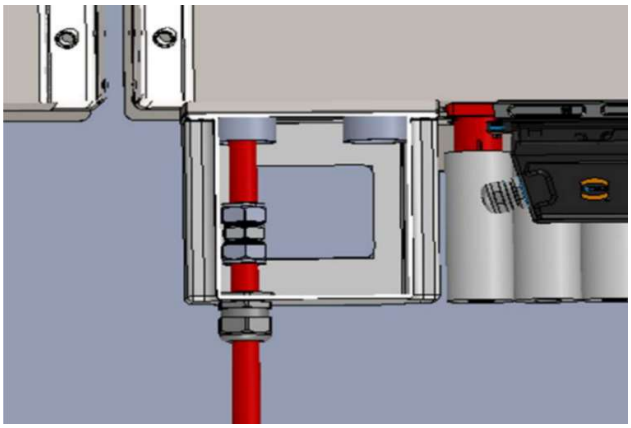
7.4.2 Hydrogen piping

The hydrogen-piping runs as seamless feed pipes from the outside of the container and into Ventilation Filter Box where it is connected to the Fuel cell module.

Figure 7: Hydrogen piping

The interior hydrogen supply system is located below the floor.

Refer to P&IDs document for more details.



Special procedure must be followed to purge hydrogen in the piping downstream from isolation valve

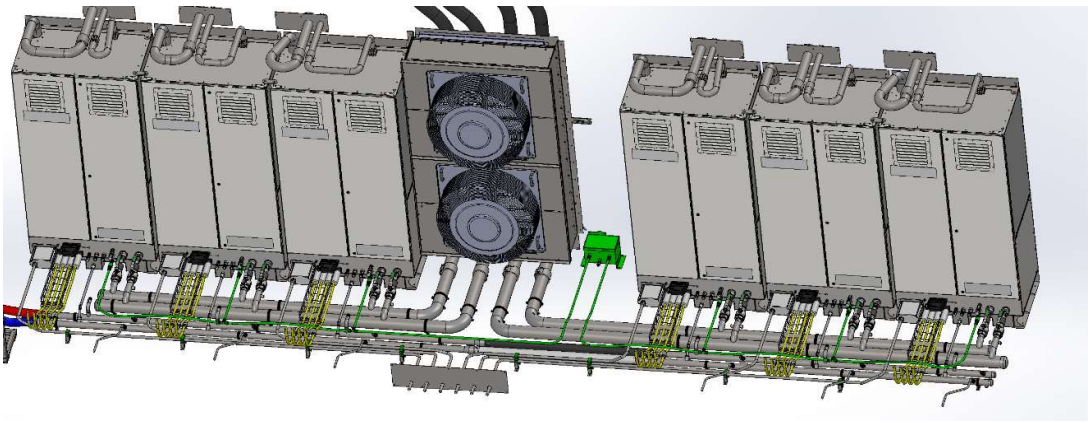
7.4.3 Fuel cell hydrogen connection (ventilation filter box)

The ventilation filter box ensures that the supply-connection is well ventilated during normal operation, ensuring dilution and removal of any, highly unlikely, hydrogen leakage.

These connections must be checked with a hydrogen sniffer, and the filter of the ventilation filter box changed as defined by the Maintenance Plan.

Figure 8: Ventilation filter box

Top-view cut-off illustration of ventilation filter box. The filter is fitted to the bottom opening.



This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

7.4.4 Fuel cell process water drain

The fuel cell process water drain system collects process water from the Fuel Cell Modules (DI-water from the chemical reaction). This is led to a separator tank where gaseous matter is separated from the media. The gaseous matter is led to an exhaust, and the liquid matter are led to the exterior drain described in section 7.1.5.

Refer to P&IDs document for more details.

Figure 9: Process water drain system

Indicative illustration of piping and tank – layout/design my vary.

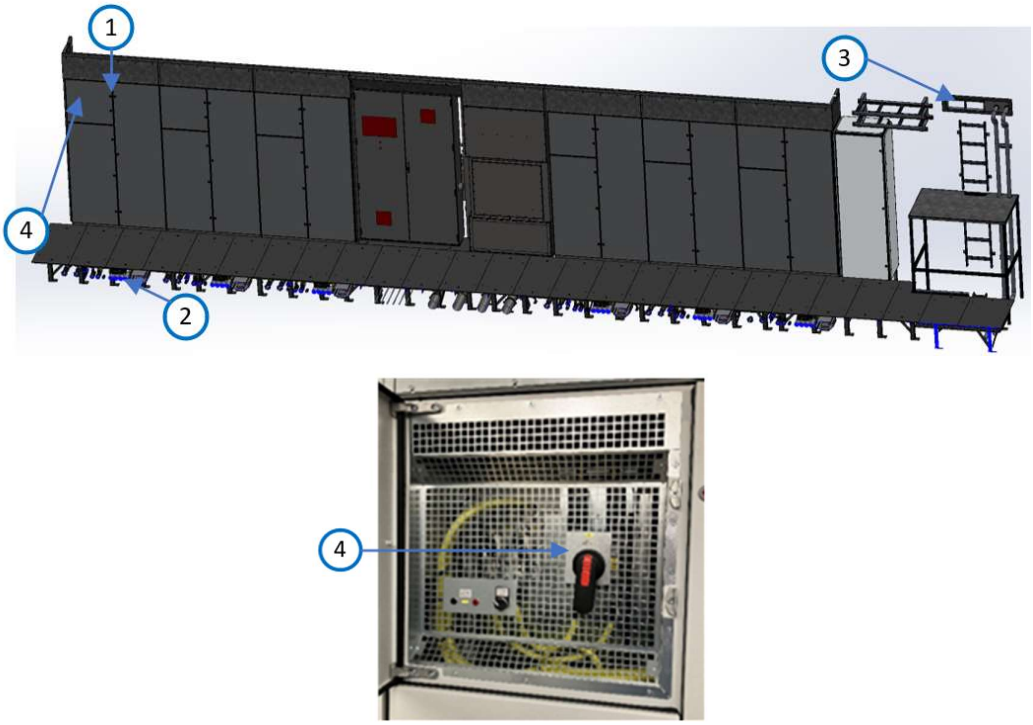
The separator tank is placed below the floor next to the main air-intake.

A heater wire is mounted to the exhaust and drain interface, ensuring that the water does not freeze. Inspect this system as defined by the Maintenance Plan.

7.4.5 Fuel cells

The service scheme for the FCwave is not covered in this document. Prior to service activity on the FCwave, the person must complete Ballard training relevant for the service planned. Service and safety instructions will be made available as part of the training.

Access to the interior of the FCwave units is only permitted for authorized personnel - see 2.3.2



For details on service and maintenance tasks, refer to FCwave – Service and Maintenance Manual and the attached Maintenance plan for the FCwave.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

7.4.6 Electrical DC system

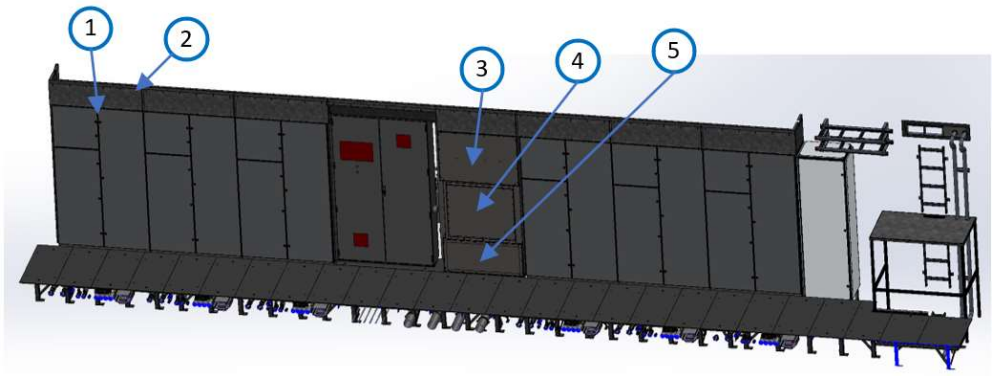
The power system is based on 750 VDC.
Special safety procedures must be followed when working on the system.
Do not open DC cabinets without following proper procedure

Figure 10: DC system

1: DC cabinet (1 of 6)
2: DC fuel cell cable
3: DC out to Converter Container
4: DC cabinet breaker

Each DC cabinet is equipped with a breaker behind the top left door. The breaker is used to isolate the cabinet and corresponding Fuel Cell Module from the DC link.

Proper procedure must be followed when dis- and re-connecting a DC cabinet, failure to do so may result in damage or injury.



A yearly inspection of each DC cabinet must be done, including checking for leakages of coolant and a thermographic inspection of electrical components and connections.

Any time access to DC areas is made, ensure cleanliness.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

7.4.7 Internal ventilation

Figure 11: Internal ventilation

1: DC/DC cabinet 2: Ventilation/DC-cable duct	3: Ventilation fan box 4: Heating element box 5: Ventilation outlet

The internal ventilation system is removing heat from the power electronics and adding room heating in case of low temperature.

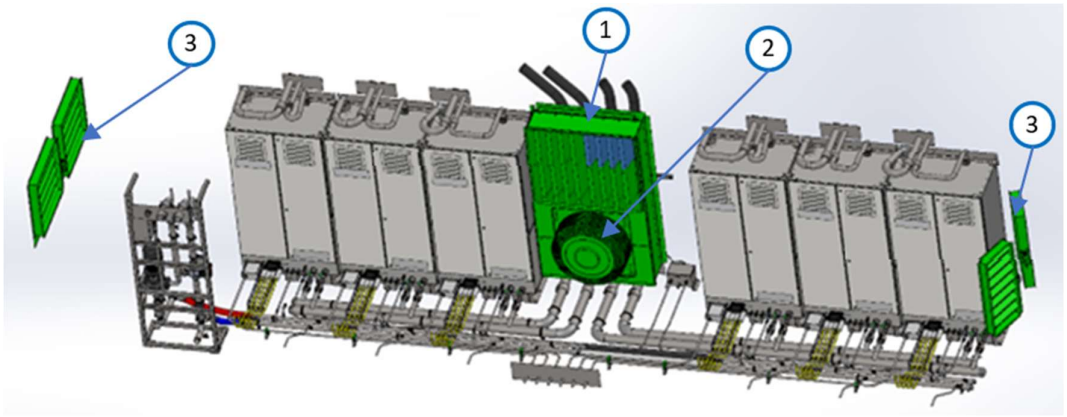
The circulation fan is placed in the central unit (3) together with a heater (4). It pulls air from below the floor, through the DC cabinets (1). Heated air exits at the outlet by the floor (5).

Each of the cabinets that the air is pulled through has a manual air-restrictor in the top, which is mounted in a fixed position, equalizing the flow through all ventilated cabinets. The settings of these are not to be changed.

There are no filters in the system.

Refer to P&IDs document for more details.

Do not open the ventilation duct unless the entire system is shut down and deenergized.



The DC cables are inside the conduit and there is access to the DC cabinets from the duct.

The heating element box must be cleaned and undergo a thermographic inspection of electrical power connections.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

7.4.8 External ventilation

Figure 12: Indicative illustration of external ventilation

1: Inlet filters
2: Main intake fans
3: Ventilation outlet with damper
Layout may vary

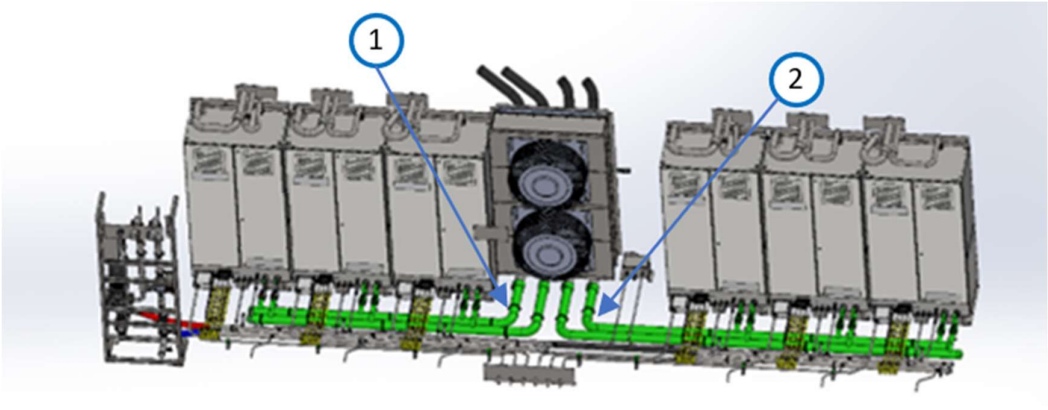
The external ventilation system is dual functioning, using external air to remove heat from the inside and providing air for the fuel cell process. Air flow is based on multiple parameters and controlled by fan speed and damper position.

The external ventilation is made to ensure a clean environment inside the container by filtering all incoming air and maintaining a slight overpressure inside the container.

Refer to P&IDs for more details.

Opening the doors of the container disturbs the air balance in the container. When doors are open, the fans will run in a locked base, unregulated setting – do not leave doors open unnecessarily.

The pressure-drop across the main filters is monitored to ensure proper function. The main filters replacement schedule is defined by the Maintenance Plan.



The service schedule for the fans of the intake is defined by the Maintenance Plan.

The dampers should be able to operate unobstructed. Any material block or damage to damper blades must be corrected without delay.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

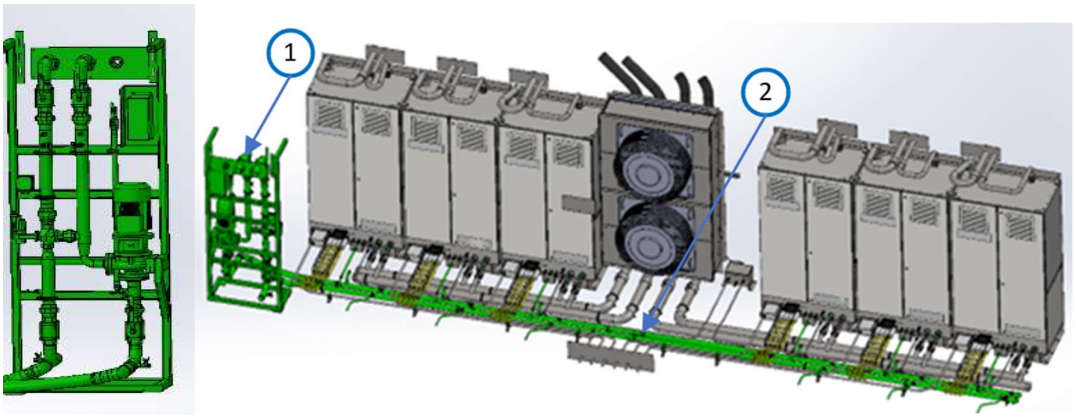
7.4.9 HT Cooling systems

Figure 13: Indicative illustration of HT cooling system

1: HT cooling manifold FC 4, 5 & 6
2: HT cooling manifold FC 1, 2 & 3
Layout may vary

The 2 HT cooling systems are cooling the fuel cell stacks for FC1,2,3 and FC4,5,6 respectively, at approximately 60°C.



Details of the cooling media can be found in the document Material Safety Data Sheets.

There are no serviceable parts of the HT cooling system inside the container, but a visual inspection for leakages must be conducted.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

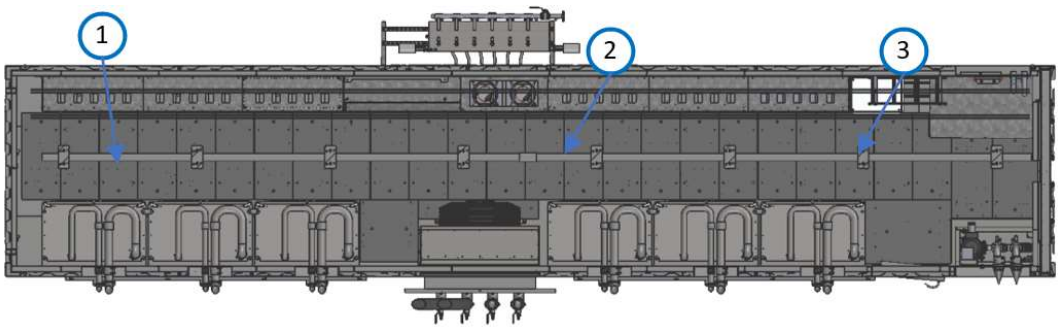
7.4.10 LT Cooling systems

Figure 14: Indicative illustration of LT cooling system

1: LT cooling pump rack
2: LT cooling manifold
Layout may vary

The LT cooling systems provides cooling for power electronics at approximately 45°C.
Refer to P&IDs and document for more details.
Details of the cooling media can be found in the document Material Safety Data Sheets.
The LT pump must be serviced as defined by the Maintenance Plan.
The LT Coolant strainer must be inspected and cleaned as defined by the Maintenance Plan.
Testing of the quality of the freeze-protection in the coolant.



7.4.11 UPS

The container houses several 24VDC UPS modules. These are located under the floor.
The functionality of these, and the battery health must be checked.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

7.4.12 Container safety system

Figure 15: Safety sensors location

1, 2 and 3: H2 sensor & smoke detector

The container interior is equipped with 3 sets of safety sensors, each consisting of an H2 sensor and a smoke detector.

The sensors are integrated in the container safety system together with the FCwave safety signals, emergency stop, and electrical safety.

Figure 16: Safety sensors

H2 detection and smoke detection

The function of the sensors is tested as defined by the Maintenance Plan.

The H2 sensor must be calibrated as defined and change of sensor must be done because of degradation.

Functionality test on the emergency stops internally and externally to the system must be conducted.

This Document is valid only at time of Printing.

8.0 Preventative Maintenance – Converter Container

Figure 17: Converter Container – external overview

1: Access door	4: Air exhaust
2: Main breaker access door	5: Grid Interface
3: Control cabinet access door	6: Air Intake

The Converter Container has the main output power electronics and transformer inside. The interior is not a workplace, and it should only be accessed as needed for specific services.

8.1 External

8.1.1 Cleaning

The outside of the container may be cleaned using water and a nonabrasive cleaning agent.

Do not use high pressure cleaning.

During cleaning of Air intakes, the corresponding damper must manually be places in closed position and disconnected. Reset to automatic after cleaning. The dampers can be actuated from the service interface.

8.1.2 Air dampers

The ventilation dampers must be able to operate unobstructed. Any material block or damage to damper blades must be corrected without unnecessary delay.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

8.2 Access

The service door at the end of the container is intended for special service cases and should otherwise be kept closed.

Access to the internals is for authorized personnel only.
Never force entry.

Proper procedures for lock-out-tag-out must be performed, prior to entering.
See Lockout Tagout document.

Before leaving the site check that all doors are safely locked.

8.3 Internal

8.3.1 General

The interior should be kept clean and walking space unobstructed.

The UPS actively supply power to the control cabinet when the AC supply is disconnected.

Never work inside the container without a colleague.

Only firefighters should open the doors in case of fire.

8.4 Ventilation

The ventilation is made to ensure proper temperature and a clean environment inside the container by filtering all incoming air and maintaining a slight overpressure inside the container.

The pressure-drop across the main filters is monitored to ensure proper function. The main filters replacement schedule is defined by the Maintenance Plan.

The service schedule for the fans of the intake is defined by the Maintenance Plan.

The dampers should be able to operate unobstructed. Any material block or damage to damper blades must be corrected without delay.

The heating elements of the container heater must be inspected and cleaned.

This Document is valid only at time of Printing.

8.5 Power components

The internal DC bus is supplied by the incoming DC from the Fuel Cell Container.

The power from the Fuel Cell Container is converted to 400 V AC and connects to the Main breaker (grid connection). Components include DCAC converter with filter, transformer 400VAC to 6,6 kVAC, main breaker and connecting busbars.

Thermographic inspection of power electronics, connections, and applicable cabinets must be performed.

8.6 LT Cooling

The LT cooling system provides cooling of power electronics at approximately 45°C.

Refer to P&IDs and Material Safety Data Sheets document for more details.

The connections of the LT cooling system must be inspected for leakages.

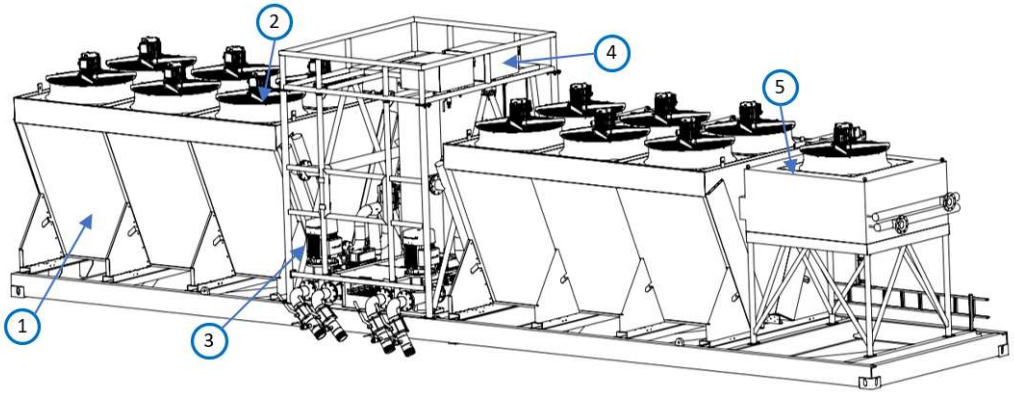
8.7 UPS

The container houses several 24VDC UPS modules. The functionality of these, and the battery health must be checked.

8.8 Container safety sensors

Figure 18: Sensors

Smoke detector & temperature sensor



The container interior is monitored for smoke, has a safe-lock and door safety switches, one on each container door pair.

The sensors are integrated in the container safety system.

This Document is valid only at time of Printing.

9.0 Preventative Maintenance - Cooling Platform

Figure 19: Cooling platform - Overview

1: HT Cooler 2: Cooler fan 3: HT pump	4: Header Tank 5: LT Cooler

The Cooler platform has 2 individual HT cooling systems and the cooler for the LT Cooling system.

The HT Cooling systems are identical, each with a dry cooler, header tank, pump, valves, and sensors.

Each of the three cooling system is designed to allow for operation up to external temperature of 45°C. The systems are without active cooling, and it is therefore important that the coolers are kept in good operating condition.

There must be regular inspection of coolers at each service visit. The coolers must be kept clean and free from material blocking the airflow.

There is minimum a yearly cleaning and inspection of the coolers.

Cleaning of coolers, access to fans etc. may require using a ladder, lift, scaffolding or similar - Availability is customer responsibility, or as agreed upon.

Rules for working in height and fall arrest equipment applies.

Pumps, sensors, and valves can generally be serviced from the work platform. The platform is designed to be reachable by ladder and has a safety cave. Working inside the cave with the gate closed can be done without fall arrest equipment.

The HT pumps must be visually checked for leakages and serviced as defined by the Maintenance Plan.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

The cooling system contains Glycol.
See Material Safety Data Sheets for details.
Avoid spillage, use gloves and eye protection.

The coolant levels are monitored by level switches in the header tanks. In case of low coolant level, it must be topped up. The function of the level switches must be verified, defined by the Maintenance Plan.

The coolant must be checked yearly to secure proper freezing protection.

If for service or other reasons one of the cooling systems must be emptied and refilled, procedure must be followed, ensuring that the system is de-aeriated.

The Control Cabinet of the Cooling platform contains a UPS that must be tested as defined by the Maintenance Plan.

Fans on the coolers must be visually inspected and cleaned.

HT Fan Drive Cabinet Chiller shall have checked/cleaned/replaced the air-intake filter, cleaned the condensate drain trap and recharged refrigerant as needed.

This Document is valid only at time of Printing.

10.0 Troubleshooting

The system allows for remote monitoring where warnings and alarms are available. The following troubleshooting processes should be done by trained personnel. Refer to Cause and Effects Chart.

10.1 Safety system

Safety trip on an FCwave, Hydrogen safety valve override, Power converter Safe Torque Off (STO) or motor drive STO:

- Check internal and integrator-provided emergency stop buttons
- Check for hydrogen detection
- Check for fire detection

10.2 Hydrogen

If the hydrogen valves by the hydrogen heater are unexpectedly closed:

- Check internal emergency stop buttons
- Check for hydrogen detection
- Check for fire detection
- Check for DCAC Converter trip
- Check for LT Cooling system loss
- Check for ventilation failure
- Check the process water drain for blockage
- Check for communication failure to integrator
- Check for hydrogen supply and signal

10.3 FCwave

Single module has stopped:

- Check for FCwave internal alarm
- Check for applicable DCDC's trip

Multiple modules have stopped:

- Check for HT Cooling system loss

All modules have stopped:

- Check for DCAC converter trip
- Check for LT Cooling system loss
- Check for ventilation failure
- Check the process water drain for blockage
- Check for communication failure to integrator
- Check for hydrogen supply and signal

Single module Derate:

- Check for FCwave internal warnings

Multiple modules Derate:

- Check for HT cooling system loss

All modules Derate:

- Check for LT Cooling system loss
- Check for Ventilation Derate

This Document is valid only at time of Printing.

10.4 Power converters

Power converter derates:

- Check LT Cooling system Derate
- Check ventilation derate (Some power converters are air-cooled)

Power converter stop:

- Check DCDC converter trip
- Check DCAC converter trip
- Check for LT Cooling system loss
- Check ventilation derate (Some power converters are air-cooled)
- Check for communication failure to integrator

1.0 Disclaimer

NOTE: READ THIS BEFORE ATTEMPTING ANY PROCEDURES DESCRIBED IN THIS MANUAL

There are inherent risks in the operation of a fuel cell module that can result in death or bodily injury or loss or damage to property. It is therefore necessary for the customer to take all prudent safety precautions in the installation, use, and maintenance of this device. Persons who install, operate, and service the device are required to be technically qualified and experienced in working with electrical equipment, compressed gases, and H2.

This manual includes certain safety guidelines and recommendations; however, this manual is not intended to cover all situations. The customer is responsible for determining the suitability of the customer's particular design or application, and for ensuring the safe operation, maintenance, and storage of the device and any systems into which it is integrated. Ballard Power Systems Europe A/S ("BPSE") cannot be responsible for the use of the device in ways, or as part of systems, that deviate from the operating recommendations in the manual. The customer is responsible for being aware of, and complying with, all applicable laws and regulations. BPSE has limited its liability for damages incurred by the customer or its personnel in the contract documents pursuant to which the device is provided to the customer. Please refer to those documents for additional information.

Procedures described in any part of the manual can only be attempted once the customer has read this entire manual. Failure to follow any instruction or recommendation could result in death or bodily injury or loss or damage to property.

BPSE intends for the device to be installed, operated, and serviced only by approved technically qualified and experienced people who understand the principles of fuel cell technology, are aware of the safe operating limits of fuel cells, and are familiar with the risks posed by operating a fuel cell module. BPSE relies on customers to use their own knowledge and experience when installing, operating, and servicing the device. BPSE also relies on the people using this manual to be familiar with common terms and abbreviations used in the manual.

Information in this manual is subject to change without notice. BPSE makes no commitment to update or keep current the information in this manual and reserves the right to make updates or other changes to this manual and/or to the products described in this manual, at any time without notice. Updates and other changes to the manual may be posted on the BPSE website and may be accessed through the customer portal; it is the customer’s responsibility to check for any such updates or changes.

Copyright

The statements in this document must not be changed without special notification from Ballard Power Systems Europe A/S. Furthermore, Ballard Power Systems Europe A/S does not commit to any further obligations with this document.

Under no circumstances may the whole or parts of this publication be copied, reproduced, stored in a retrieval system, or translated into another language, unless written permission from BPSE has been obtained.

2.0 General information

2.1 Introduction

This document serves to supply information regarding the needed maintenance on components that exists inside the ATEX zone.

Figure 1: ATEX zone

Source document: General arrangement - K559-2254-CWIWP4202202-B01-001Rev008

2.2 ATEX Zone maintenance safety

The defined EX zone is classified as Zone 2.

Only approved personnel are allowed to work in the ATEX Zone.

2.3 Coolant media

Coolant is Proviflow Neo. Refer to Material Safety Data Sheets - K559-2254-CWIWP4202202-D05-001.

2.4 De-energization

De-energization of electrical components for maintenance must be done, ensuring that no ignition source ever exists in the EX-zone.

This Document is valid only at time of Printing.

3.0 Maintenance tasks on components in ATEX zone

3.1 Hydrogen Heater

If the Hydrogen Heater has run recently, wait for it to cool down before touching it and components mounted.

The following components of the Hydrogen Heater have no defined service/maintenance tasks defined by their documentation.

- Pressure sensor
- Temperature sensor
- Cables to sensors
- Cables to heating elements
- Cable glands on JEVI D-8640 heating elements
- Cable glands on Solenoid Shut-off valve (H2)
- Sensor EX barrier
- General Hy-lok fittings

It is recommended that visual inspection on above-mentioned components is done.

3.1.1 Hydrogen Heater cooling media

The Hydrogen heater must have the coolant freeze-protection checked with the use of a refractometer regularly and changed as needed.

Coolant is 50/50% mixture of demineralized water and Proviflow Neo, which is an Ethylene-glycol based.

Criteria: minimum freezing point of -30°C

3.1.2 Level sensor – IFM LMT01A

Refer to Manufacturers (IFM) Operating Instructions – section 9.

- De-energize supply
- Check sensor tip for deposits and damage. Clean if badly soiled. In case of damage, replace the unit – the unit cannot be repaired.
- When reinstalling, carefully clean the probe neck and the installation slot, especially the sealing surface, with appropriate methods to ensure that the unit is resistant to ingress and without dead space.
- Re-energize supply.

3.1.3 Heating element - JEVI D-8640

Refer to Manufacturer's (JEVI) Installation, Operation and maintenance instructions, section 4.0

Maintenance free, however after 1 year of operation:

- De-energize supply (=LA01+UC30-FC41…42)
- Check the thermostat for damage

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

+45 8843 5500
ballard.com
Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

- Check connections inside junction box
- Re-assemble and verify correct connections
- Re-energize supply

If no heating is done when needed, check and press the manual reset button.

3.2 H2 Solenoid Shut-off valve – Emerson ACSO

Check for excessive wear – leakage tests

- Externally

  Potential leakage areas: Pipe connections (Hy-lok) and valve stem.

  Hy-lok connections have low probability of leakage. If leakage occur, refer to components manual for replacement.

  If leakage from valve stem, rebuild with manufacturer kit or replace component.
- Inline

  If inline leakage occurs, rebuild with manufacturer kit or replace component.

Leakage test:

- Close valve(s) on designated H2 line
- Lower pressure downstream
- Monitor pressure downstream for a set period
- Search for external leakages with applicable outdoor-use leakage detector.

3.3 Manual isolation valve – Hy-lok 110 Ball Valve

Refer to Manufacturers (Hy-lok) Instruction manual for maintenance.

Leakage test – Stem:

In case of stem leakage, tighten the Flange Nut. If the leakage remains after tightening, check damage to the stem, outer package and inner package. Replace parts or component(s) as needed,

Leakage test – Inline:

If the leakage happens inside the valve, ensure whether the valve is in fully closed condition. If the reason of leakage is seat damage, replace the seat or the component.

1.0 General information

1.1 Lock-out-tag-out

Always open/disconnect applicable connections and perform lock-out-tag-out, using relevant locking-methods and tagging-signage to reduce the risk of accidents.

Figure 1: ABB SA1

Example log-out-tag-out kit for MCB's and others

Always measure for voltages

Emergency buttons are NOT for Lock-out-tag-out.

This Document is valid only at time of Printing.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

2.0 Site Requirements and Permission to work systems

2.1 Site Requirements

When the FC system is installed on a customer or other site, rules governing the applicable site may be in place, which must be complied with. These rules may concern hot work, live work, work at heights or other activities.

If Ballard personnel observe any unsafe activity, by Ballard personnel or other workers, they are required to report this to site supervisor and Ballard management.

2.2 Permission to Work management

When the FC system is installed on a customer or other site, it is expected that there exists a system governing permission to work, covering scopes such as area, activities, time slot and responsible person.

Ballard personnel is required to participate and comply with relevant policies and procedures for Permission to Work management.

3.0 Fuel Cell Container

3.1 Interface connections (Externals)

3.1.1 Auxiliary power supply (=HKN70-XB01)

 The auxiliary power supply is outside Ballard scope. Responsible entity must either provide a procedure for their end (Upstream) or perform the procedure when needed.

If work on the supply-side of the switch disconnector is to be done, follow that procedure.

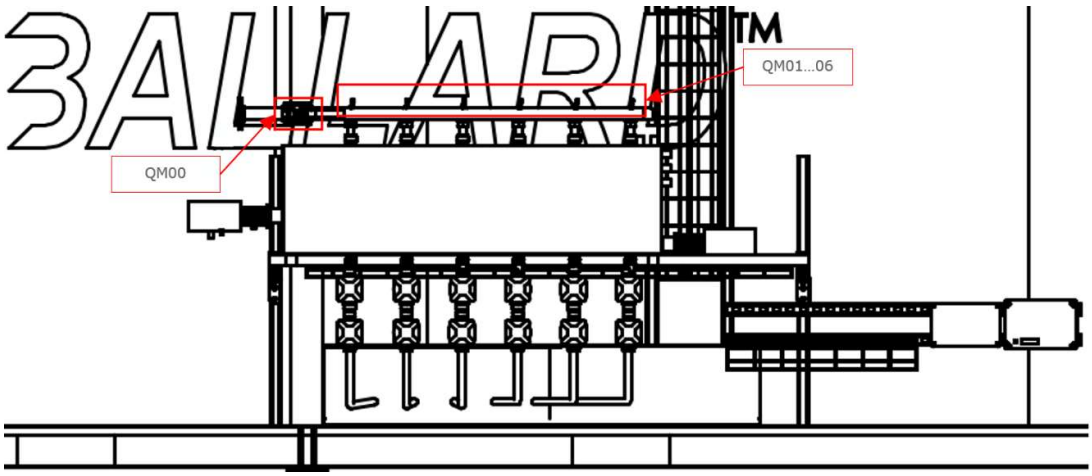
 When disconnecting the Auxiliary Power supply, the UPS inside may engage.

3.1.2 Hydrogen supply (=HKN70)

 The Hydrogen Supply is outside Ballard scope. Responsible entity must provide a procedure for their end (Upstream) or perform the procedure when needed.

If work on the supply side of the interface is to be done, follow that procedure.

LOTO from the interface and downstream on is normally in correlation with service tasks on an FCwave™ (see section electrical LOTO in section 3.2.3)



Typical hydrogen supply LOTO:

- Locate applicable manual isolation valve by the hydrogen heater (=HA01+DA02-QM01…06)
  alternatively, supply to all FCwave's can be done with the main shutoff valve (HA01+DA02-QM00)
- Turn off
- Lock-out-tag-out with padlock and sign

 Hydrogen remains in the piping from the manual isolation valve, downstream to the hydrogen supply interface of the FCwave. Refer to section 3.2.3 for bleeding.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Figure 2: Manual H2 isolation valves

All valves are lockable, enabling LOTO

3.2 Internals

3.2.1 Auxiliary power supply (-SG01)

LOTO of auxiliary power supply to the internal of the container

Auxiliary power supply may be live

1. Locate +UC50
2. Open +UC50 (The bigger cabinet door on the left)
3. Open switch disconnector (-SG01)
4. Lock-out-tag-out with padlock and sign
5. Verify absence of voltage with applicable voltmeter

When disconnecting the Auxiliary Power supply, the UPS may engage.

Re-connect

1. Ensure that work is finished, and that cabinet is clean
2. Ensure that fuses downstream of auxiliary supply switch disconnector is off
3. Re-engage switch disconnector
4. Re-engage fuses downstream one at a time
5. Remove tag-out

3.2.2 DCDC cabinet (+UC01…06)

LOTO and De-energization

1. Shut down the FCwave applicable to the DCDC cabinet through the HMI/ModBus.
   e.g.: Fuel Cell Module 1 (+GB01) if working on DCDC Cabinet #1 (+UC01)
2. Open the top-left door of the applicable DCDC cabinet with Double-bit key no. 5 cabinet key.

Do not open any other doors of the DCDC cabinet yet.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Figure 3: Top-left door on DCDC cabinet (left)

Cabinet door marked with "Switch disconnector inside"

3. Open the switch disconnector
4. Lock-out-tag-out switch disconnector with padlock and sign

RESIDUAL POWER – In DCDC's - Wait at least 5 minutes

5. Open cabinet doors

DC-link is most likely LIVE

6. Remove pre-charge fuses (4pcs - right top)
   This ensures that accidental activation of pre-charge turn-knop next to the switch disconnector handle does not introduce electrical hazard.
7. Optional: Unplug the 4 DC-connections in the bottom of the FCwave (beneath the floor).
8. Verify absence of voltage with applicable voltmeter (between top of DCDC's B+ and B-)

Re-connect

1. Ensure that work is finished, and that cabinet is clean
2. Re-apply pre-charge fuses
3. Close the two cabinet doors without the switch disconnector and turn-knop for pre-charge behind
4. Pre-charge the components of the cabinet using the turn-knop
5. Verify voltage by measuring with voltmeter in the two available plugs (530-750VDC)
6. Re-engage switch disconnector and close cabinet door.
7. Remove tag-out

3.2.3 FCwave™ (+GB01…06)

LOTO and De-energization (External to the FCwave™)

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.
Ballard Power Systems Europe A/S
Majsmarken 1

ballard.com
Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Electrical power

1. Set FCwave state to "Prepare for service" in HMI/ModBus and wait for it to transition.
2. Electrical supply LOTO:
    a. Open the top-left door of the applicable DCDC cabinet.

    Do not open any other doors of the DCDC cabinet yet.

    b. Open switch disconnector
    c. Lock-out-tag-out switch disconnector with padlock and sign

    RESIDUAL POWER – In DCDC's - Wait at least 5 minutes

    d. Open cabinet doors

    DC-link is most likely LIVE

    e. Remove pre-charge fuses (4pcs - right top)
    This ensures that accidental activation of pre-charge turn-knop next to the switch disconnector handle does not introduce electrical hazard.
    f. Verify absence of voltage with applicable voltmeter (between top of DCDC's B+ and B-)
    g. Optional: Unplug the 4 DC-connections in the bottom of the FCwave (beneath the floor).

Re-connect

1. Ensure that work is finished, and that areas are clean
2. Close the doors on the FCwave™
3. Re-apply pre-charge fuses in DCDC cabinet
4. Close the two cabinet doors in the DCDC cabinet without the switch disconnector and turn-knop for pre-charge behind
5. Pre-charge the components of the cabinet using the turn-knop
6. Verify voltage by measuring with voltmeter in the two available plugs (530-750VDC)
7. Re-engage switch disconnector and close cabinet door.
8. Remove tag-out
9. Take FCwave™ out of service state through HMI/ModBus

Gas

1. Typically, as described in section 3.1.1

Hydrogen remains in the piping from the manual isolation valve, downstream to the hydrogen supply interface of the FCwave

2. Continue de-energization of FCwave internals as described it's in manual

Re-connect

Typically reverse

24VDC Supply and control

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.
Ballard Power Systems Europe A/S

+45 8843 5500
ballard.com
Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

1. Disconnect plug from the bottom of the FCwave (beneath the floor)
2. Verify absence of voltage with applicable voltmeter

Re-connect

1. Ensure that work is finished, and that areas are clean
2. Reconnect

3.2.4 MCU cabinet (+UC20)

 MCU cabinet contains foreign control voltages – e.g. safety signals from customer

 UPS batteries supply energy to the MCU cabinet. These are located under floor by door (24VDC) and disconnected as described in section 3.2.5

The MCU cabinet is powered from +UC50

1. Ensure low-to-no power consumption in the MCU cabinet by opening fuses inside
2. Locate +UC50
3. Open +UC50 Right-lower door with Double-bit key no. 5 cabinet key
4. Open -FC04
5. Lock-out-tag-out -FC04 with ABB SA1, padlock and sign
6. Verify absence of voltage with applicable voltmeter

Alternative:

1. Ensure low-to-no power consumption in the MCU cabinet by opening fuses inside
2. Locate switch disconnector on the right side of the cabinet (-QB01)
3. Open -QB01

 The power supply (upstream from switch disconnector) remains live

4. Lock-out-tag out -QB01with padlock and sign
5. Verify absence of voltage with applicable voltmeter

Re-connect

1. Ensure that work is finished, and that cabinets are clean
2. Re-engage chosen switch disconnector
3. Re-engage fuses inside MCU cabinet
4. Remove LOTO

3.2.5 UPS

Access the UPS(s) by removing the floor-panel marked “Batteries”.

Power source:

1. Locate and turn off applicable fuse in +UC20
2. Lock-out-tag-out applicable fuse with ABB SA1, padlock and sign
3. Verify absence of voltage on UPS interface with applicable voltmeter

 Energy in UPS batteries remain

Outgoing power:

1. Ensure no power is drawn from UPS
2. Remove the 2x spade-fuses on applicable UPS unit(s)

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

3. Tag-out
4. Verify absence of voltage with applicable voltmeter

Re-connect

1. Ensure that work is finished, and that area is clean
2. Ensure no energy-draw from the UPS when reconnecting the spade-fuses by opening the applicable fuses
3. Reconnect spade connectors
4. Close the earlier opened fuses

3.2.6 LT pump drive

1. Locate and turn off the fuse in the MCU cabinet (+UC20)
2. Lock-out-tag-out of fuse with ABB SA1, padlock and sign

 RESIDUAL POWER – In Frequency Converter - Wait at least 5 minutes

3. Verify absence of voltage with applicable voltmeter

 The 24VDC control and supply remains active

Re-connect

1. Ensure that work is finished, and that area is clean
2. Reconnect in reverse order

3.2.7 Intake fans

1. Locate and turn off the fuse in the MCU cabinet (+UC20)
2. Lock-out-tag-out fuse(s) with ABB SA1, padlock and sign
3. Turn lock-function of plug on the fan and remove by pulling

Re-connect

1. Ensure that work is finished, and that area is clean
2. Reconnect plug on fan
3. Close fuse(s)

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

4.0 Converter Container

	**The internals of the Converter Container are not accessible when the system is running.**
	**Internals are IP00 area**
	**Never force entry, never de-activate safeguards.**

Entering the 10ft Converter Container

1. Remove the on the padlock on the container door with applicable key
2. Open the container door
3. Mount the padlock to the locking handle (like in Figure 4), ensuring that the container doors cannot be closed and locked by anyone with no knowledge of the work being done.

Figure 4: Mounted padlock on open container door

Indicative purpose only.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

ballard.com
Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

4.1 Interface connections

4.1.1 Grid connection (=HKN70-XB02)

 – The Grid connection is outside Ballard scope. The responsible entity must provide a procedure for their end of the cable(s). If work downstream of the 1250KVA Transformer (-TA30) is to be done, follow that procedure.

4.1.2 DC bus (DC1)

 The DC bus in the Converter Container may be supplied both from the DC interconnection from the Fuel Cell Container and the grid connection.

If work is to be done inside the Converter Container, the DC bus must be fully de-energized.

4.1.3 AC Power Supply (BP2)

AC is supplied from the Fuel Cell Container to the Control Cabinet (+UC31) in the Converter Container. It can be shut-off locally or externally (locally – refer to section 4.2.1)

 UPS batteries supply energy to the Control cabinet. – refer to section 4.2.5.

Externally to Power Converter Container:

1. Locate +UC50 in the Fuel Cell Container
2. Open door with Double-bit key no. 5 cabinet key
3. Open switch disconnector -FC05
4. Lock-out-tag-out with padlock and sign

 RESIDUAL POWER – In converters - Wait at least 5 minutes

5. Verify absence of voltage with applicable Voltmeter

4.2 Internals

4.2.1 AC Power Supply (-QB01)

AC is supplied from the Fuel Cell Container to the Control Cabinet in the Power Converter Container. It can be shut-off locally or externally (Externally - refer to section 4.1.3).

Locally:

1. Access the Control Cabinet (+UC31) on the Converter Container by opening the door on the backside of the container (Key needed).
2. Open the control cabinet (+UC31) with a Double-bit key no. 5 cabinet key.
3. Turn off the fused switch disconnector (-QB01) in the cabinet (+UC31)

 The power-supply remains active upstream from -QB01. If work is to be done upstream, follow the procedure in section 4.1.3.

 RESIDUAL POWER – In converters - Wait at least 5 minutes before proceeding

4. Verify absence of voltage with applicable voltmeter

 When disconnecting the Auxiliary Power supply, the UPS may engage.

4.2.2 Grid connection (-FC30)

Actuating/ Lock-out-tag-out is performed as defined by the manual for ABB SACE Emax 2.

 – Live parts may be present

Description of Disconnection of the Customer-end of the connected cable(s) is provided by customer

4.2.3 Transformer

Voltage to the Transformer is removed by the safety-system, when opening a door.

Make sure that the grid connection, described in section 4.2.2, is disconnected.

4.2.4 Capacitors

Voltage to the capacitors is removed by the safety system, when opening a door.

Make sure that the grid connection, described in section 4.2.2, is disconnected.

 RESIDUAL POWER – In capacitors - Wait at least 5 minutes

4.2.5 UPS

The UPS(s) is located in +UC31 which is accessed by opening the container doors that face away the Fuel Cell Container.

Power source:

1. Locate and turn off applicable fuse in +UC31
2. Lock-out-tag-out applicable fuse with ABB SA1, padlock and sign
3. Verify absence of voltage on UPS interface with applicable voltmeter

 Energy in UPS batteries remain present

Outgoing power of UPS:

4. Stop machine through HMI/ModBus
5. Locate the container doors that face away from the Fuel Cell Container.
6. Open the door with applicable key
7. Access the UPS that is located inside +UC41
8. Ensure no power is drawn from UPS
9. Remove the 2x spade-fuses on applicable UPS unit(s)
10. Tag-out
11. Verify absence of voltage with applicable voltmeter

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

5.0 HT Cooling Platform

5.1.1 Control cabinet (+UC30)

The power supply of the HT Cooling Platform can be shut off locally on the Control Cabinet, or in +UC50 inside the Fuel Cell Container.

A 24VDC UPS is in the cabinet.

Converters: DCDC for the UPS and Frequency converters for the pumps.

Foreign control signals.

Locally:

1. Turn off switch disconnector on the cabinet (-QB01)

 RESIDUAL POWER – In converters - Wait at least 5 minutes

2. Verify absence of voltage with applicable voltmeter

 The power-supply remains active upstream from -QB01. If work is to be done upstream, follow the procedure below.

Externally to HT Cooling Platform:

1. Locate +UC50 in the Fuel Cell Container
2. Open +UC50 with a Double-bit key no. 5 cabinet key.
3. Open switch disconnector -FC04
4. Lock-out-tag-out with padlock and sign

 RESIDUAL POWER – In converters - Wait at least 5 minutes

5. Access the Control Cabinet (+UC30) on the HT Cooling Platform with a Double-bit key no. 5 cabinet key.
6. Verify absence of voltage with applicable voltmeter

5.1.2 UPS

The UPS is in the Control Cabinet.

Using MCCB:

1. Locate applicable fuse (MCCB) in +UC30
2. Open the fuse
3. Lock-out-tag-out fuse with ABB SA1, padlock and sign
4. Verify absence of voltage on UPS interface with applicable voltmeter

 Energy in UPS batteries remain present

Using fuses on UPS:

1. Ensure no power is drawn from UPS by opening applicable fuses
2. Remove the 2x spade-fuses on UPS unit

 Energy in UPS batteries remain present

3. Tag-out with sign
4. Verify absence of voltage with applicable voltmeter

Re-connect

1. Ensure that work is finished, and that the cabinet is clean
2. Open the applicable fuses to ensure no energy-draw from the UPS when reconnecting the spade connectors
3. Reconnect spade connectors or turn on fuse
4. Close the earlier opened fuses

5.1.3 HT Coolant pump

1. Locate and turn off the applicable fuse in the Control cabinet (+UC30)
2. Lock-out-tag-out fuse with ABB SA1, padlock and sign

 RESIDUAL POWER – In Frequency Converter - Wait at least 5 minutes

3. Verify absence of voltage with applicable voltmeter

Re-connect

1. Ensure that work is finished, and that area is clean
2. Close fuse

5.1.4 Cooling fan / VFD

This section applies to the cooling fans -GQ11…16, -GQ21…16, and -QG31, as well as their applicable Variable Frequency Drive (VFD)

 Foreign control signals

1. Locate and turn off the applicable fuse in the Control cabinet (+UC30)

 RESIDUAL POWER – In Frequency Converter - Wait at least 5 minutes

2. Lock-out-tag-out fuse with ABB SA1, padlock and sign
3. Turn lock-function of plug on the fan and remove by pulling

Re-connect

1. Ensure that work is finished, and that area is clean
2. Reconnect any disconnected plugs on fan
3. Close fuse

5.1.5 VFD Cabinet chiller

1. Locate and turn off -FC40 in the Control cabinet (+UC30)
2. Lock-out-tag-out fuse with ABB SA1, padlock and sign

Re-connect

1. Ensure that work is finished, and that area is clean
2. Close fuse

This Document is valid only at time of Printing.

200kW Marine Fuel Cell Integration Manual

1. Disclaimer

NOTE: READ THIS BEFORE ATTEMPTING ANY PROCEDURE DESCRIBED IN THIS MANUAL

This manual includes certain safety guidelines and recommendations. However, this manual is not intended to cover all situations.

This manual attempt to specify the requirements for most applications, but for applications which may require operation outside of the stated specifications, please contact Ballard Power Systems Europe.

The integrator is responsible for being aware of, and complying with, all applicable laws and regulations.

The integrator is responsible for determining the suitability of the FCwave™ for the particular application and ensuring the safe operation, maintenance, and storage of the device and any systems into which it is integrated.

Ballard Power Systems Europe, Inc. ("Ballard") cannot be responsible for the use of the device in ways, or as part of systems, that deviate from the intended use according to this manual.

Ballard has limited its liability for damages incurred by the customer or its personnel in the contract documents pursuant to which the device is provided to the customer. Please refer to those documents for additional information.

Procedures described in any part of the manual can only be attempted once the customer has read this entire manual.

There are inherent risks in the operation of a fuel cell module that can result in death or bodily injury or loss or damage to property.

- It is necessary for the customer to take all prudent safety precautions in the installation, use, and maintenance of this device.
- Persons who install, operate, and service the device are required to be technically qualified and experienced in working with electrical equipment, hot and/or pressurized fluids, and hydrogen.

Ballard relies on customers to use their own knowledge and experience when installing, operating, and servicing the device.

Ballard also relies on the people using this manual to be familiar with common terms and abbreviations used in the manual. See abbreviation list.

Ballard reserves the right to make updates or other changes to this manual and/or to the products described in this manual, at any time without notice.

Updates and other changes to the manual may be posted on the Ballard website and may be accessed through the customer portal.

6. General Information

6.1. Scope of Manual

This Integration Manual provides the necessary system requirements for integrating and operating the FCwave™ 200 kW Marine Fuel Cell Module (hereafter referred to as the "module").

It covers topics such as

Expected product performance,
Required system inputs/outputs,
Mechanical/electrical interfaces and control details.

7. FCwave™ Fuel Cell Module Datasheet

Too see the latest revision of the electrical datasheet (CMS006), go to Customer Portal, or contact Ballard Power Systems Europe.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

7.1. Fuel cell module

The major components and features of the module sub-systems are listed below:

- Liquid cooled PEM (Proton Exchange Membrane) fuel cell stacks.
- Built-in control system, control power supplies and control power distribution.
- Independent Safety Controller with separate power supply and safety instrumentation.
- Sensors for voltage, current, pressure and temperature measurements.
- Safety devices, including ventilation system (fans and ventilation exhaust line), fuel pressure relief device, fire detection and hydrogen sensors.
- High voltage contactors for electrically isolating the fuel cell stack from the high voltage output terminals.
- High voltage system pre-charging and reverse current protection during start-up.

Hydrogen (Anode) Sub-system

- Complete hydrogen subsystem, which delivers and conditions the fuel supply to the fuel cell stacks.
- Valve block with integrated hydrogen shutoff, pressure regulation and safety pressure relief device.
- Hydrogen recirculation with purge.

Air (Cathode) Sub-system

- Air compressors and inverter assemblies for supplying process air to the fuel cell module.
- Air mass flow sensor for air flow rate measurement and control.
- Intercooler and humidifier for conditioning the incoming air stream.

Coolant Sub-system

- Internal high-temperature coolant loop, with coolant pump and controller assembly for supplying coolant to the fuel cell stacks.
- Liquid to liquid stainless-steel heat exchanger between internal high-temperature coolant loop and customer coolant loop, able to handle a wide range of coolant media (fresh water, water-glycol mix).
- Electronically actuated control valves used for stack coolant inlet temperature control.
- Separate low-temperature coolant loop to cool motors and motor controllers.

8. Safety

8.1. Hazard Symbols

WARNING *in this manual indicates actions that may result in an accident, which could cause immediate bodily injury or loss of life or could cause damage to equipment or other property.*

CAUTION *in this manual indicates actions that may result in an accident, which could cause damage to equipment or other property, and which could cause bodily injury if not promptly detected and remedied.*

ELECTRICAL HAZARD*- Obey ALL warnings, cautions, and safety instruction related to electricity. Failure to do so may result in electrical shock leading to personal injury or death.*

8.2. General Safety

The modules are to be installed in a dedicated fuel cell installation room.

The system integrator is responsible for providing means to lockout energy sources on the system prior to any service activity being performed, and a written procedure to Ballard service personnel detailing the equipment and steps required to sufficiently lock out all necessary energy sources.

- Keep module doors and electrical enclosures closed when the system is operating.
- The module and its auxiliary systems are intended to be serviced only by personnel technically qualified and experienced in handling electrical equipment and compressed/flammable gases
- Remove jewelry, watches, rings, and metal objects on clothing that can potentially cause short circuits when working on the fuel cell module.

8.3. High Temperature Safety

Integrator shall ensure that process exhaust piping is leak tight and touch proof.

- Surfaces on coolant interfaces and the process exhaust can reach up to 80 °C during normal operation.
- Components within the fuel cell module can reach temperatures up to 120 °C during normal operation.

8.4. High-Pressure Safety

The module uses pressurized gases which can be hazardous.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

- Use caution and ensure circuits are de-pressurized before opening any lines or fittings.
- Some sub-systems may remain pressurized even when the fuel cell module is powered off.

8.5. High Voltage Safety

Ballard recommends that the electrical integration of the fuel cell module must be designed under the supervision of a qualified professional electrical engineer.

It is the integrator's responsibility to design the integration of the fuel cell module such that the integration complies with all applicable legislation and requirements.

After shutdown, high voltages may remain on the fuel cell stacks for a duration of time. No maintenance activities are to be performed during this time as the stacks present a shock hazard. Also, residual reactants (oxygen and hydrogen) within the fuel cell module can cause the fuel cell output voltage to rise unexpectedly.

Allow the fuel cell voltage to drop to below 30 VDC prior to servicing the fuel cell module. Certain circumstances can lead to voltage persisting on the fuel cell stack indefinitely.

Always check for residual voltage before any service activity.

Operate the fuel cell module high voltage as a "floating electrical system". Ensure that neither the fuel cell high voltage positive terminal nor the fuel cell high voltage negative terminal is connected to the application ground, earth or chassis.

Before working on the fuel cell module and its auxiliary systems in a floating DC system, it's important to make sure the system is de-energized. This involves checking for near-zero volts in three key areas: between the fuel cell's high voltage positive and negative terminals, between the high voltage positive terminal and the chassis, and between the high voltage negative terminal and the chassis.

Measurements are to be made on both AC volts and DC volts scales.

The monitoring of the isolation resistance of the overall high voltage system shall be done with a device capable of detecting both single and double pole isolation failures.

The system integrator is responsible for ensuring that a suitable ground fault monitoring system is installed and functioning during operation of the fuel cell power system. If the level of electrical isolation is ever deemed unsafe according to regulatory standards, the integrator must provide means for the fuel cell power system to be shut down in case of a ground fault.

Select fuel cell module power output cables that appropriately suit the application.

Ensure that cable specifications meet voltage, current, environmental temperature limits, chemical and mechanical resistance and flexure requirements of the application.

Avoid hazardous and unsafe situations that could result from conditions such as, but not limited to, the following:

Improper grounding
Handling electrical leads or devices with wet hands or on wet ground
Frayed electrical leads

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Incorrect or improper connection of the terminal leads
Short circuits
Back-feed from energized normal and emergency power sources

8.6. High Voltage Isolation Failures

Under normal circumstances both high voltage output terminals (positive and negative) are isolated from the fuel cell module enclosure and low voltage system.

If isolation is lost on one high voltage pole, a person working on the module could sustain a fatal current flow by touching the other high voltage pole and ground.

If two simultaneous faults occur and isolation is lost on both high voltage poles, a high voltage short circuit can occur resulting in extremely high currents. High currents can generate a large amount of heat which will subsequently damage electrical and fuel cell systems and cause bodily harm.

It is the responsibility of the system integrator to ensure that the electrical isolation between the high voltage and low voltage systems (Ground) is accurately and continuously measured and that appropriate action is taken before a hazardous condition develops.

Normal System

Under normal operation, the fuel cell system will operate as shown in Figure 1 where both high voltage poles are isolated from ground.

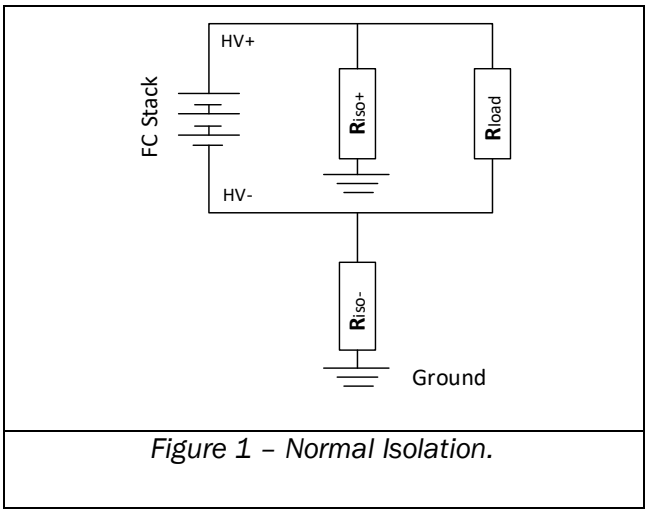

Figure 1 – Normal Isolation.

Single Pole Isolation Failure

In a single pole isolation failure, one point on the high voltage circuit is no longer isolated from ground as shown in Figure 2. An isolation resistance measurement or ground fault detection system can typically detect this failure if utilized. A single pole isolation failure will not cause a short-circuit, nor will

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

it prevent fuel cell operation, however, it significantly increases the risk of electrical shock for personnel working on or around the fuel cell system.

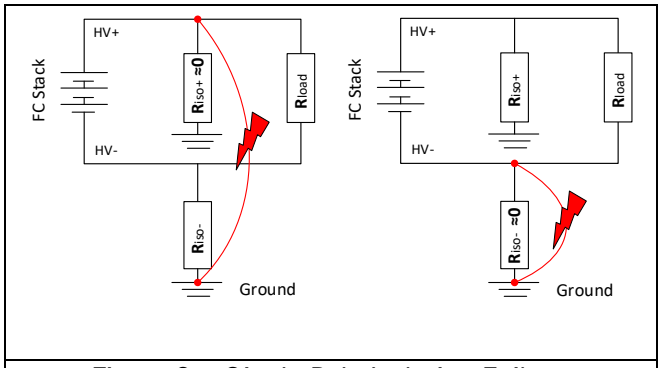

Figure 2 – Single Pole Isolation Failure.

Double Pole Isolation Failure

A double pole isolation failure, where the high voltage system is no longer isolated from ground in two different locations, may result in a high voltage short-circuit as shown in Figure 3. An isolation resistance measurement or ground fault detection system can typically detect this failure if utilized.

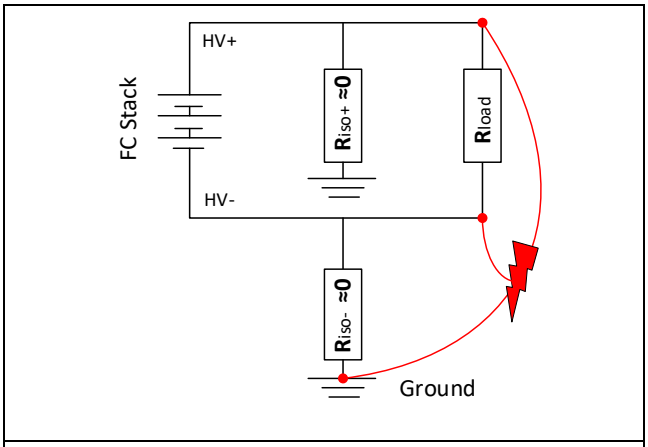

Figure 3 – Double Pole Isolation Failure.

If an isolation failure is detected and found to be located in the module, do not operate the fuel cell module until the root cause is determined and remedied.

Distributed Capacitance and Effects on HV Safety

The Distributed capacitance is the total amount of capacitance that exists between each pole of an isolated high voltage system and the chassis (fuel cell enclosure). This capacitance is a concern as it can hold charge which can be discharged into a person that simultaneously touches the high voltage system and chassis.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

In normal operation, this is not an issue as all high voltage conductors are covered and insulated but could be a concern if a system is being serviced.

HV safety due to residual reactants

Within the module, the fuel cell stack will also maintain voltage if hydrogen and air are present within the system. Voltage could also be generated when a fuel or air source is introduced, and reactants are moved to an active point in the fuel cell stack. This voltage will normally bleed down to safe levels within minutes, but this should always be verified using the RDU interface first, and then testing with digital multi-meter prior to accessing the module.

Confirm that the voltage is zero

Between pole to pole (positive to negative)
Between each pole to chassis before service.

Built in service procedures involve running the air compressors and hydrogen recirculation blower to inert the fuel cell prior to servicing the system Is necessary.

Refer to section “31.2 State: Prepare for Service” for pre-maintenance procedures. Untrained service personnel should not perform maintenance procedures on fuel cell modules.

One other effect of the distributed capacitance will be a delay in the ground fault detection system measurement.

8.7. Hydrogen Safety

⚠WARNING

Install and handle the hydrogen in accordance with applicable regulations and the gas supplier’s recommendations.

- Hydrogen is a colorless, odorless, and highly flammable gas so there will be no warning signals before unconsciousness results.
- Hydrogen is lighter than air and will escape upwards. This also allows it to diffuse through many materials considered airtight.
- Hydrogen is non-toxic, but it can cause asphyxiation by displacing the oxygen in the air, so do not operate the module in enclosed or non-ventilated areas.

Furthermore, hydrogen’s small molecular size results in high buoyancy and diffusivity, so any leaked hydrogen will be diluted readily by the surrounding air.

Present potential leakage or permeation sites

- Fuel lines,
- Non-welded connections,
- Non-metal seals such as gaskets, O-rings,
- Pipe thread compounds and packings

Hydrogen leaks which develop within the fuel cell module will be detected by a hydrogen sensor located inside the fuel cell module hydrogen enclosure ventilation duct. Detection of a high hydrogen concentration will trigger an alarm causing the closing of the fuel cell module hydrogen supply valve

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

(integrator's scope) before an unsafe condition can exist. For more information see section "14.5 Module H2 Supply Valve and H2_ENABLE"

It is possible for a hydrogen sensor to degrade to the point where it will no longer trigger an alarm if the hydrogen content exceeds safety limits. For this reason, the H2 sensor is part of the maintenance plan.

Exposure to Volatile Organic Compounds (VOC's) is known to cause hydrogen sensor degradation, care should be taken to avoid exposure whenever possible. High levels of VOCs are often encountered during vessel painting and solvent degreasing; therefore, it is recommended that the module or hydrogen sensors to be removed during these processes. Efforts have been made to isolate the sensor from contamination; however, degradation can still occur.

Some failure modes can result in hydrogen gas being present in the cooling system header tank. The risk can be mitigated by following the design considerations, maintenance procedures and filling instructions specified in Section 18.8.

The hydrogen supply to the module will remain pressurized when the module is shut down. Verify that there is no pressure in this line prior to disconnecting the hydrogen supply.

The hydrogen lines inside the module may contain hydrogen, even after the module has been removed from the system. Safely vent the remaining hydrogen pressure prior to removing the fuel cell module.

The responsibility for leak detection external of the fuel cell module rests with the system integrator.

It is strongly recommended that the integrator implement hydrogen detection in any enclosure where the fuel cell module is installed, including the fuel cell room, or similar enclosed space. Interlock the hydrogen detection system with a hydrogen supply valve installed directly upstream of the fuel cell module.

If an excessive hydrogen leak is detected, cease operation of the FCM and do not restart the FCM until safe operation conditions are reestablished.

⚠WARNING **The module hydrogen sensor may degrade if exposed to various contaminants and become less sensitive when degraded. Scheduled checks, as per the module service schedule, ensure that the sensors have sufficient sensitivity for safe operation. Failure to perform scheduled hydrogen sensor checks can result in unsafe operation of the module, as the module may not shut down in the presence of ventilation outlet emissions if the hydrogen sensor is severely degraded.**

8.8. Chemical Hazards

The fuel cell HT coolant loop contains ethylene glycol.

Ethylene glycol is toxic if ingested or if its vapors are inhaled.

All personnel handling ethylene glycol or working on the fuel cell stack HT coolant loop are required to adhere to the precautionary measures identified in the Safety Data Sheet of the specific coolant being used.

Such precautionary measures include Personal Protective Equipment (PPE), for instance wearing safety glasses and chemically protective gloves.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Dispose ethylene glycol in accordance with applicable local regulations.

8.9. Acoustical Noise

The acoustical noise of the FCwave™ during standby has an A-weighted equivalent Sound Pressure Level (SPL) of 69 dB(A) $L_{Aeq,2min}$ 1 meter from module front. During normal operation (steady at 200kW) the A-weighted equivalent SPL is 88 dB(A) $L_{Aeq,2min}$ at the same location. During ramping up, the maximum noise level reaches 92 dB(A) $L_{Aeq,1sec}$ (1m from module front).

To reduce the likelihood of hearing impairment, all personnel are advised to wear hearing protection devices entering the fuel cell engine room while FCwave(s) are operational.

8.10. FCwave™ hazard mitigation approach

The potential hazards related to the FCwave, posing the highest risks are:

- Unacceptable hydrogen concentrations (in the ventilation or process air exhaust) leading to fuel-fed combustion.
- Electrical short-circuits and possible shock hazards caused by reduced electrical isolation of the high voltage system.

The control system is coupled with sensors (Such as Pressure, temperature, H2 concentration et.al.) intended to identify conditions (which can lead to a hazardous situation) and shut down the operation of the FCwave™ and related functions, before an unsafe condition develops. The safety control functions are managed in a dedicated controller unit.

9. FCwave™ Performance

The performance and lifetime of the FCwave™ module is, among others, depending on good quality reactants (fuel = hydrogen, oxidant = air). Make sure the quality of the reactants meets or exceeds requirements outlined in this document.

The FCwave™ can be configured in either Single or Dual Output modes. The preferred configuration has to be planned before commissioning.

Table 3 shows the module output to the DC/DC or DC/AC converter (in general connected to a DC/DC).

Template 210818-1 Rev. A

Power	Configuration	Voltage	Current
50 – 200kW	Dual Output	350 – 720 VDC	(2x) 50 - 300A
50 – 195kW	Single Output	350 – 720 VDC	(1x) 100 - 550A

Table 3 – Module power, voltage, and current limits

Figure 4, Figure 5, Figure 6 and Figure 7 show the expected performance envelope of the FCwave™ module. The net power output represents the output to the module DC/DC converter and accounts for the power generated by the fuel cell stacks and the power draw of the BOP components. The net power output is the total power available to the vessel.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

9.1. System Output Voltage and Current

The voltage from the module is dependent on the load drawn from the system, the correlation between power and voltage is shown in Figure 4. Output current in relation to system output power is shown in Figure 5.

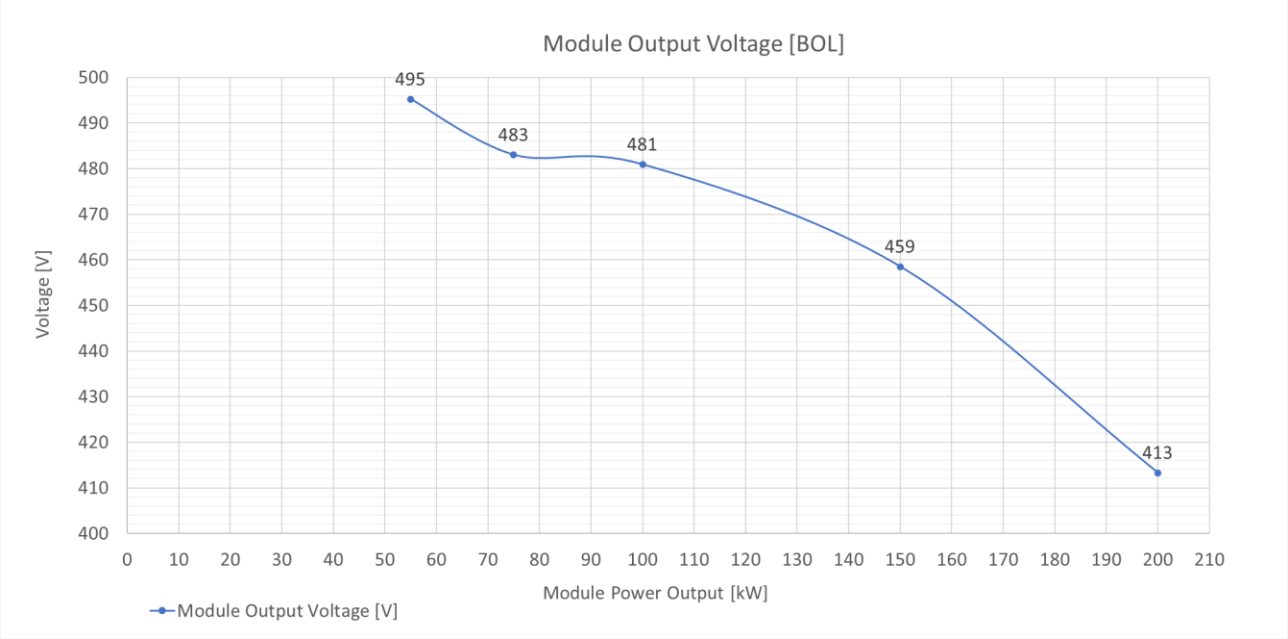

Figure 4 – Module output Voltage at Beginning of Life.

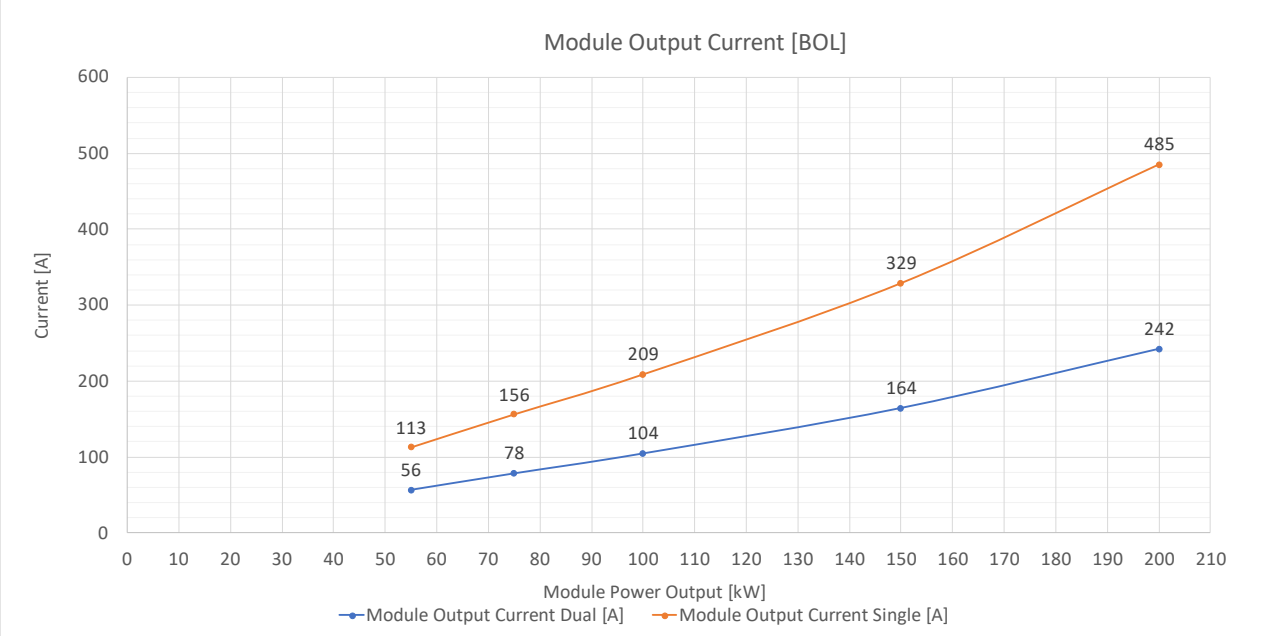

Figure 5 – Module Output Current at BOL.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

9.2. System Efficiency

The module electrical net efficiency in Figure 6 is defined as the fraction of electrical energy produced.

The lower heating value of hydrogen used for the calculation is 119,91 MJ/kg (ISO 6976:1995).

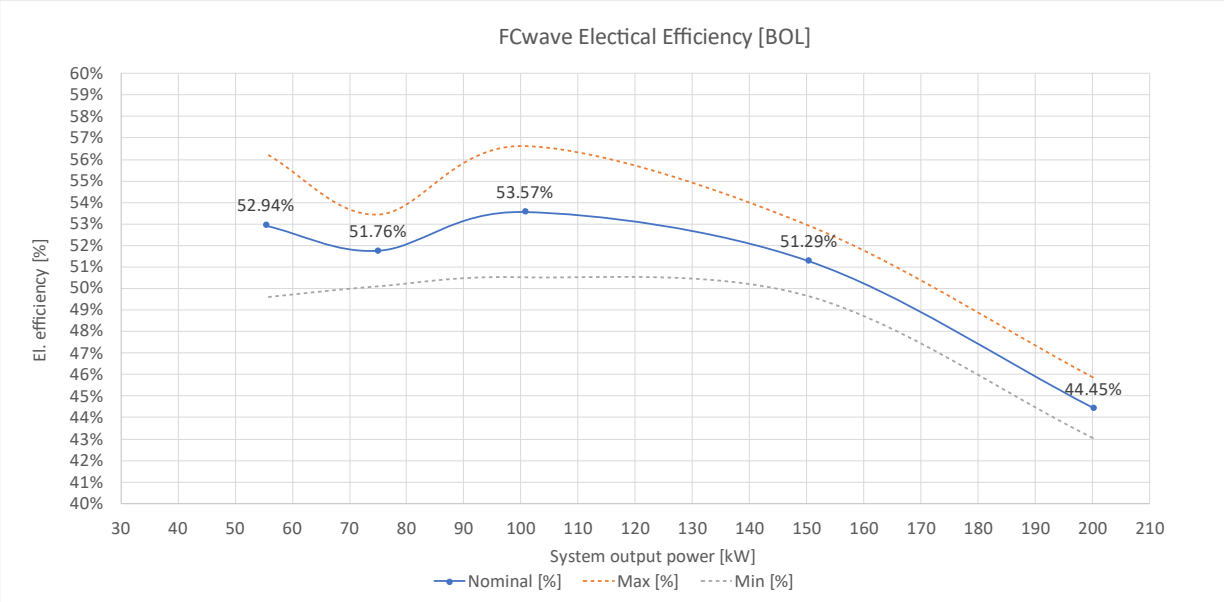

Figure 6 – Module Net Efficiency BOL.
(Test done according to IEC62282-3-200:2016 using 95 confidence interval)

9.3. System Hydrogen mass flow

The hydrogen consumed by the module at different load points are shown in Figure 7 – Hydrogen mass flow.

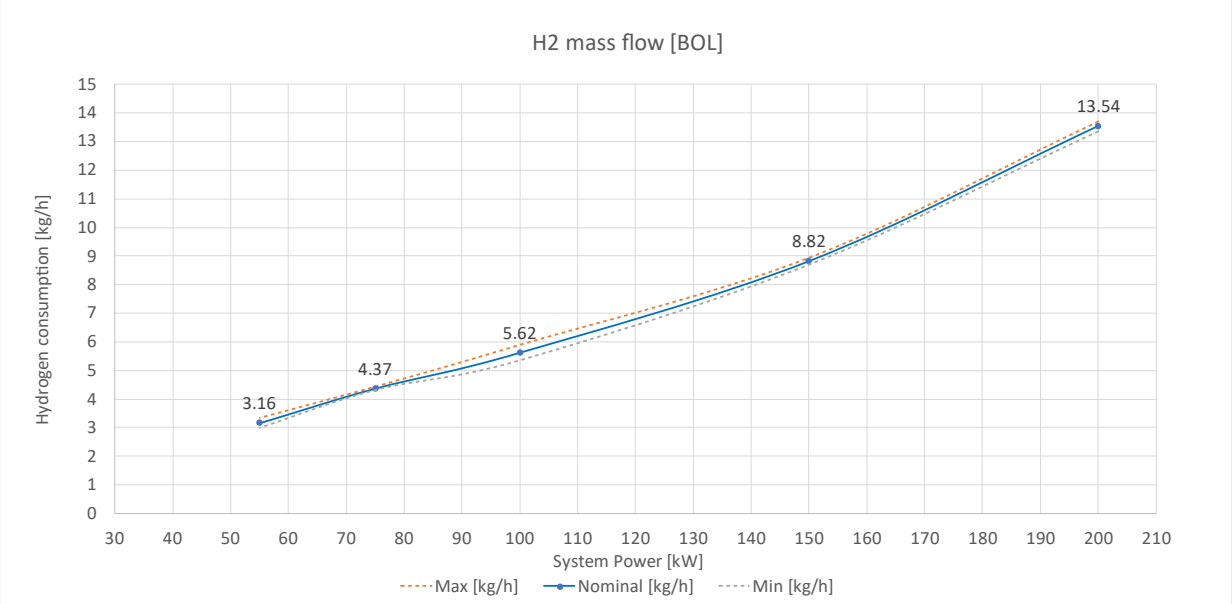

Figure 7 – Hydrogen mass flow BOL.
(Test done according to IEC62282-3-200:2016 using 95 confidence interval)

10. Mechanical Integration

Measurements and figures in this section are for reference only and should not be used for design purposes. Ballard can supply 3D models and integration drawings upon request.

10.1. Reference Drawings

For a list of the mechanical reference drawings contained in the **7001000-01**, refer to Table 4 – Mechanical Reference Drawings.

Mechanical Reference Drawings	
Drawing Number	Drawing Title
7001000-01, Sheet 1	General Arrangement Plan
7001000-01, Sheet 2	Interface Panel Connection Locations
7001000-01, Sheet 3	Process Exhaust and H2E Ventilation Locations

Table 4 – Mechanical Reference Drawings contained in 7001000-01.

10.2. Module Installation

This section describes the major physical properties of the FCwave™ fuel cell module.

Modules require front access, refer to section 10.4 “Space Claim for Service Access”. Modules do not require side or rear access and can be placed side by side, back-to-back or a combination thereof.

Refer to the isometric view of the module in Figure 8, below.

Unauthorized copying, distribution or use of this manual is strictly prohibited.

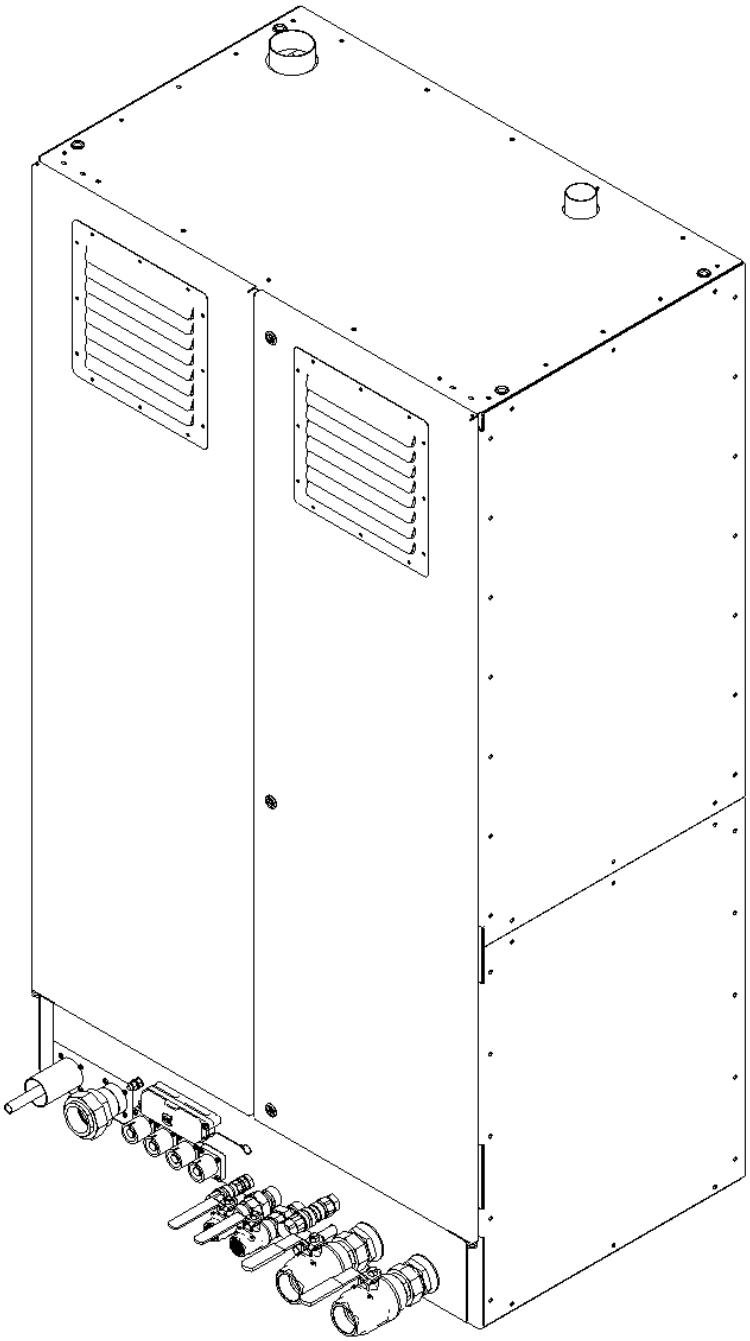

Figure 8 – Isometric view of FCwave™ module.

Template 210818-1 Rev. A

10.3. False Floor

The module is designed to be installed in a Fuel Cell Installation Room, with a false floor.

As shown in Figure 9 and Figure 10, the module is designed to mount on a solid floor, with the false floor installed 200mm above (the false floor is not included, it is responsibility of the integrator). The

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

200mm space is used to connect process and electrical connections to the module. The false floor will serve as protection for these connections.

The false floor panels should be removable for service access.

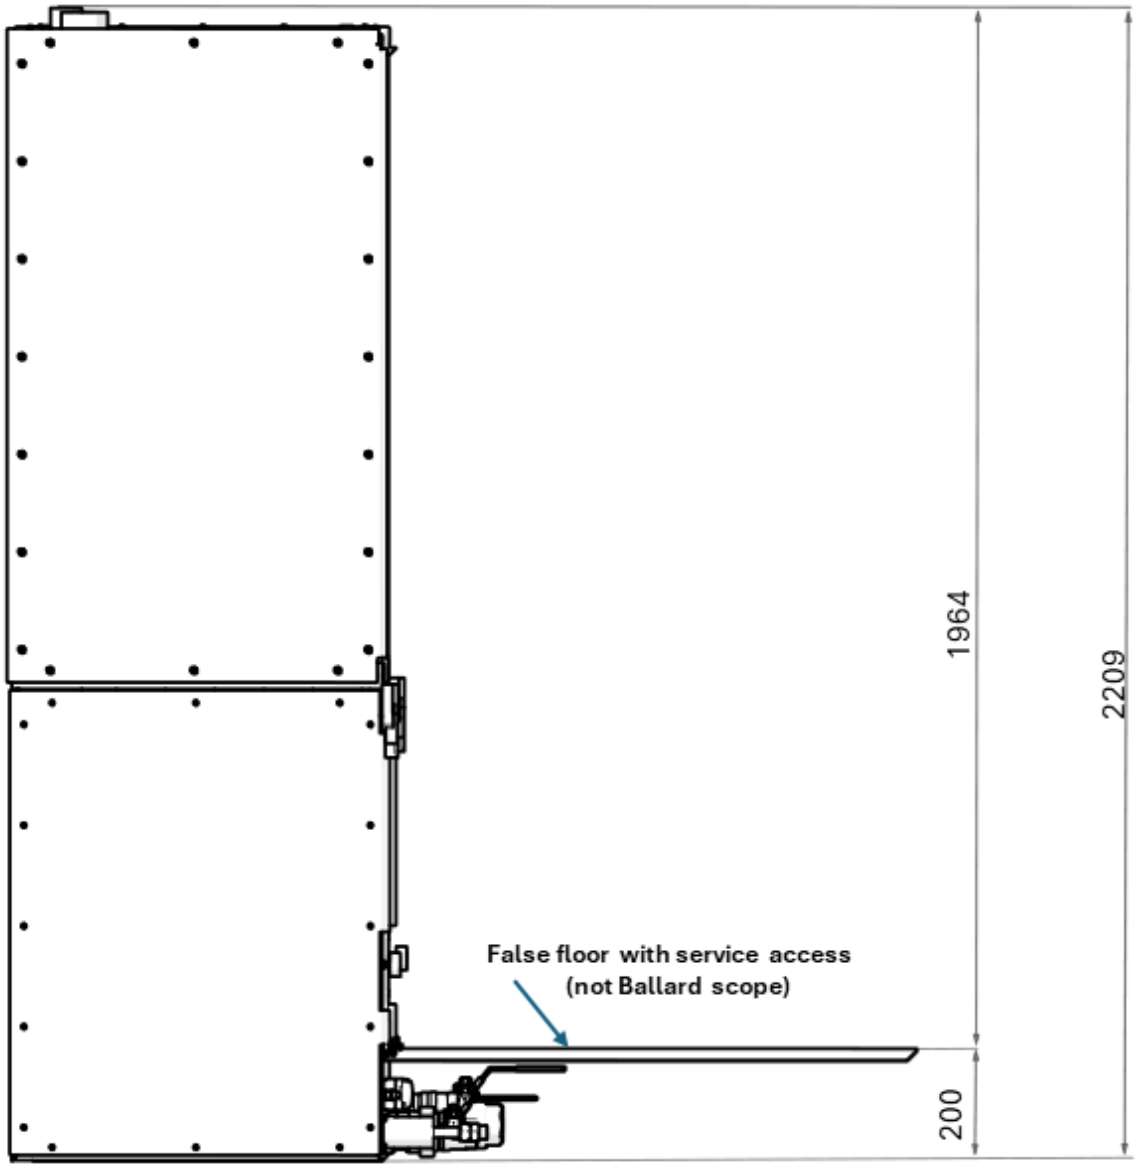

Figure 9 – Module Side View, showing details of False Floor with service access.

The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

10.4. Space Claim for Service Access

The space in front of the module shall be available for service activities. See Table 5 and Figure 11.

Cabinet doors can be wide-opened to 120°. If necessary, demount the cabinet doors for additional service access during maintenance procedures.

The false floor must be designed to carry the weight during service and component replacements, see Table 5.

Specification	
Width	1500 mm
Depth	1100 mm
Height	2300 mm
False floor load capacity	>845 kg

Table 5 – Space Claim for Service Access

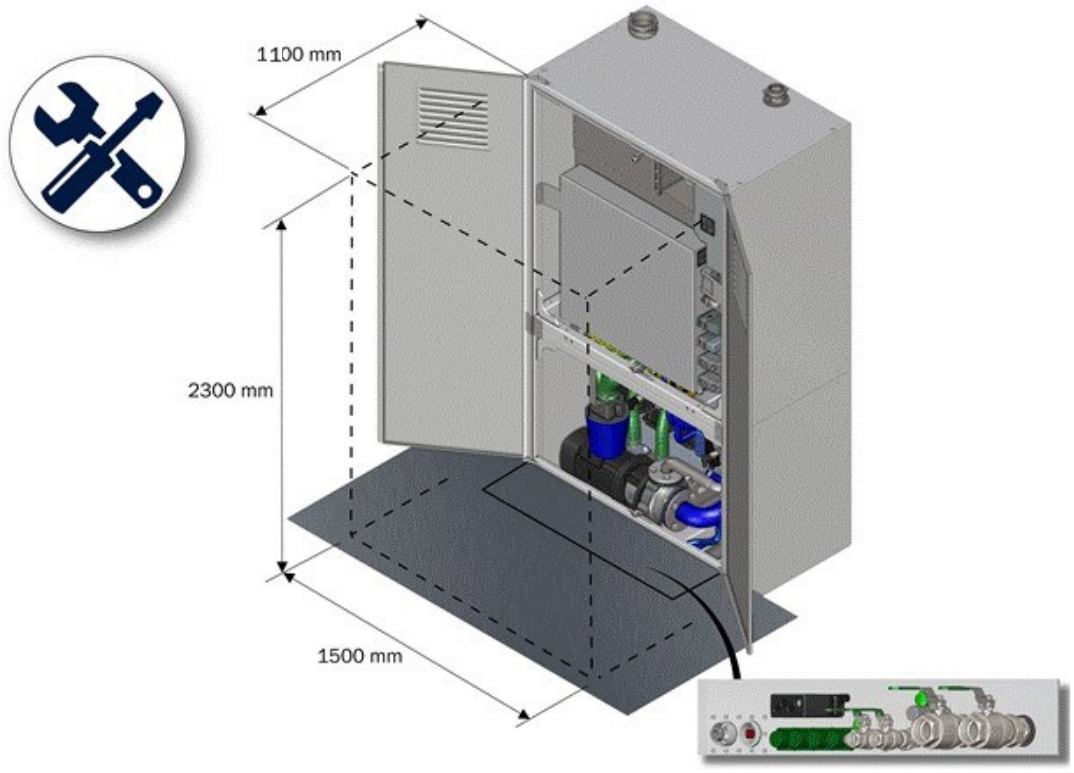

Figure 11 – Space Claim for service access to module.

Template 210818-1 Rev. A

10.5. Mounting points and Center of Gravity

Please refer to Ballard document 7001000-01. This document specifies mounting points and center of gravity for a complete FCwave™ module.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

10.6. Module Lifting

When lifting the FCwave™ module during shipping and installation, only use a suitable lifting beam, or equipment design to connect to all four lifting points on the top. Lifting beam and eyebolts are not provided by Ballard.

WARNING **Local regulation for lifting and handling the equipment have to be followed, failure to follow guidelines can cause lifting accident, which leads to personnel injury and damage to equipment.**

Figure 12 – FCwave™ cabinet with lifting beam and eyebolts.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

10.7. Module Split Cabinet

The FCwave™ module can be split in two halves (top and bottom). This separation in halves eases the installation of the module in the Fuel Cell Room (if necessary) and also makes a “top swap” of the Fuel Cell section possible, see Figure 13. This procedure is only to be undertaken by Ballard personnel or people trained by Ballard.

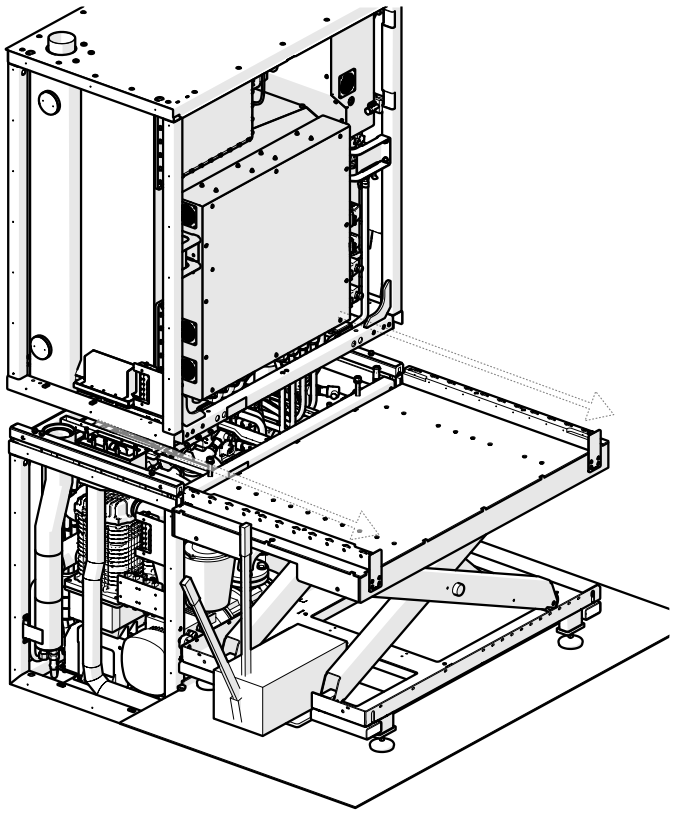

Figure 13 – The module cabinet split into upper and lower sections with lifting cart.

10.8. Lifting on sight

On sight, it is recommended to have a crane in front of the module that can lift the top part of the module and the cart, in case of top module swap. The crane has to be able to go from the module to the exit of the installation room. An example of this crane can be seen in Figure 14.

11. Fuel Cell Installation Room Requirements

For type approved FCwave™ modules it is required that the fuel cell is installed within a Fuel Cell Installation Room, which must fulfill all requirements from the classification society and IMO.

The compartment in which the fuel cell modules are to be installed are termed the “Fuel Cell Installation Room”, and requirements are presented below in the following sections.

11.1. Structural Requirements for the Installation

This section describes the structural requirements for the Fuel Cell Installation Room, where one or more fuel cell modules are installed. The FCwave™ module shall always be installed in a shelter to protect against weather conditions such as but not limited to, heavy rain, direct sun, extreme heat & cold, dust etc.

1. The FCwave™ must be securely fastened at bottom, back and top.
2. The FCwave™ is designed to be accommodated in a Fuel Cell Installation Room with a false floor, with the hydrogen and electrical supply placed below the floor.
3. Requirements for service access in front of the FCwave™ must be followed, see Figure 11.
4. The Fuel Cell Installation Room free volume should not be less than 10m^3.

11.2. Hydrogen connection

The hydrogen supply connection to the module must fulfill the following requirements:

1. A hydrogen supply shutoff valve with a reaction time less than 2 seconds is required to be installed for each module.
2. The hydrogen flow must be restricted by suitable means such that hydrogen mass flowrate shall not exceed 4.9 g/s.
3. The amount of hydrogen in the fuel cell module must be minimized when not in operation. The physical volume of the pipe between hydrogen shutoff valve and module interface plate is not to exceed 5 liters.
4. For maritime installations, it is a requirement that the pipe between the hydrogen shutoff valve and module interface plate is double-walled, with detection measures for the annular space.

11.3. Process exhaust connection

This section describes the options for process exhaust connections from a FCwave™ module in a Fuel Cell Installation Room:

In all cases, the following apply:

1. Process exhaust must be let to the outside.
2. FCwave™ process exhaust can be fully water saturated and with negligible hydrogen (below <2% of the LFL) content.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

3. The process exhaust must have provision for a drain at the lowest point of the connection, as there will be condensation inside the process piping.[1]

11.4. Module Ventilation exhaust connection

Module ventilation exhaust should be led to a safe exterior location free of any spark or ignition source. The integrator must prevent ingress of water droplets or other debris running backwards into the system through the ventilation exhaust.

The material of the exhaust systems shall withstand the environment, and not be of risk of corrosion clogging due to sediments in the exhaust system. Recommended material is EN 1.4301 / AISI 304 or EN 1.4401 / AISI 316 stainless steel. It is important that no debris or lose sediments enter the FCwave™ .

The exhaust and the ventilation is two separate systems, and should not be joined.

The integrator's side of the ventilation exhaust connection should be done of 1.4404/AISI 316L or 1.401/AISI 304 stainless steel, to minimize the amount of corrosion and other particles accumulating in their walls and the possibility of them falling into the FCwave™.

11.5. Installation Room ventilation

The air handling system in the fuel cell installation room must be sufficient to supply the FCwave™ process air (as specified in section 11.1). Addition ventilation of the fuel cell installation room to be determined by Classification Society or Vessel Integrator.

Ballard recommends performing a calculation according to IEC 60079-10 to establish the required ventilation rate for the fuel cell installation room. In normal operation, all probable leakage scenarios internal to the FCwave™ are managed inside the module.

11.6. Drain connections

It is required that integrator implements backflow prevention from module to module and/or from external source to module(s).

11.7. Safety system

The vessel control and safety system must include visual and audible signaling to crew in appropriate locations.

Recommendation is to clearly indicate which FC module is in operation inside the fuel cell room.

The FCwave™ does not provide an emergency stop button, only an input for one. It is the responsibility of the integrator to install adequate and accessible safety stop buttons or similar, as well as ensure the integration of FCwave™ in the emergency stop circuit (Figure 36).

An uninterruptible power supply must provide a 24VDC output with a maximum voltage deviation of ±10% (applicable to both normal and safety supply) for a duration exceeding 10 minutes, as indicated in Table 25.

Template 210818-1 Rev. A

[1] Draining the process exhaust though the FCwave™ module process water drain is not permissible.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

11.8. Fuel Cell Installation Room Access

Access to the fuel cell installation room during operation shall be limited to trained service technicians and personnel that have received Ballard fuel cell training.

Unrestricted access to the fuel cell installation room can be permitted by the vessel authorities when all fuel cell modules are powered off and otherwise deemed permissible.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

12. Process Connections

Process connections for the module are located on the lower part of the front panel, as shown in Figure 15. Annotation references are shown in Table 6.

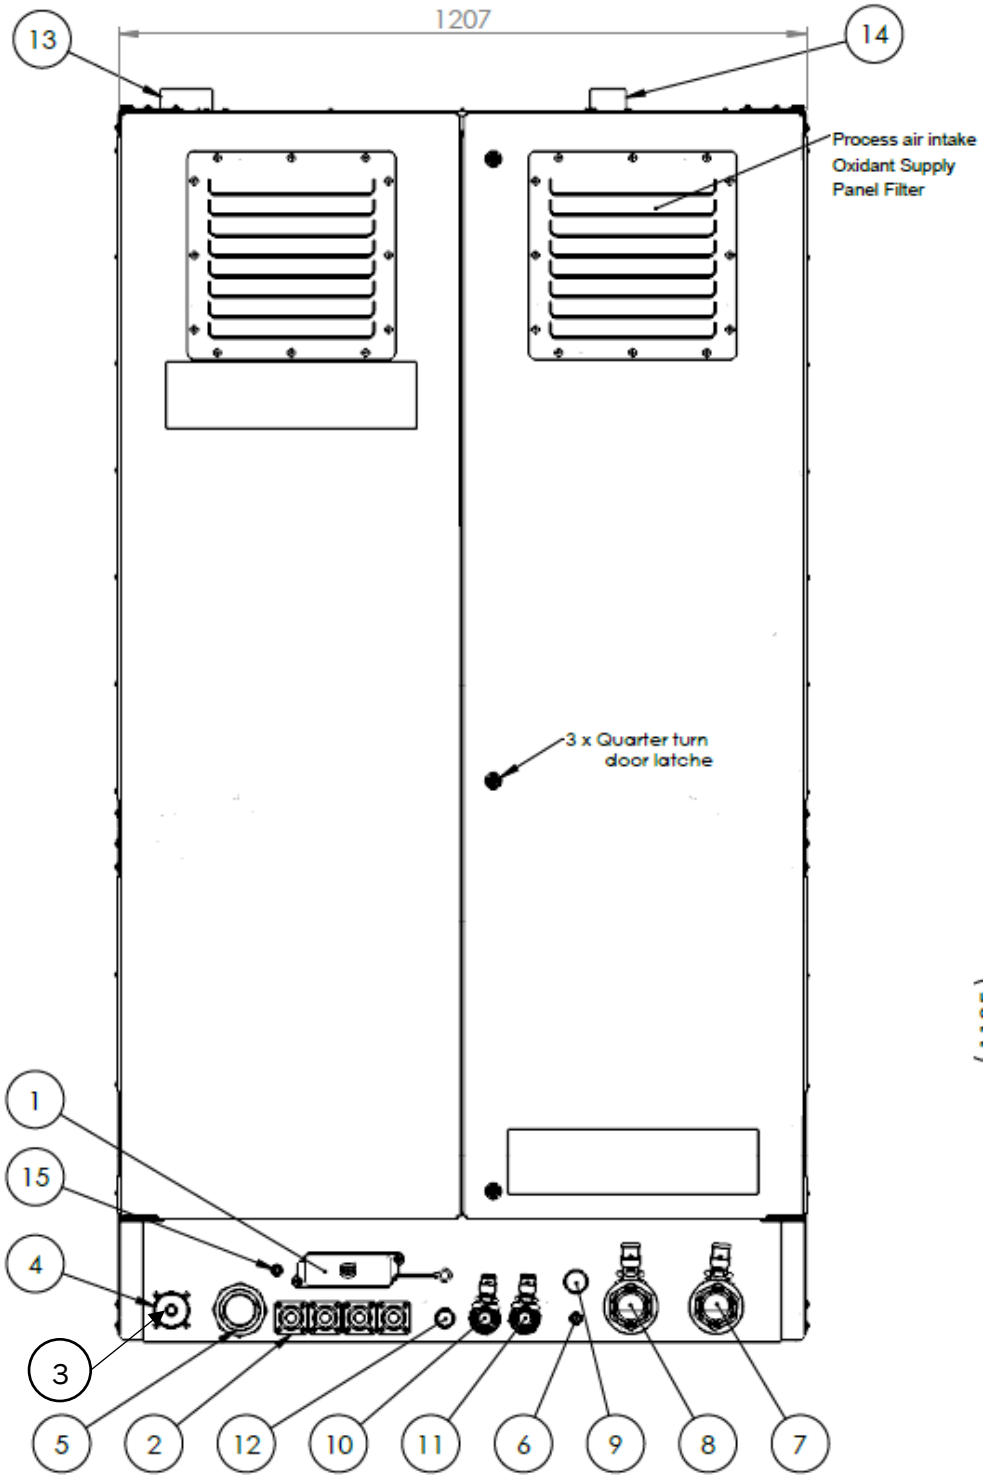

Figure 15 – Detail View of module process connections.

Unauthorized copying, distribution or use of this manual is strictly prohibited.

12.1. Process Air

The installation section describes the intake and exhaust for process air.

Process air intake is through the air filters on the module door panels, as shown on Figure 8. Integrator shall supply conditioned air to the Fuel Cell Installation Room as described in section 16.2 - Process Air Intake Quality.

The module air exhaust should be connected to an outlet with a drain downstream of the process air outlet to capture liquid that will condensate in the pipe.

Note that the pressure-drop presented by the exhaust piping and any installed equipment must be considered. See section 16.4 and 16.5 for more details.

12.2. Ventilation Air

The module is equipped with active ventilation of the hydrogen carrying sections of the module (Hydrogen Enclosure / “H2E”). The air intake for the ventilation is in the cabinet base of the module, incorporating the hydrogen pipe.

The ventilation fans inside the module are only designed to ventilate the module itself. The fans are not designed to ventilate any double-wall piping arrangement outside the module. The annular space around the primary fuel pipe is welded closed at the interface panel

The integration shall ensure the exhaust from FC modules (ventilation air) is led to a safe location free of any spark or ignition source.

The ventilation inlet and outlet must be equipped with automated fire dampers. The dampers must be closed in case of fire, and before releasing a fire extinguishing system.

12.3. Hydrogen Fuel

The gaseous hydrogen fuel process interface connections are a double wall design, detailed in Figure 16:

Primary Barrier:
Ø20 x 1,8 mm
Welded connection
Secondary Barrier:
Ø60,3mm
Welded connection surrounding the primary barrier.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

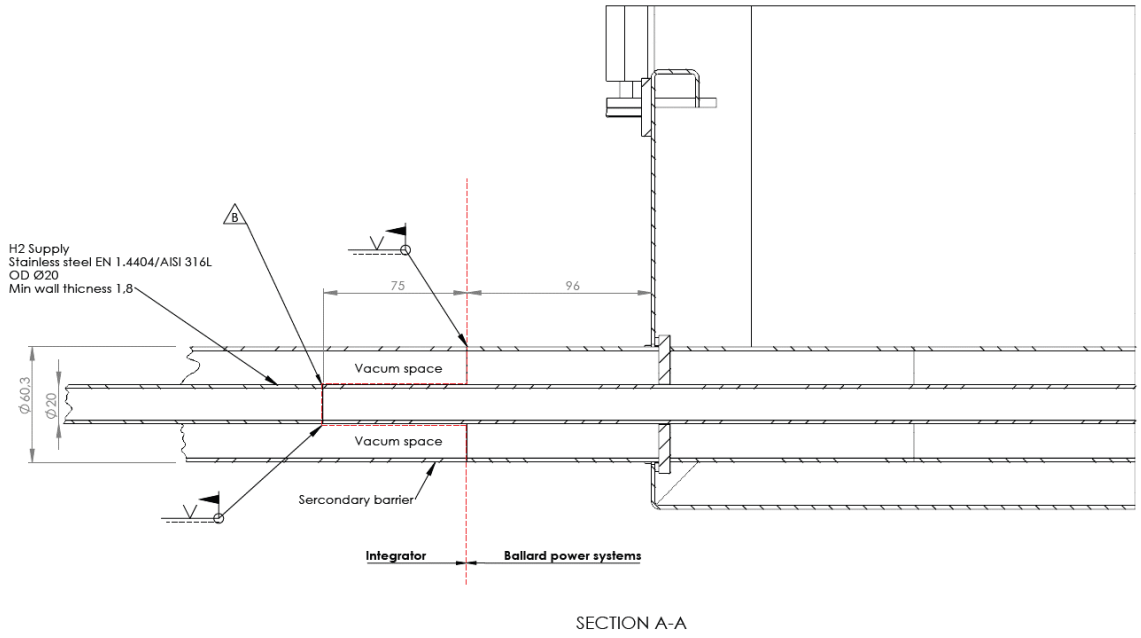

Figure 16 – H2 Supply Connection Detail View.

The space between primary and secondary barrier inside the FC module carries the H2E ventilation air. The space between inner and outer tubes must be ventilated by the integrator in a marine application. For stationary applications no ventilation is needed.

12.4. Welding of Hydrogen pipe

In marine applications, the welding of the double walled pipe has to be performed in accordance with requirements from Classification Societies and Vessel Integrator.

After welding the Hydrogen pipe in on the interface of the FCwave™ system, the welding shall go through a cleaning and pressure test.

Contact Ballard support for details

Cleaning recommendations

When welding of the double walled pipe is completed and approved, cleaning of the hydrogen pipe is required, due to removal of any impurities in the pipe. Cleaning can be performed by blowing with air or Nitrogen.

⚠ CAUTION Contact Ballard service for details regarding this procedure or check the service documentation

Pressure testing recommendations

After cleaning of H2 supply pipe, a pressure test must be carried out.

CAUTION *Contact Ballard service for details regarding this procedure or check the service documentation*

12.5. Coolant

The integrator is to supply module coolant to both the High Temperature and Low Temperature coolant loop inside the module.

High Temperature Coolant Loop:
Transfers the excess heat produced by the reaction inside the fuel cells to the integrator. See section 18 - High temperature Coolant Subsystem.

Low Temperature Coolant Loop:
Transfers the excess heat produced by the liquid cooled balance of plant components inside the module to the integrator. See 19 - Low Temperature Cooling .

12.6. Process Drain

The integrator is to connect a drain to the Process water drain. This drain separates and leads away the liquid water produced in the reaction and not carried away in the process exhaust.

12.7. Electrical connections

Locate the fuel cell module such that there is enough clearance to access:

The Low Voltage Connector, which provides 24V power to the Control and Safety systems alongside hardwired and bus data connections.
High Voltage DC output connectors, which provide the electrical power produced by the system.

13. Environmental Protection

The module is constructed with the ingress protection rating IP44 for the module (excluding connectors) and IP67 for front panel electrical connectors only.

~~Do not use a direct high pressure water spray on the FC module.~~

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

14. Anode Subsystem

This section contains information about the anode (hydrogen) system inside the FCwave™ (Ballard scope) and the upstream hydrogen delivery system (customer scope).

The purpose of the internal hydrogen system is providing hydrogen for the fuel cell stacks. A simplified hydrogen system is shown in Figure 17 – Simplified Hydrogen System.

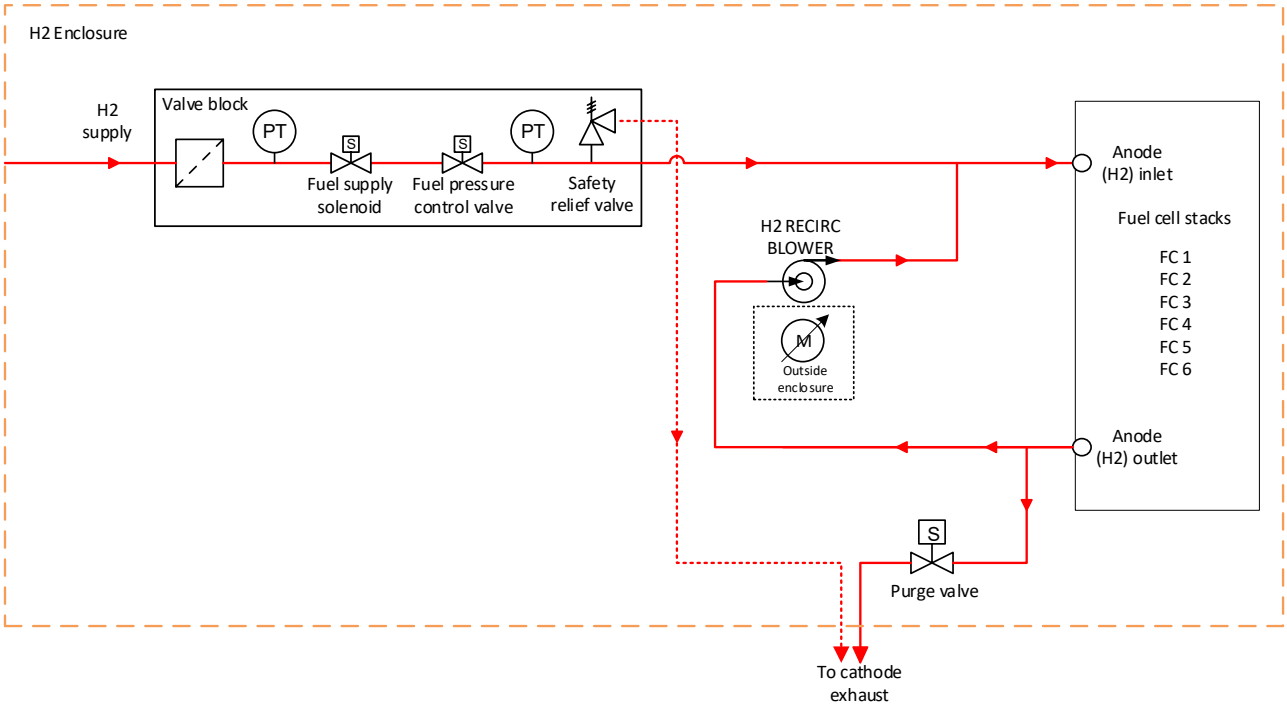

Figure 17 – Simplified Hydrogen System.

14.1. Requirements for upstream H2 delivery system

This section describes the requirements that the integrator must fulfill in the H2 supply system before the module boundary.

Integrator must provide sufficient hydrogen of a quality, pressure and temperature as specified in:

Table 7 – Hydrogen Supply Quality Specification.
Table 8 – Hydrogen Supply Temperature and Pressure Specification.
Table 9 – Hydrogen Supply Flow Rate Specification.

The source of hydrogen may be compressed gas storage, vaporization of liquid hydrogen or reforming of other fuels, if quality, pressure and temperature requirements are met.

Integrator must in accordance with classification society fulfill the requirement of H2 supply pipe leading to module.

Integrator must provide a block and bleed capability upstream of the module. A schematic of this can be seen in Figure 18.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

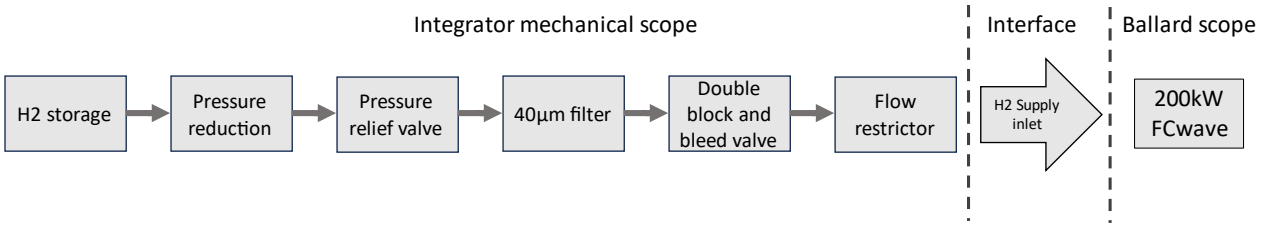

Figure 18-- Installation diagram of the H2 system with integrator and Ballard's parts differentiated.

14.2. Anode System Overview

The fuel cell module anode system is primarily comprised of an internal fuel supply shutoff valve and devices for regulating and conditioning the fuel pressure and water content. A Hydrogen Recirculation Blower (HRB) circulates the hydrogen inside the fuel loop.

A small amount of gas in the hydrogen circuit is purged to maintain acceptable hydrogen concentrations at the stack and remove N2 and water. This purged gas is directed to the process exhaust where it is diluted to a safe concentration by mixing with the process exhaust.

In the unlikely event that the hydrogen loop is over-pressurized, a mechanical pressure relief valve installed on the fuel valve block is in place to safely relieve the pressure (see section 14.3).

Perform a leak check after any service work is done to hydrogen supply fittings and associated piping

Follow the hydrogen supply quality requirements specified in Table 7 – Hydrogen Supply Quality Specification. Both hydrogen quality specifications are acceptable.

Specification	
Hydrogen Quality	SAE J2719:MAR2020
OR	
Hydrogen Quality	ISO 14687:2019 Type I, Type II – Grade D

Table 7 – Hydrogen Supply Quality Specification.

Hydrogen can be sourced from compressed gaseous storage or vaporization of liquid hydrogen if quality and temperature requirements are met.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Before commissioning and after service on the hydrogen supply system (external to module), a sequence of fill and drain cycles will be needed to ensure the correct hydrogen purity.

For the vessel tank system several fill and drain cycles (especially with new hydrogen storage tanks) will be required as they often come pre-filled with nitrogen or air. Contact the tank manufacturer for the recommended purge procedure.

If the resultant hydrogen purity is questionable, then it is recommended that a sample of the gas be analyzed by a laboratory for its composition. If these purity levels are not achieved, then there can be adverse effects to the performance of the fuel cell stack.

A 40µm filter should be installed directly upstream of the fuel cell module fuel supply inlet to ensure the particulate size requirement is met.

Note: Incomplete purging of the vessels hydrogen tank is often a source of impurity. Ensuring that hydrogen tanks are purged as per the manufacturer's specification is crucial to remove residual inert gases. After purging, it is recommended to have a gas sample analyzed ensure all inert gases are removed from the hydrogen storage system

⚠ CAUTION **Improper purging can often result in conditions leading to irreversible fuel cell damage and may have warranty implications.**

14.3. Hydrogen Supply Temperature and Pressure

When selecting a pressure regulator to install upstream of the fuel cell module, regulator droop[2] and hysteresis should be considered to ensure that the supply pressure is always within the range specified in Table 8.

Specification	
Nominal Inlet Pressure	4,5 barg
Minimum Inlet Pressure	3,5 barg
Maximum Inlet Pressure	6,5 barg
Maximum Inlet Temperature	80 °C
Minimum Inlet Temperature	0 °C

Table 8 – Hydrogen Supply Temperature and Pressure Specification.

Locating a pressure transducer and/or pressure gauge immediately upstream of the fuel cell module can be a valuable tool for troubleshooting hydrogen supply issues.

NOTE: A low pressure relief valve (internal to the module) is vented into the cathode exhaust. Implement overpressure protection in case of a fuel delivery system regulator malfunction. It is recommended that the integrator provide two levels of protection:

Electronic: If a regulating device from a storage is installed upstream ensure following:

Allow for electrical disabling of the fuel delivery system (e.g., remove power from the normally closed solenoid valves using a pressure switch) if the regulator outlet pressure exceeds 10 barg. Set up the system such that the hydrogen

[2] Sometimes referred to as the 'Proportional Band' or 'Offset', droop is an inherent characteristic in all self-operated and pilot-operated regulators. Droop is a decrease in outlet pressure from the set value due to an increase in media flow rate.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

supply will not be switched on automatically when the downstream pressure drops.

Mechanical: Install a pressure relief valve, sized to maintain the pressure less than **10 barg** at maximum flow.

WARNING **Fuel supply overpressure can result in an unsafe situation since it can cause the fuel cell module hydrogen components to fail. It is very important that these components are adequately protected in the event of a hydrogen supply pressure regulator malfunction or failure which results in an overpressure.**

14.4. Hydrogen Supply Flow Rate

Always provide enough hydrogen flow to the fuel cell module. The maximum expected hydrogen flow rates are specified in Table 9.

At this maximum flow rate, the hydrogen supply pressure should remain within the range specified in Table 8.

Integrator **shall** install an orifice restriction such that hydrogen mass flowrate shall not exceed 4,9 g/s.

Specification	
Max H2 Flow (Design)	4,9 g/s
Minimum Flow Operational Flow Full Load [BOL]	3,76 g/s

Table 9 – Hydrogen Supply Flow Rate Specification.

14.5. Module H2 Supply Valve and H2_ENABLE

The integrator is required to install a fuel shutoff solenoid valve directly upstream of the fuel cell module. This valve should be situated as close as possible to the fuel cell module fuel supply inlet to minimize the volume of hydrogen which will remain in the supply line during a shutdown.
The fuel cell module has a hydrogen supply shutoff valve inside the fuel cell module. This valve is meant to stop the flow of fuel into the fuel cell when the fuel cell module transitions from Running to Standby state. It is not designed to be a fuel system isolation/shutoff valve and does not replace the integrator's main fuel shutoff valve.

WARNING **The integrator is to ensure the H2 Supply valve is not used a shutoff method or that this valve is not closed during operation or though the shutdown sequence (see section "25 Control System – State Machine"). Failure to abide by this may result in stack fuel starvation or an alarm condition that will allow the high voltage contactors to open under load.**

WARNING **When shutdown, pressurized hydrogen is trapped in the supply line connected to the fuel cell module. The integrator must provide a means to isolate the supply line and vent any hydrogen remaining in the supply line prior to disconnecting the fuel cell module from the system for service**

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

The module provides an output to the integrator (H2_ENABLE), which signals to the vessel that the module requests opening of the H2 Supply Valve. H2_ENABLE is switched to the negative of the 24V supply when active, see Figure 19.
Please note that the H2 Supply Valve is separate from the internal shut-off valve inside the module.

This low-side output switching arrangement allows both module and integrator to control the open/close status of the H2 supply valve for the module.

The integrators H2 supply valve must be of the Normally Closed type.

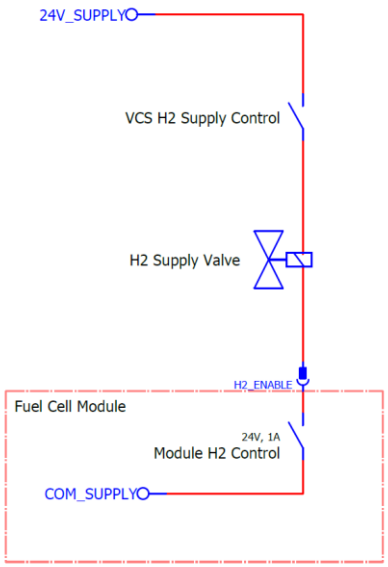

Figure 19 – H_2 Supply Valve Control.

15. Hydrogen Enclosure Ventilation

The module is equipped with active ventilation of the hydrogen carrying sections of the module (Hydrogen Enclosure / “H2E”).

> Integrator is responsible for salt and water droplet filtration from H2E Ventilation air.
> This includes prevention of water droplets running backwards into the system through the ventilation exhaust.

The air intake for the ventilation is in the cabinet base of the module. The ventilation air is in customer scope. Module ventilation shown in Figure 20 – Simplified P&ID for the Module Ventilation system.

The maximum allowable fuel cell module and auxiliary systems ambient temperature is specified in Table 10.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Specification	
Maximum Fuel Cell Module Ambient Temperature	45°C
Minimum Fuel Cell Module Ambient Temperature	>0°C

Table 10 – Ambient Temperature Specification.

Specification	
Module Ventilation Air Salt Content maximum allowable content	< 20µg/m³

Table 11 – Ventilation Air Salt Content Specification.

The ventilation duct acts as the secondary barrier in the double barrier protection principle.

Two ventilation fans are installed in the ventilation exhaust. The ventilation fans draw air from the inlet through the H2 Enclosure to the ventilation exhaust outlet.

The ventilation air is exhausted out of the upper-most part of the module, and shall be routed to a zone, with no ignition sources within a safe distance.
There is an option for rear facing ventilation exhaust, see section **Error! Reference source not found.**.

Note that the pressure-drop presented by the ventilation exhaust piping and any installed equipment must be considered. See Table 12.

Specification	
Ventilation Exhaust Backpressure (Maximum allowable pressure-drop between at Ventilation air outlet port and atmosphere)	≤2 mBar at 750 lpm
Ventilation inlet pressure drop (Maximum allowable pressure-drop between atmosphere and Ventilation air inlet port)	≤2 mBar at 750 lpm

Table 12 – Air Ventilation Exhaust Backpressure Specification.

The ventilation system is a key safety component, and is under close surveillance, with multiple monitored functions:

Redundancy of fans,
Fan rotation monitoring
Flow monitoring in inlet duct.
Pressure monitoring in hydrogen enclosure
Redundancy on Hydrogen sensors, which will detect any unacceptable levels of hydrogen in the outlet.

NOTE: The hydrogen sensors will need to be accessed periodically as part of preventive maintenance activities.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

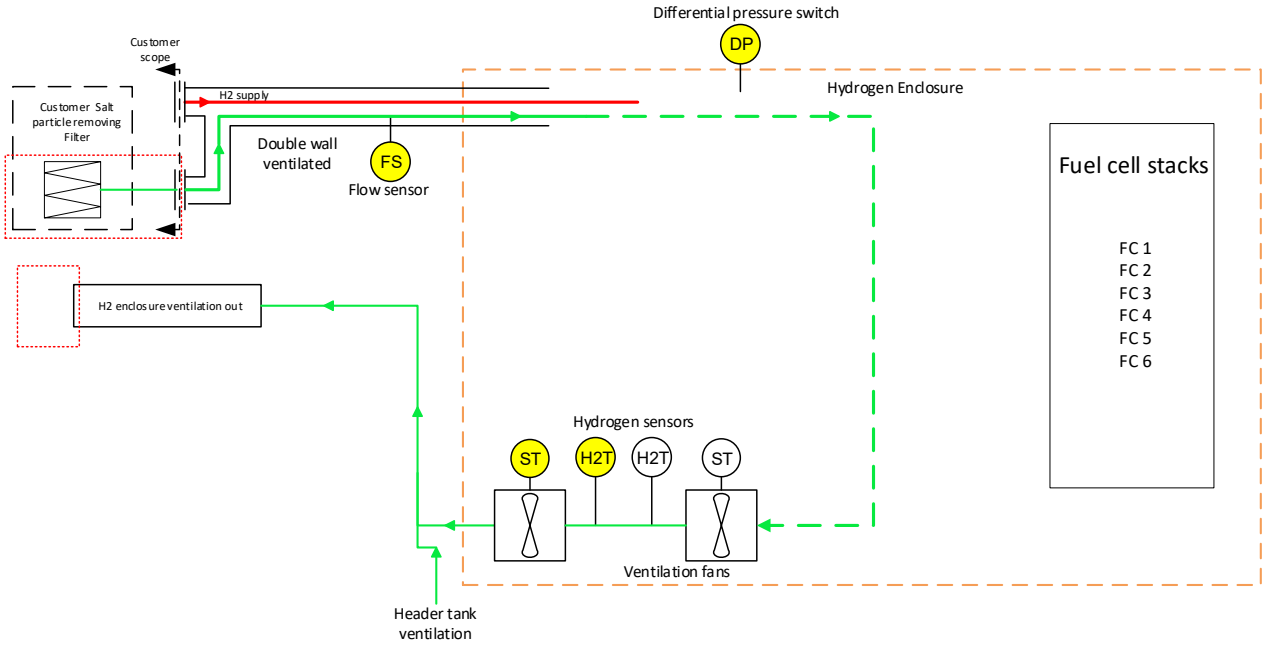

Figure 20 – Simplified P&ID for the Module Ventilation system.

16. Cathode Subsystem

The purpose of the cathode subsystem is to provide oxygen from atmospheric air to the fuel cell stacks. Process air is taken from the fuel cell installation room. It is the integrators responsibility to ensure sufficient air supply to the fuel cell modules as well as the required air quality.

Table 13 Ambient air characteristics necessary for the cathode subsystem.

Specification.	
Air inlet minimum temperature	0°C
Air inlet maximum temperature	+45°C
Maximum allowable salt concentration	< 20µg/m³
Process air pr FCwave™ module[3]	12.700 l/min

16.1. Process Air Subsystem Overview

The process air delivery system will automatically supply the necessary air to the fuel cell module. The amount of process air will depend on the current being drawn from the fuel cell.

[3] Minimum amount of air available at all times while the FC module is running

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

The process air delivery subsystem is primarily composed of an intake filter, twin compressors, and air conditioning elements (humidifiers) before air enters the stacks. After the stacks, air exits from the module through the process air exhaust. A simplified process air system is shown in Figure 21.

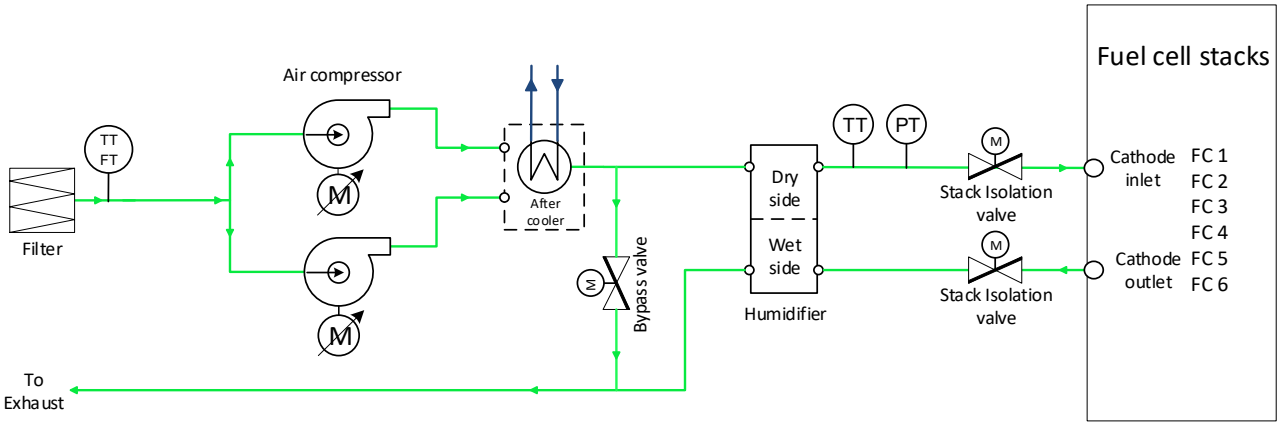

Figure 21 – Simplified Process Air System.

16.2. Process Air Intake Quality

The air filter in the cabinet doors of the module will ensure the purity of the air delivered to the fuel cell stack meets acceptable levels. To increase filter life and improve their performance, the fuel cell room shall be treated to minimize quantity of salts, SOx, NOx and ammonia, as they are quite harmful to the FCwave™ module. The air filter is a service item and part of the preventative maintenance schedule.

Consult Ballard during the integration design for feedback on this topic.

16.3. Process Air Intake

The process air intake is in the top of the two cabinet doors in the module. The air intake must have enough clearance and not be restricted . See Figure 8 – Isometric view of FCwave™ module. The air in the fuel cell room shall be of good quality (as explained above) and come from a non-hazardous zone. There shall be enough free space around the module to ensure sufficient air intake (as explained in section 11.1).

16.4. Process Air Exhaust Backpressure

The process air flow rate capacity of the air delivery system is sensitive to the backpressure exerted at the process air exhaust of the fuel cell module. In vessel integration, the integrator should work to minimize the pressure drop through the exhaust piping and any additional components such as a water separator in the exhaust. The backpressure at this exhaust should not exceed the value in Table 14

Specification	
Item	Value
Process air Exhaust Backpressure (Maximum allowable pressure-drop between the process air outlet port and atmosphere)	≤15 mbar
Average exhaust flow	12.700 lpm

Table 14 – Air Exhaust Backpressure Specification.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Consult Ballard during the integration design for feedback on this topic.

16.5. Process Air Exhaust Composition

Specification	
Item	Value
Temperature	50-80 °C
Mass flow	100 – 260 g/s (dry basis)
Nitrogen	78 – 92% (dry vol)
Oxygen	7 – 21% (dry vol)
Relative Humidity	~100% RH
Liquid Water	Stack current and coolant temperature specific
Hydrogen	Startup: <1 % (dry vol) Operation: <1 % (dry vol)

Table 15 – Air Exhaust Composition Specification.

The expected composition of the process air exhaust stream is detailed in Table 15.

The process air exhaust will contain oxygen-depleted air, water in liquid and vapor form, and a small amount of hydrogen. The hydrogen component in the process air exhaust is the result of purged gas from the hydrogen circuit.

WARNING Special note should be taken of the reduced oxygen content in the exhaust stream. Personnel is not permitted inside exhaust ducting or other spaces containing fuel cell exhaust with fuel cell operating. All such spaces shall be thoroughly ventilated before personnel is permitted to enter.

16.6. Process Air Exhaust Integrator Requirements

This section describes the requirements to the integrator when designing the process air exhaust from the fuel cell module.

The exhaust piping must be suitable for the temperatures and composition as outlined in Table 15. Note that the air stream contains significant amounts of de-ionized water droplets and vapor. The surface temperatures of the exhaust can be up to 80 °C hot.

The liquid water from the exhaust must be handled by the integrator. As the condensed water will collect in the lowest sections of the exhaust piping, experience has shown that this settlement of liquid could lead to corrosion, freezing during periods of non-operation and intermittent spraying of liquid water out the exhaust pipe. It is recommended that the integrator incorporate a water drain on low sections of the piping.

Note: The drain in the FCwave™ is not intended for draining customer part of the exhaust system.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

17. Process Water Drain

The fuel cell reaction produces DI water, which must be drained from the module from the Process Water Drain.

Refer to section 12 “Process Connections”, in Figure 15, the Process Water Drain is number “6”.

The process water drain piping must be constructed of materials resistant to DI water. Contact Ballard if there are questions regarding material selection.

The Integrator shall ensure the drain does not freeze and block the flow of liquid.

The produced water at 200 kW is ≤ 3 L/min. This is mostly water vapor mixed with the process exhaust.

Only a small percentage of this water will come out the process water drain as liquid.

Specification	
Item	**Value**
Media	De-Ionized Water
Temperature	20 – 70°C
Volume	0 – 3 L/min
Potable Water	No

Table 16 – Process Water Properties and Composition.

18. High temperature Coolant Subsystem

As part of the fuel cell stack operation, heat is developed. The liquid cooled stacks reject heat proportional to the power output. The amount of rejected heat is increased in proportion to stack aging/degradation and load. A simplified coolant circuit is shown in Figure 22 – Simplified HT Coolant Circuit.

18.1. HT Coolant System Overview

The FCwave™ module coolant delivery subsystem contains a coolant pump and motor set with a liquid cooled controller which delivers the required coolant flow to the fuel cell module. The coolant inside the module passes through an internal heat exchanger, where heat is transferred to the external coolant loop, provided by the integrator.

Coolant loop and composition:

Internal Coolant
Allowed cooling medium: High-purity De-ionized water / ethylene glycol 50/50 mix (further options see Table 17 and Table 59)

External Coolant (High Temperature loop) – **Integrator supply**
De-ionized water, fresh water, or glycol mixture. Integrator is responsible for cooling medium and pump.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

A pair of electronically controlled valves are regulating the stack coolant inlet temperature. The valves either throttles the flow of coolant to the heat exchanger or bypass the heat exchanger.

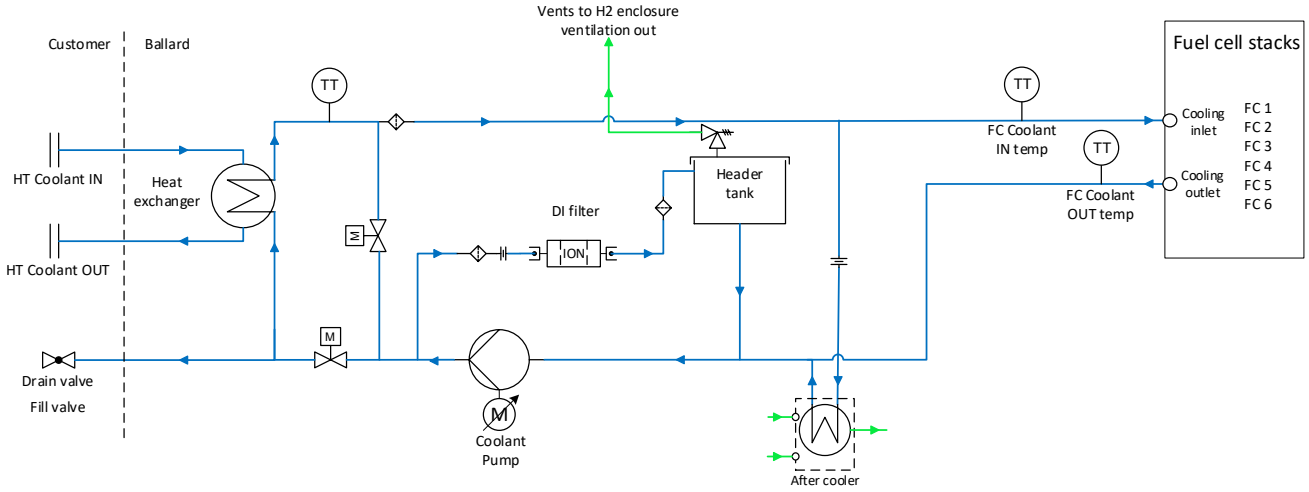

Figure 22 – Simplified HT Coolant Circuit.

During start-up, the coolant valves is positioned to bypass the heat exchanger, allowing coolant to recirculate though the stack, reducing the warm-up time. The internal cooling system also contains a particulate filter to remove any particulate matter present.

18.2. Coolant Chemical Hazard

⚠ CAUTION

The fuel cell coolant loop will contain ethylene glycol. For safety see chapter 8.8

18.3. Internal Coolant Specification

Follow the requirements specified in Table 17 – Module Coolant Specification, ensure that:

- The cooling system can maintain the conductivity below the maximum specified value.
- Adequate clean maintenance practices are in place.
- Any material used in the cooling system is compatible with the coolant type.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Specification	
Item	Value
Conductivity	≤ 5µS/cm @ 25 °C
Ethylene Glycol Concentration	≤ 50% volume Balance DI Water or 60% volume Balance DI Water[4]
Particulate Size	<100 µm
Chloride Concentration	≤2 ppm
Iron Concentration	≤2 ppm

Table 17 – Module Coolant Specification.

NOTE: High coolant conductivity will result in loss of electrical isolation between the fuel cell high voltage and the system chassis since the coolant circuit can provide a conductive path. The coolant conductivity specified in Table 17 should be suitable for most applications; however, the conductivity required for a specific application may need to be lower to achieve an overall system isolation which satisfies regulatory standards. The integrator should ensure that the conductivity limit chosen is suitable for their application.

To maintain the stack coolant conductivity below the maximum level, a DI filter is installed in the coolant circuit. Part of the overall coolant flow is diverted to the DI filter to continuously remove ions in the water.

Table 18 lists the recommended suppliers for fuel cell grade ethylene glycol mixture. Pure ethylene glycol mixed with deionized water is acceptable (providing the conductivity is <5µs) and deionized water (under **non-freezing** operation). Do not use other coolant types. Pure deionized water (<5µS conductivity) is permissible if the module is used for laboratory operation and is kept above freezing temperatures.

Specification		
Supplier	**Part Number**	**Notes**
BASF	Glysantin J21725	50/50 Ethylene Glycol / DI Water Pre-mixed
BASF / Valvoline	Glysantin FC G 20-00/50	50/50 Ethylene Glycol / DI Water Pre-mixed
Merck	100949	Ethylene Glycol Extra Pure
Univar	610583	50/50 Ethylene Glycol / DI Water Pre-mixed
Univar	1126085	Pure Ethylene Glycol
Univar UK	4338	Pure Monoethylene Glycol
Dynalene	LC-EG	Ethylene Glycol / DI Water Pre-mixed

Table 18 – Coolant Suppliers. Some of these coolants come pre-mixed others need to be diluted. The maximum 50% Ethylene Glycol concentration as mentioned in the specification must be followed.

[4] If the storage temperature after operation is expected to be <-37°C then use 60/40 glycol/DI water mix. The module is pre-flushed with 60/40 glycol/DI before shipping.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

NOTE: It is not recommended to store modules filled with deionized water for more than 7 days, due to its reactivity. Stagnant deionized water has shown an ability to create a corrosion reaction in some components of the module. For extended storage it is recommended to flush the coolant circuit with a water/ethylene glycol mix. Use only coolants shown in Table 18 or consult Ballard Power Systems.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

18.4. Internal Coolant Volume

The coolant volume of the fuel cell module and coolant delivery system is specified in Table 19.

Specification	
Item	Value
Internal coolant system volume	45 L

Table 19 – Module Coolant Volume Specification.

For filling and draining the internal coolant system, see section "18.8 Filling and Draining the Internal Coolant Loop"

The coolant header tank contains no more than 10 liters of volume.

CAUTION **Overpressure of the coolant circuit during filling can cause permanent damage to the fuel cell.**

18.5. External Coolant Specification

The list of permitted coolant compositions for the external primary coolant loop is listed in Table 20.

Specification	
Item	Value
Coolant Medium	DI Water, Water/Glycol mixture
Maximum particulate size	1,2 mm
Maximum pressure	30 barg
Maximum inlet temperature	45 °C

Table 20 – Module External Coolant Specification.

18.6. Coolant Inlet Temperature and Heat Rejection

Maintain the temperature specified in Table 21 for a nominal fuel cell module coolant inlet temperature.

Some comments and considerations for coolant heat rejection and inlet temperature control:

The expected module coolant heat rejection and flow rates at End Of Life (EOL) are specified in Table 21 – HT coolant loop specifications. These values can be used as a guideline for sizing the coolant radiator.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Specification		
Parameter	**Value**	**Unit**
Coolant inlet temperature nominal	40	°C
Coolant inlet temperature minimum	5	°C
Coolant outlet temperature maximum	65	°C
Coolant loop ΔT	25	°C
Maximum heat dissipation full load EOL	350	kW
Expected mass flowrate cold side [@40°C inlet]	14.015	kg/h
Connections	DN50, 2" ISO7/1	
Pressure drop, Heat exchanger customer side [@ 11.000 kg/h]	< 100	mbar

Table 21 – HT coolant loop specifications.

The expected module coolant heat rejection and flow rates at End Of Life.

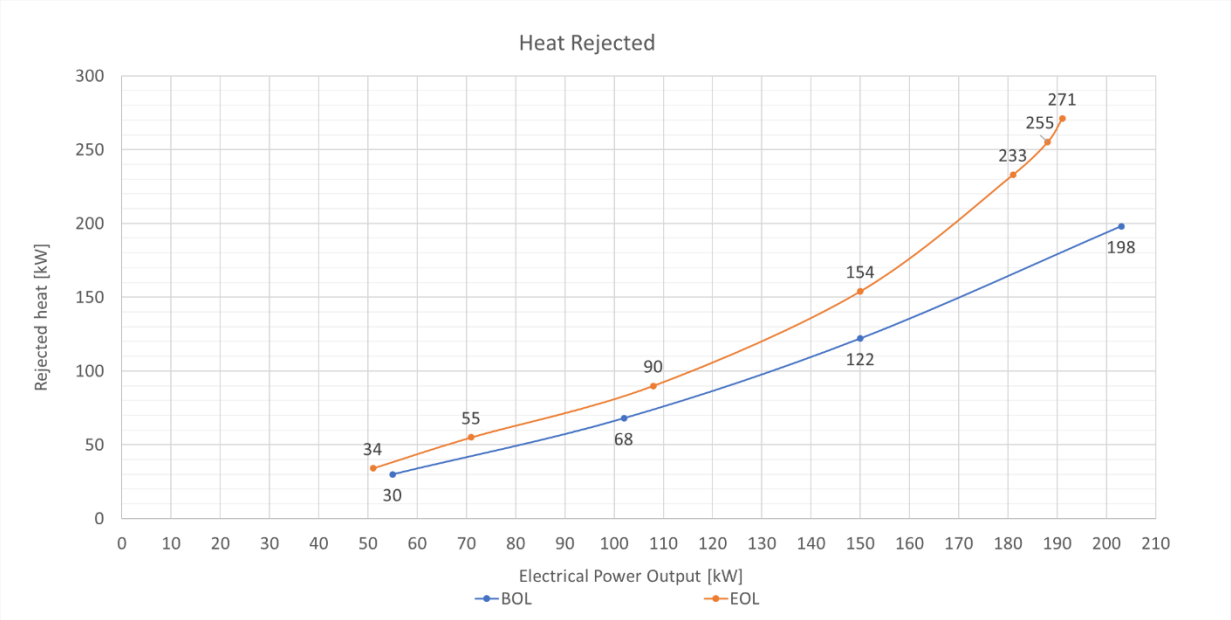

Figure 23 - System Heat Rejection through the heat exchanger vs. Power.

Unauthorized copying, distribution or use of this manual is strictly prohibited.

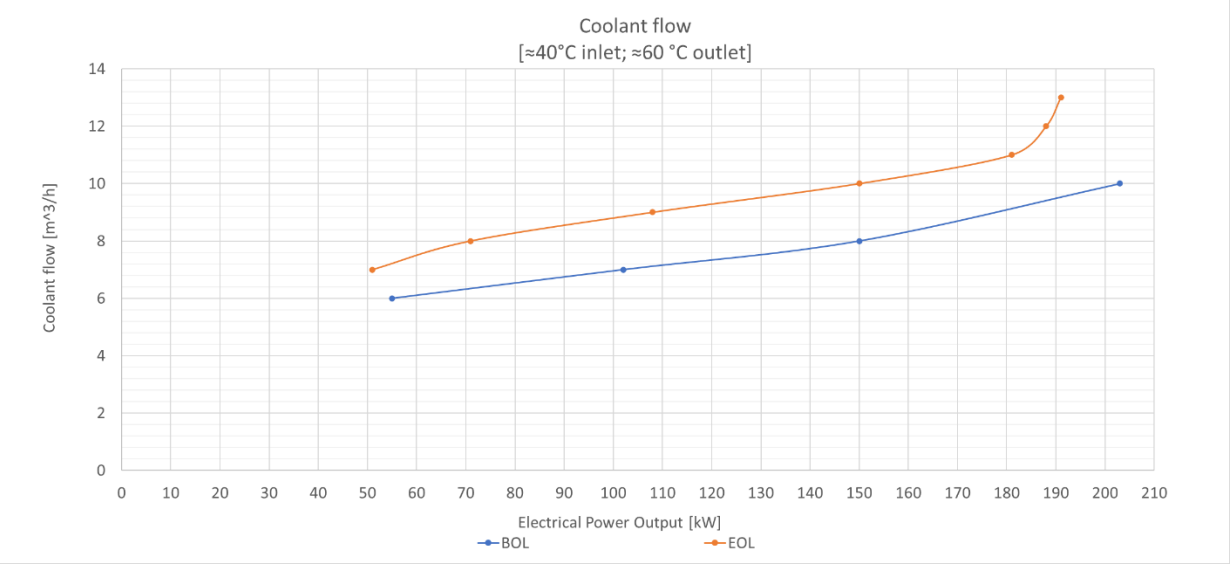

Figure 24 - System Coolant Flow vs. Power (HT customer coolant flow)

18.7. Header Tank of the Coolant System, Air Bleed and Pump Make Up

The module contains an internal header tank for the HT coolant loop, which provides a reservoir of coolant and accommodates thermal expansion of the coolant. There is a low level switch in the header tank to provide warning for low coolant levels.

When filling or draining the module's HT coolant loop, use the makeup connector outlined in Table 6 position 9. Connect an external pump to the connector and use the pump to fill the module with coolant.

When handling coolant, wear personal protective equipment in accordance with the Safety Data Sheet and local regulations. Hydrogen gas may accumulate in the coolant tank. Purge the header tank of said hydrogen prior to servicing. Always wear safety eyewear and eliminate sources of ignition (flames, sparks, electrical tools, etc.) when servicing the header tank.

18.8. Filling and Draining the Internal Coolant Loop

The Internal Coolant loop can be filled and drained by a fill/drain connection on the interface plate of the module. An external pump is connected to this port and used to fill or drain the module.

During filling operations, **do not** overfill the coolant header tank, but continually observe the reading in the sight glass on the header tank. Flowrates and pressure during filling are specified in Table 22.

To perform a filling and draining of the system Service Tier 1 training completion is required.

Specification	
Make-up pressure	Between 200 mbarg and 1 Barg

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Make-up flowrate	< 10 lpm

Table 22 – Module Coolant make up pressure and flowrate.

When changing the coolant inside the module, use the provided fill/drain port (see Figure 15).

It is strongly recommended that the coolant is pumped into the lowest part of the circuit with the use of a small off-board coolant fill pump. When filling the internal coolant circuit, keep an eye on the sight glass on the header tank, where the coolant level is visible.

Care should be taken as to not overpressure the coolant circuit during filling. This can occur if the flow of the coolant being pumped in exceeds the capacity of the header tank vent to relieve the displaced air. It is recommended to install a mechanical pressure relief device at the outlet of the coolant fill pump cart that is set to 1.0 Barg.

19. Low Temperature Cooling System

The fuel cell module also contains a low temperature cooling system. The low temperature cooling system is an independent system used for cooling of:

- Inverter for Cooling Pump motor
- Inverter for Hydrogen Recirculation Blower electrical motor
- Air compressors (2 pcs)
- Inverters for air compressors

The low temperature cooling system is considered as an auxiliary coolant circuit internal to the fuel cell module. Unlike the main cooling system, there is no coolant pump in the auxiliary circuit. The coolant and flow for this system is supplied by the integrator and should comply to the data given in Table 23. Integrator connection to the low temperature cooling system is in the base of the cabinet.

Diagram over the low temperature coolant circuit is shown in Figure 25. Interface connectors are shown in Figure 15.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.

20. Gas Freeing and Inerting Procedures

Before performing service on the FCwave™ module, the following must be verified:

- Hydrogen supply line has been depleted
- No dangerous voltages are present in the system

The FCwave™ system includes an automated procedure that must be executed before beginning maintenance procedures, which depletes hydrogen from the supply line and system.

WARNING **Before accessing High Voltage Panel or components inside the Hydrogen Enclosure, all procedures must be followed**

20.1. Inerting procedure – Prepare for Service

This automatic procedure is carried out by request of the Vessel Control System, which activates an automatic subroutine in the FCwave™ fuel cell module which performs the inerting procedure. The function “Prepare for Service” uses the module blowers and compressors to ensure the module is ready for maintenance.

There is no requirement for the integrator to supply inert gas such as Nitrogen.

After completion of the automated procedure, manual verification of voltage must be performed before any maintenance actions.

Commercial Confidential

21. Control and Electrical Introduction

The purpose of this section is to provide the integrator a high-level overview of the control and electrical systems that comprises the FCwave™ module.

The fuel cell module contains four main control and electrical systems:

- Low voltage electrical (24 VDC)
  - Responsible for supplying all process instrumentation and controllers with power. Contains internal EMC filters and fuses
- High voltage electrical (350-720 VDC)
  - Responsible for supplying power from the fuel cell stacks to the integrator and balance of plant components. Power to start the system is provided by the integrator during the start-up sequence.
- Control System
  - Responsible for monitoring and controlling the processes inside the fuel cell module, communicating with the integrator, datalogging and service functionality
- Safety System
  - Responsible for monitoring the safety and integrity of the fuel cell module. This includes hydrogen concentration measurements, ventilation air flow verification and fire detection.

The following overview includes references to the different aspects of the operation of the FCwave™ module and the sections where they are described. Use Ctrl+Click to jump to the references.

CAUTION **Before operating the FCwave™ module, carefully read through all above points and refer any questions to your Ballard representative. Improper use and handling of the fuel cell may lead to dangerous situations and permanent or temporary damage and performance degradation of the fuel cell module.**

22. Low Voltage Electrical Overview

The control system of the FCwave™ is powered by two 24V DC supply voltages, as specified in CMS006.

The normal 24V supply powers the module controller, module sensors and control voltage for the motor controllers.

The safety 24V supply powers the safety system, safety controller and safety sensors.

The 24V supply voltages are passed through EMI filters before being separated out to the different sub-systems in the module.

The module controllers are powered from the 24V supply and runs continuously while 24V is supplied to the module. Ventilation fans, internal to the module, are also running while 24V is supplied.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

The 24V system is internally fused with resettable electronic circuit breakers.

22.1. Low Voltage Supply

The system is supplied by 24V DC. Please note the voltage tolerance on the 24V supply is narrower than normal 24V marine supply. The Low voltage supply shall be equipped with a UPS system with at least 10 minutes of backup duration. When the UPS system is active, Ballard strongly recommends that the module is brought to a controlled **shutdown** without delay.

Specification	
Control and Safety system supply voltage	24 V DC
Maximum Allowable voltage deviation	±10%

*Table 24 – **Control and Safety system** supply specification.*

Specification	
Control and Safety system supply backup	Uninterruptible Power Supply required
Backup duration	10 minutes

Table 25 – Control and Safety system UPS specification.

22.2. Design Standard and Exceptions

The module control system is designed to comply with EN-60204-1:2018.

The system does not have a bonding between 0 Vdc and chassis/ground.

23. High Voltage Electrical Overview

The FCwave™ module PEM fuel cell stacks are a DC current source, with an output voltage which varies depending on the current drawn from the system. This relationship is shown in Figure 4 – Module output Voltage and Figure 5 – Module Output Current.

The HV DC system must be operated as a floating electrical system, see section 40.1.

During operation, the stacks supply power to the BOP components, internal to the module, making it self-sufficient. As described in section 27.2, external high voltage DC power must be provided during startup. During operation, the fuel cell stacks convert chemical energy from hydrogen to electrical and thermal energy, the rate of which is dependent on the load imposed on the fuel cell module by the external DCDC converters. The fuel cell operates as a load follower, such that the managing of the load is the responsibility of the integrator. To assist in this, the module communicates its operational limits to the integrator over the CAN bus.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

23.1. Pre-charge of the Electrical HV system

The input stages of the motor inverters in the module contain capacitors, which may lead to surges in current draw if directly connected to a high voltage supply without current limiting measures in place.

The FCwave™ module contain equipment and control sequences for gradually charging the internal capacitances such that current surges are avoided.

The pre-charge sequence is detailed in section “30.3 Pre-charge”

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

24. Control and Safety System Overview

The control and safety system of the Module is comprised of the following, illustrated in Figure 26:

- **Module Control Unit**
  - Responsible for control of the fuel cell and balance of plant components.
  - Monitors and controls the state of reactants and power flowing to and from the module.
  - Monitors and reacts to system conditions, including hydrogen concentration measurements.
  - Transfers data logs to Ballard when able to establish communication with the Internet (via encrypted connection)
- **Safety Control Unit**
  - Responsible for monitoring safety of the module via independent sensors and inputs. Provides hardwire signals to and from the vessel.
  - Independent from Module Control Unit, triggers emergency shutdown of module when it detects an emergency.

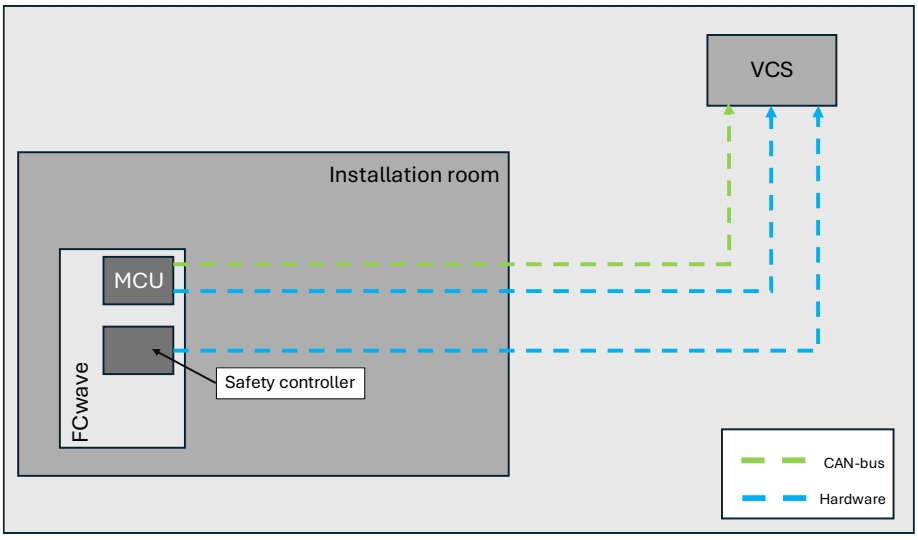

Figure 26 – Control System Architecture.

25. Control System – State Machine

The module control is based on a state machine, in which states correspond to the operating mode of the fuel cell. These states are communicated to the integrator over the CAN bus.

25.1. Introduction

In normal operation, inputs from the integrator causes the state machine to transition from the initial "Locked" state towards the "Running" state, in which the fuel cell is in operation.

The states are enumerated in Table 26. Please note that some states contain internal sub-states.

The normal high-level sequence of states for the fuel cell module, as well as the customer signals, required to initiate the various state changes, is shown in Figure 27 – High Level State Sequence.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Estimates of power flow, to and from the fuel cell, during the state sequence and the approximate timing of **Startup** and **Shutdown** sequences, are also shown.

The integrator should follow the diagram for the control signal sequence to ensure safe operation of the module.

State	Description
Locked	The module controller is active, after receiving the **SAFE_IN** signal (see Table 41) but will remain in **Locked** state until the correct CAN customization key is received.
Unlocked	Correct CAN customization key received from the drive system (see Section 37.4). High Voltage circuits are depowered.
Pre-charge	The module pre-charge internal HV circuit. When pre-charge is complete, module enters **Standby.**
Standby	The module is waiting for the **MODULE_RUN** CAN signal to start the fuel cell. Module HV bus is connected to Vessel. Stack contactors are open.
Prepare for maintenance	This state provides a function for depleting the module of hydrogen to prepare for maintenance.
Startup	A sequence of steps that power up the fuel cell stacks and prepare the module to provide power. Air and hydrogen start flowing to the fuel cell module. Fuel cell stack voltage will rise. High voltage output contactors are closed. Note: This state contains sub-states internally.
Running	The module will set I_ALLOW > 0 Amps and current can be drawn from the fuel cell (see Section 32.1).
Shutdown	Water is purged from the reactant gas circuits and a controlled bleed down of voltage from the stack is performed. Module state will return to Unlocked. Note: This state contains sub-states internally.

Table 26 – System Operating States and Descriptions.

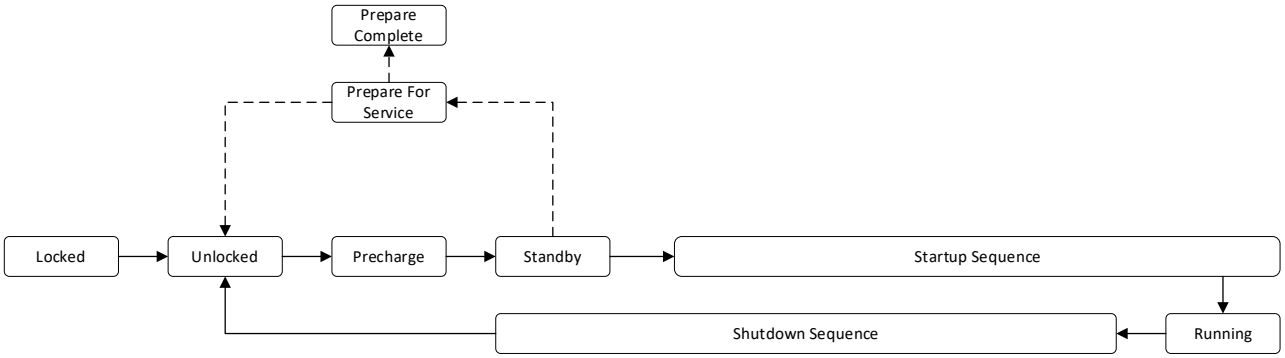

Figure 27 – High Level State Sequence for FCwave.

A more detailed overview of the module state machine is available in section 28 " DCDC Control Indicators", Figure 29 – FCwave™ State machine with DCDC Indicators.

Template 210818-1 Rev. A

Unauthorized copying, distribution or use of this manual is strictly prohibited.

26. Ballard Master Control Unit

The module can be operated from a Vessel Control System directly, or if several FCwave™ modules are present, they can be controlled from a Ballard Master Control Unit.

For questions regarding the master control unit, contact Ballard.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

27. Integration with external DCDC Converters

The fuel cell module is a DC power source and operates as a load follower, with the external DCDC operating as load controller. This makes it extremely important to have the right understanding of the fuel cell module operation when designing the DCDC control.

27.1. Requirements for external DCDC converters

This section describes the functional requirements for the DCDC converters connected to the high voltage DC outputs.

These requirements are valid for bi-directional DCDC converters, which can provide power to the module during startup. For other configurations, please contact Ballard Europe.

For control specification for the DCDC converter(s), see section 30.6 “Startup procedure of DCDCs” and section 30.7 “Shutdown procedure of the DCDCs”.

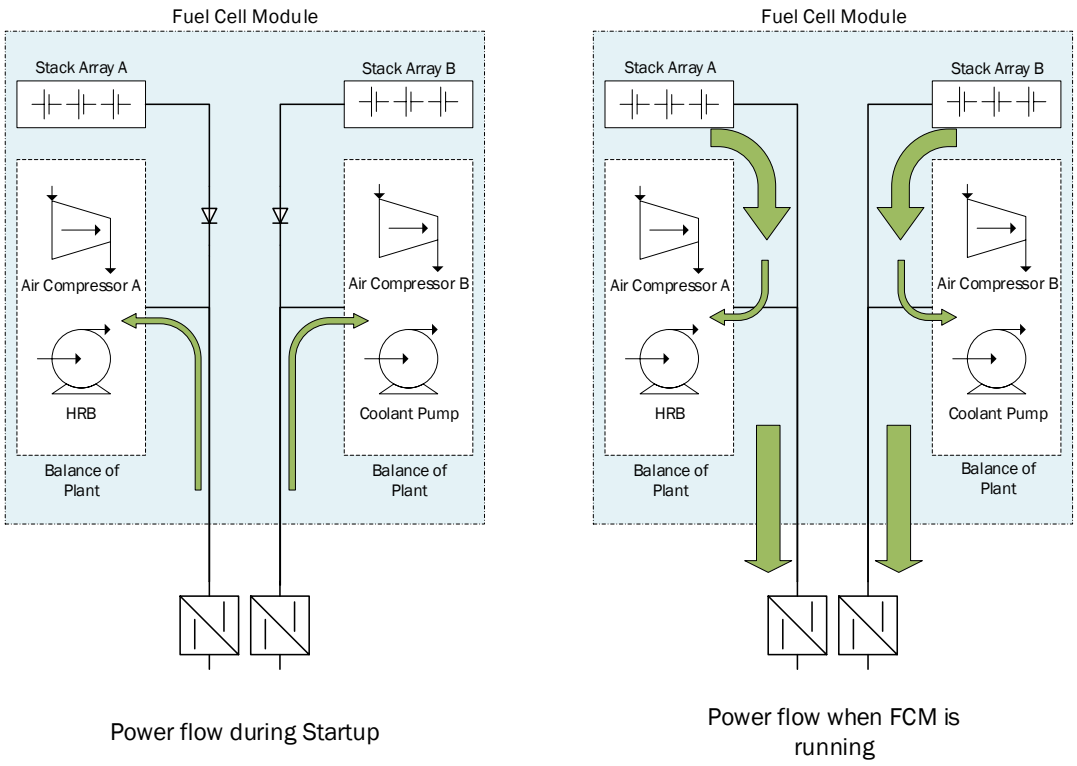

Figure 28 – Power flow to and from FCM during startup and run mode.

Dual Output configuration shown.

27.2. Role of the DCDC converters

The role of the DCDC converters is twofold:

During module startup, DCDC(s) must source power to the Balance of Plant (BOP) components of the module. After startup, the BOP components are powered by the stacks, directly.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

During normal operation, regulate the current drawn from the module, within the specified limits of I_Allow and the vessel operator.

Proper integration between the DCDC and the module is essential, as the module is a load-follower with dynamic and static limitations that the module cannot enforce by itself.

These limitations are communicated to the integrator via CAN bus (see section 37.2), and the integrator is responsible for respecting them when supplying power to the vessel.

27.3. Functional Requirements

Two converters are to be connected to the module for the dual output configuration.
Single converter is to be connected to the module for the single output configuration.
Converters must be able to handle voltages and currents as specified in CMS006 “FCwave™ Fuel Cell Module Datasheet”.
When the converter is drawing power from module to the vessel DC bus (power supplied from module to vessel):
The converter must be able to operate in constant-current (CC) mode, or a functionally identical mode. The setpoint must be on the input side.
The converter must have input side high and low voltage limits.
Stack voltage measurement is provided by the module controller and provided to integrator over CAN bus.
Output voltage and current limits are solely the responsibility of the integrator.
When the converter is drawing power form the vessel DC bus and supplying to the module (sourcing from vessel to module):
The converter must be able to operate in constant-voltage (CV) mode. The setpoint must be set on the input side.
The setpoint for the CV operation is received over CAN bus from the module and will in the range from 300 to 500 VDC.
During CV operation, the voltage must be within ±5% of setpoint. Below 2% deviation is preferred.
The CV operational mode shall implement a current-limiting function on the input side, which ensures the safety of the system.
The current draw from the module will start high and fall to 0 as BOP load transitions from external DCDCs to the internal stacks. The DCDC must allow the voltage to increase above the setpoint without exporting power from the module. Power needs during startup is detailed in section 32.2 “Startup Energy Consumption”.
Voltage ripple during operation shall not exceed 5% nominal voltage during the full range of operation. Voltage ripple of less than 2% is preferred.

27.4. DCDC Converters during start up

When the customer wishes to operate the fuel cell module, external power must be supplied.
As the stacks require both oxygen and hydrogen, the air compressor and hydrogen recirculation system must operate before the stacks can supply power.

To operate the module successfully, the DCDC must adhere to the procedures, described below and illustrated in Figure 28:

During module startup, DCDC(s) must source power to the Balance of Plant (BOP) components of the module. After startup, the BOP components are powered by the stacks, directly.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

During normal operation, regulate the current drawn from the module, within the specified limits of I_Allow and the vessel operator.
See the section 28 “DCDC Control Indicators” which describe when the DCDC converters are to operate in which direction and mode.

The voltage and current requirements are detailed in section 30.6 “Startup procedure of DCDCs”.

27.5. DCDC Converters during operation

During the “Running” state of the module, the DCDC converters are required to operate in constant current mode, with the setpoint set at the input side (towards module).

27.6. Definitions

- All voltages and currents are Direct Current.
- Power flow **from** Fuel Cell Module **to** rest of vessel is defined as positive direction.
  - Current flowing from module is denoted I > 0.
  - Current flowing from vessel to module (e.g., during startup) is I < 0.
- Input of the DCDC converter is defined to be towards the fuel cell module.
- Output of the DCDC converter is defined to be towards the vessel drivetrain.
- In dual output configuration, the DCDC converter connected to stack string A is referred to as “Converter A” or “CNV A” in abbreviated terms. “Converter B” or “CNV B” is similarly connected to stack string B.
- $I_{OutputA}$ is the current flowing from module to Converter A
- $I_{OutputB}$ is the current flowing from module to Converter B

27.7. DCDC Technical Requirements

This section describes the validated specifications for the external DCDC converters.

Product validation and EMC testing has been performed with DCDC converter switching frequency of 4kHz and 5kHz. If the integrator wishes to use switching frequencies outside the validated range, contact Ballard. If there are questions about using bigger DCDC converters, ask Ballard.

Specification		
External DCDC Converter switching frequency	Minimum	4 kHz
	Maximum	5 kHz
Voltage Ripple	Maximum	5% peak-peak
	Preferred	2% peak-peak
Maximum DCDC size	< 400kW	

Table 27 – DCDC Converter requirements.

Template 210818-1 Rev. A

28. DCDC Control Indicators

This section describes the function of several indicator bits, transmitted over the CAN bus to the integrator. These bits indicate the desired operating mode of the connect DCDC converters.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

The bits are transmitted in the CAN Message "FCM_REQUEST_1" and are defined as follows:

- **DCDC_STOP**
  - This bit, if active, signals that the Fuel Cell does not require the DCDC converter to be active and it should not be actively modulating.
- **DCDC_IMPORT**
  - This bit, if active, signals that the Fuel Cell requests that the DCDC converter is active and operates in constant voltage mode towards the fuel cell module. Desired voltage setpoints and current limits are transmitted in the "FCM_REQUEST_2" CAN message.
- **DCDC_EXPORT**
  - This bit, if active, signals that the Fuel Cell is ready to provide power to the vessel and the DCDC converter should be active and operating in constant current mode towards the vessel. Current limitations are described in the following sections:
    - Section 29 - Important limits during operation.
    - Section 29.5 - Ramp rates

The DCDC Control Indicators are illustrated in Figure 29 – FCwave™ State machine with DCDC Indicators.

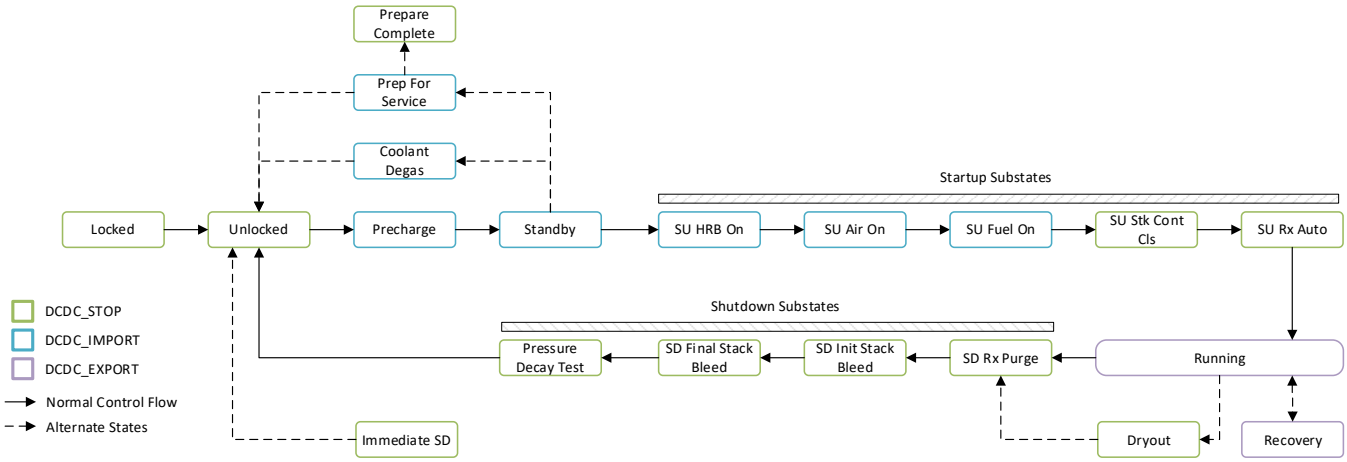

Figure 29 – FCwave™ State machine with DCDC Indicators.

28.1. DCDC_STOP Control Indicator

In case the DCDC_STOP control indicator is active, the module requests no action from the connected DCDC converters. They can be in standby mode, but no active modulation.

The DCDC_STOP control indicator is active during the following states:

- When the module is in Locked and Unlocked states
- When the module is in the shutdown sequence after operating
- When the module is in the later part of the **Startup** sequence
- When the module is in the **Dry-out** or **Prepare for Service Complete** state (see section 31 "Special Operating States")

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

28.2. DCDC_IMPORT Control Indicator

In case the DCDC_IMPORT control indicator is active, the module requests that the connected DCDC converter is active, operating in Constant Voltage mode with constant voltage towards the fuel cell module.

The DCDC_IMPORT Control Indicator is active during the following states:

When the module is in **Pre-charge** and **Standby** states.
When the module is in the early part of the **Startup** sequence
Please note that the module becomes self-powering after the SU Fuel On state, as both hydrogen and oxygen is present in the stacks, therefore the DCDC is stopped until the module reaches Running state
When the module is in the **Coolant Degas** or **Prepare for Service** state (see section 31 “Special Operating States”)

28.3. DCDC_EXPORT Control Indicator

In case the DCDC_EXPORT control indicator is active, the module requests that the connected DCDC converter is active, operating in Constant Current mode, exporting power from the fuel cell module to the DC-bus.

Current limitations are described in the following sections:

- Section 29 - Important limits during operation
- Section 29.5 - Ramp rates

The DCDC_EXPORT Control Indicator is active during the following states:

When the module is in the Running state
When the module is in the Recovery state (see section 31 “Special Operating States”)

29. Important limits during operation

29.1. Minimum and Startup Current Draw

The fuel cell module has a minimum current draw of 50A for each stack string at BOL (Equivalent to approx. 55 kW) from the module. Operating at a power level below this, for an extended period, will reduce stack lifetime. If the customer current draw is below the minimum level, for more than 10-20 seconds, the module will shut down in a controlled fashion and report an error code to the operator. For a single output module, the value is doubled (100A minimum current draw)

During startup, it is recommended that the initial current is 10A (20A for single output configuration), (see Table 28 – Initial Current Draw Specification) and then ramped to minimum current draw with the ramp rate specified in section 29.5 “Ramp rates”

Specification	
Single Output Configuration – Initial Current Draw	20 A
Dual Output Configuration – Initial Current Draw	10 A

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Table 28 – Initial Current Draw Specification.

29.2. I_Allow and I_Offset

The fuel cell controller will report a maximum allowable instantaneous current draw for the stacks (*I_Allow*) as part of the CAN message transmitted by the Fuel Cell – the message is transmitted with a 100 ms interval.

The Module Control Unit will also report a desired offset between the stack strings, which serves to balance load between components and extend lifetime of the stacks. This parameter is not used in single output systems

- Single Output Configuration:
  - The I_Allow parameter is the maximum allowable current draw from the system. Current draw is never to exceed this value
  - The I_Offset parameter is disregarded.

- Dual Output Configuration:
  - The I_Allow parameter is the maximum allowable current that can be drawn from each string. Current draw for each string is never to exceed this value.
  - The module transmits the I_Offset parameter, which should be added to the current draw from string A and subtracted to the current draw from string B
  - The I_Offset parameter is signed, and a positive value indicates that a higher current should be drawn from string A than string B
  - I_Offset is capped at ±7,5A.

$$I_{OutputA} < I_{Allow}$$

$$I_{OutputB} < I_{Allow}$$

$$I_{OutputA} = I_{Output} + I_{Offset}$$

$$I_{OutputB} = I_{Output} - I_{Offset}$$

Where:

I_{Output} is the current as desired by the customer
$I_{OutputA}$ is the current setpoint for the DCDC converter attached to Output A
$I_{OutputB}$ is the current setpoint for the DCDC converter attached to Output B
I_{Allow} is the maximum instantaneous current draw, transmitted from the Module Control Unit via CAN bus
I_{Offset} is the desired offset between $I_{OutputA}$ and $I_{OutputB}$.

Example:

- Dual Output Configuration

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

- I_{Output} is 200A
- I_{Allow} is 250A
- I_{Offset} is +2A
- In this example, the current draw from the DCDC converters ($I_{OutputA}$ and $I_{OutputB}$) must be below 250A and $I_{OutputA}$ should be 202A and $I_{OutputB}$ should be 198A.

29.3. Origin of the I_Allow parameter

The default current limit is set based on maintaining a minimum air stoichiometric ratio, with a maximum allowable current. Computations are then made to determine whether any other factors should be limiting the stack current below its default value. If any of these computations lead to a lower maximum allowable current than the default, module output is de-rated.

Exceeding I_Allow for more than 3 sec will result in an immediate shutdown procedure, to protect the module.

In order to obtain best long-term performance from the module, it is recommended to follow the current-ramp, described in section 29.5.

29.4. Reverse current protection during start-up operation

During startup, the following precautions are taken to prevent reverse polarization of the stacks:

HV system is isolated from stacks via diodes.
HV system is pre-charged gradually, to prevent sudden voltage and current spikes.
The permissible voltage range is transmitted to the integrator over CAN bus.
Voltage is measured inside the module and compared to the acceptable range.
Current limitations are transmitted to integrator over CAN bus. Integrator is responsible for ensuring that the DCDC(s) operate within this range.

If any parameters deviate from allowed ranges, start-up is aborted, and module returns to the 'unlocked' state. Module may open HV contactors to isolate itself if parameters are outside acceptable range. This is done in all alarm severity 3 and safety severity 4 situations.

⚠WARNING Reverse polarization of the stacks must be prevented. This occurs when a voltage, higher than the stack voltage, is applied to the system. A direct consequence of this is rapid heating, hydrogen development and irreversible damage to the stacks.

In worst-case, rapid heating and hydrogen development can lead to detonation or deflagration of present or developed hydrogen, inside the module.

29.5. Ramp rates

As described in section 29 "Important limits", the ability of the fuel cell module to respond to dynamic changes in current draw is bounded.

For longevity of the stacks and balance of plant components, it is recommended to avoid rapid cycling of the current draw, as this will lead to excessive wear on stacks and BOP components.

Ballard recommends that current draw, during normal operation, follows the current vs. time graph shown in Figure 30 – Current/Time ramp for operation of external DCDCs.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Specification	
Single Output Configuration - Maximum increase/decrease in current draw	40 A/s
Dual Output Configuration - Maximum increase/decrease in current draw (each output)	20 A/s

Table 29 – Current Draw Delta Specification.

Please note that in some shutdown conditions, the I_Allow parameter will decrease more rapidly than specified in Table 29.

Current draw must never exceed I_Allow, which may decrease (or become 0) more rapidly than specified ramp rates. In this case, converter current draw must be immediately reduced to I_Allow or less.

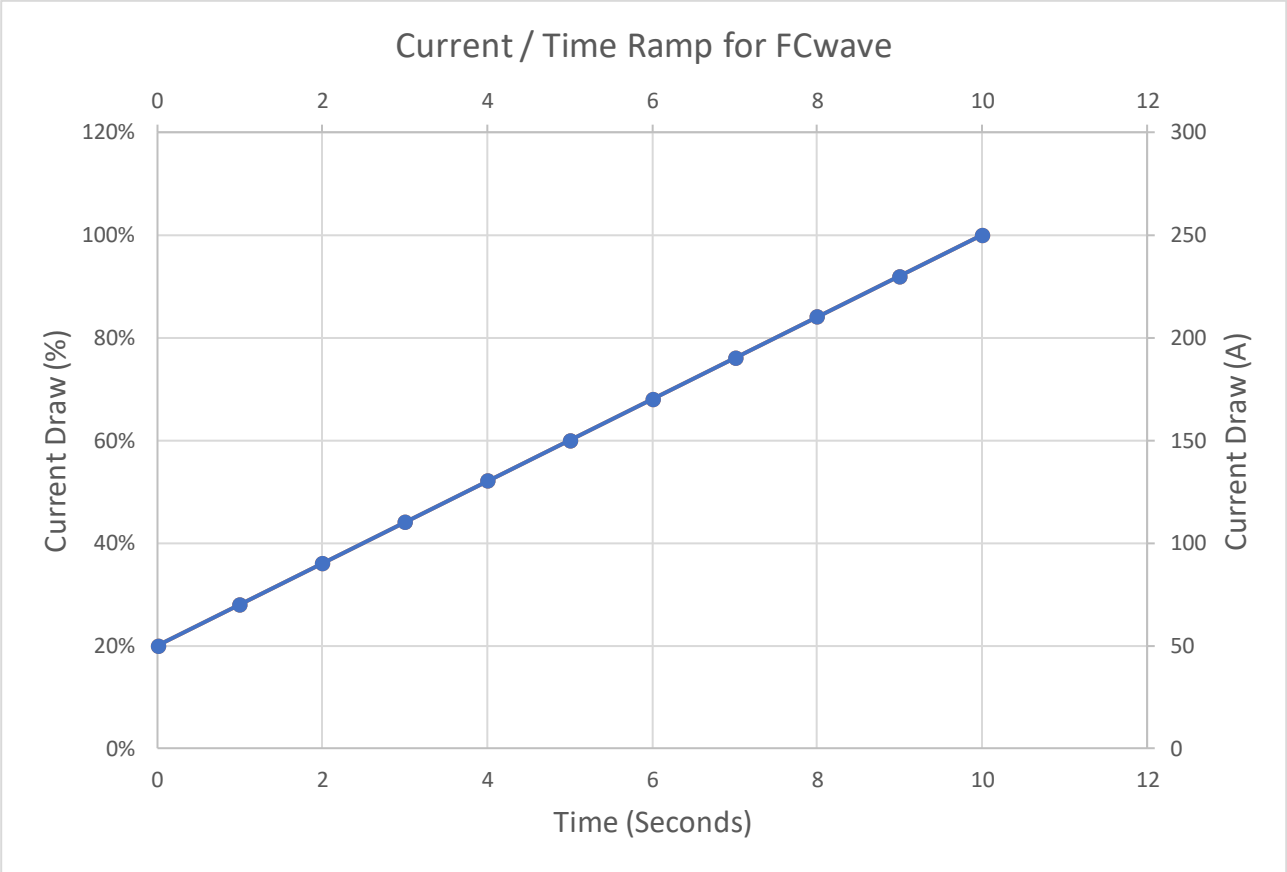

Figure 30 – Current/Time ramp for operation of external DCDCs. Dual Output Configuration shown.

The integrator must always ensure that the current draw remains below the I_Allow parameter, as transmitted over the CAN bus.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

30. Start-up sequence for the FCwave™ module

This section describes the sequence to start operation of the FCwave™ module.

30.1. Standby to Running Cycles

Lifetime of the system is based on the maximum number of **Standby** to **Running** cycles specified in Table 30. This is to preserve the performance of the fuel cell stack and BOP for the entire life cycle of the module. Ballard recommends this is not exceeded in daily use.

Recommendation	
Average Standby to Running Cycles	4 cycles per day (based on 18-hour days)

Table 30 – Maximum Standby-Running Cycles Recommended.

30.2. Vessel Requirements

When integrator desires to operate the Fuel Cell Module (FCM), the integrator must first ensure the following systems are ready to perform as outlined in the datasheet:

- H_2 supply system is ready to provide hydrogen.
- Coolant system is ready to transport heat away from module.
- DCDC converters are ready to operate.
- FCM is in the **Unlocked** state.

The integrator sets the “MD_Enable” hardwire connection to the FCM. This causes the module to enter the **Precharge** state.

30.3. Pre-charge

The module can enter the **Precharge** state from the Unlocked state. In the pre-charge state, the module connects the internal HVDC bus to the external HVDC supply and gradually charges the internal capacitors.

In Pre-charge state, the module awaits HVDC from Integrator. The module will send a severity 1 warning if HV is not measured after 5 seconds. It will stay in Pre-charge indefinitely until either HV is present and pre-charge process is complete or MD_Enable is not active.

- The module low side DC bus is directly coupled to the external DC bus.
- The module high side DC bus is coupled to the external DC bus over a pair of 500Ω resistors.
- This limits the current to 1A or less.
- Internally the voltage is measured:

When the voltage has exceeded a minimum level **AND**
Rate of change on the internal voltage is below a threshold.

- The module high side DC bus is coupled directly to the external DC bus.
- The resistors are decoupled.
- **Precharge** is complete.

When pre-charge is complete, module transitions to the **Standby** state.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

30.4. Standby state

From the **Standby** state, the module provides power to the motor controllers and prepares for operation. H_2 supply valves are closed.

When the integrator transmits the "MD_Run" signal over the CAN bus, the module will transition to the **Startup** state.

The DCDCs must provide a constant voltage to the HV system.

The module can be kept in **Standby** state indefinitely. High voltage DC power is present, but consumption is very low in **Standby** state, unless maintenance is being performed.

30.5. Startup sequence

In the **Startup** state, which comprises several sub-states, the module readies all systems for operation, requests H_2 valves open from the Integrator, and performs the stack power-up sequence.

In this mode, the constant voltage provided by the DCDCs must be kept operating, in order to provide power for the **Startup** sequence, see section 28.

> The air compressors are brought to minimum power levels and start providing oxidizer to the stacks.
> When the HRB is running, the module will flush the H_2 loop, to quickly fill the fuel cells with hydrogen.
> As oxygen and hydrogen are circulated in the stacks, the voltage increases, and rises above the voltage provided by the DCDCs. BOP supply is transitioned from external supply to the stacks.

Integrator shall stop providing a constant voltage when module state (as reported in the FCM_STATUS_1 CAN telegram, see **CMS013 CAN Matrix**) is "**Startup Stk Cont Cls**" or **Startup RX Auto**

The MCU signals the DCDCs to stop and air compressors are spooled up and the module will be able to provide power as the MCU transitions to Running state

During startup, the power supplied from the DCDCs to the module is below 4kW.

30.6. Startup procedure of DCDCs

When controlling the DCDC converters, attention must be paid to the CAN messages from the module, which describe when to provide or draw power.

The DCDC(s) must react according to the following CAN-messages, see **CMS013 - CAN Matrix**:

From message "FCM_STATUS_1"

- DCDC_STOP
- DCDC_IMPORT
- DCDC_EXPORT

From message "FCM_REQUEST_2"

- String A Maximum Import Current (I_BOP_A)
- String B Maximum Import Current (I_BOP_B)
- String A Minimum Voltage (UFC_MIN_A)

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

- String B Minimum Voltage (UFC_MIN_B)

The module must not receive nor draw any current through the DCDCs in states *Locked* and *Unlocked*. (DCDC disabled or in stopped state). In these states the contactors are open and the module is disconnected from the DCDC.

In the states **Precharge** until[6] **Startup *Stk Cont Close***, the DCDCs must keep a voltage above the minimum voltages, by supplying adequate current. Preferred voltages are 350 to 450 V, and maximum voltages are 550 V. This is signaled by the flag "DCDC_IMPORT" being true.

There must never be supplied more current than the Maximum Import Current, even if the voltage would drop to less than the minimum voltage.

Going from the beginning of the **Startup** sequence to **Startup Stk Cont Close** takes 30 seconds typically.

In the state **Startup Stk Cont Close**, the DCDC shall stop providing constant voltage (Flag DCDC_STOP is true).

In the state **Running** the DCDC converter shall be in voltage-following constant current mode. In this state I_ALLOW will be ramped up to above the minimum current, described in section 29, within 1 second. The DCDC then has 10 seconds to increase the current draw to above the minimum current.

If the DCDC fails to draw more than the minimum current, the module will first provide a warning over the CAN bus, and if the current draw still does not exceed minimum levels, will signal a fault and perform a controlled shutdown.

30.7. Shutdown procedure of the DCDCs

Before a shutdown, it is required to reduce the current draw to the minimum current, described in section 32.4 "Shutdown sequence".

When a shutdown is initiated, the module will enter the state *Shutdown Rx Purge.* The maximum current the DCDCs must draw is now 0 A. I_ALLOW will within 1 second fall to below 10 A. This state will last between 10 and 60 seconds.

After reducing DCDC power to 0A and module has transitioned to *Shutdown Rx Purge*, the DCDC converters are not needed until next restart of the module and can be switched to standby.

The module will then deplete internal reactant remains and perform a pressure decay test to verify the tightness of the hydrogen system (see section 32.5). After this test is complete the module transitions to unlocked state. If MD_Enable is still present, the module will again enter the **Precharge** state.

[6] Following the normal startup procedure. The states are *Standby, Startup HRB on, Startup Air On, and Startup Fuel On*

31. Special Operating States

This section describes the special operating states that the system can operate in when requested.

These states are not a part of normal operating sequence but are necessary for maintenance activities and pre-storage preparations.

31.1. State: Coolant Degas

The purpose of this state is to remove air bubbles from the Internal HT coolant loop. This state is typically used after coolant fill/drain cycles, or maintenance involving the HT coolant loop

Parameter:	Value:	Comment:
Preceding state	Standby	
HV Supply	Yes, <3kW	Power to operate coolant pump
Customer HT Coolant	No	
Customer LT Coolant	Yes	Coolant for inverter, expected <500W
H2 Supply	No	
Exit condition	Manual	Returns to Unlocked state

Table 31 – Coolant Degas State.

To use this state, bring module to **Standby** and activate the DEGAS_REQ bit. When completed, disable the bit. This state takes typically 5-10 minutes to degas the coolant loop after a complete drain/fill cycle.

In this state, the coolant pump circulates the coolant while the internal valves actuate in order to flush all air bubbles in the internal coolant loop.

The state is active as long as requested by customer/maintenance personnel.

This state does not affect the external HT coolant supply.

31.2. State: Prepare for Service

The purpose of this state is to remove all residual hydrogen from the fuel circuit, such that maintenance activities can be performed in a safe manner. The hydrogen is reacted with oxygen from the air and either used by the motor inverters or dissipated in the bleed resistors.

This is achieved by circulating the contents in the fuel system by operating the HRB and supplying oxygen by operating the compressors at low speed.

Parameter:	Value:	Comment:
Preceding state	Standby	
HV Supply	Yes, <4kW	Power to operate HRB, Air compressors
Customer HT Coolant	No	
Customer LT Coolant	Yes	Coolant for inverters, expected <500W
H2 Supply	No	
Exit condition	When finished	Next state: “Prepare Complete”

Table 32 – Prepare for Service State.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

When **Prepare for Service** is complete, all hydrogen in the fuel system is exhausted and the stack voltage is reduced to below 10V. The system transitions to **Prepare Complete**.

31.3. State: Prepare Complete

The purpose of this state is to indicate for maintenance personnel that the system has completed the procedures to exhaust available hydrogen and stack voltage is below dangerous levels.

This state has no exit condition, and a power cycle is required to exit it.

Parameter:	Value:	Comment:
Preceding state	Prepare for Service	
HV Supply	No	
Customer HT Coolant	No	
LT Coolant	No	
H2 Supply	No	
Exit condition	None	Requires power cycle to exit state.

Table 33 – Prepare Complete State.

Please note that the prepare for maintenance procedure it not intended for daily use, as excessive use of this functionality may degrade stack performance.

31.4. State: Dry-out

The purpose of this state is to remove liquid water from the module, such that stacks are in a “dry” condition after completing this procedure. This is intended to be the final part of the last operation cycle before long term storage or transportation of the module, where temperatures may reach freezing conditions.

Parameter:	Value:	Comment:
Preceding state	Running	I_Allow ramps to 0A, then disconnects HV system.
HV Supply	Disconnected	
Customer HT Coolant	Yes	Reduced cooling requirements
LT Coolant	Yes	
H2 Supply	Yes	
Exit condition	Timed, Conditional	Exits to module shutdown. Duration 6 min or less

Table 34 – Dry-out State.

Initiating Dry-out

The prerequisites for the dry-out sequence are as follows:

- The module must be in the “Running” state.
- No alarms

To start the dry-out sequence, enable the “DRYOUT REQUEST” bit from over the CAN bus.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Dry-out Sequence

When requested to begin a dry-out, the module ramps I_Allow to 0A. When the customer current is reduced to <5A, the module begins the dry-out process.

The integrator will observe that the fuel cell module opens its HV connectors and disconnects from the vessel HV system. When disconnected, the module ramps up temperature and airflow to accomplish the dry-out process. During this state, the air compressors are operating at high power levels.

Dry-out Completion

When the module has completed the dry-out process or 6 minutes has elapsed, the module will perform a controlled shutdown process, identical to a normal operational shutdown. After the shutdown, the module is prepared for long term storage.

Restarting module after Dry-out and Storage

When the module is to be operated again after the dry-out procedure, integrator must operate the module in a low power regime (50-75kW) for at least 20 minutes before increasing power. This allows the stack to return to proper humidification conditions.

Expect that performance is impacted until stacks are re-humidified. This is temporary and can be helped by performing a conditioning cycle, contact Ballard for details.

31.5. State: Recovery

The Recovery state is intended to recover temporary performance degradations.

Please consult with Ballard before utilizing the recovery functionality.

Parameter:	Value:	Comment:
Preceding state	Running	Certain conditions apply.
HV Supply	Operating	
HT Coolant	Yes	
LT Coolant	Yes	
H2 Supply	Yes	
Exit condition	Manual	Returns to Running.

Table 35 – Recovery State.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

32. Normal Operation Example

During normal operation, the stack converts hydrogen to power, dependent on the current drawn and at a voltage primarily dependent on the stack operating point. The voltage vs. current relationship is described by the system polarization curve.

Operation Example					
Sequence	**Description**	**Module State or Transition**	**DCDC Indicators**		**Typical duration**
1	Integrator enables 24V supplies to module and SAFE_IN safety input. Integrator sends Module key over CAN bus	Module transitions from Off to Locked to Unlocked	STOP	False	1-2 minute
			IMPORT	False	
			EXPORT	False	
	Module is in Unlocked state	Module state is Unlocked	STOP	True	Can stay in Unlocked indefinitely.
			IMPORT	False	
			EXPORT	False	
2	Integrator enables MD_Enable input	Module transitions from Unlocked to Precharge	STOP	True	<1 second
			IMPORT	False	
			EXPORT	False	
	Module pre-charges HV Circuit	Module transitions from Precharge to Standby	STOP	False	2 seconds
			IMPORT	True	
			EXPORT	False	
	Module is in Standby	Module State is Standby	STOP	False	Can stay in Standby indefinitely
			IMPORT	True	
			EXPORT	False	
3	Integrator wishes to operate FCwave™ module and sends MD_Run over CAN bus	Module transitions from Standby to Startup sequence	STOP	False	<1 second
			IMPORT	True	
			EXPORT	False	
4	Module has begun drawing power on HV bus to spin compressors, module requests H2 valves open. Hydrogen flows to stacks	Startup sequence	STOP	False	30 seconds
			IMPORT	True	
			EXPORT	False	
5	Module is self-powered from stacks, start-up sequence continues	Startup sequence	STOP	True	<15 seconds
			IMPORT	False	
			EXPORT	False	

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

6	Module completes the startup sequence and enters Running. Module transmits I_Allow > 0 on CAN bus and begins producing power	Running	STOP	False	<5 seconds
			IMPORT	False	
			EXPORT	True	
7	Module is in Running state and produces power to vessel. Integrator follows current ramp and does not exceed I_Allow	Running	STOP	False	Module can operate indefinitely
			IMPORT	False	
			EXPORT	True	
8	Integrator wishes to stop operating the module. Ramp current draw to <10A as described in section 32.4 and stop sending MD_Run	Running	STOP	False	<10 seconds
			IMPORT	False	
			EXPORT	True	
9	Module begins shutdown sequence	Module transitions from Running to Shutdown	STOP	True	<1 second
			IMPORT	False	
			EXPORT	False	
10	Module executes shutdown sequence. After complete shutdown sequence module transitions to Unlocked	Shutdown to Pressure Decay	STOP	True	30 seconds
			IMPORT	False	
			EXPORT	False	
11	Module performs pressure decay self-test of hydrogen system.	Pressure Decay to Unlocked	STOP	True	30 seconds
			IMPORT	False	
			EXPORT	False	
12	After 15 minutes inactivity, it is permissible to power off module	Unlocked to Off			15 mins

Unauthorized copying, distribution or use of this manual is strictly prohibited.

32.1. Startup Sequence

The detailed **Startup** sequence for the FCwave™ module is outlined in Table 37 and shown in Figure 32.

FCwave™ Module Startup - Detailed			
Module State	**Description**	**Module State or Transition**	**Typical duration**
Standby	Module has completed pre-charge. DCDC is providing constant voltage to BOP components. Current draw is ~0	Standby	Indefinite
Standby	Integrator transmits MD_RUN over CAN bus	Transition to SU HRB On	n/a
SU HRB On	HRB Motor spins up. DCDC maintains voltage, current draw increases.	SU HRB On	~5 sec
	HRB is at speed	Transition to SU Air On	n/a
SU Air On	Air compressors initialize and spin to startup speed. DCDC load increases as compressors draw power.	SU Air On	~10 sec
SU Air On	Air compressors stable at startup speed. DCDC load stable.	Transition to SU Fuel On	n/a
SU Fuel On	Fuel subsystem opens valves and flood stacks with hydrogen. Stack voltage increase to ~600V. Load on DCDCs fall to nearly 0, as BOP is powered by stacks through diodes.	SU HRB On	~15 sec
SU Fuel On	Fuel pressure is stable at nominal levels	Transition to SU StkContCls	n/a
SU StkContCls	Main stack contactors close, bypassing startup diodes.	Transition to SU Rx Auto	<1 sec
SU Rx Auto	BOP Components switch from minimum setpoints to operational control	SU Rx Auto	~5 sec
SU Rx Auto	BOP Components are stable at operational control	Transition to Running	n/a
Running	Module is ready to provide power	Running	n/a

Table 37 – Detailed Startup sequence, See Figure 32.

32.2. Startup Energy Consumption

The energy consumption during **Startup** is detailed in Table 38.

Type	Duration	Amount	Total Energy
24VDC auxiliary power input	Continuously	352W	10 kJ
HV DC	0-27s	4000W	52
Hydrogen	4-6s	0,11 g/s	66 kJ
Combined	-	-	128 kJ

Table 38 – Startup energy consumption.

Unauthorized copying, distribution or use of this manual is strictly prohibited.

32.3. Running state

Transition from start-up to running state

When module transitions from **Startup** to **Running** state, "I_ALLOW" will rise above 0 Amps and the integrator can begin drawing current from the module.

The interval between the transition to **Running** mode and for the integrator to begin drawing current should not exceed 5 seconds, under normal operating conditions.

If the integrator does not draw more than the minimum current, the module will first signal a severity 1 warning. If the current draw remains below minimum level for more than 20 seconds, the module will perform a controlled shutdown and signal a severity 2 alarm.

Running state limitations

In the running state, the system is providing electrical power, and acting as a load follower for the DCDCs. The system has limited dynamic capabilities and will signal its ability to provide current as described in section 29.

Note: During operation, the integrator must respect the limits imposed by "I_ALLOW".

Note: During operation, the integrator shall not reduce current draw below minimum levels (50A), except during shutdown. Brief (<5 seconds) reductions below 50A can be permitted but should be avoided.

Note: The recommended current ramp is specified in section 29.5

32.4. Shutdown sequence

When the integrator wishes to stop operating the FCM, the proper procedure is as follows:

1. Reduce current draw from DCDCs to 10A.
2. Reduce to 0 A, within 5 seconds disable the MD_Run CAN signal.
3. The module preforms the shutdown sequence. Expected duration is 45 seconds.
4. During the shutdown, the module performs a pressure decay self-test, see section 32.5.
5. After shutdown is complete, module returns to Unlocked state.
6. Integrator decides if module is expected to operate soon:
    a. If module is not expected to operate in < 1h, disable MD_Enable and module transitions to **Unlocked** state.
    b. If module is expected to operate in < 1h, maintain MD_Enable and module will return to **Standby** state
    In order to return to Standby, external HVDC supply must be active as described in section "30.3 Pre-charge"
7. When the module switches to **Standby** state, integrator can re-enable MD_Run to restart module or disable MD_Enable if an imminent restart is not expected.
8. If integrator disables MD_Enable, module switches to **Unlocked** state

Module may be powered off 15 minutes after entering **Unlocked** state[7]. The module will during this time consume the remaining hydrogen in the supply system, as it may not be turned off with excess

[7] Duration to be revised after system testing, in order to verify the duration it takes to dissipate H2 inside the module

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

hydrogen in the supply line. It is recommended to turn off the 24V supply if the module is not used for the next several hours.

During this time, the module will also upload log files to Ballard if internet is available.

32.5. Pressure Decay self-test

This section describes the pressure decay self-test performed by the module as a part of the shutdown sequence.

Conditions for performing the self-test is as follows:

- Shutdown is caused by customer disabling MD_Run CAN signal
- No alarms active

During the test, the module uses hydrogen to partially pressurize the internal hydrogen loop and then close supply valve. Then the pressure decay over time is monitored and evaluated. The pressure decay self-test typically lasts 30 seconds.

Failed Pressure Decay self-test

If the module fails the pressure decay self-test, it will signal a severity 2 alarm and require a specific acknowledgement of the alarm before allowing restart. The causes of a failed self-test can be:

- Unable to pressurize internal hydrogen loop.
  - Internal pressure does not reach setpoint within time limit. Ensure module has available hydrogen to perform self-test
- Pressure decays too rapidly
  - This indicates a leakage inside the hydrogen loop. Contact Ballard service
- Pressure test aborted
  - The test is aborted if MD_Enable becomes high or any alarms are active.

If a pressure decay test failure occurs, it is required to perform an investigation into the cause of the failure. This investigation should include all relevant data, including ventilation exhaust hydrogen content and inlet pressure. When the cause has been identified and the system is deemed safe, the pressure decay failure can be reset by setting the “Pressure Decay Failure Reset” bit in the VCS_REQUEST CAN message. For further instruction on pressure decay testing follow the maintenance instructions.

Unauthorized copying, distribution or use of this manual is strictly prohibited.

33. Overnight storage of FCwave

This section describes the options for an installed FCwave™ module during overnight (unattended) options on the vessel.

33.1. Environmental Concerns

If the module is left overnight or for longer periods, for example weekend and holidays, the environment surrounding the module must stay within the environmental specifications as listed in Table 10 – Ambient Temperature Specification.

NOTE: Do not permit the hydrogen enclosure ventilation intake to circulate air <0°C into the module

33.2. Power off

When finished with the daily operation of the module, allow the module to remain 15 minutes in non-operating state (Unlocked or Standby), such that H2E ventilation may continue to operate and allow the module to cool down.

After the 15 minutes has elapsed, shut off 24V power to the FCwave™ module.

In the unpowered state, no part of the control or safety system is operational and there is no activity inside the module.

It is not possible to turn off the control system only, as one of the ventilation fans operate off the control system supply.

33.3. Unlocked

If it is desired to maintain the hydrogen enclosure ventilation and monitoring system of the module, allow the module to remain in the “Unlocked” state, where the alarm system is operational, and the hydrogen enclosure is continually ventilated by the fans.

In this state, the module draws 350W continuously, which must be provided by the vessel.

NOTE: Do not permit the hydrogen enclosure ventilation intake to circulate air <0°C into the module

34.2. Digital Supply and Signal Definitions

Hardwired inputs and outputs between the drive system and module are defined in Table 39, Table 40, and Table 41. These include the type of signal and a description of their purpose.

Module Supply Definitions

Interface Specification				
Interface name long	**Interface name**	**Interface type**	**Input / Output**	**Description**
24V DC supply	24V_SUPPLY	Supply	Input	Max 750W power draw
DC common	COM_SUPPLY	Supply	Input	DC Common. Not connected to GND.
Module grounding stud	GND_01	Grounding stud	Grounding	Grounding of module frame

Table 39 – Connection Definitions for Module Control Supply.

Fuel Cell Controller Signal Definitions

Signals in this category are referenced to 24V_SUPPPLY. CAN bus communications are specified in **CMS013 CAN Matrix**.

Interface Specification						
Interface name long	**Interface name**	**Interface type**	**Input / output**	**Switching type**	**Description**	**Active High/Low**
Module enable	MD_Enable	24V Hardline	Input	High side input	Signal to transition module from **Unlocked** to **Standby** state – Used prior to module activation	Active High
H2 enable	H2_ENABLE	24V Hardline	Output	Low side output	Signal to hydrogen supply system to open upstream H2 valves and provide hydrogen for module activation. Switched to COM_SUPPLY when active. See section 14.5.	Switched to COM_SUPPLY when active.
FUEL CELL MODULE STATUS OK	FCM_OK	24V Hardline	Output	High side output	Signal to customer if module is operational (I.e., has no fault of severity 2 or 3). (*Please note that this is separate from a Safety system emergency).*	Active low. High = FCM OK Low = FCM Error
Customer CAN bus	CAN_02	CAN bus	Bidirectional	n/a	Customer interface to fuel cell module.	n/a
Ethernet	ETH_01	Ethernet	Bidirectional	n/a	Service and Datalogging interface.	n/a

Safety System Supply and Signal Definitions

Signals in this category are referenced to 24V_SAFE.

Interface Specification						
Interface name long	**Interface name**	**Interface type**	**Input / output**	**Switching type**	**Description**	**Active High/Low**
24V DC supply safety	24V_SAFE	Supply	Input	n/a	Max 250W power draw, Ship Emergency Supply	n/a
DC common safety	COM_SAFE	Supply	Input	n/a	DC Emergency Supply Common. Not connected to GND.	n/a
Main safety in	SAFE_IN	24V Hardline	Input	High side input	Safety input from Vessel control system. Disable this signal to trip emergency system externally.	Active High
Main safety out	SAFE_MAIN	24V Hardline	Output	High side output	Main output from safety control system. This output will, together with the following sub-system specific output signal give the condition of the emergency system.	Active High
Safety – fire detection	SAFE_FIRE	24V Hardline	Output	High side output	Output indicating the status of the fire detection system.	Active High
Safety – hydrogen concentration	SAFE_H2CONC	24V Hardline	Output	High side output	Output indicating the status of the hydrogen concentration in the H2 enclosure being too high.	Active High
Safety – ventilation status	SAFE_VENT	24V Hardline	Output	High side output	Output indicating the status of the ventilation system.	Active High
Safety - watchdog	SAFE_WD	24V Hardline	Output	High side output	Output indicating the status of the safety system internal monitoring.	Active High
Estop – wire 1	ESTOP_W1	24V Hardline	Input	High side Input	Input to safety system from external 2-wire ESTOP button, Integrator responsibility.	Active High
Estop – wire 2	ESTOP_W2	24V Hardline	Input	High side Input	Input to safety system from external 2-wire ESTOP button, Integrator responsibility.	Active High
Estop – out 1	ESTOP_OUT1	24V Hardline	Output	n/a	ESTOP output for external 2-wire ESTOP button. Connected internally to “24V-SAFE”.	n/a
Estop – out 2	ESTOP_OUT2	24V Hardline	Output	n/a	ESTOP output for external 2-wire ESTOP button. Connected internally to “24V-SAFE”.	n/a
Safety – External ESTOP	SAFE_EXTERN	24V Hardline	Output	High side output	Output indicating the status of the external safety inputs	Active High

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Safety – Fire Detection System Malfunction	SAFE_FIREMALF	24V Hardline	Output	High side output	Output indicating the status of the fire detection apparatus. When inactive, indicates a malfunction in the fire detection system	Active High

Table 41 – Signal Definitions for Safety System.

34.3. ESTOP Connections and wiring

The ESTOP connections on the FCwave™ module, as detailed in Table 41 should be wired according to applicable standards and rules for the application.

Ballard recommends the ESTOP connection and button connected to the FCwave™ should fulfill the following requirements:

Construction compliant to EN/ISO 13850
Contacts should be of the type "Positive forced opening normally closed contact", two contact sets
Wiring performed in accordance with diagram CMS010-A and section 35 2133586288.429.

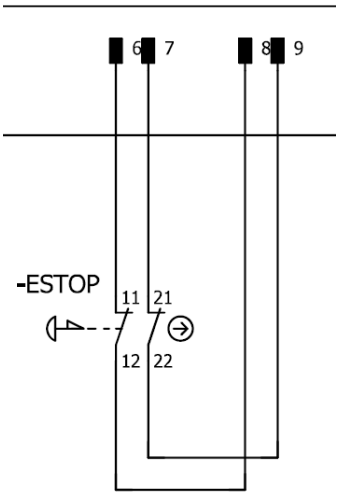

Figure 36 – ESTOP Wiring diagram, reproduced from CMS010-A.

35. Low Voltage Connector Construction

The Low Voltage Connector ("LVC") is constructed with a housing and a frame containing six modular elements, each with a distinct function and connection pattern.

35.1. Signal Wiring

Ballard strongly suggests shielded wiring for low voltage power, bus and signals. Shielding is absolutely required for CAN bus communications (Slot D).

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

35.2. Connector Elements

The Ballard scope of the Low Voltage Connector (LVC) is constructed by the following elements:

Component	Tag	Manufacturer	MFG Part name	MFG Part #
Housing	X_E01	Harting	Han 24HPR Base Panel Screw locking	09 40 024 0311
Frame	X_E01	Harting	Han hinged frame plus, for 6 modules a-f	09 14 024 0371
Slot A	X_E01-A	Harting	Han 40A axial module, female 2,5-8 mm²	09 14 002 2701
Slot B	X_E01-B	Harting	Han DD Quick-Lock module, female	09 14 012 2732
Slot C	X_E01-C	Harting	Han Gigabit Module, Female	09 14 008 3111
Slot D	X_E01-D	Harting	Han D-Sub module, crimp female	09 14 009 3101
Slot E	X_E01-E	Harting	Han 40A axial module, female 2,5-8 mm²	09 14 002 2701
Slot F	X_E01-F	Harting	Han DD Quick-Lock module, female	09 14 012 2732

Table 42 – Low Voltage Connector Construction.

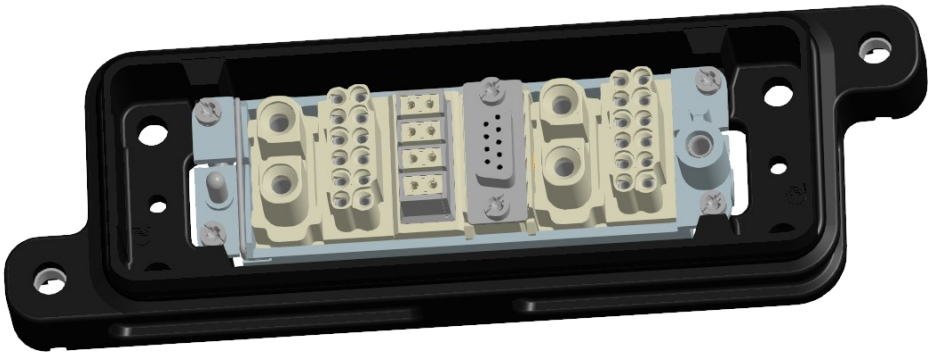

Figure 37 – Rendering of Low Voltage Connector. Slots A to F are shown from left to right.

As shown in Figure 37, the LVC is comprised of the frame with the 6 modules slotted into the frame. The Modules are designated A to F, viewing the image from left to right.

35.3. Protection of the Low Voltage Connector

When the Control and Communication Connector is not mated to a suitable plug, it should be protected against ingress of dust, grime and fluids by an appropriate protective cover.

Ballard will provide a screw locking cover for the connector during shipping and handling. If this cover is lost, replacement can be purchased from Ballard or Harting, quoting Harting Stock # 9400245411.

When mated to a suitable connector or protective cover, the Ingress Protection rating of the connector is IP65 and IP68 in both cases.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

35.4. Low Voltage Connector kit

Ballard can supply a kit containing a suitable set of parts to construct a connector. Contact Ballard Europe and request “7500168 Integrator LVDC Connector Kit”.

35.5. Low Voltage Connector Pin Assignment

This section describes the pin assignment for the low voltage connector.

Slot A

This slot in the connector is the connection point for the module 24VDC supply. Voltages and tolerances are described in CMS006.

Pin	Tag	Function	Interface name
1	=X_E01-A:1	+24VDC	24V_SUPPLY
2	=X_E01-A:2	0VDC	COM_SUPPLY

Table 43 – Slot A Signal Definitions and Assignments.

Slot B

This slot in the connector is the connection point for the fuel cell controller signals. These signals are referenced to the potentials in Slot A

Pin	Tag	Function	Interface name
1	=X_E01-B:1	Digital Out	FCM_OK
2	=X_E01-B:2	Digital Out	H2_ENABLE
3	=X_E01-B:3	Digital In	MD_Enable
4-12	Various	Not Connected	Not Applicable

Table 44 – Slot B Signal Definitions and Assignments.

Slot C

This slot in the connector is the connection point for the Module Control Unit Ethernet Interface.

The module is wired according to TIA **T568B**.

Pin	Color	Function	Interface name
1	Orange / White	Ethernet	MCU Network
2	Orange	Ethernet	
3	Green / White	Ethernet	
4	Blue	Ethernet	
5	Blue / White	Ethernet	
6	Green	Ethernet	
7	Brown / White	Ethernet	
8	Brown	Ethernet	

Table 45 – Slot C Signal Definitions and Assignments.

See section 37.6 “Module Default IP and CAN Address” for details on the ethernet connection.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Slot D

This slot in the connector is the connection point for the Module Control Unit CAN bus module control interface. The connector accepts a standard D-SUB 9 pin plug, male.

For functional details, please refer to **CMS013 CAN Matrix.**

Pin	Tag	Function	Interface name
2	=X_E01-D:2	CAN LOW	CAN02, Low
7	=X_E01-D:7	CAN HIGH	CAN02, High
3	=X_E01-D:3	CAN GND	CAN02, Ground
SH	=X_E01-D:SH	CAN Shield	CAN02, Shield
<others>	Various	Not Connected	Not Applicable

Table 46 – Slot D Signal Definitions and Assignments.

Slot E

This slot in the connector is the connection point for the module 24VDC supply for the Safety System. Voltages, Power Draw and tolerances are described in CMS006.

This should be connected to the Vessel Emergency Supply.

Pin	Tag	Function	Interface name
1	=X_E01-E:1	+24VDC	24V_SAFE
2	=X_E01-E:2	0VDC	COM_SAFE

Table 47 – Slot E Signal Definitions and Assignments.

Slot F

This slot in the connector is the connection point for the safety system signals. These signals are referenced to the potentials in Slot E.

Please refer to Table 41 – Signal Definitions for Safety System for functional description.

Pin	Tag	Function	Interface name
1	=X_E01-F:1	Digital Out	SAFE_MAIN
2	=X_E01-F:2	Digital Out	SAFE_FIRE
3	=X_E01-F:3	Digital Out	SAFE_H2CONC
4	=X_E01-F:4	Digital Out	SAFE_VENT
5	=X_E01-F:5	Digital Out	SAFE_WD
6	=X_E01-F:6	+24VDC, Max 0,25A	ESTOP_OUT1
7	=X_E01-F:7	+24VDC, Max 0,25A	ESTOP_OUT2
8	=X_E01-F:8	Digital In	ESTOP_IN1
9	=X_E01-F:9	Digital In	ESTOP_IN2
10	=X_E01-F:10	Digital In	SAFE_IN

36. High Voltage Connections

The purpose of this section is to describe the HVDC connectors on the front plate of the module.

The module has 4 connection points from the stack strings, two from each.

36.1. Connector - HVDC

The HVDC connectors are produced by Amphenol Industrial, within the product line Amphe-Power.

Figure 38 – Amphe-Power panel mount connector – Module connectors are red or black.

The four front panel mount connectors are color coded and keyed to prevent connection errors.

TAG	Electrical Connection	MFG	MFG#	Ballard Part #	Color	Keying
X_HV01	String A Positive	Amphenol Industrial	APSPS-1-R-T5	7000819	Red	1
X_HV02	String B Positive	Amphenol Industrial	APSPS-2-R-T5	7000820	Red	2
X_HV03	String A Negative	Amphenol Industrial	APSPS-1-BK-T5	7000821	Black	1
X_HV04	String B Negative	Amphenol Industrial	APSPS-2-BK-T5	7000822	Black	2

Table 49 – HVDC Connector Tags.

Amphe-Power Range – Key Specification	
No of Contacts	1
Maximum Continuous Current Rating	Up to 800A
Surge Current	75kA
Short Circuit Rating	Up to 35.5kA
Cables Cross Sectional Area C.S.A	24mm2 to 300mm2
Contact Termination	Screw or Crimp
Mating Method	Bayonet Lock
Operating Voltage	1000VAC
Max Rated Voltage to Earth	2kV AC/ 3kV DC

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Minimum Flashover	9.5kV DC or AC Peak
Insulation Resistance	>5M ohms @ 500V DC
Ingress Protection	IP67
Protection against Electrical Shock	IP2X
Flammability	UL94-V0
Mating Cycles	>500
Shell Material	High Temperature Thermoplastic
Contact Plating	Silver

Table 50 Amphe-Power key specifications

36.2. Mating Part - HVDC

This section describes the recommended mating Parts to be used with the power connectors.

TAG	Electrical Connection	MFG	MFG#	Ballard Part #	Color	Keying

Customer Scope	String B Positive	Amphenol Industrial	APSLD-2-R-S120-M40S	7000825	Red	2
Customer Scope	String A Negative	Amphenol Industrial	APSLD-1-BK-S120-M40S	7000824	Black	1
Customer Scope	String B Negative	Amphenol Industrial	APSLD-2-BK-S120-M40S	7000826	Black	2

Table 51 – HVDC Connector Mating parts.

Ballard Europe can supply a set of matching connectors suitable for 120mm2 cables. Contact Ballard Europe and request “7500169 Integrator HVDC Connector Kit”.

36.3. Protection of the High Voltage Connector

When the High Voltage Connectors are not mated to a suitable plug, they should be protected against ingress of dust, grime and fluids by an appropriate protective cover.

When mated to a suitable connector or protective cover, the Ingress Protection rating of the connectors is IP67.

37. Control System – Fault Severities and Reporting

This section details the reporting of severities and fault handling by the module. A sample alarm is listed, but the full list of possible alarms is too long to present here. Integrators are referred to **CMS014 Control System Alarm List**.

The module has 1 level of informational message and 3 levels of warnings and alarms of increasing severity, internal to the control system.
A further level is handled separately by the safety control system and is included for completeness.

37.1. Fault Severities

Table 52 – Module Fault Severities and Descriptions lists the five types of module fault severities.

> Severity 0 through 3 is handled by the control system and does not involve the independent safety system.
> Severity 4 is handled by the safety system and overrides the module control system.

There are several ways the module can notify the Vessel Control System of a fault condition. The module provides a hardwired output (**FCM_OK**) to indicate when it has entered an alarm state. The module also broadcasts its Operating State via CAN, along with the fault codes detailed in the CAN Matrix Customer Specification (**CMS013 CAN Matrix**) document. The list of fault codes, their description and details are available in document **CMS014 Control System Alarm List**.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

Alarm Severities	
Severity	**Description**
0: information	No fault reporting to drive system. May derate **I_ALLOW**, otherwise for information only. Severity 0 events are logged by the modules on-board data acquisition system.
1: Warning	A system parameter has deviated from normal range. The fault category is reported to the drive system over CAN, along with its severity. The hardwired **FCM_OK** output remains unchanged. The module should be inspected and/or process data reviewed. Does not result in a shutdown.
2: Alarm	A system parameter has exceeded acceptable operating range, and the fuel cell module will undergo a **controlled shutdown**. The fault is reported to the drive system over CAN and the hardwired signal **FCM_OK** output will go to **0V.** **I_ALLOW** will be set to 0A. Do not exceed **I_ALLOW**. After a severity 2 fault, **do not** attempt a restart until action has been taken to identify and resolve the cause of the fault. To clear this fault, cycle the hardwired **MD_EN** signal.
3: Severe Alarm	• A system parameter has exceeded a safe operating range, and the fuel cell module will undergo an **immediate shut down**. • The fault is reported to the drive system over CAN and the hardwired signal **FCM_OK** output will go **0V**. • **I_ALLOW** will be set to 0A **immediately**. Cease current draw from the fuel cell module immediately. This severity will cause the high voltage contactors to open under load. • After a severity 3 fault, the fuel cell module must not be restarted until the cause of the fault has been determined and resolved. In addition, the module should be inspected for safe operation and Ballard must be consulted before a restart is performed.
4: Safety System Activation	• The module safety system has tripped and disabled all outputs from the module controller. This causes contactors to open under load and closes all hydrogen valves. The module performs an **immediate uncontrolled shutdown.** • The type of emergency is reported over the safety hardline connections (see section Safety System Supply and Signal Definitions2133586288.429). The hardwired signal **FCM_OK** output will go **0V**. • **I_ALLOW** will be set to 0A **immediately**. Cease current draw from the fuel cell module immediately. This severity will cause the high voltage contactors to open under load. • After a severity 4 fault, the fuel cell module must not be restarted until the cause of the fault has been determined and resolved. In addition, the module should be inspected for safe operation and Ballard must be consulted before any further actions are taken.

Table 52 – Module Fault Severities and Descriptions.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

37.2. Resetting a fault

To reset an alarm from the module, after remedying the fault and verifying that the underlying cause cannot reoccur, the integrator can toggle the **MD_Enable** signal.

The module controller clears alarms on the rising edge of **MD_Enable**, refer to section 2133586288.429 “Fuel Cell Controller Signal Definitions”.

Alternatively, the integrator can attempt to reset faults over the CAN bus. This can be done in the “Unlocked” state by sending the “Alarm Acknowledge” bit in the **VCS_REQUEST** can message.

37.3. CAN Communication

The individual CAN messages to and from the fuel cell module are detailed in the CAN Matrix Customer Specification **CMS013**. Contact Ballard Power Systems for the latest version of the customer-specific CAN matrix. The CAN network operates at a fixed baud rate of 250 kbps and a watchdog is in place to verify CAN activity.

As CAN networks are susceptible to noise, it is strongly recommended to follow best practice and use shielded cables for all CAN wiring. Special care should be taken for the placement of the two terminating resistors on the CAN bus.

Include a 120Ω terminating resistor on the module CAN interface. It is the responsibility of the integrator to add the terminating resistors on the customer interface harness. The module contains one 120 Ω resistor at the MCU CAN bus connection point. After complete assembly, the measured resistance between CAN high and Low should be 60±5 Ω.

Note: The module will shut down (Severity 2) if CAN communication is lost during operation. It is strongly recommended to have a proper wiring, shield each CAN cable and to be EMI proof.

37.4. CAN Customization Key

Ballard will supply each integrator with a unique customization key, which can be found on the CAN Matrix Customer Specification (**CMS013**) document. Send this specific CAN message to allow the module to exit **Locked** state (refer to Figure 27 – High Level State Sequence). It is also used to ensure the correct software is in place for the integrator.

37.5. Controller Heartbeat

The module controller sends a heartbeat over CAN, for the integrator to use as an input for their watchdog. This heartbeat should be synchronized with the drive side watchdog as a method to ensure the module controller is powered up and active. The CAN message **FCM_REQUEST_1** transmits as soon as low voltage power is provided, and the controller is booted-up. As per the CAN matrix (**CMS013**), it is an 8-bit counter that increments every 100 milliseconds and will wrap around after 25.5 seconds (255 heartbeats).

37.6. Module Default IP and CAN Address

Modules are delivered, unless explicitly requested otherwise by customer/Integrator, according to a default IP and CAN address schedule provided in Table 54 – Single Module IP and CAN address. For multiple modules in a deployment, the range of IP, CAN source addresses and CAN destination addresses (called “PDU Specific”) are given in Table 55 – Multiple Module IP and CAN .

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

37.7. Single Module and Vessel CAN Address

For deployments of a single module, default IP and CAN addresses are as follows:

Vessel Name	IP Address	CAN bus Source Address
<no fixed name>	<no fixed address>	0x27

Table 53 – Vessel Control System CAN address.

Module Name	IP Address	CAN bus Source Address
“Vesselname 1”	10.10.10.10	0x12

Table 54 – Single Module IP and CAN address.

37.8. Multiple modules

There is a practical limit to how many modules can co-exist on a single CAN bus. This limit is currently unconfirmed but is expected to be around 8 modules without exceeding CAN bus traffic recommendations. This pre supposes no other traffic on the CAN bus.

For deployments of multiple modules, the default IP and CAN addresses are as Table 55. The vessel control system CAN source address is unchanged.

Module Name	MCU IP Address	MCU CAN bus Source Address	VCS CAN bus PDU Specific Offset
“Vesselname 1”	10.10.10.10	0x12	0x00
“Vesselname 2”	10.10.10.11	0x13	0x01
“Vesselname 3”	10.10.10.12	0x14	0x02
“Vesselname 4”	10.10.10.13	0x15	0x03
“Vesselname 5”	10.10.10.14	0x16	0x04
“Vesselname 6”	10.10.10.15	0x17	0x05
“Vesselname 7”	10.10.10.16	0x18	0x06
“Vesselname 8”	10.10.10.17	0x19	0x07
<etc>	<etc>	<etc>	<etc>

Table 55 – Multiple Module IP and CAN addresses.

The FCwave™ CAN matrix is designed with inspiration from SAE standard J1939, thus the FCwave™ CAN Matrix specifies a PDU Specific for all CAN messages from Vessel to Module controller. The CAN bus PDU Specific Offset must be added to the value specified in that document, in effect modifying the message ID of the relevant CAN messages.

Example

Table 56 below shows how the IP and CAN addresses should be set up for a vessel named “Ballard” with four FCwave™ modules installed.

Module Name	MCU IP Address	VCS_REQUEST Msg ID	VCS_STATUS Msg ID	VCS_REQUEST_FAST Msg ID	MCU CAN Source Address
“Ballard 1”	10.10.10.10	0x10FF0027	0x18FF0027	0x00FFA027	0x12
“Ballard 2”	10.10.10.11	0x10FF0127	0x18FF0127	0x00FFA127	0x13
“Ballard 3”	10.10.10.12	0x10FF0227	0x18FF0227	0x00FFA227	0x14

"Ballard 4"	10.10.10.13	0x10FF0327	0x18FF0327	0x00FFA327	0x15

Table 56 - IP and CAN address example for deployment of four FCwave™ modules.

37.9. EMC / EMI

The system integrator is responsible for ensuring EMC/EMI conformity to regulatory standards for the integration with DCDC equipment and vessel communication system.

Steps can be taken when routing the high voltage output cables in order to minimize emissions from a switching load during operation. The positive and negative conductor going to each individual load should be bundled closely and routed together. If possible, the conductors should be shielded as well.

37.10. Hydrogen Alarm Lockout

The module is equipped with two hydrogen sensors to monitor the hydrogen concentration in the hydrogen enclosure outlet ventilation.
The sensor associated with the control alarms are discussed below.

Alarm: A2_ AZT_J50_H

In an event where the ventilation air hydrogen sensor trips, a severity 2 alarm ***A2_AZT_J50_H*** will shut the module down and **FCM_OK** signal will be set to 0V. This alarm will trigger an additional alarm called ***A2_ AZT_J50_HLOCK*** (high lock) which will lock the module and prevent further attempts of restarting until the Hydrogen level is below the acceptable limit. Once the H2 is no longer in alarm, ***A2_ AZT_J50_H*** may be cleared by cycling ***MD_Enable*** but ***A2_ AZT_J50_HLOCK*** will remain latched.

A2_ AZT_J50_HLOCK

To *clear* ***AZT_J50_HLOCK, AZT_J50_HLOCK_RESET*** must be enabled from the Service Interface or over customer CAN link. Only trained personnel should perform the reset function after it is deemed safe to do so.

Note: if an attempt is made to set the *RESET* flag without a hydrogen lockout present, another severity 2 alarm ***A2_ AZT_J50_RESETERR*** will be set to ensure the system is not forced to run in an unsafe condition. To reset the reset error the reset flag needs to be cleared followed by cycling ***MD_Enable***. For details, please refer to the CAN Matrix Customer Specification (CMS013) document.

Commercial Confidential

Unauthorized copying, distribution or use of this manual is strictly prohibited.

38. Safety System – Functional description

The Safety Controllers purpose in the module is to ensure that all foreseable dangerous situations are detected, signaled to the vessel, and that the module is brought to a safe state.

The safety controller takes input from the following safety subsystems:

- Hydrogen detection
- Ventilation monitoring
- Fire detection
- External emergency notification
- Controller Watchdog

38.1. Warning and Alarm notification

It is the responsibility of the integrator to display an audible and a visual alarm if the emergency system notifies the vessel control system. The module does not include audible or visual indicators for the alarms.

38.2. Hydrogen detection

The safety controller takes input from a hydrogen volumetric concentration sensor, which gives an alarm at 40% LFL. Activation of this alarm leads to immediate shutdown of the module and signals to the vessel that an H_2 alarm has been tripped, this signaling is done over the SAFE_H2 hardwire connection, see 2133586288.429 “Safety System Supply and Signal Definitions”.

Failure of the sensor is treated as a high-level detection.

Detection of H_2 above 40% LFL or failure of the sensor causes a Severity 4 Safety System Activation.

38.3. Ventilation monitoring

The safety controller takes input from the devices and sensors ensuring the flow of ventilation air though the H_2 enclosure. If any of these fails, the safety system triggers an immediate shutdown and signals the vessel that a ventilation failure has occurred.

The ventilation subsystem monitors the following parameters:

- Ventilation intake airflow speed.
- H2 enclosure differential pressure monitoring.
- Fan and secondary fan rotational speed (Tacho).

Failure of any sensor is treated as a failure of the ventilation monitoring and causes a Severity 4 Safety System Activation.

Restriction of the ventilation airflow

If the air flow through the module ventilation is restricted, due to accident or buildup of debris, the airflow flow switch will trip. Ensure that the ventilation intake and outlet are routed correctly, and no debris may collect in the ventilation intake.

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

38.4. Fire detection

The safety system has fire detection via a linear heat detection cable. This cable passes over the electric motors, motor controllers, high voltage panel and fuel cell stacks, where heat from a fire would be detected if present.

In case of a fire, the heat will melt the insulation on the internal conductors in the fire wire cable and cause a change in ohmic resistance of the fire wire. The monitoring system detects this change and triggers a Severity 4 Alarm (Safety System Activation). The signal will be sent to vessel firefighting system.

The system also contains a smoke detector, which will trigger the Safety System activation if it detects smoke inside the module.

The monitoring system can discriminate between a fire detection and the cable failing open circuit. The open circuit triggers a shutdown and lockout of the controller, until certified personnel can perform trouble shooting and maintenance. No signal will be sent to vessel firefighting system.

38.5. External emergency

The safety controller has two external inputs to the module.

- Vessel Safety Status
- Emergency Pushbutton (two-wire)

The vessel safety status is an input from the vessel control system to the module, where the vessel signals to the module that the vessel is in a safe state. If an emergency, external to the module, occurs (from the Vessel control system, such as flooding, fire in other compartments, hydrogen detection, etc.), this input allows the vessel control system to trigger an emergency shutdown of the module.

The emergency pushbutton input is connected to a two-wire emergency “mushroom-style” pushbutton, placed in the fuel cell room **Note: Integrator scope**. This allows personnel in the fuel cell room to trigger an emergency shutdown.

38.6. Reset of the Safety Controller

A reset of the Safety Controller requires a full power cycle of the 24V power supply to the module.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

39. Datalogging function

The MCU stores operational date from the module. This information is then transmitted to Ballard over a secure connection via the vessel internet connection when the connection is enabled by bridge control.

This data allows Ballard personnel to troubleshoot and diagnose issues with the module and is essential to rapid response and resolving issues.

Before requesting assistance from Ballard, allow remote data unit to upload data to Ballard.

39.1. Remote connection details

Network Communication Specification	
Parameter	**Value**
Network Access	Ethernet/IP 100/1000 Mbit/s
WAN	Dynamic, private, internet routable IP address.
Availability	When possible, required at least once each 24-hr. period.
Internet Connection Throughput	>256 Kbps upload.
Data Logging Rate	10 MB/Hr/Module
Internet connection details	Provided during commissioning of module. Dedicated IP address and gateway needs to be aligned with integrator

Table 23 - Datalogging Connection Requirements.

39.2. Location of Stored Data

Data is stored on the module control unit (MCU) locally before being transmitted securely to Ballard.

39.3. Maintenance access

During commissioning and service, Ballard service personnel will require a wired ethernet connection which is routable to the module ethernet interface.

Service access is also possible via a service interface on the low voltage panel.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

40. High Voltage Electrical

This section describes the High Voltage interface between the FCwave™ and the DC/DC converters on the integrator's side. It also covers electrical safety both for the service personnel and the module.

40.1. High Voltage Interface

Operate the fuel cell module as a "floating electrical system" by ensuring that neither the fuel cell high voltage positive terminal nor the fuel cell high voltage negative terminal is connected to the application ground, earth or chassis.

The peak total current output at the fuel cell module high voltage connections is not to exceed 300 amps, but higher currents are possible if the limit is exceeded by the vessel system. Note that the module is **unfused**. Load cables must be sized properly for the maximum load that the vessel is expected to draw.

WARNING **To ensure a floating DC system is de-energized prior to servicing the fuel cell module, it is critical to measure zero volts between the fuel cell high voltage positive and high voltage negative terminals, between the fuel cell high voltage positive terminal and chassis, and between the fuel cell high voltage negative terminal and chassis. Measurements need to be made on both AC volts and DC volts scales.**

The system integrator is responsible for providing a means to lockout all necessary energy sources on the system prior to any service activity being performed. Furthermore, the integrator must provide a written procedure to Ballard personnel, detailing the equipment and steps required to sufficiently lock out all energy sources, such as a high voltage or high-power electrical sources.

40.2. Voltage Measurement

The fuel cell module has on-board measurements of the fuel cell stack DC voltages. While these measurements are sent by the module over CAN, it is strongly recommended that integrators do not only rely on the internal module voltage measurement.

40.3. High Voltage Disconnection

The module is disconnected from the Vessel by decoupling the HV DC connectors on the interface panel. See item #2 on Figure 15 – Detail View of module process connections.

40.4. Bonding

A stud is provided on the module for bonding. The bonding point is located left of the Control and Communication Connector (item #1 in Figure 15). The integrator must ensure that the bonding points are bonded to the vessel chassis or earth ground by a cable rated for the full current output of the fuel cell module, see (CMS006). The required maximum resistance between the fuel cell module bonding stud and chassis or earth ground is shown in Table 57.

Specification	
Maximum Resistance to Chassis	0.005Ω

Table 57 – Bonding Resistance Specification

Template 210818-1 Rev. A

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

40.5. Ground Fault Monitor

The system integrator must ensure that a suitable ground fault monitoring system is installed and is functional. For a DC dual-output floating electrical system, the ground fault monitoring system must monitor all High-voltage DC outputs. Refer to section 8.6 for safety related issues to ground faults.

40.6. Electrical Isolation

Following the directives in DS/EN 60204-1-2018, two isolating devices are required.

1. For each **incoming** supply to a machine
2. For each **onboard** power supply

The isolation of the **incoming** supply is the customer's responsibility.

For the **onboard** power supply, the precautions taken are:

- The Ampherol plugs have retaining means to prevent accidental disconnection.
- There is a clear warning notice stating "Do not disconnect under load".

Use the isolation resistance in Table 58 as a reference. The isolation resistance of the FCwave will depend on the filter used. The filter each module have will depend on whether the module was produced before or after the 2nd of August of 2024.

Typical Resistance (HV) to Chassis:	
Modules from before 02/07/2024	240kΩ
Modules from after 02/07/2024	400kΩ

Table 58 – Module Electrical Isolation.

40.7. High Voltage Power During Maintenance

During service by Ballard certified personnel, the module may request HV power to perform diagnostic tasks.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

41. Multiple Module Installation

The purpose of this section is to describe the requirements and additional action points needed for an installation of multiple FCwave™ modules in a single installation onboard a vessel or installation room.

The compartment in which the fuel cell modules are to be installed is termed the “Fuel Cell Installation Room”, and requirements are presented below in the following sections.

41.1. Structural Requirements for the Installation

Follow instructions from section 11 Fuel Cell Installation Room Requirements.

41.2. Hydrogen connection

The hydrogen supply connection to the module must fulfill the following requirements:

5. A hydrogen supply shutoff valve with a reaction time less than 2 seconds is required to be installed for each module.
6. The hydrogen flow must be restricted by suitable means such that hydrogen mass flowrate shall not exceed 4.9 g/s.
7. The amount of hydrogen in the fuel cell module must be minimized when not in operation. The physical volume of the pipe between hydrogen shutoff valve and module interface plate is not to exceed 5 liters.
8. It is a requirement that the pipe between the hydrogen shutoff valve and module interface plate is double-walled, with detection measures for the annular space.

41.3. Process exhaust connection

This section describes the options for process exhaust connections from multiple FCwave™ modules in a Fuel Cell Installation Room:

Permitted options are:

1. Individual process exhausts from each module led to the outside without combining them
   1.1. The process exhaust should not exceed the backpressure specifications in Table 14
2. Combined process exhaust from multiple modules led to the outside
   2.1. This requires a separate isolation damper for each module, which will close when modules are not operating to prevent backflow from running modules to non-running modules.
   2.2. The combined process exhaust should not exceed the backpressure specifications in Table 14 in any operational scenario
   2.3. The design of the combined process exhaust should in all operational cases prevent backflow from modules running at differing output levels (e.g. full power and partial power)

Option 1 and 2 are illustrated in Figure 39.

In all cases, the following apply:

- Process exhaust must be let to the outside.
- FCwave™ process exhaust is fully water saturated and with negligible hydrogen content.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

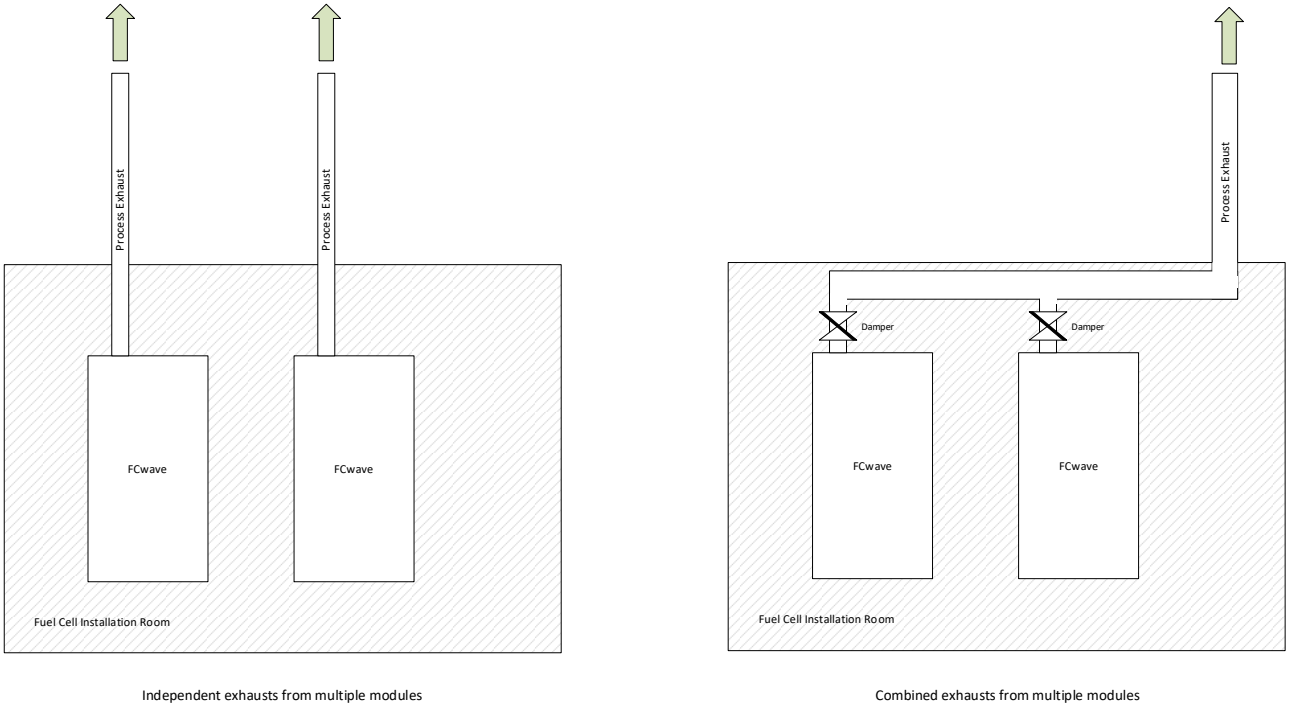

Figure 39 – Options for process exhaust of multiple FCwave™ modules.

41.4. Module Ventilation exhaust connection

If ventilation exhausts are combined from multiple systems, they must be equipped with separate isolation dampers, which must close if the module are not operating.

H2 Enclosure ventilation must be let to the outside.

The integration to the vessel shall ensure the exhaust from FC modules (ventilation air) is led to a safe location free of any spark or ignition source.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

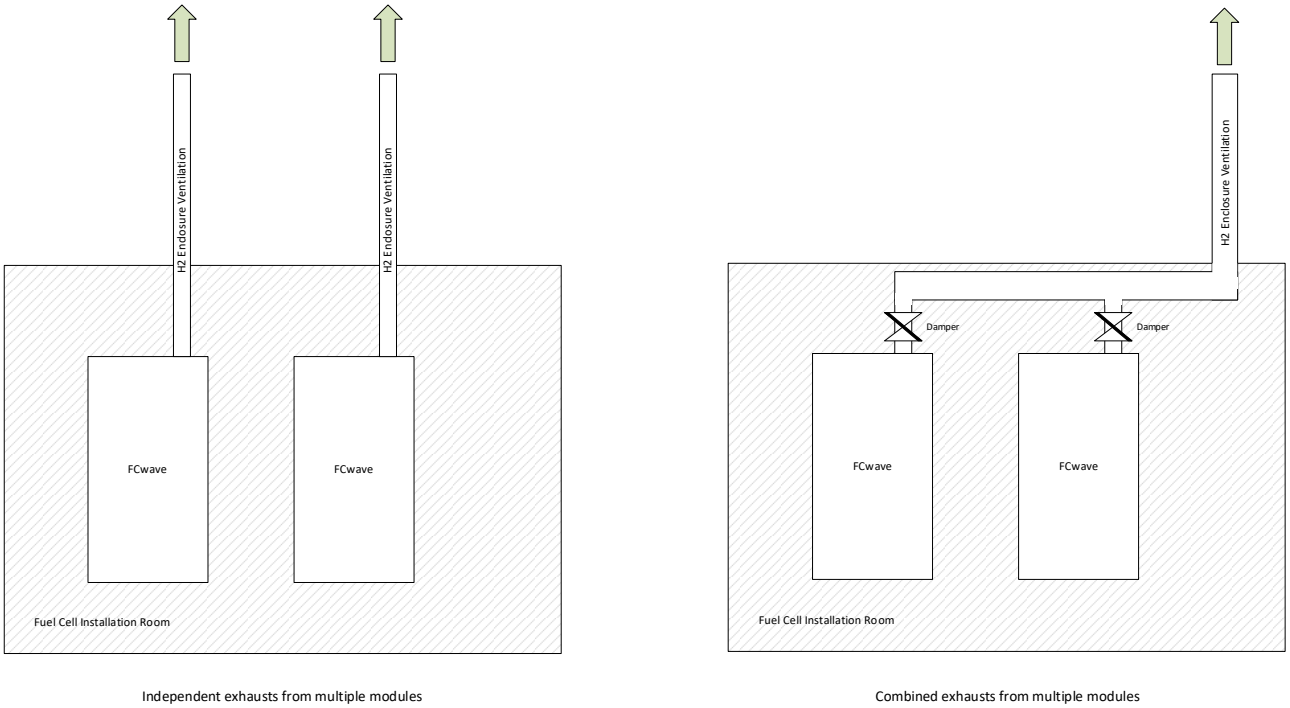

Figure 40 – Options for ventilation exhaust of multiple FCwave™ modules.

41.5. Installation Room ventilation

The air handling system in the fuel cell installation room must be sufficient to supply the FCwave™ process air. Addition ventilation of the fuel cell installation room to be determined by Classification Society or Vessel Integrator.

Ballard recommends performing a calculation according to IEC 60079-10 to establish the required ventilation rate for the fuel cell installation room. In normal operation, all probable leakage scenarios internal to the FCwave™ are managed inside the module.

41.6. Drain connections

The process water drain connection from multiple modules may be combined. It is required that integrator implements backflow prevention from module to module or from external source to module(s). The maximum allowed pressure is 25mbar.

41.7. Coolant connections

The coolant circuits from multiple modules may be combined. The integrator should consider the following:

- Each module must be provided sufficient coolant during operation.
- If individual models are in different states of operation (running / not-running), consider shutting off the cooling flow to the not-running modules.

Commercial Confidential
The information contained in this document is confidential and/or proprietary business or technical data.
Unauthorized copying, distribution or use of this manual is strictly prohibited.

41.8. Safety system

The vessel control and safety system must include visual and audible signaling to crew in appropriate locations.

Recommendation is to clearly indicate which FC module is in operation inside the fuel cell room.

The FCwave™ does not provide an emergency stop button. It is the responsibility of the integrator to install adequate and accessible safety stop buttons or similar, as well as ensure the integration of FCwave™ in the emergency stop circuit.

41.9. Fuel Cell Installation Room Access

Access to the fuel cell installation room during operation shall be limited to trained service technicians and crew that have received Ballard fuel cell training

Unrestricted access to the fuel cell installation room can be permitted by the vessel authorities when all fuel cell modules are powered off and otherwise deemed permissible.

42. Maintenance

The fuel cell module requires periodic maintenance for safe operation throughout the service lifetime of the module. Contact Ballard Customer Care for training.

It is the responsibility of the customer to carry out the maintenance tasks according to the maintenance schedule. Additionally, the customer must keep maintenance records listing each task, along with dates, fuel cell module serial number, operating hours, replaced parts, and any measurement values. The records must be provided to Ballard upon request.

43. Module Shipping and Storage

The FCwave™ module is designed to be installed in a dedicated fuel cell room fulfilling the relevant fire protection and ventilation requirements as per SOLAS and Classification Society. Generally, all the electrical components are stored in a dry room. Always place the equipment indoors for safety reasons.

Minimum requirements of warehouse/dry room storage:

Temperature between -40 °C to +60 °C
0-95% relative humidity
No condensing
Corrosion-proof atmosphere
No dripping water

For sub-zero storage after integration, consult Ballard and ensure proper precautions have been taken. Refer to Table 59 for a specified and exhaustive list.

Modules operated with deionized water are required to be flushed, according to Table 59.

Process Exhaust Hydrogen Content

Full Title: Process Exhaust Hydrogen Concentration

Abstract: The process exhaust hydrogen concentration is analyzed. The result is that in all situations the ventilation/airflow, release rate, and release type lead to a non-hazardous zone according to IEC 60079-10-1.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

1.0 Background

This document is intended to provide information on the potential hydrogen concentrations that can be present in the FCwave process exhaust and the resulting zone at the exhaust point. It is not covering the Hydrogen Enclosure Ventilation.

2.0 FCwave Operation

The FCwave is designed based on a dilution principle where air is used to dilute any hydrogen present down to a safe level. The gas present in the process exhaust is a mix of oxygen depleted air (product from the electrochemical reaction), air (from stack bypassing), and hydrogen (from purging).

The target is to dilute the hydrogen content to below 25% of LFL (1%v of H2). The safety systems in the FCwave, collectively provide assurance, that if an error occurs, safety features are in place to shut down hydrogen supply and maintain a high dilution.

2.1 Steady State Operation

During steady state operation of the FCwave the source of hydrogen is from purging. This purging happens following an internal algorithm adjusting the purge cycle based on current drawn from the fuel cell stack. At minimum load the air flow required for the electrochemical reaction is not enough to ensure high dilution. Therefore, an air bypass valve is incorporated to allow for increased air flow in these situations, resulting in high dilutions.

With this dilution principle the measured hydrogen concentration of the exhaust is as listed in Table 2-1.

Table 2-1: *Hydrogen Concentration in Exhaust*	
55 kW	<1%v H2 (dry volume)
200 kW	<1%v H2 (dry volume)
Startup	<1%v H2 (dry volume)

The ventilation/airflow, release rate, and release type lead to a non-hazardous zone according to IEC 60079-10-1[1].

During ramping the concentration is not different from steady state operation.

2.2 Startup

During startup it is ensured that air flow is initiated, and sufficient ventilation is present before any hydrogen is entering the system. This ensures that ventilation is always available, and the needed dilution is achieved.

The purge cycle in startup is adjusted to remove water and nitrogen from the anode side of the stack.

With this dilution principle the calculated hydrogen concentration of the exhaust is as listed in Table 2-1.

The ventilation/airflow, release rate, and release type lead to a non-hazardous zone according to IEC 60079-10-1.

[1] Based on IEC 60079-10-1, Table D.1, Figure F.3, and Figure F.4.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPERIATARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION FROM BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

2.3 Shutdown

During shutdown purging is stopped before air flow. Any residual hydrogen will be consumed by the electrochemical reaction. Thus, there are no sources of release and hence a non-hazardous zone.

2.4 Abnormal operation

During abnormal operation any release will be stopped immediately and there will be no persistent hydrogen present. The air flow is maintained to secure high dilution.

The ventilation/airflow, release rate, and release type lead to a non-hazardous zone according to IEC 60079-10-1.

0A	CO37932	Initial draft	2022-12-12
0B	CO42074	1. Organization: The overall structure and organization of the manual have been redefined in this version. The sections have been renumbered and rearranged, potentially for better clarity and ease of use. 2. Section Titles: The titles of some sections have been modified to streamline and better categorize the content. 3. Content Refinement: Some content has been rephrased or rearranged for better readability and understanding. For instance: • Safety information and hazard sections have been refined. • The maintenance and replacement procedures have been grouped differently. • The maintenance plan has been removed from the service manual and it is considered an independent document. • Information that´s not related to the service manual scope is removed. 4. Addition and Omission of Sections: Some sections have been added or omitted entirely in revision 0B compared to revision 0A.	2024-06-06

1.0 Disclaimer

NOTE: READ THIS BEFORE ATTEMPTING ANY PROCEDURES DESCRIBED IN THIS MANUAL

There are inherent risks in the operation of a fuel cell module that can result in death or bodily injury or loss or damage to property. It is therefore necessary for the customer to take all prudent safety precautions in the installation, use, and maintenance of this device. Persons who install, operate, and service the device are required to be technically qualified and experienced in working with electrical equipment, compressed gases, and H_2.

This manual includes certain safety guidelines and recommendations; however, this manual is not intended to cover all situations. The customer is responsible for determining the suitability of the customer's particular design or application, and for ensuring the safe operation, maintenance, and storage of the device and any systems into which it is integrated. Ballard Power Systems Europe A/S ("BPSE") cannot be responsible for the use of the device in ways, or as part of systems, that deviate from the operating recommendations in the manual. The customer is responsible for being aware of, and complying with, all applicable laws and regulations. BPSE has limited its liability for damages incurred by the customer or its personnel in the contract documents pursuant to which the device is provided to the customer. Please refer to those documents for additional information.

Procedures described in any part of the manual can only be attempted once the customer has read this entire manual. Failure to follow any instruction or recommendation could result in death or bodily injury or loss or damage to property.

BPSE intends for the device to be installed, operated, and serviced only by approved technically qualified and experienced people who understand the principles of fuel cell technology, are aware of the safe operating limits of fuel cells, and are familiar with the risks posed by operating a fuel cell module. BPSE relies on customers to use their own knowledge and experience when installing, operating, and servicing the device. BPSE also relies on the people using this manual to be familiar with common terms and abbreviations used in the manual.

Information in this manual is subject to change without notice. BPSE makes no commitment to update or keep current the information in this manual and reserves the right to make updates or other changes to this manual and/or to the products described in this manual, at any time without notice. Updates and other changes to the manual may be posted on the BPSE website and may be accessed through the customer portal; it is the customer's responsibility to check for any such updates or changes.

2.0 Abbreviations

Table 2-1: List of abbreviations

Acronym	Definition	Acronym	Definition
AC	Alternating Current	**HV**	High Voltage
BOL	Beginning of Life	**HVAC**	Heating, Ventilation and Air Conditioning
BOP	Balance of Plant	**HVP**	High Voltage Panel
BPSE	Ballard Power Systems Europe	**I/O**	Input / Output
CAN	Controller Area Network	**IMO**	International Maritime Organization
CNV	Converter	**IP**	Internet Protocol
CUS	Customer	**LED**	Light Emitting Diode
CE	Conformité Européene (European Conformity)	**LEL**	Lower Explosive Limit (18% vol mix with atmospheric air)
DC	Direct Current	**LFL**	Lower Flammability Limit (4% vol mix with atmospheric air)
DI	Deionized	**LT**	Low Temperature
EOL	End of Life	**LV**	Low Voltage
ESD	Electrostatic Discharge	**LVP**	Low Voltage Panel
FC	Fuel Cell	**MCU**	Module Control Unit
FCM	Fuel Cell Module	**PEM**	Proton Exchange Membrane (Fuel Cell Technology)
FCwave®	Product name Fuel Cell module	**RDU**	Remote Data Unit
FRU	Field Replacement Unit	**TBC/TBD**	To Be Controlled/Determined
-XD	Hydrogen Power Management	**UPS**	Uninterruptable Power Supply
H2	Hydrogen (Gaseous)	**VAC**	Volts Alternating Current
H2E	Hydrogen Enclosure	**VCS**	Vessel Control System
HT	High Temperature	**WEG**	Water Ethylene Glycol

3.0 Symbols

Table 3-1: List of Symbols

Term	Description		Term	Description
°	degree		**kg**	kilograms
µS	microsiemens		**kW**	kilowatt
Ω	ohm		**kΩ**	kiloohm
%	percent		**lbs**	pound
A	ampere		**MHz**	megahertz
bard	bar differential		**mm**	millimeter
Bar(g)	bar gauge pressure		**mVpp**	milli volts peak to peak
bin	binary (true or false)		**PCV**	pressure control valve
°C	Celsius		**PN**	part number
cm	centimeter		**rpm**	revolutions per minute
dBA	decibel		**s**	second
°F	Fahrenheit		**SEV**	severity (of a fault)
g	gram		**TETRA**	TErrestrial Trunked RAdio
H2	Hydrogen (Gaseous)		**v**	Volt
IP Rating	Ingress Protection Rating		**Vdc**	volts direct current

4.0 General information

4.1 Introduction

The FCwave™ 200kW Marine Fuel Cell Module documentation package provides a general system description, operation, installation, maintenance requirements, and safety information with the specific needs of user in mind.

This Service Manual describes the requirements and information necessary for the operation and maintenance of the FCwave™ 200kW Marine Fuel Cell Module. Proper installation and integration is described in the Integration Manual.

This manual is applicable to systems with the following name plates:

FCwave™ 200kW Marine Fuel Cell Module.

For any other additional technical information, which is not specified in this manual, please contact BPSE.

Please refer to http://ballard.com/support/global-support for updated support contact information, call +45 88435500 or contact technicalcare@ballardeurope.com.

Download Service Documentation

Customers can log on to BPSE After Sales Service Portal to download the latest product-related documents:

Go to http://www.ballard.com/, click on "Support/Global Product Support" option at the top of webpage, then go to BPSE After Sales Portal by clicking on "customer portal here."

OR

Use the direct link: https://www.ballard.com/support/customer-portal-(beta)

At the Login screen, use your Username and Password[1] to enter the portal, where you can download the latest product documentation.

Remember to read and acknowledge the terms of use in the Customer Care Portal by ensuring the box is ticked off beside the declaration:

"I have read and accept the terms and conditions as outlined by Ballard Power Systems."

[1] If you do not have a Username and Password, click on the "register here" link to get an account.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

4.2 Product information

The FCwave™ 200kW Marine Fuel Cell Module operating on hydrogen fuel is an efficient, environment-friendly, zero-emission, direct-current (DC) Power source used for mobility applications in the marine industries. The only emissions from a fuel cell are water vapor and heat. The principle is well-described, proven performance and thoroughly tested with type approvals. The system is modular in design and scalable to meet variable power requirements.

Benefits of fuel cell technology (FCwave™ module) in the marine industries are:

Longer range	–	H2 has a much higher energy density than batteries.
Fast, flexible refueling	–	onboard storage tanks which allow convenient refueling at dock.
Modular design	–	deployed in parallel and dispatchable with vessel space constraints.
Reliable power	–	proven performance, less maintenance and costs, longer service life.

Multiple 200kW modules, electrically configured in parallel to provide efficient power, for any other ranges and design requirements contact Ballard.

4.3 FCwave Marine Fuel cell Module Overview

Power	:	55 – 200 kW
Operating voltage	:	350 – 720 VDC
Input voltage	:	24 VDC
Current	:	(2x) 50 – 300 A, for dual output configuration (1x) 100 - 550 A, for single output configuration
Cooling Output Temperature	:	65°C
Humidity	:	5 – 95 %RH

The major components and features of the module systems are listed below:

- Liquid cooled PEM (Proton Exchange Membrane) fuel cell stacks.
- Built-in control system, control power supplies and control power distribution.
- Independent Safety Controller with separate power supply and safety instrumentation.
- Sensors for voltage, current, pressure and temperature measurements.
- Safety devices, including ventilation fans, fuel pressure relief device, fire detection and hydrogen sensors.
- High voltage contactors for electrically isolating the fuel cell stack from the high voltage output terminals.
- High voltage system pre-charging and reverse current protection during start-up.

4.3.1 Hydrogen Fuel sub-system (Anode)

- Complete hydrogen subsystem, which delivers and conditions the fuel supply to fuel cell stacks.
- Integrated valve block with hydrogen shutoff, pressure regulation and safety pressure relief device.
- Hydrogen recirculation with purge.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

4.3.2 Process Air sub-system (Cathode)

- Built in air compressors, motors, and inverter assemblies for supplying process air to the fuel cell module.
- Air mass flow sensor for air flow rate measurement and control.
- Intercooler and humidifier for conditioning the incoming air stream.

4.3.3 Coolant sub-system

- Internal high-temperature coolant loop, with coolant pump, motor, and controller assembly for supplying coolant to the fuel cell stacks.
- Liquid to liquid stainless-steel heat exchanger between internal high-temperature coolant loop and customer coolant loop, able to handle a wide range of coolant media (fresh water, water-glycol mix).
- Electronically actuated control valves used for stack coolant inlet temperature control.
- Separate low-temperature coolant loop to cool motors and motor controllers.

4.4 Reference Documents

The documents below are available in the online customer portal. In case you would like to request one of the documents below, please feel free to contact the Customer Care department of Ballard Power Systems Europe.

6.0 Safety, hazards, warnings, and provisos

It is the responsibility of the operator to read and understand this service manual and other information provided, and to use the correct operating procedures.

The product should only be operated by qualified (trained) personnel. Failure to do so can result in personal injury or equipment damage.

Read the entire manual before the initial start-up of the product. It is important to know the correct operating procedures for the product and all safety precautions to prevent the possibility of property damage and/or personal injury.

This section contains general safety-related information. It describes the potential hazards and associated warnings for the system and the precautions that must be taken to minimize these hazards.

Figure 6-1: General safety precautions

6.1 Hazard symbols

WARNING in this manual indicates actions that may result in an accident, which could cause immediate bodily injury or loss of life or could cause damage to equipment or other property.

CAUTION in this manual indicates actions that may result in an accident, which could cause damage to equipment or other property, and which could cause bodily injury if not promptly detected and remedied.

ELECTRICAL HAZARD Obey ALL warnings, cautions, and safety instruction related to electricity. Failure to do so may result in electrical shock leading to personal injury or death.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

6.2 Safety labels

The following standard ISO labels are used in the FCwave™ System:

The Hazardous Voltage symbol indicates that hazardous voltages exist inside the equipment.

The Earth Ground symbol (green is an older version which might occur) indicates the grounding point on the system where an Earth ground connection is required for proper system grounding.

The Auto Start symbol indicates that there are components that may start on without warning. Proper Shutdown and then disconnection of the system will prevent equipment from starting while work is being performed.

6.3 General safety

WARNING

The module is to be installed in a dedicated fuel cell installation room.

The system integrator is responsible for providing means to lockout energy sources on the system prior to any service activity being performed, and a written procedure to Ballard personnel detailing the equipment and steps required to sufficiently lockout all necessary energy sources.

- Keep cabinet doors and electrical enclosures closed when the system is operating.
- Only personnel who are technically qualified and experienced in handling electrical equipment and compressed/flammable gases are permitted to service the fuel cell module and its auxiliary system.
- Remove jewelry, watches, rings, and metal objects on clothing that can potentially cause short circuits when working on the fuel cell system.

6.4 High temperature and high-pressure safety

WARNING

Integrator shall ensure that cathode exhaust piping is leak tight and touch proof.

- Coolant interfaces and the process exhaust can reach up to 80°C during normal operation.
- Components within the fuel cell module can reach temperatures up to 120°C during normal operation.

The module uses pressurized gases which can be hazardous.

- Use caution and ensure circuits are de-pressurized before opening any lines or fittings.
- Some sub-systems may remain pressurized even when the fuel cell module is powered off.

6.5 High voltage safety

Ballard recommends that the electrical integration of the fuel cell module must be designed under strict supervision of a qualified professional electrical engineer.

It is the integrator's responsibility to design the fuel cell system such that it complies with all applicable codes and standards.

After shutdown, high voltages may remain on the fuel cell stacks for a period of time. No maintenance activities are to be performed during this time as the stacks present a shock hazard. Also, residual reactants (oxygen and hydrogen) within the fuel cell module can cause the fuel cell output voltage to rise unexpectedly.

Allow the fuel cell voltage to drop to below 30 VDC prior to servicing the fuel cell module. Certain circumstances can lead to voltage persisting on the fuel cell stack indefinitely.

- Always check for residual voltage before any service activity.

Operate the fuel cell module high voltage as a "floating electrical system". Ensure that neither the fuel cell high voltage positive terminal nor the fuel cell high voltage negative terminal is connected to the application ground, earth, or chassis.

To ensure a floating DC system is de-energized prior to servicing the fuel cell module and its auxiliary systems, it is critical to measure near zero volts between

- the fuel cell high voltage positive and high voltage negative terminals
- between the fuel cell high voltage positive terminal and chassis
- between the fuel cell high voltage negative terminal and chassis

Measurements are to be made on both AC volts and DC volts scales.

Monitor the isolation resistance of the overall high voltage system with a device capable of detecting both single and double pole isolation failures.

The system integrator is responsible for ensuring that a suitable ground fault monitoring system is installed and functioning during operation. If the level of electrical isolation is ever deemed unsafe according to regulatory standards, the system integrator is required to completely shut down the fuel cell module.

Select fuel cell module power output cables that appropriately suit the application.

Ensure that cable specifications meet voltage, current, environmental temperature limits, chemical and mechanical resistance, and flexure requirements of the application.

Avoid hazardous and unsafe situations that could result from conditions such as, but not limited to, the following:

- Improper grounding
- Handling electrical leads or devices with wet hands or on wet ground
- Frayed electrical leads
- Incorrect or improper connection of the terminal leads
- Short circuits
- Back-feed from energized normal and emergency power sources

6.5.1 High Voltage safety check before module maintenance

Before servicing the module, Ballard strongly recommends that a high voltage safety check is performed by a trained technician.

Tools needed for procedure	10mm socket screwdriver, door key, 4mm hex key, multimeter

Table 6-1: Tools needed for High Voltage safety check

1. The first step is to request system into 'Prepare for service'. Ensure module reaches 'Prepare complete' (refer to section 7.2.7 for more details) as shown below.

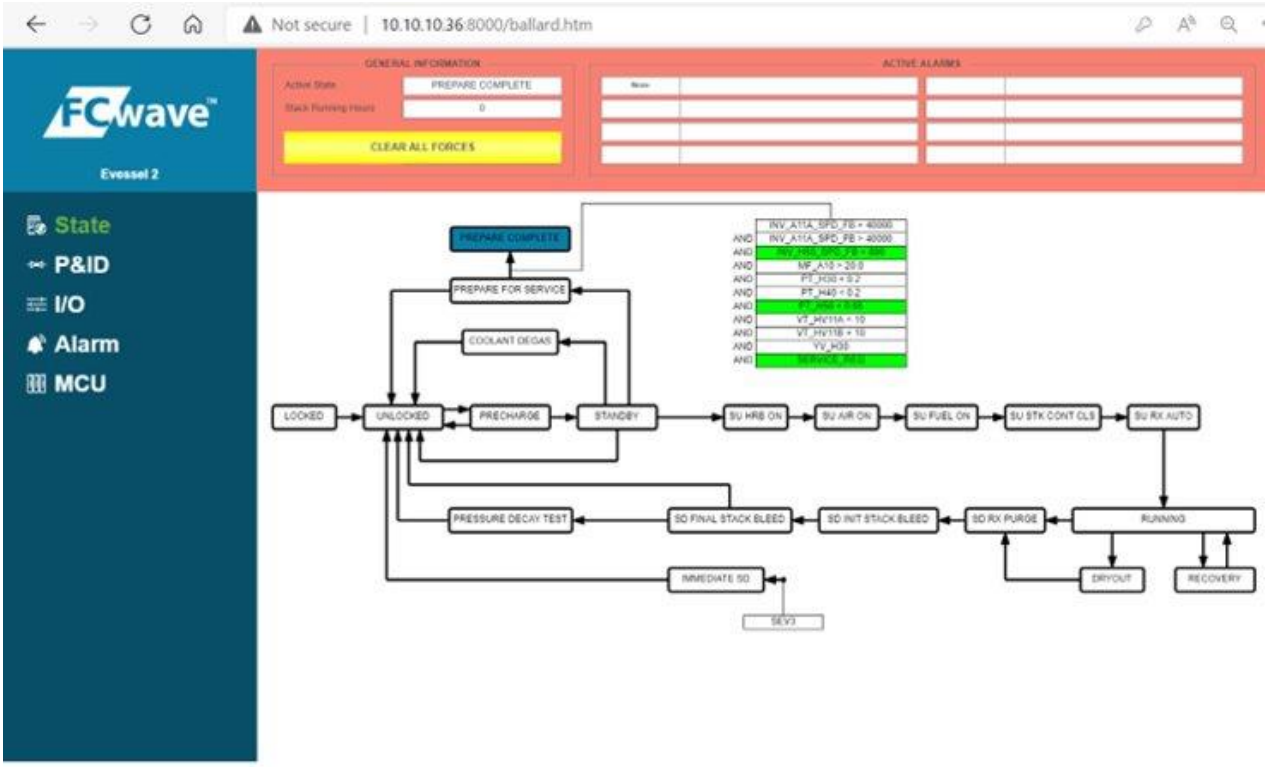

Figure 6-2: Request system to Prepare for Service

2. Confirm the module is ready for power down and maintenance by checking the integrator side. Remember to follow local lockout and tagout procedures.
3. Open system doors.

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

8. After measurement of left-hand terminals, proceed to do the same for the following right-hand terminals (shown in Figure 6-7):
   - negative (_XDB-2)
   - positive (_XDB+1, F_VTHV11B, F_VTHV12B. F_VTHV13B. F_VTHV40B)

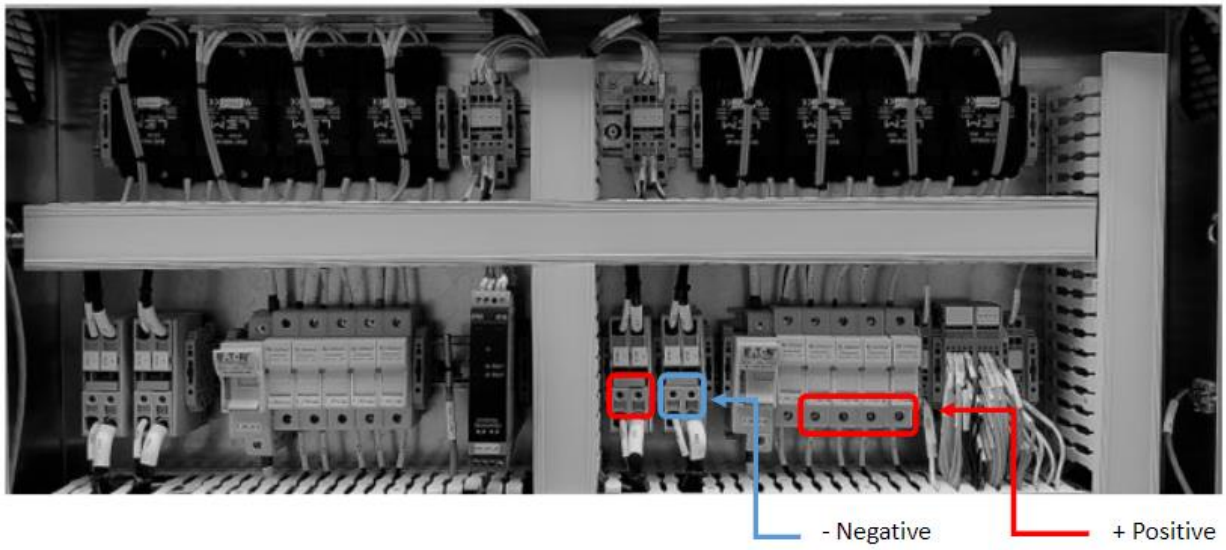

Figure 6-7: Right-hand side terminals

9. The module is now safe for maintenance and/or service.

6.6 High Voltage Isolation Failures

Under normal circumstances both high voltage output terminals (positive and negative) are isolated from the fuel cell module enclosure and low voltage system.

If isolation is lost on one high voltage pole, a person working on the module could sustain a fatal current flow by touching the other high voltage pole and ground.

If two simultaneous faults occur and isolation is lost on both high voltage poles, a high voltage short circuit can occur resulting in extremely high currents. High currents can generate a large amount of heat which will subsequently damage electrical and fuel cell systems and cause bodily harm.

6.6.1 Normal system

In normal operation, the FCwave module will operate as shown below where both high voltage poles are isolated from ground.

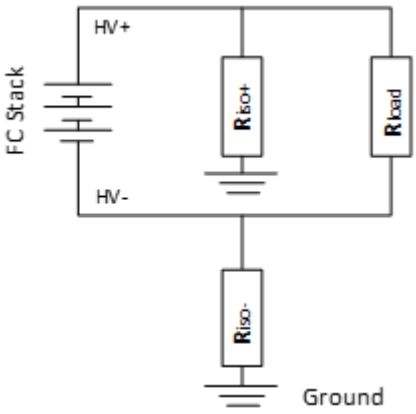

Figure 6-8: Normal isolation

6.6.2 Single Pole Isolation Failure

In a single pole isolation failure, one point on the high voltage circuit is no longer isolated from ground as shown in below figure.

An isolation resistance measurement or ground fault detection system can typically detect this failure on utilization.

A single pole isolation failure cannot cause a short-circuit nor prevent fuel cell operation, but it importantly increases the risk of electrical shock and causes injury to personnel while working on the FCwave module.

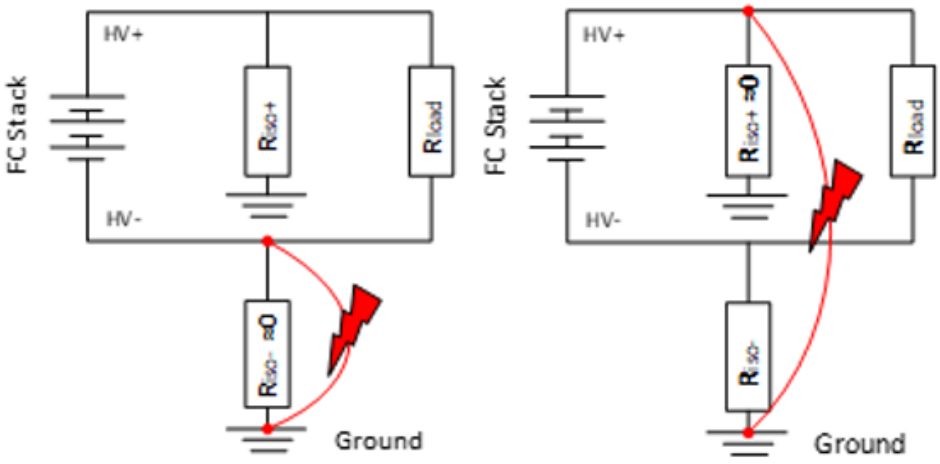

Figure 6-9: Single Pole Isolation Failure

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

6.6.3 Double Pole Isolation Failure

A double pole isolation failure, where the high voltage system is no longer isolated from ground in two different locations, can result in a high voltage short-circuit as shown in figure below.

An isolation resistance measurement or ground fault detection system can typically detect this failure on utilization.

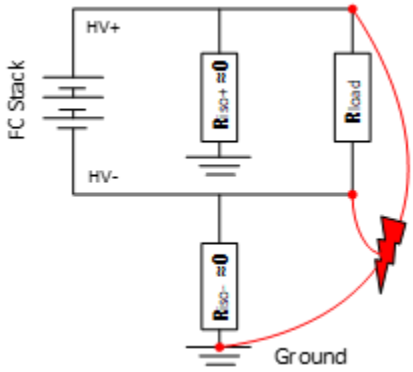

Figure 6-10: Double Pole Isolation Failure

If an isolation failure is detected and indicated in the FCwave module, do not operate the fuel cell module until the malfunction is determined and corrected.

6.6.4 Distributed Capacitance and Effects on HV Safety

The Distributed capacitance is the total amount of capacitance that exists between each pole of an isolated high voltage system and the chassis. This capacitance is a concern as it can hold charge which can be discharged into a person that simultaneously touches the high voltage system and chassis.

In normal operation, this is not an issue as all high voltage conductors are covered and insulated but it could be a concern if a system is being serviced. The fuel cell module has sources of capacitance that should be considered before servicing the high voltage system.

Within the module, the fuel cell stack will also maintain voltage if hydrogen and air are present within the system. Voltage could also be generated when a fuel or air source is introduced, and reactants are moved to an active point in the fuel cell stack. This voltage will normally bleed down to safe levels within minutes, but this should always be verified using the RDU interface first, and then testing with digital multi-meter prior to accessing the module.

Confirm that the voltage is zero

- Between pole to pole (positive to negative)
- Between each pole to chassis before service

Built in "Prepare for service" procedure involves running the air compressors and hydrogen recirculation blower to ensure the fuel cell reaches "STATE- PREPARE COMPLETE" prior to servicing the system.

One other effect of the distributed capacitance will be a delay in the ground fault detection system measurement. Some versions of the ground fault detectors are only suitable for distributed capacitance values of 1uF, and others are suitable for values up to 20uF.

6.7 Hydrogen safety

Hydrogen is a colorless, odorless, and highly flammable gas. Hydrogen is non-poisonous, but it can cause breathing problems when mixed with oxygen in the air.

1. There are no warning symptoms before unconsciousness occurs.
2. Do not operate the module in a closed space or in non-ventilated areas.
3. Install and handle the hydrogen in accordance with applicable regulations and the gas supplier's recommendations.
4. Hydrogen is lighter than air and will deflate upwards.
5. Leaked hydrogen can readily mix with the adjacent air, as its small molecular size has higher buoyancy and diffusivity.

Handle with care as hydrogen can diffuse through materials even though considered gastight. Fuel lines and non-metal seals such as gaskets, O-rings, pipe thread compounds and packings can cause potential leakages.

The FCwave module hydrogen sensors can degrade if they are exposed to various contaminants and thus become less sensitive.

The FCwave module hydrogen enclosure is equipped with primary and secondary sensors to detect leakages in the system:

- A high hydrogen concentration indication report as
  - Severity 1 Warning at 0.8% vol H_2 (20% LFL)
  - Severity 2 Alarm at 1.2% vol H_2 (30% LFL)
  - Severity 4 Safety system activation at 1.6% vol H_2 (40% LFL)
- These hydrogen sensors send signal to ship control system, which triggers alarm to the integrator (refer to Table 6-3).
- Interconnect hydrogen detection system with a hydrogen supply shutoff valve installed directly upstream of the FCwave module.
- If an excessive hydrogen concentration leak is detected, STOP the FCwave module operation.
- Perform leak tests.

As part of preventive maintenance, check the hydrogen sensor in the module regularly. Refer to the sensor's service maintenance plan (section 8.1.4).

Exposure to Volatile Organic Compounds (VOC's) causes hydrogen sensor degradation and thus precautions must be taken to avoid exposure whenever possible. The system is installed with high grade technology sensors with longer service life and increased tolerance to VOC's. High levels of VOC's are frequently experienced during vessel painting and solvent degreasing. Therefore, it is recommended that the module or hydrogen sensors are removed during these processes.

The degraded hydrogen sensor effects are:

- Makes sensor less sensitive.
- Output will have a lower indication for a given hydrogen concentration.
- A degraded sensor in operation will no longer send any alarm, even when the concentration of hydrogen exceeds the threshold limits.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

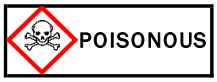
ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

A failure mode can occur if there is hydrogen present in the cooling system header tank. Follow the precautions that follow the design considerations and maintenance procedures.

- The hydrogen supply to the module can stay pressurized even after the module is shut down.
- Make sure there is no pressure in the line before disconnecting the hydrogen supply pipes
- The hydrogen lines inside the module can contain hydrogen, even after the module is removed from the system
- Safely vent the hydrogen pressure before removal of the fuel cell module



6.7.1 H_2 Sensor Alarm and Warning Limits

Control system warnings and alarms are communicated via CAN-bus. Alarm time is sensor response time plus debounce time, estimated to be 5 seconds.

H2 Alarm Limits				
Hydrogen level (vol%)	Lower Flammability Level for %vol H2	Module Action	Severity	Sensor
0.8	20%	Warning – Operation continues	1	Primary
1.2	30%	Alarm – Controlled Shutdown	2	Primary
1.6	40%	Alarm – Emergency Shutdown	4	Primary and Secondary

Table 6-2: H_2 Alarm Limits

6.8 Chemical hazards

Ethylene-glycol is poisonous, when swallowed get medical aid immediately.

The fuel cell coolant loop contains ethylene glycol.

- Ethylene glycol is toxic if ingested or if its vapors are inhaled.
- All personnel handling ethylene glycol or working on the fuel cell stack coolant loop are required to adhere to the precautionary measures identified in the safety data sheet of the specific coolant being used.
- Such precautionary measures include wearing safety glasses and chemically protective gloves.
- Dispose ethylene glycol in accordance with applicable local regulations.

6.9 FCwave module Hazard mitigation approach

The highest risk potential hazards posed by the module are unacceptable hydrogen concentrations (in the ventilation or process air exhaust) leading to fuel-fed combustion, electrical short-circuits, and possible shock hazards caused by reduced electrical isolation of the high voltage system.

The control system is coupled with various measurement devices that are designed to identify conditions (which can lead to hazards) and will terminate module operation before unsafe conditions develop.

6.9.1 Module Alarm and Shutdown Types

This section describes the types of alarm activation and subsequent control system shutdowns. The system has two controllers:

- Fuel cell module controller unit (MCU)
- Separate safety controller which handles safety related sensors

Alarm type	Description	Action	Consequence
Severity 0 – Information	No fault reporting to drive system. May derate 'I_ALLOW', otherwise for information only. Severity 0 events are logged by the module's on-board data acquisition system.	Messages of this level are only for information to the vessel, and no time constraint is placed on reaction from the vessel or integrator.	No timer
Severity 1 – Warning	A system parameter has deviated from normal range. The fault category is reported to the drive system over CAN, along with its severity. The hardwired 'FCM_OK' output remains unchanged. This level of severity is used for a functional or internal parameter, which is at the limits of normal operation. The current value of the parameter does not harm personnel or material.	Bring the warning limit back within optimal range.	If the deviation from normal operating range continues to increase, a severity 2 alarm is activated.
Severity 2 - Alarm	A system parameter has exceeded acceptable operating range, and the fuel cell module will undergo a controlled shutdown. The fault is reported to the drive system over CAN and the hardwired signal 'FCM_OK' output will go to 0V. 'I_ALLOW' will be set to 0A.	Do not exceed 'I_ALLOW' when the severity 2 fault is active. After a severity 2 fault, do not attempt a restart until action has been taken to identify and resolve the cause of the fault. To clear this fault, cycle the hardwired 'MD_EN' signal.	System performs a shutdown. ≤ 30 sec for the controlled shutdown.
Severity 3 – Severe alarm /immediate shutdown	A system parameter has exceeded a safe operating range, and the fuel cell module will undergo an immediate shut down. The fault is reported to the drive system over CAN and the hardwired signal 'FCM_OK' output will go to 0V. 'I_ALLOW' will be set to 0A immediately. Cease current draw from the fuel cell module immediately, since this severity will cause the high voltage contactors to open under load.	After a severity 3 fault, the fuel cell module must not be restarted until the cause of the fault has been determined and resolved. In addition, inspect the module for safe operation and consult Ballard before a restart is performed.	≤ 1 sec hard shut down.
Severity 4 – Safety System Activation (SIS)	The module safety system has tripped and disabled all outputs from the module controller. This causes contactors to open under load and close all hydrogen valves. The module performs an immediate shutdown. This type of emergency is reported over the safety hardline connections. The hardwired signal 'FCM_OK' output will go to 0V. 'I_ALLOW' will be set to 0A immediately. Severity 4 is handled by the safety and overrides the module control system	Cease current draw from the fuel cell module immediately, since this severity will cause the high voltage contactors to open under load. After a severity 4 fault, the fuel cell module must not be restarted until the cause of the fault has been determined and resolved. In addition, inspect the module for safe operation and consult Ballard before any further actions are taken.	≤ 1 sec emergency shut down.

NOTE: Cabinet doors can be opened to 120°. If necessary, dismantle the cabinet doors to have additional service access during maintenance procedures.

7.2 Module Controller Unit (MCU) usage

The MCU is a marine-approved multi-line 300 controller, specifically for the Power and Paralleling Unit (PPU) 300 variant. The controller communicates with the Vessel Control System (VCS) via hardwires, ethernet, and a dedicated CAN bus. The VCS is in the integrator scope.

The module controller unit (MCU) consists of a main controller and an extension rack, which:

- Is responsible for overall control of the fuel cell and balance of plant (BOP) components power supply.
- Monitors and controls the state of reactants and power flowing to and from the module.
- Monitors and reacts to system conditions with various sensors, including H_2 concentration measurements.
- Has an in-built CPU with SD card for processing, communication, and bus systems.
- Has ethernet connections for rack interconnect and external communication.

An industrial grade SD card in the MCU is utilized for local data logging storage. The ethernet connection to the VCS must provide internet connectivity for the MCU to transmit data to a Ballard server through TCP port 22 (for further information contact BPSE – section 4.1). Furthermore, the ethernet connection must provide internet connectivity through TCP port 123 for time synchronization for the MCU.

NOTE: The MCU interface is primarily used to view operational data for maintenance and troubleshooting tasks. The data is available from the MCU information pages after logging into the engineering interface.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

7.2.1 Software requirements

Any computer that is used with an MCU engineering interface must be configured with the applicable software and settings. Perform this procedure the first time logging into the engineering interface, to initialize the computer for use with the MCU interface.

Setting up the computer IP address:

- Go to computer settings,
- Select 'network and settings'
- Select 'ethernet' in the left side menu
- Select 'change adaptor options' in the right side menu
- Right click on 'Ethernet 2' and select 'Properties'.
- Select 'Internet Protocol Version 4 (TCO/Pv4) and select on 'properties'.
- Insert the IP address from the module, which can be seen as a label on the Low Voltage Panel, and introduce the rest of the setting as showed in the figure below (Figure 7-3).
- Finish off by clicking 'ok'.

Figure 7-3: Settings for setting up IP address

After the computer is correctly configured to communicate with the MCU engineering interface, it is highly recommended to install the Google Chrome web browser. Although the MCU can be used with other web browsers, it was developed for Google Chrome.

For instructions on how to login to the MCU interface the first time, see section 7.2.3.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

7.2.2 Hardware requirements

Connection to the MCU can usually be performed in two separate ways, depending on the integration.

1. The integrator must provide an ethernet connection port onboard or a service access panel onboard the vessel.
2. A technician can connect their computer to this port using an ethernet cable to access the MCU interface, when the MCU is powered by the module or by the onboard system battery.

It is necessary for a technician to be able to connect to 24 V power to the MCU, to keep it running when it is not powered by the module or by the onboard system battery. A service technician can connect their computer to the I/O tester by an ethernet cable to access the MCU engineering interface.

Follow the maintenance procedures that are necessary for the I/O tester, so the MCU can be powered when the module is not in operation.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

7.2.3 Log in to the MCU Engineering Interface

The technician can log in to the MCU interface to perform the preventive maintenance and diagnostic procedures for the FCwave module.

The general procedure for log in to the engineering interface is:

- Connect an ethernet cable from the computer to the connector of the MCU ports located in the LV panel.
- Open Google Chrome (or another web browser). Type the IP address "http://10.10.10.10:8000/ballard.htm" into the address bar at the top of the screen.
- (This IP address does not represent the IP address for any specific module, but is the standard IP address the module is "born" with. The address which will be changed by a BPSE employee during commissioning, where the IP address will be adapted to customer's local network.)
- Make sure the login screen is displayed as shown below.
- Users of different training levels will have different privileges for viewing and forcing tags.
- Operators are given the read-only log in credentials (see Table 7-1) and only have permission to view diagnostics.
- Log in credentials for technicians and integrators, which provide further access privileges, will be given by completion of appropriate level of training.

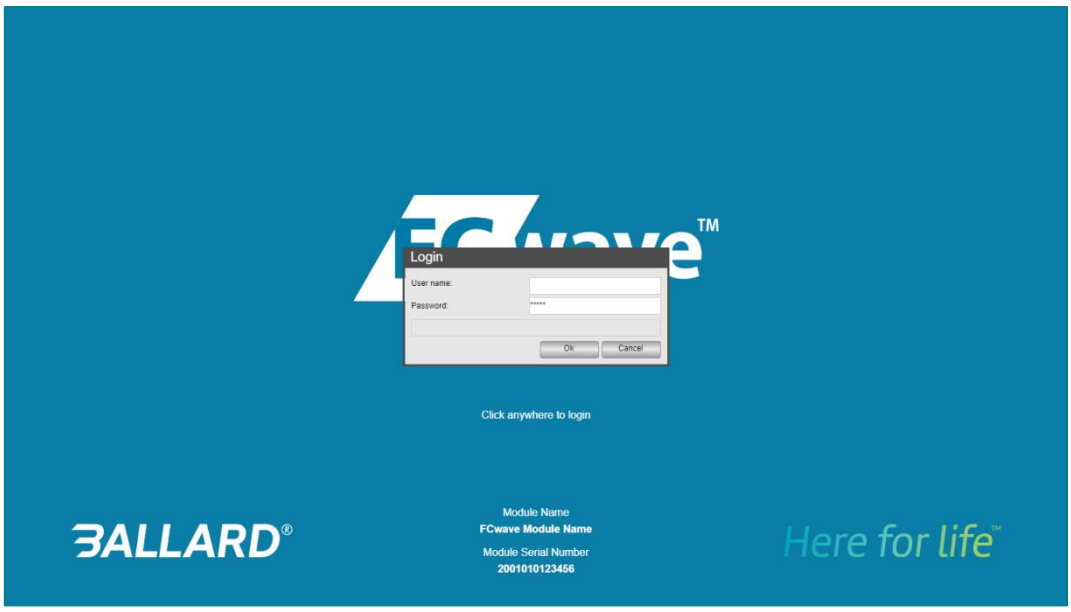

Figure 7-4: MCU Engineering Interface Login screen

User Group	Username	Password
Internal technicians (both Ballard and its partners)	OEM	[Contact BPSE (section 4.1) to get password]
Customer technicians	Customer	
Customer operators	Read-only	Ballard

Table 7-1: MCU interface login credentials

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

7.2.4 MCU Engineering Interface usage

1. Use MCU engineering interface to view run-time data and alarm codes, at the time of troubleshooting.
2. After login you will be directed to the State page of the MCU engineering interface (see Figure 7-5: MCU engineering interface State screen).
3. The State screen displays all the run-time data tags which are included in the user's selection of favorites.

- Use the navigation bar on the left of the engineering interface screen to switch between different MCU interface pages.
- Use the I/O page to access the fuel cell control unit's input and output functions.

The status bar in the top band across the screen provides information about the FCwave module's current operating state and active alarms. These are always displayed on all pages of the engineering interface.

The status bar currently displays the MCU State diagram of module page.

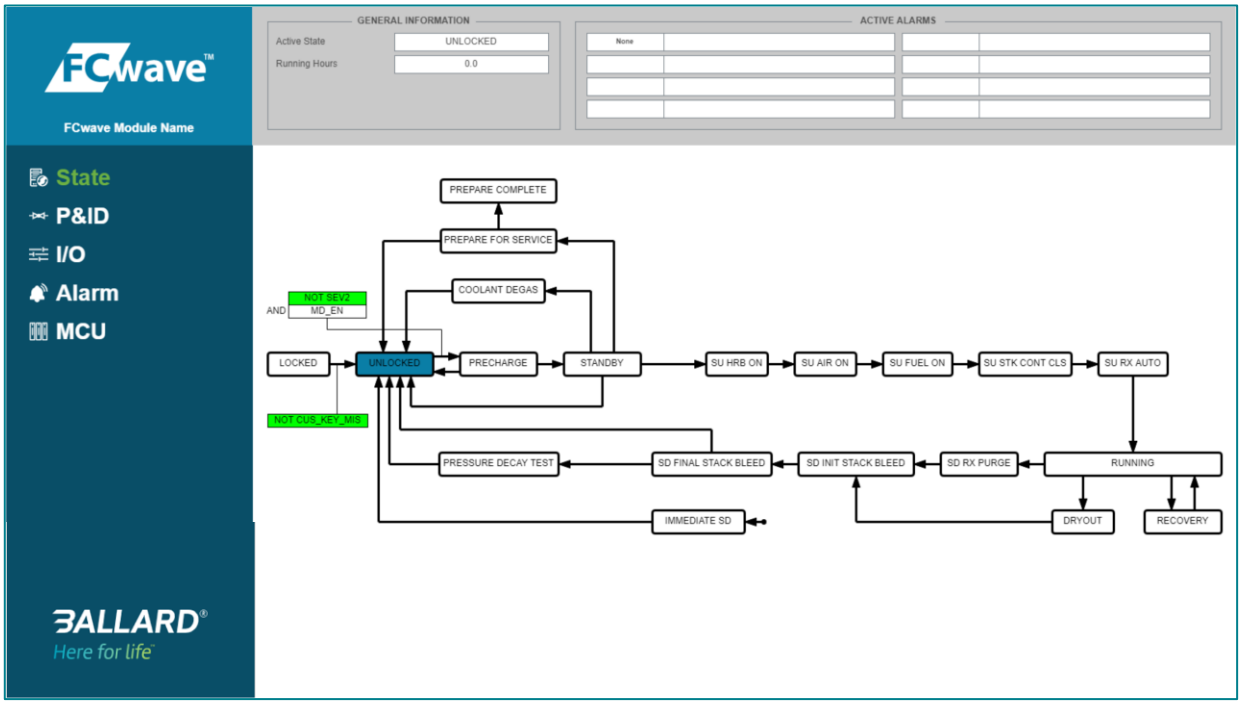

Figure 7-5: MCU engineering interface State screen

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

7.2.5 MCU Interface usage

The MCU button in the navigation bar opens the MCU Information Screen.

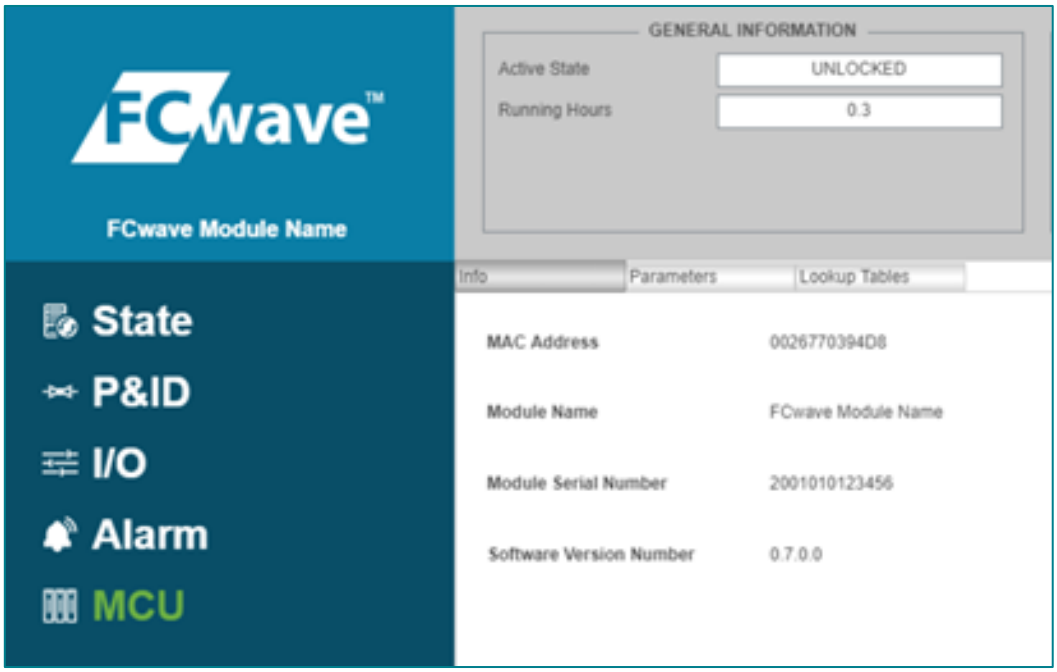

Figure 7-6: MCU Info screen

Check the module serial number.

This can be checked in two ways:

- The module serial number is shown on the login screen (Figure 7-4)
- Select MCU page in the navigation bar and then navigate the info screen to see module serial number as shown in Figure 7-6.

Check the MAC address and Software version number.

- Select MCU page in the navigation bar and then navigate the info screen to see the unique media access control (MAC) address.
- Select MCU button in the navigation bar and then navigate the info screen to see the software version number as shown in Figure 7-6.

Check running hours.

- The running hours record the FCwave module's operational hours. It is displayed on all pages of the engineering interface at the top band in status bar as shown in Figure 7-6.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

7.2.6 I/O Interface usage

It is possible to manually set the value of the various controls and sensors before/while performing any repairs.

1. Log in to the MCU engineering interface as an internal technician or customer technician user and navigate to the I/O page (Figure 7-7).
2. The MCU interface currently displays the I/O page in the navigation tab as shown in Figure 7-7.
3. Depending on the service requirement, maneuver to each I/O page - Fuel, Air, Compressors, Coolant, Electrical, Stack, Cabinet, All Input, All Output and All Calc service tabs as shown in Figure 7-7.

Figure 7-7: I/O Interface page

7.2.7 PrepForService feature usage

Tools used for procedure	Laptop, 3m ethernet cable

Table 7-2: Tools needed for PrepForService

1. Enable 'PrepforService' by activating the module state "Standby" as shown in Figure 7-8.
2. This function is developed to reduce the time for the fuel cell stacks to de-energize and to ensure safe work environment.
3. After activation, the MCU automatically operates through a protocol that commands the air compressor, the hydrogen recirculation blower, and the coolant pump to start operating with the fuel supply closed.
4. This consumes any residual reactants that can raise the stack voltage during maintenance activities.
5. Though it is intended to bleed-down the voltage to a safe level, technicians must always check the stack voltage with a multimeter before performing any service or maintenance on the module (see section 6.5.1)

'PrepForService' can be requested/forced by any MCU user group account level. It can be found under the I/O tab – 'All inputs'.

CAUTION **The coolant pump operates at a minimum speed while 'PrepForService' is active. DO NOT activate this feature, if the coolant system is already drained.**

Activate 'Standby' state, to start 'PrepForService' function. The protocol continues for 3 minutes but it can be turned off manually if the stack voltage indicates below **10V**.

CAUTION **Always check stack voltage manually with a multimeter after 'PrepForService' operation. Do not fully depend on interface stack bleed-down voltage.**

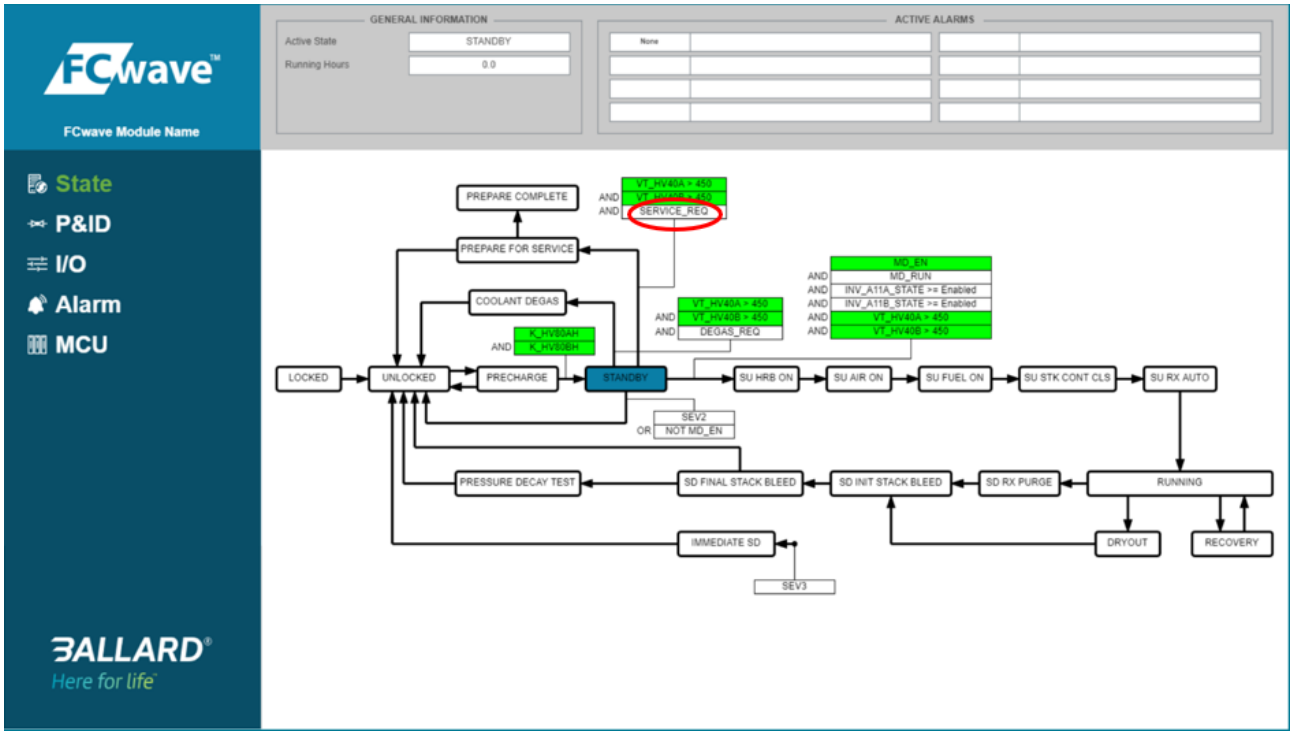

Figure 7-8: 'PrepForService'

7.2.8 Reset the shutdown alarms

High severity faults on the FCwave module requires specific inspections, to make sure the cause of the fault is corrected for safe operation. The MCU has four levels of alarms called 'Severities'.

1. **Severity 0** – Informational Message. By CAN-Bus to vessel control system
2. **Severity 1** – Warning. By CAN-Bus to vessel control system
3. **Severity 2** – Alarm, leading to shutdown. By CAN-Bus to vessel control system in ≤ 30 sec.
4. **Severity 3** – Immediate shutdown. By CAN-Bus to vessel control system in ≤ 1 sec.
5. **Severity 4** – Emergency shutdown alarm.

The **Severity 4** Emergency shutdown alarm is handled by the safety controller - Safety System Activation (SIS) by using hardwire connection and CAN bus to vessel control system. For this type of alarm activation and actions refer to section 6.9.1.

When any of the high severity fault alarms occur, it activates the hard shutdown alarm to prevent the operator from further module operation.

- When a high severity fault activates the shutdown alarm, contact BPSE for troubleshooting support.
- The shutdown alarm must only be reset after the fault is resolved and verified by a Ballard technician.
- DO NOT use the CLEAR ALARMS button, when the shutdown alarm activates like any other alarms (Also, a shutdown cannot be cleared on its own).
- To reset any shutdown alarm - disable and enable MD_EN function on the MCU I/O page.
- The safety controller will only allow to reset emergency shutdown alarm, when the fault is cleared, no failure on components is found and after power cycling of the module.

7.3 System de-energization, shut down and stack voltage check.

Perform steps in section 7.2.7 (PrepforService feature usage) and steps in section 6.5.1 (High Voltage safety check before module maintenance) to make sure all components are cooled off to a safe temperature before proceeding.

De-energizing relevant systems before dismounting the BOP components from the cabinet or while performing any maintenance activities.

This procedure can only be performed on a functional module which does not have any known failures. A custom shut down procedure is necessary if there is any failure in the module. Contact BPSE before start of any work (see section 4.1 for information).

The following sections identify safe shut down of each source of energy to be performed in sequential order:

7.3.1 Hydrogen supply shut-off

A hydrogen supply shut-off is necessary before dismantling the FCwave module from any integration, or to perform any work on the hydrogen supply pipelines.

1. It is recommended to use local lock out and tag out, then shut off and bleed the line on the integrated hydrogen supply system to upstream of H_2 inlet fuel cell module (Figure 7-9: Hydrogen supply shut-off). Double block and bleed valve functionality are in the customer scope.
2. Use the Purge valve and Air compressors to release the remaining H_2 pressure from the anode subsystem.
3. H_2 concentration in the process exhaust will be safely diluted by the air flow supplied by the air compressors into the exhaust system.

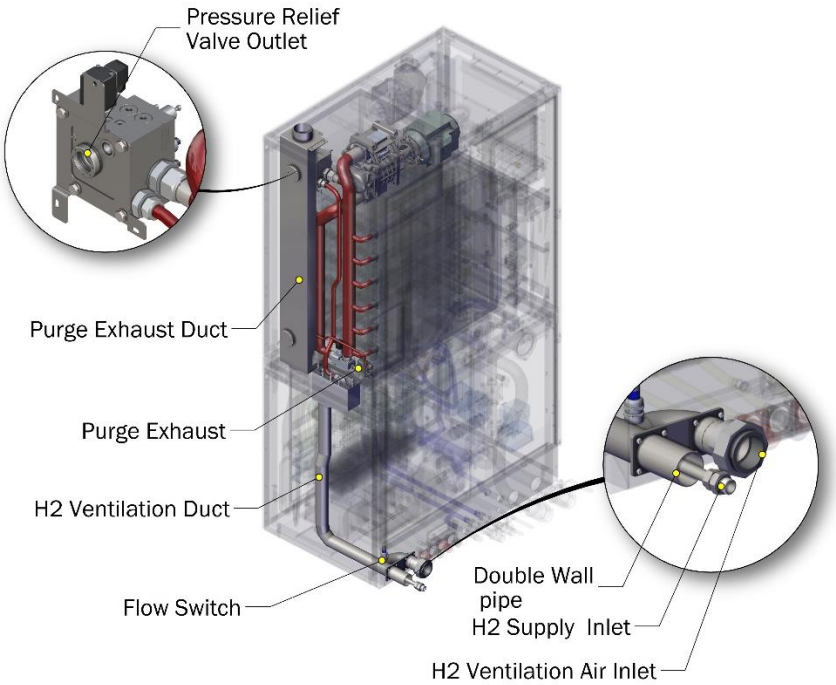

Figure 7-9: Hydrogen supply shut-off

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

7.3.2 Check coolant temperature

Perform steps in section 7.2.7 to cool down internal coolant systems to be able to check coolant temperature.

WARNING **The water can be up to 50°C.**

7.3.3 'PrepForService' Operation

1. After shutdown, the module requires at least 20 minutes to de-energize. Run 'PrepForService' via MCU engineering interface to perform any service activity (see section 7.2.7).
2. Make sure that stack voltage transducers indicate less than 10 VDC. If 'PrepForService' fails and the stack voltages CT_HV30A and CT_HV30B do not drop below 10 VDC after 3 minutes, contact Ballard for assistance (see section 4.1).

7.3.4 Electrical system shut down

An electrical system shut down is necessary before removing the FCwave module from the integration or disassembling any of the BOP components from the cabinet.

1. Turn off and disconnect the customer load terminals and outputs that follows the shut-off procedure described by the system integrator.
2. Make sure the power supply(s) is turned off and bled down before performing the next steps.
3. Disconnect the customer low voltage connection from 'HRNS-X_E01' and 24 VDC power connection.
4. Shut down and disconnect all the four terminals that are connected to the module's high voltage output from the customer interface connections (Figure 7-12):
   - HV DC A+ (HRNS-X_HV01)
   - HV DC A- (HRNS-X_HV02)
   - HV DC B- (HRNS-X_HV03)
   - HV DC B+ (HRNS-X_HV04)
5. Listen for any fan or motor operation. All rotating parts should have come to a complete stop.

7.3.5 Stack voltage check

During servicing to ensure the stack voltage is operating in safe range, follow below maintenance procedures:

1. Make sure the power output connections are disconnected to prevent personnel from starting the module.
2. Make sure the hydrogen supply is shut off upstream of the module and open the HV panel cover.

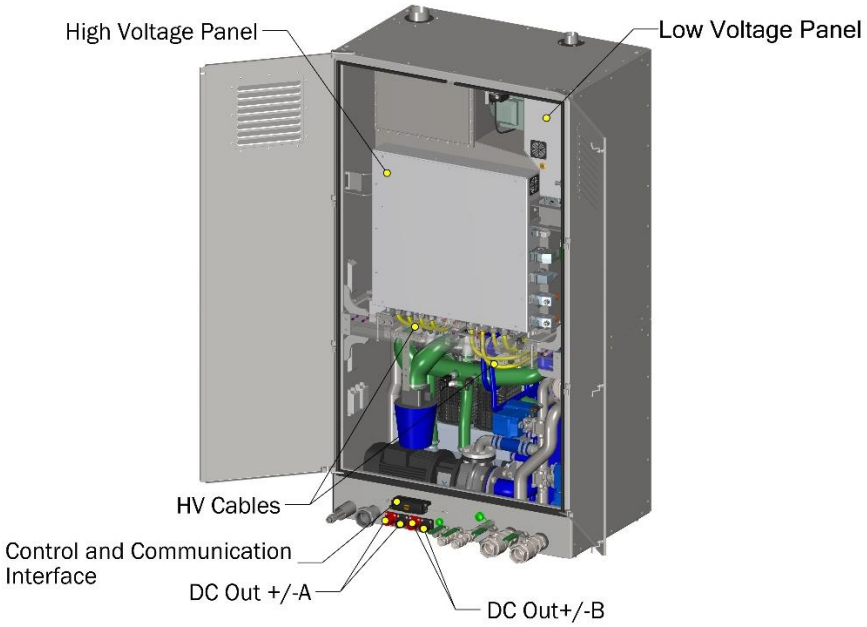

Figure 7-10: Stack voltage connections

3. Examine the components inside the HV panel using an approved multimeter.

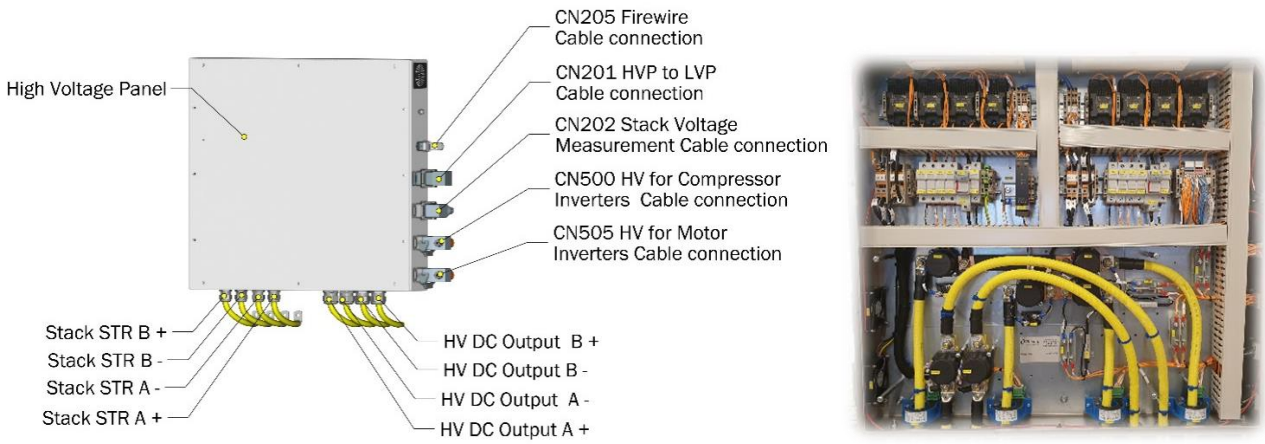

Figure 7-11: Inside the HV Panel

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

4. For safety reasons, the absence of dangerous voltage must be measured with a voltage tester (for further information, see section 6.5.1). In case of failure, try to find the root cause using the troubleshooting guide. Alternatively, discharge the electric charge using a resistor in an external circuit. Make sure the measurement criteria from Table 7-3 are met.

Measurement	Pass Criteria
HV DC A+ to STACK OUT B-	≤10 VDC
HV DC B+ to STACK OUT B+	≤10 VDC
HV DC A- to STACK OUT A-	≤10 VDC
HV DC B- to STACK OUT A+	≤10 VDC
LV -X_E01 to -CN100	≤10 VDC
LV -X_E01 to -CN101	≤10 VDC

Table 7-3: Voltage measurement criteria

5. Run PrepForService (section 7.2.7). If voltage is higher than ± 5 V AC or DC between one of the test points, wait at least 15 minutes and perform this step again.

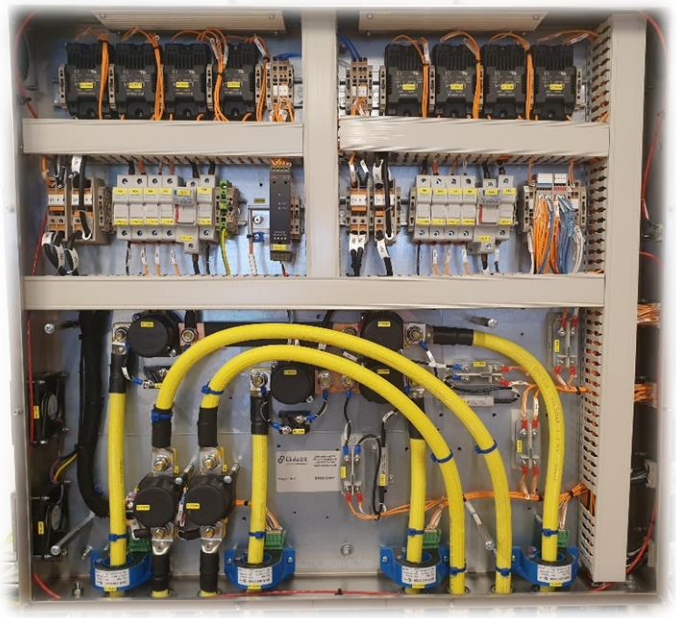

Figure 7-12: HV Panel voltage measurement points

6. Complete all further disconnections necessary by the system integrator before performing work.

7.3.6 Coolant system shut-off

A coolant system shut-off is necessary before dismantling the FCwave module from the integration, or to perform any work on the cooling systems.

1. Close and shut off all valves on the integrated coolant system to isolate the circuit of the HT external circuit and LT auxiliary coolant loop.
2. Place a clean container below the coolant drain points.
3. There are two drain valves at the lowest point on the integrated cooling system for HT and LT coolant (Figure 7-13: HT and LT Coolant drain ports
4.).
5. Drain the stack HT coolant via drain port located at the interface of lower cabinet (see section 7.1 for Interface connections).
6. Drain the low temperature coolant loop via drain port located at the interface of lower cabinet (see section 7.1).
7. Discard the used coolant according to local environmental regulations.

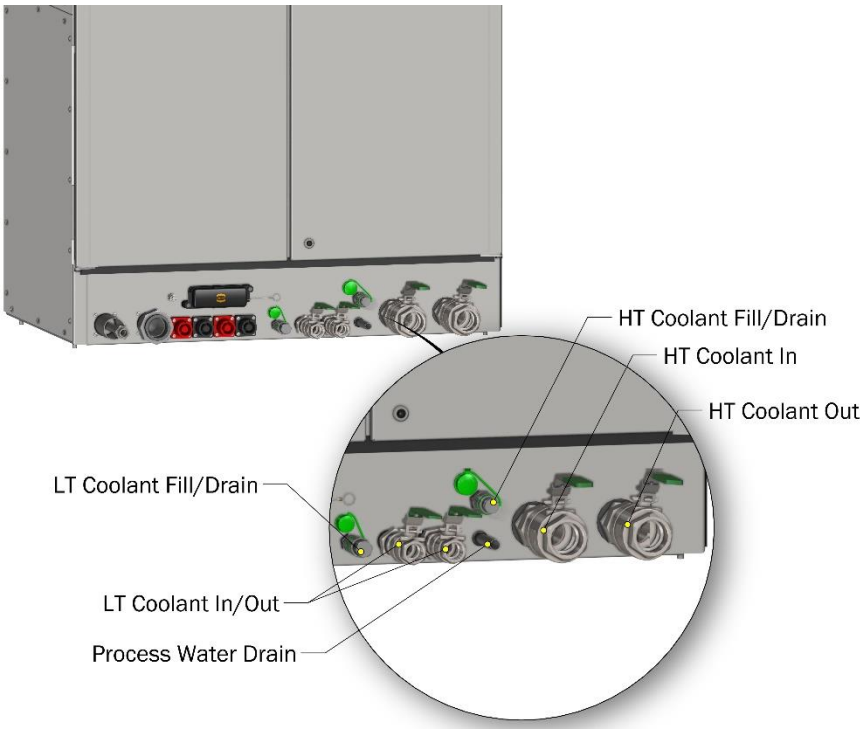

Figure 7-13: HT and LT Coolant drain ports

7.4 Lifting and Handling of the FCwave™

Lift and handle the FCwave module equipment carefully with slow motions, to avoid sudden movements and shocks. Before installation on the floor, check the alignment of all four bottom and four rear installation points on the vessel.

WARNING **Only approved personnel are allowed to lift and handle the equipment, failure to follow guidelines can cause lifting accident, which leads to personnel injury and damage to equipment.**

Figure 7-14: Lifting and handling of FCwave module

NOTE: Lifting eye bolts, slings and lifting beam are NOT in the Ballard scope of supply.

Follow the guidelines for safe use of lifting the FCwave module:

- Make sure all 4 lifting points provided on the top of cabinet are used, which carry the total weight of the complete FCwave module.
- Make sure all lifting devices are rated for the required load (see technical datasheet for exact dry weight).
- Use shackles, lifting straps, spreader/lifting beam and lifting brackets to equally distribute the load.
- Make sure the lifting points are only loaded vertically. Do not pull the lifting mounts at an angle.
- The use of an overhead electric hoist with a lifting beam is highly recommended.
- For dismounting the upper cabinet from the lower cabinet refer to section 8.5.10.

7.5 Insulation resistance Test

This procedure is currently under development and will be a part of the next revision.

Purpose

Insulation resistance (megohmmeter) tests the electrical resistance of the insulating components in a circuit. The insulation resistance is measured when the voltage is applied to the circuit, to determine if there is enough insulation to isolate the electrical current.

After performing any work on the fuel cell stacks, bus bars, high voltage connectors, contactors, or circuit boards, it is necessary to perform an Insulation resistance test.

Responsibilities

Only trained service technicians must perform this activity. For details refer to section 8.1.3.

Parts and Equipment

A list of parts and special equipment is identified to perform the procedure during the life and operation of the FCwave module.

- Crocodile clips (quantity to be decided)
- Multimeter

Safety

Wear all the required PPE (Nitrile gloves, etc.). Refer to section 8.1.2 to follow the instructions.

To perform an insulation resistance test, proceed as follows:

1. Keep a minimum of 1m safety barrier around the FCwave module with red tape. Remove all other equipment from the work area to allow the personnel to leave the area.
2. Remove all unwanted material or tripping hazards. Furthermore, no hydrogen, coolant or airline must be connected to the module.
3. System needs to be in state “Prepare for complete service”.
4. System doors can be opened safely.
5. Check stack voltage to make sure the module is safe to work.
6. Disconnect all the electrical connections to the module.
7. Locate the HV panel assembly installed in the upper cabinet and remove its front cover bolts (Figure 7-16).

7.6 Best Practices

7.6.1 Torque and Fastener Specifications

It is necessary to use the recommended tightening torques for fasteners, hose clamps and sensors for safe operation of the FCwave module.

- Tighten all fasteners to prevent parts from loosening due to vibration.
- Torque tightening must be applied with a calibrated torque wrench.
- Torque requirements depend on the type of materials, the type of part being connected, and if any washers or thread-locking chemicals are utilized.
- Do not apply excessive torque, that can cause damage to the fastener or other components.
- Do checks on torque wrenches and guns regularly, to make sure for correct calibration.
- Record the data in the logbook.

Warning and recommendations when using stainless steel bolts:

- When stainless steel surfaces with the same or similar materials come into contact and undergo friction, the risk of galling increases.
- High contact pressure between the bolt thread and nut can exacerbate galling. As the threads tighten, they can create significant friction, leading to galling if there's insufficient lubrication.
- Proper lubrication between the threads is essential to reduce friction and prevent galling.
- Under high stress and elevated temperatures, the risk of galling increases.
- Apply krytox for bolts used in the H_2 full system and for the process air system.
- To prevent galling with stainless steel bolts and nuts:
  - Apply an appropriate anti-seize lubricant or thread lubricant to the threads before assembly
  - Avoid excessive tightening torque, which can increase the risk of galling
  - Coating the threads with a material like zinc or cadmium can reduce the risk of galling

Usually, fasteners must be tightened with hand before applying the specified torque. If the assembly procedure is in the reverse order of disassembly, torque specifications will be included in its replacement maintenance section. Assembly steps will be given only when the fasteners or parts are critical. Follow manufacturer guidelines where they are applicable.

Refer to Table 7-4 for the FCwave module standard torque values. All fasteners of a given size require the torque of stainless-steel grade 8.8. Few exceptions can be found for parts that are made from a softer material, such as aluminum, plastic, etc. Multiple torque tools can be required for satisfactory torque range and safety of the BOP components.

Fastener	Tool		Torque Specification for FCwave module (Nm)	Exceptions
	Allen key	Wrench		
M3	2.5 mm hex		1.3 ± 0.2	
M4	3 mm hex	7 mm	3.5 ± 0.5	
M5	4 mm hex	8 mm	6.5 ± 0.5	
M6	5 mm hex	10 mm	10 ± 0.5	For Manifold connections M6 bolt must be tightened to 6 Nm only.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

7.6.2 Handling Controllers (MCU)

The MCU controllers are complex and easily damaged components that must be carefully handled. They are vulnerable to electrostatic discharge (ESD).

Figure 7-17: MCU Controller

ESD (also called 'static electricity') can be generated by the movement of a personnel's clothes against the skin or shoes against the floor, so it is easy for a service technician to build up a static charge. The skin is conductive, which allows the static charge to flow around the body and build up. To dissipate this charge, the skin needs to be continually grounded.

An ESD wrist strap has a conductive strap that makes 360-degree contact with the technician's wrist. The cord makes sure the technician is grounded when the clip is attached to a non-painted metal surface or other grounded point.

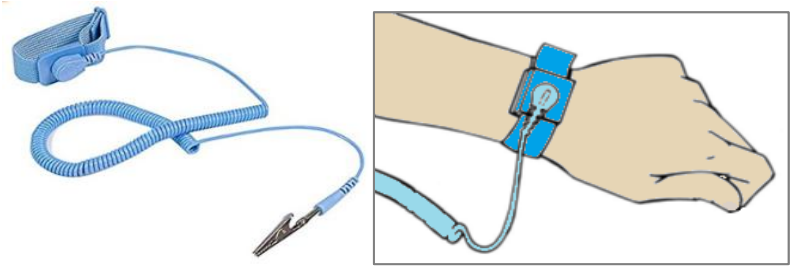

Figure 7-18: ESD wrist strap and cord

Here are a few things to keep in mind when working with controllers:

- ESD can easily damage electrical components in the MCU, even at levels that a technician cannot feel.
- Failure of controllers can happen any time after the electrostatic discharge occurs.
- Always use an ESD anti-static wrist strap and cord.
- Always transport and store controllers in sealed static protection bags (Figure 7-19: Controller cards in shielded bag) or similar containers.

Figure 7-19: Controller cards in shielded bag

7.6.3 Environmental Protection

The FCwave module is constructed to be in accordance with the ingress protection ratings IP44. The module is designed for installation in a dedicated fuel cell room (Machinery space of category A) fulfilling the relevant fire protection and ventilation requirements as per SOLAS and Classification Society. Although the module is IP44 rated, prevent direct high-pressure water sprays.

7.6.4 Standby to Operation Cycles

Maximum standby to operation cycles: **6 cycles per hour (average)**

To prevent wear of mechanical and electrical components and to preserve the performance of the fuel cell stack, it is necessary that the number of 'Standby to Operation' cycles is limited to 6 cycles/hr. More frequent cycles can result in premature performance loss.

7.6.5 Disposition

All parts removed during maintenance must be disposed of according to section 10.0. The specified disposition is included in the preventive maintenance instructions (refer to section 8.0).

There are 3 disposition specifications:

- **Return to Ballard** — Return faulty part to Ballard for failure analysis, repair, or refurbishment.
- **Scrap** — Discard the faulty part appropriately, according to any local government regulations.
- **Hold** — Hold faulty part until Ballard has been contacted, part may need to be returned.

8.0 Preventive Maintenance (PM) and Corrective Maintenance (CM)

The FCwave module requires periodic preventive maintenance for safe and reliable operation throughout the service life of the system.

Corrective maintenance of the FCwave module can be required in the case of a component not functioning and needs to be replaced.

8.1 Service Schedule

Adequate maintenance records verifying compliance with these tasks are required to validate warranty coverage. Failure to provide these records to Ballard can result in dismissal of warranty claims.

The end user must comply with these maintenance records:

- Date of each task performed
- Operating hours on the module at the time of each service task
- Calibrations of all service parts
- Date of all service part replacements and serial number of the part (where available)

The FCwave module Preventive Maintenance Checklist can be used as a detailed maintenance record form. Refer to the Customer Portal or contact BPSE (see section 4.1) for the latest revision.

The preventive maintenance activities that are necessary for FCwave module are listed in the preventive maintenance plan, find the newest version in the Customer Portal, which includes reference to relevant section for detailed instructions.

The Service Schedule specifies the necessary service interval for each procedure

- in hours (module operation time)
- months (elapsed time)

Service intervals are based on a duty cycle with an average output power of 67% rated power. Operating at a higher average power, which means exceeding 67% of rated power, will increase maintenance frequency of the module.

8.1.1 Responsibilities

Ballard provides necessary training to customer(s) for the FCwave module installation, operation, and maintenance procedures. This work must only be performed by approved personnel who understand the principle and are aware of the safe operation limits of the fuel cell. Thus, it is the customer's responsibility to get adequate training to operate, install, servicing and proper handling of the FCwave module.

Preventive maintenance of the fuel cell module is necessary for safe operation and is the responsibility of the end user, as described in the preventive maintenance plan.

DO NOT PERFORM MAINTENANCE SERVICE WITHOUT TRAINING OR SUPERVISION FROM BALLARD, AS DOING SO CAN RESULT IN LOSS OF WARRANTY

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

8.1.2 Safety Instructions and Precautions

ALL PERSONNEL MUST READ AND FOLLOW THE INSTRUCTIONS BEFORE START OF ANY WORK.

Isolate the hydrogen supply to the upstream of fuel cell system before start of any service procedures.

Always wear adequate PPE. Follow all shipboard vessel safety protocols and general safety guidelines refer to section 6.0.

Components of the fuel cell system can reach a surface temperature of 80°C or higher. Do not perform maintenance procedures immediately after operation or before the module is cooled down.

Fuel cell voltage can exceed 390V during operation. Stack voltage stays even when the system is not in operation. Allow residual voltage decay to below 5V before performing any work. Always check stack voltage before service accessing inside the module.

8.1.3 Training level Certification

At Ballard, training is classified into 3 tiers:

- **Tier 1 – Service technicians and fuelers**
  - 1st point of contact for product support
  - Activities: Cleaning and Fueling

- **Tier 2 – Service technicians and mechanics**
  - 2nd point of contact for product support
  - Activities: Preventive Maintenance, basic troubleshooting, and spare part support

- **Tier 3 – Senior service technicians and engineers**
  - 3rd point of contact for product support
  - Activities: Report design issues, provide Tier 1 and Tier 2 training, advanced support and advanced trouble shooting

Details of roles and responsibilities are reinforced by Ballard's standard Service Level Agreement.

8.1.4 Maintenance Plan

It is required to follow the maintenance plan to ensure trouble-free operation during the lifetime of the FCwave module.

The maintenance tasks for the FCwave module are listed in the preventive maintenance plan. Go to the Customer Portal or contact BPSE, to see the latest revision (see section 4.1).

8.1.5 Maintenance Checklist

To perform periodic service maintenance, refer to the preventive maintenance checklist. Go to the Customer Portal or contact BPSE, to see the latest revision (see section 4.1).

8.2 H_2 Fuel Anode Sub-system

For detailed P&ID requirements, refer to "Piping and Instrumentation Diagram" (PWR005), which can be found the Customer Portal or by contacting BPSE (see section 4.1 for further information).

8.2.1 Replace Purge Valve

Purpose:

The procedure describes the work instruction to replace a purge valve for the fuel cell system. The solenoid valve controls the purge of excess hydrogen and water from the fuel cell stack outlet, into the process exhaust. This keeps adequate concentration of H_2 in the sub-system and H_2 concentration in the process exhaust is kept below 2% volume.

Responsibilities:

Preventive maintenance of the purge valve is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance (see section 8.1.1)

Parts and equipment:

A list of parts and special equipment is identified to replace the purge valve during the life and operation of the FCwave module.

- FRU, Purge Valve (part no. 7500017)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Purge Valve

Based on the normal conditions, the estimated time for replacement is:

Purge Valve		
Duration	8 hours	
Personnel	1	
Tightening Torque	M4 bolt	3.5 ± 0.5 Nm
	M6 bolt	10 ± 0.5 Nm
	M8 bolt	25 ± 0.5 Nm
	M10 bolt	50 ± 5 Nm
	1/8" Thread connection	18 ± 0.5 Nm
	Tool: 3mm, 5mm, 6mm, 8 mm Hex key, 18mm spanner

Assembling procedure:

1. Insert new gasket in the purge valve and use 4 pcs. M4 bolts and washers to install purge valve to the bracket.
2. Place purge valve assembly into position in the purge hatch and connect the purge valve connection fittings.
3. Use 2 pcs. M4 bolts and washers to tighten the purge valve to the bracket in the purge hatch.
4. It is highly recommended to perform a leak test with H_2 sensor after any service maintenance on the purge valve (refer to section 8.2.4).
5. Use 34 pcs. M6x12 bolts and washers to install H_2 enclosure top hatch.
6. Install connector (HRNS-300-YV_H50) and place foam to cover the purge valve.
7. Use 22 pcs. M6 bolts and washers to install the purge hatch cover to the H_2 enclosure.
8. Reverse steps 2 through 9 of the disassembling procedure to install the HV panel assembly.
9. Use 12 pcs. M5x10 bolts and install the high voltage panel cover.
10. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
11. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
12. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.2.2 Hydrogen Recirculation Blower (HRB) Assembly

8.2.2.1 Check Hydrogen Recirculation Blower (HRB) Assembly

Purpose:

The procedure describes how to check the HRB assembly (Unit and Motor).

Responsibilities:

Checking the HRB assembly is necessary for safe operation according to the preventive maintenance plan (see Customer Portal). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to check the HRB Assembly

Based on the normal conditions, the estimated time for check is:

HRB Assembly	
Duration	20 min
Personnel	1
Tools	5mm hex key

Table 8-2: Time to check HRB Assembly

Procedure:

1. Before proceeding with the check, perform all steps in section 7.2.7 and 6.5.1.
2. Locate the hydrogen enclosure top hatch and use 5mm hex key to remove 34 pcs. M6x12 bolts.

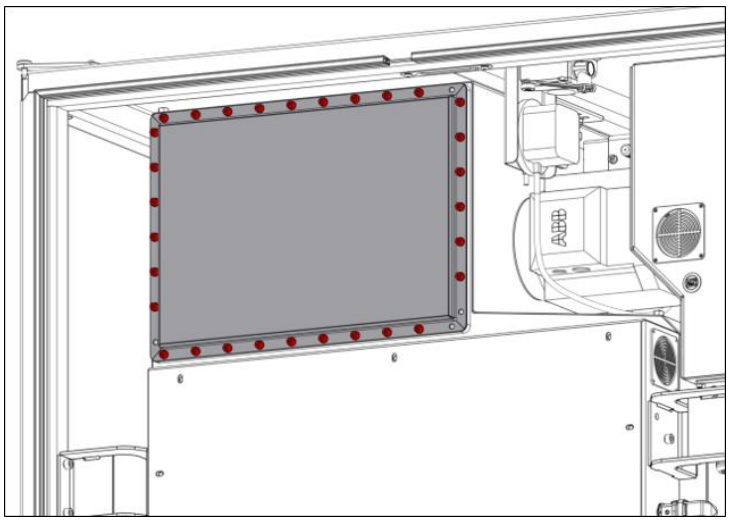

Figure 8-8: Location of H_2 enclosure top hatch

3. Remove the foam and check each piece for oil contamination from the HRB.
4. Check the HRB for oil leakage.

8.2.2.2 Replace Hydrogen Recirculation Blower (HRB) Assembly

The following section describes how to replace the two parts of a hydrogen recirculation blower (HRB) assembly for the fuel cell system. The HRB assembly comprises the HRB unit and HRB motor. Both the HRB unit and HRB motor can be disassembled by disengaging the coupling connection.

8.2.2.2.1 Replace a Hydrogen Recirculation Blower (HRB) Motor

Purpose:

The procedure describes how to replace a hydrogen recirculation blower (HRB) motor assembly for the fuel cell system.

Responsibilities:

Preventive maintenance of HRB motor is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace a HRB motor during the life and operation of the FCwave module:

- FRU, HRB Motor (part no. 7500011)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the HRB motor

Based on the normal conditions, the estimated time for replacement is:

HRB motor		
Duration	2 – 2½ hours	
Personnel	1 – 2	
Tightening Torque	M6 bolts	10 ± 0.5 Nm
	M8 bolts	25 ± 0.5 Nm
	Tool: 5mm, 6mm hex key, air bags, ¼" ratchet, ¼" extension 100mm, 22mm key, 7mm, 8mm hex socket, torque wrench	
Weight	HRB motor	25 kg

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Locate the H_2 enclosure top hatch and uninstall 34 pcs. M6x12 bolts to access the enclosure.

   Use a protective special plate below the HRB unit to prevent any loose part falling into the stack while servicing.

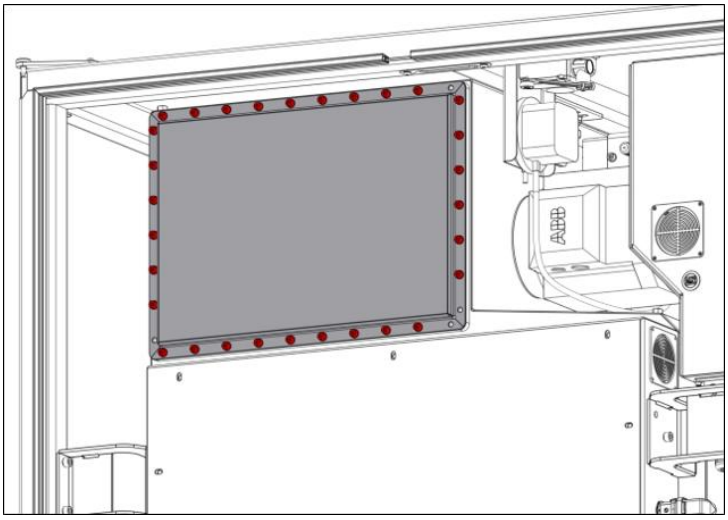

Figure 8-9: Location of H_2 enclosure top hatch

3. Gently remove foams in the enclosure and locate the HRB assembly.
4. Disconnect the CN500 plug from the right side of the HV panel to disable the HV power supply for the HRB motor controller.
5. Uninstall 2 pcs. bolts to open the HRB motor cover.
6. On the HRB motor, disconnect the inverter controller for the HRB motor connection HRN-400-CN_INV_H50 and the ground cable.
7. Uninstall 3 pcs. M8x30 bolts from the top right support bracket of the high voltage panel and remove the bracket.

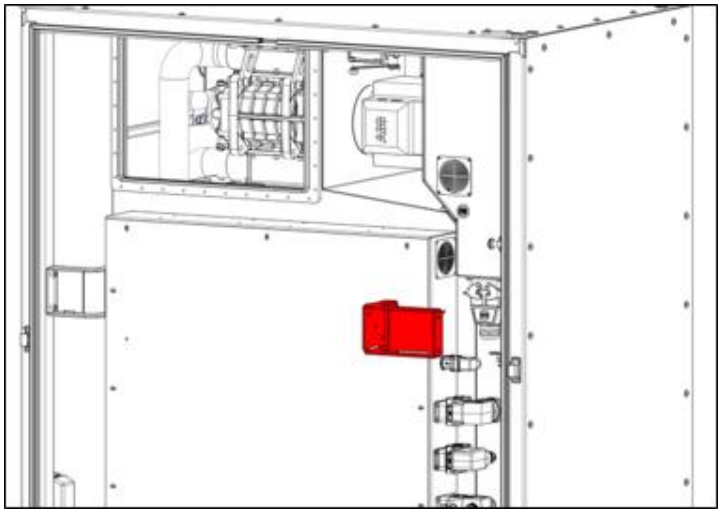

Figure 8-10: Support bracket on HV panel

Assembling procedure:

1. Place air bags beside the H_2 enclosure to support the HRB motor.
2. Carefully lift the HRB motor and place it on the air bags. Then carefully slide the motor clamping hub into the enclosure.

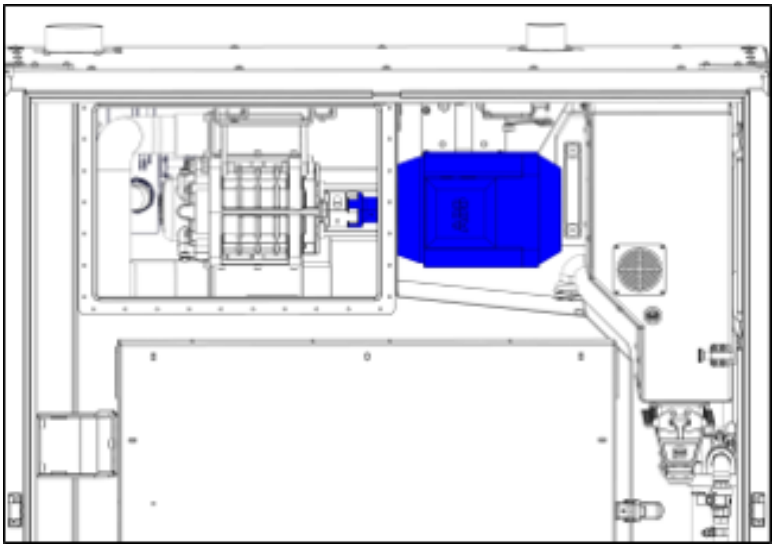

Figure 8-13: Install HRB motor to enclosure

3. Use the M6 alignment bolts to align the motor shaft.
4. Use 4 pcs. lubricated new M8 bolts to install the HRB motor to the enclosure. Tighten to 25 Nm.

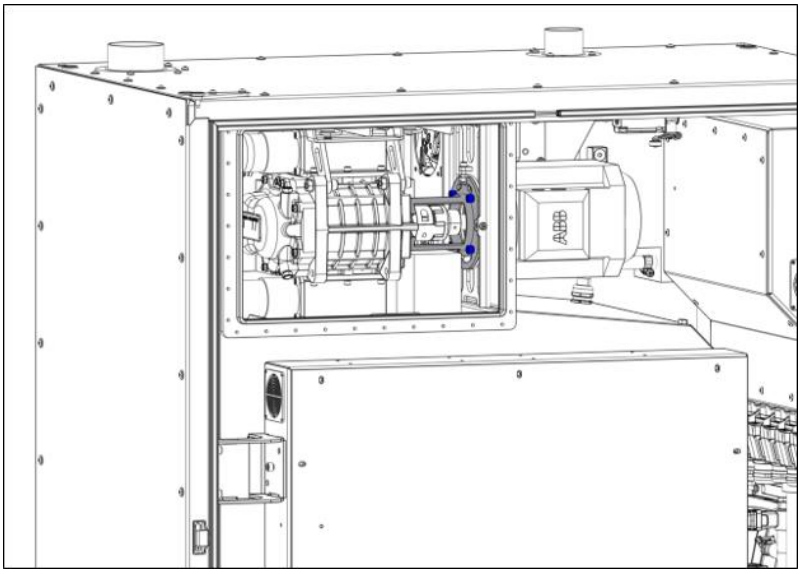

Figure 8-14: Securing motor to enclosure

5. Remove air bags from underneath the motor.
6. Connect both the inverter controller for the HRB motor connection HRNS-400-CN_INV_H50 and the ground cable.
7. Use 2 pcs. M8 bolts to install the HRB motor cover.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

8. Slide in the LV panel.
9. Use 3 pcs. M8x30 bolts and washers to install the right-side bracket of the HV panel. Tighten to 10 Nm.
10. Insert the foam on the front-side of the H_2 enclosure as shown:

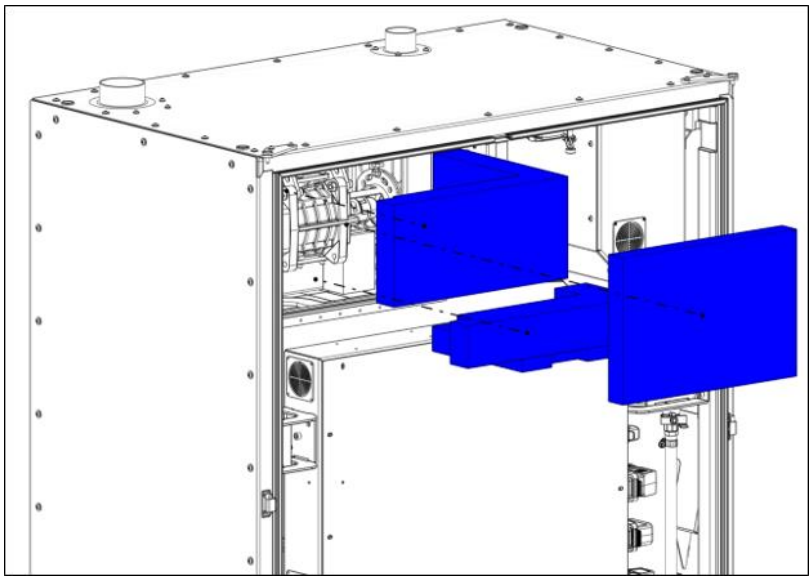

Figure 8-15: Install foam after installing HRB unit

11. Use 34 pcs. M6 bolts to install the H_2 enclosure top hatch cover. Tighten to 6 Nm.
12. Power up the module. Follow the HRB Test procedure to test the HRB alignment by manually activating the HRB motor through the engineering interface. Listen for loud noise and vibrations in the HRB assembly area before proceeding.
13. Contact BPSE customer care to register and reset the hour counter in the engineering interface for the HRB assembly.
14. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
15. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
16. Close system doors and use the integrator side to confirm the module is ready for power up. Remember to follow local lockout/tagout procedures.

8.2.2.2.2 Replace a Hydrogen Recirculation Blower (HRB) Unit

Purpose:

The procedure describes how to replace a hydrogen recirculation blower (HRB) unit assembly for the fuel cell system.

Responsibilities:

Preventive maintenance of HRB unit is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace a HRB unit during the life and operation of the FCwave module:

- FRU, HRB (part no. 7500007)
- FRU, Coupling (part no. 7500008)
- FRU, Coupling Element (part no. 7500013)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the HRB unit

Based on the normal conditions, the estimated time for replacement is:

HRB unit		
Duration	4 – 4½ hours	
Personnel	1 – 2	
Tightening Torque	M6 bolts	10 ± 0.5 Nm
	M10 bolts	50 ± 5 Nm
	Tool: 5mm + 8mm hex key, 12mm socket, 46mm crow's foot wrench, 17mm spanner, plastic bag/tape, ½" ratchet, ½" extension 400mm, torque wrench	
Weight	HRB unit	18 kg

Table 8-4: Time to replace the HRB unit

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

5. Use crow's foot wrench to remove the fuel outlet hose fitting from the valve block.

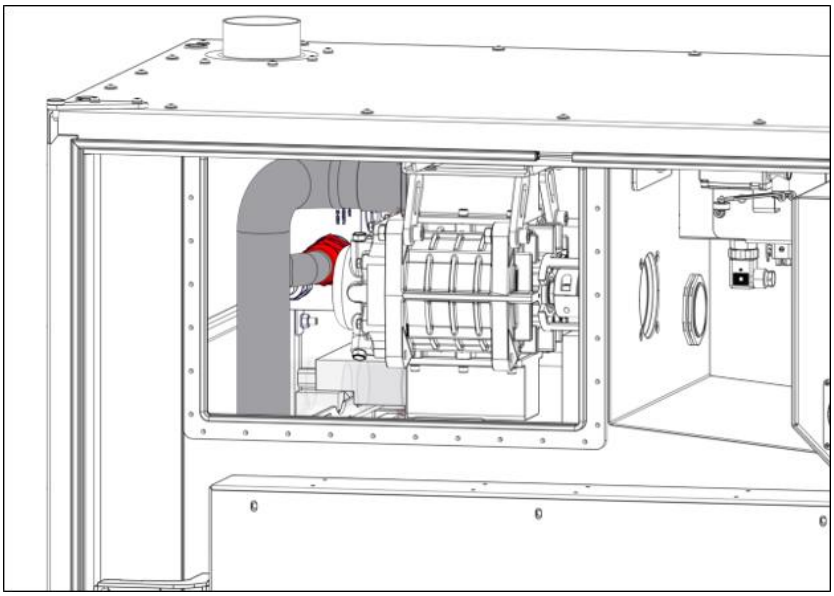

Figure 8-18: Removal of fuel outlet hose fitting

6. Uninstall 3 pcs. M6 bolts from the damper shoe brackets.
7. Carefully slide the HRB unit to the left over the mounting rails to dismount it from the H_2 enclosure. Rotate it 90 degrees horizontally, so the damper shoe bracket faces the enclosure top hatch and remove the HRB unit from the enclosure. Place it on a flat surface for service maintenance.

⚠ CAUTION Wear long sleeves and gloves to prevent cutting yourself on sharp edges when removing the HRB unit.

8. Remove old O-rings from disconnected hoses and open ports and then cover with a clean cap, plastic bag, or tape.
9. Disassemble the HRB compressor as shown:

Figure 8-19: Disassemble HRB compressor

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Assembling procedure:

1. Use 12 pcs. new M6x20 bolts and washers to reassemble the HRB manifolds with new O-rings. Tighten to 10 Nm. Remember to lubricate the bolts and to note down the serial number.
2. If not already there, carefully install the foam behind the HRB assembly.
3. Apply krytox and mount new O-rings in the fuel outlet and fuel inlet manifold fittings.
4. To insert the HRB unit, rotate it 90 degrees horizontally, so the bottom of the HRB faces the H_2 enclosure. Carefully insert the HRB unit inside the enclosure and rotate back to the correct position to mount it on the H_2 enclosure frame.
5. Fasten 3 pcs. M6 bolts to secure the HRB assembly to the H_2 enclosure. Tighten to 6 Nm.

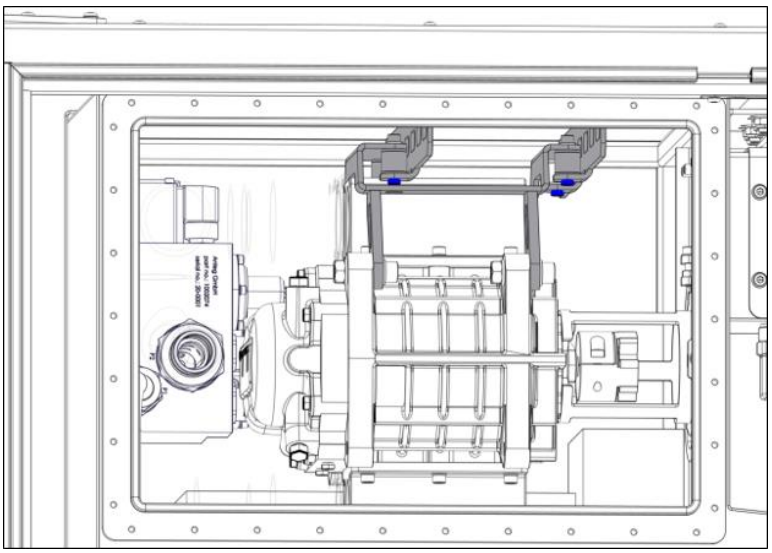

Figure 8-20: Install HRB assembly to bracket

6. Slide the lower hose onto the HRB fitting and make sure not to cut the O-ring. Use 3 pcs. M6 bolts to install it. Tighten to 6 Nm.

8.2.3 Replace Hydrogen Valve Block

Purpose:

The procedure describes how to replace a hydrogen valve block in the fuel sub-system. The function of the valve block is to start and stop the flow of H_2 fuel supply, and it is comprised of:

- Fuel filter – removes fuel intake impurities to protect the upstream equipment
- Fuel supply solenoid valve – controls the flow of H_2 to the fuel cell
- Fuel pressure control valve – from supply pressure to specified output pressure
- Safety relief valve – shuts off the inlet valve in case of an emergency

The valve block also provides feedback on inlet/outlet pressure and regulation of pressure.

Responsibilities:

Preventive maintenance of the hydrogen valve block is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the valve block during the life and operation of the FCwave module.

- FRU, Hydrogen Valve Block (part no. 7500025)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace H_2 Valve Block

Based on the normal conditions, the estimated time for replacement is:

H_2 Valve Block		
Duration	5 hours (need to remove HRB unit)	
Personnel	1	
Tightening Torque	M6 bolt	10 ± 0.5 Nm
	M10 bolt	
	1/2" Thread connection	25 ± 1 Nm
	3/4" Thread connection	50 ± 1 Nm
	1 1/4" Thread connection	120 ± 2 Nm
	Tool: 5mm + 8mm hex key, 14mm + 17mm spanner, cross-head screwdriver, 13mm hex socket, 20mm extension, 32mm crow's foot wrench, ½" ratchet, ½" extension 400mm, plastic bag/tape, torque wrench

5. Remove 4 pcs. nuts and washers used to tighten the valve block bracket to the H_2 enclosure.

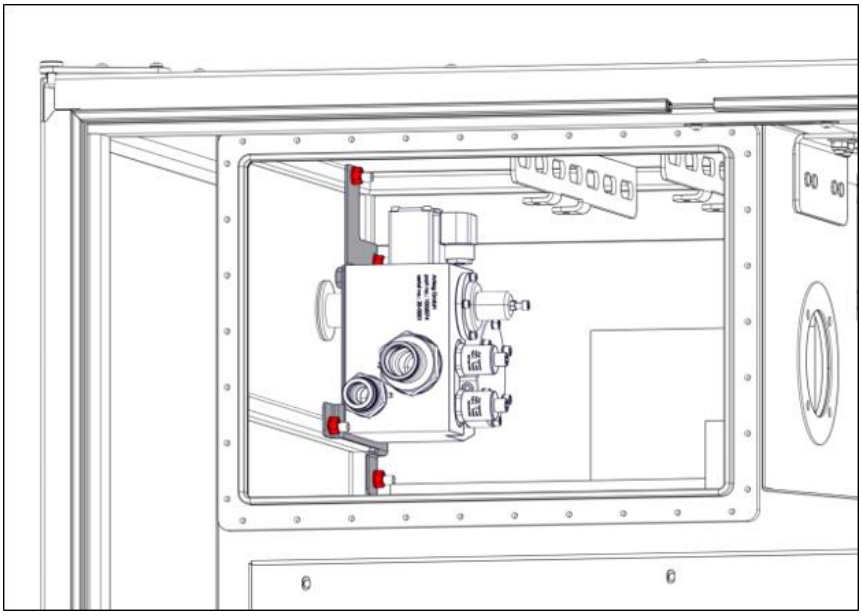

Figure 8-25: Removal of nut/washers of valve block bracket

6. Remove the valve block assembly and place it on a flat surface for service purpose.
7. Cover all disconnected hoses and open ports with clean cap or tape to prevent any unwanted material entering the hoses and open ports.

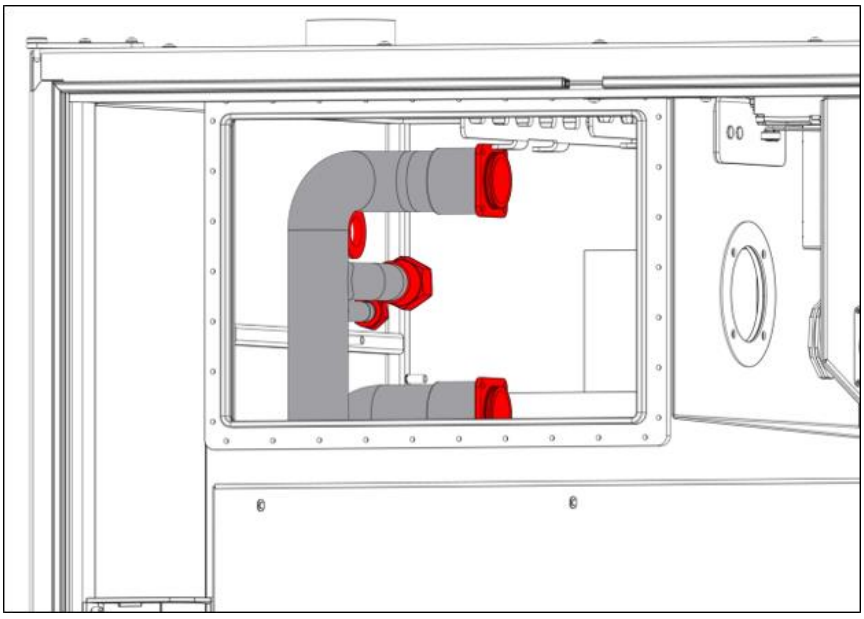

Figure 8-26: Cover up hoses and open ports

8. Remove 4 pcs. M10 bolts and washers and remove the valve block bracket from the valve block.
9. Send the used hydrogen valve block to Ballard for failure analysis (see section 4.1 for contact information).

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

Assembling procedure:

1. Install a new bonded seal in the connection tube and install the connection tube on the valve block. Apply krytox to the thread and seal to prevent any damage.
2. Use 4 pcs. M10 bolts and washers to install the valve block to the valve block bracket. Keep the bolts loose while sliding the valve block onto the bracket. Apply ceramic grease to the bolts.
3. Place the valve block assembly on the mounting points. Adjust the valve block to fit the connection tube into the exhaust. Tighten the M10 bolts to 15 Nm to secure the valve block.

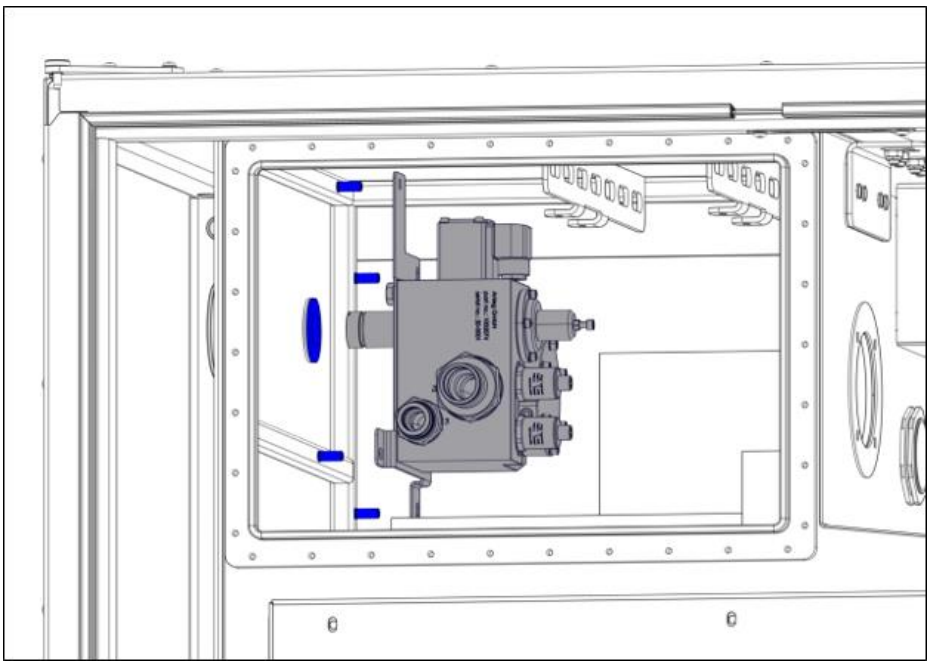

Figure 8-27: Mounting the valve block in the enclosure

4. Apply krytox and install the new O-ring onto the connection tube.

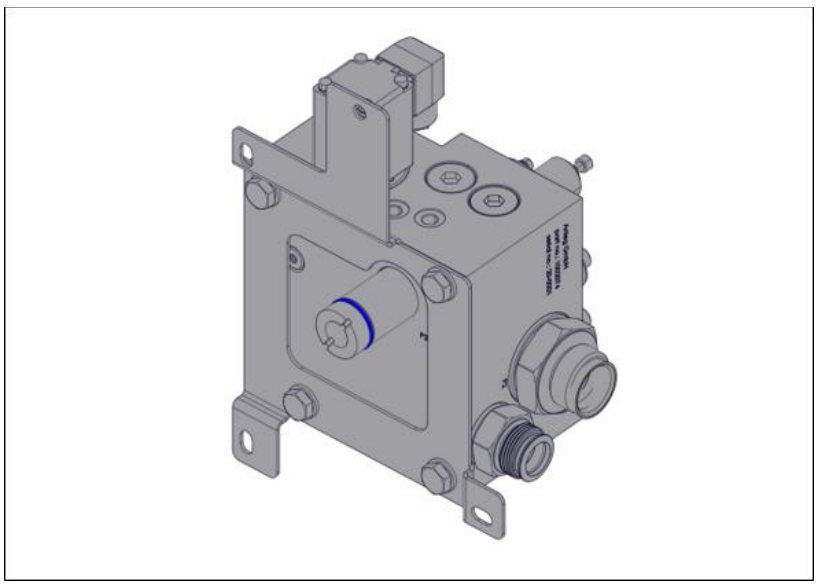

Figure 8-28: O-ring on connection tube

8.2.4 Assurance Procedure – Anode Sub-system leak test

Succes criteria for leak testing:

There is a leak if:

- Values recorded during the test are out of acceptable range provided by the "Leak Test Report Form", which can be found on the Customer Portal (see section 4.1 for further information)
- Unable to create correct pressure in the system
- Escaping air can be heard within the module
- Hydrogen gas and a hydrogen sniffer can be used to identify leaks

There is no leak if:

- All the values recorded during the test are within the accepted range provided by the "Leak Test Report Form" which can be found on the Customer Portal (see section 4.1 for further information)
- No sound coming from the module can be heard

Estimated time to perform the anode sub-system leak test

Based on the normal conditions, the estimated time for testing is:

Anode sub-system Leak Test		
Duration	3 hours	
Personnel	1	
Tightening Torque	M5 bolt	6.5 ± 0.5 Nm
	M6 bolt	10 ± 0.5 Nm
	Tool: 4mm + 5mm hex key, 8mm hex socket, leak tester, leak test hose, 32mm crow's foot wrench, laptop, WLAN cable	

Table 8-6: Time to perform anode sub-system leak test

8.3 Process Air Cathode Syb-system

For detailed P&ID requirements, refer to "Piping and Instrumentation Diagram" (PWR005), which can be found the Customer Portal or by contacting BPSE (see section 4.1 for further information).

8.3.1 Replace Process Air Filter/Mass Flow Meter

Purpose:

The procedure describes how to replace a process air filter integrated with mass flow meter for the air compressors in the cathode system. The filter conditions the clean air intake, and the mass flow meter monitors the airflow that enters the air compressors.

Responsibilities:

Preventive maintenance of the air filter/mass flow meter is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace a process air filter during the life and operation of the FCwave module.

- FRU, MAF Sensor & Inlet Filter (part no. 7500059)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Air Filter/Mass Flow Meter

Based on the normal conditions, the estimated time for replacement is:

Air Filter/Mass Flow Meter		
Duration	15 min	
Personnel	1	
Tightening Torque	Hose clamps	5 ± 0.5 Nm
	Tool: 7mm socket, torque wrench	

Table 8-7: Time to replace the air filter/mass flow meter

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Locate the air filter/mass flow meter installed in front of the twin compressors.
3. Disconnect the mass flow meter sensor (FT_A10).

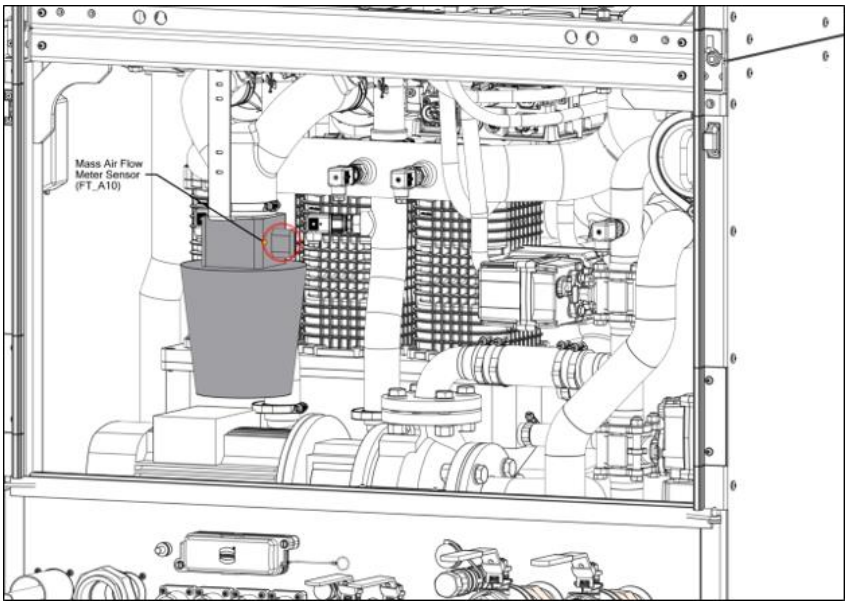

Figure 8-43: Location of mass flow sensor

4. Release the 7mm socket hose clamp to uninstall the filter/mass air flow meter.
5. Slide down the filter unit and take it out.

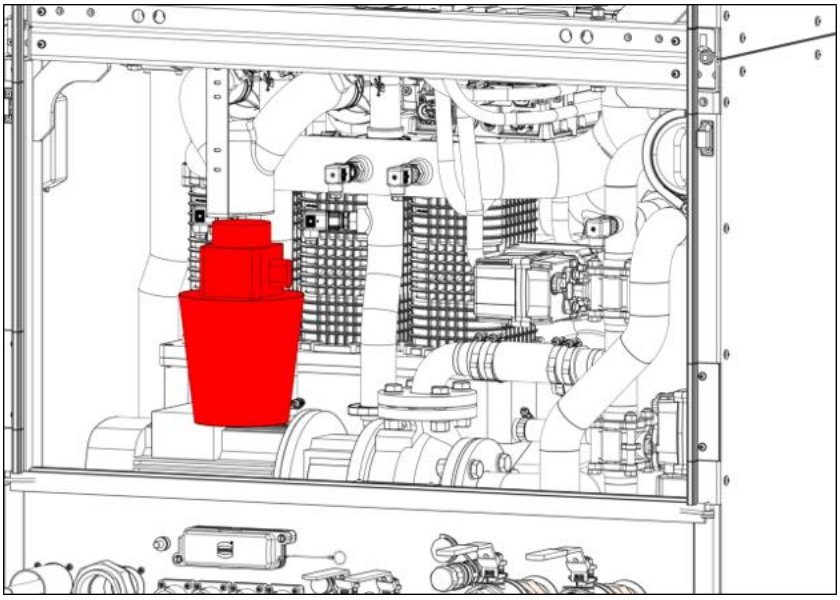

Figure 8-44: Removal of filter unit

8.3.2 Replace Process Air (cathode) Valves

Purpose:

The procedure describes how to replace air valves in the process air cathode system. There are three air valves, which are used to direct the air flow in the module, to bypass the stacks, and to recirculate the exhaust.

Responsibilities:

Preventive maintenance of the air valves is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the air valves during the life and operation of the FCwave module.

- FRU, Shutoff Valve, 3" (part no. 7500061) x2.
- FRU, Shutoff Valve, 1.75" (part no. 7500068)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Cathode Valves

Based on the normal conditions, the estimated time for replacement is:

Cathode Butterfly Valves		
Duration	30 min	
Personnel	1	
Tightening torque	Hose clamps	5 ± 0.5 Nm
	Tool: 7mm flexible socket, torque wrench	

Table 8-8: Time to replace the cathode valves

8.3.3 Replace Humidifier Assembly

Purpose:

The procedure describes how to replace a humidifier assembly for the process air system. The unit exchanges humidity between dry air entering the fuel cell inlet and outlet. This is necessary to maintain minimum fuel cell inlet relative to humidity requirements.

Responsibilities:

Preventive maintenance of the humidifier assembly is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace a humidifier assembly during the life and operation of the FCwave module.

- FRU, Humidifier Assembly v2 (part no. 7500359)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace Humidifier

Based on the normal conditions, the estimated time for replacement is:

Humidifier		
Duration	2 – 2½ hours	
Personnel	1	
Tightening Torque	M5 bolt	6.5 ± 0.5 Nm
	M8 bolt	25 ± 0.5 Nm
	Hose clamps	5 ± 0.5 Nm
	Tool: 3mm + 4mm + 6mm hex key, 7mm flexible socket, cross-head screwdriver, cable tie cutter, plastic bag/tape, 6mm hex bit, ¼" ratchet, 500mm extension, 13mm wrench, torque wrench	
Weight	10 kg	

Table 8-9: Time to replace the humidifier assembly

8.3.4 Replace Aftercooler

Purpose:

The procedure describes how to replace an aftercooler assembly for the process air system. The aftercooler cools down the temperature of the process air before it enters the humidifiers.

Responsibilities:

Preventive maintenance of the aftercooler assembly is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace an aftercooler assembly during the life and operation of the FCwave module.

- FRU, Aftercooler (part no. 7500070)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Aftercooler

Based on the normal conditions, the estimated time for replacements is:

Aftercooler		
Duration	3 – 3½ hours	
Personnel	1	
Tightening Torque	M8 bolt	
	Tool: 6mm hex key, 13mm wrench, 7mm socket, plastic bag/tape, torque wrench, hose clamps (if needed to be replaced)	

Table 8-10: Time to replace the aftercooler

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Perform disassembling procedure of Air Compressor (section 8.3.5) and Humidifiers Assembly (section 8.3.3) to remove both parts to access the aftercooler.
3. Remove the lifting table and lifting table legs from the lower cabinet. Remember to tighten M8 bolts and washers. Tighten to 15 Nm.
4. Release 2 pcs. hose clamps on the coolant hoses connected to the aftercooler assembly and slide off hoses. Prepare an empty container to drain leftover coolant to prevent leak inside the module.

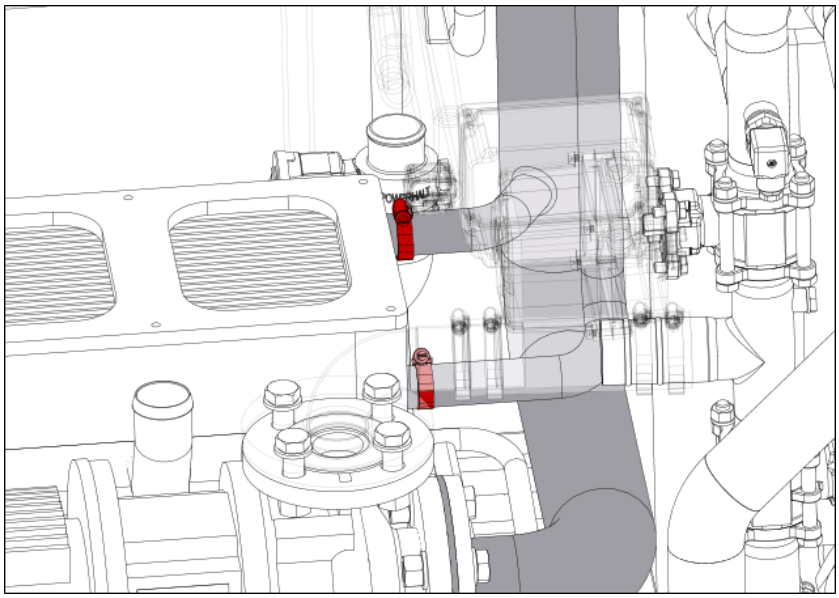

Figure 8-68: Removal of hoses to aftercooler

5. Cover disconnected ports and hoses to prevent leakage while moving the parts.
6. Release hose clamp on the back side of aftercooler and slide off hose.

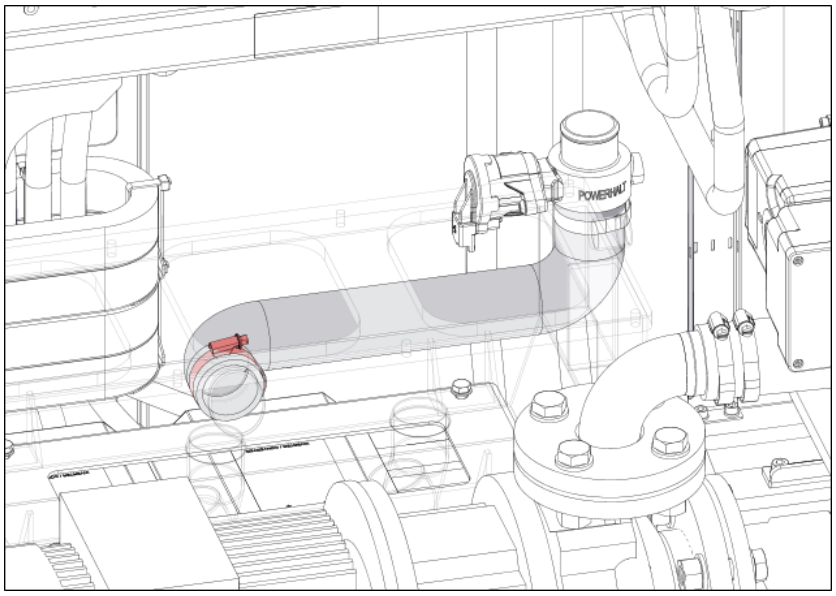

Figure 8-69: Removal of back side hose of aftercooler

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Assembling procedure:

1. Use 4 pcs. M8 bolts and washers to install the new aftercooler to the bracket. Tighten to 15 Nm.
2. Carefully lift the assembly to the lower cabinet. Use 4 pcs. M8 bolts to secure the assembly to the base of the cabinet. Tighten to 20 Nm.
3. Connect the cathode bypass hose to the back side of the aftercooler. Tighten hose clamp to 3.5 Nm. Remember to replace the hose clamp if damaged.
4. Perform assembling procedure of Humidifier Assembly (section 8.3.3) to install the humidifiers and air compressors.

   Make sure new O-rings are mounted and the surface is clean before tightening humidifier assembly to aftercooler assembly.
5. Connect the coolant hoses to the aftercooler. Tighten hose clamps to 3.5 Nm. Remember to replace the hose clamp if damaged.
6. Use 12 pcs. M5x10 bolts to install the high voltage panel cover.
7. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
8. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
9. Close system doors and use the integrator side to confirm the module is ready for power up. Remember to follow local lockout/tagout procedures.

8.3.5 Replace Air Compressors

Purpose:

The procedure describes how to replace an air compressor for the process air cathode system. The air compressors supply pressurized air to the fuel cell stacks. The compressor is sized to deliver the air at a mass flow regulated by the module system controller. The delivery pressure will be a function of air system flow resistance and required inlet pressure to the fuel cell stacks.

Responsibilities:

Preventive maintenance of the air compressors is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace an air compressor during the life and operation of the FCwave module.

- FRU, Gen3 Air Compressor (part no. 7500053)
- FRU, Gen3 Air Compressor to Inverter Sensor Cable (part no. 7500054)
- FRU, Inverter 2.0B Adaptor Cable[2] (part no. 7500361)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Air Compressors

Based on the normal conditions, the estimated time for replacement is:

Air Compressors		
Duration	2 hours	
Personnel	1	
Tightening Torque	M6 bolt	10 ± 0.5 Nm
	M8 bolt	25 ± 0.5 Nm
	Hose clamps	5 ± 0.5 Nm
	Tool: 5mm + 6mm hex key, 7mm + 10mm + 13mm socket, side cutting pliers, hose clamp plier set, cross-head screwdriver, plastic bag/tape, cable ties, torque wrench	

Table 8-11: Time to replace the air compressors

[2] Applies ONLY for modules with Inverter 2.0B

8.3.6 Assurance Procedure – Air Cathode Sub-system leak test

Succes criteria for leak testing:

There is a leak if:

- Values recorded during the test are out of acceptable range provided by the "Leak Test Report Form", which can be found on the Customer Portal (see section 4.1 for further information)
- Unable to create correct pressure in the system
- Escaping air can be heard within the module
- Hydrogen gas and a hydrogen sniffer can be used to identify leaks

There is no leak if:

- All the values recorded during the test are within the accepted range provided by the "Leak Test Report Form" which can be found on the Customer Portal (see section 4.1 for further information)
- No sound coming from the module can be heard

Estimated time to perform the cathode sub-system leak test

Based on the normal conditions, the estimated time for testing is:

Cathode sub-system Leak Test		
Duration	3 hours	
Personnel	1	
Tightening Torque	M5 bolt	6.5 ± 0.5 Nm
	M6 bolt	10 ± 0.5 Nm
	Tool: 4mm + 5mm hex key, leak tester, leak test hose, 3/8" wrench, 8mm hex socket, 7mm socket flex screwdriver, laptop, WLAN cable, 45mm fitting plug, 95mm exhaust blinding plate, 45mm blinding plug

8.4 Cooling Sub-system

For detailed P&ID requirements, refer to "Piping and Instrumentation Diagram" (PWR005), which can be found the Customer Portal or by contacting BPSE (see section 4.1 for further information).

8.4.1 Check for Coolant Leaks

Purpose:

The procedure describes how to visually inspect the cooling system and how to check for leaks or other issues. Components that show signs of damage or problems must be reported to BPSE to determine if any corrective action is necessary.

Responsibilities:

It is the end user's responsibility to do preventive maintenance (refer to section 8.1.1).

Safety:

Refer to section 8.1.2 to follow the instructions.

Procedure:

1. Perform step 1-3 in section 6.5.1 (High Voltage safety check before module maintenance) before proceeding with the disassembling procedure.
2. Visually examine HT coolant and air hoses installed in the upper cabinet and lower cabinet of module.
3. If accessible, examine the hoses connected to the air compressor and motor controllers of the LT coolant loop.
4. Record the observations and findings during inspection. If any leaks or damage are reported, do not operate the module until the issue is corrected. Contact BPSE (see section 4.1) for further support.
5. For coolant hose inspections:
    - Check DI filter housing for cracks or signs of leaks.
    - Check all coolant hoses. Make sure there are no loose clamps, bends, pinching, cuts, or cracks.
    - Check that all bolt fastenings and connections in the coolant circuit are tight and correctly aligned.
    - Check for signs of overheating, wear, or damage — damages of an excessive nature can be sign of more dangerous issues and must be investigated further.
    - Check that there are no visible leak spots, pooled liquid, corrosion, or excessive moisture around the H2 enclosure and in the lower cabinet base.
    - Check the fluid level in the header tank for evidence of any coolant loss.

8.4.2 Check Stack Coolant Conductivity

Purpose:

The procedure describes how to check the electrical conductivity of a fluid sample collected from the HT coolant circuit, through the DI filter drain valve with a conductivity meter. Higher than expected electrical conductance (5 µS) is an indication to replace the DI particulate filter. This DI filter maintains the cleanliness of the coolant circuit which prevents a conductive path through the circuit.

Responsibilities:

It is the end user's responsibility to do preventive maintenance (refer to section 8.1.1).

Parts and equipment:

A list of parts and special equipment is identified for examination of the cooling system during the life and operation of the FCwave module.

- Cooling sample KIT (part no. 7001351)
- Conductivity meter[3] 0.0 to 99.9 µS/cm or equivalent (part no. 6500424)

Safety:

Refer to section 8.1.2 to follow the instructions.

Procedure:

1. Check that the system has been in operation during the 24 hours before performing the test, to make sure the collected sample is filtered and deionized, so the data collected is representative of electrical conductance that can be expected during operation (coolant conductivity will increase over time when the system is not in operation).
2. If the module has not been in operation during the last 24 hours, operate the FCwave module for 10 minutes to circulate coolant through the DI particulate filter.
3. Perform step 1-3 in section 6.5.1 (High Voltage safety check before module maintenance) before proceeding with the disassembling procedure.
4. Follow the manufacturer instructions to prepare the conductivity meter before taking the sample.
5. Make sure the coolant sample cool to below 40°C, before immersing the conductivity probe in the collected sample.
6. Collect the necessary quantity of fluid from the HT coolant circuit into a clean container through the DI filter drain valve, so the sensing element of the conductivity meter can be immersed to about half of its length. Follow the instructions on the conductivity meter.
7. Stir the probe in the coolant sample and monitor the value until the indication is stable and record the value.
8. Make sure the indication is less than 5 µS. If conductivity indication is initially higher than 5 µS:
   - Replace the coolant DI particulate filter in the system coolant circuit (see section 8.4.8).
   - Locate the ports normally used for filling/draining the HT circuit, use a portable pump secured with mechanical relief valve to fill the HT circuit.
   - Operate the system until it reaches 40°C to deionize the coolant.
   - Collect a new test sample.
   - Measure the conductivity again, until it is below 5 µS.

   Pay attention to disconnect the vent valve connected to H_2 ventilation outlet duct to prevent any coolant spillage in the fuel cell stack during filling procedure.
9. Clean and follow the manufacturer instructions to store the conductivity meter.

[3] Conductivity meter is part of the 'Special Tools Kit FCwave' (part no. 6100062)

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

8.4.3 Check the Coolant Particulate Filter

Purpose:

The procedure describes how to check a coolant particulate filter (wedge wire screen) of the HT coolant system and how to replace if necessary. The cooling system contains a wedge wire screen to remove any particulate matter present in the coolant loop.

Responsibilities:

Preventive maintenance of the coolant wedge wire screen is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the H_2 sensors during the life and operation of the FCwave module.

- FRU, Coolant Particulate Filter (part no. 7500087) – if replaced

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to check the Coolant Particulate Filter

Based on the normal conditions, the estimated time for check is:

Coolant Particulate Filter	
Duration	10 min
Personnel	1

Table 8-13: Time to check coolant particulate filter

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

+45 8843 5500
ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Procedure:

1. Before proceeding with the check, perform all steps in section 7.2.7 and 6.5.1.
2. Drain the high temperature (HT) stack coolant circuit.
   Coolant spillage may occur while opening the wedge wire screen.
3. Loosen by hand the clamp securing the filter and then remove. There might be leftover coolant in the filter housing so prepare area for possible coolant spill.

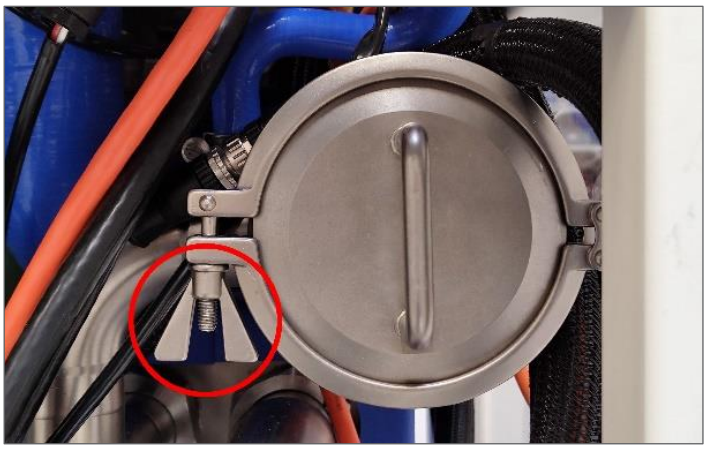

Figure 8-113: Clamp securing particulate filter

4. Grab handle on filter and gently pull out to avoid unnecessary contact with inner side of filter housing.
5. Check the filter for damage and particles. If there are any, rinse off with deionized water (DI).
6. Before reinstalling the filter, make sure the O-ring and gasket on the filter are seated properly.

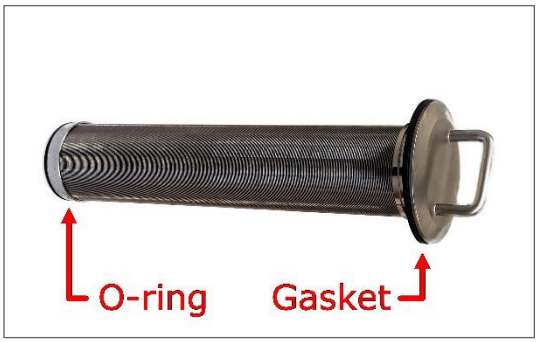

Figure 8-114: Particulate filter gasket and O-ring

7. Gently insert the filter into the housing, making sure the O-ring does not get unseated.
8. Make sure the gasket is properly seated.
   Wiggling the filter by the handle may help the gasket get seated more easily.
9. Reinstall the clamp, securing the filter to the housing, and tighten by hand.
   The module is ready to be restored to normal operating system.
10. Connect a portable pump secured with a mechanical relief valve to the connector, to fill the module with HT coolant as necessary.
11. Confirm that the module is ready for normal operation and remove local lockout and tagout when work is done.

8.4.4 Check the Coolant Level Indicator

Purpose:

The procedure describes how to visually inspect the coolant level in the header tank. The module contains an internal coolant header tank of no more than 10 litres. It provides a reservoir of coolant, allows for thermal expansion of the coolant, and has a level indicator in the header tank to provide warning for low coolant levels.

Responsibilities:

Preventive maintenance of the coolant level indicator is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Safety:

Refer to section 8.1.2 to follow the instructions.

Procedure:

1. Perform step 1-3 in section 6.5.1 (High Voltage safety check before module maintenance) before proceeding with the disassembling procedure.
2. Locate the level indicator behind the HRB motor in the upper cabinet, which is installed on the coolant header tank.

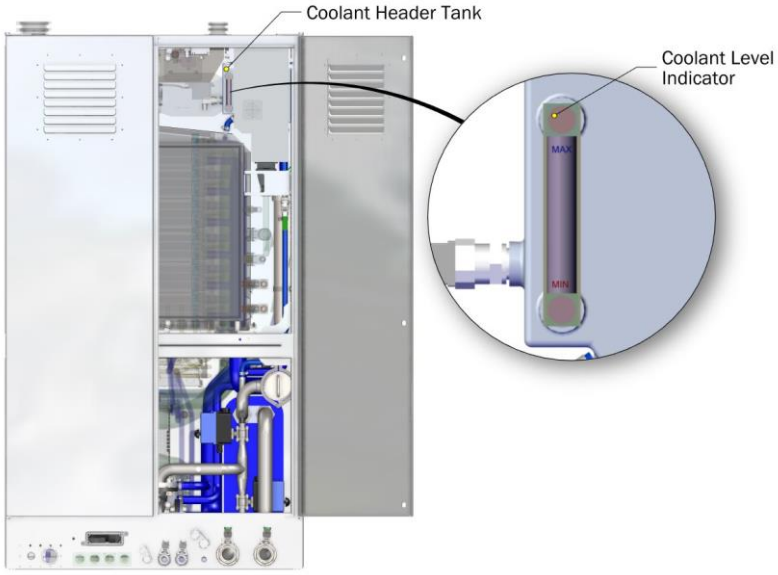

Figure 8-115: Overview of coolant header tank/level indicator

3. Visually examine the sight glass on the header tank, to make sure the coolant level is between maximum and minimum.
4. Do not exceed the maximum level of coolant to avoid any coolant spillage into the system. (During operation coolant level increases due to thermal expansion)
5. Refill the header tank when the coolant is below the minimum level.
6. Connect a portable pump secured with a mechanical relief valve to the connector, to fill the module with HT coolant as necessary.
7. Ensure the air pockets are vented through the vent valve located on the top of header tank.

8.4.5 Coolant Tank Level Switch

8.4.5.1 Check Coolant Tank Level Switch

Purpose:

This procedure describes how to check the coolant tank level switch in the FCwave™ module. The switch monitors the High Temperature (HT) coolant level. If the level is too low, it will trigger an alarm.

Responsibilities:

Preventive maintenance of the level switch is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to check the Coolant Tank Level Switch

Based on the normal conditions, the estimated time for check is:

Coolant Tank Level Switch	
Duration	15 min
Personnel	1

Table 8-14: Time to check Coolant Tank Level Switch

8.4.5.2 Replace Coolant Tank Level Switch

Purpose:

The procedure describes how to replace a coolant tank level switch for the HT coolant system. The level switch monitors the filling level of cooling water in the header tank. The level switch detects when a filling level exceeds or subceeds a set limit.

Responsibilities:

Preventive maintenance of the level switch is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the level switch H_2 sensors during the life and operation of the FCwave module.

- FRU, Coolant Tank Level Switch (part no. 7500078)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Level Switch

Based on the normal conditions, the estimated time for replacement is:

Coolant Tank Level Switch		
Duration	1 – 1½ hours	
Personnel	1	
Tightening Torque	1/2" sensor fittings	25 ± 0.5 Nm
	Tool	27 mm spanner, torque wrench, 10mm hex socket,

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Drain the HT cooling system.
3. To get more space, remove the HRB motor. Follow steps 8 through 17 of the disassembling procedure in section 8.2.2.
4. Locate the level switch behind the HRB motor, installed on the coolant header tank in the upper cabinet.

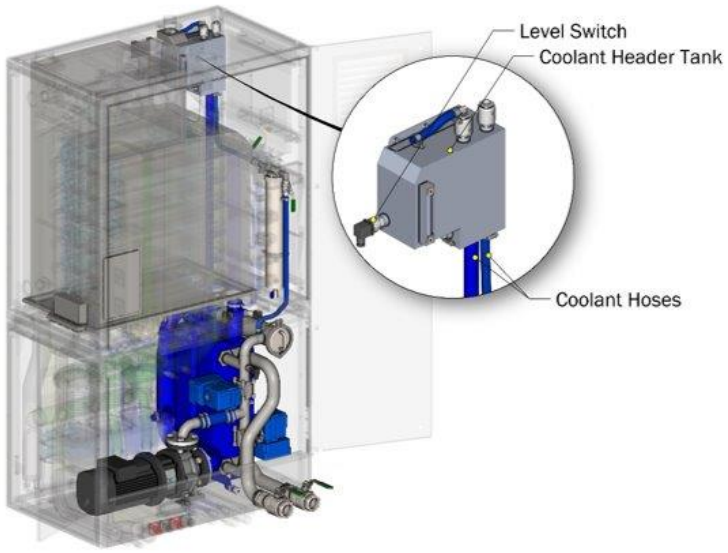

Figure 8-119: Location of the coolant header tank and level switch

5. Disconnect the level switch connection (LSL_D25) by removing the bolt in the middle of the plug.
6. Loosen the level switch and remove it by hand.

Assembling procedure:

1. Install a new level switch. Tighten to 25 Nm.
2. Use the bolt to install the sensor connector.
3. Re-install the HRB motor. Follow steps 11 through 22 of the assembling procedure in section 8.2.2.
4. Use 12 pcs. M5x10 bolts to install the high voltage panel cover.
5. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
6. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
7. Close system doors and use the integrator side to confirm the module is ready for power up. Remember to follow local lockout/tagout procedures.

8.4.6 Replace Coolant Flow Control Valves

Purpose:

The procedure describes how to replace flow control valves for the HT cooling system. A pair of electronically controlled valves regulates the stack coolant inlet temperature. One valve throttles the flow of coolant to the heat exchanger and the other bypasses the heat exchanger, depending on coolant temperature. During start-up, the coolant valves are positioned to bypass the heat exchanger, which allows coolant to recirculate through the stack and reduces warm-up time.

Responsibilities:

Preventive maintenance of the flow control coolant valve is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the coolant flow control valve during the life and operation of the FCwave module.

- FRU, Coolant Valve Actuator (part no. 7500088)
- FRU, Coolant Valve (part no. 7500089)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Coolant Valves

Based on the normal conditions, the estimated time for replacement is:

Coolant Valves		
Duration	1 – 1½ hours	
Personnel	1	
Tightening Torque	M8 bolt	25 ± 0.5 Nm
	M10 bolt	50 ± 5 Nm
	Tool	6mm + 8mm hex key, 13mm + 17mm socket key, 17 mm spanner, torque wrench

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Assembling procedure:

1. Use 4 pcs. M8 bolts to install the valve motor to the flow control valve. Tighten to 20 Nm.
2. Slide in the new ball valve and secure with 4 pcs. M10 bolts. Tighten to 25 Nm.
3. Disconnect the tank ventilation hose from the ventilation duct. The LV panel can be moved forward if more room is needed.

Figure 8-123: Disconnecting the tank ventilation hose

4. Use the filling valve to refill the HT cooling system. Pay attention to the HT coolant tank level indicator to not overflow the system.
5. Run the degas procedure (refer to 8.4.9).
6. Re-connect the tank ventilation hose from step 3.
7. Use 12 pcs. M5x10 bolts to install the high voltage panel cover.
8. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
9. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
10. Close system doors and use the integrator side to confirm the module is ready for power up. Remember to follow local lockout/tagout procedures.

8.4.7 Replace Coolant Pump

Purpose:

The procedure describes how to replace a coolant pump for the High Temperature (HT) cooling in the FCwave system. The pump re-circulates a mixture of de-ionized water and ethylene glycol through the fuel cell stacks, heat exchanger, valves, hoses, and fittings to transfer the heat generated in the fuel cells to the heat exchanger. The pump speed is controlled to maintain a steady outlet temperature from the fuel cell stack.

Responsibilities:

Preventive maintenance of the coolant pump is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the coolant pump during the life and operation of the FCwave module.

- FRU, Coolant Pump (part no. 7500355)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Coolant Pump

Based on the normal conditions, the estimated time for replacement is:

Coolant Pump		
Duration	4 hours	
Personnel	1	
Tightening Torque	M8 bolt	25 ± 0.5 Nm
	M12 bolt	85 ± 5 Nm
	M16 bolt	150 ± 5 Nm
	Tool: 6mm + 10mm + 14mm hex key, 7mm socket, 18mm + 24mm socket, 19mm + 24mm key, torx screwdriver, plugs/plastic bag, torque wrench,

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Drain and purge the LT cooling system.
3. Locate the air filter/mass flow meter installed in front of the twin compressors.
4. Disconnect the mass flow meter sensor (FT_A10).

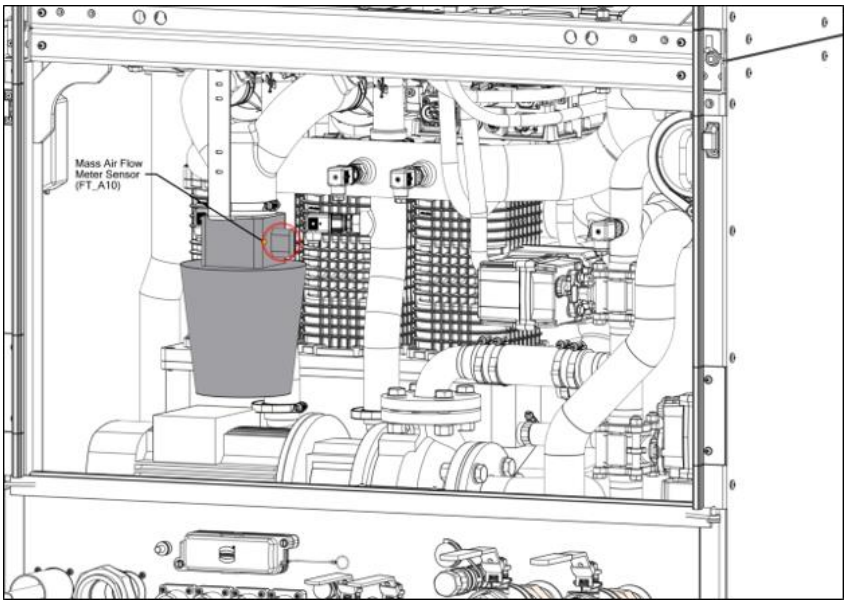

Figure 8-124: Location of mass flow sensor

5. Release the 7mm socket hose clamp to uninstall the filter/mass air flow meter.
6. Slide down the filter unit and take it out.

13. Release 2 pcs. hose clamps on the coolant hose connected to the coolant pump discharge flange and slide off hose as much as possible.

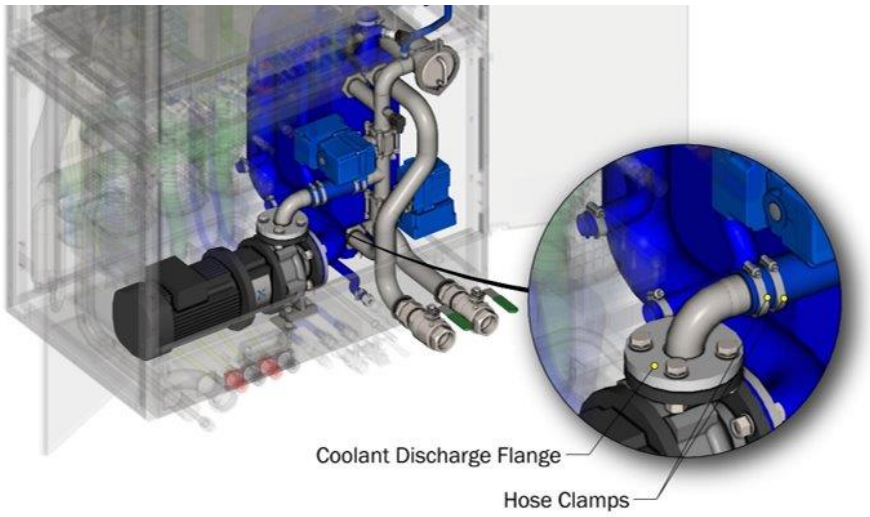

Figure 8-132: Removal of clamps on coolant pump flange

14. Remove 4 pcs. M16 bolts, washers, nuts, and gasket from the coolant pump discharge flange connection.
15. Remove 4 pcs. M16 bolts, washers, and nuts from the coolant pump suction flange connection and slide off hose as much as possible.
16. Attach a lifting device to the frame of the module and to the compressors supporting bracket.
17. Attach lifting chain around the pump and raise it just enough to create tension on the chain.
18. Uninstall 4 pcs. M12 bolts and washers used to tighten the pump mounting bracket to the base of the cabinet.

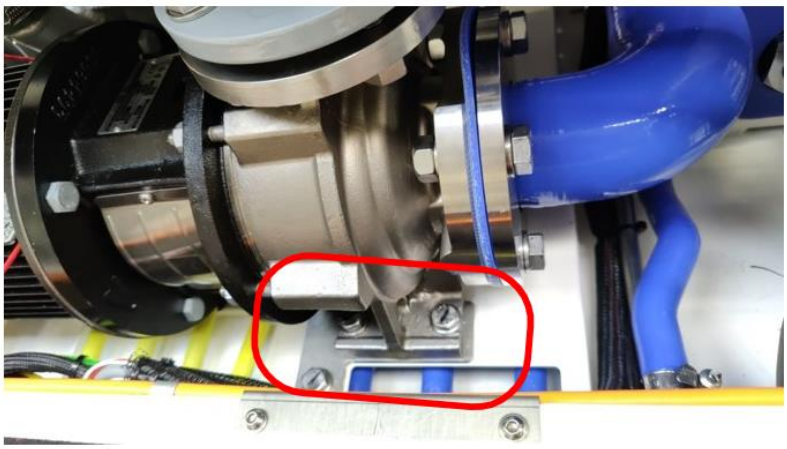

Figure 8-133: Disconnecting pump from base of cabinet

19. Lift the pump and slide it out. Remember to cover all exposed hoses and pump holes with rubber plugs or zip-tied plastic bags to avoid contamination and leaks.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

Assembling procedure:

1. Wipe up any spilled coolant from the module and remove all plugs and plastic bags from the exposed hoses.
2. Use the crane and lift the pump into the module. When in the module, lower the pump just enough so it is possible to attach the mounting bracket to the module frame, by use of 4 pcs. M12 bolts. Tighten to 85 Nm.
3. Release the tension on the crane and dismount it from the module frame.
4. Use 4 pcs. M16 bolts, washers, and nuts to install coolant pump suction flange connection to the pump. Tighten to 40 Nm.
5. Connect the coolant hose to the coolant pump discharge flange, but do not tighten the hose clamps yet.
6. Insert plastic gasket between the hose and the pump discharge flange and secure it with 4 pcs. M16 bolts, nuts, and 8 pcs. washers. Tighten to 150 Nm and tighten hose clamps from step 5 to 3.5 Nm.

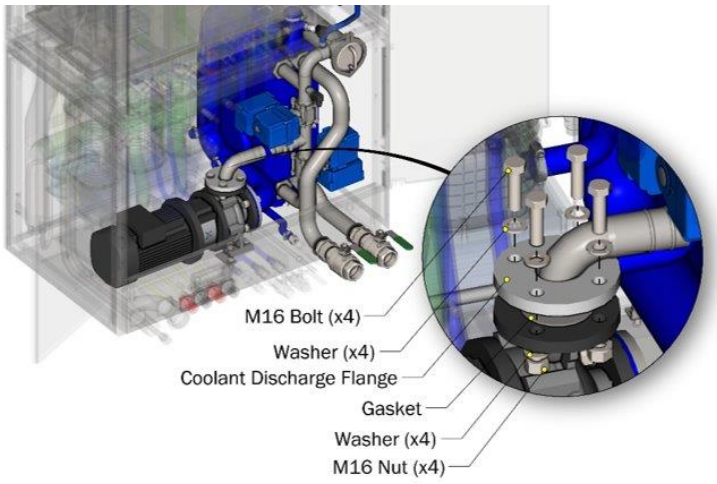

Figure 8-134: Installing plastic gasket

7. Install the orange power cable (the electrical connection) and ground wire to the black control box on top of the coolant pump as shown and secure it to the case.

8.4.8 Replace DI Filter Cartridge

Purpose:

The procedure describes how to replace a de-ionization (DI) filter for the HT cooling system. To maintain the stack coolant conductivity below the maximum level, part of the overall coolant flow is diverted to the DI filter to continuously remove ions in the liquid coolant, which minimizes the risk of electrical ground fault.

Responsibilities:

Preventive maintenance of the DI filter is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the DI filter during the life and operation of the FCwave module.

- FRU, DI Filter Cartridge (part no. 7500095)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the DI Filter

Based on the normal conditions, the estimated time for replacement is:

DI Filter		
Duration	15 min	
Personnel	1	
Tightening Torque	M6 bolt	10 ± 0.5 Nm
	M8 bolt	25 ± 0.5 Nm
	Tool	5mm + 6mm hex key, clean container, 8.15mm tube, valve, 3/8" BSP to 8mm plastic pipe adaptor

8.4.9 Assurance procedure – Cooling Sub-system Degas

Estimated time to perform degas procedure

Based on the normal conditions, the estimated time for procedure is:

Degas procedure	
Duration	1 hour
Personnel	1
Tools needed	Laptop, ethernet cable

Table 8-19: Time to perform degas procedure

Procedure:

1. Secure the area before pressurizing the system components.
   Use warning signs around the working area to ensure safety.
2. Power up the module by enabling the 24 VDC power supply.
3. Log into the engineering interface.
4. In the "unlocked" state, the module is ready to be supplied with the MD_EN signal.
   The "unlocked" state can be reached by providing the customer key from the integrator system via CAN bus.

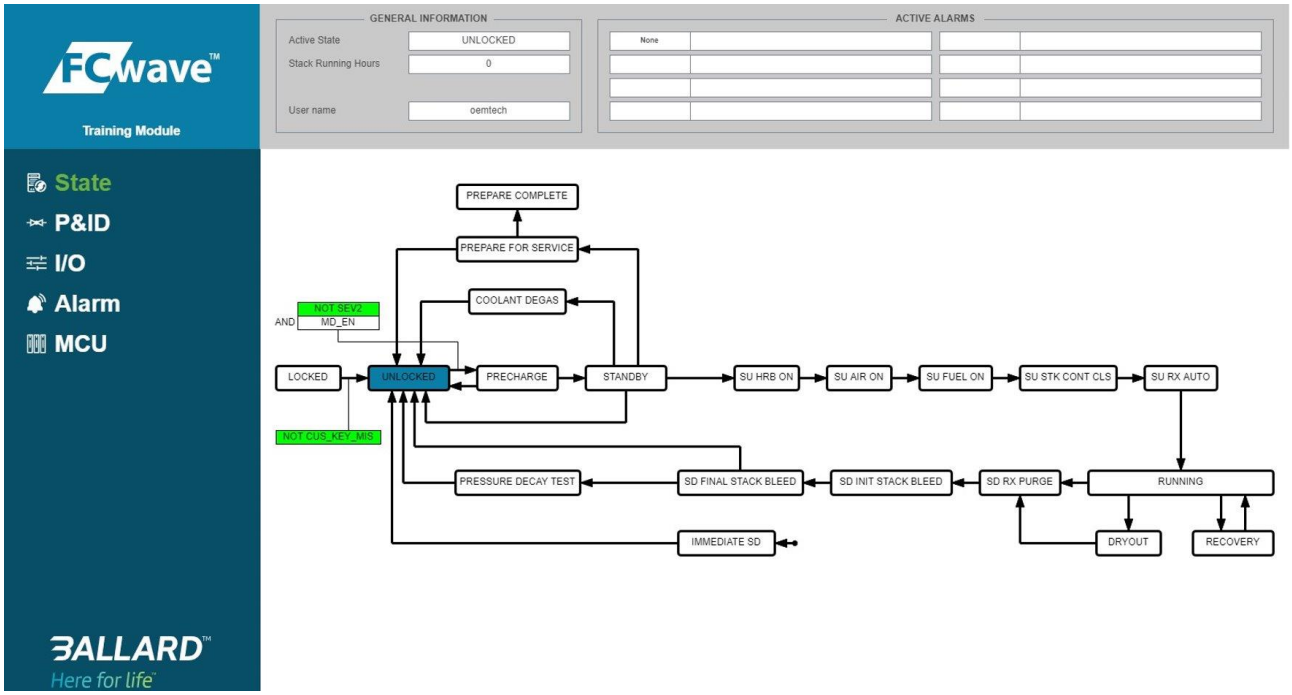

Figure 8-147: overview of unlocked state

5. Supply the module HV with "Min – 350 VDC". In the "unlocked" state, send the MD_EN signal from the integrator system.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

8.5 H_2 Enclosure Ventilation and Stack Assembly

For detailed P&ID requirements, refer to "Piping and Instrumentation Diagram" (PWR005), which can be found the Customer Portal or by contacting BPSE (see section 4.1 for further information).

8.5.1 Check Linear Heat Detector (LHD) Functionality

Purpose:

The procedure describes how to check the functionality of the LHD (also called the Fire Wire) relay in the module. The LHD will trip a relay, causing a fire alarm based on the resistance in the circuit, if a fire were to occur in the module. The LHD will also trip another relay for a Fire Wire malfunction if the circuit is broken (open circuit).

Responsibilities:

Preventive maintenance of the LHD is necessary for safe operation. It is the end user's responsibility to do preventive maintenance (refer to section 8.1.1). The LHD is considered a Field Instrument as per Classification society rules.

Parts and equipment:

A list of parts and special equipment is identified to check the LHD during the life and operation of the FCwave module.

- HRNS-LHD KIT (part no. 7500131)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to check the LHD:

Based on the normal conditions, the estimated time for check is:

Linear Heat Detector	
Duration	15 min
Personnel	1

Table 8-20: Time to check the LHD

Note:

During the procedure you will trigger the fire detection system. Personnel must coordinate with the vessel representative to ensure that a fire detection signal from the module will not cause activation of the firefighting system or in other ways cause hazard to the personnel or equipment.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Procedure:

1. Before proceeding with the check, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Disconnect the LHD connector from CN205 in the HV panel and connect the LHD test plug to CN205.

   The switch for 'Malfunction' should be ON, simulating that the Fire Wire circuit is closed and functional.

   The switch for 'Fire' should be OFF, simulating that the Fire Wire's resistance is normal. Meaning that fire has not been detected.
3. Connect the low voltage electrical connection (X_E01) and secure it by finger-tightening the two bolts.
4. Monitor the MCU engineering interface with the module in "Unlocked" state.

   Make sure there are no active alarms.
5. To test the LHD relay for "Fire", confirm the following state of LEDs on the relay 'CNV_AZT_J30':
   - Relay 1: ON
   - Relay 2: ON
6. Toggle the switch for 'Fire' to ON to simulate a change in the LHD's resistance.
7. Confirm the following state of LEDs on the relay 'CNV_AZT_J30':
   - Relay 1: OFF
   - Relay 2: ON

Figure 8-152: LED status relay CNV_AZT_J30

8. Toggle the switch for 'Fire' to OFF
9. Confirm the following alarms can be seen in the engineering interface (as shown in the figure below):
   - A3_SAFETYSTOP_I_10120
   - A2_CNV_FCV_A_OK_I_10020
   - A2_CNV_FCV_A_OK_I_10030

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

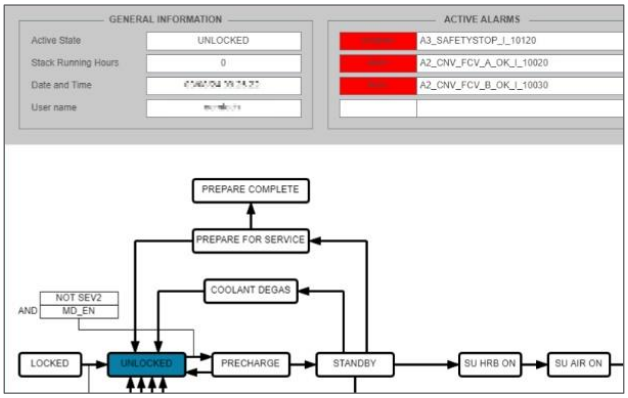

Figure 8-153: Overview of alarms

Disconnect and reconnect the X_E01 to power cycle the module to reset and confirm there are no alarms.

10. To test the LHD relay for "Malfunction", confirm the following state of LEDs on the relay 'CNV_AZT_J30'
    - Relay 1: ON
    - Relay 2: ON
11. Toggle the switch for 'Malfunction' to OFF to simulate the LHD's connection is broken.
12. Confirm the following state of LEDs on the relay 'CNV_AZT_J30':
    - Relay 1: OFF
    - Relay 2: OFF

Figure 8-154: LED status relay CNV_AZT_J30

13. Toggle the switch for 'Malfunction' to ON
14. Confirm the following alarms can be seen in the engineering interface:
    - A3_SAFETYSTOP_I_10120
    - A2_CNV_FCV_A_OK_I_10020
    - A2_CNV_FCV_A_OK_I_10030
15. Power down the module, disconnect the LHD test plug from CN205 and reconnect the LHD connector to CN205.
16. Power up the module and confirm there are no alarms.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

8.5.2 Check the H_2 Sensor

Purpose:

The procedure describes how to check calibration of the ventilation H_2 sensor. The correct operation of these hydrogen sensors is important to ensure that H_2 concentration gases exiting the FCwave module are in acceptable safe levels. The hydrogen sensors are attached to the ventilation hatch cover.

Responsibilities:

Preventive maintenance of the ventilations H_2 sensors is necessary for safe operation. It is the end user's responsibility to do preventive maintenance (refer to section 8.1.1).

Parts and equipment:

A list of parts and special equipment is identified to service the hydrogen sensors during the life and operation of the FCwave module.

- 2% hydrogen (balance air) calibration test gas mixture — calibration gas must have balance air component for correct operation of hydrogen sensors. Calibration gas with balance nitrogen or other gases is not applicable.
- Pressure regulator with flow rate control — must be used to decrease the pressure from the test gas bottle. A regulator that is sized to minimum flow, equivalent of 0.5 SLPM air, must be sufficient.
- Test nozzle — it is recommended that a simple test nozzle with a built-in needle valve is required to supply the test gas to the H_2 sensor.
- Repeat process with 1.6% hydrogen (balance air) calibration test gas mixture.

Safety:

Refer to section 8.1.2 to follow the instructions.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Procedure:

1. System needs to be in "prepare for complete service" state.
2. Open system doors.
3. Supply 24V power from the shipboard or connect an I/O tester to power the module MCU engineering interface.
4. Connect a computer to the MCU and log in to the engineering interface (see section 7.2).
5. Connect a pressure regulator to a test gas canister and test the nozzle. Do not flow gas at this point.
6. Locate the ventilation hatch cover in the top right corner of the H2 enclosure behind the HRB motor.

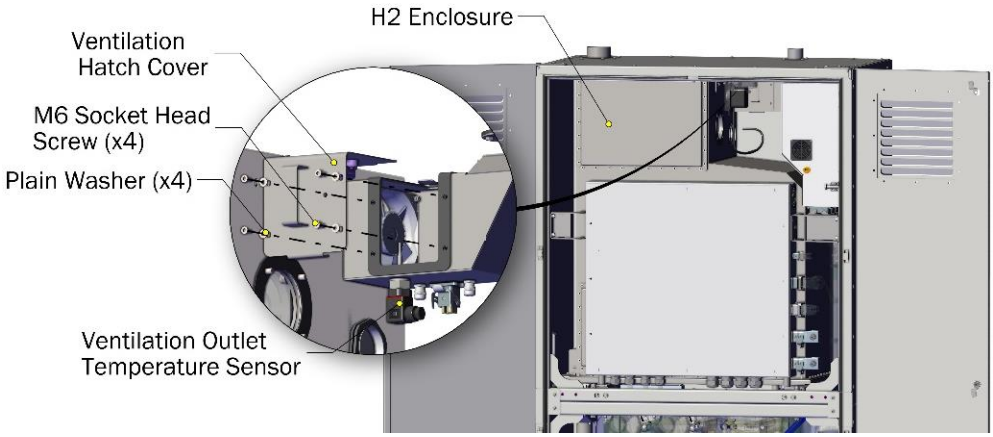

Figure 8-156: Location of ventilation hatch cover

7. Use 5mm hex key to uninstall 4 pcs. M6 bolts and washers to remove the ventilation hatch cover.
8. Disconnect the ventilation H2 sensors connections (HRNS-303-CN_AZT_J50 and CN_AZT_J50B).

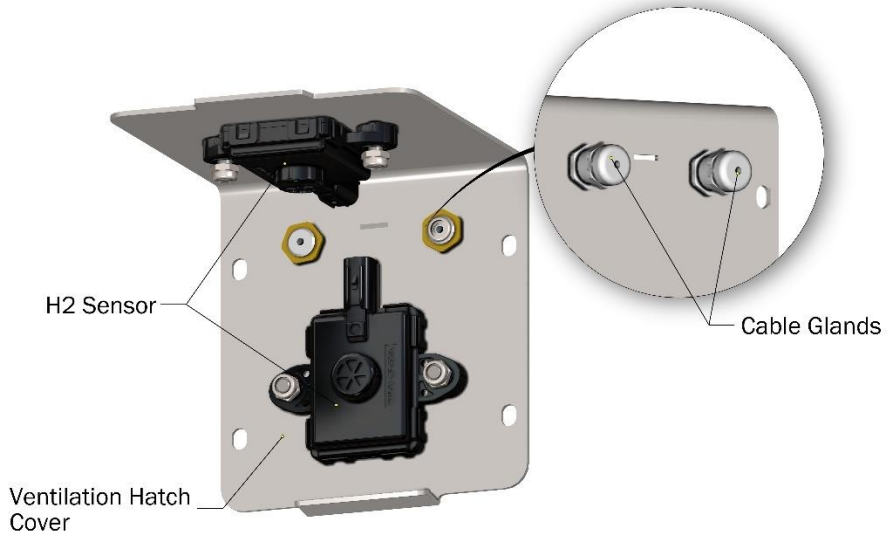

Figure 8-157: H_2 sensors

9. Remove both sensors along with the hatch cover.
10. Position the test nozzle directly over the hydrogen sensor. Make sure the nozzle fully covers the sensor element.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

11. In the MCU engineering interface, go to the I/O page and select the 'Cabinet' tab.
12. Scroll to tag 'AZT_J50A' and record the indication. The indication must be in the range 0 ± 0.2%. If the hydrogen sensor indication is outside the range:
    - Make sure the module is not in 'sleep' condition, as then the H_2 sensors will not be powered. Refer to the MCU user manual for more information. If the module is in 'sleep' condition, force 'on' to start the module that will energize the sensors.
    - Contact BPSE (see section 4.1) for further troubleshooting support.
13. Open the supply valve on the calibration gas. Expose the sensor for 10 – 30 sec until the AZT_J50A reading stabilizes.
14. Hold the sensor head above the nozzle during the test. To store the calibration gas efficiently, close the supply valve immediately after a stable indication is achieved.
15. Make sure the sensor indication is more than 1.4% and less than 2.2% H_2 concentration and record the indications.
16. If the sensor indication is still out of permitted range after performing these steps, replace the hydrogen sensor (see section 8.5.3) and repeat the steps to verify sensor functionality. Contact BPSE (see section 4.1) for further support.
17. Reset the hydrogen connection with the "Reset Lockout" button on the MCU home screen (see section 7.2).
18. Disconnect the gas nozzle from the hydrogen sensor.
19. Log out of the MCU and disconnect the computer.
20. If applicable, power off the IO tester and disconnect it from the module.

8.5.3 Replace the H_2 Sensors

Purpose:

The procedure describes how to replace a ventilation outlet H_2 sensor and safety H_2 sensor for the FCwave module. To ensure a safe atmosphere inside the H_2 Enclosure two H_2 detectors are installed, to measure the H_2 concentration in ventilation exhaust and to detect leaks in stack seals or HRB circulation piping in the H_2 enclosure.

Responsibilities:

Preventive maintenance of the H_2 sensors is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the H_2 sensors during the life and operation of the FCwave module.

- FRU, Sensor H_2, 0-4% (part no. 7500036) x2

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the H_2 Sensors

Based on the normal conditions, the estimated time for replacement is:

H_2 Sensors		
Duration	15-30 min	
Personnel	1	
Tightening Torque	M6 bolt	
	Tool	5mm hex key, 10mm wrench, torque wrench

Table 8-21: Time to replace the H_2 sensors

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and steps 1-4 of section 6.5.1 (High Voltage safety check before module maintenance).
2. Locate the ventilation hatch cover, behind the HRB motor, on the top right corner of the H_2 enclosure.
3. Remove 4 pcs. M6 bolts and washers and remove the ventilation hatch cover.

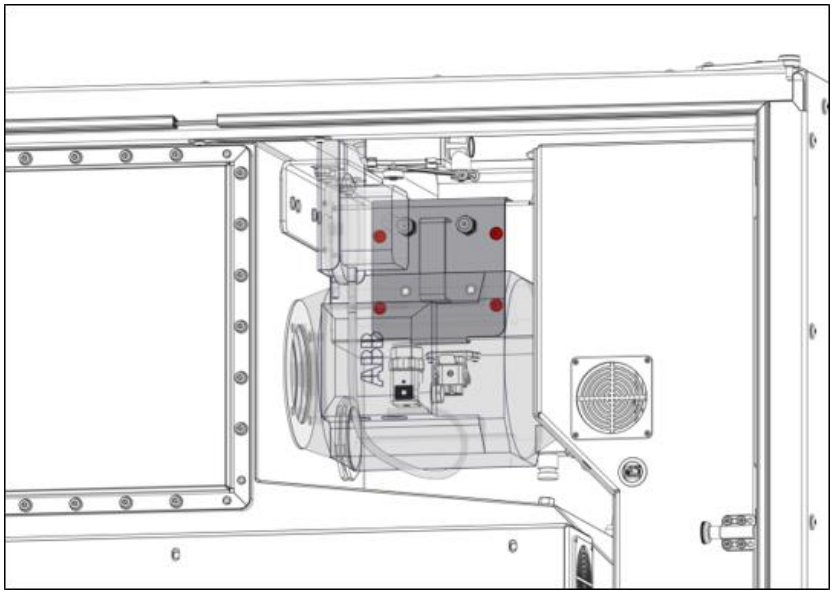

Figure 8-158: Bolts in the ventilation hatch cover

4. Remove the old gasket from the H_2 enclosure.
5. Remove 4 pcs. M6 lock nuts and washers used to tighten the H_2 detection module to the ventilation duct hatch. Then disconnect the ventilation detector connections (CN_AZT_J50A & CN-AZT_J50B) and remove the H_2 sensor from the hatch cover.

Make sure to note down the position of the sensors before removing.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Assembling procedure:

1. Insert the H_2 detectors in the ventilation hatch cover. Use M6 lock nuts and washers to fasten the H_2 detection module to the ventilation duct hatch. Tighten to 6 Nm. Then connect the ventilation detector connections (CN_AZT_J50A & CN_AZT_J50B).

   Remember to lubricate the bolts with ceramic grease.

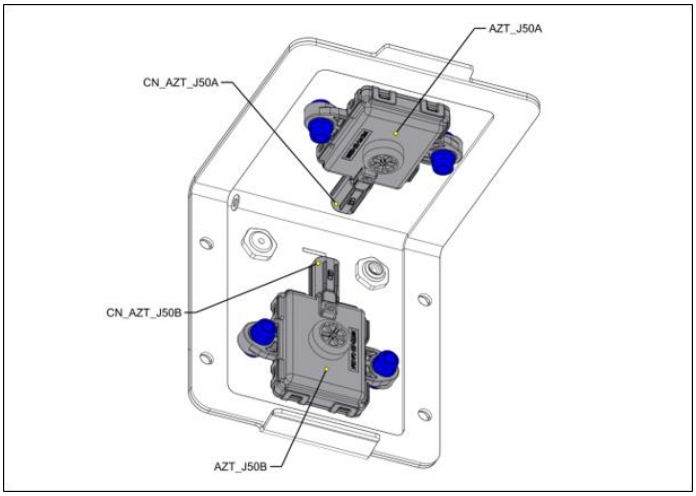

Figure 8-160: Install H_2 detectors to hatch cover

2. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm. Prepare to power up the 24 VDC system.
3. Power up the 24 VDC system. Calibrate and verify the sensor readings before assembling the cover. Refer to 8.5.2
4. Install the new rubber gasket on the H_2 enclosure.
5. Install the ventilation hatch cover to the H_2 enclosure. Use 4 pcs. M6 bolts and washers to tighten the ventilation duct hatch assembly to the ventilation duct. Tighten to 6 Nm. Remember to lubricate the bolts with ceramic grease.

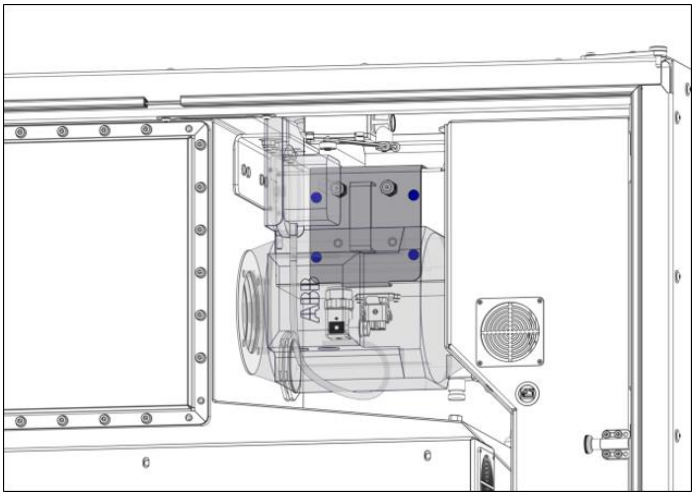

Figure 8-161: Install hatch assembly to ventilation duct

6. Close system doors and use the integrator side to confirm the module is ready for power up. Remember to follow local lockout/tagout procedures.

8.5.4 Ventilation Inlet Flow Switch

8.5.4.1 Check Ventilation Inlet Flow Switch

Purpose:

The procedure describes how to check a ventilation inlet flow switch in the FCwave™ module. The switch monitors for presence of airflow in the ventilation of the fuel supply and Hydrogen Enclosure (H_2E) and will trigger an alarm if there is no airflow through the system.

Responsibilities:

Checking the ventilation inlet flow switch functionality is necessary for safe operation according to the maintenance plan (refer to the Customer Portal) or after a replacement. It is the end user's responsibility to do preventive maintenance, as stated in section 8.1.1.

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to check the Ventilation Inlet Flow Switch

Based on the normal conditions, the estimated time for check is:

Ventilation Inlet Flow Switch	
Duration	10 min
Personnel	1
Tool	32mm spanner

Table 8-22: Time to check ventilation inlet flow switch

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Installed in the ventilation pipe in front of the coolant pump, locate the flow switch at the bottom left side of the cabinet.

   If possible, and if more convenient, the flow switch can be tested from integrator side by closing the ventilation inlet during the test to stop the airflow. If tested from integrator side, skip step 3.
3. If needed, take a photo of approximate position of flow switch before proceeding.

   Use 32mm spanner or crow foot to loosen the nut used to secure the flow switch. Loosen just enough to turn it by hand, and do not remove the switch nor let it drop down in the cabinet.

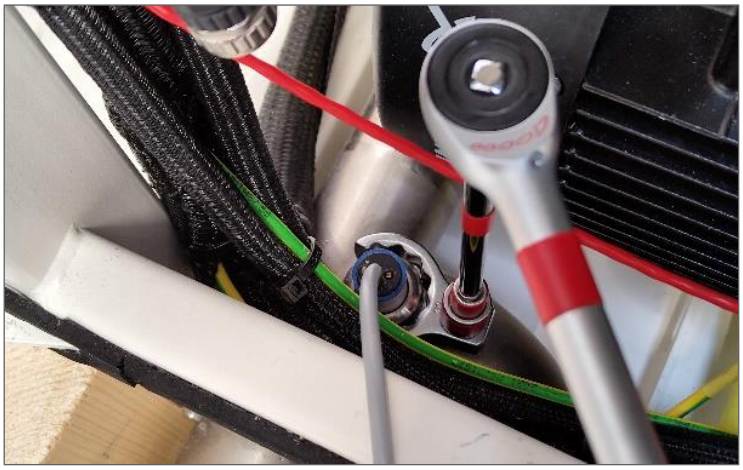

Figure 8-162: Removing inlet flow switch nut

4. Connect the low voltage electrical connection (X_E01) and secure it by finger-tightening the bolts.
5. Monitor the MCU engineering interface with the module in “Unlocked” state.

   Make sure there are no active alarms.
6. To test the flow switch, confirm the LED on the switch is green, indicating there is airflow.
7. Confirm the switch’s LED turn red once removed from the source of airflow. By hand loosen the nut securing the switch to remove it.

   If tested from the integrator side, close the ventilation inlet instead.

Figure 8-163: Inlet flow switch LED testing

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

+45 8843 5500
ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

8. Loosely reinstall the switch by hand and check the alarm codes.
9. Confirm the following alarms can be seen in the engineering interface:
    - A3_SAFETYSTOP_I_10120
    - A2_CNV_FCV_A_OK_I_10020
    - A2_CNV_FCV_A_OK_I_10030

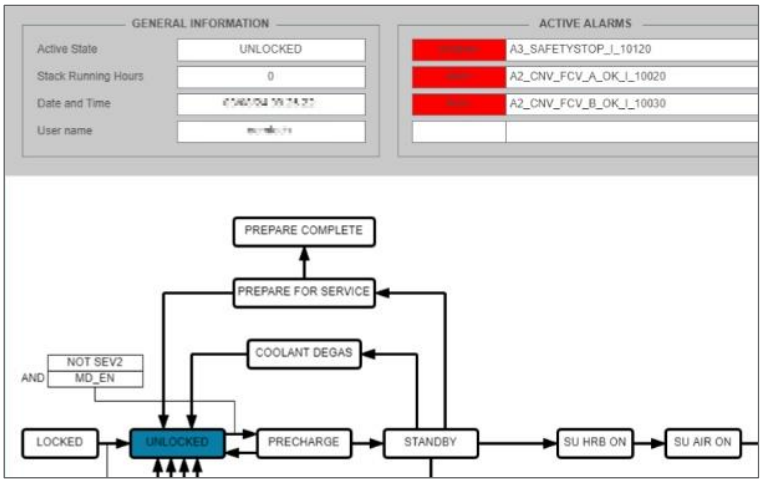

Figure 8-164: Overview of alarms

10. Remove the X_E01 to power off the module.
11. Make sure the switch is installed in the original position and use 32mm spanner or crow foot to secure it by lightly tightening. If tested from integrator side, open the ventilation side.

    Be aware to not overtighten the nut, as it can damage the switch's housing.
12. Power up the module to confirm there are no alarms, and that the switch's LED is green.

Figure 8-165: Inlet flow switch LED testing

13. The module is ready to be powered down by disconnecting the X_E01 electrical connection, and the module is ready to be restored to normal operating state.
14. Confirm that the module is ready for normal operation and remove local lockout and tagout when work is done.

8.5.4.2 Replace Ventilation Inlet Flow Switch

Purpose:

The procedure describes how to replace a ventilation inlet flow switch for the H2 ventilation intake. The flow switch monitors the airflow through the enclosure ventilation, to ensure the dilution of H2 concentration and verifies that the airflow into H2 enclosure is above the set limit.

Responsibilities:

Preventive maintenance of the flow switch is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the flow switch during the life and operation of the FCwave module.

- FRU, Ventilation Inlet Flow Switch (part no. 7500018)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Ventilation Inlet Flow Switch

Based on the normal conditions, the estimated time for replacement is:

Ventilation Inlet Flow Switch		
Duration	30 - 45 min	
Personnel	1	
Tightening Torque	1/2" sensor fitting	6 ± 0.5 Nm
	Tool	32 mm spanner, torque wrench

Table 8-23: Time to replace the Ventilation Inlet Flow Switch

8.5.5 H_2 Enclosure Water Ingress Sensor

8.5.5.1 Check H_2 Enclosure Water Ingress Sensor

Purpose:

The procedure describes how to check a water ingress sensor in the H_2 enclosure for the FCwave module.

Responsibilities:

Preventive maintenance of the water ingress sensor in the H_2 enclosure is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the H_2 Enclosure Water Ingress Sensor

Based on the normal conditions, the estimated time for replacement is:

H_2 Enclosure Water Ingress Sensor	
Duration	10 – 90 min
Personnel	1
Tool	27mm spanner

Table 8-24: Time to replace water ingress sensor

Note:
The sensor has different locations depending on the module.
Location A is towards the back of the module.
Location B is towards the front of the module.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

+45 8843 5500
ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. (For location A sensor) Perform steps 6-12 in section 8.5.5.2 to remove the sensor.
3. (For location B sensor) Loosen the bolt in the housing to remove the connector housing from the sensor and use a 27mm spanner to remove the sensor.

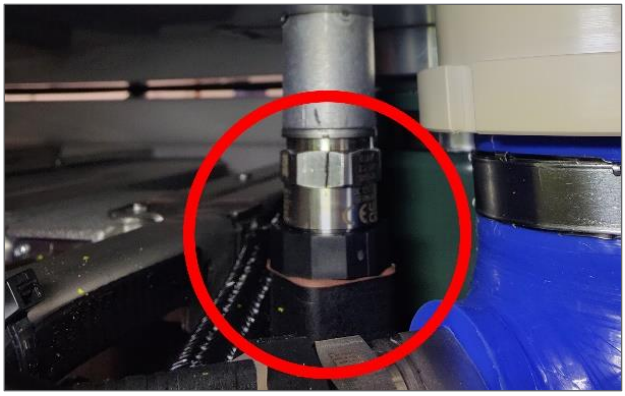

Figure 8-168: H_2 ingress sensor housing

4. Reconnect the connector housing to the sensor. Tighten the bolt if necessary.
5. Connect the low voltage electrical connection (X_E01) and secure it by finger-tightening the bolts.
6. Monitor the MCU engineering interface with the module in "Unlocked" state.
   Make sure there are no active alarms.
7. Test the sensor by one of following three methods:
   a. Cover the sensor's electrode as much as possible by hand.
      This method relies on skin contact and result can vary depending on coverage area and skin moisture.
      Wait up to 30 seconds. If there is an alarm, skip to alarm codes, otherwise try the next method.

   b. Dampen a paper or cloth towel with water and press it against the sensor's electrode, covering as much of it as possible.
      Wait up to 30 seconds. If there is an alarm, skip to alarm codes, otherwise try the next method.

   c. Submerge the sensor's electrode in a container filled with water.
      Wait up to 30 seconds for the alarm to appear.

8. No matter the method, the alarm should disappear as soon as the sensor's electrode is not in contact with the test medium. Confirm the following warning alarm can be seen in the engineering interface:
   - A1_LSH_Z40_S_10700

   Alarm events are logged and can be found in the "Alarm" tab on the menu to the left side of the engineering interface.

8.5.5.2 Replace H_2 Enclosure Water Ingress Sensor

Purpose:

The procedure describes how to replace a water ingress sensor in the H_2 enclosure for the FCwave module. The sensor monitors moisture content in the H_2 Enclosure. The level sensor detects when the moisture level exceeds a set limit.

Responsibilities:

Preventive maintenance of the water ingress sensor in the H_2 enclosure is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the differential pressure safety switch during the life and operation of the FCwave module.

- FRU, Sensor, H_2 Enclosure Water Ingress (part no. 7500035)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the H_2 Enclosure Water Ingress Sensor

Based on the normal conditions, the estimated time for replacement is:

H_2 Enclosure Water Ingress Sensor		
Duration	1 – 1½ hours	
Personnel	1	
Tightening Torque	1/2" sensor fitting	25 ± 0.5 Nm
	Tool	27 mm spanner, torque wrench, flathead + cross-head screwdriver, 10mm socket screwdriver, 7mm socket

Table 8-25: Time to replace water ingress sensor

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Disassembling procedure:

The FCwave module was built in two different ways regarding this sensor. Either located in the back of the H_2 enclosure (location A) or located in front of the H_2 enclosure (location B).

Location A	Location B
Perform all steps in section 6.5.1 (High Voltage safety check before module maintenance) before proceeding with the disassembling procedure.	Perform all steps in section 6.5.1 (High Voltage safety check before module maintenance) before proceeding with the disassembling procedure.
1. Drain the HT cooling system	1. Locate the water ingress sensor on the H2 Enclosure in the upper cabinet, which is installed behind the coolant stack outlet connections.
2. Disconnect the 2 sensors on the HT cooling inlet hose (TT_D50 & PT_D50). (Figure 8-170)	2. Disconnect the water ingress sensor connection (LSH_Z40), use spanner to loosen the sensor and remove it.
3. Uninstall bolt keeping the HT cooling inlet hose in place, dismount the hose and tuck it out of the way.	
4. Disconnect the cable from the air inlet control valve (FCV_A40). (Figure 8-171)	
5. Relive the lower hose clamp from the FCV_A40 (no. 1) and take out the air inlet hose.Then relive the hose clamp directly under the H_2 Enclosure (no.2) and take out the FCV_A40 valve. (Figure 8-172)	
6. Disconnect the cable from the air outlet control valve (FCV_A50).	
7. Relive the lower hose clamp from the FCV_A50 and take out the air inlet hose. Then relive the hose clamp directly under the H_2 Enclosure and take out the FCV_A50 valve.	
8. Locate the H_2 enclosure ingress sensor in the back of the module. (Figure 8-173)	
9. Release the bolt in the middle of the plug and remove it. (Figure 8-174)	
10. Use a spanner to disconnect the sensor (LSH_Z40) and remove it.

Assembling procedure:

The FCwave module was built in two different ways regarding this sensor. Either located in the back of the H_2 enclosure (location A) or located in front of the H_2 enclosure (location B).

Location A	Location B
1. Install the new sensor. Tighten to 25 Nm.	1. Install new sensor with a new bonded seal. Tighten to 25 Nm
2. Use the bolt to install the sensor connector.	2. Connect the new sensor to the module.
3. Reinstall the FCV_A50 valve and secure it with the hose clamps. Tighten to 3.5 Nm.	3. Install the high voltage panel cover. Use 12 pcs. M5x10 bolts
4. Reinstall the plug in the FCV_A50 valve connector.	4. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
5. Reinstall the FCV_A40 valve and secure it with the hose clamps. Tighten to 3.5 Nm.	5. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
6. Reinstall the plug in the FCV_A40 valve connector.	6. Close the system doors and confirm that the module is ready for power up from the integrator side after the maintenance. Remove local lockout and tagout procedures when work is done.
7. Remount the HT cooling inlet hose and tighten the hose clamp	
8. Install the pressure and temperature sensors (PT_D50 & TT_D50) on the HT cooling outlet. (Figure 8-175)	
9. Install the high voltage panel cover. Use 12 pcs. M5x10 bolts	
10. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.	
11. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.	
12. Close the system doors and confirm that the module is ready for power up from the integrator side after the maintenance. Remove local lockout and tagout procedures when work is done.

8.5.6 Differential Pressure Safety Switch

8.5.6.1 Check Differential Pressure Safety Switch

Purpose:

The procedure describes how to check a differential pressure safety switch in the FCwave™ module. The safety switch monitors the air pressure difference between the inside of the Hydrogen Enclosure (H2E) and that of the outside. The switch will trigger an alarm if the air pressure inside the H2E is not lower than the outside pressure.

Responsibilities:

Checking the differential pressure safety switch is necessary for safe operation according to the maintenance plan (refer to the customer portal) or after a replacement. It is the end user's responsibility to do preventive maintenance, as stated in section 8.1.1.

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to check the Differential Pressure Safety Switch

Based on the normal conditions, the estimated time for check is:

Differential Pressure Safety Switch	
Duration	10 min
Personnel	1

Table 8-26: Time to check differential pressure switch

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Connect the low voltage electrical connection (X_E01) and secure it by finger-tightening the bolts.
3. Monitor the MCU engineering interface with the module in "Unlocked" state.
   Make sure there are no active alarms.
4. Between the H_2E and the low voltage panel, locate the differential pressure safety switch below the smoke detector. Gently disconnect the tube attached to the switch.

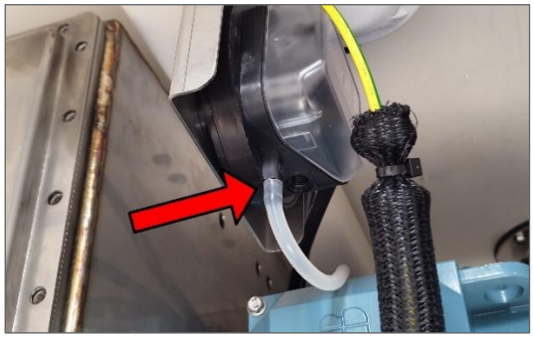

Figure 8-176: Disconnect differential pressure switch tube

5. Confirm the following alarms can be seen in the engineering:
   - A3_SAFETYSTOP_I_10120
   - A2_CNV_FCV_A_OK_I_10020
   - A2_CNV_FCV_A_OK_I_10030

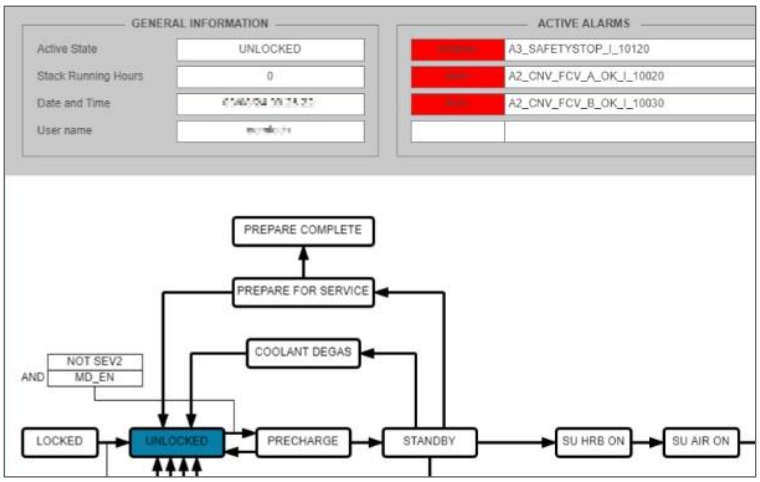

Figure 8-177: Overview of alarms

6. Reconnect the tube to the switch.
7. Power cycle the module to reset and confirm that there are no alarms.
   This can be done by disconnecting and reconnecting the X_E01 electrical connection.
8. The module is ready to be powered down by disconnecting the X_E01 electrical connection, and the module is ready to be restored to normal operating state.
9. Confirm that the module is ready for normal operation and remove local lockout and tagout when work is done.

8.5.6.2 Replace Differential Pressure Safety Switch

Purpose:

The procedure describes how to replace a differential pressure safety switch for the FCwave module. To safeguard the system, the pressure switch verifies that the pressure within the H2 enclosure is below the pressure outside the H2 enclosure.

It is important that there is a small negative pressure inside the H2 enclosure when it is in operation.

Responsibilities:

Preventive maintenance of the differential pressure switch is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace differential pressure safety switch during the life and operation of the FCwave module.

- FRU, Differential Pressure Safety Switch (Part No. 7500034)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Differential Pressure Safety Switch

Based on the normal conditions, the estimated time for replacement is:

Differential Pressure Safety Switch	
Duration	45 min
Personnel	1
Tool	3mm hex key, flathead + cross-head screwdriver, cross-head bit, hex bit rachet

Table 8-27: Time to replace differential pressure switch

8.5.7 Check Smoke Detector Functionality

Purpose:

The procedure describes how to check correct functionality of the smoke detector for the FCwave module.

Responsibilities:

Preventive maintenance of the smoke detector is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the smoke detector during the life and operation of the FCwave module.

- Smoke Detector Tester[4] (part no. 5129595, 6500524) or equivalent

Safety:

Refer to section 8.1.2 to follow the instructions.

Procedure:

During the procedure you will activate the fire detection system, so make sure to disconnect the automatic firefighting system before starting the procedure.

1. Before proceeding with the check procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Supply 24V power from the shipboard of connect an I/O tester to power up the module MCU.
3. Connect a computer to the MCU and log in to the engineering interface (see section 8.2).
4. Locate the smoke detector installed in the upper cabinet next to the H_2 enclosure.

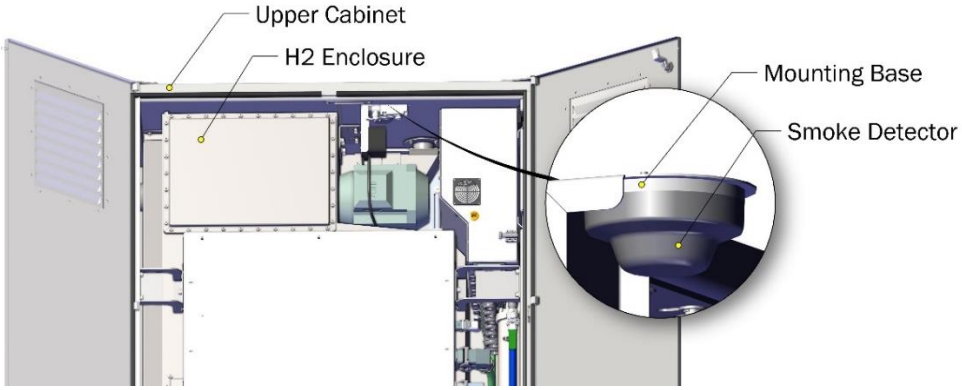

Figure 8-182: Location of smoke detector in upper cabinet

5. Read written instructions on smoke detector and follow as explained to check the smoke detector is not expired.
6. With the module in the "unlocked" state, spray a small quantity of test smoke (press for 2-3 sec) close to the smoke detector. Repeat process a few times.
7. In the engineering interface, navigate to the I/O page and select the All Inputs tab.
8. The tag "SAFETYSTOP" will be activated (ON) (1) and 3 alarms

[4] Smoke Detector Tester is part of the 'Special Tools Kit FCwave' (part no. 6100062)

8.5.8 Replace Smoke Detector

Purpose:

The procedure describes how to replace a smoke detector for the FCwave module. The smoke detector senses any smoke in the module's cabinet.

Responsibilities:

Preventive maintenance of the smoke detector is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the smoke detector during the life and operation of the FCwave module.

- FRU, Smoke Detector (part no. 7500149)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace a Smoke Detector

Based on the normal conditions, the estimated time for replacement is:

Smoke Detector	
Duration	5 min
Personnel	1

Table 8-28: Time to replace smoke detector

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Locate the smoke detector in the upper cabinet behind the door switch.
3. Hold the smoke detector and turn it counterclockwise to remove it.

Assembling procedure:

1. Replace the smoke detector by aligning it to the electrical contacts on the relay base and turn it clockwise to lock it in place.

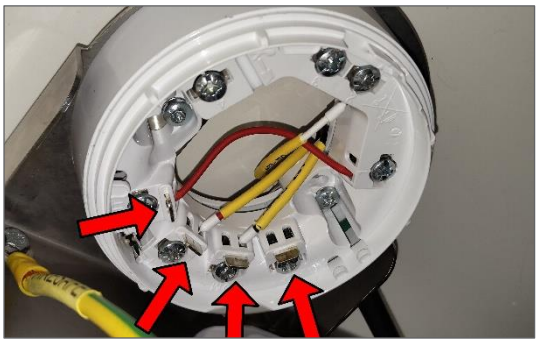

Figure 8-184: Aligning smoke detector

2. Verify the replacement smoke detector by confirming that the module will not cause a fire alarm on the integrator side during the test.
3. Confirm that the module is ready for power up to perform the smoke detector test.
4. Check smoke detector functionality (section 8.5.7).
5. Confirm the module is ready for normal operation and remove local lockout and tagout when work is done.

8.5.9 Replace Ventilation Fan

Purpose:

The procedure describes how to replace a ventilation fan for the FCwave module. A pair of fans draws ventilation air through the air inlet duct along the length of H_2 enclosure and exhaust through the ventilation outlet duct.

Responsibilities:

Preventive maintenance of the ventilation fan is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the smoke detector during the life and operation of the FCwave module.

- FRU, H_2E Ventilation Fans (part no. 7500038)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Ventilation Fan

Based on the normal conditions, the estimated time for replacement is:

Ventilation Fan		
Duration	15 – 30 min + 2 – 2½ hours for HRB Motor	
Personnel	1	
Tightening Torque	M4 nut	3.5 ± 0.5 Nm
	M6 bolt	10 ± 0.5 Nm
	Tool: 3mm + 5 mm hex key,

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Locate the ventilation hatch cover on the top right corner of the H_2 enclosure, which is behind the HRB Motor. It is high likely necessary to remove the HRB motor, to create proper access. Refer to section 8.2.2.2.1.

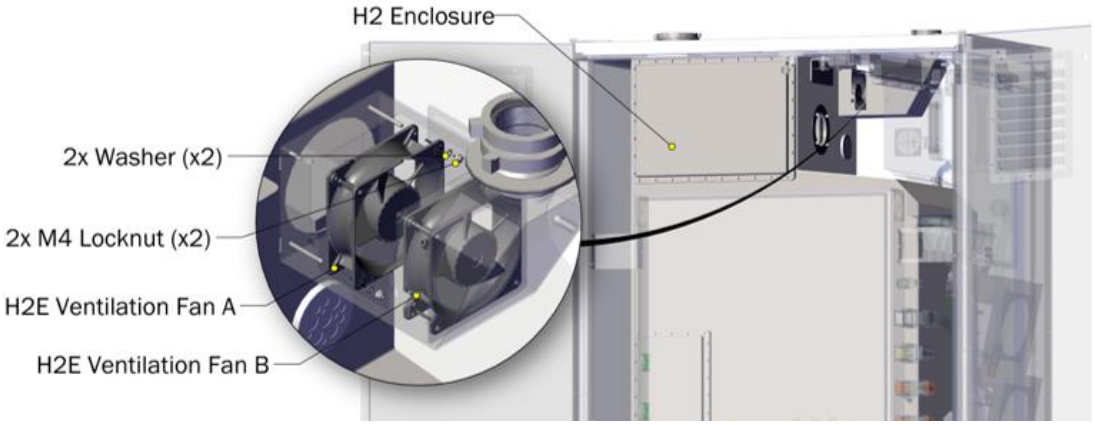

Figure 8-185: Location of ventilation hatch cover

3. Remove 4 pcs. M6 bolts and washers to disassemble the ventilation hatch cover.

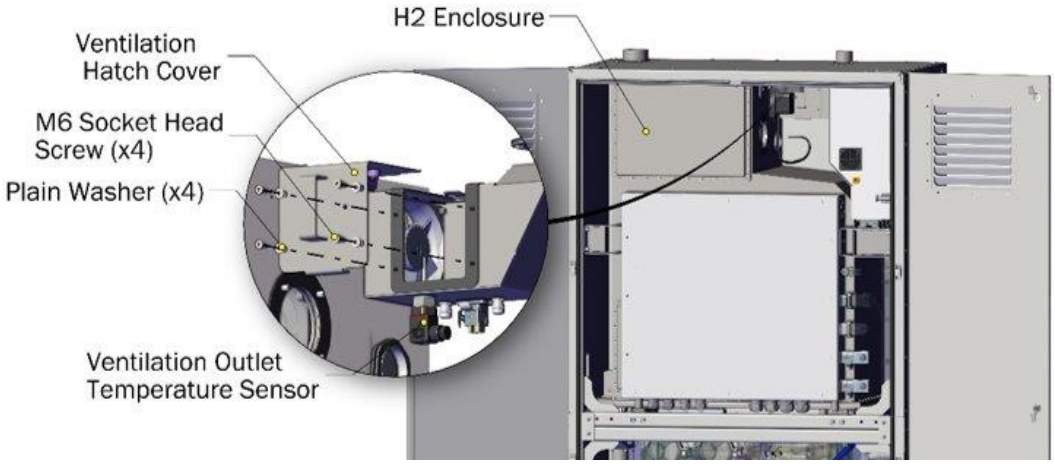

Figure 8-186: Disassemble the ventilation hatch cover

4. Disconnect the ventilation blower connection, HRNS-303-CN-FAN_J10A and CN-FAN_J10B.
5. Remove 2 pcs. M4 lock nuts and washers used to tighten the ventilation fan A to the ventilation outlet duct and remove fan. Do similarly to ventilation fan B if needed.

Assembling procedure:

1. Use 2 pcs. M4 lock nuts and washers to tighten the ventilation fan A to the ventilation outlet duct. Do similarly to ventilation fan B if needed.
2. Reconnect the ventilation blower connection – HRNS-303-CN-FAN_J10A and CN-FAN-J10B.
3. Use 4 pcs. M6 bolts and washers to install the ventilation hatch cover.
4. If HRB Motor was removed to create access, reinstall the motor. Refer to section 8.2.2.2.1.
5. Install 12 pcs. M5x10 hex head bolts to install the high voltage panel cover.
6. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
7. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
8. Close the doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.5.10 Replace Fuel Cell Stack Assembly/Module Top Cabinet Swap

Purpose:

The procedure describes how to replace a fuel cell stack assembly for the FCwave module. The fuel cell stack delivers the required power, current, and voltage to the system. The fuel cell stack assembly is installed at the center of the H_2 enclosure. Only qualified service personnel shall install, inspect, and service the fuel cell stack assembly.

Responsibilities:

Preventive maintenance of the fuel cell stack assembly is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment:

A list of parts and special equipment is identified to replace the fuel cell stack during the life and operation of the FCwave module.

- FRU, FCwave Top Module Swap Unit (part no. 7500164)

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Fuel Cell Stack Assembly

Based on the normal conditions, the estimated time for replacement is:

Fuel Cell Stack Assembly		
Duration	10 hours	
Personnel	1 - 2	
Tightening Torque	M6 bolt	10 ± 0.5 Nm
	M8 bolt	25 ± 0.5 Nm
	M10 nut	50 ± 5 Nm
	M12 bolt	85 ± 5 Nm
	Fuel supply fitting (20mm)	Hand tight + 1.25 turn
	Tool	5mm + 6mm + 8mm + 10mm hex key, 10mm + 12mm + 20mm spanner

Table 8-30: Time to replace fuel cell stack

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Drain the internal HT and LT coolant loop.
3. Disconnect the LV panel connections (see section 8.6.15).
4. Disconnect the HT panel connections (see section 8.6.14).
5. Disconnect the external connections to process exhaust and H_2 enclosure ventilation output of the upper cabinet of the module.

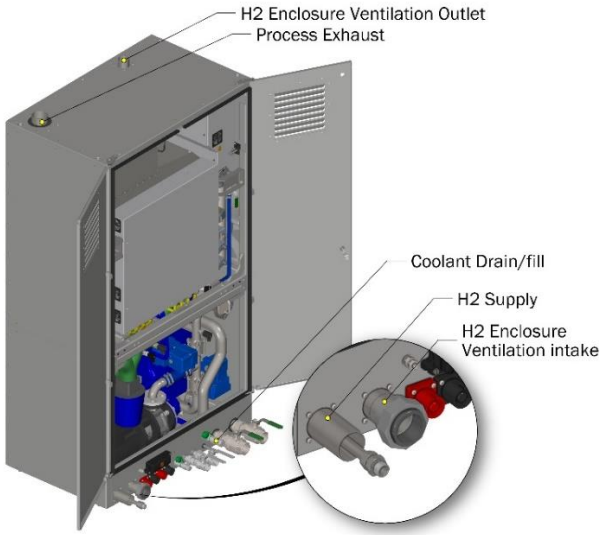

Figure 8-187: Dismounting exhaust and ventilation outlet external connections

6. Disconnect the LT cooling connections to the HRB and coolant pump motor controllers (see section 8.6.4).
7. Release the hose clamp on the bulkhead fittings of the coolant inlet hose manifold. Slide off the hoses attached with a pressure sensor and temperature sensor to have service access.

27. Mount the upper cabinet onto the scissor lift equipment.

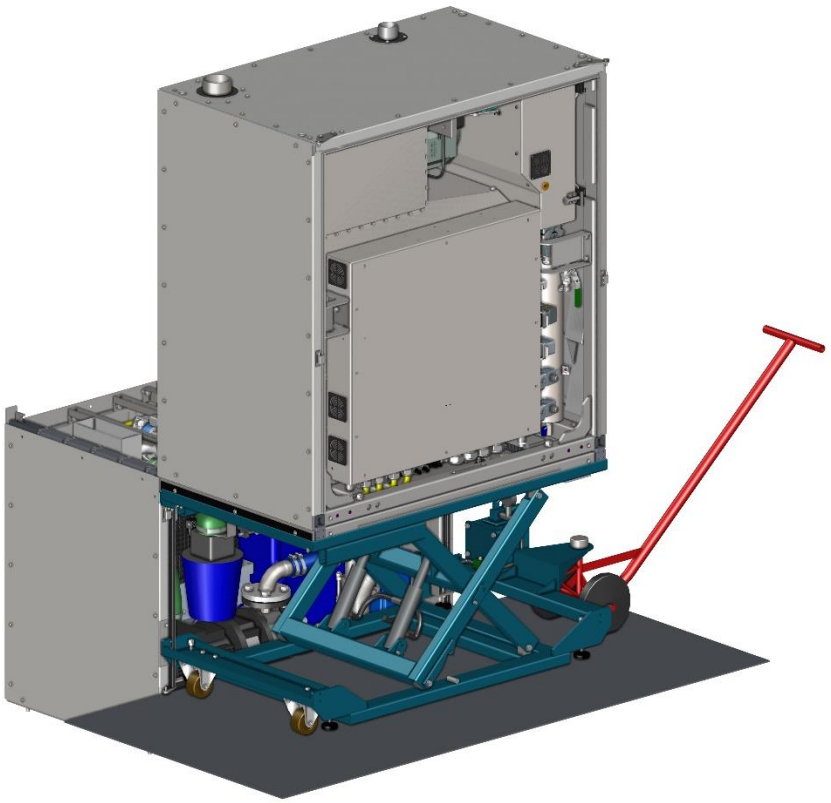

Figure 8-203: Placing upper cabinet of scissor lift

28. Make sure to cover all disconnected ports and hoses with a clean cap or tape.
29. Cover the coolant inlet and outlet ports of the stack assembly to prevent any unwanted material from falling into it.
30. Cover the oxidant inlet and outlet ports of the stack assembly to prevent any unwanted material from falling into it.
31. Cover the fuel inlet and outlet ports of the stack assembly to prevent any unwanted material from falling into it.
32. Assemble in reverse order with replacement fuel cell stack assembly.
    It is highly recommended to perform a leak test with smoke detector and H_2 sensor after any service maintenance (refer to section 8.2.4).
33. Pack and send the used fuel cell stack assembly with complete upper cabinet to Ballard, as service maintenance and stack assembly replacement requires Level-III certified service personnel from Ballard (see section 4.1 for contact information).

8.6 Electrical Sub-system

For detailed in-depth electrical document, contact BPSE (see section 4.1) to get sent document 'CMS010' (Schematic Description of IO Circuits).

8.6.1 Check Fuel Cell Module BOP Components

Purpose:

The procedure describes how to visually inspect the BOP components of the FCwave module. Any damage or deformation of the parts in BOP must be reported to BPSE to find out if corrective action is necessary, as it can lead to potentially dangerous issues.

Responsibilities:

It is the end user's responsibility to do preventive maintenance (refer to section 8.1.1).

Safety:

Refer to section 8.1.2 to follow the instructions.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Procedure:

1. Perform steps in section 6.5.1 (High Voltage safety check before module maintenance) before proceeding with the check procedure.
2. Make sure the connectors are securely plugged in.
3. Uninstall the bolts to remove the LV panel cover.

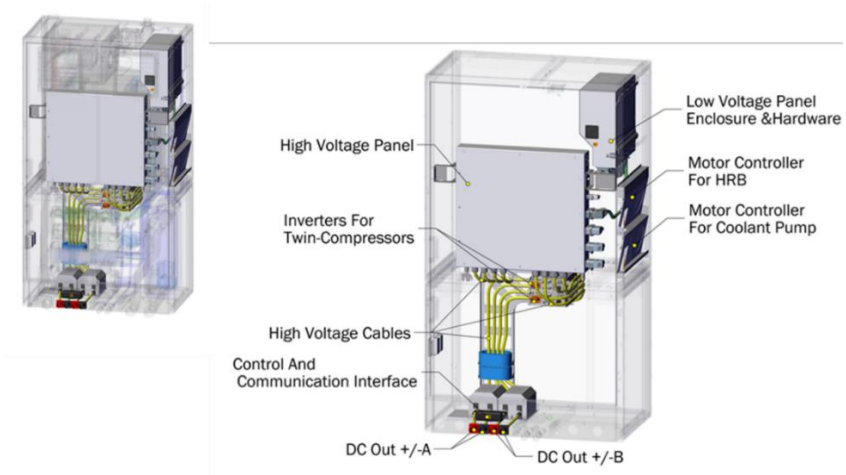

Figure 8-205: Overview of HV and LV panel covers

4. Visually examine the external harnesses and electrical components in the HV panel, LV panel, and in the BOP of the FCwave module.
5. If accessible, examine the harnesses connected to air compressor controllers and on the HRB and coolant pump controllers.
6. For inspection of harnesses and electrical components:
   - Check all the harnesses and hoses. Make sure there are no loose clamps, bends, pinching, cuts, or cracks.
   - Check that all bolt fastenings and connections are tight and correctly aligned.
   - Check that terminal boots and other covers are correctly installed.
   - Check that cable ties provides cable strain relief at vulnerable points.
   - Check that the module bonding stud and bonding harnesses are correctly installed on both upper and lower cabinet and free of corrosion.
   - Check for signs of overheating, wear, or damage — Damages of an excessive nature can be sign of more dangerous issues and must be investigated.
   - Check that there are no visible leak spots, pooled liquid, corrosion, or excessive moisture in the enclosures.
7. Record the observations and findings during inspection. If any damages are reported, do not operate the module until the issue is corrected. Contact BPSE (see Section 4.1) for further support.

8.6.3 Check Ground Fault Monitor Functionality

This is part of customer scope of supply, refer to the instructions and written procedures for periodic test of ground fault monitor.

8.6.4 Replace HRB Motor and Coolant Pump Controllers

Purpose

The procedure describes how to replace an HRB motor and coolant pump controllers for the FCwave module. Both the motor controllers are installed on the right side of the upper cabinet below the low voltage panel.

Responsibilities

Preventive maintenance of the motor controllers is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment

A list of parts and special equipment is identified to replace the motor controllers during the life and operation of the FCwave module.

- FRU, HRB Motor Controller (part no. 7500112)
- FRU, Coolant Pump Motor Controller (part no. 7500113)

Safety

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Motor Controllers

Based on the normal conditions, the estimated time for replacement is:

Motor Controllers		
Duration	1 hours	
Personnel	1	
Tightening Torque	M6 bolt	10 ± 0.5 Nm
	M8 bolt	25 ± 0.5 Nm
	Fitting 1/4"	15 ± 0.5 Nm
	Tools	5mm + 6mm hex key, special tool (7500211), clean container, valve, 8mm plastic pipe, 8mm plastic pipe adaptor, 7mm + 10mm + 19mm socket, torque wrench

Table 8-31: Time to replace motor controllers

14. Press the clip to remove both communication port connections (INV_H50 & INV_D10) from the motor controllers.

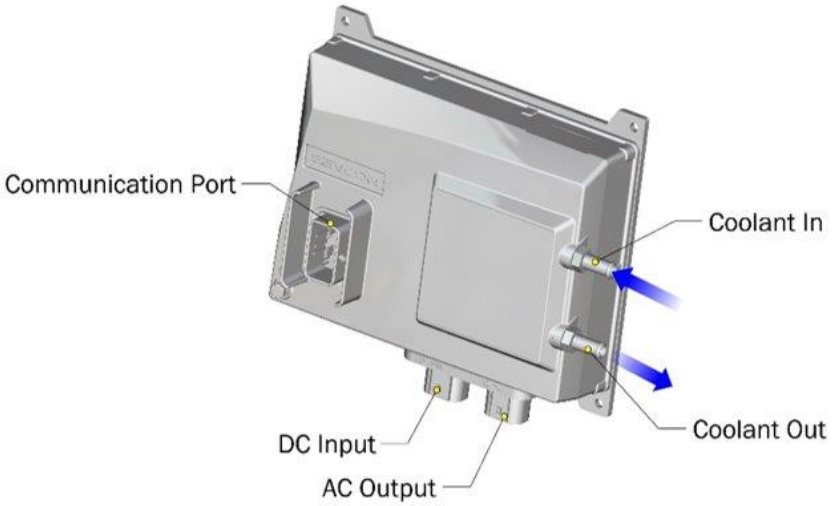

Figure 8-213: Comm port, DC input & AC output on motor controller

15. Press the tab and slide the lock bottom to remove the DC input connector plugs.
16. Press the tab and slide the lock bottom to remove the AC output connector plugs.
17. Remove 4 pcs. M6 studs, washers and nuts used to tighten the controllers to the bracket in the upper cabinet.

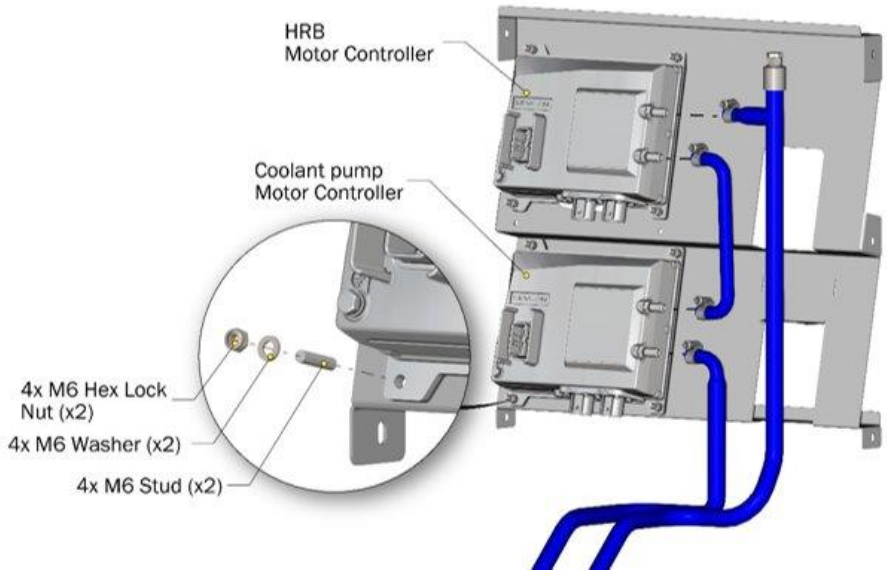

Figure 8-214: Controller studs on bracket

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

Assembling procedure:

1. Use new M6 nuts and washers to install the new controllers.
2. Connect the LT cooling hoses and secure with hose clamps. Tighten to 3.5 Nm. Remember to tighten the vent plug.
3. Connect the communication port, the DC and AC cables to the controller.
4. Install the DI filter cartridge. Use the special key to tighten the housing ring.
5. Use 2 pcs. M6 bolts to install the clamp securing the DI filter housing.
   Ensure the drain valve handle is accessible.
6. Open the DI filter isolation valves.
7. Connect the following connectors to the low voltage panel; CN100, CN101, CN300, CN303, CN400.
8. Connect the following connectors to the high voltage panel; CN201, CN202, CN500, CN505.
9. Mount the right-side bracket on the high voltage panel.
10. Use 3 pcs. M8x30 bolts and washers to secure the bracket to the frame.

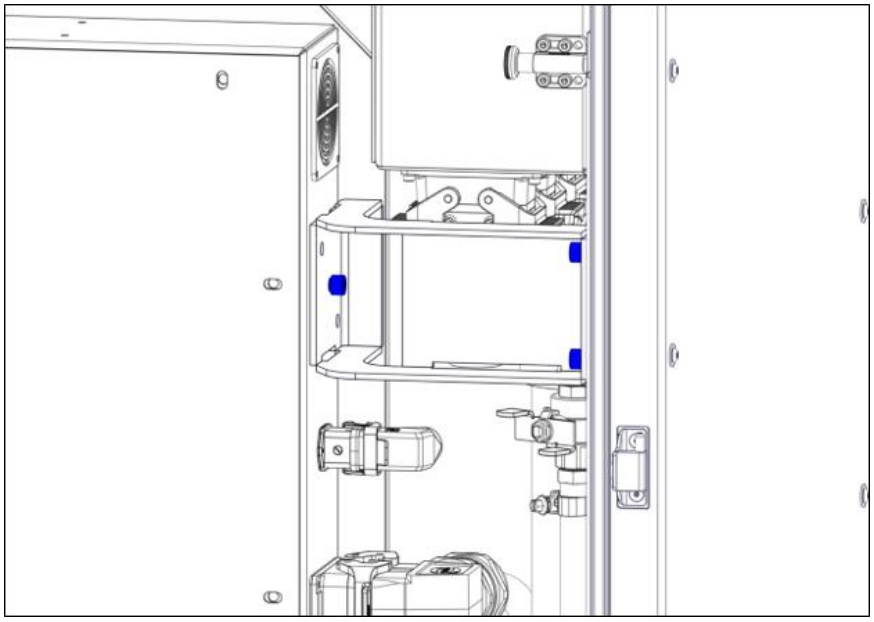

Figure 8-215: Securing bracket to frame

11. Use 12 pcs. M5x10 bolts and washers to install the high voltage panel cover.
12. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
13. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
14. Check and refill (using new coolant) the coolant level. Run the HT cooling system degas procedure. (refer to 8.4.9).
15. Log into the engineering interface with supplied username and password and reset the hour counter for the DI filter cartridge.
16. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.6.5 Replace Air Compressor Controllers

Purpose

The procedure describes how to replace the air compressor controllers for the FCwave module. These controllers have a built-in inverter, cooling channels, and interface connections to energize the air compressor unit.

Responsibilities

Preventive maintenance of the air compressor controllers is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment

A list of parts and special equipment is identified to replace the motor controllers during the life and operation of the FCwave module.

- FRU, Gen3 Air Compressor Inverter 2.0B (part no. 7500360)
- FRU, Inverter 2.0B, Adaptor Cable (part no. 7500361)

Safety

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Air Compressor Controllers

Based on the normal conditions, the estimated time for replacement is:

Air Compressor Controllers		
Duration	10 hours	
Personnel	1	
Tightening Torque	M6 bolt	10 ± 0.5 Nm
	M10 nut	50 ± 5 Nm
	Fitting 1/4"	15 ± 0.5 Nm
	Tools	Flathead screwdriver, 5mm hex bit, bent nose pliers, hose clamp pliers, 7mm hex socket flexible screwdriver, wire cutter, 15mm hex socket, clip removal tool, 5mm torx bit

Table 8-32: Time to replace air compressor controllers

Note

Based on the module, the installed inverter will be either 'Inverter 2' or the updated 'Inverter 2.0B'. The disassembling procedure will show/tell the procedure for both, while the assembling procedure will only instruct how to install a new inverter (Inverter 2.0B).

Disassembling procedure for 'Inverter 2':

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Shut off the external coolant connections valves to the module.
3. Locate the air compressor controllers in the lower cabinet next to the air compressors.

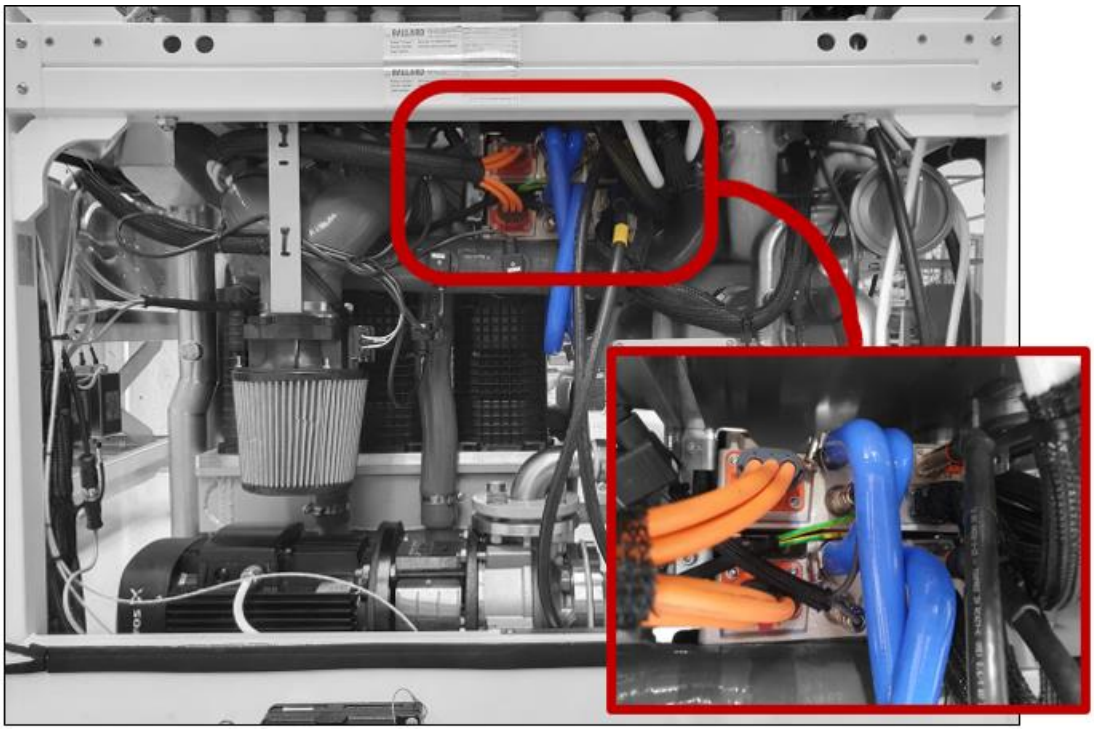

Figure 8-216: Location of air compressor controllers

4. Disconnect the HRNS-400-AC output connector plugs by pulling back and pressing the red clip.

Assembling procedure:

1. With the pins facing away from the connector side, use 12 pcs. M6 bolts to install the mounting brackets for the two air compressor controllers.
2. Install controller A, with connectors facing down/out, in the upper slot by inserting it at an angle from below, so the pins sit on top of the rails.
3. Slide in controller A and gently force the bracket around the obstructing bolt head with a clip removal tool. Also ensure that the pins at the rear will fall into place.
4. Install 2 pcs. M6 bolts to tighten the controller to the bracket in the lower cabinet.

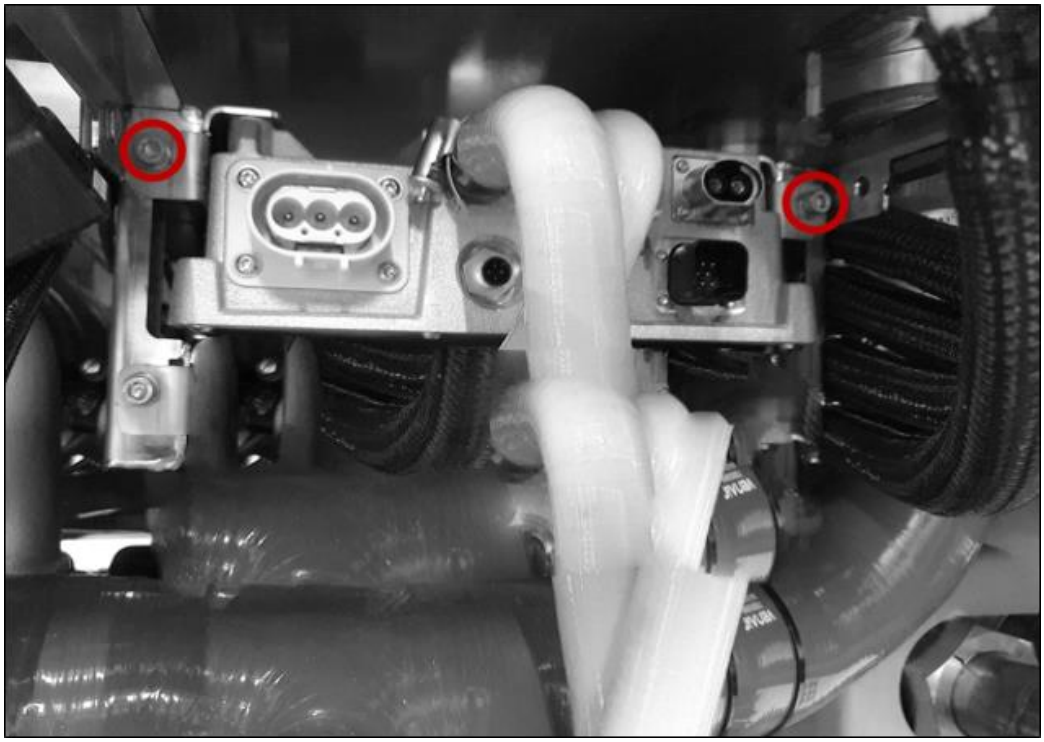

Figure 8-231: Install controller A

5. Slide in controller B in the slot below controller A. Then install 2 pcs. M6 bolts to tighten the controller to the bracket in the lower cabinet.

8.6.6 Replace Current Transducer

Purpose

The procedure describes how to replace a current transducer for the FCwave module. There are four current transducers installed in the High voltage (HV) panel assembly.

Responsibilities

Preventive maintenance of the current transducer is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment

A list of parts and special equipment is identified to replace the motor controllers during the life and operation of the FCwave module.

- FRU, DHR 400 C420 Current Measurement KIT (part no. 7500115)

Safety

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Current Transducer

Based on the normal conditions, the estimated time for replacement is:

Current Transducer		
Duration	1 – 1½ hours	
Personnel	1	
Tightening Torque	M4 bolt	3.5 ± 0.5 Nm
	M10 nut	50 ± 5 Nm
	Tool: 3mm hex key, cross-head screwdriver, cutting pliers, 10mm socket + 15mm socket, torque wrench

8.7 Cabinet and Customer Interface Sub-system

8.7.1 Replace Intake Air Filter

Purpose

The procedure describes how to check and replace the air filter for the FCwave module. The filters installed on the front panel of the cabinet clean the intake air from NOx, Sox, salts, and other chemicals entering the module.

Responsibilities

Preventive maintenance of the air filters is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment

A list of parts and special equipment is identified to replace the air filters during the life and operation of the FCwave module.

- FRU, Intake Air Filters (part no. 7500162)

Safety

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Intake Air Filter

Based on the normal conditions, the estimate time for replacement is:

Intake Air Filter		
Duration	10 – 15 min	
Personnel	1	
Tightening Torque	M6 nut	10 ± 0.5 Nm
	Tool: 5mm hex key, 10mm flex head ratcheting combination wrench

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and steps 1-3 of section 6.5.1 (High Voltage safety check before module maintenance).
2. Locate the 2 air intake filter frames on the front panel of the cabinet.
3. Uninstall 8 pcs. M6 nuts used to tighten the filter back frame to the inside of the cabinet doors and remove the filter.

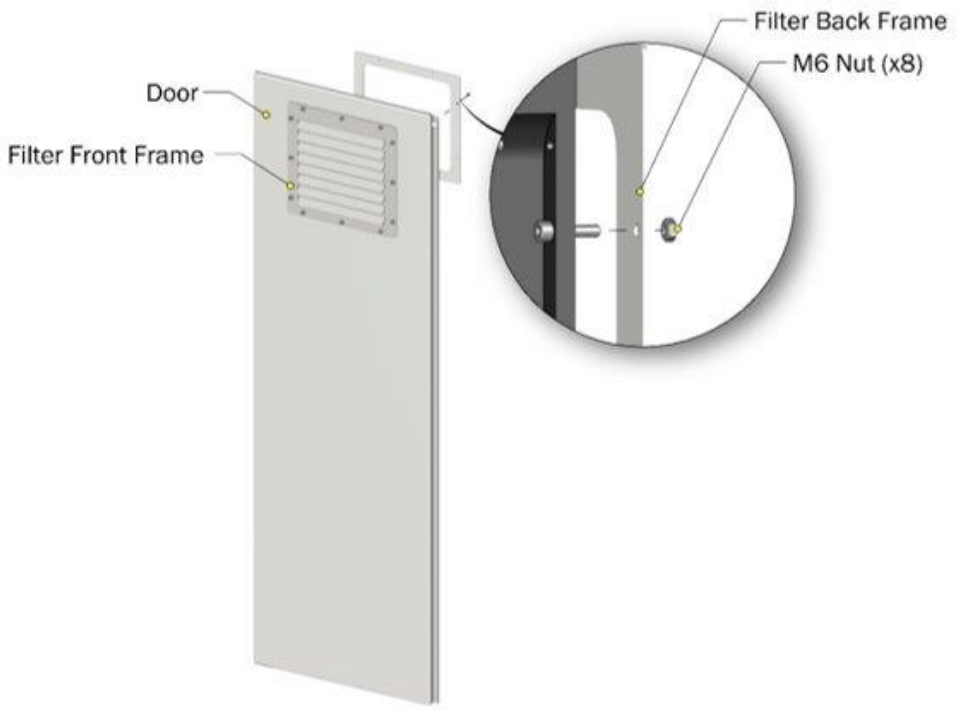

Figure 8-240: Overview air intake filter

4. Examine the air intake filter for cleanliness and check for blockages or unwanted material around it.

Assembling procedure:

1. Use 8 pcs. M6 nuts to tighten the filter back frame to the inside of the cabinet door.
2. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.7.2 Cabinet Water Ingress Sensor

8.7.2.1 Check Cabinet Water Ingress Sensor

Purpose:

The procedure describes how to check a cabinet water ingress sensor in the FCwave™ module. The sensor monitors for water ingress in the cabinet and will trigger a warning alarm when it encounters liquid.

Responsibilities:

Checking the water ingress sensor functionality is necessary for safe operation according to the maintenance plan (refer to the customer portal) or after a replacement. It is the end user's responsibility to do preventive maintenance, as stated in section 8.1.1.

Safety:

Refer to section 8.1.2 to follow the instructions.

Estimated time to check the Cabinet Water Ingress Sensor

Based on the normal conditions, the estimated time for check is:

Cabinet Water Ingress Sensor	
Duration	10 min
Personnel	1
Tools	4mm hex key

Table 8-35: Time to check differential pressure switch

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

+45 8843 5500
ballard.com

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Connect the low voltage electrical connection (X_E01) and secure it by finger-tightening the bolts.
3. Monitor the MCU engineering interface with the module in "Unlocked" state.

   Make sure there are no active alarms.
4. Mounted in the bottom of the of the cabinet frame, locate the water ingress sensor in front of the heat exchanger.

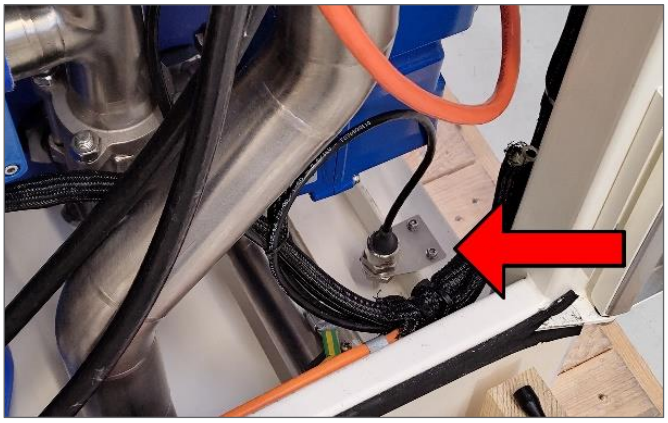

Figure 8-241: Location of water ingress sensor

5. There are 3 different methods to check the sensor. Method A and B avoids disassembly, while method C allows the sensor's electrode to be submerged in a container of liquid. Choose the most suitable.

   Be aware that the high temperature coolant pipes could be hot after a recent system shutdown.

   a) Cover the sensor's electrode as much as possible by hand. The method relies on skin contact and the result can vary depending on coverage area and skin moisture. Wait up to 30 seconds, if there is an alarm, skip to step 6, otherwise try the next method.

   b) Dampen a paper or cloth towel with water and press it against the sensor's electrode, covering as much of it as possible. Wait up to 30 seconds. If there is an alarm, skip to step 6, otherwise try the next method.

   c) Use a 4mm hex to remove 2 pcs. bolts and demount the bracket with the sensor. Cover the sensor's electrode either by hand, a damped towel, or submerge in a container filled with water. Wait up to 30 seconds for the alarm to appear.
6. No matter the method, the alarm should disappear as soon as the sensor's electrode is not in contact with the test medium. Confirm the following warning alarm can be seen in the engineering interface:
   - A1_LSH_Z80_S_10710

   Alarm events are logged and can be found in the "Alarm" tab on the menu to the left side of the engineering interface.

8.7.2.2 Replace Cabinet Water Ingress Sensor

Purpose

The procedure describes how to replace the water ingress sensor in the lower cabinet for the FCwave module. The sensor monitors the leakage of water-based liquids like coolants or condensation. The level sensor detects when the water level exceeds the switch point.

Responsibilities

Preventive maintenance of the water ingress sensor is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment

A list of parts and special equipment is identified to replace the water ingress sensor during the life and operation of the FCwave module.

- FRU, Sensor, Cabinet Water Ingress (part no. 7500151)

Safety

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Water Ingress Sensor

Based on the normal conditions, the estimated time for replacement is:

Water Ingress Sensor		
Duration	15 – 30 min	
Personnel	1	
Tightening Torque	1/2" sensor fitting	25 ± 0.5 Nm
	Tool: spanner	

Table 8-36: Time to replace water ingress sensor

How to test a level sensor

Inspect the wires, check voltage of the level switch wire with a multimeter set to 20V DC. The level switch must read 24V in presence of water and 0V when there is no water. A poor connection with the signal wire can cause inaccurate readings. Check all wires for any signs of damage and follow the manufacturer instructions.

Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time.

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and steps 1-4 of section 6.5.1 (High Voltage safety check before module maintenance).
2. Mounted on the cabinet frame bracket, disconnect the water ingress sensor connection (HRNS-601-CN_LSH_Z80).

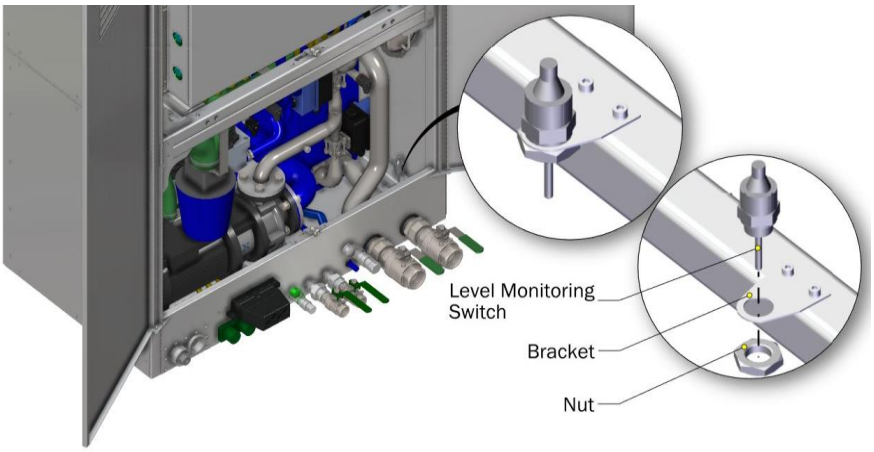

Figure 8-243: Removal of water ingress sensor

3. Use a spanner to remove the sensor.

Assembling procedure:

1. Use a spanner to install the new sensor.
2. Connect the sensor connection and make sure the correct harness is connected by checking the label.
3. Test the new sensor according to the short section just above.
4. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
5. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.8 Replace Temperature Sensor

Purpose

The procedures in section 8.8 describe how to replace the temperature sensors for the FCwave module. The module has eight temperature sensors, which measure the temperature of the process air, stack coolant, ventilation outlet, HV panel, and LV panel.

Responsibilities

Preventive maintenance of the temperature sensors is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment

A list of parts and special equipment is identified to replace the temperature sensors during the life and operation of the FCwave module.

- FRU, Sensor, Temperature PT-100, L 50mm, ø 3.5mm (part no. 7500037) x3. For section 8.8.1 + 8.8.2 + 8.8.6
- FRU, Sensor, Temperature PT-100, L 150mm, ø 8mm (part no. 7500090). For section 8.8.3
- FRU, Sensor, Temperature PT-100, L 50mm, ø 8mm (part no. 7500085) x2. For section 8.8.4 + 8.8.5

Safety

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Temperature Sensors

Based on the normal conditions, the estimated time for replacement is:

Temperature Sensors		
Duration	5 – 10 min	
	Except for coolant sensors, which requires 1 hour additional time for draining the coolant circuit	
Personnel	1	
Tightening Torque	M5 bolt	6.5 ± 0.5 Nm
	M6 bolt	10 ± 0.5 Nm
	M8 bolt	25 ± 0.5 Nm
	1/2" sensor fittings	25 ± 0.5 Nm
	Tool: 4mm + 5mm + 6mm hex key, 27 mm spanner (x2), crow foot's wrench, cross-head + flathead screwdriver, Phillips bit (PH2), torque wrench, tie cutter, cable ties	

Table 8-37: Time to replace temperature sensors

8.8.1 Replace the Humidifier Outlet Air Temperature Sensor (TT_A40)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and steps 1-4 of section 6.5.1 (High Voltage safety check before module maintenance).
2. Uninstall bolt on the connector TT_A40 to uninstall the temperature sensor.

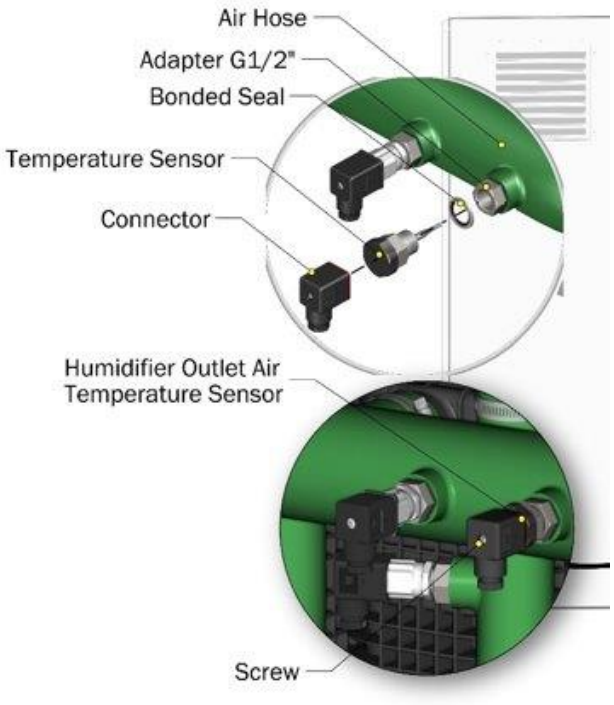

Figure 8-244: Overview of air temperature sensor

3. Uninstall the temperature sensor and the bonded seal washer.

   Remember to use a second spanner for counter turn on the silicon hose fitting to prevent any damage to the threaded insert.

Assembling procedure:

1. Install the new bonded seal washer, insert adaptor G1/2”, and then install the temperature sensor using the bolt. Tighten to 25 Nm.
2. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
3. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.8.2 Replace the Stack Outlet Air Temperature Sensor (TT_A50)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and steps 1-4 of section 6.5.1 (High Voltage safety check before module maintenance).
2. Uninstall bolt on the connector TT_A50 to uninstall the temperature sensor.

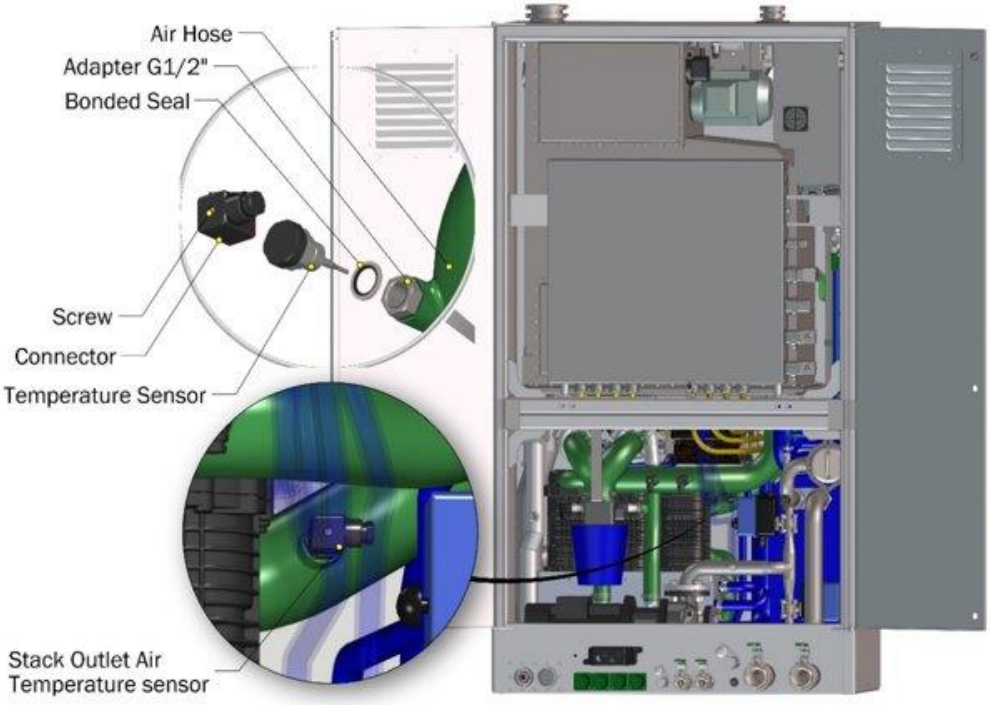

Figure 8-245: Overview of stack outlet temperature sensor

3. Uninstall the temperature sensor and the bonded seal washer.

   Remember to use a second spanner for counter turn on the silicon hose fitting to prevent any damage to the threaded insert.

Assembling procedure:

1. Install the new bonded seal washer and insert the temperature sensor. Tighten to 25 Nm.
2. Install the connector and secure it with the bolt.
3. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
4. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.8.3 Replace the Heat Exchange Temperature Sensor (TT_D20)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and steps 1-4 of section 6.5.1 (High Voltage safety check before module maintenance).
2. Drain and purge the LT cooling system.
3. Locate TT_D20 temperature sensor on the control valve assembly in the cooling system.

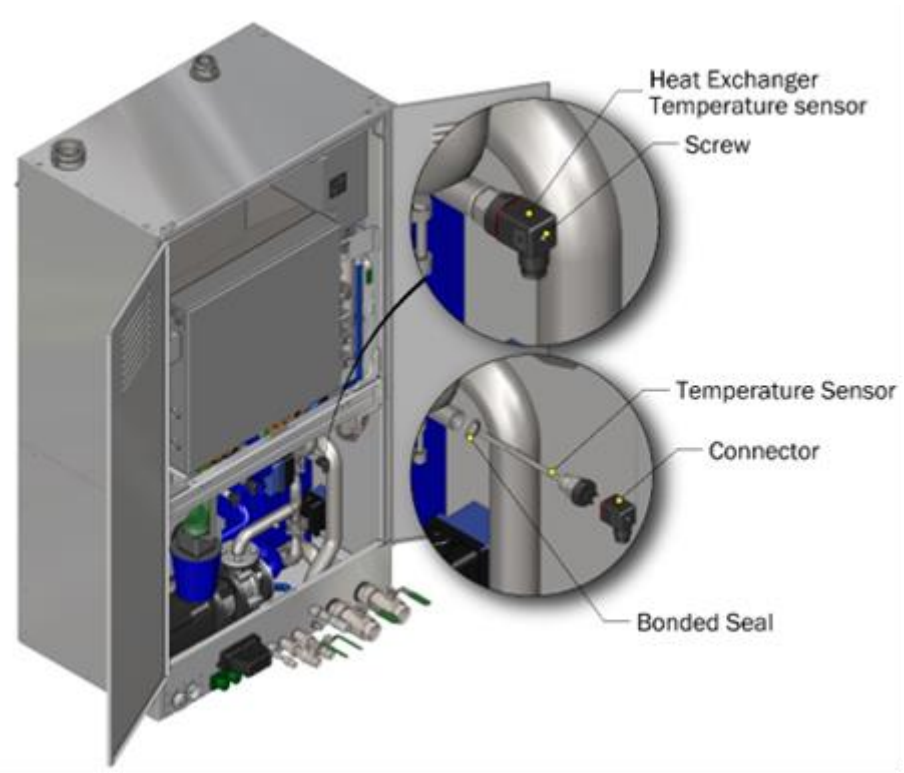

Figure 8-246: Overview of heat exchange temperature sensor

4. Disconnect the HT coolant connections of the module and drain the stack coolant system.
5. Uninstall bolt on the connector TT_D20 to uninstall the temperature sensor.
6. Uninstall the temperature sensor and the bonded seal washer.

   Remember to use a second spanner for counter turn on the silicon hose fitting to prevent any damage to the threaded insert.

Assembling procedure:

1. Install the new bonded seal washer, insert adaptor G1/2”, and then install the temperature sensor using the bolt. Tighten to 25 Nm.
2. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
3. Use the coolant pump to refill the HT coolant system and run the degas procedure (refer to section 8.4.9)
4. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.8.4 Replace the Coolant-In Temperature Sensor (TT_D40)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Drain and purge the high temperature cooling system.
3. Locate the coolant-in temperature sensor on the stack coolant inlet hose.

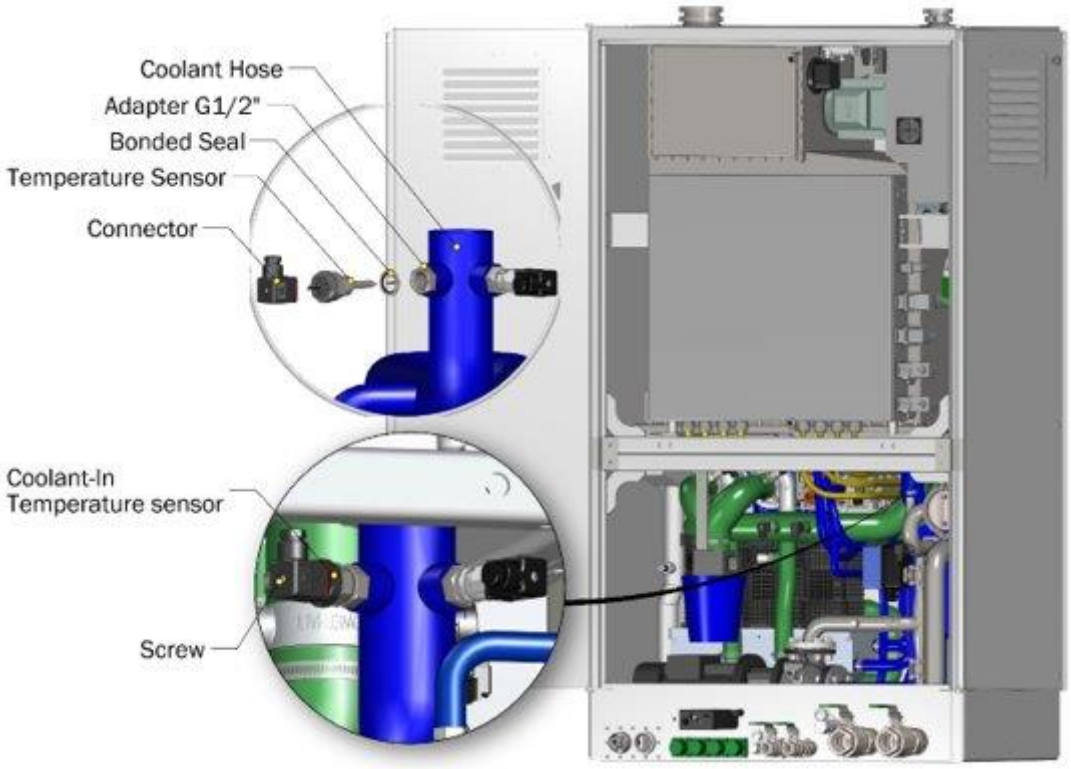

Figure 8-247: Overview of coolant-in temperature sensor

4. Uninstall bolt on the connector TT_D40 to uninstall the temperature sensor.
5. Uninstall the temperature sensor and the bonded seal washer.

   Remember to use a second spanner for counter turn on the silicon hose fitting to prevent any damage to the threaded insert.

Assembling procedure:

1. Install the new bonded seal washer, insert adaptor G1/2”, and then install the temperature sensor using the bolt. Tighten to 25 Nm.
2. Use the coolant pump to refill the HT coolant system.

   Remember to pay attention to the HT coolant tank’s level indicator while refilling.
3. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
4. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
5. Run the degas procedure (refer to section 8.4.9).
6. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.8.5 Replace the Coolant-Out Temperature Sensor (TT_D50)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Drain the coolant to a level where the sensor can be removed without coolant spillage.
3. To gain access to the temperature sensor, loosen the hose clamp securing the coolant hose to the inlet fitting and pull down to create space. Keep the hose clamp on the coolant hose for assembling procedure.

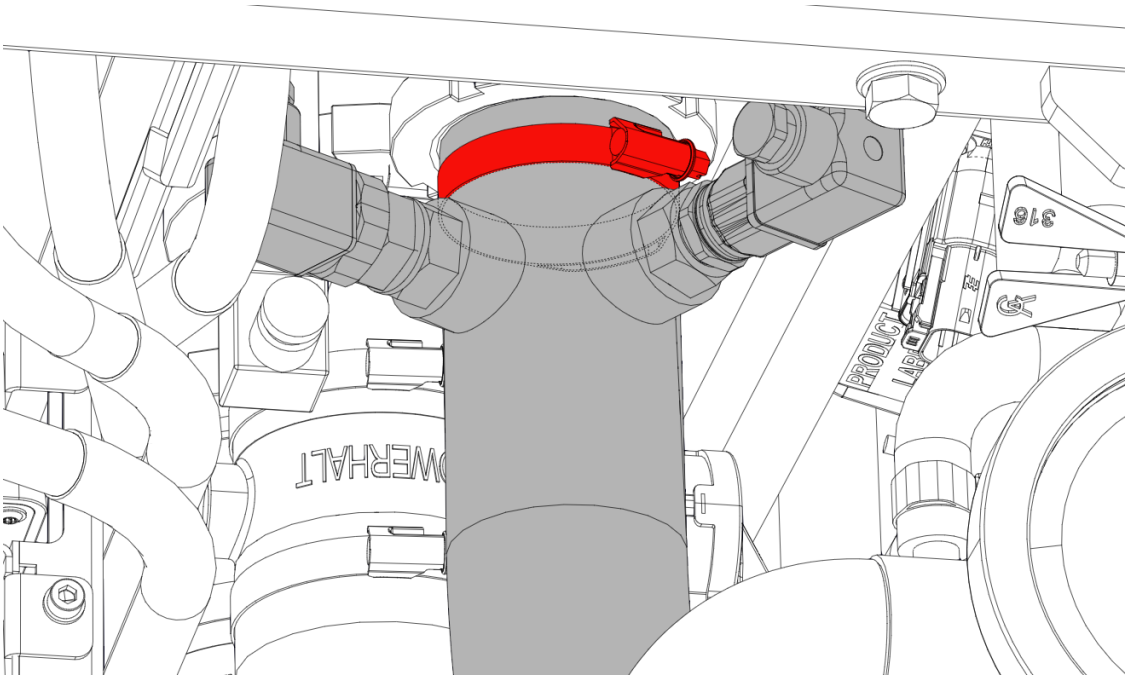

Figure 8-248: Hose clamp on coolant hose to make room

4. Loosen the lower hose clamp securing the air inlet hose to the process inlet valve and pull the hose away to create space. Keep the hose clamp on the hose for assembling procedure.

Assembling procedure:

1. Install new bonded seal washer and lubricate the thread with krytox before installing the new temperature sensor (TT_D50). Tighten to 25 Nm.
2. Connect the TT_D50 connector.
3. Use the hose clamp to secure the air outlet process valve to its fitting. Tighten clamp to 3.5 – 4.5 Nm.
4. Reconnect the FCV_A50 connector to the air process outlet valve.
5. Use the hose clamp to secure the air outlet hose to the process outlet valve. Tighten clamp to 3.5 – 4.5 Nm.
6. Use the hose clamp to secure the air inlet process valve to its fitting. Tighten clamp to 3.5 – 4.5 Nm.
7. Reconnect the FCV_A40 connector to the air process inlet valve.
8. Use the hose clamp to secure the air inlet hose to the process inlet valve. Tighten clamp to 3.5 – 4.5 Nm.
9. Use the hose clamp to secure the coolant hose to its fitting. Tighten clamp to 3.5 – 4.5 Nm.
10. Refill the coolant.
11. Use 12 pcs. M5x10 bolts to install the high voltage panel cover.
12. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
13. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
14. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.8.6 Replace the Ventilation Outlet Temperature Sensor (TT_J30)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Uninstall 3 pcs. M8x30 bolts from the top right support bracket of the high voltage panel. Remove the bracket on the right side of the high voltage panel.

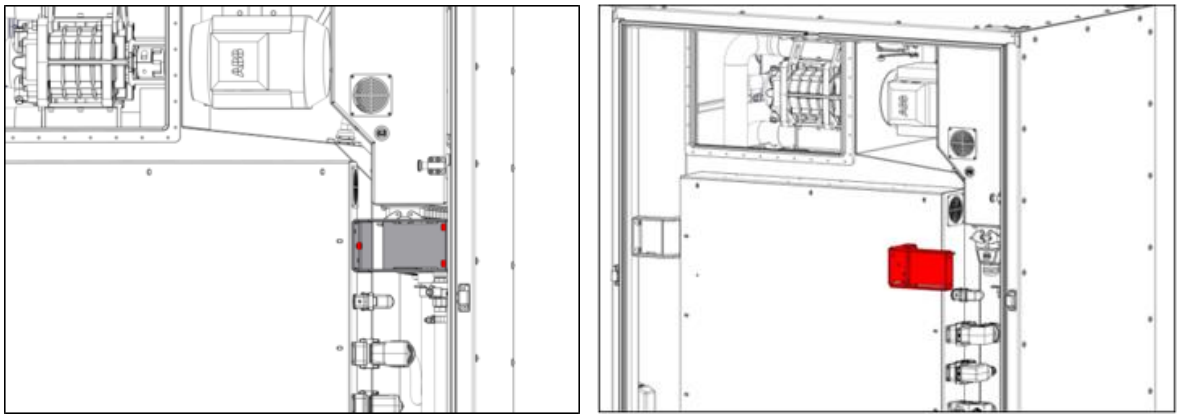

Figure 8-254: Bolts and support bracket in HV panel for TT_J30

3. Loosen the spring-loaded lock pin that locks the low voltage panel assembly to the slide on the mounting bracket.
4. Disconnect all following connectors from the bottom of the low voltage panel: CN400, CN303, CN300, CN101, CN100, CN601, CN600
5. Disconnect the CN201 connector from the side of the high voltage panel.
6. Disconnect the grounding wire from the back of the low voltage panel.
7. Remove the low voltage panel by using the rails to slide out the panel. The spring-loaded locking pin in the back will need to be loosened during the dismantling.

   Make the right precautions is taken as the panel is heavy.
8. Uninstall 4 pcs. bolts and carefully remove the ventilation hatch cover.

Figure 8-255: Ventilation hatch cover dismounting

9. Disconnect the temperature sensor connector and use a crowfoot for the contra nut and a spanner for the sensor to remove the temperature sensor.

Figure 8-256: Removal of ventilation temperature sensor

Assembling procedure:

1. Install new bonded seal washer and lubricate the thread with krytox before installing the new temperature sensor using the crowfoot on the contra nut and the spanner on the sensor. Install the sensor by hand and re-tighten to 25 Nm.
2. Mount the ventilation hatch. Make sure the hatch slides in between the hooks on top and bottom. Install the sensor by hand and re-tighten to 10 Nm.
3. Connect the temperature sensor connector.
4. Slide in the low voltage panel a little so it is placed steady and stable. Connect the grounding wire.
5. Connect all the following connectors in the low voltage panel: CN400, CN303, CN300, CN101, CN100, CN601, CN600
6. Connect the CN201 connector to the side of the high voltage panel.
7. Use 3 pcs. M8x30 bolts to install the top right support bracket to the high voltage panel.
8. Use 12 pcs M5x10 bolts to install the high voltage panel cover.
9. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
10. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
11. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.8.7 Replace the High Voltage Panel Temperature Sensor (TT_J50)

To test a new or existing temperature sensor in the high voltage panel temperature sensor (TT_J50), connect the black and the red lead of the meter to the leads from the PT1000 sensor. A typical reading for a temperature sensor on the service interface shows approx. 1078 ohms at 20° C.

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Remove the marked cable rail covers.

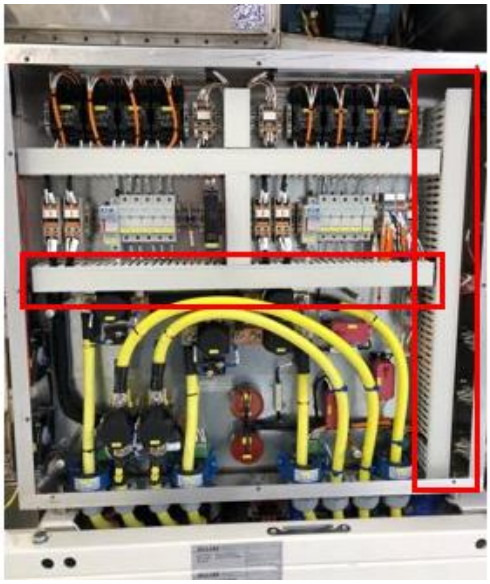

Figure 8-257: Overview of cable rail covers

3. Disconnect the CC-TT_J50 (CN201) connector.
4. Cut the cable tie securing temperature sensor TT_J50.

8.8.8 Replace the Low Voltage Panel Temperature Sensor (TT_J40)

To test a new or existing temperature sensor in the low voltage panel temperature sensor (TT_J40), connect the black and the red lead of the meter to the leads from the PT1000 sensor. A typical reading for a temperature sensor on the service interface shows approx. 1078 ohms at 20° C.

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Uninstall 3 pcs. M8x30 bolts from the top right support bracket of the high voltage panel. Remove the bracket on the right side of the high voltage panel.

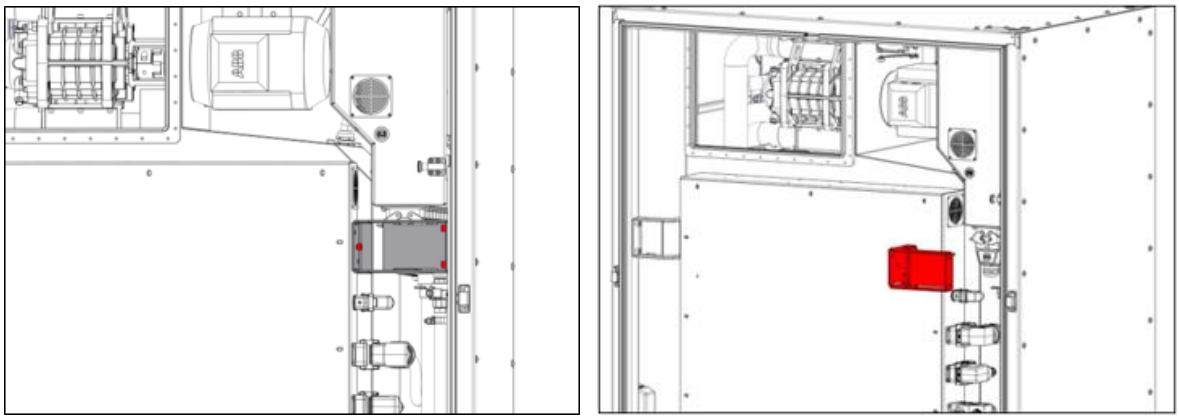

Figure 8-261: Bolts and support bracket in HV panel for TT_J30

3. Loosen the spring-loaded lock pin that locks the low voltage panel assembly to the slide on the mounting bracket.
4. Uninstall 14 pcs. M5 bolts to remove the low voltage panel cover.
5. Cut the cable tie holding the TT_J40.

8.9 Replace Pressure Sensors

Purpose

The procedures in section 8.9 describe how to replace the pressure sensors for the FCwave module. The module has eight pressure sensors that are a part of H_2 Fuel anode, oxidant cathode and stack coolant sub-systems.

Responsibilities

Preventive maintenance of the pressure sensors is necessary for safe operation, according to the preventive maintenance plan (see Customer Portal for newest revision of the plan). It is the end user's responsibility to do preventive maintenance, refer to section 8.1.1.

Parts and equipment

A list of parts and special equipment is identified to replace the pressure sensors during the life and operation of the FCwave module.

- FRU, Sensor, Pressure 0-4 bar(g) (part no. 7500016) x6. For section 8.9.2 + 8.9.4 + 8.9.5 + 8.9.6 + 8.9.7.
- FRU, Sensor, Air Compressor Pressure 0-1 bar(g) (part no. 7500058) x2. For section 8.9.3

Safety

Refer to section 8.1.2 to follow the instructions.

Estimated time to replace the Pressure Sensors

Based on the normal conditions, the estimated time for replacement is:

Pressure Sensors		
Duration	5 – 10 min	
	Except for coolant sensors, which requires 1 hour additional time for draining the coolant circuit	
Personnel	1	
Tightening Torque	M5 bolt	6.5 ± 0.5 Nm
	M6 bolt	10 ± 0.5 Nm
	M8 bolt	25 ± 0.5 Nm
	M10 bolt	50 ± 5 Nm
	1/2" sensor fittings	25 ± 0.5 Nm
	Tool: 4mm + 5mm + 6mm + 8mm hex key, 27 mm spanner (x2), cross-head screwdriver, Phillips bit (PH2), torque wrench, krytox	

Table 8-38: Time to replace pressure sensors

Test a Pressure Sensor

It is important to test a new or existing pressure sensor before replacement.

2-Wire Current Pressure Sensor:

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

- Connect the +ve terminal of the sensor to the +ve terminal of the power supply
- Connect the -ve terminal of the sensor to the +ve lead on the multimeter
- Connect the –ve lead of the multimeter to the –ve terminal on the power supply

Under no-load conditions, the sensor must produce a current ranging from 4 to 20mA. Refer to the datasheet and verify if the sensor is working within specifications.

8.9.1 Pressure Sensors on the Hydrogen Valve Block

See section 8.2.3 for instructions on how to replace the entire hydrogen valve block which contains the fuel-out pressure sensor. Do not replace only the sensors in the valve block.

8.9.2 Replace the Fuel-Out Pressure Sensor (PT_H50)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Disconnect all connectors (CN201, CN202, CN500, CN505) in the high voltage panel as shown.

Figure 8-266: Overview of connectors in HV panel

Assembling procedure:

1. Install new PFTE gasket in the sensor adaptor and install new pressure sensor by hand. Re-tighten to 25 Nm.
2. Use a new bolt to install the connector.
3. Install new foam and use 22 pcs. M6 bolts and washers to install the purge hatch cover to the H_2 enclosure.
4. Reverse steps 8 through 15 of the disassembling procedure to install the HV panel assembly.
5. Use 12 pcs. M5x10 bolts and install the high voltage panel cover.
6. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
7. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
8. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.9.3 Replace the Dual Inlet Air Pressure Sensors (PT_A11A & PT_A11B)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Locate the pressure sensors (PT_A11A & PTA11B) on the inlet compressor hose and uninstall the bolt in both sensor connectors to dismount the connectors and rubber seals.

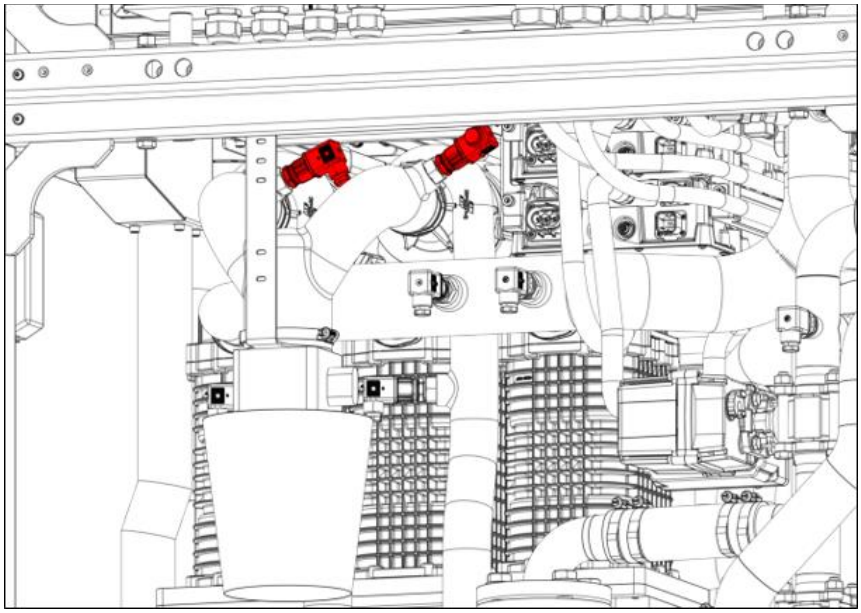

Figure 8-271: Removal of pressure sensors on dual inlet compressor hose

3. Use 2 spanners (1 as counter on the silicon hose fitting to avoid damaging the threaded insert) to uninstall both sensors and PTFE gaskets.

Assembling procedure:

1. Install new PFTE gaskets in both sensor adaptors and install new pressure sensor by hand. Re-tighten to 25 Nm.
2. Connect the sensors to harness CN_600 and mount the rubber seal and the connectors for the sensors.
3. Use 12 pcs. M5x10 bolts and install the high voltage panel cover.
4. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
5. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
6. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.9.4 Replace the Dual Outlet Air Pressure Sensors (PT_A12A & PT_A12B)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Locate the connectors for both sensors (PT_A12A & PT_A12B) and disconnect them.

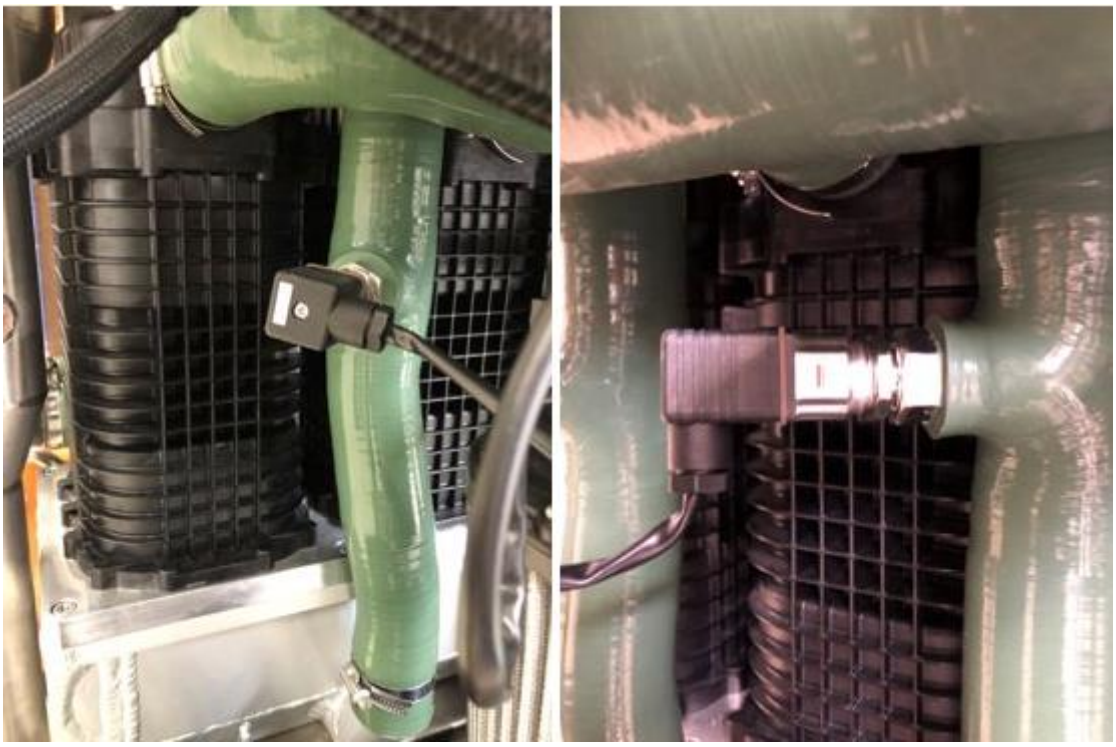

Figure 8-272: Overview of connector sensor for output air

3. Use 2 spanners (1 as counter on the nut to avoid damaging the connection) to uninstall both sensors and remove the PTFE gasket from both sensors.

Assembling procedure:

1. Install new PFTE gaskets in both sensors.
2. Lubricate thread with krytox and install new sensors. Tighten to 25 Nm.
3. Install connectors on sensors.
4. Use 12 pcs. M5x10 bolts and install the high voltage panel cover.
5. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
6. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
7. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.9.5 Replace the Stack Inlet Air Pressure Sensor (PT_A40)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Locate the PT_A40 pressure transducer and remove the bolt in the connector to uninstall the pressure sensor.

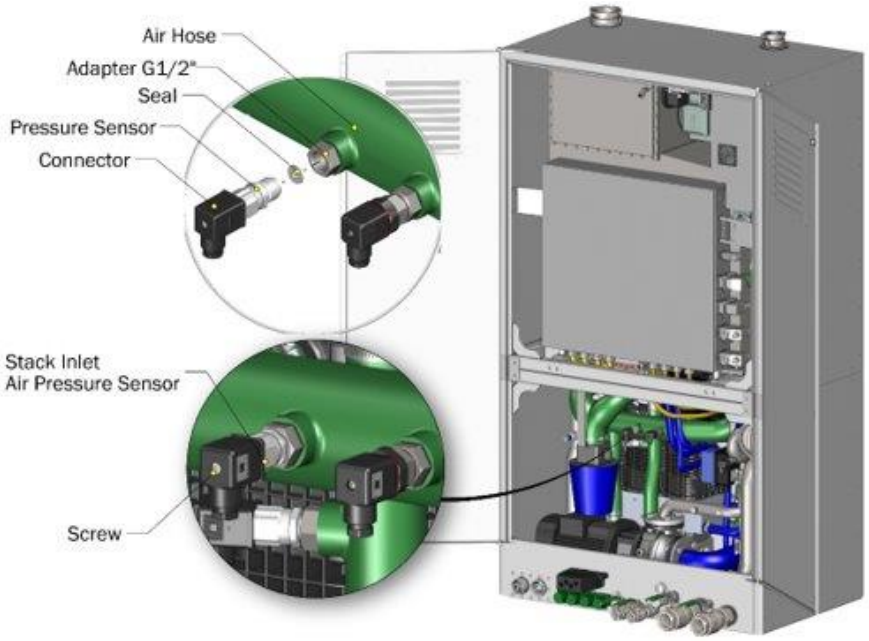

Figure 8-273: Overview of pressure transducer

3. Use a spanner to remove the pressure sensor fitting and use another as counter turn on the silicon hose fitting to avoid any damage to the threaded insert.

Assembling procedure:

1. Apply krytox to the new sensor and install sensor and seal. Tighten to 25 Nm.
2. Use the bolt to install the connector to the sensor.
3. Use 12 pcs. M5x10 bolts and install the high voltage panel cover.
4. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
5. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
6. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.9.6 Replace the Coolant-In Pressure Sensor (PT_D40)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Drain the HT cooling system.
3. Locate the PT_D40 pressure sensor on the coolant inlet hose and remove the bolt holding socket to disconnect the socket.

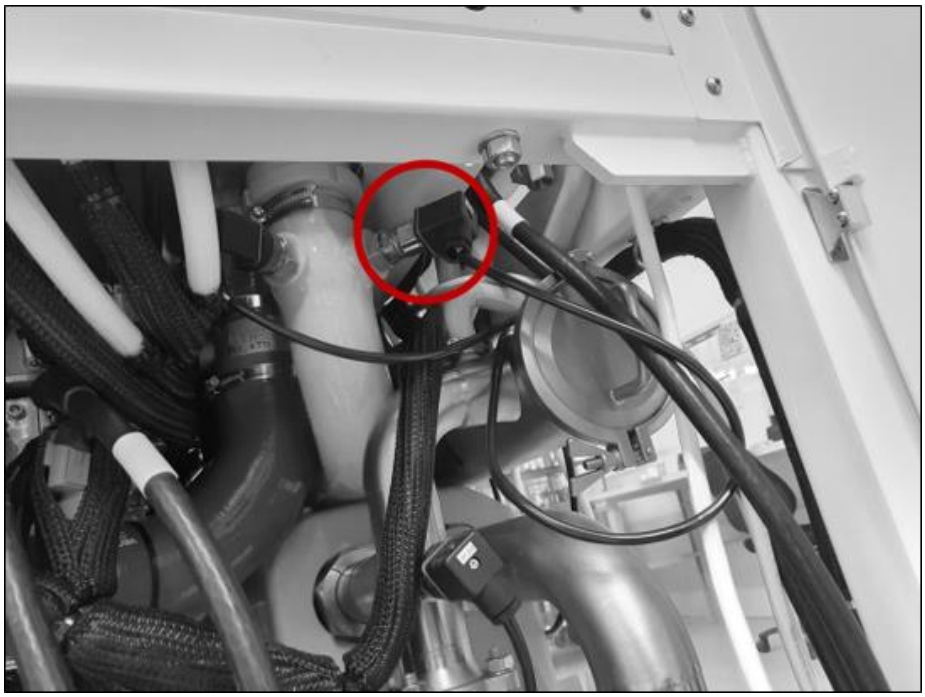

Figure 8-274: Location of PT_D40 pressure sensor

4. Use a spanner to loosen the pressure sensor fitting and use another as counter turn on the silicon hose fitting to avoid any damage to the threaded insert.
5. Remove the pressure sensor, seal washer, and wipe off any leftover grease in the hose fitting.

Assembling procedure:

1. Grease the pressure sensor thread and the new seal washer.
2. Install the new PT_D40 sensor by hand. Use spanner to re-tighten it to 25 Nm.
3. Connect socket to PT_D40 and use the bolt to install it. Check the label to make sure the right harness is connected.
4. Use 12 pcs. M5x10 bolts and install the high voltage panel cover.
5. Connect a portable pump, secured with mechanical relief valve, to the connector to fill the module with HT coolant.
6. Ensure the air pockets are vented through the vent valve located on top of the header tank.
7. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
8. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
9. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

8.9.7 Replace the Coolant-Out Pressure Sensor (PT_D50)

Disassembling procedure:

1. Before proceeding with the disassembling procedure, perform all steps in section 7.2.7 (PrepForService feature usage) and 6.5.1 (High Voltage safety check before module maintenance).
2. Drain the HT cooling system.
3. Locate the PT_D50 pressure sensor on the coolant outlet hose and remove the bolt in the connector to dismount the pressure sensor.

   If necessary, release the hose clamp to remove the oxidant outlet fittings to get better access to the sensor.

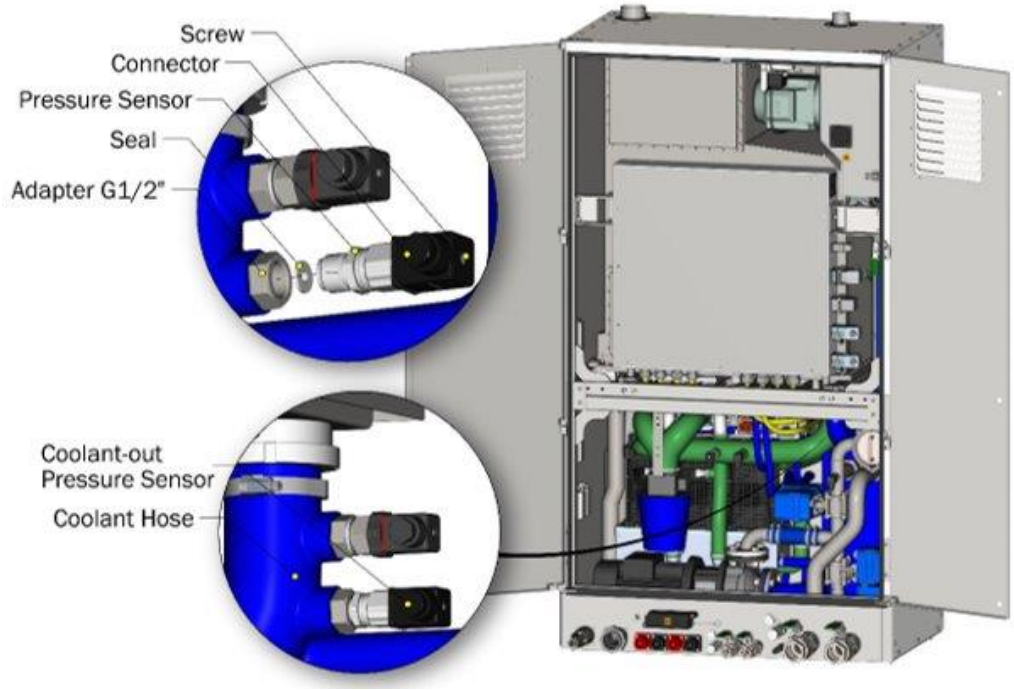

Figure 8-275: Location of PT_D50 pressure sensor

4. Use a spanner to loosen the pressure sensor fitting and use another as counter turn on the silicon hose fitting to avoid any damage to the threaded insert.
5. Remove the pressure sensor, seal washer, and wipe off any leftover grease in the hose fitting.

Assembling procedure:

1. Insert the new pressure sensor and seal in the adaptor. Tighten to 25 Nm.
2. Insert the bolt in the connector and mount the pressure sensor.
3. Use the coolant pump to refill the HT cooling system.
4. Use 12 pcs. M5x10 bolts and install the high voltage panel cover.
5. Insert the high voltage electrical plugs and turn clockwise to install in the front of the module.
6. Use 2 pcs. M6 bolt to install the low voltage electrical connection (X_E01) with attached cables to the module. Tighten to 5 Nm.
7. Run degas procedure for 30-60 min. Refer to 8.4.9.
8. Close the system doors and confirm that the module is ready for power up from the integrator side after maintenance. Remember to remove local lockout and tagout when work is done.

10.0 Handling of defective or worn-out components and disposal

Table 10-1: Handling of defective or worn-out components and disposal

The Fuel Cell system is designed to last for many years. When the time comes for the unit to be re-cycled, the unit should be recycled according to national rules and procedures to protect the environment.

- Return faulty part to BPSE for failure analysis, repair, or refurbishment in original packing.

  Every year thousands of fuel cell stacks are recycled. We seek to keep every fuel cell in use for as long as possible.
- Any parts removed during installation or maintenance should be disposed according to any local government regulations.

THIS DOCUMENT, SUBMITTED IN CONFIDENCE, CONTAINS PROPRIETARY INFORMATION WHICH SHALL NOT BE REPRODUCED OR TRANSFERRED TO OTHER DOCUMENTS OR DISCLOSED TO OTHERS OR USED FOR MANUFACTURING OR ANY OTHER PURPOSE WITHOUT PRIOR WRITTEN PERMISSION OF BALLARD POWER SYSTEMS.

1.0 Purpose

The purpose of this document is to provide a list of Spare Parts that will be delivered to commissioning Site for commissioning and start up of the Ballard 1MW fuel cell container.

2.0 Commissioning Spare Part List

The complete list of Spare Parts for commissioning and start up of 1MW fuel cell container (MEGABLOCK) is shown below.

Item	Technical Details	Quantity	Manufacture	MFG ID
DC Measurement Fuse	10x38mm, 2A, 1000VDC	1 package, 10 pcs	SIBA	5021526.2
DC/AC Fuse	10x38mm, 10A, 1000VDCAC	1 package, 10 pcs	SIBA	5019906.10
Main DCAC Fuse	SQB3, 500A, 1250V	1 package, 2 pcs	SIBA	2078032.500
DCDC Cabinet Fuse	SQB1, 315A, 1250V	1 package, 3 pcs	SIBA	2071532.315
Smoke Detector	Optical Smoke Detector	2 pcs, with holder	Apollo	ORB-OP-42001-MAR
10ft Control Cabinet door	Cubic 4x4 door with mounting kits	1 door with 2 mounting kits	CUBIC	Na
H2 Detector 0-4%	H2 Detector for Fcwave module	6 pce	Ballard FRU Part	7500036
Fuse kit	Different fuses for Fcwave module	1 kit	Ballard FRU Part	7500349
Solenoid valve	Valve for H2 manifold	1 pce	ASCO	NA
Ventilation inlet flow switch	FRU Part FCwave	3 Pce	Ballard FRU Part	7500018
Differential pressure switch	FRU Part for FCwave	2 Pce	Ballard FRU Part	7500034
Sensor, air compressor pressure 0 - 1 bar	FRU Part for FCwave	2 Pce	Ballard FRU Part	7500058

Notes:

1. Suggested Spare Parts List for 2 years of operation, based on 1,255 hours/year, and 6 FCwave fuel cell modules
2. All Prices are in EUR, and do not include customs duties, import/export brokerage and associated fees, commodity or sales/use taxes.
3. Delivery based on EXW, Ballard Facilities, Hobro, Denmark (Incoterms 2020)
4. Warranty period is 6 months from date of Delivery.
5. Prices are valid until July 31, 2025

1.0 Purpose

The purpose of this document is to provide an overview of the chemicals and catalytic materials consumed by the 1MW fuel cell container (MEGABlock) provided by Ballard Power Systems Europe to Crosswind/Shell.

2.0 References

Document ID	Document Title	Source
K559-2254-DM-PRO-001	Supplier Documentation Requirements Listing (SDRL) Definitions	KBR

MAN001	FCwave™ service manual rev1.1.1	Ballard
	Datasheet HT and LT coolers	Evapco
	Header tank calculation	Ballard

3.0 Chemicals overview

As stated in the integration manual, the only chemicals contained in the fuel cell system is the coolant. The coolant consists of a mixture of DI-water (De-ionized water) and ethylene glycol.

3.1 Circuit overview

There will be 2 different types of coolant circuits, internal meaning the FCwave™ and external meaning HT and LT coolant circuits.

3.1.1 Internal circuit

For the internal high temperature circuit, a specific Fuel cell grade coolant “BASF Glysantin J21725” I used. The mixture is determined by the application and the temperature surrounding the fuel cell module. For this application, a pre-mix of 50/50 is used. The module will be filled with the coolant before leaving the factory. Filling of the coolant levels is approximately 45L+<10L in the expansion tank per module.

Commented [RBS1]: External coolant
Commented [RBS2]: For all fc wave

3.1.2 External circuits

As for the low temperature (LT) and high temperature (HT) circuits, the external heat exchanger manufacturer specifies the use of 50/50% ethylene glycol. For this application “Glad Long Life Ethylene Glycol” is used.

3.2 Quantity of chemicals

The following list shows the total amount of chemicals expected to be used in the MEGABlock installation.

Specifications			
Coolant circuit	Chemical	Quantity (L)	Notes
Internal HT loop	BASF Glysantin J21725 Premix 50%	300	
External HT loop	Glad Long Life Ethylene Glycol Premix 50%	1,396	
External LT loop	Glad Long Life Ethylene Glycol Premix 50%	365	
	Total	2,061	

Table 1 - List of chemical quantities.

3.3 Consumption of chemicals

Service for the above-mentioned chemicals is done every 20,000 hours or 2 years, whichever comes first. Under normal operation, there will be no direct consumption of the coolant. However, coolant level will be topped up during general service on the overall system.

4.0 Catalysts overview

As stated in the integration manual for the FCwave™ module, no catalytic material is consumed by the fuel cells in the Shell/Crosswind 1MW container. Additionally, no catalytic material is needed for the external systems to work. This also means that the overall system will not have any initial filling of catalytic materials either.

1.0 Purpose

The purpose of this document is to provide an overview of all lubricants used in the 1MW fuel cell container (MEGABLOCK) provided by Ballard Power Systems Europe to Crosswind.

2.0 References

Document ID	Document Title	Source
K559-2254-DM-PRO-001	Supplier Documentation Requirements Listing (SDRL) Definitions	KBR
MAN-002	Fuel cell module integration manual V2.2.0	Ballard

3.0 Lubricants Overview

As stated in the integration manual for the FCwave™ module, no lubricants are needed for the installation and operation of the fuel cell modules in the CrossWind 1MW container. This is also the case for all the surrounding systems that make up the container solution. This means that the system does not normally require any lubrication after delivery.

For reference and completeness, the list of lubricants used during manufacturing is shown below.

Manufacturer	Lubricant	Description / Use	Sub-assembly
Putoline®	Ceramic Grease PV.20.01	High-grade assembly paste and high temperature lubricant grease without metal particles used for lubrication of bolts.	Container Solution
Chemours™	Krytox™ GPL 205	Chemically inert, PTFE thickened grease based on perfluoropolyether (PFPE) oils that is safe for use around hazardous chemicals, these lubricants are non-flammable and safe for use in oxygen service. They can be used in extreme conditions, such as continuous high temperatures of up to 204 °C (400 °F) and will survive short-term peak temperatures of up to 220 °C (429 °F).	FCwave™
	Krytox™ GPL 206	Chemically inert, PTFE thickened grease based on perfluoropolyether (PFPE) oils that is safe for use around hazardous chemicals, these lubricants are non-flammable and safe for use in oxygen service. They can be used in extreme conditions, such as continuous high temperatures of up to 260 °C (500 °F) and will survive short-term peak temperatures of up to 270 °C (518 °F).	

4.0 Safety Data Sheets

4.1 Putoline® Ceramic Grease PV.20.01

Ceramic Grease

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878
Issue date: 29-8-2018 Revision date: 21-6-2024 Supersedes version of: 13-10-2022 Version: 1.3

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1. Product identifier

Product form : Mixture
Trade name : Ceramic Grease
Product code : PV.20.01
Type of product : Paste
Product group : Trade product

1.2. Relevant identified uses of the substance or mixture and uses advised against

1.2.1. Relevant identified uses

Main use category : Industrial use,Professional use,Consumer use
Use of the substance/mixture : Lubricant
Function or use category : Lubricants and additives

1.2.2. Uses advised against

No additional information available

1.3. Details of the supplier of the safety data sheet

Putoline Oil
Dollegoorweg 15
NL 7602 EC Almelo
Netherlands
T 0031 (0)546 81 81 65
vib@putoline.com

1.4. Emergency telephone number

Country/Area	Organisation/Company	Address	Emergency number	Comment
Ireland	National Poisons Information Centre Beaumont Hospital	PO Box 1297 Beaumont Road 9	+353 1 809 2566 (Healthcare professionals-24/7) +353 1 809 2166 (public, 8am - 10pm, 7/7)	
United Kingdom	National Poisons Information Service (Cardiff Centre) University Hospital Llandough	Penlan Road CF64 2XX	0344 892 0111	Only for healthcare professionals

SECTION 2: Hazards identification

2.1. Classification of the substance or mixture

Classification according to Regulation (EC) No. 1272/2008 [CLP]

Not classified

Adverse physicochemical, human health and environmental effects

To our knowledge, this product does not present any particular risk, provided it is handled in accordance with good occupational hygiene and safety practice.

2.2. Label elements

Labelling according to Regulation (EC) No. 1272/2008 [CLP]

No labelling applicable

21-6-2024 (Revision date)
21-6-2024 (Printing date)
EN (English)
1/10

Ceramic Grease

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

2.3. Other hazards

The mixture does not contain substance(s) included in the list established in accordance with Article 59(1) of REACH for having endocrine disrupting properties, or substance(s) are not identified as having endocrine disrupting properties in accordance with the criteria set out in Commission Delegated Regulation (EU) 2017/2100 or Commission Regulation (EU) 2018/605 at a concentration equal to or greater than 0,1 %

SECTION 3: Composition/information on ingredients

3.1. Substances

Not applicable

3.2. Mixtures

This mixture does not contain any substances to be mentioned according to the criteria of section 3.2 of REACH Annex II

SECTION 4: First aid measures

4.1. Description of first aid measures

First-aid measures general : If you feel unwell, seek medical advice.
First-aid measures after inhalation : Remove person to fresh air and keep comfortable for breathing.
First-aid measures after skin contact : Wash skin with plenty of water.
First-aid measures after eye contact : Rinse eyes with water as a precaution.
First-aid measures after ingestion : Call a poison center or a doctor if you feel unwell.

4.2. Most important symptoms and effects, both acute and delayed

Symptoms/effects after inhalation : Although no appropriate human or animal health effects data are known to exist, this material is expected to be an inhalation hazard.
Symptoms/effects after skin contact : None under normal conditions.
Symptoms/effects after eye contact : None under normal conditions.
Symptoms/effects after ingestion : None under normal conditions.

4.3. Indication of any immediate medical attention and special treatment needed

Treat symptomatically.

SECTION 5: Firefighting measures

5.1. Extinguishing media

Suitable extinguishing media : Water spray. Dry powder. Foam. Carbon dioxide.
Unsuitable extinguishing media : Do not use a heavy water stream.

5.2. Special hazards arising from the substance or mixture

Fire hazard : Combustible liquid.
Explosion hazard : No direct explosion hazard.
Hazardous decomposition products in case of fire : Incomplete combustion releases dangerous carbon monoxide, carbon dioxide and other toxic gases.

5.3. Advice for firefighters

Firefighting instructions : Fight fire from safe distance and protected location. Do not enter fire area without proper protective equipment, including respiratory protection.
Protection during firefighting : Do not attempt to take action without suitable protective equipment. Self-contained breathing apparatus. Complete protective clothing.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Ceramic Grease

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

SECTION 6: Accidental release measures

6.1. Personal precautions, protective equipment and emergency procedures

General measures : Stop leak if safe to do so. Notify authorities if product enters sewers or public waters. Absorb spillage to prevent material damage.

6.1.1. For non-emergency personnel

Protective equipment : Wear recommended personal protective equipment.
Emergency procedures : Ventilate spillage area.

6.1.2. For emergency responders

Protective equipment : Do not attempt to take action without suitable protective equipment. For further information refer to section 8: "Exposure controls/personal protection".
Emergency procedures : Evacuate unnecessary personnel. Stop leak if safe to do so.

6.2. Environmental precautions

Avoid release to the environment.

6.3. Methods and material for containment and cleaning up

For containment : Absorb spilled material with sand or earth. Contain any spills with dikes or absorbents to prevent migration and entry into sewers or streams. Stop leak without risks if possible.
Methods for cleaning up : Mechanically recover the product.
Other information : Dispose of materials or solid residues at an authorized site.

6.4. Reference to other sections

For further information refer to section 13.

SECTION 7: Handling and storage

7.1. Precautions for safe handling

Additional hazards when processed : Not expected to present a significant hazard under anticipated conditions of normal use.
Precautions for safe handling : Ensure good ventilation of the work station. Wear personal protective equipment.
Hygiene measures : Do not eat, drink or smoke when using this product. Always wash hands after handling the product.

7.2. Conditions for safe storage, including any incompatibilities

Technical measures : Keep in a cool, well-ventilated place away from heat.
Storage conditions : Keep cool. Protect from sunlight.
Storage temperature : < 40 °C
Packaging materials : Store always product in container of same material as original container.

7.3. Specific end use(s)

No additional information available

SECTION 8: Exposure controls/personal protection

8.1. Control parameters

8.1.1 National occupational exposure and biological limit values

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Ceramic Grease

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

Ceramic Grease	
EU - Indicative Occupational Exposure Limit (IOEL)	
Exposure limits/standards for materials that can be formed when handling this product. When mists/aerosols can occur the following is recommended	5 mg/m³ - ACGIH TLV (inhalable fraction).

8.1.2. Recommended monitoring procedures

No additional information available

8.1.3. Air contaminants formed

No additional information available

8.1.4. DNEL and PNEC

No additional information available

8.1.5. Control banding

No additional information available

8.2. Exposure controls

8.2.1. Appropriate engineering controls

Appropriate engineering controls:
Ensure good ventilation of the work station.

8.2.2. Personal protection equipment

Personal protective equipment:
Wear recommended personal protective equipment.

Personal protective equipment symbol(s):

8.2.2.1. Eye and face protection

Eye protection:
Safety glasses

8.2.2.2. Skin protection

Skin and body protection:
Wear suitable protective clothing

Hand protection:
Protective gloves

8.2.2.3. Respiratory protection

Respiratory protection:
In case of insufficient ventilation, wear suitable respiratory equipment

8.2.2.4. Thermal hazards

No additional information available

8.2.3. Environmental exposure controls

Environmental exposure controls:
Avoid release to the environment.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Ceramic Grease

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

SECTION 9: Physical and chemical properties

9.1. Information on basic physical and chemical properties

Physical state	:	Liquid
Colour	:	Beige.
Appearance	:	Paste.
Odour	:	characteristic.
Odour threshold	:	Not available
Melting point	:	Not applicable
Freezing point	:	Not applicable
Boiling point	:	Not available
Flammability	:	Non flammable.
Lower explosion limit	:	Not available
Upper explosion limit	:	Not available
Flash point	:	Not applicable
Auto-ignition temperature	:	Not applicable
Decomposition temperature	:	Not available
pH	:	Not available
Viscosity, kinematic	:	Not applicable
Solubility	:	Water: Insoluble / Slightly miscible
Partition coefficient n-octanol/water (Log Kow)	:	Not available
Vapour pressure	:	Not available
Vapour pressure at 50°C	:	Not available
Density	:	1,03 – 1,13 g/cm³
Relative density	:	Not applicable
Relative vapour density at 20°C	:	Not available
Particle characteristics	:	Not applicable

9.2. Other information

9.2.1. Information with regard to physical hazard classes

No additional information available

9.2.2. Other safety characteristics

No additional information available

SECTION 10: Stability and reactivity

10.1. Reactivity

The product is non-reactive under normal conditions of use, storage and transport.

10.2. Chemical stability

Stable under normal conditions.

10.3. Possibility of hazardous reactions

Reacts violently with (strong) oxidizers.

10.4. Conditions to avoid

None under recommended storage and handling conditions (see section 7).

10.5. Incompatible materials

No additional information available

10.6. Hazardous decomposition products

Under normal conditions of storage and use, hazardous decomposition products should not be produced.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Ceramic Grease

Safety Data Sheet

according to the REACH Regulation (EC) 1907/2006 amended by Regulation (EU) 2020/878

SECTION 11: Toxicological information

11.1. Information on hazard classes as defined in Regulation (EC) No 1272/2008

Acute toxicity (oral)	:	Not classified
Acute toxicity (dermal)	:	Not classified
Acute toxicity (inhalation)	:	Not classified
Skin corrosion/irritation	:	Not classified
Serious eye damage/irritation	:	Not classified
Respiratory or skin sensitisation	:	Not classified
Germ cell mutagenicity	:	Not classified
Carcinogenicity	:	Not classified
Reproductive toxicity	:	Not classified
STOT-single exposure	:	Not classified
STOT-repeated exposure	:	Not classified
Aspiration hazard	:	Not classified

Ceramic Grease	
Viscosity, kinematic	Not applicable

11.2. Information on other hazards

No additional information available

SECTION 12: Ecological information

12.1. Toxicity

Ecology - general	:	The product is not considered harmful to aquatic organisms nor to cause long-term adverse effects in the environment.
Hazardous to the aquatic environment, short–term (acute)	:	Not classified
Hazardous to the aquatic environment, long–term (chronic)	:	Not classified

12.2. Persistence and degradability

Ceramic Grease	
Persistence and degradability	Rapidly degradable

12.3. Bioaccumulative potential

No additional information available

12.4. Mobility in soil

No additional information available

12.5. Results of PBT and vPvB assessment

No additional information available

12.6. Endocrine disrupting properties

No additional information available

12.7. Other adverse effects

No additional information available

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Labelling (REGULATION (EC) No 1272/2008) as amended by GB-CLP Regulation, UK SI 2019/720, and UK SI 2020/1567)

No hazard pictogram, no signal word, no hazard statement(s), no precautionary statement(s) required

2.3 Other hazards

This substance/mixture contains no components considered to be either persistent, bioaccumulative and toxic (PBT), or very persistent and very bioaccumulative (vPvB) at levels of 0.1% or higher.
The thermal decomposition vapours of fluorinated plastics may cause polymer fume fever with flu-like symptoms in humans, especially when smoking contaminated tobacco.

SECTION 3: Composition/information on ingredients

3.2 Mixtures

Components

Remarks : No hazardous ingredients

SECTION 4: First aid measures

4.1 Description of first aid measures

Protection of first-aiders : No special precautions are necessary for first aid responders.

If inhaled : If inhaled, remove to fresh air.
Get medical attention if symptoms occur.

In case of skin contact : Wash with water and soap as a precaution.
Get medical attention if symptoms occur.

In case of eye contact : Flush eyes with water as a precaution.
Get medical attention if irritation develops and persists.

If swallowed : If swallowed, DO NOT induce vomiting.
Get medical attention if symptoms occur.
Rinse mouth thoroughly with water.

4.2 Most important symptoms and effects, both acute and delayed

Symptoms : Inhalation may provoke the following symptoms:
Irritation
Lung oedema

Eye contact may provoke the following symptoms
Blurred vision
Discomfort

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.

Lachrymation

Skin contact may provoke the following symptoms:
Irritation
Redness

Inhalation may provoke the following symptoms:
Irritation
Shortness of breath

4.3 Indication of any immediate medical attention and special treatment needed

Treatment : Treat symptomatically and supportively.

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media : Not applicable
Will not burn

Unsuitable extinguishing media : Not applicable
Will not burn

5.2 Special hazards arising from the substance or mixture

Specific hazards during fire-fighting : Exposure to combustion products may be a hazard to health.

Hazardous combustion products : Hydrogen fluoride
carbonyl fluoride
potentially toxic fluorinated compounds
aerosolized particulates
Carbon oxides

5.3 Advice for firefighters

Special protective equipment for firefighters : Wear self-contained breathing apparatus for firefighting if necessary. Use personal protective equipment.

Specific extinguishing methods : Use extinguishing measures that are appropriate to local circumstances and the surrounding environment.
Use water spray to cool unopened containers.
Remove undamaged containers from fire area if it is safe to do so.
Evacuate area.

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Personal precautions : Follow safe handling advice (see section 7) and personal pro-

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Krytox™ GPL 205

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	29.05.2024	9582423-00007	Date of first issue: 15.09.2021

tective equipment recommendations (see section 8).

6.2 Environmental precautions

Environmental precautions : Avoid release to the environment.
Prevent further leakage or spillage if safe to do so.
Retain and dispose of contaminated wash water.
If spillage enters rivers or watercourses, inform the Environment Agency (emergency telephone number 0800 807060).

6.3 Methods and material for containment and cleaning up

Methods for cleaning up : Soak up with inert absorbent material.
For large spills, provide dyking or other appropriate containment to keep material from spreading. If dyked material can be pumped, store recovered material in appropriate container.
Clean up remaining materials from spill with suitable absorbent.
Local or national regulations may apply to releases and disposal of this material, as well as those materials and items employed in the cleanup of releases. You will need to determine which regulations are applicable.
Sections 13 and 15 of this SDS provide information regarding certain local or national requirements.

6.4 Reference to other sections

See sections: 7, 8, 11, 12 and 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Technical measures : See Engineering measures under EXPOSURE CONTROLS/PERSONAL PROTECTION section.

Local/Total ventilation : Use only with adequate ventilation.

Advice on safe handling : Handle in accordance with good industrial hygiene and safety practice, based on the results of the workplace exposure assessment
Take care to prevent spills, waste and minimize release to the environment.

Do not breathe decomposition products.

Hygiene measures : If exposure to chemical is likely during typical use, provide eye flushing systems and safety showers close to the working place. When using do not eat, drink or smoke. Wash contaminated clothing before re-use.

7.2 Conditions for safe storage, including any incompatibilities

Requirements for storage : Keep in properly labelled containers. Store in accordance with

8.2 Exposure controls

Engineering measures

Processing may form hazardous compounds (see section 10).
Ensure adequate ventilation, especially in confined areas.
Minimize workplace exposure concentrations.

Personal protective equipment

Eye/face protection : Wear the following personal protective equipment:
Safety glasses
Equipment should conform to BS EN 166

Hand protection

Remarks : Wash hands before breaks and at the end of workday.

Skin and body protection : Skin should be washed after contact.

Respiratory protection : If adequate local exhaust ventilation is not available or exposure assessment demonstrates exposures outside the recommended guidelines, use respiratory protection.
Equipment should conform to BS EN 14387

Filter type : Combined particulates, acidic gas/vapour and organic vapour type (AE-P)

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

Appearance : Grease

Colour : white

Odour : odourless

Odour Threshold : No data available

pH	:	7
Melting point/freezing point	:	320 °C
Initial boiling point and boiling range	:	No data available
Flash point	:	Method: Pensky-Martens closed cup Not applicable
Evaporation rate	:	Not applicable
Flammability (solid, gas)	:	Will not burn
Upper explosion limit / Upper flammability limit	:	No data available
Lower explosion limit / Lower flammability limit	:	No data available
Vapour pressure	:	Not applicable
Relative vapour density	:	Not applicable
Relative density	:	1.89 - 1.93 (24 °C)
Solubility(ies) Water solubility	:	insoluble
Partition coefficient: n-octanol/water	:	Not applicable
Auto-ignition temperature	:	No data available
Decomposition temperature	:	300 °C
Viscosity Viscosity, kinematic	:	Not applicable
Explosive properties	:	Not explosive
Oxidizing properties	:	The substance or mixture is not classified as oxidizing.

9.2 Other information

Particle size	:	No data available

SECTION 10: Stability and reactivity

10.1 Reactivity

Not classified as a reactivity hazard.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

10.2 Chemical stability
Stable under normal conditions.

10.3 Possibility of hazardous reactions
Hazardous reactions : Hazardous decomposition products will be formed at elevated temperatures.

10.4 Conditions to avoid
Conditions to avoid : None known.

10.5 Incompatible materials
Materials to avoid : None.

10.6 Hazardous decomposition products
Thermal decomposition : hydrofluoric acid
Carbonyl difluoride
Carbon dioxide
Carbon monoxide

SECTION 11: Toxicological information

11.1 Information on toxicological effects
Information on likely routes of exposure : Skin contact
Ingestion
Eye contact

Acute toxicity
Not classified based on available information.

Skin corrosion/irritation
Not classified based on available information.

Serious eye damage/eye irritation
Not classified based on available information.

Respiratory or skin sensitisation

Skin sensitisation
Not classified based on available information.

Respiratory sensitisation
Not classified based on available information.

Germ cell mutagenicity
Not classified based on available information.

Carcinogenicity
Not classified based on available information.

Reproductive toxicity
Not classified based on available information.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

STOT - single exposure
Not classified based on available information.

STOT - repeated exposure
Not classified based on available information.

Aspiration toxicity
Not classified based on available information.

SECTION 12: Ecological information

12.1 Toxicity
No data available

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment

Product:

Assessment	:	This substance/mixture contains no components considered to be either persistent, bioaccumulative and toxic (PBT), or very persistent and very bioaccumulative (vPvB) at levels of 0.1% or higher.

12.6 Other adverse effects

Product:

Endocrine disrupting potential	:	This substance/mixture does not contain components considered to have endocrine disrupting properties for environment according to UK REACH Article 57(f).

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product	:	Dispose of in accordance with local regulations. According to the European Waste Catalogue, Waste Codes are not product specific, but application specific. Waste codes should be assigned by the user, preferably in discussion with the waste disposal authorities. Do not dispose of waste into sewer.
Contaminated packaging	:	Empty containers should be taken to an approved waste handling site for recycling or disposal.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.

4.3 Krytox™ GPL 206

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Chemours™

Krytox™ GPL 206

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	17.05.2024	9582813-00006	Date of first issue: 15.09.2021

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1 Product identifier

Trade name : Krytox™ GPL 206

SDS-Identcode : 130000031500

1.2 Relevant identified uses of the substance or mixture and uses advised against

Use of the Substance/Mixture : Lubricant

Recommended restrictions on use : For industrial use only.
Do not use or resell Chemours™ materials in medical applications involving implantation in the human body or contact with internal body fluids or tissues unless agreed to by Seller in a written agreement covering such use. For further information, please contact your Chemours representative.

1.3 Details of the supplier of the safety data sheet

Company : Chemours Netherlands B.V.
Baanhoekweg 22
3313 LA Dordrecht Netherlands

Telephone : +31-(0)-78-630-1011

Telefax : +31-78-6163737

E-mail address of person responsible for the SDS : sds-support@chemours.com

1.4 Emergency telephone number

+(44)-870-8200418 (CHEMTREC - Recommended)

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

Classification (REGULATION (EC) No 1272/2008) as amended by GB-CLP Regulation, UK SI 2019/720, and UK SI 2020/1567)

Not a hazardous substance or mixture.

1 / 13

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Chemours™

Krytox™ GPL 206

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	17.05.2024	9582813-00006	Date of first issue: 15.09.2021

2.2 Label elements

Labelling (REGULATION (EC) No 1272/2008) as amended by GB-CLP Regulation, UK SI 2019/720, and UK SI 2020/1567)

No hazard pictogram, no signal word, no hazard statement(s), no precautionary statement(s) required

2.3 Other hazards

This substance/mixture contains no components considered to be either persistent, bioaccumulative and toxic (PBT), or very persistent and very bioaccumulative (vPvB) at levels of 0.1% or higher.
The thermal decomposition vapours of fluorinated plastics may cause polymer fume fever with flu-like symptoms in humans, especially when smoking contaminated tobacco.

SECTION 3: Composition/information on ingredients

3.2 Mixtures

Components

Remarks : No hazardous ingredients

SECTION 4: First aid measures

4.1 Description of first aid measures

Protection of first-aiders : No special precautions are necessary for first aid responders.

If inhaled : If inhaled, remove to fresh air.
Get medical attention if symptoms occur.

In case of skin contact : Wash with water and soap as a precaution.
Get medical attention if symptoms occur.

In case of eye contact : Flush eyes with water as a precaution.
Get medical attention if irritation develops and persists.

If swallowed : If swallowed, DO NOT induce vomiting.
Get medical attention if symptoms occur.
Rinse mouth thoroughly with water.

4.2 Most important symptoms and effects, both acute and delayed

Symptoms : Inhalation may provoke the following symptoms:
Irritation
Lung oedema

Eye contact may provoke the following symptoms
Blurred vision
Discomfort

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SAFETY DATA SHEET

Chemours™

Krytox™ GPL 206

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	17.05.2024	9582813-00006	Date of first issue: 15.09.2021

Lachrymation

Skin contact may provoke the following symptoms:
Irritation
Redness

Inhalation may provoke the following symptoms:
Irritation
Shortness of breath

4.3 Indication of any immediate medical attention and special treatment needed

Treatment : Treat symptomatically and supportively.

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media : Not applicable
Will not burn

Unsuitable extinguishing media : Not applicable
Will not burn

5.2 Special hazards arising from the substance or mixture

Specific hazards during fire-fighting : Exposure to combustion products may be a hazard to health.

Hazardous combustion products : Hydrogen fluoride
carbonyl fluoride
potentially toxic fluorinated compounds
aerosolized particulates
Carbon oxides

5.3 Advice for firefighters

Special protective equipment for firefighters : Wear self-contained breathing apparatus for firefighting if necessary. Use personal protective equipment.

Specific extinguishing methods : Use extinguishing measures that are appropriate to local circumstances and the surrounding environment.
Use water spray to cool unopened containers.
Remove undamaged containers from fire area if it is safe to do so.
Evacuate area.

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Personal precautions : Follow safe handling advice (see section 7) and personal pro-

ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

Krytox™ GPL 206

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	17.05.2024	9582813-00006	Date of first issue: 15.09.2021

tective equipment recommendations (see section 8).

6.2 Environmental precautions

Environmental precautions : Avoid release to the environment.
Prevent further leakage or spillage if safe to do so.
Retain and dispose of contaminated wash water.
If spillage enters rivers or watercourses, inform the Environment Agency (emergency telephone number 0800 807060).

6.3 Methods and material for containment and cleaning up

Methods for cleaning up : Soak up with inert absorbent material.
For large spills, provide dyking or other appropriate containment to keep material from spreading. If dyked material can be pumped, store recovered material in appropriate container.
Clean up remaining materials from spill with suitable absorbent.
Local or national regulations may apply to releases and disposal of this material, as well as those materials and items employed in the cleanup of releases. You will need to determine which regulations are applicable.
Sections 13 and 15 of this SDS provide information regarding certain local or national requirements.

6.4 Reference to other sections

See sections: 7, 8, 11, 12 and 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Technical measures : See Engineering measures under EXPOSURE CONTROLS/PERSONAL PROTECTION section.

Local/Total ventilation : Use only with adequate ventilation.

Advice on safe handling : Handle in accordance with good industrial hygiene and safety practice, based on the results of the workplace exposure assessment
Take care to prevent spills, waste and minimize release to the environment.

Do not breathe decomposition products.

Hygiene measures : If exposure to chemical is likely during typical use, provide eye flushing systems and safety showers close to the working place. When using do not eat, drink or smoke. Wash contaminated clothing before re-use.

7.2 Conditions for safe storage, including any incompatibilities

Requirements for storage : Keep in properly labelled containers. Store in accordance with

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.

areas and containers — the particular national regulations.

Advice on common storage : No special restrictions on storage with other products.

Further information on storage stability : No decomposition if stored and applied as directed.

7.3 Specific end use(s)

Specific use(s) : No data available

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Occupational Exposure Limits

Contains no substances with occupational exposure limit values.

Occupational exposure limits of decomposition products

Components	CAS-No.	Value type (Form of exposure)	Control parameters	Basis
hydrofluoric acid	7664-39-3	TWA	1.8 ppm 1.5 mg/m3 (Fluorine)	GB EH40
		STEL	3 ppm 2.5 mg/m3 (Fluorine)	GB EH40
		TWA	1.8 ppm 1.5 mg/m3	2000/39/EC
	Further information: Indicative			
		STEL	3 ppm 2.5 mg/m3	2000/39/EC
	Further information: Indicative			
Carbonyl difluoride	353-50-4	TWA	2.5 mg/m3 (Fluorine)	2000/39/EC
	Further information: Indicative			
Carbon dioxide	124-38-9	TWA	5,000 ppm 9,150 mg/m3	GB EH40
		STEL	15,000 ppm 27,400 mg/m3	GB EH40
		TWA	5,000 ppm 9,000 mg/m3	2006/15/EC
	Further information: Indicative			
Carbon monoxide	630-08-0	TWA	30 ppm 35 mg/m3	GB EH40
		STEL	200 ppm 232 mg/m3	GB EH40
		TWA	20 ppm 23 mg/m3	GB EH40
		STEL	100 ppm	GB EH40

8.2 Exposure controls

Engineering measures

Processing may form hazardous compounds (see section 10).
Ensure adequate ventilation, especially in confined areas.
Minimize workplace exposure concentrations.

Personal protective equipment

Eye/face protection : Wear the following personal protective equipment:
Safety glasses
Equipment should conform to BS EN 166

Hand protection

Remarks : Wash hands before breaks and at the end of workday.

Skin and body protection : Skin should be washed after contact.

Respiratory protection : If adequate local exhaust ventilation is not available or exposure assessment demonstrates exposures outside the recommended guidelines, use respiratory protection.
Equipment should conform to BS EN 14387

Filter type : Combined particulates, acidic gas/vapour and organic vapour type (AE-P)

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

Appearance : Grease

Colour : white

Odour : odourless

Odour Threshold : No data available

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SAFETY DATA SHEET

Version	Revision Date:	SDS Number:	Date of last issue: 02.11.2023
3.3	17.05.2024	9582813-00006	Date of first issue: 15.09.2021

pH	:	7
Melting point/freezing point	:	320 °C
Initial boiling point and boiling range	:	No data available
Flash point	:	Method: Pensky-Martens closed cup Not applicable
Evaporation rate	:	Not applicable
Flammability (solid, gas)	:	Will not burn
Upper explosion limit / Upper flammability limit	:	No data available
Lower explosion limit / Lower flammability limit	:	No data available
Vapour pressure	:	Not applicable
Relative vapour density	:	Not applicable
Relative density	:	1.89 - 1.93 (24 °C)
Solubility(ies) Water solubility	: :	 insoluble
Partition coefficient: n-octanol/water	:	Not applicable
Auto-ignition temperature	:	No data available
Decomposition temperature	:	300 °C
Viscosity Viscosity, kinematic	: :	 Not applicable
Explosive properties	:	Not explosive
Oxidizing properties	:	The substance or mixture is not classified as oxidizing.

9.2 Other information

Particle size	:	No data available

SECTION 10: Stability and reactivity

10.1 Reactivity

Not classified as a reactivity hazard.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SAFETY DATA SHEET
According to REACH Regulation (EC) No 1907/2006, as amended by UK REACH Regulations SI 2019/758

3.3	17.05.2024	9582813-00006	Date of first issue: 15.09.2021

10.2 Chemical stability
Stable under normal conditions.

10.3 Possibility of hazardous reactions
Hazardous reactions : Hazardous decomposition products will be formed at elevated temperatures.

10.4 Conditions to avoid
Conditions to avoid : None known.

10.5 Incompatible materials
Materials to avoid : None.

10.6 Hazardous decomposition products
Thermal decomposition : hydrofluoric acid
Carbonyl difluoride
Carbon dioxide
Carbon monoxide

SECTION 11: Toxicological information

11.1 Information on toxicological effects
Information on likely routes of exposure : Skin contact
Ingestion
Eye contact

Acute toxicity
Not classified based on available information.

Skin corrosion/irritation
Not classified based on available information.

Serious eye damage/eye irritation
Not classified based on available information.

Respiratory or skin sensitisation

Skin sensitisation
Not classified based on available information.

Respiratory sensitisation
Not classified based on available information.

Germ cell mutagenicity
Not classified based on available information.

Carcinogenicity
Not classified based on available information.

Reproductive toxicity
Not classified based on available information.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

SAFETY DATA SHEET

STOT - single exposure
Not classified based on available information.

STOT - repeated exposure
Not classified based on available information.

Aspiration toxicity
Not classified based on available information.

SECTION 12: Ecological information

12.1 Toxicity
No data available

12.2 Persistence and degradability
No data available

12.3 Bioaccumulative potential
No data available

12.4 Mobility in soil
No data available

12.5 Results of PBT and vPvB assessment

Product:

Assessment	:	This substance/mixture contains no components considered to be either persistent, bioaccumulative and toxic (PBT), or very persistent and very bioaccumulative (vPvB) at levels of 0.1% or higher.

12.6 Other adverse effects

Product:

Endocrine disrupting potential	:	This substance/mixture does not contain components considered to have endocrine disrupting properties for environment according to UK REACH Article 57(f).

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product	:	Dispose of in accordance with local regulations. According to the European Waste Catalogue, Waste Codes are not product specific, but application specific. Waste codes should be assigned by the user, preferably in discussion with the waste disposal authorities. Do not dispose of waste into sewer.
Contaminated packaging	:	Empty containers should be taken to an approved waste handling site for recycling or disposal.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Bureau Veritas Certification

Ballard Power Systems Europe A/S

Majsmarken 1, 9500 Hobro, Denmark

Bureau Veritas Certification Denmark A/S certifies that the Management System of the above organization has been audited and found to be in accordance with the requirements of the management system standards detailed below.

Standard

ISO 9001:2015

Scope of certification

Development, Sales, Production, and Service of Fuel Cell Generators.

Original Cycle Start Date:	**05-01-2015**
Expiry date of previous cycle:	**NA**
Certification/Recertification Audit date:	**NA**
Certification/Recertification cycle start date:	**05-01-2021**
Subject to the continued satisfactory operation of the organization's Management System, this certificate expires on:	**04-01-2024**

Certificate No.: **DK013471** Version: **1** Issue Date: **13-11-2020**

DANAK
SYSTEM Reg.nr. 5005

Certification Office: Bureau Veritas Certification Denmark A/S
Oldenborggade 25-31, 7000 Fredericia, Denmark

Further clarifications regarding the scope of this certificate and the applicability of the Management System requirements may be obtained by consulting the organization. To check this certificate validity, please call: (+45) 77 311 000.

- **Checklist:**

1.1 Hydrogen heater element

1.1.1 Test

The test is done accordingly to the test schematics in IEC 60079-17 Tabel C.1 following descriptions of the test will be below if applicable.

1.1.2 Relevant Standard / document

- IEC 60079-17
- JEVI datasheet 1953 861 100

1.1.3 Brief Test Plan

- Inspection will be done in respect to the datasheet, standards and Visual inspection prior to startup.

1.1.4 Pass/Fail criteria.

- The pass/fail criteria is specified for each inspection element is shown in Table 1.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Table 1: Heater Inspection – Test Result

Item	Criteria	Result	Pass/Fail	Notes
Equipment is appropriate to the EPL/Zone requirement of the location	Gc or better	GB	✓	
Equipment group is correct	IIC	IIC	✓	
Equipment temperature class is correct	T1	T4	✓	
Degree of protection (IP grade) of the equipment is appropriate for the level of protection/group/conductivity	>IP55	IP66	✓	
Equipment circuit identification is correct	Present	✓	✓	
Equipment circuit identification is available	Yes	✓	✓	
Enclosure, glass parts and glass-to-metal sealing gaskets and/or compounds are satisfactory	NA	—	—	—
There is no damage or unauthorized modifications	None	none	✓	
There is no evidence of unauthorized modification	None	none	✓	
Bolts, cable entry devices (direct and indirect) and blanking elements are of the correct type and are complete and tight	Yes		✓	
Threaded covers on enclosures are of the correct type, are tight and secured	Yes		✓	
Joint surfaces are clean and undamaged and gaskets, if any, are satisfactory and positioned correctly	Yes		✓	
Condition of enclosure gaskets is satisfactory	Yes		✓	
There is no evidence of ingress of water or dust in the enclosure in accordance with the IP rating	No		✓	

Dimensions of flanged joint gaps are: – within the limits in accordance with the manufacturer's documentation or – within maximum values permitted by the relevant construction standard at time of installation or – within maximum values permitted by site documentation	—	—	—	—
Electrical connections are tight	Yes		✓	
Unused terminals are tightened	Yes		✓	
Type of cable is appropriate	Voltage and Environmental		✓	
There is no obvious damage to cables	No		✓	
Sealing of trunking, ducts, pipes and/or conduits is satisfactory	Not relevant	Not relevant	Not relevant	Not relevant
Stopping boxes and cable boxes are correctly filled	Yes		N/A	N/A
Integrity of conduit system and interface with mixed system maintained	No leaks			
Earthing connections, including any supplementary earthing bonding connections are satisfactory (for example connections are tight and conductors are of sufficient cross-section)	Inspection		✓	Gnd connected inside housing
Fault loop impedance (TN systems) or earthing resistance (IT systems) is satisfactory	<100mOhm	32mΩ	✓	
Automatic electrical protective devices are set correctly (auto-reset not possible)	Not present	Not present	Not present	Not present
Automatic electrical protective devices operate within permitted limits	Not present	Not present	Not present	Not present
Specific conditions of use (if applicable) are complied with	None	none	N/A	

Cables not in use are correctly terminated	Yes		✓	
Obstructions adjacent to flameproof flanged joints are in accordance with IEC 60079-14	Not present		N/A	
Variable voltage/frequency installation complies with documentation	Not present	Not present	Not present	Not present
Temperature sensors function according to manufacturer's documents	Not present	Not present	Not present	Not present
Safety cut off devices function according to manufacturer's documents	Inspected		✓	
The setting of the safety cut off is sealed	Yes		✓	
Reset of a heating system safety cut off possible with tool only	Yes		✓	
Auto-reset is not possible	Yes		✓	
Reset of a safety cut off under fault conditions is prevented	Yes		✓	
Safety cut off independent from control system	Yes		✓	
Level switch is installed and correctly set, if required	Yes (External to heater)		✓	
Flow switch is installed and correctly set, if required	NA		N/A	
Equipment is adequately protected against corrosion, weather, vibration and other adverse factors	Yes = X in product number	IP66 SS ect	✓	
No undue accumulation of dust and dirt	No		✓	

1.2 H2 Shut Off Valve

1.2.1 Test

The test is done accordingly to the test schematics in IEC 60079-17 Tabel C.1 following descriptions of the test will be below if applicable.

1.2.2 Relevant Standard / document

- IEC 60079-17
- Datasheet "ASCO solenoid valves 210 series"
- Datasheet "ASCO Solenoid NF series"

1.2.3 Brief Test Plan

- Inspection will be done in respect to the datasheet, standards and Visual inspection prior to startup.

1.2.4 Pass/Fail criteria.

- The pass/fail criteria are specified for each inspection element is shown in Table 2.

Table 2: Hydrogen Valve Inspection – Test Result

Item	Criteria	Result	Pass/Fail	Notes
Equipment is appropriate to the EPL/Zone requirement of the location	Gc or better	Gb	✓	
Equipment group is correct	IIC	IIc	✓	
Equipment temperature class is correct	T1	T4	✓	
Degree of protection (IP grade) of the equipment is appropriate for the level of protection/group/conductivity	>IP55	IP67	✓	
Equipment circuit identification is correct	Present		✓	
Equipment circuit identification is available	Present		✓	
Enclosure, glass parts and glass-to-metal sealing gaskets and/or compounds are satisfactory	Not applicable	Not applicable	Not applicable	Not applicable
There is no damage or unauthorized modifications	None		✓	
There is no evidence of unauthorized modification	None		✓	
Bolts, cable entry devices (direct and indirect) and blanking elements are of the correct type and are complete and tight	Yes		✓	
Threaded covers on enclosures are of the correct type, are tight and secured	No threaded cover	No threaded cover	No threaded cover	No threaded cover
Joint surfaces are clean and undamaged and gaskets, if any, are satisfactory and positioned correctly	Yes		✓	
Condition of enclosure gaskets is satisfactory	Yes		✓	
There is no evidence of ingress of water or dust in the enclosure in accordance with the IP rating	No		✓	

Dimensions of flanged joint gaps are: – within the limits in accordance with the manufacturer's documentation or – within maximum values permitted by the relevant construction standard at time of installation or – within maximum values permitted by site documentation	Tightened to 85 Nm on bonded seal connection	85 Nm	✓	
Electrical connections are tight	Yes		✓	
Unused terminals are tightened	Yes		NA	
Type of cable is appropriate	Voltage and Environmental		✓	
There is no obvious damage to cables	None		✓	
Sealing of trunking, ducts, pipes and/or conduits is satisfactory	Tightness – refer to leakage test		Leakage Passed ✓	
Stopping boxes and cable boxes are correctly filled	Not applicable	Not applicable	Not applicable	Not applicable
Integrity of conduit system and interface with mixed system maintained	Not applicable	Not applicable	Not applicable	Not applicable
Earthing connections, including any supplementary earthing bonding connections are satisfactory (for example connections are tight and conductors are of sufficient cross-section)	Inspection		✓	Gnd connected inside
Fault loop impedance (TN systems) or earthing resistance (IT systems) is satisfactory	<100mOhm	<40mΩ	✓	
Automatic electrical protective devices are set correctly (auto-reset not possible)	Not present	Not present	Not present	Not present
Automatic electrical protective devices operate within permitted limits	Not present	Not present	Not present	Not present
Specific conditions of use (if applicable) are complied with	X= stainless steel	Ok	✓	

Cables not in use are correctly terminated	Pass		✓	no loose cables
Obstructions adjacent to flameproof flanged joints are in accordance with IEC 60079-14	Not present	Not present	Not present	Not present
Variable voltage/frequency installation complies with documentation	Not present	Not present	Not present	Not present
Temperature sensors function according to manufacturer's documents	Not present	Not present	Not present	Not present
Safety cut off devices function according to manufacturer's documents	Not present	Not present	Not present	Not present
The setting of the safety cut off is sealed	Not relevant	Not relevant	Not relevant	Not relevant
Reset of a heating system safety cut off possible with tool only	Not relevant	Not relevant	Not relevant	Not relevant
Auto-reset is not possible	Not relevant	Not relevant	Not relevant	Not relevant
Reset of a safety cut off under fault conditions is prevented	Not relevant	Not relevant	Not relevant	Not relevant
Safety cut off independent from control system	Not relevant	Not relevant	Not relevant	Not relevant
Level switch is installed and correctly set, if required	Not relevant	Not relevant	Not relevant	Not relevant
Flow switch is installed and correctly set, if required	Not relevant	Not relevant	Not relevant	Not relevant
Equipment is adequately protected against corrosion, weather, vibration and other adverse factors	Yes = X in product number	Yes	✓	
No undue accumulation of dust and dirt	No		✓	

1.3 Sensing elements

1.3.1 Test

The test is done accordingly to the test schematics in IEC 60079-17 Tabel C.2 following descriptions of the test will be below if applicable.

1.3.2 Relevant Standard / document

- IEC 60079-17
- Datasheet "IFM LMT01A"
- Datasheet "HUBA 520 pressure sensor"
- Datasheet "IFM TT1050-01"
- Datasheet "PR electronic 9202"
- Datasheet "PR electronic 9113"
- Datasheet "PR electronic 9106"

1.3.3 Brief Test Plan

- Inspection will be done in respect to the datasheet, standards and Visual inspection prior to startup.

1.3.4 Pass/Fail criteria.

- The pass/fail criteria are specified for each inspection element is shown in Table 3.

Table 3: Sensing Elements – Test Result

Item	Criteria	Result	Pass/Fail	Notes
Circuit and/or equipment documentation is appropriate to the EPL/zone	Gc or better	Ga + Gb	✓	
Equipment installed is that specified in the documentation	Yes		✓	
Circuit and/or equipment category and group correct	Yes		✓	
IP rating of equipment is appropriate to the Group III material present	>IP55	IP67 IP66	✓	
Equipment temperature class is correct	T1	T4, T4	✓	
Ambient temperature range of the apparatus is correct for the installation	-10°C to +25°C		✓	
Service temperature range of the apparatus is correct for the installation	0°C to 40°C		✓	
Installation is clearly labelled	Yes			needs label on PT+LT
Enclosure, glass parts and glass-to-metal sealing gaskets and/or compounds are satisfactory	Not applicable	Not applicable	Not applicable	Not applicable
Cable glands and blanking elements are the correct type, complete and tight	Yes		✓	
There are no unauthorized modifications	None		✓	
There is no evidence of unauthorized modifications	None		✓	
Diode safety barriers, galvanic isolators, relays and other energy limiting devices are of the approved type, installed in accordance with the certification requirements and securely earthed where required	Yes		✓	

Condition of enclosure gaskets is satisfactory	Yes; if applicable	N/A	✓	
Electrical connections are tight	Yes		✓	
Printed circuit boards are clean and undamaged	Yes	N/A	N/A	N/A
The maximum voltage Um of the associated apparatus is not exceeded	Yes		✓	
Cables are installed in accordance with the documentation	Yes		✓	
Cable screens are earthed in accordance with the documentation	Yes		✓	
There is no obvious damage to cables	None		✓	
Sealing of trunking, ducts, pipes and/or conduits is satisfactory	Yes		N/A	
Point-to-point connections are all correct	Yes		✓	
Earth continuity is satisfactory (e.g. connections are tight, conductors are of sufficient cross-section) for non-galvanically isolated circuits	<100mOhm	<35mΩ	✓	
Earth connections maintain the integrity of the type of protection	Yes		✓	
Intrinsically safe circuit earthing is satisfactory	Yes		✓	
Insulation resistance is satisfactory	Yes		✓	
Separation is maintained between intrinsically safe and non-intrinsically safe circuits in common distribution boxes or relay cubicles	Yes			Partly
Short-circuit protection of the power supply is in accordance with the documentation	Yes		✓	

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Specific conditions of use (if applicable) are complied with			N/A	
Cables not in use are correctly terminated	Yes		✓	
Equipment is adequately protected against corrosion, weather, vibration and other adverse factors	Yes		✓	
No undue external accumulation of dust and dirt	Yes		✓

Short Title	Storage Procedures and Winterization
Full Title	Crosswind/Baseload Power Hub Fuel Cell Package Storage Procedures and Winterization
Abstract	This document presents the options for both extremely high ambient temperatures and below freezing conditions. In both cases, if supplied with power, the FC package can both ventilate and heat the internal space. If power is not available, procedures are available for winterizing the fuel cell container. The winterization process requires some hydrogen to accomplish and to restore the fuel cell to operating conditions, Ballard personnel is required.

This document, submitted in confidence, contains proprietary information which shall not be reproduced or transferred to other documents or disclosed to others or used for manufacturing or any other purpose without prior written permission of Ballard Power Systems.

1.0 Purpose and Scope

The purpose of this document is to outline storage procedures and winterization for the Baseload Power Hub Fuel Cell Package container.

The goal for the fuel cell package container internal temperature is to stay between 5 and 40 degrees. The lower bound for the internal temperature is driven by the requirement to keep the fuel cell modules above freezing and the upper bound is the highest ambient temperature for electronics components.

The reader is expected to be familiar with the following documents:

- B01 General Arrangements
- C03 Process and Instrumentation Diagrams
- C06 Single Line Diagrams

2.0 Reference Documents

Table 1: Reference Documents

Document ID	Document Title	Revision
B01	General Arrangement	Newest
C03	Process and Instrumentation Diagram	Newest
C06	Single Line Diagram	Newest
E14	Electrical Load List	Newest

3.0 Summer Storage Options

The FC package can self-ventilate during stand still for extended periods in very hot conditions.

Under normal conditions, no action is needed but days with high ambient conditions and direct sun internal ventilation is required.

3.1 Ambient Conditions

If the ambient conditions do not exceed 35 degrees and direct sun is not expected, no action is needed.

3.2 Excessively hot days.

If ambient conditions exceed 35 degrees and periods with direct sun is expected, the container should be allowed to self-ventilate to manage internal temperatures.

To do this, the container should be connected to AUX power and be allowed to run the fans. The expected power consumption is approx. 2kW.

If it is not possible to allow AUX supply to the container, a sun-shield can also be erected as an alternative. Please confer with Ballard.

4.0 Winter Storage option overview

The FC package can be stored in several different ways:

- Fully Off
  - Everything depowered and disabled, prepared for long term storage.
- Control system active, heating disabled.
  - Control and safety system enabled.
  - Heating system disabled.
  - Fuel Cells winterized.
- Standard with Winterization
  - Control and safety system enabled.
  - Heating system enabled.
  - Fuel Cells winterized but kept above freezing by the heating system.
- Standard
  - As above, but fuel cells are not winterized.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

Each of the options are outlined with pros ands cons are outlined in the following sections.

Table 2: Storage Option Overview

System	Fully Off	Minimum	Standard with Winterization	Standard
Control System	Off	On	On	On
Safety System	Off	On	On	On
Heating	Off	Off	On	On
Fuel Cell Modules	Winterized	Winterized	Winterized	Normal

5.0 Winter Storage Methods

5.1 Fully Off

In this storage method, everything is disabled, and fuel cell modules are winterized.

This method sets the least requirements to the storage facility, but the largest pre and post storage work, including work from Ballard service technicians.

Table 3: Fully Off – Pro/Con list

Pro	Con
No requirements to storage facility	No monitoring of package condition
Can handle down to -30°C	Requires Ballard intervention to restart and recondition fuel cell modules
No power demand from AUX supply	Cannot deliver full power before reconditioning cycle is completed on modules
	No safety system active

5.2 Shipping

For shipping under known conditions or other short storage periods, the winterization can be skipped if the ambient conditions are known and guaranteed to be non-freezing.

This will save personnel hours both before and after the storage period to prepare the fuel cells for the winterization and to restore them from the winterized state after the storage.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

5.3 Minimum Power

In this storage method, the control system is powered, and fuel cell modules are winterized. The heating system for the container is disabled to minimize power usage.

This method has minor requirements to the storage facility, but still has the same pre and post storage work as the no-power solution, including work from Ballard service technicians.

Table 4: Minimum Power – Pro/Con list

Pro	Con
Control and Safety Systems active	Requires AUX Supply active
Can handle down to -30°C	Requires Ballard intervention to restart and recondition fuel cell modules
Monitoring of FC package condition	Cannot deliver full power before reconditioning cycle is completed on modules
Low power demand	

5.4 Standard with Winterization

In this storage method, the control system is powered, and the heating system is also active, thus maintaining the container at a above-freezing temperature. This will consume additional power if ambient conditions are around or below freezing.

Fuel Cell Modules are winterized to prevent damage in the cause of a prolonged power outage at the storage site if conditions are uncertain or response time to outages are expected to exceed a few hours.

This method has some requirements to the storage facility, but still has the same pre and post storage work as the no-power solution, including work from Ballard service technicians.

Table 5: Standard with Winterization – Pro/Con list

Pro	Con
Control and Safety Systems active	Requires AUX Supply active, up to 20kW
Can handle down to -20°C	Requires Ballard intervention to restart and recondition fuel cell modules
Monitoring of FC package condition	Cannot deliver full power before reconditioning cycle is completed on modules

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

No damage if loss of power occurs	Higher power demand

5.5 Standard

In this storage method, the control system is powered, and the heating system is also active, thus maintaining the container at a above-freezing temperature. This will consume additional power if ambient conditions are around or below freezing.

Fuel Cell Modules are *NOT* winterized to prevent damage and will be damaged in the cause of a prolonged power outage in freezing conditions.

Damage can be prevented if personnel can respond and restore power before the container freezes. That is estimated to take about one day, shorter on very cold days.

This method has some requirements to the storage facility, but no requirements for Ballard personnel or pre/post storage procedures.

Table 6: Standard – Pro/Con list

Pro	Con
Control and Safety Systems active	Requires AUX Supply active up to 20kW
Can handle down to -20°C	Higher power demand
Monitoring of FC package condition	
Ready for operation with no special actions	

6.0 Procedure for Winterization of FC Module

The procedure for winterizing a FCwave module is known internally as a dry-out of the module.

The procedure for doing the winterization is described in this section, split into what is required for the entire FC package and what is needed for the FC module.

6.1 Fuel Cell Preparation

The fuel cell module requires the surrounding support systems to be active, as described in the following section.

The fuel cell module itself has control interfaces capable of starting the winterization process.

This is accomplished by starting the fuel cell module without load applied and sending a command signal to start the sequence. This then causes the fuel cell to disconnect its DC bus and use internal power to displace water out of the fuel cell membrane by a hot, dry operation regime.

Prior to installation or if needed, a Ballard service technician can use portable equipment to start the fuel cell and perform the winterization without the primary AC connection or DC link active.

When it is desired to operate the fuel cell as normal again, a reconditioning is needed to achieve full performance.

6.2 Requirements – Standard Installation

The FC package requires several interfaces to be active to perform the winterization:

- MV Link must be active and capable of providing <10kW of power for the following systems:
  - MV Transformer Energization
  - Electronics cooling
  - Process cooling (at idle)
  - Startup power for the fuel cell module
- Alternatively, a Ballard service person has portable equipment which allows the fuel cell to start.
- Gas supply must be able to provide H2 for the winterization process.
  - Typically, <200g H2 pr module.
- Liquid drain must handle displaced water.
  - Typically, <200mL pr module

The process takes about 5-7 minutes pr module and can be done in parallel.

6.3 Requirements – Ballard Service Technician Onsite

If the standard installation is not available or not yet commissioned, a Ballard service technician can accomplish the winterization with portable equipment:

- An on-site 400V 3phase power must be available for the service technician to use.
- If the hydrogen installation is not ready, a portable gas bottle (50L) can provide enough hydrogen to perform dryout for an installation of 6 modules.
- Liquid water can be drained or collected in a bucket and disposed of.

- Typically, <200mL pr module

The process takes about 10-15 minutes pr module.

6.4 Procedure – Standard Installation

Using the operator interface for the FC package, perform the following steps.

1. Coordinate with BLPH to enable DC link.
2. Enable 24V to all modules that needs dryout.
3. Start DC Link
4. For each module, start module with 0kW setpoint.
    a. When running, within 10 seconds of reaching “Running”, send “Dryout” command bit.
5. Allow module to perform dryout sequence. It will take approximately 2 minutes pr module.
6. Multiple modules can perform dryout sequence simultaneously.
7. Disable DC link.
8. Depower modules.

6.5 Module Restart

Refer to service manual for FCwave modules.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

7.0 Periodic Visual Inspection

When the FC package is stored for extended periods without operation, periodic visual inspection is desired.

The purpose of the inspection is to confirm the condition of the container and to spot any issues before they develop into more severe problems.

7.1 Interval

The package should be inspected at least every 14 days (every other week) and after each significant weather event (storm, blizzard, etc).

7.2 Tools

The person inspecting the package shall wear all relevant PPE, as stated on the warning placards and local HSSE requirements.

The person should bring the following tools:

- Flashlight or inspection light
- Camera or other device to document issues
- Container access keys
- Electrical cabinet keys

7.3 External Inspection

The person should walk around the package, inspecting the following items:

- Accumulation of dust and grime
    - Any build up of dust and grime
    - Particularly around air intakes and access doors, should be removed.
- Signs of coolant spillage
    - Coolant contains blue dye, spillage will lead to blue discoloration or stains
    - Inspections sites include:
        - Primary coolant connection between 40ft container and coolant skid
        - Hydrogen heater tank
- Cables and cable trays
    - Any cables not firmly seated in cable tray or other mechanical fasteners.
- Intake and outlet louvres
    - Both on 40ft and 10ft container
    - Should be firmly closed, with no visible openings.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

7.4 Internal Inspection – 40ft Container

The person should open the door to the 40ft container and step inside, while minimizing dust and dirt into the container.

- Liquid spills
  - Inside on the container door, below false floor
  - LT coolant rack
  - HT coolant entry point (below ventilation intake fans)
- Cable inspection
  - Cable visual inspection for damage and disturbance
- Dust
  - Vacuum any dust or debris from inside container.
  - DO NOT use compressed air to shift dust around.
- Fuel Cell Module Inspection
  - Using electrical cabinet key, open FCwave front panel
  - Using inspection light, inspect bottom of cabinet for dust or liquid spill.

7.5 Internal Inspection – 10ft container

Internal inspection for dust and liquid.

1. Inside control panel access door, press the emergency stop.
2. Open container end door, and without stepping inside the container, inspect the floor for liquids and debris.
3. Close container door, reset emergency stop circuit.

THIS DOCUMENT IS VALID ONLY AT TIME OF PRINTING.
ANY COPIES MADE ARE CONSIDERED UNCONTROLLED UNLESS STAMPED OTHERWISE IN RED.

1.0 Disclaimer

NOTE: READ THIS BEFORE ATTEMPTING ANY PROCEDURES DESCRIBED IN THIS MANUAL

There are inherent risks in the operation of a fuel cell module that can result in death or bodily injury or loss or damage to property. It is therefore necessary for the customer to take all prudent safety precautions in the installation, use, and maintenance of this device. Persons who install, operate, and service the device are required to be technically qualified and experienced in working with electrical equipment, compressed gases, and H2.

This manual includes certain safety guidelines and recommendations; however, this manual is not intended to cover all situations. The customer is responsible for determining the suitability of the customer's particular design or application, and for ensuring the safe operation, maintenance, and storage of the device and any systems into which it is integrated. Ballard Power Systems Europe A/S ("BPSE") cannot be responsible for the use of the device in ways, or as part of systems, that deviate from the operating recommendations in the manual. The customer is responsible for being aware of, and complying with, all applicable laws and regulations. BPSE has limited its liability for damages incurred by the customer or its personnel in the contract documents pursuant to which the device is provided to the customer. Please refer to those documents for additional information.

Procedures described in any part of the manual can only be attempted once the customer has read this entire manual. Failure to follow any instruction or recommendation could result in death or bodily injury or loss or damage to property.

BPSE intends for the device to be installed, operated, and serviced only by approved technically qualified and experienced people who understand the principles of fuel cell technology, are aware of the safe operating limits of fuel cells, and are familiar with the risks posed by operating a fuel cell module. BPSE relies on customers to use their own knowledge and experience when installing, operating, and servicing the device. BPSE also relies on the people using this manual to be familiar with common terms and abbreviations used in the manual.

Information in this manual is subject to change without notice. BPSE makes no commitment to update or keep current the information in this manual and reserves the right to make updates or other changes to this manual and/or to the products described in this manual, at any time without notice. Updates and other changes to the manual may be posted on the BPSE website and may be accessed through the customer portal; it is the customer's responsibility to check for any such updates or changes.

2.0 Manual Introduction

2.1 Purpose and scope

This manual provides information regarding land-based transportation and handling of the 3 major components of the solution. It is intended to be used for transportation from the manufacturer to the area of designated placement, where the system will be permanently installed.

As an addition, anchoring of the components has been included.

For details regarding special transportation methods, se referrals.

2.2 Intended audience

The intended user of this manual is personnel qualified in the preparation of and execution of transportation and handling of freight, e.g. shipping and/or crane personnel.

As an addition, information regarding anchoring of the system onto the platform is provided for the integrator.

Before commencing transportation and handling of this solution, manual users must read and apply this Transportation and handling Manual

2.3 Manual series

The Manual Series provides manuals covering different life-phases of the system, as defined in Table 2-1:

Table 2-1: Manual series contents

Document no.	Title	Brief purpose description	Intended user(s)
7003672	Transportation and Handling Manual	As described in section 2.1	As described in section 2.2
7003718	Integration Manual	Enables integrators to design designated site and subsystems required within the intended use and limits of the system.	Integrators partaking in designing the designated site and subsystems, and commissioning.
7003717	Operator Manual	Provides information to personnel for safe operation of the solution, instructions for operator-based maintenance, safety rules and recommendations	Operators, Integrators, Installers, Service and Maintenance personnel, personnel working in or near the system, and persons instructing visitors.
7003719	Service and Maintenance Manual	Provide information regarding Service and Maintenance schedules and related safety.	Service and Maintenance personnel.

Ballard Power Systems Europe may update the provided manuals on an ongoing basis.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

2.5 Readers Guide

Prior to engaging in work covered by the manual, the manual user must read and apply this section.

2.5.1 Safety Indications

Throughout the manuals, hazard symbols are used to indicate objectives, hazards or prohibitions the manual user must be aware of.

Table 2-3: Hazard symbols	
	**MANDATORY ACTIONS**: are marked with blue action-points. This indicates actions that must be performed. Ignoring may result in an accident, which could cause damage to equipment or other property, and could cause bodily injury if not promptly detected and remedied.
	**PROHIBITIONS**: are marked with red prohibition-signs. This indicates a forbidden action. Ignoring may result in immediate bodily injury, loss of life, or could cause damage to equipment or other property
	**WARNINGS**: are marked with yellow triangles and/or square warning. Indicates hazards that may result in an accident, which could cause immediate bodily injury or loss of life or could cause damage equipment or other property.
	**CAUTION** in this manual indicates actions that may result in an accident, which could cause damage to equipment or other property, and which could cause bodily injury if not promptly detected and remedied.
	**ELECRICAL HAZARD** Obey ALL warnings, cautions, and safety instruction related to electricity. Failure to do so may result in electrical shock leading to personal injury or death.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

3.0 Safety

Please take notice and read this section very carefully prior to transport and handling of the system.

It is the responsibility of the operator to read and understand this transport and handling manual and other information provided, and to use the correct operating procedures.

The product should only be operated by qualified (trained) personnel. Failure to do so can result in personal injury or equipment damage.

This section contains general safety-related information. It describes the potential hazards and associated warnings for the system and the precautions that must be taken to minimize these hazards.

Figure 1: General safety precautions

Manual users must adhere to safety precautions

3.1 Batteries

The system houses 24VDC (2x12v in series) lead battery modules. This requires tools to access.

Prior to transport and handling: Check that 24VDC UPS batteries are securely fastened and remove the fuses on the module connection boards.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.
Ballard Power Systems Europe A/S

+45 8843 5500
ballard.com
Specifications and descriptions in this document were in effect at the time of publication. Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

3.2 Coolant

The Coolers may hold a small quantity, less than 100l, of Proviflow® Neo coolant in the HT and LT cooling circuit.

Each FCwave™ in the container contains Glysantin® FC G20.

Refer to Material Safety Data Sheets for details.

General rules are:

- Avoid contact with eyes and skin.
- Use protective gloves and tightly sealed googles.
- Avoid ingestion and inhalation of vapors.
- Spillage – do not allow to enter sewers/surface or ground water, absorb with a liquid–binding material, dilute with water.
- Disposal must be made according to official regulations.

3.3 Component displacements

The MV transformer is a heavy component that resides inside the 10ft container.

Fixation must be supplemented with applicable tools i.e. straps, prior to transport and handling.

After transportation and handling, the following visual inspection must be performed:

- Open the container door to access the transformer compartment.
- Visually inspect that the transformer has not been displaced, so that it does not fall over a person when opening the door container doors.

3.4 Lifting equipment

Personnel lifting the component(s) must adhere to local rules and legislation regarding the applicable lifting equipment. Improper use of equipment could result in severe injury.

3.5 Placing of components

The components must always be supported in such a way that the structural integrity of both the component and the underlying surface or structure is not damaged.

It is recommended to use applicable grillage or plating to evenly distribute the weight on surfaces (e.g. soft surfaces)

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

4.0 Anchoring/assembly on designated site

Order of procedure for placing on designated site:

1. 40ft Fuel cell container placed and anchored as described in section 5.4.
2. Cooling Platform placed and anchored onto 40ft fuel cell container as described in section 6.4.
3. 10ft Container placed and anchored as described in section 7.4.

Transporting the system with the Cooling Platform mounted on top of the container is prohibited.

Notice that when the Cooling Platform is anchored to the Fuel Cell Container the structure is 6,11m in heigh. Windy conditions will create high tension forces in the anchoring points of the Fuel Cell Container – refer to "Structural calculations - Reactions from 40ft container and flatbed with coolers on sea type barge"

5.0 Fuel Cell Container

5.1 Technical Data

Table 5-1: Key figures for 40ft Fuel Cell Container	
Container type	Modified 40ft High Cube ISO Container
Dimensions (l/w/h)	12.2/2.5/2.9 m
Weight (dry)	21680 kg

Refer to General Arrangement for CoG or attached document.

5.2 Packaging

The Fuel Cell Container needs proper packaging, and this is the responsibility of Ballard.

The LT and HT cooling circuits shall be drained from coolant to the extent possible prior to transportation and handling

5.2.1 Loose parts

Components may be shipped as loose parts inside the container if they are secured against sliding or other unintended movement, which could damage the container or component.

Loose parts may include:

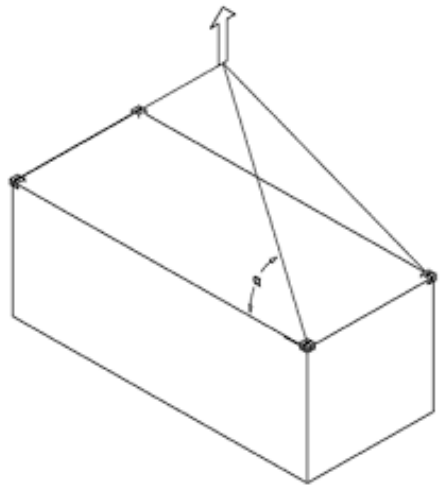
- Exhaust chimney
- Ventilation chimney
- Cooler pipes wall passthrough and piping, dried from coolant

5.2.2 Preparation for transport

Preparing the Fuel Cell container for transportation from manufacturer site is a Ballard responsibility.

The following must be completed:

- If risk of frost, the FCwave must have a dry-out procedure performed prior to shipment
- Disassembly and packaging of chimneys
  Open pipes must be covered by a protective plug/cover.
- Disassembly and packaging of cooling pipes
  Open pipes must be covered by a protective plug/cover.
- Disassembly and packaging of H2 heater
  Open pipes must be covered by a protective plug/cover.
- All wall passthroughs must be covered to ensure no ingress
- Check that all floor plates are securely fastened.
- Check that air intake and exhausts are closed.
- Check that 24VDC UPS batteries er securely fastened, and that voltage is disconnected.



This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.
Ballard Power Systems Europe A/S
Majsmarken 1
DK-9500 Hobro
contact@ballardeurope.com

- Check that all cabinets are securely locked.
- Check that access doors and container doors are securely locked against unauthorized access.
- Check that loose parts placed inside the container is fixated.
- Wrap the container if needed, to prevent dust and dirt from entering the container during transport.

5.3 Handling and Transportation

The Fuel Cell Container can be transported and craned using ordinary truck and craning equipment, suitable for handling an ISO container as per ISO 3874. It is the responsibility of the handler to read and decide the applicable method.

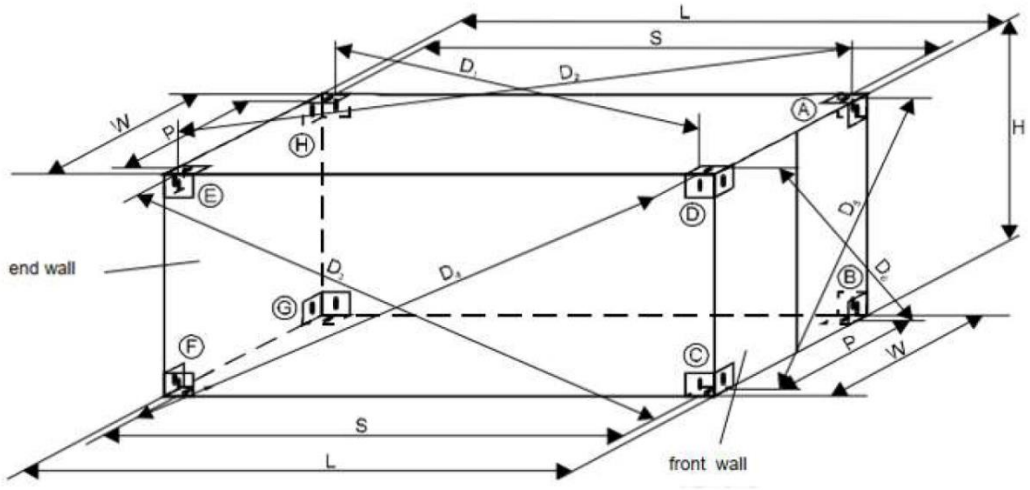
Figure 2: 40ft Container lifting example

Recommended lifting method, since the bottom corners might need to meet anchor points of the designated site.

The driver must make sure that the container is adequately secured on the truck for transport.

Standard safety procedures, approved tools and Personal Protective Equipment must be used. Ballard will inform the crane operator of any additional on-site regulations that must be adhered to.

Craning must always be supervised by Ballard responsible, however this does not remove the responsibility for the crane operator to ensure that the craning and crane equipment in use is done safely, and it does not remove the responsibility for damages incurred during craning from the operator.



5.4 Anchoring on designated site

To anchor the Fuel Cell Container on the designated site, integrator must use the standard ISO corners of the container.

Integrators of the system are recommended to anchor the container onto the designated site with ground-plate twist-locks. If anchoring is done using the bottom-side of the ISO corners (B, C, F, G in Figure 3), e.g. ground-plate twist-locks, verify the corner-distances of the containers prior to design of site.

6.0 Cooling Platform

6.1 Technical Data

The Cooling Platform has standard ISO 1161 corners for anchoring during transportation and for final assembly onto the 40ft Fuel Cell Container.

Table 6-1: Key figures of Cooling Platform	
Dimensions (l/w/h)	12.2/2.5/2.5 m
Flat Support Plate location (Figure 5)	From left to middle: 6232 mm From right to middle: 5960 mm
Weight (dry)	10060 kg

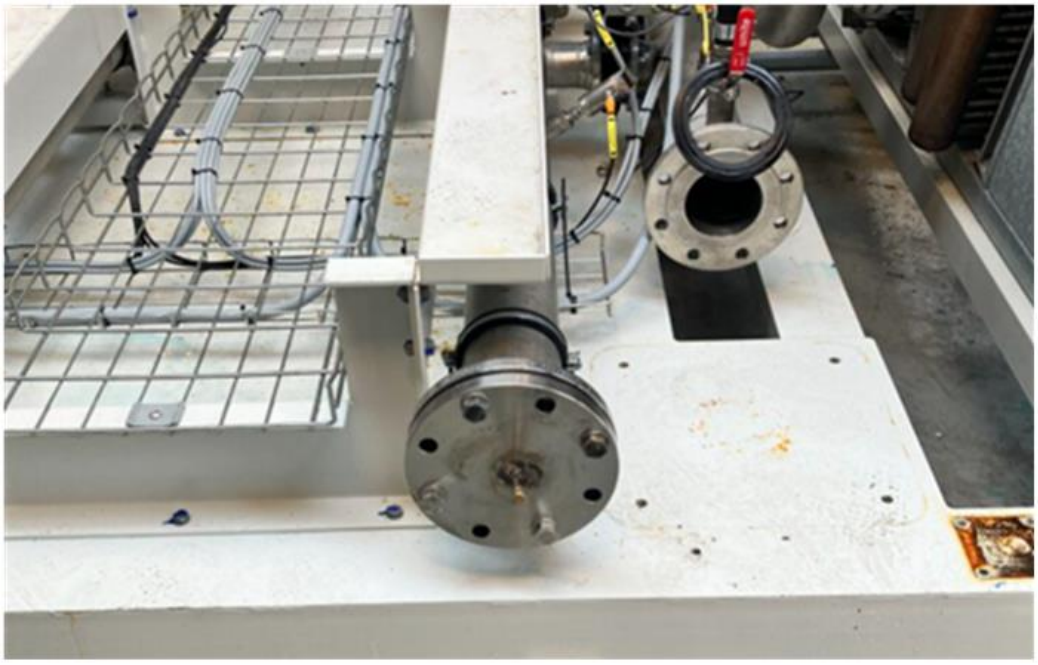
Refer to General Arrangement for CoG or attached document.

6.2 Packaging

The Cooling Platform needs packaging, and this is the responsibility of Ballard.

The coolant circuit(s) must be drained of coolant to the extend possible before transportation and handling.

6.2.1 Preparation for transport



Do not strap any loose parts onto the platform for shipping. Loose parts should be shipped separately.

The following must be completed:

- Conduct visual inspection and document the condition of the cooler fins before and after transportation.
- Disassembly and packaging of exhaust frame
- Disassembly and packaging of cooling pipes
  Open pipes must be covered by a protective flange cover.
- Check that all floor plates are securely fastened.
- Check that 24VDC UPS batteries in Cooling control cabinet is securely fastened, and that voltage is disconnected.
- Check that the cabinet is securely locked.
- Wrap the platforms to protect it from dust and dirt.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Figure 4: Prepared for shipment

Indicative picture of piping covered prior to transportation

6.2.2 Coolers fixation

The coolers must be fitted with supplementary fixation to the platform for transportation. This ensures that they do not move under de- and acceleration.

It is recommended to use straps and edge protectors.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

Ballard Power Systems, Inc. reserves the right to change specifications, product appearance or to discontinue products at any time. Ballard®, Powered by Ballard®, FCgen®, FCgen-XD™, FCveloCity®, FCmove™, FCwave™ and Here for life™ are trademarks of Ballard Power Systems Inc.

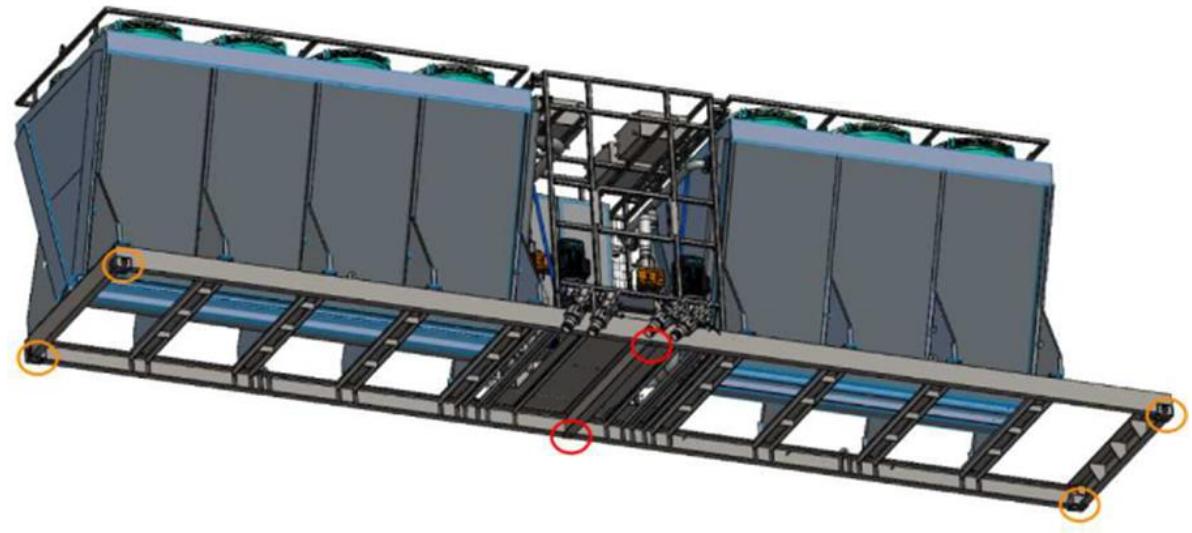
6.3 Handling and Transport

The Cooling Platform must be maneuvered, craned/lifted, and transported according to the information below. Special consideration is to be taken to protect the platform frame from deformation.

Standard safety procedures, approved tools and Personal Protective Equipment must be used. Ballard will inform the crane operator of any additional on-site regulations that must be adhered to.

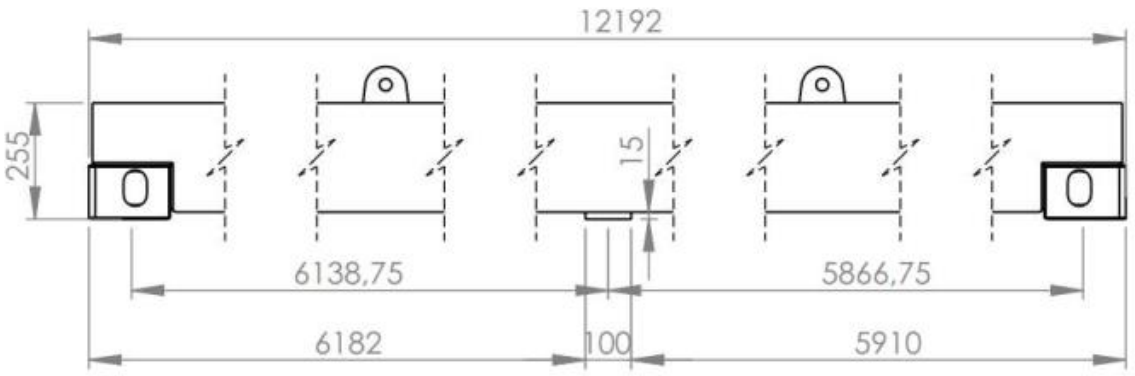
Craning/lifting must always be supervised by Ballard responsible, however this does not remove the responsibility for the crane operator to ensure that the craning and crane equipment in use is done safely, and it does not remove the responsibility for damages incurred during craning from the operator.

More details on the structure can be found in 40ft Flatbed - calculations report.



6.3.1 Support

When the Cooling Platform carries its own weight, it must be supported at the 6 points indicated in Figure 5.



The Cooling Skid must always be supported vertically at the ends and at the Flat Support Plates.

(Figure 5– Orange, ISO Corners. Red, middle Flat Support Plates).

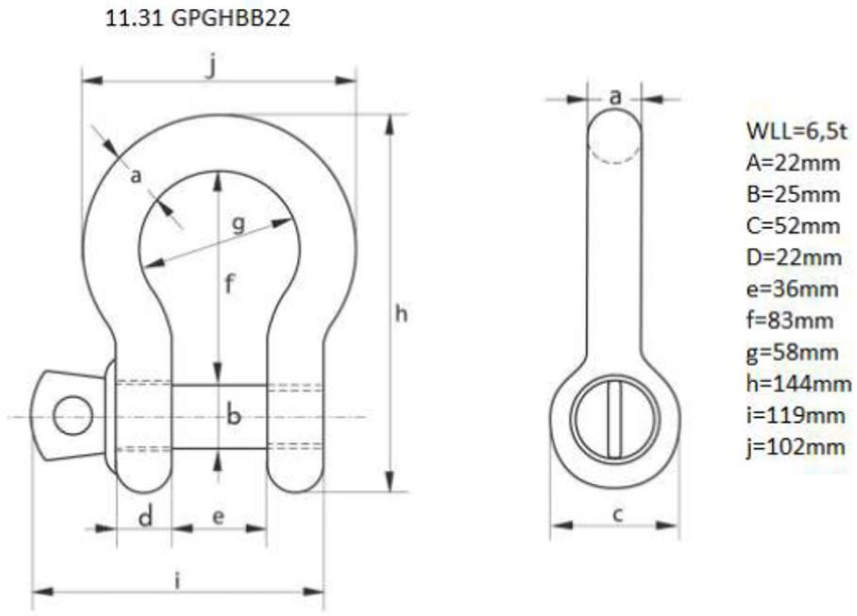
Support points of the Cooler skid, consisting of standard ISO container corners, and flat plates near the middle. Measurements in mm.

6.3.2 On-ground maneuvering

Maneuvering the platform on ground is possible with the use of Dolley's, Machine Skates, or rollers.

Placement of these must be under the designated lifting-points, as indicated in Figure 6.

Figure 6: Platform support points for on-ground maneuvering



The platform may be supported directly below the 4 lifting points during storage or for maneuvering on Dolley’s, machine skates, or rollers.

This Document is valid only at time of Printing.

6.3.3 Craning/Lifting

	**Using any other method of lifting than described in the following is prohibited.**
	**Do not use the standard ISO corners as lifting points, as the platform frame may deform.**
	**The center of gravity is displaced from the center of the platform. See section 6.1.**
	**It is recommend to use of bow shackle in the provided lifting points, Approved for minimum 6T, maximum pin diameter 25,4 mm**

6.3.4 Transportation method

Transportation of the Cooling Platform is recommended to be done with a semi-trailer for standard ISO containers, enabling fixation with the use of the standard ISO 1161 corners.

The driver must make sure that the platform is adequately secured for transport.

	**Transporting the platform mounted on top of an applicable Fuel Cell Container is prohibited.**
	**During transport, the Cooling platform must always be supported as described in section 6.3.1.**
	**The semitrailer needs locks for ISO corners for anchoring and appropriate middle support.** **Or** **Applicable fixations points and appropriate middle support.**

6.4 Anchoring/assembly on designated site

The Cooling skid is to be permanently mounted onto the 40ft Fuel Cell container.

Tools needed:

4x Twist-lock.

1. The 40ft Fuel Cell container needs to be placed and anchored to the designated site, prior to mounting of the Cooling skid.
2. Place the 4 twist-lock in the container corners
3. Lift and handle the cooling skid as described in this manual.
4. Line-up the twist-lock-applied container corners with the corners of the Cooling skid and lower the cooling skid onto the twist-locks.
5. Lock all 4 twist locks

7.0 Grid Interface Container

7.1 Technical Data

Table 7-1: Key figures of Grid Interface Container	
Container type	Modified 10ft High Cube ISO Container
Dimensions (l/w/h)	3.0/2.5/2.9 m
Weight (dry)	7350 kg

Refer to General Arrangement CoG or attached document.

7.2 Packaging

The Grid Interface Container needs proper packaging, and this is the responsibility of Ballard when transporting from manufacturer.

The cooling circuits shall be drained from coolant to the extent possible prior to transportation and handling

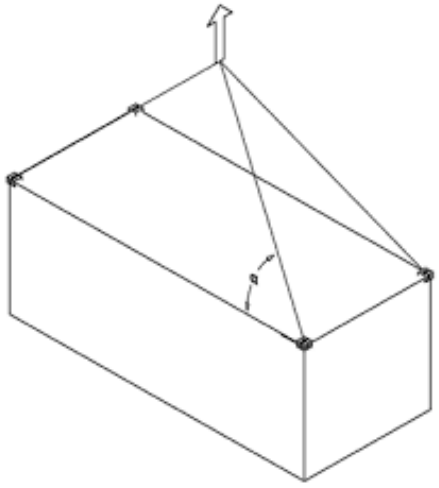
7.2.1 Loose parts

No loose parts may be placed or temporarily fixated in the container for transport.

7.2.2 Preparation for transport

Preparing the Grid Interface Container for transportation is a Ballard responsibility.

The following must be completed:



- Disassembly and packaging of cooling pipes.
  Open pipes must be covered by a protective plug/cover.
- All wall passthroughs must be covered to ensure no ingress
- Check that air intake and exhaust are closed.
- Check that 24VDC UPS batteries are securely fastened
- Ensure that the State of Charge on the UPS is <30%.
- Isolate the UPS batteries by noting the placement of fuses and remove them
- Fixated the MV transformer with the transportation spacer (Item 7003674-04).
- Check that all cabinets are securely locked.
- Check that access doors and container doors are securely locked against unauthorized access.
- Wrap the container if needed, to prevent dust and dirt from entering the container during transport.

This Document is valid only at time of Printing.
Any Copies made are considered uncontrolled unless stamped otherwise in red.

7.3 Handling and Transport

The Grid Interface Container can be transported and craned using ordinary truck and craning equipment, suitable for handling an ISO container as per ISO 3874. It is the responsibility of the handler to read and decide the applicable method.

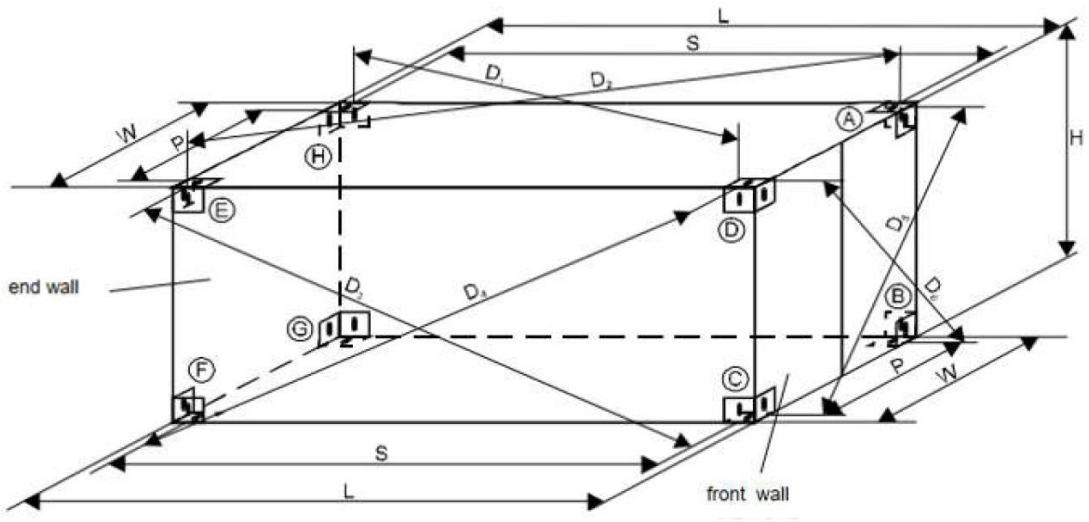
Figure 11: 40ft Container lifting example

Recommended lifting method, since the bottom corners might need to meet anchor points of the designated site.

The driver must make sure that the container is adequately secured on the truck for transport.

Standard safety procedures, approved tools and Personal Protective Equipment must be used. Ballard will inform the crane operator of any additional on-site regulations that must be adhered to.

Craning must always be supervised by Ballard responsible, however this does not remove the responsibility for the crane operator to ensure that the craning and crane equipment in use is done safely, and it does not remove the responsibility for damages incurred during craning from the operator.



7.4 Anchoring on designated site

To anchor the Grid Interface Container on the designated site, integrator must use the standard ISO corners of the container.

Integrators of the system are recommended to anchor the container onto the designated site with ground-plate twist-locks. If anchoring is done using the bottom-side of the ISO corners (B, C, F, G in Figure 12), e.g. ground-plate twist-locks, verify the corner-distances of the containers prior to design of site.

Preservation of the FCwave module:

Dry Out

When all Sat tests are completed, and it is agreed no more operation of the modules will take place the System is requested to run the Dry out program.

The Purpose of running Dry Out is to remove liquid water from the module, such that stacks are in a “dry” condition after completing this procedure. This is intended to be the final part of the last operations cycle before long time storage or transport of the module, where temperatures may reach freezing conditions.

The request to start Dry Our is communicated via MODBUS.

When requested to start Dry Out, the module ramps I_Allow to 0A. This will prevent the module from delivering current. When current is reduced to < 5A the module begins the dry out process.

Internally in the system the module will ramp up temperature and airflow to accomplish the dry out process. During this state the air compressors are operating at high power level.

When the module has completed the dry out process or 6 min has elapsed, the module will perform a controlled shutdown process, identical to normal operation shutdown. After the shutdown, the module is prepared for long time storage, for 6 month or longer.

<u>Restarting after Dry Out and Long Time Storage:</u>

When the module is to be operated again after long time storage/Dry Out procedure, integrator must operate the module in a low power regime (50 to 75kW) for at least 20 minutes before increasing power. This allows the stack to return to proper humidification conditions.

Expect that performance is impacted until stacks are re-humidified. This is temporary and can be helped by performing a conditioning cycle – contact Ballard for details.

The procedure is described in the Integration Manual for the FCwave modules.

Drainage of internal HT cooling water in the FCwave module:

Drainage of glycol within the closed HT cooling loop circuits of the FCwave modules is not recommended / required according to Ballard. However, it is for the integrator to decide if draining of the HT system is required.

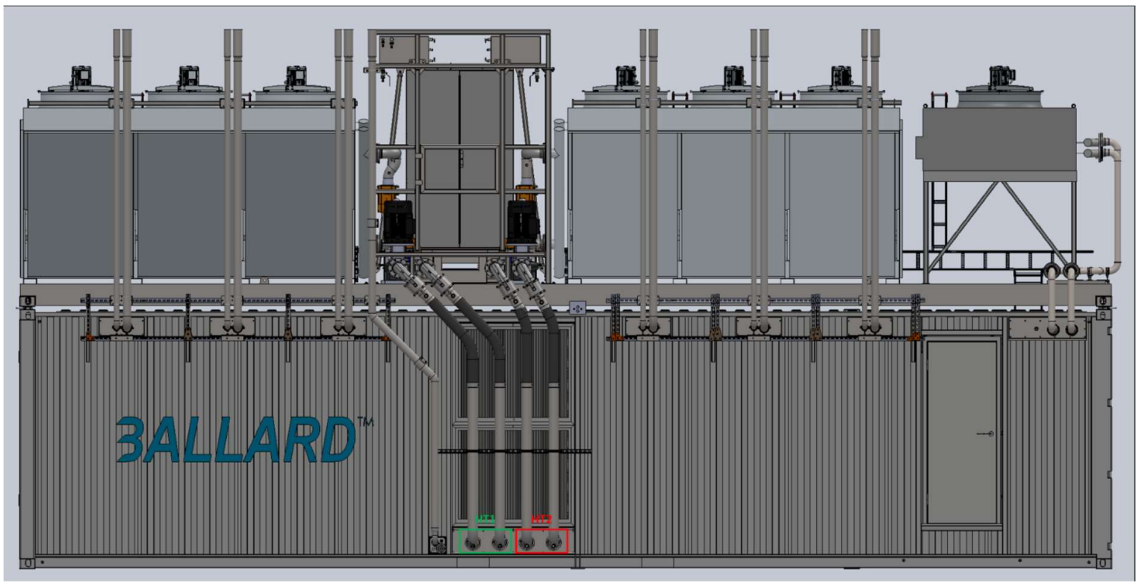
The internal HT cooling loop can be filled and drained by a connection installed in the base of each Fcwave module. An external pump is connected and used for filling as well as draining. Connecting point shown in drawing below.

Each FCwave module contains 45 litre of cooling liquid.

Draining of external cooling systems.

The draining of both external HT and LT cooling system will be performed by Ballard.

Small quantities of cooling located at low points in the HT and LT external cooling system is considered as insignificant.



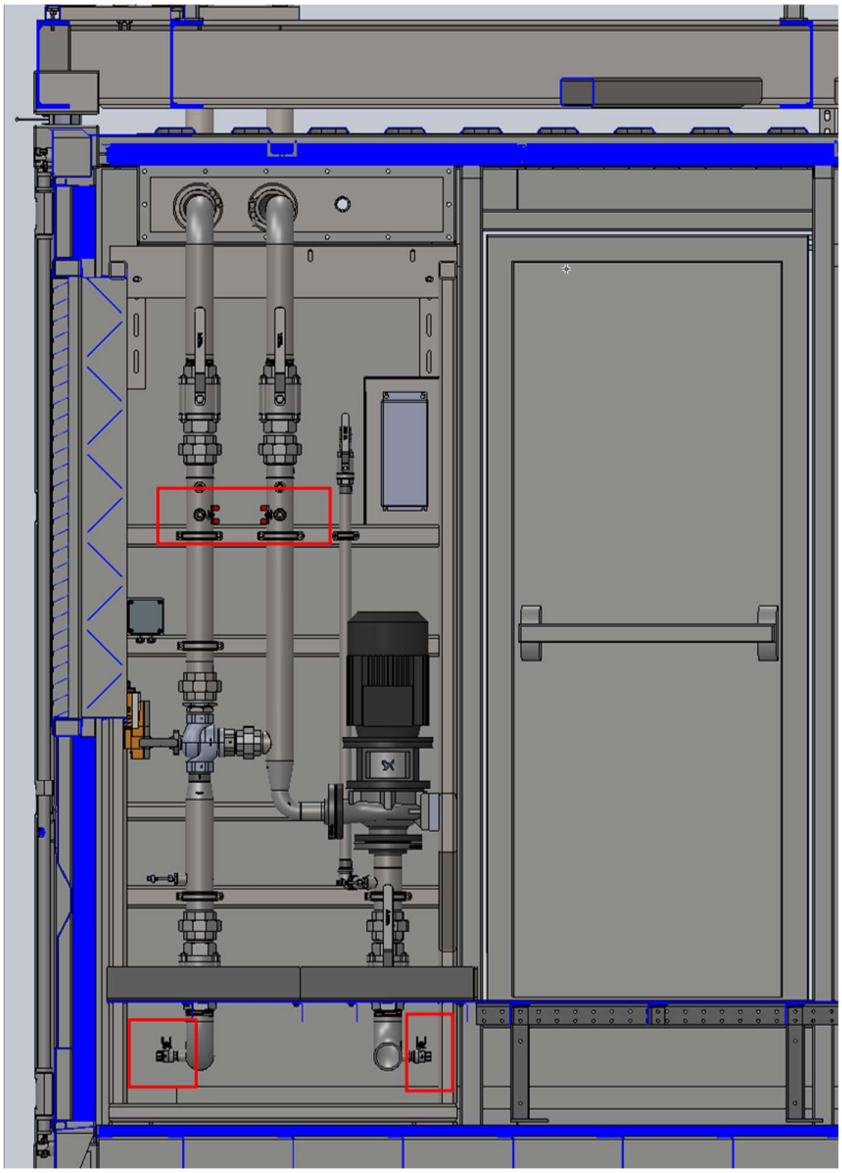
External HT cooling Loop

The HT cooling loop is divided into two loops. When the cooling media is drained of the HT system each loop must be drained.

Connect a hose to the interface at the filling/drain valve. Each system is equipped with two valves. (only one valve to be connected and opened)

Have a tank of sufficient size connected to collect the cooling water. Each HT loop contains 700 litre of cooling liquid.

The HT cooling loop is an open system as the expansion-/header tank is equipped with venting to atmosphere. The system is drained by gravity.



External LT cooling loop

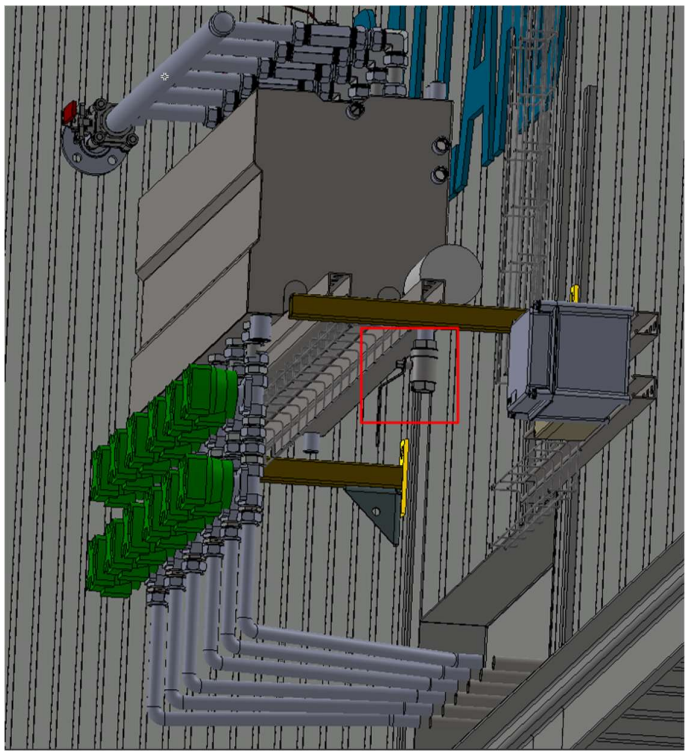
The LT cooling system is a single system. The drain valve is located inside the container.

Connect a hose to the interface at the filling/drain valve. As the system is equipped with 4 valves it is possible to choose which valve to use. (only one valve to be connected and opened)

Have a tank of sufficient size connected to collect the cooling water. The LT cooling loop contains 400 litre of cooling liquid.

The LT cooling loop is an open system as the expansion-/header tank is equipped with venting to atmosphere. The system is drained by gravity.

When the BLPH is at location and before system is taken into operation the system must be filled again. Air trapped in the system must be vented out.



Draining of H2 manifold heater.

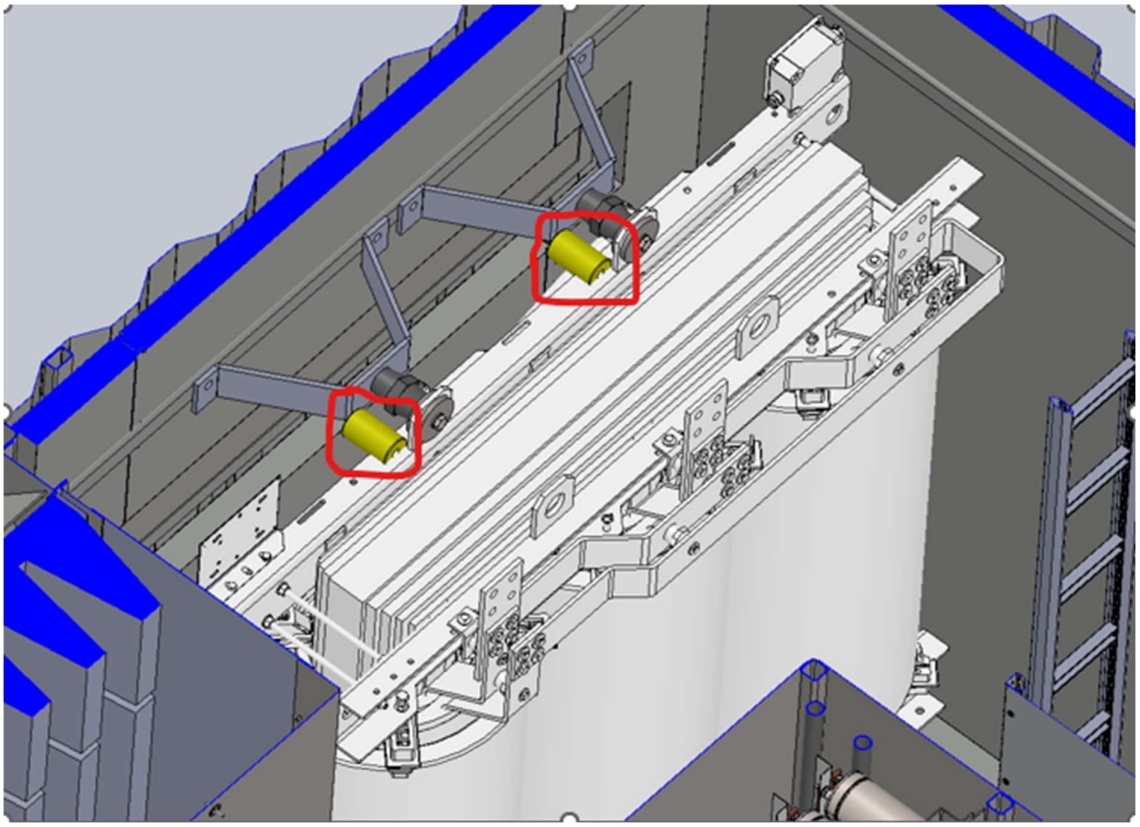
The H2 heater is filled with water/glycol. This system must also be drained before Sea Trail. It is an independent closed system.

Connect a hose to the interface at the filling/drain valve.

Have a tank of sufficient size connected to collect the cooling water. The H2 heater contains 200 litre of cooling liquid.

The H2 heater tank is equipped with venting to atmosphere. The system is drained by gravity.

When the BLPH is at location and before system is taken into operation the system must be filled again. Air trapped in the system must be vented out.



Preservation of container(s)

No other preservation actions are needed for the fuel cell package.

Sea Fastening

Preparation of transformer for sea trail.

Two Transport Brackets must be installed to ensure transformer is ready for the Sea trail. Ballard will deliver the brackets (Identification -brackets are painted yellow). Brackets will be delivered to Site by Ballard.

When the BLPH is at location and system is taken into operation the Transport Brackets must be replaced again with support brackets.

Sea fastening of external coolers.

Equipment outside the container must be secured for the Sea Trail. This will require additional support/straps that will be strapped to the container itself. Straps and other material will be delivered by Yard. The installation of the sea fastening straps will be performed by Ballard.

When the BLPH is at location and system is taken into operation the support and straps must be removed.

Sea Fastening of H2 manifold heater

The H2 manifold heated must be prepared for the Sea Train by building some wooden support or other support for mitigation of damage to installation and piping. Will be installed by Ballard just after completion of SAT. Materials will be delivered by the Yard.

When the BLPH is at location and system is taken into operation the wooden support must be removed.

Sea fastening of container doors.

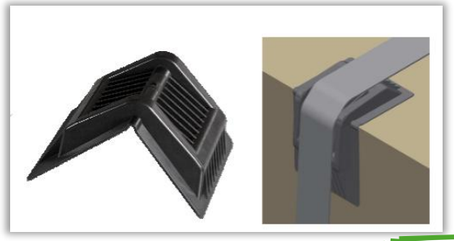
All external doors to containers must be strapped to prevent unintended opening during the Sea Trail. Materials will be delivered by Yard. The installation of the sea fastening straps will be performed by Ballard.

Specification for materials for Sea Fastening

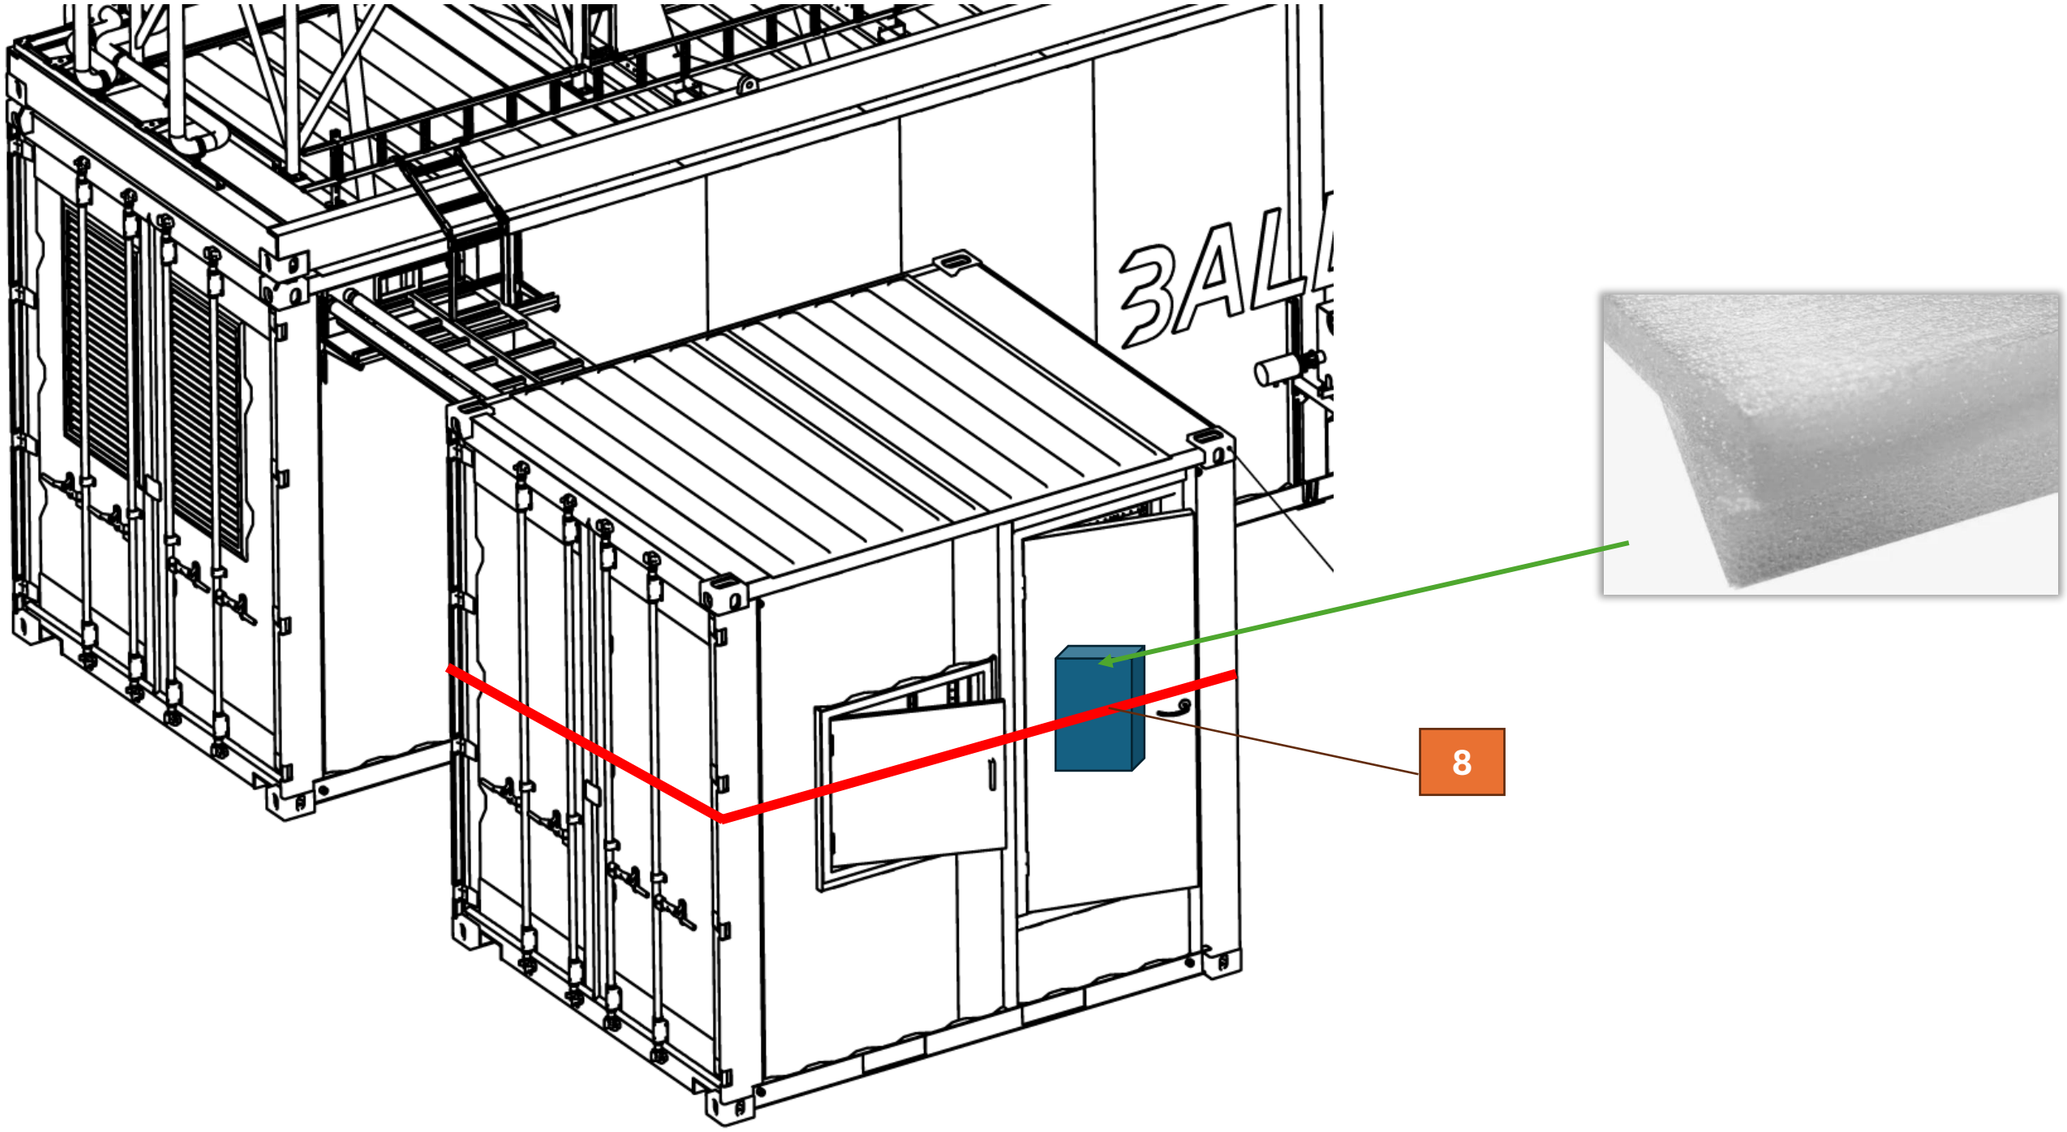
A sketch for the sea fastening straps is attached to this document with reference to each strap.

In total 8 are required for Sea fastening. Straps are listed below:

Pos No	Specification
1	Standard 50 mm lash, x 6-10 meter
2	Standard 50 mm lash, x 6-10 meter
3	Standard 50 mm lash, x 6-10 meter
4	Standard 50 mm lash, x 6-10 meter
5	Standard 50 mm lash, x 15 meter
6	Standard 50 mm lash, x 5 meter
7	Standard 50 mm lash, x 5 meter
8	Standard 50 mm lash, x 15 meter



Furthermore 4 protection corners are needed for protection of the cooler metal frame



Finally, 3 pieces of structural foam blocks for support at doors. Foam blocks must be at least 200 mm thick

Sea Transport

Provided the preservation and sea fastening steps outlined above have been completed, no further precautions must be taken during the sea transport. No need for temperature or moisture control in the containers or record keeping.
