface Unit and I/O Unit Cable Wiring (Junction Box)

IOBP: N-IO I/O Unit

Figure Example of Node Interface Unit and I/O Unit Cable Wiring (Junction Box)

WARNING

The wiring that will be intrinsic safety circuits must be installed so that they are electrically separated from the wiring of non-intrinsic safety circuits, including the in-cabinet wiring. Install the wiring according to the IEC 60079-14 standards or the requirements for explosion-proof wiring of the country where the system is used.

Connecting external alarm input terminal with Node Interface Unit

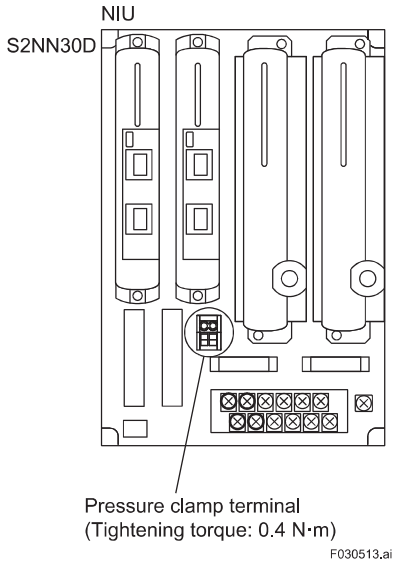

Figure Connecting external alarm input terminal with Node Interface Unit

3.6 Connecting Signal Cables to I/O Modules (for FIO)

3.6.1 Combination of I/O Modules and Terminal Blocks

A pressure clamp terminal block or signal cable interface adapter is available for field wiring, or MIL cables provided by the user may be used.

SEE ALSO For the terminal arrangement of the pressure clamp terminals and terminal board, and the pin arrangement of the MIL connector, refer to GS 32Q06J10-31E, GS 32S06J10-21E or GS 32S06J10-01E "Field Device Connection (for ProSafe-RS)."

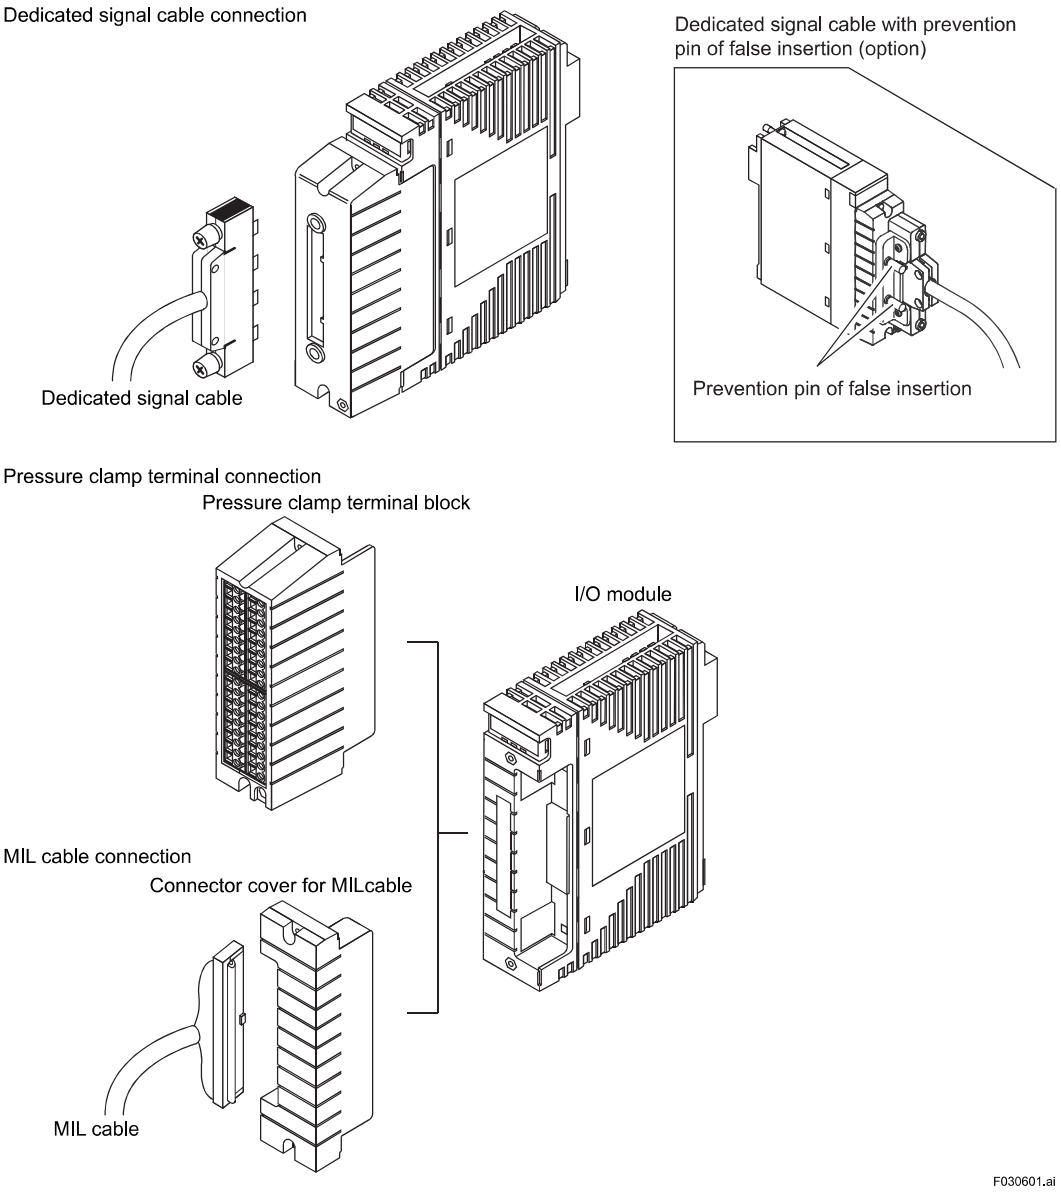

Figure Terminals for Field Wiring

3.6.2 Signal Cable Connections

The following table shows the signal cable connections.

Table Signal Cable Connections for I/O Modules (1/2)

Model	Name	I/O Channels per Module	Signal Connection			
			Pressure Clamp Terminal	MIL Cable	Yokogawa-specific Cable (*2)	
					No option code (*3)	Option code (*4)
Analog Input/Output Module						
SAI143-S53 SAI143-SE3	Analog input module (4 to 20 mA, Module isolation, General-purpose cables (*1))	16	X	X	–	
SAI143-S63 SAI143-SF3	Analog input module (4 to 20 mA, Module isolation, Yokogawa-specific cables (*2))	16	–	–	X (KS1-□□*B)	X (KS1-□□*B/ SAI143)
SAI143-H5□ SAI143-HE□	Analog input module (4 to 20 mA, HART Communication, Module isolation, General-purpose cables (*1))	16	X	X	–

ALR121	Serial communication module (RS-422/RS-485, 2-port) (*6)	Two ports	–	–	X (M4-terminal block, 10 poles) (*5)	
ALE111	Ethernet communication module	One port	–	–	X (RJ-45) (*8)	
S2LP131	Fire and gas communication module	One port	–	–	X (RJ-45) (*9) (*10)	

X: Can be connected. –: Cannot be connected.
*1: General-purpose cables are pressure clamp terminals and MIL cables.
*2: Yokogawa-specific cables are special cables for connecting input/output modules to terminal boards.
*3: If no option code is selected, a wrong connection to I/O modules with different signals cannot be avoided.
*4: If option codes associated with I/O modules are selected, a wrong connection to I/O modules with different signals can be avoided.
*5: A Yokogawa-specific cable can be connected without using a terminal block.
*6: If optical ESB extended distance is longer than 5 km, ALR1□1 module for Modbus Slave cannot be mounted to I/O node.
*7: In case of connecting AKB651 to SDV531-L6□, SDV531-LF□, SDV53A-S□3, SDV541-S6□ and SDV541-SF□, Marine Standards are not certified.
*8: ALE111 is available from ProSafe-RS R3.02.00 or later with S2SC70□, SSC60□, SSC50□ or SSC57□.
*9: S2LP131 is available from R4.05.00 or later with S2SC70□.
*10: The cables and connectors must comply with PROFINET standards.

CAUTION

When connecting a Yokogawa-specific cable to an module, ensure to keep the minimum bending radius of the cable.

The minimum bending radius of the Yokogawa-specific cable is six-fold of the diameter of the cable.

3.6.3 Connecting Signal Cables to I/O Modules

Pressure Clamp Terminal

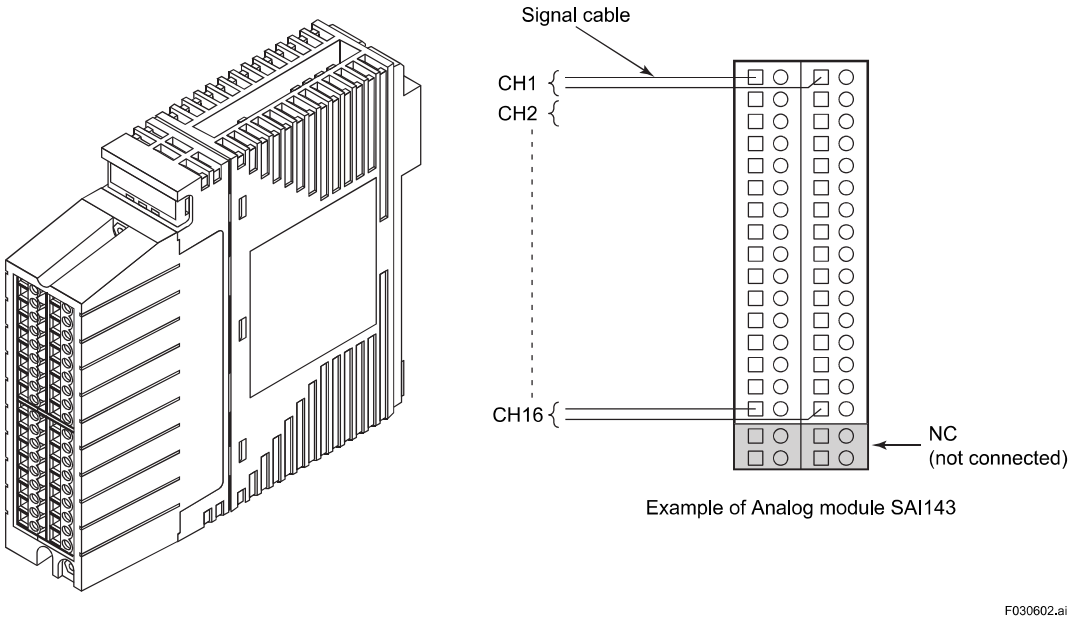

Figure I/O Module with Pressure Clamp Terminal

Dual-redundant Pressure Clamp Terminal

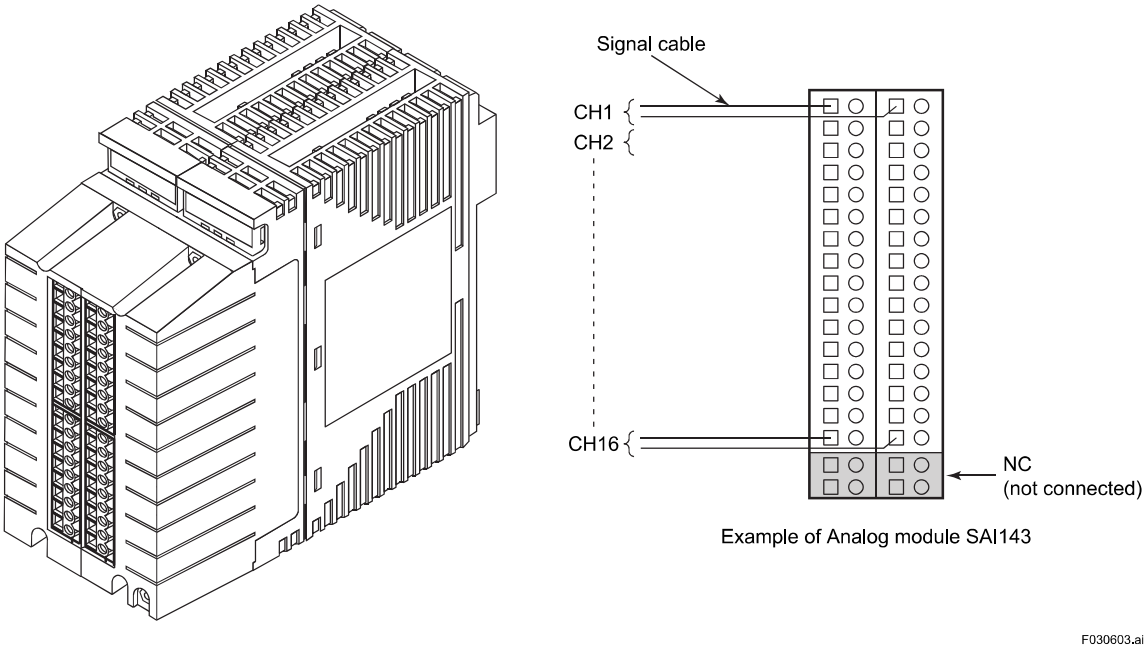

Figure I/O Module with Dual-redundant Pressure Clamp Terminal

Signal Cable Interface Adapter

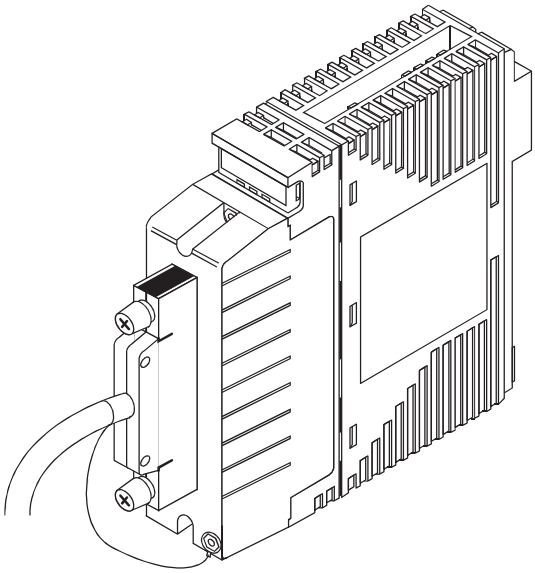

Figure I/O Module with Signal Cable Interface Adapter

The I/O modules are arranged in a dual-redundant configuration on the terminal board.

Connecting Signal Cables to Analog Input Modules

Signal cables are connected to different terminals according to the devices to be connected as shown below.

Table Analog Input Module Signal Names and Types of Input

Module	Signal Name	Type of Input	
		Connection : 2 wire (Setting : 2-wire input)	Connection : 3 wire/4wire(*2) (Setting : 4-wire input)
SAI143 (*1)	IN ☐ A	Two-wire transmitter input +	Current input -
	IN ☐ B	Two-wire transmitter input -	Current input +

☐ : Channel number
*1 : If the SAI143 module power are off or abnormal, the current input loop remains open. Do not use current signals with other receiving devices.
*2: Transmitter power supply is required separately.

Connecting I/O Module to Terminal Board

The I/O module with signal cable interface adapter can be connected to the terminal board using a Yokogawa-specific cable. Field signals are connected through the terminal board.

Example of Connection to SEA4D

SEA4D terminal board allows SAI143, SAV144 or SAI533 modules in both single and dual-redundant configurations.

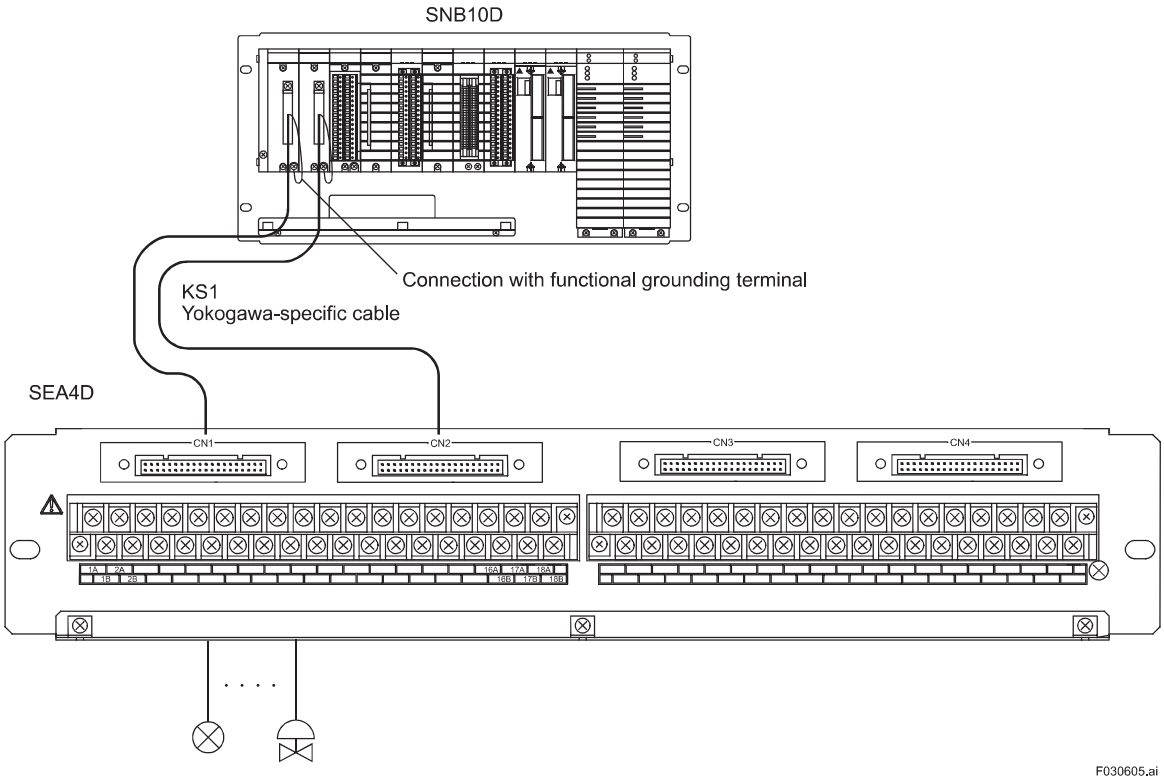

Figure Example of Terminal Board Connection with Dual-redundant I/O Module

SEE ALSO For the signal cable interface adapter model and the cable model for I/O modules, refer to GS 32Q06J10-31E, GS 32S06J10-21E or GS 32S06J10-01E “Field Device Connection (for ProSafe-RS).”

Example of Connection to SBA4D

SBA4D terminal board allows SAI143, SAV144 or SAI533 modules in both single and dual-redundant configurations.

Example of Connection to SWD2D

SWD2D terminal board allows SDV526 modules in both single and dual-redundant configurations.

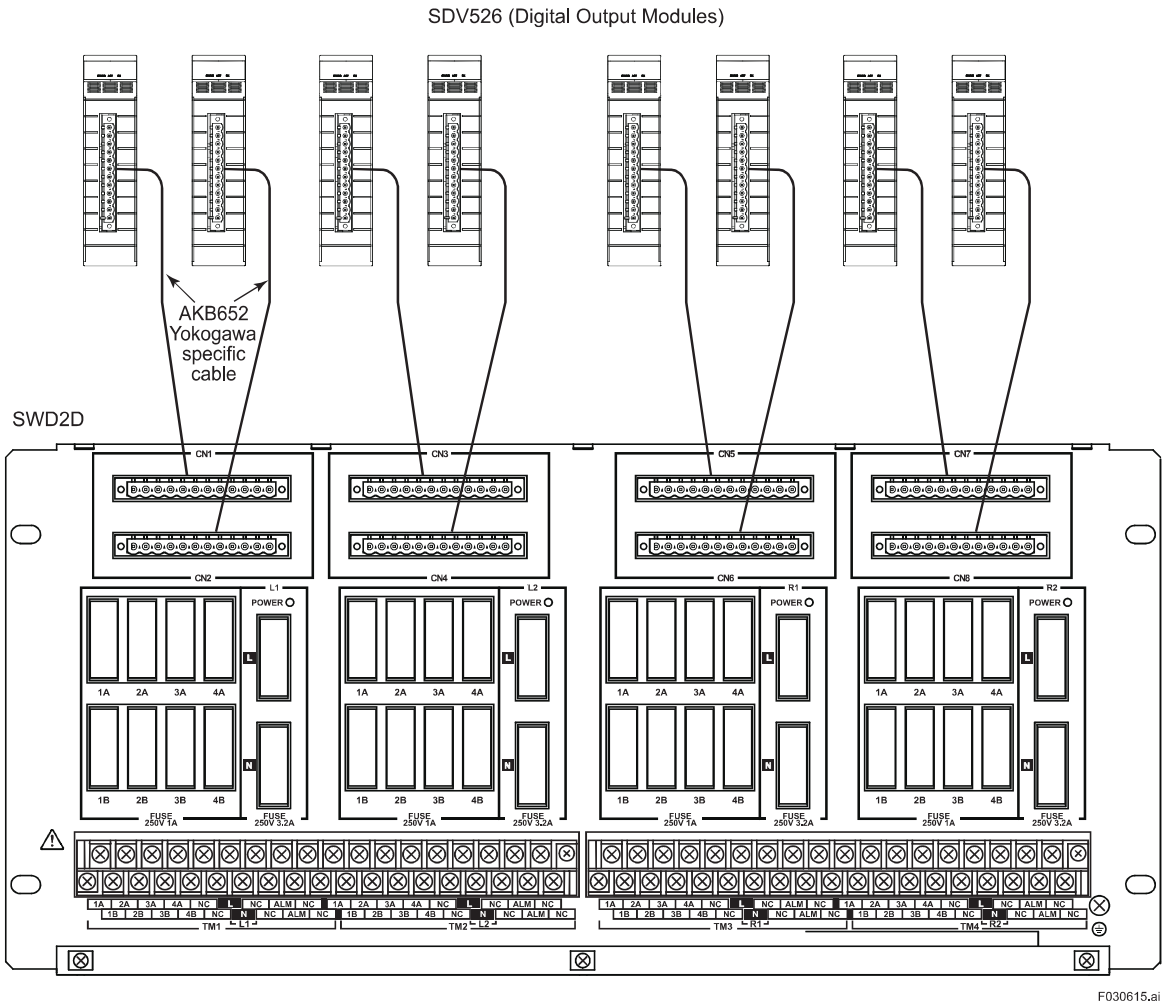

Figure Connecting Digital Output Modules to SWD2D Terminal Board (for Dual-redundant Use)

Connecting Digital Output Modules to Relay Boards

Example of Connection to SRM53D Relay Board

The SRM53D relay board allows SDV531 modules to be dual-redundant.

The SDV144 digital input modules can read back relay output statuses (up to 16 points) (*1).

The SDV144 digital input modules can also be dual-redundant.

*1: 16-point relay output statuses, including 1 to 8 points of CN1 (CN2 for dual-redundant use) and 9 to 16 points of CN5 (CN6 for dual-redundant use), can be read over simultaneously.

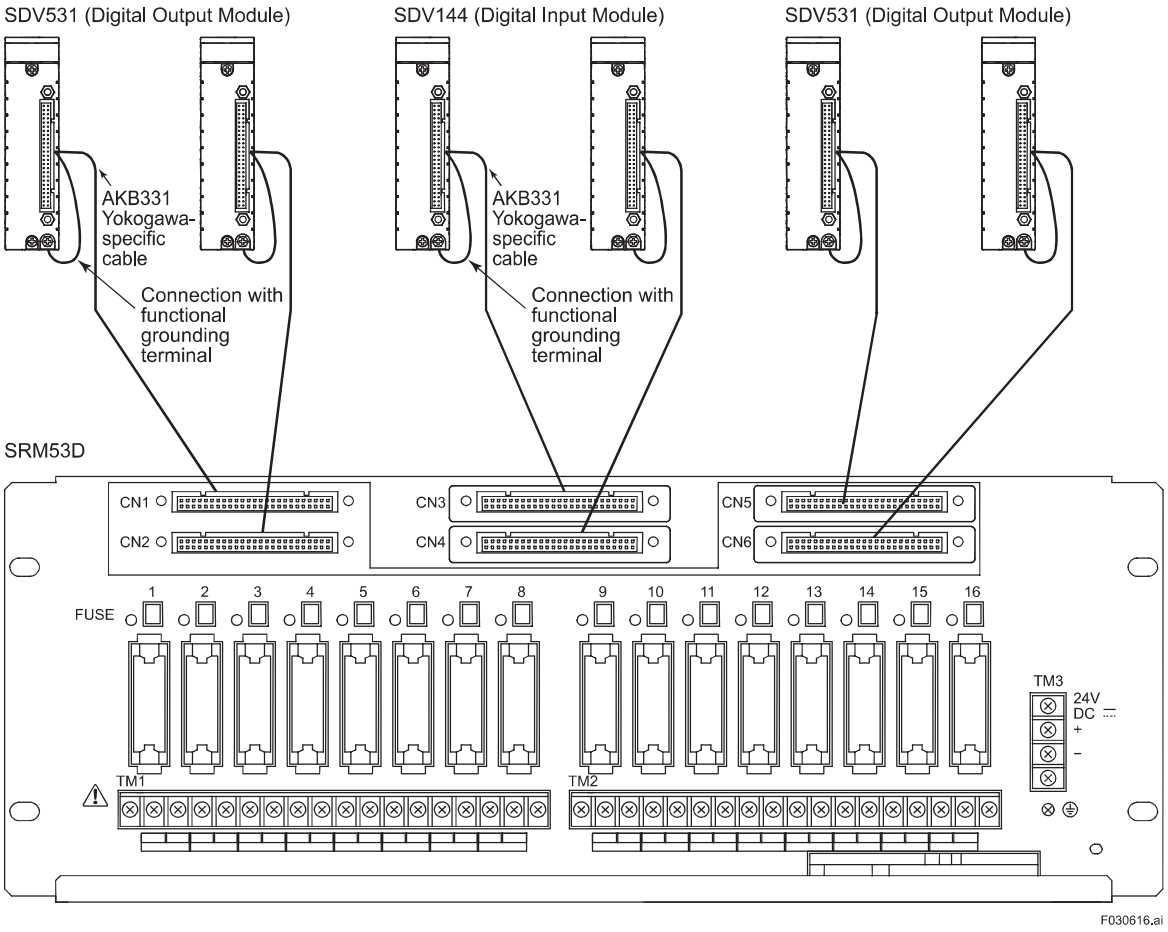

Figure Connecting Digital I/O Modules to SRM53D (for Dual-redundant Use)

Example of Connection to SRM54D Relay Board

The SRM54D relay board allows SDV541 modules to be dual-redundant. The SDV144 digital input module can read back relay output statuses. The SDV144 digital input modules can also be dual-redundant.

Example of Connection to SBM54D Relay Board

The SBM54D relay board allows SDV541 modules to be dual-redundant.

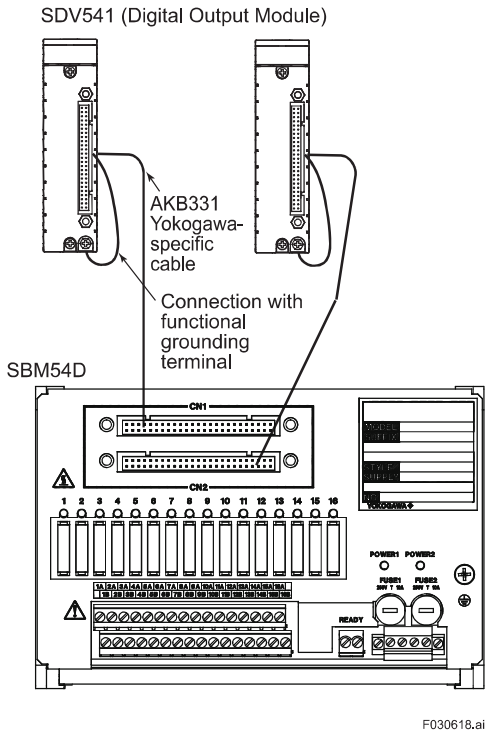

Figure Connecting Digital Output Modules to SBM54D Relay Board (for Dual-redundant Use)

Connecting Wiring Check Adapters

Connect the wiring check adapters to detect disconnected or short-circuited field wiring between the digital input module and field equipment. These adapters should be connected at the field equipment side. The two types of these adapters are:

- SCB100: Disconnection detection while accepting an OFF signal
  If this type of adapter is connected in parallel with a sensor switch, a disconnection occurring while accepting an OFF signal can be detected.
- SCB110: Short-circuit detection
  If this type of adapter is connected in series with a sensor switch, a short-circuit in the power line, occurring while accepting an ON signal, or a short-circuit with other channels can be detected. In addition to the above wiring check adapters, input module's diagnostic functions should be able to detect disconnections or short-circuits.

SEE ALSO For more information about diagnostic features of the input modules, see the following:
Appendix 1.3.4 "Setting for the DI channel" of the Engineering Guide Vol. 1 (IM 32P01C10-01EN).

Shape of Wiring Check Adapters

The following figure shows the shape of the SCB100 and SCB110.

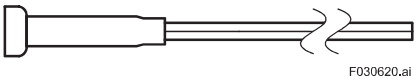

Figure External View of SCB100 and SCB110

Connecting Wiring Check Devices

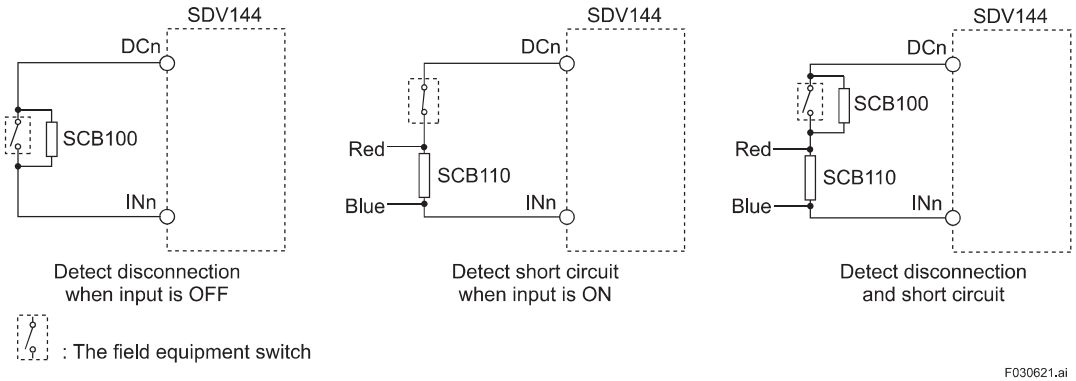

Figure Connecting Wiring Check Adapters

IMPORTANT

- Connect the SCB110 with correct polarity. If it is connected incorrectly, no detection can be made.
- To detect short-circuits or disconnections in the field wiring effectively, locate the adapters in the vicinity of the field equipment. Also install these adapters in a location out of direct sunlight and sheltered from rain.
- Be careful not to bend a covered part.

3.7 Signal Connections of N-IO I/O Unit

This section describes connecting to the N-IO I/O unit.

3.7.1 N-IO I/O Unit Types

I/O Modules that can be used with Base Plate

The following table shows I/O Modules installable with Base Plate.

Table I/O Modules Installable with Base Plate

Base plate model	Description	Base Plate		
		S2BN1D	S2BN4D	S2BN5D
S2MMM843	Analog Digital I/O Module	X	X	X
S2MDV843	Digital I/O Module	X	X	X

X: Mountable

3.7.2 Base Plate

Terminal type that can be select with Base Plate

The following table shows terminal types can be select with S2BN1D Base Plate.

Table Terminal type Compatible with S2BN1D Base Plate

Base plate model	Suffix code	Terminal type
S2BN1D (Base Plate with disconnecting terminal)	-□1□□□	Pressure clamp terminal
	-□2□□□	Spring clamp terminal
	-□9□□□	Cable connector (*1)

*1: Connecting the field signal to the pressure cramp terminal on the terminal board (A2BM4) via a dedicated cable.

Connecting Signal Cables with S2BN1D

S2BN1D

Terminal number	Signal type
□A	Analog Digital I/O (AI_□/AO_□/DI_□/DO_□)
□B	Common (COM)

□: Channel number

A2BM4

Terminal number	Signal type
□A	Analog Digital I/O (AI_□/AO_□/DI_□/DO_□)
□B	Common (COM)
□C	Field power supply (F24V) or unused (*1)

□: Channel number
*1: Field power supply (F24 V) is for Analog input function (3-wire). Otherwise, terminal-C is unused.

Base Plate Terminal Numbers (Spring Clamp Terminals)

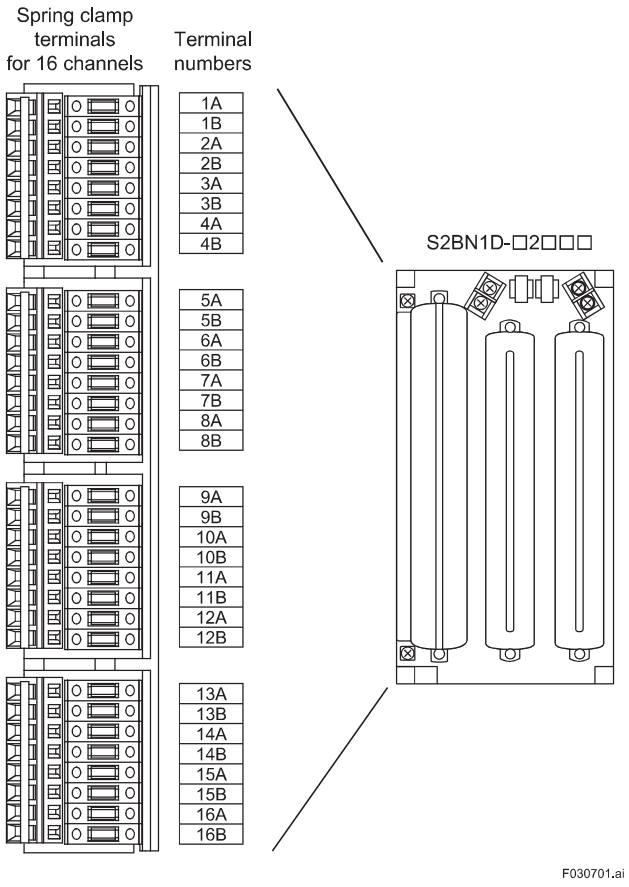

Figure S2BN1D-□2□□□ Base Plate for Adaptor

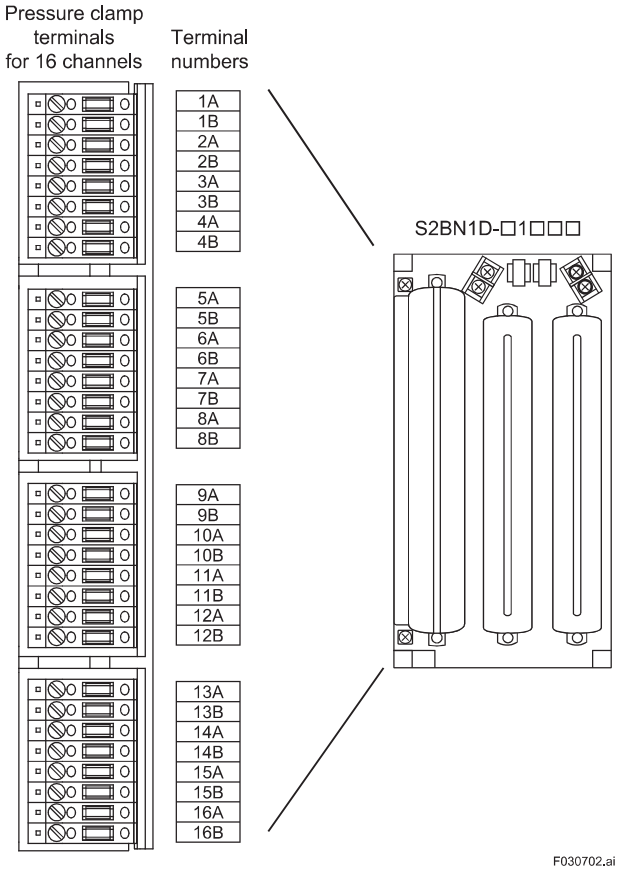
Base Plate Terminal Numbers (Pressure Clamp Terminals)



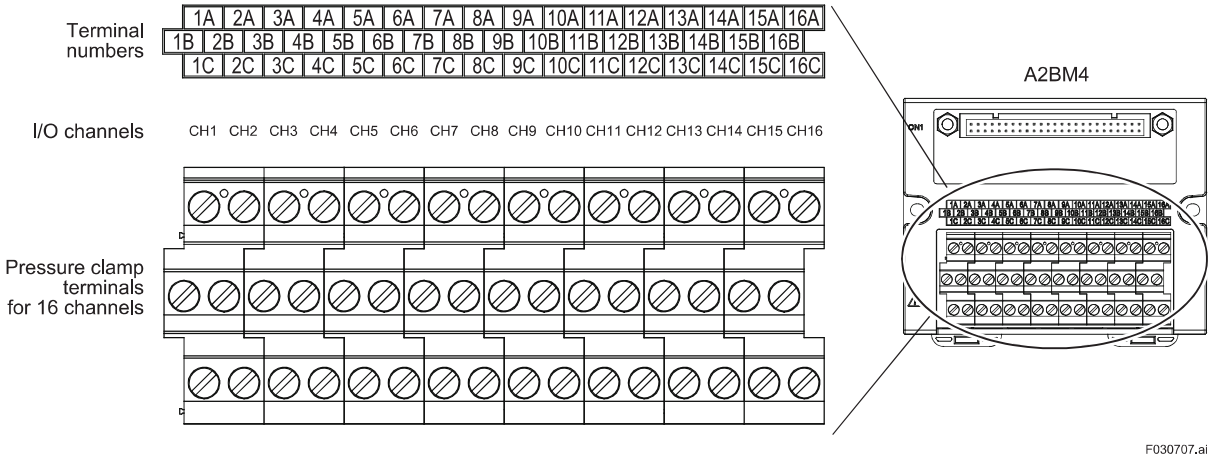


Figure S2BN1D-□1□□□ Base Plate

Terminal board Terminal Numbers (pressure Clamp Terminals)

Parallel connection with adjacent channels (S2BN1D, A2BM4)

The maximum load current per channel is 0.66 A. A load current device with more than 0.66 A can be connected by using parallel connection with adjacent channels.

- The 2 channels parallel connection allows a maximum load current of 1.3 A.
- The 3 channels parallel connection allows a maximum load current of 2.0 A.

For the parallel connection, connect the signal cable to the external terminal block from the terminal block of the base plate (S2BN1D) or terminal board (A2BM4). The following figure shows an example of parallel connection.

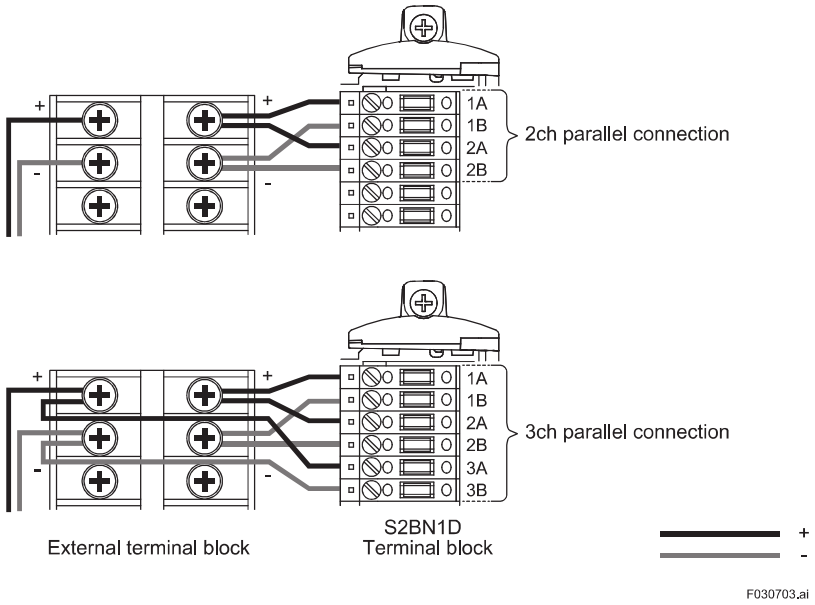

Figure Parallel connection for S2BN1D

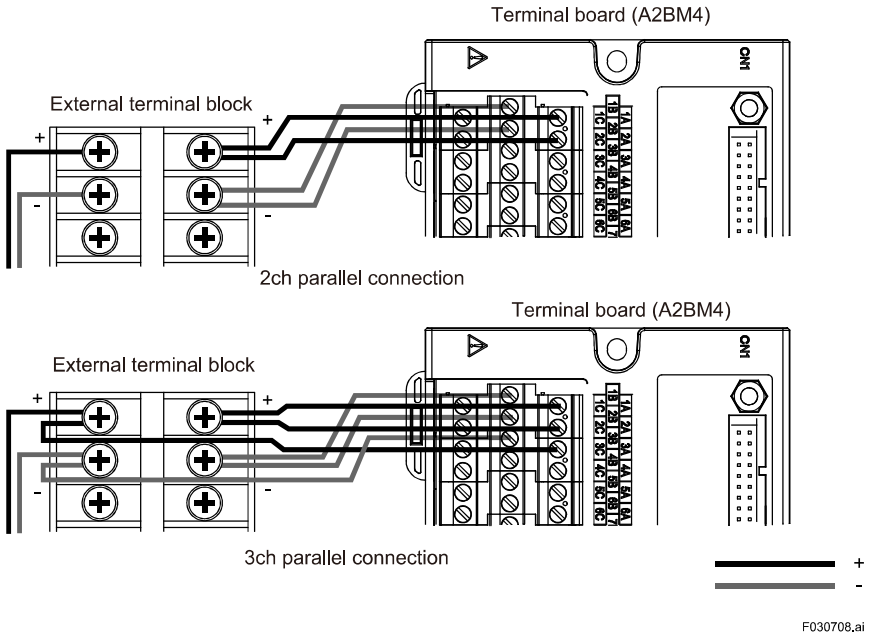

Figure Parallel connection for A2BM4

Connecting Wiring Check Adapters

Connect the wiring check adapters to detect disconnected or short-circuited field wiring between the digital input channel and field equipment. These adapters should be connected at the field equipment side. The two types of these adapters are:

- SCB100: Disconnection detection while accepting an OFF signal
  If this type of adapter is connected in parallel with a sensor switch, a disconnection occurring while accepting an OFF signal can be detected.
- SCB110: Short-circuit detection
  If this type of adapter is connected in series with a sensor switch, a short-circuit in the power line, occurring while accepting an ON signal, or a short-circuit with other channels can be detected. In addition to the above wiring check adapters, input module's diagnostic functions should be able to detect disconnections or short-circuits.

SEE ALSO For more information about diagnostic features of the input modules, see the following:
Appendix 1.3.4 "Setting for the DI channel" of the Engineering Guide Vol. 1 (IM 32P01C10-01EN).

Shape of Wiring Check Adapters

The following figure shows the shape of the SCB100 and SCB110.

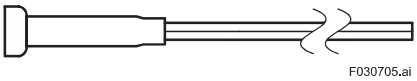

Figure External View of SCB100 and SCB110

Example of Connecting Wiring Check Devices

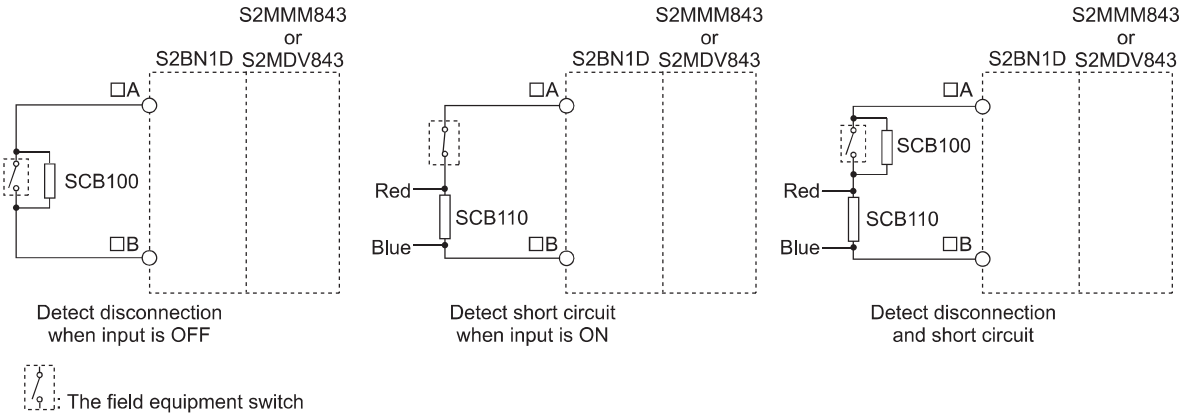

Figure Connecting Wiring Check Adapters

IMPORTANT

- Connect the SCB110 with correct polarity. If it is connected incorrectly, no detection can be made.
- To detect short-circuits or disconnections in the field wiring effectively, locate the adapters in the vicinity of the field equipment. Also install these adapters in a location out of direct sunlight and sheltered from rain.
- Be careful not to bend a covered part.

3.7.3 Base Plate for Barrier

Base Plate for Barrier Types and Terminal Types

The following table shows relation between Base Plate for Barrier Types and Terminal Types.

Table Base Plate for Barrier Types and Terminal Types

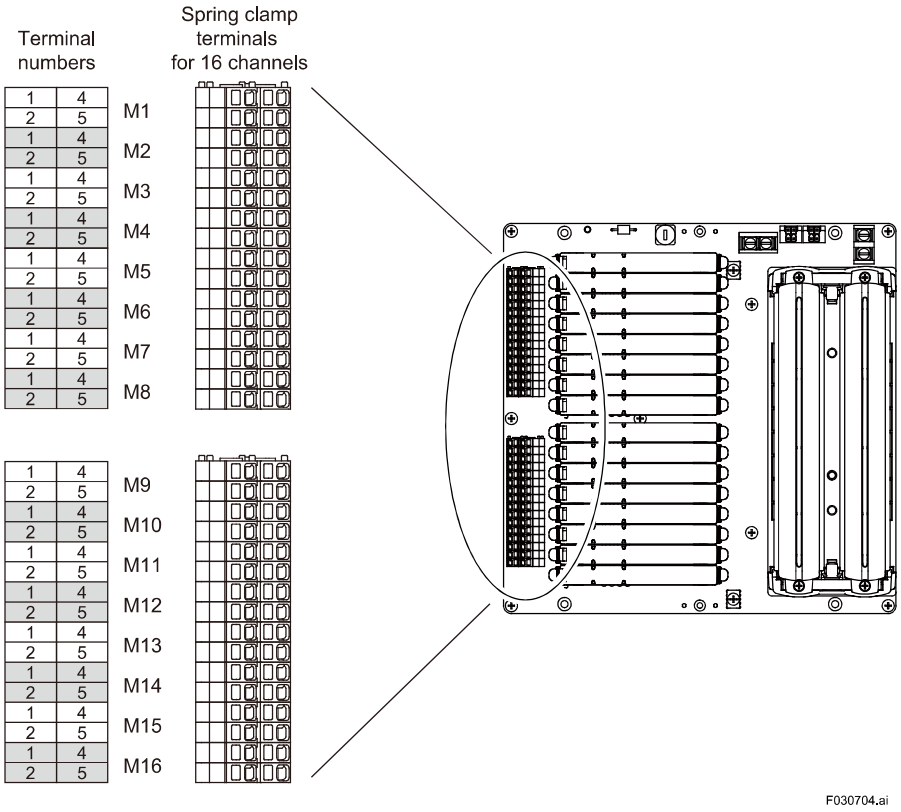
Base plate model	Suffix code	Field wiring direction	Terminal type	Terminal position
S2BN4D Base Plate for Barrier (MTL)	-□□□C□	Left	Pressure clamp terminal	On barrier module
	-□□□D□	Right		
S2BN5D Base Plate for Barrier (P+F)	-□□□C□	Left	Spring clamp terminal	On base plate
	-□□□D□	Right		

Installable Barriers with Base Plate for Barrier

The following table shows Modules installable with Base Plate for Barrier.

Table Modules Installable with Base Plate for Barrier

Base plate model	Model of installable barrier
S2BN4D Base Plate for Barrier (MTL)	Refer to the General Specifications (GS).
S2BN5D Base Plate for Barrier (P+F)	Refer to the General Specifications (GS).



Base Plate for Barrier Terminal Numbers

S2BN4D (Pressure Clamp Terminals)

The S2BN4D Base Plate for Barrier do not have signal terminals because signal terminals are provided on intrinsic safety barriers.

Information about the terminal numbers of the signal terminals provided on the intrinsic safety barriers, refer to the manufacture's catalog.

S2BN5D Base Plate for Barrier (Spring Clamp Terminals)

Connecting Signal Cables with Base Plate for Barrier (S2BN5D)

The signal connections of the base plate for Barrier (model: S2BN5D) differ depending on the signal type. The following table shows the terminal numbers and signal types.

Table Terminal Numbers and Signal Types (S2BN5D)

Intrinsic safety barriers	Terminal number	Signal type (*1)					
		Case 1	Case 2	Case 3	Case 4	Case 5	Case 6
For analog input	1	Two-wire transmitter input +	Current input +	—	—	—	—
	2	—	—	—	—	—	—
	4	Two-wire transmitter input −	—	—	—	—	—
	5	—	Current input −	—	—	—	—
For analog output	1	Analog output +	—	—	—	—	—
	2	—	—	—	—	—	—
	4	Analog output −	—	—	—	—	—
	5	—	—	—	—	—	—
For digital input	1	Digital input+	—	—	—	—	—
	2	—	—	—	—	—	—
	4	Digital input −	—	—	—	—	—
	5	—	—	—	—	—	—
For digital output	1	Digital output +	—	—	—	—	—
	2	—	—	—	—	—	—
	4	Digital output −	—	—	—	—	—
	5	—	—	—	—	—	—
For temperature input	1	RJC connection	—	RTD four-wire type current source +	RTD three-wire type current source +	RTD two-wire type current source +	Skid resistance current source +
	2	Thermocouple input +	Voltage input +	RTD four-wire type input +	—	—	—
	4	RJC connection	—	RTD four-wire type current source -	RTD three-wire type current source -	RTD two-wire type current source -	Skid resistance current source -
	5	Thermocouple input -	Voltage input -	RTD four-wire type input -	RTD three-wire type input -	—	Skid resistance input -

*1: "—" denotes that the terminal is not used. Do not connect any signal to it.

3.8 Connecting Bus Cable

There are three types of control network bus named as Vnet/IP, and Vnet/IP-Upstream for the ProSafe-RS system.
Vnet/IP or Vnet/IP-Upstream is used for S2SC70S/S2SC70D, SSC60S/SSC60D, SSC50S/SSC50D, and SSC57S/SSC57D. Vnet/IP-Upstream is the same connection as Vnet/IP.
This section describes each control network bus cabling and ESB bus cabling related to the control network bus.

3.8.1 Vnet/IP network

Information on Vnet/IP interface connection and an example of SENG and SCS connection are shown below:

● Vnet/IP Interface

- Topology : tree connection
- Configuration : dual redundancy only
- Connector : RJ45 connector
- Intra-domain connection : L2SW used
- Inter-domain connection : L3SW used
- Recommended cable : UTP cable of CAT5e or above (optical cable for outdoor use)

● SENG and SCS Connection

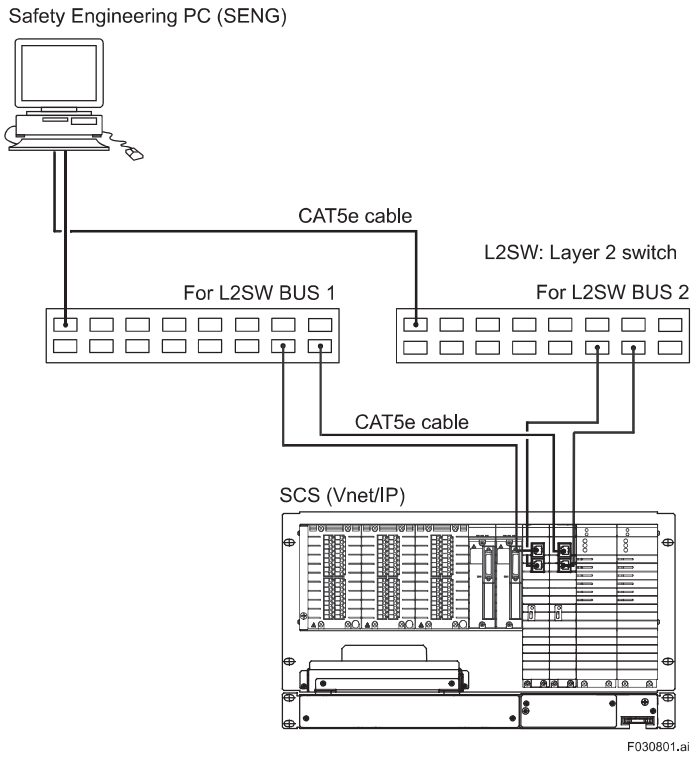


Figure Example of SENG and SCS Connection

Example of Connection between V net Router and SCS

Differentiation between BUS 1 and BUS 2

Use different colors, etc., to differentiate between BUS 1 and BUS 2.

Destination Display

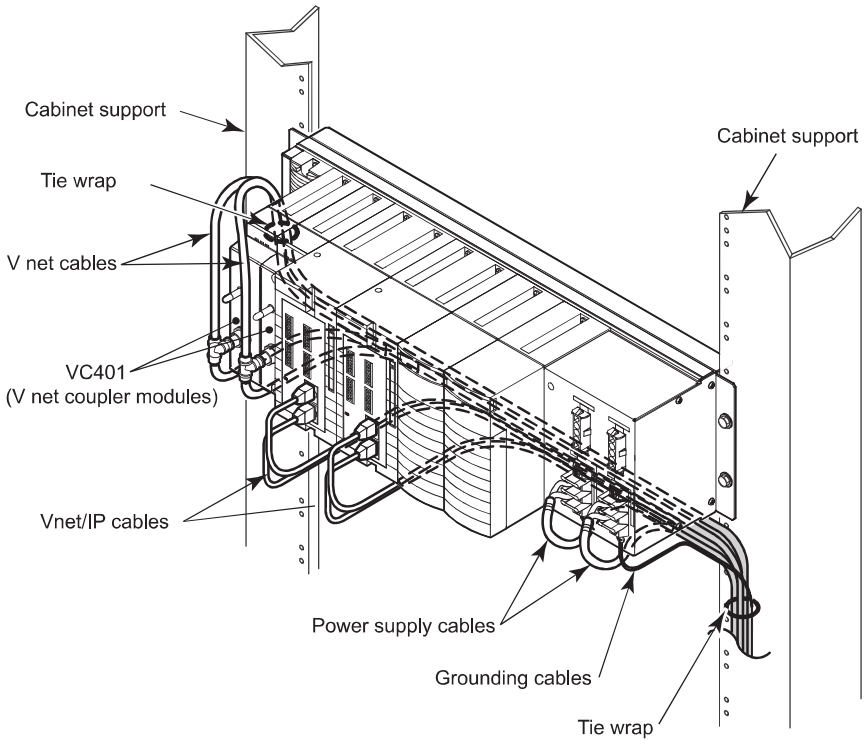
Attach a display tag at the tip of cables to indicate the station number, switch number, and port number of the destination.

Cable Fixing

Fix cables securely so that their connectors are not exposed to undue stress.

Handling of Vnet/IP Cables Connected to the Processor Module (S2CP471/ SCP461/SCP451)

- Turn the power on after connecting the cables to the processor module.
- When removing the processor module on-line, remove it with the cable connected to it.
- Before installing the processor module on-line, connect a cable to it.



Handling communication module for V net router (VI451) of Duplexed V net router (AVR10D) and connecting cable

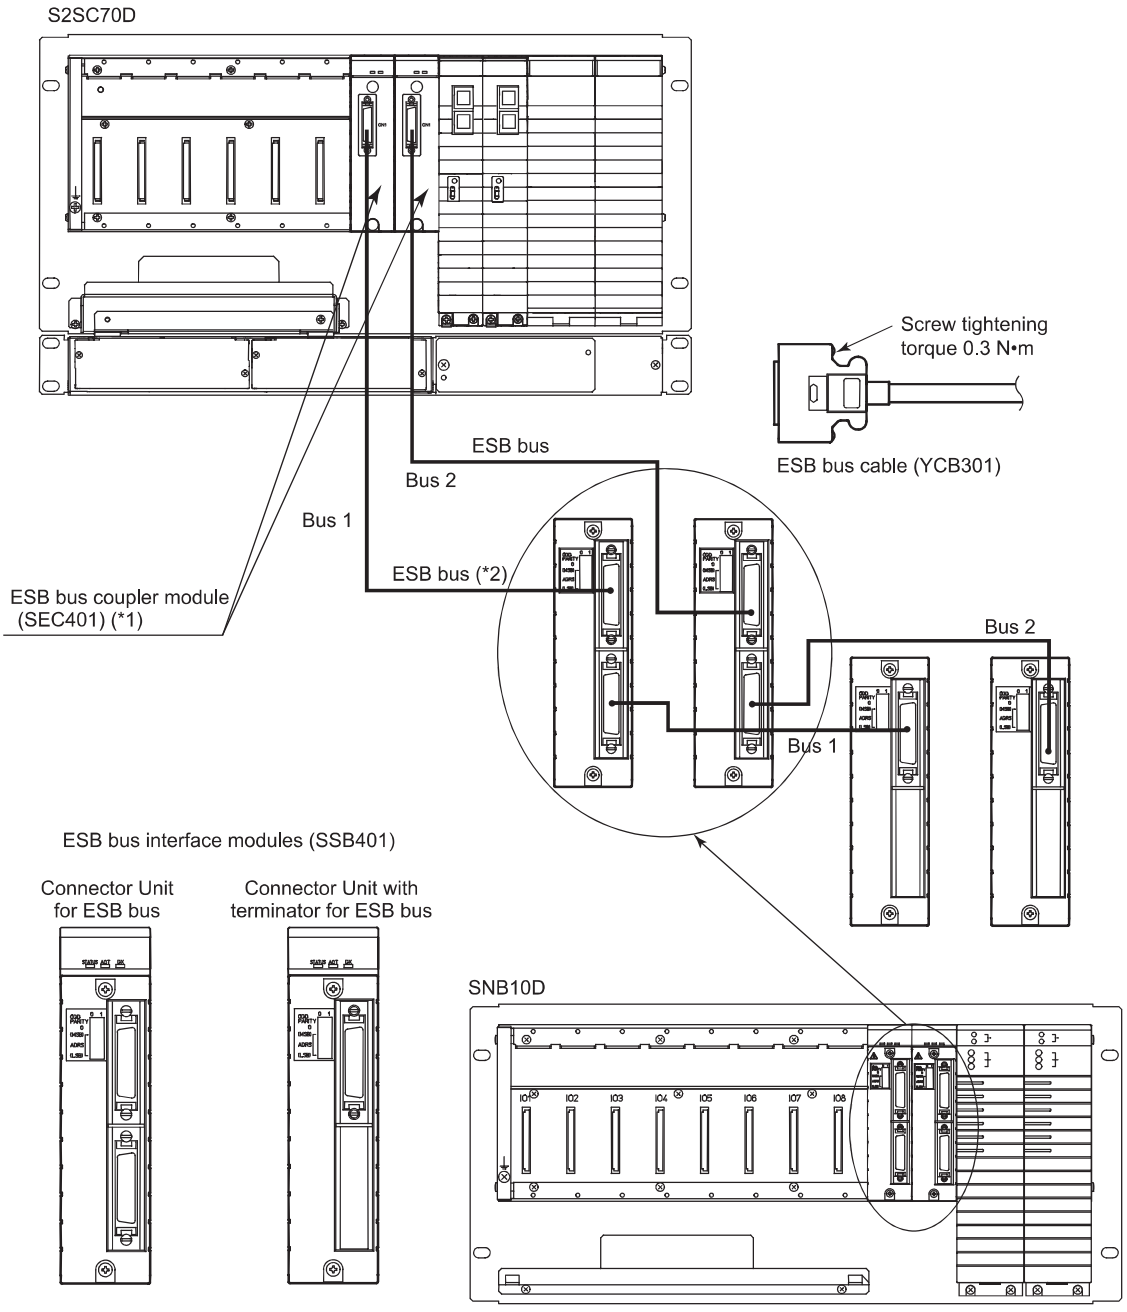
- Switch on after connecting a cable to VI451.
- Remove VI451 on line with a cable connected to VI451.
- Attach VI451 on line after connecting cable to VI451.

Handling VI702 and connecting cable

- Do not power on PC until a cable is attached.
- Power off PC first to remove a cable.

Cabling for AVR10D System

Use a tie wrap to fix the V net cable onto the support on the side of the VC401.



F030803.ai

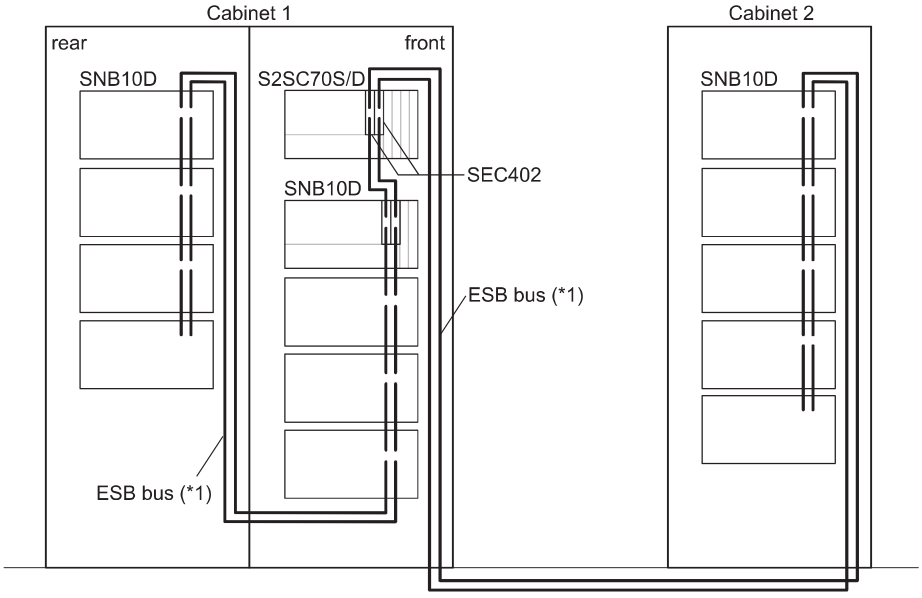
Figure Cabling Diagram for the AVR10D System

3.8.2 ESB Bus

Either the ESB bus branching connector or the branching connector that has a built-in ESB bus terminator must be mounted to SSB401 installed in the SNB10D safety node unit. If a node unit is connected next, select the ESB bus branching connector. If the node unit is the last one, select the branching connector that has a built-in ESB bus terminator.

The following is an example of connecting an ESB bus using SEC401 ESB bus coupler module. SEC401 can be installed in S2SC70☐, SSC60☐, SSC50☐, and SSC57☐.

*1: Total number of SNB10D safety node units must be 9 or less when SEC401 is used.
*2: Length of ESB buses must be 10 m or shorter from SEC401.

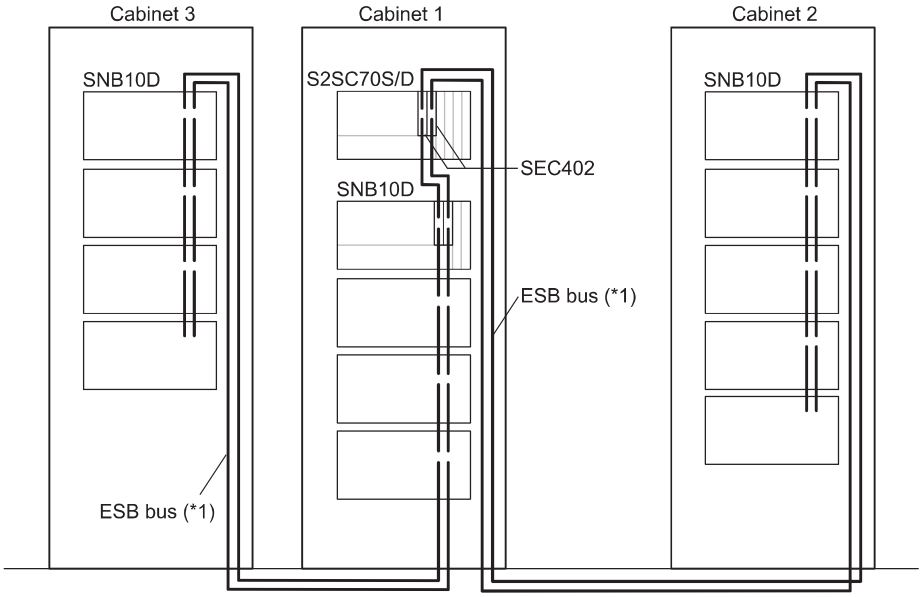


F030804.ai

Figure ESB bus Connection (S2SC70D)

Using SEC402 ESB bus coupler module, up to 13 SNB10D safety node units (*1) can be connected to S2SC70☐/SSC60☐ safety control unit. SEC402 has two ports to connect ESB bus cables. Up to 9 SNB10D units can be connected to each of the upper and lower port, and up to 13 SNB10D units can be connected to SEC402 as a total of the upper and lower ports. SEC402 can work normally even when node units are only connected to either of the two ports, leaving the other port vacant and not terminated. ESB Bus communication is available at this condition.

*1: To connect 10 or more SNB10Ds, CFS1350 Node Expansion Package is required.



The following are examples of ESB bus connection using SEC402.

*1: Length of ESB buses must be 10 m or shorter each from the upper and lower port of SEC402.

F030805.ai

Figure ESB bus Connection when Two Cabinets are Used

*1: Length of ESB buses must be 10 m or shorter each from the upper and lower port of SEC402.

F030806.ai

Figure ESB bus Connection when Three Cabinets are Used

3.8.3 N-ESB Bus

The following figure shows a connection example of the N-ESB bus.

Connect UTP straight Cable of Cat5e (two) from N-ESB bus Coupler Module (S2EN402, S2EN404) to N-ESB bus Module (S2EN501).

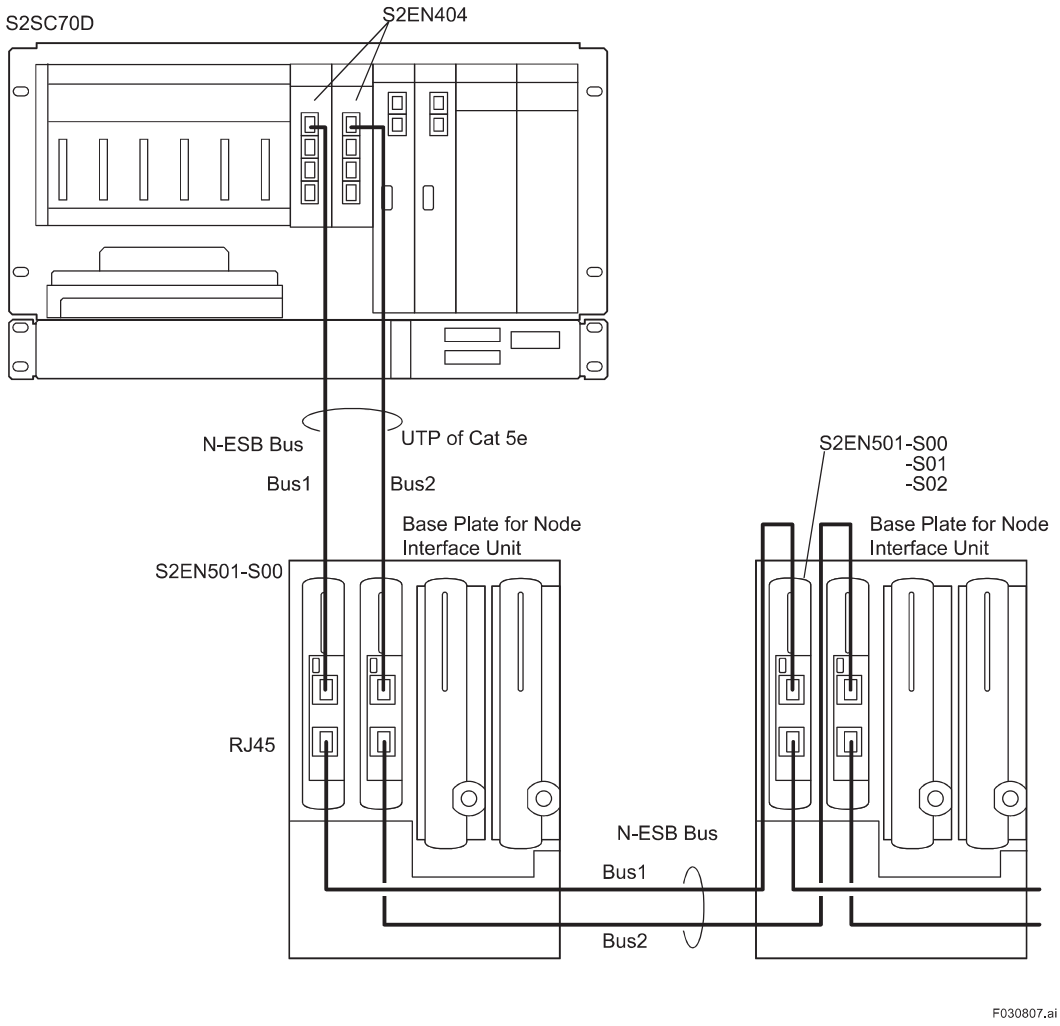


Figure Example of N-ESB Bus Connection

IMPORTANT

An N-ESB bus cable for the ProSafe-RS can be routed only in the cabinet or within the cabinets bayed together. An optical ESB bus cable must be used instead of an N-ESB bus cable when a cable is routed outside of the cabinet.

3.8.4 Optical ESB Bus

S2EN40☐

The following figure shows a connection example of the optical ESB Bus of the N-IO system.

Use a N-ESB Bus Module (S2EN501) equipped with an optical module to connect between an NIU and NIU.

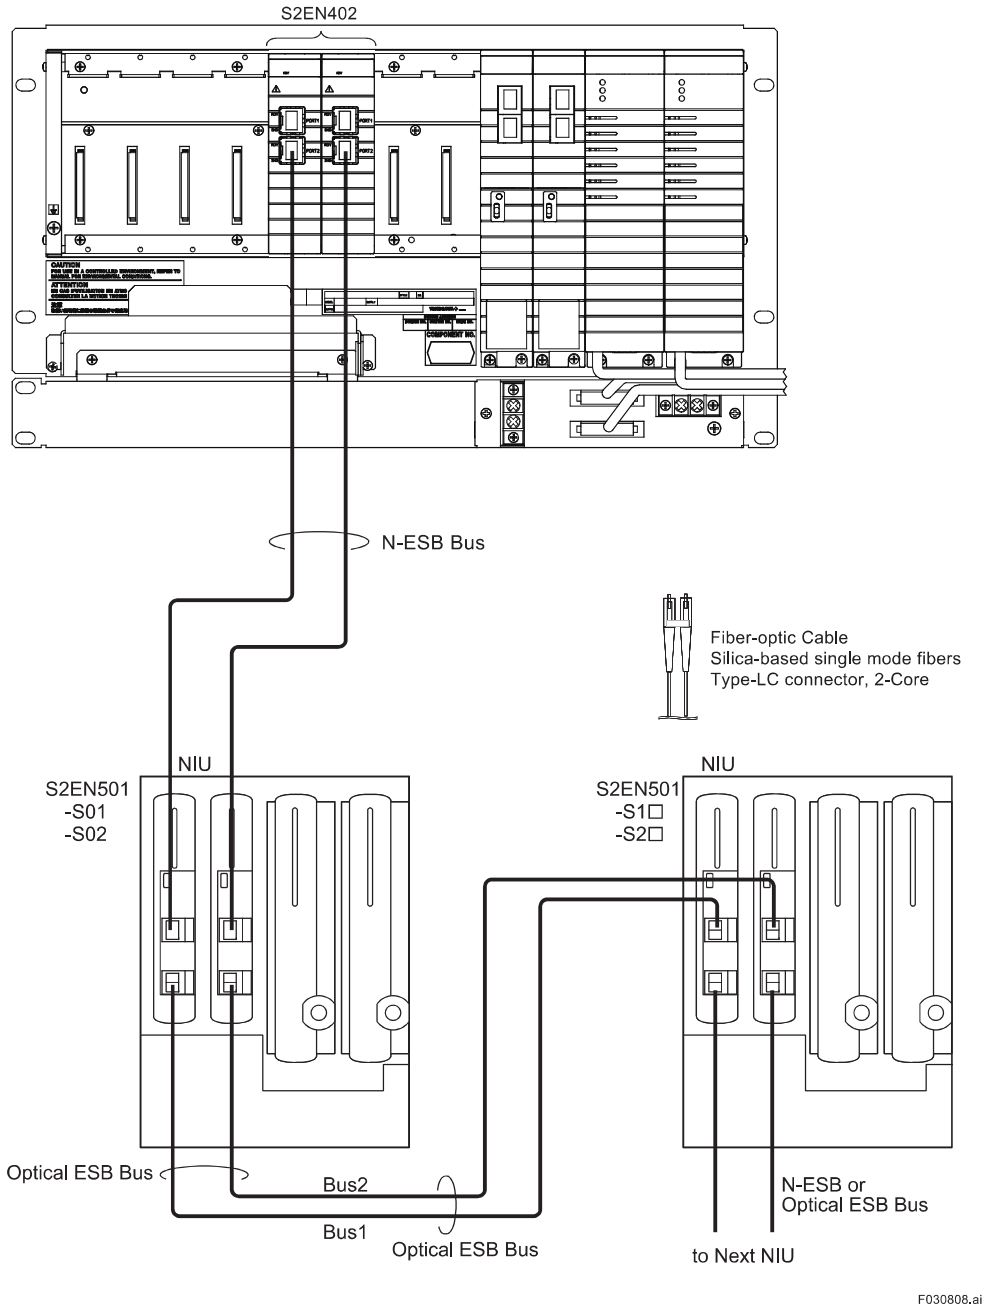

Figure Optical ESB Bus (N-IO) Connection (When Chain Connection)

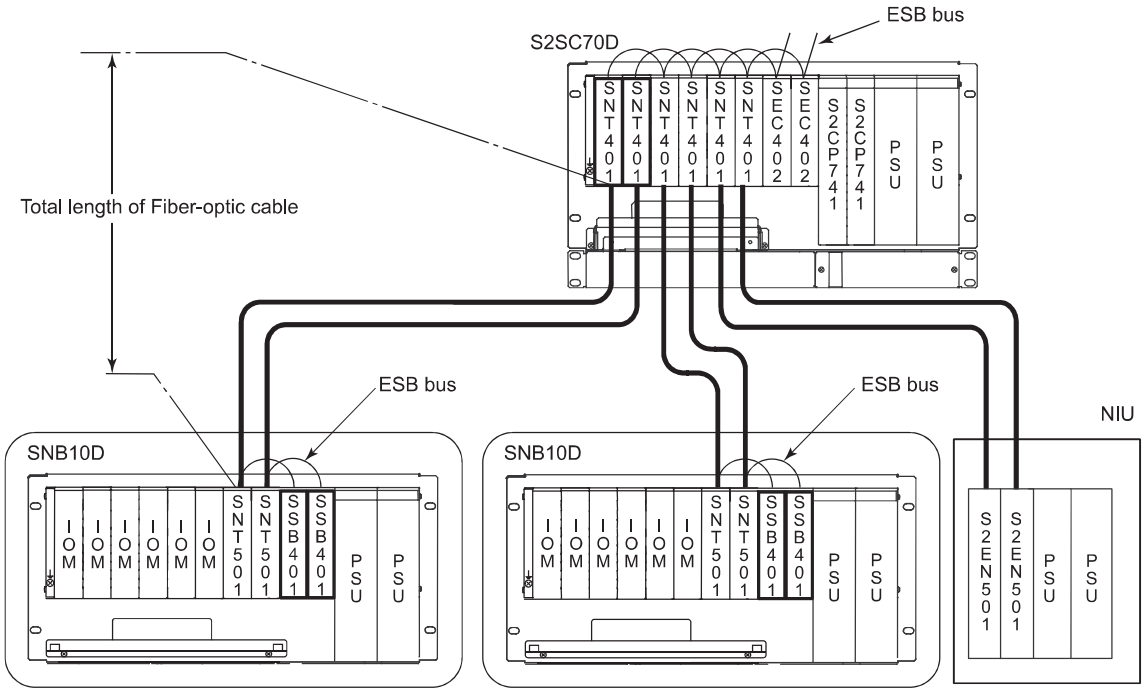
Optical ESB Bus Repeaters use fiber-optic cables to connect an SNT401/SNT411 Optical ESB Bus Repeater Master Module and an SNT501/SNT511 Optical ESB Bus Repeater Slave Module to each other.
When S2SC70☐, SSC60☐, SSC50☐ or SSC57☐ is used for the safety control unit, SNT401, SNT411, SNT501 and SNT511 are available.

You can connect these devices in the structures of star and chain type connections.

In one method, optical ESB bus repeater module unit (SNT10D) is used and in the other, it is not.



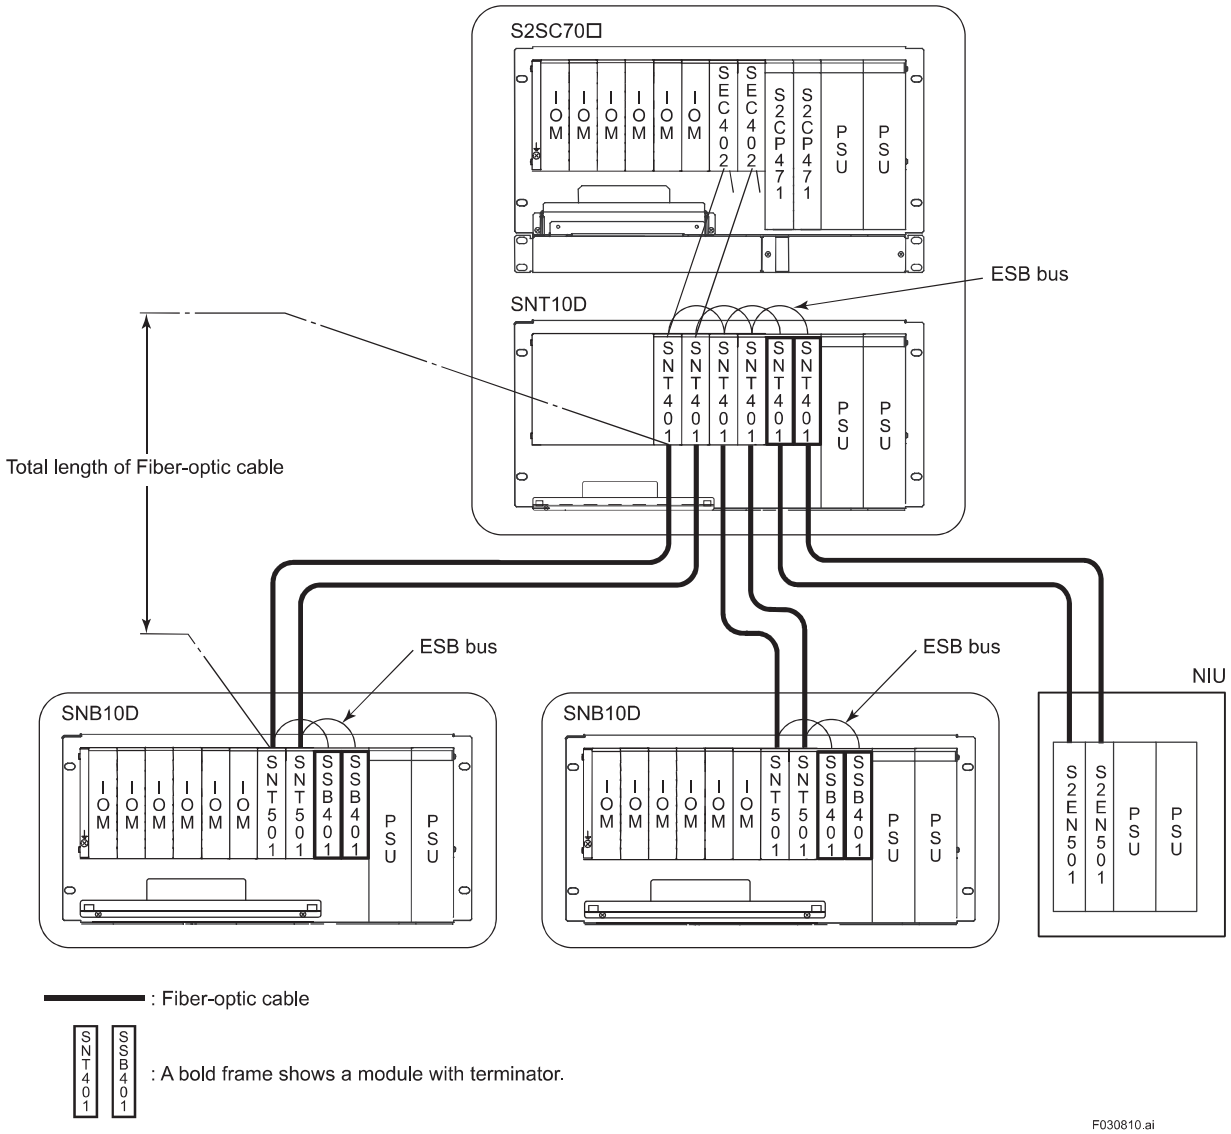
Examples of connecting optical ESB bus repeater modules are shown below using SNT401 and SNT501. The same connection can be applied to SNT411 and SNT511.

Star Type Connection

Star type connection is possible when connecting SNT401/SNT411 installed on S2SC70☐/ SSC60☐/SSC50☐/SSC57☐ (safety control unit) or SNT10D (unit for Optical ESB bus repeater module) to SNT501/SNT511 installed on SNB10D (safety node unit).

Fiber-optic cable for ESB bus can be star-connected to SNT501/SNT511.

Example of not using SNT10D



: Fiber-optic cable

: A bold frame shows a module with terminator.

F030809.ai

Figure Star Type Connection: Not Using SNT10D

Example of using SNT10D

Note: Max. five SNB10Ds are connectable to one SNT10D.

Figure Star Type Connection: Using SNT10D

Chain Type Connection

There are two structures of chain type connections: one uses the SNT10D Unit for Optical Bus Repeater Modules and the other does not use any SNT10D Unit for Optical Bus Repeater Modules.

Where No SNT10D Unit Is Used

The SNT401/SNT411 modules installed on the S2SC70☐/SSC60☐/SSC50☐/SSC57☐ Safety Control Unit as well as on the SNB10D Safety Node Unit can be chain-connected respectively to SNT501/SNT511 modules installed on the SNB10D Unit. In such a case, the number of I/O modules that can be installed on S2SC70☐/SSC60☐/SSC50☐/SSC57☐ and SNB10D is up to four and six respectively. If you have a plan to connect an SNB10D and your SNB10D with fiber-optic cables in the future, it is recommended that you reserve sufficient slots in your SNB10D for optical ESB bus repeater modules.

Example of not using SNT10D

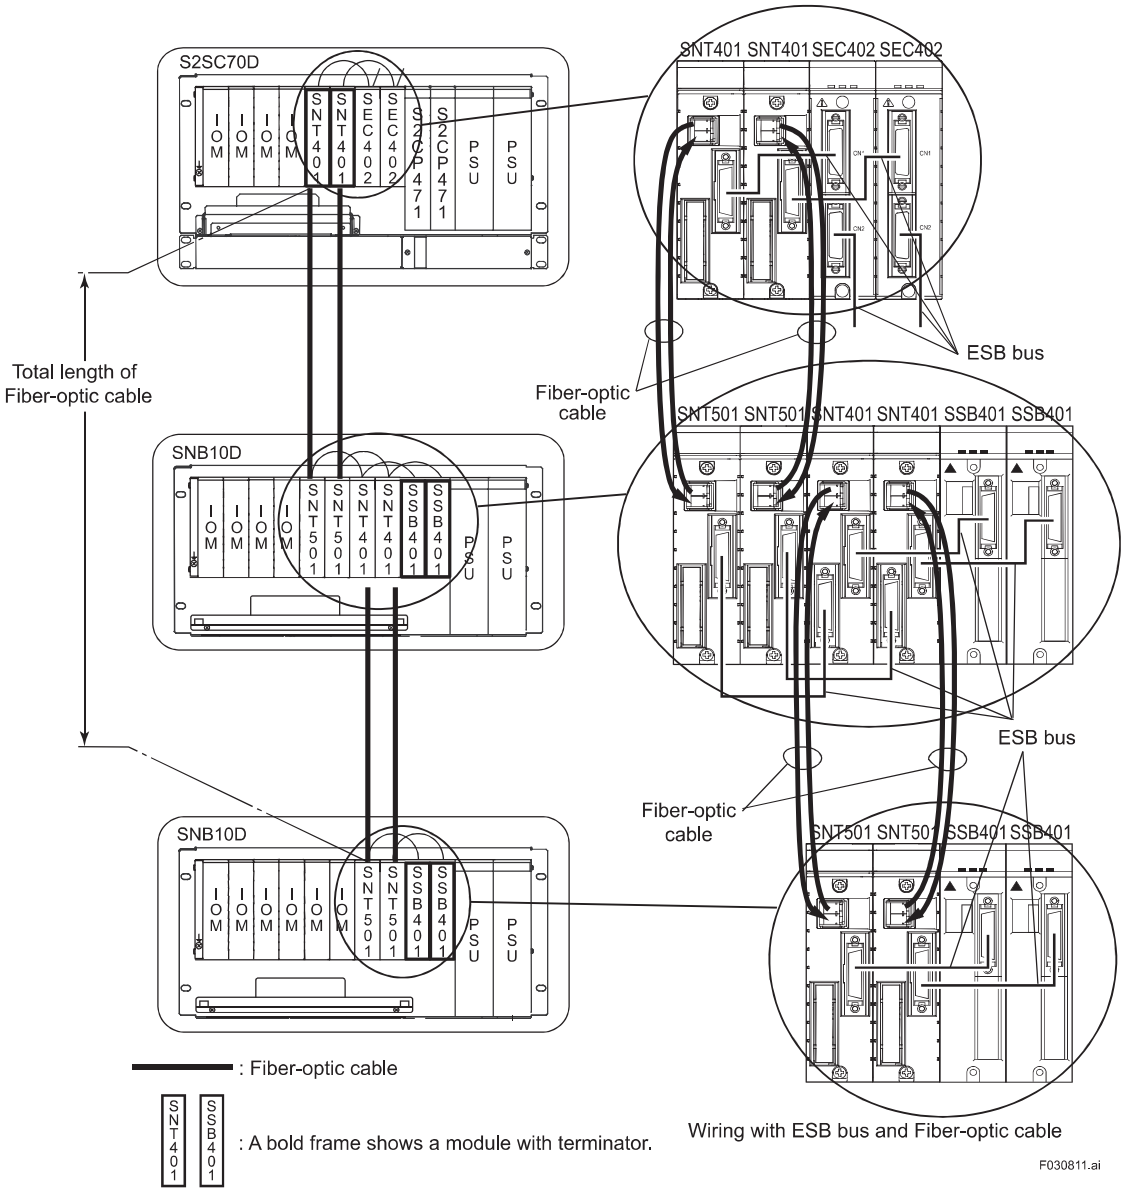


Figure Chain Type Connections: Not Using SNT10D

Where an SNT10D Unit Is Used

The SNT10D is used for S2SC70☐, SSC60☐, SSC50☐, SSC57☐, and SNB10D to allow the SNT401/SNT411 and SNT501/SNT511 modules to be chain-connected to each other. In such a case, the number of I/O modules that can be installed on each unit is six to eight. This can result in the same installation as in ESB-bus cable connections on the ESB bus.

Example of using SNT10D

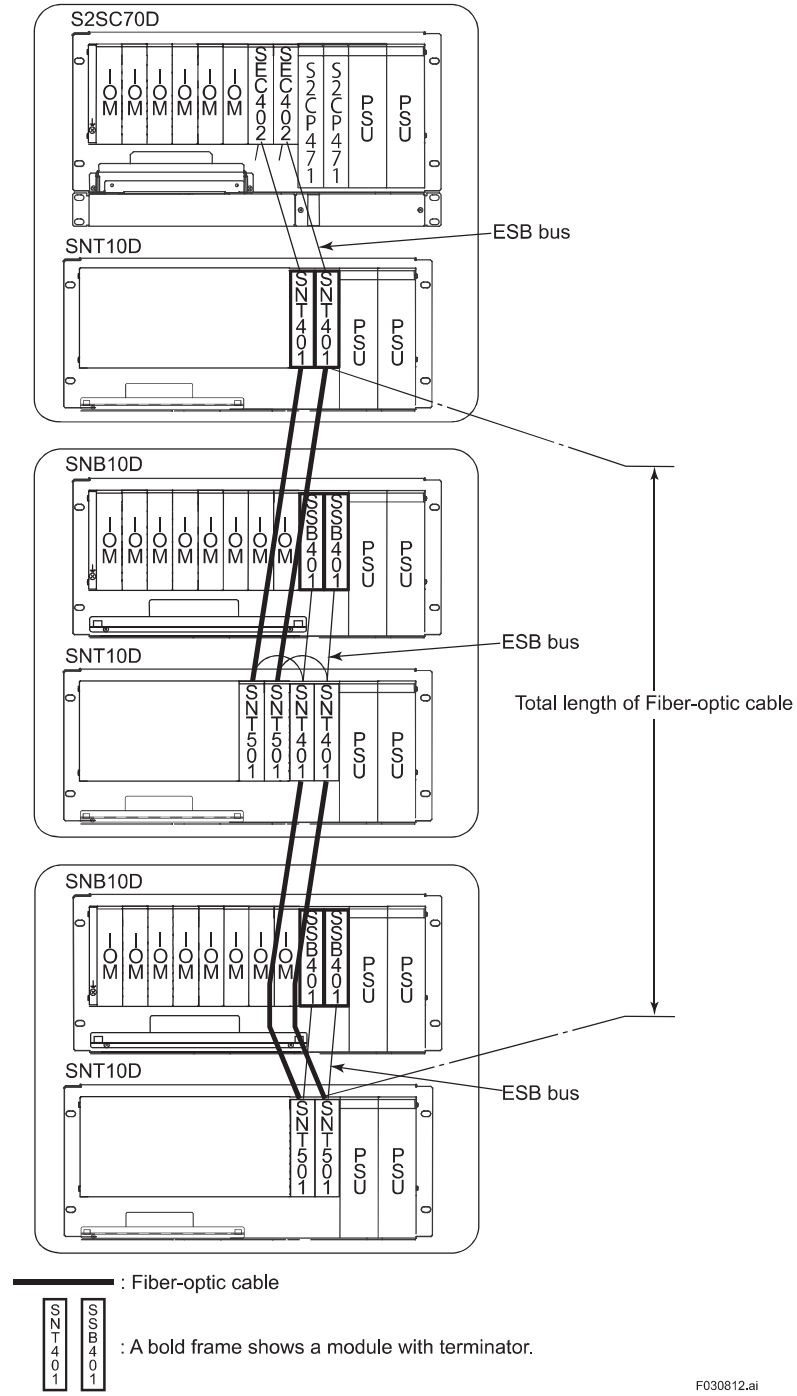

Figure Chain Type Connections: Using SNT10D

Fiber-optic Cable for Optical ESB

Specifications of Fiber-optic Cables Used in Optical ESB Bus Repeater Modules

The table below shows the specifications of the fiber-optic cables used in optical ESB bus repeater modules.

Table Specifications of Fiber-optic Cables Used in Optical ESB Bus Repeater Modules

Item	Specification
Connector	Type LC connector (IEC 61754-20-compliant product)
Cable	Silica-based single-mode fibers (JIS C6835 SSMA-9.3/125, IEC 60793-2-50B1.1)
Number of cores used	Two

Fiber-optic cables with the temperature rating of an ambient temperature plus 20 °C or more must be used.

Lay fiber-optic cables according to the manufacturer's cable handling precautions such as allowable bending radius.

Secure and wire the fiber-optic cables so as not to put extra stress on the cable trays in the units listed below:

- Safety control unit
- Safety node unit
- Unit for optical bus repeater module

3.8.5 F-SB Bus (for N-IO Node)

The following figure shows a conne.

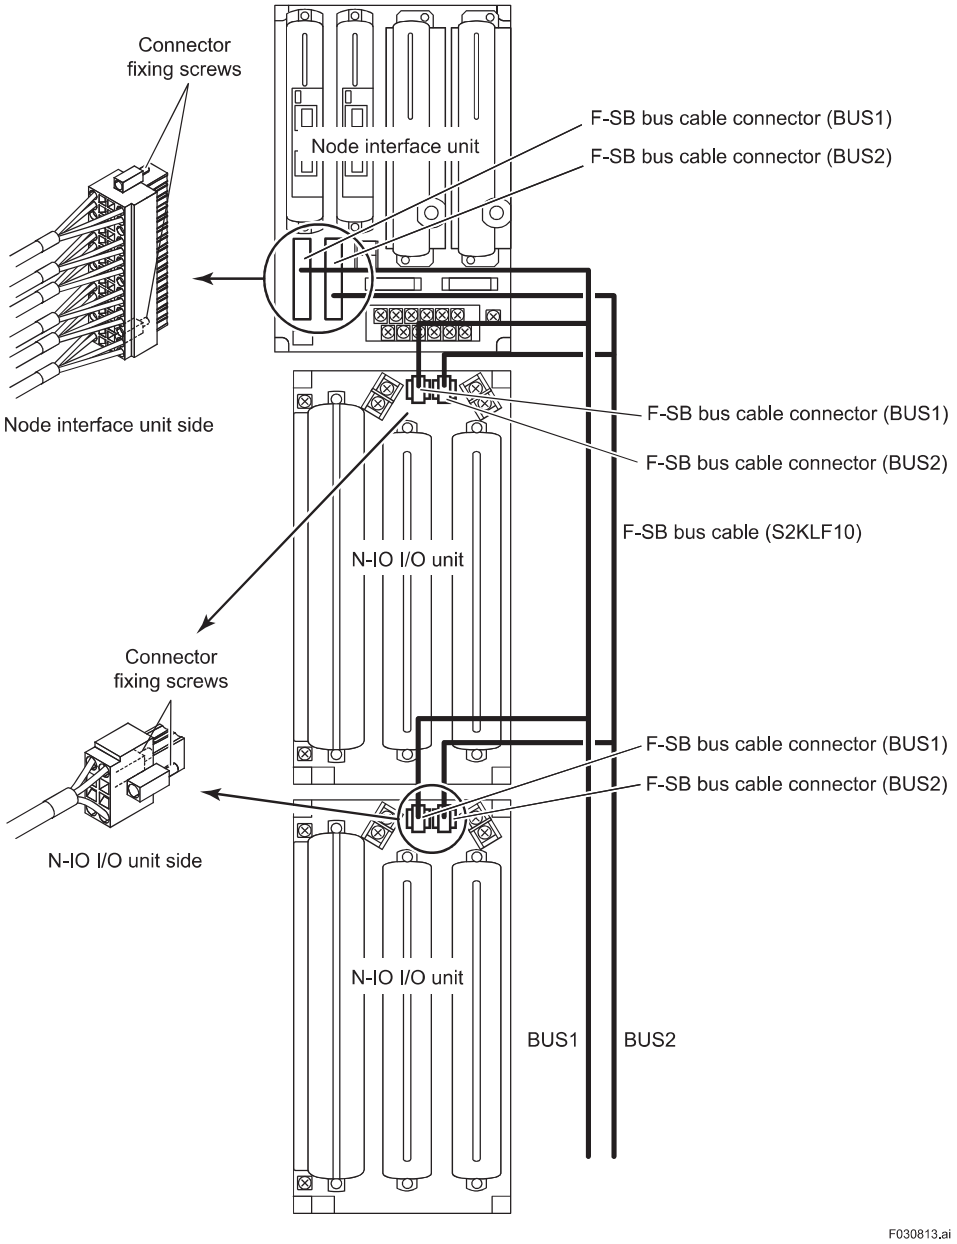

Figure F-SB Bus Connection

CAUTION

NIU and N-IO I/O Units can be installed in only the same cabinet.

When connecting a F-SB bus cable to N-IO node, ensure to keep the minimum bending radius of the cable.

The minimum bending radius of the F-SB bus cable is six-fold of the diameter of the cable.

4. Installation Specifications

This section summarizes power consumption, in-rush current, fuse (breaker) ratings, durability of parts, and other data for the installation of the ProSafe-RS system.

Electrical Specifications

Power consumption (current) and other electrical data are shown below.

Table Electrical Specifications (1/2)

Equipment	Input voltage range		Maximum power consumption/current dissipation (*1), VA, A	Heating value, J/h (*2)
	Voltage, V AC	Frequency, Hz		
SSC60S-S Safety Control Unit (for Vnet/IP)	100-120	50 or 60 ± 3	200 VA	432 x 10^3 (120 W)
	220-240		230 VA	
	24 V DC		5.5 A	
SSC60S-F Safety Control Unit (for Vnet/IP)	100-120	50 or 60 ± 3	240 VA	540 x 10^3 (150 W)
	220-240		290 VA	
	24 V DC		7.0 A	
SSC60D-S Duplex Safety Control Unit (for Vnet/IP)	100-120	50 or 60 ± 3	200 VA	432 x 10^3 (120 W)
	220-240		230 VA	
	24 V DC		5.5 A	
SSC60D-F Duplex Safety Control Unit (for Vnet/IP)	100-120	50 or 60 ± 3	240 VA	540 x 10^3 (150 W)
	220-240		290 VA	
	24 V DC		7.0 A	
SSC50S-S Safety Control Unit (for Vnet/IP)	100-120	50 or 60 ± 3	200 VA	432 x 10^3 (120 W)
	220-240		230 VA	
	24 V DC		5.5 A	
SSC50S-F Safety Control Unit (for Vnet/IP)	100-120	50 or 60 ± 3	240 VA	540 x 10^3 (150 W)
	220-240		290 VA	
	24 V DC		7.0 A	
SSC50D-S Duplex Safety Control Unit (for Vnet/IP)	100-120	50 or 60 ± 3	200 VA	432 x 10^3 (120 W)
	220-240		230 VA	
	24 V DC		5.5 A	
SSC50D-F Duplex Safety Control Unit (for Vnet/IP)	100-120	50 or 60 ± 3	240 VA	540 x 10^3 (150 W)
	220-240		290 VA	
	24 V DC		7.0 A	
SSC57S-S Safety Control Unit (for Vnet/IP-Upstream)	100-120	50 or 60 ± 3	200 VA	432 x 10^3 (120 W)
	220-240		230 VA	
	24 V DC		5.5 A	
SSC57S-F Safety Control Unit (for Vnet/IP-Upstream)	100-120	50 or 60 ± 3	240 VA	540 x 10^3 (150 W)
	220-240		290 VA	
	24 V DC		7.0 A	
SSC57D-S Duplex Safety Control Unit (for Vnet/IP-Upstream)	100-120	50 or 60 ± 3	200 VA	432 x 10^3 (120 W)
	220-240		230 VA	
	24 V DC		5.5 A	
SSC57D-F Duplex Safety Control Unit (for Vnet/IP-Upstream)	100-120	50 or 60 ± 3	240 VA	540 x 10^3 (150 W)
	220-240		290 VA	
	24 V DC		7.0 A	

*1: The power consumption in steady operation is indicated in VA (AC) or A (DC). When the power consumption varies according to the installed number of equipment, the power consumption by the maximum number of units installed is listed.

*2: The heating value in steady operation is indicated in Joule/hour. When the heating value varies according to the installed number of equipment, the heating value by the maximum number of units installed is listed.

Table Electrical Specifications (2/2)

Equipment	Input voltage range		Maximum power consumption/current dissipation (*1), VA, A	Heating value, J/h (*2)
	Voltage, V AC	Frequency, Hz		
S2SC70S-S Safety Control Unit	100-120	50 or 60 ± 3	200 VA	432 x 10^3 (120 W)
	220-240		230 VA	
	24 V DC		5.5 A	
S2SC70S-F Safety Control Unit	100-120	50 or 60 ± 3	240 VA	540 x 10^3 (150 W)
	220-240		290 VA	
	24 V DC		7.0 A	
S2SC70D-S Duplex Safety Control Unit	100-120	50 or 60 ± 3	200 VA	432 x 10^3 (120 W)
	220-240		230 VA	
	24 V DC		5.5 A	
S2SC70D-F Duplex Safety Control Unit	100-120	50 or 60 ± 3	240 VA	540 x 10^3 (150 W)
	220-240		290 VA	
	24 V DC		7.0 A	
SNB10D Safety Node Unit (with maximum number of I/O Modules Installed)	100-120	50 or 60 ± 3	200 VA	432 x 10^3 (120 W)
	220-240		230 VA	
	24 V DC		5.5 A	
SNT10D Unit for Optical Bus Repeater Module	100-120	50 or 60 ± 3	200 VA	432 x 10^3 (120 W)
	220-240		230 VA	
	24 V DC		5.5 A	
AVR10D Duplexed V net router	100-120	50 or 60 ± 3	80 VA	158 x 10^3 (44 W)
	220-240		110 VA	
	24 V DC		1.7 A	
AW810D Wide Area Communication Router	100-120	50 or 60 ± 3	80 VA	158 x 10^3 (44 W)
	220-240		110 VA	
	24 V DC		1.7 A	
S2NN30D Node Interface Unit	100-240	50 or 60 ± 3	190 VA	90 x 10^3 (25 W)
	24 V DC		150 W	
S2BN1D Base Plate	24 V DC		24 W	51 x 10^3 (14 W)
S2BN4D Base Plate for Barrier (MTL) System Power	24 V DC		24 W	51 x 10^3 (14 W)
S2BN4D Base Plate for Barrier (MTL) Barrier Power	24 V DC		38.4 W	83 x 10^3 (23 W)
S2BN5D Base Plate for Barrier (P+F) System Power	24 V DC		24 W	51 x 10^3 (14 W)
S2BN5D Base Plate for Barrier (P+F) Barrier Power	24 V DC		28.8 W	58 x 10^3 (16 W)

*1: The power consumption in steady operation is indicated in VA (AC) or A (DC). When the power consumption varies according to the installed number of equipment, the power consumption by the maximum number of units installed is listed.

*2: The heating value in steady operation is indicated in Joule/hour. When the heating value varies according to the installed number of equipment, the heating value by the maximum number of units installed is listed.

In-Rush Current for Each Component

Actual in-rush current data measured for each ProSafe-RS component is listed below.

Table System Equipment Power-On In-Rush Current

Equipment	In-rush current (A) 100 V AC		In-rush current (A) 220 V AC		In-rush current (A) 24 V DC	
	Primary	Secondary	Primary	Secondary	Primary	Secondary
SSC60S-S Safety Control Unit	62	5	124	5	30	23
SSC60S-F Safety Control Unit (Wide range temperature type)	82	9	168	8	40	23
SSC60D-S Duplexed Safety Control Unit	62	5	124	5	30	23
SSC60D-F Duplexed Safety Control Unit (Wide range temperature type)	82	9	168	8	30	23
SSC50S-S Safety Control Unit	62	5	124	5	30	23
SSC50S-F Safety Control Unit (Wide range temperature type)	82	9	168	8	40	23
SSC50D-S Duplexed Safety Control Unit	62	5	124	5	30	23
SSC50D-F Duplexed Safety Control Unit (Wide range temperature type)	82	9	168	8	30	23
SSC57S-S Safety Control Unit	62	5	124	5	30	23
SSC57S-F Safety Control Unit (Wide range temperature type)	82	9	168	8	40	23
SSC57D-S Duplexed Safety Control Unit	62	5	124	5	30	23
SSC57D-F Duplexed Safety Control Unit (Wide range temperature type)	82	9	168	8	30	23
S2SC70S-S Safety Control Unit	62	5	124	5	30	23
S2SC70S-F Safety Control Unit (Wide range temperature type)	82	9	168	8	40	23
S2SC70D-S Duplexed Safety Control Unit	62	5	124	5	30	23
S2SC70D-F Duplexed Safety Control Unit (Wide range temperature type)	82	9	168	8	30	23
SNB10D Safety Node Unit	62	5	124	5	30	23
SNT10D Unit for Optical Bus Repeater Module	62	5	124	5	30	23
AVR10D Duplexed V net router	47	1	48	0.5	10	2
AW810D Wide Area Communication Router	47	1	48	0.5	10	2
S2NN30D Node Interface Unit	40	—	80	—	60	—

Input current peak values and waveforms, influenced by input impedance, vary with system configurations, line sharing with other systems, and other factors. The rush current data shown above have been measured under the predetermined conditions (see below). Please note that the values are subject to change.

The power input circuit, with an in-rush current limiting circuit, restrains primary in-rush current, turning any current exceeding the limits to secondary and successive rush current.

Measurement Conditions

Input voltage: 132/264 V AC, 50 Hz, and 24 V DC

Line impedance: Approx. 0.4 ohms (external line impedance and internal impedance)

Turn-on timing: At 50 Hz, 90º or 5 ms after the AC zero-crossing point (60 Hz data are almost the same as the 50 Hz data shown above.)

Note

- The timing of the maximum primary/secondary in-rush current varies with devices.
- The restart in-rush current after a momentary power failure exceeds the above data and its timing is also different.
- For a system composed of multiple pieces of equipment, the in-rush current is normally smaller than the total of the in-rush currents by individual pieces of equipment.

Maximum Current Consumption of FIO Modules

Table Maximum Current Consumption of I/O Modules

Model	Name	Maximum current consumption (mA) 5 V DC	Maximum current consumption (mA) 24 V DC
Analog Input/Output Module			
SAI143-S	Analog input module (4 to 20 mA, 16 channels, Module isolation)	320	550
SAI143-H	Analog input module (4 to 20 mA, 16 channels, Module isolation, HART communication)	320	550
SAV144	Analog input module (1 to 5 V/1 to 10 V, 16 channels, Module isolation)	300	140
SAI533	Analog output module (4 to 20 mA, 8 channels, Module isolation, HART communication)	320	300
SAT145	TC/mV input module (16 channels, Isolated Channels)	400	200
SAR145	RTD input module (16 channels, Isolated Channels)	500	200
Digital Input/Output Module			
SDV144	Digital input module (non-voltage contact, 16 channels, Module isolation)	290	140
SDV521	Digital output module (24 V DC/2 A, 4 channels, Module isolation)	280	140
SDV526	Digital output module (100-120 V AC, 4 channels, Module isolation)	500	50
SDV531	Digital output module (24 V DC, 8 channels, Module isolation)	280	140
SDV53A	Digital output module (48 V DC, 8 channels, Module isolation)	290	150
SDV541	Digital output module (24 V DC, 16 channels, Module isolation)	300	150
ESB Bus Interface Module			
SNT401	Optical ESB Bus Repeater Master Module	500	0
SNT501	Optical ESB Bus Repeater Slave Module	500	0
SNT411	Optical ESB Bus Repeater Master Module 5 km - 50 km	500	-
SNT511	Optical ESB Bus Repeater Slave Module 5 km - 50 km	500	-
Communication Module			
ALR111	Serial communication module (RS-232C, 2-port)	500	-
ALR121	Serial communication module (RS-422/RS-485, 2-port)	500	-
ALE111	Ethernet communication module (1-port) (*1)	500	-
S2LP131	Fire and gas communication module (1-port) (*2)	800	-
Bus Interface Module			
SEC402	ESB Bus Coupler Module (2-Port)	500	-
SEC401	ESB Bus Coupler Module	500	-
S2EN402	N-ESB Bus Coupler Module (2-Port)	500	-
S2EN404	N-ESB Bus Coupler Module (4-Port)	500	-

*1: ALE111 is available from ProSafe-RS R3.02.00 or later with S2SC70☐, SSC60☐, SSC50☐ or SSC57☐.
*2: S2LP131 is available from ProSafe-RS R4.05.00 or later with S2SC70☐.

Maximum Current Consumption of N-IO

Mode	Name	Max current consumption 24 V DC (A)
S2BN1D	Base Plate (Field Power Supply)	11 A
S2BN4D	Base Plate for Barrier (Barrier Power Supply)	1.6 A
S2BN5D	Base Plate for Barrier (Barrier Power Supply)	1.8 A

Fuse (Breaker) Specifications

Fuse (breaker) ratings are listed below.

Table Fuse (Breaker) Ratings

Equipment	Built-in fuse rating (A/V)	External breaker rating (A/V) (*1)
SNT10D Unit for Optical Bus Repeater Module (for 100 V or 220 V AC power supply)	6.3/250	15/250
SNT10D Unit for Optical Bus Repeater Module (for 24 V DC power supply)	10/250	20/250
SSC60S/SSC60D Safety Control Unit (for 100 V AC power supply)	6.3/250	15/250
SSC60S/SSC60D Safety Control Unit (for 220 V AC power supply)	6.3/250	15/250
SSC60S/SSC60D Safety Control Unit (for 24 V DC power supply)	10/250	20/250
SSC50S/SSC50D Safety Control Unit (for 100 V AC power supply)	6.3/250	15/250
SSC50S/SSC50D Safety Control Unit (for 220 V AC power supply)	6.3/250	15/250
SSC50S/SSC50D Safety Control Unit (for 24 V DC power supply)	10/250	20/250
SSC57S/SSC57D Safety Control Unit (for 100 V AC power supply)	6.3/250	15/250
SSC57S/SSC57D Safety Control Unit (for 220 V AC power supply)	6.3/250	15/250
SSC57S/SSC57D Safety Control Unit (for 24 V DC power supply)	10/250	20/250
S2SC70S/S2SC70D Safety Control Unit (for 100 V AC power supply)	6.3/250	15/250
S2SC70S/S2SC70D Safety Control Unit (for 220 V AC power supply)	6.3/250	15/250
S2SC70S/S2SC70D Safety Control Unit (for 24 V DC power supply)	10/250	20/250
SNB10D Safety Node Unit (for 100 V or 220 V AC power supply)	6.3/250	15/250
SNB10D Safety Node Unit (for 24 V DC power supply)	10/250	20/250
AVR10D Duplexed V net router (for 100 V or 220 V AC power supply)	3.15/250	10/250
AVR10D Duplexed V net router (for 24 V DC power supply)	6.3/250	15/250
S2NN30D Node Interface Unit (100-240 V AC system)	5/250 (fuse)	15/250
S2NN30D Node interface Unit (24 V DC)	12/250 (fuse)	30/24
S2BN1D Base Plate with disconnecting terminal	—	—
S2BN4D Base Plate for Barrier (MTL): Barrier Power Input (24 V DC)	2.5/250 (fuse)	—
S2BN5D Base Plate for Barrier (P+F): Barrier Power Input (24 V DC)	3.15/250 (fuse)	—

*1: Recommended.

Durability of Parts

Some hardware components require periodical replacement. As a guideline to the intervals between preventive maintenance checks, the following table lists components with life span of less than 10 years. Users should replace the components indicated by a cross mark X during the preventive maintenance check. For other components, users should not attempt to replace them; contact Yokogawa for replacement.

Note: Random failures within the recommended replacement intervals may occur in some parts.

IMPORTANT

Parts reliability and durability depends much on environment in which they are used. Even within a range of environmental requirements, it is still important to be used in “desirable environment” to enhance reliable operation and durability.

For example, when a device whose temperature range is 5-40 degrees centigrade is used always in 35 degrees centigrade, its estimated failure rate is generally almost doubled and durability decreases by almost half, compared to the same device used in 25 degrees centigrade.

If there are corrosive gases; moreover, they promote corrosion of contact parts and printed circuit boards and their durability is shortened, compared to those in cleaner atmosphere. If there is more dust; in addition, we have to shorten the cleaning and replacement cycle for filters.

Control Devices (S2SC70☐, SSC60☐, SSC50☐, SSC57☐, and SNB10D)

Component	Part number	Recommended replacement period	Replacement by user	Remarks
Power Supply Module (100-120 V AC power supply)	SPW481	8 years	X	Average ambient temperature of 40ºC or lower
Power Supply Module (220-240 V AC power supply)	SPW482	8 years	X	Average ambient temperature of 40ºC or lower
Power Supply Module (24 V DC power supply)	SPW484	8 years	X	Average ambient temperature of 40ºC or lower
Battery Pack	S9185FA (*2)	3 years	X	Average ambient temperature of 30ºC or lower (*1)
		1.5 years	X	Average ambient temperature of 40ºC or lower (*1)
		9 months	X	Average ambient temperature of 50ºC or lower (*1)
	S9450FE (*3)	3 years	X	Average ambient temperature of 30ºC or lower (*1)
		1.5 years	X	Average ambient temperature of 50ºC or lower (*1)
		1 year	X	Average ambient temperature of 70ºC or lower (*1)
Aluminum Electrolytic Capacitor	–	8 year	–	For SPW481, SPW482, and SPW484 power supply modules and power supply units for fan units (S9159FA and S9160FA) Average ambient temperature of 40ºC or lower
Built-in Fuse	S9109VK	8 years	–	For SPW481 power supply module
	S9109VK	8 years	–	For SPW482 power supply module
	A1546EF	8 years	–	For SPW484 power supply module
Fan Unit	AIP602	4 years	X	Average ambient temperature of 60ºC or lower

X: Can be replaced. –: Cannot be replaced.
*1: Including temperature during storage.
*2: For Safety Control Unit with SCP461 and SCP451.
*3: For Safety Control Unit with S2CP471.

Unit Devices (SNT10D Unit for Optical Bus Repeater Module)

Component	Part number	Recommended replacement period	Replacement by user	Remarks
Power Supply Module (100 - 120 V AC power supply)	SPW481	8 years	X	Average ambient temperature of 40ºC or lower
Power Supply Module (220 - 240 V AC power supply)	SPW482	8 years	X	Average ambient temperature of 40ºC or lower
Power Supply Module (24 V DC power supply)	SPW484	8 years	X	Average ambient temperature of 40ºC or lower
Aluminum Electrolytic Capacitor	–	8 years	–	For SPW481, SPW482, and SPW484 power supply module Average ambient temperature of 40ºC or lower
Built-in Fuse	S9109VK	8 years	–	For SPW481 power supply module
	S9109VK	8 years	–	For SPW482 power supply module
	A15456EF	8 years	–	For SPW484 power supply module
SFP optical module (*1)	–	–	–	Recommended replacement period – every four years if in a G3 environment

X: Can be replaced.
–: Cannot be replaced.
*1: Applies to SNT401, SNT411, SNT501, and SNT511.

Control Devices (AVR10D, AW810D)

Part names	Part numbers	Recommended replacement cycle	Replacement by user	Remarks
Aluminum Electrolytic Capacitor	–	8 years	–	For PW441, PW442, PW444 Average ambient temperature of 40ºC or lower
Built-in power fuse	S9109VK	8 years	–	For PW441, PW442, PW444

–: Cannot be replaced.

S2NN30D

Table Periodic Replacement Parts Having Defined Life Spans

Part names	Part numbers	Recommended Replacement Interval	Replacement by user	Remarks
Power Supply Unit (100-240 V AC)	S2PW503	8 years	Yes	Average ambient temperature 40 °C or less
Power Supply Unit (24 V DC)	S2PW504	8 years	Yes	Average ambient temperature 40 °C or less
Bus Module	S2EN501-S1□□□□ S2EN501-S2□□□□ S2EN501-S□1□□□ S2EN501-S□2□□□	4 years	Yes	In the G3 environment, replacement is recommended due to corrosion of the SFP and SFP connectors.

5. Post-installation Inspection and Environmental Preservation

Post-installation Inspection

Upon the completion of installation of the instrumentation, before turning on the power inspect the items listed below to avoid contaminating the system with dust or condensation.

Table Inspection before Power On

	Inspection items (daily inspection/maintenance items)
Environment	☐ No water intrusion from cable ducts. ☐ No wind/rain blowing in ☐ Air-conditioned ☐ Cable ducts and cabinet bottoms covered to prevent entry of wind, dust, moisture ☐ Cabinets and surroundings cleaned ☐ No dust entering from air vents ☐ Free of salty, ferrous, corrosive gas ☐ No direct sunlight on equipment
Equipment	☐ No condensation or traces on cabinet interior/exterior ☐ No discoloration or rust on cabinet interior/exterior ☐ No condensation or traces on modules (disconnect cards on the upper, middle, and lower stands, and left and right sides of the cabinet to check that there is no condensation on the modules or defects anywhere in the cabinet.) ☐ No dust remaining inside cabinet

It is recommended that you turn on the power in the presence of Yokogawa when turning it on first.

Post-installation Environment Preservation

The following precautions should be taken to preserve the proper operating environment after the system has been installed:

- Seal the pits if they are shared by equipment in other rooms, preventing entry of dust and moisture from the other rooms.
- Seal all cable ducts of equipment and building with putty upon completion of cabling.
- Always turn on air conditioner. Turning it on/off may cause condensation inside equipment. If you turn on the power of an air conditioner after a long stop, turn on the air conditioner first and the system. Otherwise condensation may occur.
- Monitor and record the room ambient temperature and humidity. To maintain the reliability of the equipment, be sure to remove the cause if they fluctuate violently.
- Note that leaving exits and entrances open during installation, or leaving open cable ducts whiles pulling cables, may result in condensation.

Revision Information

- Title : ProSafe-RS Installation Guidance
- Manual No. : TI 32P01J10-01EN

Nov. 2020/15th Edition
1.8 Compliance with Marine Standards
■ Marine Standard-compliant ProSafe-RS Components [Added S2SC70☐ (with S2CP471), SSC60☐ (with S2CP471), S2CP471, S2BN1D-☐9, A2BM4. Deleted YCB146 and YCB128.]
■ Installation of Ferrite Cores for Vnet/IP [Added S2CP471.]

July 2020/14th Edition
1.2 Control Room Environment
■ Conformity Standards [Added ECAS-Ex Type "n"]

May 2020/13th Edition
1.2 Control Room Environment
Installation Specification [Note for S2LP131 was deleted.]
3.5 Connecting Signal Cable
■ Process I/O Signal Connection [Note added]

Mar. 2020/12th Edition
Introduction Updated descriptions of trademark.
3.2 Connecting Power
● Sleeve Terminal Processing [Table for sleeves was revised.]
3.5 Connecting Signal Cable
● Pressure Clamp Terminal (for Pressure Clamp Terminal Block) (for terminal block, terminal board, and relay board) [Table for sleeves was revised.]
● Pressure Clamp Terminal, Spring Clamp Terminal (for N-IO Node) [Table for sleeves was revised.]
3.6.2 Signal Cable Connections
Table Signal Cable Connections for I/O Modules [Note of S2LP131 was revised.]
4. Installation Specifications
Table Maximum Current Consumption of I/O Modules [Note of S2LP131 was revised.]

Jan.2020/11th Edition
Introduction Updated descriptions of trademark.
1.2 Control Room Environment
■ Conformity Standards [Added C-tick Marking]

Nov. 2019/10th Edition
Safety Precautions Descriptions of symbols are revised.
1.5 Noise Countermeasures [Changed spark killer to RC network]
1.8 Compliance with Marine Standards
Table Marine Standard-compliant ProSafe-RS Components [Added S2CP471]
2.5.5 Installation Guideline for Cabinet (FIO)
Table Number of Nodes to Be Installed and Need to Install Fans [Changed SSC60☐-F to S2SC70☐-F]
3.4 Power and Ground Cabling
Figure Example of N-IO Node devices Installation and grounding wiring [Revised]
Figure 19-inch Rack-mount Devices and Wiring [Revised]
3.6.3 Connecting Signal Cables to I/O Modules
■ Connecting Signal Cables to Analog Input Modules [Added how to connect Three-wire transmitter]
3.8 Connecting Bus Cable [Removed CP461 and CP451 from the figures]
4. Installation Specifications
■ Durability of Parts [Added S9450FE, Deleted A1159EM]

Mar. 2019/9th Edition
1.2 Measurement Categories [Updated the description of safety standard.]
Conformity Standards [Updated the description of safety standard.]
1.5.1 Examples of Spark-killer and Diode Installation [Added note *2.]
1.8 Compliance with Marine Standards [Added ENV3 to LR.]

Table Marine Standard-compliant ProSafe-RS Components (1/3) [Added the description of S2BN1D.]
Precaution on Installing Components [Add explanation.]
Figure Wiring for power cables [Updated the figure.]
Figure Locations of Ferrite Core Installation for Input/Output Modules, Terminal Boards and Relay Boards [Added note *2.]
When Leaving a Large Space between Unit Components [Added the specification of EMI shielding gasket.]
2.5.6 Installation Guideline for Rittal cabinet for N-IO [Updated the specification for cabinet.]

Jan. 2019/8th Edition
1.2 Control Room Environment
■ Conformity Standards
● Application Standards [Notes on surge immunity are changed]
● EMC Conformity Standards [Notes on surge immunity are changed]
1.5.2 Countermeasures against Static Electricity [Arrangement Information of wrist straps and conductive sheets are deleted]
1.7 Corrosive-gas Environment Compatibility
■ Outline of G3 Environment Compatibility [Contact information for environmental diagnosis is deleted]
2.2 Unpacking
IMPORTANT [Contact information for Condensation is deleted]

Oct. 2018/7th Edition
Front page ProSafe-RS Logo change
Safety Precautions Revision of logo mark description
1.2 Control Room Environment [Add note]
1.7 Table G3 Environment-compatible Products[Add A2BM4]
2.5.3 DIN Rail Mountable Devices [Add A2BM4 and S1XEU4D]
2.5.4 Wall Mountable Devices [Add A2BM4]
2.5.6 Figure Example of Mounting an SCU for N-IO and N-IO Nodes in a Cabinet is revised
Example of Mounting an SCU for N-IO and N-IO Nodes in a Cabinet (In case of field wiring via terminal board) is added
Example of Mounting N-IO Nodes (Non-Intrinsic Safety Barrier) in a Cabinet (In case of field wiring via terminal board) is added
3.1 Cables and Terminals [Add A2BM4]
3.4 Power and Ground Cabling [Add S2BN1D and A2BM4]
3.5 Connecting Signal Cable [Add description for field wiring]
[Add A2BM4]
3.7.2 Base Plate [Add S2BN1D-□9□□□ and note]
[Add figure of A2BM4]
3.7.3 Base Plate for Barrier [Clerical error correction]
4. Installation Specifications [Clerical error correction]

Mar. 2018/6th Edition
1.2 Control Room Environment ["ground" is change to "grounding"]
1.3 Notes for the field power supply unit of N-IO is added.
1.5.1 Eamples of Spark-killer and Diode Installation [Title is changed]
1.8 S2LP131 is added.
2.5.3 Figure Mounting stopper to the DIN rail is revised.
2.5.6 Example of Mounting an SCU for N-IO and N-IO Nodes in a Cabinet
[Mounting conditions are corrected.]
Example of Mounting N-IO Nodes (Non-Intrinsic Safety Barrier) in a Cabinet
[Mounting conditions are corrected.]
Example of Mounting N-IO Nodes (Intrinsic Safety Barrier) in a Cabinet
[Mounting conditions are corrected.]
3.5 Figure Area for Signal Cable from Field is revised.
Figure Example of Node Interface Unit and I/O Unit Cable Wiring (Cabinet) is revised.
Figure Example of Node Interface Unit and I/O Unit Cable Wiring (Junction Box) is revised.

Nov. 2017/5th Edition
1.2 S2LP131 is added.
1.7 S2LP131 is added.
1.8 Clerical error correction.

2.3 Notice for storage is added.
3 Figure of SBM54D is revised.
3.6.2 S2LP131 is added.
4. S2LP131 is added.
Clerical error correction.

June 2017/4th Edition
1.2 Safety Standards [CSA] is revised.
1.8 Clerical error correction.
3.2 Clerical error correction.
3.5 Clerical error correction.
3.8.3 Notice for N-ESB bus is revised.

Apr. 2017/3rd Edition
1.2 Clerical error correction.
1.5.1 Example of spark-killer installation for N-IO is added.
1.7 S2MDV843 is added.
1.8 S2MDV843 is added.
3.2 Clerical error correction.
3.7 S2MDV843 is added.
Clerical error correction.

Oct. 2016/2nd Edition
Safety Precautions [Symbol definitions were revised]
Symbol Marks of this Technical Information [Symbol marks were chaged]
1. System Installation Requirements
1.2 Control Room Environment
Installation Specification [Alt. 3000m was added]
Applied Standards
EMC Conformity Standards [The errors on notes were corrected]
Standard for Hazardous (Classified) Locations [Standards were added]
Marine Standards [DNV GL was added]
Installation Environment Specifications
Table Installation Environment Specifications [Alt. 3000m was added]
1.8 Compliance with Marine Standards [DNV GL was added] [N-IO models were added]
Table Marine Standard-compliant ProSafe-RS Components
[The suffix code limitation was added to AVR10D]
2. Transportation, Storage and Installation
2.5 Installation
2.5.3 DIN Rail Mountable Devices [Models were added]
2.5.4 Wall Mountable Devices [Mounting method of S2BN4D was revised]
[Grounding method was revised]
2.5.6 Installation Guidelin for Cabinet (N-IO) [Section was added]

Introduction

This document is a guide to the security countermeasures that can be used to protect the production control system from threats and reduce the risks for assets related to production activities. In this document, risks and measures are explained in generalized terms as much as possible, and the security control techniques are explained and referenced to industry standard models.

To cope with the growing threats, this guide will be revised as necessary. Also, there are other documents for each product to describe the detailed implementation procedures.

Target Products

This document is written for the following system products. However, the general explanations can be used for other equipments and software products.

- Integrated Production Control System — CENTUM VP
- Safety Instrumented System — ProSafe-RS
- Network Based Control system — STARDOM
- Plant Resource Manager — PRM
- Paper Quality Measurement and Control System — B/M9000 VP
- Solution-Based Software Packages
  - OPC Interface Package — Exaopc
  - Plant Information Management System — Exaquantum
  - Operation Efficiency Improvement Package — Exapilot
  - Event Analysis Package — Exaplog
- SCADA Software — FAST/TOOLS

6.3 Maintenance 6-4
6.4 Measures against Software Vulnerability 6-5

1. Quick Start

First we will show the outline of the network configurations of the system for which this document is written and the sections where each configuration is described in this document. Please use this part as a navigator to the contents of this document.

Outline of the configuration

Chapter 2 : Necessity for Security

In this chapter, the outline of the environment surrounding the production control system is shown. The assets that should be protected by security measures and examples of security risks will be explained.

Chapter 3 : Security Standards and Certifications

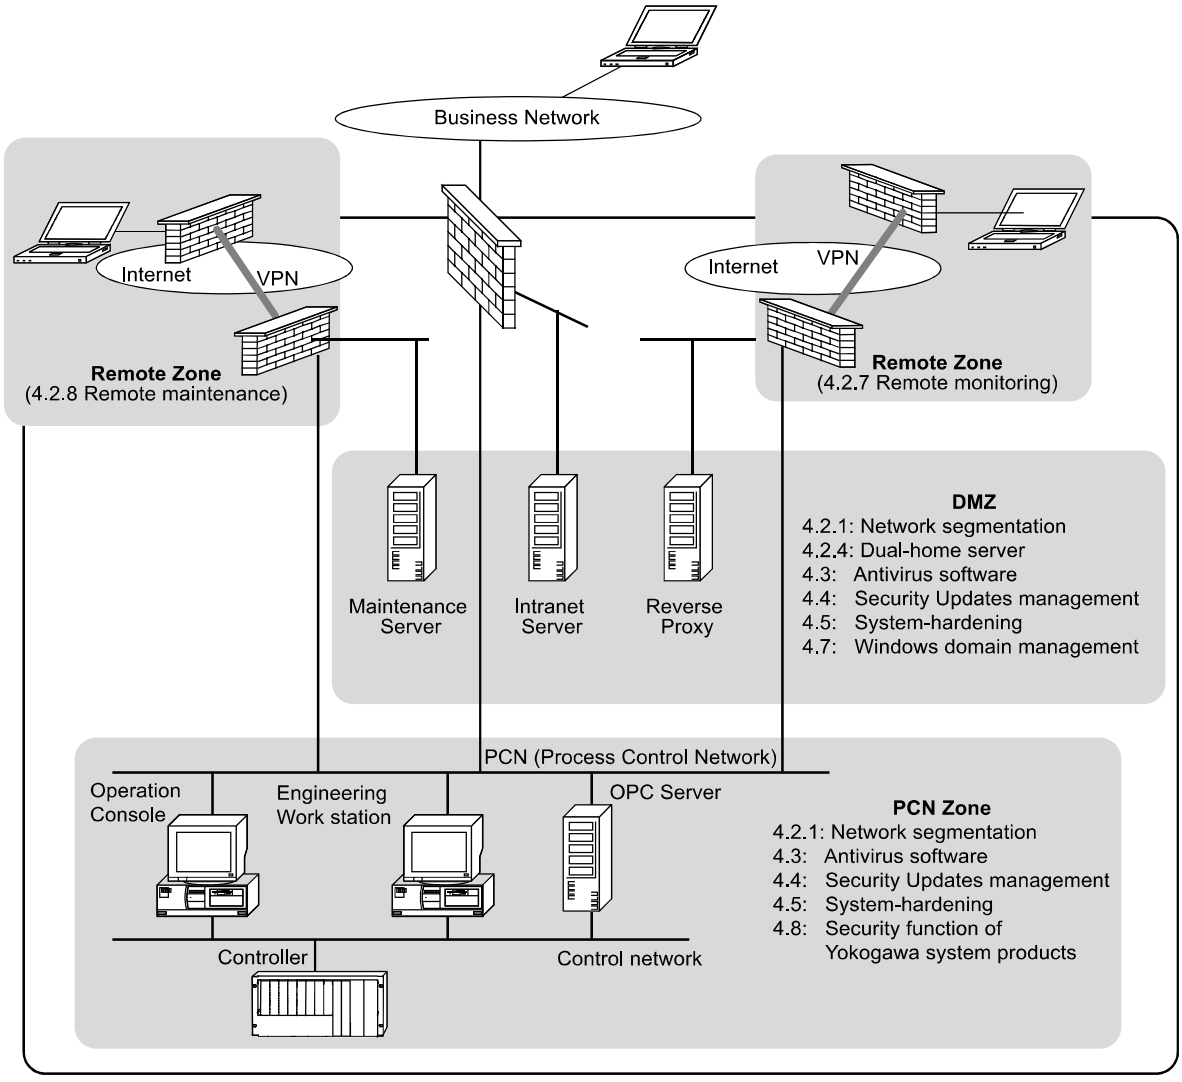
In this chapter, frameworks and standards are explained when security measures are applied to IACS (*1).

*1: IACS is an abbreviation for “Industrial Automation and Control System(s).” It is a generic name for industrial control systems,and it consists of control systems such as DCS, SIS, PLC, SCADA, networked electronic sensing, and monitoring diagnostic systems. This term is often used in security related documents for control systems.

Chapter 4: Security control

The main theme of this chapter is technical security measures. Please see “Figure Outline of the system” for the description and its actual application to the system configuration.

Chapter 5: Physical protection



In this chapter, the consideration of physical protection of instruments is explained.

Chapter 6: Business continuity plan

In this chapter, we provide the users with information about what is to be planned for the time when the security incidents should happen and result in damages.

4.9: Staff Security Policy

5: Physical Protection

6: Business Continuity Plan

Glossary

The following table describes the terms commonly used in this document.

Table Glossary terms(1/2)

Term	Description
ANSI	Abbreviation for “American National Standards Institute.”
CSMS	Abbreviation for “Cyber Security Management System.” It is modified from ISMS for control systems. It is standardized by ISA99 (to IEC 62443).
DCS	Abbreviation for “Abbreviation for “Distributed Control System.” In Yokogawa products, CENTUM VP falls under this category.
DMZ	Abbreviation for “Demilitarized Zone.”
DoS	Abbreviation for “Denial of Service.” It is an attack that sends a large (meaningless) service connection request to various servers such as Web server, FTP server, mail server, etc., increases the load on the server, causes the server to go down due to overload, or hinders in services for other legitimate users.
EDSA	Abbreviation for “Embedded Device Security Assurance.” It is a certification program for control devices. Originally, it was a certification program based on ISA99 by ISCI, and called as "ISASecure EDSA certification. It is now proposed as IEC 62443-4.
ENG	Engineering Station of CENTUM VP.
FCS	Field Control Station of CENTUM VP.
HIS	Human Interface Station of CENTUM VP.
HMI	Abbreviation for “Human-Machine Interface.”
IACS	Abbreviation for “Industrial Automation and Control Systems.” It is a term used in ISA99 and IEC 62443, and it means a generic expression for industrial control systems. It includes DCS, SIS, PLC, SCADA, SBP. Moreover, advanced control solutions, manufacturing execution system (MES), etc. are included.
ICS	Abbreviation for “Industrial Control System.” This term is used in NIST, etc. It is the same meaning as PCS in this document.
IEC	Abbreviation for “International Electrotechnical Commission.”
IPS	Abbreviation for “Intrusion Prevention/Protection System.” It is a real-time system that detect an intrusion to networks or servers, defends by cutting off connections, informs administrators, and outputs logs. The one that has an intrusion detection function only is called "Intrusion Detection System (IDS)."
ISA	Abbreviation for “International Society of Automation.” Originally, it was "Instrument Society of America," but changed to "The Instrumentation, Systems, and Automation Society" in 2000. Moreover, it has changed to the current name in 2008.
ISA99	It points to ANSI/ISA-99 series "Security for Industrial Automation and Control Systems." It was called ISA-SP99 before. At present, ISA-99 is unified to IEC 62443. In accordance with this situation, its ISA number has changed from ISA-99 to ISA-62443.
ISCI	Abbreviation for “ISA Security Compliance Institute.” It is a subordinate organization of ISA, and specialized in security.
ISMS	Abbreviation for “Information Security Management System.” It is organized security measures for general information systems. It became an international standard as the ISO/IEC 27000 series.
NIST	Abbreviation for “National Institute of Standards and Technology” in USA.
NMS	Abbreviation for “Network Management System.” It manages network devices and network information (IP address, port connection information, circuit information, etc.), and grasps the operating situation and an omen of disorder in real-time.
OPC	Abbreviation for “Open Productivity & Connectivity.” At first, it was used as an abbreviation for "OLE for Process Control," but it was changed to the current name in 2008.
PCN	Abbreviation for “Process Control Network.” A control bus used by DCS and SIS. This term is defined in this document.
PCS	Abbreviation for “Production Control System.” It includes DCS and SIS. This term is defined in this document.
PLC	Abbreviation for “Programmable Logic Controller.” In Yokogawa products, FA-M3 falls under this category.

Table Glossary terms (2/2)

Term	Description
RAS	Abbreviation for “Remote Access Server.”
SBP	Abbreviation for “Solution-Based Package.” In Yokogawa products, Exa series software falls under this category.
SCADA	Abbreviation for “Supervisory Control and Data Acquisition.” In Yokogawa products, FAST/TOOLS falls under this category.
SCS	Safety Control Station of ProSafe-RS.
SENG	Safety Engineering Station of ProSafe-RS.
SIS	Abbreviation for “Safety Instrumented System.” In Yokogawa products, ProSafe-RS falls under this category.
VPN	Abbreviation for “Virtual Private Network.”

2. Necessity for Security

Along with the recent advancement in network and information technologies, latest production control systems have adopted open technologies used in information systems, such as OS and communication protocols. It is an accelerating factor for establishing close connections between information systems and production control systems.

On the other hand, in this kind of open environment, production control systems are targeted by malicious attackers represented by computer viruses and others that cause hazardous incidents.

Nowadays, security threats aimed at production control systems are increasing by malwares (i.e. worms, viruses, Trojan horse, etc.) and appearance of Advanced Persistent Threats (APT) (i.e. targeted attacks).

In order to operate industrial plants and factories in safe and stable conditions, it is inevitable to protect the plants' production equipment.

The assets to protect

Followings are examples, but not limited to, of the important assets related with the activities of production.

Examples of data assets

- Production schedules information
- System configuration
- Application configuration
- Tuning parameters for control
- Recipes information
- Audit trails information

Example of instrument assets

- Engineering work stations
- Operator consoles
- Controllers
- Field instruments
- Network devices

Example of human and environmental assets

- Employees
- Factories and plants
- Natural environment

When the security of the assets mentioned above is threatened, it will lead to:

- the confusion and interruption of the production activities
- the leakage of the confidential information such as recipes that may affect the production activities
- the damages to human beings
- the destruction of factories and plants
- the destruction of the environment

Such consequences can bring a lot of harm to the enterprises.

The goal of the security measures is to protect such assets from the threats and to help the enterprises reduce the risks of losing property.

TIP

The standard of "ISA 99.00.01-2007: Security for Industrial Automation and Control Systems, Part 1: Terminology, Concepts, and Models" is referenced by this document. Hereinafter, this standard will be referred to as ISA 99.00.01

TIP

In ISA 99.00.01 standard, the Asset-Based criteria have defined what assets to be protected and the Activity-Based criteria have defined the activities. These criteria are referenced by this document.

TIP

Moreover, this document consults "ANSI/ISA-99.02.01-2009: Security for Industrial Automation and Control Systems: Establishing an Industrial Automation and Control Systems Security Program," and standards/draft of "ISA/IEC 62443." Security related information that is opened to the public on the Internet is referred too.

3. Security Standards and Certifications

In the industrial control system, various standards have been independently established for each industry and region in the past. However, the adoption of open technologies such as UNIX / Windows and Ethernet has led to common problems such as security vulnerabilities.

ISA (International Institute of Measurement and Control), which is mainly based in the United States, has been addressing this problem from an early stage. As a security standard for production control systems (DCS, PLC, SCADA), standardization began as ISA SP 99 in 2002. After that, the ISA 99 was compiled as a security standard that supervises the control system (= IACS) including not only a single control device, but also the surrounding IT equipment and MES (Manufacturing Execution System).

Meanwhile, IEC (International Electrotechnical Commission) was independently aiming to formulate standards related to the security of industrial control systems. However, it has not progressed quite easily, and the whole industry has become an era to strongly demand security standards. Therefore, IEC 62443 was enacted in a form to incorporate the preceding ISA 99 almostly.

Conversely, the ISA side also changed the ISA 99 to ISA 62443 in a form adjusted to the IEC number. Therefore, now it is becoming written as ISA/IEC 62443.

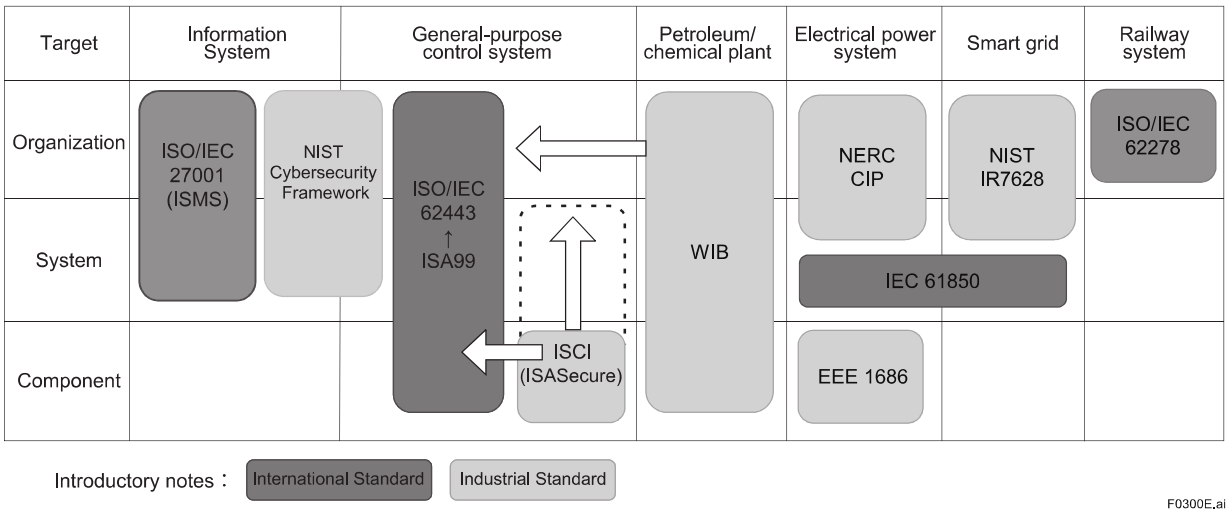

Figure International/Industrial standards for IACS

This chapter introduces the overview of the standards related to the security of industrial control systems. Because the security related information changes quickly, the contents of this document may not be up-to-date. Organizations involved in industrial control systems are constantly required to observe their trends and to respond to the times.

3.1 ISMS

The threats to the information system are increasing day by day and one after another new threats are emerging. Therefore, the security measures need to be reconsidered all the time. This program is called Information Security Management System (ISMS). It is a management framework for an information system based on the risk assessment. In this chapter, the procedures to construct ISMS for operational organizations of the information system is explained.

The following procedures are taken to construct ISMS.

- Organization of the security committee
- Identification of the assets
- Identification and evaluation of the threats
- Identification and evaluation of the vulnerability
- The evaluation of the risks
- Design and implement of the security measures
- Examination and enforcement of system change management
- Continuous monitoring and revision

SEE ALSO ISMS became an international standard as ISO/IEC 27001. For more details, refer to the Web site below:

https://www.iso.org/isoiec-27001-information-security.html

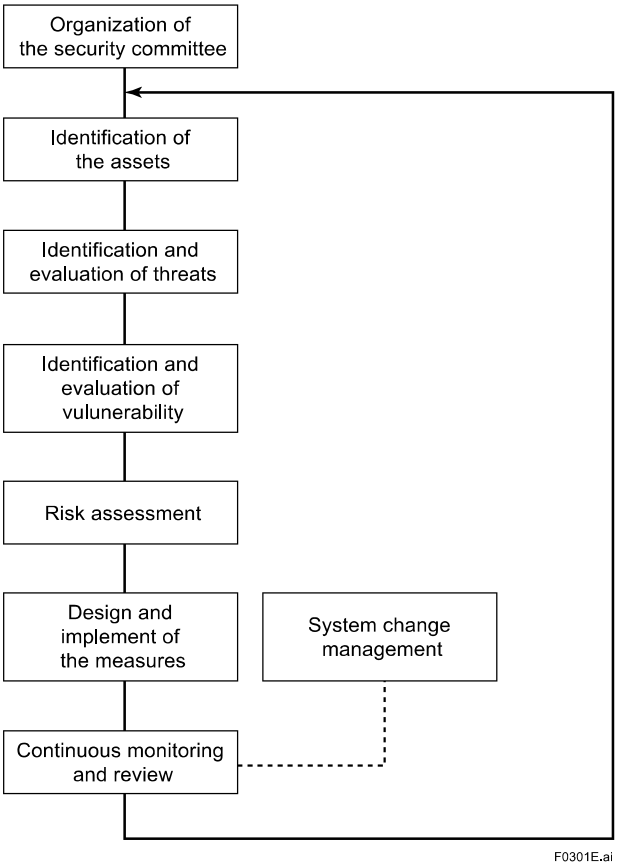

Figure Procedures to construct ISMS

Organization of the Security Committee

The security committee is the leading organization of the activities of ISMS. Please take notice of the following when it is organized.

Commitment of management

The objective of the security committee is to protect the assets of enterprises. That means that the management is responsible for this. In addition, it is necessary to get the collaboration of everybody involved in the production activities in order to enforce efficiently the security measures. Therefore, the management should express their opinions about the security activities clearly.

The management should commit itself to the security committee and take the initiative.

The cross-functional organization

The security committee consists of the representatives of all the divisions involved in the production activities. For example, we can assume an organization with the following divisions.

- Production division
- Production control system management division
- IT system management division
- Business management division
- Maintenance division

Identification and Evaluation of the Assets

The purpose of this phase is to list all the assets to be protected, identify the asset owners and evaluate the value of each asset. The assets with larger value have the higher criticality. In chapter 2, an example of assets to be protected is described.

Followings are the examples how the criticality of the assets are classified.

- Criticality A : Very High
- Criticality B : High
- Criticality C : Low
- Criticality D : Very Low

Identification and Evaluation of the Threats

Here, we need to make clear the potential threats to the assets listed above.

In identifying the list of threats, it is necessary to think from the following points of view.

Illegal access to the assets by the people with malicious intent, the people are:

- Those inside the enterprise
- Those outside the enterprise
- Those hacking around by way of networks
- Those having chance to physically access the assets (Who can perform direct operation and enter the area where the assets are placed.)

- **Illegal access to the assets by the software with malicious intent**
  - By way of networks
  - By way of removable media

- **Incidental illegal access to the assets caused by mistaken or careless operations**

  The level of possible occurrence of the identified threats will be evaluated.

  The example of the classification of this will go as follows.
  - Level A: The possibility of its occurrence is high.
  - Level B: The possibility of its occurrence is moderate.
  - Level C: The possibility of its occurrence is low.

Identification and Evaluation of Vulnerability

The purpose of this phase is to identify the vulnerability of each asset, also to identify the vulnerability of each equipment of the asset. The term “vulnerability” means the situation or condition that threats can affect the assets.

The followings are examples of the vulnerability.

- Incompleteness of the security measures or their implementations
- Incompleteness of the enforcement procedure or the procedure documentation
- Incompleteness of the security committee organization
- The lack of physical protection
- Incompleteness of Firewall settings placed on the border of the network to be protected against the external networks
- Inadequate virus definition files or engine of antivirus software (Non-updated Virus definition file or engine)
- Incompleteness of the Security Updates (Non-updated Security Updates)
- Incompleteness of backups (The system is not backed up.)
- The lack of understanding to PCS (process control system) and it’s operational environment
- The lack of the awareness of security among the people such as operators

Risk Assessment

In this phase, the risk of each asset or each instrument housing the assets is evaluated.

The risk is shown as below:

Risk = Threat x Vulnerability x Consequences

By doing risk-assessment, you can clarify the priority of the security measures. In risk assessment, the consequences are estimated such as loss of business by the stop of system function, and the expense for restoring from the damage of the production control system. By the degree of these quantitative consequences, the priority of each measure needs to be determined. Then, you can clarify which part should need concrete measures, considering which measures have to be taken over which risk, or which risk is tolerable.

However, consequences may include the damages to environment and human being, and the damages to public confidence to the enterprise. Therefore sometimes it is difficult to estimate the consequences as uniform operation loss of money.

Design and Implement of the Measures

In planning the security measures for production control system, it is necessary to make the security policy that regulates the rule of the security management. The actual security measures should be designed or selected along this rule.

Security policy

The security policy is made to regulate how the security of production control system can be managed. The followings are the examples of security controls that should be included in the security policy.

- User ID management
- Password management
- Connection to business network
- Remote access
- Computer virus
- Media management
- Physical protection
- Education, training

Notes about the measures

There are many cases where the technique or customs developed in IT systems are applied to the security measures for the production control systems. However, production control systems have different characteristics from those of IT systems, so it is necessary to take them into consideration in making the measures. We will show the differences between IT systems and production control systems as follows.

Availability

High level availability is required for production control systems. In IT systems, some operations are made on the assumption of reboot, but in case of production control systems, uninterrupted operation is most common.

Real-time ability

Real-time ability is important for production control system. For instance, it is necessary to respond quickly to the operations from HMI and so on. It is also required to make a stable throughput as well as a real time response to the data-collections and setting requirements from the upper level systems.

Consideration of Security Updates and anti-malware software

Since the high level availability and real-time ability are required for production control system, it is necessary to check the Security Updates and anti-malware software updated beforehand and consider the application, the means and timing of update for them to a large extent.

● Priority of Availability, Integrity and Confidentiality

When considering the security objects in the Production Control System, the availability of system, network, endpoint equipments such as controller and PC should have the first priority. Another important security object is integrity of data used by Production Control System. If there is loss of integrity, the reliability of production control is reduced. Finally it is possible to cause a safety problem. Also, production management may not function correctly by the loss of correct data, and the excessive cost concerning the opportunity loss and restoration may occur. Moreover, availability of system and network may be affected by loss of the data integrity. Therefore, it is very difficult to determine the priority between availability and integrity.

On the other hand, when considering the confidentiality of data and information of Production Control System, the confidentiality generally has lower priority than other two security objects. However, consideration on confidentiality may be important. User ID and the password of the production control system can flow on the network; and if they are sniffed, an attacker can attack the system as an authorized user.

■ System Change Management

It is a very important element to decide the procedures of System change management in order to keep the system secure. Whatever addition or change may be made, it has to be done in such a way as to maintain the availability, real-time ability and the degree of security. For this purpose, when some additions or changes are made, it is necessary to decide the procedure of System change management, such as going back to the first step and repeating the whole procedure from the identification of the assets to risk assessment, and to carry it out.

Apart from the addition, deletion and replacement of hardware and software, the followings are regarded as system changes, but not limited to.

Changes in settings of network devices

Changes in the settings of network devices such as in switches, routers or firewalls.

Security Updates

Before the applying the Security Updates, it is necessary to make sufficient tests.

Operation

After the construction of ISMS and the application of the security measures to the system, the system begins to operate. In this section, we will explain the activities to carry out in the phase of operation.

Organization of the team for the incident

In the operation phase, it is necessary to organize the team that will play the major role in handling the incidents.

This team takes the responsibility for the followings.

- Evaluation of the consequences caused by the security incident and the influence upon the production activities. These consequences include the damages upon health, safety, environment and public confidence.
- Inquiry into the cause and the planning and enforcement of the measures to prevent such an incident from happening again.
- Restoration of production control system from the incident.
- Gathering information on the latest threats and incidents

The procedures to take care of the incidents must be planned as a business continuity plan. This topic is explained in the chapter 6.

Daily monitoring of the system

Daily monitoring is done so as to detect the illegal access to the system in operation. The log information on the following instruments will be monitored, but not limited to.

- Monitoring log of the PC component
- Access control log of firewall
- Monitoring log of network monitoring device
- Detecting event of IPS (*1) if IPS is installed.

*1: Intrusion Prevention/Protection System:
This is a system to detect hackers to our network and/or server and to protect our system by blocking unauthorized connection, notifying a system manager and outputting logs in real time.

We will describe the monitoring of the systems in detail in Chapter 4.6.

Regular auditing

The system in operation is regularly audited to check if the settings are appropriately defined and managed. The information on the settings of the following instruments will be audited, but not limited to.

- Network devices: Information on routing control devices such as routers or switches.
- Security devices: Access control rules of firewall, detecting rules of IPS.
- System hardening of PC components: Setting information of personal firewall of PC components and the like.
- Software in use: Installations of application software to PCs are controlled, and all software is configured appropriately.

3.2 CSMS

CSMS Overview

Regarding the management and operation of information systems, application of information security management (ISMS) by ISO/IEC 27001 is common. However, regarding IACS, a mechanism of security management that takes into consideration its characteristics and properties is required. Therefore, security management for IACS based on ISMS was formulated and standardized as ISO/IEC 62443-2-1.

In Japan, as the CSMS (Cyber Security Management System for IACS), the world first certification system was built.

In ISMS, the outflow of information to be protected is a problem, and Confidentiality, Integrity, Availability are often emphasized in the order of “CIA”. But CSMS cited interruptions in operation as the most avoidable situation, focusing on the order of “AIC” and characterized by considering HSE (Health, Safety & Environment).

SEE ALSO For CSMS, please refer to the following web page.

https://isms.jp/csms/doc/JIP-CSMS120E-10.pdf

CSMS Program

CSMS is introduced and operated in the following procedure.

- Initiate CSMS program
- High-level risk assessment
- Detailed risk assessment
- Establish security policy, organization and awareness
- Select and implement countermeasures
- Maintain the CSMS

Target Organization of CSMS

CSMS certification means that the target organization establishes a security management system for the construction and operation of IACS and objectively evaluates the suitability and effectiveness by a third party.

The following companies are subject to CSMS.

- Organization that own control systems (asset owners)
- Organization that handle the operation and maintenance of control systems
- Organization that develop control systems (system integrators)

3.3 NIST

NIST Cybersecurity Framework

The National Institute of Standards and Technology (NIST) published “Framework for Improving Critical Infrastructure Cybersecurity” in February 2014. It is mainly written for enterprises engaged in important infrastructure, but it can be fully utilized by other organizations. It is also called “CSF” and its use is expanding abroad.

This framework classifies cyber security measures into five functions, “Identify”, “Protect”, “Detect”, “Respond”, “Recover”, and shows these functions in 23 categories.

Table NIST Cybersecurity Framework

Functions		Categories		Subcategories	Informative References
ID (Blue)	Identify	ID.AM	Asset Management	. . . .	. . . .
		ID.BE	Business Environment		
		ID.GV	Governance		
		ID.RA	Risk Assessment		
		ID.RM	Risk Management Strategy		
		ID.SC	Supply Chain Risk Management		
PR (Purple)	Protect	PR.AC	Identity Management and Access Control	. . . .	. . . .
		PR.AT	Awareness and Training		
		PR.DS	Data Security		
		PR.IP	Information Protection Processes and Procedures		
		PR.MA	Maintenance		
		PR.PT	Protective Technology		
DE (Yellow)	Detect	DE.AE	Anomalies and Events	. . .	. . .
		DE.CM	Security Continuous Monitoring		
		DE.DP	Detection Processes		
RS (Red)	Respond	RS.RP	Response Planning	. . . . .	. . . . .
		RS.CO	Communications		
		RS.AN	Analysis		
		RS.MI	Mitigation		
		RS.IM	Improvements		
RC (Green)	Recover	RC.RP	Recovery Planning	. . .	. . .
		RC.IM	Improvements		
		RC.CO	Communications		

Each category is further divided into several sub categories, and 108 sub categories in total. Measures are not very detailed and it have not mentioned any technical means.

In the informative references, links to other standards etc. related to each sub category are shown.

SEE ALSO For more information about NIST Cybersecurity Framework, please refer to the following Web page.

https://www.nist.gov/cyberframework

3.4 ISASecure

ISASecure is a security certification system developed by ISCI (ISA Security Compliance Institute), a lower-level organization of the United States-based industry association ISA (International Society of Automation). ISASecure is integrated into IEC 624434.

ISCI prepares certification programs for each subject to be certified. EDSA (Embedded Device Security Assurance) certification for control devices, SSA (System Security Assurance) certification for control systems, and SDLA (Security Development Lifecycle Assurance) certification for development process.

SEE ALSO For information about ISASecure's authentication, please refer to the following Web page.

http://www.isasecure.org/en-US/Certification

Embedded Device Security Assurance (EDSA) Certification

EDSA focuses on the security of embedded devices of control systems. There are three levels of certification level, and the level becomes higher in order of level 1 → 2 → 3.

EDSA has the following three tests.

- Functional Security Assessment (FSA)
- Software Development Security Assessment (SDSA)
- Communication Robustness Testing (CRT)

Yokogawa CENTUM VP and ProSafe-RS controllers have obtained EDSA certification.

http://www.yokogawa.com/pr/news/2014/pr-news-2014-20-en.htm

http://www.yokogawa.com/pr/news/2014/pr-news-2014-02-en.htm

https://www.isasecure.org/en-US/End-Users/ISASecure-Certified-Components

System Security Assurance (SSA) Certification

SSA is an authentication program for a specific subset of the control system developed by ISCI.

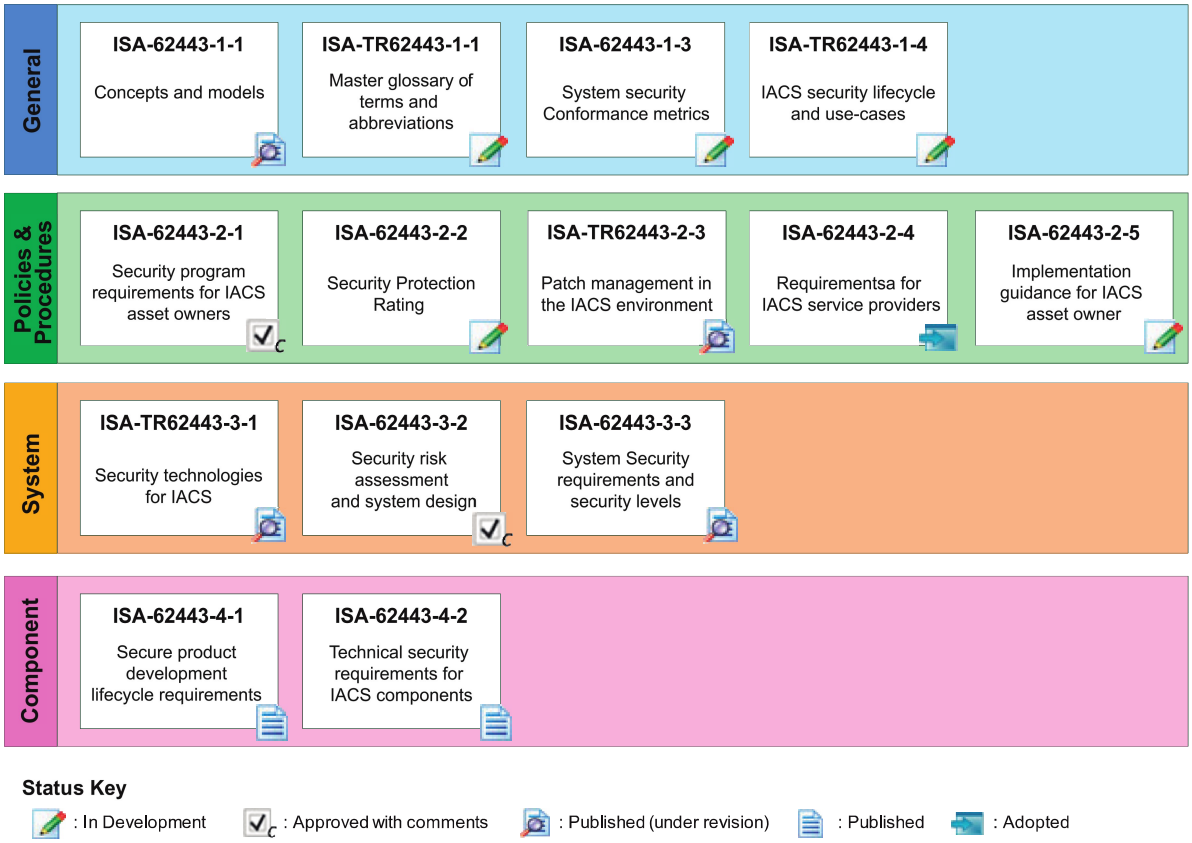
- Security Development Artifacts for systems (SDA-S)
- Functional Security Assessment for systems (FSA-S)
- Functional Security Assessment for embedded devices (FSA-E)
- System robustness testing (SRT)

Security Development Lifecycle Assurance (SDLA) Certification

SDLA is a program to evaluate the secure product development life cycle for suppliers of industrial control systems. Depending on the level of development life cycle, it is certified with four levels (ISASecure SLDA levels 1 to 4).

3.5 ISA99

ISA99 Overview



ISA99 is a security standard for Industrial Automation and Control Systems (IACS) formulated by ISA described in section 3.4. Recognizing that comprehensive security measures are necessary for IACS has been in the 1990s. However, depending on the end user and system / equipment provider, and the country and regional differences, the essential requirements were different.

Therefore, it was difficult to formulate internationally unified standards. Meanwhile, the US led the way to establish security standards as ISA. That is ISA99.

The ISA99 was eventually to be incorporated into IEC (International Electrotechnical Commission) 62443 as an international standard. Then, the ISA side changed the number from ISA-99 to ISA-62443 in accordance with the number of the IEC.

ISA-62443

As mentioned above, now ISA99 changed ANSI/ISA-62443 has been developed together with IEC 62443. ISA-62443 is not yet complete as it is trying to encompass various security measures. The figure below shows the outline of ISA-62443 as of 2019.

F030501E.ai

Figure ISA-62443 Overview

SEE ALSO For more information about ISA 99 (ISA/IEC 62443), refer to the following Web page.

https://www.isa.org/isa99/

3.6 IEC 62443

IEC 62443 Overview

As mentioned in Section 3.5, IEC 62443 is a standard created based on ISA99. Although the contents are almost the same, the requirement of WIB which was not found in ISA99 was imported as IEC 62443-2-4. In addition, it is being rewritten from the following point of view as being an international standard.

- Terms and language usage are being revised to make it easier for people who are not English native speakers.
- Consideration is given to operations in organizations with different situations in various countries and regions, and expressions are widely generalized.

Table IEC 62443 Overview

Category	IEC No.	Edition	Type	Title	Publication date
General	62443-1-1	1.0	Technical Specification	Terminology, concepts and models	2009-07-30
Policies and Procedures	62443-2-1	1.0	International Standard	Establishing an industrial automation and control system security program	2010-11-10
		2.0	(in preparation)	Security program requirements for IACS asset owners	–
	62443-2-2	1.0	(in preparation)	IACS protection levels	–
	62443-2-3	1.0	Technical Report	Patch management in the IACS environment	2015-06-30
	62443-2-4	1.1	International Standard	Security program requirements for IACS service providers	2017-08-24
System	62443-3-1	1.0	Technical Report	Security technologies for industrial automation and control systems	2009-07-30
	62443-3-2	1.0	(in preparation)	Security risk assessment and system design	–
	62443-3-3	1.0	International Standard	System security requirements and security levels	2013-08-07
Component	62443-4-1	1.0	International Standard	Secure product development lifecycle requirements	2018-01-15
	62443-4-2	1.0	International Standard	Technical security requirements for IACS components	2019-02-27

As of 2019, IEC 62443 has not been completed yet. Items in various states, such as those under formulation, those under voting, or those under revision.

For this reason, it is important for organizations involved in IACS to constantly observe their trends and take actions in line with the times.

Related Standards and Certifications

WIB Certification

WIB is an international organization of end users in the process industry, mainly in the Netherlands and Belgium. This WIB summarizes the security requirements for the supplier of the control system and it is subject to certification as "Achilles Practices Certified Solutions" by WurldTech Inc. of Canada (now under of GE digital). This is what we call WIB certification.

Yokogawa's CENTUM VP and ProSafe-RS have obtained this WIB certification.

https://www.ge.com/digital/applications/achilles-practices-certified-solutions

WIB certification is incorporated into IEC 62443-2-4.

Achilles Certification

In the world of IACS, "Achilles certification" usually means "Achilles Communications Certified Products". This is the CRT for ISASecure EDSA authentication described in Section 3.4.

Yokogawa's CENTUM VP and ProSafe-RS and STARDOM controllers have acquired this Achilles certification.

https://www.ge.com/digital/applications/achilles-communications-certified-products

4. Security Control

This chapter explains how the security controls protect the production related assets from the threats. The security countermeasures for production control system should be examined, designed, operated and evaluated while the process safety and physical defense are simultaneously taken into consideration.

4.1 Basic Strategy

It is necessary to consider the basic strategy we will describe in this chapter when carrying out the actual security control.

Risk Definition

Risk is defined by a formula as follows.

Risk = Threat x Vulnerability x Consequences

Threat is a potential attack over the system vulnerability. And risk means the potential damage or loss that is caused by the attacks over the vulnerability. Therefore, the measures to reduce risks can be categorized as follows.

- Removal of vulnerability
- Restriction of use
- Control of attack
- Mitigation of consequences

Each security control explained in this chapter corresponds to these measures.

Security Zone

ISA99.00.01 defines security zone as a logical or physical group which share common security requirements and the same security level. By making the multiple zones where each zone satisfies different security requirements, defense-in-depth strategy can be realized. The security controls are explained in this chapter, and these security controls should be designed based on the concept of zone.

Defense-in-depth strategy

Threats to information system are under daily evolution. What is more, the threats can happen not only in the external networks like business networks, but also on PCN (Process Control Network), which is an internal network. We have to get armed with the defense-in-depth strategy.

As shown in the figure, by defense-in-depth strategy, we mean the protection measures composed of more than one security control to protect the assets. By the use of this kind of multi-layer measures, another layer will protect the assets even if one layer is destroyed, so the assets are protected more firmly.

Network boundary security

It is a contact point between control network and an external network such as a business network, and it prevents the external threats from entering control networks.

vInternal network security

It tries to decrease the consequences of the threats occurring on the control network as much as possible. For instance, it divides the control network into multiple zones, and constructs the network in order not to allow the damages in one zone to affect other zones.

End point security

It is a measure for excluding the vulnerability of end point and increasing the strength of the security. For example, it applies Security Updates to PC, and excludes the security hole.

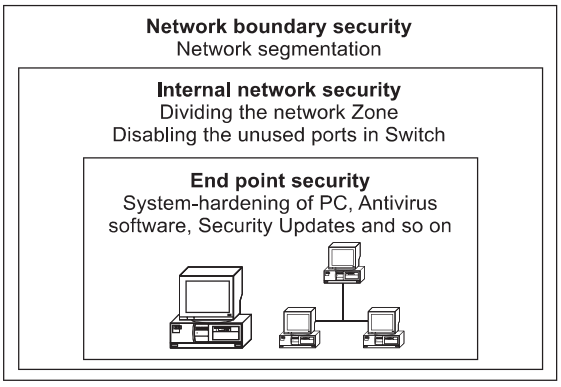


Figure Defense-in-depth strategy

Deny-all strategy

Deny-all strategy is a strategy that allows only the minimum accesses and prohibits the others. Security control with deny-all strategy makes it possible to protect the assets firmly, for it does not permit more accesses to the assets than necessary and it limits the space for illegal accesses to the least. It is necessary to take it into consideration, especially when enforcing the access control rule of firewall or system hardening of PC components.

4.2 Network Architecture

A secure network configuration is explained for connecting a Production Control System (PCS) with an external network such as a business network.

4.2.1 Network Segmentation

Segmentation of networks is the basis of security control. There are two types of segmentation, vertical and horizontal.

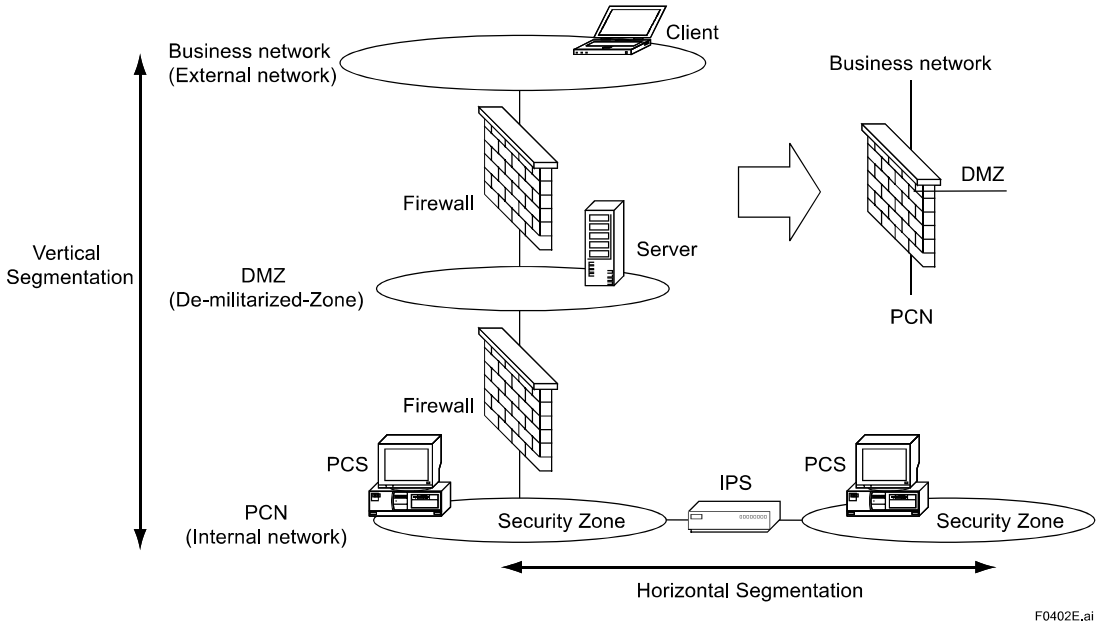

Figure Network segmentation

TIP

In terms of logic, the configuration of DMZ is supposed to be a network protected by two firewalls, as shown in the figure. However, it is usually only a single firewall with three or more network ports.

Vertical segmentation

In the vertical segmentation, the network is divided into the following three segments. Among the segments, the passage of network traffic is controlled and the threats from external networks are excluded. The access from business network is possible only to the servers on DMZ, and it is not possible to access PCN directly. In addition, it can conceal the PCS addresses from client on business network. That is, the vertical segmentation is for protecting the PCN from external networks such as business networks.

Business network

This is an external network on which the clients that may access the data of production control system are connected. This segment belongs to Level 4 of ISA 99.00.01 Reference Model.

DMZ (De-Militarized Zone)

The servers that directly communicate with the clients are placed in this zone. The servers placed here communicate with both PCS and the clients. DMZ is a buffering area placed between PCN and business network. The servers on DMZ need to be firmly fortified with the antivirus software and Security Updates, for the servers may be directly accessed from the external networks. This segment is located between Level 4 and Level 3 of ISA 99.00.01 Reference Model.

PCN (Process Control Network)

PCN is an external network that the production control system is connected. The devices placed here can not be accessed directly from business networks. The data of PCS are passed to the business networks through the servers on DMZ, so it is not necessary to access PCN directly from the business networks. This segment belongs to Level 3 of ISA 99.00.01 Reference Model.

Horizontal segmentation

The internal network is divided into multiple security zones. For example, IPS (Intrusion Prevention/Protection System) is connected in between the 2 security zones, and filters out the illegal traffics that run between the security zones. By dividing PCN into security zones, it is possible to prevent other security zones from the threats of worms that occurred in one security zone.

SEE ALSO For notices about constructing IPS, refer to “4.6.2 IDS/ IPS”.

4.2.2 Classification of Devices Composing the System

The devices are placed in different segments according to the following classification.

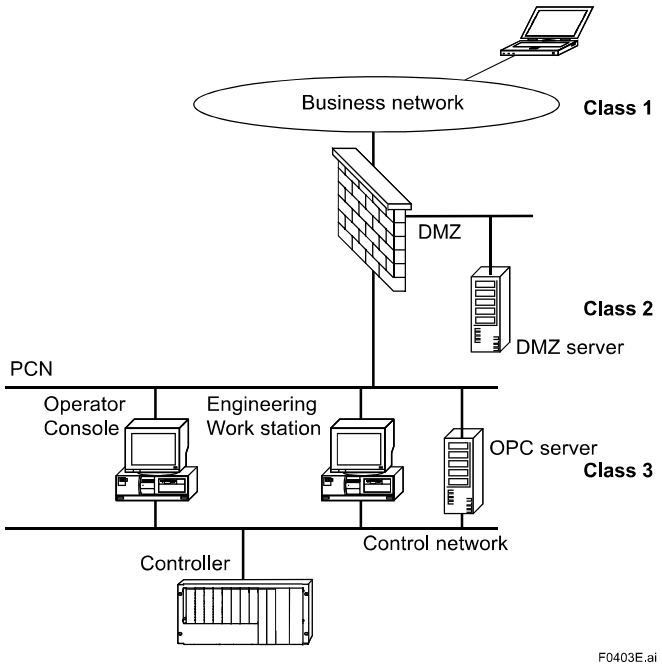

Figure Equipment class

- **Class 1: Computers connected on business network (external network)**

  The computers in this class are connected on a business network and access the data on the PCS via a server in the DMZ. This computer is usually managed by the information system department in an enterprise.

- **Class 2: DMZ server**

  The servers in this class are used for publishing the data of PCS to the computers of Class 1. It communicates with both the clients on the business network and the PCS connected on PCN. That is, the server obtains the data by accessing PCS and publishes the data to the devices of Class 1. The servers used for publishing the virus definition files or Security Updates are also classified in this class.

- **Class 3: PCS (Production Control System)**

  The devices of this class do not communicate directly with computers on the business network. The PCS devices belong to this class. They are not directly accessed from the business network.

Classification is based on the consequences of a security incident. The devices that are closer to the process have the higher priority, because the consequences are more serious. In this classification, Class 3 has the highest priority.

4.2.3 Access Control by Firewall

A firewall can restrict the communications of the three network segments to a minimum level. Moreover, applying a deny-all strategy can block all communication traffics except those permitted. (*1)

*1: It is called “Cleanup” and is specified at the end of Access Control Rule.

Port (service), IP address control

With a firewall, external accesses to the servers on the open segments, and the accesses to the control devices on the internal segments (control system segment) from the servers on the open segments are restricted to a minimum level so that only the permitted accesses are allowed.

More over, a firewall generally hides itself from the outside so that the accesses to firewall are prohibited. (*1) Therefore, the access control rule should be configured comprehensively by permitting only the necessary accesses from/to the specific sources/destinations and the accesses through the designated communication ports (or identified by the specific service names).

*1: It is called “Stealth”, for it conceals the firewall. As an exception, only the communications from the administrator console that manages the firewall need to be permitted.

DoS (*1) defense

The features of firewalls vary with firewall types. Some types of firewalls are able to defend against the DoS attacks by temporarily restricting the number of TCP connections. Applying this feature would protect the DMZ servers from the DoS attacks that would make them overloaded.

*1: Denial of Service attack: It is a kind of attacks by sending a large amount (meaningless) of service connection requirements to servers such as Web servers, FTP servers, Mail servers and so on, to make the servers overloaded and block the services to the legal users.
It is expanded to Distributed Denial of Service (DDoS) that attacks all at once from multiple places by using third party computers as a stepping-stone.

IP Spoofing (*1) defense

Restricting the network addresses from all the segments can defend against IP spoofing attacks. It can also repel the illegal packet sent from an outsider but disguised as if it were from an internal network address.

Therefore, the addresses permitted for each segment should be defined to the firewall so that only the packets with the permitted addresses can enter the segment.

*1: IP Spoofing: It means creating and sending packets with false IP addresses of the senders in order to conceal the origin of attackers. When the server receives a packet from the outsider but the packet is disguised with an internal network address, the server may assume the packet is from an address of an internal sender and relay the packet in the internal network. Because the sender is not insider, the server may fail when tries to respond. Many DoS attacks are taking advantage of this mechanism.

4.2.4 Dual-Home Server

It is not recommended that the dual-home servers (*1) for both Ethernet and Control bus be placed in DMZ. As an alternative, the dual-home server can be placed on PCN and place a reverse proxy server (*2) in DMZ.

The reverse proxy server will take the requirements from the business networks and then, pass them to the dual-home server on PCN.

*1: Dual-Home Server: a server with two or more network interfaces.
*2: Reverse Proxy Server: a proxy server to relay demands for a particular server. Every access to this particular server goes through this proxy server.
Regular proxy relays access from internal network to external network. Reverse proxy, on the other hand, relays access from external network to internal network.

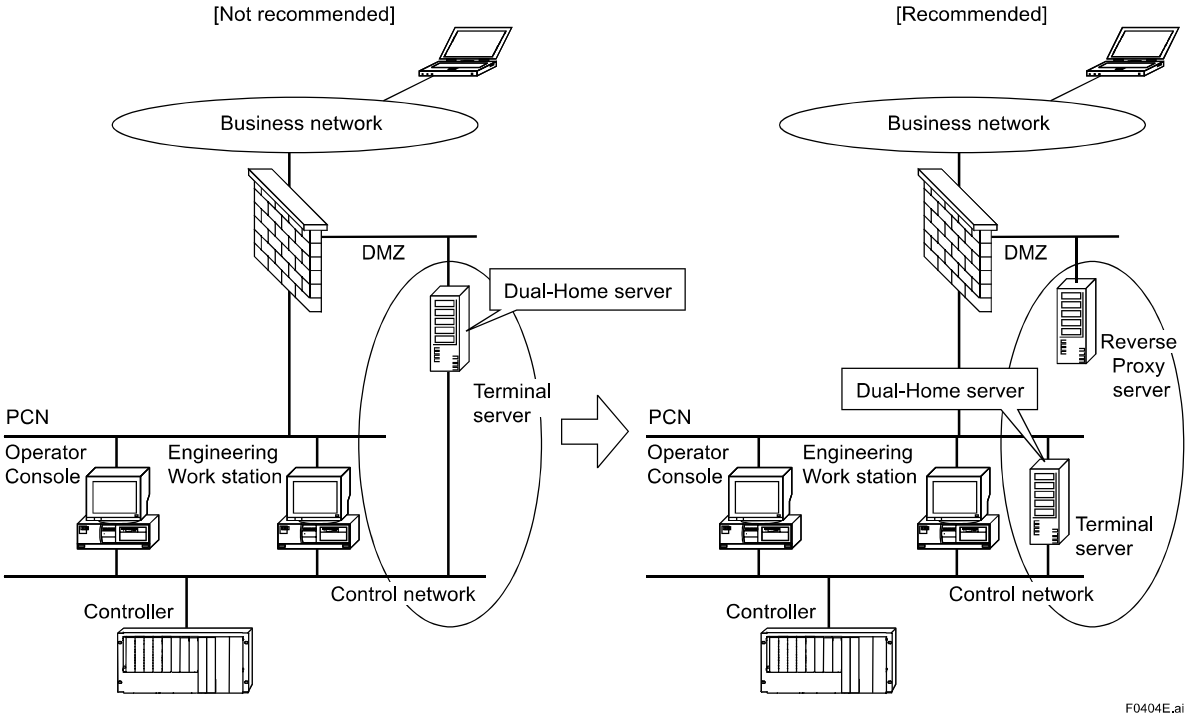

Figure Dual-Home Server

In the recommended example in the right-hand side, the terminal server is placed as a dual-home server. The applications, such as the operator console applications, are running in the terminal server. Via reverse proxy server in DMZ, it is possible for the users in the PC placed on business network to display and operate the applications running in the terminal server.

4.2.5 OPC Interface

This configuration shows that a user on a PC located on the business network can display and operate the OPC client applications by using a terminal server. The terminal server is used because the reverse proxy server can not be directly used to route to the OPC server. The terminal server is placed in PCN, and OPC client is running in the terminal server PC. OPC server is placed as a dual-home server, and it is connected to both of PCN and control network.

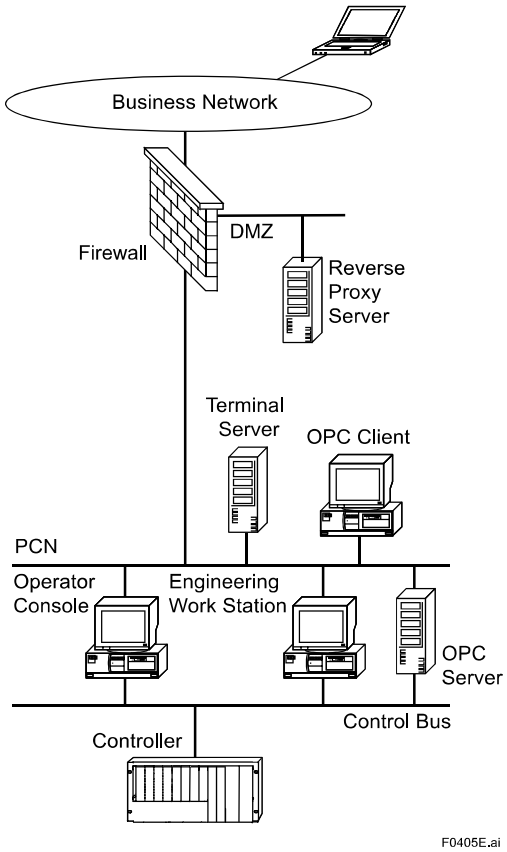

Figure Example of OPC interface configuration

By this configuration, it is possible to display and operate the OPC client applications via a Reverse Proxy Server in DMZ from the PC of business network, while the OPC client applications are running in the terminal sever of PCN.

4.2.6 Application of Wireless Networks

In this section, we will explain the security of wireless network.

Wireless LAN (IEEE 802.11)

These days, the use of wireless LAN of IEEE 802.11 series has been increasing rapidly. It became widely known to the public as “Wi-Fi” and now used in private and business environments.

In control systems, the cases have been increasing where the fieldsmen using the mobile terminals to access PCN through the wireless access points located in the company premises. The characteristics of wireless LANs increase the security risk that an outsider may use an over-the-counter wireless card for illegal access from the locations wherever the wireless transmission reaches. Moreover, outsiders may sniff the communication, tamper with the data,or hack the system by using tools such as the War driving (*1) tool.

Therefore, when wireless LANs are connected with PCN, it is necessary to take care of the following points.

*1: War driving: It is a means of cracking technique to seek for the access points of wireless LAN, moving by car in the streets lined with office buildings.

Connection of access points

Do not connect access points with PCN directly, but connect it with DMZ, and control accesses to PCN with firewall.

Authentication of terminals

It is necessary to register MAC addresses of terminals which are allowed to be connected so that to prevent the illegal terminals from getting connected. If an unauthenticated terminal is connected, the network will be threatened by the illegal usage. Moreover, it is nearly impossible to detect illegal wireless access such as wireless sniffing.

The setting of ESSID (*1)

Set the ESSID of access points and prohibit “Any connections”.

*1: ESSID: The network identifier of wireless LAN of Extended Service Set Identifier IEEE 802.11 series. It can prevent any terminals other than those with the same identifier as ESSID from accessing the access points. When “Any access” is permitted, the terminals with any ID can be connected.

Encryption

It is necessary to encrypt communication data by using WPA (*1).

*1: WPA is an encryption standard developed by the Wi-Fi Alliance to protect wireless LANs. It overcomes the weaknesses of the WEP encryption that was used and strengthens network security.
Moreover, WPA2 which is improved from WPA adopts Advanced Encryption Standard (AES), so weak points of WEP and WPA are all relieved. However, vulnerabilities of WPA2 were publicly disclosed on October, 2017. Thus, updating for the revised program is required when using WPA2.
Incidentally, WPA3 that solved the vulnerabilities of WPA2 fundamentally will be released to the public in the latter half of 2018.

The system-hardening of access points

It is highly recommended to harden the access points with the following preventions so that they can be concealed from the scanning of access points such as War-driving.

- Disable the broadcast of ESSID (Beacon signal).
- Disable the response to a probe request.

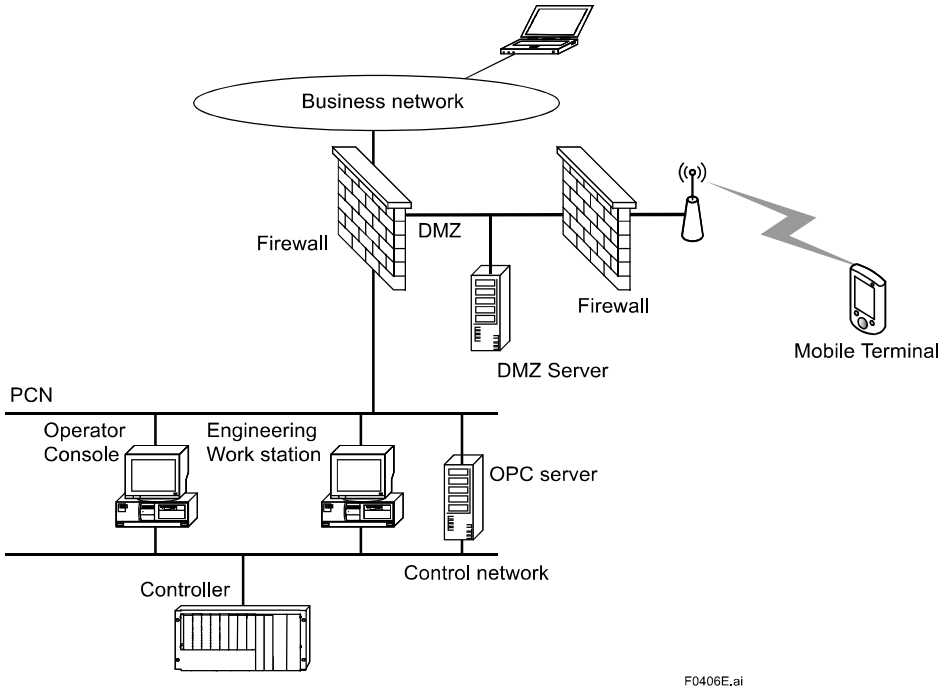

Figure Example of Wireless Network Configuration

Wireless application to control bus

When you extend the control channel of Vnet/IP or HSE (High Speed Ethernet) of STARDOM with a wireless network, you need to pay attention to the following points.

- The available band width will be restricted. (11Mbps - 54Mbps)
- The state of electric wave easily gets deteriorated because of the obstruction of electric wave and rainfall
- When the state of electric wave gets deteriorated, the performance in the band width will be lower.

In addition, control the accesses with a L3 switch and apply access points so that only the communications between the two domains connected with each other can be relayed.

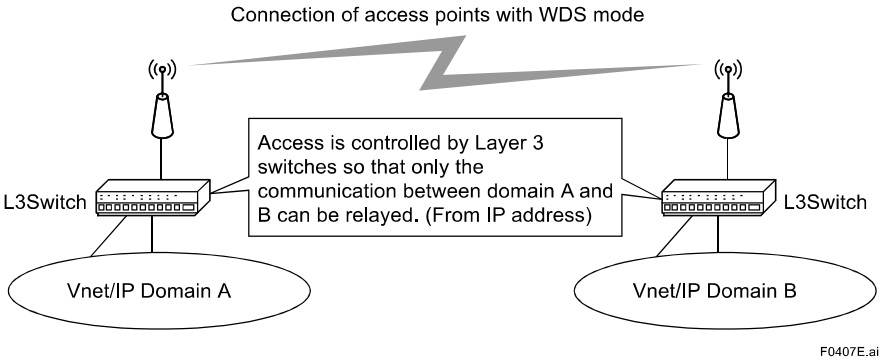

Figure Example of the configuration of the extension of Vnet/IP control channel

Field wireless (ISA 100.11a)

Field wireless networks compliant with ISA 100.11a are highly relaible in ensuring the safety of production sites and the security of information. They take care of concerns such as message confidentiality (encryption, authentication, access control), message integrity, and network availability.

You can obtain a higher level of security by implementing the following measures when building a system that handles field wireless devices.

Basic measures

- Completely separate the network for control system usage from that for field wireless usage.
- Control access by installing a switch between ISA100 gateway (*1) and computers.
- Set up firewalls for both the system and ISA100 gateway and build a VPN between them to connect to the Wide-area Universal Field Network (*2).

*1: A device that connects to the field wireless and the wired Ethernet. The Yokogawa product “YFGW710 Field Wireless Integrated Gateway” is an example of such a device.
*2: A system that uses monitoring devices such as CENTUM to monitor the process data of wireless devices by passing through the ISA100 gateway in a wide area network. It may pass through open IT networks on the way, reducing reliability and real-time performance.

Additional measures for higher security

- Separate the network for control system usage from that for field wireless usage even if they are at the same security level, and set up a firewall between the networks. (horizontal integration)
- Set up a firewall between all layers. (vertical integration)
- Install the PRM Field Communication Server on two different computers. One is for CENTUM while the other is for field wireless.
- The Field Wireless Configurator and Field Wireless Management Tool are also installed on different computers.

The following figure shows an example of a field wireless system configuration that takes security into account.

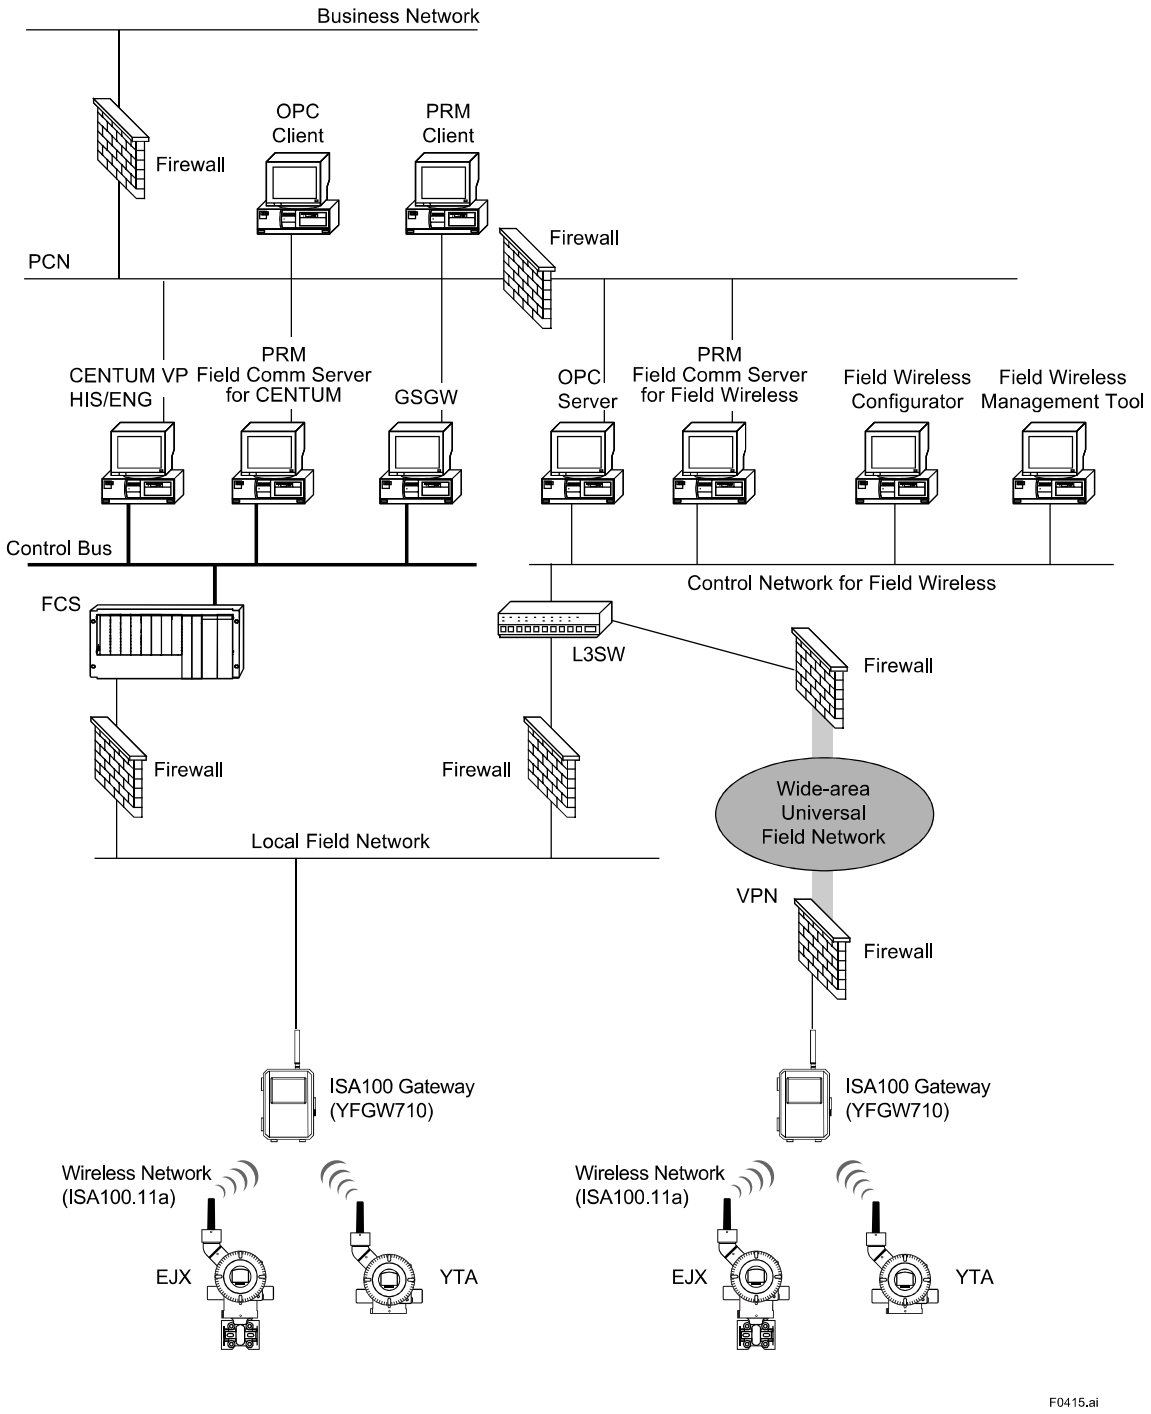

Figure An example of a field wireless system configuration with consideration for security

4.2.7 Remote Monitoring

We will explain the configuration of remote control networks for the physically remote- located clients through the terminal server.

Wide area network

The communication route for remote monitoring between the remote clients and the local firewall, the wide area network provided by the public communication services will be used.

The wide area network could be:

- Digital dedicated line
- Dial-up connection by ISDN (*1)
- Closed network (IP-VPN (*2), Wide-area Ethernet (*3) and the like)
- Internet

Although a dedicated digital line is a recommended option from the viewpoint of security and the quality of network transmission, it is not economical.

Internet is economical, since the inexpensive high speed Internet connections are available, but it has such disadvantages as unstable network quality and insufficient network security.

*1: ISDN: Integrated Services Digital Network
It is one of the telephone networks, such as analogue line network, mobile-phone network and PHS network. In using it in dial-up as a data communication line, it can be used as 64kbps or 128kbps line.

*2: IP-VPN
It signifies the Virtual Private Network constructed by way of Wide area IP communication network owned by public communication services. The use of IP-VPN makes it possible to operate remotely separated networks as if they were directly connected by LAN. The actual network consists of a large number of routers connected with one another.

*3: Wide area Ethernet
It is a wide area communication network provided by some public communication services, combining switching hubs (layer 2 switches) used in Ethernet. It is possible to construct VPN environment where only the contracted points are connected by Ethernet like IP-VPN. In case of IP-VPN the only protocols that can relay are IP protocols, but in the wide area Ethernet, it is possible to use various protocols, not just IP.

WAN that can constitute a close network is recommended.

(Digital dedicated line, IP-VPN, Wide area Ethernet and so on.)

In connection through internet, it is necessary to construct VPN tunnel between the points where Client is set and the plant.

We will cite the example of the configuration of network through IP-VPN network and Internet.

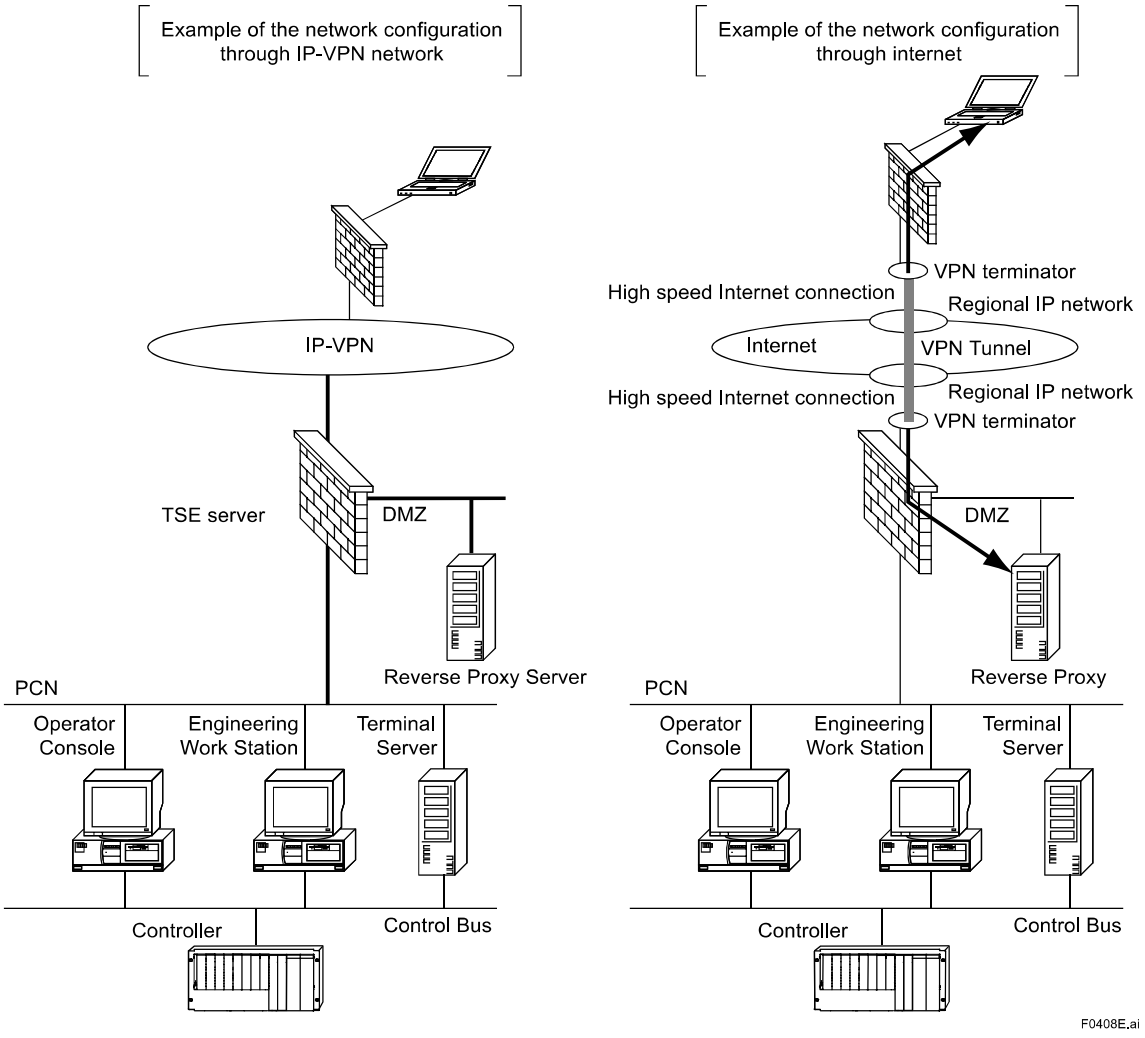

Figure Example of the configuration of remote monitoring network

Personal authentication

In remote monitoring system, sometimes, there is necessity for identifying a person to operate and monitor the plant as well as restricting his access rights to the specified devices.

In this case, a reverse proxy server that capable of authenticating the remote users for accessing the PCN should be applied. An example configuration of the system is shown below.

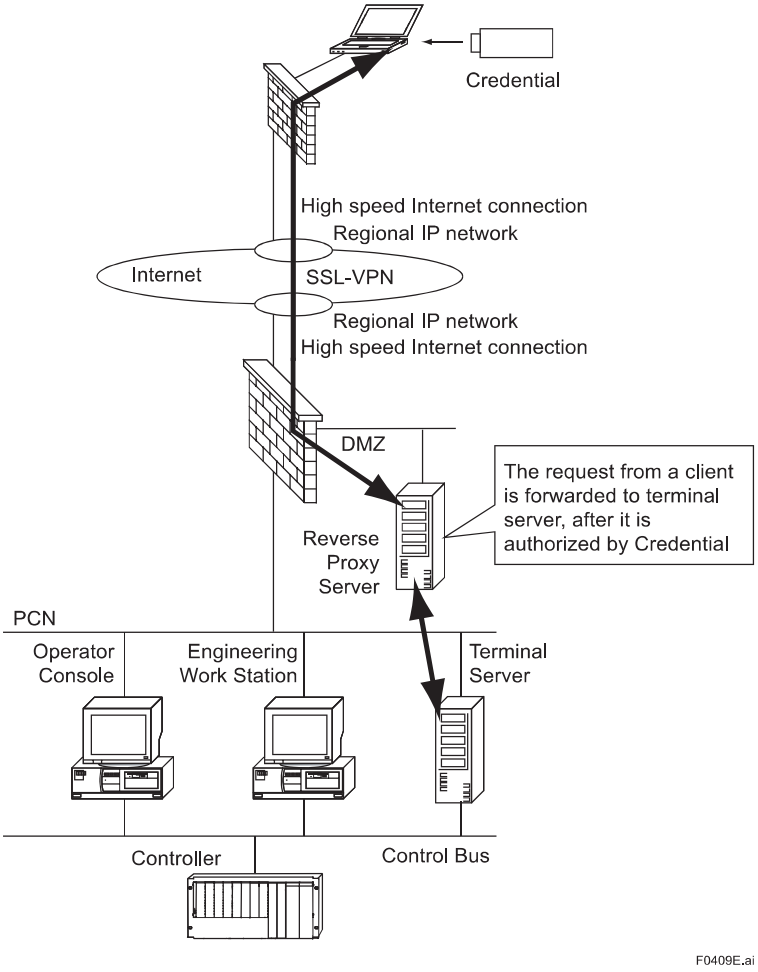

Figure Example of Personal Authentication

Before operation and monitoring, a user is authenticated between a client and the Reserve Proxy server based on individual credential. If the authentication is successful, the Reverse Proxy server will relay the request from the client to the terminal server.

The communication between the clients and the Reverse Proxy server is encrypted by SSL-VPN (*1).

*1: SSL-VPN : SSL-VPN is a technique to realize VPN, by using SSL (Secure Socket Layer), an encrypting protocol, widely used in internet. Since it is not necessary to install special software in the side of Client, unlike IPSec, it is widely used in the remote access environment of the enterprises.

4.2.8 Remote Maintenance

The remote maintenance through modem refers to the situation that a production control device or a network device vendor is using the telephone line or internet to establish the connection to access PCN for maintenances.

In a system like this, PCN can be accessed by through the telephone network or public line like internet. If there are any vulnerability in this system, it will open a backdoor (*1) to PCN, so that the PCN will be exposed to the threats of security.

*1: Backdoor: a backdoor which enables hacking.

Remote maintenance through modem

If a remote access environment or the remote access to PCN is established by using modem, the access route will bypass the protection of the firewall. Consequently, the remote access environment will not be secure, the remote access route will be the backdoor to PCN and the production control system will be exposed to the threats of security.

When constructing the environment for remote maintenance by use of modem, security should be obtained by the following measures.

- **Use of RAS (Remote Access Server)**

  Make sure that every remote access to PCN be made via RAS. A remote access protocol such as PPP (point to point protocol) that authenticates all the remote access connections between a remote PC and RAS should be used.

- **Use of callback**

  After the authentication with RAS, if it turns out to be a previously registered client, the client will get a callback.

- **Authentication by using the caller ID**

  By using a modem that have the caller ID feature with the phone number, only the calls of the previously registered phone numbers can be accepted. Also it is possible to use the caller ID feature of RAS instead of the modem's authentication feature.

- **Modem management**

  Turn off the power supply of the modem or disconnect the telephone line from the modem unless the remote maintenance is necessary.

The system-hardening of RAS

- User management

  The user IDs of minimum required users should be registered in the maintenance server. Moreover, when there is a user change, registration of the user ID should be changed accordingly.

- Password management

  The password registered in RAS should be the one impossible to guess and should be changed regularly.

- Antivirus

  Harden RAS with antivirus software and get it prepared for computer viruses. See the chapter 4.3 for more details.

- Security Updates

  Apply the latest Security Updates to RAS and exclude the security holes ever known. See the chapter 4.4 for more details.

For more descriptions about system-hardening, refer to the text on system-hardening in the chapter 4.5.

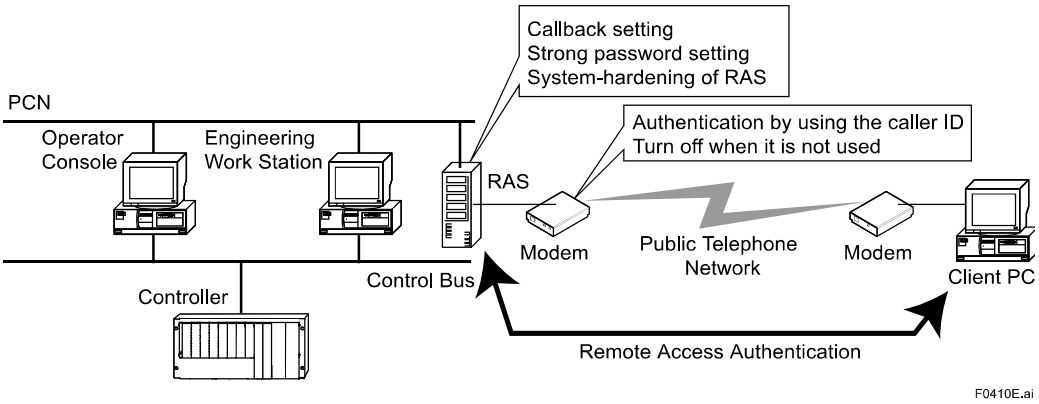

Figure Example of the configuration of remote maintenance by Modem

Remote maintenance through internet

When internet is used as a relaying line, PCN will be put in an environment where an unlimited number of people can freely access it. Therefore, it is important to enforce the security.

Security should be enforced with the following measures.

Internet VPN

For remote maintenance through internet, it is necessary to construct VPN between the two connected points.

Access control by firewall

The communication from outside should be restricted by firewall in accordance with the explanations in 4.2.3.

Maintenance server

Do not allow the remote maintenance terminals to access PCN directly but allow the access to PCN though a maintenance server set in DMZ.

The system-hardening of the maintenance server

- User management

  The user IDs of minimum required users should be registered in the maintenance server.

- Password management

  The password registered in the maintenance server should be the one impossible to guess and should be changed regularly.

- Antivirus

  Harden the maintenance server with antivirus software and make it robust against computer viruses. See the chapter 4.3 for more details.

- Security Updates

  Apply the latest Security Updates to the maintenance server and exclude the security holes ever known. See the chapter 4.4 for more details.

For more descriptions about system-hardening, refer to the text on system-hardening in the chapter 4.5.

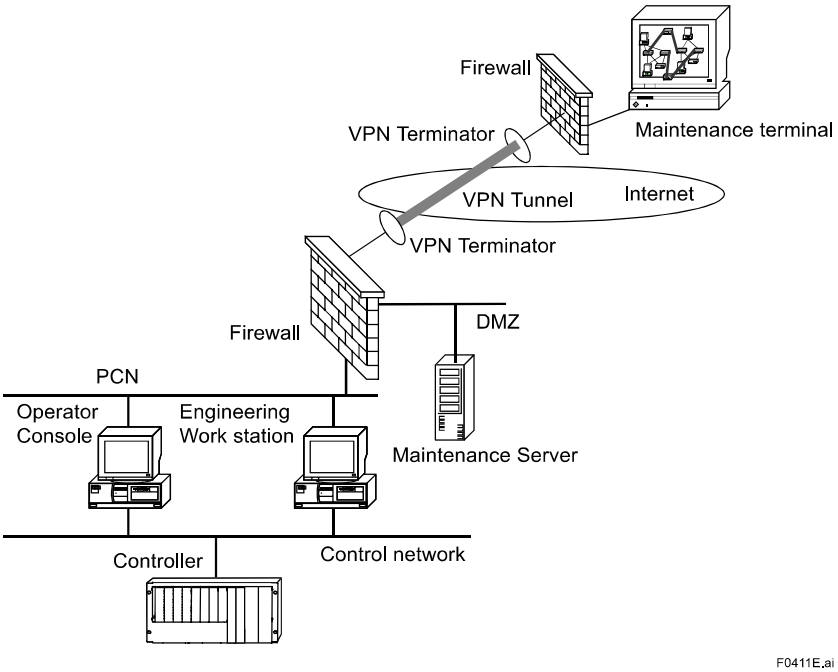

Figure Example of the configuration of remote maintenance via internet

4.3 Anti-malware Software

4.3.1 Antivirus Software

Antivirus software is effective as one of the countermeasures against malwares. Installation of antivirus software in Windows-based devices is strongly recommended, if those are components of a production control system, along with the following suggestions.

Applying antivirus software products

A production control system requires real time response and stable throughput to the operator actions via HMI and data acquisition by its supervisory systems. Due to its characteristics, antivirus software may have influence over performance of the PC.

Yokogawa has verified the performance of standard antivirus software in combination with Yokogawa's control system software.

SEE ALSO Yokogawa offers antivirus software as a fundamental solution. For more information, refer to:
Basic Endpoint Security solution (GS 43D02T30-05EN)

Environment of antivirus engine and virus definition file updates

When using antivirus software, it is most important to keep updating antivirus engine and virus definition files.

It is recommended to provide a server for updating these files in the DMZ, as accessing the external server for updating directly is vulnerable to the network configuration.

Daily management

In some cases, rebooting of a PC is required when a antivirus engine or virus definition file is updated. In other cases, the updating may bring an unexpected influence over operations of the PC. Therefore, a management procedure is required to verify if updating the antivirus engine or the virus definition file is safe before distributing them to all the PCs.

Prior confirmation

To reduce risks in conducting a prior confirmation, either one of the following measures can be taken.

- Use a system dedicated for testing. Then perform the test on the actual system.
- Conduct a test on one of the PCs in the actual system, and apply the tested updates to the rest after confirming that there is no problem.

4.3.2 Whitelisting Software

Malware inactivation

If only authorized programs are set to executable in advance, the execution of malware or unauthorized programs can be blocked. This is the malware inactivation by whitelisting method. This measure is most effective in reducing the security risk of PCs on which Microsoft Security Updates are not applicable or difficult to install. For more details, contact Yokogawa service window.

SEE ALSO Yokogawa offers antivirus software as a fundamental solution. For more information, refer to:
Standard Whitelisting Software for Endpoint Security (GS 30A15A30-01E)

4.4 Security Updates Management

Security Updates (Microsoft Security Updates) remove vulnerabilities known to Windows and protect production control system from unauthorized accesses and invasion by malwares.

Installing Security Updates

Yokogawa constantly investigates Microsoft Security Updates and conduct integration tests if those security Updates are relevant to Yokogawa products before offering. And Yokogawa let customers know the importance and priority of each security Updates.

For applying those Security Updates, it has to follow customers' security policies. Customers are to perform testing prior to applying those Security Updates considering the influences to the production control systems in advance.

Yokogawa suggests that all the applicable Security Updates must be applied to the control system as soon as possible. For installation of the Security Updates, please contact Yokogawa service department.

SEE ALSO For more information about security service, refer to:
Endpoint Security Service (GS 43D02T30-02EN)

Prior confirmation

To reduce the risk in applying Security Updates, ensure that those Security Updates works before those are applied to the PCs in the production control system.

To reduce risks, either one of the following measures can be taken in advance.

- Use a system dedicated for testing. Then perform the test on the actual system.
- Conduct a test on one of the PCs in the actual system, and apply the tested Security Updates to the rest after confirming that there is no problem.

SEE ALSO For more information about applying security Updates, refer to:
Basic Policy for Microsoft Software Updates (Including Security Patches) with Yokogawa ICSS Products (TI 33Y01B30-02E)

4.5 System-Hardening

System-hardening is explained here, to protect our system from hacking.

4.5.1 System-Hardening of PC Components

Assignment of passwords

The passwords used on the PC components are the information to prove that the user is an authorized user. If a password is leaked to an outsider, it may result in the illegal use or destruction of the data in the system. It is important to make some rules concerning the password management and to manage the passwords safely by obeying the rules.

The password policy is as follows:

- When setting a password, do not use an easily guessed password such as your name, your birth date or your telephone number.
- Change the password regularly.
- Do not tell your password to anyone but those concerned.
- Do not let anyone but those concerned take a glimpse of your password, when you are typing it.
- Do not write down your password on the paper.
- Contact the system administrator as soon as possible when you feel that your password may have leaked out.

We suggest using the following password policy in the PC components.

- The length of the password: 8 letters or more.
- The password must meet complexity requirements.

  A password must contain the characters from at least three (3) of the following types:

  English uppercase letters (A, B, ……., Z)

  English lowercase letters (a, b, ……., z)

  Westernized Arabic numerals (0, 1, ……., 9)

  Non-alphanumeric (special characters) such as punctuation symbols

Access control by personal firewall

A personal firewall helps decrease number of unauthorized accesses from external networks by restricting accesses to services on PC components.

The following personal firewall policy for PC components is recommended.

- Enable Windows firewall function
- Generate a list of services or TCP/UDP port numbers connected with outside, then register them on the firewall. If the scope (IP address and subnet) of the senders who ask for connections are already known, set the scope up.

The personal firewall settings are different by product.

SEE ALSO About Yokogawa's approach to the system-hardening of PC components, refer to "4.8 Security Function of Yokogawa System Products."

4.5.2 System-Hardening of Network Devices

Hardening network devices with defensive measures against malwares and unauthorized accesses is important. In this section, guides for system hardening for each network device are described.

Firewall

Firewall, a main device for a boundary security, is exposed to external networks and system hardening for it is of high importance. System-hardening of the firewall must be performed in the following manners:

Use a dedicated firewall

The use of a dedicated firewall is recommended for preventing the network from various troubles, rather than using a device with a firewall built with many other functions.

Administrator password

When assigning an administrator password, use one that cannot be easily guessed, by using the following rules:

English uppercase letters (A, B, ……, Z)

English lowercase letters (a, b, ……, z)

Westernized Arabic numerals (0, 1, ……, 9)

Non-alphanumeric (special characters) such as punctuation symbols

The administrator password must contain characters from at least three (3) of the above types.

Mnagement of Management Segment (*1)

Firewall needs a management console in order to set the access control rules or confirm the logs and alerts. Usually, the special tools are installed in PC or Web browsers are used. The management console can change the access control rules, so in order to prevent the illegal operations of the outsiders, it is necessary to put the management console in the environment where it is not possible to be accessed from the outside. The following measures should be taken.

- Make the independent segment for it and separate it from other segments.
- The settings in the firewall should allow only the operations from the designated management console.

*1 When the remote management service of the vender is used, these restrictions are not valid. In that case, the rules for the system requirements of the service should be followed.

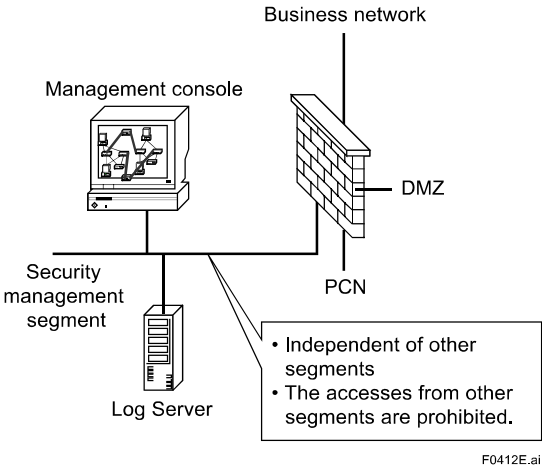

Figure Segment of security management

The restriction on network services

Only the services of minimal requirements should be allowed. Especially for the permissions on using ftp, tftp, telnet should be very careful. If they are not necessary, they should be blocked.

Management of the information on change in the setting

Set the firewall to remain the logs of all setting changes.

Software update

Update only the necessary software after confirming the release information of the vender and taking care of the security holes.

Switch

Recently, the intelligent switches are widely used. The settings of an intelligent switch can be changed through networks. Therefore, if this part is vulnerable, the devices connected to the switch will be exposed to the threats of illegal accesses. It is necessary to do the system-hardening of this part in the following way.

Disable the management via networks

The maintenance port should be used when changing the switch settings and stop the services like telnet or http so as to avoid the setting changes from the network.

Privileged password

When a user changes the settings of a switch, checking the password is the most common way for user authentication. Therefore a password that cannot be easily guessed should be set as the privileged password for changing the switch settings.

Port security

If the unused ports of a switch can be used freely, the danger of being connected by the unauthorized devices will exist. Do the followings on the switches with the port security features.

- Disable the unused ports.
- Check the MAC addresses to restrict the connection to the ports.

For a non-intelligent switch, such measures cannot be applied so that some physical measures should be taken to prevent the ports from the unauthorized accesses (for example, by installing the switch in a locked rack).

SNMP setting

Intelligent switches support SNMP. SNMP enables the network management tool to monitor the state of switches. It is possible to read and write the management information with SNMP by an outsider so that the following measures need to be taken to prevent the illegal operations.

- Restrict the communications of the switch to those with network management tools.
- Disable the setting change through SNMP. (Deny SET command)
- Set a community name that cannot be easily guessed. Treat it with the same care as a password.

Network monitoring device

Network monitoring device monitors the state of network devices such as the switches by using SNMP or Ping. The following measures should be taken.

Restriction on the accesses from the outside

If a network monitoring device is used to monitor the devices on PCN and DMZ, there will be no need to allow any access from the external network, so that the settings on the firewall should be set to block the outside accesses.

Restriction on network service

Only the services of minimal requirements should be allowed. Especially for the permissions on using ftp, tftp, telnet should be very careful. If they are not necessary, they should be blocked.

Wireless access points

Take the following measures to the access points so that they can be concealed from the scanning of access points by War-driving or other similar tools.

- Disable the broadcast of ESSID. (Beacon signal)
- Disable the response to the broad request.
- Assign an administrator password that cannot be easily guessed.

4.6 Monitoring the System and the Network

Day by day, the new vulnerability of OS or network service is found and the way of attacking them is under constant evolution.

Therefore, whatever security measure the system may take, still, it is impossible to wipe out all the possibility of security incidents. It is important to monitor the system and the network without fail and if something should be wrong with them, detect the signs that may lead to incidents and try to minimize the damage as much as possible.

4.6.1 Audit Logs

Using the audit logs is effective for detecting and tracking the signs of illegal accesses. It is necessary to assign some persons responsible for regularly monitoring the audit logs.

Time-stamps are important for logs. Time should be kept accurate using NTP and so on.

TIP

It is necessary to keep the logs for a certain time in order to track the security incidents or to secure the evidence.

PC

Enable the logs for the following events.

PC component

- Audit logon events (Success / Failure)
- Audit account management (Success / Failure)

Windows Domain controller

- Audit logon events (Success / Failure)
- Audit account logon events (Success / Failure)
- Audit account management (Success / Failure)

Firewall (including personal firewall)

Regular monitoring the logs of firewall may detect the illegal access attempts from the outside.

- All the packets that violate the access control rules set in firewall should be logged.
- Worrying that the log files may become too big for the firewall, a log server can be placed in the security management segment to store the logs output from the firewall.

4.6.2 IDS/ IPS

IDS stands for Intrusion Detection System. IPS, on the other hand, is called Intrusion Prevention/ Protection System. IDS and IPS have a mechanism to inform administrators when fraud or abnormality is detected. In order to catch the omen, the logs should be audited on a regular basis.

IDS

IDS can be divided into two types, network type and host type, depending on the monitoring method of communication results. The network type IDS (Network-Based IDS: NIDS) is what monitors data flowing over the network. The host type IDS (Host-Based IDS: HIDS) is placed on the server to be monitored and monitors the data and logs received on the server generated as a result of communication. In addition to intrusion detection, it also supports tampering with files.

IDS is also classified as “Misuse detection type” and “Anomaly detection type” depending on a method of detecting unauthorized intrusion or malicious access. The misuse detection adopted in many IDS is a method to detect intrusion by matching it with a pattern or rule called a pre-registered “signature.” If the IDS finds a packet that matches the signature, it treats it as an intrusion or attack. With this type of algorithm, only intrusions using known methods can be detected.

The other hand, the anomaly detection is possible to find intrusions using unknown method by detecting traffic different from usual. Set the threshold of normal times for conditions such as login time, network traffic status, usage command etc, and judge it as abnormal when it is different. Recent IDS products often adopt both of these detection methods.

IPS

IPS is connected with networks by in-line. Basically, the IPS functions as a bridge, monitoring the traffics, detecting and excluding illegal packets like worms.

It is used:

- To segregate the PCN network into zones. (See the chapter 4.2.1)
- To protect the devices that cannot update the Security Updates and the virus definition file of at real time.

Besides excluding the illegal packets, IPS also broadcasts the notification and logs the events, so that it can also be used for monitoring the network.

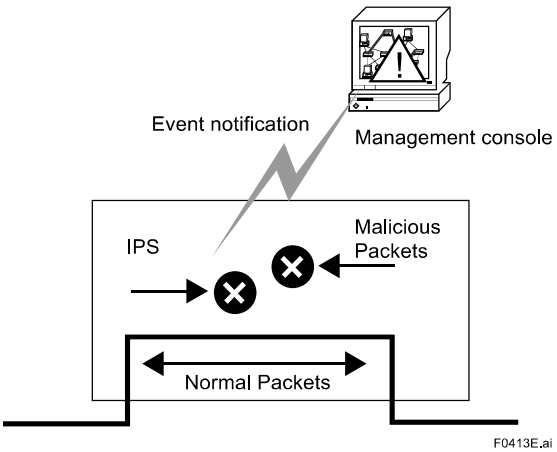

Figure The operation of IPS

Monitoring of detection events

When IPS detects and excludes the illegal packets, the notification about the events will be sent to the management console. Right after the notification is sent from IPS, a team for handling the incidents should act immediately to take care of the situation.

Notices about constructing IPS

- Handling excessive self-defense

  The communication settings defending IPS needs to be tuned in according to the environment where the IPS is placed. When the tuning is not appropriate, some inconveniences such as the intercepting the required communication frames may occur.

- Setup a route for handling troubles

  When IPS is installed in a network by in-line, if some trouble occurs in IPS, the communication between the two networks connected to IPS will be interrupted. Some IPSs have a (fail open) feature to pass all the communications at the time of troubles. However, how to handle communication packets at the time of troubles need to be decided according to the requirements of the actual systems.

- Updating signature

  In IPS, a signal called signature is used to detect the illegal packet. This signal functions the same as virus definition file in the antivirus software, so that it is necessary to update it periodically.

Difference between IDS and IPS

The difference between IDS and IPS is as follows.

- IDS only notifies that there is abnormal communication.
- IPS notifies abnormal communication and carries out even further blocks.

Yet another major difference is that IDS monitors the original copy of the communication and notifies the anomaly, but because IPS needs to block abnormal communication, it will be in between communication routes.

Therefore, in the event that a device of IPS fails, priority is given to maintaining communication, so it is necessary to pay attention that all communications are permitted as basic operation.

4.6.3 NMS

NMS (Network Management System) manages the network devices and the configuration information (IP address, port connection information, line information, etc.) present on the network, and grasps the operational status and signs of failure in real time. By performing network management, it is possible to prevent the occurrence of failures beforehand. In addition, it can gather information necessary for measures to efficiently use the network.

NMS mainly collects various information from network equipment using SNMP (Simple Network Management Protocol) and tells the administrator in an easy-to-understand manner.

SNMP

SNMP (Simple Network Management Protocol) is a UDP/IP based protocol for network monitoring and network management. It is used for status monitoring, resource monitoring, performance monitoring, traffic monitoring of network devices such as routers and switches, Windows and UNIX servers, etc. In general, CPU usage, memory usage, disk usage, process monitoring, Windows event log monitoring, and syslog monitoring are performed for the server. For network devices, it monitors the number of packets sent and received on each port, the number of error packets, the port status, CPU usage, memory usage, and so on. Some vendors have published items specific to the device, and fine monitoring is possible.

4.7 Windows Domain Management

**As Windows computers were used to run the HMI of production control systems, the Windows Domain Controller has been introduced to manage the HMI.
This section describes the operations of Windows Domain Management with considerations for security.**

TIP

The Windows domain is managed by Active Directory. Active Directory is a directory service created by Microsoft. It was released first with Windows 2000 Server. It enables centralized management of hardware resources—servers, clients, printers—on the networks, and information about users—user attributes, access rights—that use these resources. In Active Directory, the server that contains the domain database is called the Domain Controller.

Windows domain configuration for an office environment

In recent years, the needs for the clients in the office environment using their user accounts in the PC to access the process data server become more and more popular.

Generally the accounts of the PCs in office LAN are managed in a shared resource managed in the Windows domain. This section describes the Windows domain configuration for an office environment.

The users allowed to access the open process data server need to be managed. However, since the domain administrator may be different from the process data server administrator, the authorizations for accessing the process data server should be granted by the process data server administrator and independent from the Windows domain administrator.

To group the users into local groups is an effective way to manage the users for accessing the process data server.

1. Register the process data server as a member server of the domain.
2. Create a local group in the server and grant the group with the permission to access the server.
3. Register the users in the domain into this group for accessing the process data server.

In this way, the accounts of the users are managed by the domain, and it becomes possible for the local group to manage the right of the server to access.

In addition, the local groups can be granted with different privileges for accessing the process data server so that the rights of each user can be managed accordingly. The accesses are as follows.

- Permission to read data

  User has right to logon the server and read data in the server.

- Permission to write data

  User has right to logon the server and read/write data in the server.

- Permission to change the engineering settings

  In addition to the above privilege, user also has right to change the engineering settings.

By setting these privileges, it is possible to manage the user access rights properly.

Windows domain management in the production control system

Windows domain management in the PCN enables centralized management of user accounts and increases system availability. However, if the domain controller is down, there is a risk that the names cannot be resolved. It is, therefore, recommended to have a redundant Windows Domain Controller.

TIP

If a computer in the system is installed with applications that are not supported by Windows Domain Management, use the existing stand-alone management for that computer.

4.8 Security Function of Yokogawa System Products

In this clause, the security functions of Yokogawa system products that should be applied to the control system as the security countermeasures are explained from the technical point of view. Each system product is provided with the function to strengthen the security for the operation and monitoring consoles, control units and engineering stations. The security functions of an operation and monitoring console is prepared for the securities on operating the industrial plant; The security functions of an engineering station is prepared mainly for protecting the database of the system. Both operation and monitoring console and engineering station manage the security by identifying the users with the User ID and Password. The ProSafe-RS system is provided with the strengthened security functions in the controllers so that safety control means more safety.

Security of system products

Different measures have been implemented to ensure the security of Yokogawa system products. This section describes the generic IT security that uses Windows security function, and product-specific security functions.

IT security

The IT Security Setting that uses Windows security function was supported since CENTUM VP R4.01 and ProSafe-RS R2.01. Configuring IT security hardens the computer and protects it from threats.

The threats handled by IT security can be categorized as follows:

(1) Network attacks

(2) Direct attacks by manipulating computer components

(3) Theft of computer components or important data

Three different security models are available to enable you to handle these threats. These models flexibly support different system configurations and operations.

Table Security models

Model	Feature
Legacy model	This model does not strengthen the security. It prioritizes collaboration with old products and products where IT security is not applied.
Standard model	This model focuses on the relevant system operations and collaboration with other systems. It can counter threats (1) and (2).
Strengthened model	This model is used to counter all the three threats stated above. Operations may be affected if full security is in place.

Yokogawa IA system products provide a tool that automatically configures the security setting for the threats above. There are two kinds of security settings - IT security version 1.0 and IT security version 2.0.

- IT security version 2.0

  This version was designed after reconsidering the IT security version1.0 and includes more security measures. It supports the Standard and Strengthened (*1) security models.

- IT security version 1.0

  This version had been offered as the security measures of CENTUM VP R6.03 and earlier versions. It supports the Legacy, Standard, and Strengthened (*1) security models.

*1: Please contact Yokogawa for more details about settings of the strengthened model.

IT security version 2.0 and IT security version1.0 can coexist in the same project in CENTUM VP.
The following tables show the security threats that are coped by this security measures.

Table IT security version 2.0

Security measure	Threat handled		
	(1)	(2)	(3)
Password Policy-[Minimum password length]	Yes	Yes	No
Password Policy-[Minimum password age]	Yes	Yes	No
Password Policy-[Maximum password age]	Yes	Yes	No
Password Policy-[Enforce password history]	Yes	Yes	No
Disable 'Password Policy-[Store passwords using reversible encryption]'	Yes	Yes	No
Password Policy-[Password must meet complexity requirements]	Yes	Yes	No
Access Control for files and folders	Yes	Yes	No
Access control for product registry	Yes	Yes	No
Access Control for DCOM (OPC) objects	Yes	Yes	No
Personal firewall tuning	Yes	No	No
Set 'Personal Firewall-[Allow unicast response]' to 'No'	Yes	No	No
Stopping unused Windows services	Yes	No	No
Account Lockout Policy-[Account lockout threshold]	Yes	Yes	No
Account Lockout Policy-[Reset account lockout counter after]	Yes	Yes	No
Account Lockout Policy-[Account lockout duration]	Yes	Yes	No
Disabling NetBIOS over TCP/IP	Yes	No	No
Applying the StorageDevicePolicies function	No	Yes	Yes
Disabling USB storage devices	No	Yes	Yes
Applying the software restriction policies	Yes	Yes	No
. . . (0mission) . . .			
Security-[Require secure RPC communication]	Yes	No	No
Security-[Require user authentication for remote connections by using Network Level Authentication]	Yes	No	No
Sync your settings-[Do not sync Apps]	Yes	No	No
Sync your settings-[Do not sync start settings]	Yes	No	No
Disable 'Windows Error Reporting-[Automatically send memory dumps for OS-generated error reports]'	Yes	No	No
Disable 'Windows Logon Options-[Sign'-in last interactive	No	Yes	No
user automatically after a system'-initiated restart]'	No	Yes	No
Notifications-[Turn off toast notifications on the lock screen]	Yes	Yes	No
Disabling Built-in Administrator Account or Changing User Name	No	No	Yes

Table IT security version 1.0

Security measure	Threat handled		
	(1)	(2)	(3)
Access control	Yes	Yes	No
Personal firewall tuning	Yes	No	No
Stopping unused Windows services	Yes	No	No
Disabling the built-in Administrator account or changing its user name	Yes	Yes	No
Hiding the last logon user name	Yes	Yes	No
Applying the software restriction policies	Yes	Yes	No
Applying AutoRun restrictions	No	Yes	No
Applying the StorageDevicePolicies function	No	Yes	Yes
Disabling USB storage devices	No	Yes	Yes
Disabling NetBIOS over TCP/IP	Yes	No	No
Changing the LAN Manager authentication level	Yes	No	No
Applying the password policy	Yes	Yes	No
Applying the audit policy	Yes	Yes	No
Applying the account lockout policy	Yes	Yes	No
HDD password function by BIOS	No	No	Yes

For details about IT security, refer to IM of each product.

- FAST/TOOLS Windows IT Security Guide (TI 50A 01A10-04EN)

TIP

The content of “IT Security Guide for System Products (for each product)” issued as TI 30A15B3x-01E is old. For the latest information, please refer to the above IM.

4.8.1 CENTUM VP

The security settings of CENTUM can be classified into two functions, the IT security function based on Windows security feature, and the CENTUM VP peculiar security function.

IT security function of CENTUM VP

The IT security function to enhance security is supported on CENTUM VP. System-hardening of CENTUM VP IT environment is realized by using Windows functions. For example, the usage of CENTUM VP tools and access permissions to folders/files are managed by access control for users and groups of Windows. Therefore, it is possible to apply the security countermeasures in such circumstances to allow a Windows user as an operator to logon to the PC for using the operator windows and tools but restricted from starting the engineering to tools.

Moreover, some communication types and communication ports can be disabled by Windows firewall and DCOM settings.

IT security version 2.0 is applicable for CENTUM VP R6.04 or later.

Authentication mode

In R4.02 or earlier of CENTUM, you can define users and their respective access rights for CENTUM Engineering or CENTUM Operation and Monitoring function. These users are independent from Windows users. That is the CENTUM Authentication mode. By using the Windows Authentication Mode that was newly added in CENTUM VP R4.03, you can integrate Windows accounts with Operation and Monitoring users, and ensure a secure system within the Windows user management framework. In case of necessity more strong security, it is recommend to use windows authentication mode. And, by making good use of the centralized user management made possible with Windows domain configuration, you can significantly improve the usability of the system.

CENTUM VP specific security function

CENTUM VP have a specific security function for controlling accesses, mainly for controlling the accesses to the controller data and application database. The HIS user used for this access control is specially defined for CENTUM VP. As mentioned earlier, from CENTUM VP R4.03 onwards, the Windows Authentication Mode is available to associate Windows User Account function with CENTUM User management.

In CENTUM VP, the users are usually divided into 4 groups; Operators, System engineers, Recipe engineers and Report users. The access control is applied to each user group. The user groups are largely divided into the following 2 categories.

- HIS group user: Operators (Operation and Monitoring Function)
- ENG group user: System engineers (System View/Builders)

  Recipe engineers (Recipe Management Function)

  Report users (Report Function)

These are the access control functions. (*1)

- Register or delete user IDs
- Set user rights for each user ID
- Automatic User-Out
- Check Illegal access
- Lockout users
- Release locked user IDs
- Reconfirm with double authentications (*2)
- Check validity period of password
- Check and block the obsolete password
- Set minimum password length
- Automatic logon Windows
- Set CENTUM desktop environment

*1: With the Windows Authentication Mode, some of these access control functions are handled by the Windows User Account Management function.
*2: In security terms, this is known as Dual Lock function.

For the security of the system, we recommend that the above mentioned access control functions be applied according to the privileges of the users.

SEE ALSO For more details about the access control functions of ENG group user, refer to:

Access Control Package (GS 33J10D20-01EN)

Access Administrator Package (FDA:21 CFR Part 11 compliant) (GS 33J10D40-01EN)

4.8.2 ProSafe-RS

ProSafe-RS supports the IT security function based on Windows security feature, also the CENTUM VP peculiar security function can be applied on ProSafe-RS/CENTUM integrated system. In addition, ProSafe-RS has peculiar security functions to enhance security as Safety Instrumented System.

IT security function of ProSafe-RS

The IT security function to enhance security is supported on ProSafe-RS R2.01 and later. System-hardening of ProSafe-RS IT environment is realized by using Windows functions. Moreover, the IT security function can be applied on ProSafe-RS/CENTUM VP integrated system. Therefore, it is possible to apply the security countermeasures in such circumstances to allow a Windows user as a CENTUM VP engineer to logon the PC for using the CENTUM VP engineering tools but restricted from starting the ProSafe-RS engineering tools.

IT security version 2.0 is applicable for ProSafe-RS R4.03 or later.

CENTUM VP specific security function

This security function can be used on ProSafe-RS and CENTUM VP integrated system. By using the security control function with HIS user, it is possible to control access permission to the data of SCS (Safety Control Station).

ProSafe-RS specific security function

ProSafe-RS has the following securities in order to inhibit the access to the system by the unauthorized users or from the unauthorized devices to prevent the unintended changes resulted from the operation errors of the users.

Table Outline of the security function of ProSafe-RS

	Access control by password	Access control by hardware key switch	Remarks
Change in project database	Applicable	N/A	Access control rule can be set for the whole SCS or for each program in SCS.
Non-safety operations to SCS	Applicable	N/A	Access control by SCS Maintenance Support Tool in SENG
Safety-related operations to SCS	Applicable	Applicable	Access control is applied to both the operations from SENG and from HIS. Permit or Deny is handled in SCS.

The passwords should be used and the passwords should be difficult for an outsider to guess. For more information about assigning passwords, see the descriptions about the password assignment rules cited in the chapter 4.5.

In addition, a hardware key switch can also be used for access control according to the requests from the customers.

SEE ALSO There is a function that sets the operation rights of engineers. For details, refer to:

Access Control and Operation History Management Package (GS 32P04D30-01EN))

4.8.3 STARDOM

STARDOM has two types of security functions, an IT security function based on the Windows security function, and a STARDOM specific security function.

IT security function of STARDOM

The IT security function to enhance security is supported on STARDOM R3.20 or later. It makes use of Windows functions to harden the STARDOM IT environment. For example, it uses the access control function for Windows users and groups to control usage of STARDOM tools and access to folders/files. In addition, this function configures Windows Firewall and DCOM to limit communication types and communication port numbers.

Security settings are easy to use by the tool that is included in this product. STARDOM supports Legacy model and Standard model.

STARDOM specific security function

In STARDOM, the operators are divided into various groups and the operable range for each group is specified, as in CENTUM VP. Moreover, the record of the operation by the operators can be kept. Manage the passwords carefully so as not to allow an outsider masquerading as a user to operate the system. The following are the security functions of STARDOM. Apply these functions to the PCs according to the requirements for preventing the operational errors and improving the operation safety.

- Set operation range for each user group
- Protect the operation files
- Manage HMI server passwords
- Notify the password change
- Notify the password expiration in advance
- Notify the password expiration
- System inhibitions: Inhibit some Windows functions
- Desktop inhibitions: Inhibit some operations on Windows desktop
- Application inhibitions: Inhibit some operations on Internet Explorer

4.8.4 Plant Resource Manager (PRM)

PRM has two types of security functions, an IT security function based on Windows security function, and a PRM specific security function.

IT security function of PRM

The IT security function to enhance security is supported on PRM R3.03 or later. It makes use of Windows functions to harden the PRM IT environment. For example, it uses the access control function for Windows users and groups to control usage of PRM tools and access to folders/files. In addition, this function configures Windows Firewall and DCOM to restrict communication types and communication port numbers.

IT security version 2.0 is applicable for PRM R4.01 or later.

PRM specific security function

With regards to security, PRM is equipped with the functions of access control of users, access control of the connected devices and management of operation history.

Access control of operators

In PRM, users are managed by their user names. In order to use the functions of PRM, it is necessary to have a user name and a password. The passwords should be carefully managed so as not to allow an outsider to operate the system illegally.

A user must belong to a user group. Moreover, each window on PRM is provided with a setting for the access privilege of each user group. A number of default user group are already built in the PRM, however, the new user groups can be added according to the actual security management policy.

A further concept in PRM is the permissions for each user. The operation privilege of a user is not only subject to the privileges set for each user group but also subject in detail to the permissions for the individual user.

Access restrictions on the connected devices

PRM can not only restrict the users on operating various PRM functions, but also restrict users on accessing various devices connected with PRM. The permissions for accessing the connected devices need to be configured according to the authority of each user.

Audit trails of the operations

PRM keeps the records of all operations. All the operation events on PRM, all the operations on the devices connected to PRM and all the inspection events and inspection results of these devices are logged as audit trails. The audit trails can be displayed and printed out.

4.8.5 B/M9000 VP

B/M9000 VP has two types of security functions, an IT security function based on the Windows security function, and a B/M9000 VP specific security function.

IT security function of B/M9000 VP

This function was prepared to strengthen the security for B/M9000 VP, similar to that of CENTUM VP. It makes use of Windows functions to harden the B/M9000 VP IT environment. For example, it uses the access control function for Windows users and groups to control the usage of B/M9000 VP and CENTUM VP tools and access to folders/files. In addition, this function configures Windows Firewall and DCOM to restrict communication types and communication port numbers.

B/M9000 VP specific security function

B/M9000 VP has unique access control functions for screen customization. This security function is managed separately from Windows security. Users are classified into operators, staff, and engineers, and different access control functions are used for each of these user groups.

User groups are classified into three major categories:

- Operator group: operators
- Maintenance group: staff
- Engineer group: instrument engineers, engineers

The following access control functions are available:

- System installation and uninstallation, system device registration and deletion. (engineer group)
- System backup and restore, screen customization. (maintenance group)
- Screen operation. (operator group)

To ensure that the system is secure, it is recommended to configure these access control functions according to user rights.

4.8.6 Exaopc

Exaopc has two types of security functions, an IT security function based on the Windows security function, and an Exaopc specific security function.

IT security function of Exaopc

This function makes use of Windows functions to harden the Exaopc IT environment. For example, it uses the access control function for Windows users and groups to control usage of Exaopc tools and access to folders/files. In addition, this function configures Windows Firewall and DCOM to restrict communication types and communication port numbers.

IT security version 2.0 is applicable for Exaopc R3.76 or later

Authentication mode

Exaopc R3.70 or later uses the user authentication mode when accessing to CENTUM data. Either “CENTUM authentication mode” or “Windows authentication mode” is applicable.

Exaopc specific security function

OPC security interface

Exaopc can set its security by OPC Security compliant interface, when OPC client uses DA/A&E/HDA/Batch server function. The username/password specified here is used by the following CENTUM security function.

CENTUM security function

CENTUM VP specific security functions can also be applied to Exaopc. For example, access restrictions by user groups can be used. This allows you to set fine security for OPC clients.

4.8.7 Exaquantum

Exaquantum has its own unique security functions, which are as follows.

Exaquantum specific security function

The security function of Exaquantum is realized according to the users and groups managed by Windows. Each user can be defined with adequate security. For an example, an engineer or a user can change the process data, while another user can only read the process data by registering the different users to different groups as explained in below. As a result, the operation errors and illegal operations by the unauthorized users can be prevented. In addition, the operation events by the users can be recorded as audit trails.

Exaquantum has preset the default users beforehand in the system. It is especially important to manage the passwords of default users strictly. On assigning the passwords, you should follow the rules explained in the chapter 4.5 System-Hardening.

The following shows the groups regarding to the security management.

Connection security group

This group is for the users to connect with Exaquantum server; and granted with the following privileges.

- Referencing data
- Displaying graphics

Management security group

This group is for the users to change the management information or write data on Exaquantum; and granted with the following privileges.

- Changing database settings
- Creating tags
- Writing data

Writing data security group

This group is for the users to write tag data; and granted with following privileges:

- Changing data
- Writing to DCS

Graphic editing security group

This group is for the users to edit graphics; and granted with following privileges:

- Editing graphic displays

RBNS security

This is a set of settings about the permissions for reading and writing to the tags corresponding to each security groups regarding the following privileges:

- Referencing data
- Changing data

4.8.8 Exapilot

Exapilot security functions can be classified into two types, an IT security function based on the Windows security function, and an Exapilot specific security function.

IT security function of Exapilot

This function is created to strengthen the security for Exapilot R3.70 and later versions. It makes use of Windows functions to harden Exapilot VP IT environment. For example, it uses the access control function for Windows users and groups to control the usage of Exapilot tools and access to folders/files. In addition, this function configures Windows Firewall and DCOM to restrict communication types and communication port numbers.

IT security version 2.0 is applicable for Exapilot R3.97.00 or later.

Authentication mode

Exapilot has two types of user authentication mode below.

- Windows authentication mode

  The way to authenticate a user by using the Windows function.

- Exapilot authentication mode

  The way to authenticate a user by using Exapilot specific function.

Exapilot specific security function

Exapilot has a security function to authorize operation permissions for each user, where the user is controlled by Exapilot. Exapilot specific security is classified into three types; system security to apply on all operations; main procedure security to apply on main procedures; and subprocedure security to apply on sub procedures. By setting these securities, each user can have suitable security rights for administrator, operator and engineer privileges. As a result, operation errors and illegal operations by the unauthorized users can be prevented. In addition, the operation events by the users can be recorded as audit trails.

It is recommended to assign the passwords that cannot be easily guessed by the outsider to the users and set the operation privilege of each user to a minimum level. On assigning the passwords, you should follow the rules explained in the chapter 4.5 System-Hardening.

System security

Exapilot system security restricts access and permissions on the following operations for each user.

Operations that can be restricted

- Operation window
- Builder window
- Utilities window
- Security window
- The other tools

Main procedure security

Main procedure security restricts the building and running operations of individual procedures for each user.

Operations that can be restricted

- Building operation
- Running operation

Subprocedure security

Subprocedure security restricts the building and running operations of individual procedures for each user.

Operations that can be restricted

- Building operation
- Running operation

4.8.9 Exaplog

Exaplog has two types of security functions, an IT security function based on the Windows security function, and an Exaplog specific security function.

IT security function of Exaplog

This function makes use of Windows functions to harden the Exaopc IT environment. For example, it uses the access control function for Windows users and groups to control usage of Exaopc tools and access to folders/files. In addition, this function configures Windows Firewall to restrict communication types and communication port numbers.

Exaplog specific security function

Execution of the Exaplog program is limited by the user group as shown in the table below.

Window name/ Tool name	PLG_ANALYST (PLG_ANALYST_LCL)	PLG_SUPER_ ANALYST (PLG_SUPER_ ANALYST_LCL)	PLGMAINTENANCE (PLG_MAINTENANCE _LCL)	EXA_MAINTENANCE (EXA_MAINTENANCE_ LCL)
Event analysis tool (PLView)	Yes	Yes	Yes	
Long-term summary tool (PLSummary)	Yes	Yes	Yes	
Exaplog administration (PLAdmin)		Yes	Yes (*3)	
Tri-REPORT data import tool		Yes	Yes	
Command under Exaplog¥tool		Yes	Yes	
Password change tool			Yes	
IT security tool				Yes
Software Configuration View	Yes (*1)	Yes (*1)	Yes	Yes
EXA Information Gathering Tool				Yes (*2)
Install				Yes
Client Install				Yes

*1: Exaplog information can be displayed. User accounts without administrator's authority cannot display registry information.
*2: For the start method, refer to the instruction manual for the EXA Package Information Gathering Tool.
*3: PLG_MAINTENANCE is used to change the setting for automatic start of Exaplog with PLAdmin.

4.8.10 FAST/TOOLS

FAST/TOOLS has two types of security functions, an IT security function based on the Windows security function, and a FAST/TOOLS specific security function.

IT security function of FAST/TOOLS

IT security version 2.0 is applicable for FAST/TOOLS R10.04 or later. This function makes use of Windows functions to harden the FAST/TOOLS IT environment. For example, this function configures Windows Firewall to restrict communication types and communication port numbers, stops unused Windows services, and uses the access control function for Windows users and groups to control usage of FAST/TOOLS and access to folders/files.

FAST/TOOLS specific security function

The FAST/TOOLS specific security function falls into two categories.

(1) User Management function

FAST/TOOLS has security mechanism considering the SCADA based application security. This mechanism is possible to manage users considering functional authorization such as read-only permission and full system configuration permission versus area authorization. Additionally, FAST/TOOLS supports sophisticated user profiles which can integrated with Active Directory user management by mapping user group name on AD to FAST/TOOLS user profiles. And, FAST/TOOLS supports “Single sign-on” based on Active Directory.

(2) Communication function

FAST/TOOLS enables users to Monitor, Control and Engineer their application systems in a wide distributed network configuration. FAST/TOOLS supports security countermeasures to data connections as below.

- Secure Communication by encryption (Client to Server)
  Operation data is displayed in Web-HMI client and Mobile client via FAST/TOOLS Web server. FAST/TOOLS supports Secure Socket Layer(SSL) to secure this data connections.
- Secure Connection by encryption (Server to Server)
  Communication between two FAST/TOOLS Systems used in FAST/TOOLS distributed systems is encrypted. FAST/TOOLS multi-node network security is based on industry standards that are also used for secure communication on the Internet, including DTLS and public/private keys.
- OPC UA
  OPC UA is the next-generation standard of OPC developed by OPC foundation. OPC UA provides a cohesive, secure, and reliable cross-platform framework for access to real-time and historical data and events. FAST/TOOLS supports both Server (DA/AC/HA) and Client (DA) roles of OPC UA. FAST/TOOLS together with the security features of the OPC UA, supports users connecting new or existing equipment to secure, high reliable and manageable network.

4.9 Staff Security Policy

One of the major threats that may lead to security incidents is “human.” A human mistake, such as an incorrect operation, can be a major threat.

4.9.1 Education

The purpose of the education is to make the staff to have skills and knowledge of security so that they act in accordance with the security rules in daily works.

Education should include below items, but not limited to:

- To make the staff be matured for understanding about security.
- To make the staff to aware of the threats and influence to production control system correctly.
- To make the staff to implement security countermeasures and improvement adequately.
- To make the staff to operate the system correctly and manage it tidily. For example, make the staff to understand how to confirm the log to identify the existence of an attack to the system.

The education should be done on these occasions.

- When the staffs are employed
- When the staffs are moved to a new position or the accessed targets of the staffs are changed, an so on

4.9.2 Training

The first purpose of training is to enable the staff to perform the right operation and management so that to prevent the security incidents. Another purpose of the training is to make the stuffs to respond properly on the security incidents, and to make them capable to cope with such occasions. It is also important to make the staff in readiness over incidents.

The procedure in detail is provided in the Business Continuity Plan described in Chapter 6. It is necessary to regularly train the stuffs under the assumed the security incidents for taking the right actions.

5. Physical Protection

To obtain the physical security for a control room where the system is located is a very important element in decreasing the threats of security.

5.1 Define Physical Boundary

The control room where the system is located should be regarded as a security area and physical security must be defined. The secured area is an area protected the barriers.

The barriers here also include the management of the ID cards, the code numbers and the keys for entering the secured rooms. More than one security area can be defined according to the level of security required. Security areas have effects as follows, but not limited to:

- To prevent an unauthorized equipment be connected to the network.
- To prevent the loss of equipments such as PC or backup medias be stolen.

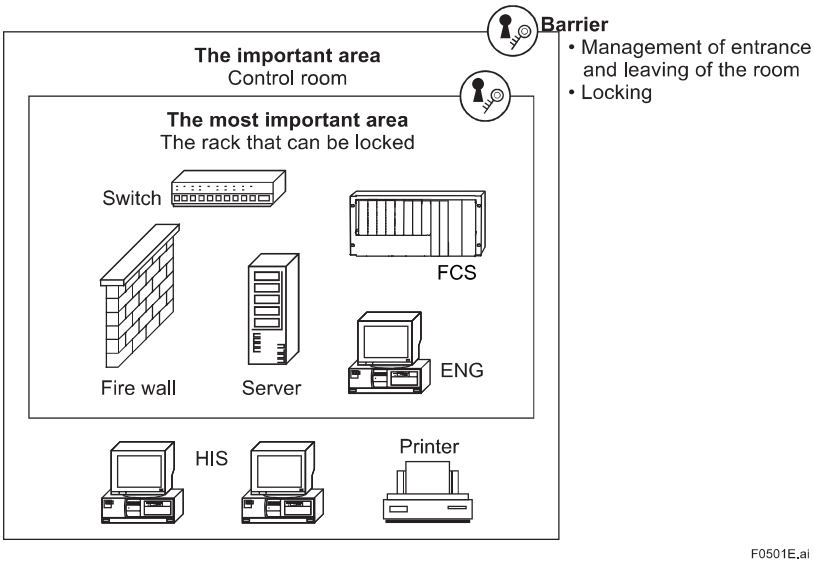

Figure Example of the configuration of security area

Moreover, PC components such as HIS and ENG should be placed in the security area by following reasons.

- To eliminate the opportunity of illegal usage.
- To prevent from installing the tool for stealing information, such as Key Logger.
- To keep the entrance and leaving records and the records can be used as forensic evidences.

Important areas

The control room where the operators operate the devices to control plant every day is considered to be an important area. The devices necessary for the operations are placed here. Only a limited number of people, i.e. operators and engineers should be allowed to enter this area.

Example of devices should be placed in the important area

- Operator stations (HIS etc.)
- Printers

Printer should be placed in the important area to secure the confidentiality of printouts.

The most important area

The important devices are placed in this area, where the devices are not necessarily operated for the daily operations. For an example, the racks that can be locked should be placed in this area. Entering to this area should be strictly controlled so that only a small number of people such as engineers are allowed.

Example: The devices that should be placed in the most important area

- Controllers including the wirings to the devices (FCS,FCJ/FCN,SCS)
- Engineering stations (ENG)
- Network devices (Switches and Gateway Units)
- Security devices (Firewalls)
- Spare equipments such as the PCs.

Example: The media that should be placed in the most important area

- Media used for installing system software to PC.
- Backup media

5.2 Management of Removable Devices

The removable devices such as CD/DVDs, floppy disks or USB memory sticks are not needed in the daily plant operation. It is dangerous to keep them in the freely accessible environment, for there may be the possibility that the files infected by computer viruses or illegal programmes are installed. Thus, it is very important to prevent the removable devices from being used illegally.

We recommend the following measures.

Disabling AutoRun

Windows has a function that automatically runs programs from atached removable drives.

Disable the AutoRun function to prevent virus infection due to misuse of AutoRun.

Disabling the removable devices

Disable the floppy disks, CD/DVD drives and USB devices in the control room. In this case, it is necessary to strictly protect the BIOS settings from the outsiders by authenticating the password and the administrator privilege.

Detaching removable drives

Consider to physically detach removable drives if it does not trouble the operating environment.

Handling USB memory sticks

IMPORTANT

USB memory sticks are widely used as external storage devices due to their large capacity, low price, and easy usage. However, USB worms or virus infection from USB memory sticks have become a very common problem.

Therefore, we need to control the usage of USB memory sticks in production control systems. This can be done by building a stringent management system that restricts the usage of USB memory sticks to limited devices, and enforces absolute compliance to regulations.

5.3 Third Party Maintenance

Some maintenance works of security devices such as PCS or Network devices, the maintenance workers of the third party vendors need to work in the important area or the most important area. Since these works are carried out to the critical devices, it is essential to guarantee the security.

The maintenance works should be carried out in the presence of the user all the time, and the user must check if the third-party maintenance works are properly performed in accordance with the work procedures.

6. Business Continuity Plan

Business continuity plan is explained here.

Since a high level of availability is required for the production system, it is important to decide the business continuity plan in advance. And make sure that the plan, including the training programs, would guarantee the system be properly restored in case an incident happened.

6.1 Plan

When creating a business continuity plan, the following has to be taken into consideration.

Recovery plan

Disaster recovery plan should be made to secure the recovery of the system on an incident. The plan should include the roles and responsibilities of the departments, persons in charge and their contact information. The plan should also include activities of restoration to deal with the confusions and obstacles occurred by the incident.

Acceptable time for restoration

Decide how much time will be required for backup and restore and if redundancy is necessary.

Backup interval

Keep a number of backups to prepare for unexpected incidents such as corrupted storage mediums.

Backup objects

Backup should contain the following three objects.

- Operating system and other system software.
- Application software
- Application parameters. The parameters tailored by the process engineer. For example, Tuning Parameter of CENTUM VP.

Backup management

Keep a number of backups to prepare for unexpected incidents such as corrupted storage mediums.

Storage location of backup media

Keep the backup media in a safe place such as a cabinet that can be locked so that the security is guaranteed. This is required because if the backup information is passed to an attacker, the possibility of cyber attack will be largely increased.

TIP

Yokogawa system products provide tools for efficiently backups.

Clarification of responsibility

It is necessary to make clear what department or who is responsible for the activities in the business continuity plan.

- Backup activity
- Training activity
- Restore activity

Review and update the plan

When the system configuration or the system environment changes, it is necessary to review and update the business continuity plan.

Review and update the plan is required when:

- the new devices are installed,
- the system is upgraded,
- the location of the equipment is changed,
- the business is expanded or changed.

6.2 Training

It is necessary to conduct regular trainings in accordance with the business continuity plan so that in case of emergency, the system can be certainly restored.

It is also essential for the staffs in charge of each activity in the business continuity plan to take part in these trainings.

Not only internal education but also external institution training and public qualification acquisition should be planned. For example, it is necessary to take measures to encourage acquisition of GICSP (Global Industrial Cyber Security Professional), which is international certification for security measures engineering of control systems.

- Global Industrial Cyber Security Professional (GICSP)

  https://www.giac.org/certification/global-industrial-cyber-security-professional-gicsp

Yokogawa trains engineers with GICSP qualifications.

- Yokogawa Promotes GICSP Training to Enhance Plant Safety

  http://www.yokogawa.com/pr/topics/2015/pr-topics-2015-0508-02-en.htm

6.3 Maintenance

Security measures should not be done once at installation. Daily new vulnerabilities are discovered, and the threat to the control system is increasing. It is necessary to always execute PDCA cycle (plan-do-check-act cycle) for security measures.

Yokogawa prepares the following security countermeasure service and support the continuous operation of IA control system.

(1) AV/OS(*1) Implementation Service

(2) AV/OS(*1) Update Service

(3) Security Information Service

(4) Virus Check Service

(5) Software Backup Service

(6) USB Port Lock Service

(7) Malware Inactivated Service

(8) Security Effectiveness Service

*1: Antivirus software / Microsoft Security Updates

SEE ALSO For details of the above services, please refer to:

Endpoint Security Service (GS 43D02T30-02EN)

6.4 Measures against Software Vulnerability

Vulnerability of software is defined as “a security flaw in a software product or other item that may be attacked by computer viruses or unauthorized access to cause damage to its function or performance.”

Vulnerability and software defect are often confused with each other, and many causes of the vulnerabilities are, in fact, defects. However, vulnerabilities are different from the defects that cause system hang-up or other failures in usual operation by customers. Vulnerability is a potential risk under the usual operation environment of customers, which causes incidents such as system hang-up only after being attacked. From the viewpoint of preventing security incidents, vulnerability must be handled while it is in the state of potential risk.

Yokogawa makes every effort to collect the latest vulnerability information, feed it back to the operations, and makes use of it for improving development processes, operation standards and operating procedures. Yokogawa offers customers not only secure products but also support regarding vulnerability through providing measures and workarounds for vulnerabilities based on the latest information.

Revision Information

Title: Security Standard of System Product

Manual No.: TI 33Y01B30-01E

Sep. 2006/1st Edition
Newly published

Apr. 2008/ 2nd Edition

Introduction	B/M 9000CS addition to Target Products.
4.2.7	Deleted a description of the Secure Ticket of Personal authentication.

Sep. 2008/3rd Edition

Introduction	CENTUM VP added to Target Products
1	Figure Outline of the system revised
2	Some items added to Examples of data assets
	TIP ISA 99.00.01 added
	TIP Activity-based criteria and Asset-based criteria added
3.4	Examples of the vulnerability revised and some items added
3.5	Risk Assessment revised
	Formula showing Risk revised
3.6	The title is revised to “Design and Implement of the Measures”
	Priority of Availability, Integrity and Confidentiality added
3.8	Description of health, safety, environment added
	Monitoring log of network added to Daily monitoring of the system
	Software in use added to Regular auditing
4.1	Risk Definition and Security Zone added
4.2.1	Level of ISA 99.00.01 Reference Model descriptions added
	Description of IPS revised at Horizontal segmentation
	SEE ALSO 4.6.2 IPS added
4.2.2	Figure Equipment class revised
	Description of classification added
4.2.4	Description of Dual-Home Server revised
4.2.5	Title is changed from “Vnet/IP Open Channel” to “OPC Interface”, and all contents are revised
4.2.6	Description added at Authentication of terminals
4.2.7	Figure Example of the configuration of remote monitoring network revised
	Figure Example of Personal Authentication revised
4.2.8	Description added at Use of RAS, Authentication by using the caller ID and The system-hardening of RAS
	Figure Example of the configuration of remote maintenance by Modem revised
4.4	Security Patches Management revised
4.8.1	The title is changed to “CENTUM VP/CS3000”
	CENTUM VP security description added
4.8.2	Revised “4.8.3 ProSafe-RS” to “4.8.2 ProSafe-RS”
	ProSafe-RS security description revised
4.8.3	Revised “4.8.2 STARDOM” to “4.8.3 STARDOM”
4.8.5	Exaquantum security description revised
4.8.6	Exapilot security description revised
4.9.1	Education revised
4.9.2	Training revised
5.1	Define Physical Boundary revised
6.1	Recovery plan and Backup objects added

Feb. 2011/4th Edition

Introduction	Deleted “R3” from “CENTUM CS 3000 R3” in Target Products
	Deleted the sentence of “CENTUM CS 1000 R3” from Target Products
	Changed “B/M9000 CS” to “B/M9000 VP” in Target Products
	Added “-Based Software” between “Solution” and “Packages”
1	Changed “Security Patches” to “Security Patch” in Figures
	Changed “Public Server” to “DMZ Server” in Figures

4.2.6	Added a lead sentence for this section Added the 1st headline “Wireless LAN (IEEE 802.11)” Changed “wireless network” to “wireless LAN” in the text Changed the 2nd headline “Application to control bus” to “Wireless application to control bus” Added the 3rd headline “Field wireless (ISA 100.11a)” and its description
4.4	Changed “Patches” to “Patch” in the title Added SEE ALSO about security patches
4.7	Changed the title “Configuration of Windows Domain” to “Windows Domain Management” Added a lead sentence and TIP Added the headline “Windows domain configuration for an office environment” Added the headline “Windows domain management in the production control system” and its description
4.8	Changed the title “Security Functions Specific to Each Product” to “Security Function of Yokogawa System Products” Added the headline “Security of System Products” and its description
4.8.1	Changed the description for the authentication mode of CENTUM VP R4.03
4.8.3	Changed “CENTUM CS 3000” to “CENTUM VP/CS 3000”
4.8.4	Added a lead sentence for this section Added the 1st headline “IT security function” and its description Added the 2nd headline “PRM specific security function” Changed “operators” to “users” in the text
4.8.5	Added the chapter “B/M9000 VP” Added 1 to chapter numbers after this chapter
4.8.7	Added a lead sentence for this section Added the 1st headline “IT security function” and its description Added the 2nd headline “Exapilot specific security function”
5.2	Added the headline “Disabling AutoRun” and its description Added the subheading “Handling USB memory sticks” and its description Changed “CD” to “CD/DVD” Changed “the removable devices” to “removable drives”
6.1	Changed “CENTUM is provided with the” to “Yokogawa system products provide” Corrected grammatical errors, usage and wording (Chapter 1, 4.2, 4.2.1, 4.2.2, 4.2.3, 4.2.5, 4.2.6, 5.1, 6)

June 2013/5th Edition

2	Added a description about the recent security threats
4.3	Added a description about antivirus software
4.4	Added a description about applying security patches
4.5.1	Deleted the description about the old security holes

Apr. 2018/6th Edition

All	Deleted descriptions about CS 3000
1	Changed the explanation about chapter 3
3	Reformed chapter 3 in its entirely (Changed “ISMS” to “Security Standards and Certifications”)
4.3	Changed the title of this chapter to “Anti-malware”, and added Whitelisting software
4.6.2	Added “IDS”
4.6.3	Added the whole chapter of “NMS”
4.8	Added the description about IT security version 2.0
4.8	Added and/or changed the descriptions in accordance with the latest version of the products
4.8.6	Added the whole chapter of “Exaopc”
4.8.9	Added the whole chapter of “Exaplog”
6.3	Added the whole chapter of “Maintenance”
6.4	Added the whole chapter of “Measures against Software Vulnerability”

Nov. 2019/7th Edition

All	Change “security patches” to “Security Updates”.
All	Change “pattern” to “virus definition file”.
3.2	Delete a description regarding CSMS certification.
3.3	Update a description regarding NIST Cybersecurity Framework.
3.4	Update a description regarding ISASecure.
3.5	Update a description regarding ISA99.

3.6 Update a description regarding IEC62443.
4.3 Change referenced document to Endpoint Security Service.
4.8.1 Add a description regarding Athentication mode.
4.8.10 Add a description regarding FAST/TOOLS.

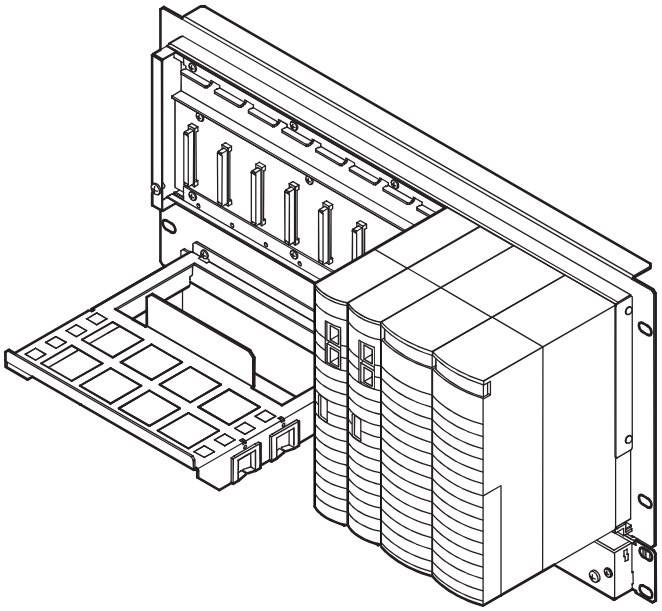
Attachment 9.15 Safety Control Station (S2SC70D)

GS 32P06D10-01EN



General Specifications

GS 32P06D10-01EN

ProSafe-RS
S2SC70S, S2SC70D
Safety Control Unit, Duplexed Safety Control Unit
(for N-IO/FIO, Rack Mountable Type)

■ GENERAL

This General Specifications (GS) provides the hardware specifications of the safety control unit, which are intelligent parts of the safety control station (SCS). This product supports both N-IO and FIO.

F01E.ai

■ HARDWARE SPECIFICATIONS

For the criteria for the installation environment, refer to “ProSafe-RS Safety Instrumented System Overview (for Vnet/IP)” (GS 32P01B10-01EN).

● Safety Integrity Level

SIL 3

● Module Configuration

Power Supply Module (SPW481, SPW482 or SPW484): 2 modules
Processor Module (S2CP471 or SCP461 style S2 or later): 2 modules for dual-redundant configuration. (*1)

*1: A dual-redundant configuration is enabled by using 2 identical modules with same model code (S2CP471 or SCP461).

● Memory Protection at Power Failured

Application program is stored in the flash memory. Processor module operation data is stored in NVRAM (nonvolatile memory).

● Temperature Adaptability

A fan unit is provided for high temperature use where the safety control units (S2SC70S-F/S2SC70D-F) ambient temperature exceeds 40 °C.

● Control Network

Vnet/IP interface: Dual-redundant

● No. of Node Units Connectable

In order to extend the number of I/O channels, S2SC70☐ allows N-IO nodes and safety node units to be connected to it. The number of individual nodes that can be connected is as follows.

N-IO node (*1): Max. 32/ SCS
Safety Node Unit (SNB10D): Max. 13/ SCS

*1: For details, refer to the GS “ProSafe-RS Outline of I/O Modules (for N-IO)” (GS 32P06F10-01EN).

● Installation Restrictions for Node Units

N-IO Node

An N-IO node is connected via an N-ESB bus or optical ESB bus. A node connection via the N-ESB bus needs an N-ESB bus coupler module (S2EN402 or S2EN404).

A node connection via the optical ESB bus needs an ESB bus coupler module (SEC401 or SEC402) and an ESB bus optical repeater module (SNT401 or SNT411).

Safety Node Unit (SNB10D)

A safety node unit is connected via an ESB bus or optical ESB bus. A safety node unit connection via the ESB bus needs an ESB bus coupler module (SEC401 or SEC402). A safety node unit connection via the optical ESB bus needs an ESB bus coupler module (SEC401 or SEC402) and an ESB bus optical repeater module (SNT401 or SNT411).

YOKOGAWA

GS 32P06D10-01EN
©Copyright Nov 2015(YK)
12th Edition Apr. 18, 2023(YK)

● Installation Restrictions for Bus Interface Module

N-ESB Bus Coupler Modules (S2EN402 or S2EN404) shall be installed in an odd-numbered slot and the adjacent slot on the right of slots 1 to 8 according to the number of branches.

A pair of ESB Bus Coupler Modules (SEC401 or SEC402) shall be installed in slots 7 and 8.

A pair of Optical ESB Bus Repeater Master Modules (SNT401 or SNT411) shall be installed in an odd-numbered slot and the adjacent slot on the right of slots 1 to 6 according to the number of branches.

For details, refer to the GS of each module.

● Installation Restrictions

Up to eight I/O modules (for FIO) can be installed to a S2SC70☐.

For the I/O module (for FIO) installation limitations and notes, refer to “ProSafe-RS Outline of I/O Modules” (GS 32P06K60-01EN).

● Power Requirements

Specify suffix codes.
Voltage: 100 to 120 V AC, 50 or 60 Hz
Voltage: 220 to 240 V AC, 50 or 60 Hz
Voltage: 24 V DC

● Power Consumption

- S2SC70S-S /S2SC70D-S

100 to 120 V AC model:	200 VA
200 to 240 V AC model:	230 VA
24 V DC model:	5.5 A

- S2SC70S-F/S2SC70D-F

100 to 120 V AC model:	240 VA
200 to 240 V AC model:	290 VA
24 V DC model:	7.0 A

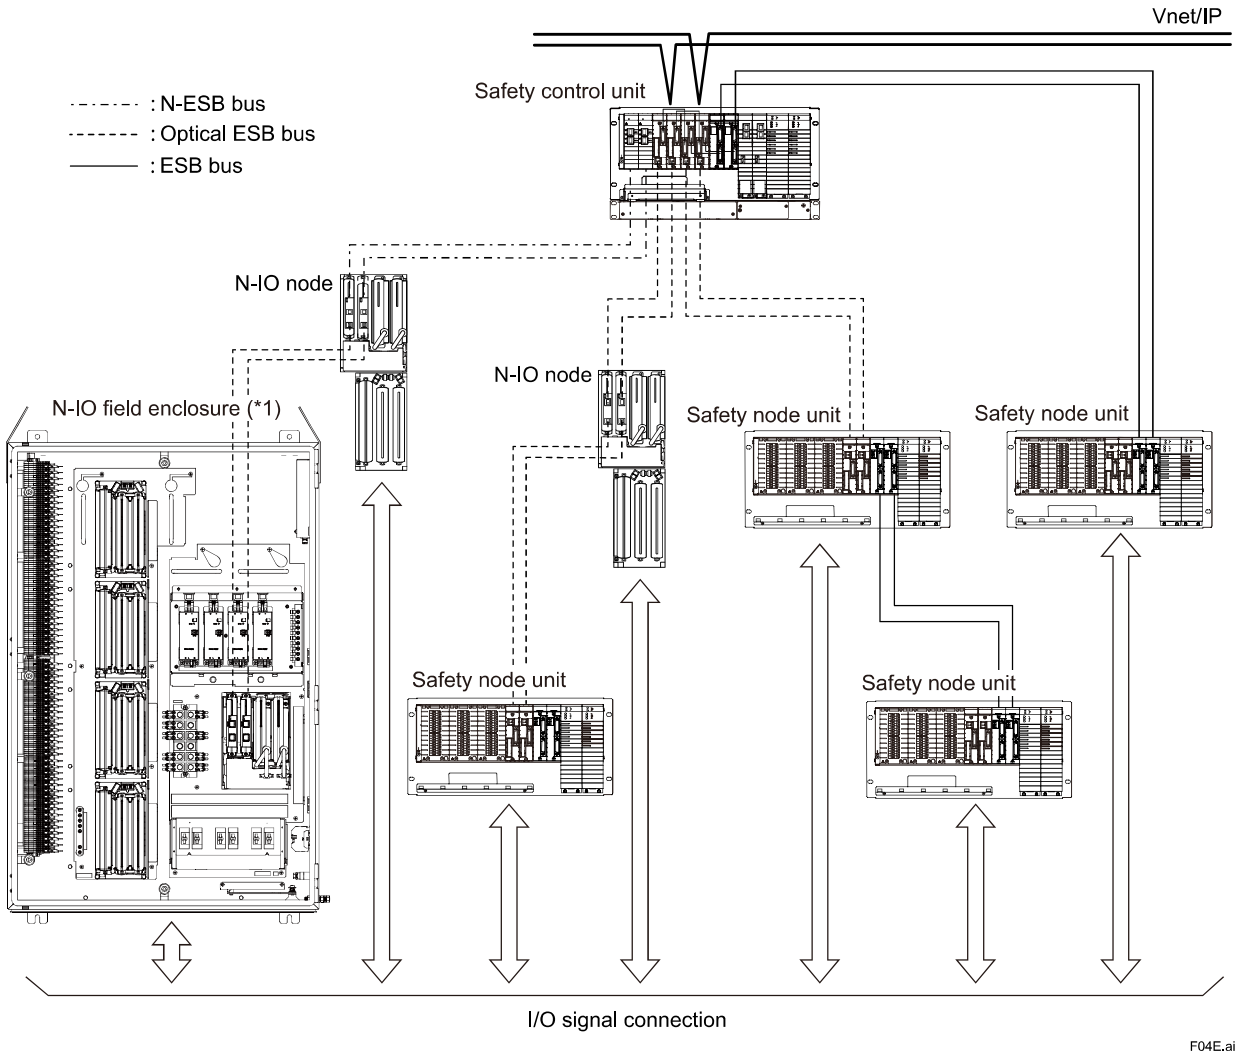
● Battery

- S2CP471
  Part No. : S9450FE
  Battery’s recommended replacement period: Three years under the average ambient temperature of 30 °C or less.
- SCP461
  Part No. : S9185FA
  Battery’s recommended replacement period: Three years under the average ambient temperature of 30 °C or less.

● Weight

S2SC70S-S:	Approx. 7.9 kg
S2SC70S-F:	Approx. 13 kg
S2SC70D-S:	Approx. 8.5 kg
S2SC70D-F:	Approx. 13 kg

● Mounting



Rack mounting: Rack mount
(S2SC70☐-S, M5x8 screws)
(S2SC70☐-F, M5x12 screws)
Insulation bush (accessory)

● Connection

Power Supply: M4 screw terminal connection
Grounding: M4 screw terminal connection

■ EXTERNAL DIMENSIONS

Unit: mm

Nominal tolerance:

Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominal tolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

■ SOFTWARE

A software licenses are required for S2SC70S and S2SC70D separately. For details, refer to the GS “Safety Control Function (for S2SC70☐), Safety Control Function for SCS Simulator (for S2SC70☐)” (GS 32P03B30-01EN) and “Project I/O License” (GS 32P03A10-01EN).

■ STANDARD ACCESSORIES

S2SC70S and S2SC70D are delivered with the following standard accessories.

Parts Names	Parts Numbers	Description	Quantity	Remarks
Insulating bush	S9049PM	S2SC70S-S / S2SC70D-S	8	Accessories
		S2SC70S-F / S2SC70D-F	12	

All Rights Reserved. Copyright © 2015, Yokogawa Electric Corporation

■ MODEL AND SUFFIX CODES

Safety Control Unit

		Description
Model	S2SC70S	Safety Control Unit (for N-IO/FIO, Rack Mountable Type) (*1)
Suffix Codes	-S	Standard type (-20 to 40 °C)
	-F	wide range temperature (-20 to 70 °C) type (with Fan unit and ISA Standard G3)
	A	S2CP471, Dual-redundant Vnet/IP, dual-redundant power supply (*2)
	4	SCP461, Dual-redundant Vnet/IP, dual-redundant power supply (*3)
	1	Always 1
	1	100 - 120 V AC power supply
	2	220 - 240 V AC power supply
	4	24 V DC power supply
	0	With no explosion protection
	1	With explosion protection
	1	With ISA Standard G3
	0	Always 0
Option Code	/ATDOC	Explosion Protection Manual (*4)

*1: Supports ProSafe-RS R4.01 or later.
*2: When S2SC70S that is mounted with S2CP471 is used with ProSafe-RS R4.01, R4.02, R4.03, or R4.04, be sure to apply the software patch for supporting S2CP471.
*3: Shipped with SCP461. Also S2CP471 is usable. Replacing from SCP461 to S2CP471 by a user is prohibited. Replacement work must be done by the service engineer authorized by Yokogawa Electric Corporation. See GS 32P06D20-01EN.
*4: Select the option code "/ATDOC" to follow the ATEX Directive and UKEX Regulation when any components are used for explosion protection.

Duplexed Safety Control Unit

		Description
Model	S2SC70D	Duplexed Safety Control Unit (for N-IO/FIO, Rack Mountable Type) (*1)
Suffix Codes	-S	Standard type (-20 to 40 °C)
	-F	wide range temperature (-20 to 70 °C) type (with Fan unit and ISA Standard G3)
	A	S2CP471, Dual-redundant Vnet/IP, dual-redundant power supply (*2)
	4	SCP461, Dual-redundant Vnet/IP, dual-redundant power supply (*3)
	1	Always 1
	1	100 - 120 V AC power supply
	2	220 - 240 V AC power supply
	4	24 V DC power supply
	0	With no explosion protection
	1	With explosion protection
	1	With ISA Standard G3
	0	Always 0
Option Code	/ATDOC	Explosion Protection Manual (*4)

*1: Supports ProSafe-RS R4.01 or later.
*2: When S2SC70D that is mounted with S2CP471 is used with ProSafe-RS R4.01, R4.02, R4.03, or R4.04, be sure to apply the software patch for supporting S2CP471.
*3: Shipped with a pair of SCP461. Also a pair of S2CP471 is usable. Replacing from SCP461 to S2CP471 by a user is prohibited. Replacement work must be done by the service engineer authorized by Yokogawa Electric Corporation. See GS 32P06D20-01EN.
*4: Select the option code "/ATDOC" to follow the ATEX Directive and UKEX Regulation when any components are used for explosion protection.

■ CONFORMITY STANDARDS

Refer to the GS "Standards compliant models" (GS 32P01B60-01EN).

All Rights Reserved. Copyright © 2015, Yokogawa Electric Corporation

■ ORDERING INFORMATION

Specify the model, suffix code(s), and option code(s).
For selecting the right products for explosion protection, please refer to the TI “Explosion Protection” (TI 32S01J30-01E) without fail.

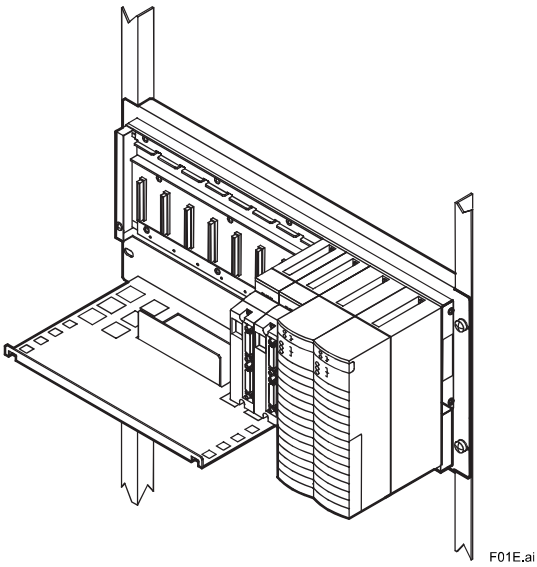
Attachment 9.16 Safety Node Unit (SNB10D)

GS 32Q06K10-31E

General Specifications

GS 32Q06K10-31E



ProSafe-RS
SNB10D
Safety Node Unit (Rack Mountable Type)

■ GENERAL

This GS describes the hardware specifications of the safety node unit (SNB10D). The safety node unit is connected to the safety control unit. The safety node unit has an interface function to transmit analog input signals and contact signals from the field to the safety control unit via an ESB bus. It also has a function to supply power to I/O modules.

The safety node unit is mounted with power supply modules, ESB bus interface modules, optical ESB bus repeater modules, and I/O modules.

For details on the I/O modules, refer to the general specifications (GS 32Q06K30-31E and GS 32Q06K40-31E).

F01E.ai

■ STANDARD SPECIFICATIONS

For the installation environment requirements that are common throughout the system, refer to the general specifications, “ProSafe-RS Safety Instrumented System Overview” (GS 32P01B10-01EN).

- **Safety Integrity Level**

  SIL 3

- **Power Supply Voltage**

  The power supply voltage is specified in the suffix codes.
  Voltage: 100 to 120 V AC and 50/60 Hz frequency
  Voltage: 220 to 240 V AC and 50/60 Hz frequency
  Voltage: 24 V DC

- **Power Consumption**

  100 to 120 V AC specification: 200 VA
  220 to 240 V AC specification: 230 VA
  24 V DC specification: 5.5 A

- **Weight**

  Approx. 5.9 kg

- **Mounting Method**

  Rack mounting: Rack mount with four M5 screws
  Insulation bushes (accessories) are used.

- **Conformity Standards**

  Refer to “Standards Compliant Models” (GS 32P01B60-01EN).

■ CONFIGURATION

- **Module Configuration**

  Power supply module: Supplies power to I/O module (two modules)
  The power supply terminal uses M4 screws.
  ESB bus interface module (SSB401): two modules

■ RESTRICTIONS AND CAUTIONS FOR MOUNTING

Regarding the mounting of I/O modules on the safety node unit, there are restrictions in terms of quantity and slot position. For details, refer to the “■ Node Unit Mounting Restrictions” of “Outline of I/O Modules (for FIO)” (GS 32P06K60-01EN).

©Copyright July 2011 (YK)
7th Edition Aug. 15, 2023 (YK)

■ EXTERNAL DIMENSIONS

● SNB10D Safety Node Unit

Unit: mm

Nominal tolerances :

Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominal tolerance is ± 1.5 mm.

The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

■ MODEL AND SUFFIX CODES

Safety node unit

		Description
Model	SNB10D	Safety Node Unit (Rack Mountable Type)
	–4	Dual-redundant power supply (R4.01 or later)
	1	100 to 120 V AC power supply
	2	220 to 240 V AC power supply
	4	24 V DC power supply
	5	ISA Standard G3 and temperature (-20 to 70 ˚C) with no explosion protection
	E	ISA Standard G3 and temperature (-20 to 70 ˚C) with explosion protection
Option Codes	/CU2N	Connector Unit for ESB Bus [Part number: S9342FA]
	/CU2T	Connector Unit with Terminator for ESB Bus [Part number: S9343FA]
	/ATDOC	Explosion Protection Manual

Note: Install the 19-inch rack mountable type devices in a keyed metallic cabinet to conform to the safety standards, the EMC conformity standards and the explosion protection standards.
Note: Please use 1 m or longer YCB301 ESB bus cable to connect SNB10D with a safety control unit .
Note: Select the option code "/ATDOC" to follow the ATEX Directive and UKEX Regulation for use in potentially explosive atmospheres.

Dummy cover

		Description
Model	SDCV01	Dummy cover (for I/O modules)

Note: Be sure to mount a dummy cover on a slot that is not mounted with an I/O module.

■ STANDARD ACCESSORIES

The safety node unit is supplied with the following accessory.

Accessory	Part number	Description	Quantity	Remark
Insulating bushing	S9049PM	SNB10D	4	Accessory

■ ORDERING INFORMATION

Specify the model and suffix codes.
For selecting the right products for explosion protection, please refer to the TI "Explosion Protection" (TI 32S01J30-01E) without fail.

■ TRADEMARK ACKNOWLEDGMENT

Attachment 9.17 ESB Bus Coupler Module (SEC401-S1)

GS 32Q06L11-31E

General Specifications

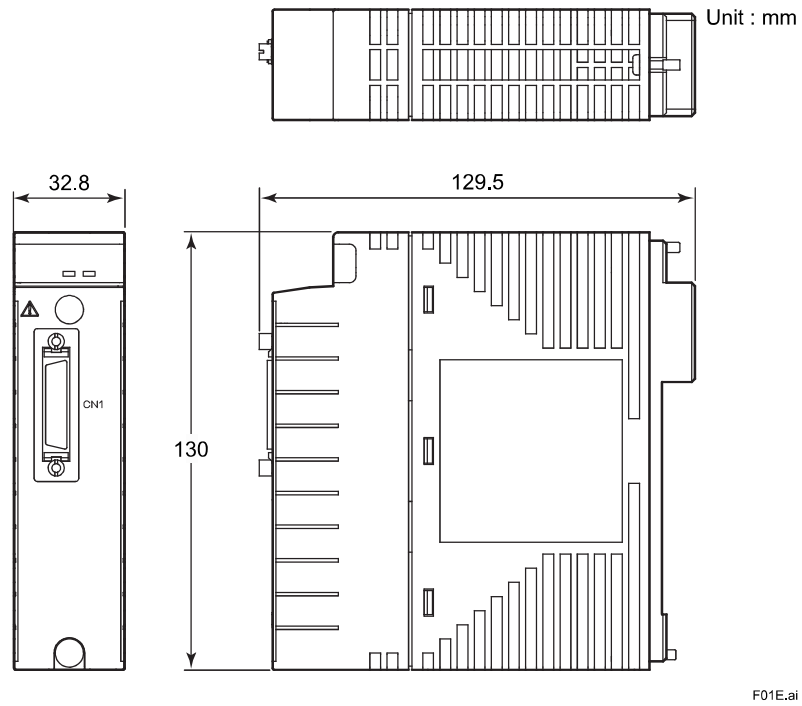
ProSafe-RS
SEC401
ESB Bus Coupler Module

GS 32Q06L11-31E

■ GENERAL

ESB Bus Coupler Module connects safety control units and safety node units via an ESB bus cable.
Two ESB Bus Coupler Modules are mounted on the safety control unit (S2SC70□, SSC60□, or SSC50□).

■ STANDARD SPECIFICATIONS



Function:	ESB bus master interface function
Number of connectable units:	9 units maximum (*1)
Transmission speed:	128 Mbps (I/O module data transmission)
Transmission distance:	10 m maximum
Current consumption:	0.5 A
Weight:	Approx. 0.24 kg

The ESB Bus Coupler Module is mounted on the seventh and eighth slots of the safety control unit.

*1: The number of SNB10D and SNT4□□ which can be connected to SEC401 is up to 9.

■ EXTERNAL DIMENSIONS

SEC401 ESB Bus Coupler Module

Nominal Tolerances:
When the reference dimension is over 0.5 mm and equal or less than 120 mm, its nominal tolerance is ± 0.8 mm, while its combination of nominal tolerance is ± 1.5 mm.
When the reference dimension is over 120 mm, its nominal tolerance is in accordance with JEM 1459.

Attachment 9.18 Analog Input Module (SAI143-H63)

GS 32Q06K30-31E

General Specifications

ProSafe-RS
Analog I/O Modules (for FIO)

GS 32Q06K30-31E

■ GENERAL

This GS describes the hardware specifications of the analog I/O modules that can be mounted on the safety node unit and the safety control unit.

■ STANDARD SPECIFICATIONS

● **Current Input Module**

This module inputs 4 to 20 mA signals from the field.

The SAI143 can be made dual redundant.

Item	Specifications
Model	SAI143 (*1)
Safety Integrity Level	SIL 3
Number of input channels	16 channels, module isolation (*5)
Rated input range	4 to 20 mA
Permissible input range	0 to 25 mA
Input impedance during Power-ON	$250\ \Omega + \frac{\text{Voltage drop in the input protection circuit inside the module}}{\text{Current value}}$ (*6)
Input impedance during Power-OFF	500 kΩ minimum
Rated accuracy	SAI143-S : ±16 µA (Input range 1 to 23 mA) SAI143-H : ±16 µA (Input range 0.05 to 23 mA) (*3) (*4)
Data update frequency	40 ms
Temperature drift	±16 µA/10 °C
Transmitter power supply	16.15 V minimum (at 20 mA) 26.4 V maximum (at 0 mA) (Output current limit: 25 mA)
2/4-wire setting	Individual channel setting Changed by setting pins
Withstand voltage	1.5 kV AC between input signal and system for 1 minute (*2)
Maximum current consumption	5 V system: 320 mA, 24 V system: 550 mA
Weight	Approx. 0.34 kg (For pressure clamp terminal block or MIL cable) Approx. 0.39 kg (With signal cable interface adapter)
External connection	Pressure clamp terminal MIL cable Dedicated signal cable (KS1)
HART communication	Available (SAI143-H)
Transmitter power supply ON/OFF function (*7)	Available in 2-wire setting, for all 16 channels at the same time.

*1: No Zener barriers can be connected to this module. An isolation barrier should be used when an intrinsic safety instrumented system is used.
*2: 500 V AC when dedicated signal cable is used.
*3: ±32 µA (input range under 0.05 mA) (Style code S3 or later)
*4: Rated accuracy of style code S3 or later is ±16 µA (Input range 0.05 to 23 mA).
Rated accuracy of style code S2 or earlier is ±16 µA (Input range 1 to 23 mA).
*5: When SAI143-S□3 or SAI143-H□C is used in the ambient temperature more than 60°C, number of input channels which a user can use is restricted. Refer to “ProSafe-RS Outline of I/O Modules (for FIO)” (GS 32P06K60-01EN).
*6: The maximum voltage drop in the input protection circuit is 0.45 V. The module input impedance varies from 272.5 Ω (20 mA) to 362.5 Ω (4 mA).
*7: This function enables to reset the alarm state of Fire and Gas devices by turning off the transmitter power supplied from this module in 2-wire setting.
Supported by R4.03.00 or later and style code S4 or later.

● Voltage Input Module

This module inputs 1 to 5 V/1 to 10 V signals from the field.
The SAV144 can be made dual redundant.

Item	Specifications
Model	SAV144
Safety Integrity Level	SIL 3
Number of input channels	16 channels, module isolation
Rated input range	1 to 5 V/1 to 10 V
Permissible input range	±30 V
Input impedance during Power-ON	1 MΩ
Input impedance during Power-OFF	100 kΩ
Rated accuracy	1 to 5 V: ±4 mV 1 to 10 V: ±9 mV
Data update frequency	40 ms
Temperature drift	1 to 5 V: ±4 mV/10 °C 1 to 10 V: ±9 mV/10 °C
Withstand voltage	1.5 kV AC between input signal and system for 1 minute (*1)
Maximum current consumption	5 V system: 300 mA 24 V system: 140 mA
Weight	Approx. 0.24 kg (For pressure clamp terminal block or MIL cable) Approx. 0.29 kg (With signal cable interface adapter)
External connection	Pressure clamp terminal MIL cable Dedicated signal cable (KS1)

*1: 500 V AC when dedicated signal cable is used.

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

● TC/mV Input Module

This module receives signals from mV and thermocouple (TC). The SAT145 can be made dual redundant.

Item	Specifications
Model	SAT145
Safety Integrity Level	SIL 3
Number of input channels	16 channels, Isolated Channels
Input signal	TC: JIS C 1602, IEC 60584-1 (ITS-90) J: -210 to 1200 °C K: -270 to 1372 °C E: -270 to 1000 °C T: -270 to 400 °C S: -50 to 1767 °C R: -50 to 1767 °C N: -270 to 1300 °C B: 42 to 1820 °C
	mV -100 to 150 mV, -20 to 80 mV, -5 to 25 mV
Switching input signals	TC/mV can be set individually for CH1 to CH16.
Permissible input range	± 5 V
Withstand voltage (*1)	Between input and system: 1500 V AC for 1 minute Between channels: 200 V AC for 1 minute
Input impedance	At least 1 MΩ during Power-ON At least 1 MΩ during Power-OFF
Accuracy	TC ± 40 μV mV ± 40 μV
Allowable total resistance of signal source plus wiring	1000 Ω or less
Effect of allowable signal source resistance (1000 Ω)	± 20 μV (*2)
Reference junction compensation accuracy (*3) (*4)	-20 to 0 °C ± 1.5 °C 0 to 30 °C ± 1.0 °C 30 to 70 °C ± 1.5 °C
Temperature drift	± 40 μV / 10 °C
Data update period	150 ms
Burn-out	Individual channel setting Setting: Burnout upscale/Burnout downscale Detection time: 1.5 s
Ambient temperature (during operation)	-20 to 70 °C
Maximum current consumption	5 V system: 400 mA 24 V system: 200 mA
Weight	Approx. 0.47 kg
External connection	Dedicated signal cable (AKB331)

*1: Use AKB331 of style code S3 or later.
*2: In dual redundant configuration, this effect is ± 40 μV.
*3: Reference junction compensation accuracy is specified on combination with SBT4D.
It varies depending on the temperature environment of SBT4D.
These values indicate Reference junction compensation accuracy against the ambient temperature of terminal board.
*4: This accuracy changes due to the installation condition.
If measured temperature is lower than 0 °C, multiply the above value by the following coefficient (K):

$$K=\frac{\text{Thermoelctromotive force per degree at 0 °C}}{\text{Thermoelectromotive force per degree at measured temperature}}$$

● RTD Input Module

This module inputs RTD signals from the field. The SAR145 can be made dual redundant.

Item	Specifications
Model	SAR145
Safety Integrity Level	SIL 3
Number of input channels	16 channels, Isolated Channels
Input signal (*5)	RTD (3 wires) JIS C 1604, IEC 60751 (ITS-90) (*3): Pt100, Pt50, Pt200, Pt500, Pt1000 DIN 43760-1987: Ni100 Minco: Ni120
Withstand voltage	Between input and system: 1500 V AC for 1 minute Between channels: 200 V AC for 1 minute
Accuracy (*1) (*2)	800 Ω range to 400 Ω: ± 160 mΩ to 800 Ω: ± 180 mΩ 4000 Ω range to 2000 Ω: ± 900 mΩ to 4000 Ω: ± 1700 mΩ
Allowable resistance of wiring	150 Ω or less (wiring resistance per wire) (*4)
Measurement current	800 Ω range: 0.5 mA 4000 Ω range: 0.1 mA
Temperature drift	800 Ω range to 400 Ω: ± 150 mΩ / 10 °C to 800 Ω: ± 300 mΩ / 10 °C 4000 Ω range to 2000 Ω: ± 750 mΩ / 10 °C to 4000 Ω: ± 1500 mΩ / 10 °C
Data update period	150 ms
Burn-out	Individual channel setting Setting: Burnout upscale/Burnout downscale Detection time: 1.5 s
Ambient temperature (during operation)	-20 to + 70 °C
Maximum current consumption	5 V system: 500 mA 24 V system: 200 mA
Weight	Approx. 0.47 kg
External connection	Dedicated signal cable (AKB611)

*1: Include the tolerance which is caused by dedicated signal cable AKB611(up to 5 m).
In case of the cable length of AKB611 is more than 5 m, 15 mΩ shall be added to the accuracy per each 5 m.
*2: These values apply for the case when the resistance of field wiring line A and line B are the same value.
If the difference of resistance between line A and line B happens, the different value among them needs to be added.
*3: SAR145 also supports JIS C 1604: 1989 JPt100.
*4: Wiring resistance for signal cable of INnA, INnB and INnC must be identical.
*5: When connecting the RTD modules, use the resisters composed of the passive parts. If an instrument that simulates resistance electronically is connected, it may cause error between reading and actual values. Do not connect voltage signal to the modules.

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

● Current Output Module

This module outputs 4 to 20 mA signals to the field.
The SAI533 can be made dual redundant.

Item	Specifications
Model	SAI533
Safety Integrity Level	SIL 3
Number of output channels	8 channels, module isolation (*2)
Rated output range	4 to 20 mA
Maximum range of guaranteed precision	1.25 to 23 mA
Output range	1.25 to 23 mA
Allowable load resistance @ rated range	230 to 600 Ω
Accuracy	±48 μA
Data update frequency	40 ms
Temperature drift	±16 μA/10 °C
Withstand voltage	1.5 kV AC between output signal and system for 1 minute (*1)
Maximum current consumption	5 V system: 320 mA 24 V system: 300 mA
Weight	Approx. 0.26 kg (For pressure clamp terminal block or MIL cable) Approx. 0.33 kg (With signal cable interface adapter)
External connection	Pressure clamp terminal MIL cable Dedicated signal cable (KS1)
HART communication	Available

*1: 500 V AC when dedicated signal cable is used.
*2: When SAI533-H□3 is used in the ambient temperature more than 60°C, number of output channels which a user can use is restricted. Refer to “ProSafe-RS Outline of I/O Modules (for FIO)” (GS 32P06K60-01EN).

■ HART COMMUNICATION

Analog I/O module with HART communication on ProSafe-RS allows Plant Resource Manager (PRM) to manage the HART communication devices connected to input and output modules on SCS. Also, the analog output module allows PRM client to conduct Partial Stroke Test (PST) on HART-supported valve positioner equipped with the PST function.

The HART communication functions on ProSafe-RS are interference-free and have no impact on the safety functions on SCS.

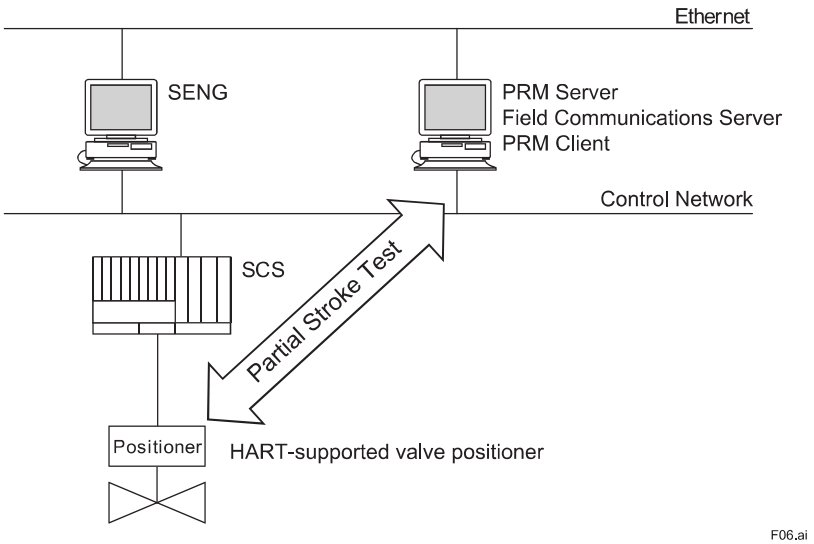

Figure Example of the HART Communication Function System Configuration

● Analog I/O Modules for HART Communication Function

The following table shows analog I/O modules for HART communication function available to ProSafe-RS.

Model	Module	Description
SAI143-H	Analog Input module (Current input)	4 to 20 mA, 16 channels, module isolation
SAI533-H	Analog Output module (Current output)	4 to 20 mA, 8 channels, module isolation

One HART device is connectable for each channel. Each channel is equipped with a power supply function to the HART device.

Each module has only one HART modem and is communicable concurrently with only one HART device.

● HART Communication Specifications

Table HART Communication Specifications

Function	Description
Communication mode	Serial half duplex, start-stop synchronization, 1 start/ 8 bit/ odd parity/ 1 stop
Applicable standard	HART Protocol Revision 5.7 (*1)
Transmission speed	1200 ±2 bps
Modulation technique	Binary phase-continuous FSK 1: 1200 Hz ±1 %, 0: 2200 Hz ±1%
Frame length	5 to 267 bytes Contents of max. 267 bytes: Delimiter: 1 Address: 5 Command: 1 Byte count: 1 Data: 255 (includes two bytes of response code) Check byte: 1
Frame detection	3 byte header byte-count carrier (ON/OFF) Preamble: 5 to 20 bytes
Error detection coding	Longitudinal/vertical parity
Response time	Max. 28 characters (256.7 ms)
No response timer	33 characters (305 ms) for primary, 41 characters (380 ms) for secondary
Bus monitor	8 characters (75 ms)
Response window	20 ms

*1: The HART 5, 6, and 7 devices can be connected but applying the HART protocol 5.7 function.

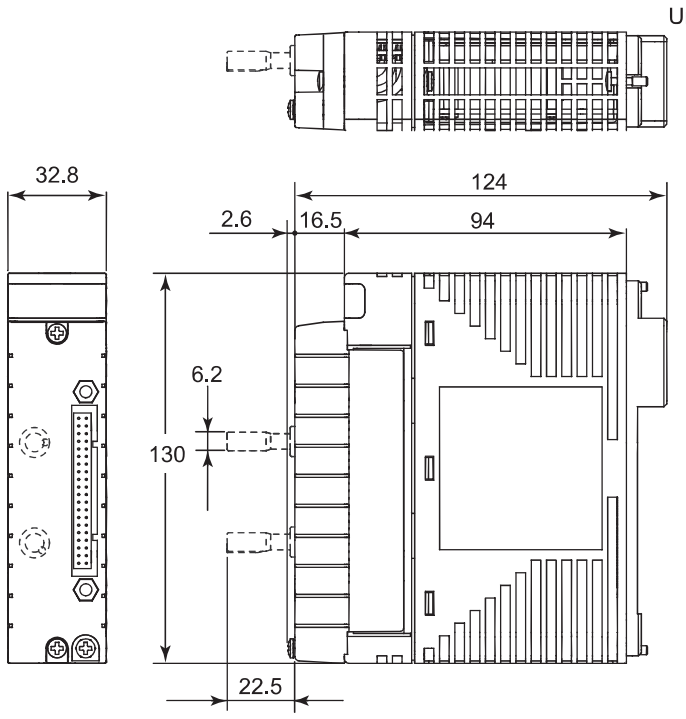
■ EXTERNAL DIMENSIONS

● SAI143, SAV144 and SAI533 Analog Input/Output Modules

For pressure clamp and MIL cable

Unit : mm



F01E.ai

Nominal tolerance:

Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominal tolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

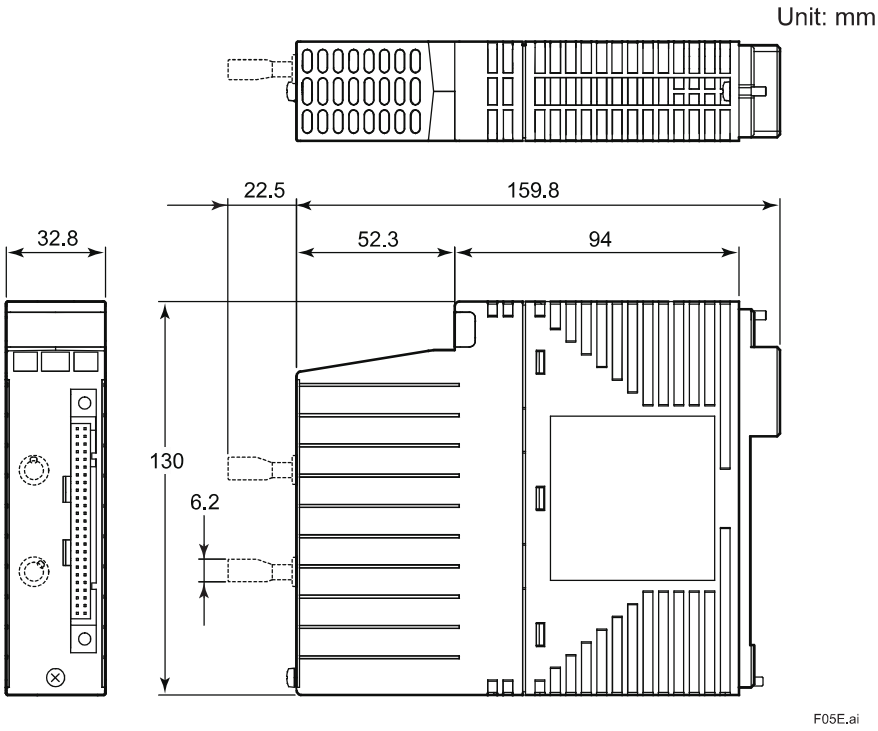
With signal cable interface adapter

Unit: mm

F02E.ai

Nominal tolerance:

Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominal tolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.



Note: Dash line expresses prevention pin of false insertion. This pin is added if option code /PRP is specified.

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

● SAT145, SAR145 Analog Input Modules

With signal cable interface adapter

Unit: mm

Nominal tolerance:

Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominal tolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

Note: Dash line expresses prevention pin of false insertion. This pin is added if option code /PRP is specified.

■ MODEL AND SUFFIX CODES

		Description
Model	SAI143	Analog Input Module (4 to 20 mA, 16 channels, module isolation)
Suffix Codes	-S	Standard type
	-H	With HART communication [Release: R1.02.00] (*1)
	5	For pressure clamp terminal block or MIL cable with no explosion protection
	6	With signal cable interface adapter and no explosion protection (*2)
	E	For pressure clamp terminal block or MIL cable with explosion protection
	F	With signal cable interface adapter and explosion protection (*2)
	3	With ISA Standard G3 and temperature (-20 to 70 ºC)
	C	With ISA Standard G3 and high-density installation (-20 to 70 ºC) (*5)
Option Codes	/A4S00	With pressure clamp terminal block for analog [Model: STA4S-00]
	/A4S10	With pressure clamp terminal block for analog (with surge absorber) [Model: STA4S-10]
	/A4D00	With dual-redundant pressure clamp terminal block for analog (*3) [Model: STA4D-00]
	/A4D10	With dual-redundant pressure clamp terminal block for analog (with surge absorber) (*3) [Part name: STA4D-10]
	/PRP	With prevention pin of false insertion (*4)
	/CCC01	With connector cover for MIL cable (for flat ribbon cable) [Model: SCCC01]

*1: For dual-redundant pressure clamp terminal block, please do not use STA4D-□0 S1.
*2: When selecting SAI143-□6□ or -□F□, you can not choose the option code of pressure clamp terminal block and MIL cable connector.
*3: When using this module in a dual-redundant configuration, order an additional module with the same specifications but without option codes.
*4: When SAI143-□6□ or -□F□ is selected, you can choose the option code for prevention pin of false insertion. A mechanism to prevent wrong type I/O module insertion is supported with signal cable. The signal cable used with this I/O module must have option code /SAI143.
*5: Suffix code for “With ISA Standard G3 and high-density installation” is available in case of SAI143-H□C. This is not available in case of SAI143-S.

		Description
Model	SAV144	Analog input module (1 to 5 V/1 to 10 V, 16 channels, module isolation)
Suffix Codes	-S	Standard type
	5	For pressure clamp terminal block or MIL cable with no explosion protection
	6	With signal cable interface adapter and no explosion protection (*1)
	E	For pressure clamp terminal block or MIL cable with explosion protection
	F	With signal cable interface adapter and explosion protection (*1)
	3	With ISA Standard G3 and temperature (-20 to 70 ºC)
Option Codes	/A4S00	With pressure clamp terminal block for analog [Model: STA4S-00]
	/A4S10	With pressure clamp terminal block for analog (with surge absorber) [Model: STA4S-10]
	/A4D00	With dual-redundant pressure clamp terminal block for analog (*2) [Model: STA4D-00]
	/A4D10	With dual-redundant pressure clamp terminal block for analog (with surge absorber) (*2) [Part name: STA4D-10]
	/PRP	With prevention pin of false insertion (*3)
	/CCC01	With connector cover for MIL cable (for flat ribbon cable) [Model: SCCC01]

*1: When selecting SAV144-S63 or -SF3, you can not choose the option code of pressure clamp terminal block and MIL cable connector.
*2: When using this module in a dual-redundant configuration, order an additional module with the same specifications but without option codes.
*3: When SAV144-S63 or -SF3 is selected, you can choose the option code for prevention pin of false insertion. A mechanism to prevent wrong type I/O module insertion is supported with signal cable. The signal cable used with this I/O module must have option code /SAV144.

		Description
Model	SAT145	TC/mV Input Module (16 channels, Isolated Channels)
Suffix Codes	-S	Standard type
	6	With signal cable interface adapter and no explosion protection
	F	With signal cable interface adapter and explosion protection
	3	With ISA Standard G3 and temperature (-20 to 70 ºC)
Option Codes	/PRP	With prevention pin of false insertion (*1)

*1: The signal cable used with this I/O module must have option code /SAT14.

		Description
Model	SAR145	RTD Input Module (16 channels, Isolated Channels)
Suffix Codes	-S	Standard type
	6	With signal cable interface adapter and no explosion protection
	F	With signal cable interface adapter and explosion protection
	3	With ISA Standard G3 and temperature (-20 to 70 ºC)
Option Codes	/PRP	With prevention pin of false insertion (*1)

*1: The signal cable used with this I/O module must have option code /SAR14.

		Description
Model	SAI533	Analog Output Module (4 to 20 mA, 8 channels, module isolation)
Suffix Codes	-H	With HART communication
	5	For pressure clamp terminal block or MIL cable with no explosion protection
	6	With signal cable interface adapter and no explosion protection (*1)
	E	For pressure clamp terminal block or MIL cable with explosion protection
	F	With signal cable interface adapter and explosion protection (*1)
	3	With ISA Standard G3 and temperature (-20 to 70 ºC)
Option Codes	/A4S00	With pressure clamp terminal block for analog [Model: STA4S-00]
	/A4S10	With pressure clamp terminal block for analog (with surge absorber) [Model: STA4S-10]
	/A4D00	With dual-redundant pressure clamp terminal block for analog (*2) [Model: STA4D-00]
	/A4D10	With dual-redundant pressure clamp terminal block for analog (with surge absorber) (*2) [Model: STA4D-10]
	/PRP	With prevention pin of false insertion (*3)
	/CCC01	With connector cover for MIL cable (for flat ribbon cable) [Model: SCCC01]

*1: When selecting SAI533-H63 or -HF3, you can not choose the option code of pressure clamp terminal block and MIL cable connector.
*2: When using this module in a dual-redundant configuration, order an additional module with the same specifications but without option codes.
*3: When SAI533-H63 or -HF3 is selected, you can choose the option code for prevention pin of false insertion.
A mechanism to prevent wrong type I/O module insertion is supported with signal cable. The signal cable used with this I/O module must have option code /SAI533.

■ CONFORMITY STANDARDS

Refer to “Standards Compliant Models” (GS 32P01B60-01EN).

■ ORDERING INFORMATION

Specify the model and suffix codes.

For selecting the right products for explosion protection, please refer to TI 32S01J30-01E without fail.

Attachment 9.19 Digital Input Module (SDV144-S63)
GS 32Q06K40-31E

General Specifications

ProSafe-RS
Digital I/O Modules (for FIO)

GS 32Q06K40-31E

■ GENERAL

This GS provides the hardware specifications of the digital I/O modules that can be installed in the Safety Node Unit and Safety Control Units.

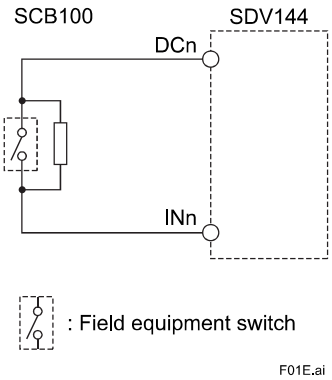
■ STANDARD SPECIFICATIONS

● Input Module

Input modules accept contact signals from the field. SDV144 can be made dual-redundant.

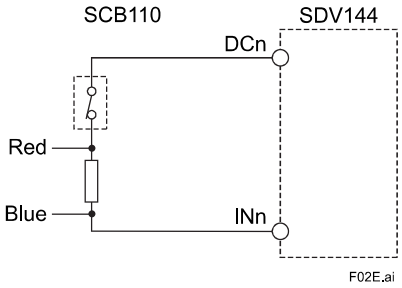
Item	Specifications
Safety Integrity Level	SIL 3
Model	SDV144
Number of inputs	16 channels, module isolation (*3)
Input signal	No-voltage contact ON: 1 kΩ maximum OFF: 100 kΩ minimum
Input current	6 mA ± 20 % (External power supply, 24 V DC at 0 Ω input)
Contact rating	24 V DC +20 % / -10 % (*4), 10 mA or greater
External power supply	24 V DC +20 % / -10 % (*3) (*4) Current capacity: 200 mA
Instantaneous maximum permissible input voltage	30.0 V DC
Input response time	40 ms maximum
Withstand voltage (*1) (*2)	2 kV AC between input signal and system for 1 minute, 16-input line collectively connected (*5)
Current consumption	290 mA maximum (5 V DC) 140 mA maximum (24 V DC)
Weight	Approx. 0.36 kg (For pressure clamp terminal block or MIL cable) Approx. 0.41 kg (With signal cable interface adapter)
External connection	Pressure clamp terminal MIL cable Dedicated signal cable (AKB331)

*1: These voltages show the case using the field power supply floating. When the field power supply is grounded, the system (functional) ground is connected to the field ground, which is not isolated. For the higher noise immunity, floating the field power supply is recommended.
*2: When the withstanding voltage of the field power supply between the secondary side and the ground is lower than the value shown in the table above, these voltages are adopted as the withstanding voltage of the field power supply.
*3: Number of input channels which a user can use and external power supply are restricted in case of SDV144-S□C. Refer to “ProSafe-RS Outline of I/O Modules (for FIO)” (GS 32P06K60-01EN).
*4: The contact rating and the external power supply of SDV144 style code S1, S2 and S3 are 24 V DC ± 5 %.
*5: When connecting SDV144 and SED4D terminal board using the dedicated signal cable, the withstand voltage is 500 V AC (between input signal lines and system). If MIL connector cables are used, the withstand voltage depends on their cable’s electrical specifications.



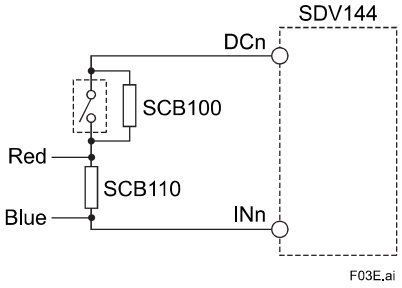
Yokogawa Electric Corporation
2-9-32, Nakacho, Musashino-shi, Tokyo, 180-8750 Japan
GS 32Q06K40-31E
©Copyright July 2011 (YK)
12th Edition Dec. 3, 2021 (YK)

If SDV144 field wiring diagnostic functions are used, the following wiring check adapter should be installed for individual channels in the vicinity of the field equipment:



- SCB100 (for defective open circuit detection while accepting off signals) (*1)
- SCB110 (for defective short-circuit detection while accepting on signals) (*2)

*1: Input signals are normally off while in normal operation.
*2: Input signals are normally on while in normal operation.



When the input signals are normally off while in normal operation, connect the SCB100 in parallel with the contact output of the field equipment as given below.

When the input signals are normally on while in normal operation, connect the SCB110 in series with the contact output of the field equipment (take care about the polarity taking note of the polarity).

When checking for both defective short and open circuits, connect the SCB100 and SCB110 in parallel and series with the contact outputs of the field equipment respectively, as given below.

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

● Output Module

Output modules output on/off status signals to field equipment.

The output modules can be made dual-redundant respectively. They incorporate field wiring diagnostic functions, so they require no wiring check adapter.

Item	Specifications
Model	SDV531
Safety Integrity Level	SIL 3
Number of outputs	8 channels, module isolation (*3)
Output voltage	24 V DC
Output voltage drop	1 V maximum
External power supply rating	24 V DC, 5 A minimum
External power supply	24 V DC +20 %/–10 % (*4) Current capacity: 5 A
Maximum leak current at output off status	1.6 mA
Output format	Current source
Maximum load current	0.6 A/output line (4.8 A in total output lines) (*3) (*5)
Minimum load current	35 mA
Load resistance range	40 to 685 Ω (*6)
Output response time	30 ms maximum
Withstand voltage (*1) (*2)	2 kV AC between output signal lines and system for 1 minute, 8-point input lines collectively connected (negative lines) (*7)
Current consumption	280 mA maximum (5 V DC) 140 mA maximum (24 V DC)
Weight	Approx. 0.28 kg (For pressure clamp terminal block or MIL cable) Approx. 0.34 kg (With dedicated signal cable interface adapter)
External connection	Pressure clamp terminal MIL cable Dedicated signal cable (AKB331, AKB651 (*8))

*1: These voltages show the case using the field power supply floating. When the field power supply is grounded, the system (functional) ground is connected to the field ground, which is not isolated. For the higher noise immunity, floating the field power supply is recommended.

*2: When the withstanding voltage of the field power supply between the secondary side and the ground is lower than the value shown in the table above, these voltages are adopted as the withstanding voltage of the field power supply.

*3: Number of output channels which a user can use and maximum load current are restricted in case of SDV531-L□C. Refer to “ProSafe-RS Outline of I/O Modules (for FIO)” (GS 32P06K60-01EN).

*4: External power supply of SDV531-S style code S1 and S2 is 24 V DC ± 5%.

*5: Do not exceed this value, including the case of inrush/variation of the load current.

*6: Resistance value of the load for both ON and OFF state, including the field wiring resistance.

*7: When connecting SDV531 and SED4D terminal board using AKB331 dedicated signal cable, the withstand voltage is 500 V AC (between output signal lines and system). If MIL connector cables are used, the withstand voltage depends on their cable’s electrical specifications.

*8: AKB651 can be used for connection with SDV531-L only.

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

Item	Specifications
Model	SDV541
Safety Integrity Level	SIL 3
Number of outputs	16 channels, module isolation (*3)
Output voltage	24 V DC
Output voltage drop	1 V maximum
External power supply rating	24 V DC, 3.4 A minimum
External power supply	24 V DC + 20 % / -10 % (*4) Current capacity: 3.4 A
Maximum leak current at output off status	1.6 mA
Output format	Current source
Maximum load current	0.2 A/output line (3.2 A in total output line) (*3) (*5)
Minimum load current	35 mA
Load resistance range	120 to 685 Ω (*6)
Output response time	30 ms maximum
Withstand voltage (*1) (*2)	2 kV AC between output signal lines and system for 1 minute, 16-point input lines collectively connected (negative lines) (*7)
Current consumption	300 mA maximum (5 V DC) 150 mA maximum (24 V DC)
Weight	Approx. 0.29 kg (For pressure clamp terminal block or MIL cable) Approx. 0.31 kg (With dedicated signal cable interface adapter)
External connection	Pressure clamp terminal MIL cable Dedicated signal cable (AKB331, AKB651)

*1: These voltages show the case using the field power supply floating. When the field power supply is grounded, the system (functional) ground is connected to the field ground, which is not isolated. For the higher noise immunity, floating the field power supply is recommended.
*2: When the withstanding voltage of the field power supply between the secondary side and the ground is lower than the value shown in the table above, these voltages are adopted as the withstanding voltage of the field power supply.
*3: Number of output channels which a user can use and maximum load current are restricted in case of SDV541-S□C. Refer to “ProSafe-RS Outline of I/O Modules (for FIO)” (GS 32P06K60-01EN).
*4: External power supply of SDV541 style code S1 is 24 V DC ± 5%.
*5: Do not exceed this value, including the case of inrush/variation of the load current.
*6: Resistance value of the load for both ON and OFF state, including the field wiring resistance.
*7: When connecting SDV541 and SED4D terminal board using AKB331 dedicated signal cable, the withstand voltage is 500 V AC (between output signal lines and system). If MIL connector cables are used, the withstand voltage depends on their cable’s electrical specifications.

Item	Specifications
Model	SDV521
Safety Integrity Level	SIL 3
Number of outputs	4 channels, module isolation (*4)
Output voltage	24 V DC
Output voltage drop	1 V maximum
External power supply rating	24 V DC, 10 A minimum
External power supply	24 V DC +20 %/–10 % Current capacity: 8.2 A (*5)
Maximum leak current at output off status	1.6 mA
Output format	Current source
Maximum load current	2 A/output line (8 A in total output lines) (*4)
Minimum load current	100 mA
Load resistance range	12 to 240 Ω (*6)
Maximum lamp load (*1)	1 A/output line
Output response time	30 ms maximum
Withstand voltage (*2) (*3)	2 kV AC between output signal lines and system for 1 minute, 4-point input lines collectively connected (negative lines)
Current consumption	280 mA maximum (5 V DC) 140 mA maximum (24 V DC)
Weight	Approx. 0.36 kg
External connection	Dedicated signal cable (AKB651)

*1: This is the maximum rated load current in the case of a filament lamp. The inrush current of a filament lamp is acceptable up to 10 times of this value.
*2: These voltages show the case using the field power supply floating. When the field power supply is grounded, the system (functional) ground is connected to the field ground, which is not isolated. For the higher noise immunity, floating the field power supply is recommended.
*3: When the withstanding voltage of the field power supply between the secondary side and the ground is lower than the value shown in the table above, these voltages are adopted as the withstanding voltage of the field power supply.
*4: Number of output channels which a user can use and maximum load current are restricted in case of SDV521-S□C. Refer to “ProSafe-RS Outline of I/O Modules (for FIO)” (GS 32P06K60-01EN).
*5: Required capacity when all the channels are loaded with rated load. Please use external source with the capacity most appropriate for load to be applied.
(When it is probable to get inrush load, use power source with the inrush current added.)
*6: Resistance value of the load for both ON and OFF state, including the field wiring resistance.

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

Item	Specifications
Model	SDV526 (*1) (*2) (*3) (*4)
Safety Integrity Level	SIL 3
Number of outputs	4 channels, module isolation
Output voltage	100 to 120 V AC
Output voltage drop	1.3 V AC + 0.01 V AC/m minimum 2.5 V AC + 0.04 V AC/m maximum (*5)
External power supply rating	100 to 120 V AC (*6)
External power supply	100 to 120 V AC +10 %/–15 %
Maximum leak current at output off status	2 mA
Output format	Current source (common N side)
Maximum load current	0.5 A/output line
Minimum load current	0.1 A/output line
Load resistance range	5 kΩ (*7)
Output response time	60 ms
Withstand voltage	1500 V AC between output signal lines and system for 1 minute
Current consumption	500 mA maximum (5 V DC) 50 mA maximum (24 V DC)
Weight	Approx. 0.36 kg
External connection	Dedicated signal cable (AKB652) (*8)

*1: SDV526 is not capable to of detecting the following faults.
- short circuit between channels
- output short circuit while output signals are off

*2: When the application logic is designed to continuously change the output state to ON and OFF alternately, at least one of the following conditions must be met.
- every ON state must be kept 1,000ms or longer
- every OFF state must be kept 1,000ms or longer

*3: Acceptable reverse electromotive voltage for output channel is 450 V, 1 ms (The reverse electromotive voltage is caused by the connection with inductive load such as relays or solenoid valves.)

*4: Supported by R2.02.00 or later.

*5: It depends on the length of AKB652.

*6: In order to comply with safety standards, the external power supply connected to the terminal board is supplied from a secondary circuit. The secondary circuit is insulated by a transformer and the primary circuit is MAINS CIRCUITS of overvoltage category II up to 300 V. The insulation must be REINFORCED INSULATION or DOUBLE INSULATION.

*7: Resistance value of the load for OFF state, including the field wiring resistance.

*8: For dual-redundant configuration, two AKB652 cables with the same length should be used.

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

Item	Specifications
Model	SDV53A (*3)
Safety Integrity Level	SIL 3
Number of outputs	8 channels, module isolation
Output voltage	48 V DC
Output voltage drop	1 V maximum
External power supply rating	48 V DC, 5 A minimum
External power supply	48 V DC +20 %/–10 % Current capacity: 5 A (*4)
Maximum leak current at output off status	3.2 mA
Output format	Current source
Maximum load current	0.6 A/output line (4.8 A in total output lines) (*5)
Minimum load current	100 mA
Load resistance range	80 to 480 Ω (*6)
Output response time	36 ms maximum
Withstand voltage (*1) (*2)	2 kV AC between output signal lines and system for 1 minute, 8-point input lines collectively connected (negative lines)
Current consumption	290 mA maximum (5 V DC) 150 mA maximum (24 V DC)
Weight	Approx. 0.46 kg
External connection	Dedicated signal cable (AKB331, AKB651)

*1: These voltages show the case using the field power supply floating. When the field power supply is grounded, the system (functional) ground is connected to the field ground, which is not isolated. For the higher noise immunity, floating the field power supply is recommended.
*2: When the withstanding voltage of the field power supply between the secondary side and the ground is lower than the value shown in the table above, these voltages are adopted as the withstanding voltage of the field power supply.
*3: R2.03 or later
*4: Required capacity when all the channels are loaded with rated load. Please use external source with the capacity most appropriate for load to be applied.
(When it is probable to get inrush load, use power source with the inrush current added.)
*5: 0.3 A for filament lamp under the specified conditions. When rush current is over 3 A, the module cannot be connected.
*6: Resistance value of the load for both ON and OFF state, including the field wiring resistance.

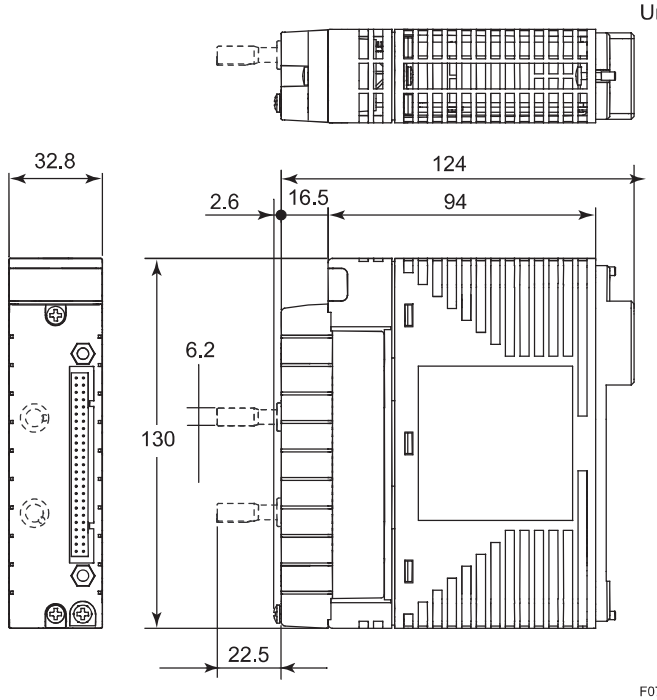
■ EXTERNAL DIMENSIONS

● SDV144 Digital Input Module

For pressure clamp and MIL cable

Unit: mm



Nominal tolerances :

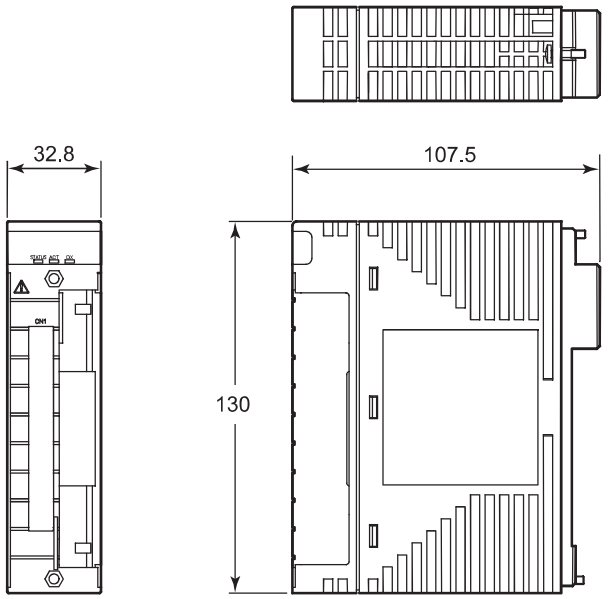
Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominaltolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

With signal cable interface adapter

Unit: mm

Nominal tolerances :

Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominaltolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.



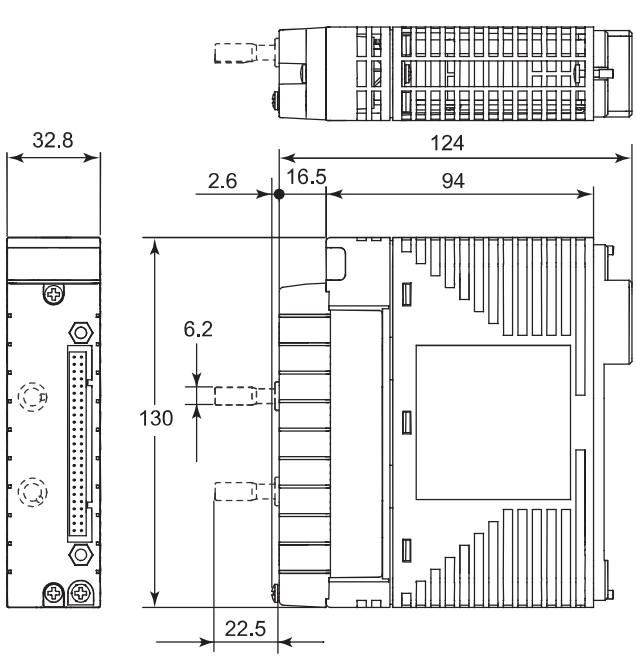
Note: Dash line expresses prevention pin of false insertion. This pin is added if option code /PRP is specified

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

● SDV531 and SDV541 Digital Output Module

For pressure clamp and MIL cable

Unit: mm



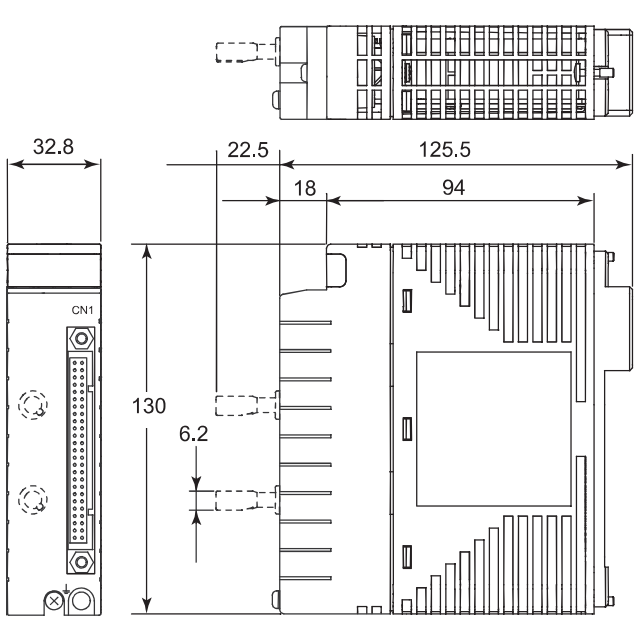
Nominal tolerances :

Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominaltolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

With signal cable interface adapter

Unit: mm

Nominal tolerances :



Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominaltolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

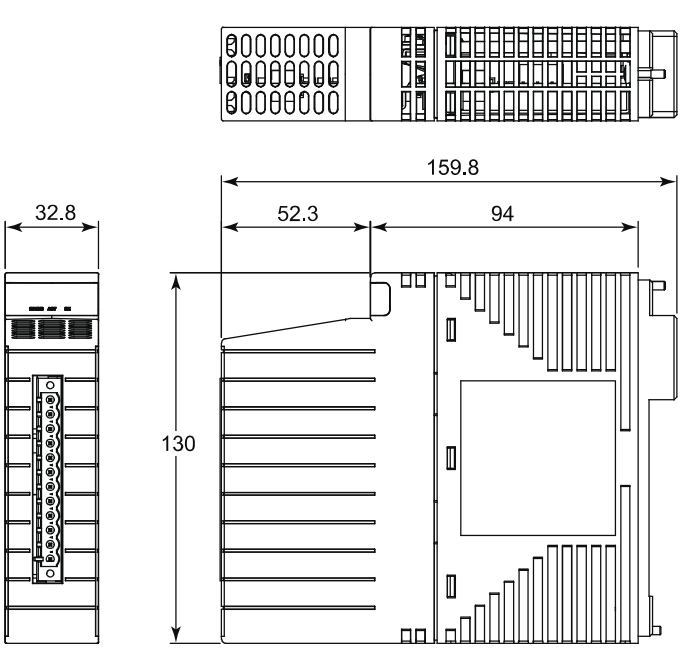
Note: Dash line expresses prevention pin of false insertion. This pin is added if option code /PRP is specified

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

● SDV521 Digital Output Module

Unit: mm

F09E.ai



Nominal tolerances :

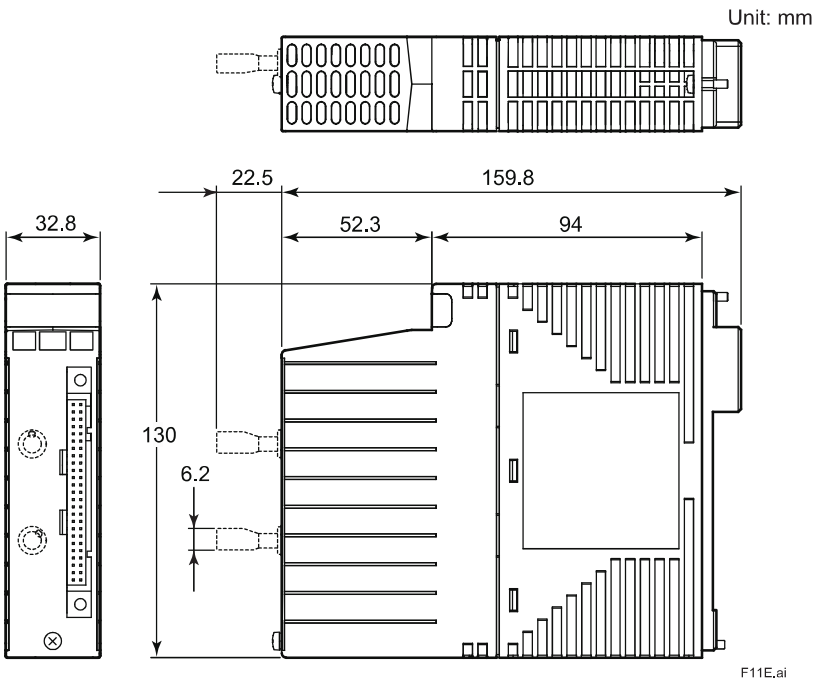
Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominaltolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

Note: Dash line expresses prevention pin of false insertion.

● SDV526 Digital Output Module

Unit: mm

F10E.ai



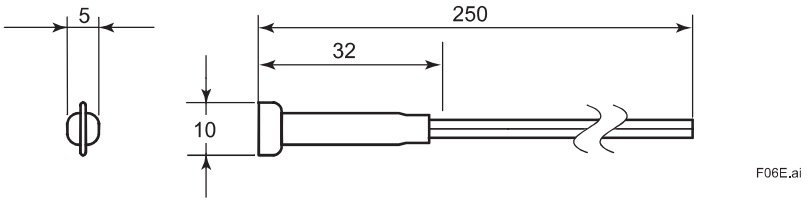
Nominal tolerances :

Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominaltolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

● SDV53A Digital Output Module

Unit: mm



Nominal tolerances :

Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominaltolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

● SCB100 and SCB110 Wiring Check Adapter

Unit: mm

Nominal tolerances :

Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominaltolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

■ MODEL AND SUFFIX CODES

Digital Input Module

		Description
Model	SDV144	Digital Input Module (24 V DC, 16 channels, module isolation)
Suffix Codes	-S	Standard type
	5	For pressure clamp terminal block or MIL cable with no explosion protection
	6	With signal cable interface adapter and no explosion protection (*1)
	E	For pressure clamp terminal block or MIL cable with explosion protection
	F	With signal cable interface adapter and explosion protection (*1)
	3	With ISA Standard G3 and temperature (-20 to 70 °C)
	C	With ISA Standard G3 and high-density installation (-20 to 70 °C)
Option Codes	/B4S00	With pressure clamp terminal block for digital input (without surge absorber) [Model: STB4S-00]
	/B4S10	With pressure clamp terminal block for digital input (with surge absorber) [Model: STB4S-10]
	/B4D00	With dual-redundant pressure clamp terminal block for digital input (without surge absorber) (*2) [Model: STB4D-00]
	/B4D10	With dual-redundant pressure clamp terminal block for digital input (with surge absorber) (*2) [Model: STB4D-10]
	/PRP	With prevention pin of false insertion (*3)
	/CCC01	With connector cover for MIL cable (for flat ribbon cable) [Model: SCCC01]
	/CCC02	With connector cover for MIL cable (for discrete wire) [Model: SCCC02]

*1: When SDV144-S6☐ or -SF☐ is selected, you cannot choose the option code for a pressure clamp terminal block and MIL cable connector.
*2: When this module is used in dual-redundant configuration, order an additional module with the same specification but without option codes.
*3: When SDV144-S6☐ or -SF☐ is selected, you can choose the option code for prevention pin of false insertion.
A mechanism to prevent wrong type I/O module insertion is supported with signal cable. The signal cable used with this I/O module must have option code /SDV144.

Digital Output Module

		Description
Model	SDV531	Digital output module (24 V DC, 8 channels, module isolation)
Suffix Codes	-L	Long distance type
	-S	Standard type
	5	For pressure clamp terminal block or MIL cable with no explosion protection
	6	With signal cable interface adapter and no explosion protection (*1)
	E	For pressure clamp terminal block or MIL cable with explosion protection
	F	With signal cable interface adapter and explosion protection (*1)
	3	With ISA Standard G3 and temperature (-20 to 70 °C)
	C	With ISA Standard G3 and high-density installation (-20 to 70 ºC) (*4)
Option Codes	/B4S00	With pressure clamp terminal block for digital output (without surge absorber) [Model: STB4S-00]
	/B4S10	With pressure clamp terminal block for digital output (with surge absorber) [Model: STB4S-10]
	/B4D00	With dual-redundant pressure clamp terminal block for digital output (without surge absorber) (*2) [Model: STB4D-00]
	/B4D10	With dual-redundant pressure clamp terminal block for digital output (with surge absorber) (*2) [Model: STB4D-10]
	/PRP	With prevention pin of false insertion (*3)
	/CCC01	With connector cover for MIL cable (for flat ribbon cable) [Model: SCCC01]
	/CCC02	With connector cover for MIL cable (for discrete wire) [Model: SCCC02]

*1: When SDV531-□6□ or -□F□ is selected, you cannot choose the option code for a pressure clamp terminal block and MIL cable connector.
*2: When this module is used in dual-redundant configuration, order an additional module with the same specification but without option codes.
*3: When SDV531-□6□ or -□F□ is selected, you can choose the option code for prevention pin of false insertion.
A mechanism to prevent wrong type I/O module insertion is supported with signal cable. The signal cable used with this I/O module must have option code /SDV531, /SDV53L or /DV53L.
*4: Suffix Code for “With ISA Standard G3 and high-density installation” is available in case of SDV531-L□C. This is not available in case of SDV531-S.

		Description
Model	SDV53A	Digital Output Module (48 V DC, 8 channels, module isolation)
Suffix Codes	-S	Standard type
	6	With signal cable interface adapter and no explosion protection
	F	With signal cable interface adapter and explosion protection
	3	With ISA Standard G3 and temperature (-20 to 70 °C)
Option Codes	/PRP	With prevention pin of false insertion (*1)

*1: The signal cable used with this I/O module must have option code /SDV53A or /DV53A.

Wiring Check Adapter

		Description
Model	SCB100	Wiring Check Adapter for Digital Input (for defective open circuit detection while accepting off signals with ISA Standard G3) (*1)
Suffix Codes	-S	Standard type
	0	Always 0

*1: Eight pcs/set

		Description
Model	SCB110	Wiring Check Adapter for Digital Input (for defective short-circuited detection while accepting on signals with ISA Standard G3) (*1)
Suffix Codes	-S	Standard type
	0	Always 0

*1: Eight pcs/set

■ STANDARD ACCESSORIES

The fuse for SDV144 style code S1, S2 and S3 are replaceable.

SDV144 style code S4 contains the fuse but it is not replaceable.

Accessory	Part number	Quantity	Remark
Fuse	A1327EF	1	Mounted

■ CONFORMITY STANDARDS

Refer to “Standards Compliant Models” (GS 32P01B60-01EN).

■ ORDERING INFORMATION

Specify the model and suffix codes when ordering.

For selecting the right products for explosion protection, please refer to the TI “Explosion Protection” (TI 32S01J30-01E) without fail.

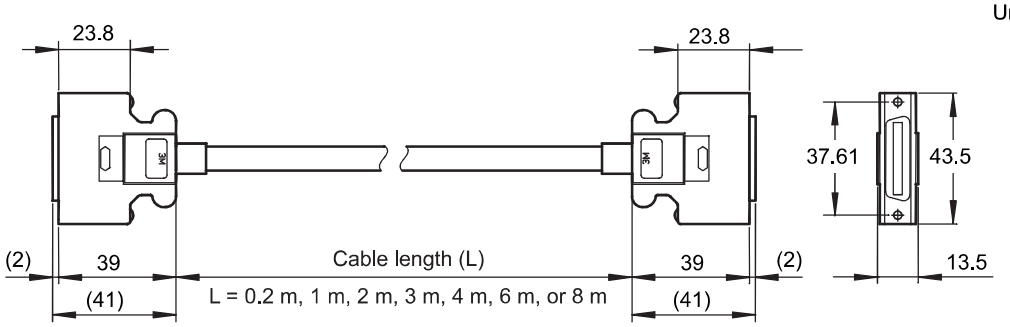
Attachment 9.20 Enhanced Serial Bus Cable (YCB301)
GS 32Q06M10-31E

General Specifications

ProSafe-RS/ProSafe-RS Lite
Cables

GS 32Q06M10-31E

GENERAL

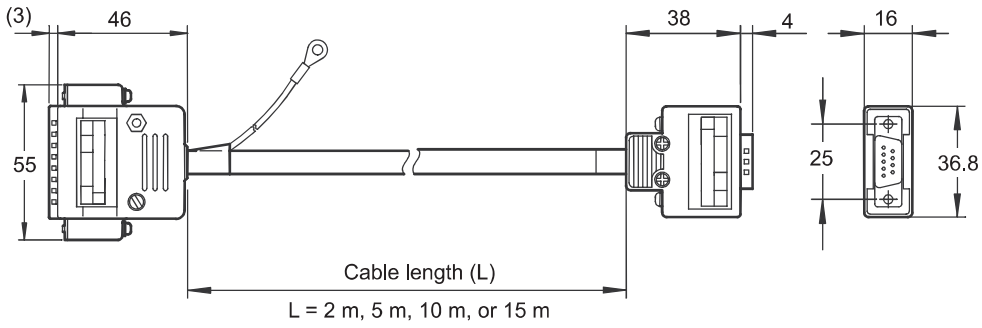


This GS provides the specifications for cables used in the ProSafe-RS/ProSafe-RS Lite system.

DIMENSIONS

Cables

YCB301 ESB Bus Cable

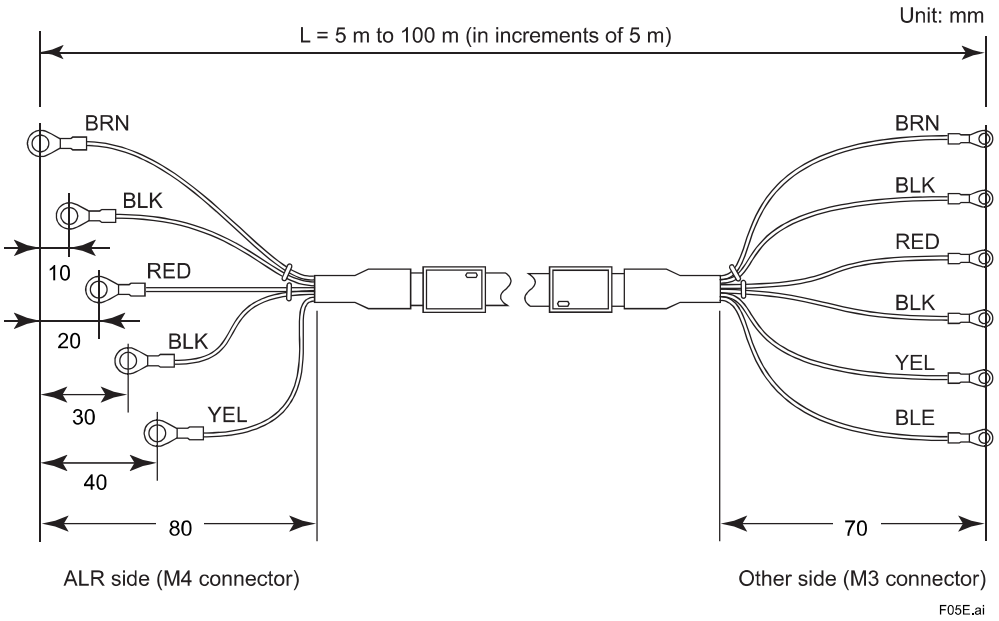


Unit: mm

F01E.ai

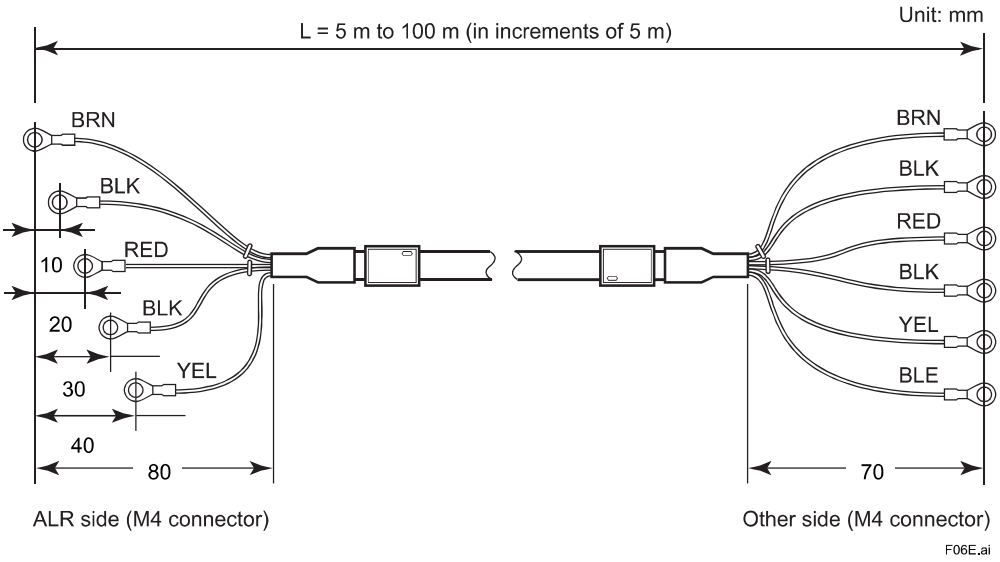
AKB131, AKB132, AKB135, AKB136 RS-232C Cables for Start-Stop Asynchronous Communications (for ALR111 Communications Module)

Unit: mm



F04E.ai

Note: An FG connection wire is attached to the other side connector of the AKB131 and AKB132 cables.



Yokogawa Electric Corporation

KS1 Cable (40-40 pins)

KS1: L = 1 m, 2 m, 3 m, 5 m, 7 m or 10 m, up to 50 m in 5 m increments

F08E.ai

Nominal tolerances:

Nominal tolerance is ± 0.8 mm for the dimensions of 0.5 mm or more and 120 mm or less, and the combined nominaltolerance is ± 1.5 mm.
The nominal tolerance is in accordance with JEM 1459 for the dimensions over 120 mm.

Nominal tolerances of cable length:

When the reference dimension is less than or equal to 3000 mm, its nominal tolerance is +5%, -0%.
When the reference dimension is over 3000 mm, its nominal tolerance is +3% or +1m(whichever is smaller), -0%.

■ MODEL AND SUFFIX CODES

EBS Bus Cable

		Description
Model	YCB301	ESB Bus Cable
Suffix Codes	-C020	Length: 20 cm
	-C100	Length: 1 m
	-C200	Length: 2 m
	-C300	Length: 3 m
	-C400	Length: 4 m
	-C600	Length: 6 m
	-C800	Length: 8 m

RS-232C Modem Cable (for connection between ALR111 and modem)

		Description
Model	AKB131	For connecting RS circuit isolated devices; RS-232C modem cable for start-stop asynchronous communications (9-25 pins)(for connection between ALR111 and modem)
Suffix Codes	-M002	Length: 2 m
	-M005	Length: 5 m
	-M010	Length: 10 m
	-M015	Length: 15 m

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

RS-232C Null Modem Cable (for connection between ALR111 and RS-232C device)

		Description
Model	AKB132	RS-232C null modem cable for start-stop asynchronous communications (9-25 pins)(for connection between ALR111 and RS-232C device)
Suffix Codes	-M002	Length: 2 m
	-M005	Length: 5 m
	-M010	Length: 10 m
	-M015	Length: 15 m

RS-232C Modem Cable (for connection between ALR111 and modem)

		Description
Model	AKB135	RS-232C modem cable for start-stop asynchronous communications (9-25 pins)(for connection between ALR111 and modem)
Suffix Codes	-M002	Length: 2 m
	-M005	Length: 5 m
	-M010	Length: 10 m
	-M015	Length: 15 m

RS-232C Null Modem Cable (for connection between ALR111 and RS-232C device)

		Description
Model	AKB136	RS-232C null modem cable for start-stop asynchronous communications (9-25 pins)(for connection between ALR111 and RS-232C device)
Suffix Codes	-M002	Length: 2 m
	-M005	Length: 5 m
	-M010	Length: 10 m
	-M015	Length: 15 m

Signal Cables

		Description
Model	AKB161	RS-422/RS-485 Cable Used between ALM side (M4 terminal) and other side (M3 terminal)
Suffix Code	-M □□□	Enter multiples of 5 in the □□□ (the cable comes in 5-m increments). Maximum length: 100 m (suffix code: -M100)

		Description
Model	AKB162	RS-422/RS-485 Cable Used between ALR side (M4 terminal) and other side (M4 terminal)
Suffix Code	-M □□□	Enter multiples of 5 in the □□□ (the cable comes in 5-m increments). Maximum length: 100 m (suffix code: -M100)

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

		Description
Model	AKB331	Signal Cable (50-50 pins) (for connection between SDV144/L1DV144, SDV531/L1DV531, SDV53A/L1DV53A, SDV541/L1DV541, or SAT145/L1AT145 and Terminal Board)
Suffix Codes	-M001	Length: 1 m
	-M002	Length: 2 m
	-M003	Length: 3 m
	-M005	Length: 5 m
	-M007	Length: 7 m
	-M010	Length: 10 m
	-M015	Length: 15 m
	-M020	Length: 20 m
	-M025	Length: 25 m
	-M030	Length: 30 m
	-M035	Length: 35 m
	-M040	Length: 40 m
	-M045	Length: 45 m
	-M050	Length: 50 m
Option Codes	/SDV144	Special cable for SDV144/L1DV144
	/SDV53L	Special cable for SDV531-L/L1DV531
	/SDV53A	Special cable for SDV53A/L1DV53A
	/SDV541	Special cable for SDV541/L1DV541
	/SAT14	Special cable for SAT145/L1AT145

Note: When connecting AKB331 with SDV531, SDV53A or SDV541, check if the cable length of AKB331 is proper or not, referring to “Terminal Board is connected” of “■ LIMITATIONS ON DIGITAL OUTPUT MODULE CONNECTIONS” in “ProSafe-RS Outline of I/O Modules (for FIO)” (GS 32P06K60-01EN).

Note: When connecting AKB331 with L1DV531, L1DV53A or L1DV541, check if the cable length of AKB331 is proper or not, referring to “Terminal Board is connected” of “■ LIMITATIONS ON DIGITAL OUTPUT MODULE CONNECTIONS” in “ProSafe-RS Lite Outline of I/O Modules” (GS 32P56K60-01EN).

Note: A mechanism to prevent wrong type I/O module insertion is supported. When you select option code /SDV144, /SDV53L, /SDV53A, /SDV541 and /SAT14, the same model I/O module with /PRP prevention pin of false insertion option can be used. For example, AKB331-M003/SDV144 can be used only with SDV144 or L1DV144 that have /PRP prevention pin of false insertion option.

		Description
Model	AKB611	Signal Cable (for connections between SAR145/L1AR145 and Terminal Board)
Suffix Code	-M002	Cable length : 2 m
	-M005	Cable length : 5 m
Option Code	/SAR14	Special cable for SAR145 /L1AR145

Note: A mechanism to prevent wrong type I/O module insertion is supported.
When you select option code /SAR14, SAR145 or L1AR145 with /PRP prevention pin of false insertion option can be used.

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

		Description
Model	AKB651	Signal Cable (50-50 pins) (for connections between SDV521/L1DV521,SDV531/L1DV531, SDV53A/L1DV53A, or SDV541/L1DV541 and Terminal Board)
Suffix Codes	-M001	Length: 1 m
	-M002	Length: 2 m
	-M003	Length: 3 m
	-M005	Length: 5 m
	-M007	Length: 7 m
	-M010	Length: 10 m
	-M015	Length: 15 m
	-M020	Length: 20 m
	-M025	Length: 25m
	-M030	Length: 30 m
Option Codes	/SDV521	Special cable for SDV521/L1DV521
	/DV53L	Special cable for SDV531-L/L1DV531
	/DV53A	Special cable for SDV53A/L1DV53A
	/DV541	Special cable for SDV541/L1DV541

Note: When connecting AKB651 with SDV521, SDV531-L, SDV53A or SDV541, check if the cable length of AKB651 is proper or not, referring to “Terminal Board is connected” of “■ LIMITATIONS ON DIGITAL OUTPUT MODULE CONNECTIONS” in “ProSafe-RS Outline of I/O Modules (for FIO)” (GS 32P06K60-01EN).
Note: When connecting AKB651 with L1DV521, L1DV531, L1DV53A or L1DV541, check if the cable length of AKB651 is proper or not, referring to “Terminal Board is connected” of “■ LIMITATIONS ON DIGITAL OUTPUT MODULE CONNECTIONS”in “ProSafe-RS Lite Outline of I/O Modules ” (GS 32P56K60-01EN).
Note: A mechanism to prevent wrong type I/O module insertion is supported. When you select option code /SDV521, /DV53L, /DV53A and /DV541, the same model I/O module with /PRP prevention pin of false insertion option can be used. For example, AKB651-M003/DV53L can be used only with SDV531-L or L1DV531 that have /PRP prevention pin of false insertion option.

		Description
Model	AKB652	Signal Cable (for connections between SDV526/L1DV526 and Terminal Board)
Suffix Codes	-M001	Length: 1 m
	-M002	Length: 2 m
	-M003	Length: 3 m
	-M005	Length: 5 m
	-M007	Length: 7 m
	-M010	Length: 10 m
	-M015	Length: 15 m
	-M020	Length: 20 m
	-M025	Length: 25 m
	-M030	Length: 30 m
Option Code	/SDV526	Special cable for SDV526/L1DV526

Note: When connecting AKB652 with SDV526, check if the cable length of AKB652 is proper or not, referring to “Terminal Board is connected” of “■ LIMITATIONS ON DIGITAL OUTPUT MODULE CONNECTIONS” in “ProSafe-RS Outline of I/O Modules (for FIO)” (GS 32P06K60-01EN).
Note: When connecting AKB652 with L1DV526, check if the cable length of AKB652 is proper or not, referring to “Terminal Board is connected” of “■ LIMITATIONS ON DIGITAL OUTPUT MODULE CONNECTIONS”in “ProSafe-RS Lite Outline of I/O Modules” (GS 32P56K60-01EN).

		Description
Model	KS1	Signal Cable (40-40 pins) (for connections between SAI143/L1AI143, SAV144/L1AV144, or SAI533/L1AI533 and Terminal Board)
Suffix Codes	-01	Length: 1 m
	-02	Length: 2 m
	-03	Length: 3 m
	-05	Length: 5 m
	-07	Length: 7 m
	-10	Length: up to 10 m (*1)
	-15	Length: 15 m
	-20	Length: 20 m
	-25	Length: 25 m
	-30	Length: 30 m
	-35	Length: 35 m
	-40	Length: 40 m
	-45	Length: 45 m
	-50	Length: 50 m
Style Code	*B	Style B
Option Codes	/SAI143	Special cable for SAI143/L1AI143
	/SAI533	Special cable for SAI533/L1AI533
	/SAV144	Special cable for SAV144/L1AV144

*1: "Length: up to 10 m" means the customer can specify the cable length that is not exceeding the 10 meters. For example, 8 m or 9 m can be specified when KS1-10*B is selected.

Note: A mechanism to prevent wrong type I/O module insertion is supported. When you select option code /SAI143, /SAI533 and /SAV144, the same model I/O module with /PRP prevention pin of false insertion option can be used. For example, KS1-03/SAI143 can be used only with SAI143/L1AI143 that have /PRP prevention pin of false insertion option.

■ CONFORMITY STANDARDS

Refer to "Standards Compliant Models" (GS 32P01B60-01EN).

■ ORDERING INFORMATION

Specify the model, suffix code(s), and option code(s).

■ TRADEMARK ACKNOWLEDGMENT

Attachment 9.21 TB for Analog Modules (SBA4D-06)

GS 32Q06L20-31E

General Specifications

ProSafe-RS/ProSafe-RS Lite
Terminal Boards/Relay Boards

GS 32Q06L20-31E

■ GENERAL

This GS describes the hardware specifications of the terminal boards used for the ProSafe-RS/ProSafe-RS Lite system.

■ STANDARD SPECIFICATIONS

● Terminal Board

19-inch Rack Mountable Type

Application	Model	Number of connection channels	Terminal	SIL (*1)	Connection module (*2)	Connection cable	Weight	Withstand voltage	Insulation resistance
For analog signals (single/ dual-redundant configuration)	SEA4D	16 channels x 2	M4 screw	SIL3	SAI143/ L1AI143	KS1	1.5 kg	500 V AC (for 1 minute) (*6)	100 MΩ minimum (500 V DC)
					SAV144/ L1AV144	KS1			
					SAI533/ L1AI533	KS1			
For digital signals (single/ dual-redundant configuration)	SED2D	4 channels x 4	M4 screw	SIL3	SDV521/ L1DV521	AKB651	2.3 kg	2000 V AC (for 1 minute) (*6)	100 MΩ minimum (500 V DC)
	SED3D	8 channels x 4	M4 screw	SIL3	SDV53A/ L1DV53A	AKB331 (*4)	2.0 kg	2000 V AC (for 1 minute) (*6)	
	SED4D	16 channels x 2 (*3)	M4 screw	SIL3	SDV144/ L1DV144	AKB331	1.5 kg	500 V AC (for 1 minute) (*6)	
					SDV531-S	AKB331			
					SDV531-L/ L1DV531-L	AKB331			
					SDV541/ L1DV541	AKB331			
	SWD2D (*5)	4 channels x 4	M4 screw	SIL3	SDV526/ L1DV526	AKB652	2.9 kg	1500 V AC (for 1 minute) (*6)	

Note: Connector covers must be mounted on connectors that do not have cables connected to them, to protect them from dust, and also to protect the connector pins.

*1: SIL (Safety Integrity level) of the terminal board alone.
*2: When connecting terminal boards with input/output modules, refer to following GS.
"ProSafe-RS Field Device Connection (for FIO)" (GS 32Q06J10-31E)
"ProSafe-RS Lite Field Device Connection" (GS 32P56J10-01EN)
*3: 8 channels × 2 for SDV531/L1DV531 connection
*4: Use AKB331 of style code S3 or later.
*5: Contact rating between ALM terminals when any fuse is blown
Meet all the following requirements.
Rated output voltage: 125 V AC or less, 125 V DC or less
Rated output current: 0.3 A or less
Rated power: 25 VA or less
*6: Between each signal terminal, and between all signal terminals and grounding terminal

DIN Rail Mount Type

Application	Model	Number of connection channels	Terminal	SIL (*1)	Connection module (*2)	Connection cable	Weight	Withstand voltage	Insulation resistance
For analog signals (single/ dual-redundant configuration)	SBA4D	16 channels x 1	Pressure clamp	SIL3	SAI143/ L1AI143	KS1	0.2 kg	NA	NA
					SAV144/ L1AV144	KS1			
					SAI533/ L1AI533	KS1			
	S1BB4D (*3) (*4)	16 channels x 1	Pressure clamp	SIL3	SAI143/ L1AI143	KS1	0.5 kg	2000 V AC (for 1 minute) (*5)	20 MΩ minimum (500 V DC)
	SBT4D	16 channels x 1	Pressure clamp	SIL3	SAT145/ L1AT145	AKB331	0.3 kg	200 V AC (for 1 minute) (*6)	10 MΩ minimum (200 V DC)
	SBR4D	16 channels x 1	Pressure clamp	SIL3	SAR145/ L1AR145	AKB611	0.3 kg		
For digital signals (single/ dual-redundant configuration)	SBD2D (*3)	4 channels x 1	Pressure clamp	SIL3	SDV521/ L1DV521	AKB651	0.3 kg	2000 V AC (for 1 minute) (*5)	10 MΩ minimum (500 V DC)
	SBD3D (*3)	8 channels x 1	Pressure clamp	SIL3	SDV531-L/ L1DV531-L	AKB331 (*7), AKB651	0.3 kg	2000 V AC (for 1 minute) (*5)	
					SDV531-S	AKB331 (*7)			
					SDV53A/ L1DV53A	AKB331 (*7), AKB651			
	SBD4D (*3)	16 channels x 1	Pressure clamp	SIL3	SDV144/ L1DV144	AKB331 (*7)	0.3 kg	2000 V AC (for 1 minute) (*5)	
					SDV541/ L1DV541	AKB331 (*7), AKB651			

Note: Connector covers must be mounted on connectors that do not have cables connected to them, to protect them from dust, and also to protect the connector pins.

*1: SIL (Safety Integrity level) of the terminal board alone.
*2: When connecting terminal boards with input/output modules, refer to following GS.
"ProSafe-RS Field Device Connection (for FIO)" (GS 32Q06J10-31E)
"ProSafe-RS Lite Field Device Connection" (GS 32P56J10-01EN)
*3: The READY contact rating shows below.
125 V AC or less and 0.3 A or less
60 V DC or less and 1 A or less
*4: Rated power supply current for field devices is 0.35 A per channel. Inrush current must be 0.7 A or less for the first 2 seconds.
*5: Between power terminal and READY terminal
*6: Between channels
*7: Use AKB331 of style code S3 or later.

● Relay Board

19-inch Rack Mountable Type

Item	Specifications	
Model	SRM53D	SRM54D
Safety integrity level	SIL 2 (*1)	SIL 2 (*1)
Type of input/output and number of I/O channels	Contact output/8 channels x 2 (dry contact outputs)	Contact output/16 channels x 1 (dry contact outputs)
Terminals	M4 screws, 16 poles x 2 (outputs) M4 screws, 2 poles x 1 (power)	
Connection module	SDV531/L1DV531, SDV144 /L1DV144 (read-back) (*2) Dual-redundant possible	SDV541/L1DV541, SDV144/L1DV144 (read-back) (*2) Dual-redundant possible
External connection	Dedicated signal cable AKB331	
Withstanding voltage	Between field device terminals and case: 2 kV for 1 minute Between 24 V power terminal and case: 500 V for 1 minute Between 24 V power terminal and field device terminals: 2.5 kV for 1 minute	
Insulation resistance	10 MΩ minimum (500 V DC)	
External supply voltage/current	24 V DC +5 %, -3.1 % (*3) Up to 1500 mA (24 V DC)	24 V DC +5 %, -1.2 % (*3) Up to 1500 mA (24 V DC)
Rated output voltage/current (current/channel)	250 V AC / 2 A 125 V DC / 0.4 A 30 V DC / 2 A	
Ambient temperature (during operation)	-20 to 70 °C	
Ambient humidity (both during operation and in transit/storage conditions)	5 to 85 % RH	
Weight	2.7 kg	

*1: SRM53D, SRM54D complies with SIL2 when used as DTS (De-energized-To-Safe) outputs under “low demand mode of operation” (the frequency of demands is no greater than one per year), which is defined in the IEC 61508.

*2: When connecting relay boards with output modules, refer to following GS.
“ProSafe-RS Field Device Connection (for FIO)” (GS 32Q06J10-31E)
“ProSafe-RS Lite Field Device Connection” (GS 32P56J10-01EN)

*3: This is the tolerance of the external supply voltage when the signal cable of 10 m (AKB331-M010) is used. The voltage loss of the external power supply varies with the length of the signal cable. For details, refer to following GS.
“ProSafe-RS Outline of I/O Modules (for FIO)” (GS 32Q06K20-31E)
“ProSafe-RS Lite Outline of I/O Modules” (GS 32P56K20-01EN)
Moreover, the maximum length of the signal cable (AKB331) used for connecting to the relay board is 20 m.

DIN Rail Mount Type

Item	Specifications
Model	SBM54D (*1)
Safety integrity level	SIL 2 (*2)
Type of input/output and number of I/O channels	Contact output/16 channels x 1 (dry contact outputs)
Terminals	Pressure clamp
Connection module (*3)	SDV541/L1DV541 (*4) Dual-redundant possible
External connection	Dedicated signal cable AKB331
Withstanding voltage	Between field device terminal and case: 2 kV for 1 minute Between 24 V power terminal and case: 2 kV for 1 minute Between 24 V power terminal and field device terminals: 2.5 kV for 1 minute Between READY terminal and case: 2 kV for 1 minute Between READY terminal and 24 V power terminal: 2 kV for 1 minute Between READY terminal and field device terminals: 2.5 kV for 1 minute
Insulation resistance	10 MΩ minimum (500 V DC)
External supply voltage/current	24 V DC +20 %, -10% Up to 500 mA (24 V DC)
Rated output voltage/current (current/channel)	30 V DC/4 A 240 V AC/4 A
Ambient temperature (during operation)	-20 to 70 °C
Ambient humidity (both during operation and in transit/storage conditions)	5 to 85 % RH
Weight	0.6 kg

*1: Dual power supply is available.
In case of power supply is normal operation, LED keeps ON. In the other case LED turns OFF.
The READY contact outputs the condition which power supply and all fuses is normal operation.
The READY contact rating shows below.
125 V AC or less and 0.3 A or less
60 V DC or less and 1 A or less

*2: SBM54D style code S3 or later complies with SIL2 when used as DTS (De-energized-To-Safe) outputs under “low demand mode of operation” (the frequency of demands is no greater than one per year), which is defined in the IEC 61508.

*3: When connecting relay boards with output modules, refer to following GS.
“ProSafe-RS Field Device Connection (for FIO)” (GS 32Q06J10-31E)
“ProSafe-RS Lite Field Device Connection” (GS 32P56J10-01EN)

*4: The style code and firmware revision numbers of SDV541 must be used following revision or later.
SDV541 S3, F1: 1 F2: 1

■ MODEL AND SUFFIX CODES

Analog terminal board for single/dual-redundant configuration

		Description
Model	SEA4D	Analog Terminal Board (Single and Dual-Redundant, 16 channels x 2)
Suffix Codes	-0	Without surge absorber
	-1	With surge absorber
	6	With ISA Standard G3 and no explosion protection
	F	With ISA Standard G3 and explosion protection
Option Code	/NTRY	Without cable tray

		Description
Model	SBA4D	Terminal Board for Analog: DIN rail mount type (Single and Dual-redundant, 16 channels x 1)
Suffix Codes	-0	Always 0
	6	With ISA Standard G3 and no explosion protection
	F	With ISA Standard G3 and explosion protection

		Description
Model	S1BB4D	Terminal Board for Analog Input, 3-wire : DIN rail mount type
Suffix Codes	-0	Always 0
	6	With ISA Standard G3 and no explosion protection
	F	With ISA Standard G3 and explosion protection

		Description
Model	SBT4D	Terminal Board for TC/mV: DIN rail mount type (Single and Dual-redundant, 16 channels x 1)
Suffix Codes	-0	Without surge absorber
	6	With ISA Standard G3 and no explosion protection
	F	With ISA Standard G3 and explosion protection

		Description
Model	SBR4D	Terminal Board for RTD Input: DIN rail mount type (Single and Dual-redundant, 16 channels x 1)
Suffix Codes	-0	Without surge absorber
	6	With ISA Standard G3 and no explosion protection
	F	With ISA Standard G3 and explosion protection

Digital terminal board for single/dual-redundant configuration

		Description
Model	SED2D	Digital Terminal Board (Single and Dual-Redundant, 4 channels x 4)
Suffix Codes	-0	Without surge absorber
	-1	With surge absorber
	6	With ISA Standard G3 and no explosion protection
	F	With ISA Standard G3 and explosion protection
Option Code	/NTRY	Without cable tray

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

		Description
Model	SED3D	Digital Terminal Board (Single and Dual-Redundant, 8 channels x 4)
Suffix Codes	-A	For 48 V DC output, without surge absorber
	6	With ISA Standard G3 and no explosion protection
	F	With ISA Standard G3 and explosion protection
Option Code	/NTRY	Without cable tray

		Description
Model	SED4D	Digital Terminal Board (Single and Dual-Redundant, 16 channels x 2)
Suffix Codes	-0	Without surge absorber
	-1	With surge absorber
	6	With ISA Standard G3 and no explosion protection
	F	With ISA Standard G3 and explosion protection
Option Code	/NTRY	Without cable tray

		Description
Model	SWD2D	Digital Terminal Board (Single and Dual-Redundant, 100 to 120 V AC, 4 channels x 4)
Suffix Codes	-2	For 100 to 120 V AC output
	1	With ISA Standard G3
Option Code	/NTRY	Without cable tray

		Description
Model	SBD2D	Terminal Board for Digital Output: DIN rail mount type (Single and Dual-redundant, 4 channels x 1, for SDV521/L1DV521)
Suffix Codes	-0	Always 0
	6	With ISA Standard G3 and no explosion protection
	F	With ISA Standard G3 and explosion protection

		Description
Model	SBD3D	Terminal Board for Digital Output: DIN rail mount type (Single and Dual-redundant, 8 channels x 1, for SDV53☐/L1DV53☐)
Suffix Codes	-0	24 V DC (for SDV531/L1DV531)
	-A	48 V DC (for SDV53A/L1DV53A)
	6	With ISA Standard G3 and no explosion protection
	F	With ISA Standard G3 and explosion protection

		Description
Model	SBD4D	Terminal Board for Digital: DIN rail mount type (Single and Dual-redundant, 16 channels x 1, for SDV144/L1DV144 and SDV541/L1DV541)
Suffix Codes	-0	Always 0
	6	With ISA Standard G3 and no explosion protection
	F	With ISA Standard G3 and explosion protection

All Rights Reserved. Copyright © 2011, Yokogawa Electric Corporation

Single or dual-redundant relay board with digital output

		Description
Model	SRM53D	Relay Board (8 × 2 Dry Contact Output)
Suffix Codes	-0	Always 0
	0	19-inch Rack mountable
	0	Basic
Option Codes	/BR4	Wall-mount bracket
	/NTRY	Without cable tray

		Description
Model	SRM54D	Relay Board (16 × 1 Dry Contact Output)
Suffix Codes	-0	Always 0
	0	19-inch Rack mountable
	0	Basic
Option Codes	/BR4	Wall-mount bracket
	/NTRY	Without cable tray

		Description
Model	SBM54D	Relay Board for Digital Output: DIN rail mount type (Single and Dual-redundant, 16 channels x 1, for SDV541/L1DV541)
Suffix Codes	-0	Always 0
	0	Always 0
	0	Standard type

■ CONFORMITY STANDARDS

Refer to “Standards Compliant Models (GS 32P01B60-01EN).”

■ ORDERING INFORMATION

Specify the model, suffix code(s), and option code(s).

For selecting the right products for explosion protection, please refer to TI 32S01J30-01E without fail.
