BLPH Project - Fabrication/Production Schedule

ID	Task Mode	Task	Duration	Start	Finish
1		**Phase 1 - Preliminary Engineering**	**83 days**	**Wed 04/01/23**	**Fri 28/04/23**
2	✓	Establish Activity & Resource Plan	5 days	Wed 04/01/23	Tue 10/01/23
3	✓	Develop Quality Plan	25 days	Wed 11/01/23	Tue 14/02/23
4	✓	Develop Procurement Plan	25 days	Wed 11/01/23	Tue 14/02/23
5		Project Execution Plan	23 days	Wed 15/02/23	Fri 17/03/23
6	✓	Marinization Gap Analysis	20 days	Wed 15/02/23	Tue 14/03/23
7	✓	L3 Schedule	10 days	Wed 15/03/23	Wed 29/03/23
8		Design & Verification - Document Elaboration as per SDR-3	73 days	Wed 11/01/23	Fri 21/04/23
9		**End of Phase 1 - Preliminary Engineering Approval**	5 days	Mon 24/04/23	Fri 28/04/23
10		Notice to Proceed	0 days	Wed 17/05/23	Wed 17/05/23
11		**Phase 2 (Part 1) - System Build-up**	**242 days?**	**Wed 17/05/23**	**Thu 18/04/24**
12		Further Document Elaboration as per SDR-3	242 days	Wed 17/05/23	Thu 18/04/24
13		**Procurement of Parts (Main Components)**	**95 days?**	**Wed 17/05/23**	**Tue 26/09/23**
14		Pumps	50 days?	Wed 17/05/23	Tue 25/07/23
15		Containers	55 days?	Wed 17/05/23	Tue 01/08/23
16		*FCwaves*	50 days?	Wed 17/05/23	Tue 25/07/23
17		DC/DC Cabinets	60 days?	Wed 17/05/23	Tue 08/08/23
18		Transformer	55 days?	Wed 17/05/23	Tue 01/08/23
19		DC/AC Cabinet	60 days?	Wed 17/05/23	Tue 08/08/23
20		HT & LT Coolers	95 days?	Wed 17/05/23	Tue 26/09/23
21		Master Controller Cabinet	40 days?	Wed 17/05/23	Tue 11/07/23
22		Prepare production	52 days	Wed 17/05/23	Thu 27/07/23
23		**Production of Systems**	**154 days**	**Tue 11/07/23**	**Mon 12/02/24**
24		**40' HC Container Build**	**111 days**	**Tue 11/07/23**	**Wed 13/12/23**
25		FCwaves on-site	0 days	Tue 25/07/23	Tue 25/07/23
26		40' HC Container on-site	0 days	Tue 01/08/23	Tue 01/08/23
27		DC/DC cabinets on-site	0 days	Tue 08/08/23	Tue 08/08/23
28		Master Controller cabinet on-site	0 days	Tue 11/07/23	Tue 11/07/23
29		40' HC Container Build	80 days	Wed 09/08/23	Tue 28/11/23
30		Build Control	3 days	Wed 29/11/23	Fri 01/12/23
31		Control Software Installation	1 day	Wed 29/11/23	Wed 29/11/23
32		Basic I/O Testing	10 days	Thu 30/11/23	Wed 13/12/23
33		**Cooler Platform Build**	**62 days**	**Tue 26/09/23**	**Thu 21/12/23**
34		Pumps on-site	0 days	Tue 26/09/23	Tue 26/09/23
35		HT & LT Coolers on-site	0 days	Tue 26/09/23	Tue 26/09/23
36		Platform on-site	0 days	Tue 26/09/23	Tue 26/09/23
37		Cooler Platform Build	60 days	Wed 27/09/23	Tue 19/12/23
38		Build Control	2 days	Wed 20/12/23	Thu 21/12/23
39		**10' HC Container Build**	**53 days**	**Wed 29/11/23**	**Mon 12/02/24**
40		10' HC Container on-site	0 days	Wed 29/11/23	Wed 29/11/23
41		DC/AC Cabinet on-site	0 days	Wed 29/11/23	Wed 29/11/23
42		Transformer on-site	0 days	Wed 29/11/23	Wed 29/11/23
43		10' HC Container Build	50 days	Thu 30/11/23	Wed 07/02/24
44		Build Control	3 days	Thu 08/02/24	Mon 12/02/24
45		**Integration Testing**	**65 days**	**Fri 22/12/23**	**Thu 21/03/24**
46		Installation of 40' HC Container with Cooler Platform	10 days	Fri 22/12/23	Thu 04/01/24
47		DC System Integration Testing	30 days	Fri 05/01/24	Thu 15/02/24
48		Integration with AC System	5 days	Fri 16/02/24	Thu 22/02/24
49		Full System Integration Testing	20 days	Fri 23/02/24	Thu 21/03/24
50		Factory Acceptance Test (FAT)	4 days	Fri 22/03/24	Wed 27/03/24
51		**End of Phase 2 (Part 1) - System Approved & Ready**	1 day	Thu 28/03/24	Thu 28/03/24
52		**Phase 2 (Part 2) - Installation & Commissioning**	**262 days**	**Fri 29/03/24**	**Mon 31/03/25**
53		System Disassembly	10 days	Fri 29/03/24	Thu 11/04/24
54		Preparation for Shipment	10 days	Fri 12/04/24	Thu 25/04/24
55		Shipment to site	3 days	Fri 26/04/24	Tue 30/04/24
56		**Delivery on site**	0 days	Tue 30/04/24	Tue 30/04/24
57		**On-site Installation & Commissioning (Onshore)**	**60 days**	**Wed 01/05/24**	**Tue 23/07/24**
58		**Installation**	**40 days**	**Wed 01/05/24**	**Tue 25/06/24**
59		Unloading, Lifting & Positioning (CrossWind Scope)	10 days	Wed 01/05/24	Tue 14/05/24
60		Mechanical Installation & Connection of Sub-Assemblies (CrossWind Scope)	10 days	Wed 15/05/24	Tue 28/05/24
61		Connection of Interfaces (CrossWind Scope)	10 days	Wed 29/05/24	Tue 11/06/24
62		Installation Check & Possible Adjustments (Joint Activity)	10 days	Wed 12/06/24	Tue 25/06/24
63		**Commissioning**	**20 days**	**Wed 26/06/24**	**Tue 23/07/24**

1. Introduction

The purpose of this Project Execution Plan is to provide a detailed overview of the project to design, build, deliver, and commission a 1 MW containerized fuel cell solution for CrossWind's BLPH (Baseload Power Hub) Project.

The BLPH project is a demonstrator project that encompasses several new technologies (i.e. a floating solar park, a short-term battery storage, an electrolyzer, a hydrogen storage system and a fuel cell system) that will be integrated with one of the wind turbine generators of an offshore wind farm, located 18.5km off the coast of The Netherlands. The combination of all these technologies is expected to balance the intermittent electricity production of the wind turbine, ensuring a continuous power supply regardless of the wind situation.

The 1 MW containerized fuel cell solution for the BLPH project will consist of hardware, software, and infrastructure components and will enable CrossWind to generate electricity from the onboard stored hydrogen during periods of low or no wind.

The scope of this project includes the design and development of the system, the procurement of all necessary components, the assembly and testing of the system, and the commissioning and handover of the system to CrossWind, as referred to in the contract CW-I-WP4-2022-02.

The project team will be composed of engineers, technicians, and project managers that will work closely together to ensure that the project is delivered on time, within budget, and to the satisfaction of all stakeholders. Effective and efficient communication, good collaboration, and strong decision-making will be critical to the success of the project. Ballard will establish clear lines of communication and decision-making authority throughout the project.

This plan outlines the organizational structure of the project team, including roles and responsibilities, reporting relationships, and communication channels. It also provides a detailed schedule that includes key milestones and deadlines. Additionally, the plan includes details about the project budget. Finally, the plan outlines the quality assurance and risk management strategies for the project and establishes a plan for closing out the project.

2. Project Organization and Communication

The project team will consist of the following individuals and/or roles:

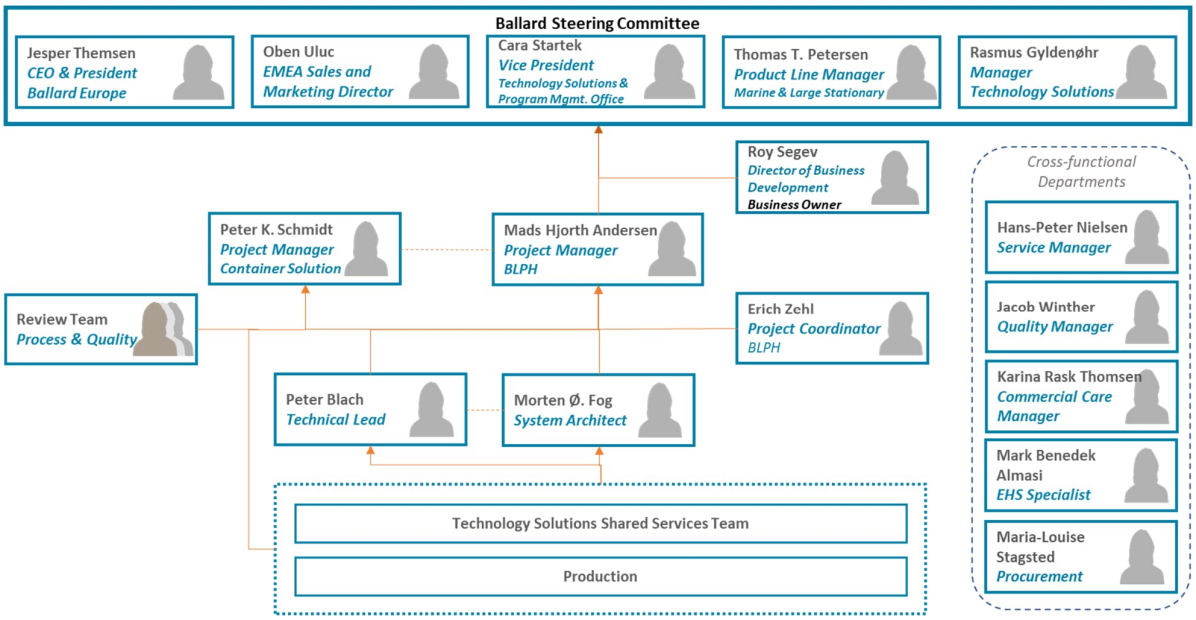

Figure 1. BLPH project organizational chart (Ballard internal).

Each team member has specific roles and responsibilities in the project. The Project Manager of the BLPH Project (henceforth referred to simply as Project Manager) is responsible for overall project management, including project planning, scheduling, budgeting, and reporting. The System Architect is responsible for overseeing the technical aspects of the project, including system design and development. The Technical Lead supports the System Architect and, together with the System Architect, coordinates activities within the Technology Solutions Shared Services Team. The Review Team evaluates and advises on design documentation, processes, methods, etc. The Review Team may have different members depending on the items being reviewed. The Project Manager of the Container Solution (not to be confused with Project Manager of the BLPH Project) coordinates closely with the Project Manager for the BLPH Project and is responsible for the overall project management of Ballard's "standard" container solution for large stationary applications, which serves as the technical basis for the BLPH Project. The Business Owner assists the Project Manager in providing leadership for and managing the team's performance of project activities.

Outside of the core project team, there are cross-functional departments that contribute to the project with their respective fields of expertise as required by the project. The Service Manager oversees and guides all activities related to service, including SLA (Service-level Agreement) creation and implementation. The Quality Manager is responsible for ensuring that the project meets all quality standards and requirements. The Commercial Care Manager is responsible for controlling project finances and deliverables. The EHS Specialist oversees the implementation of Ballard's safety policies and regulations. The Procurement Representative supports all purchasing activities and ensures the security of supply and quality of the product.

In addition to the project team, we will establish an internal Steering Committee composed of key managers. The Steering Committee will provide oversight and guidance throughout the project and will be responsible for making key decisions related to scope, budget, and schedule. The Project Manager will report regularly to the Steering Committee on project status, risks, and issues.

Effective communication is critical to the success of the project, therefore it is essential to ensure that project information is communicated to the relevant stakeholders in a timely and effective manner. To this purpose, the project team will meet regularly to review progress, discuss issues, and make decisions. The team will communicate primarily through internal weekly meetings and daily status updates, as well as through email, telephone, video calls and instant messaging. All team members are expected to communicate clearly and promptly, and to escalate any issues or concerns to the appropriate party as needed.

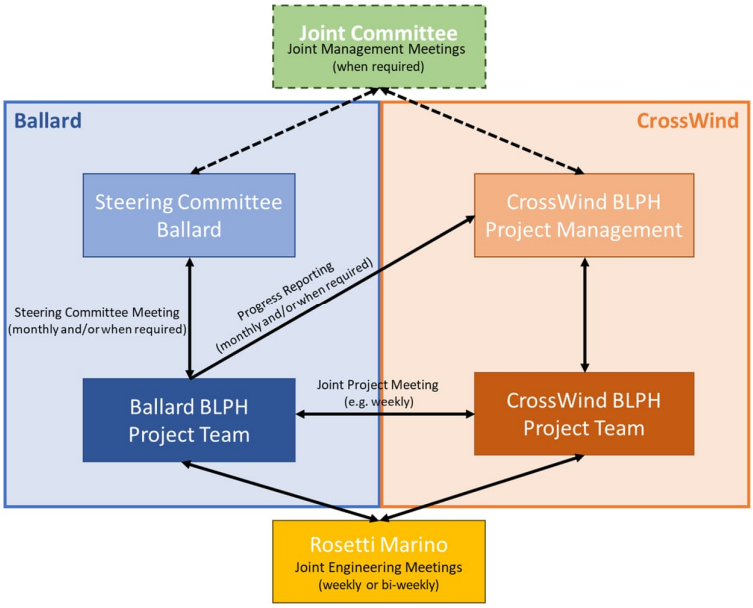

Figure 2. Communication diagram between Ballard, CrossWind and Rosetti Marino for the BLPH Project.

Communication with CrossWind will primarily take place through joint project meetings, for example in the form of technical regular meetings (weekly or bi-weekly), as well as through email, telephone, video calls and instant messaging, as needed. In addition, tripartite regular technical meetings (weekly or bi-weekly) between Rosetti Marino (Platform Integrator), CrossWind and Ballard will take place, organized and led by Rosetti Marino. Furthermore, the Project Manager will report monthly (and/or when required) to the CrossWind BLPH Project Management on project status, risks, and issues.

In case an issue with a potentially significant impact on the project arises and it is deemed that a further escalation step is needed to address the issue, a joint management meeting will be organized to discuss the matter. This process ensures that all stakeholders are adequately informed and have the opportunity to provide input and feedback before any decisions are made.

The Project Manager will be responsible for ensuring effective and timely communication throughout the project. If the Project Manager believes that adjustments to the project

organization and/or communication methods would improve communication, he or she may make those adjustments with prior approval of the Steering Committee, and in agreement with CrossWind, if applicable. This ensures that the Project Manager has the flexibility to adapt to the changing needs of the project.

General communication and updates regarding scheduling and technical updates from external suppliers to the CrossWind project is very much appreciated. Ballard is expecting updates from Shell/CrossWind if any significant changes which will have an impact on Ballard delivery and timing or if the external suppliers expect that there will be an impact. It is expected that those changes will be communicated in such time that Ballard is able to react appropriately to the changes if needed.

3. Project Schedule

The project schedule outlines the timeline for all project activities, including design, procurement, development, testing, commissioning, and handover. The schedule takes into account resource availability, critical paths, and potential risks and delays. The project will be executed in three phases, as outlined below:

Phase 1: Initial Delivery of Engineering Data / Project Initiation and Planning

During this phase, the project team will deliver engineering data (as per the SDRL) to enable the integration of the fuel cell system into the overall Topsides Design of the BLPH, develop a detailed project plan, carry out a marinization gap analysis, attend design reviews if needed, and update the technical specifications.

Phase 2: Container Solution Build, Installation and Commissioning

During this phase, the project team will conclude the development of the system and freeze the design, followed by the procurement, fabrication, construction, testing, shipping, erection, installation, and commissioning of the equipment, concluding with the handover of the container solution to CrossWind. The team will also provide further engineering data (as per the SDRL) and provide the final documentation.

This Phase is further divided into two parts; Part 1 includes System Build-Up and Testing, Part 2 includes Shipping, Installation & Commissioning.

Phase 3: Demonstration Period Support (not detailed in this Project Execution Plan)

During this phase, the project team will support the demonstration period of the BLPH Topsides by providing maintenance services of the system.

The project schedule will be updated regularly throughout the project to reflect progress and any changes in scope or timelines. The Project Manager will communicate any schedule changes internally to the project team and Steering Committee, as well as externally to the customer, as required.

Shown below is the baseline/original schedule at effective date (start of contract), considering the original set of key dates as discussed at the Kick-off meeting for Phase 1. The schedule can also be found in the separate file *BLPH-Ballard-Fuel-Cell_Proposed-Baseline_Rev001.pdf*.

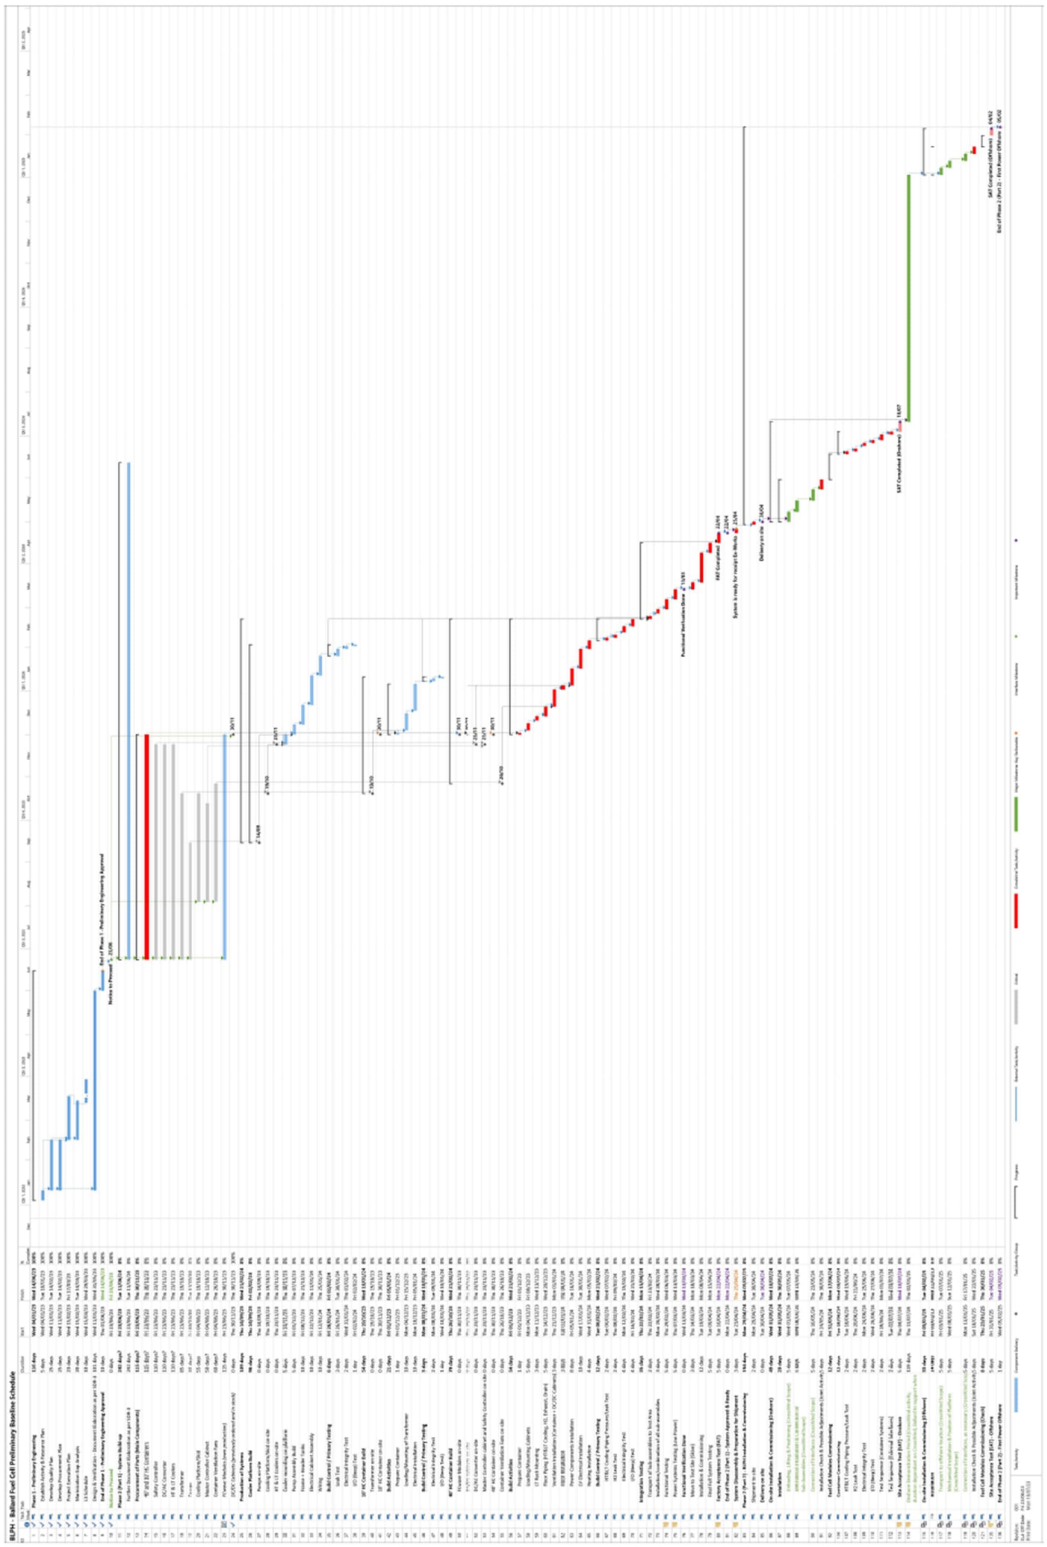

Figure 3. Baseline/original project schedule at effective date.

Assumptions and Constraints

Assumptions:

- Resources (i.e. facilities, supplies, materials, and personnel) are available when expected/required.
- Manufacturing activities run without major complications and personnel is capable of completing their tasks in the expected timeframe and at the expected level of quality.
- Testing runs without major unexpected complications.
- No major change in scope is required.

Constraints:

- Time: Handover date is April 30, 2024.
- Scope: As per contract and tech. specifications document K559-2254-ME-SPE-003.
- Resources: Available production/testing facilities and skilled personnel.

Available Facilities

Production/Warehouse:

- Location: Lupinvej 5, Hobro, Denmark.
  - Current production capacity (limited by floor area) is for 2 full container solutions (incl. all sub-assemblies) simultaneously.

Testing:

- Location: Majsmarken 1, Hobro, Denmark.
  - Capability for full system testing.
  - Hydrogen delivered by trailer.

Calendar Workability

- Important holidays are considered as non-working days and taken into account in the project schedule:
  - Christmas Break
  - Easter
  - Public holidays in Denmark
- A normal 5-day working week was assumed for all onshore work.

Critical Path

The critical path is defined by and can be impacted by the following points:

- Build activities of 40 ft container
  - Activities must be done in great part sequentially due to the limited space inside the containers.
- Integration testing
  - Initial/primary testing is done directly in the production facilities (where there is no access to hydrogen or a load bank) for each sub-assembly.
  - Integration testing is then carried out with all the sub-assemblies combined and carried out entirely at Ballard's own testing facilities.

4. Project Resources

For executing this project, Ballard was allocated some dedicated resources for this project to be successful. The resource allocation is a part of the structure in Ballard to prevent delays due to lack of personnel. The allocation is requested by the project manager. The project manager can request from a list of generic resources. The internal department manager from Ballard then reviews the requested resources, and afterwards allocates the resource to the project manager hereby making an agreement on the availability of the resource. As part of the agreement, the project manager and department manager will convert the generic resource to a specific team member hereby making the project team. The selection of which team members, who is to be a part of the project team, is an evaluation of personal competences and already allocated hours to the individual person on different projects. This ensures that the team members are of the right quality and are available for the project to be executed. Additionally, this also prevents overallocation, which can over time trigger unexpected absence for a team member.

For this project the agreement for the generic resources is as follows:

Table 1. Overview of estimated resources for Phase 2.

Resource Name	May-23	Jun-23	Jul-23	Aug-23	Sep-23	Oct-23	Nov-23	Dec-23	Jan-24	Feb-24	Mar-24	Apr-24	May-24	Jun-24	Jul-24	Aug-24	Sep-24	Oct-24	Nov-24	Dec-24
Project Manager	130	130	20	130	130	50	130	130	130	130	130	130	130	130	130	30	30	30	30	30
System Architect	10	10	10	10	10	10	10	10	10	10	10	10	10	10	10					
Application Engineer	10	10	10	10	10	10	10	10	10	10	10	10	80	40	40					
Mechanical Engineer				40	40															
Electrical Engineer				40	40															
Software Engineer	20	20			40	40	40	50	50	20	20	20	20							
Production Technician					40	40	40	260	260	260	260	60	60							
Electrical Technician					10	10	10	130	130	130	130	60	60							
Test Engineer									20	40	60	60	130							
Documentation Engineer	20	20							40	40	40	40	40							
Supply Chain		10	10	10	10	10	10	10	10	10	10	10	10							

Note that this is only an estimation of the resource needed. The resource estimate will be reviewed once every month. This will be done internally in Ballard together with the department manager and the project managers for different projects in the department. At this review, the project managers can adjust their estimates. Adjustments will then have to go through the process of allocating/deallocating before having a new agreement. This will prevent loss of resources for projects which already have an agreement on the resources.

The project will also use external resources which are booked from either a different department within Ballard or from business partners in the field. The typical time from booking a resource to the resources starting to work will be around 14 days to a month depending on the business partner and requested time. The request of a resource from a different department within Ballard will be made by the project manager together with the department manager.

5. Project Budget

The total project budget for the design, build, delivery, and commissioning of the 1 MW containerized fuel cell solution for the BLPH project is EUR 4,067,004. The budget includes all costs associated with Phase 1 and Phase 2 of the project, including personnel, materials, and equipment, as specified in the contract.

The project budget is broken down as follows:

Table 2. Detailed breakdown of project budget.

	Description	Unit of Measurement	Quantity		Total
1	Stationary fuel cell system – AC solution	unit	1	€ 624,075	€ 624,075
2	Cooling	unit	1	€ 157,775	€ 157,775
3	FCwave™ - 200kW[4]	ea	6	€ 345,000	€ 2,070,000
4	Stationary fuel cell system 1,2 MW – Fuel cell power: - Integration of Fuel cell, power & heat management system - Skid/shelter/cover - Electrical/mechanical installation of Fuel Cells & related BOP - Safety system integration	unit	1	€ 991,018	€ 991,018
5	All Certificates required by the CONTRACT including offshore certification of Fuel Cell				included
6	Installation and Operation Manual				included

7	Packaging & Marking				included
8	Testing (All temporary and permanent testing)				included
9	Commissioning & Installation Spares	LOT	1	€ 35,136	€ 35,136
10	Final Documentation				included
11	Application engineering provided by Ballard's Application Engineers to support integration in phases 1 & 2. Includes Answering questions from the integration manual, interface control diagram and CAN matrix, Discussions and feedback on integration to other plant systems, FAT test results and, on/offshore support	LS			€ 80,000
12	Installation and/or start-up services incl. commissioning onshore and offshore	LS			€ 109,000
	FCA, Incoterms 2020, CONTRACTOR's Facility, Hobo, Denmark				€ 4,067,004

The above-mentioned budget is reflected in the project's payment schedule, which is broken down by milestones which is defined in the contract CW-I-WP4-2022-02 and is outlined below:

Table 3. Detailed breakdown of project milestones.

Milestone	Description	Documents	Issue Date	Amount
Phase 1 – Data Engineering Phase				
MS01	At contract signature	Signed contract, parental guarantee	January 2023	€ 81,340.02 (2%)
MS02	End of Phase 1	Phase 1 Completion Cert.	June 2023	€122,010.12 (3%)
MS03	Notice to Proceed	Signed NTP	June 2023	€ 203,350.20 (5%)
Phase 2 – Fabrication Activities				
MS04	Placement of POs for main components	Copies of unpriced POs	August 2023	€1,626,801.60 (40%)
MS05	Receipt of main components and start of manufacturing	Copies of material receipts with date of receival	December 2023	€813,400.80 (20%)
MS06	Satisfactory testing and plant ready for receipt EXW	Signed Handover Certificate	June 2024	€ 1,016,751.00 (25%)
MS07	Final documentation received	Code 1 achieved	August 2024	€ 203,350.20 (5%)

The Project Manager will monitor the budget throughout the project to ensure that costs are kept within the approved budget. The Project Manager will also report regularly to the Steering Committee (and where appropriate also to CrossWind Project Management) on budget status, any changes or issues, and recommendations for managing costs. Any significant changes to the budget will require approval firstly from the Steering Committee and finally by CrossWind Project Management by means of the Change Management process (to be agreed by CrossWind and Ballard).

6. Procurement

dafdafdafad

7. Quality Management

The goal of the quality management plan is to ensure that the 1 MW containerized fuel cell solution is designed, built, delivered, and commissioned to meet the highest standards of quality. The quality management plan will be executed by the project team in accordance with the company's quality management policies and procedures.

Ballard's quality policy is centered on customer satisfaction, doing things right first time, and continuous improvement in pursuit of zero defects. To achieve that, reviews, measurements and control processes are put in place, such as KPIs, monthly management reviews (in the form of a Quality Council), internal audits, and external audits (e.g. customers, IATF 16949, ISO 9001).

External certifications:

- ISO 9001:2015 – Successful surveillance audit in November 2022
- ISO 14001 (environmental) – Planed certification in Q2 2023
- ISO 45001:2018 (occupational health & safety) – Planed certification in Q2 2023

To ensure quality on procured goods, a supplier management process is implemented. The supplier management process is composed of the following elements:

1. Supplier Qualification: Audits of potential suppliers are carried out before approval for Quality Systems and capabilities (e.g. QMS, Ethics, Conflict Minerals, Cybersecurity, etc.)
2. Supplier APQP and PPAP: Suppliers are assessed according to their Advanced Product Quality Planning (APQP) and Production Part Approval Process (PPAP) and how well these suit Ballard's internal maturity levels (concept, prototype). Furthermore, change management control is also implemented, and Incoming Inspections (FAI) are carried out to verify product and supplier information.
3. Supplier Scorecard: KPIs (such as OTD, NCRs, Cost of Quality) are continuously monitored in a Supplier Scorecard.

For the BLPH 1 MW containerized fuel cell solution, the following Quality Control Plan / Inspection Test Plan will be implemented:

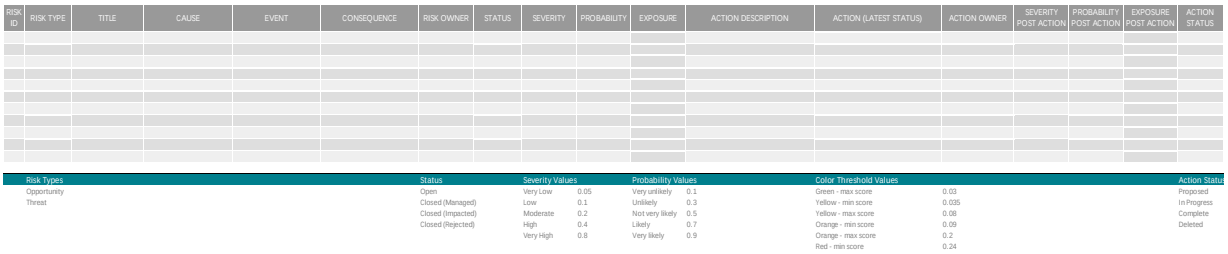
Table 4. High-level Quality Control Plan / Inspection Test Plan.

Step No.	Inspection and Test Plan Activity		Reference Document	Acceptance Criteria	Verifying Document	Expected Completion Date	Actual Completion Date	Client Witnessing
FCwave™ 200 kW Fuel Cell Modules								
1	Goods received		Delivery note	Specification	ERP system DAX			
2	Incoming inspection		IQC control plan / Aiman	Specification	ERP system DAX			
3	Inline production control		Work instruction / Aiman	Specification	Aiman			
4	Birth certificate is issued		Standard birth certificate	Completed birth certificate	Birth certificate			
5	1.0 FAT 001 Pre-operational tests		FAT procedure / FAT report	Specification	FAT report	November 15, 2023		Review
6	2.0 FAT 001 SYS LVL function check		FAT procedure / FAT report	Specification	FAT report	November 30, 2023		Review
7	3.0 FAT 001 Post FAT check		FAT procedure / FAT report	Specification	FAT report	November 30, 2023		Review
8	Down pol curve		FAT procedure / FAT report	Specification	FAT report	November 30, 2023		Review
9	Certificate of performance (CoA)		FAT procedure / FAT report	Specification	CoA certificate	December 1, 2023		Review
1 MW Fuel Cell Power Container								
10	Goods received (container components)		Delivery note	Specification	1. ERP system DAX (internal) 2. Copy of materials receipt with receival date (to client)	December 15, 2023		Review / Approval [MS05]
11	Incoming inspection		IQC control plan	Specification	ERP system DAX	December 15, 2023		-
12	Container build control (Assembly Verification)		Work instruction	Specification	Aiman (tbc)	February 29, 2024		Review
13	Container birth certificate is issued		Standard birth certificate	Completed birth certificate	Birth certificate	April 1, 2024		-
14	Container FAT	*(Pre-operational Testing)*	FAT procedure / FAT report	Specification	FAT report	March 15, 2024		Review
		(Operational Testing)				April 22, 2024		Witness
15	Container certificate of performance (CoA)		FAT procedure / FAT report	Specification	CoA certificate	April 26, 2024		Review
16	Container ready for receipt Ex-Works		FAT procedure / FAT report	Specification	Signed HANDOVER CERTIFICATE	April 30, 2024		Approval [MS06]

CrossWind will carry out an inspection at Ballard's facilities in Hobro during Phase 2 of the project to verify items from sub-section L of the SDRL, which will also form part of the Manufacturing Data Report (MDR):

- L = Certification Data (Works Review): Material Test Certificates, Welder Performance Qualification Certificates, NDE Operator Qualification Certificates, Production Test Results, NDE Records, Material traceability Records/System, Calibration Certificates, Pressure Test Certificates, Dimensional Report, Routine Test Certificate – Electrical Equipment, Measurement of Resistance (Bus Bars), Purchasers Inspection Completion Notes/Waivers, Painting/Insulation Inspection Report, Certificate of Conformity

The Project Manager will be responsible for ensuring that the quality management plan is implemented and executed effectively. The Project Manager will also report regularly to the Steering Committee on quality status, any potential issues, and recommendations for improving quality. Any significant changes to the quality management plan will need to be approved by the Steering Committee.



8. Risk Management

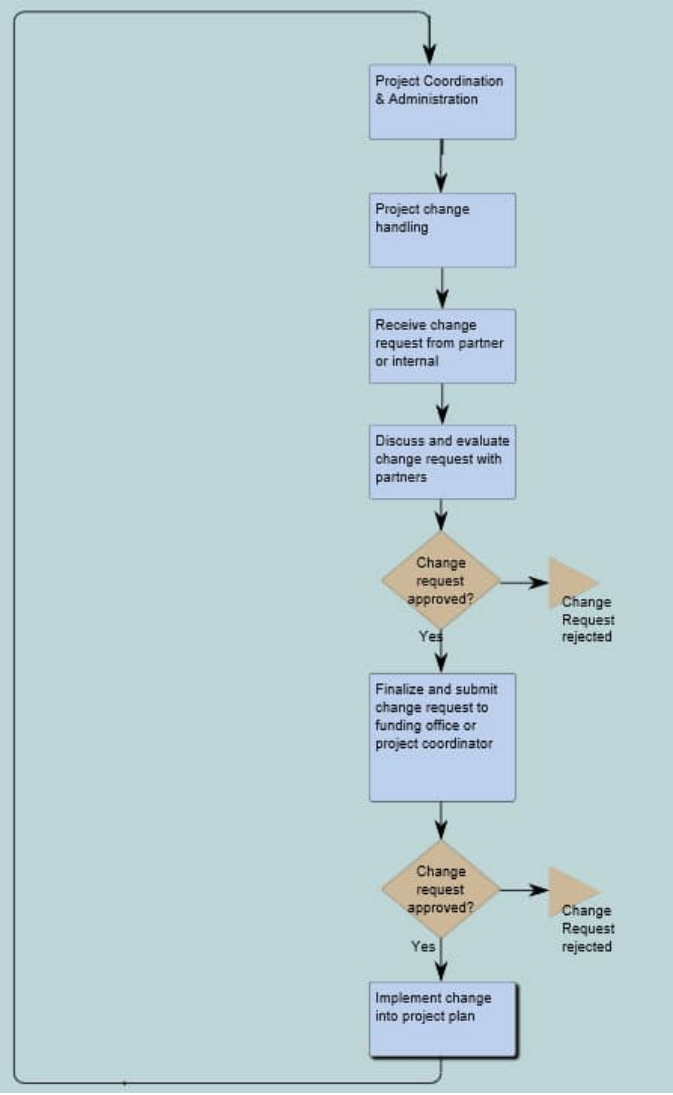
The project team will implement a risk management system used to identify, assess, and manage project risks throughout the project lifecycle. The goal of the risk management system is to minimize the impact of potential risks on the project's objectives, including schedule, budget, and quality/performance.

The risk management system will include the following elements:

1. Risk Identification: The project team will identify potential risks that could impact the project objectives. Risks will be identified through brainstorming sessions, review of project documents, and consultation with stakeholders.
2. Risk Assessment: The project team will assess the potential impact of each identified risk on the project objectives. Risks will be assessed based on their probability and severity of impact.
3. Risk Response Planning: The project team will define and implement risk response plans to mitigate potential risks. Risk response plans will be developed for each identified risk and will outline specific actions that will be taken to minimize the impact of the risk.
4. Risk Monitoring and Control: The project team will monitor and control identified risks throughout the project lifecycle. The Project Manager will be responsible for ensuring that the risk management plan is effectively implemented and that risk response plans are executed as needed.
5. Risk Reporting: The Project Manager will report regularly to the Steering Committee and CrossWind Project Management on the status of identified risks, any changes, and recommendations for managing risks. The Project Manager will also be responsible for ensuring that all project team members are aware of the identified risks and the risk response plans.
6. Contingency Planning: In case potential risks cannot be effectively mitigated through risk response plans, the project team will develop and implement contingency plans to address such risks.

The risk register used to document and track the above-mentioned elements is shown below:

RISK ID	RISK TYPE	TITLE	CAUSE	EVENT	CONSEQUENCE	RISK OWNER	STATUS	SEVERITY	PROBABILITY	EXPOSURE	ACTION DESCRIPTION	ACTION (LATEST STATUS)	ACTION OWNER	SEVERITY POST ACTION	PROBABILITY POST ACTION	EXPOSURE POST ACTION	ACTION STATUS



Risk Types	Status	Severity Values		Probability Values		Color Threshold Values		Action Status
Opportunity	Open	Very Low	0.05	Very unlikely	0.1	Green - max score	0.03	Proposed
Threat	Closed (Managed)	Low	0.1	Unlikely	0.3	Yellow - min score	0.035	In Progress
	Closed (Impacted)	Moderate	0.2	Not very likely	0.5	Yellow - max score	0.08	Complete
	Closed (Rejected)	High	0.4	Likely	0.7	Orange - min score	0.09	Deleted
		Very High	0.8	Very likely	0.9	Orange - max score	0.2	
						Red - min score	0.24	

Figure 4. Risk register template.

The Project Manager will be responsible for ensuring that the risk management system is implemented effectively and that risks are managed throughout the project lifecycle. Any significant changes to the risk management system will require approval from the Steering Committee and, if applicable, CrossWind Project Management.

12. Project Closure

The project closure phase begins when all project objectives have been met and the project deliverables have been completed and accepted by CrossWind. The purpose of this phase is to ensure that the project is concluded in an organized and effective manner, and that all project documentation is properly archived for future reference.

The following activities will be performed during the project closure phase:

1. Final Deliverables: The project team will ensure that all project deliverables have been completed, accepted, and delivered to the stakeholders as per the project plan.
2. Contract Closure: The project team will ensure that all contracts related to the project have been closed, including final payments to contractors and suppliers.
3. Lessons Learned / Project Review: The project team will conduct a review of the project to evaluate its overall success and identify areas for improvement. The review will focus, among other things, on project objectives, schedule, budget, quality, and stakeholder satisfaction.
4. Project Closure Report: The project team will prepare a project closure report summarizing the project's results, including lessons learned, and providing recommendations for future projects.
5. Project Documentation: All project documentation, including project plans, reports, and records, will be adequately archived and stored for future reference according to company policy.
6. Project Hand-over to Customer Care: With the conclusion of Phases 1 and 2, the project will be handed over to the Customer Care Department, which will oversee Phase 3 of the project; service and support during demonstration period.

The Project Manager will be responsible for ensuring that all closure activities are performed in a timely and effective manner. The project closure phase will not be considered complete until all closure activities have been completed, and the project closure report has been approved by the Steering Committee.

1.) Location relative to the directions of the world on the top view (sheet 3/14)
2.) Reactions forces and mounting details are described on sheets 13 and 14
3.) A ladder is required to access the platform above 40ft Container
4.) 40ft flatbed structure meets requirements of EN1090-2 - Execution class: EXC2.

NOTE2:
Lifting of the 40ft flatbed with equipment in accordance to guidelines specified in structural calculation report: "Crosswind - Flatbed 40ft - calculation report rev_1.pdf"

MATERIAL

Material must comply to Directive 2002/95/EC of the European Parliament (RoHS) and to Regulation (EC) No 1907/2006 of the European Parliament (Reach)

Tolerances for linear and angular dimensions without individual tolerance according to ISO 668

Surface appearance, if not specified, according to reference table LZT 142 0001, category 6

11. Summary 215

1. Abbreviations, symbols and definitions

The most important abbreviations and definitions are listed in that point of the document as they can differ in different standards.

Platform container – a container having only the base and the floor, whose width and length correspond to the dimensions of a general-purpose container, fitted with the top and bottom corner fittings

R – rating, i. e. maximum gross mass of the container including permanent equipment and its cargo, in kg, but excluding the lifting set
T – tare mass, i. e. the mass of the empty container including any permanent equipment but excluding cargo and lifting set, in kg
P – payload, i. e. the maximum permissible mass of cargo which may be safely transported by the container, in kg

$$P = R - T$$

L – external length of the container
W – external width of the container
H – external height of the container
S – distance between the centeres of apertures in corner fittings on the length of the container
P – distance between the centers of apertures in corner fittings on the breadth of the container
D – diagonals of the container measure between the centers of apertures in corner fittings (D1, D2, D3, D4, D5, D6)
K1 – difference between D1 and D2 or D3 and D4 (K1=|D1-D2| or K1=|D3-D4|)
K2 – difference between D5 and D6 (i. e. K2=|D5-D6)

2. Introduction

The main purpose of this study is to determine the most unfavorable reactions from the load of a 40-foot High Cube container with coolers mounted on it and 10 foot High Cube container placed on North Sea type barge defined by DNVGL to have a minimum size of 300' x 90' x 20' or larger.

Localization of barge (north coast of the Netherlands) on open sea.

Designed flatbed on which stands coolers is container type 1AX :
L=12192 (+0)(-10) [mm]
W=2438 (+0)(-5) [mm]
H<2438 (+0)(-5) [mm]

Dimensions between ISO 1161 Corners (with assumed tolerances in cubes and dimensions tolerances of the structure) P=2260 (+3)(-5) [mm] S=11989 (+3)(-10) [mm]

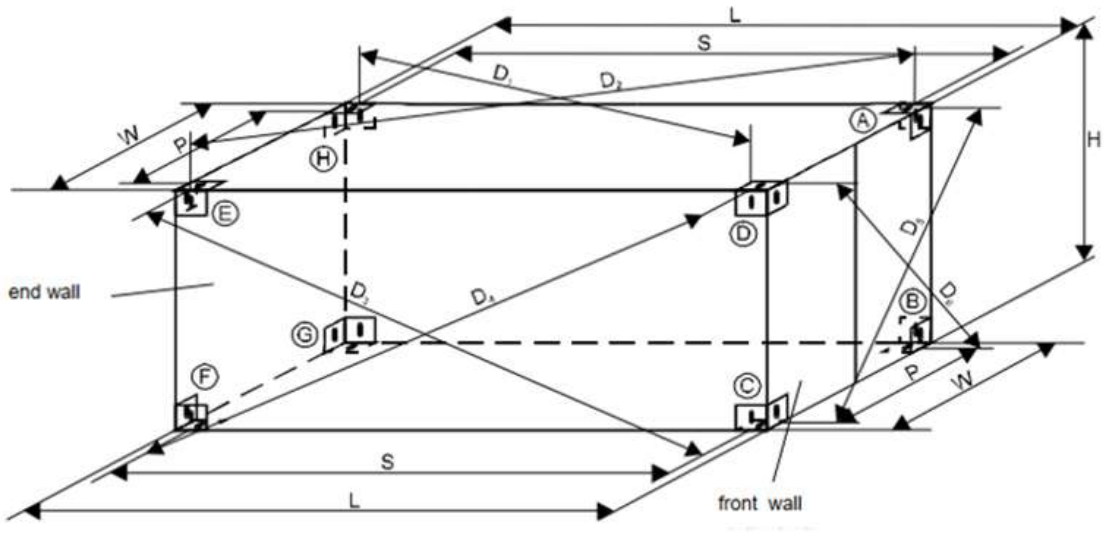

Fig 1: Dimension of the container (Polski Rejestr Statków, Rules for the Construction of Containers, Gdańsk, 2014)

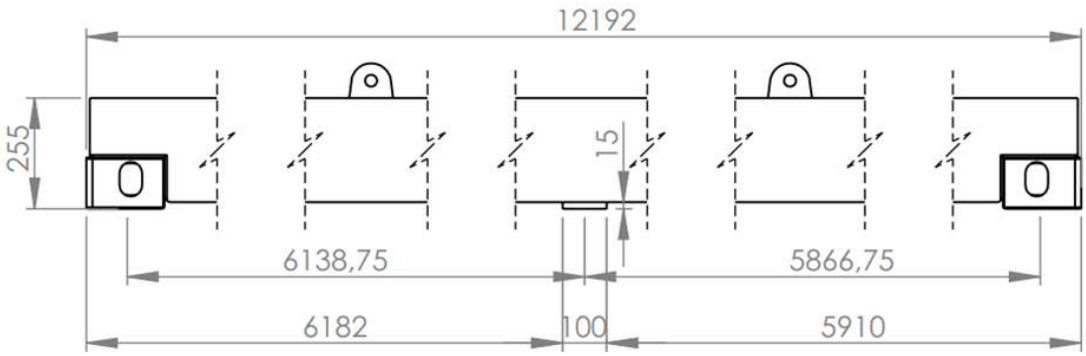

Fig 2: Dimensions of the flatbed standing on the top of the 40ft High-Cube container (supports and lifting points)

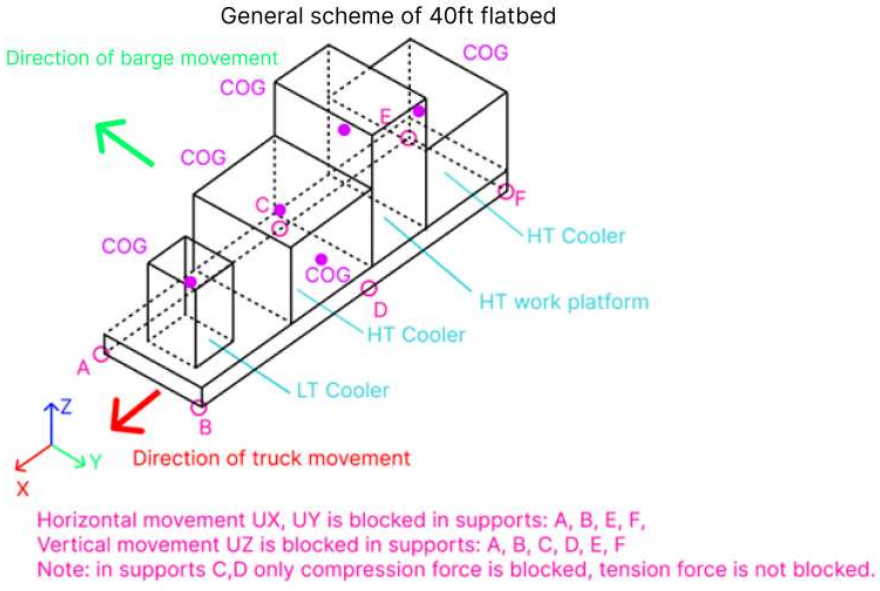

Fig 3: General scheme of 40ft flatbed (COG – Center of gravity)

- measured from the bottom of the container (G, H, I, J): 724mm

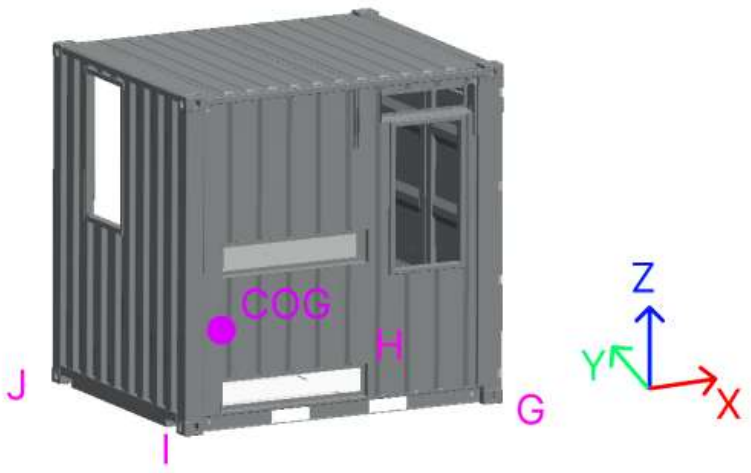

Fig 14: 10ft High Cube container – custom modified – geometry – Back view

5. Design conditions and safety factors

Safety factor for lifting offshore have been assumed for 10 tons load for 40ft flatbed with equipment. The same safety factor have been assumed for lifting of 40ft High Cube container with equipment and for 10ft High Cube container with equipment, as it is conservative assumption.

$$SHL = 10\ t = 10000kg$$

$$DAF_{onshore} = 1{,}10$$

$$DAF_{inshore} = 1{,}07 + 0{,}05 \cdot \sqrt{\frac{100t}{SHL}} = 1{,}23$$

$$DAF_{offshore} = 1 + 0{,}25 \cdot \sqrt{\frac{100t}{SHL}} = 1{,}79$$

Above dynamic safety factor combined with LRFD Table 5.8 of DNV standard gives below safety factor for lifting permanent loads:

$$SF_{DAF} = 1{,}3 \cdot 1{,}79 = 2{,}32$$

Description	Symbol	Value	Reference
Load safety factors for supported structure (road transport)	*SF*	1,6	*DNVGL-ST-N001*
Partial factor for resistance of structural members (road transport and offshore lifting)	γ_m	1,15	*DNVGL-ST-N001*
Partial factor for resistance of joints (bolts and welds) (road transport and offshore lifting)	γ_{mw}	1,30	*DNVGL-ST-N001*
Lifting with lifting sets – DAF (Dynamic Amplification Factor)- (lifting offshore)	*DAF*	1,8	*DNVGL-ST-N001 (Table 16.1)*
Lifting with lifting sets (lifting onshore)	*SF*	2	*EN 13155*
Partial factor for resistance of structural members (lifting)	γ_m	1	*EN 13155*
Partial factor for resistance of joints (bolts and welds) (lifting)	γ_{mw}	1,1	*EN 13155*
Load safety factors for supported structure (in destination place)	*SF*	1,35/1,5	*EN 1990-1-1*
Partial factor for resistance of structural members (in destination place)	γ_m γ_{M0}, γ_{M1}	1	*EN 1993-1-1*
Partial factor for resistance of joints (bolts and welds) (in destination place)	γ_{mw} γ_{M2}	1,25	*EN 1993-1-1*

Fig 15: Table of main safety factors

In destination place (offshore) has been assumed the same safety factors as for transport on barge in accordance with DNVGL-ST-N001 point 5.9.8 which states as below:

Table 5-8 Load factors for Ultimate Limit State (LRFD – Load and resistance factor design) According to DNVGL-ST-N001

Load condition	G	Q	D	E	A
ULS-a	1,3	1,3	1,0	0,7	NA
ULS-b	1,0	1,0	1,0	1,3	NA

G – permanent loads
Q – variable functional loads
D – deformation load
E – environmental loads (wind, waves, current, storm surge, tide, ice)
A – accidental loads

Fig 16: Table 5.8 of DNVGL-ST-N001 standard

6. Material properties and stress limits in appropriate load cases

40ft flatbed is made of steel S355J2
Containers are provided by external suplier. It has been assumed that these containers are also made of steel S355.

Steel grade: S355
Young modulus: $E = 210GPa$
Shear modulus: G= $81GPa$
Yield strength: $f_y = 355MPa$
Ultimate tensile strength: $f_u = 490MPa$
Possion's ratio in elastic stage: $\nu = 0{,}3$

Load cases			Load safety factors			Material partial safety factors

7. Calculations of basic wind velcotiy in destination place

7.1. First guidelines from customer

In-place Wind Loads:

Table 3.6 - Omni-Directional Extreme Values at 125 m MSL [9]

Averaging Time	Return period (years)						
	1	2	5	10	50	100	1,000
1hr	31.8	33.4	35.1	36.4	39.1	40.1	43.4
10min	33.7	35.5	37.4	38.8	41.7	42.9	46.5
3s	39.4	41.6	44.1	45.9	49.7	51.1	56.0

To adjust wind speeds to any specified averaging time or elevation, the following equations are to be used [8]:

$U(z, t) = U(z) * [1 - 0.41 * Iu(z) * \ln(t/t_0)]$

$U(z)$ = 1-hour mean wind speed given by:

$U(z) = U_0 * [1 + C * \ln(z/z_r)]$

$C = 0.0573 * (1 + 0.15 * U_0)^{1/2}$

$Iu = 0.06 * [1 + 0.043 * U_0] * (z/z_r)^{-0.22}$

U_0 = 1-hour average at the reference elevation, z_r

z_r = 10 m above sea level.

Directional exceedance data for wind is presented in Figure 3.6. The wind predominantly blows from the south-west.

Fig 18: Wind values provided by customer

In accordance to Eurokode 1991-1-4 - Wind actions:

v_{b0} - fundamental basic wind velocity is the 10 minute mean wind velocity with an annual risk of bein exceeded of 0,02 (which corrseponds with 50 years return period), irrespective of wind direction a height of 10m above flat open country terrain.

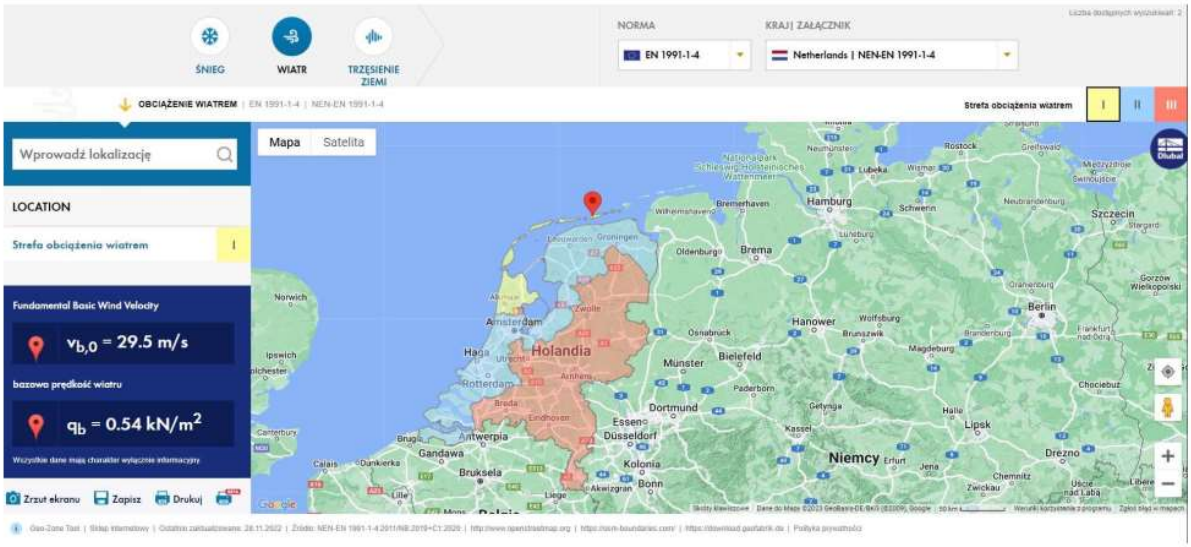

Fig 19: Wind actions according to EC1991-1-4 (Dlubal software website)

In accordance to Netherlands Eurocode 1991-1-4, North part of Netherlands is in zone 1, with fundamental basic wind velocity equals 29,5m/s.

In accordance to the above table 3.6 Omni Directional Extreme values at 125m for averaging time 10 minutes and return period 50 years, U(z) = 41,7m/s.

I am looking for fundamental basic wind velocity (averaging time 10 minuts, return period 50 years at reference elevation 10 meters):

Assumed: $v_{b,0} := 31,0 \ \frac{m}{s}$

$z := 125 \ m$

$z_r := 10 \ m$

Calculations:

$$C := 0,0573 \cdot \sqrt{1 + 0,15 \cdot v_{b,0} \ \frac{s}{m}} = 0,1362$$

Mean wind velocity (z=125m, averaging time 10 minutes, return period 50 years):

$$v_m := v_{b,0} \cdot \left(1 + C \cdot \ln\left(\frac{z}{z_r}\right)\right) = 41,7 \ \frac{m}{s}$$ U(z) = 41,7m/s

As shown above, for obtained guideliness the basic wind velocity (h=10m, 10minutes, 50years) is equal to:

$v_{b,0} := 31 \ \frac{m}{s}$

Obtained value is very similar to the value from the Netherlands Eurocode for wind (29,5), but a little bit bigger what is reasonable as the value of wind were measured on open sea.

7.2. Second guidelines from customer

Description	Unit	Value
Ambient Conditions		
Ambient Temperature (min/nom/max) – hourly @ +10m	°C	-8.4 / 10.5 / 25
Atmospheric Pressure (nominal) – hourly @ +10m	mbar	1013.7
Specific Humidity (min/nom/max) – hourly @ +10m	X 10^{-3}	4.2 / 6.5 / 9.5
Wind Conditions		
Annual average wind speed (at 100 m)	m/s	9.56
Extreme Wind Speed for 1-Year Recurrence Period (at 100 m)	m/s	33.1
Extreme Wind Speed for 50-Year Recurrence Period (at 100 m)	m/s	41.0
Marine Conditions		
Sea Water Temperature (min/max)	°C	1.3 / 20.2
Average Sea Water Density	Kg/m	1025
Highest Astronomical Tide (HAT)	m	2.2 (LAT)
Lowest Astronomical Tide (HAT)	m	0 (LAT)
Extreme High-Water Level for 50 -Year Recurrence Period	m	12.3 (LAT
Extreme High-Water Level for 1-Year Recurrence Period	m	9.1 (LAT)
Extreme Low-Water Level for 1-Year Recurrence Period	m	-0.5 (LAT)
Extreme Low-Water Level for 50-Year Recurrence Period	m	

Fig 20: Second guidelines from customer regarding the wind speed

Extreme wind speed for 50-year recurrence period at 100m:

$$v_{b,max,50y,100m} := 41\ \frac{m}{s}$$

I am looking for fundamental basic wind velocity (averaging time 10 minuts, return period 50 years at reference elevation 10 meters):

Assumed:

$$v_{b,0} := 31,2\ \frac{m}{s}$$

$$z := 100\ m$$

$$z_r := 10\ m$$

Calculations:

$$C := 0,0573 \cdot \sqrt{1 + 0,15 \cdot v_{b,0}\ \frac{s}{m}} = 0,1366$$

Mean wind velocity (z=100m, averaging time 10 minutes, return period 50 years):

$$v_m := v_{b,0} \cdot \left(1 + C \cdot \ln\left(\frac{z}{z_r}\right)\right) = 41\ \frac{m}{s}$$

U(z) = 41,0m/s

Fundamental basic wind velocity	vb0 [m/s2]
1. Calculated in acc. to 1st guidelines	31
2. From EC1991-1-4 for Norht part of Netherlands	29,5
3. Calculated in acc. to 2nd guidelines	31,2

Fig 21: Comparison of obtained basic wind velocities

8. Pre-processing

8.1. Assumptions

Strength of the 40ft flatbed have been checked in document "CrossWind – Flatbed 40ft – calculations report rev_1.pdf" from which reaction on the 40ft container were taken.
In this paper will be calculated reactions from 40ft HC Container nad 10ft HC Container during transport on barge and in destination place offshore near North Coast of Netherland and also during lifting offshore (which gives more conservative results then lifting onshore).

8.2. Loads definition

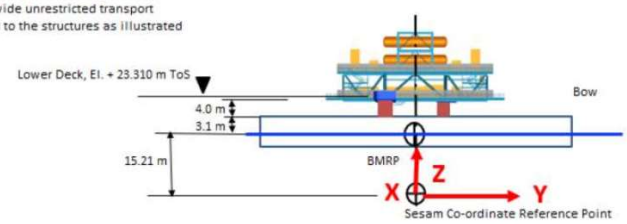
8.2.1. Accelerations during transport on barge

Customer provided guidelines of wind during transport on barge in document "Vendor Design Data RevB.pdf" which describe it as below:

Default motion criteria for unrestricted world-wide tows, provided in DNV-ST-N001 [23], shall be used. The LRFD design criteria are presented in Table 4.2.

Table 4.2 – Topside Transport Barge Motions [23]

Acceleration / Wind Force	Roll Case	Quartering Case	Pitch Case
Ay at waterline	0.50 g	0.40 g	0
Ay increase for each metre (z) above waterline	0.017 g/m	0.013 g/m	0
Ax at waterline	0	0.15 g	0.25 g
Ax incr. each metre (z) above waterline	0	0.005 g/m	0.007 g/m
Az at centre (C) barge	0.20 g	0.15 g	0.10 g
Az incr. each metre (y, d or x respectively) from C	0.017 g/m	0.012 g/m	0.007 g/m
Wind Pressure	1.0 kN/m²	1.0 kN/m²	1.0 kN/m²



Notes:

1. x = distance from barge mid ship.
2. y = distance from barge centreline.
3. d = distance used for calculating az in quartering seas, $d = \sqrt{(y^2 + 0.5x^2)}$.
4. z = height above waterline.
5. ay = transverse acceleration parallel with barge deck.
6. ax = longitudinal acceleration parallel with barge deck.
7. az = acceleration normal to the barge deck.

Transport Analysis

Ref. 1: - In the absence of barge motions analysis, the topsides is considered to be transported on a North Sea type barge, defined by DNVGL to have a minimum size of 300' x 90' x 20', or larger. DNVGL simplified worldwide unrestricted transport motion criteria for this type of barge will be used to determine transport accelerations applied to the structures as illustrated below. Design methodology for LRFD.

Acceleration / Wind Force	Roll Case	Quartering	Pitch Case
Ay at waterline	0.50 g	0.40 g	0
Ay increase for each metre (z) above waterline	0.017 g/m	0.013 g/m	0
Ax at waterline	0	0.15 g	0.25 g
Ax incr. each metre (z) above waterline	0	0.005 g/m	0.007 g/m
Az at centre (C) barge	0.20 g	0.15 g	0.10 g
Az incr. each metre (y, d or x respectively) from C	0.017 g/m	0.012 g/m	0.007 g/m
Wind Pressure	1.0 kN/m²	1.0 kN/m²	1.0 kN/m²

Gravity assumed to be vertical (adjusted in the heave value) = 9.807 m/sec²

THE ABOVE ACCELERATIONS ARE CONVERTED TO PROVIDE ACCELERATIONS FOR SESAM ANALYSIS AT MRP

Description	Linear Acceleration Amplitude, (m/Sec²)				Angular Acceleration Amplitude, (Rad/Sec²)		
	Surge, Y	Sway, X	Max.	Min. Heave,	Roll, RotY	Pitch, RotX	Yaw, RotZ
Head Sea, Bow Down	2.45	0.00	10.79	8.83	0.0000	-0.0686	0.0000
Quartering Sea, Stbd Bow Down	1.47	3.92	11.28	8.34	0.1275	-0.0490	0.0000
Beam Sea, Stbd Down	0.00	4.90	11.77	7.85	0.1667	0.0000	0.0000
Quartering Sea, Stbd Stern Down	-1.47	3.92	11.28	8.34	0.1275	0.0490	0.0000
Head Sea, Stern Down	-2.45	0.00	10.79	8.83	0.0000	0.0686	0.0000
Quartering Sea, Port Stern Down	-1.47	-3.92	11.28	8.34	-0.1275	0.0490	0.0000
Beam Sea, Port Down	0.00	-4.90	11.77	7.85	-0.1667	0.0000	0.0000
Quartering Sea, Port Bow Down	1.47	-3.92	11.28	8.34	-0.1275	-0.0490	0.0000

Notes:
1) - Accelerations applied at the Barge Motions Reference Point (BMRP)
2) - Both +ve and -ve heave to be considered.

Using the Sesam co-ordinates shown above, the most onerous location of the centre of a hydrogen storage tank is:

- X = 4.0 m, (4 m off the barge centre)
- Y = 0.0 m, (at the barge centre)
- Z = 23.0 m, (above the barge water plane area)

For all other equipment, a generic centre location may be considered at:

- X = 8.0 m, (8 m off the barge centre)
- Y = 19.0 m, (19.0 m towards bow / stern)
- Z = 18.0 m, (above the barge water plane area)

Fig 23: Calculated accelerations on barge in according to guidelines (Vendor Design Data Rev B.pdf)

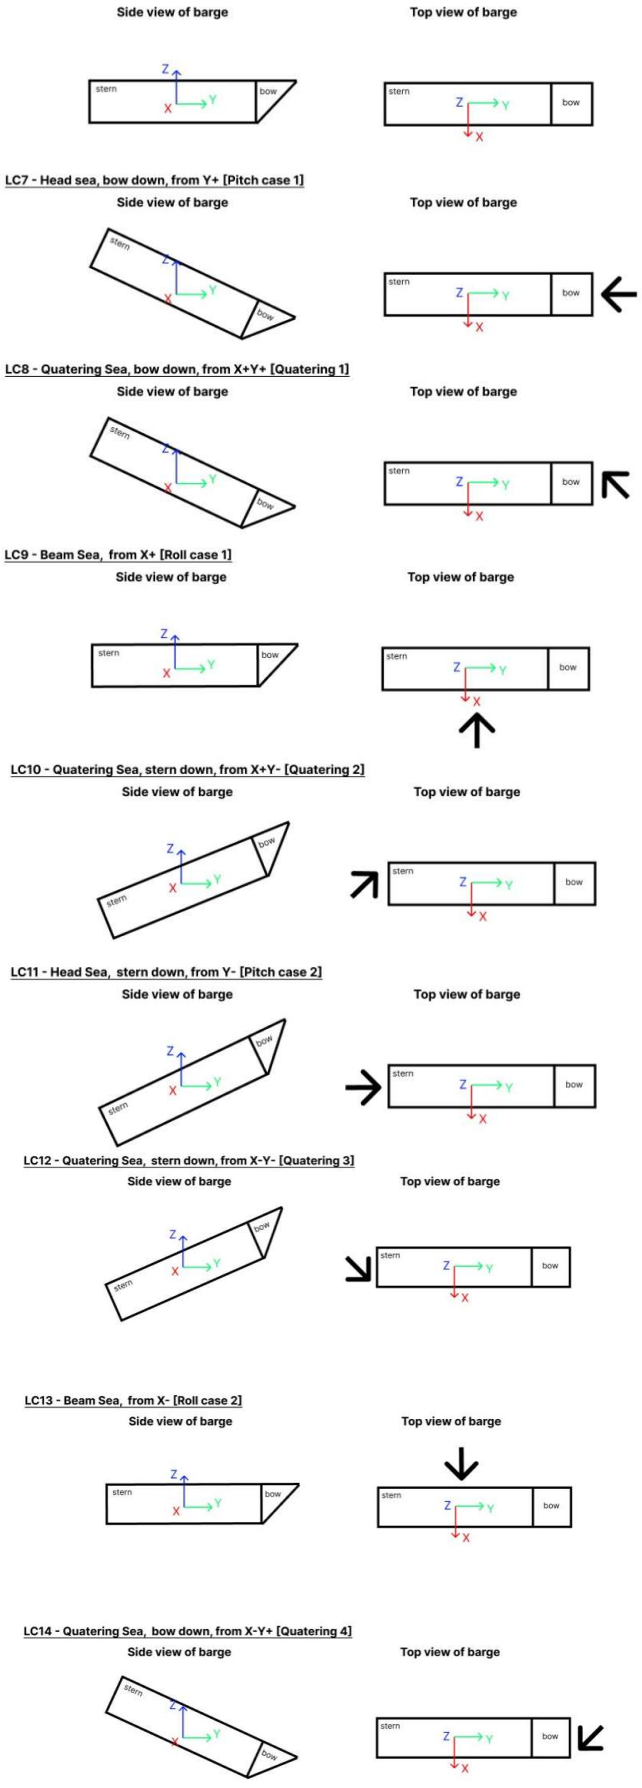

Fig 24: Schematic representation of transport on barge

8.2.2. Accelerations during transport on barge (Second guidelines from customer)

2024.01.24 – New transport guidelines were obtained from customer: "CW-BALL-TQ-0007-Transportation forces.docx" in accordance to which:

The supplier is to design the equipment to be suitable for the offshore barge transportation from the fabrication yard in Italy to the offshore site in The Netherlands.

The calculation can be done based on option 1 or 2.

For option 1: Determine if equipment is on the lower or upper deck and the orientation of the equipment on the plotplan and apply the loadcases from option 1.

For option 2: Determine if equipment is on the lower or upper deck and use the loadcases from option 2.

Option 1 Orientation specific transportation criteria			
	X (Roll)	**Y (Pitch)**	Z (incl. gravity)
Lower deck - roll	**+ / - 0.60 G**		**1G + / - 0.30 G**
Loadcase 1	-0.60 G in X		1.3 G Vertical
Loadcase 2	-0 .60 G in X		0.7 G vertical
Loadcase 3	+0.60 G in X		1.3 G Vertical
Loadcase 4	+0.60 G in X		0.7 G vertical
Lower deck - pitch		**+ / - 0.35G**	**1 G + / - 0.50 G**
Loadcase 5		-0.35 G in X	1.5 G Vertical
Loadcase 6		-0.35 G in X	0.5 G vertical
Loadcase 7		+0.35 G in X	1.5 G Vertical
Loadcase 8		+0.35 G in X	0.5 G vertical
Upper deck – roll	**+ / - 0.70 G**		**1G + / - 0.30 G**
Loadcase 1	-0.70 G in X		1.3 G Vertical
Loadcase 2	-0 .70 G in X		0.7 G vertical
Loadcase 3	+0.70 G in X		1.3 G Vertical
Loadcase 4	+0.70 G in X		0.7 G vertical
Upper deck -pitch		**+ / - 0.40 G**	**1G + / - 0.50 G**
Loadcase 5		-0.40 G in Y	1.5 G Vertical
Loadcase 6		-0.40 G in Y	0.5 G vertical
Loadcase 7		+0.40 G in Y	1.5 G Vertical
Loadcase 8		+0.40 G in Y	0.5 G vertical

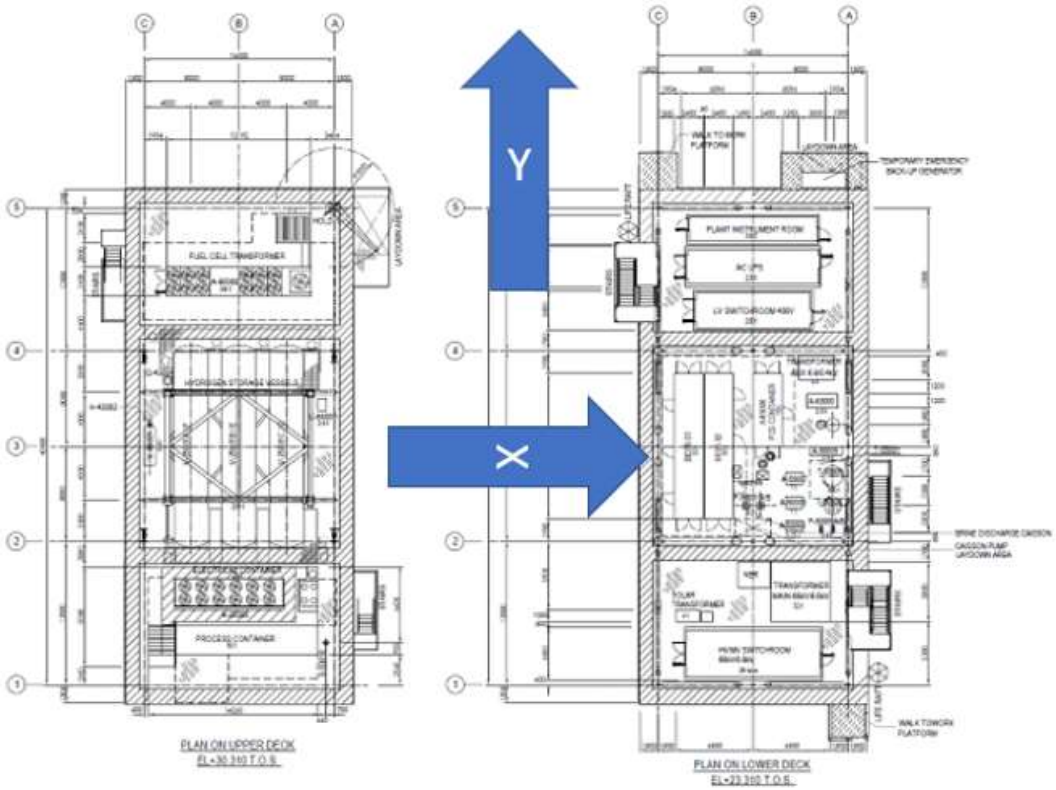

Fig 25: Second transportation guidelines from customer

Lower deck criteria	**+ / - 0.60 G**		**1 G + / - 0.50 G**
Loadcase 1	-0.60 G in X		1.5 G vertical
Loadcase 2	-0.60 G in X		0.5 G vertical
Loadcase 3	+0.60 G in X		1.5 G vertical
Loadcase 4	+0.60 G in X		0.5 G vertical
Loadcase 5	-0.60 G in Y		1.5 G vertical
Loadcase 6	-0.60 G in Y		0.5 G vertical
Loadcase 7	+0.60 G in Y		1.5 G vertical
Loadcase 8	+0.60 G in Y		0.5 G vertical
Upper deck deck criteria	**+ / - 0.70 G**		**1 G + / - 0.50 G**
Loadcase 1	-0.70 G in X		1.5 G vertical
Loadcase 2	-0.70 G in X		0.5 G vertical
Loadcase 3	+0.70 G in X		1.5 G vertical
Loadcase 4	+0.70 G in X		0.5 G vertical
Loadcase 5	-0.70 G in Y		1.5 G vertical
Loadcase 6	-0.70 G in Y		0.5 G vertical
Loadcase 7	+0.70 G in Y		1.5 G vertical
Loadcase 8	+0.70 G in Y		0.5 G vertical

Transportation acceleration to be combined with wind forces in the same direction as the horizontal acceleration.

The plot below shows the main axis as used in the table, X corresponds with roll and sway accelerations and Y with pitch and surge accelerations.

Fig 26: Second transportation guidelines from customer

Contractor to confirm that this is implemented in their package design and advise on any external seafastening requirement.

Fig 27: Second transportation uidelines from customer

In our case, as we know that our solution is placed on upper deck and in which direction will be installed, we choose to use **Option 1** which is less conservative.

DNV-ST-N001 - Old calculations

Calculation of acceleration of analyzed 40ft container with 40ft flatbed at localization X=8m; Y=19m; Z=18m						
Main data: X=8m Y=19m Z=h=18m g=9,807m/s2	Description		Linear Acceleration Amplitude (m/s2)			
			Surge, Y (a_x)	Sway, X (a_y)	Max. Heave (a_z)	Min. Heave (a_z)
	LC1	LC1 - Head sea, bow down, from Y+ [Pitch case 1]	3,69		12,09	7,52
	LC2	LC2 - Quatering Sea, bow down, from X+Y+ [Quatering 1]	2,35	6,22	13,61	6,00
	LC3	LC3 - Beam Sea, from X+ [Roll case 1]		7,90	13,10	6,51
	LC4	LC4 - Quatering Sea, stern down, from X+Y- [Quatering 2]	-2,35	6,22	13,61	6,00
	LC5	LC5 - Head Sea, stern down, from Y- [Pitch case 2]	-3,69		12,09	7,52
	LC6	LC6 - Quatering Sea, stern down, from X-Y- [Quatering 3]	-2,35	-6,22	13,61	6,00
	LC7	LC7 - Beam Sea, from X- Roll case 2]		-7,90	13,10	6,51
	LC8	LC8 - Quatering Sea, bow down, from X-Y+ [Quatering 4]	2,35	-6,22	13,61	6,00

1st option - New Italian guidelines

Calculation of acceleration of analyzed 40ft container with 40ft flatbed according to Italian guidelines 2024.01.22 - OPTION 1						
Main data: Upper deck g=9,807m/s2	Description		Linear Acceleration Amplitude (m/s2)			
			Surge, Y (a_x)	Sway, X (a_y)	Max. Heave (a_z)	Min. Heave (a_z)
	O1 LC1&LC2	LC1 - Head sea, bow down, from Y+ [Pitch case 1]	3,92 (6,2%)		14,71 (21,5%)	4,90 (35%)
		LC2 - Quatering Sea, bow down, from X+Y+ [Quatering 1]				
	O1 LC3&LC4	LC3 - Beam Sea, from X+ [Roll case 1]		(10,3%) 6,86	12,75 (2,7%)	6,86 (5,4%)
		LC4 - Quatering Sea, stern down, from X+Y- [Quatering 2]				
	O1 LC5&LC6	LC5 - Head Sea, stern down, from Y- [Pitch case 2]	-3,92 (6,2%)		14,71 (21,5%)	4,90 (35%)
		LC6 - Quatering Sea, stern down, from X-Y- [Quatering 3]				
	O1 LC7&LC8	LC7 - Beam Sea, from X- Roll case 2]		(10,3%) -6,86	12,75 (2,7%)	6,86 (5,4%)
		LC8 - Quatering Sea, bow down, from X-Y+ [Quatering 4]				

2nd option - New Italian guidelines

Calculation of acceleration of analyzed 40ft container with 40ft flatbed according to Italian guidelines 2024.01.22 - OPTION 2						
LC7 / Main data: Upper deck g=9,807m/s2 / LC9 LC11 LC13	Description		Linear Acceleration Amplitude (m/s2)			
			Surge, Y (a_x)	Sway, X (a_y)	Max. Heave (a_z)	Min. Heave (a_z)
	O2 LC1&LC2	LC1 - Head sea, bow down, from Y+ [Pitch case 1]	6,86 (86%)		14,71 (21,5%)	4,90 (35%)
		LC2 - Quatering Sea, bow down, from X+Y+ [Quatering 1]				
	O2 LC3&LC4	LC3 - Beam Sea, from X+ [Roll case 1]		(10,3%) 6,86	14,71 (12,2%)	4,90 (7,5%)
		LC4 - Quatering Sea, stern down, from X+Y- [Quatering 2]				
	O2 LC5&LC6	LC5 - Head Sea, stern down, from Y- [Pitch case 2]	-6,86 (86%)		14,71 (21,5%)	4,90 (35%)
		LC6 - Quatering Sea, stern down, from X-Y- [Quatering 3]				
	O2 LC7&LC8	LC7 - Beam Sea, from X- Roll case 2]		(10,3%) -6,86	14,71 (12,2%)	4,90 (7,5%)
		LC8 - Quatering Sea, bow down, from X-Y+ [Quatering 4]				

Fig 28: Comparision between different gudelines

As shown above, the acceleration values differ between the DNV guidelines and the 2 options provided by the customer.

The 2 customer-defined options apply to only 4 load cases, while DNV takes into account as many as 8 load cases. Therefore, 6 load cases from DNV were adopted in the calculations and 2 cases (LC7 - Head sea, bow down and LC11 - head sea - stern down) were adopted from the client's guidelines because they give higher impact values than the corresponding DNV guidelines.

8.2.3. Wind at destination place acting on 40ft flatbed with equipment

These calculations can be found in document “Cross_Wind – Flatbed 40ft – calculations report rev_1.pdf”

8.2.4. Wind at destination place acting on 40ft High Cube container

40ft and 10ft High Cube containers will be placed on sea type barge.
When the barge is its destination (at sea near the coast of the Netherlands), the whole solution will be at a height of 30,31m above sea level (according to the client’s instructions)

Assumed Terrain category: 0 (Sea, coastal area exposed to the open sea)
Fundamental value of the basic wind velocity has been calculated in regards to obtained guidelines.

Basic wind velocity:

Fundamental value of the basic wind velocity: $v_{b,0} := 31,2 \frac{m}{s}$

Directional factor: $c_{dir} := 1$

Seasonal factor: $c_{season} := 1$

Basic wind velocity: $v_b := c_{dir} \cdot c_{season} \cdot v_{b,0} = 31,2 \frac{m}{s}$ (eq:4.1-EC1991-1-4)

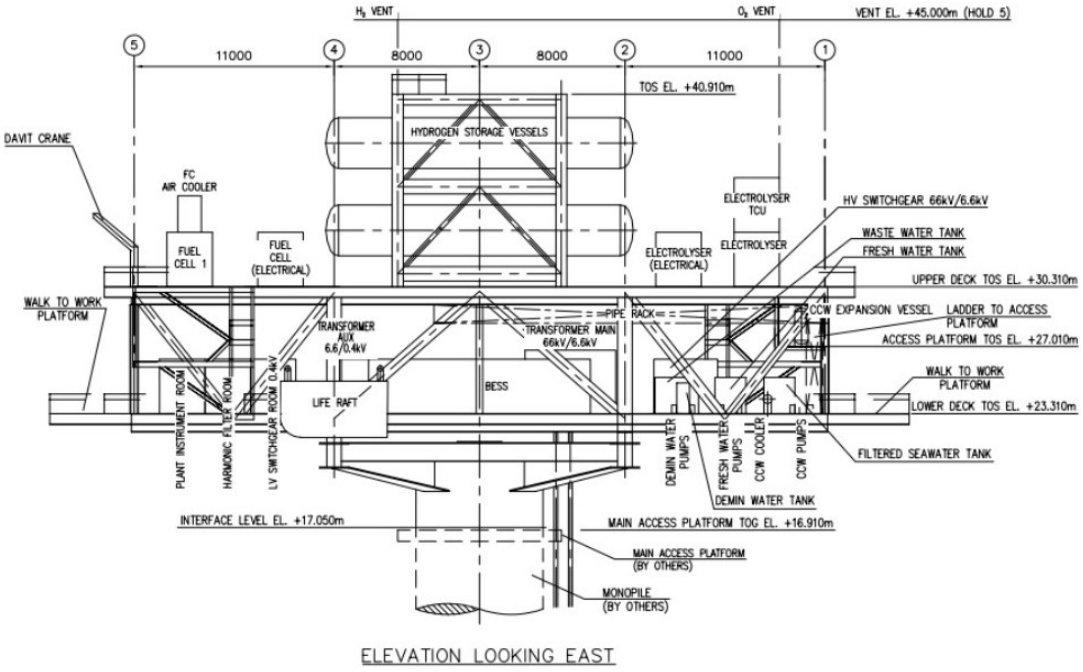

Fig 29: Guidelines from client – desitnation place of the designed structure

Maximum height at destination place:

$z := 30,31\ m + 2,896\ m + 30\ mm + 3,5\ m = 36,74\ m$

Length of 40ft HC container: $L_{40ft_container} := 12192\ mm$

Width of 40ft HC container: $W_{40ft_container} := 2438\ mm$

Height of 40ft HC container: $H_{40ft_container} := 2896\ mm$

Mean wind velocity:

$z_{0,II} := 0,05\ m$

$z_0 := 0,003\ m$

$z_{min} := 1\ m$

$z = 36,736\ m$

Orography factor:

$c_0 := 1$

Table 4.1 — Terrain categories and terrain parameters

	Terrain category	z_0 m	z_{min} m
0	Sea or coastal area exposed to the open sea	0,003	1
I	Lakes or flat and horizontal area with negligible vegetation and without obstacles	0,01	1
II	Area with low vegetation such as grass and isolated obstacles (trees, buildings) with separations of at least 20 obstacle heights	0,05	2
III	Area with regular cover of vegetation or buildings or with isolated obstacles with separations of maximum 20 obstacle heights (such as villages, suburban terrain, permanent forest)	0,3	5
IV	Area in which at least 15 % of the surface is covered with buildings and their average height exceeds 15 m	1,0	10
NOTE: The terrain categories are illustrated in A.1.			

Terrain factor: $k_r := 0,19 \cdot \left(\frac{z_0}{z_{0,II}}\right)^{0,07} = 0,156$ (eq:4.5-EC1991-1-4)

Roughness factor: $c_r := k_r \cdot \ln\left(\frac{z}{z_0}\right) = 1,4687$ (eq:4.4-EC1991-1-4)

Mean wind velocity: $v_m := c_r \cdot c_0 \cdot v_b = 45,825\ \frac{m}{s}$ (eq:4.3-EC1991-1-4)

Wind turbulence:

Turbulence factor: $k_I := 1$

Standard deviation of the turbulence: $\sigma_v := k_r \cdot v_b \cdot k_I = 4,8683\ \frac{m}{s}$ (eq:4.7-EC1991-1-4)

Turbulence intensity: $I_v := \frac{\sigma_v}{v_m} = 0,1062$ (eq:4.7-EC1991-1-4)

Peak velocity pressure:

Air density: $\rho := 1,25\ \frac{kg}{m^3}$

Peak velocity pressure: $q_p := \left(1 + I_v\right) \cdot \frac{1}{2} \cdot \rho \cdot v_m^{\ 2} = 1,4519\ kPa$

Reference mean (basic) velocity pressure: (eq:4.7-EC1991-1-4)

$q_b := \frac{1}{2} \cdot \rho \cdot v_b^{\ 2} = 0,6084\ kPa$ (eq:4.10-EC1991-1-4)

Exposure factor: $c_e := \frac{q_p}{q_b} = 2,3864$ (eq:4.9-EC1991-1-4)

Structural factor: $c_s := 1$ $c_d := 1$ $c_s \cdot c_d = 1$

Consideration of wind acting on whole structure as on a structural element with rectangular section:

Rounded corners effect factor: $\psi_r := 1$ (fig. 7.24-EC1991-1-4)

Solidity ratio: $\varphi := 1$ (eq:7.28-EC1991-1-4)

Effective slenderness:

$$\lambda_{big} := \min\left(\left[\begin{array}{c} 2 \cdot \frac{L_{40ft_container}}{H_{40ft_container}} \\ 70 \end{array}\right]\right) = 8,4199$$

(table:7.16-EC1991-1-4)

$$\lambda_{small} := \min\left(\left[\begin{array}{c} 2 \cdot \frac{H_{40ft_container}}{W_{40ft_container}} \\ 70 \end{array}\right]\right) = 2,3757$$

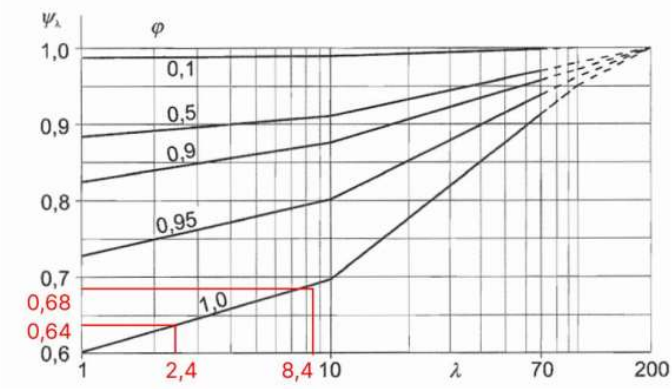

Fig 30: End effect factor from the figure 7.36 – EC1991-1-4

As slenderness in both directions is similar one value for two direction has been assumed:

End effect factor: $\psi_\lambda := 0,68$

$d_{small} := L_{40ft_container} = 12,192\ m$

$b_{small} := H_{40ft_container} = 2,9\ m$

$$\frac{d_{small}}{b_{small}} = 4,2099$$

$d_{big} := W_{40ft_container} = 2,438\ m$

$b_{big} := H_{40ft_container} = 2,896\ m$

$$\frac{d_{big}}{b_{big}} = 0,8419$$

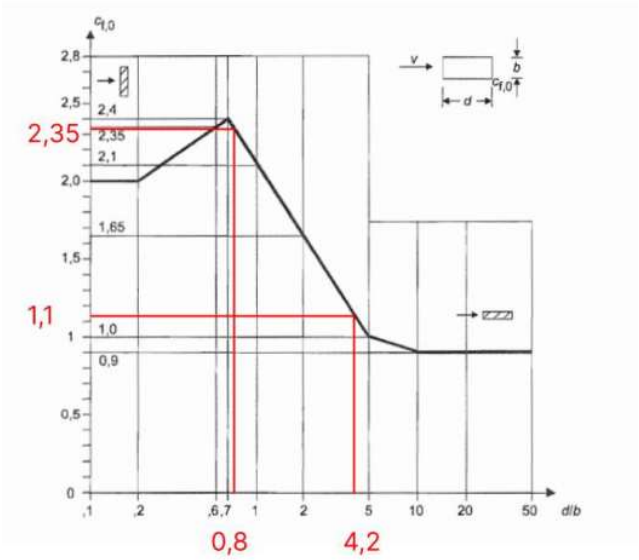

Fig 31: Force coefficient from the figure 7.23 – EC1991-1-4

The coefficient were slightly modified to more corresponds with the coefficients assumed for 40ft flatbed.

$c_{f,0,small} := 1,3$ $c_{f,0,big} := 2,20$

Force acting on small side of the 40ft HC container

$A_{40ft_container,small} := W_{40ft_container} \cdot H_{40ft_container} = 7,0604\ m^2$

$W_{40ft_container,s} := c_s \cdot c_d \cdot c_{f,0,small} \cdot q_p \cdot A_{40ft_container,small} = 13,33\ kN$

Force acting on big side of the 40ft HC container:

$A_{40ft_container,big} := L_{40ft_container} \cdot H_{40ft_container} = 35,308\ m^2$

$W_{40ft_container,b} := c_s \cdot c_d \cdot c_{f,0,big} \cdot q_p \cdot A_{40ft_container,big} = 112,78\ kN$

8.2.5. Wind at destination place acting on 10ft High Cube container

40ft and 10ft High Cube containers will be placed on sea type barge.
When the barge is its destination (at sea near the coast of the Netherlands), the whole solution will be at a height of 30,31m above sea level (according to the client's instructions)

Assumed Terrain category: 0 (Sea, coastal area exposed to the open sea)
Fundamental value of the basic wind velocity has been calculated in regards to obtained guidelines.

Basic wind velocity:

Fundamental value of the basic wind velocity: $v_{b,0} := 31,2 \frac{m}{s}$

Directional factor: $c_{dir} := 1$

Seasonal factor: $c_{season} := 1$

Basic wind velocity: $v_b := c_{dir} \cdot c_{season} \cdot v_{b,0} = 31,2 \frac{m}{s}$ (eq:4.1-EC1991-1-4)

Length of 10ft HC container: $L_{10ft_container} := 2991\ mm$

Width of 10ft HC container: $W_{10ft_container} := 2438\ mm$

Height of 10ft HC container: $H_{10ft_container} := 2896\ mm$

Maximum height in destination place:

$z := 30,31\ m + 2,896\ m = 33,206\ m$

Mean wind velocity:

$z_{0,II} := 0,05\ m$

$z_0 := 0,003\ m$

$z_{min} := 1\ m$

$z = 33,206\ m$

Orography factor:

$c_0 := 1$

Table 4.1 — Terrain categories and terrain parameters

Terrain category		z_0 m	z_{min} m
0	Sea or coastal area exposed to the open sea	0,003	1
I	Lakes or flat and horizontal area with negligible vegetation and without obstacles	0,01	1

LC18	Destination place (offshore) Y-	DNVGL-ST-N001	LRFD (Table 5.8)

This document focus on reactions from 40ft HC container and 10ft HC container during transport on barge (LC7-LC14), during lifting (LC5-LC6), and during opereting on open sea (LC14-LC18). LC1-LC4 for 40ft container were not performed, but were performed for 10ft container

8.4. Boundary conditions and mesh definition

8.4.1. 40ft HC Container

The model has been properly prepared for simulation.
All cutouts in the container were included.
The model included only the original container door on the left side. Additional doors, fans and other fittings were not included in the calculations. The calculations included welded-in additional elements such as interior columns, sheet metal or columns and beams at the locations of the additional doors.

Mesh type: Blended curvature-based mesh
Max Element Size: 1200mm
Min Element Size: 60mm
Big mesh size because of the big model and computer capabilities to handle calculations. Nevertheless, the simulations carried out still better represent reality than manual calculations because takes into account different materials (S355 and wood Gl20C), and all cutouts and additional elements welded to the container.

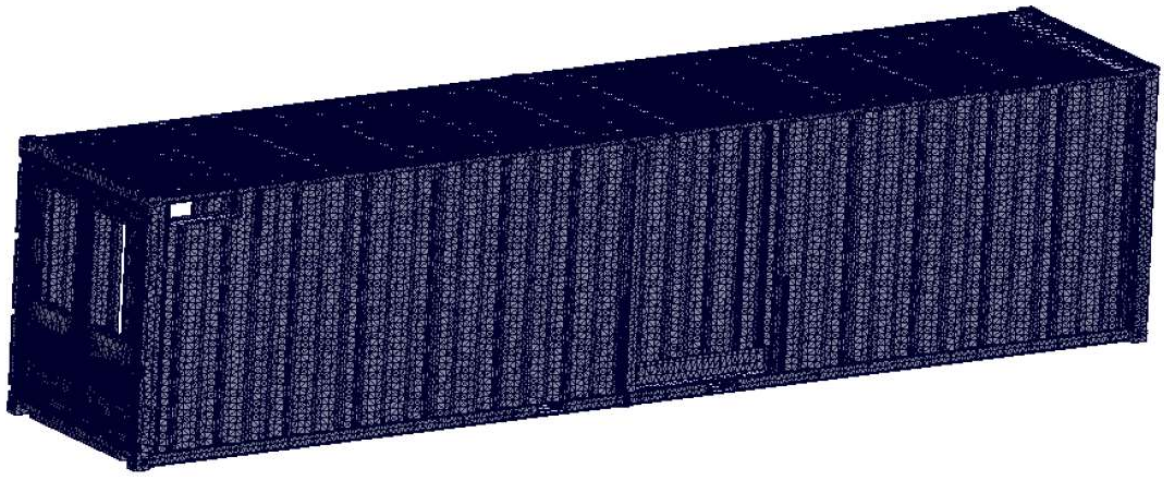

Fig 67: 40ft HC Container – Mesh – Front view

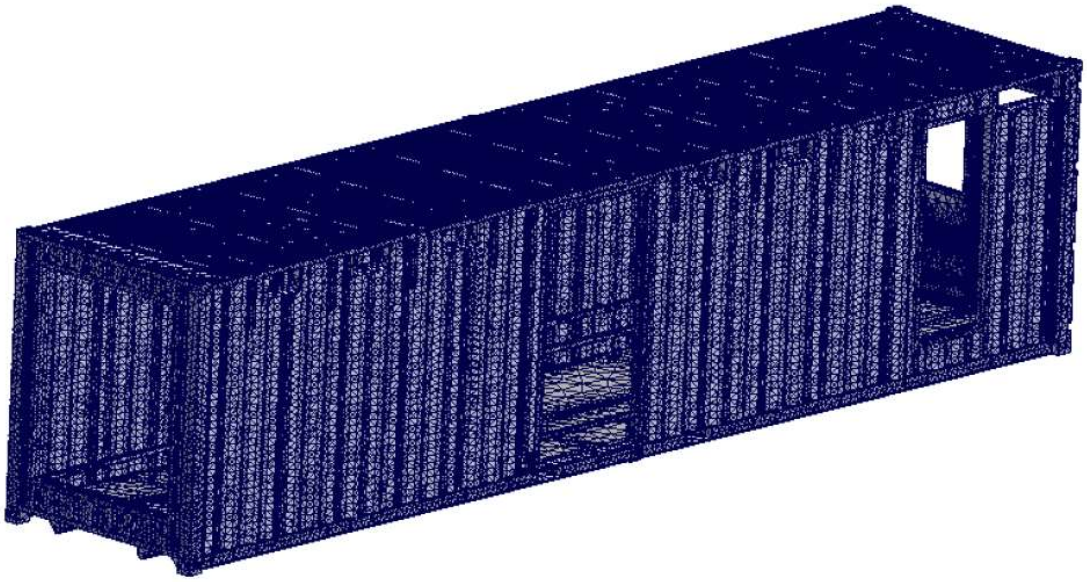

Fig 68: 40ft HC Container – Mesh – Back view

Wooden floor material properties (assumed glued laminated wood: GL20c):

- Elastic Modulus: 6720MPa
- Poisson's Ratio: 0,3
- Shear Modulus: 520MPa
- Mass Density: 340kg/m3
- Tensile strength: 7,68MPa
- Yield Strength 1,68MPa

Support conditions depends on particular load case.

8.4.2. 10ft HC Container

The model has been properly prepared for simulation.
All cutouts in the container were included.
The model included only the original container door on the left side. Additional doors, fans and other fittings were not included in the calculations. The calculations included welded-in additional elements such as interior columns, sheet metal or columns and beams at the locations of the additional doors.

Mesh type: Blended curvature-based mesh
Max Element Size: 1200mm
Min Element Size: 60mm
Big mesh size because of the big model and computer capabilities to handle calculations.
Nevertheless, the simulations carried out still better represent reality than manual calculations because takes into account different materials (S355 and wood Gl20C), and all cutouts and additional elements welded to the container

11. Summary

In tables below are listed all reaction forces from 40ft High Cube container and 10ft High Cube container which may occur during transport on sea type barge, in destination place or during lifting offshore the containers with all equipment inside them.

It is good to remember that reaction below 40ft container are caused by 40ft container and 40ft flatbed with coolers and other equipment which is placed on 40ft container, wherus 10ft container reactions are caused only by 10ft container with equipment inside them.

It is prohibited to lift 40ft container with 40ft platform together.

Structural calculations of 40ft flatbed can be found in document :"Cross_Wind – Flatbed 40ft – calculations report rev_1.pdf".

Fig 580: Ultimate Limit State – LC7-LC14 – Sea transport on barge – 10ft container reactions

It was assumed that containers are made of steel S355 or better.
It was assumed that 40ft flatbed is made of steel S355J2.
It was assumed that container floors are made of glued wood of class GL20c or better.

Due to the many cutouts in the containers and modifications to their shape, the loads are transferred in a non-obvious way, because the container is significantly weakened in some places and much more stiffened in others. The calculations showed that the containers after all modifications can be used to the scope presented in this document without the risk of damage or too large deformations (only elastic deformation).

ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

1.0 Purpose

The purpose of this document is to provide Material Safety Data Sheet, for the insulation material installed in the Ballard Fuel Cell container to provide passive fire protection. The container deliver for the Crosswind project is in accordance with standard container solution from Ballar Power systems and do not fulfill requirements for Offshore installation as stated in the contract (As a minimum, the Fuel Cell container shall provide 2 hours fire rating). The Ballard Container delivered do not have fire rating.

2.0 Overview of Material Data Sheets

The complete list of insulation material used in the 1MW fuel cell container (MEGABLOCK) is shown below.

Manufacturer	Type	Name	Description / Use	Sub-assembly
TRIMOTERM	Insulation	Insulation	Installed inside the container to create fire protection as well as creating protection for low temperature.	Container Solution

COMPANY PROFILE

Trimo is a one of the leading European companies developing original and complete building envelope solutions in the areas of fire-proof façades and roofs .

Located in Trebnje, Slovenia, Trimo sells products and services under its own brand cross more than 100 countries worldwide and has a sales network in almost 30 countries. We are a reliable, trustworthy global supplier of innovative, flexible, energy-efficient and environmentally friendly architectural building solutions.

Our customers are at the heart of our operations as we deeply understand their needs and provide them with the highest level of service and product quality. The list of outstanding and reputable partners such as Airbus, London Heathrow, Nestle, Philips, DHL, Porsche, IKEA, Prologis, Mercedes Benz, Coca Cola and many others is a true reflection of our passion, responsibility and committment to our work.

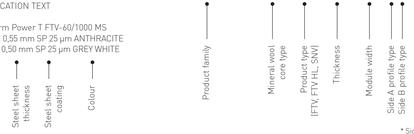
NOTES: The internal and external Trimoterm profiles seen in this document present the main range of profile options. Some combinations are mutually exclusive depending on the type of profile and product. For the approval of the requested profile combination please contact Trimo's technical support team. The arrangement of V profile (and all others) typically starts on the middle (centred) of panel steel sheet prior to forming stage. Module end, grove and the distance from the panel edge depends on Trimoterm panel module and may vary. Any other V profile arrangements are declared as non-standard and a subject of individual order. The arrangement of S profile typically starts on the middle (centred) of the Trimoterm panel module. Module end and the distance from the panel edge depends on Trimoterm panel module and may vary. Smooth profile (G) - to ensure an optimal smooth surface for building façades external side of the panel 0,7 mm steel sheet thickness must be used in lieu of standard 0,55 mm.

COLOURS

NOTES: Colours may slightly deviate due to different monitors and prints compared to original colours.



Trimo can send you a metal swatch upon request. Colour range does not in any case define delivery terms or any other terms of specific skin colour.

Colour range presented shows only a fraction of most usable colours within the variety of colours available.

1.0 Purpose

The purpose of this document is to provide a preliminary instrument and electrical logic diagram package for the 1MW Fuel Cell Container ("Megablock") provided by Ballard Power Systems Europe for the Crosswind project. This document considers the fuel cell container a black box, and process instrument and electrical logic inside the container is not described. The logic for interfaces with the supporting platform is described, with focus on the hydrogen system.

This document is meant to accompany the process and instrumentation diagrams for same and refers to these extensively.

3.0 Hydrogen Supply

This section describes the hydrogen supply connection and the logic regarding the usage of the connection.

3.1 Process flow diagram

On the process flow diagram (K559-2254-CWIWP4202202-C02-001Rev002), the hydrogen connection is shown with the tag "=HA01+DA02-XM01", which breaks down into the function, location and element detailed in Table 2.

Table 2: Hydrogen Supply Connection Tag details

Segment	Segment type	Segment Description
=HA01	Function	Hydrogen Supply System
+DA02	Location	Container #1, Outside
-XM01	Element	H2 Supply Connection

3.2 Piping and Instrumentation Diagram

On the hydrogen excerpt of the piping and instrumentation diagram ("Appendix A"), and the Instrument Logic Diagram – Hydrogen Supply System

Table 3: Hydrogen Solenoid Valve Tags and Logic

=HA01+DA02-QM06	FCwave #6 Shut-off Valve	Safety Status OK *AND* (Main State = Startup *OR* Run) *AND* FCwave #6 H2 Enable

3.3 Logic comments

The Control Philosophy & Block Logic Diagrams document, K559-2254-CWIWP4202202-C08-001, has been submitted and contains further details on control strategies.

The logic for the solenoid valves is broken down into the following elements:

- Safety Status OK:
  - Override from the container safety system, implemented via safety-rated relay
  - Enabled when safety system is in a satisfactory state and disabled when some element has tripped the safety system.
- Main State = Startup OR Run:
  - Control of the solenoid valves from the container control system.
  - Valves are normally closed, and opened when the fuel cell container is instructed to begin startup sequence from the Baseload Power Hub Central Control System. Remains open while one or more modules are operating.
- FCwave H2 Enable signal:
  - Each FCwave module controls its individual valve in front of the module, permitting gas flow only to modules actively enabling their local gas supply valve. The signal from the module is controlled by the fuel cell module process controller with override in place from the module safety system.

4.0 Coolant Systems

The control of the coolant systems (HT and LT Temperature Systems) are controlled internally to the skid and not exposed to the Baseload Power Hub Central Control System. The coolant system is not described further in this document.

5.0 Ventilation

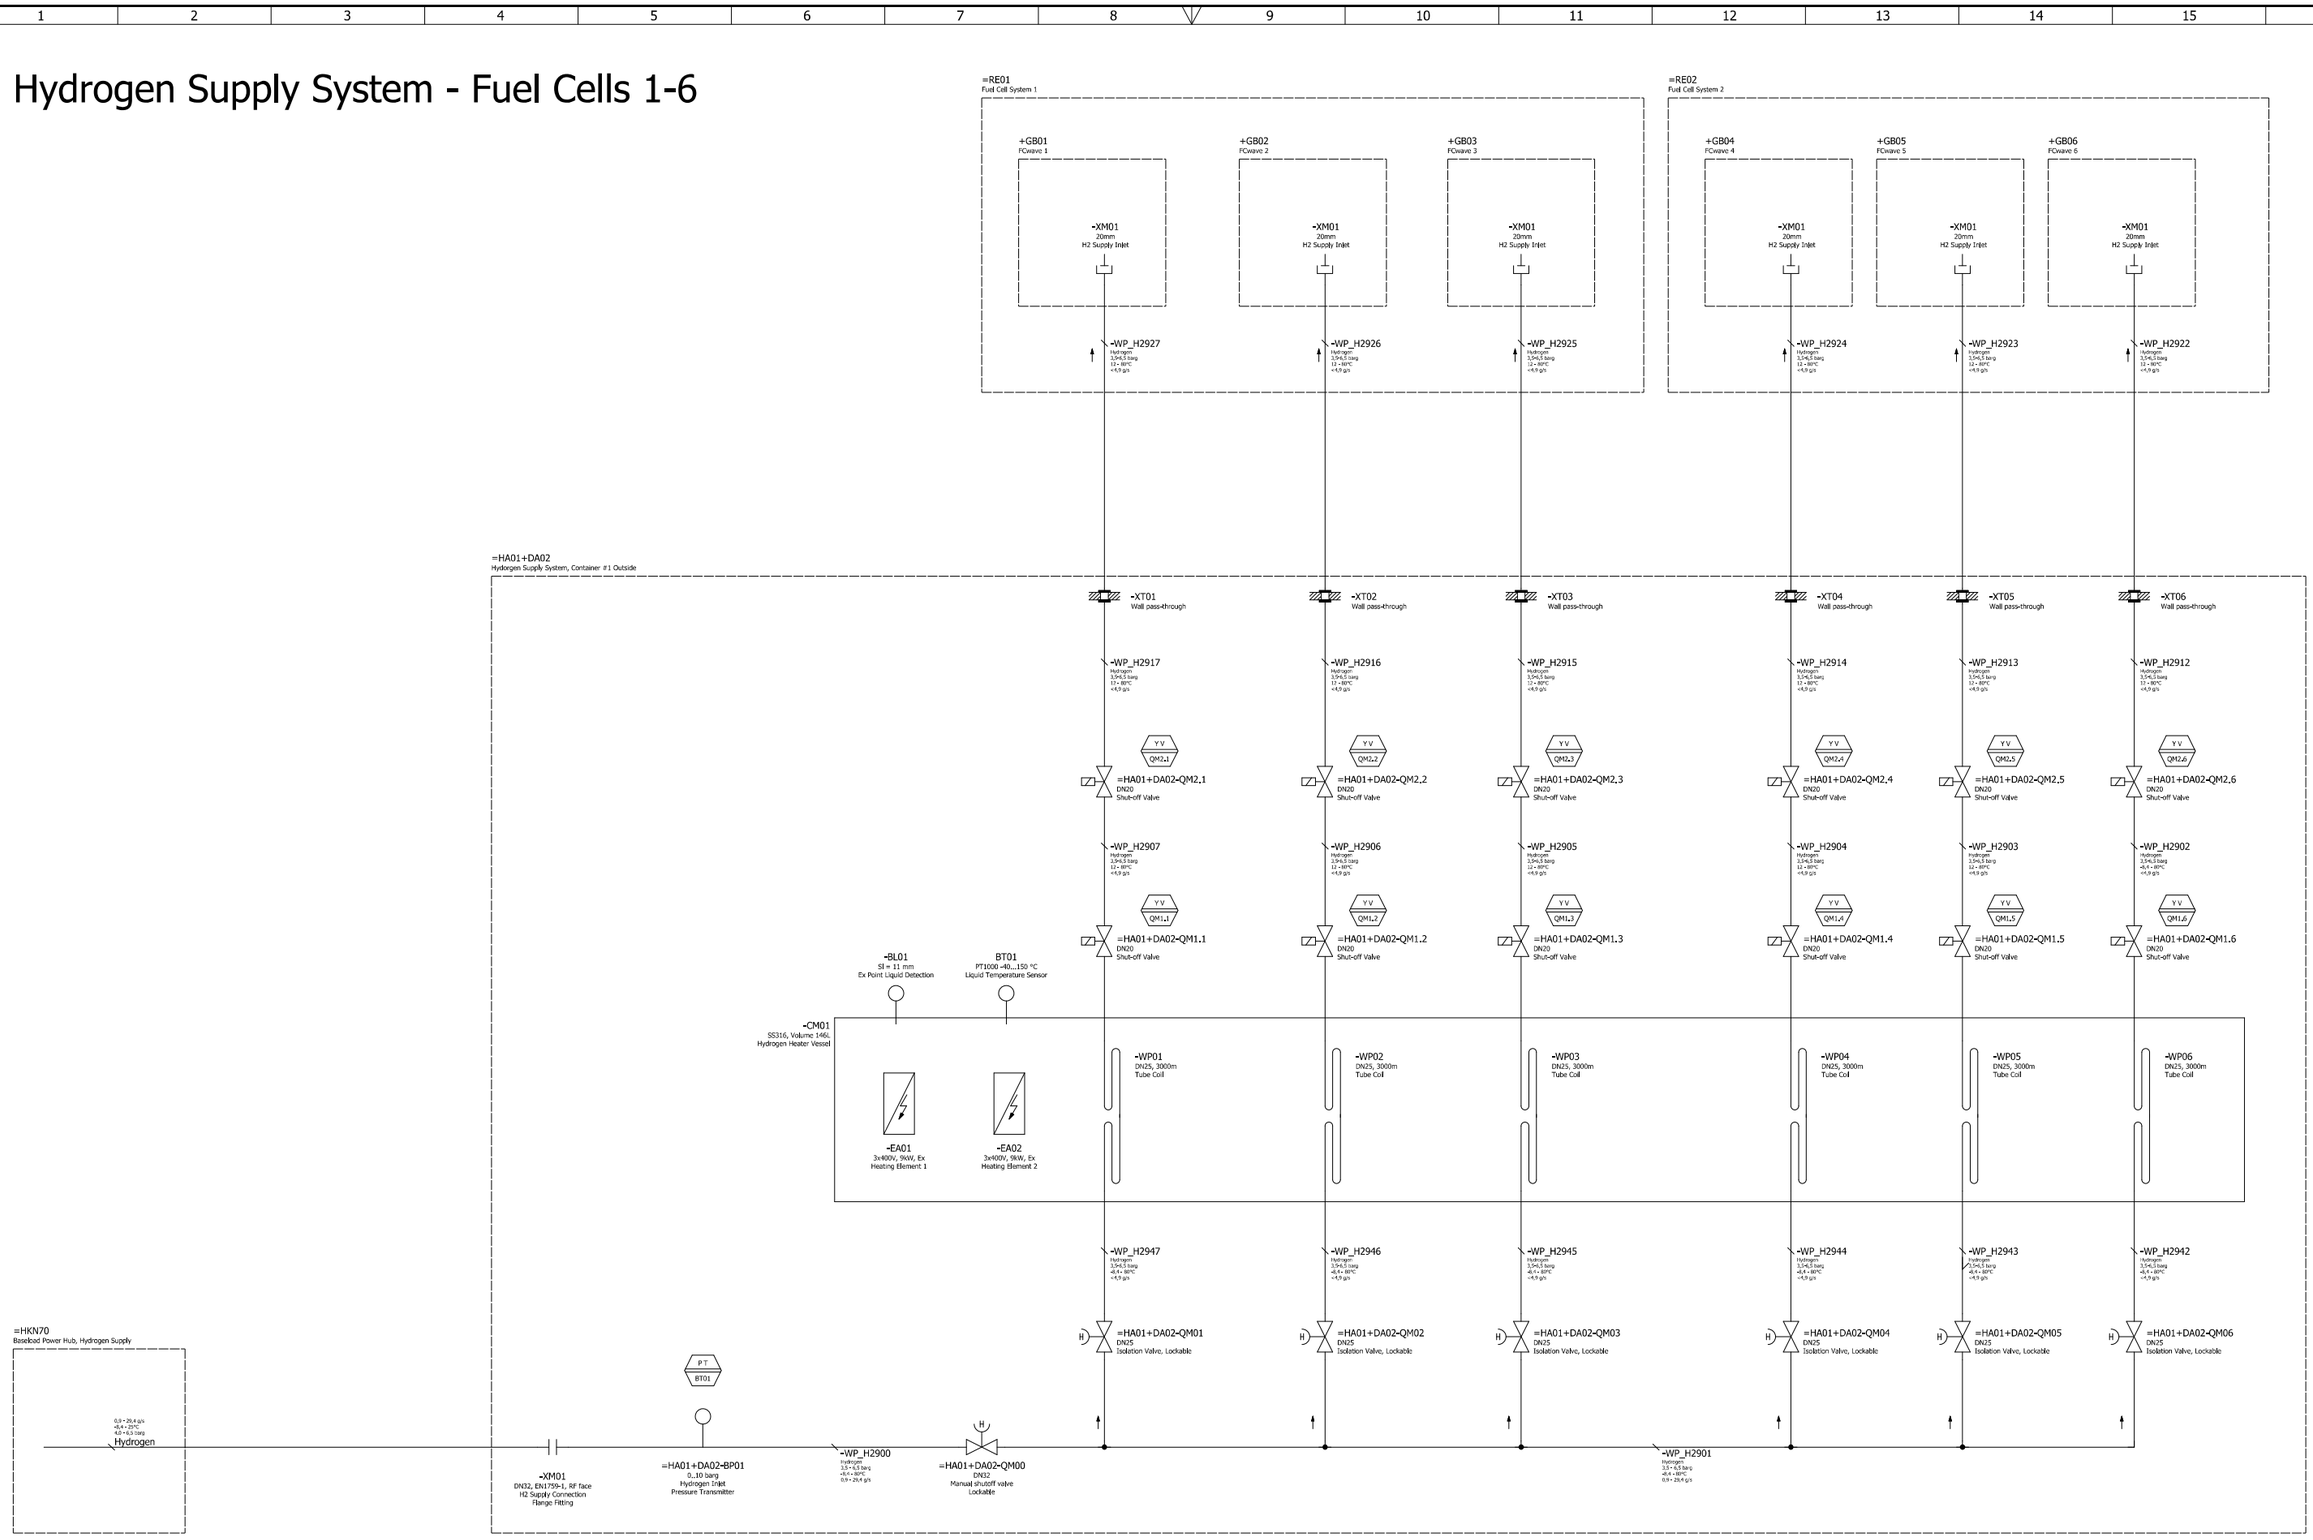
The control of the ventilation systems (Container ventilation, Process Air supply, H2 Enclosure Ventilation) are controlled internally to the skid and not exposed to the Baseload Power Hub Central Control System. The ventilation systems is not described further in this document.

6.0 Process Drain

The process drain is a passive system inside the container, with gravity-driven drainage of the process drains and process air exhausts.

The Baseload Power Hub can expect water present in the drain when the fuel cell container is commanded to startup and run, and for a minor amount to be present during the after-run of the process system after shutdown of the fuel cell modules.

7.0 Fire and Gas



The fire and gas detection strategy is outlined in document K559-2254-CWIWP4202202-B99-002. Details on container fire resistance and material selection are available in document K559-2254-CWIWP4202202-B99-003.

Symbol List

Process Engineering

Threaded Connection
Dissimilar male and female part
=+-XM00

Valve, Hand-actuated
Typically quarter-turn, lockable in both positions
=+-QM00

Wall-passthough
Penetration through enclosure or container
-XT01

Valve, solenoid-actuated
Electromagnetic shutoff valve, normally closed type
-QM00

Pipe fixed point
Eg pipe end or welding connection
-XM00

Valve, check
One-way flow control valve for gas for fluid
-RM00

Liquid cooling element
Cooling path of liquid cooled power electronics
-TA00

Cooling Tower, with fans
Suction type
=+-EG00

Pump, centrifugal, with motor
Suction type
-GP00

Hose, Flexible
-WP00

Exhaust, to free air
With weather shield
-WM00

Valve, Shut-off, Motorized, Modulating
Motorized Control Valve, gradual between 0-100%
-QN00

Vessel or tank
With volume indicated
=+-CL00
Volume XL

Flow restrictor or orifice
For limiting gas or fluid flow rate
-QN00

Reducer, concentric
With indication of size
-XM00

Ventilation and Heating

Heater, with fans
Space heating element, electric
-EB00

Damper, lamellar
For ventilation purposes
-QM00

Actuator, motor, modulating
For dampers or valves
=+-QM00.MA00

Fan, axial flow
With motor
-GQ00

Fan, radial flow
With motor
-GQ00

Sensor, Room
Sensor for sensing conditions in open space
-BT00

Sensor, Process
Sensor with process connection
-BT00

Filter, for air
Cooling path of liquid cooled power electronics
-FS00

1.0 Purpose

The purpose of this document is to provide a cover sheet and explanation of the cause-and-effect matrix attached to this document (Appendix 1).

This diagram illustrates the causal relationship between events that may occur, the inputs registering these events and the resulting effect this will have on the entire fuel cell system, as seen from outside the container.

All specific technical details and further description of causes and effect will be found in the referenced documents.

The reader should refer to this diagram while reading this document.

4.0 Safety

4.1 Introduction

The safety system of the fuel cell system container is physically separate safety rated control system, monitoring the essential safety parameters of the container.

The safety system is powered from an independent 24V supply with battery backup, with a UPS duration exceeding 30 minutes. The primary safety system is located in the control cabinet inside the 40ft container (=LB02+UC30) with a secondary connected safety controller located in the 10ft container (=LB02+UC31) with a safety rated interconnect.

4.2 Safety System Hardware

Please refer to document E06 Computer System Documentation

4.3 Tripping the Safety System

The entire fuel cell system will trip if any single of the inputs to the safety controller is outside acceptable parameters, e.g. hydrogen detection, E-Stop activation or external trip. These are further described in section

"5.0 Cause – Safety".

4.4 System Safe State

The system safe state is defined as the state where sources of energy has been disconnected (gas, electricity) and the process stopped.

- Hydrogen valves are de-energized and shut (normally closed)
- Power converters Safe Torque-Off function is activated.
    - This applies to fuel cell DCDC converters and main DCAC converter.
- Motor drives Safe Torque-Off function is activated.
    - This applies to coolant system pumps.
- Main breaker is opened.
    - Disconnect from the BLPH 6,6kV grid.
- Fuel Cell Modules emergency stop is activated.
    - Closes module internal H2 valves and opens contactors for the fuel cell module.

5.0 Cause – Safety

The section describes the causes related to the safety system.

5.1 Hydrogen Detection

The 40ft container has the following hydrogen sensors:

- 3 Sensors located inside the container, monitoring the inlet and outlet of the ventilation air.
- 2 Sensor inside each FCwave module (12 total), monitoring the hydrogen concentration in the ventilation air

5.2 Fire detection

The 40ft container has the following fire detection sensors:

- 3 smoke detectors inside the container, monitoring the inlet and outlet of the ventilation air.

- Each FCwave module contains an internal smoke detector and linear heat detector.

The 10ft container contains the following fire detection sensor:

- A smoke detector inside the container.

5.3 Emergency Stop

The hardwired emergency stop locations are:

- Control cabinet inside 40ft container
- Inside access door for the 40ft container
- On control panel door for coolant skid control panel

5.4 Physical protection

The access to the 10ft container must be safely restricted, as the container internally has IP00 rated high voltage equipment.

The container end door to the 10ft container is equipped with non-contact safety switches.

6.0 Cause – Fuel Cell Modules and Power Converters

6.1 Introduction

The 6 fuel cell modules inside the 40ft container and the power conversion equipment inside the 40ft and 10ft container may be the cause of derates or loss of production.

6.2 FCwave Internal Warning or Alarm

- The FCwave modules provides a warning when a process parameter is at the edge of allowable parameters.
- FCwave modules may perform a controlled shutdown if a process parameter exceeds allowable limits. This will reduce the maximum available power by 1/6 of the total power. The remaining 5 modules will continue operating.

6.3 DCDC Converter Trip

- Each of the 6 FCwave modules are connected to a pair of DCDC converters managing the power flow from individual modules to the common DC bus.
- If a converter trips, the connected FCwave module is also unavailable for power production. This will reduce the maximum available power by 1/6 of the total power. The remaining 5 modules will continue operating.
- This may be caused by e.g., insufficient cooling.

6.4 DCAC Converter Trip

- The power produced by the fuel cell modules is converted to AC power by a single DCAC power converter, which may also trip offline.

7.0 Cause – Coolant

7.1 Introduction

The coolant systems responsible for rejecting the heat generated by the fuel cell modules and power converters may be unable to dissipate the desired amount of heat or fail entirely

The two coolant systems are designated HT1 and HT2:

- HT1 is responsible for cooling FC1-3
- HT2 is responsible for cooling FC4-6

7.2 HT Coolant Group Derate

3 FCwave modules share a coolant system, which will reduce the power available from the modules if the cooling system is unable dissipate the heat.

- Fan failure
    - A failed fan on the HT cooler will reduce the total available cooling capacity. On days where the full cooling capacity is needed (high ambient temperatures), this may derate the cooling group and subsequently derate the available power from the modules connected to the cooling group.
- Valve failure
    - A valve may fail stuck in a given position and cause reduced cooling capacity.
- Temperature sensor failure
    - A temperature sensor may fail, hindering the control system from correctly regulating the coolant group.
- Coolant Radiator Blockage
    - The radiator fins on the radiators may be blocked by debris or damaged, hindering heat dissipation.

7.3 HT Coolant Group Loss

Some failure scenarios will prevent the coolant group from operating, and prevent the connected FCwave modules from operating, causing the power available from the container to be derated to half

- HT Pump Failure
    - If the pump driving the coolant loop fails, the coolant group is unable to dissipate any heat from the attached modules.
- Loss of coolant media
    - If a damaged or burst hose or pipe causes total loss of the coolant media, the cooling group is unable to function.
- Valve failure
    - If a valve fails stuck in certain positions, the flow of coolant through the cooler is prevented and the coolant group is unable to function.
- Fan failure
    - Fan failures may prevent correct airflow over the cooling surfaces or insufficient air flow at high ambient temperatures.

7.4 LT Coolant Group Derate

The LT coolant system provides liquid cooling to power electronics in the container and FCwave modules. If this coolant system cannot dissipate the required heat, the container will need to derate its output.

- Fan failure
    - A failed fan on the LT cooler will reduce the total available cooling capacity. On days where the full cooling capacity is needed (high ambient temperatures), this may derate the cooling group and subsequently derate the available power from the modules connected to the cooling group.

- Valve failure
    - A valve may fail stuck in a given position and cause reduced cooling capacity.
- Temperature sensor failure
    - A temperature sensor may fail, hindering the control system from correctly regulating the coolant group.
- Coolant Radiator Blockage
    - The radiator fins on the radiators may be blocked by debris or damaged, hindering heat dissipation.

7.5 LT Coolant Group Loss

Some failure scenarios will prevent the LT coolant group from operating, and prevent the fuel cell modules and power electronics from working.

- LT Pump Failure
    - If the pump driving the coolant loop fails, the coolant group is unable to dissipate any heat from the attached modules.
- Loss of coolant media
    - If a damaged or burst hose or pipe causes total loss of the coolant media, the cooling group is unable to function.
- Valve failure
    - If a valve fails stuck in certain positions, the flow of coolant through the cooler is prevented and the coolant group is unable to function.
- Fan failure
    - Fan failures may prevent correct airflow over the cooling surfaces or insufficient air flow at high ambient temperatures.

7.6 Process Water Drain Blockage

The process water drain serves as the drain for the water produced by the fuel cell modules during operation.

If this drain is blocked, the fuel cell package cannot operate. The most probable cause is a blockage in the downstream drain system.

8.0 Cause – Ventilation

8.1 Introduction

The ventilation system provides air for the container ventilation and process air for the fuel cells. The ventilation system maintains the interior of the fuel cell container at 20 Pa above ambient pressure.

If insufficient air is available, the fuel cell package will derate or shut down.

8.2 Ventilation Derate

If the ventilation system is unable to provide the full amount of air required for correct operation, the package will attempt to remain operational by derating the available power. Many ventilation derate functions are impacted by higher ambient temperatures.

- Intake damper blockage
    - The intake dampers may be blocked or stuck, preventing sufficient airflow.

- Intake ventilation failure
    - One or more of the intake ventilators may fail to operate, limiting the available air flow.
- Outlet louvre blockage
    - The ventilation outlets may be blocked, preventing egress of the ventilation air.
- Air filter blockage
    - The filters maintaining the air quality inside the container will get clogged over time, restricting the available airflow.

8.3 Ventilation Failure

Many of the causes for ventilation derate may progressively cause a ventilation failure, exacerbated by high ambient temperatures.

9.0 Cause – Integrator

9.1 Introduction

The connections to the integrator (BLPH) are required for correct operation of the fuel cell package. An exception may exist for the Aux supply connection during operation.

9.2 Integrator Aux Supply Failure

If the supply from the integrator is interrupted, one of two events will occur:

1. If the 6.6kV connection is not active, the fuel cell package is able to continue operating on battery supplies for a limited time. An alarm is raised to the BLPH control system.
2. If the 6.6kV connection is active, the fuel cell package will continue operating, supplied off the fuel cell power train. A warning is raised to the BLPH control system.

9.3 Integrator Communication Failure

If the communication is lost to the integrator (BLPH), the fuel cell package will perform a controlled shutdown and enter an idle state.

9.4 Integrator Safety Connection Failure / Trip

If the safety interlock is disabled or wires broken, the safety system is activated. This is also the case when it is intentionally triggered.

10.0 Effects - Safety

10.1 Introduction

This section describes the effects managed by the safety system, which will be caused by some of the abovementioned causes.

10.2 Fuel Cell Module Safety Trip

The fuel cell modules can be brought to a guaranteed safe state where energy sources are disconnected and the reaction is immediately stopped.

10.3 Hydrogen Valve Safety Override

The safety system has a safety-rated relay as a part of the supply to the solenoid valves, which enables the safety system to override and guarantee that the hydrogen valves are shut.

10.4 Power Converters STO

The safety system is connected to the Safe Torque-Off (STO) function on the power converters, which is a safety rated way of guaranteeing the power converters are shut down.

10.5 Motor Drives STO

The safety system is connected to the Safe Torque-Off (STO) function on the motor drives, which is a safety rated way of guaranteeing the drives are shut down.

11.0 Effects – Hydrogen Valve

11.1 Introduction

The hydrogen valves located on the outside of the container are electrically actuated, and of the normally-closed type.

11.2 Hydrogen Valves

Each of the 6 FCwave modules has a separate hydrogen string, with each string having a pair of direct acting solenoid valves in series. Each string is also fitted with a manual, lockable shutoff fitting.

12.0 Effects – FCwave Fuel Cell Modules

12.1 Introduction

This section describes the effects from the fuel cell modules, which may be derated or stopped, with a single module or multiple modules.

12.2 FCwave – Single Module Controlled Stop

Some causes may result in a single module performing its controlled stop sequence, where it signals stop of power production, ramps down and disconnects from the DC bus and H2 supply.

12.3 FCwave – Multiple Modules Controlled Stop

Some causes may result in multiple modules doing a controlled stop simultaneously. This is identical to the effect above but occurs for multiple modules.

12.4 FCwave – All Modules Controlled Stop

Some causes may result in all modules stopping. This is identical to the effect above but occurring for all modules.

12.5 FCwave – Single Module Derate

Some causes may result in a single module derating its output, until all process parameters return to normal ranges. The limited power productions is communicated to the package control system.

12.6 FCwave – Multiple Modules Derate / All Modules Derate

Some causes may result in multiple modules derating their output, e.g. high coolant temperatures.

13.0 Effects – Power Converters

13.1 Introduction

The power converters primary function is to control and condition the power from the fuel cells to match the power requested from the BLPH. The power converters require cooling to continue operating.

13.2 Power Converter Derate

Some causes limit the amount of cooling available for the power converters, which in turn limits their available performance. Inside the fuel cell package, there are both liquid and air-cooled power converters.

13.3 Power Converter Stop

The power converters may be stopped entirely if they reach a protection value or cooling is not available for them.

14.0 Effects – Integrator

14.1 Introduction

This section describes the signals and effects directly communicated to the integrator.

Please refer to documents C08-002 and C08-003 (*FC Package Modbus Map* and *FC Package Alarm List*) for details on the communication.

14.2 Information

The fuel cell package will communicate to the integrator when an internal situation occurs, which does not require action from the integrator, but would be of interest. This would be events such as warnings from the fuel cell modules or derate information due to coolant or temperature issues.

Communication method is Modbus connection.

14.3 Alarm Information

The fuel cell package will communicate to the integrator when an internal alarm has occurred, and some or all fuel cell modules are unable to function.

Communication method is Modbus connection.

14.4 Safety Trip

The fuel cell package will communicate any eventual safety system trip to the integrator.

Communication method is hardwired connections.

14.5 Power Output – Derate

If internal components are derating their performance, this is communicated to the integrator as a reduction in the total amount of power available.

Communication method is Modbus connection.

14.6 Power Output – Loss of production

If an internal fault prevents the fuel cell package from producing any power, this is communicated to the integrator.

Communication method is Modbus connection

Purpose

The purpose of this document is to provide an overview of the state machine for the 1MW Fuel Cell Container ("Megablock") provided by Ballard Power Systems Europe for the Crosswind project.

Fuel Cell Container Operating Modes

This section provides an introduction to different states of the fuel cell package control system. For each of the states, a brief description of the state is provided, with a more complete description in the following sections.

The operating mode overview is presented in Table 2: Fuel Cell Container Operating Mode Overview. This table describes the operating modes for the container, and outlines the preconditions for each operating mode (power availability, hydrogen, etc.)

Table 2: Fuel Cell Container Operating Mode Overview

Operating Mode	Brief Description	Preconditions
Off	Container fully depowered	No power supplied to container; UPS batteries depleted
Initialization	Functions to establish baseline container status, with connections to external power and communications.	After bootup 400Vac Supplied to Container
Sleep	Container minimum operational level, where control and safety system are operating, but no high power systems (>20kW) are operating. Hydrogen supply and fuel cells are inactive.	400Vac Supplied to Container Communications heartbeat from CCS
Wakeup	Container enables 24V supply to fuel cell modules and starts container ventilation system.	400Vac Supplied to Container Signal from CCS (Standby)
Standby	Waiting state for “Run” command from high level control system. Hydrogen supply and MV link disabled.	400Vac Supplied to Container Signal from CCS (Standby)
Startup	Transitional phase when CCS signals container to initiate operation. The significant part of this phase is that the container will draw a significant amount of power during startup, to energize fuel cell modules and cooling fans/pumps. After startup is complete on the fuel cells, the container transitions to “Running”. All systems operational. Hydrogen system active.	400Vac from internal microgrid Signal from CCS (Run) MV link active (10-150kW power draw, depending on # of FCwave starts concurrent) Hydrogen supply active.

Running	Operational state for the container, where the fuel cell modules are consuming hydrogen to produce electrical energy. Cooling and ventilation systems are operating to support fuel cell modules.	Signal from CCS (Run) Signal from CCS (Power request) MV link active (up to 1050kW power produced) Hydrogen supply active.
Rampdown	When signaled from CCS that operation is done, the container stops power production and performs fuel cell module shutdown procedures. Fuel cell modules shutting down. Hydrogen system transitions from active to inactive. After shutdown is complete, container proceeds to aftercooling.	Signal from CCS (Standby) MV link active (~10kW power draw) Hydrogen supply active.
Aftercooling	After fuel cell system has shut down, container performs aftercooling from the cooling system and ventilation from the container ventilation	400Vac Supplied to Container MV link active (~5kW power draw)
Shutdown	The cooling and ventilation systems shuts down. Container returns to standby.	400Vac Supplied to Container MV link transitions from active to inactive
Fault	Internal fault state. Hydrogen supply and fuel cells are inactive.	400Vac Supplied to Container Fault indication to CCS

Subsystem Activity Matrix

This section describes the matrix of container state and subsystem activity.

- Offline
  - Without power, no activity or power present
- Inactive
  - Components may be supplied with control power, but is inactive, not performing its primary functions.
- Active
  - Online and performing its function

Table 3: Subsystem Activity Matrix

Container State	Control System	Container Heating	Container Ventilation	Cooling Systems	Hydrogen system	DC Bus	Fuel Cell – Control System	Fuel Cell – Power Production
Off	Offline	Offline	Offline	Offline	Offline	Offline	Offline	Offline
Initialization	Active	Active	Inactive	Inactive	Inactive	Inactive	Offline	Offline
Sleep	Active	Active	Inactive	Inactive	Inactive	Inactive	Offline[3]	Offline
Cold Standby	Active	Active	Active	Inactive	Inactive	Inactive	Active	Inactive
Hot Standby	Active	Active	Active	Active	Inactive	Active	Active	Inactive
Startup	Active	Active	Active	Active	Active	Active	Active	Active
Running	Active	Inactive[1]	Active	Active	Active	Active	Active	Active
Rampdown	Active	Inactive[1]	Active	Active	Active	Active	Active	Active
Aftercooling	Active	Active	Active	Active	Inactive	Inactive	Active	Inactive
Shutdown	Active	Active	Active	Inactive	Inactive	Inactive	Active	Inactive
Error	Active	Active	Active	Inactive	Inactive	Inactive	Active[2]	Inactive

Notes to Table 3: Subsystem Activity Matrix

- Note 1
  - Container heating during fuel cell operation is inactive, as waste heat from fuel cells and cooling system maintain temperatures.
- Note 2
  - Fuel cell control system is not active if error state is entered from initialization or sleep state.
- Note 3
  - Fuel cell control system is unpowered to save electrical power.

State Machine Diagrams

The primary state machine is shown below in Figure 1: State Machine Diagram.

For states with a fixed duration, the current best estimate is provided.

For states with no listed duration, the transition depends on external signals.

Figure 1: State Machine Diagram

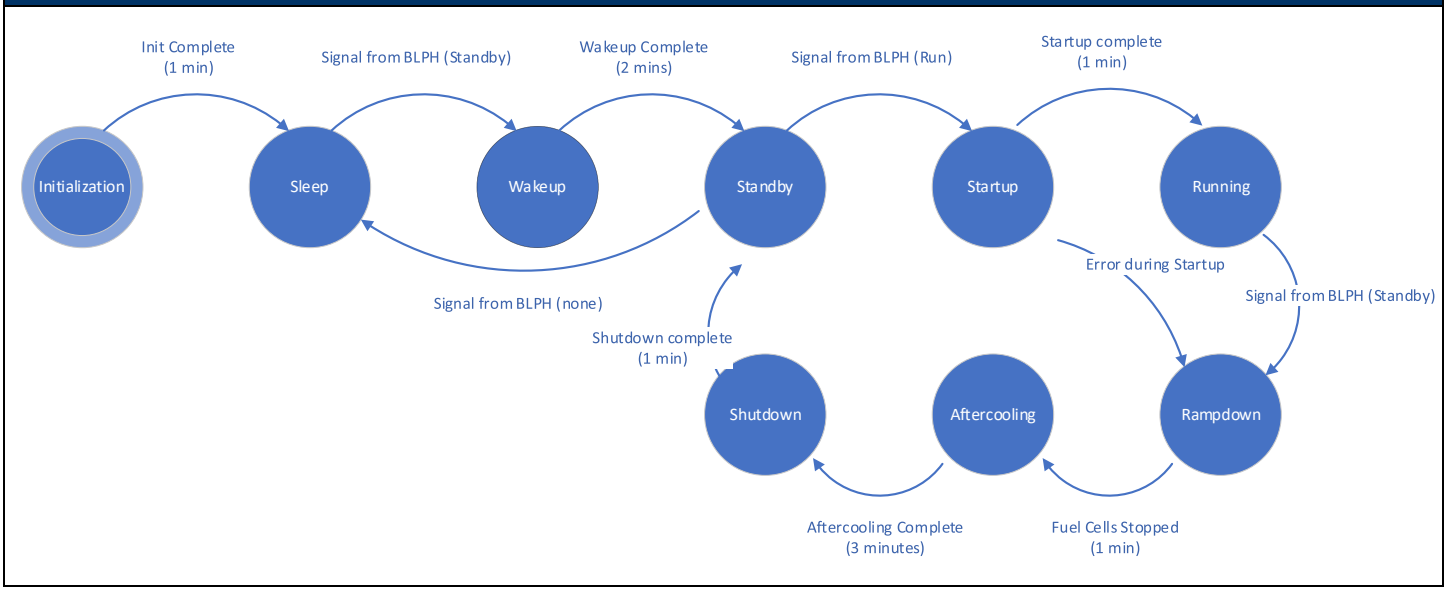

Diagram for the main state machine for the fuel cell container

State Details – Initialization

The Initialization state of the fuel cell package controller is the initial state, where the controller initializes the subsystems in the package, ensuring the container is connected to the external grid and the environment inside the container is maintained.

1.1. Possible Previous States

The state machine can enter the Initialization state from the following states:

Table 4: Previous States – Initialization

Previous State	Description	Transition Requirement
<Boot>	When the container is booted, when the controller finished initializing, the Initialization state is entered.	Controller Boot Sequence completed

1.2. Sub states and functions

The function of the Initialization state is as follows:

- External power connection management
  - The control system monitors the voltage and frequency of the AUX power connection, and if within acceptable parameters closes breaker for auxiliary supply.
- Communication management (Internal, External)
  - Waits for communication with higher-level controller.
  - Establish communication with internal components.
- Internal heating startup
  - Starts sub state machine for internal air handling (ventilation, heating)

1.3. Next State and Transition Requirements

Table 5: Next States – Initialization

Next State	Description	Transition Requirement
Sleep	When all actions completed successfully, control system transitions to sleep state	When all subtasks completed

Error State	If a process variable is outside acceptable parameters, or a fault is detected on some equipment, an error state is entered, where startup is prevented.	Process parameter outside acceptable range

State Details - Sleep

The Sleep state of the fuel cell package controller is the state, where the controller maintains a minimum level of operation to conserve power drawn from the AUX supply. In this state, the container heating and safety systems are active, but all other systems are inactive.

The container can maintain the sleep state indefinity until activity is requested by the higher-level control system.

This state is intended as the default state for long term inactivity.

1.4. Possible Previous States

The state machine can enter the Sleep state from the following states:

Table 6: Previous States – Sleep

Previous State	Description	Transition Requirement
Initialization	When Initialization state is completed, the Sleep state is entered.	Initialization requirements completed.

1.5. Sub states and functions

The following functions are active during the sleep state:

- Communication management (Internal, External)
- Container heating system

1.1. Next State and Transition Requirements

Table 7: Next States – Sleep

Next State	Description	Transition Requirement
Standby	Transition to Standby when requested by higher-level control system	Signal from CCS (Standby)

Error State	If a process variable is outside acceptable parameters, or a fault is detected on some equipment, an error state is entered, where startup is prevented.	Process parameter outside acceptable range

State Details – Wakeup

The Wakeup state of the fuel cell package controller is the state, where the controller has received a request from the higher-level control system to enter standby state and prepares to do so.

This requires enabling the control power to the fuel cell modules and waiting for them to reach readiness.

Furthermore, the ventilation system for the container is enabled to provide ventilation and process air for the fuel cell modules.

The container can maintain the standby state indefinity until power production is requested by the higher-level control system.

If the Standby request is disabled, the state machine returns to Sleep.

1.2. Possible Previous States

The state machine can enter the Wakeup state from the following states:

Table 8: Previous States – Wakeup

Previous State	Description	Transition Requirement
Sleep	Minimum power state	Signal from CCS (Standby)

1.3. Sub states and functions

The following functions are active during the sleep state:

- Communication management (Internal, External)
- Container heating system
- Fuel cell control systems
- Container ventilation system

1.4. Next State and Transition Requirements

Table 9: Next States – Wakeup

Next State	Description	Transition Requirement
Sleep	Reversion to Sleep if Standby request is disabled.	Signal from CCS (none)
Standby	All fuel cells control systems are online and ventilation system is active	Signal from CCS (Standby) Fuel cells control system is active. Ventilation is running.
Error State	If a process variable is outside acceptable parameters, or a fault is detected on some equipment, an error state is entered, where startup is prevented.	Process parameter outside acceptable range

State Details – Standby

The Standby state of the fuel cell package controller is the state, where the controller has received a request from the higher-level control system to enter standby state has completed this request.

This state maintains readiness to operate the fuel cell system but does not trigger a startup unless requested by the higher-level control system.

The container can maintain the standby state indefinity until power production is requested by the higher-level control system.

If the Standby request is disabled, the state machine returns to Sleep.

1.5. Possible Previous States

The state machine can enter the Standby state from the following states:

Table 10: Previous States – Standby

Previous State	Description	Transition Requirement
Wakeup	Fuel Cell control system and ventilation startup	Signal from CCS (Standby)
Shutdown	After shutting down the fuel cells and support systems, the container returns to Standby	Shutdown sequence complete.

1.6. Sub states and functions

The following functions are active during the sleep state:

- Communication management (Internal, External)
- Container heating system
- Fuel cell control systems
- Container ventilation system

1.7. Fuel Cell Control Systems

If the previous state was Shutdown, the Fuel Cell control system is active and will remain so for 15 minutes, allowing the fuel cell modules to ventilate the hydrogen enclosure, dissipating any remaining hydrogen. Even if the Standby signal is not received from the higher-level control system, the fuel cell package control system will remain in Standby state until the timer has elapsed.

1.8. Next State and Transition Requirements

Table 11: Next States – Standby

Next State	Description	Transition Requirement
Sleep	Reversion to Sleep if Standby request is disabled. May be delayed by fuel cell module ventilation requirements.	Signal from CCS (none)
Startup	If the run command is received from the higher-level control system, the control system begins the startup sequence.	Signal from CCS (Run)
Error State	If a process variable is outside acceptable parameters, or a fault is detected on some equipment, an error state is entered, where startup is prevented.	Process parameter outside acceptable range

State Details – Startup

The Startup state of the fuel cell package controller is the state, where the controller has received a request from the higher-level control system to begin power production and will execute the startup sequence.

If the Run request is disabled or a failed startup occurs, the state machine proceeds to Rampdown.

1.9. Possible Previous States

The state machine can enter the Startup state from the following states:

Table 12: Previous States – Startup

Previous State	Description	Transition Requirement
Standby	Container requested to begin power production	Signal from CCS (Run)

1.10. Sub states and functions

The sequence of events during the startup state is outlined below:

- Transfer of load from AUX supply to MV supply
    - If the voltage and frequency monitoring of the external grid connection is acceptable, the contactor between the AUX supply inlet and internal AC bus is opened (=BA20+UC20-AQ01) and after a delay, the breaker between the transformer and AC bus is closed (=BA30+DA03-FC31).
    - As the AUX supply is limited to 20kW, this ensures that sufficient power is available for the cooling systems and fuel cell startup.
- LT Coolant Startup
    - The cooling system for the power electronics is started, such that overheating of the power converters is prevented.
- Main breaker closing
    - The input side of the primary DC/AC (=BA30+DA03-TB30) is precharged.
    - The main breaker (=BA30+DA03-FC30) is closed.
- Main DCAC startup
    - The primary DC/AC (=BA30+DA03-TB30) is started and the internal DC bus is energized.
- High Temperature Cooling system startup
    - The pumps and fans for the process cooling system is started at low power.
- Fuel Cell module(s) are started.
    - The DCDC converters for the relevant fuel cell modules are started.
    - One or more fuel cell modules begin the module startup sequence.

1.11. Next State and Transition Requirements

Table 13: Next States – Startup

Next State	Description	Transition Requirement
Rampdown	If a failure during the startup sequence is detected, the container aborts the startup sequence and transitions to the Rampdown sequence for orderly shutdown of the container	Aborted Startup
Running	Upon completed startup sequence, the control system transitions to the running state.	Signal from CCS (Run) Signal from CCS (Power request) Startup sequence completed
Error State	If a process variable is outside acceptable parameters, or a fault is detected on some equipment, an error state is entered, where startup is prevented.	Process parameter outside acceptable range

State Details – Running

In the running state, the fuel cell package is actively producing power, and the control system is attempting to match the requested power from the higher-level control system, which may include starting and stopping fuel cells to match the power demand.

1.12. Possible Previous States

The state machine can enter the Running state from the following states:

Table 14: Previous States – Running

Previous State	Description	Transition Requirement
Startup	Fuel Cell module startup sequence	Startup sequence completed

1.13. Sub states and functions

The following functions are active during the sleep state:

- All subsystems are active during the Running state, except the heating system.

- Hydrogen, cooling, and power systems are operating to meet requested power requirements.
- The fuel cell package controller will start or stop fuel cell modules to match the requested power demand.
- During

1.14. Next State and Transition Requirements

Table 15: Next States – Running

Next State	Description	Transition Requirement
Rampdown	If the Run request from the higher-level control system is disabled or the requested power is below the minimum possible level for more than a brief period, the fuel cell container transitions to the Rampdown state	Signal from CCS (Standby) No or low power request for more than 10 seconds
Error State	If a process variable is outside acceptable parameters, or a fault is detected on some equipment, an error state is entered, where startup is prevented.	Process parameter outside acceptable range

Note to state transition to Rampdown:

The fuel cell modules can produce a minimum amount of power. If the requested power is below the minimum power for one fuel cell module for more than 10 seconds, the fuel cell package controller will initiate the Rampdown and shutdown of the package.

State Details – Rampdown

When the fuel cell package is done producing power, the fuel cell modules are returned to their internal standby state and the build up heat is dissipated before stopping cooling and pumps.

During this state, the internal container AC grid is still powered from the MV connection, drawing estimated 10 kW for several minutes.

1.15. Possible Previous States

The state machine can enter the Rampdown state from the following states:

Table 16: Previous States – Rampdown

Previous State	Description	Transition Requirement
Running	Fuel Cell module operation	Fuel cell modules not needed

1.16. Sub states and functions

The following functions are active during the Rampdown state:

- All active fuel cell modules will perform their shutdown sequence and return to their standby state.
- DCDC converters are stopped.
- The following systems will run for aftercooling:
  - HT Cooling system, 3 mins
  - LT cooling system, 3 mins
  - Ventilation system, 3 mins
- The above systems will operate at reduced power levels during Rampdown.

1.17. Next State and Transition Requirements

Table 17: Next States – Rampdown

Next State	Description	Transition Requirement
Shutdown	The Rampdown sequence has completed and the fuel cell package controller transitions to Shutdown	Rampdown complete (grid power is below 2%)
Error State	If a process variable is outside acceptable parameters, or a fault is detected on some equipment, an error state is entered, where startup is prevented.	Process parameter outside acceptable range

State Details – Shutdown

After dissipating the buildup heat in the cooling systems, the fuel cell package shuts down primary and secondary cooling systems, stops power converters and disconnects from the MV connection.

The power supply is transferred to the AUX connection.

1.18. Possible Previous States

The state machine can enter the Rampdown state from the following states:

Table 18: Previous States – Rampdown

Previous State	Description	Transition Requirement
Rampdown	Aftercooling of cooling systems	State timer elapsed

1.19. Sub states and functions

The following functions are active during the Shutdown state:

- The High Temperature cooling system is shutdown.
  - Fans and pumps stopped.
- Container heating is re-established.
- Primary DCAC converter is stopped, and DC bus is discharged.
- Main AC breaker is opened.
- LT Cooling system is stopped.
- Container load transferred from MV connection to AUX connection:
  - If the voltage and frequency monitoring of the AUX grid connection is acceptable, the breaker between the transformer and AC bus is opened (=BA30+DA03-FC31). After a delay, the contactor between the AUX supply inlet and internal AC bus is closed (=BA20+UC20-AQ01)
- State transitions to Standby

1.20. Next State and Transition Requirements

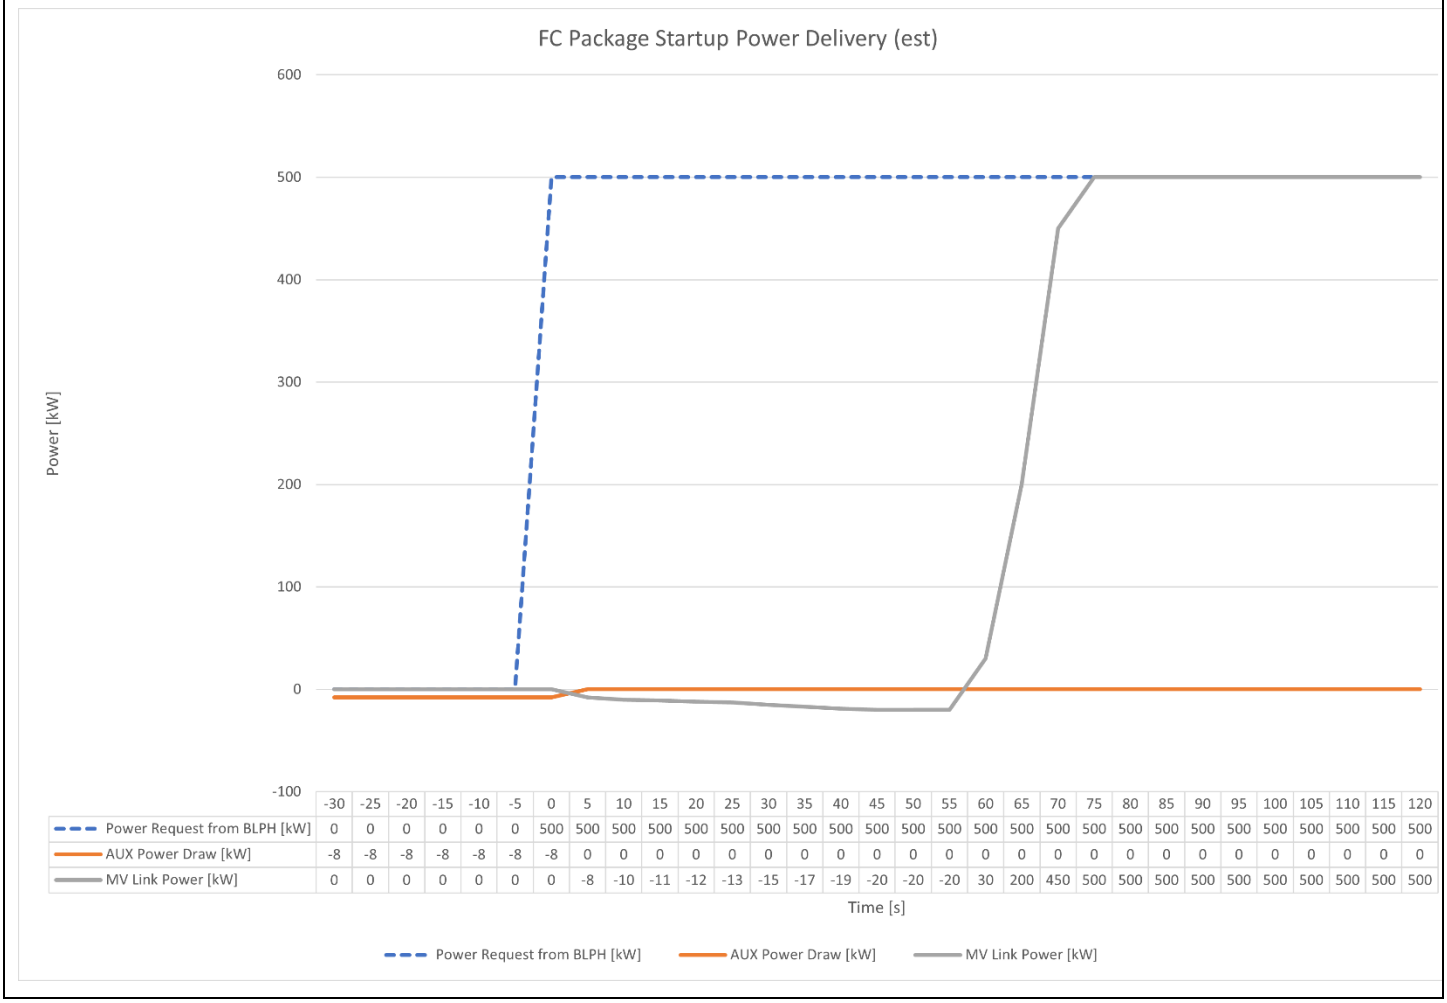

Table 19: Next States – Shutdown

Next State	Description	Transition Requirement
Standby	Shutdown sequence completed and container has disconnected from the MV connection and transitions to the AUX supply.	Shutdown sequence complete
Error State	If a process variable is outside acceptable parameters, or a fault is detected on some equipment, an error state is entered, where startup is prevented.	Process parameter outside acceptable range

Package Power Response - Startup

This section describes the power draw and subsequent power delivery from the fuel cell package during startup and when responding to a Run request and power request from the BLPH control system.

Figure 2: Startup Power Delivery

	-30	-25	-20	-15	-10	-5	0	5	10	15	20	25	30	35	40	45	50	55	60	65	70	75	80	85	90	95	100	105	110	115	120

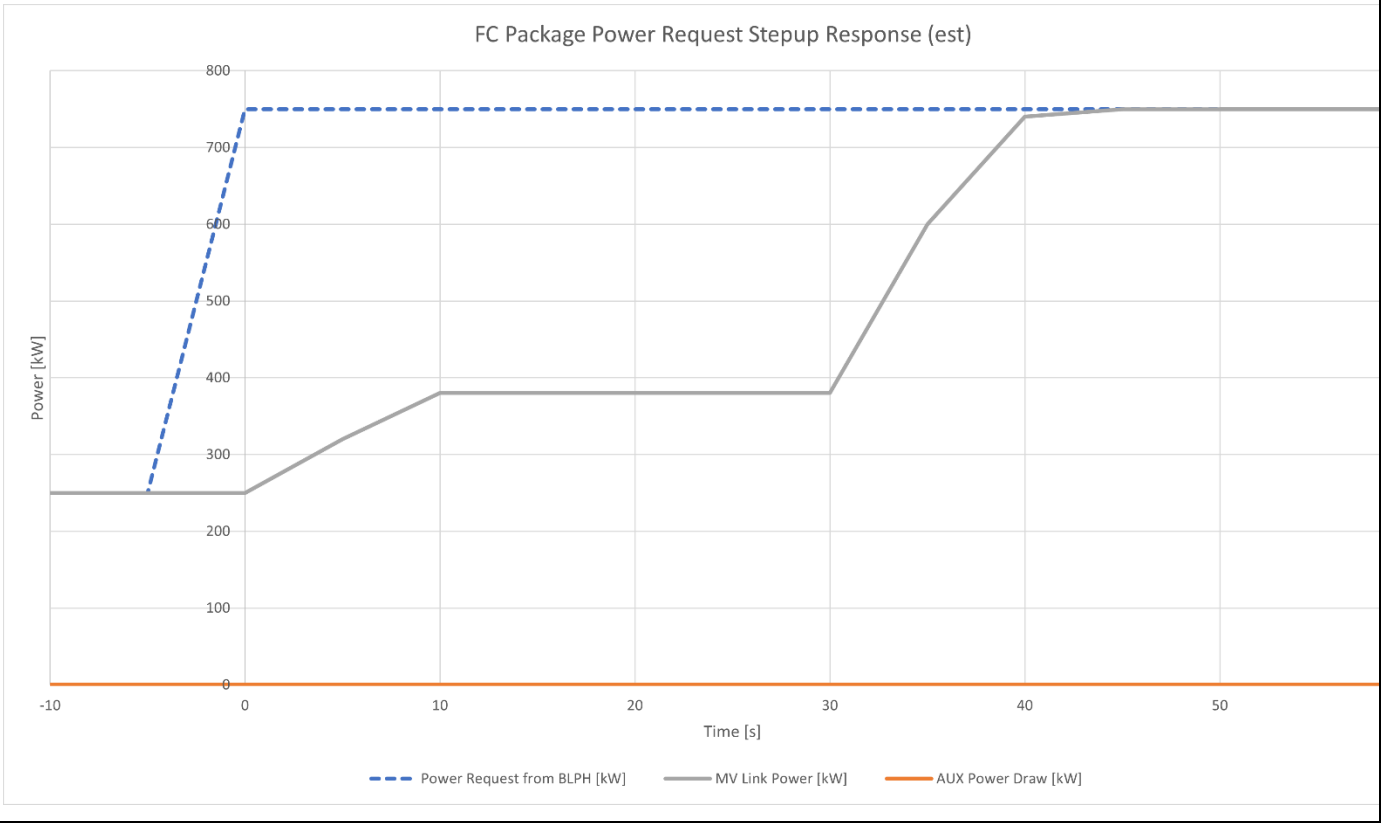
MV Link Power [kW]	0	0	0	0	0	0	0	-8	-10	-11	-12	-13	-15	-17	-19	-20	-20	-20	30	200	450	500	500	500	500	500	500	500	500	500	500

Power flow during startup of the FC package – negative values denote power to the FC package. The package is requested to start at time 0 with a power request of 500kW

1.21. Timeline for Startup response

As shown in Figure 2: Startup Power Delivery, the fuel cell package does have a delay from a power request being sent from the BLPH to the requested power is being delivered.



- At time zero, the BLPH requests the FC package to run and requests 500kW of power.
- Between time zero and 5, the FC package switches its AC supply from the auxiliary feed to the MV connection.
- Between time 5 and 25, the FC package starts electronics, process cooling and ventilation systems. The DC bus is precharged and the primary output drive energizes the DC bus.
- Between time 25 and 55, the fuel cell modules are started.
- Between time 55 and 65, the fuel cell modules are ready to produce power and their output is ramped up to meet the power request from BLPH.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Package Power Response - Step-up

This section describes power delivery from the fuel cell package during a step-up in the power request from the BLPH control system.

Figure 3: Step-Up Power Delivery

Power flow during a step-up of the power request from the BLPH. The power request is increased from 250 to 750 kW

1.22. Timeline for Step-up response

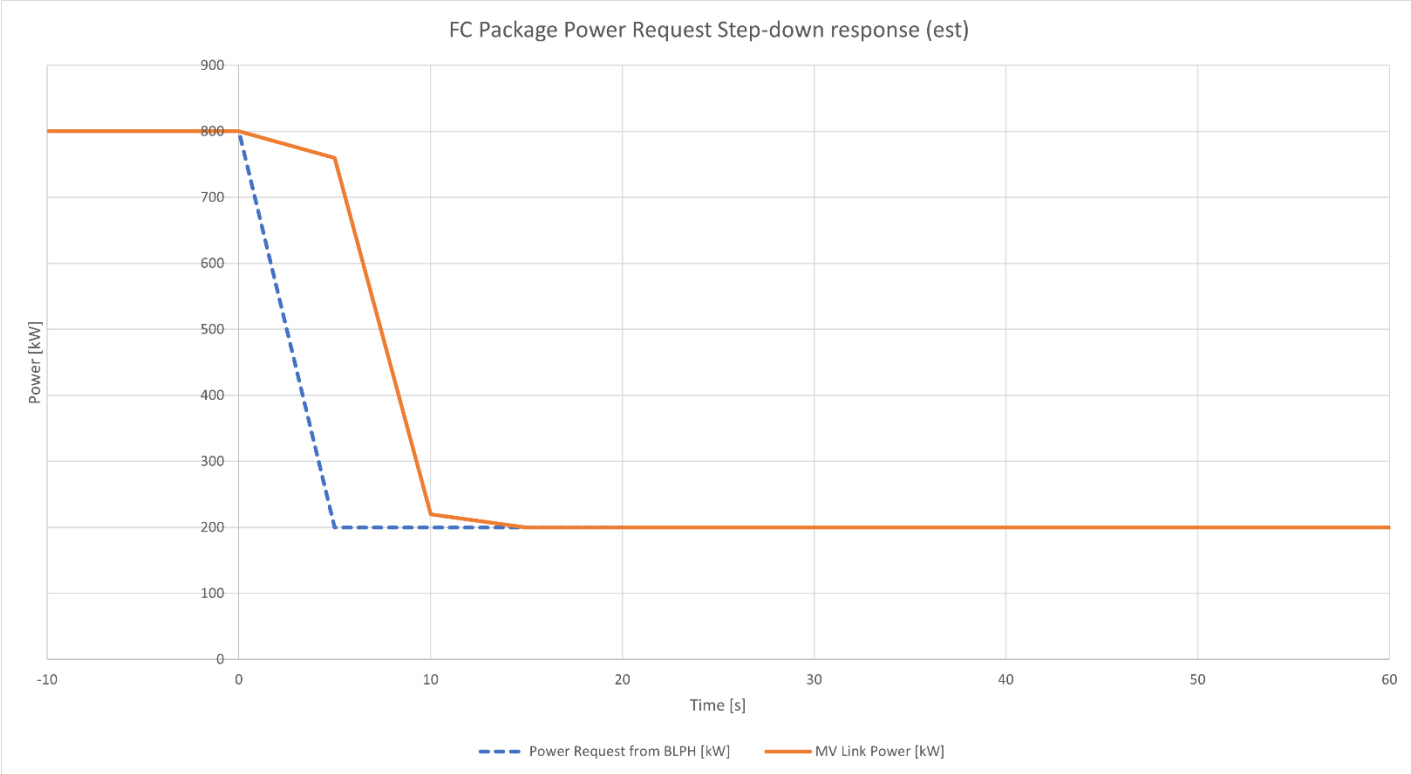
As shown in Figure 3: Step-Up Power Delivery, a step-up in the power request from BLPH may cause the FC package to start additional fuel cell modules to meet the power request.

- At time -5, the FC package is producing 250kW, as requested. In this example, two fuel cell modules are running and each producing 125kW + ancillary loads and losses.
- At time 0, the power request is stepped from 250 to 750 kW.

- At time 0 to 10, the FC package ramps the two online fuel cells to their rated power (2 x 200kW) and begins startup of the remaining fuel cell modules.
- At time 10, the active fuel cells are at rated power, producing ~380kW with the auxiliary loads and converter losses.
- Between time 10 to 30, the remaining fuel cell modules are going through their start-up sequence.
- At time 30 to 40, all fuel cell modules are running, and power output is ramped to meet the request.

1.23. Power regulator overshoot

The power regulator is a PID controlled system, with the attending risk of overshoot.



The power regulator will overshoot less than 10% of the setpoint (e.g. for a setpoint of 500kW, the overshoot will be less than 550kW peak) and have a duration less than 5 seconds.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Package Power Response - Step-down

This section describes power delivery from the fuel cell package during a step-down in the power request from the BLPH control system.

Figure 4: Step-Down Power Delivery

Power flow during a step-down of the power request from the BLPH. The power request is decreased from 800 to 200 kW

1.24. Timeline for Step-down response

As shown in Figure 4: Step-Down Power Delivery, a step-down in the power request from BLPH will cause the FC package to adjust its power output.

- At time -5, the FC package is producing 800kW, as requested. In this example, all six fuel cell modules are running.
- At time 0, the power request is stepped from 800 to 200 kW.

- At time 0 to 10, the FC package ramps down the power produced by each fuel cells to match the power request.
- At time 15, the FC package begins shutting down 4 of the 6 fuel cell modules, allowing the two remaining fuel cell modules to handle the load.
- At time 45, the 4 modules are finished shutting down and are kept ready for restart if needed.

Integrator notes for the FC package

This section outlines guidelines for the Power Request from the BLPH, which should be known by the integrator.

- The startup duration for a fuel cell module is approx. 30 seconds.
- A running fuel cell module can ramp from minimum power to rated power in 10 seconds.
- Start-up and significant step-up in power request will be limited by the startup duration, followed by the ramp-up time.
- Ramp-down is not limited by startup duration.
- The power request should be set to the desired value, instead of incrementally increased as fuel cells come online.
    - If the power request is incrementally increased, the FC package controller may not start all required fuel cell modules, and the power output will be limited by multiple sequential startup delays.
- Ballard expects that the BESS is used for short term spikes and dips in load and the FC package is responsible for long term power delivery with minimum short-term changes in requested power.
- The fuel cell package restart limits are as follows:
    - Restart less than 6 times in an hour.
    - Restart less than 20 times in a 24-hour period.

Disconnecting the MV bus

This section describes the consequences of disconnecting the MV bus from the FC package.

1.25. Disconnecting when not in operation

When the package is not in operation (State “Sleep” or “Cold Standby”), the MV bus can freely be disconnected.

1.26. Disconnecting while operating

The MV bus cannot be disconnected while the FC package is operating.

1.0 Purpose and Scope

This document presents the details and reading guide for the FC Package Alarm System for the Crosswind BLPH project.

2.0 Terminology

Table 1: List of Terminology

Abbreviation	Full Name
OT	Operational Technology
IACS	Industrial Automation and Control Systems
BLPH	Crosswind Hollandse Kust Noord Baseload Power Hub
HT	High Temperature
LT	Low Temperature
H2	Hydrogen
IsoMon	Isolation Monitor
CoolBreak	Coolant Breaker
P&ID	Process and Instrumentation Diagram
PSU	Power Supply Unit
SLD	Single Line Diagram (Electrical)
HV	High Voltage

3.0 Operator Expectations

The following is expected of the operator, which will be notified of the alarms and is responsible for reacting to the alarm codes

- Access to relevant documentation:
  - Fuel Cell Package P&ID
  - Fuel Cell Package SLD
  - Platform Safety Plan
- Understanding of the following:
  - Reading and understanding a P&ID
  - Reading and understanding a Single Line Diagram
  - Basic understanding of fuel cell package operation
  - Basic understanding of fuel cell fundamentals
  - Basic understanding of industrial control systems and electrical systems
  - Basic electrical troubleshooting knowledge is recommended.

4.0 Alarm System Introduction

An alarm is set up of several logical steps, to determine if an alarm is Active. The alarm is set up around a basic equation called the *Alarm Test*, where a process value is compared to a limit, with basic mathematical comparison-operators. An example below is shown with the Greater Than operator:

$$pv > limit$$

Here, *pv* is the Process Value – either a sensor value or a calculated value. If the equation yields True, the Alarm Test is True.

Please note that the pv and limit can be Boolean values. The operator will then always be the equality operator ('='). If the operator field is left blank, the equality operator is implicit.

When the Alarm Test is True, a timer denoted the Delay Time is started. If the Delay Time elapses, the alarm becomes Active. If the Alarm Test becomes False during the Delay Time, the Delay Time is reset. In other words, the Alarm Test must be true for the consecutive number of seconds denoted by the delay time.

An alarm can be Inactive in certain states. This means the Alarm Test is not evaluated. After the system transitions from a state where the alarm is Inactive to a state where the alarm is Active, the State Enable Delay must elapse before the Alarm Test is evaluated (and thus, before the Delay Time is started). Note that the State Enable Delay does not apply to a state transition where the alarm was Active in both states.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.0 Severities

The Severity has no effect on whether an alarm is Active or not, only how the system reacts to the alarm if it becomes Active. There are five different severities, from 0 to 4:

Severity 0 – Info: An information of a parameter being outside an optimal range but will not impair the system from running at full capacity. Action may be taken to restore optimal running conditions.

Severity 1 – Warning: A parameter is outside normal operating limits. System can still run, but possibly in a derated mode. Action should be planned to rectify the problem, as this parameter will likely lead to a shutdown of the system

Severity 2 – Delayed shutdown: A parameter is outside acceptable operating limits, but safe to operate for a short period. System will run normally for this short period, then perform a controlled shutdown. Problem must be rectified before a restart can be attempted.

Severity 3 – Controlled Shutdown: A parameter is outside safe operating limits. System will perform a controlled shutdown. Problem must be rectified before a restart can be attempted.

Severity 4 – Emergency Shutdown: A parameter is outside safe operating limits. This parameter would not allow a safe, controlled shutdown. Thus, the system will perform an immediate shutdown. Problem must be rectified before a restart can be attempted.

6.0 Corrective Action

The alarm list includes a column with a brief description of the suggested corrective action for each alarm. A column is also included with a yes/no indication of if the corrective action is plausible from a remote monitoring control station.

E.g., a high temperature warning might suggest reducing power requested from the FC package, which should be possible from a remote-operator station.

Another alarm might suggest inspection of a coolant system, which is not plausible from a remote-operator station.

Some alarms direct the operator to contact Ballard, either on occurrence or recurrence

ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Alarm Examples

6.1 Example 1

As an example, we take alarm ID 22038. This has the following definition:

Table 2 - Alarm Example 1

ID	Sub-system	Alarm Name	Tagname	Unit	Oper-ator	Limit	Sev	Delay Time	State Enable Delay	Corrective Action	Remote Friendly
22038	LT Cooling	Return Temp High-High	=HE03+DA01-BT01	°C	>	55	3	20	0	Coolant System temperature is too high, maximum ambient temperature is 25°C	Yes

This alarm belongs to the LT Cooling subsystem and is activated if the Return Temperature becomes too high. The sensor which measures this is called =HE03+DA01-BT01. If this temperature is above 55 °C for 20 consecutive seconds, the alarm becomes Active. As it is a Severity 3 alarm, it would trigger a controlled shutdown of the LT Cooling subsystem. The Corrective action is a text for the operator, indicating what is possible to mitigate the issue – in this case waiting until the ambient temperature is reduced. The remote friendly text indicates if the alarm is plausibly fixed by a remote operator, in this case no action on the platform is needed.

6.2 Example 2

For another example, let's look at alarm 1014:

Table 3 - Alarm Example 2

ID	Sub-system	Alarm Name	Tagname	Unit	Oper-ator	Limit	Sev	Delay Time	State Enable Delay	Corrective Action	Remote Fiendly
1015	Main Control	Smoke Detector OutletB	=JA01+DA01-BQ06		=	TRUE	4	3	3	Remove the cause of smoke. Reset sensor by disconnecting from base and reconnect.	No

This alarm belongs to the Main Control System. It is activated if Smoke Detector B in the 40 ft container is activated. The detector is called =JA01+DA01-BQ06. When this detector returns TRUE (high) for 3 consecutive seconds, the alarm becomes Active. As it is a Severity 4 alarm, it will trigger an emergency shutdown of the Main Control System.

This alarm is reset by removing and reseating the smoke detector, which is not feasible by a remote operator.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Short Title	Megablock Hydrogen Safety Concept
Full Title	Introduction to Hydrogen Safety Concept for Ballard Megablock Solution
Abstract	This document provides an introduction to the hydrogen safety concept employed in the Ballard Megablock solution. This document documents the location of hydrogen manifolds, valves and couplings, and how the safety is handled for each (the Safety Concept). This document does not describe other parts of the safety for the Megablock, such as electrical safety and personal protective means. The fuel cell module (Ballard FCgen 200kW Fuel Cell Module) has an internal hydrogen safety concept, which is also described.

This document, submitted in confidence, contains proprietary information which shall not be reproduced or transferred to other documents or disclosed to others or used for manufacturing or any other purpose without prior written permission of Ballard Power Systems.

1.0 Purpose and Scope

The purpose of this document is to introduce the hydrogen safety concept employed in the Ballard Megablock solution. This document will document the location of hydrogen manifolds, valves and couplings, and how the safety is handled for each (the Safety Concept).

This document does not describe other parts of the safety for the Megablock, such as electrical safety and personal protective means.

The fuel cell module (Ballard FCgen 200kW Fuel Cell Module) has an internal hydrogen safety concept, which will also be described.

The reader is expected to have basic familiarity with gas safety and hydrogen safety.

3.0 Hydrogen Supply Overview

3.1 Introduction

This section provides an overview of where hydrogen is supplied to the Megablock, how it is transported to the fuel cell system and how the fuel cell modules handle hydrogen safety. Each of these items is described in further details in following sections.

3.2 Hydrogen Flow

The hydrogen flow for the Megablock container is illustrated in Figure 1, below:

Figure 1: Hydrogen Overview for the Megablock Container

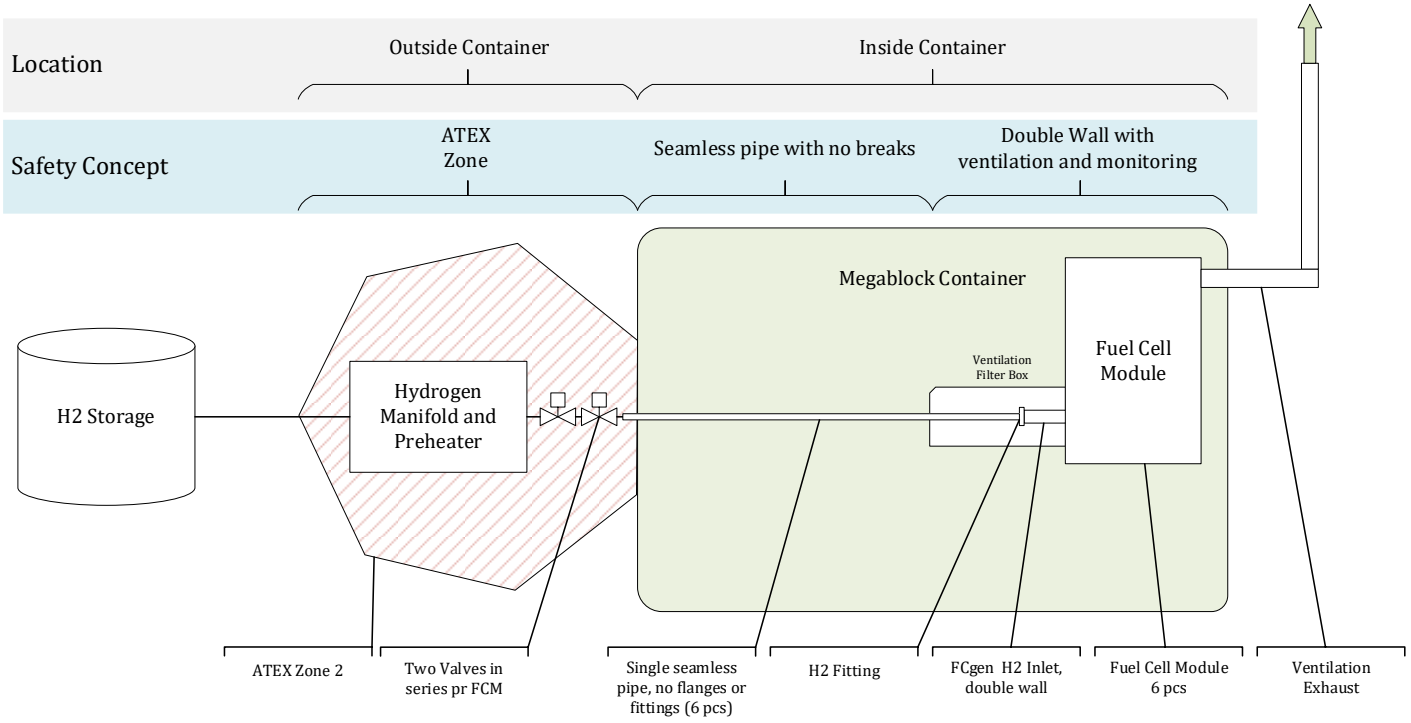

Illustration of the components in the hydrogen supply for the Megablock and the safety concept applicable for each segment.

The main components are:

- Hydrogen Inlet, Manifold and Preheater
  - Connection point for the hydrogen storage system.
  - Pressure transducer to monitor inlet pressure.
  - Hydrogen preheating system.

- Hydrogen Shutoff Valves
    - Direct acting solenoid valves, with each module having two in series.
- Module Supply Pipe
    - Seamless stainless-steel pipe, which carries hydrogen from the shutoff valves to the fuel cell module connection point. One pipe pr module, 6 pcs in total.
    - Pipe has no breaks or fittings outside of the Ventilation Filter Box.
- Ventilation Filter Box
    - Interface between single walled pipe inside container and dual wall inside Fuel Cell module. Ventilated and monitored space, with rapid air change. One filter box pr module, 6 in total.
- Fuel Cell Module
    - FCgen Fuel Cell Module.
    - Contains internal double-wall hydrogen containment system with rapid air changes and dual hydrogen detection sensors.

3.3 Overview Drawings

Better CAD Drawings

4.0 Safety Concepts

This section describes the different safety concepts applicable to parts of the hydrogen supply system for the Megablock.

4.1 ATEX Zone

For an ATEX zone, the safety concept is to follow the recommendations and requirements laid out in the Directive 2014/34/EU, commonly known as the ATEX directive. This results in all electrical components inside the zone having the “EX” marking, covering the zone class, gas type and expected temperature.

4.2 Seamless piping with no breaks

The piping between the ATEX zone and the ventilation filter box is a stainless-steel pipe with no fittings or other breaks between the ATEX zone and the controlled space in the

4.3 Double wall with ventilation and monitoring

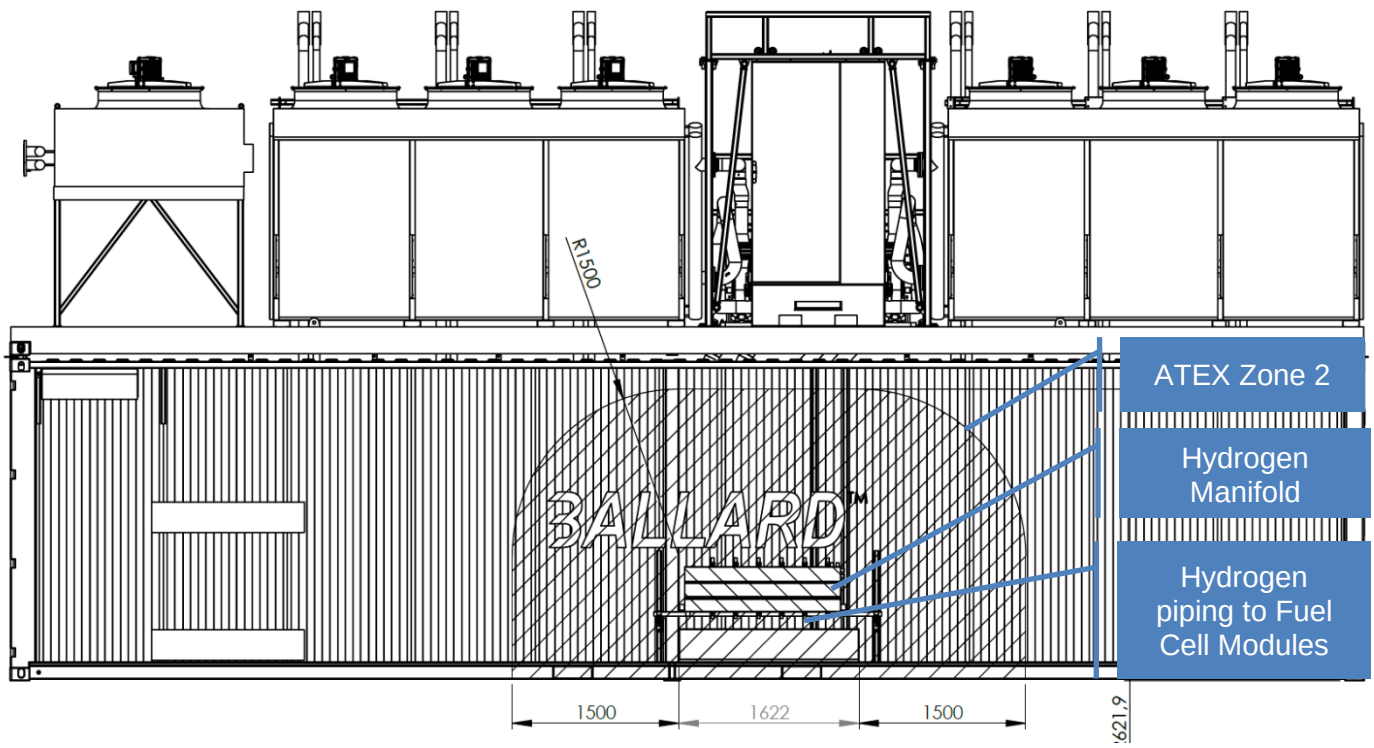
The double wall concept is based around the idea of surrounding the hydrogen carrying pipe with a secondary pipe, with the space between the primary and secondary pipe being ventilated and a hydrogen detector measuring the hydrogen concentration. In this case, a leakage is drawn past the detectors by the ventilation air stream.

5.0 Hydrogen Supply Interface and Valve Array

Please refer to document C03 Process and Instrumentation Diagrams.

The interface for the external hydrogen connection is located on the outside of the container. This hydrogen supply inlet contains a pressure transducer and a distribution manifold to the valve array.

The valve array is comprised of two shutoff valves in series for each fuel cell module, providing a redundant method of interrupting the hydrogen supply to the individual modules. There is also installed a manual lockable shutoff fitting for each fuel cell module, facilitating lock-out, tag-out procedures before maintenance activities on the fuel cell modules.



5.1 Hazardous Zone surrounding the Hydrogen Supply Interface and Valve Array

The area surrounding the hydrogen supply interface and the valve array is classified as ATEX Zone 2, where a hazardous mixture will not likely be present in normal operation, and if so, only for a short period.

The document describing the hazardous zone extent is K559-2254-CWIWP4202202-E99-002, with excerpts reproduce below in Figure 2.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

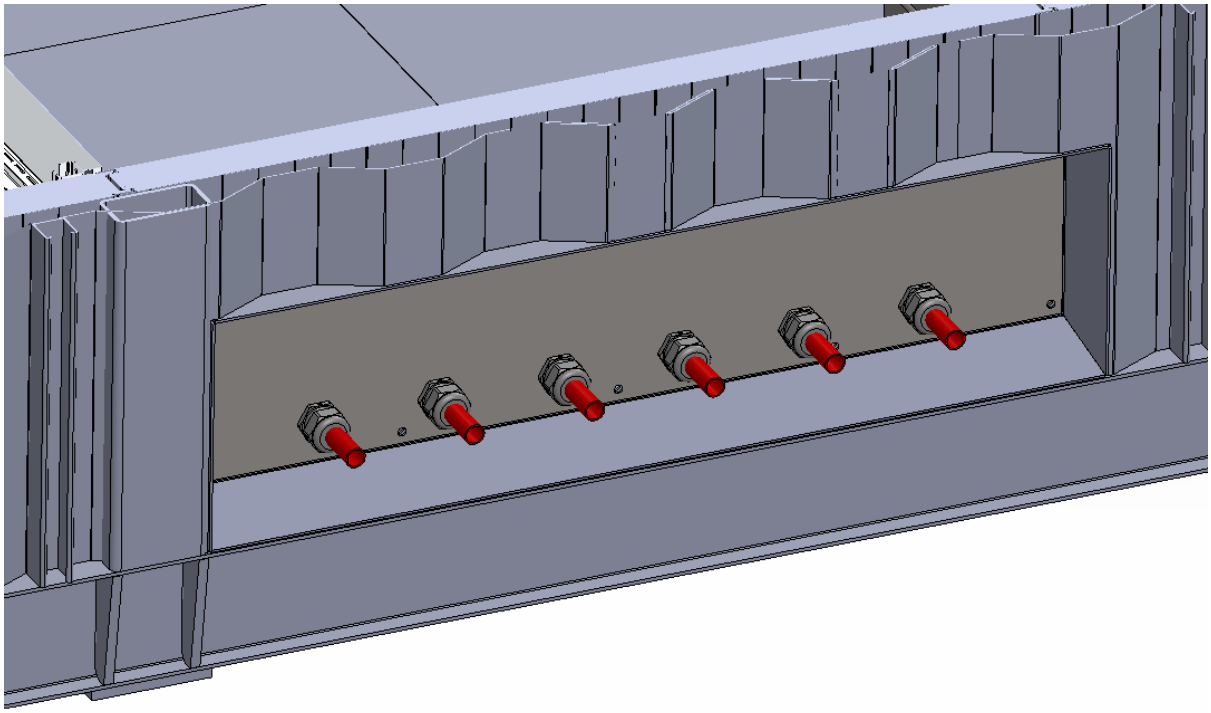


Figure 2: Hazardous Area

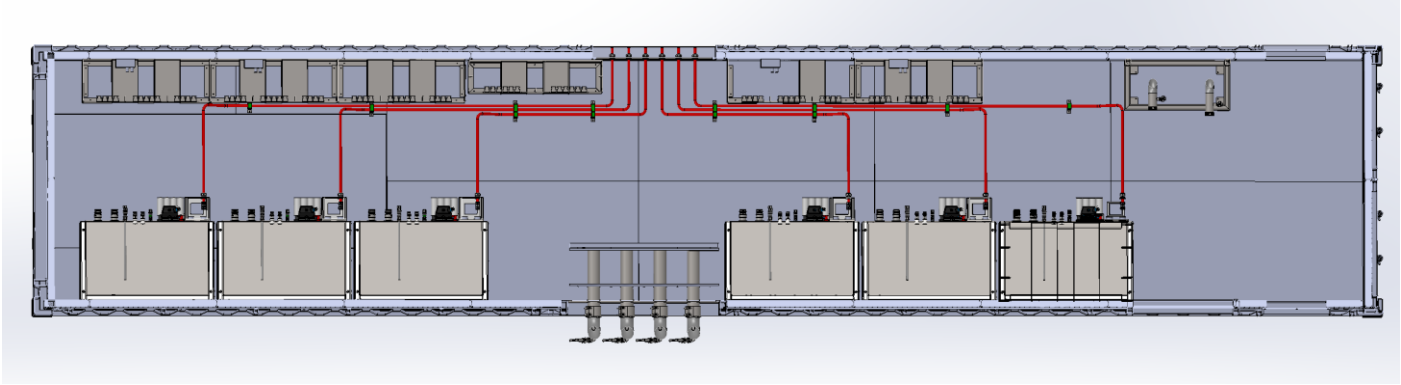
*Hazardous area on one side of the 40ft container (opposite air intake). Hydrogen intake and manifold shown above hydrogen piping to the fuel cell modules. Taken from **B01 General Arrangement**.*

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Figure 3: Hydrogen Piping – Container Entry

The piping entry into the container is show here, with the 6 hydrogen pipes shown in red. Each pipe is fixated with Ex-rated pipe gland.



THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

6.0 Hydrogen Piping to Fuel Cell Modules

The hydrogen is transported from the hydrogen supply interface and the valve array to the fuel cell module in individual, seamless pipes with no breaks or fittings outside the controlled area of the valve array and the ventilation filter box (see section 7.0 Interface to Fuel Cell Module)

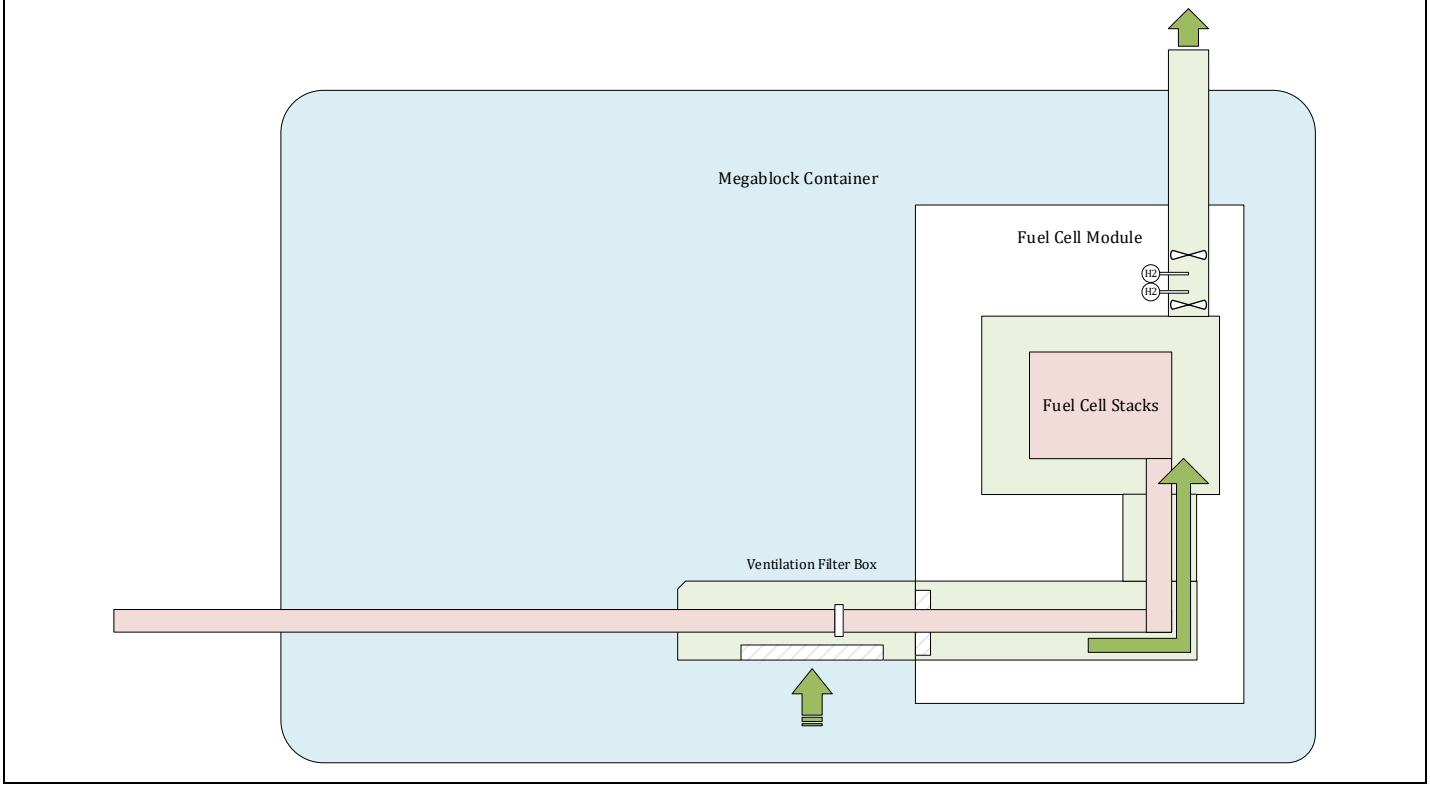
The routing of the hydrogen piping is illustrated in Figure 4: Hydrogen Piping.

Figure 4: Hydrogen Piping

Top down view of the 40ft container, with the piping between the valve array and the fuel cell module interface shown, highlighted in red.

The piping is placed below a metal grating floor, protecting it from impacts and incidental damage.

7.0 Interface to Fuel Cell Module



The hydrogen piping interface to the fuel cell module is a connected with double compression ring fitting, contained in a double wall shell, ventilated and monitored, as described in section “4.3 Double wall with ventilation and monitoring”.

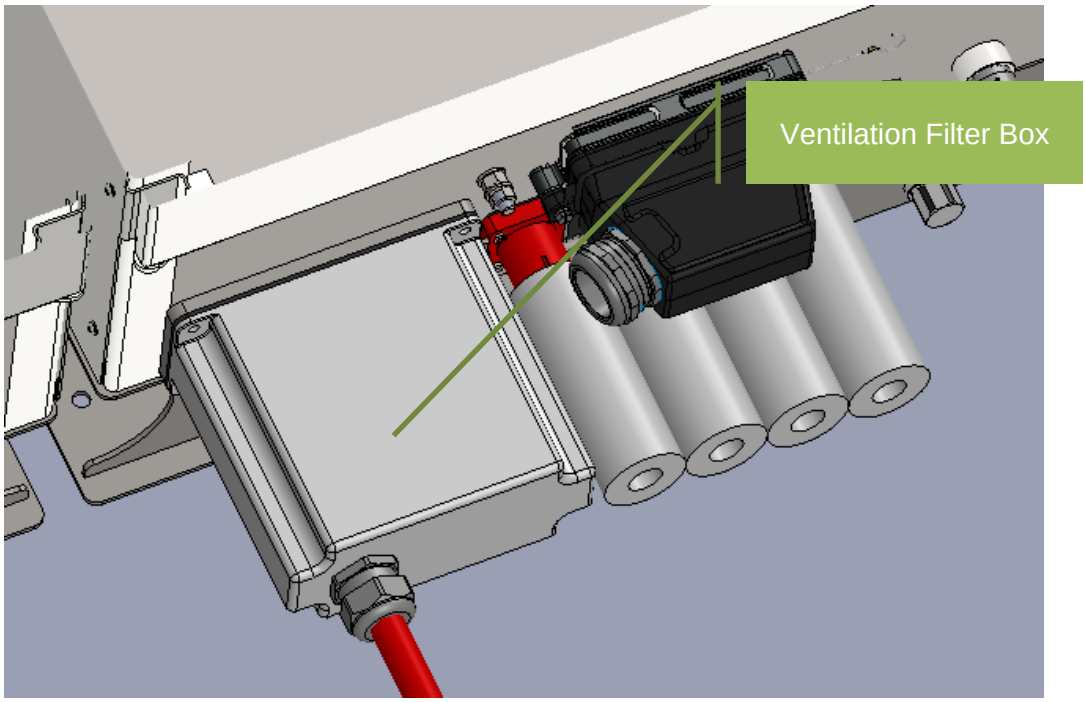
THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

7.1 Ventilation Filter Box

The connection between the hydrogen piping and the fuel cell module is contained in the ventilation filter box, with the concept shown in Figure 5.

Figure 5: Ventilation filter box with airflow indications

Concept drawing for the ventilation filter box. Air is drawn in through the bottom of the filter box and drawn past all hydrogen containing components by redundant fans. The airstream is monitored by two hydrogen detectors



This box is shown in Figure 6 and as a cutaway in Figure 7. The pipe fitting connecting the pipe from the module to the supply pipe is shown in Figure 8.

The ventilation filter box serves the following purpose:

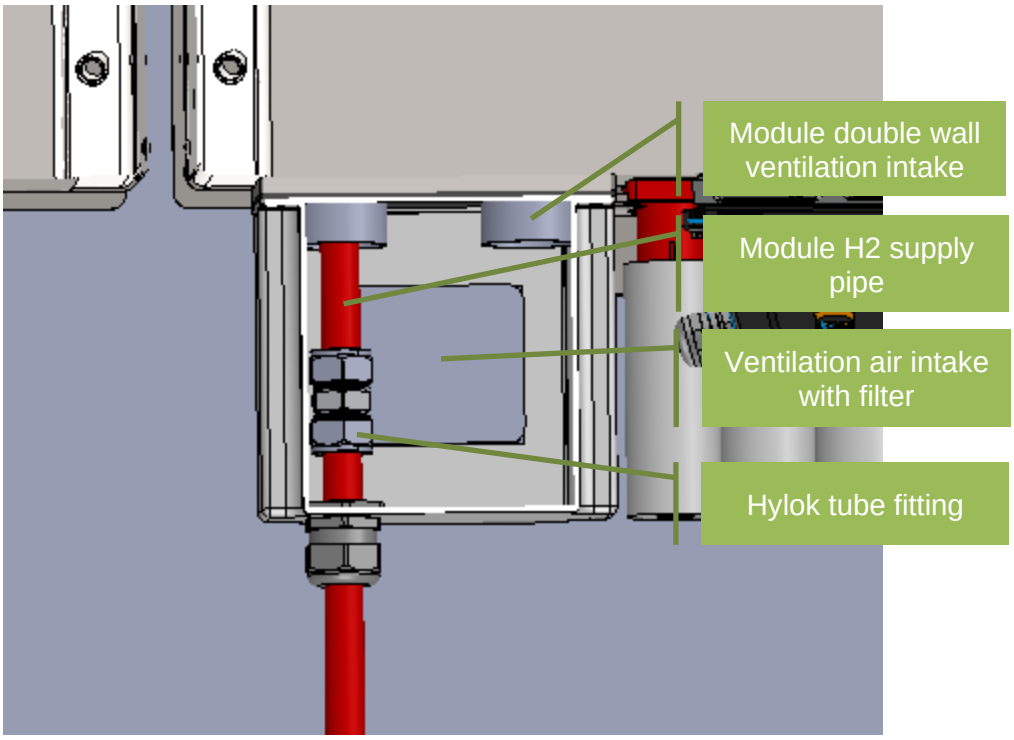
- Enclosure around the hydrogen fitting, enclosing the possible leakage point.
    - Kept at lower than ambient pressure by the module ventilation fans.
    - Airflow over the fitting is carried past module hydrogen sensors, detecting leakages.
- Filter the incoming air
    - Prevents buildup of dust and debris.

- Filter is located on the bottom of the box.

Figure 6: Ventilation Filter Box

The ventilation filter box, mounted of the front of the fuel cell module. Pipe gland fixates pipe to box structure. Air intake at the bottom of the box.

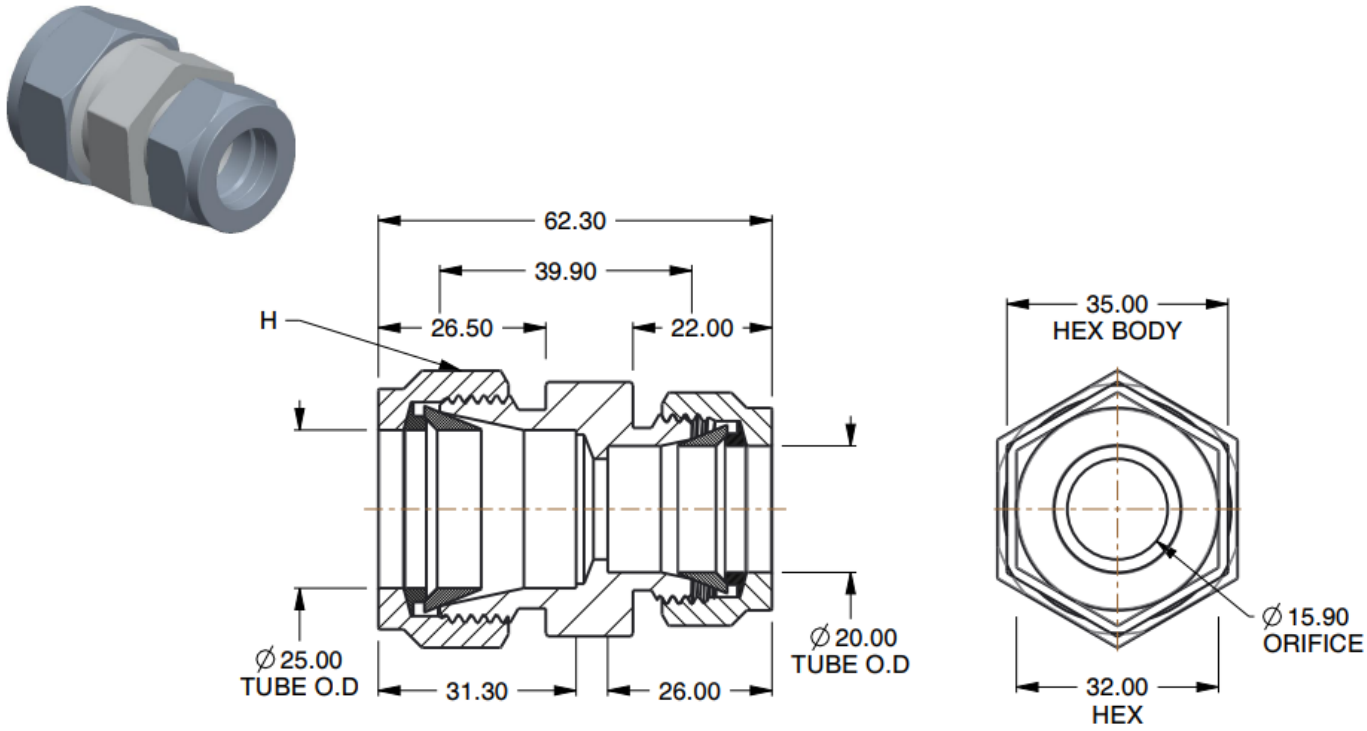
THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.



7.2 Ventilation Filter Box internal contents

The internal contents of the ventilation filter box is shown in Figure 7, below:

The air flow path is:



1. Air is drawn in through ventilation air intake through filter.
2. Air is drawn through the module double wall ventilation intake
3. Inside module, air is drawn past all hydrogen containing components (pipes, Valveblock and fuel cell stacks)
4. Redundant fans draw air out of the double wall structure and exhaust it to the module ventilation exhaust.
5. Hydrogen sensors are placed in the ventilation exhaust, monitoring the airstream for leakages.

Figure 7: Ventilation Filter box cutaway

Top-down cutaway view of the ventilation filter box, showing the hydrogen connection fitting and ventilation intake with module air inlet

Figure 8: Double compression ring reducing fitting

Mechanical drawing of double compression ring fitting for hydrogen. Reducing union from 25 to 20 mm OD shown. Material is SS316.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

8.0 Fuel Cell Module

The FCwave™ has 3 levels of safety:

1. Safety in normal operation
    a. Ventilation of hydrogen enclosure volume to prevent any build-up of hydrogen to a combustible level.
2. Safety in probable leakage scenarios
    a. Supervision of the fuel cell and shutting off hydrogen supply in the event of unsafe conditions.
3. Safety in catastrophic events
    a. Encapsulation in the event of a hydrogen explosion.

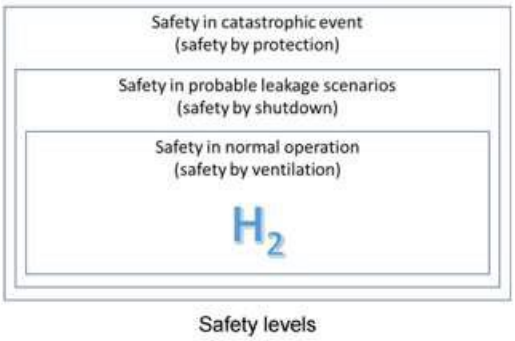


Figure 9. Safety levels of the FCwave™

Safety measures in place:

- Active ventilation through the enclosure
    - 100% redundant ventilation fan
    - No dead pockets for hydrogen – verified with CFD analysis
    - Ventilation flow monitored by safety controller
    - Flow switch
    - Tacho feedback from fans
- Negative pressure inside the enclosure
    - Differential pressure sensor
    - Enclosure sealed with a gasket at all possible openings
- Twin hydrogen sensors (range 0-4%) in ventilation air connected to:
    - Fuel cell controller
    - Safety controller

9.0 Container Hydrogen Detection

The container itself contains hydrogen sensors to detect hydrogen leakages.

The three hydrogen detectors are located at the following locations:

- Container Ventilation intake
    - Sensor located at the ventilation intake of the container and midpoint.
- Container ventilation outlet
    - Two sensors, one at each end of the container at the container ventilation outlets.

The ventilation outlet sensors detect and alarm in case of internal leakages. If a leakage is detected, the safety system shuts off the hydrogen supply valves and trigger emergency shutdown of the fuel cell modules and power converters inside the module.

See document “C07 Cause and Effect Charts” for details.

10.0 External Hydrogen Hazard

One hazard that the container can detect but not mitigate, is an external release of hydrogen impinging on the container and being drawn in with the ventilation system.

The planned mitigations are:

- Placement of the container outside hazardous areas from gas storage systems
- Orientation of the ventilation intake system, facing away from the gas storage system
- Installation of hydrogen detector on the ventilation intake, to detect the hazard and trigger internal emergency stop if hydrogen detection exceeds limit values.

Short Title	Hydrogen Preheating System Impact
Full Title	Crosswind/Baseload Power Hub Fuel Cell Hydrogen Preheating System Impact Assessment
Abstract	This document presents the hydrogen preheating system and its impact compared to excluding it. The hydrogen preheater conditions the hydrogen in cold ambient temperatures, to meet environmental specifications. For the preheater, a block diagram, functional description, and main components are outlined. Impacts are assessed for the fuel cell modules, physical plant and control system.

This document, submitted in confidence, contains proprietary information which shall not be reproduced or transferred to other documents or disclosed to others or used for manufacturing or any other purpose without prior written permission of Ballard Power Systems.

1.0 Purpose and Scope

The purpose of this document is to introduce the concept and outline the execution of the hydrogen preheating system installed on the Crosswind Baseload Power Hub Fuel Cell Package (FC Package).

The purpose of the preheating system is to condition (heat) the hydrogen gas flowing to the Fuel Cell Modules inside the FC Package.

Following the introduction of the preheating system, the impact of the inclusion or exclusion of the preheater is assessed.

2.0 Background

The Fuel Cell Modules (FCwave) use hydrogen gas to produce electricity. The intake of gas has been specified to be acceptable between 0 and 80 degrees centigrade. Initial acceptance was given to intake hydrogen gas down to -10 degrees.

Further testing from the product development team showed that stability and performance of the module internal gas regulation was impacted when the hydrogen gas was below 12 degrees.

Ballard has designed and integrated a hydrogen preheating system, which will be installed on the FC Package.

The preheating system uses a heated water bath surrounding pipe coils leading to the fuel cell modules.

3.0 Impact of the hydrogen preheating system

This section details the impact of the inclusion of the preheating system, as well as expected impact on system performance if the preheating system is not installed.

3.1 Fuel Cell Module

The primary reason for including the preheating system is to avoid a corner case for the hydrogen pressure regulation system inside the fuel cell module, which in cold media temperatures, low inlet pressure and high flow combination may oscillate and limit the maximum output of the fuel cell module.

Including the preheater ensures the corner case is avoided, and the system will provide full power in all ambient conditions.

Not including the preheater can limit the power output of the fuel cell modules in some ambient conditions and cause increased wear on the hydrogen regulation components in the fuel cell modules.

3.2 Hydrogen manifold

The hydrogen manifold is impacted by the addition of the preheater, mainly by the physical inclusion of the device. From hydrogen flow perspective, the heater is a passive flow restriction and heating device, with no ability to actively control the flow of hydrogen.

The flow restriction will add ~200 mbar of pressure droop at full flow. Considerations for expansion of trapped gas is covered in Appendix 3 – Thermal Expansion of Trapped Gas.

The mass of the hydrogen heater and the internal liquid will add approximately 200 kg to the weight of the container.

3.3 Internal control system

The control system of the FC package will control the heater, by switching on and off the heating elements inside the preheater.

This is done via solid-state contactors, which have excellent operational lifetime, even with a high number of switching cycles. The control system has been programmed, tested, and verified with previous Megablock projects.

3.4 Time to start

The startup time for fuel cell package is not impacted in a Hot Standby scenario, where the hydrogen preheater is kept at operational temperature (for power consumption, see “E14 – Load List”).

In case the fuel cell package is at cold standby, the time to readiness depends on the ambient temperature. The heater can increase its temperature at approximately 2 degrees pr minute.

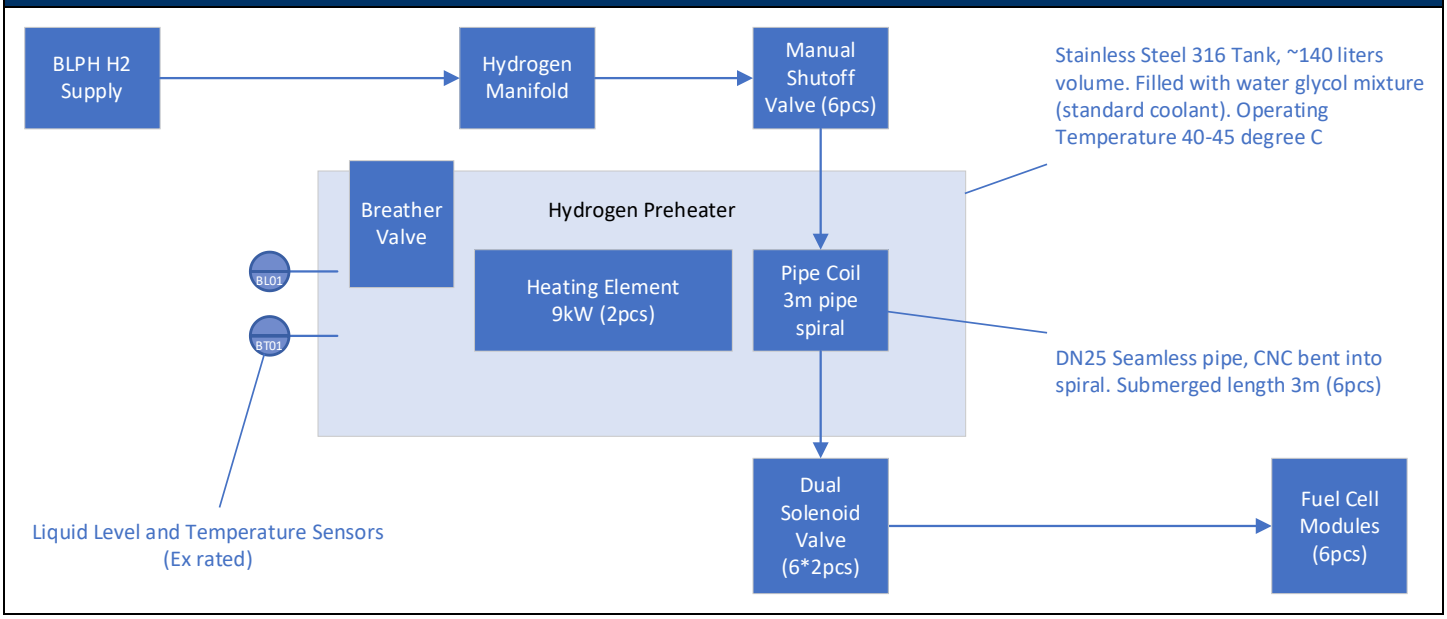
From an ambient temperature of -8 (Worst case), the heater requires about 20 minutes to reach initial operating temperature.

3.5 Impact to customer

The hydrogen heater materials and engineering is added as an integrated part of the FC package by Ballard.

The hydrogen interface point shifts from the no-heater position to the with-heater location. This is covered by existing TQs.

3.6 Service



During ordinary service visits, the service technician shall top-up the contents of the preheater tank so evaporative losses are covered. No other service is expected.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.0 Block Diagram and Functional Description

The block diagram for the Hydrogen preheating system is shown in Figure 1. The method of operation is described below.

Figure 1: Hydrogen Preheater Block Diagram

The H2 preheating system uses heat from a pair of 9kW heating elements transferred via water/glycol mixture immersion to the pipe coils, carrying hydrogen to the fuel cell modules.

The hydrogen preheating system is used when the ambient temperature is below 10 degrees centigrade.

- Ambient temperature is sensed by the FC package controller (“controller”) via a sensor exposed to the ambient air (not shown on diagram).
- When the FC package is in Cold Standby, the hydrogen preheating system is inactive.
- When the FC package is in Hot Standby or Running, the hydrogen preheating system is active.
- The level of liquid inside the preheating system is monitored via a point level switch, ensuring that heaters are not activated without coolant to transfer the heat.
- When activated, a PID controller regulates the power to the heating elements to maintain a steady temperature inside the preheater. The operational temperature setpoint is 30 °C.
- The warm liquid transfers heat to the pipe coil and through the pipe wall to the gas stream, ensuring an optimal gas temperature to the FCwave fuel cell modules.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.0 Detailed P&ID and Image

For a detailed P&ID, refer to most recent version of “C03 P&ID.”

Figure 2: Hydrogen Preheater

Hydrogen preheater mounted to the side of a Megablock system. This configuration of the preheater has valves and shutoffs mounted elsewhere.

6.0 Components of the Hydrogen Heater

Note: ATEX considerations moved to the ATEX Dossier, document M99.

The following sections describe the components of the preheater.

6.1 Coolant Media

The heater contains Glad Long Life Ethylene Glycol Premix 50%, for details refer to document N07. This coolant is a premix, also used in the HT and LT coolant systems for the lowest amount of different coolant mediums.

Service for the above-mentioned chemicals is done every 20,000 hours or 2 years, whichever comes first. Under normal operation, there will be no direct consumption of the coolant. However, coolant level will be topped up during general service on the overall system. Coolant premix is either pre-positioned on platform or brought with service technician.

6.2 Hydrogen Pipe Coils

The pipe inside the hydrogen preheater is a single piece of seamless tubing, bent using a CNC bending machine. This ensures that there are no joints or other leakage points inside the preheater assembly.

All fittings are outside the preheater assembly, where any possible leakages may vent to open air, in a ATEX area.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Figure 3: Hydrogen Pipe Coil

Half-length pipe coil used in testing setup. The production coils have double the length of piping. Made from seamless SS316 DN25 pipe on CNC bending machine.

6.3 Heating Elements

The heating elements in the system is 2 pieces 3 phase 400V, 9kW flanged immersion heaters. The heaters are Ex rated.

6.4 Temperature Sensor

The temperature sensor is a PT1000 sensor with a Ex barrier module between sensor and PLC.

6.5 Level Switch

The level switch is a sensor for point level detection in hazardous areas, manufactured by IFM. It is also installed with a Ex barrier module between sensor and PLC.

7.0 Appendix 2 – Energy Consumption

The hydrogen heater switches the pair of 9kW heating elements with a solid-state contactor.

The heating-up phase of the system will run a single 9kW heating element at 100% duty cycle (consuming 9kW of electricity off the AUX supply).

When at operating temperature, the heat transfer from the hydrogen heater to the surroundings is approximately 2kW with worst possible ambient conditions (-20°C ambient, rain and wind).

When the FC package is asked to operate and it switches from AUX supply to primary supply, it may use up to 18kW of power to maintain temperature.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

8.0 Appendix 3 – Thermal Expansion of Trapped Gas

One hazard of the system may be that cold gas is trapped inside the heater and subsequently expands when the heater is started, this heating expands the gas and leads to higher pressure.

The length of tubing is 3 meters inside the heater and less than 20 cm on each side, so a length of 4 meter is considered. The tube is 25mm outside diameter with 2mm wall thickness, so an internal diameter of 21mm is used.

The minimum operating temperature is -20°C and highest temperature conceivable is 100°C with an initial pressure of 10 barg (11 barA).

Volume of trapped gas:

$$V = \pi * r^2 * h \rightarrow V = \pi * (0{,}00105\ m)^2 * 4\ m = 0{,}00139\ m^3 = \ 1{,}39\ L$$

Moles of gas at -20°C (253,15 K):

$$n = \frac{PV}{RT} \rightarrow n = \frac{11\ barA\ * 1{,}39\ L}{0{,}08314\ \frac{L * barA}{K * mol} * 253{,}15\ K} = 0{,}726\ mol$$

Pressure of 0,726 mol of hydrogen at 100 °C (373,15 K), same volume:

$$P = \frac{nRT}{V} \rightarrow P = \frac{0{,}726\ mol * 0{,}08314\ \frac{L * barA}{K * mol} * 373{,}15\ K}{1{,}39\ L} = 16{,}2\ barA$$

Thus, the pressure increase is:

$$\Delta P = P_{100°C} - P_{-20°C} = 16{,}2\ barA - 11\ barA = 5{,}2\ bar$$

A pressure increase of 5,2 bar is well within materials specifications and valve limitations.

1.0 General Description

The stationary fuel cell system is based on 6 FCwave™ hydrogen fuel cells, built into a 40' HC container, capable of delivering 1 MW AC power. A transformer matching the local grid voltage is included in a separate 10' HC container and hence a complete microgrid can be established.

The containerized solution includes all the equipment necessary to operate the fuel cells and converts the DC power generated by the fuel cells into AC power. The container is delivered with a complete cooling system that dissipates the heat generated by the fuel cells and power conversion.

Operating Conditions:		
Altitude	< 100 m	< 328’
Minimum Ambient Temperature, Operating	-8.4 °C	16.9 °F
Maximum Ambient Temperature, Operating	+25 °C	77 °F
Humidity	5% to 95% RH	
Wind Velocity[4]	31 m/s	69.35 mph
Weather	Designed for all year operation in temperate offshore areas, including wind driven rain and snow	
Salt Mist and Sea Salt Protection	Yes	
Flooding	Approximately 10 cm above ground level	Approximately 3.94” above ground level
Earthquake	Not earthquake safe, but designed to withstand customer-defined accelerations	

Note: If there are discrepancies between metric and imperial, it will be metric that applies.

[4] *10-minute mean wind velocity at 10 m elevation with 50 years return period*

3.0 System Layout

The isometric views of the layout shown below are taken from the General Arrangements drawing. The cooling platform, incl. HT coolers, HT cooling pump sub-assemblies and LT cooler, is mounted on top of the 40' HC container. The 10' transformer container is installed next to the 40' container in an L-type arrangement. For more information, incl. details on the interface connections, please refer to the General Arrangements drawing (K559-2254-CWIWP4202202-B01-001).

4.0 Container Overview

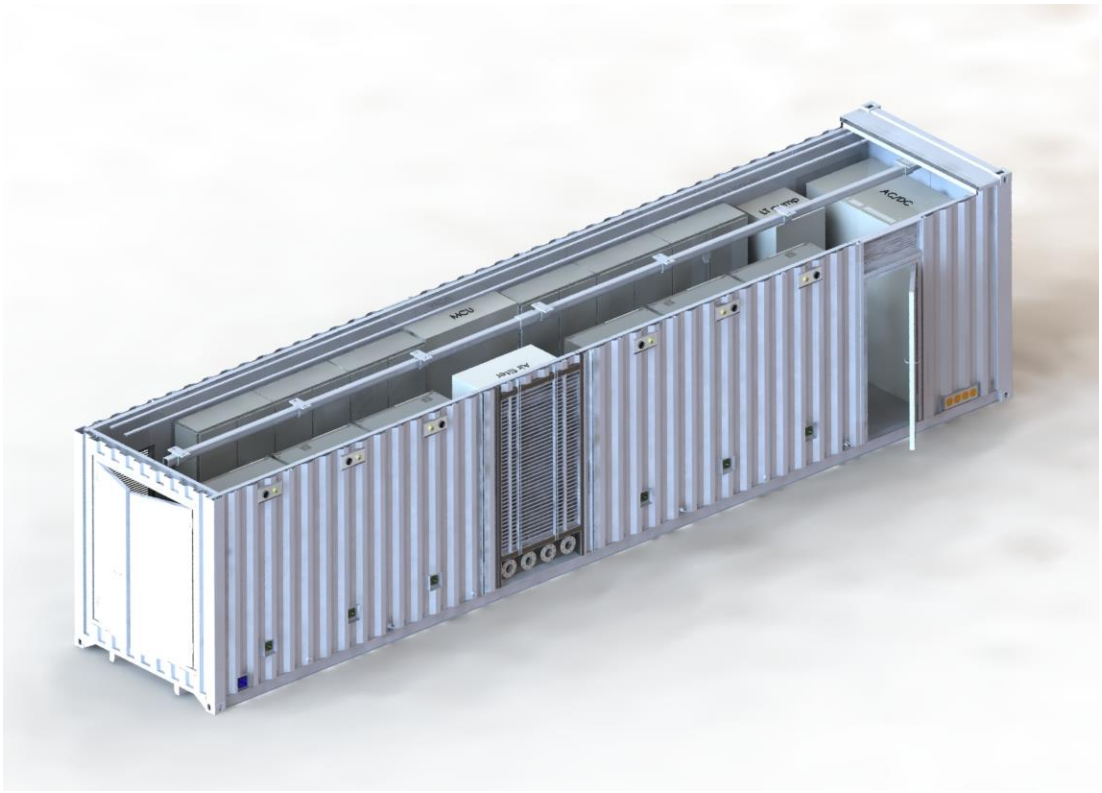

Figure 3. Visualization of the inside of the 40’ container (indicative).

The container contains the following main components:

1. Air filter with dampers and rain protection.
2. Container ventilation fans.
3. FCwave™ fuel cell modules.
4. H_2 intake manifold, incl. safety shut-off valves (opposite side).
5. Raised floor. Cooling, electrical, and interfacing is installed below the floor.
6. Container control unit (CCU) cabinet, which contains the computers and controls required to manage the container and all peripherals (e.g., coolers, transformer, power conditioning), manage load distribution and start/stop sequences as well as safety of the container. The CCU is the interface to the customer’s control system.
7. DC/DC cabinets for connecting each FCwave™ to a shared DC power bus, including necessary filters.
8. DC/AC cabinet for converting the full power capacity to the AC required, inclusive filters and connecting points for transformer.
9. Transformer to boost the AC output voltage to the customer-required voltage level (not shown).
10. Low temperature pump arrangements for cooling of power electronics, compressors, etc.
11. High temperature cooling for fuel cell stacks (not shown).
12. 2 access doors.
    The interior of the container is not to be considered a working area, and access should be prohibited during operation, unless by a trained service engineer.
13. Ventilation and process exhaust piping above FCwave™ (not shown).

5.0 Water Drainage System

The fuel cell process will produce a max. of 18 L/min of deionized (DI) water at full load. For sizing purposes, it is assumed that all of this DI water condenses and exits through the process water drain. The DI water exiting from the system may be disposed of similar to tap water or reutilized for other purposes if needed by the customer.

The drainage system is internally designed so that it shall not freeze nor block the water flow. The drainage system outlet pipe is guided to the outside of the container, where care must be taken to ensure proper functionality, also during freezing.

6.0 Requirements for Upstream H_2 Delivery System

The integrator must provide sufficient hydrogen of quality, pressure, and temperature as specified in section 2.

The integrator must provide a block and bleed capability upstream of the module.

The hydrogen supply must be designed to prevent the inlet pressure to exceed 6.5 bar(g).

7.0 Hydrogen Safety

Every FCwave™ is equipped with a comprehensive safety system, preventing any leakages of Hydrogen inside the FCwave™ to develop into an explosive or flammable mixture. The safety system is verified and tested according to maritime safety codes and has been certified by the DNV for installation on ships.

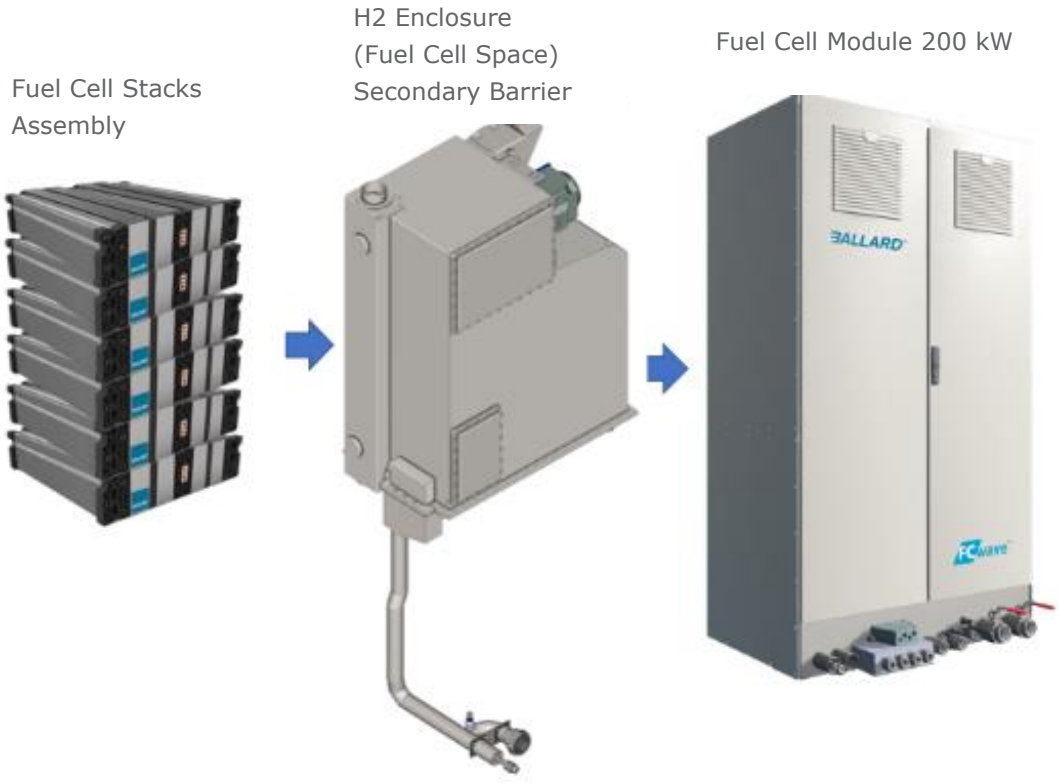

Figure 4. FCwave™ module, hydrogen enclosure, and stack assembly.

Ballard Power Systems Europe A/S
Majsmarken 1
DK-9500 Hobro

contact@ballardeurope.com
+45 8843 5500
ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen™-XD, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

The FCwave™ module has been designed with a hydrogen enclosure. The hydrogen enclosure is a unique design concept, which allows to separate the hydrogen related components such as fuel cell stacks from the auxiliary electrical components and control units.

The internal hydrogen supply installation is made as double wall piping, with a ventilated outer tube. Any leaked hydrogen will escape outside and will not build up to an explosive atmosphere inside the container.

With the hydrogen enclosure and the double wall barrier, the container is not regarded as an Atex zone, and is furthermore ventilated during operation.

The immediate outlet of the exhaust is typically to be considered an Atex zone.

The safety system for each FCwave™ is integrated with the CCU safety controller, such that any error will lead to a warning or safe shutdown, depending on the severity. The container is equipped with hydrogen sensors, which are integrated into the safety system.

For more information, please refer to the Hydrogen Safety Concept document (K559-2254-CWIWP4202202-C99-001).

8.0 Control and Monitoring System

Included in the delivery from Ballard is a Container Control Unit (CCU) for the complete embedded control of the container and auxiliary equipment required for the container to operate safely. The CCU will monitor and manage the power production according to the power requested by the customer.

The CCU is the interface to the customer's control system. The customer must supply a control system for communication with the CCU via Modbus Ethernet. Communication is bidirectional, sending operating instructions to the CCU and receiving status and alarms from the CCU, preferably to be visualized for the operator (must be included in the SCADA supply).

The CCU includes the option for connecting a PC-based engineering interface typically used during commissioning and service.

9.0 Emergency Shutdown

Emergency shutdown for the Stationary fuel cell system is an event, in which the hydrogen flow is stopped immediately, and the currents and voltages of the fuel cell modules are brought down to zero. Hydrogen flow will be handled in the gas handling unit.

The emergency shutdown procedure for the container system can be triggered by any of the FCwave™ fuel cell controllers or the CCU (e.g., due to an unsafe operating state):

- a safety system trip.
- a hydrogen alarm.
- a fire/smoke alarm.
- fuel cell control system.
- the container safety system.

1.0 Purpose

The purpose of this document is to provide Material Safety Data Sheets, in accordance with ISO 11014 or OSHA 1910 – 1200, for all relevant chemicals (incl. lubricants and coolants) supplied or recommended for use with the 1MW fuel cell container (MEGABLOCK) provided by Ballard Power Systems Europe to CrossWind.

3.0 Overview of Material Safety Data Sheets

The complete list of coolants and lubricants used in the 1MW fuel cell container (MEGABLOCK) is shown below.

Manufacturer	Type	Name	Description / Use	Sub-assembly
BASF	Coolant	Glysantin® FC G20®	Used in the internal cooling loop of the fuel cell modules, where a low electrical conductivity is required. Pre-mixed 50/50 ethylene glycol-based coolant specifically developed to support the requirements in fuel cell technologies. It maintains a low and stable electrical conductivity, while at the same time providing protection against corrosion, frost and overheating.	FCwave™
Proviron	Coolant	proviflow® Neo	Used in both HT and LT cooling loops. Pre-mixed 50/50 ethylene glycol-based coolant with OAT (Organic Acid Technology) inhibitors and designed to offer freeze point suppression as well as protection against corrosion, hard water scaling and bacterial growth.	Container Solution
Putoline®	Lubricant	Ceramic Grease PV.20.01	High-grade assembly paste and high temperature lubricant grease without metal particles used for lubrication of bolts.	Container Solution
Chemours™	Lubricant	Krytox™ GPL 205	Chemically inert, PTFE thickened grease based on perfluoropolyether (PFPE) oils that is safe for use around hazardous chemicals, these lubricants are non-flammable and safe for use in oxygen service. They can be used in extreme conditions, such as continuous high temperatures of up to 204 °C (400 °F) and will survive short-term peak temperatures of up to 220 °C (429 °F).	FCwave™
	Lubricant	Krytox™ GPL 206	Chemically inert, PTFE thickened grease based on perfluoropolyether (PFPE) oils that is safe for use around hazardous chemicals, these lubricants are non-flammable and safe for use in oxygen service. They can be used in extreme conditions, such as continuous high temperatures of up to 260 °C (500 °F) and will survive short-term peak temperatures of up to 270 °C (518 °F).	

4.0 Material Safety Data Sheets

4.1 BASF Glysantin® FC G20®

BASF
We create chemistry

Safety Data Sheet
GLYSANTIN® FC G20® ELECTRIFIED®

Revision date : 2024/04/05 Page: 1/10
Version: 3.3 (30244083/SDS_GEN_US/EN)

1. Identification

Product identifier used on the label

GLYSANTIN® FC G20® ELECTRIFIED®

Recommended use of the chemical and restriction on use

Recommended use*: Ready-to-use engine coolants
Unsuitable for use: None known

* The "Recommended use" identified for this product is provided solely to comply with a Federal requirement and is not part of the seller's published specification. The terms of this Safety Data Sheet (SDS) do not create or infer any warranty, express or implied, including by incorporation into or reference in the seller's sales agreement.

Details of the supplier of the safety data sheet

Company:
BASF CORPORATION
100 Park Avenue
Florham Park, NJ 07932, USA
Fuel and Lubricant Solutions

E-mail address: RegXcellenceFuelLubes@basf.com

Emergency telephone number
24 Hour Emergency Response Information
CHEMTREC: 1-800-424-9300
BASF HOTLINE: 1-800-832-HELP (4357)

Other means of identification
Chemical family: inhibitors, in water

2. Hazards Identification

According to Regulation 2012 OSHA Hazard Communication Standard; 29 CFR Part 1910.1200

Classification of the product

Acute Tox.	4 (oral)	Acute toxicity
STOT RE	2	Specific target organ toxicity — repeated exposure

Label elements

Pictogram:

Signal Word:
Warning

Hazard Statement:

H302	Harmful if swallowed.
H373	May cause damage to organs (Kidney) through prolonged or repeated exposure.

Precautionary Statements (Prevention):

P260	Do not breathe dust/gas/mist/vapours.
P270	Do not eat, drink or smoke when using this product.
P264	Wash contaminated body parts thoroughly after handling.

Precautionary Statements (Response):

P314	Get medical advice/attention if you feel unwell.
P301 + P312	IF SWALLOWED: Call a POISON CENTER or doctor/physician if you feel unwell.
P330	Rinse mouth.

Precautionary Statements (Disposal):

P501	Dispose of contents/container in accordance with local regulations.

Hazards not otherwise classified

If applicable information is provided in this section on other hazards which do not result in classification but which may contribute to the overall hazards of the substance or mixture.

3. Composition / Information on Ingredients

According to Regulation 2012 OSHA Hazard Communication Standard; 29 CFR Part 1910.1200

ethylene glycol
CAS Number: 107-21-1
Content (W/W): >= 25.0 - < 75.0%
Synonym: 1,2-Ethanediol; Ethylene glycol

4. First-Aid Measures

Description of first aid measures

General advice:
Immediately remove contaminated clothing.

If inhaled:
Keep patient calm, remove to fresh air, seek medical attention.

If on skin:
Remove contaminated clothing. Rinse skin immediately with plenty of water for 15 - 20 minutes. If irritation develops, seek medical attention.

If in eyes:
Wash affected eyes for at least 15 minutes under running water with eyelids held open.

Hold eyes open and rinse slowly and gently with water for 15 to 20 minutes. Remove contact lenses, if present, after first 5 minutes, then continue rinsing. Seek medical attention.

If swallowed:
Immediately rinse mouth and then drink 200-300 ml of water, seek medical attention. Administer 50 ml of pure ethanol in a drinkable concentration.

Most important symptoms and effects, both acute and delayed

Symptoms: Information, i.e. additional information on symptoms and effects may be included in the GHS labeling phrases available in Section 2 and in the Toxicological assessments available in Section 11., (Further) symptoms and / or effects are not known so far

Information on: ethylene glycol
Symptoms: Overexposure may cause:, corneal injury, severe pain, skin irritation, coughing, respiratory disorders, dyspnea, nausea, headache, vomiting, dizziness, diarrhea, abdominal cramps
---
Hazards: No applicable information available.

Indication of any immediate medical attention and special treatment needed

5. Fire-Fighting Measures

Extinguishing media

Suitable extinguishing media:
water spray, dry powder, foam

Special hazards arising from the substance or mixture
Hazards during fire-fighting:
harmful vapours
Evolution of fumes/fog. The substances/groups of substances mentioned can be released in case of fire.

Advice for fire-fighters
Protective equipment for fire-fighting:
Firefighters should be equipped with self-contained breathing apparatus and turn-out gear.

Further information:
The degree of risk is governed by the burning substance and the fire conditions. Contaminated extinguishing water must be disposed of in accordance with official regulations.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures
Use personal protective clothing. Breathing protection required.

Environmental precautions
Contain contaminated water/firefighting water. Do not discharge into drains/surface waters/groundwater.

Methods and material for containment and cleaning up
For small amounts: Pick up with absorbent material (e.g. sand, sawdust, general-purpose binder).
Dispose of absorbed material in accordance with regulations.
For large amounts: Pump off product.
Place absorbed material in the same container as the spilled substance/product for disposal.

7. Handling and Storage

Precautions for safe handling
No special measures necessary provided product is used correctly.

Protection against fire and explosion:
Take precautionary measures against static discharges.

Conditions for safe storage, including any incompatibilities
Segregate from oxidants.

Further information on storage conditions: Keep container tightly closed and dry; store in a cool place.

Storage stability:
Storage temperature: < 30 °C
Protect from temperatures above: 30 °C

8. Exposure Controls/Personal Protection

Components with occupational exposure limits

ethylene glycol	ACGIH, US:	TWA value 25 ppm Vapor fraction ;
	ACGIH, US:	STEL value 50 ppm Vapor fraction ;
	ACGIH, US:	STEL value 10 mg/m3 Inhalable fraction, Aerosole ;

Advice on system design:
No applicable information available.

Personal protective equipment

Respiratory protection:
Wear respiratory protection if ventilation is inadequate. Respiratory protection in case of vapour/aerosol release.

Hand protection:
Wear chemically impervious protective gloves.

Eye protection:
Safety glasses with side-shields.

Body protection:
Body protection must be chosen depending on activity and possible exposure, e.g. apron, protecting boots, chemical-protection suit (according to EN 14605 in case of splashes or EN ISO 13982 in case of dust).

General safety and hygiene measures:
No eating, drinking, smoking or tobacco use at the place of work. Handle in accordance with good industrial hygiene and safety practice.

9. Physical and Chemical Properties

Form:	liquid	
Odour:	of glycol	
Odour threshold:	not determined	
Colour:	colourless	
pH value:	approx. 5.5 (measured with the undiluted substance)	(ASTM D1287)
Freezing point:	approx. -38 °C	
Melting temperature:	No applicable information available.	
Boiling point:	approx. 108 °C (1,013 hPa)	(ASTM D1120)
Sublimation point:	No applicable information available.	
Flash point:	> 100 °C	(ISO 2592)
Flammability:	hardly combustible	(derived from flash point)
Lower explosion limit:	For liquids not relevant for classification and labelling. The lower explosion point may be 5 - 15 °C below the flash point.	
Upper explosion limit:	For liquids not relevant for classification and labelling.	
Autoignition:	435 °C	(DIN 51794)
Vapour pressure:	17 hPa (20 °C) 85 hPa (50 °C)	
Density:	1.065 g/cm3 (20 °C)	(ISO 2811-3)
Relative density:	No applicable information available.	
Vapour density:	not determined	
Partitioning coefficient n-octanol/water (log Pow):	Study scientifically not justified.	
Self-ignition temperature:	not self-igniting	
Thermal decomposition:	No decomposition if used as directed.	
Viscosity, dynamic:	No applicable information available.	
Viscosity, kinematic:	approx. 4 mm2/s (23 °C)	(DIN 51562)

	approx. 2.5 mm2/s (40 °C)	(DIN 51562)
Particle size:	The substance / product is marketed or used in a non solid or granular form.	
Solubility in water:	(15 °C) soluble	
Solubility (quantitative):	No applicable information available.	
Solubility (qualitative):	No applicable information available.	
Molar mass:	No applicable information available.	
Evaporation rate:	not determined	
Other Information:	If necessary, information on other physical and chemical parameters is indicated in this section.	

10. Stability and Reactivity

Reactivity
No hazardous reactions if stored and handled as prescribed/indicated.

Corrosion to metals:
No corrosive effect on metal.

Oxidizing properties:
not fire-propagating

Formation of flammable gases:	Remarks:	Forms no flammable gases in the presence of water.

Chemical stability
The product is stable if stored and handled as prescribed/indicated.

Possibility of hazardous reactions
No hazardous reactions when stored and handled according to instructions.
The product is chemically stable.

Conditions to avoid
Avoid open flames.

Incompatible materials
strong oxidizing agents

Hazardous decomposition products

Decomposition products:
Hazardous decomposition products: No hazardous decomposition products known.

Thermal decomposition:
No decomposition if used as directed.

11. Toxicological information

Primary routes of exposure

Routes of entry for solids and liquids are ingestion and inhalation, but may include eye or skin contact. Routes of entry for gases include inhalation and eye contact. Skin contact may be a route of entry for liquefied gases.

Acute Toxicity/Effects

Acute toxicity
Assessment of acute toxicity: Of moderate toxicity after single ingestion. Of low toxicity after short-term skin contact.

Oral
Type of value: LD (human)
Value: approx. 1,600 mg/kg

Information on: ethylene glycol
Type of value: LD (human)
Species: human (male/female)
Value: approx. 1,600 mg/kg

Inhalation
No applicable information available.

Dermal
Type of value: LD50
Species: rabbit
Value: > 2,000 mg/kg
Literature data.

Assessment other acute effects
Based on available data, the classification criteria are not met.

Irritation / corrosion
Assessment of irritating effects: Not irritating to eyes and skin.

Sensitization
Assessment of sensitization: Skin sensitizing effects were not observed in animal studies. Human data do not fully exclude a skin sensitizing potential.

Aspiration Hazard
No aspiration hazard expected.

Chronic Toxicity/Effects

Repeated dose toxicity
Assessment of repeated dose toxicity: Repeated exposure may affect certain organs.

Information on: ethylene glycol
Assessment of repeated dose toxicity: The substance may cause damage to the kidney after repeated ingestion. The substance may cause damage to the kidney after repeated skin contact with high doses.

Genetic toxicity
Assessment of mutagenicity: Based on the ingredients, there is no suspicion of a mutagenic effect.

Carcinogenicity
Assessment of carcinogenicity: The whole of the information assessable provides no indication of a carcinogenic effect.

Reproductive toxicity
Assessment of reproduction toxicity: Based on available data, the classification criteria are not met.

Teratogenicity
Assessment of teratogenicity: Based on available data, the classification criteria are not met.

Information on: ethylene glycol
Assessment of teratogenicity: Developmental toxicity was observed after oral ingestion of high doses in studies with rats and mice, but this effect was not seen in a study with rabbits. Mechanistic studies show that the rabbit is the relevant species for the classification for human health. As such, and since ethylene glycol is not a developmental toxicant in the rabbit, no classification is warranted.

Other Information
The product has not been tested. The statements on toxicology have been derived from the properties of the individual components.

12. Ecological Information

Toxicity

Aquatic toxicity
Assessment of aquatic toxicity:
There is a high probability that the product is not acutely harmful to aquatic organisms.

Microorganisms/Effect on activated sludge

Toxicity to microorganisms

Inhibition of degradation activity in activated sludge is not to be anticipated during correct introduction of low concentrations.

Persistence and degradability

Assessment biodegradation and elimination (H2O)
The single components are biological degradable.

Bioaccumulative potential

Assessment bioaccumulation potential
Accumulation in organisms is not to be expected.

Mobility in soil

Assessment transport between environmental compartments
The substance will not evaporate into the atmosphere from the water surface.
Adsorption to solid soil phase is not expected.

Additional information

Other ecotoxicological advice:
Do not release untreated into natural waters.

The product has not been tested. The statement has been derived from the properties of the individual components.

13. Disposal considerations

Waste disposal of substance:
Dispose of in accordance with national, state and local regulations. It is the waste generator's responsibility to determine if a particular waste is hazardous under RCRA.

Container disposal:
Dispose of in a licensed facility. Recommend crushing, puncturing or other means to prevent unauthorized use of used containers.

14. Transport Information

Land transport
USDOT
Not classified as a dangerous good under transport regulations

Sea transport
IMDG
Not classified as a dangerous good under transport regulations

Air transport
IATA/ICAO
Not classified as a dangerous good under transport regulations

Further information
DOT: This product is regulated if the amount in a single receptacle exceeds the Reportable Quantity (RQ). Please refer to Section 15 of this SDS for the RQ for this product. Bulk Shipments: RQ,UN3082 Environmentally Hazardous Substance, Liquid NOS (Ethyleneglycol), 9, PG III

15. Regulatory Information

Federal Regulations

Registration status:
Chemical TSCA, US released / listed

EPCRA 311/312 (Hazard categories): Refer to SDS section 2 for GHS hazard classes applicable for this product.

EPCRA 313:

CAS Number	Chemical name
107-21-1	ethylene glycol

CERCLA RQ	CAS Number	Chemical name
5000 LBS	107-21-1	ethylene glycol

State regulations

State RTK	CAS Number	Chemical name
PA	107-21-1	ethylene glycol
NJ	107-21-1	ethylene glycol

Safe Drinking Water & Toxic Enforcement Act, CA Prop. 65:

WARNING: This product can expose you to chemicals including ETHYLENE GLYCOL (INGESTED), which is known to the State of California to cause birth defects or other reproductive harm. For more information, go to www.P65Warnings.ca.gov.

NFPA Hazard codes:
Health: 1 Fire: 1 Reactivity: 0 Special:

HMIS III rating
Health: 1 Flammability: 1 Physical hazard: 0

4.2 Proviron proviflow® Neo

Proviflow Neo

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878
Issue date: 1/16/2024 Revision date: 1/16/2024 Supersedes version of: 12/15/2023 Version: 0.1

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1. Product identifier

Product form : Mixture
Trade name : Glad Long Life Ethylenglykol, Glad Proviflow N, Glad Proviflow Neo, Glad Proviflow N Ethylenglykol, Glad Ethylenglykol, Proviflow N, Proviflow Neo
REACH registration No. : 01-2119456816-28
PR nr : 4176178

1.2. Relevant identified uses of the substance or mixture and uses advised against

1.2.1. Relevant identified uses

Main use category : For professional use only
Use of the substance/mixture : Heat transfer fluids

1.2.2. Uses advised against

No additional information available

1.3. Details of the supplier of the safety data sheet

Supplier
Proviron Industries nv
Georges Gilliotstraat 60
BE 2620 Hemiksem
Belgium
T +32 3 870 88 20, F +32 3 877 23 33
info@proviron.com, www.proviron.com

1.4. Emergency telephone number

Country/Area	Organisation/Company	Address	Emergency number	Comment

SECTION 2: Hazards identification

2.1. Classification of the substance or mixture

Classification according to Regulation (EC) No. 1272/2008 [EU-GHS/CLP]

Acute toxicity (oral), Category 4 H302
Specific target organ toxicity – Repeated exposure, Category 2 H373
Full text of H- and EUH-statements: see section 16

Adverse physicochemical, human health and environmental effects

No additional information available

1/16/2024 (Revision date) EU - en 1/10

Proviflow Neo

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

2.2. Label elements

Labelling according to Regulation (EC) No. 1272/2008 [EU-GHS/CLP]

Hazard pictograms (CLP) :

GHS07 GHS08

Signal word (CLP) : Warning

Contains : ethanediol; ethylene glycol

Hazard statements (CLP) : H302 - Harmful if swallowed.
H373 - May cause damage to organs (kidneys) through prolonged or repeated exposure (oral).

Precautionary statements (CLP) : P260 - Do not breathe dust/fume/gas/mist/vapours/spray.
P264 - Wash hands, forearms and face thoroughly after handling.
P270 - Do not eat, drink or smoke when using this product.
P301+P312 - IF SWALLOWED: Call a POISON CENTRE or doctor if you feel unwell.
P330 - Rinse mouth.

2.3. Other hazards

Other hazards which do not result in classification : Absorbed through the skin.

This substance/mixture does not meet the PBT criteria of REACH regulation, annex XIII
This substance/mixture does not meet the vPvB criteria of REACH regulation, annex XIII
Contains no PBT and/or vPvB substances ≥ 0.1% assessed in accordance with REACH Annex XIII

The mixture does not contain substance(s) included in the list established in accordance with Article 59(1) of REACH for having endocrine disrupting properties, or substance(s) are not identified as having endocrine disrupting properties in accordance with the criteria set out in Commission Delegated Regulation (EU) 2017/2100 or Commission Regulation (EU) 2018/605 at a concentration equal to or greater than 0,1 %

SECTION 3: Composition/information on ingredients

3.1. Substances

Not applicable

3.2. Mixtures

Name	Product identifier	%	Classification according to Regulation (EC) No. 1272/2008 [EU-GHS/CLP]
Monoethylene glycol	CAS: 107-21-1 EC/EINECS/ELINS: 203-473-3 EC Index-No.: 603-027-00-1 REACH-no: 01-2119456816-28	> 92	Acute Tox. 4 (Oral), H302 (ATE=500 mg/kg bodyweight) STOT RE 2, H373

Full text of H- and EUH-statements: see section 16

SECTION 4: First aid measures

4.1. Description of first aid measures

First-aid measures after inhalation : Remove person to fresh air and keep comfortable for breathing. Administer oxygen if breathing is difficult. Get immediate medical advice/attention.

First-aid measures after skin contact : Take off immediately all contaminated clothing. After contact with skin, wash immediately with plenty of water and soap. In all cases of doubt, or when symptoms persist, seek medical attention.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.
TEMPLATE FRM5100236 0H
Ballard Confidential
Printed on: Friday, August 02, 2024

First-aid measures after eye contact	:	Rinse immediately with plenty of water for 15 minutes. Get immediate medical advice/attention.
First-aid measures after ingestion	:	Do not induce vomiting. Rinse mouth out with water. Get immediate medical advice and attention.

4.2. Most important symptoms and effects, both acute and delayed

Symptoms/effects after inhalation	:	At high concentrations, the vapours can be irritating to the respiratory system. Cough.
Symptoms/effects after eye contact	:	May cause eye-irritation of susceptible persons.
Symptoms/effects after ingestion	:	Harmful if swallowed. May cause gastrointestinal irritation, nausea, vomiting and diarrhoea.
Chronic symptoms	:	Harmful: danger of serious damage to health by prolonged exposure if swallowed. Affects the liver. Material known to cause adverse reproductive effects.

4.3. Indication of any immediate medical attention and special treatment needed

No additional information available

SECTION 5: Firefighting measures

5.1. Extinguishing media

Suitable extinguishing media	:	dry chemical powder, alcohol-resistant foam, carbon dioxide (CO2). Water spray.
Unsuitable extinguishing media	:	Strong water jet.

5.2. Special hazards arising from the substance or mixture

Reactivity in case of fire	:	On burning: release of carbon monoxide - carbon dioxide.

5.3. Advice for firefighters

Firefighting instructions	:	Use water stream to cool containers. Use water stream to cool containers.
Protection during firefighting	:	Wear fire resistant or flame retardant clothing. Extra personal protection: self-contained breathing apparatus.
Other information	:	Do not allow run-off from fire fighting to enter drains or water courses.

SECTION 6: Accidental release measures

6.1. Personal precautions, protective equipment and emergency procedures

General measures	:	Eliminate every possible source of ignition. Avoid inhalation of vapours. Avoid contact with skin, eyes and clothing.

6.1.1. For non-emergency personnel

Protective equipment	:	Wear recommended personal protective equipment.

6.1.2. For emergency responders

Protective equipment	:	Wear recommended personal protective equipment.

6.2. Environmental precautions

Stop leak without risks if possible. Do not discharge into drains or the environment.

6.3. Methods and material for containment and cleaning up

For containment	:	Absorb remaining liquid with sand or inert absorbent and remove to safe place. Collect leaking liquid in sealable containers.
Methods for cleaning up	:	After cleaning, flush traces away with water.

6.4. Reference to other sections

No additional information available

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Proviflow Neo

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

SECTION 7: Handling and storage

7.1. Precautions for safe handling

Precautions for safe handling	:	Skin resorption. Avoid contact with skin, eyes and clothing. Avoid the formation of mists in the atmosphere. Avoid inhalation of vapours. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure.
Hygiene measures	:	Wash hands immediately after handling the product. Do not eat, drink or smoke when using this product.

7.2. Conditions for safe storage, including any incompatibilities

Storage conditions	:	Keep only in the original container in a cool, well-ventilated place.
Storage temperature	:	0 – 40 °C
Heat and ignition sources	:	Avoid ignition sources.
Information on mixed storage	:	Keep away from oxidizing agents.
Storage area	:	Store in a cool, well-ventilated place.
Packaging materials	:	IBC - Composite with plastics inner receptacle - for liquids, with rigid plastics inner receptacle.

Switzerland

Storage class (LK)	:	LK 6.1 - Toxic materials

7.3. Specific end use(s)

No additional information available

SECTION 8: Exposure controls/personal protection

8.1. Control parameters

8.1.1 National occupational exposure and biological limit values

Monoethylene glycol (107-21-1)	
EU - Indicative Occupational Exposure Limit (IOEL)	
Local name	Ethylene glycol
IOEL TWA	52 mg/m³
	20 ppm
IOEL STEL	104 mg/m³
	40 ppm
Remark	Skin

8.1.2. Recommended monitoring procedures

No additional information available

8.1.3. Air contaminants formed

No additional information available

8.1.4. DNEL and PNEC

No additional information available

8.1.5. Control banding

No additional information available

8.2. Exposure controls

8.2.1. Appropriate engineering controls

Appropriate engineering controls:
Ensure good ventilation of the work station.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

8.2.2. Personal protection equipment

8.2.2.1. Eye and face protection

Eye protection:
Protective goggles or face shield

8.2.2.2. Skin protection

Skin and body protection:
Avoid contact with skin, eyes and clothing. Take off immediately all contaminated clothing and wash it before reuse.

Hand protection:
Chemical resistant gloves (according to European standard ISO 374-1 or equivalent). Butyl rubber. Polyvinylchloride (PVC)

8.2.2.3. Respiratory protection

Respiratory protection:
In order to avoid inhalation of mist/vapour, all spraying must be done wearing adequate respirator. Do not breathe gas/vapour/aerosol. On heating : Breathing equipment. A2

8.2.2.4. Thermal hazards

No additional information available

8.2.3. Environmental exposure controls

Environmental exposure controls:
Do not discharge into drains or the environment.

SECTION 9: Physical and chemical properties

9.1. Information on basic physical and chemical properties

Physical state	:	Liquid
Colour	:	Not available
Appearance	:	Viscous.
Odour	:	odourless.
Odour threshold	:	Not available
Melting point	:	Not available
Freezing point	:	Not available
Boiling point	:	Not available
Flammability	:	Not available
Lower explosion limit	:	Not available
Upper explosion limit	:	Not available
Flash point	:	124 °C Closed cup
Auto-ignition temperature	:	Not available
Decomposition temperature	:	Not available
pH	:	Not available
pH solution	:	7.5 – 10 (50% aqueous solution @ 20°C)
Viscosity, kinematic	:	18 mm²/s (@ 25°C)
Solubility	:	Soluble in water.
Partition coefficient n-octanol/water (Log Kow)	:	Not available
Vapour pressure	:	Not available
Vapour pressure at 50°C	:	Not available
Density	:	1.111 g/ml (@ 20°C)
Relative density	:	Not available
Relative vapour density at 20°C	:	Not available
Particle characteristics	:	Not applicable

9.2. Other information

9.2.1. Information with regard to physical hazard classes

No additional information available

9.2.2. Other safety characteristics

No additional information available

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SECTION 10: Stability and reactivity

10.1. Reactivity

No additional information available

10.2. Chemical stability

Stable in use and storage conditions as recommended in item 7.

10.3. Possibility of hazardous reactions

Reacts with (some) acids: (increased) risk of fire/explosion.

10.4. Conditions to avoid

High temperature. Moisture. Direct sunlight.

10.5. Incompatible materials

Strong oxidizing agents. Aluminium. Rubbers.

10.6. Hazardous decomposition products

Carbon oxides (CO, CO2).

SECTION 11: Toxicological information

11.1. Information on hazard classes as defined in Regulation (EC) No 1272/2008

Acute toxicity (oral) : Harmful if swallowed.
Acute toxicity (dermal) : Not classified (Based on available data, the classification criteria are not met)
Acute toxicity (inhalation) : Not classified (Based on available data, the classification criteria are not met)

Proviflow Neo	
ATE CLP (oral)	533.824 mg/kg bodyweight

Monoethylene glycol (107-21-1)	
LD50 oral rat	7712 mg/kg
LD50 dermal	> 3500 mg/kg mouse
LC50 inhalation rat	> 2.5 mg/l

Skin corrosion/irritation : Not classified
Serious eye damage/irritation : Not classified
Respiratory or skin sensitisation : Not classified (Based on available data, the classification criteria are not met)
Germ cell mutagenicity : Not classified (Based on available data, the classification criteria are not met)
Carcinogenicity : Not classified (Based on available data, the classification criteria are not met)
Reproductive toxicity : Not classified (Based on available data, the classification criteria are not met)
STOT-single exposure : Not classified (Based on available data, the classification criteria are not met)
STOT-repeated exposure : May cause damage to organs (kidneys) through prolonged or repeated exposure (oral).

Monoethylene glycol (107-21-1)	
STOT-repeated exposure	May cause damage to organs through prolonged or repeated exposure.

Aspiration hazard : Not classified (Based on available data, the classification criteria are not met)

Proviflow Neo	
Viscosity, kinematic	18 mm²/s (@ 25°C)

11.2. Information on other hazards

No additional information available

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Proviflow Neo

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

SECTION 12: Ecological information

12.1. Toxicity

Hazardous to the aquatic environment, short–term (acute) : Not classified

Hazardous to the aquatic environment, long–term (chronic) : Not classified

Monoethylene glycol (107-21-1)	
LC50 - Fish [1]	72860 mg/l (Pimephales promelas)

12.2. Persistence and degradability

Proviflow Neo	
Persistence and degradability	Rapidly degradable

Monoethylene glycol (107-21-1)	
Persistence and degradability	Readily biodegradable.

12.3. Bioaccumulative potential

Monoethylene glycol (107-21-1)	
Bioaccumulative potential	Low bioaccumulation potential.

12.4. Mobility in soil

No additional information available

12.5. Results of PBT and vPvB assessment

Proviflow Neo
This substance/mixture does not meet the PBT criteria of REACH regulation, annex XIII
This substance/mixture does not meet the vPvB criteria of REACH regulation, annex XIII

12.6. Endocrine disrupting properties

No additional information available

12.7. Other adverse effects

No additional information available

SECTION 13: Disposal considerations

13.1. Waste treatment methods

Regional waste regulation : Disposal must be done according to official regulations.

Waste treatment methods : Dispose of contents/container in accordance with licensed collector's sorting instructions.

Sewage disposal recommendations : Sewage treatment plant.

Product/Packaging disposal recommendations : Collect all waste in suitable and labelled containers and dispose according to local legislation.

SECTION 14: Transport information

In accordance with ADR / IMDG / IATA / ADN / RID

14.1. UN number or ID number

UN-No. (ADR) : Not applicable

1/16/2024 (Revision date) EU - en 7/10

Proviflow Neo

SECTION 15: Regulatory information

15.1. Safety, health and environmental regulations/legislation specific for the substance or mixture

15.1.1. EU-Regulations

REACH Annex XVII (Restriction List)

Contains no substance(s) listed on REACH Annex XVII (Restriction Conditions)

REACH Annex XIV (Authorisation List)

Contains no substance(s) listed on REACH Annex XIV (Authorisation List)

REACH Candidate List (SVHC)

Contains no substance(s) listed on the REACH Candidate List

PIC Regulation (Prior Informed Consent)

Contains no substance(s) listed on the PIC list (Regulation EU 649/2012 concerning the export and import of hazardous chemicals)

POP Regulation (Persistent Organic Pollutants)

Contains no substance(s) listed on the POP list (Regulation EU 2019/1021 on persistent organic pollutants)

Ozone Regulation (1005/2009)

Contains no substance(s) listed on the Ozone Depletion list (Regulation EU 1005/2009 on substances that deplete the ozone layer)

Dual-Use Regulation (428/2009)

Contains no substance subject to the COUNCIL REGULATION (EC) No 428/2009 of 5 May 2009 setting up a Community regime for the control of exports, transfer, brokering and transit of dual-use items.

Explosives Precursors Regulation (2019/1148)

Contains no substance(s) listed on the Explosives Precursors list (Regulation EU 2019/1148 on the marketing and use of explosives precursors)

Drug Precursors Regulation (273/2004)

Contains no substance(s) listed on the Drug Precursors list (Regulation EC 273/2004 on the manufacture and the placing on market of certain substances used in the illicit manufacture of narcotic drugs and psychotropic substances)

15.1.2. National regulations

France

Occupational diseases	
Code	Description
RG 84	Conditions caused by liquid organic solvents for professional use: saturated or unsaturated aliphatic or cyclic liquid hydrocarbons and mixtures thereof; liquid halogenated hydrocarbons; nitrated derivatives of aliphatic hydrocarbons; alcohols; glycols, glycol ethers; ketones; aldehydes; aliphatic and cyclic ethers, including tetrahydrofuran; esters; dimethylformamide and dimethylacetamine; acetonitrile and propionitrile; pyridine; dimethylsulfone and dimethylsulfoxide

Germany

Employment restrictions	:	Observe restrictions according Act on the Protection of Working Mothers (MuSchG). Observe restrictions according Act on the Protection of Young People in Employment (JArbSchG).

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

2.3. Other hazards

The mixture does not contain substance(s) included in the list established in accordance with Article 59(1) of REACH for having endocrine disrupting properties, or substance(s) are not identified as having endocrine disrupting properties in accordance with the criteria set out in Commission Delegated Regulation (EU) 2017/2100 or Commission Regulation (EU) 2018/605 at a concentration equal to or greater than 0,1 %

SECTION 3: Composition/information on ingredients

3.1. Substances

Not applicable

3.2. Mixtures

This mixture does not contain any substances to be mentioned according to the criteria of section 3.2 of REACH Annex II

SECTION 4: First aid measures

4.1. Description of first aid measures

First-aid measures general : If you feel unwell, seek medical advice.
First-aid measures after inhalation : Remove person to fresh air and keep comfortable for breathing.
First-aid measures after skin contact : Wash skin with plenty of water.
First-aid measures after eye contact : Rinse eyes with water as a precaution.
First-aid measures after ingestion : Call a poison center or a doctor if you feel unwell.

4.2. Most important symptoms and effects, both acute and delayed

Symptoms/effects after inhalation : Although no appropriate human or animal health effects data are known to exist, this material is expected to be an inhalation hazard.
Symptoms/effects after skin contact : None under normal conditions.
Symptoms/effects after eye contact : None under normal conditions.
Symptoms/effects after ingestion : None under normal conditions.

4.3. Indication of any immediate medical attention and special treatment needed

Treat symptomatically.

SECTION 5: Firefighting measures

5.1. Extinguishing media

Suitable extinguishing media : Water spray. Dry powder. Foam. Carbon dioxide.
Unsuitable extinguishing media : Do not use a heavy water stream.

5.2. Special hazards arising from the substance or mixture

Fire hazard : Combustible liquid.
Explosion hazard : No direct explosion hazard.
Hazardous decomposition products in case of fire : Incomplete combustion releases dangerous carbon monoxide, carbon dioxide and other toxic gases.

5.3. Advice for firefighters

Firefighting instructions : Fight fire from safe distance and protected location. Do not enter fire area without proper protective equipment, including respiratory protection.
Protection during firefighting : Do not attempt to take action without suitable protective equipment. Self-contained breathing apparatus. Complete protective clothing.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Ceramic Grease

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

SECTION 6: Accidental release measures

6.1. Personal precautions, protective equipment and emergency procedures

General measures : Stop leak if safe to do so. Notify authorities if product enters sewers or public waters. Absorb spillage to prevent material damage.

6.1.1. For non-emergency personnel

Protective equipment : Wear recommended personal protective equipment.
Emergency procedures : Ventilate spillage area.

6.1.2. For emergency responders

Protective equipment : Do not attempt to take action without suitable protective equipment. For further information refer to section 8: "Exposure controls/personal protection".
Emergency procedures : Evacuate unnecessary personnel. Stop leak if safe to do so.

6.2. Environmental precautions

Avoid release to the environment.

6.3. Methods and material for containment and cleaning up

For containment : Absorb spilled material with sand or earth. Contain any spills with dikes or absorbents to prevent migration and entry into sewers or streams. Stop leak without risks if possible.
Methods for cleaning up : Mechanically recover the product.
Other information : Dispose of materials or solid residues at an authorized site.

6.4. Reference to other sections

For further information refer to section 13.

SECTION 7: Handling and storage

7.1. Precautions for safe handling

Additional hazards when processed : Not expected to present a significant hazard under anticipated conditions of normal use.
Precautions for safe handling : Ensure good ventilation of the work station. Wear personal protective equipment.
Hygiene measures : Do not eat, drink or smoke when using this product. Always wash hands after handling the product.

7.2. Conditions for safe storage, including any incompatibilities

Technical measures : Keep in a cool, well-ventilated place away from heat.
Storage conditions : Keep cool. Protect from sunlight.
Storage temperature : < 40 °C
Packaging materials : Store always product in container of same material as original container.

7.3. Specific end use(s)

No additional information available

SECTION 8: Exposure controls/personal protection

8.1. Control parameters

8.1.1 National occupational exposure and biological limit values

Ceramic Grease

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

Ceramic Grease	
EU - Indicative Occupational Exposure Limit (IOEL)	
Exposure limits/standards for materials that can be formed when handling this product. When mists/aerosols can occur the following is recommended	5 mg/m³ - ACGIH TLV (inhalable fraction).

8.1.2. Recommended monitoring procedures

No additional information available

8.1.3. Air contaminants formed

No additional information available

8.1.4. DNEL and PNEC

No additional information available

8.1.5. Control banding

No additional information available

8.2. Exposure controls

8.2.1. Appropriate engineering controls

Appropriate engineering controls:
Ensure good ventilation of the work station.

8.2.2. Personal protection equipment

Personal protective equipment:
Wear recommended personal protective equipment.

Personal protective equipment symbol(s):

8.2.2.1. Eye and face protection

Eye protection:
Safety glasses

8.2.2.2. Skin protection

Skin and body protection:
Wear suitable protective clothing

Hand protection:
Protective gloves

8.2.2.3. Respiratory protection

Respiratory protection:
In case of insufficient ventilation, wear suitable respiratory equipment

8.2.2.4. Thermal hazards

No additional information available

8.2.3. Environmental exposure controls

Environmental exposure controls:
Avoid release to the environment.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Ceramic Grease

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

SECTION 9: Physical and chemical properties

9.1. Information on basic physical and chemical properties

Physical state	:	Liquid
Colour	:	Beige.
Appearance	:	Paste.
Odour	:	characteristic.
Odour threshold	:	Not available
Melting point	:	Not applicable
Freezing point	:	Not applicable
Boiling point	:	Not available
Flammability	:	Non flammable.
Lower explosion limit	:	Not available
Upper explosion limit	:	Not available
Flash point	:	Not applicable
Auto-ignition temperature	:	Not applicable
Decomposition temperature	:	Not available
pH	:	Not available
Viscosity, kinematic	:	Not applicable
Solubility	:	Water: Insoluble / Slightly miscible
Partition coefficient n-octanol/water (Log Kow)	:	Not available
Vapour pressure	:	Not available
Vapour pressure at 50°C	:	Not available
Density	:	1,03 – 1,13 g/cm³
Relative density	:	Not applicable
Relative vapour density at 20°C	:	Not available
Particle characteristics	:	Not applicable

9.2. Other information

9.2.1. Information with regard to physical hazard classes

No additional information available

9.2.2. Other safety characteristics

No additional information available

SECTION 10: Stability and reactivity

10.1. Reactivity

The product is non-reactive under normal conditions of use, storage and transport.

10.2. Chemical stability

Stable under normal conditions.

10.3. Possibility of hazardous reactions

Reacts violently with (strong) oxidizers.

10.4. Conditions to avoid

None under recommended storage and handling conditions (see section 7).

10.5. Incompatible materials

No additional information available

10.6. Hazardous decomposition products

Under normal conditions of storage and use, hazardous decomposition products should not be produced.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SECTION 11: Toxicological information

11.1. Information on hazard classes as defined in Regulation (EC) No 1272/2008

Acute toxicity (oral)	:	Not classified
Acute toxicity (dermal)	:	Not classified
Acute toxicity (inhalation)	:	Not classified
Skin corrosion/irritation	:	Not classified
Serious eye damage/irritation	:	Not classified
Respiratory or skin sensitisation	:	Not classified
Germ cell mutagenicity	:	Not classified
Carcinogenicity	:	Not classified
Reproductive toxicity	:	Not classified
STOT-single exposure	:	Not classified
STOT-repeated exposure	:	Not classified
Aspiration hazard	:	Not classified

Ceramic Grease	
Viscosity, kinematic	Not applicable

11.2. Information on other hazards

No additional information available

SECTION 12: Ecological information

12.1. Toxicity

Ecology - general	:	The product is not considered harmful to aquatic organisms nor to cause long-term adverse effects in the environment.
Hazardous to the aquatic environment, short–term (acute)	:	Not classified
Hazardous to the aquatic environment, long–term (chronic)	:	Not classified

12.2. Persistence and degradability

Ceramic Grease	
Persistence and degradability	Rapidly degradable

12.3. Bioaccumulative potential

No additional information available

12.4. Mobility in soil

No additional information available

12.5. Results of PBT and vPvB assessment

No additional information available

12.6. Endocrine disrupting properties

No additional information available

12.7. Other adverse effects

No additional information available

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

SECTION 15: Regulatory information

15.1. Safety, health and environmental regulations/legislation specific for the substance or mixture

15.1.1. EU-Regulations

REACH Annex XVII (Restriction List)

Contains no substance(s) listed on REACH Annex XVII (Restriction Conditions)

REACH Annex XIV (Authorisation List)

Contains no substance(s) listed on REACH Annex XIV (Authorisation List)

REACH Candidate List (SVHC)

Contains no substance(s) listed on the REACH Candidate List

PIC Regulation (Prior Informed Consent)

Contains no substance(s) listed on the PIC list (Regulation EU 649/2012 concerning the export and import of hazardous chemicals)

POP Regulation (Persistent Organic Pollutants)

Contains no substance(s) listed on the POP list (Regulation EU 2019/1021 on persistent organic pollutants)

Ozone Regulation (1005/2009)

Contains no substance(s) listed on the Ozone Depletion list (Regulation EU 1005/2009 on substances that deplete the ozone layer)

Dual-Use Regulation (428/2009)

Contains no substance subject to the COUNCIL REGULATION (EC) No 428/2009 of 5 May 2009 setting up a Community regime for the control of exports, transfer, brokering and transit of dual-use items.

Explosives Precursors Regulation (2019/1148)

Contains no substance(s) listed on the Explosives Precursors list (Regulation EU 2019/1148 on the marketing and use of explosives precursors)

Drug Precursors Regulation (273/2004)

Contains no substance(s) listed on the Drug Precursors list (Regulation EC 273/2004 on the manufacture and the placing on market of certain substances used in the illicit manufacture of narcotic drugs and psychotropic substances)

15.1.2. National regulations

No additional information available

15.2. Chemical safety assessment

No chemical safety assessment has been carried out

4.4 Krytox™ GPL 205

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Chemours™

Krytox™ GPL 205

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	29.05.2024	9582423-00007	Date of first issue: 15.09.2021

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifier

Trade name : Krytox™ GPL 205

SDS-Identcode : 130000024223

1.2 Relevant identified uses of the substance or mixture and uses advised against

Use of the Substance/Mixture : Lubricant

Recommended restrictions on use : For industrial use only.
Do not use or resell Chemours™ materials in medical applications involving implantation in the human body or contact with internal body fluids or tissues unless agreed to by Seller in a written agreement covering such use. For further information, please contact your Chemours representative.

1.3 Details of the supplier of the safety data sheet

Company : Chemours Netherlands B.V.
Baanhoekweg 22
3313 LA Dordrecht Netherlands

Telephone : +31-(0)-78-630-1011

Telefax : +31-78-6163737

E-mail address of person responsible for the SDS : sds-support@chemours.com

1.4 Emergency telephone number

+(44)-870-8200418 (CHEMTREC - Recommended)

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

Classification (REGULATION (EC) No 1272/2008) as amended by GB-CLP Regulation, UK SI 2019/720, and UK SI 2020/1567)

Not a hazardous substance or mixture.

1 / 13

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Krytox™ GPL 205

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	29.05.2024	9582423-00007	Date of first issue: 15.09.2021

2.2 Label elements

Labelling (REGULATION (EC) No 1272/2008) as amended by GB-CLP Regulation, UK SI 2019/720, and UK SI 2020/1567)

No hazard pictogram, no signal word, no hazard statement(s), no precautionary statement(s) required

2.3 Other hazards

This substance/mixture contains no components considered to be either persistent, bioaccumulative and toxic (PBT), or very persistent and very bioaccumulative (vPvB) at levels of 0.1% or higher.
The thermal decomposition vapours of fluorinated plastics may cause polymer fume fever with flu-like symptoms in humans, especially when smoking contaminated tobacco.

SECTION 3: Composition/information on ingredients

3.2 Mixtures

Components

Remarks : No hazardous ingredients

SECTION 4: First aid measures

4.1 Description of first aid measures

Protection of first-aiders : No special precautions are necessary for first aid responders.

If inhaled : If inhaled, remove to fresh air.
Get medical attention if symptoms occur.

In case of skin contact : Wash with water and soap as a precaution.
Get medical attention if symptoms occur.

In case of eye contact : Flush eyes with water as a precaution.
Get medical attention if irritation develops and persists.

If swallowed : If swallowed, DO NOT induce vomiting.
Get medical attention if symptoms occur.
Rinse mouth thoroughly with water.

4.2 Most important symptoms and effects, both acute and delayed

Symptoms : Inhalation may provoke the following symptoms:
Irritation
Lung oedema

Eye contact may provoke the following symptoms
Blurred vision
Discomfort

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Krytox™ GPL 205

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	29.05.2024	9582423-00007	Date of first issue: 15.09.2021

Lachrymation

Skin contact may provoke the following symptoms:
Irritation
Redness

Inhalation may provoke the following symptoms:
Irritation
Shortness of breath

4.3 Indication of any immediate medical attention and special treatment needed

Treatment : Treat symptomatically and supportively.

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media : Not applicable
Will not burn

Unsuitable extinguishing media : Not applicable
Will not burn

5.2 Special hazards arising from the substance or mixture

Specific hazards during fire-fighting : Exposure to combustion products may be a hazard to health.

Hazardous combustion products : Hydrogen fluoride
carbonyl fluoride
potentially toxic fluorinated compounds
aerosolized particulates
Carbon oxides

5.3 Advice for firefighters

Special protective equipment for firefighters : Wear self-contained breathing apparatus for firefighting if necessary. Use personal protective equipment.

Specific extinguishing methods : Use extinguishing measures that are appropriate to local circumstances and the surrounding environment.
Use water spray to cool unopened containers.
Remove undamaged containers from fire area if it is safe to do so.
Evacuate area.

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Personal precautions : Follow safe handling advice (see section 7) and personal pro-

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Krytox™ GPL 205

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	29.05.2024	9582423-00007	Date of first issue: 15.09.2021

tective equipment recommendations (see section 8).

6.2 Environmental precautions

Environmental precautions : Avoid release to the environment.
Prevent further leakage or spillage if safe to do so.
Retain and dispose of contaminated wash water.
If spillage enters rivers or watercourses, inform the Environment Agency (emergency telephone number 0800 807060).

6.3 Methods and material for containment and cleaning up

Methods for cleaning up : Soak up with inert absorbent material.
For large spills, provide dyking or other appropriate containment to keep material from spreading. If dyked material can be pumped, store recovered material in appropriate container.
Clean up remaining materials from spill with suitable absorbent.
Local or national regulations may apply to releases and disposal of this material, as well as those materials and items employed in the cleanup of releases. You will need to determine which regulations are applicable.
Sections 13 and 15 of this SDS provide information regarding certain local or national requirements.

6.4 Reference to other sections

See sections: 7, 8, 11, 12 and 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Technical measures : See Engineering measures under EXPOSURE CONTROLS/PERSONAL PROTECTION section.

Local/Total ventilation : Use only with adequate ventilation.

Advice on safe handling : Handle in accordance with good industrial hygiene and safety practice, based on the results of the workplace exposure assessment
Take care to prevent spills, waste and minimize release to the environment.

Do not breathe decomposition products.

Hygiene measures : If exposure to chemical is likely during typical use, provide eye flushing systems and safety showers close to the working place. When using do not eat, drink or smoke. Wash contaminated clothing before re-use.

7.2 Conditions for safe storage, including any incompatibilities

Requirements for storage : Keep in properly labelled containers. Store in accordance with

8.2 Exposure controls

Engineering measures
Processing may form hazardous compounds (see section 10).
Ensure adequate ventilation, especially in confined areas.
Minimize workplace exposure concentrations.

Personal protective equipment

Eye/face protection : Wear the following personal protective equipment:
Safety glasses
Equipment should conform to BS EN 166

Hand protection

Remarks : Wash hands before breaks and at the end of workday.

Skin and body protection : Skin should be washed after contact.

Respiratory protection : If adequate local exhaust ventilation is not available or exposure assessment demonstrates exposures outside the recommended guidelines, use respiratory protection.
Equipment should conform to BS EN 14387

Filter type : Combined particulates, acidic gas/vapour and organic vapour type (AE-P)

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	29.05.2024	9582423-00007	Date of first issue: 15.09.2021

pH	:	7
Melting point/freezing point	:	320 °C
Initial boiling point and boiling range	:	No data available
Flash point	:	Method: Pensky-Martens closed cup Not applicable
Evaporation rate	:	Not applicable
Flammability (solid, gas)	:	Will not burn
Upper explosion limit / Upper flammability limit	:	No data available
Lower explosion limit / Lower flammability limit	:	No data available
Vapour pressure	:	Not applicable
Relative vapour density	:	Not applicable
Relative density	:	1.89 - 1.93 (24 °C)
Solubility(ies) Water solubility	:	insoluble
Partition coefficient: n-octanol/water	:	Not applicable
Auto-ignition temperature	:	No data available
Decomposition temperature	:	300 °C
Viscosity Viscosity, kinematic	:	Not applicable
Explosive properties	:	Not explosive
Oxidizing properties	:	The substance or mixture is not classified as oxidizing.

9.2 Other information

Particle size	:	No data available

SECTION 10: Stability and reactivity

10.1 Reactivity

Not classified as a reactivity hazard.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Krytox™ GPL 205

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	29.05.2024	9582423-00007	Date of first issue: 15.09.2021

10.2 Chemical stability
Stable under normal conditions.

10.3 Possibility of hazardous reactions
Hazardous reactions : Hazardous decomposition products will be formed at elevated temperatures.

10.4 Conditions to avoid
Conditions to avoid : None known.

10.5 Incompatible materials
Materials to avoid : None.

10.6 Hazardous decomposition products
Thermal decomposition : hydrofluoric acid
Carbonyl difluoride
Carbon dioxide
Carbon monoxide

SECTION 11: Toxicological information

11.1 Information on toxicological effects
Information on likely routes of exposure : Skin contact
Ingestion
Eye contact

Acute toxicity
Not classified based on available information.

Skin corrosion/irritation
Not classified based on available information.

Serious eye damage/eye irritation
Not classified based on available information.

Respiratory or skin sensitisation

Skin sensitisation
Not classified based on available information.

Respiratory sensitisation
Not classified based on available information.

Germ cell mutagenicity
Not classified based on available information.

Carcinogenicity
Not classified based on available information.

Reproductive toxicity
Not classified based on available information.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

STOT - single exposure
Not classified based on available information.

STOT - repeated exposure
Not classified based on available information.

Aspiration toxicity
Not classified based on available information.

SECTION 12: Ecological information

12.1 Toxicity
No data available

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment

Product:

Assessment	:	This substance/mixture contains no components considered to be either persistent, bioaccumulative and toxic (PBT), or very persistent and very bioaccumulative (vPvB) at levels of 0.1% or higher.

12.6 Other adverse effects

Product:

Endocrine disrupting potential	:	This substance/mixture does not contain components considered to have endocrine disrupting properties for environment according to UK REACH Article 57(f).

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product	:	Dispose of in accordance with local regulations. According to the European Waste Catalogue, Waste Codes are not product specific, but application specific. Waste codes should be assigned by the user, preferably in discussion with the waste disposal authorities. Do not dispose of waste into sewer.
Contaminated packaging	:	Empty containers should be taken to an approved waste handling site for recycling or disposal.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

If not otherwise specified: Dispose of as unused product.

SECTION 14: Transport information

14.1 UN number

ADN	:	Not regulated as a dangerous good
ADR	:	Not regulated as a dangerous good
RID	:	Not regulated as a dangerous good
IMDG	:	Not regulated as a dangerous good
IATA	:	Not regulated as a dangerous good

14.2 UN proper shipping name

ADN	:	Not regulated as a dangerous good
ADR	:	Not regulated as a dangerous good
RID	:	Not regulated as a dangerous good
IMDG	:	Not regulated as a dangerous good
IATA	:	Not regulated as a dangerous good

14.3 Transport hazard class(es)

ADN	:	Not regulated as a dangerous good
ADR	:	Not regulated as a dangerous good
RID	:	Not regulated as a dangerous good
IMDG	:	Not regulated as a dangerous good
IATA	:	Not regulated as a dangerous good

14.4 Packing group

ADN	:	Not regulated as a dangerous good
ADR	:	Not regulated as a dangerous good
RID	:	Not regulated as a dangerous good
IMDG	:	Not regulated as a dangerous good
IATA (Cargo)	:	Not regulated as a dangerous good
IATA (Passenger)	:	Not regulated as a dangerous good

14.5 Environmental hazards
Not regulated as a dangerous good

14.6 Special precautions for user
Not applicable

14.7 Transport in bulk according to Annex II of Marpol and the IBC Code
Remarks : Not applicable for product as supplied.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SECTION 15: Regulatory information

15.1 Safety, health and environmental regulations/legislation specific for the substance or mixture

Relevant EU provisions transposed through retained EU law

UK REACH List of restrictions (Annex 17)	:	Not applicable
UK REACH Candidate list of substances of very high concern (SVHC) for Authorisation	:	Not applicable
The Persistent Organic Pollutants Regulations (retained Regulation (EU) 2019/1021 as amended for Great Britain)	:	Not applicable
Regulation (EC) No 1005/2009 on substances that deplete the ozone layer	:	Not applicable
UK REACH List of substances subject to authorisation (Annex XIV)	:	Not applicable
GB Export and import of hazardous chemicals - Prior Informed Consent (PIC) Regulation	:	Not applicable

Control of Major Accident Hazards Regulations 2015 (COMAH)
Not applicable

15.2 Chemical safety assessment

A Chemical Safety Assessment has not been carried out.

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Chemours™

Krytox™ GPL 206

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	17.05.2024	9582813-00006	Date of first issue: 15.09.2021

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifier

Trade name : Krytox™ GPL 206

SDS-Identcode : 130000031500

1.2 Relevant identified uses of the substance or mixture and uses advised against

Use of the Substance/Mixture : Lubricant

Recommended restrictions on use : For industrial use only.
Do not use or resell Chemours™ materials in medical applications involving implantation in the human body or contact with internal body fluids or tissues unless agreed to by Seller in a written agreement covering such use. For further information, please contact your Chemours representative.

1.3 Details of the supplier of the safety data sheet

Company : Chemours Netherlands B.V.
Baanhoekweg 22
3313 LA Dordrecht Netherlands

Telephone : +31-(0)-78-630-1011

Telefax : +31-78-6163737

E-mail address of person responsible for the SDS : sds-support@chemours.com

1.4 Emergency telephone number

+(44)-870-8200418 (CHEMTREC - Recommended)

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

Classification (REGULATION (EC) No 1272/2008) as amended by GB-CLP Regulation, UK SI 2019/720, and UK SI 2020/1567)

Not a hazardous substance or mixture.

1 / 13

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Krytox™ GPL 206

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	17.05.2024	9582813-00006	Date of first issue: 15.09.2021

2.2 Label elements

Labelling (REGULATION (EC) No 1272/2008) as amended by GB-CLP Regulation, UK SI 2019/720, and UK SI 2020/1567)

No hazard pictogram, no signal word, no hazard statement(s), no precautionary statement(s) required

2.3 Other hazards

This substance/mixture contains no components considered to be either persistent, bioaccumulative and toxic (PBT), or very persistent and very bioaccumulative (vPvB) at levels of 0.1% or higher.
The thermal decomposition vapours of fluorinated plastics may cause polymer fume fever with flu-like symptoms in humans, especially when smoking contaminated tobacco.

SECTION 3: Composition/information on ingredients

3.2 Mixtures

Components

Remarks : No hazardous ingredients

SECTION 4: First aid measures

4.1 Description of first aid measures

Protection of first-aiders : No special precautions are necessary for first aid responders.

If inhaled : If inhaled, remove to fresh air.
Get medical attention if symptoms occur.

In case of skin contact : Wash with water and soap as a precaution.
Get medical attention if symptoms occur.

In case of eye contact : Flush eyes with water as a precaution.
Get medical attention if irritation develops and persists.

If swallowed : If swallowed, DO NOT induce vomiting.
Get medical attention if symptoms occur.
Rinse mouth thoroughly with water.

4.2 Most important symptoms and effects, both acute and delayed

Symptoms : Inhalation may provoke the following symptoms:
Irritation
Lung oedema

Eye contact may provoke the following symptoms
Blurred vision
Discomfort

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SAFETY DATA SHEET

Krytox™ GPL 206

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	17.05.2024	9582813-00006	Date of first issue: 15.09.2021

Lachrymation

Skin contact may provoke the following symptoms:
Irritation
Redness

Inhalation may provoke the following symptoms:
Irritation
Shortness of breath

4.3 Indication of any immediate medical attention and special treatment needed

Treatment : Treat symptomatically and supportively.

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media : Not applicable
Will not burn

Unsuitable extinguishing media : Not applicable
Will not burn

5.2 Special hazards arising from the substance or mixture

Specific hazards during fire-fighting : Exposure to combustion products may be a hazard to health.

Hazardous combustion products : Hydrogen fluoride
carbonyl fluoride
potentially toxic fluorinated compounds
aerosolized particulates
Carbon oxides

5.3 Advice for firefighters

Special protective equipment for firefighters : Wear self-contained breathing apparatus for firefighting if necessary. Use personal protective equipment.

Specific extinguishing methods : Use extinguishing measures that are appropriate to local circumstances and the surrounding environment.
Use water spray to cool unopened containers.
Remove undamaged containers from fire area if it is safe to do so.
Evacuate area.

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Personal precautions : Follow safe handling advice (see section 7) and personal pro-

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Krytox™ GPL 206

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	17.05.2024	9582813-00006	Date of first issue: 15.09.2021

tective equipment recommendations (see section 8).

6.2 Environmental precautions

Environmental precautions : Avoid release to the environment.
Prevent further leakage or spillage if safe to do so.
Retain and dispose of contaminated wash water.
If spillage enters rivers or watercourses, inform the Environment Agency (emergency telephone number 0800 807060).

6.3 Methods and material for containment and cleaning up

Methods for cleaning up : Soak up with inert absorbent material.
For large spills, provide dyking or other appropriate containment to keep material from spreading. If dyked material can be pumped, store recovered material in appropriate container.
Clean up remaining materials from spill with suitable absorbent.
Local or national regulations may apply to releases and disposal of this material, as well as those materials and items employed in the cleanup of releases. You will need to determine which regulations are applicable.
Sections 13 and 15 of this SDS provide information regarding certain local or national requirements.

6.4 Reference to other sections

See sections: 7, 8, 11, 12 and 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Technical measures : See Engineering measures under EXPOSURE CONTROLS/PERSONAL PROTECTION section.

Local/Total ventilation : Use only with adequate ventilation.

Advice on safe handling : Handle in accordance with good industrial hygiene and safety practice, based on the results of the workplace exposure assessment
Take care to prevent spills, waste and minimize release to the environment.

Do not breathe decomposition products.

Hygiene measures : If exposure to chemical is likely during typical use, provide eye flushing systems and safety showers close to the working place. When using do not eat, drink or smoke. Wash contaminated clothing before re-use.

7.2 Conditions for safe storage, including any incompatibilities

Requirements for storage : Keep in properly labelled containers. Store in accordance with

8.2 Exposure controls

Engineering measures

Processing may form hazardous compounds (see section 10).
Ensure adequate ventilation, especially in confined areas.
Minimize workplace exposure concentrations.

Personal protective equipment

Eye/face protection : Wear the following personal protective equipment:
Safety glasses
Equipment should conform to BS EN 166

Hand protection

Remarks : Wash hands before breaks and at the end of workday.

Skin and body protection : Skin should be washed after contact.

Respiratory protection : If adequate local exhaust ventilation is not available or exposure assessment demonstrates exposures outside the recommended guidelines, use respiratory protection.
Equipment should conform to BS EN 14387

Filter type : Combined particulates, acidic gas/vapour and organic vapour type (AE-P)

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

Appearance : Grease

Colour : white

Odour : odourless

Odour Threshold : No data available

10.2 Chemical stability
Stable under normal conditions.

10.3 Possibility of hazardous reactions
Hazardous reactions : Hazardous decomposition products will be formed at elevated temperatures.

10.4 Conditions to avoid
Conditions to avoid : None known.

10.5 Incompatible materials
Materials to avoid : None.

10.6 Hazardous decomposition products
Thermal decomposition : hydrofluoric acid
Carbonyl difluoride
Carbon dioxide
Carbon monoxide

SECTION 11: Toxicological information

11.1 Information on toxicological effects
Information on likely routes of exposure : Skin contact
Ingestion
Eye contact

Acute toxicity
Not classified based on available information.

Skin corrosion/irritation
Not classified based on available information.

Serious eye damage/eye irritation
Not classified based on available information.

Respiratory or skin sensitisation

Skin sensitisation
Not classified based on available information.

Respiratory sensitisation
Not classified based on available information.

Germ cell mutagenicity
Not classified based on available information.

Carcinogenicity
Not classified based on available information.

Reproductive toxicity
Not classified based on available information.

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Krytox™ GPL 206

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	17.05.2024	9582813-00006	Date of first issue: 15.09.2021

STOT - single exposure
Not classified based on available information.

STOT - repeated exposure
Not classified based on available information.

Aspiration toxicity
Not classified based on available information.

SECTION 12: Ecological information

12.1 Toxicity
No data available

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment

Product:

Assessment	:	This substance/mixture contains no components considered to be either persistent, bioaccumulative and toxic (PBT), or very persistent and very bioaccumulative (vPvB) at levels of 0.1% or higher.

12.6 Other adverse effects

Product:

Endocrine disrupting potential	:	This substance/mixture does not contain components considered to have endocrine disrupting properties for environment according to UK REACH Article 57(f).

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product	:	Dispose of in accordance with local regulations. According to the European Waste Catalogue, Waste Codes are not product specific, but application specific. Waste codes should be assigned by the user, preferably in discussion with the waste disposal authorities. Do not dispose of waste into sewer.
Contaminated packaging	:	Empty containers should be taken to an approved waste handling site for recycling or disposal.

ATEX Components Data Sheets

Ballard Power Systems Europe A/S
Majsmarken 1
9500 Hobro
Denmark

Revision history		
Rev.	**Date.**	**Description**
001	30/08/2024	First Issue
002	15/11/2024	Expanded following ATEX Register (K02-002)

Document Title:	**BLPH Project - ATEX Components Data Sheets**
Document Number:	K559-2254-CWIWP4202202-D99-001
Revision:	Rev002
Sequence Number:	001
File Name:	K559-2254-CWIWP4202202-D99-001Rev002
Purchaser Job:	K559-2254
Purchase Order:	CWIWP4202202
Code:	D99
Requsition Number:	n/a
Customer:	CrossWind C.V., Rotterdam, The Netherlands

Short Title	D99 – ATEX Components Data Sheets
Full Title	Data Sheets of equipment for hazardous area of 1MW hydrogen fuel cell container for Crosswind
Abstract	

This document, submitted in confidence, contains proprietary information which shall not be reproduced or transferred to other documents or disclosed to others or used for manufacturing or any other purpose without prior written permission of Ballard Power Systems.

Revision Record

Rev #	Description	Revised By	Date [dd/mm/yyyy]
1.0	Initial Release	RBS	19/09/2024
2.0	Expanded following ATEX Register (K02-002)	RBS	15/11/2024

Table of Contents

1.0 Purpose 4
2.0 References 4
3.0 List of ATEX Equipment 5
4.0 Equipment Data Sheets 6
4.1 BL01 – Electronic Level Sensor, LMT01A 7
4.2 BL01-WG01 – Connecting Cable with Socket for Level Sensor, EVC14A 11
4.3 BP01 – Pressure Sensor, 520 Series 14
4.4 BP01-WG01 – Connecting Cable with Socket for Pressure Sensor, ENC03A 24
4.5 TF01 – Pressure Sensor Ex Barrier, 9113B-U9 27
4.6 BT01 – Temperature Sensor, TT1050 31
4.7 BT02-WG01 – Connecting Cable with Socket for Temperature Sensor, ENC03A 34
4.8 TF01 – Temperature Sensor Ex Barrier, 9113B-U9 35
4.9 EA01..02 – Immersion Heater, D-8640 36
4.10 EA01-WD01 and EA02-WD01 – Control Cable for Immersion Heater, CLASSIC 135 CH 45
4.11 EA01..02 – Cable Gland for Immersion Heater, ICG 653 UNIV Os M20 48
4.12 QM1.1..1.6 and QM2.1..2.6 – Solenoid Valve, NF X E210D488E 24/DC 51
4.13 QM1.1..1.6 and QM2.1..2.6 – 1/2" NPT to M20 Adaptor, ADU102904 54
4.14 QM1.1..QM1.6 and QM2.1..QM2.6 – Cable Gland for Solenoid Valve, 501/421 O M20 Brass 63
4.15 XT01..06 – Compression Seal for Wall Penetration, Roxtec RS 50 B Ex-kit 66
4.16 XT07..09 – Cable Gland for Wall Penetration, 501/421 O M20 Brass 69
4.17 XT07..09 – M32 to M20 Reducer, RDU100604 70
4.18 XT10..11 – Cable Gland for Wall Penetration, 501/421 A M20 Brass 71
4.19 XT10..11 – M40 to M20 Reducer, RDU100704 72

List of Tables

Table 1 – List of references. 4
Table 2 – List of ATEX equipment (extract from document K559-2254-CWIWP4202202-K02-002). 5

1.0 Purpose

The purpose of this document is to provide the data sheets of the equipment for hazardous area of the 1MW fuel cell container (MEGABLOCK) provided by Ballard Power Systems Europe to CrossWind.

2.0 References

Table 1 – List of references.

4.1 BL01 – Electronic Level Sensor, LMT01A

[This page intentionally left blank.]

LMT01A

Sensor for point level detection in hazardous areas

LMACE-A12E-QSKG-1/US/3D/3G

1 Tightening torque 20...25 Nm

CE EC 1935/2004 EHEDG Certified Ex FDA IO-Link UKCA

Product characteristics		
Number of inputs and outputs		Number of digital outputs: 2
Factory setting		oils; oil-based media; powder
Process connection		threaded connection G 1/2 sealing cone
Application		
Special feature		Gold-plated contacts
Media		Liquids; viscous media; powder
Cannot be used for		See the operating instructions, chapter "Function and features".
Medium temperature	[°C]	-20...85
Probe length	[mm]	11
Tank pressure	[bar]	-1...40
Electrical data		
Operating voltage	[V]	18...30 DC
Current consumption	[mA]	< 50
Protection class		III
Reverse polarity protection		yes
Measuring principle		capacitive
Inputs / outputs		
Number of inputs and outputs		Number of digital outputs: 2
Outputs		
Total number of outputs		2
Output signal		switching signal; IO-Link
Electrical design		PNP/NPN
Number of digital outputs		2
Output function		normally open / normally closed; (parameterisable)
Max. voltage drop switching output DC	[V]	2.5
Permanent current rating of switching output DC	[mA]	100

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

LMT01A

Sensor for point level detection in hazardous areas

LMACE-A12E-QSKG-1/US/3D/3G

Short-circuit protection		yes	
Type of short-circuit protection		pulsed	
Overload protection		yes	
Measuring/setting range			
Factory setting		oils; oil-based media; powder	
Response times			
Response time	[s]	< 0.5	
Interfaces			
Communication interface		IO-Link	
Transmission type		COM2 (38,4 kBaud)	
IO-Link revision		1.1	
SDCI standard		IEC 61131-9	
Profiles		Smart Sensor: Process Data Variable; Device Identification	
SIO mode		yes	
Required master port type		A	
Process data analogue		1	
Process data binary		2	
Min. process cycle time	[ms]	2.3	
Supported DeviceIDs		**Type of operation**	**DeviceID**
		default	305
Operating conditions			
Ambient temperature	[°C]	-20...60	
Storage temperature	[°C]	-40...85	
Protection		IP 67; (when used outside the hazardous area: IP 68 / IP 69)	
Tests / approvals			
ATEX marking		II 3D Ex tc IIIC T90°C Dc X	
		II 3G Ex nA IIC T4 Gc X	
EMC		DIN EN 61000-6-2	
		DIN EN 61000-6-4	open tanks
		DIN EN 61000-6-3	closed tanks
Shock resistance		DIN EN 68000-2-27	50 g (11 ms)
Vibration resistance		DIN EN 68000-2-6	20 g (10...2000 Hz)
MTTF	[years]	223	
Mechanical data			
Weight	[g]	218	
Dimensions	[mm]	Ø 30 / L = 113	
Materials		stainless steel (316L/1.4404); PEEK; PEI; FKM	
Materials (wetted parts)		PEEK; surface characteristics: Ra < 0,8 / Rz 4	
Process connection		threaded connection G 1/2 sealing cone	
Displays / operating elements			
Display		switching status	LED, yellow
		operating status	LED, green

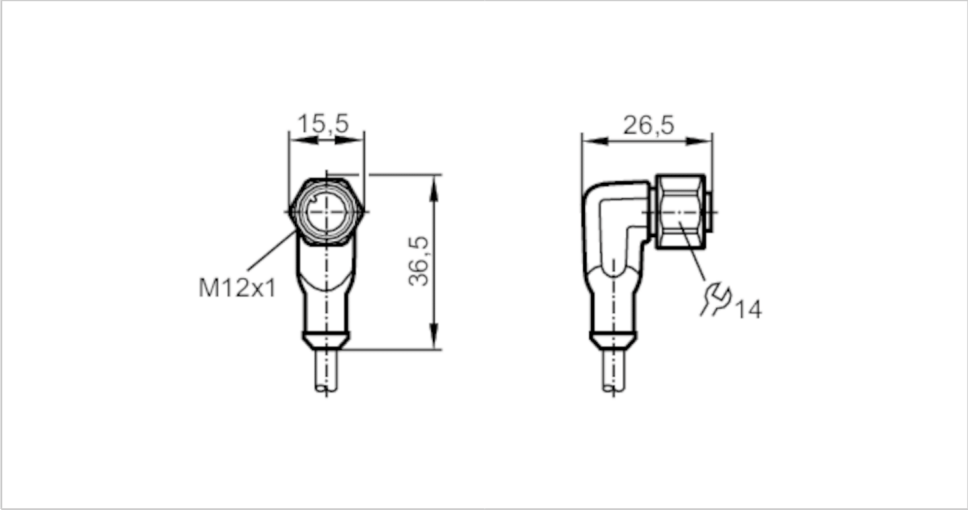
4.2 BL01-WG01 – Connecting Cable with Socket for Level Sensor, EVC14A



[This page intentionally left blank.]

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

EVC14A

Forbindelseskabel med hunstik

ADOAH040VAT0025H04/3G/2D

Applikation		
Special funktion		Halogenfri; guldbelagte kontakter
Kompatibel med maling		ja
Elektriske Data		
Driftspænding	[V]	< 60 AC/DC
Kapslingsklasse		II
Max strømbelastning total	[A]	2
Omgivende forhold		
Omgivelsestemperatur	[°C]	-20...60
Kapslingsklasse		IP 67; (ved brug udenfor ATEX området: IP 68 / IP 69K)
Godkendelser / Tests		
Godkendelse		BVS 08 ATEX E 109 U; IECEx BVS 08.0041 U
ATEX mærkning		II 3G Ex ec IIC Gc; II 2D Ex tb IIIC Db IP65/IP67
Mekaniske data		
Vægt	[g]	833
Dimensioner	[mm]	26,5 x 15,5 x 36,5
Materiale		Kapsling: TPU orange; pakning: FKM
Materiale - omløber		rustfri stål (1.4404 / 316L)
Bemærkning		
Emballage-enheder		1 stk.

4.3 BP01 – Pressure Sensor, 520 Series

[This page intentionally left blank.]

Huba Control

Relative pressure transmitter
Type 520

The compact type 520 pressure transmitter is based upon the Huba Control developed thick film technology where the pressure measuring cell is fully welded.
This transmitter meets the high burst protection demands and is suitable for the use in all types of refrigerants including ammonia.

Pressure range
-1 ... 9 bar /
0 ... 2.5 – 1000 bar

+ Compact, rugged construction
+ Welded without sealing parts, no elastomer seals
+ Large selection of connections available.
+ Saving time by quick cable mounting by the customer with swift connector

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Technical overview

Pressure range

Relative	-1 ... 9 bar / 0 ... 2.5 – 1000 bar

Operating conditions

Medium	Liquids, gases and refrigerants (incl. ammonia)	
Temperature	Medium -40 ... +135 °C	(Ex) -30 ... +120 °C)
	Ambient -30 ... +85 °C	(Ex) -25 ... +85 °C)
	Storage -50 ... +100 °C	
Tolerable overload	≤ 6 bar 5 x fs	
	> 6 bar 3 x fs (max. 1500 bar)	
Rupture pressure	≤ 6 bar 10 x fs	
	> 6 bar 6 x fs (max. 2500 bar)	

Materials

Cover		Stainless steel 1.4404 / AISI 316L (inside thread Schrader 1.4305 / AISI 303 only)
Plug accommodation		Polyarylamide 50% GF UL 94 V-0
Materials in contact with medium	Pressure connection	Stainless steel 1.4404 / AISI 316L (inside thread Schrader 1.4305 / AISI 303 only)
	Sensor	Stainless steel

Electrical overview

		Output	Power supply	Load	Current consumption
2 wire		4 ... 20 mA	7 ... 33 VDC	$< \frac{\text{supply voltage} - 7\,V}{0.02\,A}$ [Ohm]	< 23 mA
	(Ex)	4 ... 20 mA	10 ... 30 VDC	$< \frac{\text{supply voltage} - 10\,V}{0.02\,A}$ [Ohm]	< 23 mA
3 wire		0 ... 5 V	7 ... 33 VDC	>10 kOhm / < 100 nF	< 7 mA
		1 ... 6 V	8 ... 33 VDC	>10 kOhm / < 100 nF	< 7 mA
		0 ... 10 V	12 ... 33 VDC	>10 kOhm / < 100 nF	< 7 mA
		0 ... 10 V	12 ... 33 VDC / 24 VAC ± 15%	>10 kOhm / < 100 nF	< 7 mA
		ratiom. 10 ... 90%	5 VDC ± 10%	>10 kOhm / < 100 nF	< 7 mA
	(Ex)	ratiom. 10 ... 90%	5 VDC ± 10%	>10 kOhm / < 100 nF	< 7 mA
Polarity reversal protection		Short circuit proof and protected against polarity reversal. Each connection is protected against crossover up to max. supply voltage.			
Insulation voltage				standard	500 VDC

Dynamic response

Response time	< 2 ms, 1 ms typ.
Load cycle	< 100 Hz

Electrical connection	**Protection standard**	**Protection class**
Swift connector with or without cable 1.5 / 2.0 / 3.0 / 5.0 m (PVC spec.)	IP 67	III
Connector DIN EN 175301-803-A or C (industrial standard 9.4 mm)	IP 65	III
Metri Pack Serie 150	IP 67	III
Connector M12x1	IP 67	III
Braids	IP 65	III
Connector RAST 2.5 (3 wire, only)	IP 00	III

Pressure connection

Inside thread	7/16 - 20 UNF	without or with Schrader
	½ -14 NPT	(≤ 60 bar)
	G ¼	with O-Ring seal FPM (-30 ... +135 °C)
Outside thread	7/16 - 20 UNF	sealing cone 45°
	¼ -18 NPT	
	7/16 - 20 UNF	sealed at back SAE 4 with O-Ring seal FPM (-20 ... +135 °C)
	G ¼	sealed at back DIN EN ISO 1179-2 with profile seal ring in FPM (-30 ... +135 °C)
	G ¼	sealed at back and manometer (combi) with profile seal ring in FPM (-30 ... +135 °C) (≤ 60 bar)
	R ¼	EN 10226
	G ½	sealed at back and manometer (combi) with profile seal ring in FPM (-30 ... +135 °C)
	⅛ - 27 NPT	(≤ 60 bar)
	G ⅛	sealed at front (≤ 60 bar)
	G ⅛	sealed at back DIN EN ISO 1179-2 with profile seal ring in FPM (-30 ... +135 °C) (> 60 bar - without ATEX certificate)
	M10x1	sealed at back DIN EN ISO 1179-2 with Profile seal ring in FPM (-30 ... +135 °C) (≤ 60 bar)
	M20x1.5	sealed at front and manometer (combi)
	G ½, G ¼	sealed at front

Installation arrangement

Unrestricted

Tests / Admissions

Electromagnetic compatibility	CE conformity acc. EN 61326-2-3

4.4 BP01-WG01 – Connecting Cable with Socket for Pressure Sensor, ENC03A

[This page intentionally left blank.]

ENC03A

Female cordset

ADOGH040MSN0010H04/1G/1D

Application		
System		Free from silicone; Halogen-free; gold-plated contacts
Free from silicone		yes
Compatible with paint		yes
Electrical data		
Operating voltage	[V]	< 30 DC
Protection class		II
Max. input power	[mW]	group II: 1000; group III: 1000
Max. current load total	[A]	1
Operating conditions		
Ambient temperature	[°C]	-25...85
Note on ambient temperature		for use in hazardous areas: ambient temperature according to unit marking
Protection		IP 67; (when used outside the hazardous area: IP 68 / IP 69K)
Tests / approvals		
Approval		BVS 11 ATEX E 009 X; IECEx BVS 11.0002 X
ATEX marking		II 1G Ex ia IIB T6 Ga Ta: -25...75°C
		II 2G Ex ia IIC T6 Gb Ta: -25...75°C
		II 1G Ex ia IIB T5 Ga Ta: -25...85°C

4.5 TF01 – Pressure Sensor Ex Barrier, 9113B-U9

[This page intentionally left blank.]

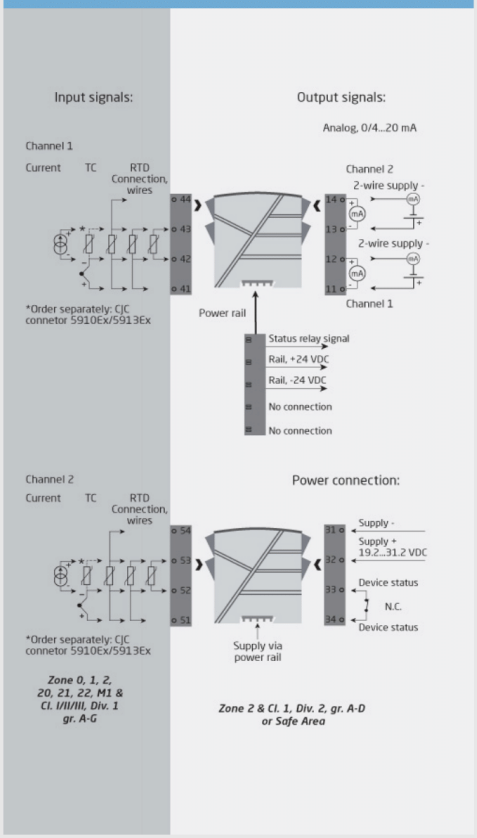
PR electronics

PERFORMANCE MADE SMARTER

Temperature / mA converter

9113B

- Input for RTD, TC and mA
- Active / passive mA output via the same two terminals
- 1 or 2 channels
- Can be supplied separately or installed on power rail, PR type 9400
- SIL 2-certified via Full Assessment



Advanced features
- Configuration and monitoring by way of detachable display front (PR 4500); process calibration and signal simulation.
- Copying of the configuration from one device to others of the same type via the display front.
- TC inputs can use either the internal CJC or a terminal with a built-in Pt100 sensor (PR 5910Ex, channel 1 / PR 5913Ex, channel 2) for higher accuracy.
- Advanced monitoring of internal communication and stored data.
- SIL 2 functionality is optional and must be activated in a menu point.

Application
- 9113Bxx can be mounted in the safe area or in zone 2 / Class 1, Division 2 and receive signals from zone 0, 1, 2 and zone 20, 21, 22 including mining / Class I/II/III, Division 1, Gr. A-G.
- Conversion and scaling of temperature (Pt, Ni and TC) and active current signals.
- The 9113 has been designed, developed and certified for use in SIL 2 applications according to the requirements of IEC 61508.
- Suitable for the use in systems up to Performance Level "d" according to ISO-13849.

Technical characteristics
- 1 green and 2 red front LEDs indicate operation status and malfunction.
- 2.6 kVAC galvanic isolation between input, output and supply.

Mounting
- The devices can be mounted vertically or horizontally without distance between neighbouring units.

Applications

This page is automatically generated on the basis of information provided on www.prelectronics.com and affiliated websites. It is provided to you as a service and for information purpose only. While we have attempted to maintain the information as accurately as possible, the page may contain errors or omissions for which we disclaim any and all liability

Order

Type	Channels	I.S. / Ex approvals
9113B	Single : A	ATEX, IECEx, FM, INMETRO, EAC-Ex, UKEX : -
	Double : B	UL 913, ATEX, IECEx, FM, INMETRO, EAC-Ex, UKEX : -U9
		KCs, ATEX, IECEx, FM, INMETRO, EAC-Ex, UKEX : -KCs

Example: 9113BB

Environmental Conditions

Operating temperature	-20°C to +60°C
Storage temperature	-20°C to +85°C
Calibration temperature	20...28°C
Relative humidity	< 95% RH (non-cond.)
Protection degree	IP20
Installation in	Pollution degree 2 & meas. / overvoltage cat. II

Mechanical specifications

Dimensions (HxWxD)	109 x 23.5 x 104 mm
Dimensions (HxWxD) w/ PR 4500	109 x 23.5 x 131 mm
Weight approx.	250 g
DIN rail type	DIN EN 60715/35 mm
Wire size	0.13...2.08 mm^2 AWG 26...14 stranded wire
Screw terminal torque	0.5 Nm
Vibration	IEC 60068-2-6
2...13.2 Hz	±1 mm
13.2...100 Hz	±0.7 g

Common specifications

Supply

Supply voltage	19.2...31.2 VDC
Fuse	400 mA SB / 250 VAC
Max. required power	≤ 0.8 W/≤ 1.4 W (1 ch./2 ch.)
Max. power dissipation, 1 / 2 ch.	≤ 0.8 W / ≤ 1.4 W

Isolation voltage

Test /working: Input to any	2.6 kVAC / 300 VAC reinforced isolation
Analog output to supply	2.6 kVAC / 300 VAC reinforced isolation
Status relay to supply	1.5 kVAC / 150 VAC reinforced isolation

Response time

Temperature input, programmable (0...90%, 100...10%)	1...60 s
mA / V input (programmable)	0.4...60 s
Programming	PR 4500 communication interfaces
Signal / noise ratio	Min. 60 dB (0...100 kHz)
Signal dynamics, input	24 bit
Signal dynamics, output	16 bit
Accuracy	Better than 0.1% of sel. range
EMC immunity influence	< ±0.5% of span
Extended EMC immunity: NAMUR NE21, A criterion, burst	< ±1% of span

Input specifications

RTD input

RTD type	Pt10/20/50/100/200/250; Pt300/Pt400/500/1000; Ni50/100/120/1000
Cable resistance per wire	50 Ω (max.)
Sensor current	Nom. 0.2 mA
Effect of sensor cable resistance (3-/4-wire)	< 0.002 Ω / Ω
Sensor error detection	Programmable ON / OFF

TC input

Thermocouple type	B, E, J, K, L, N, R, S, T, U, W3, W5, LR
Cold junction compensation (CJC) via ext. sensor in 5910	20...28°C ≤ ±1°C, -20...20°C / 28...70°C ≤ 2°C
CJC via int. mounted sensor	±(2.0°C + 0.4°C * Δt)
Sensor error detection	Programmable ON or OFF (only wire breakage)
Sensor error current: When detecting / else	Nom. 2 µA / 0 µA

Current input

Measurement range	0...23 mA
Programmable measurement ranges	0...20 and 4...20 mA
Input resistance	Nom. 20 Ω + PTC 50 Ω
Sensor error detection	Programmable ON / OFF

Output specifications

Current output

Signal range	0...23 mA
Programmable signal ranges	0...20/4...20/20...0/20...4 mA
Load (@ current output)	≤ 600 Ω
Load stability	≤ 0.01% of span / 100 Ω
Sensor error indication	0 / 3.5 / 23 mA / none
NAMUR NE43 Upscale/Downscale	23 mA / 3.5 mA
Output limitation, on 4...20 and 20...4 mA signals	3.8...20.5 mA
Output limitation, on 0...20 and 20...0 mA signals	0...20.5 mA
Current limit	≤ 28 mA

Passive 2-wire mA output

Max. external 2-wire supply	26 VDC
Effect of external 2-wire supply voltage variation	< 0.005% of span / V

Status relay

Max. voltage	125 VAC / 110 VDC
Max. current	0.5 AAC / 0.3 ADC
Max. AC power	62.5 VA / 32 W

Observed authority requirements

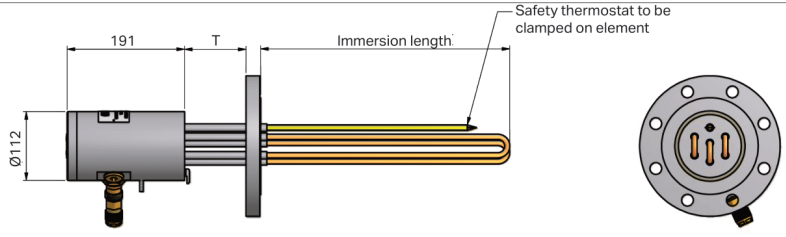
Catalogue Immersion Heaters type D-8640

Gas and Dust flame-proof immersion heater type D-8640
For hazardous areas, Sinus Jevi has developed explosion-proof Ex 'de' heating equipment, designed and manufactured in accordance with EN-IEC 60079-0, EN-IEC 60079-1, EN 60079-7 and EN-IEC 60079-31 certified by the independent testing institute ISSeP. The certificates cover zone 1 and zone 2 for hazardous areas. Gas groups II A, II B and II C and temperature classes T6-T1. Dust group Ex tb zone 21.

The flame-proof (d) enclosures have been designed for non save areas to protect the environment against gas-explosions, caused by sparking by electrical connections of the heating elements and control devices. Several types of enclosures for immersion heaters, flanged or screwed, have been described on the next pages.
Each type covers a range of a maximum number of installed hairpin shaped heating elements and giving a range of installed capacities.

The screwed types for dimensions up to 3".
The terminal enclosures have a IP66 degree of protection.
Standard the enclosure is coated with two layers, a zinc silicate primer and a top coating. Other coatingsystems on request.

All heaters are standard internal wired on terminals.



The maximum temperature for the terminal enclosure during operation is 80°C (based on maximum 50°C ambient temperature). If cable entry exceeds 70°C, high temperature cables must be used. The required minimum distance between enclosure and connection flange, to ensure the temperature limit of 80°C in the enclosure, is listed in the following table as a function of temperature classes. Maximum number of cable entries: 2 pcs M25/M20

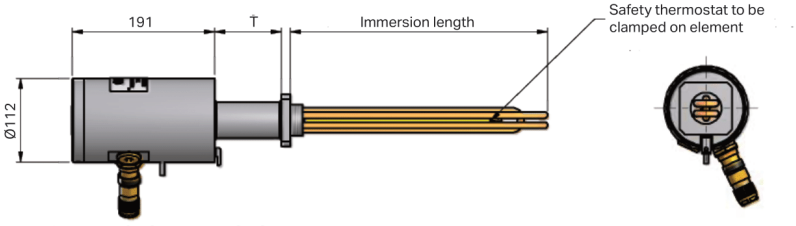
* Limitation power by cable entry

- Flange connection with tubular type heating element

SINUS JEVI

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Description
Suitable for heating of fluids both liquids and gases and also solids. The heater consists of a certified flameproof enclosure D-8640, containing:
- certified electric heating elements (Ex e II) tubular, ceramic or cartridge heating elements.
- one manually protective thermostat with manual reset or one thermocouple or pt100 as a safety device. Thermocouple and pt100 are only applicable in combination with an external temperature controller executed with a manual reset.
- threaded holes for cable entries and/or plugs of a certified flameproof model Ex d II B or Ex d II C.



The flame-proof enclosure has been built up out of a seamless body, a top cover and base plate. Each cover and base plate has been provided with 6 screw thread windings with a total length of 18 mm. The connection length of the threaded joint between cover or base plate and body should always be 5 thread windings minimum. The cover has been locked with an M4 screw and the base plate with an M6 screw. In the base plate of the enclosure spacer tubes can be welded in which the heating elements are brazed or welded.

Temperature class		Distance enclosure to heater (T)
T6	85°C	50 mm
T5	100°C	75 mm
T4	135°C	100 mm
T3	200°C	150 mm
T2	300°C	200 mm
T1	450°C	250 mm

Technical specification
- Tubular heating elements with a diameter of Ø8.5 mm up to and including Ø16 mm and cartridge heating elements of Ø12.5 mm up to including Ø31.5 mm can be applied, also ceramic elements from Ø26 mm up to including Ø46 mm.
- Material of the enclosure: carbon, low alloy steel, or ferrous steel.
- Material of heating elements: stainless steels AISI 304, AISI 321, AISI 316, AISI 904L, Inconel 600, Incoloy 800, Incoloy 825, Titanium, SMO, Copper alloy or Nickel alloy.
- Degree of protection of the enclosure: IP66.
- The maximum allowable energy-dissipation of the heating elements has been based on a maximum Watt density, determined by the temperature class, type of medium and process conditions.

The temperature setting of the thermostat, thermocouple or pt100, as stated in the EC type Examination Certificate, is applicable only for heaters immersed into a hazardous fluid flow.

If the heater has not been immersed into a hazardous fluid but forms a part of an apparatus located in a hazardous zone, the temperature setting has to prevent the maximum temperature of the outside of the apparatus to exceed the temperature according to the temperature classification.

- Threaded boss from 1½" G BSP up to 3" G BSP with tubular type heating element.

Gas and Dust flame-proof immersion heater type D-8640 VARIATION for relative low working temperatures

Description
The heater serie D-8640 variation is designed to heat a wide range of liquids, gases and solids.
The heater consists of a certified flameproof enclosure Ex d II C T6 - T1 Gb, certified electric heating elements Ex e II and a manually reset protective safety device. Unheated length heating elements into the medium is 30 mm minimum.
The surface loading of the elements in the heater is determined by the thermal characteristics of the fluid or gas being heated and its operating temperature and pressure.
The heaters are designed to operate within an ambient temperature range of -30°C to +50°C.

Heating elements
The heater consists of certified electric heating elements Ex e II which can be tubular heating elements with a diameter up to Ø16 mm or cartridge heating elements up to a diameter of Ø31.5 mm or retractable ceramic core elements Ø26 mm - Ø46 mm placed in a metal sheath with welded end plate.
Voltage supply up to 690 Volt.

Mounting
Threaded boss or flange connection in carbon steel or high alloy steel.

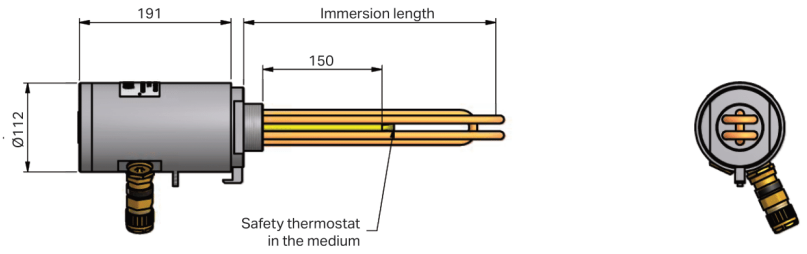
Set point safety thermostat
Set point on safety thermostat in medium:

Temperature class T1 to T4:	110°C
Temperature class T5:	90°C
Temperature class T6:	75°C

Set point on safety thermostat inside the terminal enclosure:

Temperature class T1 to T4:	90°C
Temperature class T5:	85°C
Temperature class T6:	70°C

If the cable entries exceed 70°C suitable high temperature cabling methods must be used. A warning label on the outside of the enclosure next to the cable gland shows the maximum allowable temperature. By a working temperature of more than 90°C the terminal enclosure will be at a distance from the heater. See table on page 3.



Temperature safety
Minimum of 1 over temperature thermostat or thermocouple or pt100 must be installed for guarding flange, plate or screw head and junction box temperature and must be either:
- Manually reset at the control panel by key switch or special tool
- Manually reset unit inside the terminal enclosure (klixon)
- Possibly with added manually reset unit on the highest surface temperature of the apparatus

When the electric heater type D-8640 and his variation does not have a temperature regulation of its own, the process medium temperature for each combination must be regulated with a seperate flameproof control thermostat, thermocouple or Pt100 and a seperate safety thermostat, thermocouple or Pt100 with manual reset. Both devices shall guarantee the temperature limit and the temperature class.

Special note
The end user must ensure that the heating elements are always inserted into the liquid or gas.
The end user must ensure that there is always a protection against an incorrect direction of flow (e.g. an one way valve). The lowest temperature of the liquid or gas flow is always at the end where the terminal enclosure is situated.

Terminal enclosure
The terminal enclosure can be either direct on or stand off depending on the process temperature.

SINUS JEVI Ω

Sinus is one of the pioneers in the field of explosion proof heating equipment, today we are still operating at the forefront. We manufacture according to ATEX as well as IECEx and EAC directives.

For the production of Ex-proof equipment a PQAN (Product Quality Assurance Notification) is issued by TUV-Nord. Our ISO-9001 and ISO-14001 systems are also monitored by this organisation.

4.10 EA01-WD01 and EA02-WD01 – Control Cable for Immersion Heater, CLASSIC 135 CH

[This page intentionally left blank.]

1123460	DATA SHEET	LAPP
valid from: 15.01.2024	ÖLFLEX® CLASSIC 135 CH BK 0,6/1 kV	

Application

ÖLFLEX® CLASSIC 135 CH BK 0,6/1 kV are screened halogen free, highly flame retardant power and control cables designed for the European and North American market, for occasional flexible use and fixed installation subject to normal mechanical load conditions. They are also suitable for use in dry or damp areas. They are suitable for outdoor use if the indicated temperature range is observed. They are suitable for occasional, non-automated movements. The maximum tensile load is 15 N/mm² of conductor cross-section during installation and operation. Compulsory guidance is not permitted.
The screening braid protects against interference from electrical fields.

Application range:
Public buildings, plant engineering, industrial machinery, heating and air-conditioning systems and particularly where human and animal life as well as valuable property exposed to high risk of fire hazards

USE gem. UL: FRPE sheathed cable for internal wiring of appliances or external interconnection

Design

Design	acc. to UL AWM Style 21156, UL 758 based on EN 50525-3-11
Certification	UL AWM Style 21156 (File No. E63634), UL 758 EN 13501-6 and EN 50575 Classification of fire behaviour (article/dimension range see www.lappkabel.com/cpr)

CABLE GLAND BARRIER SERIES

ICG/653/UNIV

Flameproof, Increased Safety, Dust Protection and Restricted Breathing
Class - Zones - Divisions
Certified ATEX / IECEx / UKEX

- 1 Inspectable Deluge Seal
  - Offering IP66, IP67, IP68 & IP69 Ingress Protection
- 2 Transparent Elastomeric Fully Inspectable Compound Pot – compatible with both injectable resin and 2 part compound
- 3 Reversible Armour Clamp
  - For all types of armour and braid
- 4 Patented Cable Gland Tightening Guide
  - Helps prevent damage caused by over tightening
- 5 Unique Rear Seal - Offering ultimate sealing over an extremely wide cable acceptance range

International Approvals

Dual certified Exe/Exd barrier gland, providing a seal around individual cable cores, especially for cables that exhibit "cold flow" characteristics, are not effectively filled, have hygroscopic fillers or contains fibre optic cores. For use with single wire armour 'W', wire braid 'X', steel tape armour 'Z' elastomer and plastic insulated cables. The ICG/653/UNIVERSAL is available with either ExPress liquid barrier resin or QSP 2-part hand mix compound, both with a cure time 30 minutes

Ordering Information

If brass is required please omit material selection
Format for ordering is as follows: Alternative Ring (R), add suffix R to ordering information
All barrier glands are supplied with Express resin as standard. If QSP (Quick Set Putty) is required please select Q in compound selection

Cable Gland Type	Size	Thread	Material	(Optional)	Compound
653U	C	M32		R	
653U	C	1.25	NP	R	Q

Example Code: 653UCM32R
Assembly instructions are supplied with the cable gland
Please note all NPT entries should be state as a decimal
Please refer to part code logic information page for further details on product options

ExPress Barrier Resin

Specify your barrier gland with our ExPress injectable resin for faster, easier installation
A liquid injectable and fast curing resin, allowing for faster installation time than traditional 2-part compounds. Utilising a unique clear compound chamber for full visibility of the flameproof seal during installation and inspection, the ExPress barrier resin is unparalleled as a global solution, with a 30 minute gel time and unrivalled ease of use.
All barrier glands are now supplied with Express Resin as standard.

EXPRESS

Cable Gland **Tightening Guide**

Whilst Hawke International goes to great lengths to ensure products are designed to be as simple to install, inspect and maintain as is possible, differing levels of competency, training and understanding can lead to glands being incorrectly installed. With hazardous area products, any poor installation issues can not only lead to expensive equipment failure, but also potential explosion risks and associated risk to life.

To help address issues with the overtightening of cable glands and the resultant damage to cables and seals, Hawke International has developed the patented **INBUILT TIGHTENING GUIDE**.

Without the need for fiddly measuring systems, the guide provides a permanent visual indication of the gland tightness through installation, inspection and maintenance.

FEATURES

- *Explosionproof operator for use in potentially explosive atmospheres according to ATEX-Directive 2014/34/EU*
  EC type examination certificate no.: ***LCIE 00 ATEX 6008 X***
  IECEx Certificate of Conformity no.: ***IECEx LCI 07.0015X***
- *Compliance with the Essential Health and Safety Requirements has been assured by compliance with the International and European Standards EN-IEC 60079-0, EN-IEC 60079-1 and EN-IEC 60079-31*
- *Easy electrical installation by means of a screw terminal coil*
- *Enclosure provided with a 1/2 NPT threaded entry hole (M20 x 1,5 in option) for a broad range of cable entries*
- *Ingress protection degree IP66/67*
- *A wide range of valves can be supplied with the operator*

CONSTRUCTION

Check the wattage compatibility with the product selected.
(1) **The minimum allowable ambient temperature is -60°C for the operator.** Actual temperature range can be limited depending on valve operation limits.
(2) AC (~): rectified coil construction.
(3) 230 V AC does not exist (Pn 1,85 W).

ORDERING INFORMATION

A valve supplied with the explosionproof operator will be identified with prefix NF or WSNF before the catalogue number.

Example: **NF** E 210D095 230V/50 Hz

- **NF** — operator
- E — pipe thread ISO 7/1
- 210D095 — basic number
- 230V/50 Hz — voltage

A valve supplied with the explosionproof operator will be identified with electrical interface FN, FS, FT or FU in the 15-digit product code.

15-DIGIT PRODUCT CODE

E 262 K 232 **FN** V00 H1

- E — Thread connection
- 262 — Product series
- K — Revision letter
- 232 — Valves version
- **FN** — Electrical interface
- V00 — Options
- H1 — Voltage - class

Electrical interface
FN = NF
FS = WSNF
FT = NFET
FU = WSNFET

Metallic (Exd/Exe) adaptors and reducers - AD-U / RD-U Series

Type AD-U

Type RD-U

Redapt AD-U and RD-U series of explosion-proof metallic adaptors and reducers provide a method of matching electrical thread forms on hazardous area approved equipment whilst ensuring the integrity and Ex approval of the installation is maintained.

Manufactured from hexagon material to facilitate easy installation, they are also supplied complete with a captive O-ring seal. The O-ring is located within a recess on the face of the product, helping to protect the O-ring from the environmental damage and ensuring it is not displaced during installation. Designed for hazardous area applications and the range is certified to protection concepts Exd "Flameproof" and Exe "Increased Safety" for use in Zone 1 and Zone 2 applications. Also certified Ex tb "dust tight" for use in Zone 21 & 22 applications.

Materials

- Brass CZ121
- 316 stainless steel
- Aluminium
- Mild steel

Threadforms

- Metric
- NPT
- PG
- ISO Pipe (BSP)
- ET

Plating options

- Electroless nickel
- Zinc
- Chromated
- Others on application

Temperature
Temperature will depend on the type of O-ring used:
None: -60°C to +200°C
Nitrile: -30°C to +80°C (supplied as standard)
EPDM: -50°C to +100°C
Neoprene: -40°C to +80°C
Viton: -20°C to +180°C
Silicone: -60°C to +180°C
Fluorosilicone: -60°C to +130°C
The maximum temperature is limited to +150°C for Group I applications
Ingress protection (IP):
IP64 when fitted without sealing washer. IP66/IP68 when fitted with O-ring or thread sealant according to manufacturer's instructions.
Part number:
Please refer to part numbering system below

- Threadform codes below to be used for both male and female threads.

Adaptors and reducers selection guide

STEP 1 – To obtain the correct reference number, select the male size from the left hand column, then refer horizontally across the page to the female size (i.e. M32 (male) x M40 (female) = 208). Reference numbers in blue are adaptors; other references are reducers.

Female Size

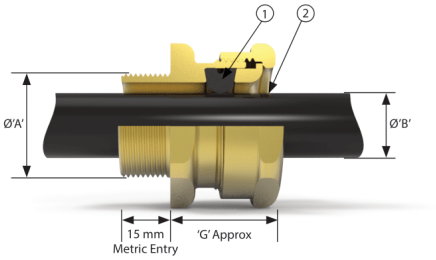
4.14 QM1.1..QM1.6 and QM2.1..QM2.6 – Cable Gland for Solenoid Valve, 501/421 O M20 Brass



[This page intentionally left blank.]

CABLE GLAND COMPRESSION SERIES

501/421

Flameproof, Increased Safety, Dust Protection and Restricted Breathing
Class - Zones
Certified ATEX / IECEx / UKEX / c CSA us

International Approvals

■1 Elastomeric Exd Flameproof and Exe Increased Safety seal on cable outer sheath

■2 Rounded Cable entry to prevent cable damage

The 501/421 dual certified Exe/Exd cable gland is intended for use on non-armoured elastomer and plastic insulated cables.
This cable gland may be used with braided cables where the braid and outer sheath pass into the enclosure.
The braid must then be suitably terminated inside the enclosure. For Exd applications, the cable must be suitable in compliance with with BS EN 60079-14.

4.15 XT01..06 – Compression Seal for Wall Penetration, Roxtec RS 50 B Ex-kit

[This page intentionally left blank.]

Roxtec RS B Ex kit

The Roxtec RS B Ex is a round entry seal including a sleeve for bolting. The seal consists of two halves and an adaptable center with removable layers. Compression is integrated in the seal.

- For use in hazardous locations
- Attachment by bolting

1.0 Purpose and Scope

The purpose of this document is to provide the reader of the E03 series of documents with an overview of the electrical cabinets present in the Fuel Cell Package and the documents providing the documentation for each of them.

2.0 Electrical Cabinets

2.1 List of Cabinets

Designation	Description	Physical Location
GB01..GB06	Fuel Cell Modules (FCwave #1..#6)	40ft Container, one side of the container
UC01..UC06	Fuel Cell DCDC Converter Cabinet	40ft container, opposite fuel cells
UC20	40ft Container control Cabinet	40ft container, middle on DCDC side
UC30	Coolant Skid Control Cabinet	On the coolant skid, middle
UC31	10ft Container Control Cabinet	10ft container, behind control panel access hatch
UC41	Coolant Skid VFD Cabinet	On the coolant skid, back-to-back with UC30
UC50	AC Power Distribution	40ft container, facing entrance door

Table 1 - List of Cabinets

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

3.0 Document contents

The documentation for the cabinets follows a standard template as follows:

3.1 Panel Information and Introduction

The section serves as front page and standard compliance requirements.

- Front Page with cabinet DT and name
- Ballard Standard wire color page
- Ballard Tagging Standard page
- Table of Contents

3.2 Controller IO Schematics

This section is only present if the cabinet contains PLC/Safety PLC racks. The section outlines the construction of the PLC and the cards in the PLC rack(s). For each input/output (DI/DO/AI/AO), the associated control loop is outlined.

3.3 Electrical Design Documentation

This section contains the multiline electrical documentation. Reader is expected to be familiar with electrical drawings.

3.4 Terminal Connections

This section contains terminal block listings and layouts for all terminal blocks.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Ballard Power Systems Europe - Technology Solutions, Cabinet Wiring Colors

Standard Basis: EN 61439

Required wire standard compliance:

Required: IEC Wire
Required: UL Recognized
Required: CSA/UL

Wire Numbering:

- Wires inside panels are to be numbered
- Wire number system is perferably "potential oriented with subnumber"
- All wires of the same potential (e.g. DC Common) have the same main number, with sequential subnumber.
- Potential numbers with fewer digits may be leading zero padded (e.g. 19 -> 019)
- Separator between main and subnumber is "."

Example: 019.1 BUWH 0.75mm²

- 019 — Wire potential number
- .1 — Wire sequential subnumber with separator
- BUWH — Wire color code (Dark Blue with White stripe)
- 0.75mm² — Wire dimension

AC Wiring Colors

AC Power Circuit (Generic)	Black (BK)
AC Phase L1	Brown (BN)
AC Phase L2	Black (BK)
AC Phase L3	Grey (GY)
AC Neutral	Light Blue (BU)
Externally supplied circuit	Orange (OG)

DC Wiring Colors

DC Power Circuit	Black (BK)
DC Control Voltage (24V)	Dark Blue (BU)
DC Control Voltage Refence (0V)	Dark Blue with White Stripe (BUWH)
Signal Wire (DI, DO)	White (WH)
Signal Wire (AI, AO)	Violet (VT)
Externally supplied circuit	Orange (OG)

PE Wiring Colors

Protective Earth (PE)	Green/Yellow (GNYE)

Conductor Colour Identification

IEC 60757:1983 Designation	Description
BK	Black
BN	Brown
RD	Red
OG	Orange
YE	Yellow
GN	Green
BU	Blue
VT	Violet
GY	Gray
WH	White
PK	Pink

Ballard Power Systems Europe - Technology Solutions Device Tag Process

A Ballard Device Tagname consists of three parts:
- A function designation (=)
  - According to IEC81346-10, Table B.1 and B2.
  - Always two letters followed by two digits
- A location designation (+)
  - According to IEC81346-2, Table 4
  - Always two letters followed by two digits
- A class code (-)
  - According to IEC81346-2, Table 2
  - Always two letters followed by two or three digits plus optional suffix

Sample fully qualified Device Tag (DT) for a Coolant Pump

IEC81346-10 Function Examples

IEC 81346-10 Table B.1 and B.2 provide a class definition system, which provides a two letter code for the functional description
Table B.1 is used for power supply systems and table B.2 for other systems

IEC 81346-10 Table B.1 / B.2	Function Codes (Example)
=AA	Structural System, Load support (Frame)
=BA	Transporting Electrical Energy (Power Converters)
=HA	Supply System, Gaseous Matter (Gas Piping)
=HE	Supply System, Heating/Cooling (Radiator)
=JA	Distribution System, Gaseous Matter (Gas Handling Unit)
=JB	Distribution System, Liquid Matter (Fluid Drain)
=LA	Control System, Process (PLC, SCADA)
=LB	Control System, Safety (Safety PLC)
=QA	Storage System, Gaseous Matter (Gas Storage)
=RE	Energy Conversion System, Chemical to Electricity (Fuel cells, Batteries)

IEC81346-2 Space Classification

IEC 81346-2 Table 4 provide a classification scheme for spaces, which provides a two and three letter code for the space (location) classification.
Class code "1" and "1" is used for the location scheme

IEC 81346-2 Table 4	Location Codes (Example)
+GB	Space for power generation, Chemical (Fuel Cells)
+DA	Space for active technical equipment
+UC	Space for electrical equipment (Electrical Cabinet)

IEC81346-2 Class Code

IEC 81346-2 Class Codes is a scheme for defined objects for reference designations according to their inherent function

IEC 81346-2 Table 2	Class Codes (Example)
-BA	Sensing, electrical potential (Voltage Transducer)
-BC	Sensing, electrical current (Current Transducer)
-BP	Sensing, pressure (Pressure Transducer)
-BT	Sensing, temperature (Temperature Transducer)
-EA	Emitting, light (Light Fixture)
-FC	Protecting, overcurrent (Fuse, MCCB)
-GB	Generating, Chemical Reaction (Fuel Cell)
-GP	Generating, Liquid Flow (Pump)
-GQ	Generating, Gas Flow (Van, Ventilator)
-KE	Processing, Electrical signals (PLC)
-KF	Processing, Information (Network Switch)
-MA	Driving, Torque (AC Motor)
-QA	Controlling, Electric Current (Contactor, Motor Starter)
-QB	Controlling, Electric Separation (Disconnector)
-QM	Controlling, Fluid On/Off (Valve)
-QN	Controlling, Fluid Regulation (Damper, Gas Control Valve)
-WD	Guiding, Low Voltage Electric Energy (AC or DC power Cable)
-WE	Guiding, Reference Potential (Grounding Wire/Cable)
-WG	Guiding, Electric Signals (Control, Network Cable)

Ballard Power Systems Europe - Technology Solutions, Cabinet Wiring Colors

Standard Basis: EN 61439

Required wire standard compliance:

Required: IEC Wire
Required: UL Recognized
Required: CSA/UL

Wire Numbering:

- Wires inside panels are to be numbered
- Wire number system is perferably "potential oriented with subnumber"
- All wires of the same potential (e.g. DC Common) have the same main number, with sequential subnumber.
- Potential numbers with fewer digits may be leading zero padded (e.g. 19 -> 019)
- Separator between main and subnumber is "."

Example: 019.1 BUWH 0.75mm²

- 019 — Wire potential number
- 1 — Wire sequential subnumber with separator
- BUWH — Wire color code (Dark Blue with White stripe)
- 0.75mm² — Wire dimension

AC Wiring Colors

AC Power Circuit (Generic)	Black (BK)
AC Phase L1	Brown (BN)
AC Phase L2	Black (BK)
AC Phase L3	Grey (GY)
AC Neutral	Light Blue (BU)
Externally supplied circuit	Orange (OG)

DC Wiring Colors

DC Power Circuit	Black (BK)
DC Control Voltage (24V)	Dark Blue (BU)
DC Control Voltage Refence (0V)	Dark Blue with White Stripe (BUWH)
Signal Wire (DI, DO)	White (WH)
Signal Wire (AI, AO)	Violet (VT)
Externally supplied circuit	Orange (OG)

PE Wiring Colors

Protective Earth (PE)	Green/Yellow (GNYE)

Conductor Colour Identification

IEC 60757:1983 Designation	Description
BK	Black
BN	Brown
RD	Red
OG	Orange
YE	Yellow
GN	Green
BU	Blue
VT	Violet
GY	Gray
WH	White
PK	Pink
GD	Gold
TQ	Turquoise

FRM5103656/0B

Ballard Power Systems Europe - Technology Solutions Device Tag Process

A Ballard Device Tagname consists of three parts:
- A function designation (=)
  - According to IEC81346-10, Table B.1 and B2.
  - Always two letters followed by two digits
- A location designation (+)
  - According to IEC81346-2, Table 4
  - Always two letters followed by two digits
- A class code (-)
  - According to IEC81346-2, Table 2
  - Always two letters followed by two or three digits plus optional suffix

Sample fully qualified Device Tag (DT) for a Coolant Pump

IEC81346-10 Function Examples

IEC 81346-10 Table B.1 and B.2 provide a class definition system, which provides a two letter code for the functional description
Table B.1 is used for power supply systems and table B.2 for other systems

IEC 81346-10 Table B.1 / B.2	Function Codes (Example)
=AA	Structural System, Load support (Frame)
=BA	Transporting Electrical Energy (Power Converters)
=HA	Supply System, Gaseous Matter (Gas Piping)
=HE	Supply System, Heating/Cooling (Radiator)
=JA	Distribution System, Gaseous Matter (Gas Handling Unit)
=JB	Distribution System, Liquid Matter (Fluid Drain)
=LA	Control System, Process (PLC, SCADA)
=LB	Control System, Safety (Safety PLC)
=QA	Storage System, Gaseous Matter (Gas Storage)
=RE	Energy Conversion System, Chemical to Electricity (Fuel cells, Batteries)

IEC81346-2 Space Classification

IEC 81346-2 Table 4 provide a classification scheme for spaces, which provides a two and three letter code for the space (location) classification.
Class code "1" and "1" is used for the location scheme

IEC 81346-2 Table 4	Location Codes (Example)
+GB	Space for power generation, Chemical (Fuel Cells)
+DA	Space for active technical equipment
+UC	Space for electrical equipment (Electrical Cabinet)

IEC81346-2 Class Code

IEC 81346-2 Class Codes is a scheme for defined objects for reference designations according to their inherent function

IEC 81346-2 Table 2	Class Codes (Example)
-BA	Sensing, electrical potential (Voltage Transducer)
-BC	Sensing, electrical current (Current Transducer)
-BP	Sensing, pressure (Pressure Transducer)
-BT	Sensing, temperature (Temperature Transducer)
-EA	Emitting, light (Light Fixture)
-FC	Protecting, overcurrent (Fuse, MCCB)
-GB	Generating, Chemical Reaction (Fuel Cell)
-GP	Generating, Liquid Flow (Pump)
-GQ	Generating, Gas Flow (Van, Ventilator)
-KE	Processing, Electrical signals (PLC)
-KF	Processing, Information (Network Switch)
-MA	Driving, Torque (AC Motor)
-QA	Controlling, Electric Current (Contactor, Motor Starter)
-QB	Controlling, Electric Separation (Disconnector)
-QM	Controlling, Fluid On/Off (Valve)
-QN	Controlling, Fluid Regulation (Damper, Gas Control Valve)
-WD	Guiding, Low Voltage Electric Energy (AC or DC power Cable)
-WE	Guiding, Reference Potential (Grounding Wire/Cable)
-WG	Guiding, Electric Signals (Control, Network Cable)

Ballard Power Systems Europe - Technology Solutions, Cabinet Wiring Colors

Standard Basis: EN 61439

Required wire standard compliance:

Required: IEC Wire
Required: UL Recognized
Required: CSA/UL

Wire Numbering:

- Wires inside panels are to be numbered
- Wire number system is perferably "potential oriented with subnumber"
- All wires of the same potential (e.g. DC Common) have the same main number, with sequential subnumber.
- Potential numbers with fewer digits may be leading zero padded (e.g. 19 -> 019)
- Separator between main and subnumber is "."

Example: 019.1 BUWH 0.75mm²

- 019 — Wire potential number
- 1 — Wire sequential subnumber with separator
- BUWH — Wire color code (Dark Blue with White stripe)
- 0.75mm² — Wire dimension

AC Wiring Colors

AC Power Circuit (Generic)	Black (BK)
AC Phase L1	Brown (BN)
AC Phase L2	Black (BK)
AC Phase L3	Grey (GY)
AC Neutral	Light Blue (BU)
Externally supplied circuit	Orange (OG)

DC Wiring Colors

DC Power Circuit	Black (BK)
DC Control Voltage (24V)	Dark Blue (BU)
DC Control Voltage Refence (0V)	Dark Blue with White Stripe (BUWH)
Signal Wire (DI, DO)	White (WH)
Signal Wire (AI, AO)	Violet (VT)
Externally supplied circuit	Orange (OG)

PE Wiring Colors

Protective Earth (PE)	Green/Yellow (GNYE)

Wire Color Abbreviations

BK	Black
BN	Brown
RD	Red
OG	Orange
YE	Yellow
GN	Green
BU	Blue
VT	Violet
GY	Gray
WH	White
PK	Pink
GD	Gold
TQ	Turquoise
SR	Silver
GNYE	Green/Yellow
SH	Shield

Ballard Power Systems Europe - Technology Solutions Device Tag Process

A Ballard Device Tagname consists of three parts:
- A function designation (=)
  - According to IEC81346-10, Table B.1 and B2.
  - Always two letters followed by two digits
- A location designation (+)
  - According to IEC81346-2, Table 4
  - Always two letters followed by two digits
- A class code (-)
  - According to IEC81346-2, Table 2
  - Always two letters followed by two or three digits plus optional suffix

Sample fully qualified Device Tag (DT) for a Coolant Pump

IEC81346-10 Function Examples

IEC 81346-10 Table B.1 and B.2 provide a class definition system, which provides a two letter code for the functional description
Table B.1 is used for power supply systems and table B.2 for other systems

IEC 81346-10 Table B.1 / B.2	Function Codes (Example)
=AA	Structural System, Load support (Frame)
=BA	Transporting Electrical Energy (Power Converters)
=HA	Supply System, Gaseous Matter (Gas Piping)
=HE	Supply System, Heating/Cooling (Radiator)
=JA	Distribution System, Gaseous Matter (Gas Handling Unit)
=JB	Distribution System, Liquid Matter (Fluid Drain)
=LA	Control System, Process (PLC, SCADA)
=LB	Control System, Safety (Safety PLC)
=QA	Storage System, Gaseous Matter (Gas Storage)
=RE	Energy Conversion System, Chemical to Electricity (Fuel cells, Batteries)

IEC81346-2 Space Classification

IEC 81346-2 Table 4 provide a classification scheme for spaces, which provides a two and three letter code for the space (location) classification.
Class code "1" and "1" is used for the location scheme

IEC 81346-2 Table 4	Location Codes (Example)
+GB	Space for power generation, Chemical (Fuel Cells)
+DA	Space for active technical equipment
+UC	Space for electrical equipment (Electrical Cabinet)

IEC81346-2 Class Code

IEC 81346-2 Class Codes is a scheme for defined objects for reference designations according to their inherent function

IEC 81346-2 Table 2	Class Codes (Example)
-BA	Sensing, electrical potential (Voltage Transducer)
-BC	Sensing, electrical current (Current Transducer)
-BP	Sensing, pressure (Pressure Transducer)
-BT	Sensing, temperature (Temperature Transducer)
-EA	Emitting, light (Light Fixture)
-FC	Protecting, overcurrent (Fuse, MCCB)
-GB	Generating, Chemical Reaction (Fuel Cell)
-GP	Generating, Liquid Flow (Pump)
-GQ	Generating, Gas Flow (Van, Ventilator)
-KE	Processing, Electrical signals (PLC)
-KF	Processing, Information (Network Switch)
-MA	Driving, Torque (AC Motor)
-QA	Controlling, Electric Current (Contactor, Motor Starter)
-QB	Controlling, Electric Separation (Disconnector)
-QM	Controlling, Fluid On/Off (Valve)
-QN	Controlling, Fluid Regulation (Damper, Gas Control Valve)
-WD	Guiding, Low Voltage Electric Energy (AC or DC power Cable)
-WE	Guiding, Reference Potential (Grounding Wire/Cable)
-WG	Guiding, Electric Signals (Control, Network Cable)

Ballard Power Systems Europe - Technology Solutions, Cabinet Wiring Colors

Standard Basis: EN 61439

Required wire standard compliance:

Required: IEC Wire
Required: UL Recognized
Required: CSA/UL

Wire Numbering:

- Wires inside panels are to be numbered
- Wire number system is perferably "potential oriented with subnumber"
- All wires of the same potential (e.g. DC Common) have the same main number, with sequential subnumber.
- Potential numbers with fewer digits may be leading zero padded (e.g. 19 -> 019)
- Separator between main and subnumber is "."

Example: 019.1 BUWH 0.75mm²

- 019 — Wire potential number
- 1 — Wire sequential subnumber with separator
- BUWH — Wire color code (Dark Blue with White stripe)
- 0.75mm² — Wire dimension

AC Wiring Colors

AC Power Circuit (Generic)	Black (BK)
AC Phase L1	Brown (BN)
AC Phase L2	Black (BK)
AC Phase L3	Grey (GY)
AC Neutral	Light Blue (BU)
Externally supplied circuit	Orange (OG)

DC Wiring Colors

DC Power Circuit	Black (BK)
DC Control Voltage (24V)	Dark Blue (BU)
DC Control Voltage Refence (0V)	Dark Blue with White Stripe (BUWH)
Signal Wire (DI, DO)	White (WH)
Signal Wire (AI, AO)	Violet (VT)
Externally supplied circuit	Orange (OG)

PE Wiring Colors

Protective Earth (PE)	Green/Yellow (GNYE)

Conductor Colour Identification

IEC 60757:1983 Designation	Description
BK	Black
BN	Brown
RD	Red
OG	Orange
YE	Yellow
GN	Green
BU	Blue
VT	Violet

FRM5103656/0B

Ballard Power Systems Europe - Technology Solutions Device Tag Process

A Ballard Device Tagname consists of three parts:
- A function designation (=)
  - According to IEC81346-10, Table B.1 and B2.
  - Always two letters followed by two digits
- A location designation (+)
  - According to IEC81346-2, Table 4
  - Always two letters followed by two digits
- A class code (-)
  - According to IEC81346-2, Table 2
  - Always two letters followed by two or three digits plus optional suffix

Sample fully qualified Device Tag (DT) for a Coolant Pump

IEC81346-10 Function Examples

IEC 81346-10 Table B.1 and B.2 provide a class definition system, which provides a two letter code for the functional description
Table B.1 is used for power supply systems and table B.2 for other systems

IEC 81346-10 Table B.1 / B.2	Function Codes (Example)
=AA	Structural System, Load support (Frame)
=BA	Transporting Electrical Energy (Power Converters)
=HA	Supply System, Gaseous Matter (Gas Piping)
=HE	Supply System, Heating/Cooling (Radiator)
=JA	Distribution System, Gaseous Matter (Gas Handling Unit)
=JB	Distribution System, Liquid Matter (Fluid Drain)
=LA	Control System, Process (PLC, SCADA)
=LB	Control System, Safety (Safety PLC)
=QA	Storage System, Gaseous Matter (Gas Storage)
=RE	Energy Conversion System, Chemical to Electricity (Fuel cells, Batteries)

IEC81346-2 Space Classification

IEC 81346-2 Table 4 provide a classification scheme for spaces, which provides a two and three letter code for the space (location) classification.
Class code "1" and "1" is used for the location scheme

IEC 81346-2 Table 4	Location Codes (Example)
+GB	Space for power generation, Chemical (Fuel Cells)
+DA	Space for active technical equipment
+UC	Space for electrical equipment (Electrical Cabinet)

IEC81346-2 Class Code

IEC 81346-2 Class Codes is a scheme for defined objects for reference designations according to their inherent function

IEC 81346-2 Table 2	Class Codes (Example)
-BA	Sensing, electrical potential (Voltage Transducer)
-BC	Sensing, electrical current (Current Transducer)
-BP	Sensing, pressure (Pressure Transducer)
-BT	Sensing, temperature (Temperature Transducer)
-EA	Emitting, light (Light Fixture)
-FC	Protecting, overcurrent (Fuse, MCCB)
-GB	Generating, Chemical Reaction (Fuel Cell)
-GP	Generating, Liquid Flow (Pump)
-GQ	Generating, Gas Flow (Van, Ventilator)
-KE	Processing, Electrical signals (PLC)
-KF	Processing, Information (Network Switch)
-MA	Driving, Torque (AC Motor)
-QA	Controlling, Electric Current (Contactor, Motor Starter)
-QB	Controlling, Electric Separation (Disconnector)
-QM	Controlling, Fluid On/Off (Valve)
-QN	Controlling, Fluid Regulation (Damper, Gas Control Valve)
-WD	Guiding, Low Voltage Electric Energy (AC or DC power Cable)
-WE	Guiding, Reference Potential (Grounding Wire/Cable)
-WG	Guiding, Electric Signals (Control, Network Cable)

Ballard Power Systems Europe - Technology Solutions, Cabinet Wiring Colors

Standard Basis: EN 61439

Required wire standard compliance:

Required: IEC Wire
Required: UL Recognized
Required: CSA/UL

Wire Numbering:

- Wires inside panels are to be numbered
- Wire number system is perferably "potential oriented with subnumber"
- All wires of the same potential (e.g. DC Common) have the same main number, with sequential subnumber.
- Potential numbers with fewer digits may be leading zero padded (e.g. 19 -> 019)
- Separator between main and subnumber is "."

Example: 019.1 BUWH 0.75mm²

- 019 — Wire potential number
- 1 — Wire sequential subnumber with separator
- BUWH — Wire color code (Dark Blue with White stripe)
- 0.75mm² — Wire dimension

AC Wiring Colors

AC Power Circuit (Generic)	———	Black (BK)
AC Phase L1	———	Brown (BN)
AC Phase L2	———	Black (BK)
AC Phase L3	———	Grey (GY)
AC Neutral	———	Light Blue (BU)
Externally supplied circuit	———	Orange (OG)

DC Wiring Colors

DC Power Circuit	———	Black (BK)
DC Control Voltage (24V)	———	Dark Blue (BU)
DC Control Voltage Refence (0V)	-·-·-·-	Dark Blue with White Stripe (BUWH)
Signal Wire (DI, DO)	———	White (WH)
Signal Wire (AI, AO)	———	Violet (VT)
Externally supplied circuit	———	Orange (OG)

PE Wiring Colors

Protective Earth (PE)	- - - - - - -	Green/Yellow (GNYE)

Conductor Colour Identification

IEC 60757:1983 Designation	Description
BK	Black
BN	Brown
RD	Red
OG	Orange
YE	Yellow
GN	Green
BU	Blue
VT	Violet
GY	Gray
WH	White
PK	Pink
GD	Gold
TQ	Turquoise
SR	Silver
GNYE	Green/Yellow
SH	Shield

Ballard Power Systems Europe - Technology Solutions Device Tag Process

A Ballard Device Tagname consists of three parts:
- A function designation (=)
  - According to IEC81346-10, Table B.1 and B2.
  - Always two letters followed by two digits
- A location designation (+)
  - According to IEC81346-2, Table 4
  - Always two letters followed by two digits
- A class code (-)
  - According to IEC81346-2, Table 2
  - Always two letters followed by two or three digits plus optional suffix

Sample fully qualified Device Tag (DT) for a Coolant Pump

IEC81346-10 Function Examples

IEC 81346-10 Table B.1 and B.2 provide a class definition system, which provides a two letter code for the functional description
Table B.1 is used for power supply systems and table B.2 for other systems

IEC 81346-10 Table B.1 / B.2	Function Codes (Example)
=AA	Structural System, Load support (Frame)
=BA	Transporting Electrical Energy (Power Converters)
=HA	Supply System, Gaseous Matter (Gas Piping)
=HE	Supply System, Heating/Cooling (Radiator)
=JA	Distribution System, Gaseous Matter (Gas Handling Unit)
=JB	Distribution System, Liquid Matter (Fluid Drain)
=LA	Control System, Process (PLC, SCADA)
=LB	Control System, Safety (Safety PLC)
=QA	Storage System, Gaseous Matter (Gas Storage)
=RE	Energy Conversion System, Chemical to Electricity (Fuel cells, Batteries)

IEC81346-2 Space Classification

IEC 81346-2 Table 4 provide a classification scheme for spaces, which provides a two and three letter code for the space (location) classification.
Class code "1" and "1" is used for the location scheme

IEC 81346-2 Table 4	Location Codes (Example)
+GB	Space for power generation, Chemical (Fuel Cells)
+DA	Space for active technical equipment
+UC	Space for electrical equipment (Electrical Cabinet)

IEC81346-2 Class Code

IEC 81346-2 Class Codes is a scheme for defined objects for reference designations according to their inherent function

IEC 81346-2 Table 2	Class Codes (Example)
-BA	Sensing, electrical potential (Voltage Transducer)
-BC	Sensing, electrical current (Current Transducer)
-BP	Sensing, pressure (Pressure Transducer)
-BT	Sensing, temperature (Temperature Transducer)
-EA	Emitting, light (Light Fixture)
-FC	Protecting, overcurrent (Fuse, MCCB)
-GB	Generating, Chemical Reaction (Fuel Cell)
-GP	Generating, Liquid Flow (Pump)
-GQ	Generating, Gas Flow (Van, Ventilator)
-KE	Processing, Electrical signals (PLC)
-KF	Processing, Information (Network Switch)
-MA	Driving, Torque (AC Motor)
-QA	Controlling, Electric Current (Contactor, Motor Starter)
-QB	Controlling, Electric Separation (Disconnector)
-QM	Controlling, Fluid On/Off (Valve)
-QN	Controlling, Fluid Regulation (Damper, Gas Control Valve)
-WD	Guiding, Low Voltage Electric Energy (AC or DC power Cable)
-WE	Guiding, Reference Potential (Grounding Wire/Cable)
-WG	Guiding, Electric Signals (Control, Network Cable)

Ballard Power Systems Europe - Technology Solutions, Cabinet Wiring Colors

Standard Basis: EN 61439

Required wire standard compliance:

Required: IEC Wire
Required: UL Recognized
Required: CSA/UL

Wire Numbering:

- Wires inside panels are to be numbered
- Wire number system is perferably "potential oriented with subnumber"
- All wires of the same potential (e.g. DC Common) have the same main number, with sequential subnumber.
- Potential numbers with fewer digits may be leading zero padded (e.g. 19 -> 019)
- Separator between main and subnumber is "."

Example: 019.1 BUWH 0.75mm²

- 019 — Wire potential number
- 1 — Wire sequential subnumber with separator
- BUWH — Wire color code (Dark Blue with White stripe)
- 0.75mm² — Wire dimension

AC Wiring Colors

AC Power Circuit (Generic)	———	Black (BK)
AC Phase L1	———	Brown (BN)
AC Phase L2	———	Black (BK)
AC Phase L3	———	Grey (GY)
AC Neutral	———	Light Blue (BU)
Externally supplied circuit	———	Orange (OG)

DC Wiring Colors

DC Power Circuit	———	Black (BK)
DC Control Voltage (24V)	———	Dark Blue (BU)
DC Control Voltage Refence (0V)	-·-·-·-	Dark Blue with White Stripe (BUWH)
Signal Wire (DI, DO)	———	White (WH)
Signal Wire (AI, AO)	———	Violet (VT)
Externally supplied circuit	———	Orange (OG)

PE Wiring Colors

Protective Earth (PE)	- - - - - - -	Green/Yellow (GNYE)

Conductor Colour Identification

IEC 60757:1983 Designation	Description
BK	Black
BN	Brown
RD	Red
OG	Orange
YE	Yellow
GN	Green
BU	Blue
VT	Violet
GY	Gray
WH	White

SHEET TYPE/DESC	Standard Wire Colors		
ALL SHEETS ARE THE SAME REVISION STATUS	SIZE A3	LANGUAGE EN	SHEET/TOTAL 2 / 18

Ballard Power Systems Europe - Technology Solutions Device Tag Process

A Ballard Device Tagname consists of three parts:
- A function designation (=)
  - According to IEC81346-10, Table B.1 and B2.
  - Always two letters followed by two digits
- A location designation (+)
  - According to IEC81346-2, Table 4
  - Always two letters followed by two digits
- A class code (-)
  - According to IEC81346-2, Table 2
  - Always two letters followed by two or three digits plus optional suffix

Sample fully qualified Device Tag (DT) for a Coolant Pump

IEC81346-10 Function Examples

IEC 81346-10 Table B.1 and B.2 provide a class definition system, which provides a two letter code for the functional description
Table B.1 is used for power supply systems and table B.2 for other systems

IEC 81346-10 Table B.1 / B.2	Function Codes (Example)
=AA	Structural System, Load support (Frame)
=BA	Transporting Electrical Energy (Power Converters)
=HA	Supply System, Gaseous Matter (Gas Piping)
=HE	Supply System, Heating/Cooling (Radiator)
=JA	Distribution System, Gaseous Matter (Gas Handling Unit)
=JB	Distribution System, Liquid Matter (Fluid Drain)
=LA	Control System, Process (PLC, SCADA)
=LB	Control System, Safety (Safety PLC)
=QA	Storage System, Gaseous Matter (Gas Storage)
=RE	Energy Conversion System, Chemical to Electricity (Fuel cells, Batteries)

IEC81346-2 Space Classification

IEC 81346-2 Table 4 provide a classification scheme for spaces, which provides a two and three letter code for the space (location) classification.
Class code "1" and "1" is used for the location scheme

IEC 81346-2 Table 4	Location Codes (Example)
+GB	Space for power generation, Chemical (Fuel Cells)
+DA	Space for active technical equipment
+UC	Space for electrical equipment (Electrical Cabinet)

IEC81346-2 Class Code

IEC 81346-2 Class Codes is a scheme for defined objects for reference designations according to their inherent function

IEC 81346-2 Table 2	Class Codes (Example)
-BA	Sensing, electrical potential (Voltage Transducer)
-BC	Sensing, electrical current (Current Transducer)
-BP	Sensing, pressure (Pressure Transducer)
-BT	Sensing, temperature (Temperature Transducer)
-EA	Emitting, light (Light Fixture)
-FC	Protecting, overcurrent (Fuse, MCCB)
-GB	Generating, Chemical Reaction (Fuel Cell)
-GP	Generating, Liquid Flow (Pump)
-GQ	Generating, Gas Flow (Van, Ventilator)
-KE	Processing, Electrical signals (PLC)
-KF	Processing, Information (Network Switch)
-MA	Driving, Torque (AC Motor)
-QA	Controlling, Electric Current (Contactor, Motor Starter)
-QB	Controlling, Electric Separation (Disconnector)
-QM	Controlling, Fluid On/Off (Valve)
-QN	Controlling, Fluid Regulation (Damper, Gas Control Valve)
-WD	Guiding, Low Voltage Electric Energy (AC or DC power Cable)
-WE	Guiding, Reference Potential (Grounding Wire/Cable)
-WG	Guiding, Electric Signals (Control, Network Cable)

1.0 Purpose

This document has two primary purposes:

- Outline the separation of duties between the process control system and safety system
- Hardware chosen to implement the duties for both process control system and safety system.

Please note that description of software implementing the process control is described in document C08.

Document C07 (Cause and effect charts) may be helpful in understanding the duties of the safety control system.

3.0 Separation of duties between process control and safety control

3.1 Introduction

This section describes the overall functions inside the container and the separation of duties. Functions are listed with the tag given from the P&ID documentation, see C03, sheet 2.

3.2 List of functionalities and responsibilities

When reading the following table, please refer to Single Line Diagram (SLD, C06) and Process and Instrumentation Diagram (P&ID, C03).

The markings indicate the following:

- "Yes" - This system is responsible for this function.
- "-" - This system has no responsibility for this function.
- "STO" - The Safety system can initiate Safe Torque Off (STO) functionality on the drive or power converter.
- "Trip" - The Safety system can trip the breaker.

Table 2: List of functions in the 1MW container

Function (=) (See C03, Sheet 2)	Comment	Process Control	Safety System
=RE01, =RE02	Fuel Cell Module – Process Control	Yes	-

4.0 Hardware Selection for Process Control

This section describes the hardware used for process control for the FC Package process control system.

4.1 Controller Family

The chosen hardware family is the AMC (Advanced Modular Controller) 300 series by the manufacturer DEIF AS in Denmark, shown in Figure 1.

Figure 1: AMC300 Controller with option cards

DEIF AMC300 controller in 7-slot rack, with IO modules included. System CPU is located rightmost slot.

4.2 Controller Series Approvals

The DEIF AMC300 controller has a series of approvals, some of which are listed in Table 3.

Table 3: AMC300 Approvals (excerpt)

Approval	Issuing body	Approval Type
CE Marking	DEIF AS	EU Goods Marking
BV 42536/C0 BV	Bureau Veritas	Marine Type Approval
DNV TAA00002YK Rev 1	DNV	Marine Type Approval
UKCA	DEIF AS	UK Goods Marks

4.3 Controller Topology

The chosen topology for the controller is multiple racks with a single CPU. The racks communicate via an separate EtherCAT ring network.

4.4 Controller Modules (IO Cards)

Table 4: AMC300 IO Cards

IO Card	Purpose	IO on Card
PSM3.1	Rack power supply and EtherCAT Primary (Master)	2 NO Relay
PSM3.2	Rack power supply and EtherCAT Secondary (Follower)	2 NO Relay
ACM3.1	Alternating Current Module	2 x 3 phase voltage measurement, 4 current transducer inputs
ACM3.2	Differential Current Module	2 x 3 phase current transducer inputs

IOM3.1	Input Output Module, Relays and DI	4 Change over relays, 10 DI
IOM3.2	Input Output Module, Mixed Signals	4 NO Relay, 4 AO, 4 DI, 4 AI
IOM3.3	Input Output Module, Analogue Input	10 AI (V, mA, RTD)
IOM3.4	Input Output Module, Digital Input/Output	12 DO, 2 x 8 DI

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.0 Hardware Selection for Safety Controller

This section describes the hardware used for process control for the FC Package Safety control system.

5.1 Controller Family

The chosen Safety controller is the FlexiSoft FX3 series produced by SICK AG.

The FlexiSoft series is a modular safety controller, programmed in software and capable of achieving very high safety ratings (PLe / SIL3)

Figure 2: SICK FlexiSoft FX3

Modular Safety Controller, CPU located leftmost with IO and network modules to the right.

5.2 Controller Series Approvals

The SICK FlexiSoft FX3 controller has a series of approvals, some of which are listed in

Table 3.

Table 5: SICK FlexiSoft FX3 Approvals (excerpt)

Approval	Issuing body	Approval Type
EU Declaration of Conformity	SICK AG	CE Marking
UK Declaration of Conformity	SICK AG	UKCE Marking
CULus	Underwriters Laboratory	UL508, CSA C22.2
TÜV Safe	TÜV Rheinland	UL508, CSA C22.2

5.3 Controller Series Safety Data

The manufacturer supplied Safety Data for the FlexiSoft FX3 series are listed in Table 6.

Table 6: SICK FlexiSoft FX3 Safety Data

Type	Performance	Standard
Safety Integrity Level	SIL3	IEC 61508
Category	Category 4	EN ISO 13849
Performance Level	PLe	EN ISO 13849
PFH_D	$1{,}69 * 10^{-9}$	EN ISO 13849
T_M	20 years	EN ISO 13849

5.4 Controller Topology

The chosen topology for the controller is two independent controllers, one located in the 40ft container and one located in the 20ft container. These two controllers are connected via a safety-rated EFI (CAN-bus based) connection, such that safety system trip in one container will guarantee activation of the safety system in the other container.

The controller in the 40ft container is connected via modbus to the process controller, such that the internal status of the controller can by communicated to the process control system. The communication is not safety rated. The process control system cannot influence the safety control system over the modbus connection.

5.5 Controller Modules (IO Cards)

Table 7: FlexiSoft FX3 IO Cards

IO Card	Purpose	IO on Card
CPU1	Controller CPU card with EFI bus	2 EFI bus channels
GMOD	Non-safe Modbus communication	2 RJ45 (Modbus TCP)
XTIO	Safe Digital Input/Output Module	8 DI 4 DO
XTDI	Safe Digital Input Module	8 DI with test outputs
ANA0	Safe Analog Module (4-20 mA)	2 AI / 1 AI (mirrored input)

1 MW Megablock Load List	
Date	13/08/2025
Responsible	RKN
Rev.	3

Note: With regards to BLPH platform modes, the Megablock Load List remains these 3 load cases for standby depending on the ambient temperature. During blackout the Megablock load is zero. When Megablock is running it covers its own BOP which equals zero load from BLPH.

													Case 1 - Hot Standby (-10 °C)			Case 2 - Hot Standby (10 °C)			Case 3 - Hot Standby (25 °C)

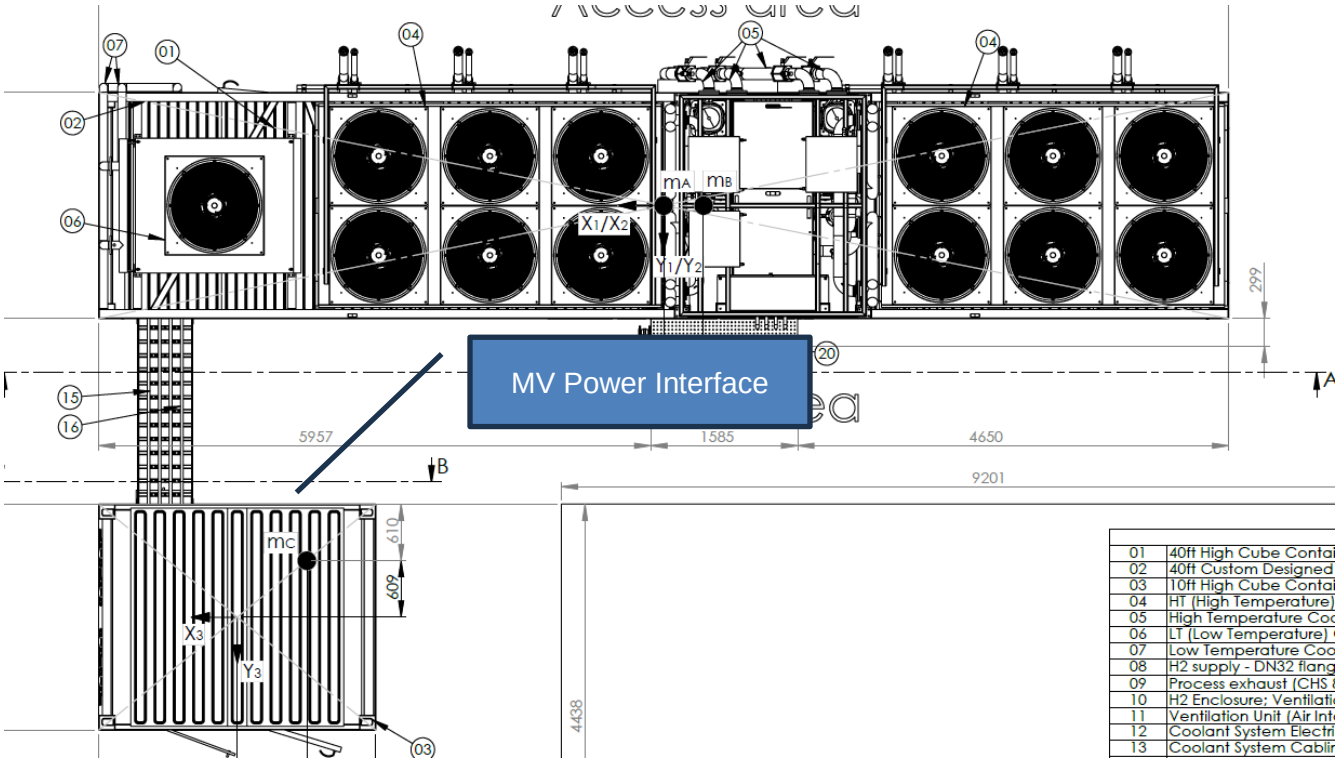
1.0 Purpose and Scope

The purpose of this document is to outline the MV(Medium-voltage) interface between FC package to the Base Load Power Hub platform.

The document further includes the LV and controls interfaces between the BLPH platform and the FC package.

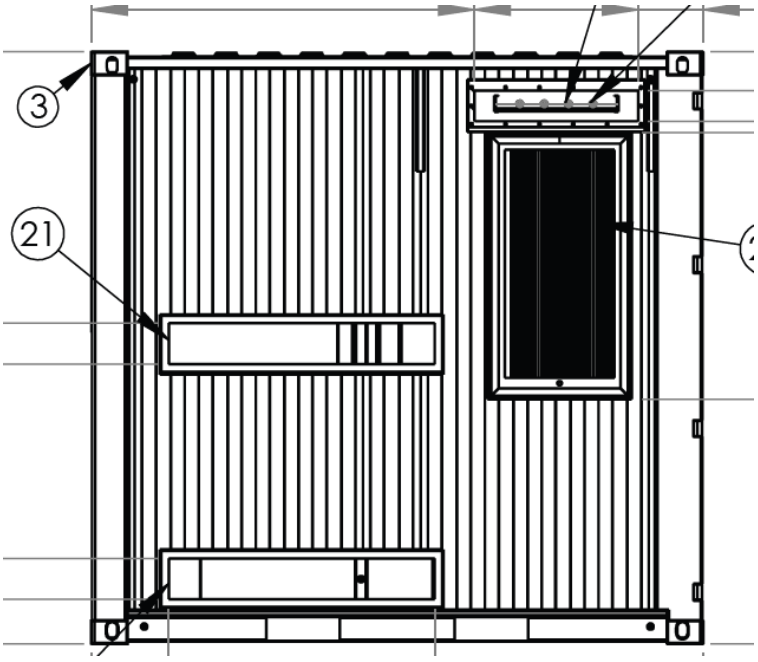
Drawings of the interface is presented, and details of the connection points is outlined.



2.0 Connection Overview

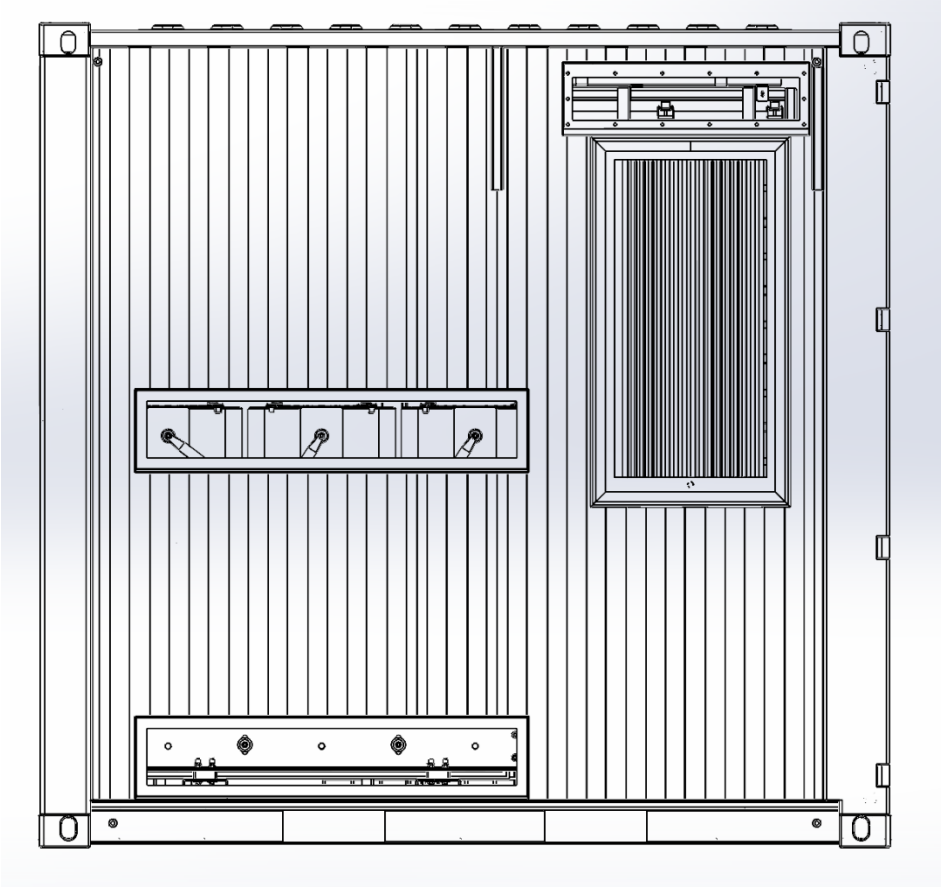
2.1 List of Connections

Connection	Description	Physical Connection
MV Interface	Main power delivery interface – 3 phase 6,6kV AC 50Hz 100A connection	3 pcs single Conductor Cables
Auxiliary Supply	Container auxiliary supply – 3p+N+PE 400V 50Hz 32A supply	5G6 Cable (optionally 5G10)
Network Connection	Network cable carrying Modbus TCP control signals and SCADA data to BLPH	Fiber optic cable
Service Connection	Network cable carrying service and troubleshooting information to Ballard. Encrypted.	Fiber optic cable **OR** Copper ethernet (4x2x0,5mm^2)
Safety Signals	Multiconductor signal cable carrying safety signals between FC package and BLPH control system	Multiconductor cable (6x2x0,75mm^2)



2.2 MV Interface (6,6kV Interface)

Figure 1: Location of the MV power interface

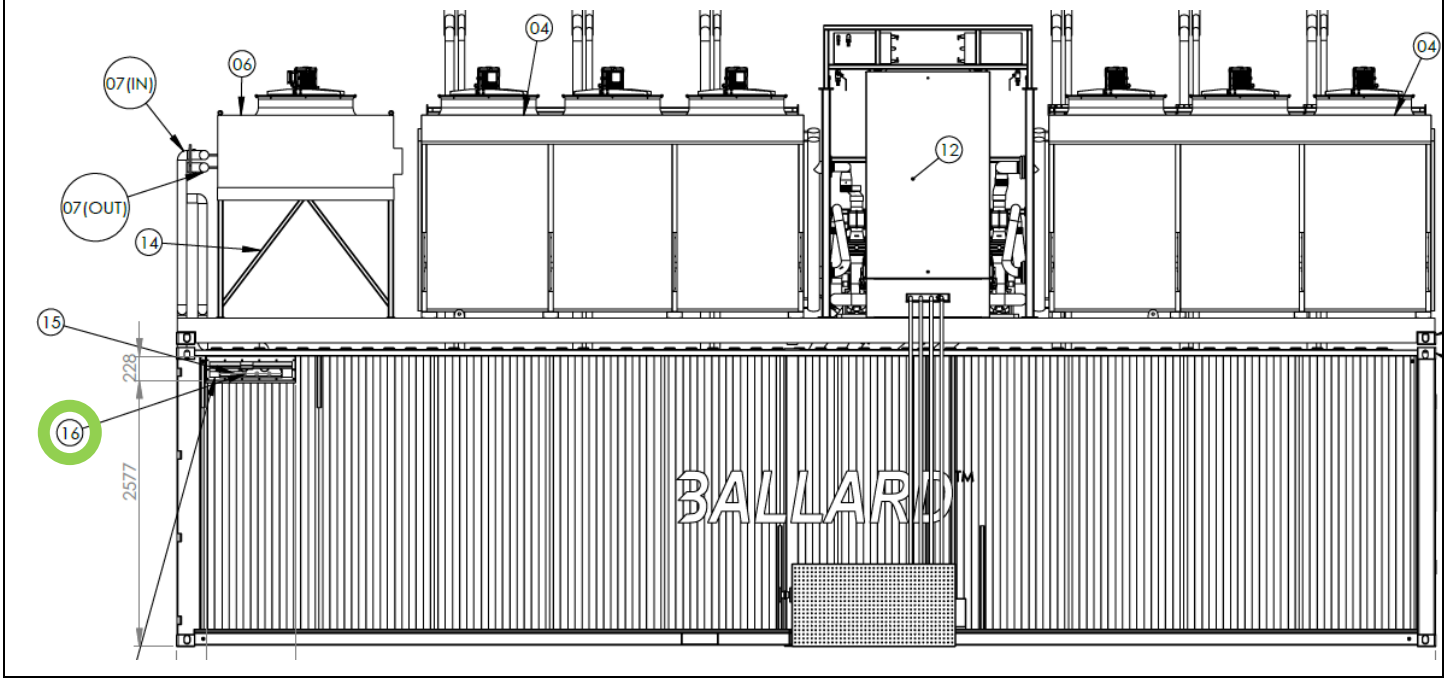


Location of the MV power interface shown on the General Arrangement (B01). The view is detailed in Figure 2*, which is section view "B".*

Figure 2: Section View “B”

Section view “B” of the 10ft container, showing the MV interface as item 21.

Figure 3: Transformer Connection Points



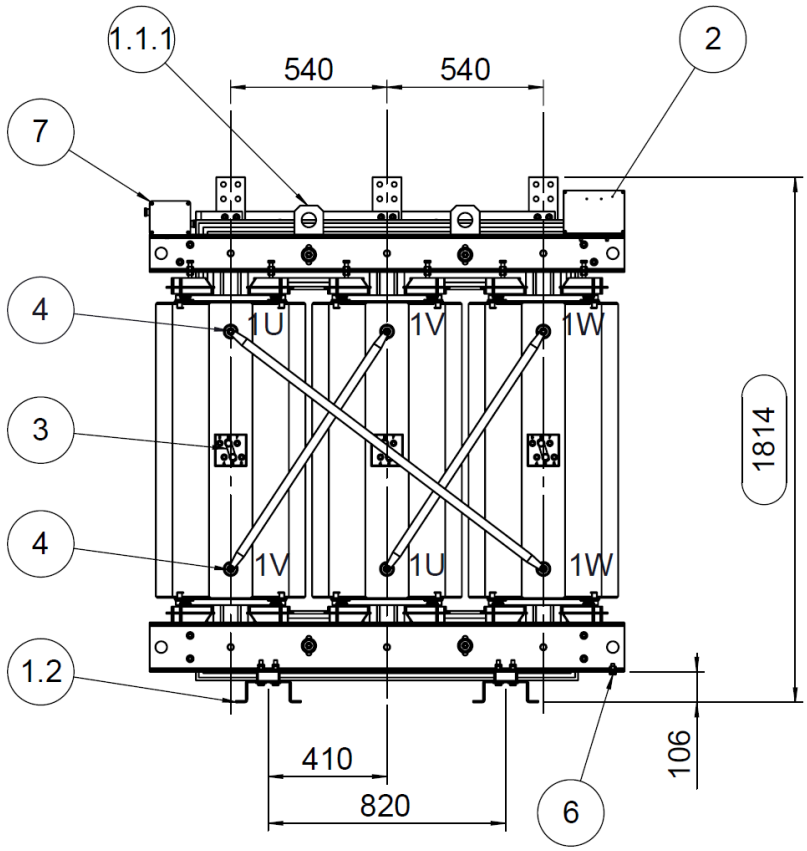
Rendering of transformer connection points as seen through the access ports. Access is possible through both upper and lower port. Both ports are covered by a sealing plate, the desired access plate is supplied with cable glands installed.

2.3 LV and Controls Interface

The physical location of the LV and controls interface is shown in document “K559-2254-CWIWP4202202-B01-001Rev005”, section view “A”, balloon 16.

Figure 4: Location of the LV and Controls Interface

Location of the LV and Control interface shown on the General Arrangement (B01). The view is detailed in Figure 2*, which is section view “A”. The Interface is shown as balloon “16”.*



3.0 Electrical Overview – MV Connection

The MV connection between the FC package and the BLPH platform is a 3 phase 6,6kV 50Hz AC connection.

The power produced in the FC package is transmitted via this connection to the BLPH, which in turn provides power to start the fuel cell systems for a short period of time.

The interface point of the connection is on the MV connection points on the output transformer, as illustrated in Figure 5.

Figure 5: Output Transformer Drawing

Side view of the MV side of the output transformer, taken from transformer manufacturer general arrangement. Items are detailed in Table 1.

Table 1: Transformer GA Items

Item	Description	Quantity
1.1.1	Lifting Lug, 100x100x10	4
1.2	Truck	2
2	Plate A5 Al Black [Rating Plate]	1
3	Voltage Regulation Plate	3
4	HV Terminal M12 Brass Stud	6
5	LV Busbar Terminal 100x10 Al	3
6	Stainless Steel Earthing Stud M12 A2-70	2
7	Probes Marshalling Box, 3xPt100	1

3.1 Terminal Lugs

The MV terminal lugs on the transformer are bolts of size M12 with brass bolts present.

3.2 Connection Responsibility Matrix

The parties responsible for each part of the MV interface is outlined in the following table:

Table 2: Responsibility Matrix – MV Connection

Item	Description	Responsible
MV Connection Bolts	Transformer MV connection bolts	Ballard
Weather sealing plate	Cover plate for transformer connection points	Ballard
Cable Glands	3 pcs cable glands to mechanical fasten and weather seal MV AC cable	Ballard
MV Cable	3 pcs AC cable to carry power to/from FC package	RM
MV Cable lugs	3 pcs cable lugs to fit M12 brass bolts	RM
MV Cable Workmanship	Mounting, adjusting, cutting and crimping cable lugs to cables and mounting to transformer MV connection points	RM

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

4.0 Electrical Overview – Auxiliary Connection

The Auxiliary connection to the FC package is the supply of AC power to the package when the fuel cells are not operating.

The expectation is that RM provides cable and mounting up to the interface point, with a specified additional length (see Table 5) that Ballard personnel will pull through the interface point, mount to the terminal blocks inside the package and coordinate with RM personnel for relevant electrical tests.

The expected cable coloring is described in Table 3.

Table 3: Cable Markings – Auxiliary Connection

Item	Electrical Connection
1 or BROWN	Phase L1
2 or BLACK	Phase L2
3 or GREY	Phase L3
4 or BLUE	Neutral
GREEN YELLOW	Protective Earth

Table 4: Responsibility Matrix – Auxiliary Connection

Item	Description	Responsible
Cable outside FC package	Provisioning and mounting the cable outside the FC package interface point	RM
Cable extra length	Specified extra length of cable above for routing inside FC package	RM
Cable Interface Plate and cable gland	Weather sealing for cable	Ballard
Cable routing	Routing cable inside FC package	Ballard
Cable connection and workmanship	Mounting cable inside FC package	Ballard

Table 5: Cable Extra Length – Auxiliary Connection

Item	Description	Length
Cable extra length	Extra length of auxiliary supply cable needed	12m

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.0 Electrical Overview – Network and Service Connection

The Network connection to the FC package is the control connection between the FC package and the BLPH platform control system.

The service connection to the FC package is the service/troubleshooting/data transfer connection from the FC package to the Ballard OT infrastructure. It is expected that RM provides a routing through relevant firewalls of this connection to a specified IP for Ballard's SCADA. The data is secured against unauthorized access and malicious actors.

The expectation is that RM provides cable and mounting up to the interface point, with a specified additional length that Ballard personnel will pull through the interface point and route to the cabinet.

Ballard will raise a TQ on the specifics of the Fiber converter and material.

Table 6: Responsibility Matrix – Network and Service Connection

Item	Description	Responsible
Cable outside FC package	Provisioning and mounting the cable outside the FC package interface point	RM
Cable extra length	Specified extra length of cable above for routing inside FC package	RM
Cable Interface Plate and cable gland	Weather sealing for cable	Ballard
Cable routing	Routing cable inside FC package	Ballard
Cable splice	Splice of fiber inside FC package and mounting connector	RM

Table 7: Cable Extra Length – Network service Connection

Item	Description	Length
Cable extra length	Extra length of network fiberoptic cable needed	10m

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

6.0 Electrical Overview – Safety Connection

The safety connection is a single multicore cable carrying the hardwired safety signals between the FC package safety controller and the BLPH safety system.

The expectation is that RM provides cable and mounting up to the interface point, with a specified additional length (see Table 9) that Ballard personnel will pull through the interface point and route to the cabinet.

Table 8: Responsibility Matrix – Safety Connection

Item	Description	Responsible
Cable outside FC package	Provisioning and mounting the cable outside the FC package interface point	RM
Cable extra length	Specified extra length of cable above for routing inside FC package	RM
Cable Interface Plate and cable gland	Weather sealing for cable	Ballard
Cable routing	Routing cable inside FC package	Ballard
Cable connection and workmanship	Mounting cable inside FC package	Ballard

Table 9: Cable Extra Length – Safety Connection

Item	Description	Length
Cable extra length	Extra length of multicore cable needed	25m

7.0 Assembly pictures

Figure 6: View of transformer connection points from outside

Picture taken of the transformer installed into the container, from approximately same angle as Figure 2*. Cover plate not installed on this picture.*

Figure 7: View of transformer connection points, inside

Picture of the transformer, as seen from inside the 10ft container. Both cover plates not installed.

1.0 Purpose and Scope

The purpose of this document is to outline the requirements and preferences of Ballard regarding remote access and operational and security data transfer from the fuel cell package controller to Ballard internal databases.

This document will describe the intent from Ballard both during the on-shore commissioning and work-up phase onshore at Rosetti Marinos facilities in Ravenna, Italy and when transported and installed at final location on the offshore monopile at the HKN wind farm.

The intent of the document is to be shared with project partners, covered by the project NDA.

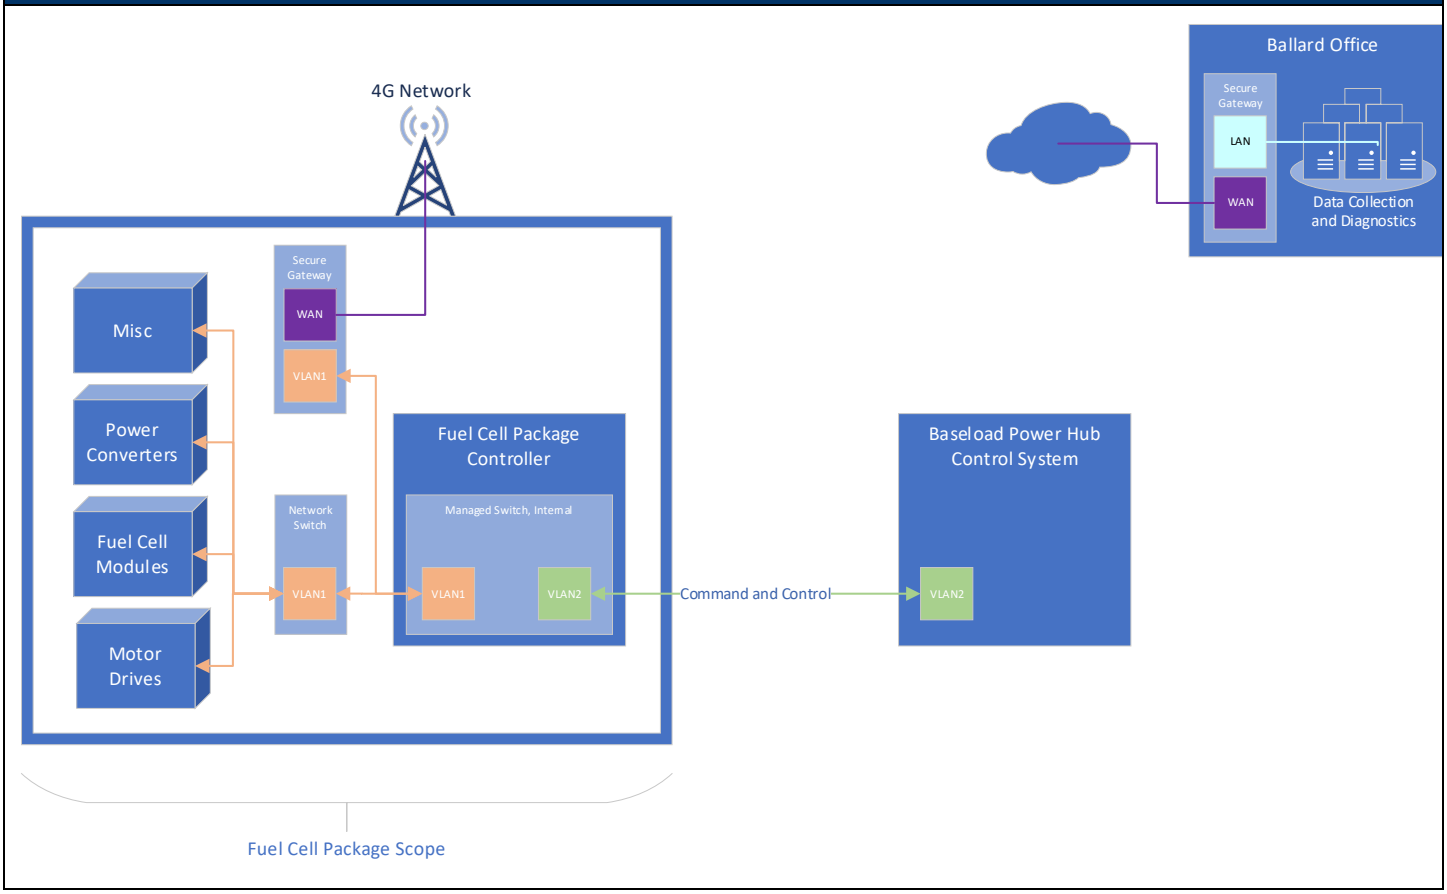
3.0 Terminology

Table 1: List of Terminology

Abbreviation	Full Name
OT	Operational Technology
IACS	Industrial Automation and Control Systems



4.0 Fuel Cell Package OT Structure

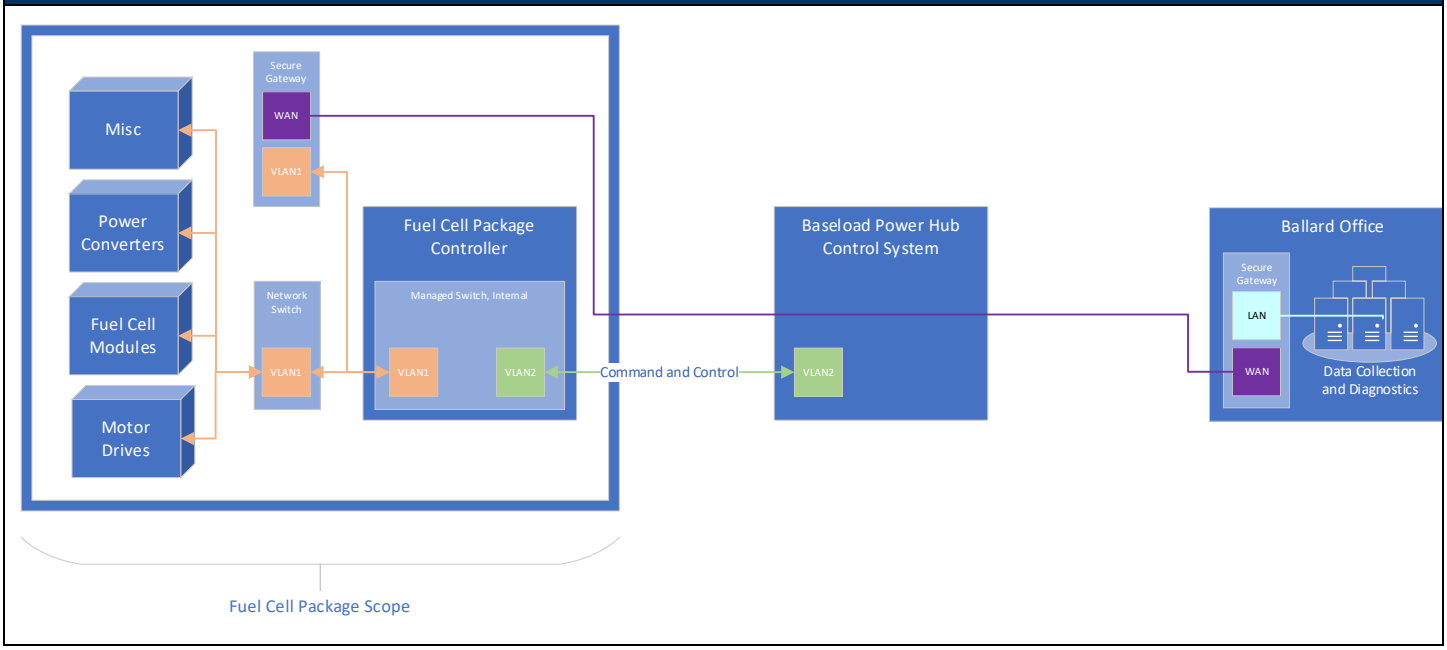
The purpose of this section is to outline the OT architecture as designed in the fuel cell package for the Crosswind HKN project.

4.1 Proposed architecture during onshore commissioning

The Fuel Cell Package will be delivered with a Secure Remote Access gateway installed including a 4G wireless antenna, which allows troubleshooting, data collection and remote access.

Figure 1: Proposed Secure Remote Access architecture onshore

During onshore commissioning and work-up, Ballard proposes to have a 4G network connection from the fuel cell package container to Ballard main office, allowing rapid response from engineering back office support.



4.2 Proposed architecture during offshore operation

The Fuel Cell package can either continue with the setup from commissioning or be adapted to the architecture proposed in Figure 2.

As the 4G connection is expected to be non-existent at the final location, the solution with a secure access tunnel though the BLPH infrastructure to the internet would be preferred.

The secure access tunnel should be completely separated from the command and control system for the BLPH, in order to maintain the best possible separation between the OT network and data going to the internet.

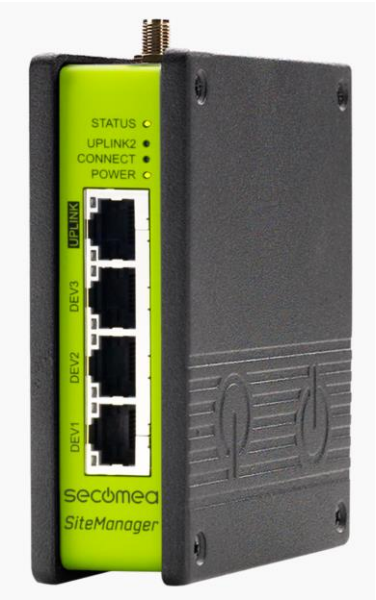
Figure 2: Proposed Secure Remote Access architecture offshore

When the BLPH is completed and moved to the final offshore location, the proposed secure remoted access solution would be a pass-though the BLPH network infrastructure to Ballard.

5.0 Secure Remote Access Hardware

5.1 Crosswind Cybersecurity Requirements

The Crosswind project requirements for Secure Remote Access is given in document CWHKN-PMT-PJA-PLN-00009, section “Secure Remote Access”, page 11.



This section allows for the use of Secure Remote Access to OT systems and requires the use of a standard remote access solution.

There is no further explanation what this standard remote access solution is comprised of.

5.2 Ballard proposed Secure Remote Access solution.

The secure remote access solution proposed by Ballard is based on the SiteManager product line from the company Secomea.

Figure 3: Secomea Secure Remote Access Hardware

The Secomea SiteManager Secure Remote Access device. The OT side is the DEV1-3 ports with the WAN connection via the UPLINK port to the other end of the secure tunnel. The SiteManager can also connect via 4G connection

5.3 Security certifications of the proposed hardware and vendor

Table 2: IEC 62443 Certifications

3.0 Inputs

3.1 Hydrogen Supply

- Pressure and temperature ranges are per design of FCwave™.
- Min. flow during operation of a single FCwave™ is 0.9 g/s (equivalent to 3.24 kg/h).
- Max. possible H2 flow per design of the FCwave™ is 4.9 g/s.

  → 6 x FCwave™ = 29.4 g/s (equivalent to 105.84 kg/h)

Note: There is no hydrogen consumption when the FCwave™ modules are not running.

3.2 AUX Supply

The AUX power interface supplies all necessary auxiliaries and controls within Ballard's scope while the fuel cells are not running.

The max. theoretical power consumptions for the AUX Supply is equal to 22 kW and is represented by two loads: 16 kW for Space Heating and 6 kW for the Control PSU. This max. possible power consumption occurs only during "keep warm" Standby mode (no operation) with space heating at max. power.

$$\rightarrow I = \frac{22{,}000\ W}{\sqrt{3} \times 400\ V} = 31.76\ A \approx 32\ A$$

The expected loads for the AUX Supply during the different operating modes are summarized as follows:

- Idle: 3 kW + Space Heating (according to table below)
- Standby: 6 kW + Space Heating (according to table below)
- Running: 0 kW
- Startup / Shutdown: 6 kW

Ambient Temperature	Expected Heating Loss (40 ft HC Container)	Expected Heating Loss (10 ft HC Container)	Total Heating Loss (Both Combined)
-20 °C	7.6 kW	2.3 kW	**9.9 kW**
-15 °C	6.2 kW	2.0 kW	**8.2 kW**
-10 °C	4.8 kW	1.4 kW	**6.2 kW**
-5 °C	3.4 kW	< 1 kW	**< 4.4 kW**
0 °C	2.0 kW	< 1 kW	**<3 kW**
5 °C	< 0.5 kW	< 0.5 kW	**<1 kW**
> 5 °C	0	0	**0**

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

3.3 MV Link - Input

- This is a bi-directional interface.
- The voltage of 6.6 kV_{ac} and frequency of 50 Hz are the specified interface.
- Power is needed during the following modes:
  - "Startup": 10 kW – 150 kW (depending on number of FCwave™ modules starting at the same time)
  - "Rampdown": ~ 10 kW
  - "Aftercooling": ~ 5 kW

3.4 Total Air Intake (for Process and Ventilation of Container and H_2 Enclosures)

- Temperature and humidity ranges are per design.
- When in “Sleep” mode, where no FCwave™ is running and the container ventilation is OFF, the air intake is equal to 0 g/s.
- Min. air intake during “Standby”, where no FCwave™ is running and the container ventilation is ON, is equal to 135 g/s.
- Max. air intake assumes operation of all six FCwave™ modules at max. power and at a max. ambient temperature of 40 °C (*Ballard-internal design criterion*).
  - Process Air: 6 x 260 g/s = 1,560 g/s
  - H2E ventilation: 6 x 15 g/s = 90 g/s
  - Container ventilation: Rest of the 30,000 m^3/h max. flow (equivalent to ~10,000 g/s) needed to cool the inside of the container so it does not exceed 45 °C, which is the upper limit of the FCwave™ at max. *design* ambient temperature.

  Note: Actual mass flow at 25 °C (max. ambient temperature at project location) is not expected to exceed ~6,000 g/s.

3.5 Cooling Air (for HT and LT coolers)

Assumptions:

- Atmospheric pressure: 101,325 kPa
- Ambient temperature: 25 °C
- RH: 60%
  - Density of air = 1,184 g/m3

Calculations:

- Air flow of HT cooler fans at max. speed (according to manufacturer's datasheet): 47.86 m3/s (equivalent to ~56,500 g/s)
- Air flow of LT cooler fans at max. speed (according to manufacturer's datasheet): 8.81 m3/s (equivalent to ~10,500 g/s)
  - Total for 2 x HT coolers + LT cooler = ~123,500 g/s

4.0 Outputs

4.1 MV Link - Output

- The voltage of 6.6 kV_{ac} and frequency of 50 Hz are the specified interface.
- Max. power output for 6x FCwave™ after power conditioning losses and consumption of auxiliaries (assuming a max. of 12.5% combined) is 1.05 MW.

4.2 Water Drain

Assumptions:

- All hydrogen is electrochemically converted to water.
- All process water exits through the water drain.
- Max. hydrogen flowrate (design criteria) is 4.9 g/s per FCwave™
  - 29.4 g/s for 6 FCwave™ modules.

Calculations:

$$2H_2 + O_2 \rightarrow 2H_2O$$

- 1 mol of H_2 produces 1 mol of H_2O
- H_2 has a molecular weight of 2 g/mol, H_2O has a molecular weight of 18 g/mol
  - 29.4 g/s of H_2 produces 264.6 g/s of H_2O (equivalent to 15.9 L/min)
- Considering any additional water previously present along the process air exhaust and drain system due to changing ambient/operating conditions, a conservative design flowrate of **18 L/min** is assumed.

4.3 Process Air Exhaust

- For a single FCwave™, the process air exhaust mass flow during operation ranges from 100 g/s to 260 g/s.

  → For the container solution with 6x FCwave™, the range during operation is: 100 g/s – 1,560 g/s

4.4 Ventilation Air Exhaust (H_2 Enclosures)

- For a single FCwave™, the mass flow of the hydrogen enclosure ventilation during operation is 750 L/min (equivalent to ~15 g/s).

  → For the container solution with 6x FCwave™, the range during operation is: 15 g/s – 90 g/s

4.5 Ventilation Air Exhaust (Container)

- Outlet max. temperature is based on an estimated max. ΔT of 13 °C at max. ambient temperature of 40 °C (*Ballard-internal design criterion*) and max. fuel cell power with an assumed max. heat of 110 kW, composed mostly of losses that are not rejected by liquid cooling and radiant heat from direct sunlight.
- Max. mass flow is equal to the total max. *design* air intake minus the max. Process Air Exhaust and max. Ventilation Air Exhaust for the hydrogen enclosures:
  - 10,000 g/s - 1,560 g/s - 90 g/s = 8,350 g/s

Note: Actual mass flow at 25 °C (max. ambient temperature at project location) is not expected to exceed ~4,350 g/s.

1.0 Purpose

The purpose of this document is to give an impression of reliability and availability for the Fuel Cell container (1MW) for Crosswind Baseload Power Hub.

As the Fuel Cell container (1MW) for Crosswind Baseload Power Hub is a first of its kind system, there are no reliability or availability data covering the overall Fuel Cell container (1MW) system.

Most critical components regarding reliability are the FCwave™200kW fuel cell modules. Hence the data presented in appendix 1 is the maintenance plan including Preventive Maintenance intervals for this module.

2.0 Appendix

Table 1: Appendix Documents

Document ID	Short ID	Document Title	Source
SPC5114412-0A	Appendix 1	Maintenance Plan, FCwave™ 200kW	BPSE

3.0 Maintenance Plan for FCwave™ 200kW

The data presented in appendix 1 only coverers the FCwave™ module.

It is required to follow the maintenance plan to ensure trouble-free operation.

Maintenance intervals are influenced by the operating pattern for the system.

Background for the maintenance plan is that the system operates up to 6000 h/year (1500 hours quarterly) and that preventive service is carried out 4 times / year by trained service technicians.

Purpose of Document

The purpose of this document is to inform about the Preventive Maintenance intervals for the FCwave™ 200kW fuel cell module. It is required to follow the maintenance plan to ensure trouble-free operation during the lifetime of the FCwave™ module.

Conducting maintenance requires a certain level of competences. It is assumed that the owner or operator of the FCwave™ employs the right technical skills.
To ensure that the activities are carried out in a correct and safe manner, Ballard offers a dedicated FCwave™ training program consisting of several levels.
It is considered mandatory having participated in- and successfully passed such training prior to executing any work on the FCwave™.

The actual execution is governed by a task and interval reference, the Maintenance Plan, and supported by in-depth instructions collected in the always current version of the Fuel Cell System Service Manual, FCwave™ 200kW.

Conditional Inspections

In the Maintenance Plan below, several routine inspections are listed which shall be carried out according to the specified intervals.

These checks and inspections are intended to support an early-stage detection of any deviation of a condition, which later can cause a malfunction and/or need for intrusive corrective actions.

Conditional Inspection Plan

Covered by sensors in container system

Task	Interval *Whichever comes first		Comments
	Hours	Month(s)	
High Temperature Coolant Sub-system			
Check **coolant level indicator** on header tank.	250	1	Check HT coolant level is between minimum and maximum.
Check **cooling sub-system**.	250	1	Visual inspection for signs of coolant leaks.
Check **stack coolant** conductivity.	1.500	3	Replace **DI filter** (resin cartridge) if conductivity exceeds specification of 5 µS/cm @20°C.
Check **coolant tank level switch**.	6.000	12	Functional check. Replace if needed.
Check **coolant particulate filter** (wedge wire screen) for damage.	6.000	12	Clean filter. Replace if necessary.
H_2 Enclosure and Stack Sub-system			
Check **H_2 Enclosure water ingress sensor**.	3.000	6	Functional check as part of safety verification. Replace if necessary.
Check **differential pressure safety switch**.	3.000	6	Functionality check as part of safety verification.
Check **ventilation inlet flow switch**.	3.000	6	Functional check as part of safety verification.
Check **H_2 sensors**.	3.000	6	Functionality check as part of safety verification. Replace if necessary.
Check **enclosure ventilation fans**.	3.000	6	Functionality check as part of safety verification. Replace if necessary.

Process Air (Cathode) Sub-system			
Check **air filter w/ Mass Air Flow (MAF) meter**.	6.000	12	Replace if necessary.
H_2 Fuel (Anode) Sub-system			
Check **Hydrogen Recirculation Blower (HRB)** for oil leaks. Check elastic coupling element for wear.	6.000	12	Check HRB for oil leaks and replace if necessary. Inspect coupling for wear and replace if clear signs of damage to coupling material.
Check **HRB motor** for signs of wear to bearings, noticeable by wear on coupling element.	6.000	12	Check for vibration levels depending on RPM of the motor.
Cabinet Assembly			
Check **cabinet doors air filters**.	1.000	2	Check condition and replace if necessary.
Check **cabinet water ingress sensor**.	3.000	6	Functional check as part of safety verification. Replace if necessary.
Check **smoke detector**.	3.000	6	Functional check as part of safety verification. Replace if necessary.
Electrical Sub-system			
Check **electrical wire harness**.	6.000	12	Visual inspection of damage to insulation from rubbing against fixation or other objects.
Check **Linear Heat Detector (LHD) / fire wire**.	6.000	12	Visual inspection of visible fire wire. Check functionality. Replace if damage to insulation or lacking function.

Periodic Exchange of Components Due to Wear

Compared to other means of energy provision, the Ballard FCwave™ fuel cell only require a minimal number of components to be changed with fixed intervals in the, prolonged, period between the need for conducting a major overhaul.

Periodic Exchange Plan

Task	**Interval** *Whichever comes first		**Comments**
	Hours	**Month(s)**	
High Temperature Coolant Sub-system			
Change **DI filter** cartridge.	6.000	12	Replace DI filter cartridge.
H_2 Enclosure and Stack Sub-system			
Change **purge valve** due to wear as consequence of accumulated activations.	12.000	24	Replace purge valve.
Process Air (Cathode) Sub-system			
Change **humidifier assembly**.	5.000	10	Replace.
Change **cabinet door air filters**.	6.000	12	Replace filters.
Change **air filter w/ MAF meter**.	12.000	24	Replace filter and sensor.

Components Replaced Due to Safety

Given the FCwave™ module is operated on hydrogen, a corresponding number of dedicated hydrogen sensors are part of the safety system as well as the smoke detector installed in the FCwave™ module cabinet.

Safety Component Exchange Plan

Task	Interval *Whichever comes first		Comments
	Hours	Month(s)	
H_2 Enclosure and Stack Sub-system			
Change **H_2 sensors**.	6.000	12	Replace.
Cabinet Assembly			
Change **smoke detector**.	6.000	12	Replace.

Major Overhaul

Ballard scope

At a certain point of time, just like for any other type of machinery having operated for thousands and thousands of hours, the need for a Major Overhaul is present.
The indication of major overhaul is either by an increased consumption of hydrogen to produce a certain amount of energy, or the module can no longer output maximum energy according to the specification.
The Ballard Customer Care department can assist with evaluation of such need, as well as predict the activity in due time, if a service contract is established which include remote data monitoring.

The upper compartment containing the actual fuel cell stack can be removed by Ballard service technicians within a short period of hours and replaced with a 1-to-1 exchange unit containing a fully refurbished, tested, certified and trouble-free unit.

Owner scope or outsourced to Ballard

The lower unit is considered the BOP, Balance of Plant, for the fuel cell. It contains the systems required for the fuel cell to produce energy, such as air supply- and conditioning plus cooling system consisting of pump, valves, pipes, and heat exchanger.

The BOP components are standard heavy duty industrial designs which can be maintained and serviced by competences with a basic technical experience of marine, industry and/or automotive background, plus the specific training. As such, the required activities for these components at the time of Major Overhaul, can be scheduled in a way causing minimal intrusion of the operation. This is a recommendation however it will be based on owners preferred principle.

Major Overhaul Plan Owner Scope

Task	Interval *Whichever comes first		Comments
	Hours	Month(s)	
High Temperature Coolant Sub-system			
Change all HT coolant.	25.000	60	Replace cooling water as part of major overhaul and stack replacement.
Replace DI filter cartridge.	25.000	60	Replace DI filter.
Check coolant particulate filter (wedge wire screen).	25.000	60	Check for damage and clean. If damaged or perforated, replace with new.
HT coolant pump.	25.000	60	Replace shaft seal, O-rings, and gaskets or entire pump based on owners preferred principle.
HT coolant heat exchanger.	25.000	60	Evaluate the need for de-acidification or backflushing of customer side of heat exchanger.
Low Temperature Coolant Sub-system			
LT coolant condition – replace if necessary.	25.000	60	Evaluate the need for de-acidification or backflushing depending on visual signs of contamination or impurities.
Process Air (Cathode) Sub-system			
Replace cabinet doors air filters.	25.000	60	Replace filters.
Check air filter w/ MAF meter.	25.000	60	Replace filter and sensor.
Replace humidifier assembly.	25.000	60	Replace.
Electrical Sub-system			
Check electrical wire harness and power cables.	25.000	60	Visual inspection of damage to insulation from rubbing against fixation or other objects.
Check Linear Heat Detector / fire wire.	25.000	60	Visual inspection of fire wire in lower cabinet. Replace entire loop if damage to insulation.
Cabinet Assembly			
Check cabinet water ingress sensor.	25.000	60	Functional check, replace if necessary.
Clean cabinet.	25.000	60	Clean internal surface for collected dust and impurities.

1.0 Introduction and Purpose

All FCwave™ modules are connected to Emergency Shutdown (ESD) valves. These valves are normally closed and are intended to quickly and reliably stop the flow of hydrogen to the system during emergency situations. Additionally, since these valves are intended for use in potentially explosive atmospheres (ATEX Zone 2), they must also be explosion proof according to Directive ATEX 2014/34/EU.

Furthermore, to provide additional safety in the form of redundancy, each independent FCwave™ supply line is equipped with two identical ESD valves.

The location of the ESD valves can be seen in Figure 1 below.

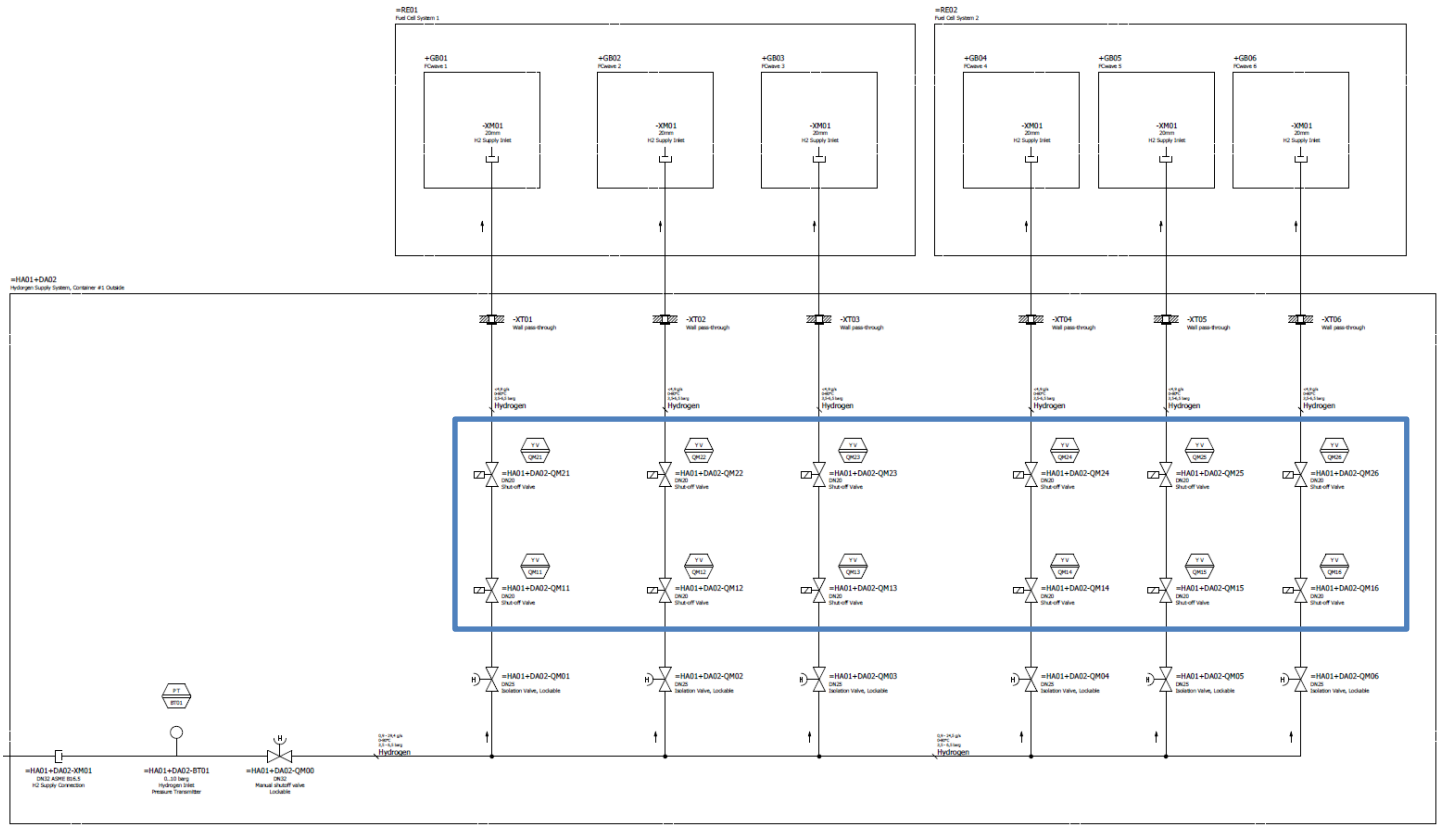

Figure 1. Excerpt of P&ID showing the hydrogen supply system; ESD valves are shown inside the blue rectangle.

The relevant sizing calculations and documentation for these valves are presented in this document.

3.0 Flow Capacity Calculations

In order to size an adequate emergency shutdown (ESD) valve for use in the individual supply lines of each of the six FCwave™ modules in the container solution, the norm IEC 60534-2-1 was used as the basis. The IEC 60534-2-1 specifies the use of the equation below (among other equivalent equations for use with different variables) to determine the minimum flow coefficient K_v required.

Note: *The equation is valid for non-choked turbulent flow without attached fittings.*

$$K_v = \frac{Q_n}{NP_1Y} \cdot \sqrt{\frac{G_g T_1 Z}{x}} \qquad (1)$$

where:

K_v is the flow coefficient for flow rates given in m^3/h.

Q_n is the normal volumetric flow rate of the gas [Nm^3/h].

According to the FCwave™ Integration Manual, the maximum flow rate to each fuel cell module should not exceed 4.9 g/s. Assuming a worst case, we can take 5 g/s (equivalent to ~**190 Nm^3/h**) for the calculation.

N is the applicable numerical constant at normal conditions for units given in m^3/h, bar and K (for K_v).

In this case, the value is linearly extrapolated to the application-specific inlet absolute temperature (263 K, see below) from values given for different temperatures on Table 1 of the norm IEC 60534-2-1 and the manufacturer's Control Valve Handbook, and is equal to **439**.

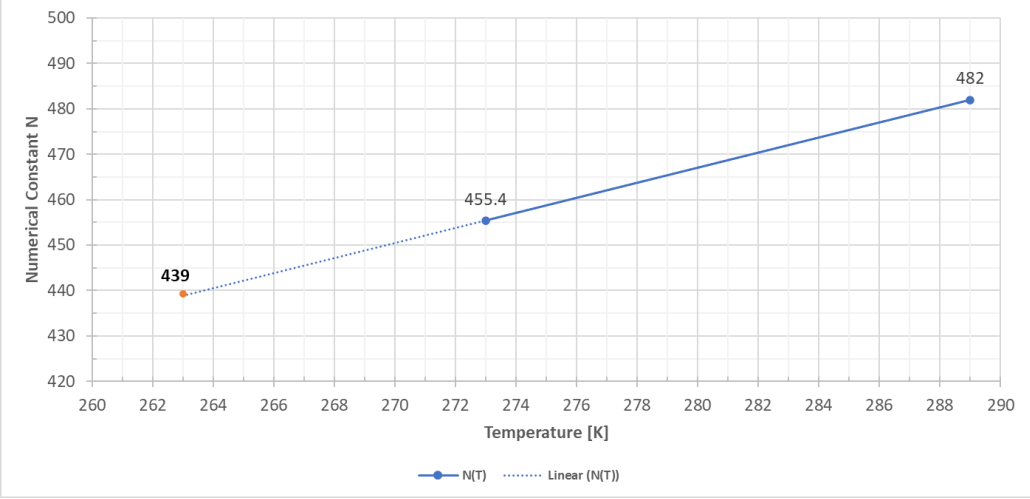

Figure 1. Extrapolation of numerical constant N for min. inlet temperature.

P_1 is the inlet absolute static pressure [bar].

Assuming a worst case in which the supply pressure is lower than the minimum required inlet pressure of 3.5 bar gauge, we can take 3.0 bar gauge for the calculation (**4.0 bar** absolute).

G_g is the gas specific gravity (ratio of density of flowing gas to density of air with both at standard conditions, which is considered in this practice to be equal to the ratio of the molecular weight of gas to molecular weight of air) [dimensionless].

For hydrogen gas, the gas specific gravity is equal to **0.07**.

T_1 is the inlet absolute temperature [K].

Assuming a worst case in which the supply temperature is somewhat below the required -8.4 °C, we can take -10 °C (equivalent to **263 K**) for the calculation.

Z is the compressibility factor at inlet conditions [dimensionless].

At the relative low pressure and temperature for this application, a value of **1.0** can be assumed.

x is the ratio of pressure differential to inlet absolute pressure ($\Delta P / P_1$) [dimensionless].

Assuming a maximum pressure drop of 0.15 bar (estimate based on expert assessment of the specific piping design) and an absolute inlet pressure of 4.0 bar, the ratio of pressure differential would be equal to **0.0375**.

Y is the expansion factor [dimensionless] and is given by:

$$Y = 1 - \frac{x}{3F_\gamma x_\tau} \qquad (II)$$

where:

F_γ is the specific heat ratio factor [dimensionless], as compared to air.

For hydrogen, the specific heat ratio at the given conditions is approx. 1.41 and that of air is 1.4, so the specific heat ratio factor can be assumed to be **1.0**.

x_τ is the pressure differential ratio factor of a control valve without attached fittings at choked flow [dimensionless].

This value is usually determined experimentally and is conservatively assumed here to be **0.5**, which in reality is likely to be considerably higher, giving the calculation an additional safety margin.

Filling in all values in equations *(I)* and *(II)*, we obtain:

$$Y = 1 - \frac{x}{3F_\gamma x_\tau} = 1 - \frac{0.0375}{3(1.0)(0.5)} = 0.975$$

$$Kv = \frac{Q_n}{NP_1Y} \cdot \sqrt{\frac{G_g T_1 Z}{x}} = \frac{190}{(439)(4.0)(0.975)} \cdot \sqrt{\frac{(0.07)(263)(1.0)}{0.0375}}$$

$$\boldsymbol{Kv = 2.46\ (m^3/h)}$$

Based on the calculation above, the valve that was selected is a ¾" direct acting hung diaphragm type valve with a K_v of 3.9 (m^3/h), which should provide a sufficient volume flow under the worst possible conditions assumed (see Appendix A and B for relevant datasheets).

Hung type diaphragms or pistons are mechanically held open (by a solenoid in this case) and are able to operate from the maximum pressure rating all the way down to zero, in that way, a safe closure of the valve can be guaranteed even during one of the most critical situations, which is when a fault is detected while the fuel cell module is on standby, with no hydrogen being consumed and, therefore, with no pressure differential across the valve.

For reference, the full catalog number of the valve selected is **NF X E210C488E 24/DC**. This valve has a metal plug and a metal seat (i.e. metal to metal type), and therefore can be expected to have a Class IV leakage class.

Moreover, rearranging factors of equation *(I)* and using the actual K_v value of the selected valve, we can calculate the pressure differential required to achieve the maximum flow of 190 Nm^3/h at an inlet pressure of 3 bar gauge:

$$\Delta P = \frac{G_g T_1 Z}{P_1}\left(\frac{Q_n}{NK_v Y}\right)^2 \qquad (III)$$

$$\Delta P = \frac{(0.07)(263)(1.0)}{4.0}\left[\frac{190}{(439)(3.9)(0.975)}\right]^2$$

$$\boldsymbol{\Delta P = 0.06\ bar}$$

Similarly, rearranging factors of equation *(I)* and using the actual K_v value of the selected valve together with the estimated maximum pressure drop of 0.15 bar, we can calculate the flow rate at an inlet pressure of 3 bar gauge:

$$Q_n = K_v N P_1 Y \sqrt{\frac{x}{G_g T_1 Z}} \qquad (IV)$$

$$Q_n = (3.9)(439)(4.0)(0.975)\sqrt{\frac{0.0375}{(0.07)(263)(1.0)}}$$

$$\boldsymbol{Q_n = 301\ Nm^3/h}$$

The summary of all three calculations can be found in the table below.

Table 1. Summary of calculations; results are highlighted in bold.

Inlet Pressure [bar_a]	Inlet Temperature [K]	Volumetric Flow [Nm^3/h]	Pressure Drop ΔP [bar]	Flow Coefficient K_v [m^3/h]
4.0	263	190	0.15	**2.46**
4.0	263	190	**0.06**	3.9
4.0	263	**301**	0.15	3.9

ASCO™ Solenoid Valves

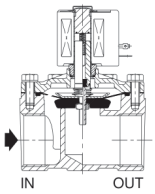
Pilot Operated, Hung Diaphragm, 3/8" to 1 1/2"

2/2
Series
210

Features and Benefits

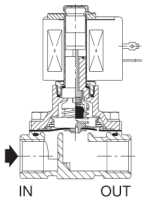
- *Two way shut-off valves for the control air, inert gas, water, oil and other gases/liquids compatible with the sealing material used*
- *Valves do not require a minimum operating pressure*
- *All products are covered by Pressure Equipment Directive 2014/68/EU and are suitable for group 1 and 2 fluids*
- *The solenoid valves satisfy all relevant EU directives*

General



Differential pressure	See «SPECIFICATIONS» [1 bar =100 kPa]
Maximum viscosity	65 cSt (mm²/s)
Response time	15 - 120 ms

Fluids (∗)	Temperature range (TS)	Seal materials (∗)
air, inert gas, water, oil	-20°C to +85°C	NBR (nitrile)



Materials of components in contact with fluid

(∗) Ensure that compatibility of materials in contact with fluids is verified.
