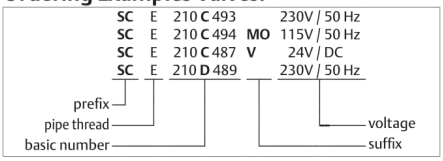
(∗) Ensure that compatibility of materials in contact with fluids is verified.
(1) Mounting position: piping horizontal, solenoid upright.

Options

- Valves can also be supplied with FPM (fluoroelastomer), EPDM (ethylene-propylene) and CR (chloroprene) diaphragms, seals and discs. Use the appropriate optional suffix letter for identification
- Waterproof enclosure with embedded screw terminal coil according to protection class IP67, CEE-10
- Explosionproof enclosures for use in zones 1/21-2/22, categories 2-3 to ATEX Directive 2014/34/EU
- Electrical enclosures according to "NEMA" standards are available
- Compliance with "UL", "CSA" and other local approvals available on request
- Mounting brackets for brass bodied valves, suffix MB (Except pipe size Rp 1, 1 1/4 and 1 1/2)
- For protection against corrosion caused by the environment or the fluid, contact us
- Other pipe connections are available on request
- Connector with visual indication and peak voltage suppression or with cable length of 2 m

Installation



- The solenoid valves can be mounted in any position without affecting operation, unless indicated otherwise in the specifications table.
- Stainless steel valves are standard supplied with mounting brackets
- Pipe connection is E = Rp (ISO 7/1)
- Installation/maintenance instructions are included with each valve

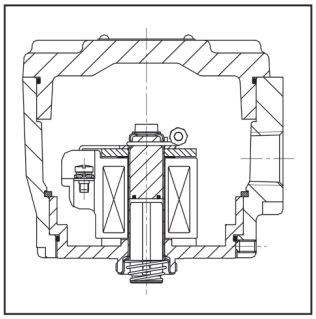
OPERATORS

for potentially explosive atmospheres
flameproof enclosure
II 2G/D Ex **d** IIC T6..T4 Gb / Ex **tb** IIIC Db IP66/67
aluminium or stainless steel enclosure

Series
NF
WSNF



FEATURES

- *Explosionproof operator for use in potentially explosive atmospheres according to ATEX-Directive 2014/34/EU*
  EC type examination certificate no.: ***LCIE 00 ATEX 6008 X***
  IECEx Certificate of Conformity no.: ***IECEx LCI 07.0015X***
- *Compliance with the Essential Health and Safety Requirements has been assured by compliance with the International and European Standards EN-IEC 60079-0, EN-IEC 60079-1 and EN-IEC 60079-31*
- *Easy electrical installation by means of a screw terminal coil*
- *Enclosure provided with a 1/2 NPT threaded entry hole (M20 x 1,5 in option) for a broad range of cable entries*
- *Ingress protection degree IP66/67*
- *A wide range of valves can be supplied with the operator*

Check the wattage compatibility with the product selected.
[1] **The minimum allowable ambient temperature is -60°C for the operator.** Actual temperature range can be limited depending on valve operation limits.
[2] AC (~): rectified coil construction.
[3] 230 V AC does not exist (Pn 1,85 W).

ORDERING INFORMATION

A valve supplied with the explosionproof operator will be identified with prefix NF or WSNF before the catalogue number.

Example: **NF** E 210D095 230V/50 Hz

- **NF** → operator
- E → pipe thread ISO 7/1
- 210D095 → basic number
- 230V/50 Hz → voltage

A valve supplied with the explosionproof operator will be identified with electrical interface FN, FS, FT or FU in the 15-digit product code.

15-DIGIT PRODUCT CODE

E 262 K 232 **FN** V00 H1

- E → Thread connection

IEC 60079-10 Analysis 601456B Crosswind

Full Title: EN IEC 60079-10-1 Analysis, Crosswind 1MW MEGAblock

Abstract: EN IEC 60079-10-1:2021 is intended to be applied where there may be a presence of flammable gas or vapor mixed with air. This is done by classifying areas where gas/air mixtures may be present into zones. Suitable design choices can be made based on the analysis, to eliminate the ignition hazard in the identified zones.

In this report, two areas are evaluated: the fuel connection to FCwave and External hydrogen handling unit.

1.0 Executive Summary

Two areas were evaluated using the methodology described in EN IEC 60079-10-1:2021:

1. Fuel connection to FCwave: due to the presence of continuous ventilation, and the quality of the ventilation as well as the ventilation speed surrounding the connection the area is considered non-hazardous. Those are discussed in further detail in this report.
2. External hydrogen handling unit: this area contains several fittings, flanges and valves fittings, which are considered potential sources of a secondary grade of release. Using natural ventilation present in the external location and the methodology in the standard, it is determined that the fuel connection area should be classified as Zone 2 for hydrogen gas with 1 meter radius.

5.0 Background Information

Figure 1: System installation with auxiliary equipment

System overview of the complete assembled system

5.1 Crosswind 1MW MEGAblock

The FC PowerGen 1000kW® system is comprised of 3 main components:

1. Fuel cell container, 40ft: is an area for installation of the Ballard FCwave module and DCDC converters. Inside the container distribution of HT and LT cooling is done, as well as control system for all BOP components.
2. Power Converter container, 10ft: All the power electronic converting the DC from the FCwaves into AC to the customer, build up in a separate container. The Customer AC connections as well as switchgear and controls for equipment are included in this container.
3. Cooling Unit: An external skid frame containing dry coolers and pumps for cooling the FCwave and power electronic. The skid includes a control cabinet for controlling of valves and fans on the cooling.

5.2 EN IEC 60079-10-1:2021

Specific terms used in this report are related to EN IEC 60079-10-1:2021, where a specific technical definition is given. Grade of release, zone type, and ventilation class are examples. Please refer to the standard for these definitions.

The standard provides a number of methods for classification of hazardous zones inside and outside of equipment containing flammable gases. The analysis performed and described through this report, follows the “classification by sources of release method” as described in Section 5.2 of the standard.

The general steps are:

- Is a flammable substance present (As described in Annex F, figure F.1.)
- Identify and specify grade of release sources (Continuously, Primary, Secondary).
- Determine the release rate for each source based on likely frequency and duration of release (as described in Annex F, figure F.4.).
- Assess ventilation or dilution conditions and effectiveness.
- Determine zone, based on grade of release and ventilation or dilution effectiveness.
- Determine extent of zone

For secondary grades of release, a process to determine the estimated leak rate and release characteristic is provided. The process relies on a number of calculations which are mentioned in this report but performed in a separate workbook. Results are shown in figures and tables included in this report.

5.3 Safety instrumented system

The safety instrumented system is comprised of a number of safety monitoring devices coupled with a safety controller which, in the event of a faulty condition being detected, stops the flow of hydrogen into the system. The monitoring devices include hydrogen detectors and smoke detectors, Further information on the Megablock Hydrogen Safety Concept referred to in document K559-2254-CWIWP4202202-C99-001.

5.4 P&ID

Several components are mentioned in this report that serve important functions with respect to hydrogen safety. These components and their relative location in the system can be found in the process and instrumentation diagram K559-2254-CWIWP4202202-C03-001 referenced in Section 2. For further details refer to the P&ID documentation.

6.0 Fuel connection to FCwave

Figure 2: Cross section of hydrogen extension box

Top view of the Fuel cell container. The red pipes are the unbroken seamless stainless-steel pipes, for hydrogen. The inlet connection is outside the container, and the outlet (inlet to FCwave) is enclosed in a ventilated space. See details in Figure 3.

6.1 Safety Approach

The hydrogen feed pipes are the connection pipes between the hydrogen interface pipe and the fuel cell module. All pipes are seamless stainless steel. The feed pipe is connected in both ends with a double-ferrule compression fitting. The pipe is a one-piece bended pipe with no welds or connections throughout the full length of the pipe, as illustrated on Figure 2 and Figure 3.

Figure 3: Cross section of hydrogen extension box

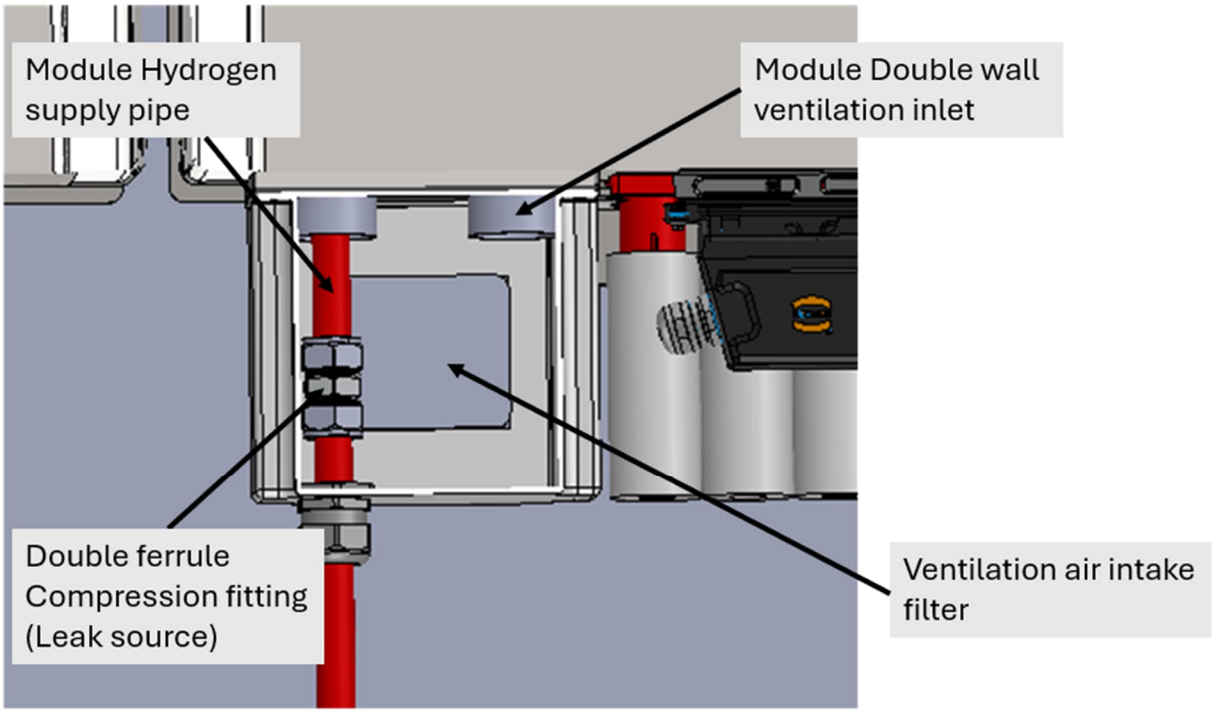

Figure shows a cross cut of the hydrogen enclosure extension. The prime component is the double ferrule compression fitting which is the potential leak

The connection to the fuel cell, from the hydrogen feed pipe, is made with a double-ferrule compression fitting, encapsulated in a ventilated space (box) as an extension of the fuel cell hydrogen ventilation system and the "double walled piping" approach, applied in the FCwave. Hereby transferring all the safety features from the module to this connection.

The FCwave module does not introduce any further risk of leakage due to the construction and certification on the product. For details on this refer to the safety Strategy for the FCwave in document MAN002.

Additionally, the container is equipped with 3 hydrogen sensors. 2 of these hydrogen sensors are located on the roof and near the point where the ventilated air from the container passes by to exhaust the container, so a leak anywhere in the container space will be detected here. The third is located next to the fresh air intake, making sure no hydrogen is introduced into the container from the outside.

The following chapter 6.2 to 6.6 are an assessment of the potential individual leak sources inside the container to determine if there is a local zone or area which requires further consideration.

6.2 Sources of Release

There is one connection inside the container, hence this will be the only potential source of release. This potential leak will be defined as a secondary grade of release.

6.3 Degree of Dilution

The potential leak (1) in Table 6 1, on the connection to the FCwave module is inside the extension of the hydrogen enclosure, surrounded by forced ventilation. The air velocity in the enclosure surrounding the potential leak is defined: The area of the box is calculated to be: 0,0205m2, with the minimum ventilation flow from the FCwave integration manual (MAN002) being 0,0125m^3/s, resulting in a total air velocity of the ventilation surrounding the potential leak: 0,4062m/s.

Table B.1 from EN IEC 60079-10-1:2021 is used to determine the theoretical hole size (cross section) to estimate the release rate. Input data for the calculation and results are listed in Table 6-1.

Using the equations provided in the standard (ex. B.7.2.3.2 and B.7.2.3.3), release rates are determined for each group. Factoring in the lower flammability limit for hydrogen (4%), the release characteristics are calculated.

Based on the Ventilation velocity and the release characteristics, the degree of dilution is determined to be high, as shown in Figure 4, where the green square indicates the value from the leak source.

Figure 4: Degree of Dilution Chart for release sources inside the container

The green point above corresponds to the data in Table 6-1. Points to the left of the blue line have a high degree of dilution, points between the blue and red lines have a medium degree of dilution.

6.4 Classification of Zone

Based on the schematic approach described in Figure F.4 of EN IEC 60079-10-1:2021, the zone classification of a *secondary grades of release* is assessed. The release characteristic and the degree of dilution, as described in Figure 4 and Table 6-1, “Leak 1”, results in a Non-Hazardous zone.

6.5 Extent of Zone

As the potential leak in “Leak 1” is classified to be a non-Hazardous zone, the extent is not calculated.

6.6 Summary of Fuel connection to FCwave

The process fuel connection to the FCwave is considered non-hazardous due to the safety approach described in Table 6-1.

Table 6-1: *Release sources inside the container (not including FCwave).*

1	2	3	4	5	6	B.1	8	11	12	13	14
	Description	Location	Grade	Rate of Release (kg/s)	Release Characteristic (m^3/s)	Estimate Size of Hole (mm^2)	Operating Pressure (Barg)	Degree of Dilution	Availability	type	Extent (m)
1	M20-M25 Hy-lok double ferrule compression fitting reducer	Connection to FC wave module inside H2E extension box	S	3,62E-05	0,0115	0.1	10	High	Good	Non-Hazardous	none

The table is built up after the "Hazardous Area Classification data sheet" from Table A.2 – EN IEC 60079-10-1:2021. The data listed is equivalent to the "ATEX zone definition calculation document". Not all columns from Table A.2 are given in this table. Notes to columns:

1. The release source has reference "Leak 1" in the calculation document.

4. Grade: S. the Hy-lock connection is one of the tightest pipe connection methods on the market, hence only rare leakages are to be expected from this connection type.

5,6. Calculated based amongst others on the estimated hole size (after table B.1) and the maximum operation pressure in the pipes (8). (same as 6, but another unit)

B.1: from table B.1 in EN IEC 60079-10-1:2021 and based on sealing element type.

8. The maximum operating pressure is used in the calculations.

9. Releases are all "G" for gas type

10. Ventilation type is "Forced ventilation"

11. Based on the release characteristics and the available ventilation, figure C.1 from the standard, points to a "High" dilution.

12. The availability is specified as good, due to the safety/redundancy built into the ventilation pf the given space.

13. looking at table D.1 from the standard, the conditions: Secondary release, high dilution, good availability of ventilation points to "non-hazardous".

14. as the zone is classified to be "Non-hazardous", based on dilution and ventilation, the extend is Not applicable.

7.0 External hydrogen handling unit

The fuel connection area is where the customer connects the hydrogen fuel supply to the fuel cell container. The external hydrogen handling unit also contains two in series safety shutoff valves as well as hydrogen heater for preheating the hydrogen in subzero conditions.

Figure 5: External hydrogen handling unit

The fuel connection area and safety shutoff valves are placed outside of the container, in free air.

The key elements of the "hydrogen handling unit" is pointed out in the figure.

7.1 Safety Approach

The fuel connection area outside the container contains a large number of fittings, flanges, and valves which may cause a secondary grade of release, at some point in the life of the product. As a hazardous zone is determined through the analysis, proper zone identification shall be made and the component and equipment in the area must be of the appropriate equipment category (EX approved). The extend and placement of the identified zone will be communicated to the integrator and end user in a general arrangement drawing K559-2254-CWIWP4202202-B01-001.

7.2 Sources of Release

There are three types of components which qualify as a potential source of release;

- fittings, flanges and valve stem packing.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

The Hydrogen handling unit consists of several individual fittings, flanges and connections, which are grouped in Table 7-1 below. Background hydrogen concentrations is not considered, as the system is not allowed to be installed in an already existing EX zone. All leaks are rated to be “secondary grade of release”, so according to EN IEC 60079-10-1:2021 Annex B section B4, one leak at a time is only considered.

7.3 Degree of Dilution

For outdoor locations where natural ventilation is available, a minimum ventilation velocity (for dilution) can be determined based on the location of the sources of release. Using Table C.1 from the standard, an estimated wind velocity or speed of buoyancy of worst case 0.5 m/s was determined based on:

- release of lighter than air gas.
- obstructed area less than 2 meters above ground.

Combined with the release characteristics from Table 7-1, the degree of dilution is determined to be “High” on “Leak 2,3”, and Medium at “Leak 4,5,6”, See Figure 6, where each leak source is plotted in to the diagram.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Figure 6: Degree of dilution chart for connections on hydrogen handling unit.

The colored points in the chart correspond to the color groups in Table 7-1. Points to the left of the blue line have a high degree of dilution, points between the blue and red lines have a medium degree of dilution.

7.4 Classification of Zone

Based on the schematic approached described in Figure F.4 of EN IEC 60079-10-1:2021, the zone classification of a *secondary grades of release* is assessed. The release characteristic and the degree of dilution, as described in Figure 6 and Table 7-1, “Leak 2,3”, results in a Non-Hazardous zone and “Leak 4,5,6” result in a Zone 2, with max 1 m extend.

7.5 Extent of Zone

Figure D.1 from EN IEC 60079-10-1:2021 is used as basics for the zone extend assessment. For the area around the "hydrogen handling unit", it is determined that all potential hydrogen releases will be jet type based, due to the high velocity of the modelled releases and the relative density of hydrogen to air. Based on the release characteristics specified in Table 7-1, it is found that the potential component releases from "Leak 5,6,7,8" would result in a zone that would be less than 1 meter in extent, see Figure 8. Since the minimum distance is 1 meter, the zone is defined to be 1m from the release source.

Figure 7: Extend of zone.

The colored points in the chart correspond to the color groups in Table 7-1. All points are below the line, determine the zone size.

7.6 Summary of External hydrogen handling unit

There are numerous fittings and valves (packing) that could leak at some point over the lifetime of the Fuel cell container. These leaks would generate jet plumes that would be relatively small and would dilute quickly. This analysis shows that adequate dilution would occur within 1 meter of the source. Therefore a 1 meter, Zone 2 setback should be

Table 7-1: List of leak sources identified in the External hydrogen handling unit.

The table is built up after the “Hazardous Area Classification data sheet” from Table A.2 – EN IEC 60079-10-1:2021. The data listed is equivalent to the “Atex zone definition calculation document”. Not all columns from Table A.2 are given in this table. Notes to columns:

1. The release source has reference “Leak 2-6” in the calculation document.

4. Grade: S. The Hy-lock connection, fittings and valves are selected due to their qualities in tightness, hence only rare leakages is connection with fault conditions are to be expected from this connection type.

5,6. Calculated based amongst others on the estimated hole size (after table B.1) and the maximum operation pressure in the pipes (8). (same as 6, but another unit)

7. No references used

B.1: from table B.1 in EN IEC 60079-10-1:2021 and based on sealing element type.

8: The maximum allowable operating pressure is applied in the calculations.

9. Releases are all “G” for gas type

10. Ventilation type is “Natural”

11. Based on the release characteristics and the available ventilation, figure C.1 from the standard, points to a “High” dilution from leak 2,3 and a medium dilution from leak 4,5,6.

12. The availability is specified as good, due to the ventilation being “natural”.

13. looking at table D.1 from the standard, the conditions: Secondary release, high dilution, good availability of ventilation points to “non-hazardous”. The conditions: Secondary release, medium dilution, good availability of ventilation points to “Zone 2”.

14. The extent of the zone is in all cases less than 1 m I radius from the leak point.

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

8.0 Process exhaust and drain

8.1 Background for evaluation

As stated in the integration manual (MAN0002) for the FCwave module the maximum amount of hydrogen present at all scenarios in the process exhaust is 1%vol. This is equal to 25% LEL of hydrogen.

The composition of gas in the drain is the same as the process exhaust due to the fact that the process exhaust is by "fault" emptying the static air lock (previous referred to as water lock) within the module. This means the maximum content of hydrogen in the drain will be 1%vol equal to the process exhaust.

8.2 Definition of explosive gas atmosphere

Due to the concentration being so low (below LEL) the general foundation of the definition of an Explosive atmosphere is not met. According to the standard IEC 60079-10-1:2021 section 3.2 the definition is:

- *"Explosive gas atmosphere*

  Mixture of air, under atmospheric conditions, of flammable substances in the form of gas or vapor, which, after ignition, permits self-sustaining flame propagation"

As the composition of gas in the drain is below 25% of LEL the gas is not able to self-sustain a flame propagation, meaning it is by definition not an Explosive gas atmosphere. Additionally, the IEC 60079-10-1 section 4.4.2 has a clause for releases which is considered as negligible extend. Either due to the potential explosion being of a negligible consequence, or if the release rate or quantity is of a negligible extent in reference to the volume. Yet the clause still operates with the gas potentially being able to combust or explode, which is not the case for a mixture of 1% vol hydrogen.

Additionally, the mixture is also below 25% LEL making sure no clauses from IEC 60079-10-1 Annex I is applicable.

8.3 Risk mitigation considerations

As part of the IEC 60079-10-1 Zone classification procedure a risk assessment can determine to increase or decrease the zoning and EPL. For this installation, the mitigation for not increasing the zoning from e.g. a non-hazardous to a Zone 2 is mitigated by selection of components for the drain system. Which for this system is converted into gastight fittings, instrumentation and pipe with the weakest component being able to withstand a constant pressure of 69 Barg. In addition to this, the general design eliminates the risk of the hydrogen up-concentrating in unintended areas by making sure the exhaust is at the highest point and with a pressure less system securing hydrogen and steam from the process exhaust gas will be able to escape the system through normal buoyancy.

9.0 Pressure testing according to IEC 62282-3-100

To make sure the Hazardous Area Classification is not exceeding the specified area of extent, release rate and frequency, the system within the Fuel cell container (from the hydrogen heating unit to the valve block (inside the FCwave)) has a build in function to automatically do a pressure decay test according to 62282-3-100:2020.

To maintain the specified HAC, the allowable maximum release of hydrogen is calculated in relation to the zone to make sure that the system is at all times within the boundaries provided in EN IEC 60079-10-1:2021.

The frequency at which this release can occur is still considered to be a “secondary grade of release” as *the release is not expected to occur in normal operation and, if it does occur, is likely to do so only infrequently and for short periods*[4]. Safety precautions describe in the document: *K559-2254-CWIWP4202202-C99-001 Megablock Hydrogen Safety Concept*, supports this assessment of the grade of release.

All leak sources mentioned in Table 7-1, are considered as a uniform leak, throughout this chapter.

9.1 Maximum release flow in respect to zone extend

As calculated in chapter 7.5, the minimum required extent of the zone 2 is 1m in radius. The maximum allowable leak, from the secondary leak source, is determined by the Figure 8 to have a release characteristic on 0,22m^3/s.

[4] From the definitions given in EN IEC 60079-10-1:2021.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Figure 8: Extent of Zone

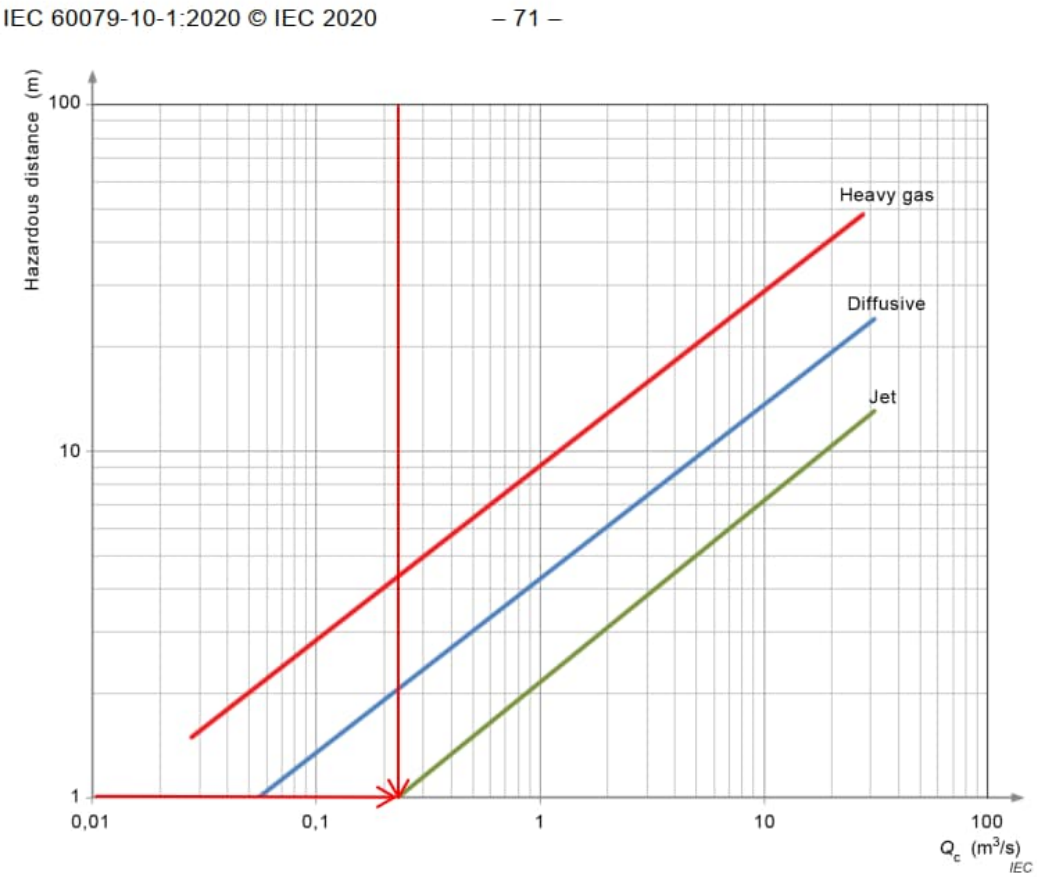

Figure D.1 – Chart for estimating hazardous area distances

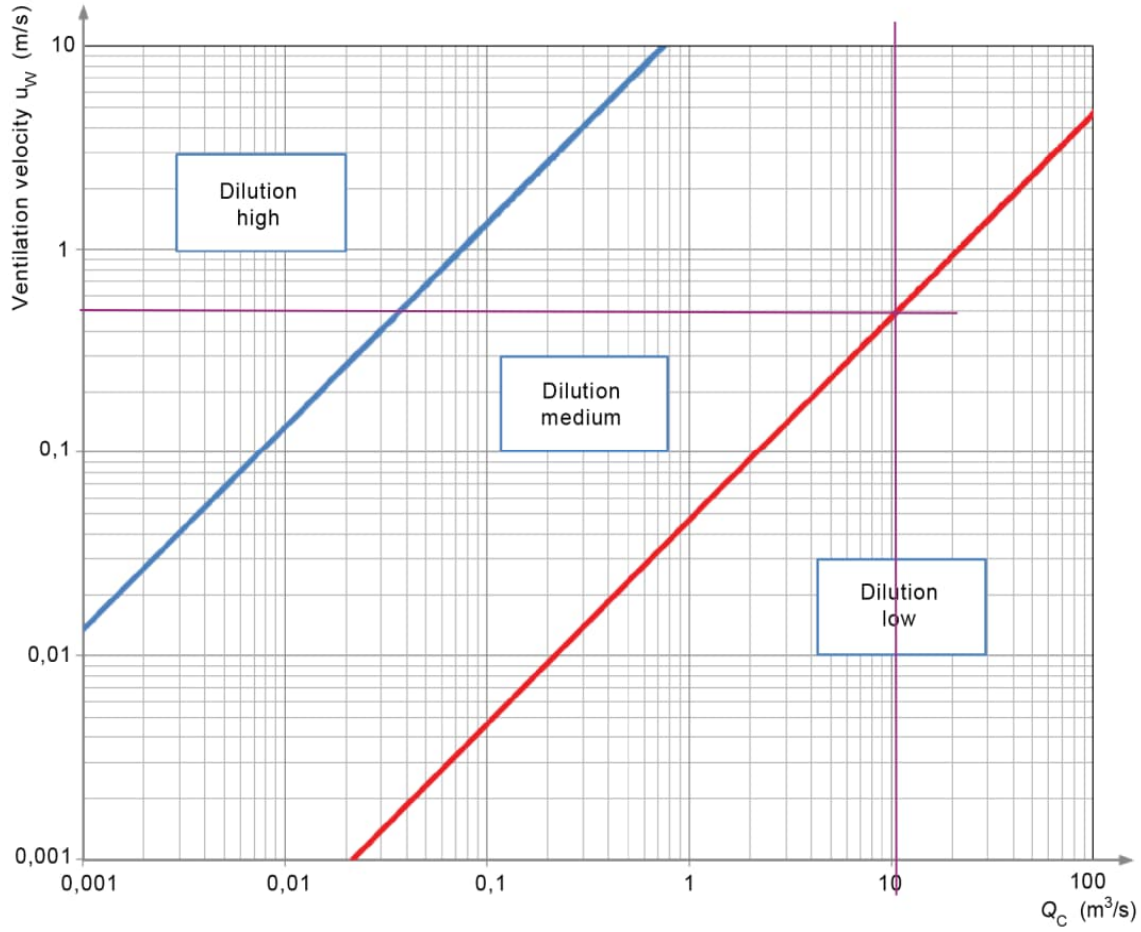
Red lines show the assumptions for the minimum requirements to be measured

Converting this into the Release Flow (Wg) using the relative density and LFL, the maximum allowable Release Flow is 6,904x10-7 g/s to still maintain the applicable zone 2. However, considering the leak source a secondary grade of release, as under normal operation there is not expected to be a leak.



9.2 Maximum release flow in respect to effectiveness of ventilation

To maintain the same applicable zone 2 as calculated in chapter 7.4 the following criteria need to be met to maintain a Zone 2 according to Table D.1 and figure C.1 – EN IEC 60079-10-1:2021:

- Degree of dilution to be at least Medium Dilution
- Availability of ventilation to be at least Fair
- Ventilation speed is fixed by the physical installation to be 0,5m/s
- It is a prerequisite that the leak source is specified as secondary grade of release.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Figure 9: Degree of dilution and maximum release flow accepted.

Based on C.1 from EN IEC 60079-10-1:2021. Chart for assessing the degree of dilution.

Converting this into the Release Flow (W_g) using the relative density and LFL we will get that the maximum allowable Release Flow is 3,169x10^{-5} g/s to still maintain the applicable zone 2

9.3 Summary of pressure testing value calculation

To make sure the Release Flow submitted to be the dimensioning value according to 60079-10. The value needs to be the one which will be equal or better than the worst Release Flow meaning but conditions for the calculation will be met. For the current installation this is equal to a maximum Release Flow of 6,904x10^{-7} g/s. To convert the value into a pressure, drop, which can be used to e.g. a pressure decay test, the volume, e.g. a pressure decay test, the volume and temperature need to be specified as part of the testing.

1.0 Purpose

The purpose of this document is to highlight the safe design of the simple apparatus circuit on the FC PowerGen 1000kW®. The document will be formed on background of IEC 60079-25.

2.0 Analysis

The following system contains only a pressure transmitter and a temperature transmitter. Since they are connected to different complete independent barriers, two analyses will be made following the Annex A in IEC 60079-25.

Table 2-1: Simple system analysis pressure transmitter.

Step	Item	I.S. interface PR electronic 9106B1B	Pressure sensor HUBA control 520 Series	System

[1]Not applicable for simple apparatus.

[2]Not applicable for simple apparatus.

[3]Acordingly to IEC 60079-25 annex F the temperature rating will be T4 if the power does not exceed 1,2W at the ambient temperature of 60°C, which is applicable for this application. Further explanation is described in IEC 60079-0 section 5.3.3 Table 3 and 4.

[4]As it is a RTD type temperature sensor those values are not applicable.

2.1 Simple apparatus requirements

There are some requirements to apply for a component to be classified as a simple apparatus. The IEC 60079-11 section 5.7 describes the following requirements:

a) *Passive components, for example switches, junction boxes, resistors and simple semiconductor devices;*

b) *Sources of stored energy consisting of single components in simple circuits with well defined parameters, for example capacitors or inductors, whose values shall be considered when determining the overall safety of the system;*

c) *sources of generated energy, for example thermocouples and photocells, which do not generate more than 1.5 V, 100 mA and 25 mW.*

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WITCH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

Sins this temperature sensor is based on the RTD technology the sensor will not be able to induce any current nor voltage to make this a potential ignition source. Hence relying on the associated apparatus being the EX Barriere.

The barrier is built and approved for connection to RTD type of temperature sensors. The following data from the barrier is included in the Table 2-2.

3.0 Conclusion

According to this analysis of both the Pressure transmitter HUBA520 and the corresponding EX barrier PR electronic 9106B1B the conditions for intrinsically safe circuit are being met accordingly to the IEC 60079-25.

Furthermore, the analysis of Temperature transmitter IFM TT1050 and the corresponding EX barrier PR electronic 9113B does also comply with the requirements form intrinsically safe according to the IEC 60079-25. Since this is a simple apparatus the conditions for this are met accordingly to IEC 60079-11.

1.0 Introduction and Purpose

The present document contains relevant performance data for the 1 MW fuel cell container solution provided by Ballard Power Systems Europe to CrossWind.

Note: The data provided is for BoL (Begin of Life) conditions and an ambient temperature of 20 °C.

2.0 References

3.0 Electrical Efficiency

The electrical efficiency of a single FCwave™ module directly at its DC output is shown below:

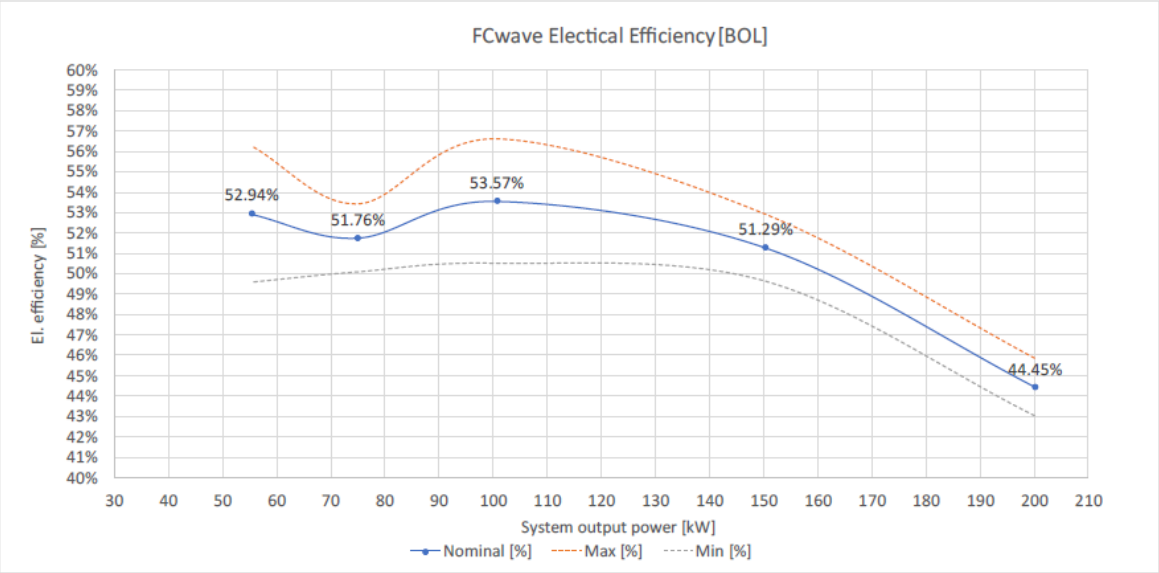

Figure 1. Electrical efficiency of a single FCwave™ module.
(Test done according to IEC62282-3-200:2016 using 95 confidence interval)

Including system losses caused by power conditioning, the overall electrical efficiency of the 1 MW container solution at the 6.6 kV AC output is shown below:

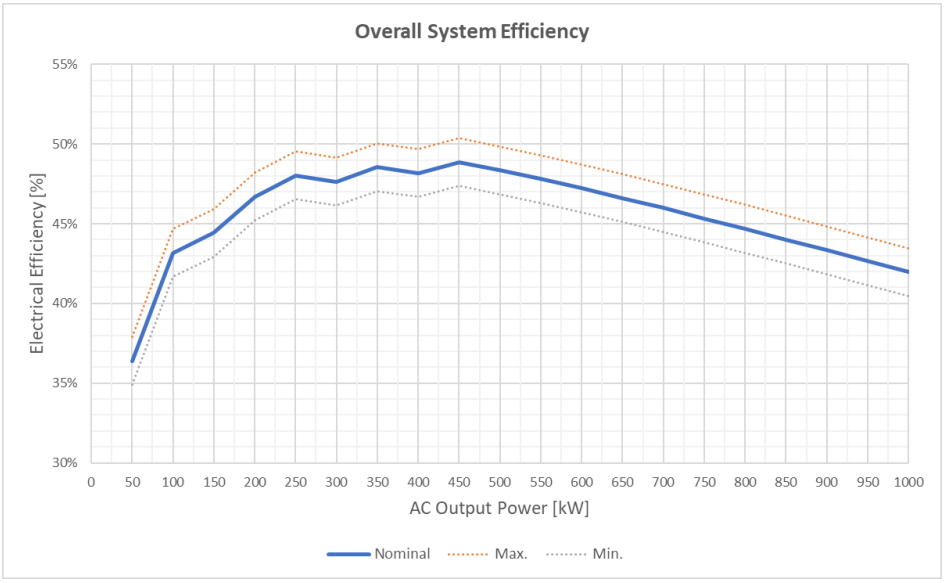

Figure 2. Electrical efficiency as a function of net output (AC) power of 1 MW container solution.

4.0 Hydrogen Consumption

The hydrogen consumed by the 1 MW container solution along its entire power range is shown below:

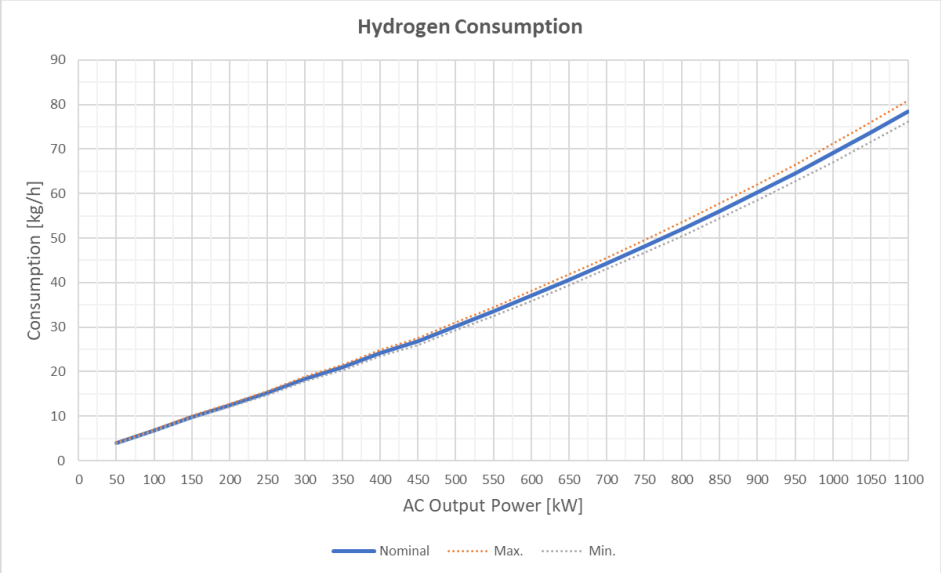

Figure 3. Hydrogen consumption as a function of net output (AC) power of 1 MW container solution.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.0 Heat Rejection

The overall heat rejection of the 1 MW container solution results from the energy content of the consumed hydrogen (based on the lower heating value, LHV) that is not transformed into electrical energy.

The heat rejection chart shown below includes all heat that is generated by the components of the container solution and dissipated through the HT coolers, LT cooler, process air exhaust, and ventilation air (both actively as well as passively).

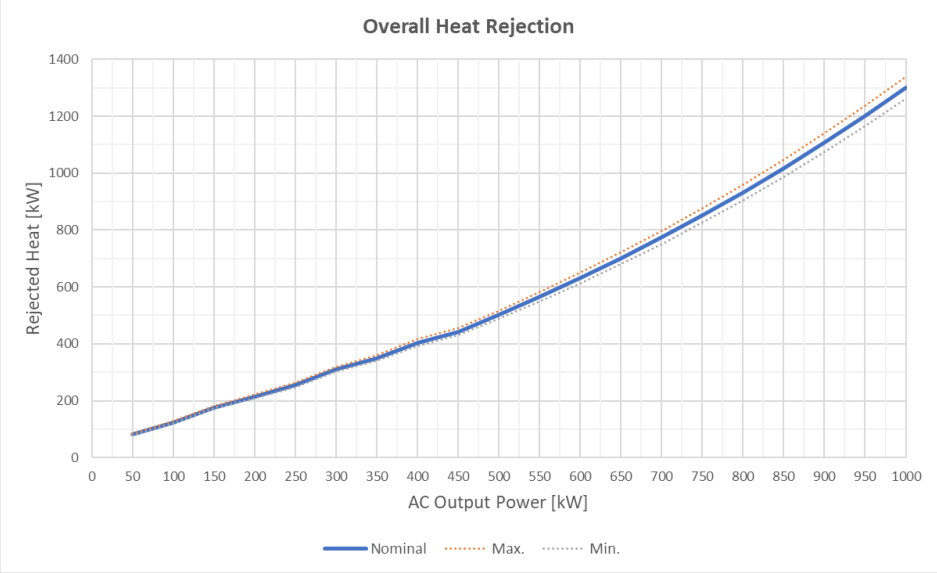

Figure 4. Overall heat rejection as a function of net output (AC) power of 1 MW container solution.

Vi godkender herved denne svejseprocedure til svejsning på omtalte projekt under de begrænsninger, der er givet i standarden/normen og/eller kundens specifikation.

We hereby approve this welding procedure for welding on the referring projekt within the limitations given in the standard/code and/or client´s specifikation.

Svejsninger, ingen sporbarhed, EN ISO 15614-1:2006/A2:2012

NDT Metode	Prøvningsspecifikation	Acceptkriterie	Andre krav
Penetrant (PT)	EN/ISO 3452-1:2013	EN/ISO 23277:2009 - 2X	
Radiografi (RT)	EN/ISO 17636-1:2013 - B	EN/ISO 10675-1:2013 - 1	

PRØVNINGSRESULTAT

	Svejsning Status	
	Acceptkriterie opfyldt	6 svejsninger

Detaljer om prøvningsresultat kan findes i "PRØVNINGSRESULTAT DETALJER" sektionen.

Tekniske data, NDT informationer, identifikation af udstyr, kalibreringsdata for udstyr, og andre relevante data, er registreret for hver NDT-metode i sektionen for Prøvningsmetode Detaljer. Uddrag fra Prøvningsrapporten må kun gengives efter skriftlig tilladelse fra FORCE Technology. Den elektroniske version af Prøvningsrapporten, som er gemt i "FORCE NDT Online", er defineret som originalen. Prøvningsresultaterne gælder kun for de emner som er testet. FORCE Technology - Almindelige betingelser er en integreret del af aftalen, medmindre andet er skriftligt aftalt.

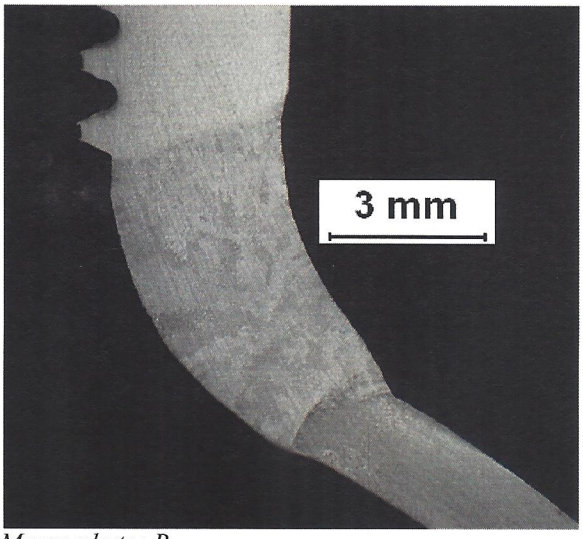
Provning enligt / Testing according to	**Provningsdatum / Testing date**	**Utfört av / Performed by**
SS-EN 1321	2016-01-22	Johan Ageryd

Macroscopic examination:



Two macro samples were cut out for macroscopic examination of weld metal, HAZ and base metal. The macro samples were ground (to 2000- paper) and examined in not etched and etched condition at magnification of 1× - 20×.

Macro sample			Base metal		Filler metal	Etchant *(acc. to SIS-CEN/CR 12361:1996)*
ID / No	Position	Orientation	Horizontal	Vertical		
2015544-01A	PC	Perpendicular to the weld direction	1.4301/ 1.4307	1.4301/ 1.4307	Hyundai SMT-316LSi	B.5 (Kalling´s)
Examined macro samples are assessed to fulfil the requirements in EN ISO 5817:2014. See macro photos below.						

Macro photos:

Macro photo: A

Macro photo: B

Den rapporterade utvidgade mätosäkerheten är baserad på en standardosäkerhet multiplicerad med täckningsfaktor, k=2, vilket för en normaldistribution motsvarar en sannolikhet med ca 95 %. Mätosäkerhetsberäkningarna är utförda i enlighet med EA-4/16:2003.

The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor, k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%. The uncertainty evaluation was carried out in accordance with EA-4/16:2003.

Length measurement: ± 1.5 %

Not.: Avsteg från punkt 10 i SS-EN 1321 har gjorts. Beteckning har ej redovisats i enlighet med exemplifierade versioner.
Note: Deviation from clause 10 in SS-EN 1321 has been done. Description has not been presented in accordance with exemplified versions.

Tensile testing:

Pipe strip acc. to ISO 4136 / No	Dimensions		Square-area	Yield strength				Tensile strength	Elongation	Location of fracture
	Diameter/ width	Thickness		$R_{p0.2}$	$R_{p1.0}$	R_{eL}	R_{eH}	R_m	A_5	
	mm		mm^2	MPa					%	
TT/1	12.01	1.58	19.16	-	-	-	-	638	-	HAZ
TT/2	12.02	1.77	21.49	-	-	-	-	632	-	HAZ
SS-EN 10217-7:2005 1.4307:				≥180	≥215	-	-	470-670	≥35 T ≥40 L	-
SS-EN 10217-7:2005 1.4301:				≥195	≥230	-	-	500-700	≥35 T ≥40 L	-

Result: Satisfactory according to the requirement for the base material.

Den rapporterade utvidgade mätosäkerheten är baserad på en standardosäkerhet multiplicerad med täckningsfaktor, k=2, vilket för en normaldistribution motsvarar en sannolikhet med ca 95 %. Mätosäkerhetsberäkningarna är utförda i enlighet med EA-4/16:2003.

The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor, k=2, which for a normal distribution corresponds to a coverage probability of approximately 95 %. The uncertainty evaluation was carried out in accordance with EA-4/16:2003.

R_m: 2.0 % *$R_{p0.2}$ / $R_{p1.0}$:3.0 %* *R_{eH} / R_{eL}: 2.0 %*

1.0 General

In terms of obtaining the required level of antirust protection of surfaces that are to be provided with such protection by painting depends greatly on the condition of the surfaces and physical elements of their design. It is therefore very important that the material and surface treatment and pre-treatment prior to the painting of the parts can be carried out in the prescribed manner. The recommendations will be found in this document.

Any and all weld spatter, slag must be removed before the item is painted. It is important that the manufacturing document clearly indicates which surfaces are to be painted and what type of treatments are to be given. If areas are not to be painted, the item document should also indicate which surfaces are NOT to be treated.

Parts or objects which, after assembly or installation, have surfaces that are not accessible for technically correct pre-treatment and painting must be finished before they are assembled or installed. If not done correctly, the antirust protection will NOT be achieved.

Painting of bolts and nuts with the intention to protect them against rust must be avoided, since painting does not provide good rust protection. If nevertheless, painting is prescribed, it is essential that the thickness of the paint applied to nuts and bolt heads does not prevent the appropriate spanners/wrenches from correctly fitting and tightening them.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

3.0 Surface Preparation and Painting Specifications

The applicable corrosion environment category for the containers according to ISO 12944-9 is defined as **CX**; for Offshore areas of high salinity or industrial areas of extremely high humidity and aggressive atmosphere or subtropical and tropical areas.

The requirements of a coating system for category CX are (for a zinc-rich primer):

- Primer Dry Film Thickness: ≥ 40 µm
- Minimum Number of Coats: 3
- Total Dry Film Thickness: ≥ 280 µm

3.1 Containers

The surface preparation and painting specifications used by the supplier of the containers are detailed in the table below.

Table 2. Coating System Specification (Containers).

Manufacturer		Type of Substrate	Type of Environment
Name:	PPG Industries, Inc.	Uncoated carbon steel	CX (offshore)
Address:	One PPG Place Pittsburgh, PA 15272 USA		
Surface Preparation:	ISO 8501-3 P3 ISO 8501-1 Sa 2½ ISO 8503-1 40-70 µm ISO 8502-6 <50 mg/m^2 NaCl ISO 8502-3 Rate 2		

	Trade Name	Color Shade	Generic Type	NDFT (µm)
1st coat	SigmaZinc™ 68 GP	Grey	Zinc Epoxy	60
2nd coat	SigmaFast™ 278	Div. Ral	Epoxy	170
3rd coat	SigmaDur™ 550	Div. Ral	Acrylic PU	50
			Total NDFT (µm)	280

3.2 Cooling Platform and LT Cooler Support Structure

The surface preparation and painting specifications used by the supplier of the cooling platform and LT cooler support structure are categorized as No. 1A based on the NORSOK M501 standard, which also fulfill the requirements of ISO 12944-9 CX, and are detailed in the table below.

Table 3. Coating System Specification No. 1A (Cooling Platform and LT Cooler Support Structure).

Manufacturer		Type of Substrate	Type of Environment
Name:	Hempel A/S	Uncoated carbon steel	CX (offshore)
Address:	Lundtoftegårdsvej 91 2800 Kgs. Lyngby Denmark		
Surface Preparation:	ISO 8501-1 Sa 2½ ISO 8501-3 Grade P3 ISO 8502-3 Rate 2 ISO 8502-6 and ISO 8502-9 ≤20 mg/m^2 NaCl ISO 8503-1 Medium G (50-85 µm) ISO 2801 Surface control between layers		

	Trade Name	Color Shade	Generic Type	NDFT (µm)
1st coat	Hempadur Avantguard 750	Grey	Zinc Epoxy	60
2nd coat	Hempadur 4774D	Ral 7035	Epoxy	170
3rd coat	Hempadur 4774D	Ral 9001	Epoxy	
4th coat	Hempathane HS 5610	Ral 7035	Acrylic PU	50
			Total NDFT (µm)	280

3.3 Performance (Pre-qualification) Testing

The requirements for pre-qualification are applicable to both coating systems specified above.

Acceptance criteria in the pre-qualification testing are considered as minimum performance requirements.

Table 4. Performance tests requirements and acceptance criteria for coating systems.

Activity Description	**Environment corrosivity to ISO 12944-2**	**Verification Method**	**Acceptance Criteria**
Fingerprinting	All environments	ISO 12944-9 Annex C	ISO 12944-9 Annex C
Cyclic ageing test	CX (Offshore and coastal atmospheric zone) and CX + Im4 (splash zone and tidal zone), seawater filled compartments and Im3 (buried items)	ISO 12944-9 Clause 9	ISO 12944-9 Clause 9 Supplementary requirements: Chalking to ISO 4628-6, maximum rating 2. Pull-off test to ISO 4624, minimum 5.0 MPa and maximum 50% reduction from value measured before ageing.

3.4 Coating Procedure Test (CPT)

The Coating Procedure Test (CPT) is a systematic and controlled evaluation process used to verify the effectiveness and performance of a coating system under the defined conditions. The purpose of the CPT is to ensure that the coating procedure meets the desired quality standards and performs as expected while in service.

The table below shows the initial activities that form part of the CPT and are responsibility of the coating manufacturers.

Table 5. Coating procedure testing (partial).

Test Type	Method	Frequency	Acceptance Criteria	Consequence
Routine batch testing of painting material	a) Density ISO 2811-1 or ASTM D1475 b) Non-volatile matter (solid content) ISO 3251 or ASTM D2369	Each batch of paint	a1) For density ≤ 2.0 g/cm^3, ±0,05 g/cm^3 from fingerprint of paint used for CPT. a2) For density > 2.0 g/cm^3 , ±0,10 g/cm^3 from fingerprint of paint used for CPT. b) ±2 % wt from fingerprint of paint used for CPT.	Unused painting material shall be quarantined. Fingerprinting check shall be carried out to verify material against CPT material. If the fingerprint does not match the material used for the CPT, the entire batch shall be rejected and the areas coated with the non-compliant material shall be re-blasted and re-coated with a coating that meets the specification.
Fingerprinting	ISO 12944-9 Annex C	CPT paint material only, unless required to verify a paint batch.	ISO 12944-9 Annex C	Paint material to be rejected. Re-blast and re-coat with material compliant with CPT.

The CPT then follows all activities listed in the Inspection and Testing section below, which are responsibility of the coating applicators.

3.5 Inspection and Testing

Testing and inspection is carried out in accordance with the table below.

Table 6. Inspection and testing.

Test Type	Method	Frequency	Acceptance Criteria	Consequence
Environmental conditions	Ambient and metal temperature, relative humidity, and dew point.	At the start of each shift and minimum of twice per shift	In accordance with specified requirements (see data sheets)	No blasting or coating
Visual examination	Visual for sharp edges, weld spatter slivers, rustgrade, etc.	100% of all surfaces	No defects	Defects to be removed or repaired
Cleanliness	a) ISO 8501-1 b) ISO 8502-3	a) 100% visual of all surfaces b) Spot checks	a) In accordance with specified requirements b) Maximum quantity and size rating 2	a) Re-blasting b) Re-cleaning and retesting of non-conforming area until acceptable
Salt test	ISO 8502-6 and ISO 8502-9	Spot checks	Maximum conductivity corresponding to specification	Repeated washing of non-conforming area with potable water and retesting until acceptable followed by re-blasting
Roughness	ISO 8503-5	Each component or once per 10 m^2	As specified	Re-blasting non-conforming area with abrasive of suitable grade to achieve desired surface profile
Visual examination of coating	Visual to determine curing, contamination, solvent retention, pinholes/popping, sagging and surface defects	100% of surface after each coat	According to specified requirements	Repair of defects

Film thickness	ISO 19840. Calibration on a smooth surface	ISO 19840	ISO 19840, and coating system data sheet	Repair, additional coats or re-coating as appropriate
Adhesion	ISO 4624 (method A or B) using equipment with an automatic centred pulling force, and carried out when coating system are fully cured.	Spot checks	See notes below	Coating to be rejected. Re-blast and re-coat.
Notes: 1. 50 % reduction of average adhesion value from the CPT is acceptable as minimum adhesion during production coating. Absolute minimum value is 5 MPa.				

3.6 Field Painting Procedure / Repairs to Damaged Finishes

During handling, turning and assembly, damage to edges and to surfaces by the use of sharp-toothed clamps must be avoided by taking precautionary measures, such as the use of lifting devices with soft renewable contact surfaces or properly designed lifting cleats. If damage does occur, it must be carefully blended out by grinding (and the full protective treatment restored, with specified overlaps between coats).

Just as surface cleanliness before first coating is fundamental to performance of the system, so is the cleanliness of painted surfaces prior to the application of subsequent coats. On site, thorough cleaning shortly before painting is always necessary to remove contamination accumulated over time and from construction activities including dust, grout leaks from concreting, and the products of blast cleaning, bolting and welding.

3.7 Data Sheets

3.7.1 PPG Sigmazinc 68 GP

PRODUCT DATA SHEET

March 2, 2023 (Revision of January 4, 2023)

SIGMAZINC™ 68 GP

DESCRIPTION

Two-component, high solids polyamine adduct cured zinc rich epoxy primer

PRINCIPAL CHARACTERISTICS

- Designed as a system primer in various paint systems for aggressive environments
- Suitable for use in offshore and onshore environments with ISO 12944-2 corrosivity categories of C5 and CX (offshore)
- Meets the requirements of Norsok M-501 rev. 6, System 1
- Quick-drying, can be overcoated after a short interval
- Complies with the compositional requirements of ISO 12944–5
- Complies with the compositional requirements of SSPC-Paint 20, Level 2
- The zinc dust used in this product complies with minimum ASTM D520 Type II

COLOR AND GLOSS LEVEL

- Gray, reddish gray
- Flat

BASIC DATA AT 20°C (68°F)

Data for mixed product	
Number of components	Two
Mass density	2.4 kg/l (20.0 lb/US gal)
Volume solids	68 ± 2%
VOC (Supplied)	Directive 2010/75/EU, SED: max. 130.0 g/kg max. 310.0 g/l (approx. 2.6 lb/US gal)
Recommended dry film thickness	50 - 150 µm (2.0 - 6.0 mils) depending on system
Theoretical spreading rate	13.6 m^2/l for 50 µm (545 ft^2/US gal for 2.0 mils) See spreading rate tables
Dry to touch	20 minutes
Overcoating Interval	Minimum: 1.5 hours See overcoating tables
Full cure after	7 days
Shelf life	Base: at least 24 months when stored cool and dry Hardener: at least 24 months when stored cool and dry

Note: See ADDITIONAL DATA – Curing time

RECOMMENDED SUBSTRATE CONDITIONS AND TEMPERATURES

Substrate conditions

- Steel; blast cleaned to ISO-Sa2½ (SSPC SP-10), blasting profile 40 – 70 µm (1.6 – 2.8 mils)

Ref. P844

Page 1/4

PRODUCT DATA SHEET

March 2, 2023 (Revision of January 4, 2023)

SIGMAZINC™ 68 GP

Substrate temperature

- Substrate temperature during application should be at least 0°C (32°F)
- Substrate temperature during application and curing should be at least 3°C (5°F) above dew point

INSTRUCTIONS FOR USE

Mixing ratio by volume: base to hardener 90:10 (9:1)

- The temperature of the paint should preferably be above 15°C (59°F), otherwise extra thinner may be required to obtain application viscosity
- Adding too much thinner results in reduced sag resistance
- Thinner should be added after mixing the components

Induction time

None

Pot life

6 hours at 20°C (68°F)

Air spray

Recommended thinner
THINNER 91-92 or THINNER 91-82 (AMERCOAT T-10)

Volume of thinner
0 - 5%, depending on required thickness and application conditions

Nozzle orifice
1.5 – 2.5 mm (approx. 0.060 – 0.100 in)

Nozzle pressure
0.3 - 0.6 MPa (approx. 3 - 6 bar; 44 - 87 p.s.i.)

Airless spray

Recommended thinner
THINNER 91-92 or THINNER 91-82 (AMERCOAT T-10)

Volume of thinner
0 - 5%, depending on required thickness and application conditions

Nozzle orifice
Approx. 0.43 – 0.53 mm (0.017 – 0.021 in)

Nozzle pressure
15.0 MPa (approx. 150 bar; 2176 p.s.i.)

ADDITIONAL DATA

Spreading rate and film thickness	
DFT	**Theoretical spreading rate**
50 µm (2.0 mils)	13.6 m^2/l (545 ft^2/US gal)
60 µm (2.4 mils)	11.3 m^2/l (454 ft^2/US gal)
75 µm (3.0 mils)	9.1 m^2/l (364 ft^2/US gal)
100 µm (4.0 mils)	6.8 m^2/l (273 ft^2/US gal)

Overcoating interval for DFT up to 100 µm (4.0 mils)						
Overcoating with...	**Interval**	**0°C (32°F)**	**10°C (50°F)**	**20°C (68°F)**	**30°C (86°F)**	**40°C (104°F)**
subsequent coating	Minimum	6 hours	3 hours	1.5 hours	1 hour	30 minutes
	Maximum	3 months	3 months	3 months	3 months	3 months

Notes:
- Zinc rich primers can form zinc salts on the surface; preferably they should not be weathered for long periods before overcoating
- Before overcoating visible surface contamination must be removed by high-pressure water cleaning, sweep blasting or mechanical cleaning

Curing time for DFT up to 100 µm (4.0 mils)			
Substrate temperature	**Dry to touch**	**Dry to handle**	**Full cure**
0°C (32°F)	1.5 hours	6 hours	20 days
10°C (50°F)	1 hour	3 hours	15 days
15°C (59°F)	40 minutes	2 hours	10 days
20°C (68°F)	20 minutes	1.5 hours	7 days
30°C (86°F)	10 minutes	1 hour	5 days

Notes:
- Adequate ventilation must be maintained during application and curing
- In case of application at air or surface temperature below 5°C (41°F), the temperature of the mixed paint is recommended to be higher than 10°C (50°F)

SAFETY PRECAUTIONS

- See Safety Data Sheet and product label for complete safety and precaution requirements
- This is a solvent-borne paint and care should be taken to avoid inhalation of spray mist or vapor, as well as contact between the wet paint and exposed skin or eyes

WORLDWIDE AVAILABILITY

It is always the aim of PPG Protective and Marine Coatings to supply the same product on a worldwide basis. However, slight modification of the product is sometimes necessary to comply with local or national rules/circumstances. Under these circumstances an alternative product data sheet is used.

WARRANTY

PPG warrants (i) its title to the product, (ii) that the quality of the product conforms to PPG's specifications for such product in effect at the time of manufacture and (iii) that the product shall be delivered free of the rightful claim of any third person for infringement of any U.S. patent covering the product. THESE ARE THE ONLY WARRANTIES THAT PPG MAKES AND ALL OTHER EXPRESS OR IMPLIED WARRANTIES, UNDER STATUTE OR ARISING OTHERWISE IN LAW, FROM A COURSE OF DEALING OR USAGE OF TRADE, INCLUDING WITHOUT LIMITATION, ANY OTHER WARRANTY OF FITNESS FOR A PARTICULAR PURPOSE OR USE, ARE DISCLAIMED BY PPG. Any claim under this warranty must be made by Buyer to PPG in writing within five (5) days of Buyer's discovery of the claimed defect, but in no event later than the expiration of the applicable shelf life of the product, or one year from the date of the delivery of the product to the Buyer, whichever is earlier. Buyer's failure to notify PPG of such non-conformance as required herein shall bar Buyer from recovery under this warranty.

LIMITATIONS OF LIABILITY

IN NO EVENT WILL PPG BE LIABLE UNDER ANY THEORY OF RECOVERY (WHETHER BASED ON NEGLIGENCE OF ANY KIND, STRICT LIABILITY OR TORT) FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES IN ANY WAY RELATED TO, ARISING FROM, OR RESULTING FROM ANY USE MADE OF THE PRODUCT. The information in this sheet is intended for guidance only and is based upon laboratory tests that PPG believes to be reliable. PPG may modify the information contained herein at any time as a result of practical experience and continuous product development. All recommendations or suggestions relating to the use of the PPG product, whether in technical documentation, or in response to a specific inquiry, or otherwise, are based on data, which to the best of PPG's knowledge, is reliable. The product and related information is designed for users having the requisite knowledge and industrial skills in the industry and it is the end-user's responsibility to determine the suitability of the product for its own particular use and it shall be deemed that Buyer has done so, as its sole discretion and risk. PPG has no control over either the quality or condition of the substrate, or the many factors affecting the use and application of the product. Therefore, PPG does not accept any liability arising from any loss, injury or damage resulting from such use or the contents of this information (unless there are written agreements stating otherwise). Variations in the application environment, changes in procedures of use, or extrapolation of data may cause unsatisfactory results. This sheet supersedes all previous versions and it is the Buyer's responsibility to ensure that this information is current prior to using the product. Current sheets for all PPG Protective & Marine Coatings Products are maintained at www.ppgpmc.com. The English text of this sheet shall prevail over any translation thereof.

3.7.2 PPG Sigmafast 278

PRODUCT DATA SHEET

March 2, 2023 (Revision of November 16, 2022)

SIGMAFAST™ 278

DESCRIPTION

Two-component, high solids, zinc phosphate epoxy primer and buildcoat

PRINCIPAL CHARACTERISTICS

- Epoxy primer or buildcoat in protective coating systems
- Excellent corrosion resistance in atmospheric exposure
- Cures at temperatures down to -5°C (23°F)
- Speed curing in steel fabrication
- Easy application by airless spray
- Wide application range
- ACQPA 27752-certified

COLOR AND GLOSS LEVEL

- Redbrown, gray and a selected range of (MIO) colors
- Semi-gloss

Notes:
- Epoxy coatings will chalk and fade upon exposure to sunlight, elevated temperatures, or chemical exposure. Discoloration and normal chalking do not impact performance. Light colors will darken over time. Some batch-to-batch variation in color is to be expected. Color matches are approximate.
- The addition of a UV stable topcoat should be considered when using epoxy coatings in cosmetic areas

BASIC DATA AT 20°C (68°F)

Data for mixed product	
Number of components	Two
Mass density	1.5 kg/l (12.5 lb/US gal)
Volume solids	80 ± 2%
VOC (Supplied)	Directive 2010/75/EU, SED: max. 153.0 g/kg UK PG 6/23(92) Appendix 3: max. 230.0 g/l (approx. 1.9 lb/US gal) EPA Method 24: 220.0 g/ltr (1.8 lb/USgal) China GB 30981-2020 (tested) 198.0 g/l (approx. 1.7 lb/gal)

PRODUCT DATA SHEET

March 2, 2023 (Revision of November 16, 2022)

SIGMAFAST™ 278

Data for mixed product	
Shelf life	Base: at least 24 months when stored cool and dry Hardener: at least 24 months when stored cool and dry

Notes:
- See ADDITIONAL DATA – Spreading rate and film thickness
- See ADDITIONAL DATA – Overcoating intervals
- See ADDITIONAL DATA – Curing time

RECOMMENDED SUBSTRATE CONDITIONS AND TEMPERATURES

- Apply this product to the specified thickness as soon as possible after the surface is prepared

Substrate conditions

- Steel; blast cleaned to ISO-Sa2½ or minimum SSPC SP-6, blasting profile 40 – 70 µm (1.6 – 2.8 mils) or power tool cleaned to minimum ISO-St3 / SSPC SP3

Primed steel or previous coat

- Previous suitable coat must be dry and free from any contamination
- Surface of previous coat should be sufficiently roughened if necessary
- When applied to zinc silicate, a mist coat and full coat technique is required

Galvanized steel

- The surface must be properly prepared, dry, clean and free of any contamination
- The surface should be sufficiently roughened by sweep blasting to achieve a uniform matt appearance
- Sweep blast in accordance with the SSPC SP-16 guidelines

Stainless steel

- The surface must be properly prepared, dry, clean and free of any contamination
- The surface should be sufficiently roughened by sweep blasting with inert non-metallic abrasives
- Sweep blast in accordance with the SSPC SP-16 guidelines

Thermal Sprayed Metallization (TSM)

- Surface must be dry and free from any contamination
- The mist coat / full coat technique is required. See mist coat thinning recommendation in the Instructions For Use part below

PPG

Page 2/6

PRODUCT DATA SHEET

March 2, 2023 (Revision of November 16, 2022)

SIGMAFAST™ 278

Substrate temperature and application conditions

- Substrate temperature during application and curing should be at least 3°C (5°F) above dew point
- Substrate temperature during application and curing down to -5°C (23°F) is acceptable; provided the substrate is free from ice and dry

INSTRUCTIONS FOR USE

Mixing ratio by volume: base to hardener 75:25 (3:1)

- The temperature of the paint should preferably be above 15°C (59°F), otherwise extra thinner may be required to obtain application viscosity
- Adding too much thinner results in reduced sag resistance and slower cure
- Thinner should be added after mixing the components

Induction time
None

Pot life
1 hour at 20°C (68°F)

Air spray

Recommended thinner
THINNER 91-92

Volume of thinner
0 - 10%, depending on required thickness and application conditions

Nozzle orifice
1.7 – 2.0 mm (approx. 0.070 – 0.079 in)

Nozzle pressure
0.3 - 0.4 MPa (approx. 3 - 4 bar; 44 - 58 p.s.i.)

Ref. 6829

Page 3/6

PRODUCT DATA SHEET

March 2, 2023 (Revision of November 16, 2022)

SIGMAFAST™ 278

Airless spray

Recommended thinner
THINNER 91-92

Volume of thinner
0 - 10%, 30 - 50% when mist coat applied

Nozzle orifice
Approx. 0.46 – 0.53 mm (0.018 – 0.021 in)

Nozzle pressure
20.0 - 25.0 MPa (approx. 200 - 250 bar; 2901 - 3626 p.s.i.)

Brush/roller

Recommended thinner
THINNER 91-92

Volume of thinner
0 – 5%

Notes:
- Application by roller will leave roller marking and is suitable for minimum DFT requirements only
- A roller suitable for epoxy application must be used
- Application by brush may show brush marking, due to the thixatropic nature of the paint and is most suitable to small areas, tight angle areas or for stripe coating or touch-up

Cleaning solvent
THINNER 90-53

ADDITIONAL DATA

Spreading rate and film thickness	
DFT	**Theoretical spreading rate**
75 µm (3.0 mils)	10.7 m^2/l (428 ft^2/US gal)
125 µm (5.0 mils)	6.4 m^2/l (257 ft^2/US gal)

Mixed product temperature	**Pot life**
0°C (32°F)	10 hours
10°C (50°F)	3 hours
20°C (68°F)	1 hour
30°C (86°F)	30 minutes

SAFETY PRECAUTIONS

- See Safety Data Sheet and product label for complete safety and precaution requirements
- This is a solvent-borne paint and care should be taken to avoid inhalation of spray mist or vapor, as well as contact between the wet paint and exposed skin or eyes

WORLDWIDE AVAILABILITY

It is always the aim of PPG Protective and Marine Coatings to supply the same product on a worldwide basis. However, slight modification of the product is sometimes necessary to comply with local or national rules/circumstances. Under these circumstances an alternative product data sheet is used.

WARRANTY

PPG warrants (i) its title to the product, (ii) that the quality of the product conforms to PPG's specifications for such product in effect at the time of manufacture and (iii) that the product shall be delivered free of the rightful claim of any third person for infringement of any U.S. patent covering the product. THESE ARE THE ONLY WARRANTIES THAT PPG MAKES AND ALL OTHER EXPRESS OR IMPLIED WARRANTIES, UNDER STATUTE OR ARISING OTHERWISE IN LAW, FROM A COURSE OF DEALING OR USAGE OF TRADE, INCLUDING WITHOUT LIMITATION, ANY OTHER WARRANTY OF FITNESS FOR A PARTICULAR PURPOSE OR USE, ARE DISCLAIMED BY PPG. Any claim under this warranty must be made by Buyer to PPG in writing within five (5) days of Buyer's discovery of the claimed defect, but in no event later than the expiration of the applicable shelf life of the product, or one year from the date of the delivery of the product to the Buyer, whichever is earlier. Buyer's failure to notify PPG of such non-conformance as required herein shall bar Buyer from recovery under this warranty.

LIMITATIONS OF LIABILITY

IN NO EVENT WILL PPG BE LIABLE UNDER ANY THEORY OF RECOVERY (WHETHER BASED ON NEGLIGENCE OF ANY KIND, STRICT LIABILITY OR TORT) FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES IN ANY WAY RELATED TO, ARISING FROM, OR RESULTING FROM ANY USE MADE OF THE PRODUCT. The information in this sheet is intended for guidance only and is based upon laboratory tests that PPG believes to be reliable. PPG may modify the information contained herein at any time as a result of practical experience and continuous product development. All recommendations or suggestions relating to the use of the PPG product, whether in technical documentation, or in response to a specific inquiry, or otherwise, are based on data, which to the best of PPG's knowledge, is reliable. The product and related information is designed for users having the requisite knowledge and industrial skills in the industry and it is the end-user's responsibility to determine the suitability of the product for its own particular use and it shall be deemed that Buyer has done so, as its sole discretion and risk. PPG has no control over either the quality or condition of the substrate, or the many factors affecting the use and application of the product. Therefore, PPG does not accept any liability arising from any loss, injury or damage resulting from such use or the contents of this information (unless there are written agreements stating otherwise). Variations in the application environment, changes in procedures of use, or extrapolation of data may cause unsatisfactory results. This sheet supersedes all previous versions and it is the Buyer's responsibility to ensure that this information is current prior to using the product. Current sheets for all PPG Protective & Marine Coatings Products are maintained at www.ppgpmc.com. The English text of this sheet shall prevail over any translation thereof.

PRODUCT DATA SHEET

August 8, 2022 (Revision of November 3, 2021)

SIGMADUR™ 550

DESCRIPTION

Two-component, aliphatic acrylic polyurethane finish

PRINCIPAL CHARACTERISTICS

- Unlimited recoatable
- Excellent resistance to atmospheric exposure conditions
- Good color and gloss retention
- Cures at temperatures down to -5°C (23°F)
- Resistant to splash of mineral and vegetable oils, paraffins, aliphatic petroleum products and mild chemicals
- Can be recoated even after long atmospheric exposure
- Good application properties

COLOR AND GLOSS LEVEL

- White and various other colors (see also SIGMACARE shade card)
- Gloss

Note: Certain colors, especially red, orange, and yellow may require additional coats for adequate hiding, especially if applied over primers with a significant color contrast

BASIC DATA AT 20°C (68°F)

Data for mixed product	
Number of components	Two
Mass density	1.3 kg/l (10.8 lb/US gal)
Volume solids	55 ± 2%
VOC (Supplied)	Directive 2010/75/EU, SED: max. 334.0 g/kg EUR Directive: 2004/42/IIA(i)(500) 459 g/l max. 430.0 g/l (approx. 3.6 lb/US gal) China GB 38469-2019 (tested) 409.0 g/l (approx. 3.4 lb/gal)
Recommended dry film thickness	50 - 60 µm (2.0 - 2.4 mils) depending on system
Theoretical spreading rate	11.0 m^2/l for 50 µm (441 ft^2/US gal for 2.0 mils)
Dry to touch	1 hour
Overcoating Interval	Maximum: 6 hours Maximum: Unlimited
Full cure after	4 days
Shelf life	Base: at least 36 months when stored cool and dry Hardener: at least 24 months when stored cool and dry

SIGMADUR™ 550

RECOMMENDED SUBSTRATE CONDITIONS AND TEMPERATURES

Substrate conditions

- Previous coat (epoxy or polyurethane) must be dry and free from any contamination
- Previous coat: surface should be sufficiently roughened if necessary

Substrate temperature and application conditions

- Substrate temperature during application at -5°C (23°F) is acceptable; provided the substrate is free from ice and dry
- Substrate temperature during application and curing should be at least 3°C (5°F) above dew point
- Relative humidity during application and curing should not exceed 85%
- Should condensation on the surface occur during, or soon after application, this could result in color and gloss change

INSTRUCTIONS FOR USE

Mixing ratio by volume: base to hardener 88:12

- The temperature of the mixed base and hardener should be above 10°C (50°F), otherwise extra thinner may be required to obtain application viscosity
- Thinner should be added after mixing the components
- Adding too much thinner results in reduced sag resistance

Induction time

None

Pot life

5 hours at 20°C (68°F)

3.7.4 Hempel Hempadur Avantguard 750

Product Data Sheet

Hempadur Avantguard 750

Product characteristics

Description
Hempadur Avantguard 750 is an activated zinc-rich epoxy primer in compliance with the requirements of Level 2, type II in SSPC Paint-20, 2019 and ISO 12944 Part 5, 2018. The product is in full compliance with ASTM D520 type II and EU Directive 2004/42/EC, the Paints Directive on the limitation of volatile organic compounds: subcategory j.

Recommended use
Hempadur Avantguard 750 is recommended as a versatile primer for long-term protection of steel in severely corrosive environments including offshore.

Service temperature:
- Maximum, dry exposure only: 160°C [320°F].

Certificates / Approvals
- Meets requirements to NORSOK M-501 when used as part of a predefined paint system. Edition 6, System 1. Edition 7, System 1B
- Reaction to fire tested (as part of a coating system with approved primer and topcoat) according to EN13501-1 B-s1, d0.

Features
- Reduces the effect of corrosion and provides excellent galvanic protection.
- Fast drying primer with short minimum overcoating intervals.
- Excellent mechanical strength, also in cyclic temperatures, with improved tolerance to high film thickness through high flexibility and self-healing effect.
- Superior tolerance to high relative humidity during application.
- Cures down to -10°C [14°F].

Product safety

Flash point 25°C [77°F]

VOC content mixed product

Legislation	Value	5% thinning, by volume	Limit value, phase II (2010)[a]
EU	330 g/L [2.75 lb/US gal]	356	500
US (coatings)	330 g/L [2.75 lb/US gal]		
US (regulatory)	330 g/L [2.75 lb/US gal]		
China	330 g/L [2.75 lb/US gal]		

VOC values may vary with shade, please consult the Safety Data Sheet, section 9. According to specific legislation, see details in the Explanatory Notes available at Hempel website, hempel.com or at your local Hempel website. [a]EU Directive 2004/42/CE.

Handling
Handle with care. Before and during use, observe safety labels on packaging and paint containers and follow all local and national safety regulations. Always consult Hempel's Safety Data Sheet for this product along with the Product Data Sheet.

For professional use only.

Hempadur Avantguard 750

Specific gravity
2.3 kg/L [19 lb/US gal]

Reference dry film thickness
60 micron [2.4 mils]

Surface preparation

Cleanliness
- Remove oil, grease and other contaminants by suitable detergent cleaning.
- Remove salts, detergents and other contaminants by high pressure fresh water cleaning.

New build:
- Abrasive blasting to min. Sa 2½ (ISO 8501-1) / SP 10 (SSPC).
- Remove dust, blast media and loose materials.

Roughness
- Surface profile Medium (G) (ISO 8503-2).

Consult Hempel's separate Surface Preparation Guidelines for more details.

Application

Mixing ratio
Base 1736U : Curing Agent 97043
(8.5 : 1.5 by volume)

Products containing floating or settling particles/pigments need to be continuosly stirred during application. This is especially important in case of heavy thinning.

Thinner
Above 20°C [68°F] Hempel's Thinner 08450
Below 20°C [68°F] Hempel's Thinner 08510

Cleaner
Hempel's Tool Cleaner 99610

Pot life

Product temperature	0°C [32°F]	20°C [68°F]	40°C [104°F]
Pot life	5 hours	4 hours	1½ hours

Application method

Tool	Thinning max vol.	Application parameters
Airless spray	5%	Nozzle pressure: 220 bar [3200 psi] Nozzle orifice: 0.017-0.021"

If brush or roller application is used, more coats will be necessary to achieve the specified dry film thickness. Spray data are indicative and subject to adjustment. Pressure is for a material temperature of 20°C [68°F].

Film thickness

Specification range	Low	High	Recommended
Dry film thickness	40 micron [1.6 mils]	100 micron [4.0 mils]	60 micron [2.4 mils]
Wet film thickness	60 micron [2.4 mils]	150 micron [6.0 mils]	90 micron [3.6 mils]
Theoretical spreading rate	16 m²/L [652 sq ft/US gal]	6.5 m²/L [265 sq ft/US gal]	11 m²/L [448 sq ft/US gal]

Overthickness must be closely controlled and never locally exceed 200 micron [8.0 mils] DFT. On irregular surfaces it is recommended to employ special care in avoiding over application.

Application conditions
- Temperature of product must be above 15°C [59°F] during application.
- To avoid condensation, apply on a clean and dry surface with a temperature that is at least 3°C [5°F] above the dew point.
- Surface temperature must be above -10°C [14°F] during application and curing.
- Surface temperature must be below 40°C [104°F] during application and curing.

Relative Humidity:
- Relative humidity must be below 95% during curing.
- Relative humidity must be below 95% during application.

Hempadur Avantguard 750

Drying and overcoating

Product compatibility
- Previous coat: None.
- Subsequent coat: According to Hempel's Specification.

Drying time

Surface temperature		-10°C [14°F]	0°C [32°F]	20°C [68°F]	40°C [104°F]
Touch dry	min	50	30	10	5
Hard dry	hours	4½	3	1½	½

Determined for dry film thickness 60 micron [2.4 mils] at standard conditions, see Hempel's Explanatory Notes for details.

Overcoating

Hempel's specification supersedes any guidelines indicated in the overcoating table

Quality name		-10°C [14°F]	0°C [32°F]	20°C [68°F]	40°C [104°F]
Atmospheric medium					
Hempaprime Multi 500 Winter	Min	3 h	90 min	45 min	25 min
	Max	Ext*	Ext	Ext	Ext
Hempathane HS 55610	Min	3 h	90 min	45 min	25 min
	Max	56 d	42 d	14 d	3½ d
Atmospheric severe					
Hempaprime Multi 500 Winter	Min	3 h	90 min	45 min	25 min
	Max	90 d	90 d	30 d	7 d
Hempathane HS 55610	Min	3 h	90 min	45 min	25 min
	Max	20 d	15 d	5 d	28 h

Overcoating times are indicative for products of the same generic chemistry. Consult Hempel's specification for more information.

Drying conditions
- To obtain the drying time stated, it is important to maintain sufficient ventilation during application, drying and curing.

Overcoating details
- If the maximum overcoating interval is exceeded, roughening of the surface is necessary to ensure intercoat adhesion.
- Remove zinc salts or other contamination before overcoating.
- The surface must be dry and clean prior to application.

Other remarks
- Hempel's Specification supersedes any recommendations given in the Product Data Sheets.

Storage

Shelf life

Ambient temperature	25°C [77°F]
Base	12 months
Curing Agent	36 months

Shelf life from date of production, when stored in original, unopened containers. Thereafter, the product quality must be re-inspected. Storage at elevated temperatures may reduce shelf life. For advice, please consult Hempel.

Storage conditions
- Product must be stored according to local legislation, at maximum 40°C [104°F], without direct sunlight and protected from rain and snow.

Carbon Footprint

Dry film thickness	1 µm	1 mil
GWP (Global Warming Potential)	18.9 g CO_2e/m^2	0.098 lb CO_2e/ft^2

The carbon footprint is for 1 square meter / square foot of surface area with a dry film thickness of 1 micron / mil.

The scope includes raw materials, in-bound transport to the Hempel factory, Hempel manufacturing processes, and any Volatile Organic Compounds emitted during and after the application of the product.

Additional documents

Additional information is available at the Hempel website
https://www.hempel.com/service-and-support/technical-guidelines
or at your local Hempel website:

- Explanatory Notes for Product Data Sheet.
- Application methods.
- Substrates.
- Surface Preparation.
- Application Instruction for this product.
- Repair & maintenance.
- Inspection & quality control.

This Product Data Sheet ("**PDS**") relates to the supplied product ("**Product**") and is subject to updating from time-to-time. Accordingly, the buyer/applicator should have regard to the PDS supplied together with the relevant batch of the Product (and not an earlier version). In addition to the PDS, the buyer/applicator may receive some or all of the following specifications, statements and/or guidelines as listed below or as are available from the Hempel website under 'Products' at www.hempel.com (the "**Additional documents**"):

No.	Document description	Location/comments
1.	Technical Statement	One-off specific advice provided on request for specific projects
2.	Specification	Only issued for specific projects
3.	PDS	This document
4.	Explanatory Notes to the PDS	Available at www.hempel.com and contain relevant information about the Product testing parameters
5.	Application Instruction	Where available, at www.hempel.com
6.	Generic technical guidelines (e.g. on application and surface preparation)	Where available, at www.hempel.com

In the event of a conflict of information between the PDS and the Additional documents, the order of priority of information shall be in the order as set out above. In such event you should also contact your representative at Hempel for clarification. Furthermore, the buyer/applicator must have full regard to the relevant Safety Data Sheet provided with each Product and which can also be downloaded from www.hempel.com.

Hempel shall not be liable for defects where the application of the Product has not been made fully in accordance with the recommendations and requirements set out in the relevant PDS and the Additional Documents. The information and terms of this disclaimer apply to this PDS, the Additional documents and any other documents supplied by Hempel in respect of the Product. In addition, the Product is supplied and all technical assistance is given subject to Hempel's General Conditions of Sale, Delivery and Service, unless otherwise expressly agreed in writing.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.

3.7.5 Hempel Hempadur 4774D

Product Data Sheet

HEMPEL
Trust is earned

Hempadur 4774D

Product characteristics

Description
Hempadur 4774D is a self-priming, high-build, pure epoxy paint providing both abrasion and corrosion resistance.

Recommended use
Hempadur 4774D is recommended as a high-build primer, intermediate and/or self-primed finish for high performance, heavy-duty coating systems. Hempadur 4774D is fast curing and therefore suitable when high productivity is key - such as in the Wind segment.

Service temperature:
- Maximum, dry exposure only: 120°C [248°F].

Certificates / Approvals
- Meets requirements to ISO 12944 when used as part of a predefined paint system. Part 6 C5.
- Meets requirements to NORSOK M-501 when used as part of a predefined paint system. Edition 6, System 1. Edition 7, System 1B.

Features
- Heavy duty, abrasion resistant coating.
- Overcoatable by a wide range of epoxy- and polyurethane coatings.
- Low VOC.
- Applicable by standard heavy duty airless spray equipment in a wide range of film thicknesses.

Product Data Sheet

HEMPEL
Trust is earned

Hempadur 4774D

Surface preparation

Cleanliness
- Remove oil, grease and other contaminants by suitable detergent cleaning.
- Remove salts, detergents and other contaminants by high pressure fresh water cleaning.

New build:
- Abrasive blasting to min. Sa 2½ (ISO 8501-1) / SP 10 (SSPC).
- Remove dust, blast media and loose materials.
- All damage of shopprimer and contamination from storage and fabrication should be thoroughly mechanically/chemically cleaned prior to final painting.

Maintenance and Repair
- Abrasive blasting to min. Sa 2 (ISO 8501-1) / SP 6 (SSPC).
- Minor areas can be cleaned by power tool to St 3 provided the surface is roughened and not polished.
- Remove dust, blast media and loose materials.

Roughness
- Surface profile Medium (G) (ISO 8503-2).

Consult Hempel's separate Surface Preparation Guidelines for more details.

Application

Mixing ratio
Base 4774M : Curing Agent 9874D
(4 : 1 by volume)

Stir well before use.

Thinner
Hempel's Thinner 08450

Cleaner
Hempel's Tool Cleaner 99610

Pot life

Product temperature	15°C [59°F]	20°C [68°F]	30°C [86°F]
Pot life	60 min	45 min	20 min
Pot life (spray)	60 min	45 min	20 min
Pot life (brush)	60 min	45 min	20 min

Application method

Tool	Thinning max vol.	Application parameters
Airless spray	5%	Nozzle pressure: 250 bar [3600 psi] Nozzle orifice: 0.021-0.025"
Brush	5%	Not Applicable.

If brush or roller application is used, more coats will be necessary to achieve the specified dry film thickness. Spray data are indicative and subject to adjustment. Pressure is for a material temperature of 20°C [68°F].

Film thickness

Specification range	Low	High	Recommended
Dry film thickness	100 micron [4.0 mils]	250 micron [10 mils]	150 micron [6.0 mils]
Wet film thickness	130 micron [5.2 mils]	330 micron [13 mils]	200 micron [8.0 mils]
Theoretical spreading rate	7.6 m²/L [310 sq ft/US gal]	3 m²/L [122 sq ft/US gal]	5.1 m²/L [208 sq ft/US gal]

For best performance, avoid excessive film thickness. Product may be specified in another film thickness than indicated depending on purpose and area of use. This will alter spreading rate, drying and curing time and overcoating interval.

Application conditions
- Temperature of product must be above 15°C [59°F] during application.
- To avoid condensation, apply on a clean and dry surface with a temperature that is at least 3°C [5°F] above the dew point.
- Surface temperature must be above 5°C [41°F] during application and curing.
- Surface temperature must be below 60°C [140°F] during application and curing.

Product Data Sheet

HEMPEL
Trust is earned

Hempadur 4774D

Relative Humidity:
- Relative humidity must be below 85% during application.
- Relative humidity must be below 85% during curing.

Application remarks
- Product requires heavy duty spray equipment; spray hoses shall be as short as possible.
- The practical consumption factor may vary depending on application conditions, equipment and workmanship.

Drying and overcoating

Product compatibility
- Previous coat: None or according to Hempel's specification.
- Subsequent coat: None or according to Hempel's specification. Recommended products are: Hempadur, Hempathane

Drying time

Surface temperature		10°C [50°F]	20°C [68°F]	30°C [86°F]	40°C [104°F]
Touch dry	min	30	15	15	15
Hard dry	hours	5	2½	2	1½
Fully cured	days	-	7	-	-

Determined for dry film thickness 150 micron [6.0 mils] at standard conditions, see Hempel's Explanatory Notes for details.

Overcoating

Hempel's specification supersedes any guidelines indicated in the overcoating table

Quality name		10°C [50°F]	20°C [68°F]	30°C [86°F]	40°C [104°F]
Atmospheric medium					
Hempadur 4774D	Min	4 h	2 h	90 min	60 min
	Max	60 d	30 d	22 d	15 d
Hempathane HS 55610	Min	4 h	2 h	90 min	60 min
	Max	14 d	7 d	5½ d	3½ d
Atmospheric severe					
Hempadur 4774D	Min	4 h	2 h	90 min	60 min
	Max	60 d	30 d	22 d	15 d
Hempathane HS 55610	Min	4 h	2 h	90 min	60 min
	Max	14 d	7 d	5½ d	3½ d

Overcoating times are indicative for products of the same generic chemistry. Consult Hempel's specification for more information.

Drying conditions
- To obtain the drying time stated, it is important to maintain sufficient ventilation during application, drying and curing.

Overcoating details
- If the maximum overcoating interval is exceeded, roughening of the surface is necessary to ensure intercoat adhesion.
- The surface must be clean before overcoating.
- The surface must be dry and clean prior to application.

Other remarks
- Epoxy coats have an inherent tendency of chalking in outdoor exposure. This does not affect the performance of the coating.
- Hempel's Specification supersedes any recommendations given in the Product Data Sheets.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Product Data Sheet

Storage

Shelf life

Ambient temperature	25°C [77°F]
Base	36 months
Curing Agent	36 months

Shelf life from date of production, when stored in original, unopened containers. Thereafter, the product quality must be re-inspected. Storage at elevated temperatures may reduce shelf life. For advice, please consult Hempel.

Storage conditions

- Product must be stored according to local legislation, at maximum 40°C [104°F], without direct sunlight and protected from rain and snow.

Carbon Footprint

Dry film thickness	1 µm	1 mil
GWP (Global Warming Potential)	7 g CO_2e/m^2	0.036 lb CO_2e/ft^2

The carbon footprint is for 1 square meter / square foot of surface area with a dry film thickness of 1 micron / mil.

The scope includes raw materials, in-bound transport to the Hempel factory, Hempel manufacturing processes, and any Volatile Organic Compounds emitted during and after the application of the product.

It is calculated based on the standard shade defined in this PDS. Values may vary with shade.

Additional documents

Additional information is available at the Hempel website https://www.hempel.com/service-and-support/technical-guidelines or at your local Hempel website:

- Explanatory Notes for Product Data Sheet.

- Inspection & quality control.

This Product Data Sheet ("**PDS**") relates to the supplied product ("**Product**") and is subject to updating from time-to-time. Accordingly, the buyer/applicator should have regard to the PDS supplied together with the relevant batch of the Product (and not an earlier version). In addition to the PDS, the buyer/applicator may receive some or all of the following specifications, statements and/or guidelines as listed below or as are available from the Hempel website under 'Products' at www.hempel.com (the "**Additional documents**"):

No.	Document description	Location/comments
1.	Technical Statement	One-off specific advice provided on request for specific projects
2.	Specification	Only issued for specific projects
3.	PDS	This document
4.	Explanatory Notes to the PDS	Available at www.hempel.com and contain relevant information about the Product testing parameters
5.	Application Instruction	Where available, at www.hempel.com
6.	Generic technical guidelines (e.g. on application and surface preparation)	Where available, at www.hempel.com

In the event of a conflict of information between the PDS and the Additional documents, the order of priority of information shall be in the order as set out above. In such event you should also contact your representative at Hempel for clarification. Furthermore, the buyer/applicator must have full regard to the relevant Safety Data Sheet provided with each Product and which can also be downloaded from www.hempel.com.

Hempel shall not be liable for defects where the application of the Product has not been made fully in accordance with the recommendations and requirements set out in the relevant PDS and the Additional Documents. The information and terms of this disclaimer apply to this PDS, the Additional documents and any other documents supplied by Hempel in respect of the Product. In addition, the Product is supplied and all technical assistance is given subject to Hempel's General Conditions of Sale, Delivery and Service, unless otherwise expressly agreed in writing.

3.7.6 Hempel Hempathane HS 55610

Product Data Sheet

Hempathane HS 55610

Product characteristics

Description
Hempathane HS 55610 is a glossy polyurethane topcoat, cured with aliphatic isocyanate. The product has very good gloss and colour retention and contains zinc phosphate.
Complies with EU Directive 2004/42/EC, The Paints Directive on the limitation of volatile organic compounds: subcategory j.

Recommended use
Hempathane HS 55610 is recommended as VOC compliant, high-build finishing coat for protection of structural steel in severely corrosive environment. The product may be specified as a one coat "direct to metal" system in environments classified as C2 and C3. It may also be applied directly on galvanised steel.

Service temperature:
- Maximum, dry exposure only: 120°C [248°F].

Certificates / Approvals
- EC-type examined as a low flame spread material when used as part of a predefined paint system. Please refer to “Declaration of Conformity” on hempel.com for further details.
- The following shades are formulated with special electrical conductive pigments that makes it possible to design paint systems that meet the requirements in ISO 80079-36:2016 Explosive atmospheres (ATEX): 95000
- Meets requirements to NORSOK M-501 when used as part of a predefined paint system. Edition 6, System 1. Edition 7, System 1A, 1B.

Features
- For severely corrosive atmospheric environment.
- Direct-to-metal in C2 and C3 environments.
- Glossy with very good gloss and colour retention.
- High volume solids and VOC-compliant.
- The minimum temperature for curing is -10°C [14°F].

Product safety

Flash point 31°C [88°F]

VOC content mixed product

Legislation	Value	5% thinning, by volume	Limit value, phase II (2010)[a]
EU	343 g/L [2.86 lb/US gal]	366 g/L [3.05 lb/US gal]	500 g/L [4.17 lb/US gal]
US (coatings)	320 g/L [2.67 lb/US gal]	-	-
US (regulatory)	343 g/L [2.86 lb/US gal]		
China	343 g/L [2.86 lb/US gal]		
Hong Kong	320 g/L [2.67 lb/US gal]		

According to specific legislation, see details in the Explanatory Notes available at Hempel website, hempel.com or at your local Hempel website. VOC values may vary with shade, please consult the Safety Data Sheet, section 9. [a]EU Directive 2004/42/CE. According to EPA Method 24.

Handling
Handle with care. Before and during use, observe safety labels on packaging and paint containers and follow all local and national safety regulations. Always consult Hempel’s Safety Data Sheet for this product along with the Product Data Sheet.

For professional use only.

Surface preparation

Cleanliness
- Remove oil, grease and other contaminants by suitable detergent cleaning.
- Remove salts, detergents and other contaminants by high pressure fresh water cleaning.

New build:
- Abrasive blasting to min. Sa 2½ (ISO 8501-1) / SP 10 (SSPC).
- Remove dust, blast media and loose materials.

Maintenance and Repair
- Abrasive blasting to min. Sa 2 (ISO 8501-1) / SP 6 (SSPC).
- Minor areas may be hand or power tool cleaned instead of abrasive blasting.
- Water jetting to Wa 2½ (ISO 8501-4).
- Flash rust degree of maximum FR M (ISO 8501-4).
- Remove dust, blast media and loose materials.

Roughness
- Surface profile Medium (S) (ISO 8503-2).

Consult Hempel's separate Surface Preparation Guidelines for more details.

Product Data Sheet

HEMPEL
Trust is earned

Hempathane HS 55610

Pot life

Product temperature	10°C [50°F]	20°C [68°F]	30°C [86°F]
Pot life	3½ hours	2 hours	1 hour

Application method

Tool	Thinning max vol.	Application parameters
Airless spray	5%	Nozzle pressure: 175 bar [2500 psi] Nozzle orifice: 0.017-0.021"

If brush or roller application is used, more coats will be necessary to achieve the specified dry film thickness. Never thin more than allowed according to local environmental legislation. Spray data are indicative and subject to adjustment. Pressure is for a material temperature of 20°C [68°F].

Film thickness

Specification range	Low	High	Recommended
Dry film thickness	50 micron [2.0 mils]	125 micron [5.0 mils]	80 micron [3.2 mils]
Wet film thickness	75 micron [3.0 mils]	187 micron [7.5 mils]	120 micron [4.8 mils]
Theoretical spreading rate	13 m²/L [530 sq ft/US gal]	5.3 m²/L [216 sq ft/US gal]	8.3 m²/L [338 sq ft/US gal]

For best performance, avoid excessive film thickness.

Application conditions

- To avoid condensation, apply on a clean and dry surface with a temperature that is at least 3°C [5°F] above the dew point.
- Surface temperature must be above -10°C [14°F] during application and curing.
- Beware of ice on the surface at low temperatures.
- The film formation may be adversely affected by light rain, high humidity and/or condensation during application and the following interval after application: “8 hours, 20°C/68°F”.
- Optimal spraying properties are obtained at paint temperatures of 15-30°C [59-86°F]. Beyond these temperatures additional thinning may be necessary.

Relative Humidity:

- Relative humidity must be below 85% during curing.
- Relative humidity must be below 85% during application.

Drying and overcoating

Product compatibility

- Previous coat: According to Hempel’s Specification. Recommended products are: Hempaprime Multi 500, Hempadur
- Subsequent coat: None.

Drying time

Surface temperature		10°C [50°F]	20°C [68°F]	30°C [86°F]
Touch dry	min	120	90	60
Surface dry	hours	11	3½	2
Hard dry	hours	12	5	3
Fully cured	days	-	7	-

Determined for dry film thickness 80 micron [3.2 mils] at standard conditions, see Hempel’s Explanatory Notes for details.

Overcoating

Hempel’s specification supersedes any guidelines indicated in the overcoating table

Quality name		-10°C [14°F]	10°C [50°F]	20°C [68°F]	30°C [86°F]
Atmospheric medium					
Hempathane HS 55610	Min	30 h	9 h	6 h	3 h
	Max	Ext*	Ext	Ext	Ext

Overcoating times are indicative for products of the same generic chemistry. Consult Hempel’s specification for more information.

Drying conditions

- To obtain the drying time stated, it is important to maintain sufficient ventilation during application, drying and curing.
- Condensation on the freshly applied coating should be avoided.

Overcoating details

- The surface must be dry and clean prior to application.

Other remarks

- Hempel’s Specification supersedes any recommendations given in the Product Data Sheets.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Product Data Sheet

HEMPEL
Trust is earned

Hempathane HS 55610

Storage

Shelf life

Ambient temperature	25°C [77°F]
Base	36 months
Curing Agent	24 months

Shelf life from date of production, when stored in original, unopened containers. Thereafter, the product quality must be re-inspected. Storage at elevated temperatures may reduce shelf life. For advice, please consult Hempel.

Storage conditions

- Product must be stored according to local legislation, at maximum 40°C [104°F], without direct sunlight and protected from rain and snow.
- The curing agent is sensitive to moisture. Store in a dry place and keep the can tightly closed until use.

Carbon Footprint

Dry film thickness	1 µm	1 mil
GWP (Global Warming Potential)	8.7 g CO_2e/m^2	0.045 lb CO_2e/ft^2

The carbon footprint is for 1 square meter / square foot of surface area with a dry film thickness of 1 micron / mil.

The scope includes raw materials, in-bound transport to the Hempel factory, Hempel manufacturing processes, and any Volatile Organic Compounds emitted during and after the application of the product.

It is calculated based on the standard shade defined in this PDS. Values may vary with shade.

1.0 Introduction and Purpose

This document describes the hydrostatic, pneumatic and leak test procedures carried out on the FCwave™ fuel cell modules and its sub-assemblies. It includes duration of tests, quality of test media, and respective passing criteria.

The tests described in this document are divided into two main sections: FC stack level testing and FCwave™ component and module level testing. The first section is part of the functionality and leak testing activities prior to shipping the FC stacks from Canada to Denmark for further installation in the FCwave™ modules. The second section is part of the module FAT.

Additional container level leak tests are carried out after the installation of the FCwave™ modules and the container solution build has been completed. These additional tests are part of the container FAT and are described in a separate document, namely K559-2254-CWIWP4202202-J08-001 (SDRL Code: J08).

Note: The contents of documents J06 and J09 have been combined into this single document for convenience.

4.0 FC Stack Level Testing

All stacks produced by Ballard in Burnaby, Canada undergo functionality and leak testing prior to being shipped to Hobro, Denmark, where they are then installed in the FCwave™ modules.

The stacks used in the FCwave™ have been designed for operating pressures of up to 1.7 barg. The operating pressure of the FCwave™ is lower (< 1 barg).

4.1 Fuel Cell Stack – External Static Leak Test

The external static leak test of the fuel cell stack is performed under the following conditions:

Table 1. Testing conditions for fuel cell stack external static leak test.

Test / Item	Test Media	Pressure	Criteria
Cathode (Air) Loop	Air	2.0 barg	≤ 0.25 sccm/cell
Anode (Fuel) Loop	Air	2.0 barg	≤ 0.60 sccm/cell
Coolant Loop	Air	2.0 barg	≤ 0.11 sccm/cell

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.0 FCwave™ Component and Module Level Testing

5.1 Humidifier Leak Test

The shell and tube humidifier is a delicate component, with countless small permeable straws, allowing the transfer of water between the cathode outlet effluent and the incoming air.

After assembly of the three humidifiers on the aftercooler, the assembly is pressure tested with a dedicated humidifier test cart.

Table 2. Testing conditions for humidifier leak test.

Test / Item	Test Media	Pressure	Criteria
External humidifier leak test	Air	1.0 barg	< 5 sccm total
Internal humidifier leak test	Air	0.5 barg	< 5,000 sccm/minute per column

5.2 H_2 Supply Valve Block Test

The H_2 Supply valve is tightness tested by the manufacturer.

5.3 HRB Leak Test

The HRB assembly is leak tested in conjunction with the leak test of the H2Enclosure (see section 5.5).

If in doubt or found necessary, the HRB can be tested individually.

5.4 Cooling Assembly Leak Tests

The liquid cooling lines are pressure tested prior to installation of the H2Enclosure as part of the build test.

The lines can be pressure tested with air to verify that there is no leak.

If in doubt, water is used to verify no droplets form. The lines are filled with water and pressurized for a length of time. When the unit under test is filled and the pressure is established, the pressure can be sealed, and the equipment left unattended for the duration of the test period.

The auxiliary cooling loop runs between the upper and lower cabinet of the FCwave™ module and is therefore tested during the leak test of the entire module (see section 5.6.2).

Table 3. Testing conditions for cooling assembly leak tests (with air as test medium).

Test / Item	Test Media	Pressure	Test Period	Criteria
Main internal cooling loop	Air	2.0 barg	> 1 hour	< 10 sccm
Main external line	Air	2.0 barg	> 1 hour	< 5 sccm
Auxiliary cooling loop	Air	1.0 barg	> 1 hour	< 2 sccm

Table 4. Testing conditions for cooling assembly leak tests (with water as test medium).

Test / Item	Test Media	Pressure	Test Period	Criteria
Main internal cooling loop	DI Water	2.0 barg	> 2 hours	No drops
Main external line	Tap Water	2.0 barg	> 2 hours	No drops
Auxiliary cooling loop	Tap Water	1.0 barg	> 2 hours	No drops

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.5 FC Stack Assembly in H2Enclosure Leak Test

The stress and leak tests of the FC Stack Assembly in the H2Enclosure, including entry ports and manifolds, ensure proper assembly before sealing the enclosure. These tests are described in the following sub-sections.

5.5.1 FC Stack Assembly Pressure Stress Test

To verify the assembly of hoses and tightness of hose bands, etc. of the FC stack assembly, the H2Enclosure is stress tested with 2.0 bar air pressure. The stress test is to verify that all hose clamps and silicone hose crimps satisfy strength requirements before attaching the H2Enclosure top.

All lines must be pressurized to ensure equal pressure on Air (Cathode), Coolant and Fuel (Anode) side of the stack plates, to minimize stack plate stress.

The test pressure is kept stable at 2.0 bar for a duration of 30 minutes.

Table 5. Testing conditions for FC stack assembly pressure stress test.

Test / Item	Test Media	Pressure	Criteria
Stack assembly stress test	Air	2.0 barg	No damage or malfunction

Additionally, the correct function of the purge line components is also verified.

Table 6. Testing conditions for function test of purge line components.

Test / Item	Test Media	Pressure	Criteria
Pressure sensor	Air	2.0 barg	2.0 bar readout
Purge valve	Air	2.0 barg	Open/Close

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.5.2 FC Stack Assembly External Leak Test

All lines are pressurized to ensure equal pressure on each side of the stack plates to measure the external leak.

The acceptance criteria result from the sum of the leak rates from the individual stacks and components, with an additional defined amount to allow for minor assembly leak sources. The stacks are tested at 2.0 barg individually as a part of the test procedure during manufacturing (see section 4.1). The leak rate criteria are then correlated to the actual system leak test pressure of 1.1 barg.

This means the leak criteria are dynamic and follow the assembly variances of the stacks.

Table 7. Testing conditions for FC stack assembly external leak test.

Test / Item	Test Media	Pressure	Criteria [sccm]
Total external leak	Air	1.1 barg	Total (Anode + Cathode + Coolant) + 56
Anode (external)	Air	1.1 barg	< (Σ of anode external (FC1..6)@2.0 barg/2)x1.1 + 20
Cathode (external)	Air	1.1 barg	< (Σ of cathode external (FC1..6)@2.0 barg/2)x1.1 + 20
Coolant (external)	Air	1.1 barg	< (Σ of coolant external (FC1..6)@2.0 barg/2)x1.1 + 6

ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.5.3 FC Stack Assembly Internal Leak Test

The internal leak rate is initially determined in ml/minute through a graduated water bath cylinder leak test station and then converted to sccm.

The test initially measures the leak rate from the anode side to the other two sides: cathode and coolant.

The pressure is then applied to the cathode side, and the leak rate to the coolant side is measured.

Table 8. Testing conditions for FC stack assembly external leak test.

Test / Item	Test Media	Pressure	Criteria [sccm]
Anode → Cathode	Air	0.5 barg	< (Σ of anode internal (FC1..6) to cathode) + 15
Anode → Coolant	Air	0.5 barg	< (Σ of anode internal (FC1..6) to coolant) + 6
Cathode → Coolant	Air	0.5 barg	< (Σ of cathode internal (FC1..6) to coolant) + 6

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.6 Module Stress and Tightness Test

5.6.1 Module Stress Test

To verify the assembly of all hoses and tightness of hose bands, etc. in the FCwave™, the complete module is stress tested with 2.0 barg air pressure.

All lines are pressurized to ensure equal pressure on Air (Cathode), Coolant and Fuel (Anode) side of the stack plates, to minimize stack plate stress.

The test pressure is kept stable at 2.0 barg for a duration of 30 minutes.

Note: The PRV outlet from the valve block is blocked during this test, since the test pressure is above the release pressure.

5.6.2 Module Tightness Test

The module tightness test is carried out after the FCwave™ module has been fully assembled.

During the module leak check, all pressure sensor readings are verified.

The passing criteria are dependant on the results from section 5.5.2.

Table 9. Testing conditions for module tightness test.

Test / Item	Test Media	Pressure	Criteria [sccm]
External leak	Air	1.1 barg	< Total from section 5.5.2 + 110
Anode (external)	Air	1.1 barg	< Anode external from section 5.5.2 + 50
Cathode (external)	Air	1.1 barg	< Cathode external from section 5.5.2 + humidifier total from section 5.1 + 50
Coolant (external)	Air	1.1 barg	< Coolant external from section 5.5.2 + 10

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.6.3 Pressure Decay Test

As an alternative method for establishing the leak rate of the FC module, a pressure decay over time can be measured, and a leak rate determined for each string.

Instead of reading the individual flows on the flow meters, the test valves are closed when the pressure is stabilized, and the test period started. After a minimum of 10 minutes, the individual pressures of Fuel (Anode), Air (Cathode) and Coolant are noted.

From the measured pressure difference, the actual leak flow can be derived from the free volume in each string and normalized to sccm.

Anode Loop Leak Rate

$$L_{Anode} = V_{Anode} \cdot \frac{T_0}{P_0} \cdot \frac{\left(\frac{p_{1Anode}}{T_1} - \frac{p_{2Anode}}{T_2}\right)}{t}$$

Cathode Loop Leak Rate

$$L_{Cathode} = V_{Cathode} \cdot \frac{T_0}{P_0} \cdot \frac{\left(\frac{p_{1Cathode}}{T_1} - \frac{p_{2Cathode}}{T_2}\right)}{t}$$

Coolant Loop Leak Rate

$$L_{Coolant} = V_{Coolant} \cdot \frac{T_0}{P_0} \cdot \frac{\left(\frac{p_{1Coolant}}{T_1} - \frac{p_{2Coolant}}{T_2}\right)}{t}$$

5.6.4 Auxiliary Cooling Leak Test

The auxiliary cooling loop is tested with air at a pressure of 1.0 barg for > 1 hour or alternatively with tap water at a pressure of 1.0 barg for > 2 hours, as stated in Table 3 and Table 4 of section 5.4, respectively.

1.0 Executive Summary

This document outlines the tests to be included in the factory acceptance test. These tests aim to verify the overall functionality of the fuel cell-based power plant. The verification should show the capability of delivering the expected AC power and that the product is ready to be delivered and installed on site.

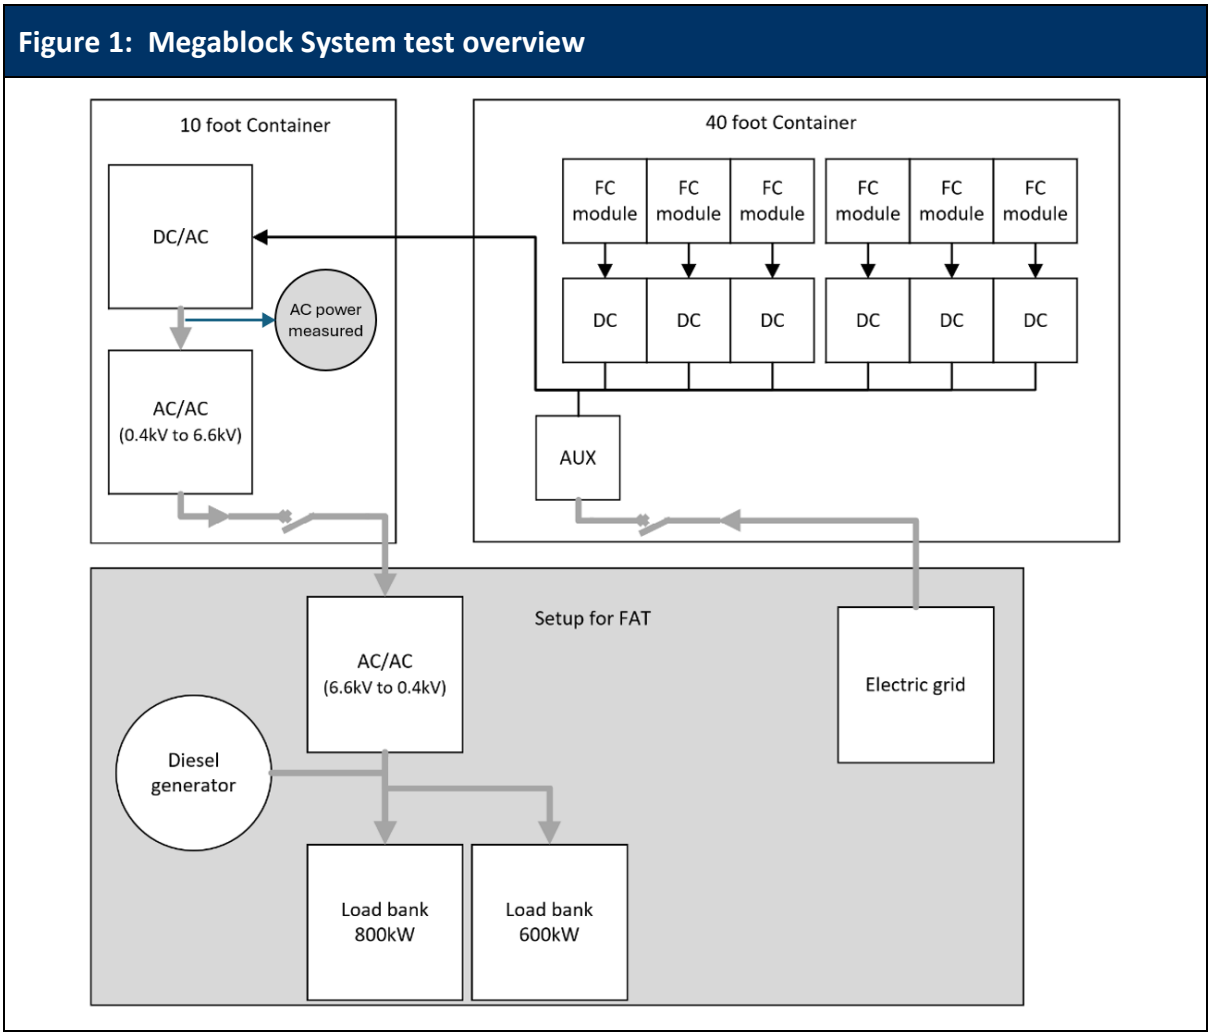
FC	FCwave™
H2	Hydrogen
FAT	Factory Acceptance Test
HT1	High temperature 1050kW cooling system
HT2	High temperature 1050kW cooling system
LT	Low temperature cooling system



4.0 Objectives and Background

This document describes the factory acceptance tests. The FAT does not include the internal testing that has been done to secure product maturity, mechanical and electrical connections have been done correctly.

The scope of testing is:

- Safety systems are functioning correctly in a complete Megablock with coolers.
- Megablock produces AC current, and the tests shall verify the capability to produce AC current following the demand.
- Tests to verify that the performance of cooling systems is as designed.
- Correct handling of operation, including error handling and service, including the correct signals to communicating systems.

Figure 1: Megablock System test overview

5.0 Functional tests

5.1 F01 Weight

5.1.1 Test

This test will be carried out using the weighbridge at Hobro Varme.

5.1.2 Relevant Standard / document

- General arrangement

5.1.3 Brief Test Plan

- Measure weight during transport using a weighbridge at Hobro Varme.

5.1.4 Pass/Fail criteria.

Table 1: Weights

Item	Expected Weight
40 foot container	25,000 kg
10 foot container	8,000 kg
Cooling platform	9,000 kg

5.1.5 Test Result

Table 2: Weights - Test Result

Date tested	Item	Result	Pass/Fail	Notes
1/7-2024	40 foot container	21,320 kg	Pass	-
1/7-2024	10 foot container	7,310 kg	Pass	-
1/7-2024	Cooling platform	9,060 kg	Pass	-

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.2 F02 Visual inspection

5.2.1 Test

The test involves an examination of the paint job through visual inspection, assessing the overall build quality, and checking for any dents. The focus is also on evaluating the assembly quality to ensure compliance with weather resistance.

5.2.2 Relevant Standard / document

- No reference

5.2.3 Brief Test Plan

- Visual inspection with customer of full system meaning inside and outside container solution.
- Take comprehensive pictures of the full system and test setup, including close-ups of vital components, with timestamps for reference.

5.2.4 Pass/Fail criteria.

- Visual inspect with customer to review quality of full system.

5.2.5 Test Result

Table 3: Visual inspection – Test Result

Date tested	Item	Result	Pass/Fail	Notes
13/8-2024	Inspection of paint	Accepted	Pass	See item/punch list for further elaboration
13/8-2024	Assessing build quality	Accepted	Pass	See item/punch list for further elaboration
13/8-2024	Check for dents	Accepted	Pass	See item/punch list for further elaboration

5.3 F03 Cooling leakage HT1

5.3.1 Test

Follow designated test procedure for inspection and verification of a leak-free HT1 coolant circuit.

5.3.2 Relevant Standard / document

- SPC ID 0103 Cooling Circuit Pressure and Leak Test Procedure

5.3.3 Brief Test Plan

- Follow test procedure.
- Test procedure 4.4 Pressure decay test with coolant from SPC ID 0103 is performed.

5.3.4 Pass/Fail criteria.

- Allow system to maintain pressure, after 2 hours pressure must not drop more than 0,1 bar.

5.3.5 Test Result

Table 4: Cooling leakage HT1 - Test Result

Date tested	Item	Result	Pass/Fail	Notes
12/8-2024	HT 1	-	Pass	-

5.4 F04 Cooling leakage HT2

Follow designated test procedure for inspection and verification of a leak-free HT2 coolant circuit.

5.4.1 Relevant Standard / document

- SPC ID 0103 Cooling Circuit Pressure and Leak Test Procedure

5.4.2 Brief Test Plan

- Follow test procedure.
- Test procedure 4.4 Pressure decay test with coolant from SPC ID 0103 is performed.

5.4.3 Pass/Fail criteria.

- Allow system to maintain pressure, after 2 hours pressure must not drop more than 0,1 bar.

5.4.4 Test Result

Table 5: Cooling leakage HT2 - Test Result

Date tested	Item	Result	Pass/Fail	Notes
13/8-2024	HT 2	-	Pass	-

5.5 F05 Cooling leakage LT

Follow designated test procedure for inspection and verification of a leak-free LT coolant circuit.

5.5.1 Relevant Standard / document

- SPC ID 0103 Cooling Circuit Pressure and Leak Test Procedure

5.5.2 Brief Test Plan

- Follow test procedure.
- Test procedure 4.4 Pressure decay test with coolant from SPC ID 0103 is performed.

5.5.3 Pass/Fail criteria.

- Allow system to maintain pressure, after 2 hours pressure must not drop more than 0,1 bar.

5.5.4 Test Result

ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.6 F07 Electrical safety test – 10 foot container

5.6.1 Test

Follow designated standard to conduct electrical safety test, grounding continuity and high potential.

5.6.2 Relevant Standard / document

- EN 60204-1

5.6.3 Brief Test Plan

- According to EN 60204-1

5.6.4 Pass/Fail criteria.

- All relevant checks in EN 60204-1 chapter 18 passed.

5.6.5 Test Result

Table 7: Electrical safety test - Test results

Date tested	Item	Result	Pass/Fail	Notes
7/8-2024	Grounding Continuity	-	Pass	-
8/8-2024	High Potential	-	Pass	-

Metrel CE-Multitester	086-003	19/1-2025	Grounding Continuity and High Potential

5.8 F10 Safety

5.8.1 Test

Conduct tests of safety inputs and outputs, including emergency stop buttons, smoke detectors, gas detectors and external connections.

5.8.2 Relevant Standard / document

- Safety input checklist according to EN/ISO 13849-2 procedure

5.8.3 Brief Test Plan

- Trigger each safety input according to checklist.
  - Emergency pushbuttons
  - Smoke detectors test
  - H2 sensor test
  - External safety switches
  - External feedback

5.8.4 Pass/Fail criteria.

- Verified according to checklist.
- Each item triggers the correct emergency stop.

5.8.5 Test Result

Table 11: Safety - Test Result

Date tested	Item	Result	Pass/Fail	Notes
29/7-2024	Emergency pushbuttons	-	Pass	-
29/7-2024	Smoke detectors	-	Pass	3 sensors in 40ft container and 1 sensor in 10 ft container
29/7-2024	H2 sensors	-	Pass	3 sensors in 40ft container
7/8-2024	External safety switches	-	Pass	-

5.10 F18 H_2 leakage test

5.10.1 Test procedure

All pipework and H2 instrumentation subassemblies must be inspected, recorded, verified and pass in accordance with the procedure in section 5.4 in *SPC ID 0104 H2 Leak Test Procedure Rev 002* prior to full system FAT.

System H2 leakage test is done system pressure decay test, according to section 5.5 in *SPC ID 0104 H2 Leak Test Procedure Rev 002*.

5.10.2 Pass/Fail criteria.

Pressure decay test with a maximum leakage no greater than specified in test procedure.

Result details are documented in the template *SPC ID 0204 System pressure decay test template*

Parameter	Value	Description
L_A [Nm^3/h]	**2,72 – 3,58 x10^{-3}**	**Maximum allowed pressure decay to pass pressure decay test, where L_A = L_S + L_Mu**
L_S [Nm^3/h]	0	Summarized expected leak rates of all components in the system (per design leak rate).
L_Mu [Nm^3/h]	2,72 – 3,58 x10^{-3}	Calculated accuracy of the measuring system, used to perform the test.
L_C [Nm^3/h]	2,7x10^{-5}	Maximum allowed leak rate for a given pipe section, where integrity/operability of the system may be maintained safely

5.10.3 Test Result

Table 14: H2 leakage - Test Result

Date tested	Item	Leakage rate L_1 [Nm^3/h]	Pass/Fail	Notes

5.11 F19 H2 Heater Test

5.11.1 Test

Follow test procedure

5.11.2 Relevant Standard/Document

SPC ID0108 Hydrogen preheating System Test Procedure

5.11.3 Brief Test Plan

Follow test procedure

5.11.4 Pass/Fail criteria

Start Up time test: Pass when the temperature reaches 30°C in less than 12 minutes

Sustain set point temperature at high hydrogen consumption test: pass when the temperature is ±4°C of the set point.

Power Consumption test: The power consumption is between 0-20kW when heater is running full load.

5.11.5 Test Results

Date tested	Item	Result	Pass/Fail	Notes
13/8-2024	Start Up time	From 19°C to 39°C in 11 minutes	Pass	-
8/8-2024	Sustain set point temperature at high hydrogen consumption	-	Pass	-
13/8-2024	Power Consumption test	18 kW	Pass	-

Unit	Equipment number	Calibration due date	Test used for
Clamp meter	039-040	26/4-2025	Power Consumption test

6.2 P02 Emergency stop

6.2.1 Test

Verify emergency stop function during stand-by.

6.2.2 Relevant Standard / document

- No reference

6.2.3 Brief Test Plan

- Use service interface.
- All Fuel Cell System in stand-by.
- Press emergency-stop pushbutton.

6.2.4 Pass/Fail criteria.

- Correct emergency shutdown of systems.
- Correct emergency stop signaling observed.
- Restart prohibited.
- Release emergency stop button.
- Reset possible.
- Restart to stand-by possible.
- No persistent system alarms.

6.2.5 Test Result

6.4 P04 Steady state operation – HT1 cooler function

6.4.1 Test

Verify performance of cooling by operating at maximum load and all cooling components forced to 100%.

6.4.2 Relevant Standard / document

- No reference

6.4.3 Brief Test Plan

- Use service interface.
- Operate FC1 to FC3 at 100% load +/-5%.
- Wait for steady coolant temperature (regulated)
- Force cooling system to 100% or HT inlet temperature 10°C
- Wait for steady coolant temperature.

6.4.4 Pass/Fail criteria.

- Measure produced power.
- Measure Cooler fan speed.
- Measure temperatures.
- In controlled mode 10°C< HTin <60°C
- In controlled mode 10°C< HTout - HTin <20°C

6.4.5 Test Result

Table 18: Steady state operation - HT1 cooler function - Test Result

Date tested	Item	Result	Pass/Fail	Notes
8/8-2024	HT1 cooler function	-	Pass	-

6.5 P05 Steady state operation – HT2 cooler function

6.5.1 Test

Verify performance of cooling by operating at maximum load and all cooling components forced to 100%.

6.5.2 Relevant Standard / document

- No reference

6.5.3 Brief Test Plan

- Use service interface.
- Operate FC4 to FC6 at 100% load +/-5%.
- Wait for steady coolant temperature (regulated)
- Force cooling system to 100% or HT inlet temperature 10°C
- Wait for steady coolant temperature.

6.5.4 Pass/Fail criteria.

- Measure produced power.
- Measure Cooler fan speed.
- Measure temperatures.
- In controlled mode 10°C< HTin <60°C
- In controlled mode 10°C< HTout - HTin <20°C

8/8-2024	HT2 cooler function	-	Pass	-

6.6 P06 Steady state operation – LT cooler function

6.6.1 Test

Verify performance of cooling by operating at maximum load and all cooling components forced to 100%.

6.6.2 Relevant Standard / document

- No reference

6.6.3 Brief Test Plan

- Operate all FC at 100% load +/-5%.
- Wait for steady coolant temperature (regulated)
- Force cooling system to 100% or LT inlet temperature 3°C
- Wait for steady coolant temperature.

6.6.4 Pass/Fail criteria.

- Measure produced power.
- Measure Cooler fan speed.
- Measure temperatures.
- In controlled mode 10°C< LTin <45°C
- In controlled mode 3°C< LTout - LTin <15°C

6.6.5 Test Result

Table 20: Steady state operation - LT cooler function - Test Result

Date tested	Item	Result	Pass/Fail	Notes
8/8-2024	LT cooler function	-	Pass	-

6.7 P07 Steady state operation - ventilating function

6.7.1 Test

Verify performance of cooling by operating at maximum load and all cooling components forced to 100%.

6.7.2 Relevant Standard / document

- No reference

6.7.3 Brief Test Plan

- Use service interface.
- Operate system all FC at 100% load +/-5%.
- Wait for steady state on Container internal temperature.
- Forced cooling system to to 100% duty (Ventilation fans, DCDC cooling fans).
- and achieve thermal steady state for 10 minutes.

6.7.4 Pass/Fail criteria.

- Measure produced power.
- Container internal temperature max 5°C>ambient.
- HT forward <25
- HT return <15
- LT forward <14
- LT return <10
- DCDC Cabinet temp <10°

6.7.5 Test Result

Table 21: Steady state operation - ventilating function - Test Result

8/8-2024	Ventilating function	-	Pass	-

6.8 P08 Thermographic report – Cooling and ventilation

6.8.1 Test

Thermographic inspection report of solution with focus on cooling and ventilation performance.

6.8.2 Relevant Standard / document

- SPC ID 0102 Thermographic - Cooling and Ventilation Test Procedure

6.8.3 Brief Test Plan

- Thermographic inspection is done while stressing cooling and ventilation circuits. Ventilation circuit can be adjusted and re-tested to ensure even cooling and avoiding hot spots. If accessible surfaces are above 60°C hot surface labels should be installed.

6.8.4 Pass/Fail criteria.

- Surface temperatures on cabinets maximum 60°C if there are no warning label on panel.
- Even temperature distribution on coolers.

6.8.5 Test Result

Table 22: Thermographic report – Cooling and ventilation - Test Result

Date tested	Item	Result	Pass/Fail	Notes
4/9-2024	40 foot container inside	-	Pass	-
4/9-2024	40 foot container outside	-	Pass	-
4/9-2024	10 foot container inside	-	N/A	Not possible for worker to enter during running state and thus not relevant to monitor. See P09's report for thermographic pictures of the inside electrical parts in the 10 foot container.
4/9-2024	10 foot container outside	-	Pass	-
4/9-2024	HT Cooling skid	-	Pass	-
4/9-2024	LT Cooling skid	-	Pass	-

Unit	Equipment number	Calibration due date	Test used for
Thermal camera	045-002	April 2025	40ft container, 10 ft container and Cooling skid

ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

6.9 P09 Thermographic report – Electrical

6.9.1 Test

Follow test procedure to inspect and control all relevant electrical installations.

6.9.2 Relevant Standard / document

- SPC ID 0105 Thermographic - Electrical Test Procedure

6.9.3 Brief Test Plan

- Follow test procedure.

6.9.4 Pass/Fail criteria.

- No cables should exceed the temperature limit specified by the supplier including a correction factor of ambient temperature in container.

6.9.5 Test Result

Table 23: Thermographic report - Electrical - Test Result

Date tested	Item	Result	Pass/Fail	Notes
8/8-2024	40 ft container	-	Pass	-
8/8-2024	10 ft container	-	Pass	-
8/8-2024	Cooling skid	-	Pass	-

7.0 Operational tests

Operations are done using operator HMI or remote HMI in normal operating mode.

7.1 O01 System Start/Stop - Normal low load operation.

7.1.1 Test

Fuel Cell system can start, deliver minimum power and perform controlled stop without faults. This test is based on DC power.

7.1.2 Relevant Standard / document

- No reference

7.1.3 Brief Test Plan

- All FC in standby
- Request 100kW DC
- Delay 120 seconds
- Request zero power
- Repeat with new preferred FC until all tested.

7.1.4 Pass/Fail criteria.

- Fuel Cell Package starts without faults.
- No persistent system alarms.
- Correct available power signal.
- DC Power output within +/-5% and stable in less than 60 seconds
- Fuel Cell Package stops without faults.
- FC in stand-by in less than 30 seconds.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

7.1.5 Test Result

Table 24: System Start/Stop – Normal low load operation - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	FCwave 1	All pass criterias passed except time to standby	Pass with note	Shut down to standby longer than 30 seconds
3/9-2024	FCwave 2	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 58 seconds. Power output dipped to 82 kW during the test.
3/9-2024	FCwave 3	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 55 seconds.
3/9-2024	FCwave 4	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 59 seconds.
3/9-2024	FCwave 5	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 57 seconds.
3/9-2024	FCwave 6	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 1 minute 3 seconds.

7.2 O02 Error resulting in loss of one FC module.

7.2.1 Test

Verify that FCwave performs stop in case of simulate error and correct transfer to next FC. This test is based on DC power.

7.2.2 Relevant Standard / document

- No reference

7.2.3 Brief Test Plan

- Systems operating at 200kW load, such that 2 fuel cell modules are operating.
- Use module engineering interface to force high coolant temperature error resulting in controlled shut-down.

7.2.4 Pass/Fail criteria.

- Respective FC will perform shutdown.
- Correct alarm signaling.
- Correct signal of reduced available power.
- Restart of FC under test prevented.
- Remaining running FC shall continue operation and increase to cover lost FC production until 200kW production is reestablished.
- No persistent system alarms.

7.2.5 Test Result

Table 25: Error resulting in loss of one FC module - Test Result

Date tested	Item	Result	Pass/Fail	Notes
9/8-2024	Loss of 1 FC test	-	Pass	-

7.3 O06 Noise Level Test

7.3.1 Test

Follow test procedure to check noise level in work environment and noise emitted from Megablock setup.

7.3.2 Relevant Standard / document

- SPC ID 0106 Noise Level Measurement Test Procedure

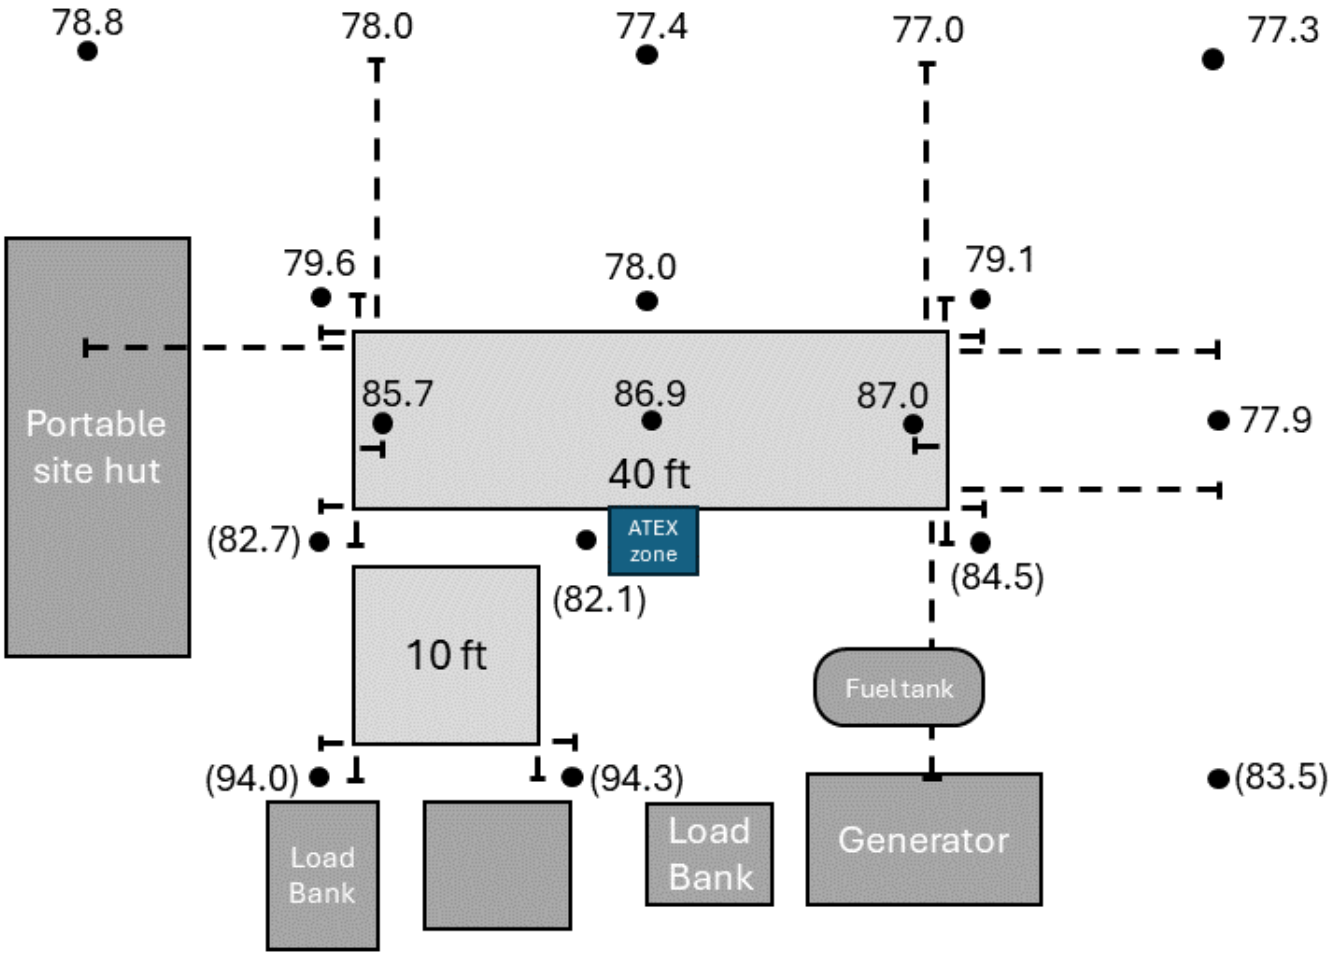
7.3.3 Brief Test Plan

- Follow test procedure.

7.3.4 Pass/Fail criteria.

- Follow criteria from test procedure.

7.3.5 Test Result



See table and figure below.

Table 26: Noise Level Test - Fully Operational - Test Result

Date tested	Item	Result	Pass/Fail	Notes
4/9-2024	Max noise inside	87 dBA	Pass	Recommendation that service personal wear hearing protection
4/9-2024	Max noise 1 meter	79.6 dBA	Pass	-
4/9-2024	Max noise 7 meter	77.9 dBA	Pass	-

7.4 O07 Load Test - Ramp up

7.4.1 Test

Ramp up from 0kW to 1000kW AC power while measuring AC power quality.

7.4.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

7.4.3 Brief Test Plan

- All FC is stand-by.
- Ramp slope: 0kW to 1000kW AC Power in 180 seconds.

7.4.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Startup time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

7.4.5 Test Result

Table 27: Load Test - Ramped up - Test Result

Date tested	Item	Result	Pass/Fail	Notes
9/8-2024	Ramp up from 0 kW to 1000kW	-	Pass	-

7.5 O08 Load Test - Ramp Down

7.5.1 Test

Ramp down from 1000kW to 0kW AC power while measuring AC power quality.

7.5.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

7.5.3 Brief Test Plan

- All FC running.
- Steady state at 1000kW AC.
- Ramp slope: 1000kW to 0kW AC Power in 180 seconds.

7.5.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Shutdown time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

7.5.5 Test Result

Table 28: Load Test - Ramp Down - Test Result

Date tested	Item	Result	Pass/Fail	Notes
9/8-2024	Ramp down from 1000kW to 0kW	-	Pass	-
9/8-2024	AC power quality	-	Pass	-

7.6 O09 Load Test – step response 0 to 35%

7.6.1 Test

Test step response by adding 35% load in one step from no load while measuring AC power quality.

7.6.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

7.6.3 Brief Test Plan

- All FC in stand-by.

- Apply set point by requesting 350kW AC

7.6.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Startup time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

7.6.5 Test Result

Table 29: Load Test - step response 0 to 35% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 0-35%	45 seconds for start-up 0-350kW AC. Slight overshoot on 30 kW AC	Pass	With reference to document C08 it is estimated that a ramp time to 500 kW is 75 seconds.
3/9-2024	AC power quality	2,9-2,8% VAC THD 2-50 No alarms	Pass	-

7.7 O10 Load Test – step response 35% to 70%

7.7.1 Test

Test step response by adding 35% load in one step to reach 70% load while measuring AC power quality.

7.7.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

7.7.3 Brief Test Plan

- 3 FC running delivering 350kW AC steady state.
- 2 FC in stand-by
- Apply set point by requesting 700kW AC power.

7.7.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Startup time < curve+5 seconds at any FC
- AC power quality within SPC ID 107
- No persistent system alarms.

7.7.5 Test Result

Table 30: Load Test - step response 35% to 70% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 35%-70%	All 3 started up. 23 seconds startup time	Pass	With reference to document C08 it is estimated that a ramp time from 250 kW to 750 kW is 45 seconds.
3/9-2024	AC power quality	2,8-3,0 % VAC THD 2-50 No alarms	Pass	-

7.8 O11 Load Test – step response 65% to 100%

7.8.1 Test

Test step response by adding 35% load in one step to reach full load while measuring AC power quality.

7.8.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

7.8.3 Brief Test Plan

- 6 FC running delivering 650kW AC steady state.
- Apply set point by requesting 1000kW AC power.

7.8.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Startup time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

7.8.5 Test Result

Table 31: Load Test - step response 65% to 100% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 65%-100%	18 seconds startup time	Pass	With reference to document C08 it is estimated that a ramp time from 250 kW to 750 kW is 45 seconds.
3/9-2024	AC power quality	3,0-3,1 % VAC THD 2-50 No alarms	Pass	-

7.9 O12 Load Test – 100% stability test - 3 hours.

7.9.1 Test

Test steady state at 100% load for 3 hours while measuring power quality.

7.9.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

7.9.3 Brief Test Plan

- 6 FC running delivering 1000kW steady state.

7.9.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Shutdown time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

7.9.5 Test Result

Table 32: Load Test – Steady state 100% load - Test Result

Date tested	Item	Result	Pass/Fail	Notes
4/9-2024	Full load test	1000 kW for 3 hours	Pass	See below
4/9-2024	AC power quality	2.3-3.6 % VAC THD 2-50 No alarms	Pass	-

7.10 O13 Load Test – step response 100% to 50%

7.10.1 Test

Test step response by removing 50% load in one step at full load while measuring power quality.

7.10.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

7.10.3 Brief Test Plan

- 6 FC running delivering 1000kW steady state.
- Request 500kW AC.

7.10.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Shutdown time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

7.10.5 Test Result

Table 33: Load Test - step response 100% to 50% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 100%-50%	Ramp down in 15 seconds	Pass	With reference to document C08 it is estimated that a ramp down time from 800 kW to 200 kW is 15 seconds.
3/9-2024	AC power quality	3,0-2,6 % VAC THD 2-50 No alarms	Pass	-

7.11 O14 Load Test – step response 50% to 0%

7.11.1 Test

Test step response by removing 50% load in one step to no load while measuring AC power quality.

7.11.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

7.11.3 Brief Test Plan

- 3 FC running delivering 500kW AC.
- Request 0% and apply set point.

7.11.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Shutdown time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

7.11.5 Test Result

Table 34: Load Test - step response 50% to 0% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 50%-0%	-	Pass	Test is executed with 6 FC instead of 3 as the plan describes
3/9-2024	AC power quality	NA	NA	Not applicable due to the unit not producing power

FCwave	FCwave 200kW Marine Fuel Cell Module

1.0 Objectives and background

The objectives of this test procedure is to demonstrate the performance of ventilation and cooling on full system solution. The thermographic inspection will be conducted around solution as well as inside where service staff can enter while system stays operational.

- Ensure ventilation system performing as expected.
- Ensure cooling system is performing as expected.
- Validate accessible surface temperatures.

2.0 References

Document	Titel

3.0 Equipment list

Equipment	Purpose
Thermographic imager	Measure temperatures, capture images and create data folder with evidence.

4.0 Test Procedure

4.1 Personal protective equipment

Before commencing the test procedure always analyze the work environment and make sure you take the right precautions.

Suggested PPE depending on solution and work environment:

- Safety shoes
- Goggles
- Hearing protection

4.2 Preparation

- Verify equipment is calibrated and withing valid calibration period.
- Identify how and where to measure the ventilation system.
- Identify how and where to measure the cooling system.
- Identify possible heat surfaces to be inspected.

4.3 Measurement locations

- Inside solution:
  - Ventilation of components
  - Container ventilation
  - Surface temperatures
  - Cooling circuit
- Outside solution:
  - Container ventilation
  - Surface temperatures
  - Coolers and cooling circuit

4.4 Conducting measurements

Set the Megablock to full power (1000 kW) and wait until temperatures have stabilised. Monitor the containers and ventilation described in section 4.3 through the thermographic imager and take pictures of all relevant areas with elevated temperatures. File in the pictures in a report.

Equipment	Purpose
Pressure gauge	Monitor pressure

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.0 Test Procedure

The main purpose of this test procedure is to ensure that the cooling circuit is leak free and can handle maximum system pressure. Furthermore, it is structured in a way to minimize the chance of having big leaks or lose clamps or fittings.

WARNING: The stress test is with elevated pressure, potentially turning plugs or loose fittings into projectiles.

Minimum safety precautions:

- Hose clamps and fittings
- Wear safety goggles
- When dealing with glycol wear gloves
- Check service manual for maximum system pressure.

4.1 Pre-conditioning

- Check and make sure valves in the cooling circuit are in the correct position.
- For pressure testing with coolant in the cooling circuit, make sure the system is fully bleed. Air in the system can act as a spring and can obscure results.
- To achieve stable temperature let system soak for 12 hours. Alternative watch data from temperature sensors in the full system to ensure stable temperature conditions.

4.2 Leak test with air

- Check service manual for maximum system pressure.
- No temperature pre-conditioning needed this is not a sign off test.
- Find compressor and leak test kit.
- Adjust pressure reduction valve to minimum (no pressure after reduction valve)
- Attach leak test kit to cooling circuit (not applying pressure to circuit)
- Open valve from compressed air
- Slowly increase pressure from reduction valve to 20% of maximum system pressure
- Close valve from compressed air
    - If pressure is not maintained
        - Open valve from compressed air again and look for leaks (where surface material is suitable soapy water spray can be used for leak detection)
        - Fix leak and repeat step.
    - If pressure is maintained
        - Continue to next step.
- Open valve from compressed air
- Slowly increase pressure from reduction valve to 80% of maximum system pressure
- Close valve from compressed air
    - If pressure is not maintained
        - Open valve from compressed air again and look for leaks (where surface material is suitable soapy water spray can be used for leak detection)
        - Fix leak and repeat step.
    - If pressure is maintained
        - Continue to next step.
- Open valve from compressed air
- Slowly increase pressure from reduction valve to 100% of maximum system pressure
- Close valve from compressed air
    - If pressure is not maintained
        - Open valve from compressed air again and look for leaks (where surface material is suitable soapy water spray can be used for leak detection)
        - Fix leak and repeat step.
    - If pressure is maintained – test completed and passed.

4.3 Leak test with air setup

Compressor and adaptor hose to be connected. Close valve to expansion tank so that pressure can build in cooling circuit. Find test setup image in appendix.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.4 Pressure decay test with coolant

- Check service manual for maximum system pressure.
- Make sure cooling circuit have been filled and bled before starting this test.
- Make sure pre-conditioning have been done.
- Find coolant pressure test kit.
- Attach test kit to cooling circuit (not applying pressure to circuit)
- Slowly increase pressure 50% of maximum system pressure
- Close valve from test kit.
    - Quick inspection of cooling circuit for any coolant leaks.
    - If pressure is not maintained
        - Further inspection of test setup and cooling circuit
            - If there is still air in the system if can cause spring effect and drop in pressure
        - Found and fixed issue, repeat step.
    - If pressure is maintained
        - Continue to next step.
- Open valve from test kit
- Slowly increase pressure to 100% of maximum system pressure
- Close valve from test kit
    - Quick inspection of cooling circuit for any coolant leaks.
    - If pressure is not maintained
        - Further inspection of test setup and cooling circuit
            - If there is still air in the system if can cause spring effect and drop in pressure
        - Found and fixed issue, repeat step.
    - If pressure is maintained
        - Continue to next step.
- Wait 30 minutes if pressure have dropped re-apply pressure to reach 100% system pressure again.
- Wait 2 hours and check pressure again.
    - If pressure have dropped more than 0.1bar
        - Repeat test
    - If pressure have dropped less than 0.1bar after 2 hours – test completed and passed.

4.5 Pressure decay test with coolant setup

Pressure pump and adaptor hose to be connected. Close valve to expansion tank so that pressure can build in cooling circuit. Find test setup image in appendix.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.6 Pressure decay test with coolant at increased pressure

- **Do not use this test procedure** for pressure testing cooling circuits with strict pressure limits such as LT circuit on FCwave
- Check service manual for maximum system pressure.
- Make sure cooling circuit have been filled and bled before starting this test.
- Make sure pre-conditioning have been done.
- Find coolant pressure test kit.
- Attach test kit to cooling circuit (not applying pressure to circuit)
- Slowly increase pressure 50% of maximum system pressure
- Close valve from test kit.
    - Quick inspection of cooling circuit for any coolant leaks.
    - If pressure is not maintained
        - Further inspection of test setup and cooling circuit
            - If there is still air in the system if can cause spring effect and drop in pressure
        - Found and fixed issue, repeat step.
    - If pressure is maintained
        - Continue to next step.
- Open valve from test kit
- Slowly increase pressure to 150% of maximum system pressure
- Close valve from test kit
    - Quick inspection of cooling circuit for any coolant leaks.
    - If pressure is not maintained
        - Further inspection of test setup and cooling circuit
            - If there is still air in the system if can cause spring effect and drop in pressure
        - Found and fixed issue, repeat step.
    - If pressure is maintained
        - Continue to next step.
- Wait 2 hours and check pressure again.
    - If pressure have dropped more than 0.1bar
        - Repeat test
    - If pressure have dropped less than 0.1bar after 2 hours – test completed and passed.

5.0 Results and discussion

6.0 Appendix

6.1 Cooling leakage HT1 (Suggested section for FAT or SAT document)

6.1.1 Test

Follow designated test procedure for inspection and verification of a leak-free HT1 coolant circuit.

6.1.2 Relevant Standard / document

- SPC ID 0103 Cooling Circuit Pressure and Leak Test Procedure

6.1.3 Brief Test Plan

- Follow test procedure.

6.1.4 Pass/Fail criteria.

- Allow system to maintain pressure, after 2 hours pressure must not drop more than 0,1 bar.

6.1.5 Test Result

Table 1: Cooling leakage HT1 - Test Result

Date tested	Item	Result	Pass/Fail	Notes
	HT 1

SME	Subject Matter Expert
PPE	Personal Protective Equipment
DUT	Device under test

2.0 Objectives and Background

The purpose of this test procedure is to generalise how Ballard Product Solutions secure that the fabricated hydrogen systems are not leaking more than the specified limits and the circuits will withstand maximum operation pressure. Furthermore, this procedure is intended to be used on full systems and/or sub assemblies. This test procedure is based on *IEC 62282-3-1 section 5.4 Leakage tests and 5.4.1 Gas leakage tests* with regards to system tests. For hydrogen pipework testing, the IEC 62282-3-1 references *ISO 15649:2001 "Petroleum and natural gas industries – Piping* which states that piping shall be tested according to *ASME B31.12 Hydrogen piping and pipelines.* Hence, the described procedure for component/pipework inspection and leakage test is based on this standard.

SPC ID 0203	Pipework inspection and leakage test check sheet template
SPC ID 0204	System pressure decay test template

4.0 Equipment list

Equipment	Type	Purpose
H2 sniffer	Sewerin Snooper Mini H2	Detection instrument to snif/locate source of potential leaks
Pressure sensor	Fluke 700RG07 500PSIG	Measuring device to accurately adjust and monitor gas pressure during leakage test
Test gas	Formier gas 5% hydrogen	Test gas for pressurizing pipework where the 5% hydrogen acts as tracer agent for sniffing.
Sniffer test station	Sewerin SPE-HG	Test instrument the emits a reference gas to check the correct function of the Snooper Mini H2 sniffer
Pressure regulator		Test gas pressure regulator for pressurizing the DUT
Pressure relief valve		Safety valve to ensure safe pipework pressurization during test.

5.0 Test Procedures

Any system is comprised of several subassemblies and/or components. Any of these subsystems must be individually inspected and leakage tested before assembly into the complete system. For systems fabricated or assembled by Ballard Product Solutions, testing per section 5.4 applies. Externally delivered systems/modules as well as Ballard standard products must be tested in accordance with *IEC 62282-3-1:2019* or similar industry relevant standards.

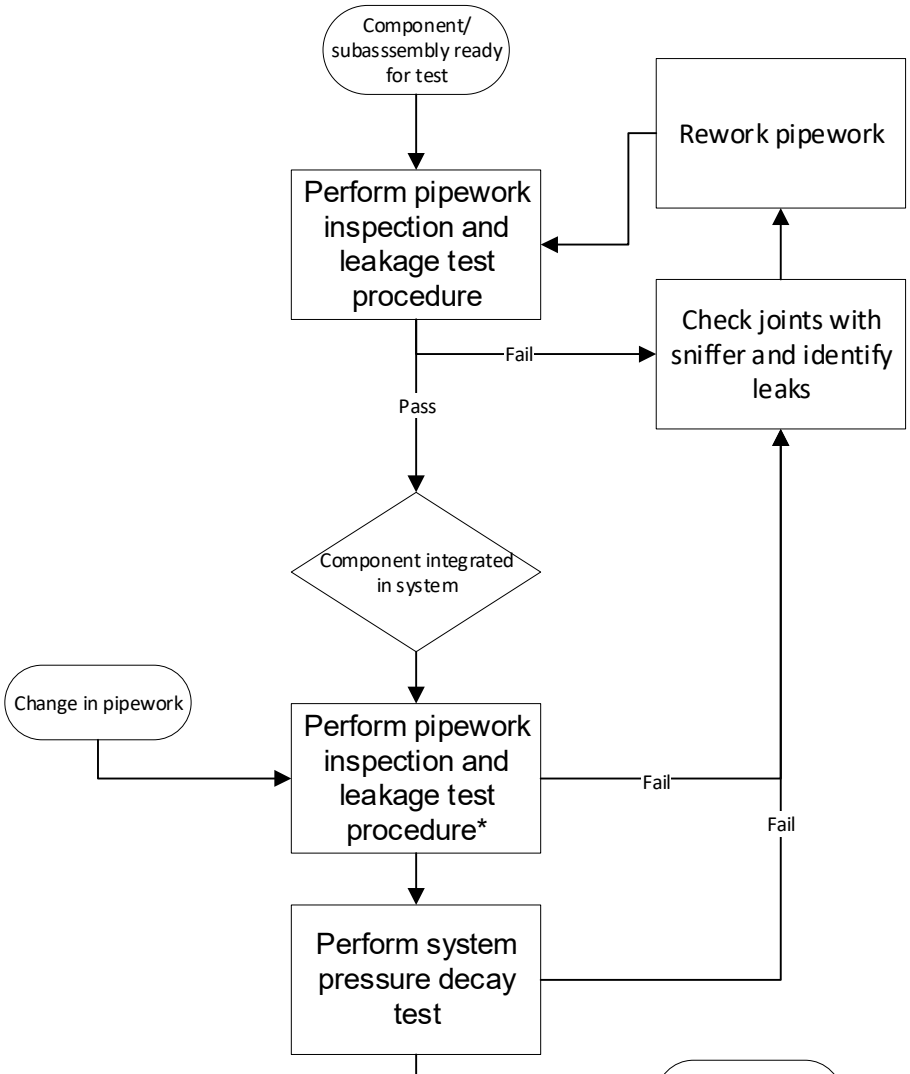
Attention: All test personnel, including external witness should be informed about risks associated with the test and instructed to use proper PPE prior to conducting the test.

WARNING: Pressure testing can potentially turn plugs or loose fittings into projectiles.

Minimum safety precautions:

- The test must be carried out by trained personnel.
- Prior to test start make sure that the work has been HSE risk assessed according to Ballard internal procedures.
- All connection and mechanical assemblies shall be checked before applying pressure.
- All personnel attending the test shall use appropriate PPE.

5.1 Installations and connections



Make sure that all parts of the hydrogen system have been correctly assembled and according to assembly guides and build manuals.

5.2 Review test setup.

Before proceeding to testing, the test setup should be reviewed by a SME. The SME should also determine the pressure of which the system under test will be tested to. Once a setup has been reviewed and approved re-testing can proceed on same approval if the setup remains unchanged. If a diagram of the system under test does not exist create a diagram like the one in appendix. The results from the test should be added on the diagram and saved as part of the test report. During the review a risk assessment should be done and shared with all staff involved with testing and working in proximity to an ongoing test. Make sure that relevant measurement instruments, used during the test all have valid calibration certificates if applicable. Furthermore, ensure that manufacturers procedures are followed for maintaining the equipment accuracy and dependability.

5.3 System test sequence

On any system the following test sequence must be followed during first assembly or reassembly of a system.

* Only for changed/interfacing joints

5.4 Pipework inspection and leakage test

The pipework inspection and leakage test are performed to ensure proper assembly quality is achieved during fabrication and assembly of components/subassemblies. The test is designed to be performed upon work completion in the assembly plant/workshop before release to system assembly.

The test is performed in accordance with or exceeding requirements in *ASME B31.12 Hydrogen piping and pipelines*.

The associated template for documenting the test must be used: *SPC ID 0203 Pipework inspection and leakage test check sheet* template

5.4.1 Test setup

The assembled component or subassembly pipe ends are appropriately sealed off and the pressure regulator with formier gas supply is connected, together with a pressure gauge and appropriate pressure relief valve.

Use of the H2 sniffer instrument must be performed in accordance with *SPC ID 0202 Snooper mini H2 sniffing procedure.*

5.4.2 Test sequence

1. Check for proper functionality of the sniffing tool by using the sniffer test station
2. Inspect the pipework visually for any damage or loose parts
    a. For ferrule fittings, check every fitting with appropriate gap inspection gauge to ensure sufficient tightening is achieved
3. Pressurize pipework to between 1.0-1.2 barg with formier gas and listen for leaks
4. Increase pressure to 50% of test pressure by adjusting the pressure regulator
5. Maintain the pressure for 10 minutes.
6. Listen for leaks and use H2 sniffer to inspect all joints. If leaks are identified record all positions and values in the check sheet, abort test by proceeding to item 10 and file the pipework for rework.
7. If no leaks are detected, proceed to increase pressure to “test pressure” by adjusting the pressure regulator.
8. Maintain the pressure for minimum 10 minutes.
9. Listen for leaks and use the H2 sniffer to inspect all joints. Record all leak positions and values in the check sheet.
10. Blow down system, disconnect test gas supply and secure pipe ends.
11. Check for proper functionality of the sniffing tool by using the sniffer test station.
12. For identified leaks file the pipework for rework.
13. For joints that pass the procedure, a suitable marking must be applied to identify that the joint is verified.
14. If all joints are accepted, sign and file the check sheet.

If leaks are identified during the procedure, the test sequence must be performed again on reworked pipework.

5.4.1 Test evaluation

Each joint of the DUT is subject to the following test pass criteria:

Inspection element	Pass criteria
Visual inspection	No visible damage, incorrect assembly or misplacement of the joint. No dirt, lubricants or foreign materials left on the joint No indication of excessive use of force No indication of incorrect use of tools to assemble the joint.
Auditory inspection	No hearable leaks unless allowed by the particular joint.
Gauge inspection (where applicable)	According to gauge tool instruction.
Sniffing	According to acceptable leakage rate of a particular joint + measurement uncertainty of the sniffer (see SPC ID 0202) To be referenced from the ATEX documentation/design manual and recorded in the check sheet.

5.5 System pressure decay test

The system pressure decay test is performed to validate integrity of pipework and instrumentation of the complete H2 system. The test is performed in accordance with *IEC 62282-3-100:2020 section 6.2: Leakage test.*

5.5.1 Test setup

The system pressure decay test may only be performed if all subassemblies have been validated with the procedure described in section 5.4 or equivalent (for externally delivered subassemblies).

The test is performed using the regular fuel supply of the system at test pressure level.

If appropriate, the test may be isolated and divided into appropriate sections to allow for separate validation of individual pipe sections.

To ensure that the validation of the integrity of the pipework is sound, a measurement system analysis must be performed. The accuracy of the equipment, used to measure the necessary variables of the test must contribute to a measuring error of no more than 2% of the allowable leak rate in the system.

The associated template for documenting the test must be used: *SPC ID 0204 System pressure decay test template*

5.5.2 Test parameters

To properly validate the pipework system, the following variables are used. Variables are either universal constants, calculated values, system design values or measured values:

Variable	Name	Unit	Description
P_ops	Max operating pressure	barg	As defined by manufacturer spec
P_d	Design pressure	barg	Highest pressure that may occur under any and all operating modes, including steady state and transient.
P_t	Test pressure	barg	110% of design pressure
P_PRV	Relief pressure of relief valve	barg.	Test setup PRV
L_A	Max evaluated leak rate for pipework system acceptance	Nm^3/h	Maximum allowed pressure decay to pass pressure decay test
L_S	Expected leak rate for pipework system	Nm^3/h	Summarized expected leak rates of all components in the system (per design leak rate). The leak rates may be obtained from component category values or from actual measured leak rates during acceptance testing of the component.
L_C	Max allowed leak rate zone integrity (Critical leak level)	Nm^3/h	Maximum allowed leak rate for a given pipe section, where integrity/operability of the system may be maintained safely

Variable	Name	Unit	Description
L_Mu	Measuring system uncertainty	Nm^3/h	Calculated accuracy of the measuring system, used to perform the test. The MSA must consider the complete signal path of sensors and control system.
L1	Actual leak rate	Nm^3/h	Calculated gas leakage rate from the tested system by performing the pressure decay test
V	Internal space volume	m^3	Calculated Internal space volume within the pressurized section (m^3) (gas volume excepting the internal structure volume) Internal pipework space volume must be obtained from the system design team as a value for any of the relevant sections.
T0	Reference temperature	K	Theoretical reference temperature (288.15K)
T1	internal space temperature start	K	Measured internal space temperature at the beginning of measurement
T2	internal space temperature end	K	Measured internal space temperature at the end of measurement
P0	Absolute reference pressure	kPa	Theoretical reference pressure (1 atm) (101.325 kPa)
P1	Internal space pressure start	kPag	Measured internal space pressure at the beginning of measurement
P2	Internal space pressure end	kPag	Measured space pressure at the end of the measurement
Pa1	Absolute pressure start	kPag	Measured atmospheric pressure at the beginning of the measurement
Pa2	Absolute pressure end	kPag	Measured atmospheric pressure at the end of the measurement (kPa)
t	Test duration	min	Measured test duration (t_end – t_start)

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.5.3 Sequence

If at any point the system pressure is dropping, investigate leak before continuing testing.

1. Introduce hydrogen to the system by increasing gradually the inlet pressure until test pressure level is reached in the system.
2. Close the relevant inlet valve, isolating pressure supply from the system under test.
3. Let the pressure in the system settle for 2 minutes.
4. Start the pressure decay monitoring by recording
   -start time t_start
   -start internal space pressure P1
   -start atmospheric pressure Pa1
   -start temperature T1
5. Wait for 10 minutes
6. Finish the pressure decay monitoring by recording
   -end time t_end
   -end internal space pressure P2
   -end atmospheric pressure Pa2
   -end temperature T2
7. Calculate the leak rate L1
8. Blow down system or continue operation if test is successful.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.5.4 Test evaluation

The actual leakage rate from the system is calculated in accordance with *IEC 62282-3-100:2019. Section 6.2* from the pressure difference in the system, measured over time using the following formula, and with variables as described in section 5.5.2:

$$L_1 = V \times T_0/p_0 \times \{(p_1 + p_{a1})/(T_1) - (p_2 + p_{a2})/(T_2)\} \times 60/t$$

The allowable leakage rate of the system is a function of the allowable leak rates of each component in the system and the uncertainty of the measurement system itself.

The expected leakage rate of components/subassemblies may vary from system to system and may be comprised of a mix of maximum allowed leak rates, obtained from the system's *ATEX zone classification and pipework plan* or expected leakage rates obtained from actual measured values in component acceptance tests.

The measurement system must be evaluated (MSA) to estimate the measurement uncertainty (L_Mu). The measuring system can only be considered sound if the calculated uncertainty amounts to less than 2% of the critical leak rate (L_C).

The test pass criteria threshold is calculated as the allowable/expected leak rate of the system + the measurement uncertainty:

$$L_A = L_S + L_Mu$$

System will pass the pressure decay test under the following criteria:

$$L_1 < L_A$$

Document	Titel

2.0 Objectives and Background

The objectives of this test procedure are to demonstrate the performance of the electrical parts on full system solution. The thermographic inspection will be conducted around solution as well as inside where service staff can enter while system stays operational.

3.0 Test Procedure

3.1 Personal protective equipment

Before commencing the test procedure always analyze the work environment and make sure you take the right precautions.

Suggested PPE depending on solution and work environment:

- Safety shoes
- Goggles
- Hearing protection

3.2 Preparation

- Verify equipment is calibrated and withing valid calibration period.
- Identify how and where to measure the ventilation system.
- Identify how and where to measure the cooling system.
- Identify possible heat surfaces to be inspected.

3.3 Measurement locations

- Inside solution:
  - 40ft container
  - 10ft container
- Outside solution:
  - 40ft container
  - 10ft container
  - Cooling skid

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

3.4 Conducting measurements

Set the Megablock to full power (1000 kW) and wait until temperatures have stabilised. Monitor the electrical cabinets and electrical installations described in section 3.3 through the thermographic imager and take pictures of all relevant areas with elevated temperatures. File in the pictures in a report.

3.0 Equipment list

Equipment	Purpose
Decibel meter	Measure noise level
Anemometer	Measure wind speed
Measuring tape	To measure up to 7 meter

4.0 Test Procedure

4.1 Personal protective equipment

Before commencing the test procedure always analyze the work environment and make sure you take the right precautions.

Suggested PPE depending on solution and work environment:

- Safety shoes
- Goggles
- Hearing protection

4.2 Preparation

- Verify equipment is calibrated and within valid calibration period.
- Identify the main noise sources inside and outside solution.
- Identify at which the operating points the solution will emit the most noise.
- Identify normal operating point for solution.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.3 Measurement locations

- Inside solution
  - Multiple measurements to capture the overall sound level within the work environment.
- Outside solution
  - 1-meter grid around solution
  - 7-meter grid around solution

4.4 Conducting measurements

- If decibel meter does have recording function:
  - Inside container measurement:
    - Measure maximum noise level at identified operating point in 5.2 and at location identified in 5.3. Measure for around 30 seconds to ensure a stable reading.
    - Noise level sweep:
      - Container running normal operating condition.
      - Start record noise level and walk from one end of the container to the other end.
      - Sweep should last around 20 seconds.
  - Outside container 1 meter:
    - Mark up the 1-meter perimeter around the container for example with a cone in each corner. If site does not allow 360 degree walk around at 1 meter while running, multiple recordings can be taken and compared to find maximum noise level.
    - System off (with noisy surroundings take a reference log)
    - Start recording the noise level, and slowly walk around the perimeter marked up.
    - Container running at most noise emitting point.
    - Start recording the noise level, and slowly walk around the perimeter marked up.
    - Analyze and find maximum noise level.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

- Outside container 7 meter:
  - Mark up the 7-meter perimeter around the container for example with a cone in each corner. If site does not allow 360-degree walk around at 7 meter while runnin0g, multiple recordings can be taken and compared to find maximum noise level.
  - System off (with noisy surroundings take a reference log)
  - Start recording the noise level, and slowly walk around the perimeter marked up.
  - Container running at most noise emitting point.
  - Start recording the noise level, and slowly walk around the perimeter marked up.
  - Analyze and find maximum noise level.

- If decibel meter does not have recording function:
  - Inside container measurement:
    - Measure maximum noise level. Measure for around 30 seconds to ensure a stable reading.
    - Noise level at 3 points in the container:

      Container running normal operating condition.

      - Measure noise level 1 meter from the one end of the container.
      - Measure noise in the mid point of the container.
      - Measure noise level 1 meter from the other end of the container.
  - Outside container 1 meter:
    - Mark up the 1-meter perimeter around the container for example with a cone in each corner. (If test setup does not allow full access complete as many points as possible)
    - System off (with noisy surroundings take a reference log)
    - Container running at most noise emitting point.
    - Start measuring the noise level, at each corner and in the mid point. Find reference map in appendix. And note down the noise level.
    - Analyze and find maximum noise level.

- Outside container 7 meter:
  - Mark up the 7-meter perimeter around the container for example with a cone in each corner. (If test setup does not allow access complete as many points as possible)
  - System off (with noisy surroundings take a reference log)
  - Container running at most noise emitting point.
  - Start measuring the noise level, at each corner and in the mid point. Find reference map in appendix. And note down the noise level.
  - Analyze and find maximum noise level.

Fluke 1775	Power Quality Analyzer, measures Voltage, Current and Frequency Data

4.0 Test Procedure

4.1 Personal protective equipment

Before commencing the test procedure always analyze the work environment and make sure you take the right precautions.

Suggested PPE depending on solution and work environment:

- Safety shoes
- Goggles
- Hearing protection

4.2 Preparation

Fuel Cell Megablock system is to be connected to a variable power consumer such as a load bank or grid connection.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.3 Steady state testing

4.3.1 Apply rated power of the fuel cell Megablock system.

4.3.2 Monitor and record the following parameters for at least 10 minutes:

- Voltage
- Frequency
- THDi
- THDu

4.3.3 Analyse data to make sure recorded values are within the limits.

Fill in the following table:

Date tested	Parameter	Criteria (ISO8528-5:2022, Table 4)	Result	Pass/Fail	Notes
	Voltage	≤±5% At 400V: +/-20V			
	Frequency	≤0.5% At 50Hz: +/-0.25Hz			
	THDu	<5%			
	THDi	<5%			

4.4 Dynamic testing

4.4.1 Apply the following load step changes of rated power of the system. In systems where these load steps are not possible perform alternative dynamic tests:

- 0% to 35%
- 35% to 70%
- 65% to 100%
- 100% to 50%
- 50% to 0%

If it is not possible to perform these load steps, due to either system design or test setup, alternative load steps shall be used, and these should be confirmed with SME and test engineer.

4.4.2 Monitor and record the following parameters for at least 1 minute after each load change:

- Voltage
- Frequency
- THDi
- THDu

Fill in the following tables:

4.4.3 0% to 35%

Date tested	Parameter	Criteria (ISO8528-5:2022, Table 4)	Result	Pass/Fail	Notes
	Voltage	≤-15[c]% At 400V: (<60V_{ac} droop)			
	Frequency	≤-/7+δf_{st})[c] % At 50Hz: >45Hz			
	THDu	<5%			
	THDi	<5%			

4.4.4 35% to 70%

Date tested	Parameter	Criteria (ISO8528-5:2022, Table 4)	Result	Pass/Fail	Notes
	Voltage	≤-15[c]% At 400V: (<60V_{ac} droop)			

Date tested	Parameter	Criteria (ISO8528-5:2022, Table 4)	Result	Pass/Fail	Notes
	Frequency	≤-/7+δf_{st})^{c} % At 50 Hz: >45Hz			
	THDu	<5%			
	THDi	<5%			

4.4.5 65% to 100%

Date tested	Parameter	Criteria (ISO8528-5:2022, Table 4)	Result	Pass/Fail	Notes
	Voltage	≤-15^{c}% At 400V: (<60V_{ac} droop)			
	Frequency	≤-/7+δf_{st})^{c} % At 50Hz: >45Hz			
	THDu	<5%			
	THDi	<5%			

4.4.6 100% to 50%

Date tested	Parameter	Criteria (ISO8528-5:2022, Table 4)	Result	Pass/Fail	Notes
	Voltage	≤+20% At 400V: (<80V_{ac} overshoot)			
	Frequency	≤+10% At 50Hz <55Hz

Short Title	F19 Hydrogen Preheating System, Testing
Full Title	Crosswind/Baseload Power Hub Fuel Cell Hydrogen Preheating System testing
Abstract	

Revision Record

Rev #	Description	Revised By	Date
1	Initial Release	TAN	06-08-2024
2	Updated specification	TAN	12-08-2024

This document, submitted in confidence, contains proprietary information which shall not be reproduced or transferred to other documents or disclosed to others or used for manufacturing or any other purpose without prior written permission of Ballard Power Systems.

1.0 Purpose and Scope

The purpose of this document is to describe the procedures to test the hydrogen preheating system capacities.

2.0 Functional tests

2.1 Start Up Time

2.1.1 Test description

This test is made to find the time from startup of the hydrogen preheating system to it reaches its set temperature of 30°C.

2.1.2 Method

1. Note down ambient temperature and liquid temperature in heater
2. Connect power to hydrogen preheating system and start clock
3. Stop clock when temperature reaches 30°C
4. Note down the time

2.2 Sustain set point temperature at high hydrogen consumption

2.2.1 Test description

Set the system to full power to ensure that the hydrogen preheating system has the capacity to stay at its set point temperature.

Optional: If the ambient temperature at the testing day is assessed too hot compared to the real working scenario, the hydrogen heater temperature can be raised to some extent.

2.2.2 Method

1. Heat up the hydrogen heater to the set temperature
2. Start the container up at full power (1000 kW) and monitor the hydrogen heater temperature

3. Let the system run for 30 minutes and see that the liquid temperature in the heater does not go below the set point temperature more than ±4°C

2.3 Power Consumption

2.3.1 Test description

The test is made to monitor the power consumption from the hydrogen preheating system.

2.3.2 Method

1. Install equipment in the electrical cabinet to measure the power consumption
2. Start up the H2 heater and monitor the power consumption while heating. Note down the average power consumption over 30 seconds.

Item #	Severity	Deadline	Topic	Description	Solution	Status	Responsible	Checked by	Date
1	A	Prior to FAT2	Cooling skid access door	Lock missing	To be added	Closed	ASM	MHA	22-08-2024
2	B	Prior to FAT2	Emergency exit (end of door) poor fitment	Door may blow open	Door must be adjusted	Closed	ASM	MFO	15-08-2024
3	B	Prior to shipment	Spacers for cooling skid	Temperary spacers mounted during FAT	Correct spacers ordered by Ballard. Will be shipped with package. 04-09-2024: Spacers inspected by customer during FAT	Closed	ASM		23-08-2024
4	C	NA	Drain connection	During FAT the drain connection is a hose connection	To be changed to flanged connection. Ordered by Ballard. Will be shipped with package 28-08-2024 Adapter piece missing (to provide correct nozzle position) - to be ordered.	Closed	ASM	MHA	03-09-2024
5	C	NA	Access to cooling skid	No permanent access to the cooling skid pump area	Since no preventive maintenance is needed on the cooling skid, no permanent accessway is made.	Closed	MHA	NA	15-08-2024
6	C	Prior to SAT	Cable tray riser for Cooling skid	On 40ft-10ft cable tray the cable tray riser for the cooling skid is not shown on the GA	GA must be updated. 26-08-2024: GA Updated - to be approved by CW.	Closed	ASM	MHA	26-08-2024
7	C	NA	UC06 door lock broken		Fix it!	Closed	BPH	MHA	15-08-2024
11	A	Prior to FAT2	UC50 Neutral conductor not fastned to cabinet		Fix it!	Closed	JKM	PBL	21-08-2024
12	B	Prior to shipment	10ft earthing	Missing earthing bonding in 10ft container	All cable ladders to be bonded with ground wiring	Closed	JKM	PBL	12-09-2024
13	C	Prior to FAT2	Cable gland with no cable on vent cabinet	Gland should have been a blind	Blind off empty cable gland.	Closed	JKM	PBL	23-08-2024
14	C	Prior to FAT2	10 ft cabling	Cables needs better anchoring to cable ways	To be corrected	Closed	JKM	PBL	20-08-2024
19	C	Prior to shipment	Crane trolly not secured	Must be fixed prior to shipment and during operation	Solutions to be designed 04-09-2024: To be fitted 05-09-2024	Closed	PBH	MHA	06-09-2024
20	C	Prior to shipment	DCDC internal cooling pipes	Concern that piping bend radius is out of spec for pipe used.	Verify with supplier 21-08-2024: Statement from supplier receved, confirming correct tools used for pipework.	Closed	ASM	MHA	21-08-2024
24	B	Prior to shipment	Weight measurement documentation	Documentation missing	Provide necessary documentation 17-09-2024: Added in FAT documentation	Closed	MHA	MHA	17-09-2024
25	A	Prior to FAT2	Check C joint in Fcwave	Since two Fcwave modules had failures, the remaining modules might suffer same error	Check proper sealing on C joint in Fcwave #1, #2, #3 and #4	Closed	MNJ	TAN	21-08-2024
26	A	Prior to shipment	Emergency lighting	Not turned on	Emergency lighting philosophy to be clarified including identification of emergency exits.	Closed	KJM	PBL	30-08-2024

28	A	Prior to FAT2	H2 shutoff valve assembly leaking	Leaks above quality acceptance level (FAT procedure) detected.	Leaks to be corrected to pass FAT criteria	Closed	PBH	TAN	26-08-2024
32	C	Prior to SAT	10ft/40ft LT connection hoses	During FAT the container are placed 15mm closer than specified. Concern that the hoses might be too short.	Bring extra hose to yard 21-08-2024: Extra hoses will be brought to the yard	Closed	PBH	MHA	21-08-2024
33	A	Prior to FAT2	H2 heater junction box	ATEX tag/label missing	Add necessary label 29-08-2024: Junction box moved out of ATEX zone and ID label added (No ATEX label needed).	Closed	JKM	PBL	29-08-2024
34	A	Prior to FAT2	ATEX/leak test procedure	Current FAT test procedure not sufficiently unambiguous.	FAT test leak test procedure must specify to greater extend the measuring principle, method, and standard reference.	Closed	RBS/TAN	MHA	30-08-2024
38	C	Prior to shipment	Cooling skid valve restriction	Due to a cableway, the breather/header tank isolation valve is restricted from fully closing.	To be corrected	Closed	PBH	MHA	03-09-2024
40	C	Prior to shipment	Fcwave Cabinet markings	Missing on cabinets	Add markings	Closed	MKD	PBL	04-09-2024
42	C	Prior to shipment	Cable markings missing	-DCDC cables in 10ft missing tags -UC50 400V cable missing tag -Cables from DC bus to DC/AC missing tags -	Add markings	Closed	MKD	PBL	12-09-2024
43	C	Prior to shipment	Time to shutdown is expected at max 30 sec (FAT procedure O01 item 6.1.4)	Proces takes at least 1:05 minutes	Ballard to investigate if the acceptance criteria is wrong or if the design must be investigated 17-09-2024: Specification in FAT document faulty. Corrected in documentation.	Closed	MFO	MHA	17-09-2024
44	C	Prior to shipment	FAT procedure unclear (O13/O14)	FAT procedure states 3 Fcwaves to be running from 50% to 0% O10 states 3 running 2 standby - to be corrected	Ballard to investigate if the acceptance criteria is wrong or if the design must be investigated 17-09-2024: Specification in FAT document faulty. Corrected in documentation.	Closed	MFO	MHA	17-09-2024
8	C	Prior to SAT	Backup battery control board not shielded		Ballard to investigate if shielding is required	Open	MOS		
9	C	Prior to SAT	External cabinets not shielded from rain during servici	Rain may enter cabinets if opened during bad weather	Ballard to instruct how to safely carry out maintenance in the external cabinets	Open	CJA		
10	A	Prior to SAT	10ft Container Safety Door Sensors	There is an intermittet issue with the 10ft door safety sensors (periodic dropout). The sensors have been disabled in software. The doors are kept padlocked to ensure no danger to people	To be replaced with new sensors 29-08-2024: New sensors fitted and tested, but with temporary plastic brackets. Steel brackets to be fitted prior to energization in the yard.	Open	JKM		
15	C	Prior to SAT	10ft inspection hatch control panel	No door mounted to the cabinet	Internal (cabinet door to be added)	Open	JKM		
16	C	Prior to SAT	Customer/external E-stop	HMI message does not specify that the external e-stop is activated	Must present a relevant alarm 04-09-2024: Will be corrected with next sw release	Open	LNY		
17	C	Prior to SAT	H2 sensor reading in HMI	Current reading in pct vol	To be changed to pct LEL 04-09-2024: Will be corrected with next sw release	Open	LNY		
18	C	Prior to SAT	FCwave #3 - Coolant leak	At FC module #3, there is coolant leakage (drops) at the connections to the heat exchanger, both connections.	To be tightened and/or gaskets replaced. 04-09-2024: Gasket will be changed when LT coolant is drained prior to shipment 17-09-2024: To be corrected during installation	Open	MNJ		

21	C	Prior to SAT	P&ID tags missing	Tags for valves, sensors and actuators missing on cooling circuits	Valves or other removable/serviceable items should be attached with zip ties while internal non service items can be with stickers. External/outside tags are preferred to be stainless/etched. Existing tag system is appropriate for the environment so the zip tie version will be used 04-09-2024: CW to investigate requirement for SS tags externally. Ballard to investigate plastic tag durability for offshore environment.	Open	PBL
22	C	Prior to SAT	Error messages	Error messages not elaborate enough	Review error message readability (must be more explanatory) 04-09-2024: Will be corrected with next sw release	Open	LNY
23	C	Prior to SAT	Main control cabinet (UC20)	Cable duct is too loaded (full).	Correct/reorganize the cables to allow sufficient space. 30-08-2024: Cables rearranged to the extend possible. 12-09-2024: Additional cable ladder will be added prior to SAT	Open	PBL
27	C	Prior to SAT	H2 and smoke detector voting	Currently 1/3	Preferred by Crosswind to be 2/3 to increase fault tolerance to align with platform philosophy. To be risk assessed Ballard	Open	MOS
29	B	Prior to SAT	Coolant leak on cooling skid (HT)	HT2 mixing valve valve seal or flange seal coolant leak	To be investigated and sealed 04-09-2024: Will be corrected when HT coolant is drained.	Open	PBH
30	B	Prior to SAT	HT Cooling hoses too short (leaking)	Between mix manifold and cooler manifold hoses too short.	Short term: Reposition hose clamps. Long term: Replace hoses with correct length.	Open	PBH
31	C	Prior to SAT	Type signs/name plate missing	Temporary name plates placed. To be approved and permanent SS signs will be attached prior to SAT.	To be approved (contents and placements). Will be permanently mounted with rivets and made in laser etched SS. 04-09-2024: To be reviewed and approved by CW. 17-09-2024: Name plates in metal ordered. Will be mounted prior to SAT	Open	MHA
35	B	Prior to SAT	Ventilation output vent louvers	Concern about the ventilation output louvers not sufficiently shielding against offshore storms/rain showers.	To be investigated further by Ballard	Open	
36	B	Prior to SAT	HMI operator screen	Operator screen built for HMI use not ready (Engineering interface not designed for HMI but for laptop use).	Must be developed by Ballard 28-08-2024: Draft HMI ready for review @FAT2	Open	LNY
37	C	Prior to SAT	Paintwork	Damage to paintwork	All chips or missing paint must be touched up	Open	PBH
39	NA	Prior to SAT	Main DCAC	Main DCAC is not fully power factor corrected when running. We are consuming 30-40kVAr during operation.	DC/AC parameters to be tuned during pre-commissioning. Currenly 0,98. Spec is better than 0,95.	Open	MFO

41	B	Prior to SAT	Intermittend timeout of FCwave shutdown test	During shutdown of the FCwave, an intermittant timeout occours (ca 5% of shutdowns) where the test stalls.	Expected to be a software glitch to be corredcted by FCwave dev team.	Open	MFO

1.0 Executive Summary

This document outlines the recommended commissioning activities and site acceptance tests. These tests aim to verify correct installation, and that the system performance onsite matches the performance level shown during FAT. There should be no CAT A items outstanding prior to power up.

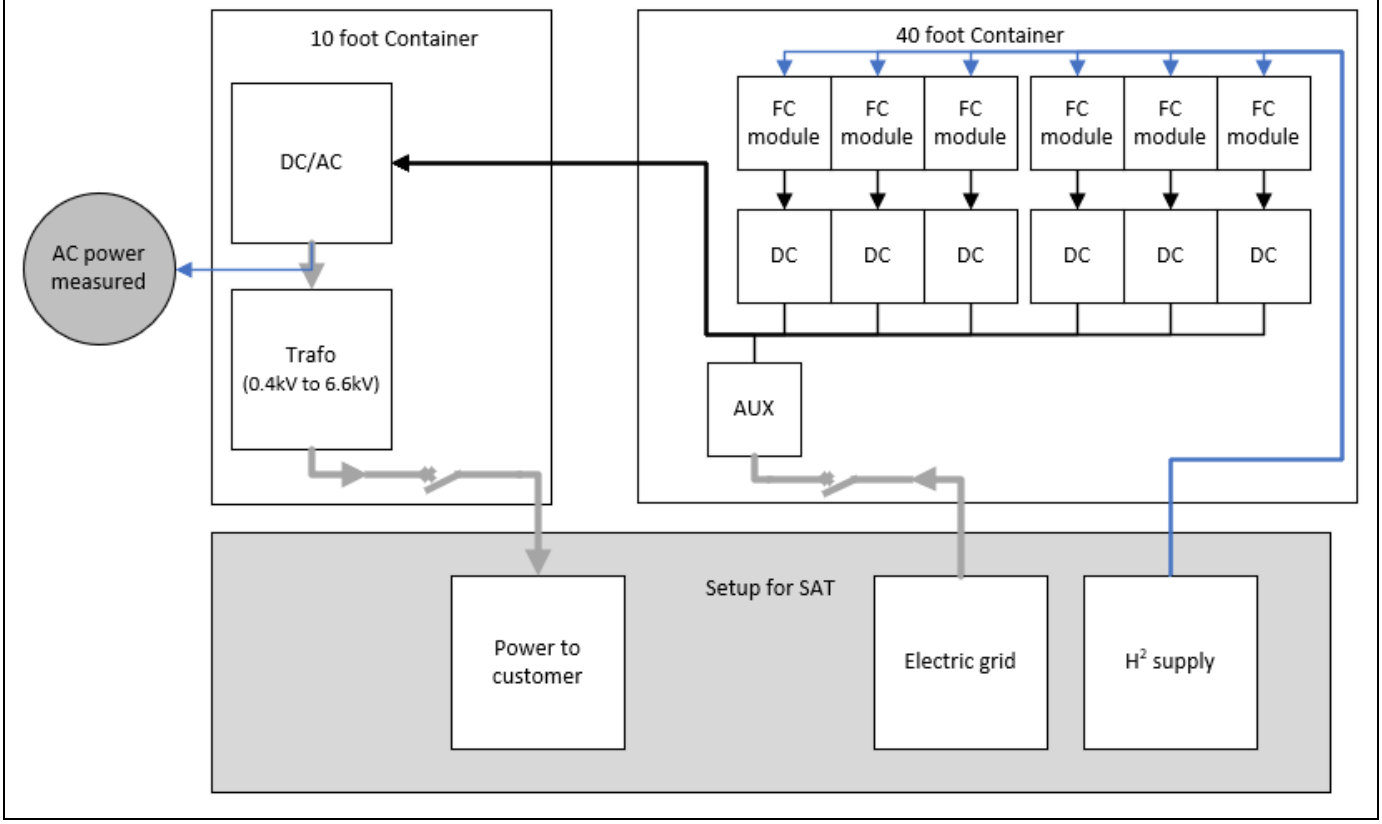
FAT	Factory Acceptance Test
SAT	Site Acceptance Test
HT1	High temperature 1050kW cooling system 1
HT2	High temperature 1050kW cooling system 2
LT	Low temperature cooling system

4.0 Objectives and Background

The tests in the document are based on the test matrix in document J99-02 (Aconex K559-2254-CWIWP4202202-J99-002-Rev002)

This document describes the witnessed Site Acceptance Tests. The tests do not include the internal testing that has been done to secure product maturity, mechanical and electrical connections have been done correctly.



The SAT is not intended to replace an integration test. If third-party features are not yet ready for testing, those specific test cases will be temporarily excluded from the SAT and should be performed during integration testing. This will not affect the overall SAT signoff.

There should be no CAT A items outstanding prior to power up.

The scope of testing is:

- Visual Inspection of the delivered product (Tri-party walkaround)
- Verification of safety systems for the Megablock.
- Production of electrical power to the customer grid to verify performance.

Figure 1: Megablock System test overview

5.0 Note on Power Quality Measurements

The power quality measurements are indicative during SAT, as the measured power quality depends also on the customer load dissipating the produced power. Ballard is also not capable of measuring power quality on the 6.6kV bus, and any measurements are done on the 400V side of the output transformer. This results in lower measurements than on the medium voltage side of the output transformer, as the transformer inductance is an integral part of the harmonic dampening of the FC package.

Power quality measurements have been removed from pass/fail criteria.

6.0 Note on Electrical Load

The electrical load that is to dissipate the power generated by the FC package is not in Ballard scope. During step response tests and full load tests, it is required that it is present and able to absorb the power from the FC package.

7.0 Functional tests

7.1 F02 Visual inspection

7.1.1 Test

The test involves an examination of the paint job through visual inspection, assessing the overall build quality, and checking for any dents. The focus is also on evaluating the assembly quality to ensure compliance with weather resistance.

This test is superseded by the tri party walkaround.

7.1.2 Relevant Standard / document

- No reference

7.1.3 Brief Test Plan

- Visual inspection with customer of full system, meaning inside and outside container solution.
- Take comprehensive pictures of the full system and test setup, including close-ups of vital components, with timestamps for reference.

7.1.4 Pass/Fail criteria.

- Visual inspect with customer to review quality of full system.

7.1.5 Test Result

Table 1: Visual inspection – Test Result

Date tested	Item	Result	Pass/Fail	Notes

7.2 F07 Electrical safety test – 10-foot container

7.2.1 Test

Follow designated standard to conduct electrical safety test, grounding continuity and high potential.

7.2.2 Relevant Standard / document

- EN 60204 Electrical safety test 10ft
- F07 & F08, Electrical safety SAT

7.2.3 Brief Test Plan

- According to EN 60204-1

7.2.4 Pass/Fail criteria.

- All relevant checks in EN 60204-1 chapter 18 passed.

7.2.5 Test Result

Table 2: Electrical safety test - Test results

7.5 F18 H_2 Leakage test

7.5.1 Test procedure

All pipework and H2 instrumentation subassemblies must be inspected, recorded, verified and pass in accordance with the procedure in section 5.4 in *SPC ID 0104 H2 Leak Test Procedure Rev 002* prior to full system SAT.

System H2 leakage test is done system pressure decay test, according to section 5.5 in *SPC ID 0104 H2 Leak Test Procedure Rev 002*.

7.5.2 Pass/Fail criteria.

Pressure decay test with a maximum leakage no greater than specified in test procedure.

Result details are documented in the template *SPC ID 0204 System pressure decay test template*

Parameter	Value	Description
L_A [Nm^3/h]	**2,72 – 3,58 x10^{-3}**	**Maximum allowed pressure decay to pass pressure decay test, where L_A = L_S + L_Mu**
L_S [Nm^3/h]	0	Summarized expected leak rates of all components in the system (per design leak rate).
L_Mu [Nm^3/h]	2,72 – 3,58 x10^{-3}	Calculated accuracy of the measuring system, used to perform the test.
L_C [Nm^3/h]	2,7x10^{-5}	Maximum allowed leak rate for a given pipe section, where integrity/operability of the system may be maintained safely

8.0 Operational tests

Operations are done using operator HMI or remote HMI in normal operating mode.

8.1 O01 System Start/Stop - Normal low load operation.

8.1.1 Test

Fuel Cell system can start, deliver minimum power and perform controlled stop without faults. This test is based on DC power.

8.1.2 Relevant Standard / document

- No reference

8.1.3 Brief Test Plan

- All FC in standby
- Request 100kW DC
- Delay 120 seconds
- Request zero power
- Repeat with new preferred FC until all tested.

8.1.4 Pass/Fail criteria.

- Fuel Cell Package starts without faults.
- No persistent system alarms.
- Correct available power signal.
- DC Power output within +/-5% and stable in less than 60 seconds
- Fuel Cell Package stops without faults.
- Fuel Cell in stand-by in less than 120 seconds.

8.1.5 Test Result

Table 9: System Start/Stop – Normal low load operation - Test Result

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

8.2 O09 Load Test – step response 0 to 35%

8.2.1 Test

Test step response by adding 35% load in one step from no load while measuring AC power quality.

8.2.2 Relevant Standard / document

- N/A

8.2.3 Brief Test Plan

- All FC in stand-by.
- Apply set point by requesting 350kW AC

8.2.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- No persistent system alarms.

8.2.5 Test Result

Table 10: Load Test - step response 0 to 35% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
	Step response 0-35%			
	AC power quality		Indicative	

8.3 O10 Load Test – step response 35% to 70%

8.3.1 Test

Test step response by adding 35% load in one step to reach 70% load while measuring AC power quality.

8.3.2 Relevant Standard / document

- N/A

8.3.3 Brief Test Plan

- 3 FC running delivering 350kW AC steady state.
- 3 FC in stand-by
- Apply set point by requesting 700kW AC power.

8.3.4 Pass/Fail criteria.

- No persistent system alarms.

8.3.5 Test Result

Table 11: Load Test - step response 35% to 70% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
	Step response 35%-70%			
	AC power quality		Indicative	

8.4 O11 Load Test – step response 65% to 100%

8.4.1 Test

Test step response by adding 35% load in one step to reach full load while measuring AC power quality.

8.4.2 Relevant Standard / document

- N/A

8.4.3 Brief Test Plan

- 6 FC running delivering 650kW AC steady state.
- Apply set point by requesting 1000kW AC power.

8.4.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- No persistent system alarms.

8.4.5 Test Result

Table 12: Load Test - step response 65% to 100% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
	Step response 65%-100%			
	AC power quality		Indicative	

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.

8.5 O12 Load Test – 100% stability test - 3 hours.

8.5.1 Test

Test steady state at 100% load for 3 hours while measuring power quality.

This test is also dependent on the hydrogen supply for the system.

8.5.2 Relevant Standard / document

- N/A

8.5.3 Brief Test Plan

- 6 FC running delivering 1000kW steady state.

8.5.4 Pass/Fail criteria

- AC output: +/- 10% actual to curve at any time.
- No persistent system alarms.

8.5.5 Test Result

Table 13: Load Test – Steady state 100% load - Test Result

Date tested	Item	Result	Pass/Fail	Notes
	Full load test			
	AC power quality		Indicative	

8.6 O13 Load Test – step response 100% to 50%

8.6.1 Test

Test step response by removing 50% load in one step at full load while measuring power quality.

8.6.2 Relevant Standard / document

- N/A

8.6.3 Brief Test Plan

- 6 FC running delivering 1000kW steady state.
- Request 500kW AC.

8.6.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- No persistent system alarms.

8.6.5 Test Result

Table 14: Load Test - step response 100% to 50% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
	Step response 100%-50%			
	AC power quality		Indicative	

8.7 O14 Load Test – step response 50% to 0%

8.7.1 Test

Test step response by removing 50% load in one step to no load while measuring AC power quality.

8.7.2 Relevant Standard / document

- N/A

8.7.3 Brief Test Plan

- 3-6 FC running delivering 500kW AC.
- Request 0% and apply set point.

Megablock		40ft Container Electrical Safety Checklist	
Document type	*Author*	*Revision date*	*Revision*
Test Specification	RKN	09-01-2025	4.0.0

1. Introduction

The Megablock system contains many components utilizing potentially dangerous voltages and currents. It is a safety requirement that the electrical safety is tested before a product is shipped.

The testing is done according to the standard EN60204-1 Chapter 18, from which the tests in this document are described with room to note test results.

2. Revision Record

Rev #	Author	Description	Revised By	Date
1.0	PBL	Initial Release		09/11-2023
2.0	PBL	Adapted from 40ft Coolant Skid document		04/07-2024
3.0	CJA	Adapted from 10ft power converter container document		15/10-2024
4.0	RKN	General review		09/01-2025

3. List of Figures

Unauthorized copying, distribution or use of this manual is strictly prohibited.

Table 5 – Voltage Test Requirements 10
Table 6 – Summary Table 13

5. Purpose and structure of this document

As Megablock is a large system, containing several parts assembled individually and brought together to fulfill the customer requirements, the components are tested individually.

With each component tested before final assembly, the interconnect must be tested, both before initial operation and after any disassembly, e.g. after shipping.

The purpose of this document is to compare the requirements outlined in EN60204-1 Chapter 18 against following testing performed Megablock components.

This is required for the CE approval of the Megablock Fuel Cell Power Plant.

This document is structured as follows:

1. The requirements from EN60204-1 are outlined:
    a. Section 7
2. Test Specifications to comply with the requirement outlined above.
    a. Sections 10 to 16
3. Summary table
    a. Section 17

6. References

7. Requirements from EN60204-1 Ch 18

Figure 1 is reproduced from the EN60204-1 Ch18.1:

18.1 General

The extent of verification will be given in the dedicated product standard for a particular machine. Where there is no dedicated product standard for the machine, the verifications shall always include the items a), b), c) and h) and may include one or more of the items d) to g):

a) verification that the electrical equipment complies with its technical documentation;
b) verification of continuity of the protective bonding circuit (Test 1 of 18.2.2);
c) in case of fault protection by automatic disconnection of supply, conditions for protection by automatic disconnection shall be verified according to 18.2;
d) insulation resistance test (see 18.3);
e) voltage test (see 18.4);
f) protection against residual voltage (see 18.5);
g) verification that the relevant requirements of 8.2.6 are met;
h) functional tests (see 18.6).

Figure 1 – Excerpt from EN60204-1:2018, Chapter 18.1

The mapping between the headlines from the standard and the requirement ID used in this document is listed in Table 2.

Requirement headline	EN60204-1 Chapter 18.1	EN60204-1 Chapter	Requirement ID
Verification that the electrical equipment complies with its technical documentation	A	n/a	A1
Verification of continuity of the protective bonding circuit (Test 1 of 18.2.2)	B	18.2.2 – Test #1	A2
Verification of conditions for protection by automatic disconnection of supply	C	18.2	A3
Insulation resistance tests	D	18.3	A4
Voltage tests	E	18.4	A5
Protection against residual voltages	F	18.5	A6
Verification that the relevant requirements of 8.2.6 are met	G	8.2.6	A7

Table 2 – Requirement headlines, chapter, and ID mapping

Functional testing of the equipment is outside the scope of this document.

8. Test Equipment.

The test equipment is a CE MultiTester, manufactured by Metrel.

Test Equipment	Ballard Equipment ID	Calibration valid until:

9. Device Under Test

The device to be tested is the 40ft Fuel Cell Container for the Megablock project.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Megablock		40ft Container Electrical Safety Checklist	
Document type	*Author*	*Revision date*	*Revision*
Test Specification	RKN	09-01-2025	4.0.0

10. A1 – Verification that the electrical equipment complies with its technical documentation

EN60204-1 requirements:

a) verification that the electrical equipment complies with its technical documentation;

Figure 2 – EN60204-1:2018, Chapter 18.1

Megablock Component requirements:

Inspection of the electrical equipment and cabinets to ensure congruence between documentation and equipment/cabinet.

Megablock Component validation:

Component	40ft Container
Result (pass/fail)	
Date and Initials	

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

11. A2 – Verification of continuity of the protective bonding circuit

EN60204-1 requirements:

18.2.2 Test 1 – Verification of the continuity of the protective bonding circuit

The resistance between the PE terminal (see 5.2 and Figure 4) and relevant points that are part of the protective bonding circuit shall be measured with a current between at least 0,2 A and approximately 10 A derived from an electrically separated supply source (for example SELV, see 414 of IEC 60364-4-41:2005) having a maximum no-load voltage of 24 V AC or DC.

The resistance measured shall be in the expected range according to the length, the cross sectional area and the material of the related protective conductors and protective bonding conductor(s).

Earthed PELV supplies can produce misleading results in this test and therefore shall not be used.

Figure 3 – EN60204-1:2018, Chapter 18.2.2

Megablock Component requirements:

The EN60204-1 Chapter 18.2.2, Test #1 specifies a current of 10A.

Megablock Component bonding resistance test is performed with a current of 10A and a test period of 10 seconds.

Megablock Component validation:

The primary earthing point for the 40ft Fuel Cell Container is the main ground bar located in +UC50.

Each component is verified and compared to expected values for the following locations.

ID	Test Point	Expected Value	Recorded Value
1	Busbar to busbar	<100mΩ	
2	Module 1		
3	DC/DC cabinet 1		
4	Module 2		
5	DC/DC cabinet 2		
6	Module 3

15	Control cabinet right door		
16	Lifting crane track, dolly		
17	LT piping		
18	Isolation transformer cover		
19	Cable tray		

Table 3 – Bonding Resistance Test point and expected resistance values.

When performing the test, ensure the connection between the test leads and the equipment is not contributing to inaccurate measurements.

12. A3 - Verification of conditions for protection by automatic disconnection of supply

EN60204-1 requirements:

18.2 Verification of conditions for protection by automatic disconnection of supply

18.2.1 General

The conditions for automatic disconnection of supply (see 6.3.3) shall be verified by tests.

Test 1 verifies the continuity of the protective bonding circuit.

Figure 4 – EN60204-1:2018, Chapter 18.2

Megablock Component requirements:

As specified in chapter 18.2.1, Test #1 is performed (see section 11).

Chapter 18.2.1 further specifies testing of Residual Current Devices (RCD) according to manufacturer specifications.

Megablock RCD Testing:

All RCD (Residual Current Device) in the Megablock system is equipped with self-test functionality from the manufacturer. This takes the shape of a push button, which must cause the RCD device to trip when actuated.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Megablock		40ft Container Electrical Safety Checklist	
Document type	*Author*	*Revision date*	*Revision*
Test Specification	RKN	09-01-2025	4.0.0

For the test, first enable all RCD circuits, and then actuate the self-test button on the devices. The devices must trip within 1 second. After the trip, use a multimeter to verify that the output of the device has no voltage (<10VAC)

Component	RCD Devices in UC20 (40ft Control Cabinet)
Result – 3ph RCD	
Result – 1ph RCD/MCCB	
Date and Initials	

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

13. A4 - Insulation resistance tests

EN60204-1 requirements:

18.3 Insulation resistance tests

When insulation resistance tests are performed, the insulation resistance measured at 500 V DC between the power circuit conductors and the protective bonding circuit shall be not less than 1 MΩ. The test may be made on individual sections of the complete electrical installation.

Figure 5 – EN60204-1:2018, Chapter 18.3

Megablock Component requirements:

Before performing this test, isolate all fuel cell DCDC converters from the DC bus (Cabinets UC01 to UC05)

Use a set of test leads and alligator clips to create a single AC node (3 phases shorted together)

The Megablock Component insulation requirements are higher than as specified chapter 18.3. The test is specified in Table 4):

Test point	Pass criteria	Test Voltage [VDC]
Internal side of the output breaker	>1MΩ	500

Table 4 – Megablock Component Power Circuit Insulation Resistance Requirements

Megablock Component validation:

Each component is verified and compared to pass criteria in Table 4.

Test Specification	RKN	09-01-2025	4.0.0

14. A5 – Voltage tests

EN60204-1 requirements:

18.4 Voltage tests

When voltage tests are performed, test equipment in accordance with IEC 61180-2 should be used.

The test voltage shall be at a nominal frequency of 50 Hz or 60 Hz.

The maximum test voltage shall have a value of twice the rated supply voltage of the equipment or 1 000 V, whichever is the greater. The maximum test voltage shall be applied between the power circuit conductors and the protective bonding circuit for at least 1 s. The requirements are satisfied if no disruptive discharge occurs.

Components and devices that are not rated to withstand the test voltage and surge protection devices which are likely to operate during the test shall be disconnected during testing.

Components and devices that have been voltage tested in accordance with their product standards may be disconnected during testing.

Figure 6 – EN60204-1:2018, Chapter 18.4

Megablock Component requirements:

The requirements from EN 60204-1:2018, Chapter 18.4 is compared in Table 5.
AC Voltage for Megablock Components is at most 480V, so twice the supply voltage is 960Vac.

Parameter	EN 60204-1:2018, Chapter 18.4	Megablock Component Testing
Voltage [VAC]	960	2500
Frequency [Hz]	50 or 60	50
Duration [sec]	1	10
Maximum Current [mA]	No arcing	5

Table 5 – Voltage Test Requirements

Megablock Component validation:

Megablock		40ft Container Electrical Safety Checklist	
Document type	*Author*	*Revision date*	*Revision*
Test Specification	RKN	09-01-2025	4.0.0

15. A6 – Protection against residual voltages

EN60204-1 requirements:

18.5 Protection against residual voltages

Where appropriate, tests shall be performed to ensure compliance with 6.2.4.

Figure 7 – EN60204-1:2018, Chapter 18.5

6.2.4 Protection against residual voltages

Live parts having a residual voltage greater than 60 V when the supply is disconnected shall be discharged to 60 V or less within a time period of 5 s provided that this rate of discharge does not interfere with the proper functioning of the equipment. Exempted from this requirement are components having a stored charge of 60 μC or less. Where this specified rate of discharge would interfere with the proper functioning of the equipment, a durable warning notice drawing attention to the hazard and stating the delay required before the enclosure may be opened shall be displayed at an easily visible location on or immediately adjacent to the enclosure that contains the live parts.

In the case of plugs or similar devices, the withdrawal of which results in the exposure of conductors (for example pins), the discharge time to 60 V shall not exceed 1 s, otherwise such conductors shall be protected to at least IP2X or IPXXB. If neither a discharge time of 1 s nor a protection of at least IP2X or IPXXB can be achieved (for example in the case of removable collectors on conductor wires, conductor bars, or slip-ring assemblies, see 12.7.4), additional switching devices or an appropriate warning, for example a warning sign drawing attention to the hazard and stating the delay required shall be provided. When the equipment is located in places open to all persons, which can include children, warnings are not sufficient and therefore a minimum degree of protection against contact with live parts to IP4X or IPXXD is required.

Figure 8 – EN60204-1:2018, Chapter 6.2.4

Megablock Component requirements:

Identical to EN60204-1 requirements.

Megablock Component validation:

No live parts of the Megablock Component system are accessible without disassembling barriers or accessing electrical cabinets. All connectors are IP2X or higher in unmated state in applications higher than 60V (power system)

Frequency converters and motor drives are marked with applicable durations before internal capacitors are discharged.

Maintenance procedures for the Megablock Component module include a manual verification before any work on exposed components is permitted.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

16. A7 – Verification that the relevant requirements of 8.2.6 are met

EN60204-1 requirements:

8.2.6 Additional requirements for electrical equipment having earth leakage currents higher than 10 mA

Where electrical equipment has an earth leakage current that is greater than 10 mA AC or DC in any protective conductor, one or more of the following conditions for the integrity of each section of the associated protective bonding circuit that carries the earth leakage current shall be satisfied:

a) the protective conductor is completely enclosed within electrical equipment enclosures or otherwise protected throughout its length against mechanical damage;

b) the protective conductor has a cross-sectional area of at least 10 mm^2 Cu or 16 mm^2 Al;

c) where the protective conductor has a cross-sectional area of less than 10 mm^2 Cu or 16 mm^2 Al, a second protective conductor of at least the same cross-sectional area is provided up to a point where the protective conductor has a cross-sectional area not less than 10 mm^2 Cu or 16 mm^2 Al. This can require that the electrical equipment has a separate terminal for a second protective conductor.

d) the supply is automatically disconnected in case of loss of continuity of the protective conductor;

e) where a plug-socket combination is used, an industrial connector in accordance with IEC 60309 series, with adequate strain relief and a minimum protective earthing conductor cross-section of 2,5 mm^2 as part of a multi-conductor power cable is provided.

A statement shall be given in the instructions for installation that the equipment shall be installed as described in this 8.2.6.

Figure 9 – EN60204-1:2018, Chapter 8.2.6

Megablock Component requirements:

The Megablock Component does not have a leakage current higher than 10mA.

Megablock Component validation:

The protection against excessive leakage current is twofold:

- Ground fault detection is installed with a proven component (Bender Isometer). Detection of ground fault causes system shutdown and service technician is dispatched.
- Conductivity measurement of internal coolant is a part of the regular maintenance procedures (see N01-003 Service and Maintenance Manual)

Megablock		10ft Container Electrical Safety Checklist	
Document type	*Author*	*Revision date*	*Revision*
Test Specification	RKN	09-01-2025	3.0.0

1. Introduction

The Megablock system contains many components utilizing potentially dangerous voltages and currents. It is a safety requirement that the electrical safety is tested before a product is shipped.

The testing is done according to the standard EN60204-1 Chapter 18, from which the tests in this document are described with room to note test results.

2. Revision Record

Rev #	Author	Description	Revised By	Date
1.0	PBL	Initial Release		09/11-2023
2.0	PBL	Adapted from 40ft Coolant Skid document		04/07-2024
3.0	RKN	General review		09/01-2025

5. Purpose and structure of this document

As Megablock is a large system, containing several parts assembled individually and brought together to fulfill the customer requirements, the components are tested individually.

With each component tested before final assembly, the interconnect must be tested, both before initial operation and after any disassembly, e.g. after shipping.

The purpose of this document is to compare the requirements outlined in EN60204-1 Chapter 18 against following testing performed Megablock components.

This is required for the CE approval of the Megablock Fuel Cell Power Plant.

This document is structured as follows:

1. The requirements from EN60204-1 are outlined:
    a. Section 7
2. Test Specifications to comply with the requirement outlined above.
    a. Sections 10 to 16
3. Summary table
    a. Section 17

7. Requirements from EN60204-1 Ch 18

Figure 1 is reproduced from the EN60204-1 Ch18.1:

18.1 General

The extent of verification will be given in the dedicated product standard for a particular machine. Where there is no dedicated product standard for the machine, the verifications shall always include the items a), b), c) and h) and may include one or more of the items d) to g):

a) verification that the electrical equipment complies with its technical documentation;
b) verification of continuity of the protective bonding circuit (Test 1 of 18.2.2);
c) in case of fault protection by automatic disconnection of supply, conditions for protection by automatic disconnection shall be verified according to 18.2;
d) insulation resistance test (see 18.3);
e) voltage test (see 18.4);
f) protection against residual voltage (see 18.5);
g) verification that the relevant requirements of 8.2.6 are met;
h) functional tests (see 18.6).

Figure 1 – Excerpt from EN60204-1:2018, Chapter 18.1

The mapping between the headlines from the standard and the requirement ID used in this document is listed in Table 2.

Requirement headline	EN60204-1 Chapter 18.1	EN60204-1 Chapter	Requirement ID
Verification that the electrical equipment complies with its technical documentation	A	n/a	A1
Verification of continuity of the protective bonding circuit (Test 1 of 18.2.2)	B	18.2.2 – Test #1	A2
Verification of conditions for protection by automatic disconnection of supply	C	18.2	A3
Insulation resistance tests	D	18.3	A4
Voltage tests	E	18.4	A5
Protection against residual voltages	F	18.5	A6
Verification that the relevant requirements of 8.2.6 are met	G	8.2.6	A7

Test Specification	RKN	09-01-2025	3.0.0

11. A2 – Verification of continuity of the protective bonding circuit

EN60204-1 requirements:

18.2.2 Test 1 – Verification of the continuity of the protective bonding circuit

The resistance between the PE terminal (see 5.2 and Figure 4) and relevant points that are part of the protective bonding circuit shall be measured with a current between at least 0,2 A and approximately 10 A derived from an electrically separated supply source (for example SELV, see 414 of IEC 60364-4-41:2005) having a maximum no-load voltage of 24 V AC or DC.

The resistance measured shall be in the expected range according to the length, the cross sectional area and the material of the related protective conductors and protective bonding conductor(s).

Earthed PELV supplies can produce misleading results in this test and therefore shall not be used.

Figure 3 – EN60204-1:2018, Chapter 18.2.2

Megablock Component requirements:

The EN60204-1 Chapter 18.2.2, Test #1 specifies a current of 10A.

Megablock Component bonding resistance test is performed with a current of 10A and a test period of 10 seconds.

Megablock Component validation:

The primary earthing point for the Power Converter Container is the main ground bar located at the rear of the main output breaker (=BA30-FC30).

Each component is verified and compared to expected values for the following locations.

ID	Test Point	Expected Value	Recorded Value
1	Busbar to busbar	<100mΩ	
2	Main DC/Acpoint 1		
3	Main DC/Acpoint 2		
4	Main DC/Acpoint 3		
5	DC/AC conduncter point 1		
6	DC/AC conduncter point 2		
7	DC/AC conduncter point 3		
8	LT coolant pipe

11	Main transformer chassis		
12	Cable tray		

Table 3 – Bonding Resistance Test point and expected resistance values.

When performing the test, ensure the connection between the test leads and the equipment is not contributing to inaccurate measurements.

12. A3 - Verification of conditions for protection by automatic disconnection of supply

EN60204-1 requirements:

18.2 Verification of conditions for protection by automatic disconnection of supply

18.2.1 General

The conditions for automatic disconnection of supply (see 6.3.3) shall be verified by tests.

Test 1 verifies the continuity of the protective bonding circuit.

Figure 4 – EN60204-1:2018, Chapter 18.2

Megablock Component requirements:

As specified in chapter 18.2.1, Test #1 is performed (see section 11). Chapter 18.2.1 further specifies testing of Residual Current Devices (RCD) according to manufacturer specifications.

Megablock Component module does not contain any RCD devices.

13. A4 - Insulation resistance tests

EN60204-1 requirements:

18.3 Insulation resistance tests

When insulation resistance tests are performed, the insulation resistance measured at 500 V DC between the power circuit conductors and the protective bonding circuit shall be not less than 1 MΩ. The test may be made on individual sections of the complete electrical installation.

Figure 5 – EN60204-1:2018, Chapter 18.3

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Megablock		10ft Container Electrical Safety Checklist	
Document type	*Author*	*Revision date*	*Revision*
Test Specification	RKN	09-01-2025	3.0.0

Megablock Component requirements:

Before performing this test, isolate all fuel cell DCDC converters from the DC bus (Cabinets UC01 to UC06)

Use a set of test leads and alligator clips to create a single AC node (3 phases shorted together)

The Megablock Component insulation requirements are higher than as specified chapter 18.3. The test is specified in Table 4):

Test point	Pass criteria	Test Voltage [VDC]
=LA01+UC31-QB01	>1MΩ	500

Table 4 – Megablock Component Power Circuit Insulation Resistance Requirements

Megablock Component validation:

Each component is verified and compared to pass criteria in Table 4.

Component	Power Converter Container
Result – AC Node (value and pass/fail)	
Date and Initials	

14. A5 – Voltage tests

EN60204-1 requirements:

18.4 Voltage tests

When voltage tests are performed, test equipment in accordance with IEC 61180-2 should be used.

The test voltage shall be at a nominal frequency of 50 Hz or 60 Hz.

The maximum test voltage shall have a value of twice the rated supply voltage of the equipment or 1 000 V, whichever is the greater. The maximum test voltage shall be applied between the power circuit conductors and the protective bonding circuit for at least 1 s. The requirements are satisfied if no disruptive discharge occurs.

Components and devices that are not rated to withstand the test voltage and surge protection devices which are likely to operate during the test shall be disconnected during testing.

Components and devices that have been voltage tested in accordance with their product standards may be disconnected during testing.

Figure 6 – EN60204-1:2018, Chapter 18.4

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Megablock Component requirements:

The requirements from EN 60204-1:2018, Chapter 18.4 is compared in Table 5.
AC Voltage for Megablock Components is at most 480V, so twice the supply voltage is 960Vac.

Parameter	EN 60204-1:2018, Chapter 18.4	Megablock Component Testing
Voltage [VAC]	960	2500
Frequency [Hz]	50 or 60	50
Duration [sec]	1	10
Maximum Current [mA]	No arcing	5

Table 5 – Voltage Test Requirements

Megablock Component validation:

Connection point is internal side of main output breaker.

Component	Power Converter Container
Voltage Test – L1 (value and pass/fail)	
Voltage Test – L2 (value and pass/fail)	
Voltage Test – L3 (value and pass/fail)	
Date and Initials	

15. A6 – Protection against residual voltages

EN60204-1 requirements:

18.5 Protection against residual voltages

Where appropriate, tests shall be performed to ensure compliance with 6.2.4.

Figure 7 – EN60204-1:2018, Chapter 18.5

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Megablock		10ft Container Electrical Safety Checklist	
Document type	*Author*	*Revision date*	*Revision*
Test Specification	RKN	09-01-2025	3.0.0

6.2.4 Protection against residual voltages

Live parts having a residual voltage greater than 60 V when the supply is disconnected shall be discharged to 60 V or less within a time period of 5 s provided that this rate of discharge does not interfere with the proper functioning of the equipment. Exempted from this requirement are components having a stored charge of 60 µC or less. Where this specified rate of discharge would interfere with the proper functioning of the equipment, a durable warning notice drawing attention to the hazard and stating the delay required before the enclosure may be opened shall be displayed at an easily visible location on or immediately adjacent to the enclosure that contains the live parts.

In the case of plugs or similar devices, the withdrawal of which results in the exposure of conductors (for example pins), the discharge time to 60 V shall not exceed 1 s, otherwise such conductors shall be protected to at least IP2X or IPXXB. If neither a discharge time of 1 s nor a protection of at least IP2X or IPXXB can be achieved (for example in the case of removable collectors on conductor wires, conductor bars, or slip-ring assemblies, see 12.7.4), additional switching devices or an appropriate warning, for example a warning sign drawing attention to the hazard and stating the delay required shall be provided. When the equipment is located in places open to all persons, which can include children, warnings are not sufficient and therefore a minimum degree of protection against contact with live parts to IP4X or IPXXD is required.

Figure 8 – EN60204-1:2018, Chapter 6.2.4

Megablock Component requirements:

Identical to EN60204-1 requirements.

Megablock Component validation:

No live parts of the Megablock Component system are accessible without disassembling barriers or accessing electrical cabinets. All connectors are IP2X or higher in unmated state in applications higher than 60V (power system)

Frequency converters and motor drives are marked with applicable durations before internal capacitors are discharged.

Maintenance procedures for the Megablock Component module include a manual verification before any work on exposed components is permitted.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

16. A7 – Verification that the relevant requirements of 8.2.6 are met

EN60204-1 requirements:

8.2.6 Additional requirements for electrical equipment having earth leakage currents higher than 10 mA

Where electrical equipment has an earth leakage current that is greater than 10 mA AC or DC in any protective conductor, one or more of the following conditions for the integrity of each section of the associated protective bonding circuit that carries the earth leakage current shall be satisfied:

a) the protective conductor is completely enclosed within electrical equipment enclosures or otherwise protected throughout its length against mechanical damage;

b) the protective conductor has a cross-sectional area of at least 10 mm^2 Cu or 16 mm^2 Al;

c) where the protective conductor has a cross-sectional area of less than 10 mm^2 Cu or 16 mm^2 Al, a second protective conductor of at least the same cross-sectional area is provided up to a point where the protective conductor has a cross-sectional area not less than 10 mm^2 Cu or 16 mm^2 Al. This can require that the electrical equipment has a separate terminal for a second protective conductor.

d) the supply is automatically disconnected in case of loss of continuity of the protective conductor;

e) where a plug-socket combination is used, an industrial connector in accordance with IEC 60309 series, with adequate strain relief and a minimum protective earthing conductor cross-section of 2,5 mm^2 as part of a multi-conductor power cable is provided.

A statement shall be given in the instructions for installation that the equipment shall be installed as described in this 8.2.6.

Figure 9 – EN60204-1:2018, Chapter 8.2.6

Megablock Component requirements:

The Megablock Component does not have a leakage current higher than 10mA.

Megablock Component validation:

The protection against excessive leakage current is twofold:

- Ground fault detection is installed with a proven component (Bender Isometer). Detection of ground fault causes system shutdown and service technician is dispatched.
- Conductivity measurement of internal coolant is a part of the regular maintenance procedures (see N01-003 Service and Maintenance Manual)

11. A2 – Verification of continuity of the protective bonding circuit

EN60204-1 requirements:

18.2.2 Test 1 – Verification of the continuity of the protective bonding circuit

The resistance between the PE terminal (see 5.2 and Figure 4) and relevant points that are part of the protective bonding circuit shall be measured with a current between at least 0,2 A and approximately 10 A derived from an electrically separated supply source (for example SELV, see 414 of IEC 60364-4-41:2005) having a maximum no-load voltage of 24 V AC or DC.

The resistance measured shall be in the expected range according to the length, the cross sectional area and the material of the related protective conductors and protective bonding conductor(s).

Earthed PELV supplies can produce misleading results in this test and therefore shall not be used.

Figure 5 – EN60204-1:2018, Chapter 18.2.2

Megablock Component requirements:

The EN60204-1 Chapter 18.2.2, Test #1 specifies a current of 10A.

Megablock Component bonding resistance test is performed with a current of 10A and a test period of 10 seconds.

Megablock Component validation:

The primary earthing point for the coolant skid is the main ground terminal in the control enclosure.

Each component is verified and compared to expected values for the following locations.

ID	Test Point	Expected Value	Recorded Value
1	Control Cabinet Backplate	<100mΩ	
2	Grounding Bar, Below PLC		
3	HT1 Cooling Pipe, From HT1 Cooler		
4	HT1 Manual Valve, HT1 Cooler Outlet		
5	HT1 Coolant Pump, Grounding Connection		
6	HT1 Header Tank, Bolts		
7	HT1 Cooler Frame (Metal)		
8	HT2 Cooling Pipe, From HT1 Cooler		
9	HT2 Manual Valve, HT1 Cooler Outlet		
10	HT2 Coolant Pump, Grounding Connection		

Commercial Confidential

Unauthorized copying, distribution or use of this manual is strictly prohibited.

11	HT2 Header Tank, Bolts		
12	HT2 Cooler Frame (Metal)		

Table 3 – Bonding Resistance Test point and expected resistance values.

When performing the test, ensure the connection between the test leads and the equipment is not contributing to inaccurate measurements.

Notes to test points:

- Point 1-2 is inside the electrical cabinet.
- Point 3-6 is indicated on Figure 6 – Test points for Grounding Test
- Point 7-12 are identical to points 3-6, except mirrored to HT2.

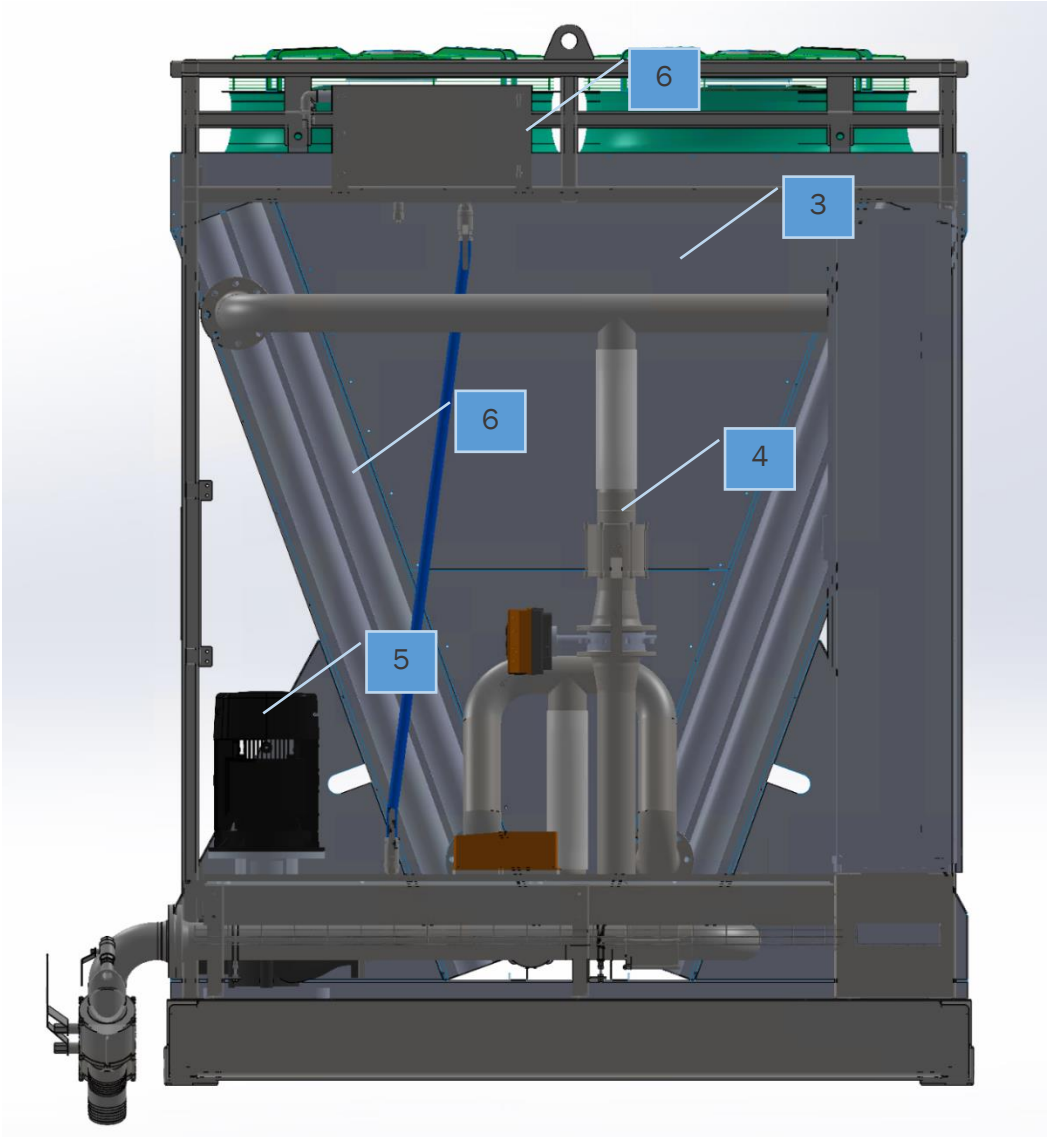

Figure 6 – Test points for Grounding Test

Unauthorized copying, distribution or use of this manual is strictly prohibited.

12. A3 - Verification of conditions for protection by automatic disconnection of supply

EN60204-1 requirements:

18.2 Verification of conditions for protection by automatic disconnection of supply

18.2.1 General

The conditions for automatic disconnection of supply (see 6.3.3) shall be verified by tests.

Test 1 verifies the continuity of the protective bonding circuit.

Figure 7 – EN60204-1:2018, Chapter 18.2

Megablock Component requirements:

As specified in chapter 18.2.1, Test #1 is performed (see section 11). Chapter 18.2.1 further specifies testing of Residual Current Devices (RCD) according to manufacturer specifications. Megablock Component module does not contain any RCD devices.

Megablock Component is not a TN-system, and Test #2 is not relevant.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

13. A4 - Insulation resistance tests

EN60204-1 requirements:

18.3 Insulation resistance tests

When insulation resistance tests are performed, the insulation resistance measured at 500 V DC between the power circuit conductors and the protective bonding circuit shall be not less than 1 MΩ. The test may be made on individual sections of the complete electrical installation.

Figure 8 – EN60204-1:2018, Chapter 18.3

Megablock Component requirements:

The Megablock Component insulation requirements are higher than as specified chapter 18.3. The test is specified in Table 4):

Test point	Pass criteria	Test Voltage [VDC]
UC40-FC04	>1MΩ	500

Table 4 – Megablock Component Power Circuit Insulation Resistance Requirements

Megablock Component validation:

Each component is verified and compared to pass criteria in Table 4.

Component	Coolant Skid
Result – AC Node (value and pass/fail)

Unauthorized copying, distribution or use of this manual is strictly prohibited.

14. A5 – Voltage tests

EN60204-1 requirements:

18.4 Voltage tests

When voltage tests are performed, test equipment in accordance with IEC 61180-2 should be used.

The test voltage shall be at a nominal frequency of 50 Hz or 60 Hz.

The maximum test voltage shall have a value of twice the rated supply voltage of the equipment or 1 000 V, whichever is the greater. The maximum test voltage shall be applied between the power circuit conductors and the protective bonding circuit for at least 1 s. The requirements are satisfied if no disruptive discharge occurs.

Components and devices that are not rated to withstand the test voltage and surge protection devices which are likely to operate during the test shall be disconnected during testing.

Components and devices that have been voltage tested in accordance with their product standards may be disconnected during testing.

Figure 9 – EN60204-1:2018, Chapter 18.4

Megablock Component requirements:

The requirements from EN 60204-1:2018, Chapter 18.4 is compared in Table 5.
AC Voltage for Megablock Components is at most 480V, so twice the supply voltage is 960Vac.

Parameter	EN 60204-1:2018, Chapter 18.4	Megablock Component Testing
Voltage [VAC]	960	2500
Frequency [Hz]	50 or 60	50
Duration [sec]	1	10
Maximum Current [mA]	No arcing	5

Table 5 – Voltage Test Requirements

Megablock Component validation:

Unauthorized copying, distribution or use of this manual is strictly prohibited.

15. A6 – Protection against residual voltages

EN60204-1 requirements:

18.5 Protection against residual voltages

Where appropriate, tests shall be performed to ensure compliance with 6.2.4.

Figure 10 – EN60204-1:2018, Chapter 18.5

6.2.4 Protection against residual voltages

Live parts having a residual voltage greater than 60 V when the supply is disconnected shall be discharged to 60 V or less within a time period of 5 s provided that this rate of discharge does not interfere with the proper functioning of the equipment. Exempted from this requirement are components having a stored charge of 60 μC or less. Where this specified rate of discharge would interfere with the proper functioning of the equipment, a durable warning notice drawing attention to the hazard and stating the delay required before the enclosure may be opened shall be displayed at an easily visible location on or immediately adjacent to the enclosure that contains the live parts.

In the case of plugs or similar devices, the withdrawal of which results in the exposure of conductors (for example pins), the discharge time to 60 V shall not exceed 1 s, otherwise such conductors shall be protected to at least IP2X or IPXXB. If neither a discharge time of 1 s nor a protection of at least IP2X or IPXXB can be achieved (for example in the case of removable collectors on conductor wires, conductor bars, or slip-ring assemblies, see 12.7.4), additional switching devices or an appropriate warning, for example a warning sign drawing attention to the hazard and stating the delay required shall be provided. When the equipment is located in places open to all persons, which can include children, warnings are not sufficient and therefore a minimum degree of protection against contact with live parts to IP4X or IPXXD is required.

Figure 11 – EN60204-1:2018, Chapter 6.2.4

Megablock Component requirements:

Identical to EN60204-1 requirements.

Megablock Component validation:

No live parts of the Megablock Component system are accessible without disassembling barriers. All connectors are IP2X or higher in unmated state in applications higher than 60V (power system)

Frequency converters and motor drives are marked with applicable durations before internal capacitors are discharged.

Maintenance procedures for the Megablock Component module include a voltage drawdown process and manual verification before any work on exposed components is permitted.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

16. A7 – Verification that the relevant requirements of 8.2.6 are met

EN60204-1 requirements:

8.2.6 Additional requirements for electrical equipment having earth leakage currents higher than 10 mA

Where electrical equipment has an earth leakage current that is greater than 10 mA AC or DC in any protective conductor, one or more of the following conditions for the integrity of each section of the associated protective bonding circuit that carries the earth leakage current shall be satisfied:

a) the protective conductor is completely enclosed within electrical equipment enclosures or otherwise protected throughout its length against mechanical damage;

b) the protective conductor has a cross-sectional area of at least 10 mm^2 Cu or 16 mm^2 Al;

c) where the protective conductor has a cross-sectional area of less than 10 mm^2 Cu or 16 mm^2 Al, a second protective conductor of at least the same cross-sectional area is provided up to a point where the protective conductor has a cross-sectional area not less than 10 mm^2 Cu or 16 mm^2 Al. This can require that the electrical equipment has a separate terminal for a second protective conductor.

d) the supply is automatically disconnected in case of loss of continuity of the protective conductor;

e) where a plug-socket combination is used, an industrial connector in accordance with IEC 60309 series, with adequate strain relief and a minimum protective earthing conductor cross-section of 2,5 mm^2 as part of a multi-conductor power cable is provided.

A statement shall be given in the instructions for installation that the equipment shall be installed as described in this 8.2.6.

Figure 12 – EN60204-1:2018, Chapter 8.2.6

Megablock Component requirements:

The Megablock Component does not have a leakage current higher than 10mA.

Megablock Component validation:

The protection against excessive leakage current is twofold:

- Ground fault detection is in the scope of the 10ft Container (DCAC system)
- Conductivity measurement of internal coolant is a part of the regular maintenance procedures (see N01-003 Service and Maintenance Manual)

Commercial Confidential

1.0 Objectives and background

The objectives of this test procedure is to demonstrate the performance of ventilation and cooling on full system solution. The thermographic inspection will be conducted around solution as well as inside where service staff can enter while system stays operational.

- Ensure ventilation system performing as expected.
- Ensure cooling system is performing as expected.
- Validate accessible surface temperatures.

2.0 References

Document	Titel

3.0 Equipment list

Equipment	Purpose
Thermographic imager	Measure temperatures, capture images and create data folder with evidence.

4.0 Test Procedure

4.1 Personal protective equipment

Before commencing the test procedure always analyze the work environment and make sure you take the right precautions.

Suggested PPE depending on solution and work environment:

- Safety shoes
- Goggles
- Hearing protection

4.2 Preparation

- Verify equipment is calibrated and withing valid calibration period.
- Identify how and where to measure the ventilation system.
    - Access to areas that are normally accessible during operation to sweep for hot surfaces.
- Identify how and where to measure the cooling system.
    - It should be possible to view majority of cooling skid to check temperature distribution.
        - If this is not possible, review need for additional equipment during measurements
- Identify possible hot surfaces to be inspected.

4.3 Measurement locations

- Inside solution:
  - Ventilation of components
  - Container ventilation
  - Surface temperatures
  - Cooling circuit
- Outside solution:
  - Container ventilation
  - Surface temperatures
  - Coolers and cooling circuit

4.4 Conducting measurements

Set the Megablock to full power (1000 kW) and wait until temperatures have stabilised. Monitor the containers and ventilation described in section 4.3 through the thermographic imager and take pictures of all relevant areas with elevated temperatures. File in the pictures in a report.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.0 Test Procedure

The main purpose of this test procedure is to ensure that the cooling circuit is leak free and can handle maximum system pressure. Furthermore, it is structured in a way to minimize the chance of having big leaks or lose clamps or fittings.

WARNING: The stress test is with elevated pressure, potentially turning plugs or loose fittings into projectiles.

Minimum safety precautions:

- Hose clamps and fittings
- Wear safety goggles
- When dealing with glycol wear gloves
- Check service manual for maximum system pressure.

4.1 Pre-conditioning

- Check and make sure valves in the cooling circuit are in the correct position.
- For pressure testing with coolant in the cooling circuit, make sure the system is fully bleed. Air in the system can act as a spring and can obscure results.
- To achieve stable temperature let system soak for 12 hours. Alternative watch data from temperature sensors in the full system to ensure stable temperature conditions.

4.2 Leak test with air

- Maximum system pressure on Megablock is 1.5barg.
- No temperature pre-conditioning needed; this is not a sign off test.
- Find compressor and leak test kit.
- Adjust pressure reduction valve to minimum (no pressure after reduction valve)
- Attach leak test kit to cooling circuit (not applying pressure to circuit)
- Open valve from compressed air
- Slowly increase pressure from reduction valve to 20% of maximum system pressure (0.3barg)
- Close valve from compressed air
    - If pressure is not maintained
        - Open valve from compressed air again and look for leaks (where surface material is suitable soapy water spray can be used for leak detection)
        - Fix leak and repeat step.
    - If pressure is maintained
        - Continue to next step.
- Open valve from compressed air
- Slowly increase pressure from reduction valve to 80% of maximum system pressure (1.2barg)
- Close valve from compressed air
    - If pressure is not maintained
        - Open valve from compressed air again and look for leaks (where surface material is suitable soapy water spray can be used for leak detection)
        - Fix leak and repeat step.
    - If pressure is maintained
        - Continue to next step.
- Open valve from compressed air
- Slowly increase pressure from reduction valve to 100% of maximum system pressure (1.5barg)
- Close valve from compressed air
    - If pressure is not maintained
        - Open valve from compressed air again and look for leaks (where surface material is suitable soapy water spray can be used for leak detection)
        - Fix leak and repeat step.
    - If pressure is maintained – test completed and passed.

4.3 Leak test with air setup

Compressor and adaptor hose to be connected. Close valve to expansion tank so that pressure can build in cooling circuit. Find test setup image in appendix.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.4 Pressure decay test with coolant

- Maximum system pressure on Megablock is 1.5 barg.
- Make sure cooling circuit have been filled and bled before starting this test.
- Make sure pre-conditioning have been done.
- Find coolant pressure test kit.
- Attach test kit to cooling circuit (not applying pressure to circuit)
- Slowly increase pressure 50% of maximum system pressure (0.75barg)
- Close valve from test kit.
    - Quick inspection of cooling circuit for any coolant leaks.
    - If pressure is not maintained
        - Further inspection of test setup and cooling circuit
            - If there is still air in the system if can cause spring effect and drop in pressure
        - Found and fixed issue, repeat step.
    - If pressure is maintained
        - Continue to next step.
- Open valve from test kit
- Slowly increase pressure to 100% of maximum system pressure (1.5barg)
- Close valve from test kit
    - Quick inspection of cooling circuit for any coolant leaks.
    - If pressure is not maintained
        - Further inspection of test setup and cooling circuit
            - If there is still air in the system if can cause spring effect and drop in pressure
        - Found and fixed issue, repeat step.
    - If pressure is maintained
        - Continue to next step.
- Wait 30 minutes if pressure have dropped re-apply pressure to reach 100% system pressure again.
- Wait 2 hours and check pressure again.
    - If pressure have dropped more than 0.1bar
        - Repeat test
    - If pressure have dropped less than 0.1bar after 2 hours – test completed and passed.

4.5 Pressure decay test with coolant setup

Pressure pump and adaptor hose to be connected. Close valve to expansion tank so that pressure can build in cooling circuit. Find test setup image in appendix.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.0 Results and discussion

6.0 Appendix

6.1 Cooling leakage HT1 (Suggested section for FAT or SAT document)

6.1.1 Test

Follow designated test procedure for inspection and verification of a leak-free HT1 coolant circuit.

6.1.2 Relevant Standard / document

- SPC ID 0103 Cooling Circuit Pressure and Leak Test Procedure

6.1.3 Brief Test Plan

- Follow test procedure.

6.1.4 Pass/Fail criteria.

- Allow system to maintain pressure, after 2 hours pressure must not drop more than 0,1 bar.

6.1.5 Test Result

Table 1: Cooling leakage HT1 - Test Result

Date tested	Item	Result	Pass/Fail	Notes
	HT 1

PPE	Personal Protective Equipment
DUT	Device under test

2.0 Objectives and Background

The purpose of this test procedure is to generalise how Ballard Product Solutions secure that the fabricated hydrogen systems are not leaking more than the specified limits and the circuits will withstand maximum operation pressure. Furthermore, this procedure is intended to be used on full systems and/or sub assemblies. This test procedure is based on *IEC 62282-3-1 section 5.4 Leakage tests and 5.4.1 Gas leakage tests* with regards to system tests. For hydrogen pipework testing, the IEC 62282-3-1 references *ISO 15649:2001 "Petroleum and natural gas industries – Piping* which states that piping shall be tested according to *ASME B31.12 Hydrogen piping and pipelines.* Hence, the described procedure for component/pipework inspection and leakage test is based on this standard.

SPC ID 0203	Pipework inspection and leakage test check sheet template
SPC ID 0204	System pressure decay test template

4.0 Equipment list

Equipment	Type	Purpose
H2 sniffer	Sewerin Snooper Mini H2	Detection instrument to snif/locate source of potential leaks
Pressure sensor	Fluke 700RG07 500PSIG	Measuring device to accurately adjust and monitor gas pressure during leakage test
Test gas	Formier gas 5% hydrogen	Test gas for pressurizing pipework where the 5% hydrogen acts as tracer agent for sniffing.
Sniffer test station	Sewerin SPE-HG	Test instrument the emits a reference gas to check the correct function of the Snooper Mini H2 sniffer
Pressure regulator		Test gas pressure regulator for pressurizing the DUT
Pressure relief valve		Safety valve to ensure safe pipework pressurization during test.

5.0 Test Procedures

Any system is comprised of several subassemblies and/or components. Any of these subsystems must be individually inspected and leakage tested before assembly into the complete system. For systems fabricated or assembled by Ballard Product Solutions, testing per section 5.4 applies. Externally delivered systems/modules as well as Ballard standard products must be tested in accordance with *IEC 62282-3-1:2019* or similar industry relevant standards.

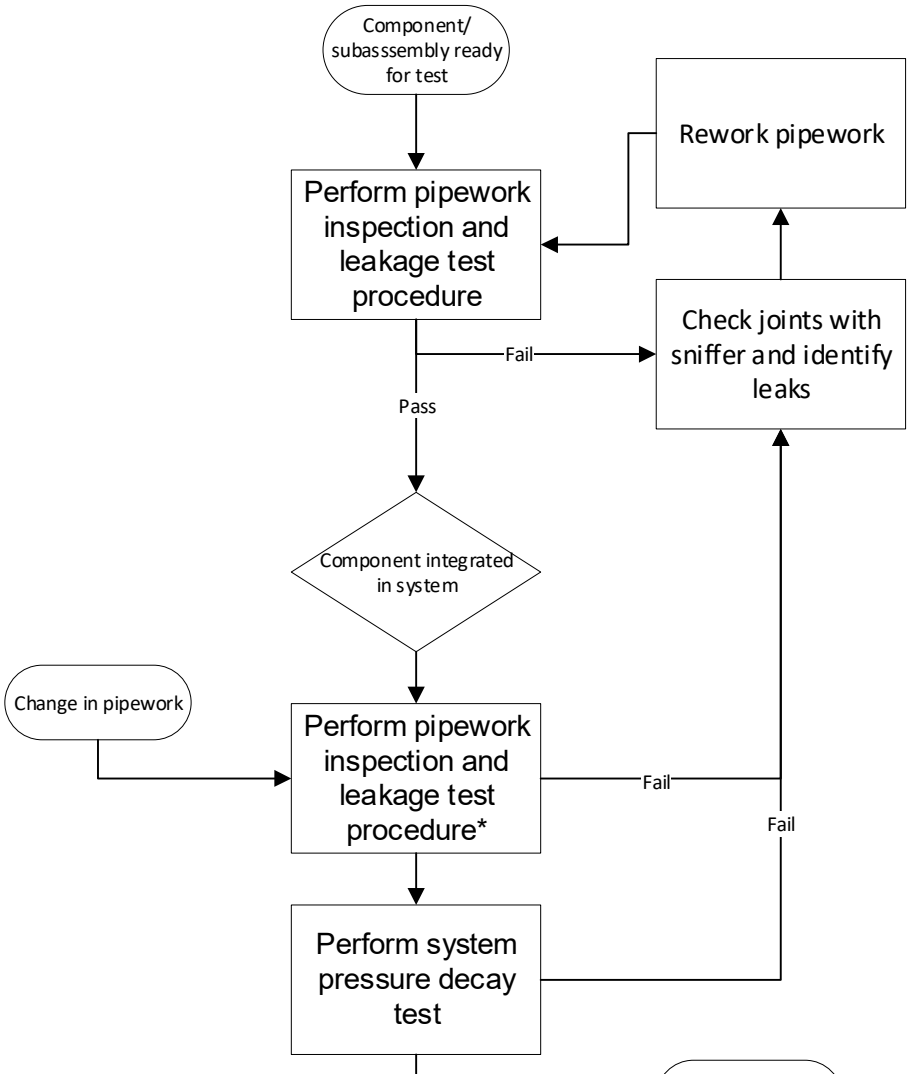
Attention: All test personnel, including external witness should be informed about risks associated with the test and instructed to use proper PPE prior to conducting the test.

WARNING: Pressure testing can potentially turn plugs or loose fittings into projectiles.

Minimum safety precautions:

- The test must be carried out by trained personnel.
- Prior to test start make sure that the work has been HSE risk assessed according to Ballard internal procedures.
- All connection and mechanical assemblies shall be checked before applying pressure.
- All personnel attending the test shall use appropriate PPE.

5.1 Installations and connections



Make sure that all parts of the hydrogen system have been correctly assembled and according to assembly guides and build manuals.

5.2 Review test setup.

Before proceeding to testing, the test setup should be reviewed by a SME. The SME should also determine the pressure of which the system under test will be tested to. Once a setup has been reviewed and approved re-testing can proceed on same approval if the setup remains unchanged. If a diagram of the system under test does not exist create a diagram like the one in appendix. The results from the test should be added on the diagram and saved as part of the test report. During the review a risk assessment should be done and shared with all staff involved with testing and working in proximity to an ongoing test. Make sure that relevant measurement instruments, used during the test all have valid calibration certificates if applicable. Furthermore, ensure that manufacturers procedures are followed for maintaining the equipment accuracy and dependability.

5.3 System test sequence

On any system the following test sequence must be followed during first assembly or reassembly of a system.

* Only for changed/interfacing joints

5.4 Pipework inspection and leakage test

The pipework inspection and leakage test are performed to ensure proper assembly quality is achieved during fabrication and assembly of components/subassemblies. The test is designed to be performed upon work completion in the assembly plant/workshop before release to system assembly.

The test is performed in accordance with or exceeding requirements in *ASME B31.12 Hydrogen piping and pipelines*.

The associated template for documenting the test must be used: *SPC ID 0203 Pipework inspection and leakage test check sheet* template

5.4.1 Test setup

The assembled component or subassembly pipe ends are appropriately sealed off and the pressure regulator with formier gas supply is connected, together with a pressure gauge and appropriate pressure relief valve.

Use of the H2 sniffer instrument must be performed in accordance with *SPC ID 0202 Snooper mini H2 sniffing procedure.*

5.4.2 Test sequence

1. Check for proper functionality of the sniffing tool by using the sniffer test station
2. Inspect the pipework visually for any damage or loose parts
    a. For ferrule fittings, check every fitting with appropriate gap inspection gauge to ensure sufficient tightening is achieved
3. Pressurize pipework to between 1.0-1.2 barg with formier gas and listen for leaks
4. Increase pressure to 50% of test pressure by adjusting the pressure regulator
5. Maintain the pressure for 10 minutes.
6. Listen for leaks and use H2 sniffer to inspect all joints. If leaks are identified record all positions and values in the check sheet, abort test by proceeding to item 10 and file the pipework for rework.
7. If no leaks are detected, proceed to increase pressure to “test pressure” by adjusting the pressure regulator.
8. Maintain the pressure for minimum 10 minutes.
9. Listen for leaks and use the H2 sniffer to inspect all joints. Record all leak positions and values in the check sheet.
10. Blow down system, disconnect test gas supply and secure pipe ends.
11. Check for proper functionality of the sniffing tool by using the sniffer test station.
12. For identified leaks file the pipework for rework.
13. For joints that pass the procedure, a suitable marking must be applied to identify that the joint is verified.
14. If all joints are accepted, sign and file the check sheet.

If leaks are identified during the procedure, the test sequence must be performed again on reworked pipework.

5.4.1 Test evaluation

Each joint of the DUT is subject to the following test pass criteria:

Inspection element	Pass criteria
Visual inspection	No visible damage, incorrect assembly or misplacement of the joint. No dirt, lubricants or foreign materials left on the joint No indication of excessive use of force No indication of incorrect use of tools to assemble the joint.
Auditory inspection	No hearable leaks unless allowed by the particular joint.
Gauge inspection (where applicable)	According to gauge tool instruction.
Sniffing	According to acceptable leakage rate of a particular joint + measurement uncertainty of the sniffer (see SPC ID 0202) To be referenced from the ATEX documentation/design manual and recorded in the check sheet.

5.5 System pressure decay test

The system pressure decay test is performed to validate integrity of pipework and instrumentation of the complete H2 system. The test is performed in accordance with *IEC 62282-3-100:2020 section 6.2: Leakage test.*

5.5.1 Test setup

The system pressure decay test may only be performed if all subassemblies have been validated with the procedure described in section 5.4 or equivalent (for externally delivered subassemblies).

The test is performed using the regular fuel supply of the system at test pressure level.

If appropriate, the test may be isolated and divided into appropriate sections to allow for separate validation of individual pipe sections.

To ensure that the validation of the integrity of the pipework is sound, a measurement system analysis must be performed. The accuracy of the equipment, used to measure the necessary variables of the test must contribute to a measuring error of no more than 2% of the allowable leak rate in the system.

The associated template for documenting the test must be used: *SPC ID 0204 System pressure decay test template*

5.5.2 Test parameters

To properly validate the pipework system, the following variables are used. Variables are either universal constants, calculated values, system design values or measured values:

Variable	Name	Unit	Description
P_ops	Max operating pressure	barg	As defined by manufacturer spec
P_d	Design pressure	barg	Highest pressure that may occur under any and all operating modes, including steady state and transient.
P_t	Test pressure	barg	110% of design pressure
P_PRV	Relief pressure of relief valve	barg.	Test setup PRV
L_A	Max evaluated leak rate for pipework system acceptance	Nm^3/h	Maximum allowed pressure decay to pass pressure decay test
L_S	Expected leak rate for pipework system	Nm^3/h	Summarized expected leak rates of all components in the system (per design leak rate). The leak rates may be obtained from component category values or from actual measured leak rates during acceptance testing of the component.
L_C	Max allowed leak rate zone integrity (Critical leak level)	Nm^3/h	Maximum allowed leak rate for a given pipe section, where integrity/operability of the system may be maintained safely

Variable	Name	Unit	Description
L_Mu	Measuring system uncertainty	Nm^3/h	Calculated accuracy of the measuring system, used to perform the test. The MSA must consider the complete signal path of sensors and control system.
L1	Actual leak rate	Nm^3/h	Calculated gas leakage rate from the tested system by performing the pressure decay test
V	Internal space volume	m^3	Calculated Internal space volume within the pressurized section (m^3) (gas volume excepting the internal structure volume) Internal pipework space volume must be obtained from the system design team as a value for any of the relevant sections.
T0	Reference temperature	K	Theoretical reference temperature (288.15K)
T1	internal space temperature start	K	Measured internal space temperature at the beginning of measurement
T2	internal space temperature end	K	Measured internal space temperature at the end of measurement
P0	Absolute reference pressure	kPa	Theoretical reference pressure (1 atm) (101.325 kPa)
P1	Internal space pressure start	kPag	Measured internal space pressure at the beginning of measurement
P2	Internal space pressure end	kPag	Measured space pressure at the end of the measurement
Pa1	Absolute pressure start	kPag	Measured atmospheric pressure at the beginning of the measurement
Pa2	Absolute pressure end	kPag	Measured atmospheric pressure at the end of the measurement (kPa)
t	Test duration	min	Measured test duration (t_end – t_start)

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.5.3 Sequence

If at any point the system pressure is dropping, investigate leak before continuing testing.

1. Introduce hydrogen to the system by increasing gradually the inlet pressure until test pressure level is reached in the system.
2. Close the relevant inlet valve, isolating pressure supply from the system under test.
3. Let the pressure in the system settle for 2 minutes.
4. Start the pressure decay monitoring by recording
   -start time t_start
   -start internal space pressure P1
   -start atmospheric pressure Pa1
   -start temperature T1
5. Wait for 10 minutes
6. Finish the pressure decay monitoring by recording
   -end time t_end
   -end internal space pressure P2
   -end atmospheric pressure Pa2
   -end temperature T2
7. Calculate the leak rate L1
8. Blow down system or continue operation if test is successful.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.5.4 Test evaluation

The actual leakage rate from the system is calculated in accordance with *IEC 62282-3-100:2019. Section 6.2* from the pressure difference in the system, measured over time using the following formula, and with variables as described in section 5.5.2:

$$L_1 = V \times T_0/p_0 \times \{(p_1 + p_{a1})/(T_1) - (p_2 + p_{a2})/(T_2)\} \times 60/t$$

The allowable leakage rate of the system is a function of the allowable leak rates of each component in the system and the uncertainty of the measurement system itself.

The expected leakage rate of components/subassemblies may vary from system to system and may be comprised of a mix of maximum allowed leak rates, obtained from the system's *ATEX zone classification and pipework plan* or expected leakage rates obtained from actual measured values in component acceptance tests.

The measurement system must be evaluated (MSA) to estimate the measurement uncertainty (L_Mu). The measuring system can only be considered sound if the calculated uncertainty amounts to less than 2% of the critical leak rate (L_C).

The test pass criteria threshold is calculated as the allowable/expected leak rate of the system + the measurement uncertainty:

$$L_A = L_S + L_Mu$$

System will pass the pressure decay test under the following criteria:

$$L_1 < L_A$$

Document	Titel

2.0 Objectives and Background

The objectives of this test procedure are to demonstrate the performance of the electrical parts on full system solution. The thermographic inspection will be conducted around solution as well as inside where service staff can enter while system stays operational.

3.0 Test Procedure

3.1 Personal protective equipment

Before commencing the test procedure always analyze the work environment and make sure you take the right precautions.

Suggested PPE depending on solution and work environment:

- Safety shoes
- Goggles
- Hearing protection

3.2 Preparation

- Verify equipment is calibrated and withing valid calibration period.
- Identify how and where to measure the ventilation system.
- Identify how and where to measure the cooling system.
- Identify possible heat surfaces to be inspected.

3.3 Measurement locations

- Inside solution:
  - 40ft container
  - 10ft container
- Outside solution:
  - 40ft container
  - 10ft container
  - Cooling skid

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

3.4 Conducting measurements

Set the Megablock to full power (1000 kW) and wait until temperatures have stabilised. Monitor the electrical cabinets and electrical installations described in section 3.3 through the thermographic imager and take pictures of all relevant areas with elevated temperatures. File in the pictures in a report.

1.0 Objectives and Background

The objective of this test procedure is to determine the noise level generated by a full system solution. The measurements will be conducted around solution as well as inside where service staff can enter while system stays operational.

- Ensure compliance with noise regulations and safety standards.
- Evaluating the impact of the system noise to the surrounding environment.

3.0 Equipment list

Equipment	Purpose
Decibel meter	Measure noise level
Anemometer	Measure wind speed
Measuring tape	To measure up to 7 meter

4.0 Test Procedure

4.1 Personal protective equipment

Before commencing the test procedure always analyze the work environment and make sure you take the right precautions.

Suggested PPE depending on solution and work environment:

- Safety shoes
- Goggles
- Hearing protection

4.2 Preparation

- Verify equipment is calibrated and within valid calibration period.
- Identify the main noise sources inside and outside solution.
- Identify at which the operating points the solution will emit the most noise.
- Identify normal operating point for solution.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.3 Measurement locations

- Inside solution
  - Multiple measurements to capture the overall sound level within the work environment.
- Outside solution
  - 1-meter grid around solution
  - 7-meter grid around solution

4.4 Conducting measurements

- If decibel meter does have recording function:
  - Inside container measurement:
    - Measure maximum noise level at identified operating point in 5.2 and at location identified in 5.3. Measure for around 30 seconds to ensure a stable reading.
    - Noise level sweep:
      - Container running normal operating condition.
      - Start record noise level and walk from one end of the container to the other end.
      - Sweep should last around 20 seconds.
  - Outside container 1 meter:
    - Mark up the 1-meter perimeter around the container for example with a cone in each corner. If site does not allow 360 degree walk around at 1 meter while running, multiple recordings can be taken and compared to find maximum noise level.
    - System off (with noisy surroundings take a reference log)
    - Start recording the noise level, and slowly walk around the perimeter marked up.
    - Container running at most noise emitting point.
    - Start recording the noise level, and slowly walk around the perimeter marked up.
    - Analyze and find maximum noise level.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

- Outside container 7 meter:
  - Mark up the 7-meter perimeter around the container for example with a cone in each corner. If site does not allow 360-degree walk around at 7 meter while runnin0g, multiple recordings can be taken and compared to find maximum noise level.
  - System off (with noisy surroundings take a reference log)
  - Start recording the noise level, and slowly walk around the perimeter marked up.
  - Container running at most noise emitting point.
  - Start recording the noise level, and slowly walk around the perimeter marked up.
  - Analyze and find maximum noise level.

- If decibel meter does not have recording function:
  - Inside container measurement:
    - Measure maximum noise level. Measure for around 30 seconds to ensure a stable reading.
    - Noise level at 3 points in the container:

      Container running normal operating condition.

      - Measure noise level 1 meter from the one end of the container.
      - Measure noise in the mid point of the container.
      - Measure noise level 1 meter from the other end of the container.
  - Outside container 1 meter:
    - Mark up the 1-meter perimeter around the container for example with a cone in each corner. (If test setup does not allow full access complete as many points as possible)
    - System off (with noisy surroundings take a reference log)
    - Container running at most noise emitting point.
    - Start measuring the noise level, at each corner and in the mid point. Find reference map in appendix. And note down the noise level.
    - Analyze and find maximum noise level.

- Outside container 7 meter:
  - Mark up the 7-meter perimeter around the container for example with a cone in each corner. (If test setup does not allow access complete as many points as possible)
  - System off (with noisy surroundings take a reference log)
  - Container running at most noise emitting point.
  - Start measuring the noise level, at each corner and in the mid point. Find reference map in appendix. And note down the noise level.
  - Analyze and find maximum noise level.

Fluke 1775	Power Quality Analyzer, measures Voltage, Current and Frequency Data

4.0 Test Procedure

4.1 Personal protective equipment

Before commencing the test procedure always analyze the work environment and make sure you take the right precautions.

Suggested PPE depending on solution and work environment:

- Safety shoes
- Goggles
- Hearing protection

4.2 Preparation

Fuel Cell Megablock system is to be connected to a variable power consumer such as a load bank or grid connection.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.3 Steady state testing

4.3.1 Apply rated power of the fuel cell Megablock system.

4.3.2 Monitor and record the following parameters for at least 10 minutes:

- Voltage
- Frequency
- THDi
- THDu

4.3.3 Analyse data to make sure recorded values are within the limits.

Fill in the following table:

Date tested	Parameter	Criteria (ISO8528-5:2022, Table 4)	Result	Pass/Fail	Notes
	Voltage	≤±5% At 400V: +/-20V			
	Frequency	≤0.5% At 50Hz: +/-0.25Hz			
	THDu	<5%			
	THDi	<5%			

4.4 Dynamic testing

4.4.1 Apply the following load step changes of rated power of the system. In systems where these load steps are not possible perform alternative dynamic tests:

- 0% to 35%
- 35% to 70%
- 65% to 100%
- 100% to 50%
- 50% to 0%

If it is not possible to perform these load steps, due to either system design or test setup, alternative load steps shall be used, and these should be confirmed with SME and test engineer.

4.4.2 Monitor and record the following parameters for at least 1 minute after each load change:

- Voltage
- Frequency
- THDi
- THDu

Fill in the following tables:

4.4.3 0% to 35%

Date tested	Parameter	Criteria (ISO8528-5:2022, Table 4)	Result	Pass/Fail	Notes
	Voltage	≤-15[c]% At 400V: (<60V_{ac} droop)			
	Frequency	≤-/7+δf_{st})[c] % At 50Hz: >45Hz			
	THDu	<5%			
	THDi	<5%

Confirmation of Satisfactory SAT

Part No.	601456B-7002362 Incl. sub-assemblies: 601456B-7002973 601456B-7003716
Product name	FC PowerGen 1000kW
Serial No.	601456B

Ballard Power Systems Europe A/S confirms that the above-listed equipment has satisfactorily with comments undergone and passed the Site Acceptance Test (SAT) according to

BLPH Project – Site Acceptance Test (SAT) Procedure [K559-2254-CWIWP4202202-J99-001]

BLPH Project - Test Matrix for FAT and SAT [K559-2254-CWIWP4202202-J99-002]

prior to the site integration test.

CrossWind C.V. acknowledges that the Site Acceptance Test (SAT) for the above-listed equipment was witnessed and confirms that the test was performed satisfactorily with comments, and all agreed-upon specifications have been met.

Megablock		10ft Container Electrical Safety Checklist	
Document type	*Author*	*Revision date*	*Revision*
Test Specification	RKN	09-01-2025	3.0.0

1. Introduction

The Megablock system contains many components utilizing potentially dangerous voltages and currents. It is a safety requirement that the electrical safety is tested before a product is shipped.

The testing is done according to the standard EN60204-1 Chapter 18, from which the tests in this document are described with room to note test results.

2. Revision Record

Rev #	Author	Description	Revised By	Date
1.0	PBL	Initial Release		09/11-2023
2.0	PBL	Adapted from 40ft Coolant Skid document		04/07-2024
3.0	RKN	General review		09/01-2025

3. List of Figures

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

5. Purpose and structure of this document

As Megablock is a large system, containing several parts assembled individually and brought together to fulfill the customer requirements, the components are tested individually.

With each component tested before final assembly, the interconnect must be tested, both before initial operation and after any disassembly, e.g. after shipping.

The purpose of this document is to compare the requirements outlined in EN60204-1 Chapter 18 against following testing performed Megablock components.

This is required for the CE approval of the Megablock Fuel Cell Power Plant.

This document is structured as follows:

1. The requirements from EN60204-1 are outlined:
    a. Section 7
2. Test Specifications to comply with the requirement outlined above.
    a. Sections 10 to 16
3. Summary table
    a. Section 17

6. References

7. Requirements from EN60204-1 Ch 18

Figure 1 is reproduced from the EN60204-1 Ch18.1:

18.1 General

The extent of verification will be given in the dedicated product standard for a particular machine. Where there is no dedicated product standard for the machine, the verifications shall always include the items a), b), c) and h) and may include one or more of the items d) to g):

a) verification that the electrical equipment complies with its technical documentation;
b) verification of continuity of the protective bonding circuit (Test 1 of 18.2.2);
c) in case of fault protection by automatic disconnection of supply, conditions for protection by automatic disconnection shall be verified according to 18.2;
d) insulation resistance test (see 18.3);
e) voltage test (see 18.4);
f) protection against residual voltage (see 18.5);
g) verification that the relevant requirements of 8.2.6 are met;
h) functional tests (see 18.6).

Figure 1 – Excerpt from EN60204-1:2018, Chapter 18.1

The mapping between the headlines from the standard and the requirement ID used in this document is listed in Table 2.

Requirement headline	EN60204-1 Chapter 18.1	EN60204-1 Chapter	Requirement ID
Verification that the electrical equipment complies with its technical documentation	A	n/a	A1
Verification of continuity of the protective bonding circuit (Test 1 of 18.2.2)	B	18.2.2 – Test #1	A2
Verification of conditions for protection by automatic disconnection of supply	C	18.2	A3
Insulation resistance tests	D	18.3	A4
Voltage tests	E	18.4	A5
Protection against residual voltages	F	18.5	A6
Verification that the relevant requirements of 8.2.6 are met	G	8.2.6	A7

Table 2 – Requirement headlines, chapter, and ID mapping

Functional testing of the equipment is outside the scope of this document.

Commercial Confidential

Test Specification	RKN	09-01-2025	3.0.0

11. A2 – Verification of continuity of the protective bonding circuit

EN60204-1 requirements:

18.2.2 Test 1 – Verification of the continuity of the protective bonding circuit

The resistance between the PE terminal (see 5.2 and Figure 4) and relevant points that are part of the protective bonding circuit shall be measured with a current between at least 0,2 A and approximately 10 A derived from an electrically separated supply source (for example SELV, see 414 of IEC 60364-4-41:2005) having a maximum no-load voltage of 24 V AC or DC.

The resistance measured shall be in the expected range according to the length, the cross sectional area and the material of the related protective conductors and protective bonding conductor(s).

Earthed PELV supplies can produce misleading results in this test and therefore shall not be used.

Figure 3 – EN60204-1:2018, Chapter 18.2.2

Megablock Component requirements:

The EN60204-1 Chapter 18.2.2, Test #1 specifies a current of 10A.

Megablock Component bonding resistance test is performed with a current of 10A and a test period of 10 seconds.

Megablock Component validation:

The primary earthing point for the Power Converter Container is the main ground bar located at the rear of the main output breaker (=BA30-FC30).

Each component is verified and compared to expected values for the following locations.

ID	Test Point	Expected Value	Recorded Value
1	Busbar to busbar	<100mΩ	
2	Main DC/Acpoint 1		
3	Main DC/Acpoint 2		
4	Main DC/Acpoint 3		
5	DC/AC conduncter point 1		
6	DC/AC conduncter point 2		
7	DC/AC conduncter point 3		
8	LT coolant pipe		
9	Cable tray

10	Main transforer grounding bolt		
11	Main transformer chassis		
12	Cable tray		

Table 3 – Bonding Resistance Test point and expected resistance values.

When performing the test, ensure the connection between the test leads and the equipment is not contributing to inaccurate measurements.

12. A3 - Verification of conditions for protection by automatic disconnection of supply

EN60204-1 requirements:

18.2 Verification of conditions for protection by automatic disconnection of supply

18.2.1 General

The conditions for automatic disconnection of supply (see 6.3.3) shall be verified by tests.

Test 1 verifies the continuity of the protective bonding circuit.

Figure 4 – EN60204-1:2018, Chapter 18.2

Megablock Component requirements:

As specified in chapter 18.2.1, Test #1 is performed (see section 11). Chapter 18.2.1 further specifies testing of Residual Current Devices (RCD) according to manufacturer specifications.

Megablock Component module does not contain any RCD devices.

13. A4 - Insulation resistance tests

EN60204-1 requirements:

18.3 Insulation resistance tests

When insulation resistance tests are performed, the insulation resistance measured at 500 V DC between the power circuit conductors and the protective bonding circuit shall be not less than 1 MΩ. The test may be made on individual sections of the complete electrical installation.

Figure 5 – EN60204-1:2018, Chapter 18.3

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Megablock		10ft Container Electrical Safety Checklist	
Document type	*Author*	*Revision date*	*Revision*
Test Specification	RKN	09-01-2025	3.0.0

Megablock Component requirements:

Before performing this test, isolate all fuel cell DCDC converters from the DC bus (Cabinets UC01 to UC06)

Use a set of test leads and alligator clips to create a single AC node (3 phases shorted together)

The Megablock Component insulation requirements are higher than as specified chapter 18.3. The test is specified in Table 4):

Test point	Pass criteria	Test Voltage [VDC]
=LA01+UC31-QB01	>1MΩ	500

Table 4 – Megablock Component Power Circuit Insulation Resistance Requirements

Megablock Component validation:

Each component is verified and compared to pass criteria in Table 4.

Component	Power Converter Container
Result – AC Node (value and pass/fail)	
Date and Initials	

14. A5 – Voltage tests

EN60204-1 requirements:

18.4 Voltage tests

When voltage tests are performed, test equipment in accordance with IEC 61180-2 should be used.

The test voltage shall be at a nominal frequency of 50 Hz or 60 Hz.

The maximum test voltage shall have a value of twice the rated supply voltage of the equipment or 1 000 V, whichever is the greater. The maximum test voltage shall be applied between the power circuit conductors and the protective bonding circuit for at least 1 s. The requirements are satisfied if no disruptive discharge occurs.

Components and devices that are not rated to withstand the test voltage and surge protection devices which are likely to operate during the test shall be disconnected during testing.

Components and devices that have been voltage tested in accordance with their product standards may be disconnected during testing.

Figure 6 – EN60204-1:2018, Chapter 18.4

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Megablock Component requirements:

The requirements from EN 60204-1:2018, Chapter 18.4 is compared in Table 5.
AC Voltage for Megablock Components is at most 480V, so twice the supply voltage is 960Vac.

Parameter	EN 60204-1:2018, Chapter 18.4	Megablock Component Testing
Voltage [VAC]	960	2500
Frequency [Hz]	50 or 60	50
Duration [sec]	1	10
Maximum Current [mA]	No arcing	5

Table 5 – Voltage Test Requirements

Megablock Component validation:

Connection point is internal side of main output breaker.

Component	Power Converter Container
Voltage Test – L1 (value and pass/fail)	
Voltage Test – L2 (value and pass/fail)	
Voltage Test – L3 (value and pass/fail)	
Date and Initials	

15. A6 – Protection against residual voltages

EN60204-1 requirements:

18.5 Protection against residual voltages

Where appropriate, tests shall be performed to ensure compliance with 6.2.4.

Figure 7 – EN60204-1:2018, Chapter 18.5

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Megablock		10ft Container Electrical Safety Checklist	
Document type	*Author*	*Revision date*	*Revision*
Test Specification	RKN	09-01-2025	3.0.0

6.2.4 Protection against residual voltages

Live parts having a residual voltage greater than 60 V when the supply is disconnected shall be discharged to 60 V or less within a time period of 5 s provided that this rate of discharge does not interfere with the proper functioning of the equipment. Exempted from this requirement are components having a stored charge of 60 µC or less. Where this specified rate of discharge would interfere with the proper functioning of the equipment, a durable warning notice drawing attention to the hazard and stating the delay required before the enclosure may be opened shall be displayed at an easily visible location on or immediately adjacent to the enclosure that contains the live parts.

In the case of plugs or similar devices, the withdrawal of which results in the exposure of conductors (for example pins), the discharge time to 60 V shall not exceed 1 s, otherwise such conductors shall be protected to at least IP2X or IPXXB. If neither a discharge time of 1 s nor a protection of at least IP2X or IPXXB can be achieved (for example in the case of removable collectors on conductor wires, conductor bars, or slip-ring assemblies, see 12.7.4), additional switching devices or an appropriate warning, for example a warning sign drawing attention to the hazard and stating the delay required shall be provided. When the equipment is located in places open to all persons, which can include children, warnings are not sufficient and therefore a minimum degree of protection against contact with live parts to IP4X or IPXXD is required.

Figure 8 – EN60204-1:2018, Chapter 6.2.4

Megablock Component requirements:

Identical to EN60204-1 requirements.

Megablock Component validation:

No live parts of the Megablock Component system are accessible without disassembling barriers or accessing electrical cabinets. All connectors are IP2X or higher in unmated state in applications higher than 60V (power system)

Frequency converters and motor drives are marked with applicable durations before internal capacitors are discharged.

Maintenance procedures for the Megablock Component module include a manual verification before any work on exposed components is permitted.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

16. A7 – Verification that the relevant requirements of 8.2.6 are met

EN60204-1 requirements:

8.2.6 Additional requirements for electrical equipment having earth leakage currents higher than 10 mA

Where electrical equipment has an earth leakage current that is greater than 10 mA AC or DC in any protective conductor, one or more of the following conditions for the integrity of each section of the associated protective bonding circuit that carries the earth leakage current shall be satisfied:

a) the protective conductor is completely enclosed within electrical equipment enclosures or otherwise protected throughout its length against mechanical damage;

b) the protective conductor has a cross-sectional area of at least 10 mm^2 Cu or 16 mm^2 Al;

c) where the protective conductor has a cross-sectional area of less than 10 mm^2 Cu or 16 mm^2 Al, a second protective conductor of at least the same cross-sectional area is provided up to a point where the protective conductor has a cross-sectional area not less than 10 mm^2 Cu or 16 mm^2 Al. This can require that the electrical equipment has a separate terminal for a second protective conductor.

d) the supply is automatically disconnected in case of loss of continuity of the protective conductor;

e) where a plug-socket combination is used, an industrial connector in accordance with IEC 60309 series, with adequate strain relief and a minimum protective earthing conductor cross-section of 2,5 mm^2 as part of a multi-conductor power cable is provided.

A statement shall be given in the instructions for installation that the equipment shall be installed as described in this 8.2.6.

Figure 9 – EN60204-1:2018, Chapter 8.2.6

Megablock Component requirements:

The Megablock Component does not have a leakage current higher than 10mA.

Megablock Component validation:

The protection against excessive leakage current is twofold:

- Ground fault detection is installed with a proven component (Bender Isometer). Detection of ground fault causes system shutdown and service technician is dispatched.
- Conductivity measurement of internal coolant is a part of the regular maintenance procedures (see N01-003 Service and Maintenance Manual)

Commercial Confidential

1. Introduction

The Megablock system contains many components utilizing potentially dangerous voltages and currents. It is a safety requirement that the electrical safety is tested before a product is shipped.

The testing is done according to the standard EN60204-1 Chapter 18, from which the tests in this document are described with room to note test results.

5. Purpose and structure of this document

As Megablock is a large system, containing several parts assembled individually and brought together to fulfill the customer requirements, the components are tested individually.

With each component tested before final assembly, the interconnect must be tested, both before initial operation and after any disassembly, e.g. after shipping.

The purpose of this document is to compare the requirements outlined in EN60204-1 Chapter 18 against following testing performed Megablock components.

This is required for the CE approval of the Megablock Fuel Cell Power Plant.

This document is structured as follows:

1. The requirements from EN60204-1 are outlined:
    a. Section 7
2. Test Specifications to comply with the requirement outlined above.
    a. Sections 10 to 16
3. Summary table
    a. Section 17

7. Requirements from EN60204-1 Ch 18

Figure 1 is reproduced from the EN60204-1 Ch18.1:

18.1 General

The extent of verification will be given in the dedicated product standard for a particular machine. Where there is no dedicated product standard for the machine, the verifications shall always include the items a), b), c) and h) and may include one or more of the items d) to g):

a) verification that the electrical equipment complies with its technical documentation;
b) verification of continuity of the protective bonding circuit (Test 1 of 18.2.2);
c) in case of fault protection by automatic disconnection of supply, conditions for protection by automatic disconnection shall be verified according to 18.2;
d) insulation resistance test (see 18.3);
e) voltage test (see 18.4);
f) protection against residual voltage (see 18.5);
g) verification that the relevant requirements of 8.2.6 are met;
h) functional tests (see 18.6).

Figure 1 – Excerpt from EN60204-1:2018, Chapter 18.1

The mapping between the headlines from the standard and the requirement ID used in this document is listed in Table 2.

Requirement headline	EN60204-1 Chapter 18.1	EN60204-1 Chapter	Requirement ID
Verification that the electrical equipment complies with its technical documentation	A	n/a	A1
Verification of continuity of the protective bonding circuit (Test 1 of 18.2.2)	B	18.2.2 – Test #1	A2
Verification of conditions for protection by automatic disconnection of supply	C	18.2	A3
Insulation resistance tests	D	18.3	A4
Voltage tests	E	18.4	A5
Protection against residual voltages	F	18.5	A6
Verification that the relevant requirements of 8.2.6 are met	G	8.2.6	A7

Test Specification	RKN	09-01-2025	4.0.0

10. A1 – Verification that the electrical equipment complies with its technical documentation

EN60204-1 requirements:

a) verification that the electrical equipment complies with its technical documentation;

Figure 2 – EN60204-1:2018, Chapter 18.1

Megablock Component requirements:

Inspection of the electrical equipment and cabinets to ensure congruence between documentation and equipment/cabinet.

Megablock Component validation:

Component	40ft Container
Result (pass/fail)	
Date and Initials	

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

11. A2 – Verification of continuity of the protective bonding circuit

EN60204-1 requirements:

18.2.2 Test 1 – Verification of the continuity of the protective bonding circuit

The resistance between the PE terminal (see 5.2 and Figure 4) and relevant points that are part of the protective bonding circuit shall be measured with a current between at least 0,2 A and approximately 10 A derived from an electrically separated supply source (for example SELV, see 414 of IEC 60364-4-41:2005) having a maximum no-load voltage of 24 V AC or DC.

The resistance measured shall be in the expected range according to the length, the cross sectional area and the material of the related protective conductors and protective bonding conductor(s).

Earthed PELV supplies can produce misleading results in this test and therefore shall not be used.

Figure 3 – EN60204-1:2018, Chapter 18.2.2

Megablock Component requirements:

The EN60204-1 Chapter 18.2.2, Test #1 specifies a current of 10A.

Megablock Component bonding resistance test is performed with a current of 10A and a test period of 10 seconds.

Megablock Component validation:

The primary earthing point for the 40ft Fuel Cell Container is the main ground bar located in +UC50.

Each component is verified and compared to expected values for the following locations.

ID	Test Point	Expected Value	Recorded Value
1	Busbar to busbar	<100mΩ	
2	Module 1		
3	DC/DC cabinet 1		
4	Module 2		
5	DC/DC cabinet 2

19	Cable tray		

Table 3 – Bonding Resistance Test point and expected resistance values.

When performing the test, ensure the connection between the test leads and the equipment is not contributing to inaccurate measurements.

12. A3 - Verification of conditions for protection by automatic disconnection of supply

EN60204-1 requirements:

18.2 Verification of conditions for protection by automatic disconnection of supply

18.2.1 General

The conditions for automatic disconnection of supply (see 6.3.3) shall be verified by tests.

Test 1 verifies the continuity of the protective bonding circuit.

Figure 4 – EN60204-1:2018, Chapter 18.2

Megablock Component requirements:

As specified in chapter 18.2.1, Test #1 is performed (see section 11).

Chapter 18.2.1 further specifies testing of Residual Current Devices (RCD) according to manufacturer specifications.

Megablock RCD Testing:

All RCD (Residual Current Device) in the Megablock system is equipped with self-test functionality from the manufacturer. This takes the shape of a push button, which must cause the RCD device to trip when actuated.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Megablock		40ft Container Electrical Safety Checklist	
Document type	*Author*	*Revision date*	*Revision*
Test Specification	RKN	09-01-2025	4.0.0

For the test, first enable all RCD circuits, and then actuate the self-test button on the devices. The devices must trip within 1 second. After the trip, use a multimeter to verify that the output of the device has no voltage (<10VAC)

Unauthorized copying, distribution or use of this manual is strictly prohibited.

13. A4 - Insulation resistance tests

EN60204-1 requirements:

18.3 Insulation resistance tests

When insulation resistance tests are performed, the insulation resistance measured at 500 V DC between the power circuit conductors and the protective bonding circuit shall be not less than 1 MΩ. The test may be made on individual sections of the complete electrical installation.

Figure 5 – EN60204-1:2018, Chapter 18.3

Megablock Component requirements:

Before performing this test, isolate all fuel cell DCDC converters from the DC bus (Cabinets UC01 to UC05)

Use a set of test leads and alligator clips to create a single AC node (3 phases shorted together)

The Megablock Component insulation requirements are higher than as specified chapter 18.3. The test is specified in Table 4):

Test point	Pass criteria	Test Voltage [VDC]
Internal side of the output breaker	>1MΩ	500

Table 4 – Megablock Component Power Circuit Insulation Resistance Requirements

Megablock Component validation:

Each component is verified and compared to pass criteria in Table 4.

Test Specification	RKN	09-01-2025	4.0.0

14. A5 – Voltage tests

EN60204-1 requirements:

18.4 Voltage tests

When voltage tests are performed, test equipment in accordance with IEC 61180-2 should be used.

The test voltage shall be at a nominal frequency of 50 Hz or 60 Hz.

The maximum test voltage shall have a value of twice the rated supply voltage of the equipment or 1 000 V, whichever is the greater. The maximum test voltage shall be applied between the power circuit conductors and the protective bonding circuit for at least 1 s. The requirements are satisfied if no disruptive discharge occurs.

Components and devices that are not rated to withstand the test voltage and surge protection devices which are likely to operate during the test shall be disconnected during testing.

Components and devices that have been voltage tested in accordance with their product standards may be disconnected during testing.

Figure 6 – EN60204-1:2018, Chapter 18.4

Megablock Component requirements:

The requirements from EN 60204-1:2018, Chapter 18.4 is compared in Table 5.
AC Voltage for Megablock Components is at most 480V, so twice the supply voltage is 960Vac.

Parameter	EN 60204-1:2018, Chapter 18.4	Megablock Component Testing
Voltage [VAC]	960	2500
Frequency [Hz]	50 or 60	50

15. A6 – Protection against residual voltages

EN60204-1 requirements:

18.5 Protection against residual voltages

Where appropriate, tests shall be performed to ensure compliance with 6.2.4.

Figure 7 – EN60204-1:2018, Chapter 18.5

6.2.4 Protection against residual voltages

Live parts having a residual voltage greater than 60 V when the supply is disconnected shall be discharged to 60 V or less within a time period of 5 s provided that this rate of discharge does not interfere with the proper functioning of the equipment. Exempted from this requirement are components having a stored charge of 60 μC or less. Where this specified rate of discharge would interfere with the proper functioning of the equipment, a durable warning notice drawing attention to the hazard and stating the delay required before the enclosure may be opened shall be displayed at an easily visible location on or immediately adjacent to the enclosure that contains the live parts.

In the case of plugs or similar devices, the withdrawal of which results in the exposure of conductors (for example pins), the discharge time to 60 V shall not exceed 1 s, otherwise such conductors shall be protected to at least IP2X or IPXXB. If neither a discharge time of 1 s nor a protection of at least IP2X or IPXXB can be achieved (for example in the case of removable collectors on conductor wires, conductor bars, or slip-ring assemblies, see 12.7.4), additional switching devices or an appropriate warning, for example a warning sign drawing attention to the hazard and stating the delay required shall be provided. When the equipment is located in places open to all persons, which can include children, warnings are not sufficient and therefore a minimum degree of protection against contact with live parts to IP4X or IPXXD is required.

Figure 8 – EN60204-1:2018, Chapter 6.2.4

Megablock Component requirements:

Identical to EN60204-1 requirements.

Megablock Component validation:

No live parts of the Megablock Component system are accessible without disassembling barriers or accessing electrical cabinets. All connectors are IP2X or higher in unmated state in applications higher than 60V (power system)

Frequency converters and motor drives are marked with applicable durations before internal capacitors are discharged.

Maintenance procedures for the Megablock Component module include a manual verification before any work on exposed components is permitted.

Unauthorized copying, distribution or use of this manual is strictly prohibited.

16. A7 – Verification that the relevant requirements of 8.2.6 are met

EN60204-1 requirements:

8.2.6 Additional requirements for electrical equipment having earth leakage currents higher than 10 mA

Where electrical equipment has an earth leakage current that is greater than 10 mA AC or DC in any protective conductor, one or more of the following conditions for the integrity of each section of the associated protective bonding circuit that carries the earth leakage current shall be satisfied:

a) the protective conductor is completely enclosed within electrical equipment enclosures or otherwise protected throughout its length against mechanical damage;

b) the protective conductor has a cross-sectional area of at least 10 mm^2 Cu or 16 mm^2 Al;

c) where the protective conductor has a cross-sectional area of less than 10 mm^2 Cu or 16 mm^2 Al, a second protective conductor of at least the same cross-sectional area is provided up to a point where the protective conductor has a cross-sectional area not less than 10 mm^2 Cu or 16 mm^2 Al. This can require that the electrical equipment has a separate terminal for a second protective conductor.

d) the supply is automatically disconnected in case of loss of continuity of the protective conductor;

e) where a plug-socket combination is used, an industrial connector in accordance with IEC 60309 series, with adequate strain relief and a minimum protective earthing conductor cross-section of 2,5 mm^2 as part of a multi-conductor power cable is provided.

A statement shall be given in the instructions for installation that the equipment shall be installed as described in this 8.2.6.

Figure 9 – EN60204-1:2018, Chapter 8.2.6

Megablock Component requirements:

The Megablock Component does not have a leakage current higher than 10mA.

Megablock Component validation:

The protection against excessive leakage current is twofold:

- Ground fault detection is installed with a proven component (Bender Isometer). Detection of ground fault causes system shutdown and service technician is dispatched.
- Conductivity measurement of internal coolant is a part of the regular maintenance procedures (see N01-003 Service and Maintenance Manual)

5. Purpose and structure of this document

As Megablock is a large system, containing several parts assembled individually and brought together to fulfill the customer requirements, the components are tested individually.

With each component tested before final assembly, the interconnect must be tested, both before initial operation and after any disassembly, e.g. after shipping.

The purpose of this document is to compare the requirements outlined in EN60204-1 Chapter 18 against following testing performed Megablock components.

This is required for the CE approval of the Megablock Fuel Cell Power Plant.

This document is structured as follows:

1. The requirements from EN60204-1 are outlined:
    a. Section 7
2. Test Specifications to comply with the requirement outlined above.
    a. Sections 10 to 16
3. Summary table
    a. Section 17

7. Requirements from EN60204-1 Ch 18

Figure 1 is reproduced from the EN60204-1 Ch18.1:

18.1 General

The extent of verification will be given in the dedicated product standard for a particular machine. Where there is no dedicated product standard for the machine, the verifications shall always include the items a), b), c) and h) and may include one or more of the items d) to g):

a) verification that the electrical equipment complies with its technical documentation;
b) verification of continuity of the protective bonding circuit (Test 1 of 18.2.2);
c) in case of fault protection by automatic disconnection of supply, conditions for protection by automatic disconnection shall be verified according to 18.2;
d) insulation resistance test (see 18.3);
e) voltage test (see 18.4);
f) protection against residual voltage (see 18.5);
g) verification that the relevant requirements of 8.2.6 are met;
h) functional tests (see 18.6).

Figure 1 – Excerpt from EN60204-1:2018, Chapter 18.1

The mapping between the headlines from the standard and the requirement ID used in this document is listed in Table 2.

Requirement headline	EN60204-1 Chapter 18.1	EN60204-1 Chapter	Requirement ID
Verification that the electrical equipment complies with its technical documentation	A	n/a	A1
Verification of continuity of the protective bonding circuit (Test 1 of 18.2.2)	B	18.2.2 – Test #1	A2
Verification of conditions for protection by automatic disconnection of supply	C	18.2	A3
Insulation resistance tests	D	18.3	A4
Voltage tests	E	18.4	A5
Protection against residual voltages	F	18.5	A6
Verification that the relevant requirements of 8.2.6 are met	G	8.2.6	A7

10. A1 – Verification that the electrical equipment complies with its technical documentation

EN60204-1 requirements:

a) verification that the electrical equipment complies with its technical documentation;

Figure 4 – EN60204-1:2018, Chapter 18.1

Megablock Component requirements:

Inspection of the electrical equipment and cabinets to ensure congruence between documentation and equipment/cabinet.

Megablock Component validation:

Component	Coolant Skid
Result (pass/fail)	
Date and Initials	

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

11. A2 – Verification of continuity of the protective bonding circuit

EN60204-1 requirements:

18.2.2 Test 1 – Verification of the continuity of the protective bonding circuit

The resistance between the PE terminal (see 5.2 and Figure 4) and relevant points that are part of the protective bonding circuit shall be measured with a current between at least 0,2 A and approximately 10 A derived from an electrically separated supply source (for example SELV, see 414 of IEC 60364-4-41:2005) having a maximum no-load voltage of 24 V AC or DC.

The resistance measured shall be in the expected range according to the length, the cross sectional area and the material of the related protective conductors and protective bonding conductor(s).

Earthed PELV supplies can produce misleading results in this test and therefore shall not be used.

Figure 5 – EN60204-1:2018, Chapter 18.2.2

Megablock Component requirements:

The EN60204-1 Chapter 18.2.2, Test #1 specifies a current of 10A.

Megablock Component bonding resistance test is performed with a current of 10A and a test period of 10 seconds.

Megablock Component validation:

The primary earthing point for the coolant skid is the main ground terminal in the control enclosure.

Each component is verified and compared to expected values for the following locations.

ID	Test Point	Expected Value	Recorded Value
1	Control Cabinet Backplate	<100mΩ	
2	Grounding Bar, Below PLC		
3	HT1 Cooling Pipe, From HT1 Cooler		
4	HT1 Manual Valve, HT1 Cooler Outlet		
5	HT1 Coolant Pump, Grounding Connection		
6	HT1 Header Tank, Bolts		
7	HT1 Cooler Frame (Metal)		
8	HT2 Cooling Pipe, From HT1 Cooler		
9	HT2 Manual Valve, HT1 Cooler Outlet		
10	HT2 Coolant Pump, Grounding Connection

12. A3 - Verification of conditions for protection by automatic disconnection of supply

EN60204-1 requirements:

18.2 Verification of conditions for protection by automatic disconnection of supply

18.2.1 General

The conditions for automatic disconnection of supply (see 6.3.3) shall be verified by tests.

Test 1 verifies the continuity of the protective bonding circuit.

Figure 7 – EN60204-1:2018, Chapter 18.2

Megablock Component requirements:

As specified in chapter 18.2.1, Test #1 is performed (see section 11). Chapter 18.2.1 further specifies testing of Residual Current Devices (RCD) according to manufacturer specifications. Megablock Component module does not contain any RCD devices.

Megablock Component is not a TN-system, and Test #2 is not relevant.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

13. A4 - Insulation resistance tests

EN60204-1 requirements:

18.3 Insulation resistance tests

When insulation resistance tests are performed, the insulation resistance measured at 500 V DC between the power circuit conductors and the protective bonding circuit shall be not less than 1 MΩ. The test may be made on individual sections of the complete electrical installation.

Figure 8 – EN60204-1:2018, Chapter 18.3

Megablock Component requirements:

The Megablock Component insulation requirements are higher than as specified chapter 18.3. The test is specified in Table 4):

Test point	Pass criteria	Test Voltage [VDC]
UC40-FC04	>1MΩ	500

Table 4 – Megablock Component Power Circuit Insulation Resistance Requirements

Megablock Component validation:

Each component is verified and compared to pass criteria in Table 4.

Unauthorized copying, distribution or use of this manual is strictly prohibited.

14. A5 – Voltage tests

EN60204-1 requirements:

18.4 Voltage tests

When voltage tests are performed, test equipment in accordance with IEC 61180-2 should be used.

The test voltage shall be at a nominal frequency of 50 Hz or 60 Hz.

The maximum test voltage shall have a value of twice the rated supply voltage of the equipment or 1 000 V, whichever is the greater. The maximum test voltage shall be applied between the power circuit conductors and the protective bonding circuit for at least 1 s. The requirements are satisfied if no disruptive discharge occurs.

Components and devices that are not rated to withstand the test voltage and surge protection devices which are likely to operate during the test shall be disconnected during testing.

Components and devices that have been voltage tested in accordance with their product standards may be disconnected during testing.

Figure 9 – EN60204-1:2018, Chapter 18.4

Megablock Component requirements:

The requirements from EN 60204-1:2018, Chapter 18.4 is compared in Table 5.
AC Voltage for Megablock Components is at most 480V, so twice the supply voltage is 960Vac.

Parameter	EN 60204-1:2018, Chapter 18.4	Megablock Component Testing
Voltage [VAC]	960	2500
Frequency [Hz]	50 or 60	50
Duration [sec]	1	10
Maximum Current [mA]	No arcing	5

15. A6 – Protection against residual voltages

EN60204-1 requirements:

18.5 Protection against residual voltages

Where appropriate, tests shall be performed to ensure compliance with 6.2.4.

Figure 10 – EN60204-1:2018, Chapter 18.5

6.2.4 Protection against residual voltages

Live parts having a residual voltage greater than 60 V when the supply is disconnected shall be discharged to 60 V or less within a time period of 5 s provided that this rate of discharge does not interfere with the proper functioning of the equipment. Exempted from this requirement are components having a stored charge of 60 μC or less. Where this specified rate of discharge would interfere with the proper functioning of the equipment, a durable warning notice drawing attention to the hazard and stating the delay required before the enclosure may be opened shall be displayed at an easily visible location on or immediately adjacent to the enclosure that contains the live parts.

In the case of plugs or similar devices, the withdrawal of which results in the exposure of conductors (for example pins), the discharge time to 60 V shall not exceed 1 s, otherwise such conductors shall be protected to at least IP2X or IPXXB. If neither a discharge time of 1 s nor a protection of at least IP2X or IPXXB can be achieved (for example in the case of removable collectors on conductor wires, conductor bars, or slip-ring assemblies, see 12.7.4), additional switching devices or an appropriate warning, for example a warning sign drawing attention to the hazard and stating the delay required shall be provided. When the equipment is located in places open to all persons, which can include children, warnings are not sufficient and therefore a minimum degree of protection against contact with live parts to IP4X or IPXXD is required.

Figure 11 – EN60204-1:2018, Chapter 6.2.4

Megablock Component requirements:

Identical to EN60204-1 requirements.

Megablock Component validation:

No live parts of the Megablock Component system are accessible without disassembling barriers. All connectors are IP2X or higher in unmated state in applications higher than 60V (power system)

Frequency converters and motor drives are marked with applicable durations before internal capacitors are discharged.

Maintenance procedures for the Megablock Component module include a voltage drawdown process and manual verification before any work on exposed components is permitted.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

16. A7 – Verification that the relevant requirements of 8.2.6 are met

EN60204-1 requirements:

8.2.6 Additional requirements for electrical equipment having earth leakage currents higher than 10 mA

Where electrical equipment has an earth leakage current that is greater than 10 mA AC or DC in any protective conductor, one or more of the following conditions for the integrity of each section of the associated protective bonding circuit that carries the earth leakage current shall be satisfied:

a) the protective conductor is completely enclosed within electrical equipment enclosures or otherwise protected throughout its length against mechanical damage;

b) the protective conductor has a cross-sectional area of at least 10 mm^2 Cu or 16 mm^2 Al;

c) where the protective conductor has a cross-sectional area of less than 10 mm^2 Cu or 16 mm^2 Al, a second protective conductor of at least the same cross-sectional area is provided up to a point where the protective conductor has a cross-sectional area not less than 10 mm^2 Cu or 16 mm^2 Al. This can require that the electrical equipment has a separate terminal for a second protective conductor.

d) the supply is automatically disconnected in case of loss of continuity of the protective conductor;

e) where a plug-socket combination is used, an industrial connector in accordance with IEC 60309 series, with adequate strain relief and a minimum protective earthing conductor cross-section of 2,5 mm^2 as part of a multi-conductor power cable is provided.

A statement shall be given in the instructions for installation that the equipment shall be installed as described in this 8.2.6.

Figure 12 – EN60204-1:2018, Chapter 8.2.6

Megablock Component requirements:

The Megablock Component does not have a leakage current higher than 10mA.

Megablock Component validation:

The protection against excessive leakage current is twofold:

- Ground fault detection is in the scope of the 10ft Container (DCAC system)
- Conductivity measurement of internal coolant is a part of the regular maintenance procedures (see N01-003 Service and Maintenance Manual)

Commercial Confidential

1 INTRODUCTION

1.1 PROJECT OVERVIEW

Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.

Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.1.1 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

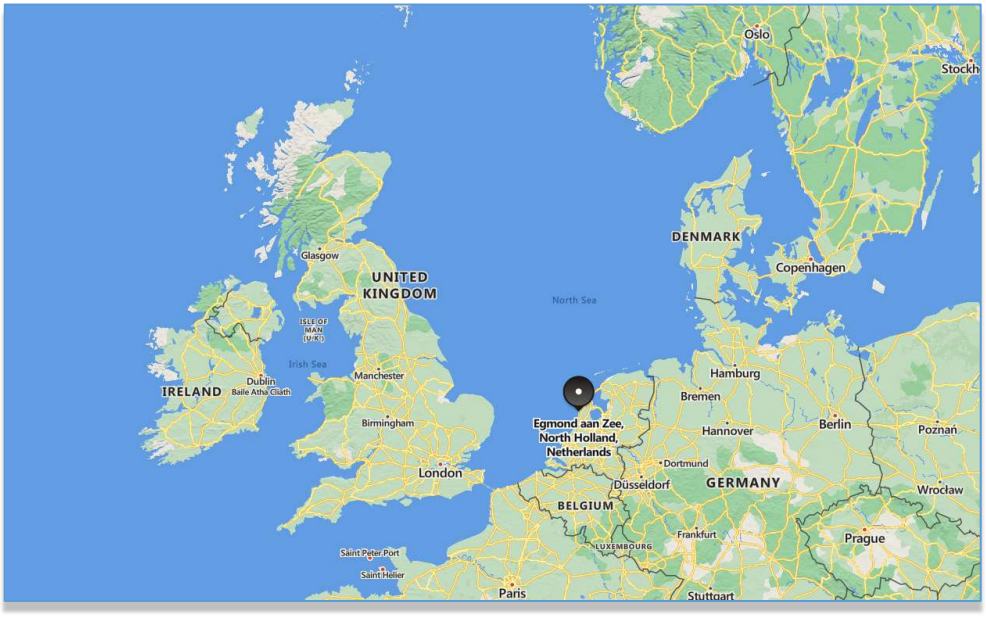

Figure 1 - HOLLANDSE KUST NOORD WIND PARK Location Map

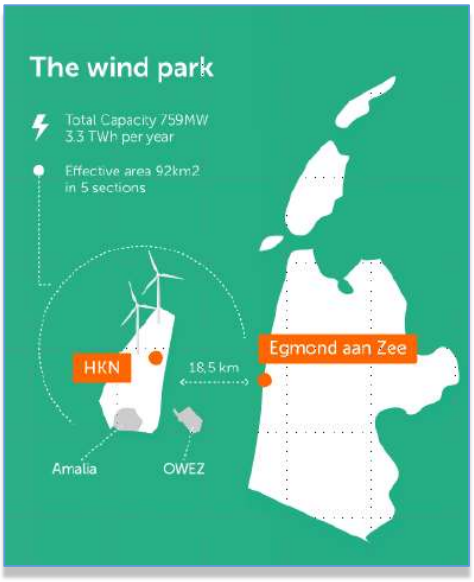

Figure 2 - Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile is located on coordinates E 590719.1, N 5841602.3 and is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

1.1.2 Project Concept

All components included in the BLPH will be integrated onshore on a topsides and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

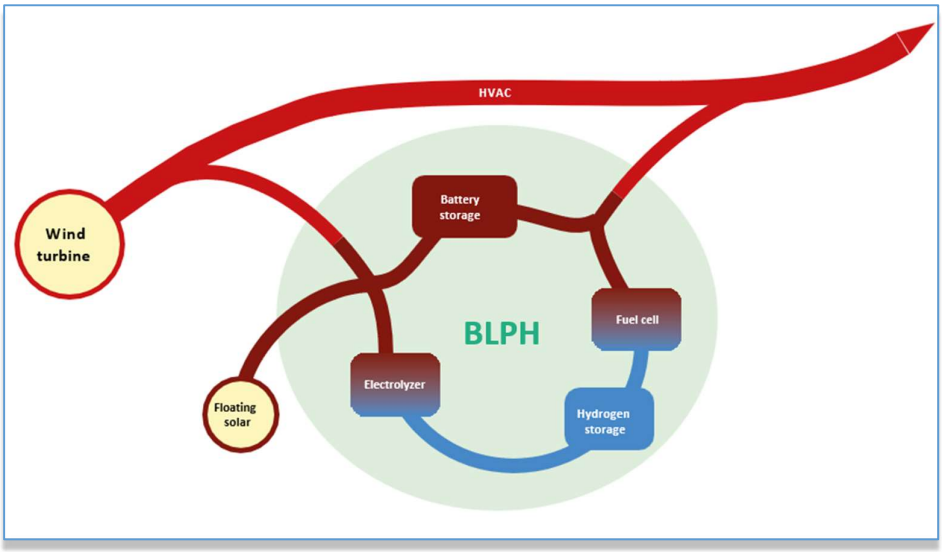

Figure 3 – BLPH Concept

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.

The purpose of the BLPH is to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy.

2 DOCUMENT SCOPE

The purpose of this Procedure/Plan is to establish a detailed methodology for carrying out:

All activities at the integration yard.

2.5 CRITICALITY, KEY RISK AND CONTROLS

The work described in the procedure has been classified as Critical.

All the work must be carried in the vicinity of the Fuel Cell already installed on the platform. The key risk is electrical shock once energisation occurs, and risks associated with the introduction of hydrogen.

Adequate lighting shall be provided.

2.6 ROLES & RESPONSIBILITIES

2.6.1 Company Representative

Responsibilities:

- Management of all resources, equipment / materials and subcontractors mobilized for the execution of the onshore activities;
- Promotes safety & quality to all personnel within his organization;
- Assess project risks and ensure proper mitigation;

2.6.2 Vendor Representative

Responsibilities:

- Implements and issues a comprehensive and supported Progress Reporting System to the Project Manager all the necessary info to be used as a basis for decisions (i.e. Target, Actual & Forecast), to maintain analyses in a proactive manner the possible impacts to contractual key dates on a continuous basis.
- Preparation of project specific templates for Periodical Project Progress Report to Client (Daily)
- Safely execute the work in compliance with all HSE & Quality requirements.

2.6.3 Vendor workers

- Peter Blok Hansen (lead)
- Peter Van Black (lead – CE&I)
- Rasmus Knudsen (lead – Mechanical)
- John Holebæk
- Mikkel Kannegaard

13	CE multitester	1
14	Multimeter	1

- H2 Sniffer - Sewerin Snooper Mini H2, Detection instrument to sniff/locate source of potential leaks.
- Pressure sensor - Fluke 700RG07 500PSIG, measuring device to accurately adjust and monitor gas pressure during leakage test.
- Test gas - Formier gas 5% hydrogen. Test gas for pressurizing pipework where the 5% hydrogen acts as tracer agent for sniffing
- Sniffer test station - Sewerin SPE-HG. Test instrument the emits a reference gas to check the correct function of the Snooper Mini H2 sniffer.
- Pressure regulator, Test gas pressure regulator for pressurizing the DUT.
- Pressure relief valve, Safety valve to ensure safe pipework pressurization during test.

2.8 SEQUENCE OF ACTIVITIES

This method statement has been developed to provide the necessary information and guidelines toensure satisfactory and safe execution at Site.

2.8.1 General Requirements and Site Preparation

- All CONTRACTOR approved AFC drawings, schedule and construction documents (Method Statement andJSA) shall be available and understood by site construction team.
- During the operation in the ups room only qualified personnel shall be allowed.
- Adequate ventilation and lighting shall be provided.
- Identify the working area and barricade with proper signage by company. (Such as Warning,Work in Progress).
- Ensure that all the necessary equipment and tools are approved by CONTRACTOR focal safety/maintenance personnel and are in good condition and safe to use with

current colorcodes and CONTRACTOR stickers.

- All competent direct and indirect manpower shall be available at site.
- Personnel shall be qualified and approved by Company for such job.
- All the doors at nearest roof elevation shall be kept open during the work and shall be properly barricaded for personal entry.
- Keep the work permit in the PTW Bag and display at work booth.
- Entry and Exit register shall be kept ready and ensure to maintain properly.
- Tool box talks with LMRA will be done prior work start.

2.8.2 Mandatory Requirements

ATEX corrections

- No interfaces live (no AUX power, no HV power, no H2 pressurized).

Pre-commissioning

- No interfaces live (no AUX power, no HV power, no H2 pressurized).

Commissioning (Powered)

- Mechanically Complete.
    - ITRs complete.
    - Rosetti drain connection complete.
- Aux Power available.

Commissioning Campaign 2

- Air compressor on platform – coolant system testing.
- Coolant IBCs on platform – coolant system testing.
- Spill pads available. – coolant system testing.
- Formier gas procured – H2 installation leak test.

Commissioning Campaign 3

- Platform communication ready.
- Rosetti test genset setup ready for energisation – 6.6kV.

Commissioning Campaign 4

- Commissioning test setup ready for hydrogen – H2 supply, LB & 6.6kV.
- Rosetti H2 interface connection complete.
- Confirmation from Crosswind ready for SAT.

2.8.3 Sequence of Activities

2.8.3.1 ATEX CORRECTIONS

ACTIVITY 1 – PREPARE CONTAINER FOR ATEX CORRECTIONS

- Remove existing internal drain hoses (40' container).
- Remove collector tank.
- Remove bulkhead plate with drain flange.
- Modify 6x H2 fuel pipe bulkhead entries (enlarge holes for new pipe glands).

ACTIVITY 2 – NEW DRAIN INSTALLATION

Note once this activity is complete CONTRACTOR are to complete the drainpipe interface connection.

- Install new collector box assembly.
- Install and route 6x SS pipes from FC wave to collector box.
- Install external exhaust.
- CONTRACTOR to connect drain interface.

ACTIVITY 3 – ATEX INSPECTION

Note this is not currently detailed in the schedule.

- Perform ATEX ITR inspection

ACTIVITY 4 – MECHANICAL COMPLETION PRE-CHECK INSPECTIONS

Note this is not currently detailed in the schedule.

- CONTRACTOR to complete mechanical and electrical prechecks utilizing the provided ITRs by COMPANY.
- ITRs to be reviewed by COMPANY & VENDOR prior to triparty walkdown.

2.8.3.2 TRIPARTY WALKDOWN

To be completed with the COMPANY, CONTRACTOR & VENDOR in attendance upon completion of all the above activities.

Walkdown procedure is to be provided by CONTRACTOR

2.8.3.3 COMMISSIONING (POWERED)

ACTIVITY 1 – AUX FIRST POWER ON

- Check 400V AUX connection integrity
- Power up the container controller

Enable essential systems in container (lighting, heating, ventilation, detection systems)

ACTIVITY 2 – SUBSYTEMS POWER ON CHECK

- Power up remaining BOP functions

2.8.3.4 COMMISSIONING CAMPAIGN 2

ACTIVITY 1 – PREPARE COOLANT FILL (SETUP PUMPS, HOSES, TANKS)

- CONTRACTOR to lifr air compressor on to platform.
- CONTRACTOR to lift 2x IBC coolant tanks to platform
- CONTRACTOR to ensure scaffolding to access cooling skid service area
- CONTRACTOR to provide spill kit and overflow routing for coolant
- Connect pump station to IBC tanks and cooling skid, including header tank return flow pipework

ACTIVITY 2 – COOLANT SYSTEM LEAK TEST (DRY)

Vendor to complete cooling system dry leakage test as per Vendor Document: SPC ID 0103 Cooling Circuit Pressure and Leak Test Procedure

- HT coolant system dry leakage test (with compressed air)
- LT coolant system dry leakage test (with compressed air)
- Connect pump station to IBC tanks and cooling skid, including header tank return flow pipework

ACTIVITY 3 – COOLANT FILL

- Perform HT coolant filling procedure
- Perform LT coolant filling procedure

ACTIVITY 4 – COOLANT SYSTEM DEGAS

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy.

- Perform HT system degas procedure (pump agitation and coolant top up)
- Perform LT system degas procedure (pump agitation and coolant top up)

ACTIVITY 5 – COOLING SYSTEM LEAK CHECK (WET)

Vendor to complete Cooling Circuit Pressure and Leak Test procedure per Vendor Document: SPC ID 0103 Cooling Circuit Pressure and Leak Test Procedure

- Perform leak test procedure on HT system
- Perform leak test procedure on LT system

ACTIVITY 6 – H2 INSTALLATION ASSEMBLY LEAK TESTING

Vendor to complete *Pipework inspection and leakage test* per Vendor Document: SPC ID 0104 H2 Leak Test Procedure

- Install test pressurization equipment to H2 manifold
- Perform sniffing test to ensure pipework tightness
    - Pressurize pipework with formier gas and perform sniffing procedure

2.8.3.5 COMMISSIONING CAMPAIGN 3

ACTIVITY 1 – IO TEST (PACKAGE INTERNAL)

- Test all sensors and actuators on BOP systems

ACTIVITY 2 ELECTRICAL SAFETY CHECK (PART OF SAT PROCEDURE)

- According to SAT procedure.
    - F07 Electrical Safety Test – 10 foot container
    - F08 Electrical Safety Test – 40 foot container
    - F10 Safety

ACTIVITY 3 FUNCTION CHECK OF VFD COOLER/HVAC

- Manually operate HT Cooling system pumps and fans, checking functionality of fans, pumps and valves.

ACTIVITY 4 - SOFTWARE UPDATE ON CONTROL SYSTEMS

- Connect Ballard laptop to control system of container and fuel cells
- From Ballard servers, upload updated versions of programming on the container and fuel control systems.
- This activity will cause disruptions on communication between BLPH and Fuel Cell package, as the control system is stopped as a part of the upgrade process.
- This activity allows activity #3 in campaign 4 to be completed, which includes testing of the software functions which have been impacted by the changes.

ACTIVITY 5 - PLATFORM COMMUINCATION CHECK

Note the platform is to be "communication ready" by CONTRACTOR before this activity can start and be completed.

- CONTRACTOR to bring communication interface live
- Check network communication between package controller and platform
- Check E-stop (hardwired) between package controller and platform

ACTIVITY 6 – HV LINK CHECK (6.6 kV TRAFO ENERGIZATION)

Note the platform is genset is to be confirmed ready by CONTRACTOR before this activity can start and be completed.

- Perform LOTO procedure with CONTRACTOR (Lock 10ft container with breaker room key)
- CONTRACTOR to energize 6,6kV supply to package

ACTIVITY 7 – TEST BACKFLOW 6.6KV TRAFO

Note the platform is genset is to be confirmed ready by CONTRACTOR before this activity can start and be completed.

- Energize DC link through 6,6kV supply (backflow)
- Bring BOP functions to operation to test load capability

ACTIVITY 8 – BRING FUEL CELLS TO STANDBY (NO H2)

Note the platform is genset is to be confirmed ready by CONTRACTOR before this activity can start and be completed.

- Energize DC link (backflow)
- Bring Fuel Cell 1 – 6 to standby state (power from DC link) – no H2 introduced.
- Operate BOP components within each Fuel Cell

2.8.3.6 COMMISSIONING CAMPAIGN 4 (HOT COMMISSIONING)

ACTIVITY 1 – COMPLETION OF OPEN PUNCH LIST ITEMS

VENDOR to complete open punch list items including the necessary software updates.

ACTIVITY 2 – RETEST – PLATFORM COMMUNICATION CHECK

Retest of network communication between package and platform due to new alarm list in bit array.

ACTIVITY 3 – H2 AVAILABILITY AND QUALITY CHECK (BEFORE INTRODUCING H2 to FC MODULES)

Note CONTRACTOR to confirm following ACTIVITY 3 tasks completed before VENDOR can continue HOT _COMMISSIONING. If H2 quality check is not completed, COMPANY takes full responsibility for potential damages or repairs caused by poor fuel quality.

- CONTRACTOR providing documentation on H2 fuel quality from sampling point
- CONTRACTOR providing Load Bank

ACTIVITY 4 – FILL H2 HEATER WITH COOLANT

- CONTRACTOR to lift 1x IBC coolant tanks to platform
- CONTRACTOR to provide spill kit and overflow routing for coolant
- VENDOR connecting pump to H2 heater and fill to level

ACTIVITY 5 – COMMISSIONING SINGLE FC WITH REDUCED PRESSURE (UNTIL SINGLE FC COMMISSIONED) (WITH H2, 0 to 200 KW, 6.6KV LIVE)

Main purpose: Start 1 FC verifying H2 fuel quality and regulator capable of start-up and commissioning

Note if FC module shutdown due to low H2 quality, VENDOR will stop activities and wait for CONTRACTOR to perform new H2 quality checks. If FC modules shutdown due to H2 pressure issues CONTRACTOR must perform pressure regulator adjustments. If H2 quality check is not completed, COMPANY takes full responsibility for potential damages or repairs caused by poor fuel quality.

- First start of one FC module (first start from long time out of service)
    - If FC module does not start after completing VENDOR start up procedure VENDOR will stop further start up attempts. If VENDOR deems the cause to be poor fuel quality, COMPANY/CONTRACTOR will have the responsibility to improve fuel quality before continuing.
- Continue conditioning by running one FC module at varies load point between 50kW and 200kW

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy.

ACTIVITY 6 (ROSETTI) – REGULATOR/CONTROL VALVE TUNING WITH FC (UNTIL BASELINE FUNCTIONALITY IS PROVEN WITH FC (REDUCED LOAD, INLET RANGE) (WITH H2, 0 to 200 KW, 6.6KV LIVE)

Main purpose: Give CONTRACTOR the opportunity to adjust and setup regulator control for a single (one) FC Module

Note if FC modules shutdown due to low H2 quality, VENDOR will stop activities and wait for CONTRACTOR to perform new H2 quality checks. If FC modules shutdown due to H2 pressure issues CONTRACTOR must perform pressure regulator adjustments before VENDOR continue testing.

- CONTRACTOR to adjust H2 regulators
- Start FC Module No.1 from idle to max load (50 to 200kW)
- Run module – ramping up and down
- Start stop test of module with storage tank high and low pressure

ACTIVITY 7 – COMMISSIONING REST OF FCs (5PCS) (WITH H2, 0 to 200 KW, 6.6KV LIVE)

Main purpose: Start the last 5 FC modules and commission

Note if FC module shutdown due to low H2 quality, VENDOR will stop activities and wait for CONTRACTOR to perform new H2 quality checks. If FC modules shutdown due to H2 pressure issues CONTRACTOR must perform pressure regulator adjustments. If H2 quality check is not completed, COMPANY takes full responsibility for potential damages or repairs caused by poor fuel quality.

- Conditioning of each individual FC modules (first start from long time out of service)
- Continue conditioning by running each individual FC modules at varies load points between 50kW and 200kW

ACTIVITY 8 (ROSETTI) – FULL REGULATOR/CONTROL VALVE VERIFICATION WITH 6 FC (WITH H2, 0 to 1000 KW, 6.6KV LIVE)

Main purpose: Give CONTRACTOR the opportunity to adjust and setup regulator control for the full power range

Note if FC modules shutdown due to low H2 quality, VENDOR will stop activities and wait for CONTRACTOR to perform new H2 quality checks. If FC modules shutdown due to H2 pressure issues CONTRACTOR must perform pressure regulator adjustments before VENDOR continue testing.

- CONTRACTOR to adjust H2 regulators
- Start FC Module No.1 to 6 tests from idle to max load (0 to 1000kW)
- Run modules – ramping up and down. At high and low storage tank pressure
- Start stop test of all modules with storage tank high and low pressure.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy.

2.8.3.7 RFSU CERTIFICATE

Ready for Start Up Certificate to be signed by COMPANY, CONTRACTOR & VENDOR upon completion of all the above activities.

2.8.3.8 SITE ACCEPTANCE TEST

Note all activities above must be successfully completed before commencement of the SAT.

Note if FC modules shutdown due to low H2 quality, VENDOR will stop activities and wait for CONTRACTOR to perform new H2 quality checks. If FC modules shutdown due to H2 pressure issues CONTRACTOR must perform pressure regulator adjustments before VENDOR continue testing.

SAT to follow document: K559-2254-CWIWP4202202-J99-001-Rev004, Site Acceptance Test (SAT) Procedure

- Follow SAT procedure

2.9 CLASS OF WORK

2.9.1 Proposed Work Window to CONTRACTOR Yard

Refer to schedule as listed in the references.

2.9.2 Disciplines

Discipline Included in Work Scope							
Piping	Structural	Electrical	Instrument	Rigging	Scaffolding	Vendor	Insulation
X		X	X		X	X	

2.9.3 Equipment/System Affected/Impacts to Operation

N/A

2.9.4 Special Requirements

The table below shows the activities which require the attention of CONTRACTOR

Activity	Requirements
• Scaffolding for accessing cooling skid service area.	

• Scaffolding for installing drain exhaust.	
• Spill kits and containment pallets.	
• 230V utility connection (for power tools and pumps) available on platform/next to FC package.	
• Drainpipe interface connection.	
• Crane available for lifting activities – Air compressor, coolant IBCs etc..	
• Platform communication ready	
• Test Genset ready for energization	
• Commissioning test set up ready (H2 Supply, LB & 6.6kV)	

2.10 HOUSE KEEPING & DEMOBILIZATION

As per CONTRACTOR procedures.

2.11 TIME SCHEDULE

The tasks are executed in day shift, 8 working hours per day.

2.12 GENERAL SAFETY, PTW SYSTEMS & SAFETY CHECK LISTS

2.12.1 General Safety

- All construction activities shall comply with the CONTRACTOR Safety Management System.
- Safety will be the main target during the whole of the execution of works. Workers will be fullyadhered to safety requirements.
- There will be a full time safety representative from COMPANY to ensure the safety throughout the scheduled activity.
- Tool box talk shall be conducted by performing party prior to start of the job every day attended byall the concerned work party. The performing party shall make a record of the toolbox meeting in presence of HSE person.
- Make sure that all the relevant signatures are obtained in PTW and all the work group signatures inthe appropriate area after the job briefing
- All Hazardous activities shall be identified and adequate safety precautions shall be taken as per JSA/RA.
- All the personnel working at site shall wear PPE as per CONTRACTOR PPE policy.
- All Insulators shall wear special PPE such as disposable coverall, hand gloves, mask as

recommendedin SDS.

- Work permit pack should include the relevant documents (MS, JSA/RA, SDS etc.)
- COMPANY's supervisor will ensure that all workers, directly or indirectly employed by it, have attended the necessary safety training required by law, safety regulations and have necessary workexperience. Documented evidence of such training shall be given upon request.
- Hygiene will be of utmost priority and the work areas will be maintained clean all rubbish and debris will be removed regularly.
- After completion of the job all waste shall be segregated and disposed separately as per RM policy & procedure for Waste Management. (PRO-HSE-28)
- Demobilize all tools and equipment from site after completion of work including housekeeping andcleaning the work location.

2.12.2 Permit To Work System

CONTRACTOR Permit to Work system (PRO-HSE-23) is a formal written Agreement andmean of Communication between CONTRACTOR and VENDOR while performing the task.

"Permit to Work system" provides a mechanism to control certain hazardous activities, non-routine activities and ensure a safe working environment so that the work carried out is conducted in a safe, coordinated & consistent manner without harm to people, Asset and Environment.

Dedicated training on PTW System will be provided by CONTRACTOR upon request.

2.12.3 PTW Office:

Original of the PTW and Original Certificates/ Documents shall be kept in the PTW Office (Project HSE office) and a copy at site in order to avoid spoil or misplaced. Also, this shall be easily accessible to both PTW holder and CONTRACTOR when it requires.

2.12.4 Lost Permit/Documents:

If any permits or associated documents are lost then the work must be stopped and new permit and associated document must be obtained before work started.

2.12.5 Operations Hold point:

Task list may have HOLD POINTS against some activities. The purpose of a hold point is to allow the intervention of CONTRACTOR before executing the activity. This can be added by CONTRACTOR Area Operator at the time of issuing the permit (on the hard copy) if required. In such cases, the PTW holder shall consult CONTRACTOR Area Operator and visit the site and obtain the signature in the task list before startingthe work. CONTRACTOR shall be informed of any special requirements after the site verification study.

2.12.6 PTW Suspension:

All permits are considered suspended at the end of the shift. If during the shift, a permit needs to be suspended due to some reasons, then CONTRACTOR shall collect the permit pack from site. PTW suspension due to Emergency situation during shift following an emergency Alarm, all PTWs shall be considered suspended and Permit receiver must leave the permits in PTW office at the work site. CONTRACTOR Shift Supervisor shall revalidate all PTWs after "All Clear "announcement. In case of false alarm, no need of PTW revalidation if the interruption is less than one hour.

For planned emergency exercise/drill, need not required to suspend the PTWs.

2.12.7 Safety Checklist

The following activities will be carried out:

- Discuss work scope permits with the production / discipline supervisors.
- Toolbox talk with foreman / charge-hand.
- Walk job with production / discipline supervisors.
- PIC to check worksite immediately prior to work starting.
- PPE Check List.

2.13 JOB SAFETY ANALYSIS

Shall be prepared separately as an attachment to PTW. Can be replaced by a Risk Assessment of the activities required for any step to complete the scope of work.

2.14 ATTACHMENTS

Stationary Fuel cell module. converting Hydrogen to electricity.

For stationary purposes, Also intended for the CE marking approval.

Functional description

Fuel Cell Container

The container contains 4-6 FCwave units. Each FC wave is a separate unit with full hydrogen safety and a double wall barrier to ventilate any possible hydrogen leakages directly to the outside. Ventilation is led to a level above the cooling radiators, to ensure that any hydrogen is kept away from igniting sources. This solution ensures that the interior of the container is not an Ex-zone. The fuel cell container is equipped with a ventilation system, which will ensure that the filtered process air for the FC wave is available. The ventilation system will also create a flow through the container, for cooling and ventilating the room. The container inside is kept at a small overpressure to prevent ingress of dust or fumes from the outside. The DC/DC panels for fuel cell output in the container connect each FC wave to a common DC link busbar. Each DC/DC panel for fuel cell output can be isolated electrically, to allow for maintenance on the specific cabinet or related FC wave. The system controller is a centralized unit that monitors and operates the entire FC Power Gen system and include a separate safety controller to prevent any critical failure or emergency situations to escalate. The power for auxiliary units such as water pumps, container ventilation and basic power is fed from a 400V AUX power panel during shut down.

Customer interface container

The customer interface container provides the main output AC power to the customer output. The DC power from the fuel cell container converts into 50Hz AC through the DC/AC output converter located in the customer interface container. This converter is further connected to the isolation transformer and main breakers for the customer connections. The container doors are prevented from opening during operationt. Access is restricted to instructed and trained personnel, and only after a safety procedure is followed, which will de-energize the container to a safe mode.

Cooling Unit

The purpose of the high-temperature (HT) cooling system is to dissipate the heat generated by the fuel cells. It is an open unpressurized system with an open header tank for volume changes due to temperature. The purpose of the Low-Temperature (LT) cooling system is to provide cooling for power electronics. Like HT, it is also an open unpressurized system with an open header tank for volume changes due to temperature.

Function

Functional Modes

Shut down

The hydrogen supply is manually isolated from the container. The container will be internally heated to keep temperature above freezing. Light and service plugs are available in the container, and the controller can be accessed by the customer.

Stand.by

The hydrogen supply is available to the fuel cell container when needed. Availability of hydrogen at an allowable pressure is provided by the customer hydrogen supply system. Loss of the hydrogen signal or hydrogen pressure error will place the FC Power Gen system in failure state. The FC Power Gen hydrogen manifold is closed. The main breaker of the customer grid is disconnected by the control system. The container will be internally heated to keep temperature above freezing. Light and service plugs are available in the container, and the controller can be accessed by the communication interface.If the FC Power Gen system receives an operating signal and no failures are observed, the FC Power Gen will go to operating state and perform a start-up.

Operating

The hydrogen supply is available to the fuel cell container. Availability of hydrogen at allowable pressure is provided by the customer hydrogen supply system. Loss of hydrogen signal or hydrogen pressure error will place the FC PowerGen system in failure state.The main breaker of the customer grid is controlled by the control system. The normal operating condition is the FC PowerGen operating and producing, where the main breaker is closed and the FC PowerGen system supporting the microgrid. .If the producing signal is removed, the FC Power Gen will open the main customer grid breaker and then perform a controlled shutdown going back to stand-by mode. The current available power is continuously signaled to the customers power management system together with various operating data. It is the responsibility of the customers power management system to avoid overloading the customer grid, e.g., by managing allowable consumers on the customer grid.The FC Power Gen system will allow for a FC wave fuel cell unit to be out due to service or failure, and continue supporting the customer grid with remaining fuel cells, at a lower available power level. If a critical error is seen by the FC Power Gen control system, the system will shut down to failure mode.

Failure

When an error that require the FC Power Gen to shut down is identified, the system will enter into one of the following states:

	• Emergency shutdown will immediately stop hydrogen supply and disconnect the FC power Gen from the customer grid. The FC Power Gen will remain in failure mode until the necessary action has been taken to rectify the error condition and the state has manually been cleared. The network connection will provide error data and engineering access for analyzing and correcting the		
Project number	PRJ-2024-07-04-0002

Product	N/A		
Commercial name	FC PowerGen 1000kW ®/ TM		
Additional information	N/A		
Batch number	N/A		
Scheduled date of placing on the market			
	The overall project is divided into 3 subproject in order to perform risk assessment precisely. 1) Fuel cell container: This part consists of risks involved in fuel cells, fuel cell DC/DC converter system, system controller, auxiliary supply input, low temperature pump system, container ventilation and integrated safety. Following are the hazard zone in the fuel cell container: ☐Electrical cabinets (MCU, AUX,breakers) ☐Fuel' container built (inside and outside) ☐DC/DC panels for fuel cell output ☐Raised floor ☐Container ventilation system ☐Fuel cell, H2 enclosure ventilation extension and exhaust (internal) ☐External exhaust ☐Crane ☐Hydrogen supply 2) Cooling System: This part consists of risks involved in 2 HT radiators dimensioned for the specific site, 2 HT pump systems, 1 LT pump system, piping/valves/vessels and a cooling control panel/cabinets. Following are the hazard zones in the cooling system:		

Project note	☐Cooling platforms (HT & LT) ☐Pipings/valves/vessels ☐HT cooling radiators ☐HT pumps ☐Electrical cabinets ☐Inverter cabinets ☐Modem box (removable) ☐LT cooling radiators 3) Main Power output container: This part consists of risks involved in microgrid DC/AC, microgrid transformer, microgrid main breaker. Following are the hazard zones in the main power output container: ☐Electrical cabinets ☐Ventilation for power output container ☐Transformer ☐AC power connection (customer interface) ☐Main panel and control panel for power output container ☐Main power output container Besides, we have 2 interfaces are also added in the risk assessment: 1) Fuel cell container<...> Main power output container: This part consists of risks involved in the connections between two containers. Following are the hazard involved in this interface: ☐Interconnecting bridge between containers ☐Interconnection of power cables 2) Fuel cell container<...> Cooling: This part consists of risks involved in the connections between fuel cell containers and cooling. Following are the hazard involved in this interface: ☐Connecting parts (40' and cooling skid)

Limits of the machine

Intended use

The FC PowerGen system acts as a grid following power generator, providing up to 1MW at 6.6kVAC 50Hz. This system is designed and is intended to be used for offshore stationery application (fixed installed system). Hydrogen supply to the system is in the customer scope and the details about the hydrogen standards, quality etc are mentioned in the integration and other manuals that will be provided to the customers. The customer local Power Management System (PMS) requests the amount of power to be generated within the given dynamic and capacity limits of the system, which are communicated in real-time on the Modbus TCP/IP. The Modbus data is transported between the system and the PMS. The system have multiple operating data available on the same Modbus, including alarms.The FC Power Gen is placed in operation by request from PMS via Modbus, and similarly can be stopped, if necessary, which will stop power supplying the to the grid. The system can be stopped remotely on request. During normal operation, a power request of 0 is accepted by the system.

Dynamic Properties:

In order to match the response (ramping) time of the fuel cells in the FC PowerGen load should be managed as following:

Load increase ramp: Load is requested by the customer and the module/modules start up to deliver the power as demanded. One fuel cell modules takes approx 30 secs to ready to deliver the power.

Block loading can be accommodated in steps below 200 kW, with a minimum of 90 seconds between each step.
Calculated Maximum Power (CMP):
Range is 0 to 1000 kW. CMP will dynamically provide the maximum available power from the Megablock under current running conditions. The value will typically be 1000 kW.

In the following situations the CMP may be reduced:

☐ One or more fuel cells are out of service due to error or maintenance. This will reduce the CMP in steps of around 180kW.
☐ High temperature or other conditions which reduce the total capacity due to derating.
☐ Complete stop due to system failure, loss of hydrogen or remote stop from Customer control system. This will reduce CMP to 0kW

Reasonably foreseeable misuse

☐ Untrained personnel working on the system.
☐ Personnel working on the system not following proper instructions declared in the Ballard manuals
☐ Hydrogen handling: quality/temperature/pressure not aligned with the standards declared in the Ballard manuals.
☐Water/glycol mixture handling: the concentration and quality not aligned with the specification declared in the manuals.
☐System in operation without following Ballard service schedule and service bulletins.
☐Cleaning of containers from outside using high pressure water spray guns could possibly damage paint and other components.
☐Process air and/or ventilation air blocked.
☐Operation out of environmental ranges in the Ballard manuals.
☐Load ramping up/down abruptly or not according to the instruction provided.
☐Transportation of the system without proper preservation initiatives including transport safety measures.

Space limits

Space limits are defined as per the general arrangement layout drawing attached.(601456B-7 Rev007)

Time limits

Expected lifetime of the system: 10 years if maintained according to the Ballard service manual instructions.

Other limits

☐The system is designed to operate in seismic zone lower than 0.1 m/s2 according to European norm EN1998-1

The ventilation system will also create a flow through the container, for cooling and ventilating the room. The container inside is kept at a small overpressure to prevent ingress of dust or fumes from the outside. The DC/DC panels for fuel cell output in the container connect each FC wave to a common DC link busbar. Each DC/DC panel for fuel cell output can be isolated electrically, to allow for maintenance on the specific cabinet or related FC wave. The system controller is a centralized unit that monitors and operates the entire FC Power Gen system and include a separate safety controller to prevent any critical failure or emergency situations to escalate. The power for auxiliary units such as water pumps, container ventilation and basic power is fed from a 400V AUX power panel during shut down. Customer interface container The customer interface container provides the main output AC power to the customer output. The DC power from the fuel cell container converts into 50Hz AC through the DC/AC output converter located in the customer interface container. This converter is further connected to the isolation transformer and main breakers for the customer connections. The container doors are prevented from opening during operationt. Access is restricted to instructed and trained personnel, and only after a safety procedure is followed, which will de-energize the container to a safe mode. Cooling Unit The purpose of the high-temperature (HT) cooling system is to dissipate the heat generated by the fuel cells. It is an open unpressurized system with an open header tank for volume changes due to temperature. The purpose of the Low-Temperature (LT) cooling system is to provide cooling for power electronics. Like HT, it is also an open unpressurized system with an open header tank for volume changes due to temperature.		

	Functional Modes Shut down The hydrogen supply is manually isolated from the container. The container will be internally heated to keep temperature above freezing. Light and service plugs are available in the container, and the controller can be accessed by the customer. Stand.by The hydrogen supply is available to the fuel cell container when needed. Availability of hydrogen at an allowable pressure is provided by the customer hydrogen supply system. Loss of the hydrogen signal or hydrogen pressure error will place the FC Power Gen system in failure state. The FC Power Gen hydrogen manifold is closed. The main breaker of the customer grid is disconnected by the control system. The container will be internally heated to keep temperature above freezing. Light and service plugs are available in the container, and the controller can be accessed by the communication interface.If the FC Power Gen system receives an operating signal and no failures are observed, the FC Power Gen will go to operating state and perform a start-up. Operating The hydrogen supply is available to the fuel cell container. Availability of hydrogen at allowable pressure is provided by the customer hydrogen supply system. Loss of hydrogen signal or hydrogen pressure error will place the FC PowerGen system in failure state.The main breaker of the customer grid is controlled by the control system. The normal operating condition is the FC PowerGen operating and producing, where the main breaker is closed and the FC PowerGen system supporting the microgrid. .If the producing signal is removed, the FC Power Gen will open the main customer grid breaker and then perform a controlled shutdown going back to stand-by mode. The current available power is continuously signaled to the customers power management system together with various operating data. It is the responsibility of the customers power management system to avoid overloading the customer grid, e.g., by managing allowable consumers on the customer grid.The FC Power Gen system will allow for a FC wave fuel cell unit to be out due to service or failure, and continue supporting the customer grid with remaining fuel cells, at a lower available power level. If a critical error is seen by the FC Power Gen control system, the system will shut down to failure mode. Failure When an error that require the FC Power Gen to shut down is identified, the system will enter into one of the following states: • Emergency shutdown will immediately stop hydrogen supply and disconnect the FC power Gen from the customer grid. The FC Power Gen will remain in failure mode until the necessary action has been taken to rectify the error condition and the state has manually been cleared. The network connection will provide error data and engineering access for analyzing and correcting the error condition.
Type	601456B Crosswind BLPH
Order	601456B

Safexpert risk graph

V = Value (0 - 10):
0 = Lowest Risk
10 = Highest Risk
SH = Severity of the harm:
N = no injury
SL = slight injury
SE = serious injury
D = death
DS = Duration of stay in hazard zone:
R = rarely to more often
O = often to continuously
RA = Possibility of recognition and avoidance:
P = Possible under certain circumstances
H = Hardly possible
PO = Probability of occurence:
SM = Small (improbable)
MI = Middle (probably occur a number of times during the life)
HI = High (happen often)

Complete solution

1 - Mechanical hazards

in all phases of the "life"

Hazard description

The mechanical hazards of the complete solution are described in detail in the subprojects and interface risk assessments.

Risk assessment and risk reduction

	0	Risk IN: SH: Slight injury, RA: Possible under certain circumstances, PO: Small			
1	ISD	Measures are presented in the subprojects along with the risks.	PLr / SILr	PL / SIL	Applied documents
	0	Risk OUT: SH: No injury, PO: Small			

Risk adequately reduced ☑ No ☐ Yes

2 - Electrical hazards

in all phases of the "life"

Hazard description

The electrical hazards of the complete solution are described in detail in the subprojects and interface risk assessments.

Risk assessment and risk reduction

	0	Risk IN: SH: No injury, PO: Small			
1	ISD	Measures are also presented along with risks in the subprojects risk assessments.	PLr / SILr	PL / SIL	Applied documents
	0	Risk OUT: SH: No injury, PO: Small			

Risk adequately reduced ☑ No ☐ Yes

3 - Thermal hazards

in all phases of the "life"

Hazard description

The thermal hazards of complete solution are described in detail in the subprojects and interface risk assesments.

Risk assessment and risk reduction

	0	Risk IN: SH: No injury, PO: Small			
1	ISD	Measures are presented along with risk assesment in the subprojects and interfaces.	PLr / SILr	PL / SIL	Applied documents
	0	Risk OUT: SH: No injury, PO: Small			

Risk adequately reduced ☑ No ☐ Yes

4 - Noise hazards

in all phases of the "life"

Hazard description

The noise hazards of complete solution are described in detail in the subprojects and interface risk assesments.

Risk assessment and risk reduction

	0	Risk IN: SH: No injury, PO: Small			
1	ISD	Measures are presented along with risks in the subprojects and interfaces risk assesments.	PLr / SILr	PL / SIL	Applied documents

Fuel Cell Container,40'

Limit of the product: Use-, space-, time- and other limits

Container ventilation system

1 - Mechanical hazards

1.3 - crushing

in all phases of the "life"

Hazard description

Risk of crushing individual fingers from all louver dampers inside the container.

Risk assessment and risk reduction

	1	Risk IN: SH: Serious injury, DS: Rarely to more often, RA: Possible under certain circumstances, PO: Small			
1	PIC	Caution label indicating risk of crush on all louvre dampers inside the container.	PLr / SILr	PL / SIL	Applied documents
	0	Risk OUT: SH: No injury, PO: Small			

Risk adequately reduced ☐ No ☑ Yes Chaudhary Hijab 20-08-2024

1 - Mechanical hazards

1.4 - cutting or severing

Malfunctioning

Hazard description

Ventilator failure leading to overpressure in the container (700 pa) that could possibly result in the opening of doors unintended and that rapid opening could lead to the personnel damage.

Risk assessment and risk reduction

	4	Risk IN: SH: Serious injury, DS: Often to continuously, RA: Hardly possible, PO: Small			
1	SCP	DP Sensor will detect the overpressure and make an error in the SW.	PLr / SILr	PL / SIL	Applied documents
	0	Risk OUT: SH: Slight injury, RA: Possible under certain circumstances, PO: Small			

Risk adequately reduced ☐ No ☑ Yes Chaudhary Hijab 12-08-2024

Crane

1 - Mechanical hazards

1.3 - crushing

Maintenance

Hazard description

Moving FC wave and power electronics equipment IN/OUT during maintenance with crane operation. Errors in those crane operation could possibly result in personnel damage.

Risk assessment and risk reduction

	5	Risk IN: SH: Death, DS: Rarely to more often, RA: Possible under certain circumstances, PO: Small			
1	SCP	Proper marking and fences during crane operations to be arrange(	PLr / SILr	PL / SIL	Applied documents
	1	Risk OUT: SH: Serious injury, DS: Rarely to more often, RA: Possible under certain circumstances, PO: Small

Risk adequately reduced ☑ No ☐ Yes

Fuel cell container built (Inside/Roof)

1 - Mechanical hazards

1.3 - crushing

Maintenance

Hazard description

Fans filter replacement requires their unassembly. During the unassembly, there is a risk of crushing due to the heavy weight of the fans. Also, during reassembly, if the screws are not tightened properly the fans won't be adjusted at their place properly and could possibly fall down. Personnel standing/working down the container could potentially get severely injured.

Risk assessment and risk reduction

	1	Risk IN: SH: Serious injury, DS: Rarely to more often, RA: Possible under certain circumstances, PO: Small			
1	SCP	Only trained personnel to be working on maintenance.	PLr / SILr	PL / SIL	Applied documents

Declaration of Conformity

As manufacturer, Ballard Power Systems Europe A/S, Majsmarken 1, 9500 Hobro, Denmark, hereby declares that the product(s) mentioned below:

Product no. and name:

Product no.: **7001000** Product name: **FCwave**
Product Designation: **Fuel Cell Power System**

Complies with the requirements of the following Union harmonized legislation, standards and specifications:

Legislation:

- Machinery Directive (2006/42/EC)
- Electromagnetic Compatibility Directive (2014/30/EU)
- RoHS (2011/65/EU)

References:

Directive	Standard	Description
MD	EN 62282-3-100:2020	Fuel cell technologies - Part 3-100: Stationary fuel cell power systems - Safety
EMC	EN 61000-6-2:2019	Electromagnetic compatibility (EMC) – Part 6-2: Generic standards – Immunity standard for industrial environments
EMC	EN 61000-6-4:2019	Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments
RoHS	EN IEC 63000:2018	Technical documentation for the assessment of electrical and electronic products with respect to the restriction of hazardous substances

Additional:

This declaration is only valid as long as the service and maintenance instructions for the product is followed, and the product is not modified.

The pressurized equipment in the product is out of scope for the PED directive 2014/68/EU, as it is covered by article 4, section 3. Hence the PED directive is not listed.

Declaration of Conformity

Ballard Power Systems Europe A/S, Majsmarken 1, 9500 Hobro, Denmark hereby declares that the product(s) mentioned below:

Product no. and name:

Product no.: **601456B-7002362** Product name: **FC PowerGen 1000kW**
Product designation: **Stationary Fuel Cell Power System**

Complies with the requirements of the following directives and standards:

Accessories/sub-assemblies:
The following accessories/sub-assemblies are also cowered by this DoC (If any):

Product no.:	**601456B-7002362**	Product name:	**40ft Fuel Cell Container**
Product no.:	**601456B-7002973**	Product name:	**Cooling unit**
Product no.:	**601456B-7003716**	Product name:	**10ft Converter container**

Directives:

- Machinery Directive (2006/42/EC)
- Pressure equipment (2014/68EU)
- ATEX Directive (2014/34/EU)
- Low voltage Directive (2014/35/EU)
- Electromagnetic Compatibility (EMC) (2014/30/EU)

Additional:

This declaration is only valid as long as the service and maintenance instructions for the product is followed, and the product is not modified.
Hydrogen Manifold compliance to PED is covered by K599-2254-CWIWP4202202-K01-003.

1.0 Executive Summary

The document will contain a walkthrough of the analysis of Pressure equipment directive compliance accordingly to 2008/68/EU. The analysis concluded that the maximum pipe diameter is a DN32 and a pressure of 6,5 Barg. Due to this the conformity category is "category 1" which leads to "Module A" conformity assessment procedure. Documentation according to this is described, and/or combined in a PED dossier to verify compliance with PED module A.

4.0 Purpose

The following document will contain the PED analysis of the H2 manifold as an add on part to the FC PowerGen 1000kW®. The document is created based on the process described in the PED 2014/68/EU

The following part which is not a part of the document 550002 and will be covered by this PED statement: **DN32 H2 collector manifold**

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

5.2 Analysis of conformity category.

According to article 4 section C, the category for Fluida groupe 1 is defined in following table 6 in the PED shown in Figure 1.

Figure 1: Conformity category PED 2008/68/EU Tabel 6

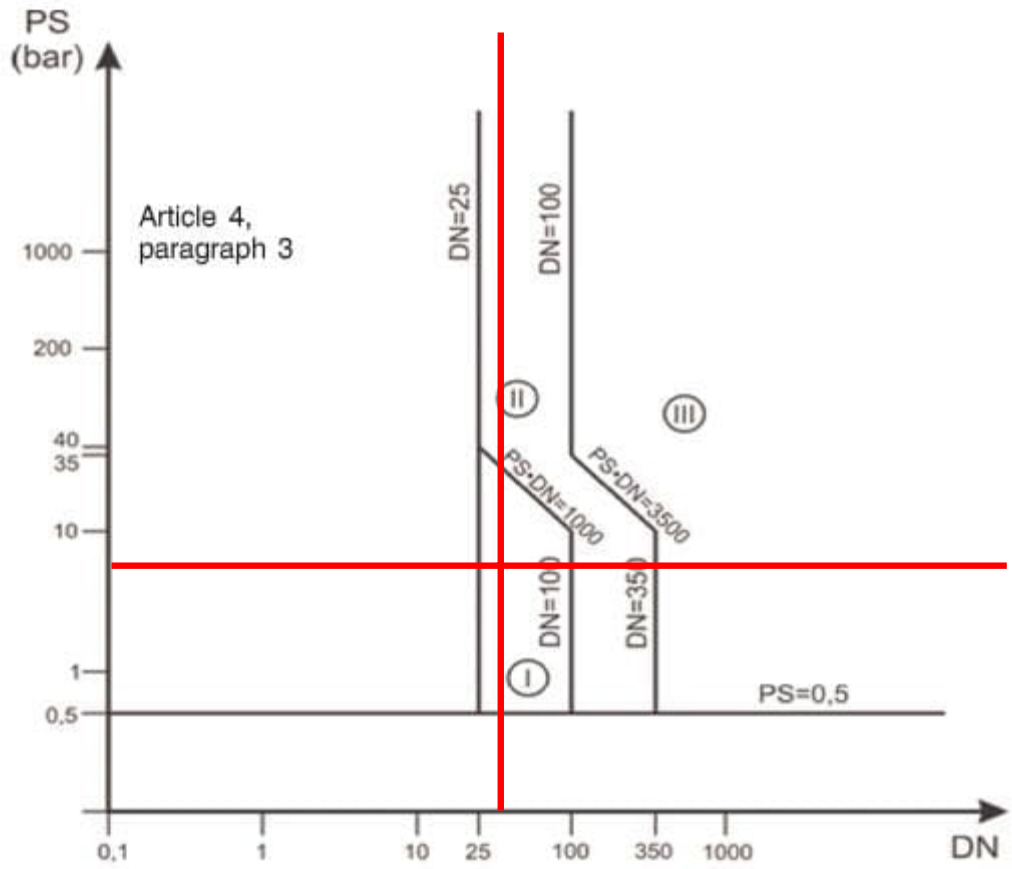

Table 6

Piping referred to in Article 4(1)(c)(i), first indent

The Red lines is an approximate line of the Size and pressure of the part. The intersection will define the point defining the category.

As visualized in the Figure 1, the category applicable for the part will be **Category 1.** As shown in the diagram from PED Annex II section 1. The "Conformity group I" will refer to a "module A" Conformity assessment procedure according to PED Annex III. The following procedure will be described in the following sections of this document.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

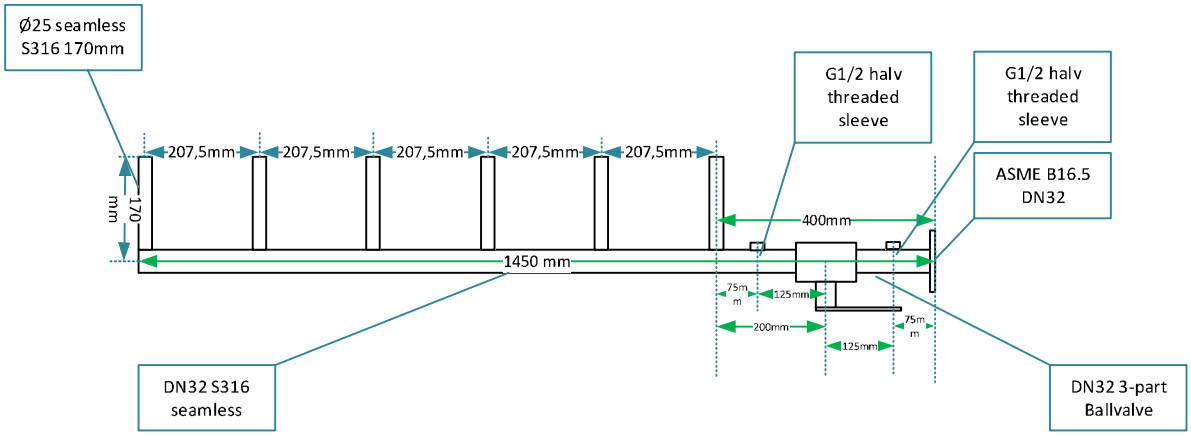
6.0 Technical documentation



6.1 General description of the product

The product is a hydrogen manifold capable of distributing hydrogen from a single input into 6 independent outputs. The product contains an ASME B16.5 flange for connecting the input. A DN32 pipe with 25mm branches all in stainless steel. There is installed a 3-part welded ball valve type DVC 131150032 suitable for hydrogen 6,5 Barg. The valve is for manually blocking the hydrogen supply during e.g. service.

The product may not be installed in applications where a non-sufficient pressure relief valve set to 10 Barg is not installed.

6.2 Drawings of the Construction

Figure 2: Technical drawing of H2 Manifold

6.3 Results of construction calculations and examination

As the part is not relying on any structural strength since the pipe is not holding any weight, the only relevant construction is the pipe pressure rating. The following pipes are used:

- DN32 42.40x2.00mm EN-10216-5 1.4401/1.4404 TC2 pressure tested to 1500 PSI
- 25.00x2.00mm EN-10216-5 TC2 A269 213 pressure tested to 199 Barg

Further Certificates on welds and parts for the manifold will be in a separate file. And is done according to the "module A" requirements

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

6.4 Inspection and test

6.4.1 Hydrogen pressure test

The hydrogen manifold has gone through several tests to verify the tightness of the system, even though the material used for manufacturing the hydrogen manifold is higher than the intended maximum pressure of the Hydrogen manifold.

To sum up the test:

- Individual test of component (document not released. Procedure according to 62282-3-100:2020 section 6.2 Leakage test)
- Complete assembly test Formier gas 5% H2 (document not released. Procedure according to 62282-3-100:2020 section 6.2 Leakage test and SPC ID 0104)
- Complete test pure H2 (document not released. Procedure according to 62282-3-100:2020 section 6.2 Leakage test and SPC ID 0104)

6.4.2 Welding testing

The following welds on the hydrogen manifold has been tested according to the certificates included in the Certificate dossier.

DEKRA

1 # EU-Baumusterprüfbescheinigung

2 **Richtlinie 2014/34/EU des Europäischen Parlaments und des Rates vom 26. Februar 2014**

3 Nr. der EU-Baumusterprüfbescheinigung: **BVS 08 ATEX E 109 U** Ausgabe: **01**

4 Komponente: **Kabeldosen und -stecker Typ EVC** A**

5 Hersteller: **ifm electronic gmbh**

6 Anschrift: **Friedrichstraße 1, 45128 Essen, Deutschland**

7 Die Bauart dieses Produktes sowie die verschiedenen zulässigen Ausführungen sind in der Anlage zu dieser Baumusterprüfbescheinigung festgelegt.

8 Die Zertifizierungsstelle der DEKRA Testing and Certification GmbH, benannte Stelle Nr. 0158 gemäß Artikel 17 der Richtlinie 2014/34/EU des Europäischen Parlaments und des Rates vom 26. Februar 2014, bescheinigt, dass das Produkt die wesentlichen Gesundheits- und Sicherheitsanforderungen für die Konzeption und den Bau von Produkten zur bestimmungsgemäßen Verwendung in explosionsgefährdeten Bereichen gemäß Anhang II der Richtlinie erfüllt.
Die Ergebnisse der Prüfung sind in dem vertraulichen Prüfprotokoll BVS PP 08.2137 EU niedergelegt.
Diese Ausgabe der EU-Baumusterprüfbescheinigung ersetzt die bisherige Ausgabe der EG-Baumusterprüfbescheinigung BVS 08 ATEX E 109 U inklusive der Nachträge 1 bis 2.

9 Die Einhaltung der Grundlegenden Sicherheits- und Gesundheitsanforderungen wurde überprüft durch Berücksichtigung von:

EN IEC 60079-0:2018	**Allgemeine Anforderungen**
EN IEC 60079-7:2015 + A1:2018	**Erhöhte Sicherheit „e“**
EN 60079-31:2014	**Schutz durch Gehäuse „t“**

10 Das Zeichen „U“ hinter der Zertifikatsnummer weist darauf hin, dass dieses Zertifikat nicht mit Zertifikaten für Geräte oder Schutzsysteme verwechselt werden darf. Diese Teilzertifizierung kann als Grundlage für die Zertifizierung eines Geräts oder Schutzsystems verwendet werden. Die „Einschränkungen für die Verwendung“ ist unter Punkt 17 dieser Bescheinigung aufgeführt.

11 Diese EU-Baumusterprüfbescheinigung bezieht sich nur auf den technischen Entwurf des angegebenen Produkts gemäß der Richtlinie 2014/34/EU.
Weitere Anforderungen der Richtlinie gelten für den Herstellungsprozess und die Bereitstellung dieses Produkts. Diese sind nicht Gegenstand der Zertifizierung.

12 Die Kennzeichnung des Produktes muss die folgenden Angaben enthalten:

13 **Anlage zur**

14 **EU-Baumusterprüfbescheinigung**

BVS 08 ATEX E 109 U Ausgabe 01

15 **Beschreibung des Produktes**

15.1 **Gegenstand und Typ**

Kabeldosen und -stecker Typ EVC**A

** - Kabellänge (0,1 ...100 m)

15.2 **Beschreibung**

Die 90° abgewinkelten M12 Kabeldosen Typ EVC0*A haben 4 Kontakte und ein angespritztes 4-adriges Kabel. Sie sind mit einer Edelstahl-Überwurfmutter versehen, die zur mechanischen Befestigung des Kabels an den Betriebsmitteln verwendet wird. Die Fixierung wird über eine spezielle Befestigungstechnik sichergestellt, die über eine Rasterung ein ungewolltes Lösen der Mutter verhindert. Die Kabeldosen und -stecker Typ EVC**A sind in der Zündschutzart Erhöhte Sicherheit „ec" und Schutz durch Gehäuse „tb" ausgeführt.

Grund für diese Ausgabe

- Umstellung auf die Richtlinie 2014/34/EU
- Aktualisierung der Normen EN IEC 60079-0:2018 und EN 60079-31:2014, sowie Umstellung von EN 60079-15:2010 auf EN IEC 60079-7:2015+A1:2018.

15.3 **Kenngrößen**

Bemessungsspannung		AC/DC 60 V
Stromtragfähigkeit		2 A
Umgebungstemperaturbereich	-	20 °C ≤ T_a ≤ 60 °C
Anzugsdrehmoment der Überwurfmutter		1,2… 1,5 Nm

16 **Prüfprotokoll**

BVS PP 08.2137 EU, Stand 17.02.2023

17 **Einschränkungen für die Verwendung**

Die Kabeldosen und -stecker müssen an ein metallisches Gegenstück angeschlossen werden, das die IP-Anforderungen gemäß EN IEC 60079-7 und EN 60079-31 erfüllt und eine M12-Größe hat.

Die Kabeldosen und -stecker müssen gegen eine Schlagenergie > 4 J geschützt sein.

Die Kabeldosen und -stecker müssen gegen UV-Licht geschützt sein.

Die Kontermutter muss mit einem Anzugsmoment von 1,2...1,5 Nm angezogen werden.

Die Kabel sind fest zu verlegen und gegen mechanische Beschädigungen zu schützen.

Translation

1 # EU-Type Examination Certificate

2 **Directive 2014/34/EU of the European Parliament and of the Council of 26 February 2014**

3 EU-Type Examination Certificate Number: **BVS 08 ATEX E 109 U** Issue: **01**

4 Component: **Sockets and plugs type EVC**A**

5 Manufacturer: **ifm electronic gmbh**

6 Address: **Friedrichstraße 1, 45128 Essen, Germany**

7 This product and any acceptable variations thereto are specified in the appendix to this certificate and the documents referred to therein.

8 DEKRA Testing and Certification GmbH, Notified Body number 0158, in accordance with Article 17 of Directive 2014/34/EU of the European Parliament and of the Council, dated 26 February 2014, certifies that this product has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of products intended for use in potentially explosive atmospheres given in Annex II to the Directive.
The examination and test results are recorded in the confidential Report No. BVS PP 08.2137 EU.
This issue of the EU-Type Examination Certificate replaces the previous issue of the EC-Type Examination Certificate BVS 08 ATEX E 109 U including supplements 1 to 2.

9 Compliance with the Essential Health and Safety Requirements has been assured by compliance with:

EN IEC 60079-0:2018	**General requirements**
EN IEC 60079-7:2015 + A1:2018	**Increased Safety "e"**
EN 60079-31:2014	**Protection by Enclosure "t"**

10 The sign "U" placed behind the certificate number indicates that this certificate should not be confounded with certificates issued for equipment or protective systems. This partial certification may be used as a basis for certification of an equipment or protective systems. "Schedule of limitations" is listed under item 17 of this certificate.

11 This EU-Type Examination Certificate relates only to the technical design of the specified product in accordance to the Directive 2014/34/EU. Further requirements of the Directive apply to the manufacturing process and supply of this product. These are not covered by this certificate.

12 The marking of the product shall include the following:

II 2D Ex tb IIIC Db
II 3G Ex ec IIIC Gc

DEKRA Testing and Certification GmbH

13 **Appendix**

14 **EU-Type Examination Certificate**

BVS 08 ATEX E 109 U issue 01

15 **Product description**

15.1 **Subject and type**

Sockets and plugs type EVC**A

**-length of cable (0.1 ...100 m)

15.2 **Description**

The 90° angled M12 sockets type EVC0*A have 4 pins and a potted 4-wire cable. They are equipped with a stainless steel lock nut to fasten the socket at the equipment. A special fastening technique protects against unintended loosening. The plugs and sockets type EVC**A are built in type of protection Increased Safety “ec” and Protection by Enclosure “tb”.

Reason for this issue

- Change to Directive 2014/34/EU
- The reason of the supplement is the updating to the standards EN IEC 60079-0:2018 and EN 60079-31:2014, as well as change from EN 60079-15:2010 to EN IEC 60079-7:2015+A1:2018.

15.3 **Parameters**

Rated voltage AC/DC	60 V
Current carrying capacity	2 A
Ambient temperature range	-20 °C ≤ T_a ≤ 60 °C
Tightening torque of lock nut	1.2… 1.5 Nm

16 **Report Number**

BVS PP 08.2137 EU, as of 2023-02-17

17 **Schedule of limitations**

The sockets have to be connected to a metallic counterpart which meets the IP requirements according to EN IEC 60079-7 and EN 60079-31 which has a M12 size.

The sockets have to be protected against an impact energy > 4 J.

The sockets have to be protected against UV emitting light.

The lock nut has to be fastened with a tightening torque of 1.2…1.5 Nm.

The cables have to be installed in a fixed manner and have to be protected against mechanical damage.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

18 **Essential Health and Safety Requirements**

Met by compliance with the requirements mentioned in item 9.

19 **Remarks and additional information**

Drawings and documents are listed in the confidential report.

We confirm the correctness of the translation from the German original.
In the case of arbitration only the German wording shall be valid and binding.

4.3 BP01 – Pressure Sensor, 520 Series

[This page intentionally left blank.]

eurofins | E&E

EU-Type Examination Certificate

(1)

(2) Equipment or protective system intended for use in potentially explosive atmospheres **- Directive 2014/34/EU**

(3) Certificate number: **SEV 10 ATEX 0145**

(4) Product: Pressure transmitter, Types: 520.*, 522.*, 527.*, 528.*

(5) Manufacturer: Huba Control AG

(6) Address: Industriestrasse 17, 5436 Würenlos, Switzerland

(7) The equipment and any acceptable variation thereto is specified in the schedule to this certificate and the documents therein referred to.

(8) Eurofins, notified body No. 1258, in accordance with article 17 of Directive 2014/34/EU of the European parliament and of the council, dated 26 February 2014, certifies that this product has been found to comply with the essential health and safety requirements relating to the design and construction of products intended for use in potentially explosive atmospheres given in Annex II to the Directive.
The examination and test results are recorded in confidential report no 21CH-00562.X04

(9) Compliance with the essential health and safety requirements has been assured by compliance with:

EN IEC 60079-0:2018
EN 60079-11:2012
EN 60079-26:2015

Except in respect of those requirements listed at item 18 of the schedule.

(10) If the sign «X» is placed after the certificate number, it indicates that the product is subjected to special conditions for safe use specified in the schedule to this certificate. The sign "U" is placed after the certificate number. It indicates that this certificate must not be mistaken for a certificate intended for an equipment or protective system. This partial certification may be used as a basis for certification of an equipment or protective system.

(11) This EU type examination certificate relates only to design and construction of the specified product. Further requirements of this directive apply to the manufacturing process and supply of this product. These are not covered by this certificate.

(12) The marking of the product shall include the following:

(13) # Appendix

(14) **EU-Type Examination Certificate no. SEV 10 ATEX 0145**

(15) **Description of product**

The pressure transmitter is used to measure relative and absolute pressure of gases, liquids and refrigerants (incl. ammonia). The pressure transmitter differ in the pressure measuring cell and the pressure range. For the measuring of the pressure the signal of a pressure measuring cell made of stainless steel (type 520.* / 522.*) or made of ceramic (type 527.* / 528.*) with a membrane is converted into a 4…20 mA output signal by the electronic.
The pressure transmitter can be installed in the partition which separates the area, which requires apparatus of category 1 from the area, which requires apparatus of category 2. The pressure measuring cell may be used only for flammable substances for which the membranes of cells are sufficiently chemically and corrosion resistant.
Effective internal inductance and capacitance for versions with plugs complying with EN 175301-80 A (IP65) or M12x1 (IP67)

Classification of installation and use:	stationary
Ingress protection:	IP65 with connector EN 175301-803A IP67 with connector M12x1
Rated ambient temperature range (°C):	-25 °C ≤ Tamb ≤ +85 °C
Rated medium temperature range (°C):	-30 °C … +120 °C
Rated ambient temperature range (°C) for Ex Components:	N/A

Ratings:
Connection to certified intrinsically safe resistive circuits with maximum values:

Ui ≤ 30 V
Ii ≤ 100 mA
Pi ≤ 750 mW
Ci = 0 nF
Li = 0 µH

Output:
4 … 20 mA

13 **Anlage zur**

14 **EU-Baumusterprüfbescheinigung**

BVS 11 ATEX E 009 X Ausgabe 01

15 **Beschreibung des Produktes**

15.1 **Gegenstand und Typ**

Steckverbinder Typ ENC**A

In der vollständigen Bezeichnung werden anstelle der ** Ziffern eingefügt, die Änderungen kennzeichnen wie: Art des Kabels, Länge des Kabels, Konstruktion gerade oder gebogen.

15.2 **Beschreibung**

Der Steckverbinder wird bei eigensicheren Geräten für den Anschluss der eigensicheren Stromkreise verwendet.
Die Steckdose ist ein einfaches elektrisches Betriebsmittel.
Der Steckverbinder hat ein fest angeschlossenes Kabel und ist konstruktionsbedingt in der Lage, zwei verschiedene eigensichere Stromkreise bis zu einer Summe von Spannungen von 30 V zu führen; in diesem Fall muss das Kabel wirksam gegen Beschädigung geschützt werden.

Grund für diese Ausgabe:

- Umstellung auf die Richtlinie 2014/34/EU
- Aktualisierung der Norm EN IEC 60079-0:2018
- Modifikation des Umgebungstemperaturbereichs
- Erweiterung der "Besondere Bedingungen für die Verwendung"

15.3 **Kenngrößen**

Spannung	U_i	DC	30	V
Strom	I_i		1	A
Leistung	P_i			
Für den Einsatz in Gruppe II			1	W
Für den Einsatz in Gruppe III			1	W
Umgebungstemperaturbereich (mit Ausnahme von IIIC)	T_a	-25 °C bis +75 °C / +85 °C		
Für Gruppe IIIC	T_a	-20 °C bis +60 °C		

Für Umgebungstemperaturen bis 75 °C sind die Sensoren als T6 bzw. T_{200} 85 °C klassifiziert (ausgenommen Gruppe IIIC).
Für Umgebungstemperaturen bis 85 °C sind die Sensoren als T5 bzw. T200 95 °C klassifiziert (ausgenommen Gruppe IIIC).

Der Steckverbinder darf zwei verschiedene eigensichere Stromkreise bis zu einer Summe der Spannungen von 30 V führen.

Die Werte der internen Kapazität und Induktivität hängen von der Länge des fest angeschlossenen Kabels ab und werden wie folgt berechnet:

Interne Kapazität	C_i	0,1 nF/m
Interne Induktivität	L_i	2 µH/m

16 **Prüfprotokoll**

BVS PP 11.2018 EU, Stand 06.09.2023

17 **Besondere Bedingungen für die Installation und den Betrieb**

17.1 Die Steckverbinder und das angeschlossene Kabel müssen so installiert werden, dass intensive elektrostatische Aufladung ausgeschlossen ist.

17.2 Aus Platzgründen kann die Kennzeichnung nicht vollständig auf dem Gerät angebracht werden. Die vollständige Kennzeichnung ist der Betriebsanleitung zu entnehmen.

17.3 Das Kabel und der Steckverbinder müssen fest verlegt und wirksam gegen mechanische Beschädigungen geschützt werden.

17.4 Für Gruppe IIIC:

- Der Betrieb des Steckverbinders ohne ein geeignetes M12-Gegenstück ist nicht zulässig. Das M12-Gegenstück muss die IP-Anforderungen nach IEC 60079-11 erfüllen.
- Beim Öffnen des Steckverbinders muss das Eindringen von Staub vermieden werden.
- Der Steckverbinder muss vor UV-Strahlung geschützt werden.
- Die Überwurfmutter muss mit einem Anzugsdrehmoment von 1,2...1,5 Nm angezogen werden.

18 **Wesentliche Gesundheits- und Sicherheitsanforderungen**

Erfüllt durch Einhaltung der unter Punkt 9 genannten Anforderungen.

19 **Zeichnungen und Unterlagen**

Die Zeichnungen und Unterlagen sind in dem vertraulichen Prüfprotokoll gelistet.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.

1 # EU-Type Examination Certificate

2 **Directive 2014/34/EU of the European Parliament and of the Council of 26 February 2014**

3 EU-Type Examination Certificate Number: **BVS 11 ATEX E 009 X** Issue: **01**

4 Equipment: **Socket type ENC**A**

5 Manufacturer: **ifm electronic gmbh**

6 Address: **Friedrichstraße 1, 45128 Essen, Germany**

7 This product and any acceptable variations thereto are specified in the appendix to this certificate and the documents referred to therein.

8 DEKRA Testing and Certification GmbH, Notified Body number 0158, in accordance with Article 17 of Directive 2014/34/EU of the European Parliament and of the Council, dated 26 February 2014, certifies that this product has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of products intended for use in potentially explosive atmospheres given in Annex II to the Directive.
The examination and test results are recorded in the confidential Report No. BVS PP 11.2018 EU.
This issue of the EU-Type Examination Certificate replaces the previous issue of the EC-Type Examination Certificate BVS 11 ATEX E 009 X including supplement 1.

9 Compliance with the Essential Health and Safety Requirements has been assured by compliance with:

EN IEC 60079-0:2018	**General requirements**
EN 60079-11:2012	**Intrinsic Safety "i"**

10 If the sign "X" is placed after the certificate number, it indicates that the product is subject to the "Specific Conditions of Use" listed under item 17 of this certificate.

11 This EU-Type Examination Certificate relates only to the technical design of the specified product in accordance with the Directive 2014/34/EU. Further requirements of the Directive apply to the manufacturing process and supply of this product. These are not covered by this certificate.

12 The marking of the product shall include the following:

II 1G Ex ia IIB T6 Ga **II 2G Ex ia IIC T6 Gb** **II 1D Ex ia IIIB T_{200}85°C Da** **for -25 °C ≤ T_a ≤ +75 °C**	**II 1G Ex ia IIB T5 Ga** **II 2G Ex ia IIC T5 Gb** **II 1D Ex ia IIIB T_{200}95°C Da** **for -25 °C ≤ T_a ≤ +85 °C**	**II 1D Ex ia IIIC T_{200}70°C Da** **for -20 °C ≤ T_a ≤ +60 °C**

13 **Appendix**

14 **EU-Type Examination Certificate**

BVS 11 ATEX E 009 X issue 01

15 **Product description**

15.1 **Subject and type**

Steckverbinder type ENC**A

In the complete denomination instead of the ** numerals will be inserted which characterize modifications as: kind of cable, length of cable, construction straight or bent.

15.2 **Description**

The socket is used as intrinsically safe apparatus for the connection of the intrinsically safe circuits.
The socket is a simple apparatus.
The socket has a permanently connected cable and is due to construction able to carry two different intrinsically safe circuits up to a sum of voltages of 30 V; in this case the cable must be effectively protected against damage.

Reason for this issue:

- Change to Directive 2014/34/EU
- Standards update EN IEC 60079-0:2018
- Modification of the ambient temperature range
- Extension of the "Special conditions for use"

15.3 **Parameters**

Voltage	U_i	DC	30	V
Current	I_i		1	A
Power	P_i			
For use in Group II			1	W
For use in Group III			1	W
Ambient temperature range (except IIIC)	T_a	-25 °C up to +75 °C / +85 °C		
For Group IIIC	T_a	-20 °C up to 60 °C		

For ambient temperatures up to 75 °C, the sensors are classified as T6 resp. T_{200} 85 °C (except Group IIIC).
For ambient temperatures up to 85 °C, the sensors are classified as T5 resp. T_{200} 95 °C (except Group IIIC).

The socket may carry two different intrinsically safe circuits up to a sum of voltages of 30 V.

The values of internal capacitance and inductance depend on the length of the permanently connected cable and be calculated as:

Internal capacitance	C_i	0.1	nF/m
Internal inductance	L_i	2	µH/m

16 **Report Number**

BVS PP 11.2018 EU, as of 2023-09-06

17 **Specific Conditions of Use**

17.1 The connectors and the connected cable must be installed in a way that an intensive electrostatic charge is excluded.

17.2 Due to space restriction the markings may not be applied completely to the unit. See operating instructions for the compete marking.

17.3 The cable and socket must be installed fixed and effectively protected against mechanical damage.

17.4 For Group IIIC:

- The operation of the sockets without a suitable M12 counterpart is not permissible.
  The M12 counterpart has to meet the IP requirements according to IEC 60079-11.
- When the socket is opened, the ingress of dust must be avoided.
- The sockets have to be protected against UV emitting light.
- The lock nut has to be fastened with a tightening torque of 1.2…1.5 Nm.

18 **Essential Health and Safety Requirements**

Met by compliance with the requirements mentioned in item 9.

19 **Remarks and additional information**

Drawings and documents are listed in the confidential report.

We confirm the correctness of the translation from the German original.
In the case of arbitration only the German wording shall be valid and binding.

CERTIFICATE

EU-Type Examination

(1)

(2) **Equipment or protective systems intended for use in potentially explosive atmospheres - Directive 2014/34/EU**

(3) EU-Type Examination Certificate Number: **DEKRA 11ATEX0244 X** Issue Number: **4**

(4) Product: **HART-Transparent Repeater, Types 9106B1A, 9106B1B, 9106B2A , 9106B2B and Types 9106A1A, 9106A1B, 9106A2A , 9106A2B**

(5) Manufacturer: **PR electronics A/S**

(6) Address: **Lerbakken 10, 8410 Rønde, Denmark**

(7) This product and any acceptable variation thereto is specified in the schedule to this certificate and the documents therein referred to.

(8) DEKRA Certification B.V., Notified Body number 0344 in accordance with Article 17 of Directive 2014/34/EU of the European Parliament and of the Council, dated 26 February 2014, certifies that this product has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of products intended for use in potentially explosive atmospheres given in Annex II to the Directive.

The examination and test results are recorded in confidential test report number NL/DEK/ExTR11.0097/04.

(9) Compliance with the Essential Health and Safety Requirements has been assured by compliance with:

EN IEC 60079-0 : 2018 **EN 60079-11 : 2012**

EN 60079-15 : 2019 **EN 60079-7 : 2015 + A1 : 2018**

except in respect of those requirements listed at item 18 of the Schedule.

(10) If the sign "X" is placed after the certificate number, it indicates that the product is subject to the Specific Conditions of Use specified in the schedule to this certificate.

(11) This EU-Type Examination Certificate relates only to the design and construction of the specified product. Further requirements of the Directive apply to the manufacturing process and supply of this product. These are not covered by this certificate.

(12) The marking of the product shall include the following:

II (1) G [Ex ia Ga] IIC/IIB/IIA
II (1) D [Ex ia Da] IIIC
I (M1) [Ex ia Ma] I

Date of certification: 23 June 2020

DEKRA

(13) **SCHEDULE**

(14) **to EU-Type Examination Certificate DEKRA 11ATEX0244 X** Issue No. **4**

(15) **Description**

HART-Transparent Repeater, Types 9106B1A, 9106B1B, 9106B2A, 9106B2B and Types 9106A1A, 9106A1B, 9106A2A, 9106A2B for rail mounting, are 24 V powered isolating barriers that serve as a repeater.
The repeater transfers the intrinsically safe 4 - 20 mA current signal (with HART communication) of either a loop powered transmitter or an active current source to a non-intrinsically safe 4 - 20 mA output signal (with HART communication).
The Repeater is supplied via terminals at the front of the module, or via Power Rail Type 9400.
Removable display module 4501 can be used for programming of the Repeater.

The HART-Transparent Repeater, Types 9106B*A, 9106A*A are one channel version and Types 9106B*B, 9106A*B are two channel version.

Ambient temperature range -20 °C to +60 °C.

Marking

The equipment marking may additionally include the code II 3 G Ex ec nC IIC T4 Gc.

Electrical data

All Repeater Types

Supply (terminals 31, 32 and rear contacts): U = 19,2 ... 31,2 Vdc.

Status-Relay output (terminals 33, 34):
U ≤ 32 Vac or 32 Vdc, I ≤ 0,5 Aac or I ≤ 1 Adc respectively.
If the Repeater is installed outside the hazardous area, the following data for the relay contacts apply: U ≤ 110 Vdc or 125 Vac, I ≤ 0,3 Adc or I ≤ 0,5 Aac respectively.

Outputs (terminals 11, 12 resp. 13, 14): I = 4 ... 20 mA.

For all circuits above: U_m = 253 Vac (max. frequency 400 Hz).

Repeater Types 9106B1A, 9106B1B, 9106B2A, 9106B2B

Loop current input (terminals 43, 44 resp. terminals 53, 54):
in type of protection intrinsic safety Ex ia IIC/IIB/IIA/IIIC/I, with following maximum values:
for Type 9106B1A and Type 9106B1B:
U_o = 27,5 V; I_o = 92,6 mA; P_o = 0,64 W;
C_o = 0,084 µF (IIC) or 0,67 µF (IIB) or 2,23 µF (IIA) or 3,94 µF (I) ;
L_o = 4,15 mH (IIC) or 16,59 mH (IIB) or 33,17 mH (IIA) or 54,42 mH (I);
L_o/R_o = 223 µH/Ω (IIB) or 447 µH/Ω (IIA) or 733 µH/Ω (I)

for Type 9106B2A and Type 9106B2B:
U_o = 25,3 V; I_o = 96 mA; P_o = 0,61 W;
C_o = 0,104 µF (IIC) or 0,818 µF (IIB) or 2,85 µF (IIA) or 4,74 µF (I);
L_o = 3,86 mH (IIC) or 15,43 mH (IIB) or 30,86 mH (IIA) or 50,64 mH (I).
L_o/R_o = 234 µH/Ω (IIB) or 468 µH/Ω (IIA) or 769 µH/Ω (I)
For group IIIC, the parameters of group IIB apply.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

DEKRA

(13) **SCHEDULE**

(14) **to EU-Type Examination Certificate DEKRA 11ATEX0244 X** Issue No. **4**

Current input (terminals 41, 42 resp. terminals 51, 52):
in type of protection intrinsic safety Ex ia IIC/IIB/IIA/IIIC/I, for connection to a certified intrinsically safe circuit, with following maximum values:
U_i = 30 V; I_i = 120 mA; P_i = 0,85 W; $_{Ci}$ = 2 nF; L_i = 0 µH;
U_o = 0 V; I_o = 0 mA; P_o = 0 mW.

Current input and Loop current input of one channel are not applied simultaneously.

Both channels (terminals 41...44 and terminals 51...54) are infallibly galvanically isolated from each other and from the non-intrinsically safe supply and output circuits

Combination of Loop current input of channel 1 (terminals 43, 44) and Current input of channel 2 (terminals 51, 52) in series, where terminal 43 is connected to terminal 51:
Loop current circuit (terminals 44 and 52) is in type of protection intrinsic safety Ex ia IIC/IIB/IIA/IIIC/I, with following maximum values:
for Type 9106B1A and Type 9106B1B:
U_o = 27,5 V; I_o = 92,6 mA; P_o = 0,64 W;
C_o = 0,084 µF (IIC) or 0,67 µF (IIB) or 2,23 µF (IIA) or 3,94 µF (I) ;
L_o = 4,15 mH (IIC) or 16,59 mH (IIB) or 33,17 mH (IIA) or 54,42 mH (I);
L_o/R_o = 223 µH/Ω (IIB) or 447 µH/Ω (IIA) or 733 µH/Ω (I)

for Type 9106B2A and Type 9106B2B:
U_o = 25,3 V; I_o = 96 mA; P_o = 0,61 W;
C_o = 0,104 µF (IIC) or 0,818 µF (IIB) or 2,85 µF (IIA) or 4,74 µF (I);
L_o = 3,86 mH (IIC) or 15,43 mH (IIB) or 30,86 mH (IIA) or 50,64 mH (I).
L_o/R_o = 234 µH/Ω (IIB) or 468 µH/Ω (IIA) or 769 µH/Ω (I)
For group IIIC, the parameters of group IIB apply.

Combination of both Current inputs (terminals 41, 42 resp. 51, 52) in series, where terminal 41 is connected to terminal 52:
Current input (terminals 42 and 51) is in type of protection intrinsic safety Ex ia IIC/IIB/IIA/IIIC/I, for connection to a certified intrinsically safe circuit, with following maximum values:
U_i = 30 V; Ii = 120 mA; Pi = 0,85 W; C_i = 4 nF; L_i = 0 µH;
U_o = 0 V; I_o = 0 mA; P_o = 0 mW.

Installation instructions

The instructions provided with the product shall be followed in detail to assure safe operation.

(16) **Report Number**

No. NL/DEK/ExTR11.0097/04.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

DEKRA

(13) **SCHEDULE**

(14) **to EU-Type Examination Certificate DEKRA 11ATEX0244 X** Issue No. **4**

(17) **Specific conditions of use**

The HART Transparent Repeater shall be installed in a controlled environment with suitably reduced pollution, limited to pollution degree 2 or better.

The non intrinsically safe circuits shall be limited to overvoltage category I/II as defined in EN 60664-1.

If the HART-Transparent Repeater is installed in an explosive atmosphere where the use of apparatus of equipment category 3 G is required, the following specific conditions of use apply:

The HART Transparent Repeater shall be installed in an enclosure in type of protection Ex n or Ex e, providing a degree of protection of at least IP54. Cable entry devices and blanking elements shall fulfil the same requirements.

Removable Display Module 4501, when connected to the Repeater, may not be damaged and shall be free of dust and moisture.

(18) **Essential Health and Safety Requirements**

Covered by the standards listed at item (9)

(19) **Test documentation**

As listed in Report No. NL/DEK/ExTR11.0097/04.

(20) **Certificate history**

Issue 1 -	214940700	initial certificate
Issue 2 -	215635200	changes to the construction and standards update
Issue 3 -	219950900	changes to the electrical data
Issue 4 -	224396500	assesed per latest edition of the standards addition of 9106Axx models

(13) SCHEDULE

(14) **EC TYPE EXAMINATION CERTIFICATE No ISSeP08ATEX008X**

(15) Description of the equipment :
Electrical heating apparatus allotted to the heating of inert liquids and gases. This apparatus bears the type designation D-8640 and consists of:

- a certified flameproof connection box
- certified electrical heating elements
- a manually rearmed protective device

The length "H" (to see drawing 953.D8640-01) required to not exceed the temperature limit of 80°C inside the connection box in accordance with the different temperature classes is listed in the here-below table

Temperature class	Length "H" (mm)
T6	50
T5	75
T4	100
T3	150
T2	200
T1	250

Remark :
When the heating elements are fitted on the bottom plate of the housing, the temperature is limited by a safety thermostat and an additional marking is foreseen for the cables (to see drawing 953.D8521-04)

Temperature classes

TEMPERATURE CLASS	TEMPERATURE SETTING OF THE THERMOSTAT (°C)					
	Inert liquids	Gases				
	Power dissipated by the heating element (W/cm^2)	Power dissipated by the heating element (W/cm^2)				
	7,5	2	1,5	1	0,5	0,2

(17) Special conditions for safe use: symbol X
- The layer of dust accumulated on the housing shall not exceed 5 mm.
- The ignition temperature of the dust shall be higher than 185°C
- The setting of the protective device to the limit temperature ensuring the temperature class shall be realised for each apparatus under the responsibility of the manufacturer. Furthermore this device shall be sealed and its setting shall not be modified later.
- The temperature sensor of the protective device shall be placed as nearest as possible to the tube containing the heating elements.
- When the apparatus is energised the tube containing the heating elements shall be completely immersed in the liquid – the depth of immersion above the tube is at least 50 mm.
- The values of the power dissipated by the heating elements mentioned in the table (page 2) cannot be exceeded

(18) Essential Health and Safety Requirements: covered by the standards listed at 9 and by the descriptive documents of the manufacturer

This certificate may only be reproduced in its entirety and without any change, schedule included

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.

Manufacturing locations:

This certificate is issued as verification that a sample(s), representative of production, was assessed and tested and found to comply with the IEC Standard list below and that the manufacturer's quality system, relating to the Ex products covered by this certificate, was assessed and found to comply with the IECEx Quality system requirements.This certificate is granted subject to the conditions as set out in IECEx Scheme Rules, IECEx 02 and Operational Documents as amended

STANDARDS :
The equipment and any acceptable variations to it specified in the schedule of this certificate and the identified documents, was found to comply with the following standards

IEC 60079-0:2017 Edition:7.0	Explosive atmospheres - Part 0: Equipment - General requirements
IEC 60079-1:2014 Edition:7.0	Explosive atmospheres - Part 1: Equipment protection by flameproof enclosures "d"
IEC 60079-31:2013 Edition:2	Explosive atmospheres - Part 31: Equipment dust ignition protection by enclosure "t"
IEC 60079-7:2017 Edition:5.1	Explosive atmospheres - Part 7: Equipment protection by increased safety "e"

This Certificate **does not** indicate compliance with safety and performance requirements other than those expressly included in the Standards listed above.

TEST & ASSESSMENT REPORTS:
A sample(s) of the equipment listed has successfully met the examination and test requirements as recorded in:

Annexe to:	IECEx CML 18.0131X Issue 4
Applicant:	Hawke International (A Division of Hubbell Limited) (A member of the Hubbell group of companies)
Apparatus:	Ranges of Barrier and Diaphragm Seal Hybrid Cable Glands

Description

The ranges of cable glands are designed in two versions: barrier and diaphragm seal. Hybrid configurations of these glands are also described.

All cable glands within the ranges are manufactured in brass, nickel plated brass, stainless steel, or aluminium.

Both barrier and diaphragm seal type glands internal parts marked with an asterisk (*) in the description below are interchangeable with respect to the type of application. When parts are interchanged, these assemblies may be dual marked with both product types on the stamp band. The "Deluge Boot" colour indicates the internal component that is used, the ICG/653/UNIV being indicated by a red deluge boot. This does not apply to the ICG 653 UNIV J-Size.

Cable glands may be fitted with an optional external clamp or a Hawke Gland Mounted Clamp (GMC) accessory. When fitted, no additional clamping is required on the barrier or diaphragm sealed glands.

Items in *italic* are optional and may be omitted from the cable gland dependent on the application.

Hybrid cable glands are available for the gland types ICG/653/UNIV and 501/453/UNIV. These types are fitted with the middle nut and back nut components of any smaller trade size compared to the entry. Glands may combine entries and seals with small armour clamping rings and back nut seals. Hybrid gland marking to include second size reference with no spaces e.g. for example C2 to C hybrid size reference would be C2C.

The use of Hawke IP sealing washers may be considered a suitable sealing method to maintain IP rating to the enclosure (see conditions of use) and will maintain the service temperature.

Where marked IIC or IIIC, the equipment can also be marked for gas groups IIA or IIB and for dust groups IIIA or IIIB.

Type 501/453/UNIV Cable Gland

501/453/UNIV cable gland is a diaphragm seal cable gland the glands are fitted with a diaphragm silicone rubber seal and are designed for effectively filled type cable when used for flameproof applications. This gland type is rated for ingress protection IP66, 67, 69 and IPX8 size Os to C only at 10m for 24 hours. This cable gland is available in sizes Os (M16) up to and including F(M75). The entry thread form can either be metric or NPT equivalent. They are used with cables that are circular and armoured, un-armoured or braided cables. The cable gland comprises the following components:

a) Entry
b) Deluge boot *
c) Diaphragm seal *
d) Spigot *
e) Armour clamping ring
f) Middle nut
g) Back nut
h) Back nut clamp
i) Back nut seal

Type ICG/653/UNIV Cable Gland

The ICG/653/UNIV Cable Gland is a barrier seal type gland designed for sealing around individual cores and are for use with circular cables of armoured, un-armoured or corrugated cables. This cable gland is available in sizes Os (M16) up to and including J (M100). The entry thread form is either metric or NPT equivalent. This gland type is rated for ingress protection IP66, 67, 69 and IPX8 size Os to C only at 10m for 24 hours. Trade size J is IP66 only.
The cable gland comprises the following components:

a) Entry
b) Deluge boot*
c) Compound chamber*
*d) Resin dam **
e) Spigot*
*f) VBL Clip **
g) Armour/braid clamping ring
h) Middle nut
i) Back nut
j) Back nut clamp
k) Back nut seal

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Type 710 Cable Gland

The 710 Cable gland is a barrier cable gland designed for sealing around individual cores and are for use with circular cables of armoured, un-armoured or corrugated cables. This gland type is rated for ingress protection IP66, 67, 69 and IPX8 size Os to C only at 10m for 24 hours. This cable gland is available in sizes Os (M16) up to and including F (M75). The entry thread form is either metric or NPT equivalent. The cable gland comprises the following components:

a) Entry
b) Deluge boot
c) Compound chamber
d) Resin dam
e) Spigot
f) Middle nut
g) Back nut
h) Back nut clamp
i) Back nut seal

Type 711 Cable Gland

711 Cable gland is a barrier cable gland designed for sealing around individual cores and are for use with circular cables of armoured, un-armoured or corrugated cables. This gland type is rated for ingress protection IP66, 67, 69 and IPX8 size Os to C only at 10m for 24 hours. This cable gland is available in sizes A (M20) up to and including F (M75). The entry thread form is either metric or NPT equivalent. The cable gland comprises the following components:

a) Entry
b) Deluge boot
c) Compound chamber
d) Resin dam
e) Front diablo support
f) Diablo cage
g) Rear diablo support
h) Middle nut
i) Back nut
j) Back nut clamp
k) Back nut seal

TEMPLATE FRM5100236 0H

Ballard Confidential

Printed on: Wednesday, March 19, 2025

Type 753 Cable Gland

753 cable gland Cable gland is a barrier cable gland designed for sealing around individual cores and are for use with circular cables of armoured, un-armoured or braided cables. This gland type is rated for ingress protection IP66, 67, 69 and IPX8 size Os to C only at 10m for 24 hours. This cable gland is available in sizes Os (M16) up to and including F(M75). The entry thread form is either metric or NPT equivalent. The cable gland comprises the following components:

a) Entry
b) Deluge boot
c) Compound chamber
d) Resin dam
e) Spigot
f) Middle nut
g) Back nut
h) Back nut clamp
i) Back nut seal

Cable glands types ICG/653/UNIV, 710, 711 and 753, in trade sizes Os to F, have been subjected to overpressure test up to 62bar/900 Psi.

Variation 1

1. To update the certification drawing with minor dimensional corrections.
2. To include the type of protection “Ex nR” Restricted Breathing.
3. To include an additional specific condition of use for braided cables.

Variation 2

1. Introduction of undersize compound pot for gland size Os, O, D, E and F.
2. Introduction of thread size M16 for size Os and O, except from gland type 711.
3. Adding NPT thread size: 1½”, 2”, 2½” for gland size D, E and F respectively.

Variation 3

1. To amend the specific conditions of safe use.
2. Update GA drawings.
3. Add accessory optional item GMC 'Gland Mounted Clamp'.
4. Clarify the Ingress Protections IP ratings.
5. To review and update the cable glands against the latest standard.
6. Hybrid Gland Combinations to permit flexibility.
7. Update the marking.
8. To revise the equipment title.
9. To revise the product description.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Variation 4

1. To introduce and update the certification product description to include type ICG 653 oversize cable gland J-Size.
2. Removal of Ex nR from IECEx CML 18.0131X.
3. To review and assess the ICG 653 Oversize cable glands J-Size against the latest technical knowledge IEC 60079-0:2017 Ed.7.
4. To review the ICG 653 Oversize cable gland J-Size against the latest Increase Safety requirements "Ex eb".
5. To amend the specific condition of safe use.
6. To remove the condition of manufacture.
7. Introduction of new set of certification drawings.

Conditions of Manufacture

None

Specific Conditions of Use

The following conditions relate to safe installation and/or use of the equipment.

i. 501/453/UNIV when used with unarmoured or braided cables are only suitable for fixed installations, the cable for which shall be effectively clamped to prevent pulling and twisting (does not apply when fitted with rear clamping device or Hawke Gland Mounted Clamp (GMC)).

ii. Barrier glands of sizes C2, D, E and F and containing (Express) XO99-41-2 resin when used with unarmoured or braided cables are only suitable for fixed installations, the cable for which must be effectively clamped to prevent pulling and twisting. No clamping is required on barrier cable glands sizes Os-C2, or if containing 2122 Hawkeseal or 2132 QSP compound.

iii. The entry thread shall be suitably sealed (in accordance with IEC 60079-14) to maintain the ingress protection rating of the associated enclosure. This condition does not apply if the Hawke International nylon sealing washer is installed as part of the gland assembly.

Components covered by Ex Certificates issued to older editions of Standards

None

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

ATTESTATION D'EXAMEN UE DE TYPE - ANNEXE
EU TYPE EXAMINATION CERTIFICATE - SCHEDULE

1 **Version : 15** — **LCIE 00 ATEX 6008 X** — **Issue : 15**

12 **DESCRIPTION DU PRODUIT**

Le produit est constitué d'une enveloppe en aluminium ou en acier inoxydable contenant une bobine et deux bornes de connexions.

Il fonctionne sur différentes puissances (AC-DC). Il est conçu pour être utilisé avec des vannes avec 2, 3, 4 ou 5 voies.

Les types de protection sont « d » (enveloppe antidéflagrante) et « t » (protection contre l'inflammation des poussières).

Il y a également 2 versions spéciales où les caractéristiques électriques sont différentes, à la demande de clients.

DESCRIPTION OF PRODUCT

The product is made of an aluminium or stainless steel enclosure including a coil and two connections terminals.

It operates on different wattage (AC-DC). It is designed to be used in conjunction with valves with 2, 3, 4 or 5 channels.

The types of protection are "d" (flameproof enclosure) and "t" (dust ignition protection).

There is also 2 specific version where the electrical ratings are different, at customer's request.

ATTESTATION D'EXAMEN UE DE TYPE - ANNEXE
EU TYPE EXAMINATION CERTIFICATE - SCHEDULE

1 **Version : 15** **LCIE 00 ATEX 6008 X** **Issue : 15**

CARACTERISTIQUES

Tension d'alimentation :
6 à 250 V DC / rectifié ou 6 à 380 V AC.

Pour la version spéciale NF 14462403.24/DC :

Tension d'alimentation : 24 V DC
Puissance maximale : 36.2 W
Fonctionnement électrique intermittent :
- Temps de fonctionnement = 2 minutes
- Temps à l'arrêt = 5 minutes
Température maximale du fluide : 55°C.

Pour la version spéciale X263429069235F1 :

Tension d'alimentation : 24 V DC
Puissance maximale : 11.2 W
Fonctionnement électrique intermittent :
- Temps de fonctionnement = 2 minutes
- Temps à l'arrêt = 15 minutes
Température maximale du fluide : 70°C.

RATINGS

Supply voltage :
6 to 250 V DC / rectified or 6 to 380 V AC.

For the specific version NF 14462403.24/DC :

Supply voltage : 24 V DC
Maximum power : 36.2W
Electric operation intermittent :
- Time on = 2 minutes
- Time off = 5 minutes.
Maximum fluid temperature: 55°C.

For the specific version X263429069235F1 :

Supply voltage : 24 V DC
Maximum power : 11.2W
Electric operation intermittent :
- Time on = 2 minutes
- Time off = 15 minutes.
Maximum fluid temperature: 70°C.

MARQUAGE

Le marquage du produit doit comprendre :

ASCO SAS ou ASCO™
Adresse : …
Type : *NF-* (1)
N° de fabrication : …
Année de fabrication : …
Ⓔx II 2 G D
Ex db IIC T6…220°C (T2) Gb (2)
Ex tb IIIC T85°C…T220°C Db (2)
LCIE 00 ATEX 6008 X
-60°C ≤ Tamb ≤ +…°C (2)
AVERTISSEMENTS –
NE PAS OUVRIR SOUS TENSION.
APRES MISE HORS TENSION, ATTENDRE 35 MINUTES AVANT L'OUVERTURE.
Sur la plaque de marquage :
T câble : …°C (2)
U = ….V ; I = …. A ; P = …. W (3)

(1) : complété par la désignation du type.
(2) : voir les tableaux des températures.
(3) : complété par les paramètres électriques.

MARKING

The marking of the product shall include the following :

ASCO SAS or ASCO™
Address: …
Type : *NF-* (1)
Serial number: …
Year of construction: …
Ⓔx II 2 G D
Ex db IIC T6…220°C (T2) Gb (2)
Ex tb IIIC T85°C…T220°C Db (2)
LCIE 00 ATEX 6008 X
-60°C ≤ Tamb ≤ +…°C (2)
WARNINGS –
DO NOT OPEN WHEN ENERGIZED.
AFTER DE-ENERGIZING, DELAY 35 MINUTES BEFORE OPENING.
On the marking plate :
T cable : …°C (2)
U = ….V; I = …. A; P = …. W (3)

(1): completed with type designation.
(2): see temperatures tables.
(3): completed by electrical parameters.

U = ….V; I = …. A; P = …. W (2)

(1): completed with type designation.
(2): completed by electrical parameters.

The equipment shall also bear the usual marking required by the product standards applying to such equipment under the manufacturer responsibility.

13 **CONDITIONS PARTICULIERES D'UTILISATION**

a. Les joints antidéflagrants ne sont pas destinés à être réparés.

b. Les fermetures spéciales du couvercle sont des vis hexagonales à six pans creux conformes à l'ISO 4762. La classe de propriété minimale des vis doit être A4-70. Le cas échéant, les vis du couvercle doivent être remplacées par des vis identiques.

c. Le classement en température dépend de la température ambiante. Voir tableaux des températures.

SPECIFIC CONDITIONS OF USE

The flameproof joints are not intended to be repaired.

The special fasteners of the cover are hexagon socket head cap screws conforming to ISO 4762. The minimum grade of screws must be A4-70. If any, the screws shall only be replaced with identical ones.

The temperature class depend on ambient temperature. See temperature tables.

14 **EXIGENCES ESSENTIELLES DE SANTE ET DE SECURITE**

Couvertes par les normes listées au point 8.

ESSENTIAL HEALTH AND SAFETY REQUIREMENTS

Covered by standards listed at 8.

Conditions de certification

Les détenteurs d'attestations d'examen UE de type doivent également satisfaire les exigences de contrôle de production telles que définies à l'article 13 de la Directive 2014/34/UE.

En accord avec l'Article 41 de la Directive 2014/34/UE, les attestations d'examen CE de type mentionnant la Directive 94/9/CE émises avant la date d'application de la Directive 2014/34/UE (20 avril 2016) peuvent être considérées comme émises en accord avec la Directive 2014/34/UE. Les nouvelles versions de ces attestations peuvent conserver le numéro de l'attestation d'origine émise avant le 20 avril 2016.

Conditions of certification

Holders of EU type examination certificates are also required to comply with the production control requirements defined in article 13 of Directive 2014/34/EU.

In accordance with Article 41 of Directive 2014/34/EU, EC-Type Examination Certificates referring to Directive 94/9/EC that were in existence prior to the date of application of Directive 2014/34/EU (20 April 2016) may be referenced as if they were issued in accordance with Directive 2014/34/EU. New issues of such certificates may continue to bear the original certificate number issued prior to 20 April 2016.

EU TYPE EXAMINATION CERTIFICATE - SCHEDULE

1 **Version : 15** **LCIE 00 ATEX 6008 X** **Issue : 15**

17 **DETAILS DES MODIFICATIONS DE L'ATTESTATION**

Version 00 : 02/03/2001	Version initiale selon les normes suivantes : - EN 50014:1997, - EN 50018:1994.
Version 01 : 18/01/2002	Possibilité d'utiliser l'équipement en atmosphère poussières.
Version 02 : 10/09/2002	Modification du dossier technique.
Version 03 : 28/11/2003	Diminution de la température ambiante minimale à -60°C.
Version 04 : 10/09/2007	Mise à jour normative suivant les normes suivantes : - EN 60079-0:2006, - EN 60079-1:2004, - EN 61241-0:2006, - EN 61241-1:2004. Mise à jour des classements en température.
Version 05 : 23/10/2008	Ajout de sites de production.
Version 06 : 05/03/2009	Ajout d'un site de production.
Version 07 : 25/02/2010	Ajout d'un site de production. Modification du dossier technique.
Version 08 : 12/10/2010	Mise à jour normative suivant les normes suivantes : - EN 60079-0:2009, - EN 60079-1:2007, - EN 61241-1:2004. Mise à jour des classements en température.
Version 09 : 27/12/2011	Mise à jour normative suivant la norme EN 60079-31:2009.
Version 10 : 08/03/2013	Mise à jour de la liste des sites de production.
Version 11 : 25/04/2013	Ajout d'un nouveau site de production.
Version 12 : 25/02/2016	Changement du nom de la société. Mise à jour normative suivant les normes suivantes : - EN 60079-0:2012 + A11:2013, - EN 60079-31:2014. Ajout d'un nouveau site de production.
Version 13 : 25/10/2016	Ajout d'une version spéciale codifiée NF 14462403.24/DC, pour le type *NF-M12-II. Mise à jour suivant la norme EN 60079-1:2014.

DETAILS OF CERTIFICATE CHANGES

Issue 00 : 2003/03/02	Initial issue according to following standards: - EN 50014:1997, - EN 50018:1994.
Issue 01 : 2002/01/18	Possibility to use the equipment in dust atmosphere.
Issue 02 : 2002/09/10	Technical file modification.
Issue 03 : 2003/11/28	Decrease of minimal ambient operating temperature to -60°C.
Issue 04 : 2007/09/10	Normative update according to following standards : - EN 60079-0:2006, - EN 60079-1:2004, - EN 61241-0:2006, - EN 61241-1:2004. Update of temperature classes.
Issue 05 : 2008/10/23	Addition of manufacturing locations.
Issue 06 : 2009/03/05	Addition of a manufacturing location.
Issue 07 : 2010/02/25	Addition of a new manufacturing location. Technical file modification.
Issue 08 : 2010/10/12	Normative update according to following standards : - EN 60079-0:2009, - EN 60079-1:2007, - EN 61241-1:2004. Update of temperature tables.
Issue 09 : 2011/12/27	Normative update according to standard EN 60079-31:2009.
Issue 10 : 2013/03/08	Update of manufacturing locations list.
Issue 10 : 2013/04/25	Addition of a new manufacturing location.
Issue 12 : 2016/02/25	Change of company name. Normative update according to following standards : - EN 60079-0:2012 + A11:2013, - EN 60079-31:2014. Addition of a new manufacturing location.
Issue 13 : 2016/10/25	Addition of a specific version, codified NF 14462403.24/DC for type *NF-M12-II. Normative update according to standard EN 60079-1:2014.

ATTESTATION D'EXAMEN UE DE TYPE - ANNEXE
EU TYPE EXAMINATION CERTIFICATE - SCHEDULE

1 **Version : 15** **LCIE 00 ATEX 6008 X** **Issue : 15**

DETAILS DES MODIFICATIONS DE L'ATTESTATION (suite)

Version 14 : 26/07/2017	Correction de la version 13 (mise à jour du marquage et de la description du produit). Nouvelle détermination de la pression d'explosion. Mise à jour des conditions particulières d'utilisation. Mise à jour de la liste des sites de production.
Version 15 :	Ajout d'une version spéciale codifiée X263429069235F1, pour le type *NF-MXX. Mise à jour de la liste des sites de production. Clarification sur la définition du type.

DETAILS OF CERTIFICATE CHANGES (continued)

Issue 14 : 2017/07/26	Correction of the issue 13 (update marking and description of product). New determination of explosion pressure. Update of specific conditions of use. Update of manufacturing locations list.
Issue 15 :	Addition of a specific version, codified X263429069235F1, for type *NF-MXX. Update list of manufacturing locations. Clarification of type definition.

EU TYPE-EXAMINATION CERTIFICATE

1. **EU type-examination Certificate (Module B)**
2. **Equipment or Protective System intended for use in potentially explosive atmospheres (Directive 2014/34/EU)**
3. **EU type examination certificate Nr** **ITS16ATEX101339X R.1**
4. **Product:** AD-U, AM-D/AM-U, AF-U, AD-E4 Thread Adapters, RD-U, RD-E4 Reducers and AE-E Earthlead Adapters, Reducers, UN-D / UN-U, UF-D / UF-U, FB and FL Unions
5. **Manufacturer:** EATON ELECTRICAL SYSTEMS Ltd Trading as Eaton, Raxton, Redapt or Capri
   Applicant: EATON ELECTRICAL SYSTEMS Ltd Trading as Eaton, Raxton, Redapt or Capri
6. **Address:** Kingsway South Westgate, Aldridge West Midlands WS9 8FS
   Address: Kingsway South Westgate, Aldridge West Midlands WS9 8FS
7. This product and any acceptable variation thereto are specified in the schedule to this certificate and therein referred to.
8. INTERTEK ITALIA S.p.A., Notified Body n° 2575 in accordance with article 17 of the Directive 2014/34/EU of the European Parliament and Council of the 26 February 2014, certifies that the equipment or protective system has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of equipment and protective system intended for use in potentially explosive atmosphere, given in Annex II of the Directive.

   The examination and tests results are recorded in confidential technical evaluation Intertek Report Nr. 105332195LHD-001 dated 31st August 2023.
9. Compliance with the Essential Health and Safety Requirements has been assured by compliance with EN IEC 60079-0:2018, EN 60079-1:2014, EN IEC 60079-7:2015+A1:2018 and EN 60079-31:2014 except in respect of those requirements referred to at item 16 of the Schedule.
10. If the sign X is placed after the certificate number, it indicates that the product is subject to Specific Conditions of Use specified in the schedule to this certificate.
11. This EU-Type Examination Certificate relates only to the design and construction of the specified product. Further requirements of the Directive apply to the manufacturing process and supply of this product. These are not covered by this certificate.
12. The marking of the product shall include the following:

Types AD-U, AM-D/AM-U, AF-U Thread Adapters, RD-U Reducers and UN-D / UN-U, UF-D / UF-U, FB and FL Unions (Mining not applicable to Aluminium version)

SCHEDULE

EU TYPE EXAMINATION CERTIFICATE NUMBER: ITS16ATEX101339X R.1

13. **DESCRIPTION OF THE EQUIPMENT OR PROTECTIVE SYSTEM**

Adaptors and Reducers
The ranges of thread adaptors and reducers each comprise a hollow body with an external male thread and an internal female thread. The devices are used to convert an existing cable entry aperture thread to a different thread form and / or size. The adaptors and reducers may optionally be machined with a groove to fit an 'o' ring seal. An increase of up to two step thread sizes is permitted on the AD-U series.

AD-U and RD-U Series – Metallic hexagonal or round bodied adaptors (AD-U) or reducers (RD-U)
Coded: Ex db I/IIC Mb/Gb, Ex eb I/IIC Mb/ Gb Ex tb IIIC Db
M12 TO M120 (or equivalent thread forms)

The **AM-D / AM-U** range of Male to Male thread adaptors each comprises a hexagon body with a male thread form at each end. The devices are used to convert an existing cable entry aperture thread to a different thread form and/or size. Coded: Ex db I/IIC Mb/Gb, Ex eb I/IIC Mb/ Gb Ex tb IIIC Db
M16 TO M90 (or equivalent thread forms)

The **AF-U** range of Female to Female thread adaptors each comprises a hexagon body with a female thread form at each end. The devices are used to convert an existing cable entry aperture thread to a different thread form and/or size. Coded: Ex db I/IIC Mb/Gb, Ex eb I/IIC Mb/ Gb Ex tb IIIC Db
M16 TO M120 (or equivalent thread forms)

Types **AD-E4** Adaptors and Types **RD-E4** Reducers are glass fibre nylon versions, 30% Glass filled Nylon is the standard material type and 40% Glass filed Nylon is a specific type. They are designed to convert an existing cable entry aperture in the associated apparatus to a different thread form and/or size. Each device comprises a hollow body with a male thread at one end and a female thread at the other. The AD-E4 is a hexagon type adaptor. The RD-E4 is a hexagon type reducer.
Coded: Ex eb IIC Gb, Ex tb IIIC Db

The **AE-E** Series range of earth lead adaptors and reducers each comprise a hexagon body with a male thread at one end and a female thread machined into the other. The devices are designed to provide a connection from a cable gland or termination to earth via a 300mm long earth lead cable riveted and soldered to the body and additionally may be used to convert an existing cable entry aperture thread to a different thread form and/or size. Coded Ex eb I/IIC Mb/Gb Ex tb IIIC Db IP6X
M16 TO M75 (or equivalent thread forms)

Type **UN-D / UN-U and FB** Male to Female Unions and **UF-D / UF-U and FL** Female to Female Unions each comprise a hexagon body, an internally threaded cone and an external nut. The devices are designed for connection when a conventional adaptor is impractical. Additionally, they may be used to convert an existing cable entry to a different thread form and/or size.
Coded: Ex db I/IIC Mb/Gb, Ex eb I/IIC Mb/Gb Ex tb IIIC Db IP6X
M16 TO M75 for FB-FL (or equivalent thread forms)
UN-D / UN-U and **UF-D / UF-U** are between M20 and M75 (or equivalent thread forms)

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SCHEDULE

EU TYPE EXAMINATION CERTIFICATE NUMBER: ITS16ATEX101339X R.1

Thread forms Options:

ISO Metric (to BS3463), PG to DIN40430, NPT (ANSI/ASME B1.20.1), NPS (ANSI/ASME B1.20.1), ISO Pipe Thread (BS21) BSPP/BSPT, Imperial conduit ET BS31 BSP to BS21 or thread forms complying with standard EN 60079-1.

As an option for AD-E4 & ADU adaptors (Ex eb or tb application only), male threads can be drilled with holes to drain the water (when assembled with a breather drain for instance).

Material options:

Brass to BS 2874:1985
Brass to BS 2872:1989
Lead-free brass: CW724R Stainless
steel to BS 970: part4 Mild steel to
BS 970: Part 1: 1983 Aluminium
(Not for Group I) 30 % Glass filled
Nylon
40% Glass filled Nylon

CE Marking shall be accompanied by the identification number of the Notified Body responsible for surveillance of production.

SCHEDULE

EU TYPE EXAMINATION CERTIFICATE NUMBER: ITS16ATEX101339X R.1

15. **SPECIFIC CONDITIONS OF USE**

1. When used in flameproof applications. only one adaptor or reducer is to be used with any single cable entry on the associated equipment.
2. The interfaces between these devices and the associated enclosure cannot be defined; therefore, it is the user's responsibility to ensure that the appropriate ingress protection level is maintained at these interfaces.
3. Aluminum variants are not permitted for Group I applications
4. At their point of mounting, these devices are suitable for use at the following temperatures dependent on the type of 'o'-ring:

O-ring Service temp

Material	Service Temperature
None fitted	-60°C to 200°C*
EPDM	-50°C to +100°C
Nitrile	-30°C to +80°C
Neoprene	-40°C to +80°C
Viton	-20°C to +180°C*
Silicone	-60°C to +180°C *
Fluorosilicone	-60°C to +130°C
30% Glass Filled Nylon	-30°C to +90°C
40% Glass Filled Nylon	-20°C to +45°C

Note:. The limiting temperatures specified above are de-rated by 20K according to Clause 7.2.2 'Material Selection' of EN 60079-0

Note: The maximum temperature is limited to 150°C in Group I application (Coal dust, Mining) O-ring materials affect marked with '*' above.

Note: Unless fitted with an interface sealing O-ring with lower properties, temperatures shall then be limited as per the manufacturer's instructions.

Conditions specific to type:

AD-U Adaptors and RD-U Reducers

1. When installed in Group I applications, the ADU M12 (M) to M20 (F) adaptor manufactured in brass shall be installed where the risk of impact is low

AE-E Earth Lead Adaptors and Reducer

2. At their point of mounting, these devices are suitable for use at -20°C to +40°C.

AD-E4, RD-E4

3. The adaptors/reducers, made from non-metallic material, are only suitable for installation in areas considered to be a low risk from mechanical impact.
4. The adaptors/reducers, made from non-metallic material 40% Glass Filled Nylon, shall be adequately protected from direct exposure to sunlight.

EU Type Examination Certificate CML 19ATEX1167X Issue 3

1 Equipment intended for use in Potentially Explosive Atmospheres Directive 2014/34/EU

2 Equipment **A Range of Cable Glands with Compression Seals**

501/421; 501/421 "Size 2K"; 501/423; 501/453 RAC; PSG 553 RAC; 501/414; SB474

3 Manufacturer **Hawke International (A Division of Hubbell Limited) (A member of the Hubbell group of Companies)**

4 Address **Oxford Street West, Ashton-under-Lyne, Lancashire, OL7 0NA United Kingdom**

5 The equipment is specified in the description of this certificate and the documents to which it refers.

6 CML B.V., Chamber of Commerce No 67386717, Koopvaardijweg 32, 4906CV Oosterhout, The Netherlands, Notified Body Number 2776, in accordance with Article 17 of Directive 2014/34/EU of the European Parliament and of the Council, dated 26 February 2014, certifies that this equipment has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of equipment intended for use in potentially explosive atmospheres given in Annex II to the Directive.

The examination and test results are recorded in the confidential reports listed in Section 12.

7 If an 'X' suffix appears after the certificate number, it indicates that the equipment is subject to conditions of safe use (affecting correct installation or safe use). These are specified in Section 14.

8 This EU Type Examination certificate relates only to the design and construction of the specified equipment or component. Further requirements of Directive 2014/34/EU Article 13 apply to the manufacture of the equipment or component and are separately certified.

9 Compliance with the Essential Health and Safety Requirements, with the exception of those listed in the confidential report, has been demonstrated through compliance with the following documents:

EN IEC 60079-0:2018 EN 60079-1:2014 EN 60079-31:2014

EN IEC 60079-7:2015+A1:2018

Issue 3

11 Description

Each of the following gland types may be manufactured in brass, nickel plated brass, stainless steel or aluminium and may be supplied with agreed alternative entry thread forms.

The Type 501/421 Cable Gland is intended for use with an effectively filled and circular unarmoured cables and comprises the following components: -

a) An entry component in the size range Os to J
b) A compressible sealing ring
c) A compression spigot
d) A back nut
e) An optional earth continuity device for use with metallic sheathed cables

The Type 501/421 'Size 2K' Gland comprises the following components only: -

a) A dedicated entry component
b) A compressible sealing ring
c) A nylon skid washer
d) A threaded compression spigot

The Type 501/423 Cable Gland is intended for use with effectively filled and circular unarmoured cables and comprises the following components: -

a) An entry component, in the size range Os to J
b) Two compressible sealing rings
c) Two compression spigots
d) A middle nut
e) A back nut
f) An optional earth continuity device for use with metallic sheathed cables

The Type 501/453 RAC Cable Gland is intended for use with armoured, unarmoured, or braided cable and comprises the following components:

a. An entry component, in the size range Os to J
b. A compressible sealing ring.
c. A combined compression spigot and armour clamping cone.
d. A reversible armour clamping ring.
e. A middle nut
f. An outer seal assembly (sleeve seal and support cage)
g. A back nut
h. An optional earth continuity device for use with metallic inner sheathed cables

The Type PSG 553 RAC Cable Gland is intended for use with armoured, unarmoured, or braided cables of unspecified construction and comprises the following components: -

a) An entry component in the size range Os to C
b) A compressible seal designed to accept a number of individual conductors
c) A combined compression spigot and armour clamping cone
d) A reversible armour clamping ring.
e) A middle nut
f) An outer seal assembly (sleeve seal and support cage)
g) A back nut

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

CML 19ATEX1167X
Issue 3

The Type 501/414 Conduit Stopping Gland is intended for use with an effectively filled and circular unarmoured cable enclosed within a conduit and comprises the following components: -

a) An entry component in the size range Os to F
b) A compressible sealing ring
c) A compression assembly comprising a compression spigot with a female thread at the rear and integral back nut

The Type SB474 Conduit Stopping Gland is intended for use with a number of circular conductors enclosed within a conduit and comprises the following components: -

a) An entry component in the size range O to C
b) A compressible seal designed to accept a number of individual conductors
c) A compression assembly comprising a compression spigot with a female thread at the rear and integral back nut.

Design option

1. The use of a 3M cold Shrink tubing to be fitted to the outer sheath of specific non-circular cables as specified in the drawing 320000, and fitted into 'Os', 'O' and 'A' sizes of the 501/453 cable glands. To ensure that the IP sealing arrangement utilizing the cable shrink tube assembly does not affect the assigned IP rating of the glands. The selection of the relevant cable gland to meet the protection concept for the cable and the enclosure it is fitted on to as detailed in EN 60079-14 remain un-affected.
2. The gland assemblies as described above are rated for ingress protection IP66 and 67.
3. Cable glands may be fitted with an optional external clamp or a second accessory option type Hawke Gland Mounted Clamp (GMC).
4. Where marked IIC or IIIC, the equipment can also be marked for gas groups IIA or IIB and for dust groups IIIA or IIIB.

Variation 1

This variation introduces the following modifications:

i. Update GA drawings.
ii. Add accessory optional item GMC 'Gland Mounted Clamp'.
iii. Clarify the ingress protection, IP ratings.
iv. To review and update the cable glands against the latest standard.
v. To include the 501/453 RAC type cable Gland.
vi. To permit the update to gland sizes.
vii. Update the marking.
viii. To revise the equipment title.
ix. To revise the product description.
x. To revise the specific conditions of use.

Variation 2

This variation introduces the following modifications, and it is is applicable to Type PSG 553 RAC Cable Gland and Type SB474 Conduit Stopping Gland.

i. To introduce a new seal design for PSG/553/RAC, sizes Os to C and SB 474, sizes O to C; as a result the product description was amended.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

CML 19ATEX1167X
Issue 3

ii. To introduce a new compressible seal which has an increased service temperature of -60°C to +100°C; to reflect this modification the product description and Specific Conditions of Use were updated.
iii. To permit minor editorial updates to the Product Description.
iv. To permit changes to the Specific Conditions of Use.
v. To remove cable gland types 501/452 RAC and PSG 421; as a result, the product description was amended.

Variation 3
This variation introduces the following modifications:

i. To modify the core diameter range on sizes O/A/B/C and B-ALT of the PSG 553 RAC and SB474 gland types and modify certification documentation.

12 Certificate history and evaluation reports

Issue	Date	Associated report	Notes
0	04 June 2019	R11908A/00	The issue of the prime certification.
1	28 Sept 2021	R13593A/00	The introduction of variation 1. (UKEX)
2	31 Mar 2022	R14930A/00	The introduction of variation 2
3	23 Aug 2023	R16380A/00	The introduction of variation 3

Note: Drawings that describe the equipment or component are listed in the Annex.

13 Conditions of Manufacture

None

14 Specific Conditions of Use (Special Conditions)

The following conditions relate to safe installation and/or use of the equipment.

i. The PSG/553/RAC and SB 474 cables glands are limited to an operating temperature range of -60°C to +80°C, unless marked “P PSG/553/RAC” and “P SB 474” respectively. In these cases, they are suitable for use with an operating temperature range of -60°C to +100°C. All other cable gland types are suitable for use with an operating temperature range of -60°C to +100°C.

ii. When the glands are used for increased safety or dust protection the entry thread shall be suitably sealed (in accordance with IEC 60079-14) to maintain the ingress protection rating of the associated enclosure. Not applicable when Hawke IP 66/67 seal is used.

iii. Glands for use with conduit, unarmoured or braided cables are only suitable for fixed installations, the cable for which must be effectively clamped to prevent pulling and twisting (does not apply when fitted with rear clamping device or Hawke Gland Mounted Clamp (GMC)).

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

This certificate is issued as verification that a sample(s), representative of production, was assessed and tested and found to comply with the IEC Standard list below and that the manufacturer's quality system, relating to the Ex products covered by this certificate, was assessed and found to comply with the IECEx Quality system requirements.This certificate is granted subject to the conditions as set out in IECEx Scheme Rules, IECEx 02 and Operational Documents as amended

STANDARDS :
The equipment and any acceptable variations to it specified in the schedule of this certificate and the identified documents, was found to comply with the following standards

IEC 60079-0:2017 Edition:7.0	Explosive atmospheres - Part 0: Equipment - General requirements
IEC 60079-1:2014 Edition:7.0	Explosive atmospheres - Part 1: Equipment protection by flameproof enclosures "d"
IEC 60079-31:2022 Edition:3.0	Explosive atmospheres – Part 31: Equipment dust ignition protection by enclosure "t"
IEC 60079-7:2017 Edition:5.1	Explosive atmospheres - Part 7: Equipment protection by increased safety "e"

This Certificate **does not** indicate compliance with safety and performance requirements other than those expressly included in the Standards listed above.

TEST & ASSESSMENT REPORTS:
A sample(s) of the equipment listed has successfully met the examination and test requirements as recorded in:

Test Reports:

GB/CML/ExTR19.0096/00 GB/CML/ExTR21.0018/00 GB/CML/ExTR21.0314/00

IECEx Certificate of Conformity

Certificate No.: **IECEx CML 19.0045X** Page 3 of 4

Date of issue: 2023-08-23 Issue No: 3

EQUIPMENT:
Equipment and systems covered by this Certificate are as follows:

Each of the gland types may be manufactured in brass, stainless steel or aluminium and may be supplied with agreed alternative entry thread forms.

Refer to Certificate Annex for full product description.

SPECIFIC CONDITIONS OF USE: YES as shown below:
Refer to Certificate Annex for list of specific conditions of use.

IECEx Certificate of Conformity

Certificate No.: **IECEx CML 19.0045X** Page 4 of 4

Date of issue: 2023-08-23 Issue No: 3

DETAILS OF CERTIFICATE CHANGES (for issues 1 and above)
Issue 1
This issue introduces the following changes:

1. Update GA drawings.
2. Add accessory optional item GMC 'Gland Mounted Clamp'.
3. Clarify the ingress protection, IP
4. To review and update the cable glands against the latest standard.
5. To include the 501/453 RAC type cable Gland.
6. To permit the update to gland sizes.
7. Update the marking.
8. To revise the equipment title.
9. To revise the product description.
10. To revise the specific conditions of use.

Issue 2
This issue introduces the following changes and it is applicable to Type PSG 553 RAC Cable Gland and Type SB474 Conduit Stopping Gland.

1. To introduce a new seal design for PSG/553/RAC, sizes Os to C and SB 474, sizes O to C; as a result the product description was amended.
2. To introduce a new compressible seal which has an increased service temperature of -60°C to +100°C; to reflect this modification the product description and Specific Conditions of Use were updated.
3. To permit minor editorial updates to the Product Description.
4. To permit changes to the Specific Conditions of Use.
5. To remove cable gland types 501/452 RAC and PSG 421; as a result, the product description was amended.

Issue 3
This issue introduces the following changes:

1. To modify the core diameter range on sizes O/A/B/C and B-ALT of the PSG 553 RAC and SB474 gland types and modify certification documentation.
2. To review and update the equipment against the latest requirement of IEC 60079-31:2022 Ed.3.

Description

Each of the following gland types may be manufactured in brass, nickel plated brass, stainless steel or aluminium and may be supplied with agreed alternative entry thread forms.

The Type 501/421 Cable Gland is intended for use with an effectively filled and circular unarmoured cables and comprises the following components: -

a) An entry component in the size range Os to J
b) A compressible sealing ring
c) A compression spigot
d) A back nut
e) An optional earth continuity device for use with metallic sheathed cables

The Type 501/421 'Size 2K' Gland comprises the following components only: -

a) A dedicated entry component
b) A compressible sealing ring
c) A nylon skid washer
d) A threaded compression spigot

The Type 501/423 Cable Gland is intended for use with effectively filled and circular unarmoured cables and comprises the following components: -

a) An entry component, in the size range Os to J
b) Two compressible sealing rings
c) Two compression spigots
d) A middle nut
e) A back nut
f) An optional earth continuity device for use with metallic sheathed cables

The Type 501/453 RAC Cable Gland is intended for use with armoured, unarmoured, or braided cable and comprises the following components:

a. An entry component, in the size range Os to J
b. A compressible sealing ring.
c. A combined compression spigot and armour clamping cone.
d. A reversible armour clamping ring.
e. A middle nut
f. An outer seal assembly (sleeve seal and support cage)
g. A back nut
h. An optional earth continuity device for use with metallic inner sheathed cables

TEMPLATE FRM5100236 0H

Ballard Confidential

Printed on: Wednesday, March 19, 2025

The Type PSG 553 RAC Cable Gland is intended for use with armoured, unarmoured, or braided cables of unspecified construction and comprises the following components: -

a) An entry component in the size range Os to C
b) A compressible seal designed to accept a number of individual conductors
c) A combined compression spigot and armour clamping cone
d) A reversible armour clamping ring.
e) A middle nut
f) An outer seal assembly (sleeve seal and support cage)
g) A back nut

The Type 501/414 Conduit Stopping Gland is intended for use with an effectively filled and circular unarmoured cable enclosed within a conduit and comprises the following components: -

a) An entry component in the size range Os to F
b) A compressible sealing ring
c) A compression assembly comprising a compression spigot with a female thread at the rear and integral back nut

The Type SB474 Conduit Stopping Gland is intended for use with a number of circular conductors enclosed within a conduit and comprises the following components: -

a) An entry component in the size range O to C
b) A compressible seal designed to accept a number of individual conductors
c) A compression assembly comprising a compression spigot with a female thread at the rear and integral back nut.

Design option

1. The use of a 3M cold Shrink tubing to be fitted to the outer sheath of specific non-circular cables as specified in the drawing 320000, and fitted into 'Os', 'O' and 'A' sizes of the 501/453 cable glands. To ensure that the IP sealing arrangement utilizing the cable shrink tube assembly does not affect the assigned IP rating of the glands. The selection of the relevant cable gland to meet the protection concept for the cable and the enclosure it is fitted on to as detailed in EN 60079-14 remain un-affected.
2. The gland assemblies as described above are rated for ingress protection IP66 and 67.
3. Cable glands may be fitted with an optional external clamp or a second accessory option type Hawke Gland Mounted Clamp (GMC).
4. Where marked IIC or IIIC, the equipment can also be marked for gas groups IIA or IIB and for dust groups IIIA or IIIB

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Conditions of Manufacture

None

Specific Conditions of Use

The following conditions relate to safe installation and/or use of the equipment.

i. The PSG/553/RAC and SB 474 cables glands are limited to an operating temperature range of -60°C to +80°C, unless marked "P PSG/553/RAC" and "P SB 474" respectively. In these cases, they are suitable for use with an operating temperature range of -60°C to +100°C. All other cable gland types are suitable for use with an operating temperature range of -60°C to +100°C.

ii. When the glands are used for increased safety or dust protection the entry thread shall be suitably sealed (in accordance with IEC 60079-14) to maintain the ingress protection rating of the associated enclosure. Not applicable when Hawke IP 66/67 seal is used.

iii. Glands for use with conduit, unarmoured or braided cables are only suitable for fixed installations, the cable for which must be effectively clamped to prevent pulling and twisting (does not apply when fitted with rear clamping device or Hawke Gland Mounted Clamp (GMC)).

Components used which are covered by Ex Certificates issued to older editions of Standards

None

Date of Issue: **2015-11-04** Page 3 of 5

Schedule

EQUIPMENT:

Equipment and systems covered by this certificate are as follows:

The Cable Transit Devices 'CTDs'(see Type Designation below), for use with circular cables both armoured and non-armoured or corrugated cables (see Corrugated cables below) of non-interrupted and non-metallic outer jacket type or conduits. The CTDs consists of multi diameter sealing modules (type RM Ex and CM Ex as standard or with EMC properties) that depending on each individual size, accepts a limited number of cable diameters in applicable types of frames or sleeves and shall be marked with the Ex symbol.

The modules are made of mirrored rubber profiles and each part has a number of thin rubber layers that are ending up with a solid rubber core. The layers are made with two different colours to make the adaption to a cable exactly same on both halves and are allowed to differ one layer at most. To achieve appropriate sealing and mechanical properties to prevent the cables from slippage there shall always be a visible separation between the sealing module halves.

The modules made of EPDM are available with layers and core, but some greater sizes are also available without the core. In addition there are also single diameter- and solid modules.

The correct sizes and procedure of assembling the cables to the modules are described in detail in the enclosed installation instructions. Ex Compression devices are used to achieve appropriate compression of the modules and solids some CTDs uses compression units that expands inside the CTDs and some others have incorporated solid rubber profiles that achieve the expansion.

There are also two types of CTDs that incorporates both the compression device and multi diameter modules as a single unit, but still with two halves. The method to assemble the compression devices etc. and to achieve sealing of the CTDs is described in detail in the enclosed installation instructions.

Most CTDs that has a rectangular opening with or without rounded corners with modules of type RM Ex are all available for different combinations with several openings in width and/or in high. CTDs for use with rectangular openings with CM Ex modules (one type with dual opening) and round sleeves are only available with single openings.

The CTDs installation instructions listed in this report will define each variant in detail and all applicable parts that are approved for use within that variant.

CONDITIONS OF CERTIFICATION: YES as shown below:

Conditions for safe use

1. For maintaining the explosion protection, the installation instructions that accompany the products shall be considered.
2. Only cable for fixed installation is permitted for the cable transit device.
3. For optimum reliability wait 24 hours or longer after installation before exposing the cables/pipes to strain or pressure.

New revisions added and corrections to mistyping in previous descriptive document list, issue No. 4.0.

4.16 XT07..09 – Cable Gland for Wall Penetration, 501/421 O M20 Brass

[Please refer to certificate from Section 4.14.]

4.17 XT07..09 – M32 to M20 Reducer, RDU100604

[Please refer to certificate from Section 4.13.]

4.18 XT10..11 – Cable Gland for Wall Penetration, 501/421 A M20 Brass

[Please refer to certificate from Section 4.14.]

4.19 XT10..11 – M40 to M20 Reducer, RDU100704

[Please refer to certificate from Section 4.13.]

Sub Section K02-002

1.0 Objectives and Background

The following document contains the design journal and considerations for the EX related system. This document is an internal document stating the decisions and background for a safe system.

This is an addendum to the ATEX dossier containing the following documents.

- ATEX general arrangement
- ATEX register
- ATEX inspection checklist
- ATEX personal competences
- Intrinsically safe calculations
- Datasheet dossier
- Certification dossier

2.0 *FC PowerGen 1000kW®*

2.1 H2 solenoid valve

2.1.1 Selection of component

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is ***Emerson ASCO*** valve ***NF X E210D488E 24/DC*** with the following EX approvals: ***II 2 G D Ex db IIC T2..T6 Gb*** hereby confirming that the points above is covered by the certificate.

2.1.2 Cable glands

The cable glands for the installation shall maintain the certificate and appropriate Type of protection as the valve accordingly to section 10.2 in IEC 60079-14, hence the cable gland shall be a type of protection: db or d.

The following component is ***HAWKE* 501/421/O M20 421OM20** *with an adaptor to fit the thread of the valve from* ***Eaton Corporation*** *type* ***ADU102904*** with the following EX approvals: **Ex db IIC Gb Ex eb IIC Gb** for the cable gland, and **II 2G Ex db IIC Gb II 2G Ex eb IIC Gb** hereby confirming that the points above is covered by the certificate.

2.1.3 Cable and installation

The valve is installed with a LAPP 3G1 and resistant to UV light making them suitable for outside use.

The grounding is installed inside the valve to eliminate any risk of corrosion. The cable is in all its length (from valve to terminal box) un-cut

The cable is installed together with the other valves, with at smooth bend before cable glands. The cable will be mechanical fixed to a cable tray making sure no mechanical ware will happen.

The diameter of the cable is according to manufacture 8,4mm which is within the specifications (6,5-11,9mm) provided by the manufacture of the cable glands.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

2.2 H2 pressure transmitter

2.2.1 Selection of component

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is ***HUBA controls AG*** type ***520930S04M801*** with the following EX approvals: ***Ex II 1/2G EX ia IIC T4 Ga/Gb*** hereby confirming that the points above are covered by the certificate.

2.2.2 Ex barrier

The component will be installed with an Ex barrier eliminating the potential current going out the component and zone. The following Ex barrier is chosen: ***PR electronic 9106-B1B*** with the following EX approvals: ***II (1) G [Ex ia Ga] IIC/IIB/IIA*** hereby confirming that the points above are covered by the certificate. Installation of the barrier will be covered in section 2.8

2.2.3 Cables

For the connection of the temperature transmitter to the Ex barrier the following cable is used: ***IFM ENC03A*** with the following EX approvals: ***Ex ia IIC T6 Gb*** hereby confirming that the points above are covered by the certificate.

2.3 H2 heater heating element

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is ***JEVI Heating Elements A/S*** heating element ***D-8640*** with the following EX approvals: ***Ex d IIC T4 Gb*** hereby confirming that the points above is covered by the certificate.

The heating element has a build in over temperature cut off. The heating element is factory tested to make sure to not be able to overheat as part of the EX installation.

The flameproof type of protection is a threaded joint type and is installed according to IEC 60079-1. This means that there are no distances required to obstructions.

2.3.1 Cable glands

The cable glands for the installation shall maintain the certificate and appropriate Type of protection as the valve accordingly to point 16.3 in IEC 60079-0, hence the cable gland shall be a type of protection: d.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

For this component the cable gland was delivered as part of the delivery from the manufacture of the heating element. Following cable glands for the valve is delivered: ***HAWKE*** type ***ICG 653 UNIV Os M20*** with the EX approvals: ***EX db IIC Gb and EX eb IIC GB***

2.3.2 Cable and installation

The Heater unit is installed with a LAPP 4G2.5 and resistant to UV light making them suitable for outside use.

The grounding is installed inside the heating unit to eliminate any risk of corrosion. The cable is in all its length (from heating unit to terminal box) un-cut

The cable is installed together with the other non intrinsically safe components, with at smooth bend before cable glands. The cable will be mechanical fixed to a cable tray making sure no mechanical ware will happen.

The diameter of the cable is according to manufacture 9 mm which is within the specifications (5,5-12mm) provided by the manufacture of the cable glands.

2.4 H2 heater Level sensor

2.4.1 Selection of component

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is ***IFM LMT01A*** with the following EX approvals: ***II 3G Ex nA IIC T4 Gc X*** hereby confirming that the points above is covered by the certificate.

2.4.2 Ex barrier

The level sensor does not require a barrier due to the type of protection not being intrinsically safe.

2.4.3 Cables

For the connection of the temperature transmitter to the controller the following cable is used: ***IFM EVC14A*** with the following EX approvals: ***II 3G EX ec IIC Gc*** hereby confirming that the points above is covered by the certificate.

Installation of the cabling will be separated from intrinsically safe sensors, as the cable on this devise is not protected by an ex barrier.

2.5 H2 heater Temperature transmitter

2.5.1 Selection of component

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The temperature transmitter is defined as a simple apparatus accordingly to IEC 60079-14 section 16.4 as the type of transmitter is resister type PT1000 hence no possibility for generating any voltage by its own. Hereby eliminating the option of calculating the surface temperature. Since there are no requirement for an Ex certificate for an simple apparatus, there are no code for concluding the match.

2.5.2 Ex barrier

The component will be installed with an Ex barrier eliminating the potential current going out the component and zone. The following Ex barrier is chosen: ***PR electronic 9113B-U9*** with the following EX approvals: ***II (1) G [Ex ia Ga] IIC/IIB/IIA*** hereby confirming that the points above is covered by the certificate. Installation of the barrier will be covered in section 2.8

2.5.3 Cables

For the connection of the temperature transmitter to the Ex barriere the following cable is used: ***IFM ENC03A*** with the following EX approvals: ***Ex ia IIC T6 Gb*** hereby confirming that the points above is covered by the certificate.

2.6 H2 feed pipe container penetration

2.6.1 Selection of component

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is chosen to safe penetrate the container: **Roxtec** cable and pipe penetration type: **RS 50 B Ex-kit AISI316/AISI316** with the following EX approvals**: II 2G EX e IIC Gb** hereby confirming that the points above is covered by the certificate.

2.7 Electrical container penetration within EX zone

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is ***HAWKE*** cable gland type **501/421/O M20 and 501/421/A M20** with the following adaptor to compensate for the hole size: **Eaton Corporation** type **RDU100604 and RDU100704** with the following EX approvals: **Ex db IIC Gb Ex eb IIC Gb** for the cable glands and **II 2G Ex db IIC Gb II 2G Ex eb IIC Gb** for the reducers hereby confirming that the points above is covered by the certificate.

2.7.1 Cable and installation

The following type of cables are used in the above-mentioned cable glands:

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

- ÖLFLEX CLASSIC 110 CH 4X1 from Mastercontorller in 40' container to cooling skid cabinet. Diameter 8,9mm with an allowable diameter for the cable gland of 6,5mm to 11,9mm
- ETHERLINE® TORSION Cat.6A from mastercontorller in 40' container to cooling skid cabinet. Diameter 8,9mm with an allowable diameter for the cable gland of 6,5mm to 11,9mm
- ETHERLINE® TORSION Cat.6A from mastercontorller in 40' container to cooling skid cabinet. Diameter 8,9mm with an allowable diameter for the cable gland of 6,5mm to 11,9mm
- ÖLFLEX CLASSIC 135 CH 18G0,75 from mastercontroller cabinet in 40' to hydrogen valve box. Diameter 13mm with an allowable diameter for the cable gland of 10,0mm to 14,3mm
- ÖLFLEX CLASSIC 135 CH 18G0,75 from mastercontorller in 40' container to cooling skid cabinet. Diameter 13mm with an allowable diameter for the cable gland of 10,0mm to 14,3mm

2.8 General electrical installation

There are no junction boxes within the zone except the one which is a part of the components. All junction boxes are moved outside the zone.

Cables are all installed below the temperature of the zone and goes uncut through the zone as 60079-14pt. 9.6.1

The intrinsically safe barriers are positioned in a separate junction box outside the Ex Zone. The junction box will contain the components which are described in section 2.2.2 and 2.5.2. The intrinsically safe circuits are separated from the non-safe circuit. Where the one side of the box will contain the non-safe part and the opposite side containing the intrinsically safe circuit hereby following the guidelines/philosophy from the manufacture of the Ex barriers. The circuits are to be installed **50mm** apart from each other according to section 16.5.3 in IEC 60079-14

The junction box will be the following: ***Schneider Electric Thalassa PLS, fiber glass armed polyester cabinet, IP65, 180 x 270 x 180mm, gray*** With the IP rating of IP65. The box will be marked with: *"Warning - Non Intrinsically safe circuits protected by internal IP20 cover"*

The cables will be separated from the non-safe circuits in the cable tray.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

1.0 Purpose

The purpose of this document is to highline the competences of the personnel working on Ex related equipment and systems. The following definitions are defined according to IEC 60079-14 Annex A

2.0 Definitions

Definitions of terms or acronyms unique to the Policy.

BPSE: Ballard Power Systems Europe.

3.0 Responsible Persons

As described in IEC 60079-14 Annex A section A.2.1 the following knowledge and skills is required to be approved for being the **Responsible Person** on a EX installation

"Responsible persons who are responsible for the processes involved in the design, selection and erection of explosion protected equipment shall possess, at least, the following:

a) general understanding of relevant electrical engineering;

b) understanding and ability to read and assess engineering drawings;

c) practical understanding of explosion protection principles and techniques;

d) working knowledge and understanding of relevant standards in explosion protection;

e) basic knowledge of quality assurance, including the principles of auditing, documentation, traceability of measurement and instrument calibration.

Such persons shall confine their involvement to the management of competent operatives conducting selection and erection duties and not engage themselves directly in the work without ensuring their practical skills at least meet the requirements given in A.2.2."

Besides the knowledge and skills, the following competences are also required in some way to approve for the **Responsible Person** as described in IEC 60079-14 Annex A section A.3.2.

"Responsible persons shall be able to demonstrate their competency and provide evidence of attaining the knowledge and skill requirements specified in A.2.1 relevant to the types of protection and/or types of equipment involved."

4.0 Operatives/technicians

As described in IEC 60079-14 Annex A section A.2.2 the following knowledge and skills is required to be approved for being **Operatives** or **technicians** on a EX installation.

"*Operatives/technicians shall possess, to the extent necessary to perform their tasks, the following:*

a) understanding of the general principles of explosion protection;

b) understanding of the general principles of types of protection and marking;

c) understanding of those aspects of equipment design which affect the protection concept;

d) understanding of content of certificates and relevant parts of this standard;

e) general understanding of inspection and maintenance requirements of IEC 60079-17;

f) familiarity with the particular techniques to be employed in the selection and erection of equipment referred to in this standard;

g) understanding of the additional importance of permit to work systems and safe isolation in relation to explosion protection."

Besides the knowledge and skills, the following competences are also required in some way to approve for being **Operatives** or **technicians** as described in IEC 60079-14 Annex A section A.3.3.

"*Operatives/technicians shall be able to demonstrate their competency and provide evidence*

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

of attaining the knowledge and skill requirements specified in A.2.2 relevant to the types of protection and/or types of equipment involved.

They shall also be able to demonstrate their competency with documentary evidence in the:

a) use of documentation in 4.2;

b) production of reports, e.g. inspection reports, to the user as identified in 4.2;

c) practical skills necessary for the preparation and installation of relevant concepts of protection;

d) use and production of installation records as identified in 4.2."

5.0 Designer

As described in IEC 60079-14 Annex A section A.2.3 the following knowledge and skills is required to be approved for being **Designer** on a EX installation.

"*Designers shall possess, to the extent necessary to perform their tasks, the following:*

a) detailed knowledge of the general principles of explosion protection;

b) detailed knowledge of the general principles of types of protection and marking;

c) detailed knowledge of those aspects of equipment design which affect the protection concept;

d) detailed knowledge of content of certificates and relevant parts of this standard;

e) understanding of practical skills for the preparation and installation of relevant concepts of protection;

f) detailed knowledge of the additional importance of permit to work systems and safe isolation in relation to explosion protection;

g) detailed knowledge of the particular techniques to be employed in the selection and erection of equipment referred to in this standard;

h) general understanding of inspection and maintenance requirements of IEC 60079-17."

*Besides the knowledge and skills, the following competences are also required in some way to approve for being **Designers** as described in IEC 60079-14 Annex A section A.3.4.*

"Designers shall be able to demonstrate their competency and provide evidence of attaining the knowledge and skill requirements specified in A.2.3 relevant to the types of protection and/or types of equipment involved.

They shall also be able to demonstrate their competency with documentary evidence in the:

a) production of documentation specified in 4.2;

b) production of designers certificates to the user as identified in 4.2;

c) practical skills necessary for the preparation and compilation of relevant design details for the concepts of protection and systems involved;

d) updated and production of installation records as identified in 4.2."

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

6.0 Appendices

Table 6-1: List of people and competences for Crosswind project

Name:	Initials:	Background/competences:	Allowable role:
Rasmus Simonsen	RBS	Qualification -Marine engineer (Bachelor in Technology Management and Marine Engineering) Graduated in 2020 Experience 2023-present Ballard power system lead ATEX engineer on stationary products. Responsible for EX design and approval on various containerized solutions for land based and marine applications. EX consultant for various customers and internal projects. 2020-2023 Fuel cell development project manager. Lead engineer and owner of documentation for storage and testing facilities involving liquid and gas installations. Courses -ATEX course at Teknologisk Institut -Zone classification 60079-10 course at TML safety engineering -Internal Ballard H2 fuel cell course	Responsible person, Operatives/technician and designer

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Table 6-1: List of people and competences for Crosswind project			
Karin Hesselholt	KHE	Qualification -Marine engineer (Bachelor in Technology Management and Marine Engineering) Graduated in 1987 Experience: 1987 to 2006 (Maersk Line). Worked as Marine Engineer -Chief Engineer onboard LPG/C vessels Performing maintenance work on cargo equipment as well as performing Approval Scheme on behalf of Lloyds Register. 2013 to 2017 (Svanehøj Pumps) Senior Project Manager on delivery of Cargo Pumps for Statoil Floating Storage Vessels. Preforming ATEX certification of the Cargo Pumps (capacity 500m^3 crude Oil/hour) for installation in Zone 1. Notified Body DTI (Teknologisk Institut) 2020 – present (Ballard Power Systems) Senior Application Engineer/Marine Specialist. Working with development of the Fcwave module and the Type Approval of the modules with Class Societies DNV, LR and ABS. Participating in HAZID approvals for marine installation of FCwave modules in Vessels. Courses -ATEX course at Teknologisk Institut -Internal Ballard H2 fuel cell course	Project Manager/Technician and designer

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Table 6-1: List of people and competences for Crosswind project			
Peter Blach	PBL	Qualification -Automation Engineer Graduated in 2012 Experience 2017 – present (Ballard Power Systems) Working with development of the FCwave module and the Type Approval of the modules with Class Societies DNV Courses -Internal Ballard H2 fuel cell course	Operatives/technician and designer
Peter Blok	PBH	Qualification -Marine engineer (Bachelor in Technology Management and Marine Engineering)	Operatives/technician
Andreas Simony	ASM	Qualification -BSc - Motorsport Technology Graduated in 2016 -MSc - Racing Engine Design Graduated in 2017 Experience NA Courses -Internal Ballard H2 fuel cell course	Operatives/technician

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Table 6-1: List of people and competences for Crosswind project			
Rasmus Knudsen	RKL	Qualification -BSc - Motorsport Technology Graduated in 2016 -MSc - Racing Engine Design Graduated in 2017 Experience NA Courses -Internal Ballard H2 fuel cell course	Operatives/technician
Morten Fog	MFO	Qualification -Marine engineer (Bachelor in Technology Management and Marine Engineering) Graduated in 2008	Operatives/technician and designer

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Table 6-2: *Qualifications Rasmus Simonsen*			
Qualification	Fulfil	Not fulfil	Note:
Responsible person qualifications			
general understanding of relevant electrical engineering	x		
understanding and ability to read and assess engineering drawings	x		
practical understanding of explosion protection principles and techniques	x		
working knowledge and understanding of relevant standards in explosion protection	x		
basic knowledge of quality assurance, including the principles of auditing, documentation, traceability of measurement and instrument calibration	x		
Operatives/technicians qualifications			
understanding of the general principles of explosion protection	x		
understanding of the general principles of types of protection and marking	x		
understanding of those aspects of equipment design which affect the protection concept	x		
understanding of content of certificates and relevant parts of this standard	x		
general understanding of inspection and maintenance requirements of IEC 60079-17	x		
familiarity with the particular techniques to be employed in the selection and erection of equipment referred to in this standard	x		
understanding of the additional importance of permit to work systems and safe isolation in relation to explosion protection	x		
use of documentation in 4.2	x		
production of reports, e.g. inspection reports, to the user as identified in 4.2	x		
practical skills necessary for the preparation and installation of relevant concepts of protection	x		
use and production of installation records as identified in 4.2.	x		
Designer qualification			

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Table 6-2: *Qualifications Rasmus Simonsen*			
detailed knowledge of the general principles of explosion protection	x		
detailed knowledge of the general principles of types of protection and marking	x		
detailed knowledge of those aspects of equipment design which affect the protection concept	x		
detailed knowledge of content of certificates and relevant parts of this standard	x		
understanding of practical skills for the preparation and installation of relevant concepts of protection	x		
detailed knowledge of the additional importance of permit to work systems and safe isolation in relation to explosion protection	x		
detailed knowledge of the particular techniques to be employed in the selection and erection of equipment referred to in this standard	x		
general understanding of inspection and maintenance requirements of IEC 60079-17	x		
production of documentation specified in 4.2	x		
production of designers certificates to the user as identified in 4.2	x		
practical skills necessary for the preparation and compilation of relevant design details for the concepts of protection and systems involved	x		
updated and production of installation records as identified in 4.2	x		

Table 6-3: *Qualifications Peter Blach*			
Qualification	Fulfil	Not fulfil	Note:
Responsible person qualifications			
general understanding of relevant electrical engineering	X		
understanding and ability to read and assess engineering drawings	X		
practical understanding of explosion protection principles and techniques	X		

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Table 6-3: *Qualifications Peter Blach*			
working knowledge and understanding of relevant standards in explosion protection	X		
basic knowledge of quality assurance, including the principles of auditing, documentation, traceability of measurement and instrument calibration		x	
Operatives/technicians qualifications			
understanding of the general principles of explosion protection	X		
understanding of the general principles of types of protection and marking	X		
understanding of those aspects of equipment design which affect the protection concept	X		
understanding of content of certificates and relevant parts of this standard	X		Understanding of the certificate part, but concrete content of the standard may be limited
general understanding of inspection and maintenance requirements of IEC 60079-17		X	Only what is instructed in manuals written by qualified personnel
familiarity with the particular techniques to be employed in the selection and erection of equipment referred to in this standard	X		To an electrical point of view
understanding of the additional importance of permit to work systems and safe isolation in relation to explosion protection	X		To an electrical point of view
use of documentation in 4.2	X		
production of reports, e.g. inspection reports, to the user as identified in 4.2	X		
practical skills necessary for the preparation and installation of relevant concepts of protection	X		Primarily to an electrical point of view
use and production of installation records as identified in 4.2.	X		
Designer qualification			
detailed knowledge of the general principles of explosion protection	X		
detailed knowledge of the general principles of types of protection and marking	X		

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Table 6-3: *Qualifications Peter Blach*			
detailed knowledge of those aspects of equipment design which affect the protection concept	X		To an electrical point of view
detailed knowledge of content of certificates and relevant parts of this standard		X	Understanding of the certificate part, but concrete content of the standard may be limited
understanding of practical skills for the preparation and installation of relevant concepts of protection	X		
detailed knowledge of the additional importance of permit to work systems and safe isolation in relation to explosion protection	X		
detailed knowledge of the particular techniques to be employed in the selection and erection of equipment referred to in this standard	X		
general understanding of inspection and maintenance requirements of IEC 60079-17		X	Only what is instructed in manuals written by qualified personnel
production of documentation specified in 4.2	X		
production of designers certificates to the user as identified in 4.2	X		
practical skills necessary for the preparation and compilation of relevant design details for the concepts of protection and systems involved	X		
updated and production of installation records as identified in 4.2	X		

Table 6-4: *Qualifications Peter Blok*			
Qualification	Fulfil	Not fulfil	Note:
Responsible person qualifications			
general understanding of relevant electrical engineering	X		
understanding and ability to read and assess engineering drawings	X		
practical understanding of explosion protection principles and techniques	X		

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

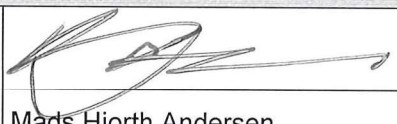
Confirmation of Satisfactory FAT

Part No.	601456B-7002362 Incl. sub-assemblies: 601456B-7002973 601456B-7003716
Product name	FC PowerGen 1000kW
Serial No.	601456B

Ballard Power Systems Europe A/S confirms that the above-listed equipment has satisfactorily with comments undergone and passed the Factory Acceptance Test (FAT) according to

BLPH Project – Acceptance Test Procedure (FAT) [K559-2254-CWIWP4202202-J08-001]



BLPH Project - Test Matrix for FAT and SAT [K559-2254-CWIWP4202202-J99-002]

601456B Crosswind BLPH FAT punch list [K559-2254-CWIWP4202202-J08-003]

prior to the shipment.

CrossWind C.V. acknowledges that the Factory Acceptance Test (FAT) for the above-listed equipment was witnessed and confirms that the test was performed satisfactorily with comments, and all agreed-upon specifications have been met.

1.0 Executive Summary

This document outlines the tests to be included in the witnessed Factory Acceptance Test. These tests aim to show the overall functionality of the fuel cell-based power plant. The verification should show the capability of delivering the expected AC power and that the product is ready to be delivered and installed on site.

When the delegations from CrossWind, Shell, Rosetti Marino and the surveyor from Fulkrum (CrossWind) were at Ballard Europe, Hobro to witness the selection of Factory Acceptance Tests 4/12 tests were performed and passed. The remaining eight tests are to be performed later are the following:

- F18 H2 leakage test
- O01 System Start/stop
- O09 Load Test – Step response 0 to 35%
- O10 Load Test – step response 35% to 70%
- O11 Load Test – Step response 65 to 100%
- O12 Load Test – 100% stability test – 3 hours
- O13 Load Test – Step response 100% to 50%
- O14 Load Test – step response 50% to 0%

4.0 Objectives and Background

This document describes the witnessed Factory Acceptance Tests. The tests do not include the internal testing that has been done to secure product maturity, mechanical and electrical connections have been done correctly.

The scope of testing is:

- Go through the Megablock with the customer to find defects that needs to be corrected
- Safety systems are functioning correctly in a complete Megablock with coolers.
- Megablock produces AC current, and the tests shall verify the capability to produce AC current following the demand.

Figure 1: Megablock System test overview

5.0 Functional tests

5.1 F02 Visual inspection

5.1.1 Test

The test involves an examination of the paint job through visual inspection, assessing the overall build quality, and checking for any dents. The focus is also on evaluating the assembly quality to ensure compliance with weather resistance.

5.1.2 Relevant Standard / document

- No reference

5.1.3 Brief Test Plan

- Visual inspection with customer of full system meaning inside and outside container solution.
- Take comprehensive pictures of the full system and test setup, including close-ups of vital components, with timestamps for reference.

5.1.4 Pass/Fail criteria.

- Visual inspect with customer to review quality of full system.

5.1.5 Test Result

Table 1: Visual inspection – Test Result

Date tested	Item	Result	Pass/Fail	Notes
13/8-2024	Inspection of paint	Accepted	Pass	See item list for further elaboration
13/8-2024	Assessing build quality	Accepted	Pass	See item list for further elaboration
13/8-2024	Check for dents	Accepted	Pass	See item list for further elaboration

5.2 F07 Electrical safety test – 10-foot container

5.2.1 Test

Follow designated standard to conduct electrical safety test, grounding continuity and high potential.

5.2.2 Relevant Standard / document

- EN 60204-1

5.2.3 Brief Test Plan

- According to EN 60204-1

5.2.4 Pass/Fail criteria.

- All relevant checks in EN 60204-1 chapter 18 passed.

5.2.5 Test Result

Table 2: Electrical safety test - Test results

Date tested	Item	Result	Pass/Fail	Notes
13/8-2024	Grounding Continuity	Accepted	Pass	-
13/8-2024	High Potential	Accepted	Pass	-

Table 3: Electrical safety test - calibration equipment

Unit	Equipment number	Calibration due date	Equipment used for
Metrel CE-Multitester	086-003	19/1-2025	Grounding Continuity and High Potential

5.3 F08 Electrical safety test – 40-foot container

5.3.1 Test

Follow designated standard to conduct electrical safety test, grounding continuity and high potential.

5.3.2 Relevant Standard / document

- EN 60204-1

5.3.3 Brief Test Plan

- According to EN 60204-1

5.3.4 Pass/Fail criteria.

- All relevant checks in EN 60204-1 chapter 18 passed.

5.3.5 Test Result

Table 4: Electrical safety test - Test Result

Date tested	Item	Result	Pass/Fail	Notes
13/8-2024	Grounding Continuity	Accepted	Pass	-
13/8-2024	High Potential	Accepted	Pass	-

Table 5: Electrical safety test - Calibration equipment

Unit	Equipment number	Calibration due date	Equipment used for
Metrel CE-Multitester	086-003	19/1-2025	Grounding Continuity and High Potential

5.4 F10 Safety

5.4.1 Test

Conduct tests of safety inputs and outputs, including emergency stop buttons, smoke detectors, gas detectors and external connections.

5.4.2 Relevant Standard / document

- Safety input checklist according to EN/ISO 13849-2 procedure

5.4.3 Brief Test Plan

- Trigger each safety input according to checklist.
  - Emergency pushbuttons
  - Smoke detectors test
  - H2 sensor test
  - External safety switches
  - External feedback

5.4.4 Pass/Fail criteria.

- Verified according to checklist.
- Each item triggers the correct alarm

5.4.5 Test Result

Table 6: Safety - Test Result

Date tested	Item	Result	Pass/Fail	Notes
13/8-2024	Emergency pushbuttons	OK	Pass	-
13/8-2024	Smoke detectors	OK	Pass	3 sensors in 40ft container and 1 sensor in 10 ft container
13/8-2024	H2 sensors	OK	Pass	3 sensors in 40ft container
13/8-2024	External safety switches	OK	Pass	-
13/8-2024	External feedback	OK	Pass	-

Table 7: Safety - Calibration Equipment

Unit	Equipment number	Calibration due date	Equipment used for
Dräger calibration gas, 2% Hydrogen	Cylinder No: 955-657732	Valid until 10/1-2029	H2 sensors

5.5 F18 H_2 Leakage test

5.5.1 Test procedure

All pipework and H2 instrumentation subassemblies must be inspected, recorded, verified and pass in accordance with the procedure in section 5.4 in *SPC ID 0104 H2 Leak Test Procedure Rev 002* prior to full system FAT.

System H2 leakage test is done system pressure decay test, according to section 5.5 in *SPC ID 0104 H2 Leak Test Procedure Rev 002.*

5.5.2 Pass/Fail criteria.

Pressure decay test with a maximum leakage no greater than specified in test procedure.

Result details are documented in the template *SPC ID 0204 System pressure decay test template*

Parameter	Value	Description
L_A [Nm^3/h]	**2,72 – 3,58 x10^{-3}**	**Maximum allowed pressure decay to pass pressure decay test, where L_A = L_S + L_Mu**
L_S [Nm^3/h]	0	Summarized expected leak rates of all components in the system (per design leak rate).
L_Mu [Nm^3/h]	2,72 – 3,58 x10^{-3}	Calculated accuracy of the measuring system, used to perform the test.
L_C [Nm^3/h]	2,7x10^{-5}	Maximum allowed leak rate for a given pipe section, where integrity/operability of the system may be maintained safely

5.5.3 Test Result

Table 8: H2 leakage - Test Result

Date tested	Item	Leakage rate L_1 [Nm^3/h]	Pass/Fail	Notes
3/9-2024	H2 line 1	4.03E-05	Pass	-
3/9-2024	H2 line 2	8.06E-05	Pass	-
3/9-2024	H2 line 3	0.00E+00	Pass	-

3/9-2024	H2 line 5	7.27E-05	Pass	-
3/9-2024	H2 line 6	-8.16E-05	Pass	-

6.0 Operational tests

Operations are done using operator HMI or remote HMI in normal operating mode.

6.1 O01 System Start/Stop - Normal low load operation.

6.1.1 Test

Fuel Cell system can start, deliver minimum power and perform controlled stop without faults. This test is based on DC power.

6.1.2 Relevant Standard / document

- No reference

6.1.3 Brief Test Plan

- All FC in standby
- Request 100kW DC
- Delay 120 seconds
- Request zero power
- Repeat with new preferred FC until all tested.

6.1.4 Pass/Fail criteria.

- Fuel Cell Package starts without faults.
- No persistent system alarms.
- Correct available power signal.
- DC Power output within +/-5% and stable in less than 60 seconds
- Fuel Cell Package stops without faults.
- FC in stand-by in less than 30 seconds.

6.1.5 Test Result

Table 9: System Start/Stop – Normal low load operation - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	FCwave 1	All pass criterias passed except time to standby	Pass with note	Shut down to standby longer than 30 seconds
3/9-2024	FCwave 2	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 58 seconds. Power output dipped to 82 kW during the test.
3/9-2024	FCwave 3	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 55 seconds.
3/9-2024	FCwave 4	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 59 seconds.
3/9-2024	FCwave 5	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 57 seconds.
3/9-2024	FCwave 6	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 1 minute 3 seconds.

6.2 O09 Load Test – step response 0 to 35%

6.2.1 Test

Test step response by adding 35% load in one step from no load while measuring AC power quality.

6.2.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.2.3 Brief Test Plan

- All FC in stand-by.
- Apply set point by requesting 350kW AC

6.2.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Startup time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

6.2.5 Test Result

Table 10: Load Test - step response 0 to 35% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 0-35%	45 seconds for start-up 0-350kW AC. Slight overshoot on 30 kW AC	Pass	With reference to document C08 it is estimated that a ramp time to 500 kW is 75 seconds.
3/9-2024	AC power quality	2,8-2,9% VAC THD 2-50 No alarms	Pass	

6.3 O10 Load Test – step response 35% to 70%

6.3.1 Test

Test step response by adding 35% load in one step to reach 70% load while measuring AC power quality.

6.3.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.3.3 Brief Test Plan

- 3 FC running delivering 350kW AC steady state.
- 2 FC in stand-by
- Apply set point by requesting 700kW AC power.

6.3.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Startup time < curve+5 seconds at any FC
- AC power quality within SPC ID 107
- No persistent system alarms.

6.3.5 Test Result

Table 11: Load Test - step response 35% to 70% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 35%-70%	All 3 started up. 23 seconds startup time	Pass	With reference to document C08 it is estimated that a ramp time from 250 kW to 750 kW is 45 seconds.
3/9-2024	AC power quality	2,8-3,0 % VAC THD 2-50 No alarms	Pass	

6.4 O11 Load Test – step response 65% to 100%

6.4.1 Test

Test step response by adding 35% load in one step to reach full load while measuring AC power quality.

6.4.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.4.3 Brief Test Plan

- 6 FC running delivering 650kW AC steady state.
- Apply set point by requesting 1000kW AC power.

6.4.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Startup time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

6.4.5 Test Result

Table 12: Load Test - step response 65% to 100% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 65%-100%	18 seconds startup time	Pass	With reference to document C08 it is estimated that a ramp time from 250 kW to 750 kW is 45 seconds.
3/9-2024	AC power quality	3,0-3,1 % VAC THD 2-50 No alarms	Pass	

6.5 O12 Load Test – 100% stability test - 3 hours.

6.5.1 Test

Test steady state at 100% load for 3 hours while measuring power quality.

6.5.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.5.3 Brief Test Plan

- 6 FC running delivering 1000kW steady state.

6.5.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Shutdown time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

6.5.5 Test Result

Table 13: Load Test – Steady state 100% load - Test Result

Date tested	Item	Result	Pass/Fail	Notes
04-09-24	Full load test	1000 kW for 3 hours	Pass	See below
04-09-24	AC power quality	2.3-3.6 % VAC THD 2-50 No alarms	Pass	

- Following added to document 05/09/2024
- In agreement with customer, after half elapsed time of the test, BOP load was increased to maximum by the following:
  - All HT fans forced to 100%
  - HT Coolant pumps forced to 70%
  - Ventilation (40ft+10ft) increased to 100%
- No impact on power delivery was observed.

6.6 O13 Load Test – step response 100% to 50%

6.6.1 Test

Test step response by removing 50% load in one step at full load while measuring power quality.

6.6.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.6.3 Brief Test Plan

- 6 FC running delivering 1000kW steady state.
- Request 500kW AC.

6.6.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Shutdown time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

6.6.5 Test Result

Table 14: Load Test - step response 100% to 50% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 100%-50%	Ramp down in 15 seconds	Pass	Wit reference to document C08 it is estimated that a ramp down time from 800 kW to 200 kW is 15 seconds.
3/9-2024	AC power quality	3,0-2,6 % VAC THD 2-50 No alarms	Pass	

6.7 O14 Load Test – step response 50% to 0%

6.7.1 Test

Test step response by removing 50% load in one step to no load while measuring AC power quality.

6.7.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.7.3 Brief Test Plan

- 3 FC running delivering 500kW AC.
- Request 0% and apply set point.

6.7.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Shutdown time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

6.7.5 Test Result

Table 15: Load Test - step response 50% to 0% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
03-09-2024	Step response 50%-0%		Pass	Test is executed with 6 FC instead of 3 as the plan describes
—	AC power quality	NA	NA	Not applicable due to the unit not producing power

SPC ID 0204 System Pressure Decay Test Template

This document, submitted in confidence, contains proprietary information which shall not be reproduced or transferred to other documents or disclosed to others or used for manufacturing or any other purpose without prior written permission of Ballard Power Systems.

Revision Record

Rev #	Description	Revised By	Date dd-mm-yyyy
-	Initial Draft	TAN	21-08-2024
1	Released	TAN	30-08-2024
2	Updated	TAN	09-09-2024

Purpose	Pressure decay test template for recording tightness and evaluating system pipework integrity
Reference procedure	SPC ID 0104 rev 002 H2 Leak Test Procedure

Checked by	MHA	Date: 09/09-2024
Approved by	MHA	Date: 09/09-2024

Title	System Pressure Decay, Complete Assembly, Crosswind
Project	601456B Crosswind BLPH
Test date	03-09-2024
Identification of piping system (photo or P&ID) [✓ or -]	✓ see Sheet "P&ID"

Test volume	String 1 HA01+DA02-QM01 to YV_H30 solenoid valve in FCwave 1. Similar valves for string 2-6.
Test fluid/gas	Hydrogen
Test location	Crosswind Container, Majsmarken 1, 9500 Hobro Denmark
Test performed by	TAN
Results approved by	MHA
Filing date	09-09-2024

L_S - Expected leak rate for pipework system							
Ferrule fittings tightness tolerance	< 0		bar				
Bonded seal tightness tolerance	< 0		bar				
L_S total*	= 0		bar				
L_S total	=	0	NM3/h				
L_Mu - Measuring system uncertainty							
pressure gauge uncertainty							
transmitter FS (full scale)	=	16	barg				
Linearity	<	0.2	% of FS	=	<	32	mbar
Non-repeatability	<	0.1	% of FS	=	<	16	mbar
Analogue input	±	10	microA	=		10	mbar/10 minutes
Accuracy ±0.25% actual reading	±	32.5	microA		=	32.5	mbar
Temperature uncertainty (3 Kelvin)				=	±	82	mbar/10 minutes
L_Mu total					=	172.5	mbar

*=All joints and valves are considered to be classified "enhanced tightness". Hence zero allowable leak rate

Calculation of L_Mu, measuring system uncertainty

	V	T0	T1	T2	P0	P1	P2	Pa1	Pa2	t	L_Mu
	M3	°C	°C	°C	kPa	barg	barg	kPa	kPa	minutes	NM3/h
String 1	3.46E-03	15	15	15	101.325	7.150	6.978	101.325	101.325	10	3.53E-03
String 2	3.05E-03	15	15	15	101.325	7.150	6.978	101.325	101.325	10	3.12E-03

String 3	2.67E-03	15	15	15	101.325	7.150	6.978	101.325	101.325	10	2.72E-03
String 4	2.74E-03	15	15	15	101.325	7.150	6.978	101.325	101.325	10	2.80E-03
String 5	3.12E-03	15	15	15	101.325	7.150	6.978	101.325	101.325	10	3.19E-03

Calculation of L_A, max evaluated leak rate for pipework system acceptance

	L_S	L_Mu		L_A
	NM3/h	NM3/h		NM3/h
String 1	0	3.53E-03	=	3.53E-03
String 2	0	3.12E-03	=	3.12E-03
String 3	0	2.72E-03	=	2.72E-03
String 4	0	2.80E-03	=	2.80E-03
String 5	0	3.19E-03	=	3.19E-03
String 6	0	3.58E-03	=	3.58E-03

Procedure

Fill in design pressure =	6.5	barg
The Test Pressure is 1.1 times design pressure or above =	7.15	barg
If the system previosly has been leakage tested with formier gas, this test can also use the used gas for operation		
To perform the test follow "Sequence" paragraph 5.5.3 in SPC 0104 H2 Leak Test Procedure		

Calculation of L1, actual leak rate

	V	T0	T1	T2	P0	P1	P2	Pa1	Pa2	t	L1 (gas leakage rate)
	M3	°C	°C	°C	kPa	barg	barg	kPa	kPa	minutes	NM3/h
String 1	0.003458573	15	19.7	19.7	101.325	7.494	7.492	1015	1015	10	4.03E-05
String 2	0.003458573	15	19.7	19.7	101.325	7.578	7.574	1015	1015	10	8.06E-05

Author: PBL, TAN

Ballard Power Systems Europe

Summary:

Thermographic report from Crosswind FAT2, 2024-09-04.

System is operating at 100% (1MW) and have been at full power for >1 hour with the cooling and ventilation system operating at 100%.

Test start at 8:55

The first few images are the system from a distance.

First half of the report shows thermal images from inside the 40ft container, with focus on DC power cables, pumps and fans and process exhaust pipes.

Second half of the report shows the system test equipment and outside the system.

There are no items of concern.

Summary:

Date: 09/08/2024

Author: PBL

Ballard Power Systems Europe

Summary:

Thermograhic test of the Crosswind BLPH 1MW system

Entire power train included, from Fuel DCDC converters to AC output transformer.

Hottest item found is DC fuses at 70-75 degrees, which is within expected range.

No items found with elevated temperatures

Some images of test setup is included, but not inside Crosswind scope.

TYPE APPROVAL CERTIFICATE

Certificate No:
TAE00004GG
Revision No:
2

This is to certify:

That the Fuel Cell

with type designation(s)
FCwave

Issued to
Ballard Power Systems Europe A/S
Hobro, Nordjylland, Denmark

is found to comply with
DNV rules for classification – Ships

Application :

Product(s) approved by this certificate is/are accepted for installation on all vessels classed by DNV.

Issued at **Hamburg** on **2023-07-14**
This Certificate is valid until **2027-05-31**.
DNV local unit: **Denmark CMC**

Approval Engineer: **Sven Lellesch**

for **DNV**

Olaf Drews
Head of Section

This Certificate is subject to terms and conditions overleaf. Any significant change in design or construction may render this Certificate invalid.
The validity date relates to the Type Approval Certificate and not to the approval of equipment/systems installed.

LEGAL DISCLAIMER: Unless otherwise stated in the applicable contract with the holder of this document, or following from mandatory law, the liability of DNV AS, its parent companies and their subsidiaries as well as their officers, directors and employees ("DNV") arising from or in connection with the services rendered for the purpose of the issuance of this document or reliance thereon, whether in contract or in tort (including negligence), shall be limited to direct losses and under any circumstance be limited to 300,000 USD.

Product description

FCwave™ is a PEM fuel cell power module with rated power of 200 kW for marine applications. The system is comprised of an enclosure with an internal separate lower and upper cabinet. The system, lower and upper cabinet, each have individual serial numbers and can be replaced during the service lifetime of the product.

The fuel for the system is pressurized gaseous hydrogen. The hydrogen storage system is not part of Ballard Power Systems Europe scope and therefore not part of the type approval. Oxidant for the reaction is drawn from ambient air and compressed in the internal compressors to feed the fuel cell stacks.
From the stacks, the module will deliver up to 720V direct current to the output of the system. It acts as a load follower electrically. The system needs power from external power source such as the vessels power system to start up, but when running it self-powers the internal Balance of Plant components. The controller and safety system require 24 VDC continuously from the vessels power system to function.
The system requires external water cooling to remove excess heat from the exothermic reaction in the fuel cells. The heat transfer is done with the integrated heat exchanger. The heat can be used in shipboard systems or disposed of as the customer desires. The fuel cells used in the system are Low Temperature PEM fuel cells. Temperatures in the system are below 100°C. The Fuel cell system is built into a cabinet. The cabinet has an ingress protection of IP44. The system is designed to be installed inside a fuel cell installation room. FCwave™ follows the gas safe machinery space concept as per IGF Code.

H2 Enclosure ventilation Inlet
Process air inlet
Water drain

Application/Limitation

Fuel cell of type FCwave™ is approved for application as per DNV-RU-SHIP Pt.6 Ch.2 Sec.3.

Installation room
The fuel cell space (H2 enclosure as part of the FCwave™ cabinet) is not equipped with A60 insulation and is not equipped with a fire extinguishing system as indicated in MSC.1/Circ.1647 para 3.1.2 and 3.3.1. Additional installation room requirements shall be defined in the detailed design phase for the vessel.

The installation room is regarded as non-hazardous space.
The free volume of the installation room shall not be less than 10m³.
Gas detection is recommended for the fuel cell installation room and in the ventilation exhaust.

The FCwave™ does not provide an emergency stop button. Adequate and accessible emergency stop buttons shall be provided and integrated to the FCwave™ emergency stop circuit.
Access to the installation room during operation shall be limited to trained service technicians and crew that have received Ballard fuel cell training. Unrestricted access to the installation room can be permitted when all fuel cell modules are powered off and otherwise deemed permissible.

Hydrogen supply
Supply piping to each cabinet shall be carried out as double walled piping following the IGF Code principles.
Each FCwave™ cabinet shall be provided with a shut-off valve with a closing time of less than 2 seconds.
The hydrogen mass flow to each FCwave™ must be restricted by suitable means in all operation scenarios to 4.9g/s.
The dimension (diameter and length) of the hydrogen supply piping from shut-off valve to module interface plate shall not exceed 5000 cm³ as per Integration Manual.

Ventilation
The fuel cell space (H2 enclosure as part of the FCwave™ cabinet) is designed with area classification according to IEC 60079-10:2020, at least suitable for zone 2 installation.
In all cases process air and ventilation exhaust must remain separated, combination of multiple systems exhaust of the same type only. If process and/or ventilation exhausts are combined from multiple systems, they must be equipped with separate isolation dampers, which must close if the module are not operating.
The integration to the vessel shall ensure the exhaust from FC modules (ventilation air) is led to a safe location free of any spark or ignition source.

Approval Conditions
For each delivery to DNV class the following documentation of the fuel cell power installation is to be submitted for approval:

Fuel cell power installation
- Reference to this type approval certificate
- Documents according to DNV RU-SHIP, Pt. 6 Ch. 2 Sec. 3, table 3 for Fuel cell power installation
- G060 Structural fire protection drawing
- G200 Fixed fire protection drawing
- MAN002 Integration Manual

The Type Approval covers hardware and software listed under product description.

When the type approved software is revised (affecting all future deliveries) DNV is to be informed by forwarding updated software version documentation. If the changes are judged to affect functionality for which rule requirements apply a new functional type test may be required and the certificate may have to be renewed to identify the new software version.

Product certificate
Each delivery of the application system is to be certified according to Pt.6, Ch.2, Sec. 3. The certification test is to be performed at the manufacturer of the application system before the system is shipped to the yard. After certification, the clause for application software control will be put into force

Application software control
All changes in software are to be recorded as long as the system is in use on board. Documentation of major changes are to be forwarded to DNV for evaluation and approval before implemented on board

Type Approval documentation

Tests carried out

Marking of product
The components shall be marked for traceability to the Type Approval.

Periodical assessment
For retention of the Type Approval, a periodical assessment as per DNV-CP-0338 Sec.4 shall be performed by a DNV Surveyor in order to verify that the conditions for the Type Approval are complied with.
To check the validity of this certificate, please look it up in https://approvalfinder.dnv.com.

Certificate No: LR23327644TA
Issue Date: 27/07/2023
Expiry Date: 26/07/2028

Type Approval Certificate

This is to certify that the undernoted product(s) has/have been tested with satisfactory results in accordance with the relevant requirements of the Lloyd's Register Type Approval System.

Manufacturer	**Ballard Power Systems Europe A/S**
Address	Majsmarken 1, Hobro, 9500, Denmark
Type	Fuel Cell Module
Description	FCwave™ is a PEM fuel cell power module with rated power of 200 kW for marine applications. The system is comprised of an enclosure with an internal separate lower and upper cabinet. The system, lower and upper cabinet, each have individual serial numbers and can be replaced during the service lifetime of the product. The fuel for the system is pressurized gaseous hydrogen. The hydrogen storage system is not part of Ballard Power Systems Europe scope and therefore not part of the type approval. Oxidant for the reaction is drawn from ambient air and compressed in the internal compressors to feed the fuel cell stacks. From the stacks, the module will deliver up to 720V DC to the output of the system. It acts as a load follower electrically. The system needs power from external power source such as the vessels power system to start up, but when running it self-powers the internal Balance of Plant components. The controller and safety system require 24V DC continuously from the vessels power system to function. The system requires external water cooling to remove excess heat from the exothermic reaction in the fuel cells. The heat transfer is done with the integrated heat exchanger. The heat can be used in shipboard systems or disposed of as the customer desires. The fuel cells used in the system are Low Temperature PEM fuel cells. Temperatures in the system are below 100°C. The Fuel cell system is built into a cabinet. The cabinet has an ingress protection of IP 44. The system is designed to be installed inside a fuel cell installation room.

Electrical & Control - Senior Specialist to
Lloyd's Register EMEA
A member of the Lloyd's Register group

71 Fenchurch Street, London, EC3M 4BS, United Kingdom

Lloyd's Register Group Limited, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as 'Lloyd's Register'. Lloyd's Register assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

Type Approval Certificate

FCwave™ follows the gas safe machinery space concept as per IGF Code.

Trade Name

FCwave™

Application

Marine, Offshore and Industrial applications for use in environmental categories ENV1, as defined in Lloyd's Register Type Approval System, Test Specification Number 7, Fuel Cell Modules, January 2023.

Specified Standard

-Manufacturer's specification
-IACS UR E10 Rev. 8 / 2021 as applicable

Ratings

-Maximum rated output power: 200kW
-Operating voltage: 350 – 720V DC
-Rated current: 2 x 300A or 1 x 550A

Other Conditions

The Fuel Cell Module is approved subject to the following conditions:

- A risk assessment specific to fuel cell power installations is to be carried out for each installation on board.The risk assessment is to evaluate risks related to the safe operation of the ship and as such is to address the safety of the fuel cell power installation itself and, where the fuel cell installation provides power for propulsion of the ship or other essential services, the dependability of the fuel cell power installation.
- The Fuel Cell Module shall only be used in accordance with the manufacturer's instructions and recommendations.
- The Fuel Cell Module shall be installed and maintained in accordance with the applicable rules, regulations, and standards for marine applications.
- The Fuel Cell Module shall be operated and monitored in accordance with the relevant safety requirements.
- The Fuel Cell Module shall be subject to periodic inspections and maintenance, in accordance with the manufacturer's recommendations and applicable rules and regulations.

Lloyd's Register Group Limited, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as 'Lloyd's Register'. Lloyd's Register assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

Type Approval Certificate

Type Approval does not eliminate the need for normal inspection and survey procedures required by the Rules and Regulations.
If the specified standards are amended during the validity of this certificate, the product is to be re-approved prior to it being supplied to vessels to which the amended standards apply.

This certificate is not valid for equipment, the design, ratings or operating parameters of which have been varied from the specimen tested. The manufacturer should notify Lloyd's Register EMEA of any modification or changes to the equipment in order to obtain a valid Certificate.

The Design Appraisal Document HPC2262032/JM/PH and its supplementary Type Approval Terms and Conditions form part of this Certificate.

71 Fenchurch Street, London, EC3M 4BS, United Kingdom

Lloyd's Register Group Limited, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as 'Lloyd's Register'. Lloyd's Register assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

Tier
5 - Unit Certification Required

Intended Service
Main & Auxiliary Power Generation for Marine and Offshore Applications

Description
FCwave is a low temperature PEM fuel cell power system with rated power output of 200kW for marine applications. The system is comprised of an enclosure with an internal separate lower and upper cabinets, each has individual serial numbers and can be replaced during the service lifetime of the product, as necessary.

Ratings
Power output: 200 KW

H2 Inlet Supply Pressure: 3.5 - 6.5 barg

H2 Design Temperature of operation: 0 - 80°C

Fuel Cell Hydrogen Operating Pressure: 0.2 - 1.0 barg

H2 Flowrate to Valve Block: 4.9 g/s

Ingress Protection of Cabinet: IP44

Operating Ambient Temperature: 0 -45 degree

Service Restrictions
Unit Certification is required for this product as indicated in the 4-9-3/Table 2 and 4-9-9/15.7 of the ABS Rules for Building and Classing Marine Vessels (2024).

Copyright 2019 American Bureau of Shipping. All rights reserved.

If the manufacturer or purchaser request an ABS Certificate for compliance with a specification or standard, the specification or standard, including inspection standards and tolerances, must be clearly defined.

Comments

1. The Manufacturer has provided a declaration about the control of, or the lack of Asbestos in this product.

2. During final installation the attending Surveyor is to verify that redundant gas detectors able to detect H2 are installed in the appropriate locations and operate properly. Any accumulation of gas to 20% LFL should trigger gas detector alarm and accumulation to 40% LFL should trigger the ESD.

3. During final installation the attending Surveyor is to verify that the FCwave is equipped with anchor mechanisms or other suitable attachments to the base structure or the hull.

4. Upon installation, the Surveyor is to verify that the door air intakes/inlets are clear to minimize the risk of complete blockage.

5. Upon installation, the Surveyor is to verify that the Chassis is properly grounded.

6. After assembled to a complete assembly unit or subassembly unit, each production unit of equipment used in control, monitoring and safety systems is to be tested at the manufacturer’s shop in the presence of the ABS Surveyor according to 4-9-9/15.7 TABLE 2 as follows:

i) Visual inspection

ii) Performance test

iii) External Power supply failure

7. FCwave system has been assigned with a Category II system classification per 4-9-3/Table 1 of the Marine Vessels Rules. Accordingly, the following tests are to be performed and are to be witnessed by the Surveyor at the Factory in accordance with 4-9-3/Table 2 of the Marine Vessels Rules (MVR).

i) 3.6: Fault Simulation.

ii) 3.7: Factory Acceptance Tests.

8. The design applies the Hazardous Zone Classification method of IEC 60079-10. The fuel cell installation room is considered as a Non-Hazardous Zone or Zone 2 with negligible extent in accordance with IEC 60079-10-1/Table D.1, with all hydrogen fuel piping entering the space and leading to or from the non-structural fuel cell space enclosure to be provided with a double-wall containment system appropriate to the fuel used by the piping.

9. Structural fire protection shall apply to the fuel cell installation room boundaries, not the fuel cell space enclosure; fire detection and fire extinguishing system requirements shall apply to the fuel cell installation room, not within the fuel cell space enclosure as per Section 3 of Fuel Cell Power Systems Requirements.

10. For each installation, safety concepts including the hazardous zone of the fuel cell installation room and multiple installation of the fuel cell units are to be declared to the flag administration for further consideration and evaluated during the risk assessment.

Term of Validity
This Product Design Assessment (PDA) Certificate remains valid until 30/Jun/2029 or until the Rules and/or Standards used in the assessment are revised or until there is a design modification warranting design reassessment (whichever occurs first).

Acceptance of product is limited to the "Intended Service" details prescribed in the certificate and as per applicable Rules and Standards.

This Certificate is valid for installation of the listed product on ABS units which exist or are under contract for construction on or previous to the effective date of the ABS Rules and standards applied at the time of PDA issuance. Use of the Product for non-ABS units is subject to agreement between the manufacturer and intended client.

ABS Rules
Rules for Conditions of Classification, Part 1 - 2024 Marine Vessel Rules 1-1-4/7.7, 1-1-A3, 1-1-A4, Which covers the following:

Marine Vessel Rules (MVR) 2024 :4-9-3/Table 1, 4-9-3/Table 2, 4-9-9/15.7, 5C-13-7/3, 5C-13-16/1.1

Requirements for Fuel Cell Power Systems for Marine and Offshore Applications 2023

International Standards
IEC 60079-10: Classification of Area – Explosive Gas Atmosphere

IEC 62282-2-100:2020, Fuel cell technologies - Part 2-100: Fuel cell modules – Safety

IEC 62282-3-100:2019, Fuel cell technologies - Part 3-100: Stationary fuel cell power systems - Safety

Print Date and Time: 30-Aug-2024 2:49

ABS has used due diligence in the preparation of this certificate, and it represents the information on the product in the ABS Records as of the date and time the certificate is printed.

If the Rules and/or standards used in the PDA evaluation are revised or if there is a design modification (whichever occurs first), a PDA revalidation may be necessary.

The continued validity of the MA is dependent on completion of satisfactory audits as required by the ABS Rules. The validity of both PDA and MA entitles the product to receive a **Confirmation of Product Type Approval**.

Acceptance of product is limited to the “Intended Service” details prescribed in the certificate and as per applicable Rules and Standards.

This Certificate is valid for installation of the listed product on ABS units which exist or are under contract for construction on or prior to the effective date of the ABS Rules and standards applied at the time of PDA issuance. ABS makes no representations regarding Type Approval of the Product for use on vessels, MODUs or facilities built after the date of the ABS Rules used for this evaluation.

Type Approval requires Drawing Assessment, Prototype Testing and assessment of the manufacturer's quality assurance and quality control arrangements. The manufacturer is responsible to maintain compliance with all specifications applicable to the product design assessment. Unless specifically indicated in the description of the product, certification under type approval does not waive requirements for witnessed inspection or additional survey for product use on a vessel, MODU or facility intended to be ABS classed or that is presently in class with ABS.

Due to wide variety of specifications used in the products ABS has evaluated for Type Approval, it is part of our contract that; whether the standard is an ABS Rule or a non-ABS Rule, the Client has full responsibility for continued compliance with the standard.

Questions regarding the validity of ABS Rules or the need for supplemental testing or inspection of such products should, in all cases, be addressed to ABS.

1.0 General

This document contains the Material Test Certificates of the products supplied to Ballard for the manufacturing of the 1 MW Fuel Cell Power Container intended for CrossWind. The Material Test Certificates state the national material specifications that the materials conform to, incl. chemical analysis, specification range analysis mechanical test results, and heat-treated conditions, and are valid for the following products:

- Stainless Steel Cold Finish Seamless Pipes
- Stainless Steel Welded Pipes
- Stainless Steel Forged Flanges
- Stainless Steel Pipe Nipples
- Stainless Steel End Caps

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Material manufactured & supplied against this original Inspection Certificate (I.C) is warranted towards manufacturing defects / failure for 18 months from the date of dispatch or 12 months from the date of commissioning whichever is earlier. subject to utilisation within appropriate suitable applications and in accordance to GEP.

Overall liability of KRYSTAL is limited to the value of the defective material supplied subject to proven evidence of manufacturing defects only & not application failure/misuse.

Duplication / forged photocopy / unauthorised usage of any documentary property of KRYSTAL is a punishable criminal act & subject to Law of Indian Jurisdiction.

Tests on Authenticity of Inspection Certificate - Pre-condition marked

We certify that the material herein described has been manufactured, inspected & tested in accordance to the above specification/order & the results comply in accordance to the requisite of the specification/order.

NACE CERT : MATERIAL CONFORMS TO NACE MR 0175/ISO 15156 - 2009 & NACE MR 0103 - 2012
MELTING PROCESS : INDUCTION / AOD (IRS) / CONCAST
HEAT TREATMENT : SOLUTION ANNEALED AT 1080°C AND WATER QUENCHED
DIMENSIONS : CONFORM WITH THE SPECIFICATION (100% INSPECTED)
SURFACE QUALITY : SATISFACTORY ROUGHNESS VALUE - RZ 12.5 TO 25 µm / RA 3.2 TO 6.3 µm
PMI : NO OBJECTION(100% TESTED WITH MOBILE SPECTRO)
INTER GRANULAR CORROSION TEST : PASSED IGC TEST IN ACCORDANCE WITH DIN EN ISO 3651-2 & ASTM A262 PRACTICE E
MICRO OBSERVATION : NO CARBIDE PRECIPITATION OBSERVED ON GRAIN BOUNDARIES
RADIOACTIVITY TEST : ALL THE ABOVE MATERIAL IS TESTED FOR RADIOACTIVITY AND FOUND WITH IN THE LIMIT OF BACKGROUND RADIATION
REMARKS : MATERIAL WAS MANUFACTURED,SAMPLE TESTED & INSPECTED IN ACCORDANCE WITH INDICATED SPECIFICATION(S) & FOUND TO MEET THE REQUIREMENTS
: NO WELD REPAIR WAS PERFORMED & ALL THE ITEMS ARE FREE OF WELD REPAIR

WE CERTIFY THAT THE MATERIAL DESCRIBED ABOVE HAS BEEN TESTED AND COMPLIES WITH THE ORDER/CONTRACT AND IS OF INDIAN ORIGIN

Customer:
L-tek A/S
Auningvej 91C
8961 Allingåbro

Location:
Auningvej 91C

Scope.
MoseTechnology ApS has on behalf of our customer, performed NDT Inspection on:

1 pcs 40 FT flatbed – drawing/part no: 4007950

Extent.
Inspection was performed as stated in below list for all welds and according to Technical background also mentioned below.
This report cover both:
Visual inspection (VT)
Magnetic Inspection (MT)

MoseTechnology

	10ft Converter Container, Part number: 601456B-7003716		
Year of construction:	2024		
Range of ambient temperature (°C):	MAX: 25°C	MIN: -10°C	
Fuel:	Type: Hydrogen, Gaseous Fuel Quality: SAE J2719 or ISO 14687, Grade D		
Fuel pressure range:	MIN: 4 barg	MAX: 6,5 barg	
Weight (kg.):		DRY:	WET:
	Fuel cell container, 40ft:	21.320 kg	21.680 kg
	Cooling Unit:	9.060 kg	10.060 kg
	Power Converter container, 10ft:	7.310 kg	7.350 kg
Aux Power Input:	MAX load: 3P+N+PE 400V 50Hz, 40A. Power consumption typ. 10kW		
Rated Power Output:	1000 kW @ 100% duty, within the stated fuel pressure range.		
Electrical Output:	3P 6600V 50Hz, 93 A		
Short circuit capacity (A):	93 A		
Power Factor:	0.95		

Plate size:

Height: 22 cm

Width: 18 cm

Hole size Ø4,3 mm

Corner radius: 0,63mm

Plate material: AISI 316/EN 1.4401 or AISI 316L/EN1.4404

BALLARD™	Ballard Power Systems Europe A/S Majsmarken 1, 9500 Hobro - DK Phone: + 45 88435500 E-mail: service@ballardeurope.com	
Product name:	Cooling unit	
Part number:	601456B-7002973	
Sub-assembly in:	FC PowerGen 1000kW, part number 601456B-7002362	
Range of ambient temperature (°C):	MAX: 25 °C	MIN: -10 °C
Cooling agent:	Ethylene glycol mixture/water 50/50 mix	
Weight (kg):	DRY:	WET:
	9.060 kg.	10.060 kg.
Input Power:	3p+N+PE, 400V, 160A	
Control system voltage (V):	24 V DC

1.0 General

This document gathers all Painting/Insulation Inspection Reports that verify that painting and/or insulation is in accordance with Purchaser's specifications and provided by the painting/insulation contractor for the relevant components corresponding to the CrossWind BLPH Project.

Namely:

1. 40 ft and 10 ft containers
2. 40 ft cooling flatbed
3. LT cooler support structure

Document K559-2254-CWIWP4202202-J04-001 details the Surface Preparation and Painting Specifications.

Generelle noter

1 Det anbefales at udføre stripe coat for hvert malingslag på svært tilgængelige områder, sevjsesøm Osv.
2 Det anbefales at konsultere tekniske samt sikkerhedsdatablade inden arbejdet påbegyndes.
3 TFT skal være iht. ISO 19840

System noter

1 Alle overflader skal være rene, fri for snavs, forurening og salte.
2 Ovenstående system er iht. ISO 12944-9 CX.
3 -
4 -
5 -

PPG Coatings Belgium BV ved inspektion og teknisk rådgivning, på intet tidspunkt overtager det ansvar for overfladebehandlingen.
PPG Coatings Belgium BVindestår for vores produkters kvalitet, samt at specifikation, datablade og rådgivning er afgivet/udarbejdet efter bedste viden og overbevisning.

1.0 Purpose

The purpose of this document is to provide a cover sheet and explanation of the cause-and-effect matrix attached to this document (Appendix 1).

This diagram illustrates the causal relationship between events that may occur, the inputs registering these events and the resulting effect this will have on the entire fuel cell system, as seen from outside the container.

All specific technical details and further description of causes and effect will be found in the referenced documents.

The reader should refer to this diagram while reading this document.

4.0 Safety

4.1 Introduction

The safety system of the fuel cell system container is physically separate safety rated control system, monitoring the essential safety parameters of the container.

The safety system is powered from an independent 24V supply with battery backup, with a UPS duration exceeding 30 minutes. The primary safety system is located in the control cabinet inside the 40ft container (=LB02+UC30) with a secondary connected safety controller located in the 10ft container (=LB02+UC31) with a safety rated interconnect.

4.2 Safety System Hardware

Please refer to document E06 Computer System Documentation

4.3 Tripping the Safety System

The entire fuel cell system will trip if any single of the inputs to the safety controller is outside acceptable parameters, e.g. hydrogen detection, E-Stop activation or external trip. These are further described in section

"5.0 Cause – Safety".

4.4 System Safe State

The system safe state is defined as the state where sources of energy has been disconnected (gas, electricity) and the process stopped.

- Hydrogen valves are de-energized and shut (normally closed)
- Power converters Safe Torque-Off function is activated.
    - This applies to fuel cell DCDC converters and main DCAC converter.
- Motor drives Safe Torque-Off function is activated.
    - This applies to coolant system pumps.
- Main breaker is opened.
    - Disconnect from the BLPH 6,6kV grid.
- Fuel Cell Modules emergency stop is activated.
    - Closes module internal H2 valves and opens contactors for the fuel cell module.

5.0 Cause – Safety

The section describes the causes related to the safety system.

5.1 Hydrogen Detection

The 40ft container has the following hydrogen sensors:

- 3 Sensors located inside the container, monitoring the inlet and outlet of the ventilation air.
- 2 Sensor inside each FCwave module (12 total), monitoring the hydrogen concentration in the ventilation air

5.2 Fire detection

The 40ft container has the following fire detection sensors:

- 3 smoke detectors inside the container, monitoring the inlet and outlet of the ventilation air.

- Each FCwave module contains an internal smoke detector and linear heat detector.

The 10ft container contains the following fire detection sensor:

- A smoke detector inside the container.

5.3 Emergency Stop

The hardwired emergency stop locations are:

- Control cabinet inside 40ft container
- Inside access door for the 40ft container
- On control panel door for coolant skid control panel

5.4 Physical protection

The access to the 10ft container must be safely restricted, as the container internally has IP00 rated high voltage equipment.

The container end door to the 10ft container is equipped with non-contact safety switches.

6.0 Cause – Fuel Cell Modules and Power Converters

6.1 Introduction

The 6 fuel cell modules inside the 40ft container and the power conversion equipment inside the 40ft and 10ft container may be the cause of derates or loss of production.

6.2 FCwave Internal Warning or Alarm

- The FCwave modules provides a warning when a process parameter is at the edge of allowable parameters.
- FCwave modules may perform a controlled shutdown if a process parameter exceeds allowable limits. This will reduce the maximum available power by 1/6 of the total power. The remaining 5 modules will continue operating.

6.3 DCDC Converter Trip

- Each of the 6 FCwave modules are connected to a pair of DCDC converters managing the power flow from individual modules to the common DC bus.
- If a converter trips, the connected FCwave module is also unavailable for power production. This will reduce the maximum available power by 1/6 of the total power. The remaining 5 modules will continue operating.
- This may be caused by e.g., insufficient cooling.

6.4 DCAC Converter Trip

- The power produced by the fuel cell modules is converted to AC power by a single DCAC power converter, which may also trip offline.

7.0 Cause – Coolant

7.1 Introduction

The coolant systems responsible for rejecting the heat generated by the fuel cell modules and power converters may be unable to dissipate the desired amount of heat or fail entirely

The two coolant systems are designated HT1 and HT2:

- HT1 is responsible for cooling FC1-3
- HT2 is responsible for cooling FC4-6

7.2 HT Coolant Group Derate

3 FCwave modules share a coolant system, which will reduce the power available from the modules if the cooling system is unable dissipate the heat.

- Fan failure
    - A failed fan on the HT cooler will reduce the total available cooling capacity. On days where the full cooling capacity is needed (high ambient temperatures), this may derate the cooling group and subsequently derate the available power from the modules connected to the cooling group.
- Valve failure
    - A valve may fail stuck in a given position and cause reduced cooling capacity.
- Temperature sensor failure
    - A temperature sensor may fail, hindering the control system from correctly regulating the coolant group.
- Coolant Radiator Blockage
    - The radiator fins on the radiators may be blocked by debris or damaged, hindering heat dissipation.

7.3 HT Coolant Group Loss

Some failure scenarios will prevent the coolant group from operating, and prevent the connected FCwave modules from operating, causing the power available from the container to be derated to half

- HT Pump Failure
    - If the pump driving the coolant loop fails, the coolant group is unable to dissipate any heat from the attached modules.
- Loss of coolant media
    - If a damaged or burst hose or pipe causes total loss of the coolant media, the cooling group is unable to function.
- Valve failure
    - If a valve fails stuck in certain positions, the flow of coolant through the cooler is prevented and the coolant group is unable to function.
- Fan failure
    - Fan failures may prevent correct airflow over the cooling surfaces or insufficient air flow at high ambient temperatures.

7.4 LT Coolant Group Derate

The LT coolant system provides liquid cooling to power electronics in the container and FCwave modules. If this coolant system cannot dissipate the required heat, the container will need to derate its output.

- Fan failure
    - A failed fan on the LT cooler will reduce the total available cooling capacity. On days where the full cooling capacity is needed (high ambient temperatures), this may derate the cooling group and subsequently derate the available power from the modules connected to the cooling group.

- Valve failure
    - A valve may fail stuck in a given position and cause reduced cooling capacity.
- Temperature sensor failure
    - A temperature sensor may fail, hindering the control system from correctly regulating the coolant group.
- Coolant Radiator Blockage
    - The radiator fins on the radiators may be blocked by debris or damaged, hindering heat dissipation.

7.5 LT Coolant Group Loss

Some failure scenarios will prevent the LT coolant group from operating, and prevent the fuel cell modules and power electronics from working.

- LT Pump Failure
    - If the pump driving the coolant loop fails, the coolant group is unable to dissipate any heat from the attached modules.
- Loss of coolant media
    - If a damaged or burst hose or pipe causes total loss of the coolant media, the cooling group is unable to function.
- Valve failure
    - If a valve fails stuck in certain positions, the flow of coolant through the cooler is prevented and the coolant group is unable to function.
- Fan failure
    - Fan failures may prevent correct airflow over the cooling surfaces or insufficient air flow at high ambient temperatures.

7.6 Process Water Drain Blockage

The process water drain serves as the drain for the water produced by the fuel cell modules during operation.

If this drain is blocked, the fuel cell package cannot operate. The most probable cause is a blockage in the downstream drain system.

8.0 Cause – Ventilation

8.1 Introduction

The ventilation system provides air for the container ventilation and process air for the fuel cells. The ventilation system maintains the interior of the fuel cell container at 20 Pa above ambient pressure.

If insufficient air is available, the fuel cell package will derate or shut down.

8.2 Ventilation Derate

If the ventilation system is unable to provide the full amount of air required for correct operation, the package will attempt to remain operational by derating the available power. Many ventilation derate functions are impacted by higher ambient temperatures.

- Intake damper blockage
    - The intake dampers may be blocked or stuck, preventing sufficient airflow.

- Intake ventilation failure
    - One or more of the intake ventilators may fail to operate, limiting the available air flow.
- Outlet louvre blockage
    - The ventilation outlets may be blocked, preventing egress of the ventilation air.
- Air filter blockage
    - The filters maintaining the air quality inside the container will get clogged over time, restricting the available airflow.

8.3 Ventilation Failure

Many of the causes for ventilation derate may progressively cause a ventilation failure, exacerbated by high ambient temperatures.

9.0 Cause – Integrator

9.1 Introduction

The connections to the integrator (BLPH) are required for correct operation of the fuel cell package. An exception may exist for the Aux supply connection during operation.

9.2 Integrator Aux Supply Failure

If the supply from the integrator is interrupted, one of two events will occur:

1. If the 6.6kV connection is not active, the fuel cell package is able to continue operating on battery supplies for a limited time. An alarm is raised to the BLPH control system.
2. If the 6.6kV connection is active, the fuel cell package will continue operating, supplied off the fuel cell power train. A warning is raised to the BLPH control system.

9.3 Integrator Communication Failure

If the communication is lost to the integrator (BLPH), the fuel cell package will perform a controlled shutdown and enter an idle state.

9.4 Integrator Safety Connection Failure / Trip

If the safety interlock is disabled or wires broken, the safety system is activated. This is also the case when it is intentionally triggered.

10.0 Effects - Safety

10.1 Introduction

This section describes the effects managed by the safety system, which will be caused by some of the abovementioned causes.

10.2 Fuel Cell Module Safety Trip

The fuel cell modules can be brought to a guaranteed safe state where energy sources are disconnected and the reaction is immediately stopped.

10.3 Hydrogen Valve Safety Override

The safety system has a safety-rated relay as a part of the supply to the solenoid valves, which enables the safety system to override and guarantee that the hydrogen valves are shut.

10.4 Power Converters STO

The safety system is connected to the Safe Torque-Off (STO) function on the power converters, which is a safety rated way of guaranteeing the power converters are shut down.

10.5 Motor Drives STO

The safety system is connected to the Safe Torque-Off (STO) function on the motor drives, which is a safety rated way of guaranteeing the drives are shut down.

11.0 Effects – Hydrogen Valve

11.1 Introduction

The hydrogen valves located on the outside of the container are electrically actuated, and of the normally-closed type.

11.2 Hydrogen Valves

Each of the 6 FCwave modules has a separate hydrogen string, with each string having a pair of direct acting solenoid valves in series. Each string is also fitted with a manual, lockable shutoff fitting.

12.0 Effects – FCwave Fuel Cell Modules

12.1 Introduction

This section describes the effects from the fuel cell modules, which may be derated or stopped, with a single module or multiple modules.

12.2 FCwave – Single Module Controlled Stop

Some causes may result in a single module performing its controlled stop sequence, where it signals stop of power production, ramps down and disconnects from the DC bus and H2 supply.

12.3 FCwave – Multiple Modules Controlled Stop

Some causes may result in multiple modules doing a controlled stop simultaneously. This is identical to the effect above but occurs for multiple modules.

12.4 FCwave – All Modules Controlled Stop

Some causes may result in all modules stopping. This is identical to the effect above but occurring for all modules.

12.5 FCwave – Single Module Derate

Some causes may result in a single module derating its output, until all process parameters return to normal ranges. The limited power productions is communicated to the package control system.

12.6 FCwave – Multiple Modules Derate / All Modules Derate

Some causes may result in multiple modules derating their output, e.g. high coolant temperatures.

13.0 Effects – Power Converters

13.1 Introduction

The power converters primary function is to control and condition the power from the fuel cells to match the power requested from the BLPH. The power converters require cooling to continue operating.

13.2 Power Converter Derate

Some causes limit the amount of cooling available for the power converters, which in turn limits their available performance. Inside the fuel cell package, there are both liquid and air-cooled power converters.

13.3 Power Converter Stop

The power converters may be stopped entirely if they reach a protection value or cooling is not available for them.

14.0 Effects – Integrator

14.1 Introduction

This section describes the signals and effects directly communicated to the integrator.

Please refer to documents C08-002 and C08-003 (*FC Package Modbus Map* and *FC Package Alarm List*) for details on the communication.

14.2 Information

The fuel cell package will communicate to the integrator when an internal situation occurs, which does not require action from the integrator, but would be of interest. This would be events such as warnings from the fuel cell modules or derate information due to coolant or temperature issues.

Communication method is Modbus connection.

14.3 Alarm Information

The fuel cell package will communicate to the integrator when an internal alarm has occurred, and some or all fuel cell modules are unable to function.

Communication method is Modbus connection.

14.4 Safety Trip

The fuel cell package will communicate any eventual safety system trip to the integrator.

Communication method is hardwired connections.

14.5 Power Output – Derate

If internal components are derating their performance, this is communicated to the integrator as a reduction in the total amount of power available.

Communication method is Modbus connection.

14.6 Power Output – Loss of production

If an internal fault prevents the fuel cell package from producing any power, this is communicated to the integrator.

Communication method is Modbus connection

Short Title	Megablock Hydrogen Safety Concept
Full Title	Introduction to Hydrogen Safety Concept for Ballard Megablock Solution
Abstract	This document provides an introduction to the hydrogen safety concept employed in the Ballard Megablock solution. This document documents the location of hydrogen manifolds, valves and couplings, and how the safety is handled for each (the Safety Concept). This document does not describe other parts of the safety for the Megablock, such as electrical safety and personal protective means. The fuel cell module (Ballard FCgen 200kW Fuel Cell Module) has an internal hydrogen safety concept, which is also described.

This document, submitted in confidence, contains proprietary information which shall not be reproduced or transferred to other documents or disclosed to others or used for manufacturing or any other purpose without prior written permission of Ballard Power Systems.

1.0 Purpose and Scope

The purpose of this document is to introduce the hydrogen safety concept employed in the Ballard Megablock solution. This document will document the location of hydrogen manifolds, valves and couplings, and how the safety is handled for each (the Safety Concept).

This document does not describe other parts of the safety for the Megablock, such as electrical safety and personal protective means.

The fuel cell module (Ballard FCgen 200kW Fuel Cell Module) has an internal hydrogen safety concept, which will also be described.

The reader is expected to have basic familiarity with gas safety and hydrogen safety.

3.0 Hydrogen Supply Overview

3.1 Introduction

This section provides an overview of where hydrogen is supplied to the Megablock, how it is transported to the fuel cell system and how the fuel cell modules handle hydrogen safety. Each of these items is described in further details in following sections.

3.2 Hydrogen Flow

The hydrogen flow for the Megablock container is illustrated in Figure 1, below:

Figure 1: Hydrogen Overview for the Megablock Container

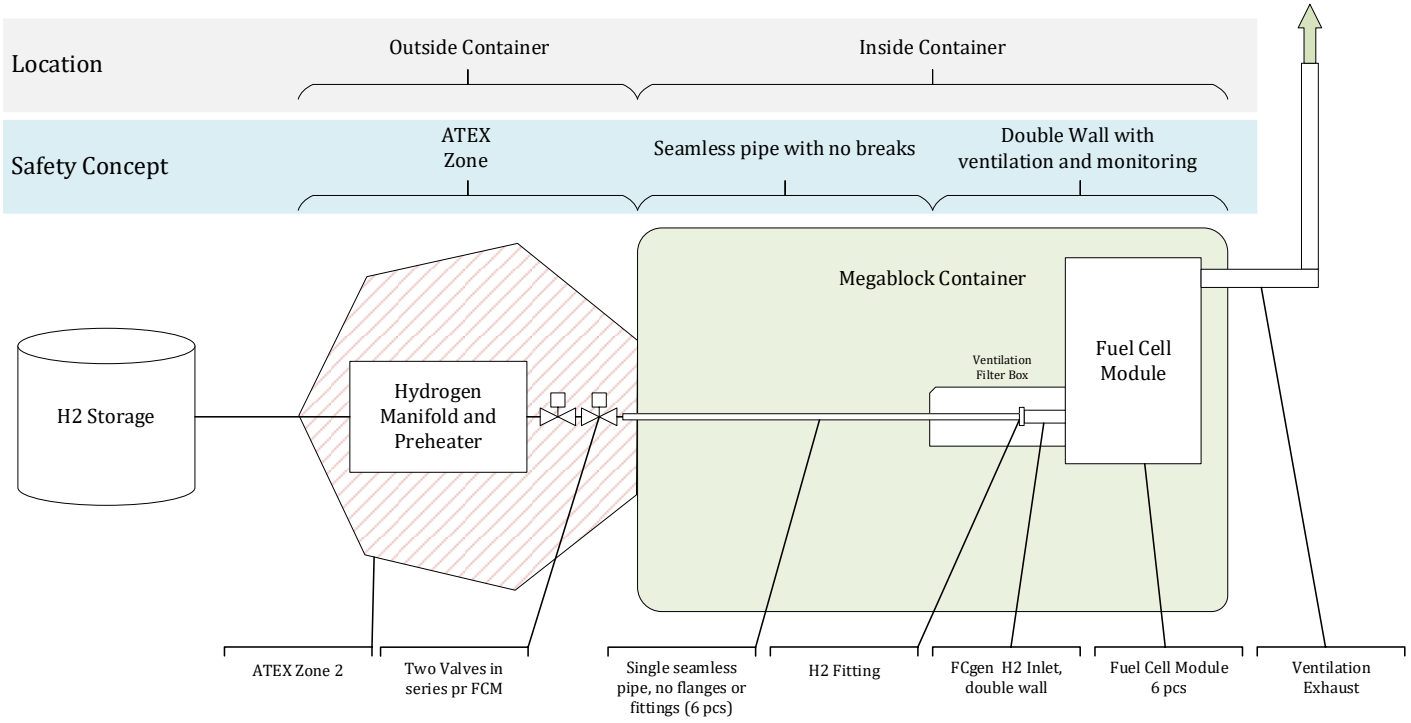

Illustration of the components in the hydrogen supply for the Megablock and the safety concept applicable for each segment.

The main components are:

- Hydrogen Inlet, Manifold and Preheater
  - Connection point for the hydrogen storage system.
  - Pressure transducer to monitor inlet pressure.
  - Hydrogen preheating system.

- Hydrogen Shutoff Valves
    - Direct acting solenoid valves, with each module having two in series.
- Module Supply Pipe
    - Seamless stainless-steel pipe, which carries hydrogen from the shutoff valves to the fuel cell module connection point. One pipe pr module, 6 pcs in total.
    - Pipe has no breaks or fittings outside of the Ventilation Filter Box.
- Ventilation Filter Box
    - Interface between single walled pipe inside container and dual wall inside Fuel Cell module. Ventilated and monitored space, with rapid air change. One filter box pr module, 6 in total.
- Fuel Cell Module
    - FCgen Fuel Cell Module.
    - Contains internal double-wall hydrogen containment system with rapid air changes and dual hydrogen detection sensors.

3.3 Overview Drawings

Better CAD Drawings

4.0 Safety Concepts

This section describes the different safety concepts applicable to parts of the hydrogen supply system for the Megablock.

4.1 ATEX Zone

For an ATEX zone, the safety concept is to follow the recommendations and requirements laid out in the Directive 2014/34/EU, commonly known as the ATEX directive. This results in all electrical components inside the zone having the “EX” marking, covering the zone class, gas type and expected temperature.

4.2 Seamless piping with no breaks

The piping between the ATEX zone and the ventilation filter box is a stainless-steel pipe with no fittings or other breaks between the ATEX zone and the controlled space in the

4.3 Double wall with ventilation and monitoring

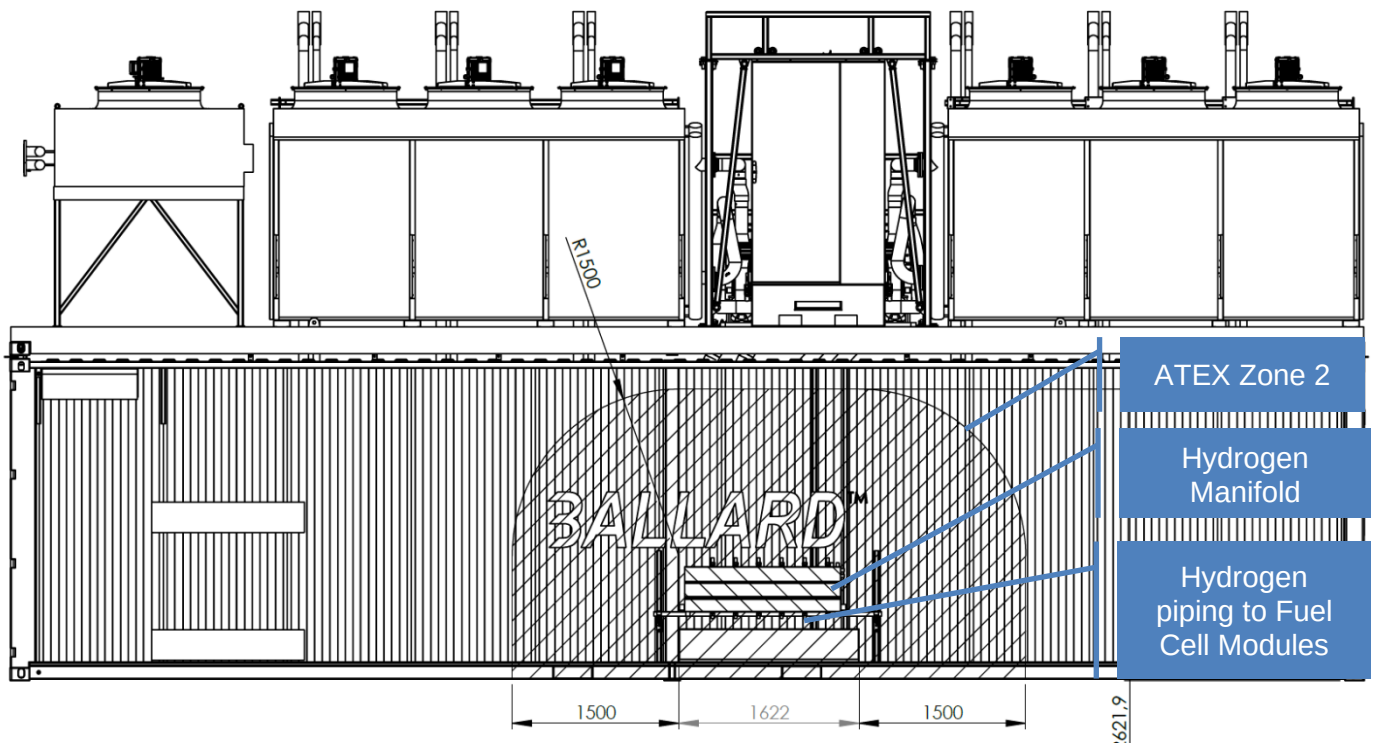
The double wall concept is based around the idea of surrounding the hydrogen carrying pipe with a secondary pipe, with the space between the primary and secondary pipe being ventilated and a hydrogen detector measuring the hydrogen concentration. In this case, a leakage is drawn past the detectors by the ventilation air stream.

5.0 Hydrogen Supply Interface and Valve Array

Please refer to document C03 Process and Instrumentation Diagrams.

The interface for the external hydrogen connection is located on the outside of the container. This hydrogen supply inlet contains a pressure transducer and a distribution manifold to the valve array.

The valve array is comprised of two shutoff valves in series for each fuel cell module, providing a redundant method of interrupting the hydrogen supply to the individual modules. There is also installed a manual lockable shutoff fitting for each fuel cell module, facilitating lock-out, tag-out procedures before maintenance activities on the fuel cell modules.



5.1 Hazardous Zone surrounding the Hydrogen Supply Interface and Valve Array

The area surrounding the hydrogen supply interface and the valve array is classified as ATEX Zone 2, where a hazardous mixture will not likely be present in normal operation, and if so, only for a short period.

The document describing the hazardous zone extent is K559-2254-CWIWP4202202-E99-002, with excerpts reproduce below in Figure 2.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

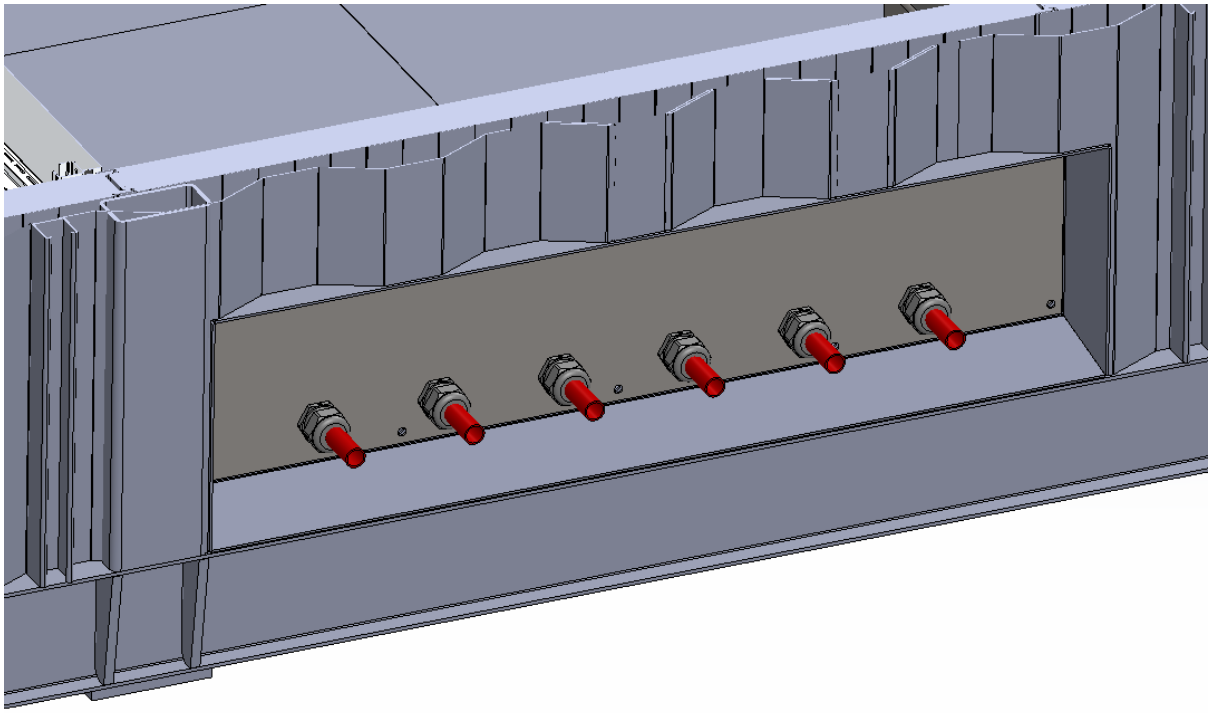


Figure 2: Hazardous Area

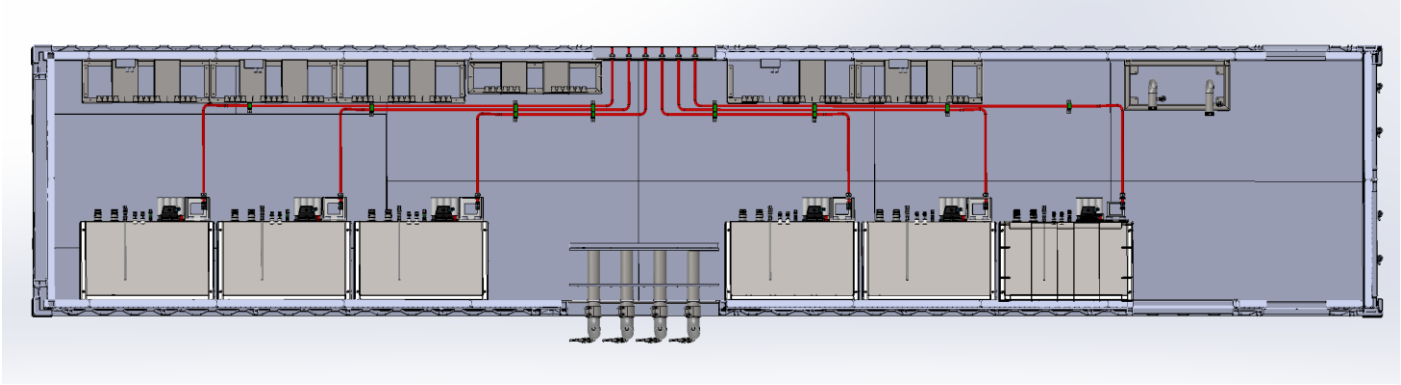
*Hazardous area on one side of the 40ft container (opposite air intake). Hydrogen intake and manifold shown above hydrogen piping to the fuel cell modules. Taken from **B01 General Arrangement**.*

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Figure 3: Hydrogen Piping – Container Entry

The piping entry into the container is show here, with the 6 hydrogen pipes shown in red. Each pipe is fixated with Ex-rated pipe gland.



THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

6.0 Hydrogen Piping to Fuel Cell Modules

The hydrogen is transported from the hydrogen supply interface and the valve array to the fuel cell module in individual, seamless pipes with no breaks or fittings outside the controlled area of the valve array and the ventilation filter box (see section 7.0 Interface to Fuel Cell Module)

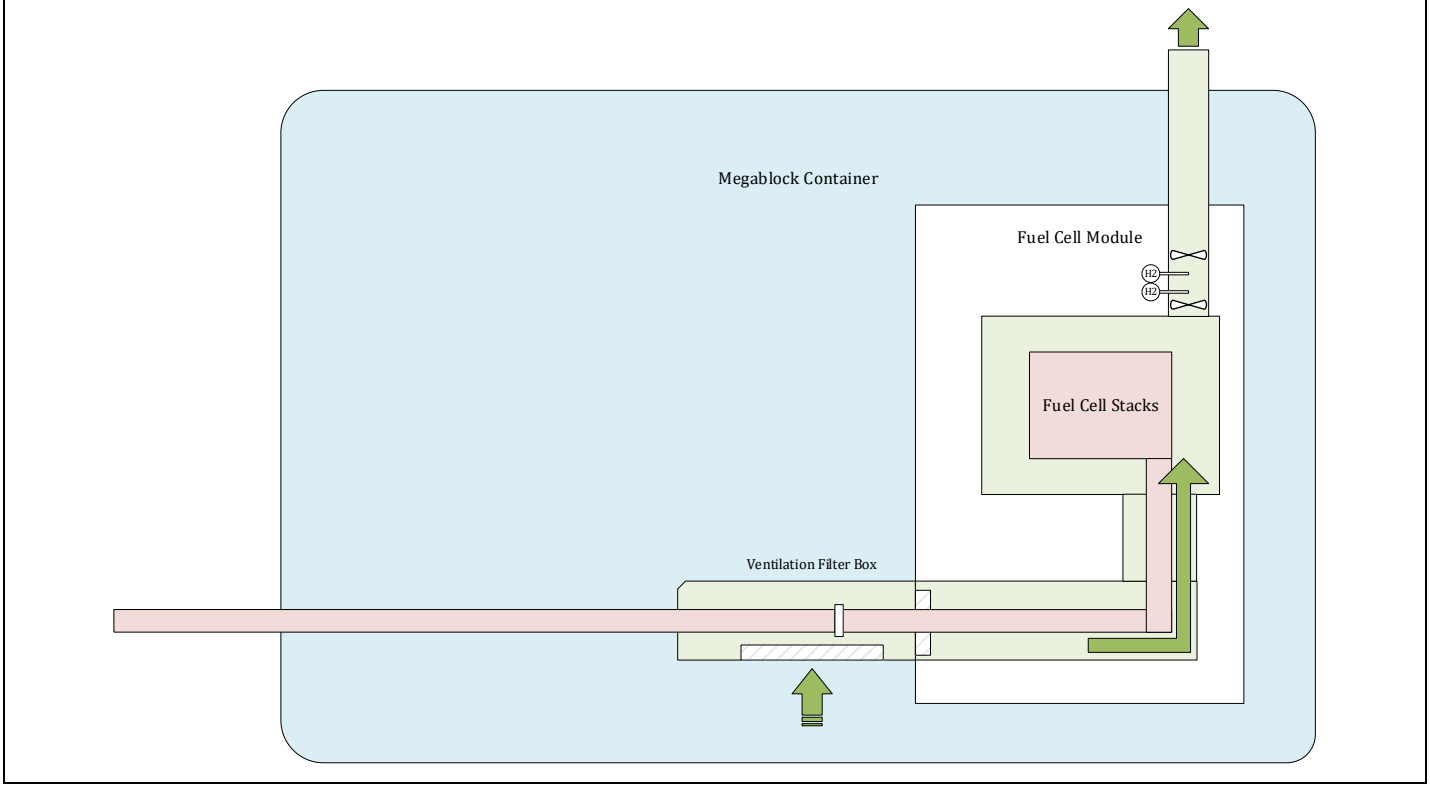
The routing of the hydrogen piping is illustrated in Figure 4: Hydrogen Piping.

Figure 4: Hydrogen Piping

Top down view of the 40ft container, with the piping between the valve array and the fuel cell module interface shown, highlighted in red.

The piping is placed below a metal grating floor, protecting it from impacts and incidental damage.

7.0 Interface to Fuel Cell Module



The hydrogen piping interface to the fuel cell module is a connected with double compression ring fitting, contained in a double wall shell, ventilated and monitored, as described in section “4.3 Double wall with ventilation and monitoring”.

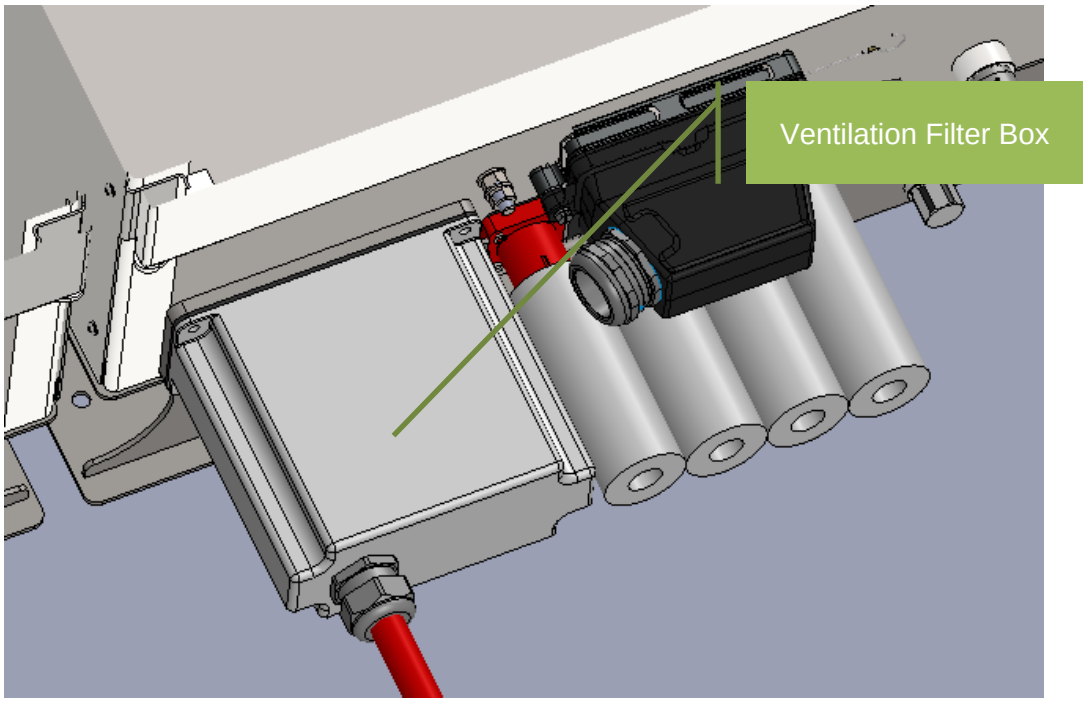
THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

7.1 Ventilation Filter Box

The connection between the hydrogen piping and the fuel cell module is contained in the ventilation filter box, with the concept shown in Figure 5.

Figure 5: Ventilation filter box with airflow indications

Concept drawing for the ventilation filter box. Air is drawn in through the bottom of the filter box and drawn past all hydrogen containing components by redundant fans. The airstream is monitored by two hydrogen detectors



This box is shown in Figure 6 and as a cutaway in Figure 7. The pipe fitting connecting the pipe from the module to the supply pipe is shown in Figure 8.

The ventilation filter box serves the following purpose:

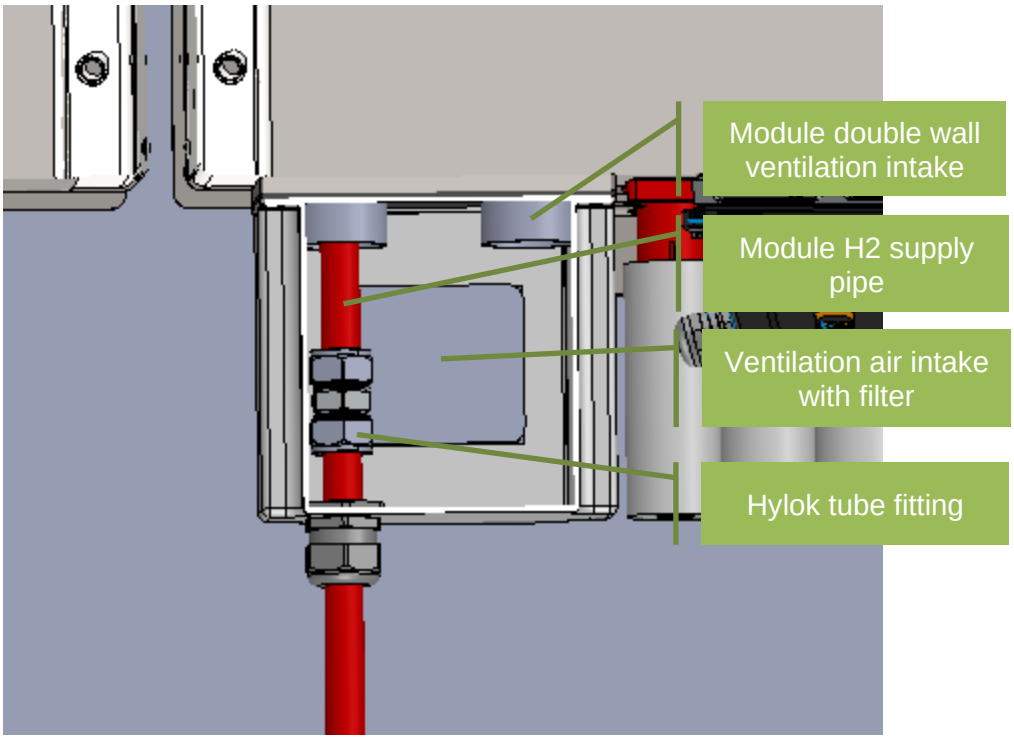
- Enclosure around the hydrogen fitting, enclosing the possible leakage point.
    - Kept at lower than ambient pressure by the module ventilation fans.
    - Airflow over the fitting is carried past module hydrogen sensors, detecting leakages.
- Filter the incoming air
    - Prevents buildup of dust and debris.

- Filter is located on the bottom of the box.

Figure 6: Ventilation Filter Box

The ventilation filter box, mounted of the front of the fuel cell module. Pipe gland fixates pipe to box structure. Air intake at the bottom of the box.

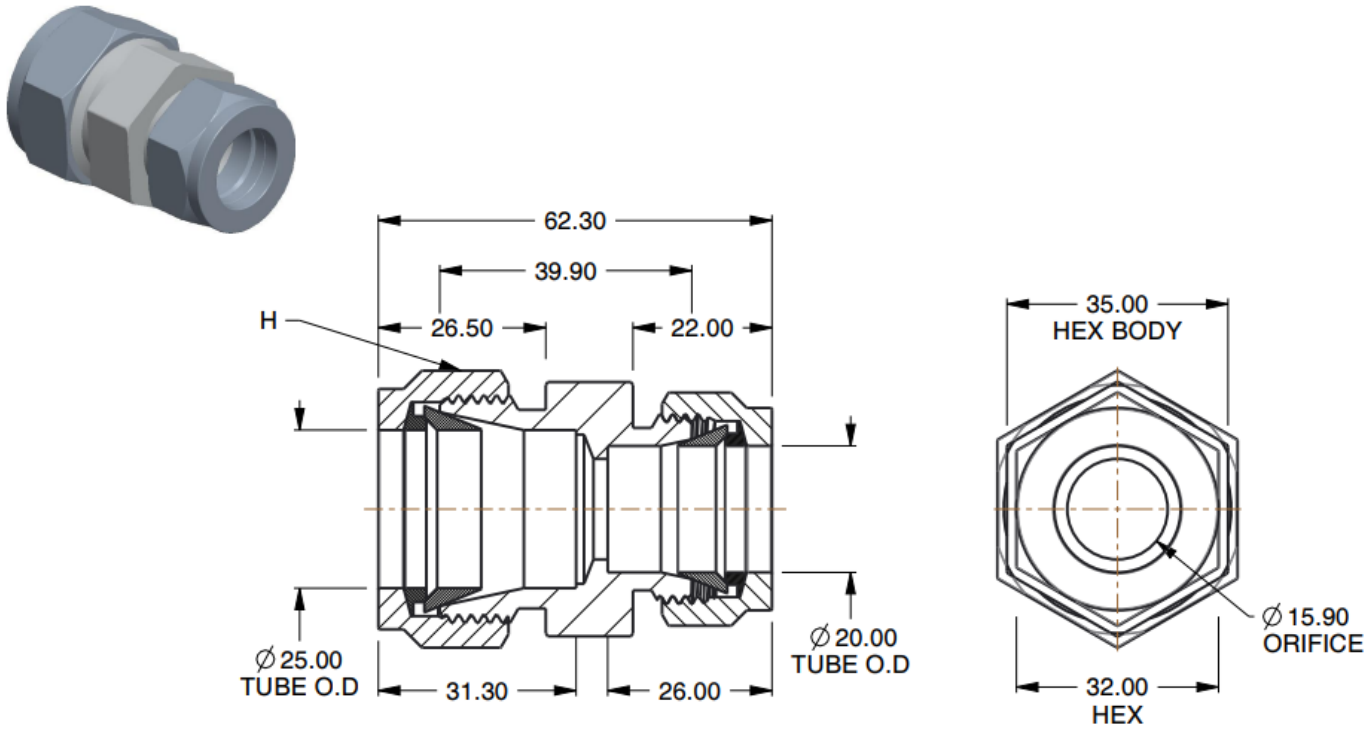
THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.



7.2 Ventilation Filter Box internal contents

The internal contents of the ventilation filter box is shown in Figure 7, below:

The air flow path is:



1. Air is drawn in through ventilation air intake through filter.
2. Air is drawn through the module double wall ventilation intake
3. Inside module, air is drawn past all hydrogen containing components (pipes, Valveblock and fuel cell stacks)
4. Redundant fans draw air out of the double wall structure and exhaust it to the module ventilation exhaust.
5. Hydrogen sensors are placed in the ventilation exhaust, monitoring the airstream for leakages.

Figure 7: Ventilation Filter box cutaway

Top-down cutaway view of the ventilation filter box, showing the hydrogen connection fitting and ventilation intake with module air inlet

Figure 8: Double compression ring reducing fitting

Mechanical drawing of double compression ring fitting for hydrogen. Reducing union from 25 to 20 mm OD shown. Material is SS316.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

8.0 Fuel Cell Module

The FCwave™ has 3 levels of safety:

1. Safety in normal operation
    a. Ventilation of hydrogen enclosure volume to prevent any build-up of hydrogen to a combustible level.
2. Safety in probable leakage scenarios
    a. Supervision of the fuel cell and shutting off hydrogen supply in the event of unsafe conditions.
3. Safety in catastrophic events
    a. Encapsulation in the event of a hydrogen explosion.

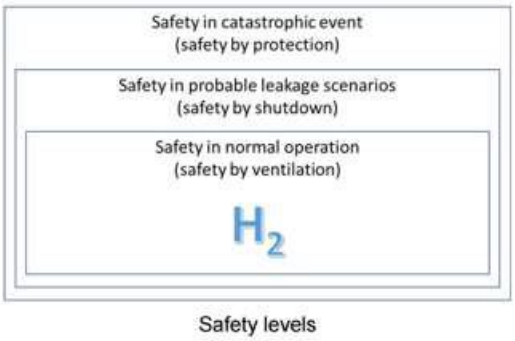


Figure 9. Safety levels of the FCwave™

Safety measures in place:

- Active ventilation through the enclosure
    - 100% redundant ventilation fan
    - No dead pockets for hydrogen – verified with CFD analysis
    - Ventilation flow monitored by safety controller
    - Flow switch
    - Tacho feedback from fans
- Negative pressure inside the enclosure
    - Differential pressure sensor
    - Enclosure sealed with a gasket at all possible openings
- Twin hydrogen sensors (range 0-4%) in ventilation air connected to:
    - Fuel cell controller
    - Safety controller

9.0 Container Hydrogen Detection

The container itself contains hydrogen sensors to detect hydrogen leakages.

The three hydrogen detectors are located at the following locations:

- Container Ventilation intake
    - Sensor located at the ventilation intake of the container and midpoint.
- Container ventilation outlet
    - Two sensors, one at each end of the container at the container ventilation outlets.

The ventilation outlet sensors detect and alarm in case of internal leakages. If a leakage is detected, the safety system shuts off the hydrogen supply valves and trigger emergency shutdown of the fuel cell modules and power converters inside the module.

See document “C07 Cause and Effect Charts” for details.

10.0 External Hydrogen Hazard

One hazard that the container can detect but not mitigate, is an external release of hydrogen impinging on the container and being drawn in with the ventilation system.

The planned mitigations are:

- Placement of the container outside hazardous areas from gas storage systems
- Orientation of the ventilation intake system, facing away from the gas storage system
- Installation of hydrogen detector on the ventilation intake, to detect the hazard and trigger internal emergency stop if hydrogen detection exceeds limit values.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.

1.0 Purpose

The purpose of this document is to highlight the safe design of the simple apparatus circuit on the FC PowerGen 1000kW®. The document will be formed on background of IEC 60079-25.

2.0 Analysis

The following system contains only a pressure transmitter and a temperature transmitter. Since they are connected to different complete independent barriers, two analyses will be made following the Annex A in IEC 60079-25.

Table 2-1: Simple system analysis pressure transmitter.

[1]Not applicable for simple apparatus.

[2]Not applicable for simple apparatus.

[3]Acordingly to IEC 60079-25 annex F the temperature rating will be T4 if the power does not exceed 1,2W at the ambient temperature of 60°C, which is applicable for this application. Further explanation is described in IEC 60079-0 section 5.3.3 Table 3 and 4.

[4]As it is a RTD type temperature sensor those values are not applicable.

2.1 Simple apparatus requirements

There are some requirements to apply for a component to be classified as a simple apparatus. The IEC 60079-11 section 5.7 describes the following requirements:

a) *Passive components, for example switches, junction boxes, resistors and simple semiconductor devices;*

b) *Sources of stored energy consisting of single components in simple circuits with well defined parameters, for example capacitors or inductors, whose values shall be considered when determining the overall safety of the system;*

c) *sources of generated energy, for example thermocouples and photocells, which do not generate more than 1.5 V, 100 mA and 25 mW.*

Sins this temperature sensor is based on the RTD technology the sensor will not be able to induce any current nor voltage to make this a potential ignition source. Hence relying on the associated apparatus being the EX Barriere.

The barrier is built and approved for connection to RTD type of temperature sensors. The following data from the barrier is included in the Table 2-2.

3.0 Conclusion

According to this analysis of both the Pressure transmitter HUBA520 and the corresponding EX barrier PR electronic 9106B1B the conditions for intrinsically safe circuit are being met accordingly to the IEC 60079-25.

Furthermore, the analysis of Temperature transmitter IFM TT1050 and the corresponding EX barrier PR electronic 9113B does also comply with the requirements form intrinsically safe according to the IEC 60079-25. Since this is a simple apparatus the conditions for this are met accordingly to IEC 60079-11.

4.1 BL01 – Electronic Level Sensor, LMT01A

[This page intentionally left blank.]

LMT01A

Sensor for point level detection in hazardous areas

LMACE-A12E-QSKG-1/US/3D/3G

1 Tightening torque 20...25 Nm

CE EC 1935/2004 EHEDG Certified Ex FDA IO-Link UKCA

Product characteristics		
Number of inputs and outputs		Number of digital outputs: 2
Factory setting		oils; oil-based media; powder
Process connection		threaded connection G 1/2 sealing cone
Application		
Special feature		Gold-plated contacts
Media		Liquids; viscous media; powder
Cannot be used for		See the operating instructions, chapter "Function and features".
Medium temperature	[°C]	-20...85
Probe length	[mm]	11
Tank pressure	[bar]	-1...40
Electrical data		
Operating voltage	[V]	18...30 DC
Current consumption	[mA]	< 50
Protection class		III
Reverse polarity protection		yes
Measuring principle		capacitive
Inputs / outputs		
Number of inputs and outputs		Number of digital outputs: 2
Outputs		
Total number of outputs		2
Output signal		switching signal; IO-Link
Electrical design		PNP/NPN
Number of digital outputs		2
Output function		normally open / normally closed; (parameterisable)
Max. voltage drop switching output DC	[V]	2.5
Permanent current rating of switching output DC	[mA]	100

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.

LMT01A

Sensor for point level detection in hazardous areas

LMACE-A12E-QSKG-1/US/3D/3G

Short-circuit protection		yes	
Type of short-circuit protection		pulsed	
Overload protection		yes	
Measuring/setting range			
Factory setting		oils; oil-based media; powder	
Response times			
Response time	[s]	< 0.5	
Interfaces			
Communication interface		IO-Link	
Transmission type		COM2 (38,4 kBaud)	
IO-Link revision		1.1	
SDCI standard		IEC 61131-9	
Profiles		Smart Sensor: Process Data Variable; Device Identification	
SIO mode		yes	
Required master port type		A	
Process data analogue		1	
Process data binary		2	
Min. process cycle time	[ms]	2.3	
Supported DeviceIDs		**Type of operation**	**DeviceID**
		default	305
Operating conditions			
Ambient temperature	[°C]	-20...60	
Storage temperature	[°C]	-40...85	
Protection		IP 67; (when used outside the hazardous area: IP 68 / IP 69)	
Tests / approvals			
ATEX marking		II 3D Ex tc IIIC T90°C Dc X	
		II 3G Ex nA IIC T4 Gc X	
EMC		DIN EN 61000-6-2	
		DIN EN 61000-6-4	open tanks
		DIN EN 61000-6-3	closed tanks
Shock resistance		DIN EN 68000-2-27	50 g (11 ms)
Vibration resistance		DIN EN 68000-2-6	20 g (10...2000 Hz)
MTTF	[years]	223	
Mechanical data			
Weight	[g]	218	
Dimensions	[mm]	Ø 30 / L = 113	
Materials		stainless steel (316L/1.4404); PEEK; PEI; FKM	
Materials (wetted parts)		PEEK; surface characteristics: Ra < 0,8 / Rz 4	
Process connection		threaded connection G 1/2 sealing cone	
Displays / operating elements			
Display		switching status	LED, yellow
		operating status	LED, green

4.3 BP01 – Pressure Sensor, 520 Series

[This page intentionally left blank.]

Huba Control

Relative pressure transmitter
Type 520

The compact type 520 pressure transmitter is based upon the Huba Control developed thick film technology where the pressure measuring cell is fully welded.
This transmitter meets the high burst protection demands and is suitable for the use in all types of refrigerants including ammonia.

Pressure range
-1 ... 9 bar /
0 ... 2.5 – 1000 bar

+ Compact, rugged construction
+ Welded without sealing parts, no elastomer seals
+ Large selection of connections available.
+ Saving time by quick cable mounting by the customer with swift connector

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Technical overview

Pressure range

Relative	-1 ... 9 bar / 0 ... 2.5 – 1000 bar

Operating conditions

Medium	Liquids, gases and refrigerants (incl. ammonia)	
Temperature	Medium -40 ... +135 °C	(Ex) -30 ... +120 °C)
	Ambient -30 ... +85 °C	(Ex) -25 ... +85 °C)
	Storage -50 ... +100 °C	
Tolerable overload	≤ 6 bar 5 x fs	
	> 6 bar 3 x fs (max. 1500 bar)	
Rupture pressure	≤ 6 bar 10 x fs	
	> 6 bar 6 x fs (max. 2500 bar)	

Materials

Cover		Stainless steel 1.4404 / AISI 316L (inside thread Schrader 1.4305 / AISI 303 only)
Plug accommodation		Polyarylamide 50% GF UL 94 V-0
Materials in contact with medium	Pressure connection	Stainless steel 1.4404 / AISI 316L (inside thread Schrader 1.4305 / AISI 303 only)
	Sensor	Stainless steel

Electrical overview

		Output	Power supply	Load	Current consumption
2 wire		4 ... 20 mA	7 ... 33 VDC	$< \frac{\text{supply voltage} - 7\,V}{0.02\,A}$ [Ohm]	< 23 mA
	(Ex)	4 ... 20 mA	10 ... 30 VDC	$< \frac{\text{supply voltage} - 10\,V}{0.02\,A}$ [Ohm]	< 23 mA
3 wire		0 ... 5 V	7 ... 33 VDC	>10 kOhm / < 100 nF	< 7 mA
		1 ... 6 V	8 ... 33 VDC	>10 kOhm / < 100 nF	< 7 mA
		0 ... 10 V	12 ... 33 VDC	>10 kOhm / < 100 nF	< 7 mA
		0 ... 10 V	12 ... 33 VDC / 24 VAC ± 15%	>10 kOhm / < 100 nF	< 7 mA
		ratiom. 10 ... 90%	5 VDC ± 10%	>10 kOhm / < 100 nF	< 7 mA
	(Ex)	ratiom. 10 ... 90%	5 VDC ± 10%	>10 kOhm / < 100 nF	< 7 mA
Polarity reversal protection		Short circuit proof and protected against polarity reversal. Each connection is protected against crossover up to max. supply voltage.			
Insulation voltage				standard	500 VDC

Dynamic response

Response time	< 2 ms, 1 ms typ.
Load cycle	< 100 Hz

Electrical connection	**Protection standard**	**Protection class**
Swift connector with or without cable 1.5 / 2.0 / 3.0 / 5.0 m (PVC spec.)	IP 67	III
Connector DIN EN 175301-803-A or C (industrial standard 9.4 mm)	IP 65	III
Metri Pack Serie 150	IP 67	III
Connector M12x1	IP 67	III
Braids	IP 65	III
Connector RAST 2.5 (3 wire, only)	IP 00	III

Pressure connection

Inside thread	7/16 - 20 UNF	without or with Schrader
	½ -14 NPT	(≤ 60 bar)
	G ¼	with O-Ring seal FPM (-30 ... +135 °C)
Outside thread	7/16 - 20 UNF	sealing cone 45°
	¼ -18 NPT	
	7/16 - 20 UNF	sealed at back SAE 4 with O-Ring seal FPM (-20 ... +135 °C)
	G ¼	sealed at back DIN EN ISO 1179-2 with profile seal ring in FPM (-30 ... +135 °C)
	G ¼	sealed at back and manometer (combi) with profile seal ring in FPM (-30 ... +135 °C) (≤ 60 bar)
	R ¼	EN 10226
	G ½	sealed at back and manometer (combi) with profile seal ring in FPM (-30 ... +135 °C)
	⅛ - 27 NPT	(≤ 60 bar)
	G ⅛	sealed at front (≤ 60 bar)
	G ⅛	sealed at back DIN EN ISO 1179-2 with profile seal ring in FPM (-30 ... +135 °C) (> 60 bar - without ATEX certificate)
	M10x1	sealed at back DIN EN ISO 1179-2 with Profile seal ring in FPM (-30 ... +135 °C) (≤ 60 bar)
	M20x1.5	sealed at front and manometer (combi)
	G ½, G ¼	sealed at front

Installation arrangement

Unrestricted

Tests / Admissions

Electromagnetic compatibility	CE conformity acc. EN 61326-2-3
Enhanced EMC protection	EN 50121-3-2
Shock acc. IEC 68-2-27	100 g, 11 ms half sine wave, all 6 directions, free fall from 1 m on concrete (6x)
Constant shock acc. IEC 68-2-29	40 g for 6 ms, 1000x all 3 directions
Vibration acc. IEC 68-2-6	20 g, 15 ... 2000 Hz, 15 ... 25 Hz with amplitude ± 15 mm, 1 Octave/min. all 3 directions, 50 constant load
UL	ANSI/UL 61010-1 acc. E325110
Drinking water approval	NSF/ANSI 61/372 acc. MH60087
	WRAS
EAC	

Protection against explosion (Ex)	**ratiom. 10 ... 90%**	**4 ... 20 mA**
Intrinsic safety «i»	Ex II 1/2 G Ex ia IIC T4 Ga/Gb	Ex II 1/2 G Ex ia IIC T4 Ga/Gb
	Ex II 1/2 D Ex ia IIIC T125°C Da/Db	Ex II 1/2 D Ex ia IIIC T125°C Da/Db
EC type examination certificate	SEV 15 ATEX 0173	SEV 10 ATEX 0145
Connection to certified intrinsically safe resistive circuits with maximum values	Ui ≤ 15 VDC; Ii ≤ 200 mA; Pi ≤ 750 mW	Ui ≤ 30 VDC; Ii ≤ 100 mA; Pi ≤ 750 mW
Effective internal inductance and capacitance for versions with plugs complying with EN 175301-803-A or M12x1	Li = 0 nH; Ci ≤ 150 nF	Li = 0 nH; Ci = 0 nF
IECEx		SEV 16.0007

Weight

~ 90 g

Packaging (Please state on order)

Single packaging in cardboard	accessories integrated
Multiple packaging in cardboard (25 pcs)	

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.5 TF01 – Pressure Sensor Ex Barrier, 9113B-U9

[This page intentionally left blank.]

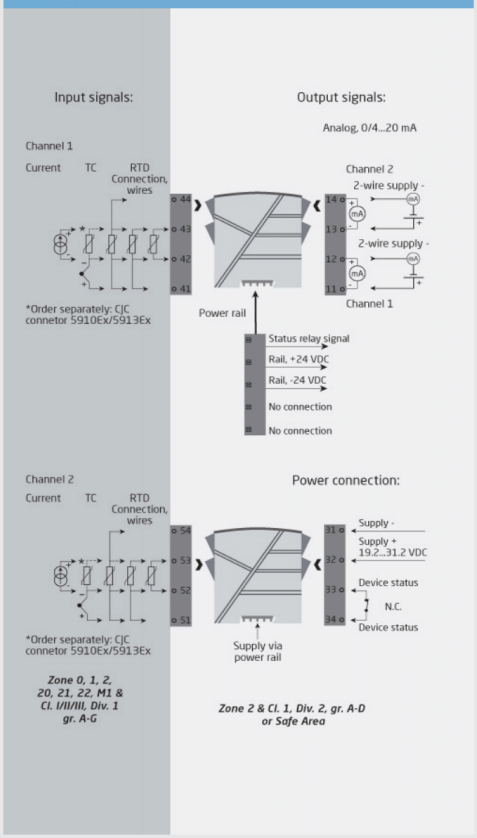
PR electronics

PERFORMANCE MADE SMARTER

Temperature / mA converter

9113B

- Input for RTD, TC and mA
- Active / passive mA output via the same two terminals
- 1 or 2 channels
- Can be supplied separately or installed on power rail, PR type 9400
- SIL 2-certified via Full Assessment



Advanced features
- Configuration and monitoring by way of detachable display front (PR 4500); process calibration and signal simulation.
- Copying of the configuration from one device to others of the same type via the display front.
- TC inputs can use either the internal CJC or a terminal with a built-in Pt100 sensor (PR 5910Ex, channel 1 / PR 5913Ex, channel 2) for higher accuracy.
- Advanced monitoring of internal communication and stored data.
- SIL 2 functionality is optional and must be activated in a menu point.

Application
- 9113Bxx can be mounted in the safe area or in zone 2 / Class 1, Division 2 and receive signals from zone 0, 1, 2 and zone 20, 21, 22 including mining / Class I/II/III, Division 1, Gr. A-G.
- Conversion and scaling of temperature (Pt, Ni and TC) and active current signals.
- The 9113 has been designed, developed and certified for use in SIL 2 applications according to the requirements of IEC 61508.
- Suitable for the use in systems up to Performance Level "d" according to ISO-13849.

Technical characteristics
- 1 green and 2 red front LEDs indicate operation status and malfunction.
- 2.6 kVAC galvanic isolation between input, output and supply.

Mounting
- The devices can be mounted vertically or horizontally without distance between neighbouring units.

Applications

This page is automatically generated on the basis of information provided on www.prelectronics.com and affiliated websites. It is provided to you as a service and for information purpose only. While we have attempted to maintain the information as accurately as possible, the page may contain errors or omissions for which we disclaim any and all liability

Environmental Conditions

Operating temperature	-20°C to +60°C
Storage temperature	-20°C to +85°C
Calibration temperature	20...28°C
Relative humidity	< 95% RH (non-cond.)
Protection degree	IP20
Installation in	Pollution degree 2 & meas. / overvoltage cat. II

Mechanical specifications

Dimensions (HxWxD)	109 x 23.5 x 104 mm
Dimensions (HxWxD) w/ PR 4500	109 x 23.5 x 131 mm
Weight approx.	250 g
DIN rail type	DIN EN 60715/35 mm
Wire size	0.13...2.08 mm^2 AWG 26...14 stranded wire
Screw terminal torque	0.5 Nm
Vibration	IEC 60068-2-6
2...13.2 Hz	±1 mm
13.2...100 Hz	±0.7 g

Common specifications

Supply

Supply voltage	19.2...31.2 VDC
Fuse	400 mA SB / 250 VAC
Max. required power	≤ 0.8 W/≤ 1.4 W (1 ch./2 ch.)
Max. power dissipation, 1 / 2 ch.	≤ 0.8 W / ≤ 1.4 W

Isolation voltage

Test /working: Input to any	2.6 kVAC / 300 VAC reinforced isolation
Analog output to supply	2.6 kVAC / 300 VAC reinforced isolation
Status relay to supply	1.5 kVAC / 150 VAC reinforced isolation

Response time

Temperature input, programmable (0...90%, 100...10%)	1...60 s
mA / V input (programmable)	0.4...60 s
Programming	PR 4500 communication interfaces
Signal / noise ratio	Min. 60 dB (0...100 kHz)
Signal dynamics, input	24 bit
Signal dynamics, output	16 bit
Accuracy	Better than 0.1% of sel. range
EMC immunity influence	< ±0.5% of span
Extended EMC immunity: NAMUR NE21, A criterion, burst	< ±1% of span

Input specifications

RTD input

RTD type	Pt10/20/50/100/200/250; Pt300/Pt400/500/1000; Ni50/100/120/1000
Cable resistance per wire	50 Ω (max.)
Sensor current	Nom. 0.2 mA
Effect of sensor cable resistance (3-/4-wire)	< 0.002 Ω / Ω
Sensor error detection	Programmable ON / OFF

TC input

Thermocouple type	B, E, J, K, L, N, R, S, T, U, W3, W5, LR
Cold junction compensation (CJC) via ext. sensor in 5910	20...28°C ≤ ±1°C, -20...20°C / 28...70°C ≤ 2°C
CJC via int. mounted sensor	±(2.0°C + 0.4°C * Δt)
Sensor error detection	Programmable ON or OFF (only wire breakage)
Sensor error current: When detecting / else	Nom. 2 µA / 0 µA

Current input

Measurement range	0...23 mA
Programmable measurement ranges	0...20 and 4...20 mA
Input resistance	Nom. 20 Ω + PTC 50 Ω
Sensor error detection	Programmable ON / OFF

Output specifications

Current output

Signal range	0...23 mA
Programmable signal ranges	0...20/4...20/20...0/20...4 mA
Load (@ current output)	≤ 600 Ω
Load stability	≤ 0.01% of span / 100 Ω
Sensor error indication	0 / 3.5 / 23 mA / none
NAMUR NE43 Upscale/Downscale	23 mA / 3.5 mA
Output limitation, on 4...20 and 20...4 mA signals	3.8...20.5 mA
Output limitation, on 0...20 and 20...0 mA signals	0...20.5 mA
Current limit	≤ 28 mA

Passive 2-wire mA output

Max. external 2-wire supply	26 VDC
Effect of external 2-wire supply voltage variation	< 0.005% of span / V

Status relay

Max. voltage	125 VAC / 110 VDC
Max. current	0.5 AAC / 0.3 ADC
Max. AC power	62.5 VA / 32 W

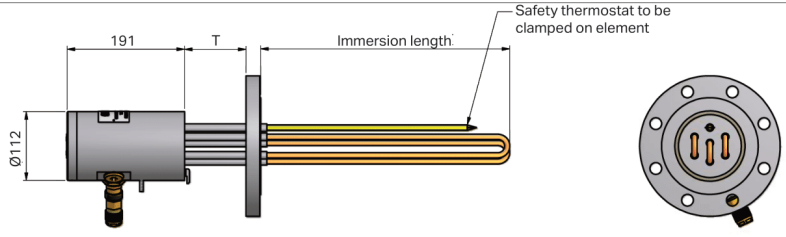
Catalogue Immersion Heaters type D-8640

Gas and Dust flame-proof immersion heater type D-8640
For hazardous areas, Sinus Jevi has developed explosion-proof Ex 'de' heating equipment, designed and manufactured in accordance with EN-IEC 60079-0, EN-IEC 60079-1, EN 60079-7 and EN-IEC 60079-31 certified by the independent testing institute ISSeP. The certificates cover zone 1 and zone 2 for hazardous areas. Gas groups II A, II B and II C and temperature classes T6-T1. Dust group Ex tb zone 21.

The flame-proof (d) enclosures have been designed for non save areas to protect the environment against gas-explosions, caused by sparking by electrical connections of the heating elements and control devices. Several types of enclosures for immersion heaters, flanged or screwed, have been described on the next pages.
Each type covers a range of a maximum number of installed hairpin shaped heating elements and giving a range of installed capacities.

The screwed types for dimensions up to 3".
The terminal enclosures have a IP66 degree of protection.
Standard the enclosure is coated with two layers, a zinc silicate primer and a top coating. Other coatingsystems on request.

All heaters are standard internal wired on terminals.



The maximum temperature for the terminal enclosure during operation is 80°C (based on maximum 50°C ambient temperature). If cable entry exceeds 70°C, high temperature cables must be used. The required minimum distance between enclosure and connection flange, to ensure the temperature limit of 80°C in the enclosure, is listed in the following table as a function of temperature classes. Maximum number of cable entries: 2 pcs M25/M20

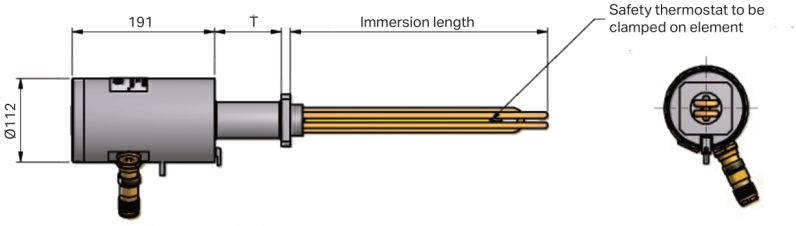
* Limitation power by cable entry

- Flange connection with tubular type heating element

SINUS JEVI

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Description
Suitable for heating of fluids both liquids and gases and also solids. The heater consists of a certified flameproof enclosure D-8640, containing:
- certified electric heating elements (Ex e II) tubular, ceramic or cartridge heating elements.
- one manually protective thermostat with manual reset or one thermocouple or pt100 as a safety device. Thermocouple and pt100 are only applicable in combination with an external temperature controller executed with a manual reset.
- threaded holes for cable entries and/or plugs of a certified flameproof model Ex d II B or Ex d II C.



The flame-proof enclosure has been built up out of a seamless body, a top cover and base plate. Each cover and base plate has been provided with 6 screw thread windings with a total length of 18 mm. The connection length of the threaded joint between cover or base plate and body should always be 5 thread windings minimum. The cover has been locked with an M4 screw and the base plate with an M6 screw. In the base plate of the enclosure spacer tubes can be welded in which the heating elements are brazed or welded.

Temperature class		Distance enclosure to heater (T)
T6	85°C	50 mm
T5	100°C	75 mm
T4	135°C	100 mm
T3	200°C	150 mm
T2	300°C	200 mm
T1	450°C	250 mm

Technical specification
- Tubular heating elements with a diameter of Ø8.5 mm up to and including Ø16 mm and cartridge heating elements of Ø12.5 mm up to including Ø31.5 mm can be applied, also ceramic elements from Ø26 mm up to including Ø46 mm.
- Material of the enclosure: carbon, low alloy steel, or ferrous steel.
- Material of heating elements: stainless steels AISI 304, AISI 321, AISI 316, AISI 904L, Inconel 600, Incoloy 800, Incoloy 825, Titanium, SMO, Copper alloy or Nickel alloy.
- Degree of protection of the enclosure: IP66.
- The maximum allowable energy-dissipation of the heating elements has been based on a maximum Watt density, determined by the temperature class, type of medium and process conditions.

The temperature setting of the thermostat, thermocouple or pt100, as stated in the EC type Examination Certificate, is applicable only for heaters immersed into a hazardous fluid flow.

If the heater has not been immersed into a hazardous fluid but forms a part of an apparatus located in a hazardous zone, the temperature setting has to prevent the maximum temperature of the outside of the apparatus to exceed the temperature according to the temperature classification.

- Threaded boss from 1½" G BSP up to 3" G BSP with tubular type heating element.

Gas and Dust flame-proof immersion heater type D-8640 VARIATION for relative low working temperatures

Description
The heater serie D-8640 variation is designed to heat a wide range of liquids, gases and solids.
The heater consists of a certified flameproof enclosure Ex d II C T6 - T1 Gb, certified electric heating elements Ex e II and a manually reset protective safety device. Unheated length heating elements into the medium is 30 mm minimum.
The surface loading of the elements in the heater is determined by the thermal characteristics of the fluid or gas being heated and its operating temperature and pressure.
The heaters are designed to operate within an ambient temperature range of -30°C to +50°C.

Heating elements
The heater consists of certified electric heating elements Ex e II which can be tubular heating elements with a diameter up to Ø16 mm or cartridge heating elements up to a diameter of Ø31.5 mm or retractable ceramic core elements Ø26 mm - Ø46 mm placed in a metal sheath with welded end plate.
Voltage supply up to 690 Volt.

Mounting
Threaded boss or flange connection in carbon steel or high alloy steel.

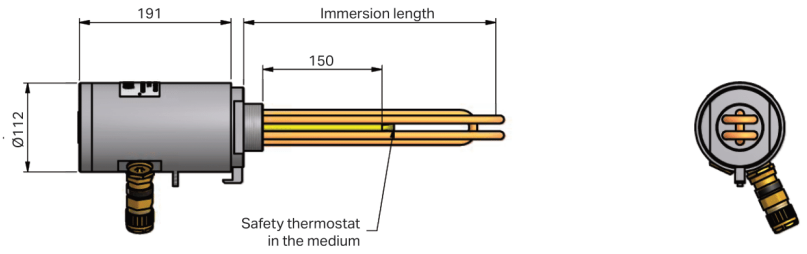
Set point safety thermostat
Set point on safety thermostat in medium:

Temperature class T1 to T4:	110°C
Temperature class T5:	90°C
Temperature class T6:	75°C

Set point on safety thermostat inside the terminal enclosure:

Temperature class T1 to T4:	90°C
Temperature class T5:	85°C
Temperature class T6:	70°C

If the cable entries exceed 70°C suitable high temperature cabling methods must be used. A warning label on the outside of the enclosure next to the cable gland shows the maximum allowable temperature. By a working temperature of more than 90°C the terminal enclosure will be at a distance from the heater. See table on page 3.



Temperature safety
Minimum of 1 over temperature thermostat or thermocouple or pt100 must be installed for guarding flange, plate or screw head and junction box temperature and must be either:
- Manually reset at the control panel by key switch or special tool
- Manually reset unit inside the terminal enclosure (klixon)
- Possibly with added manually reset unit on the highest surface temperature of the apparatus

When the electric heater type D-8640 and his variation does not have a temperature regulation of its own, the process medium temperature for each combination must be regulated with a seperate flameproof control thermostat, thermocouple or Pt100 and a seperate safety thermostat, thermocouple or Pt100 with manual reset. Both devices shall guarantee the temperature limit and the temperature class.

Special note
The end user must ensure that the heating elements are always inserted into the liquid or gas.
The end user must ensure that there is always a protection against an incorrect direction of flow (e.g. an one way valve). The lowest temperature of the liquid or gas flow is always at the end where the terminal enclosure is situated.

Terminal enclosure
The terminal enclosure can be either direct on or stand off depending on the process temperature.

SINUS JEVI Ω

Sinus is one of the pioneers in the field of explosion proof heating equipment, today we are still operating at the forefront. We manufacture according to ATEX as well as IECEx and EAC directives.

For the production of Ex-proof equipment a PQAN (Product Quality Assurance Notification) is issued by TUV-Nord. Our ISO-9001 and ISO-14001 systems are also monitored by this organisation.

1123460	DATA SHEET	LAPP
valid from: 15.01.2024	ÖLFLEX® CLASSIC 135 CH BK 0,6/1 kV	

Application

ÖLFLEX® CLASSIC 135 CH BK 0,6/1 kV are screened halogen free, highly flame retardant power and control cables designed for the European and North American market, for occasional flexible use and fixed installation subject to normal mechanical load conditions. They are also suitable for use in dry or damp areas. They are suitable for outdoor use if the indicated temperature range is observed. They are suitable for occasional, non-automated movements. The maximum tensile load is 15 N/mm² of conductor cross-section during installation and operation. Compulsory guidance is not permitted.
The screening braid protects against interference from electrical fields.

Application range:
Public buildings, plant engineering, industrial machinery, heating and air-conditioning systems and particularly where human and animal life as well as valuable property exposed to high risk of fire hazards

USE gem. UL: FRPE sheathed cable for internal wiring of appliances or external interconnection

Design

Design	acc. to UL AWM Style 21156, UL 758 based on EN 50525-3-11
Certification	UL AWM Style 21156 (File No. E63634), UL 758 EN 13501-6 and EN 50575 Classification of fire behaviour (article/dimension range see www.lappkabel.com/cpr)
Conductor	fine wire strands of bare copper, acc. to IEC 60228 resp. EN 60228, Class 5
Insulation	halogen free compound TI6, acc. to EN 50363-7, with increased requirements
Core identification code	acc. to VDE 0293-1 up to 5 cores: colour-coded acc. to HD 308 S2, with or without GN/YE ground conductor starting at 6 cores: black cores with white numbers, with or without GN/YE ground conductor, acc. to EN 50334
Stranding	cores are stranded in layers
Wrapping	plastic foil
Screen	braid of tinned copper, coverage = 85% (nominal value)
Outer sheath	halogen free compound TM7 acc. to EN 50363-8 colour: black, similar RAL 9005

Electrical properties at 20 °C

Nominal voltage	EN U_0/U: 600/1000 V UL: 1000 V
Test voltage	core / core: 4000 V AC core / screen: 3000 V AC

Mechanical and thermal properties

Minimum bending radius	occasional flexing: 20 x outer diameter fixed installation: 6 x outer diameter
Temperature range	occasional flexing (EN): -25 °C up to +70 °C max. conductor temp. occasional flexing (UL): up to +75 °C max. conductor temp. fixed installation (EN): -40 °C up to +80 °C max. conductor temp. fixed installation (UL): up to +75 °C max. conductor temp.
Flammability	flame retardant acc. to IEC 60332-1-2 resp. EN 60332-1-2 UL: Cable flame test acc. to UL 1581 §1061 no flame-propagation acc. to IEC 60332-3-24 resp. EN 60332-3-24 or acc. to IEC 60332-3-25 resp. EN 60332-3-25
Halogen free	acc. to IEC 60754-1 resp. EN 60754-1
Corrosivity of gases	acc. to IEC 60754-2 resp. EN 60754-2
Smoke density	acc. to IEC 61034-2 resp. EN 61034-2
Toxicity	acc. to EN 50306-1 (≤ 6)

We reserve all rights according to DIN ISO 16016.
PDC 0019/06_03.23EN

1123460	DATA SHEET	LAPP
valid from: 15.01.2024	ÖLFLEX® CLASSIC 135 CH BK 0,6/1 kV	

UV resistance	acc. to EN 50525-1 cables with black sheath are suitable for permanent outdoor use. acc. to EN 50618 acc. to EN 50620 acc. to EN ISO 4892-2-2013, method A (change of colour allowed)
Ozone resistance	acc. to EN 50396, method B
Tests	acc. to IEC 60811 resp. EN 60811, EN 50395, EN 50396, UL 1581
General requirements	These cables are conform to the EU-Directive 2014/35/EU (Low Voltage Directive). A part of these cables (see www.lappkabel.com/cpr) are classified in accordance with the EU-Regulation no. 305/2011 (CPR).
Environmental information	These cables meet the substance-specific requirements of the EU Directive 2011/65/EU (RoHS).

We reserve all rights according to DIN ISO 16016.

CABLE GLAND BARRIER SERIES

ICG/653/UNIV

Flameproof, Increased Safety, Dust Protection and Restricted Breathing
Class - Zones - Divisions
Certified ATEX / IECEx / UKEX

- 1 Inspectable Deluge Seal
  - Offering IP66, IP67, IP68 & IP69 Ingress Protection
- 2 Transparent Elastomeric Fully Inspectable Compound Pot – compatible with both injectable resin and 2 part compound
- 3 Reversible Armour Clamp
  - For all types of armour and braid
- 4 Patented Cable Gland Tightening Guide
  - Helps prevent damage caused by over tightening
- 5 Unique Rear Seal - Offering ultimate sealing over an extremely wide cable acceptance range

International Approvals

Dual certified Exe/Exd barrier gland, providing a seal around individual cable cores, especially for cables that exhibit "cold flow" characteristics, are not effectively filled, have hygroscopic fillers or contains fibre optic cores. For use with single wire armour 'W', wire braid 'X', steel tape armour 'Z' elastomer and plastic insulated cables. The ICG/653/UNIVERSAL is available with either ExPress liquid barrier resin or QSP 2-part hand mix compound, both with a cure time 30 minutes

Ordering Information

If brass is required please omit material selection
Format for ordering is as follows: Alternative Ring (R), add suffix R to ordering information
All barrier glands are supplied with Express resin as standard. If QSP (Quick Set Putty) is required please select Q in compound selection

Cable Gland Type	Size	Thread	Material	(Optional)	Compound
653U	C	M32		R	
653U	C	1.25	NP	R	Q

Example Code: 653UCM32R
Assembly instructions are supplied with the cable gland
Please note all NPT entries should be state as a decimal
Please refer to part code logic information page for further details on product options

ExPress Barrier Resin

Specify your barrier gland with our ExPress injectable resin for faster, easier installation
A liquid injectable and fast curing resin, allowing for faster installation time than traditional 2-part compounds. Utilising a unique clear compound chamber for full visibility of the flameproof seal during installation and inspection, the ExPress barrier resin is unparalleled as a global solution, with a 30 minute gel time and unrivalled ease of use.
All barrier glands are now supplied with Express Resin as standard.

EXPRESS

Cable Gland **Tightening Guide**

Whilst Hawke International goes to great lengths to ensure products are designed to be as simple to install, inspect and maintain as is possible, differing levels of competency, training and understanding can lead to glands being incorrectly installed. With hazardous area products, any poor installation issues can not only lead to expensive equipment failure, but also potential explosion risks and associated risk to life.

To help address issues with the overtightening of cable glands and the resultant damage to cables and seals, Hawke International has developed the patented **INBUILT TIGHTENING GUIDE**.

Without the need for fiddly measuring systems, the guide provides a permanent visual indication of the gland tightness through installation, inspection and maintenance.

FEATURES

- *Explosionproof operator for use in potentially explosive atmospheres according to ATEX-Directive 2014/34/EU*
  EC type examination certificate no.: ***LCIE 00 ATEX 6008 X***
  IECEx Certificate of Conformity no.: ***IECEx LCI 07.0015X***
- *Compliance with the Essential Health and Safety Requirements has been assured by compliance with the International and European Standards EN-IEC 60079-0, EN-IEC 60079-1 and EN-IEC 60079-31*
- *Easy electrical installation by means of a screw terminal coil*
- *Enclosure provided with a 1/2 NPT threaded entry hole (M20 x 1,5 in option) for a broad range of cable entries*
- *Ingress protection degree IP66/67*
- *A wide range of valves can be supplied with the operator*

Check the wattage compatibility with the product selected.
(1) **The minimum allowable ambient temperature is -60°C for the operator.** Actual temperature range can be limited depending on valve operation limits.
(2) AC (~): rectified coil construction.
(3) 230 V AC does not exist (Pn 1,85 W).

ORDERING INFORMATION

A valve supplied with the explosionproof operator will be identified with prefix NF or WSNF before the catalogue number.

Example: **NF** E 210D095 230V/50 Hz

- **NF** — operator
- E — pipe thread ISO 7/1
- 210D095 — basic number
- 230V/50 Hz — voltage

A valve supplied with the explosionproof operator will be identified with electrical interface FN, FS, FT or FU in the 15-digit product code.

15-DIGIT PRODUCT CODE

E 262 K 232 **FN** V00 H1

- E — Thread connection
- 262 — Product series
- K — Revision letter
- 232 — Valves version
- **FN** — Electrical interface
- V00 — Options
- H1 — Voltage - class

Electrical interface
FN = NF
FS = WSNF
FT = NFET
FU = WSNFET

Metallic (Exd/Exe) adaptors and reducers - AD-U / RD-U Series

Type AD-U

Type RD-U

Redapt AD-U and RD-U series of explosion-proof metallic adaptors and reducers provide a method of matching electrical thread forms on hazardous area approved equipment whilst ensuring the integrity and Ex approval of the installation is maintained.

Manufactured from hexagon material to facilitate easy installation, they are also supplied complete with a captive O-ring seal. The O-ring is located within a recess on the face of the product, helping to protect the O-ring from the environmental damage and ensuring it is not displaced during installation. Designed for hazardous area applications and the range is certified to protection concepts Exd "Flameproof" and Exe "Increased Safety" for use in Zone 1 and Zone 2 applications. Also certified Ex tb "dust tight" for use in Zone 21 & 22 applications.

Materials

- Brass CZ121
- 316 stainless steel
- Aluminium
- Mild steel

Threadforms

- Metric
- NPT
- PG
- ISO Pipe (BSP)
- ET

Plating options

- Electroless nickel
- Zinc
- Chromated
- Others on application

Temperature
Temperature will depend on the type of O-ring used:
None: -60°C to +200°C
Nitrile: -30°C to +80°C (supplied as standard)
EPDM: -50°C to +100°C
Neoprene: -40°C to +80°C
Viton: -20°C to +180°C
Silicone: -60°C to +180°C
Fluorosilicone: -60°C to +130°C
The maximum temperature is limited to +150°C for Group I applications
Ingress protection (IP):
IP64 when fitted without sealing washer. IP66/IP68 when fitted with O-ring or thread sealant according to manufacturer's instructions.

Notes:
- Always quote male thread first
- Threadform codes below to be used for both male and female threads.

Adaptors and reducers selection guide

STEP 1 – To obtain the correct reference number, select the male size from the left hand column, then refer horizontally across the page to the female size (i.e. M32 (male) x M40 (female) = 208). Reference numbers in blue are adaptors; other references are reducers.

Female Size

Adaptors and reducers selection guide

STEP 2 – Having obtained the reference number, go to the relevant column within the dimension tables to obtain the adaptor or reducer's dimensions. Please note that these dimensions refer to metallic products only.

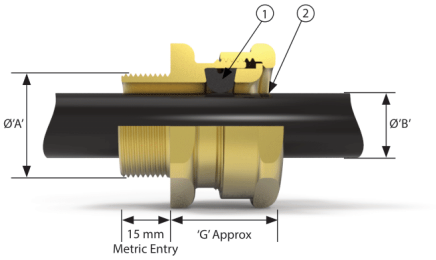
4.14 QM1.1..QM1.6 and QM2.1..QM2.6 – Cable Gland for Solenoid Valve, 501/421 O M20 Brass



[This page intentionally left blank.]

CABLE GLAND COMPRESSION SERIES

501/421

Flameproof, Increased Safety, Dust Protection and Restricted Breathing
Class - Zones
Certified ATEX / IECEx / UKEX / c CSA us

International Approvals

■1 Elastomeric Exd Flameproof and Exe Increased Safety seal on cable outer sheath

■2 Rounded Cable entry to prevent cable damage

The 501/421 dual certified Exe/Exd cable gland is intended for use on non-armoured elastomer and plastic insulated cables.
This cable gland may be used with braided cables where the braid and outer sheath pass into the enclosure.
The braid must then be suitably terminated inside the enclosure. For Exd applications, the cable must be suitable in compliance with with BS EN 60079-14.

IEC 60079-10 Analysis 601456B Crosswind

Full Title: EN IEC 60079-10-1 Analysis, Crosswind 1MW MEGAblock

Abstract: EN IEC 60079-10-1:2021 is intended to be applied where there may be a presence of flammable gas or vapor mixed with air. This is done by classifying areas where gas/air mixtures may be present into zones. Suitable design choices can be made based on the analysis, to eliminate the ignition hazard in the identified zones.

In this report, two areas are evaluated: the fuel connection to FCwave and External hydrogen handling unit.

1.0 Executive Summary

Two areas were evaluated using the methodology described in EN IEC 60079-10-1:2021:

1. Fuel connection to FCwave: due to the presence of continuous ventilation, and the quality of the ventilation as well as the ventilation speed surrounding the connection the area is considered non-hazardous. Those are discussed in further detail in this report.
2. External hydrogen handling unit: this area contains several fittings, flanges and valves fittings, which are considered potential sources of a secondary grade of release. Using natural ventilation present in the external location and the methodology in the standard, it is determined that the fuel connection area should be classified as Zone 2 for hydrogen gas with 1 meter radius.

5.0 Background Information

Figure 1: System installation with auxiliary equipment

System overview of the complete assembled system

5.1 Crosswind 1MW MEGAblock

The FC PowerGen 1000kW® system is comprised of 3 main components:

1. Fuel cell container, 40ft: is an area for installation of the Ballard FCwave module and DCDC converters. Inside the container distribution of HT and LT cooling is done, as well as control system for all BOP components.
2. Power Converter container, 10ft: All the power electronic converting the DC from the FCwaves into AC to the customer, build up in a separate container. The Customer AC connections as well as switchgear and controls for equipment are included in this container.
3. Cooling Unit: An external skid frame containing dry coolers and pumps for cooling the FCwave and power electronic. The skid includes a control cabinet for controlling of valves and fans on the cooling.

5.2 EN IEC 60079-10-1:2021

Specific terms used in this report are related to EN IEC 60079-10-1:2021, where a specific technical definition is given. Grade of release, zone type, and ventilation class are examples. Please refer to the standard for these definitions.

The standard provides a number of methods for classification of hazardous zones inside and outside of equipment containing flammable gases. The analysis performed and described through this report, follows the “classification by sources of release method” as described in Section 5.2 of the standard.

The general steps are:

- Is a flammable substance present (As described in Annex F, figure F.1.)
- Identify and specify grade of release sources (Continuously, Primary, Secondary).
- Determine the release rate for each source based on likely frequency and duration of release (as described in Annex F, figure F.4.).
- Assess ventilation or dilution conditions and effectiveness.
- Determine zone, based on grade of release and ventilation or dilution effectiveness.
- Determine extent of zone

For secondary grades of release, a process to determine the estimated leak rate and release characteristic is provided. The process relies on a number of calculations which are mentioned in this report but performed in a separate workbook. Results are shown in figures and tables included in this report.

5.3 Safety instrumented system

The safety instrumented system is comprised of a number of safety monitoring devices coupled with a safety controller which, in the event of a faulty condition being detected, stops the flow of hydrogen into the system. The monitoring devices include hydrogen detectors and smoke detectors, Further information on the Megablock Hydrogen Safety Concept referred to in document K559-2254-CWIWP4202202-C99-001.

5.4 P&ID

Several components are mentioned in this report that serve important functions with respect to hydrogen safety. These components and their relative location in the system can be found in the process and instrumentation diagram K559-2254-CWIWP4202202-C03-001 referenced in Section 2. For further details refer to the P&ID documentation.

6.0 Fuel connection to FCwave

Figure 2: Cross section of hydrogen extension box

Top view of the Fuel cell container. The red pipes are the unbroken seamless stainless-steel pipes, for hydrogen. The inlet connection is outside the container, and the outlet (inlet to FCwave) is enclosed in a ventilated space. See details in Figure 3.

6.1 Safety Approach

The hydrogen feed pipes are the connection pipes between the hydrogen interface pipe and the fuel cell module. All pipes are seamless stainless steel. The feed pipe is connected in both ends with a double-ferrule compression fitting. The pipe is a one-piece bended pipe with no welds or connections throughout the full length of the pipe, as illustrated on Figure 2 and Figure 3.

Figure 3: Cross section of hydrogen extension box

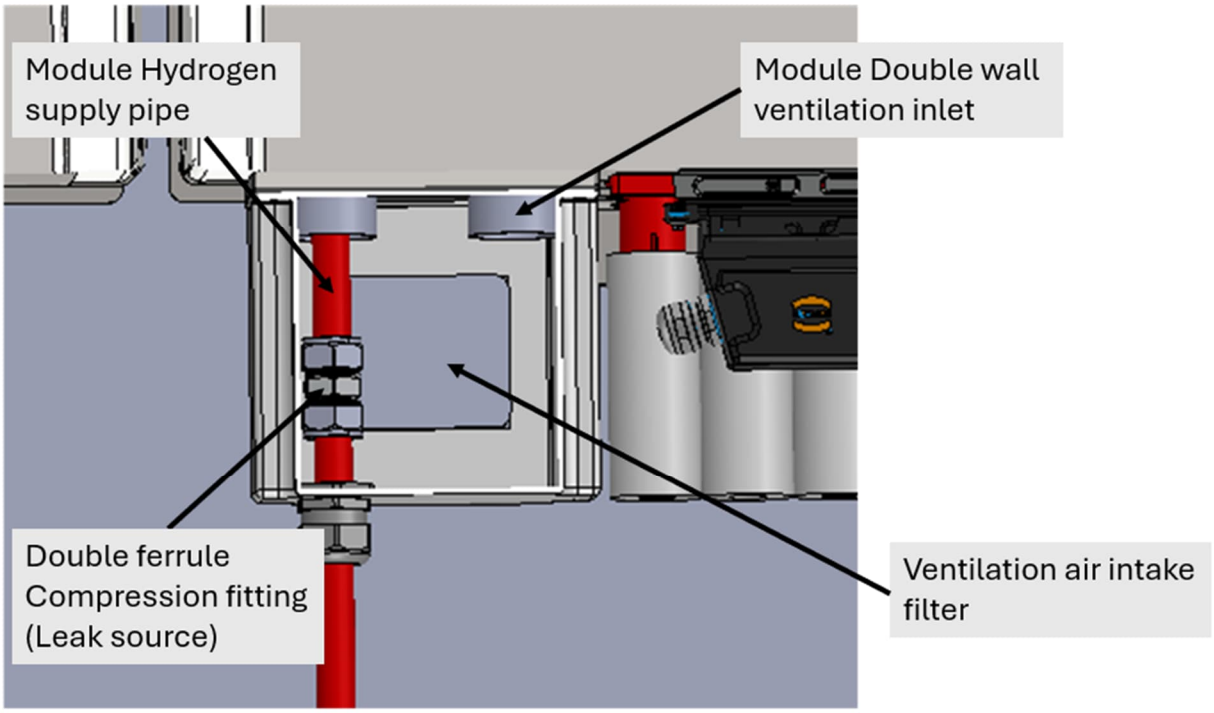

Figure shows a cross cut of the hydrogen enclosure extension. The prime component is the double ferrule compression fitting which is the potential leak

The connection to the fuel cell, from the hydrogen feed pipe, is made with a double-ferrule compression fitting, encapsulated in a ventilated space (box) as an extension of the fuel cell hydrogen ventilation system and the "double walled piping" approach, applied in the FCwave. Hereby transferring all the safety features from the module to this connection.

The FCwave module does not introduce any further risk of leakage due to the construction and certification on the product. For details on this refer to the safety Strategy for the FCwave in document MAN002.

Additionally, the container is equipped with 3 hydrogen sensors. 2 of these hydrogen sensors are located on the roof and near the point where the ventilated air from the container passes by to exhaust the container, so a leak anywhere in the container space will be detected here. The third is located next to the fresh air intake, making sure no hydrogen is introduced into the container from the outside.

The following chapter 6.2 to 6.6 are an assessment of the potential individual leak sources inside the container to determine if there is a local zone or area which requires further consideration.

6.2 Sources of Release

There is one connection inside the container, hence this will be the only potential source of release. This potential leak will be defined as a secondary grade of release.

6.3 Degree of Dilution

The potential leak (1) in Table 6 1, on the connection to the FCwave module is inside the extension of the hydrogen enclosure, surrounded by forced ventilation. The air velocity in the enclosure surrounding the potential leak is defined: The area of the box is calculated to be: 0,0205m2, with the minimum ventilation flow from the FCwave integration manual (MAN002) being 0,0125m^3/s, resulting in a total air velocity of the ventilation surrounding the potential leak: 0,4062m/s.

Table B.1 from EN IEC 60079-10-1:2021 is used to determine the theoretical hole size (cross section) to estimate the release rate. Input data for the calculation and results are listed in Table 6-1.

Using the equations provided in the standard (ex. B.7.2.3.2 and B.7.2.3.3), release rates are determined for each group. Factoring in the lower flammability limit for hydrogen (4%), the release characteristics are calculated.

Based on the Ventilation velocity and the release characteristics, the degree of dilution is determined to be high, as shown in Figure 4, where the green square indicates the value from the leak source.

Figure 4: Degree of Dilution Chart for release sources inside the container

The green point above corresponds to the data in Table 6-1. Points to the left of the blue line have a high degree of dilution, points between the blue and red lines have a medium degree of dilution.

6.4 Classification of Zone

Based on the schematic approach described in Figure F.4 of EN IEC 60079-10-1:2021, the zone classification of a *secondary grades of release* is assessed. The release characteristic and the degree of dilution, as described in Figure 4 and Table 6-1, “Leak 1”, results in a Non-Hazardous zone.

6.5 Extent of Zone

As the potential leak in “Leak 1” is classified to be a non-Hazardous zone, the extent is not calculated.

6.6 Summary of Fuel connection to FCwave

The process fuel connection to the FCwave is considered non-hazardous due to the safety approach described in Table 6-1.

Table 6-1: *Release sources inside the container (not including FCwave).*

1	2	3	4	5	6	B.1	8	11	12	13	14
	Description	Location	Grade	Rate of Release (kg/s)	Release Characteristic (m^3/s)	Estimate Size of Hole (mm^2)	Operating Pressure (Barg)	Degree of Dilution	Availability	type	Extent (m)
1	M20-M25 Hy-lok double ferrule compression fitting reducer	Connection to FC wave module inside H2E extension box	S	3,62E-05	0,0115	0.1	10	High	Good	Non-Hazardous	none

The table is built up after the "Hazardous Area Classification data sheet" from Table A.2 – EN IEC 60079-10-1:2021. The data listed is equivalent to the "ATEX zone definition calculation document". Not all columns from Table A.2 are given in this table. Notes to columns:

1. The release source has reference "Leak 1" in the calculation document.

4. Grade: S. the Hy-lock connection is one of the tightest pipe connection methods on the market, hence only rare leakages are to be expected from this connection type.

5,6. Calculated based amongst others on the estimated hole size (after table B.1) and the maximum operation pressure in the pipes (8). (same as 6, but another unit)

B.1: from table B.1 in EN IEC 60079-10-1:2021 and based on sealing element type.

8. The maximum operating pressure is used in the calculations.

9. Releases are all "G" for gas type

10. Ventilation type is "Forced ventilation"

11. Based on the release characteristics and the available ventilation, figure C.1 from the standard, points to a "High" dilution.

12. The availability is specified as good, due to the safety/redundancy built into the ventilation pf the given space.

13. looking at table D.1 from the standard, the conditions: Secondary release, high dilution, good availability of ventilation points to "non-hazardous".

14. as the zone is classified to be "Non-hazardous", based on dilution and ventilation, the extend is Not applicable.

7.0 External hydrogen handling unit

The fuel connection area is where the customer connects the hydrogen fuel supply to the fuel cell container. The external hydrogen handling unit also contains two in series safety shutoff valves as well as hydrogen heater for preheating the hydrogen in subzero conditions.

Figure 5: External hydrogen handling unit

The fuel connection area and safety shutoff valves are placed outside of the container, in free air.

The key elements of the "hydrogen handling unit" is pointed out in the figure.

7.1 Safety Approach

The fuel connection area outside the container contains a large number of fittings, flanges, and valves which may cause a secondary grade of release, at some point in the life of the product. As a hazardous zone is determined through the analysis, proper zone identification shall be made and the component and equipment in the area must be of the appropriate equipment category (EX approved). The extend and placement of the identified zone will be communicated to the integrator and end user in a general arrangement drawing K559-2254-CWIWP4202202-B01-001.

7.2 Sources of Release

There are three types of components which qualify as a potential source of release;

- fittings, flanges and valve stem packing.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

The Hydrogen handling unit consists of several individual fittings, flanges and connections, which are grouped in Table 7-1 below. Background hydrogen concentrations is not considered, as the system is not allowed to be installed in an already existing EX zone. All leaks are rated to be “secondary grade of release”, so according to EN IEC 60079-10-1:2021 Annex B section B4, one leak at a time is only considered.

7.3 Degree of Dilution

For outdoor locations where natural ventilation is available, a minimum ventilation velocity (for dilution) can be determined based on the location of the sources of release. Using Table C.1 from the standard, an estimated wind velocity or speed of buoyancy of worst case 0.5 m/s was determined based on:

- release of lighter than air gas.
- obstructed area less than 2 meters above ground.

Combined with the release characteristics from Table 7-1, the degree of dilution is determined to be “High” on “Leak 2,3”, and Medium at “Leak 4,5,6”, See Figure 6, where each leak source is plotted in to the diagram.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Figure 6: Degree of dilution chart for connections on hydrogen handling unit.

The colored points in the chart correspond to the color groups in Table 7-1. Points to the left of the blue line have a high degree of dilution, points between the blue and red lines have a medium degree of dilution.

7.4 Classification of Zone

Based on the schematic approached described in Figure F.4 of EN IEC 60079-10-1:2021, the zone classification of a *secondary grades of release* is assessed. The release characteristic and the degree of dilution, as described in Figure 6 and Table 7-1, “Leak 2,3”, results in a Non-Hazardous zone and “Leak 4,5,6” result in a Zone 2, with max 1 m extend.

7.5 Extent of Zone

Figure D.1 from EN IEC 60079-10-1:2021 is used as basics for the zone extend assessment. For the area around the "hydrogen handling unit", it is determined that all potential hydrogen releases will be jet type based, due to the high velocity of the modelled releases and the relative density of hydrogen to air. Based on the release characteristics specified in Table 7-1, it is found that the potential component releases from "Leak 5,6,7,8" would result in a zone that would be less than 1 meter in extent, see Figure 8. Since the minimum distance is 1 meter, the zone is defined to be 1m from the release source.

Figure 7: Extend of zone.

The colored points in the chart correspond to the color groups in Table 7-1. All points are below the line, determine the zone size.

7.6 Summary of External hydrogen handling unit

There are numerous fittings and valves (packing) that could leak at some point over the lifetime of the Fuel cell container. These leaks would generate jet plumes that would be relatively small and would dilute quickly. This analysis shows that adequate dilution would occur within 1 meter of the source. Therefore a 1 meter, Zone 2 setback should be

Table 7-1: List of leak sources identified in the External hydrogen handling unit.

The table is built up after the “Hazardous Area Classification data sheet” from Table A.2 – EN IEC 60079-10-1:2021. The data listed is equivalent to the “Atex zone definition calculation document”. Not all columns from Table A.2 are given in this table. Notes to columns:

1. The release source has reference “Leak 2-6” in the calculation document.

4. Grade: S. The Hy-lock connection, fittings and valves are selected due to their qualities in tightness, hence only rare leakages is connection with fault conditions are to be expected from this connection type.

5,6. Calculated based amongst others on the estimated hole size (after table B.1) and the maximum operation pressure in the pipes (8). (same as 6, but another unit)

7. No references used

B.1: from table B.1 in EN IEC 60079-10-1:2021 and based on sealing element type.

8: The maximum allowable operating pressure is applied in the calculations.

9. Releases are all “G” for gas type

10. Ventilation type is “Natural”

11. Based on the release characteristics and the available ventilation, figure C.1 from the standard, points to a “High” dilution from leak 2,3 and a medium dilution from leak 4,5,6.

12. The availability is specified as good, due to the ventilation being “natural”.

13. looking at table D.1 from the standard, the conditions: Secondary release, high dilution, good availability of ventilation points to “non-hazardous”. The conditions: Secondary release, medium dilution, good availability of ventilation points to “Zone 2”.

14. The extent of the zone is in all cases less than 1 m I radius from the leak point.

8.0 Process exhaust and drain

8.1 Background for evaluation

As stated in the integration manual (MAN0002) for the FCwave module the maximum amount of hydrogen present at all scenarios in the process exhaust is 1%vol. This is equal to 25% LEL of hydrogen.

The composition of gas in the drain is the same as the process exhaust due to the fact that the process exhaust is by "fault" emptying the static air lock (previous referred to as water lock) within the module. This means the maximum content of hydrogen in the drain will be 1%vol equal to the process exhaust.

8.2 Definition of explosive gas atmosphere

Due to the concentration being so low (below LEL) the general foundation of the definition of an Explosive atmosphere is not met. According to the standard IEC 60079-10-1:2021 section 3.2 the definition is:

- *"Explosive gas atmosphere*

  Mixture of air, under atmospheric conditions, of flammable substances in the form of gas or vapor, which, after ignition, permits self-sustaining flame propagation"

As the composition of gas in the drain is below 25% of LEL the gas is not able to self-sustain a flame propagation, meaning it is by definition not an Explosive gas atmosphere. Additionally, the IEC 60079-10-1 section 4.4.2 has a clause for releases which is considered as negligible extend. Either due to the potential explosion being of a negligible consequence, or if the release rate or quantity is of a negligible extent in reference to the volume. Yet the clause still operates with the gas potentially being able to combust or explode, which is not the case for a mixture of 1% vol hydrogen.

Additionally, the mixture is also below 25% LEL making sure no clauses from IEC 60079-10-1 Annex I is applicable.

8.3 Risk mitigation considerations

As part of the IEC 60079-10-1 Zone classification procedure a risk assessment can determine to increase or decrease the zoning and EPL. For this installation, the mitigation for not increasing the zoning from e.g. a non-hazardous to a Zone 2 is mitigated by selection of components for the drain system. Which for this system is converted into gastight fittings, instrumentation and pipe with the weakest component being able to withstand a constant pressure of 69 Barg. In addition to this, the general design eliminates the risk of the hydrogen up-concentrating in unintended areas by making sure the exhaust is at the highest point and with a pressure less system securing hydrogen and steam from the process exhaust gas will be able to escape the system through normal buoyancy.

9.0 Pressure testing according to IEC 62282-3-100

To make sure the Hazardous Area Classification is not exceeding the specified area of extent, release rate and frequency, the system within the Fuel cell container (from the hydrogen heating unit to the valve block (inside the FCwave)) has a build in function to automatically do a pressure decay test according to 62282-3-100:2020.

To maintain the specified HAC, the allowable maximum release of hydrogen is calculated in relation to the zone to make sure that the system is at all times within the boundaries provided in EN IEC 60079-10-1:2021.

The frequency at which this release can occur is still considered to be a “secondary grade of release” as *the release is not expected to occur in normal operation and, if it does occur, is likely to do so only infrequently and for short periods*[4]. Safety precautions describe in the document: *K559-2254-CWIWP4202202-C99-001 Megablock Hydrogen Safety Concept*, supports this assessment of the grade of release.

All leak sources mentioned in Table 7-1, are considered as a uniform leak, throughout this chapter.

9.1 Maximum release flow in respect to zone extend

As calculated in chapter 7.5, the minimum required extent of the zone 2 is 1m in radius. The maximum allowable leak, from the secondary leak source, is determined by the Figure 8 to have a release characteristic on 0,22m^3/s.

[4] From the definitions given in EN IEC 60079-10-1:2021.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Figure 8: Extent of Zone

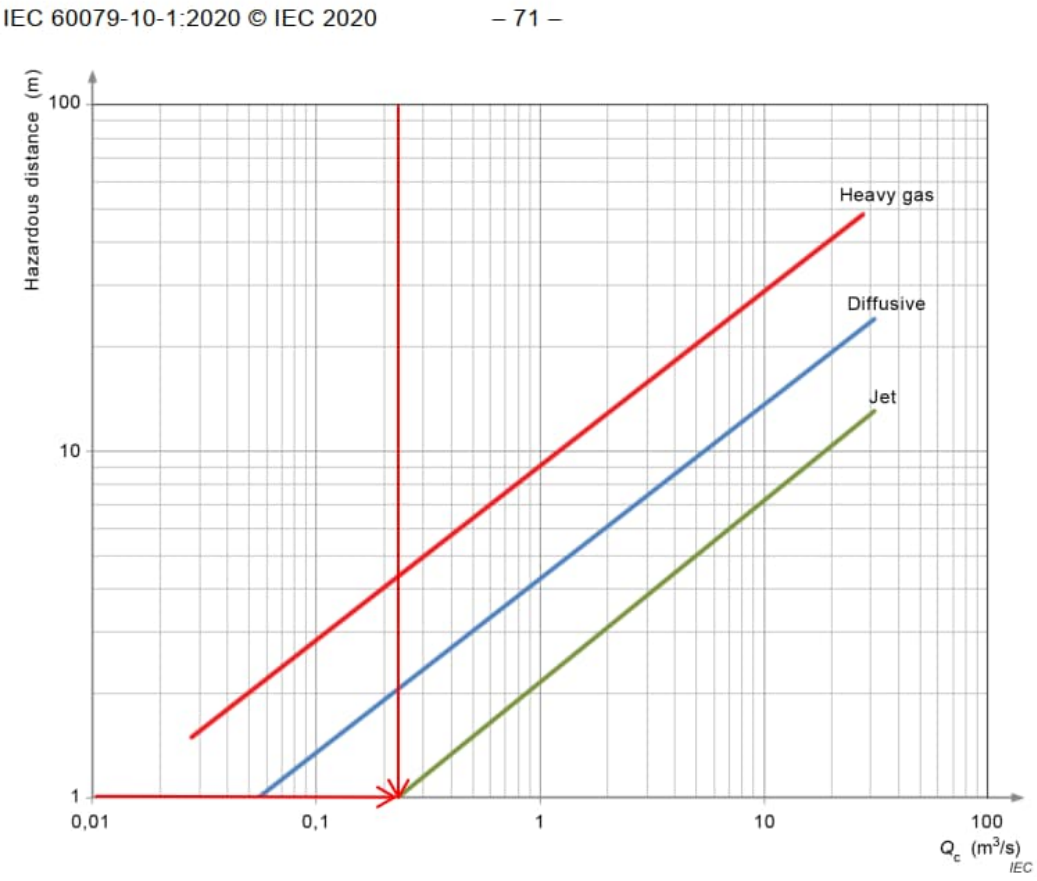

Figure D.1 – Chart for estimating hazardous area distances

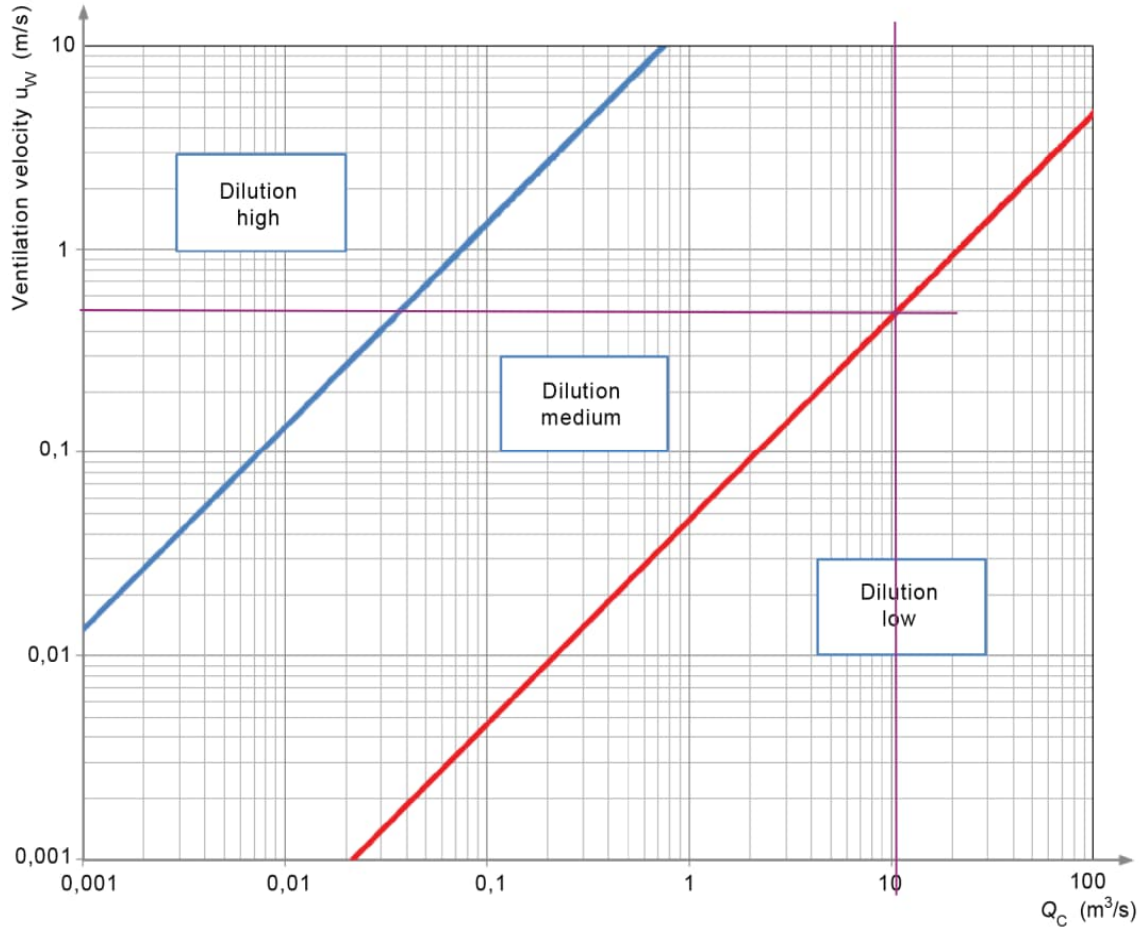
Red lines show the assumptions for the minimum requirements to be measured

Converting this into the Release Flow (Wg) using the relative density and LFL, the maximum allowable Release Flow is 6,904x10-7 g/s to still maintain the applicable zone 2. However, considering the leak source a secondary grade of release, as under normal operation there is not expected to be a leak.



9.2 Maximum release flow in respect to effectiveness of ventilation

To maintain the same applicable zone 2 as calculated in chapter 7.4 the following criteria need to be met to maintain a Zone 2 according to Table D.1 and figure C.1 – EN IEC 60079-10-1:2021:

- Degree of dilution to be at least Medium Dilution
- Availability of ventilation to be at least Fair
- Ventilation speed is fixed by the physical installation to be 0,5m/s
- It is a prerequisite that the leak source is specified as secondary grade of release.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Figure 9: Degree of dilution and maximum release flow accepted.

Based on C.1 from EN IEC 60079-10-1:2021. Chart for assessing the degree of dilution.

Converting this into the Release Flow (W_g) using the relative density and LFL we will get that the maximum allowable Release Flow is 3,169x10^{-5} g/s to still maintain the applicable zone 2

9.3 Summary of pressure testing value calculation

To make sure the Release Flow submitted to be the dimensioning value according to 60079-10. The value needs to be the one which will be equal or better than the worst Release Flow meaning but conditions for the calculation will be met. For the current installation this is equal to a maximum Release Flow of 6,904x10^{-7} g/s. To convert the value into a pressure, drop, which can be used to e.g. a pressure decay test, the volume, e.g. a pressure decay test, the volume and temperature need to be specified as part of the testing.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

1.0 Purpose

The purpose of this document is to highlight the safe design of the simple apparatus circuit on the FC PowerGen 1000kW®. The document will be formed on background of IEC 60079-25.

2.0 Analysis

The following system contains only a pressure transmitter and a temperature transmitter. Since they are connected to different complete independent barriers, two analyses will be made following the Annex A in IEC 60079-25.

Table 2-1: Simple system analysis pressure transmitter.

Step	Item	I.S. interface PR electronic 9106B1B	Pressure sensor HUBA control 520 Series	System
A	Equipment group	IIC	IIC	IIC

[1]Not applicable for simple apparatus.

[2]Not applicable for simple apparatus.

[3]Acordingly to IEC 60079-25 annex F the temperature rating will be T4 if the power does not exceed 1,2W at the ambient temperature of 60°C, which is applicable for this application. Further explanation is described in IEC 60079-0 section 5.3.3 Table 3 and 4.

[4]As it is a RTD type temperature sensor those values are not applicable.

2.1 Simple apparatus requirements

There are some requirements to apply for a component to be classified as a simple apparatus. The IEC 60079-11 section 5.7 describes the following requirements:

a) *Passive components, for example switches, junction boxes, resistors and simple semiconductor devices;*

b) *Sources of stored energy consisting of single components in simple circuits with well defined parameters, for example capacitors or inductors, whose values shall be considered when determining the overall safety of the system;*

c) *sources of generated energy, for example thermocouples and photocells, which do not generate more than 1.5 V, 100 mA and 25 mW.*

Sins this temperature sensor is based on the RTD technology the sensor will not be able to induce any current nor voltage to make this a potential ignition source. Hence relying on the associated apparatus being the EX Barriere.

The barrier is built and approved for connection to RTD type of temperature sensors. The following data from the barrier is included in the Table 2-2.

3.0 Conclusion

According to this analysis of both the Pressure transmitter HUBA520 and the corresponding EX barrier PR electronic 9106B1B the conditions for intrinsically safe circuit are being met accordingly to the IEC 60079-25.

Furthermore, the analysis of Temperature transmitter IFM TT1050 and the corresponding EX barrier PR electronic 9113B does also comply with the requirements form intrinsically safe according to the IEC 60079-25. Since this is a simple apparatus the conditions for this are met accordingly to IEC 60079-11.

Declaration of Conformity

As manufacturer, Ballard Power Systems Europe A/S, Majsmarken 1, 9500 Hobro, Denmark, hereby declares that the product(s) mentioned below:

Product no. and name:

Product no.: **7001000** Product name: **FCwave**
Product Designation: **Fuel Cell Power System**

Complies with the requirements of the following Union harmonized legislation, standards and specifications:

Legislation:

- Machinery Directive (2006/42/EC)
- Electromagnetic Compatibility Directive (2014/30/EU)
- RoHS (2011/65/EU)

References:

Directive	Standard	Description
MD	EN 62282-3-100:2020	Fuel cell technologies - Part 3-100: Stationary fuel cell power systems - Safety
EMC	EN 61000-6-2:2019	Electromagnetic compatibility (EMC) – Part 6-2: Generic standards – Immunity standard for industrial environments
EMC	EN 61000-6-4:2019	Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments
RoHS	EN IEC 63000:2018	Technical documentation for the assessment of electrical and electronic products with respect to the restriction of hazardous substances

Additional:

This declaration is only valid as long as the service and maintenance instructions for the product is followed, and the product is not modified.

The pressurized equipment in the product is out of scope for the PED directive 2014/68/EU, as it is covered by article 4, section 3. Hence the PED directive is not listed.

1.0 Executive Summary

The document will contain a walkthrough of the analysis of Pressure equipment directive compliance accordingly to 2008/68/EU. The analysis concluded that the maximum pipe diameter is a DN32 and a pressure of 6,5 Barg. Due to this the conformity category is "category 1" which leads to "Module A" conformity assessment procedure. Documentation according to this is described, and/or combined in a PED dossier to verify compliance with PED module A.

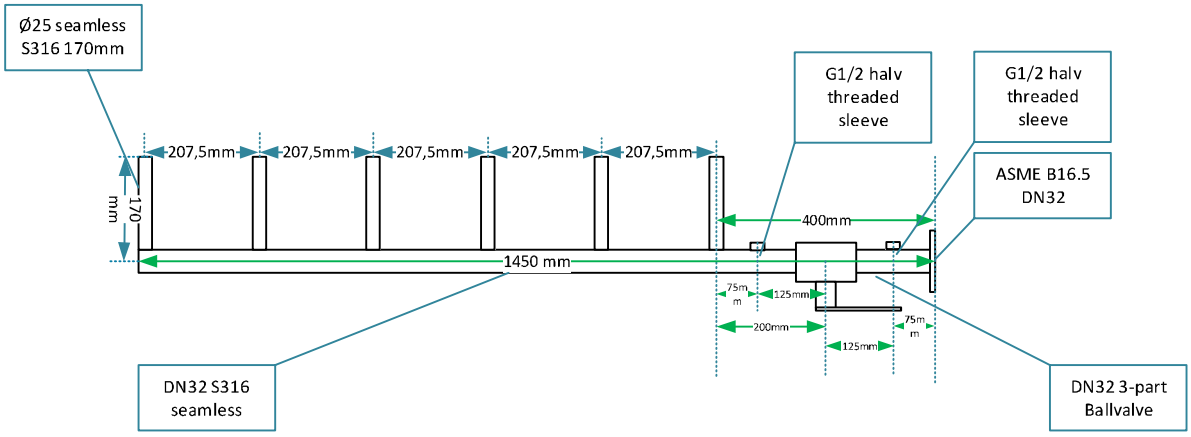
6.0 Technical documentation



6.1 General description of the product

The product is a hydrogen manifold capable of distributing hydrogen from a single input into 6 independent outputs. The product contains an ASME B16.5 flange for connecting the input. A DN32 pipe with 25mm branches all in stainless steel. There is installed a 3-part welded ball valve type DVC 131150032 suitable for hydrogen 6,5 Barg. The valve is for manually blocking the hydrogen supply during e.g. service.

The product may not be installed in applications where a non-sufficient pressure relief valve set to 10 Barg is not installed.

6.2 Drawings of the Construction

Figure 2: Technical drawing of H2 Manifold

6.3 Results of construction calculations and examination

As the part is not relying on any structural strength since the pipe is not holding any weight, the only relevant construction is the pipe pressure rating. The following pipes are used:

- DN32 42.40x2.00mm EN-10216-5 1.4401/1.4404 TC2 pressure tested to 1500 PSI
- 25.00x2.00mm EN-10216-5 TC2 A269 213 pressure tested to 199 Barg

Further Certificates on welds and parts for the manifold will be in a separate file. And is done according to the "module A" requirements

6.4 Inspection and test

6.4.1 Hydrogen pressure test

The hydrogen manifold has gone through several tests to verify the tightness of the system, even though the material used for manufacturing the hydrogen manifold is higher than the intended maximum pressure of the Hydrogen manifold.

To sum up the test:

- Individual test of component (document not released. Procedure according to 62282-3-100:2020 section 6.2 Leakage test)
- Complete assembly test Formier gas 5% H2 (document not released. Procedure according to 62282-3-100:2020 section 6.2 Leakage test and SPC ID 0104)
- Complete test pure H2 (document not released. Procedure according to 62282-3-100:2020 section 6.2 Leakage test and SPC ID 0104)

6.4.2 Welding testing

The following welds on the hydrogen manifold has been tested according to the certificates included in the Certificate dossier.

DEKRA

1 # EU-Baumusterprüfbescheinigung

2 **Richtlinie 2014/34/EU des Europäischen Parlaments und des Rates vom 26. Februar 2014**

3 Nr. der EU-Baumusterprüfbescheinigung: **BVS 08 ATEX E 109 U** Ausgabe: **01**

4 Komponente: **Kabeldosen und -stecker Typ EVC** A**

5 Hersteller: **ifm electronic gmbh**

6 Anschrift: **Friedrichstraße 1, 45128 Essen, Deutschland**

7 Die Bauart dieses Produktes sowie die verschiedenen zulässigen Ausführungen sind in der Anlage zu dieser Baumusterprüfbescheinigung festgelegt.

8 Die Zertifizierungsstelle der DEKRA Testing and Certification GmbH, benannte Stelle Nr. 0158 gemäß Artikel 17 der Richtlinie 2014/34/EU des Europäischen Parlaments und des Rates vom 26. Februar 2014, bescheinigt, dass das Produkt die wesentlichen Gesundheits- und Sicherheitsanforderungen für die Konzeption und den Bau von Produkten zur bestimmungsgemäßen Verwendung in explosionsgefährdeten Bereichen gemäß Anhang II der Richtlinie erfüllt.
Die Ergebnisse der Prüfung sind in dem vertraulichen Prüfprotokoll BVS PP 08.2137 EU niedergelegt.
Diese Ausgabe der EU-Baumusterprüfbescheinigung ersetzt die bisherige Ausgabe der EG-Baumusterprüfbescheinigung BVS 08 ATEX E 109 U inklusive der Nachträge 1 bis 2.

9 Die Einhaltung der Grundlegenden Sicherheits- und Gesundheitsanforderungen wurde überprüft durch Berücksichtigung von:

EN IEC 60079-0:2018	**Allgemeine Anforderungen**
EN IEC 60079-7:2015 + A1:2018	**Erhöhte Sicherheit „e“**
EN 60079-31:2014	**Schutz durch Gehäuse „t“**

10 Das Zeichen „U“ hinter der Zertifikatsnummer weist darauf hin, dass dieses Zertifikat nicht mit Zertifikaten für Geräte oder Schutzsysteme verwechselt werden darf. Diese Teilzertifizierung kann als Grundlage für die Zertifizierung eines Geräts oder Schutzsystems verwendet werden. Die „Einschränkungen für die Verwendung“ ist unter Punkt 17 dieser Bescheinigung aufgeführt.

11 Diese EU-Baumusterprüfbescheinigung bezieht sich nur auf den technischen Entwurf des angegebenen Produkts gemäß der Richtlinie 2014/34/EU.
Weitere Anforderungen der Richtlinie gelten für den Herstellungsprozess und die Bereitstellung dieses Produkts. Diese sind nicht Gegenstand der Zertifizierung.

12 Die Kennzeichnung des Produktes muss die folgenden Angaben enthalten:

13 **Anlage zur**

14 **EU-Baumusterprüfbescheinigung**

BVS 08 ATEX E 109 U Ausgabe 01

15 **Beschreibung des Produktes**

15.1 **Gegenstand und Typ**

Kabeldosen und -stecker Typ EVC**A

** - Kabellänge (0,1 ...100 m)

15.2 **Beschreibung**

Die 90° abgewinkelten M12 Kabeldosen Typ EVC0*A haben 4 Kontakte und ein angespritztes 4-adriges Kabel. Sie sind mit einer Edelstahl-Überwurfmutter versehen, die zur mechanischen Befestigung des Kabels an den Betriebsmitteln verwendet wird. Die Fixierung wird über eine spezielle Befestigungstechnik sichergestellt, die über eine Rasterung ein ungewolltes Lösen der Mutter verhindert. Die Kabeldosen und -stecker Typ EVC**A sind in der Zündschutzart Erhöhte Sicherheit „ec" und Schutz durch Gehäuse „tb" ausgeführt.

Grund für diese Ausgabe

- Umstellung auf die Richtlinie 2014/34/EU
- Aktualisierung der Normen EN IEC 60079-0:2018 und EN 60079-31:2014, sowie Umstellung von EN 60079-15:2010 auf EN IEC 60079-7:2015+A1:2018.

15.3 **Kenngrößen**

Bemessungsspannung		AC/DC 60 V
Stromtragfähigkeit		2 A
Umgebungstemperaturbereich	-	20 °C ≤ T_a ≤ 60 °C
Anzugsdrehmoment der Überwurfmutter		1,2… 1,5 Nm

16 **Prüfprotokoll**

BVS PP 08.2137 EU, Stand 17.02.2023

17 **Einschränkungen für die Verwendung**

Die Kabeldosen und -stecker müssen an ein metallisches Gegenstück angeschlossen werden, das die IP-Anforderungen gemäß EN IEC 60079-7 und EN 60079-31 erfüllt und eine M12-Größe hat.

Die Kabeldosen und -stecker müssen gegen eine Schlagenergie > 4 J geschützt sein.

Die Kabeldosen und -stecker müssen gegen UV-Licht geschützt sein.

Die Kontermutter muss mit einem Anzugsmoment von 1,2...1,5 Nm angezogen werden.

Die Kabel sind fest zu verlegen und gegen mechanische Beschädigungen zu schützen.

Translation

1 # EU-Type Examination Certificate

2 **Directive 2014/34/EU of the European Parliament and of the Council of 26 February 2014**

3 EU-Type Examination Certificate Number: **BVS 08 ATEX E 109 U** Issue: **01**

4 Component: **Sockets and plugs type EVC**A**

5 Manufacturer: **ifm electronic gmbh**

6 Address: **Friedrichstraße 1, 45128 Essen, Germany**

7 This product and any acceptable variations thereto are specified in the appendix to this certificate and the documents referred to therein.

8 DEKRA Testing and Certification GmbH, Notified Body number 0158, in accordance with Article 17 of Directive 2014/34/EU of the European Parliament and of the Council, dated 26 February 2014, certifies that this product has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of products intended for use in potentially explosive atmospheres given in Annex II to the Directive.
The examination and test results are recorded in the confidential Report No. BVS PP 08.2137 EU.
This issue of the EU-Type Examination Certificate replaces the previous issue of the EC-Type Examination Certificate BVS 08 ATEX E 109 U including supplements 1 to 2.

9 Compliance with the Essential Health and Safety Requirements has been assured by compliance with:

EN IEC 60079-0:2018	**General requirements**
EN IEC 60079-7:2015 + A1:2018	**Increased Safety "e"**
EN 60079-31:2014	**Protection by Enclosure "t"**

10 The sign "U" placed behind the certificate number indicates that this certificate should not be confounded with certificates issued for equipment or protective systems. This partial certification may be used as a basis for certification of an equipment or protective systems. "Schedule of limitations" is listed under item 17 of this certificate.

11 This EU-Type Examination Certificate relates only to the technical design of the specified product in accordance to the Directive 2014/34/EU. Further requirements of the Directive apply to the manufacturing process and supply of this product. These are not covered by this certificate.

12 The marking of the product shall include the following:

II 2D Ex tb IIIC Db
II 3G Ex ec IIIC Gc

13 **Appendix**

14 **EU-Type Examination Certificate**

BVS 08 ATEX E 109 U issue 01

15 **Product description**

15.1 **Subject and type**

Sockets and plugs type EVC**A

**-length of cable (0.1 ...100 m)

15.2 **Description**

The 90° angled M12 sockets type EVC0*A have 4 pins and a potted 4-wire cable. They are equipped with a stainless steel lock nut to fasten the socket at the equipment. A special fastening technique protects against unintended loosening. The plugs and sockets type EVC**A are built in type of protection Increased Safety “ec” and Protection by Enclosure “tb”.

Reason for this issue

- Change to Directive 2014/34/EU
- The reason of the supplement is the updating to the standards EN IEC 60079-0:2018 and EN 60079-31:2014, as well as change from EN 60079-15:2010 to EN IEC 60079-7:2015+A1:2018.

15.3 **Parameters**

Rated voltage AC/DC	60 V
Current carrying capacity	2 A
Ambient temperature range	-20 °C ≤ T_a ≤ 60 °C
Tightening torque of lock nut	1.2… 1.5 Nm

16 **Report Number**

BVS PP 08.2137 EU, as of 2023-02-17

17 **Schedule of limitations**

The sockets have to be connected to a metallic counterpart which meets the IP requirements according to EN IEC 60079-7 and EN 60079-31 which has a M12 size.

The sockets have to be protected against an impact energy > 4 J.

The sockets have to be protected against UV emitting light.

The lock nut has to be fastened with a tightening torque of 1.2…1.5 Nm.

The cables have to be installed in a fixed manner and have to be protected against mechanical damage.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

18 **Essential Health and Safety Requirements**

Met by compliance with the requirements mentioned in item 9.

19 **Remarks and additional information**

Drawings and documents are listed in the confidential report.

We confirm the correctness of the translation from the German original.
In the case of arbitration only the German wording shall be valid and binding.

[This page intentionally left blank.]

eurofins | E&E

EU-Type Examination Certificate

(1)

(2) Equipment or protective system intended for use in potentially explosive atmospheres **- Directive 2014/34/EU**

(3) Certificate number: **SEV 10 ATEX 0145**

(4) Product: Pressure transmitter, Types: 520.*, 522.*, 527.*, 528.*

(5) Manufacturer: Huba Control AG

(6) Address: Industriestrasse 17, 5436 Würenlos, Switzerland

(7) The equipment and any acceptable variation thereto is specified in the schedule to this certificate and the documents therein referred to.

(8) Eurofins, notified body No. 1258, in accordance with article 17 of Directive 2014/34/EU of the European parliament and of the council, dated 26 February 2014, certifies that this product has been found to comply with the essential health and safety requirements relating to the design and construction of products intended for use in potentially explosive atmospheres given in Annex II to the Directive.
The examination and test results are recorded in confidential report no 21CH-00562.X04

(9) Compliance with the essential health and safety requirements has been assured by compliance with:

EN IEC 60079-0:2018
EN 60079-11:2012
EN 60079-26:2015

Except in respect of those requirements listed at item 18 of the schedule.

(10) If the sign «X» is placed after the certificate number, it indicates that the product is subjected to special conditions for safe use specified in the schedule to this certificate. The sign "U" is placed after the certificate number. It indicates that this certificate must not be mistaken for a certificate intended for an equipment or protective system. This partial certification may be used as a basis for certification of an equipment or protective system.

(11) This EU type examination certificate relates only to design and construction of the specified product. Further requirements of this directive apply to the manufacturing process and supply of this product. These are not covered by this certificate.

(12) The marking of the product shall include the following:

(13) # Appendix

(14) **EU-Type Examination Certificate no. SEV 10 ATEX 0145**

(15) **Description of product**

The pressure transmitter is used to measure relative and absolute pressure of gases, liquids and refrigerants (incl. ammonia). The pressure transmitter differ in the pressure measuring cell and the pressure range. For the measuring of the pressure the signal of a pressure measuring cell made of stainless steel (type 520.* / 522.*) or made of ceramic (type 527.* / 528.*) with a membrane is converted into a 4…20 mA output signal by the electronic.
The pressure transmitter can be installed in the partition which separates the area, which requires apparatus of category 1 from the area, which requires apparatus of category 2. The pressure measuring cell may be used only for flammable substances for which the membranes of cells are sufficiently chemically and corrosion resistant.
Effective internal inductance and capacitance for versions with plugs complying with EN 175301-80 A (IP65) or M12x1 (IP67)

Classification of installation and use:	stationary
Ingress protection:	IP65 with connector EN 175301-803A IP67 with connector M12x1
Rated ambient temperature range (°C):	-25 °C ≤ Tamb ≤ +85 °C
Rated medium temperature range (°C):	-30 °C … +120 °C
Rated ambient temperature range (°C) for Ex Components:	N/A

Ratings:
Connection to certified intrinsically safe resistive circuits with maximum values:

Ui ≤ 30 V
Ii ≤ 100 mA
Pi ≤ 750 mW
Ci = 0 nF
Li = 0 µH

Output:
4 … 20 mA

(16) **Report number** 21CH-00562.X04

(17) **"Special conditions for safe use" / "Schedule of limitations"**
None

(18) **Essential health and safety requirements**
In addition to the essential health and safety requirements (EHSRs) covered by the standards listed at item 9, the following are considered relevant to this product, and conformity is demonstrated in the report:

Clause **Subject**
None

(19) **Drawings and Documents**
See test report "Manufacturer's Documents"

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Additional manufacturing locations:

This certificate is issued as verification that a sample(s), representative of production, was assessed and tested and found to comply with the IEC Standard list below and that the manufacturer's quality system, relating to the Ex products covered by this certificate, was assessed and found to comply with the IECEx Quality system requirements.This certificate is granted subject to the conditions as set out in IECEx Scheme Rules, IECEx 02 and Operational Documents as amended

STANDARDS :
The equipment and any acceptable variations to it specified in the schedule of this certificate and the identified documents, was found to comply with the following standards

IEC 60079-0:2017 Edition:7.0	Explosive atmospheres - Part 0: Equipment - General requirements
IEC 60079-11:2011 Edition:6.0	Explosive atmospheres - Part 11: Equipment protection by intrinsic safety "i"
IEC 60079-26:2014-10 Edition:3.0	Explosive atmospheres – Part 26: Equipment with Equipment Protection Level (EPL) Ga

This Certificate **does not** indicate compliance with safety and performance requirements other than those expressly included in the Standards listed above.

TEST & ASSESSMENT REPORTS:
A sample(s) of the equipment listed has successfully met the examination and test requirements as recorded in:

Test Report:

CH/SEV/ExTR16.0008/02

Quality Assessment Report:

CH/SEV/QAR12.0006/06

DEKRA

EU-Baumusterprüfbescheinigung

Richtlinie 2014/34/EU des Europäischen Parlaments und des Rates vom 26. Februar 2014

3 Nr. der EU-Baumusterprüfbescheinigung: **BVS 11 ATEX E 009 X** Ausgabe: **01**

4 Gerät: **Steckverbinder Typ ENC**A**

5 Hersteller: **ifm electronic gmbh**

6 Anschrift: **Friedrichstraße 1, 45128 Essen, Deutschland**

7 Die Bauart dieses Produktes sowie die verschiedenen zulässigen Ausführungen sind in der Anlage zu dieser Baumusterprüfbescheinigung festgelegt.

8 Die Zertifizierungsstelle der DEKRA Testing and Certification GmbH, benannte Stelle Nr. 0158 gemäß Artikel 17 der Richtlinie 2014/34/EU des Europäischen Parlaments und des Rates vom 26. Februar 2014, bescheinigt, dass das Produkt die wesentlichen Gesundheits- und Sicherheitsanforderungen für die Konzeption und den Bau von Produkten zur bestimmungsgemäßen Verwendung in explosionsgefährdeten Bereichen gemäß Anhang II der Richtlinie erfüllt.
Die Ergebnisse der Prüfung sind in dem vertraulichen Prüfprotokoll BVS PP 11.2018 EU niedergelegt.
Diese Ausgabe der EU-Baumusterprüfbescheinigung ersetzt die bisherige Ausgabe der EG-Baumusterprüfbescheinigung BVS 11 ATEX E 009 X inklusive des Nachtrags 1.

9 Die Einhaltung der Grundlegenden Sicherheits- und Gesundheitsanforderungen wurde überprüft durch Berücksichtigung von:

EN IEC 60079-0:2018	**Allgemeine Anforderungen**
EN 60079-11:2012	**Eigensicherheit „i"**

10 Falls das Zeichen „X" hinter der Bescheinigungsnummer steht, bedeutet dies, dass das Produkt den unter Punkt 17 dieser Bescheinigung aufgeführten „Besondere Bedingungen für die Installation und den Betrieb" unterliegt.

11 Diese EU-Baumusterprüfbescheinigung bezieht sich nur auf den technischen Entwurf des angegebenen Produkts gemäß der Richtlinie 2014/34/EU.
Weitere Anforderungen der Richtlinie gelten für den Herstellungsprozess und die Bereitstellung dieses Produkts. Diese sind nicht Gegenstand der Zertifizierung.

12 Die Kennzeichnung des Produktes muss die folgenden Angaben:

II 1G Ex ia IIB T6 Ga	**II 1G Ex ia IIB T5 Ga**	**II 1D Ex ia IIIC T_{200}70°C Da**
II 2G Ex ia IIC T6 Gb	**II 2G Ex ia IIC T5 Gb**	**for -20 °C ≤ T_a ≤ +60 °C**
II 1D Ex ia IIIB T_{200}85°C Da	**II 1D Ex ia IIIB T_{200}95°C Da**	
for -25 °C ≤ T_a ≤ +75 °C	**for -25 °C ≤ T_a ≤ +85 °C**

13 **Anlage zur**

14 **EU-Baumusterprüfbescheinigung**

BVS 11 ATEX E 009 X Ausgabe 01

15 **Beschreibung des Produktes**

15.1 **Gegenstand und Typ**

Steckverbinder Typ ENC**A

In der vollständigen Bezeichnung werden anstelle der ** Ziffern eingefügt, die Änderungen kennzeichnen wie: Art des Kabels, Länge des Kabels, Konstruktion gerade oder gebogen.

15.2 **Beschreibung**

Der Steckverbinder wird bei eigensicheren Geräten für den Anschluss der eigensicheren Stromkreise verwendet.
Die Steckdose ist ein einfaches elektrisches Betriebsmittel.
Der Steckverbinder hat ein fest angeschlossenes Kabel und ist konstruktionsbedingt in der Lage, zwei verschiedene eigensichere Stromkreise bis zu einer Summe von Spannungen von 30 V zu führen; in diesem Fall muss das Kabel wirksam gegen Beschädigung geschützt werden.

Grund für diese Ausgabe:

- Umstellung auf die Richtlinie 2014/34/EU
- Aktualisierung der Norm EN IEC 60079-0:2018
- Modifikation des Umgebungstemperaturbereichs
- Erweiterung der "Besondere Bedingungen für die Verwendung"

15.3 **Kenngrößen**

Spannung	U_i	DC	30	V
Strom	I_i		1	A
Leistung	P_i			
Für den Einsatz in Gruppe II			1	W
Für den Einsatz in Gruppe III			1	W
Umgebungstemperaturbereich (mit Ausnahme von IIIC)	T_a	-25 °C bis +75 °C / +85 °C		
Für Gruppe IIIC	T_a	-20 °C bis +60 °C		

Für Umgebungstemperaturen bis 75 °C sind die Sensoren als T6 bzw. T_{200} 85 °C klassifiziert (ausgenommen Gruppe IIIC).
Für Umgebungstemperaturen bis 85 °C sind die Sensoren als T5 bzw. T200 95 °C klassifiziert (ausgenommen Gruppe IIIC).

Der Steckverbinder darf zwei verschiedene eigensichere Stromkreise bis zu einer Summe der Spannungen von 30 V führen.

Die Werte der internen Kapazität und Induktivität hängen von der Länge des fest angeschlossenen Kabels ab und werden wie folgt berechnet:

Interne Kapazität	C_i	0,1 nF/m
Interne Induktivität	L_i	2 µH/m

16 **Prüfprotokoll**

BVS PP 11.2018 EU, Stand 06.09.2023

17 **Besondere Bedingungen für die Installation und den Betrieb**

17.1 Die Steckverbinder und das angeschlossene Kabel müssen so installiert werden, dass intensive elektrostatische Aufladung ausgeschlossen ist.

17.2 Aus Platzgründen kann die Kennzeichnung nicht vollständig auf dem Gerät angebracht werden. Die vollständige Kennzeichnung ist der Betriebsanleitung zu entnehmen.

17.3 Das Kabel und der Steckverbinder müssen fest verlegt und wirksam gegen mechanische Beschädigungen geschützt werden.

17.4 Für Gruppe IIIC:

- Der Betrieb des Steckverbinders ohne ein geeignetes M12-Gegenstück ist nicht zulässig. Das M12-Gegenstück muss die IP-Anforderungen nach IEC 60079-11 erfüllen.
- Beim Öffnen des Steckverbinders muss das Eindringen von Staub vermieden werden.
- Der Steckverbinder muss vor UV-Strahlung geschützt werden.
- Die Überwurfmutter muss mit einem Anzugsdrehmoment von 1,2...1,5 Nm angezogen werden.

18 **Wesentliche Gesundheits- und Sicherheitsanforderungen**

Erfüllt durch Einhaltung der unter Punkt 9 genannten Anforderungen.

19 **Zeichnungen und Unterlagen**

Die Zeichnungen und Unterlagen sind in dem vertraulichen Prüfprotokoll gelistet.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Translation

1 # EU-Type Examination Certificate

2 **Directive 2014/34/EU of the European Parliament and of the Council of 26 February 2014**

3 EU-Type Examination Certificate Number: **BVS 11 ATEX E 009 X** Issue: **01**

4 Equipment: **Socket type ENC**A**

5 Manufacturer: **ifm electronic gmbh**

6 Address: **Friedrichstraße 1, 45128 Essen, Germany**

7 This product and any acceptable variations thereto are specified in the appendix to this certificate and the documents referred to therein.

8 DEKRA Testing and Certification GmbH, Notified Body number 0158, in accordance with Article 17 of Directive 2014/34/EU of the European Parliament and of the Council, dated 26 February 2014, certifies that this product has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of products intended for use in potentially explosive atmospheres given in Annex II to the Directive.
The examination and test results are recorded in the confidential Report No. BVS PP 11.2018 EU.
This issue of the EU-Type Examination Certificate replaces the previous issue of the EC-Type Examination Certificate BVS 11 ATEX E 009 X including supplement 1.

9 Compliance with the Essential Health and Safety Requirements has been assured by compliance with:

EN IEC 60079-0:2018	**General requirements**
EN 60079-11:2012	**Intrinsic Safety "i"**

10 If the sign "X" is placed after the certificate number, it indicates that the product is subject to the "Specific Conditions of Use" listed under item 17 of this certificate.

11 This EU-Type Examination Certificate relates only to the technical design of the specified product in accordance with the Directive 2014/34/EU. Further requirements of the Directive apply to the manufacturing process and supply of this product. These are not covered by this certificate.

12 The marking of the product shall include the following:

II 1G Ex ia IIB T6 Ga **II 2G Ex ia IIC T6 Gb** **II 1D Ex ia IIIB T_{200}85°C Da** **for -25 °C ≤ T_a ≤ +75 °C**	**II 1G Ex ia IIB T5 Ga** **II 2G Ex ia IIC T5 Gb** **II 1D Ex ia IIIB T_{200}95°C Da** **for -25 °C ≤ T_a ≤ +85 °C**	**II 1D Ex ia IIIC T_{200}70°C Da** **for -20 °C ≤ T_a ≤ +60 °C**

13 **Appendix**

14 **EU-Type Examination Certificate**

BVS 11 ATEX E 009 X issue 01

15 **Product description**

15.1 **Subject and type**

Steckverbinder type ENC**A

In the complete denomination instead of the ** numerals will be inserted which characterize modifications as: kind of cable, length of cable, construction straight or bent.

15.2 **Description**

The socket is used as intrinsically safe apparatus for the connection of the intrinsically safe circuits.
The socket is a simple apparatus.
The socket has a permanently connected cable and is due to construction able to carry two different intrinsically safe circuits up to a sum of voltages of 30 V; in this case the cable must be effectively protected against damage.

Reason for this issue:

- Change to Directive 2014/34/EU
- Standards update EN IEC 60079-0:2018
- Modification of the ambient temperature range
- Extension of the "Special conditions for use"

15.3 **Parameters**

Voltage	U_i	DC	30	V
Current	I_i		1	A
Power	P_i			
For use in Group II			1	W
For use in Group III			1	W
Ambient temperature range (except IIIC)	T_a	-25 °C up to +75 °C / +85 °C		
For Group IIIC	T_a	-20 °C up to 60 °C		

For ambient temperatures up to 75 °C, the sensors are classified as T6 resp. T_{200} 85 °C (except Group IIIC).
For ambient temperatures up to 85 °C, the sensors are classified as T5 resp. T_{200} 95 °C (except Group IIIC).

The socket may carry two different intrinsically safe circuits up to a sum of voltages of 30 V.

The values of internal capacitance and inductance depend on the length of the permanently connected cable and be calculated as:

Internal capacitance	C_i	0.1	nF/m
Internal inductance	L_i	2	µH/m

This certificate may only be reproduced in its entirety and without any change.

16 **Report Number**

BVS PP 11.2018 EU, as of 2023-09-06

17 **Specific Conditions of Use**

17.1 The connectors and the connected cable must be installed in a way that an intensive electrostatic charge is excluded.

17.2 Due to space restriction the markings may not be applied completely to the unit. See operating instructions for the compete marking.

17.3 The cable and socket must be installed fixed and effectively protected against mechanical damage.

17.4 For Group IIIC:

- The operation of the sockets without a suitable M12 counterpart is not permissible.
  The M12 counterpart has to meet the IP requirements according to IEC 60079-11.
- When the socket is opened, the ingress of dust must be avoided.
- The sockets have to be protected against UV emitting light.
- The lock nut has to be fastened with a tightening torque of 1.2…1.5 Nm.

18 **Essential Health and Safety Requirements**

Met by compliance with the requirements mentioned in item 9.

19 **Remarks and additional information**

Drawings and documents are listed in the confidential report.

We confirm the correctness of the translation from the German original.
In the case of arbitration only the German wording shall be valid and binding.

DEKRA

(13) **SCHEDULE**

(14) **to EU-Type Examination Certificate DEKRA 11ATEX0244 X** Issue No. **4**

(15) **Description**

HART-Transparent Repeater, Types 9106B1A, 9106B1B, 9106B2A, 9106B2B and Types 9106A1A, 9106A1B, 9106A2A, 9106A2B for rail mounting, are 24 V powered isolating barriers that serve as a repeater.
The repeater transfers the intrinsically safe 4 - 20 mA current signal (with HART communication) of either a loop powered transmitter or an active current source to a non-intrinsically safe 4 - 20 mA output signal (with HART communication).
The Repeater is supplied via terminals at the front of the module, or via Power Rail Type 9400.
Removable display module 4501 can be used for programming of the Repeater.

The HART-Transparent Repeater, Types 9106B*A, 9106A*A are one channel version and Types 9106B*B, 9106A*B are two channel version.

Ambient temperature range -20 °C to +60 °C.

Marking

The equipment marking may additionally include the code II 3 G Ex ec nC IIC T4 Gc.

Electrical data

All Repeater Types

Supply (terminals 31, 32 and rear contacts): U = 19,2 ... 31,2 Vdc.

Status-Relay output (terminals 33, 34):
U ≤ 32 Vac or 32 Vdc, I ≤ 0,5 Aac or I ≤ 1 Adc respectively.
If the Repeater is installed outside the hazardous area, the following data for the relay contacts apply: U ≤ 110 Vdc or 125 Vac, I ≤ 0,3 Adc or I ≤ 0,5 Aac respectively.

Outputs (terminals 11, 12 resp. 13, 14): I = 4 ... 20 mA.

For all circuits above: U_m = 253 Vac (max. frequency 400 Hz).

Repeater Types 9106B1A, 9106B1B, 9106B2A, 9106B2B

Loop current input (terminals 43, 44 resp. terminals 53, 54):
in type of protection intrinsic safety Ex ia IIC/IIB/IIA/IIIC/I, with following maximum values:
for Type 9106B1A and Type 9106B1B:
U_o = 27,5 V; I_o = 92,6 mA; P_o = 0,64 W;
C_o = 0,084 µF (IIC) or 0,67 µF (IIB) or 2,23 µF (IIA) or 3,94 µF (I) ;
L_o = 4,15 mH (IIC) or 16,59 mH (IIB) or 33,17 mH (IIA) or 54,42 mH (I);
L_o/R_o = 223 µH/Ω (IIB) or 447 µH/Ω (IIA) or 733 µH/Ω (I)

for Type 9106B2A and Type 9106B2B:
U_o = 25,3 V; I_o = 96 mA; P_o = 0,61 W;
C_o = 0,104 µF (IIC) or 0,818 µF (IIB) or 2,85 µF (IIA) or 4,74 µF (I);
L_o = 3,86 mH (IIC) or 15,43 mH (IIB) or 30,86 mH (IIA) or 50,64 mH (I).
L_o/R_o = 234 µH/Ω (IIB) or 468 µH/Ω (IIA) or 769 µH/Ω (I)
For group IIIC, the parameters of group IIB apply.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

DEKRA

(13) **SCHEDULE**

(14) **to EU-Type Examination Certificate DEKRA 11ATEX0244 X** Issue No. **4**

Current input (terminals 41, 42 resp. terminals 51, 52):
in type of protection intrinsic safety Ex ia IIC/IIB/IIA/IIIC/I, for connection to a certified intrinsically safe circuit, with following maximum values:
U_i = 30 V; I_i = 120 mA; P_i = 0,85 W; $_{Ci}$ = 2 nF; L_i = 0 µH;
U_o = 0 V; I_o = 0 mA; P_o = 0 mW.

Current input and Loop current input of one channel are not applied simultaneously.

Both channels (terminals 41...44 and terminals 51...54) are infallibly galvanically isolated from each other and from the non-intrinsically safe supply and output circuits

Combination of Loop current input of channel 1 (terminals 43, 44) and Current input of channel 2 (terminals 51, 52) in series, where terminal 43 is connected to terminal 51:
Loop current circuit (terminals 44 and 52) is in type of protection intrinsic safety Ex ia IIC/IIB/IIA/IIIC/I, with following maximum values:
for Type 9106B1A and Type 9106B1B:
U_o = 27,5 V; I_o = 92,6 mA; P_o = 0,64 W;
C_o = 0,084 µF (IIC) or 0,67 µF (IIB) or 2,23 µF (IIA) or 3,94 µF (I) ;
L_o = 4,15 mH (IIC) or 16,59 mH (IIB) or 33,17 mH (IIA) or 54,42 mH (I);
L_o/R_o = 223 µH/Ω (IIB) or 447 µH/Ω (IIA) or 733 µH/Ω (I)

for Type 9106B2A and Type 9106B2B:
U_o = 25,3 V; I_o = 96 mA; P_o = 0,61 W;
C_o = 0,104 µF (IIC) or 0,818 µF (IIB) or 2,85 µF (IIA) or 4,74 µF (I);
L_o = 3,86 mH (IIC) or 15,43 mH (IIB) or 30,86 mH (IIA) or 50,64 mH (I).
L_o/R_o = 234 µH/Ω (IIB) or 468 µH/Ω (IIA) or 769 µH/Ω (I)
For group IIIC, the parameters of group IIB apply.

Combination of both Current inputs (terminals 41, 42 resp. 51, 52) in series, where terminal 41 is connected to terminal 52:
Current input (terminals 42 and 51) is in type of protection intrinsic safety Ex ia IIC/IIB/IIA/IIIC/I, for connection to a certified intrinsically safe circuit, with following maximum values:
U_i = 30 V; Ii = 120 mA; Pi = 0,85 W; C_i = 4 nF; L_i = 0 µH;
U_o = 0 V; I_o = 0 mA; P_o = 0 mW.

Installation instructions

The instructions provided with the product shall be followed in detail to assure safe operation.

(16) **Report Number**

No. NL/DEK/ExTR11.0097/04.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

DEKRA

(13) **SCHEDULE**

(14) **to EU-Type Examination Certificate DEKRA 11ATEX0244 X** Issue No. **4**

(17) **Specific conditions of use**

The HART Transparent Repeater shall be installed in a controlled environment with suitably reduced pollution, limited to pollution degree 2 or better.

The non intrinsically safe circuits shall be limited to overvoltage category I/II as defined in EN 60664-1.

If the HART-Transparent Repeater is installed in an explosive atmosphere where the use of apparatus of equipment category 3 G is required, the following specific conditions of use apply:

The HART Transparent Repeater shall be installed in an enclosure in type of protection Ex n or Ex e, providing a degree of protection of at least IP54. Cable entry devices and blanking elements shall fulfil the same requirements.

Removable Display Module 4501, when connected to the Repeater, may not be damaged and shall be free of dust and moisture.

(18) **Essential Health and Safety Requirements**

Covered by the standards listed at item (9)

(19) **Test documentation**

As listed in Report No. NL/DEK/ExTR11.0097/04.

(20) **Certificate history**

Issue 1 -	214940700	initial certificate
Issue 2 -	215635200	changes to the construction and standards update
Issue 3 -	219950900	changes to the electrical data
Issue 4 -	224396500	assesed per latest edition of the standards addition of 9106Axx models

(1) EC TYPE EXAMINATION CERTIFICATE

(2) **Equipment or protective system intended for use in potentially explosive atmospheres**
Directive 94/9/EC

(3) EC type examination certificate number: **ISSeP08ATEX008X**

(4) Equipment or protective system: housing for electrical heating apparatus
Type: D-8640

(5) Applicant – Manufacturer :
Sinus Jevi Electric Heating B.V.

(6) Address: Nijverheidsweg 2
1671 GC Medemblik

(7) This equipment or protective system and any acceptable variation thereto is specified in the schedule to this certificate and the documents therein referred to.

(8) ISSeP, notified body n^{r} 492 in accordance with article 9 of the Council Directive 94/9/EC of 23 March 1994, certifies that this equipment or protective system has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of equipment and protective systems intended for use in potentially explosive atmospheres given in annex II to the Directive.

The examination and test results are recorded in confidential report no 06090

(9) Compliance with the Essential Health and Safety Requirements has been assured by compliance with:
EN 60079-0: 2006 (IEC 60079-0: 2004) EN 60079-1: 2007 (IEC 60079-1: 2007)
EN 60079-7: 2007 (IEC 60079-7:2006)
EN 61241-0: 2006 (IEC 61241-0: 2004) EN 61241-1: 2004 (IEC 61241-1: 2004)

(10) If the symbol "X" is placed after the certificate number, it indicates that the equipment or protective system is subject to special conditions for safe use specified in the schedule to this certificate

(11) This EC TYPE EXAMINATION CERTIFICATE relates only to the design, examination and tests of the specified equipment or protective system in accordance to the Directive 94/9/EC. Further requirements of this Directive may apply to the manufacturing process and supply of this equipment or protective system. These are not covered by this certificate.

(12) The marking of the equipment or protective system shall include the following indications:
Ex II 2 G D Ex de IIC T6 to T1 Ex tD A21 IP66 T110°C

(13) SCHEDULE

(14) **EC TYPE EXAMINATION CERTIFICATE No ISSeP08ATEX008X**

(15) Description of the equipment :
Electrical heating apparatus allotted to the heating of inert liquids and gases. This apparatus bears the type designation D-8640 and consists of:

- a certified flameproof connection box
- certified electrical heating elements
- a manually rearmed protective device

The length "H" (to see drawing 953.D8640-01) required to not exceed the temperature limit of 80°C inside the connection box in accordance with the different temperature classes is listed in the here-below table

Temperature class	Length "H" (mm)
T6	50
T5	75
T4	100
T3	150
T2	200
T1	250

Remark :
When the heating elements are fitted on the bottom plate of the housing, the temperature is limited by a safety thermostat and an additional marking is foreseen for the cables (to see drawing 953.D8521-04)

Temperature classes

TEMPERATURE CLASS	TEMPERATURE SETTING OF THE THERMOSTAT (°C)					
	Inert liquids	Gases				
	Power dissipated by the heating element (W/cm^2)	Power dissipated by the heating element (W/cm^2)				
	7,5	2	1,5	1	0,5	0,2
T6	90	-----	-----	-----	-----	-----
T5	110	-----	-----	-----	-----	65
T4	145	-----	-----	-----	70	85
T3	210	-----	-----	90	110	130
T2	310	130	135	150	190	250
T1	-------	230	250	300	-----	-----

This certificate may only be reproduced in its entirety and without any change, schedule included

SCHEDULE

EC TYPE EXAMINATION CERTIFICATE No ISSeP08ATEX008X

Electrical parameters
Voltage supply: 110 up to 690 V
Eventual prescriptions
The ambient temperature range: -30 °C to + 50°C
Routine tests
The manufacturer shall make the routine verifications and tests to ensure that the electrical apparatus produced complies with the specification submitted to the testing station together with the prototype.
Each empty enclosure shall be submitted to a routine test under the pressure of 10.5 bar maintained during at least 10 seconds (maximum 60 seconds)

(16) Report n° 06090 of 5.03.2008 composed of 29 pages
The descriptive and technical note from the manufacturer dated of 25.05.2007 related to heating apparatus – size 6" (6 and 3 pages)
The additional descriptive note dated 1.08.2007 (2 pages)
The notices of instruction (8 pages)
A data sheet related to the sealing gasket dated 1.09.2006
The drawings
953.D6150-10 of 19.11.2002 Rev.1 of 28.01.2008
953.D8521-04 of 14.08.2006
953.D8615-20 of 18.02.2008
953.D8640-01 of 29.08.2002
953.D8640-03 of 9.12.2002
953.D8640-05 of 10.01.2005
953.D8640-11 of 11.05.2000

953.D8640-22 of 7.05.2007 – Rev.1 of 18.02.2008
953.D8640-23 of 7.05.2007 – Rev.1 of 18.02.2008

(17) Special conditions for safe use: symbol X
- The layer of dust accumulated on the housing shall not exceed 5 mm.
- The ignition temperature of the dust shall be higher than 185°C
- The setting of the protective device to the limit temperature ensuring the temperature class shall be realised for each apparatus under the responsibility of the manufacturer. Furthermore this device shall be sealed and its setting shall not be modified later.
- The temperature sensor of the protective device shall be placed as nearest as possible to the tube containing the heating elements.
- When the apparatus is energised the tube containing the heating elements shall be completely immersed in the liquid – the depth of immersion above the tube is at least 50 mm.
- The values of the power dissipated by the heating elements mentioned in the table (page 2) cannot be exceeded

(18) Essential Health and Safety Requirements: covered by the standards listed at 9 and by the descriptive documents of the manufacturer

This certificate may only be reproduced in its entirety and without any change, schedule included

Annexe to:	IECEx CML 18.0131X Issue 4
Applicant:	Hawke International (A Division of Hubbell Limited) (A member of the Hubbell group of companies)
Apparatus:	Ranges of Barrier and Diaphragm Seal Hybrid Cable Glands

Description

The ranges of cable glands are designed in two versions: barrier and diaphragm seal. Hybrid configurations of these glands are also described.

All cable glands within the ranges are manufactured in brass, nickel plated brass, stainless steel, or aluminium.

Both barrier and diaphragm seal type glands internal parts marked with an asterisk (*) in the description below are interchangeable with respect to the type of application. When parts are interchanged, these assemblies may be dual marked with both product types on the stamp band. The "Deluge Boot" colour indicates the internal component that is used, the ICG/653/UNIV being indicated by a red deluge boot. This does not apply to the ICG 653 UNIV J-Size.

Cable glands may be fitted with an optional external clamp or a Hawke Gland Mounted Clamp (GMC) accessory. When fitted, no additional clamping is required on the barrier or diaphragm sealed glands.

Items in *italic* are optional and may be omitted from the cable gland dependent on the application.

Hybrid cable glands are available for the gland types ICG/653/UNIV and 501/453/UNIV. These types are fitted with the middle nut and back nut components of any smaller trade size compared to the entry. Glands may combine entries and seals with small armour clamping rings and back nut seals. Hybrid gland marking to include second size reference with no spaces e.g. for example C2 to C hybrid size reference would be C2C.

The use of Hawke IP sealing washers may be considered a suitable sealing method to maintain IP rating to the enclosure (see conditions of use) and will maintain the service temperature.

Where marked IIC or IIIC, the equipment can also be marked for gas groups IIA or IIB and for dust groups IIIA or IIIB.

Type 501/453/UNIV Cable Gland

501/453/UNIV cable gland is a diaphragm seal cable gland the glands are fitted with a diaphragm silicone rubber seal and are designed for effectively filled type cable when used for flameproof applications. This gland type is rated for ingress protection IP66, 67, 69 and IPX8 size Os to C only at 10m for 24 hours. This cable gland is available in sizes Os (M16) up to and including F(M75). The entry thread form can either be metric or NPT equivalent. They are used with cables that are circular and armoured, un-armoured or braided cables. The cable gland comprises the following components:

a) Entry
b) Deluge boot *
c) Diaphragm seal *
d) Spigot *
e) Armour clamping ring
f) Middle nut
g) Back nut
h) Back nut clamp
i) Back nut seal

Type ICG/653/UNIV Cable Gland

The ICG/653/UNIV Cable Gland is a barrier seal type gland designed for sealing around individual cores and are for use with circular cables of armoured, un-armoured or corrugated cables. This cable gland is available in sizes Os (M16) up to and including J (M100). The entry thread form is either metric or NPT equivalent. This gland type is rated for ingress protection IP66, 67, 69 and IPX8 size Os to C only at 10m for 24 hours. Trade size J is IP66 only.
The cable gland comprises the following components:

a) Entry
b) Deluge boot*
c) Compound chamber*
*d) Resin dam **
e) Spigot*
*f) VBL Clip **
g) Armour/braid clamping ring
h) Middle nut
i) Back nut
j) Back nut clamp
k) Back nut seal

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Type 710 Cable Gland

The 710 Cable gland is a barrier cable gland designed for sealing around individual cores and are for use with circular cables of armoured, un-armoured or corrugated cables. This gland type is rated for ingress protection IP66, 67, 69 and IPX8 size Os to C only at 10m for 24 hours. This cable gland is available in sizes Os (M16) up to and including F (M75). The entry thread form is either metric or NPT equivalent. The cable gland comprises the following components:

a) Entry
b) Deluge boot
c) Compound chamber
d) Resin dam
e) Spigot
f) Middle nut
g) Back nut
h) Back nut clamp
i) Back nut seal

Type 711 Cable Gland

711 Cable gland is a barrier cable gland designed for sealing around individual cores and are for use with circular cables of armoured, un-armoured or corrugated cables. This gland type is rated for ingress protection IP66, 67, 69 and IPX8 size Os to C only at 10m for 24 hours. This cable gland is available in sizes A (M20) up to and including F (M75). The entry thread form is either metric or NPT equivalent. The cable gland comprises the following components:

a) Entry
b) Deluge boot
c) Compound chamber
d) Resin dam
e) Front diablo support
f) Diablo cage
g) Rear diablo support
h) Middle nut
i) Back nut
j) Back nut clamp
k) Back nut seal

Printed on: Wednesday, March 19, 2025

Type 753 Cable Gland

753 cable gland Cable gland is a barrier cable gland designed for sealing around individual cores and are for use with circular cables of armoured, un-armoured or braided cables. This gland type is rated for ingress protection IP66, 67, 69 and IPX8 size Os to C only at 10m for 24 hours. This cable gland is available in sizes Os (M16) up to and including F(M75). The entry thread form is either metric or NPT equivalent. The cable gland comprises the following components:

a) Entry
b) Deluge boot
c) Compound chamber
d) Resin dam
e) Spigot
f) Middle nut
g) Back nut
h) Back nut clamp
i) Back nut seal

Cable glands types ICG/653/UNIV, 710, 711 and 753, in trade sizes Os to F, have been subjected to overpressure test up to 62bar/900 Psi.

Variation 1

1. To update the certification drawing with minor dimensional corrections.
2. To include the type of protection “Ex nR” Restricted Breathing.
3. To include an additional specific condition of use for braided cables.

Variation 2

1. Introduction of undersize compound pot for gland size Os, O, D, E and F.
2. Introduction of thread size M16 for size Os and O, except from gland type 711.
3. Adding NPT thread size: 1½”, 2”, 2½” for gland size D, E and F respectively.

Variation 3

1. To amend the specific conditions of safe use.
2. Update GA drawings.
3. Add accessory optional item GMC 'Gland Mounted Clamp'.
4. Clarify the Ingress Protections IP ratings.
5. To review and update the cable glands against the latest standard.
6. Hybrid Gland Combinations to permit flexibility.
7. Update the marking.
8. To revise the equipment title.
9. To revise the product description.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Variation 4

1. To introduce and update the certification product description to include type ICG 653 oversize cable gland J-Size.
2. Removal of Ex nR from IECEx CML 18.0131X.
3. To review and assess the ICG 653 Oversize cable glands J-Size against the latest technical knowledge IEC 60079-0:2017 Ed.7.
4. To review the ICG 653 Oversize cable gland J-Size against the latest Increase Safety requirements "Ex eb".
5. To amend the specific condition of safe use.
6. To remove the condition of manufacture.
7. Introduction of new set of certification drawings.

Conditions of Manufacture

None

Specific Conditions of Use

The following conditions relate to safe installation and/or use of the equipment.

i. 501/453/UNIV when used with unarmoured or braided cables are only suitable for fixed installations, the cable for which shall be effectively clamped to prevent pulling and twisting (does not apply when fitted with rear clamping device or Hawke Gland Mounted Clamp (GMC)).

ii. Barrier glands of sizes C2, D, E and F and containing (Express) XO99-41-2 resin when used with unarmoured or braided cables are only suitable for fixed installations, the cable for which must be effectively clamped to prevent pulling and twisting. No clamping is required on barrier cable glands sizes Os-C2, or if containing 2122 Hawkeseal or 2132 QSP compound.

iii. The entry thread shall be suitably sealed (in accordance with IEC 60079-14) to maintain the ingress protection rating of the associated enclosure. This condition does not apply if the Hawke International nylon sealing washer is installed as part of the gland assembly.

Components covered by Ex Certificates issued to older editions of Standards

None

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

ATTESTATION D'EXAMEN UE DE TYPE - ANNEXE
EU TYPE EXAMINATION CERTIFICATE - SCHEDULE

1 **Version : 15** — **LCIE 00 ATEX 6008 X** — **Issue : 15**

12 **DESCRIPTION DU PRODUIT**

Le produit est constitué d'une enveloppe en aluminium ou en acier inoxydable contenant une bobine et deux bornes de connexions.

Il fonctionne sur différentes puissances (AC-DC). Il est conçu pour être utilisé avec des vannes avec 2, 3, 4 ou 5 voies.

Les types de protection sont « d » (enveloppe antidéflagrante) et « t » (protection contre l'inflammation des poussières).

Il y a également 2 versions spéciales où les caractéristiques électriques sont différentes, à la demande de clients.

DESCRIPTION OF PRODUCT

The product is made of an aluminium or stainless steel enclosure including a coil and two connections terminals.

It operates on different wattage (AC-DC). It is designed to be used in conjunction with valves with 2, 3, 4 or 5 channels.

The types of protection are "d" (flameproof enclosure) and "t" (dust ignition protection).

There is also 2 specific version where the electrical ratings are different, at customer's request.

ATTESTATION D'EXAMEN UE DE TYPE - ANNEXE
EU TYPE EXAMINATION CERTIFICATE - SCHEDULE

1 **Version : 15** **LCIE 00 ATEX 6008 X** **Issue : 15**

CARACTERISTIQUES

Tension d'alimentation :
6 à 250 V DC / rectifié ou 6 à 380 V AC.

Pour la version spéciale NF 14462403.24/DC :

Tension d'alimentation : 24 V DC
Puissance maximale : 36.2 W
Fonctionnement électrique intermittent :
- Temps de fonctionnement = 2 minutes
- Temps à l'arrêt = 5 minutes
Température maximale du fluide : 55°C.

Pour la version spéciale X263429069235F1 :

Tension d'alimentation : 24 V DC
Puissance maximale : 11.2 W
Fonctionnement électrique intermittent :
- Temps de fonctionnement = 2 minutes
- Temps à l'arrêt = 15 minutes
Température maximale du fluide : 70°C.

RATINGS

Supply voltage :
6 to 250 V DC / rectified or 6 to 380 V AC.

For the specific version NF 14462403.24/DC :

Supply voltage : 24 V DC
Maximum power : 36.2W
Electric operation intermittent :
- Time on = 2 minutes
- Time off = 5 minutes.
Maximum fluid temperature: 55°C.

For the specific version X263429069235F1 :

Supply voltage : 24 V DC
Maximum power : 11.2W
Electric operation intermittent :
- Time on = 2 minutes
- Time off = 15 minutes.
Maximum fluid temperature: 70°C.

MARQUAGE

Le marquage du produit doit comprendre :

(1): completed with type designation.
(2): completed by electrical parameters.

The equipment shall also bear the usual marking required by the product standards applying to such equipment under the manufacturer responsibility.

13 **CONDITIONS PARTICULIERES D'UTILISATION**

a. Les joints antidéflagrants ne sont pas destinés à être réparés.

b. Les fermetures spéciales du couvercle sont des vis hexagonales à six pans creux conformes à l'ISO 4762. La classe de propriété minimale des vis doit être A4-70. Le cas échéant, les vis du couvercle doivent être remplacées par des vis identiques.

c. Le classement en température dépend de la température ambiante. Voir tableaux des températures.

SPECIFIC CONDITIONS OF USE

The flameproof joints are not intended to be repaired.

The special fasteners of the cover are hexagon socket head cap screws conforming to ISO 4762. The minimum grade of screws must be A4-70. If any, the screws shall only be replaced with identical ones.

The temperature class depend on ambient temperature. See temperature tables.

14 **EXIGENCES ESSENTIELLES DE SANTE ET DE SECURITE**

Couvertes par les normes listées au point 8.

ESSENTIAL HEALTH AND SAFETY REQUIREMENTS

Covered by standards listed at 8.

Conditions de certification

Les détenteurs d'attestations d'examen UE de type doivent également satisfaire les exigences de contrôle de production telles que définies à l'article 13 de la Directive 2014/34/UE.

En accord avec l'Article 41 de la Directive 2014/34/UE, les attestations d'examen CE de type mentionnant la Directive 94/9/CE émises avant la date d'application de la Directive 2014/34/UE (20 avril 2016) peuvent être considérées comme émises en accord avec la Directive 2014/34/UE. Les nouvelles versions de ces attestations peuvent conserver le numéro de l'attestation d'origine émise avant le 20 avril 2016.

Conditions of certification

Holders of EU type examination certificates are also required to comply with the production control requirements defined in article 13 of Directive 2014/34/EU.

In accordance with Article 41 of Directive 2014/34/EU, EC-Type Examination Certificates referring to Directive 94/9/EC that were in existence prior to the date of application of Directive 2014/34/EU (20 April 2016) may be referenced as if they were issued in accordance with Directive 2014/34/EU. New issues of such certificates may continue to bear the original certificate number issued prior to 20 April 2016.

EU TYPE-EXAMINATION CERTIFICATE

1. **EU type-examination Certificate (Module B)**
2. **Equipment or Protective System intended for use in potentially explosive atmospheres (Directive 2014/34/EU)**
3. **EU type examination certificate Nr** **ITS16ATEX101339X R.1**
4. **Product:** AD-U, AM-D/AM-U, AF-U, AD-E4 Thread Adapters, RD-U, RD-E4 Reducers and AE-E Earthlead Adapters, Reducers, UN-D / UN-U, UF-D / UF-U, FB and FL Unions
5. **Manufacturer:** EATON ELECTRICAL SYSTEMS Ltd Trading as Eaton, Raxton, Redapt or Capri
   Applicant: EATON ELECTRICAL SYSTEMS Ltd Trading as Eaton, Raxton, Redapt or Capri
6. **Address:** Kingsway South Westgate, Aldridge West Midlands WS9 8FS
   Address: Kingsway South Westgate, Aldridge West Midlands WS9 8FS
7. This product and any acceptable variation thereto are specified in the schedule to this certificate and therein referred to.
8. INTERTEK ITALIA S.p.A., Notified Body n° 2575 in accordance with article 17 of the Directive 2014/34/EU of the European Parliament and Council of the 26 February 2014, certifies that the equipment or protective system has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of equipment and protective system intended for use in potentially explosive atmosphere, given in Annex II of the Directive.

   The examination and tests results are recorded in confidential technical evaluation Intertek Report Nr. 105332195LHD-001 dated 31st August 2023.
9. Compliance with the Essential Health and Safety Requirements has been assured by compliance with EN IEC 60079-0:2018, EN 60079-1:2014, EN IEC 60079-7:2015+A1:2018 and EN 60079-31:2014 except in respect of those requirements referred to at item 16 of the Schedule.
10. If the sign X is placed after the certificate number, it indicates that the product is subject to Specific Conditions of Use specified in the schedule to this certificate.
11. This EU-Type Examination Certificate relates only to the design and construction of the specified product. Further requirements of the Directive apply to the manufacturing process and supply of this product. These are not covered by this certificate.
12. The marking of the product shall include the following:

Types AD-U, AM-D/AM-U, AF-U Thread Adapters, RD-U Reducers and UN-D / UN-U, UF-D / UF-U, FB and FL Unions (Mining not applicable to Aluminium version)

SCHEDULE

EU TYPE EXAMINATION CERTIFICATE NUMBER: ITS16ATEX101339X R.1

13. **DESCRIPTION OF THE EQUIPMENT OR PROTECTIVE SYSTEM**

Adaptors and Reducers
The ranges of thread adaptors and reducers each comprise a hollow body with an external male thread and an internal female thread. The devices are used to convert an existing cable entry aperture thread to a different thread form and / or size. The adaptors and reducers may optionally be machined with a groove to fit an 'o' ring seal. An increase of up to two step thread sizes is permitted on the AD-U series.

AD-U and RD-U Series – Metallic hexagonal or round bodied adaptors (AD-U) or reducers (RD-U)
Coded: Ex db I/IIC Mb/Gb, Ex eb I/IIC Mb/ Gb Ex tb IIIC Db
M12 TO M120 (or equivalent thread forms)

The **AM-D / AM-U** range of Male to Male thread adaptors each comprises a hexagon body with a male thread form at each end. The devices are used to convert an existing cable entry aperture thread to a different thread form and/or size. Coded: Ex db I/IIC Mb/Gb, Ex eb I/IIC Mb/ Gb Ex tb IIIC Db
M16 TO M90 (or equivalent thread forms)

The **AF-U** range of Female to Female thread adaptors each comprises a hexagon body with a female thread form at each end. The devices are used to convert an existing cable entry aperture thread to a different thread form and/or size. Coded: Ex db I/IIC Mb/Gb, Ex eb I/IIC Mb/ Gb Ex tb IIIC Db
M16 TO M120 (or equivalent thread forms)

Types **AD-E4** Adaptors and Types **RD-E4** Reducers are glass fibre nylon versions, 30% Glass filled Nylon is the standard material type and 40% Glass filed Nylon is a specific type. They are designed to convert an existing cable entry aperture in the associated apparatus to a different thread form and/or size. Each device comprises a hollow body with a male thread at one end and a female thread at the other. The AD-E4 is a hexagon type adaptor. The RD-E4 is a hexagon type reducer.
Coded: Ex eb IIC Gb, Ex tb IIIC Db

The **AE-E** Series range of earth lead adaptors and reducers each comprise a hexagon body with a male thread at one end and a female thread machined into the other. The devices are designed to provide a connection from a cable gland or termination to earth via a 300mm long earth lead cable riveted and soldered to the body and additionally may be used to convert an existing cable entry aperture thread to a different thread form and/or size. Coded Ex eb I/IIC Mb/Gb Ex tb IIIC Db IP6X
M16 TO M75 (or equivalent thread forms)

Type **UN-D / UN-U and FB** Male to Female Unions and **UF-D / UF-U and FL** Female to Female Unions each comprise a hexagon body, an internally threaded cone and an external nut. The devices are designed for connection when a conventional adaptor is impractical. Additionally, they may be used to convert an existing cable entry to a different thread form and/or size.
Coded: Ex db I/IIC Mb/Gb, Ex eb I/IIC Mb/Gb Ex tb IIIC Db IP6X
M16 TO M75 for FB-FL (or equivalent thread forms)
UN-D / UN-U and **UF-D / UF-U** are between M20 and M75 (or equivalent thread forms)

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

15. **SPECIFIC CONDITIONS OF USE**

1. When used in flameproof applications. only one adaptor or reducer is to be used with any single cable entry on the associated equipment.
2. The interfaces between these devices and the associated enclosure cannot be defined; therefore, it is the user's responsibility to ensure that the appropriate ingress protection level is maintained at these interfaces.
3. Aluminum variants are not permitted for Group I applications
4. At their point of mounting, these devices are suitable for use at the following temperatures dependent on the type of 'o'-ring:

O-ring Service temp

Material	Service Temperature
None fitted	-60°C to 200°C*
EPDM	-50°C to +100°C
Nitrile	-30°C to +80°C
Neoprene	-40°C to +80°C
Viton	-20°C to +180°C*
Silicone	-60°C to +180°C *
Fluorosilicone	-60°C to +130°C
30% Glass Filled Nylon	-30°C to +90°C
40% Glass Filled Nylon	-20°C to +45°C

Note:. The limiting temperatures specified above are de-rated by 20K according to Clause 7.2.2 'Material Selection' of EN 60079-0

Note: The maximum temperature is limited to 150°C in Group I application (Coal dust, Mining) O-ring materials affect marked with '*' above.

Note: Unless fitted with an interface sealing O-ring with lower properties, temperatures shall then be limited as per the manufacturer's instructions.

Conditions specific to type:

AD-U Adaptors and RD-U Reducers

1. When installed in Group I applications, the ADU M12 (M) to M20 (F) adaptor manufactured in brass shall be installed where the risk of impact is low

AE-E Earth Lead Adaptors and Reducer

2. At their point of mounting, these devices are suitable for use at -20°C to +40°C.

AD-E4, RD-E4

3. The adaptors/reducers, made from non-metallic material, are only suitable for installation in areas considered to be a low risk from mechanical impact.
4. The adaptors/reducers, made from non-metallic material 40% Glass Filled Nylon, shall be adequately protected from direct exposure to sunlight.

SCHEDULE

EU TYPE EXAMINATION CERTIFICATE NUMBER: ITS16ATEX101339X R.1

16. **ESSENTIAL HEALTH AND SAFETY REQUIREMENTS**

The relevant essential Health and Safety Requirements have been identified and assessed in Intertek Report Nr. 105332195LHD-001 dated 31st August 2023.

17. **ROUTINE (FACTORY) TESTS**

None.

18. **DETAIL OF CERTIFICATE CHANGES**

R.1 (?? August 2023):

- Add holes into threads for the Adaptors & Reducers AD-U / AD-E4 in order to drain moisture when associated with a breather.
- Update of some drawings.
- Update to EN IEC 60079-0:2018.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.

EU Type Examination Certificate CML 19ATEX1167X Issue 3

1 Equipment intended for use in Potentially Explosive Atmospheres Directive 2014/34/EU

2 Equipment **A Range of Cable Glands with Compression Seals**

501/421; 501/421 "Size 2K"; 501/423; 501/453 RAC; PSG 553 RAC; 501/414; SB474

3 Manufacturer **Hawke International (A Division of Hubbell Limited) (A member of the Hubbell group of Companies)**

4 Address **Oxford Street West, Ashton-under-Lyne, Lancashire, OL7 0NA United Kingdom**

5 The equipment is specified in the description of this certificate and the documents to which it refers.

6 CML B.V., Chamber of Commerce No 67386717, Koopvaardijweg 32, 4906CV Oosterhout, The Netherlands, Notified Body Number 2776, in accordance with Article 17 of Directive 2014/34/EU of the European Parliament and of the Council, dated 26 February 2014, certifies that this equipment has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of equipment intended for use in potentially explosive atmospheres given in Annex II to the Directive.

The examination and test results are recorded in the confidential reports listed in Section 12.

7 If an 'X' suffix appears after the certificate number, it indicates that the equipment is subject to conditions of safe use (affecting correct installation or safe use). These are specified in Section 14.

8 This EU Type Examination certificate relates only to the design and construction of the specified equipment or component. Further requirements of Directive 2014/34/EU Article 13 apply to the manufacture of the equipment or component and are separately certified.

9 Compliance with the Essential Health and Safety Requirements, with the exception of those listed in the confidential report, has been demonstrated through compliance with the following documents:

EN IEC 60079-0:2018 EN 60079-1:2014 EN 60079-31:2014

EN IEC 60079-7:2015+A1:2018

10 The equipment shall be marked with the following:

Ex II 2 G D

Ex db IIC Gb

Ex eb IIC Gb

Ex tb IIIC Db
IP 66/67/X8 – 10m/24h
See conditions of use for service temperature range

Issue 3

11 Description

Each of the following gland types may be manufactured in brass, nickel plated brass, stainless steel or aluminium and may be supplied with agreed alternative entry thread forms.

The Type 501/421 Cable Gland is intended for use with an effectively filled and circular unarmoured cables and comprises the following components: -

a) An entry component in the size range Os to J
b) A compressible sealing ring
c) A compression spigot
d) A back nut
e) An optional earth continuity device for use with metallic sheathed cables

The Type 501/421 'Size 2K' Gland comprises the following components only: -

a) A dedicated entry component
b) A compressible sealing ring
c) A nylon skid washer
d) A threaded compression spigot

The Type 501/423 Cable Gland is intended for use with effectively filled and circular unarmoured cables and comprises the following components: -

a) An entry component, in the size range Os to J
b) Two compressible sealing rings
c) Two compression spigots
d) A middle nut
e) A back nut
f) An optional earth continuity device for use with metallic sheathed cables

The Type 501/453 RAC Cable Gland is intended for use with armoured, unarmoured, or braided cable and comprises the following components:

a. An entry component, in the size range Os to J
b. A compressible sealing ring.
c. A combined compression spigot and armour clamping cone.
d. A reversible armour clamping ring.
e. A middle nut
f. An outer seal assembly (sleeve seal and support cage)
g. A back nut
h. An optional earth continuity device for use with metallic inner sheathed cables

The Type PSG 553 RAC Cable Gland is intended for use with armoured, unarmoured, or braided cables of unspecified construction and comprises the following components: -

a) An entry component in the size range Os to C
b) A compressible seal designed to accept a number of individual conductors
c) A combined compression spigot and armour clamping cone
d) A reversible armour clamping ring.
e) A middle nut
f) An outer seal assembly (sleeve seal and support cage)
g) A back nut

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

CML 19ATEX1167X
Issue 3

The Type 501/414 Conduit Stopping Gland is intended for use with an effectively filled and circular unarmoured cable enclosed within a conduit and comprises the following components: -

a) An entry component in the size range Os to F
b) A compressible sealing ring
c) A compression assembly comprising a compression spigot with a female thread at the rear and integral back nut

The Type SB474 Conduit Stopping Gland is intended for use with a number of circular conductors enclosed within a conduit and comprises the following components: -

a) An entry component in the size range O to C
b) A compressible seal designed to accept a number of individual conductors
c) A compression assembly comprising a compression spigot with a female thread at the rear and integral back nut.

Design option

1. The use of a 3M cold Shrink tubing to be fitted to the outer sheath of specific non-circular cables as specified in the drawing 320000, and fitted into 'Os', 'O' and 'A' sizes of the 501/453 cable glands. To ensure that the IP sealing arrangement utilizing the cable shrink tube assembly does not affect the assigned IP rating of the glands. The selection of the relevant cable gland to meet the protection concept for the cable and the enclosure it is fitted on to as detailed in EN 60079-14 remain un-affected.
2. The gland assemblies as described above are rated for ingress protection IP66 and 67.
3. Cable glands may be fitted with an optional external clamp or a second accessory option type Hawke Gland Mounted Clamp (GMC).
4. Where marked IIC or IIIC, the equipment can also be marked for gas groups IIA or IIB and for dust groups IIIA or IIIB.

Variation 1

This variation introduces the following modifications:

i. Update GA drawings.
ii. Add accessory optional item GMC 'Gland Mounted Clamp'.
iii. Clarify the ingress protection, IP ratings.
iv. To review and update the cable glands against the latest standard.
v. To include the 501/453 RAC type cable Gland.
vi. To permit the update to gland sizes.
vii. Update the marking.
viii. To revise the equipment title.
ix. To revise the product description.
x. To revise the specific conditions of use.

Variation 2

This variation introduces the following modifications, and it is is applicable to Type PSG 553 RAC Cable Gland and Type SB474 Conduit Stopping Gland.

i. To introduce a new seal design for PSG/553/RAC, sizes Os to C and SB 474, sizes O to C; as a result the product description was amended.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

CML 19ATEX1167X
Issue 3

ii. To introduce a new compressible seal which has an increased service temperature of -60°C to +100°C; to reflect this modification the product description and Specific Conditions of Use were updated.
iii. To permit minor editorial updates to the Product Description.
iv. To permit changes to the Specific Conditions of Use.
v. To remove cable gland types 501/452 RAC and PSG 421; as a result, the product description was amended.

Variation 3
This variation introduces the following modifications:

i. To modify the core diameter range on sizes O/A/B/C and B-ALT of the PSG 553 RAC and SB474 gland types and modify certification documentation.

12 Certificate history and evaluation reports

Issue	Date	Associated report	Notes
0	04 June 2019	R11908A/00	The issue of the prime certification.
1	28 Sept 2021	R13593A/00	The introduction of variation 1. (UKEX)
2	31 Mar 2022	R14930A/00	The introduction of variation 2
3	23 Aug 2023	R16380A/00	The introduction of variation 3

Note: Drawings that describe the equipment or component are listed in the Annex.

13 Conditions of Manufacture

None

14 Specific Conditions of Use (Special Conditions)

The following conditions relate to safe installation and/or use of the equipment.

i. The PSG/553/RAC and SB 474 cables glands are limited to an operating temperature range of -60°C to +80°C, unless marked “P PSG/553/RAC” and “P SB 474” respectively. In these cases, they are suitable for use with an operating temperature range of -60°C to +100°C. All other cable gland types are suitable for use with an operating temperature range of -60°C to +100°C.

ii. When the glands are used for increased safety or dust protection the entry thread shall be suitably sealed (in accordance with IEC 60079-14) to maintain the ingress protection rating of the associated enclosure. Not applicable when Hawke IP 66/67 seal is used.

iii. Glands for use with conduit, unarmoured or braided cables are only suitable for fixed installations, the cable for which must be effectively clamped to prevent pulling and twisting (does not apply when fitted with rear clamping device or Hawke Gland Mounted Clamp (GMC)).

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.

This certificate is issued as verification that a sample(s), representative of production, was assessed and tested and found to comply with the IEC Standard list below and that the manufacturer's quality system, relating to the Ex products covered by this certificate, was assessed and found to comply with the IECEx Quality system requirements.This certificate is granted subject to the conditions as set out in IECEx Scheme Rules, IECEx 02 and Operational Documents as amended

STANDARDS :
The equipment and any acceptable variations to it specified in the schedule of this certificate and the identified documents, was found to comply with the following standards

IEC 60079-0:2017 Edition:7.0	Explosive atmospheres - Part 0: Equipment - General requirements
IEC 60079-1:2014 Edition:7.0	Explosive atmospheres - Part 1: Equipment protection by flameproof enclosures "d"
IEC 60079-31:2022 Edition:3.0	Explosive atmospheres – Part 31: Equipment dust ignition protection by enclosure "t"
IEC 60079-7:2017 Edition:5.1	Explosive atmospheres - Part 7: Equipment protection by increased safety "e"

This Certificate **does not** indicate compliance with safety and performance requirements other than those expressly included in the Standards listed above.

TEST & ASSESSMENT REPORTS:
A sample(s) of the equipment listed has successfully met the examination and test requirements as recorded in:

Test Reports:

DETAILS OF CERTIFICATE CHANGES (for issues 1 and above)
Issue 1
This issue introduces the following changes:

1. Update GA drawings.
2. Add accessory optional item GMC 'Gland Mounted Clamp'.
3. Clarify the ingress protection, IP
4. To review and update the cable glands against the latest standard.
5. To include the 501/453 RAC type cable Gland.
6. To permit the update to gland sizes.
7. Update the marking.
8. To revise the equipment title.
9. To revise the product description.
10. To revise the specific conditions of use.

Issue 2
This issue introduces the following changes and it is applicable to Type PSG 553 RAC Cable Gland and Type SB474 Conduit Stopping Gland.

1. To introduce a new seal design for PSG/553/RAC, sizes Os to C and SB 474, sizes O to C; as a result the product description was amended.
2. To introduce a new compressible seal which has an increased service temperature of -60°C to +100°C; to reflect this modification the product description and Specific Conditions of Use were updated.
3. To permit minor editorial updates to the Product Description.
4. To permit changes to the Specific Conditions of Use.
5. To remove cable gland types 501/452 RAC and PSG 421; as a result, the product description was amended.

Issue 3
This issue introduces the following changes:

1. To modify the core diameter range on sizes O/A/B/C and B-ALT of the PSG 553 RAC and SB474 gland types and modify certification documentation.
2. To review and update the equipment against the latest requirement of IEC 60079-31:2022 Ed.3.

Description

Each of the following gland types may be manufactured in brass, nickel plated brass, stainless steel or aluminium and may be supplied with agreed alternative entry thread forms.

The Type 501/421 Cable Gland is intended for use with an effectively filled and circular unarmoured cables and comprises the following components: -

a) An entry component in the size range Os to J
b) A compressible sealing ring
c) A compression spigot
d) A back nut
e) An optional earth continuity device for use with metallic sheathed cables

The Type 501/421 'Size 2K' Gland comprises the following components only: -

a) A dedicated entry component
b) A compressible sealing ring
c) A nylon skid washer
d) A threaded compression spigot

The Type 501/423 Cable Gland is intended for use with effectively filled and circular unarmoured cables and comprises the following components: -

a) An entry component, in the size range Os to J
b) Two compressible sealing rings
c) Two compression spigots
d) A middle nut
e) A back nut
f) An optional earth continuity device for use with metallic sheathed cables

The Type 501/453 RAC Cable Gland is intended for use with armoured, unarmoured, or braided cable and comprises the following components:

a. An entry component, in the size range Os to J
b. A compressible sealing ring.
c. A combined compression spigot and armour clamping cone.
d. A reversible armour clamping ring.
e. A middle nut
f. An outer seal assembly (sleeve seal and support cage)
g. A back nut
h. An optional earth continuity device for use with metallic inner sheathed cables

f) An outer seal assembly (sleeve seal and support cage)
g) A back nut

The Type 501/414 Conduit Stopping Gland is intended for use with an effectively filled and circular unarmoured cable enclosed within a conduit and comprises the following components: -

a) An entry component in the size range Os to F
b) A compressible sealing ring
c) A compression assembly comprising a compression spigot with a female thread at the rear and integral back nut

The Type SB474 Conduit Stopping Gland is intended for use with a number of circular conductors enclosed within a conduit and comprises the following components: -

a) An entry component in the size range O to C
b) A compressible seal designed to accept a number of individual conductors
c) A compression assembly comprising a compression spigot with a female thread at the rear and integral back nut.

Design option

1. The use of a 3M cold Shrink tubing to be fitted to the outer sheath of specific non-circular cables as specified in the drawing 320000, and fitted into 'Os', 'O' and 'A' sizes of the 501/453 cable glands. To ensure that the IP sealing arrangement utilizing the cable shrink tube assembly does not affect the assigned IP rating of the glands. The selection of the relevant cable gland to meet the protection concept for the cable and the enclosure it is fitted on to as detailed in EN 60079-14 remain un-affected.
2. The gland assemblies as described above are rated for ingress protection IP66 and 67.
3. Cable glands may be fitted with an optional external clamp or a second accessory option type Hawke Gland Mounted Clamp (GMC).
4. Where marked IIC or IIIC, the equipment can also be marked for gas groups IIA or IIB and for dust groups IIIA or IIIB

Conditions of Manufacture

None

Specific Conditions of Use

The following conditions relate to safe installation and/or use of the equipment.

i. The PSG/553/RAC and SB 474 cables glands are limited to an operating temperature range of -60°C to +80°C, unless marked "P PSG/553/RAC" and "P SB 474" respectively. In these cases, they are suitable for use with an operating temperature range of -60°C to +100°C. All other cable gland types are suitable for use with an operating temperature range of -60°C to +100°C.

ii. When the glands are used for increased safety or dust protection the entry thread shall be suitably sealed (in accordance with IEC 60079-14) to maintain the ingress protection rating of the associated enclosure. Not applicable when Hawke IP 66/67 seal is used.

iii. Glands for use with conduit, unarmoured or braided cables are only suitable for fixed installations, the cable for which must be effectively clamped to prevent pulling and twisting (does not apply when fitted with rear clamping device or Hawke Gland Mounted Clamp (GMC)).

Components used which are covered by Ex Certificates issued to older editions of Standards

None

[This page intentionally left blank.]

Attestation of Conformity for Components

We, Roxtec International AB, declare under sole responsibility that the products to which this declaration relates is in accordance with the provisions of the Directive 2014/34/EU
The products complies following harmonized stancards:

EN IEC 60079-0:2018, EN IEC 60079-7:2015/A1:2018 and EN 60079-31:2014

The standards listed in the EC-Type Examination Certificate are no longer harmonized, the revised (now harmonized) standards have been compared to the standards used for certification purposes and no changes in the "state of the art" apply to the equipment.

Cable Transit Device:
G...W Ex, S Ex, S...S0...Ex, SRC Ex, SK Ex, S BTB Ex, S...WM Ex,
SF...W Ex, R...W Ex, RO...W Ex, RS...W Ex and B...C Ex

Certificate:
No.12ATEX1279U issued by Nemko (id.no. 0470), based on EC-type Examination performed by them.
No. SP03ATEX7102 issued by RISE - Research Institutes of Sweden
(id.no 0402), based on assessment of the quality system performed by them.

Characteristics and how the components shall be incorporated into equipment:
Stated in EC-type Examination certificate and the instructions which accompany the components.

IECEx Certificate of Conformity

Certificate No:	IECEx NEM 12.0014X	Issue No: 4
Date of Issue:	**2015-11-04**	Page 2 of 5
Manufacturer:	**Roxtec International AB** Rombvägen 2 Box 540 SE-371 23 Karlskrona **Sweden**	
Additional Manufacturing location(s):		

This certificate is issued as verification that a sample(s), representative of production, was assessed and tested and found to comply with the IEC Standard list below and that the manufacturer's quality system, relating to the Ex products covered by this certificate, was assessed and found to comply with the IECEx Quality system requirements. This certificate is granted subject to the conditions as set out in IECEx Scheme Rules, IECEx 02 and Operational Documents as amended.

STANDARDS:

The electrical apparatus and any acceptable variations to it specified in the schedule of this certificate and the identified documents, was found to comply with the following standards:

IEC 60079-0 : 2011 Edition:6.0	Explosive atmospheres - Part 0: General requirements
IEC 60079-31 : 2008 Edition:1	Explosive atmospheres – Part 31: Equipment dust ignition protection by enclosure 't'
IEC 60079-7 : 2006-07 Edition:4	Explosive atmospheres - Part 7: Equipment protection by increased safety "e"

*This Certificate **does not** indicate compliance with electrical safety and performance requirements other than those expressly included in the Standards listed above.*

TEST & ASSESSMENT REPORTS:

A sample(s) of the equipment listed has successfully met the examination and test requirements as recorded in

IECEx Certificate of Conformity

Certificate No: IECEx NEM 12.0014X Issue No: 4

Date of Issue: **2015-11-04** Page 3 of 5

Schedule

EQUIPMENT:

Equipment and systems covered by this certificate are as follows:

The Cable Transit Devices 'CTDs'(see Type Designation below), for use with circular cables both armoured and non-armoured or corrugated cables (see Corrugated cables below) of non-interrupted and non-metallic outer jacket type or conduits. The CTDs consists of multi diameter sealing modules (type RM Ex and CM Ex as standard or with EMC properties) that depending on each individual size, accepts a limited number of cable diameters in applicable types of frames or sleeves and shall be marked with the Ex symbol.

The modules are made of mirrored rubber profiles and each part has a number of thin rubber layers that are ending up with a solid rubber core. The layers are made with two different colours to make the adaption to a cable exactly same on both halves and are allowed to differ one layer at most. To achieve appropriate sealing and mechanical properties to prevent the cables from slippage there shall always be a visible separation between the sealing module halves.

The modules made of EPDM are available with layers and core, but some greater sizes are also available without the core. In addition there are also single diameter- and solid modules.

The correct sizes and procedure of assembling the cables to the modules are described in detail in the enclosed installation instructions. Ex Compression devices are used to achieve appropriate compression of the modules and solids some CTDs uses compression units that expands inside the CTDs and some others have incorporated solid rubber profiles that achieve the expansion.

There are also two types of CTDs that incorporates both the compression device and multi diameter modules as a single unit, but still with two halves. The method to assemble the compression devices etc. and to achieve sealing of the CTDs is described in detail in the enclosed installation instructions.

Most CTDs that has a rectangular opening with or without rounded corners with modules of type RM Ex are all available for different combinations with several openings in width and/or in high. CTDs for use with rectangular openings with CM Ex modules (one type with dual opening) and round sleeves are only available with single openings.

The CTDs installation instructions listed in this report will define each variant in detail and all applicable parts that are approved for use within that variant.

CONDITIONS OF CERTIFICATION: YES as shown below:

Conditions for safe use

1. For maintaining the explosion protection, the installation instructions that accompany the products shall be considered.
2. Only cable for fixed installation is permitted for the cable transit device.
3. For optimum reliability wait 24 hours or longer after installation before exposing the cables/pipes to strain or pressure.

IECEx Certificate of Conformity

1.0 Objectives and Background

The following document contains the design journal and considerations for the EX related system. This document is an internal document stating the decisions and background for a safe system.

This is an addendum to the ATEX dossier containing the following documents.

- ATEX general arrangement
- ATEX register
- ATEX inspection checklist
- ATEX personal competences
- Intrinsically safe calculations
- Datasheet dossier
- Certification dossier

2.0 *FC PowerGen 1000kW®*

2.1 H2 solenoid valve

2.1.1 Selection of component

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is ***Emerson ASCO*** valve ***NF X E210D488E 24/DC*** with the following EX approvals: ***II 2 G D Ex db IIC T2..T6 Gb*** hereby confirming that the points above is covered by the certificate.

2.1.2 Cable glands

The cable glands for the installation shall maintain the certificate and appropriate Type of protection as the valve accordingly to section 10.2 in IEC 60079-14, hence the cable gland shall be a type of protection: db or d.

The following component is ***HAWKE* 501/421/O M20 421OM20** *with an adaptor to fit the thread of the valve from* ***Eaton Corporation*** *type* ***ADU102904*** with the following EX approvals: **Ex db IIC Gb Ex eb IIC Gb** for the cable gland, and **II 2G Ex db IIC Gb II 2G Ex eb IIC Gb** hereby confirming that the points above is covered by the certificate.

2.1.3 Cable and installation

The valve is installed with a LAPP 3G1 and resistant to UV light making them suitable for outside use.

The grounding is installed inside the valve to eliminate any risk of corrosion. The cable is in all its length (from valve to terminal box) un-cut

The cable is installed together with the other valves, with at smooth bend before cable glands. The cable will be mechanical fixed to a cable tray making sure no mechanical ware will happen.

The diameter of the cable is according to manufacture 8,4mm which is within the specifications (6,5-11,9mm) provided by the manufacture of the cable glands.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

2.2 H2 pressure transmitter

2.2.1 Selection of component

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is ***HUBA controls AG*** type ***520930S04M801*** with the following EX approvals: ***Ex II 1/2G EX ia IIC T4 Ga/Gb*** hereby confirming that the points above are covered by the certificate.

2.2.2 Ex barrier

The component will be installed with an Ex barrier eliminating the potential current going out the component and zone. The following Ex barrier is chosen: ***PR electronic 9106-B1B*** with the following EX approvals: ***II (1) G [Ex ia Ga] IIC/IIB/IIA*** hereby confirming that the points above are covered by the certificate. Installation of the barrier will be covered in section 2.8

2.2.3 Cables

For the connection of the temperature transmitter to the Ex barrier the following cable is used: ***IFM ENC03A*** with the following EX approvals: ***Ex ia IIC T6 Gb*** hereby confirming that the points above are covered by the certificate.

2.3 H2 heater heating element

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is ***JEVI Heating Elements A/S*** heating element ***D-8640*** with the following EX approvals: ***Ex d IIC T4 Gb*** hereby confirming that the points above is covered by the certificate.

The heating element has a build in over temperature cut off. The heating element is factory tested to make sure to not be able to overheat as part of the EX installation.

The flameproof type of protection is a threaded joint type and is installed according to IEC 60079-1. This means that there are no distances required to obstructions.

2.3.1 Cable glands

The cable glands for the installation shall maintain the certificate and appropriate Type of protection as the valve accordingly to point 16.3 in IEC 60079-0, hence the cable gland shall be a type of protection: d.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

For this component the cable gland was delivered as part of the delivery from the manufacture of the heating element. Following cable glands for the valve is delivered: ***HAWKE*** type ***ICG 653 UNIV Os M20*** with the EX approvals: ***EX db IIC Gb and EX eb IIC GB***

2.3.2 Cable and installation

The Heater unit is installed with a LAPP 4G2.5 and resistant to UV light making them suitable for outside use.

The grounding is installed inside the heating unit to eliminate any risk of corrosion. The cable is in all its length (from heating unit to terminal box) un-cut

The cable is installed together with the other non intrinsically safe components, with at smooth bend before cable glands. The cable will be mechanical fixed to a cable tray making sure no mechanical ware will happen.

The diameter of the cable is according to manufacture 9 mm which is within the specifications (5,5-12mm) provided by the manufacture of the cable glands.

2.4 H2 heater Level sensor

2.4.1 Selection of component

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is ***IFM LMT01A*** with the following EX approvals: ***II 3G Ex nA IIC T4 Gc X*** hereby confirming that the points above is covered by the certificate.

2.4.2 Ex barrier

The level sensor does not require a barrier due to the type of protection not being intrinsically safe.

2.4.3 Cables

For the connection of the temperature transmitter to the controller the following cable is used: ***IFM EVC14A*** with the following EX approvals: ***II 3G EX ec IIC Gc*** hereby confirming that the points above is covered by the certificate.

Installation of the cabling will be separated from intrinsically safe sensors, as the cable on this devise is not protected by an ex barrier.

2.5 H2 heater Temperature transmitter

2.5.1 Selection of component

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The temperature transmitter is defined as a simple apparatus accordingly to IEC 60079-14 section 16.4 as the type of transmitter is resister type PT1000 hence no possibility for generating any voltage by its own. Hereby eliminating the option of calculating the surface temperature. Since there are no requirement for an Ex certificate for an simple apparatus, there are no code for concluding the match.

2.5.2 Ex barrier

The component will be installed with an Ex barrier eliminating the potential current going out the component and zone. The following Ex barrier is chosen: ***PR electronic 9113B-U9*** with the following EX approvals: ***II (1) G [Ex ia Ga] IIC/IIB/IIA*** hereby confirming that the points above is covered by the certificate. Installation of the barrier will be covered in section 2.8

2.5.3 Cables

For the connection of the temperature transmitter to the Ex barriere the following cable is used: ***IFM ENC03A*** with the following EX approvals: ***Ex ia IIC T6 Gb*** hereby confirming that the points above is covered by the certificate.

2.6 H2 feed pipe container penetration

2.6.1 Selection of component

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is chosen to safe penetrate the container: **Roxtec** cable and pipe penetration type: **RS 50 B Ex-kit AISI316/AISI316** with the following EX approvals**: II 2G EX e IIC Gb** hereby confirming that the points above is covered by the certificate.

2.7 Electrical container penetration within EX zone

The component is to be placed with the following zone: ***EX zone 2 IIC T1***

Following allowable EPL is ok to use in the installation: Ga, Gb and Gc

Type of protection is limited to table 1 in IEC 60079-14

Ignition temperature is T1 for the medium (Hydrogen) in the zone. Hereby accepting the following ratings on the components T1-T6.

The following component is ***HAWKE*** cable gland type **501/421/O M20 and 501/421/A M20** with the following adaptor to compensate for the hole size: **Eaton Corporation** type **RDU100604 and RDU100704** with the following EX approvals: **Ex db IIC Gb Ex eb IIC Gb** for the cable glands and **II 2G Ex db IIC Gb II 2G Ex eb IIC Gb** for the reducers hereby confirming that the points above is covered by the certificate.

2.7.1 Cable and installation

The following type of cables are used in the above-mentioned cable glands:

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

- ÖLFLEX CLASSIC 110 CH 4X1 from Mastercontorller in 40' container to cooling skid cabinet. Diameter 8,9mm with an allowable diameter for the cable gland of 6,5mm to 11,9mm
- ETHERLINE® TORSION Cat.6A from mastercontorller in 40' container to cooling skid cabinet. Diameter 8,9mm with an allowable diameter for the cable gland of 6,5mm to 11,9mm
- ETHERLINE® TORSION Cat.6A from mastercontorller in 40' container to cooling skid cabinet. Diameter 8,9mm with an allowable diameter for the cable gland of 6,5mm to 11,9mm
- ÖLFLEX CLASSIC 135 CH 18G0,75 from mastercontroller cabinet in 40' to hydrogen valve box. Diameter 13mm with an allowable diameter for the cable gland of 10,0mm to 14,3mm
- ÖLFLEX CLASSIC 135 CH 18G0,75 from mastercontorller in 40' container to cooling skid cabinet. Diameter 13mm with an allowable diameter for the cable gland of 10,0mm to 14,3mm

2.8 General electrical installation

There are no junction boxes within the zone except the one which is a part of the components. All junction boxes are moved outside the zone.

Cables are all installed below the temperature of the zone and goes uncut through the zone as 60079-14pt. 9.6.1

The intrinsically safe barriers are positioned in a separate junction box outside the Ex Zone. The junction box will contain the components which are described in section 2.2.2 and 2.5.2. The intrinsically safe circuits are separated from the non-safe circuit. Where the one side of the box will contain the non-safe part and the opposite side containing the intrinsically safe circuit hereby following the guidelines/philosophy from the manufacture of the Ex barriers. The circuits are to be installed **50mm** apart from each other according to section 16.5.3 in IEC 60079-14

The junction box will be the following: ***Schneider Electric Thalassa PLS, fiber glass armed polyester cabinet, IP65, 180 x 270 x 180mm, gray*** With the IP rating of IP65. The box will be marked with: *"Warning - Non Intrinsically safe circuits protected by internal IP20 cover"*

The cables will be separated from the non-safe circuits in the cable tray.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

1.0 Purpose

The purpose of this document is to highline the competences of the personnel working on Ex related equipment and systems. The following definitions are defined according to IEC 60079-14 Annex A

2.0 Definitions

Definitions of terms or acronyms unique to the Policy.

BPSE: Ballard Power Systems Europe.

3.0 Responsible Persons

As described in IEC 60079-14 Annex A section A.2.1 the following knowledge and skills is required to be approved for being the **Responsible Person** on a EX installation

"Responsible persons who are responsible for the processes involved in the design, selection and erection of explosion protected equipment shall possess, at least, the following:

a) general understanding of relevant electrical engineering;

b) understanding and ability to read and assess engineering drawings;

c) practical understanding of explosion protection principles and techniques;

d) working knowledge and understanding of relevant standards in explosion protection;

e) basic knowledge of quality assurance, including the principles of auditing, documentation, traceability of measurement and instrument calibration.

Such persons shall confine their involvement to the management of competent operatives conducting selection and erection duties and not engage themselves directly in the work without ensuring their practical skills at least meet the requirements given in A.2.2."

Besides the knowledge and skills, the following competences are also required in some way to approve for the **Responsible Person** as described in IEC 60079-14 Annex A section A.3.2.

"Responsible persons shall be able to demonstrate their competency and provide evidence of attaining the knowledge and skill requirements specified in A.2.1 relevant to the types of protection and/or types of equipment involved."

4.0 Operatives/technicians

As described in IEC 60079-14 Annex A section A.2.2 the following knowledge and skills is required to be approved for being **Operatives** or **technicians** on a EX installation.

"*Operatives/technicians shall possess, to the extent necessary to perform their tasks, the following:*

a) understanding of the general principles of explosion protection;

b) understanding of the general principles of types of protection and marking;

c) understanding of those aspects of equipment design which affect the protection concept;

d) understanding of content of certificates and relevant parts of this standard;

e) general understanding of inspection and maintenance requirements of IEC 60079-17;

f) familiarity with the particular techniques to be employed in the selection and erection of equipment referred to in this standard;

g) understanding of the additional importance of permit to work systems and safe isolation in relation to explosion protection."

Besides the knowledge and skills, the following competences are also required in some way to approve for being **Operatives** or **technicians** as described in IEC 60079-14 Annex A section A.3.3.

"*Operatives/technicians shall be able to demonstrate their competency and provide evidence*

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

of attaining the knowledge and skill requirements specified in A.2.2 relevant to the types of protection and/or types of equipment involved.

They shall also be able to demonstrate their competency with documentary evidence in the:

a) use of documentation in 4.2;

b) production of reports, e.g. inspection reports, to the user as identified in 4.2;

c) practical skills necessary for the preparation and installation of relevant concepts of protection;

d) use and production of installation records as identified in 4.2."

5.0 Designer

As described in IEC 60079-14 Annex A section A.2.3 the following knowledge and skills is required to be approved for being **Designer** on a EX installation.

"*Designers shall possess, to the extent necessary to perform their tasks, the following:*

a) detailed knowledge of the general principles of explosion protection;

b) detailed knowledge of the general principles of types of protection and marking;

c) detailed knowledge of those aspects of equipment design which affect the protection concept;

d) detailed knowledge of content of certificates and relevant parts of this standard;

e) understanding of practical skills for the preparation and installation of relevant concepts of protection;

f) detailed knowledge of the additional importance of permit to work systems and safe isolation in relation to explosion protection;

g) detailed knowledge of the particular techniques to be employed in the selection and erection of equipment referred to in this standard;

h) general understanding of inspection and maintenance requirements of IEC 60079-17."

*Besides the knowledge and skills, the following competences are also required in some way to approve for being **Designers** as described in IEC 60079-14 Annex A section A.3.4.*

"Designers shall be able to demonstrate their competency and provide evidence of attaining the knowledge and skill requirements specified in A.2.3 relevant to the types of protection and/or types of equipment involved.

They shall also be able to demonstrate their competency with documentary evidence in the:

a) production of documentation specified in 4.2;

b) production of designers certificates to the user as identified in 4.2;

c) practical skills necessary for the preparation and compilation of relevant design details for the concepts of protection and systems involved;

d) updated and production of installation records as identified in 4.2."

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

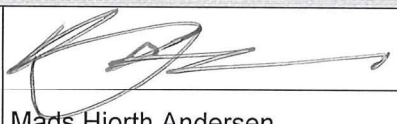
Confirmation of Satisfactory FAT

Part No.	601456B-7002362 Incl. sub-assemblies: 601456B-7002973 601456B-7003716
Product name	FC PowerGen 1000kW
Serial No.	601456B

Ballard Power Systems Europe A/S confirms that the above-listed equipment has satisfactorily with comments undergone and passed the Factory Acceptance Test (FAT) according to

BLPH Project – Acceptance Test Procedure (FAT) [K559-2254-CWIWP4202202-J08-001]



BLPH Project - Test Matrix for FAT and SAT [K559-2254-CWIWP4202202-J99-002]

601456B Crosswind BLPH FAT punch list [K559-2254-CWIWP4202202-J08-003]

prior to the shipment.

CrossWind C.V. acknowledges that the Factory Acceptance Test (FAT) for the above-listed equipment was witnessed and confirms that the test was performed satisfactorily with comments, and all agreed-upon specifications have been met.

1.0 Executive Summary

This document outlines the tests to be included in the witnessed Factory Acceptance Test. These tests aim to show the overall functionality of the fuel cell-based power plant. The verification should show the capability of delivering the expected AC power and that the product is ready to be delivered and installed on site.

When the delegations from CrossWind, Shell, Rosetti Marino and the surveyor from Fulkrum (CrossWind) were at Ballard Europe, Hobro to witness the selection of Factory Acceptance Tests 4/12 tests were performed and passed. The remaining eight tests are to be performed later are the following:

- F18 H2 leakage test
- O01 System Start/stop
- O09 Load Test – Step response 0 to 35%
- O10 Load Test – step response 35% to 70%
- O11 Load Test – Step response 65 to 100%
- O12 Load Test – 100% stability test – 3 hours
- O13 Load Test – Step response 100% to 50%
- O14 Load Test – step response 50% to 0%

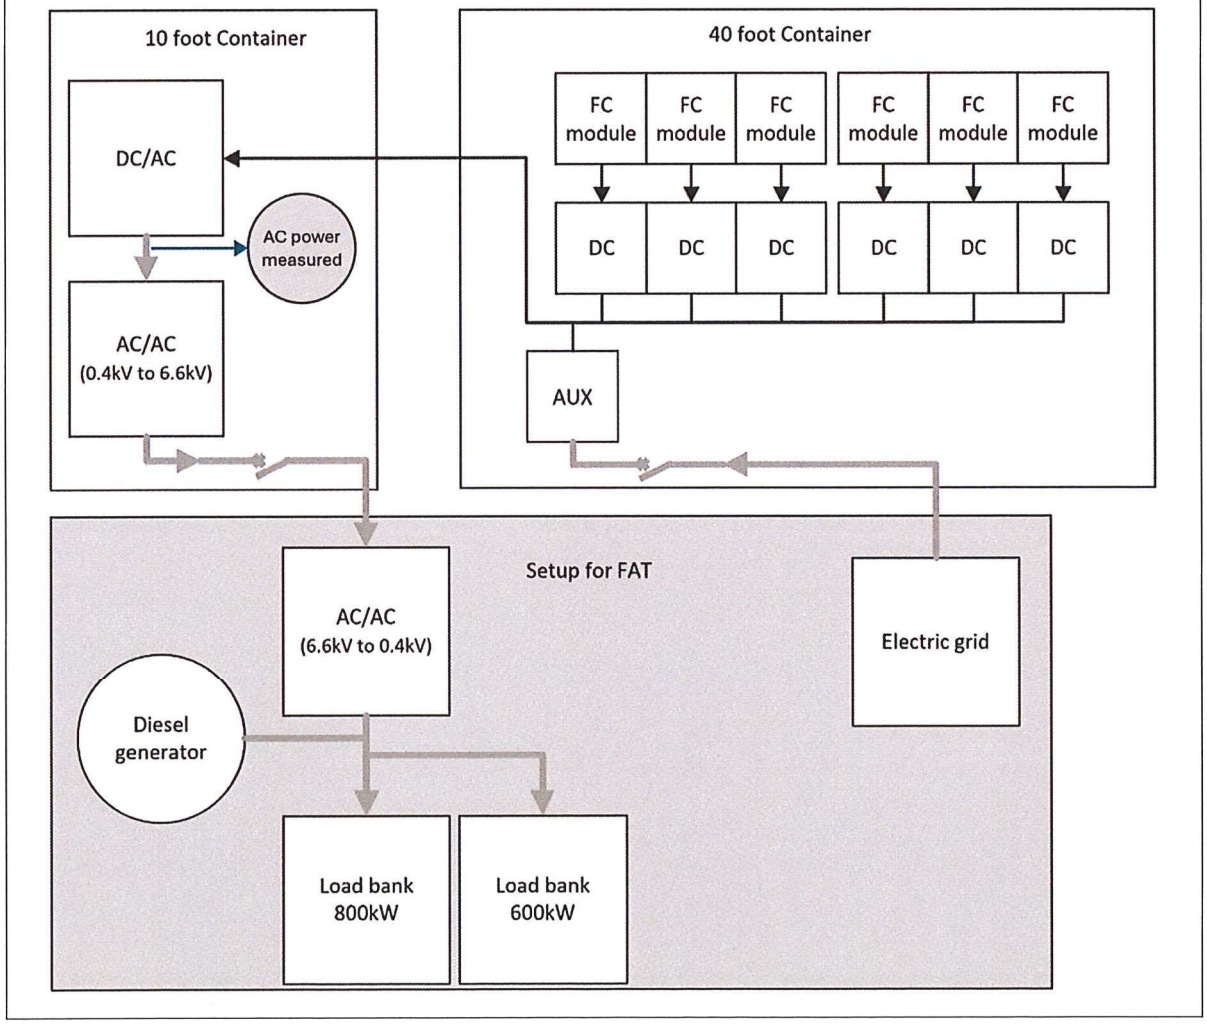
LT	Low temperature cooling system



4.0 Objectives and Background

This document describes the witnessed Factory Acceptance Tests. The tests do not include the internal testing that has been done to secure product maturity, mechanical and electrical connections have been done correctly.

The scope of testing is:

- Go through the Megablock with the customer to find defects that needs to be corrected
- Safety systems are functioning correctly in a complete Megablock with coolers.
- Megablock produces AC current, and the tests shall verify the capability to produce AC current following the demand.

Figure 1: Megablock System test overview

5.0 Functional tests

5.1 F02 Visual inspection

5.1.1 Test

The test involves an examination of the paint job through visual inspection, assessing the overall build quality, and checking for any dents. The focus is also on evaluating the assembly quality to ensure compliance with weather resistance.

5.1.2 Relevant Standard / document

- No reference

5.1.3 Brief Test Plan

- Visual inspection with customer of full system meaning inside and outside container solution.
- Take comprehensive pictures of the full system and test setup, including close-ups of vital components, with timestamps for reference.

5.1.4 Pass/Fail criteria.

- Visual inspect with customer to review quality of full system.

5.1.5 Test Result

Table 1: Visual inspection – Test Result

Date tested	Item	Result	Pass/Fail	Notes
13/8-2024	Inspection of paint	Accepted	Pass	See item list for further elaboration
13/8-2024	Assessing build quality	Accepted	Pass	See item list for further elaboration
13/8-2024	Check for dents	Accepted	Pass	See item list for further elaboration

5.2 F07 Electrical safety test – 10-foot container

5.2.1 Test

Follow designated standard to conduct electrical safety test, grounding continuity and high potential.

5.2.2 Relevant Standard / document

- EN 60204-1

5.2.3 Brief Test Plan

- According to EN 60204-1

5.2.4 Pass/Fail criteria.

- All relevant checks in EN 60204-1 chapter 18 passed.

5.2.5 Test Result

Table 2: Electrical safety test - Test results

Date tested	Item	Result	Pass/Fail	Notes
13/8-2024	Grounding Continuity	Accepted	Pass	-
13/8-2024	High Potential	Accepted	Pass	-

Table 3: Electrical safety test - calibration equipment

Unit	Equipment number	Calibration due date	Equipment used for
Metrel CE-Multitester	086-003	19/1-2025	Grounding Continuity and High Potential

5.3 F08 Electrical safety test – 40-foot container

5.3.1 Test

Follow designated standard to conduct electrical safety test, grounding continuity and high potential.

5.3.2 Relevant Standard / document

- EN 60204-1

5.3.3 Brief Test Plan

- According to EN 60204-1

5.3.4 Pass/Fail criteria.

- All relevant checks in EN 60204-1 chapter 18 passed.

5.3.5 Test Result

Table 4: Electrical safety test - Test Result

Date tested	Item	Result	Pass/Fail	Notes
13/8-2024	Grounding Continuity	Accepted	Pass	-
13/8-2024	High Potential	Accepted	Pass	-

Table 5: Electrical safety test - Calibration equipment

Unit	Equipment number	Calibration due date	Equipment used for
Metrel CE-Multitester	086-003	19/1-2025	Grounding Continuity and High Potential

5.4 F10 Safety

5.4.1 Test

Conduct tests of safety inputs and outputs, including emergency stop buttons, smoke detectors, gas detectors and external connections.

5.4.2 Relevant Standard / document

- Safety input checklist according to EN/ISO 13849-2 procedure

5.4.3 Brief Test Plan

- Trigger each safety input according to checklist.
  - Emergency pushbuttons
  - Smoke detectors test
  - H2 sensor test
  - External safety switches
  - External feedback

5.4.4 Pass/Fail criteria.

- Verified according to checklist.
- Each item triggers the correct alarm

5.4.5 Test Result

Table 6: Safety - Test Result

Date tested	Item	Result	Pass/Fail	Notes
13/8-2024	Emergency pushbuttons	OK	Pass	-
13/8-2024	Smoke detectors	OK	Pass	3 sensors in 40ft container and 1 sensor in 10 ft container
13/8-2024	H2 sensors	OK	Pass	3 sensors in 40ft container
13/8-2024	External safety switches	OK	Pass	-
13/8-2024	External feedback	OK	Pass	-

Table 7: Safety - Calibration Equipment

Unit	Equipment number	Calibration due date	Equipment used for
Dräger calibration gas, 2% Hydrogen	Cylinder No: 955-657732	Valid until 10/1-2029	H2 sensors

5.5 F18 H_2 Leakage test

5.5.1 Test procedure

All pipework and H2 instrumentation subassemblies must be inspected, recorded, verified and pass in accordance with the procedure in section 5.4 in *SPC ID 0104 H2 Leak Test Procedure Rev 002* prior to full system FAT.

System H2 leakage test is done system pressure decay test, according to section 5.5 in *SPC ID 0104 H2 Leak Test Procedure Rev 002.*

5.5.2 Pass/Fail criteria.

Pressure decay test with a maximum leakage no greater than specified in test procedure.

Result details are documented in the template *SPC ID 0204 System pressure decay test template*

Parameter	Value	Description
L_A [Nm^3/h]	**2,72 – 3,58 x10^{-3}**	**Maximum allowed pressure decay to pass pressure decay test, where L_A = L_S + L_Mu**
L_S [Nm^3/h]	0	Summarized expected leak rates of all components in the system (per design leak rate).
L_Mu [Nm^3/h]	2,72 – 3,58 x10^{-3}	Calculated accuracy of the measuring system, used to perform the test.
L_C [Nm^3/h]	2,7x10^{-5}	Maximum allowed leak rate for a given pipe section, where integrity/operability of the system may be maintained safely

5.5.3 Test Result

Table 8: H2 leakage - Test Result

Date tested	Item	Leakage rate L_1 [Nm^3/h]	Pass/Fail	Notes

6.0 Operational tests

Operations are done using operator HMI or remote HMI in normal operating mode.

6.1 O01 System Start/Stop - Normal low load operation.

6.1.1 Test

Fuel Cell system can start, deliver minimum power and perform controlled stop without faults. This test is based on DC power.

6.1.2 Relevant Standard / document

- No reference

6.1.3 Brief Test Plan

- All FC in standby
- Request 100kW DC
- Delay 120 seconds
- Request zero power
- Repeat with new preferred FC until all tested.

6.1.4 Pass/Fail criteria.

- Fuel Cell Package starts without faults.
- No persistent system alarms.
- Correct available power signal.
- DC Power output within +/-5% and stable in less than 60 seconds
- Fuel Cell Package stops without faults.
- FC in stand-by in less than 30 seconds.

6.1.5 Test Result

Table 9: System Start/Stop – Normal low load operation - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	FCwave 1	All pass criterias passed except time to standby	Pass with note	Shut down to standby longer than 30 seconds
3/9-2024	FCwave 2	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 58 seconds. Power output dipped to 82 kW during the test.
3/9-2024	FCwave 3	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 55 seconds.
3/9-2024	FCwave 4	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 59 seconds.
3/9-2024	FCwave 5	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 57 seconds.
3/9-2024	FCwave 6	All pass criterias passed except time to standby	Pass with note	Shut down to standby took 1 minute 3 seconds.

6.2 O09 Load Test – step response 0 to 35%

6.2.1 Test

Test step response by adding 35% load in one step from no load while measuring AC power quality.

6.2.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.2.3 Brief Test Plan

- All FC in stand-by.
- Apply set point by requesting 350kW AC

6.2.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Startup time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

6.2.5 Test Result

Table 10: Load Test - step response 0 to 35% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 0-35%	45 seconds for start-up 0-350kW AC. Slight overshoot on 30 kW AC	Pass	With reference to document C08 it is estimated that a ramp time to 500 kW is 75 seconds.
3/9-2024	AC power quality	2,8-2,9% VAC THD 2-50 No alarms	Pass	

6.3 O10 Load Test – step response 35% to 70%

6.3.1 Test

Test step response by adding 35% load in one step to reach 70% load while measuring AC power quality.

6.3.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.3.3 Brief Test Plan

- 3 FC running delivering 350kW AC steady state.
- 2 FC in stand-by
- Apply set point by requesting 700kW AC power.

6.3.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Startup time < curve+5 seconds at any FC
- AC power quality within SPC ID 107
- No persistent system alarms.

6.3.5 Test Result

Table 11: Load Test - step response 35% to 70% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 35%-70%	All 3 started up. 23 seconds startup time	Pass	With reference to document C08 it is estimated that a ramp time from 250 kW to 750 kW is 45 seconds.
3/9-2024	AC power quality	2,8-3,0 % VAC THD 2-50 No alarms	Pass	

6.4 O11 Load Test – step response 65% to 100%

6.4.1 Test

Test step response by adding 35% load in one step to reach full load while measuring AC power quality.

6.4.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.4.3 Brief Test Plan

- 6 FC running delivering 650kW AC steady state.
- Apply set point by requesting 1000kW AC power.

6.4.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Startup time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

6.4.5 Test Result

Table 12: Load Test - step response 65% to 100% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 65%-100%	18 seconds startup time	Pass	With reference to document C08 it is estimated that a ramp time from 250 kW to 750 kW is 45 seconds.
3/9-2024	AC power quality	3,0-3,1 % VAC THD 2-50 No alarms	Pass	

6.5 O12 Load Test – 100% stability test - 3 hours.

6.5.1 Test

Test steady state at 100% load for 3 hours while measuring power quality.

6.5.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.5.3 Brief Test Plan

- 6 FC running delivering 1000kW steady state.

6.5.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Shutdown time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

6.5.5 Test Result

Table 13: Load Test – Steady state 100% load - Test Result

Date tested	Item	Result	Pass/Fail	Notes
04-09-24	Full load test	1000 kW for 3 hours	Pass	See below
04-09-24	AC power quality	2.3-3.6 % VAC THD 2-50 No alarms	Pass	

- Following added to document 05/09/2024
- In agreement with customer, after half elapsed time of the test, BOP load was increased to maximum by the following:
  - All HT fans forced to 100%
  - HT Coolant pumps forced to 70%
  - Ventilation (40ft+10ft) increased to 100%
- No impact on power delivery was observed.

6.6 O13 Load Test – step response 100% to 50%

6.6.1 Test

Test step response by removing 50% load in one step at full load while measuring power quality.

6.6.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.6.3 Brief Test Plan

- 6 FC running delivering 1000kW steady state.
- Request 500kW AC.

6.6.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Shutdown time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

6.6.5 Test Result

Table 14: Load Test - step response 100% to 50% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
3/9-2024	Step response 100%-50%	Ramp down in 15 seconds	Pass	Wit reference to document C08 it is estimated that a ramp down time from 800 kW to 200 kW is 15 seconds.
3/9-2024	AC power quality	3,0-2,6 % VAC THD 2-50 No alarms	Pass	

6.7 O14 Load Test – step response 50% to 0%

6.7.1 Test

Test step response by removing 50% load in one step to no load while measuring AC power quality.

6.7.2 Relevant Standard / document

- SPC ID 0107 Power Quality Measurement Test Procedure

6.7.3 Brief Test Plan

- 3 FC running delivering 500kW AC.
- Request 0% and apply set point.

6.7.4 Pass/Fail criteria.

- AC output: +/- 10% actual to curve at any time.
- FC: Shutdown time < curve+5 seconds at any FC.
- AC power quality within SPC ID 107
- No persistent system alarms.

6.7.5 Test Result

Table 15: Load Test - step response 50% to 0% - Test Result

Date tested	Item	Result	Pass/Fail	Notes
03-09-2024	Step response 50%-0%		Pass	Test is executed with 6 FC instead of 3 as the plan describes
—	AC power quality	NA	NA	Not applicable due to the unit not producing power

SPC ID 0204 System Pressure Decay Test Template

This document, submitted in confidence, contains proprietary information which shall not be reproduced or transferred to other documents or disclosed to others or used for manufacturing or any other purpose without prior written permission of Ballard Power Systems.

Revision Record

Rev #	Description	Revised By	Date dd-mm-yyyy
-	Initial Draft	TAN	21-08-2024
1	Released	TAN	30-08-2024
2	Updated	TAN	09-09-2024

Purpose	Pressure decay test template for recording tightness and evaluating system pipework integrity
Reference procedure	SPC ID 0104 rev 002 H2 Leak Test Procedure

Checked by	MHA	Date: 09/09-2024
Approved by	MHA	Date: 09/09-2024

Title	System Pressure Decay, Complete Assembly, Crosswind
Project	601456B Crosswind BLPH
Test date	03-09-2024
Identification of piping system (photo or P&ID) [✓ or -]	✓ see Sheet "P&ID"

Test volume	String 1 HA01+DA02-QM01 to YV_H30 solenoid valve in FCwave 1. Similar valves for string 2-6.
Test fluid/gas	Hydrogen
Test location	Crosswind Container, Majsmarken 1, 9500 Hobro Denmark
Test performed by	TAN
Results approved by	MHA
Filing date	09-09-2024

L_S - Expected leak rate for pipework system							
Ferrule fittings tightness tolerance	< 0		bar				
Bonded seal tightness tolerance	< 0		bar				
L_S total*	= 0		bar				
L_S total	=	0	NM3/h				
L_Mu - Measuring system uncertainty							
pressure gauge uncertainty							
transmitter FS (full scale)	=	16	barg				
Linearity	<	0.2	% of FS	=	<	32	mbar
Non-repeatability	<	0.1	% of FS	=	<	16	mbar
Analogue input	±	10	microA	=		10	mbar/10 minutes
Accuracy ±0.25% actual reading	±	32.5	microA		=	32.5	mbar
Temperature uncertainty (3 Kelvin)				=	±	82	mbar/10 minutes
L_Mu total					=	172.5	mbar

*=All joints and valves are considered to be classified "enhanced tightness". Hence zero allowable leak rate

Calculation of L_Mu, measuring system uncertainty

String 5	0	3.19E-03	=	3.19E-03
String 6	0	3.58E-03	=	3.58E-03

Procedure

Fill in design pressure =	6.5	barg
The Test Pressure is 1.1 times design pressure or above =	7.15	barg
If the system previosly has been leakage tested with formier gas, this test can also use the used gas for operation		
To perform the test follow "Sequence" paragraph 5.5.3 in SPC 0104 H2 Leak Test Procedure		

Calculation of L1, actual leak rate

	V	T0	T1	T2	P0	P1	P2	Pa1	Pa2	t	L1 (gas leakage rate)
	M3	°C	°C	°C	kPa	barg	barg	kPa	kPa	minutes	NM3/h

Title	F07 & F08 Electrical safety test - 40 ft and 10 ft container
Project	601456B CrossWind BLPH
Test date [DD-MM-YYYY]	13-08-2024
Test location	Crosswind Containers, Majsmarken 1, 9500 Hobro, Denmark
Test performed by	PBL & TAN

Grounding continuity

EN 60204-1:2018 - Section 18.2.2 - Test 1

Test performed with a test current of 10A

Main location	Location	Measurement	Unit
40ft container	Busbar to busbar	0.024	Ohm
	Module 1	0.018	Ohm
	DC/DC cabinet 1	0.023	Ohm
	Module 2	0.024	Ohm
	DC/DC cabinet 2	0.019	Ohm
	Module 3	0.026	Ohm
	DC/DC cabinet 3	0.016	Ohm
	Module 4	0.026	Ohm
	DC/DC cabinet 4	0.016	Ohm
	Module 5	0.024	Ohm
	DC/DC cabinet 5	0.017	Ohm
	Module 6	0.029	Ohm
	DC/DC cabinet 6	0.015	Ohm
	Control cabinet	0.021	Ohm
	Control cabinet right door	0.032	Ohm
	Lifting crane track, dolly	0.028	Ohm
	LT piping	0.031	Ohm
	Isolation transformer cover	0.039	Ohm
	Cable tray	0.019	Ohm

Main location	Location	Measurement	Unit
10ft container	Busbar to busbar	0.019	Ohm
	Main DC/Acpoint 1	0.032	Ohm
	Main DC/Acpoint 2	0.024	Ohm
	Main DC/Acpoint 3	0.027	Ohm
	DC/AC conduncter point 1	0.037	Ohm
	DC/AC conduncter point 2	0.022	Ohm
	DC/AC conduncter point 3	0.023	Ohm
	LT coolant pipe	0.024	Ohm
	Cable tray	0.02	Ohm
	Main transforer grounding bolt	0.023	Ohm
	Main transformer chassis	0.02	Ohm
	Cable tray	0.022	Ohm

Title	F07 & F08 Electrical safety test - 40 ft and 10 ft container
Project	601456B CrossWind BLPH
Test date [DD-MM-YYYY]	13-08-2024
Test location	Crosswind Containers, Majsmarken 1, 9500
Test performed by	PBL & TAN

Isolation resistance
EN 60204-1:2018 - Section 18.3
Test performed with a test voltage of 1000V

Main location	Location	Measurement	Unit
40 ft container	L1-PE	> 999.9	MOhm
	Cooling skid L1	10.01	Mohm
	Colling skid L2	6.252	Mohm
	Cooling skid L3	12.81	Mohm
	AUX supply L1	251	Mohm
	AUX supply L2	337	MOhm
	AUX supply L3	237	Mohm

Main location	Location	Measurement	Unit
10ft container	L1+L2+L3-PE on AC circuit	592	Mohm

Title	F07 & F08 Electrical safety test - 40 ft and 10 ft container
Project	601456B CrossWind BLPH
Test date [DD-MM-YYYY]	13-08-2024
Test location	Crosswind Containers, Majsmarken 1, 9500
Test performed by	PBL & TAN

Isolation resistance

EN 60204-1:2018 - Section 18.4

Test performed with a test voltage of 2500VAC

Main location	Location	Measurement	Unit	Notes
40ft container	PE and L1	0	mA	The surge arrestor has been bypassed to allow the test to be conducted
	PE and L2	0	mA	
	PE and L3	0	mA	

Main location	Location	Measurement	Unit	Notes
10 FT container	PE and L1	7.1	mA	
	PE and L2	7.1	mA	
	PE and L3	7	mA	

Date: 2024-09-11

Author: PBL, TAN

Ballard Power Systems Europe

Summary:

Thermographic report from Crosswind FAT2, 2024-09-04.

System is operating at 100% (1MW) and have been at full power for >1 hour with the cooling and ventilation system operating at 100%.

Test start at 8:55

The first few images are the system from a distance.

First half of the report shows thermal images from inside the 40ft container, with focus on DC power cables, pumps and fans and process exhaust pipes.

Second half of the report shows the system test equipment and outside the system.

There are no items of concern.

Summary:

Date: 09/08/2024

Author: PBL

Ballard Power Systems Europe

Summary:

Thermograhic test of the Crosswind BLPH 1MW system

Entire power train included, from Fuel DCDC converters to AC output transformer.

Hottest item found is DC fuses at 70-75 degrees, which is within expected range.

No items found with elevated temperatures

Some images of test setup is included, but not inside Crosswind scope.

TYPE APPROVAL CERTIFICATE

Certificate No:
TAE00004GG
Revision No:
2

This is to certify:

That the Fuel Cell

with type designation(s)
FCwave

Issued to
Ballard Power Systems Europe A/S
Hobro, Nordjylland, Denmark

is found to comply with
DNV rules for classification – Ships

Application :

Product(s) approved by this certificate is/are accepted for installation on all vessels classed by DNV.

Issued at **Hamburg** on **2023-07-14**
This Certificate is valid until **2027-05-31**.
DNV local unit: **Denmark CMC**

Approval Engineer: **Sven Lellesch**

for **DNV**

Olaf Drews
Head of Section

This Certificate is subject to terms and conditions overleaf. Any significant change in design or construction may render this Certificate invalid.
The validity date relates to the Type Approval Certificate and not to the approval of equipment/systems installed.

LEGAL DISCLAIMER: Unless otherwise stated in the applicable contract with the holder of this document, or following from mandatory law, the liability of DNV AS, its parent companies and their subsidiaries as well as their officers, directors and employees ("DNV") arising from or in connection with the services rendered for the purpose of the issuance of this document or reliance thereon, whether in contract or in tort (including negligence), shall be limited to direct losses and under any circumstance be limited to 300,000 USD.

Product description

FCwave™ is a PEM fuel cell power module with rated power of 200 kW for marine applications. The system is comprised of an enclosure with an internal separate lower and upper cabinet. The system, lower and upper cabinet, each have individual serial numbers and can be replaced during the service lifetime of the product.

The fuel for the system is pressurized gaseous hydrogen. The hydrogen storage system is not part of Ballard Power Systems Europe scope and therefore not part of the type approval. Oxidant for the reaction is drawn from ambient air and compressed in the internal compressors to feed the fuel cell stacks.
From the stacks, the module will deliver up to 720V direct current to the output of the system. It acts as a load follower electrically. The system needs power from external power source such as the vessels power system to start up, but when running it self-powers the internal Balance of Plant components. The controller and safety system require 24 VDC continuously from the vessels power system to function.
The system requires external water cooling to remove excess heat from the exothermic reaction in the fuel cells. The heat transfer is done with the integrated heat exchanger. The heat can be used in shipboard systems or disposed of as the customer desires. The fuel cells used in the system are Low Temperature PEM fuel cells. Temperatures in the system are below 100°C. The Fuel cell system is built into a cabinet. The cabinet has an ingress protection of IP44. The system is designed to be installed inside a fuel cell installation room. FCwave™ follows the gas safe machinery space concept as per IGF Code.

System Data

Control System Hardware and Software Version

Software	2.X.X	Dated 01/06 2023
Firmware	4.0.4.0	Dated 24/11 2021 (Deif AS)

Process air inlet
Water drain

Application/Limitation

Fuel cell of type FCwave™ is approved for application as per DNV-RU-SHIP Pt.6 Ch.2 Sec.3.

Installation room
The fuel cell space (H2 enclosure as part of the FCwave™ cabinet) is not equipped with A60 insulation and is not equipped with a fire extinguishing system as indicated in MSC.1/Circ.1647 para 3.1.2 and 3.3.1. Additional installation room requirements shall be defined in the detailed design phase for the vessel.

The installation room is regarded as non-hazardous space.
The free volume of the installation room shall not be less than 10m³.
Gas detection is recommended for the fuel cell installation room and in the ventilation exhaust.

The FCwave™ does not provide an emergency stop button. Adequate and accessible emergency stop buttons shall be provided and integrated to the FCwave™ emergency stop circuit.
Access to the installation room during operation shall be limited to trained service technicians and crew that have received Ballard fuel cell training. Unrestricted access to the installation room can be permitted when all fuel cell modules are powered off and otherwise deemed permissible.

Hydrogen supply
Supply piping to each cabinet shall be carried out as double walled piping following the IGF Code principles.
Each FCwave™ cabinet shall be provided with a shut-off valve with a closing time of less than 2 seconds.
The hydrogen mass flow to each FCwave™ must be restricted by suitable means in all operation scenarios to 4.9g/s.
The dimension (diameter and length) of the hydrogen supply piping from shut-off valve to module interface plate shall not exceed 5000 cm³ as per Integration Manual.

Ventilation
The fuel cell space (H2 enclosure as part of the FCwave™ cabinet) is designed with area classification according to IEC 60079-10:2020, at least suitable for zone 2 installation.
In all cases process air and ventilation exhaust must remain separated, combination of multiple systems exhaust of the same type only. If process and/or ventilation exhausts are combined from multiple systems, they must be equipped with separate isolation dampers, which must close if the module are not operating.
The integration to the vessel shall ensure the exhaust from FC modules (ventilation air) is led to a safe location free of any spark or ignition source.

Approval Conditions
For each delivery to DNV class the following documentation of the fuel cell power installation is to be submitted for approval:

Fuel cell power installation
- Reference to this type approval certificate
- Documents according to DNV RU-SHIP, Pt. 6 Ch. 2 Sec. 3, table 3 for Fuel cell power installation
- G060 Structural fire protection drawing
- G200 Fixed fire protection drawing
- MAN002 Integration Manual

The Type Approval covers hardware and software listed under product description.

When the type approved software is revised (affecting all future deliveries) DNV is to be informed by forwarding updated software version documentation. If the changes are judged to affect functionality for which rule requirements apply a new functional type test may be required and the certificate may have to be renewed to identify the new software version.

Product certificate
Each delivery of the application system is to be certified according to Pt.6, Ch.2, Sec. 3. The certification test is to be performed at the manufacturer of the application system before the system is shipped to the yard. After certification, the clause for application software control will be put into force

Application software control
All changes in software are to be recorded as long as the system is in use on board. Documentation of major changes are to be forwarded to DNV for evaluation and approval before implemented on board

Type Approval documentation

Tests carried out

Marking of product
The components shall be marked for traceability to the Type Approval.

Periodical assessment
For retention of the Type Approval, a periodical assessment as per DNV-CP-0338 Sec.4 shall be performed by a DNV Surveyor in order to verify that the conditions for the Type Approval are complied with.
To check the validity of this certificate, please look it up in https://approvalfinder.dnv.com.

Certificate No: LR23327644TA
Issue Date: 27/07/2023
Expiry Date: 26/07/2028

Type Approval Certificate

This is to certify that the undernoted product(s) has/have been tested with satisfactory results in accordance with the relevant requirements of the Lloyd's Register Type Approval System.

Manufacturer	**Ballard Power Systems Europe A/S**
Address	Majsmarken 1, Hobro, 9500, Denmark
Type	Fuel Cell Module
Description	FCwave™ is a PEM fuel cell power module with rated power of 200 kW for marine applications. The system is comprised of an enclosure with an internal separate lower and upper cabinet. The system, lower and upper cabinet, each have individual serial numbers and can be replaced during the service lifetime of the product. The fuel for the system is pressurized gaseous hydrogen. The hydrogen storage system is not part of Ballard Power Systems Europe scope and therefore not part of the type approval. Oxidant for the reaction is drawn from ambient air and compressed in the internal compressors to feed the fuel cell stacks. From the stacks, the module will deliver up to 720V DC to the output of the system. It acts as a load follower electrically. The system needs power from external power source such as the vessels power system to start up, but when running it self-powers the internal Balance of Plant components. The controller and safety system require 24V DC continuously from the vessels power system to function. The system requires external water cooling to remove excess heat from the exothermic reaction in the fuel cells. The heat transfer is done with the integrated heat exchanger. The heat can be used in shipboard systems or disposed of as the customer desires. The fuel cells used in the system are Low Temperature PEM fuel cells. Temperatures in the system are below 100°C. The Fuel cell system is built into a cabinet. The cabinet has an ingress protection of IP 44. The system is designed to be installed inside a fuel cell installation room.

Electrical & Control - Senior Specialist to
Lloyd's Register EMEA
A member of the Lloyd's Register group

71 Fenchurch Street, London, EC3M 4BS, United Kingdom

Lloyd's Register Group Limited, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as 'Lloyd's Register'. Lloyd's Register assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

Type Approval Certificate

FCwave™ follows the gas safe machinery space concept as per IGF Code.

Trade Name

FCwave™

Application

Marine, Offshore and Industrial applications for use in environmental categories ENV1, as defined in Lloyd's Register Type Approval System, Test Specification Number 7, Fuel Cell Modules, January 2023.

Specified Standard

-Manufacturer's specification
-IACS UR E10 Rev. 8 / 2021 as applicable

Ratings

-Maximum rated output power: 200kW
-Operating voltage: 350 – 720V DC
-Rated current: 2 x 300A or 1 x 550A

Other Conditions

The Fuel Cell Module is approved subject to the following conditions:

- A risk assessment specific to fuel cell power installations is to be carried out for each installation on board.The risk assessment is to evaluate risks related to the safe operation of the ship and as such is to address the safety of the fuel cell power installation itself and, where the fuel cell installation provides power for propulsion of the ship or other essential services, the dependability of the fuel cell power installation.
- The Fuel Cell Module shall only be used in accordance with the manufacturer's instructions and recommendations.
- The Fuel Cell Module shall be installed and maintained in accordance with the applicable rules, regulations, and standards for marine applications.
- The Fuel Cell Module shall be operated and monitored in accordance with the relevant safety requirements.
- The Fuel Cell Module shall be subject to periodic inspections and maintenance, in accordance with the manufacturer's recommendations and applicable rules and regulations.

Lloyd's Register Group Limited, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as 'Lloyd's Register'. Lloyd's Register assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

Type Approval Certificate

Type Approval does not eliminate the need for normal inspection and survey procedures required by the Rules and Regulations.
If the specified standards are amended during the validity of this certificate, the product is to be re-approved prior to it being supplied to vessels to which the amended standards apply.

This certificate is not valid for equipment, the design, ratings or operating parameters of which have been varied from the specimen tested. The manufacturer should notify Lloyd's Register EMEA of any modification or changes to the equipment in order to obtain a valid Certificate.

The Design Appraisal Document HPC2262032/JM/PH and its supplementary Type Approval Terms and Conditions form part of this Certificate.

71 Fenchurch Street, London, EC3M 4BS, United Kingdom

Lloyd's Register Group Limited, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as 'Lloyd's Register'. Lloyd's Register assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

Tier
5 - Unit Certification Required

Intended Service
Main & Auxiliary Power Generation for Marine and Offshore Applications

Description
FCwave is a low temperature PEM fuel cell power system with rated power output of 200kW for marine applications. The system is comprised of an enclosure with an internal separate lower and upper cabinets, each has individual serial numbers and can be replaced during the service lifetime of the product, as necessary.

Ratings
Power output: 200 KW

H2 Inlet Supply Pressure: 3.5 - 6.5 barg

H2 Design Temperature of operation: 0 - 80°C

Fuel Cell Hydrogen Operating Pressure: 0.2 - 1.0 barg

H2 Flowrate to Valve Block: 4.9 g/s

Ingress Protection of Cabinet: IP44

Operating Ambient Temperature: 0 -45 degree

Service Restrictions
Unit Certification is required for this product as indicated in the 4-9-3/Table 2 and 4-9-9/15.7 of the ABS Rules for Building and Classing Marine Vessels (2024).

Copyright 2019 American Bureau of Shipping. All rights reserved.

If the manufacturer or purchaser request an ABS Certificate for compliance with a specification or standard, the specification or standard, including inspection standards and tolerances, must be clearly defined.

Comments

1. The Manufacturer has provided a declaration about the control of, or the lack of Asbestos in this product.

2. During final installation the attending Surveyor is to verify that redundant gas detectors able to detect H2 are installed in the appropriate locations and operate properly. Any accumulation of gas to 20% LFL should trigger gas detector alarm and accumulation to 40% LFL should trigger the ESD.

3. During final installation the attending Surveyor is to verify that the FCwave is equipped with anchor mechanisms or other suitable attachments to the base structure or the hull.

4. Upon installation, the Surveyor is to verify that the door air intakes/inlets are clear to minimize the risk of complete blockage.

5. Upon installation, the Surveyor is to verify that the Chassis is properly grounded.

6. After assembled to a complete assembly unit or subassembly unit, each production unit of equipment used in control, monitoring and safety systems is to be tested at the manufacturer’s shop in the presence of the ABS Surveyor according to 4-9-9/15.7 TABLE 2 as follows:

i) Visual inspection

ii) Performance test

iii) External Power supply failure

7. FCwave system has been assigned with a Category II system classification per 4-9-3/Table 1 of the Marine Vessels Rules. Accordingly, the following tests are to be performed and are to be witnessed by the Surveyor at the Factory in accordance with 4-9-3/Table 2 of the Marine Vessels Rules (MVR).

i) 3.6: Fault Simulation.

ii) 3.7: Factory Acceptance Tests.

8. The design applies the Hazardous Zone Classification method of IEC 60079-10. The fuel cell installation room is considered as a Non-Hazardous Zone or Zone 2 with negligible extent in accordance with IEC 60079-10-1/Table D.1, with all hydrogen fuel piping entering the space and leading to or from the non-structural fuel cell space enclosure to be provided with a double-wall containment system appropriate to the fuel used by the piping.

9. Structural fire protection shall apply to the fuel cell installation room boundaries, not the fuel cell space enclosure; fire detection and fire extinguishing system requirements shall apply to the fuel cell installation room, not within the fuel cell space enclosure as per Section 3 of Fuel Cell Power Systems Requirements.

10. For each installation, safety concepts including the hazardous zone of the fuel cell installation room and multiple installation of the fuel cell units are to be declared to the flag administration for further consideration and evaluated during the risk assessment.

Term of Validity
This Product Design Assessment (PDA) Certificate remains valid until 30/Jun/2029 or until the Rules and/or Standards used in the assessment are revised or until there is a design modification warranting design reassessment (whichever occurs first).

Acceptance of product is limited to the "Intended Service" details prescribed in the certificate and as per applicable Rules and Standards.

This Certificate is valid for installation of the listed product on ABS units which exist or are under contract for construction on or previous to the effective date of the ABS Rules and standards applied at the time of PDA issuance. Use of the Product for non-ABS units is subject to agreement between the manufacturer and intended client.

ABS Rules
Rules for Conditions of Classification, Part 1 - 2024 Marine Vessel Rules 1-1-4/7.7, 1-1-A3, 1-1-A4, Which covers the following:

Marine Vessel Rules (MVR) 2024 :4-9-3/Table 1, 4-9-3/Table 2, 4-9-9/15.7, 5C-13-7/3, 5C-13-16/1.1

ABS has used due diligence in the preparation of this certificate, and it represents the information on the product in the ABS Records as of the date and time the certificate is printed.

If the Rules and/or standards used in the PDA evaluation are revised or if there is a design modification (whichever occurs first), a PDA revalidation may be necessary.

The continued validity of the MA is dependent on completion of satisfactory audits as required by the ABS Rules. The validity of both PDA and MA entitles the product to receive a **Confirmation of Product Type Approval**.

Acceptance of product is limited to the “Intended Service” details prescribed in the certificate and as per applicable Rules and Standards.

This Certificate is valid for installation of the listed product on ABS units which exist or are under contract for construction on or prior to the effective date of the ABS Rules and standards applied at the time of PDA issuance. ABS makes no representations regarding Type Approval of the Product for use on vessels, MODUs or facilities built after the date of the ABS Rules used for this evaluation.

Type Approval requires Drawing Assessment, Prototype Testing and assessment of the manufacturer's quality assurance and quality control arrangements. The manufacturer is responsible to maintain compliance with all specifications applicable to the product design assessment. Unless specifically indicated in the description of the product, certification under type approval does not waive requirements for witnessed inspection or additional survey for product use on a vessel, MODU or facility intended to be ABS classed or that is presently in class with ABS.

Due to wide variety of specifications used in the products ABS has evaluated for Type Approval, it is part of our contract that; whether the standard is an ABS Rule or a non-ABS Rule, the Client has full responsibility for continued compliance with the standard.

Questions regarding the validity of ABS Rules or the need for supplemental testing or inspection of such products should, in all cases, be addressed to ABS.

- **Checklist:**

1.1 Hydrogen heater element

1.1.1 Test

The test is done accordingly to the test schematics in IEC 60079-17 Tabel C.1 following descriptions of the test will be below if applicable.

1.1.2 Relevant Standard / document

- IEC 60079-17
- JEVI datasheet 1953 861 100

1.1.3 Brief Test Plan

- Inspection will be done in respect to the datasheet, standards and Visual inspection prior to startup.

1.1.4 Pass/Fail criteria.

- The pass/fail criteria is specified for each inspection element is shown in Table 1.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Table 1: Heater Inspection – Test Result

Item	Criteria	Result	Pass/Fail	Notes
Equipment is appropriate to the EPL/Zone requirement of the location	Gc or better	GB	✓	
Equipment group is correct	IIC	IIC	✓	
Equipment temperature class is correct	T1	T4	✓	
Degree of protection (IP grade) of the equipment is appropriate for the level of protection/group/conductivity	>IP55	IP66	✓	
Equipment circuit identification is correct	Present	✓	✓	
Equipment circuit identification is available	Yes	✓	✓	
Enclosure, glass parts and glass-to-metal sealing gaskets and/or compounds are satisfactory	NA	—	—	—
There is no damage or unauthorized modifications	None	none	✓	
There is no evidence of unauthorized modification	None	none	✓	
Bolts, cable entry devices (direct and indirect) and blanking elements are of the correct type and are complete and tight	Yes		✓	
Threaded covers on enclosures are of the correct type, are tight and secured	Yes		✓	
Joint surfaces are clean and undamaged and gaskets, if any, are satisfactory and positioned correctly	Yes		✓	
Condition of enclosure gaskets is satisfactory	Yes		✓	
There is no evidence of ingress of water or dust in the enclosure in accordance with the IP rating	No		✓	

Dimensions of flanged joint gaps are: – within the limits in accordance with the manufacturer's documentation or – within maximum values permitted by the relevant construction standard at time of installation or – within maximum values permitted by site documentation	—	—	—	—
Electrical connections are tight	Yes		✓	
Unused terminals are tightened	Yes		✓	
Type of cable is appropriate	Voltage and Environmental		✓	
There is no obvious damage to cables	No		✓	
Sealing of trunking, ducts, pipes and/or conduits is satisfactory	Not relevant	Not relevant	Not relevant	Not relevant
Stopping boxes and cable boxes are correctly filled	Yes		N/A	N/A
Integrity of conduit system and interface with mixed system maintained	No leaks			
Earthing connections, including any supplementary earthing bonding connections are satisfactory (for example connections are tight and conductors are of sufficient cross-section)	Inspection		✓	Gnd connected inside housing
Fault loop impedance (TN systems) or earthing resistance (IT systems) is satisfactory	<100mOhm	32mΩ	✓	
Automatic electrical protective devices are set correctly (auto-reset not possible)	Not present	Not present	Not present	Not present
Automatic electrical protective devices operate within permitted limits	Not present	Not present	Not present	Not present
Specific conditions of use (if applicable) are complied with	None	none	N/A	

Cables not in use are correctly terminated	Yes		✓	
Obstructions adjacent to flameproof flanged joints are in accordance with IEC 60079-14	Not present		N/A	
Variable voltage/frequency installation complies with documentation	Not present	Not present	Not present	Not present
Temperature sensors function according to manufacturer's documents	Not present	Not present	Not present	Not present
Safety cut off devices function according to manufacturer's documents	Inspected		✓	
The setting of the safety cut off is sealed	Yes		✓	
Reset of a heating system safety cut off possible with tool only	Yes		✓	
Auto-reset is not possible	Yes		✓	
Reset of a safety cut off under fault conditions is prevented	Yes		✓	
Safety cut off independent from control system	Yes		✓	
Level switch is installed and correctly set, if required	Yes (External to heater)		✓	
Flow switch is installed and correctly set, if required	NA		N/A	
Equipment is adequately protected against corrosion, weather, vibration and other adverse factors	Yes = X in product number	IP66 SS ect	✓	
No undue accumulation of dust and dirt	No		✓	

1.2 H2 Shut Off Valve

1.2.1 Test

The test is done accordingly to the test schematics in IEC 60079-17 Tabel C.1 following descriptions of the test will be below if applicable.

1.2.2 Relevant Standard / document

- IEC 60079-17
- Datasheet "ASCO solenoid valves 210 series"
- Datasheet "ASCO Solenoid NF series"

1.2.3 Brief Test Plan

- Inspection will be done in respect to the datasheet, standards and Visual inspection prior to startup.

1.2.4 Pass/Fail criteria.

- The pass/fail criteria are specified for each inspection element is shown in Table 2.

Table 2: Hydrogen Valve Inspection – Test Result

Item	Criteria	Result	Pass/Fail	Notes
Equipment is appropriate to the EPL/Zone requirement of the location	Gc or better	Gb	✓	
Equipment group is correct	IIC	IIc	✓	
Equipment temperature class is correct	T1	T4	✓	
Degree of protection (IP grade) of the equipment is appropriate for the level of protection/group/conductivity	>IP55	IP67	✓	
Equipment circuit identification is correct	Present		✓	
Equipment circuit identification is available	Present		✓	
Enclosure, glass parts and glass-to-metal sealing gaskets and/or compounds are satisfactory	Not applicable	Not applicable	Not applicable	Not applicable
There is no damage or unauthorized modifications	None		✓	
There is no evidence of unauthorized modification	None		✓	
Bolts, cable entry devices (direct and indirect) and blanking elements are of the correct type and are complete and tight	Yes		✓	
Threaded covers on enclosures are of the correct type, are tight and secured	No threaded cover	No threaded cover	No threaded cover	No threaded cover
Joint surfaces are clean and undamaged and gaskets, if any, are satisfactory and positioned correctly	Yes		✓	
Condition of enclosure gaskets is satisfactory	Yes		✓	
There is no evidence of ingress of water or dust in the enclosure in accordance with the IP rating	No		✓	

Dimensions of flanged joint gaps are: – within the limits in accordance with the manufacturer's documentation or – within maximum values permitted by the relevant construction standard at time of installation or – within maximum values permitted by site documentation	Tightened to 85 Nm on bonded seal connection	85 Nm	✓	
Electrical connections are tight	Yes		✓	
Unused terminals are tightened	Yes		NA	
Type of cable is appropriate	Voltage and Environmental		✓	
There is no obvious damage to cables	None		✓	
Sealing of trunking, ducts, pipes and/or conduits is satisfactory	Tightness – refer to leakage test		Leakage Passed ✓	
Stopping boxes and cable boxes are correctly filled	Not applicable	Not applicable	Not applicable	Not applicable
Integrity of conduit system and interface with mixed system maintained	Not applicable	Not applicable	Not applicable	Not applicable
Earthing connections, including any supplementary earthing bonding connections are satisfactory (for example connections are tight and conductors are of sufficient cross-section)	Inspection		✓	Gnd connected inside
Fault loop impedance (TN systems) or earthing resistance (IT systems) is satisfactory	<100mOhm	<40mΩ	✓	
Automatic electrical protective devices are set correctly (auto-reset not possible)	Not present	Not present	Not present	Not present
Automatic electrical protective devices operate within permitted limits	Not present	Not present	Not present	Not present
Specific conditions of use (if applicable) are complied with	X= stainless steel	Ok	✓	

Cables not in use are correctly terminated	Pass		✓	no loose cables
Obstructions adjacent to flameproof flanged joints are in accordance with IEC 60079-14	Not present	Not present	Not present	Not present
Variable voltage/frequency installation complies with documentation	Not present	Not present	Not present	Not present
Temperature sensors function according to manufacturer's documents	Not present	Not present	Not present	Not present
Safety cut off devices function according to manufacturer's documents	Not present	Not present	Not present	Not present
The setting of the safety cut off is sealed	Not relevant	Not relevant	Not relevant	Not relevant
Reset of a heating system safety cut off possible with tool only	Not relevant	Not relevant	Not relevant	Not relevant
Auto-reset is not possible	Not relevant	Not relevant	Not relevant	Not relevant
Reset of a safety cut off under fault conditions is prevented	Not relevant	Not relevant	Not relevant	Not relevant
Safety cut off independent from control system	Not relevant	Not relevant	Not relevant	Not relevant
Level switch is installed and correctly set, if required	Not relevant	Not relevant	Not relevant	Not relevant
Flow switch is installed and correctly set, if required	Not relevant	Not relevant	Not relevant	Not relevant
Equipment is adequately protected against corrosion, weather, vibration and other adverse factors	Yes = X in product number	Yes	✓	
No undue accumulation of dust and dirt	No		✓	

1.3 Sensing elements

1.3.1 Test

The test is done accordingly to the test schematics in IEC 60079-17 Tabel C.2 following descriptions of the test will be below if applicable.

1.3.2 Relevant Standard / document

- IEC 60079-17
- Datasheet "IFM LMT01A"
- Datasheet "HUBA 520 pressure sensor"
- Datasheet "IFM TT1050-01"
- Datasheet "PR electronic 9202"
- Datasheet "PR electronic 9113"
- Datasheet "PR electronic 9106"

1.3.3 Brief Test Plan

- Inspection will be done in respect to the datasheet, standards and Visual inspection prior to startup.

1.3.4 Pass/Fail criteria.

- The pass/fail criteria are specified for each inspection element is shown in Table 3.

Table 3: Sensing Elements – Test Result

Item	Criteria	Result	Pass/Fail	Notes
Circuit and/or equipment documentation is appropriate to the EPL/zone	Gc or better	Ga + Gb	✓	
Equipment installed is that specified in the documentation	Yes		✓	
Circuit and/or equipment category and group correct	Yes		✓	
IP rating of equipment is appropriate to the Group III material present	>IP55	IP67 IP66	✓	
Equipment temperature class is correct	T1	T4, T4	✓	
Ambient temperature range of the apparatus is correct for the installation	-10°C to +25°C		✓	
Service temperature range of the apparatus is correct for the installation	0°C to 40°C		✓	
Installation is clearly labelled	Yes			needs label on PT+LT
Enclosure, glass parts and glass-to-metal sealing gaskets and/or compounds are satisfactory	Not applicable	Not applicable	Not applicable	Not applicable
Cable glands and blanking elements are the correct type, complete and tight	Yes		✓	
There are no unauthorized modifications	None		✓	
There is no evidence of unauthorized modifications	None		✓	
Diode safety barriers, galvanic isolators, relays and other energy limiting devices are of the approved type, installed in accordance with the certification requirements and securely earthed where required	Yes		✓	

Condition of enclosure gaskets is satisfactory	Yes; if applicable	N/A	✓	
Electrical connections are tight	Yes		✓	
Printed circuit boards are clean and undamaged	Yes	N/A	N/A	N/A
The maximum voltage Um of the associated apparatus is not exceeded	Yes		✓	
Cables are installed in accordance with the documentation	Yes		✓	
Cable screens are earthed in accordance with the documentation	Yes		✓	
There is no obvious damage to cables	None		✓	
Sealing of trunking, ducts, pipes and/or conduits is satisfactory	Yes		N/A	
Point-to-point connections are all correct	Yes		✓	
Earth continuity is satisfactory (e.g. connections are tight, conductors are of sufficient cross-section) for non-galvanically isolated circuits	<100mOhm	<35mΩ	✓	
Earth connections maintain the integrity of the type of protection	Yes		✓	
Intrinsically safe circuit earthing is satisfactory	Yes		✓	
Insulation resistance is satisfactory	Yes		✓	
Separation is maintained between intrinsically safe and non-intrinsically safe circuits in common distribution boxes or relay cubicles	Yes			Partly
Short-circuit protection of the power supply is in accordance with the documentation	Yes		✓	

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Specific conditions of use (if applicable) are complied with			N/A	
Cables not in use are correctly terminated	Yes		✓	
Equipment is adequately protected against corrosion, weather, vibration and other adverse factors	Yes		✓	
No undue external accumulation of dust and dirt	Yes		✓

1.0 Disclaimer

NOTE: READ THIS BEFORE ATTEMPTING ANY PROCEDURES DESCRIBED IN THIS MANUAL

There are inherent risks in the operation of a fuel cell module that can result in death or bodily injury or loss or damage to property. It is therefore necessary for the customer to take all prudent safety precautions in the installation, use, and maintenance of this device. Persons who install, operate, and service the device are required to be technically qualified and experienced in working with electrical equipment, compressed gases, and H2.

This manual includes certain safety guidelines and recommendations; however, this manual is not intended to cover all situations. The customer is responsible for determining the suitability of the customer's particular design or application, and for ensuring the safe operation, maintenance, and storage of the device and any systems into which it is integrated. Ballard Power Systems Europe A/S ("BPSE") cannot be responsible for the use of the device in ways, or as part of systems, that deviate from the operating recommendations in the manual. The customer is responsible for being aware of, and complying with, all applicable laws and regulations. BPSE has limited its liability for damages incurred by the customer or its personnel in the contract documents pursuant to which the device is provided to the customer. Please refer to those documents for additional information.

Procedures described in any part of the manual can only be attempted once the customer has read this entire manual. Failure to follow any instruction or recommendation could result in death or bodily injury or loss or damage to property.

BPSE intends for the device to be installed, operated, and serviced only by approved technically qualified and experienced people who understand the principles of fuel cell technology, are aware of the safe operating limits of fuel cells, and are familiar with the risks posed by operating a fuel cell module. BPSE relies on customers to use their own knowledge and experience when installing, operating, and servicing the device. BPSE also relies on the people using this manual to be familiar with common terms and abbreviations used in the manual.

Information in this manual is subject to change without notice. BPSE makes no commitment to update or keep current the information in this manual and reserves the right to make updates or other changes to this manual and/or to the products described in this manual, at any time without notice. Updates and other changes to the manual may be posted on the BPSE website and may be accessed through the customer portal; it is the customer’s responsibility to check for any such updates or changes.

Copyright

The statements in this document must not be changed without special notification from Ballard Power Systems Europe A/S. Furthermore, Ballard Power Systems Europe A/S does not commit to any further obligations with this document.

Under no circumstances may the whole or parts of this publication be copied, reproduced, stored in a retrieval system, or translated into another language, unless written permission from BPSE has been obtained.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. 2.0 General Information

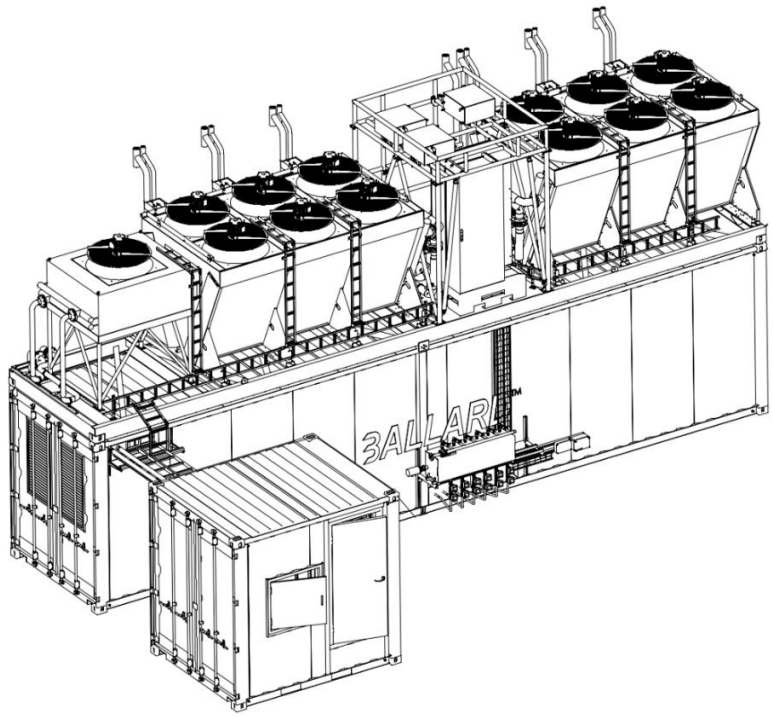
2.1 System introduction



The Ballard FC PowerGen is a modularized power generator, comparable to a diesel-generator. It is a stationary, megawatt-scale hydrogen PEM fuel cell solution, utilizing the FCwave™ from Ballard.

The solution contains all needed elements to produce 1MW AC from hydrogen, when supplied with an auxiliary power supply, a local hydrogen supply, and an electrical grid that is controlled by a Power Management System (PMS), communicating with the use of Modbus.

Integration between the FC PowerGen and the local PMS enables the integrator to create a coherent and automatic system that reacts on the power-demand on the grid, within the given dynamic and capability limits of the solution.

The FCwave and the internals of the containers are designed in such a way that no explosive hazard zones are created inside the solution.

Figure 1: System overview

Indicative illustration layout of system.

2.2 Manual purpose and scope

This Integration Manual offers instructions, procedures, technical information, and best practice to assist integrators in designing a compatible designated site and subsystems that integrate seamlessly with it, in preparation for installation of the system.

It covers topics such as:

- Integration safety
- System descriptions
- Mechanical/electrical interfaces and control details.
- Required In- and Outputs

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

Before commencing integration and installation of the system, personnel must read and understand the Operator Manual and this Integration Manual.

2.3 Intended audience

The intended user of this manual is qualified Integrators partaking in designing the designated site and subsystems for the FC PowerGen, within the intended use and limits of the system.

Aspects of this manual require the integrator to have read and understood the Transport and Handling Manual, Operator Manual and Service and Maintenance Manual. Furthermore, a general knowledge of the fuel cell processes, and how to set up control and communications using Modbus TCP/IP are required.

2.4 Manual series

The Manual Series provides manuals covering different life-phases of the system, as defined in Table 2-1:

Table 2-1: Manual series contents

Document no.	Title	Brief purpose description	Intended user(s)
Ballard: 7003672 CW: K559-2254-CWIWP4202202-R01-002	Transportation and Handling Manual	Enables safe, land-based, transport and handling from manufacturer to designated site.	Personnel qualified in preparation of, handling, and transport of freight.
Ballard: 7003718 CW: K559-2254-CWIWP4202202-N01-001	Integration Manual	As described in section 2.2	As described in section 2.3
Ballard: 7003717 CW: K559-2254-CWIWP4202202-N01-002	Operator Manual	Provides information to personnel for safe operation of the solution, instructions for operator-based maintenance, safety rules and recommendations	Operators, Integrators, Installers, Service and Maintenance personnel, personnel working in or near the system, and persons instructing visitors.
Ballard: 7003719 CW: K559-2254-CWIWP4202202-N01-003	Service and Maintenance Manual	Provide information regarding Service and Maintenance schedules and related safety.	Service and Maintenance personnel.

2.5 Hazard Symbols

Hazard symbols throughout the manual indicate objectives or potentially dangerous situations.

Table 2-2: Hazard symbols

	**MANDATORY ACTIONS**: are marked with blue action-points. This indicates actions that must be performed. Ignoring may result in an accident, which could cause damage to equipment or other property, and could cause bodily injury if not promptly detected and remedied.
	**PROHIBITIONS**: are marked with red prohibition-signs. This indicates a forbidden action. Ignoring may result in immediate bodily injury or loss of life or could cause damage to equipment or other property
	**WARNINGS**: are marked with yellow triangles and/or square warning. Indicates hazards that may result in an accident, which could cause immediate bodily injury or loss of life or could cause damage to equipment or other property.
	**CAUTION:** indicates actions that may result in an accident, which could cause damage to equipment or other property, and which could cause bodily injury if not promptly detected and remedied.
	**ELECRICAL HAZARD** Obey ALL warnings, cautions, and safety instruction related to electricity. Failure to do so may result in electrical shock leading to personal injury or death.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

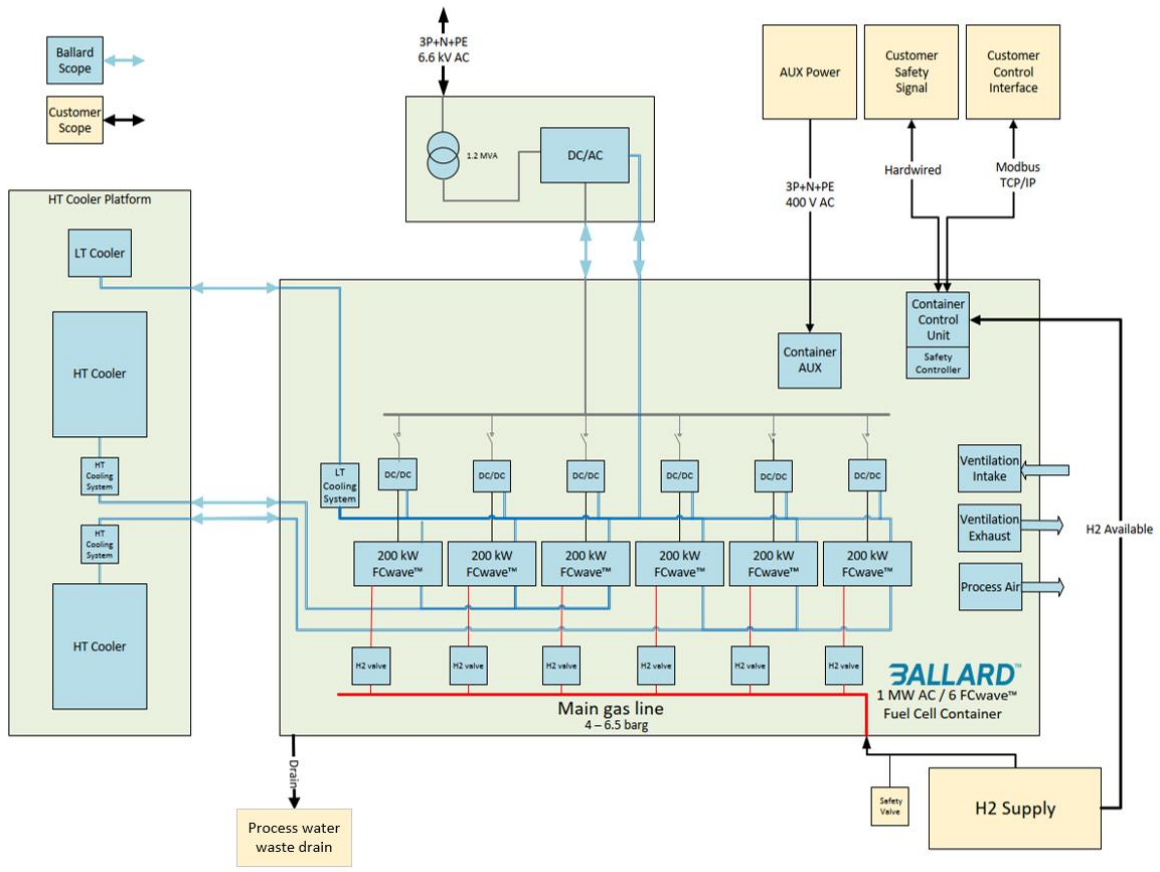
3.0 System Description

The system is a modularized power generator based on a number of FCwave™ Fuel cell units.
The FC PowerGen consists of the following main components:

Figure 2: Major components overview



Short descriptions of major components can be found in Table 3-1

Table 3-1: Major components of the machine (See Figure 2)

Component	Short Description
Fuel Cell Container	Based on a 40ft HC container, modified to a machine housing with access, ventilation, light safety etc. The container holds 6 FCwave modules with installation, internal 400VAC power supply for complete Balance of Plant components, main controller, LT pump system and DC/DC converters.
Cooling Platform	40ft Cooling Platform with service platform. 2 individual HT radiators dimensioned to the specific solution 2 individual HT pump-systems 1 LT radiator
Converter Container	Based on a 10ft HC container, modified to a machine housing with access, ventilation, light, safety etc. Holds DC to AC grid-forming power electronics, Isolation transformer, and Grid Main Breaker.

Figure 3: Scope block diagram

Block Diagram showing the scope of main components and connections of the system.

3.1 Intended use

The system acts as a grid following power generator, providing up to 1MW electrical power from H2 at 6.6kVAC 50Hz. This system is designed and is intended to be used for offshore stationery application (fixed installed system). Hydrogen supply to the system is in the customer scope and the details about the hydrogen standards, quality etc. are mentioned in the integration and other manuals that will be provided to the customers. The customer local Power Management System (PMS) requests the amount of power to be generated within the given dynamic and capacity limits of the system, which are communicated in real-time on the Modbus TCP/IP. The Modbus data is transported between the system and the PMS.

The system has multiple operating data available on the same Modbus, including alarms.

The system is placed in operation by request from PMS via Modbus, and similarly can be stopped, if necessary, which will stop power supplying the to the grid. The system can be stopped remotely on request. During normal operation, a power request of 0 is accepted by the system.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

3.2 General Operating states

Table 3-2: General Operating mode descriptions

Operating Mode	Brief description
Off	Container fully depowered.
Sleep	Container minimum operational level. Control and safety system are operating, but no high-power systems (>20kW) are operating. Hydrogen supply and fuel cells are inactive.
Standby	Waiting state for "Run" command from high level control system. Hydrogen supply and MV link disabled.
Running	Operational state for the container, where the fuel cell modules are consuming hydrogen to produce electrical energy. Cooling and ventilation systems are operating to support fuel cell modules.
Shutdown	The cooling and ventilation systems shuts down. Container returns to standby.
Fault	Internal fault state. Hydrogen supply and fuel cells are inactive.

For more details, refer to section 7.1

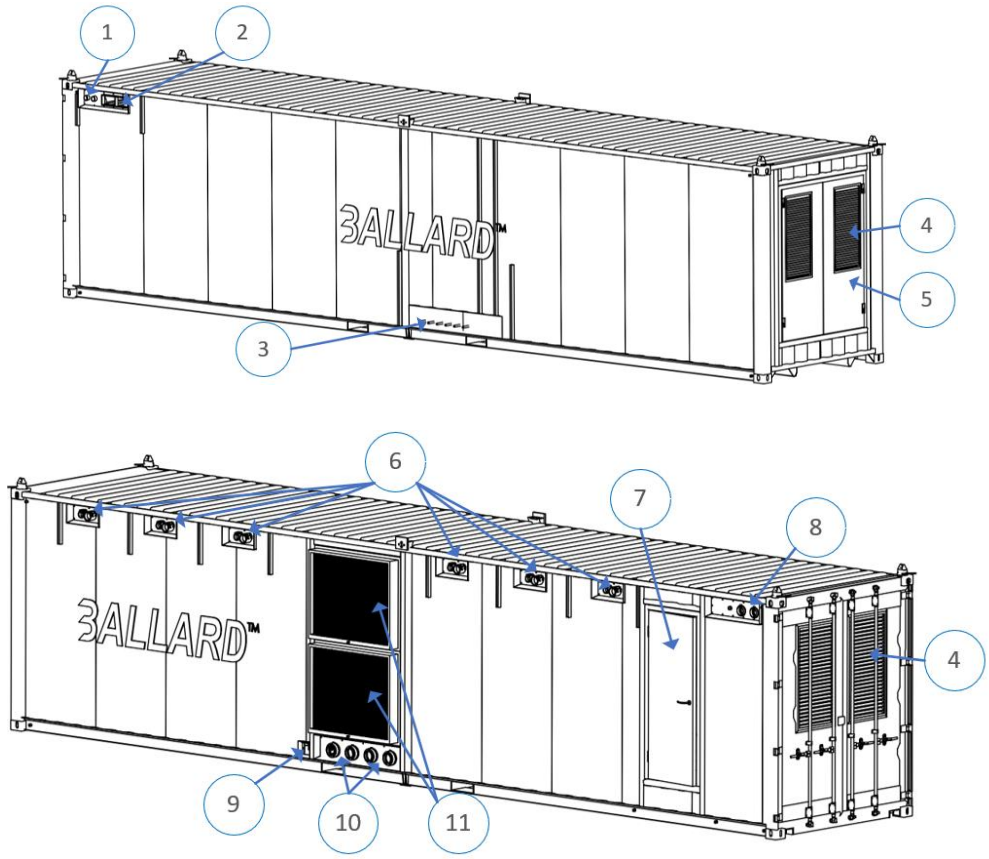
3.3 General System description

3.3.1 Fuel Cell Container

The Fuel Cell Container houses 4-6 FCwave™ units. Each FCwave™ is a separate unit with full hydrogen safety and a double wall barrier to ventilate any possible hydrogen leakages, internal to the FCwave™, directly to the outside.

The fuel cell container is equipped with a ventilation system, which will ensure that filtered process air is available for the FCwave™. The ventilation system will also create an air flow through the container, for cooling and ventilation the room.

Process piping installation is generally below the raised floor. Access to this area below the floor is for service only and requires tools. For moving heavy service components inside the container, it is equipped with a crane rail for a manual trolley.



The DCDC panels for fuel cell power output connects each FCwave™ to a common DC link busbar, which feeds the outgoing connection of the Fuel Cell Container. Each DCDC panel for fuel cell output can be isolated electrically, to allow for maintenance on the specific cabinet or related FC wave.

The system controller is a centralized unit that monitors and operates the entire system and includes a separate safety controller to prevent any critical failure or emergency situations to escalate.

The power for auxiliary units such as water pumps, container ventilation and basic power is fed from a 400V AUX power panel which again is supplied from the DC link or from an external power supply, in case of shutdown of the solution.

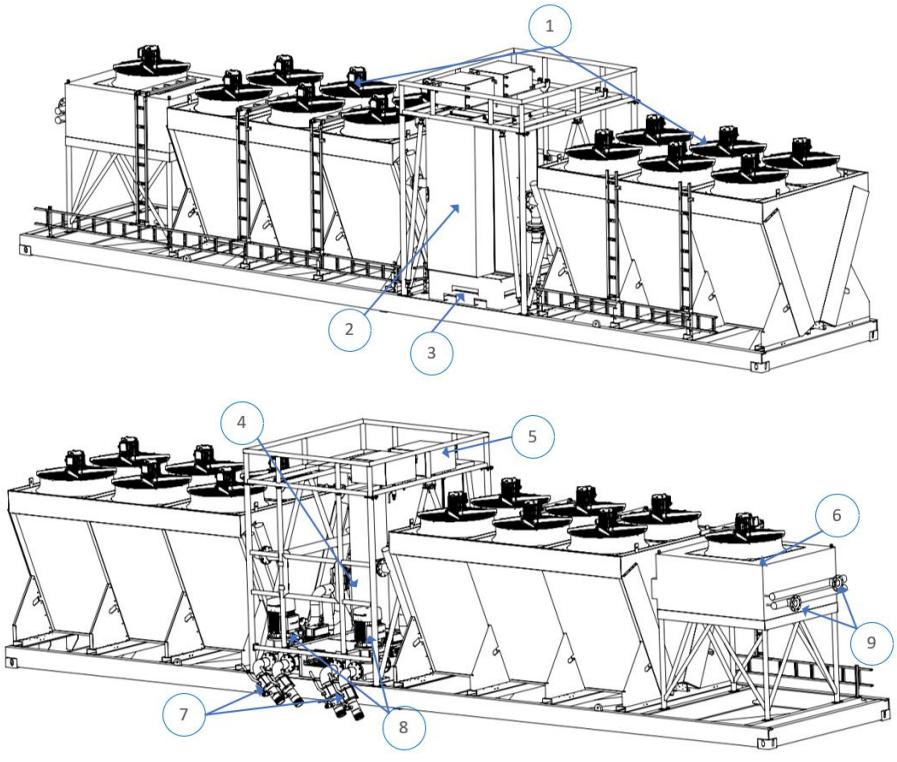
3.3.2 Cooling Platform

The Cooling platform is a steel structure with the footprint of a 40ft container. The purpose of the cooling platform is to dissipate the heat generated by the High Temperature (HT) cooling system that cools the Fuel Cell Modules, and heat generated by the Low Temperature (LT) cooling system that cools the power electronics of the solution. The standard installation method of the platform is to mount it on top of the fuel cell container, using standard container locks.

The sizing of the coolant fans and radiators are dependent on the ambient temperatures of the designated site and operating conditions of the system.

If utilization of the generated heat produced by the fuel cells during operating for heating of building etc., a heat exchanger can be fitted to allow heat recovery.



The cooling systems are open unpressurized circuits, cooling with the media Ethylene glycol. Each system has an open header tank for volume changes due to temperature.

The highest temperature of the HT and LT cooling systems are approximately 60 and 48 °C.

The pumps and pump control for the HT Cooling system is placed between the two big radiators (HT Coolers) on the cooling platform. Access is to this area is for service only and requires a ladder.

The pump for the LT Cooling system is located inside the Fuel Cell Container. The control is located in the same cabinet as the HT cooling.

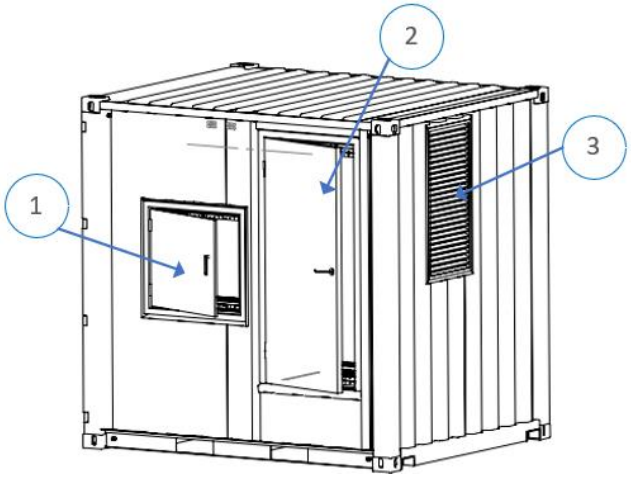
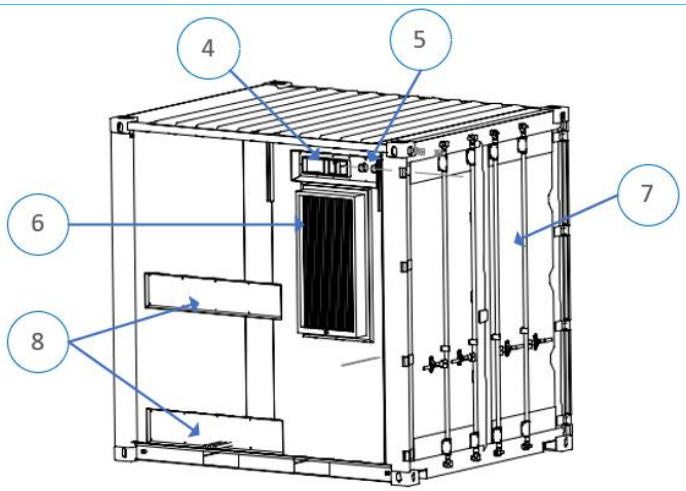
3.3.3 Converter Container



The Converter Container is structurally a 10ft high-cube double-door container, modified to the specific need. It is designed as an electrical cabinet, housing DC/AC converters and a transformer that converts the energy to the desired voltage (6,6kV). Access to the inside is through the normal container doors which are, because of electrical safety, mechanically prevented from opening during operation. These are also equipped with safety sensors, which will immediately bring the entire solution to "Failure state" if opened.

Access is restricted to instructed and trained personnel, and only after a safety procedure is followed, which will deenergize the container to a safe mode.



The control panel and grid breaker front of the Converter Container is accessible from the outside, behind an additional locked door which will not shut down the solution if opened.

Customers connection of the grid is through the container side.

4.0 Safety

The system is to be installed in cooperation with Ballard personnel. While working on the system there should always be more than one person present.

The reader of this manual must read the operator manual mentioned in section 2.4 as a complement to this integration manual regarding general function and safety.

4.1 Designated site Access and Security

It is recommended that the designated site is fenced off to prevent unauthorized access, and access within the fenced area should be limited.

The site responsible shall ensure that access to the site is limited to qualified personnel who are familiar with the site safety requirements. Appropriate Personal Protection Equipment (PPE) must be worn per site guidelines and warning signage must be adhered to.

4.2 Machine Access

At no time is unauthorized personnel permitted inside the containers or on the Cooling Platform of the solution.

To access the containers and the Cooling Platform through the designated doors, it may be required by local legislation that permanent stairs and use of temporary scaffolding or lifts are installed/available. Stairs could be as indicated in Figure 7.

Ballard can assist in creating such additional component to the system if agreed upon.

Figure 7: Example access stairs

Indicative example of solution to access the Main Access Door on the Fuel Cell Container

The exterior container doors must always remain locked except during active installation, integration, service, or maintenance. The locks should be inspected regularly by site personnel to ensure that only authorized personnel have access to the insides.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

It is recommended to keep a communications device on your person when being inside.

During operation, it is not recommended to be inside the Fuel Cell Container and access the Cooling Platforms.

The Converter Container is designed with safety-interlock on the access door, preventing access during operation. Opening the container doors of the Converter Container triggers a safety-switch which acts as an emergency stop, immediately shutting down the system.

4.3 Site safety for Personnel

As soon as practical the site responsible shall provide Ballard with a written set of site safety requirements and safety protocols that will conform with local regulations and industry norms.

The site responsible may amend the site safety requirements to conform to local regulations and such industry norms, by providing written notice of changes to Ballard reasonably in advance of their effective date.

The site responsible must require that all contractors and visitors comply with these site safety requirements. Ballard will comply with site safety requirements provided and be allowed access to the site to perform necessary tasks throughout the life of the system.

Site safety requirements given by Ballard are minimum requirements, as they may be a result of a mitigation measure from the risk assessment.

This Document is valid only at time of Printing.

4.4 Hazardous materials

The complete list of coolants and lubricants used in the 1MW Fuel Cell Container is shown below.

Table 4-1: Hazardous materials

Type	Name	Description / Use	Sub-assembly
Coolant	Glysantin® FC G20®	Used in the internal cooling loop of the fuel cell modules, where a low electrical conductivity is required. Pre-mixed 50/50 ethylene glycol-based coolant specifically developed to support the requirements in fuel cell technologies. It maintains a low and stable electrical conductivity, while at the same time providing protection against corrosion, frost and overheating.	Fuel Cell Modules
Coolant	Proviflow® Neo	Used in both HT and LT cooling loops. Pre-mixed 50/50 ethylene glycol-based coolant with OAT (Organic Acid Technology) inhibitors and designed to offer freeze point suppression as well as protection against corrosion, hard water scaling and bacterial growth.	Container Solution
Lubricant	Ceramic Grease PV.20.01	High-grade assembly paste and high temperature lubricant grease without metal particles used for lubrication of bolts.	Container Solution
Lubricant	Krytox™ GPL 205	Chemically inert, PTFE thickened grease based on perfluoropolyether (PFPE) oils that is safe for use around hazardous chemicals, these lubricants are non-flammable and safe for use in oxygen service. They can be used in extreme conditions, such as continuous high temperatures of up to 204 °C (400 °F) and will survive short-term peak temperatures of up to 220 °C (429 °F).	Fuel Cell Modules
Lubricant	Krytox™ GPL 206	Chemically inert, PTFE thickened grease based on perfluoropolyether (PFPE) oils that is safe for use around hazardous chemicals, these lubricants are non-flammable and safe for use in oxygen service. They can be used in extreme conditions, such as continuous high temperatures of up to 260 °C (500 °F) and will survive short-term peak temperatures of up to 270 °C (518 °F).	

More details can be found in the document Material Safety Data Sheets.

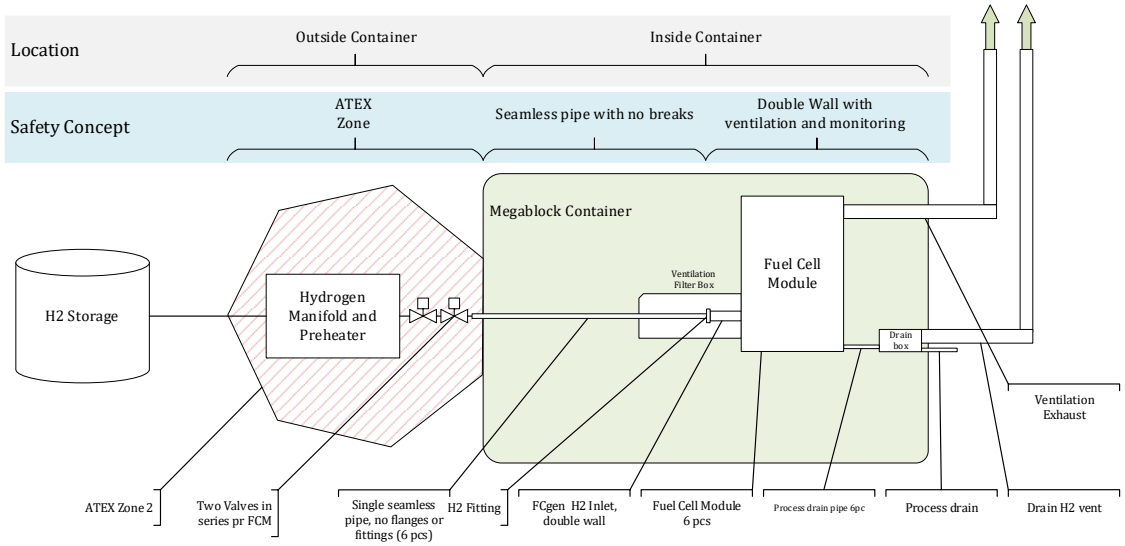
4.5 Energy Lock-out-tag-out (LOTO)

Energy sources provided to the system, as well as the Grid connection, must be provided with means for lockout (de-energization), and a written procedure detailing the equipment, and steps required.



Use proper work-etiquette regarding LOTO when working on energy-suppling components.

Refer to Lockout Tagout document for details.

4.6 Explosion safety

The hydrogen safety philosophy has several safety concepts, as indicated in Figure 8.

Figure 8: Hydrogen flow overview

Illustrative overview of hydrogen flow. See Hydrogen Safety Concept for more details.

Hydrogen is delivered to the hydrogen interface from a local hydrogen storage (refer to section 6.3 for specifications).

The area in which the interface, the hydrogen-manifold and -preheater, and hydrogen safety valves resides, is classified as an ATEX Zone 2. A hazardous mixture will not likely be present in normal operating conditions, and if so, only for a short period at a time. Electrical equipment in this zone is and shall conform to regulations and have the "EX" marking or similar. Detailed drawing of the hazard zone can be found in the General Arrangement. For more information regarding equipment installed in the zone, refer to the Equipment hazardous area certificate and schedule

Respect the zone indicated, do not introduce any source of ignition.

This Document is valid only at time of Printing.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

There is no risk of hydrogen leakages inside the general space of the FC PowerGen Fuel Cell Container that can create an explosive atmosphere, due to the design of the feed pipes being seamless, one-piece-bends from outside of the container, routed through the container space, and connected the applicable Fuel Cell module.

The connection to a Fuel Cell Module (The H2 Fitting) is encapsulated within an extension of the Fuel Cell Modules Hydrogen Enclosure called the "Ventilation filter box", thus utilizing dilution and removal of any potential hydrogen with mechanical ventilation. Should leakages from this connection occur, the hydrogen detectors within the Fuel Cell Module will detect it and trigger a safe shutdown of that module and hydrogen supply.

The Ventilation system of the Fuel Cell Container creates a slight over-pressure to counteract ingress from particles and gas. As an additional precaution in case of hydrogen entering, the general space inside is equipped with hydrogen sensors. The position of these will detect any hydrogen entering or exiting the container through the ventilation system.

All safety-related triggers of the solution will shut off the hydrogen supply of either the affected system or the entire system.

4.6.1 Trace amount of H2

The process exhaust contains all biproducts from the fuel-cell stacks within the Fuel Cell Modules. The exhaust is a mixture of high-humidity, low-oxygen process air with trace amounts of hydrogen. The concentration of hydrogen will always be below 1%v, i.e. 25% of Lower Explosive Level (LEL), leading to a non-hazardous zone according to Fuel Cell Module Integration Manual.

The source of the media in the Process Water Drain stems from the process exhaust. Thereby are also here found trace amount hydrogen which also are under 25% of LEL, leading to a non-hazardous zone. A hydrogen separator is fitted upstream to the process water drain and the trace amount of hydrogen are led through an exhaust to above the containers.

4.7 Fire safety

The Fuel Cell Modules have internal fire detection in the form om smoke detectors and linear heat detectors. If a Fuel Cell module detects to high temperature, it will automatically perform a safe shutdown of itself and indicate an alarm.

If Smoke is detected inside the general space of the Fuel Cell Container, the entire system will perform a safe shutdown and indicate an alarm.

Should a fire occur, exit through the provided emergency exits.

The system is not delivered with fire-extinguishers.

4.8 Craneage and lifts

During installation onto the designated site, and installation of general hardware i.e. exhausts and interconnections between the major components of the solution, tools such as cranes and lifts are to be used. These tasks can only be done by instructed personnel.

Scaffolding, lifts, and cranes must be made available, unless otherwise agreed upon with Ballard.

A lifting study for craneage is recommended to be conducted by the site responsible, referring to the respective transport and handling manual of the solution's major components and description of positioning and assembly in section 5.1.

4.9 Electrical safety

Installation of electrical connections between the major components of the solution is the responsibility of Ballard if not agreed upon otherwise. Electrical connections to the Interfaces described in section 6.0 is the responsibility of the interface-connecting party.

The electrical system of the solution is designed in accordance with electrical and fuel cell codes to minimize electrical hazards. Electrical hazards will occur when the design is significantly compromised, typically through alteration, improper maintenance, or wear.

Dimensioning of cables and safety-equipment on the supplying and receiving end of electrical connections outside the solution must be done according to local legislation.

Select cabling and safety-equipment to the system that appropriately suits the application. Ensure to meet specifications of voltage, current, environmental temperature limits, chemical and mechanical resistance, and flexure requirements of the application. Avoid hazardous and unsafe situations that could result from condition such as, but not limited to:

- Improper grounding
- Handling electrical leads or devices with wet hands or on wet ground
- Frayed electrical leads
- Incorrect or improper connection of the terminal leads
- Short circuits
- Back-feed from energized normal and emergency power sources

Shutting down the solution during active installation and integration may be necessary. Voltages may remain in the solution for a length of time. No activities are to be performed during this time as it presents a shock hazard.

Certain circumstances can lead to voltage persisting on the electrical systems. Always check for residual voltage before any activities. In some cases, it may require removal of hydrogen in the FCwave.

4.9.1 High DC Voltage Isolation Failures

Under normal circumstances, all high DC voltages are isolated from ground and the resistance is monitored. If isolation is lost on one high-voltage pole, a person working on the electrical system can sustain a fatal current-flow by touching the other voltage-pole and ground.

If two simultaneous faults occur and isolation is lost on both voltage-poles, a high voltage short circuit can occur resulting in extremely high currents/flash arcs. High currents can generate a large amount of heat which can subsequently damage electrical equipment and cause bodily harm.

Components inside the solution affects the resistance to ground, resulting in lower resistance over time.

Above-mentioned hazards are mitigated by the safety system of the solution. It actively monitors the resistance, warning if anything is to be reacted on, or shutting down the entire system in case of sustained resistance-drop or fault.

⚠ ELECTRICAL HAZARD	
	**If an isolation failure is detected and located in the MODULE, do not operate the fuel cell module until the root cause is determined and remedied.**

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

4.9.2 Batteries

Inside the solution reside several Lead-acid batteries for UPS systems. Prior to transportation of the solution, the State of Charge (SoC) have been lowered to >30% and connections have been disconnected.

Ballard personnel will re-connect these according to respective manuals and the SoC is raised to normal operation conditions during commissioning.

4.9.3 Converter Container access

The internals of the Converter Container are designed as an electrical cabinet (IP00), meaning that current-carrying conductors and terminals are exposed.

⚠ ELECTRICAL HAZARD	
	**HIGH VOLTAGE – 6.6 kV** **Danger of electrocution** **Authorized personnel only** **Keep clear and follow safety protocols** **Proper PPE required** **Failure to comply may result in serious injury or death**

Access is prohibited during operation. Opening the doors, except the control panel door on the side, activates the safety system, triggering emergency stop of the entire system. Residual voltages remain in certain components.

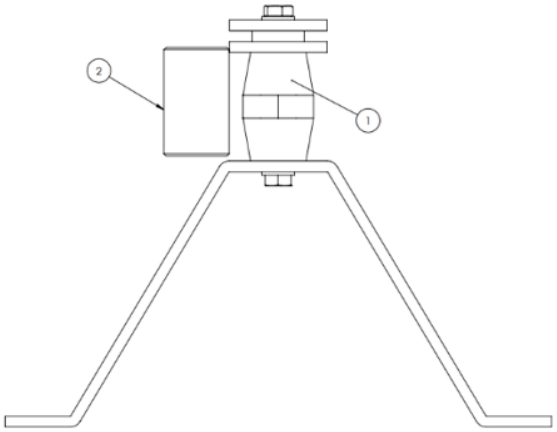
Entering this container requires prober de-energization and lockout tagout. Wait at least 10 minutes after de-energization before entering, and measure for residual voltages (<20VDC is safe)

Disconnection of the 6.6 kV connection must be done by trained personnel.

The disconnection must have lock-out-tag-out performed (Keyed interlock system) by the work-responsible. Please referee to Lockout Tagout procedure

4.9.4 Earthing

Provided Earthing-connection by the site is crucial for electrical safety. Refer to Grounding Layout for details.



This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

4.9.5 Transportation Spacer

Prior to Transportation of the solution, an electrical isolator has been swapped with a transportation tube made of steel, ensuring stability of the MV transformer, located in the Converter Container.

This must be swapped back to the isolator prior to any commissioning activities.

Figure 9: Transportation Spacer

Indicative illustration of the Isolator (1) that are swapped with the transportation tube (2)

4.10 Personal Protective Equipment (PPE)

Personnel must bring and use appropriate PPE.

In general:

- Safety shoes are mandatory.
- Hearing protection must be available and used when the system is operational.
- Fire inhibited clothes must be used when working on the electrical system.
- Helmets must be used when working with internal crane.
- Helmets and Fall arrest equipment must be used when working in heights.
- Suitable gloves and eye protection must be used for working with coolant.
- Suitable gloves must be used for where risk of cuts is present.
- Suitable tools for working on live voltages – marked with double triangle as per EN 60900.

During installation is it further recommended that personnel around the activities wear fluorescent jackets for visibility.

Working atop the containers (outside of the service platform) creates a risk of falling from almost 3m - Harnesses are required.

Do not work in these areas during extreme raining, windy, or snowy conditions.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

4.11 Environmental conditions

Activities during rainy/snowy conditions should be avoided. If activities are performed during these conditions, the technician is responsible for ensuring that rain etc. does not enter the containers and electrical cabinets.

Process exhaust contains water. During freezing conditions, snow and icicles may form.

Wear safety helmets under these conditions.

4.12 Installation planning

It is recommended to create a realistic timeline for an installation-plan, mitigating the risk of stressful situations, potentially leading to injuries.

4.13 Control safety

The solution provides several control signals and information through the Modbus TCP/IP Connection. Follow the instructions in section 7.0 to ensure safe operation.

4.14 Testing safety

The solution is tested at the manufactures site according to the Factory Acceptance Test (FAT).

During commissioning of the solution, a similar Site Acceptance Test (SAT) will be conducted.

Only authorized personnel are allowed in the vicinity of the solution during testing.

During full-load testing (all FCwave™ running), no personnel are allowed on the Cooling platform.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

5.0 Positioning and Assembly

Activities during positioning and assembly of the solution at the designated site is according to agreements with Ballard. Customer must provide the specified requirements in section 5.2 as well as a cranage plan on site, prior to Ballard engagement in these activities.

NOTE: Some interface connections described in section 6.0 could be beneficial to have ready prior to Positioning and Assembly.

5.1 General Positioning and Assembly process

The following procedure describes the general process of positioning and assembly onto the designated site, not necessarily in chronological order. Refer to General Arrangement for details on site-specific details.

The major units of the system are to be handled as described in the respective Transport and Handling Manual (See section 2.4).

- The Fuel Cell Container is positioned onto the designated site for permanent installation, anchored to the ground.
- Twist-locks are placed in the upper ISO corners of the Fuel Cell Container, as well as middle-support for Cooling Platform.
- The Cooling platform is lifted and placed on top of the twist-locks and the middle-support, ensuring that it is properly supported.
- Twist-locks are locked, permanently fixating the Cooling platform to Fuel Cell Container.
- The Converter Container is positioned onto the designated site for permanent installation, anchored to the ground.
- Electrical and mechanical assembly between the units are carried out by Ballard personnel.
- Electrical and mechanical connection to the system is carried out by suppliers.
- Applicable tests after assembly are performed.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

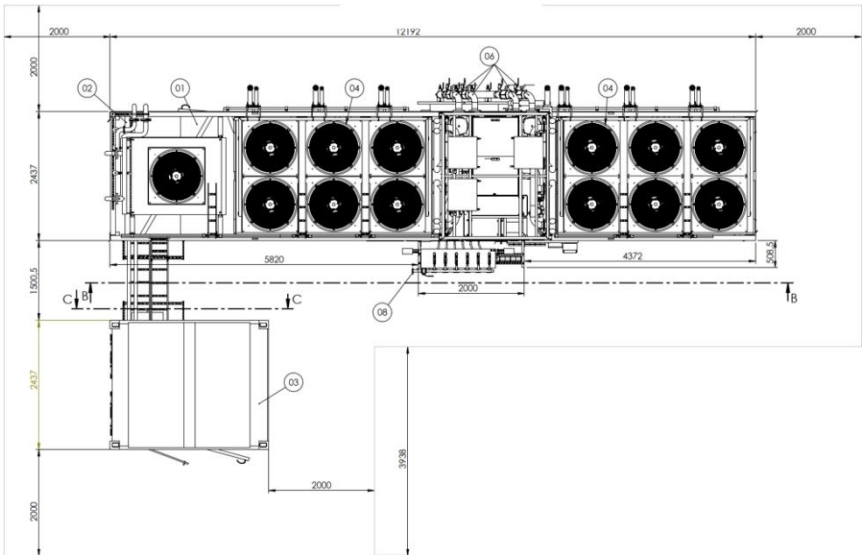
5.2 Designated site Requirements

The following sections describe requirements for Positioning and Assembly of the system.

5.2.1 Environmental Operation Conditions



The system is intended to be installed outside, exposed to weather conditions.

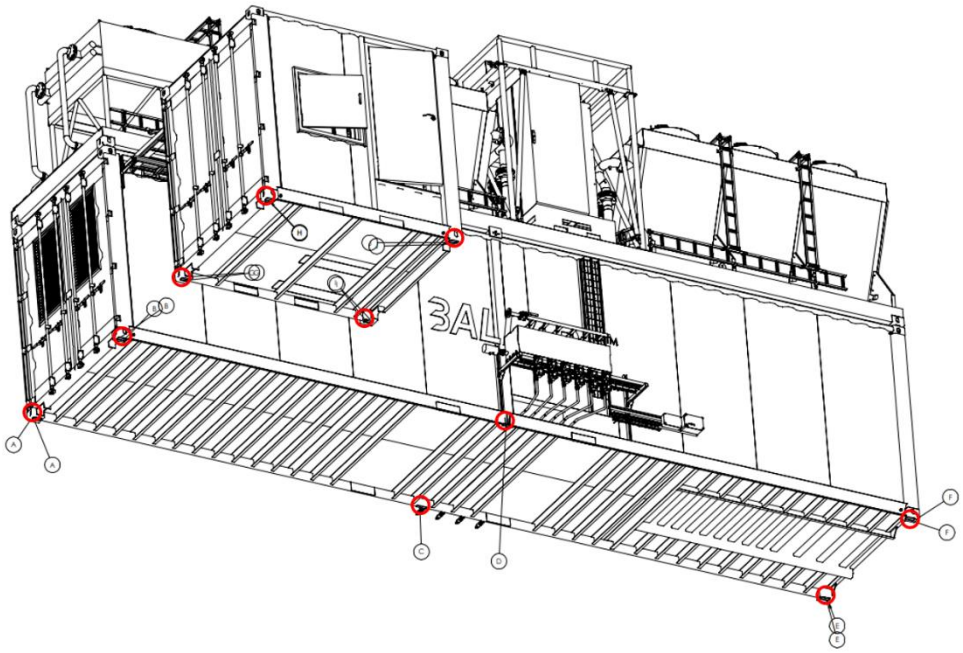
Table 5-1: Operating conditions	
Altitude	< 100 m
Minimum ambient temperature, operating	-8,4 °C
Maximum ambient temperature, operating	+25 °C
Humidity	5-95% RH
Wind velocity	31 m/s
Extreme wind velocity for 1-Year recurrence	33,1 m/s
Extreme wind velocity	41 m/s
Weather	Designed for all year operation in temperate offshore areas, including wind driven rain and snow
Salt mist and Sea salt protection	Yes
Flooding	Approx 10cm above ground level
Earthquake	Not earthquake safe but designed to withstand customer-defined accelerations.

5.2.2 Space claim

The system has a space claim that enables access to the system required for future service and maintenance. To ensure proper function of the coolers, any buildings taller than 6.6 meters should be located at least 5 meters away.

Figure 10: Indicative illustration of space claim

Actual space claim can be found in General Arrangement



This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

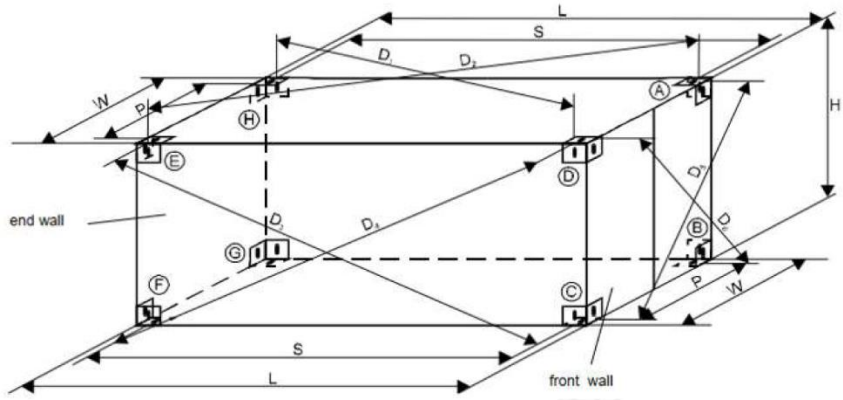
5.2.3 Floor/foundation characteristics

Requirements of the foundation is a level surface, and it need to be able to carry the final weight of the assembled system on the designated load-points.

Refer to General Arrangement for details.

Figure 11: Indicative illustration of load-points

Specific Loads can be found in General Arrangement



This Document is valid only at time of Printing.

5.2.4 Anchoring

The containers must be anchored to the ground using container tie-downs or ground-plate twist-locks. Ensure physical support of designated load-points as described in section 5.2.3.

If anchoring is done using the bottom-side of the ISO corners (B, C, F, G in Figure 12), e.g. ground-plate twist-locks, verify the corner-distances of the containers prior to design of site.

Figure 12: ISO Container corners distances (see Table 5-2)

5.3 Temporary requirements

For commissioning of the system, the following temporary requirements are applicable, depending on the agreements with Ballard.

5.3.1 Trucking and crane workspace

The designated site for the system shall provide space for the trucks delivering the major system components, as well as for crane lifting and handling as defined in the respective Transportation and Handling Manual (see section 2.4).

5.3.2 Load bank

If the designated grid for the system is not ready to provide the needed load for testing procedures defined in the SAT, an electrical load bank may be necessary during commissioning. The load bank can be provided by Ballard if agreed upon.

A load bank needs to be installed temporarily, and the site must provide space and power for this unit.

Space claim and power requirements for the Load bank provided by Ballard may vary.

Ballard-provided load bank will be removed after functional testing of the system.

5.3.3 Hydrogen Battery and manifold

For testing purposes during commissioning, a Hydrogen Battery and manifold may be needed if the local supply is not ready. For guidance on the hydrogen battery and manifold please contact your Ballard representative.

The hydrogen battery needs to be installed temporarily, and the site must provide space and power for the unit, keeping in mind safety precautions.

Space claim for the Hydrogen Battery and manifold may vary. Contact your Ballard representative for more information.

Ballard-provided Hydrogen and manifold battery will be removed after functional testing of the system.

This Document is valid only at time of Printing.

6.0 Interface descriptions and requirements

All delivered energy sources to the interfaces must have an applicable LOTO-procedure for Ballard personnel to use when installing. All interfacing flanges/connections must be fully supported and compensated for loads and moments.

6.1 Cable connections

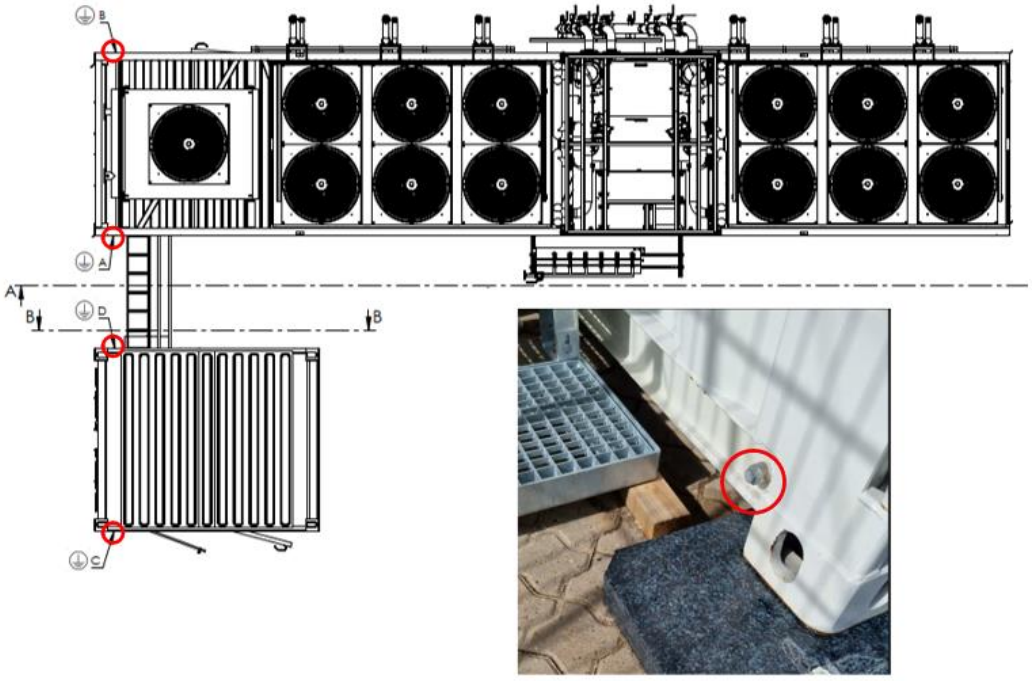
Drawing of cable connections can be seen below in Figure 13.

Figure 13: Cable Interconnection Diagram

See Interconnection Diagram for detailed version.

Table 6-1: Electrical, network and safety-signals connections

Connection	Description	Physical connection
MV Interface	Main power delivery interface – 3 phase 6,6kV AC 50Hz 100A connection	3 pcs single Conductor Cables
Auxiliary supply	Container auxiliary supply – 3p+N+PE 400V 50Hz 32A supply	5G6 Cable (optionally 5G10)
Network Connection	Network cable carrying Modbus TCP control signals and SCADA data to local Power Management System.	Copper ethernet ($4x2x0,5mm^2$) OR Fiber optic cable (addon, depends on agreed upon solution)
Service Connection	Network cable carrying service and troubleshooting information to Ballard. Encrypted. See section 6.2 for details.	
Safety Signals	Multiconductor signal cable carrying hardwired safety signals between FC package and local PMS.	Multiconductor cable ($6x2x0,75mm^2$)



Details of connections in Table 6-1 can be found in the Cable Transit Schedule and the Electrical Interface Documentation.

This Document is valid only at time of Printing.

6.1.1 Earthing

The solution provides 2 earthing studs on each container. Each stud needs an earthing connection with low enough resistance to ground as defined by local legislation.

Figure 14: Location of interfaces for Earthing

The earthing points are located at each corner of each container – refer to Grounding Layout

Table 6-2: Earthing point specifications

Point	Bolt size
A	M12x1.5
B	M12x1.5
C	M12x1.5
D	M12x1.5

6.2 Service connection

The service connection enables Ballard service technicians to use a secure and encrypted VPN connection to gain remote access to the control system for monitoring and service. During installation, it is Ballard preference to deliver with a Secure Remote Access gateway installed including a 4G wireless antenna, which allows the service connection, data collection and remote access.

This wireless function will be removed if the final architecture enables a wired secure access tunnel through the local infrastructure to the internet. This access tunnel should be completely separated from the local PMS in order to maintain the best possible separation between the Operational Technology and data going to the internet.

Refer to Secure Remote Access document for more details.

This Document is valid only at time of Printing.

6.3 Upstream Hydrogen supply

For each FCwave™ installed in the Fuel Cell Container, a hydrogen supply pipe is routed inside the Fuel Cell Container to the outside. Each pipe it is connected to an outlet on the Hydrogen heater, that increases the temperature of the supplied hydrogen if needed.

The upstream hydrogen supply is to be connected to the interfaces on the hydrogen heater, located as indicated in Figure 15.

The upstream hydrogen supply provided may be compressed gas storage, vaporization of liquid hydrogen or reforming of other fuels, if requirements listed in Table 6-3 are met.

Figure 15: Location of Upstream hydrogen supply interface

Indicative figure of Upstream hydrogen supply interface. Refer to General Arrangement for specific location.

Table 6-3: Upstream hydrogen supply requirements

Item	Requirements
Fuel type	Gaseous hydrogen
Hydrogen grade	As per SAE spec. J2719 OR ISO 14687:2019 Type I, Type II – Grade D
Hydrogen supply Pressure	4 – 6.5 bar(g)
Hydrogen temperature	-8,4 - 80 °C
Hydrogen Consumption Rate, BOL	0,9-29,4 g/s

This Document is valid only at time of Printing.

Table 6-3: Upstream hydrogen supply requirements	
Physical interface	Standard flange DN32 (EN1759-1) Flange face RF Allowable nozzle load: 50 N*
Upstream particulate filter	40µm
Upstream isolation valve	Manual and lockable isolation valve as close interface as possible (Access for service personnel)

Refer to P&IDs for more details.

* All interfacing flanges/connections must be fully supported and compensated for loads and moments.

The pipe connection must be protected against accidental damage.

Purging the internal H2 system through the hydrogen supply is prohibited. Special procedures apply for purging of the FCwave, and training is required.

6.3.1 Pressure relief valve

With the required pressure of the system stated in Table 6-3, the integrator must install a pressure relief valve for the hydrogen supply set for 10 bar(g). The solution closes the hydrogen supply safety valve(s) applicable if pressure exceeds the maximum.

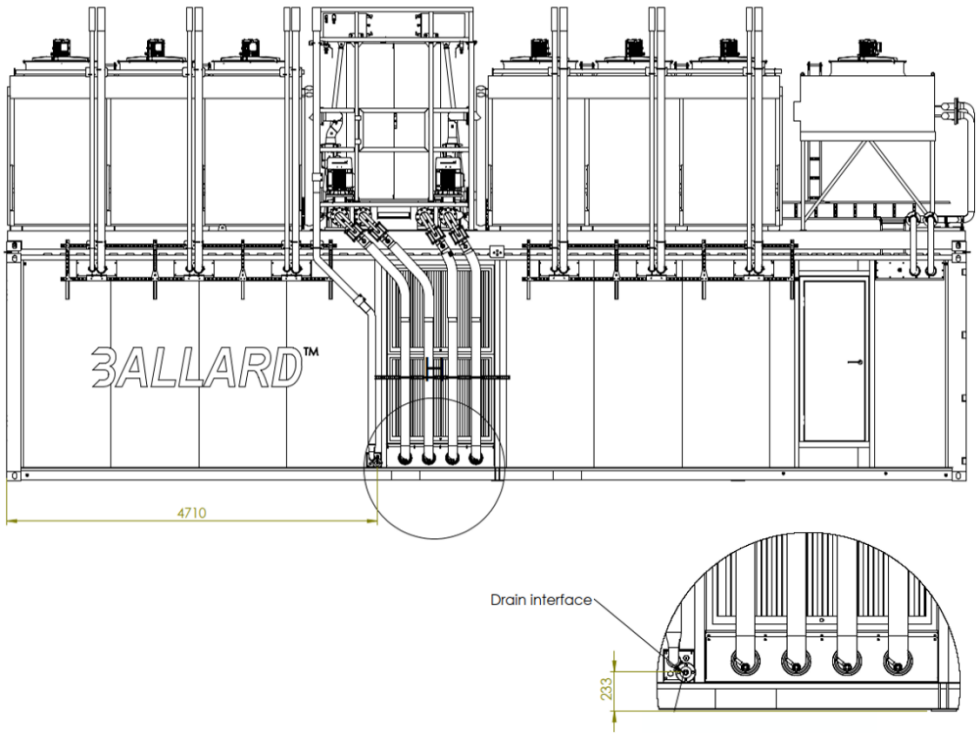
Handling of released hydrogen must be done in a safe manner, not creating a potential explosion zone near the equipment.

6.4 Process Water drainage

The fuel cell process produces DI water, which are routed from each FCwave™ to a common drainpipe using gravity. The common drainpipe has a hydrogen separation box to make sure no traces of hydrogen will be in the process drain. The potential H2 is routed in a pressure loose chimney to a safe area. Due to this separation box, only pure process water will exit at the drain connection.

The process water drain piping downstream must be constructed of materials resistant to corrosion since DI water is present. Contact Ballard with questions regarding material selection.

The solution provides a heat-trace cable that is pushed into the drainpipe downstream from the interface so that it does not freeze and/or block the flow of liquid. If the process water is unable to flow, the system will indicate with an error.



Disposal of the media should be done according to local legislation.

Table 6-4: Process Water Drainage connection requirements

7.0 Control of the system

The solution is designed for the Integrators local PMS to control the system through a wired Ethernet Modbus TCP/IP Connection.

The solution is made as simple as possible for the Integrator, with few control signals, and a high amount of system information signals available.

7.1 Operating States

The solution operates in the modes described in Table 7-1 and illustrated in Figure 17.

Table 7-1: Operating mode descriptions

Operating Mode	Brief description	Preconditions
Off	Container fully depowered.	No power supplied to container; UPS batteries depleted
Initialization	Functions to establish baseline container status, with connections to external power and communications.	After bootup. 400Vac Auxiliary power supplied to Container.
Sleep	Container minimum operational level. Control and safety system are operating, but no high-power systems (>20kW) are operating. Hydrogen supply and fuel cells are inactive.	400Vac Supplied to Container. Communications heartbeat from PMS
Wakeup	Container enables 24V supply to fuel cell modules and starts container ventilation system.	400Vac Supplied to Container. Signal from PMS (Standby).
Standby	Waiting state for "Run" command from high level control system. Hydrogen supply and MV link disabled.	400Vac Supplied to Container Signal from PMS (Standby)
Startup	Transitional phase when PMS signals container to initiate operation. The significant part of this phase is that the container will draw a significant amount of power during startup, to energize fuel cell modules and cooling fans/pumps. After startup is complete on the fuel cells, the container transitions to "Running". All systems operational. Hydrogen system active.	400Vac from internal microgrid. Signal from PMS (Run). MV link active (10-150kW power draw, depending on # of FCwave starts concurrent). Hydrogen-supply active.
Running	Operational state for the container, where the fuel cell modules are consuming hydrogen to produce electrical energy. Cooling and ventilation systems are operating to support fuel cell modules.	Signal from PMS (Run). Signal from PMS (Power request). MV link active (up to 1050kW power produced) Hydrogen-supply active.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Table 7-1: Operating mode descriptions		
Rampdown	When signaled from PMS that operation is done, the container stops power production and performs fuel cell module shutdown procedures. Fuel cell modules shutting down. Hydrogen system transitions from active to inactive. After shutdown is complete, container proceeds to aftercooling.	Signal from PMS (Standby) MV link active (~10kW power draw) Hydrogen-supply active.
Aftercooling	After fuel cell system has shut down, container performs aftercooling from the cooling system and ventilation from the container ventilation	400Vac Supplied to Container MV link active (~5kW power draw)
Shutdown	The cooling and ventilation systems shuts down. Container returns to standby.	400Vac Supplied to Container. MV link transitions from active to Inactive.
Fault	Internal fault state. Hydrogen supply and fuel cells are inactive.	400Vac Supplied to Container. Fault indication to PMS.

For more details, refer to Control philosophy and Logic block diagrams.

The primary state machine is shown below in Figure 17.

For states with a fixed duration, the current best estimate is shown.

For states with no duration listed, the transition depends on external signals.

In all states, the solution can transition to a fault state and the corresponding alarm will appear on the HMI and Modbus, where measures must be remedied prior to re-engagement/reset.

7.2 Control

This section outlines guidelines for the Power Request from the BLPH, which should be known by the integrator.

- The startup duration for a fuel cell module is approx. 30 seconds.
- A running fuel cell module can ramp from minimum power to rated power in 10 seconds.
- Start-up and significant step-up in power request will be limited by the startup duration, followed by the ramp-up time.
- Ramp-down is not limited by startup duration.
- The power request should be set to the desired value, instead of incrementally increased as fuel cells come online.
    - If the power request is incrementally increased, the FC package controller may not start all required fuel cell modules, and the power output will be limited by multiple sequential startup delays.
- Ballard expects that a Battery Energy Storage System (BESS) or similar power-spike capable system is used for short term spikes and dips in load and the FC package is responsible for long term power delivery with minimum short-term changes in requested power.
- The fuel cell package restart limits are as follows:
    - Restart less than 6 times in an hour.
    - Restart less than 20 times in a 24-hour period.

7.3 Disconnecting the MV bus

This section describes the consequences of disconnecting the MV bus from the FC package.

7.3.1 Disconnecting when not in operation

When the package is not in operation (State "Sleep" or "Cold Standby"), the MV bus can freely be disconnected.

7.3.2 Disconnecting while operating

The MV bus cannot be disconnected while the FC package is operating.

7.4 Modbus TCP/IP

Control of the system is through the use of ethernet Modbus TCP/IP.

Provided Modbus table can be found in the FC package Modbus Map.

The Modbus Map presents the available read and write signals, using the function codes in Table 7-2.

The following descriptions presents the main signals that are available for the Integrator.

Table 7-2: Allowable Function Codes	
Discrete coils	
Function code 01	Read single coil
Function code 05	Write single coil
Function code 15	Write multiple coils
Discrete inputs	
Function code 02	Read single discrete input
Holding register	
Function code 03	Read single Holding register
Function code 06	Write single Holding register
Function code 16	Write multiple Holding register
Input register	
Function code 04	Read single Input register

7.4.1 Discrete coils

Read and write access.

A limited amount, if any at all, of discrete coils may be available.

7.4.2 Discrete Inputs

Read only access.

Here the status of components such as the Main Low Voltage Breaker, Local/remote control status, and statuses of internal subsystem are available.

7.4.3 Holding register

Read and write access.

7.4.3.1 Export Power Setpoint

The purpose of this signal is for the integrators PMS to signal the amount of delivered power desired at any given time.

Function: Export Power Setpoint

Tag: POWER_SP

Address 1000

Datatype: INT16

Scaling: 0.1 [kW]

Range: 55.0 to 1000.0 kW *(.0 is necessary)*

If 0<POWER_SP<55.0, the delivered power is 55.0 kW.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.
Ballard Power Systems Europe A/S

ballard.com
Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

The nature of Fuel Cell technology limits the speed of which it can rise and lower the delivered power. With this, the integrator can expect a defined maximum ramp-up and Ramp-down. The system will automatically follow these ramps, regardless of the export power setpoint.

7.4.3.2 Control word

The control word is the signal that enables the external signal to initiate the state changes described in section 7.1.

Function: Control word

Address 1001

Datatype: BOOL

Bit 0: wakeup/go to standby

Bit 1: go to sleep

Bit 2: Start/run

(In running mode, exported power is controlled as defined in section 7.4.1)

Bit 3: Stop

Bit 4: <Spare>

Bit 5: Reset

7.5 Input Register

Read only access.

An extensive list of live information, such as statuses and error codes. Refer to the FC package Modbus Map.

7.6 Alarm list

Refer to Alarm list for details.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

8.0 Testing

During installation and integration of the system, subsystems and interface connections, test procedures are conducted. These procedures verify the functionality and safety of specific parts of the system and integrated subsystems.

The tests are performed by/in collaboration with Ballard personnel and sub-suppliers.

The Site Acceptance Test (SAT) is similar to the Factory Acceptance Test document.

Tests could include, but are not limited to:

- Functionality tests
  - Visual inspection
  - Coolant circuit leakage tests
  - Electrical interconnection test
  - Electrical safety test
  - Initial Power up
  - Safety system
  - Auxiliary power and Balance of Plant (BOP) validation
  - UPS
  - Internal Load test
  - Hydrogen leakage test
- Pre-operations tests
  - Fuel Cell Commissioning
  - Emergency stop, no load, low load, full load
  - Hydrogen storage interface
  - Cooling circuits
  - Ventilation
  - Noise level
  - Thermographic
- Operations test
  - System start/stop – normal low load
  - Error simulation
  - Change FCwave to "service state"
  - Steady state operation
  - Power quality tests
  - Load test
    - ramp up, ramp down
    - step response
    - Load test – full load
    - Load test – no load
  - Full operation test cycle

8.1 Testing of hydrogen supply

For initial testing of the system itself, a temporary hydrogen supply in the form of a Hydrogen Battery and manifold (See requirements of this in section 5.3.3) may be used. This is to verify the functionality of the delivered system, prior to integration of the hydrogen supply delivery system of the designated site.

Integration and testing of the hydrogen supply on the designated site is a collaborative test.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

8.2 Load testing

Initial load-testing of the solution may be performed with the use of a temporary load bank that is mounted to the grid interface.

Testing with the designated grid and signals to/from the integrators PMS is done in collaboration with the responsible.

This Document is valid only at time of Printing.

1.0 Disclaimer

NOTE: READ THIS BEFORE ATTEMPTING ANY PROCEDURES DESCRIBED IN THIS MANUAL

There are inherent risks in the operation of a fuel cell module that can result in death or bodily injury or loss or damage to property. It is therefore necessary for the customer to take all prudent safety precautions in the installation, use, and maintenance of this device. Persons who install, operate, and service the device are required to be technically qualified and experienced in working with electrical equipment, compressed gases, and H2.

This manual includes certain safety guidelines and recommendations; however, this manual is not intended to cover all situations. The customer is responsible for determining the suitability of the customer's particular design or application, and for ensuring the safe operation, maintenance, and storage of the device and any systems into which it is integrated. Ballard Power Systems Europe A/S ("BPSE") cannot be responsible for the use of the device in ways, or as part of systems, that deviate from the operating recommendations in the manual. The customer is responsible for being aware of, and complying with, all applicable laws and regulations. BPSE has limited its liability for damages incurred by the customer or its personnel in the contract documents pursuant to which the device is provided to the customer. Please refer to those documents for additional information.

Procedures described in any part of the manual can only be attempted once the customer has read this entire manual. Failure to follow any instruction or recommendation could result in death or bodily injury or loss or damage to property.

BPSE intends for the device to be installed, operated, and serviced only by approved technically qualified and experienced people who understand the principles of fuel cell technology, are aware of the safe operating limits of fuel cells, and are familiar with the risks posed by operating a fuel cell module. BPSE relies on customers to use their own knowledge and experience when installing, operating, and servicing the device. BPSE also relies on the people using this manual to be familiar with common terms and abbreviations used in the manual.

Information in this manual is subject to change without notice. BPSE makes no commitment to update or keep current the information in this manual and reserves the right to make updates or other changes to this manual and/or to the products described in this manual, at any time without notice. Updates and other changes to the manual may be posted on the BPSE website and may be accessed through the customer portal; it is the customer's responsibility to check for any such updates or changes.

Copyright

The statements in this document must not be changed without special notification from Ballard Power Systems Europe A/S. Furthermore, Ballard Power Systems Europe A/S does not commit to any further obligations with this document.

Under no circumstances may the whole or parts of this publication be copied, reproduced, stored in a retrieval system, or translated into another language, unless written permission from BPSE has been obtained.

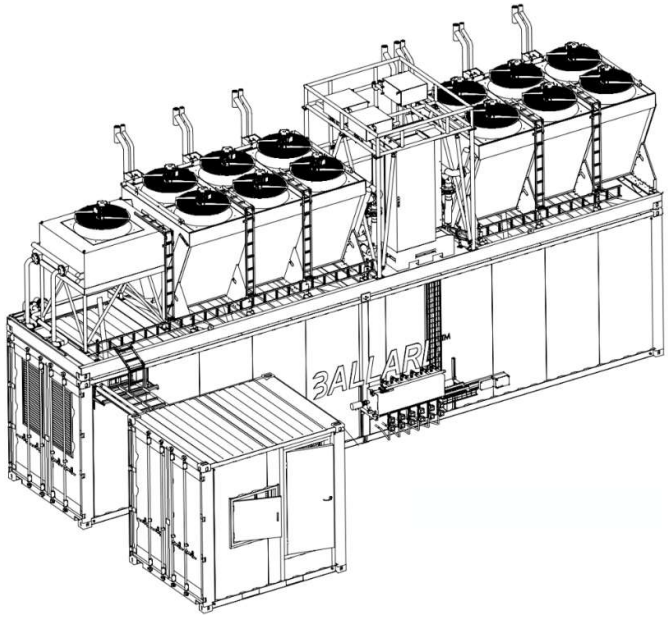
2.0 General Information

This manual is mandatory reading for personnel working in or near the system, and persons instructing visitors prior to access to the system.

2.1 System introduction



The Ballard FC PowerGen is a modularized power generator, comparable to a diesel-generator. It is a stationary, megawatt-scale hydrogen PEM fuel cell solution, utilizing the Ballard FCwave™.

The solution contains all needed elements to produce 1MW AC, when supplied with an auxiliary power supply, a local hydrogen supply, and an electrical grid that is controlled by a Power Management System (PMS), communicating with the use of Modbus.

Integration between the FC PowerGen and the local PMS enables the integrator to create a coherent and automatic system that reacts on the power-demand on the grid, within the given dynamic and capability limits of the solution.

The FCwave and the internals of the containers are designed in such a way that no explosive hazard zones are created in or around the system.

Figure 1: System overview

Indicative illustration of entire system

2.2 Manual purpose and scope

This operator Manual offers instructions for operating the system, instructions for operator-based maintenance, safety rules and recommendations.

It does not cover the operating instructions through the Modbus connection, refer to the Integration manual.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

2.3 Intended audience

The intended user of this Operator Manual is Operators, integrators, Installers, Service and Maintenance personnel, customer personnel working in or near the system, and persons instructing visitors prior to access to the system.

Before interacting directly or indirectly with the system, personnel must read and apply this manual.

2.4 Manual series

The Manual Series provides manuals covering different life-phases of the plant, as defined in Table 2-1:

Table 2-1: Manual series contents

Document no.	Title	Brief purpose description	Intended user(s)
Ballard: 7003672 CW: K559-2254-CWIWP4202202-R01-002	Transportation and Handling Manual	Enables safe, land-based, transport and handling from manufacturer to designated site.	Personnel qualified in preparation of, handling, and transport of freight.
Ballard: 7003718 CW: K559-2254-CWIWP4202202-N01-001	Integration Manual	Enables integrators to design designated site and subsystems required within the intended use and limits of the system.	Integrators partaking in designing the designated site and subsystems, and commissioning.
Ballard: 7003717 CW: K559-2254-CWIWP4202202-N01-002	Operator Manual	As described in section 2.2	As described in section 2.3
Ballard: 7003719 CW: K559-2254-CWIWP4202202-N01-003	Service and Maintenance Manual	Provide information regarding Service and Maintenance schedules and related safety.	Service and Maintenance personnel.

Ballard Power Systems Europe (BPSE) may update the provided manuals on an ongoing basis.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

2.5 Hazards Symbols

Hazard symbols throughout the manual indicate objectives or potentially dangerous situations.

Table 2-2: Hazard symbols

	**MANDATORY ACTIONS**: are marked with blue action-points. This indicates actions that must be performed. Ignoring may result in an accident, which could cause damage to equipment or other property, and could cause bodily injury if not promptly detected and remedied.
	**PROHIBITIONS**: are marked with red prohibition-signs. This indicates a forbidden action. Ignoring may result in immediate bodily injury or loss of life or could cause damage to equipment or other property
	**WARNINGS**: are marked with yellow triangles and/or square warning. Indicates hazards that may result in an accident, which could cause immediate bodily injury or loss of life or could cause damage to equipment or other property.
	**CAUTION** in this manual indicates actions that may result in an accident, which could cause damage to equipment or other property, and which could cause bodily injury if not promptly detected and remedied.
	**ELECRICAL HAZARD** Obey ALL warnings, cautions, and safety instruction related to electricity. Failure to do so may result in electrical shock leading to personal injury or death.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

2.6 References

Throughout the manual are referrals to separate documents. These references documents are available on the BSPE after sales Service Portal.

Should a document not be available, contact BSPE.

3.0 FC PowerGen Description

3.1 Major components

The system is a modularized power generator based on a number of FCwave™ Fuel cell units.
The FC PowerGen consists of the following main components:

Figure 2: Major components overview

Short descriptions of major components can be found in Table 3-1

Table 3-1: Major components of the machine (See Figure 2)

Component	Short Description
Fuel Cell Container	Based on a 40ft HC container, modified to a machine housing with access, ventilation, light safety etc. The container holds 6 FCwave modules with installation, internal 400VAC power supply for complete Balance of Plant components, main controller, LT pump system and DC/DC converters.
Cooling Platform	40ft Cooling Platform with service platform. 2 individual HT radiators dimensioned to the specific solution 2 individual HT pump-systems 1 LT radiator
Converter Container	Based on a 10ft HC container, modified to a machine housing with access, ventilation, light, safety etc. Holds DC to AC grid-forming power electronics, Isolation transformer, and Grid Main Breaker.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

3.2 General Functional Description

The FC PowerGen is designed for fully autonomous and remote operation with no operator interface, except for service purposes. It is activated and operated remotely by the PMS of the integrators designated microgrid, for the solution to deliver power to.

While there is no fault internally on the fuel cell system or externally signaled, the solution will start and stop fuel cells as needed, to maintain delivery of requested power and keep operational health.

The solution accepts a power-request of zero. In this case it will be running in a stand-by mode, powered by either the auxiliary power supply, the power produced by itself, or a combination.

If any single input to the safety controller is outside acceptable parameters, e.g. hydrogen detection, E-stop activation, or external trip, the safety-system will trip and activate emergency shutdown. Depending on the severity of a potential fault, it will either:

- Initiate controlled shutdown on affected system(s) or the entire solution, or
- Instantaneously shutdown and isolate energy on affected system(s) or the entire solution.

Loss of hydrogen supply will stop operation and be handled as a failure.

3.3 Local HMI

Inside the Fuel Cell Container is located an HMI in the form of a touchscreen. This is available for service purposes of the machine. An overview of the system can be seen, and parameter changes can be made when unlocked with the use of a password (for authorized personnel only).

Instructions of use and/or creation of an HMI/SCADA for the PMS of local grid is not within the scope of the FC PowerGen, but a responsibility of the local integrator with the use of the Integration Manual.

3.4 Alarms

The following alarms are externally to the FC PowerGen triggered and should be handled by the site operator. For other alarms than mentioned, contact Ballard.

3.4.1 No hydrogen

The solution provides a signal to show that hydrogen is not available at the proper requirements. In case of "no hydrogen" alarm, please investigate hydrogen-supply upstream.

3.4.2 Remote Emergency Hydrogen Supply

The system has received a remote stop signal from upstream hydrogen supply, please investigate upstream.

3.4.3 Remote Emergency Site

The system has received a remote stop signal from PMS, please investigate downstream.

This Document is valid only at time of Printing.

3.5 General Operating States

The solution is designed for the Integrators local PMS to control the system through a wired Ethernet Modbus TCP/IP Connection.

The solution operates in the modes described in Table 3-2.

Table 3-2: General Operating mode descriptions

Operating Mode	Brief description	Preconditions
Off	Container fully depowered.	No power supplied to container; UPS batteries depleted
Initialization	Functions to establish baseline container status, with connections to external power and communications.	After bootup. 400Vac Supplied to Container.
Sleep	Container minimum operational level. Control and safety system are operating, but no high-power systems (>20kW) are operating. Hydrogen supply and fuel cells are inactive.	400Vac Supplied to Container. Communications heartbeat from PMS
Wakeup	Container enables 24V supply to fuel cell modules and starts container ventilation system.	400Vac Supplied to Container. Signal from PMS (Standby).
Standby	Waiting state for "Run" command from high level control system. Hydrogen supply and MV link disabled.	400Vac Supplied to Container Signal from PMS (Standby)
Startup	Transitional phase when PMS signals container to initiate operation. The significant part of this phase is that the container will draw a significant amount of power during startup, to energize fuel cell modules and cooling fans/pumps. After startup is complete on the fuel cells, the container transitions to "Running". All systems operational. Hydrogen system active.	400Vac from internal microgrid. Signal from PMS (Run). MV link active (10-150kW power draw, depending on # of FCwave starts concurrent). Hydrogen-supply active.
Running	Operational state for the container, where the fuel cell modules are consuming hydrogen to produce electrical energy. Cooling and ventilation systems are operating to support fuel cell modules.	Signal from PMS (Run). Signal from PMS (Power request). MV link active (up to 1050kW power produced) Hydrogen-supply active.
Rampdown	When signaled from PMS that operation is done, the container stops power production and performs fuel cell module shutdown procedures. Fuel cell modules shutting down. Hydrogen system transitions from active to inactive. After shutdown is complete, container proceeds to aftercooling.	Signal from PMS (Standby) MV link active (~10kW power draw) Hydrogen-supply active.

Table 3-2: General Operating mode descriptions		
Aftercooling	After fuel cell system has shut down, container performs aftercooling from the cooling system and ventilation from the container ventilation	400Vac Supplied to Container MV link active (~5kW power draw)
Shutdown	The cooling and ventilation systems shuts down. Container returns to standby.	400Vac Supplied to Container. MV link transitions from active to Inactive.
Fault	Internal fault state. Hydrogen supply and fuel cells are inactive.	400Vac Supplied to Container. Fault indication to PMS.

4.0 General Safety

⚠ CAUTION	
	**The FC PowerGen is intended to be remotely controlled.** **Automated start up may occur at any time if not prevented with applicable procedures.**

4.1 Machine access

At no time is access permitted inside the machine containers for unauthorized personnel, especially the Converter Container.

The exterior container doors must always remain locked except during active installation, integration, service, or maintenance.

⚠ WARNING	
	**Access to the internals of Converter Container is strictly prohibited except when applicable procedures are done by trained personnel, approved by the manufacturer.**

4.2 Hazardous materials

4.2.1 Coolant

The solution utilizes two types of coolant. The LT and HT cooling circuit uses the Glycol-based coolant Proviflow®, and the internal closed coolant loop of the FCwave™ uses GLYSANTIN® FC G20.

For more details, refer to the document "Material Safety Data Sheets".

During normal operation there should be no leakage of coolant. If a leakage is noted, Manufacturer must be informed.

General rules are:

- Avoid contact with eyes and skin.
- Use protective gloves and tightly sealed googles.
- Avoid ingestion and inhalation of vapors.
- Spillage – do not allow to enter sewers/surface or ground water, absorb with a liquid–binding material, dilute with water.
- Disposal must be made according to official regulations.

4.2.2 Lubricant

General for container solution: Ceramic Grease PV.20.01, used as assembly paste and high temperature lubricant grease without metal particles for lubrication of bolts.

Fuel Cell Modules: Krytox™ GPL 205 & 206: Grease safe for use around hazardous chemicals, non-flammable. For extreme temperatures.

General rules are:

- Avoid contact with eyes and skin
- Avoid ingestion and inhalation of vapors.
- Use protective gloves, safety glasses, and suitable protective clothing.
- Spillage – do not allow to enter sewers/surface or ground water, absorb with a liquid-binding material, dilute with water.
- Disposal must be made according to official regulations.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

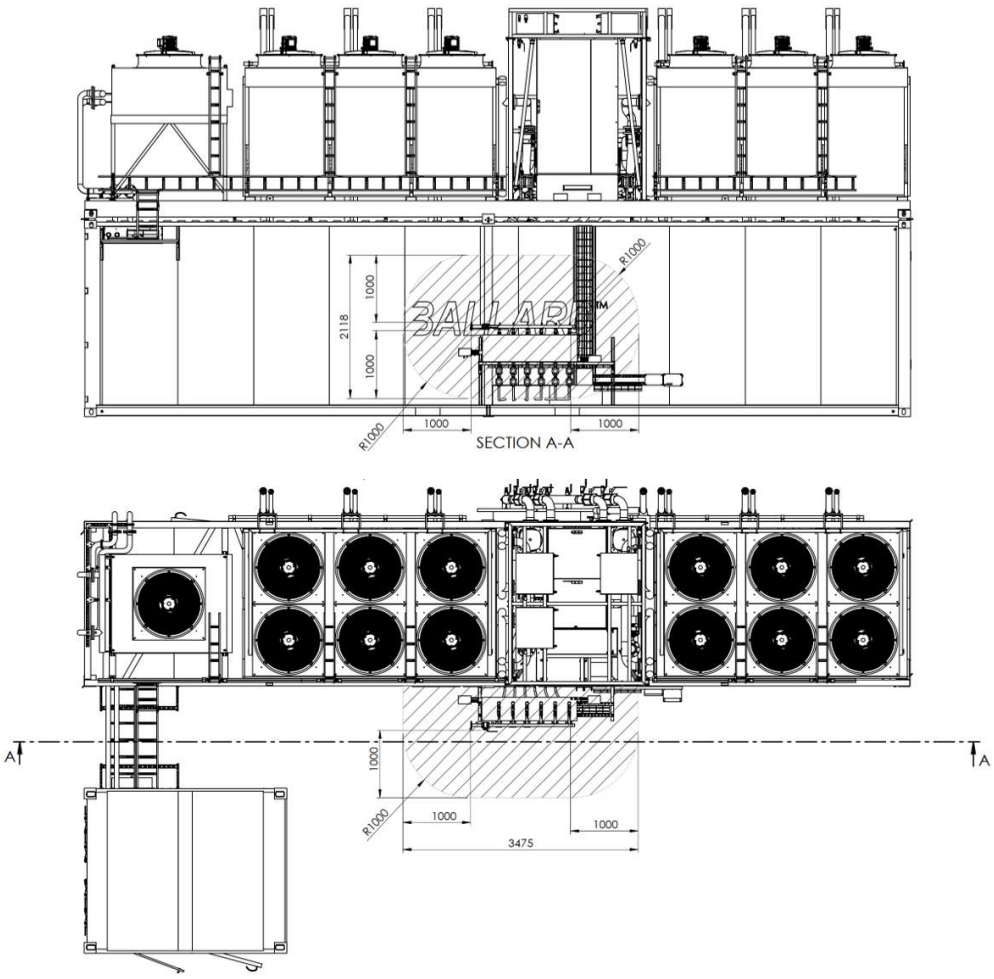
Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

4.2.3 Process water

The fuel cell process produces De-Ionized Water, which is routed from each FCwave™ to a H2 separator. The trace amount of H2 is led to the process-drain exhaust, and the process water is led to a drainpipe, connected to the outside drain system.

De-Ionized Water is not suitable for drinking water.

4.2.4 Hydrogen



Risks of hydrogen leakages is highly unlikely.

Areas within the solution are classified as non-hazardous since areas with the slightest risk of leakage are monitored by the safety system and excessively ventilated to dilute and remove the hydrogen, thereby removing any explosion hazard inside the system.

The area around the External hydrogen handling unit is classified as an EX-Zone 2 with a max 1 meter extend. Here, an explosive gas atmosphere is not likely to occur in normal operation, but, if it does occur, will exist for a short period only.

Figure 3: EX Zone – External hydrogen handling unit

EX-zone marked around the External hydrogen handling unit.

Refer to Hydrogen Safety Concept for more details about the EX-zone.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Minimize all activities in the EX-zone
Activities must be done by trained personnel
Do not introduce any ignition source into the EX-zone

4.3 Site safety for Personnel

4.3.1 Personal Protection Equipment (PPE)

Appropriate PPE should always be worn while interacting with the system directly and/or indirectly. Wear a safety helmet, protective glasses, gloves, and other protective equipment, as required by the designated site.

4.3.2 Noise

During normal operation the noise-level emitted varies depending on the operating conditions. The noise-level in the surrounding area may reach up to 80dB, the highest being in front of the air-intakes.

Hearing protection should be available and used when in the surrounding area.

4.3.3 Emergency doors

The fuel cell container is equipped with two emergency exit doors, see Figure 4.

Do not store material or in other way block the emergency doors.

4.3.4 Freezing conditions

The process exhaust contains water. This water will freeze and turn into snow and ice. Care must be taken when outside temperatures are at or below 0 °C.

- It is possible that icicles are formed on the exterior of the containers, creating a risk of falling objects.
- It is possible that surrounding surfaces have icing, creating a risk of slipping.
- Avoid or restrict access to the area if needed

4.3.5 Medical devices

During some operating modes, the system will create a magnetic field which may influence medical devices. Such devices shall not enter the system.

4.3.6 Fire

The Fuel Cell Modules have internal fire detection in the form of smoke detectors and linear heat detectors. If a Fuel Cell module detects fire, it will automatically perform a safe shutdown of itself and indicate an alarm.

If Smoke is detected inside the general space of the Fuel Cell Container, the entire system will perform a safe shutdown and indicate an alarm.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

Should a fire occur, exit through the provided emergency exits.

4.3.7 Explosion Safety

The solution introduces an area with explosion hazard around the hydrogen interface. This zone is classified as a Zone 2, meaning that a hazardous mixture of hydrogen in the area will not likely be present under normal operating conditions, and if so, only for a short period at a time. Detailed drawing of the hazard zone can be found in the General Arrangement.

	**Respect the zone indicated, do not introduce any source of ignition.**

4.3.8 Hot surfaces

	**During operation, hot surfaces are present. Respect the nature of the machine and avoid touching surfaces marked.**

4.3.9 Service and maintenance

	**When service and maintenance are conducted, personnel in the area must follow the instructions from the responsible service technician.**

4.4 Cleaning

The area around the system should be kept clean and with unrestricted access, e.g. during winter snow.

Cleaning of the major components of the system must be done according to the service instruction. Do not wash down exterior without consulting the service manual.

4.5 Settings

No settings for the FC PowerGen are available for the general operator. Settings are restricted to Integrators and Service and Maintenance Personnel through the use of Modbus communication and the HMI inside the Fuel Cell Container.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

4.6 Safety labels on the machine

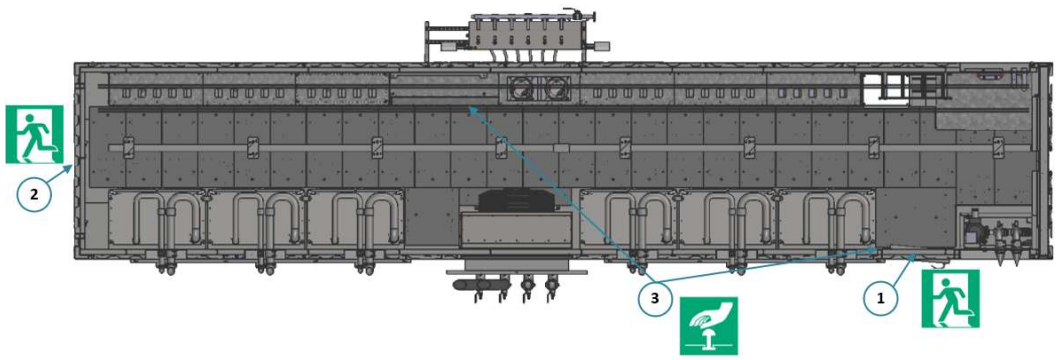

Table 4-1: Safety labels on the machine			
	Emergency exit		Use hearing protection
	Authorized personnel only		Wear safety footwear
	No smoking		Read manual
	No open flame		Risk of electric shock
	No access for active implanted cardiac devices or others alike		Hot surface
	Not lifting point		Automatic startup
	Lifting point		Crush of hands

This Document is valid only at time of Printing.

5.0 Safety inside Fuel Cell Container

When the entirety of this manual has been consulted, it is safe to enter the Fuel Cell Container during operation. The Fuel Cell Container is designed to meet minimum IP20 for all equipment installed.

Figure 4: Safety equipment in Fuel Cell Container

Emergency doors, emergency buttons

5.1 General rules

The interior of the Fuel Cell Container is to be kept as clean as possible:

- Remove any litter or debris.
- Keep the doors closed to allow for ventilation air to be filtered.
- The Fuel Cell Container is a machine, respect the rules and signs. Do NOT open equipment without proper instruction and safety measures as described in relevant service work instruction.
- It is recommended to keep a communications device on your person when being inside.

The interior light can be switched on and off next to the main entrance door.

If any abnormal condition is noted on entry, avoid entering and contact Ballard service.

5.2 Emergency exit

The main entry door (Figure 4, 1) is on the side of the container. The door is equipped with an emergency Push bar on the inside.

There is an additional service access door (Figure 4, 2) at the end of the container. This door is intended for use only during specific service activities and emergency exit.

5.3 Emergency Stop button

The Emergency Stop buttons (Figure 4, 3) are placed next to the main access door, and on the MCU panel. Activating one will immediately shut down the entire system and disengage the main output connection to the grid.

The emergency stop button may not be used as a general stop button of the machine.

It is important to note that not all energy sources are disconnected from the machine when the emergency button is activated. Systems such as UPS batteries for the control-systems and the Auxiliary power supply etc., supplies energy to the system during emergency stop.

This Document is valid only at time of Printing.

Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

5.4 Emergency lighting

Part of the internal lighting of the container is supplied with power from the UPS during an emergency.

5.5 Fire safety

The Fuel Cell Container is equipped with a fire detection system using multiple detectors. The activating of a detector may lead to partial shutdown of the affected unit or a complete shutdown of the system.

- Smoke detectors are mounted in the ceiling of the container, monitoring the inlet and outlet of the ventilation air.
- Each FCwave module contains an internal smoke detector and linear heat detector.

5.6 Hydrogen safety

The Fuel Cell Container is designed to prevent leakages of hydrogen inside the container, and there are no hydrogen-flammable or -explosive conditions inside the system.

As an additional precaution, in case of hydrogen entering the container, the container is equipped with three hydrogen sensors in the general space of the container. One at the ventilation intake and one at each of the ventilation exhausts, which will detect incoming and exiting hydrogen.

If one of these hydrogen detector is triggered, the safety system shuts off all the hydrogen supply valves and trigger emergency shutdown of the fuel cell modules and power converters.

Refer to Hydrogen Safety Concept for more details.

5.7 Electrical safety

The electrical cabinets are only to be opened by instructed electricians and require a tool.

⚠ ELECTRICAL HAZARD	
	**Special attention is required to the DC cabinets.** **The voltage on the DC busbars is 750V, and special procedures must be followed to disconnect and discharge the system prior to opening.** **Refer to Service and Maintenance Manual.**

5.8 Auxiliary power supply

The system requires a permanently mounted auxiliary power supply. Auxiliary power supply is used during operating modes where power from the fuel cells is not available.

The auxiliary power is present at all times, also when the main grid breaker is open, unless disconnected remotely.

5.9 Noise

During operation the sound level may reach up to 94dB inside the container. Hearing protection must be used when inside the container.

If the fuel cell system is shut down for service and starting are prevented by applicable lock-out, hearing protection is not mandatory.

This Document is valid only at time of Printing.

Hearing protection must be worn during operation.

5.10 Hot surfaces

The components and piping of the LT cooling rack may reach a temperature of 45°C.

The components and piping of the HT cooling that are placed below the raised technical floor may reach a temperature of 65°C. The floor should only be opened in consultation with the instructions in the service manual.

The Process exhaust piping above the fuel cells may reach a temperature of 70°C during fuel cell operation. Avoid touching.

The HT Coolant pipes reach temperatures up to 65°C during normal operation.

The process exhausts reach temperatures above 70°C during operation.

6.0 Cooling Platform

The Cooling platform is a steel structure with the footprint of a 40ft container. The purpose of the cooling platform is to dissipate the excess heat generated. The cooling systems are open unpressurized systems with open header tanks to accommodate for volume changes due to temperature. The cooling media is Ethylene glycol, and the highest temperature is approximately 65 °C.

The exhausts from each FCwave™ is fastened to the HT cooling platform.

- Process air, oxygen reduced air from the electrochemical process saturated with water.
- Hydrogen ventilation air

Figure 5: Cooling platform overview

Indicative overview of HT Cooling Platform with numbered ballons (see Table 6-1)

Table 6-1: HT Cooling platform overview descriptions (See Figure 5)

1	HT Coolers with fans
2	HT Coolant pumps
3	LT Cooler with fan
4	Platform Service area
5	HT Coolant in- and outlet

6.1 Platform Service area

The Service Area of the Cooling Platform is located between the HT coolers. The Cooling Platform is placed on top of the Fuel Cell Container, approximately 3 meters above ground level. This makes the Service Area inaccessible for unauthorized personnel.

Access for authorized personnel is with a designated ladder which is hooked on to the service area extension, or from a scaffold or similar, if service work requires.

The Service Area has a surrounding fencing. This prevents service engineers from falling from height. Special care must be taken in extreme weather conditions, consider using PPE equipment (harness).

This Document is valid only at time of Printing.

Prior to accessing the Service Area of the Cooling Platform, the Service and Maintenance Manual must be consulted.

6.2 Hydrogen safety

There is no Hydrogen present at the service area.

6.3 Electrical safety

The electrical cabinets are only to be opened by instructed electricians and require a tool.

6.4 Noise

During operation the sound level may reach up to 80dB in the Service Area, main source being the cooling fans on top of the coolers.

Use hearing protection when in operation.

6.5 Hot surfaces

The components and piping of the HT cooling may reach a temperature of 65°C during operation.

Mounted to the HT Cooling Platform are the Process exhaust from the Fuel Cell Modules that resides inside the Fuel Cell Container. These may reach temperatures up to 70°C.

Avoid touching.

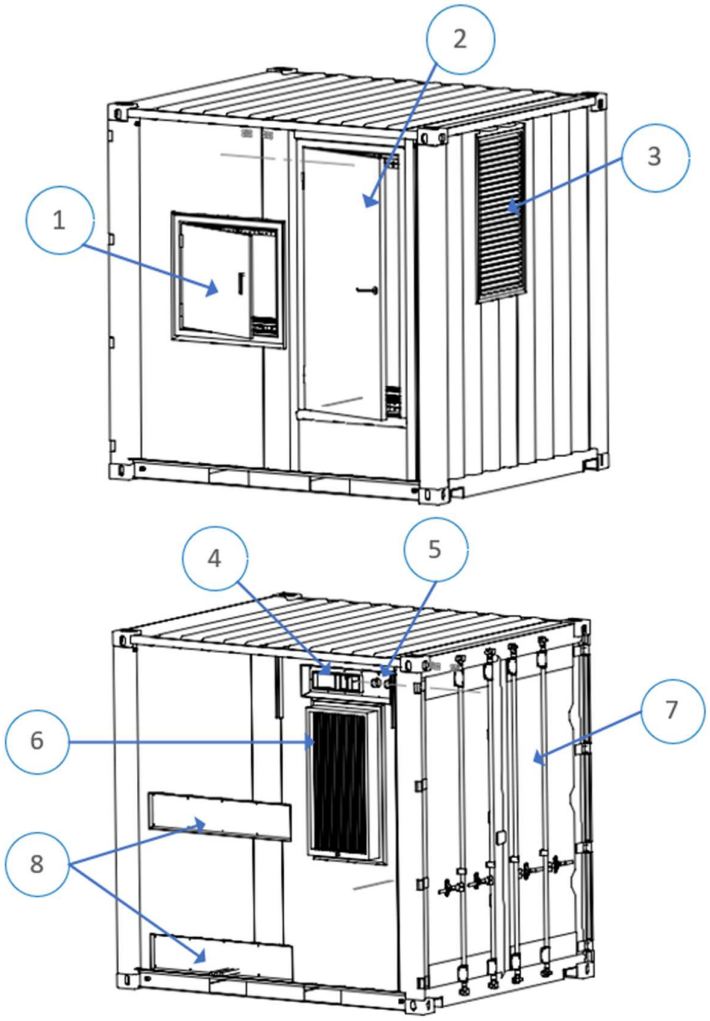
7.0 Converter Container



The Converter Container is structurally a 10ft high-cube double-door container, modified to the specific need. It is designed as an electrical cabinet, housing DC/AC converters and a transformer that converts the energy to the desired voltage (6.6 kV).

Access to the inside is through the normal container doors which are, because of electrical safety, mechanically prevented from opening during operation. These are also equipped with safety sensors, which will immediately bring the entire solution to "Failure state" if opened.

Access is restricted to instructed and trained personnel, and only after a safety procedure is followed, which will deenergize the container to a safe mode.

The control panel and grid breaker front of the Converter Container is accessible from the outside, behind an additional locked door which will not shut down the solution if opened.

7.1 Electrical safety

⚠ ELECTRICAL HAZARD	
	**HIGH VOLTAGE – 6.6 kV** **Danger of electrocution** **Authorized personnel only** **Keep clear and follow safety protocols** **Proper PPE required** **Failure to comply may result in serious injury or death**

7.2 Access

There is no access to the insides of the Converter Container for unauthorized personnel, as some aspects inside are IP00.

Access is only granted with proper de-energization procedures found in the Service and Maintenance Manual.

Opening any of the access doors triggers a safeguard, immediately de-energizing the entire FC PowerGen and requires a resetting procedure.

It is recommended to keep a communications device on your person when being inside.

⚠ WARNING	
	**Access to the internals of Converter Container is strictly prohibited except when applicable procedures are done by trained personnel, approved by the manufacturer.**

1.0 Disclaimer

NOTE: READ THIS BEFORE ATTEMPTING ANY PROCEDURES DESCRIBED IN THIS MANUAL

There are inherent risks in the operation of a fuel cell module that can result in death or bodily injury or loss or damage to property. It is therefore necessary for the customer to take all prudent safety precautions in the installation, use, and maintenance of this device. Persons who install, operate, and service the device are required to be technically qualified and experienced in working with electrical equipment, compressed gases, and H2.

This manual includes certain safety guidelines and recommendations; however, this manual is not intended to cover all situations. The customer is responsible for determining the suitability of the customer's particular design or application, and for ensuring the safe operation, maintenance, and storage of the device and any systems into which it is integrated. Ballard Power Systems Europe A/S ("BPSE") cannot be responsible for the use of the device in ways, or as part of systems, that deviate from the operating recommendations in the manual. The customer is responsible for being aware of, and complying with, all applicable laws and regulations. BPSE has limited its liability for damages incurred by the customer or its personnel in the contract documents pursuant to which the device is provided to the customer. Please refer to those documents for additional information.

Procedures described in any part of the manual can only be attempted once the customer has read this entire manual. Failure to follow any instruction or recommendation could result in death or bodily injury or loss or damage to property.

BPSE intends for the device to be installed, operated, and serviced only by approved technically qualified and experienced people who understand the principles of fuel cell technology, are aware of the safe operating limits of fuel cells, and are familiar with the risks posed by operating a fuel cell module. BPSE relies on customers to use their own knowledge and experience when installing, operating, and servicing the device. BPSE also relies on the people using this manual to be familiar with common terms and abbreviations used in the manual.

Information in this manual is subject to change without notice. BPSE makes no commitment to update or keep current the information in this manual and reserves the right to make updates or other changes to this manual and/or to the products described in this manual, at any time without notice. Updates and other changes to the manual may be posted on the BPSE website and may be accessed through the customer portal; it is the customer's responsibility to check for any such updates or changes.

Copyright

The statements in this document must not be changed without special notification from Ballard Power Systems Europe A/S. Furthermore, Ballard Power Systems Europe A/S does not commit to any further obligations with this document.

Under no circumstances may the whole or parts of this publication be copied, reproduced, stored in a retrieval system, or translated into another language, unless written permission from BPSE has been obtained.

Specifications and descriptions in this document were in effect at the time of publication. 2.0 General Information

Service and Maintenance personnel must read and understand the Operator Manual mentioned in section 2.4 prior to activities covered by this manual.

2.1 Manual Purpose and scope

This Service and Maintenance Manual for the FC PowerGen provides guidance and instructions for routine inspections, testing, and maintenance tasks necessary for the safe and reliable operation of the system throughout its operational lifetime.

It covers topics such as:

- Safety protocols
- System Description
- Preventative Maintenance

Excluded from this manual are specific Service-, Maintenance-, and Repair- instructions. These are separate documents, reserved for trained and authorized personnel.

2.2 Intended audience

The intended audience for this manual is persons involved in service and maintenance of the FC PowerGen system.

Technicians and maintenance personnel who are responsible for servicing and maintaining the system must be authorized and trained by Ballard to perform service and maintenance according to this Manual, referred documentation, and instructions.

Technicians and Maintenance personnel must read and adhere to this manual when performing service and maintenance on the system.

Audience Key characteristics:

- **Technical proficiency**: The intended audience possesses a strong technical background and expertise in Fuel cells and electrical systems.
- **Authorized personnel**: Technicians and maintenance personnel are authorized by the manufacturer to access and use the Service and Maintenance Manual.
- **Training requirement**: The service responsible must use technicians who have undergone specific training programs provided by the manufacturer to ensure proficiency in servicing and maintaining the system safely.
- **Responsibility**: The service responsible must ensure the execution of routine inspections, testing, components change, and other maintenance tasks necessary for the safe functionality of the system.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

2.3 Training Level Certification

2.3.1 System service

Service on the system, excluding the FCwave, may only be performed by Ballard authorized personnel listed in the service authorization list and only according to the service tasks for which they are approved.

2.3.2 Fuel cell service

Personnel performing service on FCwave must be trained according to Ballard training levels:

Tier 1 – Service technicians and fuelers

Tier 2 – Service technicians and mechanics

Tier 3 – Senior Service technicians and Engineers

Details of roles and responsibilities are reinforced by Ballard's standard Service Level Agreement. Contact Ballard for details regarding training.

2.4 Manual series

The Manual Series provides manuals covering different life-phases of the system, as defined in Table 2-1:

Table 2-1: Manual series contents

Document no.	Title	Brief purpose description	Intended user(s)
Ballard: 7003672 CW: K559-2254-CWIWP4202202-R01-002	Transportation and Handling Manual	Enables safe, land-based, transport and handling from manufacturer to designated site.	Personnel qualified in preparation of, handling, and transport of freight.
Ballard: 7003718 CW: K559-2254-CWIWP4202202-N01-001	Integration Manual	Enables integrators to design a designated site and subsystems required within the intended use and limits of the system.	Integrators partaking in designing the designated site and subsystems, and commissioning.
Ballard: 7003717 CW: K559-2254-CWIWP4202202-N01-002	Operator Manual	Provides information to personnel for safe operation of the solution, instructions for operator-based maintenance, safety rules and recommendations	Operators, Integrators, Installers, Service and Maintenance personnel, personnel working in or near the system, and persons instructing visitors.
Ballard: 7003719 CW: K559-2254-CWIWP4202202-N01-003	Service and Maintenance Manual	As described in section 2.1	As described in section 2.2

Ballard Power Systems Europe (BPSE) may update the provided manuals on an ongoing basis.

https://www.ballard.com/support/

2.6 Hazard Symbols

Hazard symbols throughout the manual indicate objectives or potentially dangerous situations.

Table 2-2: Hazard symbols

	**MANDATORY ACTIONS**: are marked with blue action-points. This indicates actions that must be performed. Ignoring may result in an accident, which could cause damage to equipment or other property, and could cause bodily injury if not promptly detected and remedied.
	**PROHIBITIONS**: are marked with red prohibition-signs. This indicates a forbidden action. Ignoring may result in immediate bodily injury or loss of life or could cause damage to equipment or other property
	**WARNINGS**: are marked with yellow triangles and/or square warning. Indicates hazards that may result in an accident, which could cause immediate bodily injury or loss of life or could cause damage to equipment or other property.
	**CAUTION** in this manual indicates actions that may result in an accident, which could cause damage to equipment or other property, and which could cause bodily injury if not promptly detected and remedied.
	**ELECRICAL HAZARD** Obey ALL warnings, cautions, and safety instruction related to electricity. Failure to do so may result in electrical shock leading to personal injury or death.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

3.0 General System Description

The system is a modularized power generator based on a number of FCwave™ Fuel cell units.
The FC PowerGen consists of the following main components:

Figure 1: Major components overview

Short descriptions of major components can be found in Table 3-1

Table 3-1: Major components of the machine (See Figure 1)

Component	Short Description
Fuel Cell Container	Based on a 40ft HC container, modified to a machine housing with access, ventilation, light safety etc. The container holds 6 FCwave modules with installation, internal 400VAC power supply for complete Balance of Plant components, main controller, LT pump system and DC/DC converters.
Cooling Platform	40ft Cooling Platform with service platform. 2 individual HT radiators dimensioned to the specific solution 2 individual HT pump-systems 1 LT radiator
Converter Container	Based on a 10ft HC container, modified to a machine housing with access, ventilation, light, safety etc. Holds DC to AC grid-supplying power electronics, Isolation transformer, and Grid Main Breaker.

This Document is valid only at time of Printing.

4.0 Safety

4.1 General safety

The reader of this manual shall read the operator manual mentioned in section 2.4 for additional information on general function and safety, as a supplement to the manual.

The applicable service procedure must always be consulted before any service activity is performed.

Any safety related information herein must be followed.

All service technicians must understand and comply with good workmanship and safety procedures generally associated with machinery service, even if these procedures are not specifically stated in this document.

While working on the system, there should always be more than one person present on-site.

4.2 Personal Protective Equipment

The service technician must bring and use appropriate PPE.

In general:

- Safety shoes are mandatory.
- Hearing protection must be available and used when the system is operational.
- Fire inhibited clothes must be used when working on the electrical system.
- Helmets must be used when hoisting equipment inside the Fuel Cell Container.
- Helmets and Fall arrest equipment must be used when working at heights.
- Suitable gloves and eye protection must be used for working with coolant.
- Suitable gloves must be used for where risk of cuts is present, i.e. under the raised floor because of sharp edges.
- Suitable tools for working on live voltages – as per EN 60900.

Procedures may specify additional PPE.

4.3 Corrective maintenance

In situations where errors arise because of defective or worn-out parts, contact Ballard for support. Corrective maintenance must be done by authorized personnel.

4.4 Retrofitting and modifications

Retrofitting and modifications of the system shall be in collaboration with Ballard. Contant Ballard for support. Ballard will not take responsibility for any non-approved items applied; it is the responsibility of the applying entity. Unapproved modification may affect the warranty on the entire system.

4.5 Spare and wear parts and consumables

Using spare parts and consumables from third party manufacturers can cause risk. Only use original parts or parts approved by the manufacturer.

The manufacturer takes no responsibility for damage as a result of using parts not released by, or approved by, the manufacturer.

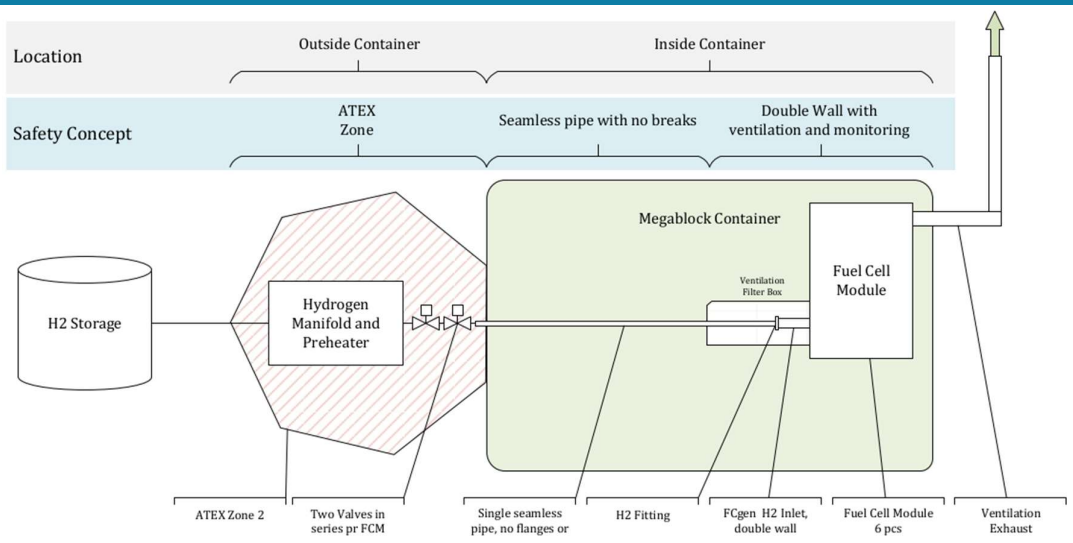
Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

4.6 Coolant

The solution utilizes two types of coolant. The LT and HT cooling circuit uses the Glycol-based coolant Proviflow®, and the internal closed coolant loop of the FCwave™ uses GLYSANTIN® FC G20.

For more details, refer to the document "Material Safety Data Sheets".

During normal operation there should be no leakage of coolant. If a leakage is noted, Manufacturer must be informed.



General rules are:

- Avoid contact with eyes and skin.
- Use protective gloves and tightly sealed googles.
- Avoid ingestion and inhalation of vapors.
- Spillage – do not allow to enter sewers/surface or ground water, absorb with a liquid–binding material, dilute with water.
- Disposal must be made according to official regulations.

4.7 Explosion safety

The hydrogen safety philosophy has several safety concepts, as indicated in Figure 2.

Figure 2: Hydrogen flow overview

Illustrative overview of hydrogen flow. See Hydrogen Safety Concept for more details.

Hydrogen is delivered to the hydrogen interface from a local hydrogen storage.

The area in which the interface, the hydrogen-manifold and -preheater, and hydrogen safety valves resides, is classified as an ATEX Zone 2. A hazardous mixture will not likely be present in normal operating conditions, and if so, only for a short period at a time. Electrical equipment in this zone is and shall conform to regulations and have the "EX" marking or similar. Detailed drawing of the hazard zone can be found in the General Arrangement. For more information regarding equipment installed in the zone, refer to the Equipment hazardous area certificate and schedule

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.
Ballard Power Systems Europe A/S
Majsmarken 1
DK-9500 Hobro
contact@ballardeurope.com
+45 8843 5500
ballard.com
Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

Respect the zone indicated, do not introduce any source of ignition.

There is no risk of hydrogen leakages inside the general space of the FC PowerGen Fuel Cell Container that can create an explosive atmosphere, due to the design of the feed pipes being seamless, one-piece-bends from outside of the container, routed through the container space, and connected the applicable Fuel Cell module.

The connection to a Fuel Cell Module (The H2 Fitting) is encapsulated within an extension of the Fuel Cell Modules Hydrogen Enclosure called the "Ventilation filter box", thus utilizing dilution and removal of any potential hydrogen with mechanical ventilation. Should leakages from this connection occur, the hydrogen detectors within the Fuel Cell Module will detect it and trigger a safe shutdown of that module and hydrogen supply.

The Ventilation system of the Fuel Cell Container creates a slight over-pressure to counteract ingress from particles and gas. As an additional precaution in case of hydrogen entering, the general space inside is equipped with hydrogen sensors. The position of these will detect any hydrogen entering or exiting the container through the ventilation system.

All safety-related triggers of the solution will shut off the hydrogen supply of either the affected system or the entire system.

4.7.1 Trace amount of H2

The process exhaust contains all biproducts from the fuel-cell stacks within the Fuel Cell Modules. The exhaust is a mixture of high-humidity, low-oxygen process air with trace amounts of hydrogen. The concentration of hydrogen will always be below 1%v, i.e. 25% of Lower Explosive Level (LEL), leading to a non-hazardous zone.

The source of the media in the Process Water Drain stems from the process exhaust. Thereby are also here found trace amount hydrogen which also are under 25% of LEL, leading to a non-hazardous zone. A hydrogen separator is fitted upstream to the process water drain and the trace amount of hydrogen are led through an exhaust to above the containers.

4.7.2 Working in the EX Zone

Personnel working in the EX-zone needs knowledge and skills as required by IEC 60079-14 and be approved as Operatives or Technicians on the EX-installation.

The defined EX zone is classified as Zone 2.

Only approved personnel are allowed to work in the ATEX Zone.

When working on systems containing hydrogen, refer to the correct procedures for Lock-out-tag-out. See Lockout Tagout document.

4.8 Fire safety

The Fuel Cell Modules have internal fire detection in the form of smoke detectors and linear heat detectors. If a Fuel Cell module detects fire, it will automatically perform a safe shutdown of itself and indicate an alarm.

If Smoke is detected inside the general space of the Fuel Cell Container or Converter Container, the entire system will perform a safe shutdown and indicate an alarm.

Should a fire occur, exit through the provided emergency exits.

There is no fire fighting equipment provided with the system.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

4.9 Electrical safety

The electrical system of the solution is designed in accordance with electrical and fuel cell codes to minimize electrical hazards. Electrical hazards may occur when the design is significantly compromised, typically through alteration, improper maintenance, or wear.

Dimensioning of cables and safety-equipment on the supplying and receiving end of electrical connections outside the solution must be done according to local legislation.

Select cabling and safety-equipment to the system that appropriately suits the application. Ensure to meet specifications of voltage, current, environmental temperature limits, chemical and mechanical resistance, and flexure requirements of the application. Avoid hazardous and unsafe situations that could result from condition such as, but not limited to:

- Improper grounding
- Handling electrical leads or devices with wet hands or on wet ground
- Frayed electrical leads
- Incorrect or improper connection of the terminal leads
- Short circuits
- Back-feed from energized normal and emergency power sources

Shutting down the solution during active Service and Maintenance may be necessary. Voltages may remain in the solution for a length of time. No activities are to be performed during this time as it presents a shock hazard.

Certain circumstances can lead to voltage persisting on the electrical systems. Always check for residual voltage before any activities. In some cases, it may require removal of hydrogen in the FCwave.

4.9.1 High DC Voltage Isolation Failures

Under normal circumstances, all high DC voltages are isolated from ground and the resistance is monitored. If isolation is lost on one high-voltage pole, a person working on the electrical system can sustain a fatal current-flow by touching the other voltage-pole and ground.

If two simultaneous faults occur and isolation is lost on both voltage-poles, a high voltage short circuit can occur resulting in extremely high currents/flash arcs. High currents can generate a large amount of heat which can subsequently damage electrical equipment and cause bodily harm.

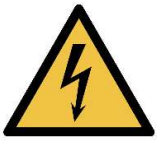
Components inside the solution affects the resistance to ground, resulting in lower resistance over time.

Above-mentioned hazards are mitigated by the safety system of the solution. It actively monitors the resistance, warning if anything is to be reacted on, or shutting down the entire system in case of sustained resistance-drop or fault. Maintenance on the resistance-lowering-over-time-, and the monitoring-device(s) are crucial for the electrical safety of the system.

⚠ ELECTRICAL HAZARD	
	**If an isolation failure is detected and located in the MODULE, do not operate the fuel cell module until the root cause is determined and remedied.**

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

4.9.2 Batteries



Batteries resides inside the system. Use applicable LOTO when working on system to avoid electrical hazards.

4.9.3 Converter Container access

The internals of the Converter Container are designed as an electrical cabinet (IP00), meaning that current-carrying conductors and terminals are exposed.

⚠ ELECTRICAL HAZARD	
	**HIGH VOLTAGE – 6.6 kV** **Danger of electrocution** **Authorized personnel only** **Keep clear and follow safety protocols** **Proper PPE required** **Failure to comply may result in serious injury or death**

Access is prohibited during operation. Opening the container doors activates the safety system, triggering emergency stop of the entire system. Residual voltages remain in certain components.

Entering this container requires prober de-energization and lockout tagout. Wait at least 10 minutes after de-energization before entering, and measure for residual voltages (<20VDC is safe).

4.10 Lock-out-tag-out (LOTO)

Ensure to use proper work-etiquette regarding LOTO on energy-containing systems, such as electrical supply, hydrogen, and batteries, when working on the system.

See Lockout Tagout document for procedures.

4.11 Heavy equipment

Some service and maintenance procedures require lifting of heavy equipment, such as an air-intake fan, top-module of an FCwave™, or an HT coolant pump motor.

Use of the monorail inside the fuel cell container, chain hoists, or forklifts are required, and safety precautions regarding these apply.

The Working Load Limit (WLL) of the monorail inside the Fuel Cell Container is 750kg.

4.12 Environmental conditions

Activities during rainy/snowy conditions should be avoided. If activities are performed during these conditions, the technician is responsible for ensuring that rain etc. does not enter the containers and electrical cabinets.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

Process exhaust contains water. During freezing conditions, snow and icicles may form.

Wear safety helmets under these conditions.

5.0 HMI - Service Interface

The system has a password-protected Service Interface, only accessible for authorized technicians.

The Service Interface can be accessed in three different ways:

1. Locally through the HMI touch screen located inside the Fuel Cell Container,
2. Locally with the use of a PC and a wired ethernet connection, to the secure internal network of the system, or
3. Remote access through the Secure Remote Access gateway.

Only trained and authorized personnel may access and use the Service Interface

Unauthorized accessing and usage of the Service Interface without proper training may result in serious injury

A default display showing main operating status is displayed when not in use as service interface.

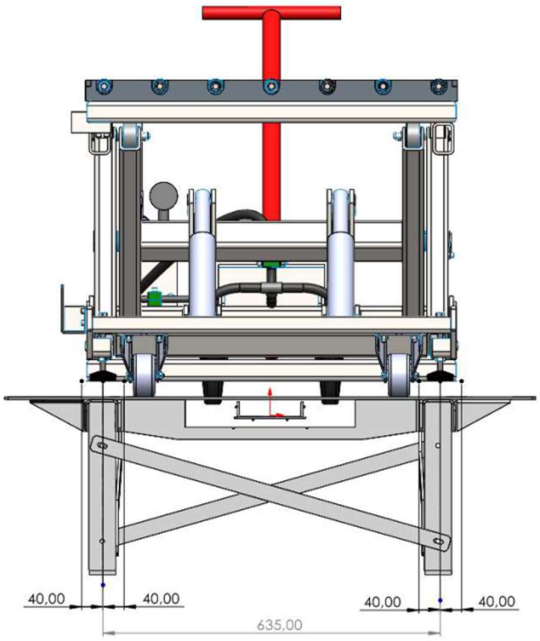
6.0 Preparation for Maintenance

Technicians must examine the need for de-energization through means which is not within the scope of the system. Processes for de-energization of these shall be provided by whomever responsible.
Examples:

- Grid-connection switch-disconnector at customer end.
- Safety and/or isolation valve for Hydrogen supply.

Each service and maintenance tasks within the system may require varying de-energization of different sub-systems. User proper LOTO procedures as defined in the Lockout Tagout document.

An FCwave™ is placed in a "service state" prior to any de-energization of the hydrogen supply.



Service technicians must refer to the documents P&IDs, Electrical Single Line Diagram, and Electrical Cabinet Documentation for technical details of the system.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

6.1 FCwave™ Top-swap service tool

In order to perform a top-swap on an FCwave™, the service technician must use the applicable Service Cart Tool and follow the limits-of-use described below.

Figure 3: Placement of FCwave™ Service Cart Tool

Applicable service tool part number: 7000512

The flooring is designed only to temporarily carry the weight of the cart and top-module in a static state, transferring the weight to the legs of the floor through the leveling foots.

Ensure that the placement is correct (±40mm) – failing to do so will deform the flooring and may create a potential hazard for personnel.

The Service Cart Tool it is NOT intended to be moved on the wheels while carrying the top part of an FCwave™

To move a top-module of an FCwave™ inside the container, use an applicable hoist, mounted in the monorail.

For more details on the flooring, refer to the document Structural calculations - false floor.

This Document is valid only at time of Printing.

7.0 Preventative Maintenance - Fuel Cell Container

Figure 4: Fuel Cell Container – External overview

1: Main access door	4: HT drain valves
2: Service door	5: Hydrogen Heater
3: Air intakes	6: Hydrogen Interface

7.1 General External

7.1.1 Cleaning

The outside of the container may be cleaned using water and a nonabrasive cleaning agent.

Do not use high pressure cleaning.

During cleaning of Air intakes, the corresponding damper must manually be placed in closed position and disconnected. Reset to automatic after cleaning. The dampers can be actuated from the service interface.

7.1.2 Air dampers

The ventilation dampers must be able to operate unobstructed. Any material block or damage to damper blades must be corrected without unnecessary delay.

7.1.3 HT coolant drains

The HT coolant-drain valves at the bottom of the HT main pipes connecting the HT loop of the container to the HT cooling platform must be closed.

In case of leakage, immediately correct and check level of coolant.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

7.1.4 Access areas

The areas in front of the main door, the service door, and the cooling platform service area should be kept clean and free from obstacles.

7.1.5 Process water drain

The process water drain is directed to a designated drainage system of the local site.

It should be checked at every maintenance period that the drain is unobstructed.

The process drain is equipped with an exhaust and a heat trace that protects the drain against freezing. Inspection is performed according to the Maintenance Plan.

Process water is DI water and is not suitable as drinking water.

7.1.6 Process-, ventilation, and drain exhausts.

Each FCwave unit has a set of exhausts: process air and ventilation.

The drain has an exhaust.

It should be checked at every maintenance period that the exhausts are unobstructed.

This Document is valid only at time of Printing.

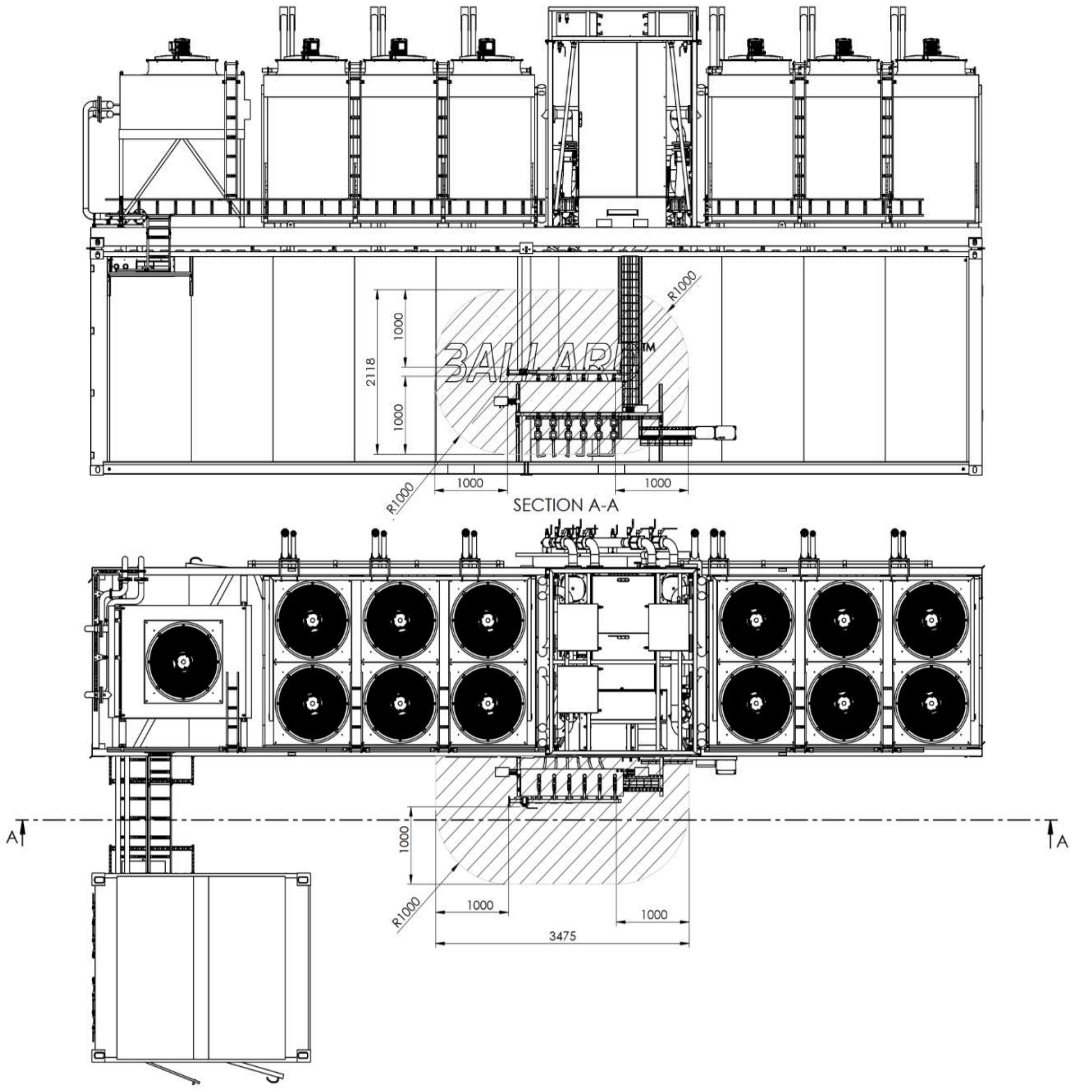
7.2 EX-zone

De-energization of electrical components for maintenance must be done, ensuring that no ignition source ever exists in the EX-zone.



The defined EX zone is classified as Zone 2.

Only approved personnel are allowed to work in the ATEX Zone.

Figure 5: EZ-zone illustration

For detailed version, refer to the General Arrangement

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

7.2.1 Hydrogen heater

During low ambient temperature, the hydrogen is heated to the hydrogen heater. The heater is filled with coolant and are heated using electrical heating elements.

The surface of the heater may reach up to 45°C.

If the Hydrogen Heater has run recently, wait for it to cool down before touching it and components mounted.

The following components of the Hydrogen Heater have no defined service/maintenance tasks defined by their documentation.

- Pressure sensor
- Temperature sensor
- Cables to sensors
- Cables to heating elements
- Cable glands on JEVI D-8640 heating elements
- Cable glands on Solenoid Shut-off valve (H2)
- Sensor EX barrier
- General Hy-lok fittings

  It is recommended that visual inspection on above-mentioned components is done.

7.2.1.1 Hydrogen Heater cooling media

The coolant level is monitored. In case of low level, it must be topped up.

The Hydrogen heater must have the coolant freeze-protection checked with the use of a refractometer regularly and changed as needed.

Coolant is 50/50% mixture of demineralized water and Proviflow Neo, which is an Ethylene-glycol based. Can be purchased as pre-mixed.

Criteria: minimum freezing point of -30°C

7.2.1.2 Level sensor – IFM LMT01A

Refer to Manufacturers (IFM) Operating Instructions – section 9.

- De-energize supply
- Check sensor tip for deposits and damage. Clean if badly soiled. In case of damage, replace the unit – the unit cannot be repaired.
- When reinstalling, carefully clean the probe neck and the installation slot, especially the sealing surface, with appropriate methods to ensure that the unit is resistant to ingress and without dead space.
- Re-energize supply.

7.2.1.3 Heating element - JEVI D-8640

Refer to Manufacturer's (JEVI) Installation, Operation and maintenance instructions, section 4.0

Maintenance free, however after 1 year of operation:

- De-energize supply (=LA01+UC30-FC41…42)
- Check the thermostat for damage

- Check connections inside junction box
- verify correct connections and re-assemble
- Re-energize supply

If no heating is done when needed, check and press the manual reset button.

7.2.2 H2 Solenoid Shut-off valve – Emerson ACSO

Check for excessive wear – leakage tests

- Externally

  Potential leakage areas: Pipe connections (Hy-lok) and valve stem.

  Hy-lok connections have low probability of leakage. If leakage occur, refer to components manual for replacement.

  If leakage from valve stem, rebuild with manufacturer kit or replace component.
- Inline

  If inline leakage occurs, rebuild with manufacturer kit or replace component.

Leakage test:

- Close valve(s) on designated H2 line
- Lower pressure downstream
- Monitor pressure downstream for a set period
- Search for external leakages with applicable outdoor-use leakage detector.

7.2.3 Manual isolation valve – Hy-lok 110 Ball Valve

Refer to Manufacturers (Hy-lok) Instruction manual for maintenance.

Leakage test – Stem:

In case of stem leakage, tighten the Flange Nut. If the leakage remains after tightening, check damage to the stem, outer package and inner package. Replace parts or component(s) as needed,

Leakage test – Inline:

If the leakage happens inside the valve, ensure whether the valve is in fully closed condition. If the reason of leakage is seat damage, replace the seat or the component.

7.3 Access

Access is restricted to authorized personnel only

7.3.1 Main access door

The door on the container side is the main entrance to the interior of the Fuel Cell Container. The door is locked and should only be unlocked by authorized personnel during service.

It is possible to unlock the door and enter the container while it is in full or partial operation.

In this case the door may not be kept open for a longer period, as this will affect the internal ventilation system. **Note**: The ventilation creates a slight overpressure inside the container.

Generally, the door should be closed to keep a clean environment inside the container.

7.3.2 Service door

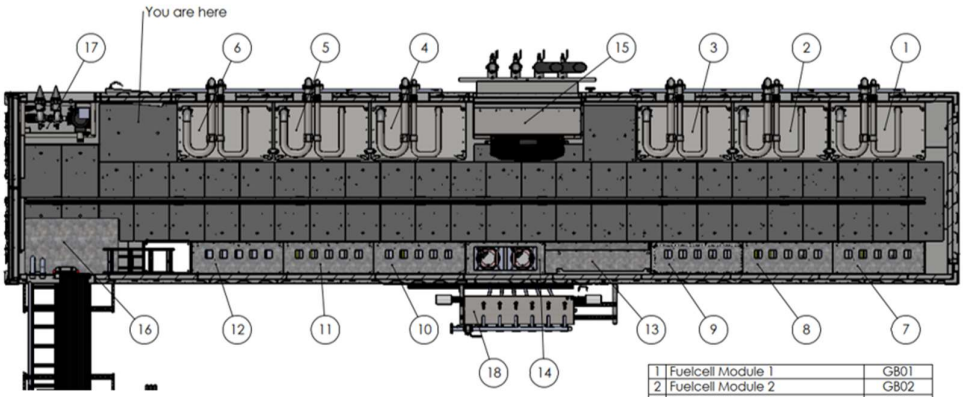
The service door at the end of the container is intended for special service cases and should otherwise be kept closed.

The door can in any case be opened from inside and functions as an emergency exit.

Service personnel must unlock this service door when any activities are performed inside the container, to enable any first responders to gain access if needed.

7.3.3 Container doors

The standard container doors are not intended for use and should always be locked.



Before leaving the site check that all doors are safely locked.

7.4.1 General

The interior should be kept clean and walking space unobstructed.

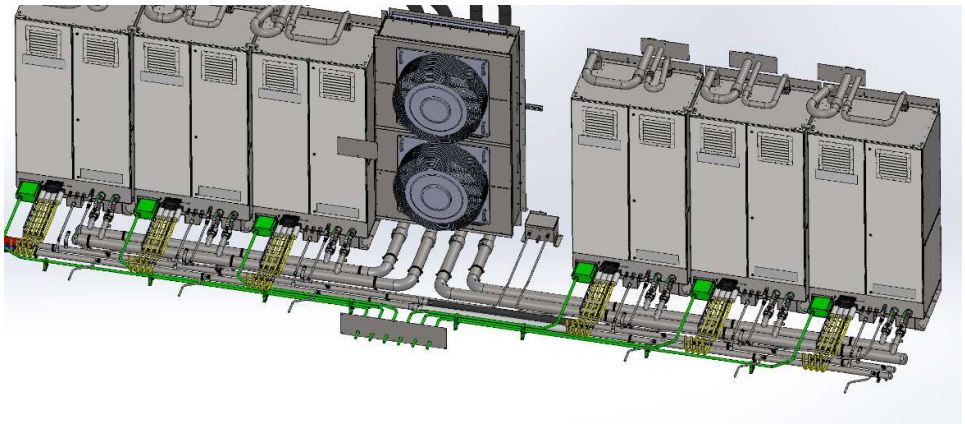
The floor plates are secured by screws and should always be secured unless service is in progress.

When working in the area below the floor, it is recommended to use gloves.

When the system is in operation use hearing protection.

If the system is locked to prevent starting, having hearing protection available is only recommended.

When working in the container, make sure that there is free access to an emergency exit door, and unlock the doors to allow for rescue personnel to enter the container through the emergency doors.



The container interior is equipped with overhead light sources. Use additional light where appropriate to avoid errors.
