# 1 SCOPE OF SUPPLY (BOM)

## 1.1 GIS bay HNA6-AFA70 [Qty: 1]

composed of the following 3-phase encapsulated modules :

1 : Circuit breaker for 3 phases

2 : Combined disconnector & earthing switch for 3 phases

1 : Low power instrument transformer for 3 phase [LPIT type]

1 : Low power instrument transformer for 3 phase [LPVT type]

2 : Cable connection part including F-Bushing and Voltage Detecting Sensor

## 1.2 Local control panel CP-100E1 [Qty: 1]

# 2 TECHNICAL DATA

## 2.1 Environment

| | |
|---|---|
| - Installation | : Indoor |
| - Altitude | : ≤ 1000 above sea level |
| - Ambient temperature | : -5 ℃ ~ 40 ℃ (Indoor) |

## 2.2 Complete GIS Module

| | |
|---|---|
| - Type designation | : HSGE-074B |
| - System voltage | : 66 kV |
| - Rated voltage | : 72.5 kV |
| - Number of phases | : 3Φ |
| - Earth system | : Ungrounded |
| - Rated frequency | : 50 Hz |
| - Rated continuous current | |
| • Feeder | : 1250 A |
| - Rated short-time withstand current | : 31.5 kA rms |
| - Rated peak withstand current | : 78.75 kA peak |
| - Rated duration of short-circuit | : 1 sec |
| - Rated short-duration power-frequency withstand voltage (1 min) | |
| • Phase-to-earth, across open switching device and between phases | : 140 kV rms |
| • Across isolating distance | : 160 kV rms |
| - Rated lightning impulse withstand voltage (1.2/50μs) | |
| • Phase-to-earth, across open switching device and between phases | : 325 kV peak |
| • Across isolating distance | : 375 kV peak |
| - Rated switching impulse withstand voltage (250/2500μs) | |
| • Phase-to-earth | : Not Applicable |
| • Across open switching device | : Not Applicable |
| • Across isolating distance | : Not Applicable |
| - Partial discharge level | : ≤ 5 pC |
| - Gas pressure (bar.G, at 20 ℃) | |
| • Design | : 6.59 (CB) / 6.59 (Others) |

| | |
|---|---|
| • Rated | : 5 (CB) / 5 (Others) |
| • 1st alarm signal | : 4.7 (CB) / 4.7 (Others) |
| • Minimum (2nd alarm signal) | : 4.5 (CB) / 4.5 (Others) |
| - Rated control voltage | : 110 Vdc |
| - Enclosure type | : 3 phases common type |
| - Maximum gas leakage rate [Dry air] | : 0.5 %/year |
| - The phases are fully insulated. | |

## 2.3 Circuit Breaker (CB)

| | |
|---|---|
| - Type designation | : HCSP-E074C |
| - Rated continuous current | |
| • Feeder | : 1250 A |
| - Rated short-circuit breaking current | : 31.5 kA rms |
| - Rated short-circuit making current | : 78.75 kA peak |
| - Rated short-line fault breaking current | : 28.35 kA rms |
| - Rated out-of-phase breaking current | : 7.875 kA rms |
| - Rated capacitive switching current | |
| • Rated line-charging breaking current | : 10 A |
| • Rated cable-charging breaking current | : 125 A |
| - Rated short-time withstand current | : 31.5 kA rms |
| - Rated duration of short-circuit | : 1 sec |
| - Rated breaking time | : 3 cycle (60ms) |
| - Operating duty cycle | : O-0.3s-CO-3m-CO |
| - Rated short-duration power-frequency withstand voltage (1 min) | |
| • Phase-to-earth, between phases | : 140 kV rms |
| • Across open switching device | : 140 kV rms |
| - Rated lightning impulse withstand voltage (1.2/50μs) | |
| • Phase-to-earth, between phases | : 325 kV peak |
| • Across open switching device | : 325 kV peak |
| - Rated switching impulse withstand voltage (250/2500μs) | |
| • Phase-to-earth | : Not Applicable |
| • Across open switching device | : Not Applicable |

| | |
|---|---|
| - Operating method | : Charged Spring |
| - No load closing time | : < 70 ms |
| - No load opening time | : < 32 ms |
| - First-pole-to-clear factor | : 1.5 |
| - Trip coil current | : ≤ 5 A |
| - Close coil current | : ≤ 5 A |
| - Rated control voltage | : 110 Vdc |
| - Motor power (1 motor for 3 phase) | : 260 Watt |

## 2.4 Disconnecting Switch (DS)

| | |
|---|---|
| - Type designation | : HDMO-E74E<br>HDMO-E74F |
| - Rated continuous current | |
| • Feeder | : 1250 A |
| - Rated short-time withstand current | : 31.5 kA rms |
| - Rated duration of short-circuit | : 1 sec |
| - Rated short-duration power-frequency withstand voltage (1 min) | |
| • Phase-to-earth, between phases | : 140 kV rms |
| • Across isolating distance | : 160 kV rms |
| - Rated lightning impulse withstand voltage (1.2/50μs) | |
| • Phase-to-earth, between phases | : 325 kV peak |
| • Across isolating distance | : 375 kV peak |
| - Rated switching impulse withstand voltage (250/2500μs) | |
| • Phase-to-earth | : Not Applicable |
| • Across isolating distance | : Not Applicable |
| - Operating method | : Motor driven & Manual |
| - Motor & control voltage | : 110 Vdc |
| - Motor power (1 motor for 3 phase) | : 350 Watt |

## 2.5 Maintenance Earthing Switch (ES)

| | |
|---|---|
| - Type designation | : HEMO-E074D<br>HEMO-E074E |
| - Rated short-time withstand current | : 31.5 kA rms |

- Rated duration of short-circuit : 1 sec
- Rated short-duration power-frequency withstand voltage (1 min) : 140 kV rms
- Rated lightning impulse withstand voltage (1.2/50μs) : 325 kV peak
- Rated switching impulse withstand voltage (250/2500μs) : Not Applicable
- Operating method : Motor driven & Manual
- Motor & control voltage : 110 Vdc
- Motor power (1 motor for 3 phase) : 350 Watt

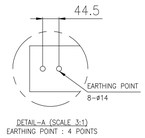
## 2.6 Low Power Current Transformer (LPCT)

- Type : LPCT
- Polarity : Subtractive
- Rated Primary Current [A], Ipr : In 250, Imax 1250
- Accuracy Class : 0.2S / 5TPE
- Rated short-time thermal current : 31.5 kA rms
- Rated short-duration power-frequency withstand voltage (1 min)
  - Main circuit : 140 kV rms
  - Secondary circuit : 2.2 kV rms
- Rated lightning impulse withstand voltage (1.2/50μs) : 325 kV peak

## 2.7 Low Power Voltage Transformer (LPVT)

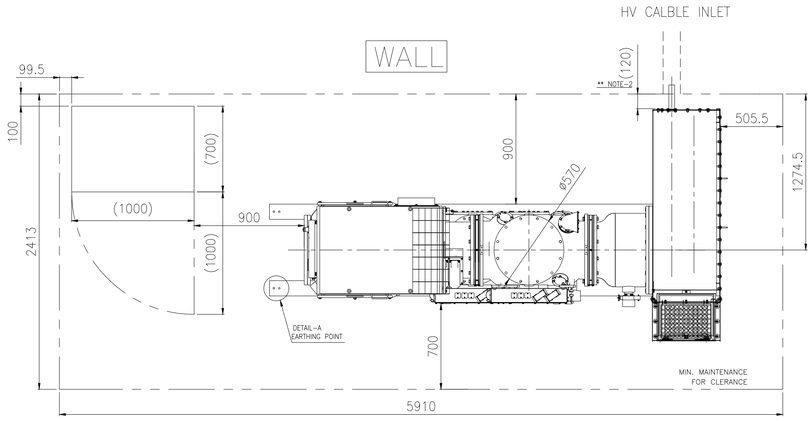
- Type : LPVT
- Primary voltage [kV] : 66/ √3
- Primary voltage Factor, Fv : 1.9 x Upr
- Accuracy class : 0.5 / 3P
- Rated short-duration power-frequency withstand voltage (1 min)
  - Main circuit : 140 kV rms
  - Secondary circuit : 2.2 kV rms
- Rated lightning impulse withstand voltage (1.2/50μs) : 325 kV peak
- Rated switching impulse withstand voltage (250/2500μs) : Not Applicable

## 2.8 Local Control Panel



| | |
|---|---|
| - Type | : Stand Alone |
| - Size [mm] | : 1000(W), 700(D), 2250(H) |
| - IP | : 55 |
| - Metal Thickness of Panel | : SPHC 2.3mm |
| - Ground bus bar | : 6T x 30 |
| - Gland plate | : 3T Al plate |
| - Front door opening angle | : 120° |
| - Cable entry from top | |

## 2.9 HV cable Termination with VD (voltage detecting) sensor



| | |
|---|---|
| - Type | : F bushing |
| | VD sensor built in type |
| - Manufactuerer | : TE connectivity |
| - Rated Voltage | : 72.5 kV |
| - Rated continuous current | : 1250 A |
| - Rated lightning impulse withstand voltage | : 325 kV peak |
| - Power frequency withstand voltage | : 155kV/1min |
| - Partial discharge | : 63kV < 10pc |
| | : 44kV < 5pc |

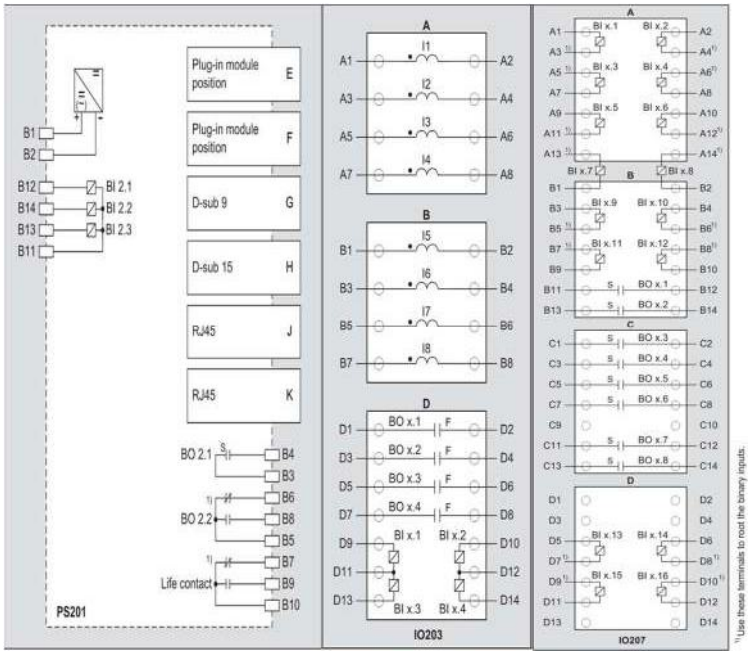
## Device: 7UT85 Protection Unit

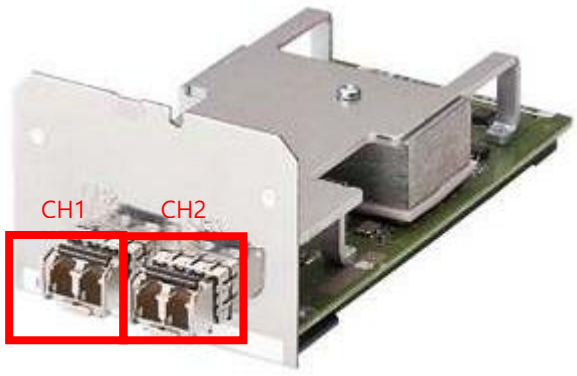


Product code(Short) : P1F940825

Product code(Long) : 7UT85DAAAAA00AAAA0AH011122111BBBD000000AC0CC1BA1CG0

## Technical Data

| | | |
|---|---|---|
| ① | Binary inputs : | 23 |
| ② | Binary outputs : | 15 Relays (11 Standard, 4 Fast) |
| ③ | CT/PT Inputs : | 8CT (protection), 0VT (standard), PB Client |
| ④ | Measuring-transducer inputs : | 0 (4~20 mA)<br>0 (RTD) |
| ⑤ | Dimensions : | 1/2 19" |
| ⑥ | Housing type : | Flush mounting |
| ⑦ | LCD : | Small display 192 x 128 pixels |
| ⑧ | LEDs : | 32 LED |
| ⑨ | Power Supply : | 60-250 Vdc, 100-230 Vac |

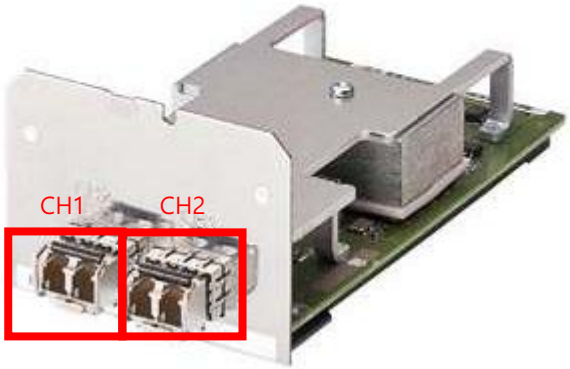


## Communication

① module E (Station Bus)

ETH-BB-2FO

Communication Protocols : applicable for DIGSI 5, IEC 61850-8-1 MMS and GOOSE, IEC 60870-5-104, DNP3 TCP, Modbus TCP, Synchrophasor (IEEEC37.118 - IP), SNTP, SNMP, etc.

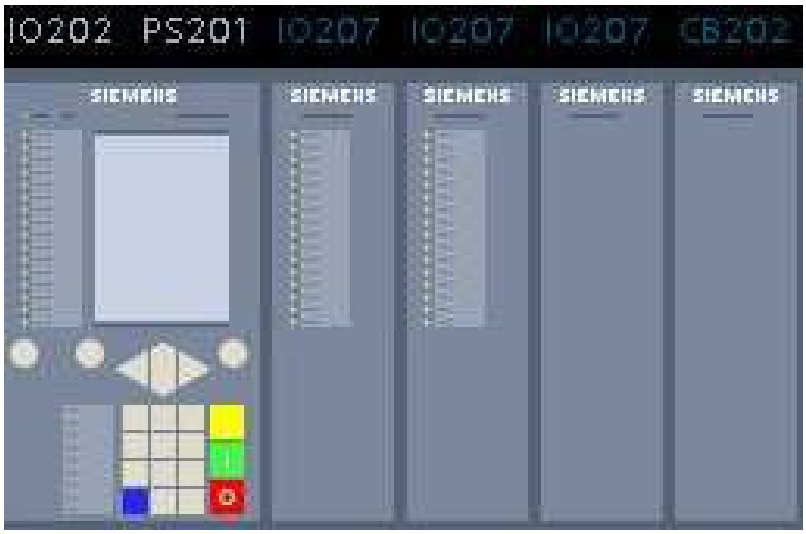


Redundancy protocols: Line Mode, RSTP, HSR, PRP

| | | |
|---|---|---|
| ② | E module SFP<br>(Station Bus) | 2x optical Ethernet 100 Mbit/s, 1300 nm, duplex LC type<br>2 km over 50/125 um or 62.5/125 um multimode optical fiber |

| | | |
|---|---|---|
| ③ | module F:<br>(Process Bus) | ETH-BD-2FO<br>Communication Protocols : applicable for DIGSI 5, IEC61850-9-2 Processbus Client und Merging Unit, IEC 61850-8-1 MMS and GOOSE, IEEE1588v2/PTP(1us accuracy), DNP3 IP, IEC 60870-5-104, Modbus TCP, IEEE C37.118 PMU, SNTP, SNMP,<br>Redundancy protocols: Line Mode, PRP, HSR, RSTP |

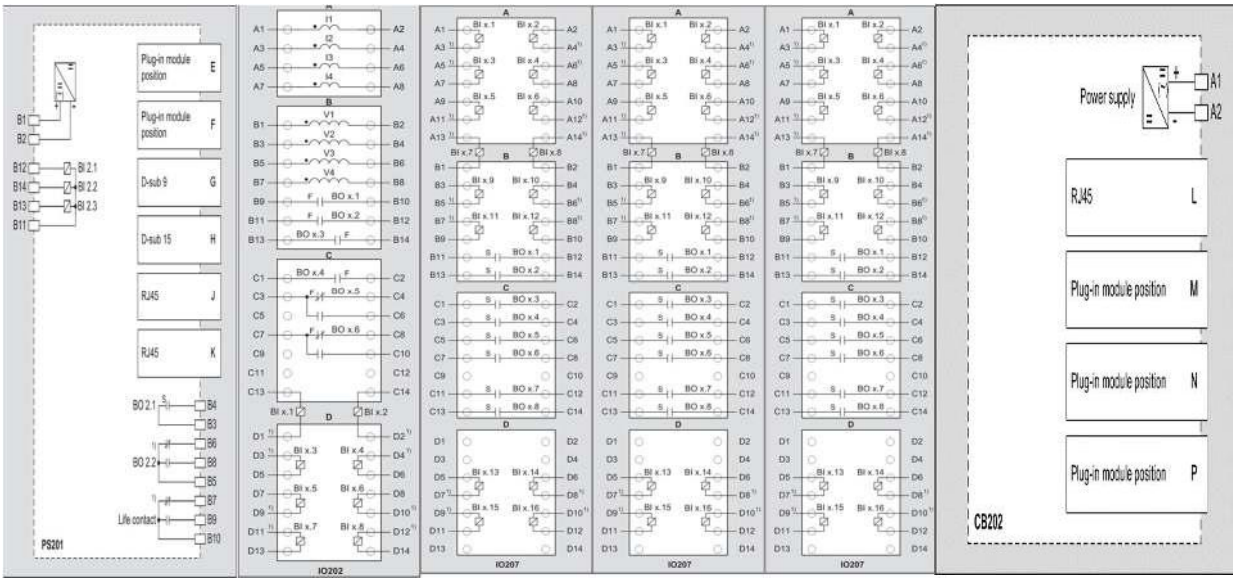
④ F module SFP (Process Bus) 2x optical Ethernet 100 Mbit/s, 1300 nm, duplex LC type
2 km over 50/125 um or 62.5/125 um multimode optical fiber



## Functions

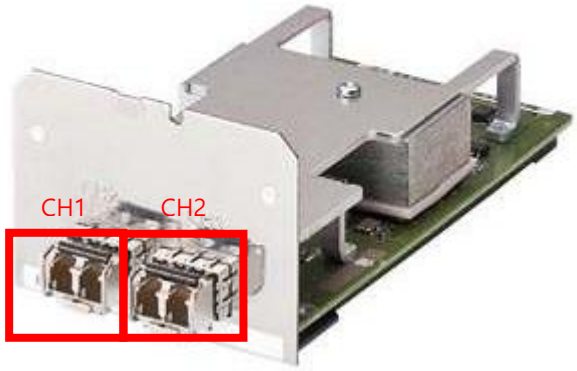
① Function points class: Base + 100 function points

## Device: 7SJ85 Protection Unit



Product code(Short) : P1J1799071

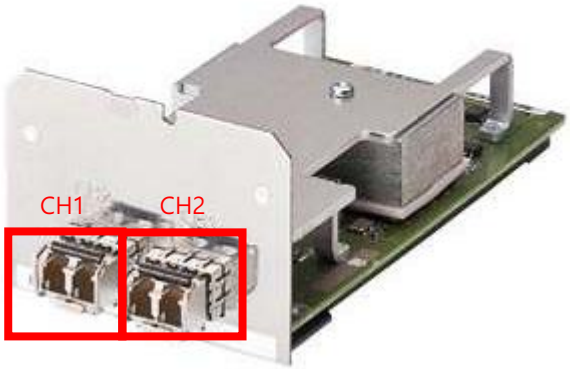
Product code(Long) : 7SJ85DAAAAA00AAAA0AM011133111BBBD000000AC0CB1BA1CG0CG0CG0CG0CG0



## Technical Data

| | | |
|---|---|---|
| ① | Binary inputs : | 59 |
| ② | Binary outputs : | 33 Relays (27 Standard, 6 Fast) |
| ③ | CT/PT Inputs : | 4CT (protection), 4VT (standard), PB Client |
| ④ | Measuring-transducer inputs : | 0 (4~20 mA)<br>0 (RTD) |
| ⑤ | Dimensions : | 1/1 19″ |
| ⑥ | Housing type : | Flush mounting |
| ⑦ | LCD : | Large display 240 x 320 pixels |
| ⑧ | LEDs : | 48 LED |
| ⑨ | Power Supply : | 60-250 Vdc, 100-230 Vac |

## Communication



| | | |
|---|---|---|
| ① | module E<br>(Station Bus) | ETH-BB-2FO<br>Communication Protocols : applicable for DIGSI 5, IEC 61850-8-1 MMS and GOOSE, IEC 60870-5-104, DNP3 TCP, Modbus TCP, Synchrophasor (IEEEC37.118 - IP), SNTP, SNMP, etc.<br>Redundancy protocols: Line Mode, RSTP, HSR, PRP |

| | | |
|---|---|---|
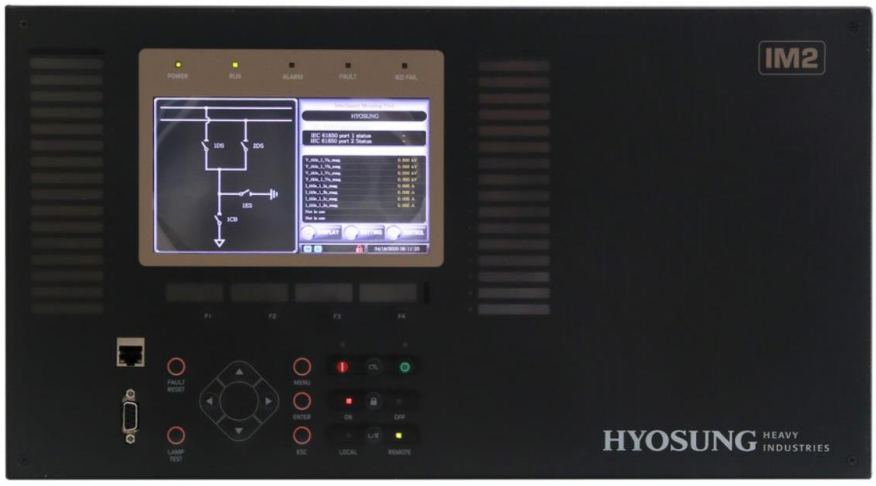
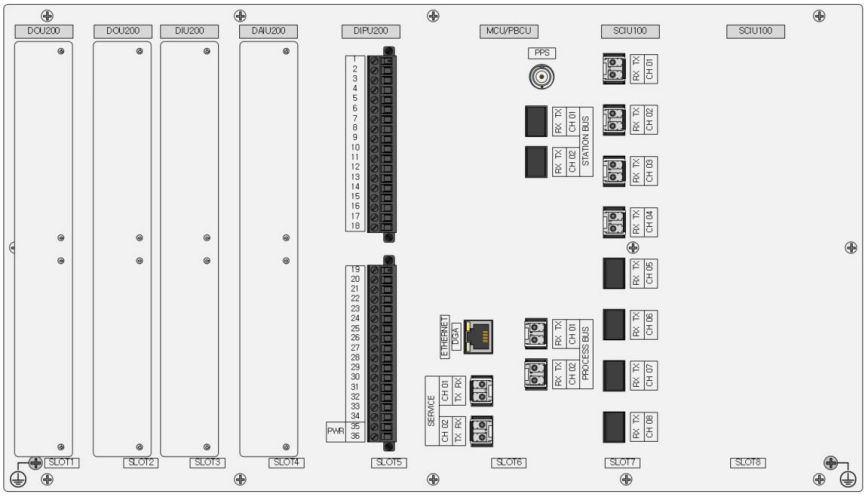
| ⑤ | module N:<br>(Station Bus) | ETH-BD-2FO<br>Communication Protocols : applicable for DIGSI 5, IEC61850-9-2 Processbus Client und Merging Unit, IEC 61850-8-1 MMS and GOOSE, IEEE1588v2/PTP(1us accuracy), DNP3 IP, IEC 60870-5-104, Modbus TCP, IEEE C37.118 PMU, SNTP, SNMP,<br>Redundancy protocols: Line Mode, PRP, HSR, RSTP |

| | | |
|---|---|---|
| ⑥ | N module SFP<br>(Station Bus) | 2x optical Ethernet 100 Mbit/s, 1300 nm, duplex LC type<br>24 km for 9 µm/125 µm optical fibers |



## Functions

① Function points class: Base + 200 function points



## Device: IM2 Merging Unit

Product code : B1-0000-0B-L040

## Technical Data

| | | |
|---|---|---|
| ① | Binary inputs : | 26 |
| ② | Binary outputs : | 0 |
| ③ | LPIT Inputs : | 4 |
| ④ | Measuring-transducer inputs : | 0 (4~20 mA)<br>0 (RTD) |
| ⑤ | Dimensions : | 263(H) x 487(W) x 219(D) mm |
| ⑥ | Housing type : | Flush mounting |
| ⑦ | LCD : | 800×480 TFT LCD with touch screen |
| ⑧ | LEDs : | 32 LEDs, 3-colored (green/red/yellow) |
| ⑨ | Power Supply : | 100-250 Vdc, 100-250 Vac (50/60Hz ± 3Hz) |

## Communication

| | | |
|---|---|---|
| ① | Process Level | 2x optical Ethernet 1000 Mbit/s, 1310 nm, duplex LC connector,<br>2 km over 50/125 µm and 62.5/125 µm multimode optical fiber<br>Communication Protocols: IEC61850-9-2LE Sampled Value,<br>IEEE1588v2/PTP(1 µs accuracy)<br>Redundancy protocols: PRP, HSR |
| ② | Station Level | - |

## Functions

① Transmits SV up to 8 streams

② Sampling rate : 80 or 256 samples per cycle

③ Provides high-precision time synchronization : PTP, PPS

④ Provides protocols for network redundancy : HSR/PRP (IEC 62439-3)

⑤ Fault recording of analog and binary signals

⑥ Interoperability with IEC 61850 Ed2 compliance certificate

## Device: RED BOX

Product code : 6GK6490-7RB00-1CN0

## Technical Data

| | | |
|---|---|---|
| ① | Ports : | 4 x 100BASE-FX + 3 x 1000 BASE-X (SFP) |
| ② | RNA uplinks (A / B) & coupler port : | 3 x 1 Gbit/s SFP ports |
| ③ | Supported specifications : | IEEE 1588 |
| ④ | Supported input voltage ranges : | 24/48 VDC (12 – 60 VDC)<br>HI (85 – 264 VAC / 88 – 300 VDC) |
| ⑤ | Dimensions (w x h x d) in mm : | 91 mm x 177 mm x 173 mm |
| ⑥ | Weight : | 2.9 kg |
| ⑦ | Mounting : | DIN rail and panel mount |
| ⑧ | Operating temperature : | -40° C to +85° C |
| ⑨ | IP rating : | IP40 |

## Communication Port

① RNA and coupler ports(SFP Module)

### 5.2 RUGGEDCOM SFP1122-1SX2

Siemens' RUGGEDCOM SFP1122-1SX2 industrial grade 1 Gbps fiber optic SFP transceiver operates within a wide temperature range (-40 to 85 °C or -40 to 185 °F) and provides high performance Gigabit Ethernet communication up to 2 km (1.2 mi) using multi-mode fiber.

#### Highlights

- Compliant with SFP MSA and IEEE 802.3z for 1000Base-SX
- Compliant with SFF-8472 Digital Diagnostic Monitoring Interface
- Transmission distance up to 2 km (1.2 mi)
- LC duplex connector optical interface
- Operates with 50/125 µm and 62.5/125 µm multi-mode fiber
- Bail latch
- Hot swappable
- RoHS compliant

#### Specifications

##### Optical Characteristics

| | |
|---|---|
| **Transmit Power** | -9 to 1 dBm |
| **Receiver Sensitivity** | -19 to -1 dBm |
| **Power Budget** | 10 dB |

##### Cabling

| | |
|---|---|
| **Speed** | 1 Gbps |
| **Mode** | MM (Multi-Mode) |
| **Interface** | SX |
| **Connector** | LC |
| **Cable Type** | 50/125 or 62.5/125 µm |
| **Wavelength (Tx)** | 1280 to 1355 nm |
| **Wavelength (Rx)** | 1270 to 1620 nm |
| **Nominal Distance** | 2 km (1.2 mi) |

##### Environment

| | |
|---|---|
| **Operating Temperature** | -40 to 85 °C (-40 to 185 °F) |
| **Operating Relative Humidity** | 5 to 85% (non-condensing) |
| **Storage Temperature** | -40 to 85 °C (-40 to 185 °F) |
| **Mean Time Between Failures (MTBF)** | 182 years[a] |

[a] Tested at an operating temperature of 40 °C (104 °F)

② Singly Attached Node (SAN) ports

## 5.4 Fiber Optic Ethernet Port Specifications

The following details the specifications for fiber Ethernet ports that can be ordered with the RUGGEDCOM RSG907R.

**Note**

- All optical power numbers are listed as dBm averages. To convert from average to peak, add 3 dBm. To convert from peak to average, subtract 3 dBm.
- Maximum segment length is greatly dependent on factors such as fiber quality, and the number of patches and splices. Consult a Siemens sales associate when determining maximum segment distances.

| Data Rate (Mbps) | Mode | Connector | Cable (µm) | Wavelength (nm)[a] | | Transmit Power (dBm) | | Receiver Sensitivity (dBm) | Receiver Saturation (dBm) | Distance (km)[a] | Power Budget |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | Transmit | Receive | Min | Max | | | | |
| 100 | MM | LC | 50/125 | 1308 | 1308 | -22.5 | -14 | -31 | -14 | 2 | 11 |
| 100 | MM | LC | 62.5/125 | 1308 | 1308 | -20 | -14 | -31 | -14 | 2 | 11 |

[a] Typical.

## 1. MODELING

**[Total heat loss] = [Heat loss of conductor] + [Heat loss of enclosure]**

– Considered only for GIS part which is installed indoor

**$Q_c$ : Conductor ohmic loss (Aluminum)** **[W/m]**

1250 A circuit for Incomming / Outg : 51

**$Q_s$ : Enclosure stray loss (Aluminum)** **[W/m]**

1250 A circuit for Incomming / Outg : 7

## 2. CALCULATION

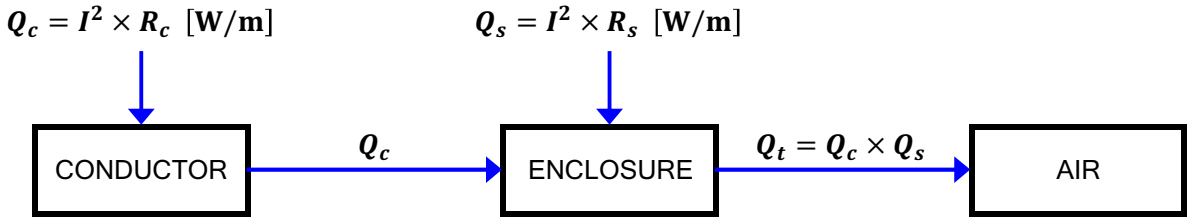
1) GIS conductor and enclosure part

| Feeder | Unit loss [W/m] | Circuit Length [m] | Bay Quantity | Total Loss [W] |
|---|---|---|---|---|
| Incomming / Outgoing feeder | 58.17 | 7 | 1 | 407.17 |
| | | | Sub total [W] | 407.17 |

Note.1. Refer to the next page for the Unit loss calculation.

2) Heater for Operating Mechanism Box for GIS

| Devices description | Designation | Loss [W] | Quantity | Total Loss [W] |
|---|---|---|---|---|
| Curcit Breaker | Q0 (QA1) | 100 | 1 | 0 |
| Disconnector & Earthing Switch | QZ91, QZ92 | 50 | 2 | 0 |
| | | | Sub total [W] | 0 |



3) LCP heat dissipation

| Devices description | Designation | Loss [W] | Quantity | Total Loss [W] |
|---|---|---|---|---|
| Redbox | RSG907R | 18 | 1 | 18 |
| MU (Merging Unit) | IM2 | 45 | 1 | 45 |
| Protection Relay | 7UT85 | 15 | 1 | 15 |
| Protection Relay | 7SJ85 | 15 | 1 | 15 |
| Lock out Relay | 7PJ1524 | 12 | 1 | 12 |
| Pilot Lamp | CL, OL | 2 | 10 | 20 |
| Relays | K11, K12… | 2.7 | 30 | 81 |
| Heater | CP100F1 | 100 | 1 | 0 |
| | | | Sub total [W] | 128 |

– The total Watt losses of the GIS system (GIS and LCP) are extimated about 407+128 [W].
(where 128 [W] are the LCP losses as per point 3)

– The current applied in the calculation is 100% of rated current considering typical load factor.

– Heater will be operated On and Off as per temperature and humitidy.

**Where,**

**1) Conductor**

| | | |
|---|---|---|
| – In diameter, $D_i$ [mm] | : | 50 |
| – Out diameter, $D_o$ [mm] | : | 80 |
| – Material | : | A6063 |
| – Resistvity(ρ) [Ω·m] | : | 3.32.E-08 |
| – Cross section area, A [$mm^2$] | : | 3063.05 |
| – **Resistance per meter [μ Ω/m]** | **:** | **10.84** |

**2) Enclosure**

| | | |
|---|---|---|
| – In diameter, $D_i$ [mm] | : | 434 |
| – Out diameter, $D_o$ [mm] | : | 452 |
| – Material | : | A5083 |
| – Resistvity(ρ) [Ω·m] | : | 5.90.E-08 |
| – Cross section area, A [$mm^2$] | : | 12525.53 |
| – **Resistance per meter [μ Ω/m]** | **:** | **4.71** |

(for 3 phase)

| Feeder | $Q_c$ [W/m] | $Q_s$ [W/m] | $Q_t$ [W/m] |
|---|---|---|---|
| 1250 A circuit for Incomming / Outgoing feeder | 50.81 | 7.36 | **58.17** |

– $Q_c$ : Conductor ohmic loss
– $Q_s$ : Enclosure stray loss
– $Q_t$ : Total heat loss (= $Q_c$ + $Q_s$)
– $R_c$ : Resistance for counductor
– $R_s$ : Resistance for enclosure
– I : Rated current

- OTHERS COMPARTMENT : 5 bar.G

## ❑ PRESSURE OF GAS AND ALARM SETTING

| | | PRESSURE SETTINGS : bar.G at 20°C | | | DESIGNATION |
|---|---|---|---|---|---|
| | | RATED | ALARM ON | RESET | |
| CB | LOW 1'ST STAGE | 5 | 4.7 | 4.9 | GD-1 |
| | LOW 2'ND STAGE | | 4.5 | 4.7 | |
| OTHERS | LOW 1'ST STAGE | 5 | 4.7 | 4.9 | GD-2, GD-3 |
| | LOW 2'ND STAGE | | 4.5 | 4.7 | |

## ❑ DETAIL-A(TYPICAL) FOR GAS VALVE & GAS PRESSURE SWITCH WITH GAUGE

## NOTES

1. DESCRIPTION of ABBREVIATIONS.
   - CB : CIRCUIT BREAKER
   - DS : DISCONNECTING SWITCH
   - ES : EARTHING SWITCH
   - VD : VOLTAGE DETECTOR
   - LPIT : LOW POWER INSTRUMENT TRANSFORMER
   - ECVT : ELECTRONIC CT AND VT
   - EVT : ELECTRONIC VT

## LEGEND

| SYMBOL | DESCRIPTION |
|---|---|
| | CIRCUIT BREAKER (SPRING OPERATION) |
| | COMBINED WITH DS(ISOLATOR) AND ES(EARTHING SWITCH) (MOTOR DRIVEN OPERATION) |
| | VOLTAGE & CURRENT TRANSFORMER (3ø X 2) (LPIT TYPE) |
| | VOLTAGE TRANSFORMER (3ø X 2) (LPVT TYPE) |
| | T-CONNECTOR |
| | GAS DENSITY MONITOR (PRESSURE SWITCH WITH GAUGE) |
| | GAS VALVE (NORMALLY CLOSED)-NON RETURN TYPE |
| | GAS VALVE (NORMALLY OPENED)-NON RETURN TYPE |
| | GAS TIGHT SPACER (BARRIER) |
| | RUPTURE DISK |
| | VOLTAGE DETECTING SENSOR |

## HOLDS

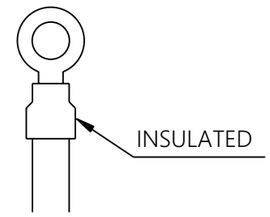
CONT. 7

# DESCRIPTION OF WIRE SYSTEM

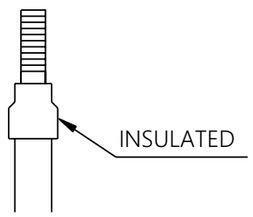
## 1.1 EMPLOYED WIRE

450/750V HALOGEN FREE INSULATED FLEXIBLE WIRE (IEC 60332-2-2)



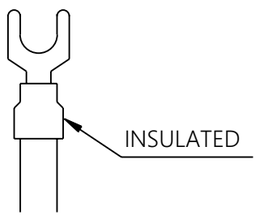
## 1.2 WIRE COLORING & SIZE

| KIND OF CIRCUIT | | | WIRE COLOR | SIZE[mm²] | AUX CAP | | REMARK |
|---|---|---|---|---|---|---|---|
| | | | | | LETTER | COLOR | |
| AC CIRCUIT | 1-PHASE AC CIRCUIT (HEATER) | PHASE | GRAY | 2.5 | L | WHITE | |
| | | NEUTRAL | GRAY | 2.5 | N | WHITE | |
| DC CIRCUIT | DC SUPPLY CIRCUIT | POSITIVE(+ve) | GRAY | 1.5 | + | WHITE | |
| | | NEGATIVE(-ve) | GRAY | 1.5 | - | WHITE | |
| | DC CONTROL CIRCUIT | | GRAY | 1.5 | + or - | WHITE | |
| | TRIP CIRCUIT | | GRAY | 1.5 | TRIP | RED | |
| | ALARM CIRCUIT | | GRAY | 1.5 | | | |
| CT CIRCUIT | R/Y/B/N | | GRAY | 2.5 | | | |
| VT CIRCUIT | R/Y/B/N | | GRAY | 2.5 | | | |
| EARTH (FOR GROUNDING) | | | GREEN WITH YELLOW STRIPS | 2.5 | | | |

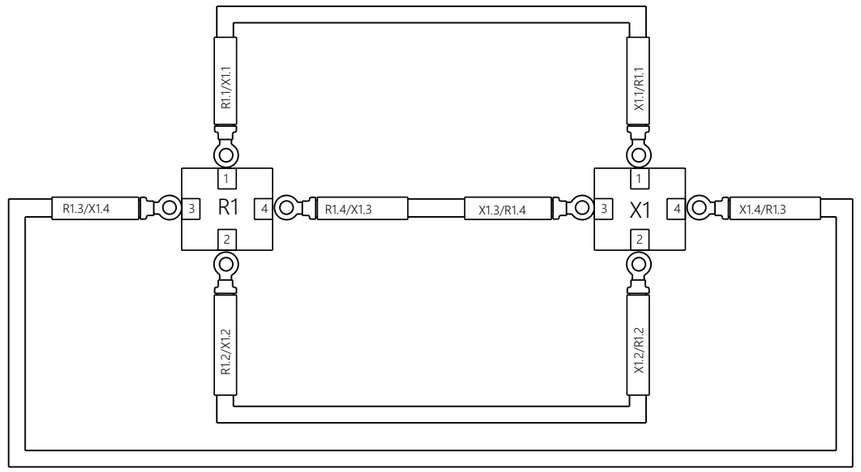


1) PLEASE REFER TO DETAIL FERRULE(AUX CAP) ON '4.3) AUX CAP'.

## 2. CRIMP TERMINAL

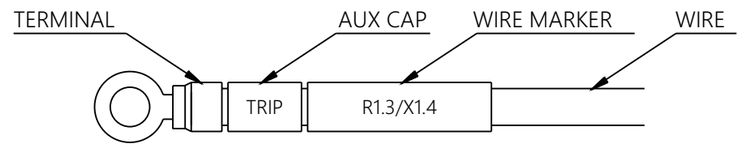


1) RING TYPE



2) BLADE TYPE

3) SPADE TYPE



## 3. INSERTION OF WIRE MARK

## 4. WIRING MARKER(FERRULES)

1) DETAIL OF WIRING

2) LETTERS OF WIRE MARKER

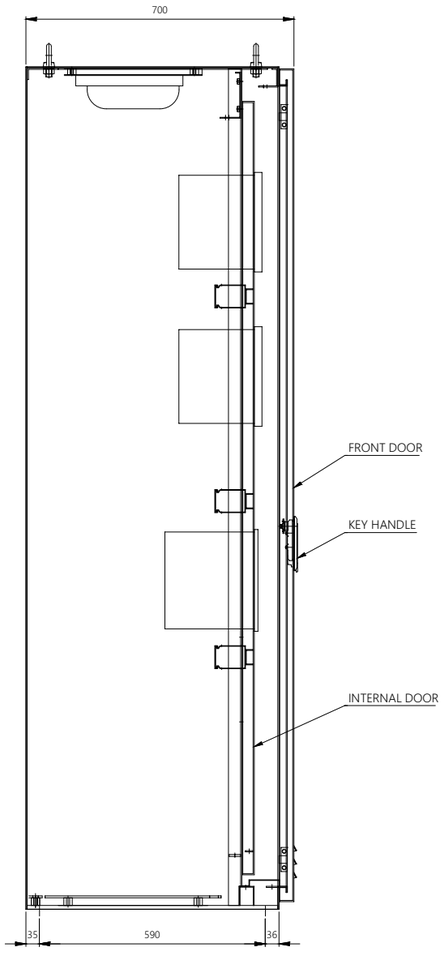
a. THE LETTERS STARTS FROM LEFT TO RIGHT

b. BLACK LETTER ON WHITE BACK GROUND

3) AUX CAP

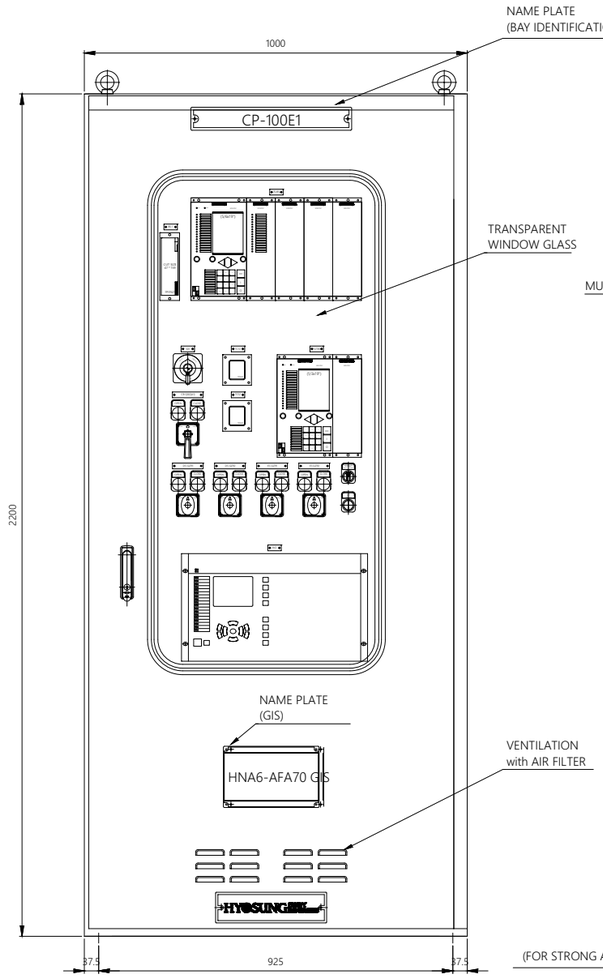
a. WHITE LETTER ON RED BACK GROUND (LETTER : TRIP)

b. BLACK LETTER ON WHITE BACK GROUND (DC CIRCUIT, LETTER : + )



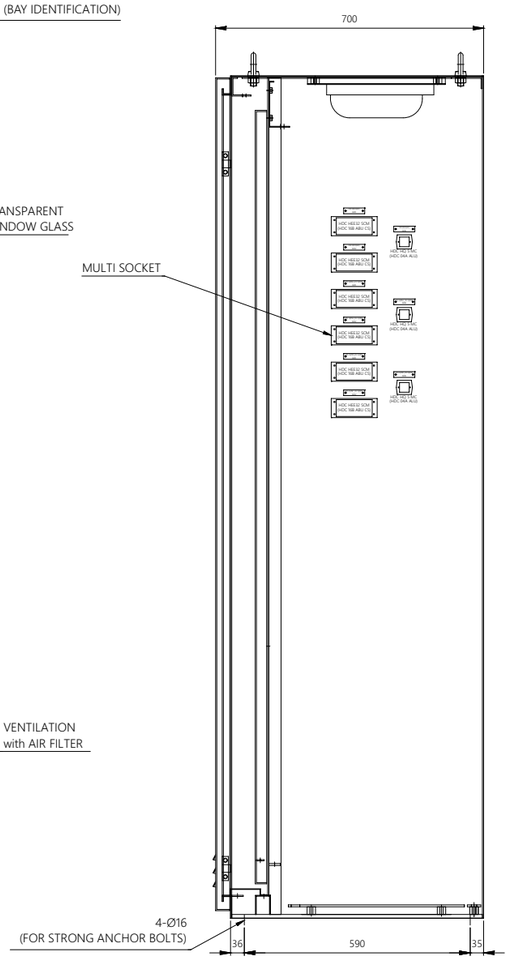
b. BLACK LETTER ON WHITE BACK GROUND (DC CIRCUIT, LETTER : - )

d. BLACK LETTER ON WHITE BACK GROUND (AC CIRCUIT, LETTER : L/L1/L2/L3)



e. BLACK LETTER ON WHITE BACK GROUND (AC CIRCUIT, LETTER : N)

## 5. CRIMP TERMINAL PVC INSULATION COLOR



| WIRE SIZE | COLORING |
|---|---|
| 1.5mm $^2$ | RED |
| 2.5mm $^2$ | BLUE |
| 4.0mm $^2$ | YELLOW |

# Material Safety Data Sheet

| Material | Mix gas (Nitrogen 21% + Oxygen 79%) |
|---|---|

## 1. Product and company identification

1.1. Product name: Mix gas (Nitrogen 21% + Oxygen 79%)

1.2. Recommended Use and Usage Restrictions

- Recommended use of products: No Data
- Restriction of use of products: No Data

1.3. Manufacturer/Importer/Distributor

- Company Name: : DAEYOUCORE
- address: : 13, jangin-ro 78beon-gil, sasang-gu,busan 617-843 korea
- Telephone: : (82 51)313-4270~2

## 2. Hazard · risk

2.1. Hazard and risk classification: Oxidation gas : Part 1
High Pressure Gas : Compressed Gas

2.2. Warning signs including preventive action statements

Pictograph

- Signal language: The Dangers
- Dangerous and dangerous phrase: H270 May cause fire or intense fire ; oxidization
  H280 Contains high pressure gas ; may explode if heated
- Precautionary clause
- Prevention: P220 Isolate from clothing, (··) and combustible materials.
  P244 Make sure that no grease and oil is smeared in the valve and fittings.
- Response: P370+P376 Prevent leakage if it is safe to dispose of in a fire.
- Storage: P403 Store in well-ventilated place.
  P410+P403 Avoid direct sunlight and store in well ventilated areas.
- Disposal: Not applicable

NITROGEN

- Health: 3
- Fire: 0
- Reactivity: 0

Oxygen

- Health: 3
- Fire: 0
- Reactivity: 0

## 3. Name and content of components

| Substance of substance | alias name | CAS | Content(%) |
|---|---|---|---|
| Nitrogen | | 7727-37-9 | 79 |
| Oxygen | Oxygen, compressed [UN1072] [Nonflammable gas]) | 7782-44-7 | 21 |
| | Oxygen, refrigerated liquid (cryogenic liquid) [UN1073] [Nonflammable gas]) | | |

## 4. First aid procedure

| | |
|---|---|
| 4.1. When I got into the eyes, | Get emergency medical attention. |
| 4.2. When contact comes into contact with skin | Get emergency medical attention. |
| | Remove contaminated clothing and shoes and isolate the contaminated area. |
| | Dissolve the affected area with lukewarm water when contacting liquid gas. |
| 4.3. When inhaled | Move to the fresh air. |
| | Perform CPR if you do not breathe. |
| | Provide oxygen if breathing is difficult. |
| | Keep warm and stabilize. |
| 4.4. When eating | Get emergency medical attention. |
| 4.5. Other doctors ' notes | Ensure that the medical personnel are aware of the material and take protective measures. |

## 5. Fire handling method

5.1. Suitable (inappropriate) fire extinguishing agents

Use alcohol foam, carbon dioxide or water spray when dealing with this substance

Use dry sand or soil during vaginal digestion

5.2. Specific hazards arising from chemical substances

A fire caused by fire or intensity ; oxidization

Contains high pressure gas ; may explode if heated

May cause fire in contact with other flammable materials

May ignite flammable substances (wood, paper, oil, clothing etc.)

Container may explode when heating

Leakage of fire / explosion risk

Some burns but do not ignite easily.

Non-burnt combustion

Some may ignite flammable substances with oxidising agents

May cause irritation, corrosive and toxic fumes during fires

Be careful not to leave any flammable residue after evaporation.

5.3. Protective gear and precautions to be worn during firefighting

Nitrogen

Keep away from the area and keep it safe.

Be careful not to breathe because liquefied gas vapor is heavier than air.

Take care that the damaged cylinder can fly.

Move the container in the fire area if it is not dangerous.

Do not spray directly onto the source or safety device as it may cause freezing in the tank.

Use fire extinguishing equipment or use unmanned extinguishing equipment during tank fires.

Cool the tank with plenty of water after digesting the fire in the tank.

Evacuate immediately if there is a high noise in the discharge unit or if the tank discounts the tank.

Stand out of a tank filled with flames in a tank fire.

Handle broken cylinders only by experts.

Use fire extinguisher suitable for fire types.

Oxygen

Prevent leakage if it is safe to dispose of in a fire.

Keep away from the area and keep it safe.

Be careful not to breathe because liquefied gas vapor is heavier than air.

Take care that the damaged cylinder can fly.

Move the container in the fire area if it is not dangerous.

| | |
|---|---|
| Oxygen | Do not spray directly onto the source or safety device as it may cause freezing in the tank.<br>Use fire extinguishing equipment or use unmanned extinguishing equipment during tank fires.<br>Cool the tank with plenty of water after digesting the fire in the tank.<br>Evacuate immediately if there is a high noise in the discharge unit or if the tank discounts the tank.<br>Stand out of a tank filled with flames in a tank fire.<br>Use unmanned fire extinguishing equipment for large fires in case of fire and let stand if impossible.<br>Handle broken cylinders only by experts.<br>Use fire extinguisher suitable for fire types. |

## 6.To deal with leakage during a leakage accident

| | |
|---|---|
| 6.1. Necessary actions and protective measures needed to protect the human body | If possible, turn the leak container to allow it to be discharged by gas rather than liquid.<br>Isolate the contaminated area until the gas is completely dispersed and diluted.<br>Stay away from flammable substances and leaks.<br>Do not touch or walk around.<br>Do not spray directly onto the leak source.<br>Use water spray to reduce vapors or disperse steam clouds so that the water does not come into contact with water.<br>Let the matter disperse.<br>Vent the contaminated area.<br>Stop leaking if it is not dangerous.<br>Be careful not to leave any flammable residue after evaporation.<br>Be aware of the substance and conditions to avoid. |
| 6.2.Necessary measures to protect the environment | Prevent entry into waterways, sewers, basements, and closed spaces. |
| 6.3. Methods for cleaning or removing | Build up the dike and collect water for digestion.<br>Do not use combustible materials such as sawdust. |

## 7. Handling and storing methods

| | |
|---|---|
| 7.1.Safety tips | Make sure that no grease and oil is smeared in the valve and fittings.<br>Do not expose, cut, weld, pierce, pierce, pierce, or otherwise expose to light, flame, flame, static or other sources of ignition, flame, or other ignition sources.<br>Follow all MSDS preventive precautions since the container may remain empty even after the container has been emptied.<br>Be aware of the substance and conditions to avoid.<br>Refer to engineering management and personal protective equipment. |
| 7.2. Safe Storage Method | Isolate from clothing, (‥) and combustible materials.<br>Avoid direct sunlight and store in well ventilated areas.<br>Do not expose the container to heat as it may cause heat to rise when exposed to heat. |

## 8.Exposure prevention and personal protective equipment

8.1. Exposure criteria for chemical substances, biological exposure criteria, etc.

Domestic regulations

| | |
|---|---|
| Nitrogen | No Data |
| Oxygen | No Data |

ACGIH Regulation

| | |
|---|---|
| Nitrogen | Simple suffocate |
| Oxygen | No Data |

| | |
|---|---|
| Biological exposure criteria | |
| Nitrogen | No Data |
| Oxygen | No Data |
| 8.2. Personal protective equipment | |
| Respiratory protection | |
| Nitrogen | Wear respiratory protection that is certified by the Korea Occupational Safety & Health Agency certified by the Physical Chemical Properties of the exposed substance. |
| Oxygen | Wear respiratory protection that is certified by the Korea Occupational Safety & Health Agency certified by the Physical Chemical Properties of the exposed substance. |

## 9. Physicochemical characteristics

| | |
|---|---|
| 9.1. The external appearance | |
| Persona non grata | No Data |
| Color | No Data |
| 9.2. Smell | No Data |
| 9.3. Olfactory threshold | No Data |
| 9.4. pH | No Data |
| 9.5. Melting point / freezing point | No Data |
| 9.6. Early boiling point and boiling point | No Data |
| 9.7. Flash point | No Data |
| 9.8. Rate of evaporation | No Data |
| 9.9. Flammable (solid, gas) | No Data |
| 9.10. Upper / lower limit of flammability or explosive range | No Data |
| 9.11. Vapor pressure | No Data |
| 9.12. Solubility | No Data |
| 9.13. Steam density | No Data |
| 9.14. the specific gravity | No Data |
| 9.15. N-oxygenoliphyte factor | No Data |
| 9.16. Spontaneous combustion temperature | No Data |
| 9.17. Decomposition temperature | No Data |
| 9.18. Viscosity | No Data |
| 9.19. Molecular weight | No Data |

Nitrogen

| | |
|---|---|
| 9.1. The external appearance | |
| Persona non grata | Gas |
| Color | Achromatism |
| 9.2. Smell | Muchwihada odorless |
| 9.3. Olfactory threshold | No Data |
| 9.4. pH | No Data |
| 9.5. Melting point / freezing point | -210 ℃ |
| 9.6. Early boiling point and boiling point | -196 ℃ (-195.79 DEG C /LIQ/ (NLM;HSDB)) |
| 9.7. Flash point | No Data |
| 9.8. Rate of evaporation | No Data |
| 9.9. Flammable (solid, gas) | No Data |
| 9.10. Upper / lower limit of flammability or explosive range | - / - |
| 9.11. Vapor pressure | 1 atm (77.347 deg K) |
| 9.12. Solubility | (1.18E+004mg/L(25℃)) |
| 9.13. Steam density | 0.97 ((air = 1)) |
| 9.14. the specific gravity | 0.808 (kg/l at the boiling point of liquid) |
| 9.15. N-oxygenoliphyte factor | 0.67 |

| | |
|---|---|
| 9.16. Spontaneous combustion temperature | No Data |
| 9.17. Decomposition temperature | No Data |
| 9.18. Viscosity | No Data |
| 9.19. Molecular weight | 28.0 |

Oxygen

| | |
|---|---|
| 9.1. The external appearance | |
| Persona non grata | Gas (compressed gas, frozen liquid gas) |
| Color | Blue, pale. |
| 9.2. Smell | Muchwihada odorless |
| 9.3. Olfactory threshold | (N/A) |
| 9.4. pH | (None) |
| 9.5. Melting point / freezing point | -218 ℃ |
| 9.6. Early boiling point and boiling point | -183 ℃ |
| 9.7. Flash point | No Data |
| 9.8. Rate of evaporation | No Data |
| 9.9. Flammable (solid, gas) | No Data |
| 9.10. Upper / lower limit of flammability or | - / - |
| 9.11. Vapor pressure | 760 ㎜Hg ( -183 ℃) |
| 9.12. Solubility | (3.1㎖/100㎖(20℃)) |
| 9.13. Steam density | 1.1 (Air = 1) |
| 9.14. the specific gravity | 1.1407 ( -183 ℃) |
| 9.15. N-oxygenoliphyte factor | 0.65 |
| 9.16. Spontaneous combustion temperature | (N/A) |
| 9.17. Decomposition temperature | No Data |
| 9.18. Viscosity | 0.156 cP ( -173 C) |
| 9.19. Molecular weight | 32.00 |

## 10. Stability and responsiveness

10.1. Possibility of chemical stability and hazardous reactions

| | |
|---|---|
| Nitrogen | Contains high pressure gas ; may explode if heated |
| | Container may explode when heating |
| | Non-existing |
| | Vapor can cause dizziness or suffocation without awareness |
| Oxygen | A fire caused by fire or intensity ; oxidization |
| | Contains high pressure gas ; may explode if heated |
| | May cause fire in contact with other flammable materials |
| | May ignite flammable substances (wood, paper, oil, clothing etc.) |
| | Container may explode when heating |
| | Leakage of fire / explosion risk |
| | Some react violently with fuel. |
| | Non-burnt combustion |
| | Vapor can cause dizziness or suffocation without awareness |
| | May cause irritation and toxic fumes during fire |

10.2. Conditions to Avoid

| | |
|---|---|
| Nitrogen | Heat |
| Oxygen | Heat |

10.3. Substance to be avoided

| | |
|---|---|
| Nitrogen | No Data |
| Oxygen | Isolate from clothing, (‥) and combustible materials. |
| Oxygen | Combustible substances (wood, paper, oil, clothing, etc.) |
| Oxygen | Fuel |
| Oxygen | Reductive substance |

라. Hazardous Substances Created by Disassembly

| | |
|---|---|
| Nitrogen | No Data |
| Oxygen | Irritant, toxic gas |

## 11. Information about toxicity

11.1. Information about the likelihood of a highly probable exposure

| | |
|---|---|
| Nitrogen | No Data |
| Oxygen | Irresponsiveness, temperature, heat, irregular heart, dizziness, irregular heart rate, dizziness, disorientation, disorientation, tremors, severe pain, tremors, lung congestion, spasm, lung pain, spasm, lung failure |

11.2. Health hazard information

Acute toxicity

epigram

| | |

# SAFETY DATA SHEET

According to OSHA Hazcom Standard 29 CFR 1910.1200

# UT6780(H)(S)-RAL7032(HS)

## 1. IDENTIFICATION

A. Product name

- UT6780(H)(S)-RAL7032(HS)

B. Recommended use and restriction on use

- General use : urethane top coat
- Restriction on use : Do not use except for purpose

C. Manufacturer / Supplier / Distributor information

○ Manufacturer information

- Company name : KCC Corporation
- Address : 30, Bangeojinsunhwando-ro, Dong-gu, Ulsan
- Emergency telephone number : 82-52-280-1717

○ Supplier/Distributer information

- Company name : KCC Corporation
- Address : 30, Bangeojinsunhwando-ro, Dong-gu, Ulsan
- Emergency telephone number : 82-52-280-1717

## 2. HAZARD IDENTIFICATION

A. GHS Classification

- Flammable liquids : Category3
- Acute toxicity (oral) : Category5
- Acute toxicity (inhalation: vapor) : Category4
- Skin corrosion/irritation : Category2
- Serious eye damage/irritation : Category2
- Skin sensitization : Category1A
- Carcinogenicity : Category2
- Reproductive toxicity : Category2
- Specific target organ toxicity(Single exposure) : Category3(Narcotic effects)
- Specific target organ toxicity(Single exposure) : Category3(Respiratory tract irritation)
- Specific target organ toxicity(Repeated exposure) : Category2
- Aspiration hazard : Category1
- Acute aquatic toxicity : Category2

B. GHS label elements

○ Hazard symbols

○ Signal words

- Danger

○ Hazard statements

- H226 Flammable liquid and vapour
- H303 May harmful if swallowed.
- H304 May be fatal if swallowed and enters airways
- H315 Causes skin irritation
- H317 May cause an allergic skin reaction
- H319 Causes serious eye irritation
- H332 Harmful if inhaled
- H335 May cause respiratory irritation.
- H336 May cause drowsiness and dizziness.
- H351 Suspected of causing cancer
- H361 Suspected of damaging fertility or the unborn child
- H373 May cause damage to organs through prolonged or repeated exposure
- H401 Toxic to aquatic organisms.

○ Precautionary statements

1) Prevention

- P201 Obtain special instructions before use.
- P202 Do not handle until all safety precautions have been read and understood.
- P210 Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking.
- P233 Keep container tightly closed.
- P240 Ground and bond container and receiving equipment.
- P241 Use explosion-proof electrical/ventilating/lighting/equipment.
- P242 Use non-sparking tools.
- P243 Take action to prevent static discharges.
- P260 Do not breathe dust/fume/gas/mist/vapours/spray.
- P261 Avoid breathing dust/fume/gas/mist/vapours/spray.
- P264 Wash hands thoroughly after handling.
- P271 Use only outdoors or in a well-ventilated area.
- P272 Contaminated work clothing should not be allowed out of the workplace.
- P273 Avoid release to the environment.
- P280 Wear protective gloves/protective clothing/eye protection/face protection/hearing protection.

2) Response

- P301+P310 IF SWALLOWED: Immediately call a POISON CENTER or doctor/physician.
- P301+P312 IF SWALLOWED: Call a POISON CENTER or doctor/physician if you feel unwell.
- P302+P352 IF ON SKIN: Wash with plenty of soap and water.
- P303+P361+P353 IF ON SKIN (or hair): Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower.
- P304+P340 IF INHALED: Remove person to fresh air and keep comfortable for breathing.
- P305+P351+P338 IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
- P308+P313 If exposed or concerned: Get medical advice/attention.

- P312 Call a POISON CENTER or doctor/physician if you feel unwell.
- P314 Get medical advice/attention if you feel unwell.
- P321 Specific treatment
- P331 Do NOT induce vomiting.
- P332+P313 If skin irritation occurs: Get medical advice/attention.
- P333+P313 If skin irritation or rash occurs: Get medical advice/attention.
- P337+P313 If eye irritation persists: Get medical advice/attention.
- P362+P364 Take off contaminated clothing and wash before reuse.
- P370+P378 In case of fire: Use Suitable extinguishing media for extinction(Refer Section MSDS 5).

3) Storage

- P403+P233 Store in a well-ventilated place. Keep container tightly closed.
- P403+P235 Store in a well-ventilated place. Keep cool.
- P405 Store locked up.

4) Disposal

- P501 Dispose of contents/container in accordance with local/regional/national/international regulation

C. Other hazards which do not result in classification

- Not available

## 3. COMPOSITION/INFORMATION ON INGREDIENTS

| Chemical Name | Trade names and Synonyms | CAS No. | Content(%) |
|---|---|---|---|
| Xylene | Xylol ; Methyltoluene | 1330-20-7 | 19 ~ 26 |
| Titanium dioxide | Titanium oxide (Tio2) ; Titanium peroxide (Tio2) ; Dioxotitanium ; Pigment white 6 | 13463-67-7 | 19 ~ 26 |
| Pyrophyllite | Not available | 12269-78-2 | 4 ~ 11 |
| Talc(Containing no asbestos fibers) | Talc (Mg3H2(SiO3)4) | 14807-96-6 | 4 ~ 11 |
| n-Butyl acetate | Acetic acid, butyl ester ; 1-Butyl acetate ; Butyl acetate ; Acetic acid N-butyl ester ; Butyl ethanoate ; 1-Acetoxybutane | 123-86-4 | 1 ~ 8 |
| Ethylbenzene | Benzene, ethyl- ; Ethyl benzene ; Ethylbenzol ; Phenylethane ; | 100-41-4 | 1 ~ 8 |
| Styrene, 2-hydroxyethyl methacrylate, methyl methacrylate, methacrylic acid, n-butyl acrylate, diethylaminoethyl methacrylate, n-butyl methacrylate, fumaric acid copolymer with glycidyl neodecanoate | Not available | 190524-92-6 | 1 ~ 8 |
| Propylene glycol methyl ether acetate | Propylene glycol monomethyl ether acetate ; 2-(1-Methoxy)propyl acetate ; 1-Methoxypropan-2-yl acetate ; | 108-65-6 | 1 ~ 6 |
| Iron hydroxide oxide yellow (C.I. pigment yellow 042) | FERRIC OXIDE, FERRIC HYDROXIDE, CALCIUM CARBONATE ; FERRIC OXIDE, FERRIC HYDROXIDE, CALCIUM CARBONATE ; | 51274-00-1 | 1 ~ 6 |
| Silicon dioxide | Precipitated silica ; Silica, amorphous, precipitated and gel ; Silica gel, precipitated, crystalline free ; Amorphous synthetic silica gel ; Pptd. crystalline-free silica sol ; | 112926-00-8 | 1 ~ 6 |
| Toluene | Methylbenzene ; Methylbenzol ; Phenyl methane ; Methacide ; Toluol ; 1-Methylbenzene | 108-88-3 | 0.1~1 |
| Dihydro-3-(tetrapropenyl)-2,5-furandione | 2-DODECEN-1-YLSUCCINIC ANHYDRIDE | 26544-38-7 | 0.1~1 |

## 4. FIRST AID MEASURES

A. Eye contact

- Do not rub your eyes.
- Immediately flush eyes with plenty of water for at least 15 minutes and call a doctor/physician.
- Get medical attention immediately.
- Go to the hospital immediately if symptoms(flare, irritate) occur.
- Remove contact lenses if worn.

B. Skin contact

- Flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes.
- Wash contaminated clothing thoroughly before re-using.
- Get medical attention immediately.
- Go to the hospital immediately if symptoms(flare, irritate) occur.
- Wash thoroughly after handling.

C. Inhalation contact

- Take specific treatment if needed.
- When exposed to large amounts of steam and mist, move to fresh air.
- Get medical attention immediately.
- If breathing is stopped or irregular, give artificial respiration and supply oxygen.

D. Ingestion contact

- Please be advised by doctor whether induction of vomit is demanded or not.
- Rinse your mouth with water immediately.
- Get medical attention immediately.
- If swallowed, large amounts of water to drink and do not induce vomiting.

E. Delayed and immediate effects and also chronic effects from short and long term exposure

- Not available

F. Notes to physician

- Notify medical personnel of contaminated situations and have them take appropriate protective measures.
- If exposed or concerned, get medical attention/advice.

## 5. FIREFIGHTING MEASURES

A. Suitable (Unsuitable) extinguishing media

- Avoid use of water jet for extinguishing
- Dry chemical, carbon dioxide, regular foam extinguishing agent, spray

B. Specific hazards arising from the chemical

- Causes serious eye irritation
- Causes skin irritation
- Flammable liquid and vapour
- Harmful if inhaled
- May be fatal if swallowed and enters airways

C. Special protective actions for firefighters

- Avoid inhalation of materials or combustion by-products.
- Cool containers with water until well after fire is out.
- Do not approach the tank surrounded by fire until it is extinguished.
- In case of conflagration, use automatic fire sprinkler. Major fire may require withdrawal, allowing the object itself to burn.
- Keep unauthorized personnel out.

## 6. ACCIDENTAL RELEASE MEASURES

A. Personal precautions, protective equipment and emergency procedures

- Do not touch spilled material. Stop leak if you can do it without risk.

- Handle the damaged containers or spilled material after wearing appropriate protective equipment
- Move container to safe area from the leak area.
- Must work against the wind, let the upwind people to evacuate.
- Remove all sources of ignition.

B. Environmental precautions

- If large amounts have been spilled, inform the relevant authorities.
- Prevent runoff and contact with waterways, drains or sewers.

C. Methods and materials for containment and cleaning up

- Appropriate container for disposal of spilled material collected.
- Dike for later disposal.
- Disposal of waste shall be in compliance with the Wastes Control Act
- Large spill : Stay upwind and keep out of low areas. Dike for later disposal.
- Notify the central and local government if the emission reach the standard threshold.

## 7. HANDLING AND STORAGE

A. Precautions for safe handling

- Avoid contact with incompatible materials.
- Avoid direct physical contact.
- Comply with all applicable laws and regulations for handling
- Dealing only with a well-ventilated place.
- Do not handle until all safety precautions have been read and understood.

B. Conditions for safe storage, including any incompatibilities

- Avoid direct sunlight.
- Check regularly for leaks.
- Do not apply any physical shock to container.
- Do not apply direct heat.
- Do not use damaged containers.

## 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

A. Exposure limits

○ ACGIH TLV

- [Xylene] : TWA 20 ppm
- [Titanium dioxide] : TWA 0.2 mg/m3 (Nanoscale particles), 2.5 mg/m3 (Finescale particles)
- [Talc(Containing no asbestos fibers) ] : TWA 2 mg/m3, Respirable particulate matter (containing no asbestos and <1% crystalline silica)
- [n-Butyl acetate] : TWA 50 ppm , STEL 150 ppm
- [Ethylbenzene] : TWA, 20 ppm (87 mg/m3)
- [Toluene] : TWA 20 ppm (75 mg/m3)

○ OSHA PEL

- [Xylene] : 100 ppm, 435 mg/m3
- [Titanium dioxide] : 15 mg/m3 (Total dust)
- [n-Butyl acetate] : 150 ppm, 710 mg/m3
- [Ethylbenzene] : 100 ppm, 435 mg/m3
- [Silicon dioxide] : 80 mg/m3(%SiO2)
- [Toluene] : 200 ppm, (C) 300 ppm

B. Engineering controls

- Business owner is recommended to maintain below recommended exposure limits for the working place with general exhaust of gas/vapour/mist/fume.

C. Individual protection measures, such as personal protective equipment

○ Respiratory protection

- Any air-purifying respirator with a full facepiece and an organic vapor canister.
- Any chemical cartridge respirator with a full facepiece and organic vaporcartridge(s).
- Any chemical cartridge respirator with organic vapor cartridge(s).
- Consider warning properties before use.
- For Unknown Concentration or Immediately Dangerous to Life or Health : Any supplied-air respirator with full facepiece and operated in a pressure-demand or other positive-pressure mode in combination with a separate escape supply. Any self-contained breathing apparatus with a full facepiece.
- Respiratory protection is ranked in order from minimum to maximum.
- Under conditions of frequent use or heavy exposure, Respiratory protection may be needed.

○ Eye protection

- Provide an emergency eye wash station and quick drench shower in the immediate work area.
- Wear primary eye protection such as splash resistant safety goggles with a secondary protection face shield.

○ Hand protection

- Wear appropriate chemical resistant glove.

○ Skin protection

- Wear appropriate chemical resistant protective clothing.

○ Others

- Not available

## 9. PHYSICAL AND CHEMICAL PROPERTIES

| | |
|---|---|
| A. Appearance | |
| - Appearance | Liquid |
| - Color | BEIGE |
| B. Odor | Solvent odor |
| C. Odor threshold | Not available |
| D. pH | Not available |
| E. Melting point/Freezing point | Not available |
| F. Initial Boiling Point/Boiling Ranges | Not available |
| G. Flash point | 23℃ |
| H. Evaporation rate | Not available |
| I. Flammability(solid, gas) | Not available |
| J. Upper/Lower Flammability or explosive limits | Not available |
| K. Vapour pressure | Not available |
| L. Solubility | Not available |
| M. Vapour density | >1 |
| N. Specific gravity(Relative density) | 1.3 ~ 1.38 |
| O. Partition coefficient of n-octanol/water | Not available |
| P. Autoignition temperature | 408 |
| Q. Decomposition temperature | Not available |
| R. Viscosity | 65 ~ 70 KU |
| S. Molecular weight | Not available |

## 10. STABILITY AND REACTIVITY

A. Chemical Stability

- This material is stable under recommended storage and handling conditions.

B. Possibility of hazardous reactions

- Cylinders exposed to fire may vent and release flammable gas.

C. Conditions to avoid

- Avoid : Accumulation of electrostatic charges, Heating, Flames and hot surfaces
- Avoid contact with incompatible materials and condition.
- Avoid contact with heat, sparks, flame or other ignition sources.

D. Incompatible materials

- Sparks, flames, static electricity, strong acids and base substances

E. Hazardous decomposition products

- May emit flammable vapour if involved in fire.

## 11. TOXICOLOGICAL INFORMATION

A. Information on the likely routes of exposure

○ Respiratory tracts

- May be fatal if swallowed and enters airways
- May cause respiratory irritation.

○ Oral

- May harmful if swallowed.

○ Eye·Skin

- Causes skin irritation
- May cause an allergic skin reaction

B. Delayed and immediate effects and also chronic effects from short and long term exposure

○ Acute toxicity

* Oral

- Product (ATEmix) : 2000mg/kg < ATEmix <= 5000mg/kg
- [Xylene] : LD50 3523 mg/kg Rat (EU Method B.1) (ECHA)
- [Titanium dioxide] : LD50 >5000 ㎎/㎏ Mouse (OECD TG 420) (OECD SIDS)
- [Talc(Containing no asbestos fibers) ] : LD50 >5000 ㎎/㎏ Rat (OECD TG 423, GLP)(ECHA)
- [n-Butyl acetate] : LD50 10760 mg/kg Rat (12.2 mL/kg) (OECD TG 423) (ECHA)
- [Ethylbenzene] : LD50 3500 mg/kg Rat (ECHA)
- [Propylene glycol methyl ether acetate] : LD50 6190 mg/kg Rat (OECD TG 401, GLP) (ECHA)
- [Iron hydroxide oxide yellow (C.I. pigment yellow 042)] : LD50 >10000 ㎎/㎏ Rat (ECHA)
- [Silicon dioxide] : LD50 > 3300 ㎎/㎏ Rat (OECD Guideline 401, GLP)(ECHA)
- [Toluene] : LD50 5580 mg/kg Rat (EU Method B.1) (ECHA)
- [Dihydro-3-(tetrapropenyl)-2,5-furandione] : LD50 2550 ㎎/㎏ Rat (NLM; ChemIDplus)

* Dermal

- Product (ATEmix) : >5000mg/kg
- [Xylene] : LD50 12126 mg/kg Rabbit (ECHA)
- [Talc(Containing no asbestos fibers) ] : LD50 >2000 ㎎/㎏ Rat (OECD TG 402, GLP)(ECHA)
- [n-Butyl acetate] : LD50 > 14112 mg/kg Rabbit (> 16 mL/kg) (OECD TG 402) (ECHA)
- [Ethylbenzene] : LD50 15432 mg/kg (17.8 mL/kg) Rabbit (ECHA)
- [Propylene glycol methyl ether acetate] : LD50 > 5000 mg/kg Rabbit (IUCLID)
- [Silicon dioxide] : LD50 > 5000 ㎎/㎏ Rat (ECHA)
- [Toluene] : LD50 > 5000 mg/kg Rabbit (ECHA)
- [Dihydro-3-(tetrapropenyl)-2,5-furandione] : LD50 6220 ㎎/㎏ Rabbit NLM; ChemIDplus

* Inhalation

- Product (ATEmix) : 10.0mg/L 4hr < ATEmix <= 20.0mg/L 4hr
- [Xylene] : Vapor LC50 10~20 mg/L 4 hr (NIER)

- [Titanium dioxide] : Aerosol LC50 5.09 mg/L 4h Rat No death, Not classified (ECHA)
- [Talc(Containing no asbestos fibers) ] : Dust LC50 >2.1 ㎎/ℓ 4 hr Rat No death (OECD TG 403, GLP)(ECHA)
- [n-Butyl acetate] : Vapor LC50 > 6.6 mg/L 4 hr Rat No death Not classified (OECD TG 403, GLP) (ECHA)
- [Ethylbenzene] : Vapor LC50 10~20 mg/L 4 hr (EU Harmonized Cat. 4) (ECHA)
- [Propylene glycol methyl ether acetate] : Vapor LC0 >23.3 mg/L/4h, LC0 > 1732ppm 4hr (> 2000 ppm 3hr) Rat No death Not classified (ECHA)
- [Iron hydroxide oxide yellow (C.I. pigment yellow 042)] : LC50 5.05 ㎎/ℓ 4 hr Rat (OECD Guideline 403, GLP)(ECHA)
- [Silicon dioxide] : Dust LC50 > 2.08 ㎎/ℓ 4 hr Rat (Amorphous silica (CAB-O-SIL M5)_SIDS (2006))
- [Toluene] : Vapor LC50 28.1 mg/L 4 hr Rat (OECD TG 403) (ECHA)

○ Skin corrosion/irritation

- Causes skin irritation

○ Serious eye damage/irritation

- Causes serious eye irritation

○ Respiratory sensitization

- Not available

○ Skin sensitization

- May cause an allergic skin reaction

○ Carcinogenicity

* IARC
  - [Xylene] : Group 3
  - [Titanium dioxide] : Group 2B
    ※ IARC (International Agency for Research on Cancer) has classified TiO2 as a substance which may be possibly carcinogenic to humans. However, studies on TiO2 conducted by the IARC state that when TiO2 is mixed in substance such as paints and coatings, the level of exposure is not severe. An increase in cancer was found only when ultrafine TiO2 particles of less than 100nm were used in a Study on Long-term Inhalation of TiO2 by Animals, issued by the National Institute for Occupational Safety & Health (NIOSH). Therefore, it is difficult to conclude that this product, which contains TiO2 with a particle size of 280~360nm, can be carcinogenic enough to cause cancer.
  - [Talc(Containing no asbestos fibers) ] : Group 3
  - [Ethylbenzene] : Group 2B
  - [Silicon dioxide] : Group 3 (Silica, amorphous)
  - [Toluene] : Group 3
* OSHA
  - Not available
* ACGIH
  - [Xylene] : A4
  - [Titanium dioxide] : A3
  - [Talc(Containing no asbestos fibers) ] : A4 (Talc(containing no asbestos fibers))
  - [Ethylbenzene] : A3
  - [Toluene] : A4
* NTP
  - Not available
* EU CLP
  - [Titanium dioxide] : Carc. 2

○ Germ cell mutagenicity

- Not available

○ Reproductive toxicity

- Suspected of damaging fertility or the unborn child

○ STOT-single exposure

- May cause drowsiness and dizziness.
- May cause respiratory irritation.

○ STOT-repeated exposure

- May cause damage to organs through prolonged or repeated exposure

○ Aspiration hazard

- May be fatal if swallowed and enters airways

## 12. ECOLOGICAL INFORMATION

### A. Ecotoxicity

○ Fish

- [Xylene] : LC50 7.6 mg/L 96 hr Oncorhynchus mykiss (OECD TG 203) (ECHA)
- [Titanium dioxide] : LC50 >100 ㎎/L 96 hr Carassius auratus, Oncorhynchus mykiss (ECHA)
- [n-Butyl acetate] : LC50 18 mg/L 96 hr Pimephales promelas (OECD TG 203) (ECHA)
- [Ethylbenzene] : LC50 5.1 mg/L 96 hr Menidia menidia (ECHA)
- [Propylene glycol methyl ether acetate] : LC50 100~180 mg/L 96 hr Oncorhynchus mykiss (OECD TG 203), NOEC 47.5 mg/L 14 d Oryzias latipes (OECD TG 204, GLP) (ECHA)
- [Silicon dioxide] : LC50 10000 ㎎/ℓ 96 hr (Danio rerio, (OECD TG203, GLP)(ECHA)
- [Toluene] : LC50 5.5 mg/L 96 hr, NOEC 1.39 mg/L 40 d Oncorhynchus kistutch (ECHA)

○ Crustaceans

- [Xylene] : NOEC 1.17 mg/L 7 d Ceriodaphnia dubia (ECHA)
- [Titanium dioxide] : EC50 >100 ㎎/L 48 hr Daphnia magna, OECD TG 202 (ECHA)
- [n-Butyl acetate] : EC50 44 mg/L 48 hr Daphnia sp. (OECD TG 202), NOEC 23.2 mg/L 21 d Daphnia magna (OECD TG 211, GLP, Read-across CAS No. 110-19-0) (ECHA)
- [Ethylbenzene] : EC50 1.8~2.4 mg/L 48 hr Daphnia magna, NOEC 0.96 mg/L 7 d Ceriodaphnia dubia (ECHA)
- [Propylene glycol methyl ether acetate] : EC50 408 mg/L 48 hr Daphnia magna (OECD TG 202, GLP), NOEC >= 100 mg/L 21 d Daphnia magna (OECD TG 211, GLP) (ECHA)
- [Iron hydroxide oxide yellow (C.I. pigment yellow 042)] : LC50 ≥ 100 ㎎/ℓ 48 hr Daphnia magna (GLP, ECHA)
- [Silicon dioxide] : EC50 >1000 ㎎/ℓ 24 hr Daphnia magna(OECD TG202)(ECHA)
- [Toluene] : EC50 3.78mg/L 48hr, NOEC 0.74 mg/L 7 d Ceriodaphnia dubia (ECHA)

○ Algae

- [Xylene] : EC50 4.7 mg/L 72 hr Raphidocelis subcapitata (OECD TG 201) (ECHA)
- [Titanium dioxide] : ErL50 > 100 ㎎/ℓ 72 hr Pseudokirchneriella subcapitata, growth rate, static, (72h-EyL50 >100 mg/L static, OECD TG 201) (ECHA)
- [n-Butyl acetate] : EC50 392 mg/L 48 hr, NOEC 196 mg/L 48 hr Raphidocelis subcapitata (OECD TG 201, GLP) (Read-across CAS No. 110-19-0) (ECHA)
- [Ethylbenzene] : EC50 3.6 mg/L 96 hr, NOEC 3.4 mg/L 96 hr Raphidocelis subcapitata (ECHA)
- [Propylene glycol methyl ether acetate] : EC50 >1000 mg/L 72 hr, NOEC >= 1000 mg/L 96 hr Raphidocelis subcapitata (OECD TG 201) (ECHA)
- [Iron hydroxide oxide yellow (C.I. pigment yellow 042)] : EC50 18 ㎎/ℓ 72 hr Pseudokirchneriella subcapitata (ECHA)
- [Silicon dioxide] : EC50 >10000 ㎎/ℓ 72 hr (Desmodesmus subspicatus, OECD TG201, GLP)(ECHA)
- [Toluene] : EC50 134 mg/L 3 hr Chlorella vulgaris and Chlamydomonas angulosa (ECHA)

### B. Persistence and degradability

○ Persistence

- [Xylene] : log Pow 3.12 (ECHA)
- [n-Butyl acetate] : log Pow 2.3 (25°C) (OECD TG 117, GLP) (ECHA)
- [Ethylbenzene] : log Pow 3.6 (20 °C) (ECHA)
- [Propylene glycol methyl ether acetate] : log Pow 1.2 (20 °C) (OECD TG 117, GLP) (ECHA)
- [Toluene] : log Pow 2.73 (20 °C) (ECHA)
- [Dihydro-3-(tetrapropenyl)-2,5-furandione] : log Kow >=4.39 (ECHA)

○ Degradability

- Not available

C. Bioaccumulative potential

○ Bioaccumulative potential

- [Ethylbenzene] : BCF 1 (ECHA)
- [Toluene] : BCF 90 (ECHA)

○ Biodegradation

- [Xylene] : 94 % 28 d, Readily biodegradable (OECD TG 301 F, GLP) (ECHA)
- [n-Butyl acetate] : 83 % 28 d, Readily biodegradable (OECD TG 301 D) (ECHA)
- [Ethylbenzene] : 70~ 80 % 28 d, Readily biodegradable (ECHA)
- [Propylene glycol methyl ether acetate] : 83 % 28 d, Readily biodegradable (OECD TG 301 F, GLP) (ECHA)
- [Toluene] : 69 % 5 d, Readily biodegradable (ECHA)
- [Dihydro-3-(tetrapropenyl)-2,5-furandione] : no biodegradation observed (ECHA)

D. Mobility in soil

- [Xylene] : log Koc ca. 2.73 dimensionless (OECD TG 121) (ECHA)
- [Dihydro-3-(tetrapropenyl)-2,5-furandione] : 10280 (Estimate)

E. Other adverse effects

- [Iron hydroxide oxide yellow (C.I. pigment yellow 042)] : Insoluble substances (water solubility 1㎎/ℓ or less (Not classified in acute toxicity)(ECHA)

## 13. DISPOSAL CONSIDERATIONS

A. Disposal methods

- It shall be treated by incineration
- Oil water separation technology shall be applied as pre-waste treatment if it is applicable
- Stabilization and minimization treatment by incineration or similar method can be applied, if more than two kinds of designated wastes are in mixture state and it is impractical to separate them

B. Special precautions for disposal

- Anyone with business license number who generates industrial wastes shall treat the waste by him/herself or by entrusting to the legal entities who treat the wastes, recycle the wastes of others or install and operate the waste treatment facilities according to the Wastes Control Act
- Dispose of waste in accordance with all applicable laws and regulations.

## 14. TRANSPORT INFORMATION

A. UN No. (IMDG CODE/IATA DGR)

- 1263

B. Proper shipping name

- PAINT (including paint, lacquer, enamel, stain, shellac, varnish, polish, liquid filler and liquid lacquer base)

C. Hazard Class

- 3

D. IMDG CODE/IATA DGR Packing group

- III

E. Marine pollutant

- Not applicable

F. Special precautions for user related to transport or transportation measures

- Local transport follows in accordance with Dangerous goods Safety Management Law.
- Package and transport follow in accordance with Department of Transportation (DOT) and other regulatory agency requirements.
- EmS FIRE SCHEDULE : F-E (Non-water-reactive flammable liquids)
- EmS SPILLAGE SCHEDULE : S-E (Flammable liquids, floating on water)

## 15. REGULATORY INFORMATION

A. National and/or international regulatory information

○ POPs Management Law

- [Xylene] : Not applicable
- [Titanium dioxide] : Not applicable
- [Pyrophyllite] : Not applicable
- [Talc(Containing no asbestos fibers) ] : Not applicable
- [n-Butyl acetate] : Not applicable
- [Ethylbenzene] : Not applicable
- [Styrene, 2-hydroxyethyl methacrylate, methyl methacrylate, methacrylic acid, n-butyl acrylate, diethylaminoethyl methacrylate, n-butyl methacrylate, fumaric acid copolymer with glycidyl neodecanoate] : Not applicable
- [Propylene glycol methyl ether acetate] : Not applicable
- [Iron hydroxide oxide yellow (C.I. pigment yellow 042)] : Not applicable
- [Silicon dioxide] : Not applicable
- [Toluene] : Not applicable
- [Dihydro-3-(tetrapropenyl)-2,5-furandione] : Not applicable

○ Information of EU Classification

* Classification
  - [Xylene] : H226,H312,H315,H332
  - [n-Butyl acetate] : H226,H336
  - [Ethylbenzene] : H225,H304,H332,H373
  - [Propylene glycol methyl ether acetate] : H226
  - [Toluene] : H225,H304,H315,H336,H361,H373

○ U.S. Federal regulations

* OSHA PROCESS SAFETY (29CFR1910.119)
  - Not applicable

* CERCLA Section 103 (40CFR302.4)
  - [Xylene] : 45.3599 kg 100 lb
  - [n-Butyl acetate] : 2267.995 kg 5000 lb
  - [Ethylbenzene] : 453.599 kg 1000 lb
  - [Toluene] : 453.599 kg 1000 lb
  - [Titanium dioxide] : Not applicable
  - [Pyrophyllite] : Not applicable
  - [Talc(Containing no asbestos fibers) ] : Not applicable
  - [Styrene, 2-hydroxyethyl methacrylate, methyl methacrylate, methacrylic acid, n-butyl acrylate, diethylaminoethyl methacrylate, n-butyl methacrylate, fumaric acid copolymer with glycidyl neodecanoate] : Not
  - [Propylene glycol methyl ether acetate] : Not applicable
  - [Iron hydroxide oxide yellow (C.I. pigment yellow 042)] : Not applicable
  - [Silicon dioxide] : Not applicable
  - [Dihydro-3-(tetrapropenyl)-2,5-furandione] : Not applicable

* EPCRA Section 302 (40CFR355.30)
  - Not applicable

* EPCRA Section 304 (40CFR355.40)
  - Not applicable

* EPCRA Section 313 (40CFR372.65)
  - [Xylene] : Applicable
  - [Ethylbenzene] : Applicable
  - [Toluene] : Applicable

- [Titanium dioxide] : Not applicable
- [Pyrophyllite] : Not applicable
- [Talc(Containing no asbestos fibers) ] : Not applicable
- [n-Butyl acetate] : Not applicable
- [Styrene, 2-hydroxyethyl methacrylate, methyl methacrylate, methacrylic acid, n-butyl acrylate, diethylaminoethyl methacrylate, n-butyl methacrylate, fumaric acid copolymer with glycidyl neodecanoate] : Not
- [Propylene glycol methyl ether acetate] : Not applicable
- [Iron hydroxide oxide yellow (C.I. pigment yellow 042)] : Not applicable
- [Silicon dioxide] : Not applicable
- [Dihydro-3-(tetrapropenyl)-2,5-furandione] : Not applicable

○ Rotterdam Convention listed ingredients

- Not applicable

○ Stockholm Convention listed ingredients

- Not applicable

○ Montreal Protocol listed ingredients

- Not applicable

## 16. OTHER INFORMATION

### A. Reference

- The information contained herein is believed to be accurate. It is provided independently of any sale of the product for purpose of hazard communication. It is not intended to constitute performance information concerning the product. No express warranty, or implied warranty of merchantability or fitness for a particular purpose is made with respect to the product or the information contained herein.
- This Safety Data Sheet was compiled with data and information from the following sources: KOSHA, NITE, ESIS, NLM, SIDS, IPCS

### B. Issue date

- 2019-10-11

### C. Revision number and Last date revised

- 3 times, 2024-02-07

### D. Other

- This SDS is prepared according to the Globally Harmonized System (GHS).

# SAFETY DATA SHEET

According to OSHA Hazcom Standard 29 CFR 1910.1200

# 2958(RT)C.A

## 1. IDENTIFICATION

A. Product name

- 2958(RT)C.A

B. Recommended use and restriction on use

- General use : urethane hardener
- Restriction on use : Do not use except for purpose

C. Manufacturer / Supplier / Distributor information

○ Manufacturer information

- Company name : KCC Corporation
- Address : 30, Bangeojinsunhwando-ro, Dong-gu, Ulsan
- Emergency telephone number : 82-52-280-1717

○ Supplier/Distributer information

- Company name : KCC Corporation
- Address : 30, Bangeojinsunhwando-ro, Dong-gu, Ulsan
- Emergency telephone number : 82-52-280-1717

## 2. HAZARD IDENTIFICATION

A. GHS Classification

- Flammable liquids : Category3
- Acute toxicity (oral) : Category5
- Acute toxicity (dermal) : Category5
- Acute toxicity (inhalation: vapor) : Category3
- Skin corrosion/irritation : Category2
- Serious eye damage/irritation : Category2
- Respiratory sensitization : Category1
- Skin sensitization : Category1
- Germ cell mutagenicity : Category1B
- Carcinogenicity : Category1B
- Reproductive toxicity : Category2
- Specific target organ toxicity(Single exposure) : Category3(Narcotic effects)
- Specific target organ toxicity(Single exposure) : Category3(Respiratory tract irritation)
- Specific target organ toxicity(Repeated exposure) : Category2
- Aspiration hazard : Category1
- Acute aquatic toxicity : Category3
- Chronic aquatic toxicity : Category3

B. GHS label elements

○ Hazard symbols

○ Signal words

- Danger

○ Hazard statements

- H226 Flammable liquid and vapour
- H303 May harmful if swallowed.
- H304 May be fatal if swallowed and enters airways
- H313 May be harmful if contact with skin.
- H315 Causes skin irritation
- H317 May cause an allergic skin reaction
- H319 Causes serious eye irritation
- H331 Toxic if inhaled
- H334 May cause allergy or asthma symptoms or breathing difficulties if inhaled
- H335 May cause respiratory irritation.
- H336 May cause drowsiness and dizziness.
- H340 May cause genetic defects
- H350 May cause cancer
- H361 Suspected of damaging fertility or the unborn child
- H373 May cause damage to organs through prolonged or repeated exposure
- H402 Harmful to aquatic organisms.
- H412 Harmful to aquatic life with long lasting effects

○ Precautionary statements

1) Prevention

- P201 Obtain special instructions before use.
- P202 Do not handle until all safety precautions have been read and understood.
- P210 Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking.
- P233 Keep container tightly closed.
- P240 Ground and bond container and receiving equipment.
- P241 Use explosion-proof electrical/ventilating/lighting/equipment.
- P242 Use non-sparking tools.
- P243 Take action to prevent static discharges.
- P260 Do not breathe dust/fume/gas/mist/vapours/spray.
- P261 Avoid breathing dust/fume/gas/mist/vapours/spray.
- P264 Wash hands thoroughly after handling.
- P271 Use only outdoors or in a well-ventilated area.
- P272 Contaminated work clothing should not be allowed out of the workplace.
- P273 Avoid release to the environment.
- P280 Wear protective gloves/protective clothing/eye protection/face protection/hearing protection.
- P284 In case of inadequate ventilation wear respiratory protection.

2) Response

- P301+P310 IF SWALLOWED: Immediately call a POISON CENTER or doctor/physician.
- P301+P312 IF SWALLOWED: Call a POISON CENTER or doctor/physician if you feel unwell.

- P302+P312 IF ON SKIN: Call a POISON CENTER/doctor if you feel unwell.

- P302+P352 IF ON SKIN: Wash with plenty of soap and water.

- P303+P361+P353 IF ON SKIN (or hair): Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower.

- P304+P340 IF INHALED: Remove person to fresh air and keep comfortable for breathing.

- P305+P351+P338 IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.

- P308+P313 If exposed or concerned: Get medical advice/attention.

- P311 Call a POISON CENTER or doctor/physician.

- P312 Call a POISON CENTER or doctor/physician if you feel unwell.

- P314 Get medical advice/attention if you feel unwell.

- P321 Specific treatment

- P331 Do NOT induce vomiting.

- P332+P313 If skin irritation occurs: Get medical advice/attention.

- P333+P313 If skin irritation or rash occurs: Get medical advice/attention.

- P337+P313 If eye irritation persists: Get medical advice/attention.

- P342+P311 If experiencing respiratory symptoms: Call a POISON CENTER or doctor/physician.

- P362+P364 Take off contaminated clothing and wash before reuse.

- P370+P378 In case of fire: Use Suitable extinguishing media for extinction(Refer Section MSDS 5).

3) Storage

- P403+P233 Store in a well-ventilated place. Keep container tightly closed.

- P403+P235 Store in a well-ventilated place. Keep cool.

- P405 Store locked up.

4) Disposal

- P501 Dispose of contents/container in accordance with local/regional/national/international regulation

C. Other hazards which do not result in classification

- Not available

## 3. COMPOSITION/INFORMATION ON INGREDIENTS

| Chemical Name | Trade names and Synonyms | CAS No. | Content(%) |
|---|---|---|---|
| 1,6-Diisocyanatohexane homopolymer | POLY(HEXAMETHYLENE DIISOCYANATE) | 28182-81-2 | 64 ~ 71 |
| Xylene | Xylol ; Methyltoluene | 1330-20-7 | 16 ~ 23 |
| Propylene glycol methyl ether acetate | Propylene glycol monomethyl ether acetate ; 2-(1-Methoxy)propyl acetate ; 1-Methoxypropan-2-yl acetate ; | 108-65-6 | 1 ~ 8 |
| n-Butyl acetate | Acetic acid, butyl ester ; 1-Butyl acetate ; Butyl acetate ; Acetic acid N-butyl ester ; Butyl ethanoate ; 1-Acetoxybutane | 123-86-4 | 1 ~ 8 |
| Solvent naphtha (petroleum), light arom. | Naphtha | 64742-95-6 | 1 ~ 8 |
| Ethylbenzene | Benzene, ethyl- ; Ethyl benzene ; Ethylbenzol ; Phenylethane ; | 100-41-4 | 1 ~ 6 |
| 4-Methylbenzenesulfonyl isocyanate | p-Toluenesulfonic acid,anhydride with isocyanic acid (7CI,8CI) | 4083-64-1 | 0.1~1 |
| Hexamethylene Diisocyanate | 1,6-Diisocyanatohexane ; 1,6-Hexamethylene diisocyanate ; 1,6-Hexanediol diisocyanate ; 1,6-Hexylene diisocyanate ; Isocyanic acid, hexamethylene ester ; Hexane-1,6-diisocyanate | 822-06-0 | 0.1~1 |

## 4. FIRST AID MEASURES

A. Eye contact

- Do not rub your eyes.
- Immediately flush eyes with plenty of water for at least 15 minutes and call a doctor/physician.
- Get medical attention immediately.
- Go to the hospital immediately if symptoms(flare, irritate) occur.
- Remove contact lenses if worn.

B. Skin contact

- Flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes.
- Wash contaminated clothing thoroughly before re-using.
- Get medical attention immediately.
- Go to the hospital immediately if symptoms(flare, irritate) occur.
- Remove contaminated clothing, shoes and isolate.
- Wash thoroughly after handling.
- Wear gloves when washing the patient, and please avoid contact with contaminated clothing.

C. Inhalation contact

- Take specific treatment if needed.
- When exposed to large amounts of steam and mist, move to fresh air.
- Get medical attention immediately.
- Go to the hospital immediately if symptoms(flare, irritate) occur.
- If breathing is stopped or irregular, give artificial respiration and supply oxygen.
- Take the doctor's examination.

D. Ingestion contact

- Please be advised by doctor whether induction of vomit is demanded or not.
- Rinse your mouth with water immediately.
- Get medical attention immediately.
- If swallowed, large amounts of water to drink and do not induce vomiting.

E. Delayed and immediate effects and also chronic effects from short and long term exposure

- Not available

F. Notes to physician

- Notify medical personnel of contaminated situations and have them take appropriate protective measures.
- If exposed or concerned, get medical attention/advice.
- Remove to fresh air and keep at rest in a position comfortable for breathing.

## 5. FIREFIGHTING MEASURES

A. Suitable (Unsuitable) extinguishing media

- Avoid use of water jet for extinguishing
- Dry chemical, carbon dioxide, regular foam extinguishing agent, spray

B. Specific hazards arising from the chemical

- Causes serious eye irritation
- Causes skin irritation
- Flammable liquid and vapour
- Harmful to aquatic life with long lasting effects
- Harmful to aquatic organisms.

C. Special protective actions for firefighters

- Avoid inhalation of materials or combustion by-products.
- Cool containers with water until well after fire is out.
- Do not approach the tank surrounded by fire until it is extinguished.
- In case of conflagration, use automatic fire sprinkler. Major fire may require withdrawal, allowing the object itself to burn.

- Keep unauthorized personnel out.

## 6. ACCIDENTAL RELEASE MEASURES

### A. Personal precautions, protective equipment and emergency procedures

- Do not touch spilled material. Stop leak if you can do it without risk.
- Handle the damaged containers or spilled material after wearing appropriate protective equipment
- Move container to safe area from the leak area.
- Must work against the wind, let the upwind people to evacuate.
- Remove all sources of ignition.

### B. Environmental precautions

- If large amounts have been spilled, inform the relevant authorities.
- Prevent runoff and contact with waterways, drains or sewers.

### C. Methods and materials for containment and cleaning up

- Appropriate container for disposal of spilled material collected.
- Dike for later disposal.
- Disposal of waste shall be in compliance with the Wastes Control Act
- Large spill : Stay upwind and keep out of low areas. Dike for later disposal.
- Notify the central and local government if the emission reach the standard threshold.

## 7. HANDLING AND STORAGE

### A. Precautions for safe handling

- Avoid contact with incompatible materials.
- Avoid direct physical contact.
- Comply with all applicable laws and regulations for handling
- Dealing only with a well-ventilated place.
- Do not handle until all safety precautions have been read and understood.

### B. Conditions for safe storage, including any incompatibilities

- Avoid direct sunlight.
- Check regularly for leaks.
- Do not apply any physical shock to container.
- Do not apply direct heat.
- Do not use damaged containers.

## 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

### A. Exposure limits

○ ACGIH TLV

- [Xylene] : TWA 20 ppm
- [n-Butyl acetate] : TWA 50 ppm , STEL 150 ppm
- [Ethylbenzene] : TWA, 20 ppm (87 mg/m3)
- [Hexamethylene Diisocyanate] : TWA, 0.005 ppm (0.034 mg/m3)

○ OSHA PEL

- [Xylene] : 100 ppm, 435 mg/m3
- [n-Butyl acetate] : 150 ppm, 710 mg/m3
- [Ethylbenzene] : 100 ppm, 435 mg/m3

### B. Engineering controls

- Business owner is recommended to maintain below recommended exposure limits for the working place with general exhaust of gas/vapour/mist/fume.

### C. Individual protection measures, such as personal protective equipment

○ Respiratory protection

- Any air-purifying respirator with a full facepiece and an organic vapor canister.

- Any chemical cartridge respirator with a full facepiece and organic vaporcartridge(s).
- Any chemical cartridge respirator with organic vapor cartridge(s).
- Consider warning properties before use.
- For Unknown Concentration or Immediately Dangerous to Life or Health : Any supplied-air respirator with full facepiece and operated in a pressure-demand or other positive-pressure mode in combination with a separate escape supply. Any self-contained breathing apparatus with a full facepiece.
- Respiratory protection is ranked in order from minimum to maximum.
- Under conditions of frequent use or heavy exposure, Respiratory protection may be needed.

○ Eye protection

- Provide an emergency eye wash station and quick drench shower in the immediate work area.
- Wear primary eye protection such as splash resistant safety goggles with a secondary protection face shield.

○ Hand protection

- Wear appropriate chemical resistant glove.

○ Skin protection

- Wear appropriate chemical resistant protective clothing.

○ Others

- Not available

## 9. PHYSICAL AND CHEMICAL PROPERTIES

| | |
|---|---|
| A. Appearance | |
| - Appearance | Liquid |
| - Color | CLEAR |
| B. Odor | Solvent odor |
| C. Odor threshold | Not available |
| D. pH | Not available |
| E. Melting point/Freezing point | Not available |
| F. Initial Boiling Point/Boiling Ranges | Not available |
| G. Flash point | 23℃ |
| H. Evaporation rate | Not available |
| I. Flammability(solid, gas) | Not available |
| J. Upper/Lower Flammability or explosive limits | Not available |
| K. Vapour pressure | Not available |
| L. Solubility | Not available |
| M. Vapour density | >1 |
| N. Specific gravity(Relative density) | 1.0~1.4 |
| O. Partition coefficient of n-octanol/water | Not available |
| P. Autoignition temperature | 408 |
| Q. Decomposition temperature | Not available |
| R. Viscosity | 15~25 sec |
| S. Molecular weight | Not available |

## 10. STABILITY AND REACTIVITY

A. Chemical Stability

- This material is stable under recommended storage and handling conditions.

B. Possibility of hazardous reactions

- Cylinders exposed to fire may vent and release flammable gas.

C. Conditions to avoid

- Avoid : Accumulation of electrostatic charges, Heating, Flames and hot surfaces
- Avoid contact with incompatible materials and condition.
- Avoid contact with heat, sparks, flame or other ignition sources.

D. Incompatible materials

- Sparks, flames, static electricity, strong acids and base substances

E. Hazardous decomposition products

- May emit flammable vapour if involved in fire.

## 11. TOXICOLOGICAL INFORMATION

A. Information on the likely routes of exposure

○ Respiratory tracts

- May be fatal if swallowed and enters airways
- May cause allergy or asthma symptoms or breathing difficulties if inhaled
- May cause respiratory irritation.

○ Oral

- May harmful if swallowed.

○ Eye·Skin

- Causes skin irritation
- May cause an allergic skin reaction

B. Delayed and immediate effects and also chronic effects from short and long term exposure

○ Acute toxicity

* Oral

- Product (ATEmix) : 2000mg/kg < ATEmix <= 5000mg/kg
- [1,6-Diisocyanatohexane homopolymer] : LD50 > 2500 mg/kg Rat (ECHA)
- [Xylene] : LD50 3523 mg/kg Rat (EU Method B.1) (ECHA)
- [Propylene glycol methyl ether acetate] : LD50 6190 mg/kg Rat (OECD TG 401, GLP) (ECHA)
- [n-Butyl acetate] : LD50 10760 mg/kg Rat (12.2 mL/kg) (OECD TG 423) (ECHA)
- [Solvent naphtha (petroleum), light arom.] : LD50 = 8400 ㎎/㎏ Rat (RTECS)
- [Ethylbenzene] : LD50 3500 mg/kg Rat (ECHA)
- [4-Methylbenzenesulfonyl isocyanate] : LD50 = 2234 ㎎/㎏ Rat (NLM: ChemIDplus)
- [Hexamethylene Diisocyanate] : LD50 746 ㎎/㎏ Rat (OECD TG 401)(NIER, ECHA)

* Dermal

- Product (ATEmix) : 2000mg/kg < ATEmix <= 5000mg/kg
- [1,6-Diisocyanatohexane homopolymer] : LD50 > 2000 mg/kg Rat (ECHA)
- [Xylene] : LD50 12126 mg/kg Rabbit (ECHA)
- [Propylene glycol methyl ether acetate] : LD50 > 5000 mg/kg Rabbit (IUCLID)
- [n-Butyl acetate] : LD50 > 14112 mg/kg Rabbit (> 16 mL/kg) (OECD TG 402) (ECHA)
- [Solvent naphtha (petroleum), light arom.] : LD50 > 2000 ㎎/㎏ Rabbit (IUCLID)
- [Ethylbenzene] : LD50 15432 mg/kg (17.8 mL/kg) Rabbit (ECHA)
- [Hexamethylene Diisocyanate] : LD50 559 mg/kg Rabbir (NIER), LD50 593 ㎎/㎏ rabbit (CERI Hazard Data 2000-50 (2001))

* Inhalation

- Product (ATEmix) : 2.0mg/L 4hr < ATEmix <= 10.0mg/L 4hr
- [1,6-Diisocyanatohexane homopolymer] : Aerosol LC50 2.61 mg/L 4h Rat (ECHA)
- [Xylene] : Vapor LC50 10~20 mg/L 4 hr (NIER)
- [Propylene glycol methyl ether acetate] : Vapor LC0 >23.3 mg/L/4h, LC0 > 1732ppm 4hr (> 2000 ppm 3hr) Rat No death Not classified (ECHA)

- [n-Butyl acetate] : Vapor LC50 > 6.6 mg/L 4 hr Rat No death Not classified (OECD TG 403, GLP) (ECHA)
- [Solvent naphtha (petroleum), light arom.] : Vapor LC50 > 5.61 mg/L 4 hr Rat (Read-across: 86290-81-5) No death (ECHA)
- [Ethylbenzene] : Vapor LC50 10~20 mg/L 4 hr (EU Harmonized Cat. 4) (ECHA)
- [4-Methylbenzenesulfonyl isocyanate] : LC50 > 2.58 ㎎/ℓ 4hr (>640 ppm/1hr) Rat (NLM: ChemIDplus)
- [Hexamethylene Diisocyanate] : LC50 0.124 mg/L (124 ㎎/㎥ 4hr) Rat (OECD TG 403, GLP)(NIER, ECHA)

○ Skin corrosion/irritation

- Causes skin irritation

○ Serious eye damage/irritation

- Causes serious eye irritation

○ Respiratory sensitization

- May cause allergy or asthma symptoms or breathing difficulties if inhaled

○ Skin sensitization

- May cause an allergic skin reaction

○ Carcinogenicity

* IARC
  - [Xylene] : Group 3
  - [Ethylbenzene] : Group 2B
* OSHA
  - Not available
* ACGIH
  - [Xylene] : A4
  - [Ethylbenzene] : A3
* NTP
  - Not available
* EU CLP
  - [Solvent naphtha (petroleum), light arom.] : Carc. 1B (Note P)

○ Germ cell mutagenicity

- May cause genetic defects

○ Reproductive toxicity

- Suspected of damaging fertility or the unborn child

○ STOT-single exposure

- May cause drowsiness and dizziness.
- May cause respiratory irritation.

○ STOT-repeated exposure

- May cause damage to organs through prolonged or repeated exposure

○ Aspiration hazard

- May be fatal if swallowed and enters airways

## 12. ECOLOGICAL INFORMATION

### A. Ecotoxicity

○ Fish

- [Xylene] : LC50 7.6 mg/L 96 hr Oncorhynchus mykiss (OECD TG 203) (ECHA)
- [Propylene glycol methyl ether acetate] : LC50 100~180 mg/L 96 hr Oncorhynchus mykiss (OECD TG 203), NOEC 47.5 mg/L 14 d Oryzias latipes (OECD TG 204, GLP) (ECHA)
- [n-Butyl acetate] : LC50 18 mg/L 96 hr Pimephales promelas (OECD TG 203) (ECHA)
- [Solvent naphtha (petroleum), light arom.] : LC50 = 9.22 ㎎/ℓ 96 hr Oncorhynchus mykiss (IUCLID)
- [Ethylbenzene] : LC50 5.1 mg/L 96 hr Menidia menidia (ECHA)

- [Hexamethylene Diisocyanate] : LC0 Danio rerio ≥82.8 mg/L 96h (EU Method C.1)(ECHA)

○ Crustaceans

- [Xylene] : NOEC 1.17 mg/L 7 d Ceriodaphnia dubia (ECHA)
- [Propylene glycol methyl ether acetate] : EC50 408 mg/L 48 hr Daphnia magna (OECD TG 202, GLP), NOEC >= 100 mg/L 21 d Daphnia magna (OECD TG 211, GLP) (ECHA)
- [n-Butyl acetate] : EC50 44 mg/L 48 hr Daphnia sp. (OECD TG 202), NOEC 23.2 mg/L 21 d Daphnia magna (OECD TG 211, GLP, Read-across CAS No. 110-19-0) (ECHA)
- [Solvent naphtha (petroleum), light arom.] : EC50 = 6.14 ㎎/ℓ 48 hr Daphnia magna (IUCLID)
- [Ethylbenzene] : EC50 1.8~2.4 mg/L 48 hr Daphnia magna, NOEC 0.96 mg/L 7 d Ceriodaphnia dubia (ECHA)
- [Hexamethylene Diisocyanate] : EC50 >= 89.1 ㎎/ℓ 48 hr (NITE)

○ Algae

- [1,6-Diisocyanatohexane homopolymer] : EC50 > 1000 mg/L 72h Scenedesmus subspicatus CHODAT (ECHA)
- [Xylene] : EC50 4.7 mg/L 72 hr Raphidocelis subcapitata (OECD TG 201) (ECHA)
- [Propylene glycol methyl ether acetate] : EC50 >1000 mg/L 72 hr, NOEC >= 1000 mg/L 96 hr Raphidocelis subcapitata (OECD TG 201) (ECHA)
- [n-Butyl acetate] : EC50 392 mg/L 48 hr, NOEC 196 mg/L 48 hr Raphidocelis subcapitata (OECD TG 201, GLP) (Read-across CAS No. 110-19-0) (ECHA)
- [Solvent naphtha (petroleum), light arom.] : EC50 = 19 ㎎/ℓ 72 hr Selenastrum capricornutum (IUCLID)
- [Ethylbenzene] : EC50 3.6 mg/L 96 hr, NOEC 3.4 mg/L 96 hr Raphidocelis subcapitata (ECHA)
- [Hexamethylene Diisocyanate] : EC50 >77.4 ㎎/ℓ 72 hr (EU Method C.3)(ECHA)

B. Persistence and degradability

○ Persistence

- [1,6-Diisocyanatohexane homopolymer] : Log Kow 9.81 (ECHA)
- [Xylene] : log Pow 3.12 (ECHA)
- [Propylene glycol methyl ether acetate] : log Pow 1.2 (20 °C) (OECD TG 117, GLP) (ECHA)
- [n-Butyl acetate] : log Pow 2.3 (25°C) (OECD TG 117, GLP) (ECHA)
- [Solvent naphtha (petroleum), light arom.] : log Kow = 2.1 ~ 6 (Estimate) (IUCLID)
- [Ethylbenzene] : log Pow 3.6 (20 °C) (ECHA)
- [Hexamethylene Diisocyanate] : log Kow 1.07 (ICSC)

○ Degradability

- [Solvent naphtha (petroleum), light arom.] : BOD5/COD = 0.43

C. Bioaccumulative potential

○ Bioaccumulative potential

- [Ethylbenzene] : BCF 1 (ECHA)

○ Biodegradation

- [1,6-Diisocyanatohexane homopolymer] : 1%, 28d (O2 consumption) No biodegradation observed (ECHA)
- [Xylene] : 94 % 28 d, Readily biodegradable (OECD TG 301 F, GLP) (ECHA)
- [Propylene glycol methyl ether acetate] : 83 % 28 d, Readily biodegradable (OECD TG 301 F, GLP) (ECHA)
- [n-Butyl acetate] : 83 % 28 d, Readily biodegradable (OECD TG 301 D) (ECHA)
- [Ethylbenzene] : 70~ 80 % 28 d, Readily biodegradable (ECHA)
- [Hexamethylene Diisocyanate] : 42% 28 day (Nonbiodegradable, OECD TG301F)(ECHA)

D. Mobility in soil

- [Xylene] : log Koc ca. 2.73 dimensionless (OECD TG 121) (ECHA)

E. Other adverse effects

- Not available

## 13. DISPOSAL CONSIDERATIONS

A. Disposal methods

- It shall be treated by incineration

- Oil water separation technology shall be applied as pre-waste treatment if it is applicable

- Stabilization and minimization treatment by incineration or similar method can be applied, if more than two kinds of designated wastes are in mixture state and it is impractical to separate them

- High temperature incinerate

- After taking off organic solvents that are supposed to be recycled, incinerate the rest of them at a high degree.

B. Special precautions for disposal

- Anyone with business license number who generates industrial wastes shall treat the waste by him/herself or by entrusting to the legal entities who treat the wastes, recycle the wastes of others or install and operate the waste treatment facilities according to the Wastes Control Act

- Dispose of waste in accordance with all applicable laws and regulations.

## 14. TRANSPORT INFORMATION

A. UN No. (IMDG CODE/IATA DGR)

- 1992

B. Proper shipping name

- PAINT (including paint, lacquer, enamel, stain, shellac, varnish, polish, liquid filler and liquid lacquer base)

C. Hazard Class

- 3

D. IMDG CODE/IATA DGR Packing group

- III

E. Marine pollutant

- Not applicable

F. Special precautions for user related to transport or transportation measures

- Local transport follows in accordance with Dangerous goods Safety Management Law.

- Package and transport follow in accordance with Department of Transportation (DOT) and other regulatory agency requirements.

- EmS FIRE SCHEDULE : F-E (Non-water-reactive flammable liquids)

- EmS SPILLAGE SCHEDULE : S-E (Flammable liquids, floating on water)

## 15. REGULATORY INFORMATION

A. National and/or international regulatory information

○ POPs Management Law

- [1,6-Diisocyanatohexane homopolymer] : Not applicable
- [Xylene] : Not applicable
- [Propylene glycol methyl ether acetate] : Not applicable
- [n-Butyl acetate] : Not applicable
- [Solvent naphtha (petroleum), light arom.] : Not applicable
- [Ethylbenzene] : Not applicable
- [4-Methylbenzenesulfonyl isocyanate] : Not applicable
- [Hexamethylene Diisocyanate] : Not applicable

○ Information of EU Classification

* Classification

- [Xylene] : H226,H312,H315,H332
- [Propylene glycol methyl ether acetate] : H226
- [n-Butyl acetate] : H226,H336
- [Solvent naphtha (petroleum), light arom.] : H304,H340,H350
- [Ethylbenzene] : H225,H304,H332,H373
- [4-Methylbenzenesulfonyl isocyanate] : H315,H319,H334,H335
- [Hexamethylene Diisocyanate] : H315,H317,H319,H331,H334,H335

○ U.S. Federal regulations

* OSHA PROCESS SAFETY (29CFR1910.119)
  - Not applicable
* CERCLA Section 103 (40CFR302.4)
  - [Xylene] : 45.3599 kg 100 lb
  - [n-Butyl acetate] : 2267.995 kg 5000 lb
  - [Ethylbenzene] : 453.599 kg 1000 lb
  - [Hexamethylene Diisocyanate] : 45.3599 kg 100 lb
  - [1,6-Diisocyanatohexane homopolymer] : Not applicable
  - [Propylene glycol methyl ether acetate] : Not applicable
  - [Solvent naphtha (petroleum), light arom.] : Not applicable
  - [4-Methylbenzenesulfonyl isocyanate] : Not applicable
* EPCRA Section 302 (40CFR355.30)
  - Not applicable
* EPCRA Section 304 (40CFR355.40)
  - Not applicable
* EPCRA Section 313 (40CFR372.65)
  - [Xylene] : Applicable
  - [Ethylbenzene] : Applicable
  - [Hexamethylene Diisocyanate] : Applicable
  - [1,6-Diisocyanatohexane homopolymer] : Not applicable
  - [Propylene glycol methyl ether acetate] : Not applicable
  - [n-Butyl acetate] : Not applicable
  - [Solvent naphtha (petroleum), light arom.] : Not applicable
  - [4-Methylbenzenesulfonyl isocyanate] : Not applicable

○ Rotterdam Convention listed ingredients
  - Not applicable

○ Stockholm Convention listed ingredients
  - Not applicable

○ Montreal Protocol listed ingredients
  - Not applicable

## 16. OTHER INFORMATION

A. Reference

- The information contained herein is believed to be accurate. It is provided independently of any sale of the product for purpose of hazard communication. It is not intended to constitute performance information concerning the product. No express warranty, or implied warranty of merchantability or fitness for a particular purpose is made with respect to the product or the information contained herein.
- This Safety Data Sheet was compiled with data and information from the following sources: KOSHA, NITE, ESIS, NLM, SIDS, IPCS

B. Issue date

- 2016-12-12

C. Revision number and Last date revised

- 8 times, 2024-02-23

D. Other

- This SDS is prepared according to the Globally Harmonized System (GHS).

# SAFETY DATA SHEET

**According to OSHA Hazcom Standard 29 CFR 1910.1200**

## 037U(FOR WINTER)

## 1. IDENTIFICATION

### A. Product name

- 037U(FOR WINTER)

### B. Recommended use and restriction on use

- General use : thinner
- Restriction on use : Do not use except for purpose

### C. Manufacturer / Supplier / Distributor information

○ **Manufacturer information**

- Company name : KCC Corporation
- Address : 30, Bangeojinsunhwando-ro, Dong-gu, Ulsan
- Emergency telephone number : 82-52-280-1717

○ **Supplier/Distributer information**

- Company name : KCC Corporation
- Address : 30, Bangeojinsunhwando-ro, Dong-gu, Ulsan
- Emergency telephone number : 82-52-280-1717

## 2. HAZARD IDENTIFICATION

### A. GHS Classification

- Flammable liquids : Category2
- Acute toxicity (oral) : Category5
- Acute toxicity (inhalation: vapor) : Category5
- Skin corrosion/irritation : Category2
- Serious eye damage/irritation : Category2
- Carcinogenicity : Category2
- Reproductive toxicity : Category2
- Specific target organ toxicity(Single exposure) : Category3(Narcotic effects)
- Specific target organ toxicity(Single exposure) : Category3(Respiratory tract irritation)
- Specific target organ toxicity(Repeated exposure) : Category2
- Aspiration hazard : Category1
- Acute aquatic toxicity : Category2
- Chronic aquatic toxicity : Category3

### B. GHS label elements

○ **Hazard symbols**

○ **Signal words**

- Danger

○ **Hazard statements**

- H225 Highly flammable liquid and vapour
- H303 May harmful if swallowed.
- H304 May be fatal if swallowed and enters airways
- H315 Causes skin irritation

- H319 Causes serious eye irritation
- H333 May be harmful if inhaled.
- H335 May cause respiratory irritation.
- H336 May cause drowsiness and dizziness.
- H351 Suspected of causing cancer
- H361 Suspected of damaging fertility or the unborn child
- H373 May cause damage to organs through prolonged or repeated exposure (Refer Section SDS 11)
- H401 Toxic to aquatic organisms.
- H412 Harmful to aquatic life with long lasting effects

○ **Precautionary statements**

**1) Prevention**

- P201 Obtain special instructions before use.
- P202 Do not handle until all safety precautions have been read and understood.
- P210 Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking.
- P233 Keep container tightly closed.
- P240 Ground and bond container and receiving equipment.
- P241 Use explosion-proof electrical/ventilating/lighting/equipment.
- P242 Use non-sparking tools.
- P243 Take action to prevent static discharges.
- P260 Do not breathe dust/fume/gas/mist/vapours/spray.
- P261 Avoid breathing dust/fume/gas/mist/vapours/spray.
- P264 Wash hands thoroughly after handling.
- P271 Use only outdoors or in a well-ventilated area.
- P273 Avoid release to the environment.
- P280 Wear protective gloves/protective clothing/eye protection/face protection/hearing protection.

**2) Response**

- P301+P310 IF SWALLOWED: Immediately call a POISON CENTER or doctor/physician.
- P301+P312 IF SWALLOWED: Call a POISON CENTER or doctor/physician if you feel unwell.
- P302+P352 IF ON SKIN: Wash with plenty of soap and water.
- P303+P361+P353 IF ON SKIN (or hair): Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower.
- P304+P312 IF INHALED: Call a POISON CENTER or doctor/physician if you feel unwell.
- P304+P340 IF INHALED: Remove person to fresh air and keep comfortable for breathing.
- P305+P351+P338 IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
- P308+P313 If exposed or concerned: Get medical advice/attention.
- P312 Call a POISON CENTER or doctor/physician if you feel unwell.
- P314 Get medical advice/attention if you feel unwell.
- P321 Specific treatment
- P331 Do NOT induce vomiting.
- P332+P313 If skin irritation occurs: Get medical advice/attention.
- P337+P313 If eye irritation persists: Get medical advice/attention.
- P362+P364 Take off contaminated clothing and wash before reuse.
- P370+P378 In case of fire: Use Suitable extinguishing media for extinction(Refer Section MSDS 5).

**3) Storage**

- P403+P233 Store in a well-ventilated place. Keep container tightly closed.
- P403+P235 Store in a well-ventilated place. Keep cool.
- P405 Store locked up.

**4) Disposal**

- P501 Dispose of contents/container in accordance with local/regional/national/international regulation

### C. Other hazards which do not result in classification

- Not available

## 3. COMPOSITION/INFORMATION ON INGREDIENTS

| Chemical Name | Trade names and Synonyms | CAS No. | Content(%) |
|---|---|---|---|
| Toluene | Methylbenzene ; Methylbenzol ; Phenyl methane ; Methacide ; Toluol ; 1-Methylbenzene | 108-88-3 | 46 ~ 53 |

| | | | |
|---|---|---|---|
| Acetic acid ethyl ester | Acetic ether ; Acetidin ; Acetoxyethane ; Ethyl acetic ester ; Ethyl ester ; Ethyl ethanoate ; Vinegar naphtha ; Acetoxy ethane ; | 141-78-6 | 16 ~ 23 |
| 4-Methyl-2-pentanone | 2-Methyl-4-pentanone ; 2-Methylpropyl methyl ketone ; Hexanone ; 4-Methyl-2-pentanone ; Isobutyl methyl ketone ; Hexone ; 4-Methylpentan-2-one ; Isopropylacetone ; | 108-10-1 | 10 ~ 17 |
| n-Butyl acetate | Acetic acid, butyl ester ; 1-Butyl acetate ; Butyl acetate ; Acetic acid N-butyl ester ; Butyl ethanoate ; 1-Acetoxybutane | 123-86-4 | 7 ~ 14 |
| Xylene | Xylol ; Methyltoluene | 1330-20-7 | 4 ~ 11 |
| Ethylbenzene | Benzene, ethyl- ; Ethyl benzene ; Ethylbenzol ; Phenylethane ; | 100-41-4 | 1 ~ 6 |

## 4. FIRST AID MEASURES

### A. Eye contact

- Do not rub your eyes.
- Immediately flush eyes with plenty of water for at least 15 minutes and call a doctor/physician.
- Get medical attention immediately.
- Go to the hospital immediately if symptoms(flare, irritate) occur.
- Remove contact lenses if worn.

### B. Skin contact

- Flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes.
- Wash contaminated clothing thoroughly before re-using.
- Get medical attention immediately.
- Go to the hospital immediately if symptoms(flare, irritate) occur.
- Wash thoroughly after handling.

### C. Inhalation contact

- Take specific treatment if needed.
- When exposed to large amounts of steam and mist, move to fresh air.
- Get medical attention immediately.
- If breathing is stopped or irregular, give artificial respiration and supply oxygen.

### D. Ingestion contact

- Please be advised by doctor whether induction of vomit is demanded or not.
- Rinse your mouth with water immediately.
- Get medical attention immediately.
- If swallowed, large amounts of water to drink and do not induce vomiting.

### E. Delayed and immediate effects and also chronic effects from short and long term exposure

- Not available

### F. Notes to physician

- Notify medical personnel of contaminated situations and have them take appropriate protective measures.
- If exposed or concerned, get medical attention/advice.

## 5. FIREFIGHTING MEASURES

### A. Suitable (Unsuitable) extinguishing media

- Avoid use of water jet for extinguishing
- Dry chemical, carbon dioxide, regular foam extinguishing agent, spray

### B. Specific hazards arising from the chemical

- Causes serious eye irritation
- Causes skin irritation
- Harmful to aquatic life with long lasting effects
- Highly flammable liquid and vapour
- May be fatal if swallowed and enters airways

### C. Special protective actions for firefighters

- Avoid inhalation of materials or combustion by-products.
- Cool containers with water until well after fire is out.
- Do not approach the tank surrounded by fire until it is extinguished.
- In case of conflagration, use automatic fire sprinkler. Major fire may require withdrawal, allowing the object itself to burn.
- Keep unauthorized personnel out.

## 6. ACCIDENTAL RELEASE MEASURES

### A. Personal precautions, protective equipment and emergency procedures

- Do not touch spilled material. Stop leak if you can do it without risk.
- Handle the damaged containers or spilled material after wearing appropriate protective equipment
- Move container to safe area from the leak area.
- Must work against the wind, let the upwind people to evacuate.
- Remove all sources of ignition.

### B. Environmental precautions

- If large amounts have been spilled, inform the relevant authorities.
- Prevent runoff and contact with waterways, drains or sewers.

### C. Methods and materials for containment and cleaning up

- Appropriate container for disposal of spilled material collected.
- Dike for later disposal.
- Disposal of waste shall be in compliance with the Wastes Control Act
- Large spill : Stay upwind and keep out of low areas. Dike for later disposal.
- Notify the central and local government if the emission reach the standard threshold.

## 7. HANDLING AND STORAGE

### A. Precautions for safe handling

- Avoid contact with incompatible materials.
- Avoid direct physical contact.
- Comply with all applicable laws and regulations for handling
- Dealing only with a well-ventilated place.
- Do not handle until all safety precautions have been read and understood.

### B. Conditions for safe storage, including any incompatibilities

- Avoid direct sunlight.
- Check regularly for leaks.
- Do not apply any physical shock to container.
- Do not apply direct heat.
- Do not use damaged containers.

## 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

### A. Exposure limits

○ **ACGIH TLV**

- [Toluene] : TWA 20 ppm (75 mg/m3)
- [Acetic acid ethyl ester] : TWA, 400 ppm (1440 mg/m3)
- [4-Methyl-2-pentanone] : TWA, 20 ppm (82 mg/m3) STEL 75 ppm (307 mg/m3)
- [n-Butyl acetate] : TWA 50 ppm , STEL 150 ppm
- [Xylene] : TWA 20 ppm
- [Ethylbenzene] : TWA, 20 ppm (87 mg/m3)

○ **OSHA PEL**

- [Toluene] : 200 ppm, (C) 300 ppm
- [Acetic acid ethyl ester] : 400 ppm, 1400 mg/m3
- [4-Methyl-2-pentanone] : 100 ppm, 410 mg/m3
- [n-Butyl acetate] : 150 ppm, 710 mg/m3
- [Xylene] : 100 ppm, 435 mg/m3
- [Ethylbenzene] : 100 ppm, 435 mg/m3

### B. Engineering controls

- Business owner is recommended to maintain below recommended exposure limits for the working place with general exhaust of gas/vapour/mist/fume.

### C. Individual protection measures, such as personal protective equipment

○ **Respiratory protection**

- Any air-purifying respirator with a full facepiece and an organic vapor canister.
- Any chemical cartridge respirator with a full facepiece and organic vaporcartridge(s).
- Any chemical cartridge respirator with organic vapor cartridge(s).
- Consider warning properties before use.
- For Unknown Concentration or Immediately Dangerous to Life or Health : Any supplied-air respirator with full facepiece and operated in a pressure-demand or other positive-pressure mode in combination with a separate escape supply. Any self-contained breathing apparatus with a full facepiece.
- Respiratory protection is ranked in order from minimum to maximum.
- Under conditions of frequent use or heavy exposure, Respiratory protection may be needed.

○ **Eye protection**

- Provide an emergency eye wash station and quick drench shower in the immediate work area.
- Wear primary eye protection such as splash resistant safety goggles with a secondary protection face shield.

○ **Hand protection**

- Wear appropriate chemical resistant glove.

○ **Skin protection**

- Wear appropriate chemical resistant protective clothing.

○ **Others**

- Not available

## 9. PHYSICAL AND CHEMICAL PROPERTIES

| | |
|---|---|
| A. Appearance | |
| - Appearance | Liquid |
| - Color | CLAER |
| B. Odor | Solvent odor |
| C. Odor threshold | Not available |
| D. pH | Not available |
| E. Melting point/Freezing point | Not available |
| F. Initial Boiling Point/Boiling Ranges | 105.5℃ |
| G. Flash point | 6.5℃ |
| H. Evaporation rate | Not available |
| I. Flammability(solid, gas) | Not available |
| J. Upper/Lower Flammability or explosive limits | Not available |
| K. Vapour pressure | Not available |
| L. Solubility | Not available |
| M. Vapour density | >1 |
| N. Specific gravity(Relative density) | 0.82~0.92 |
| O. Partition coefficient of n-octanol/water | No data |
| P. Autoignition temperature | 360℃ |
| Q. Decomposition temperature | Not available |
| R. Viscosity | Not available |
| S. Molecular weight | Not available |

## 10. STABILITY AND REACTIVITY

### A. Chemical Stability

- This material is stable under recommended storage and handling conditions.

### B. Possibility of hazardous reactions

- Cylinders exposed to fire may vent and release flammable gas.

### C. Conditions to avoid

- Avoid : Accumulation of electrostatic charges, Heating, Flames and hot surfaces

- Avoid contact with incompatible materials and condition.
- Avoid contact with heat, sparks, flame or other ignition sources.

### D. Incompatible materials

- Not available

### E. Hazardous decomposition products

- May emit flammable vapour if involved in fire.

## 11. TOXICOLOGICAL INFORMATION

### A. Information on the likely routes of exposure

○ **Respiratory tracts**

- May be fatal if swallowed and enters airways
- May cause respiratory irritation.

○ **Oral**

- May harmful if swallowed.

○ **Eye·Skin**

- Causes skin irritation

### B. Delayed and immediate effects and also chronic effects from short and long term exposure

○ **Acute toxicity**

*** Oral**

- Product (ATEmix) : 2000mg/kg < ATEmix <= 5000mg/kg
- [Toluene] : LD50 5580 mg/kg Rat (EU Method B.1) (ECHA)
- [Acetic acid ethyl ester] : LD50 5620 ㎎/㎏ Rat (IUCLID), LD50 11.3 mL/kg Rat(female)(ECHA)
- [4-Methyl-2-pentanone] : LD50 2080 ㎎/㎏ Rat (NITE, ECHA)
- [n-Butyl acetate] : LD50 12789 mg/kg Rat (calculated, 12.2 ㎖/㎏, based on specific gravity of 0.882) (ECHA)
- [Xylene] : LD50=3523 mg/kg Rat (EU Method B1) (ECHA)
- [Ethylbenzene] : LD50 3500 mg/kg Rat (ECHA)

*** Dermal**

- Product (ATEmix) : >5000mg/kg
- [Toluene] : LD50 > 5000 mg/kg Rabbit (ECHA)
- [Acetic acid ethyl ester] : LD50 > 18000 ㎎/㎏ Rabbit (IUCLID)
- [4-Methyl-2-pentanone] : LD50 >16,000 ㎎/㎏ rabbit (NITE)
- [n-Butyl acetate] : LD50 > 14112 mg/kg Rabbit (calculated, 16 ㎖/㎏, based on specific gravity of 0.882) (ECHA)
- [Xylene] : LD50 ≥1,700mg/kg Rabbit (NIER)
- [Ethylbenzene] : LD50 15432 mg/kg (17.8 mL/kg) Rabbit (ECHA)

*** Inhalation**

- Product (ATEmix) : 20.0mg/L < ATEmix <= 50.0mg/L, Vapour, 4hr
- [Toluene] : Vapor LC50 28.1 mg/L 4 hr Rat (OECD TG 403) (ECHA)
- [Acetic acid ethyl ester] : Steam LC50 100 ㎎/ℓ 4 hr Rat (LC50 = 200 mg/L/1hr)(IUCLID)
- [4-Methyl-2-pentanone] : vapor LC50 11.6 ㎎/ℓ 4h Rat (ECHA)
- [n-Butyl acetate] : Vapour LC50 >21 mg/L 4hr Rat No death Not classified (OECD Guideline 403, GLP)(ECHA)
- [Xylene] : Vapor LC50 = 10 ~ 20 mg/L/4hr (NIER)
- [Ethylbenzene] : Vapor LC50 10~20 mg/L 4 hr (EU Harmonized Cat. 4) (ECHA)

○ **Skin corrosion/irritation**

- Causes skin irritation

○ **Serious eye damage/irritation**

- Causes serious eye irritation

○ **Respiratory sensitization**

- Not available

○ **Skin sensitization**

- Not available

○ **Carcinogenicity**

*** IARC**

- [Toluene] : Group 3
- [4-Methyl-2-pentanone] : Group 2B

- [Xylene] : Group 3
- [Ethylbenzene] : Group 2B

*** OSHA**

- Not available

*** ACGIH**

- [Toluene] : A4
- [4-Methyl-2-pentanone] : A3
- [Xylene] : A4
- [Ethylbenzene] : A3

*** NTP**

- Not available

*** EU CLP**

- Not available

○ **Germ cell mutagenicity**

- Not available

○ **Reproductive toxicity**

- Suspected of damaging fertility or the unborn child

○ **STOT-single exposure**

- May cause drowsiness and dizziness.
- May cause respiratory irritation.

○ **STOT-repeated exposure**

- May cause damage to organs through prolonged or repeated exposure (Refer Section SDS 11)

○ **Aspiration hazard**

- May be fatal if swallowed and enters airways

## 12. ECOLOGICAL INFORMATION

### A. Ecotoxicity

○ **Fish**

- [Toluene] : LC50 5.5 mg/L 96 hr, NOEC 1.39 mg/L 40 d Oncorhynchus kistutch (ECHA)
- [Acetic acid ethyl ester] : LC50 230 ㎎/ℓ 96 hr Pimephales promelas (ECHA)
- [4-Methyl-2-pentanone] : LD50 >179 ㎎/ℓ 96 hr Brachydanio rerio (OECD Guideline 203, GLP) (ECHA)
- [n-Butyl acetate] : LC50 18 ㎎/ℓ 96 hr Pimephales promelas (OECD TG 203)(ECHA)
- [Xylene] : LC50=3.3mg/L 96 hr (NITE)
- [Ethylbenzene] : LC50 5.1 mg/L 96 hr Menidia menidia (ECHA)

○ **Crustaceans**

- [Toluene] : EC50 3.78mg/L 48hr, NOEC 0.74 mg/L 7 d Ceriodaphnia dubia (ECHA)
- [Acetic acid ethyl ester] : EC50 2500 ㎎/ℓ 24 hr Daphnia magna(other guideline: DIN 38412 pt 11) (ECHA)
- [4-Methyl-2-pentanone] : EC50 >200 ㎎/ℓ 48 hr Daphnia magna (OECD TG 202, GLP) (ECHA)
- [n-Butyl acetate] : EC50 44 ㎎/ℓ 48 hr Daphnia magna (ECHA)
- [Xylene] : LC50 3.6 ㎎/ℓ 24 hr (OECD TG202) (ECHA)
- [Ethylbenzene] : EC50 1.8~2.4 mg/L 48 hr Daphnia magna, NOEC 0.96 mg/L 7 d Ceriodaphnia dubia (ECHA)

○ **Algae**

- [Toluene] : EC50 134 mg/L 3 hr Chlorella vulgaris and Chlamydomonas angulosa (ECHA)
- [Acetic acid ethyl ester] : EC50 1800 ~ 3200 ㎎/ℓ 72 hr (Selenastrum sp.) (ECOTOX)
- [4-Methyl-2-pentanone] : EC50 >146 ㎎/ℓ 7day Other(Blue algae, OECD221) (ECHA)
- [n-Butyl acetate] : EC50 397mg/L 72hr, NOEC 105 mg/L 72hr Raphidocelis subcapitata (Read-across CAS No 110-19-0) (ECHA)
- [Xylene] : ErC50 4.06 ㎎/ℓ 73 hr (OECD TG201, GLP) (ECHA)
- [Ethylbenzene] : EC50 3.6 mg/L 96 hr, NOEC 3.4 mg/L 96 hr Raphidocelis subcapitata (ECHA)

### B. Persistence and degradability

○ **Persistence**

- [Toluene] : log Pow 2.73 (20 °C) (ECHA)
- [Acetic acid ethyl ester] : log Kow 0.73 (ICSC), 0.68 log Kow (25°C, pH 7, EPA OPPTS 830.7560)
- [4-Methyl-2-pentanone] : log Kow 1.9 (OECD TG 117) (ECHA)
- [n-Butyl acetate] : log Kow 2.3 (25°C, OECD TG 117) log Kow 1.78 (HSDB)
- [Xylene] : log Kow=3.16 (NITE)
- [Ethylbenzene] : log Pow 3.6 (20 °C) (ECHA)

○ **Degradability**

- [Acetic acid ethyl ester] : BOD5/COD 0.81 (IUCLID)

### C. Bioaccumulative potential

○ **Bioaccumulative potential**

- [Toluene] : BCF 90 (ECHA)
- [Acetic acid ethyl ester] : BCF 30 (IUCLID)
- [Xylene] : BCF25.9 (ECHA)
- [Ethylbenzene] : BCF 1 (ECHA)

○ **Biodegradation**

- [Toluene] : 69 % 5 d, Readily biodegradable (ECHA)
- [Acetic acid ethyl ester] : 100 (%) 28 day (IUCLID)
- [4-Methyl-2-pentanone] : 83% 28 day (O2 consumption) Readily biodegradable (OECD TG 301, GLP) (ECHA)
- [n-Butyl acetate] : 83% 28 day Readily biodegradable (OECD TG 301D) (ECHA)
- [Xylene] : 90 % 28 day (OECD TG301F, GLP)(ECHA)
- [Ethylbenzene] : 70~ 80 % 28 d, Readily biodegradable (ECHA)

### D. Mobility in soil

- [4-Methyl-2-pentanone] : Koc 101.85 (Estimate) (ECHA)
- [Xylene] : log Kow = 3.12 (measured) (ortho), 3.2 (measured) (meta), 3.15 (measurements) (p) (5)

### E. Other adverse effects

- [Acetic acid ethyl ester] : Fish 32d-NOEC Pimephales promelas< 9.65 mg/L OECD TG 210 Crustacean: 21d-NOEC Daphnia magna=2.4 mg/L OECD TG 211 Algae: 72h-NOEC Scenedesmus subspicatus> 100 mg/L growth rate OECD TG 201, GLP (ECHA)
- [4-Methyl-2-pentanone] : crustaceans(Daphnia magna) : NOEC(21d) 78mg/L (OECD TG 211) (ECHA)
- [Xylene] : Fish NOEC 56d>1.3mg/L Daphnia magna (US EPA 600/4-91-003) NOEC=1.17 mg/L(ECHA)

## 13. DISPOSAL CONSIDERATIONS

### A. Disposal methods

- It shall be treated by incineration
- Oil water separation technology shall be applied as pre-waste treatment if it is applicable
- Stabilization and minimization treatment by incineration or similar method can be applied, if more than two kinds of designated wastes are in mixture state and it is impractical to separate them
- Will be pre-processed by the separation of oil and water.

### B. Special precautions for disposal

- Anyone with business license number who generates industrial wastes shall treat the waste by him/herself or by entrusting to the legal entities who treat the wastes, recycle the wastes of others or install and operate the waste treatment facilities according to the Wastes Control Act
- Dispose of waste in accordance with all applicable laws and regulations.

## 14. TRANSPORT INFORMATION

### A. UN No. (IMDG CODE/IATA DGR)

- 1263

### B. Proper shipping name

- PAINT RELATED MATERIAL (including paint thinning or reducing compound)

### C. Hazard Class

- 3

### D. IMDG CODE/IATA DGR Packing group

- II

### E. Marine pollutant

- Not applicable

### F. Special precautions for user related to transport or transportation measures

- Local transport follows in accordance with Dangerous goods Safety Management Law.

- Package and transport follow in accordance with Department of Transportation (DOT) and other regulatory agency requirements.
- EmS FIRE SCHEDULE : F-E (Non-water-reactive flammable liquids)
- EmS SPILLAGE SCHEDULE : S-E (Flammable liquids, floating on water)

## 15. REGULATORY INFORMATION

### A. National and/or international regulatory information

○ **POPs Management Law**

- [Toluene] : Not applicable
- [Acetic acid ethyl ester] : Not applicable
- [4-Methyl-2-pentanone] : Not applicable
- [n-Butyl acetate] : Not applicable
- [Xylene] : Not applicable
- [Ethylbenzene] : Not applicable

○ **Information of EU Classification**

*** Classification**

- [Toluene] : H225,H304,H315,H336,H361,H373
- [Acetic acid ethyl ester] : H225,H319,H336
- [4-Methyl-2-pentanone] : H225,H319,H332,H335,H351
- [n-Butyl acetate] : H226,H336
- [Xylene] : H226,H312,H315,H332
- [Ethylbenzene] : H225,H304,H332,H373

○ **U.S. Federal regulations**

*** OSHA PROCESS SAFETY (29CFR1910.119)**

- Not applicable

*** CERCLA Section 103 (40CFR302.4)**

- [Toluene] : 453.599 kg 1000 lb
- [Acetic acid ethyl ester] : 2267.995 kg 5000 lb
- [4-Methyl-2-pentanone] : 2267.995 kg 5000 lb
- [n-Butyl acetate] : 2267.995 kg 5000 lb
- [Xylene] : 45.3599 kg 100 lb
- [Ethylbenzene] : 453.599 kg 1000 lb

*** EPCRA Section 302 (40CFR355.30)**

- Not applicable

*** EPCRA Section 304 (40CFR355.40)**

- Not applicable

*** EPCRA Section 313 (40CFR372.65)**

- [Toluene] : Applicable
- [4-Methyl-2-pentanone] : Applicable
- [Xylene] : Applicable
- [Ethylbenzene] : Applicable
- [Acetic acid ethyl ester] : Not applicable
- [n-Butyl acetate] : Not applicable

○ **Rotterdam Convention listed ingredients**

- Not applicable

○ **Stockholm Convention listed ingredients**

- Not applicable

○ **Montreal Protocol listed ingredients**

- Not applicable

## 16. OTHER INFORMATION

### A. Reference

- The information contained herein is believed to be accurate. It is provided independently of any sale of the product for purpose of hazard communication. It is not intended to constitute performance information concerning the product. No express warranty, or implied warranty of merchantability or fitness for a particular purpose is made with respect to the product or the information contained herein.
- This Safety Data Sheet was compiled with data and information from the following sources: KOSHA, NITE, ESIS, NLM, SIDS, IPCS

### B. Issue date

- 2013-10-02

**C. Revision number and Last date revised**

- 15 times,  2023-03-14

**D. Other**

- This SDS is prepared according to the Globally Harmonized System (GHS).

## SECTION 1: Identification

| | |
|---|---|
| 1.1. Product identifier | **YUSOL-E120H** |
| 1.2. Recommended use and restrictions on use | |
| Recommended use | For High Precision Degreasing and Cleaning (For Industrial Use Only.) |
| Restrictions on use | Not Intended For Use As A Medical Device Or Drug. |
| 1.3. Supplier's details | |
| MANUFACTURER | YOUNG DO OIL-CHEM CO., Ltd. |
| ADDRESS | #71, Bong am gong dan 1 gil, Hoe won gu, Chang won si, Gyeoung nam, Korea |
| Telephone: | +82-(0)55-297-0111 |
| | +82-(0)10-3632-4588 (In Emergency, 24hrs) |

## SECTION 2: Hazard identification

| | |
|---|---|
| 2.1. Hazard classification | Flammable liquid : Group 2 |
| | Eye irritation : Group 2 |
| | Chronic aquatic toxicant : Group 4 |
| 2.2. Label elements | |
| Pictograms | |

| | |
|---|---|
| Signal word | **Danger** |
| Hazard statements | **H225** Highly flammable liquid and vapour |
| | **H319** May cause an allergic skin reaction. |
| | **H413** May cause long lasting harmful effects to aquatic life. |
| Precautionary statements | **P201** Obtain special instructions before use. |
| | **P210** Keep away from heat/sparks/open flames/hot surfaces. — No smoking. |
| | P233 Keep container tightly closed. |
| | **P240** Ground/bond container and receiving equipment |
| | **P243** Take precautionary measures against static discharge. |
| | **P264** Wash … thoroughly after handling |
| | **P273** Avoid release to the environment |
| | **P303+P361+P353** IF ON SKIN (or hair): Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower |
| | **P305+P351+P338** IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing |
| | **P370+P378** In case of fire: Use … for extinction |
| | **P501** Dispose of contents/container to … |
| 2.3. NFPA RATINGS (SCALE 0-4) | |

| | |
|---|---|
| Health | 0 |
| Fire | 3 |
| Reactivity | 0 |

## SECTION 3: Composition/information on ingredients

This content is strictly banned Unauthorized copy

| Ingredient | CAS No. | % by Wt |
|---|---|---|
| Synthetic, C8-10 ISOALKANES | 68551-15-5 | 55~65 |
| Synthetic, C9-11 ISOALKANES | 68551-16-6 | 30~40 |
| Anti-static additive (Trade secret) | | 1~10 |

***This product doesn't contain any reportable hazardous substance***

## SECTION 4: First aid measures

| | |
|---|---|
| 4.1 Eye Contact | Flush with large amounts of water. Remove contact lenses if easy to do. Continue rinsing. |
| | If signs/symptoms persist, get medical attention. |
| 4.2 Skin Contact | Wash skin with soap and water for at least 15 minutes while removing contaminated clothing and shoes. |
| | Get medical attention, if needed. |
| | Thoroughly clean and dry contaminated clothing and shoes before reuse. |
| 4.3 Inhalation | If adverse effects occur, remove to uncontaminated area. |
| | Give artificial respiration if not breathing. |
| | Get immediate medical attention. |
| 4.4 If Swallowed | Rinse mouth. Do not induce vomiting. |
| | If a large amount is swallowed, get medical attention. |

## SECTION 5: Fire-fighting measures

| | |
|---|---|
| 5.1. Suitable extinguishing media | Use water fog, foam, dry chemical or carbon dioxide (CO2) to extinguish flames. |
| 5.2. Fire and Explosion Hazards | Highly flammable. |
| | Vapors are flammable and heavier than air. |
| | Vapors may travel across the ground and reach remote ignition sources causing a flashback fire danger. |
| 5.3. Special protective actions for fire-fighters | Evacuate area. |
| | If a leak or spill has not ignited, use water spray to disperse the vapors and to protect personnel attempting to stop a leak. |
| | Prevent runoff from fire control or dilution from entering streams, sewers, or drinking water supply. |
| | Firefighters should use standard protective equipment and in enclosed spaces, self-contained breathing apparatus (SCBA). |
| | Use water spray to cool fire exposed surfaces and to protect personnel. |

## SECTION 6: Accidental release measures

| | |
|---|---|
| 6.1. Personal precautions, protective equipment and emergency procedures | Avoid heat, flames, sparks and other sources of ignition. |
| | Remove sources of ignition. |
| | Avoid contact with spilled material. |
| | Warn or evacuate occupants in surrounding and downwind areas if required due to toxicity or flammability of the material. |

| | |
|---|---|
| 6.2. Spill management | **Land Spill**: Eliminate all ignition sources (no smoking, flares, sparks or flames in immediate area). Stop leak if you can do it without risk. All equipment used when handling the product must be grounded. Do not touch or walk through spilled material. Prevent entry into waterways, sewer, basements or confined areas. A vapor suppressing foam may be used to reduce vapors. Use clean non-sparking tools to collect absorbed material. Absorb or cover with dry earth, sand or other non-combustible material and transfer to containers. Large Spills: Water spray may reduce vapor; but may not prevent ignition in closed spaces. |
| | **Water Spill**: Stop leak if you can do it without risk. Eliminate sources of ignition. Warn other shipping. If the Flash Point exceeds the Ambient Temperature by 10 degrees C or more, use containment booms and remove from the surface by skimming or with suitable absorbents when conditions permit. If the Flash Point does not exceed the Ambient Temperature by 10 degrees C or is less than the Ambient Temperature, use booms as a barrier to protect shorelines and allow the material to evaporate. Seek the advice of a specialist before using dispersants. |
| | Water spill and land spill recommendations are based on the most likely spill scenario for this material; however, geographic conditions, wind, temperature, (and in the case of a water spill) wave and current direction and speed may greatly influence the appropriate action to be taken. For this reason, local experts should be consulted. Note: Local regulations may prescribe or limit action to be taken. |
| 6.3. Environmental considerations | Large Spills: Dike far ahead of liquid spill for later recovery and disposal. Prevent entry into waterways, sewers, basements or confined areas. |

## SECTION 7: Handling and storage

| | |
|---|---|
| 7.1. Precautions for safe handling | Use non-sparking tools and explosion-proof equipment. |
| | Use proper bonding and/or grounding procedures. |
| | Prevent small spills and leakage to avoid slip hazard. |
| | For industrial or professional use only. |
| | Avoid release to the environment. |
| 7.2. Conditions for safe storage including any incompatibilities | Keep container tightly closed. |
| | Ample fire water supply should be available. |
| | A fixed sprinkler/deluge system is recommended. |
| | Keep container closed. |
| | Handle containers with care. |
| | Open slowly in order to control possible pressure release |
| | Store in a cool, well-ventilated area. |
| | Storage containers should be grounded and bonded. |
| | Drums must be grounded and bonded and equipped with self-closing valves, pressure vacuum bungs and flame arresters. |
| | **Storage Temperature:** [Ambient ] |
| | **Storage Pressure:** [Ambient ] |
| | **Suitable Containers/Packing:** Tank Cars; Tank Trucks; Drums; Tank Vessel |
| | **Suitable Materials and Coatings:** Carbon Steel; Stainless Steel; Polyethylene; Polypropylene; Polyester; Teflon |
| | **Unsuitable Materials and Coatings:** Natural Rubber; Butyl Rubber; Ethylene-proplyene-diene monomer (EPDM); Polystyrene |

## SECTION 8: Exposure controls/personal protection

| | |
|---|---|
| 8.1. Occupational exposure limits | |
| Domestic Regulation (Korea) | N/A |
| ACGIH | N/A |
| Biological Exposure Limit | N/A |
| 8.2. Exposure controls | N/A |

| | |
|---|---|
| 8.3. Personal protective equipment | N/A |

## SECTION 9: Physical and chemical properties

9.1. Information on basic physical and chemical properties

| | |
|---|---|
| Physical State | Liquid |
| Color | Colorless |
| Odor | Faint odor |
| pH | Not availlable |
| Freezing Point | -63℃ |
| Boiling Point | 115℃ - 140℃ |
| Flash Point | 7 ℃ |
| Evaporation Rate | 2.08 (Ether=1) |
| Flammable Limits | 0.9 - 6.2 vol % |
| Vapor Pressure | 2.37 kPa at 20℃ |
| Water Solubility | Insoluble |
| Vapor Density | 4.1 at 101kPa |
| Density | 0.9 ~ 0.95 |
| Partition coefficient: n-octanol/ water | No Data Available |
| Autoignition temperature | 395℃ |
| Decomposition temperature | No Data Available |
| Viscosity | 0.85cSt (1.8 mm2/sec) at25℃/0.72 cSt(1.39 mm2/sec) at 40℃ |
| Molecular Weight | No Data Available |

## SECTION 10: Stability and reactivity

| | |
|---|---|
| 10.1. Chemical stability | Material is stable under normal conditions. |
| 10.3. Conditions to avoid | Avoid heat, sparks, open flames and other ignition sources. |
| 10.4. Incompatible materials | Strong oxidizers |
| 10.5. Hazardous decomposition products | Material does not decompose at ambient temperatures |

## SECTION 11: Toxicological information

| | |
|---|---|
| 11.1. Acute Toxicity | |
| Oral | LD50 > 34600 mg/kg Rat |
| Dermal | N/A |
| Inhalation | N/A |
| 11.2. Skin Corrosion/Irritation | N/A |
| 11.3. Serious Eye Damage/Irritation | May cause mild, short-lasting discomfort to eyes. Based on test data for the material. |
| 11.4 Respiratory Sensitization | N/A |
| 11.5 Skin Sensitization | N/A |
| 11.6. Carcinogenicity | |
| IARC | N/A |
| OSHA | N/A |
| ACGIH | N/A |
| NTP | N/A |
| EU CLP | N/A |
| 11.7 Reproductive Toxicity | N/A |
| 11.8. Specific Target Organ Toxicity- single exposure | N/A |
| 11.9 Specific Target Organ Toxicity-repeated exposure | N/A |
| 11.10 Aspiration Hazard | N/A |

## SECTION 12: Ecological information

| | |
|---|---|
| 12.1. Ecotoxicological information | |
| Fish | N/A |
| Shellfish | N/A |
| Bird | N/A |

## SECTION 13: Disposal considerations

Dispose of contents/ container in accordance with the local/regional/national/international regulations.

## SECTION 14: Transport Information

| | |
|---|---|
| 14.1 UN No. | 1268 |
| 14.2 Proper Shipping Name | PETROLEUM DISTILLATES, N.O.S |
| 14.3. Hazard Class or Division | III |
| 14.4. Packing Group | I |

## SECTION 15: Regulatory information

| | |
|---|---|
| 15.1 Domestic (Korea) | |
| Occupation Safety and Health Acts | N/A |
| The Law of Harmful Chemical Material Control | N/A |
| Safety Control of Dangerous Substances | Classified [The 4th The Third Petrolium Category] |
| Waste Management Act | N/A |
| 15.2 International | |
| OSHA (USA) | N/A |
| CERCLA (USA) | N/A |
| EPCRA 302 (USA) | N/A |
| EPCRA 304 (USA) | N/A |
| EPCRA 313 (USA) | N/A |
| Rotterdam Convention | N/A |
| Stockholm Convention | N/A |
| Montreal Protocol | N/A |
| EU Classification | N/A |

International Paint (Korea) Limited

# Safety Data Sheet

## QPA975 INTERTHANE 976 POLYURETHANE VARNISH PTA

**Version No** 14 **Revision Date** 04/06/20

## 1. Product and company identification

**1.1. Product identifier** INTERTHANE 976 POLYURETHANE VARNISH PTA

Product Code QPA975

**1.2. Relevant identified uses of the substance or mixture and uses advised against**

Intended use Cosmetic finish coat
For professional use only.

Application Method Refer Technical Data Sheet.

**1.3. Details of the supplier of the safety data sheet**
**Importer or**
**Manufacturer**

International Paint (Korea) Limited
(8-6B/L Chilseo Industrial Complex),
626-6 Gyenae-Ri,
Chilseo-Myeon, Haman-Gun,
Gyeongsangnam-Do
Korea

**Telephone No.** 055-632-6286(R&D), 055 586 2310(Fact
**Fax No.** 055 632-6287(R&D), 055 587 6276(Fact
**1.4. Emergency telephone number (24 hour)** 055-586-2310(Factory)
**For Poisons Advice telephone** 055-586-2310(Factory) For Advice to Doctors & Hospitals only

## 2. Hazard identification of the product

**2.1. Classification of the substance or mixture**

| | |
|---|---|
| Flam. Liq. 3;H226 | Flammable liquid and vapour. |
| Skin Irrit. 2;H315 | Causes skin irritation. |
| Eye Irrit. 2;H319 | Causes serious eye irritation. |
| STOT SE 3;H335 | May cause respiratory irritation. Specific Target Organs: ( narcotic effects) |

**2.2. Label elements**

Using the Toxicity Data listed in section 11 & 12 the product is labelled as follows.

**Warning**

H226 Flammable liquid and vapour.
H315 Causes skin irritation.
H319 Causes serious eye irritation.
H335 May cause respiratory irritation.

**[Prevention]:**

P210 Keep away from heat / sparks / open flames / hot surfaces - No smoking.
P235 Keep cool.
P240 Ground / bond container and receiving equipment.
P241 Use explosion-proof electrical / ventilating / light / equipment.
P242 Use only non-sparking tools.
P243 Take precautionary measures against static discharge.
P261 Avoid breathing dust / fume / gas / mist / vapours / spray.
P264 Wash thoroughly after handling.
P271 Use only outdoors or in a well-ventilated area.
P280 Wear protective gloves / eye protection / face protection.

**[Response]:**

P302+352 IF ON SKIN: Wash with soap and water.
P303+361+353 IF ON SKIN (or hair): Remove / Take off immediately all contaminated clothing. Rinse skin with water / shower.
P304+312 IF INHALED: Call a POISON CENTER or doctor / physician if you feel unwell.
P305+351+338 IF IN EYES: Rinse continuously with water for several minutes. Remove contact lenses if present and easy to do - continue rinsing.
P321 Specific treatment (see information on this label).
P337+313 If eye irritation persists: Get medical advice / attention.
P304+340 IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing.
P362 Take off contaminated clothing and wash before reuse.
P370+378 In case of fire: Use alcohol resistant foam, CO2, powder, water spray for extinction. Do not use water jet.

**[Storage]:**

P403+233 Store in a well ventilated place. Keep container tightly closed.
P405 Store locked up.

**[Disposal]:**

P501 Dispose of contents / container in accordance with local / national regulations.

**2.3. Other hazards**

This product contains no PBT/vPvB chemicals.

## 3. Composition/information on ingredients

This product contains the following hazardous substances.

| Ingredient/Chemical Designations | Weight % | GHS Classification | Notes |
|---|---|---|---|
| **1-Methoxy-2-propylacetate**<br>**CAS Number: 0000108-65-6** | **20- <30** | **Flam. Liq. 3;H226** | **[1]** |
| **Xylene**<br>**CAS Number: 0001330-20-7** | **20- <30** | **Flam. Liq. 3;H226**<br>**Acute Tox. 4;H312**<br>**Acute Tox. 4;H332**<br>**Skin Irrit. 2;H315**<br>**Eye Dam. 2A;H319**<br>**STOT SE 3;H336**<br>**STOT RE 1;H372** | **[1][2]** |
| **Ethyl acetate**<br>**CAS Number: 0000141-78-6** | **5- <10** | **Flam. Liq. 2;H225**<br>**Eye Irrit. 2;H319**<br>**STOT SE 3;H336** | **[1][2]** |
| **Bis(pentamethyl-4-piperidyl)sebacate**<br>**CAS Number: 0041556-26-7** | **0.1 =< ~ < 0.2** | **Skin Sens. 1;H317**<br>**Aquatic Chronic 1;H410** | **[1]** |

[1] Substance classified with a health or environmental hazard.
[2] Substance with a workplace exposure limit.
[3] PBT-substance or vPvB-substance.

*The full texts of the Hazard (H) phrases are shown in Section 16.

There are no additional ingredients present which, within the current knowledge of the supplier and in the concentrations applicable, are classified as hazardous to health or the environment and hence do not require reporting in this section.

Common Names

0000108-65-6 (1-Methoxy-2-propylacetate)
0001330-20-7 (Xylene)
0000141-78-6 (Ethyl acetate )
0041556-26-7 (Bis(pentamethyl-4-piperidyl)sebacate)

## 4. First aid measures

### 4.1. Description of first aid measures

**General**

In all cases of doubt, or when symptoms persist, seek medical attention.

Never give anything by mouth to an unconscious person.

**Inhalation**

Remove to fresh air, keep patient warm and at rest. If breathing is irregular or stopped, give artificial respiration. If unconscious place in the recovery position and obtain immediate medical attention. Give nothing by mouth.

**Skin Contact**

Remove contaminated clothing. Wash skin thoroughly with soap and water or use a recognised skin cleanser. Do NOT use solvents or thinners.

**Eye Contact**

Irrigate copiously with clean fresh water for at least 10 minutes, holding the eyelids apart and seek medical attention.

**Ingestion**

If accidentally swallowed obtain immediate medical attention. Keep at rest. Do NOT induce vomiting.

**4.2. Most important symptoms and effects, both acute and delayed**

No data available

**4.3. Indication of any immediate medical attention and special treatment needed and notes for physician**

No data available

## 5. Fire-fighting measures

**5.1. Extinguishing media**

Recommended extinguishing media; alcohol resistant foam, CO2, powder, water spray.

Do not use - water jet.

Note; Fire will produce dense black smoke. Decomposition products may be hazardous to health. Avoid exposure and use breathing apparatus as appropriate.

Cool closed containers exposed to fire by spraying them with water. Do not allow run off water and contaminants from fire fighting to enter drains or water courses.

**5.2. Special hazards arising from the substance or mixture**

Fire will produce dense black smoke. Decomposition products may include the following materials: carbon monoxide, carbon dioxide, smoke, oxides of nitrogen.
Avoid exposure and use breathing apparatus as appropriate.

**5.3. Advice for fire-fighters**

Cool closed containers exposed to fire by spraying them with water. Do not allow run off water and contaminants from fire fighting to enter drains or water courses.

## 6. Accidental release measures

**6.1. Personal precautions, protective equipment and emergency procedures**

Remove sources of ignition, do not turn lights or unprotected electrical equipment on or off. In case of a major spill or spillage in a confined space evacuate the area and check that solvent vapour levels are below the Lower Explosive Limit before re-entering.

**6.2. Environmental precautions**

Do not allow spills to enter drains or watercourses.

**6.3. Methods and material for containment and cleaning up**

Ventilate the area and avoid breathing vapours. Take the personal protective measures listed in section 8.

Contain and absorb spillage with non-combustible materials e.g. sand, earth, vermiculite. Place in closed containers outside buildings and dispose of according to the Waste Regulations. (See section 13).

Clean, preferably with a detergent. Do not use solvents.

Do not allow spills to enter drains or watercourses.

If drains, sewers, streams or lakes are contaminated, inform the local water company immediately. In the case of contamination of rivers, streams or lakes the Environmental Protection Agency should also be informed.

## 7. Handling and storage

### 7.1. Precautions for safe handling

**Handling**

This coating contains solvents. Solvent vapours are heavier than air and may spread along floors. Vapours may form explosive mixtures with air. Areas of storage, preparation and application should be ventilated to prevent the creation of flammable or explosive concentrations of vapour in air and avoid vapour concentrations higher than the occupational exposure limits.

**In Storage**

Handle containers carefully to prevent damage and spillage.

Naked flames and smoking should not be permitted in storage areas. It is recommended that fork lift trucks and electrical equipment are protected to the appropriate standard.

This coating contains solvents. Solvent vapours are heavier than air and may spread along floors. Vapours may form explosive mixtures with air. Areas of storage, preparation and application should be ventilated to prevent the creation of flammable or explosive concentrations of vapour in air and avoid vapour concentrations higher than the occupational exposure limits.

### 7.2. Conditions for safe storage, including any incompatibilities

Keep away from the following materials: oxidising agents, strong alkalis, strong acids.

Avoid skin and eye contact. Avoid inhalation of vapours and spray mists. Observe label precautions. Use personal protection as shown in section 8.

Smoking, eating and drinking should be prohibited in all preparation and application areas.

Never use pressure to empty a container; containers are not pressure vessels.

There are no exposure scenarios, see details in section 1.

### 7.3. Specific end use(s)

Store in a well ventilated, dry place away from sources of heat and direct sunlight.

Store on concrete or other impervious floor, preferably with bunding to contain any spillage. Do not stack more than 3 pallets high.

Keep container tightly closed. Containers which are opened must be carefully resealed and kept upright to prevent leakage. Keep in the original container or one of the same material.

Prevent unauthorised access.

All sources of ignition (hot surfaces, sparks, open flames etc) should be excluded from areas of preparation and application. All electrical equipment (including torches) should be protected (Ex) to the appropriate standard.

The product may charge electrostatically. Always use earthing leads when pouring solvents and transferring product. Operators should wear clothing which does not generate static (at least 60% natural fibre) and antistatic footwear; floors should be of conducting type.

## 8. Exposure controls and personal protection

### 8.1. Control parameters

Exposure standards are those provided by the ACGIH (American Conference of Government Industrial Hygenists).

| Material | Short term (15 min. ave) | | Long term (8hr time weighted average) | | Comments |
|---|---|---|---|---|---|
| | ppm | mg/m³ | ppm | mg/M3 | |
| **Ethyl acetate** | | | **400** | **1440** | |
| **Xylene** | **150** | **655** | **100** | **434** | |

Key to notification

(P) Peak exposure limit
(R) Suppliers Recommended Limit
(Sk) There is a risk of absorption through unbroken skin
(Sen) Sensitiser
(Cat1) Category 1 - established human carcinogen
(Cat2) Category 2 - probable human carcinogen
(Cat3) Category 3 - substances suspected of having carcinogenic potential

**DNEL/PNEC values**

No Data Available

### 8.2. Exposure controls

Provide adequate ventilation. Where reasonably practicable this should be achieved by the use of local exhaust ventilation and good general extraction. If these are not sufficient to maintain concentrations of particulates and any vapour below occupational exposure limits suitable respiratory protection must be worn.

**Eye Protection**

Wear safety eyewear, e.g. safety spectacles, goggles or visors to protect against the splash of liquids. Eyewear should comply with an approved standard.

Wear a full face shield if mixing or pouring operations pose a risk of splashes.

An eye wash station is suggested as a good work place practice.

**Skin Protection**

Gloves of an appropriate material should be worn during mixing and application.

**Other**

Overalls which cover the body, arms and legs should be worn. Skin should not be exposed. Barrier creams may help to protect areas which are difficult to cover such as the face and neck. They should however not be applied once exposure has occurred. Petroleum jelly based types such as Vaseline should not be used. All parts of the body should be washed after contact.

**Respiratory Protection**

When concentrations exceed the exposure limits shown above, workers must wear appropriate approved respirators. Provision of other controls such as exhaust ventilation should be considered if practical.

**Thermal hazards**

No Data Available

## 9. Physical and chemical properties

| | |
|---|---|
| **Appearance** | Colourless Liquid |
| **Odour** | Smell of Solvent |
| **Odour threshold** | Not Measured |
| **pH** | N/A |
| **Melting point / freezing point (°C)** | Not Measured |
| **Initial boiling point and boiling range (°C)** | 137 |
| **Flash Point (°C)** | 34 |
| **Evaporation rate (Ether = 1)** | Not Measured |
| **Flammability (solid, gas)** | Not Applicable |
| **Upper/lower flammability or explosive limits** | Lower Explosive Limit: 1.1<br>Upper Explosive Limit: 6.6 |
| **Vapour pressure (Pa)** | Not Measured |
| **Vapour Density** | Heavier than air. |
| **Specific Gravity** | 0.99 |
| **Solubility in Water** | Immiscible |
| **Partition coefficient n-octanol/water (Log Kow)** | Not Measured |
| **Autoignition temperature (℃)** | Not Measured |
| **Decomposition temperature** | Not Measured |
| **Viscosity (cSt)** | N/A |
| **Molecular Weight** | Not Measured |

**9.2. Other information**

No further information

## 10. Stability and reactivity

**10.1. Reactivity**

No data available

**10.2. Chemical stability**

Stable under recommended storage and handling conditions (see section 7). When exposed to high temperatures may produce hazardous decomposition products such as carbon monoxide, carbon dioxide, oxides of nitrogen and smoke.

Keep away from oxidising agents, strongly alkaline and strongly acid materials in order to avoid possible exothermic reactions.

**10.3. Possibility of hazardous reactions**

May react exothermically with: oxidising agents, strong alkalis, strong acids.

**10.4. Conditions to avoid**

Stable under recommended storage and handling conditions (see section 7).

**10.5. Incompatible materials**

Keep away from the following materials: oxidising agents, strong alkalis, strong acids.

**10.6. Hazardous decomposition products**

Fire will produce dense black smoke. Decomposition products may include the following materials: carbon monoxide, carbon dioxide, smoke, oxides of nitrogen.
Avoid exposure and use breathing apparatus as appropriate.

## 11. Toxicological information

**Acute toxicity**

Exposure to solvent vapour concentrations from the component solvents in excess of the stated occupational exposure limits may result in adverse health effects such as mucous membrane and respiratory system irritation and adverse effects on the kidneys, liver and central nervous system. Symptoms include headache, nausea, dizziness, fatigue, muscular weakness, drowsiness and in extreme cases, loss of consciousness.

Repeated or prolonged contact with the preparation may cause removal of natural fat from the skin resulting in dryness, irritation and possible non-allergic contact dermatitis. Solvents may also be absorbed through the skin. Splashes of liquid in the eyes may cause irritation and soreness with possible reversible damage.

The preparation has been assessed using the Acute Toxicity Data listed below, and classified for toxicological hazards accordingly. See section 2 for details.

| Ingredient | Oral LD50, mg/kg | Skin LD50, mg/kg | Inhalation Vapour LD50, mg/L/4hr | Inhalation Dust/Mist LD50, mg/L/4hr |
|---|---|---|---|---|
| 1-Methoxy-2-propylacetate - (108-65-6) | 8,532.00, Rat | 5,000.00, Rabbit | Not Available | Not Available |
| Bis(pentamethyl-4-piperidyl)sebacate - (41556-26-7) | 2,615.00, Rat | Not Available | Not Available | Not Available |
| Ethyl acetate - (141-78-6) | 5,600.00, Rat | 18,000.00, Rabbit | 58.60, Rat | Not Available |
| Xylene - (1330-20-7) | 4,299.00, Rat | 1,548.00, Rabbit | Not Available | 20.00, Rat |

| Item | Category | Hazard |
|---|---|---|
| Acute Toxicity (mouth) | Not Classified | Not Applicable |
| Acute Toxicity (skin) | Not Classified | Not Applicable |
| Acute Toxicity (inhalation) | Not Classified | Not Applicable |
| Skin corrosion/irritation | 2 | Causes skin irritation. |
| Eye damage/irritation | 2 | Causes serious eye irritation. |
| Sensitization (respiratory) | Not Classified | Not Applicable |
| Sensitization (skin) | Not Classified | Not Applicable |
| Germ toxicity | Not Classified | Not Applicable |
| Carcinogenicity | Not Classified | Not Applicable |
| Reproductive Toxicity | Not Classified | Not Applicable |
| Specific target organ systemic toxicity (single exposure) | 3 | May cause respiratory irritation. |
| Specific target organ systemic Toxicity (repeated exposure) | Not Classified | Not Applicable |
| Aspiration hazard | Not Classified | Not Applicable |

## 12. Ecological information

### 12.1. Toxicity

The preparation has been assessed according to the GHS criteria and is classified as dangerous for the environment, using the toxicity data listed below.

There are no data available on the product itself.

The product should not be allowed to enter drains or water courses.

### Aquatic Ecotoxicity

| Ingredient | 96 hr LC50 fish, mg/l | 48 hr EC50 crustacea, mg/l | ErC50 algae, mg/l |
|---|---|---|---|
| 1-Methoxy-2-propylacetate - (108-65-6) | 100.00, Salmo gairdneri | 500.00, Daphnia magna | Not Available |
| Xylene - (1330-20-7) | Not Available | Not Available | Not Available |
| Ethyl acetate - (141-78-6) | 100.00, Danio rerio | 100.00, Daphnia magna | 100.00 (72 hr), Desmodesmus subspicatus |
| Bis(pentamethyl-4-piperidyl)sebacate - (41556-26-7) | 1.00, Lepomis macrochirus | 20.00, Daphnia magna | Not Available |

**12.2. Persistence and degradability**

There is no data available on the preparation itself.

**12.3. Bioaccumulative potential**

Not Measured

**12.4. Mobility in soil**

No data available

**12.5. Results of PBT and vPvB assessment**

This product contains no PBT/vPvB chemicals.

**12.6. Other adverse effects**

No data available

## 13. Disposal considerations

**13.1. Waste treatment methods**

Do not allow into drains or water courses. Wastes and empty containers should be disposed of in accordance with State and Federal regulations.

Using information provided in this data sheet advice should be obtained from the local Waste Regulation Authority as to whether special waste regulations apply.

## 14. Transport information

| | | |
|---|---|---|
| **14.1. UN number** | | 1263 |
| **14.2. UN proper shipping name** | | Paint |
| **14.3. Transport hazard class(es)** | | |
| **Road and Rail Transport** | | UN1263, Paint, CLASS 3, PG III, HAZCHEM *3Y |
| **IMDG reference :** | **Class/Div** 3 | **Sub Class** |
| | **Ems** | F-E,S-E |
| **ICAO/IATA** | **Class** 3 | **Sub Class** |
| **14.4. Packing group** | | III |

**14.5. Environmental hazards**

| | |
|---|---|
| **Road and Rail Transport** | Environmentally Hazardous: No |
| | Marine Pollutant: No |

**IMDG reference :**

**14.6. Special precautions for user**

No further information

**14.7. Transport in bulk according to Annex II of MARPOL73/78 and the IBC Code**

Not Applicable

## 15. Regulatory information

Some non-disclosed ingredients in section 3 can be disclosed in this section 15 by the MoEL Public Notice for MSDS generation. If you want to know the reason why the non-disclosed ingredient in section 3 was informed in this section, please contact Regulatory Affair representative of the material supplier or this safety data sheet provider.

This product and all its components complies with the chemical and transport regulations from the country listed in section 1.3.
Other regulatory information specific to the hazardous chemical(s):

**Dangerous Goods Act** Class 4 Flammable Liquid, 2nd Petroleum Division, hazard class III

**Waste Control Act** Hazardous Waste

**KOSHA**

**Please see section 8 in this MSDS for Harmful Factors Subject to Exposure Limit.**

**Harmful Factors Subject to Work Environment Measurement:**

Ethyl acetate

**Hazard Substances Subject to Control:**

Ethyl acetate

Xylene

**Harmful Factors Subject to Special Health Check-up:**

Xylene

**Harmful Substances Requiring Permission :**

(No Product Ingredients Listed)

**Harmful Substances Prohibited for Manufacturing, Importing, Transferring, or Supplying:**

(No Product Ingredients Listed)

**Chemical Substances Control Act**

**Toxic Chemicals:**

Ethyl acetate

Xylene

**Observational Chemicals:**

(No Product Ingredients Listed)

**TRI PRTR Group I:**

(No Product Ingredients Listed)

**TRI PRTR Group II:**

Dibutyltindilaurate

Ethyl acetate

Xylene

**Accident Precaution Chemicals:**

Ethyl acetate

**Restricted Chemicals**

(No Product Ingredients Listed)

**Banned Chemicals:**

(No Product Ingredients Listed)

## 16. Other information

**Revision Date:** 04/06/2020

**Version:** 14

**Initial Date:** 05/09/2012

This Safety Data Sheet was compiled with data and information from the following sources: KOSHA, NITE, ESIS, NLM, SIDS, IPCS, NCIS.

The information on this SDS is based upon the present state of our knowledge and on current law. The product should not be used for purposes other than shown in the product data sheet without first obtaining written advice.

It is always the responsibility of the user to take all necessary steps to meet the demands of applicable legislation.

The information in this Safety Data Sheet is required according to legislation.

The full text of the phrases appearing in section 3 is:

H225 Highly flammable liquid and vapour.

H226 Flammable liquid and vapour.

H312 Harmful in contact with skin.

H315 Causes skin irritation.

H319 Causes serious eye irritation.

H332 Harmful if inhaled.

H336 May cause drowsiness and dizziness.

H372 Causes damage to organs through prolonged or repeated exposure.

**This SDS is valid for 5 years from the revised date on page 1.**
**The revision date is in American format (e.g. MM/DD/YY).**

End of document

AkzoNobel

All information concerning this product and/or suggestions for handling and use contained herein are offered in good faith and are believed to be reliable. Akzo Nobel however makes no warranty as to the accuracy of and/or sufficiency of such information.

International Paint (Korea) Limited

# Safety Data Sheet

## QPA976 INTERTHANE 976 PART B

**Version No** 8 **Revision Date** 02/07/20

## 1. Product and company identification

**1.1. Product identifier** INTERTHANE 976 PART B

Product Code QPA976

**1.2. Relevant identified uses of the substance or mixture and uses advised against**

Intended use Cosmetic finish coat
For professional use only.

Application Method Refer Technical Data Sheet.

**1.3. Details of the supplier of the safety data sheet**
**Importer or**
**Manufacturer**

International Paint (Korea) Limited
(8-6B/L Chilseo Industrial Complex),
626-6 Gyenae-Ri,
Chilseo-Myeon, Haman-Gun,
Gyeongsangnam-Do
Korea

**Telephone No.** 055-632-6286(R&D), 055 586 2310(Fact
**Fax No.** 055 632-6287(R&D), 055 587 6276(Fact
**1.4. Emergency telephone number (24 hour)** 055-586-2310(Factory)
**For Poisons Advice telephone** 055-586-2310(Factory) For Advice to Doctors & Hospitals only

## 2. Hazard identification of the product

**2.1. Classification of the substance or mixture**

| | |
|---|---|
| Flam. Liq. 3;H226 | Flammable liquid and vapour. |
| Acute Tox. 4;H312 | Harmful in contact with skin. |
| Acute Tox. 4;H332 | Harmful if inhaled. |
| Skin Irrit. 2;H315 | Causes skin irritation. |
| Eye Irrit. 2;H319 | Causes serious eye irritation. |
| Skin Sens. 1;H317 | May cause an allergic skin reaction. |
| Resp. Sens. 1;H334 | May cause allergy or asthma symptoms of breathing difficulties if inhaled. |
| STOT SE 3;H335 | May cause respiratory irritation. Specific Target Organs: ( narcotic effects) |
| Aquatic Chronic 3;H412 | Harmful to aquatic life with long lasting effects. |

**2.2. Label elements**

Using the Toxicity Data listed in section 11 & 12 the product is labelled as follows.

**Danger**

H226 Flammable liquid and vapour.
H312 Harmful in contact with skin.
H315 Causes skin irritation.
H317 May cause an allergic skin reaction.
H319 Causes serious eye irritation.
H332 Harmful if inhaled.
H334 May cause allergic or asthmatic symptoms or breathing difficulties if inhaled.
H335 May cause respiratory irritation.
H412 Harmful to aquatic life with long lasting effects.

**[Prevention]:**

P210 Keep away from heat / sparks / open flames / hot surfaces - No smoking.
P235 Keep cool.
P240 Ground / bond container and receiving equipment.
P241 Use explosion-proof electrical / ventilating / light / equipment.
P242 Use only non-sparking tools.
P243 Take precautionary measures against static discharge.
P261 Avoid breathing dust / fume / gas / mist / vapours / spray.
P264 Wash thoroughly after handling.
P271 Use only outdoors or in a well-ventilated area.
P272 Contaminated work clothing should not be allowed out of the workplace.
P273 Avoid release to the environment.
P280 Wear protective gloves / eye protection / face protection.

**[Response]:**

P302+352 IF ON SKIN: Wash with soap and water.
P303+361+353 IF ON SKIN (or hair): Remove / Take off immediately all contaminated clothing. Rinse skin with water / shower.
P304+312 IF INHALED: Call a POISON CENTER or doctor / physician if you feel unwell.
P305+351+338 IF IN EYES: Rinse continuously with water for several minutes. Remove contact lenses if present and easy to do - continue rinsing.
P321 Specific treatment (see information on this label).
P322 Specific measures (see information on this label).
P333+313 If skin irritation or a rash occurs: Get medical advice / attention.
P337 If eye irritation persists:
P304+340 IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing.

P304+341 If breathing is difficult, remove victim to fresh air and keep at rest in a position comfortable for breathing.

P342+311 If experiencing respiratory symptoms: Call a POISON CENTER or doctor / physician.

P362 Take off contaminated clothing and wash before reuse.

P363 Wash contaminated clothing before reuse.

P370+378 In case of fire: Use alcohol resistant foam, CO2, powder, water spray for extinction. Do not use water jet.

**[Storage]:**

P403+233 Store in a well ventilated place. Keep container tightly closed.

P405 Store locked up.

**[Disposal]:**

P501 Dispose of contents / container in accordance with local / national regulations.

**2.3. Other hazards**

This product contains no PBT/vPvB chemicals.

## 3. Composition/information on ingredients

This product contains the following hazardous substances.

| Ingredient/Chemical Designations | Weight % | GHS Classification | Notes |
|---|---|---|---|
| **HDI homopolymer**<br>**CAS Number: 0028182-81-2** | **50- <60** | **Skin Sens. 1;H317**<br>**Resp. Sens. 1;H334** | **[1]** |
| **Xylene**<br>**CAS Number: 0001330-20-7** | **30- <40** | **Flam. Liq. 3;H226**<br>**Acute Tox. 4;H312**<br>**Acute Tox. 4;H332**<br>**Skin Irrit. 2;H315**<br>**Eye Dam. 2A;H319**<br>**STOT SE 3;H336**<br>**STOT RE 1;H372** | **[1][2]** |
| **Ethyl Benzene**<br>**CAS Number: 0000100-41-4** | **5- <10** | **Flam. Liq. 2;H225**<br>**Acute Tox. 4;H332**<br>**STOT RE 2;H373**<br>**Asp. Tox. 1;H304**<br>**Skin Irrit. 2;H315**<br>**Eye Irrit. 2;H319**<br>**STOT SE 3;H335** | **[1][2]** |
| **Hexamethylene diisocyanate**<br>**CAS Number: 0000822-06-0** | **0.1 =< ~ < 0.2** | **Acute Tox. 4;H302**<br>**Acute Tox. 3;H311**<br>**Acute Tox. 1;H330**<br>**Skin Irrit. 2;H315**<br>**Eye Irrit. 2;H319**<br>**Skin Sens. 1;H317**<br>**Resp. Sens. 1;H334**<br>**STOT SE 3;H335** | **[1][2]** |

[1] Substance classified with a health or environmental hazard.
[2] Substance with a workplace exposure limit.
[3] PBT-substance or vPvB-substance.

*The full texts of the Hazard (H) phrases are shown in Section 16.

There are no additional ingredients present which, within the current knowledge of the supplier and in the

concentrations applicable, are classified as hazardous to health or the environment and hence do not require reporting in this section.

Common Names

0028182-81-2 (HDI homopolymer)

0001330-20-7 (Xylene)

0000100-41-4 (Ethyl Benzene)

0000822-06-0 (Hexamethylene diisocyanate)

## 4. First aid measures

### 4.1. Description of first aid measures

**General**

In all cases of doubt, or when symptoms persist, seek medical attention.

Never give anything by mouth to an unconscious person.

**Inhalation**

Remove to fresh air, keep patient warm and at rest. If breathing is irregular or stopped, give artificial respiration. If unconscious place in the recovery position and obtain immediate medical attention. Give nothing by mouth.

**Skin Contact**

Remove contaminated clothing. Wash skin thoroughly with soap and water or use a recognised skin cleanser. Do NOT use solvents or thinners.

**Eye Contact**

Irrigate copiously with clean fresh water for at least 10 minutes, holding the eyelids apart and seek medical attention.

**Ingestion**

If accidentally swallowed obtain immediate medical attention. Keep at rest. Do NOT induce vomiting.

### 4.2. Most important symptoms and effects, both acute and delayed

No data available

### 4.3. Indication of any immediate medical attention and special treatment needed and notes for physician

No data available

## 5. Fire-fighting measures

### 5.1. Extinguishing media

Recommended extinguishing media; alcohol resistant foam, $CO_2$, powder, water spray.

Do not use - water jet.

Note; Fire will produce dense black smoke. Decomposition products may be hazardous to health. Avoid exposure and use breathing apparatus as appropriate.

Cool closed containers exposed to fire by spraying them with water. Do not allow run off water and contaminants from fire fighting to enter drains or water courses.

**5.2. Special hazards arising from the substance or mixture**

Fire will produce dense black smoke. Decomposition products may include the following materials: carbon monoxide, carbon dioxide, smoke, oxides of nitrogen.
Avoid exposure and use breathing apparatus as appropriate.

**5.3. Advice for fire-fighters**

Cool closed containers exposed to fire by spraying them with water. Do not allow run off water and contaminants from fire fighting to enter drains or water courses.

## 6. Accidental release measures

**6.1. Personal precautions, protective equipment and emergency procedures**

Remove sources of ignition, do not turn lights or unprotected electrical equipment on or off. In case of a major spill or spillage in a confined space evacuate the area and check that solvent vapour levels are below the Lower Explosive Limit before re-entering.

**6.2. Environmental precautions**

Do not allow spills to enter drains or watercourses.

**6.3. Methods and material for containment and cleaning up**

Ventilate the area and avoid breathing vapours. Take the personal protective measures listed in section 8. Contain and absorb spillage with non-combustible materials e.g. sand, earth, vermiculite. Place in a suitable container. The contaminated area should be cleaned up immediately with a suitable decontaminant. One possible (flammable) decontaminant comprises (by volume): water (45 parts), ethanol or isopropyl alcohol (50 parts), concentrated (d:0,880) ammonia solution (5 parts). A non-flammable alternative is sodium carbonate (5 parts), water (95 parts). Add the same decontaminant to any residues and allow to stand for several days in a non-sealed container until no further reaction occurs. Once this stage is reached, close container and dispose of in accordance with the waste regulations (see section 13). Do not allow spills to enter drains or watercourses.If drains or sewers are contaminated, inform the local water company immediately. In the case of contamination of rivers, streams or lakes the Environmental Protection Agency should also be informed.

## 7. Handling and storage

**7.1. Precautions for safe handling**

**Handling**

Persons with a history of asthma, allergies or chronic or recurrent respiratory disease should only be employed in processes in which this product is used under appropriate medical supervision.

**In Storage**

Handle containers carefully to prevent damage and spillage.

Precautions should be taken to minimise exposure to atmospheric humidity or water as carbon dioxide may be formed which, in closed containers can result in pressurisation. Care should be taken when re-opening partly used containers.

Naked flames and smoking should not be permitted in storage areas. It is recommended that fork lift trucks and electrical equipment are protected to the appropriate standard.

This coating contains solvents. Solvent vapours are heavier than air and may spread along floors. Vapours may form explosive mixtures with air. Areas of storage, preparation and application should be ventilated to prevent the creation of flammable or explosive concentrations of vapour in air and avoid vapour concentrations higher than the occupational exposure limits.

### 7.2. Conditions for safe storage, including any incompatibilities

Keep away from the following materials: oxidising agents, strong alkalis, strong acids.

Avoid skin and eye contact. Avoid inhalation of vapours and spray mists. Observe label precautions. Use personal protection as shown in section 8.

Smoking, eating and drinking should be prohibited in all preparation and application areas.

Never use pressure to empty a container; containers are not pressure vessels.

There are no exposure scenarios, see details in section 1.

### 7.3. Specific end use(s)

Store in a well ventilated, dry place away from sources of heat and direct sunlight.

Store on concrete or other impervious floor, preferably with bunding to contain any spillage. Do not stack more than 3 pallets high.

Keep container tightly closed. Containers which are opened must be carefully resealed and kept upright to prevent leakage. Keep in the original container or one of the same material.

Prevent unauthorised access.

All sources of ignition (hot surfaces, sparks, open flames etc) should be excluded from areas of preparation and application. All electrical equipment (including torches) should be protected (Ex) to the appropriate standard.

The product may charge electrostatically. Always use earthing leads when pouring solvents and transferring product. Operators should wear clothing which does not generate static (at least 60% natural fibre) and antistatic footwear; floors should be of conducting type.

## 8. Exposure controls and personal protection

### 8.1. Control parameters

Exposure standards are those provided by the ACGIH (American Conference of Government Industrial Hygenists).

| Material | Short term (15 min. ave) | | Long term (8hr time weighted average) | | Comments |
|---|---|---|---|---|---|
| | ppm | mg/m³ | ppm | mg/M3 | |
| **Ethyl Benzene** | **125** | **545** | **100** | **435** | |
| **HDI homopolymer** | | | | **0.02** | |
| **Hexamethylene diisocyanate** | | | **0.005** | **0.034** | |
| **Xylene** | **150** | **655** | **100** | **434** | |

Key to notification

(P) Peak exposure limit
(R) Suppliers Recommended Limit
(Sk) There is a risk of absorption through unbroken skin
(Sen) Sensitiser
(Cat1) Category 1 - established human carcinogen
(Cat2) Category 2 - probable human carcinogen
(Cat3) Category 3 - substances suspected of having carcinogenic potential

**DNEL/PNEC values**

No Data Available

**8.2. Exposure controls**

Provide adequate ventilation. Where reasonably practicable this should be achieved by the use of local exhaust ventilation and good general extraction. If these are not sufficient to maintain concentrations of particulates and any vapour below occupational exposure limits suitable respiratory protection must be worn.

Provide adequate ventilation. This should be achieved by the use of local exhaust ventilation and good general extraction. Air-fed protective respiratory equipment must be worn by spray operators even when good ventilation is provided . In other operations, if local exhaust ventilation and good general extraction are not sufficient to maintain concentrations of particulates and solvent vapour below the WEL, suitable respiratory protection must be worn. (See Personal Protection)

Persons with a history of asthma, allergies, chronic or recurrent respiratory disease should not be employed in any process in which this preparation is used.

Examination of lung function should be carried out on a regular basis on persons spraying this preparation.

**Eye Protection**

Wear safety eyewear, e.g. safety spectacles, goggles or visors to protect against the splash of liquids. Eyewear should comply with an approved standard.

Wear a full face shield if mixing or pouring operations pose a risk of splashes.

An eye wash station is suggested as a good work place practice.

**Skin Protection**

Gloves of an appropriate material should be worn during mixing and application.

**Other**

Overalls which cover the body, arms and legs should be worn. Skin should not be exposed. Barrier creams may help to protect areas which are difficult to cover such as the face and neck. They should however not be applied once exposure has occurred. Petroleum jelly based types such as Vaseline should not be used. All parts of the body should be washed after contact.

**Respiratory Protection**

When concentrations exceed the exposure limits shown above workers must wear appropriate respirators approved in accordance with Directive 89/656/EEC and the Personal Protection Equipment Regulations. Provision of other controls such as exhaust ventilation should be considered if practical.

An air fed respirator must be worn when applying this product in a confined space. Even in open spaces, an air fed respirator should be worn when spraying.
If applying by brush or roller in an open, well ventilated area, air fed respirators could be replaced by a charcoal filter mask.

**Thermal hazards**
No Data Available

## 9. Physical and chemical properties

| | |
|---|---|
| **Appearance** | Colourless Liquid |
| **Odour** | Smell of Solvent |
| **Odour threshold** | Not Measured |
| **pH** | N/A |
| **Melting point / freezing point (°C)** | Not Measured |
| **Initial boiling point and boiling range (°C)** | 137 |
| **Flash Point (°C)** | 50 |
| **Evaporation rate (Ether = 1)** | Not Measured |
| **Flammability (solid, gas)** | Not Applicable |
| **Upper/lower flammability or explosive limits** | Lower Explosive Limit: 1.1<br>Upper Explosive Limit: 6.6 |
| **Vapour pressure (Pa)** | Not Measured |
| **Vapour Density** | Heavier than air. |
| **Specific Gravity** | 1.02 |
| **Solubility in Water** | Immiscible |
| **Partition coefficient n-octanol/water (Log Kow)** | Not Measured |
| **Autoignition temperature (℃)** | Not Measured |
| **Decomposition temperature** | Not Measured |
| **Viscosity (cSt)** | N/A |
| **Molecular Weight** | Not Measured |

**9.2. Other information**
No further information

## 10. Stability and reactivity

**10.1. Reactivity**
No data available
**10.2. Chemical stability**
Stable under recommended storage and handling conditions (see section 7). In a fire, hazardous decomposition products such as smoke, carbon monoxide, carbon dioxide, oxides of nitrogen, hydrogen cyanide may be produced.

Keep away from oxidising agents, strongly alkaline and strongly acid materials, amines, alcohols and water. Uncontrolled exothermic reactions occur with amines and alcohols. The product reacts slowly with water resulting in evolution of carbon dioxide. In closed containers, pressure build up could result in distortion,blowing and in extreme cases bursting of the container.

**10.3. Possibility of hazardous reactions**

May react exothermically with: oxidising agents, strong alkalis, strong acids.

**10.4. Conditions to avoid**

Stable under recommended storage and handling conditions (see section 7).

**10.5. Incompatible materials**

Keep away from the following materials: oxidising agents, strong alkalis, strong acids.

**10.6. Hazardous decomposition products**

Fire will produce dense black smoke. Decomposition products may include the following materials: carbon monoxide, carbon dioxide, smoke, oxides of nitrogen.
Avoid exposure and use breathing apparatus as appropriate.

## 11. Toxicological information

**Acute toxicity**

Exposure to solvent vapour concentrations from the component solvents in excess of the stated occupational exposure limits may result in adverse health effects such as mucous membrane and respiratory system irritation and adverse effects on the kidneys, liver and central nervous system. Symptoms include headache, nausea, dizziness, fatigue, muscular weakness, drowsiness and in extreme cases, loss of consciousness.

Repeated or prolonged contact with the preparation may cause removal of natural fat from the skin resulting in dryness, irritation and possible non-allergic contact dermatitis. Solvents may also be absorbed through the skin. Splashes of liquid in the eyes may cause irritation and soreness with possible reversible damage.

Based on the properties of the isocyanate content of this product, respiratory exposure may cause acute irritation and/or sensitisation of the respiratory system resulting in asthmatic symptoms, wheezing and a tightness of the chest. Sensitised persons may subsequently show asthmatic symptoms when exposed to airborne concentrations of isocyanates well below the occupational exposure limit. Repeated exposure may lead to permanent respiratory disability. Persons with a chronic or recurrent respiratory disease should not be employed in any process in which these products are used.

The preparation has been assessed using the Acute Toxicity Data listed below, and classified for toxicological hazards accordingly. See section 2 for details.

| Ingredient | Oral LD50, mg/kg | Skin LD50, mg/kg | Inhalation Vapour LD50, mg/L/4hr | Inhalation Dust/Mist LD50, mg/L/4hr |
|---|---|---|---|---|
| Ethyl Benzene - (100-41-4) | 3,500.00, Rat | 15,433.00, Rabbit | 17.20, Rat | Not Available |
| HDI homopolymer - (28182-81-2) | 5,000.00, Rat | Not Available | Not Available | Not Available |
| | | | | |

| | | | | |
|---|---|---|---|---|
| Hexamethylene diisocyanate - (822-06-0) | Not Available | Not Available | Not Available | Not Available |
| Xylene - (1330-20-7) | 4,299.00, Rat | 1,548.00, Rabbit | Not Available | 20.00, Rat |

| Item | Category | Hazard |
|---|---|---|
| Acute Toxicity (mouth) | Not Classified | Not Applicable |
| Acute Toxicity (skin) | 4 | Harmful in contact with skin. |
| Acute Toxicity (inhalation) | 4 | Harmful if inhaled. |
| Skin corrosion/irritation | 2 | Causes skin irritation. |
| Eye damage/irritation | 2 | Causes serious eye irritation. |
| Sensitization (respiratory) | 1 | May cause allergy or asthma symptoms of breathing difficulties if inhaled. |
| Sensitization (skin) | 1 | May cause an allergic skin reaction. |
| Germ toxicity | Not Classified | Not Applicable |
| Carcinogenicity | Not Classified | Not Applicable |
| Reproductive Toxicity | Not Classified | Not Applicable |
| Specific target organ systemic toxicity (single exposure) | 3 | May cause respiratory irritation. |
| Specific target organ systemic Toxicity (repeated exposure) | Not Classified | Not Applicable |
| Aspiration hazard | Not Classified | Not Applicable |

## 12. Ecological information

### 12.1. Toxicity

The preparation has been assessed according to the GHS criteria and is classified as dangerous for the environment, using the toxicity data listed below.

There are no data available on the product itself.

The product should not be allowed to enter drains or water courses.

### Aquatic Ecotoxicity

| Ingredient | 96 hr LC50 fish, mg/l | 48 hr EC50 crustacea, mg/l | ErC50 algae, mg/l |
|---|---|---|---|
| HDI homopolymer - (28182-81-2) | 100.00, Danio rerio | 100.00, Daphnia magna | 100.00 (72 hr), Scenedesmus subspicatus |
| Xylene - (1330-20-7) | Not Available | Not Available | Not Available |
| Ethyl Benzene - (100-41-4) | 4.20, Oncorhynchus mykiss | 2.93, Daphnia magna | 3.60 (96 hr), Pseudokirchneriella subcapitata |

| | | | |
|---|---|---|---|
| Hexamethylene diisocyanate - (822-06-0) | 82.80, Danio rerio | 89.10, Daphnia magna | 77.40 (72 hr), Desmodesmus subspicatus |

**12.2. Persistence and degradability**

There is no data available on the preparation itself.

**12.3. Bioaccumulative potential**

Not Measured

**12.4. Mobility in soil**

No data available

**12.5. Results of PBT and vPvB assessment**

This product contains no PBT/vPvB chemicals.

**12.6. Other adverse effects**

No data available

## 13. Disposal considerations

**13.1. Waste treatment methods**

Do not allow into drains or water courses. Wastes and empty containers should be disposed of in accordance with State and Federal regulations.

Using information provided in this data sheet advice should be obtained from the local Waste Regulation Authority as to whether special waste regulations apply.

## 14. Transport information

**14.1. UN number** 1263

**14.2. UN proper shipping name** Paint

**14.3. Transport hazard class(es)**

**Road and Rail Transport** UN1263, Paint, CLASS 3, PG III, HAZCHEM *3Y

**IMDG reference :** **Class/Div** 3 **Sub Class**

**Ems** F-E,S-E

**ICAO/IATA** **Class** 3 **Sub Class**

**14.4. Packing group** III

**14.5. Environmental hazards**

**Road and Rail Transport** Environmentally Hazardous: No

**IMDG reference :** Marine Pollutant: No

**14.6. Special precautions for user**

No further information

**14.7. Transport in bulk according to Annex II of MARPOL73/78 and the IBC Code**

Not Applicable

## 15. Regulatory information

Some non-disclosed ingredients in section 3 can be disclosed in this section 15 by the MoEL Public Notice for MSDS generation. If you want to know the reason why the non-disclosed ingredient in section 3 was informed in this section, please contact Regulatory Affair representative of the material supplier or this safety data sheet provider.

This product and all its components complies with the chemical and transport regulations from the country listed in section 1.3.
Other regulatory information specific to the hazardous chemical(s):

**Dangerous Goods Act** Class 4 Flammable Liquid, 2nd Petroleum Division, hazard class III

**Waste Control Act** Hazardous Waste

**KOSHA**

**Please see section 8 in this MSDS for Harmful Factors Subject to Exposure Limit.**

**Harmful Factors Subject to Work Environment Measurement:**

Ethyl Benzene

**Hazard Substances Subject to Control:**

Ethyl Benzene

Xylene

**Harmful Factors Subject to Special Health Check-up:**

Ethyl Benzene

Xylene

**Harmful Substances Requiring Permission :**

(No Product Ingredients Listed)

**Harmful Substances Prohibited for Manufacturing, Importing, Transferring, or Supplying:**

(No Product Ingredients Listed)

**Chemical Substances Control Act**

**Toxic Chemicals:**

Hexamethylene diisocyanate

Xylene

**Observational Chemicals:**

(No Product Ingredients Listed)

**TRI PRTR Group I:**
(No Product Ingredients Listed)

**TRI PRTR Group II:**

Hexamethylene diisocyanate

Ethyl Benzene

Xylene

**Accident Precaution Chemicals:**
(No Product Ingredients Listed)

**Restricted Chemicals**
(No Product Ingredients Listed)

**Banned Chemicals:**
(No Product Ingredients Listed)

## 16. Other information

**Revision Date:** 02/07/2020

**Version:** 8

**Initial Date:** 05/09/2012

This Safety Data Sheet was compiled with data and information from the following sources: KOSHA, NITE, ESIS, NLM, SIDS, IPCS, NCIS.

The information on this SDS is based upon the present state of our knowledge and on current law. The product should not be used for purposes other than shown in the product data sheet without first obtaining written advice.

It is always the responsibility of the user to take all necessary steps to meet the demands of applicable legislation.

The information in this Safety Data Sheet is required according to legislation.

The full text of the phrases appearing in section 3 is:

H225 Highly flammable liquid and vapour.

H226 Flammable liquid and vapour.

H304 May be fatal if swallowed and enters airways.

H312 Harmful in contact with skin.

H315 Causes skin irritation.

H317 May cause an allergic skin reaction.

H319 Causes serious eye irritation.

H332 Harmful if inhaled.

H334 May cause allergic or asthmatic symptoms or breathing difficulties if inhaled.

H335 May cause respiratory irritation.

H336 May cause drowsiness and dizziness.

H372 Causes damage to organs through prolonged or repeated exposure.

H373 May cause damage to organs through prolonged or repeated exposure.

**This SDS is valid for 5 years from the revised date on page 1.**
**The revision date is in American format (e.g. MM/DD/YY).**

End of document

All information concerning this product and/or suggestions for handling and use contained herein are offered in good faith and are believed to be reliable. Akzo Nobel however makes no warranty as to the accuracy of and/or sufficiency of such information.

# Material Safety Data Sheet

**DDP SPECIALTY PRODUCTS KOREA LTD.**

**Product name: MOLYKOTE® 111 Compound**

**Issue Date:** 2018.10.18
**Print Date:** 2020.04.30

DDP SPECIALTY PRODUCTS KOREA LTD. encourages and expects you to read and understand the entire (M)SDS, as there is important information throughout the document. We expect you to follow the precautions identified in this document unless your use conditions would necessitate other appropriate methods or actions.

## 1. PRODUCT AND COMPANY IDENTIFICATION

**Product name:** MOLYKOTE® 111 Compound

**Recommended use of the chemical and restrictions on use**
**Identified uses:** Lubricants and lubricant additives
**Uses advised against:** We recommend that you use this product in a manner consistent with the listed use. If your intended use is not consistent with the stated use, please contact your sales or technical service representative.

**COMPANY IDENTIFICATION**
DDP SPECIALTY PRODUCTS KOREA LTD.
430, NONHYEON-RO
GANGNAM-GU SEOUL (YEOKSAM_DONG)
SOUTH KOREA

**Customer Information Number:** +82-2-2222-5200

## 3. COMPOSITION/INFORMATION ON INGREDIENTS

This product is a mixture.

| Component | Common Name | CASRN | Concentration | KECI Number |
|---|---|---|---|---|
| Silicon dioxide | No data available | 7631-86-9 | >= 10.0 - < 20.0 % | KE-31032 |
| Siloxanes and silicones, dimethyl | No data available | 63148-62-9 | >= 80.0 - < 90.0 % | KE-31068 |
| Silicone Metalloid Complex | No data available | Trade secret | >= 1.0 - < 10.0 % | - |

## 4. FIRST AID MEASURES

**Description of first aid measures**
**General advice:**
If potential for exposure exists refer to Section 8 for specific personal protective equipment.

**Inhalation:** Move person to fresh air; if effects occur, consult a physician.

**Skin contact:** Wash off with plenty of water.

**Eye contact:** Flush eyes thoroughly with water for several minutes. Remove contact lenses after the initial 1-2 minutes and continue flushing for several additional minutes. If effects occur, consult a physician, preferably an ophthalmologist.

**Ingestion:** No emergency medical treatment necessary.

**Most important symptoms and effects, both acute and delayed:**
Aside from the information found under Description of first aid measures (above) and Indication of immediate medical attention and special treatment needed (below), any additional important symptoms and effects are described in Section 11: Toxicology Information.

**Indication of any immediate medical attention and special treatment needed**
**Notes to physician:** No specific antidote. Treatment of exposure should be directed at the control of symptoms and the clinical condition of the patient.

## 5. FIREFIGHTING MEASURES

**Suitable extinguishing media:** Water spray Alcohol-resistant foam Carbon dioxide (CO2) Dry chemical

**Unsuitable extinguishing media:** None known.

**Special hazards arising from the substance or mixture**
**Hazardous combustion products:** Carbon oxides Silicon oxides Boron oxides Formaldehyde

**Unusual Fire and Explosion Hazards:** Exposure to combustion products may be a hazard to health.

**Advice for firefighters**
**Fire Fighting Procedures:** Use extinguishing measures that are appropriate to local circumstances and the surrounding environment. Use water spray to cool unopened containers. Remove undamaged containers from fire area if it is safe to do so. Evacuate area.

**Special protective equipment for firefighters:** Wear self-contained breathing apparatus for firefighting if necessary. Use personal protective equipment.

## 6. ACCIDENTAL RELEASE MEASURES

**Personal precautions, protective equipment and emergency procedures:** Follow safe handling advice and personal protective equipment recommendations.

**Environmental precautions:** Discharge into the environment must be avoided. Prevent further leakage or spillage if safe to do so. Retain and dispose of contaminated wash water. Local authorities should be advised if significant spillages cannot be contained.

**Methods and materials for containment and cleaning up:** Wipe up or scrape up and contain for salvage or disposal. Local or national regulations may apply to releases and disposal of this material, as well as those materials and items employed in the cleanup of releases. You will need to determine which regulations are applicable. For large spills, provide dyking or other appropriate containment to keep material from spreading. If dyked material can be pumped, Sections 13 and 15 of this SDS provide information regarding certain local or national requirements.
See sections: 7, 8, 11, 12 and 13.

## 7. HANDLING AND STORAGE

**Precautions for safe handling:** Take care to prevent spills, waste and minimize release to the environment. Handle in accordance with good industrial hygiene and safety practice.
Use only with adequate ventilation. See Engineering measures under EXPOSURE CONTROLS/PERSONAL PROTECTION section.

**Conditions for safe storage:** Keep in properly labelled containers. Store in accordance with the particular national regulations.

Do not store with the following product types: Strong oxidizing agents.
Unsuitable materials for containers**:** None known.

## 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

**Control parameters**
If exposure limits exist, they are listed below. If no exposure limits are displayed, then no values are applicable.

| Component | Regulation | Type of listing | Value/Notation |
|---|---|---|---|
| Silicon dioxide | Dow IHG | TWA Respirable fraction. | 0.2 mg/m3 |
| | KR OEL | TWA | 10 mg/m3 |

Although some of the components of this product may have exposure guidelines, no exposure would be expected under normal handling conditions due to the physical state of the material.

**Exposure controls**
**Engineering controls:** Use local exhaust ventilation, or other engineering controls to maintain airborne levels below exposure limit requirements or guidelines. If there are no applicable exposure limit requirements or guidelines, general ventilation should be sufficient for most operations.

**Individual protection measures**

**Eye/face protection:** Use safety glasses (with side shields).

**Skin protection**

**Hand protection:** Use gloves chemically resistant to this material when prolonged or frequently repeated contact could occur. Examples of preferred glove barrier materials include: Butyl rubber. Neoprene. Nitrile/butadiene rubber ("nitrile" or "NBR"). Ethyl vinyl alcohol laminate ("EVAL"). Polyvinyl alcohol ("PVA"). Polyvinyl chloride ("PVC" or "vinyl"). Viton. Examples of acceptable glove barrier materials include: Natural rubber ("latex"). NOTICE: The selection of a specific glove for a particular application and duration of use in a workplace should also take into account all relevant workplace factors such as, but not limited to: Other chemicals which may be handled, physical requirements (cut/puncture protection, dexterity, thermal protection), potential body reactions to glove materials, as well as the instructions/specifications provided by the glove supplier.

**Other protection:** Wear clean, body-covering clothing.

**Respiratory protection:** Respiratory protection should be worn when there is a potential to exceed the exposure limit requirements or guidelines. If there are no applicable exposure limit requirements or guidelines, wear respiratory protection when adverse effects, such as respiratory irritation or discomfort have been experienced, or where indicated by your risk assessment process. For most conditions no respiratory protection should be needed; however, if discomfort is experienced, use an approved air-purifying respirator.
The following should be effective types of air-purifying respirators: Organic vapor cartridge.

## 9. PHYSICAL AND CHEMICAL PROPERTIES

**Appearance**

| | |
|---|---|
| **Physical state** | Grease |
| **Color** | white translucent |
| **Odor** | none |
| **Odor Threshold** | No data available |

| | |
|---|---|
| **pH** | Not applicable |
| **Melting point/range** | No data available |
| **Freezing point** | No data available |
| **Boiling point (760 mmHg)** | Not applicable |
| **Flash point** | **Seta closed cup** >101.1 °C |
| **Evaporation Rate (Butyl Acetate = 1)** | Not applicable |
| **Flammability (solid, gas)** | Not classified as a flammability hazard |
| **Lower explosion limit** | No data available |
| **Upper explosion limit** | No data available |
| **Vapor Pressure** | Not applicable |
| **Relative Vapor Density (air = 1)** | No data available |
| **Relative Density (water = 1)** | 1.1 |
| **Water solubility** | No data available |
| **Partition coefficient: n-octanol/water** | No data available |
| **Auto-ignition temperature** | No data available |
| **Decomposition temperature** | No data available |
| **Dynamic Viscosity** | Not applicable |
| **Kinematic Viscosity** | Not applicable |
| **Explosive properties** | Not explosive |
| **Oxidizing properties** | The substance or mixture is not classified as oxidizing. |
| **Liquid Density** | 1.1 g/cm3 |
| **Molecular weight** | No data available |
| **Particle size** | No data available |

NOTE: The physical data presented above are typical values and should not be construed as a specification.

## 10. STABILITY AND REACTIVITY

**Reactivity:** Not classified as a reactivity hazard.

**Chemical stability:** Stable under normal conditions.

**Possibility of hazardous reactions:** Can react with strong oxidizing agents.

**Conditions to avoid:** None known.

**Incompatible materials:** Oxidizing agents

**Hazardous decomposition products:** Formaldehyde.

## 11. TOXICOLOGICAL INFORMATION

*Toxicological information appears in this section when such data is available.*

**Information on the likely route of exposure**
Please refer to the information below.
**Acute toxicity**

**Acute oral toxicity**
Very low toxicity if swallowed. Harmful effects not anticipated from swallowing small amounts.

As product: Single dose oral LD50 has not been determined.

Based on information for component(s):
LD50, Rat, > 5,000 mg/kg Estimated.

**Acute dermal toxicity**
Prolonged skin contact is unlikely to result in absorption of harmful amounts.

Based on information for component(s):
LD50, Rabbit, > 2,000 mg/kg Estimated. No deaths occurred at this concentration.

**Acute inhalation toxicity**
Vapors are unlikely due to physical properties. No adverse effects are anticipated from inhalation.
As product: The LC50 has not been determined.

**Skin corrosion/irritation**
Brief contact is essentially nonirritating to skin.

**Serious eye damage/eye irritation**
May cause slight temporary eye irritation.
Corneal injury is unlikely.

**Skin and Respiratory Sensitization**
Contains component(s) which did not cause allergic skin sensitization in guinea pigs.

For respiratory sensitization:
No relevant data found.

**Specific Target Organ Systemic Toxicity (Single Exposure)**
Evaluation of available data suggests that this material is not an STOT-SE toxicant.

**Specific Target Organ Systemic Toxicity (Repeated Exposure)**
For the component(s) tested:
Based on available data, repeated exposures are not anticipated to cause significant adverse effects.

**Carcinogenicity**
For the component(s) tested: Did not cause cancer in laboratory animals.

**Teratogenicity**
For the component(s) tested: Did not cause birth defects or any other fetal effects in laboratory animals.

**Reproductive toxicity**
For the component(s) tested: In animal studies, did not interfere with reproduction.

**Mutagenicity**
For the component(s) tested: In vitro genetic toxicity studies were negative. Animal genetic toxicity studies were negative.

**Aspiration Hazard**
Based on physical properties, not likely to be an aspiration hazard.

**COMPONENTS INFLUENCING TOXICOLOGY:**

**Silicon dioxide**

**Acute inhalation toxicity**
Maximum attainable concentration. LC50, Rat, 4 Hour, dust/mist, > 2.08 mg/l No deaths occurred at this concentration.

**Siloxanes and silicones, dimethyl**

**Acute inhalation toxicity**
The LC50 has not been determined.

**Silicone Metalloid Complex**

**Acute inhalation toxicity**
No adverse effects expected from single exposure.

The LC50 has not been determined.

## 12. ECOLOGICAL INFORMATION

*Ecotoxicological information appears in this section when such data is available.*

**Ecotoxicity**

**Silicon dioxide**

**Acute toxicity to fish**
Material is practically non-toxic to aquatic organisms on an acute basis (LC50/EC50/EL50/LL50 >100 mg/L in the most sensitive species tested).
LC50, Danio rerio (zebra fish), 96 Hour, 5,000 - 10,000 mg/l

**Acute toxicity to aquatic invertebrates**
EC50, Daphnia magna (Water flea), 24 Hour, > 1,000 mg/l

**Acute toxicity to algae/aquatic plants**
EC50, Pseudokirchneriella subcapitata (green algae), 72 Hour, Biomass, 440 mg/l

**Siloxanes and silicones, dimethyl**

**Acute toxicity to fish**
Material is practically non-toxic to aquatic organisms on an acute basis (LC50/EC50/EL50/LL50 >100 mg/L in the most sensitive species tested).
LC50, Fish, 96 Hour, > 100 mg/l

**Acute toxicity to aquatic invertebrates**
EC50, Daphnia magna (Water flea), 48 Hour, > 100 mg/l

**Acute toxicity to algae/aquatic plants**

EC50, algae, 14 d, > 2,000 mg/l

**Chronic toxicity to fish**
NOEC, Cyprinodon variegatus (sheepshead minnow), 33 d, 91 mg/l

**Toxicity to Above Ground Organisms**
Material is practically non-toxic to birds on an acute basis (LD50 > 2000 mg/kg).
oral LD50, Colinus virginianus (Bobwhite quail), > 5,000 mg/kg

**Silicone Metalloid Complex**
**Acute toxicity to fish**
No relevant data found.

**Persistence and degradability**

**Silicon dioxide**
**Biodegradability:** Biodegradation is not applicable.

**Siloxanes and silicones, dimethyl**
**Biodegradability:** The product is not biodegradable.

**Silicone Metalloid Complex**
**Biodegradability:** No relevant data found.

**Bioaccumulative potential**

**Silicon dioxide**
**Bioaccumulation:** Partitioning from water to n-octanol is not applicable.

**Siloxanes and silicones, dimethyl**
**Bioaccumulation:** No bioconcentration is expected because of the relatively high molecular weight (MW greater than 1000).

**Silicone Metalloid Complex**
**Bioaccumulation:** No relevant data found.

**Mobility in Soil**

**Silicon dioxide**
No relevant data found.

**Siloxanes and silicones, dimethyl**
Expected to be relatively immobile in soil (Koc > 5000).

**Silicone Metalloid Complex**
No relevant data found.

**Results of PBT and vPvB assessment**

**Silicon dioxide**
This substance has not been assessed for persistence, bioaccumulation and toxicity (PBT).

**Siloxanes and silicones, dimethyl**
This substance has not been assessed for persistence, bioaccumulation and toxicity (PBT).

**Silicone Metalloid Complex**

This substance has not been assessed for persistence, bioaccumulation and toxicity (PBT).

**Other adverse effects**

**Silicon dioxide**

This substance is not on the Montreal Protocol list of substances that deplete the ozone layer.

**Siloxanes and silicones, dimethyl**

This substance is not on the Montreal Protocol list of substances that deplete the ozone layer.

**Silicone Metalloid Complex**

This substance is not on the Montreal Protocol list of substances that deplete the ozone layer.

## 13. DISPOSAL CONSIDERATIONS

**Disposal methods:** DO NOT DUMP INTO ANY SEWERS, ON THE GROUND, OR INTO ANY BODY OF WATER. All disposal practices must be in compliance with all Federal, State/Provincial and local laws and regulations. Regulations may vary in different locations. Waste characterizations and compliance with applicable laws are the responsibility solely of the waste generator. AS YOUR SUPPLIER, WE HAVE NO CONTROL OVER THE MANAGEMENT PRACTICES OR MANUFACTURING PROCESSES OF PARTIES HANDLING OR USING THIS MATERIAL. THE INFORMATION PRESENTED HERE PERTAINS ONLY TO THE PRODUCT AS SHIPPED IN ITS INTENDED CONDITION AS DESCRIBED IN MSDS SECTION: Composition Information. FOR UNUSED & UNCONTAMINATED PRODUCT, the preferred options include sending to a licensed, permitted: Incinerator or other thermal destruction device. For additional information, refer to: Handling & Storage Information, MSDS Section 7 Stability & Reactivity Information, MSDS Section10 Regulatory Information, MSDS Section 15

**Disposal precautions:** Empty containers should be recycled or otherwise disposed of by an approved waste management facility. Waste characterizations and compliance with applicable laws are the responsibility solely of the waste generator. Do not re-use containers for any purpose.

**Contaminated packaging:** All disposal practices must be in compliance with all Federal, State/Provincial and local laws and regulations.

## 14. TRANSPORT INFORMATION

**Classification for ROAD and Rail transport:**

| | |
|---|---|
| **UN number** | Not applicable |
| **Proper shipping name** | Not regulated for transport |
| **Class** | Not applicable |
| **Packing group** | Not applicable |
| **Environmental hazards** | Not applicable |
| **Special precautions for user** | No data available. |

**Classification for SEA transport (IMO-IMDG):**

| | |
|---|---|
| **UN number** | Not applicable |
| **Proper shipping name** | Not regulated for transport |
| **Class** | Not applicable |
| **Packing group** | Not applicable |
| **Marine pollutant** | Not applicable |
| **Special precautions for user** | No data available. |
| **Transport in bulk according to Annex I or II of MARPOL 73/78 and the IBC or IGC Code** | Consult IMO regulations before transporting ocean bulk |

**Classification for AIR transport (IATA/ICAO):**

| | |
|---|---|
| **UN number** | Not applicable |
| **Proper shipping name** | Not regulated for transport |
| **Class** | Not applicable |
| **Packing group** | Not applicable |
| **Special precautions for user** | No data available. |

This information is not intended to convey all specific regulatory or operational requirements/information relating to this product. Transportation classifications may vary by container volume and may be influenced by regional or country variations in regulations. Additional transportation system information can be obtained through an authorized sales or customer service representative. It is the responsibility of the transporting organization to follow all applicable laws, regulations and rules relating to the transportation of the material.

## 15. REGULATORY INFORMATION

**Regulation under the Occupational Safety and Health Act**
The product is not classified as hazardous by ISHL in Korea.

**Harmful Substances Prohibited from Manufacturing**

Not applicable

**Harmful Substances Required Permission for Manufacture**

Not applicable

**Harmful Agents to be kept below Occupational Exposure Limits**

| Components | CASRN |
|---|---|
| Silicon dioxide | 7631-86-9 |

**Harmful Agents Required to be kept below Permission Levels**

Not applicable

**Information Source and References**
This SDS is prepared by Product Regulatory Services and Hazard Communications Groups from information supplied by internal references within our company.

DDP SPECIALTY PRODUCTS KOREA LTD. urges each customer or recipient of this (M)SDS to study it carefully and consult appropriate expertise, as necessary or appropriate, to become aware of and understand the data contained in this (M)SDS and any hazards associated with the product. The information herein is provided in good faith and believed to be accurate as of the effective date shown above. However, no warranty, express or implied, is given. Regulatory requirements are subject to change and may differ between various locations. It is the buyer's/user's responsibility to ensure that his activities comply with all federal, state, provincial or local laws. The information presented here pertains only to the product as shipped. Since conditions for use of the product are not under the control of the manufacturer, it is the buyer's/user's duty to determine the conditions necessary for the safe use of this product. Due to the proliferation of sources for information such as manufacturer-specific (M)SDSs, we are not and cannot be responsible for (M)SDSs obtained from any source other than ourselves. If you have obtained an (M)SDS from another source or if you are not sure that the (M)SDS you have is current, please contact us for the most current version.

## Material Safety Data Sheet

Version: 1.1
Revision Date: 2016/1/04

**LUBCHEM VA 3012 F**

## 1. IDENTIFICATION THE SUBSTANCE AND OF THE COMPANY

**Lubchem Corporation** **TEL : (82-54)954-8500**
**1762, Songgok-ri, Dasan-myeon, Goryeong-gun, FAX : (82-54)954-0131**
**Gyeongsangbuk-do, Korea WebSite : http://www.lubchem.co.kr**

MSDS No. : Revision Date:

Generic Description: Organic grease
Physical Form: Grease
Color: Dark Beige
Odor: Odorless

## 2. HAZARDS IDENTIFICATION

POTENTIAL HEALTH EFFECTS

Acute Effects

| | |
|---|---|
| Eye: | Direct contact may temporary redness and discomfort. |
| Skin: | No significant irritation expected from a single short-term exposure. |
| Inhalation: | Irritates respiratory passages very slightly. |
| Oral: | Low ingestion hazard in normal use. |

Prolonged/Repeated Exposure Effects

| | |
|---|---|
| Skin: | Repeated or prolonged exposure may cause irritation. |
| Inhalation: | No known applicable information. |
| Oral: | Repeated ingestion or swallowing large amounts may injure internally. |

Signs and Symptoms of Overexposure

No known applicable information.

Medical Conditions Aggravated by Exposure

No known applicable information.

The above listed potential effects of overexposure are based on actual data, results of studies performed upon similar compositions, component data and/or expert review of the products. Please refer to Section 11 for the detailed toxicology information.

(주)루브캠코리아
LUB CHEM KOREA CO.,LTD

# LUBCHEM CORPORATION
## Material Safety Data Sheet

**LUBCHEM VA 3012 F**

## 3. COMPOSITIONS/INFORMATION ON INGREDIENTS

| | |
|---|---|
| **Dec-1-ene, Homopolymer, Hydrogenated** | **(CAS No. : 68037-01-4) 60 ~ 80%** |
| **Urea Soap** | **(CAS No. : 57-13-6) 10~30%** |
| **Polytetrafluoroethylene** | **(CAS No. : 9002-84-0) 5~10%** |

## 4. FIRST AID MEASURES

| | |
|---|---|
| Eye: | Immediately flush with water. |
| Skin: | No first aid should be needed. |
| Inhalation: | No first aid should be needed. |
| Oral: | Get medical attention. |
| Notes to Physician: | Treat according to person's condition specifies of exposure. |

## 5. FIRE FIGHTING MEASURES

| | |
|---|---|
| Flash Point: | Not applicable. |
| Auto ignition Temperature: | Not determined. |
| Flammability Limits in Air: | Not determined. |
| Extinguishing Media: | On large fires use dry chemical, foam or water spray. On small fires use carbon dioxide(CO2), dry chemical or water spray. Water can be used to cool fire exposed containers. |
| Fire Fighting Measures: | Self-contained breathing apparatus and protective clothing should be worn in fighting large fires involving chemicals. Determine the need to evacuate or isolate the area according to your local emergency plan. Use water spray to keep fire exposed containers cool. |
| Unusual Fire Hazards: | None. |

## 6. ACCIDENTAL RELEASE MEASURES

| | |
|---|---|
| Containment/Clean up: | Observe all personals protection equipment recommendations described in Sections 5 and 8. Wipe up or scrape up and contain for salvage or disposal. Clean area as appropriate since spilled materials, even in small quantities, may present a slip hazard. Final cleaning may require use of steam, solvents or detergents. Dispose of saturated absorbant or cleaning materials appropriately, since spontaneous heating may occur. Local, state and federal |

laws and regulations may apply to releases and disposal of this material, as well as those materials and items employed in the cleanup of releases.

Note: See Section 8 for personal protective Equipment for Spills.

## 7. HANDLING AND STORAGE

Use with adequate ventilation. At temperatures above 482F/250C this material may produce highly toxic gaseous compounds such as hydrogen fluoride and perfluorohydrocarbons. Provide adequate ventilation or use the appropriate respiratory protection if the possibility of exceeding 482F/250C exists. Avoid contamination of tobacco products. Fluoropolymers on tobacco goods may cause adverse health effects by inhalation of the decomposition products.
Employees should wash their hands and face before eating, drinking or using tobacco products. Avoid eye contact. Do not take internally.

Use reasonable care and store away from oxidizing materials.

## 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

**Component Exposures Limits**

There are no components with workplace exposure limits.

**Engineering Controls**

| | |
|---|---|
| Local Ventilation: | None should be needed. |
| General Ventilation: | Recommended. |

**Personal Protective Equipment for Routine Handling**

| | |
|---|---|
| Eyes: | Use proper protection - safety glasses as a minimum. |
| Skin: | Washing at mealtime and end of shift is adequate. |
| Suitable Gloves: | Avoid skin contact by implementing good industrial hygiene practices and procedures. and use gloves and/or protective clothing to further minimize the potential for skin contact. Consult with your glove and/or personnel protective equipment manufacturer for selection of appropriate compatible materials. |
| Inhalation: | No respiratory protection should be needed. |
| Suitable Respirator: | None should be needed. |

## LUBCHEM VA 3012 F

### 10. STABILITY AND REACTIVITY

| | |
|---|---|
| Chemical Stability: | Stable. |
| Hazardous Polymerization: | Hazardous polymerization will not occur. |
| Conditions to Avoid: | None. |
| Materials to Avoid: | Oxidizing material can cause a reaction. |

Hazardous Decomposition Products

Thermal breakdown of this product during fire or very high heat conditions may evolve the following decomposition products: Nitrogen oxides. Carbon oxides and traces of incompletely burned carbon compounds. Phosphorous oxides. Fluorine compounds. Metal oxides. Formaldehyde.

### 11. TOXICOLOGICAL INFORMATION

**Component Toxicology Information**

No known applicable information.

**Special Hazard Information on Components**

No known applicable information.

### 12. OTHER INFORMATION

Prepared by: LUBCHEM KOREA Corporation

These data are offered in good faith as typical values and not as product specifications. No warranty, either expressed or implied, is herby made. The recommended industrial hygiene and safe handling procedures are believed to be generally applicable. However, each user should review these recommendations in the specific context of the intended use and determine whether they are appropriate.

## Material Safety Data Sheet

**LUBCHEM VA 3012 F**

## 13. DISPOSAL CONSIDERATION

**RCRA Hazard Class**

When a decision is made to discard this material, as received, is it classified as a hazardous waste?

No.

State or local laws may impose additional regulatory requirements regarding disposal. Call(82-54)954-8500, if additional information is required.

## 14. TRANSPORT INFORMATION

**DOT Road Shipment Information**

Not subject to DOT.

**Ocean Shipment(IMDG)**

Not subject to IMDG code.

**Air Shipment(IATA)**

Not subject to IATA regulations.

Call LUBCHEM Sales dept. (82-54)954-8500, if additional information is required.

## 15. REGULATORY INFORMATION

Regulation by law for industrial safety and health : Article 41.
Other foreign regulations : none

## 16. OTHER INFORMATION

## 1. PRODUCT AND COMPANY IDENTIFICATION

| | | |
|---|---|---|
| Product name | : | Sikaflex®-221 |
| Product code | : | 000000601552 |
| Type of product | : | paste |

**Manufacturer or supplier's details**

| | | |
|---|---|---|
| Company | : | Sika Korea Ltd.<br>724, Anseongmatchum-daero<br>Miyang-myeon<br>Anseong-si<br>Gyeonggi-do<br>Korea |
| Telephone | : | +82-31-8056-7777 |
| Emergency telephone number | : | +82-31-8056-7777 |
| Telefax | : | +82-31-8056-7788 |
| E-mail address | : | ehs@kr.sika.com |

## 2. HAZARDS IDENTIFICATION

**GHS Classification**

| | | |
|---|---|---|
| Reproductive toxicity | : | Category 1B |
| Specific target organ toxicity - single exposure | : | Category 2 (Central nervous system, Kidney, Liver, Respiratory Tract) |
| Specific target organ toxicity - repeated exposure | : | Category 2 (Nervous system, Respiratory Tract) |
| Specific target organ toxicity - repeated exposure (Inhalation) | : | Category 2 (Central nervous system) |
| Long-term (chronic) aquatic hazard | : | Category 3 |

**GHS label elements**

Hazard pictograms :

Signal word : Danger

Hazard statements : H360 May damage fertility or the unborn child.
H371 May cause damage to organs (Central nervous system, Kidney, Liver, Respiratory Tract).
H373 May cause damage to organs (Nervous system, Respiratory Tract) through prolonged or repeated exposure.
H373 May cause damage to organs (Central nervous system)

through prolonged or repeated exposure if inhaled.
H412 Harmful to aquatic life with long lasting effects.

Precautionary statements : **Prevention:**
P201 Obtain special instructions before use.
P202 Do not handle until all safety precautions have been read and understood.
P260 Do not breathe dust/ fume/ gas/ mist/ vapours/ spray.
P264 Wash the contact area thoroughly after handling.
P270 Do not eat, drink or smoke when using this product.
P273 Avoid release to the environment.
P280 Wear protective gloves/ eye protection/ face protection.
P281 Use personal protective equipment as required.
**Response:**
P308 + P313 IF exposed or concerned: Get medical advice/ attention.
**Storage:**
P405 Store locked up.
**Disposal:**
P501 Dispose of contents and container (according to the description in the related regulation).

**Other hazards which do not result in classification**

None known.

## 3. COMPOSITION/INFORMATION ON INGREDIENTS

Substance / Mixture : Mixture

**Components**

| Chemical name | Common Name | CAS-No. | Concentration (%) |
|---|---|---|---|
| xylene | xylenes | 1330-20-7 | >= 1 - < 5 |
| Hydrocarbons, C9-C12, n-alkanes, isoalkanes, cyclics, aromatics (2-25%) | Naphtha (petroleum), hydrodesulfurized heavy | 64742-82-1 | >= 1 - < 5 |
| ethylbenzene | ethylbenzene | 100-41-4 | >= 0.1 - < 1 |
| 4,4'-methylenediphenyl diisocyanate | 4,4'-methylenediphenyl diisocyanate | 101-68-8 | 0 - < 1 |
| [3-(2,3-epoxypropoxy)propyl]trimethoxysilane | [3-(2,3-epoxypropoxy)propyl]trimethoxysilane | 2530-83-8 | 0 - < 1 |

## 4. FIRST AID MEASURES

General advice : Move out of dangerous area.
Consult a physician.
Show this safety data sheet to the doctor in attendance.

| | | |
|---|---|---|
| In case of eye contact | : | Remove contact lenses.<br>Keep eye wide open while rinsing.<br>If eye irritation persists, consult a specialist. |
| In case of skin contact | : | Take off contaminated clothing and shoes immediately.<br>Wash off with soap and plenty of water.<br>If symptoms persist, call a physician. |
| If inhaled | : | Move to fresh air.<br>Consult a physician after significant exposure. |
| If swallowed | : | Clean mouth with water and drink afterwards plenty of water.<br>Do not give milk or alcoholic beverages.<br>Never give anything by mouth to an unconscious person. |
| Most important symptoms and effects, both acute and delayed | : | No known significant effects or hazards.<br>See Section 11 for more detailed information on health effects and symptoms.<br>May damage fertility or the unborn child.<br>May cause damage to organs.<br>May cause damage to organs through prolonged or repeated exposure.<br>May cause damage to organs through prolonged or repeated exposure if inhaled. |
| Notes to physician | : | Treat symptomatically. |

## 5. FIREFIGHTING MEASURES

**Suitable and unsuitable extinguishing media**

| | | |
|---|---|---|
| Suitable extinguishing media | : | Carbon dioxide (CO2) |
| Unsuitable extinguishing media | : | Water |
| Hazardous combustion products | : | No hazardous combustion products are known |
| Specific extinguishing methods | : | Standard procedure for chemical fires. |
| Special protective equipment for firefighters | : | In the event of fire, wear self-contained breathing apparatus. |

## 6. ACCIDENTAL RELEASE MEASURES

| | | |
|---|---|---|
| Personal precautions, protective equipment and emergency procedures | : | Use personal protective equipment.<br>Deny access to unprotected persons. |
| Environmental precautions | : | Try to prevent the material from entering drains or water courses. |

Methods and materials for containment and cleaning up : Soak up with inert absorbent material (e.g. sand, silica gel, acid binder, universal binder, sawdust).
Keep in suitable, closed containers for disposal.

## 7. HANDLING AND STORAGE

Advice on protection against fire and explosion : Normal measures for preventive fire protection.

Advice on safe handling : Avoid exceeding the given occupational exposure limits (see section 8).
Do not get in eyes, on skin, or on clothing.
For personal protection see section 8.
Smoking, eating and drinking should be prohibited in the application area.
Follow standard hygiene measures when handling chemical products

Conditions for safe storage : Store in original container.
Keep in a well-ventilated place.
Observe label precautions.
Store in accordance with local regulations.

## 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

**Components with workplace control parameters**

| Components | CAS-No. | Value type (Form of exposure) | Control parameters / Permissible concentration | Basis |
|---|---|---|---|---|
| xylene | 1330-20-7 | TWA | 100 ppm | KR OEL |
| | | STEL | 150 ppm | KR OEL |
| | | TWA | 100 ppm | ACGIH |
| | | STEL | 150 ppm | ACGIH |
| ethylbenzene | 100-41-4 | STEL | 125 ppm | KR OEL |
| | Further information: Limited evidence of carcinogenicity in humans or animals, which is not sufficiently convincing to place the substance in Category 1 | | | |
| | | TWA | 100 ppm | KR OEL |
| | Further information: Limited evidence of carcinogenicity in humans or animals, which is not sufficiently convincing to place the substance in Category 1 | | | |
| | | TWA | 20 ppm | ACGIH |
| | | STEL | 125 ppm | ACGIH |
| 4,4'-methylenediphenyl diisocyanate | 101-68-8 | TWA | 0.005 ppm | KR OEL |
| | Further information: Limited evidence of carcinogenicity in humans or animals, which is not sufficiently convincing to place the substance in Category 1 | | | |
| | | TWA | 0.005 ppm | ACGIH |

**Personal protective equipment**

Respiratory protection : Use respiratory protection unless adequate local exhaust ventilation is provided or exposure assessment demonstrates

| | | |
|---|---|---|
| | | that exposures are within recommended exposure guidelines. The filter class for the respirator must be suitable for the maximum expected contaminant concentration (gas/vapour/aerosol/particulates) that may arise when handling the product. If this concentration is exceeded, self-contained breathing apparatus must be used. |
| Eye protection | : | Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary. |
| Hand protection | : | Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary. |
| Skin and body protection | : | Choose body protection in relation to its type, to the concentration and amount of dangerous substances, and to the specific work-place. |
| Hygiene measures | : | Handle in accordance with good industrial hygiene and safety practice.<br>When using do not eat or drink.<br>When using do not smoke.<br>Wash hands before breaks and at the end of workday. |

## 9. PHYSICAL AND CHEMICAL PROPERTIES

| | | |
|---|---|---|
| Appearance | : | paste |
| Colour | : | various |
| Odour | : | very faint |
| Odour Threshold | : | No data available |
| pH | : | Not applicable |
| Melting point/range / Freezing point | : | No data available |
| Boiling point/boiling range | : | No data available |
| Flash point | : | ca. 64.6 °C (148.3 °F)<br>Method: closed cup |
| Evaporation rate | : | No data available |
| Flammability | : | No data available |
| Upper/Lower explosion limit | | |
| Upper explosion limit | : | No data available |
| Lower explosion limit | : | No data available |

| | | |
|---|---|---|
| Vapour pressure | : | No data available |
| Solubility(ies) | | |
| Water solubility | : | insoluble |
| Relative vapour density | : | No data available |
| Density | : | 1.26 g/cm3 (23 °C (73 °F) ()) |
| Partition coefficient: n-octanol/water | : | No data available |
| Auto-ignition temperature | : | No data available |
| Decomposition temperature | : | No data available |
| Viscosity | | |
| Viscosity, dynamic | : | No data available |
| Viscosity, kinematic | : | Not applicable |
| Explosive properties | : | No data available |
| Molecular weight | : | No data available |

## 10. STABILITY AND REACTIVITY

| | | |
|---|---|---|
| Chemical stability and possibility of hazardous reactions | : | No dangerous reaction known under conditions of normal use.<br>The product is chemically stable.<br>Stable under recommended storage conditions. |
| Conditions to avoid | : | No data available |
| Incompatible materials | : | No data available |
| Hazardous decomposition products | : | No decomposition if stored and applied as directed. |

## 11. TOXICOLOGICAL INFORMATION

**Health hazard information**

**Acute toxicity**

Not classified based on available information.

**Components:**

**xylene:**

| | | |
|---|---|---|
| Acute oral toxicity | : | LD50 Oral (Rat): 3,523 mg/kg |
| Acute dermal toxicity | : | LD50 Dermal (Rabbit): 1,700 mg/kg |

**ethylbenzene:**

| | | |
|---|---|---|
| Acute oral toxicity | : | LD50 Oral (Rat): 3,500 mg/kg |

Acute dermal toxicity : LD50 Dermal (Rabbit): 5,510 mg/kg

**4,4'-methylenediphenyl diisocyanate:**
Acute oral toxicity : LD50 Oral (Rat): > 4,700 mg/kg
Method: OECD Test Guideline 401

Acute inhalation toxicity : Acute toxicity estimate: 1.5 mg/l
Test atmosphere: dust/mist
Method: Expert judgement

**[3-(2,3-epoxypropoxy)propyl]trimethoxysilane:**
Acute oral toxicity : LD50 Oral (Rat): 7,010 mg/kg

Acute inhalation toxicity : LC50 (Rat): > 5.3 mg/l
Exposure time: 4 h
Test atmosphere: dust/mist

Acute dermal toxicity : LD50 Dermal (Rabbit): 4,248 mg/kg

**Skin corrosion/irritation**

Not classified based on available information.

**Serious eye damage/eye irritation**

Not classified based on available information.

**Respiratory or skin sensitisation**

Skin sensitisation: Not classified based on available information.
Respiratory sensitisation: Not classified based on available information.

**Carcinogenicity**

Not classified based on available information.

**Germ cell mutagenicity**

Not classified based on available information.

**Components:**

**4,4'-methylenediphenyl diisocyanate:**
Genotoxicity in vivo : Species: Bacteria
Method: OECD Test Guideline 471
Result: negative

Method: TA98

Method: TA100

Method: TA1535

Method: TA1537

**Reproductive toxicity**

May damage fertility or the unborn child.

**STOT - single exposure**

May cause damage to organs (Central nervous system, Kidney, Liver, Respiratory Tract).

**STOT - repeated exposure**

May cause damage to organs (Nervous system, Respiratory Tract) through prolonged or repeated exposure.
May cause damage to organs (Central nervous system) through prolonged or repeated exposure if inhaled.

**Aspiration toxicity**

Not classified based on available information.

## 12. ECOLOGICAL INFORMATION

**Ecotoxicity**

**Components:**

**xylene:**

| | | |
|---|---|---|
| Toxicity to fish | : | LC50 (Oncorhynchus mykiss (rainbow trout)): 3.3 mg/l<br>Exposure time: 96 h |

**[3-(2,3-epoxypropoxy)propyl]trimethoxysilane:**

| | | |
|---|---|---|
| Toxicity to fish | : | LC50 (Cyprinus carpio (Carp)): 55 mg/l<br>Exposure time: 96 h |

**Persistence and degradability**

No data available

**Bioaccumulative potential**

No data available

**Mobility in soil**

No data available

**Other adverse effects**

**Product:**

| | | |
|---|---|---|
| Additional ecological information | : | There is no data available for this product. |

## 13. DISPOSAL CONSIDERATIONS

**Disposal methods**

| | | |
|---|---|---|
| Waste from residues | : | Do not contaminate ponds, waterways or ditches with chemical or used container.<br>Send to a licensed waste management company. |
| Contaminated packaging | : | Empty remaining contents.<br>Dispose of as unused product.<br>Do not re-use empty containers.<br>Do not burn, or use a cutting torch on, the empty drum. |

**Disposal precautions**

Dispose of in accordance with local regulations.

## 14. TRANSPORT INFORMATION

### International Regulations

**UNRTDG**
Not regulated as a dangerous good

**IATA-DGR**
Not regulated as a dangerous good

**IMDG-Code**
Not regulated as a dangerous good

| | | |
|---|---|---|
| UN number | : | Not applicable |
| Proper shipping name | : | Not applicable |
| Class | : | Not applicable |
| Subsidiary risk | : | Not applicable |
| Packing group | : | Not applicable |
| Labels | : | Not applicable |
| EmS Code | : | Not applicable |
| Marine pollutant | : | Not applicable |

**Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code**
Not applicable for product as supplied.

**National Regulations**
Refer to section 15 for specific national regulation.

**Special precautions for user**
Not applicable

## 15. REGULATORY INFORMATION

### National regulatory information

**Regulation under the Occupational Safety and Health Act**

**Harmful Substances Prohibited from Manufacturing**
Not applicable

**Harmful Substances Required Permission for Manufacture**
Not applicable

**Hazardous substances requiring management**

| Chemical name | CAS-No. | Threshold limits (%) |
|---|---|---|
| Xylene | 1330-20-7 | >= 1 Vol-% |
| Ethyl benzene | 100-41-4 | >= 1 Vol-% |

**Controlled Substances Subject to Environment Monitoring**

| Chemical name | CAS-No. | Threshold limits (%) |
|---|---|---|
| Titanium dioxide | 13463-67-7 | >= 1 % |
| Xylene, o,m,p-isomers | 1330-20-7 | >= 1 % |

**Controlled Substances Subject to Health Examination**

| Chemical name | CAS-No. | Threshold limits (%) |
|---|---|---|
| Xylene | 1330-20-7 | >= 1 % |

**Act on the Registration and Evaluation, etc. of Chemical Substances, Chemicals Control Act**

**Toxic Chemicals**
Not applicable

**Observational chemicals**
Not applicable

**Restricted Chemicals**
Not applicable

**Prohibited Chemicals**
Not applicable

**Toxic Release Inventory**

| Chemical name | CAS-No. | Group | Threshold limits (%) |
|---|---|---|---|
| Xylene (o-,m-,p- isomer mixture) | 1330-20-7 | Group II | >= 1 % |
| Ethylbenzene | 100-41-4 | Group II | >= 0.1 % |

**Accident Precaution Chemicals**
Not applicable

**Dangerous Substances Safety Management Act**

Classification : Group 4, Flammable liquids, Type 2 petroleums, Water insoluble liquid

Hazard rank : Hazardous rank III

Designated Quantity : 1000 litre

Safety Warning : Keep away from fire

International Chemical Weapons Convention (CWC) Schedules of Toxic Chemicals and Precursors : Not applicable

**Wastes Control Act**

Industrial waste
Follow article 13 of the act to dispose the product waste

**Other requirements in domestic and other countries**

**The components of this product are reported in the following inventories:**

REACH : Not in compliance with the inventory

ENCS : Not in compliance with the inventory

ISHL : Not in compliance with the inventory

KECI : Not in compliance with the inventory

## 16. OTHER INFORMATION

Issuing date : 22.12.2015

**Revision number and date**

| | | |

## Material Safety Data Sheet

Version: 1.1
Revision Date: 2020/01/02

## LUBCHEM CA 8242 HS

## 1. IDENTIFICATION THE SUBSTANCE AND OF THE COMPANY

Lubchem Corporation
1762, Songgok-ri, Dasan-myeon, Goryeong-gun,
Gyeongsangbuk-do, Korea
TEL : (82-54)954-8500
FAX : (82-54)954-0131
WebSite : http://www.lubchem.co.kr

MSDS No. :
Revision Date:

Generic Description: Organic grease
Physical Form: Grease
Color: White
Odor: Odorless

## 2. HAZARDS IDENTIFICATION

### POTENTIAL HEALTH EFFECTS

Acute Effects

Eye: Direct contact may temporary redness and discomfort.
Skin: No significant irritation expected from a single short-term exposure.
Inhalation: Irritates respiratory passages very slightly.
Oral: Low ingestion hazard in normal use.

Prolonged/Repeated Exposure Effects

Skin: Repeated or prolonged exposure may cause irritation.
Inhalation: No known applicable information.
Oral: Repeated ingestion or swallowing large amounts may injure internally.

Signs and Symptoms of Overexposure

No known applicable information.

Medical Conditions Aggravated by Exposure

No known applicable information.

The above listed potential effects of overexposure are based on actual data, results of studies performed upon similar compositions, component data and/or expert review of the products. Please refer to Section 11 for the detailed toxicology information.

(주)루브캠코리아
LUB CHEM KOREA CO.,LTD

# LUBCHEM CORPORATION
## Material Safety Data Sheet

LUBCHEM CA 8242 HS

## 3. COMPOSITIONS/INFORMATION ON INGREDIENTS

1. Dimethypolysiloxane (CAS No. : 63148-62-9) 65~75%
2. Polytetrafluoroethylene (CAS No. : 9002-84-0) 25~35%

## 4. FIRST AID MEASURES

| | |
|---|---|
| Eye: | Immediately flush with water. |
| Skin: | No first aid should be needed. |
| Inhalation: | No first aid should be needed. |
| Oral: | Get medical attention. |
| Notes to Physician: | Treat according to person's condition specifies of exposure. |

## 5. FIRE FIGHTING MEASURES

| | |
|---|---|
| Flash Point: | Not applicable. |
| Auto ignition Temperature: | Not determined. |
| Flammability Limits in Air: | Not determined. |
| Extinguishing Media: | On large fires use dry chemical, foam or water spray. On small fires use carbon dioxide(CO2), dry chemical or water spray. Water can be used to cool fire exposed containers. |
| Fire Fighting Measures: | Self-contained breathing apparatus and protective clothing should be worn in fighting large fires involving chemicals. Determine the need to evacuate or isolate the area according to your local emergency plan. Use water spray to keep fire exposed containers cool. |
| Unusual Fire Hazards: | None. |

## 6. ACCIDENTAL RELEASE MEASURES

| | |
|---|---|
| Containment/Clean up: | Observe all personals protection equipment recommendations described in Sections 5 and 8. Wipe up or scrape up and contain for salvage or disposal. Clean area as appropriate since spilled materials, even in small quantities, may present a slip hazard. Final cleaning may require use of steam, solvents or detergents. Dispose of saturated absorbant or cleaning materials appropriately, since spontaneous heating may occur. Local, state and federal |

laws and regulations may apply to releases and disposal of this material, as well as those materials and items employed in the cleanup of releases.

Note: See Section 8 for personal protective Equipment for Spills.

## 7. HANDLING AND STORAGE

Use with adequate ventilation. At temperatures above 482F/250C this material may produce highly toxic gaseous compounds such as hydrogen fluoride and perfluorohydrocarbons. Provide adequate ventilation or use the appropriate respiratory protection if the possibility of exceeding 482F/250C exists. Avoid contamination of tobacco products. Fluoropolymers on tobacco goods may cause adverse health effects by inhalation of the decomposition products.
Employees should wash their hands and face before eating, drinking or using tobacco products. Avoid eye contact. Do not take internally.

Use reasonable care and store away from oxidizing materials.

## 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Component Exposures Limits

There are no components with workplace exposure limits.

Engineering Controls

| | |
|---|---|
| Local Ventilation: | None should be needed. |
| General Ventilation: | Recommended. |

Personal Protective Equipment for Routine Handling

| | |
|---|---|
| Eyes: | Use proper protection - safety glasses as a minimum. |
| Skin: | Washing at mealtime and end of shift is adequate. |
| Suitable Gloves: | Avoid skin contact by implementing good industrial hygiene practices and procedures. and use gloves and/or protective clothing to further minimize the potential for skin contact. Consult with your glove and/or personnel protective equipment manufacturer for selection of appropriate compatible materials. |
| Inhalation: | No respiratory protection should be needed. |
| Suitable Respirator: | None should be needed. |

## Material Safety Data Sheet

LUBCHEM CA 8242 HS

## 10. STABILITY AND REACTIVITY

| | |
|---|---|
| Chemical Stability: | Stable. |
| Hazardous Polymerization: | Hazardous polymerization will not occur. |
| Conditions to Avoid: | None. |
| Materials to Avoid: | Oxidizing material can cause a reaction. |

Hazardous Decomposition Products

Thermal breakdown of this product during fire or very high heat conditions may evolve the following decomposition products: Nitrogen oxides. Carbon oxides and traces of incompletely burned carbon compounds. Phosphorous oxides. Fluorine compounds. Metal oxides. Formaldehyde.

## 11. TOXICOLOGICAL INFORMATION

Component Toxicology Information

No known applicable information.

Special Hazard Information on Components

No known applicable information.

## 12. OTHER INFORMATION

Prepared by: LUBCHEM KOREA Corporation

These data are offered in good faith as typical values and not as product specifications. No warranty, either expressed or implied, is herby made. The recommended industrial hygiene and safe handling procedures are believed to be generally applicable. However, each user should review these recommendations in the specific context of the intended use and determine whether they are appropriate.

# Safety Data Sheet

LOCTITE® 242™ THREADLOCKER MEDIUM STRENGTH

SDS No. : 150233
V001.4
Revision: 06.03.2018
printing date: 17.12.2018

## 1. Identification of the substance/preparation and of the company/undertaking

**A. Product name:** LOCTITE® 242™ THREADLOCKER MEDIUM STRENGTH

**B. Purpose of the product and limitations:**

**Purpose of the product** Anaerobic
**Limitations** Prohibition on use except the above

**C. Identification of manufacturer, importer or distributor**

**Importer:** Henkel Korea Limited, 121-734, 8th Floor, Henkel Tower Bldg., 41, Mapo-daero 4da-gil, Mapo-gu, Seoul, Korea.
Phone : +82-2-3279-1700

**Emergency information:** +82-2-3279-1700 or Emergency tel : +82-2-3279-1707 (24hr)

**D. Writer division and contact person:**
Product Safety & Regulatory Affairs for South Korea, msdsakorea@henkel.com

## 2. Hazards and Risk identification

**A. Hazard Classification:**

| Hazard Class | Hazard Category | Target organ |
|---|---|---|
| Serious eye damage/eye irritation | Category 2 | |
| Specific target organ toxicity - single exposure | Category 3 | Respiratory irritation |

**B. Item of labeling with Risk and Safety assessment phrase:**

**Hazard pictogram:**

**Signal word:** Warning

**Hazard statement:**
H319 Causes serious eye irritation.
H335 May cause respiratory irritation.
H412 Harmful to aquatic life with long lasting effects.

**Precautionary Statement(s):**

**Prevention:**
P261 Avoid breathing mist/vapours.
P264 Wash thoroughly after handling.
P271 Use only outdoors or in a well-ventilated area.
P280 Wear eye protection/face protection.

**Response:**
P304+P340 IF INHALED: Remove person to fresh air and keep comfortable for breathing.
P305+P351+P338 IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P312 Call a POISON CENTER/doctor/… if you feel unwell.
P337+P313 If eye irritation persists: Get medical advice/attention.

**Storage:**
P403+P233 Store in a well-ventilated place. Keep container tightly closed.
P405 Store locked up.

**Disposal:**
P501 Dispose of contents/container in accordance with Wastes Control Act .

**C. Possible Hazards:** None if used properly.

## 3. Composition / information on ingredients

**General description:** Mixture

| Chemical name | Other name(s) | CAS No. or ID No. | Contents (%) |
|---|---|---|---|
| Polyglycol dimethacrylate | Polyglycol dimethacrylate | Proprietary | 60 - 70 % |
| Modifier | Modifier | Proprietary | 1 - 10 % |
| Silica, amorphous, fumed, crystal-free | Silica, amorphous, fumed, cryst.-free | 112945-52-5 | 1 - 10 % |
| Alkyl hydroperoxide | Alkyl hydroperoxide | Proprietary | 1 - < 3 % |
| Glycol | Glycol | Proprietary | 1 - 10 % |

All remaining chemical compositions are trade secret and are not subject to GHS classification according to the Ministry of Employment and Labor Public Notice.

## 4. First aid measures

**A. After eye contact:**
Flush with copious amounts of water, preferably, lukewarm water for at least 15 minutes, holding eyelids open all the time.
Get medical attention.

**B. After skin contact:**
Wash with soap and water.
Remove contaminated clothing and footwear.
Wash clothing before reuse.
If symptoms develop and persist, get medical attention.

**C. After inhalation:** Move to fresh air.
If breathing is difficult, give oxygen.
If breathing has stopped, give artificial respiration, and get medical attention immediately.

**D. After ingestion:** Do not induce vomiting.
Keep individual calm.
Get medical attention.

**E. Others / Medical advice:** Treat symptomatically and supportively.

## 5. Explosion / Fire fighting measures

**A. Suitable (and unsuitable) extinguishing media:**

**Suitable extinguishing media:** Foam, dry chemical or carbon dioxide.

**B. Special exposure hazard arising from product itself:**

**Hazardous combustion products:** Oxides of carbon.
Oxides of sulfur.
Oxides of nitrogen.
Irritating organic vapours.

**Fire and Explosion Risk:** None

**C. Special protective equipments for firefighters and safety measures:**
Wear protective equipment.

## 6. Accidental release measures

**A. Personal precautions / measures and equipments:**
Ensure adequate ventilation.

**B. Environmental precautions / measures:**
Do not allow product to enter sewer or waterways.

**C. Methods of cleaning up / removing:**
Soak up with inert absorbent material (e.g. sand, silica gel, acid binder, universal binder, sawdust).
Store in a partly filled, closed container until disposal.

## 7. Handling and storage

**A. Safety Handling precaution:**

**Safety Handling precaution:** Use only in well-ventilated areas.
Gloves and safety glasses should be worn
Prolonged or repeated skin contact should be avoided to minimise any risk of sensitisation.

**B. Suitable storage conditions:**

**Suitable storage conditions:** Store in original containers at 8-21°C (46.4-69.8°F) and do not return residual materials to containers as contamination may reduce the shelf life of the bulk product.

## 8. Exposure controls / personal protection

**A. Component exposure limits:**

| Hazardous components | National standard | OSHA | ACGIH |
|---|---|---|---|
| Polyglycol dimethacrylate | none | None | none |
| Modifier | none | None | none |
| Silica, amorphous, fumed, crystal-free<br>112945-52-5 | none | 20 MPPCF TWA<br>0.8 mg/m3 TWA | <br>10 mg/m3 TWA<br>3 mg/m3 TWA |
| Alkyl hydroperoxide | none | None | none |
| Glycol | none | None | none |

**B. Engineering controls:** Ensure good ventilation/suction at the workplace.

**C. Personal protective equipments:**

- **Respiratory protection:** An approved mask or respirator fitted with an organic vapour cartridge should be worn if the product is used in a poorly ventilated area
- **Eye protection:** Safety goggles or safety glasses with side shields.
- **Skin protection:** Use impermeable gloves and protective clothing as necessary to prevent skin contact.
- Neoprene gloves.
- Butyl rubber gloves.
- Natural rubber gloves.
- **Personal protection:**

Good industrial hygiene practices should be observed.

## 9. Physical and chemical properties

**A. Appearance (physical state, color):** Liquid
Blue
**B. Odor:** Mild
**C. Odor threshold value:** Not available.
**D. pH:** Not applicable
**E. Melting point / Freezing point:** Not available.
**F. Boiling point:** > 149 °C (> 300.2 °F)
**G. Flash point:** > 93.3 °C (> 199.94 °F)
**H. Speed of volatilization:** Not available.
**I. Flammability:** Not applicable
**J. Upper flammable /Lower flammable:**
2.6 %(V)
**lower [vol%]** 12.5 %(V)
**upper [vol%]** (propylene glycol)

**K. Vapor pressure:** < 6.67 mbar
**L. Solubility:** Slightly soluble
**M. Vapor density:** Not available.
**N. Specific Gravity:** 1.1
**O. N-Octanol / Water partition coefficient:** Not available.
**P. Self ignition point:** Not available.
**Q. Decomposition:** Not available.
**R. Viscosity:** 800 - 1,600 mPa.s
()GRP 2

**S. Molecular Weight:** Not available.

## 10. Stability and reactivity

**A. Chemical stability:** Stable under recommended storage conditions.

**B. Possibility of hazardous polymerization:** Will not occur.

**C. Avoid condition (discharge of static electricity, shock, vibration):** See "Handling and Storage" (Section 7) and "Incompatibility" (Section 10).

**D. Avoid materials:**
Strong oxidizing agents.
Free radical initiators.
Strong reducing agents.
Alkalis.
Oxygen scavengers.
Other polymerization initiators.
Copper.
Iron.
Zinc.
Aluminum.
Rust.

**E. Decomposition products:**
Oxides of carbon.
Oxides of sulfur.
Oxides of nitrogen.
Irritating organic vapours.

## 11. Toxicological information

**A. Information for exposure route:** Skin, Inhalation, Eyes

**B. Information for health and hazard identification:**

**Acute toxicity:**

| Hazardous components<br>CAS-No. | Value type | Value | Route of application | Exposure time | Species | Method |
|---|---|---|---|---|---|---|
| Alkyl hydroperoxide<br>Proprietary | LD50<br>LD50 | 550 mg/kg<br>1,200 - 1,520 mg/kg | oral<br>dermal | | rat | not specified<br>not specified |

**Carcinogenicity:** No data available.

**Reproductive toxicity:** No data available.

**Specific Target Organ Toxicity - Single exposure :** No data available.

**Specific Target Organ Toxicity – Repeated exposure :**

| Hazardous components CAS-No. | Hazard category | Target Organs |
|---|---|---|
| Alkyl hydroperoxide | Category 2 | No data available. |

**Aspiration hazard:** No data available.

**Additional Health Hazard Information**

| Ingredients | Hazard class | Hazard category | Route of exposure | Target organ(s) |
|---|---|---|---|---|
| Polyglycol dimethacrylate | No classification required. | | | |
| Modifier | No classification required. | | | |
| Silica, amorphous, fumed, crystal-free | No classification required. | | | |
| Alkyl hydroperoxide | Acute toxicity | Category 4 | Oral | |
| | Acute toxicity | Category 3 | Inhalation | |
| | Acute toxicity | Category 4 | Dermal | |
| | Skin corrosion/irritation | Category 1 | | |
| | Target Organ Systemic Toxicant - Repeated exposure | Category 2 | | |
| Glycol | No classification required. | | | |

## 12. Ecological information

**A. Ecological toxicity**

| Hazardous components CAS-No. | Value type | Value / Remark | Acute Toxicity Study | Exposure time | Species | Method |
|---|---|---|---|---|---|---|
| Polyglycol dimethacrylate | LC50 | > 100 mg/l | Fish | 96 h | Danio rerio | OECD Guideline 203 (Fish, Acute Toxicity Test) |
| Modifier | LC50 | 18.3 mg/l | Fish | 96 h | Pimephales promelas | OECD Guideline 203 (Fish, Acute Toxicity Test) |
| Silica, amorphous, fumed, crystal-free 112945-52-5 | LC50 | > 10,000 mg/l | Fish | 96 h | Brachydanio rerio (new name: Danio rerio) | OECD Guideline 203 (Fish, Acute Toxicity Test) |
| Silica, amorphous, fumed, crystal-free 112945-52-5 | EL50 | > 1,000 mg/l | Daphnia | 24 h | Daphnia magna | OECD Guideline 202 (Daphnia sp. Acute Immobilisation Test) |
| Silica, amorphous, fumed, crystal-free 112945-52-5 | NOELR | 10,000 mg/l | Algae | 72 h | Desmodesmus subspicatus | OECD Guideline 201 (Alga, Growth Inhibition Test) |
| | EL50 | > 10,000 mg/l | Algae | 72 h | Desmodesmus subspicatus | OECD Guideline 201 (Alga, Growth Inhibition Test) |
| Silica, amorphous, fumed, crystal-free 112945-52-5 | EC0 | 10,000 mg/l | Bacteria | 30 min | Pseudomonas putida | DIN 38412, part 27 (Bacterial oxygen consumption test) |
| Alkyl hydroperoxide | LC50 | 3.9 mg/l | Fish | 96 h | Oncorhynchus mykiss | OECD Guideline 203 (Fish, Acute Toxicity Test) |
| Alkyl hydroperoxide | EC 50 | 7 mg/l | Daphnia | 24 h | Water flea (Daphnia magna) | |
| | EC50 | 18 mg/l | Daphnia | 48 h | Daphnia magna | OECD Guideline 202 (Daphnia sp. Acute Immobilisation Test) |
| Alkyl hydroperoxide | ErC50 | 3.1 mg/l | Algae | 72 h | Pseudokirchneriella subcapitata | OECD Guideline 201 (Alga, Growth Inhibition Test) |
| Alkyl hydroperoxide | EC10 | 70 mg/l | Bacteria | 30 min | | not specified |
| Glycol | LC50 | > 10,000 mg/l | Fish | 48 h | Leuciscus idus | DIN 38412-15 |
| Glycol | EC50 | 34,400 mg/l | Daphnia | 48 h | Daphnia magna | OECD Guideline 202 (Daphnia sp. Acute Immobilisation Test) |
| Glycol | EC50 | 19,000 mg/l | Algae | 14 d | Selenastrum capricornutum (new name: Pseudokirchneriella subcapitata) | OECD Guideline 201 (Alga, Growth Inhibition Test) |
| | NOEC | 15,000 mg/l | Algae | 14 d | Selenastrum capricornutum (new name: Pseudokirchneriella subcapitata) | OECD Guideline 201 (Alga, Growth Inhibition Test) |
| Glycol | EC50 | > 1,000 mg/l | Bacteria | 3 h | activated sludge | OECD Guideline 209 (Activated Sludge, Respiration Inhibition Test) |

**B. Persistence / degradability:**

| Hazardous components CAS-No. | Result | Route of application | Degradability | Method |
|---|---|---|---|---|

| | | | | |
|---|---|---|---|---|
| Polyglycol dimethacrylate | readily biodegradable | aerobic | 84.3 % | OECD Guideline 301 C (Ready Biodegradability: Modified MITI Test (I)) |
| Alkyl hydroperoxide | | no data | 0 % | OECD Guideline 301 B (Ready Biodegradability: CO2 Evolution Test) |
| Glycol | not inherently biodegradable | aerobic | 60 % | OECD Guideline 302 B (Inherent biodegradability: Zahn-Wellens/EMPA Test) |
| | readily biodegradable | aerobic | > 70 % | OECD Guideline 301 A (new version) (Ready Biodegradability: DOC Die Away Test) |

**C. Bioaccumulative Potential**

| Hazardous components CAS-No. | LogPow | Bioconcentration factor (BCF) | Exposure time | Species | Temperature | Method |
|---|---|---|---|---|---|---|
| Alkyl hydroperoxide | | 9.1 | | calculation | | OECD Guideline 305 (Bioconcentration: Flow-through Fish Test) |

**D. Soil Mobility**

| Hazardous components CAS-No. | LogPow | Bioconcentration factor (BCF) | Exposure time | Species | Temperature | Method |
|---|---|---|---|---|---|---|
| Modifier | 0.91 | | | | | not specified |
| Silica, amorphous, fumed, crystal-free 112945-52-5 | 0.53 | | | | | QSAR (Quantitative Structure Activity Relationship) |
| Alkyl hydroperoxide | 2.16 | | | | | not specified |
| Glycol | -1.07 | | | | 20.5 °C | EU Method A.8 (Partition Coefficient) |

**E. Other Adverse Effects:** Do not empty into drains, soil or bodies of water.

**Additional Ecotoxicity**

| Ingredients | Hazard class | Hazard category |
|---|---|---|
| Alkyl hydroperoxide | Chronic hazards to the aquatic environment | Category 2 |

## 13. Disposal considerations

**A. Disposal method:**

Dispose of in accordance with local and national regulations.

**B. Waste information (including waste method of contaminated container and packaging):**

Waste disp. packag. not clean:After use, tubes, cartons and bottles containing residual product should be disposed of as chemically contaminated waste in an authorised legal land fill site or incinerated., Disposal must be made according to official regulations.

## 14. Transport information

**A. UN number:** Not classified as dangerous goods for transport
**B. UN proper shipping name:** Not applicable
**C. Transport hazard class:** Not applicable
**D. Packing group (if applicable):** Not applicable
**E. Marine pollution (yes/no):** Not applicable
**F. Special precaution which a user to be aware of or needs to comply with in connection with transport or conveyance either within or outside their premises:** Not hazardous according to RID, ADR, ADN, IMDG, IATA-DGR.

## 15. Regulatory information

**A. According to Industrial Safety & Health Act:**

**Harmful Substances Prohibited from Manufacturing:**
Neither banned nor restricted

**Harmful Substances Requiring Permission for Manufacture or Use:**
Neither banned nor restricted

**Harmful Substances Requiring Workplace Environment Monitoring:**
Silica, amorphous, fumed, crystal-free

**Controlled Hazardous Substances:**
Neither banned nor restricted

**Harmful Substances Requiring Special Medical Examination:**
Silica, amorphous, fumed, crystal-free

**Korea OELs:**
Neither banned nor restricted

**B. According to Chemicals Control Law:**

**Toxic Chemicals:**
Neither banned nor restricted

**Banned Toxic Chemicals:**
Neither banned nor restricted

**Restricted Toxic Chemicals:**
Neither banned nor restricted

**Accidental Release Prevention Substances:**
Neither banned nor restricted

**C. According to Dangerous Substances Safety Management Act Enforcement Rule :**
4th Class Flammable Liquids, Class 3 Petroleum

**D. According to Enforcement Decree of The wastes control Act :**

**Designated Wastes, Appendix 4, Code Numbers.**
Designated Wastes

**E. According to other regulations:**
Not available.

# Safety Data Sheet

LOCTITE® 263™ THREADLOCKER

SDS No. : 347828
V001.2
Revision: 12.10.2018
printing date: 17.12.2018

## 1. Identification of the substance/preparation and of the company/undertaking

**A. Product name:** LOCTITE® 263™ THREADLOCKER

**B. Purpose of the product and limitations:**

**Purpose of the product** Adhesive
**Limitations** Prohibition on use except the above

**C. Identification of manufacturer, importer or distributor**

**Importer:** Henkel Korea Limited, 121-734, 8th Floor, Henkel Tower Bldg., 41, Mapo-daero 4da-gil, Mapo-gu, Seoul, Korea.
Phone : +82-2-3279-1700

**Emergency information:** +82-2-3279-1700 or Emergency tel : +82-2-3279-1707 (24hr)

**D. Writer division and contact person:**
Product Safety & Regulatory Affairs for South Korea, msdsakorea@henkel.com

## 2. Hazards and Risk identification

**A. Hazard Classification:**

| Hazard Class | Hazard Category | Target organ |
|---|---|---|
| Skin corrosion/irritation | Category 2 | |
| Serious eye damage/eye irritation | Category 2 | |
| Skin sensitizer | Category 1 | |
| Specific target organ toxicity - single exposure | Category 3 | Respiratory irritation |

**B. Item of labeling with Risk and Safety assessment phrase:**

**Hazard pictogram:**

**Signal word:** Warning

**Hazard statement:**
H315 Causes skin irritation.
H317 May cause an allergic skin reaction.
H319 Causes serious eye irritation.
H335 May cause respiratory irritation.

**Precautionary Statement(s):**

**Prevention:**
P261 Avoid breathing mist/vapours.
P264 Wash thoroughly after handling.
P271 Use only outdoors or in a well-ventilated area.
P272 Contaminated work clothing should not be allowed out of the workplace.
P280 Wear protective gloves, eye protection, and face protection.

**Response:**
P302+P352 IF ON SKIN: Wash with plenty of water.
P304+P340 IF INHALED: Remove person to fresh air and keep comfortable for breathing.
P305+P351+P338 IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P312 Call a POISON CENTER/doctor/… if you feel unwell.
P321 Specific treatment (see on this label).
P332+P313 If skin irritation occurs: Get medical advice/attention.
P333+P313 If skin irritation or rash occurs: Get medical advice/attention.
P337+P313 If eye irritation persists: Get medical advice/attention.
P362+P364 Take off contaminated clothing and wash it before reuse.

**Storage:**
P403+P233 Store in a well-ventilated place. Keep container tightly closed.
P405 Store locked up.

**Disposal:**
P501 Dispose of contents/container in accordance with Wastes Control Act .

**C. Possible Hazards:** None if used properly.

## 3. Composition / information on ingredients

**General description:** Mixture

| Chemical name | Other name(s) | CAS No. or ID No. | Contents (%) |
|---|---|---|---|
| Methacrylate monomer | Methacrylate monomer | Proprietary | 20 - 30 % |
| Polyglycol dimethacrylate | Polyglycol dimethacrylate | Proprietary | 20 - 30 % |
| thickener | thickener | Proprietary | 20 - 30 % |
| Polyglycol dimethacrylate | Polyglycol dimethacrylate | Proprietary | 1 - 10 % |
| Alkyl hydroperoxide | Alkyl hydroperoxide | Proprietary | 1 - < 3 % |
| Acetic acid, 2-phenylhydrazide | Acetic acid, 2-phenylhydrazide | 114-83-0 | 0.1 - < 1 % |

All remaining chemical compositions are trade secret and are not subject to GHS classification according to the Ministry of Employment and Labor Public Notice.

## 4. First aid measures

**A. After eye contact:** Flush with copious amounts of water, preferably, lukewarm water for at least 15 minutes, holding eyelids open all the time.
Get medical attention.

**B. After skin contact:** Wash with soap and water.
Remove contaminated clothing and footwear.
Wash clothing before reuse.
If symptoms develop and persist, get medical attention.

**C. After inhalation:** Move to fresh air.
If symptoms develop and persist, get medical attention.

**D. After ingestion:** Do not induce vomiting.
Keep individual calm.
Get medical attention.

**E. Others / Medical advice:** Treat symptomatically and supportively.

## 5. Explosion / Fire fighting measures

**A. Suitable (and unsuitable) extinguishing media:**

**Suitable extinguishing media:** If product is involved in fire extinguish with dry powder, foam or carbon dioxide.

**B. Special exposure hazard arising from product itself:**

**Hazardous combustion products:** Oxides of carbon.
Oxides of nitrogen.
Thermal decomposition can lead to release of irritating gases and vapors.

**Fire and Explosion Risk:** None

**C. Special protective equipments for firefighters and safety measures:**

Wear self contained breathing apparatus.

## 6. Accidental release measures

**A. Personal precautions / measures and equipments:**

Avoid skin and eye contact.
Ensure adequate ventilation.

**B. Environmental precautions / measures:**

Do not let product enter drains.

**C. Methods of cleaning up / removing:**

For small spills wipe up with paper towel and place in container for disposal.
For large spills absorb onto inert absorbent material and place in sealed container for disposal.

## 7. Handling and storage

**A. Safety Handling precaution:**

**Safety Handling precaution:** Prevent contact with eyes, skin and clothing. Do not breathe vapor and mist. Wash thoroughly after handling.

**B. Suitable storage conditions:**

**Suitable storage conditions:** Store in original containers at 8-21°C (46.4-69.8°F) and do not return residual materials to containers as contamination may reduce the shelf life of the bulk product.

## 8. Exposure controls / personal protection

**A. Component exposure limits:**

| Hazardous components | National standard | OSHA | ACGIH |
|---|---|---|---|
| Methacrylate monomer | none | None | none |
| Polyglycol dimethacrylate | none | None | none |
| thickener | none | None | none |
| Polyglycol dimethacrylate | none | None | none |
| Alkyl hydroperoxide | none | None | none |
| Acetic acid, 2-phenylhydrazide<br>114-83-0 | none | None | none |

**B. Engineering controls:** Ensure good ventilation/extraction.

**C. Personal protective equipments:**

- **Respiratory protection:** Use only in well-ventilated areas.
- **Eye protection:** Safety goggles or safety glasses with side shields.
- **Skin protection:** Use impermeable gloves and protective clothing as necessary to prevent skin contact.
- Natural rubber gloves.
- Neoprene gloves.
- Butyl rubber gloves.
- **Personal protection:**

Good industrial hygiene practices should be observed.

## 9. Physical and chemical properties

| | |
|---|---|
| **A. Appearance (physical state, color):** | Liquid<br>Red |
| **B. Odor:** | Characteristic |
| **C. Odor threshold value:** | Not available. |
| **D. pH:** | Not available. |
| **E. Melting point / Freezing point:** | Not available. |
| **F. Boiling point:** | Not determined |
| **G. Flash point:** | 107 °C (224.6 °F) |
| **H. Speed of volatilization:** | Not available. |
| **I. Flammability:** | Not applicable |
| **J. Upper flammable /Lower flammable:** | Not available. |
| **K. Vapor pressure:** | Not available. |
| **L. Solubility:** | Slightly soluble |
| **M. Vapor density:** | Not available. |
| **N. Specific Gravity:** | 1.08 |
| **O. N-Octanol / Water partition coefficient:** | Not available. |
| **P. Self ignition point:** | Not available. |
| **Q. Decomposition:** | Not available. |
| **R. Viscosity:** | 400 - 600 mPa.s |
| **S. Molecular Weight:** | Not available. |

## 10. Stability and reactivity

**A. Chemical stability:** Stable under recommended storage conditions.

**B. Possibility of hazardous polymerization:** Will not occur.

**C. Avoid condition (discharge of static electricity, shock, vibration):** See "Handling and Storage" (Section 7) and "Incompatibility" (Section 10).

**D. Avoid materials:**
Strong oxidizing agents.
Reducing agents.
Strong acids and strong bases.
Oxygen scavengers.
Other polymerization initiators.
Heavy metals.

**E. Decomposition products:**
Oxides of carbon.
Oxides of nitrogen.
Irritating organic vapours.

## 11. Toxicological information

**A. Information for exposure route:** Skin, Inhalation, Eyes

**B. Information for health and hazard identification:**

**Acute toxicity:**

| Hazardous components<br>CAS-No. | Value type | Value | Route of application | Exposure time | Species | Method |
|---|---|---|---|---|---|---|
| Polyglycol dimethacrylate<br>Proprietary | LD50<br>LD50 | 10,837 mg/kg<br>> 2,000 mg/kg | oral<br>dermal | | rat<br>mouse | not specified<br>not specified |
| Alkyl hydroperoxide<br>Proprietary | LD50<br>LD50 | 550 mg/kg<br>1,200 - 1,520 mg/kg | oral<br>dermal | | rat | not specified<br>not specified |
| Acetic acid, 2-phenylhydrazide<br>114-83-0 | LD50 | 270 mg/kg | oral | | rat | not specified |

**Skin corrosion/irritation:**

| Hazardous components<br>CAS-No. | Result | Exposure time | Species | Method |
|---|---|---|---|---|
| Polyglycol dimethacrylate<br>Proprietary | not irritating | 24 h | rabbit | Draize Test |
| Alkyl hydroperoxide<br>Proprietary | corrosive | | rabbit | Draize Test |

**Serious eye damage/irritation:**

| Hazardous components<br>CAS-No. | Result | Exposure time | Species | Method |
|---|---|---|---|---|
| Polyglycol dimethacrylate<br>Proprietary | not irritating | | rabbit | OECD Guideline 405 (Acute Eye Irritation / Corrosion) |

**Respiratory or skin sensitization:**

| Hazardous components<br>CAS-No. | Result | Test type | Species | Method |
|---|---|---|---|---|
| Polyglycol dimethacrylate<br>Proprietary | sensitising | Mouse local lymphnode assay (LLNA) | mouse | OECD Guideline 429 (Skin Sensitisation: Local Lymph Node Assay) |

**Germ cell mutagenicity:**

| Hazardous components<br>CAS-No. | Result | Type of study /<br>Route of administration | Metabolic activation /<br>Exposure time | Species | Method |
|---|---|---|---|---|---|
| Polyglycol dimethacrylate<br>Proprietary | negative<br>negative<br>negative | mammalian cell gene mutation assay<br>bacterial reverse mutation assay (e.g Ames test)<br>in vitro mammalian cell micronucleus test | with and without<br>with and without<br>with and without | | OECD Guideline 476 (In vitro Mammalian Cell Gene Mutation Test)<br>OECD Guideline 471 (Bacterial Reverse Mutation Assay)<br>OECD Guideline 487 (In vitro Mammalian Cell Micronucleus Test) |
| Alkyl hydroperoxide<br>Proprietary | positive | bacterial reverse mutation assay (e.g Ames test) | without | | OECD Guideline 471 (Bacterial Reverse Mutation Assay) |
| Alkyl hydroperoxide<br>Proprietary | negative | dermal | | mouse | not specified |

**Carcinogenicity:**

| Hazardous components<br>CAS-No. | Hazard category | Route of exposure |
|---|---|---|
| Acetic acid, 2-phenylhydrazide<br>114-83-0 | Category 2 | |

**Reproductive toxicity:** No data available.

**Specific Target Organ Toxicity - Single exposure :**

| Hazardous components CAS-No. | Hazard category | Target Organs |
|---|---|---|
| Methacrylate monomer | Category 3 | No data available. |
| Acetic acid, 2-phenylhydrazide 114-83-0 | Category 3 | No data available. |

**Specific Target Organ Toxicity – Repeated exposure :**

| Hazardous components CAS-No. | Hazard category | Target Organs |
|---|---|---|
| Alkyl hydroperoxide | Category 2 | No data available. |

**Aspiration hazard:** No data available.

**Additional Health Hazard Information**

| Ingredients | Hazard class | Hazard category | Route of exposure | Target organ(s) |
|---|---|---|---|---|
| Methacrylate monomer | Skin corrosion/irritation | Category 2 | | |
| | Serious eye damage/eye irritation | Category 2 | | |
| | Target Organ Systemic Toxicant - Single exposure | Category 3 | | respiratory tract irritation |
| Polyglycol dimethacrylate | No classification required. | | | |
| thickener | No classification required. | | | |
| Polyglycol dimethacrylate | Skin sensitizer | Category 1 | | |

## 12. Ecological information

**A. Ecological toxicity**

| Hazardous components CAS-No. | Value type | Value / Remark | Acute Toxicity Study | Exposure time | Species | Method |
|---|---|---|---|---|---|---|
| Polyglycol dimethacrylate | LC50 | > 100 mg/l | Fish | 96 h | Danio rerio | OECD Guideline 203 (Fish, Acute Toxicity Test) |
| | LC50 | 16.4 mg/l | Fish | 96 h | Danio rerio | OECD Guideline 203 (Fish, Acute Toxicity Test) |
| Polyglycol dimethacrylate | EC50 | > 100 mg/l | Algae | 72 h | Pseudokirchneriella subcapitata | OECD Guideline 201 (Alga, Growth Inhibition Test) |
| | NOEC | 18.6 mg/l | Algae | 72 h | Pseudokirchneriella subcapitata | OECD Guideline 201 (Alga, Growth Inhibition Test) |
| Alkyl hydroperoxide | LC50 | 3.9 mg/l | Fish | 96 h | Oncorhynchus mykiss | OECD Guideline 203 (Fish, Acute Toxicity Test) |
| Alkyl hydroperoxide | EC50 | 18 mg/l | Daphnia | 48 h | Daphnia magna | OECD Guideline 202 (Daphnia sp. Acute Immobilisation Test) |
| Alkyl hydroperoxide | ErC50 | 3.1 mg/l | Algae | 72 h | Pseudokirchneriella subcapitata | OECD Guideline 201 (Alga, Growth Inhibition Test) |
| Alkyl hydroperoxide | EC10 | 70 mg/l | Bacteria | 30 min | | not specified |

**B. Persistence / degradability:**

| Hazardous components CAS-No. | Result | Route of application | Degradability | Method |
|---|---|---|---|---|
| Polyglycol dimethacrylate | readily biodegradable | aerobic | 84.3 % | OECD Guideline 301 C (Ready Biodegradability: Modified MITI Test (I)) |
| | readily biodegradable | aerobic | 85 % | OECD Guideline 301 B (Ready Biodegradability: CO2 Evolution Test) |
| Alkyl hydroperoxide | | no data | 0 % | OECD Guideline 301 B (Ready Biodegradability: CO2 Evolution Test) |

**C. Bioaccumulative Potential**

| Hazardous components CAS-No. | LogPow | Bioconcentration factor (BCF) | Exposure time | Species | Temperature | Method |
|---|---|---|---|---|---|---|
| Alkyl hydroperoxide | | 9.1 | | calculation | | OECD Guideline 305 (Bioconcentration: Flow-through Fish Test) |

**D. Soil Mobility**

| Hazardous components CAS-No. | LogPow | Bioconcentration factor (BCF) | Exposure time | Species | Temperature | Method |
|---|---|---|---|---|---|---|
| Polyglycol dimethacrylate | 2.3 | | | | | OECD Guideline 117 (Partition Coefficient (n-octanol / water), HPLC Method) |
| Alkyl hydroperoxide | 2.16 | | | | | not specified |
| Acetic acid, 2-phenylhydrazide 114-83-0 | 0.74 | | | | | not specified |

**E. Other Adverse Effects:** Do not empty into drains, soil or bodies of water.

**Additional Ecotoxicity**

| Ingredients | Hazard class | Hazard category |
|---|---|---|
| Alkyl hydroperoxide | Chronic hazards to the aquatic environment | Category 2 |

## 13. Disposal considerations

**A. Disposal method:**

Dispose of in accordance with local and national regulations.

**B. Waste information (including waste method of contaminated container and packaging):**

Waste disp. packag. not clean:Disposal must be made according to official regulations.

## 14. Transport information

| | |
|---|---|
| **A. UN number:** | Not classified as dangerous goods for transport |
| **B. UN proper shipping name:** | Not applicable |
| **C. Transport hazard class:** | Not applicable |
| **D. Packing group (if applicable):** | Not applicable |
| **E. Marine pollution (yes/no):** | Not applicable |
| **F. Special precaution which a user to be aware of or needs to comply with in connection with transport or conveyance either within or outside their premises:** | Not hazardous according to RID, ADR, ADN, IMDG, IATA-DGR. |

## 15. Regulatory information

**A. According to Industrial Safety & Health Act:**

**Harmful Substances Prohibited from Manufacturing:**
Neither banned nor restricted

**Harmful Substances Requiring Permission for Manufacture or Use:**
Neither banned nor restricted

**Harmful Substances Requiring Workplace Environment Monitoring:**
Neither banned nor restricted

**Controlled Hazardous Substances:**
Neither banned nor restricted

**Harmful Substances Requiring Special Medical Examination:**
Neither banned nor restricted

**Korea OELs:**
Neither banned nor restricted

**B. According to Chemicals Control Law:**

**Toxic Chemicals:**
Neither banned nor restricted

**Banned Toxic Chemicals:**
Neither banned nor restricted

**Restricted Toxic Chemicals:**
Neither banned nor restricted

**Accidental Release Prevention Substances:**
Neither banned nor restricted

**C. According to Dangerous Substances Safety Management Act Enforcement Rule :**

4th Class Flammable Liquids, Class 3 Petroleum (Non Water Soluble)

**D. According to Enforcement Decree of The wastes control Act :**

**Designated Wastes, Appendix 4, Code Numbers.**
Designated Wastes

**E. According to other regulations:**

Not available.

## 16. Other information

| | |
|---|---|
| **A. Reference:** | www.KOSHA.net<br>IUCLID<br>Henkel MSDS …..etc.<br>NCIS |
| **B. Date of creation:** | 08.01.2017 |
| **C. Revision number and the latest version date** | V001.2<br>12.10.2018 |
| **D. Disclaimer:** | This Safety Data Sheet has been generated based on KOSHA Standard (MoEL Notice No. 2016-19) and provides information in accordance with Korea law only. No warranty or representation of any kind is given with respect to the substantive or export laws of any other jurisdiction or country. Please confirm that the information provided herein conforms to the substantive export or other law of any other jurisdiction prior to export. Please contact Henkel Product Safety and Regulatory Affairs for additional assistance.This information is based on our current level of knowledge and relates to the product in the state in which it is delivered. It is intended to describe our products from the point of view of safety requirements and is not intended to guarantee any particular properties. The data contained herein are furnished for information only and are believed to be reliable. However, Henkel Corporation and its affiliates ("Henkel") does not assume responsibility for any results obtained by persons over whose methods Henkel has no control. It is the user's responsibility to determine the suitability of Henkel's products or any production methods mentioned herein for a particular purpose, and to adopt such precautions as may be advisable for the protection of property and persons against any hazards that may be involved in the handling and use of any Henkel's products. In light of the foregoing, Henkel specifically disclaims all warranties, express or implied, including warranties of merchantability and fitness for a particular purpose, arising from sale or use of Henkel's products. Henkel further disclaims any liability for consequential or incidental damages of any kind, including lost profits. |

① Test Condition

- Output : Test Trip BO 2.2 , X21A (11,12)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Operating Time | | |
| AØ | 30.00 [msec] | 33.00 [msec] | ±1[%] or 10[ms] | Pass |
| BØ | 30.00 [msec] | 31.70 [msec] | | Pass |
| CØ | 30.00 [msec] | 32.40 [msec] | | Pass |
| 3Ø | 30.00 [msec] | 31.90 [msec] | | Pass |

2-5. 87T 66kV HV Side & LV Side Slope Test

① Test Condition

- Output : Test Trip BO 2.2 , X21A (11,12)
- CT Source (HV) : IED S.V BLPH_EW300 / FDR_P1 (AØ), (BØ), (CØ), (NØ)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- Side2= Ia=fixed∠30°, Ib=fixed∠-90°, Ic=fixed∠150°(LV Side)
- Side1= Ia=variable∠0°, Ib=variable∠-120°, Ic=variable∠120°(HV Side)

| Phase | TEST POINT | | SIDE-2 (Fix) | SIDE-1 (Variable) | | Limit | Result |
|---|---|---|---|---|---|---|---|
| | Ir(pu) | Id(pu) | Current | Expected(A) | Pickup(A) | | |
| 3Ø | 0.67 | 0.20 | 0.459 [A] | 0.164 [A] | 0.167 [A] | ±2[%] | Pass |
| | 1.0 | 0.30 | 0.684 [A] | 0.245 [A] | 0.247 [A] | | Pass |
| | 2.5 | 0.97 | 1.490 [A] | 0.612 [A] | 0.617 [A] | | Pass |

2-6. 87T 2nd Harmonic block Test

① Test Condition

- Output : Test Trip BO 2.2 , X21A (11,12)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- Fundamental wave 5A to each phase, test by applying the second harmonic current

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected Current | Pickup Current | | |
| AØ | 0.600 [A] | 0.588 [A] | ±2[%] | Pass |
| BØ | 0.600 [A] | 0.589 [A] | | Pass |
| CØ | 0.600 [A] | 0.588 [A] | | Pass |
| 3Ø | 0.600 [A] | 0.588 [A] | | Pass |

2-7. 87T 66kV HV Side Fast stage Pickup Test

① Test Condition

- Output : Test Pickup BO 2.1 , X22A (9,10)
- CT Source (HV) : IED S.V BLPH_EW300 / FDR_P1 (AØ), (BØ), (CØ), (NØ)
- Test by 87 Fast Threshold Setting Value to 5[I/IrObj]
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Pickup Current | | |
| AØ | 1.225 [A] | 1.230 [A] | ±2[%] | Pass |
| BØ | 1.225 [A] | 1.210 [A] | | Pass |
| CØ | 1.225 [A] | 1.230 [A] | | Pass |
| 3Ø | 1.225 [A] | 1.210 [A] | | Pass |

2-8. 87T 66kV HV Side Fast stage Operate Time Test

① Test Condition

- Output : Test Trip BO 2.2 , X21A (11,12)
- CT Source (HV) : IED S.V BLPH_EW300 / FDR_P1 (AØ), (BØ), (CØ), (NØ)
- Test by 87 Fast Threshold Setting Value to 5[I/IrObj]
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Operating Time | | |
| AØ | 18.00 [msec] | 13.00 [msec] | ±1[%] or 10[ms] | Pass |
| BØ | 18.00 [msec] | 11.20 [msec] | | Pass |
| CØ | 18.00 [msec] | 11.60 [msec] | | Pass |
| 3Ø | 18.00 [msec] | 11.70 [msec] | | Pass |

2-9. 87T 6.9kV LV Side Fast stage Pickup Test

① Test Condition

- Output : Test Pickup BO 2.1 , X22A (9,10)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- Test by 87 Fast Threshold Setting Value to 5[I/IrObj]
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Pickup Current | | |
| AØ | 8.454 [A] | 8.440 [A] | ±2[%] | Pass |
| BØ | 8.454 [A] | 8.430 [A] | | Pass |
| CØ | 8.454 [A] | 8.450 [A] | | Pass |
| 3Ø | 4.881 [A] | 4.870 [A] | | Pass |

2-10. 87T 6.9kV LV Side Fast stage Operate Time Test

① Test Condition

- Output : Test Trip BO 2.2 , X21A (11,12)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- Test by 87 Fast Threshold Setting Value to 5[I/IrObj]
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Operating Time | | |
| AØ | 18.00 [msec] | 12.20 [msec] | ±1[%] or 10[ms] | Pass |
| BØ | 18.00 [msec] | 12.30 [msec] | | Pass |
| CØ | 18.00 [msec] | 12.50 [msec] | | Pass |
| 3Ø | 18.00 [msec] | 12.30 [msec] | | Pass |

3. Test Result

## Restricted Ground-Fault Protection(87N. REF)

1. Setting Table

1-1. 87N. REF 1

| NO. | Settings | Value |
|---|---|---|
| 912.10081.1 | Mode | on |
| 912.10081.2 | Operate & flt.rec. blocked | no |
| 912.10081.103 | Threshold | 0.10 [I/IrObj] |
| 912.10081.105 | Slope | 0.05 |
| 912.10081.109 | Operate delay | 0.10 [s] |

2. Test Value

2-1. 87N REF Minimum Pickup Test (Neutral Side 100%)

① Test Condition

- Output : Test Pickup BO 2.1 , X22A (9,10)
- ZCT Source : X43 1(AØ), 2(NØ)
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Pickup Current | | |
| NØ | 0.234 [A] | 0.236 [A] | ±2[%] | Pass |

2-2. 87N REF Minimum Pickup Test (Neutral Side 50%, Phase Side 50%)

① Test Condition

- Output : Test Pickup BO 2.1 , X22A (9,10)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- ZCT Source : X43 1(AØ), 2(NØ)
- Neutral Side = IN=variable∠0°
- Phase Side = Ia=fixed∠180°
- A Phase current is fixed to 0.049A which is 50% of the pickup value
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Pickup Current | | |
| NØ | 0.117 [A] | 0.117 [A] | ±2[%] | Pass |

2-3. 87N REF Minimum Operate Time Test (Neutral Side 100%)

① Test Condition

- Output : Test Trip BO 2.2 , X21A (11,12)
- ZCT Source : X43 1(AØ), 2(NØ)
- Test by suddenly changing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Operating Time | | |
| NØ | 30.00 [msec] | 29.80 [msec] | ±1[%] or 10[ms] | Pass |

2-4. 87N REF Minimum Operate Time Test (Neutral Side 50%, Phase Side 50%)

① Test Condition

- Output : Test Trip BO 2.2 , X21A (11,12)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- ZCT Source : X43 1(AØ), 2(NØ)
- Neutral Side = IN=variable∠0°
- Phase Side = Ia=fixed∠180°
- A Phase current is fixed to 0.049A which is 50% of the pickup value
- Test by suddenly changing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Operating Time | | |
| NØ | 30.00 [msec] | 35.90 [msec] | ±1[%] or 10[ms] | Pass |

2-3. 87N REF Slope Test

① Test Condition

- Output : Test Pickup BO 2.1 , X22A (9,10)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- ZCT Source : X43 1(AØ), 2(NØ)
- Neutral Side = IN=fixed∠0°
- Phase Side = Ia=Variable∠0°

| Phase | TEST POINT | | SIDE-1 (Fix) | SIDE-2 (Variable) | | Limit | Result |
|---|---|---|---|---|---|---|---|
| | Ir(pu) | Id(pu) | Current | Expected(A) | Pickup(A) | | |
| NØ | 3.0 | 0.15 | 3.691 [A] | 1.391 [A] | 1.390 [A] | ±2[%] | Pass |
| | 4.0 | 0.20 | 4.919 [A] | 1.854 [A] | 1.850 [A] | | Pass |
| | 5.0 | 0.25 | 6.149 [A] | 2.318 [A] | 2.320 [A] | | Pass |

## Definite-time overcurrent protection - 3 Phase(50-1)

1. Setting Table

1-1. 50 Definite-T 1 General

| NO. | Settings | Value |
|---|---|---|
| 822.1941.661.1 | Mode | on |
| 822.1941.661.2 | Operate & flt.rec. blocked | no |
| 822.1941.661.8 | Method of measurement | fundamental comp. |
| 822.1941.661.3 | Threshold | 1.600 [A] |
| 822.1941.661.6 | Operate delay | 0.80 [s] |

2. Test Value

2-1. 50 Overcurrent, Phases Pickup Test

① Test Condition

- Output : Test Pickup BO 3.2 , X21A (21,22)
- CT Source : IED S.V BLPH_EW300 / FDR_P2 (AØ), (BØ), (CØ), (NØ)
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Pickup Current | | |
| AØ | 1.600 [A] | 1.600 [A] | ±1[%] or 5[mA] | Pass |
| BØ | 1.600 [A] | 1.600 [A] | | Pass |
| CØ | 1.600 [A] | 1.600 [A] | | Pass |
| 3Ø | 1.600 [A] | 1.600 [A] | | Pass |

2-2. 50 Overcurrent, Phases Operate Time Test

① Test Condition

- Output : Test Trip BO 3.3 , X21A (23,24)
- CT Source : IED S.V BLPH_EW300 / FDR_P2 (AØ), (BØ), (CØ), (NØ)
- Test by suddenly changing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Operating Time | | |
| AØ | 0.800 [sec] | 0.810 [sec] | ±1[%] or 10[ms] | Pass |
| BØ | 0.800 [sec] | 0.809 [sec] | | Pass |
| CØ | 0.800 [sec] | 0.808 [sec] | | Pass |
| 3Ø | 0.800 [sec] | 0.810 [sec] | | Pass |

## Definite-time overcurrent protection - 3 Phase(50-2)

1. Setting Table

2. Test Value

2-1. 87T 66kV HV Side Minimum Pickup Test

① Test Condition

- Output : Test Pickup BO 2.1 , X22A (9,10)
- CT Source (HV) : IED S.V BLPH_EW300 / FDR_P1 (AØ), (BØ), (CØ), (NØ)
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Pickup Current | | |
| AØ | 0.049 [A] | | ±2[%] | |
| BØ | 0.049 [A] | | | |
| CØ | 0.049 [A] | | | |
| 3Ø | 0.049 [A] | | | |

2-2. 87T 66kV HV Side Minimum Operate Time Test

① Test Condition

- Output : Test Trip BO 2.2 , X21A (11,12)
- CT Source (HV) : IED S.V BLPH_EW300 / FDR_P1 (AØ), (BØ), (CØ), (NØ)
- Test by suddenly changing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Operating Time | | |
| AØ | 30.00 [msec] | | ±1[%] or 10[ms] | |
| BØ | 30.00 [msec] | | | |
| CØ | 30.00 [msec] | | | |
| 3Ø | 30.00 [msec] | | | |

2-3. 87T 6.9kV LV Side Minimum Pickup Test

① Test Condition

- Output : Test Pickup BO 2.1 , X22A (9,10)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Pickup Current | | |
| AØ | 0.338 [A] | | ±2[%] | |
| BØ | 0.338 [A] | | | |
| CØ | 0.338 [A] | | | |
| 3Ø | 0.195 [A] | | | |

2-4. 87T 6.9kV LV Side Minimum Operate Time Test

① Test Condition

- Output : Test Trip BO 2.2 , X21A (11,12)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Operating Time | | |
| AØ | 30.00 [msec] | | ±1[%] or 10[ms] | |
| BØ | 30.00 [msec] | | | |
| CØ | 30.00 [msec] | | | |
| 3Ø | 30.00 [msec] | | | |

2-5. 87T 66kV HV Side & LV Side Slope Test

① Test Condition

- Output : Test Trip BO 2.2 , X21A (11,12)
- CT Source (HV) : IED S.V BLPH_EW300 / FDR_P1 (AØ), (BØ), (CØ), (NØ)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- Side2= Ia=fixed∠30º, Ib=fixed∠-90º, Ic=fixed∠150º(LV Side)
- Side1= Ia=variable∠0º, Ib=variable∠-120º, Ic=variable∠120º(HV Side)

| Phase | TEST POINT | | SIDE-2 (Fix) | SIDE-1 (Variable) | | Limit | Result |
|---|---|---|---|---|---|---|---|
| | Ir(pu) | Id(pu) | Current | Expected(A) | Pickup(A) | | |
| 3Ø | 0.67 | 0.20 | 0.459 [A] | 0.164 [A] | | ±2[%] | |
| | 1.0 | 0.30 | 0.684 [A] | 0.245 [A] | | | |
| | 2.5 | 0.97 | 1.490 [A] | 0.612 [A] | | | |

2-6. 87T 2nd Harmonic block Test

① Test Condition

- Output : Test Trip BO 2.2 , X21A (11,12)
- CT Source (LV) : X42 1(AØ), 3(BØ), 5(CØ), 6(NØ)
- Fundamental wave 5A to each phase, test by applying the second harmonic current

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected Current | Pickup Current | | |
| AØ | 0.600 [A] | | ±2[%] | |
| BØ | 0.600 [A] | | | |
| CØ | 0.600 [A] | | | |
| 3Ø | 0.600 [A] | | | |

2-7. 87T 66kV HV Side Fast stage Pickup Test

① Test Condition

- Output : Test Pickup BO 2.1 , X22A (9,10)
- CT Source (HV) : IED S.V BLPH_EW300 / FDR_P1 (AØ), (BØ), (CØ), (NØ)
- Test by 87 Fast Threshold Setting Value to 5[I/IrObj]
- Test by increasing the current magnitude

| TEST | | | Limit | Result |
|---|---|---|---|---|
| Phase | Expected | Pickup Current | | |
| AØ | 1.225 [A] | | ±2[%] | |
| BØ | 1.225 [A] | | | |

# NONDESTRUCTION EXAMINATION PROCEDURE

for 72.5 kV 31.5 kA Gas Insulated Switchgear

| | | |
|---|---|---|
| DOCUMENT NO. | : | 1723001595-QC-PRO-00025 |
| CUSTOMER | : | CrossWind. |
| PROJECT | : | BASE LOAD POWER HUB (BLPH) 66kV SWITCH GEAR (GIS) |
| DATE OF ISSUE | : | 14 May, 2024 |
| REVISION NO. | : | Rev. 2 |

## 1. PERSONNEL QUALIFICATION

The examiner who carries out dye penetrant test and evaluates indication on all the other welds shall be qualified as a Level 2 or 3 in the applicable method and on the relevant product sector in accordance with the requirements of ISO9712.
The operator shall have a valid near vision acuity test, which permits reading, a minimum of Times Roman N°4.5 or equivalent letters Jaeger 1 at not less than 30 cm with one or both eyes, either corrected or uncorrected.
Colour vision shall be sufficient that the candidate can distinguish contrast between the colours used in NDT method.

## 2. NDT EXTENSION

The extend shall be in accordance to Spec. ASME Sec.V and will reported on design drawings and inspection test plan.

## 3. SURFACE PREPARATION

The examination surface and adjacent areas within at least 1 inch (25mm), prior to penetrant application, shall be dry and free of rust, paint, grease, oil, water, welding flux, weld spatters or any other impediments that may prevent the penetrant from entering the discontinuity
Weld should be brushed or ground to remove surface irregularities prior to inspection.
After cleaning the surfaces with cleaner, drying of the surfaces to be examined shall be accomplished by normal evaporation, for at least 5 minutes prior to application of the penetrant.
For welds requiring cap to be ground flush for inspection purposes final PT examination shall be performed after cap removal.
Status of weld shall be reported in PT inspection report.

## 4. CONSUMABLES

For execution of Penetrant Test the following materials shall be used:

- ➢ Cleaner CGM Velnet / Elite BC1 or MAGNAFLUX SKC-S cleaner
- ➢ Penetrant CGM Red W / Elite K71B2p or MAGNAFLUX SKL-SP2 penetrant
- ➢ Remover Water
- ➢ Developer CGM White W rotrivel U / Elite D112A or MAGNAFLUX SKD-S2 developer

※ Note: Above materials can be applied as similar product with the same function.
Equivalent products may be used but is not allowed mixed products from different manufacturer.
All products used for the inspection (cleaner, penetrant, developer) shall be with impurity levels of sulphur and halogens in the products shall not exceed 1%.

Products will be detailed on the Technique Sheet.

## 5. PENETRANT EXAMINATION

The temperature of the surface to be processed shall be from 10°C to 50°C.
Local heating and cooling is permitted provided that parts temperature remains in the required range.
Penetrant shall be applied by spraying.
Penetration dwell time shall be 10 minutes, during that time penetrant shall not be allowed to dry.
If for any reason the penetrant does dry, the examination procedure shall be repeated, beginning with a cleaning of the examination surface.
For temperatures from 5°C up to 10°C, minimum penetrant dwell time shall be 2 times the value listed.

## 6. EXCESS PENETRAL REMOVAL

After the specified penetration time has elapsed, any excess penetrant remaining on the surface shall be removed with low pressure water.
Excess penetrant shall be removed by washing (rinsing), immersion or wiping using water.
Care shall be taken to minimize the effect of mechanical action caused by the rinsing method.
The remaining traces shall be removed by wiping the surface with a cloth or absorbent paper, lightly moistened with water.
To minimize removal of penetrant from discontinuities, care shall be taken to avoid the use of excess water.
After excess penetrant removal the surface shall be dried.
At all times the surface temperature shall be not raised above 50°C.
Flushing the surface with solvent, following the application of the penetrant and prior to developing, is prohibited.

## 7. DEVELOPER APPLICATION

The developer shall be applied after penetrant removal by means of spraying, the time interval shall not exceed that established in the procedure.
The developer shall be thoroughly agitated to ensure adequate dispersion of suspended particles.
The developer shall be applied so that a thin coating is obtained over the entire area of interest. During the developer application the nozzle shall be kept at a distance not less than 12" (300 mm).

## 8. EVALUATION

Any indication on the detector indicates the possibility of discontinuity (false or true).
Anyhow the true size and type of discontinuities are difficult to evaluate.
It is a good practice that the surface shall be closely observed during the application of the developer.
The drying after removal excess penetrant shall be maximum 5 minutes.

Final interpretation shall be made after allowing the penetrant to bleed-out for at least shall be minimum 15-20 minutes.

## 9. VIEWING CONDITION

All the testing area shall be easily accessible in safety condition; if necessary, the part shall be moved, to avoid that limited access could interfere with the test results.
The area under test shall be evenly illuminated at a level of not less than 500 lx (lux) daylight or artificial light.
Light meters shall be calibrated at least once a year or whenever a meter has been repaired.
If meters have not been in use for one year or more, calibration shall be done before being used.

## 10. ACCEPTANCE CRITERIA

The acceptance criteria shall be the same acceptance criteria of magnetic examination in accordance with ASME Sec.V.
All surfaces to be examined shall be free of the following:
• Relevant linear indications
• Relevant rounded indications greater than 4mm
• 4 or more relevant rounded indications in a line, separated by 1,5mm or less (Edge to Edge)

### 10.1 Relevant indications

A “relevant” indication is that caused by defect rather than by weld geometry.

### 10.2 Linear Indication

A “linear” indication is one having a length greater than three times the width. Intermittent and aligned indications shall be treated as a linear indication.

### 10.3 Rounded Indication

A “rounded” indication is one having circular or elliptical shape with the length equal or less than three times the width.

## 11. WELD REPAIR

All defects after repair with a new dye penetrant examination, shall be carried out all over the interested area including 50 mm on either side of defects.
The examination after repair shall be performed not earlier than 48 hours after completion weld.
Welding repairs (or replaced welds) shall be examined with the methods prescribed for the original WPS.

## 12. CLEANING AFTER EXAMINATION

After examination, external surfaces shall be cleaned by solvent or water and will be dried with cloths.

## 13. EXAMINATION REPORT

All NDT shall be documented, and all reports shall be generate by database (See attachment 3)
The documentation shall include as minimum the following information, where appropriate:

- contract number;
- applicable procedure specification;
- weld identification;
- material type and dimensions;
- description and location (with sketch where appropriate) of all reportable indications;
- welding process used;
- surface conditions;
- post weld heat treatment (if required)
- temperature of the object;
- consumables
- viewing conditions
- date of testing;
- name and qualification level of inspector;
- approval signature of responsible inspector.

9. Other components ..... 6
10. Repair for Coating ..... 7
11. Attachment ..... 7

## 1. General information

Surface treatment for the switchgear (and components) shall be applied based on the material and environment with paints or coatings.

The components installed outside may receive a huge environmental stress while operation. It should be endured. However, the components installed inside is not strongly influenced by environmental stress from atmospheric changes. Therefore, outdoor application should be considered more than indoor application in terms of environmental influence.

## 2. The main functions of surface treatment

- Anti-corrosion protection layer : This shall be applied on ferrous products.
- Decorative layer : This shall be applied on paint finishing in order to protect from environmental stresses.

## 3. General considerations of surface treatment

Excessive painting or coating thickness around edges or holes(1inch or 25 ㎜) should be avoided in terms of protection from damage.

In case that some damages are found while using, repairing work by touch-up can be carried out if necessary after checking conditions on the damaged surface.

## 4. Applicable standard and regulations

- SSPC — The Society for Protective Coatings
- ISO 12944-1_2017 — Corrosion Protection of Steel Structures by Protective Paint Systems Part 1 : General Information
- ISO 12944-2_2017 — Corrosion Protection of Steel Structures by Protective Paint Systems Part 2 : Classification of environments
- ISO 12944-5_2019 — Corrosion Protection of Steel Structures by Protective Paint Systems Part 5 : Protective Paint System
- ISO 1461_2022 — Hot dip galvanized coatings on fabricated iron and steel articles - Specifications and test methods
- ISO 14713-1_2017 — Zinc coatings - guidelines and recommendations for the protection against corrosion of iron and steel in structure

## 5. Applicable Category for painting system

The painting system is in compliance with the standard Iso 12944-5 category C3 H

## 6. Pre-treatment method

Pre-treatment Method based on SSPC is defined as below.

- SSPC - SP 1 — Solvent Cleaning
- SSPC - SP 3 — Power Tools Cleaning
- SSPC - SP 5 — White Metal Blast
- SSPC - SP 6 — Commercial Blast
- SSPC - SP 8 — Pickling (Acid Cleaning)
- SSPC - SP 10 — Near-White Metal Blast Cleaning

– SSPC - SP 16 Brush-Off Blast Cleaning of Coated and Uncoated Galvanized steel, Stainless Steels and Non-Ferrous Metal

SSPC - SP 1

Solvent Cleaning is a method for removing all visible oil, grease, soil, drawing and cutting compounds, and other soluble contaminants from steel surfaces. It is intended that solvent cleaning be used prior to the application or paint and in conjunction with surface preparation methods specified for the removal of rust, mill scale or paint.

SSPC - SP 6

Blast Cleaning with steel grit or ball is a method for removing all visible oil, grease, dust, dirt, mill scale, rust, coatings, oxides, corrosion products and other foreign matter, which makes a near-whiter metal blast cleaned surface when viewed without magnification.

Random staining shall be limited to no more than 33 percent of each unit area of surface, and may consist of light shadows, slight streaks or minor discolorations caused by stains of rust, stains of mill scale or stains of previously applied coating.

SSPC - SP 8

Pickling is a method of preparing steel surfaces by chemical reaction, electrolysis or both. The surfaces when viewed without magnification shall be free of all visible mill scale and rust.

SSPC - SP 10

Blast Cleaning with steel grit or ball is a method for removing all visible oil, grease, dust, dirt, mill scale, rust, coatings, oxides, corrosion products and other foreign matter, which makes a near-whiter metal blast cleaned surface when viewed without magnification.

Random staining shall be limited to no more than 5 percent of each unit area of surface, and may consist of light shadows, slight streaks or minor discolorations caused by stains of rust, stains of mill scale or stains of previously applied coating.

SSPC - SP 16

Blast Cleaning with abrasive is a method for removing all visible oil, grease, dirt, dust, metal oxide(corrosion products) and other foreign matter, which makes a brush-off blast cleaned non-ferrous metal surface when viewed without magnification.

## 7. Surface treatment and painting specification of components

For the description of the surface treatment for GIS, refer to the following.

### 7.1 Enclosure and cover

| Base material | Pre-treatment | Surface treatment | | | Color |
|---|---|---|---|---|---|
| Aluminum | Degreasing<br>Blasting<br>– SSPC-SP 16 | Painting<br>– Primer<br>– Top | <br>Liquid<br>Liquid | <br>40 ㎛<br>40 ㎛ | Munsell No. 5GY 7.5/1<br>RAL 7032 |
| | | | Total | **80** ㎛ | |
| Mild steel | Degreasing<br>Blasting<br>– SSPC-SP 10 | Painting<br>– Primer<br>– Intermediate<br>– Top | <br>Liquid<br>Liquid<br>Liquid | <br>80 ㎛<br>40 ㎛<br>80 ㎛ | Munsell No. 5GY 7.5/1<br>Munsell No. 5GY 7.5/1<br>RAL 7032 |
| | | | Total | **200** ㎛ | |

NOTE

- To keep the sealing of gas compartment, the machined surface for mild and stainless steel is applied with only primer painting as color "Munsell No. 5GY 7.5/1" after SSPC-SP 1 pre-treatment and for aluminum is not painted.
- The inside of enclosure filled with SF6 gas and not exposed to air is finished according to Hyosung internal standards.

### 7.2 Sheet metal parts

Grit and Shot profile criteria are different and are not related to SSPC's criteria.
When the profile rating is applied as medium, it is between Segment 2 and 3.
And we are using Grit and Shot, so our standard is defined as 50~100 ㎛.

#### 7.2.1 Mechanism box / duct / plate / accessories

| Base material | Pre-treatment | Surface treatment | | | Color |
|---|---|---|---|---|---|
| Mild steel<br>(Powder painting) | Degreasing<br>Pickling<br>Phosphating | Painting<br>– Top | Powder | **120** ㎛ | RAL 7032 |

#### 7.2.2 Local Control Panel (C&P panel)

| Base material | Pre-treatment | Surface treatment | | | Color |
|---|---|---|---|---|---|
| Mild steel<br>(Powder painting) | Degreasing<br>Pickling<br>Phosphating | Painting<br>– Top | Powder | **120** ㎛ | RAL 7032 |

### 7.3 Support structures and platform

#### 7.3.1 Support / Platform / CB base frame

| Base material | Pre-treatment | Surface treatment | | Color |
|---|---|---|---|---|
| Mild steel | Degreasing<br>Blasting<br>– SSPC-SP 1<br>– SSPC-SP 6 | Hot dip galvanized<br>– Steel > 6 ㎜ | 85 ㎛ | |

NOTE

- Standard coating thickness of galvanizing is in accordance with ISO 1461 - 2009.
- For more details on the case where the thickness of the base material is less than 6mm, please refer to above standard.

### 7.4 Additional application

In case of operating mechanism, mechanism box(case) is applied with customer's painting specification, however, internal components in the mechanism box are applied with manufacturer's standard painting specification.

Rupture disk and control gear box of earthing switch can be applied with manufacturer's painting specification due to safety issues.

## 8. Inspection of painting thickness

The Inspection of painting thickness will be carried out according to SSPC-PA2.

For the hot dip galvanizing, inspection will be carried out according to ISO 1461-2009.

## 9. Other components

Gas barriers and insulation supports will be provided with original color itself. And painting for gas section marks will be performed by contractor after installation as per contractor's practice.

Gas pipes will be provided with yellow color if applicable.

Internal components including parts in the mechanism box are applied with manufacturer's standard painting specification.

## 10. Repair for Coating

1) Sag / Runs / Curtains
   - Let dry, grind and recoat

2) Overspray / Dry spray
   - Let dry, grind smooth and recoat

3) Orange peel
   - Cosmetic defect; If necessary - grind until smooth surface and recoat

4) Pinholes
   - Grind, open holes and recoat

5) Blistering / Voids
   - Sand down to smooth the surface and repaint

6) Cratering / popping
   - Grind smooth and recoat

7) Fisheyes
   - Solvent wash, grind smooth and recoat

8) Mudcracking
   - Blast-cleaning to Sa 2.5 and recoat in correct DFT

9) Checking/Cracks
   - Grind smooth and recoat

## 11. Attachment

1. Painting inspection procedure
2. Certificate of Analysis
3. Technical Data Sheet

| HYOSUNG | TITLE | NO. | First | Revise | Rev. | Page |
|---|---|---|---|---|---|---|
| | Painting Inspection Procedure | HS-CB-60-0002 | 1999.09.07 | 2019.03.14 | 18 | 1/6 |

No. : HS-CB-60-0002

# Power Systems PU Painting Inspection Procedure

| HYOSUNG | TITLE | NO. | First | Revise | Rev. | Page |
|---|---|---|---|---|---|---|
| | Painting Inspection Procedure | HS-CB-60-0002 | 1999.09.07 | 2019.03.14 | 18 | 2/6 |

## 1. Scope

This procedure is for the painting inspection of parts and products of Power Systems PU.

## 2. The definition of terms

2.1 TPI(Target Painting Item): The Item shall be Painted.

2.2 Pretreatment: Treatment on the surface to be painted for increase adhesion.

2.3 SR(Surface Roughness): The degree of bump or dent on the surface.

2.4 ST(Surface Temperature): The surface temperature of TPI

2.5 ET(Environment Temperature): The dry bulb temperature of paint work shop

2.6 RH(Relative Humidity): Relative humidity from present temperature of paint work shop

2.7 DPT(Dew Point Temperature): Condensation starting temperature (water vapor→water).

2.8 Visual defect of painting surface

2.8.1 Sagging: Un-uniform surface from excess application of paint (running)

2.8.2 Pinhole/Crack: Opened to previous coating layer or base metal.

2.8.3 Blistering: Blister of the painting surface.

## 3. Preparation of painting surface

3.1 Conduct pretreatment as per the painting specification.

3.2 In case no specified in painting specification, follow Table 1.

<Table 1 Method of preparation of surface in case no specified>

| Material | Parts | Preparation |
|---|---|---|
| Steel parts | Sheet metal | SSPC-SP 8 + Phosphate |
| | Except Sheet metal | SSPC-SP 1 + SSPC-SP10 |
| Non-ferrous metal | Aluminum, Stainless steel | SSPC-SP 1 + SSPC-SP16 |

SSPC-SP1: Solvent Cleaning

SSPC-SP8: Pickling (Acid cleaning)

SSPC-SP10: Blast cleaning with steel grit/ball (Allow color difference 5% or less)

SSPC-SP16: Blast cleaning with abrasive (non-ferrous)

3.3 Panel product follows “Panel product painting manual (HS-CP-31-0271)

## 4. Suitable paint working condition

4.1 Appropriate temperature/humidity condition

4.1.1 RH is lower than 80%.

4.1.2 ST(Surface Temperature) of TPI is lower than 43℃

4.1.3 ST(Surface Temperature) of TPI ≥ DPT(Dew Point Temperature)+ 3℃

4.2 Appropriate surface roughness and cleanness

4.2.1 Build suitable roughness on the surface of blasted TPI (Remark Table 2)

<Table 2 Roughness on the surface of TPI after blast cleaning>

| Ferrous metal | Non-ferrous metal, stainless steel |
|---|---|
| 50~100㎛ | 19㎛ and above |

* Roughness value means $R_{max}$ value (ISO 8503-1)

* Not applicable for un-blasted items (sheet metal parts)

* Upper limit of surface roughness is not a mandatory (recommendation)

4.2.2 Build suitable cleanness on the surface of TPI

- No oil, grease, lubricant, rust, mill scale on the surface after preparation.

## 5. Inspection requisition procedure

5.1 Inspection of surface preparation

5.1.1 GIS division: Request to GIS inspection team with form HS-CB-60-0002-3A4.

5.1.2 Transformer (High, Medium/Low) division: Request to Transformer inspection team with form HS-CB-60-0002-2A4.

5.2 Inspection of painting

5.2.1 GIS division: Request to GIS inspection team with form HS-CB-60-0002-3A4.

5.2.2 Transformer (High, Medium/Low) division: Request to Transformer inspection team with form HS-CB-60-0002-2A4.

5.2.3 After repairing of welding, in case the paint rework in needed, request inspection from paint work shop with each form of inspection requisition.

## 6. Inspection sequence and acceptance criteria

6.1 Sequence of inspection

<Table 3 Inspection stage and point>

| Inspection stages | Inspection items | Inspection point | |
|---|---|---|---|
| | | Painting shop | HYOSUNG |
| working condition | As per clause 4.1 | O | |
| Surface preparation | As per clause 4.2 | O | |
| Painting inspection | Curing | O | O |
| | Painting thickness | O | O |
| | Visual inspection | O | O |

6.2 Acceptance criteria

6.2.1 Working condition and surface preparation condition: Check the whole conditions of environment and TPI are satisfied as per the clause 4.1~4.2.

6.2.3 Painting inspection

6.2.3.1 Curing: Push the painted surface with tip of thumb nail vertical direction toward on paint surface and shall not be deformed or moved.

6.2.3.2 Painting thickness: Use “Spot measurement method from SSPC-PA2 and the detail given in annex 1.

6.2.3.3 No contamination, sagging, pinhole/crack on painted surface and same color with color sample from paint raw material maker or color code book.

Follow “Visual inspection criteria for outer surface of GIS (HS-CB-61-Y629)” for painted items of GIS division.

6.3 Correction of coating thickness according to roughness

6.3.1 In case the coating on blast cleaning surface, adjust coating thickness gage reading with correction value from roughness (Blasted surface only, Remark Table 4).

<Table 4. Correction value table according to roughness – From ISO 8503>

| Surface roughness | 25㎛≤ X <60㎛ | 60㎛≤ X <100㎛ | 100㎛≤ X <150㎛ |
|---|---|---|---|
| Correction value | 10㎛ | 25㎛ | 40 |

6.3.2 Application Example

① Steel enclosure with blast cleaning

- Roughness: 77㎛ → Correction Value: 25㎛
- Painting thickness: 200㎛ → Final reading: 200-25=175㎛

② Sheet metal ducts with pickling + phosphate

- Roughness: 7㎛ → Correction Value: Not applicable
- Painting thickness: 110㎛ → Final reading: 110-0=110㎛

## 7. Management of inspected lots

7.1 Accepted items are moved to next step with identification (tags or similar way)

7.2 Non-conformance products are processed as per procedure for non-conformance product treatment (HS-CP-34-0009).

## 8. Inspection record & storage

8.1 The inspection records shall be written on the form CB-60-0002-1A4 and the storage of records are according to quality record control procedure (HS-CP-14-0013).

8.2 In case the projects related with nuclear power plant, the inspection records shall be written on the form of HS-CB-60-0002-6A4.

# Korepox PrimerEP1160(H)(Two-components) DATA-SHEET

KOREPOX PRIMER EP1160(H) is A two-component, modified polyamide cured epoxy primerwith high content of corrosion inhibiting pigment. It forms a hard andtough film with excellent adhesion property, abrasion resistance and impact resistance. It hasno heavy-metal materials, so can improvement a environment of your work place and meetthe international environmental regulations.

| | |
|---|---|
| Recommended use | As the primer for use on heavy-industrial equipment, transformer, gas insulated switchgear, tank, container and the general steel appliance, etc. |

## Physical Properties

| | |
|---|---|
| Finish and Color | Flat. White, Gray , Red, Ivory<br>Colors are depending on KCC's standard color card, and other colors are available on reguest. |
| Specific gravity | 1.3 ~ 1.5 (Kg/L) according to color. |
| Solids by volume | Approx. 55~60% (It's depended on color ) |
| Spreading rate (Theoretical) | 12㎡/L in 50 micron dry film thickness on a smooth surface. |
| Flash point | 22~32℃/73.4~89.6°F (Closed cup). |

## Application details

| | |
|---|---|
| Surface preparation | Remove any rust, dirt, oil and other contaminants from surface to be coated with suitable cleaning method.<br>(Blast Cleaning to Sa 2 ½ or Phosphating treatment)<br><br>* Iron phosphate series is less resistant to water and corrosion than zinc phosphate series. * Coating film during repair painting thoroughly polish the defective area of the product and dry it thoroughly. |
| Preceding coat | GALVANY SHOPPRIMER IZ182 or according to specification |
| Method of application | Air spray application.<br>Nozzle orifice : 1.3 ~ 1.5mm<br>Output pressure : 4 ~ 5Kg/㎠<br>Number of spray : 3 ~ 5 times (going and coming)<br>(Air spray data are indicative and subject to adjustment.)<br>* Roller or Dipping is not recommendable. |
| Thinning | * For air spray application, use THINNER No. 024 Adjust the viscosity up to 16~20 sec. in Ford cup No.4 at 20℃/68°F (Thinning rate : 25~35% by volume).<br>But, it may be changed by application condition and environment, etc. * Use well strained paint.<br>* Only use specified THINNER. |
| Application conditions | The surface must be completely clean and dry.<br>Preferred temperature during application is 15~25℃/59~77°F, and relative humidity is 35 ~ 80%. |

| | |
|---|---|
| | The surface temperature must be at least 3℃(5°F) above dew point to prevent condensation. |
| Film thickness | Recommended per coat 40 ~ 50 microns dry. |
| Drying time | dry film thickness: 60microns |

| panel temperature | 5℃/41 F | 10℃/50 F | 20℃/68 F | 30℃/86 F |
|---|---|---|---|---|
| set to touch | 8h | 3h | 1h | 0.5h |
| dry-hard | 16h | 7h | 4h | 4h |
| repainting interval(minimum) | 16h | 7h | 4h | 4h |
| repainting interval(max) | 7d | 5d | 5d | 5d |
| dry-through | 7d | 7d | 7d | 7d |

h : hour d : day

* Actual drying time is affected by film thickness, humidity, ventilation, etc.

* forced drying: 80℃(176 F ) X 30mins (panel temperture standard)

| | |
|---|---|
| Recoating interval | At 20℃, minimum: within 5 days after 5 hours (however, within 3 days in hot weather)<br>* When re-coating, clean the foreign matter or defective area or dry it completely before painting. |
| Heat resistance temperature | Continuous : 120℃/248°F<br>Non-Continuous : 180℃/356°F |

## Storage and package

| | |
|---|---|
| Shelf life | 12 months |
| Storage | Store in cool, dry, well-ventilated place.<br>Can of bottom composition should be turned regularly twice a month. |
| Packing Unit | 16ℓ (Base : Curing Agent = 13.7ℓ : 2.3ℓ) |
| Transportation condition | - Transport in refurbished containers between 5°C~30°C(41°F~86°F)<br>Use air cushions when loading containers |

## Remarks

| | |
|---|---|
| Note | Avoid humidity and direct sunlight.<br>Mix thoroughly prior to application.<br>Keep containers closed when not in use.<br>Keep away from sparks and open flames.<br>Avoid prolonged breathing of solvent vapors and contact with skin and eyes.<br>In case of eyes contact, flush immediately with plenty of water for at least 15 minutes.<br>Use with adequate ventilation.<br>Respiratory protection is recommended when spraying this material in confined space or stagnant air. |

# non-heavy metal (industrial)-UT6780(H) DATA-SHEET

High-solids urethane coating UT6780(H)" is a two-component coating material primarily composed of acrylic polyurethane resin. It is a product that does not contain heavy metals. Additionally, it boasts excellent properties such as gloss and color retention, chemical resistance, durability, and weather resistance. It is an ideal coating for applications in the electrical and electronic industries, such as transformers, as it is a non-yellowing type of acrylic polyol product.

| | |
|---|---|
| Recommended use | 1. heavy electricity such as transformers, high-voltage breakers, rotors, etc<br>2. Industrial top coat of general steel, steel frame, steel plate, etc |

## Physical Properties

| | |
|---|---|
| Finish and Color | Gloss, Semigloss, Flat<br>Colors are depending on KCC's standard color card, and other colors are available on reguest except for yellowish, redish, orangish color. |
| Specific gravity | Approx. 0.9 ~ 1.3 (㎏/ℓ). |
| Solids by volume | Approx. 43 ~ 48%<br>It's depended on color |
| Spreading rate (Theoretical) | 11 ~ 13 ㎡/ℓ in 40 microns dry film thickness on a smooth surface |
| Flash point | 23℃ ~ 32℃/ 73°F ~ 89°F (Closed cup) |
| Viscosity | Approx. 60~70 KU (25℃ / 77°F) |

## Application details

| | |
|---|---|
| Surface preparation | Remove any rust, dirt, oil and other contaminants from surface to be coated with suitable cleaning method. (Blast Cleaning to Sa 2 ½ or Phosphating treatment)<br>* For new work : Remove any dust, oil , grease and other impurities from the surface to be coated and allow to dry completely. |
| Preceding coat | According to EP1160(H), UP195, or painting specifications |
| Method of application | Air spray application.<br>Nozzle orifice : 1.3 ~ 1.5mm<br>Output pressure : 4 ~ 5Kg/㎠<br>Number of spray : 2 ~ 3 times (going and coming)<br>(Air spray data are indicative and subject to adjustment.)<br>* Roller or Dipping, Brush, Airless spray, electrostatic coating is not recommendable. |
| Thinning | 037U, 0278(HD), ZY0404(HCE)(For electrostatic use)<br>* Dilution Viscosity : 16~20 sec (20℃/ 68°F)/ Ford Cup No. 4 (When using air spray)<br>* Dilutiob : 5~10% (Volume ratio)<br>* Do not dilute components separately, only the mixture.<br>* Adjust the thinner ratio accordingly based on working conditions, painting environment, temperature of the coating material, size, and shape of the object.<br>* Only use specified THINNER.. |

| | |
|---|---|
| Application conditions | In order to prevent condensation of moisture, the surface temperature of the substrate should be at least 3℃ higher than the dew point, and the temperature of the substrate suitable for painting is 15~25℃, and the relative humidity is 35~80% The surface must be clean, free from moisture, and avoid painting on wet days. |
| Film thickness | dry film thickness 35~45㎛ |
| Drying time | Dry time(20℃ / 68°F standard)<br>set to touch : 30 mins<br>Dry hard : 10 hrs<br>Dry-through : 7 days<br>*forced drying: 80℃(176F ) X 30mins (panel temperture standard) |
| Pot life | 8hrs (20℃/ 68°F standard) |

## Storage and package

| | |
|---|---|
| Shelf life | 12 months |
| Storage | Due to the possibility of deterioration over time, store the product in a cool, well-ventilated place without direct sunlight or open flames at room temperature (5~35°C). Please use within the storage period. |
| Packing Unit | 16L (PTA (UT6780(H)) : PTB(2958(RT)C.A) = 12.8L : 3.2L)<br>4L (PTA (UT6780(H)) : PTB(2958(RT)C.A) = 3.2L : 0.8L) |
| Transportation condition | - Transport in refurbished containers between 5°C~30°C(41°F~86°F)<br>Use air cushions when loading containers |

## Remarks

| | |
|---|---|
| Handling Precautions | 1. Avoid humidity and direct sunlight.<br>2. Mix thoroughly prior to application.<br>3. Keep containers closed when not in use.<br>4. Keep away from sparks and open flames.<br>5. Avoid prolonged breathing of solvent vapors and contact with skin and eyes.<br>6. In case of eyes contact, flush immediately with plenty of water for at least 15 minutes.<br>7. Use with adequate ventilation.<br>8. Respiratory protection is recommended when spraying this material in confined space or stagnant air. |

# ROUTINE TEST REPORT FOR GIS

Document No. : YP-24-10248704_0002

Bay(CB) Name : Q0(QA1) CB

## 1. Design and Visual Check

The below contents are checked whether the test objects are suitable according to approved specification and relevant standards.

| Test Item | Result |
|---|---|
| Dimension and Nameplate are checked in according to the approved drawings. | |
| Construction, indicator, painting & welding condition are inspected visually. | |
| Other specified items are checked in approved specification. | |

## 2. Power Frequency Withstand Voltage Test on the Main circuit

The power frequency withstand voltage tests is performed after mechanical operation tests.

The specified power frequency withstand voltage test has been performed successfully.

2.1 Test condition

Dryair Gas pressure [bar.G] CB : 4.5 Others : 4.5

| Test Item | Test Voltage [kV] | Test Duration [s] | Result |
|---|---|---|---|
| Phase to Earth | 140 | 60 | |
| Across Open Pole (CB, DS) | 140 | 60 | |

2.2 Measurement of insulation resistance

| Test sequence | Test Voltage [V] | Acceptance criteria [MΩ] | Measured Value [MΩ] | Resule |
|---|---|---|---|---|
| Before H.V test | 10,000 | ≤1,000 | | |
| After H.V test | 10,000 | ≤1,000 | | |

## 3. Partial Discharge Measurement

After line to earth condition of the power frequency withstand voltage test, the quantity of partial discharges has been measured successfully.

| Test Item | Test Voltage [kV] | Acceptance criteria [pC] | Measured Value [pC] | Result |
|---|---|---|---|---|
| Phase to Earth | 87 | ≤5 | | |

## 4. Mechanical Operation Test - Continuous Operating Test

All operating test required by the standards have been carried out successfully.

### 4.1 Continuous Operating Test (CB)

| Sequence | Control Voltage [Vdc] | | Control Pressure [bar.G] | | Operating Times | Result |
|---|---|---|---|---|---|---|
| Close | Max | 121 | Max | N/A | 5 | |
| | Rated | 110 | Rated | N/A | 5 | |
| | Min | 94 | Min | N/A | 5 | |
| Open | Max | 121 | Max | N/A | 5 | |
| | Rated | 110 | Rated | N/A | 5 | |
| | Min | 77 | Min | N/A | 5 | |
| C-O | Rated | 110 | Rated | N/A | 5 | |
| O-C | Rated | 110 | Rated | N/A | 5 | |
| O-CO | Rated | 110 | Rated | N/A | 1 | |
| Manual Operation | - | | | | 5 | |

### 4.2 Continuous Operating Test(DS, ES)

| Sequence | Control Voltage [Vdc] | | Operating Times | Result |
|---|---|---|---|---|
| Close / Open | Max | 121 | 5 | |
| | Rated | 110 | 5 | |
| | Min | 94 | 5 | |
| Manual Operation | - | | 5 | |

### 4.3 Spring Charge Time

| Test Item | CB [s] | Result |
|---|---|---|
| Spring charge time | | |

*Acceptance criteria : Less than 15sec

## 5. Mechanical Operation Test - Timing Test

All operating test required by the standards have been carried out successfully.

5.1 Timing Test (CB)

| Sequence | | Control Voltage [Vdc] | Control Pressure [bar.G] | Phase 8 [ms] | Phase 12 [ms] | Phase 4 [ms] | Pole discrepancy [ms] | Page No. (Annex. A) | Result |
|---|---|---|---|---|---|---|---|---|---|
| Close | C1 | - | - | - | - | - | - | - | - |
| | | - | - | - | - | - | - | - | - |
| | | - | - | - | - | - | - | - | - |
| | C2 | - | - | - | - | - | - | - | - |
| | | - | - | - | - | - | - | - | - |
| | | - | - | - | - | - | - | - | - |
| Open | T1 | - | - | - | - | - | - | - | - |
| | | - | - | - | - | - | - | - | - |
| | | - | - | - | - | - | - | - | - |
| | T2 | - | - | - | - | - | - | - | - |
| | | - | - | - | - | - | - | - | - |
| | | - | - | - | - | - | - | - | - |
| C-O | C1,T1 | - | - | - | - | - | - | - | - |
| | C1,T2 | - | - | - | - | - | - | - | - |
| O-C | C1,T1 | - | - | - | - | - | - | - | - |
| | C1,T2 | - | - | - | - | - | - | - | - |
| O-C-O | C1,T1 | - | - | - | - | - | - | - | - |

* Acceptance criteria : Close time ( less than 70ms ), Pole discrepancy ( less than 5ms )

(At rated condition) Open time ( less than 32ms ), Pole discrepancy ( less than 3.3ms )

CO ( must be possible ), O-C time ( Less than 300ms )

* Refer to the attached <Annex A>

# ROUTINE TEST REPORT FOR GIS

Document No. : YP-24-10248704_0002

Bay(CB) Name : Q0(QA1) CB

## 6. Measurement of the Resistance of the Main Circuit

Applying DC current of 100A to the main circuit, the resistance of GIS has been measured by voltage drop method.

| Measuring Parts | Measured Value / Acceptance criteria [μΩ] | | | Result |
|---|---|---|---|---|
| | Phase 8 | Phase 12 | Phase 4 | |
| 1 ~ 2 | / | / | / | |
| 3 ~ 4 | / | / | / | |
| 1 ~ 4 | / | / | / | |

* Acceptance criteria : Measuring Value is less than 120% of the Design Value.

**< Reference Drawing >**

## 7. Tightness test

After filling the test object to rated gas pressure with SF6 gas and wrapping all connection part with vinyl.

At least 6 hour later, it has been checked with gas detector.

SF6 Gas pressure [bar.G] CB : 5 Others : 5

| Test Duration [hr] | Acceptance Criteria | Measured | Result |
|---|---|---|---|
| 6 | Less than 0.5% per year | | |

## 8. Gas Density Switch Test

Alarm contacts of gas density switch have been checked successfully.

| Test Item | Standard Gas Pressure [bar.G] | | | | Result |
|---|---|---|---|---|---|
| | 1'st Alarm | 2'nd Alarm | High pressure | - | |
| GD-1 | 4.7±0.2 | 4.5±0.2 | - | - | |
| GD-2 | 4.7±0.2 | 4.5±0.2 | - | - | |
| GD-3 | 4.7±0.2 | 4.5±0.2 | - | - | |
| - | - | - | - | - | - |
| - | - | - | - | - | - |
| - | - | - | - | - | - |
| - | - | - | - | - | - |
| - | - | - | - | - | - |
| - | - | - | - | - | - |
| - | - | - | - | - | - |
| - | - | - | - | - | - |
| - | - | - | - | - | - |

## 9. Test on auxiliary & control circuit(Including LCP test)

The below contents are checked whether the test objects are suitable according to approved specification and relevant Standards.

| Test Item | Result |
|---|---|
| Dimension and nameplate check | |
| Painting and wiring color check | |
| Interlock test | |
| Functional Test | |

9.1 Aux. Device Resistance Measurement

9.1.1 Coil & Resistor

| Test Item | Acceptance Criteria [Ω] | Measured Value [Ω] | | | Result |
|---|---|---|---|---|---|
| | | Phase 8 | Phase 12 | Phase 4 | |
| Open Coil (T1) | | | | | |
| Open Coil (T2) | | | | | |
| Close Coil (C1) | | | | | |
| Close Coil (C2) | - | - | - | - | - |

9.1.2 Heater

| Test Item | Acceptance Criteria [Ω] | Measured Value [Ω] | | | Result |
|---|---|---|---|---|---|
| | | Phase 8 | Phase 12 | Phase 4 | |
| LCP | | | | | |
| QA1 | | | | | |
| QZ92 DS | | - | | - | |
| QZ92 ES | | - | | - | |
| QZ91 DS | | - | | - | |
| QZ91 ES | | - | | - | |
| - | - | - | - | - | - |
| - | - | - | - | - | - |
| - | - | - | - | - | - |

9.2 Dielectric Test and Insulation Resistance Measurement on Auxiliary and Control Circuits

| Test Item | Test Voltage [V] | Test Duration [s] | Measured Value [MΩ] | Result |
|---|---|---|---|---|
| Auxiliary and Control Circuits to Earth | 1000 Vac | 1 | | |
| | 500 Vdc (Megger) | - | | |

* Acceptance criteria of Insulation Resistance : ≥2 MΩ

## 10. Pressure Test for Enclosure

- Refer to the attached <Appendix A>

## 11. Pressure Test on Partition

- Refer to the attached <Appendix B>

## 1. Design and Visual Check

The below contents are checked whether the test objects are suitable according to approved specification and relevant standards.

| Test Item | Result |
|---|---|
| Dimension is checked according to the approved drawings. | |
| Construction, indicator, painting & welding condition are inspected visually. | |

## 2. Verification of markings

The below test items satisfied with approved specification and relevant standards.

| Test Item | Result |
|---|---|
| Nameplate is checked according to the approved drawings. | |
| Terminal markings are checked according to the approved drawings. | |

## 3. Power-frequency voltage withstand tests on primary terminals (With GIS)

The specified power frequency withstand voltage test has been performed successfully.

| Test Item | Test Voltage [kV] | Test Duration [s] | Result |
|---|---|---|---|
| Primary terminals to Earth | 140 | 60 | |

## 4. Partial Discharge Measurement (With GIS)

After the power frequency withstand voltage test, the quantity of partial discharges has been measured successfully.

| Test Item | Test Voltage [kV] | Acceptance criteria [pC] | Measured Value [pC] | Result |
|---|---|---|---|---|
| Primary terminals to Earth | 87 | ≤5 | | |

## 5. Enclosure tightness test at ambient temperature (With GIS)

The LPIT is fully assembled with the GIS and tested simultaneously.

At least 6 hour later, it has been checked with gas detector.

SF6 Gas pressure [MPa.G] LPIT : 0.5

| Test Duration [hr] | Acceptance Criteria | Measured | Result |
|---|---|---|---|
| 6 | Less than 0.5% per year | | |

## 6. MU test

- The below contents are checked whether the test objects are suitable according to approved specification and relevant standards.
- Refer to the attached <Appendix A>

### 6.1 Sampled value check

| Test Item | Result |
|---|---|
| The Sampled Value checked that there were no errors in the data sets. | |

### 6.2 Alarm check

| Test Item | Result |
|---|---|
| Alarm, LED statue etc. condition are inspected visually. | |

## 7. Power-frequency voltage withstand tests on secondary terminals & low-voltage components

- Refer to the attached <Appendix B>

## 8. Pressure Test for Enclosure

- Refer to the GIS test report.

## 9. Test for accuracy with MU

- Refer to the attached <Appendix C>

# SITE TEST REPORT FOR GIS

Document Number :

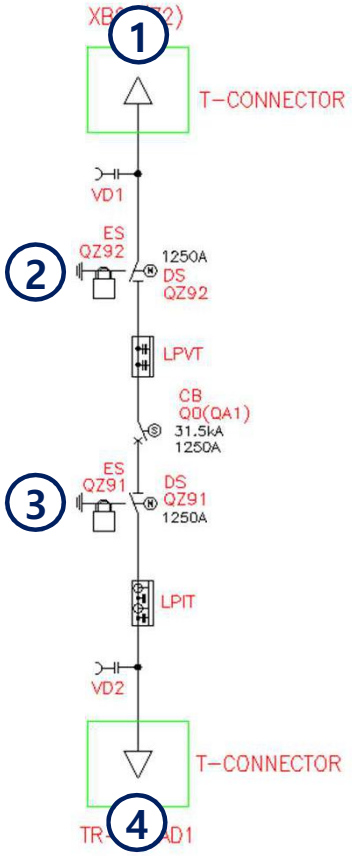
## 1. Visual and Dimension Check

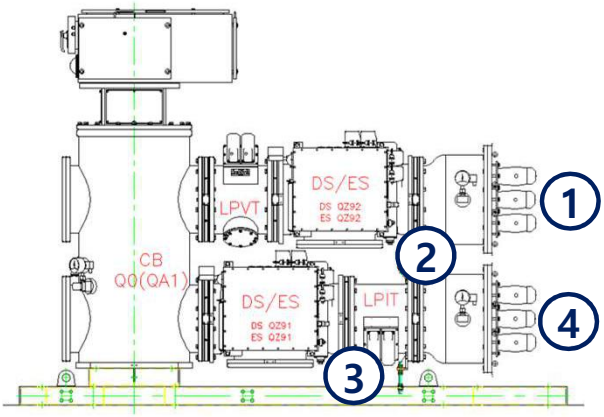
The below contents are checked whether the test objects are suitable according to approved specification and relevant standards.

| Bay Name | Test Item | Result |
|---|---|---|
| All Bays | Dimension and Nameplate are checked in according to the approved drawings. | |
| | Construction, indicator, grounding, painting & welding condition are inspected visually. | |
| | Other specified items are checked in approved specification. | |
| | Physical damage or defects during transportation were identified. | |

## 2. Measurement of the Resistance of the Main Circuit



Applying DC current of 100A to the main circuit, the resistance of GIS has been measured by voltage drop method.



Ambient Temp. [℃] : .0

| Measuring Parts | Measured Value / Acceptance criteria [μΩ] | | | Result |
|---|---|---|---|---|
| | Phase 8 | Phase 12 | Phase 4 | |
| 1 ~ 4 | / | / | / | |
| 1 ~ 2 | / | / | / | |
| 3 ~ 4 | / | / | / | |

* Acceptance criteria : Measuring Value is less than 120% of the Design Value.

**< Reference Drawing >**

### 3. Test on auxiliary & control circuit

Before control voltage applying, all wiring in the control mechanism have been checked with multi-tester orbuzzer based on the schematic.

| Bay(CB) Name | Test Item | Result |
|---|---|---|
| QA1 | The schematic wiring has been checked. | |
| | Insulation resistance measurement on the control and auxiliary circuits. | |

### 4. Functional Test

The below contents are checked whether the test objects are suitable according to approved specification and relevant standards.

| Bay(CB) Name | Test Item | Result |
|---|---|---|
| QA1 | All interface wiring between LCC & GIS is checked with buzzer based on approved schematic. | |
| | All kind of devices & wiring are checked by operation at site properly. | |
| | Mechanical interlock is proven. | |
| | The operating and interlock circuits are proven. | |
| | Wiring relevant to the alarm and warning circuits are checked by buzzer or announciator of LCP | |
| | Checked that the final setting was applied to all adjustable devices. (Timers, thermostat, etc..) | |
| | Manual operation is checked for CB, DS, ES. | |

## 5. Mechanical Operation Test

All operating test required by the standards have been carried out successfully.

### 5.1 Timing Test (CB)

* Acceptance criteria : Close time ( less than 70ms ), Pole discrepancy ( less than 5ms ) / Open time ( less than 32ms ), Pole discrepancy ( less than 3.3ms )

(At 110Vdc) CO ( must be possible ), O-C time ( Less than 300ms )

| Bay(CB) Name | Sequence | | Phase 8 [ms] | Phase 12 [ms] | Phase 4 [ms] | Pole discrepancy [ms] | Test Criteria | Result |
|---|---|---|---|---|---|---|---|---|
| QA1 | Close | C1 | | | | | < 70ms | |
| | Open | T1 | | | | | < 32ms | |
| | | T2 | | | | | | |
| | C-O (Trip free) | T1 | | | | - | must be possible | |
| | | T2 | | | | - | | |
| | O-CO | T1 | | | | - | < 300ms | |
| | | T2 | | | | - | | |

5.2 DS&ES Operation test

| Bay(CB) Name | Test Item | Close time(ms) | | | Open time(ms) | | | Test Criteria | Result |
|---|---|---|---|---|---|---|---|---|---|
| | | Phase 8 | Phase 12 | Phase 4 | Phase 8 | Phase 12 | Phase 4 | | |
| QA1 | QZ91 DS | | | | | | | < 10000ms | |
| | QZ91 ES | | | | | | | | |
| | QZ92 DS | | | | | | | | |
| | QZ92 ES | | | | | | | | |

## 6. Spring motor charging time & current measurement

| Bay(CB) Name | Motor Charging Time (sec) | | Motor Current (A) | Result |
|---|---|---|---|---|
| | Measured Value | Criteria | Measured Value | |
| QA1 | | < 15 | | |

## 7. Moisture content measurement in SF6 Gas

Measured date :

| Bay(CB) Name | Test Item | Measured moisture content | Dryair Gas pressure [bar.G] | $O_2$ content in Dryair | Result |
|---|---|---|---|---|---|
| QA1 | GD-1 | | | | |
| | GD-2 | | | | |
| | GD-3 | | | | |

# INSTALLATION, OPERATION AND MAINTENANCE MANUAL

## PART A-0 INTRODUCTION

## CONTENTS

1.1 Introduction....3
1.2 Warning Signs....3
1.3 General Safety....4
1.3 Specific Safety....5
1.4 Service Safety....6
1.4.1 Disconnecting AC and DC Power Supplies at the GIS....6

## 1.1 Introduction

During manufacturing, the products described in this manual meet applicable International Electrotechnical Commission (IEC), Institute of Electrical and Electronics Engineers (IEEE), American National Standards Institute (ANSI), and National Electrical Manufacturers Association (NEMA) required standards. However, no such assurance is given with respect to local codes and ordinances because they vary greatly. The term, GIS, includes all equipment mounted on the GIS foundation.

**Note:** These instructions do not purport to cover all details or variations in equipment or to provide for every possible contingency to be met in connection with equipment installation, operation, or maintenance. Should further information be desired or should a particular problem arise that is not covered sufficiently for the purchaser's purposes, the matter should be referred to HYOSUNG Corporation, HICO's parent company.

Each user is responsible for instructing all personnel associated with this equipment on all safety precautions that must be observed.

The following are recommendations to be considered in developing a user's safety program. These recommendations are not intended to replace the user's responsibility for developing a complete safety program and shall not be considered as such. The recommendations cover the more important aspects of personnel safety related to GIS. HYOSUNG neither condones nor assumes any responsibility for user practices that deviate from these recommendations.

## 1.2 Warning Signs

Throughout this manual, warning signs are used to emphasize instructions and information that should be very carefully observed.

### Danger

Danger indicates an imminently hazardous situation that, if not avoided, will result in death or serious injury.

### Warning

Warning indicates a potentially hazardous situation that, if not avoided, could result in death or serious injury.

### Caution

Caution indicates a hazardous situation that, if not avoided, may result in minor or moderate injury.

### Notice

Notice indicates hazards that may result in property damage only.

### Important

Important indicates an operational tip or maintenance suggestion.

## 1.3 General Safety

### Danger

All personnel associated with the installation, operation, and maintenance of power GISs should be thoroughly instructed and supervised on power equipment, in general, and on the particular model of equipment with which they are working. Instruction manuals and service advisories should be closely studied and followed.

Maintenance programs must be well planned and carried out in a way that is consistent with both customer experience and manufacturer's recommendations, including service advisories and instruction manuals. Good maintenance is essential to GIS reliability and safety.

Safety programs should also take into account the local environment and GIS application, including such variables as ambient temperatures, actual continuous current, number of operations, type of interrupting duty, and any unusual local condition, such as a corrosive atmosphere or major insect problems.

### Important

The network function can be used when the Network Interface option is installed.

## 1.3 Specific Safety

### Danger

*Do not* work on an energized GIS. If work must be performed on the GIS, take it out of service, open the disconnect switches at each side of the GIS, then close the GIS and ground each phase.

*Do not* work on any part of the de-energized GIS until all control power has been disconnected.

*Do not* disassemble any portion of the gas system of any GIS until system pressure has been reduced to zero psig (0 psig) by opening the appropriate drain valves. When the gas pressure has been reduced to zero, cautiously remove covers, tubes, fittings, and other parts.

Dry air is to be added to a pressurized system, measures should be taken to protect personnel against sudden gas release. After dry air gas has been added to the GIS, close the fill valve to relieve pressure between the source and the fill valve prior to removing the transfer tool/filter drier.

Keep personnel clear of all spring-charged mechanisms. Only skilled and knowledgeable personnel capable of releasing each spring load in a controlled manner must service the GIS. Information on the construction of such mechanisms is provided in this manual.

### Important

This GIS is spring open and spring closed. Always ensure that *both* springs are discharged before working on the GIS.

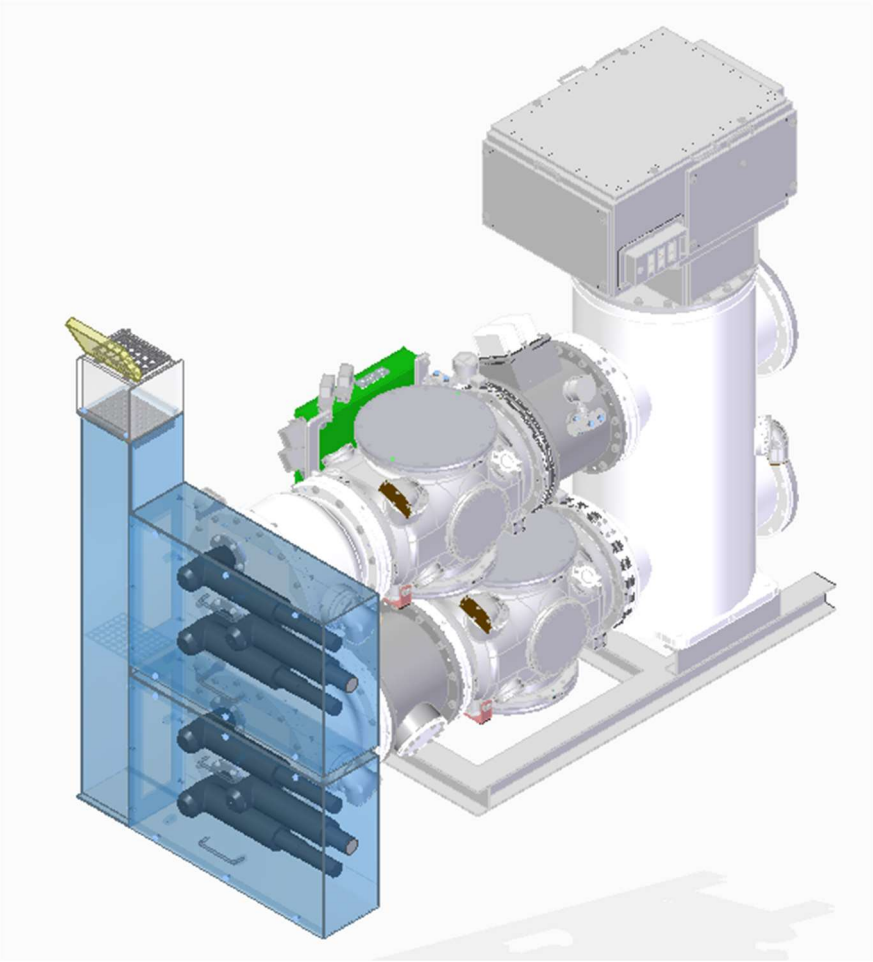
The gas GIS will hold line-to-ground voltage under positive dry air pressure on an energized transmission line where no voltage disturbances are present. Under these conditions, the GIS should be de-energized by back-up protection GISs, isolated, and removed from the system as a safety precaution.

If there is any evidence of deterioration of the GIS's dielectric capability, the GIS should be de-energized by back-up protection GISs and isolated from the systems by disconnect switches.

Operational tests and checks should be made on a GIS after maintenance and prior to returning the GIS to service to ensure that it is capable of operating properly. The extent of such tests and checks should be consistent with the level of maintenance performed.

## 1.4 Service Safety

There are three simple and basic rules that will provide safety for anyone working on this type of GIS:



- Disconnect AC and DC power supplies at the GIS.
- Turn the dry air test valve to the test position.
- GIS open and close spring discharged

### 1.4.1 Disconnecting AC and DC Power Supplies at the GIS

When the AC and DC power supplies have been removed from the GIS, no powered operation can be done, either locally or remotely. This prevents anyone from accidentally operating the GIS by pressing the local trip/close push buttons (optional) or remotely operating the GIS from the control system. Although the GIS control power has been removed, the GIS can still operate mechanically. Safe position is GIS status open and close spring discharged.

1.1.6 Marking....6

# 1. TRANSPORT

## 1.1 Packaging

### 1.1.1 Packaging requirements

For packaging equipment, the followings should be considered:
Appropriate standards and requirements
Environmental preservation
Packaging method (material and type)
Transportation conditions (means of transportation, routes)
Various potential damage (moisture, rain, rust, corrosion, shocks, force, handling etc.)
Weather conditions
Transportation dimensions, weights and volumes
Storage after shipment

### 1.1.2 Types of packaging

Depending on the property, weight and shape of items, packaging types shall be selected, such as wood case, crate, skid bundle, pallet bundle or bare equipment, etc.

1) Seaworthy packaging

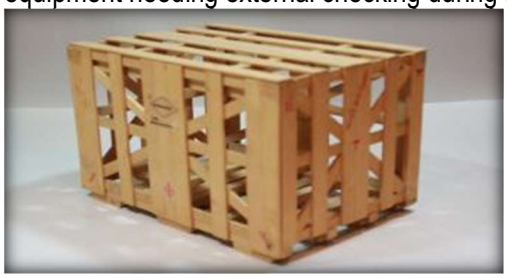
All materials shall be packaged as compact and durable as possible. All packages shall be properly and solidly made to be suitable for all mechanical and inland transportation. All packages shall also take into account the following eventualities.

a. Handling at the loading and unloading port 3 or 4 times.
b. Outdoor storage after shipment to job site
c. Significant variation in ambient temperature during ocean shipment
d. Design in consideration of the weight when loading them in accordance with related standards of the project.

2) Wooden Framed Box

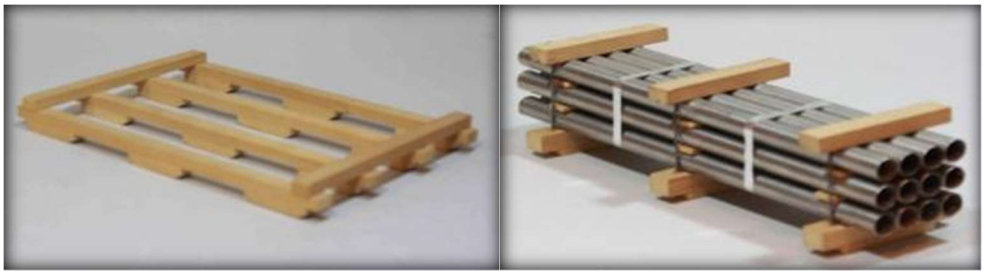
a. Closed Crate

This packing form shall be closed completely and applied to packing needed for the prevention of damage due to vibration, pressure weight and shock. Accessories and small parts shall be packed in this packing form.



b. Water-proof Closed Crate

This packing form shall be applied as a water-proof case for the item, such as instrumentation or electric equipment, requiring complete protection from water or moisture. Watertight paper or sheets will be used inside case wall.



c. Open Crate

Crate packing shall be applied to equipment and parts resistant to rain, dust, sunshine, vibration, pressure and shock. And this type of packing shall be applied to equipment needing external checking during transportation.

d. Wooden Skid Bundle

This type of packaging shall be applied for items which are weatherproof and strong enough to resist an external impact such as vessel, exchanger, large beams, column, box column, girders etc. Wooden skids and goods will be tightened with cord straps or stud bolts.

e. Bundle

This type of packaging shall be applied for items which are weatherproof and have a simple shape. The quality of goods should not be affected by weather during transportation and storage as a bundle. The bundle should be property packed to protect goods from external impact during handling, transportation and storage.

3) Steel Frame

This type of packaging shall be applied for items which could be damage easily due to their large sizes and light weights compared to the sizes. Special care shall be taken to protect the goods when they are stacked.

4) Drum Packing

Drum packing shall be used for the packing of chemical, liquid, powder and tower packing. A wooden drum shall be used for the packing of electric cable or wire

5) Moisture-proof packaging

This type of packaging shall be applied for items such as precision instruments, bearing equipment, etc. to be protected from moisture. Products required to be packaged in moisture-proof packaging shall be wrapped with the moisture-proof materials (e.g. Aluminum sheet) to protect damage or defect from outer contamination. The inside air shall be removed to keep the inside closed off to the corrosion factors and sustain the origin shape.

6) Special Case

Special cases are to be used for shipping and handling and shall be designed considering weights and volumes of modules.

### 1.1.3 Packaging unit

Package size and weight shall be decided after considering the delivery condition and handling method.

### 1.1.4 Environmental factors

Packing must protect the equipment against all kinds of damage (moisture, rain, rust, etc.) during transportation by different means of transportation such as truck, railway, air, ship.

Materials shall be suitably protected from weather damage. Packing shall include preservatives suitable to weather conditions.

### 1.1.5 Sealing of equipment

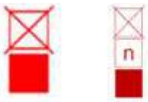
For transportation, the equipment is filled with N2 or dry air to an absolute pressure of 150 kPa.

The gas pressure shall not drop below 110 kPa during shipment and storage.

All open flanges must be sealed with a shipping cover.

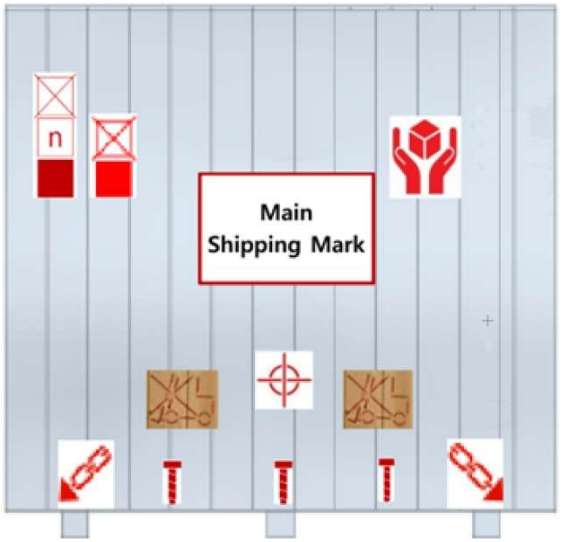
### 1.1.6 Marking

Marking Specification and position for Boxes, crates and shrink packaging are followed by below TABLE 4.1.



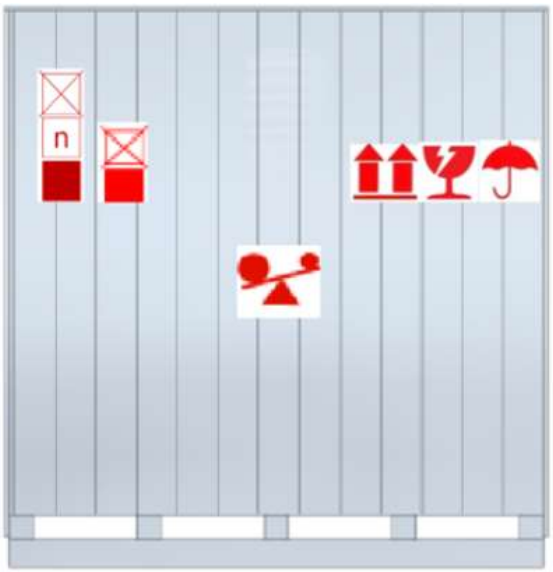
| | | Ink | | Mark Location | Size | Remarks |
|---|---|---|---|---|---|---|
| | | Color | Material | | | |
| Main Shipping Mark | | Black | High Quality Waterproof Ink or Oil Paint | Both Sides | Optimum Size For each Package | Printed Weatherproof Paper |
| Care Mark | Sling mark and Center of Gravity Mark, other Marks | Red | High Quality Waterproof Ink or Oil Paint | Both Sides | Optimum Size For each Package | |
| Approximate Weight | | Red | High Quality Waterproof Ink or Oil Paint | Both Sides | 15cm and over | Only for Packages exceeding 5tons: Hand Writing is Permissible unit shall be in tons. |
| Packing List Cover | | Yellow Letters on Black Background | Enamel | Upper part of one Side | L : 18cm W:14cm | Do not overlap with Care Mark Use Template |

TABLE 4.1 Marking applications for case, crate wooden box



2) Marking shipping mark

Main shipping mark shall be clearly stenciled on surface of package or attached on printed shipping paper. When the mark is to be stenciled directly onto the surface of equipment such as a column, drum and tower, etc., a color contrasting to the color of the equipment shall be used. If the package does not have sufficient space for the main shipping mark or in the case of bundles cargo cannot be stenciled, three or more labels of appropriate size shall be firmly affixed to the package.



3) Auxiliary Shipping Mark

| No. | Name of Mark | Stenciled Marked and Letters | Remarks |
|---|---|---|---|
| 1 | Center of Gravity |  | At the center of gravity |
| 2 | Sling |  | Where sling wire is to be applied |
| 3 | Top |  | When package cannot be placed upside down |
| 4 | Keep Dry |  | For boxes that need protection from water and moisture |
| 5 | Hand With Care |  | For Handling with care |
| 6 | Heavy Weight this end |  | When center of gravity is on one side |
| 7 | Bolt |  | Bolt fastened area |
| 8 | Fragile |  | For fragile cargo |
| 9 | Forklift Prohibition |  | Do not lift using Fork Lift |
| 10 | Do Not Stack |  | Stack limited |

4) Position of main auxiliary shipping mark

# 1. SHIPPING

## 1.1 Preparations

A worker shall investigate specification and characteristics (weight, center of gravity, etc.) of products. And shall designate carriers and vehicles in accordance with specification of cargo. The means of transportation shall be selected for ensure that shipping units will be subjected to the smallest-possible amount of vibration.
Select appropriate equipment and ropes to lift products in a safe manner.
When lifting products, it is required to adjust equipment or ropes properly to prevent products from tilting toward one direction.

## 1.2 Loading in vehicles

A worker shall check characteristics and specification of transportation vehicles. And then, shall lift products to a loading position onto a vehicle and suspend cargo above a cargo deck for a moment in a non-swaying state. Lower cargo down in a correct position. When loading products on a cargo deck, it shall be put in a correct position on the cargo deck while paying attention to prevent a vehicle from tilting due to weight pressed toward one direction.

## 1.3 Lashing

Select ropes or wires suitable for characteristics and specification of products, and check if they are broken before use. Bind each loaded product with ropes or wires in two or more positions so that products may be fixed to avoid swaying in a cargo deck of transportation vehicle.

## 1.4 Unloading

1.4.1 Prepare appropriate capacity of crane, folk lift, wire rope sling and hook.
1.4.2 Check the marking for the point of notice based on the center of gravity as shown in Figure 1.
1.4.3 Unload products using crane or folk lift as shown in Figure 2,3 and 4.

[Fig. 1]

[Fig. 2]

[Fig. 3]

[Fig. 4]

## 1.5 Inspection

**Before shipment**

Prior to closing the shipping containers, make sure that the equipment to be shipped is properly secured and without damage.

**After shipment**

Check shipping container for any damage before opening.

After opening a container, immediately check the equipment for external damage and completeness.

## 1.6 Irregularities

### 1.6.1 During shipment

Any damage which has occurred on the package in transit shall, to the extent possible, be repaired immediately. If this cannot be done, appropriate measures shall be taken at once to avoid any further damage to the cargo.

All irregularities occurring during shipment as well as any remedial action taken shall be documented and reported.

### 1.6.2 After shipment

In the event of any damage detected on the packaging or equipment, the insurance company should be called and the damage should be assessed and recorded by an authorized agent.

Photographs should be taken of any damaged packaging to serve as evidence at a later time.

Any packaging which is damaged or soaked shall under no circumstances be used for prolonged storage of equipment.

Any corrective action taken with regard to packaging or equipment preservation shall be recorded in detail. All materials used for these measure must have been tested and approved.

## 1.7 On-site Transportation

1.7.1 On-site transportation includes the moving of packed or unpacked product before or during installation.

1.7.2 Check the capacity and type of trucks or other vehicles for transportation.
1.7.3 Remove all possible dangerous objects and obstacles of the road to final destination for transportation of the product. Check the limit of road condition (like tunnel height limit) on the way in advance.
1.7.4 When transporting the assembly of products or wooden crates, stabilize the transport vehicle during loading and then load the products on suitable position of the rack of vehicle considering the center of gravity to prevent them from any possible vibration or damage.
1.7.5 The speed limit of the vehicle should be considered properly with depending on the road condition during transportation. Under the condition of paved road, 50~60km/h (30~37.2 mi/h) is proposed and Under the condition of unpaved road, below 20km/h is proposed.
1.7.6 When the package arrives at final destination, follow unloading procedure mentioned in section 1.4.

# 2. STORAGE

## 2.1 Storage requirements

All storage areas must comply with the following general requirements:
Good accessibility for transport and inspection
Protection against damage
Restricted access for authorized personnel only
Guaranteed fire protection
The storage area must be clean and free from unused packing material
When stocking, the moisture contents of the packing must be considered
Flammable material must be stored in a separated area
Compliance with all local regulations and requirements must be guaranteed

## 2.2 Warehouse requirements

Warehouse should be built on a concrete floor as shown in Figure 5 and 6. and the concrete floor level must be higher than ground level. In case that site condition is not applicable, the drainage should be equipped around the floor.
Warehouse should supported by steel structure. Ensure each structure installed inside warehouse and the warehouse roof has enough space for moving GIS box into the warehouse.
The packing side aspect vinyl of the GIS in the wooden box should be removed for air circulation for long storage.
The storage warehouse should be kept proper humidity lower than 80% and temperature between -10~35℃

[Fig. 5]

[Fig. 6]

## 2.3 Check point before storage of GIS.

2.3.1 Upon arrival, a visual inspection shall be performed to ensure that all materials are properly transferred. Check that all equipment and goods coincide with packing list.

2.3.2 The GIS is filled to 0.2~0.5 bar of N2 or dry air for transportation. Open the gas valve with care and check the leaking from inside. In case product is stored more than six months, it is necessary to supplement nitrogen gas up to 0.2bar.

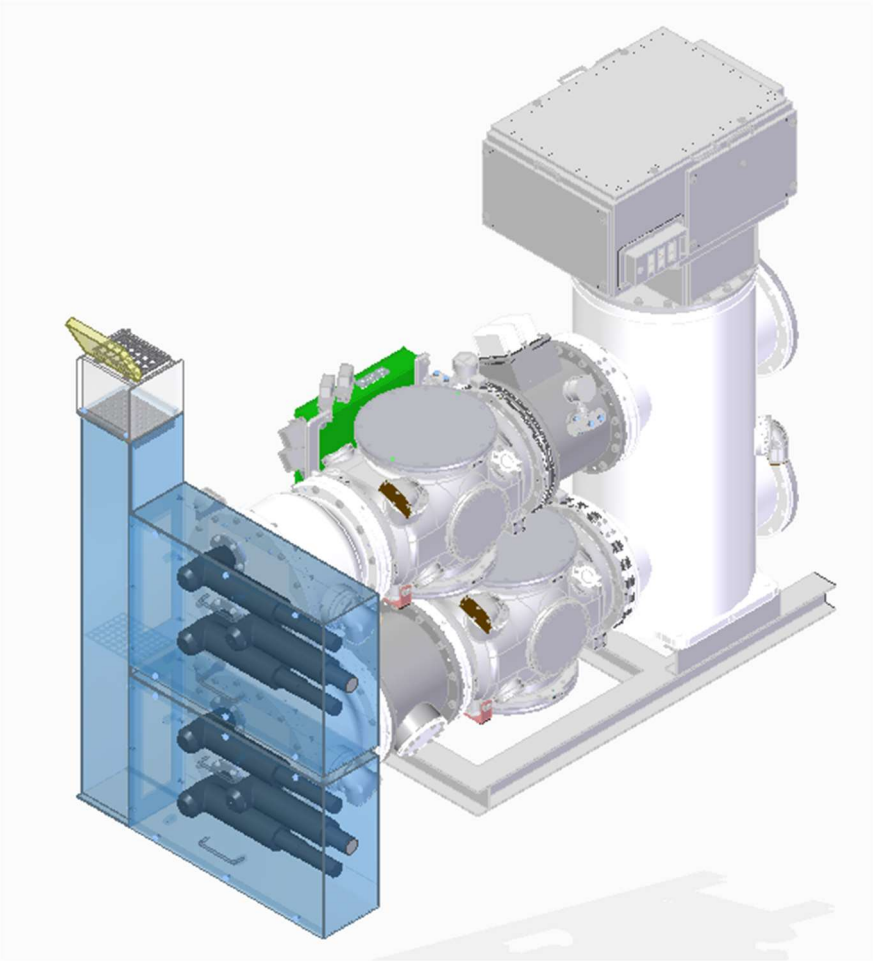
Dry air bottle shall be stored inside of building at below 40℃ and keep out of the direct sunlight.

2.3.4 Control cubicle such as local control panel or control mechanism shall be kept away from unauthorized person and should be covered with vinyl to prevent contamination from water, moisture and dust. If the place does not satisfy the conditions specified above, unpack the goods and operate a heater to prevent damage by corrosion and/or freezing.

2.3.5 Store spare parts and special tools the same as they are packed initially. Items which are made of rubber (seals) should be protected from direct sunlight to prevent deterioration.

## 2.4 Checking point after unpacking

2.4.1 Do not stack packing box on box to prevent damage to the packing box.
2.4.2 Cover for transportation shall be opened just before assembly. The internal inspection and cleaning shall be performed to remove any dust inside.
2.4.1 A visual inspection of the exterior shall be performed to check any crack, deformation and/or rust.



**Caution**

- Since the inside of GIS is filled with 0.2~0.5 bar of N2 or dry air for transportation, no valve should be manipulated before dry air injection is prepared.
- Do not remove the cover of gas pipe until piping facilities are prepared.
- In case of storing hydraulic operating mechanism more than 6 months, inner operation oil circulation shall be performed.

12. DRY AIR FILLING AND EVACUATION .....12

## 1. INSTALLATION REQUIREMENT

1.1 The gas insulated switchgear (GIS) outline, lay out, section view, plant view drawings will be submitted as attachment drawings. Shop drawing such as base channel, cable termination position, grounding position, for GIS installation and for civil work will be submitted later by partial.

1.2 All components of GCB, bus bars, disconnecting switches, earthing switches, VT, CT, and operation mechanism assembly arrangement will be provided under approved drawings.

1.3 For the bus bar (GIB) to be connected between GIS and main power transformer, we will submit the GIS drawing and the connection drawing for transformer's primary bushing connection.

## 2. CLEANLINESS ON SITE

2.1 Before any assembly housings are opened at the site, all work in the switchgear room must be completed and the floor should be coated with a dust-binding primer. Windows and doors should be lockable. Caulking, drilling and other such work must be prohibited inside the building while module assemblies are open.

2.2 If an air conditioning unit exists, it should be in operation before assembly work begins.

The air conditioning unit should not be turned on for the first time during switchgear installation due to the likelihood of whirling dust.

2.3 Protection against dust and humidity

- Dust quantity : less than 20 CPM (0.2 mg/m3)
- Relative humidity : less than 80%

## 3. UNPACKING GIS

3.1 Check the quantity of total packing BOX

3.2 Check the quantity of N2 or dry air Gas at each packing BOX.

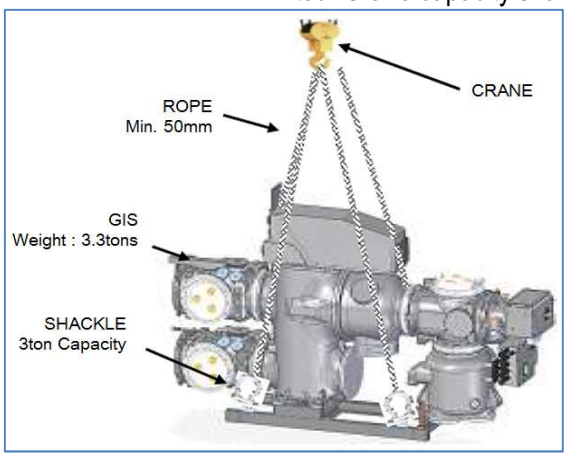
3.3 Confirm GIS room base level and line marking as per foundation drawing.

3.4 Unpack GIS preventing damage to GIS equipment

a) Before unpacking GIS, check if there is any damage or any shock indicator turns red before proceeding. If there is damage recognized before unpacking, information including photo of damage and box number and other appropriate details shall be sent to Hyosung supervisor.

<Confirm GIS Room Base Level>

<Line Marking on the GIS Room>



<Unpacking GIS>

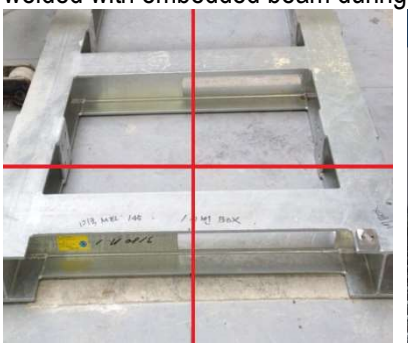
# 4. CARRYING GIS INTO BUILDING

4.1.Lifting GIS

a) To lift and unload GIS, Crane is required up to weight of each GIS module to be lifted. Crane capacity shall exceed weight information provided by Hyosung.

4.2. Lowering and placing GIS upon foundation

a) After lowering GIS, GIS equipment can move upon embedded plate on foundation by overhead crane at site. If overhead crane in GIS substation is not available, steel pipe or roller can be used to move GIS to proper location as shown in the picture below.



# 5. ARRANGEMENT OF GIS

5.1 Place GIS according to approved foundation drawing.

a) Center line of each bay and main busbar shall be marked by Hyosung supervisor

b) Check the location of open hole and H-beam as per foundation drawing.
c) H-beam level tolerance should be ±1 mm (Total 2mm)
5.2 GIS shall be put onto embedded beam bay by bay and main base of GIS shall be welded with embedded beam during docking process.

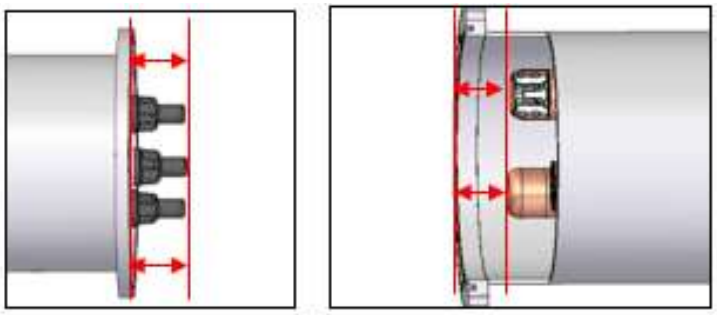
## 6. BUS DOCKING PROCEDURE

6.1 GIS is filled to 0.2-0.5 kg/cm2 of dry air inside circuit breaker tank and 0.2-0.5 kg/cm2 of N2 gas inside other tanks. No gas shall be released from the portion of adjointing tanks and other gas sections in which other components are installed.

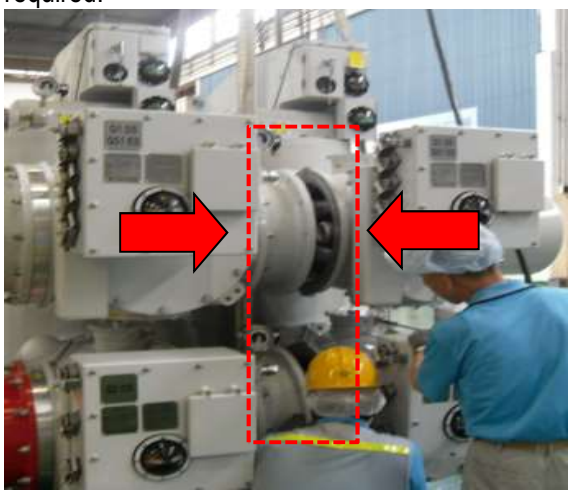
6.2 While working inside tank, proper tool management is required to keep tools from being lost or left inside the tank.
a) Tool management
- All tools necessary for work shall be put in tool-hanger
- Any remained extra tool shall be locked in a tool box.
- Make sure that all tools not locked are on the tool-hanger.
b) Tool work
- When working inside tank, tie tool being used to worker's hand to prevent any tool from being lost inside the tank.

6.3 In case of an extension installation, work is carried out during an interruption of power on existing portion. Gas shall not be released from gas section in operation.
a) Check gas-distribution-section by checking the combination of gas section diagram of existing close-open device and gas-section diagram of extension portion.
b) According to the above a) result, adhere "DO NOT OPERATE" warning mark on gas valve operating handle after winding up red tape on the section from which gas leakage shall be prohibited.
c) At extension work, first close handle of each panel on existing portion, second, attach "DO NOT OPERATE" mark, third, on DS side, then close its operating substantially.
d) At extension work, the inside-work shall start after checking earthing state when opening the end-cover of Main-bus.

6.4 After recording total quantity of components taken in, finish the work, then check the components quantity used and the remaining quantity. Also, any damaged component shall be marked "Do not use".



6.5 After removal of the cover for transportation at tank connecting portion, clean the inside component while checking the condition.
a) After removing of the cover for transportation, cover with vinyl cover for dust protection (see picture below).
Make sure that the inside of vinyl shall be used in order to protect the tank from attached dust on the outside of vinyl.
b) The portion which consists of manual deep grooves between fabricated components shall be vacuumed with a flat nozzle hose.
c) Clean insulating material, shield, conductor and inside-surface of tank with industrial wipe. At this time in case an industrial wipe is used for metal portions such as conductor or shield, do not use the wipe again on which metal particles might be, to clean insulating material.



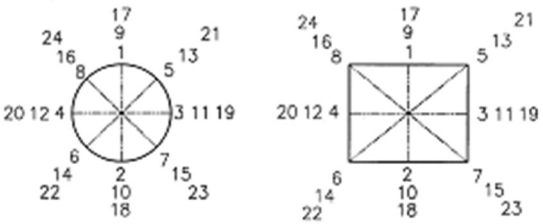
6.6 As gas tight surface is likely to affect product life, check any scratch, friction or painting defects.
a) If there is any scratch, use sandpaper, then clean that part with a wipe.
b) For the portion of paint defects, sand that portion and re-paint before cleaning with wipe.

6.7 In case of too-much HITALUBE in O-ring groove when inserting O-ring paraffin, the extra HITALUBE which provides connection would cause gas leakages. Therefore, the thickness of HITALUBE coating shall be thick as a finger-print leaves. (Air tight surface of insulating spacers do not require HITALUBE coating)
6.8 Before tank connection, check tank flange surface and contactor length like the figure to check connecting depth of contactor.
a) Tank Connection
Contact-depth of contactor (depth criteria : 56±2mm)

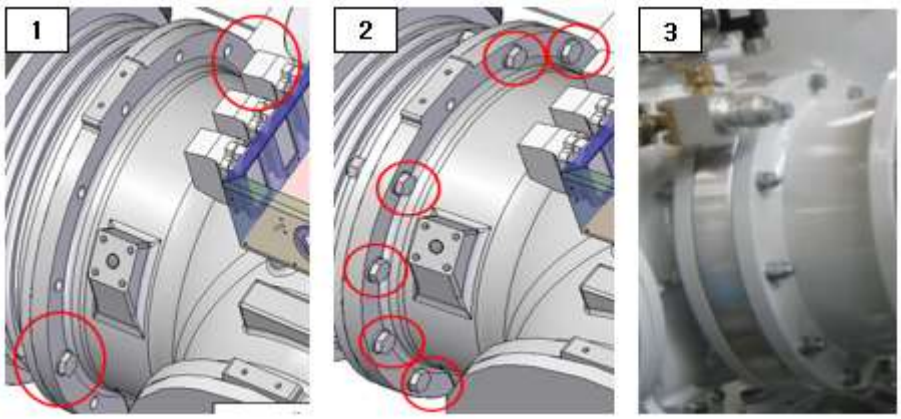
b) Tank and bellows connection

Check the connection depth, comparing it to the compression side of bellow shall be required.

Before connection bellows



Check the connection depth of contactor according to the change of bellow side it's connecting.

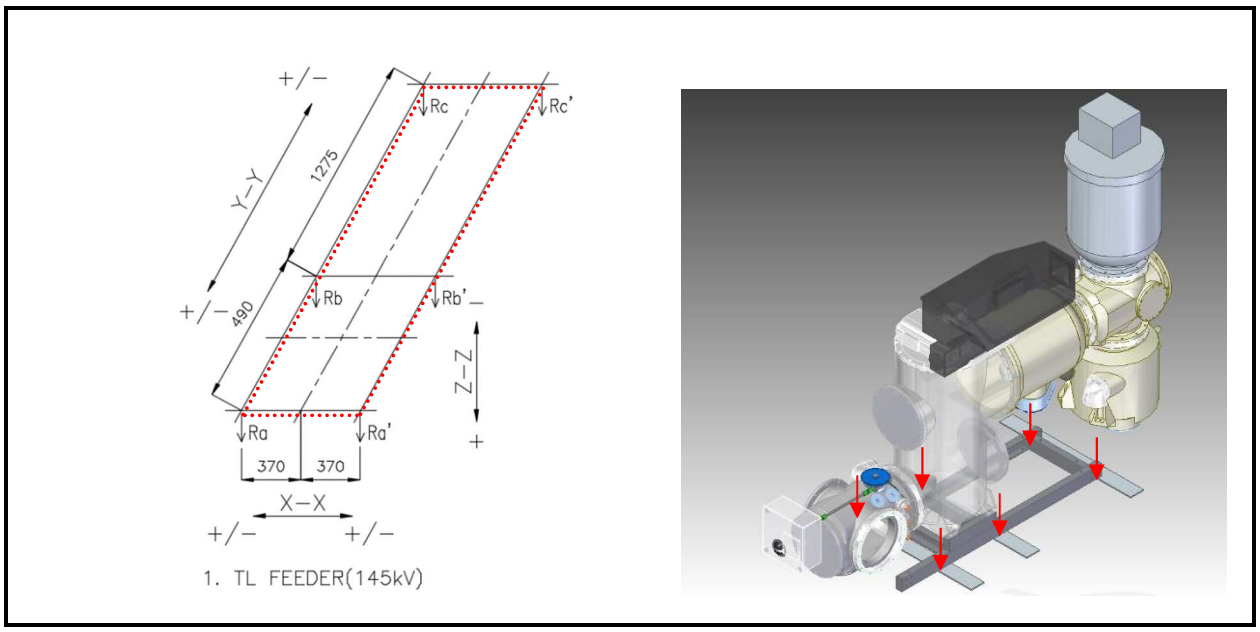


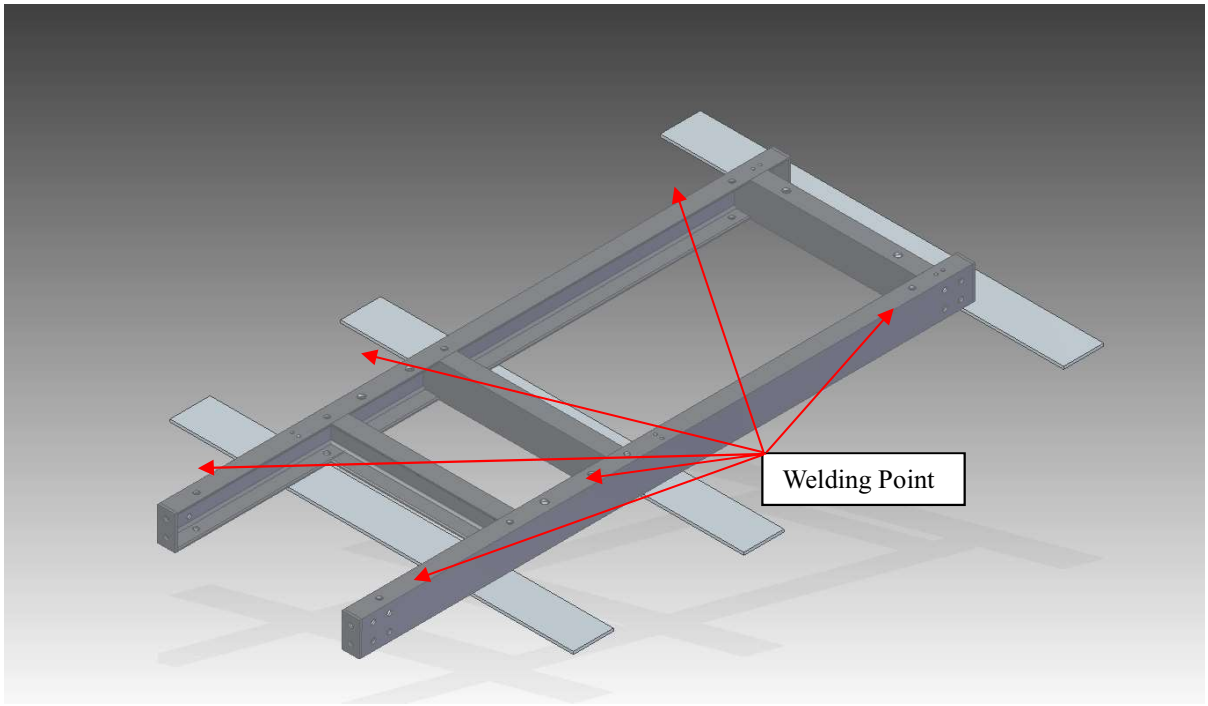
After docking bellow of main bus and injecting gas, unfasten nut about 5mm. (Only the inside nut)

6.9 Flange connection and bolting cover portion shall be done as bellow.

a) In case of small diameter flange with bolting numbers less than 8, cracking O-ring's complete adherence by bolting No.1, No.2 bolt, and the remaining bolts in the sequence of No.3 to No.8.

b) In case of large diameter flange with bolts numbering more then 9, checking O-ring's complete adherence by bolting No.1 to No.4 and the remaining in the sequence of No.5 to No.16.





6.10 At gas-pipe connection, work gas pipe holes of flange or valve shall be covered with vinyl tape to protect it from dust.
At this time, the vinyl tape is required a little longer than pipe hole covering size in order to attach the remaining tape to the pipe side which provides easy-checking from outlook.
6.11 After removing absorbent for work, substitute it with new zeolite.

## 7. WELDING LOCATION

Welding location shall basically follow foundation drawing.

<Figure 1. Welding location in Foundation drawing & 3D Modeling>

<Figure 2. Welding point on 3D Modeling

## 8. DOCKING OF VT/LA/BUSHING (If needed)

8.1 Check the condition of O-ring on the surface of flange.

8.2 Check the connection depth of conductor through the drawing.

8.3 Mount the VT/LA by crane.

8.4 Docking between VT/LA and GIS.

8.5 Docking between Bushing Enclosure and Conductor. <Figure.3>

8.6 Mount the Bushing by crane.

8.7 Check the center of Bushing and Conductor. <Figure.4>

8.8 Docking between Air-Bushing and Conductor.

## 9. CABLE CONNECTION

9.1 Check the specification of cable.

9.2 Spread and cut of cable

9.3 Insulate between cable and core.

9.4 Insert the cable numbering tube.

9.5 Select the amp terminal and pressure.

9.6 Work for insulation tube.

9.7 Make a bundle wire.

## 10. LAY A PIPE FOR GAS

10.1 Constitute the gas line through gas system diagram.

## 11. WORK FOR VACUUM

11.1 Check the identity of vacuum section and pipe connection.

11.2 Vacuum machine is connected at valve using the exclusive hose for vacuum.

11.3 Vacuum of GIS is continued during more than 2 hours after the degree of vacuum has reached 1Torr. And record the final Torr.

11.4 Close cover at valve inlet after finished vacuum work.

11.5 Vinyl tape both ends of hose.

# 12. DRY AIR GAS FILLING AND EVACUATION

12.1 Connect the evacuation device (including vacuum pump) to the fill (Dilo) valve.

12.2 Operate the evacuation device (vacuum pump) until reaching 0.2mmHg(0.2torr). Check the vacuum degree with vacuum pump off. Turn vacuum back on and vacuum

over 3 hours after reaching a reading below 0.2mmHg. Total vacuum pump operating time should exceed 5 hours, depending on the evacuation device.

12.3 Disconnect the evacuation device.

12.4 Connect DRY AIR gas cylinder to the valve of the GIS.

Refer to the manual of Dilo valve manufacturer with customer.

Do not fill the cylinder with too much pressure, or the equipment could be damaged.

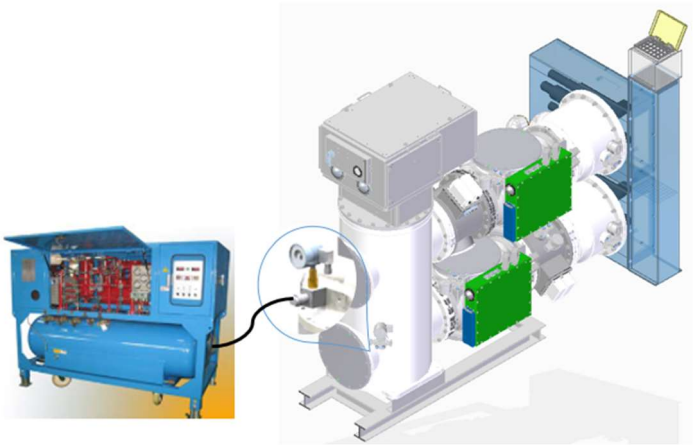
12.5 Gas flow may cease due to chilling; the cylinder may have to be heated.

12.6 Monitor gas pressure using the gauge provided in the control cabinet.

12.7 Fill the GIS gas compartment until the correct pressure has been reached.

12.8 Close the DRY AIR gas cylinder valve.

12.9 Remove the fill hose from the tank-fill valve and the cylinder valve. Replace the Safety cap on the DRY AIR cylinder and the tank-fill valve.



12.10 Allow the gas pressure to balance for twelve hours and the recheck the pressure level. If additional gas is needed add as required.

12.11 Sample the gas from the breaker for moisture after twenty-four hours. Use the fill valve for sampling instead of the valve in the control cabinet.

12.12 Leave the hygrometer on until a reading of less than 150ppm has been obtained. If a reading of 150ppm cannot be reached, dry the hygrometer with dry air or nitrogen until attaining a reading of below 100ppm. Immediately recheck the

breaker gas. If a reading of 150ppm is still not obtained, wait one week and recheck during the cool morning hours.

12.13 If hygrometer reading is higher than 150ppm, then remove gas, replace desiccant, and refill with new gas.

Intentionally Blank

# PART B-1

# OPERATION SEQUENCE

## CONTENTS

1. OPERATING SEQUENCE ..... 2
1.1 PREPARATION BEFORE OPERATION ..... 2
1.2 OPERATION FROM LOCAL CONTROL PANEL AND REMOTE CONTROL PANEL ..... 2
2. OPERATING LIMITS ..... 3
3. PRE-STATE CHECK LIST ..... 4
4. IN-SERVICE CHECK LIST ..... 5
5. ABNORMAL CONDITIONS ..... 7

# 1. OPERATING SEQUENCE

## 1.1 PREPARATION BEFORE OPERATION

Gas Insulated Switchgear (GIS) must be filled with Dry air before operation.
In the final stage of installation or maintenance, fill Dry air into enclosure of GIS to the rated gas pressure. If Dry air is not filled before operation, under-mentioned performance will not be ready;

1.1.1) Dielectric strength for main circuit
1.1.2) Interruption performance
1.1.3) Mechanical damping action for Circuit Breaker operation

Before charging gas, evacuation of air is needed for more than 1 hour after 1Torr vacuum is reached.

After charging gas, normal open gas valve should be open and normal closed gas valve should be closed on each gas piping system.

## 1.2 OPERATION FROM LOCAL CONTROL PANEL AND REMOTE-CONTROL PANEL

Operation of CB, DS and ES is able to be performed at Local position and/or Remote position by the Change-Over Switch (43R).

1.2.1) CB opening and closing

When opening and closing each CB, the Remote or Local operation may be performed by setting the 43R on each Local Control Panels (LCP). The 43R is marked "REMOTE & LOCAL" on LCP.

1) CB opening from RCP (or LCP)
   a) Set the 43R on each LCP to "REMOTE (or LOCAL)" position.
   b) Command the CB opening from the RCP (or LCP).

2) CB closing from RCP (or LCP)
   a) Set the 43R on each LCP to "REMOTE (or LOCAL)" position.
   b) Command the CB opening from the RCP (or LCP).

Note: The 43R on each LCP of Bay is usually set to "REMOTE" position. Do not operate the switch by force. That can cause damage to the switch.

1.2.2) DS opening and closing of combined DS & ES

1) Opening
   a) Set the 43R on each LCP(RCP) of Bay to "LOCAL (or REMOTE)" position.
   b) Push-turn the Control Switch (CS) of DS to "OPEN" position.
2) Closing
   a) Set the 43R on each LCP(RCP) of Bay to "LOCAL (or REMOTE)" position.
   b) Push-turn the CS of DS to "CLOSE" position.

1.2.3) ES opening and closing of Combined with DS & ES

1) Opening

a) Set the 43R on each LCP of Bay to "LOCAL" position.

b) Push turn the CS of ES to "OPEN" position.

2) Closing

c) Set the 43R on each LCP of Bay to "LOCAL" position.

d) Push-turn the CS of ES to "CLOSE" position.

# 2. OPERATING LIMITS

## 2.1. OPERATING DRY AIR PRESSURE

| Items | Circuit Breaker (bar.G at 20°C) | Other Equipment (bar.G at 20°C) |
|---|---|---|
| Normal | 5.0 | 5.0 |
| Minimum | 4.5 | 4.5 |
| Reason | Dielectric characteristics<br>Interrupting characteristics | |

## 2.2. CONTROL VOLTAGE

| Items | Closing voltage (Vdc) | Tripping voltage (Vdc) | AC circuit (Vac) |
|---|---|---|---|
| Maximum | 121 | 121 | - |
| Normal | 110 | 110 | 120 ~ 240 |
| Minimum | 93 | 77 | - |
| Reason | Operating characteristics | | |

## 3. PRE-STATE CHECK LIST

The individual items for each component are listed in each paragraph as follows;

| No. | Procedure | Test and work contents | | Remarks |
|---|---|---|---|---|
| 1 | Construction check | 1) Check each part for proper tightness condition. | | |
| | | 2) Confirm that tools and foreign substances are removed from each part. | | Main terminal parts, control box interior, control cubicle |
| | Stop valve check | Gas | 1) Fully open the stop valve on the enclosure. | Refer to "GAS SYSTEM DIAGRAM" |
| | | | 2) Fully close the stop valve in the gas monitoring box. | Refer to "GAS SYSTEM |
| 3 | Gas pressure check | 1) Check the stop valve of gas piping. | | See Table B-2. |
| | | 2) Check the gas pressure | | |
| 4 | Insulation resistance measurement | 1) Prepare a 2500 volt megger. | | Confirm that measured values exceed 10000 MΩ. |
| | | 2) Measure insulation resistance between main and ground with GIS kept in closed position. | | |
| | | 3) Measure insulation resistance between main terminal with GIS kept in open position. | | |

Table B-1 CHECK PROCEDURE FOR TEST OPERATION

## 4. IN-SERVICE CHECK LIST

Check the equipment in service visually to ensure no abnormality appears.

Special attention shall be paid to gas pressure.

The procedure is as shown in Table B-2 and the individual items for each component are listed in each paragraph as follows:

| No. | Check item | Check procedure | Range of acceptable valve | Remedy |
|---|---|---|---|---|
| 1 | Gas pressure | 1) Read gas pressure on Dry air density monitor.<br>2) Record the gas pressure and temperature.<br>If Dry air leakage occurs, supply Dry air according to the procedure described in part labeled MAINTENANCE before the gas pressure drops to the alarm pressure.<br>After supplying dry air, close the gas stop valve and then accurately install the protective cover. | a) 5.0-5.2 bar. G at 20 for CB<br>b)5.0-5.2 bar. G at 20 for others | Recharge Dry air |
| 2 | Operation counter | Check and record the operation number during detail inspection. | | |
| 3 | Space heater | When humidity is high, the temperature drops Sharply, or the temperature is low. | | |
| 4 | Others | Check for signs of abnormal noises and contamination of insulators. | | |

Table B-2 IN-SERVICE CHECK (PATROLLING INSPECTION) PROCEDURE

*** Table B-3 shown remedies to abnormal noise ***

| No. | Phenomena | Remedy |
|---|---|---|
| 1 | Abnormal noise | Confirm the location of noise source. |
| 2 | a) Mechanical noise<br>b) Corona noise | a) Frequency analysis:<br>Noise will have the frequency multiplied<br>by the power frequency.<br>b) Dry air analysis:<br>Decomposed gas will be detected. |
| 3 | In case of mechanical noise | Loose hardware is suspected. Tighten loose hardware<br>and ensure proper operation without noises before<br>putting back in service.. |
| 4 | In case of corona noise | Electrical floating is expected inside.<br>Replace gas in the section including the noise, |
| 5 | | After taking above remedies,<br>consult to the nearest representative<br>of HYOSUNG CORPORATION. |

Table B-3 REMEDIES TO ABNORMAL NOISE

## 5. ABNORMAL CONDITIONS

The following Table B-4 show the abnormal condition which may appear annunciator windows.

| Part | Name of alarm | Cause of alarm detection | Symptoms | Remedy |
|---|---|---|---|---|
| CB | 1ST GAS LEAK (**CB) | 1st stage gas leak contact operated. | Gas leak from CB compartment, density above lower limit. | Confirm the location of leakage and repair. Recharge Dry air. |
| | 2ND GAS LEAK (**CB) | 2nd stage gas leak contact operated. | Gas leak from CB compartment, density under lower limit. | Confirm the location of leakage and repair. Replace the leakage section, if possible. Recharge Dry air. |
| Others | 1ST GAS LEAK (****) | 1st stage gas leak contact operated. | Gas leak from compartment, density still above lower limit. | Confirm the location of leakage and repair. Recharge Dry air. |
| | 2ND GAS LEAK (****) | 2nd stage gas leak contact operated. | Gas leak from compartment, density under lower limit. | Confirm the location of leakage and repair. Replace the leakage section, if possible. Recharge Dry air. |

# 1. GENERAL

The type HCSP-E074C is an eco-friendly circuit breaker that uses dead tank type dry air.

This vaccum circuit breaker is eco-friendly by using dry air, and has improved voltage withstanding and breaking characteristics, by utilizing the excellent dielectric and arc quenching capability.

The HCSP-E074C vaccum circuit breaker has following characteristics.

(1) Excellent in fault current interrupting performance type HCSP-E074C circuit breaker can attain the rated short-circuit breaking current of 31.5kA and rated voltage of 72.5kV.

(2) Small size and light weight

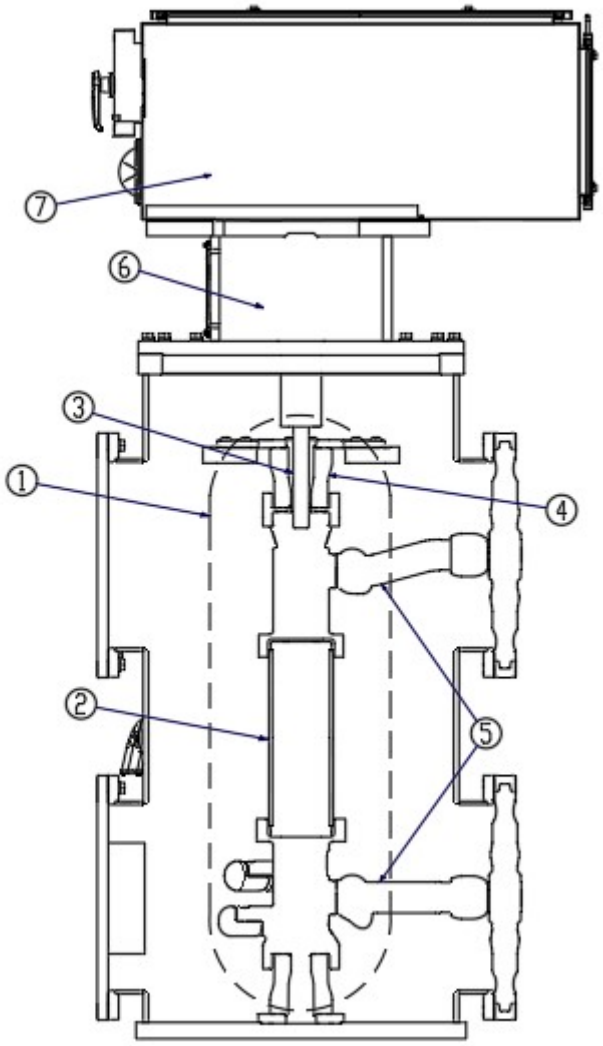
The adoption of the motor spring operating mechanism, type HCSP-E074C circuit breaker, contributes to the reduction of installation space.

(3) High reliability

Motor spring operating mechanism is block-constructed to minimize the piping and has high reliability.

(4) Low noise

adoption of motor spring operating mechanism makes low noise operation possible.



(5) Easy maintenance

Simple construction and a small number of parts allows easy maintenance.

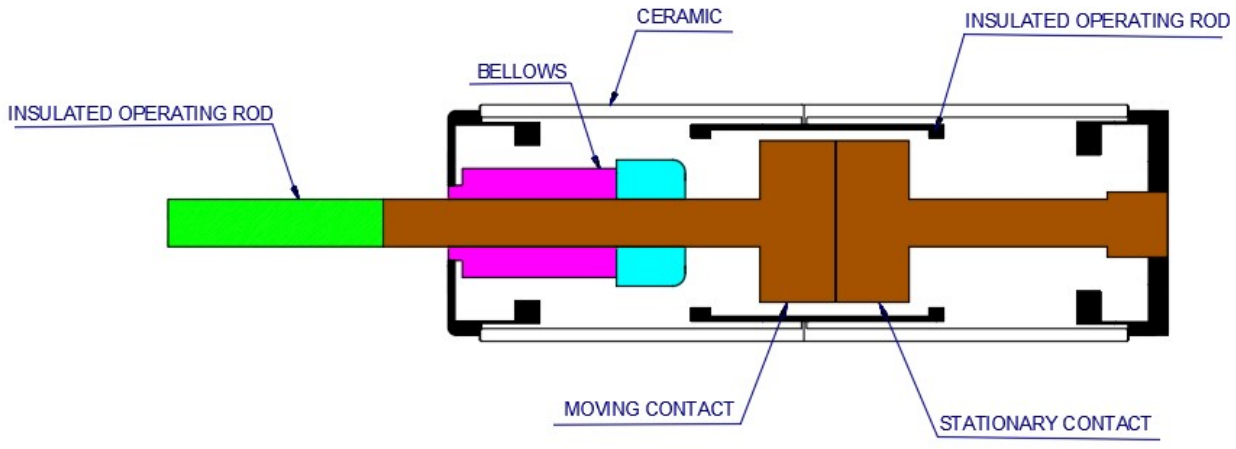
# 3. CONSTRUCTION

## 3.1 Basic construction (See FIG. CB-1)

FIG. CB-1 is the outline drawing of Vaccum Circuit Breaker using dry air with the construction diagram of this breaker.

## 3.2 Interrupter assembly (See FIG. CB-2)

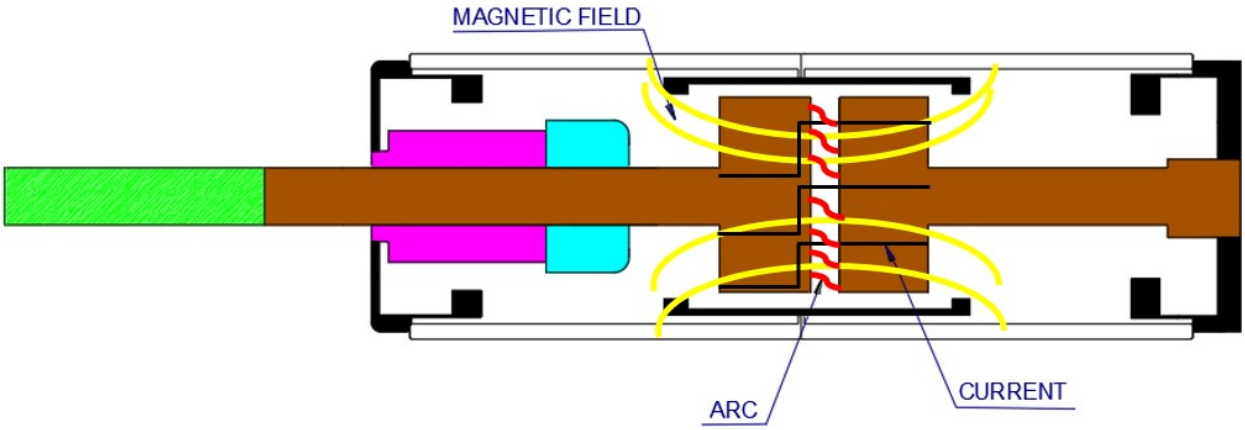
This interrupter is the vaccum interrupter and is accommodated in a grounded tank filled with Dry air at a pressure of 600 kPa.G at 20oC.



## 3.3 Control box assembly

This control operating mechanism is provided with control mechanism assembly and operating spring assembly in FIG. CB-1.

# 4. OPERATING PRINCIPLE

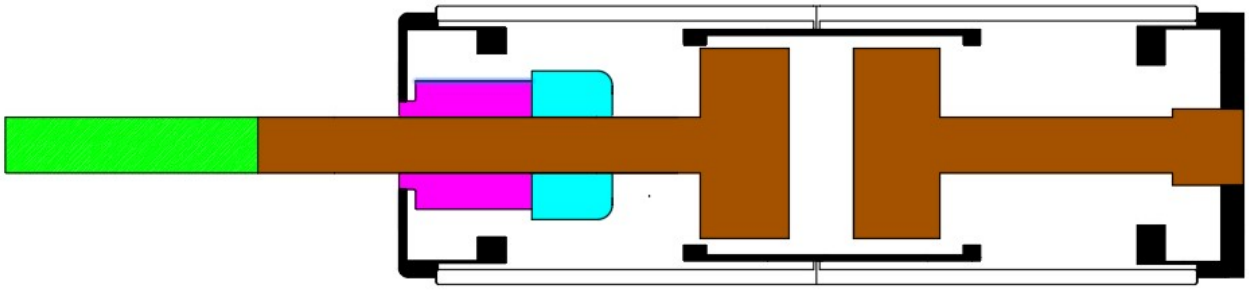


## 4.1 Process of ARC quenching

When the breaker operates, the moving contact separates from the fixed contact. An arc is struck between the contacts. The production of arc is due to the ionization of metal ions and depends largely on the material of contacts.

<FIG. CB-3. fully closed state>

The arc is quickly extinguished because the metallic vapors, electrons and ions produced during arc are diffused in a short time and detained by the surfaces of moving and fixed members and condensing shields.



< FIG. CB-4. stage of interrupting>

Since vacuum has very fast rate of recovery of dielectric strength, the arc extinction in a vacuum breaker occurs with a short contact separation.

When the current decreases, the rate of vapor release decreases and after current zero, the medium regains its dielectric strength if the vapor density is reduced.

Next FIG. CB-5 show fully opened state of interrupter.

< FIG. CB-5. fully opened state>

## 4.2 Compression mechanism of Closing Spring due to Shaft (See FIG. CB-7)

When the shaft is rotated, the gear is rotated and the link becomes stimulated and the spring is compressed.

When the Close-hook is caught, the limit-switch stops the operation of the motor and the spring compression ends and becomes the Close alert-condition.

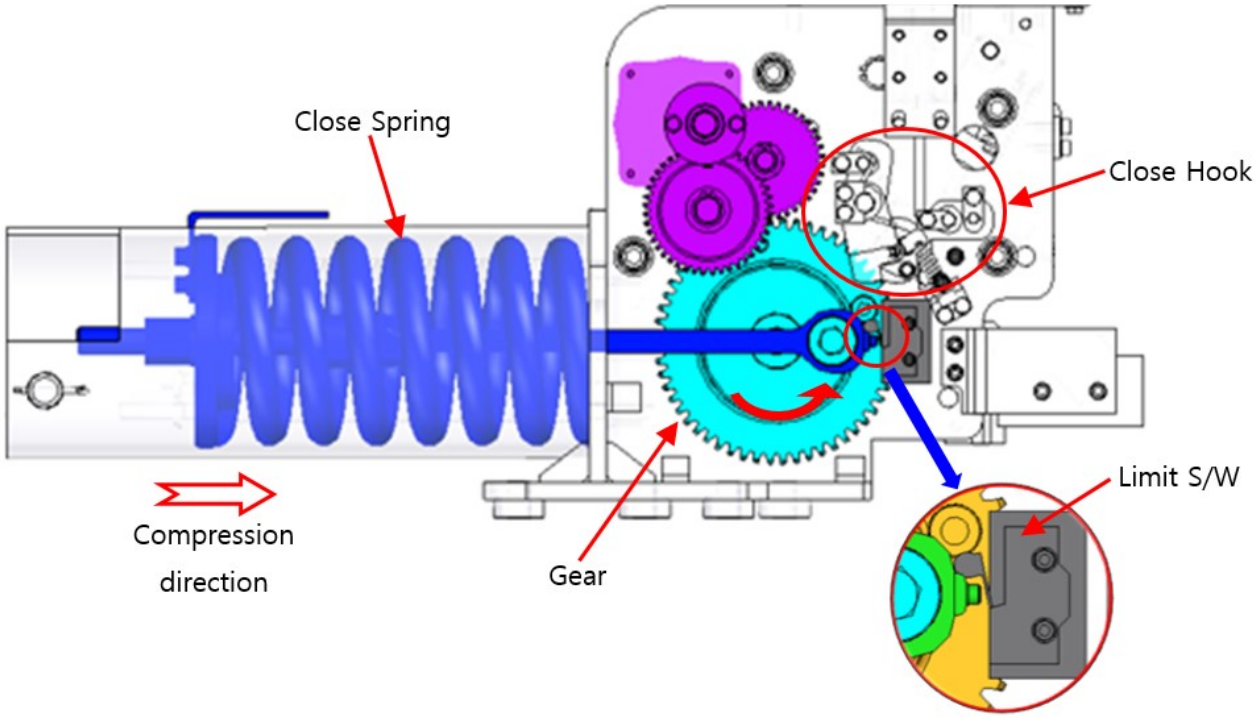


**FIG. CB-7 COMPRESSION MECHANISM**

## 4.3 Interrupting operation (See FIG. CB-8)

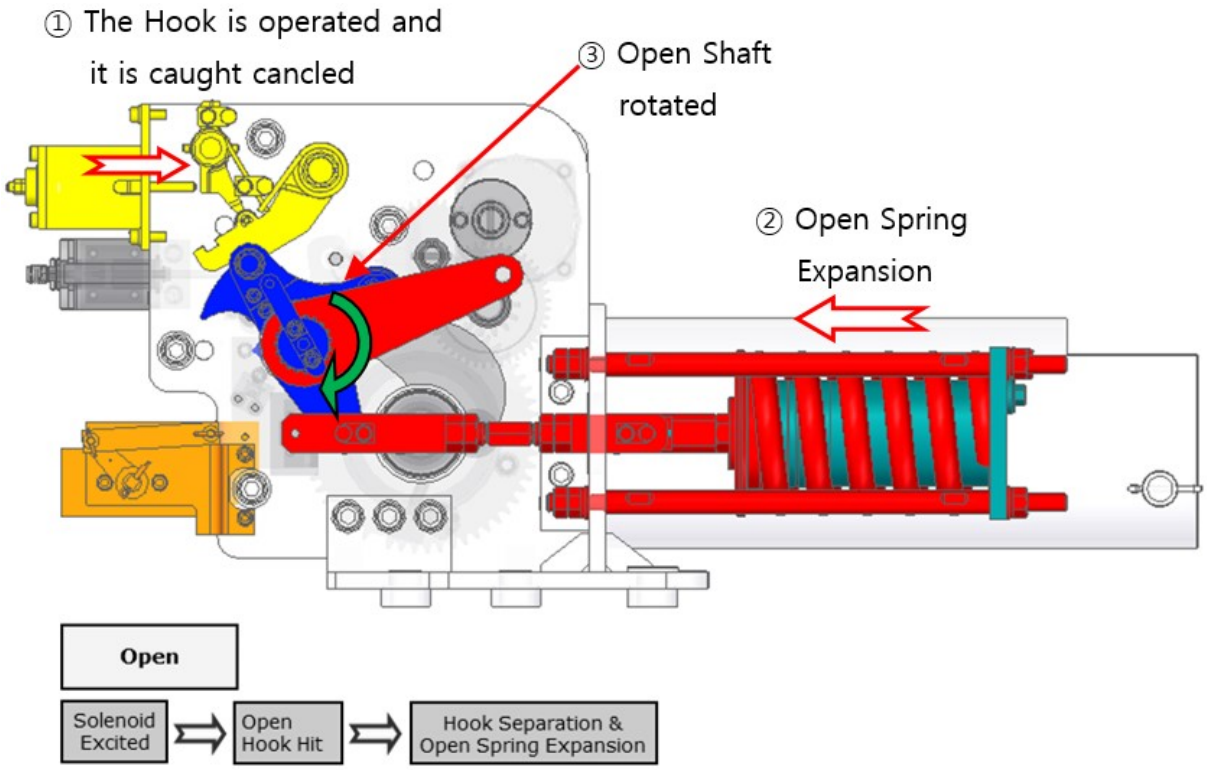

FIG. CB-8 INTERRUPTING OPERATION

## 4.4 Closing operation (See FIG. CB-9)

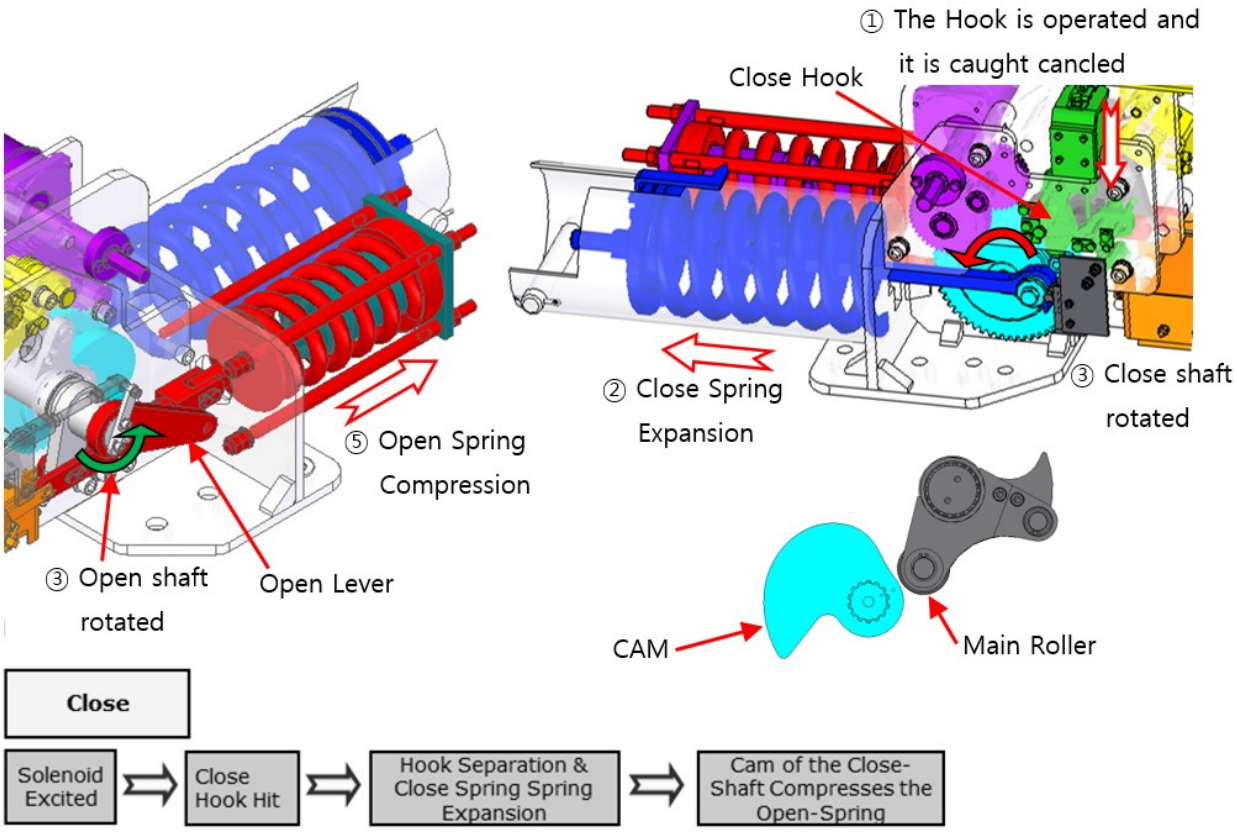

FIG. CB-9 CLOSING OPERATION

## 4.5 Manual operation (See FIG. CB-10)

### Danger

Before manual operation, the circuit must be cut by circuit breaker itself and Disconnect switch in both side of Circuit breaker. Although power source of motor shall be off when manual handle is inserted, Hyosung recommends MCB for motor power is off also.

The circuit breaker is usually operated by an electrical command from the remote-control panel.

Since the local control cubicle is also provide with a discrepancy switch. Manual switch is for manual operation. Manual operation can be done to allow only for checking and operation in the field.

Manual operation is allowed only when the high voltage circuit is de-energized.

(Open all DS's and close all ES's associated with CB.)

# 1. GENERAL

HYOSUNG's 3-position (Combined with DS & ES) switch has three isolating chambers or one set filled with 4.5 bar DRY AIR gas and one driven operator.

This disconnector and earthing switch module functions as the disconnector and work-in-progress earthing switch.

After isolating the appropriate switchgear parts, one can establish an isolating distance for secure work on electrical systems and create the earthing and short-circuiting.

As result of the design of the three position switchgear devices, both functions are interlocked back-to-back for a positive no-slip drive.

# 2. RATINGS

| Function | DS | | ES | |
|---|---|---|---|---|
| Model No. | HDMO-E074E | HDMO-E074F | HEMO-E074D | HEMO-E074E |

| Standard | IEC 62271-102 | | | |
| Refer Drawing | Fig. 1 to 2 | Fig. 3 to 4 | Fig. 1 to 4 | |

# 3. CONSTRUCTION

## 3.1 Basic Construction

Recently, a GIS design concept trend is compactness and modular approach.
The 3-position switch is combines a DS with ES and accepted aluminum casting enclosure for this trend.

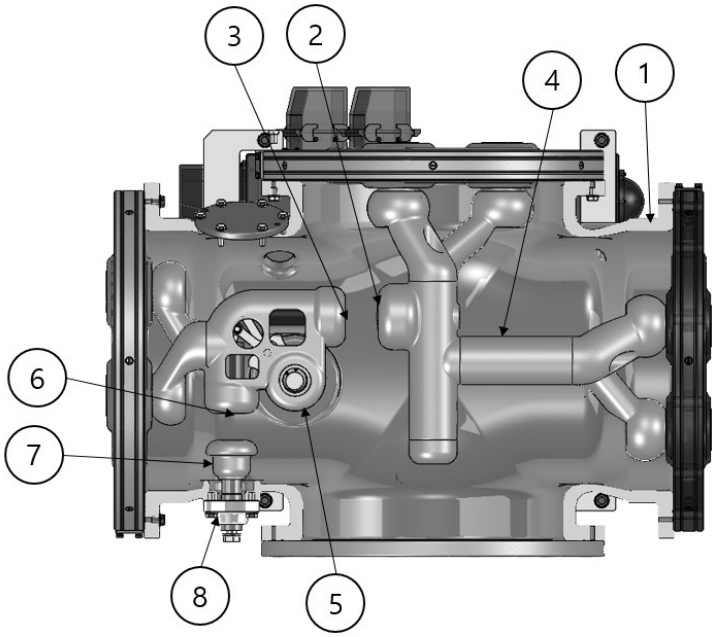
### 3.1.1 Disconnecting switch

The basic design of disconnecting switch generally supports no-load switching operations. As per system constitution, disconnecting switch can be applicable with capacitive charging current and loop current switching due to customer requirements.
The distance between poles is designed with basic insulation level as per IEC standards.
A mechanical indicator fixed to the operating shaft inside the operating mechanism box provides a visual means of checking operated position.

### 3.1.2 Earthing switch

Every earthing switch has a short time current endurance function. They are divided into two types with each one having its own particular function. The first one is the maintenance earthing switch which is operated motor driven and/or manually. The second one is high speed earthing switch operated automatically by motor drive spring charge and/or manually which makes the capacity of the fault current.
The distance between phase to ground is designed with basic insulation level as per IEC standards.
And a mechanical indicator fixed to the operating shaft inside the operating mechanism box provides a visual means of checking operated position.
The earthing switches can be used as primary injection terminals for checking voltages and currents. It is, therefore, possible to check the current transformer's ratio and contact resistance without degassing the DRY AIR gas.

## 3.2 Construction of DE & ES



### 3.2.1 Disconnecting switch

Disconnecting switch (Model No. HDMO-E074E, HDMO-E074F) was combined with DS and ES(3-PDS) and is considered a combined operating mechanism.
The disconnecting switch consists of operating link mechanism, insulation rod, conductor, spring type current collector, moving contactor, spring type fixed contactor etc. as shown in FIG.1. And these parts are mounted in each phase of the isolated enclosure.
Disconnecting switches are to be classified into two types; HDMO-E074E and HDMO-E074F. First type, HDMO-E074F, has arc resistant metal on the moving

contactor and fixed contactor. Second type, HDMO-E074E, has no arc resistant metal on the moving contactor and fixed contactor.
The operating link mechanism and insulation rod or which is assembled in the enclosure are designed to give straight line motion of the moving contact and convert the motion of the operating mechanism to the proper isolating stroke.
The DRY AIR gas pressure in the enclosure is 5.0 bar.G(72psig) at 20℃.

## 3.2 2 Earthing switch

Earthing switches are two types; high-speed and maintenance function.
Maintenance Earthing switch is as shown in FIG 1 to 4. The high-speed earthing switch is shown in another report.
The maintenance ES of combined type has the model type, HEMO- E074D, HEMO-E074E
The earthing switch (maintenance ES) consists of spring type current collector, spring type fixed contactor, conductor, moving contactor and operating mechanism part. These parts are mounted with each phase enclosure.
The neutral ends of moving contactors are led into an outside terminal through bushing; refer to FIG 1.
The fixed contactor and moving contactor for earthing switch with making capacity are made of copper and arc resistant metal attached to the top of them. The operating mechanism part which is assembled in the enclosure is designed to give straight line motion of the moving contact and to convert the motion of the operation mechanism to the proper switch stroke.
In case of earthing switches maintenance, they are located at both sides of circuit breaker.
The DRY AIR gas pressure in the enclosure is 5.0 bar.G(72psig) at 20℃

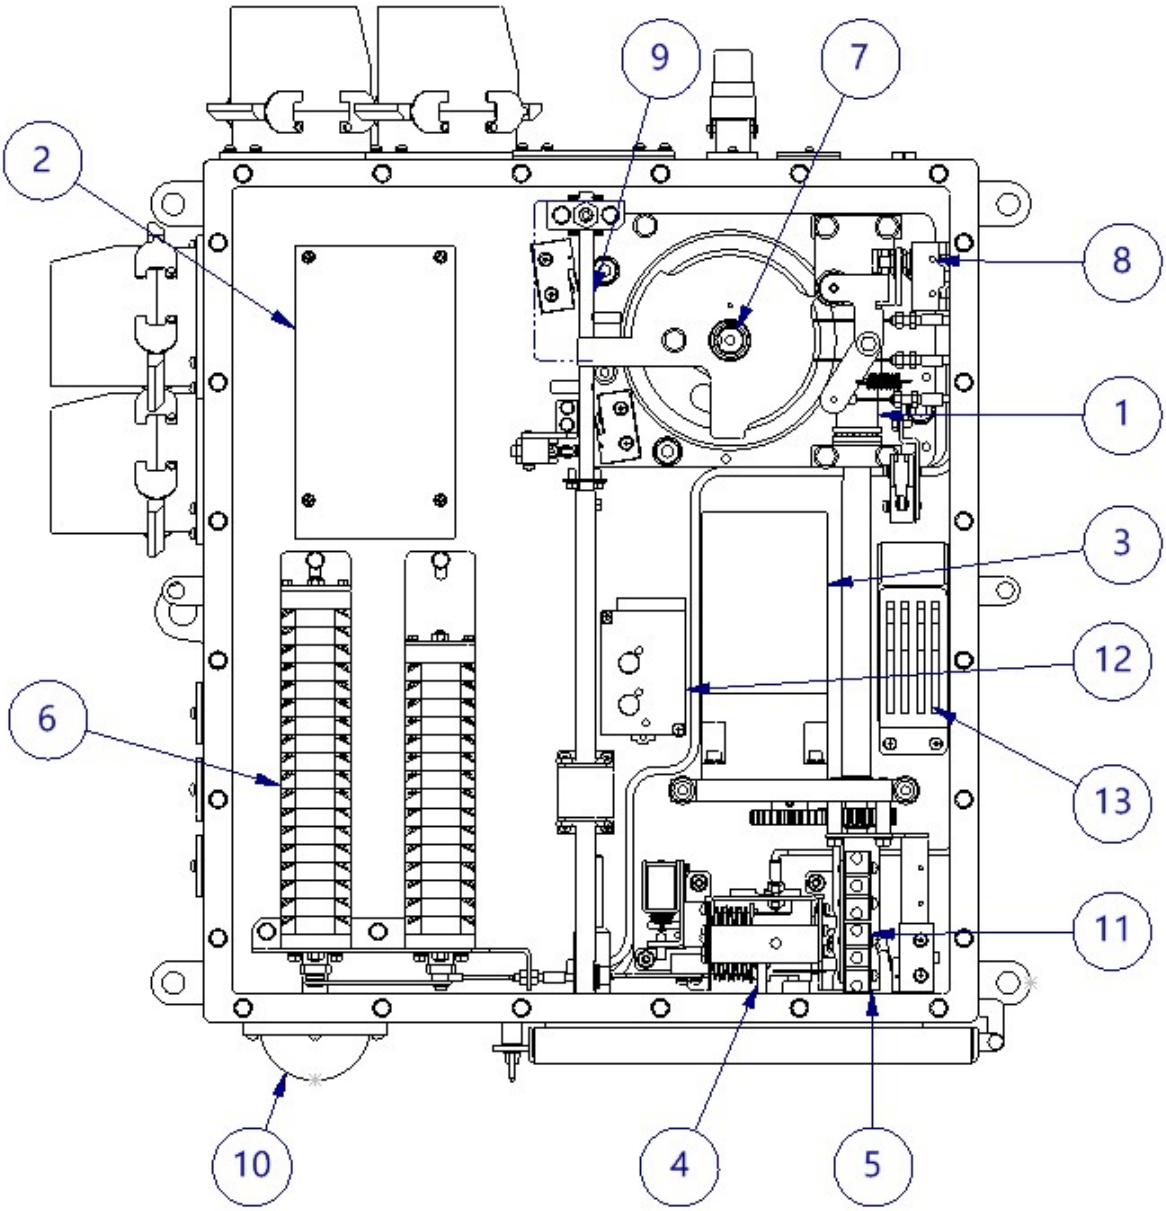
# 4. Motor driven Operating Equipment for Combined DS & ES

## 4.1 Construction (See FIG. OM-1)

The mechanism may be applied as operating mechanism for disconnecting / earthing switch of gas insulated switchgear.
The mechanism consists of motor operating mechanism and control devices.
Manual operation is also available.

## 4.2 Functions

The following functions shall be equipped in the mechanism.



1) Electrical interlock of manual operation with CB status or necessary status.
2) Manual operating handle stop mechanism.
3) Limitation of handle draw-out position.
4) Mode selection device.

## 4.3 Electrical operating method (See FIG.OM-1, 2)

Construction and operating principle of the mechanism are shown in FIG. OM-1.

1) The motor drives the output shaft through the worm wheel as shown in FIG. OM-2.
   a. Operation principle of DS operation / Rotation direction
      - CLOSE : A → D
      - OPEN : D → E
   b. Operation principle of ES operation / Rotation direction
      - CLOSE : A → B
      - OPEN : B → C
2) The output shaft does not rotate by the load-side torque at the stop position.

Limit switch(LS1) acts and breaks control circuit of the motor at stop position

FIG. OM-1 MOTOR DRIVEN OPERATING MECHANISM BOX & GEAR ASSEMBLY

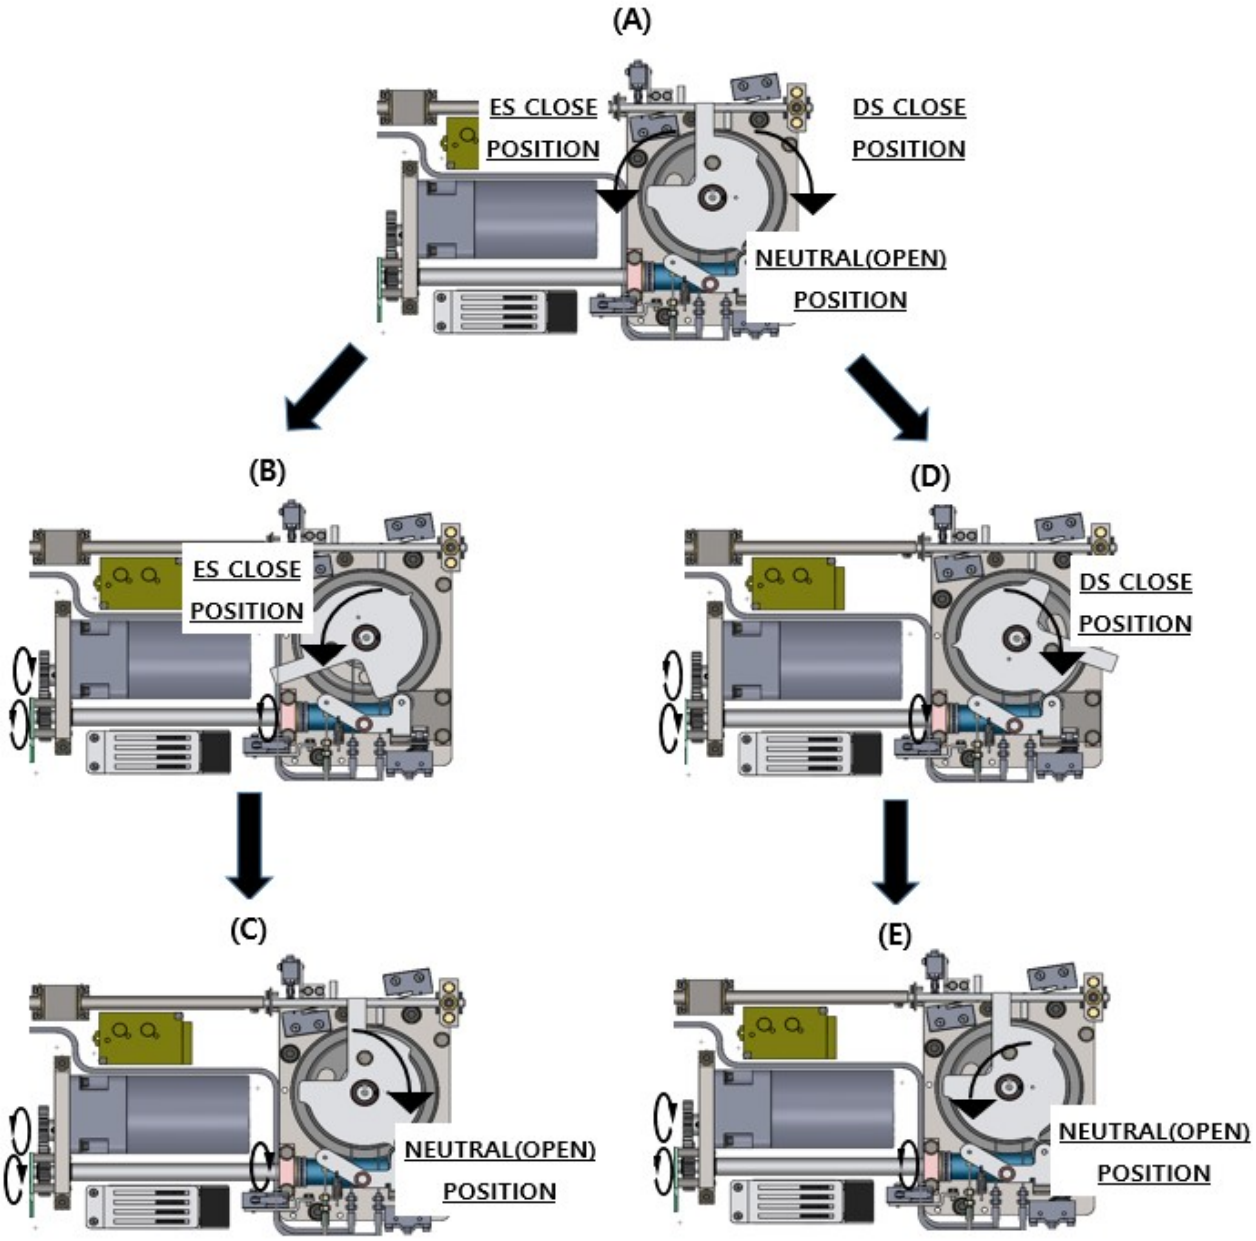

FIG. OM-2 MOTOR DRIVEN OPERATING MECHANISM

## 4.4 Manual Operating method

**Danger**

Before manual operation, the circuit must be cut by circuit breaker and Disconnect switch in both side of Circuit breaker. Although power source of motor shall be off when manual handle is inserted, Hyosung recommends MCB for motor power is off also.

### 4.4.1 Mode Selection device

The mode selection device is equipped to avoid wrong manual operation.
This device can limit the operation under two below modes.
DS mode : Only DS position can be operated to reach manually, because ES position is blocked.
ES mode : Only ES position can be operated to reach manually, because DS position is blocked.

### 4.4.2 Manual operating procedure (See FIG.OM-3)

1) Rotate the mode selection lever to the desired direction, either DS(A→D→E) or ES(A→B→C).
2) Pull to the left “Shutter lever”.
   The shutter lever is locked and can only be opened under allowable operating condition of interlock.
   Shutter lever is held at “open” after being pulled to the left side.
   A solenoid stopper are equipped to prevent abnormal operation under interlock condition.
3) Insert handle.
   The Limit switch on the manual handle insert hole side acts and breaks control circuit of the motor.
4) Rotate handle.
   Handle drawn-out action is prevented in half way.
   Rotation of manual operating handle is locked at stop position by “shutter lever” which returns to the right side automatically.
5) Pull to the left “Shutter lever”.
6) Draw out handle.
7) Slide “Release lever” upward.
   “Shutter lever” is released.

# 1. GENERAL

HYOSUNG's Line earthing switch has three isolating chambers or one set filled with 5.0 bar DRY AIR gas and one driven operator.

This equipment is operated by motor charged-spring operation mechanism.

# 2. RATINGS

| | |
|---|---|
| Function | HES |
| Model No. | HEMS-E074C |
| Operating method | Motor drive spring charged & manual |
| Rated Dry air pressure | 5.0 bar.G(72psig) at 20oC |
| Standard | IEC 62271-102 |
| Refer Drawing | Fig. 1 |

# 3. CONSTRUCTION

## 3.1 Basic design

The high-speed earthing switch has a short time current endurance function. It is automatically switch operated by charged motor drive spring and/or manually charged which has making capacity of fault current.

The distance between phase to ground is designed with basic insulation level as per IEC standards.

A mechanical indicator fixed to the operating shaft inside the operating mechanism box provides a visual means of checking operated position.

The earthing switches can be used as primary injection terminals for checking voltages and currents. It is, therefore, possible to check the current transformer's ratio and contact resistance without degassing the DRY AIR gas.

Electrical endurance of primary injection terminal is limited up to 10kV/min. If other voltage and duration levels are required on this terminal, confirmation from Hyosung HV GIS engineer is essential. Please contact us before testing.

## 3.2 Construction

The high-speed earthing switch is connected to the operating mechanism directly, as shown in FIG 1. So, there is no connecting link with operating mechanism.

The high-speed earthing switch consists of a tulip type current collector, tulip type fixed contactor, conductor, shield, moving contactor and operating mechanism part etc.

The neutral ends of moving contactors are led into an outside terminal through bushing as referred to in FIG 1.

The bushing has electrical characteristic of AC power frequency withstand voltage at 10kV for 10 minutes.

The fixed contactor and moving contactor for earthing switch with making capacity are made of copper and arc resistant metal attached on their tops. The operating mechanism part which is assembled in the enclosure is designed to give straight line motion of the moving contact and convert the motion of the operation mechanism to the proper switch stroke.

The Dry air pressure in the enclosure is 5.0 bar.G(72psig) at 20℃

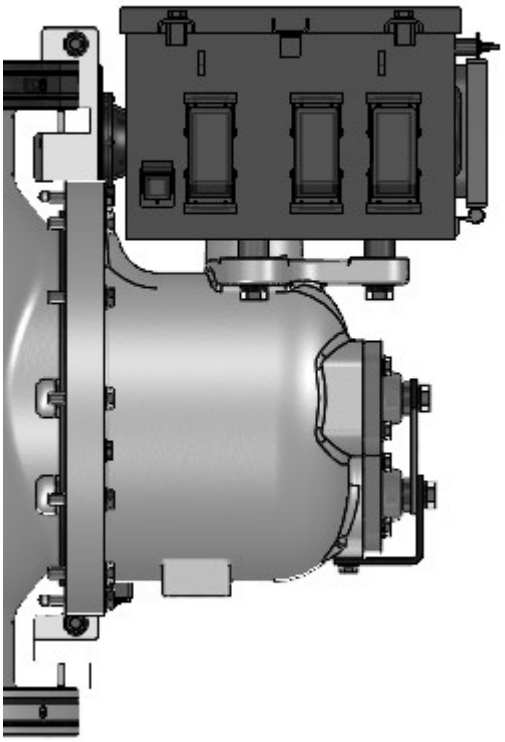

FIG-1. HEMS-E074C

# 4. MOTOR DRIVE SPRING CHARGED EQUIPMENT

## 4.1 Construction (See FIG. OM-1)

Motor drive spring charged equipment is adapted to high-speed earthing switch which is driven by DC motor. FIG. OM-1 shows the construction of the motor drive spring charged operating equipment.

It consists of operating mechanism, control circuit, mechanical indicator and interlock mechanism.

1) Operating mechanism

Operating mechanism consists of geared motor(1), worm gear(2), worm wheel(3) and driving shaft(4). And it can also be operated manually.

2) Control circuit

It consists of the geared motor(1) circuit controlled by open or close commands and for auxiliary contacts used for indication and interlock.

3) Mechanical indicator

An indicator(5) is linked to the high-speed ES mechanically.

It indicates the open or closed position of switching equipment.

4) Interlock mechanism

It consists of a mechanism to avoid remote operation during manual operation and manually operating the coil-LMG for the manual operating handle to prevent access during remote operation. The manual operating coil-LMG is energized and the manual handle insert hole is opened only when the interlock condition of related switching equipment is complete.

## 4.2 Operation

1) Operation by electrical command (See FIG. OM-1)

FIG. OM-1 shows the operation of motor drive spring charged device.

After receiving open or close commands, geared motor(1) starts. Its torque is transmitted to worm gear(1), worm wheel(3) and lever(6), then it charges the spring of switching equipment.

In case of the open operation, the geared motor keeps rotating and the driving shaft rotates at the same time. When the spring reaches a certain point, the spring slightly discharges in order to maintain the open state.

In case of the close operation, the geared motor rotates slightly, and when the spring reaches a certain point, the spring rapidly discharges. These operations cause the switching equipment to open or close through a lever linked to the driving shaft(4).

For the detail operation mechanism, refer to FIG. OM-3 & OM-4.

2) Operation by manual handle with DC power(See FIG. OM-2)

Mechanism of manual operation is shown in FIG. OM-1. Open the door and insert the manual handle a little into the insert hole(10) (Please handle softly). Then, the limit switch(11) attached to the insert hole turns on and the manual operating coil-LMG(12) is excited and allows the removal of the handle stopper(13). Insert the manual handle continuously until the handle can be inserted no further. If the interlock condition of related switching equipment is not complete, the Manual operating coil-LMG(12) is not energized and the insert hole is not opened.

3) Operation by manual handle without DC power(See FIG. OM-2)

Basically, operation method is the same as above. But in order to release the handle stopper, pull up the pin(14) and insert the manual handle at the same time.

## 4.3 Mechanical Locking device(See FIG.OM-4)

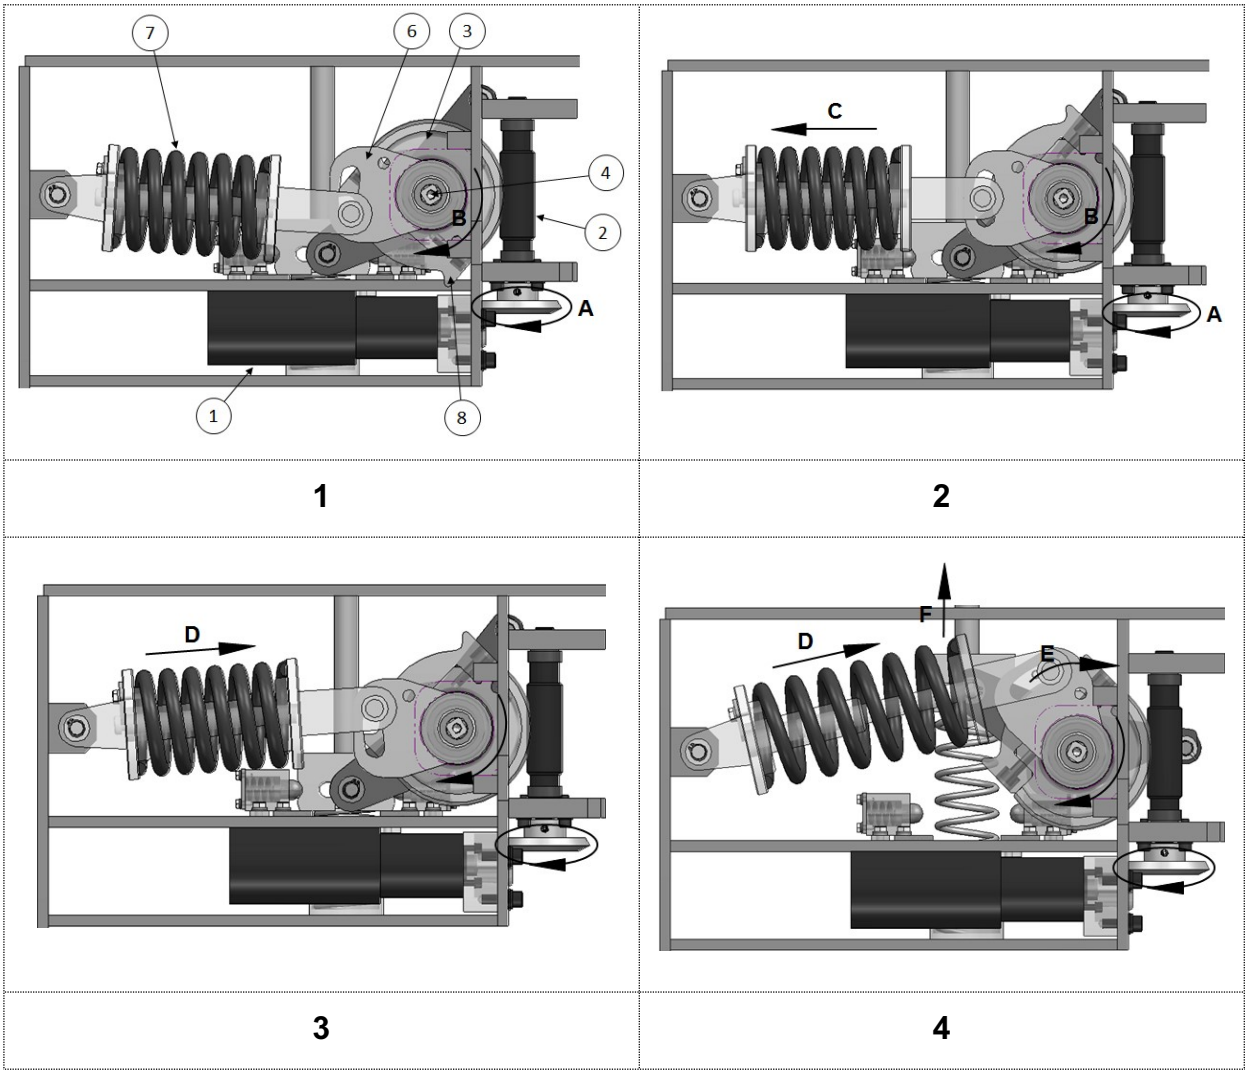
This is a switch to avoid incorrect operation by locking the handle at OPEN or CLOSED position. Before the maintenance or the inspection of switching equipment, the locking handle(15) of operating equipment must be locked both at OPEN and CLOSED positions. By carrying out the above operations, it becomes impossible to operate the switching equipment mechanically. And at the same time, limit switch(11) is open. Then remote operation of switching equipment cannot be carried out electrically. In normal operating condition, the lock handle is put in the "unlocked" position.

## 4.4 Operation principle of H-ES-Opening Operation (See FIG. OM-3) (Motor Drive Spring Charged Equipment)

1) Operating cycle : A → B → C → D → E → F

2) Electrical operation

Geared motor(1) rotational force is transmitted to hook(8) by worm wheel(3) and worm gear(2). And the hook(8) of worm wheel charges the connected operating spring(7). When the hook reaches the end of the lever's hole(6), worm wheel, lever, driving shaft(4) and driving lever(9) will rotate at the same time. The driving lever transmits rotational force to linear force by link structure.



When the charged spring goes over the central position, it expends the repulsive force. At this moment, driving shaft(4) is released from the hook(8) of worm wheel(3). When operation is finished, the driving shaft is stopped by equipment on the case, operating spring is charged, and mechanism waits for next signal.

3) Manual operation

Rotational force by manual handle is transmitted to bevel gear(16) assembled motor by manual shaft(17). Thereby, it is transmitted to bevel gear(18) and worm gear(2).

Rotational force of worm gear(2) is transmitted to hook(8) by worm wheel(3) and worm gear(2). And the hook(8) of worm wheel charges the connected operating spring(7).

Next process is the same as the electrical operation explained above.

1 2

3 4

FIG. OM-4 OPERATING PRINCIPLE OF MOTOR DRIVE SPRING CHARGED OPERATING MECHANISM (CLOSING OPERATION)

## 4.5 Operation principle of H-ES-Closing Operation(See FIG. OM-4) (Motor Drive Spring Charged Equipment)

1) Operating cycle : A → B → C → D → E → F

2) Electrical operation

Geared motor(1) rotational force is transmitted to hook(8) by worm wheel(3) and worm gear(2). The hook(8) of worm wheel charges the connected operating spring(7) slightly.

When charged spring goes over the central position, it expends the repulsive force. At this moment, operating spring is connected with lever(6), driving shaft(4) and driving lever(9).

Its driving shaft(5) transmits rotational force to linear force by link structure.

When operation is finished, the driving shaft(5) is stopped by equipment on the case and mechanism waits for next signal.

3) Manual operation

Rotational force by manual handle is transmitted to bevel gear(16) assembled motor by manual shaft(17). Thereby, it is transmitted to bevel gear(18) and worm gear(2).

Rotational force of worm gear(2) is transmitted to hook(8) by worm wheel(3) and worm gear(2). And the hook(8) of worm wheel charges the connected operating spring(7). Next process is the same as the electrical operation explained above.

## 4.6 Operation principle of HES operation

**Danger**

Before manual operation, the circuit must be cut by circuit breaker and Disconnect switch in both side of Circuit breaker. Also HES operation shall be considered with status of another substation line connection to avoid making live line grounded (Fault). Although power source of motor shall be off when manual handle is inserted, Hyosung recommends MCB for motor power is off also.

Manual Operation proceed by insert and rotate manual handle after opening small door front side of mechanism

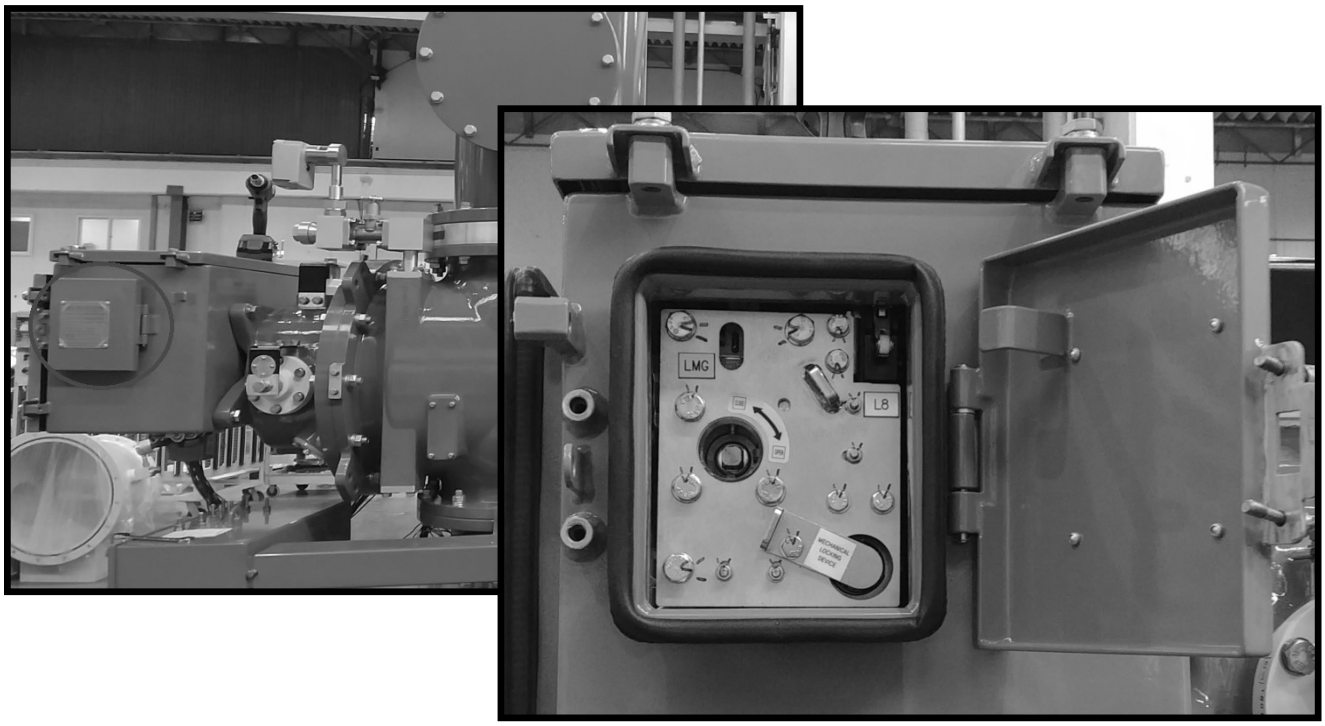


FIG. OM-5 STRUCTURE FOR MANUAL OPERATION

## PART B-5

## OPERATION OF CURRENT TRANSFORMER

## CONTENTS

1. GENERAL ..... 2
2. CONSTRUCTION ..... 2
3. POLARITY AND CONNECTION ..... 2
4. INSTALLING LOCATION ..... 3
5. SPECIFICATION OF CURRENT TRANSFORMER ..... 3
6. CONSTRUCTION OF CT TERMINAL WITH GAS SEALING ..... 3

# 1. GENERAL

The type of current transformer is Bushing-Type CT(called BCT) which secondary windings are distributed around a core and installed in Gas Insulated Switchgear(GIS).

The CT is insulated completely against primary winding by the earthed shield or earthed enclosure of GIS, while the CT itself has completely insulated permanently assembled toroidal secondary winding.

The current ratio, accuracy class and other characteristics of CT are shown on its name-plate and submitted technical schedule. The detail test procedure is described on “Part B-14 (Configuration of CT Primary Injection Test)”.

# 2. CONSTRUCTION

The construction of CT is shown as FIG. CT-1.

Low loss, high permeability, and annealed grain-oriented silicon-steel is used for the core of the CT. The core(1) is covered with several insulation material(2,3,5). It is wrapped with rubber and PE(Polyethylene) tape for core insulation and the proper number of turns of enamel-coated magnet wire are wound over the core(1). When the secondary windings(4) need to be wound on more than two layers, it is wrapped with rubber, epoxy glass laminate and PE taped properly for layer insulation(2).

Lead wires are connected to taps, and the end of the winding with connection is insulated by sleeves.

The material of the finish insulation(3) of the CT uses PE tape and glass filament adhesive tape to protect from the absorption of moisture.

The dimension of the CT is designed by the required characteristics as proposed data.

# 3. POLARITY AND CONNECTION

The identification system of terminals of the CT is marked according to IEC 61869, i.e. P1, P2, etc. for primary side and s1, s2, etc. for secondary terminals as shown on single line diagram and nameplate.

The connection of CT wiring lead to the corresponding terminals of outlet box as shown on the CT wiring diagram in schematic drawings.

The following caution must be observed in connection and in service.

1) Insulate all leads so that they will not make contact with any other leads or ground parts.

2) Ground one side of the secondary circuit unless doing so will interfere with the proper operation of instruments.

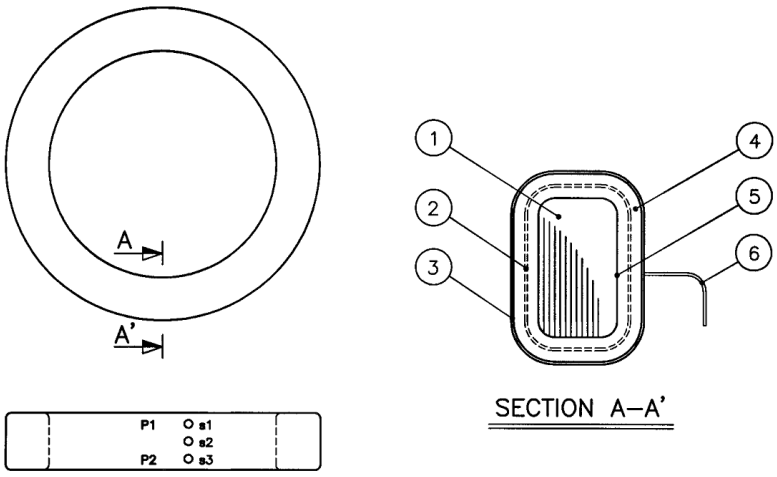
3) Never open the secondary circuit while the CT is in operation because the core will be permanently saturated and induce dangerously high voltages on secondary circuit.

4) The secondary terminals must be closed through a burden or by the short-circuiting lead.

## 4. INSTALLING LOCATION

The construction of the CT case with the arrangement of the CT is shown as FIG. CT-2.

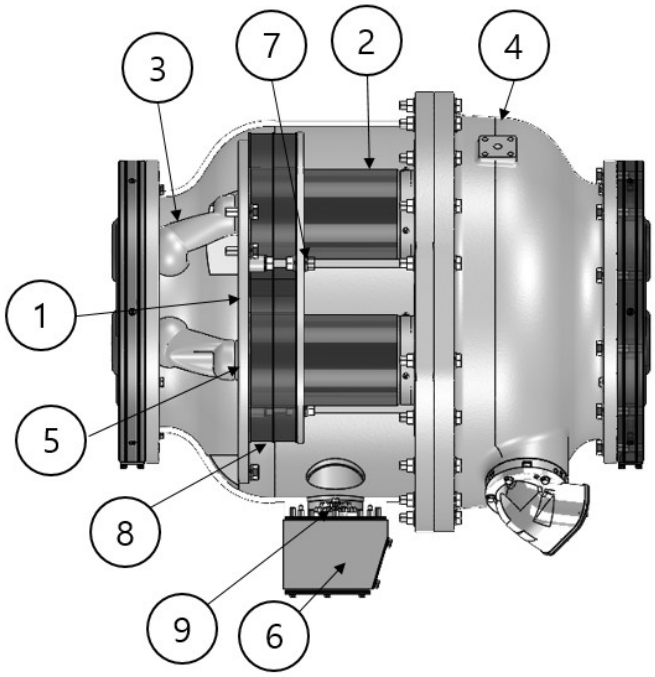
The CT is installed internal or external of enclosure and the secondary wiring is connected through the sealing terminal block to the local control panel (cubicle).



## 5. SPECIFICATION OF CURRENT TRANSFORMER

For specification of current transformer, refer to the submitted technical schedule and single line diagram drawing.

## 6. CONSTRUCTION OF CT TERMINAL WITH GAS SEALING



The construction of terminal is the same as shown in FIG.CT-2 and CT-3.

The number of poles depends upon required current ratio; single or multi ratio.

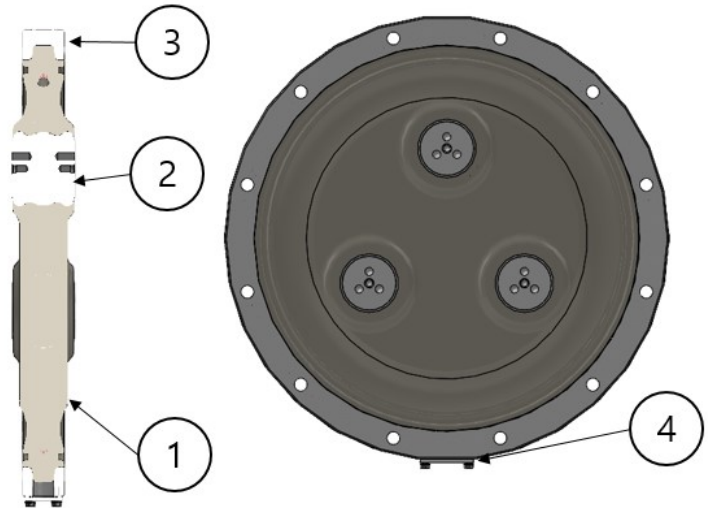
1. Structure of Insulator ..... 2
2. Configuration of Insulator ..... 2
2.1 Spacer ..... 2

# 1. Structure of Insulator



The insulator had been applied with a spacer and post insulator at the GIS(HSG-074B). The spacer is designed as a gas tight barrier type(stop spacer) for separate gas section and gas through barrier(normal/hole type spacer) for support of conductor in the enclosure. There are applied metal flanges (Ring-Flanges) outside of the spacer for electrically continuous connection on both sides of enclosures as shown FIG. IN-1.

Three types of post insulators ae designed for supported of conductor in the enclosure as shown FIG. IN-2.

## PART B-7

## OPERATION FOR DRY AIR GAS

## CONTENTS

## Contents

1. Properties of DRY AIR Gas .....2

## 4.8.1 Dry - Air

(1) Dry-Air consists of O2, N2, Ar and other impurities in regular operation status, The gas life of the device must be equal or greater than the device life.
Gas composition and management standards must be presented at the time of delivery. The standards for impurities are as follows.

**Table 6. Standards for impurities in gas**

| classification | CO | $CO_2$ | Total hydrocarbon(THC) | Nitrogen oxides(NOx) | Sulfur oxides(SOx) |
|---|---|---|---|---|---|
| Content(ppm) | < 1 | < 1 | < 1 | - | - |

(2) Annual gas leakage rate is 0.5% or less, moisture content in gas is 2.6ppmv or less (surrounding environment 0Mpa.G, 20℃) and the condensation point should be below –70℃.

(3) There should be no problem with the device even if O3 gas is temporarily generated during internal arc.

(4) When delivering, mark (paint) the Dry-Air component on the surface of the gas storage container or attach a printed label. It must be identifiable from the outside, and a method for detecting leaks must be provided.

## 1. General

The absorbent serves as moisture control in the enclosure and absorbent changing procedure works as follows:

Detach fixing bolts form absorbent case and detach absorbent case form hand hole cover.

Replace absorbent with new absorbent as quickly as possible, just before hand hole cover is closed, so that the absorbent may not absorb moisture in the atmosphere. Don't expose the absorbent to the atmosphere for more than 10 minutes.

## 2. Construction

The construction of the absorbent case is shown Fig. AB-1 and absorbent detail is in the attached catalog.

## OPERATION OF GAS DENSITY DETECTOR

## CONTENTS

1. General ..... 2
2. Explanation of Gas Density Monitor ..... 3
2.1 Alarming pressure and locking pressure ..... 3
2.2 Construction of gas pressure detector ..... 3

# 1. General

The entire Dry air system of the GIS, including the gas section, is shown as Gas System Diagram.

The enclosure of GIS is filled with Dry air to 5 bar for the CB compartment and other compartments based on 20℃. The gas density monitor with pressure switch is installed in each compartment and continuously monitors Dry air pressure.

If gas pressure reduces to 4.7 bar in the CB, then No.1 pressure contact of gas density monitor operates and will produce an alarm.

If gas pressure reduces to 4.5 bar, No.2 contact operates and will block the trip and close operations of the circuit breaker and will produce an alarm.

For other compartments, in case of gas pressure drop, the gas density monitor will produce the appropriate alarm to circuit with 2 stages; i.e. 1st stage at 4.7 bar and 2nd stage at 4.5 bar.

For the outline of gas monitoring device, please, refer to the attached manufacture catalog.

## Caution

1.. Don't remove the end covers of piping until ready to install the piping.

2. Use dry nitrogen gas or dry air to blow out the piping so as to completely remove the moisture and foreign substance before installing the piping.

3. Be particularly careful not to allow ingress of dust and foreign substances into piping during the work.

4. Keep the stop valve closed after piping until Dry air is ready.

# 2. Explanation of Gas Density Monitor

## 2.1 Alarming pressure and locking pressure

Mostly the gas system is monitored and divided into two systems:

a. Gas Circuit Breaker

b. Bus and Isolator (others)

In the event of Dry air pressure drop, an alarm will be operated by the gas density detector at the 1st leakage level. If the leakage reached the 2nd level, the circuit breaker is to be locked by the relaying sequence.

## 2.2 Construction of gas density detector

For more details, refer to attached catalogue of Gas Density Monitors.

# Gas density monitor
# Model GDM-100

## Applications

- Medium and high-voltage instruments
- Monitoring of the density of gas in closed tanks
- Raising an alarm when defined limit values have been reached

## Special features

- Case and wetted parts from stainless steel
- On-site display with switch contact
- Temperature-compensated and hermetically sealed, therefore no influence of temperature fluctuations, differences in level and atmospheric pressure fluctuations
- Compensation for gas mixtures possible
- Traceability by serial number

**Gas density monitor model GDM-100**

## Description

Gas density is a crucial operating parameter for high-voltage equipment. If the required gas density is not present, safe operation of the plant cannot be guaranteed.

The WIKA gas density measuring instruments provide reliable warnings against dangerously low gas levels, even in extreme environmental conditions. Electrical switch contacts warn the plant operator when the gas density drops below defined levels due to leakage.

**Numerous fields of application**
The WIKA gas density monitor is hermetically sealed and temperature-compensated. Measured value fluctuations and erroneous alarms caused by changes in either ambient temperature or air pressure are therefore prevented.

Via the on-site display, the system pressure based on 20 °C can be read directly on the instrument. With the integrated switch contacts, simple switching tasks can be realised quickly and without complication.

# 1. Preface

**WARNING**

The instructions and procedures included in this manual are intended to provide general guidance to trained personnel, with experience and expertise in the safe and careful performance of their job. These instructions and procedures cannot and do not cover all details of every task nor can they cover all possible situations that may be encountered during the performance of the tasks.

The user is solely responsible for ensuring that all work is performed safely and without damage to the LPIT

If any additional guidance is required, contact HYOSUNG

It must be noted that the instructions and procedures in this manual cannot consider all possible site conditions and circumstances. As experts in the design and construction of the equipment, HYOSUNG reserves the right for HYOSUNG's Field Service Supervisors to modify the instructions and procedures herein to meet the intent of the requirements under the specific conditions or circumstances that may arise.

All work performed on the LPIT covered under this manual must be performed in compliance with all site, local, state, provincial and national regulations. If any such regulations conflict with any instructions or procedures in this manual, contact HYOSUNG for clarification.

## 1.1 Safety Notations

The following notations are used in this manual to alert the user to potential safety hazards.

| Kinds of Mark | Meaning of Mark |
|---|---|
|   | Danger indicates an imminently dangerous situation which, if not avoided, results in death or serious injury to personnel. This signal word is limited to the most extreme situation. |
|   | Warning indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury. |
|   | Caution indicates a potentially hazardous situation which, if not avoided, may result in equipment or installation damage. It may also be used to alert against unsafe practices. |
|  | Electrical Hazard warning. |

## 1.2 Safe Working Practices

These warnings apply to every part of this section and should be considered as applicable to each line in this section.

Workers who use this manual should be trained by their company's Safety organization in the company's Safe Working Practices. Workers who have not been trained in Safe Working Practices or their company's Safety Program, or companies without a Safety Program should delegate or contract all work on this equipment to individuals or companies who have been properly trained. This HYOSUNG manual is not intended to replace the user's Safety Program or any policies of the user's Safety Program.

This section is provided to help remind trained, qualified workers of the risks that may be present when working on power transformers and to provide suggestions in some cases to mitigate those risks. This manual cannot anticipate all conditions that might occur at every jobsite and must be used as a general reference and not as a procedure for working safely. The contents of this section are presented as "Thought Joggers" intended to help the user recognize the various risks associated with this type of work.

Workers must follow all local, state, provincial and federal safety requirements and the user's site-specific Safety Program requirements. It is the User's sole responsibility to be aware of all applicable requirements.

Failure to properly mitigate the risks associated with this type of work could result in serious injury or death.

Communication is critically important when working with others. Every job should be thoroughly discussed with the full crew before starting work to ensure that everyone understands the work that will be performed by each worker and the risks associated with that work. When multiple crews are working at a site, each crew leader should understand the scope of the other crews' work as well. When circumstances change, everyone who might be affected should be informed.

Every worker should have the proper PPE to protect them from all expected risks. The site or worker's Safety Co-ordinator should determine the risks that exist at the site and during the tasks performed by the worker.

# 2. Introduction

## 2.1 Application

Low-Power Instrument Transformers offer advantages in terms of size, power consumption, safety, accuracy and signal reliability. With the introduction of digital communication in substations according to the IEC61850-9-2 standard, LPCT(Low Power Current Transformer) and LPVT(Low Power Voltage Transformer) measures voltage and current from a gas-insulated switchgear. And the measured data is collected by Merging Unit(MU) and can be transmitted via IEC 61850-9-2 protocol to further protection, control and measuring systems.

LPCT sensor structure is simple, robust and less complex than a conventional CT. The core does not saturate, and the coil produces an undistorted, hysteresis-free output signal with a wide measuring range. Homogeneously manufactured Rogowski coils are insensitive to external magnetic fields (proximity effects). The secondary output is a relatively safe, low voltage signal that does not require special shorting and grounding considerations.

LPVT uses coaxial capacitive voltage divider to transform the measured voltage. And it is Compact and robust design, can be easily integrated in GIS enclosures.

The secondary converter is used to calibrate output signals of LPCT and LPVT.

Fully making use of the characteristics of GIS gas insulation design, this device has features of a simple and reliable insulation design, small size, relatively light weight, good linearity, etc., and as a result, the size of GIS is reduced effectively.

LPCT satisfies the test items of IEC 60044-8 type test and guarantees an accuracy level of 0.2S/5TPE. LPVT satisfies the test items of IEC 60044-7 type test and guarantees an accuracy level of 0.2/3P.

## 2.2 Function

LPIT is installed to Gas-insulated switchgear (GIS) with rated voltage of 72.5kV and frequency of 50Hz or 60Hz for measuring the primary current and voltage and providing the current and voltage information for the digitalized metering devices, BCU and the protection relays. It can be installed both outdoor and indoor.

# 3. Technical Data

### A. Power Supply For Secondary Converter

| Classification | Description |
|---|---|
| Nominal operating voltage | 85-264$V_{AC}$, 85-370$V_{DC}$ |
| Frequency | 50/60Hz, DC |
| Power consumption | MAX 6W |
| Connector | 3pin: positive (L), negative (N) and ground(F.G) |

### B. Dimensions and Weight

| Classification | Description |
|---|---|
| Height | 735mm |
| Width | 410mm(W/O Spacer) |
| Depth | 570mm |
| Weight | 110kg |
| Enclosure color | As per customer Requirement |
| Enclosure material | Aluminum |

### C. Environmental Conditions

| Classification | Description |
|---|---|
| Operating temperature | -40°C~+60°C |
| Relative humidity | <95%, non-condensing |
| Altitude | <1000m |
| Transport and storage temperature | -40°C~+60°C |

### D. Insulation Level

| Classification | Description |
|---|---|
| Max. voltage of equipment | 72.5kV |
| Power-frequency withstand voltage | 140kV |
| Lightning impulse withstand voltage | 325kV |
| Rated gas pressure | 0.5MPa.G(Min 0.45Mpa) |

### E. LPIT rating

| Classification | Description |
|---|---|
| Nominal frequency | 50Hz, 60Hz |
| Rated primary voltage(Upr) | 66kV/√3 |
| Voltage Factor (Fv) | 1.9/8h |
| Rated primary current(Ipr) | 250A |
| Rated extended primary current factor(Kpcr) | 25.2 |
| Accuracy limit primary current | 63kA |
| Rated symmetrical short-circuit-current factor(Kssc) | 680 |

### F. Accuracy

| Classification | Description |
|---|---|
| Voltage transformer | 0.2/3P |
| Current transformer | 0.2S/5TPE |

### G. Protection Class

| Classification | Description |
|---|---|
| Enclosure | IP65 |

# 4. Operation Theory

## 1. LPCT and LPVT

LPCT converts the current signal of the primary conductor and consists of two Rogowski coils per phase to improve product reliability. LPVT adopts the coaxial capacitive voltage dividers to convert the primary voltage signal. LPVT also consists of two capacitive voltage dividers per phase to improve product reliability

## 2. Secondary convertor

Secondary converter including integrator and compensating circuits for temperature, gas pressure, etc., processes the output signals of LPCT/LPVT. The operation power of secondary convertor is 85-264V AC, 85-370V DC supplied from the GIS marshalling cubicle.

Both LPCT/LPVT and the secondary convertor are located at the low voltage side. The construction diagram is shown in Figure 1.

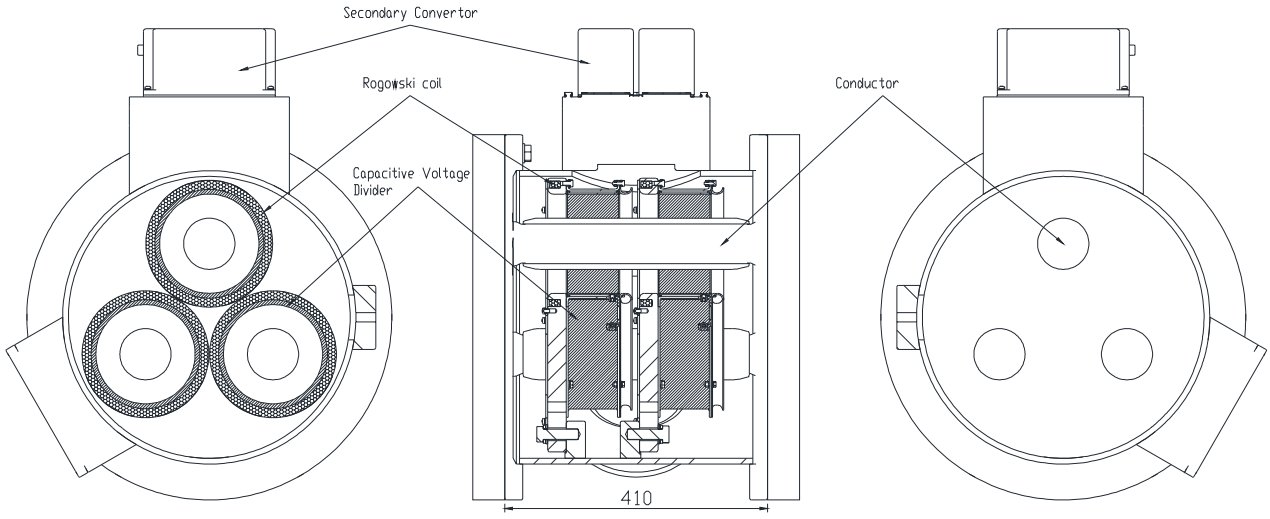

Figure 1. Construction diagram of LPIT

LPCT (Rogowski coil) measures the current induced by current flows through the primary conductor. The primary conductor, intermediate level and the grounded metal-clad constitute the LPVT (coaxial capacitor voltage divider) to measure the induced voltage from primary conductor. Dry-air is filled-in the space between the different voltages as insulation. Secondary converter compensates output signals.

## 4.1 Low Power Current Transformer

PCB-type Rogowski coil are used in this device to transform measured primary current. The operation principle of Rogowski coil is same as that of the conventional CT. The toroidal coil is a solenoid wound on a non-magnetic skeleton as shown in Figure 2.

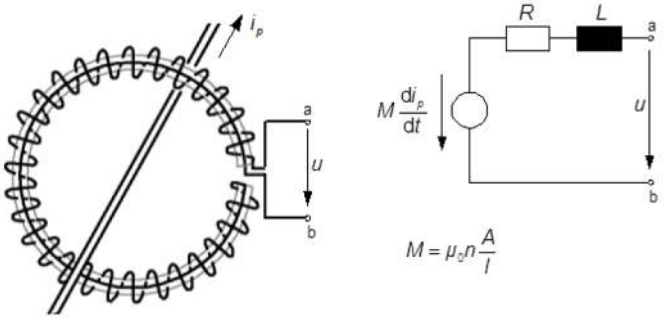

Figure 2. Rogowski coil

The Rogowski coil output signal $u$ and the measured current $i_p$ have a relation follows:

$$u = M\frac{di_p}{dt}$$

Where M is mutual inductance of Rogowski coil

According to above expression, the measured current ip can be obtained from the rogowski coil output signal after integral transform by secondary converter.

Rogowski coil has no iron core and hence has a very good linearity. And its performance is susceptible to influence of the temperature variation and external field, etc. The effect by these interferences can be minimized by printing its winding on circuit board (PCB-type Rogowski coil). PCB Rogowski coil effectively enhances device compactness and structural stability.

## 4.2 Low Power Voltage Transformer

The coaxial capacitive voltage divider is adopted for measuring the voltage. As shown in Figure 3, a cylinder-shaped conductor is connected in parallel at the output of the capacitor voltage divider to enhance the accuracy and improve the transient characteristic of voltage measurement.

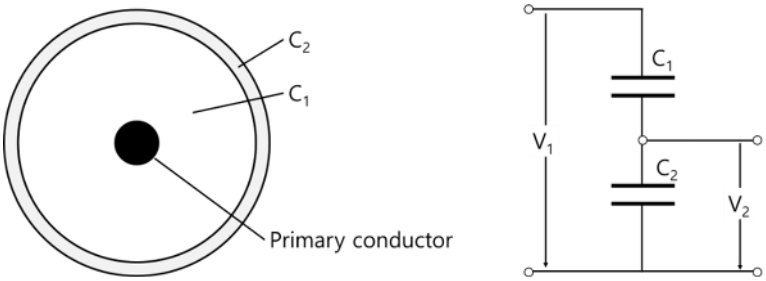

Figure 3. Coaxial capacitive voltage divider

The output signal of capacitor voltage divider V2 and the measured voltage V1 has the following relation:

$$V_2 = \frac{C_1}{C_1 + C_2} V_1$$

Where C1 is high voltage capacitance and C2 is low voltage capacitance.

Based on the above expression, the measured voltage can be obtained from the output signal of voltage transformer by secondary converter.

## 4.3 Interface Board

The Interface Board has two input terminals that receive analog voltage signals generated from the Rogowski coil and capacitive voltage divider per each phasor. The signal from the Rogowski coil is for measurement and protection signals, and the signal from the CVD is divided to an appropriate magnitude.

The output of the Rogowski coil and capacitive voltage divider is connected to the input terminal of the Interface Board through an RG316 cable and SMA connector. Each sensor and the Interface Board are connected with a vacuum connector to maintain Dry-air tightness. The output of the primary converter is connected to the input of the secondary converter through the D-sub connector 37pin.

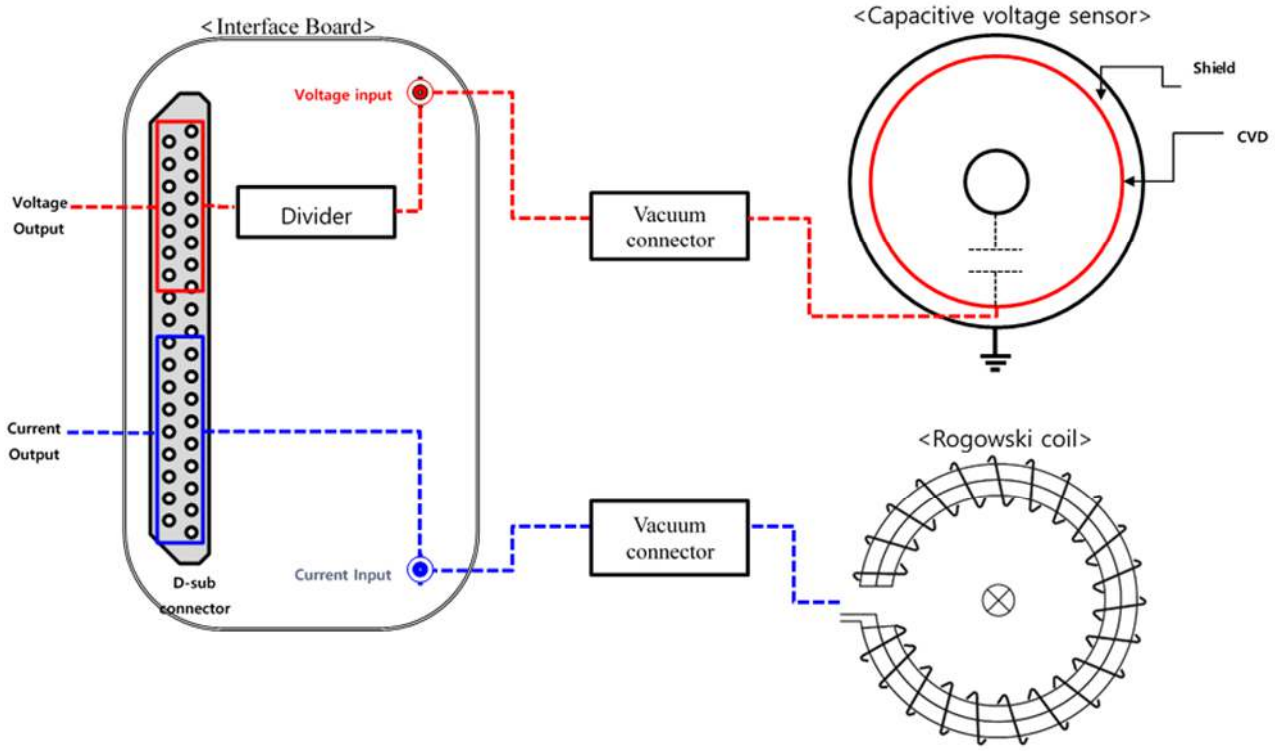

Figure 4. simple diagram of sensor and primary converter

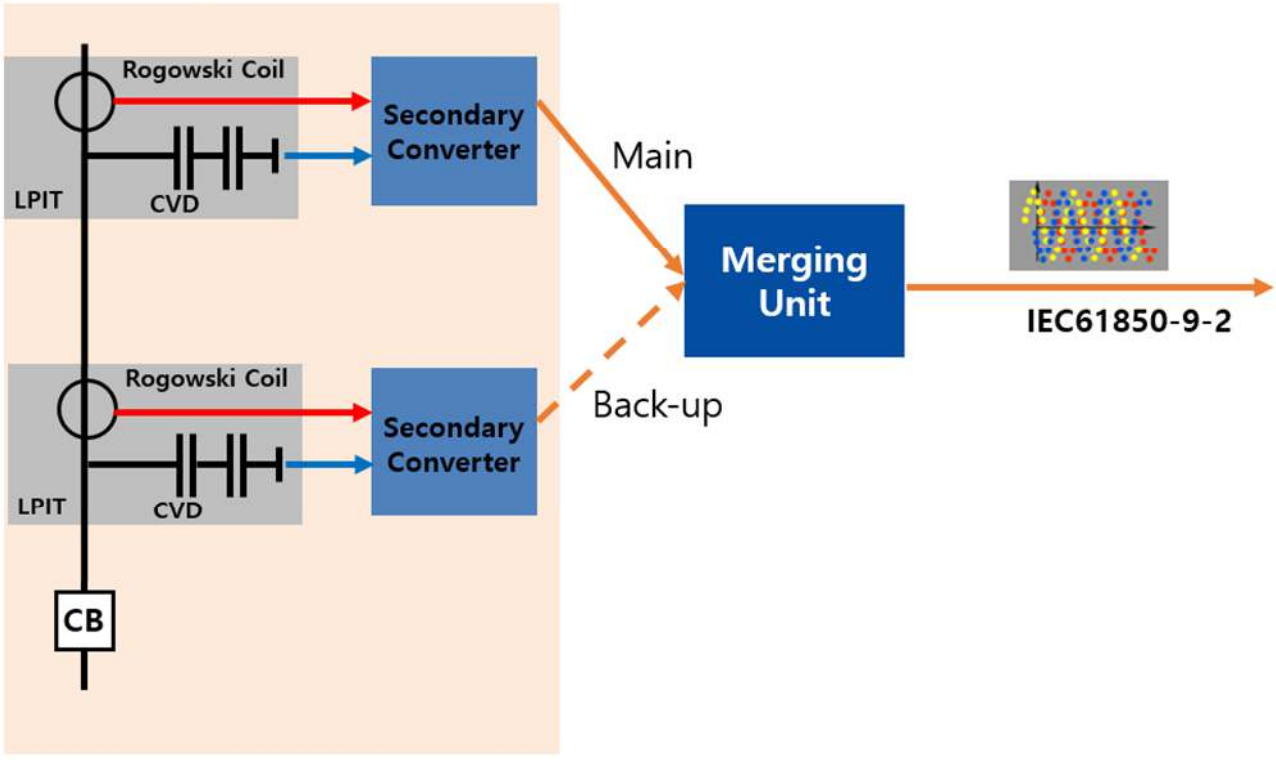
# 5. Secondary Converter

## 5.1. Introduction

### 5.1.1. Overview

Secondary Converter is a device for digital substation that digitizes the analog output value of LPIT and transmits it to MU



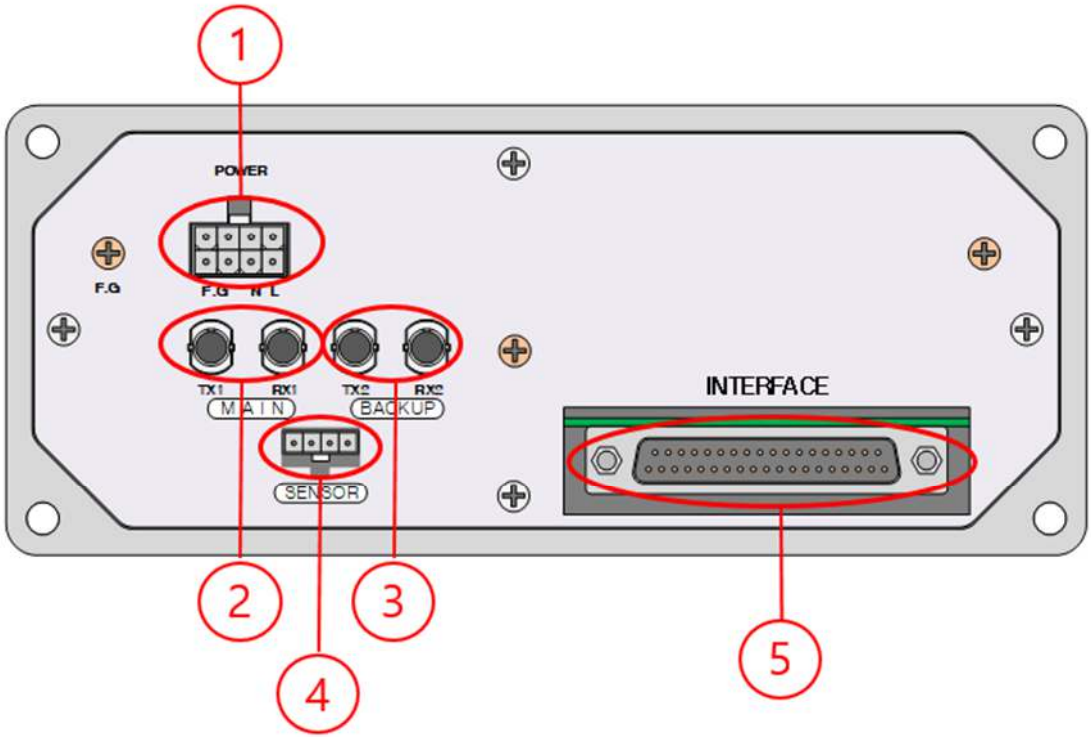
- Obtained IEC61869-6 certification according to LPIT standard
- Confirmed performance that satisfies measurement accuracy 0.1Class by securing analog to digital converter accuracy design technology

### 5.1.2. Features

- Guaranteed voltage/current measurement accuracy of 0.1 Class
- LPCT 3, LPVT 3 connection
- Fiber Optic 10Mbps duplex communication support
- GIS pressure, density sensor connection

### 5.1.3. Connection Diagram

- The followings are configuration diagrams showing the general connection of SC.



## 5.1.4. Specifications

| Classification | Item | Specifications | Note |
|---|---|---|---|
| Condition of Use | Ambient temperature | -40…+80ºC (continuous) | |
| | Relative humidity | <93%, non-condensing | |
| | Height | <1,500m | |
| Rating | Rated frequency | 50Hz, 60Hz Selected | |
| | LPVT | 83.7kVrms | |
| | LPIT Model Protection LPCT | 76,400Arms /108kApeak | |
| | LPIT Model Metering LPCT | 3150A RATED / 6300A Max | |
| | Supplied Power | 85Vac ~ 264Vac / 85Vdc ~ 370Vdc / 6W | |
| Appearance of Product | Dimension (W x H x D) | 205 * 85 * 101mm | |
| | Weight | 1.7Kg | |
| | Material | Aluminum | |
| | Type of Installation | Bolt tightening Method | |

## 5.2. Appearance and Wiring

### 5.2.1. Appearance

- Appearance of rear side

<Back side of SC>

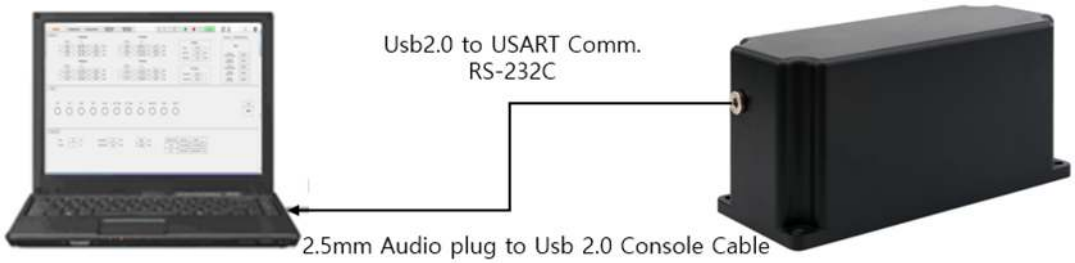
① **Power Supply Unit** connects the power cable of S/C(Secondary Converter) Unit.
② **Main communication** connects IM2 to main communication.
③ **Sub Communication** connects IM2 to preliminary communication.
④ **Sensor Unit** connects cable of the GIS pressure, density sensor.
⑤ **Interface Board Insertion** connects S/C Interface Board.

- Appearance of side of SC

<Side of SC>

① **USB to USART Comm. Console Plug** is connected to plug for maintenance communication after removing screw.

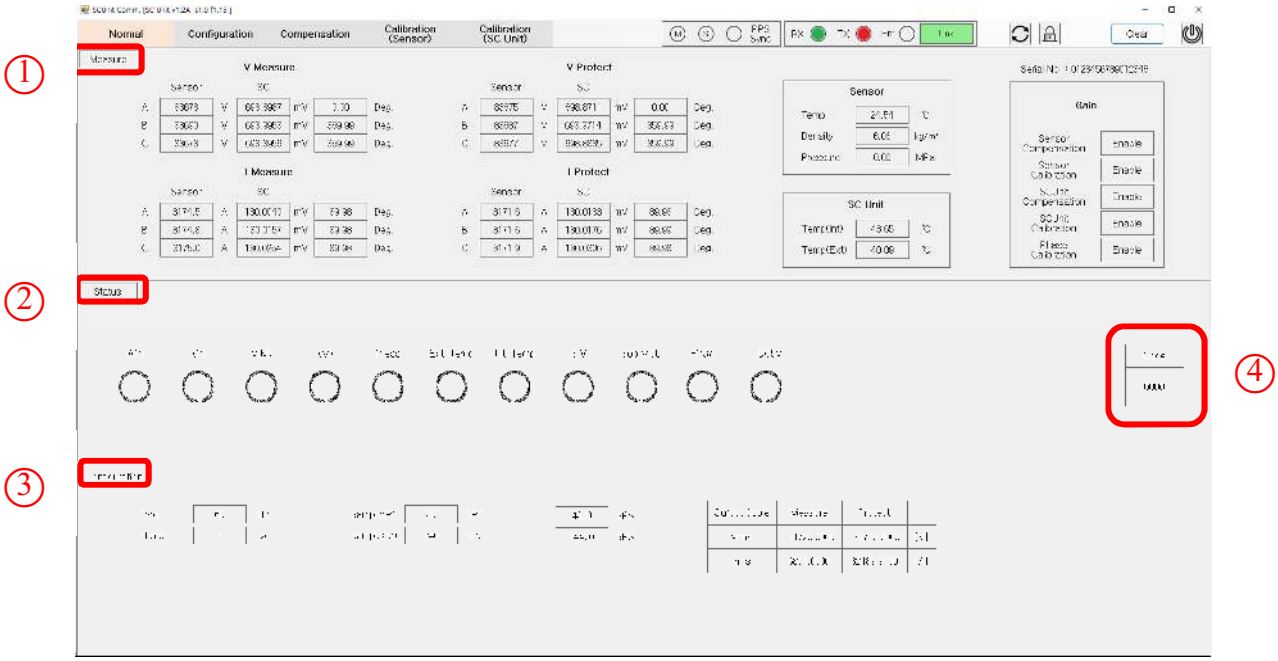
### 5.2.2. Wiring Features



Wiring cables used on the back side should be cables equal to or higher than the following standards.

- Vinyl chloride insulated cable less than 450/750V that meets KSC C IEC 60227-3(2005) or IEEE 383
- Cable for power and ground-related circuit: copper cable of 1.5㎟ or thicker
- Cable for optical communication: Multi-mode, 1310nm
- The solderless terminals must be certified by an authorized agency or conform to KSC 2620 standard.

# 5.3. Maintenance



## 5.3.1. Introduction

The status and alarms of SC can be checked using the PC Interface software. To check the details of SC, the user needs to connect to the SC interface software installed PC to SC USB to USART COMM. port located at the side of the SC. The communication between the SC interface software and SC is shown below.

<Interface software and SC>

## 5.3.2. SC Interface Software

<SC Interface Software at PC>

① **Measure** section shows real time voltage, current, phase, temp, and etc.
② **Status** section alarms H/W failure to user.
③ **Configuration** section shows the settings of SC, such as sampling rate, frequency, and output scale..
④ **Code** shows the SC failures.

The details of Measure and Status section are shown below.

| Section | Component | Description |
|---|---|---|
| Measure | Sensor (left) | Primary voltage & current |
| | SC | CVD and Rogowski coil voltage and current sensors output |
| | Sensor(right) | LPIT internal measure sensor (Temperature/Density/Pressure) |
| | SC Unit | SC Unit internal PCB temperature |
| | Gain | Calibration and compensation function key (Normally, it should be all enabled) |
| Status | V(P) | Protect voltage circuit measure error or failure |
| | I(P) | Protect current circuit measure error or failure |
| | V(M) | Measure voltage circuit measure error or failure |
| | I(M) | Measure current circuit measure error or failure |
| | Pressure | LPIT internal pressure/density/temperature sensor & RS485 communication error |
| | SV | SC Unit failure |
| | Sub MCU | Analog H/W maintenance sub MCU Failure |
| | FPGA | Communication between MCU and FPGA failure |
| | -±DC5V | Analog circuit power supply failure |

### 5.3.3 Alarm

If the user notices the alarms from the merging unit, the status of the SC should be checked by the error code at the PC interface software to browse the details of the error. The description of the error code is shown below.

| Code | Category | Description |
|---|---|---|
| 0x01 | SV Fail | Serial Number |
| 0x02 | | Communication Error |
| 0x03 | | Calibration Scale Protect 0~2 Settings |
| 0x04 | | Calibration Scale Protect 3~4 Settings |
| 0x05 | | Calibration Scale Measure 0~2 Settings |
| 0x06 | | Calibration Scale Measure 3~4 Settings |
| 0x07 | | Calibration Save Code Protect 0 Settings |
| 0x08 | | Calibration Save Code Protect 1 Settings |
| 0x09 | | Calibration Save Code Protect 2 Settings |
| 0x0A | | Calibration Save Code Protect 3 Settings |
| 0x0B | | Calibration Scale Code Protect Settings |
| 0x0C | | Calibration Save Code Measure 0 Settings |
| 0x0D | | Calibration Save Code Measure 1 Settings |
| 0x0E | | Calibration Save Code Measure 2 Settings |
| 0x0F | | Calibration Save Code Measure 3 Settings |
| 0x10 | | Calibration Scale Code Measure Settings |
| 0x11 | | Output Scale Settings |
| 0x12 | | Integral Compensation Settings |
| 0x13 | | Electrical Resistance Phase Protect Settings |
| 0x14 | | Electrical Resistance Phase Measure Settings |
| 0x15 | | Bias Protect Settings |
| 0x16 | | Bias Measure Settings |
| 0x17 | | Rogowski Protect Gain Settings |
| 0x18 | | Rogowski Measure Gain Settings |
| 0x19 | | CVD Protect Gain Settings |
| 0x1A | | CVD Measure Gain Settings |
| 0x1B | | Sensor Rogowski -40~10 Degree Gain Settings |
| 0x1C | | Sensor Rogowski 20~80 Degree Gain Settings |
| 0x1D | | Sensor Rogowski -40~10 Degree Phase Settings |

| | | |
|---|---|---|
| 0x1E | | Sensor Rogowski 20~80 Degree Phase Settings |
| 0x1F | | Sensor CVD -40~10 Degree Gain Settings |
| 0x20 | | Sensor CVD 20~80 Degree Gain Settings |
| 0x21 | | Sensor CVD -40~10 Degree Phase Settings |
| 0x22 | | Sensor CVD 20~80 Degree Phase Settings |
| 0x23 | | SCUnit Rogowski -40~10 Degree Gain Settings |
| 0x24 | | SCUnit Rogowski 20~80 Degree Gain Settings |
| 0x25 | | SCUnit Rogowski -40~10 Degree Phase Settings |

# 6. Installation

## 1. Installation

During assembling, attention shall be paid to the following matters.

Don't separate secondary convertor to the plate without permission.

## 2. Wiring

Number of LPCT/LPVTs to be configured for the LPIT depends on whether the duplex configuration is made for the relevant protection device and composite unit. The wiring mode of LPIT is given below.

1) Wiring of secondary convertor

LPIT is provided with two secondary convertors. The wiring diagram of primary convertor is shown below.

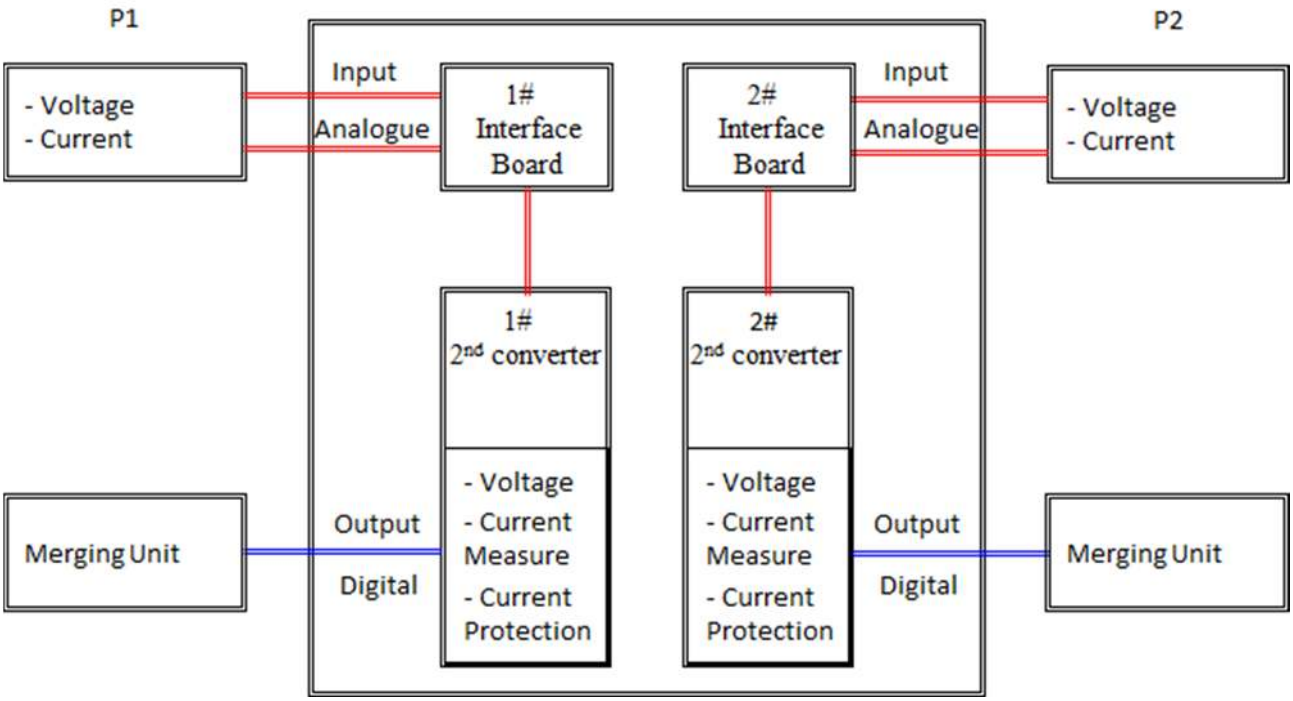

Figure 5. Wiring of Interface Board & secondary convertor

2) LPIT connection with MU(Merging Unit)

The merging unit is installed locally in the marshalling cubicle or in the protection cubicle nearby the cubicle, the optic cable from the secondary convertor will be led into the cubicle where the merging unit.

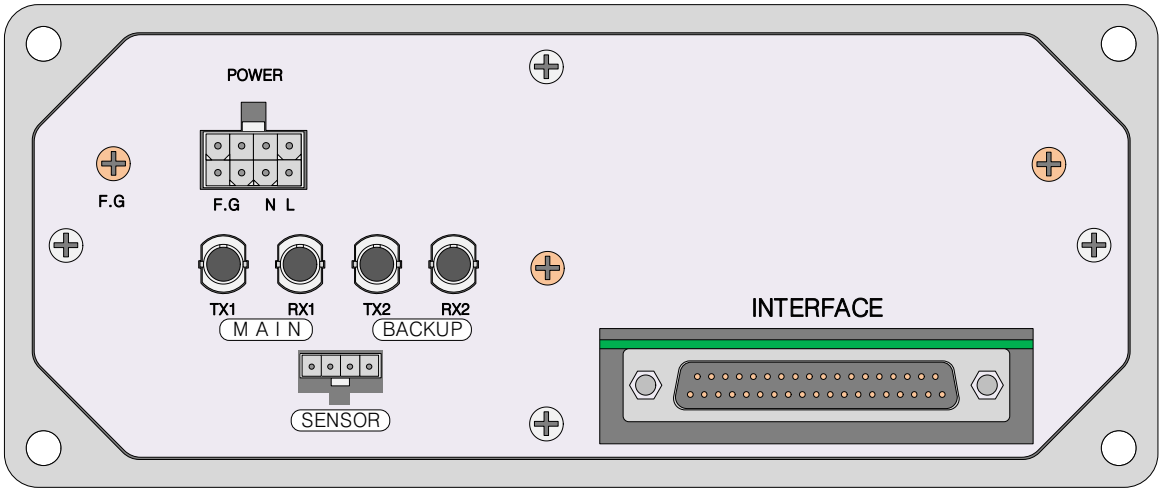

Figure 6. Secondary converter

The Secondary converter has two optical communication connectors, MAIN and BACKUP, for redundant to the merging unit. The communication cable is made with two pairs of optical(ST-type) connectors to connect MAIN and BACKUP merging unit. It is also possible to connect to only MAIN merging unit. Specifications for optical communication cable are listed in the table below.

| Classification | Description |
|---|---|
| Number of Port | 2 (physical) |
| Characteristics | Glass optical fiber |
| Connector type | Duplex ST(to SC), Duplex LC(to MU) |
| Fiber type | Multi-mode (62.5 μm/125 μm optical cable) |
| Transmission distance | Maximum 2km |
| Wave length | 850nm |
| Bit Rate | 50 Mbps |
| Protocol | Manufacturer's own protocol |

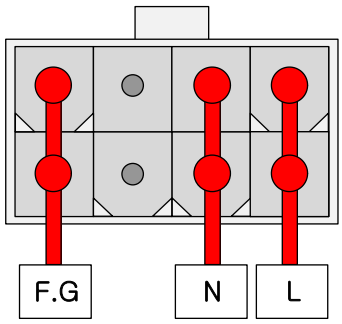

Figure 7 Power cable Connection

The secondary converter power terminal consists of three wires, each connected to L, N, and F.G., and the power rating is listed in 3.A Power Supply. There is a terminal for F.G. on the power line, but use another F.G. line and fasten it with a bolt to the F.G. connection terminal of the secondary converter.

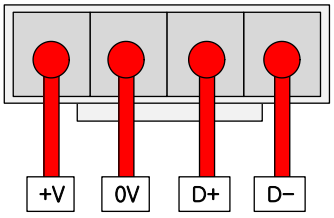

Figure 8 Temperature sensor cable Connection

The connection terminal for the temperature sensor consists of two power lines and two communication lines.

# 7. Maintenance

**WARNING** **Do not remove any protective covers if an assembly is energized**

Assemblies of the product are energized with hazardous voltages. Contact with live parts can lead to death or severe injuries.

Check the readings of Dry-air pressure gauge in the routine inspection. Please check whether there is no gas leaking.

No recalibration is needed after the LPIT is assembled. When recalibration of secondary convertor is needed, it should be replaced as calibrated secondary convertor from Hyosung. The old secondary convertor should be shipped back to Hyosung for recalibration.

# INSTALLATION, OPERATION AND MAINTENANCE MANUAL

## PART B-13

## VIEWPORT OF GIS

## CONTENTS

1. General ..... 2
2. Construction ..... 2

## 1. General

To check contact status of disconnecting switch and grounding switch physically, there is viewport on GIS module

## 2. Construction

The construction of viewport is shown Fig. VP-1

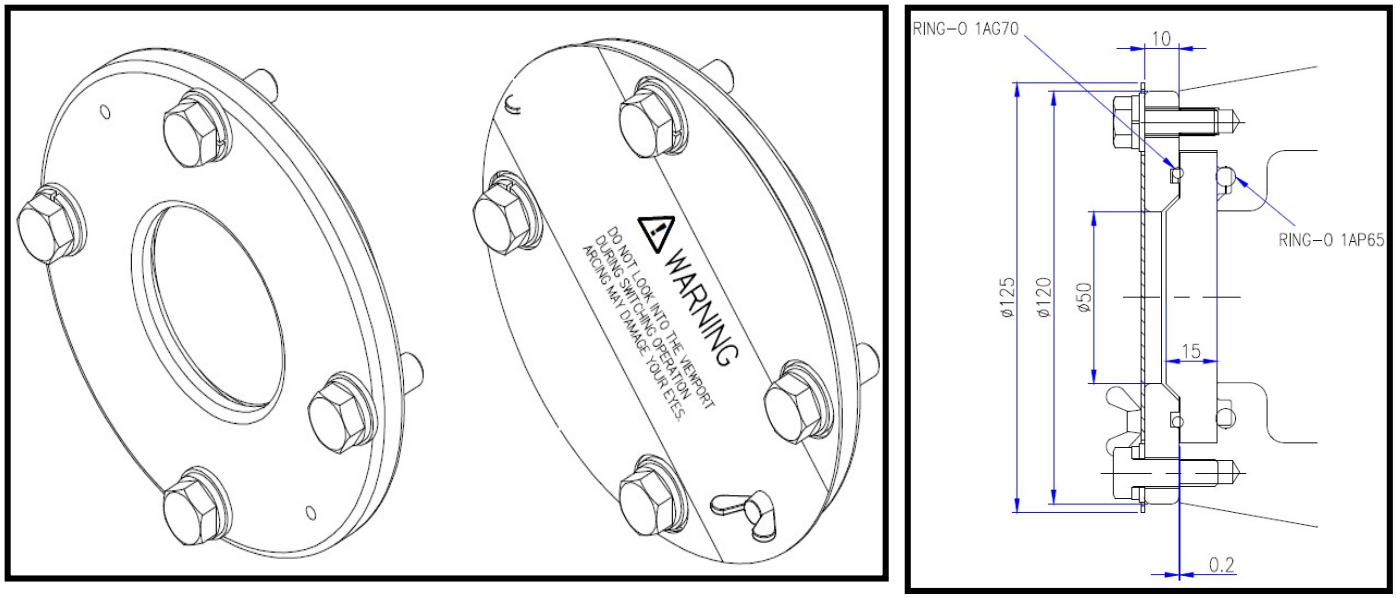

**Fig. VP-1. Feature of viewport**

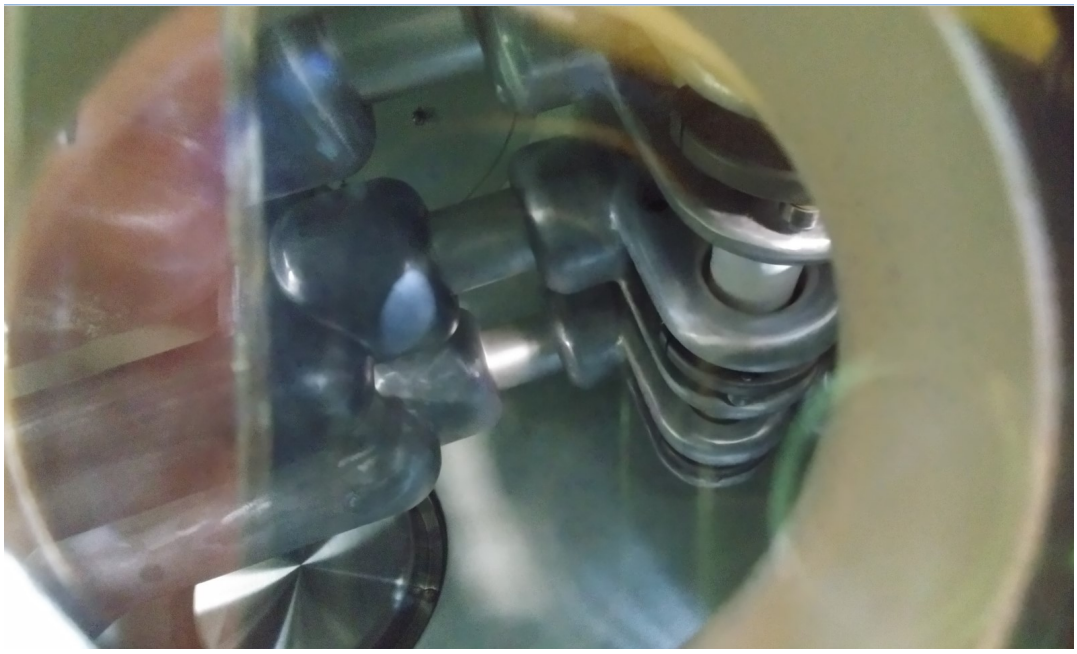

**Fig. VP-2. Example of Contact status check through viewport**

# INSTALLATION, OPERATION AND MAINTENANCE MANUAL

## PART B-14

## Local Control Panel of GIS

## CONTENTS

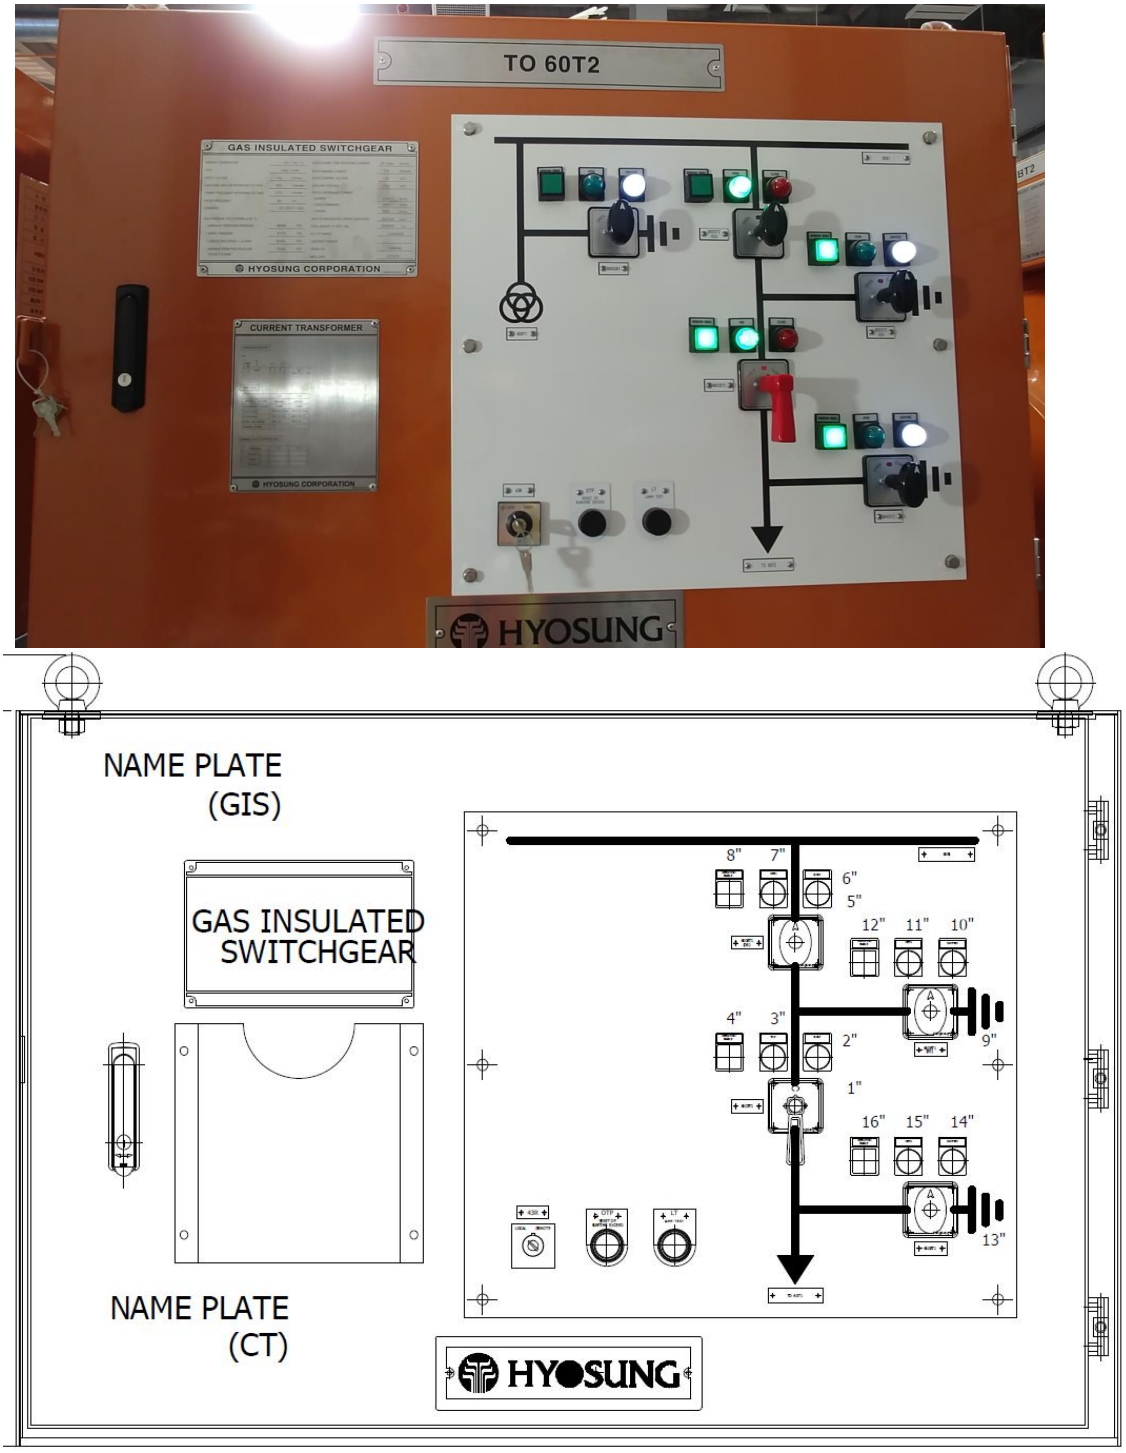
1. General ..... 2
2. Construction ..... 2

## 1. General

Local control panel (LCP) is used for controlling GIS device for testing and maintenance. Each LCP has interlocking circuit arrangement and operation is following the interlocking scheme

## 2. Construction

The construction of LCP is shown on Fig. LCP-1



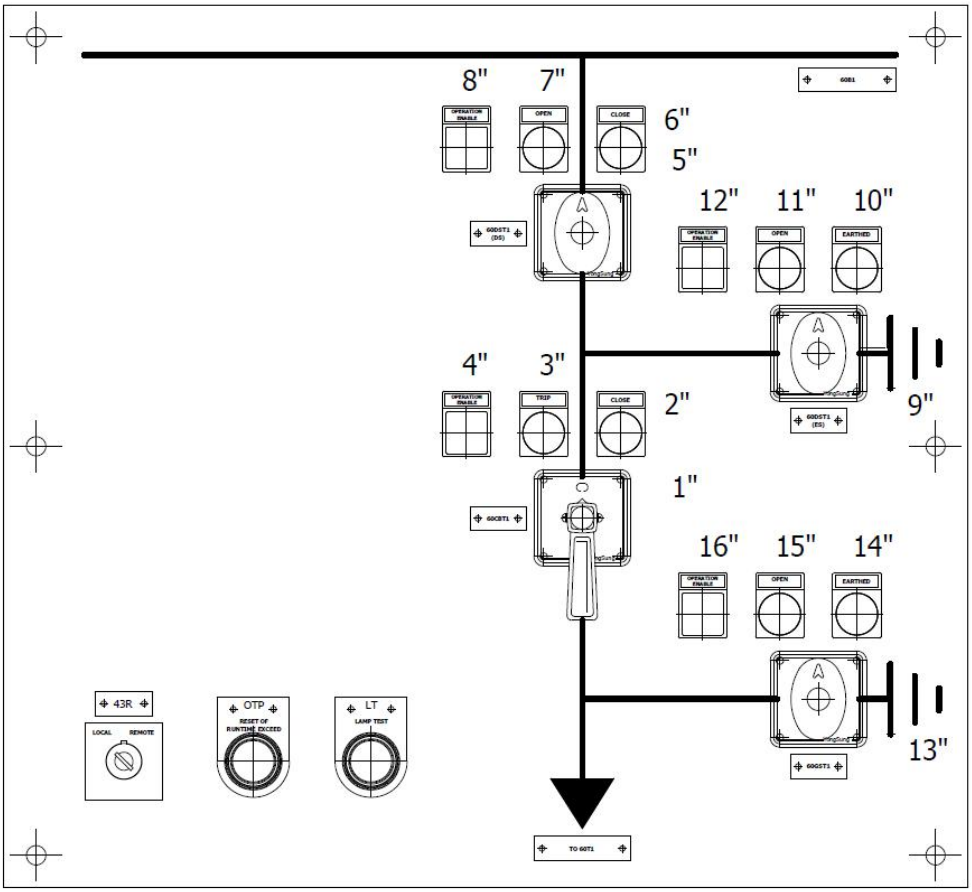


**Fig. LCP-1. Example Structure of LCP**

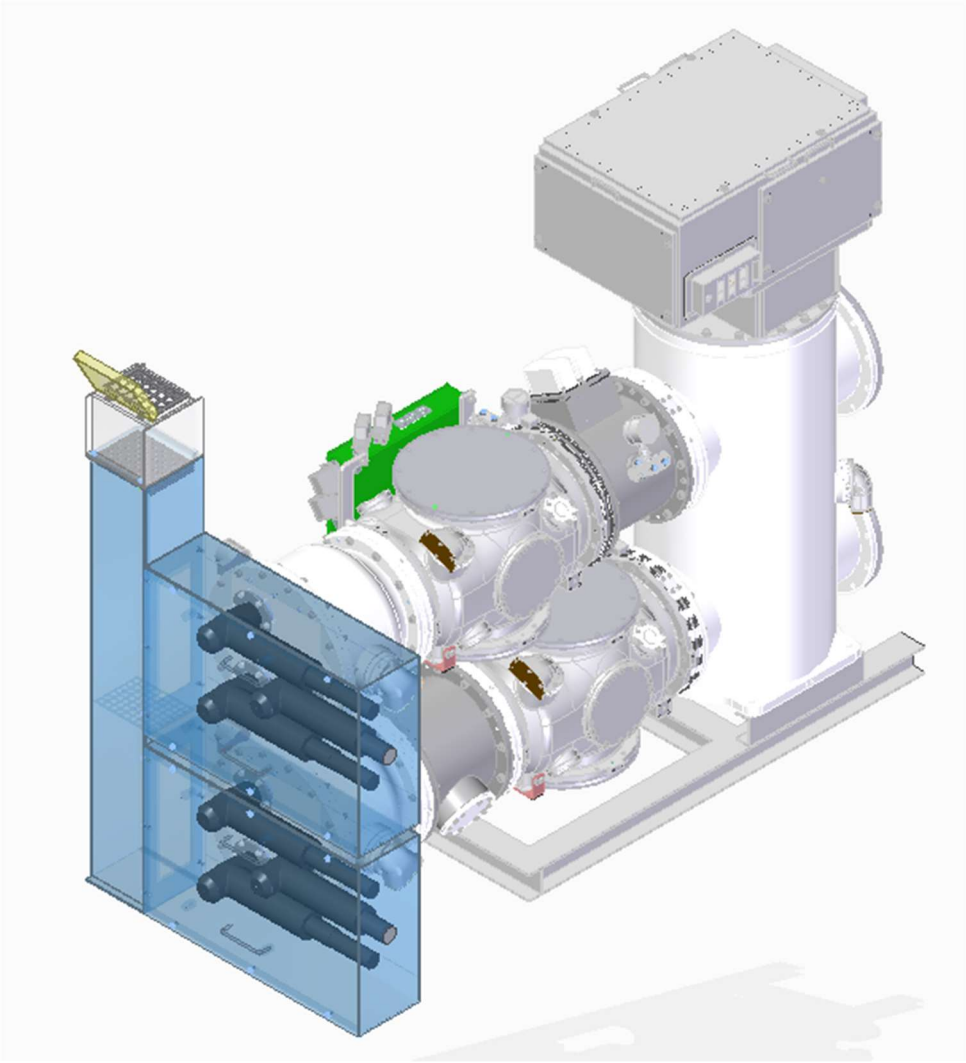
Each LCP has MIMIC that has single line of GIS and switch for controlling the GIS equipment and lamp showing status of the equipment as below. Fig. LCP-2



| ITEM | DEVICE TAG | NAMEPLATE | FACEPLATE | FUNCTION |
|---|---|---|---|---|
| 1 | CS1 | 60CBT1 | TRIP/CLOSE | SELECTOR SWITCH FOR 60CBT1 CONTROL |
| 2 | CLOSE1 | - | CLOSED | PILOT LAMP FOR 60CBT1 CLOSE RED INDICATOR |
| 3 | TRIP1 | - | TRIP | PILOT LAMP FOR 60CBT1 TRIP GREEN INDICATOR |
| 4 | OE1 | - | OPERATION ENABLE | PILOT LAMP FOR 60CBT1 OPERATION ENABLE GREEN INDICATOR |
| 5 | CS2 | 60DST1(DS) | OPEN/CLOSE | SELECTOR SWITCH FOR 60DST1(DS) CONTROL |

# 1. PERIODIC INSPECTION AND MAINTENANCE PROCEDURE

## 1.1.1 General

Among GIS equipment, inspection works on Gas Circuit Breaker shall be the most important works because GCB is the key component and has heavier duties than any other component mechanically and electrically.

Therefore it is important to follow the procedures about Gas Circuit Breaker including

Dry air, and the description about it is detailed mainly.

Concerning about the components except Gas Circuit Breaker, it is recommended that they are inspected at the same inspection period as Gas Circuit Breaker, however so detailed procedure as Gas Circuit Breaker are not described because

they are basically maintenance-free components, and the required procedure for them are almost same as what will be described in Gas Circuit Breaker.

- For Inspection Criteria, refer to Table C1-1.
- For Contact Inspection criteria, refer to Table C1-2.
- For Concept for Inspection and Maintenance recommendation, refer to Table C1-3

According to of algorithm of Fig.C1-1~C1-3, it is recommended that the section of GIS is inspected and maintained. If any problem during each step of inspection, preventive maintenance is needed

- For Patrolling Inspection Procedures, refer to Table C1-4.
- Table C1-5 ~ C1-6 shows the Inspection Point of GIS.
- Table C1-7 ~ C1-10 shows the recording format of each component of CB at the inspection for the customer's convenience.

| No. | Inspection Item | Inspection Period | After start of service | Contents | Remarks |
|---|---|---|---|---|---|
| 1 | Patrolling Inspection | - | - | Recommend to as per customer practice | See Table C1-4,5 |
| 2 | Ordinary Inspection | - | Every 5 years | Conduct maintenance and inspection by utilizing service interruption with-out discharging Dry air. | See Table C1-6 |
| 3 | Detail Inspection | Every 2,000 operation | Every 20 years | Conduct maintenance and inspection discharging Dry air. | - |

Table C1-1 INSPECTION CRITERIA

a) Circuit breaker

| | | |
|---|---|---|
| Rated interrupting current | 40000A (40kA) | Once every 10 operations |
| Interrupting current | 10000-15000A (10~15kA) | Once every 30 operations |
| Interrupting current | 5000A (5kA) | Once every 100 operations |
| Rated current | 2000A | Once every 2,000 operations |
| No-load operation | - | Once every 10,000 operations |

b) Disconnecting switch

| | |
|---|---|
| No load switching | Once every 10,000 operations |
| Switching | Once every 2,000 operations |

c) Earthing switch

| | |
|---|---|
| With making capacity (High Speed ES Only) | Once every 2 making operations Or Once every 2,000 operations |
| Others | Once every 10,000 operations Once every 2,000 switching |

Table C1-2 CONTACT INSPECTION CRITERIA

## 1.1.2 Patrolling Inspection

▪ Conduct a Patrolling Inspection in order to check to faulty or improper operating condition of device.
Important checking point is gas pressure.
▪ For the procedure, refer to Table C1-4.
▪ For the checking items, refer to Table C1-5.

| No. | Descriptions items | Inspection procedure |
|---|---|---|
| 1 | Gas pressure | Read pressure on gas pressure gauge(1) in Gas System Diagram<br>Record the gas pressure, ambient temperature.<br>If any Dry air leakage is detected, supply the Dry air according to the procedure described in before the gas pressure drops to the alarm pressure. |
| 2 | Operation counter | Check and record the number of operation. |
| 3 | Space heater | When the check the operations of heaters as bellows humidity is high, the temperature drops sharply or the ambient temperature is low, the heater in the control cubicle is operated to turn on |
| 4 | Closing spring | Check that charged / discharged indicator shows charged. |
| 5 | Others | Check if abnormal noise occurring. |

Table C1-4 PATROLLING INSPECTION PROCEDURE

| Inspection Item | No. | Main points of inspection | Reference | Result |
|---|---|---|---|---|
| DRY AIR | 1 | Gas pressure with gauge | Gas System Diagram | |
| | | | Gas System Diagram | |
| | 2 | Gas piping and valve | Tightness | |

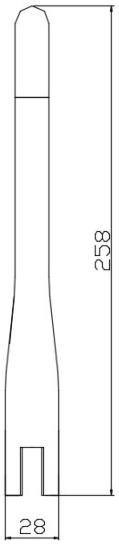
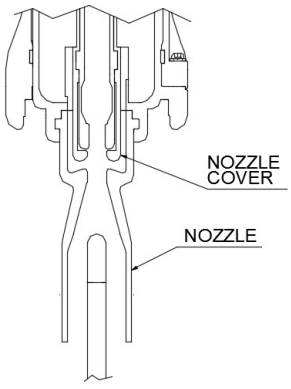
Table C1-5 PATROLLING INSPECTION POINT

## 1.1.3 Ordinary Inspection





- Conduct an ordinary inspection at not live condition of objective equipment, without discharging gas.
- The following caution should be paid before inspection starts.
- Ordinary inspection point, refer to Table C1-6 .

| Inspection Item | No. | Main points of inspection | | Reference | | Result |
|---|---|---|---|---|---|---|
| DRY AIR | 1 | Patrolling inspection (related to 1, 2) | | Table C1-5 | | |
| | 2 | Gas piping and valve | | Tightness | | |
| | 3 | Gas pressure with tool | | Gas System Diagram | | |
| | | | | Gas System Diagram | | |
| | 4 | Local point gas leak test<br>(If more than one alarm per year) | | 0.5%/year,<br>Table C1-9 | | |
| | 5 | Check moisture of gas | | CB : 150ppm<br>(max 300) | | |
| | | | | Others:<br>300ppm<br>(max 500) | | |
| | 6 | Measurement SO2 content | | Below 1ppm | | |
| | 7 | Density switch check of CB | Leak stage 1 | Make | Gas System Diagram | |
| | | | | Break | | |

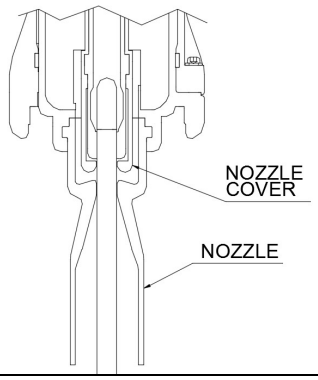
| | 42 | Condition check contact in visual window | | No damage | |
| | 43 | Operation with manual tool | | Normal operating | |
| | 44 | Operation with electric power | | Normal operating | |
| | 45 | Estimate condition of contact | | Table C1-2 | |
| | 46 | Link, lever, pins, bolts and nuts | | Normal, Tightness | |
| | 47 | Shock absorber | | No leak | |
| | 48 | Auxiliary switch of contact | | Normal | |
| | 49 | Auxiliary switch of lever | | No damage | |
| | 50 | Contact of limit switch | | Normal | |
| | 51 | Wiring | | Tightness | |
| | 52 | Lubrication (If applicable) | | Table C1-14 | |
| Others | 53 | Patrolling inspection (related to 17) | | Table C1-5 | |
| | 54 | Function test of local control panel (interlock, operating, lamp, alarm) | | Normal | |
| | 55 | Wiring of CT & local control panel | | Tightness | |
| | 56 | Insulation resistance | Main circuit | Over 1,000MΩ | |
| | | | Auxiliary circuit | Over 2MΩ | |
| | | | Refer to Table C1-9 | | |

Table C1-6 ORDINARY INSPECTION POINT

| No. | Inspection item | Inspection and repair procedure | Disassembly procedure | Person and hour |
|---|---|---|---|---|
| 1 | Stationary arcing contact | When contact surface is found uneven, remove it from interrupter, and contact it with sandpaper.<br>When the wear has become 2mm or over, replace the contact with a new one.<br>Apply thin coat of Rubchem grease to the contacts | Take off the upper enclosure and conductor as shown Fig. C-13, loosen M10 bolts and exchange stationary arcing contact<br> | 2 persons<br>X<br>12 hours<br><br>(This item Includes the Dry air collecting and refilling Dry air.) |
| 2 | Moving arcing contact | When surface is found uneven, polish the surface with a smooth cut file.<br>When the amount of wear become 2mm or over, replace the contact with a new one.<br>Apply thin coat of Rubchem grease to the contacts | Dimension of arcing contact to be measured are indicated below.<br> | |



| No | Inspection item | Inspection and repair procedure | Disassembly procedure | Person and hour |
|---|---|---|---|---|
| 3 | Insulation nozzle and Insulation cover | Use lint free cloth to clean up the interior and exterior. When the nozzle's or cover's inner diameter is enlarged by 1mm or more, replace it with a new one. | The nozzle and cover can be removed together with the moving contact. Dimensions of nozzle can be measured as picture below.   | |
| 4 | Insulation material | Use lint free cloth to clean up the surface. When any crack or color change of nozzle is found (with camera), replace it with a new one. | | |
| 5 | CB linkage adjustment | When linkage of CB is adjustment, refer to below Open gap 10mm Stroke 120±1 mm Wipe 29.2±1 mm | | |

Table C1-7 CONTACT INSPECTION CRITERIA

| No | Inspection item | Inspection and repair procedure | Disassembly procedure | Person and hour |
|---|---|---|---|---|
| 1 | Absorbent | Replace with a new one. Exchange it quickly just before vacuum drying. | Remove the hand hole cover, and take out the absorbent case to replace absorbent with a new one. | |

Table C1-8 ABSORBENT REPLACE CRITERIA

| No. | Check items | Measured value | Check marks |
|---|---|---|---|
| 1 | Confirm that each insulation resistance exceeds 1,000 MΩ by 1000V Megger.<br>- Main circuit to ground<br>- Between poles | | |
| 2 | Confirm that each insulation resistance exceeds 2 MΩ by 500V Megger.<br>- CT's secondary wiring to ground<br>- Between CT's secondary wirings<br>- Control and auxiliary circuit to ground | | |

Table C1-9 INSULATION RESISTANCE CHECK CRITERIA

| Check items | | | | | |
|---|---|---|---|---|---|
| Using a gas leak detector, confirm that gas leakage is less than 200ppm for ten hours by accumulation method, after covers the portions to be measured with polyethylene (or vinyl) cloths | | | | | |
| No | Portion | H (Hr) | Pi (ppm by volume) | 10 X pi / H (ppm) | Check mark |
| 1 | Man-holes | | | | |
| 2 | Stop valve | | | | |
| 3 | Gas piping | | | | |

Table C1-10 GAS LEAKAGE CHECK SHEET

* H : Operating time (minimum duration time should be more than 4 hours)

* pi : Gas amount accumulating in the vinyl cloths

* 10 X pi / H : Gas leakage of ten hours

## 1.2 MAINTENANCE PROCEDURE

### 1.2.1 Safety for Manual Operation

The GIS has the mechanisms moving very fast and filled with pressurized Dry air, so most care should be taken to operate the GIS every time.
Besides, since very high voltage is applied to the main circuit, so understand clearly to which portion it is applied or not.
The conditions of the GIS should be confirmed prior to the operations at the Inspection and/or maintenance.
Typical means for safety are shown Table C1-11, but not limited to them;
The correct understanding is really required every time.

| No. | Item | Operation | Explanation |
|---|---|---|---|
| 1 | Closing spring force | Closing circuit breaker. | Before you start maintenance, close Circuit Breaker, for discharging closing spring. |
| 2 | Electric power | Switch off. | Before you start maintenance, cut off electrical power. |
| 3 | Gas | Keep oxygen density. | Before you start maintenance, hand hole put in air up to 0 bar.G |
| | | | Before you enter to inside of tank, you need measure density of oxygen. |
| | | | Do not charge gas in the low plate part. It is easy to stay in the low place. |

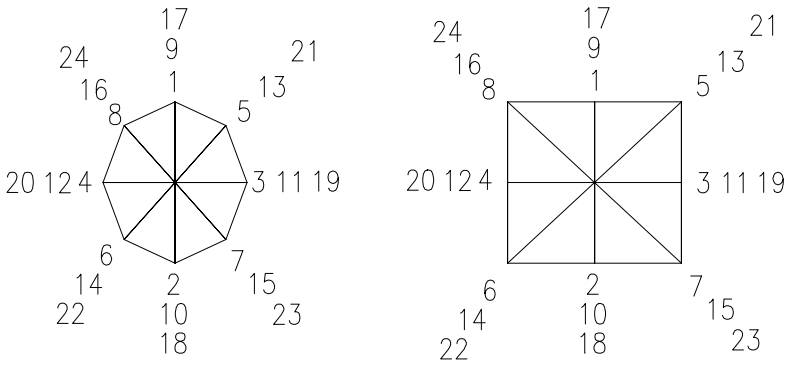


Table C1-11 SAFETY FOR MANUAL OPERATION

## 1.2.2 Tightening and Re-tightening

The torque required to tighten and re-tighten bolts and nuts should be applied the values specified in Table C1-12.
When tightening by more than 2 bolts, tighten bolts not only but more than 2 times in order shown in below 'BOLT TEIGHTENING ORDER'.
Don't forget to tighten all bolts and/or nuts fully.

| Kind of screw thread | Proper torque(kgf·cm) | | | | | |
|---|---|---|---|---|---|---|
| | Steel or stainless steel bolts | | | Copper, brass or aluminum alloy bolt | | |
| | Upper limit | Standard | Lower limit | Upper limit | Standard | Lower limit |
| M4 | 18 | 15 | 12 | 12 | 10 | 8 |
| M5 | 36 | 30 | 24 | 24 | 20 | 16 |
| M6 | 90 | 75 | 67 | 36 | 30 | 24 |
| M8 | 216 | 180 | 160 | 95 | 80 | 65 |
| M10 | 360 | 300 | 270 | 145 | 120 | 95 |
| M12 | 810 | 675 | 610 | 360 | 300 | 240 |
| M16 | 1710 | 1425 | 1280 | 700 | 600 | 500 |
| M20 | 3240 | 2700 | 2420 | 1300 | 1100 | 900 |
| M24 | 5000 | 4200 | 3400 | 2300 | 1900 | 1600 |
| M30 | 8400 | 7000 | 5800 | 4500 | 3800 | 3200 |
| M36 | 14000 | 12000 | 10000 | 8000 | 6600 | 5600 |
| M42 | 23000 | 20000 | 16000 | 13000 | 11000 | 9000 |
| M48 | 35000 | 30000 | 24000 | 19000 | 16000 | 13000 |

Table C1-12 PROPER TORQUE FOR TIGHTENING BOLT AND NUT

BOLT TIGHTENING ORDER

## 1.2.3 DRY AIR Gas System

Whole DRY AIR gas system of the GIS including the gas section is shown in Gas System Diagram.
Enclosure of GIS is filled with DRY AIR gas as specified in gas system diagram
And the gas density detector with pressure gauge which is installed in each compartment always monitors DRY AIR gas pressure.
If the gas pressure of CB section drops to the gas specified in gas system diagram at 20℃, then Low pressure contact is made and alarm is given.

And if it drops the gas specified in gas system diagram at 20℃. Blocks trip and close operation of the circuit breaker.

**1) Insulation at atmospheric pressure**

The insulation strength is designed to withstand the normal operation voltage even when the DRY AIR gas pressure drops to the atmospheric pressure(0 bar.G).

**2) Alarming pressure and locking pressure**

Mostly the gas system is monitored as divided into two systems:

ⓐ Gas Circuit Breaker

ⓑ Bus and Isolator

In the event of the DRY AIR gas pressure drop, an alarm will be operated by the gas density detector at about 10% leakage, if the leakage reached about 20%, Circuit Breaker is to be locked by the relaying sequence then.

**3) Construction of gas density detector**

Fig. C1-4 and C1-5 shows an outline of the gas density detector. Since the DRY AIR gas is sealed in containers, the DRY AIR gas pressure varies along with the surrounding temperature. The pressure will read what higher by general pressure gauges even though there were no change of gas quantity as such (no gas injection). Thus a special pressure switch, so called density detector, which has the temperature compensating function so that the pressure compensated to a certain standard temperature (20℃) can be checked, I.e. the same meaning of the gas density Gas density detectors are provided with each reasonably divided compartment.

## 1.2.4 DRY AIR Gas Refilling(See Fig. C1-4)

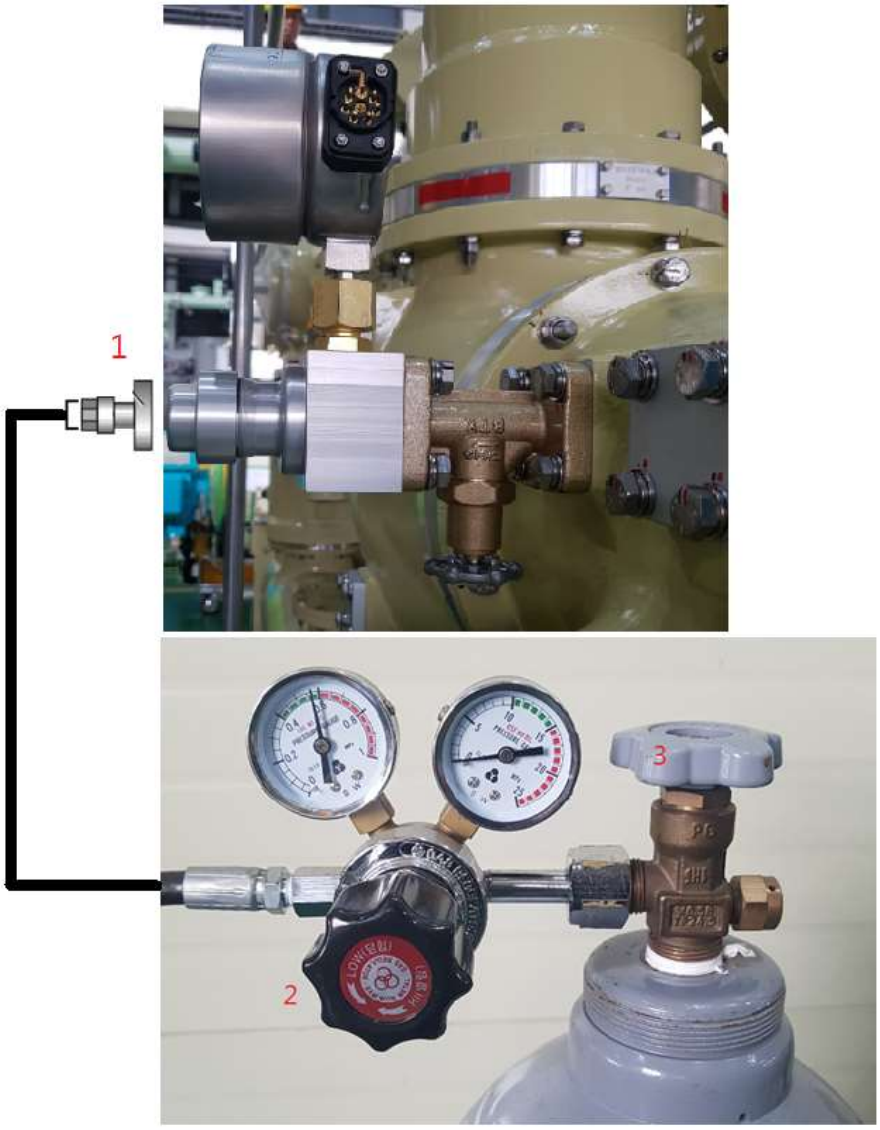

Fig. C1-4 GAS REFILLING DEVICE

1. Injection valve
2. Reducer valve
3. Gas valve

1) Connect Injection valve (1) to GIS valve
2) Open the Gas valve (3) carefully
3) Open the Reducer valve (2) and control with appropriate pressure to inject

## 1.2.5 Gas Density Detector Check (See Fig. C1-5)

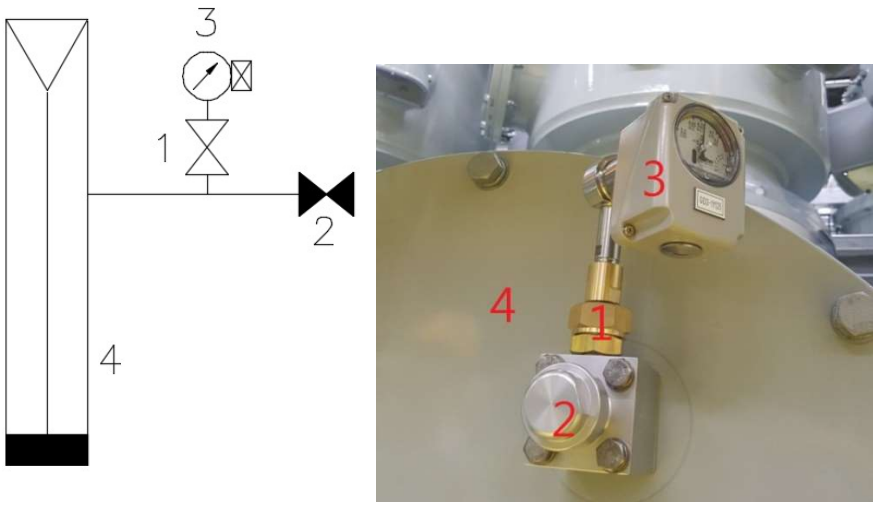

Fig. C1-5 (a) EXAMPLE OF CB GAS PIPING

1) Untie the union of valve (No.1) and pull out GD (gas density monitor, No.3)
2) Connect GD(No.3) to Test Jig and carry out GD calibration Test
3) Re-assemble GD into the valve (No.1) after test

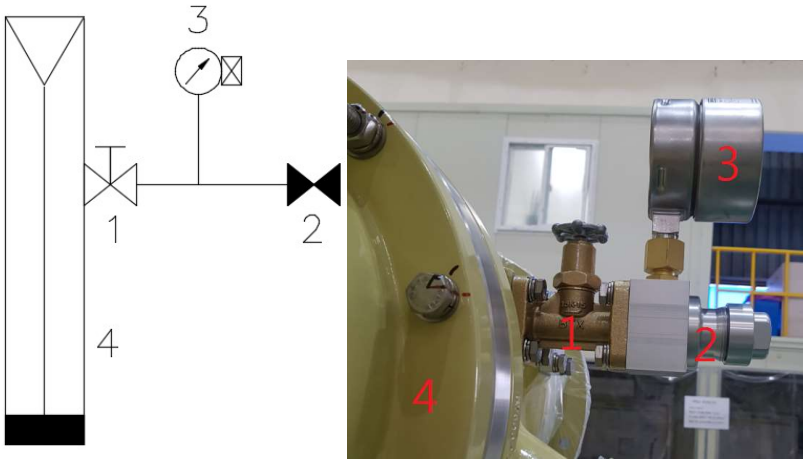

Fig. C1-5 (b) EXAMPLE OF CB GAS PIPING

1) Turn valve (No.1) as much as possible in Close direction
2) Connect Test Jig to valve (No.2)
3) Carry out GD calibration Test
4) Pull out JIG from valve (No.2) after Test
5) Turn valve (No.1) as much as possible in Open direction

## 1.2.6 Dry – Air

(1) Dry-Air consists of O2, N2, Ar and other impurities in regular operation status, The gas life of the device must be equal or greater than the device life.
Gas composition and management standards must be presented at the time of delivery. The standards for impurities are as follows.

**Table 6. Standards for impurities in gas**

| classification | co | $co_2$ | Total hydrocarbon(THC) | Nitrogen oxides(NOx) | Sulfur oxides(SOx) |
|---|---|---|---|---|---|
| **Content(ppm)** | < 1 | < 1 | < 1 | - | - |

(2) Annual gas leakage rate is 0.5% or less, moisture content in gas is 2.6ppmv or less (surrounding environment 0Mpa.G, 20℃) and the condensation point should be below –70℃.

(3) There should be no problem with the device even if O3 gas is temporarily generated during internal arc.

(4) When delivering, mark (paint) the Dry-Air component on the surface of the gas storage container or attach a printed label. It must be identifiable from the outside, and a method for detecting leaks must be provided.

## 1.2.7 Operation Test of CB

Perform the operation test in accordance with the following procedures.
The standard procedure on operation test items to be check is shown in Table C-13 below.

| No. | Procedure | Description | Remarks |
|---|---|---|---|
| 1 | Construction | 1) Check tightening conditions of each part<br>2) Confirm that tools and foreign substances are not left unremoved in each part | Connecting bolts, Base piping. etc.<br>The interior of control mechanism box and the interior of local control panel etc. |
| 2 | Gas pressure check | 1) Check the stop valve of gas piping | Check results referring to "Dry air pressure"<br>Normal gas pressure is 5.0 bar.G(72psig) at 20℃ |
| 3 | Opening and Closing characteristic test<br>Measurement of opening and closing time Measurement | 1) Set the operating time measuring instrument for CB<br>2) Measure the closing time, opening time and the difference between three phase<br>3) Check the control voltage. | Confirm that measured values are almost equal to those on routine test data. |

Table C1-13 CHECK PROCEDURE FOR TEST OPERATION

## 1.2.8 Resistance Measurement at Earthing Switch

The insulation resistance can be measured at the Earthing switch.
When measuring, operate the Earthing switch in the closed condition.
Remove the earthing bars.
Use the 2500V Megger for the resistance measuring, the earthing bars must be reassembled,
and operate the Earthing switch to make it in the "OPEN" position.

**Warning**

1. Shut down the power line of main circuit.
2. The test and inspection are allowed to the qualified person ONLY.

## 1.2.9 Lubrication

Table C1-14 shows lubrication time the kind of lubricating oil.
Avoid using greases not specified in Table C1-14.
Coat grease smoothly by fingers to such an extent that finger prints remain.

| Portion | Name of parts | Lubricated time | | Kind of lubricating oil | Part No. |
|---|---|---|---|---|---|
| | | Ordinary inspection | Detail inspection | | |
| Control mechanism box | Operating rod | | O | Multemp grease | |
| | Hook | O | O | Turbine oil | |
| | Oil | | O | Multemp grease | |
| | Roller | | O | | |
| | Link | O | O | | |
| Control mechanism assembly | Oil dashpot | O | O | Oil (Transformer oil) | |
| | Link, pin | O | O | Multemp gress | |
| Interrupter assembly | Stationary arcing contact | | O | Rubchem | |
| | Moving arcing contact | | O | Rubchem | |

| | | | | | |
|---|---|---|---|---|---|
| Switching Assembly (DS/ES/HES) | Stationary contact | | O | Rubchem | |
| | Moving contact | | O | Rubchem | |

Table C1-14 LUBRICATION STANDARD

## 1.2.10 Maintenance Procedure of Gas Circuit Breaker

Safety precaution

• Before attempting to install, operate, inspect and repair, read and understand this manual sufficiently.

• Due to need knowledge of the GIS using safely, Only qualified personnel are authorized to install, operate, inspect and repair

• We will not accept any liability whatever for damage arising either directly or in directly from the incorrect operation of our product.

• The recipient will not without our prior written approval make this document available neither in part nor in whole to any third party or copy it for any purpose other. Be punished for violation as relevant laws and regulations.

• The information in manual can be changed without prior notice.

• This manual indicate basic of GIS. If you need more information or doing operation except this manual, please contact the below address.

• This IOM Manual is written for explain basic instruction. So it is not always corresponding with offered product. If operating is unable or breakdown is occur ;

1. Time of the occurrence of an accident
2. Type disordered condition
3. Mentioned item of plague of abnormal applicant

(Names of goods, type, capacity, manufacture number)

## Warning

Before installation, operation, maintenance and inspecting, Read the contents of the instruction manual carefully. And we strongly recommend that you prepare safe instruction and preventive measure.
In this manual, symbols of particular importance are marked as followed,
The symbols are divided into three danger stages and information.

| | |
|---|---|
|  **DANGER** | Indicates a imminently hazardous situation which, if not avoided, will result in serious injury or death. |
|  **Warning** | Indicates a potentially hazardous situation which, if not avoided, could result in serious injury or death. |
|  **Caution** | Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. |
| **NOTICE** | Contains information of particular importance. Additionally, a hazardous situation which may result in equipment malfunction. |

## DANGER

• Inspection and Assembly/Disassembly work requires basic familiarity with these equipment. Therefore it must be operated by qualified person only. If someone who has scant knowledge operates these equipment, there is a possibility of bodily harm or damage of products.
• Do not touch on busing terminal of high-voltage and live wire. A loss of lives from electrical shock can occur.
• Opening, disassembly and movement of high-pressure container (gas tank, gas pipe, accumulator, hydraulic actuators, and high-pressure pipeline) must be performed after reducing pressure to air pressure. If not, a loss of live can occur from explosion of container.

## Warning

• Use replacement part which is offered by Hyosung. If not, it can be damaged to safety of operator and capability of appliance.
• Every time you inject Dry air, Use decompressor (Regulator) and inject slowly with low pressure less than 5MPa·G. If not, it can be damaged to body and instrument by high-pressure of gas container.
• To prevent injuries caused by filling over pressure of gas, KEEP standards recorded in tags.
• To prevent injuries or damage of instruments, DO NOT shock gas pipe, hydraulic pipe, insulator, bushing or HTH.
• To prevent injuries caused by fractions of bushing(Porcelain) that filled gas, Should decrease gas pressure in bushing under 5 bar.G(72psig)
• To prevent injuries caused by breaking of spacers with accidental shock, Should decrease gas pressure of working section under 5 bar.G(72psig) at inside enclosure working.
• To prevent injuries caused by electric shock, Should disconnect by opening DS, and ground by making ES at inside enclosure working.
• In case of GIS is under operation or current is isolated, GIS gas should exhaust after neutralization at the surface on the earth level in opened conditions

## Caution

• Check the ground condition before applying main circuit. If ground wire and ground bond is leave out, there is a possibility of a shock and it can adversely affect the proper functioning of this instrument.

• When checking up the operating part of breaker, Inspector has to carry out an inspection after remove all of oil pressure by using stop-valve. (Oil pressure should be 0 bar.G) When inspects from the condition where the if oil pressure becomes filling, there is a possibility of injury with the physical contact which is accidental

• Operational angle, length and gap etc. of link, lever and hook of breaker electronic hook organization does not regulated with option. If do regulate with option there is a possibility of accidental occurrence operation of the breaker.

• When operate in manual operation by using Shutter open button for Motor-spring operator, relationship without interlock condition is possible. Therefore, please make sure interlock condition with other instrument before operation

• Do not open the secondary circuit of the BCT (Bushing Current Transformer). If the secondary circuit is opened, operator may have injury because of the electric shock.

• Do not approach or touch Link and Lever which is connected to operating mechanism, while the GIS equipment is being operated. If not avoided, could result in moderate injury

• When the main body pulling up, certainly confirm a weight which is marked on the plate and use the proper rope and method. If it is not like that the equipment could be damaged which is caused by falling and dropping.

▪ PREPARATION

- Before disassembling the above equipment, be sure to carry out the following procedure.

1. Confirm that the above equipment concerned are de-energized (CB : Open).
2. Cut off the power source of the control cable connected to the CB.
3. Disconnect the power cable.
4. Evacuate SF6 gas from the gas compartments of CB and connected equipment.

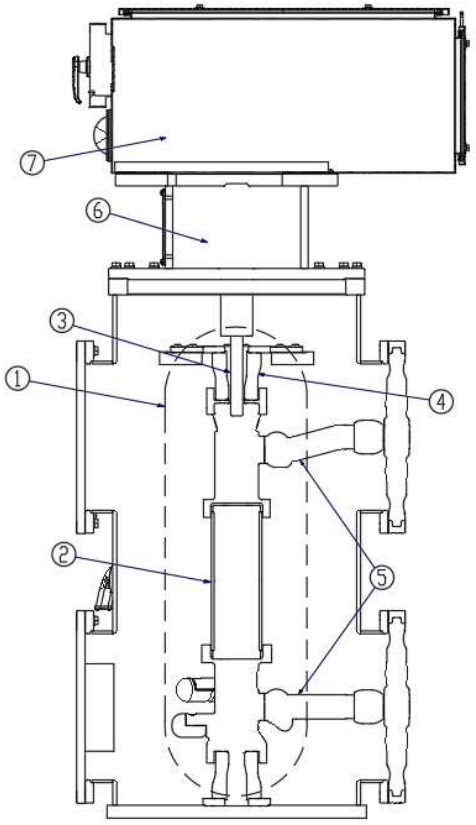

FIG. C1-6 STRUCTURE OF CIRCUIT BREAKE

| No | DESCRIPTION |

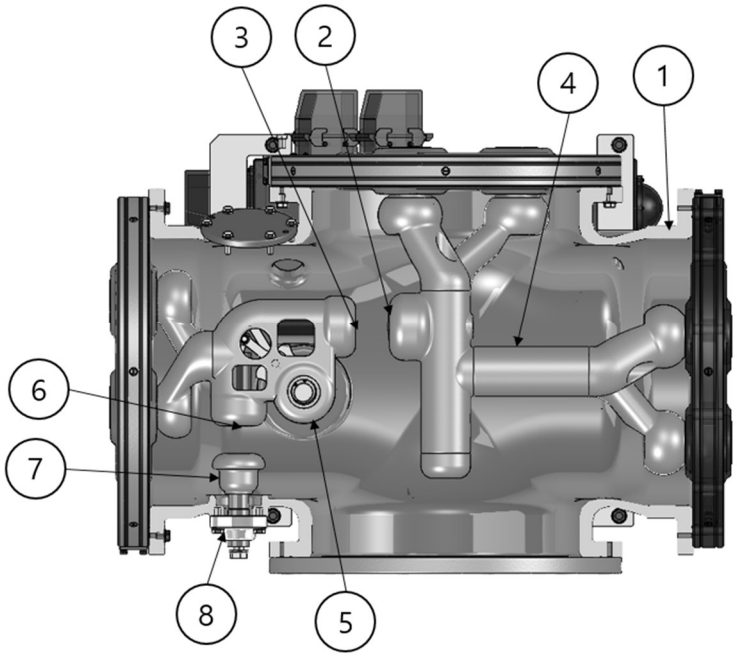
| Water content, as shipped (wt-%) | <1 | <1 | <1 | <1 | <1 | <1 |

(1) Measured at 250 mm Hg and 25 °C
(2) Measured at 17.5 mm Hg and 25 °C

Fig. C1-9 SPECIFICATION OF ABSORBENT

▪ CHANGE AND ASSEMBLE GCB



1. Change the Arcing contact, Cover, Nozzle, Spring and Main contact as Table C1-7 CONTACT INSPECTION CRITERIA.
2. Assemble Interrupter of GCB in reverse procedure of disassembly.

## 1.2.11 Maintenance Procedure of DS&ES

▪ PREPARATION

- Before maintenance the above equipment, be sure to carry out the following procedure.

1. Confirm that the above equipment concerned are de-energized (DS: Open, ES : Closed).
2. Cut off the power source of the control cable connected to the DS & ES.
3. Disconnect the power cable.
4. Evacuate DRY AIR gas from the gas compartments of DS & ES and connected equipment.
5. Following procedure is assembling procedure.

| No. | DESCRIPTION |
|---|---|
| 1 | ENCLOSURE |
| 2 | CONTACT |
| 3 | MOVING CONDUCTOR |
| 4 | CONDUCTOR |
| 5 | OPERATION LINK MECHANISM |
| 6 | MOVING CONDUCTOR |
| 7 | CONTACT |
| 8 | INSULATOR BUSHING |

Fig. C1-10 STRUCTURE OF DS & ES.

▪ ASSEMBLE 3PDS TANK AND OPERATION MECHANISM.

1. Assemble the fixed conductor to moving conductor tank.
2. Attach the mechanism box to 3PDS tank.
3. Disassemble 3PDS in reverse procedure of disassembly
4. Change the contact and shield on disassembly procedure.

## 1.2.12 Maintenance Procedure of others

1. Confirm that the above equipment concerned are de-energized (CB: Open, DS: Open, ES : Closed).
2. Cut off the power source of the control cable connected to the CB, DS & ES for maintenance section.
3. Disconnect the power cable.
4. Evacuate DRY AIR gas from the gas compartments of DS & ES and connected equipment.
5. Loose the bolt both side enclosure for maintenance.
6. Change the contact and clean the inside of enclosure.
7. Connect the enclosure to another enclosure.

## 1.2.13 Checking procedure for gas system

1. Connect the inlet valve of measuring instrument to GIS gas valve.
2. Measure moisture content through outlet valve of measuring instrument.
3. Standard of moisture content

- Section of CB : more than -13℃

- Others : more than -8℃

- Graph shows dew point and moisture content for DRY AIR Gas

Graph Dew point vs. pressure and moisture content for DRY AIR

4. Testing equipment (DILO or Parametric: Dew point meter)

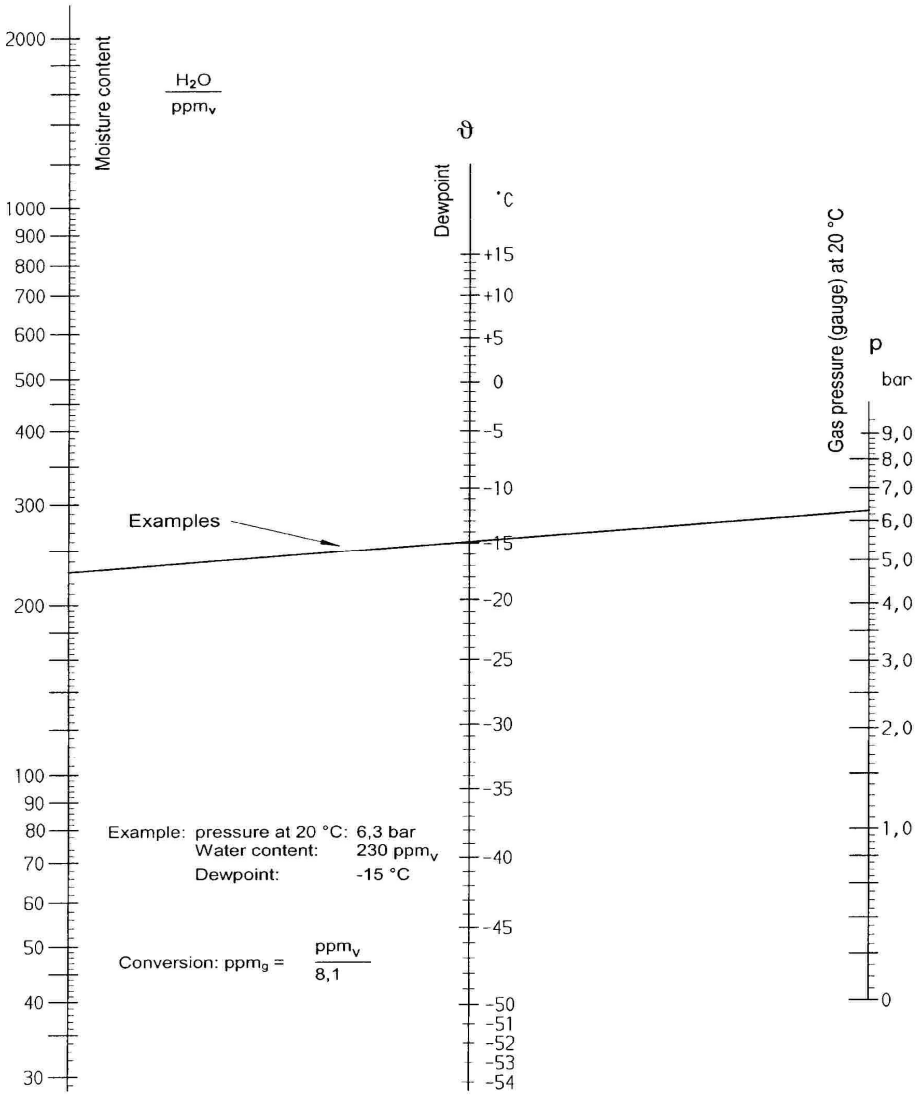


Fig. C1-23 Testing Equipment (MULTI ANALYZER)

## 1.2.14 Earthing system

1. Earthing system for LCC

1) Earthing between body and door for LCC

- Bolt the 22SQ cable in LCC as below Fig. C1-25.

Fig. C1-25 Earthing between body and door for LCC

2) Main earthing for LCC

- Install the Earthing plate as below Fig. C1-25
- Specification of earthing plate

a) The both side of LCC : TWL 5 X 30 X 370

b) The back side of LCC

- TR, UG, B/C BAY : TWL 5 X 30 X 560
- B/S BAY : TWL 5 X 30 X 810

- Connect the main earthing cable

: The LCC have earthing terminal of 4type (100SQ, 150SQ, 180SQ, 200SQ)

: Select the earthing terminal as earting cable specification

: Connect the earthing cable to the earthing terminal.

2. Earthing system for Cable sealing end

1) Earthing between cable sealing end and base as below Fig. C1-26

- Bolt the earthing bond on earthing seat.
- Specification of earthing bond : TWL 5 X 50 X 373
- Specification of earthing seat : TWL 22 X 55 X 55

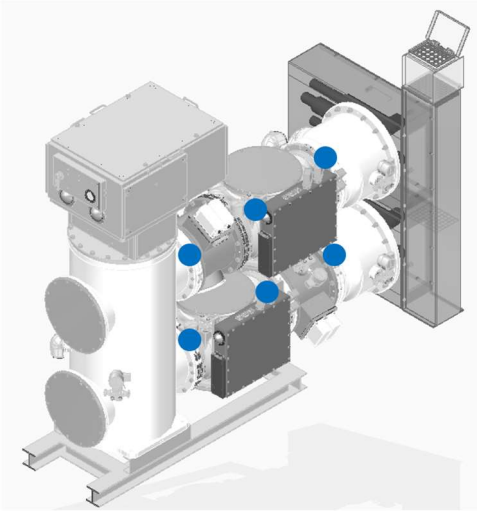
2) Main earthing for cable sealing end as below Fig. C1-26

- connected electrical continuously by aluminum flange of spacer, as below Fig. C1-27

2. Earthing system for main body

1) Earthing for bus.

- All Enclosure of components is connected electrical continuously by aluminum flange of spacer, as below Fig. C1-27



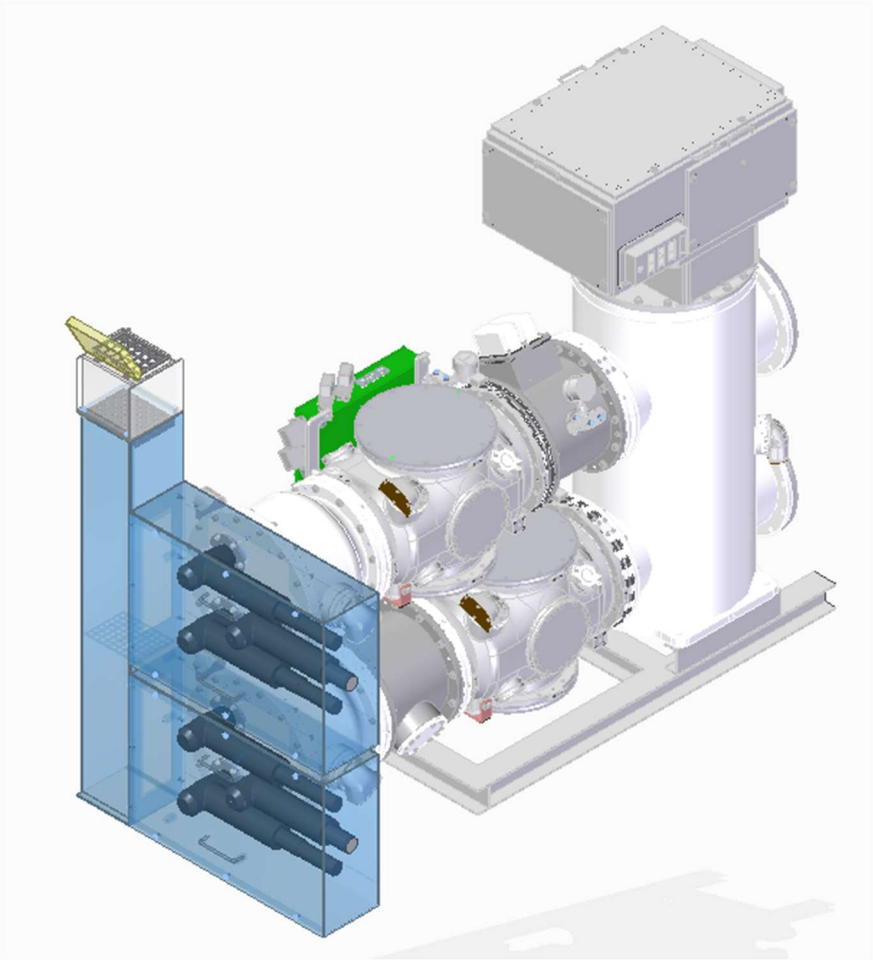


Fig. C1-27 Earthing system for main body

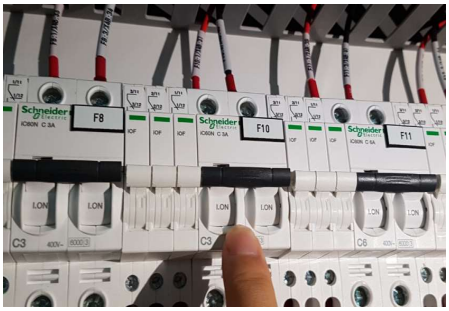
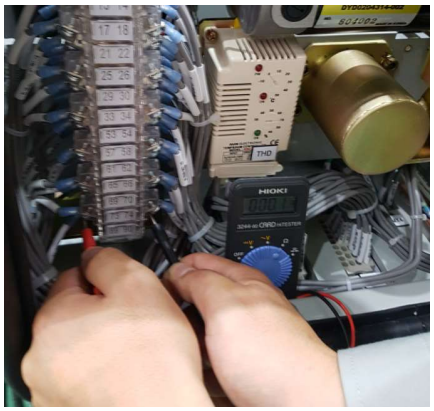
## PART C-2 FAULT DIAGNOSIS

## CONTENTS

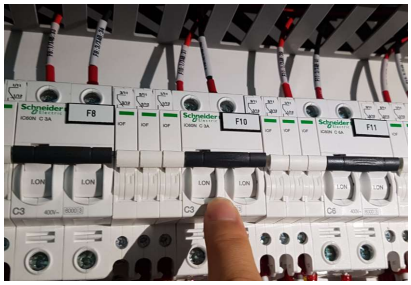
1. FAULT DIAGNOSIS....3
1.1 CIRCUIT BREAKER....3
1.2 DISCONNECTOR, EARTHING SWITCH AND HIGH SPEED EARTHING SWITCH....7
1.3 VOLTAGE TRANSFORMER, SURGE ARRESTER AND OTHERS....9
1.3 SURGE ARRESTER....10
1.1.1 MEASUREMENT OF LEAKAGE CURRENT....10
1.1.2 HANDLING AND NOTICE....10

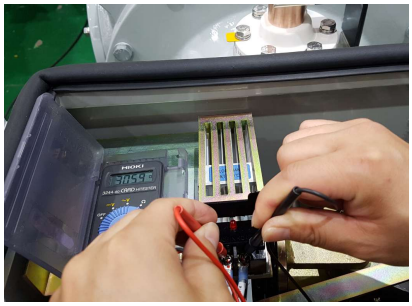


# 1. FAULT DIAGNOSIS



Most of the possible faults on the GIS equipment will be detected by the various detection devices and indicated on the fault indicators installed in the local control panel.



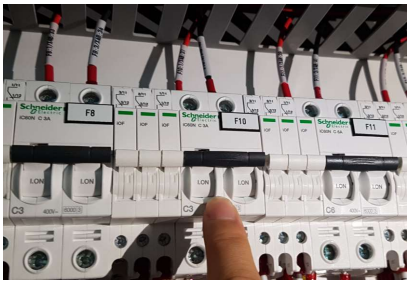


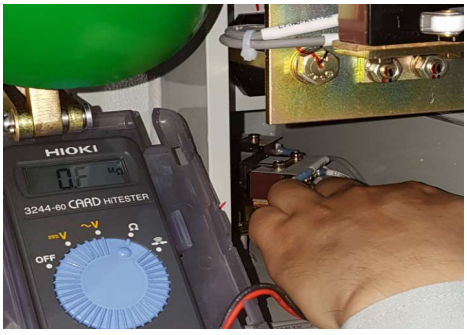
The following table, Table C2-1 will give more detailed description concerning the fault diagnosis for reference, in case of abnormal phenomena.

## 1.1 CIRCUIT BREAKER

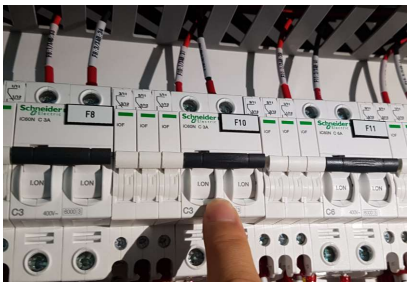
Table C2-1 FAULT DIAGNOSIS FOR CB

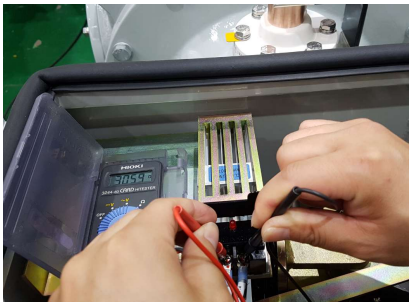
| Phenomenon | Cause | Counter measure |
|---|---|---|
| Spring in operating mechanism is not charged automatically | 1. MCB* tripped<br>2. Supply voltage lacking<br>3. Motor defective | 1. Switch the MCB* on<br><br><br>2. Secure the supply voltage<br>3. Check the motor resist and compare with others,<br>1) DC 125V: 3.2 Ω ± 15% at 20 ℃<br>2) DC 220V: 5.1 Ω ± 15% at 20 ℃<br>If abnormal, replace the motor<br> |





| | | |
|---|---|---|
| Operating mechanism does not trip or close | 1. Control voltage lacking<br>2. Coil defective<br>3. Auxiliary switch does not transmit the Command | 1. Secure the control voltage<br>2. Check the coil resist and compare with others, if abnormal, replace the coil.<br>1) DC 125V<br>- TRIP COIL: 30.7 Ω ± 5% at 20 ℃<br>- CLOSE COIL: 36.5 Ω ± 5% at 20 ℃<br>2) DC 220V<br>- TRIP COIL: 96.4 Ω ± 5% at 20 ℃<br>- CLOSE COIL: 112.2 Ω ± 5% at 20 ℃<br><br>3. Check the auxiliary switch by using buzzer Test.<br>If not, replace the auxiliary switch<br>**Contact Rating of Aux. Switch is 4.4A @ 125Vdc**<br> |





| | | |
|---|---|---|
| Corrosion in the operating mechanism housing | 1. MCB* tripped<br>2. Voltage lacking<br>3. Heater defective<br>4. Moisture Impregnation | 1. Switch the MCB* on<br><br>2. Secure the voltage<br>3. Check the heater resistance and compare with below values. If abnormal, replace the Heater.<br>1) AC 220V: 484 Ω ± 10% at 20 ℃<br>2) AC 230V: 529 Ω ± 10% at 20 ℃<br>3) AC 240V: 576 Ω ± 10% at 20 ℃<br><br>4. Check the seals of the operating mechanism |

| | | |
|---|---|---|
| Circuit breaker is locked | 1. Dry air leakage<br>2. GD is defective | 1. Check leakage rate comparing with Gas System Diagram and if less than rate pressure,<br>- Fill gas<br>- Check for faulty seals and replace it if abnormal<br><br>2. Check that the dial point is normal position.<br>If dial point is normal, the possibility of a GD defect exists.<br>Check the GD by using a buzzer Test and<br>if abnormal, replace the GD<br> |

## 1.2 DISCONNECTOR, EARTHING SWITCH AND HIGH SPEED EARTHING SWITCH

Table C2-2 FAULT DIAGNOSIS FOR DS, ES and HES

| Phenomenon | Cause | Counter measure |
|---|---|---|
| Operating mechanism not Running | 1. MCB* tripped<br>2. Supply voltage lacking<br>3. Motor defect<br>4. Limit switch defect | 1. Switch on MCB*<br><br>2. Secure supply voltage<br>3. Check the motor resistance and compare with others, if abnormal, replace the motor<br>1) 3PDS<br>- DC 125V : 1.85 Ω ± 15% at 20 ℃<br>- DC 220V : 5.6 Ω ± 15% at 20 ℃<br>2) HES<br>- DC 125V : 9.5 Ω ± 15% at 20 ℃<br>- DC 220V : 34 Ω ± 15% at 20 ℃<br><br>4. Check the limit S/W by using buzzer Test.<br>If defective, replace the limit switch<br> |

| | | |
|---|---|---|
| Corrosion in the operating mechanism housing | 1. MCB* tripped<br>2. Voltage lacking<br>3. Heater defective<br>4. Moisture Impregnation | 1. Switch the MCB* on<br><br>2. Secure the voltage<br>3. Check the heater resistance and if the value cannot be in this range, replace the Heater<br>1) AC220, 230, 240V: 270 ~ 370 Ω at 20℃<br><br>4. Check the seals of the operating mechanism |

## 1.3 VOLTAGE TRANSFORMER, SURGR ARRESTER AND OTHERS

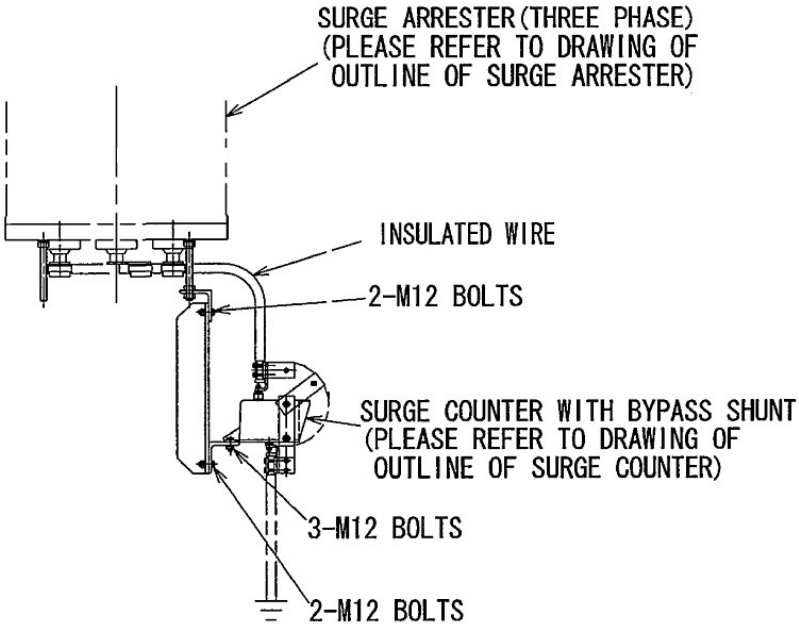
Table C2-3 FAULT DIAGNOSIS FOR VT, SA and OTHERS

| Phenomenon | Cause | Counter measure |
|---|---|---|
| Low dry air-pressure | 1. Dry air gas leakage | 1. Check flange seals by using gas leakage detector  Check leakage rate comparing with Gas System Diagram and if less than rate pressure,<br>- Fill gas<br>- Check for faulty seals and replace it if abnormal |

**※If phenomenon remains, please follow Appendix A**

# 1.4 SURGR ARRESTER

## 1.4.1 Measurement of leakage current



Total leakage current measurement test

The leakage current of a surge arrester can be measured while energized; being the most convenient maintenance test method.

Unexpected high leakage current might cause arrester thermal runaway.

It is the most useful to periodically measure the leakage current of the arrester under the normal operating voltage in order to check the soundness of the arrester.

When the leakage current value is 50~130% of the initial leakage current value measured at initial inspection after energization, the surge arrester is in good condition.

If a measurement cannot be made on the surge counter, please check the earth insulated wire is within 2.5m. in length. If there are differences on leak current values between phases, please contact to Hyosung Engineering Department.

## 1.4.2 Handling and Notice

The earth lead wire should be kept a distance more than 10 mm from the nearby-grounded structures to avoid flashover from the earth wire to the grounded structure.

Please install the surge counter to be within the limit of ±45 degrees to horizontal using attached bolt and nut (M12x20).

Don't disassemble the moisture-proof housing to prevent moisture from coming in the surge counter, and do not apply excess force and impact to the housing.

To cheek the operational characteristics of the counter on site, please charge up an additional condenser (2~4ùF) by means of a 1000V megger and connect it to both terminals across the surge counter. This method will confirm whether the surge counter is in good condition or not. Type "SDC-N4©" and "SDC-N4©" surge counters don't have set and reset-buttons, so keep a record of the number of operations before and after the check.

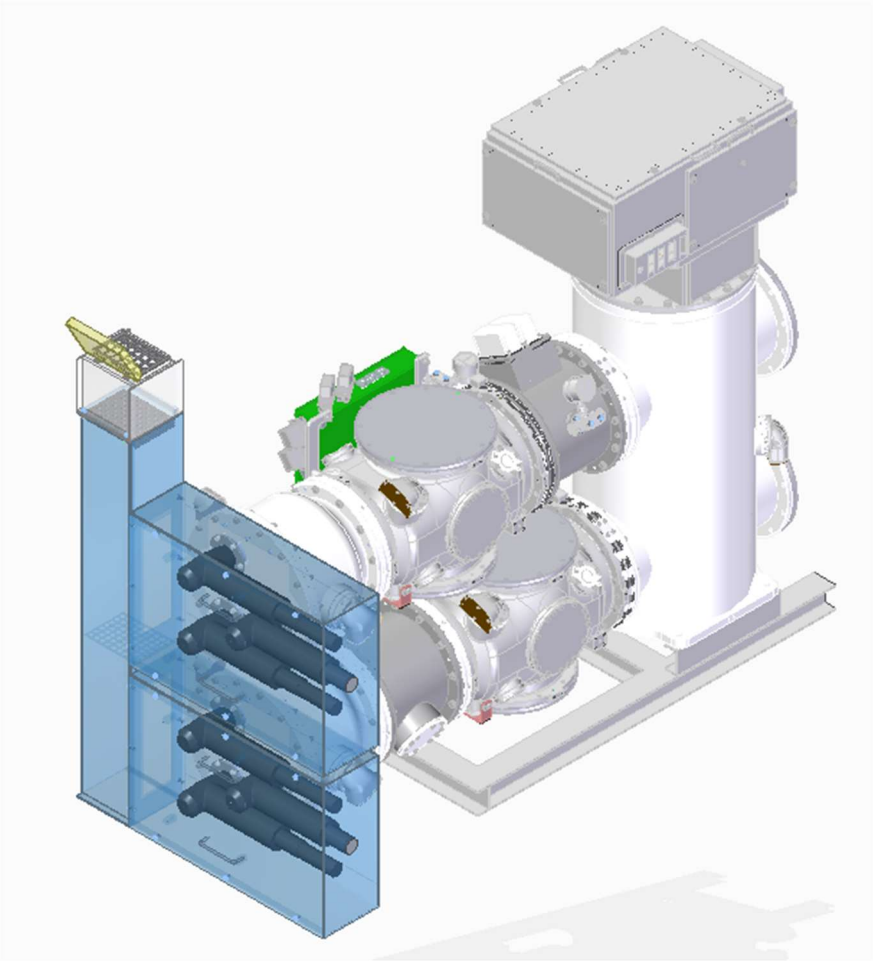
The relay box must be installed nearly horizontal. The Surge counter and relay box shall be connected. The earth terminal if the relay box (G terminal box) shall be connected to earth using wire.

The transformer tap shall be chosen according to the source voltage.

The wire connection procedure to the terminal box of the relay box is as follows.

(1) Remove the front cover by loosening the hexagon bolts (M6).

(2) Cut the rubber bushing in a cross-shape to make wire inlet hole, then lead the wires through the hole.



(3) Connect the wires on the terminals in accordance with the numbers

(4) Set the front cover as it was.

The wires will be connected to the surge counter after the terminal covers are removed.

2.2 Disposal process – internal part of GIS....5

## 1.1 Introduction

These instructions to inform how Hyosung GIS to be disposed after its own life cycle.

**Note:** These instructions do not subject to cover all details work procedure for disposal of GIS. In case technical support is required from Hyosung, users to contact to Hyosung HV GIS engineering.

## 1.2 Warning Signs

Throughout this Instruction, warning signs are used to emphasize instructions and information that should be very carefully observed.

### Danger

Danger indicates an imminently hazardous situation that, if not avoided, will result in death or serious injury.

### Warning

Warning indicates a potentially hazardous situation that, if not avoided, could result in death or serious injury.

### Caution

Caution indicates a hazardous situation that, if not avoided, may result in minor or moderate injury.

### Notice

Notice indicates hazards that may result in property damage only.

### Important

Important indicates an operational tip or maintenance suggestion.

## 1.3 General Safety

### Danger

All personnel associated with the disposal of the GIS should be thoroughly instructed and supervised on de-energizing and de-gassing.

Safety programs should also take into account the local environment and GIS application, including such variables as ambient temperatures, actual continuous current, number of operations, type of interrupting duty, and any unusual local condition, such as a corrosive atmosphere or major insect problems.

### Important

The network function can be used when the Network Interface option is installed.

## 1.4 Specific Safety

### Danger

*Do not* work on an energized GIS. If work must be performed on the GIS, take it out of service, open the disconnect switches at each side of the GIS, then close the GIS and ground each phase.

*Do not* work on any part of the de-energized GIS until all control power has been disconnected.

*Do not* disassemble any portion of the gas system of any GIS until system pressure has been reduced to zero psig (0 psig) by opening the appropriate drain valves. When the gas pressure has been reduced to zero, cautiously remove covers, tubes, fittings, and other parts.

### Important

This GIS is spring open and spring closed. Always ensure that *both* springs are discharged before working on the GIS.

## 2.1 Disposal process – gas and lubricant

After GIS is de-energized, degassing and removing lubricant on external GIS to proceed. Disassembly, removing lubricant internal GIS and absorbent filter is next step to do.

| Material | Spot to work | Approx. Weight |
|---|---|---|
| Lubricant - external | On flange of GIS connection, Each mechanism gear part | 7kg / 1 bay of GIS |
| Lubricant - internal | On surface of each oring groove | 5kg / 1 bay of GIS |
| Absorbent filter | Each Gas section of GIS | 15kg / 1 bay of GIS |

### Notice

Weight of each kind of material is variable up to configuration of each GIS bay

All the materials to be disposed separated as far as possible.

## 2.2 Disposal process – internal part of GIS

After GIS step 2.1 above, internal GIS part to be disassembled and separated. Removing internal lubricant and absorbent filter may proceed with this work.

| Material | Spot to work | Approx. Weight |
|---|---|---|
| Rubber – Industrial waste | Each sealing groove and selected moving part | 12kg / 1 bay of GIS |
| Aluminum - recycling | GIS enclosure, conductor | 2550kg / 1 bay of GIS |
| Iron steel - recycling | GIS cover on enclosure | 120kg / 1 bay of GIS |
| Copper - recycling | On surface of each oring groove | 60kg / 1 bay of GIS |
| Epoxy - Industrial waste | Each GIS compartment | 200kg / 1 bay of GIS |
| Electric device (Motor, Contactor, Terminal block, wire etc.) - Industrial waste or recycling | Each GIS mechanism, CT/VT terminal box and LCC. | 140kg / 1 bay of GIS |

### Notice

Weight of each kind of material is variable up to configuration of each GIS bay

All the materials to be disposed separated as far as possible.

When disposal of GIS is required at site, the instruction may need to be revised or support from GIS manufacturer may be needed. Local service office of Hyosung will provide technical support if required.

# Install, Operation & Maintenance Manual

## Intelligent Merging Unit 2

# Preface

## Introduction

This Manual and the explanatory document for the operation of IM2 or related service provide the entire information on the safe handling, commissioning and testing of IM2.

The use should be familiar with the contents of this manual and read the relevant information carefully before carrying out work on IM2.

## Safety

Proper and safer operation of IM2 depend on proper transportation and handling, proper storage, installation and commissioning, and careful operation, maintenance and service. For this reason, only qualified personnel may work on or operate IM2.

Requirements for eligible employee

- Be sure to be proficient in installation, commissioning and operation of IM2 and system to which IM2 is connected.
- Be sure to be able to perform switching works safely pursuant to the approved safety engineering practices.
- Be sure to have authority to supply and disconnect power to/from IM2, and to detach, ground and label IM2.
- Be sure to complete training on management and use of safe equipment according to safety engineering.
- Be sure to complete training on emergency procedures.

## Caution

- Be sure to ground the terminal of IM2 safely.
- Be sure to install IM2 an environment free from abnormal vibration within the ambient environment specified in the specification.
- Be sure to apply AC voltage and current, or power to IM2.
- Be sure to carefully check the supply voltage when connecting the output contact of IM2 to the external circuit.
- Be sure to use the linking cables carefully without applying excessive force.

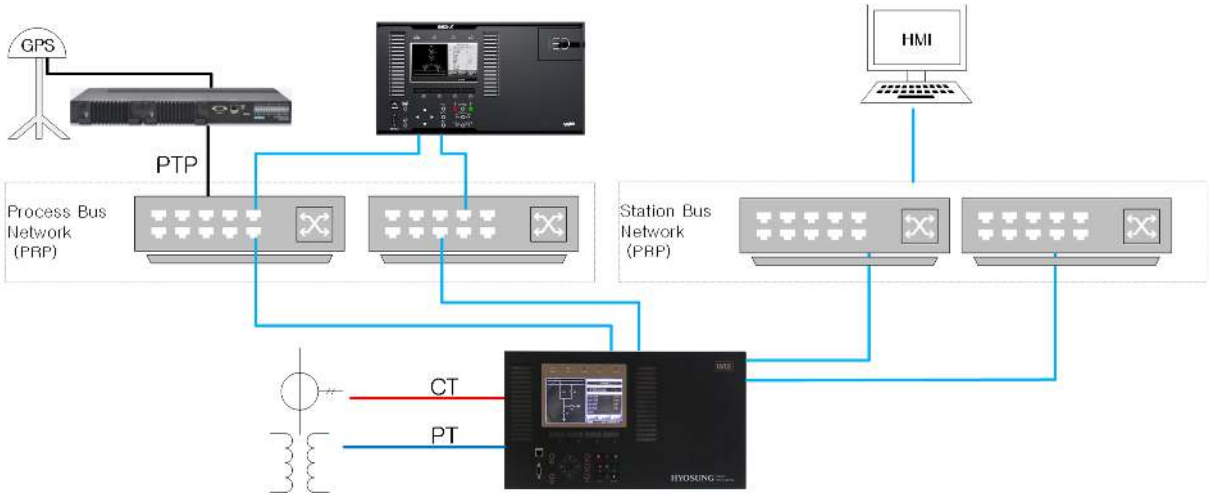
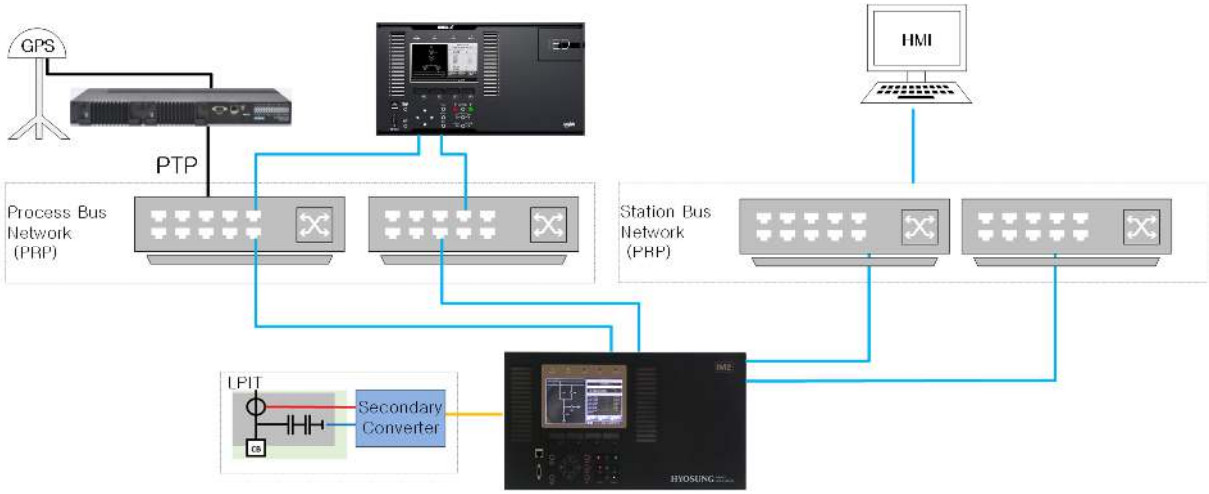
# 1. Introduction

## 1.1. Overview



- Intelligent Merging Unit 2 (“IM2”) is an equipment for digital substations that receives analogue output from instrumental transformers and transmits the sampled values.
- IM2 for CT/PT receives analog signals from the conventional potential and/or current instrument transformers and transmits the sampled value packets.
- IM2 for LPIT receives the optical output digital signal of the secondary converter (SC) connected to Low Power Instrumental Transformer (“LPIT”) such as Rogowski Coil and Capacitive Voltage Divider, and transmits the sampled value packets.
- IM2’s sampling clock synchronization offers 2 methods: IEEE 1588v2 PTP and 1PPS. It processes PTP packets coming through the Process Bus Network for synchronizing clock, or receives 1PPS signal to synchronize with the Grand Master Time, and then maintain synchronization difference within ±2μsec, the allowable value according to IEC 61869-9.
- IM2 transmits the sampled value according to IEC 61850-9-2 standard, uses 4PT and 4CT data set defined in the IEC 61850-9-2LE guide, and supports the sampling rate defined in IEC 61850-9-2LE, as well as the sampling rate of 5760(60Hz), 4800(60Hz), 4800(50Hz), 4000(50Hz) for protection, and 15360(60Hz), 14400(60Hz), 14400(50Hz), 12800(50Hz) for measurement as defined in IEC 61869-9.
-

### 1.1.1. Features



- Process voltage and current signals using 24-bit high-precision, high-resolution ADC
- Process outputs from the Secondary Converter for LPIT
- Be capable of using 50/60Hz and support 80, 96 samples/cycle for protection and 80, 96, 240, 256, 288 samples/cycle for measurement
- Configure the sampled data compatible with IEC 61850-9-2LE and IEC 61869-9
- Be able to transmit up to 8 Sampled Value streams (8 Sampled Value Control Block (SVCB))
  - 4 streams for protection, 4 streams for measurement
- Support the lossless redundancy protocol, HSR/PRP
- Support the IEC61850 Report function/ & GOOSE transmitting/receiving through the Process Bus network
  - A total of 15 GOOSE Control Blocks (GOCB) (recommended)
- Support the function of the global clock synchronization
  - IEEE 1588v2 PTP
  - 1PPS BNC port
  - 1PPS jitter < ±2μsec

## 1.2. Connection Diagram

- The followings are configuration diagrams showing the general connection of IM2.

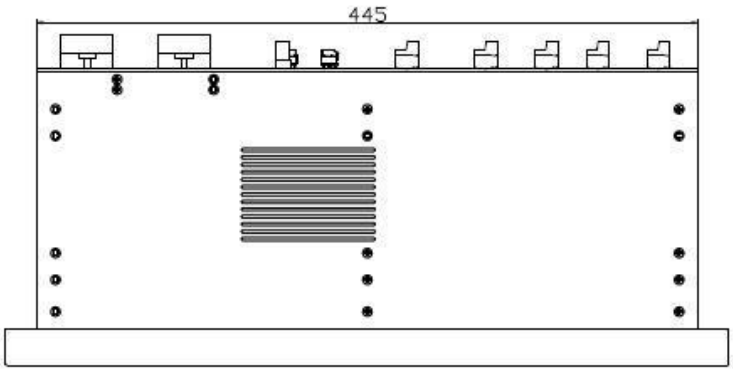
<Connection diagram example for using conventional CP/PT>

<Connection diagram example for using LPIT>

- IM2 for CT/PT is connected with CTs, PTs analog signal lines. Maximum 32 lines are connected, including maximum 12 voltages and maximum 20 currents.
- IM2 for LPIT is connected through the Secondary Converters to LPITs. Maximum 16 SCs can be connected to IM2 for LPIT, through 1 optical cable per 1 SC.
- IM2's Station/Process Bus communication ports are connected to network switching hubs that provides redundancy protocol, HSR/PRP, via optical cables, respectively. When using PTP

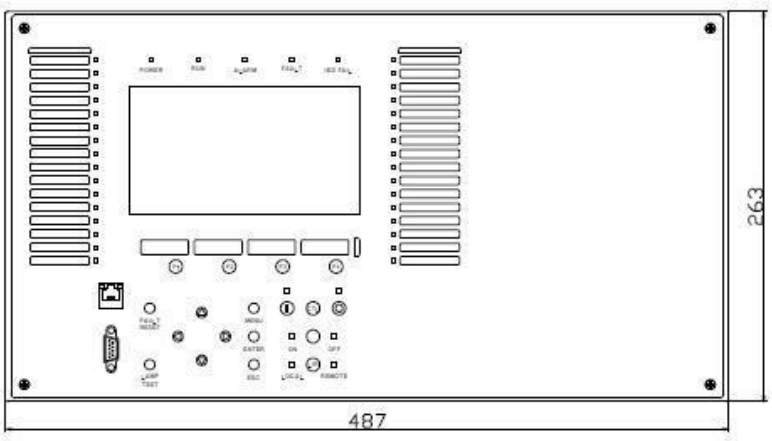
for clock synchronization, it can be used without additional connection. However, when IM2 is going to use PPS signal for synchronization, it may be needed to be connected to a PPS output device via a BNC cable.

- IED connected to Process Bus network that receives the Sampled Value can perform the functions of protection and measurement, using the sampled values transmitted by IM2.



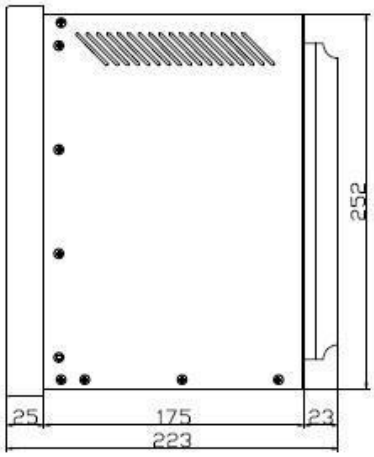
## 1.3. Specifications

| Classification | Item | Specifications | Note |
|---|---|---|---|
| Condition of Use | Ambient temperature | -40℃ ~ +70℃ | |
| | Relative humidity | Below 95% | |
| | Altitude | Below 1,000m | |
| Rating | Frequency | 50/60Hz | |
| | Current | 1A, 5A | |
| | Line voltage | 100, 110, 115, 120, 200, 230V | |
| | Power | DC 125V (100~250V)<br>AC 220V (100~240V) 50/60Hz | |
| Appearance of Product | Dimension (W x H x D) | 487 x 263 x 223mm<br>487 x 263 x 219mm | for CT/PT<br>for LPIT |
| | Type | Stand-Alone Type | |
| | Weight | Below 13kg<br>Below 10kg | for CT/PT<br>for LPIT |
| | Material | Aluminum | |



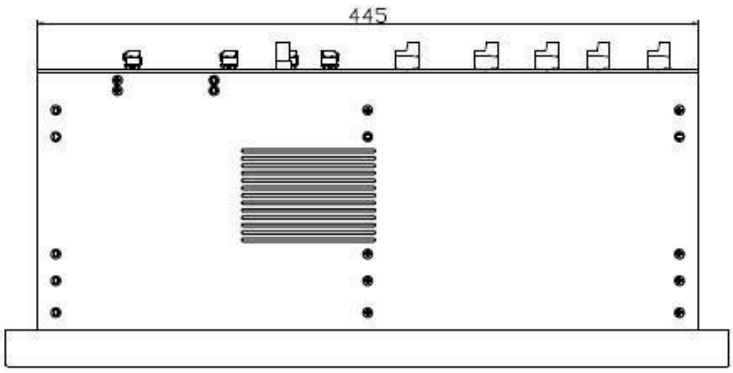
# 2. Appearance and Wiring

## 2.1. Appearance

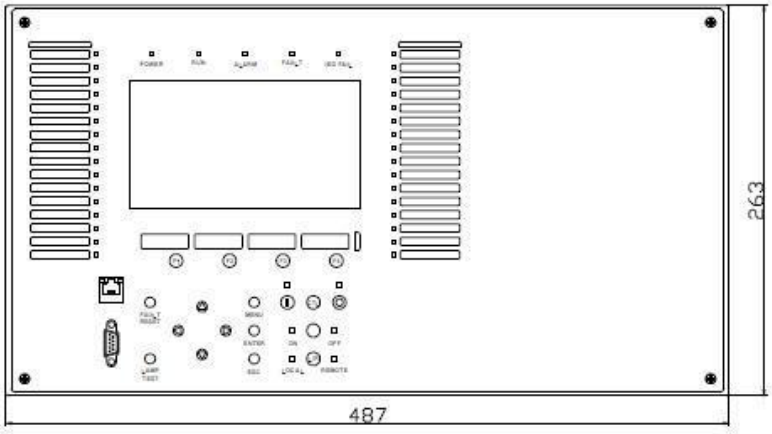


- The enclosure of IM2 is made of a fully-sealed aluminum metal case structure so as not to be affected by external interference.

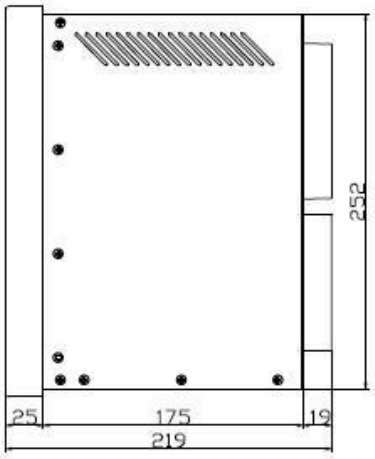
Top view



Front view

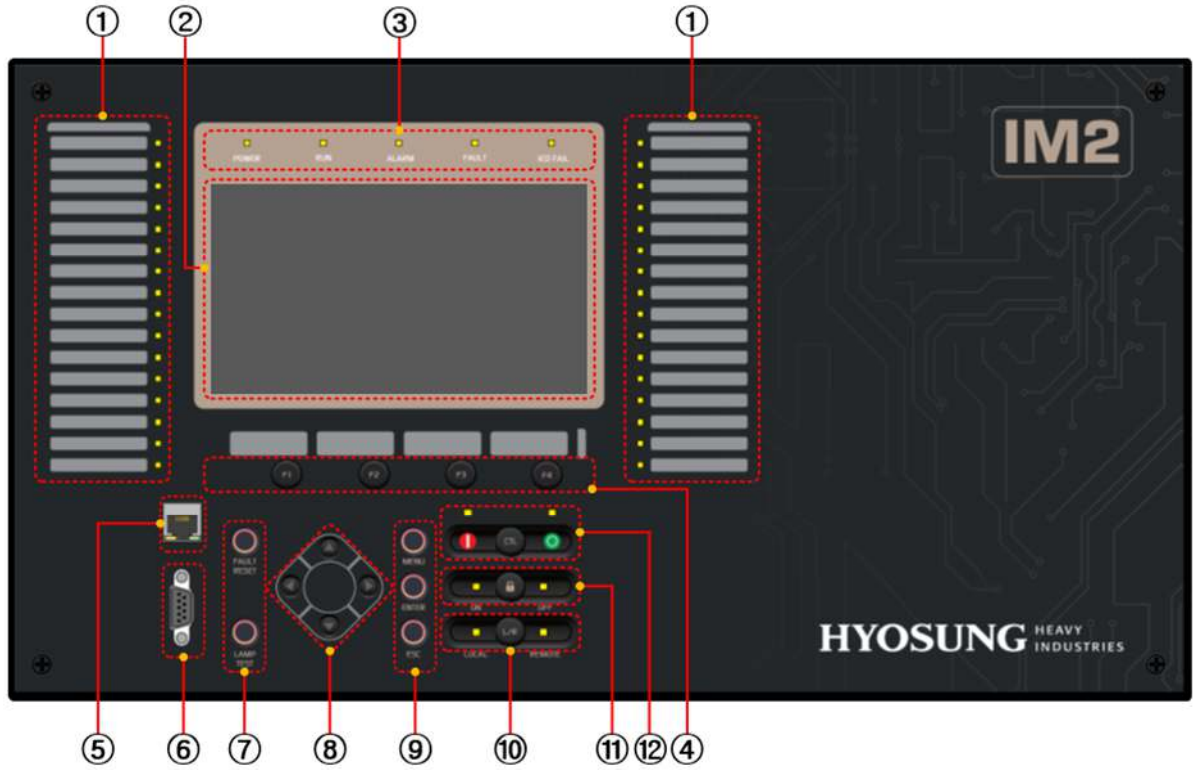


Side view



<Appearance of IM2 for CT/PT>

Top view



Front view

Side view

<Appearance of IM2 for LPIT>

### 2.1.1. Front Side

<Front Side of IM2 HMI>

- The description of the front side is as follows.

① LED for displaying the operational status

② TFT color graphic LCD (7") that can confirm and change the operational status and the set value

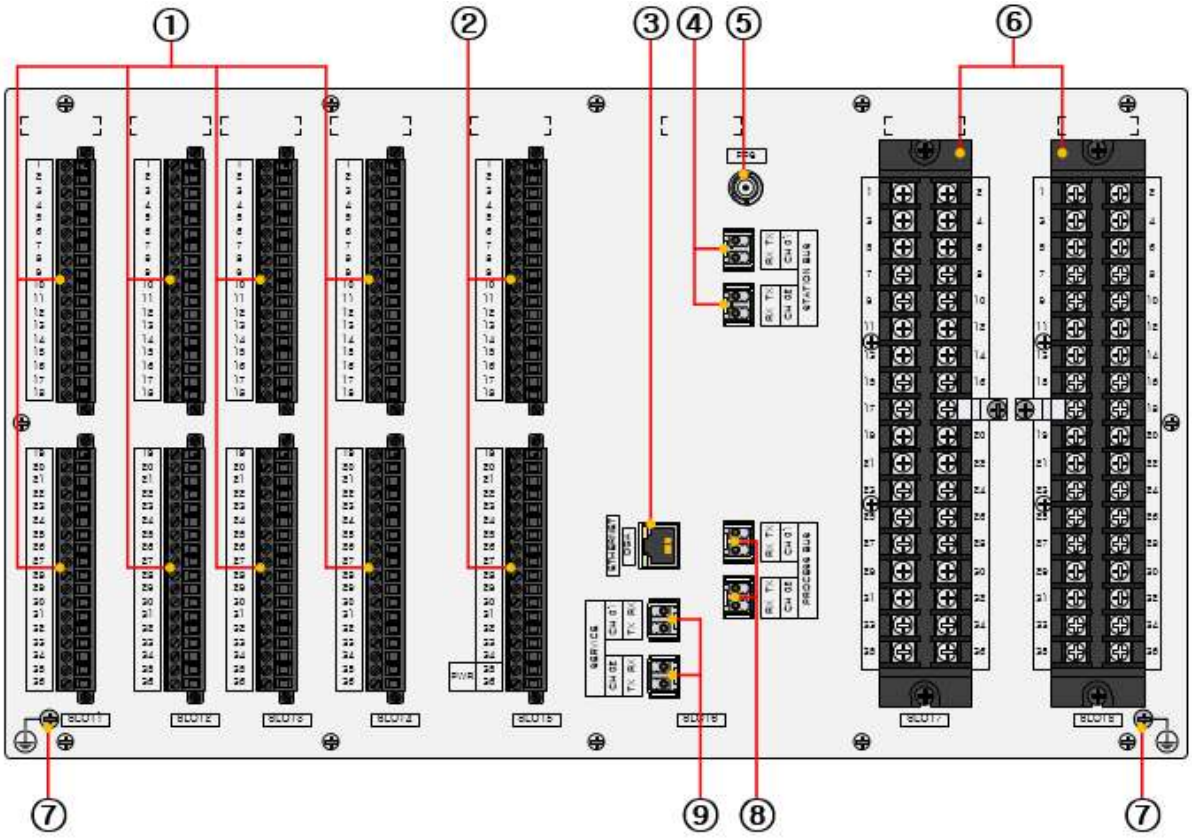
③ LED(Power) for displaying system status

④ Function button

⑤ Ethernet communication port

⑥ Console for connecting the operating software

⑦ Buttons for initializing LED status, and for testing LED



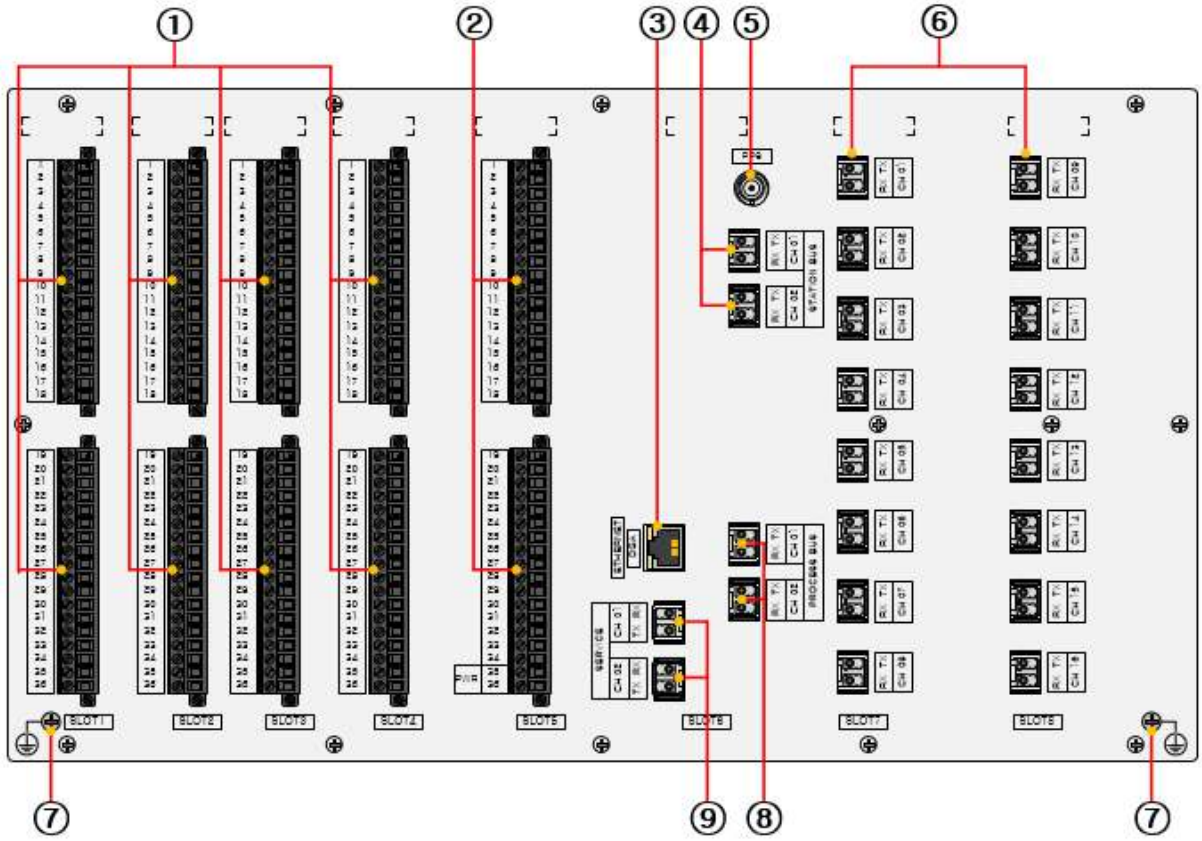
⑧ , ⑨ Buttons to move upward and downward, to select or cancel item in the menu

⑩ A button and status LED for local/remote operation

⑪ A button and status LED for operating to turn on/off interlock

⑫ A button and status LED to control device

## 2.1.2. Back Side (CT/PT)

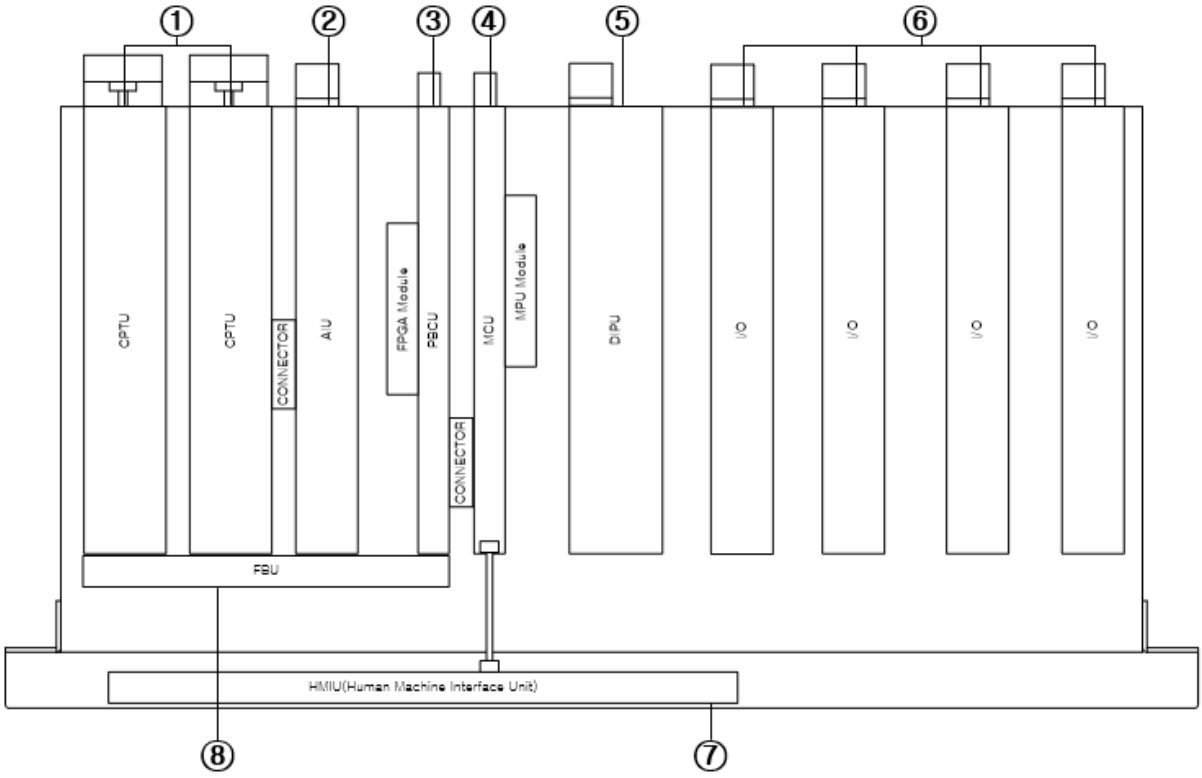


<Back side of IM2 for CT/PT>

- The back side of IM2 for CT/PT is configured as follows.

① Contact input/output terminal block
② Contact input and power input terminal block
③ Ethernet and DGA port
④ IEC 61850 Station Bus communication port (Optical)
⑤ 1PPS clock synchronization input port
⑥ Voltage/current input terminal block
⑦ Ground
⑧ IEC 61850 Process Bus communication port (Optical)
⑨ Service communication port (Optical)

### 2.1.3. Back Side (LPIT)



<Back side of IM2 for LPIT>

- The back side of IM2 for LPIT is configured as follows.

① Contact intput/output terminal block
② Contact input and power input terminal block
③ Ethernet and DGA port
④ IEC 61850 Station Bus communication port (Optical)
⑤ 1PPS clock synchronization input port
⑥ S/C Unit communication port (Optical)
⑦ Ground
⑧ IEC 61850 Process Bus communication port (Optical)
⑨ Service communication port (Optical)

### 2.1.4. Module mounting positions (for CT/PT)

<Module mounting positions>

- Modules of CPTU, AIU and PBCU are connected by FBU module, and MCU board and modules of HMIU, DIPU, I/O(DAIU, DOU, DIU) are connected via cable.

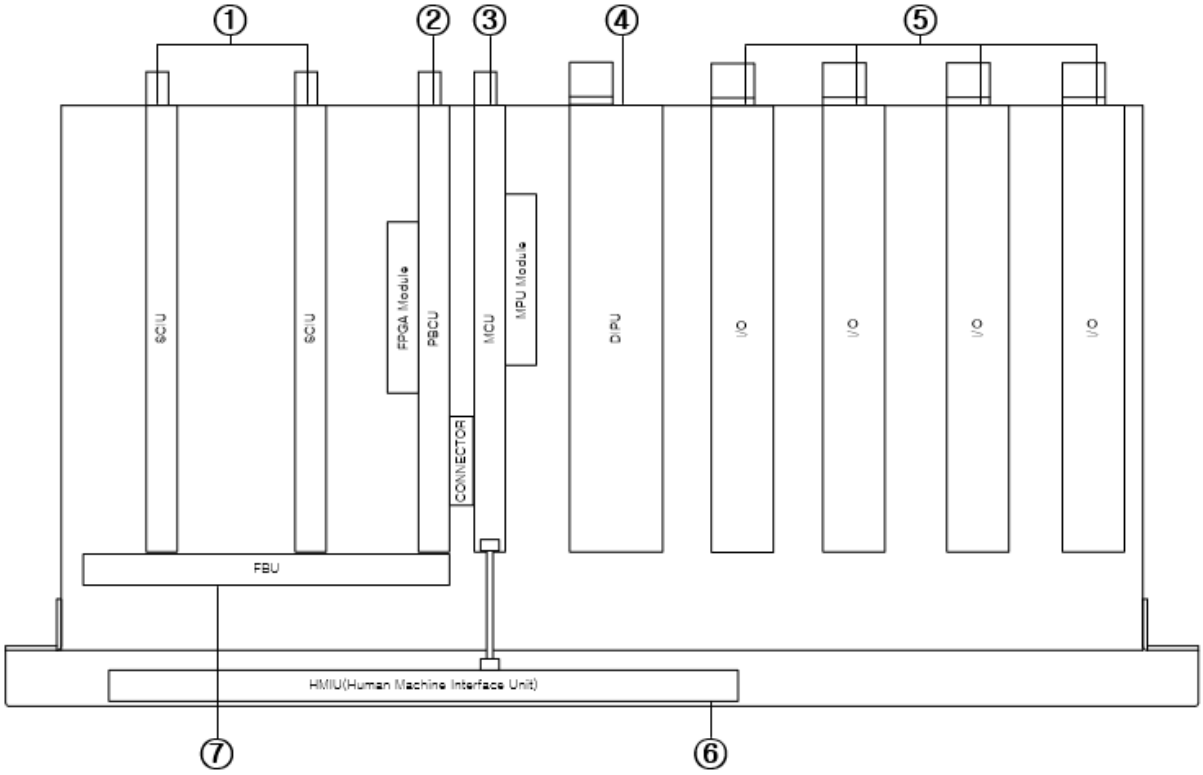
① **CPTU** module is divided into two types. CPTU-A is a module that provides input of 12 currents (CT) and 4 voltages (PT), and carries out function of inputting analog data. CPTU-B is a module that provides input of 8 currents (CT) and 8 voltages (PT), and carries out function of inputting analog data.

② **AIU** carries out digital conversion of the input analog data.

③ **PBCU** carries out function of converting the measure data into SV(Sampled Value), and then transmitting it.

④ **MCU** is a module where MPU, DSP and memory are positioned, and carries out functions of performing protection logic and processing HMI.

⑤ **DIPU** is a module that provides 26 contact input points, and carries out monitoring function, receives power and then supplies power used by each module.



⑥ **I/O** modules have three types

- **DAIU** is a module that provides 16 contact input points as well as input of 6 TDs and 2 RTDs, and carries out monitoring and measurement functions.
- **DOU** is a module that provides 17 contact output points for each module and is responsible for the control function.
- **DIU** is a module that provides 28 contact input points, and carries out monitoring function.

⑦ **HMIU** is an operator interface module that provides information to the operator via LCD and LED as well as receives input from the operator via button and touch screen, and carries out functions of setting and displaying.

⑧ **FBU** carries out interface function that connects AIU and PBCU module.

## 2.1.5. Module mounting positions (for LPIT)

<Module mounting positions>

- SICU and PBCU modules are connected by FBU module, and MCU board and modules of HMIU, DIPU, I/O(DAIU, DOU, DIU) are connected via cable.

① **SCIU** carries out function for inputting communication data of S/C(Secondary Converter) Unit.

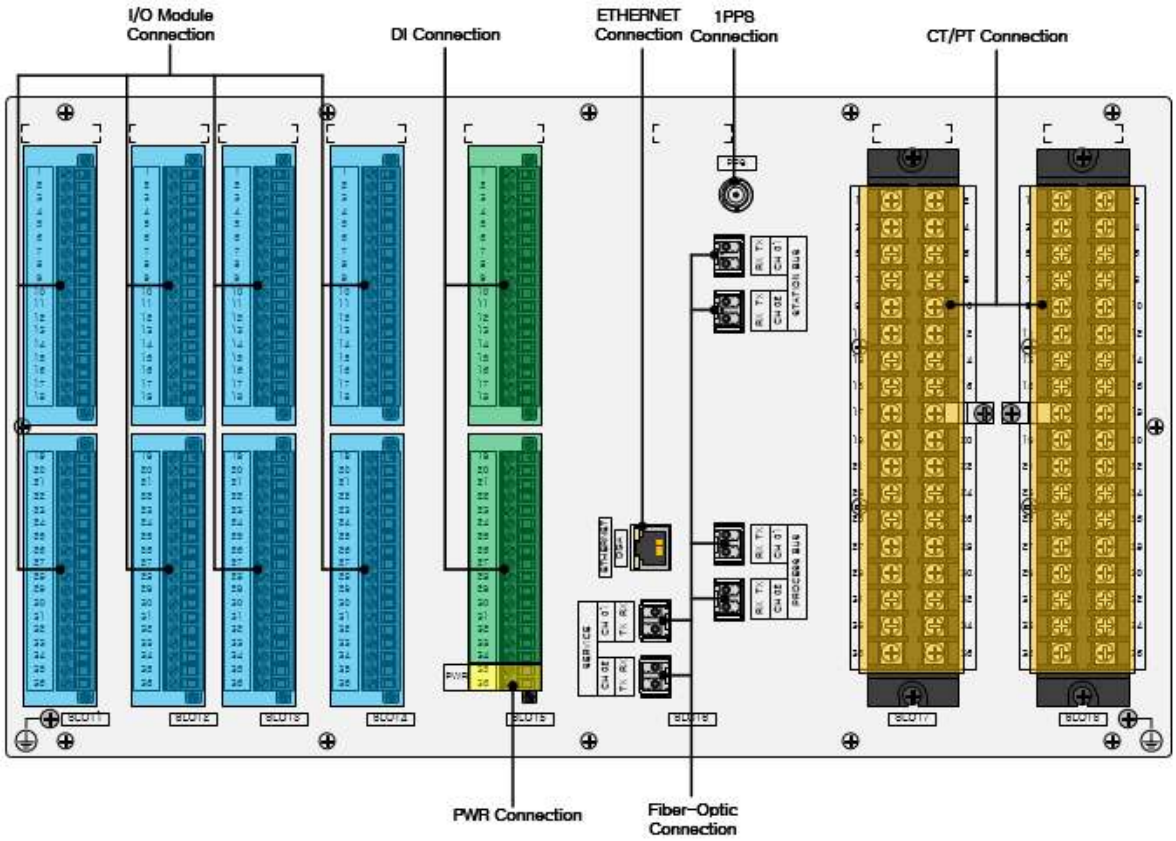
② **PBCU** carries out functions of converting measurement data into SV(Sampled Value) and transmitting it.

③ **MCU** is a module where MPU, DSP and memory are positioned, and carries out functions of performing logic and processing HMI.

④ **DIPU** is a module that provides 26 contact input points, carries out a monitoring function, and receives and provides power used by each module.

⑤ **I/O** board has three types.

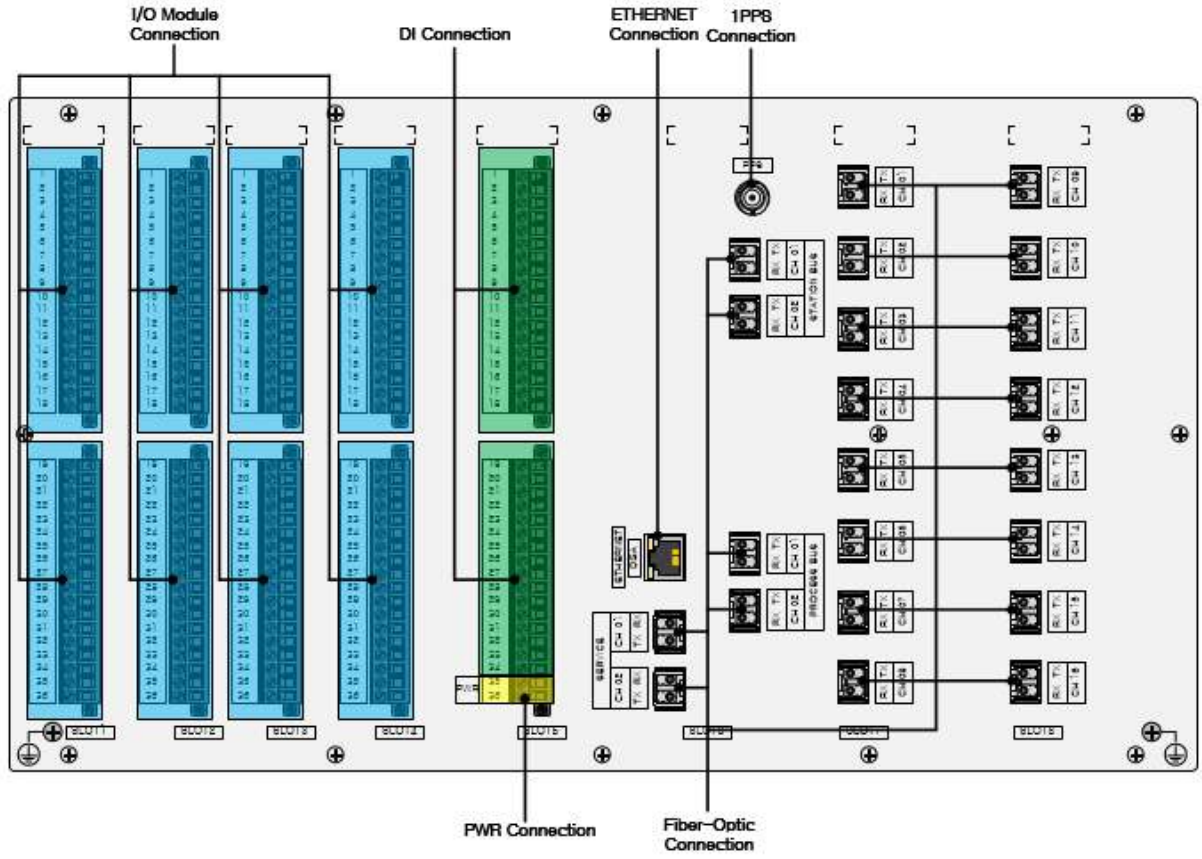
- **DAIU** is a module that provides 16 contact input points, 6 TD input and 2 RTD inputs, and carries out functions of monitoring and measurement.
- **DOU** is a module that provides 17 contact output points for each module and is responsible for the control function.
- **DIU** is a module that provides 28 contact input points, and carries out a monitoring function.



⑥ **HMIU** is an operator interface module that provides information to the operator via LCD and LED, and receives input from the operator via button and touch screen, and carries out functions of setting and displaying.

⑦ **FBU** carries out interface function that connects AIU and PBCU module.

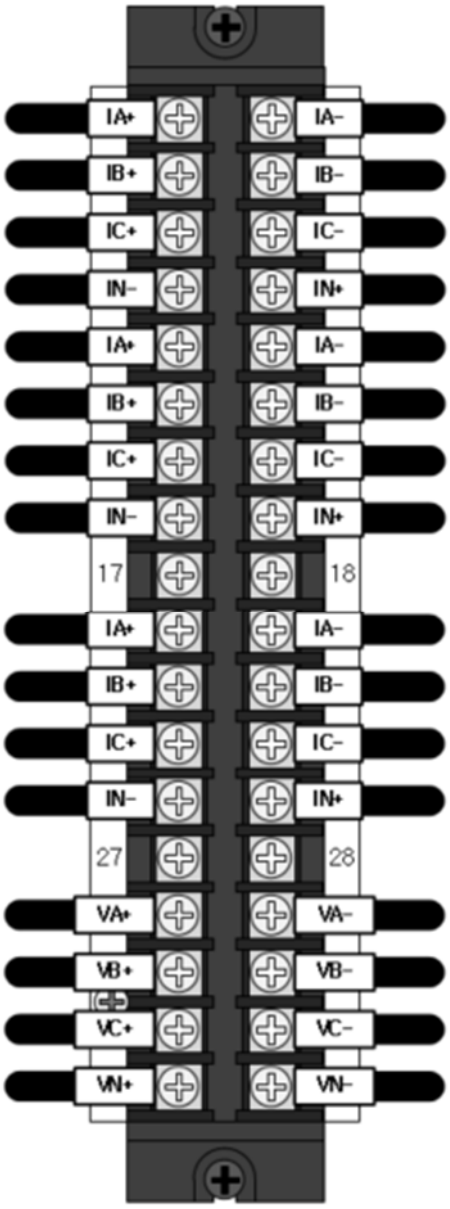
## 2.2. Connection



- IM2 has terminal blocks in the rear side to enable rear wiring, and is connected to the outside through the terminal block. Wiring should be made in a structure that is completely in contact with each other and does not come loose.

### 2.2.1. Connection Positions (for CT/PT)

<Connection positions of IM2 for CT/PT>

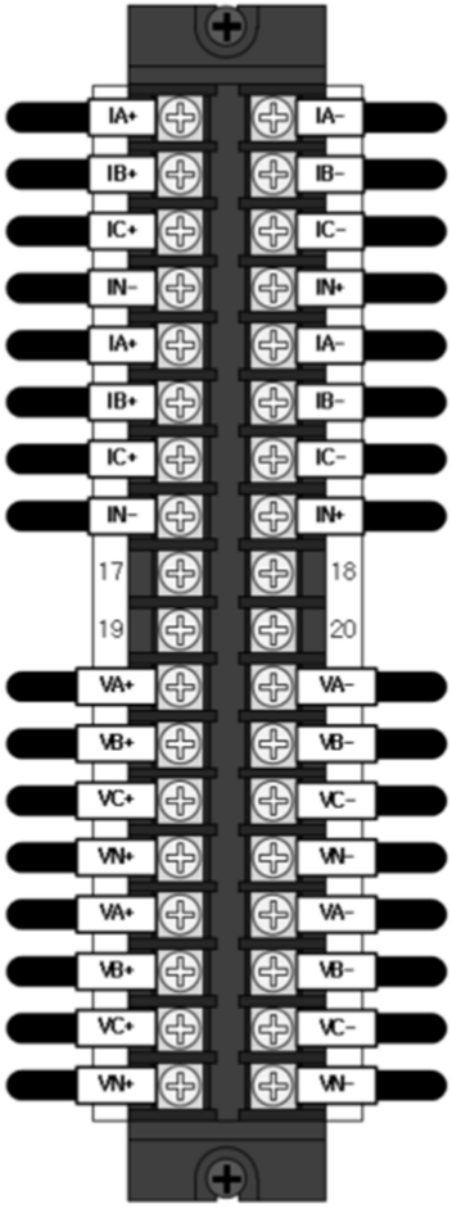


## 2.2.2. Connection Positions (for LPIT)

<Connection positions of IM2 for LPIT>

## 2.2.3. How to connect

### 2.2.3.1. CPTU-A Connection



<CPTU-A cnnection>

- CT connection uses #1~#16 and #19~#26 of the CPTU-A terminal block, and the current input connection should be made as +/- pairs.
- PT connection uses #29~36 of the CPTU-A terminal block, and the input connection should be made as +/- pairs.

- Terminal block for CPTU-A connection is configured as follows.

| CPTU-A | Function | CPTU-A | Function | Components |
|---|---|---|---|---|
| 1 | IA1+ | 2 | IA1- | CT |
| 3 | IB1+ | 4 | IB1- | |
| 5 | IC1+ | 6 | IC1- | |
| 7 | IN1- | 8 | IN1+ | |
| 9 | IA2+ | 10 | IA2- | |
| 11 | IB2+ | 12 | IB2- | |
| 13 | IC2+ | 14 | IC2- | |
| 15 | IN2- | 16 | IN2+ | |
| 17 | - | 18 | - | NC |
| 19 | IA3+ | 20 | IA3- | CT |
| 21 | IB3+ | 22 | IB3- | |
| 23 | IC3+ | 24 | IC3- | |
| 25 | IN3- | 26 | IN3+ | |
| 27 | | 28 | | NC |

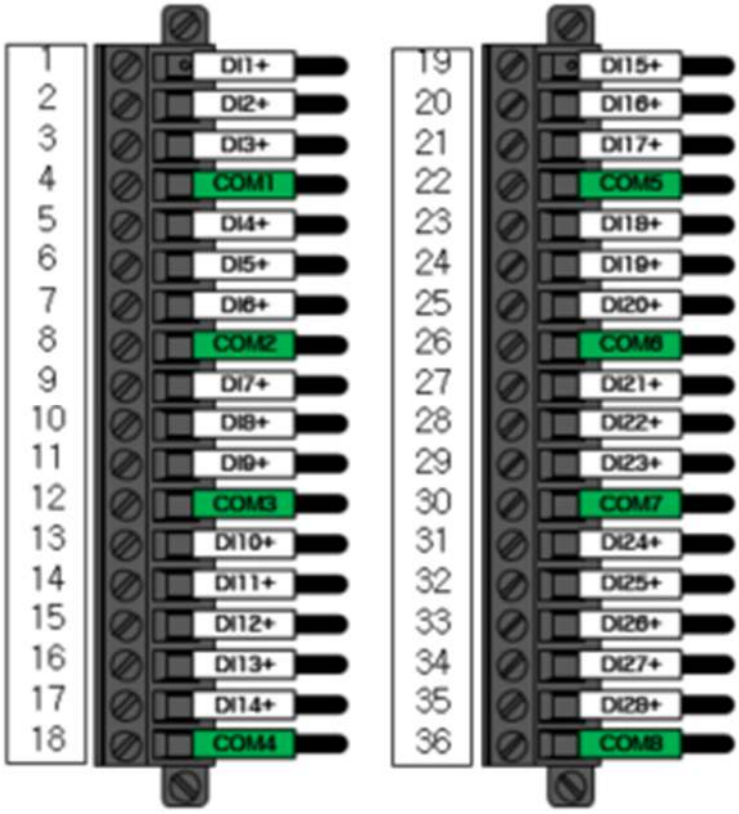
### 2.2.3.2. CPTU-B Connection



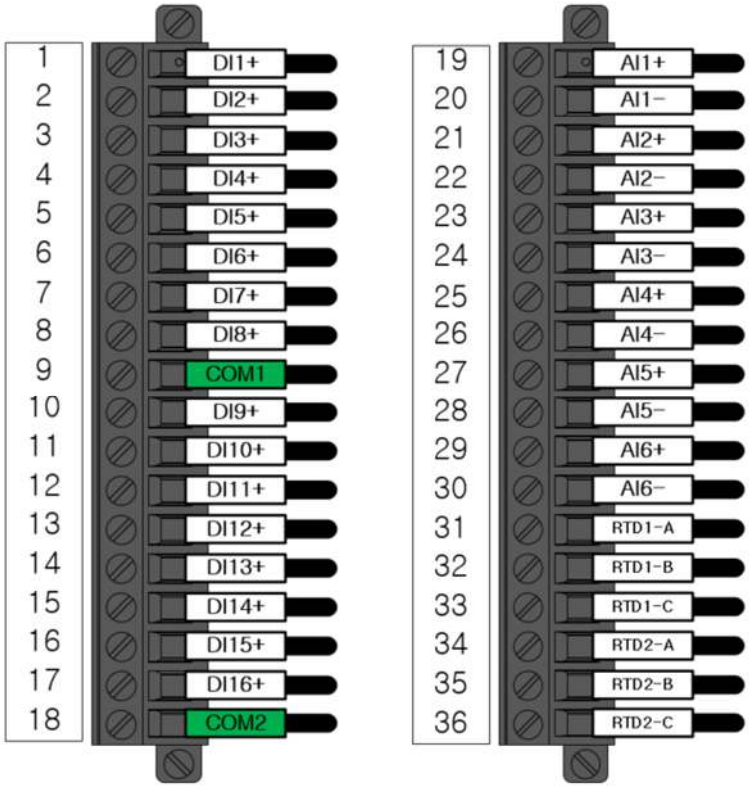
<CPTU-B Connection>

- CT connection uses #1~#16 of the CPTU-B terminal block, and the current input connection should be made as +/- pairs.
- PT connection uses #21~#36 of the CPTU-B terminal block, and the input connection should be made as +/- pairs.

- Terminal block for CPTU-B connection is configured as follows.

| CPTU-B | Function | CPTU-B | Function | Components |
|---|---|---|---|---|
| 1 | IA1+ | 2 | IA1- | CT |
| 3 | IB1+ | 4 | IB1- | |
| 5 | IC1+ | 6 | IC1- | |
| 7 | IN1- | 8 | IN1+ | |
| 9 | IA2+ | 10 | IA2- | |
| 11 | IB2+ | 12 | IB2- | |
| 13 | IC2+ | 14 | IC2- | |
| 15 | IN2- | 16 | IN2+ | |
| 17 | - | 18 | - | NC |
| 19 | - | 20 | - | |
| 21 | VA1+ | 22 | VA1- | PT |
| 23 | VB1+ | 24 | VB1- | |
| 25 | VC1+ | 26 | VC1- | |
| 27 | VN1+ | 28 | VN1- | |
| 29 | VA2+ | 30 | VA2- | |
| 31 | VB2+ | 32 | VB2- | |
| 33 | VC2+ | 34 | VC2- | |
| 35 | VN2+ | 36 | VN2- | |

### 2.2.3.3. Connection of DIU



< DIU connection>

- Connection of contact inputs in DIU uses #1~#36 of each terminal block, and is made so that 3 points or 5 points of each terminal block share one COM.

- The configuration for connecting the contact DIU terminal block is as follows.

| DIU | Function | DIU | Function |
|---|---|---|---|
| 1 | DI1+ | 19 | DI15+ |
| 2 | DI2+ | 20 | DI16+ |
| 3 | DI3+ | 21 | DI17+ |
| 4 | DI1,2,3- | 22 | DI15,16,17- |
| 5 | DI4+ | 23 | DI18+ |
| 6 | DI5+ | 24 | DI19+ |
| 7 | DI6+ | 25 | DI20+ |
| 8 | DI4,5,6- | 26 | DI18,19,20- |
| 9 | DI7+ | 27 | DI21+ |
| 10 | DI8+ | 28 | DI22+ |
| 11 | DI9+ | 29 | DI23+ |
| 12 | DI7,8,9- | 30 | DI21,22,23- |
| 13 | DI10+ | 31 | DI24+ |
| 14 | DI11+ | 32 | DI25+ |
| 15 | DI12+ | 33 | DI26+ |
| 16 | DI13+ | 34 | DI27+ |
| 17 | DI14+ | 35 | DI28+ |
| 18 | DI10,11, 12,13,14- | 36 | DI24,25, 26,27,28- |

### 2.2.3.4. Connection of DAIU

<DAIU connection>

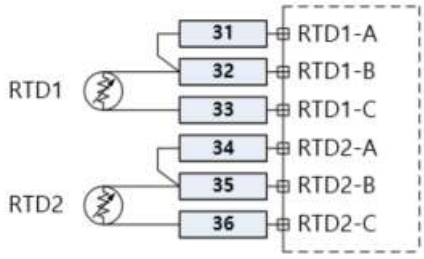
- Connection of contact inputs in DIU uses #1~18 of each terminal block, and is made so that 8 points of each terminal block share one COM.

- The configuration for connecting the contact DIU terminal block is as follows.

| DAIU | Function |
|---|---|
| 1 | DI1+ |
| 2 | DI2+ |
| 3 | DI3+ |
| 4 | DI4+ |
| 5 | DI5+ |
| 6 | DI6+ |
| 7 | DI7+ |
| 8 | DI8+ |
| 9 | DI1,2,3,4,5,6,7,8- |
| 10 | DI9+ |
| 11 | DI10+ |
| 12 | DI11+ |
| 13 | DI12+ |
| 14 | DI13+ |
| 15 | DI14+ |
| 16 | D15+ |
| 17 | D16+ |
| 18 | DI9,10,11,12,13,14,15,16- |

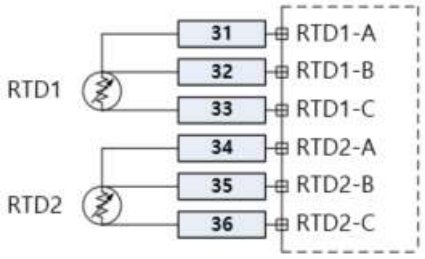
- Connection of AI in DIU uses #19~#30 of each terminal block, and the connection should be made as +/- pairs.

- The configuration for connecting the contact AI terminal block is as follows.



| DAIU | Function |
|---|---|
| 19 | AI1+ |
| 20 | AI1- |
| 21 | AI2+ |
| 22 | AI2- |
| 23 | AI3+ |
| 24 | AI3- |
| 25 | AI4+ |
| 26 | AI4- |
| 27 | AI5+ |
| 28 | AI5- |
| 29 | AI6+ |
| 30 | AI6- |

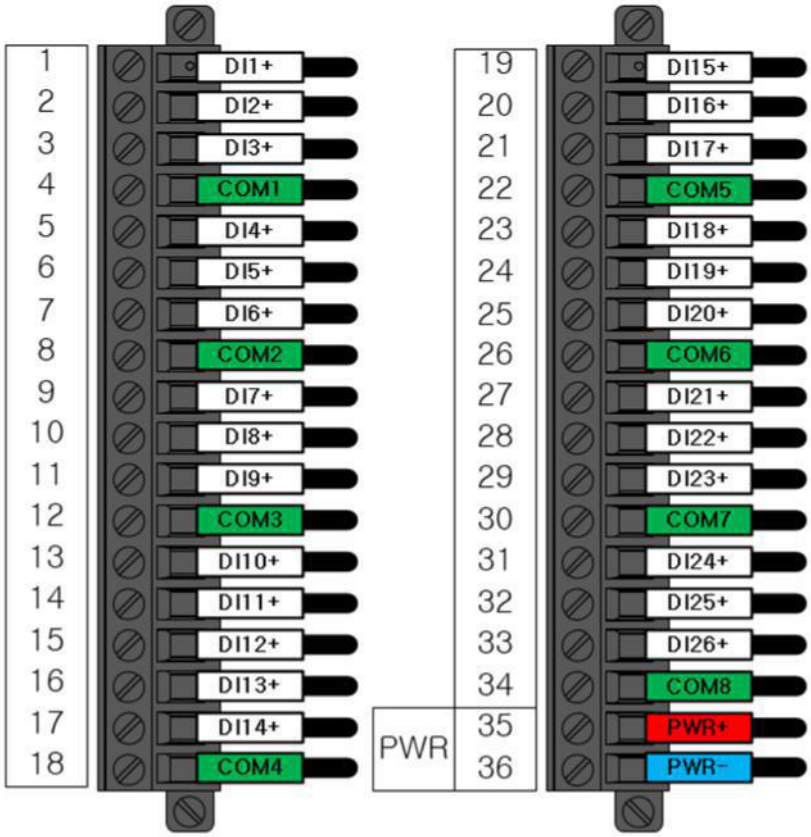
- Connection of RTD in DIU uses #31~#36 of each terminal block. #31~#33 are RTD1 [A.B.C], #34~36 are RTD2 [A,B,C] and they are connected as 2-wire or 3-wire connections.



- The configuration for connecting the RTD terminal block is as follows.

| DAIU | Function |
|---|---|
| 31 | RTD1-A |
| 32 | RTD1-B |
| 33 | RTD1-C |
| 34 | RTD2-A |
| 35 | RTD2-B |
| 36 | RTD2-C |

- The configuration for connecting the RTD sensors is as follows.



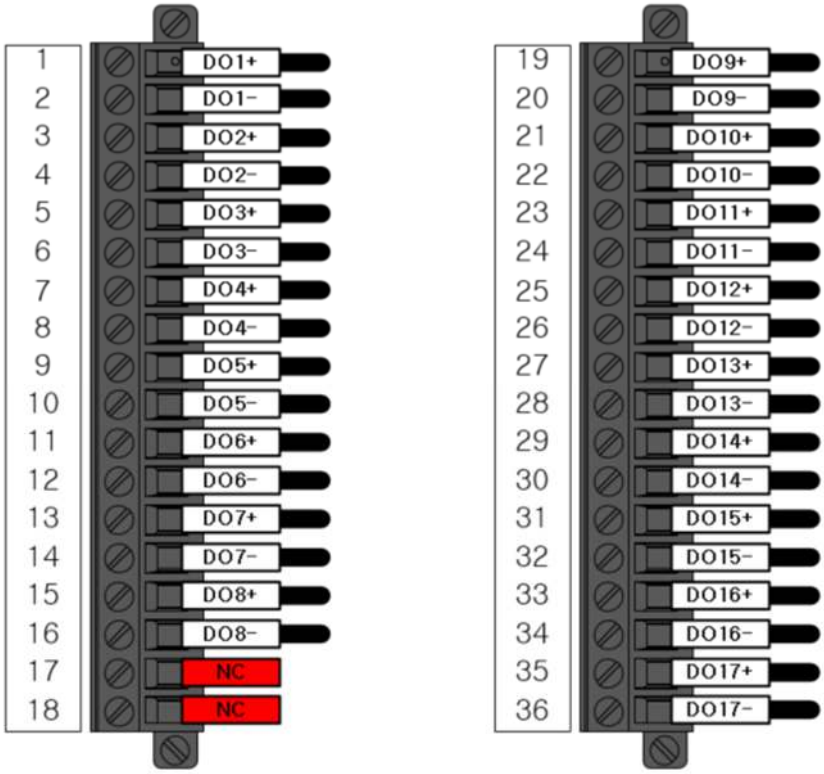
2-wire

3-wire

### 2.2.3.5. Connection of DIPU

< DIPU connection >

- Connection of contact input in DIPU uses #1~#36 of each terminal block, and is made so that 3 points or 5 points of each terminal block share one COM.



- The configuration for connecting the DIPU terminal block is as follows.

| DIPU | Function | DIPU | Function |
|---|---|---|---|
| 1 | DI1+ | 19 | DI15+ |
| 2 | DI2+ | 20 | DI16+ |
| 3 | DI3+ | 21 | DI17+ |
| 4 | DI1,2,3- | 22 | DI15,16,17- |
| 5 | DI4+ | 23 | DI18+ |
| 6 | DI5+ | 24 | DI19+ |
| 7 | DI6+ | 25 | DI20+ |
| 8 | DI4,5,6- | 26 | DI18,19,20- |
| 9 | DI7+ | 27 | DI21+ |
| 10 | DI8+ | 28 | DI22+ |
| 11 | DI9+ | 29 | DI23+ |
| 12 | DI7,8,9- | 30 | DI21,22,23- |
| 13 | DI10+ | 31 | DI24+ |
| 14 | DI11+ | 32 | DI25+ |
| 15 | DI12+ | 33 | DI26+ |
| 16 | DI13+ | 34 | D24,25,26- |
| 17 | DI14+ | | |
| 18 | DI10,11, 12,13,14- | | |

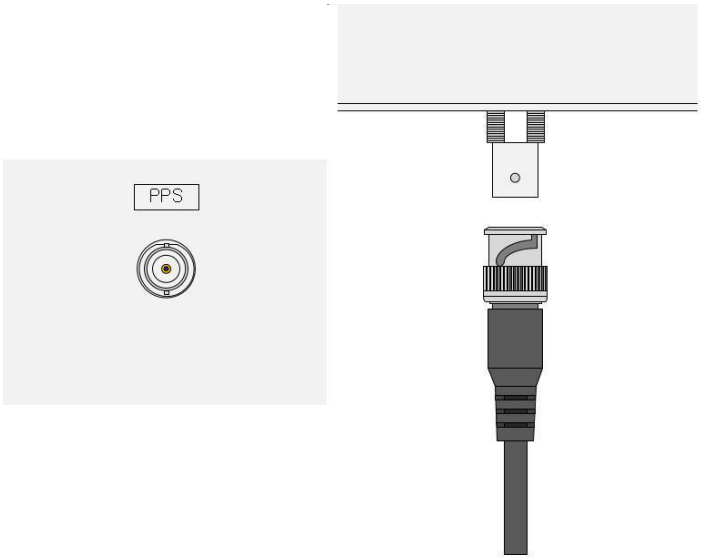
- DIPU can be used with AC and DC power supply.
- The configuration for connecting the power supply terminal block is as follows.

| DIPU | Function | |
|---|---|---|
| 35 | DC125V+ | AC220(L) |
| 36 | DC125V - | AC220(N) |

### 2.2.3.6. Connection of DOU

<DOU Connection>

- Connection of AI in DOU uses #1~36 of each terminal block, and the connection is made so that there are input as +/- pairs.
- output # 35~36 point out of contacts of DOU terminal blocks are used as the basic B contact.

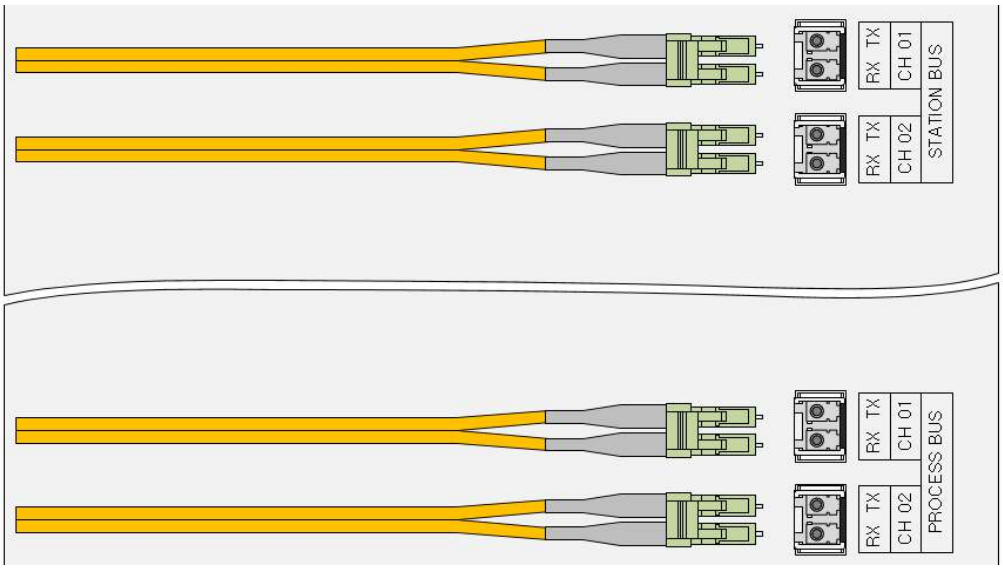


**Be sure to check the status of the contact point B before connecting the contact output terminal block.**

- The configuration for connecting the power supply terminal block is as follows.

| DOU | Function | Contact |
|---|---|---|
| 1 | DO1+ | |
| 2 | DO1- | |
| 3 | DO2+ | |
| 4 | DO2- | |
| 5 | DO3+ | |
| 6 | DO3- | |
| 7 | DO4+ | |
| 8 | DO4- | |
| 9 | DO5+ | |
| 10 | DO5- | |
| 11 | DO6+ | |
| 12 | DO6- | |
| 13 | DO7+ | |
| 14 | DO7- | |
| 15 | DO8+ | |
| 16 | DO8- | |
| 17 | - | |
| 18 | - | |

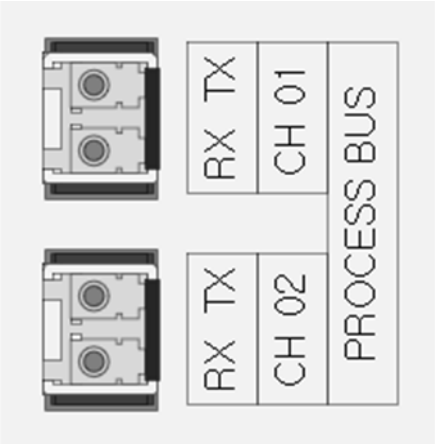
| DOU | Function | Contact |
|---|---|---|
| 19 | DO9+ | |
| 20 | DO9- | |
| 21 | DO10+ | |
| 22 | DO10- | |
| 23 | DO11+ | |
| 24 | DO11- | |
| 25 | DO12+ | |
| 26 | DO12- | |
| 27 | DO13+ | |
| 28 | DO13- | |
| 29 | DO14+ | |
| 30 | DO14- | |
| 31 | DO15+ | |
| 32 | DO15- | |
| 33 | DO16+ | |
| 34 | DO16- | |
| 35 | DO17+ | B contact |
| 36 | DO17- | |



### 2.2.3.7. 1PPS Connection

<PPS connection>

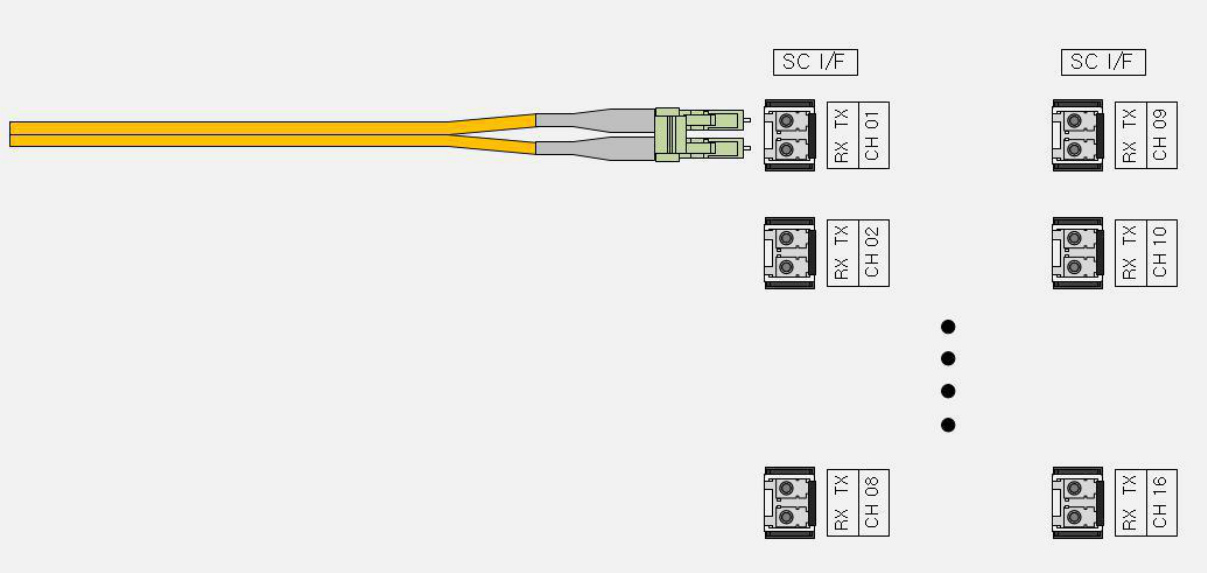
- 1PPS input cable is connected to 1PPS input port, using BNC cable.



### 2.2.3.8. Fiber-Optic Connection

<Fiber-optic connection>

- The optical port for connecting STATION BUS terminal (IEC 61850) and PROCESS BUS terminal consists of 2 channels (redundancy), respectively, and the optical cables are connected to CH 01 and CH 02 ports.



- SFP Specification

| Classification | Description |
|---|---|
| Number of Port | 2 (physical) / 1 (HSR/PRP redundant) |
| Figure | Rear   |

| Classification | Description | | |
|---|---|---|---|
| Characteristics | Glass optical fiber | | |
| Connector type | 2 x duplex LC | | |
| | Select option | | |
| | 100Base-FX | 1000Base-SX 1 | 1000Base-SX 2 |
| Fiber type | Multi mode<br>(50/125μm and 62.5/125μm optical cable) | | |
| Transmission distance | 2km | 550m | 2km |
| Wave length | 1310nm | 850nm | 1310nm |
| Max. Data Rate | 100 Mbps | 1000 Mbps | 1000 Mbps |
| Operating Temperature | -40 ~ 85℃ | | |
| Storage Temperature | -40 ~ 85℃ | | |
| Protocol | IEC 61850-9-2LE, IEC 61869-9, limited IEC 61850-8-1<br>IEEE1588v2 | | |

**Do not replace SFP modules supplied by the manufacturer arbitrarily**

### 2.2.3.9. Fiber-Optic Connection for Secondary Converter in the IM2 for LPIT

<Fiber-optic connection to SCs in IM2 for LPIT>

- Optical port for connecting Secondary Converter Unit communication consists of a total of 16 channels, and optical cable is connected as LC to ST type between Secondary Converter unit and IM2.

- SFP Specification

| Classification | Description |
|---|---|
| Number of Port | 8 (physical) |
| Characteristics | Glass optical fiber |
| Connector type | duplex LC |
| Fiber type | Multi mode (62.5 μm/125 μm optical cable) |
| Transmission distance | Maximum 2km |
| Wave length | 850nm |
| Bit Rate | DC-50 MHz |

| Classification | Description |
|---|---|
| Operating Temperature | -40 ~ 85℃ |
| Storage Temperature | -40 ~ 85℃ |
| Protocol | Manufacturer's own protocol |

**Do not replace SFP modules supplied by the manufacturer arbitrarily**

### 2.2.3.10. Wiring Feature

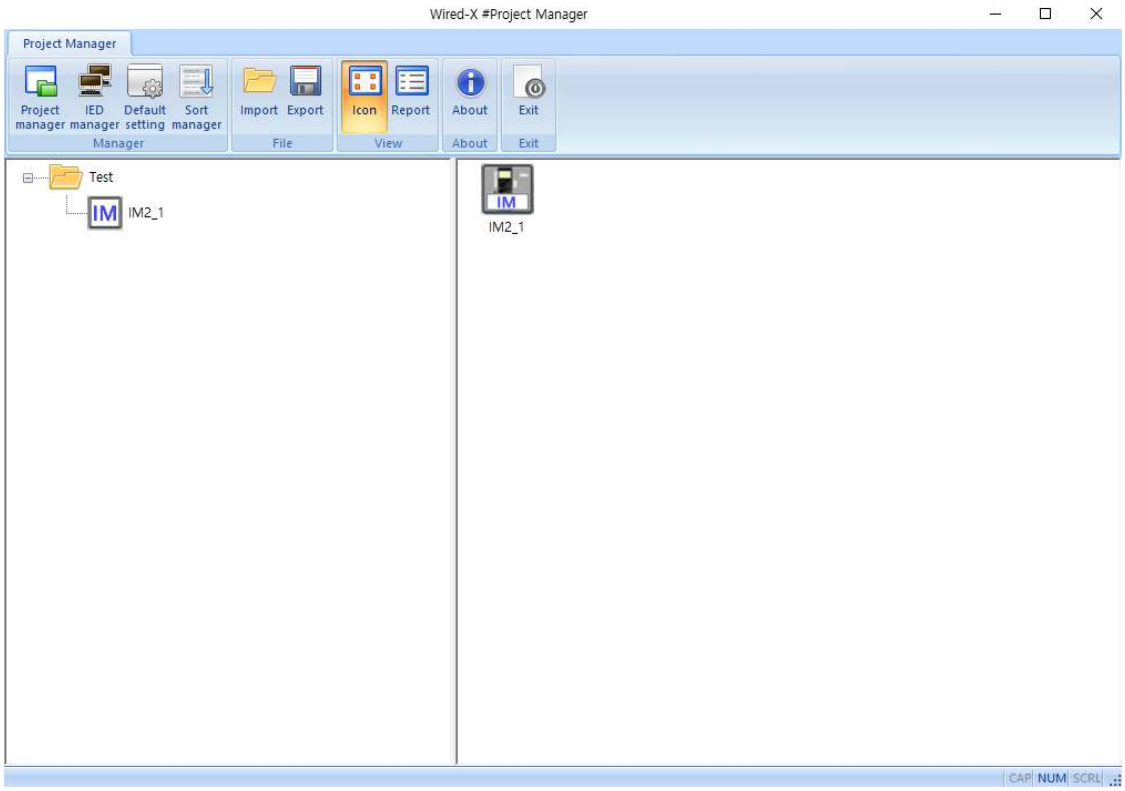
- Wiring cables used on the back side should be cables equal to or higher than the following standards.
  - Vinyl chloride insulated cable less than 450/750V that meets KSC C IEC 60227-3(2005) or IEEE 383
  - Cables for AC current circuit: copper cable of 2.5㎟ or thicker
  - Cable for power and ground-related circuit: copper cable of 2.5㎟ or thicker
  - Cable for optical communication: Multi-mode, 1310nm
  - Cable for other circuits: copper cable of 1.5㎟ or thicker
  - Treatment of wiring end: Be sure to use the ring-shaped solderless terminals with appropriate dimensions or sleeve-type solderless terminal, and mark bands and colors should be attached to facilitate wiring inspection. However, the solderless terminals must be certified by an authorized agency or conform to KSC 2620 standard.

# 3. Operation

## 3.1. Wired-X

The operating software for IM2 is installed on a Windows OS-based PC to connect to IM2 via TCP/IP over Ethernet communication service ports located at the front and the rear of IM2. The communication between the operating software and IM2 is based on request-response scheme.

<Operating software and IM2>

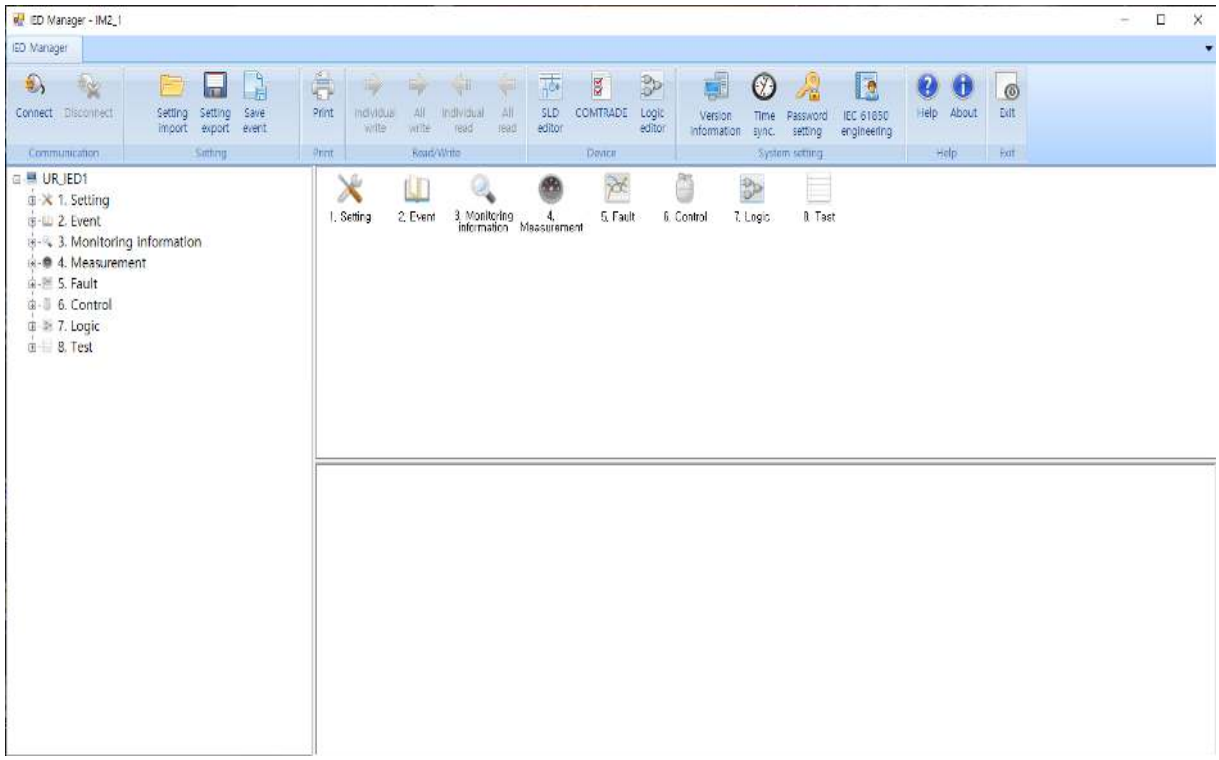


### 3.1.1. Software Components

Operating software consists of the following modules.

| Software module | Details |
|---|---|
| Project Manager | Project management, device management |
| Device Manager | Device communication, event, setting, status management |
| IEC 61850 engineering tool | Management of IEC 61850 engineering files |

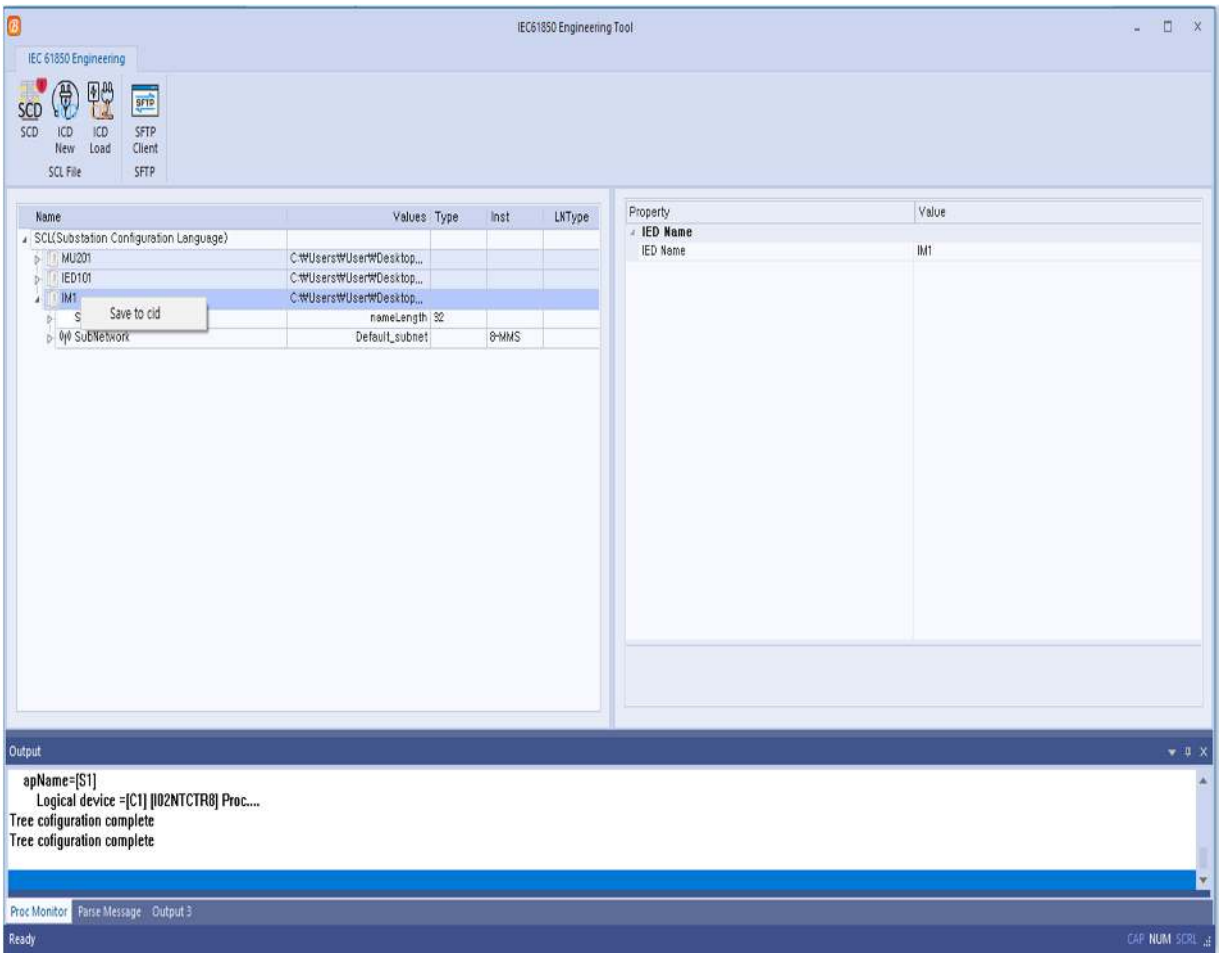
### 1) Project Manager



This is the window screen when the operating software is initially run, creating projects and managing devices to be used in the project by device model. Folders where data are saved, communication methods, communication settings for each device model can be managed.

<Project manager window>

**2) Device Manager**



The following is the Device Manager screen which appears after the connection to a device registered in the project created in the Project Manager is completed. Functions of transmitting and receiving the setting, event and history data with the device are provided. IEC 61850 engineering tool can be launched in the device manager screen.

<Device manager window>

### 3) IEC 61850 engineering tool

IEC 61850 engineering tool is a tool launched in the device manager, which functions to export .ICD files of devices, or import .SDC files to export .CID files. Also, it functions to upload/download the engineering files on/from devices via FTP.

<Window of IEC 61850 engineering tool>

## 3.1.2. Software Installation

**1) Supporting Operating Systems**

• Windows XP

• Windows Server 2003, 2008, 2019 Standard

• Windows Vista

• Windows 7

• Windows 8

• Windows 10

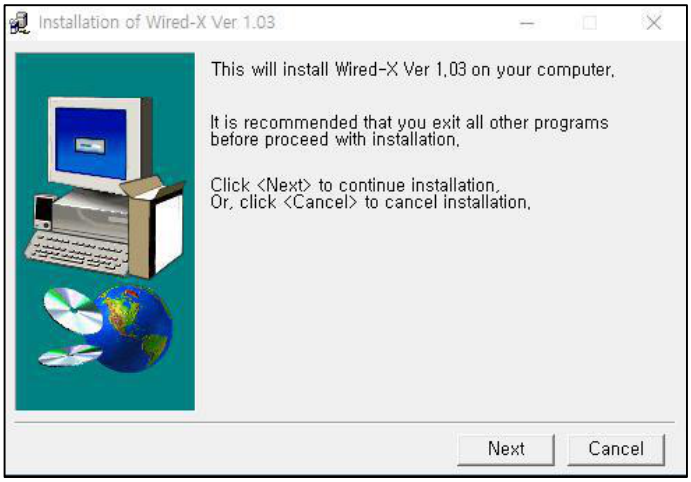
• Windows 11

**2) PC requirements**

• CPU: 1.5GHz or higher

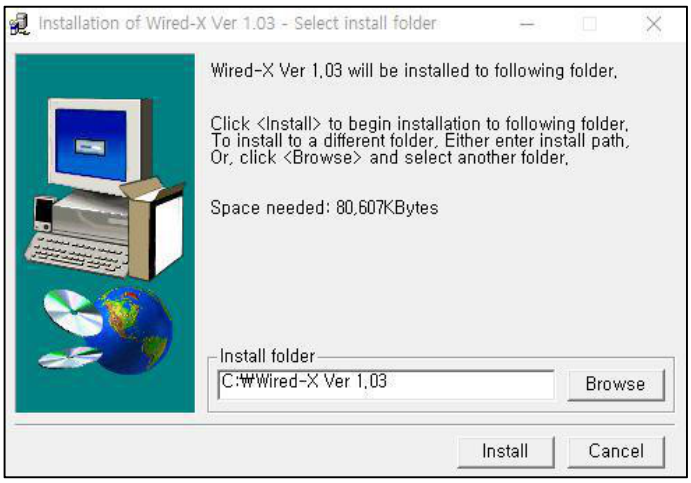
• RAM: 1GB or greater

• HDD: available space of 30GB or more



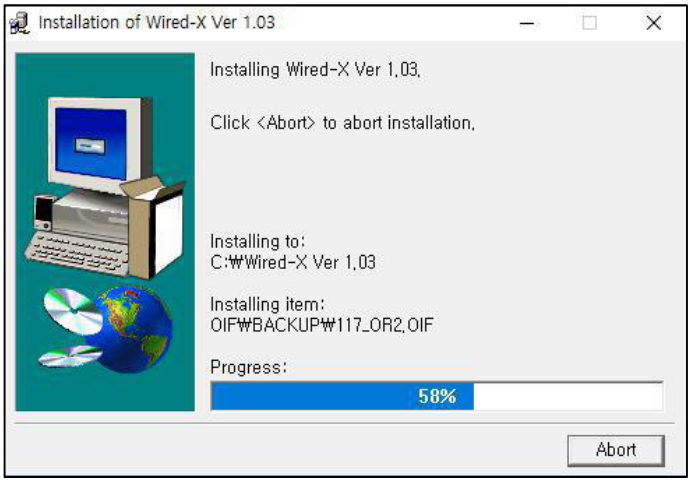
• Ethernet port

**3) Installation**

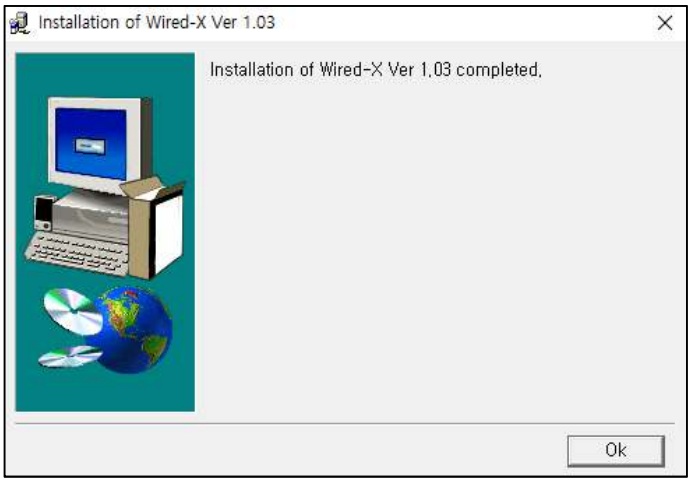


• Run "Wired-X Setup.exe" 

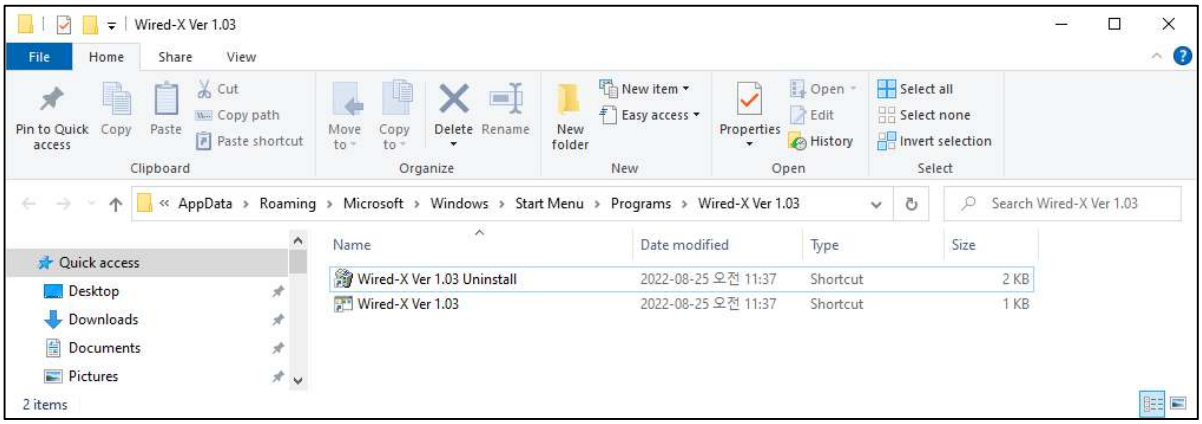
to start the installation.



• Click the "Next" button.

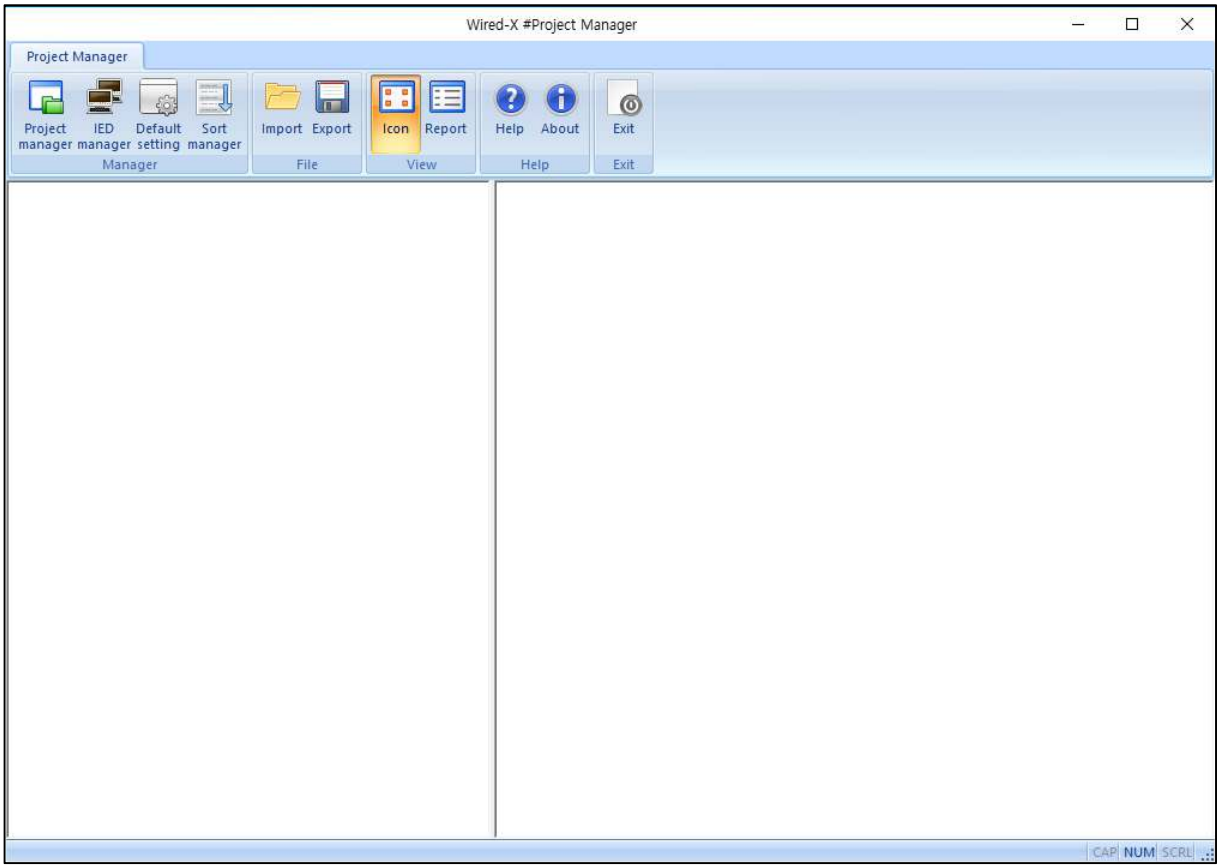


• Designate the "installation folder" and click the "Install" button.



• Installation is proceeded.

• When the installation is completed, click “Ok” button.

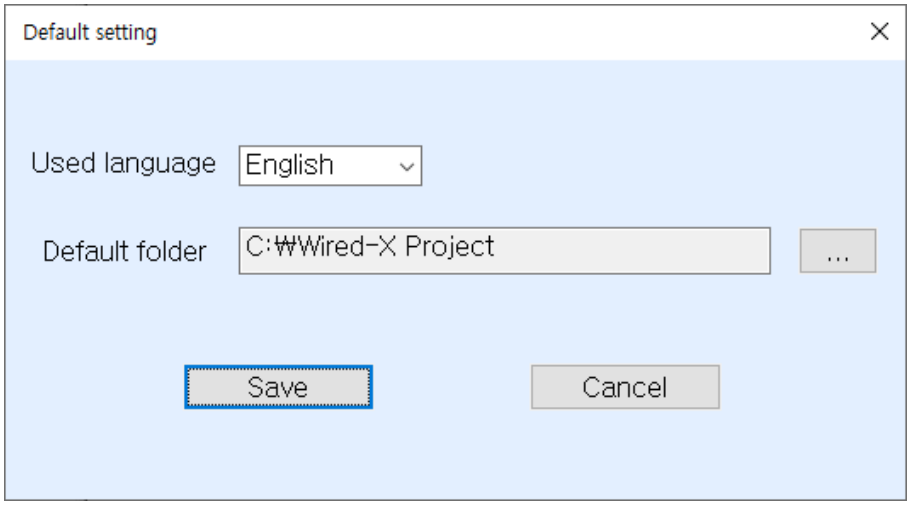


• When the installation is completed normally, the following icons are generated.

<Icons generated >

### 3.1.3. Running the Software

After the installation is completed, the operating software can be launched by double-clicking  icon. Below is the first screen that appears when the operating software is launched. When first launched, nothing is displayed on the screen. Project registration and device registration step should be first executed in order to being ready to make a connection to a device.



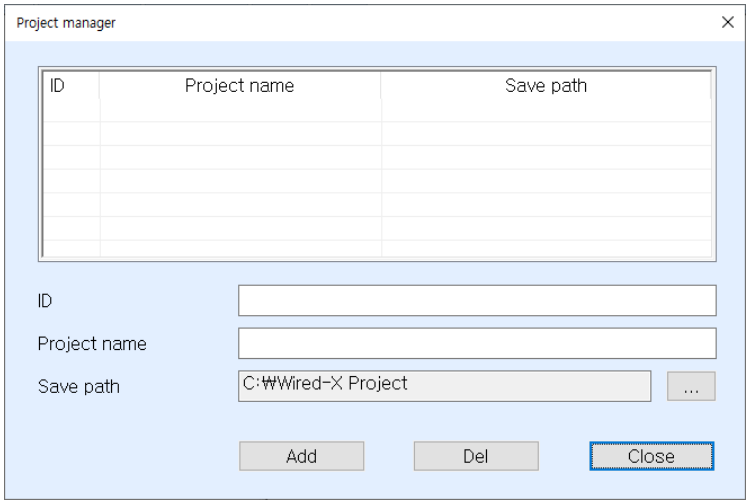
<Initial screen of the operating software (Project Manager)>

### 3.1.4. Environment Setting for Software

**1) Save Path Setting**

Set up a “default folder” that saves information on all devices to which the operating software is connected. Be sure to set up before registering project or devices. Click  icon on the toolbar.

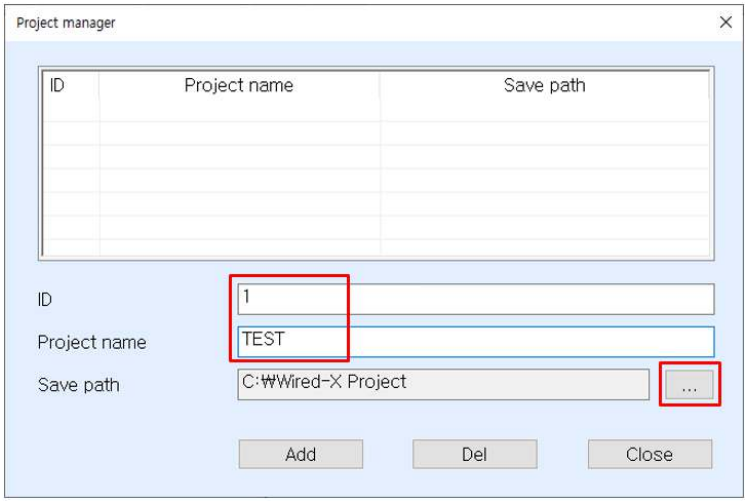
<Default setting>



The language used in the software can be changed between “Korean” and “English”. Click "..." button to select the path of default folder. The default path is "C:\Wired-X Project".

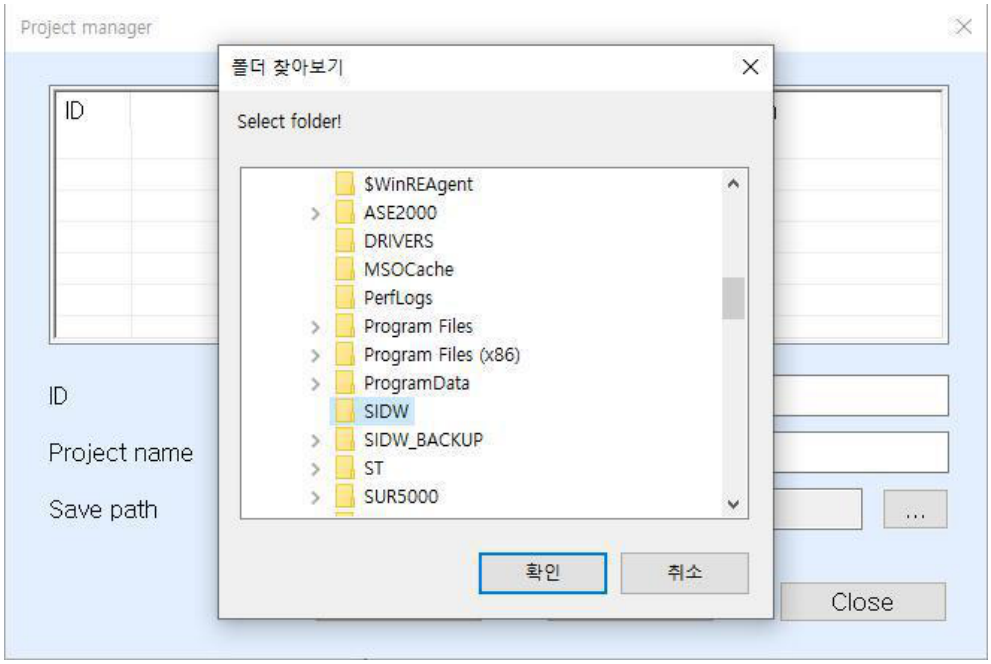
After selecting the desired folder, click "OK" button and then click “Save” button on the previous screen to complete the change of the “default folder”. The change of language takes effect after restarting the program. The information on all devices connected to and managed by the operating software is saved in the set “default folder”.

**2) Registration of Project**



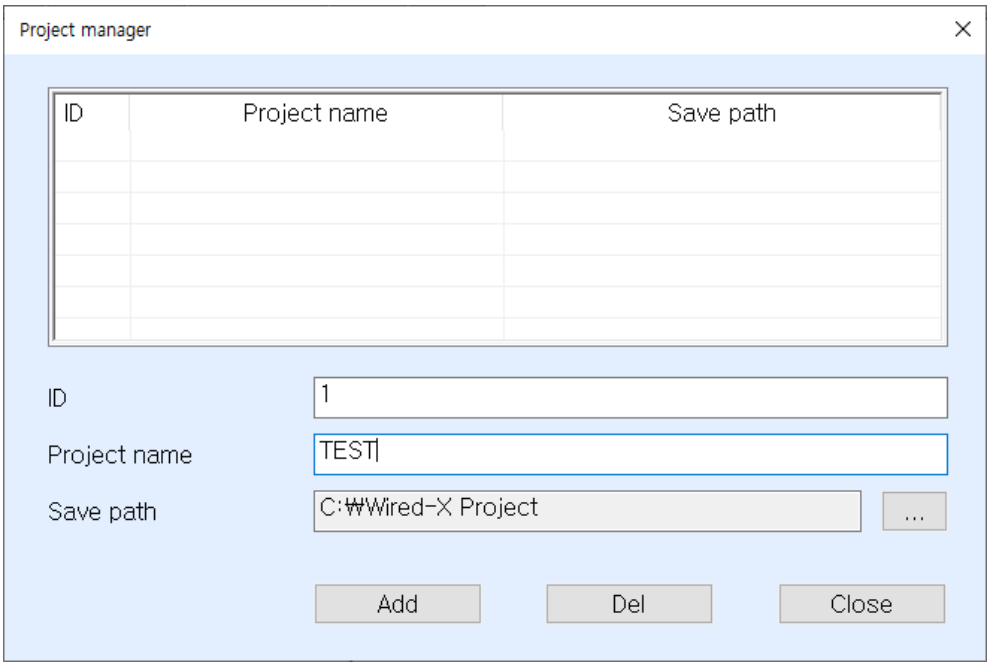
Be sure to register project in order to classify devices connected to and managed by the operating software into project units. For example, one substation can be a project.

First, click  icon on the toolbar.



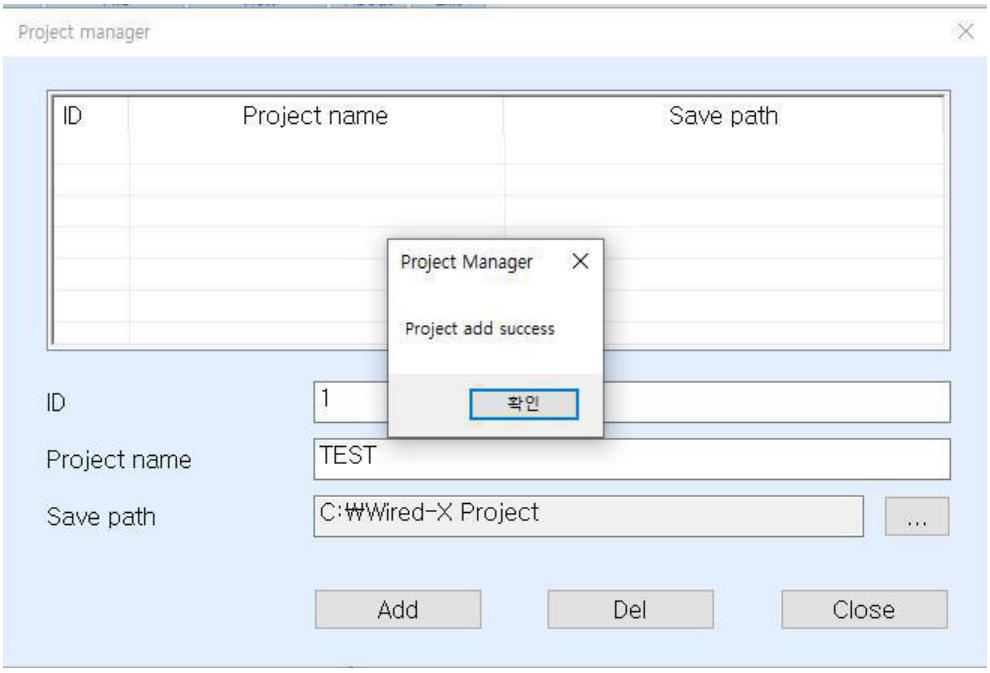
<Project Manager window>

Register projects on the window of Project Manager. Items to be registered are "Project ID", "Project Name", and "Save Path". For "Project ID", enter a numerical value that is distinct from other projects, and for “Project Name”, enter a distinguishable name (e.g., substation name). For "Save Path", select the folder where the project is saved. Check the items for registering project.



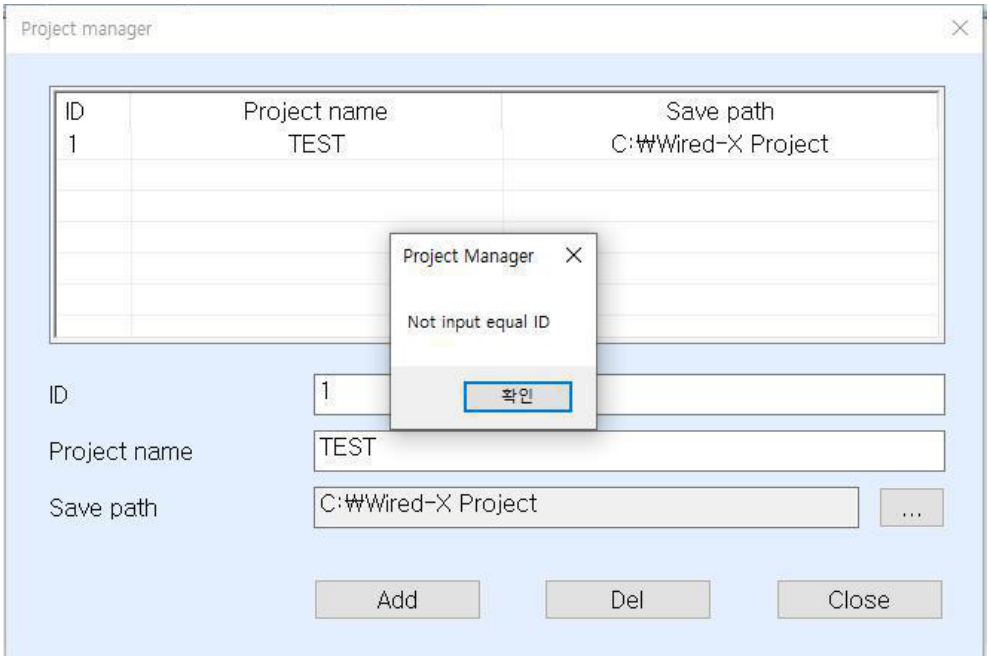
<Window for registering projects>

Select a folder where project will be saved.



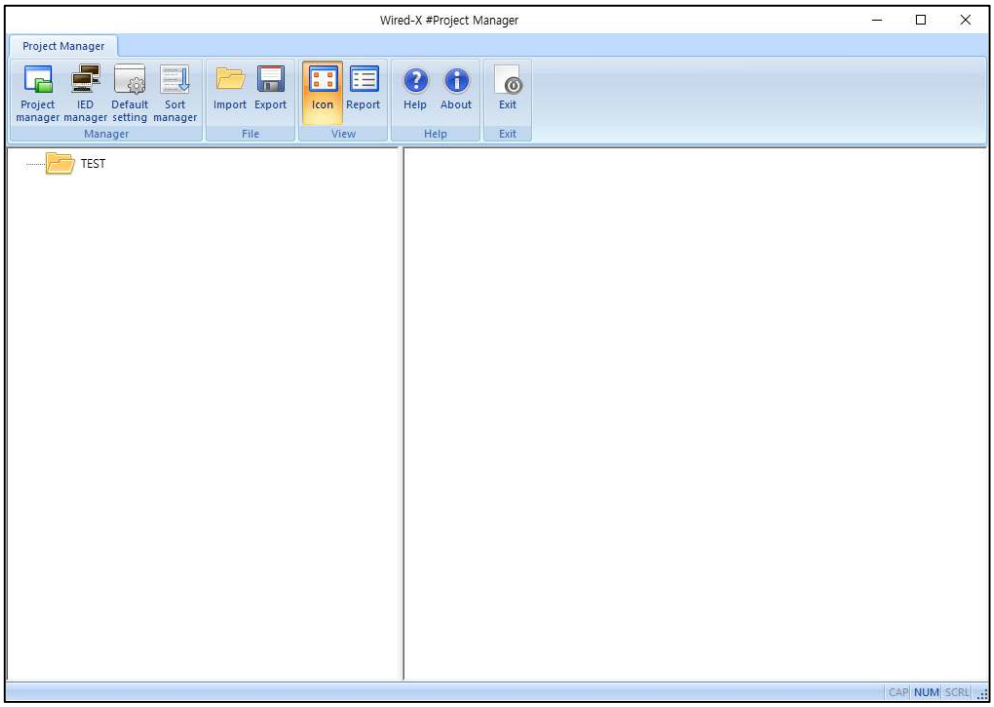
<Window for selecting save path>

Check the input items and then click “Add” button to register the project.



<Window for entering project items>

The added project details will be updated in the upper list.

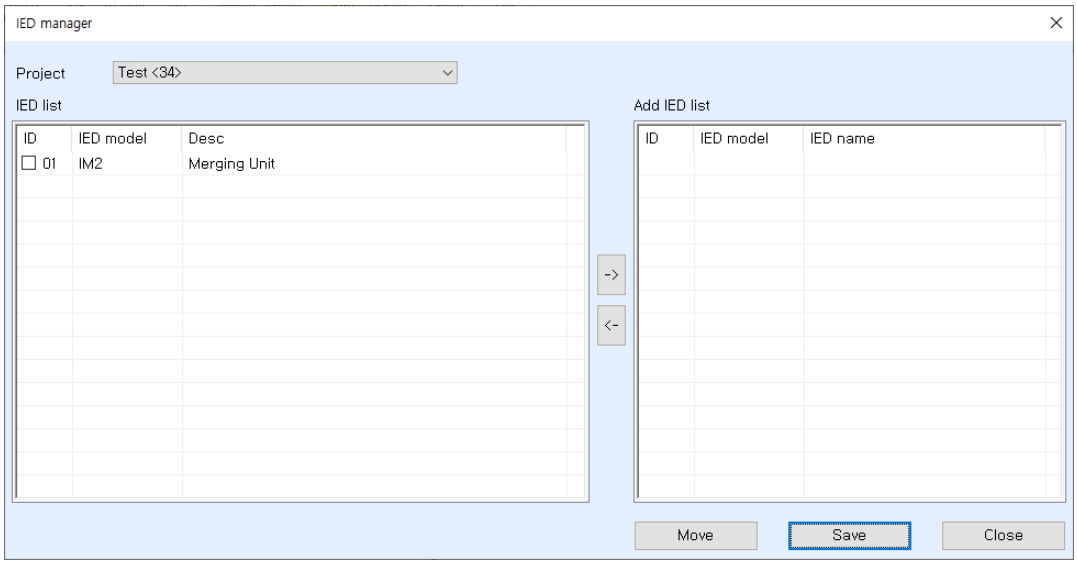


<Window that displays message of 'Project add success'>

If the ID is same as the existing value, project registration will fail.

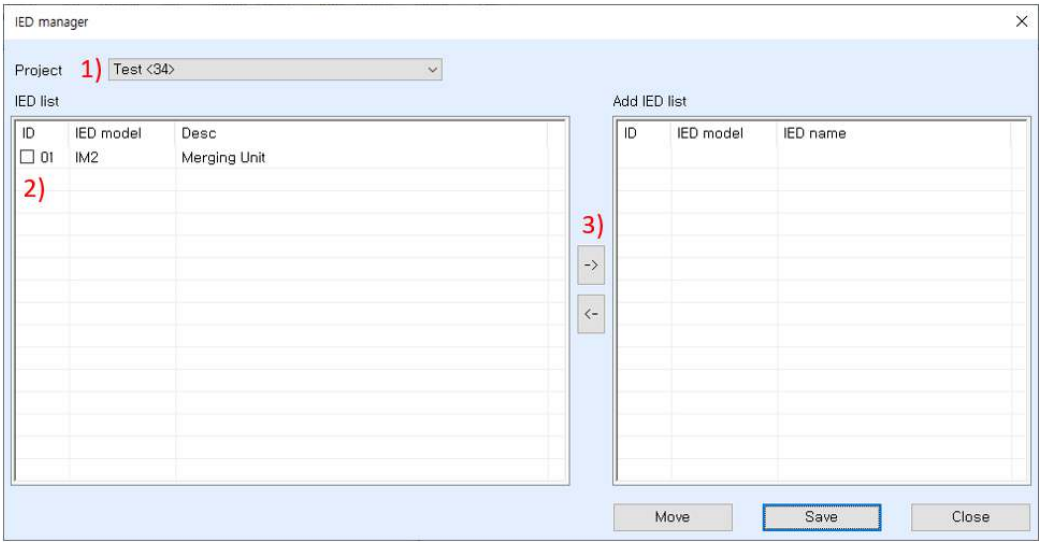
<Window that displays error message when inputting an existing ID>

After the registration process is finished, the name of the registered project is generated in the tree on the left side of the initial screen.



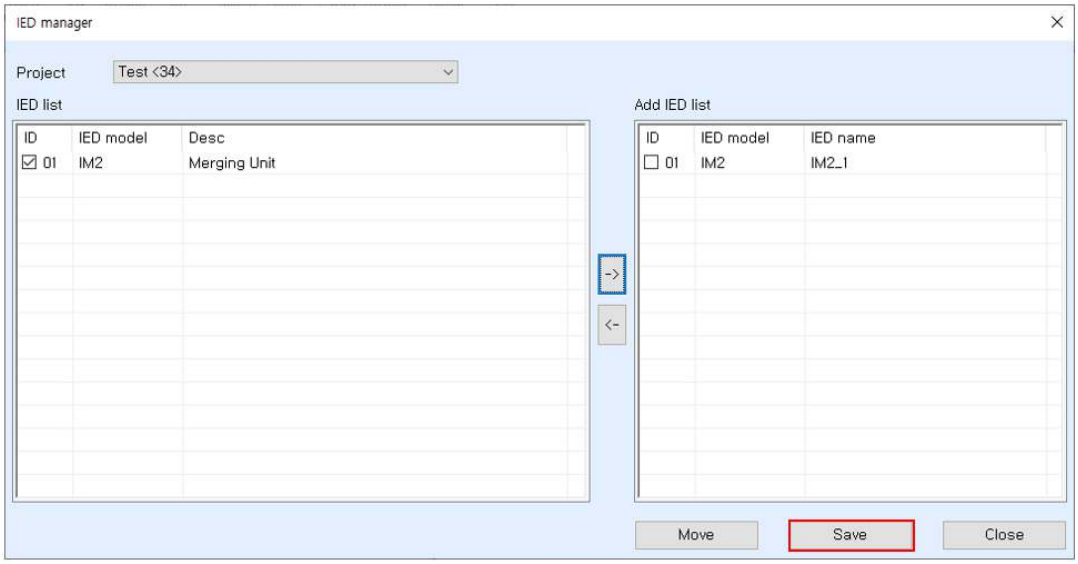
<window for checking the registered projects>

### 3) Registration of Devices

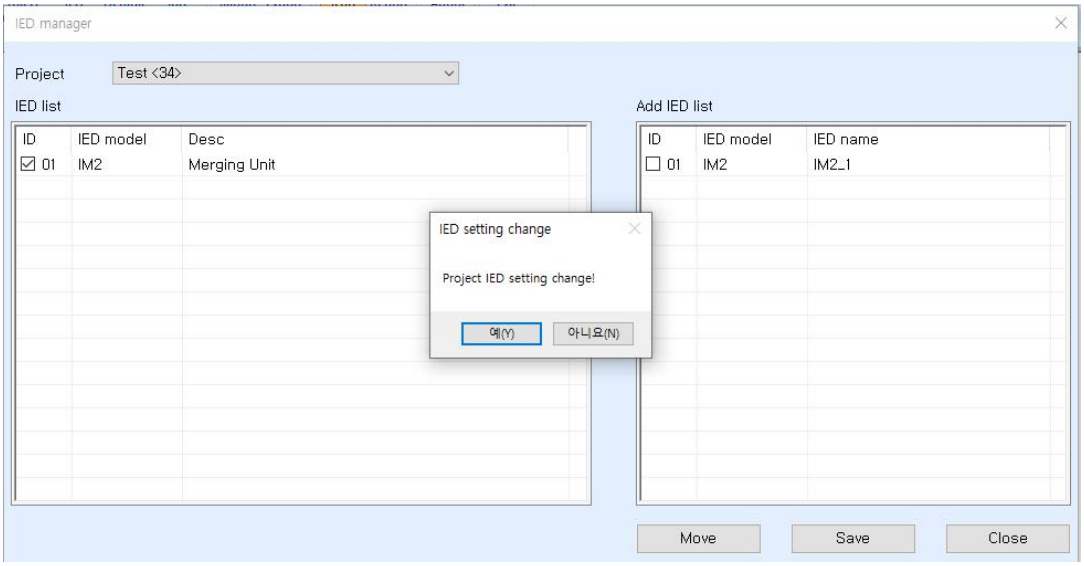


After a project is successfully registered, it is necessary to register devices for the project. For example, the IM2 devices installed in one substation can be the devices for the project.

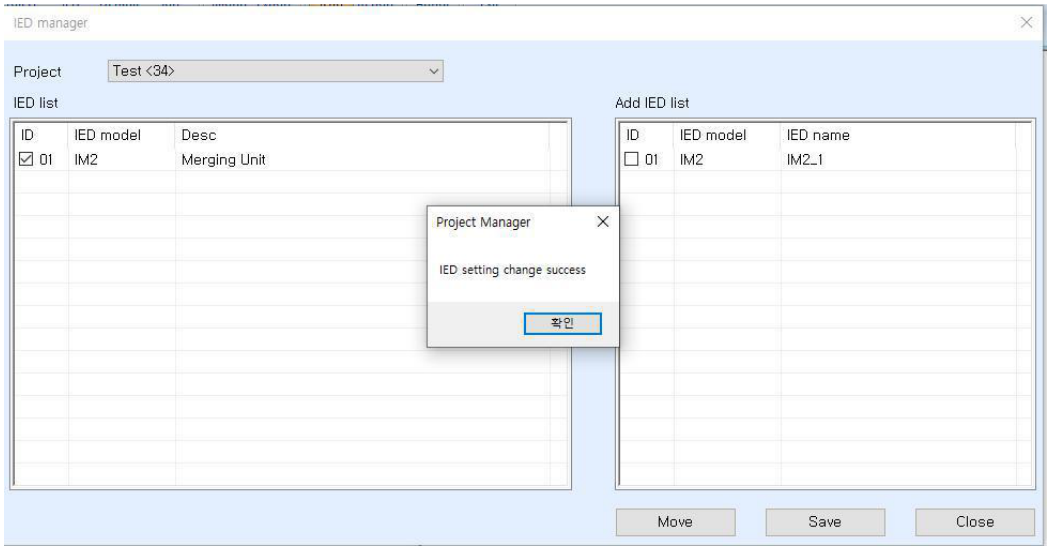
Click  icon on the toolbar.



<Manager window>

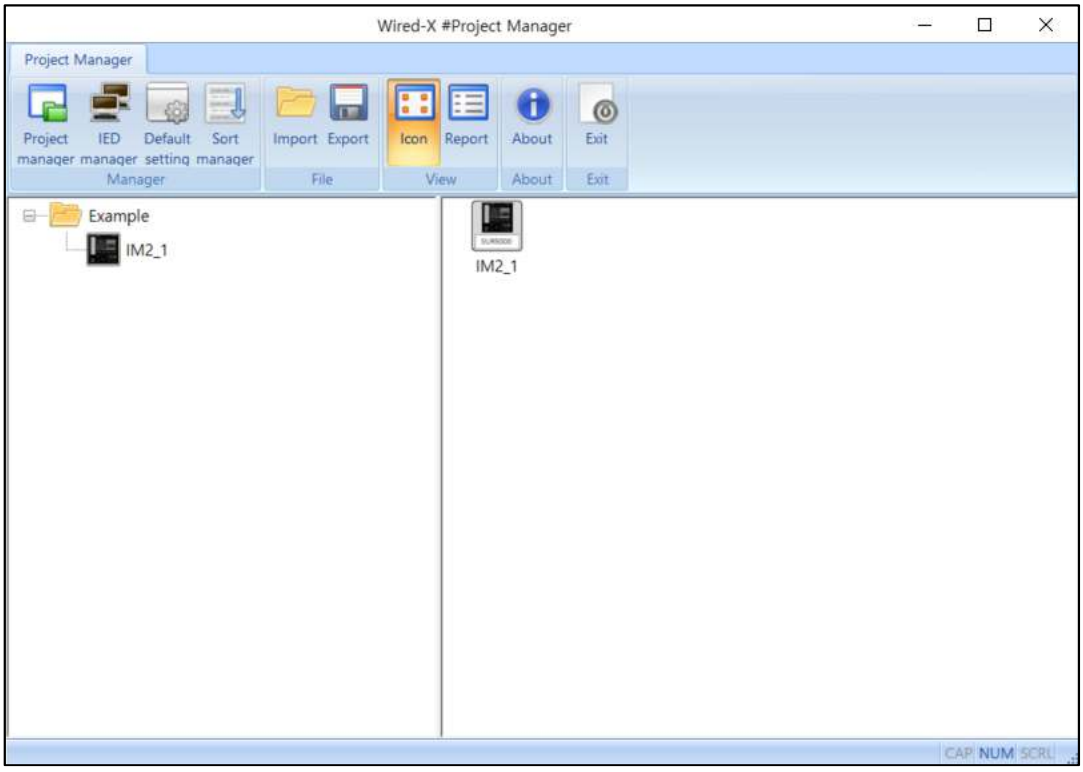


Select "Project", and then select “Device Model” to register from “Device List” on the left (multiple selections are possible), and click “-->” button to update “Registered List of Devices” on the right. Click “Save” button to complete the registration of device.



<Device registration procedure 1 – selection of item>

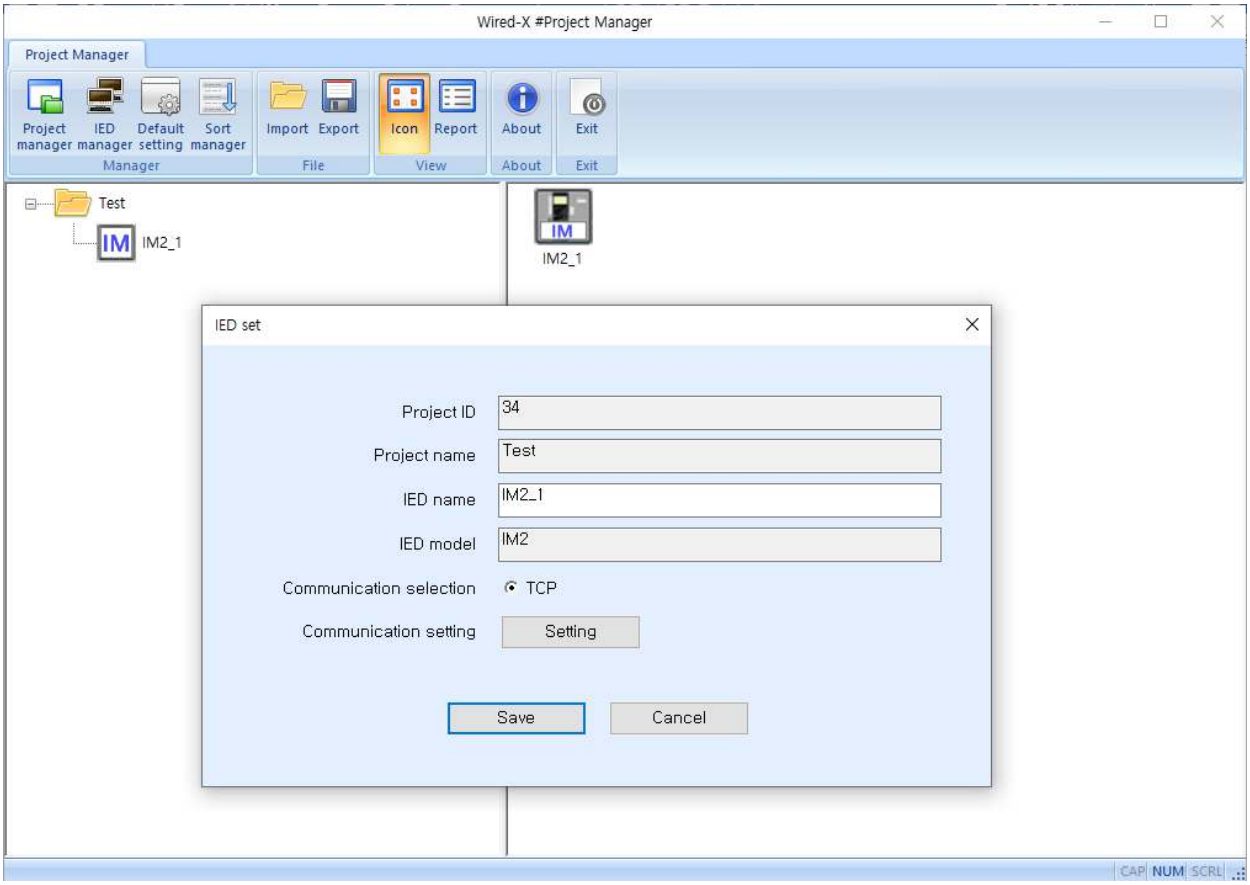
<Device registration procedure 2 – Save>



<Device registration procedure 3 – Check setting>

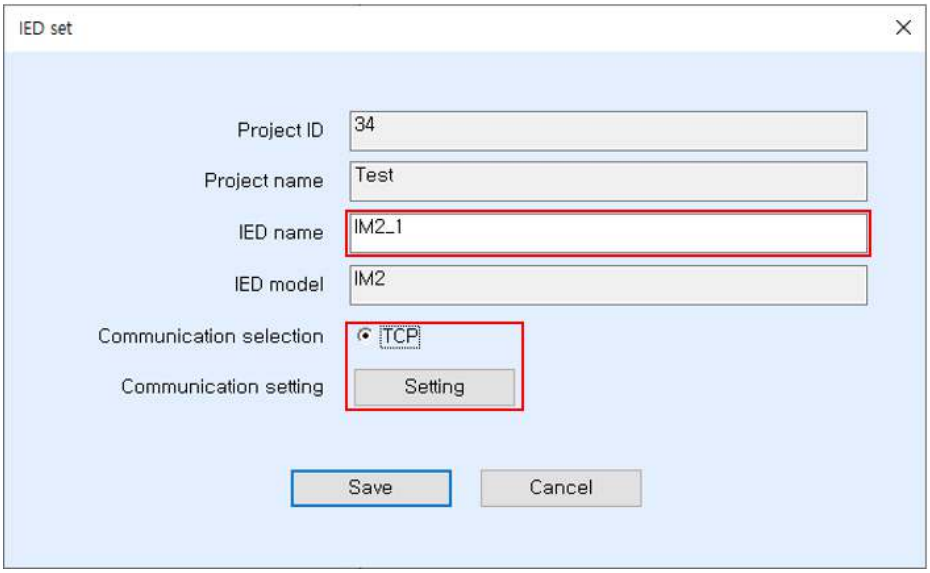
<Device registration procedure 4 – Setting completed>

When the device is registered normally and the above window is closed, the registered device is displayed below the corresponding project item on the left list as follows, and is also displayed in the right side of the screen if the project is selected.



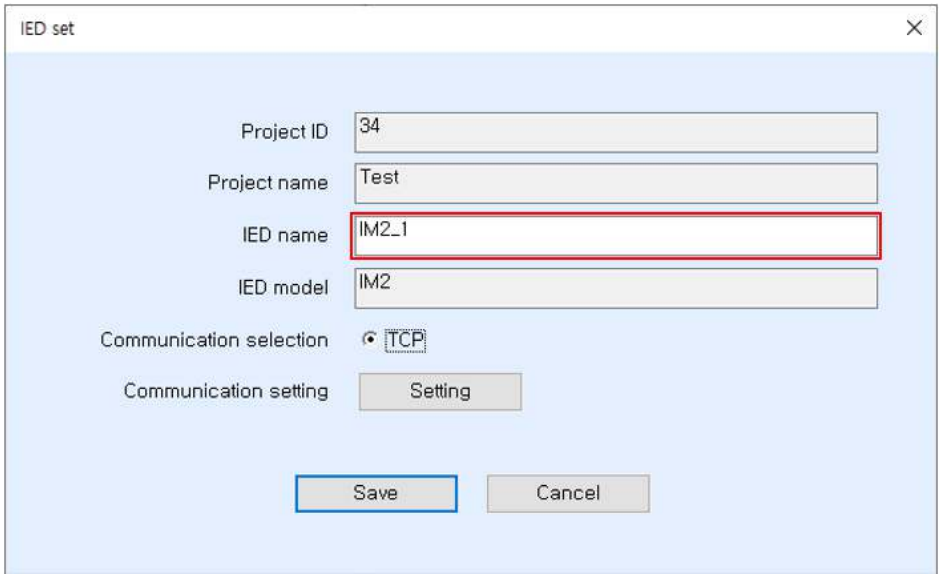
<Result of registering the device>

## 3.1.5. Connection to Software



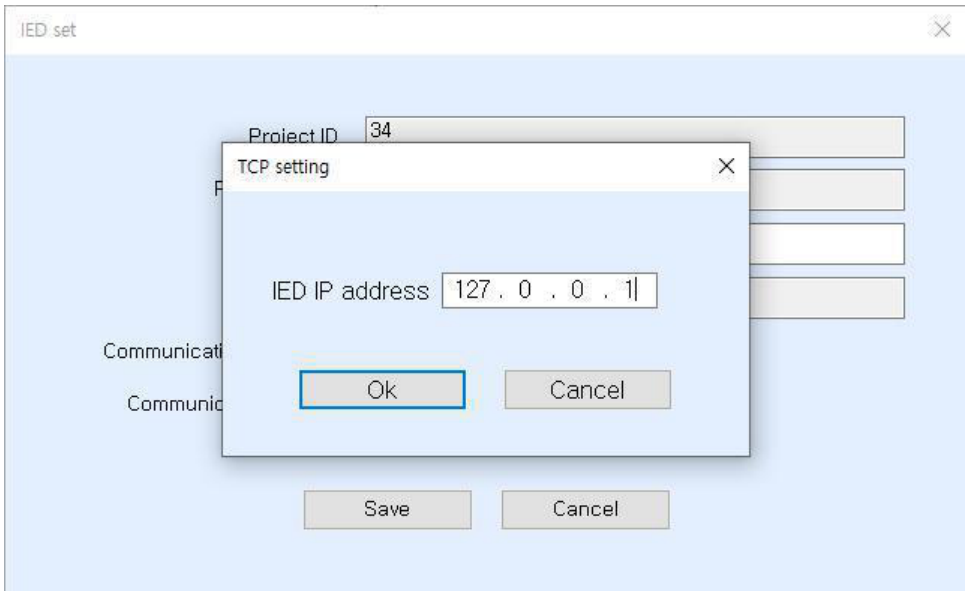
### 1) Setting of Connection

In order to connect the operating software to the registered device, the communication scheme and related parameters should be set up. Select the device to connect in the left or right side of the screen, click the right button on the mouse to display a window for “Device setting”.

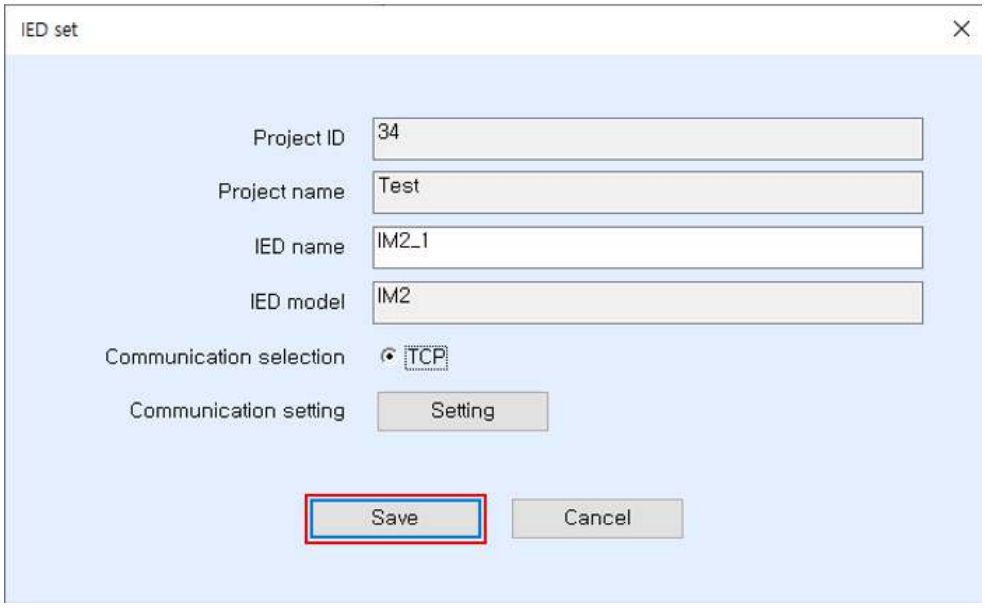


<Window for device setting>

In the above screen, “Device name”, “Communication selection” and “Communication setting” can be modified. The initial value of "Device name" is entered as the same string with the “Device model” at the time of registration, and the operator can change it. “Communication selection” is an item to select how to communicate with the device, and in such case, the setting items on the window of “Communication setting” varies depending on the selected communication scheme.



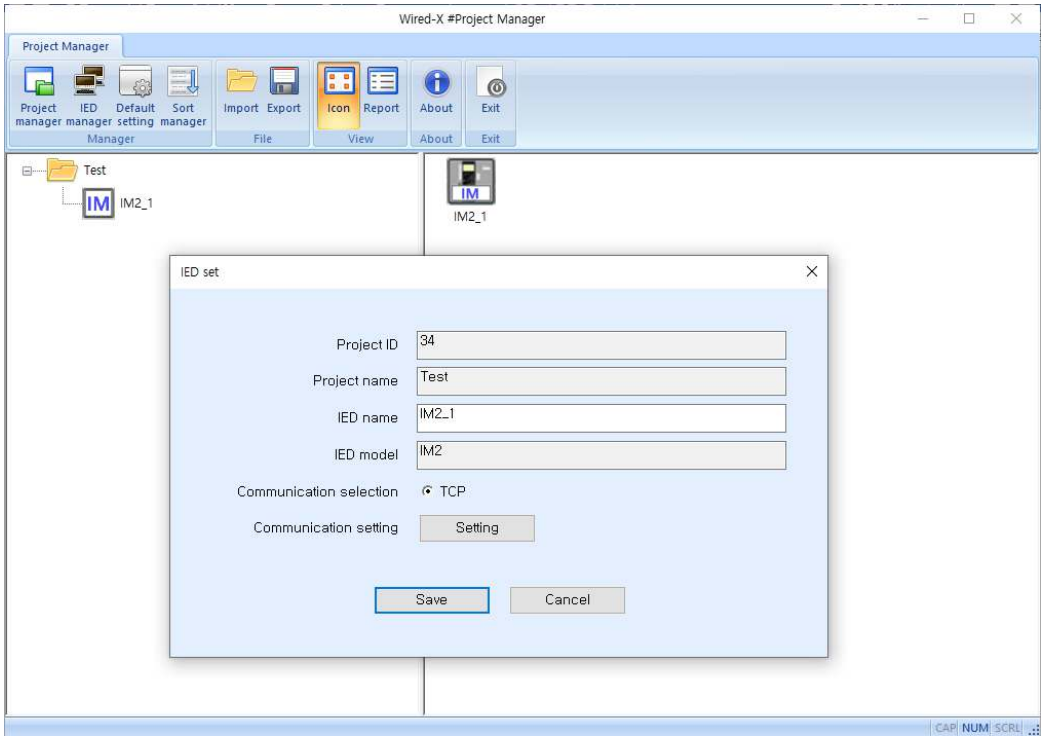
<Device setting – modifiable items>



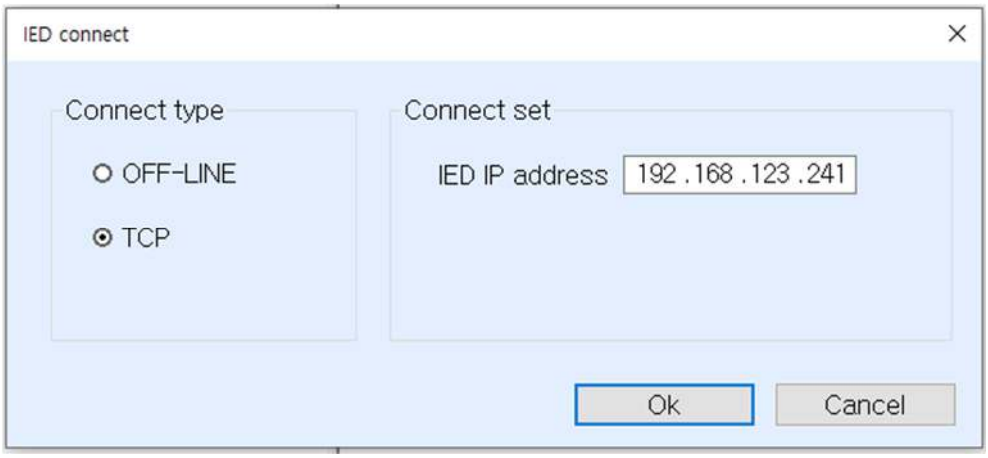
<Device name setting>

For the communication scheme, only TCP/IP is supported by IM2. In the communication setting window, the IP address of the device to connect should be correctly set. Click "OK" button after setting.

<Device setting – setting of TCP communication>

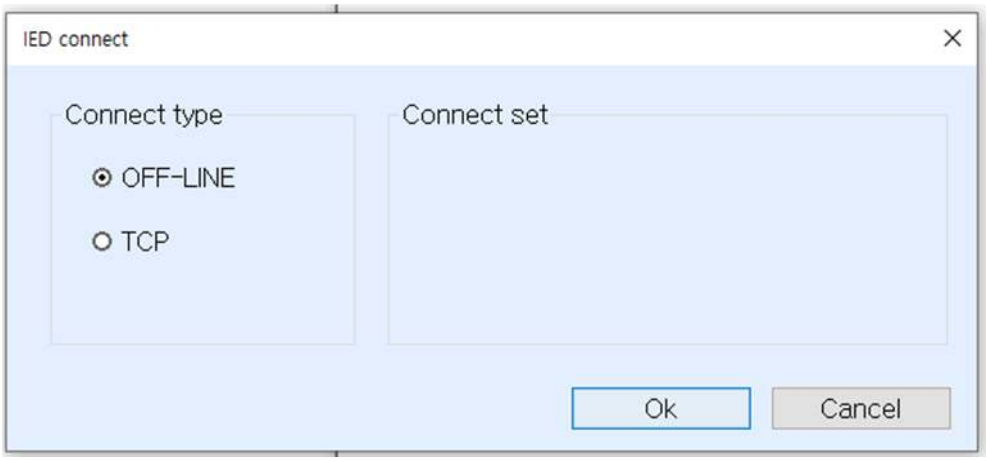


Check the set items after setting, and then click "Save" button.



<Device setting completed>

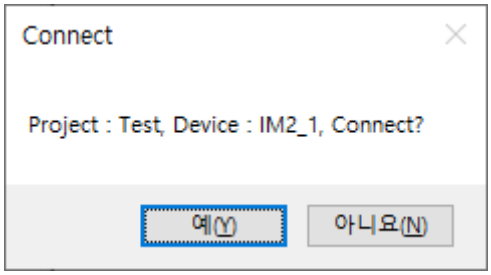
**2) Connection**



After setting communication parameters, double-click the device to be connected. Then, a window for device connection will be displayed.

<1st step of device connection – select and double-click the device>

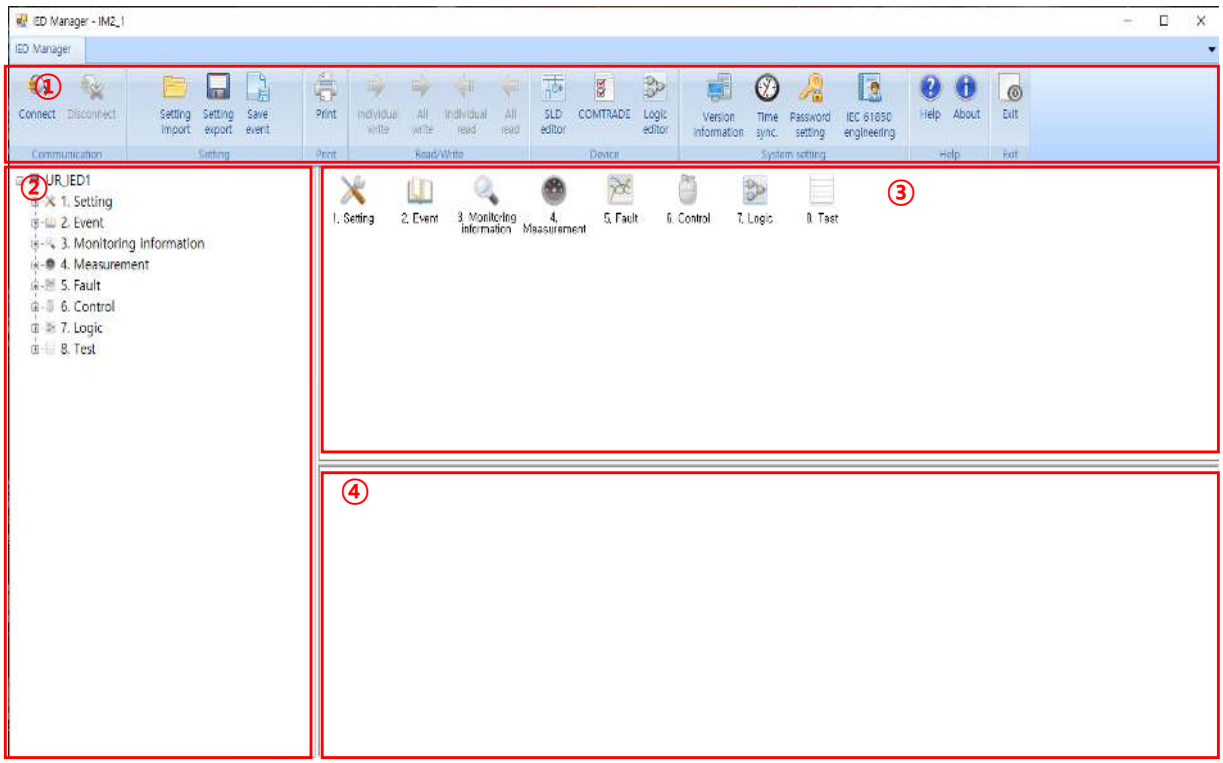
<2nd step of device connection – TCP selected>



<2nd step of device connection – off-line selected>

The connection type can be reselected in the above window. For the connection type designated in the left side of the above window, the detailed information for the type should be set in the right side of the window.

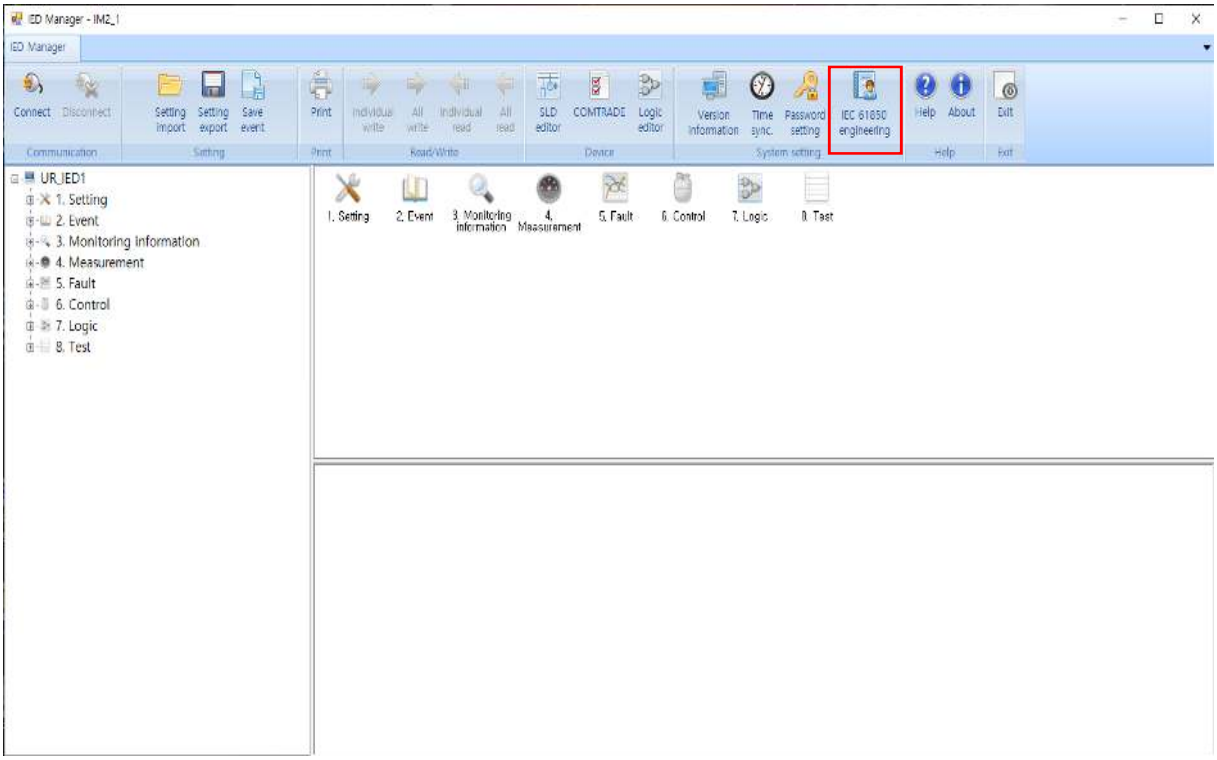
If "OFF-LINE" mode is selected, the Wired-X operates, without connecting to the device, with the information which is pre-set in the software. The values can be modified and saved also in the "OFF-LINE" mode, and it is possible to connect to the device again via TCP and read/write the values from/to the device.



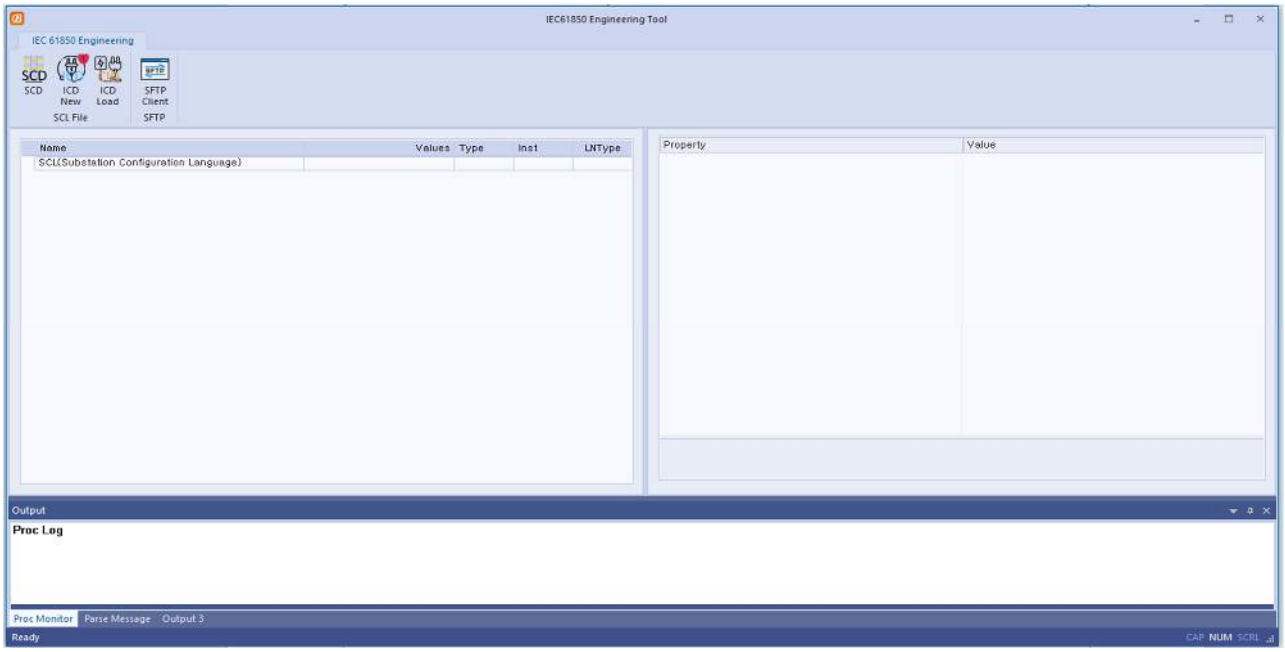
Check "Connection type", and "Connection settings", and then click "OK" button to display the confirmation window, and then click "Yes" button to connect to the device.

<3rd step of device connection – confirmation window>

When connected to the device, the software automatically reads data from the device. If the



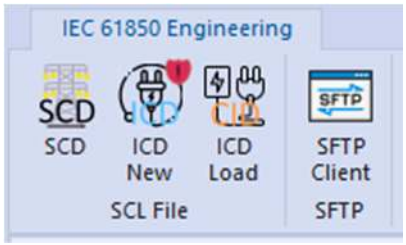
software failed to connect with the device due to some reason, a communication error message is displayed and the connection trial is terminated. If a communication error message is displayed, check the device settings again and proceed to try connection. When the connection and data synchronization with the device are completed successfully, the initial screen of the Device Manager is displayed. Device Manager view is consist of 4 area (①Main Tool Bar, ②Tree View, Detail Information View, ④Log view)



<Screen layout of the Device Manager>

## 3.1.6. Running IEC 61850 Engineering Tool

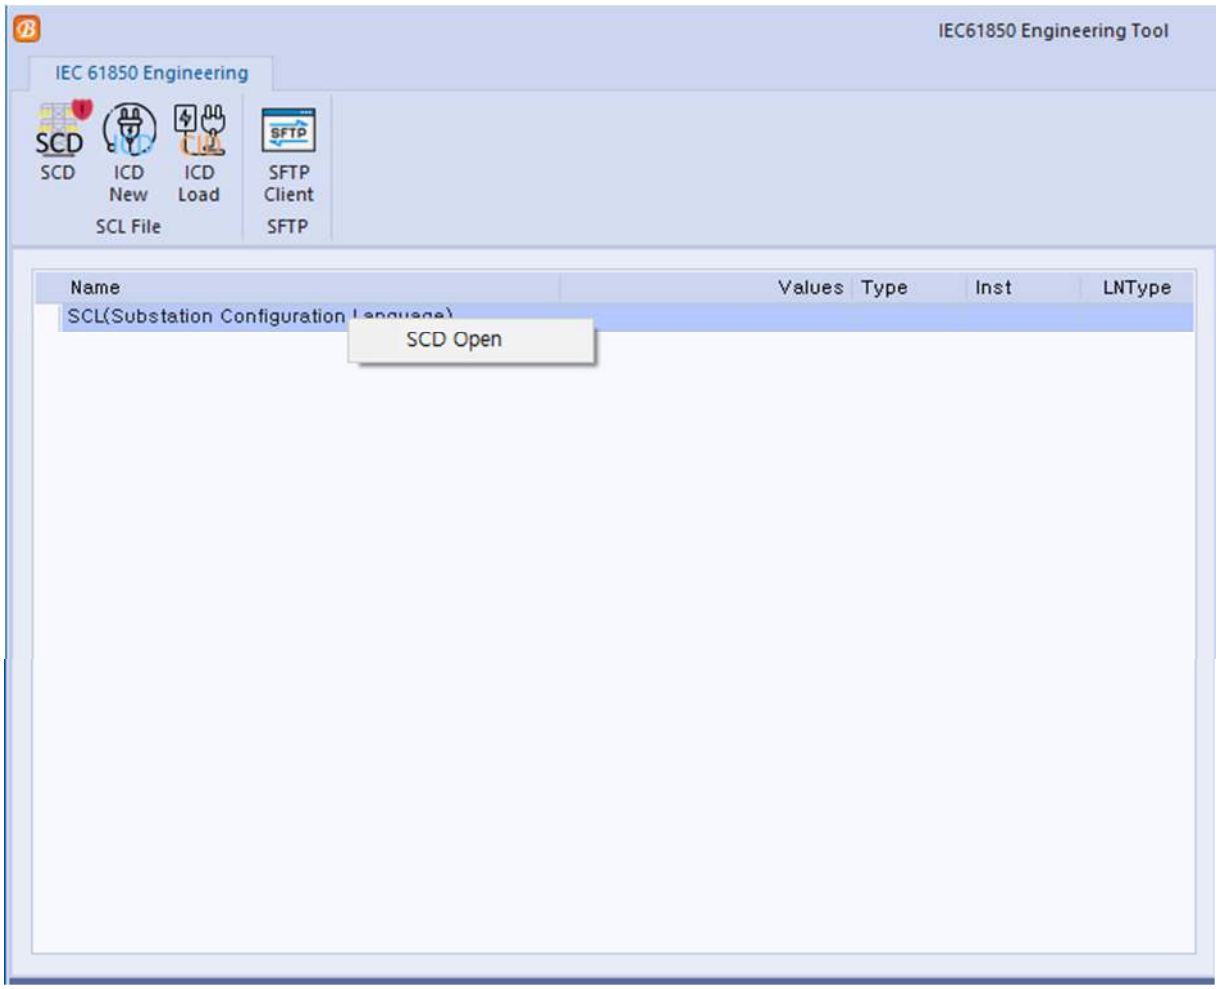
### 1) Running IEC61850 Engineering Tool on Wired-X



<IEC 61850 Engineering Tool Run Button>

<IEC61850 Engineering Tool>

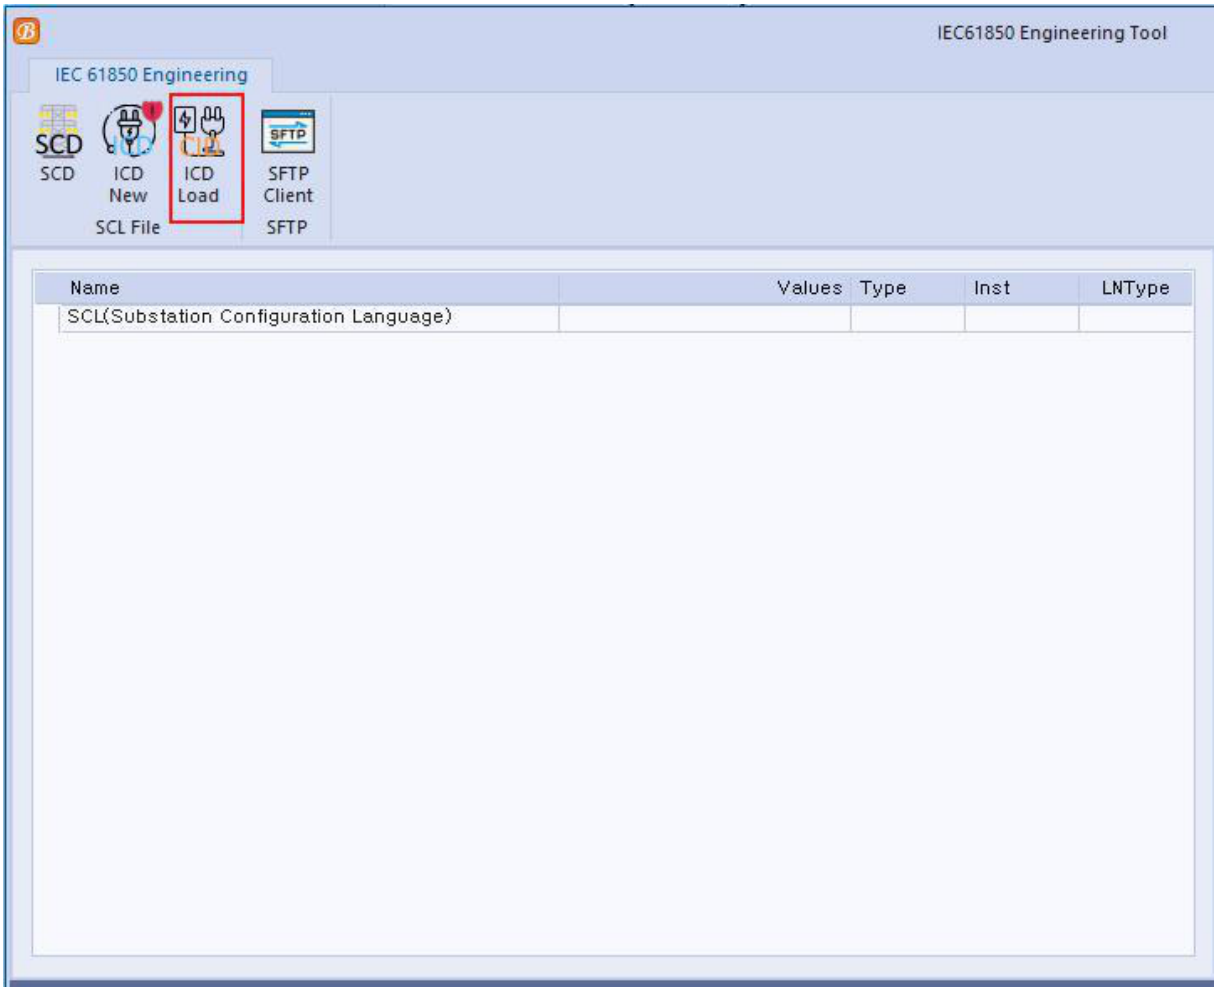
### 2) Basic Menu and Tools for IEC61850 Engineering Tool



Reading SCL and Connecting to SFTP can be found under the SCL File Menu.

<SCL File Menu>

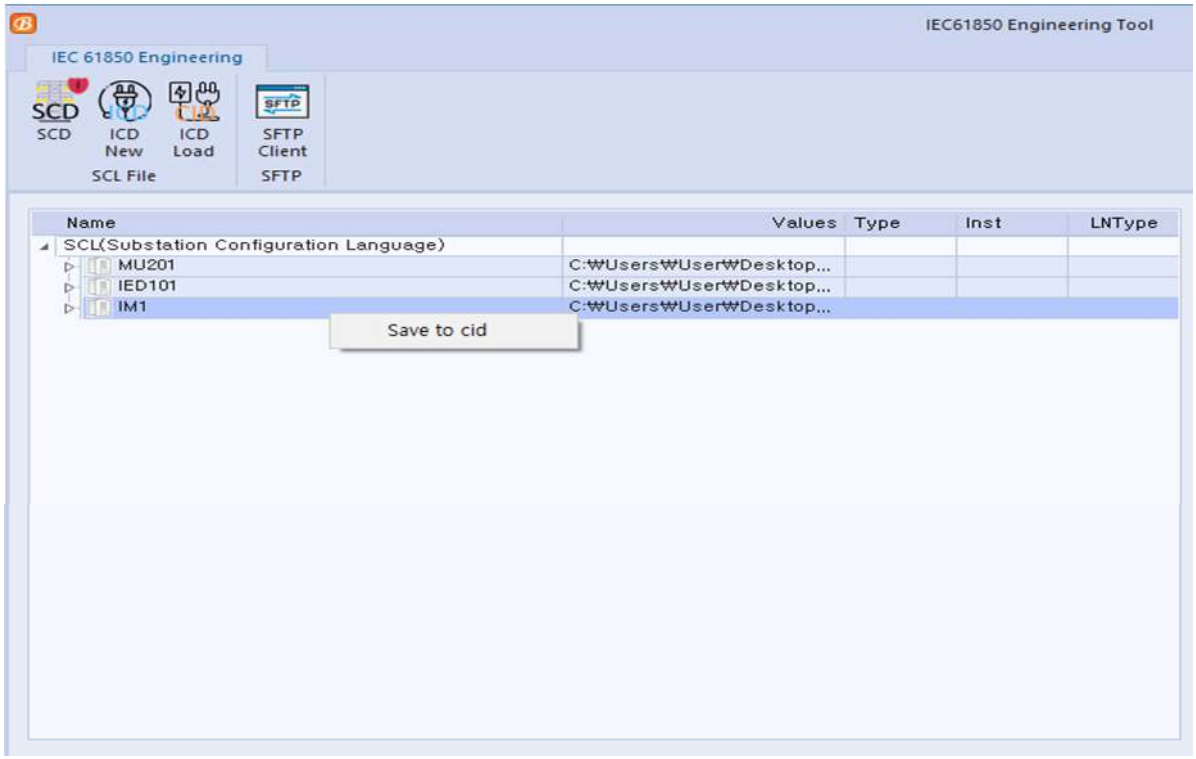
### 3) Opening SCD File



Click SCD under SCL File Menu, and right click on SCL to open.

<SCD File Open>

### 4) Loading ICD File

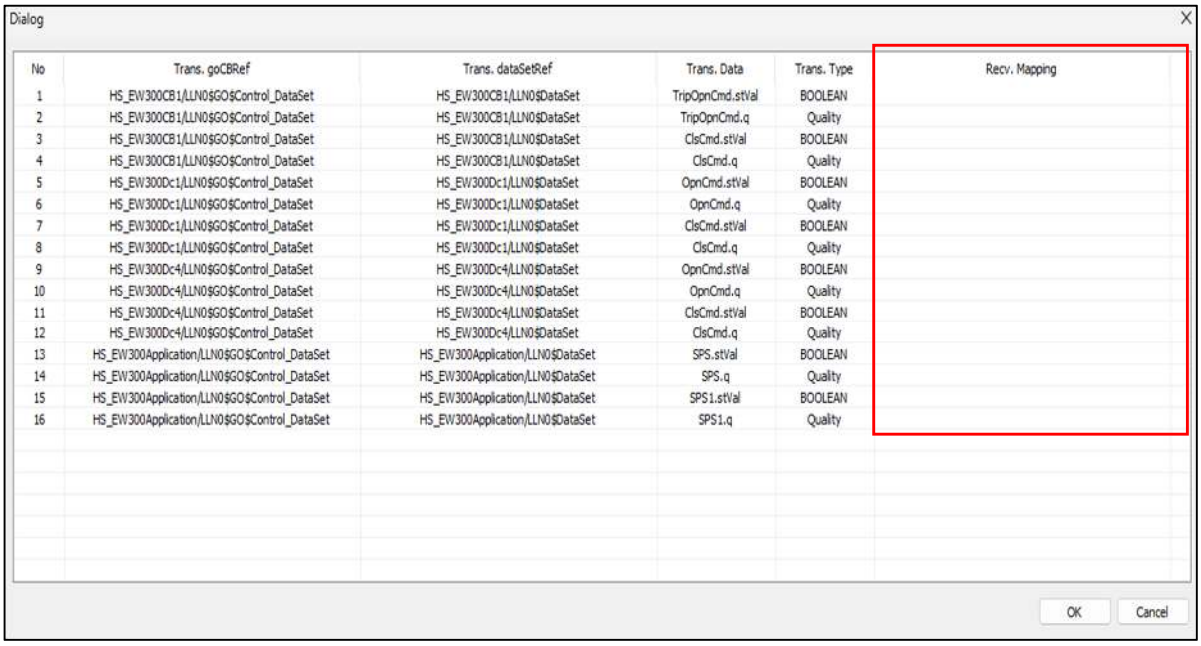


Click ICD Load under SCL File menu to load ICD File.

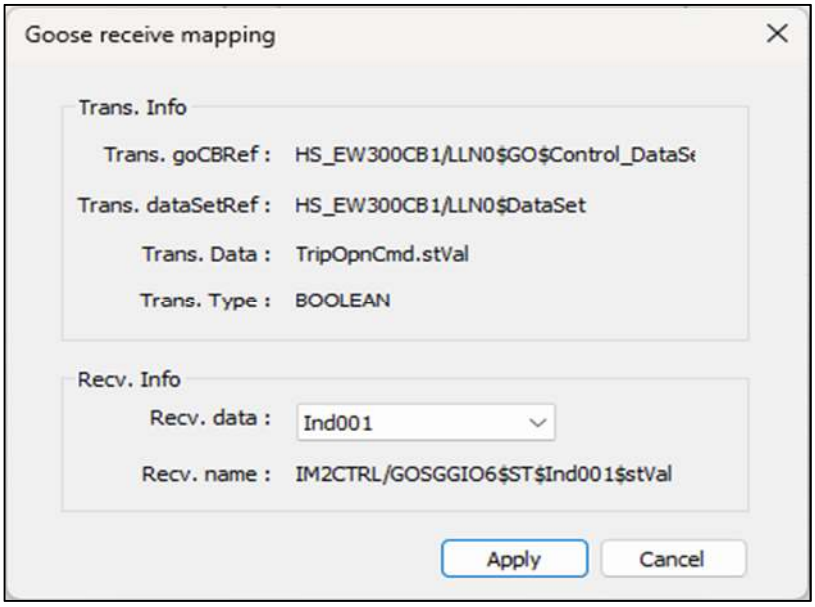
<Loading ICD File>

### 5) Exporting CID File

To export CID file, opening the SCD file and click on "Save to cid".

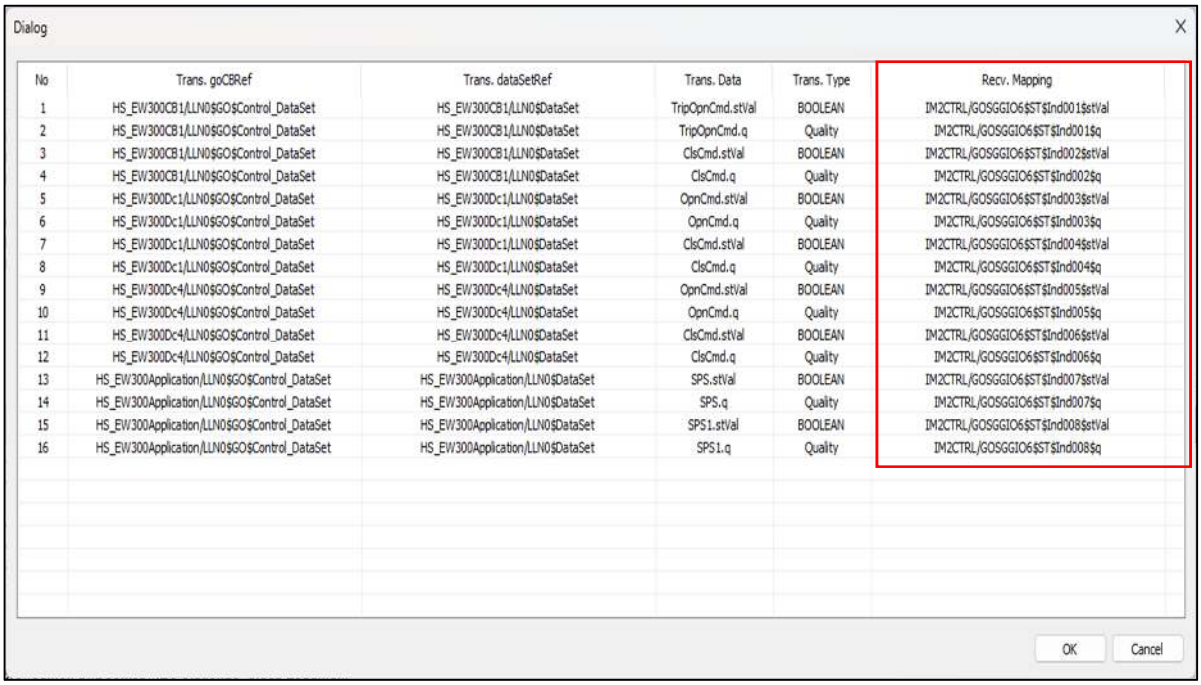


<Exporting CID File>

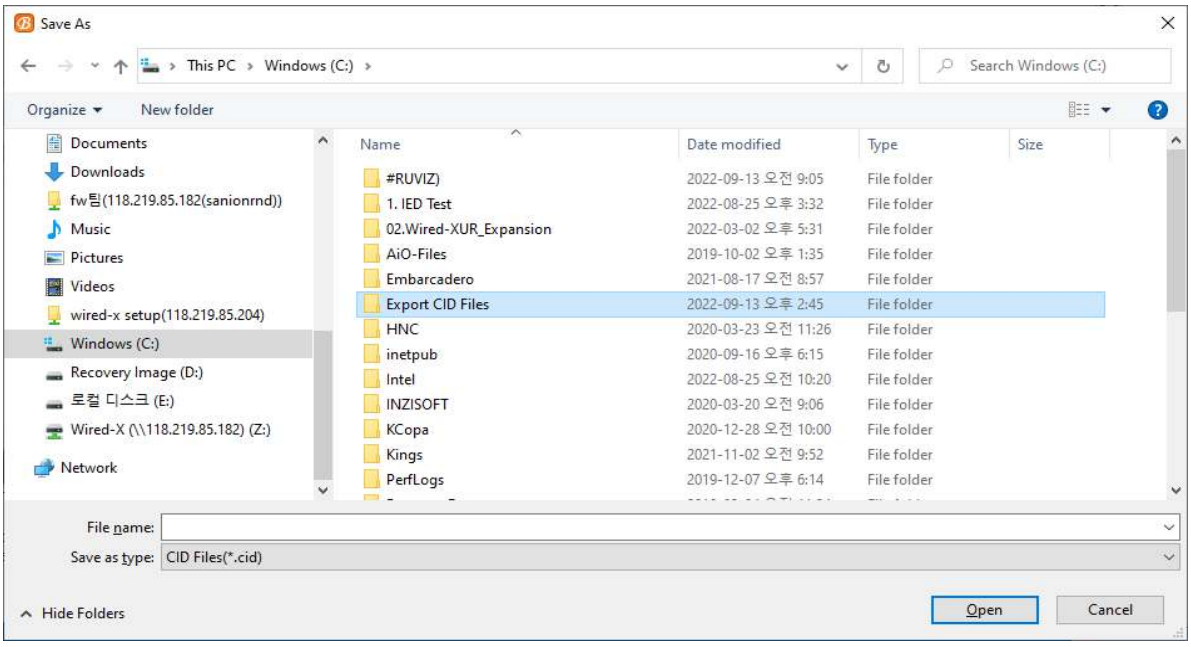


If GOOSE receive has not been mapped to IM2 in the SCD file, a window will appear, prompting you to specify the location for saving the CID file.

If you have configured the IM2 to receive GOOSE in the SCD, the GOOSE detailed mapping window will appear automatically. This is because the SCT usually only progresses the mapping to the LN level. To map to the DA level for the IM2 to receive GOOSE, follow this process.



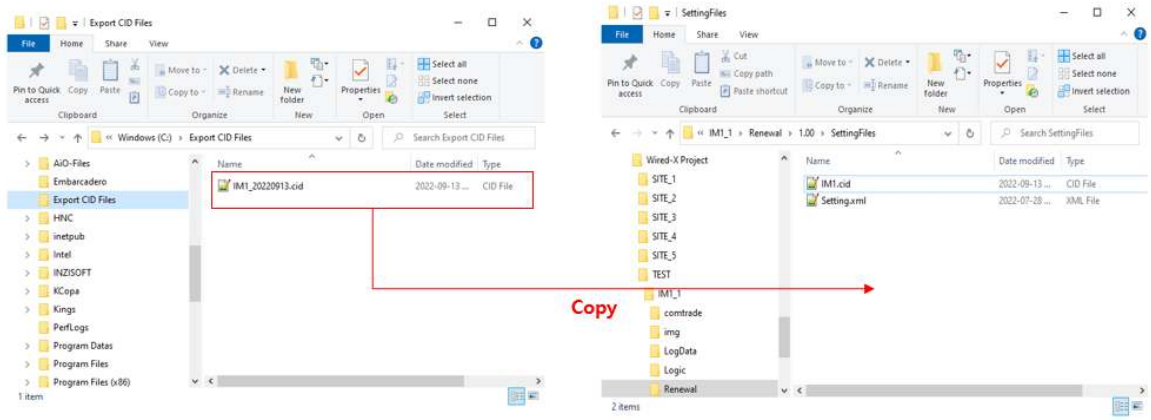
A window like the one below will pop up, and you can see that the "Recv. Mapping" column on the left is empty.



Referring to the GOOSE transmit value on the right, select and assign the value to the desired DA on IM2's GGIO6. In general, it is important to note whether it is a single point or double point.

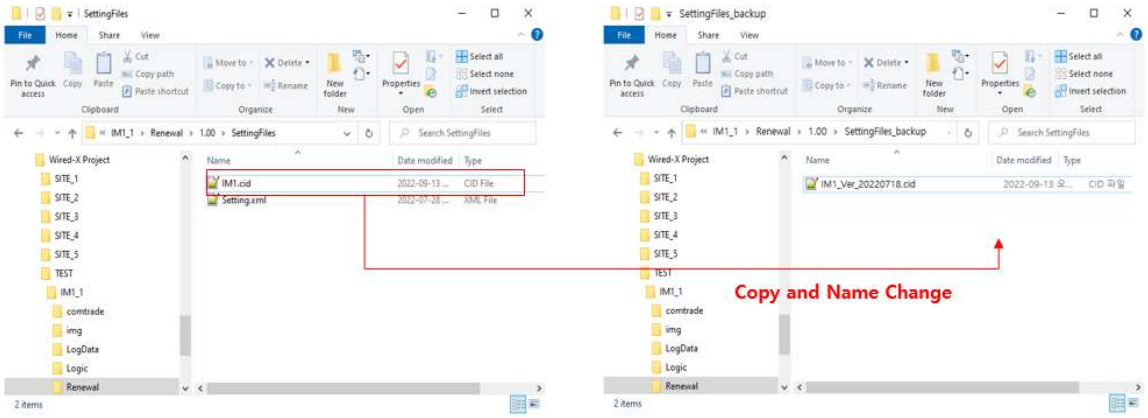
After completing all the GOOSE incoming mappings, the status displayed below should indicate completion.

Clicking the "ok" button will prompt a window to appear, asking where to save the CID file.



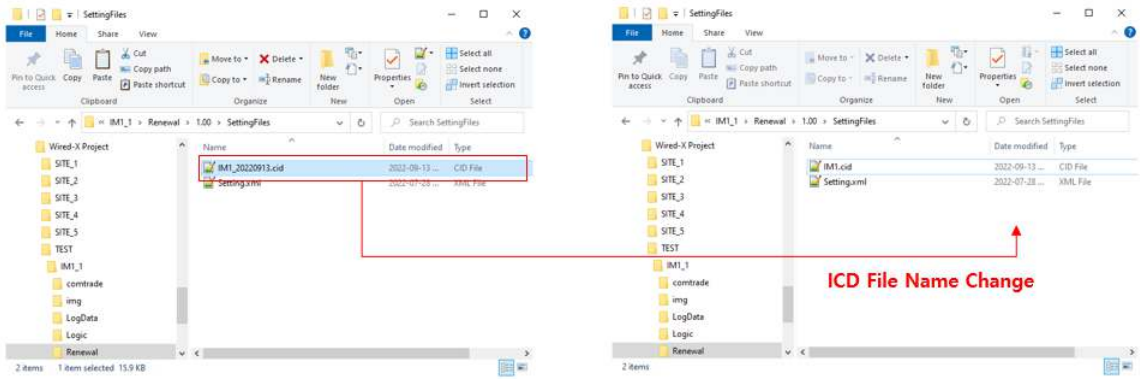
Finally, update the extracted CID file in the IM2 CID file management folder.

CID file management folder is as follows.



: Project create folder\Device name\Renewal\version\SettingFiles

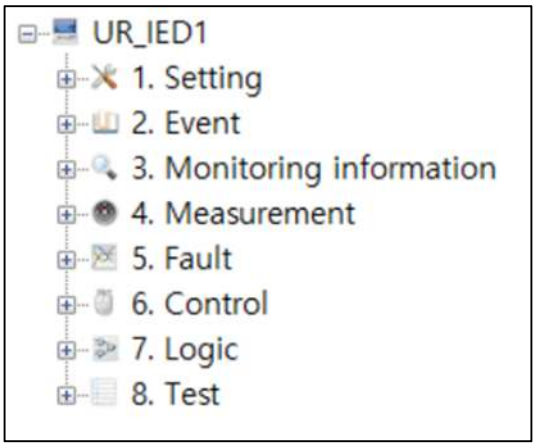
Ex. C:\Wired-X Project\IM2 Test Project\IM2_1\Renewal\1.00\SettingFiles



Step1. Copy the extracted CID file to the IM2 CID file management folder.

Step2. Copy the old CID file to the IM2 CID file backup folder and change the CID file name according to your history management rules.

Step3. Delete the old CID file and rename the CID file to be updated to “IM2.cid”. The deleted CID file cannot be recovered. Please must be back up your old CID file before proceeding.

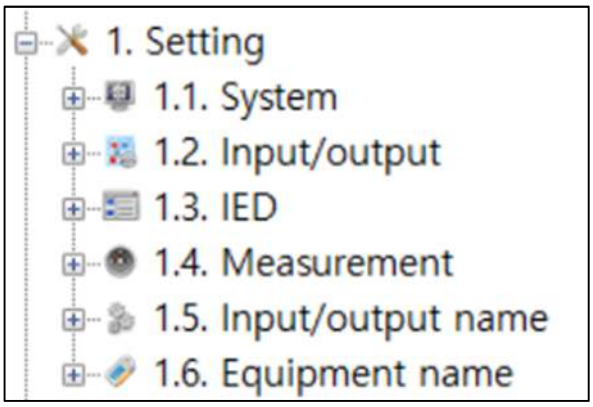


ICD File Name Change

## 3.2. Wired-X Menus and Settings

A description of Wired-X's menu organization and the settings available through Wired-X.

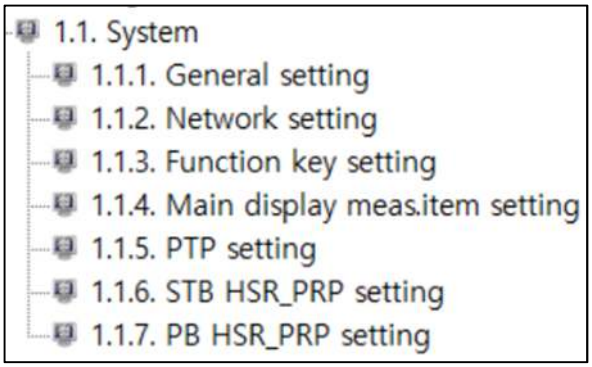
### 3.2.1. Menus on Wired-X



The menu organization and brief description of Wired-X is shown below.

| Item | Description |
|---|---|
| 1. Setting | Provide settings for IM2 |
| 2. Event | Viewing events recorded in IM2 |
| 3. Monitoring information | Check IM2's various monitoring information |
| 4. Measurement | View the IM2's measurement information |
| 5. Fault | Check the COMTRADE recorded in IM2 |
| 6. Control | Provide device control over Wired-X |
| 7. Logic | Downloading and uploading user logic |
| 8. Test | Provide simulated tests |

### 3.2.2. Wired-X : Setting



The settings menu is divided into six sections, each of which is briefly described below.

| Item | Description |
|---|---|
| 1. System | General system settings for IM2 |
| 2. Input/output | Provides a mapping of physical and logical elements |
| 3. IED | Operation related settings for IM2 |
| 4. Measurement | Select measurement sets that are displayed on the main display and "4.Measurement" on Wired-X |
| 5. Input/output name | Modify Input/output point name |
| 6. Equipment name | Modify the name displayed on the main display |

#### 3.2.2.1. Wired-X : Setting – System

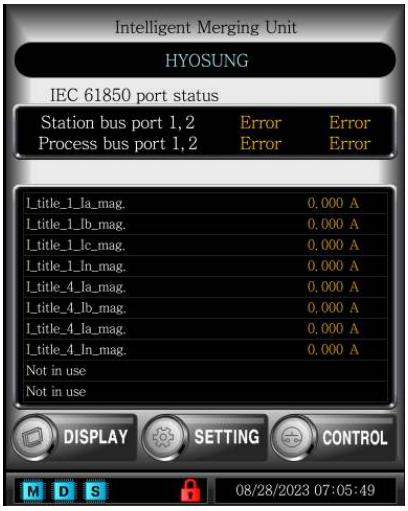
The system menu is divided into seven sections, each of which is described below.

"General setting" allows you to set general settings for IM2. The items and their values are described below.

| Item | Value |
|---|---|
| Station bus time sync | PB Sync : synchronized time to PB bus time<br>SNTP : synchronized time to SNTP server |
| Process bus time sync | PTP : synchronized time to PTP server<br>PPS : synchronized internal PPS to external PPS input |
| Local time offset hour | -24 ~ 24 : UTC time |
| Local time offset minute | 0 ~ 59 : UTC time |
| Language | English / Korean |
| LCD backlight time | 1 ~ 180 minute |
| Measurement angle display | Negative / Positive |
| Wired-X connection port | Front port / Back port |
| SLD display | IEC symbol / LED symbol |
| SLD open LED location | Left / Right |

※ SNTP and PTP cannot be used at the same time.

Network setting allows IM2 to set the IP, subnet, and gateway address of the network port, and the items are as follows.



| Item | | Current value | New value |
|---|---|---|---|
| Service port | IP address | 10,10,10,12 | |
| | Subnet mask | 255,255,255,0 | |
| | Default gateway | 10,10,10,1 | |
| SNTP server | IP address | 203,248,240,140 | |
| | Subnet mask | 255,255,255,0 | |
| | Default gateway | 203,248,240,1 | |
| Station bus port | IP address | 10,10,10,51 | |
| | Subnet mask | 255,255,255,0 | |
| | Default gateway | 0,0,0,0 | |
| Process bus port | IP address | 192,168,37,242 | |
| | Subnet mask | 255,255,255,0 | |
| | Default gateway | 192,168,37,1 | |

Station & Process bus port are set by CID file.

"Function key setting" allows you to set shortcut keys from F1 to F4, and switches the screen directly to the set page.

| Item | Current value | New value |
|---|---|---|
| F1 | Control event | |
| F2 | Counter status | |
| F3 | Process bus GOOSE publisher | |
| F4 | PTP information | |

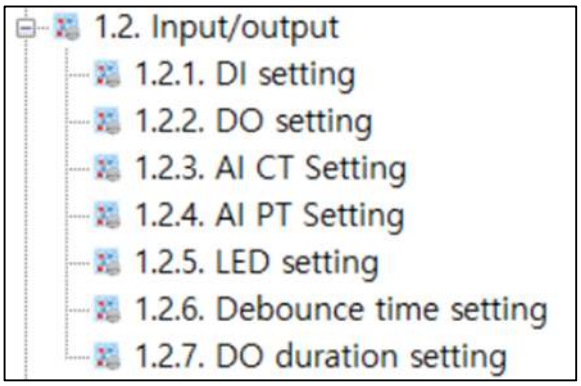
"Main display meas. Item setting" is a menu to set the measurement items to be displayed on the main LCD display shown below. Up to 10 items can be set in total.

| Item | Current value | New value |
|---|---|---|
| Measurement item 1 | I_title_1/Ia_mag | |
| Measurement item 2 | I_title_1/Ib_mag | |
| Measurement item 3 | I_title_1/Ic_mag | |
| Measurement item 4 | I_title_1/In_mag | |
| Measurement item 5 | I_title_4/Ia_mag | |
| Measurement item 6 | I_title_4/Ib_mag | |
| Measurement item 7 | I_title_4/Ia_mag | |
| Measurement item 8 | I_title_4/In_mag | |
| Measurement item 9 | Not in use | |
| Measurement item 10 | Not in use | |

"PTP settings" allows you to modify settings related to PTP and includes the following items.

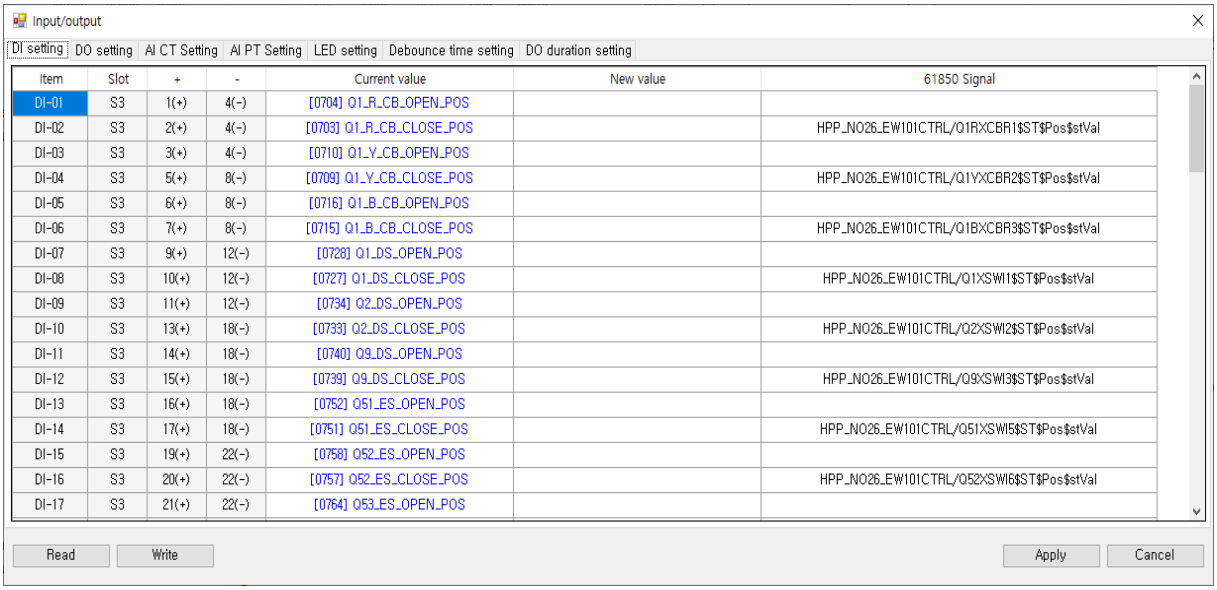
| Item | Current value | New value |
|---|---|---|
| Delay mechanisim | P2P | |
| Transper mode | L2 | |
| Slave only in use | In use | |
| Priority 1 | 128 | |
| Priority 2 | 128 | |
| Domain number | 0 | |
| Clock class | 255 | |
| Clock accuracy | 25ns under | |
| Anounce message period | 2 Sec | |
| Sync message period | 1 MSG every sec | |
| Delay request period | 1 MSG every sec | |
| PDelay request period | 1 MSG every sec | |
| Announce timeout | 3 sec | |
| Sync timeout | 2 sec | |
| Transper-Receive time diff. | 0 ns | |
| Egress latency | 0 ns | |
| Ingress latency | 0 ns | |

It is recommended to use the default values. If needed, PTP specialist may change the settings as the network requirement.



"STB HSR_PRP setting" and “PB HSR_PRP setting” allow you to modify settings related to HSR/PRP and includes the following items.

| Item | Current value | New value |
|---|---|---|
| PRP in use | In use | |
| PRP mode | Duplicate discard | |
| HSR in use | Not in use | |
| HSR mode | Mode H | |
| HSR interface | HSR-SAN | |
| Rsdbox LAN ID | A | |
| Own net ID | 0 | |
| Port A speed | 1000 Mbps | |
| Port B speed | 1000 Mbps | |

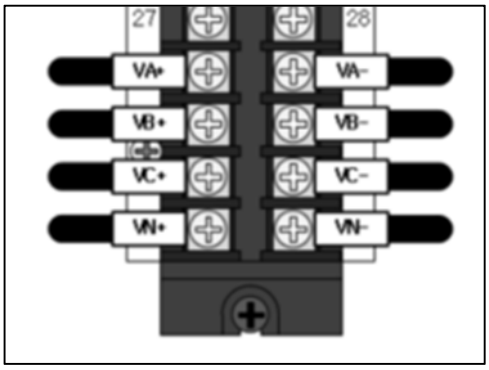


It is recommended to use the default values. If needed, HSR/PRP specialist may change the settings as the network requirement.

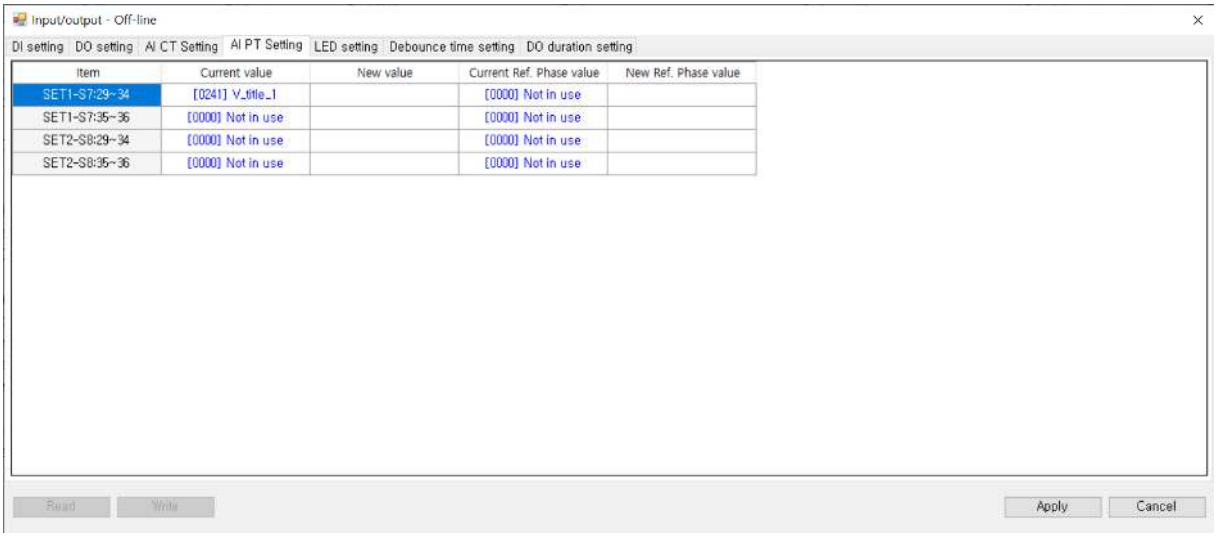
### 3.2.2.2. Wired-X : Setting – Input/output

The Input/out menu is divided into seven sections, each of which is described below.

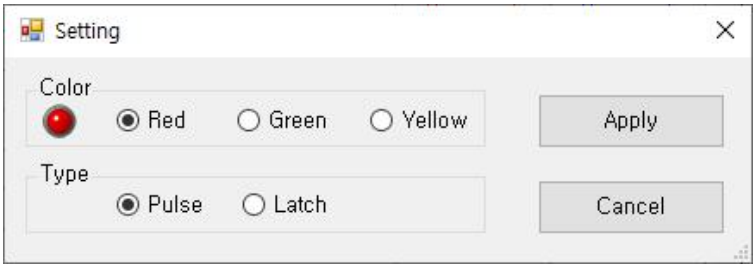
The "DI setting" allows you to map the inputs of the DI module to internal points. If the internal points related to IEC 61850 signal, it shows on the column



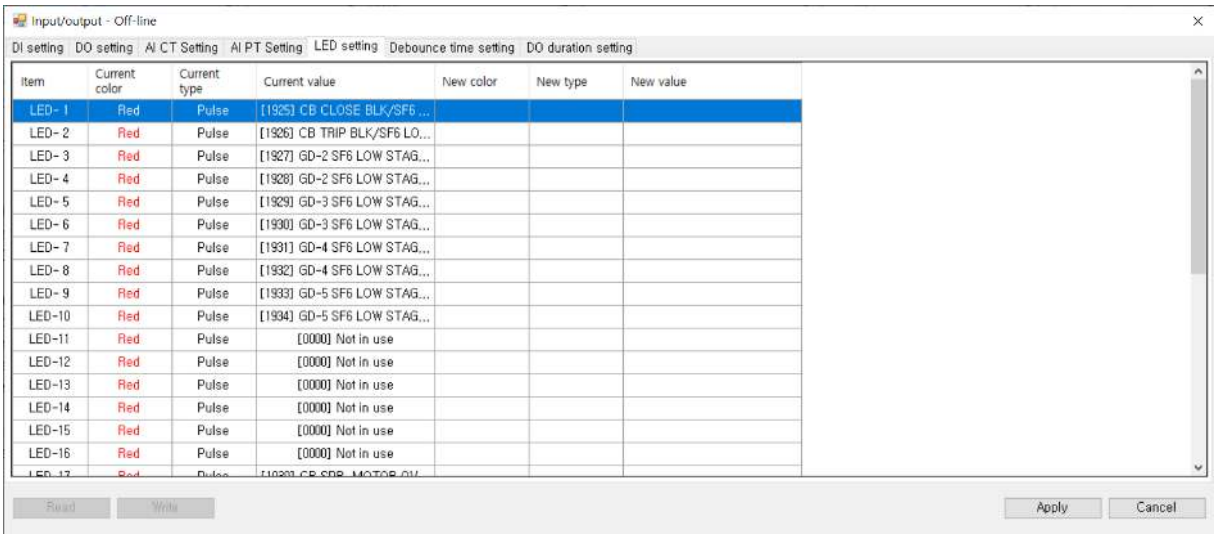
"DO setting" allows you to map the internal points to outputs of the DO module.



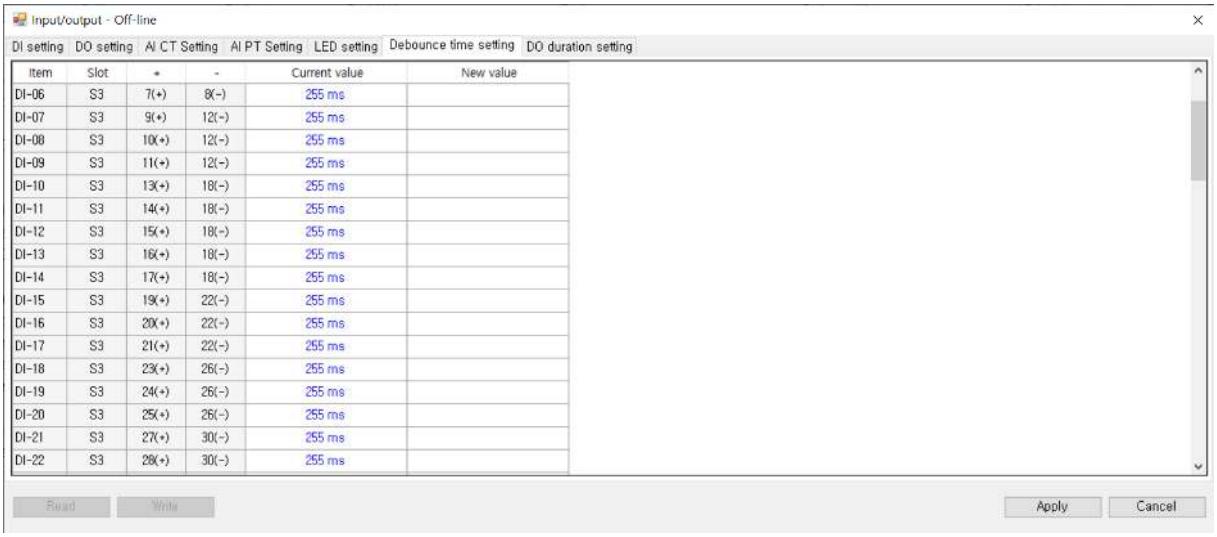
"AI CT setting" allows you to assign current inputs of CPT module to internal current set. Also, a user can set N phase as calculated (3I0) or measured (Y-Connection). The user may select reference angle of phase for display, otherwise the angle of A phase in internal voltage set #1 is the default angle.



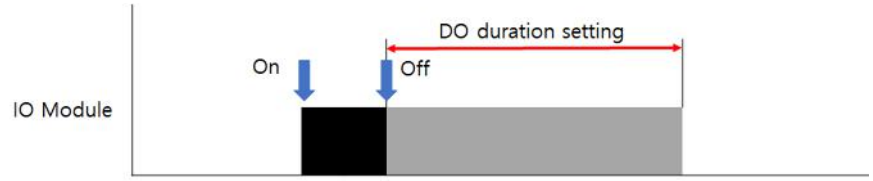
"AI PT setting" allows you to assign voltage inputs of CPT module to internal voltage set. N phase is calculated, therefore VN terminal can be assigned independently from VA,VB,VC.

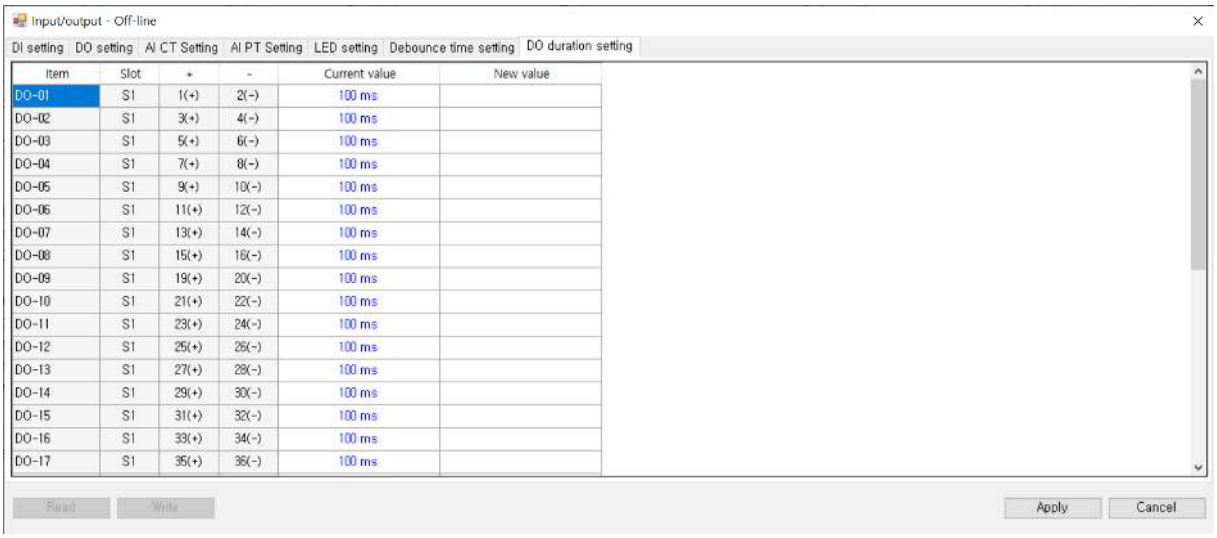


The user may select reference angle of phase for display, otherwise the angle of A phase in internal voltage set #1 is the default angle.



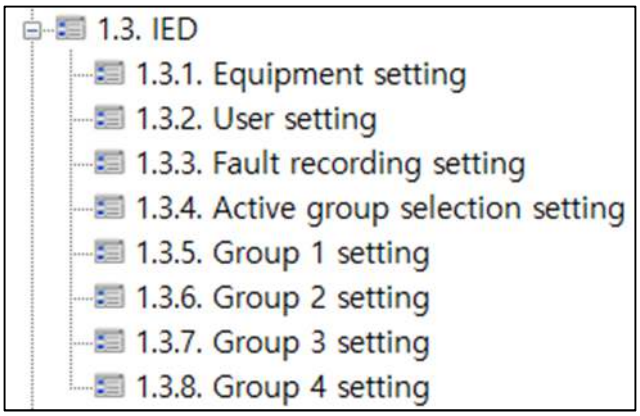
“LED setting” allows you to assign internal points to 32 LEDs. Red, green and yellow colors are provided. Pulse and latch types are provided.



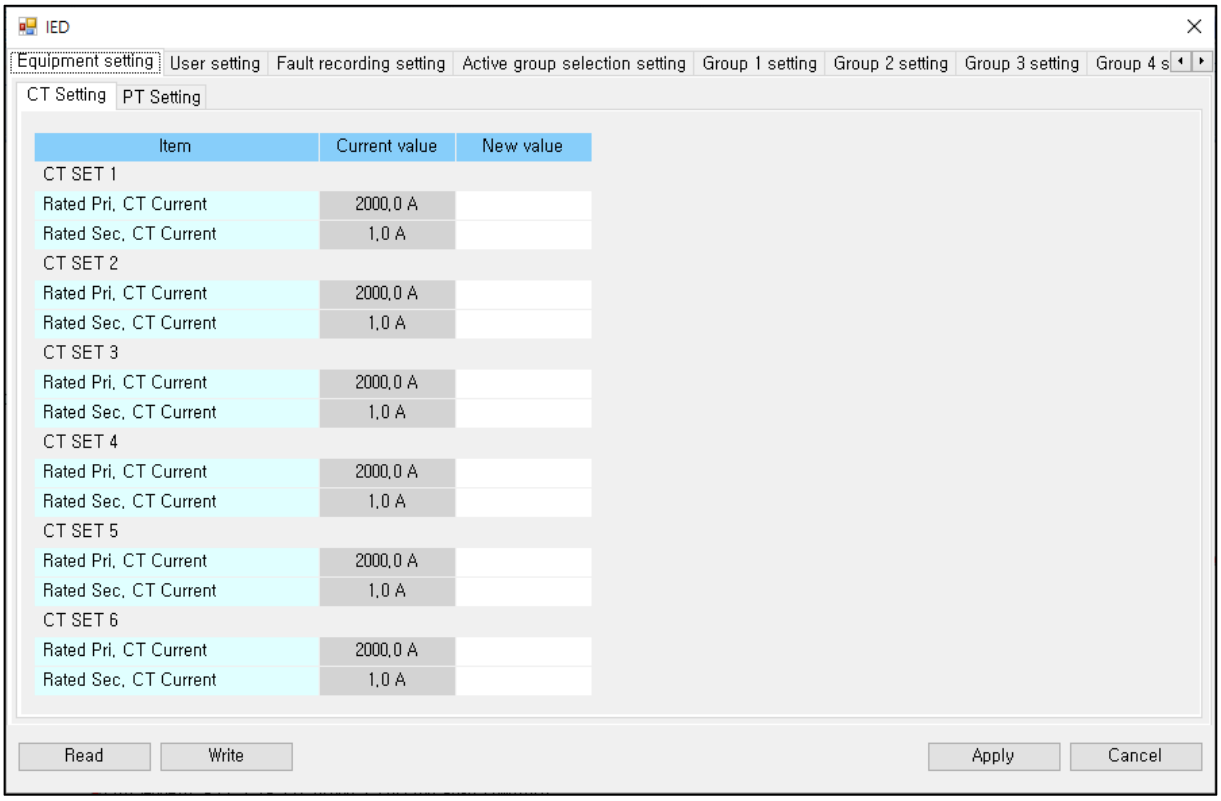


"Debounce setting" sets the debounce value to prevent mechanical chattering of the DI module inputs. Setting range is 1 ~ 255msec.

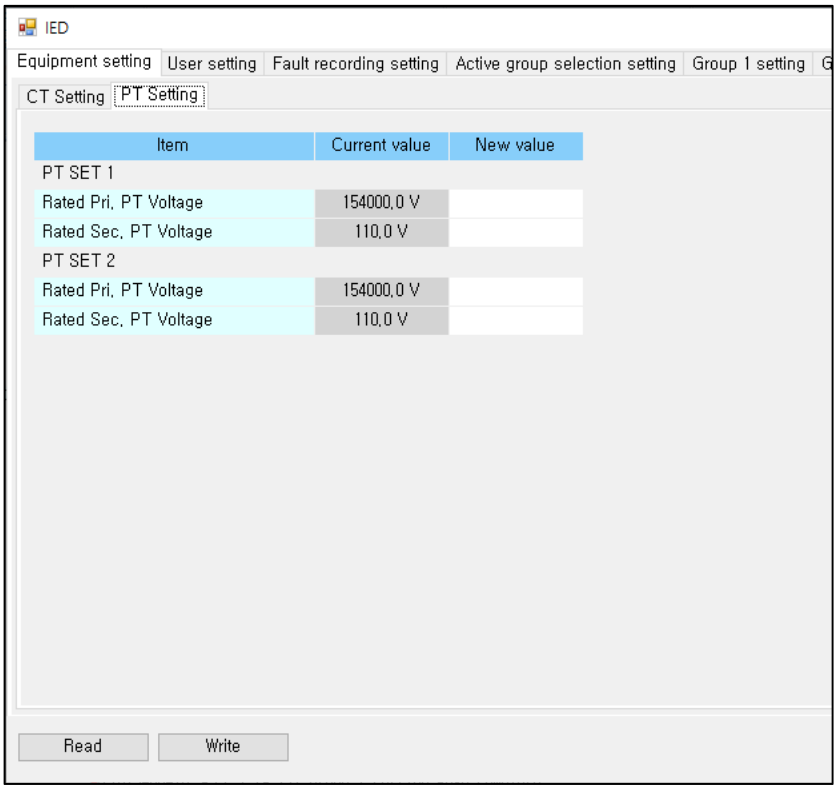
"DO duration setting" allows the output of the DO module to be maintained for a set amount of time after the internal point is turned off. Setting range is 1 ~ 10,000msec.



A pictorial representation of the description is shown below.



### 3.2.2.3. Wired-X : Setting – IED



The IED menu is divided into eight sections, each of which is described below.

User setting, Active group selection setting, Group 1~4 setting are emptied in factory settings. The above settings may be configured by the manufacturer to suit the site logic upon reasonable request of the site user.

"Equipment setting" sets CT/PT primary and secondary ratio that are used in the measurement display

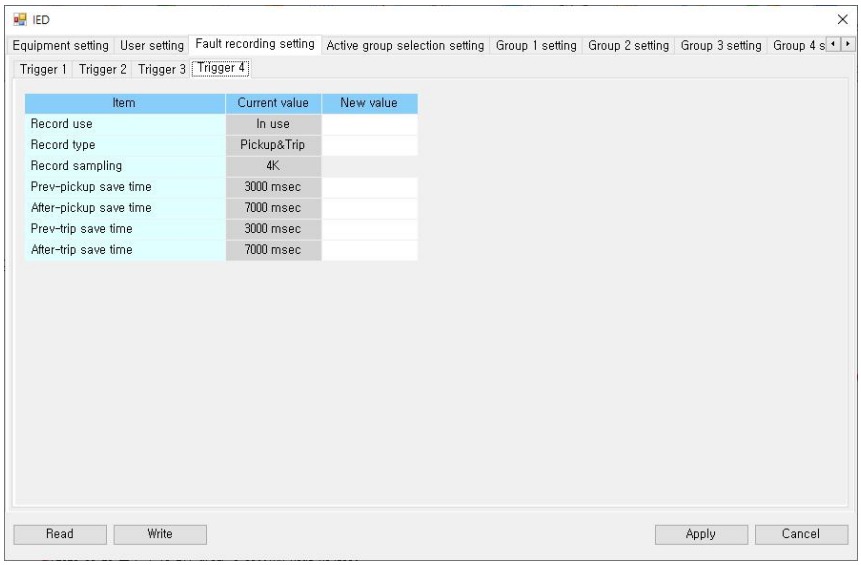
In "Fault recording setting", user can set whether to enable, how to record, and how long to record.

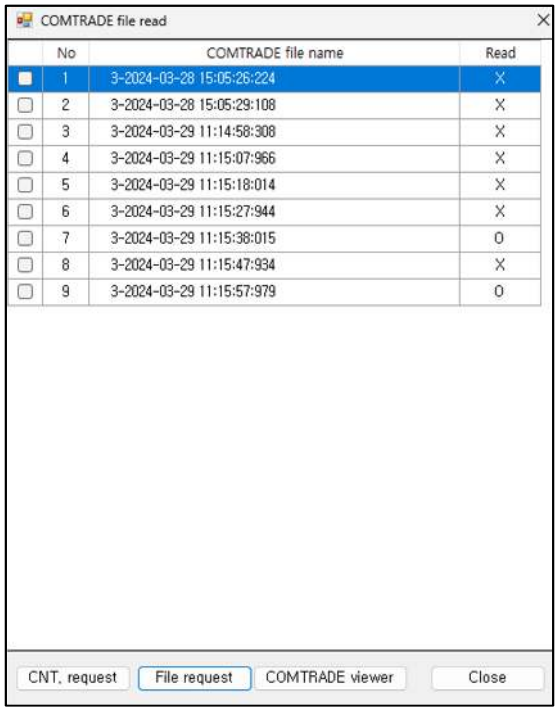
| Item | Description |
|---|---|
| Record use | In use / Not in use |
| Record type | Internally, recording is triggered on the rising edge of the Trip and Pickup signals.<br>Trip : Triggered only on rising edge of the trip signal. One COMTRADE file is generated.<br>Pickup & Trip : Trip is same as the above. Pickup is only generated when the pickup signal has been maintained until "pickup after time". All conditions met two COMTRADE files are generated. |
| Record sampling | 4.0K (50Hz) / 4.8K (60Hz). Not settable. Display only |
| Prev-pickup save time | Record time before the rising edge of pickup signal |
| After-pickup save time | Record time after the rising edge of pickup signal |
| Prev-trip save time | Record time before the rising edge of trip signal |
| Atfer-trip save time | Record time before the rising edge of trip signal |

Maximum recording time is 10 seconds (10000 ms) fixed. IM2 can record 32 channels, CT & PT depending on the ordering code, and assigned DI, DO binary points from the Logic Editor. The maximum number of DAT files that can be stored is 64 fixed. If the saving DAT exceeds the maximum number, the oldest DAT files are deleted automatically.

Input Signal to triggering fault record

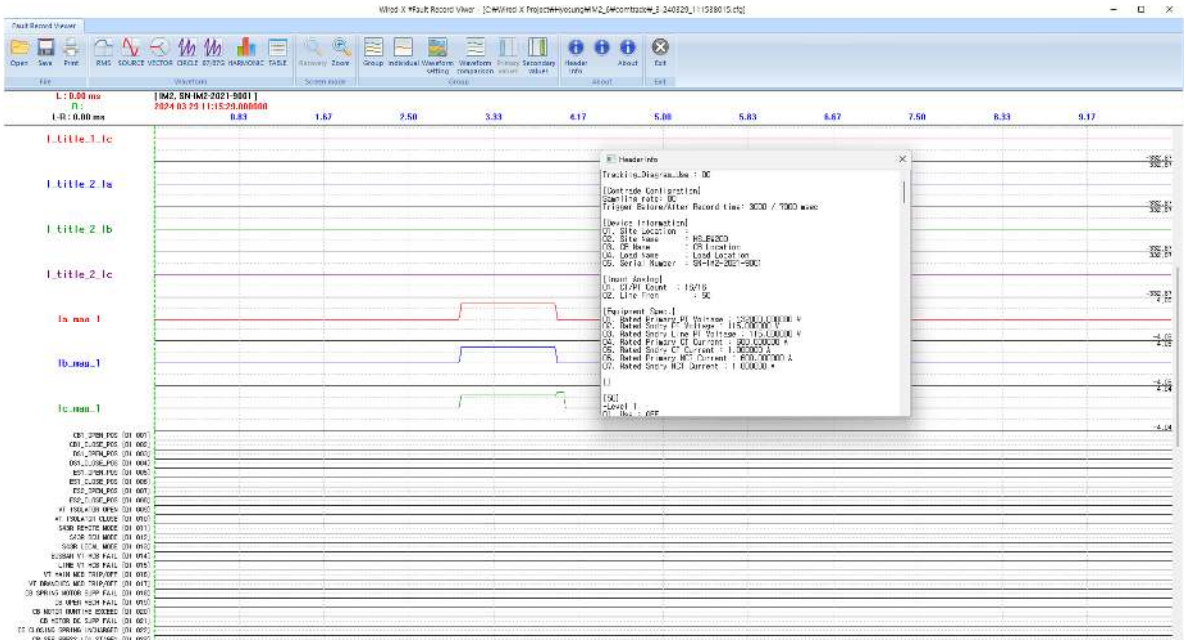


- Triggering points can be recorded by external signals. It can be set from “1.7.1. Fault recording details settings” as below. External signals can be the protection signals from other devices or the DI signals.



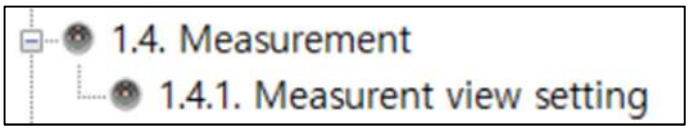
Output Signals from the fault record

- When the fault recording is done, the alarm will be shown at the front LCD as a popup screen.

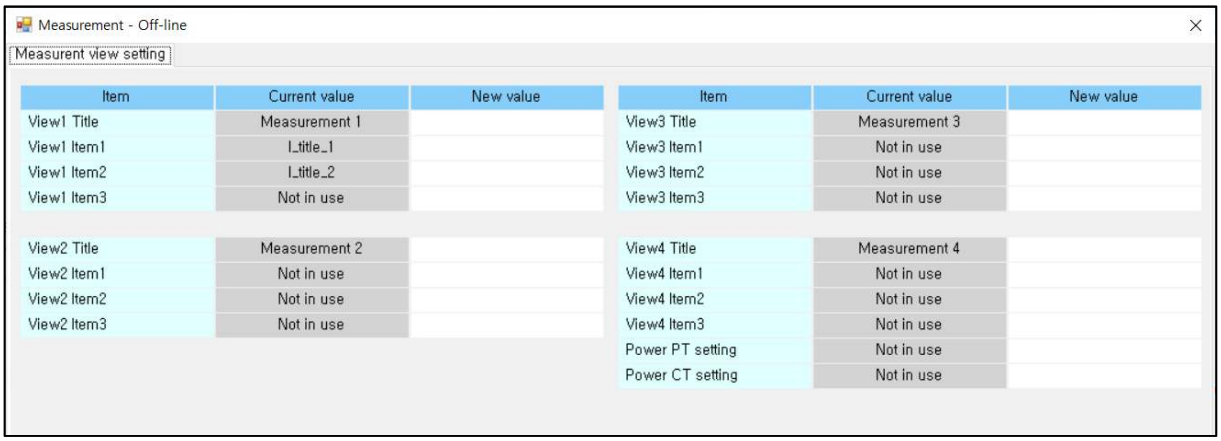


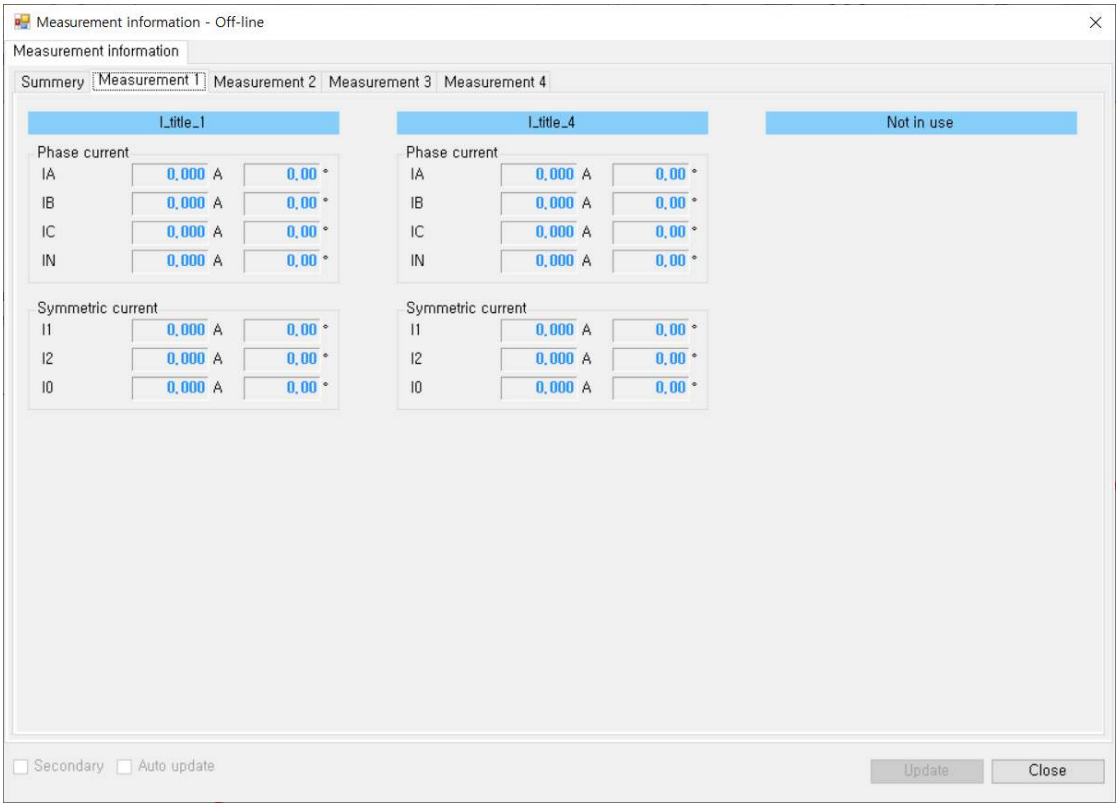
The triggering settings can be done in Wired-X as follows. It can be set in LCD also.

The details of the COMTRADE file can be analyzed in “COMTRADE” at the top of the menu. The list of COMTRADE files in the selected IM2 is shown as below.



Click on the COMTRADE viewer to see the result and analysis screen from Wired-X as below.

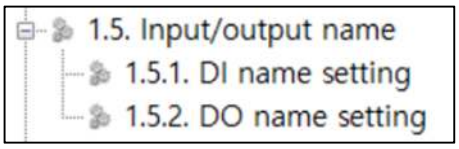


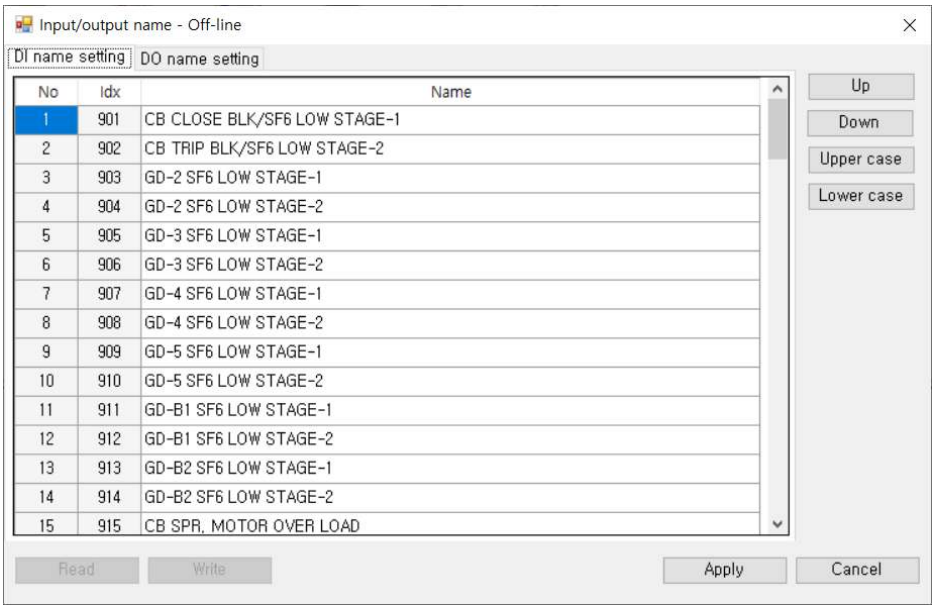


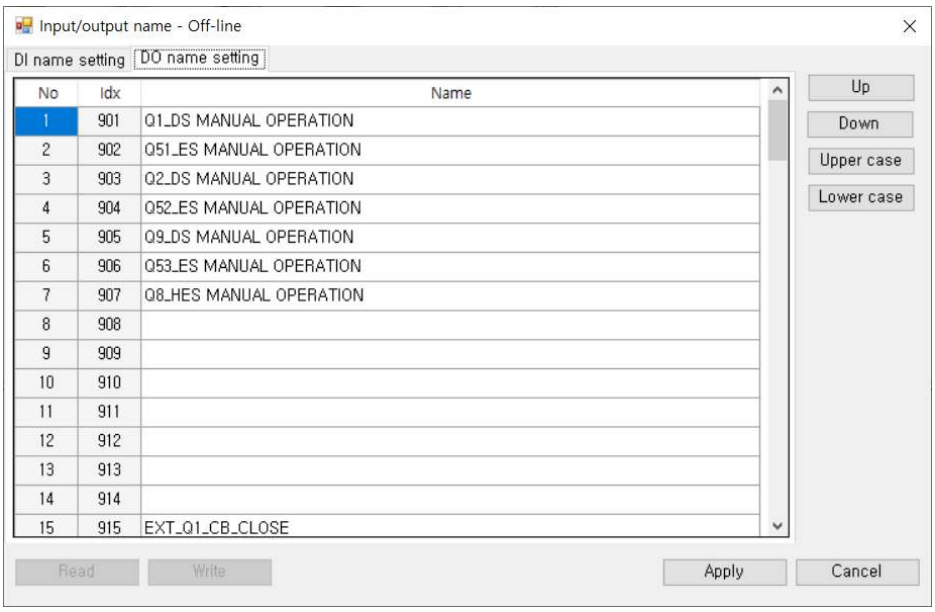
It includes analog data and DI/DO points.

### 3.2.2.4. Wired-X : Setting – Measurement

Select CT or PT set that will displayed on LCD & Wired-X measurement window or screen. A user may select maximum 3 sets in one window

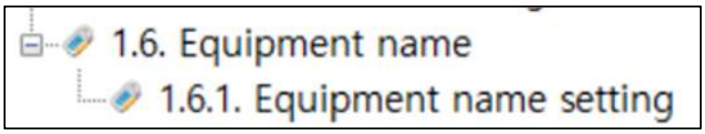


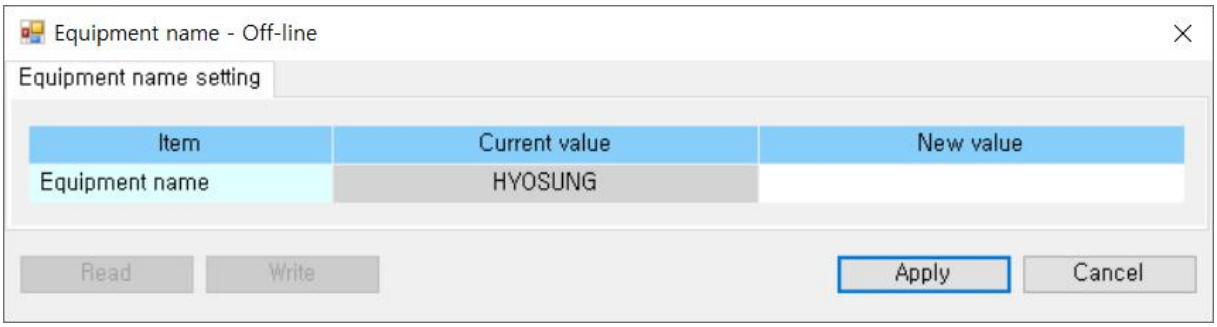




### 3.2.2.5. Wired-X : Setting – Input/output name

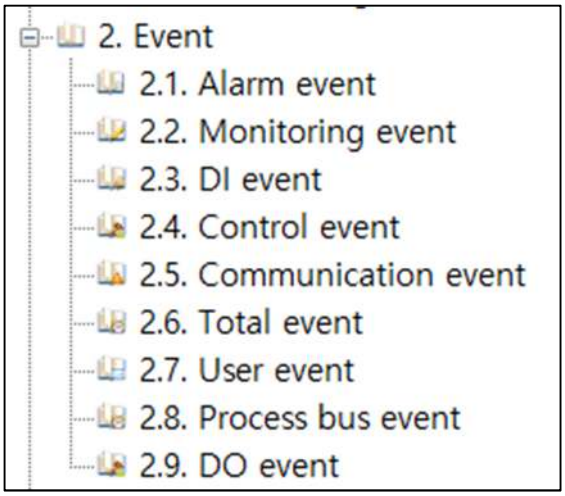
DI/DO name is set as shown in approved drawing by default. However, a user may change the name as below



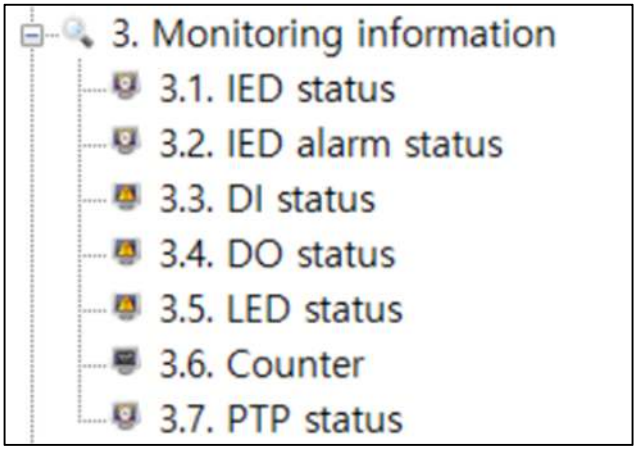


### 3.2.2.6. Wired-X : Setting – Equipment name

Use this setting to modify the IM2 name that will appear on the main home display.



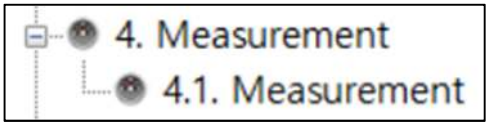
### 3.2.3. Wired-X : Event



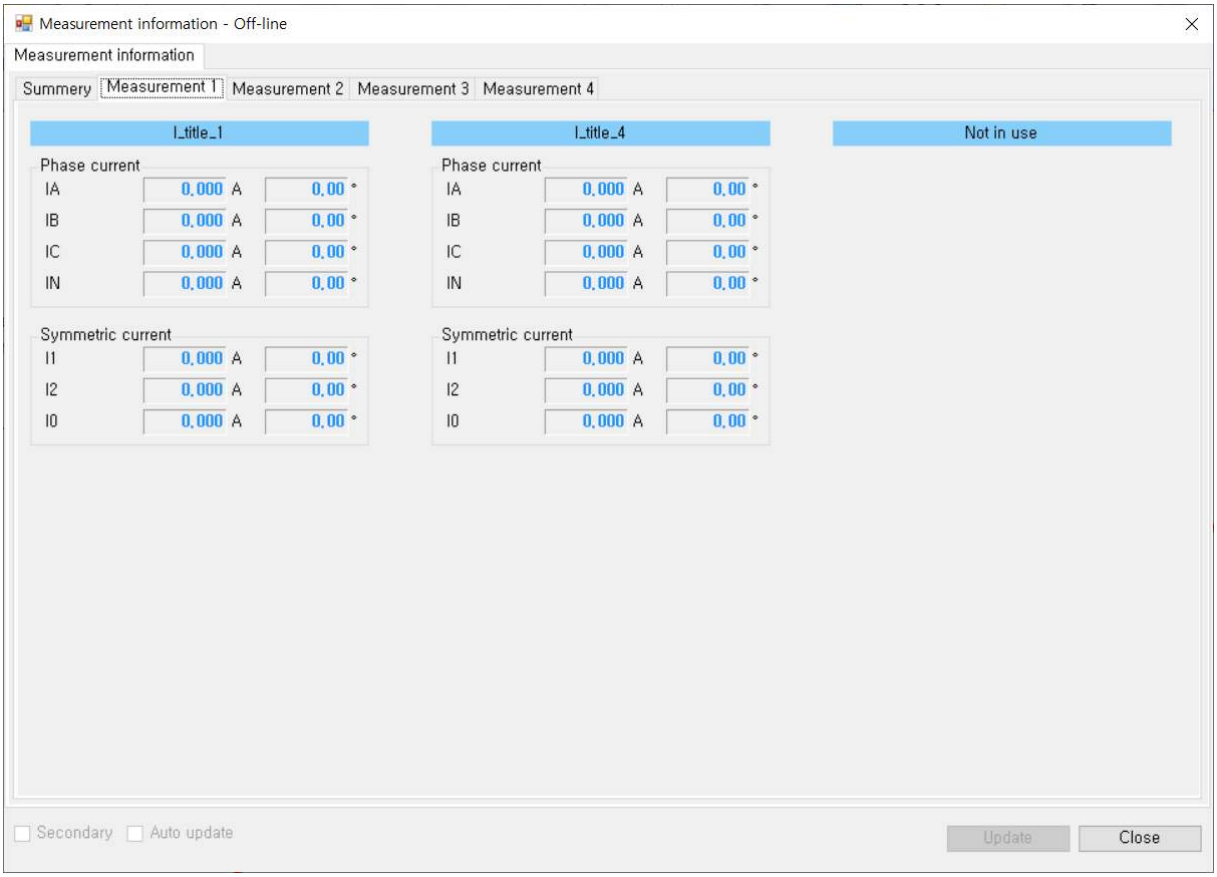
Before accessing the events recorded in IM2 using this menu, you must first read all events in IM2 through the "All read" button. There are a total of nine events, which are described below.

| Event | Description |
|---|---|
| Alarm | Events logged when an alarm situation occurs in IM2 |
| Monitoring | Events recorded by IM2's self-supervision |
| DI | Record event when DI status changed |
| Control | Record event when control happens |
| Communication | Internal/external communication event (Including 61850) |
| Total | Show all events in recorded order |
| User | User logic/setting related event |
| Process bus | Process bus related event |
| DO | Record event when DO status changed |

### 3.2.4. Wired-X : Monitoring information



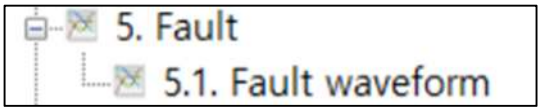
This menu enables you to monitor the up-to-date status of IM2 and the input/output status of DI/DO modules.



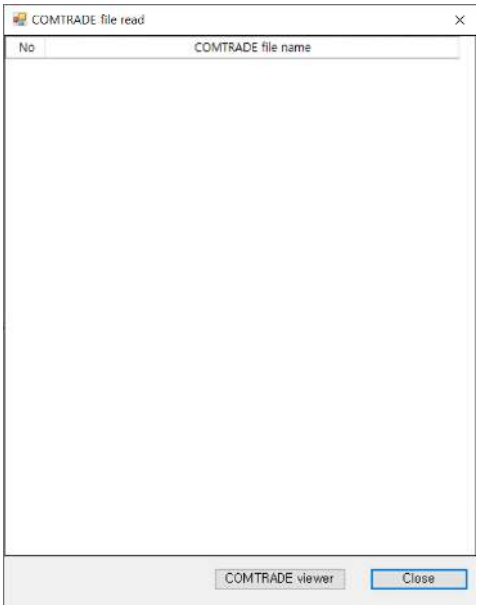
| Item | Description |
|---|---|
| IED status | Shows the main status of IM2 |
| IED alarm status | Shows the status related to the IM2 alarm (related to the Alarm LED). |
| DI status | Real-time input status of each terminal on the DI module |
| DO status | Real-time output status of each terminal on the DO module |
| LED status | Real-time status of each LED on the front panel |
| Counter | Show recorded counters of IED reset, LED reset, IED fault |
| PTP status | Shows real-time PTP-related status. |

### 3.2.5. Wired-X : Measurement

The measurement sets that you configure in "view settings" will be visible on one tab. A maximum of three sets can be displayed on the tab.



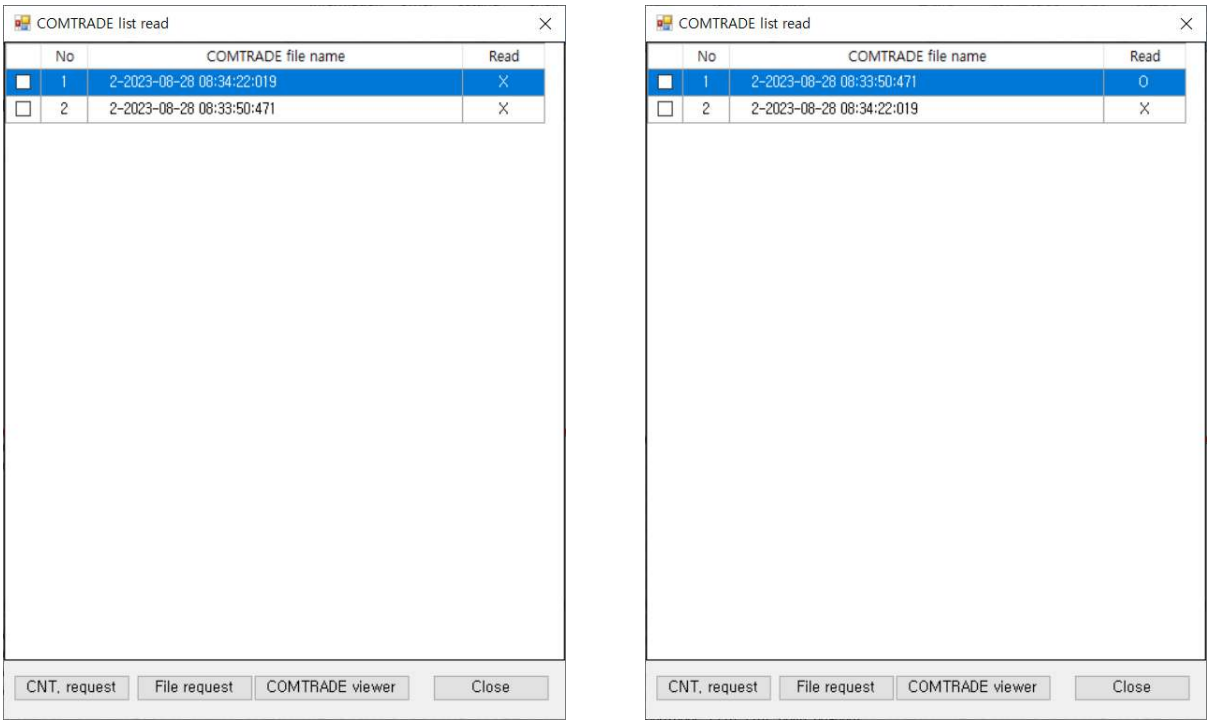
For a voltage set, the magnitude and phase of each phase, the magnitude and phase of the symmetry component, the magnitude and phase of the line to line voltage, and the frequency processed by phase A are displayed.



### 3.2.6. Wired-X : Fault

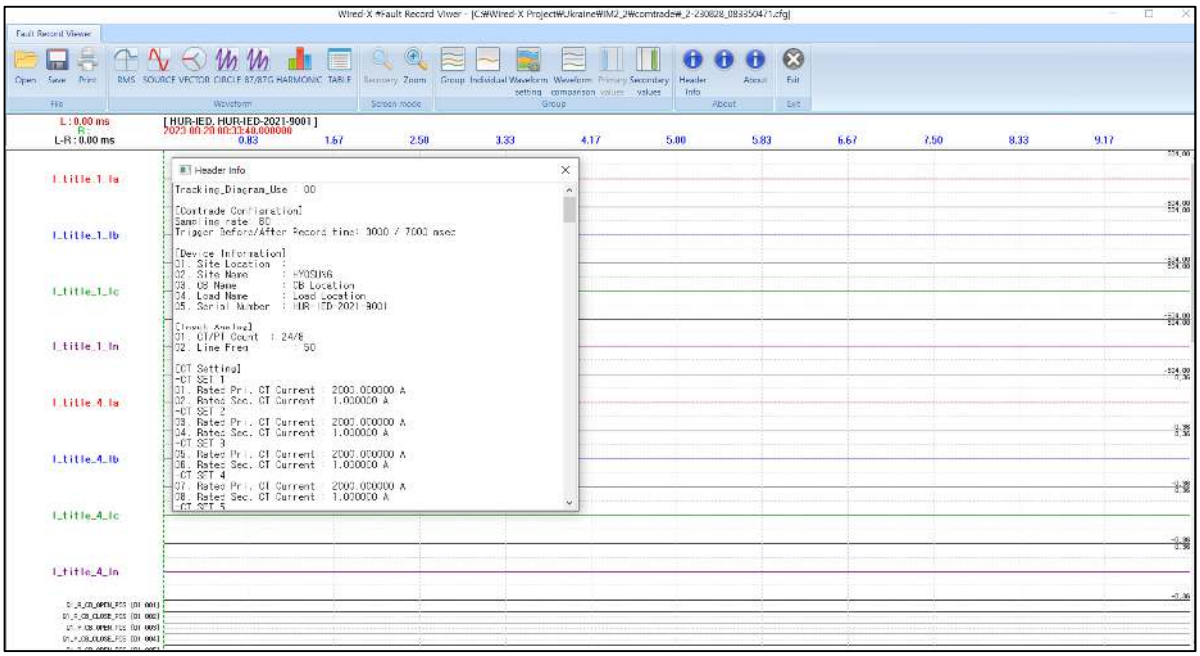
You can view the COMTRADE file stored in your PC folder via Wired-X.

Select the COMTRADE file you want to view and click the "COMTRADE viewer" button.



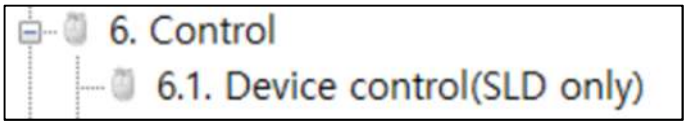
To import a COMTRADE file recorded in IM2, follow the procedure below. A user may access by clicking 

located at toolbar. Read file from COMTRADE by clicking "CNT.Request".



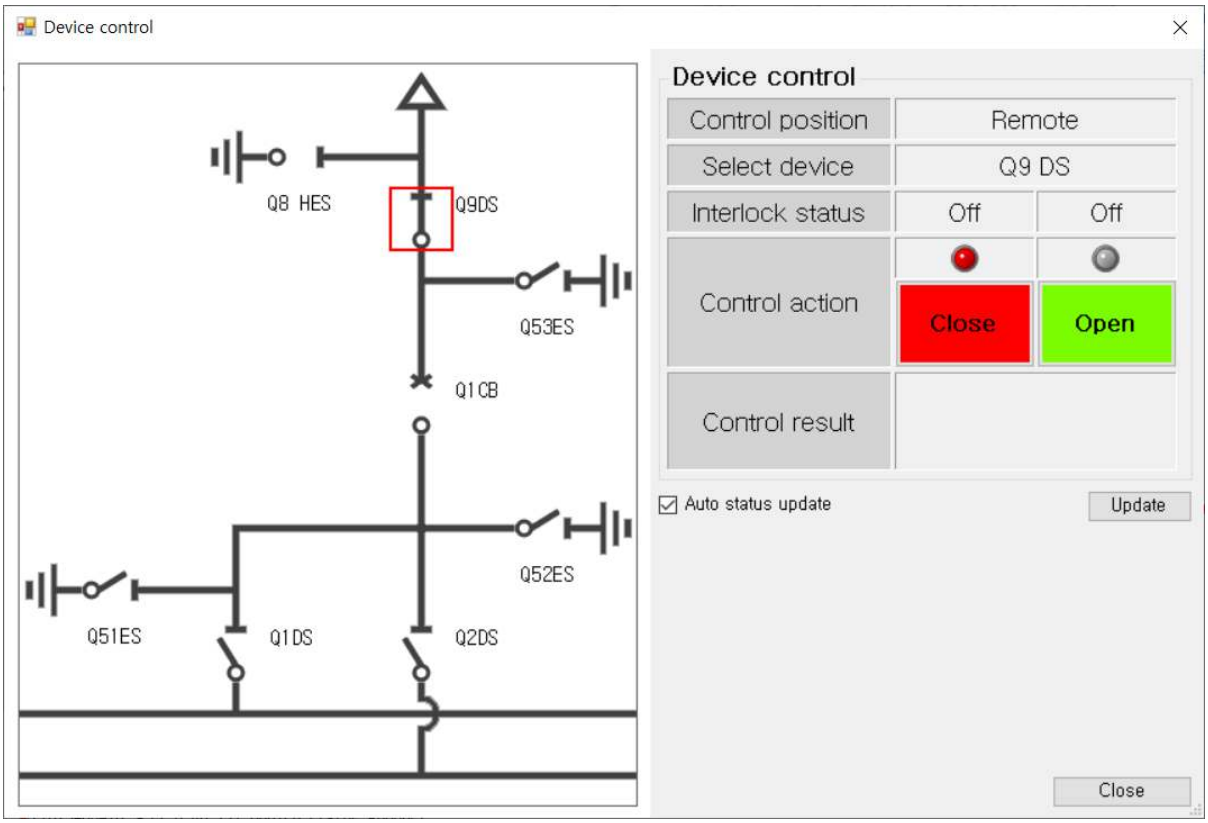
Click File request after selecting COMTRADE file to transfer IM2 → Wired-X

The file already read, is marked as 'O' on Read column. Already read data can be read again in offline mode



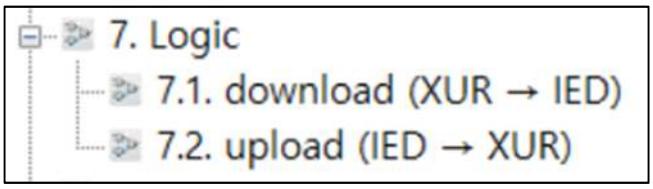
The user may check individual file by entering COMTRADE viewer.

AI CT, AI PT, DI, and DO are displayed by default.



### 3.2.7. Wired-X : Control

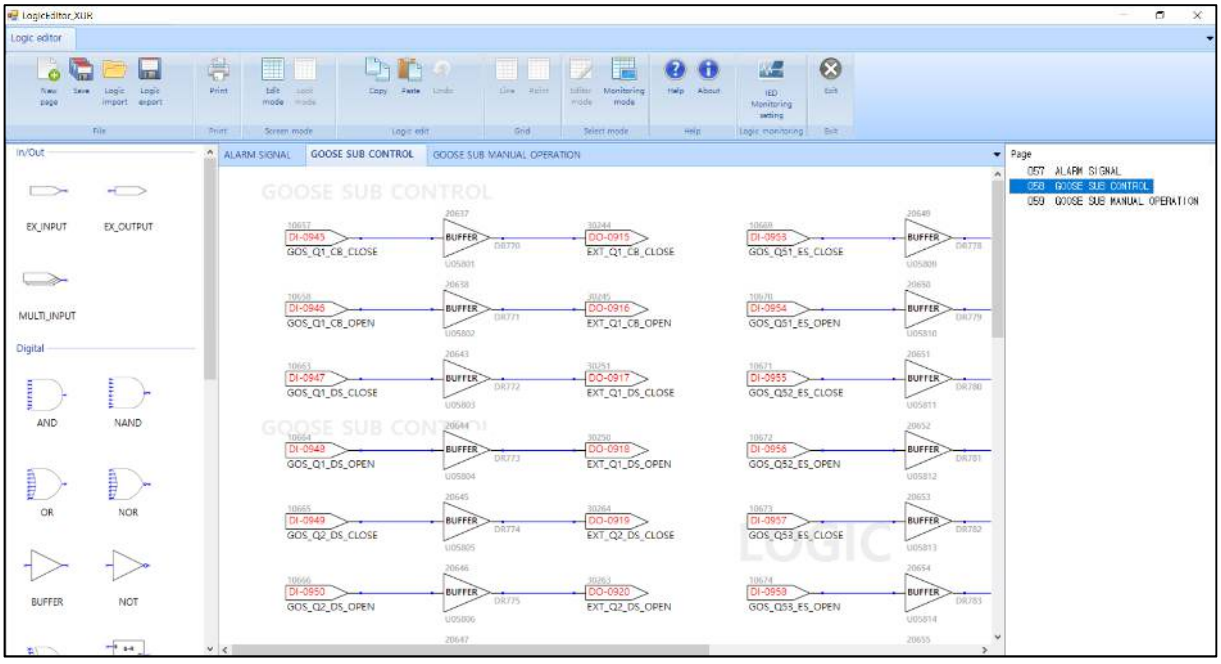
IM2 controls connected devices such as CB, ES, DS.



The source of control can be 61850 control service, Wired-X, LCD and external connected DI point. Control command will be processed correctly, if all the conditions are fulfilled.

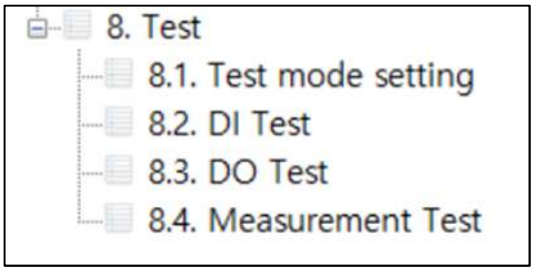
This is covered in more detail in “4.3 Function of CB/DS/ES control in SLD”

## 3.2.8. Wired-X : Logic



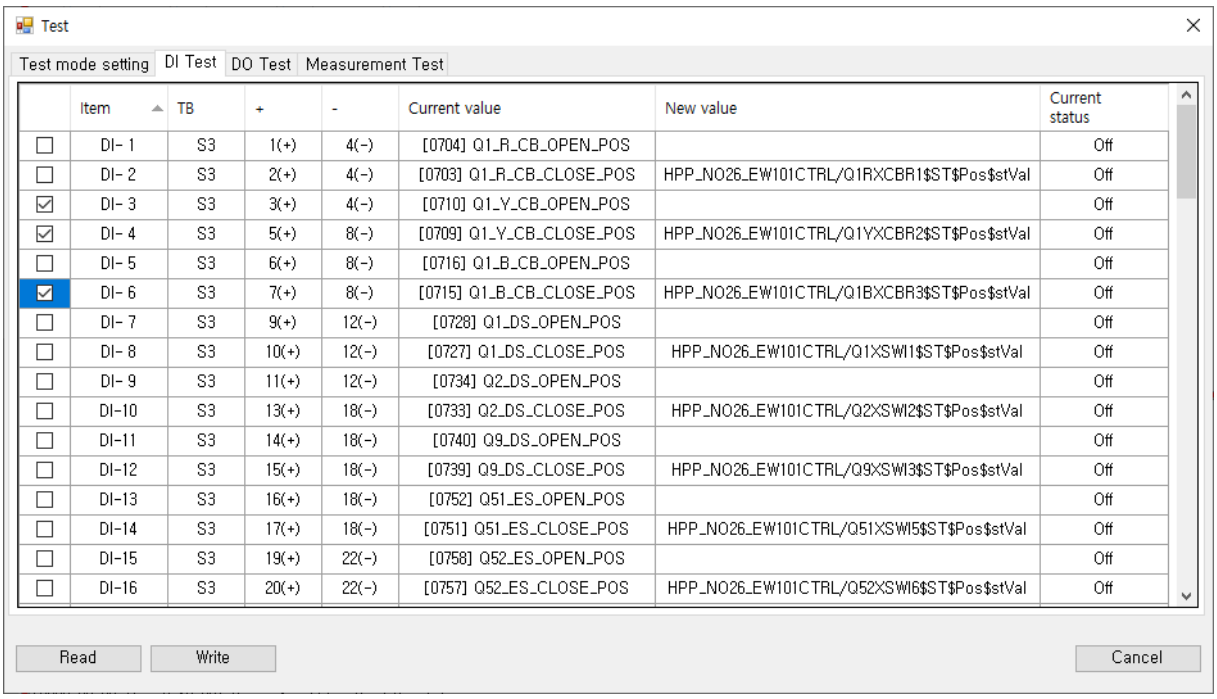
Upload/Download pre-structured logic from a manufacturer.

A user may execute the logic editor by pressing 



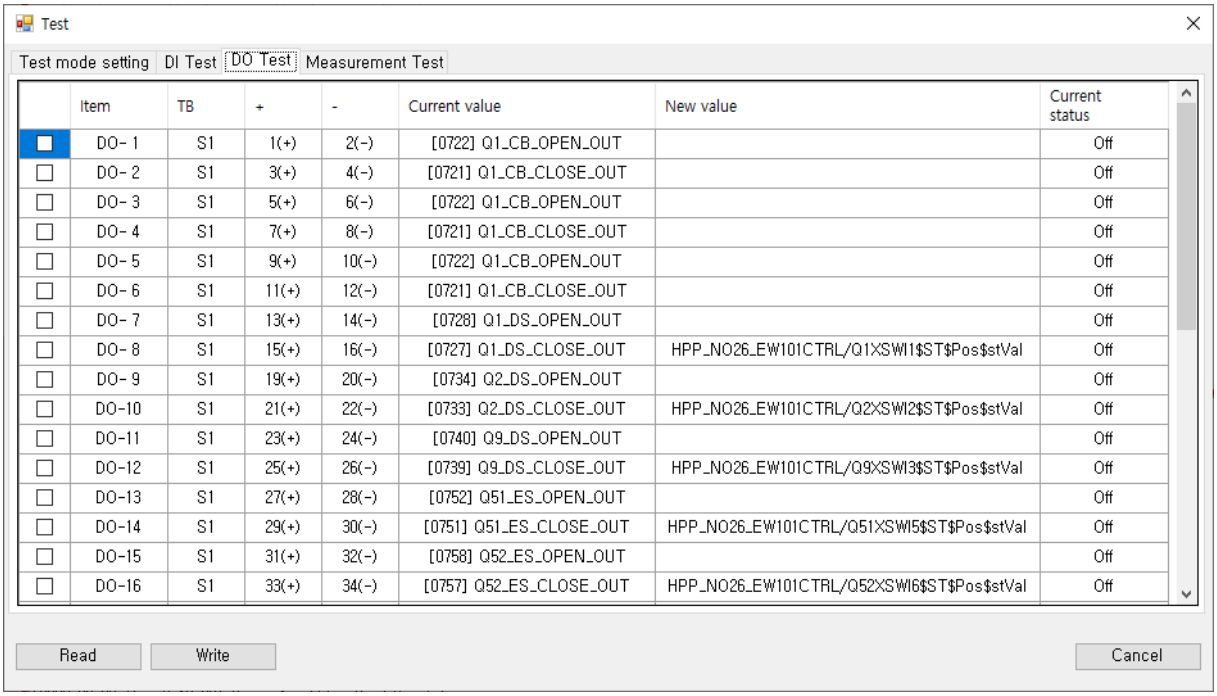
button on the toolbar

In general, the user may use GOOSE subscription data to design the logic.

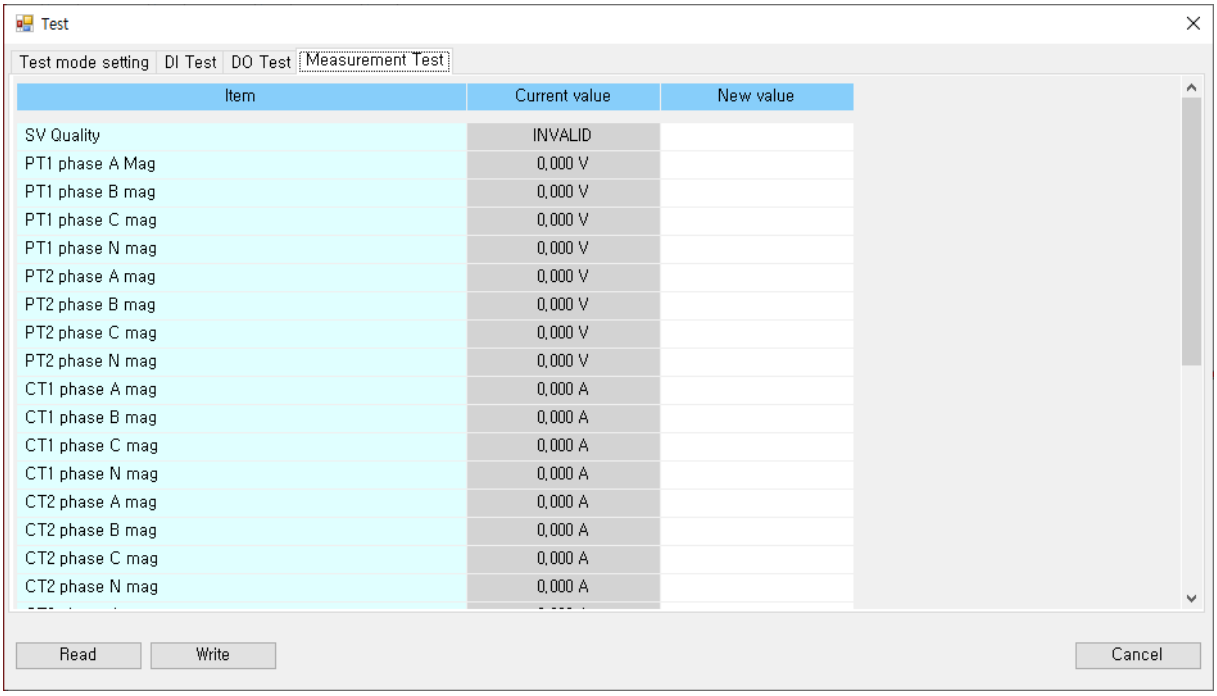


### 3.2.9. Wired-X : Test

A user can test DI, DO, SV without physical source connected to IM2.



| Item | Description |
|---|---|
| Test mode setting | Choose whether you want to test DI, DO, and SV.<br>When test mode is activated, the selected test values are used for input and output, while the actual DI/DO/AI inputs and outputs are ignored. |
| DI Test | Select a point to test as if the input were coming in virtually |
| DO Test | Outputs to the selected DO terminal. |
| Measurement Test | Used when exporting a virtual SV. |



In DI Test mode, Select and configure testing DI and press “write” button.

In DO Test mode, Select and configure testing DO and press “write” button

In SV Test mode, Select and configure SV simulation test and press “write” button.

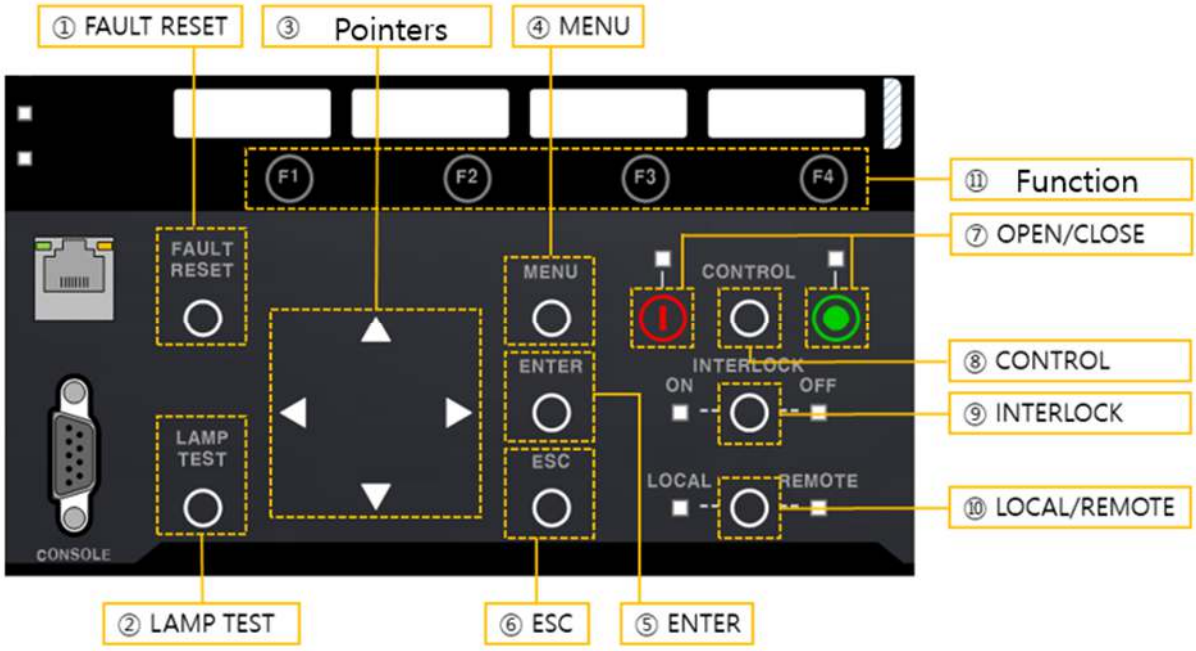
## 3.3. HMI Configuration

### 3.3.1. Overview

- HMI carries out functions of mutual information exchange between the operator and IED. It also operates so that the operator can easily recognize the operating state of IM2, and change the operating value and set value with a simple manipulation. The features of HMI are as follows.

1. The use of LCD and touch screen allows to display and process various information.

2. 4 LEDs for displaying system status and 32 LEDs for displaying operation status provide necessary information to the operator.



3. Simple manipulation allows the operator to carry out functions, such as setting and controlling IED.

4. The operator can conveniently check information and change settings on PC (operating software), using the communication port on the front.

### 3.3.2. Input Device

- Input device consists of a total of 18 buttons, including 4 function buttons, a button to move direction (up, down, left and right), interlock button, local/remote button and FAULT RESET button.

- Input device is configured as follows.

① FAULT RESET : a button to reset LED

② LAMP TEST : a button to test the operation of LED

③ A button to move up, down, left and right

④ MENU : a button to run menu

⑤ ENTER : a button to start the operation

⑥ ESC : a button to cancel the operation

⑦ OPEN/CLOSE : a button to run control devices at the control menu

⑧ CONTROL : a button that must be selected before operating the control device

⑨ INTERLOCK : a button to change the status of using(On)/not using (Off) interlock

⑩ LOCAL/REMOTE : a button to change Local or Remote status

⑪ Function Button : a shortcut button to move to a specific screen

- A more detailed description of button function is as follows.

① FAULT RESET

- [FAULT] The user can return LED and the operational status of LED to "Off". However, if the current operational status of LED is 'True', it does not change to 'Off'.

② LAMP TEST

- The user can run 'On/Off' of all LEDs, and check the normal status of each LED.

③ Button to move up, down, left and right

- Up/Down
  1. The user can move the cursor for selecting item up and down on a screen where the menu can be selected.
  2. During the control operation, The user can move the selected relaying element.
- Left/Right
  3. The user can move the cursor for selecting item left and right on a screen where the menu can be selected.
  4. During the control operation, You can move the selected relaying element.
  5. If the menu items consist of two or more pages, the user can move to the previous or next page.

④ MENU

- When the main menu is running, the user can move to the submenu.
- When the submenu is running, the user can move to the display, setting, and control menu in sequence.

⑤ ENTER

- The user can run the active menu or item.
- When the user intend to change the set value, the user can apply the input value.

⑥ ESC

- When the submenu is running, the user can move to the previous menu.
- When the highest menu is running, the user can move to the main screen.
- When a pop-up window is displayed, the user can close the pop-up window.
- If an item is selected on the fault event page, the user can deselect the item.

⑦ OPEN/CLOSE

- The user can run OPEN/CLOSE control operation for the selected object to be controlled.

⑧ CONTROL

- This is a button to select a control operation. Be sure to press this button first before pressing OPEN/CLOSE button in order to run the control operation.

⑨ INTERLOCK

- A User can control after selecting a device on the Control> Device Control screen.
- The user can select whether to run Interlock.
  1. When ‘not in use’(Off), the user can forcibly release the Interlock to control devices.
  2. When ‘in use’ (On), the user can activate the Interlock logic to control devices.
- Change of Interlock status
  3. Change of ‘not in use’ (Off): The user can change ‘in use’ (On) to ‘not in use’ (Off) only in the state of ‘Local', and change to ‘not in use’ (Off) only while the button is pressed.
  4. Change of ‘in use’ (On): When the button is pressed and then released, ‘not in use’ (Off) is maintained according to the set delay time of returning the set IED Interlock key, and then becomes ‘in use’ (On) automatically.
  5. However, When 'Local' status is changed to 'Remote' status, the Interlock status is automatically changed to ‘in use’ (On).

⑩ LOCAL/REMOTE

- This button assigns the position where the operator sets or controls IED.
  1. When 'Local' is selected, the user can run the setting and controlling operation in front of the IED.
  2. When 'Remote' is selected, the user can run the setting and controlling operation, using the upper-level commands or communication.

⑪ Function Buttons (F1, F2, F3, F4)

- The user can run functions set by the operator for each button.

• Display

- LED for displaying system status

◆ The types, colors and functions of LEDs for displaying system status are as shown in the table below.

| Item | Color | Function |
|---|---|---|
| POWER | Green | LED indicating DC power is in a normal state |
| RUN | Green | LED indicating that power is applied and the CPU of the IED is operating normally.<br>When IED is in normal operation, LED turns on, and when IED software or the front HMI does not operate normally, LED turns off. Also, in the event of IED_FAIL, LED turns off. |
| ALARM | Red | LED indicating that an abnormality has occurred in the device, and such abnormality is detected by the constant monitoring function.<br>In the event of IED_ALARM, it turns on in red, and in the event of IED_LOCK, it blinks in red.<br>When returning to a normal state, LED turns off. |
| FAULT | Red | LED indicating that a fault has been detected and protective action has been performed.<br>If the fault is cleared, be sure to use [FAULT RESET] button on the front to turn off the light. |

■ LED indicating the operational status

A total of 32 LEDs displaying the operational status are provided, and it is possible to set items the operator wants to display on each LED. It is also possible to set the operational properties of LED for each items to be displayed, such as color and display type.

■ LCD and touch screen

LCD and touch screen provides an operator interface, such as checking the set value and operational status, and changing the set value.

## 3.4. HMI Features

### 3.4.1. Functions displaying information on the operational status

- IM2 stores various information on operational state, which can be checked in the display menu.
- Up to 2000 items of event on fault, self-monitoring and control are saved, and the non-volatile memory inside the IM2 allow to store them permanently. However, since there is a limit to the number of storage and they are managed in the order of the latest record, the information on the oldest event is deleted when any events occur in excess of the maximum number.
- Up to 64 fault waveforms are stored in 4K/4.8K rate, which is identical to the samples used for protection per cycle. They are saved in the form of COMTRADE file, so the user can transmit them to the higher-level system, including the operating system of substation and SCADA, and analyze them using the operating software.
- It is possible to save fault waveform of 10 seconds long.
- The set values are saved in the nonvolatile memory inside the IM2, and therefore, preserved permanently. Data loss and damage are prevented by the use of 2 nonvolatile memories to save the set value in duplicate.
- In order to check whether all items, such as the set value related to the function, are normal during operation, the constant monitoring function checks whether the data is normal.

### 3.4.2. Function for Verifying Passwords

- In order for the operator to run the operation of each menu, the operator must have the authority to run such operation. Therefore, be sure to go through procedures for verifying passwords in order to check the authority before running the setting and control menus.
- The operator's authority is divided into 4 levels in total as shown below: display, setting, control and admin.

  - display authority : Information on setting and operational status inside the IM2 can be checked.
  - setting authority : All items can be set (including display authority)
  - control authority : CB, etc. can be controlled (including display authority).
  - admin authority : All items can be set and controlled.

- Password for each authority can be changed at the menu of 'setting'.

### 3.4.3. Operator's setting function

- The operator can set items, including time, network, the use of contract input/output, factors, holding time of controlled output and debouncing time.
- The set value of factors are individually managed in for set groups, and the group selected according to the operators' settings is applied to the operation of the factors.
- The operator's setting is possible even during normal operation of IM2, and is reflected in the operation of IM2 immediately after change.

### 3.4.4. Alarm for occurrence of fault event

- When a fault event occurs, the status is displayed on IM2 so that the operator can know the occurrence of a fault. The [FAULT] LED on the front is turned on, a pop-up window containing the fault details is displayed on the front LCD, and then the tray icon for occurrence of fault event on the status bar turns on.
- If the user select the 'Check' button after checking information of the pop-up window, the pop-up window disappears and the IM2's HMI function can be used normally.
- The tray icon for occurrence of fault event on the status bar turns on in the event of a fault event, and it turns off when the operator checks the fault event history in the display menu.
- In the event of a fault event, the screen is as follow.

### 3.4.5. Communication Port

Communication ports are provided that allow an operator to acquire data or enter information using a PC in which the operating software is installed. The role of the communication port is as follows.

- When the communication port is connected to the PC in which the operating software is installed, and acquires data of IM2, it supports the operator to easily analyze the IM2 monitoring information, or measurement data and fault information data via the operating software.
- The operator can easily enter the set value for IM2, transmit it to IM2 for application via the operating software.
- The operating software allows to acquire COMTRADE file containing the fault record from IM2, and then to analyze the fault.
- It is possible to connect the front communication port to the PC on the spot in order to update IM2 software.

# 4. Function

## 4.1. Setting standards of equipment

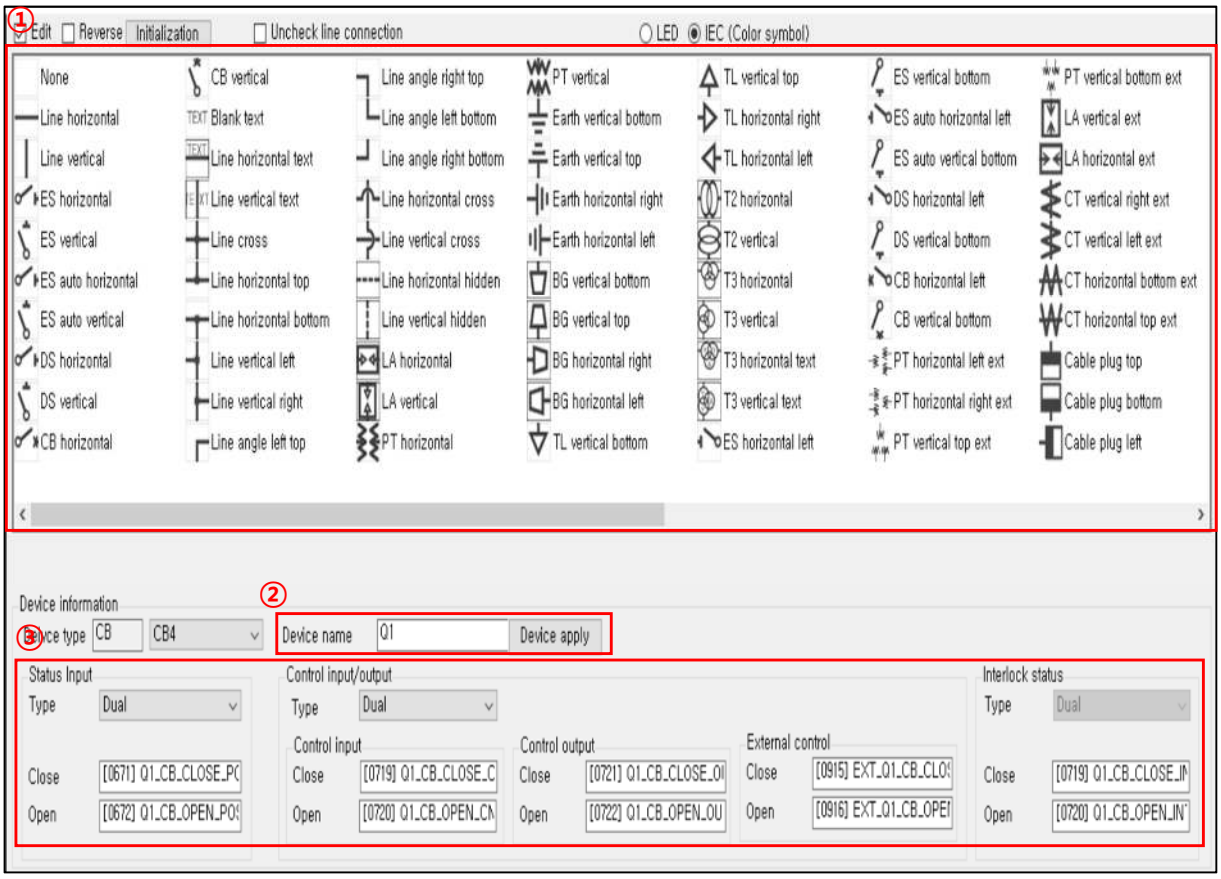
IM2 sets the rated voltage and current of the power system in which IM2 is installed. The equipment that sets the rating includes the bus PT, line PT, phase CT and N-phase CT.

| Items set | Unit | Min. | Max. | Step | Default value |
|---|---|---|---|---|---|
| Rated Primary PT Voltage | V | 1 | 2000 | 1 | 154000 |
| Rated Secondary PT Voltage | V | 1 | 1000 | 1 | 110 |
| Rated Secondary Line PT Voltage | V | 1 | 1000 | 1 | 110 |
| Rated Primary CT Current | A | 100 | 10000 | 1 | 2000 |
| Rated Secondary CT Current | A | 1 | 100 | 1 | 5 |
| Rated Primary NCT Current | A | 100 | 10000 | 1 | 2000 |
| Rated Secondary NCT Current | A | 1 | 100 | 1 | 5 |

## 4.2. Function of saving fault record

IM2 has a function to save the voltage, current signal input to IM2, and the operational result of internal logic as the fault record when internal function works. The setting items for the function of saving fault record are as shown in the table below.

| Items set | Unit | Min. | Max. | Step | Default value |
|---|---|---|---|---|---|
| Use or not to use | - | Off | On | - | Off |
| Mode of saving fault waveform | - | Trip | Trip & pickup | - | Trip |
| Record Sampling | - | - | - | - | 4K |
| Saved length of waveform before pickup occurs | msec | 1 | 10000 | 1 | 3000 |
| Saved length of waveform after pickup occurs | msec | 1 | 10000 | 1 | 7000 |
| Saved length of waveform before trip occurs | msec | 1 | 10000 | 1 | 3000 |
| Saved length of waveform after trip occurs | msec | 1 | 10000 | 1 | 7000 |

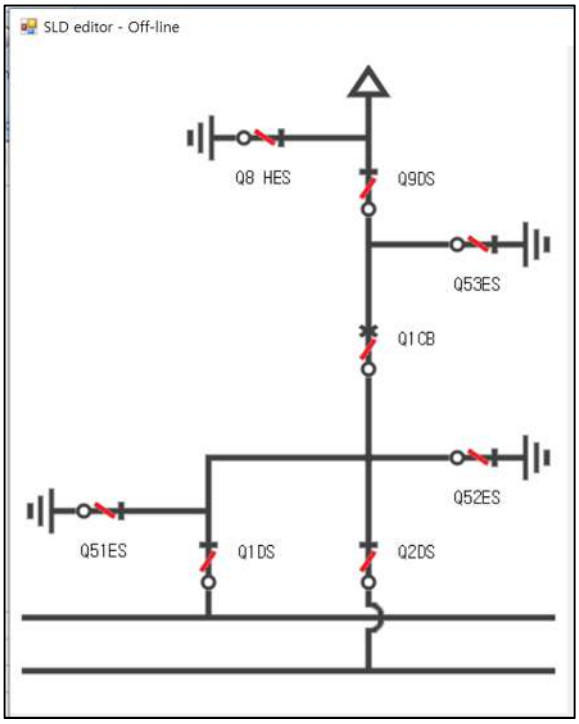


IM2 internally performs 80 samplings per cycle in order to carry out sampled value generation, therefor fault record sampling is fixed to 80 samples/cycle (=4K sample/sec(50Hz), =4.8K sample/sec(60Hz)).

## 4.3. Function of CB/DS/ES control in SLD

IM2 has a function to control an equipment such as CB, DS and ES in Single Line Diagram.

Wired-X provides a single line diagram editor, and a user can draw or edit SLD through the SLD editor as shown below. However, user generally do not need to modify SLD as they are designed/tested to match the approved drawings upon delivery. If you want to make a modification, please contact the manufacturer first.



① Available Symbols for SLD

② Device name as it appears on the schematic

③ Assigning points for control in SLD. ***This setting is critical and may not function properly***

***if altered. Please contact the manufacturer before making any adjustments..***

Below is an example of a single line diagram implemented through the Single Line Diagram Editor. A single line diagram can contain up to 4 CB symbols, 4 DS symbols, and 4 ES symbols.

- The real-time status of the current device is displayed on a single line diagram.
- The operator can change symbols indicated on the single line diagram according to the settings, and the status of the device is displayed differently according to the symbol.
- The status of the device is displayed as follows.

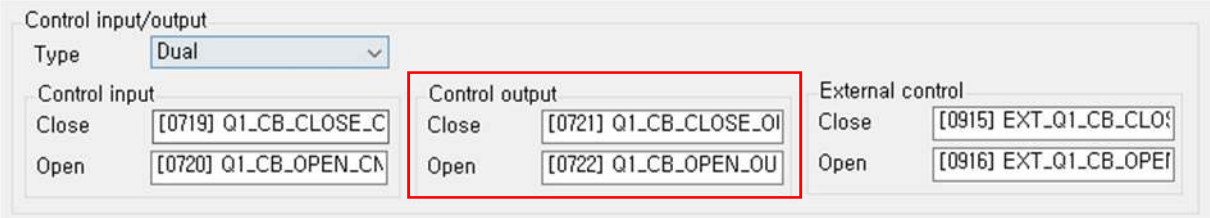
| | The state of Open input | The state of Close input | IEC Symbol | LED Symbol |
|---|---|---|---|---|
| 1 | Off | Off |  |  |
| 2 | On | Off |  |  |
| 3 | Off | On |  |  |
| 4 | On | On |  |  |

### 4.3.1. Control related conditions

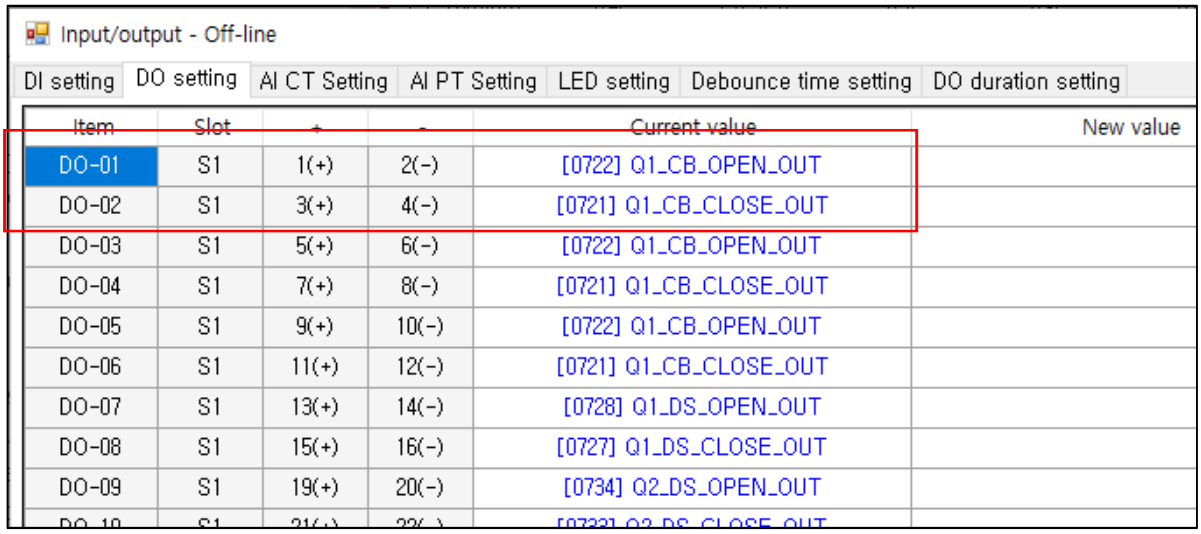
The following conditions must be met for the control output to function properly.

- Local/Remote status
- Interlock status
- Position status /Command input
- Control output point and whether to assign a DO

Control depends on local/remote status to determine which sources are controllable, as shown below.



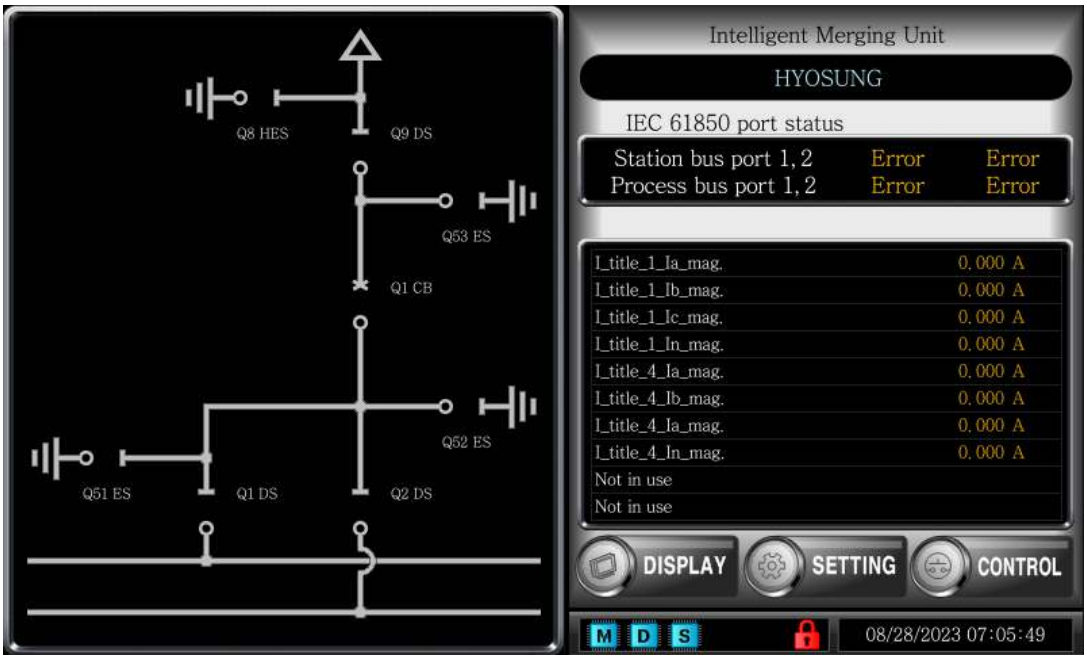
| | Controllable source |
|---|---|
| Local | LCD touch panel, Button |
| Remote | Control input : 61850 Control Service, Wired-X<br>External control : Internal digital points assigned to a GOOSE or DI |



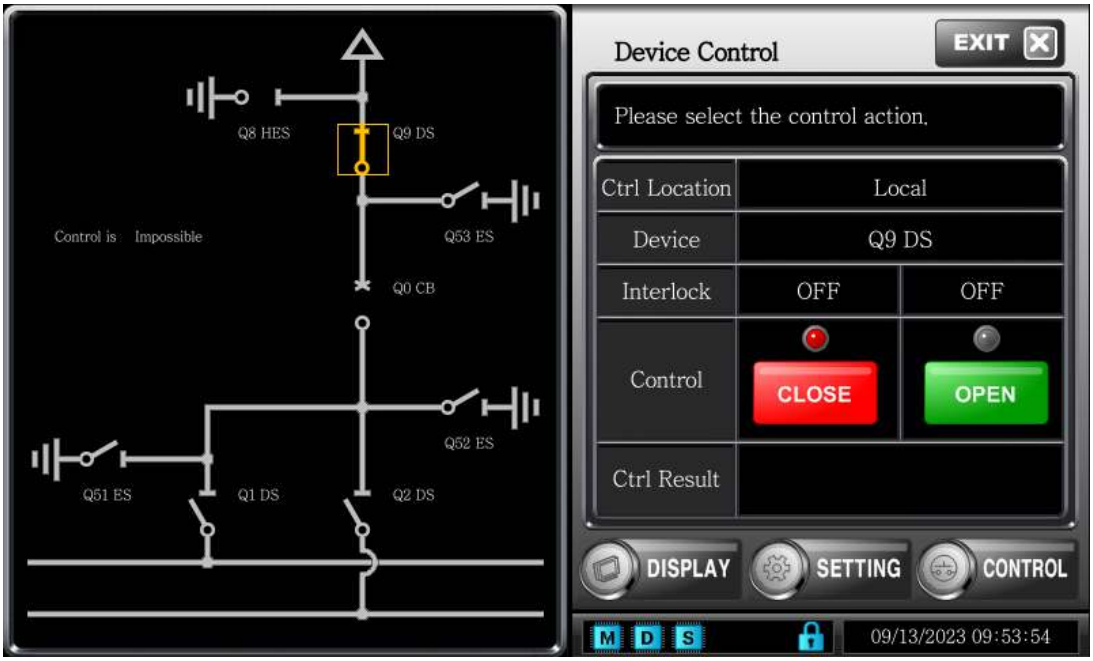
Obviously, you can't control the LCD touch panel or buttons in the Remote state, and vice versa. Check the local/remote status before executing the control action.

The Interlock status is an input that blocks the control output, preventing output when on and allowing output when off.

The position of the device and the command input must always be opposite. If a command identical to the device's position is given, no output is produced. Ex) open output occurs on close position, no output occurs on , and a failure event occurs on OPEN.

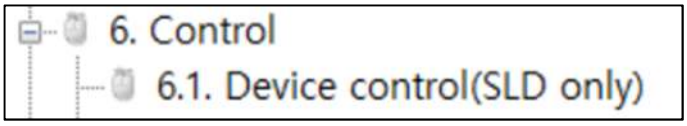


The control output point must be assigned to a DO on the DOU module. DO settings can be checked at 1.2.2 “DO setting”

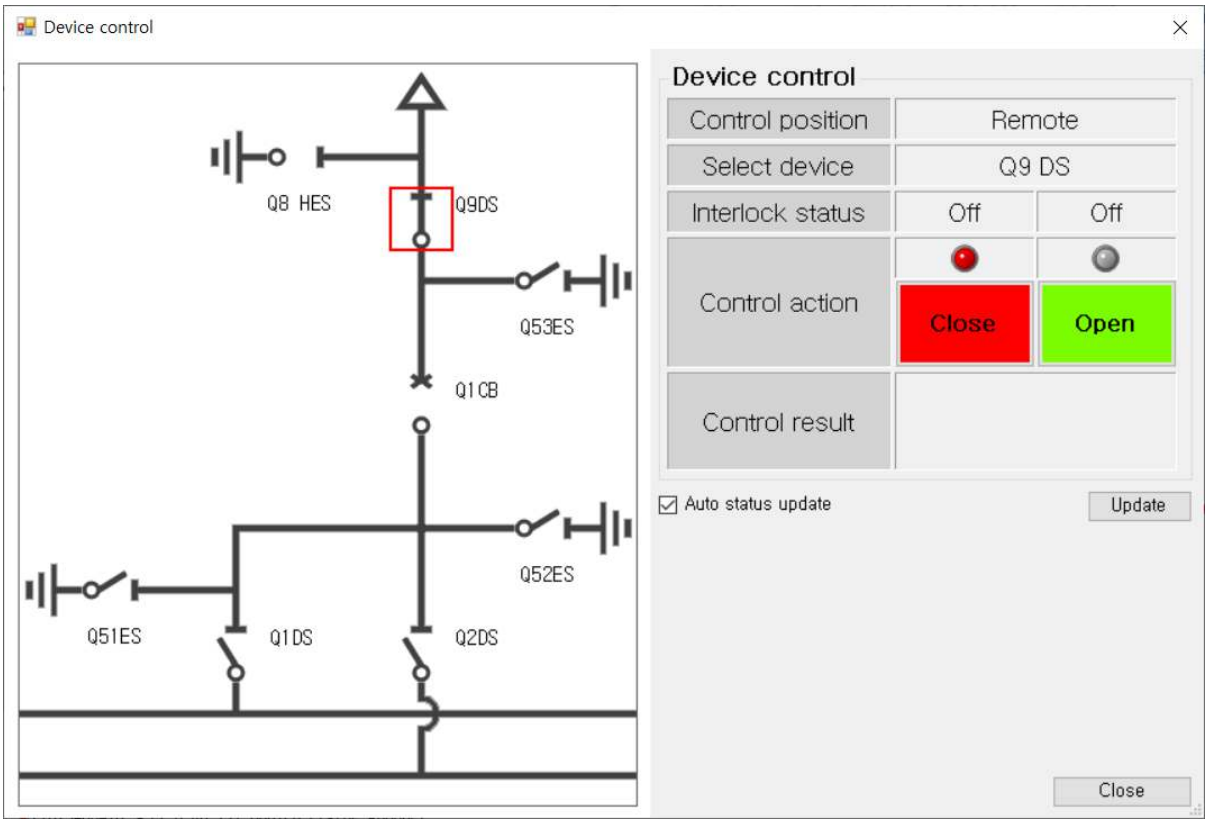


### 4.3.2. How to control CB/DS/ES in SLD

The conditions necessary for the control to operate have been verified, and now we will proceed to explain the actual method of operation. The IM2 can be operated in two ways: through the LCD or Wired-X. First, let's explain how to operate on the LCD.



When the device in the SLD is tapped on the Main Home screen like the above picture, a password prompt will appear. After entering the correct password, you will be directed to the control screen displayed below.



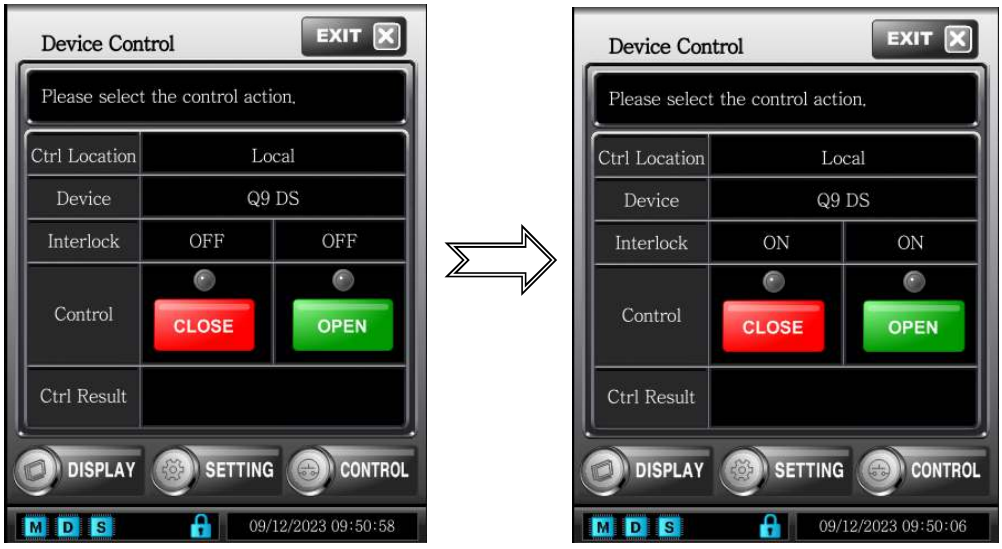
In the previous descriptions, you can see that after checking the control condition and issuing the control command, it works normally. To summarize the control conditions using the LCD/Button, we have the following:

| Item | Condition |
|---|---|
| Ctrl Location | Local |
| Interlock | OFF |
| Device's Position | Open or Close |

Similarly, Wired-X can control through "6. Control" after connecting to IM2 through Wired-X.

The control conditions using Wired-X are as follows

| Item | Condition |
|---|---|
| Ctrl Location | Remote |
| Interlock | OFF |
| Device's Position | Open or Close |



### 4.3.3. How to take control of CB/DS/ES in an Emergency

During an emergency, it may be necessary to take control of a device to prevent further damage. This behavior is only possible on-site in Local mode. To do so, follow these steps:

1. Select a device in SLD and enter password.
2. Press and hold "Lock" button over 3 seconds. (Releasing the button, it will revert after 3 seconds)

3. Check interlock status and confirm "OFF" to "ON".

# 5. Alarm & Self-Monitoring

## 5.1. Overview

- If the ARM lamp of this device is lit, be sure to check whether this device is free from error. Therefore, the automatic monitoring function is very important to check the status of this device in the course of startup and normal operation. A fatal error detected during automatic monitoring means that this device will be blocked and out of service. Accordingly, the power of this device must be turned off/on in order to make this device work again, or otherwise this device must be replaced.

## 5.2. How to classify alarms and check events

### 5.2.1. Description of alarm events

Alarm LED is lit upon occurrence of alarm event, and divided into [alarm element for locking the operation] and [alarm element for unlocking the operation].
When [alarm element for locking the operation] event occurs, the logic function does not work, and be sure to check it promptly and take actions because there may be problems with IM2's own hardware.

### 5.2.2. How to check upon occurrence of alarm event

Select "Display>Event>Alarm Event" to check the event.

### 5.2.3. Alarm Table

IM2 Alarm & Fail LED work in the following situations.

| Status | Alarm LED | Fail LED |
|---|---|---|
| Operation alarm | blinking | Turn on |
| Non-operation alarm | Turn on | OFF |
| Normal & other alarm | OFF | OFF |

### 5.2.4. How to check and inspect when alarm LED on the front of IED is turned on

**1) How to check and take actions when 'Alarm event for locking the operation' occurs**

- This is the case where IM2_LOCK or IM2_FAIL occurs, and if problems inside IM2 occurs, ALARM LED blinks every 1 second, and IM2 FAIL LED is turned on.

| NO. | Occurrence of event | Confirmations and checklist |
|---|---|---|
| 1 | Abnormality in external power | This is an event of monitoring the control power. As this works when DC is not more than 90V and not less than 140V, be sure to check whether the power is DC 125V at the input terminal of the control power. |
| 2 | Abnormality in DSP Core | This is an event that occurs when IED's internal circuit is abnormal. When checking this event, be sure to contact the maker. |
| 3 | Abnormality in the set value | |
| 4 | DSP's failure to receive the initially set value | |
| 5 | Abnormality in measurement circuit | |
| 6 | Abnormality in ADC | |
| 7 | Abnormality in internal power | |

**2) How to check and take action upon occurrence of alarm event 'unlocked operation'**

- This the case where IM2_ALARM elements work, and if the logic element is not locked, ALARM LED is turned on.

| NO. | Event checking | Confirmations and checklist |
|---|---|---|
| 1 | Abnormality in IEC 61850 communication<br>※ *When IEC 61850 function is applied* | Be sure to check whether the connection of 61850 port and the optical distributor's cable linked to the rear of IM2 is normal, and whether the cables are connected mutually crosswise. |
| 2 | | Be sure to check whether IEC 61850 IP for connecting to IM2 from HMI and clients is properly set.<br>Be sure to check at "Setting>System>Network setting >IEC61850 port". |
| 3 | Abnormality in DI circuit | It operates when the state is changes more than 40 times within 1 second, so be sure to check the connection bolts on the rear of IM2 are loose. |

| | | |
|---|---|---|
| 4 | Abnormality in DO circuit | This is an event that occurs when IED's internal circuit is abnormal. When checking this event, be sure to contact the maker. |
| 5 | Abnormality in DO contact | |
| | | |
| 7 | Abnormality in the set value of MPU | |
| 8 | Abnormality in IEC 61850 communication process<br>※ *When IEC 61850 function is applied* | |
| 9 | Abnormality in IM2 event information | |

### 3) How to check and inspect when an equipment is not controlled

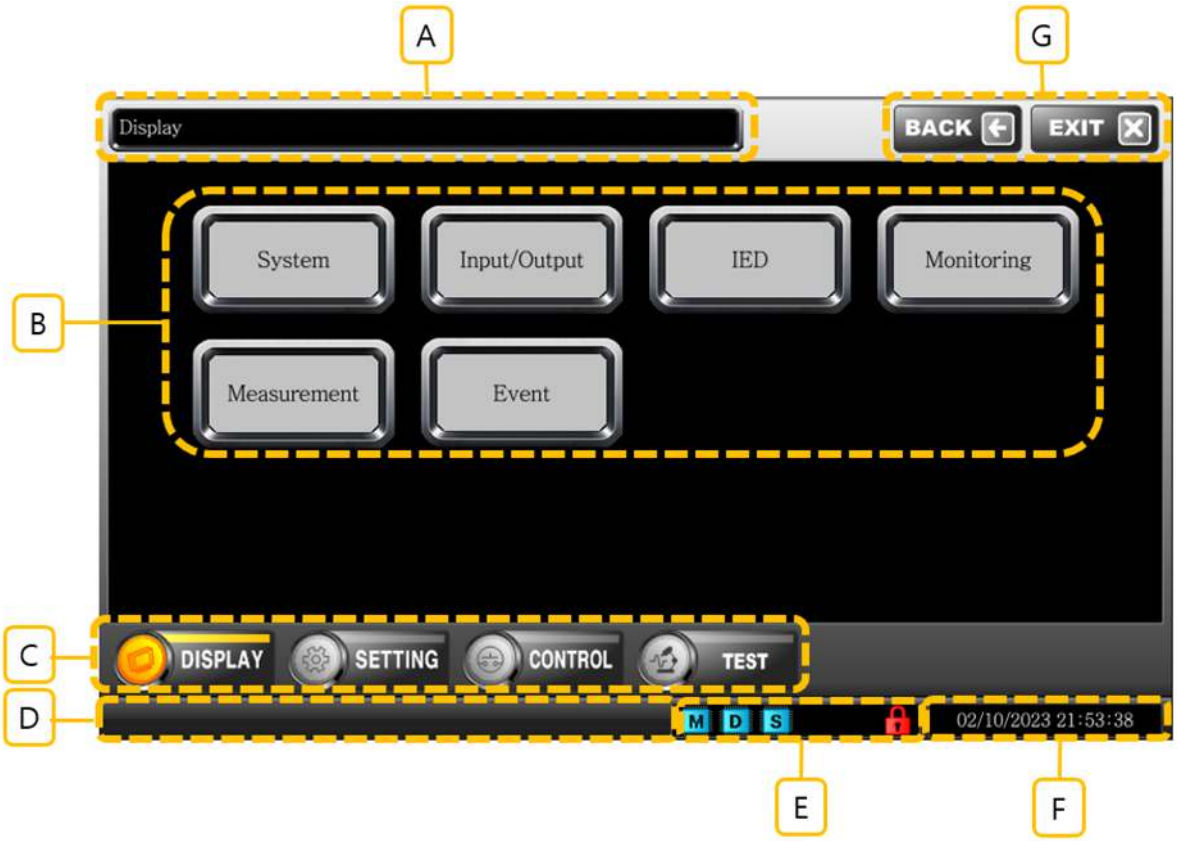
| NO. | Confirmations and checklist |
|---|---|
| 1 | If an equipment is controlled at the site, be sure to check whether the control position is in the state of the site, and whether it is in the remote state when the equipment is controlled at a higher level, such as HMI. |
| 2 | The same control is not executed..<br>e.g.) When the state of inputting contact is in the state of 'CB close', 'CB close' is not controlled. |
| 3 | If the state of inputting the contact of an equipment to be controlled is not input, the equipment is not controlled. In other words, if the state of the equipment is recognized as abnormal, the equipment is not controlled. e.g.) 'CB close' can be controlled only when the state of inputting the contact is in the state of 'CB open'. |
| 4 | Be sure to check whether the interlock logic for controlling the device is applied. (Be sure to check at 'Display-Logic-Interlock)<br>If the output of interlock logic for controlling the device is "0", the device is not controlled, so the device must be controlled after configuring the output of interlock logic as "1". |

**4) How to check and inspect when the connection to Wired-X communication fails**

| NO. | Item | Confirmations and checklist |
|---|---|---|
| 1 | When connecting to Console (serial) communication | Be sure to check whether COM port of the operator's PC matches with the Wired-X Com port. The user can check the COM port number at "My Computer>Hardware> Device Admin>Port". (How to check may vary depending on the operating system.) |
| 2 | When connecting to Ethernet communication | Be sure to check whether IP entered in IM2 is properly set.<br>The user can check IP at "Settings>System>Network setting>Ethernet Console port". |
| 3 | | Be sure to check whether the communication cable is properly connected to Ethernet port on the front of IM2. |
| 4 | | Be sure to run 'Ping Test' to check whether IP assigned to IED is being used by other equipment.<br>The user can check on the operator's PC at 'Start>Run> Enter CMD> Enter ping IP' |
| 5 | | Be sure to check whether the access is blocked by the firewall on the operator's PC. |

# 6. Display

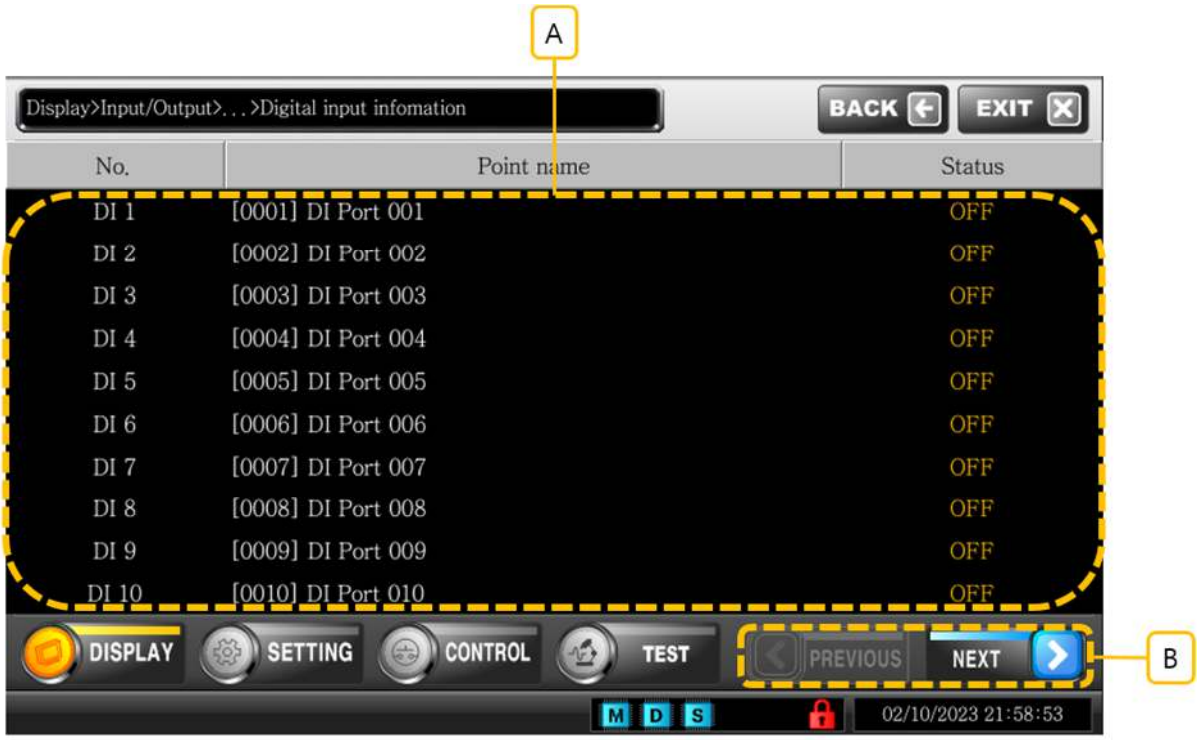
## 6.1. Main Screen



- The main screen displays product name, the state of IEC 61850 port, time and measurement information. The user can move to Display/Settings/Control Tab on the main screen. the mark 'lock' at the bottom of the screen indicates 'Remote/Local mode and Lock/Unlock status. The settings can be changed, using buttons on the front of IM2 (10,11). The icon, 'lock' is displayed in blue for Local mode, and in red for Remote mode, and the set value can be changed only in Local mode.

| | |
|---|---|
| A. Single Line Diagram | : Single line diagram and equipment status are displayed. |
| B. Device name | : IED name |
| C. Facility name | : Facility name |
| D. the state of IEC 61850 communication | : the state of 2 ports on IEC 61850 is displayed.<br>※ The user can use it when applying IEC 61850. |
| E. Measurement data | : Key information on measurement is displayed. |
| F. Menu category | : All menus are classified and displayed depending on function |

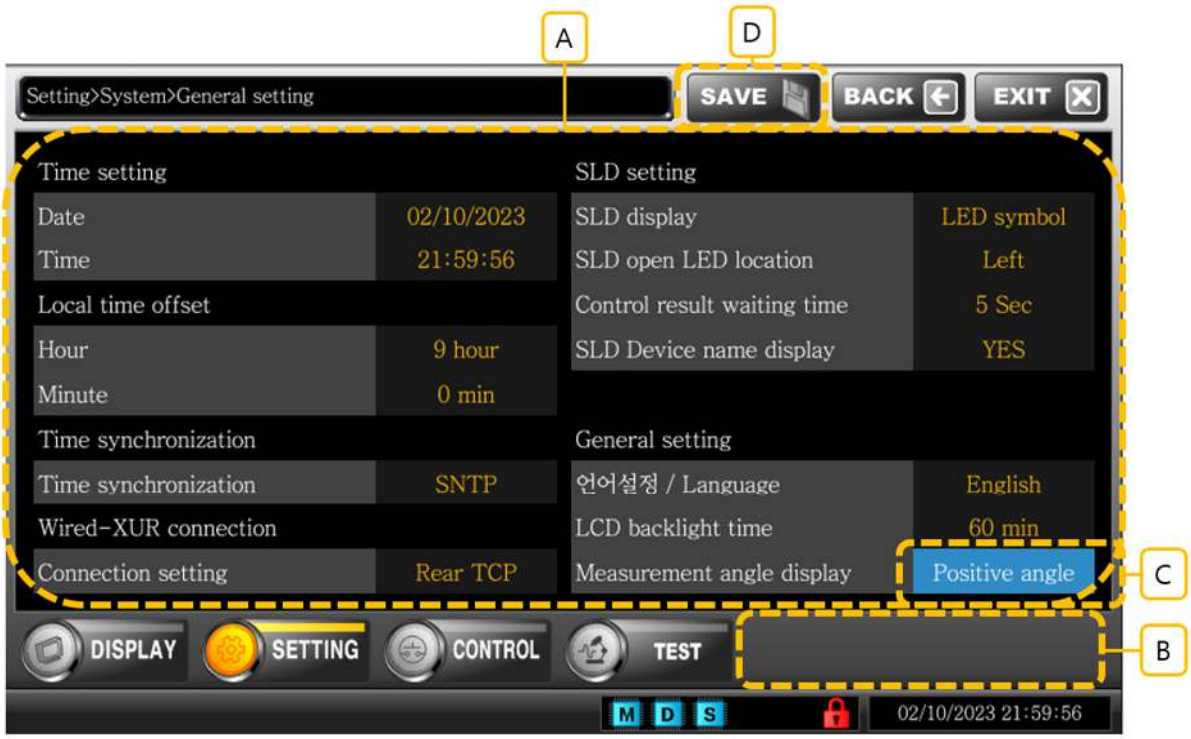
| | |
|---|---|
| G. Time display | : information on current time is displayed |
| H. Tray icon | : The status of IED operation is displayed simply<br>For details, see [Tray Icon] below. |



### 6.1.1. Screen for selecting menu

- The configuration and meaning of the screen for selecting the detailed menu, such as display, setting and control, are as follows. The figure below is the screen for setting menu.

| | | |
|---|---|---|
| A. | Display of menu path | : displaying the path of the currently running menu |
| B. | Detailed menu | : displaying the detailed menu belonging to the menu |
| C. | Menu category | : Classifying and displaying all menus according to the operation |
| D. | Display of status | : displaying information on status |
| E. | Tray icon | : simply displaying the status of IED operation |
| F. | Display of time | : displaying information on the current time |
| G. | Moving backward /End button | : moving to the previous menu or main menu |



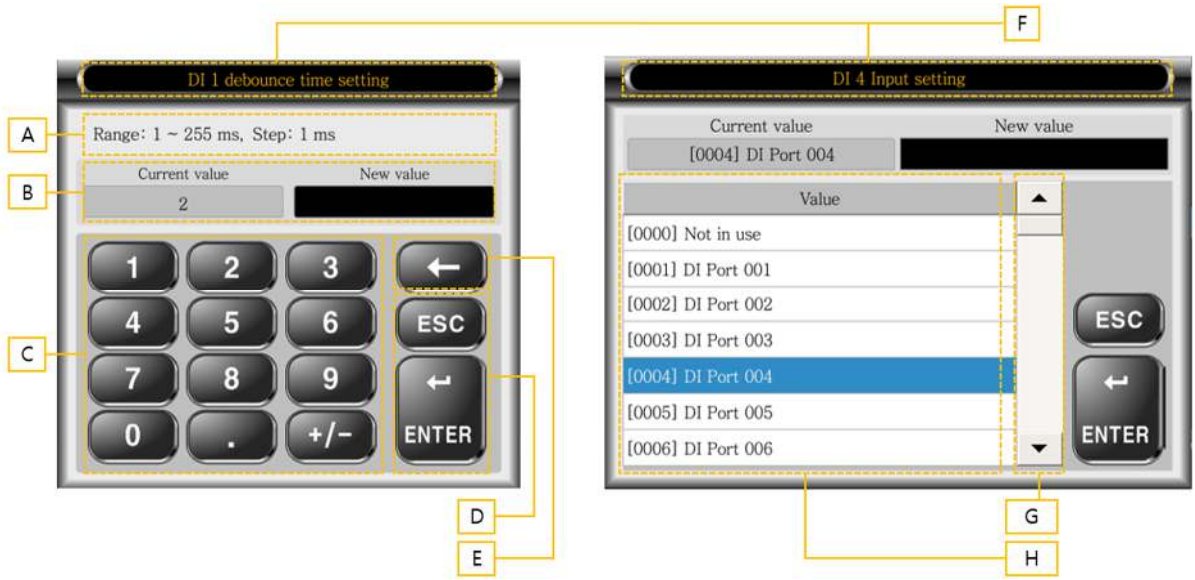
### 6.1.2. Screen of Display Menu

A. Detailed data : displaying the detailed data belonging to the menu

B. previous/next button : If there are 2 pages or more, a button to move page

### 6.1.3. Screen of menu set

A. Items set : settable items belonging to the menu



B. Previous/Next button : If there are more than 2 pages of data, a button to move page

C. Activation of menu set : Element to select and classify for running item

D. Save button : a button to save and apply the set value changed by the operator

## 6.1.4. Screen of pop-up window

- Pop-up windows displayed during the operation of menu is largely divided into a window with a button for entering numbers, and a window with a set list.

| | | |
|---|---|---|
| A. | Displaying the settable range | : Displaying the settable range, such as Min., Max. Step of the item |
| B. | Displaying the set value | : Displaying the existing set value and new set value entered by the operator |
| C. | Button to enter numbers | : Number button used to enter the set value |
| D. | Cancel/Confirm button | : 'Confirm' button to cancel the changed setting or to apply new input value |
| E. | Button to cancel input | : Button to cancel the input of new set value one by one |
| F. | Name of the set item | : Displaying the name of the set item |
| G. | Up/Down scroll | : a button to move to the previous/next item in the set list |
| H. | List set | : Displaying the list for the operator to select the settable item |

### 6.1.5. Tray Icon

- Types and meanings of icons displayed on HMI are as follows.

A. MPU : Display whether MPU is normal or abnormal
- M : MPU is normal
- M : MPU processor is abnormal
- M : MPU is abnormal (None-Lock alarm)
- M : MPU is abnormal (Lock alarm)

B. DSP : Display whether DSP is normal or abnormal
- D : DSP is normal
- D : DSP processor is abnormal
- D : DSP is abnormal (None-Lock alarm)
- D : DSP is abnormal (Lock alarm)

C. IEC 61850 (STB) : Display whether IEC 61850(STB) is normal or abnormal
- S : IEC 61850 is normal
- S : IEC 61850 processor is abnormal
- S : IEC 61850 communication is abnormal
- S : IEC 61850 communication is abnormal

※ It is possible to use when applying IEC 61850.

D. Displaying fault waveform : the state of saving fault waveform
- : completing to record fault waveform

E. Interlock : Display the status of Interlock
- : Remote/ Locked
- : Local / Unlocked
- : Local / Locked

### 6.1.6. LED operation

- LED repeats the following process sequentially. In terms of LED display for each type, it checks and displays the data on 32 setting elements of LED individually.
- Check the displaying items set on the LED: The user can check the displaying items on LED set by the operator, and operate the LED according to the set type and color.
  1. Monitoring of the value of LED setting elements: The user can monitor data in real time, and reflect them in LED display as soon as they are changed..
  2. LED display: There is a difference in the display method for each type of LED setting. The details of the display method for each type are as follow.

| Type | How to display |
|---|---|
| Pulse | It is displayed in real time according to the status value. If 'True', it is on, and if 'False', it is Off. |
| Latch | It monitors the status value in real time, and if 'True', LED is turned on, but even if it is changed to 'False', LED is not turned off. If the status is 'False', The user can turn off LED, using [FAULT RESET] button on the front. |

### 6.1.7. LCD operation

- LCD repeats the following functions in order.
  1. Input on LCD: The image and status values are displayed on the LCD. The image and data name displayed on the LCD are updated only when the power is turned on for the first time or when the menu is shifted, and various status are updated and displayed ever 200ms, and the measured values are displayed every 3 second. Therefore, the operator can check the status change inside the IED in real time.
  2. Input on screen touch: The operator's screen touch is monitored, and the corresponding operation is performed. When the position, where the touch screen is pressed, is the menu button, the LCD of the selected button is changed, and when it is the button related to the saving of the settings, the changed set value is reflected inside the IED.
  3. LCD backlight: To protect the LCD, if there is no input on LCD touch or button for a set time, the LCD backlight is turned off. The backlight time can be set by the operator, and the backlight turns on again when the screen is touched or a button on the front is pressed.

### 6.1.8. Menu List on the Display

- The display function does not require a separate password.. That is, all operators can use the display function.
- The status of IED operation and monitoring elements are displayed, and the value set and measured by the operator can be checked..
- The menu tree on the display is as follows.

| Menu on the display | Sub-menu | Sub-sub menu |
|---|---|---|
| System | Version information | |
| | General setting | |
| | Network information | |
| | Function button setting | |
| | Setting of measurement on the main screen | |
| | Board information | |
| | PBCU system information | |
| | PTP information | |
| | HSR/PRP information | |
| Input/ Output | Information on contact point | Information on input of contact point |
| | | Information on output of contact point |
| | GOOSE information | Station/Process Bus GOOSE subscriber |
| | | Station/Process Bus GOOSE publisher |
| | | Station/Process Bus GOOSE control block |
| | LED information | |
| | Information on debouncing time | |
| | Information on duration of controlled output | |
| | Information on type of contact output | |
| IED (inclusion is undecided.) | Information on logic elements | |
| | Information on machine dimensions | |
| | Information on elements of saving fault record | |
| | Information on the set groups | |
| Monitoring | Status of IED operation | |
| | Status of IED alarm | |

| | | |
|---|---|---|
| | Status of counter | |
| | Status of PBCU system | |
| | PTP status | |
| | HSR/PRP status | |
| Measurement (Information will be added after installing functions later) | Measurement information | Voltage: 1~3 Set |
| | | Current: 1~3 Set |
| | | Current: 4~5 Set |
| | | Comprehensive information |
| | | Information on user's measurement 1 |
| | | Information on user's measurement 2 |
| | Transducer information | |
| | RTD information | |
| | Information on measurement inside IED | |
| | Electric energy | |
| Event | Alarm event | |
| | Monitoring event | |
| | Contact input event | |
| | Control event | |
| | Communication event | |
| | Fault event | |
| | Setting event | |

## 6.2. Menu on the Display

### 6.2.1. How to run menu on the Display

**1) "Move" while running the main menu on the LCD**

① When moving from the main menu, which is the initial screen of IM2, to the menu on the Display, touch the "Display" button on the LCD to move to the top menu of the Display.

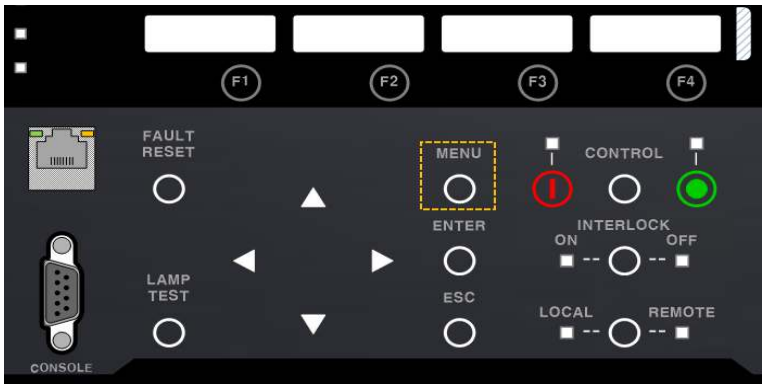
② Go to the menu of "Version Information" to check the information on IM2 version. The position of the menu of "Version Information" can be checked, referring to the menu structure of the upper Display. The menu of "Version Information" is positioned at 'Display> System>Version Information'.

③ Touch "System" button out of the buttons of the detailed menu displayed on the top menu on the display to move to the "System" menu.

④ Touch "Version Information" button out of the detailed menu buttons belonging to the System menu and go to the menu of "Version Information".

⑤ The data of [Version Information] menu are displayed on the LCD. The path of the currently running menu can be checked in the part of displaying title at the top.

※ STB of F/W version can be used when IEC 61850 is applied.

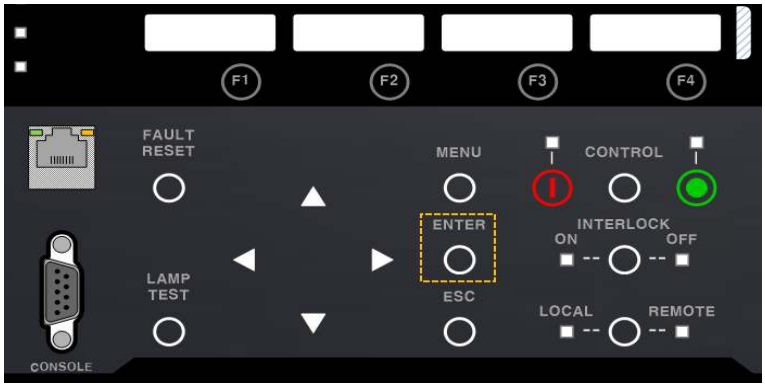


**2) 'Move" while setting, controlling LCD and running test menu**

① When moving to the menu on the display while other menu is running, touch "Display" menu on the LCD to go to the top menu on the display.

② Moving in the top menu on the display is the same as moving the above 'moving while the main menu on the LCD is running'.

**3) Move using the front buttons**



① When moving from the main menu, which is the initial screen of IM2, to the menu on the display, press the "Menu" button on the front of IM2 to go to the top menu on the display.

② To check information on IM2 version, go to the menu of "Version Information". The menu of "Version Information" is positioned at "Display>System>Version Information".

③ Use "Up, Down, Left, Right" button on the top menu of the Display to go to the "System" button among the buttons of the detailed menu. The movement of button can be checked by the indication of button selection.

④ When the button selection is activated, press "Enter" button to run the menu of "System".

⑤ Also use "Up, Down, Left, Right" menu in the "System" menu to go to "Version Information" button out of detailed menus. When the button selection is activated, press "Enter" button to run the menu of "Version Information".

⑥ The data of "Version Information" menu is displayed on the LCD.

⑦ When moving to the Display menu while other menus are running, Press "Menu" button on the front of IM2 to run. Pressing "Menu" button switches from the currently running menu to the next menu in the order of "Display" – "Setting" – "Control".

## 6.3. System

### 6.3.1. Version Information

- IM2 information and each version, including product name and model name of IM2, are displayed.

| Item | Data |
|---|---|
| Product information | Product name |
| | Model name |
| | Product number |
| Firmware version | MPU |
| | DSP |
| | STB |
| Hardware version | Hardware |

### 6.3.2. General Information

- Information is displayed, including Language of IM2, LCD backlighting time and clock synchronization.
- The generally set items are displayed as follows.

| Item | Data |
|---|---|
| Time setting | Date |
| | Time |
| Offset of local time | Hour |
| | Minute |
| Clock synchronization | |
| How to access Wired_X | |
| Setting of single line diagram | Display of singled line diagram |
| | LED position for opening single line diagram |
| | Waiting time for the result of control |
| | Displaying the name of device on the single line diagram |
| General settings | Language setting / Language |
| | LCD backlight setting |
| | Displaying measurement phase |

### 6.3.3. Information on network settings

- Communication network address of IM2 is displayed.
- IP addresses of Ethernet console port and SNTP server on the back of IED set by the operator are displayed, respectively.
- Network setting items are displayed as follows.

| Item | Data |
|---|---|
| Ethernet console port | IP address |
| | Subnet mask |
| | Default gateway |
| SNTP server | IP address |
| | Subnet mask |
| | Default gateway |
| IEC 61850 port | IP address |
| | Subnet mask |
| | Default gateway |

※ The settings of IEC 61850 port (IP address, subnet mask, default gateway) are applied to CID(Configured IED Description) files.

### 6.3.4. Information on settings of function buttons

- The operating elements of the total 4 function buttons of IM2 are displayed.

| Item | Data |
|---|---|
| Settings of function button | Function button 1 |
| | Function button 2 |
| | Function button 3 |
| | Function button 4 |

### 6.3.5. Information on measurement settings on the main screen

- Information on measurement items on the main screen of IM2 is displayed.
- The main screen displays up to 10 Measurement Items.

| Item | Data |
|---|---|
| Measurement settings on the main screen | Measurement Item 1 |
| | Measurement Item 2 |
| | Measurement Item 3 |

| | |
|---|---|
| | Measurement Item 4 |
| | Measurement Item 5 |
| | Measurement Item 6 |
| | Measurement Item 7 |
| | Measurement Item 8 |
| | Measurement Item 9 |
| | Measurement Item 10 |

### 6.3.6. Board Information

- Information on the type of AI board and IO board used by IM2 is displayed.
- Information on up to 2 AI boards and 5 IO boards is displayed.

| Item | Data |
|---|---|
| AI Board | Board A |
| | Board B |
| IO Board | Board 1 |
| | Board 2 |
| | Board 3 |
| | Board 4 |
| | Board 5 |

### 6.3.7. Information on PBCU system

- Settings of clock synchronization and power of PBCU at IM2 can be checked.

| Item | Data |
|---|---|
| Process Bus Live Config | PBCU On/Off |
| Process Bus Time Sync Mode | PTP /Local Time(RTC) |
| Process Bus Clock Sync Mode | PTP/PPS/GPS |

### 6.3.8. Information on STB Time system

- Settings of clock synchronization of STB at IM2 can be checked.

| Item | Data |
|---|---|
| Station Bus Time Sync Mode | SNTP/Internal Clock (PBCU) |

### 6.3.9. PTP information

- Settings and status of PTP of IM2 can be checked.

| Item | Data |
|---|---|
| Master offset | - |
| Path delay | - |
| Ingress time | - |
| Initial delay | - |
| Cumulative scaled rate offset | - |
| UTC offset | - |
| Local clock id | - |
| Current clock id | - |
| Current clock status | - |
| Delay Mechanism | Auto/E2E/P2P |
| Network Transport | UDS/UDP IPv4/UDP IPv6/IEEE 802.3/DEVICENET/CONTROLNET/PROFINET |
| Timestamping | Software/Hardware/Legacy H/W/One Step/P2P 1 Step |
| Slave Only | Enable/Disable |
| Priority 1 | 0~255 |
| Priority 2 | 0~255 |
| Domain Number | Default/ALTERNATE 1,2,3 |
| Clock Class | 0~255 |
| Clock Accuracy | Unknown Accuracy/Within 25ns ~ >10s |
| Announce message period | (1 msg every 1/2/4/8 sec) / (2/4/8/16/32/64 msg every sec) |
| Sync. Message period | (1 msg every 1/2/4/8 sec) / (2/4/8/16/32/64 msg every sec) |

| | |
|---|---|
| Delay request message period | (1 msg every 1/2/4/8 sec) / (2/4/8/16/32/64 msg every sec) |
| PDelay request message period | (1 msg every 1/2/4/8 sec) / (2/4/8/16/32/64 msg every sec) |
| Announce receipt timeout | 2~255 |
| Sync Receipt timeout | 0~255 |
| Delay asymmetry | $-2^{31}$~$2^{31}$ |
| Egress latency | $-2^{31}$~$2^{31}$ |
| Ingress latency | $-2^{31}$~$2^{31}$ |

### 6.3.10. HSR/PRP Information

- The settings of communication redundancy of IM2 (HSR/PRP) are displayed.

| Item | Data |
|---|---|
| Redundancy Mode | HSR/PRP |
| HSR Work Mode | Mode H/N/T/U |
| PRP Work Mode | Duplicate Discard/Duplicate Accept |
| HSR Ring Interface | HSR-SAN/HSR-HSR/HSR-PRP |
| Redundancy A Port Speed | 100/1000 |
| Redundancy B Port Speed | 100/1000 |

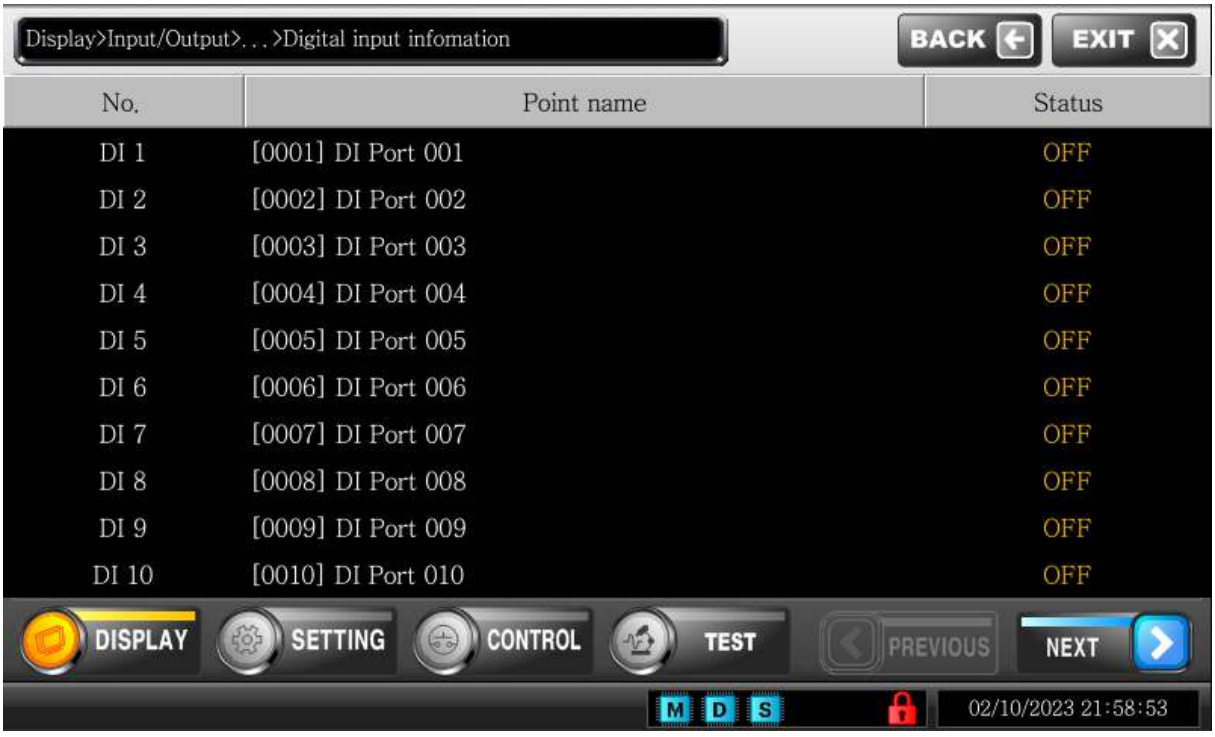
## 6.4. Input / Output

- Analog and digital information output/input in/from the corresponding IM2 are set in the screen below.

### 6.4.1. Information on contact input

- The operating value of the contact input of IM2 is displayed in real time.
- It is possible to check the status of contact input as many as the number of the mounted pointers, and the operating elements set by the operator are displayed on each number of physical point.
- Items of displaying information on contact input are as follows.

| Item | Status | |
|---|---|---|
| Number | - | - |
| Point name | unused | The set point name |
| Status | Off | On |



### 6.4.2. Information on contact output

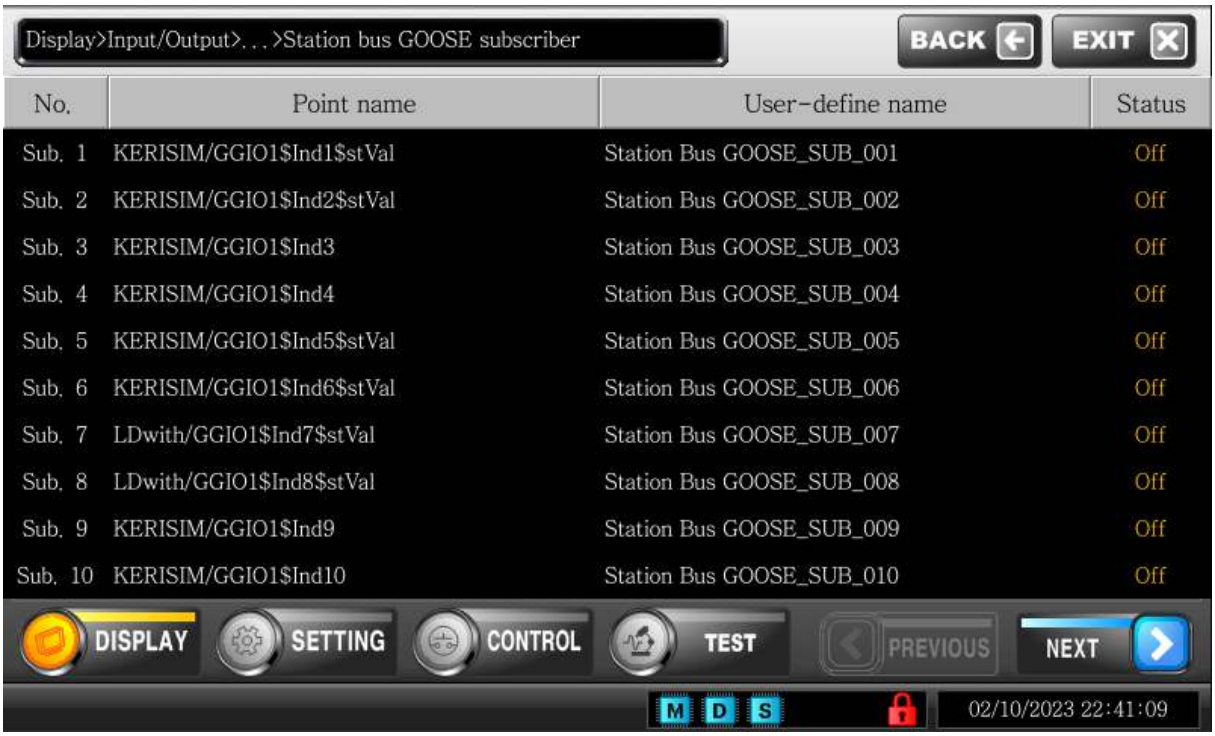
- The operating value of the contact output of IM2 is displayed in real time.

- It is possible to check the status of contact output as many as the number of the mounted pointers, and the operating elements set by the operator are displayed on each number of physical point.
- Items of displaying information on contact output are as follows.

| Item | Status | |
|---|---|---|
| Number | - | - |
| Point name | unused | Name of the set point |
| Type of contact | Contact A | Contact B |
| Controlled output | OFF | ON |
| Status of contact | OFF | ON |

- The screen displaying information on contact input/output is configured as follows.

## 6.4.3. GOOSE Information

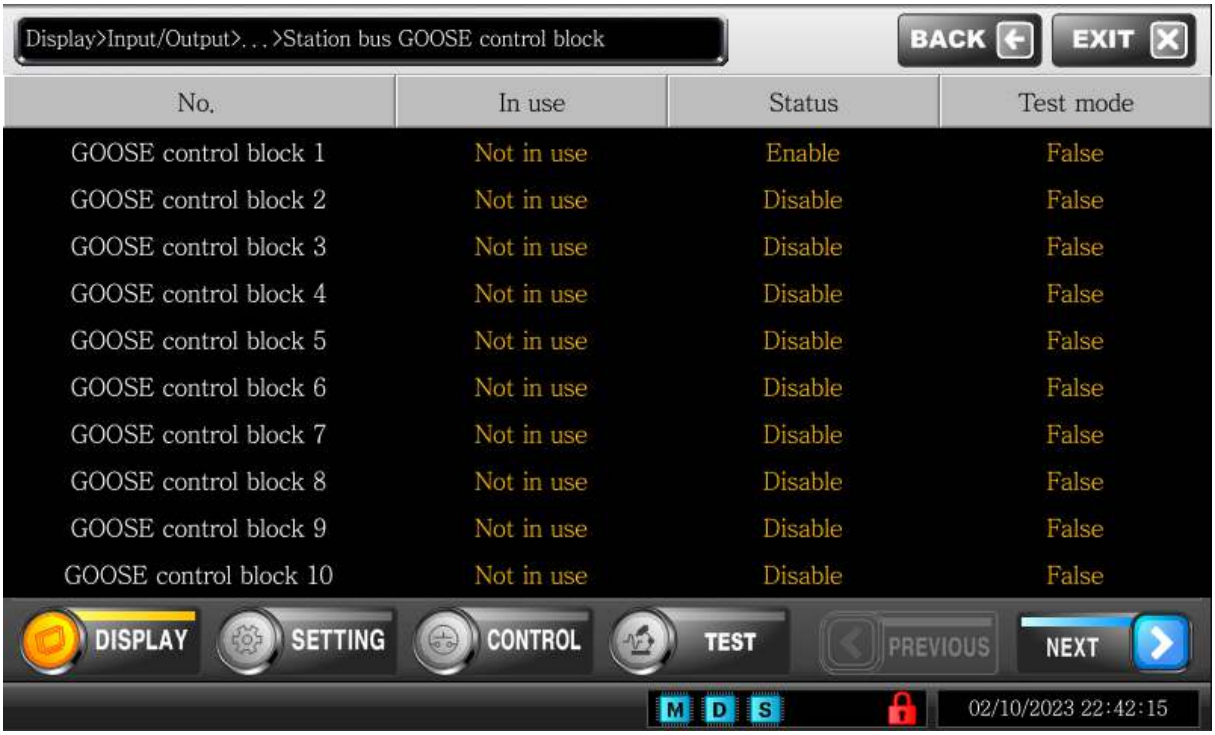


- The status of GOOSE publisher and subscriber is displayed.
- The operator can check the status of input and output of GOOSE messages in real time, and the use of each GOOSE control block.
- Items of GOOSE subscriber and publisher that can display status correspond to the elements

defined in the CID file for IEC 61850 communication.

- The point of GOOSE subscriber and publisher can additionally define "the User-defined names" via the operating software, and When a user defines 'the User-defined name", an operator can check the set point name and user-defined name together.
- It shows information on GOOSE subscriber and publisher of Station/Process Bus, respectively. The configuration of GOOSE status display in Station and Process bus is the same, so Station bus GOOSE display is shown as a representative.

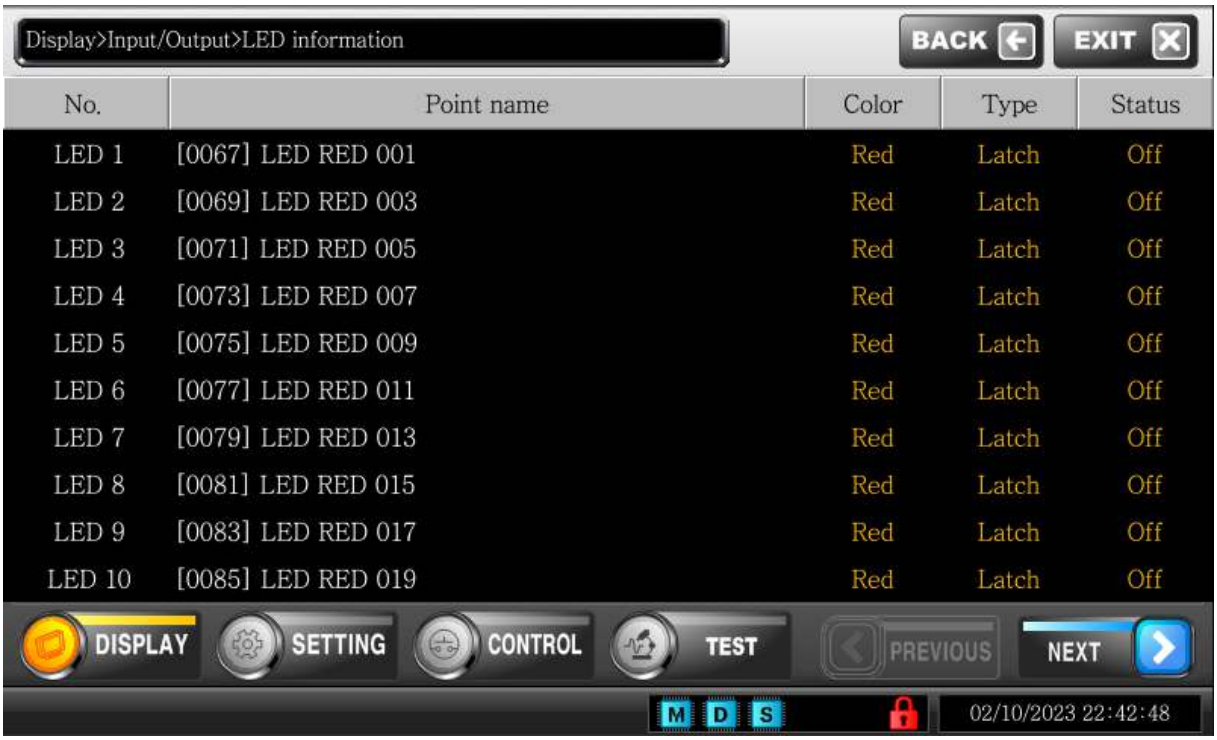
| Item | Data |
|---|---|
| Station/Process Bus GOOSE subscriber | Point number |
| | Point name |
| | User-defined name |
| | Status |
| Station/Process Bus GOOSE publisher | Point number |
| | GoCB number |
| | Point name |
| | User-defined name |
| | Status |
| Station/Process Bus GOOSE control block | Point number |
| | In use or not in use |
| | Status |
| | Test mode |



- The screen displaying GOOSE subscriber is configured as follows.

- GoCB number means the control block number to which the corresponding publisher point is transmitted, and GOOSE message is transmitted only when the setting of GOOSE control block is 'Enable'.
- The screen displaying GOOSE publisher is configured as follows.

- It shows the use and condition of GOOSE CB and test mode.



### 6.4.4. LED information

- It displays the monitoring elements and attributes of LED set using the front LCD and operating software. It displays the set value of each of the total 32 LEDs so that the operator can recognize them.
- The following Items are displayed.

| Item | Status | | |
|---|---|---|---|
| LED number | - | - | - |
| Point name | unused | Name of the set point | - |
| Color | Red | Green | Yellow |
| Type | PULSE | LATCH | - |
| Status | OFF | ON | |

- LED operation by type
  - Operation when the type is PULSE: When LED monitoring element is turned on, and LED is turned on, and when LED monitoring element is turned off, LED is turned off .
  - Operation when the type is LATCH: When LED monitoring element is turned on, LED is turned on, and even when LED monitoring element is turned off, LED is not turned off. LED is turned out only when pressing “FAULT RESET” button on the front of HMI.
- LED information screen is configured as follows. When LED is set to ‘unused’, information on color and type is not displayed.

### 6.4.5. Information on Debounce Time

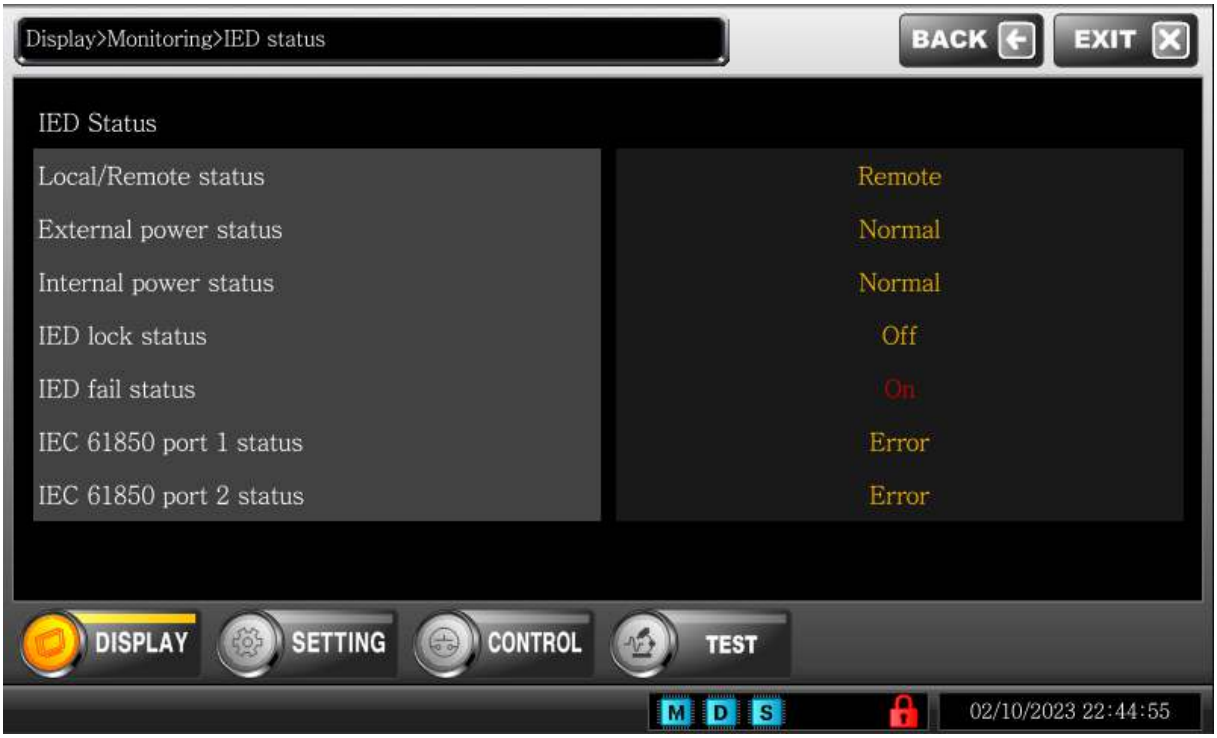
- With respect to the input contact, the debounce time for the input signal is displayed for each input contact.
- The input contact is 54 points, and the debounce time can be set in unit of 1ms from 1ms to 255ms.

### 6.4.6. Information on duration of control output

- When the output contact is operated, the output duration of each contact is displayed for each output contact.
- The output contact is 66 points, and the duration of the control output can be set in unit of 1ms from 1ms to 10000ms.

### 6.4.7. Information on the type of contact output

- When the output contact is operated, the type of contact is displayed for each output contact.
- The output contact is 66 points and the type of contact can be set to Latch and Pulse.



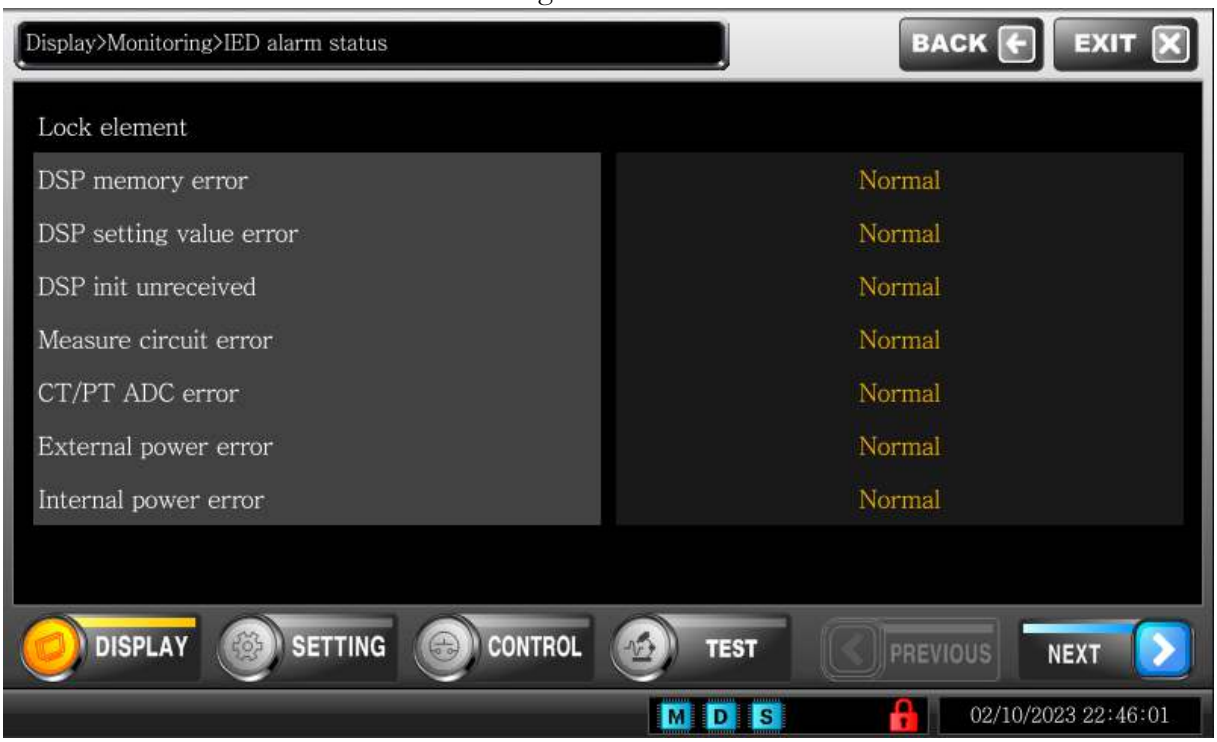
## 6.5. Monitoring

### 6.5.1. Operation Status of IED

- The operation status of IM2 is monitored in real time to check for its abnormalities.
- The operation status of IM2 displays the items below.

| Item | Status | |
|---|---|---|
| Status of Local/Remote | Remote | Local |
| Status of input power | Normal | abnormal |
| Status of internal power | Normal | abnormal |
| Status of IED lock | Normal | abnormal |
| Status of abnormalities in IED | Normal | abnormal |
| Status of IEC 61850 port 1 | Normal | abnormal |
| Status of IEC 61850 port 2 | Normal | Abnormal |

- The screen of IM2 operation status is configured as follows.

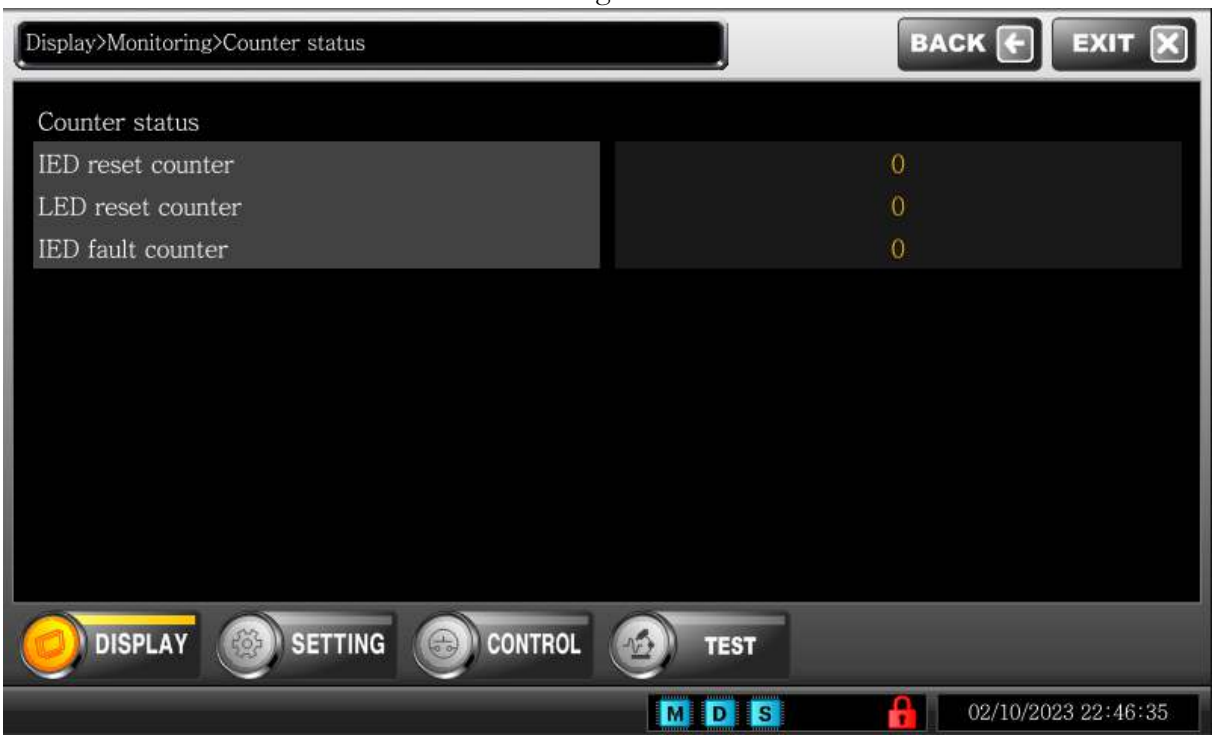


## 6.5.2. Alarm status of IM2

- The alarm status of IM2 is displayed in real time to determine the cause of status.

| Alarm element for locking operation | Alarm element for 'not locking' operation |
|---|---|
| DSP memory is abnormal | DI circuit is abnormal |
| Set value of DSP is abnormal | DO circuit is abnormal |
| Initial set value of DSP is not received | DO contact is abnormal |
| Measurement circuit is abnormal | MPU event information is abnormal |
| CT/PT ADC is abnormal | The set value of MPU is abnormal |
| Input power is abnormal | IEC 61850 communication is abnormal |
| Internal power is abnormal | MPU processor is abnormal |
| - | DSP processor is abnormal |
| - | SMO processor is abnormal |
| - | STB processor is abnormal |

- The screen of IM2 alarm status is configured as follows.

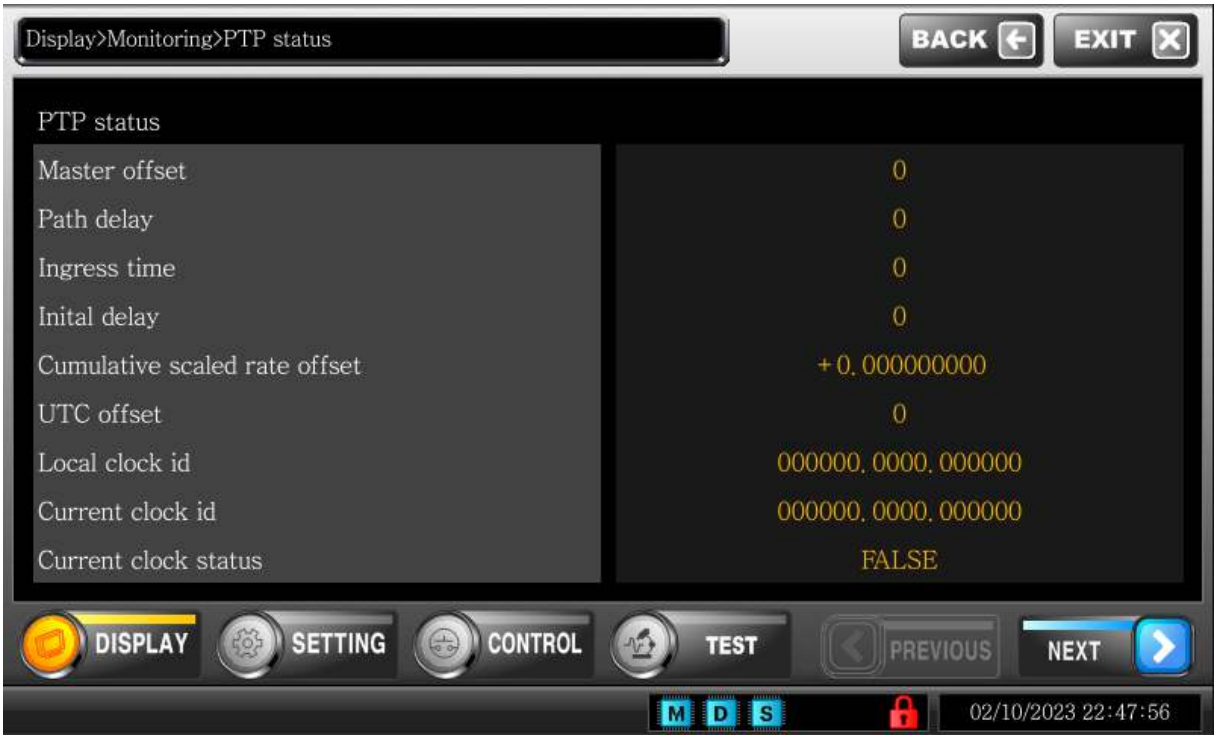


### 6.5.3. Status of Counter

- It displays the reset counter value of IM2. When IM2's internal reset and LED reset is operated, or failure occurs, each counter value increases.
- The status of counter displays the following items.

| Item | Description |
|---|---|
| IM2 reset counter | The number of times IM2's own system has been rebooted is displayed |
| LED reset counter | The number of times the LED status has been initialized is displayed, using "Fault Reset" button on the front of HMI. |
| Counter for the occurrence of failure in IM2 | The number of failures is displayed. |

- The screen for the status of counter is configured as follows.



### 6.5.4. Status of PBCU System

- It displays the status of PBCU system.

### 6.5.5. PTP Status

- It displays the status and settings of PTP connected to IM2.

Display>Monitoring>PTP status
BACK
EXIT
PTP status
Announce message period
1 msg every 8 sec
Sync. message period
1 msg every 8 sec
Delay request message period
1 msg every 8 sec
Pdelay request message period

### 6.5.6. HSR/PRP Status

- It displays HSR/PRP status of IM2.

## 6.6. Event

### 6.6.1. Alarm event

- Alarm event consists of items that stop the operation of IED and the user must check, out of elements that monitor the abnormal operation of IED.
- It saves up to 2000 events, and if more than 2000 events occur, the latest event replaces the oldest event and is saved.
- The user can check in order of the latest history.
- Upon occurrence of alarm event, "ALARM" LED on the front is turned on and ALARM Data is transmitted to the upper level.
- Events include data of occurrence time for each item, event type and detailed items.

| Items to be displayed | Description |
|---|---|
| Time | Event occurrence time: "YYYY/MM/DD hh:mm:ss:ms" |
| Type | Type of distinguishing alarm events is displayed. |
| Detailed Item | Detailed description according to the status that each type may have is displayed. |

- For detailed items for alarm events, refer to "XI.2.A. Alarm Event".

### 6.6.2. Monitoring Event

- The monitoring event saves the unusual state that occurred during the operation of IM2.
- It saves up to 2000 events, and if more than 2000 events occur, the latest event replaces the oldest event and is saved.
- The user can check in order of the latest history.
- Events include information on the occurrence time and event type for each item.

| Item | Description |
|---|---|
| Time | Event occurrence time: "YYYY/MM/DD hh:mm:ss:ms" |
| Type | Item of event occurrence |
| Detailed Item | Detailed description according to the status that each type may have is displayed. |

- For more details for monitoring event, refer to "XI.2.B. Monitoring Event".

### 6.6.3. Contact input event

- The contact input event monitors and save the status of changes in contact input point of IM2.
- Individual monitoring of the contact input point is performed, including the time of change in status, element name for the physical contact point set by the operator, and data on the status of contact input point.
- The time of change in status is monitored and saved in unit of 1ms.
- It saves up to 2000 events, and if more than 2000 events occur, the latest event replaces the oldest event and is saved.
- The user can check in order of the latest history.
- One contact input event includes time, the name of contact input point, and information on the status of operation.

| Item to be displayed | Description |
|---|---|
| Time | Event occurrence time: "YYYY/MM/DD hh:mm:ss:ms" |
| Point name | The element of DI operation point is displayed.<br>The number of operated contact point and the operating element name set at the corresponding contact point are displayed. |
| Operation | The status of the input contact point is displayed.<br>On(1) / Off(0) |

### 6.6.4. Control Event

- Control event saves all control history according to the control command received from IM2.
- It saves up to 2000 events, and if more than 2000 events occur, the latest event replaces the oldest event and is saved.
- The user can check in order of the latest history.
- One control event includes a total of 5 information: the occurrence time, position, type, object, and result of control.

| Item | Description | Data |
|---|---|---|
| Time | Event occurrence time: | "YYYY/MM/DD hh:mm:ss:ms" |
| Type of control | Where the operator issued the control command | Input element (LCD, PC, 61850) |
| Name of control point | DO object operated by the operator | Output element |
| Result | Result of control action | Success |
| | | Fail - Interlock |
| | | Fail - Timeout |

### 6.6.5. Communication event

- Communication event saves the CAN communication status between boards, and the history on the status of connection to the operating program.
- It saves up to 2000 events, and if more than 2000 events occur, the latest event replaces the oldest event and is saved.
- The operator can check in order of the latest history.
- One communication event includes the occurrence time, event item and detailed item.
- Event items that can save using communication event are as follows.

| Item | Data |
|---|---|
| Abnormal CAN communication occurs | CAN BUS ID |
| Abnormal CAN communication is released. | CAN BUS ID |
| Abnormal PCIF communication occurs | - |
| Abnormal PCIF communication is released. | - |
| Abnormal ADC SPI communication occurs. | ADC ID |
| Abnormal ADC SPI communication is released. | ADC ID |
| Connection to Wired-X | Access IP |
| Disconnection from Wired-X | Access IP |

### 6.6.6. User event

- IM2 saves fault events when it detects faults in the system.
- It saves up to 2000 events, and if more than 2000 events occur, the latest event replaces the oldest event and is saved.
- The operator can check in order of the latest history.
- Events include information on occurrence time for each item.
- Running the menu of fault event displays a list of fault events first, and selecting an item in the displayed list displays information on the detailed event of the selected item.

### 6.6.7. Setting event

- If the settings in operation is changed in IM2, it saves the setting event.
- It saves up to 2000 events, and if more than 2000 events occur, the latest event replaces the oldest event and is saved.
- The operator can check in order of the latest history.
- The event items that can be saved as the setting events are as follows.

| Item to be displayed | Description |
|---|---|
| Time | Event occurrence time: "YYYY/MM/DD hh:mm:ss:ms" |
| Control | Position of the set change |
| Setting | Name of the set change |
| previous/changed set value | Changed value |

# 7. Setting

## 7.1. Overview

- Changing the setting of IM2 affects critical operations of device, such as transmission of the sampled value, so it is recommended to set it only when it is not in operation. In addition, the setting function should be used after fully understanding the user manual.
- The current value can be checked and changed for all setting items.
- The setting function can be run only by the operator who has setting authority or admin authority. That is, a password corresponding to the authority must be entered.
- There are a settable range and unit for each item in order to prevent malfunction of IM2, and the value set by the operator is constantly monitored, but if the corresponding condition is not met, it is not applied to the internal operation of IM2.
- The set value is saved in the non-volatile memory inside IED, and can be permanently preserved.
- Saving the set value is possible only when the current status of IM2 is 'Local'.
- As soon as the operator changes and saves the set value, it is reflected in the internal operation of IM2.
- The status of IM2 must be returned to 'Remote' after the operator completes to change the set value.
- The menu tree for setting is as follows.

| Menu for setting | Sub menu | Sub-sub menu |
|---|---|---|
| System | General setting | |
| | Network setting | |
| | Function button setting | |
| | Measurement setting of main screen | |
| | Correction of touch screen | |
| | Board setting | |
| | PBCU system setting | |
| | PTP setting | |
| | HSR/PRP setting | |
| Input/ Output | Contact setting | Setting of contact input |
| | | Setting of contact output |
| | GOOSE setting | Setting the use of Station/Process Bus GoCB |
| | | Setting the test mode of Station/Process Bus GoCB |

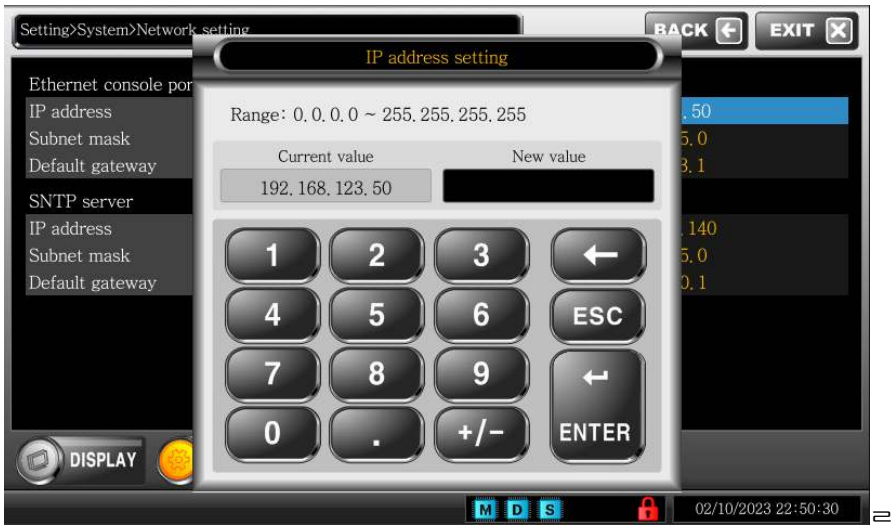
| | | |
|---|---|---|
| | LED setting | Setting of LED output |
| | | Setting of LED color |
| | | Setting of LED type |
| | Debounce setting | |
| | Setting of duration of control output | |
| | Setting the type of contact output | |
| Password | Password setting | |

## 7.2. How to set

### 7.2.1. Items for setting numeric input

① When moving from the main menu, which is the initial screen of IM2, to the setting menu, touch the "Setting Menu" button on the LCD to go to the top setting menu.

② Enter password using the number button on the pop-up window for entering password, and then touch "Confirm" button.

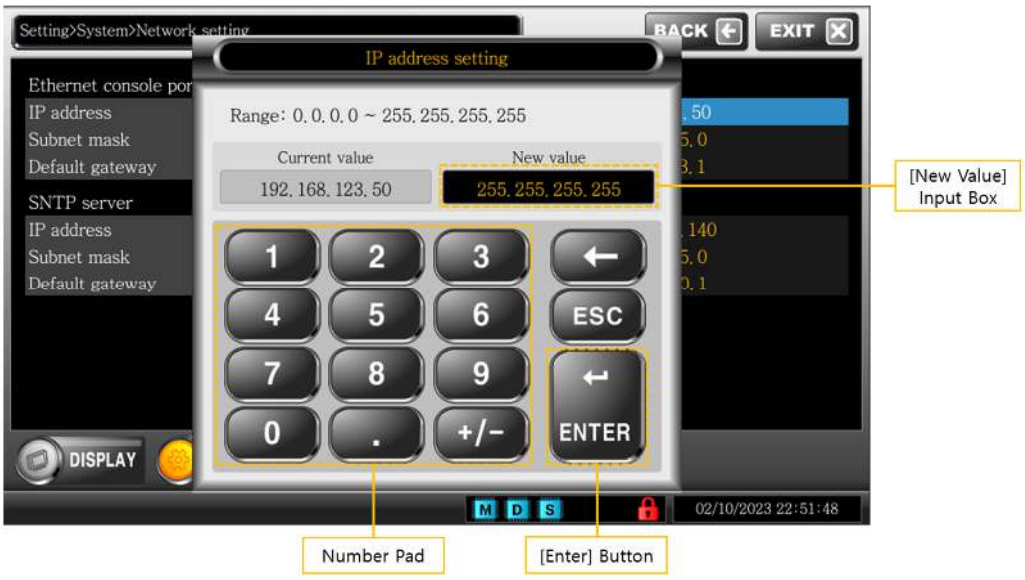


③ If the user move to the setting menu while other menu is running, touch "Setting" button on the LCD to go to the top setting menu.

④ For example, the user need to go to "Network Setting" menu to set up the device network. For checking the position of "Network Setting" menu, refer to the structure of the upper setting menu. "Network Setting" menu is positioned at 'Setting>System>Network Setting'.

⑤ Touch "System" button in the detailed menu displayed in the setting menu.

⑥ Touch "Network Setting" button to move, out of the detailed menus displayed in the system menu.

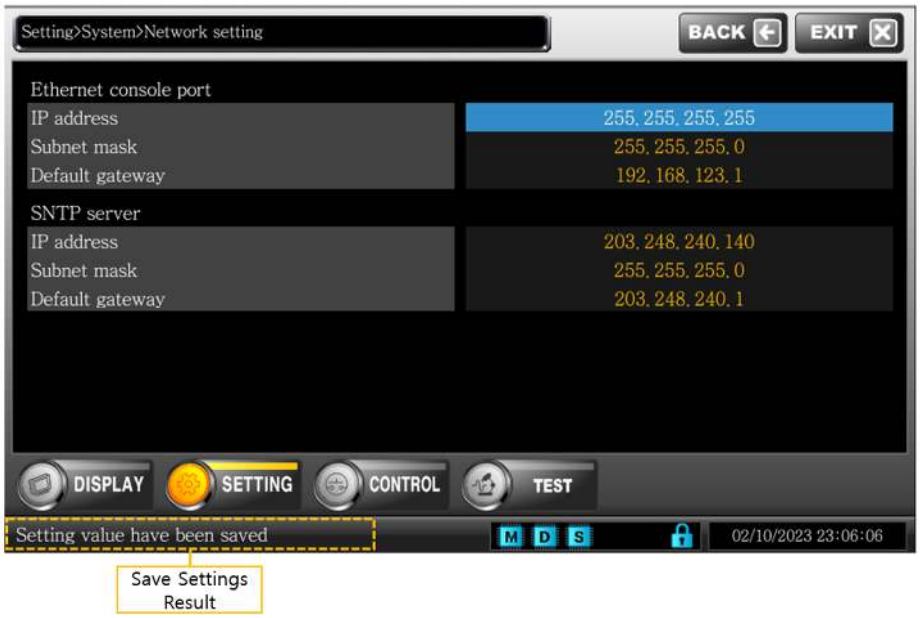


⑦ When the user touch "IP address" item out of items for setting device network, the pop-up window for setting IP address will appear.

⑧ Enter the IP addresses of device network in order from the beginning, using the number button. For example, if the user set the IP of '255.255.255.255', enter the number using the number button '2', '5', '5' and then press '.' button to go to the next input of number, and thereafter, press the number button. Enter the next numbers in the same way.

⑨ The entered setting value can be checked in the part of displaying the new setting value on the

pop-up window. Touch "Confirm" button after checking whether the entered setting value is correct.



⑩ The newly entered setting value is reflected and displayed in the "Network Setting" menu.

⑪ After completing to change the setting item, be sure to touch "Save" button at the top of the menu.

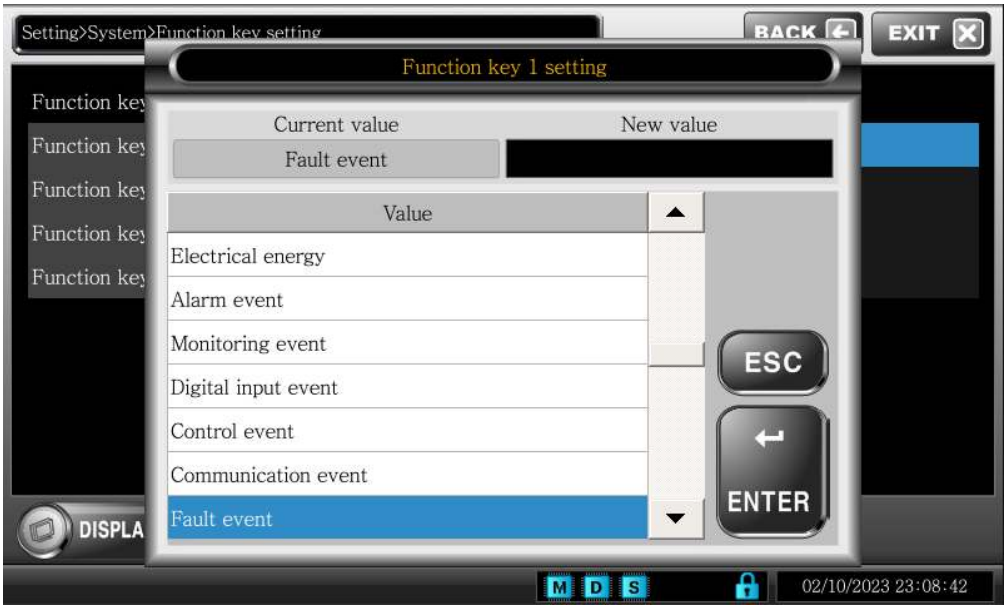
⑫ In order to prevent the erroneous operation of the reflected setting value, be sure to check once again on the pop-up window whether it is saved or not.

⑬ If the user touch “Save” button to save, the user can check the saving result in the status bar at the bottom.

⑭ If the user touch “Cancel” button, the saving is cancelled and the next operation is waited.

⑮ If the operator changes the set value, touch “Back” or “End” button to check whether the changed setting value is saved, and then move to “Back” or “End”.

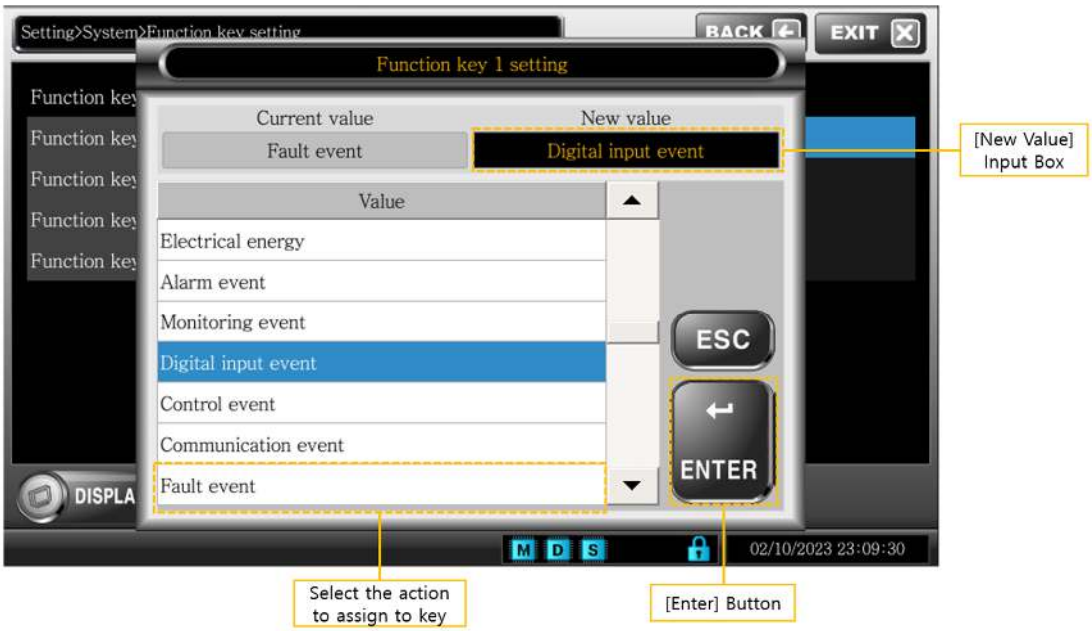
### 7.2.2. Items for selecting the setting list



① Move to the setting menu. “How to move” is the same as the method mentioned in the upper level ‘A) the setting of numeric input’.

② For example, in order to set the function button, the user need to go to “Setting of Function Button” menu. To check the position of “Setting of Function Button” menu, refer to the structure of the upper setting menu. “Setting of Function Button” menu is positioned at ‘Setting>System>Setting of Function Button’.

③ Touch “System” button among the detailed menus displayed in the setting menu.



④ Touch the relevant button to move, following the path from “System” menu to “Setting of Function Button” menu.

⑤ If the user touch Item “Function Button 2” out of Item for setting the function button, a pop-up window for setting appears.

⑥ The setting list is displayed on the pop-up window, and if the user touch the right scroll “Up/Down” button, the displayed list page moves.

⑦ If the user select a changed Item, the selected item will be activated. The selected setting value can be checked in the part of displaying the new setting value on the pop-up window. Be sure to check whether it is entered correctly, and then touch “Confirm” button.

⑧ The newly entered setting value is reflected and displayed in the "Setting of Function Button".

⑨ When the user complete to change the setting Item, be sure to touch "Save" button at the top of the menu.

⑩ To prevent erroneous operation of the reflected setting value, be sure to check once again on the pop-up window for checking 'Save" whether it is saved or not.

⑪ When the user touch "Confirm" button to save, the user can check the saving result in the status bar at the bottom.

### 7.2.3. System Menu

**1) General Settings**

- General settings allow the operator to set language, backlighting time, and how to synchronize clock and how to display the single line diagram.
- Date and Time: The current date and time of IED can be set.
  - Set Year (YYYY)/Month(MM)/Day (DD), Hour (hh):Minute (mm):Second (ss).
- Offset hour and minute of local time: It is the offset time to apply the time of each country to the received world standard time in synchronizing clock, etc., and basically set to "+9:00" in order to display the Korean standard time. The offset time must be changed depending on the state in which the clock synchronization system is built.
- Clock synchronization: It sets a method for synchronizing the time of IM2. The RTC clock synchronization method is used unless the setting is changed separately.
  - For clock synchronization, the user can select SNTP using server IP or clock synchronization using GPS.
- Setting of connection to Wired-X: It sets how to connect to Wired-X.
  - Wired-X can be selected as the connection method using TCP on the front/rear side, or using RS232C on the rear side.
- Display of single line diagram: If IEC symbol or LED symbol is set, the display of single line diagram on the main screen and the control screen. are changed.
- LED position for opening the single line diagram: It sets LED position for opening the single line diagram.
  - LED symbol is selected for displaying the single line diagram, and the function to change LED position of 'Open' (green)/Closed (red) is set to 'Left', 'Green (open)' is displayed at the left top of device (CB, DS, ES) symbol, and 'Red (closed)' is displayed at the right. If this function is set to 'Right', 'Red (closed)' is displayed at the left top of device (CB, DS, ES) symbol and 'Red (closed)' is displayed at the right.
- Waiting time for control result: It sets the waiting time for checking and running the result.
  - It sets time for checking the changed time of contact for checking the control result.
  - The settable range is from 1 to 60Sec, which can be set in a unit of 1Sec, and the default value is set to 5 Sec.
- Display of devices on the single line diagram: It sets whether the name of device is displayed on the single line diagram.
- Language setting/Language: It is possible to select language displayed on HMI, depending on the operator's convenience.

- LCD backlight time: It sets the time to turning off LCD backlight when the user does not touch or input on HMI LCD. If the user does not touch or input on LCD or button while setting "Backlight time", LCD backlight is turned off. When the front LCD is turned off, the screen and interlock return to the initial mode, and in such case, when selecting input of LCD touch or button, LCD backlight is turned on. However, the LCD backlight is not turned off in the state of 'Local'.
- Display of measurement phase: It sets how to display the phase value of measurement. If it is set to 'Negative angle', the phase value is displayed as ∠-359.99~∠0, and if it is set to 'Positive angle', the phase value is displayed as ∠0~∠359.99.

**2) Network settings**

- It can set communication port related to network communication of IM2, and information on access to network for external devices.
- It can set Ethernet console port on the front of IM2 and network of SNTP server (IP address, subnet mast, default gateway).

**3) Setting the function button**

- It sets whether to use a total of 4 function buttons, and their operation elements.
- It sets operation elements of each function button so that the operator can perform his/her desired function with the simple pressing of button on the front.

**4) Setting the measurement on the main screen**

- It sets whether to use a total of 10 measurement items, and measurement elements.
- Variable setting of items for displaying measurement can be set.
- If the user set measurement elements to be displayed on the main screen, they appear on the main screen in order.

**5) Calibration of touch screen**

- This is a menu to calibrate LCD touch screen, and calibrating the touch screen is in order of "Left_Top", "Right_Top", "Right_Bottom", "Left_Bottom", "Center", which is carried out, touching the center of the cross mark on the screen.

**6) Board setting**

- It sets the types on A and B of AI board connected to IM2.

**7) Setting the PBCU system**

- It can set the status and clock synchronization of PBCU.

**8) PTP Setting**

- For normal PTP synchronization, the following IM2 PTP settings must be compatible with PTP settings of devices connected to the starters.

**9) HSR/PRP Setting**

- Communication redundancy (HSR/PRP) can be set as follows. For normal operation, it must be set in the same way as devices connected to the same network.

### 7.2.4. Input/ Output Menu

**1) Setting of contact input**

- It sets the operation elements to be used for each contact point of input.
- Input contact can be set as many as the number of the mounted points, and the same operation elements cannot be set in duplicate.

**2) Setting of contact output**

- It sets the operation elements to be used for each contact point of output.
- Output contact can be set as many as the number of the mounted points, and the same operation elements can be set in duplicate.

※ Of elements to set the contact output in the table of the set value, some elements **must be assigned to contact B among DO points.**

**3) Setting of whether to use GoCB**

- In order to transmit IM2's information to GOOSE, the operator must set whether to use GOOSE control block as "Enable".
- The usable GOOSE control block is 'item in GOOSE control block' defined in the CID file for IEC 61850 communication, and can be activated in the menu to set whether to use it or not.
- Up to 15 GOOSE control blocks can be set.
- If the state of GOOSE control block is set to 'Enable', GOOSE information is transmitted to the corresponding GOOSE control block.

**4) Setting of GoCB test mode**

- It is set when transmitting IM2's information to GOOSE in the state of test mode.
- If the test mode for GOOSE control block is set to 'True', Test bit is set and transmitted at the time of transmitting GOOSE.
- The usable GOOSE control block is 'item in GOOSE control block' defined in the CID file for IEC 61850 communication, and can be activated in the menu to set the test mode.
- GOOSE control block is up to 20, and the test mode therefor can be set.
- Be sure not to change the test mode for GOOSE control block while IM2 is in operation.

**5) Setting of LED output**

- It sets monitoring elements to be applied to LED on the front of IM2 that displays a total of 32 operating status.
- It has information on color and type to be displayed on LED for each monitoring element, and information on LED setting can be checked at 'Display>Input/Output>LED Information'.

**6) Setting of LED color**

- It sets colors to be applied to LED on the front of IM2 that displays a total of 32 operating status.
- It has information on color and type to be displayed on LED for each monitoring element, and information on LED setting can be checked at 'Display>Input/Output>LED Information'.

**7) Setting of LED type**

- It sets types to be applied to LED on the front of IM2 that displays a total of 32 operating status.
- It has information on color and type to be displayed on LED for each monitoring element, and information on LED setting can be checked at 'Display>Input/Output>LED Information'.

**8) Setting of debounce time**

- With respect to the input contact, the debounce time for the input signal can be set for each input contact.

**9) Setting the duration of control output**

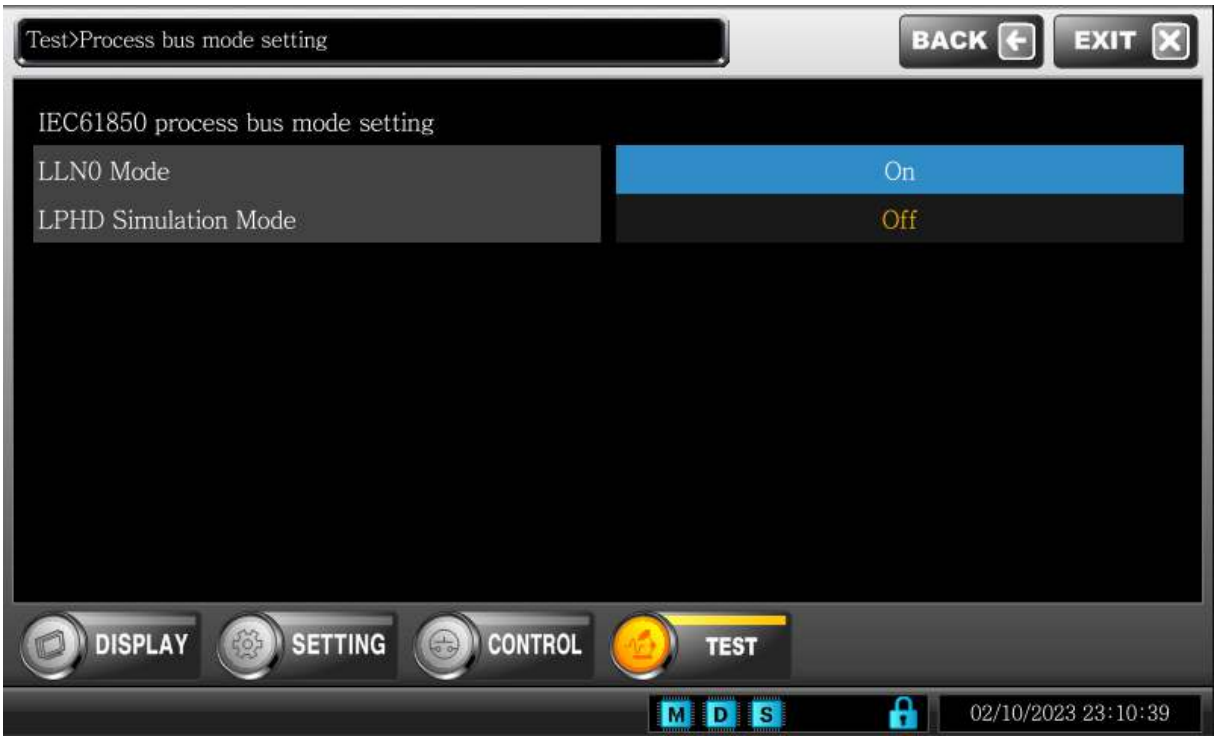
- When the output contact operates, the duration of contact output can be set for each contact output.
- If the output element is Pulse type, this duration is applied as the time when the output contact is maintained as 1.
- If the output element is Latch type, this duration is applied as the time when the output contact is maintained as 1 after the element is released.

**10) Setting the type of contact output**

- The set value can be set to Latch and Pulse, and its initial value is Latch.

**11) Password setting**

- If provide a function to set a password for each authority, such as setting, control and admin.
- Passwords are classified (setting, control, admin) in the same way as the classification of authority, and can be set after going through the procedures for verifying the password for the authority (a function that allows the user to change the password only if the password is the same when entering the existing password before changing the password).
- A password consists of four digits.
- When entering a password, numbers are not displayed, and the input value is displayed as '*'.
- If the user forgets the password after specifying it, the user should contact a manufacturer to set the password again after resetting the system.



## 7.3. Test

### 7.3.1. Outline

- In order to enter the test tab, the user should set any tab (display, setting, control) on the main screen to enter, and can see it at the bottom. In the test tab, the user can change the mode of LLN0 and LPHD according to IEC 61850 standard for each Station/Process bus.

- The contents of Station bus and Process Bus are the same as below. When LPHD mode is turned on, the simulated measurement information is updated instead of the measurement values. GOOSE, SV and MMS Report are transmitted or stopped depending on LLN0 value.

Test>Process bus mode setting
BACK
EXIT
IEC61850 process bus mode setting
LLN0 Mode
On
LPHD Simulation Mode
Off

# 8. Installation

## 8.1. Overview

IM2 must be shipped, stored and installed carefully. Be sure to select an installation place where can easily connect to the communication and access the HMI on the front of IM2. Be sure to check whether the external wiring is properly connected and correctly disconnected to IM2, and pay special attention to grounding. Strictly observe the applicable guidelines contained in this Section.

## 8.2. Safety Guideline

Hardware of IM2 can be replaced only by the trained personnel. Always comply with the basic preventive measures to avoid damage caused by electrostatic discharge when handling IM2.

In some cases, the settings must be changed and applied as required by the engineering configuration after replacement. Therefore, the responsible personnel must be familiar with the setting of device.

## 8.3. Installation position and ambient conditions

IM2 must not be exposed to excessive air pollution (dust, toxic substances). In addition, be sure to avoid severe vibration, extreme temperature change, high humidity, high amplitudes and short rise time, and strong induced magnetic fields as much as possible. Excessively high temperature may materially reduce the operating life of IM2.

## 8.4. Conditions of cable connection

Cables of 20M or shorter must be used to obtain the precision provided by IM2. Precision is not guaranteed for cables longer than 20M.

# 9. Maintenance

## 9.1. Overview

IM2 provides alarms and events for problems occurred during filed operation, and describes countermeasures for the alarms.

If you make an mistake in settings and IM2 fails to function correctly, we will demonstrate how to restore your settings.

Once you are satisfied with the modifications you have made to the settings and IM2 is functioning correctly, I will demonstrate how to back up those settings.

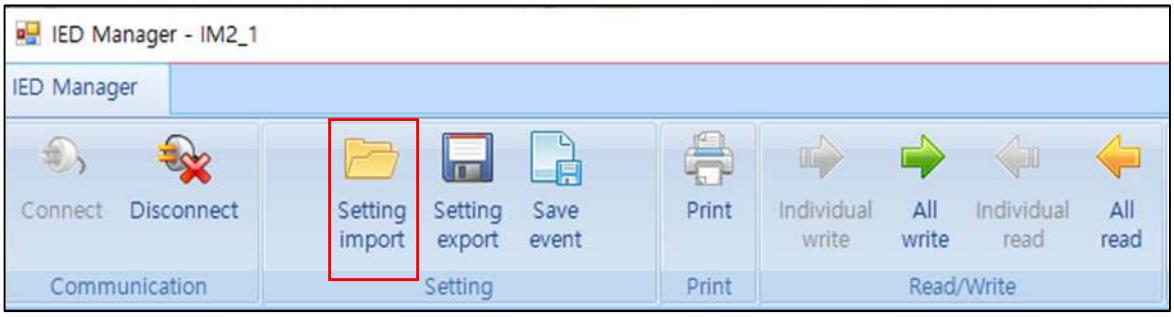
## 9.2. Countermeasures taken when ARM LED is turned on

The situations in which ARM LED is turned on are described in the table below, and the countermeasures can be taken as follows. In addition, a temporary network failure may be the main cause, so it may be necessary to power off/on or reset the network switch device connected to IM2.

| Alarm Information | Alarm details | Troubleshooting |
|---|---|---|
| PTP master clock synchronization fail | PTP Fail :<br>1. The PTP master is not on the network.<br>2. Network DELAY MECHANISM is not identical to each other. | This is an alarm that occurs when the Grand Master device and PTP are not synchronized. Be sure to check whether the status and setting information of the network and the Grand Master match the device. |
| HSR/PRP switch Port N link down | Sampled value transport Network N port link down. | This is an alarm that occurs when a redundant port link is down. Be sure to check the status of network. |
| IEC61850 port link down | Communication Port all link down. | This is an alarm that occurs when all links of the redundant ports are down. Be sure to check the network status, the speed of SFP (optical module) and whether HSR/PRP matches the mode of network configuration. |

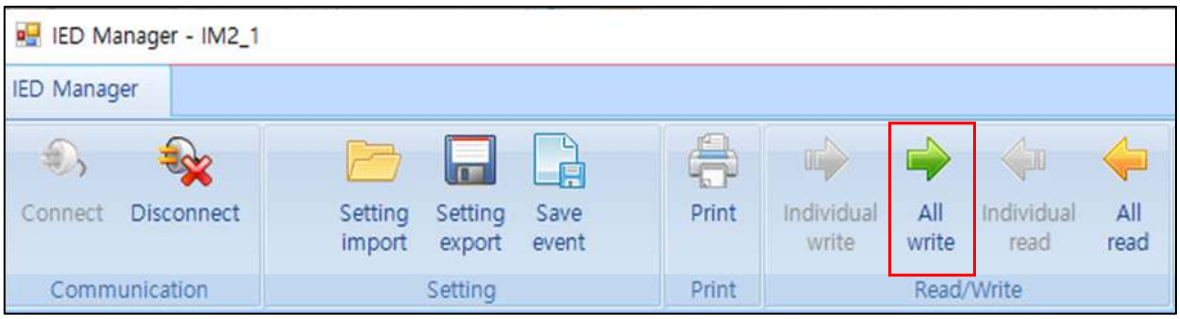
| Alarm Information | Alarm details | Troubleshooting |
|---|---|---|
| Internal power abnormality occur | Internal power anomaly detection | This is an event that occurs when the internal circuit is abnormal. Be sure to contact the maker after checking. |
| ADC(N) power abnormality occur | ADC(N) reference power anomaly detection | This is an event that occurs when the internal circuit is abnormal. Be sure to contact the maker after checking. |
| ADC(N) status abnormality occur | ADC(N) channel status anomaly detection | This is an abnormality in internal circuit or problems with ADC. Be sure contact the maker. |
| External Power abnormality occur | External input power anomaly detection | This is an alarm caused by an abnormality in external power. Be sure to check the external power and contact the maker. |
| PPS Input abnormality occur | No 1PPS input | Be sure to check the PPS Input entered from the outside and whether a rising edge occurs every second using an oscilloscope, etc. |
| DPLL Synchronization Fail | Detects when the external global sync signal and internal PLL signal are out of sync. | This is an alarm that occurs when there is no input of PTP or PPS from the outside. Be sure to contact the maker. If an external global synchronizer exist, it is an internal logic problem. |

<Information, type and explanation on alarm>



## 9.3. Countermeasures taken when COMM LED is turned off

Lights-out of COMM LED occurs when all links of redundancy (HSR/PRP) are down, so it is required to check the status of communication. Be sure to check whether the network status, the speed of SFP (optical module) matches the speed of network configuration, as well as whether the speed of HSR/PRP port is set to the same speed as the SFP, or whether the mode of network configuration is the same as the device setting.

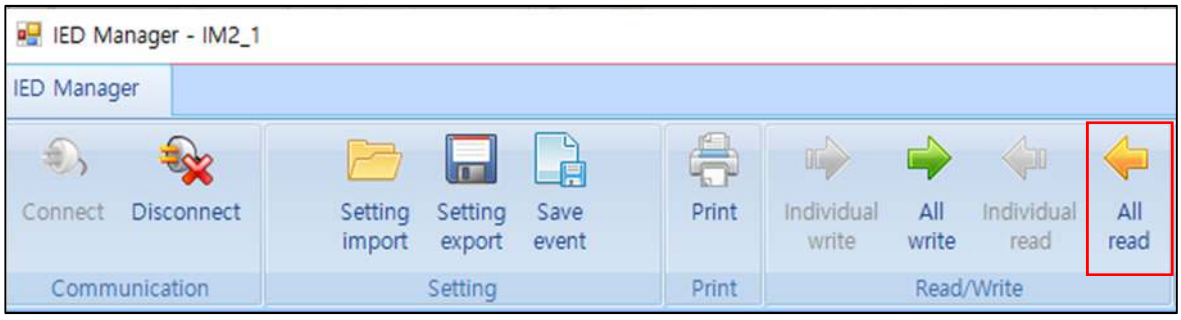


- If the network configuration is HSR, the device setting is also HSR, and if the network configuration is PRP, the device setting is also PRP.
- If the network configuration is 100Mbit/s, the speeds of SFP and Redundancy Port are also set to 100Mbit/s.

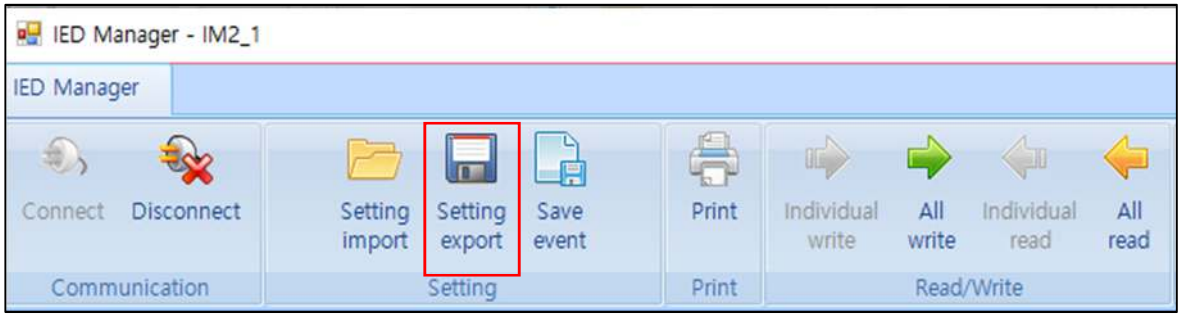
## 9.4. Recovery / Restore

If the IM2 is in operation and user change the settings incorrectly, causing the IM2 to behave abnormally, you can recover the IM2 to its previous settings or to the settings it had when it was shipped. (When restoring to the settings provided at delivery, any settings that have changed since delivery will need to be re-set by the user.)

Launch Wired-X and connect the IM2. Click the "Setting import" button to select a working setting file or the setting file provided at delivery, and the settings from the file will be loaded into Wired-X. (If the loaded Wired-X settings differ from the current Wired-X settings, they will be highlighted in red.)



Then, press the "All write" button to download the settings from the Wired-X to the IM2, and complete the recovery process.



## 9.5. Backup

You'll often change settings while running IM2. Once you have verified that IM2 is working properly with the settings you have changed, it is recommended that you back up those settings.

Firstly press the "All read" button to upload the settings from the IM2 to the Wired-X.

After pressing the "export settings" button, you will be prompted for the name and path of the file to be saved. Specify the name and path and Wired-X's settings will be saved as a file.

# 10. Appendix

## 10.1. Abbreviation

| Abbreviation | Explanation |
|---|---|
| AI | Analog Input |
| AT | Analog Terminal |
| BFI | Break Failure Initiation |
| BRCB | Buffered Report Control Block |

| 48 | Release of abnormality in DO Select | DO number |
| 49 | Occurrence of abnormality in DO Operate | DO number |
| 50 | Recovery of abnormality in DO Operate | DO number |
| 51 | Occurrence of abnormality in DO TCS | - |
| 52 | Recovery of abnormality in DO TCS | - |
| 53 | Occurrence of abnormality in DO contact | DO number |
| 54 | Recovery of abnormality in DO contact | DO number |
| 55 | Occurrence of abnormality in DO circuit | DO number |
| 56 | Recovery of abnormality in DO circuit | DO number |
| 57 | Occurrence of abnormality in trip coil of IO board | - |
| 58 | Recovery of abnormality in trip coil of IO board | - |
| 59 | Occurrence of abnormality in ADC interrupt | |
| 60 | Termination of abnormality in ADC interrupt | |

- User event

• The elements recorded as fault events are variable, and may be selected and used out of the input and output elements. The followings show the event items set to the transformer properly as examples.

| Element | Value | | Element | Value |
|---|---|---|---|---|
| Pickup | Occurrence / - | | | |
| Trip | Occurrence / - | | | |
| Fault in A phase | Occurrence / - | | | |
| Fault in B phase | Occurrence / - | | | |
| Fault in C phase | Occurrence / - | | | |
| Fault in N phase | Occurrence / - | | | |

**NOTE**

For your own safety, observe the warnings and safety instructions contained in this document, if available.

**Disclaimer of Liability**

Subject to changes and errors. The information given in this document only contains general descriptions and/or performance features which may not always specifically reflect those described, or which may undergo modification in the course of further development of the products. The requested performance features are binding only when they are expressly agreed upon in the concluded contract.

Document version: C53000-G5040-C016-M.01

Edition: 12.2023

Version of the product described: V9.70 and higher

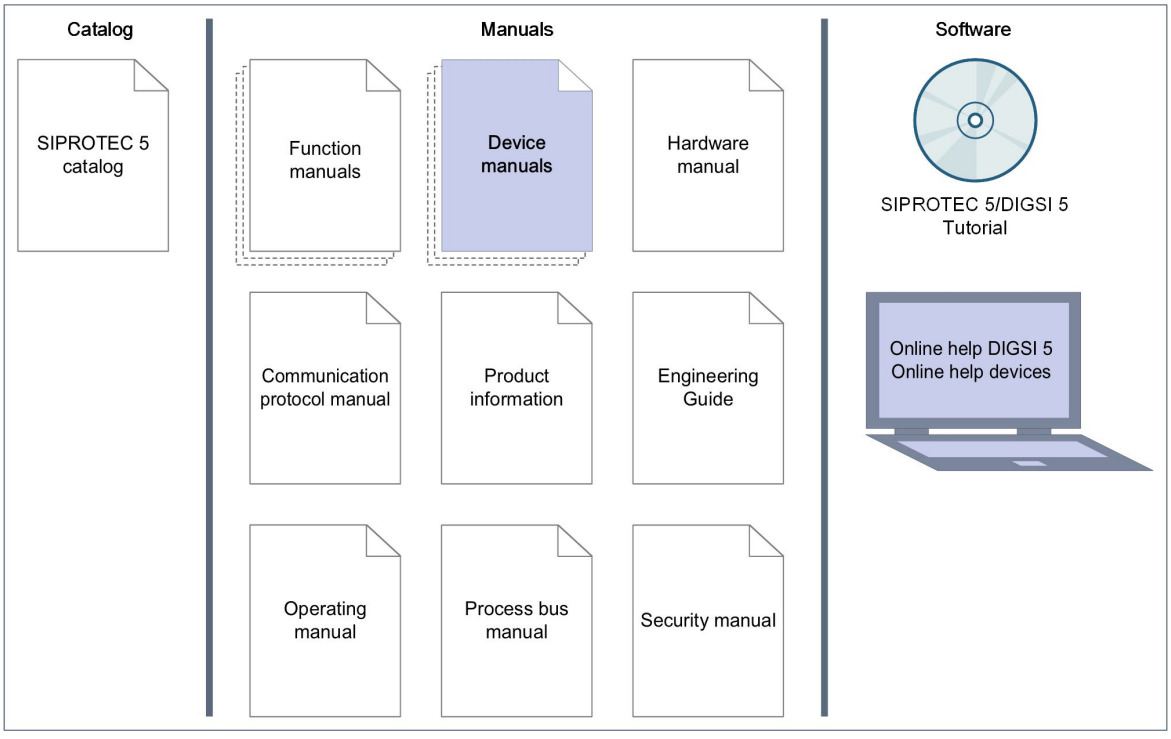
# Preface

### Purpose of the Manual

This manual describes the functions for transformer protection.



### Target Audience

Protection system engineers, commissioning engineers, persons entrusted with the setting, testing and maintenance of automation, selective protection and control equipment, and operational crew in electrical installations and power plants.

### Scope

This manual applies to the SIPROTEC 5 device family.

### Further Documentation

[dw_product-overview_SIP5_device-manual, 5, en_US]

- Device manuals
  Each Device manual describes the functions and applications of a specific SIPROTEC 5 device. The printed manual and the online help for the device have the same informational structure.
- Hardware manual
  The Hardware manual describes the hardware building blocks and device combinations of the SIPROTEC 5 device family.

- Operating manual
  The Operating manual describes the basic principles and procedures for operating and assembling the devices of the SIPROTEC 5 range.
- Communication protocol manual
  The Communication protocol manual contains a description of the protocols for communication within the SIPROTEC 5 device family and to higher-level network control centers.
- Security manual
  The Security manual describes the security features of the SIPROTEC 5 devices and DIGSI 5.
- Process bus manual
  The process bus manual describes the functions and applications specific for process bus in SIPROTEC 5.
- Product information
  The Product information includes general information about device installation, technical data, limiting values for input and output modules, and conditions when preparing for operation. This document is provided with each SIPROTEC 5 device.
- Engineering Guide
  The Engineering Guide describes the essential steps when engineering with DIGSI 5. In addition, the Engineering Guide shows you how to load a planned configuration to a SIPROTEC 5 device and update the functionality of the SIPROTEC 5 device.
- DIGSI 5 online help
  The DIGSI 5 online help contains a help package for DIGSI 5 and CFC.
  The help package for DIGSI 5 includes a description of the basic operation of software, the DIGSI principles and editors. The help package for CFC includes an introduction to CFC programming, basic examples of working with CFC, and a reference chapter with all the CFC blocks available for the SIPROTEC 5 range.
- SIPROTEC 5/DIGSI 5 Tutorial
  The tutorial on the DVD contains brief information about important product features, more detailed information about the individual technical areas, as well as operating sequences with tasks based on practical operation and a brief explanation.
- SIPROTEC 5 catalog
  The SIPROTEC 5 catalog describes the system features and the devices of SIPROTEC 5.

**Indication of Conformity**

CE

This product complies with the directive of the Council of the European Communities on harmonization of the laws of the Member States concerning electromagnetic compatibility (EMC Directive 2014/30/EU), restriction on usage of hazardous substances in electrical and electronic equipment (RoHS Directive 2011/65/EU), and electrical equipment for use within specified voltage limits (Low Voltage Directive 2014/35/EU).

This conformity has been proved by tests performed according to the Council Directive in accordance with the product standard EN 60255-26 (for EMC directive), the standard EN IEC 63000 (for RoHS directive), and with the product standard EN 60255-27 (for Low Voltage Directive) by Siemens.

The device is designed and manufactured for application in an industrial environment.

The product conforms with the international standards of IEC 60255 and the German standard VDE 0435.

**Standards**

IEEE Std C 37.90

The technical data of the product is approved in accordance with UL.

For more information about the UL database, see *ul.com*

You can find the product with the **UL File Number E194016**.

E-mail: *support.ea.si@siemens.com*

### Training Courses

Inquiries regarding individual training courses should be addressed to our Training Center:

Siemens AG
Siemens Power Academy TD
Humboldtstraße 59
90459 Nuremberg
Germany

Phone: +49 911 9582 7100
E-mail: *poweracademy@siemens.com*
Internet: *www.siemens.com/poweracademy*

### Notes on Safety

This document is not a complete index of all safety measures required for operation of the equipment (module or device). However, it comprises important information that must be followed for personal safety, as well as to avoid material damage. Information is highlighted and illustrated as follows according to the degree of danger:

## DANGER

**DANGER** means that death or severe injury **will** result if the measures specified are not taken.

✧ Comply with all instructions, in order to avoid death or severe injuries.

## WARNING

**WARNING** means that death or severe injury **may** result if the measures specified are not taken.

✧ Comply with all instructions, in order to avoid death or severe injuries.

## CAUTION

**CAUTION** means that medium-severe or slight injuries **can** occur if the specified measures are not taken.

✧ Comply with all instructions, in order to avoid moderate or minor injuries.

## NOTICE

**NOTICE** means that property damage **can** result if the measures specified are not taken.

✧ Comply with all instructions, in order to avoid property damage.

**NOTE**

Important information about the product, product handling or a certain section of the documentation which must be given attention.

### Qualified Electrical Engineering Personnel

Only qualified electrical engineering personnel may commission and operate the equipment (module, device) described in this document. Qualified electrical engineering personnel in the sense of this document are people who can demonstrate technical qualifications as electrical technicians. These persons may commission, isolate, ground and label devices, systems and circuits according to the standards of safety engineering.

### Proper Use

The equipment (device, module) may be used only for such applications as set out in the catalogs and the technical description, and only in combination with third-party equipment recommended and approved by Siemens.

Problem-free and safe operation of the product depends on the following:

- Proper transport
- Proper storage, setup and installation
- Proper operation and maintenance

When electrical equipment is operated, hazardous voltages are inevitably present in certain parts. If proper action is not taken, death, severe injury or property damage can result:

- The equipment must be grounded at the grounding terminal before any connections are made.
- All circuit components connected to the power supply may be subject to dangerous voltage.
- Hazardous voltages may be present in equipment even after the supply voltage has been disconnected (capacitors can still be charged).
- Operation of equipment with exposed current-transformer circuits is prohibited. Before disconnecting the equipment, ensure that the current-transformer circuits are short-circuited.
- The limiting values stated in the document must not be exceeded. This must also be considered during testing and commissioning.

### Selection of Used Symbols on the Device

| Nr. | Symbol | Beschreibung |
|---|---|---|
| 1 |  | Direct current, IEC 60417, 5031 |
| 2 |  | Alternating current, IEC 60417, 5032 |
| 3 |  | Direct and alternating current, IEC 60417, 5033 |
| 4 |  | Earth (ground) terminal, IEC 60417, 5017 |
| 5 |  | Protective conductor terminal, IEC 60417, 5019 |

| Nr. | Symbol | Beschreibung |
|---|---|---|
| 6 |  | Caution, risk of electric shock |
| 7 |  | Caution, risk of danger, ISO 7000, 0434 |
| 8 |  | Protective insulation, IEC 60417, 5172, safety class II devices |
| 9 |  | Guideline 2002/96/EC for electrical and electronic devices |
| 10 |  | Guideline for the Eurasian market |
| 11 |  | Mandatory conformity mark for electronics and electrotechnical products in Morocco |
| 12 |  | Extra low voltage (ELV), IEC 60417, 5180, Safety Class III devices |

**OpenSSL**

This product includes software developed by the OpenSSL Project for use in OpenSSL Toolkit (*http://www.openssl.org/*).

This product includes software written by Tim Hudson (*tjh@cryptsoft.com*).

This product includes cryptographic software written by Eric Young (*eay@cryptsoft.com*).

# Table of Contents

**Preface** ... **3**

**1 Introduction** ... **51**

1.1 General ... 52
1.2 Properties of SIPROTEC 5 ... 53
1.3 Overview of Transformer Protection Devices ... 54

**2 Basic Structure of the Function** ... **57**

2.1 Embedding of Functions in the Device ... 58
2.2 Application Templates/Adaptation of Functional Scope ... 64
2.3 Function Control ... 66
2.4 Text Structure and Reference Number for Settings and Indications ... 72
2.5 Information Lists ... 74

**3 System Functions** ... **75**

3.1 Indications ... 76
3.1.1 General ... 76
3.1.2 Reading Indications on the On-Site Operation Panel ... 76
3.1.3 Reading Indications from the PC with DIGSI 5 ... 78
3.1.4 Displaying Indications ... 79
3.1.5 Logs ... 82
3.1.5.1 General ... 82
3.1.5.2 Operational Log ... 83
3.1.5.3 Fault Log ... 85
3.1.5.4 Ground-Fault Log ... 86
3.1.5.5 Setting-History Log ... 88
3.1.5.6 User Log ... 90
3.1.5.7 Communication Log ... 91
3.1.5.8 Communication-Supervision Log ... 93
3.1.5.9 Security Log ... 94
3.1.5.10 Device-Diagnosis Log ... 95
3.1.5.11 Motor-Starting Log ... 96
3.1.6 Saving and Deleting the Logs ... 98
3.1.7 Spontaneous Indication Display in DIGSI 5 ... 100
3.1.8 Spontaneous Fault Display on the On-Site Operation Panel ... 100
3.1.9 Stored Indications in the SIPROTEC 5 Device ... 102
3.1.10 Application Mode/Test Mode and Influence of Indications on Substation Automation Technology ... 103
3.1.11 Resetting Stored Indications of the Function Group ... 103
3.2 Measured-Value Acquisition ... 104
3.3 Sampling-Frequency Tracking and Frequency Tracking Groups ... 106
3.3.1 Overview ... 106

3.3.2 Sampling-Frequency Tracking ... 106
3.3.3 Frequency Tracking Groups ... 109
3.3.4 Frequency Tracking Groups – Interpretation of Measured Values ... 114
3.4 Processing Quality Attributes ... 116
3.4.1 Overview ... 116
3.4.2 Quality Processing/Affected by the User for Received GOOSE Values ... 118
3.4.3 Quality Processing/Affected by the User in CFC Charts ... 124
3.4.4 Quality Processing/Affected by the User in Internal Device Functions ... 128
3.5 Fault Recording ... 133
3.5.1 Overview of Functions ... 133
3.5.2 Structure of the Function ... 133
3.5.3 Function Description ... 133
3.5.4 Application and Setting Notes ... 137
3.5.5 Settings ... 140
3.5.6 Information List ... 141
3.6 Protection Communication ... 142
3.6.1 Overview ... 142
3.6.2 Protection Communication in the Overall System ... 143
3.6.3 Function Description ... 143
3.6.4 Available Variants for the Protection Communication ... 153
3.6.5 Classic Protection Communication ... 154
3.6.5.1 Overview ... 154
3.6.5.2 Classic Protection Communication in the Overall System ... 154
3.6.5.3 Structure of the Function Group ... 154
3.6.5.4 Configuration of the Protection Interface in DIGSI 5 ... 156
3.6.5.5 Setting Notes for the Device Combination ... 157
3.6.5.6 Setting Notes on Selecting the Communication Medium ... 160
3.6.5.7 Setting Notes for the Classic Protection Interface ... 161
3.6.5.8 Indications and Measured Values in the Classic Protection Interface ... 165
3.6.5.9 Remote Data ... 170
3.6.5.10 Constellation Measured Values for Type 1 and Type 2 ... 177
3.6.5.11 Settings ... 178
3.6.5.12 Information List ... 179

3.6.6.14 Settings ... 211
3.6.6.15 Information List ... 212
3.6.7 Assignment of the Protection Function Group to the FG Protection Communication ... 213
3.6.8 Application Examples and Setting Notes for IP Communication ... 214
3.6.8.1 Overview ... 214

3.6.8.2 Device Combination of 2 Devices and Redundant Communication Connection..... 214
3.6.8.3 Device Combination of 3 Devices and Only IP Communication..... 215
3.6.8.4 Device Combination of 3 Devices and Hybrid Communication Media..... 216
3.6.8.5 Device Combination of 6 Devices and Hybrid Communication Media..... 218
3.6.8.6 Unsupported Configurations..... 221
3.7 Date and Time Synchronization..... 223
3.7.1 Overview of Functions..... 223
3.7.2 Structure of the Function..... 223
3.7.3 Function Description..... 223
3.7.4 Application and Setting Notes..... 226
3.7.5 Settings..... 229
3.7.6 Information List..... 230
3.8 User-Defined Objects..... 231
3.8.1 Overview..... 231
3.8.2 Basic Data Types..... 232
3.8.3 Pulse-Metered and Energy-Metered Values..... 236
3.8.4 Additional Data Types..... 236
3.8.5 External Signals..... 236
3.9 Other Functions..... 238
3.9.1 Signal Filtering and Chatter Blocking for Input Signals..... 238
3.9.2 Acquisition Blocking and Manual Updating..... 242
3.9.3 Persistent Commands..... 244
3.9.4 Device Logout..... 245
3.9.4.1 Overview..... 245
3.9.4.2 Application and Setting Notes..... 246
3.9.4.3 Information List..... 249
3.10 General Notes for Setting the Threshold Value of Protection Functions..... 250
3.10.1 Overview..... 250
3.10.2 Modifying the Transformer Ratios in DIGSI 5..... 251
3.10.3 Changing the Transformation Ratios of the Transformer on the Device..... 257
3.11 Device Settings..... 259
3.11.1 Settings-Group Switching..... 259
3.11.1.1 Overview of Functions..... 259
3.11.1.2 Structure of the Function..... 259
3.11.1.3 Function Description..... 259
3.11.1.4 Application and Setting Notes..... 260
3.11.1.5 Settings..... 261
3.11.1.6 Information List..... 261
3.11.2 General Device Settings..... 262
3.11.2.1 Overview..... 262
3.11.2.2 Application and Setting Notes..... 263
3.11.2.3 Settings..... 265
3.11.2.4 Information List..... 268
3.11.3 Display-Page Setting..... 269
3.11.3.1 Overview..... 269
3.11.3.2 Application and Setting Notes..... 270
3.11.3.3 Settings..... 272
3.12 Using a SIPROTEC 5 Device as a Client or Merging Unit..... 273

**4 Applications..... 277**

4.1 Overview..... 278

4.2 Application Templates and Functional Scope of the Device 7UT82 ... 279
4.3 Application Templates and Functional Scope of the Device 7UT85 ... 282
4.4 Application Templates and Functional Scope of the Device 7UT86 ... 288
4.5 Application Templates and Functional Scope of the Device 7UT87 ... 298

**5 Function-Group Types and Bay Proxy ... 299**

5.1 Overview Function Group Transformer Differential Protection ... 300
5.1.1 Function-Group Types ... 300
5.1.2 Function-Group Type Transformer Differential Protection ... 301
5.1.2.1 Overview ... 301
5.1.2.2 Structure of the Function Group ... 302
5.1.2.3 Information List ... 304
5.1.3 Function-Group Type Transformer Side ... 305
5.1.3.1 Overview ... 305
5.1.3.2 Structure of the Function Group ... 306
5.1.3.3 Application and Setting Notes ... 310
5.1.3.4 Write-Protected Settings ... 313
5.1.3.5 Settings ... 314
5.1.3.6 Information List ... 315
5.1.4 Function-Group Type Transformer Neutral Point ... 315
5.1.4.1 Overview ... 315
5.1.4.2 Structure of the Function Group ... 316
5.1.4.3 Application and Setting Notes ... 319
5.1.4.4 Write-Protected Settings ... 320
5.1.4.5 Information List ... 320
5.2 Function-Group Type Auto Transformer Differential Protection ... 322
5.2.1 Function-Group Types ... 322
5.2.2 Function-Group Type Auto Transformer Differential Protection ... 324
5.2.2.1 Overview ... 324
5.2.2.2 Structure of the Function Group ... 325
5.2.2.3 Application and Setting Notes ... 327
5.2.2.4 Settings ... 327
5.2.2.5 Information List ... 327
5.2.3 Function-Group Type Auto Transformer Auto Side ... 328
5.2.3.1 Overview ... 328
5.2.3.2 Structure of the Function Group ... 329
5.2.3.3 Application and Setting Notes ... 333
5.2.3.4 Write-Protected Settings ... 335
5.2.3.5 Settings ... 336
5.2.3.6 Information List ... 336
5.2.4 Function-Group Type Auto Transformer Compensation Side ... 337
5.2.4.1 Overview ... 337
5.2.4.2 Structure of the Function Group ... 338
5.2.4.3 Application and Setting Notes ... 342
5.2.4.4 Write-Protected Settings ... 345
5.2.4.5 Settings ... 346
5.2.4.6 Information List ... 346
5.2.5 Function-Group Type Auto Transformer Ground Side ... 347
5.2.5.1 Overview ... 347
5.2.5.2 Structure of the Function Group ... 348
5.2.5.3 Application and Setting Notes ... 352
5.2.5.4 Write-Protected Settings ... 353
5.2.5.5 Information List ... 354

5.2.6 Function-Group Type Auto Transformer Neutral Point ... 354
5.2.6.1 Overview ... 354
5.2.6.2 Structure of the Function Group ... 355
5.2.6.3 Application and Setting Notes ... 358
5.2.6.4 Write-Protected Settings ... 359
5.2.6.5 Information List ... 360
5.3 Overview Function Group Motor Differential Protection ... 361
5.3.1 Function-Group Types ... 361
5.3.2 Function-Group Type Motor Diff ... 362
5.3.2.1 Overview ... 362
5.3.2.2 Structure of the Function Group ... 363
5.3.2.3 Information List ... 365
5.3.3 Function-Group Type Motor Side ... 365
5.3.3.1 Overview ... 365
5.3.3.2 Structure of the Function Group ... 366
5.3.3.3 Application and Setting Notes ... 371
5.3.3.4 Write-Protected Settings ... 372
5.3.3.5 Settings ... 373
5.3.3.6 Information List ... 373
5.4 Overview Function Groups Generator Differential Protection ... 375
5.4.1 Overview ... 375
5.5 Function-Group Type Line ... 376
5.5.1 Overview ... 376
5.5.2 Structure of the Function Group ... 378
5.5.3 Application and Setting Notes ... 382
5.5.4 Process Monitor (FG Line) ... 389
5.5.4.1 Overview of Functions ... 389
5.5.4.2 Structure of the Function ... 389
5.5.4.3 Current-Flow Criterion ... 391
5.5.4.4 Application and Setting Notes (Current-Flow Criterion) ... 391
5.5.4.5 Settings ... 392
5.5.4.6 Circuit-Breaker Condition for the Protected Object ... 392
5.5.4.7 Closure Detection ... 392
5.5.4.8 Application and Setting Notes (Closure Detection) ... 394
5.5.4.9 Settings ... 394
5.5.4.10 Voltage Criterion (Optional) ... 395
5.5.4.11 Application and Setting Notes (Voltage Criterion) ... 395
5.5.4.12 Settings ... 396
5.5.4.13 Cold-Load Pickup Detection (Optional) ... 396
5.5.4.14 Application and Setting Notes (Cold-Load Pickup Detection) ... 397
5.5.4.15 Settings ... 398
5.5.4.16 Information List ... 398
5.5.5 Settings ... 399
5.5.6 Information List ... 399
5.6 Function-Group Type Voltage 3-Phase ... 400
5.6.1 Overview ... 400
5.6.2 Structure of the Function Group ... 400
5.6.3 Application and Setting Notes ... 401
5.6.4 Settings ... 401
5.6.5 Information List ... 402
5.7 Function-Group Type Voltage/current 1-Phase ... 403
5.7.1 Overview ... 403

5.7.2 Structure of the Function Group ... 403
5.7.3 Write-Protected Settings ... 407
5.7.4 Parameter ... 407
5.7.5 Information List ... 407
5.8 Function-Group Type Voltage/current 3-Phase ... 408
5.8.1 Overview ... 408
5.8.2 Structure of the Function Group ... 408
5.8.3 Write-Protected Settings ... 412
5.8.4 Settings ... 413
5.8.5 Information List ... 413
5.9 Function-Group Type Circuit Breaker ... 414
5.9.1 Overview ... 414
5.9.2 Structure of the Function Group ... 414
5.9.3 Application and Setting Notes ... 416
5.9.4 Settings ... 417
5.9.5 Information List ... 417
5.9.6 Trip Logic ... 418
5.9.6.1 Function Description ... 418
5.9.6.2 Application and Setting Notes ... 420
5.9.6.3 Settings ... 420
5.9.6.4 Information List ... 420
5.9.7 Circuit Breaker ... 420
5.9.7.1 Overview ... 420
5.9.7.2 Tripping, Opening and Closing the Circuit Breaker ... 421
5.9.7.3 Acquisition of Circuit-Breaker Auxiliary Contacts and Further Information ... 422
5.9.7.4 Circuit-Breaker Tripping Alarm Suppression ... 424
5.9.7.5 Tripping and Opening Information ... 425
5.9.7.6 Application and Setting Notes ... 426
5.9.7.7 Settings ... 429
5.9.7.8 Information List ... 429
5.9.8 Circuit-Breaker Position Recognition for Protection-Related Auxiliary Functions ... 429
5.9.8.1 Overview ... 429
5.9.9 Detection Manual Closure (for AREC and Process Monitor) ... 430
5.9.9.1 Function Description ... 430
5.9.9.2 Application and Setting Notes ... 431
5.9.9.3 Settings ... 432
5.9.9.4 Information List ... 432
5.10 Function-Group Type Circuit Breaker [without Current] ... 433
5.10.1 Overview ... 433
5.10.2 Structure of the Function Group ... 433
5.10.3 Application and Setting Notes ... 435
5.10.4 Settings ... 435
5.10.5 Trip Logic ... 435
5.10.5.1 Function Description ... 435
5.10.5.2 Application and Setting Notes ... 436
5.10.5.3 Settings ... 437
5.10.5.4 Information List ... 437
5.10.6 Circuit Breaker ... 437
5.10.6.1 Overview ... 437
5.10.6.2 Tripping, Opening, and Closing the Circuit Breaker ... 437
5.10.6.3 Detection of Circuit-Breaker Auxiliary Contacts and Further Information ... 439

5.10.6.4 Circuit-Breaker Tripping Alarm Suppression ... 441
5.10.6.5 Tripping and Opening Information ... 442
5.10.6.6 Application and Setting Notes ... 442
5.10.6.7 Settings ... 445
5.10.6.8 Information List ... 445
5.10.7 Circuit-Breaker Position Recognition for Protection-Related Auxiliary Functions ... 445
5.10.7.1 Overview ... 445
5.10.8 Detection Manual Closure (for Processor Monitor) ... 446
5.10.8.1 Function Description ... 446
5.10.8.2 Application and Setting Notes ... 447
5.10.8.3 Settings ... 448
5.10.8.4 Information List ... 448
5.11 Function-Group Type Analog Units ... 449
5.11.1 Overview ... 449
5.11.2 Structure of the Function Group ... 449
5.11.3 20-mA Unit Ethernet ... 451
5.11.3.1 Overview ... 451
5.11.3.2 Structure of the Function ... 451
5.11.3.3 Communication with 20-mA Unit Ethernet ... 452
5.11.3.4 Application and Setting Notes ... 453
5.11.3.5 20-mA Channel ... 453
5.11.3.6 Application and Setting Notes ... 456
5.11.3.7 Settings ... 457
5.11.3.8 Information List ... 459
5.11.4 20-mA Unit Serial ... 459
5.11.4.1 Overview ... 459
5.11.4.2 Application and Setting Notes ... 460
5.11.4.3 Settings ... 461
5.11.4.4 Information List ... 463
5.11.5 Communication with 20-mA Unit ... 463
5.11.5.1 Integration of a Serial 20-mA Unit ... 463
5.11.5.2 Integration of a 20-mA Unit Ethernet ... 466
5.11.6 V/I-Measuring-Transducer Unit with Fast Inputs ... 468
5.11.6.1 Overview ... 468
5.11.6.2 Structure of the Function ... 469
5.11.6.3 Function Description ... 469
5.11.6.4 Application and Setting Notes ... 470
5.11.6.5 Settings ... 474
5.11.6.6 Information List ... 476
5.11.7 RTD Unit Ethernet ... 476
5.11.7.1 Overview ... 476
5.11.7.2 Structure of the Function ... 476
5.11.7.3 Communication with an RTD Unit ... 477
5.11.7.4 Application and Setting Notes ... 478
5.11.7.5 Temperature Sensor ... 479
5.11.7.6 Application and Setting Notes ... 480
5.11.7.7 Settings ... 481
5.11.7.8 Information List ... 481
5.11.8 RTD Unit, Serial ... 481
5.11.8.1 Overview ... 481
5.11.8.2 Application and Setting Notes ... 481
5.11.8.3 Settings ... 482
5.11.8.4 Information List ... 482
5.11.9 Communication with RTD Unit ... 483
5.11.9.1 Integration of a Serial RTD Unit (Ziehl TR1200) ... 483

5.11.9.2 Integration of an RTD Unit Ether. (TR1200 IP) ... 485
5.11.9.3 Temperature Simulation without Sensors ... 487
5.11.10 Temperature Acquisition via Protocols ... 487
5.11.10.1 Overview ... 487
5.11.10.2 Structure of the Function ... 488
5.11.10.3 Stage Temperature Acquisition via PROFINET IO or IEC 61850 ... 488
5.11.10.4 PROFINET IO Configuration for the Temperature Acquisition ... 490
5.11.10.5 IEC 61850 Configuration for the Temperature Acquisition ... 492
5.11.10.6 Stage Temperature Acquisition via GOOSE ... 495
5.11.10.7 GOOSE Configuration for the Temperature Acquisition ... 496
5.11.10.8 Application and Setting Notes ... 508
5.11.10.9 Settings ... 509
5.11.10.10 Information List ... 509
5.11.11 LPIT Module IO240 ... 509
5.11.11.1 Overview ... 509
5.11.11.2 Structure of the Function ... 510
5.11.11.3 Function Description ... 511
5.11.11.4 Application and Setting Notes ... 512
5.11.11.5 Settings ... 517
5.11.11.6 Information List ... 519
5.12 Function-Group Recording ... 520
5.12.1 Overview ... 520
5.12.2 Structure of the Function Group ... 520
5.13 Bay Proxy ... 522
5.13.1 Overview ... 522
5.13.2 Structure of the Bay ... 523
5.13.3 Application and Setting Notes (Mode Behavior of Bay) ... 525
5.13.4 Application and Setting Notes (Bay-Related Switching Authority) ... 526
5.13.5 Application and Setting Notes (Displays and Connections for Bay) ... 527
5.13.6 Settings ... 530
5.13.7 Information List ... 531
5.14 Process Monitor ... 532
5.14.1 Overview of Functions ... 532
5.14.2 Structure of the Function ... 532
5.14.3 Current-Flow Criterion ... 533
5.14.4 Application and Setting Notes (Current-Flow Criterion) ... 534
5.14.5 Settings ... 534
5.14.6 Circuit-Breaker Condition for the Protected Object ... 535
5.14.7 Closure Detection ... 535
5.14.8 Information List ... 536
5.14.9 Cold-Load Pickup Detection (Optional) ... 536
5.14.10 Application and Setting Notes (Cold-Load Pickup Detection) ... 537
5.14.11 Settings ... 538
5.14.12 Information List ... 538
**6 Protection and Automation Functions ... 539**
6.1 Power-System Data ... 541
6.1.1 Overview ... 541
6.1.2 Structure of the Power-System Data ... 541
6.1.3 Application and Setting Instructions - General Settings ... 541

6.1.4 Application and Setting Notes for Measuring-Point Voltage 3-Phase (V-3ph)..... 542
6.1.5 Application and Setting Notes for Measuring-Point Current 3-Phase (I-3ph)..... 545
6.1.6 Disconnection of Measuring Points..... 548
6.1.6.1 Overview..... 548
6.1.6.2 Description..... 549
6.1.6.3 Application and Setting Notes..... 549
6.1.6.4 Settings..... 552
6.1.6.5 Information List..... 552
6.1.7 Application and Setting Notes for Line Differential Protection Settings..... 552
6.1.8 Settings..... 556
6.1.9 Information List..... 563
6.2 Transformer Differential Protection..... 567
6.2.1 Overview of Functions..... 567
6.2.2 Structure of the Function..... 567
6.2.3 Functional Description..... 568
6.2.3.1 Basic Principle of Differential Protection..... 568
6.2.3.2 Logic of the Function..... 571
6.2.3.3 Measurand Processing..... 572
6.2.3.4 Neutral-Point Current Treatment..... 575
6.2.3.5 Special Aspects of an Auto Transformer..... 578
6.2.3.6 Differential Protection Function (I-DIFF)..... 579
6.2.3.7 Differential Protection Function I-DIFF Fast..... 588
6.2.3.8 I-DIFF Unrestrained Differential Protection Function..... 592
6.2.3.9 Trip Logic of the Differential Protection..... 595
6.2.3.10 Disconnection of the Measuring Point from the Transformer Differential Protection Function..... 596
6.2.3.11 Fault Logging and Fault Recording..... 599
6.2.4 Application and Setting Notes..... 599
6.2.5 Settings..... 618
6.2.6 Information List..... 624
6.3 Differential Protection for Phase-Angle Regulating Transformer..... 626
6.3.1 Overview of Functions..... 626
6.3.2 Phase-Angle Regulating Transformers of the Single-Core PST Type..... 627
6.3.3 Application and Setting Notes for the Single-Core PST..... 631
6.3.4 Settings..... 634
6.3.5 Information List..... 635
6.3.6 Phase-Angle Regulating Transformers of the Type Special Transformer..... 635
6.3.7 Application and Setting Notes for the Special Transformer..... 637
6.3.8 Settings..... 638
6.3.9 Phase-Angle Regulating Transformers of the Two-Core PST Type..... 638
6.3.10 Application and Setting Notes for the Two-Core PST..... 641
6.3.11 Settings..... 645
6.4 Restricted Ground-Fault Protection..... 646
6.4.1 Overview of Functions..... 646
6.4.2 Structure of the Function..... 646
6.4.3 Function Description..... 647
6.4.4 Application and Setting Notes..... 654
6.4.5 Settings..... 666
6.4.6 Information List..... 667

6.5 Motor Differential Protection....668
6.5.1 Overview of Functions....668
6.5.2 Structure of the Function....668
6.5.3 Function Description....668
6.5.4 Application and Setting Notes....686
6.5.5 Settings....691
6.5.6 Information List....693
6.6 Generator Differential Protection....695
6.6.1 Overview of Functions....695
6.6.2 Structure of the Function....695
6.6.3 Function Description....695
6.6.4 Application and Setting Notes....713
6.6.5 Settings....717
6.6.6 Information List....722
6.7 Line Differential Protection....724
6.7.1 Overview of Functions....724
6.7.2 Structure of the Function....724
6.7.3 Function Description....727
6.7.4 Application and Setting Instructions - General Settings....732
6.7.5 Settings....734
6.7.6 Information List....735
6.7.7 Stage I-DIFF....736
6.7.7.1 Description....736
6.7.7.2 Application and Setting Notes....739
6.7.7.3 Settings....740
6.7.7.4 Information List....741
6.7.8 Stage I-DIFF Fast 2....742
6.7.8.1 Description....742
6.7.8.2 Application and Setting Notes....745
6.7.8.3 Settings....746
6.7.8.4 Information List....747
6.7.9 Stage I-DIFF Fast....747
6.7.9.1 Description....747
6.7.9.2 Application and Setting Notes....749
6.7.9.3 Settings....749
6.7.9.4 Information List....749
6.7.10 Stage IN-DIFF....750
6.7.10.1 Description....750
6.7.10.2 Application and Setting Notes....755
6.7.10.3 Settings....756
6.7.10.4 Information List....756
6.7.11 Stage IN-DIFF unrestr....757
6.7.11.1 Description....757
6.7.11.2 Application and Setting Notes....761
6.7.11.3 Settings....762
6.7.11.4 Information List....763
6.7.12 Stage I2-DIFF....763
6.7.12.1 Description....763
6.7.12.2 Application and Setting Notes....767
6.7.12.3 Settings....769
6.7.12.4 Information List....770

6.7.13 Remote Tripping....770
6.7.13.1 Description....770
6.7.13.2 Application and Setting Notes for Remote Tripping....771
6.7.13.3 Settings....772
6.7.13.4 Information List....773
6.7.14 Pickup and Tripping....773
6.7.14.1 Pickup Logic....773
6.7.14.2 Trip Logic....774
6.7.14.3 Information List....774
6.7.15 Logging Off the Local Line Differential Protection....774
6.7.16 Charging-Current Compensation Ic-Compensation....777
6.7.16.1 Description....777
6.7.16.2 Application and Setting Notes....779
6.7.16.3 Settings....780
6.7.16.4 Information List....780
6.8 Stub Differential Protection....781
6.8.1 Overview of Functions....781
6.8.2 Structure of the Function....781
6.8.3 Function Description....783
6.8.4 Stage S-DIFF....786
6.8.4.1 Description....786
6.8.4.2 Application and Setting Notes....788
6.8.4.3 Settings....788
6.8.4.4 Information List....788
6.8.5 Stage S-DIFF Fast 2....790
6.8.5.1 Description....790
6.8.5.2 Application and Setting Notes....792
6.8.5.3 Settings....792
6.8.5.4 Information List....792
6.8.6 Stage S-DIFF Fast....793
6.8.6.1 Description....793
6.8.6.2 Application and Setting Notes....794
6.8.6.3 Settings....794
6.8.6.4 Information List....794
6.8.7 Stage Description of the Output Logic....795
6.9 Ground-Fault Protection for High-Resistance Ground Faults in Grounded Systems....796
6.9.1 Overview of Functions....796
6.9.2 Structure of the Function....796
6.9.3 Stage Control....797
6.9.4 Stage with Definite-Time Characteristic Curve....800
6.9.4.1 Description....800
6.9.4.2 Application and Setting Notes....802
6.9.4.3 Settings....804
6.9.4.4 Information List....809
6.9.5 Stage with Inverse-Time Overcurrent Protection According to IEC and ANSI....811
6.9.5.1 Description....811
6.9.5.2 Application and Setting Notes....814
6.9.5.3 Settings....816
6.9.5.4 Information List....818
6.9.6 Stage with Inverse-Time Overcurrent Protection with Logarithmic-Inverse Characteristic Curve....819
6.9.6.1 Description....819
6.9.6.2 Application and Setting Notes....820
6.9.6.3 Settings....821

6.9.6.4 Information List ... 823
6.9.7 Stage with S0 Characteristic Curve ... 824
6.9.7.1 Description ... 824
6.9.7.2 Application and Setting Notes ... 825
6.9.7.3 Settings ... 826
6.9.7.4 Information List ... 827
6.9.8 Stage with U0 Characteristic Curve ... 828
6.9.8.1 Description ... 828
6.9.8.2 Application and Setting Notes ... 831
6.9.8.3 Settings ... 833
6.9.8.4 Information List ... 834
6.9.9 Direction Determination ... 834
6.9.9.1 Description ... 834
6.9.9.2 Application and Setting Notes ... 840
6.9.10 Phase Selection ... 842
6.9.11 Blocking of the Tripping by Device-Internal Inrush-Current Detection ... 843
6.9.11.1 Description ... 843
6.9.11.2 Application and Setting Notes ... 843
6.9.12 Signal Transmission ... 844
6.9.13 Influence of Other Functions via Dynamic Settings ... 844
6.9.13.1 Description ... 844
6.9.13.2 Application and Setting Notes ... 846
6.10 Teleprotection with Ground-Fault Protection ... 848
6.10.1 Overview of Functions ... 848
6.10.2 Structure of the Function ... 848
6.10.3 Receive Blocks ... 849
6.10.4 Permissive Overreach Transfer Trip ... 852
6.10.4.1 Description ... 852
6.10.4.2 Application and Setting Notes for the Trip Logic of the Permissive Mode ... 854
6.10.4.3 Application and Setting Notes for the Permissive Scheme ... 854
6.10.4.4 Application and Setting Notes for the Directional-Unblocking Method ... 855
6.10.4.5 Settings ... 856
6.10.4.6 Information List ... 857
6.10.5 Blocking Method ... 858
6.10.5.1 Description ... 858
6.10.5.2 Application and Setting Notes for the Blocking Method ... 860
6.10.5.3 Settings ... 861
6.10.5.4 Information List ... 862
6.10.6 Transient Blocking ... 862
6.10.6.1 Description ... 862
6.10.6.2 Application and Setting Notes for Transient Blocking ... 863
6.10.7 Sensitive Measuring Stage of Ground-Fault Protection ... 863
6.10.7.1 Description ... 863
6.10.7.2 Application and Setting Notes for the Sensitive Stage of the Ground-Fault Protection ... 864
6.11 Directional Intermittent Ground-Fault Protection ... 866
6.11.1 Overview of Functions ... 866
6.11.2 Structure of the Function ... 866
6.11.3 Stage Description ... 867
6.11.4 Application and Setting Notes ... 873
6.11.5 Settings ... 876
6.11.6 Information List ... 876

6.12 Non-Directional Intermittent Ground-Fault Protection....878
6.12.1 Overview of Functions....878
6.12.2 Structure of the Function....878
6.12.3 Stage Description....879
6.12.4 Application and Setting Notes....883
6.12.5 Settings....885
6.12.6 Information List....886
6.13 Sensitive Ground-Fault Detection....887
6.13.1 Overview of Functions....887
6.13.2 Structure of the Function....887
6.13.3 General Functionality....890
6.13.3.1 Description....890
6.13.3.2 Application and Setting Notes....893
6.13.3.3 Settings....895
6.13.3.4 Information List....895
6.13.4 Directional 3I0 Stage with Cos φ or Sin φ Measurement....896
6.13.4.1 Description....896
6.13.4.2 Application and Setting Notes....902
6.13.4.3 Settings....905
6.13.4.4 Information List....906
6.13.5 Directional Transient Ground-Fault Stage....906
6.13.5.1 Description....906
6.13.5.2 Application and Setting Notes....911
6.13.5.3 Settings....914
6.13.5.4 Information List....914
6.13.6 Directional 3I0 Stage with φ (V0,3I0) Measurement....915
6.13.6.1 Description....915
6.13.6.2 Application and Setting Notes....919
6.13.6.3 Settings....921
6.13.6.4 Information List....921
6.13.7 Directional Y0 Stage with G0 or B0 Measurement....922
6.13.7.1 Description....922
6.13.7.2 Application and Setting Notes....927
6.13.7.3 Settings....931
6.13.7.4 Information List....932
6.13.8 Directional Stage with Phasor Measurement of a Harmonic....932
6.13.8.1 Description....932
6.13.8.2 Application and Setting Notes....937
6.13.8.3 Settings....939
6.13.8.4 Information List....940
6.13.9 Non-Directional V0 Stage with Zero-Sequence Voltage/Residual Voltage....941
6.13.9.1 Description....941
6.13.9.2 Application and Setting Notes....942
6.13.9.3 Settings....945
6.13.9.4 Information List....945
6.13.10 Non-Directional 3I0 Stage....945
6.13.10.1 Description....945
6.13.10.2 Application and Setting Notes....947
6.13.10.3 Settings....949
6.13.10.4 Information List....949
6.13.11 Non-Directional Y0 Stage....949
6.13.11.1 Description....949
6.13.11.2 Application and Setting Notes....952
6.13.11.3 Settings....953

6.13.11.4 Information List ... 953
6.13.12 Non-Directional 3I0 Harmonic Stage ... 954
6.13.12.1 Description ... 954
6.13.12.2 Application and Setting Notes ... 955
6.13.12.3 Settings ... 956
6.13.12.4 Information List ... 957
6.13.13 Pulse-Pattern Detection Stage ... 957
6.13.13.1 Description ... 957
6.13.13.2 Application and Setting Notes ... 962
6.13.13.3 Settings ... 965
6.13.13.4 Information List ... 965
6.13.14 Intermittent Ground-Fault Blocking Stage ... 966
6.13.14.1 Description ... 966
6.13.14.2 Application and Setting Notes ... 967
6.13.14.3 Settings ... 968
6.13.14.4 Information List ... 968
6.14 Echo and Tripping in the Event of Weak Infeed ... 969
6.14.1 Overview of Functions ... 969
6.14.2 Structure of the Function ... 969
6.14.3 Echo Function ... 970
6.14.4 Tripping on Weak Infeed (TWI Function) ... 974
6.14.5 Application and Setting Notes ... 974
6.14.6 Settings ... 976
6.14.7 Information List ... 976
6.15 Distance Protection ... 977
6.15.1 Overview of Functions ... 977
6.15.2 Distance Protection for Grounded Systems ... 977
6.15.2.1 Overview of Functions ... 977
6.15.2.2 Structure of the Function ... 977
6.15.2.3 Application and Setting Notes - General Settings ... 981
6.15.2.4 Settings ... 985
6.15.2.5 Information List ... 989
6.15.3 Distance Protection for Isolated/Resonant-Grounded Systems ... 991
6.15.3.1 Overview of Functions ... 991
6.15.3.2 Structure of the Function ... 991
6.15.3.3 Application and Setting Notes - General Settings ... 997
6.15.3.4 Settings ... 1000
6.15.3.5 Information List ... 1004
6.15.4 Direction Determination ... 1006
6.15.5 Pickup Method: Impedance Pickup ... 1010
6.15.5.1 Description ... 1010
6.15.5.2 Application and Setting Notes ... 1011
6.15.5.3 Settings ... 1014
6.15.5.4 Information List ... 1015
6.15.6 Zone with Quadrilateral Characteristic Curve ... 1016
6.15.6.1 Description ... 1016
6.15.6.2 Impedance Calculation ... 1018
6.15.6.3 Application and Setting Notes ... 1020
6.15.6.4 Settings ... 1024
6.15.6.5 Information List ... 1025
6.15.7 Zone with Quadrilateral Characteristic Curve and Adaptive Pickup ... 1025
6.15.7.1 Description ... 1025
6.15.7.2 Application and Setting Notes ... 1026

6.15.7.3 Settings ... 1027
6.15.7.4 Information List ... 1028
6.15.8 Zone with MHO Characteristic Curve ... 1029
6.15.8.1 Description ... 1029
6.15.8.2 Application and Setting Notes ... 1034
6.15.8.3 Settings ... 1036
6.15.8.4 Information List ... 1036
6.15.9 Zone with Circular Characteristic Curve ... 1037
6.15.9.1 Description ... 1037
6.15.9.2 Application and Setting Notes ... 1041
6.15.9.3 Settings ... 1049
6.15.9.4 Information List ... 1050
6.15.10 Release of Tripping through AREC Zone ... 1051
6.15.10.1 Description ... 1051
6.15.10.2 Application and Setting Notes ... 1053
6.15.10.3 Settings ... 1054
6.15.10.4 Information List ... 1054
6.15.11 Output Logic of the Distance Protection ... 1054
6.16 Impedance Protection ... 1056
6.16.1 Overview of Functions ... 1056
6.16.2 Structure of the Function ... 1056
6.16.3 Description ... 1056
6.16.4 Application and Setting Notes ... 1064
6.16.5 Settings ... 1071
6.16.6 Information List ... 1072
6.17 Power-Swing Blocking ... 1074
6.17.1 Overview of Functions ... 1074
6.17.2 Structure of the Function ... 1074
6.17.3 Function Description ... 1074
6.17.4 Application and Setting Notes ... 1078
6.17.5 Settings ... 1079
6.17.6 Information List ... 1079
6.18 Teleprotection with Distance Protection ... 1080
6.18.1 Overview of Functions ... 1080
6.18.2 Structure of the Function ... 1080
6.18.3 Receive Blocks ... 1081
6.18.4 Permissive Underreach Transfer Trip ... 1084
6.18.4.1 Description ... 1084
6.18.4.2 Application and Setting Notes for Permissive Underreach Transfer Trip, General ... 1086
6.18.4.3 Application and Setting Notes for the Permissive Underreach Transfer Trip via an Extended Measuring Range (Distance Protection with Underreaching and Grading-Time Shortening) ... 1087
6.18.4.4 Application and Setting Notes for the Permissive Underreach Transfer Trip via Pickup (Distance Protection with Underreaching and Remote Tripping with Release) ... 1087
6.18.4.5 Application and Setting Notes for the Direct Permissive Underreach Transfer trip ... 1088
6.18.4.6 Settings ... 1089
6.18.4.7 Information List ... 1090
6.18.5 Permissive Overreach Transfer Trip ... 1090
6.18.5.1 Description ... 1090
6.18.5.2 Application and Setting Notes for Permissive Schemes, General ... 1093

6.18.5.3 Application and Setting Notes for the Permissive Overreach Transfer Trip Scheme (Distance Protection with Overreaching and Release) ..... 1094
6.18.5.4 Application and Setting Notes for the Directional-Comparison Method ..... 1095
6.18.5.5 Application and Setting Notes for the Directional Unblocking Method (Distance Protection with Overreaching and Unblocking) ..... 1096
6.18.5.6 Settings ..... 1097
6.18.5.7 Information List ..... 1098
6.18.6 Blocking Method ..... 1099
6.18.6.1 Description ..... 1099
6.18.6.2 Application and Setting Notes for the Blocking Method ..... 1101
6.18.6.3 Settings ..... 1103
6.18.6.4 Information List ..... 1103
6.18.7 Reverse Interlocking ..... 1104
6.18.7.1 Description ..... 1104
6.18.7.2 Application and Setting Notes for Reverse Interlocking ..... 1105
6.18.7.3 Settings ..... 1107
6.18.7.4 Information List ..... 1107
6.18.8 Transient Blocking ..... 1108
6.18.8.1 Description ..... 1108
6.18.8.2 Application and Setting Notes for Transient Blocking ..... 1108
6.19 Universal Teleprotection with Distance Protection ..... 1110
6.19.1 Overview of Functions ..... 1110
6.19.2 Structure of the Function ..... 1110
6.19.3 Receive Blocks ..... 1112
6.19.4 Application ..... 1112
6.19.5 Settings ..... 1112
6.19.6 Information List ..... 1114
6.20 External Trip Initiation 3-Pole ..... 1117
6.20.1 Overview of Functions ..... 1117
6.20.2 Structure of the Function ..... 1117
6.20.3 Stage Description ..... 1118
6.20.4 Application and Setting Notes ..... 1118
6.20.5 Settings ..... 1119
6.20.6 Information List ..... 1119
6.21 External Trip Initiation with Current-Flow Criterion 3-Pole ..... 1120
6.21.1 Overview of Functions ..... 1120
6.21.2 Structure of the Function ..... 1120
6.21.3 Stage Description ..... 1121
6.21.4 Application and Setting Notes ..... 1122
6.21.5 Settings ..... 1122
6.21.6 Information List ..... 1122
6.22 Automatic Reclosing Function ..... 1124
6.22.1 Overview of Functions ..... 1124
6.22.2 Structure of the Function ..... 1125
6.22.3 Cooperation of the Automatic Reclosing Function and Protection Functions ..... 1127
6.22.4 Cyclic Automatic Reclosing Function ..... 1128
6.22.4.1 Operating Modes for Cyclic Automatic Reclosing Function ..... 1128
6.22.4.2 Structure of the Cyclic Automatic Reclosing Function ..... 1132
6.22.4.3 Input Logic for Operating Modes with Tripping ..... 1133
6.22.4.4 Input Logic for Operating Modes with Pickup ..... 1134

6.22.4.5 Start ... 1135
6.22.4.6 Cycle Control with Operating Mode 1: with Tripping/with Action Time ... 1137
6.22.4.7 Cycle Control with Operating Mode 2: With Pickup/With Action Time ... 1138
6.22.4.8 Cycle Control with Operating Mode 3: With Tripping/Without Action Time ... 1140
6.22.4.9 Cycle Control with Operating Mode 4: with Pickup/without Action Time ... 1141
6.22.4.10 Stage Release ... 1142
6.22.4.11 Dead Time for Operating Modes with Tripping ... 1143
6.22.4.12 Dead Time for Operating Modes with Pickup ... 1145
6.22.4.13 Evolving-Fault Detection During the Dead Time ... 1147
6.22.4.14 Closing Indication and Close Command ... 1149
6.22.4.15 Reclaim Time ... 1151
6.22.4.16 Circuit-Breaker Readiness and Circuit-Breaker Condition ... 1152
6.22.4.17 Blockings ... 1154
6.22.4.18 1-/3-pole Tripping of the Circuit Breaker ... 1157
6.22.4.19 Dead-Line Check (DLC) and Reduced Dead Time (RDT) ... 1158
6.22.4.20 Settings ... 1160
6.22.4.21 Information List ... 1162
6.22.5 Automatic Reclosing Function with Adaptive Dead Time (ADT) ... 1164
6.22.5.1 Description ... 1164
6.22.5.2 Settings ... 1165
6.22.5.3 Information List ... 1166
6.22.6 Automatic Reclosing Function with Secondary Arc Detection ... 1167
6.22.6.1 Description ... 1167
6.22.6.2 Application and Setting Notes for the Automatic Reclosing Function with Arc Detection ... 1170
6.22.6.3 Parameter ... 1172
6.22.6.4 Information ... 1173
6.22.7 Operation with External Automatic Reclosing Function ... 1175
6.22.7.1 Description ... 1175
6.22.7.2 Information List ... 1176
6.22.8 Control of the Internal Automatic Reclosing Function by an External Protection Device ... 1177
6.22.9 Application and Setting Notes for General Settings ... 1180
6.22.10 Application and Setting Notes for 1 Cycle of the Cyclic Automatic Reclosing Function 1188
6.23 Overcurrent Protection, Phases ... 1192
6.23.1 Overview of Functions ... 1192
6.23.2 Structure of the Function ... 1192
6.23.3 Filter for RMS Value Gain ... 1193
6.23.3.1 Description ... 1193
6.23.3.2 Application and Setting Notes ... 1195
6.23.3.3 Settings ... 1195
6.23.3.4 Information List ... 1196
6.23.4 Stage with Definite-Time Characteristic Curve ... 1197
6.23.4.1 Description ... 1197
6.23.4.2 Application and Setting Notes ... 1201
6.23.4.3 Settings ... 1205
6.23.4.4 Information List ... 1207
6.23.5 Stage with Inverse-Time Characteristic Curve ... 1209
6.23.5.1 Description ... 1209
6.23.5.2 Application and Setting Notes ... 1213
6.23.5.3 Settings ... 1216
6.23.5.4 Information List ... 1219
6.23.6 Stage with User-Defined Characteristic Curve ... 1219
6.23.6.1 Description ... 1219
6.23.6.2 Application and Setting Notes ... 1221

6.23.6.3 Settings ... 1222
6.23.6.4 Information List ... 1225
6.23.7 Blocking of the Tripping by Device-Internal Inrush-Current Detection ... 1225
6.23.7.1 Description ... 1225
6.23.7.2 Application and Setting Notes ... 1226
6.23.8 Influence of Other Functions via Dynamic Settings ... 1227
6.23.8.1 Description ... 1227
6.23.8.2 Application and Setting Notes (Advanced Stage) ... 1228
6.24 Overcurrent Protection, Ground ... 1230
6.24.1 Overview of Functions ... 1230
6.24.2 Structure of the Function ... 1230
6.24.3 General Functionality ... 1231
6.24.3.1 Description ... 1231
6.24.3.2 Application and Setting Notes ... 1232
6.24.3.3 Settings ... 1233
6.24.4 Stage with Definite-Time Characteristic Curve ... 1234
6.24.4.1 Description ... 1234
6.24.4.2 Application and Setting Notes ... 1236
6.24.4.3 Settings ... 1239
6.24.4.4 Information List ... 1244
6.24.5 Stage with Inverse-Time Characteristic Curve ... 1245
6.24.5.1 Description ... 1245
6.24.5.2 Application and Setting Notes ... 1248
6.24.5.3 Settings ... 1249
6.24.5.4 Information List ... 1252
6.24.6 Stage with User-Defined Characteristic Curve ... 1253
6.24.6.1 Description ... 1253
6.24.6.2 Application and Setting Notes ... 1254
6.24.6.3 Settings ... 1256
6.24.6.4 Information List ... 1258
6.24.7 Blocking of the Tripping by Device-Internal Inrush-Current Detection ... 1259
6.24.7.1 Description ... 1259
6.24.7.2 Application and Setting Notes ... 1259
6.24.8 Influence of Other Functions via Dynamic Settings ... 1260
6.24.8.1 Description ... 1260
6.24.8.2 Application and Setting Notes (Advanced Stage) ... 1262
6.25 Overcurrent Protection, 1-Phase ... 1264
6.25.1 Function Overview ... 1264
6.25.2 Structure of the Function ... 1264
6.25.3 Stage with Definite-Time Characteristic Curve ... 1266
6.25.3.1 Description ... 1266
6.25.3.2 Application and Setting Notes ... 1267
6.25.3.3 Settings ... 1267
6.25.3.4 Information List ... 1268
6.25.4 Stage with Inverse-Time Characteristic Curve ... 1269
6.25.4.1 Description ... 1269
6.25.4.2 Application and Setting Notes ... 1270
6.25.4.3 Settings ... 1271
6.25.4.4 Information List ... 1272
6.25.5 Stage with Inverse-Time Overcurrent Protection with Logarithmic-Inverse Characteristic Curve ... 1273
6.25.5.1 Description ... 1273
6.25.5.2 Application and Setting Notes ... 1275
6.25.5.3 Settings ... 1276

6.25.5.4 Information List ... 1276
6.25.6 Stage with User-Defined Characteristic Curve ... 1277
6.25.6.1 Description ... 1277
6.25.6.2 Application and Setting Notes ... 1278
6.25.6.3 Settings ... 1279
6.25.6.4 Information List ... 1279
6.25.7 Fast Stage ... 1280
6.25.7.1 Description ... 1280
6.25.7.2 Application and Setting Notes ... 1280
6.25.7.3 Settings ... 1281
6.25.7.4 Information List ... 1281
6.25.8 Blocking of the Tripping by Device-Internal Inrush-Current Detection ... 1281
6.25.8.1 Description ... 1281
6.25.8.2 Application and Setting Notes ... 1282
6.25.9 Application Example: High-Impedance Restricted Ground-Fault Protection ... 1283
6.25.9.1 Description ... 1283
6.25.9.2 Application and Setting Notes ... 1285
6.25.10 Application Example: Tank Leakage Protection ... 1289
6.25.10.1 Description ... 1289
6.25.10.2 Application and Setting Notes ... 1290
6.26 Voltage-Dependent Overcurrent Protection, Phases ... 1291
6.26.1 Overview of Functions ... 1291
6.26.2 Structure of the Function ... 1291
6.26.3 Stage with Inverse-Time Overcurrent Protection, Voltage-Dependent ... 1292
6.26.3.1 Description ... 1292
6.26.3.2 Application and Setting Notes ... 1294
6.26.3.3 Settings ... 1296
6.26.3.4 Information List ... 1296
6.26.4 Stage with Inverse-Time Overcurrent Protection, Voltage-Released ... 1298
6.26.4.1 Description ... 1298
6.26.4.2 Application and Setting Notes ... 1299
6.26.4.3 Settings ... 1300
6.26.4.4 Information List ... 1300
6.26.5 Stage with Definite-Time Overcurrent Protection, Undervoltage Seal-In ... 1302
6.26.5.1 Description ... 1302
6.26.5.2 Application and Setting Notes ... 1303
6.26.5.3 Settings ... 1304
6.26.5.4 Information List ... 1305
6.26.6 Stage with Definite-Time Overcurrent Protection, Voltage-Released Undervoltage Seal-In ... 1306
6.26.6.1 Description ... 1306
6.26.6.2 Application and Setting Notes ... 1307
6.26.6.3 Settings ... 1309
6.26.6.4 Information List ... 1310
6.27 Directional Overcurrent Protection, Phases ... 1311
6.27.1 Overview of Functions ... 1311
6.27.2 Structure of the Function ... 1311
6.27.3 Stage Control ... 1313
6.27.3.1 Description ... 1313
6.27.3.2 Application and Setting Notes ... 1313
6.27.4 Stage with Definite-Time Characteristic Curve ... 1314
6.27.4.1 Description ... 1314
6.27.4.2 Application and Setting Notes ... 1317
6.27.4.3 Settings ... 1319

6.27.4.4 Information List ... 1324
6.27.5 Stage with Inverse-Time Characteristic Curve ... 1326
6.27.5.1 Description ... 1326
6.27.5.2 Application and Setting Notes ... 1329
6.27.5.3 Settings ... 1332
6.27.5.4 Information List ... 1334
6.27.6 Stage with User-Defined Characteristic Curve ... 1335
6.27.6.1 Description ... 1335
6.27.6.2 Application and Setting Notes ... 1336
6.27.6.3 Settings ... 1337
6.27.6.4 Information List ... 1340
6.27.7 Direction Determination ... 1340
6.27.7.1 Description ... 1340
6.27.7.2 Application and Setting Notes ... 1343
6.27.8 Influence of Other Functions via Dynamic Settings ... 1343
6.27.9 Application Notes for Parallel Lines ... 1344
6.27.10 Application Notes for Directional Comparison Protection ... 1344
6.28 Directional Overcurrent Protection, Ground ... 1346
6.28.1 Overview of Functions ... 1346
6.28.2 Structure of the Function ... 1346
6.28.3 General Functionality ... 1348
6.28.3.1 Measured-Value Selection ... 1348
6.28.3.2 Direction Determination ... 1349
6.28.3.3 Application and Setting Notes ... 1351
6.28.3.4 Settings ... 1353
6.28.3.5 Information List ... 1354
6.28.4 Stage Control ... 1354
6.28.4.1 Description ... 1354
6.28.4.2 Application and Setting Notes ... 1355
6.28.5 Stage with Definite-Time Characteristic Curve ... 1356
6.28.5.1 Description ... 1356
6.28.5.2 Application and Setting Notes ... 1359
6.28.5.3 Settings ... 1362
6.28.5.4 Information List ... 1367
6.28.6 Stage with Inverse-Time Characteristic Curve ... 1368
6.28.6.1 Description ... 1368
6.28.6.2 Application and Setting Notes ... 1372
6.28.6.3 Settings ... 1375
6.28.6.4 Information List ... 1378
6.28.7 Stage with Inverse-Time Overcurrent Protection with Logarithmic-Inverse Characteristic Curve ... 1379
6.28.7.1 Description ... 1379
6.28.7.2 Application and Setting Notes ... 1381
6.28.7.3 Settings ... 1382
6.28.7.4 Information List ... 1384
6.28.8 Stage with Knee-Point Characteristic Curve ... 1386
6.28.8.1 Description ... 1386
6.28.8.2 Application and Setting Notes ... 1387
6.28.8.3 Settings ... 1388
6.28.8.4 Information List ... 1389
6.28.9 Stage with User-Defined Characteristic Curve ... 1390
6.28.9.1 Description ... 1390
6.28.9.2 Application and Setting Notes ... 1391
6.28.9.3 Settings ... 1392

6.28.9.4 Information List ... 1395
6.28.10 Influence of Other Functions via Dynamic Settings ... 1396
6.29 Positive-Sequence Overcurrent Protection ... 1397
6.29.1 Overview of Functions ... 1397
6.29.2 Structure of the Function ... 1397
6.29.3 Stage with Definite-Time Characteristic Curve ... 1398
6.29.3.1 Description ... 1398
6.29.3.2 Application and Setting Notes ... 1399
6.29.3.3 Settings ... 1401
6.29.3.4 Information List ... 1401
6.29.4 Stage with Inverse-Time Characteristic Curve ... 1403
6.29.4.1 Description ... 1403
6.29.4.2 Application and Setting Notes ... 1404
6.29.4.3 Settings ... 1405
6.29.4.4 Information List ... 1405
6.30 Group Indications of Overcurrent Protection Functions ... 1407
6.30.1 Description ... 1407
6.31 Negative-Sequence Protection ... 1409
6.31.1 Overview of Functions ... 1409
6.31.2 Structure of the Function ... 1409
6.31.3 General Functionality ... 1410
6.31.3.1 Description ... 1410
6.31.3.2 Application and Setting Notes ... 1410
6.31.4 Stage with Definite-Time Characteristic Curve ... 1412
6.31.4.1 Stage Description ... 1412
6.31.4.2 Application and Setting Notes ... 1413
6.31.4.3 Settings ... 1415
6.31.4.4 Information List ... 1416
6.31.5 Stage with Inverse-Time Characteristic Curve ... 1417
6.31.5.1 Description ... 1417
6.31.5.2 Application and Settings Notes ... 1418
6.31.5.3 Settings ... 1419
6.31.5.4 Information List ... 1419
6.32 Directional Negative-Sequence Protection ... 1420
6.32.1 Overview of Functions ... 1420
6.32.2 Structure of the Function ... 1420
6.32.3 Function Description ... 1420
6.32.4 Application and Setting Notes for Direction Determination ... 1425
6.32.5 Application and Setting Notes for Stages ... 1426
6.32.6 Settings ... 1428
6.32.7 Information List ... 1429
6.33 Undercurrent Protection ... 1430
6.33.1 Overview of Functions ... 1430
6.33.2 Structure of the Function ... 1430
6.33.3 Stage Description ... 1431
6.33.4 Application and Setting Notes ... 1432
6.33.5 Settings ... 1434
6.33.6 Information List ... 1434
6.34 Overexcitation Protection ... 1436
6.34.1 Overview of Functions ... 1436

6.34.2 Structure of the Function ..... 1436
6.34.3 Stage with Dependent Characteristic Curve (Thermal Stage) ..... 1437
6.34.3.1 Function Description ..... 1437
6.34.3.2 Application and Setting Notes ..... 1440
6.34.4 Stage with Definite-Time Characteristic Curve (Time Stage) ..... 1442
6.34.4.1 Function Description ..... 1442
6.34.4.2 Application and Setting Notes ..... 1442
6.34.5 Settings ..... 1443
6.34.6 Information List ..... 1443
6.35 Unbalanced-Load Protection ..... 1445
6.35.1 Overview of Functions ..... 1445
6.35.2 Structure of the Function ..... 1445
6.35.3 Function Description ..... 1446
6.35.4 Application and Setting Notes ..... 1448
6.35.5 Settings ..... 1450
6.35.6 Information List ..... 1450
6.36 Instantaneous High-Current Tripping ..... 1452
6.36.1 Overview of Functions ..... 1452
6.36.2 Structure of the Function ..... 1452
6.36.3 Standard Release Procedure ..... 1453
6.36.4 Application and Setting Notes ..... 1454
6.36.5 Release Procedure via Protection Interface ..... 1455
6.36.6 Application and Setting Notes ..... 1457
6.36.7 Settings ..... 1457
6.36.8 Information List ..... 1458
6.37 Overvoltage Protection with 3-Phase Voltage ..... 1459
6.37.1 Overview of Functions ..... 1459
6.37.2 Structure of the Function ..... 1459
6.37.3 Stage with Definite-Time Characteristic Curve ..... 1460
6.37.3.1 Description ..... 1460
6.37.3.2 Application and Setting Notes ..... 1461
6.37.3.3 Settings ..... 1463
6.37.3.4 Information List ..... 1464
6.37.4 Stage with Inverse-Time Characteristic Curve ..... 1466
6.37.4.1 Description ..... 1466
6.37.4.2 Application and Setting Notes ..... 1469
6.37.4.3 Settings ..... 1471
6.37.4.4 Information List ..... 1471
6.38 Overvoltage Protection with Positive-Sequence Voltage ..... 1472
6.38.1 Overview of Functions ..... 1472
6.38.2 Structure of the Function ..... 1472
6.38.3 Stage Description ..... 1473
6.38.4 Application and Setting Notes ..... 1473
6.38.5 Settings ..... 1474
6.38.6 Information List ..... 1474
6.39 Overvoltage Protection with Negative-Sequence Voltage ..... 1476
6.39.1 Overview of Functions ..... 1476
6.39.2 Structure of the Function ..... 1476

6.39.3 General Functionality ... 1476
6.39.3.1 Description ... 1476
6.39.3.2 Application and Setting Notes ... 1477
6.39.3.3 Settings ... 1478
6.39.3.4 Information List ... 1478
6.39.4 Stage with Negative-Sequence Voltage ... 1479
6.39.4.1 Description ... 1479
6.39.4.2 Application and Setting Notes ... 1479
6.39.4.3 Settings ... 1481
6.39.4.4 Information List ... 1482
6.40 Overvoltage Protection with Negative-Sequence Voltage/Positive-Sequence Voltage ... 1483
6.40.1 Overview of Functions ... 1483
6.40.2 Structure of the Function ... 1483
6.40.3 General Functionality ... 1483
6.40.3.1 Description ... 1483
6.40.3.2 Application and Setting Notes ... 1484
6.40.3.3 Settings ... 1485
6.40.3.4 Information List ... 1485
6.40.4 Stage with Negative-Sequence Voltage/Positive-Sequence Voltage ... 1486
6.40.4.1 Description ... 1486
6.40.4.2 Application and Setting Notes ... 1486
6.40.4.3 Settings ... 1488
6.40.4.4 Information List ... 1489
6.41 Overvoltage Protection with Zero-Sequence Voltage/Residual Voltage ... 1490
6.41.1 Overview of Functions ... 1490
6.41.2 Structure of the Function ... 1490
6.41.3 Stage with Definite-Time Characteristic Curve ... 1491
6.41.3.1 Stage Description ... 1491
6.41.3.2 Application and Setting Notes ... 1492
6.41.3.3 Settings ... 1495
6.41.3.4 Information List ... 1495
6.41.4 Stage with Inverse-Time Characteristic Curve ... 1496
6.41.4.1 Description ... 1496
6.41.4.2 Application and Setting Notes ... 1499
6.41.4.3 Settings ... 1501
6.41.4.4 Information List ... 1502
6.42 Overvoltage Protection with Any Voltage ... 1503
6.42.1 Overview of Functions ... 1503
6.42.2 Structure of the Function ... 1503
6.42.3 Stage Description ... 1504
6.42.4 Application and Setting Notes ... 1505
6.42.5 Settings ... 1507
6.42.6 Information List ... 1508
6.43 Undervoltage Protection with 3-Phase Voltage ... 1509
6.43.1 Overview of Functions ... 1509
6.43.2 Structure of the Function ... 1509
6.43.3 Stage with Definite-Time Characteristic Curve ... 1510
6.43.3.1 Description ... 1510
6.43.3.2 Application and Setting Notes ... 1512
6.43.3.3 Settings ... 1515
6.43.3.4 Information List ... 1516

6.43.4 Stage with Inverse-Time Characteristic Curve ... 1518
6.43.4.1 Description ... 1518
6.43.4.2 Application and Setting Notes ... 1522
6.43.4.3 Settings ... 1525
6.43.4.4 Information List ... 1525
6.44 Undervoltage Protection with Positive-Sequence Voltage ... 1526
6.44.1 Overview of Functions ... 1526
6.44.2 Structure of the Function ... 1526
6.44.3 Stage Description ... 1527
6.44.4 Application and Setting Notes ... 1528
6.44.5 Settings ... 1530
6.44.6 Information List ... 1531
6.45 Undervoltage Protection with Any Voltage ... 1532
6.45.1 Overview of Functions ... 1532
6.45.2 Structure of the Function ... 1532
6.45.3 Stage Description ... 1533
6.45.4 Application and Setting Notes ... 1534
6.45.5 Settings ... 1536
6.45.6 Information List ... 1537
6.46 Rate-of-Voltage-Change Protection ... 1539
6.46.1 Overview of Functions ... 1539
6.46.2 Structure of the Function ... 1539
6.46.3 General Functionality ... 1540
6.46.3.1 Description ... 1540
6.46.3.2 Application and Setting Notes ... 1540
6.46.4 Stage Description ... 1541
6.46.4.1 Description ... 1541
6.46.4.2 Application and Setting Notes ... 1542
6.46.5 Settings ... 1543
6.46.6 Information List ... 1544
6.47 Undervoltage-Controlled Reactive-Power Protection ... 1546
6.47.1 Overview of Functions ... 1546
6.47.2 Structure of the Function ... 1546
6.47.3 Protection Stage ... 1547
6.47.3.1 Description ... 1547
6.47.3.2 Application and Setting Notes ... 1548
6.47.3.3 Settings ... 1550
6.47.3.4 Information List ... 1551
6.47.4 Reclosure Stage ... 1552
6.47.4.1 Description ... 1552
6.47.4.2 Application and Setting Notes ... 1553
6.47.4.3 Settings ... 1554
6.47.4.4 Information List ... 1554
6.48 Voltage-Comparison Supervision ... 1555
6.48.1 Overview of Functions ... 1555
6.48.2 Structure of the Function ... 1555
6.48.3 Stage Description ... 1556
6.48.3.1 Description ... 1556
6.48.3.2 Application and Setting Notes ... 1559
6.48.3.3 Settings ... 1560

6.48.3.4 Information List ... 1560
6.49 Fault Locator ... 1561
6.49.1 Overview of Functions ... 1561
6.49.2 Structure of the Function ... 1561
6.49.3 Function Description ... 1562
6.49.4 Application and Setting Notes ... 1570
6.49.5 Settings ... 1575
6.49.6 Information List ... 1576
6.50 Fault Locator Plus ... 1577
6.50.1 Overview of Functions ... 1577
6.50.2 Structure of the Function ... 1577
6.50.3 Function Description ... 1579
6.50.4 Application and Setting Notes ... 1582
6.50.5 Settings ... 1589
6.50.6 Information List ... 1590
6.51 Overfrequency Protection ... 1591
6.51.1 Overview of Functions ... 1591
6.51.2 Structure of the Function ... 1591
6.51.3 Overfrequency-Protection Stage ... 1592
6.51.4 Application and Setting Notes ... 1593
6.51.5 Settings ... 1595
6.51.6 Information List ... 1595
6.52 Underfrequency Protection ... 1597
6.52.1 Overview of Functions ... 1597
6.52.2 Structure of the Function ... 1597
6.52.3 Underfrequency-Protection Stage ... 1598
6.52.4 Application and Setting Notes ... 1599
6.52.5 Settings ... 1601
6.52.6 Information List ... 1601
6.53 Underfrequency Load Shedding ... 1603
6.53.1 Overview of Functions ... 1603
6.53.2 Structure of the Function ... 1603
6.53.3 General Functionality ... 1604
6.53.3.1 Description ... 1604
6.53.3.2 Application and Setting Notes ... 1607
6.53.4 Stage Description ... 1610
6.53.4.1 Description ... 1610
6.53.4.2 Application and Setting Notes ... 1612
6.53.5 Settings ... 1613
6.53.6 Information List ... 1614
6.54 Rate of Frequency Change Protection ... 1615
6.54.1 Overview of Functions ... 1615
6.54.2 Structure of the Function ... 1615
6.54.3 General Functions (Undervoltage Test, df/dt Calculation) ... 1615
6.54.3.1 Description ... 1615
6.54.3.2 Application and Setting Notes ... 1616

6.54.4 Stage Description ... 1617
6.54.4.1 Description ... 1617
6.54.4.2 Application and Setting Notes ... 1618
6.54.4.3 Settings ... 1619
6.54.4.4 Information List ... 1619
6.55 Phase-Sequence Switchover ... 1621
6.55.1 Overview of Functions ... 1621
6.55.2 Structure of the Function ... 1621
6.55.3 Function Description ... 1621
6.55.4 Application and Setting Notes ... 1624
6.55.5 Settings ... 1625
6.55.6 Information List ... 1626
6.56 Instantaneous Tripping at Switch onto Fault ... 1627
6.56.1 Overview of Functions ... 1627
6.56.2 Structure of the Function ... 1627
6.56.3 Stage Description ... 1628
6.56.4 Application and Setting Notes ... 1628
6.56.5 Settings ... 1629
6.56.6 Information List ... 1629
6.57 Thermal Overload Protection, 3-Phase - Advanced ... 1630
6.57.1 Overview of Functions ... 1630
6.57.2 Structure of the Function ... 1630
6.57.3 Filter for RMS Value Gain ... 1630
6.57.3.1 Description ... 1630
6.57.3.2 Application and Setting Notes ... 1631
6.57.3.3 Settings ... 1632
6.57.3.4 Information List ... 1633
6.57.4 Stage with Thermal Overload Protection, 3-Phase - Advanced ... 1634
6.57.4.1 Description ... 1634
6.57.4.2 Application and Setting Notes ... 1639
6.57.4.3 Settings ... 1643
6.57.4.4 Information List ... 1644
6.58 Thermal Overload Protection, User-Defined Characteristic Curve ... 1645
6.58.1 Overview of Functions ... 1645
6.58.2 Structure of the Function ... 1645
6.58.3 Function Description ... 1645
6.58.4 Application and Setting Notes ... 1651
6.58.5 Settings ... 1654
6.58.6 Information List ... 1655
6.59 Thermal Overload Protection, 1-Phase ... 1657
6.59.1 Overview of Functions ... 1657
6.59.2 Structure of the Function ... 1657
6.59.3 Function Description ... 1658
6.59.4 Application and Setting Notes ... 1662
6.59.5 Settings ... 1666
6.59.6 Information List ... 1667
6.60 Temperature Supervision ... 1668
6.60.1 Overview of Functions ... 1668

6.60.2 Structure of the Function ..... 1668
6.60.3 Function Description ..... 1669
6.60.4 Application and Setting Notes ..... 1670
6.60.5 Settings ..... 1671
6.60.6 Information List ..... 1675
6.61 Hotspot Calculation ..... 1678
6.61.1 Overview of Functions ..... 1678
6.61.2 Structure of the Function ..... 1678
6.61.3 Function Description ..... 1679
6.61.4 Application and Setting Notes ..... 1684
6.61.5 Settings ..... 1687
6.61.6 Information List ..... 1688
6.62 Circuit-Breaker Failure Protection ..... 1689
6.62.1 Overview of Functions ..... 1689
6.62.2 Structure of the Function ..... 1689
6.62.3 Function Description ..... 1690
6.62.4 Application and Setting Notes ..... 1697
6.62.5 Settings ..... 1705
6.62.6 Information List ..... 1707
6.63 Circuit-Breaker Restrike Protection ..... 1708
6.63.1 Overview of Function ..... 1708
6.63.2 Structure of the Function ..... 1708
6.63.3 Function Description ..... 1708
6.63.4 Application and Setting Notes ..... 1712
6.63.5 Settings ..... 1715
6.63.6 Information List ..... 1716
6.64 Pole Discrepancy Protection ..... 1717
6.64.1 Overview of Functions ..... 1717
6.64.2 Structure of the Function ..... 1717
6.64.3 Description ..... 1717
6.64.4 Application and Setting Notes ..... 1719
6.64.5 Settings ..... 1720
6.64.6 Information List ..... 1720
6.65 Out-of-Step Protection ..... 1721
6.65.1 Overview of Functions ..... 1721
6.65.2 Structure of the Function ..... 1721
6.65.3 Description of a Zone ..... 1721
6.65.4 Application and Setting Notes (System Protection) ..... 1727
6.65.5 Settings ..... 1736
6.65.6 Information List ..... 1737
6.66 Arc Protection ..... 1739
6.66.1 Overview of Function ..... 1739
6.66.2 Structure of the Function ..... 1739
6.66.3 Function Description ..... 1740
6.66.4 Application and Setting Notes – General Settings ..... 1742
6.66.5 Application and Setting Notes for the Stage ..... 1743

6.66.6 Settings....1744
6.66.7 Information List....1746
6.66.8 Application Example for Arc Protection with Point Sensors in Operating Mode: Light Only....1747
6.66.8.1 Description....1747
6.66.8.2 Application and Setting Notes....1749
6.66.9 Application Example for Arc Protection with Point Sensors in Operating Mode: Light and Current....1750
6.66.9.1 Description....1750
6.66.9.2 Application and Setting Notes....1751
6.66.10 Application Example for Arc Protection with Point Sensors via External Trip Initiation....1752
6.66.10.1 Description....1752
6.66.10.2 Application and Setting Notes....1754
6.66.10.3 Application and Setting Notes for Variant 2 (with Feedback to Feeder Protection Devices)....1756
6.67 Power-Plant Disconnection Protection....1760
6.67.1 Overview of Functions....1760
6.67.2 Structure of the Function....1760
6.67.3 Function Description....1760
6.67.4 Application and Setting Notes....1765
6.67.5 Settings....1770
6.67.6 Information List....1770
6.68 Inrush-Current and 2nd Harmonic Detection....1772
6.68.1 Inrush-Current Detection....1772
6.68.1.1 Overview of Functions....1772
6.68.1.2 Structure of the Function....1772
6.68.1.3 Function Description....1772
6.68.1.4 Application and Setting Notes....1776
6.68.1.5 Settings....1777
6.68.1.6 Information List....1778
6.68.2 2nd Harmonic Ground Detection....1778
6.68.2.1 Overview of Functions....1778
6.68.2.2 Structure of the Function....1779
6.68.2.3 Function Description....1779
6.68.2.4 Application and Setting Notes....1780
6.68.2.5 Settings....1780
6.68.2.6 Information List....1780
6.68.3 2nd Harmonic Detection 1-Phase....1781
6.68.3.1 Overview of Functions....1781
6.68.3.2 Structure of the Function....1781
6.68.3.3 Function Description....1782
6.68.3.4 Application and Setting Notes....1783
6.68.3.5 Settings....1783
6.68.3.6 Information List....1783
6.69 Power Protection (P,Q), 3-Phase....1784
6.69.1 Overview of Functions....1784
6.69.2 Structure of the Function....1784
6.69.3 Active Power Stage....1785
6.69.4 Reactive Power Stage....1787
6.69.5 Application Example....1788
6.69.6 Setting Notes for the Active Power Stage....1789
6.69.7 Setting Notes for the Reactive Power Stage....1790

6.69.8 Settings....1791
6.69.9 Information List....1793
6.70 Reverse-Power Protection....1794
6.70.1 Overview of Functions....1794
6.70.2 Structure of the Function....1794
6.70.3 General Functionality....1795
6.70.3.1 Description....1795
6.70.3.2 Application and Setting Notes....1796
6.70.3.3 Settings....1798
6.70.3.4 Information List....1798
6.70.4 Stage Description....1799
6.70.4.1 Description....1799
6.70.4.2 Application and Setting Notes....1800
6.70.4.3 Settings....1801
6.70.4.4 Information List....1801
6.71 Voltage Measuring-Point Selection....1802
6.71.1 Overview of Functions....1802
6.71.2 Function Description....1802
6.71.3 Application and Setting Notes....1803
6.71.4 Information List....1804
6.72 Current-Jump Detection....1805
6.72.1 Overview of Functions....1805
6.72.2 Structure of the Function....1805
6.72.3 Function Description....1805
6.72.4 Application and Setting Notes....1806
6.72.5 Settings....1807
6.72.6 Information List....1807
6.73 Voltage-Jump Detection....1808
6.73.1 Overview of Functions....1808
6.73.2 Structure of the Function....1808
6.73.3 Function Description....1808
6.73.4 Application and Setting Notes....1809
6.73.5 Settings....1810
6.73.6 Information List....1810
6.74 Vector-Jump Protection....1812
6.74.1 Overview of Functions....1812
6.74.2 Structure of the Function....1812
6.74.3 General Functionality....1812
6.74.3.1 Description....1812
6.74.3.2 Application and Setting Notes....1815
6.74.3.3 Settings....1815
6.74.3.4 Information List....1815
6.74.4 Δφ Stage....1816
6.74.4.1 Description....1816
6.74.4.2 Application and Setting Notes....1817
6.74.4.3 Settings....1818
6.74.4.4 Information List....1818
6.74.5 I1 < Release Stage....1818
6.74.5.1 Description....1818
6.74.5.2 Application and Setting Notes....1819

6.74.5.3 Settings ... 1819
6.74.5.4 Information List ... 1819

**7 Control Functions ... 1821**

7.1 Introduction ... 1822
7.1.1 Overview ... 1822
7.1.2 Concept of Controllables ... 1822
7.2 Switching Devices ... 1825
7.2.1 General Overview ... 1825
7.2.2 Switching Device Circuit Breaker ... 1825
7.2.2.1 Structure of the Circuit-Breaker Switching Device ... 1825
7.2.2.2 Application and Setting Notes ... 1829
7.2.2.3 Connection Variants of the Circuit Breaker ... 1831
7.2.2.4 Settings ... 1839
7.2.2.5 Information List ... 1841
7.2.3 Disconnector Switching Device ... 1843
7.2.3.1 Structure of the Disconnector Switching Device ... 1843
7.2.3.2 Application and Setting Notes ... 1847
7.2.3.3 Trigger Variants of the Disconnector ... 1849
7.2.3.4 Settings ... 1852
7.2.3.5 Information List ... 1853
7.3 Switching Sequences ... 1855
7.3.1 Overview of Functions ... 1855
7.3.2 Function Description ... 1855
7.3.3 Application and Setting Notes ... 1857
7.3.4 Settings ... 1861
7.3.5 Information List ... 1861
7.4 Control Functionality ... 1862
7.4.1 Command Checks and Switchgear Interlocking Protection ... 1862
7.4.2 Command Logging ... 1883
7.4.3 Settings ... 1888
7.4.4 Information List ... 1889
7.5 Synchronization Function ... 1890
7.5.1 Overview of Functions ... 1890
7.5.2 Structure of the Function ... 1890
7.5.3 Connection and Definition ... 1891
7.5.4 General Functionality ... 1894
7.5.4.1 Description ... 1894
7.5.4.2 Application and Setting Notes ... 1898
7.5.4.3 Settings ... 1905
7.5.5 Dynamic Measuring-Point Switching ... 1906
7.5.6 Sequence of Functions ... 1908
7.5.7 Stage Synchrocheck ... 1910
7.5.7.1 Description ... 1910
7.5.7.2 Application and Setting Notes ... 1911
7.5.7.3 Settings ... 1911
7.5.7.4 Information List ... 1912
7.5.8 Stage Synchronous/Asynchronous ... 1913
7.5.8.1 Description ... 1913
7.5.8.2 Application and Setting Notes ... 1917
7.5.8.3 Settings ... 1919

7.5.8.4 Information List ... 1920
7.5.9 Expanded Checks (df/dt and Smoothing of Oscillations) ... 1921
7.5.10 Closing at De-Energized Line/Busbar ... 1922
7.5.10.1 Description ... 1922
7.5.10.2 Application and Setting Notes ... 1924
7.5.11 Direct Close Command ... 1925
7.5.12 Interaction with Control and External Triggering ... 1926
7.5.13 External Synchronization ... 1927
7.5.13.1 Description ... 1927
7.5.13.2 Application and Setting Notes (External Synchronization) ... 1930
7.5.13.3 Settings ... 1931
7.5.13.4 Information List ... 1933
7.5.14 Settings ... 1933
7.5.15 Information List ... 1935
7.6 User-Defined Function Block [Control] ... 1938
7.6.1 Overview of Functions ... 1938
7.6.2 Function Description ... 1938
7.6.3 Application and Setting Notes ... 1939
7.6.4 Settings ... 1941
7.6.5 Information List ... 1941
7.7 CFC-Chart Settings ... 1943
7.7.1 Overview of Functions ... 1943
7.7.2 Function Description ... 1943
7.7.3 Application and Setting Notes ... 1944
7.7.4 Settings ... 1944
7.7.5 Information List ... 1944
7.8 Tap Changers ... 1945
7.8.1 Function Description ... 1945
7.8.2 Application and Setting Notes ... 1949
7.8.3 Settings (Properties Dialog) ... 1956
7.8.4 Settings ... 1956
7.8.5 Information List ... 1957
7.9 Voltage Controller ... 1959
7.9.1 Overview of Functions ... 1959
7.9.2 Structure of the Function ... 1959
7.9.3 Function Description ... 1961
7.9.3.1 General ... 1961
7.9.3.2 Logic of the Function ... 1968
7.9.3.3 Control Response ... 1970
7.9.3.4 Function Supervision ... 1973
7.9.3.5 Dynamic Voltage Control (DVC) ... 1973
7.9.3.6 Line Compensation ... 1976
7.9.3.7 Limiting Values ... 1978
7.9.3.8 Blockings ... 1978
7.9.3.9 Parallel Operation ... 1979
7.9.3.10 Creating a GOOSE Later Binding for Parallel Control ... 1991
7.9.3.11 Functional Measured Values ... 1999
7.9.4 Application and Setting Notes ... 2003
7.9.4.1 General ... 2003
7.9.4.2 Controlling ... 2005

7.9.4.3 Voltage Controller ... 2006
7.9.4.4 Dynamic Voltage Control (DVC) ... 2011
7.9.4.5 Line Compensation ... 2013
7.9.4.6 Limiting Values ... 2016
7.9.4.7 Blockings ... 2017
7.9.4.8 Parallel Control ... 2018
7.9.5 Settings ... 2019
7.9.6 Information List ... 2032
7.10 Point-on-Wave Switching ... 2038

**8 Supervision Functions ... 2039**

8.1 Overview ... 2040
8.2 Resource-Consumption Supervision ... 2041
8.2.1 Load Model ... 2041
8.2.2 Function Points ... 2043
8.2.3 CFC Resources ... 2044
8.3 Supervision of the Secondary System ... 2046
8.3.1 Overview ... 2046
8.3.2 Measuring-Voltage Failure ... 2046
8.3.2.1 Overview of Functions ... 2046
8.3.2.2 Structure of the Function ... 2047
8.3.2.3 Unbalanced Measuring-Voltage Failure ... 2049
8.3.2.4 3-Phase Measuring-Voltage Failure ... 2050
8.3.2.5 Switching onto a 3-Phase Measuring-Voltage Failure, Low Load ... 2051
8.3.2.6 Application and Setting Notes ... 2052
8.3.2.7 Settings ... 2054
8.3.2.8 Information List ... 2054
8.3.3 Signaling-Voltage Supervision ... 2055
8.3.3.1 Overview of Functions ... 2055
8.3.3.2 Structure of the Function ... 2055
8.3.3.3 Function Description ... 2055
8.3.3.4 Application and Setting Notes ... 2057
8.3.3.5 Settings ... 2058
8.3.3.6 Information List ... 2060
8.3.4 Voltage-Transformer Circuit Breaker ... 2060
8.3.4.1 Overview of Functions ... 2060
8.3.4.2 Structure of the Function ... 2061
8.3.4.3 Function Description ... 2061
8.3.4.4 Application and Setting Notes ... 2061
8.3.4.5 Settings ... 2062
8.3.4.6 Information List ... 2062
8.3.5 Broken-Wire Detection ... 2062
8.3.5.1 Overview of Functions ... 2062
8.3.5.2 Structure of the Function ... 2062
8.3.5.3 Function Description ... 2062
8.3.5.4 Application and Setting Notes ... 2064
8.3.5.5 Settings ... 2064
8.3.5.6 Information List ... 2064
8.3.6 Voltage-Balance Supervision ... 2065
8.3.6.1 Overview of Functions ... 2065
8.3.6.2 Structure of the Function ... 2065
8.3.6.3 Function Description ... 2065
8.3.6.4 Application and Setting Notes ... 2066
8.3.6.5 Settings ... 2067

8.3.6.6 Information List ... 2067
8.3.7 Voltage-Sum Supervision ... 2067
8.3.7.1 Overview of Functions ... 2067
8.3.7.2 Structure of the Function ... 2068
8.3.7.3 Function Description ... 2068
8.3.7.4 Application and Setting Notes ... 2070
8.3.7.5 Settings ... 2070
8.3.7.6 Information List ... 2070
8.3.8 Voltage Phase-Rotation Supervision ... 2070
8.3.8.1 Overview of Functions ... 2070
8.3.8.2 Structure of the Function ... 2070
8.3.8.3 Function Description ... 2071
8.3.8.4 Application and Setting Notes ... 2072
8.3.8.5 Settings ... 2072
8.3.8.6 Information List ... 2072
8.3.9 Auxiliary Direct-Voltage Supervision ... 2072
8.3.9.1 Overview of Functions ... 2072
8.3.9.2 Structure of the Function ... 2073
8.3.9.3 Auxiliary Direct-Voltage Measurement ... 2073
8.3.9.4 Stage Description ... 2074
8.3.9.5 Application and Setting Notes ... 2075
8.3.9.6 Settings ... 2076
8.3.9.7 Information List ... 2077
8.3.10 Current-Balance Supervision ... 2077
8.3.10.1 Overview of Functions ... 2077
8.3.10.2 Structure of the Function ... 2077
8.3.10.3 Function Description ... 2078
8.3.10.4 Application and Setting Notes ... 2079
8.3.10.5 Settings ... 2080
8.3.10.6 Information List ... 2080
8.3.11 Current-Sum Supervision ... 2080
8.3.11.1 Overview of Functions ... 2080
8.3.11.2 Structure of the Function ... 2081
8.3.11.3 Function Description ... 2081
8.3.11.4 Application and Setting Notes ... 2083
8.3.11.5 Settings ... 2083
8.3.11.6 Information List ... 2084
8.3.12 Current Phase-Rotation Supervision ... 2084
8.3.12.1 Overview of Functions ... 2084
8.3.12.2 Structure of the Function ... 2084
8.3.12.3 Function Description ... 2085
8.3.12.4 Application and Setting Notes ... 2086
8.3.12.5 Settings ... 2086
8.3.12.6 Information List ... 2086
8.3.13 Saturation Detection ... 2086
8.3.13.1 Overview of Functions ... 2086
8.3.13.2 Structure of the Function ... 2087
8.3.13.3 Function Description ... 2087
8.3.13.4 Application and Setting Notes ... 2087
8.3.13.5 Settings ... 2088
8.3.14 Trip-Circuit Supervision ... 2088
8.3.14.1 Overview of Functions ... 2088
8.3.14.2 Structure of the Function ... 2088
8.3.14.3 Trip-Circuit Supervision with 2 Binary Inputs ... 2089
8.3.14.4 Trip-Circuit Supervision with 1 Binary Input ... 2090
8.3.14.5 Application and Setting Notes ... 2093

8.3.14.6 Settings ... 2094
8.3.14.7 Information List ... 2094
8.3.15 Closing-Circuit Supervision ... 2094
8.3.15.1 Overview of Functions ... 2094
8.3.15.2 Structure of the Function ... 2095
8.3.15.3 Closing-Circuit Supervision with 3 Binary Inputs ... 2095
8.3.15.4 Closing-Circuit Supervision with 2 Binary Inputs ... 2100
8.3.15.5 Closing-Circuit Supervision with 1 Binary Input ... 2101
8.3.15.6 Application and Setting Notes ... 2104
8.3.15.7 Settings ... 2104
8.3.15.8 Information List ... 2105
8.4 Supervision of the Device Hardware ... 2106
8.4.1 Overview ... 2106
8.4.2 Analog-Channel Supervision via Fast Current-Sum ... 2107
8.4.2.1 Overview of Functions ... 2107
8.4.2.2 Structure of the Function ... 2107
8.4.2.3 Function Description ... 2108
8.5 Supervision of Device Firmware ... 2111
8.6 Supervision of Hardware Configuration ... 2112
8.7 Supervision of Communication Connections ... 2113
8.8 Error Responses and Corrective Measures ... 2114
8.8.1 Overview ... 2114
8.8.2 Defect Severity 1 ... 2115
8.8.3 Defect Severity 2 ... 2119
8.8.4 Defect Severity 3 ... 2120
8.8.5 Defect Severity 4 (Group Alarm) ... 2121
8.9 Group Indications ... 2123

**9 Measured Values, Energy Values, and Supervision of the Primary System ... 2125**
9.1 Overview of Functions ... 2126
9.2 Structure of the Function ... 2127
9.3 Operational Measured Values ... 2129
9.4 Fundamental and Symmetrical Components ... 2131
9.5 Phasor Measurement Unit (PMU) ... 2132
9.5.1 Overview of Functions ... 2132
9.5.2 Structure of the Function Group ... 2132
9.5.3 Function Description ... 2132
9.5.4 Transmitted Data ... 2137
9.5.5 PMU Communication (IEEE C37.118) ... 2137
9.5.6 Parameterizing the PMU with DIGSI ... 2139
9.5.7 Parameterizing the PMU on the Device ... 2150
9.5.8 Application and Setting Notes ... 2151
9.5.9 Settings ... 2155
9.5.10 Information List ... 2156
9.6 Average Values ... 2157
9.6.1 Function Description of Average Values ... 2157
9.6.2 Application and Setting Notes for Average Values ... 2157
9.7 Minimum/Maximum Values ... 2160
9.7.1 Function Description of Minimum/Maximum Values ... 2160

9.7.2 Application and Setting Notes for Minimum/Maximum Values....2161
9.8 Energy Values....2162
9.8.1 Function Description of Energy Values....2162
9.8.2 Application and Setting Notes for Energy Values....2163
9.9 User-Defined Metered Values....2165
9.9.1 Function Description of Pulse-Metered Values....2165
9.9.2 Application and Setting Notes for Pulse-Metered Values....2166
9.10 Statistical Values of the Primary System....2169
9.11 Measuring Transducers....2170
9.11.1 Overview of Functions....2170
9.11.2 Structure of the Function....2170
9.11.3 Function Description....2170
9.11.4 Application and Setting Notes....2173
9.11.5 Settings....2174
9.11.6 Information List....2176
9.12 Circuit-Breaker Monitoring....2177
9.12.1 Overview of Functions....2177
9.12.2 Structure of the Function....2177
9.12.3 General Functionality....2178
9.12.3.1 Description....2178
9.12.3.2 Application and Setting Notes....2179
9.12.3.3 Settings....2180
9.12.3.4 Information List....2180
9.12.4 ΣIx Method....2181
9.12.4.1 Description....2181
9.12.4.2 Application and Setting Notes....2183
9.12.4.3 Settings....2183
9.12.4.4 Information List....2183
9.12.5 2P Method....2187
9.12.5.1 Description....2187
9.12.5.2 Application and Setting Notes....2190
9.12.5.3 Settings....2191
9.12.5.4 Information List....2192
9.12.6 I2t Method....2195
9.12.6.1 Description....2195
9.12.6.2 Application and Setting Notes....2196
9.12.6.3 Settings....2196
9.12.6.4 Information List....2196
9.12.7 Make Time....2200
9.12.7.1 Description....2200
9.12.7.2 Application and Setting Notes....2201
9.12.7.3 Settings....2201
9.12.7.4 Information List....2202
9.12.8 Break Time....2206
9.12.8.1 Description....2206
9.12.8.2 Application and Setting Notes....2207
9.12.8.3 Settings....2207
9.12.8.4 Information List....2208
9.12.9 Pole Scatter Time Open....2211
9.12.9.1 Description....2211
9.12.9.2 Application and Setting Notes....2212
9.12.9.3 Settings....2212

9.12.9.4 Information List ... 2213
9.12.10 Pole scatter time close ... 2214
9.12.10.1 Description ... 2214
9.12.10.2 Application and Setting Notes ... 2214
9.12.10.3 Settings ... 2215
9.12.10.4 Information List ... 2215
9.12.11 Mechanical Switching Time Open ... 2217
9.12.11.1 Description ... 2217
9.12.11.2 Application and Setting Notes ... 2219
9.12.11.3 Settings ... 2220
9.12.11.4 Information List ... 2221
9.12.12 Mechanical Switching Time Close ... 2225
9.12.12.1 Description ... 2225
9.12.12.2 Application and Setting Notes ... 2227
9.12.12.3 Settings ... 2228
9.12.12.4 Information List ... 2229
9.12.13 Operation counter ... 2232
9.12.13.1 Description ... 2232
9.12.13.2 Application and Setting Notes ... 2233
9.12.13.3 Settings ... 2233
9.12.13.4 Information List ... 2233
9.13 Disconnector-Switch Monitoring ... 2237
9.13.1 Overview of Functions ... 2237
9.13.2 Structure of the Function ... 2237
9.13.3 General Functionality ... 2237
9.13.3.1 Description ... 2237
9.13.3.2 Application and Setting Notes ... 2237
9.13.3.3 Settings ... 2237
9.13.3.4 Information List ... 2238
9.13.4 Mechanical Switching Time Open ... 2239
9.13.4.1 Description ... 2239
9.13.4.2 Application and Setting Notes ... 2240
9.13.4.3 Settings ... 2241
9.13.4.4 Information List ... 2241
9.13.5 Mechanical Switching Time Close ... 2242
9.13.5.1 Description ... 2242
9.13.5.2 Application and Setting Notes ... 2243
9.13.5.3 Settings ... 2244
9.13.5.4 Information List ... 2244

# 1 Introduction

| | | |
|---|---|---|
| 1.1 | General | 52 |
| 1.2 | Properties of SIPROTEC 5 | 53 |
| 1.3 | Overview of Transformer Protection Devices | 54 |

# 1.1 General

The digital multifunctional protection and bay controllers of the SIPROTEC 5 device series are fitted with a powerful microprocessor. As a result, all tasks, from acquiring measurands to entering commands in the circuit breaker, are processed digitally.

### Analog Inputs

The measuring inputs transform the currents and voltages sent by the instrument transformers and adapt them to the internal processing level of the device. A SIPROTEC 5 device consists of inputs for measuring current and voltage. The current inputs are intended for the detection of phase currents and ground current. The ground current can be detected sensitively using a core balance current transformer. In addition, phase currents can be detected very sensitively for a particularly precise measurement. The voltage inputs detect the measuring voltage of device functions requiring voltage measured values.

The analog values are digitized in the microprocessor for data processing.

### Microprocessor System

All device functions are processed in the microprocessor system.

This includes, for example:

- Filtering and preparation of the measurands
- Constant monitoring of the measurands
- Monitoring of the pickup conditions for the individual protection functions
- Querying of limiting values and time sequences
- Control of signals for logic functions
- Control of open and close commands
- Recording of indications, fault data, and fault values for fault analysis
- Administration of the operating system and its functions, for example data storage, real-time clock, communication, interfaces
- External distribution of information

### Binary Inputs and Outputs

Using the binary inputs and outputs, the device receives information from the system or from other devices (such as locking commands). The most important outputs include the commands to the switching devices and the indications for remote signaling of important events and states.

### Front Elements

For devices with an integrated or offset operation panel, LEDs and an LC display on the front provide information on the device function and report events, states, and measured values. In conjunction with the LC display, the integrated keypad enables on-site operation of the device. All device information such as setting parameters, operating and fault indications or measured values can be displayed, and setting parameters changed. In addition, system equipment can be controlled via the user interface of the device.

### Serial Interfaces

The serial interface in the front panel enables communication with a personal computer when using the DIGSI operating program. As a result, the operation of all device functions is possible. Additional interfaces on the rear are used to implement various communication protocols.

### Power Supply

The individual functional units of the device are powered by an internal power supply. Brief interruptions in the supply voltage, which can occur during short circuits in the system auxiliary voltage supply, are bridged by capacitor storage (see also the Technical Data).

# 1.2 Properties of SIPROTEC 5

The SIPROTEC 5devices at the bay level are compact and can be installed directly in medium and high-voltage switchgear. They are characterized by comprehensive integration of protection and control functions.

**General Properties**

- Powerful microprocessor
- Fully digital measured-value processing and control, from sampling and digitizing of measurands to closing and tripping decisions for the circuit breaker
- Complete galvanic and interference-free isolation of the internal processing circuits from the system measuring, control, and supply circuits through instrument transformers, binary input and output modules, and DC and AC voltage converters
- Easy operation using an integrated operator and display panel, or using a connected personal computer with user interface
- Continuous display of measured and metered values at the front
- Storage of min/max measured values (slave pointer function) and storage of long-term average values
- Storage of fault indications for system incidents (faults in system) with real-time assignment and instantaneous values for fault recording
- Continuous monitoring of the measurands as well as the device hardware and software
- Communication with central control and storage devices possible via the device interface
- Battery-buffered, synchronizable clock

**Modular Concept**

The SIPROTEC 5 modular concept ensures the consistency and integrity of all functionalities across the entire device series. Significant features here include:

- Modular system design in hardware, software, and communication
- Functional integration of various applications, such as protection, control, and fault recorder
- The same expansion and communication modules for all devices in the family
- Innovative terminal technology with easy assembly and interchangeability and the highest possible degree of safety
- The same functions can be configured individually across the entire family of devices
- Ability to upgrade with innovations possible at all times through libraries
- Open, scalable architecture for IT integration and new functions
- Multi-layered security mechanisms in all links of the security chain
- Self-monitoring routines for reliable localization and indication of device faults
- Automatic logging of access attempts and security-critical operations on the devices and systems

**Redundant Communication**

SIPROTEC 5devices maintain full communication redundancy:

- Multiple redundant communication interfaces
- Redundant and independent protocols to control centers possible (such as IEC 60870-5-103 and IEC 61850, either single or redundant)
- Redundant time synchronization (such as IRIG B, SNTP or IEEE 1588).

# 1.3 Overview of Transformer Protection Devices

The protected object can be a power transformer in multi-winding design as well as an auto transformer. The main protection functions supplement the transformer differential protection by the restricted ground-fault protection. In addition more supplemental protection functions can be activated.

The protection device classification is oriented to the basic design of the protected object. The simplest design is a two-winding transformer with different vector group. The design can also be the simplest form of the auto transformer. After that comes the three-winding transformer with different vector-group design. The design can also be an auto transformer with stabilizing winding. The last groups are multi-winding transformers, which are often found with converter applications (for example high-voltage direct-current transmission).

An important differentiating characteristic of the devices is the ability to process the number of windings (in the following called transformer sides) and the number of measuring points. For the transformer sides, the 7UT8x offers greater flexibility. In this way, you can expand 7UT85 (two-winding transformer) to up to 3 transformer sides, and the 7UT86 (three-winding transformer) to up to 4 transformer sides using function points, if necessary. This allows greater flexibility for plant expansions or for spare parts stocking.

The following table gives you a rough overview of the 4 classes of the transformer differential protection devices.

Table 1-1 Classification of the Devices

| 7 | UT | | Essential Differentiating Characteristics |
|---|---|---|---|
| 7 | UT | 82 | Two-winding transformer (2 sides and maximum 2 measuring points) |
| 7 | UT | 85 | Two-winding transformer (3 sides of which 2 are free of charge and a maximum of 5 measuring points) |
| 7 | UT | 86 | Three-winding transformer (4 sides of which 3 are free of charge and a maximum of 7 measuring points) |
| 7 | UT | 87 | Multi-winding transformer (5 sides and maximum 20 measuring points) |

With 7UT87, there is a special feature. Due to the maximum number of 5 sides, the simultaneous protection of 2 transformers (for example from 2 two-winding transformers) is possible through one device. More information on possibilities for use can be found in the device catalog or the application templates in chapter *4 Applications*.

Typical properties of the 4 device types are presented in the following table:

Table 1-2 Overview of the Available Measuring Points

| Device | Measuring Points |
|---|---|
| 7UT82 | Two 1-phase current measuring points (1ph I)<br>Two 3-phase current measuring points (3ph I) |
| 7UT85 | Five 3-phase current measuring points (3ph I)<br>Five 1-phase current measuring points (1ph I)<br>Five 3-phase voltage measuring points (3ph V)<br>Five 1-phase voltage measuring points (1ph V) |
| 7UT86 | Seven 3-phase current measuring points (3ph I)<br>Seven 1-phase current measuring points (1ph I)<br>Seven 3-phase voltage measuring points (3ph V)<br>Seven 1-phase voltage measuring points (1ph V) |
| 7UT87 | Twenty 3-phase current measuring points (3ph I)<br>Twenty 1-phase current measuring points (1ph I)<br>Twenty 3-phase voltage measuring points (3ph V)<br>Twenty 1-phase voltage measuring points (1ph V) |

Table 1-3 Properties – 7UT82

| | |
|---|---|
| Short description | Differential protection for two-winding transformers for all voltage levels |
| Main protection function | 1 differential protection function (standard transformer) with additional stabilization; up to 2 restricted ground-fault protection functions |
| Inputs and outputs | 1 predefined standard variable with 8 current transformers, 7 binary inputs, 6 binary outputs |
| Width of housing | 1/3 × 19 inches |

Table 1-4 Properties – 7UT85

| | |
|---|---|
| Short description | Differential protection for two-winding transformers for all voltage levels |
| Main protection function | 1 differential protection function (standard or auto transformer) with additional stabilization; up to 2 restricted ground-fault protection functions |
| Inputs and outputs<br>Hardware flexibility | 2 predefined standard variants with 8 current transformers, 7 to 19 binary inputs, 7 to 23 binary outputs<br>Flexible adaptable and expandable I/O quantity structure of the modular SIPROTEC 5 module |
| Width of housing | 1/3 × 19 inches to 1/1 × 19 inches |

Table 1-5 Properties – 7UT86

| | |
|---|---|
| Short description | Differential protection for three-winding transformers for all voltage levels |
| Main protection function | 1 differential protection function (standard) with additional stabilization; up to 3 restricted ground-fault protection functions.<br>For auto transformer applications 2 differential protection functions can be processed in an auto transformer function group. |
| Inputs and outputs<br>Hardware flexibility | 2 predefined standard variants with 12 current transformers, 4 voltage transformers, 11 to 23 binary inputs, 19 to 34 binary outputs<br>Flexible adaptable and expandable I/O quantity structure of the modular SIPROTEC 5 module |
| Width of housing | 1/2 × 19 inches to 1/1 × 19 inches |

Table 1-6 Properties – 7UT87

| | |
|---|---|
| Short description | Differential protection for multi-winding transformers for all voltage levels |
| Main protection function | Up to 3 differential protection functions with additional stabilization (in different transformer function groups); up to 5 restricted ground-fault protection functions.<br>For auto transformer applications 2 differential protection functions can be processed in an auto transformer function group. |
| Inputs and outputs<br>Hardware flexibility | 2 predefined standard variants with 20 current transformers, 4 voltage transformers, 15 to 27 binary inputs, 22 to 38 binary outputs<br>Flexible adaptable and expandable I/O quantity structure of the modular SIPROTEC 5 module |
| Width of housing | 2/3 × 19 inches to 1/1 × 19 inches |

The important functional properties of the devices are:

- Transformer protection for two-winding, three-winding, and multi-winding transformers with versatile, additional protection functions
- Universal usability of the permissible measuring points
- Applicable from average up to extra-high voltage
- Protection from standard power transformers and auto transformers

- Typical properties of a transformer differential protection, such as flexible adaptation to the transformer vector group, command of closing and overexcitation processes, reliable behavior in current-transformer saturation with different degrees of saturation
- Increased sensitivity with near-neutral-point ground faults through a separate restricted ground-fault protection
- Voltage controller for the control and regulation of motor-operated tap changers
- Additional current and voltage inputs can be supplements for standard protection functions, such as overcurrent, voltage frequency, etc.
- In the standard design 2 communication modules are pluggable, as well as different logs are usable (IEC 61850, IEC 60870-5-103, DNP3 (serial+IP), Modbus RTU Slave)
- Performance automation with CFC (Continuous Function Chart)
- Secure serial protection data communication, also over great distances and all available physical media (optical fibers, two-wire connections and communication networks)
- Measurement of all relevant operating variables
- Powerful fault recording
- Consistent monitoring concept
- Auxiliary functions for simple tests and commissioning

# 2 Basic Structure of the Function

# 2.1 Embedding of Functions in the Device

### General

SIPROTEC 5 devices offer great flexibility in the handling of functions. Functions can be individually loaded into the device. Additionally, it is possible to copy functions within a device or between devices. The necessary integration of functions in the device is illustrated by the following example.

**NOTE**

The availability of certain settings and setting options depends on the device type and the functions available on the device!

**EXAMPLE**

A 1 1/2 circuit-breaker layout of the 7SA86 distance protection device serves as an example. The following protection functions are required for implementation (simplified and reduced):

- Distance protection (21)
- Overcurrent protection, phases (51)
- Circuit-breaker failure protection (50BF), for circuit breakers 1 and 2
- Basic functionality (for example handling of tripping)

Several predefined function packages that are tailored to specific applications exist for each device family. A predefined functional scope is called an **application template**. The existing application templates are offered for selection automatically when you create a new device in DIGSI 5.

**EXAMPLE**

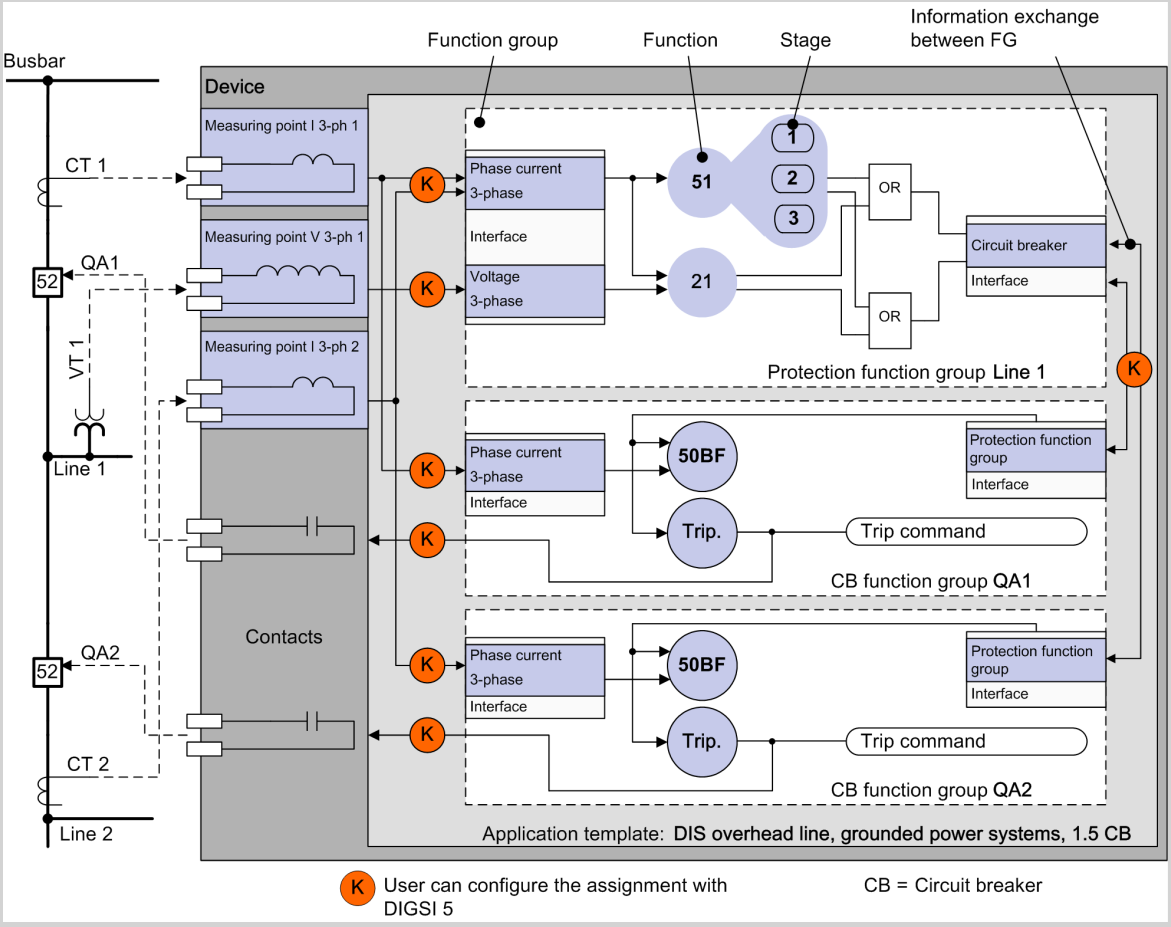
When creating the device in DIGSI 5, you must select the appropriate application template. In the example, select the application template **DIS overhead line, grounded systems, 1 1/2 circuit-breaker layout**. This application template covers the required functional scope. Selecting this application template determines the preconfigured functional scope. This can be changed as necessary (see *2.2 Application Templates/Adaptation of Functional Scope*).

### Function Groups (FG)

Functions are arranged in function groups. This simplifies handling of functions (adding and copying). The function groups are assigned to primary objects, such as a line, transformer, or circuit breaker.

The function groups bundle functions with regard to the following basic tasks:

- Assignment of functions to currentand/or voltage transformers (assignment of functions to the measuring points and thus to the protected object)
- Exchange of information between function groups



When a function is copied into a function group, it automatically works with the measuring points assigned to the function group. Their output signals are also automatically included in the configured interfaces of the function group.

**EXAMPLE**

The selected application template **DIS overhead line, grounded systems, 1 1/2 circuit-breaker layout** comprises 3 function groups:

- Protection function group **Line 1**
- Circuit-breaker function group **QA 1**
- Circuit-breaker function group **QA 2**

The following figure shows the embedding of functions via function groups.

[dw_eifkfg, 1, en_US]

Figure 2-1 Embedding the Functions via Function Groups

Depending on the type of device, there are different types of function groups:

- Protection function groups
- Circuit-breaker function groups

Protection function groups bundle functions that are assigned to one protected object – for example to the line. Depending on the device type and nature of the protected object, there are different types of protection function groups (for example line, voltage/current 3-phase, transformer, motor, generator).

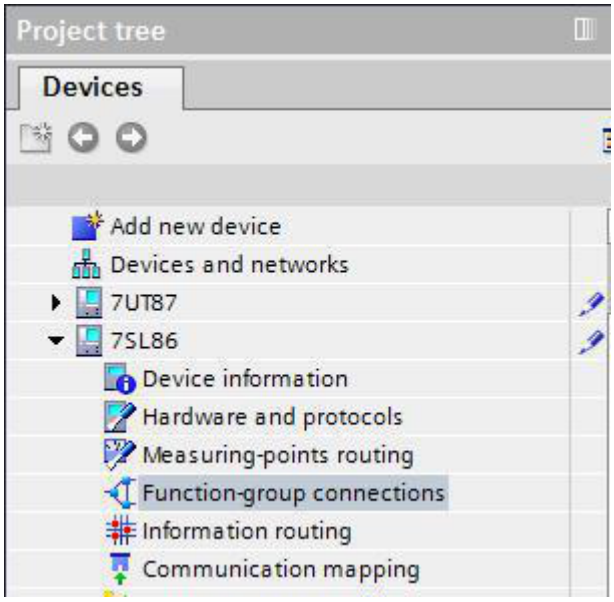
Circuit-breaker function groups bundle functions assigned to the local switches – for example, circuit breakers and disconnectors (such as processing of tripping, circuit-breaker failure protection).

The number and type of function groups differ in the respective application templates, depending on the type of the device and application. You can add, copy, or even delete function groups for a specific application. You can also adapt the functional scope within a function group according to the use case. For detailed information on this, refer to the DIGSI 5 Online Help manual.

### Interface Between Function Group and Measuring Point

The function groups receive the measurands of the current and voltage transformers from measuring points. For this, the function groups are connected to 1 or more measuring points.

The number of measuring points and the assignment of function groups to the measuring points are preset by the selected application template in accordance with the specific application. Therefore, this specifies which measuring point(s) and the corresponding measurands have to be used by which function within the function group.

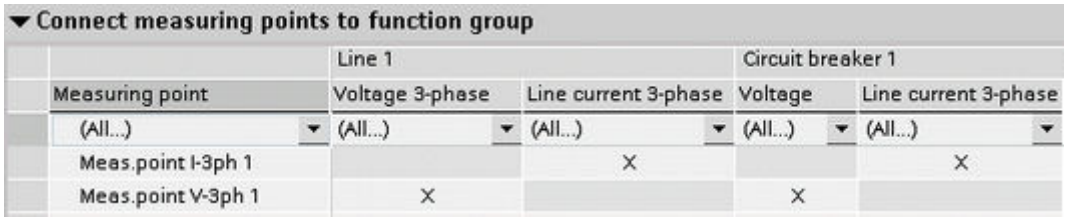


**EXAMPLE**

The measuring points are assigned to the function groups in the application template in *Figure 2-1* as follows:

- The protection function group **Line** is assigned to the measuring points **I-3ph 1**, **I-3ph 2**, and **V-3ph 1**. The function group therefore receives the measured values from the current transformers 1 and 2, as well as from the voltage transformer 1. The currents of measuring points **I-3ph 1** and **I-3ph 2** are geometrically added, for a feeder-related processing.
- The circuit-breaker function group **QA1** is assigned to the measuring point **I-3ph 1** and receives the measured values from current transformer 1.
- The circuit-breaker function group **QA2** is assigned to the measuring point **I-3ph 2** and receives the measured values from current transformer 2.

You can change the assignment on demand, that is, function groups can be assigned to any available measuring points of the device.



To check or change the assignment of measuring points to the function groups, double-click **Function-group connections** in the DIGSI 5 project tree.

[sc_fgverb, 1, en_US]

Figure 2-2 Project Tree in DIGSI 5 (Detail)

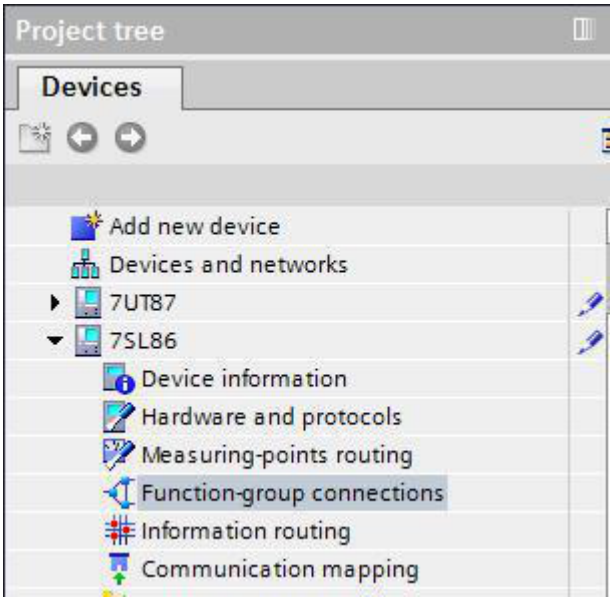
The window for routing of the measuring points opens in the working area (see the following figure, does not correspond to the example).

[scmscofg-180311-01.tif, 1, en_US]

Figure 2-3 Connecting Measuring Points and Function Groups

### Interface Between Protection and Circuit-Breaker Function Groups

The protection function group(s) is/are connected to one or several circuit-breaker function groups. This connection generally determines:

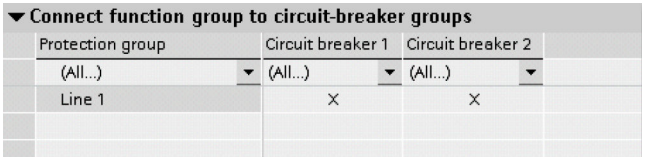


- Which circuit breaker(s) is/are started by the protection functions of the protection FG.
- Starting the **Circuit-breaker failure protection** function (if available in the Circuit-breaker function group) through the protection functions of the connected protection function group
- Starting the **Automatic reclosing** function (AREC, if available in the Circuit-breaker function group) through the protection functions of the connected protection function group

Besides the general assignment of the protection function group(s) to the circuit-breaker function groups, you can also configure the interface for specific functionalities in detail. Further information on this is included later. *Figure 2-6* shows how to reach the detail configuration. *Figure 2-7* shows the possible assignments in detail.

These definitions are also set appropriately for the specific application by the selected application template.

You can change this connection, if needed. That is, the protection function groups can be assigned to the circuit-breaker function groups as desired.

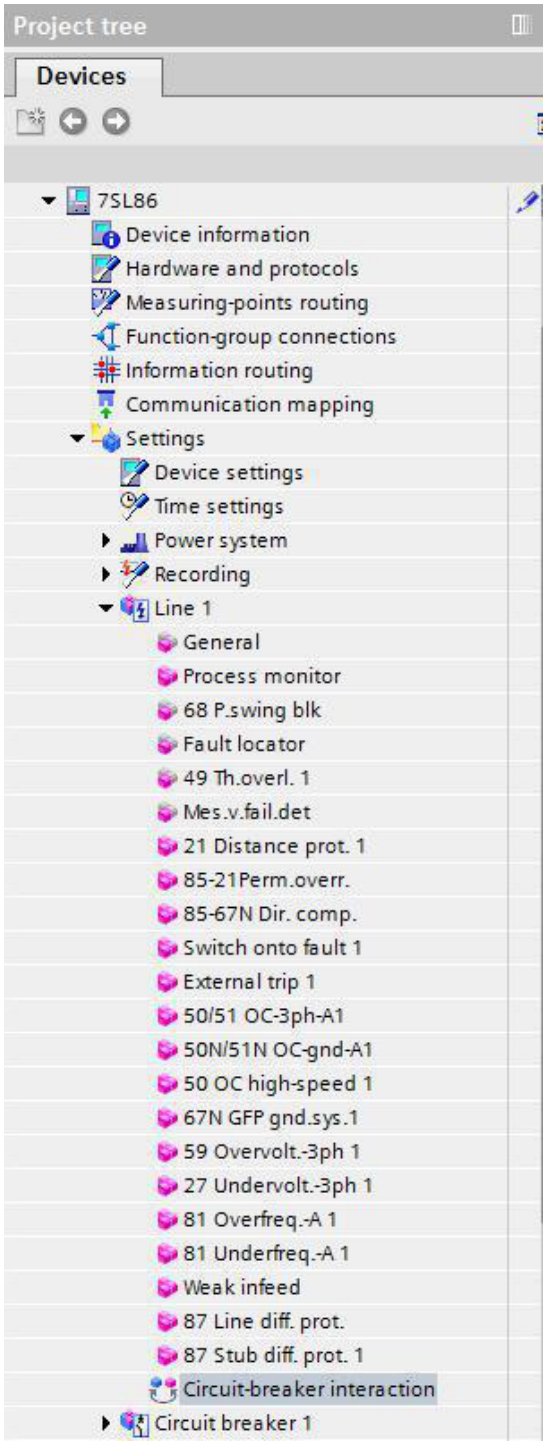


To check or change the assignment of the protection function groups to the Circuit-breaker function groups, double-click **Function group connections** in the DIGSI 5 project tree → **Name of device**.

[sc_fgverb, 1, en_US]

Figure 2-4 Project Tree in DIGSI 5 (Detail)

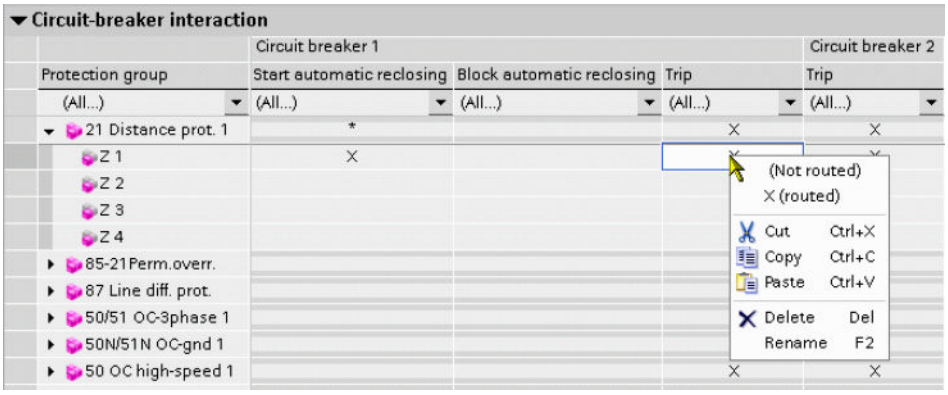
The window for general routing of the function groups opens in the working area.



[scfgcols-220211-01.tif, 1, en_US]

Figure 2-5 Connection of Protection Function Group with Circuit-Breaker Function Group

Besides the general assignment of the protection function group(s) to the circuit-breaker function groups, you can also configure the interface for specific functionalities in detail. Proceed as follows:



- Open the SIPROTEC 5 device folder in the DIGSI 5 project tree.
- Open the function settings folder in the DIGSI 5 project tree.
- Open the appropriate protection function group in the DIGSI 5 project tree, for example **Line 1**.

[sclsinta-190214-01, 1, en_US]

Figure 2-6 Project Tree in DIGSI 5 (Detail)

- Double-click **Circuit-breaker interaction** (see *Figure 2-6*).
- The window for the detailed configuration of the interface between the protection function group and the **Circuit-breaker** function group(s) opens in the working area.
- In this view, configure the interface via the context menu (right mouse button), see *Figure 2-7*.

[sc_detail, 1, en_US]

Figure 2-7 Detail Configuration of the Interface Between the Protection Function Group and the Circuit-Breaker Function Groups

In the detail configuration of the interface, you define:

- Which operate indications of the protection functions go into the generation of the trip command
- Which protection functions start the Automatic reclosing function
- Which protection functions block the Automatic reclosing function
- Which protection functions start the Circuit-breaker failure protection function

### Functions (FN), Tripping Stages/Function Blocks (FB)

As already illustrated in *Figure 2-1*, functions are assigned to the protected objects or other primary objects via function groups.

Functions can be further subdivided. For example, protection functions often consist of multiple protection stages (for example, the Overcurrent-protection function). Other functions can contain one or more function blocks.

Each stage, each function block, and each function (without stages/function blocks) can be individually switched into specific operating modes (for example, switch on/off). This is termed function control and is explained in *2.3 Function Control*.

To adjust the functionality to the specific application, functions, stages, and function blocks can be added, copied, and deleted (see *2.2 Application Templates/Adaptation of Functional Scope*).

# 2.2 Application Templates/Adaptation of Functional Scope

### Application Template

The application template defines the preconfigured functional scope of the device for a specific use case. A certain number of application templates is predefined for each device type. DIGSI 5 automatically offers the application templates for selection when a new device is installed. The available application templates with the respective functional scope are described in more detail in *4 Applications*.

The selection of the application template first predefines which function groups and functions are present in the device (see also *Figure 2-1* in *2.1 Embedding of Functions in the Device*).

You can adjust the functional scope to your specific application.

### Adjusting the Functional Scope

Adjust the functional scope based on the selected application template. You can add, copy or delete functions, tripping stages, function blocks, or complete function groups.

In the DIGSI 5 project tree, this can be done via the following Editors:

- Single-line configuration
- Information routing
- Function settings

Siemens recommends the **Single-line configuration** Editor to adjust the functional scope.

Complete missing functionalities from the Global DIGSI 5 Library. Then, the default settings of the added functionality are active. You can copy within a device and between devices as well. Settings and routings are also copied when you copy functionalities.

**NOTE**

If you delete a parameterized function group, function, or stage from the device, all settings and routings will be lost. The function group, function, or tripping stage can be added again, but then the default settings are active.

In most cases, the adaptation of the functional scope consists of adding and deleting functions, stages, and function blocks. As previously described, the functions, tripping stages, and function blocks automatically connect themselves to the measuring points assigned to the function group.

In few cases, it may be necessary to add a protection or circuit-breaker function group. These newly added function groups do not contain (protection) functions. You must individually load the (protection) functions for your specific application. You must also connect the protection or circuit-breaker function group to one or more measuring points (see *2.1 Embedding of Functions in the Device*). You must connect newly added protection function groups to a circuit-breaker function group (see *2.1 Embedding of Functions in the Device*).

Functions, tripping stages, function blocks, and function groups can be added up to a certain maximum number. The maximum number can be found in the respective function and function-group descriptions.

### Function Points

Function points (FP) are assigned to specific functions, but not to other functions. You can find more detailed information in the description of application templates, in *4 Applications*.

The device is supplied with the acquired function-point credit. Functions with function points can be loaded into the device only within the available function-point credit. The functional scope cannot be loaded into the device if the required number of points of the functional scope is higher than the function-point credit. You must either delete functions or upgrade the function-point credit of the device.

In addition to function-point classes (10, 20, 30, 40, 50, 75, 100 to 1400) beginning with firmware version V09.20, any function-point values in the range from 0 to 5000 are supported as a credit in the device. Thus, the precise function-point credit required can be loaded into the device by the Function-Point Manager. Alternatively, you can order classless devices with 0 points (new option beginning with V09.20) or class-bound with the required function-point class.

### Extending the Function-Point Credit

You can reorder function points if the function-point credit for the device is not enough or if you have ordered a classless device with 0 points. Proceed as follows:

- Determine the function-point requirement of certain functions, for example, with DIGSI 5 or the SIPROTEC 5 Configurator.
- Create a signed license file for your device with the SIPROTEC Function-Point Manager at *www.siprotec-function-point-manager.siemens.com* or order the license file from your sales partner.
- Once you have ordered the license file using the Function-Point Manager, you can download it from there directly.
- Once you have ordered the license file from your sales partner, you will receive it by e-mail or to download.
- Use DIGSI 5 to load the signed license file onto your device. The procedure is described in the Online Help of DIGSI 5.

# 2.3 Function Control

Function control is used for:

- Functions that do not contain stages or function blocks
- Stages within functions
- Function blocks within functions

**NOTE**

Simplifying **functions** and **function control** will be discussed in the following. The description also applies to tripping stage control and function block control.

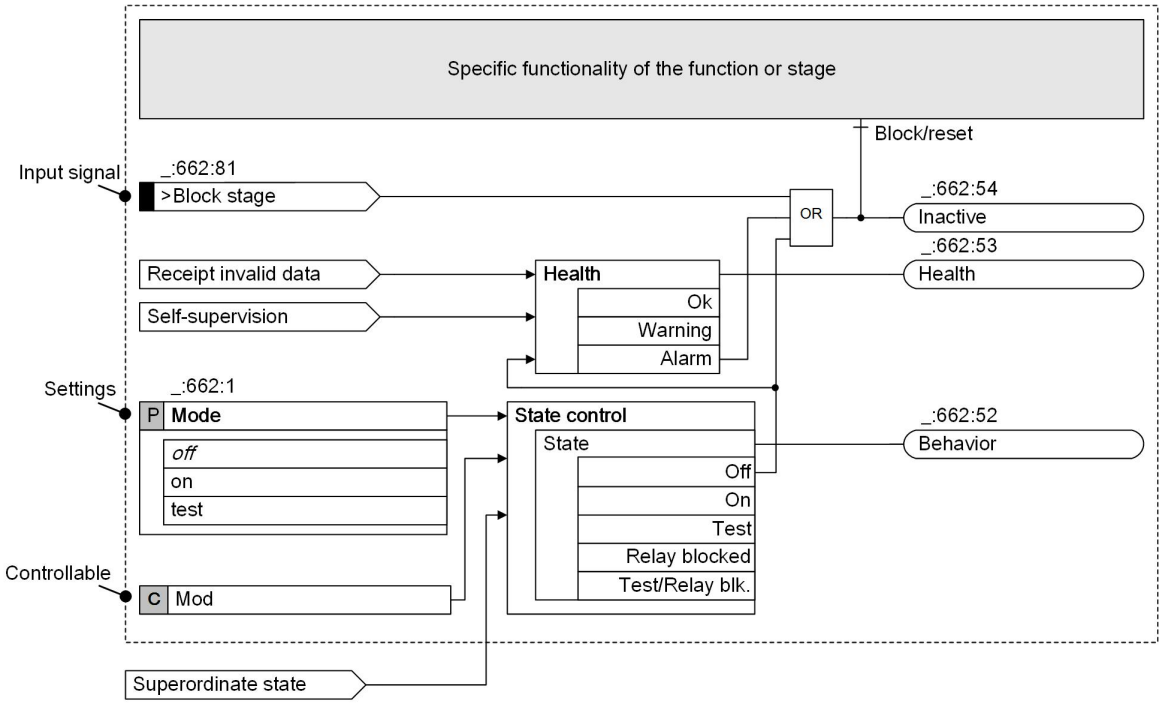
Functions can be switched to different operating modes. You use the parameter **Mode** to define whether you want a function to run (***on***) or not (***off***). In addition, you can temporarily block a function. For the purpose of commissioning, you can switch it into test mode (parameter **Mode** = ***test***).

Devices with the activated IEC 61850 allow you to switch the operating mode by using the logical node zero **LLN0**. Depending on the option **LDevice Mod controllable**[1] in DIGSI 5 under **Settings** > **Device settings**, the logical devices (as well as the child logical devices and logical nodes) can be set to one of the following operating modes:

- ***On***
- ***Off***
- ***Test***
- ***Relay blocked***
- ***Test/Relay blk.***

The following table describes the relationship between the LLN0 and the setting **LDevice Mod controllable**.

| LLN0.Mod | Setting LDevice Mod controllable | |
|---|---|---|
| | Deactivated | Activated |
| Application/LLN0.Mod | Controllable | Controllable |
| Logical device/LLN0.Mod | Status only | Controllable |
| Child logical device/LLN0.Mod | Status only | Controllable |
| Logical node/LLN0.Mod | Status only | Controllable |
| **_:51 Mode (controllable)** of an individual tripping stage of a protection function | Controllable | Controllable |



With the setting **LDevice Mod controllable** being activated, the behavior of a logical device (as well as the child logical devices and logical nodes) can be controlled also by the parameter **SetMod** (**SetMod** = ***on***: behavior = on; **SetMod** = ***off***: behavior = off) of the LLN0.

The function shows the current status – such as an *Alarm* – via the *Health* signal.

For more details, refer to the Application Notes *SIPROTEC 5 IEC 61850 Mod/Beh*.

The following explains the different operating modes and mechanisms and how you set the functions into these modes. The function control is shown in *Figure 2-8*. It is standardized for all functions. Therefore, this control is not discussed further in the individual function descriptions.

1 This parameter is only applicable if IEC 61850 is active.

[lo_steurg, 2, en_US]

Figure 2-8 General Control of a Function

### State Control

You can control the state of a function via the parameter **Mode**, the controllable **Mod** and the input **Superordinate state**.

The superordinate state is also influenced by the state of the superordinate logical devices (LD) of the IEC 61850 structure.

You set the specified operating state of the function via the parameter **Mode**. You can set the function mode to ***on***, ***off*** and ***test***. The operating principle is described in *Table 2-2*. You can set the parameter **Mode** via:

- DIGSI 5
- On-site operation at the device
- Browser-based user interface
- Certain systems control protocols (IEC 61850, IEC 60870-5-103)

You can also set the set point operating state of the function through the controllable **Mod**. You can set the function mode to ***On***, ***Off***, ***Test***, ***Relay blocked*** and ***Test/Relay blk.***. The operating principle is described in *Table 2-2*. You can set the controllable **Mod** via:

- IEC 61850-8-1
- CFC

The **superordinate state** can accept the values ***On***, ***Relay blocked*** ***Test*** and ***Test/Relay blk.***.

The state of the function resulting from the parameter **Mode**, the controllable **Mod** and the **Superordinate state** is shown in the following table. The resulting state of the function results from the combination of all sources (parameters **Mode**, Controllable **Mod** and **Superordinate state**). For simplicity, the table represents only the combination of 2 sources.

Table 2-1 Resulting State of the Function

| Inputs | | State of the Function |
|---|---|---|
| Source A | Source N | |
| On | On | On |
| On | Off | Off |
| On | Test | Test[2] |
| On | Relay blocked | Relay blocked |
| On | Test/Relay blk. | Test/Relay blk. |
| Test | On | Test[2] |
| Test | Off | Off |
| Test | Test | Test[2] |
| Test | Relay blocked | Test/Relay blk. |
| Test | Test/Relay blk. | Test/Relay blk. |
| Off | On | Off |
| Off | Off | Off |
| Off | Test | Off |
| Off | Relay blocked | Off |
| Off | Test/Relay blk. | Off |
| Relay blocked | On | Relay blocked |
| Relay blocked | Off | Off |
| Relay blocked | Test | Test/Relay blk. |
| Relay blocked | Relay blocked | Relay blocked |
| Relay blocked | Test/Relay blk. | Test/Relay blk. |
| Test/Relay blk. | On | Test/Relay blk. |
| Test/Relay blk. | Off | Off |
| Test/Relay blk. | Test | Test/Relay blk. |
| Test/Relay blk. | Relay blocked | Test/Relay blk. |
| Test/Relay blk. | Test/Relay blk. | Test/Relay blk. |

**NOTE**

The browser-based user interface shows an easy-to-read list of the states of all functions if they deviate from the state ***On***.

The following table describes the possible states of a function:

2 With the parameter **(_:151) Oper.bin.outp. under test**, you define whether functions in test mode can activate relay outputs. If the parameter **(_:151) Oper.bin.outp. under test** and the test mode are activated for the entire device, all functions – including the relay outputs – are in **Test** state. If the parameter **(_:151) Oper.bin.outp. under test** is not active and the test mode is activated for the entire device, all functions – except the relay outputs – are in **Test** state. The relay outputs adopt the **Test/Relay blk.** state.

Table 2-2 Possible States of a Function

| State of the Function | Explanation |
|---|---|
| On | The function is activated and operating as defined. The prerequisite is that the health of the function is ***OK***. |
| Relay blocked | The function is activated and operating as defined. The prerequisite is that the health of the function is ***OK***. All outputs of indications of this function to relays are blocked.<br><br>**Note:**<br><br>Logics outside this function block, for example, superordinate group indications, are not affected by the blocking. Their output to a relay still leads to an activation. |
| Off | The function is turned off. It does not create any information. The health of a disabled function always has the value ***OK***. |

<table>
<tr><th>State of the Function</th><th colspan="2">Explanation</th></tr>
<tr><td>Test</td><td colspan="2">The function is set to test mode. This state supports the commissioning. All outgoing information from the function (indications and, if present, measured values) is provided with a test bit. This test bit significantly influences the further processing of the information, depending on the target.<br>When leaving the state Test, functions that process measured values are briefly reset for ~500 ms and blocked internally. This state is documented by the message Inactive and other function-specific messages, where appropriate.</td></tr>
<tr><td></td><td>Target of the Information</td><td>Processing</td></tr>
<tr><td></td><td>Log</td><td>The indication is labeled as Test in the log.</td></tr>
<tr><td></td><td>Binary output</td><td>An indication routed to binary outputs does not control the switching contact, unless the behavior of the binary output is in test state.</td></tr>
<tr><td></td><td>Light-emitting diode (LED)</td><td>An indication routed to the LED triggers the LED (normal processing)</td></tr>
<tr><td></td><td>CFC</td><td>Here, the behavior depends on the state of the CFC chart.<br>• CFC chart itself is not in test state:<br>The CFC chart is not triggered by a status change of information with a set test bit. The initial state of the information (state before test bit was set) is not processed during execution of the CFC chart.<br>• CFC chart itself is in test state:<br>The CFC chart continues to process the information (indication or measured value) normally. The CFC outgoing information is provided with a test bit. The definitions in this table apply to its continued processing.<br>A CFC chart can be set to the test state by switching the entire device to test mode or by using the CFC block CHART_STATE to switch a single CFC chart to Test mode.</td></tr>
<tr><td></td><td>Protocol</td><td>Indication and measured value are transmitted with set test bit, provided that the protocol supports this functionality.<br>If an object is transmitted as a GOOSE message, the test bit is set spontaneously and the GOOSE message is transmitted immediately. The receiver of the GOOSE message is automatically notified of transmitter test mode.<br>If an object is transmitted via the protection interface, the test bit is not transmitted. The Test state must also be transmitted as information for this state to be taken into account in the application on the receiver side. You must route the Test signal in the DIGSI 5 project tree → Device → Communication routing.<br>The test mode of the differential protection is dealt with separately in the application.</td></tr>
<tr><td>Test/Relay blk.</td><td colspan="2">The function works as described under Test. All output information (indications) of this function which is routed to a relay is blocked.<br>All output information from the function (indications and, if available, measured values) is provided with a test bit. This test bit significantly influences the further processing of the information, depending on the target.<br>Logics outside this function block, for example, superordinate group indications, are not affected by the blocking. If the state of these functions allows the processing of indications with a test bit (target function in the state Test or Test/Relay blk.), the output information routed to a relay continues to the control of the relays.</td></tr>
</table>

### Health

Health signals if a selected function can perform its designated functionality. If so, the health is *OK*. In case the functionality is only possible in a limited way or not at all, due to state or problems within the device, the health will signal *Warning* (limited functionality) or *Alarm* (no functionality).

Internal self-monitoring can cause functions to assume the health state *Alarm* (see *8 Supervision Functions*). If a function assumes the health state *Alarm*, it is no longer active (indication *not active* is generated).

Only a few functions can signal the health state *Warning*. The health state *Warning* results from function-specific supervision and - where it occurs - it is explained in the function description. If a function assumes the *Warning* status, it will remain active, that is, the function can continue to work in a conditional manner and trip in the case of a protection function.

### Not Active

The indication *Inactive* signals that a function is currently not working. The indication *Inactive* is active in the following cases:

- Function is disabled
- The function is in the health state *Alarm*
- Function is blocked by an input signal (see *Figure 2-8*)
- All protection-function steps are disabled via the *Enable protection* controllable (state = false). The indication *Protection inactive* is active.
- The function is briefly *Inactive* when exiting the state **Test**.

### Blocking of the Operate Indication, No Fault Recording at Pickup

With the parameter **Blk. Op. Ind. & Fault Rec.** , you define whether a function works as a protection or a monitoring function. Further, you use this to determine the type and scope of the logging (see following table).

| Parameter Value | Description |
|---|---|
| ***No*** | The function works as a protection function. It generates an operate indication and starts fault recording with pickup. During fault recording, a fault is created and logged as a fault record in the fault log. |
| ***Yes*** | The function works as a supervision function. The logic runs normally, but without creating the operate indication. The time-out indication is still generated and can be processed further if necessary. No fault recording starts with pickup. |

**NOTE**

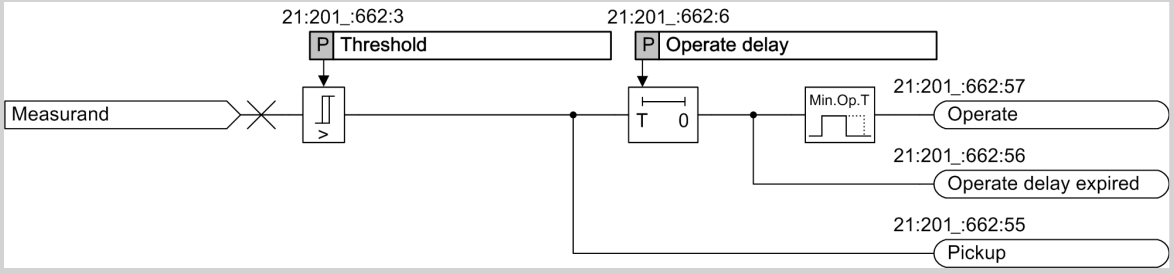
With the IEC 61850 structure editor, you can assign the logical nodes (LN) of the stages of a function to different logical devices (LD).

Always assign all LNs of a function to the same LD.

# 2.4 Text Structure and Reference Number for Settings and Indications

Each parameter and each indication has a unique reference number within every SIPROTEC 5 device. The reference number gives you a clear reference, for example, between an indication entry in the buffer of the device and the corresponding description in the manual. You can find the reference numbers in this document, for example, in the application and setting notes, in the logic diagrams, and in the parameter and information lists.

In order to form unique texts and reference numbers, each function group, function, function block/stage, and indication or parameter has a text and a number. This means that structured overall texts and numbers are created.



The structure of the texts and reference numbers follows the already shown in *Figure 2-1*, hierarchy:

- Function group:Function:Stage/Function Block:Indication
- Function group:Function:Stage/Function Block:Parameter

The colon serves as a structure element to separate the hierarchy levels. Depending on the functionality, not all hierarchy levels are always available. Function Group and Stage/Function block are optional. Since the function groups, functions as well as tripping stages/function blocks of the same type can be created multiple times, a so-called instance number is added to these elements.

**EXAMPLE**

The structure of the text and reference number is shown in the protection-function group **Line** as an example of the parameter **`Threshold value`** and the indication **`Pickup`** of the 2nd definite-time overcurrent protection stage of the function **Overcurrent protection, phases** (see *Figure 2-9*). Only one function and one function group exist in the device. The representation of the stage is simplified.

[lo_stuumz_1_en_US]

Figure 2-9 Stage of the Overcurrent Protection Function, Phases (without Representation of Stage Control)

The following table shows the texts and numbers of the hierarchy elements concerned:

| | Name | Number of the Type | Instance Number |
|---|---|---|---|
| Protection function group | Line | 2 | 1 |
| Function | Overcurrent 3ph | 20 | 1 |
| Stage | Definite-time overcurrent protection | 66 | 2 |
| Settings | Threshold value | 3 | – |
| Indication | Pickup | 55 | – |

The instance numbers arise as follows:

- Function group: Line **1**
  **1** instance, because only one **Line** function group exists in the device
- Function: Overcurrent 3ph **1**
  **1** instance, because only one **Overcurrent 3ph** function exists in the **Line** function group

- Stage: Definite-time overcurrent protection **2**

  **2** instances, because 2 definite-time overcurrent protection stages exist in the **Overcurrent 3ph** function (here the 2nd instance as an example)

This results in the following texts and numbers (including the instance numbers):

| **Parameter:** | **Number** |
|---|---|
| Line 1:Overcurrent 3-ph 1:Definite-time overcurrent protection 2:Threshold value | 21:201:662:3 |
| **Indication:** | **Number** |
| Line 1:Overcurrent 3-ph 1:Definite-time overcurrent protection 2:Pickup | 21:201:662:55 |

The structure is simplified accordingly for parameters and indications with fewer hierarchy levels.

# 2.5 Information Lists

For the function groups, functions, and function blocks, settings and miscellaneous signals are defined that are shown in the settings and information lists.

The information lists merge the signals. The data type of the information may differ. Possible data types are ENS, ACD, ACT, SPS and MV.

One type is assigned to the individual data types. The following table shows the possible types:

| Type | Meaning |
|---|---|
| **I** | **I**nput – input signal |
| **O** | **O**utput – output signal |
| **C** | **C**ontrollable – control signal |

**EXAMPLE:**

The following table shows the types for some data types as examples:

| Data Type | Type |
|---|---|
| ENS | O |
| ACD | O |
| ACT | O |
| SPS | I or O |
| SPC | C |
| MV | O |

For further information, refer to *3.8.2 Basic Data Types*.

# 3 System Functions

| | | |
|---|---|---|
| 3.1 | Indications | 76 |
| 3.2 | Measured-Value Acquisition | 104 |
| 3.3 | Sampling-Frequency Tracking and Frequency Tracking Groups | 106 |
| 3.4 | Processing Quality Attributes | 116 |
| 3.5 | Fault Recording | 133 |
| 3.6 | Protection Communication | 142 |
| 3.7 | Date and Time Synchronization | 223 |
| 3.8 | User-Defined Objects | 231 |
| 3.9 | Other Functions | 238 |
| 3.10 | General Notes for Setting the Threshold Value of Protection Functions | 250 |
| 3.11 | Device Settings | 259 |
| 3.12 | Using a SIPROTEC 5 Device as a Client or Merging Unit | 273 |

# 3.1 Indications

## 3.1.1 General

During operation, indications deliver information about operational states. These include:

- Measured data
- Power-system data
- Device supervisions
- Device functions
- Function procedures during testing and commissioning of the device

In addition, indications give an overview of important fault events after a failure in the system. All indications are furnished with a time stamp at the time of their occurrence.

Indications are saved in logs inside the device and are available for later analyses. The following number of indications are saved at least in the respective buffer (depending on the scope of the indications):

- Operational log 2000 indications
- Fault log 1000 indications
- Switching-device log 2000 indications
- Ground-fault log 100 indications
- User-defined log 200 indications
- Motor-starting log 200 indications

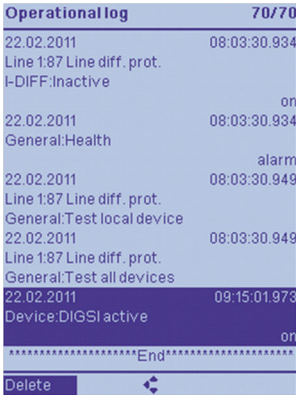
If the maximum capacity of the user-defined log or of the operational log is exhausted, the newest entries overwrite the oldest entries. If the maximum capacity of the fault log or of the ground-fault log is reached, the number of the last fault is output via the signal **Fault recording buffer is full**. You can route this signal in the information routing. If indications in the information routing of DIGSI 5 are routed to a log, then they are also saved. During a supply-voltage failure, recorded data are securely held by means of battery buffering or storage in the flash memory. You can read and analyze the log from the device with DIGSI 5. The device display and navigation using keys allow you to read and analyze the logs on site.

Indications can be output spontaneously via the communication interfaces of the device and through external request via general interrogation. In DIGSI 5, indications can be tracked spontaneously duringonline mode in a special indication window. Indications can be made accessible to higher-level control systems through mapping on various communication protocols.

**NOTE**

All indications are assigned to certain device functions. The text of each indication contains the corresponding function designation. You can find explanations of the meaning of indications in the corresponding device functions. However, you can also define indications yourself and group them into your own function blocks. These can be set by binary inputs or CFC logic.

**Reading Indications**



To read the indications of your SIPROTEC 5 device you can use the on-site operation panel of the device or a PC on which you have installed DIGSI 5. The subsequent section describes the general procedure.

## 3.1.2 Reading Indications on the On-Site Operation Panel

**Procedure**

The menus of the logs begin with a header and 2 numbers at the top right corner of the display. The number after the slash signifies the number of indications that are available. The number before the slash indicates

how many indications have just been selected or shown. The end of the indication list is closed with the entry ***END***.

[sc_oprlog, 1, en_US]

Figure 3-1 On-Site Display of an Indication List (Example: Operational Indications)

| Menu Path | Log |
|---|---|
| Main menu → Indications → | Operational log<br>Fault log<br>Switch. device log<br>Ground-fault log<br>Setting-history log<br>User log 1<br>User log 2<br>Motor-starting log<br>Com supervision log |
| Main Menu → Test & Diagnosis → Log → | Device diagnosis<br>Security log<br>Communication log |

To reach the desired log from the main menu, use the navigation keys of the on-site operation panel.

✧ Navigate inside the log using the navigation keys (top/bottom). You will find the most current indication at the top of the list. The selected indication is shown with a dark background.

Which indications can be shown in the selected log depends on the assignments in the DIGSI 5 information routing matrix or is predefined. Every indication contains date, time, and its state as additional information.

You will find information about this in chapter *3.1.5.1 General*.

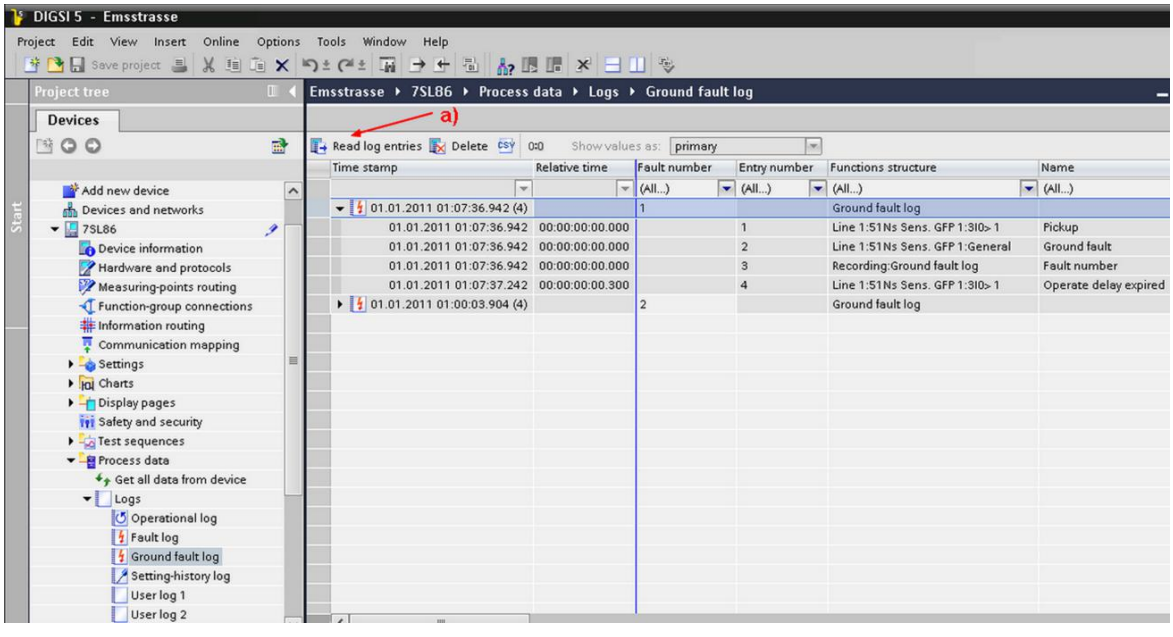
In some logs, you are given the option of deleting the entire indication list by softkey in the footer of the display. To learn more about this, read chapter *3.1.6 Saving and Deleting the Logs*.

**NOTE**

No password entry is necessary to read indications from the device.

## 3.1.3 Reading Indications from the PC with DIGSI 5

**Procedure**



| Menu Path (Project) | Log |
|---|---|
| Project → Device → Process data → Log → | Operational log<br>Fault log<br>Switch. device log<br>Ground-fault log<br>Setting-history log<br>User log 1<br>User log 2<br>Motor-starting log<br>Com supervision log |
| Online access → Device → Device information → **Logs** tab → | Device-diagnosis log<br>Security indications |
| Online access → Device → Test suite → Communication module → Hardware[3] | Communication log |

To read the indications with DIGSI 5 your PC must be connected via the **USB user interface** of the on-site operation panel or via an **Ethernet interface** of the device. You can establish a direct connection to your PC via the Ethernet interfaces. It is also possible to access all connected SIPROTEC 5 devices via a data network from your DIGSI 5 PC.

✧ You reach the desired logs of the SIPROTEC 5 device using the project-tree window. If you have not created the device within a project, you can also do this via the **Online access** menu item.

After selecting the desired log, you are shown the last state of the log loaded from the device. To update, it is necessary to synchronize with the log in the device.

✧ Synchronize the log. For this purpose, click the appropriate button in the headline of the log (see the ground-fault indications example in *Figure 3-2* a)).

[sc_grfimd, 1, en_US]

Figure 3-2 DIGSI 5 Display of an Indication List (Example of Ground-Fault Log)

3 There may potentially be several communication modules to select from

You will find additional information about deleting and saving logs in chapter *3.1.6 Saving and Deleting the Logs*.

Which indications can be shown in the selected log depends on the assignments in the DIGSI 5 information routing matrix or is predefined. You will find information about this in chapter *3.1.5.1 General*.

**Setting Relative Time Reference**

✧ Reference the display of log entries, if needed, to the real time of a specific entry. In this way, you determine a relative time for all other indications. The real-time stamps of events remain unaffected.

## 3.1.4 Displaying Indications

Displayed indications are supplemented in DIGSI 5 and on the on-site operation panel with the following information:

Table 3-1 Overview of Additional Information

| Indications in | DIGSI 5 Information | Device Display Information |
|---|---|---|
| Log for operational indications and log for user-defined and switching-device indications | Time stamp (date and time),<br>Relative time,<br>Entry number,<br>Function structure,<br>Name,<br>Value,<br>Quality,<br>Cause,<br>Number | Time stamp (date and time),<br>Function structure,<br>Name,<br>Value |
| Log for fault indications | Time stamp (date and time),<br>Relative time,<br>Fault number,<br>Entry number,<br>Function structure,<br>Name,<br>Value,<br>Quality,<br>Cause,<br>Number | Time stamp (date and time),<br>Fault number,<br>Value |
| Log for motor-starting indications | Time stamp (date and time),<br>Motor-starting time,<br>Starting current,<br>Starting voltage,<br>Starting duration | Time stamp (date and time),<br>Function structure,<br>Name,<br>Value |

| Indications in | DIGSI 5 Information | Device Display Information |
|---|---|---|
| Log for ground-fault indications | Time stamp (date and time),<br>Relative time,<br>Fault number,<br>Entry number,<br>Function structure,<br>Name,<br>Value,<br>Indication number,<br>Quality,<br>Cause,<br>Number | Time stamp (date and time),<br>Fault number,<br>Value |
| Log for parameter changes | Time stamp (date and time),<br>Relative time,<br>Entry number,<br>Function structure,<br>Name,<br>Value,<br>Quality,<br>Cause,<br>Number | Time stamp (date and time),<br>Function structure,<br>Name,<br>Value |
| Spontaneous indication window (DIGSI 5) | Time stamp (date and time),<br>Relative time,<br>Indication,<br>Value,<br>Quality,<br>Additional Information | Time stamp (date and time),<br>Fault number,<br>Value |
| Log for safety indications[4] | Time stamp (date and time),<br>Indication number,<br>Indication | Time stamp (date and time),<br>Indication |
| Log for device-diagnostic indications[4] | Time stamp (date and time),<br>Indication number,<br>Indication | Time stamp (date and time),<br>Indication |
| Log for communication indications[4] | Time stamp (date and time),<br>Indication number,<br>Indication | Time stamp (date and time),<br>Indication |
| Log for communication supervision (GOOSE) | Time stamp (date and time),<br>Relative time,<br>Entry number,<br>Function structure,<br>Name,<br>Value,<br>Quality,<br>Cause,<br>Number | Time stamp (date and time),<br>Function structure,<br>Name,<br>Value |

4 Only online access

### Overview of Displayed Quality Attributes

If values are shown on the device display or in DIGSI, the following quality attributes are different for measured values and metered values.

Table 3-2 Measured Values

| IEC 61850 | | | | Device Display/ DIGSI | Description |
|---|---|---|---|---|---|
| Detail Quality | Validity | | | | |
| | Good | Invalid | Questionable | | |
| – | X | | | Value | The measured value is valid. |
| Failure | | X | | Fault | The device is defective. Contact Support. |
| Inaccurate | | | X | --- | The measured value was not calculated (for example, the angle between current and voltage if 1 of the 2 variables is missing). |
| Bad Reference | | | X | ≈ Value | The measured value can be inaccurate (for example, outside the frequency-tracking range). |
| Out of Range | | | X | > Value | The measured value exceeds the measuring range. |

Table 3-3 Metered Values

| IEC 61850 | | | Device Display/ DIGSI | Description |
|---|---|---|---|---|
| Validity | | | | |
| Good | Invalid | Questionable | | |
| X | | | Value | The metered value is invalid. |
| | X | | --- | The metered value was not calculated. |
| | | X | ≈ Value | The metered value has no reference. |

### Indication Columns

The following table shows the meaning of the individual columns in the log:

| Indication Column | Meaning |
|---|---|
| Time stamp | Time stamp of the indication in device time using the local time zone of the device or the query time for the motor log |
| Relative time | Relative time to a reference entry |
| Error number | Number of the error that occurred in the device. This number increments continuously. |
| Entry number | Entry identification of buffer entries. This identification displays the sequence of buffer entries. |
| Indication number | Number of the indication that occurred in the device. This number increments continuously and is necessary for an analysis by Siemens. |
| Indication | Indication text |
| Function structure | Path of the signal with the signal name |
| Name | Signal name |
| Value | Current state of the command. Also pay attention to the value quality to check whether the value is up to date. |

| Indication Column | Meaning |
|---|---|
| Quality | The quality of the value shows the source of the value and whether the value is up to date. |
| Cause | Additional information such as the cause and validity |
| Number | DIGSI address of the signal |
| Motor startup time | Time of motor starting |
| Starting current | Current needed by the motor to start up |
| Starting voltage | Voltage needed by the motor to start up |
| Start duration | Time needed by the motor to start up |

## 3.1.5 Logs

### 3.1.5.1 General

Indications are saved in logs inside the device and are available for later analyses. Different logs allow categorization of indication logging based on operating states (for example, operational and fault logs) and based on fields of application.

Table 3-4 Log Overview

| Log | Logging |
|---|---|
| Operational log | Operational indications |
| Fault log | Fault indications |
| Switching-device log | Switching operation and circuit-breaker statistics |
| Ground-fault log | Ground-fault indications |
| Setting-history log | Setting changes |
| User-defined log | User-defined indication scope |
| Security log | Access with safety relevance |
| Device-diagnosis log | Error of the device (software, hardware) and the connection circuits |
| Communication log | Status of communication interfaces |
| Motor-starting log | Information on the motor starting |
| Communication-supervision log | Communication supervision (GOOSE) |

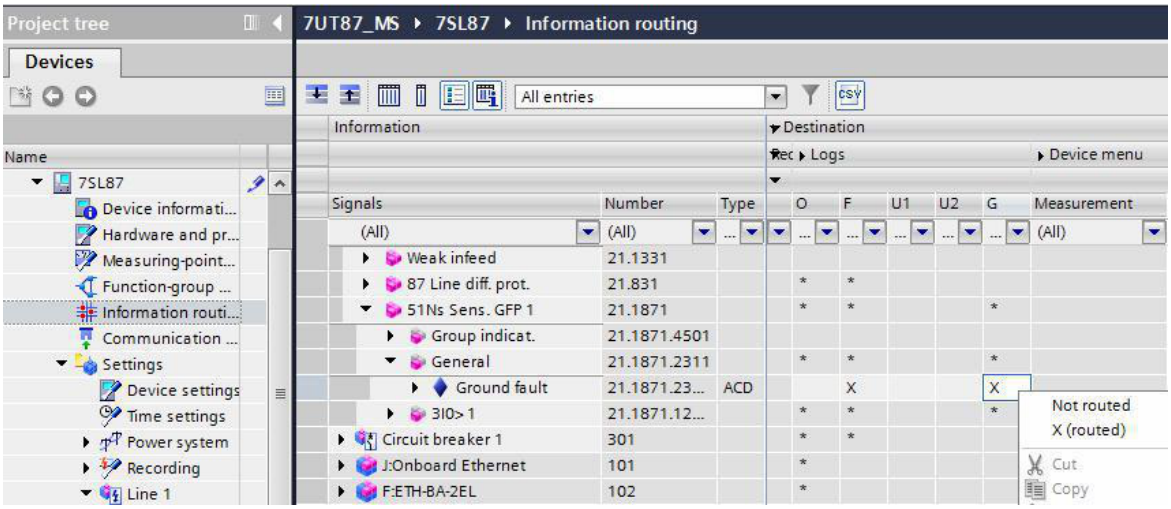
#### Log Management

Logs have a ring structure and are automatically managed. If the maximum capacity of a log is exhausted, the oldest entries disappear before the newest entries. If the maximum capacity of the fault or ground-fault log is reached, the number of the last fault is output via the signal **Fault recording buffer is full**. You can route this signal in the information routing. If indications in the information routing of DIGSI 5 are routed to a log, then they are also saved. During a supply-voltage failure, recorded data are securely held by means of battery buffering or storage in the flash memory. You can read and analyze the log from the device with DIGSI 5. The device display and the navigation allow you to read and evaluate the logs on site using keys.

#### Configurability of Logs

The indication capacity to be recorded in configurable logs (for example, ground-fault log) is laid down in columns of the information routing (matrix) of DIGSI 5 specifically defined for this purpose.

#### Procedure



To reach the information routing of your SIPROTEC 5 device, use the project-tree window. Access is only through the project:

- Open the information routing.
  Project → Device → **Information routing**

- Select the appropriate routing column.
  Destination → Logs → Column **Ground-fault log (G)**

The routing of the selected indication is done via right click.

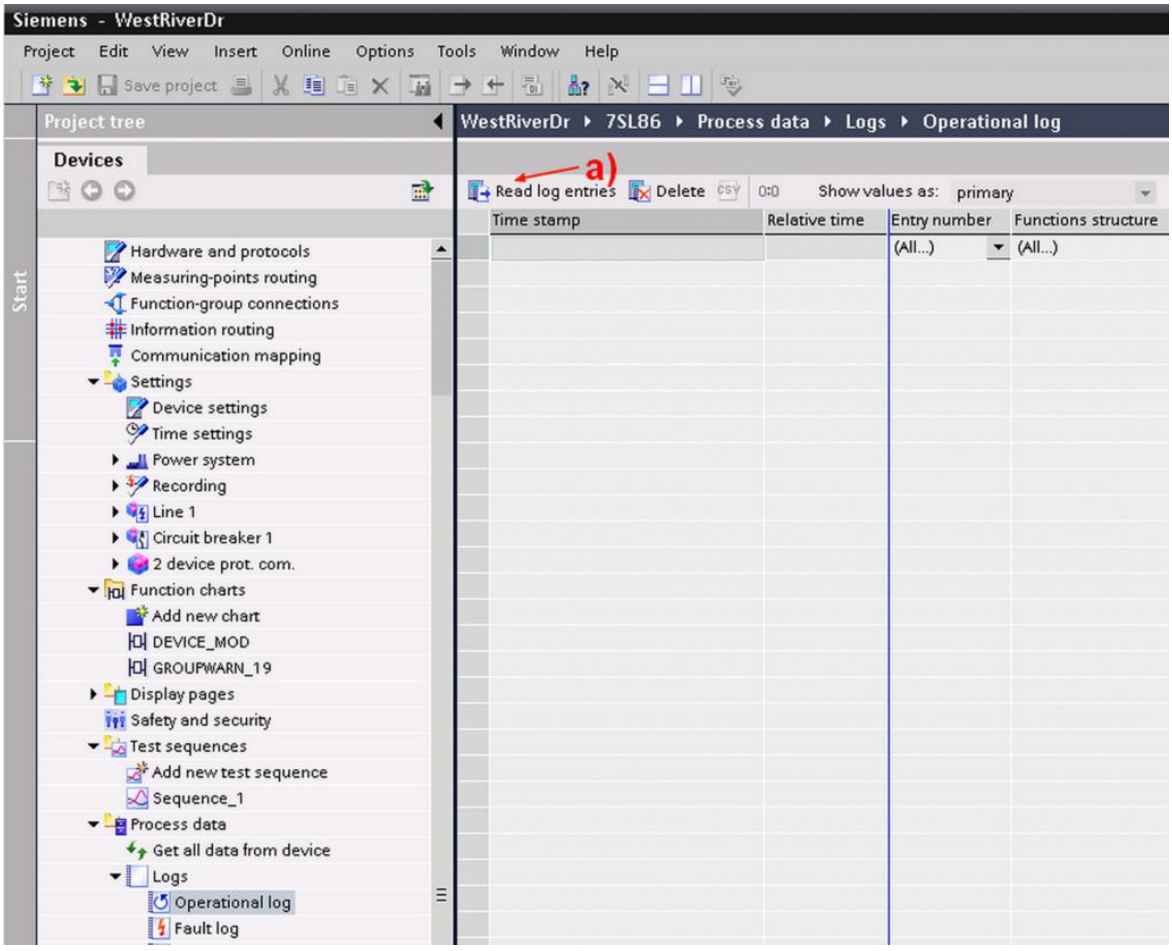
- Select one of the options in the list box shown:
  - Routed (X)
  - Unrouted

[sc_infpuf, 2, en_US]

Figure 3-3 Indication Configuration in DIGSI 5 (Example: Ground-Fault Log, Column G)

For non-configurable logs (for example, setting-history logs) scope and type of logged indications are described separately (see following chapter about logs).

### 3.1.5.2 Operational Log



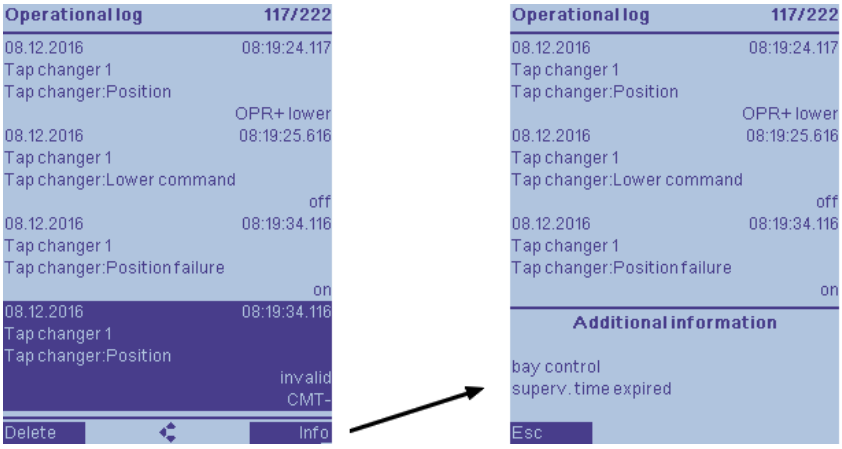
Operational indications are information that the device generates during operation. This includes information about:

- State of device functions
- Measured data
- Power-system data

Exceeding or dropping below limiting values is output as an operational indication. Short circuits in the network are indicated as an operational indication **Fault** with sequential fault number. For detailed information about the recording of system incidents, refer to the description of the fault log (chapter *3.1.5.3 Fault Log*). Up to 2000 indications can be stored in the operational log.

#### Reading from the PC with DIGSI 5

- To reach the operational log of your SIPROTEC 5 device, use the project-tree window.
  Project → Device → Process Data → Log → **Operational log**
- The status of the operational log last loaded from the device is shown to you. To update (synchronization with the device), click the button **Read log entries** in the headline of the indication list (*Figure 3-4* a)).



[sc_betrmd, 1, en_US]

Figure 3-4 Reading the Operational Log with DIGSI 5

**Reading on the Device via the On-Site Operation Panel**

- To reach the operational log via the main menu, use the navigation keys of the on-site operation panel.
  Main Menu → Indications → **Operational log**
- You can navigate within the displayed indication list using the navigation keys (up/down) on the on-site operation panel.
- Using the **Info** softkey, you can retrieve auxiliary information on the entry depending on the context.

[sc_operlog1_2_en_US]

Figure 3-5 On-Site Display of an Indication List (Example: Operational Indications)

### Deletability

The operational log of your SIPROTEC 5 device can be deleted. This is done usually after testing or commissioning the device. To know more about this, read chapter *3.1.6 Saving and Deleting the Logs*.

### Configurability

The indication scope of the operational log is configured in a specifically defined column of the information routing (matrix) of DIGSI 5:

Target → Log → **Operational log** column

Selected application templates and functions from the library bring with them a predefined set of operational indications which you can adjust individually at any time.

## 3.1.5.3 Fault Log

Fault indications are events which arise during a fault. They are logged in the fault log with real-time stamp and relative-time stamp (reference point: fault occurrence) . Faults are numbered consecutively in rising order. With fault recording engaged, a corresponding fault record with the same number exists for every fault logged in the fault log. A maximum of 128 fault logs can be stored. A maximum of 1000 indications can be recorded in each fault log.

### Fault Definition

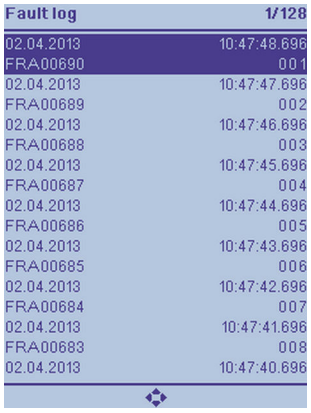
In general, a fault is started by the raising pickup of a protection function and ends with the cleared pickup after the trip command.

When using an automatic reclosing function, the complete reclosing cycle (successful or unsuccessful) is preferably integrated into the fault. If evolving faults appear within reclosing cycles, the entire clearing process is logged under one fault number even in multiple pickup cycles. Without automatic reclosing function every pickup is also recorded as its own fault.

User-defined configuration of a fault is also possible.

**NOTE**

The definition of the fault is done through settings of the fault recording (see Device manual). Events are logged in the fault log even when fault recording is switched off.



Apart from the recording of fault indications in the fault log, spontaneous display of fault indications of the last fault on the device display is also done. You will find details about this in chapter *3.1.8 Spontaneous Fault Display on the On-Site Operation Panel*.

**Deletability**

The fault log of your SIPROTEC 5 device can be deleted. For more details about this, refer to chapter *3.1.6 Saving and Deleting the Logs*.

**Reading on the Device through the On-Site Operation Panel**

- To reach the fault log from the main menu, use the navigation keys of the on-site operation panel.
  Main Menu → Indications → **Fault logs**
- You can navigate within the displayed indication list using the navigation keys (up/down) on the on-site operation panel.

[sc_faullg, 1, en_US]

Figure 3-6 Reading the Fault Log on the On-Site Operation Panel of the Device

**Configurability**

The indication scope of the fault log is configured in a specifically defined column of the information routing (matrix) of DIGSI 5:

Target → Log → **Fault log** column

Selected application templates and functions from the library already bring a predefined set of operational indications with them which you can adjust individually at any time.

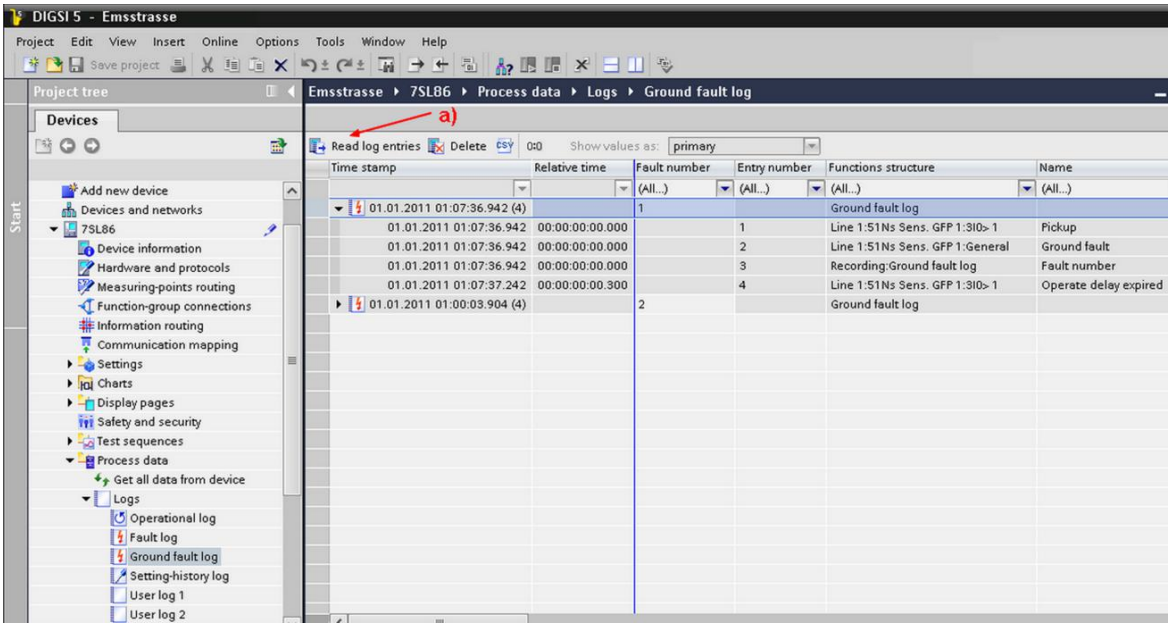
The operational measured values and the measured values of the fundamental components and symmetrical components (see Device Manual) are calculated every 9 cycles (at 50 Hz, this is every 180 ms). However, this can mean that the data are not synchronized with the sampled values of the analog channels. The recording of these measured values can be used to analyze the slowly changing processes.

### 3.1.5.4 Ground-Fault Log

Ground-fault indications are events which arise during a ground fault. They are logged in the ground-fault log with real-time stamp and relative-time stamp (reference point: ground-fault occurrence). Ground faults are numbered consecutively in rising order. A maximum of 10 ground-fault logs are stored, and for each ground-fault log it is guaranteed that at least 100 indications are recorded.

The following functions can start the logging of a ground fault with the raising ground-fault indication:

- **Directional sensitive ground-fault protection for deleted and isolated systems** (67Ns)
- **Sensitive ground current protection with I0** (50Ns/51Ns)
- **Intermittent ground-fault protection**



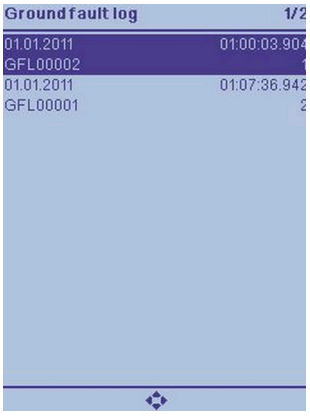
The logging ends with the clearing ground-fault indication.

**Reading from the PC with DIGSI 5**

- To reach the ground-fault log of your SIPROTEC 5 device, use the project-tree window.
  Project → Device → Process data → Logs → **Ground-fault log**

The status of the device-diagnosis log last loaded from the ground-fault log is shown to you.

- To update (synchronization with the device) click the button **Read log entries** in the headline of the indication list (*Figure 3-7* a)).



[sc_grflmd, 1, en_US]

Figure 3-7 Reading the Ground-Fault Log with DIGSI 5

### Reading on the Device through the On-Site Operation Panel

- To reach the ground-fault log from the main menu, use the navigation keys of the on-site operation panel.
  Main menu → Indications → **Ground-fault indication**
- You can navigate within the displayed indication list using the navigation keys (up/down) on the on-site operation panel.

[scgfllg1-191012-01.tif, 1, en_US]

Figure 3-8 Reading the Ground-Fault Log on the On-Site Operation Panel of the Device

### Deletability

The ground-fault log of your SIPROTEC 5 device can be deleted. Read details about this in chapter *3.1.6 Saving and Deleting the Logs*.

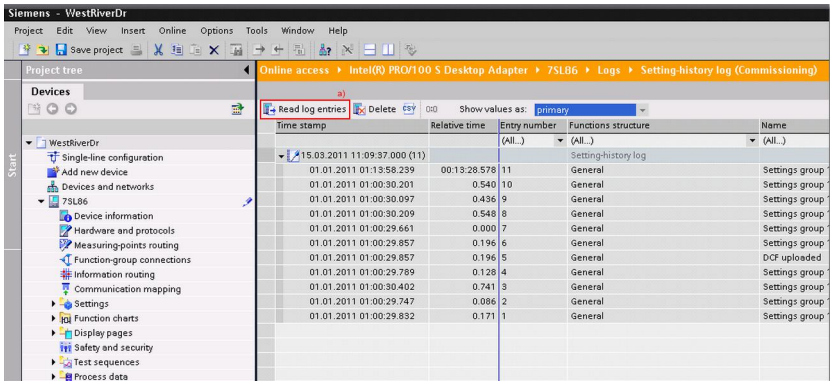
### Configurability

The indication scope of the ground-fault log is configured in a specifically defined column of the information routing (matrix) of DIGSI 5:

Target → Log → Column **Ground-fault log**

Selected application templates and functions from the library already bring a predefined set of operational indications with them which you can adjust individually at any time.

## 3.1.5.5 Setting-History Log



All individual setting changes and the downloaded files of entire parameter sets are recorded in the log for setting changes. This enables you to determine setting changes made are associated with events logged (for example faults). On the other hand, it is possible to obtain verification with fault analyses, for example, that the current status of all settings truly corresponds to their status at the time of the fault. Up to 200 indications can be stored in the setting-history log.

### Reading from the PC with DIGSI 5

- To reach the log for setting changes of your SIPROTEC 5 device, use the project-tree window.
  Project → Device → Process data → Log → **Setting changes**

The status of the setting-history log last loaded from the device is shown to you.

- To update (synchronization with the device), click the **Read log entries** button in the headline of the indication list (*Figure 3-9*).

[sc_paramd, 1, en_US]

Figure 3-9 Reading the Setting-History Log with DIGSI 5

### Reading on the Device through the On-Site Operation Panel

- To reach the setting-history log from the main menu, use the navigation keys of the on-site operation panel.
  Main menu → Indications → **Setting changes**
- You can navigate within the displayed indication list using the navigation keys (up/down) on the on-site operation panel.

[sc_hislog, 1, en_US]

Figure 3-10 Reading the Setting-History Log on the On-Site Operation Panel of the Device

### Indication Categories in the Setting-History Log

For this log, there is selected information that is stored in case of successful as well as unsuccessful setting changes. The following list gives you an overview of this information.

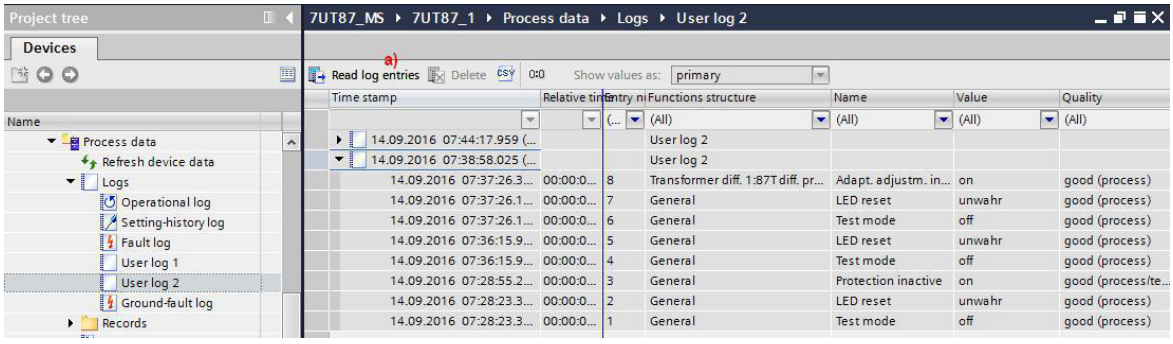
Table 3-5 Overview of Indication Types

| Displayed Information | Explanation |
|---|---|
| Selection edit+ | Selection of settings group to be edited |
| Cancelation+ | Cancelling of all changes successful |
| SG activation+ | SG activation via command successful |
| SG activation- | SG activation via command failed |
| Set+ | Parameter value was changed |
| Confirmation+ | Confirmation of change successful |
| Confirmation- | Confirmation of change failed |
| DCF uploaded | DCF loaded into device |
| SG 1 | Settings group 1 |
| SG 2 | Settings group 2 |
| SG 3 | Settings group 3 |
| SG 4 | Settings group 4 |
| SG 5 | Settings group 5 |
| SG 6 | Settings group 6 |
| SG 7 | Settings group 7 |
| SG 8 | Settings group 8 |

**NOTE**

- The logged indications are preconfigured and cannot be changed!
- The log, which is organized as a ring buffer, cannot be deleted by the user!
- If you want to archive security-relevant information of the device without loss of information, you must regularly read this log.
- You cannot route additional indication objects to the setting-history log.

### 3.1.5.6 User Log



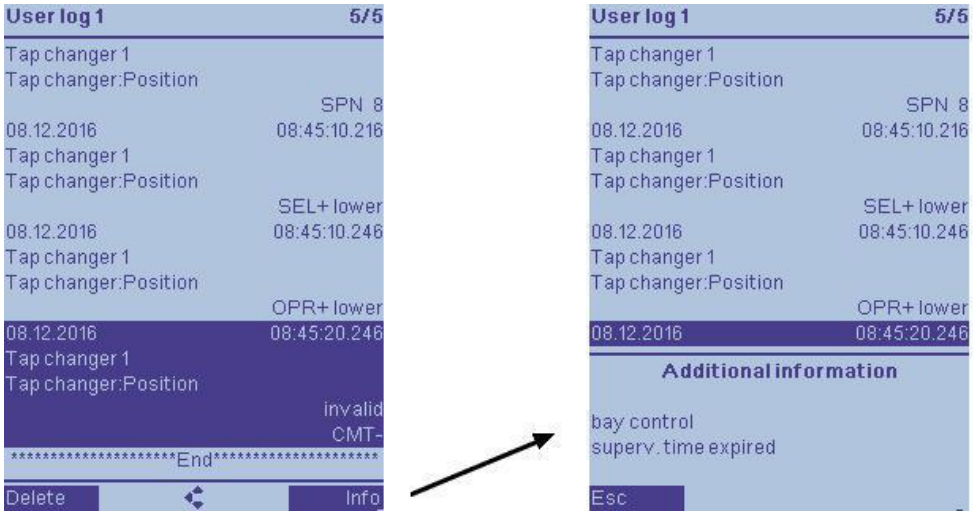
With the user-defined log (up to 2), you have the possibility of individual indication logging parallel to the operational log. This is helpful, for example, in special monitoring tasks but also in the classification into different areas of responsibility of the logs. Up to 200 indications can be stored in the user-defined log.

**Reading from the PC with DIGSI 5**

- To reach the user-defined log of your SIPROTEC 5 device, use the project-tree window.
  Project → Device → Process Data → Log → **User log 1/2**

The status of the user-defined log last loaded from the device is shown to you.

- To update (synchronization with the device), click the **Read log entries** button in the headline of the indication list (*Figure 3-11* a)).



[sc_application_md, 2, en_US]

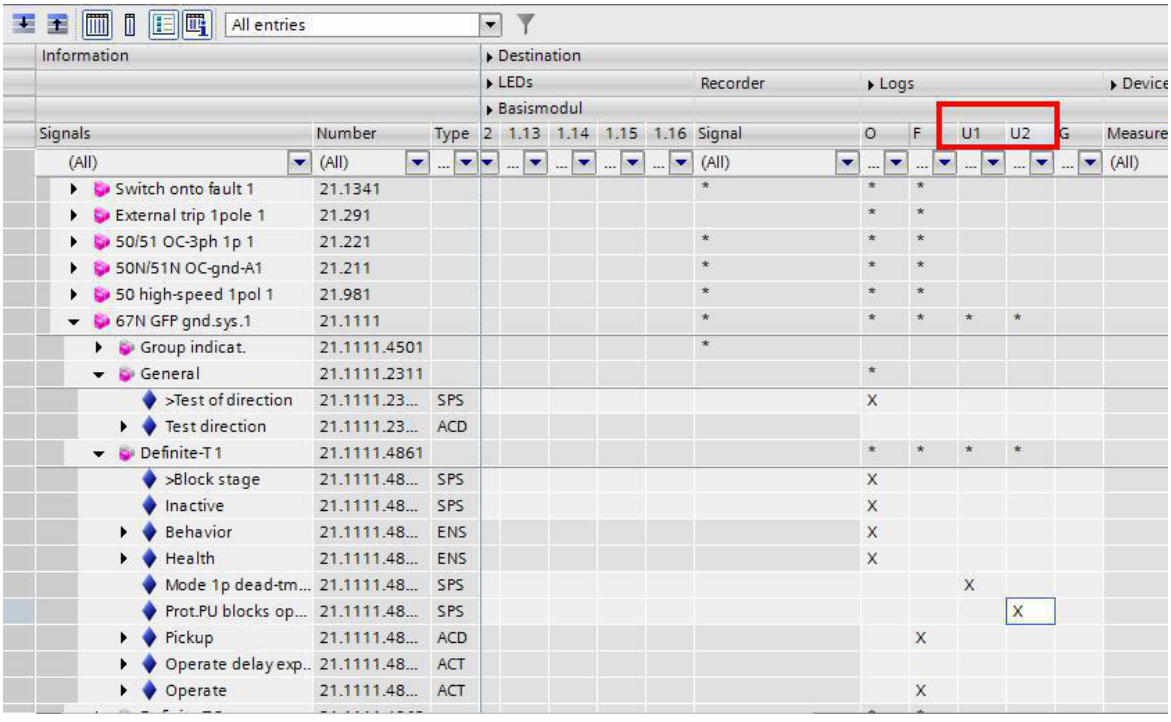
Figure 3-11 Reading the User-Defined Log with DIGSI 5

**Reading on the Device through the On-Site Operation Panel**

- To reach user-specific logs from the main menu, use the navigation keys of the on-site operation panel.
  Main Menu → Indications → **User-defined log 1/2**
- You can navigate within the displayed indication list using the navigation keys (up/down) on the on-site operation panel.
- Using the **Info** softkey, you can retrieve auxiliary information on the entry depending on the context.

[sc_userlog1, 1, en_US]

Figure 3-12 Reading the User-Defined Log on the On-Site Operation Panel of the Device



### Deletability

The user-defined log of your SIPROTEC 5 device can be deleted. You will find details about this in chapter *3.1.6 Saving and Deleting the Logs*.

### Configuration of a User-Defined Log

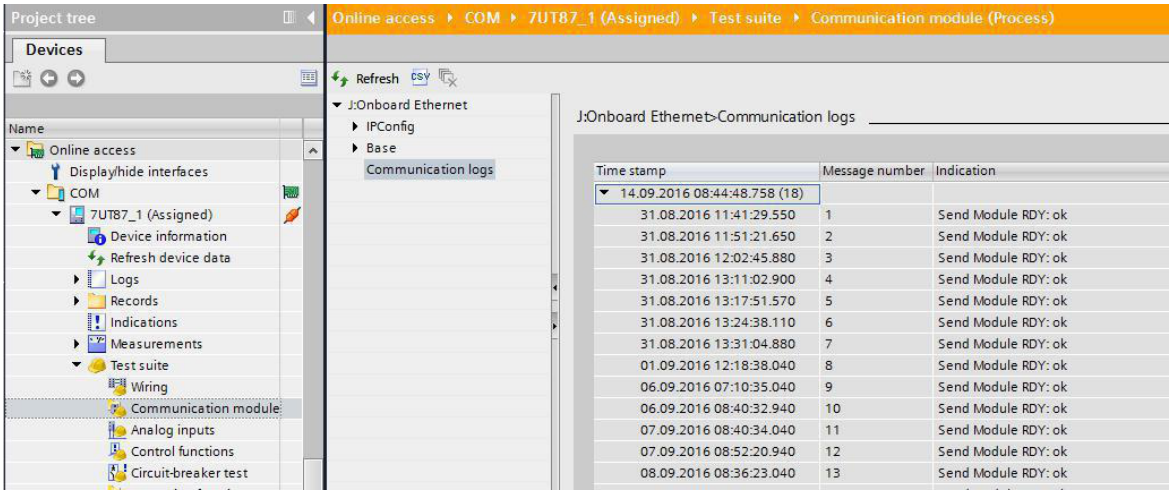
The indication capacity of a created user-defined log can be configured freely in the associated column of the information routing (matrix) of DIGSI 5:

Target → Log → U1 or U2

[sc_diu1u2, 1, en_US]

Figure 3-13 Indication Configuration in DIGSI 5 (Example: User-Defined Log U1/2)

## 3.1.5.7 Communication Log



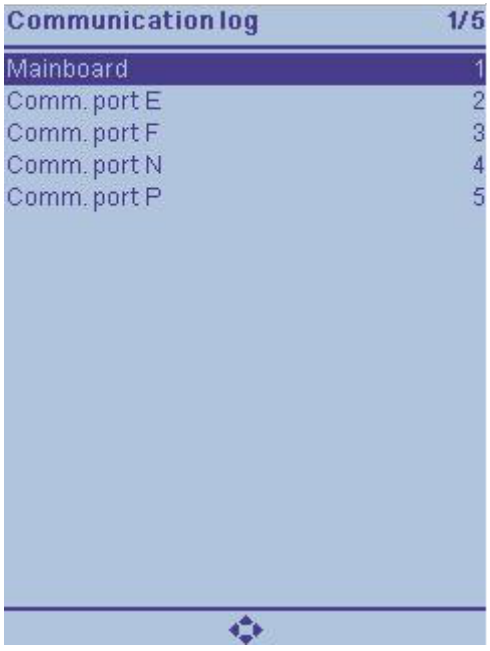
The logging of the respective status such as ensuing faults, test and diagnosis operation, and communication capacity utilizations is done for all hardware-based configured communication interfaces. Up to 500 indications can be stored in the communication log. Logging occurs separately for each communication port of the configured communication modules.

### Reading from the PC with DIGSI 5

- Use the project-tree window to reach the communication logs of your SIPROTEC 5 device.
  Online access → Device → Test suite → Communication module
- Then select:
  J:Onboard Ethernet → **Communication log**

The communication log is shown to you in the state last loaded from the device.

- Before this, refresh the contents by clicking the update arrows in the headline.



[sc_compuf, 2, en_US]

Figure 3-14 Reading the Communication Log with DIGSI 5

### Reading on the Device through the On-Site Operation Panel

- To reach the communication log from the main menu, use the navigation keys on the on-site operation panel.
  Main Menu → Test & Diagnosis → Logs → **Communication logs**
- You can navigate within the displayed indication list using the navigation keys (up/down) on the on-site operation panel.

[sc_commlg, 1, en_US]

Figure 3-15 Reading the Communication Log on the On-Site Operation Panel of the Device

### Deletability

The communication logs of your SIPROTEC 5 device can be deleted. Read details about this in chapter *3.1.6 Saving and Deleting the Logs*.

### Configurability

The communication logs are not freely configurable. The entries are preconfigured.

## 3.1.5.8 Communication-Supervision Log

The communication-supervision log is used to log communication events.
The following events are currently logged:

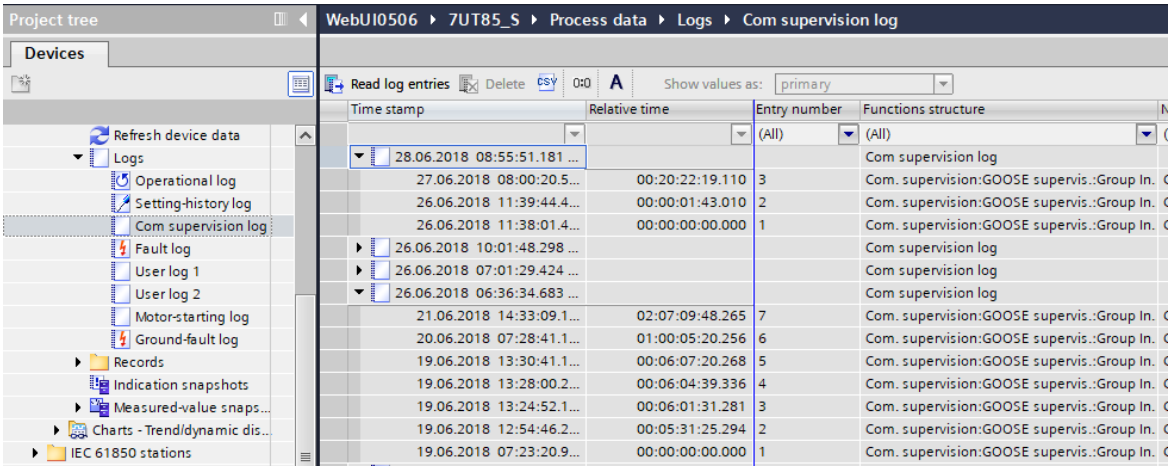
- Status for each GOOSE subscription (if configured)
  A log is kept of whether the GOOSE subscription has received valid messages or not.
- Aggregated status for all GOOSE subscriptions
  The status is **TRUE** if at least one GOOSE subscription does not receive any valid message.
- Subscriber in simulation mode
  GOOSE messages are processed with a simulation flag. The status is **TRUE** if at least one GOOSE subscription processes simulated messages.

### Reading from the PC with DIGSI 5

- To reach the communication-supervision log of your SIPROTEC 5 device, use the project-tree window.
  Project → Device → Process data → Logs → **Com supervision log**

The status of the communication-supervision log last loaded from the device is shown.

- To update (synchronization with the device), click the button **Read log entries** in the headline of the indication list.



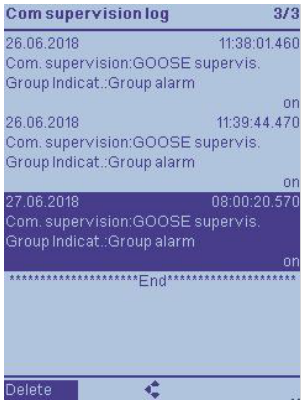


Figure 3-16 Reading the Communication-Supervision Log with DIGSI 5

### Reading on the Device through the On-Site Operation Panel

- To reach the communication-supervision log from the main menu, use the navigation keys on the on-site operation panel.
  Main menu → Logs → **Com supervision log**
- You can navigate within the displayed indication list using the navigation keys (up/down) on the on-site operation panel.

[sc_comsupervlg, 1, en_US]

Figure 3-17 Reading the Communication-Supervision Log on the On-Site Operation Panel of the Device

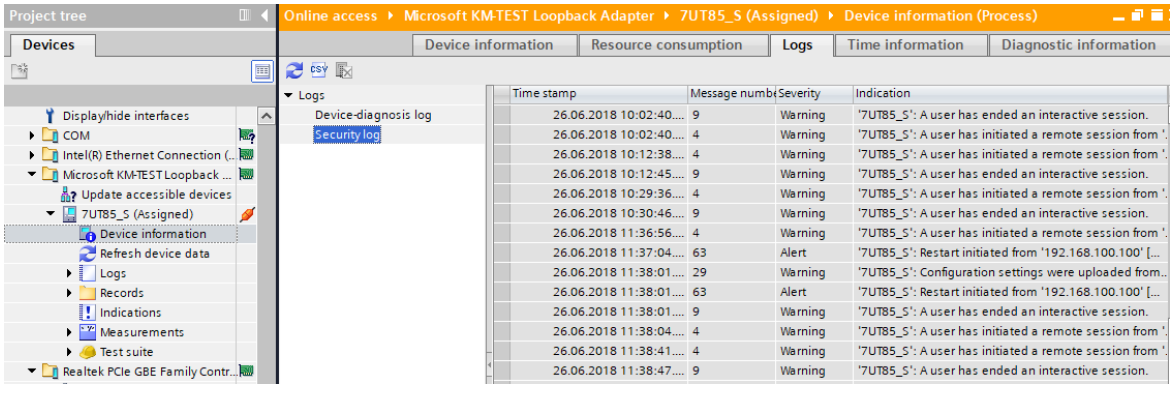
**Deletability**

The communication-supervision log of your SIPROTEC 5 device can be deleted. Read details about this in chapter *3.1.6 Saving and Deleting the Logs*.

**Configurability**

The communication-supervision log cannot be freely configured. The entries are preconfigured.

### 3.1.5.9 Security Log



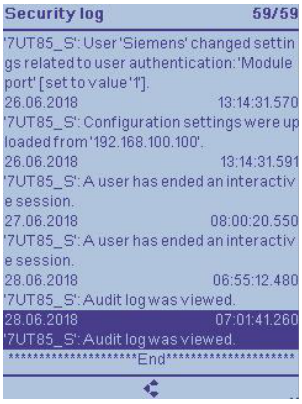
Access to areas of the device with restricted access rights is recorded in the security log. Unsuccessful and unauthorized access attempts are also recorded. Up to 2048 indications can be stored in the security log.

**Reading from the PC with DIGSI 5**

- To reach the security log of your SIPROTEC 5 device, use the project-tree window. The device must be in Online access.
  Project → Online access → Device → Device Information → **Logs** tab → Security logs

The state of the security log last loaded from the device is displayed.

- Before this, refresh the contents by clicking the update arrows in the headline.



[sc_secmld, 2, en_US]

Figure 3-18 Reading the Security Indications with DIGSI 5

**Reading on the Device through the On-Site Operation Panel**

- To reach the security log from the main menu, use the navigation keys of the on-site operation panel.
  Main menu → Test & Diagnosis → Logs → **Security log**
- You can navigate on the on-site operation panel using the navigation keys (top/bottom) inside the displayed indication list.

[sc_seclog, 1, en_US]

Figure 3-19 Reading the Security Log on the On-Site Operation Panel of the Device

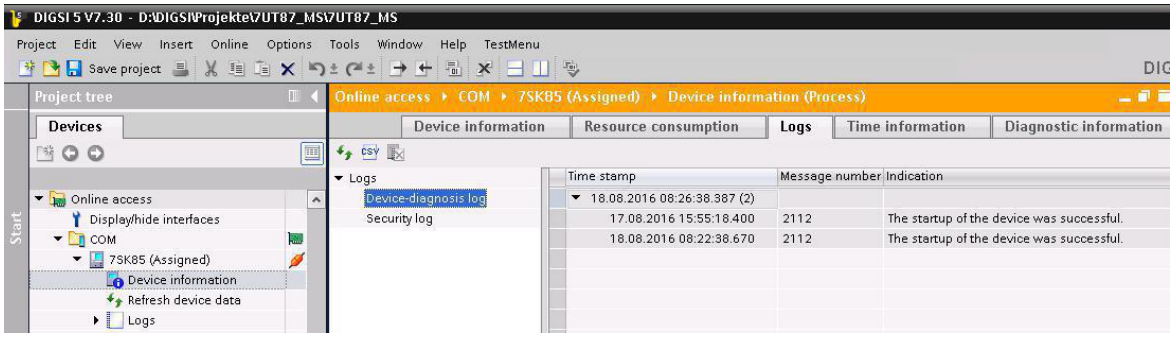
**NOTE**

- The logged indications are preconfigured and cannot be changed!
- This log, which is organized as a ring buffer, cannot be deleted by the user!
- If you want to archive security-relevant information of the device without loss of information, you must regularly read this log.

### 3.1.5.10 Device-Diagnosis Log

Concrete take-action instructions are logged and displayed in the device-diagnosis log for the following items:

- Required maintenance (for example, battery supervision)
- Identified hardware defects
- Compatibility problems



Up to 500 indications can be stored in the device-diagnosis log. In normal operation of the device, it is sufficient for diagnostic purposes to follow the entries of the operational log. This specific significance is assumed by the device-diagnosis log when the device is no longer ready for operation due to hardware defect or compatibility problems and the fallback system is active.

**Reading from the PC with DIGSI 5 in Normal Operation**

- To reach the device-diagnosis log of your SIPROTEC 5 device, use the project-tree window.
  Project → Online access → Device → Device information → **Logs** tab → Device-diagnosis log

The status of the device-diagnosis log last loaded from the device is shown to you.

- Before this, refresh the contents by clicking the update arrows in the headline.

[sc_devdia, 1, en_US]

Figure 3-20 Reading the Device-Diagnosis Log with DIGSI 5

**Reading on the Device through the On-Site Operation Panel in Normal Operation**

- To reach the diagnosis log from the main menu, use the navigation keys of the on-site operation panel.
  Main Menu → Test & Diagnosis → Logs → **Device diagnosis**
- You can navigate on the on-site operation panel using the navigation keys (top/bottom) inside the displayed indication list.

[sc_devdia_01, 1, en_US]

Figure 3-21 Reading the Device-Diagnosis Log on the On-Site Operation Panel of the Device

**NOTE**

- The device-diagnosis log cannot be deleted!
- The logged indications are preconfigured and cannot be changed!

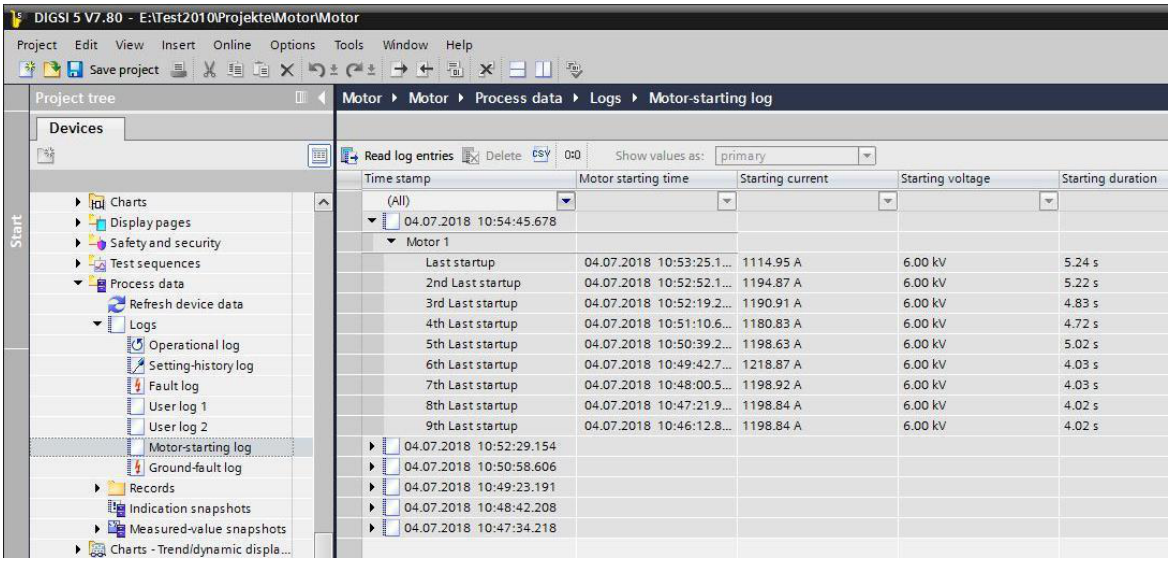
### 3.1.5.11 Motor-Starting Log

The motor-starting log records the starting current, starting voltage and the start duration each time a motor starts. The motor-starting current and the motor-starting voltage are displayed as primary values. Up to 200 indications can be stored in the motor-starting log.

Measurement of the motor statistics starts when the motor state changes to ***Start***. Measurement of the motor starting time ends as soon as the motor state changes to ***Standstill*** or ***Running***. The motor state is obtained from the **Motor-state detection** function.

No entry is recorded in the motor-starting log if the motor state changes to ***Start*** and the current drops below the motor starting current within 500 ms.

Table 3-6 Motor-Starting Log



| Measured Values | | Primary |
|---|---|---|
| Start duration | Motor starting time | s |
| Starting current | Motor-starting current (primary) | A (or kA) |
| Starting voltage | Motor-starting voltage (primary) | V (or kV) |

### Reading from the PC with DIGSI 5

- Use the project-tree window to reach the motor-starting log of your SIPROTEC 5 device.
  Project → Device → Process data → Logs → **Motor-starting log**

The state of the motor-starting log last loaded from the device is shown to you.

- To update (synchronization with the device), click the **Read log entries** button in the headline of the indication list (*Figure 3-22*).

[scmotmlp-160713-01, 2, en_US]

Figure 3-22 Reading the Motor-Starting Log with DIGSI 5

### Reading on the Device through the On-Site Operation Panel

- To reach the motor-starting log from the main menu, use the navigation keys of the on-site operation panel.
  Main Menu → Indications → **Motor-starting log**
- You can navigate within the displayed indication list using the navigation keys (up/down) on the on-site operation panel.

[ScMotLog-280618, 1, en_US]

Figure 3-23 Reading the Motor-Starting Log on the On-Site Operation Panel of the Device

**Deletability**

The motor-starting log of your SIPROTEC 5 device can be deleted. Read details about this in chapter *3.1.6 Saving and Deleting the Logs*.

**Configurability**

The motor-starting log is only present in the **Motor** function group. There is no column for the motor-starting log in the DIGSI information routing. The entries in the motor-starting log are preconfigured and cannot be changed.

## 3.1.6 Saving and Deleting the Logs

Deleting the logs of the device in the operating state is unnecessary. If storage capacity is no longer sufficient for new indications, the oldest indications are automatically overwritten with new incoming events. In order for the memory to contain information about the new faults in the future, for example, after a revision of the system, a deletion of the log makes sense. Resetting the logs is done separately for the various logs.

**NOTE**

Before you delete the content of a log on your SIPROTEC 5 device, save the log with DIGSI 5 on the hard disk drive of your PC.

**NOTE**

Not all logs of your SIPROTEC 5 device can be deleted. These limitations apply especially to logs with relevance for security and after-sales (security log, device-diagnosis log, setting-history log).

**NOTE**

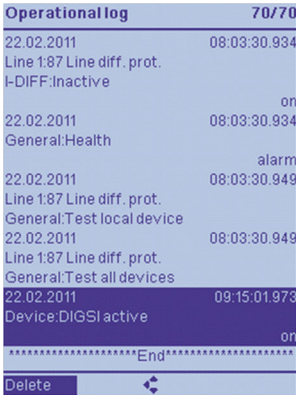
If you delete any files directly from the fault log or fault record, the error number for new fault records continues incrementing up to the maximum number 2^32. It does not reset to 0.

If you initialize flash partitioning of the fault log and fault record, the error number for new fault records resets to 0.

**NOTE**

If the device executes an initial start, for example after an update of the device software, the following logs are automatically deleted:

- Operational log
- Fault log
- Switching-device log
- Ground-fault log
- Setting-history log
- User-defined log
- Motor-starting log
- Communication-supervision log



Back up the deletable logs using DIGSI 5.

**NOTE**

If a ground fault is currently active, the ground-fault log cannot be deleted.

### Deleting Logs on the On-Site Operation Panel

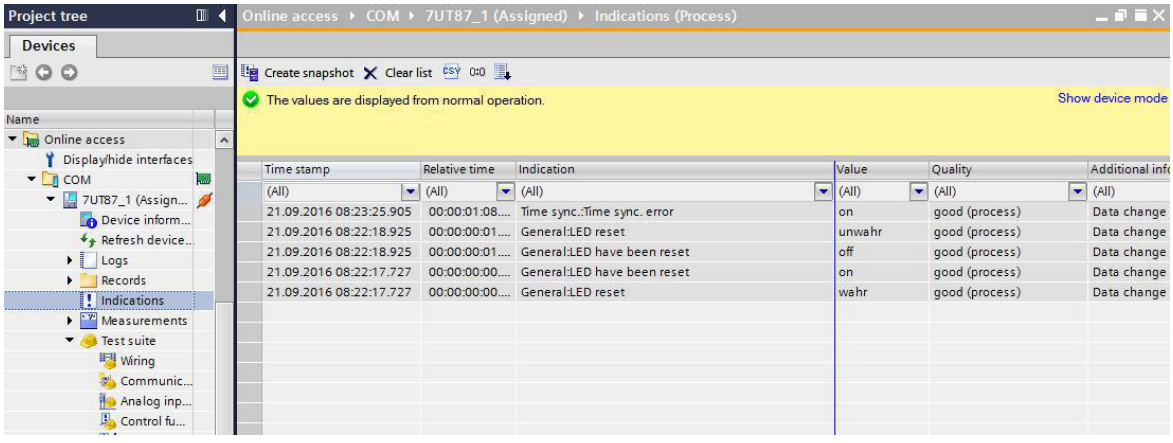
- To reach the selected log from the main menu, use the navigation keys of the on-site operation panel (example operational log):
  Main menu → Logs → **Operational log**

[sc_oprlog, 1, en_US]

Figure 3-24 Deleting the Operational Log on the On-Site Operation Panel

- You can navigate within the displayed indication list using the navigation keys (up/down) on the on-site operation panel.
- The option to delete the entire log is offered to you in the footer of the display at the bottom left. Use the softkeys below under the display to activate the command prompts. Confirm the request to **Delete**.
- After being requested, enter the password and confirm with **Enter**.
- After being requested, confirm the **Deletion of all entries** with **Ok**.

**Deleting Logs from the PC with DIGSI 5**



- To reach the selected log of your SIPROTEC 5 device, use the project-tree window (for example operational log).
  Project → Device → Process data → Logs → **Operational log**

## 3.1.7 Spontaneous Indication Display in DIGSI 5

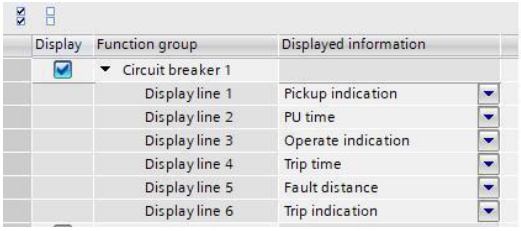
With DIGSI 5 you have the possibility of displaying all currently transmitted indications of the selected device in a special indication window.

**Procedure**

- Call up the spontaneous indications of your selected device in the navigation window under Online access.
- Click **Indications** in the path:
  Online access → Interface → Device → **Indications**
- The raising indications appear immediately without you having to wait for a cyclical update or initiate the manual update.

[sc_spnmld, 2, en_US]

Figure 3-25 Displaying Spontaneous Device Indications in DIGSI 5



## 3.1.8 Spontaneous Fault Display on the On-Site Operation Panel

After a fault, the most important data of the last fault can be displayed automatically on the device display without further operational measures. In SIPROTEC 5 devices, protected objects and even circuit breakers can be freely created and configured depending on the application (even several instances). In DIGSI 5, several spontaneous fault displays can be configured, depending on the application, with each individual one being assigned a particular circuit breaker. These displays remain stored in the device until they are manually confirmed or released by LED reset.

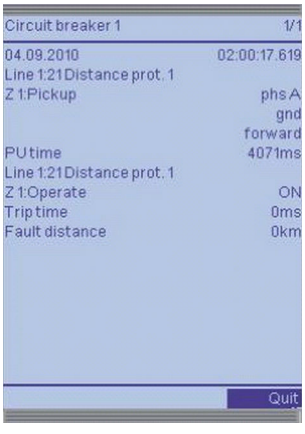
**Configuration of a Spontaneous Fault Display with DIGSI 5**

- To reach the **Fault-display configuration** of your SIPROTEC 5 device, use the project-tree window.
  Project → Device → Display pages → **Fault-display configuration**

- In the main window, all configured circuit breakers are displayed. A list of a maximum of 6 configurable display lines is offered for each circuit breaker. The activation of a spontaneous fault display occurs for each circuit breaker by selection via checkmark in the column **Display**.
- With the parameter **(_:139) Fault-display** (under Device → Parameter → Device settings) you determine whether spontaneous fault displays should be shown for each pickup or only pickups with the trip command.

[sc_konstf, 2, en_US]

Figure 3-26 Configuration of the Spontaneous Fault Display on the Device



For every display line the following display options can be selected:

Table 3-7 Overview of Display Options

| Displayed Information | Explanation |
|---|---|
| Pickup indication | Display of the first function stage picked up in a fault, as needed with auxiliary information (phases, ground, direction) |
| PU time | Display of the entire pickup duration of the fault |
| Operate indication | Display of the first function stage triggered in a fault, as needed with auxiliary information (phases) |
| Trip time | Display of the operate time related to the beginning of the fault (pickup start) |
| Fault distance | Display of the measured fault-location distance |
| Operate result indication | Display of the control or switching device triggered in a fault, with auxiliary information (phases) where necessary |

### Acknowledgment of the Spontaneous Fault Display on the Device

After faults, the last occurred fault is always displayed to you. In cases where more than one circuit breaker is configured, several stored fault displays can be present after faults, with the latest being displayed. These displays remain stored in the device until manual acknowledgment or release by LED reset.

[sc_stfanz, 1, en_US]

Figure 3-27 Spontaneous Fault Display on the Device

Method 1: Manual acknowledgment

- Press the softkey button **Quit** in the base bar of the display. The display is irretrievably closed. Repeat this step until no further spontaneous fault displays appear.
- After completion of all confirmations the last display view is showed before the faults.

Method 2: Acknowledgment via LED reset

- An LED reset (device) causes the reset of all stored LEDs and binary output contacts of the device and also to the confirmation of all fault displays stored in the display.

You can find more details on the topic of LED reset in chapter *3.1.9 Stored Indications in the SIPROTEC 5 Device*

## 3.1.9 Stored Indications in the SIPROTEC 5 Device

In your SIPROTEC 5 device, you can also configure indications as **stored**. This type of configuration can be used for LEDs as well as for output contacts. The configured output (LED or contact) is activated until it is acknowledged. Acknowledgment occurs via:

- On-site operation panel
- DIGSI 5
- Binary input
- Protocol of substation automation technology

### Configuration of Stored Indications with DIGSI 5

In the **Information Routing** of each device set up in DIGSI 5, you can route binary signals, among others, to LEDs and output contacts.

- To do this, proceed in the project tree to:
  Project → Device → **Information routing**
- Right-click the routing field of your binary indication in the desired LED or binary output column in the routing range of the targets.

You are offered the following options:

Table 3-8 Overview of Routing Options

| Routing Options | | LEDs | BOs | BIs | Description |
|---|---|---|---|---|---|
| H | (active) | | | X | The signal is routed as active with voltage. |
| L | (active) | | | X | The signal is routed as active without voltage. |
| V | (unlatched) | X | X | | The signal is routed as unlatched. Activation and reset of the output (LED, BO) occurs automatically via the binary-signal value. |
| G | (latched) | X | X | | The binary signal is latched when the output (LED) is activated. To reset, a targeted confirmation must occur. |

| Routing Options | | LEDs | BOs | BIs | Description |
|---|---|---|---|---|---|
| NT | (conditioned latching) | X | | | Fault indications are stored during control of the output (LED) as a function of the parameter **(_:91:139) Fault-display**. In the event of a new fault, the previously stored states are reset.<br>• If the fault gets terminated via a trip command from the assigned circuit breaker, the status of an indication remains as latched with the setting option ***with trip***. Without a trip command, the status is displayed before the fault (if necessary, the status of the last fault) is restored.<br>• With the setting option ***with pickup*** the current indication image of a pickup gets stored. The image comprises all indications of functions that are effective in the event of tripping on the same circuit breaker, like the picked up function. |
| TL | (stored only with tripping) | | X | | Routing option TL (tripping stored) is only possible for the switching object circuit breaker.<br>The output is saved with protection tripping. The contact remains activated until acknowledged.<br>Control commands are not affected. A control command is pending above the parameterized command period until feedback has been successfully received.<br>**Note**:<br>You can realize the functionality of the **Lockout** (ANSI 86) by storing the output relay with the routing option TL. |

## 3.1.10 Application Mode/Test Mode and Influence of Indications on Substation Automation Technology

With the controllable *Application mode* = ***Test*** or ***Test/Relay blk.***, you switch on or off the test mode for the entire device.

For further information, refer to *11.2 Enabling/Disabling the Application/Test Mode for the Entire Device*.

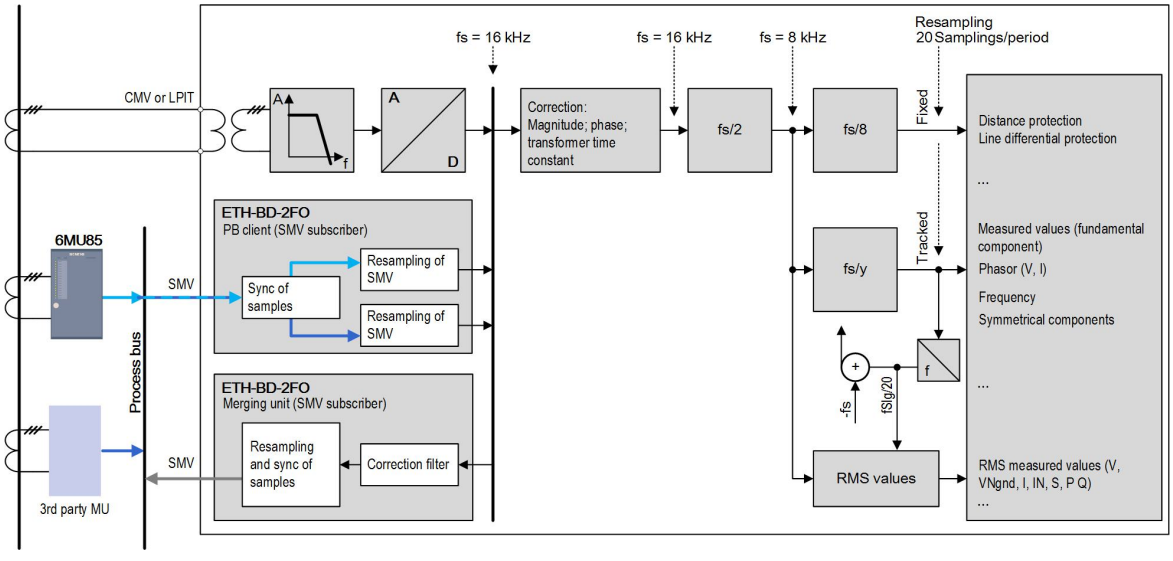
If the test mode of the device or of individual functions is switched on, the SIPROTEC 5 device marks indications sent to substation automation technology station control system with an additional test bit. This test bit makes it possible to determine that an indication was set during a test.

## 3.1.11 Resetting Stored Indications of the Function Group

You can configure indications of individual functions as "stored" in a function group. This type of configuration can be used for LEDs as well as for output contacts. The configured output (LED or contact) is activated until it is acknowledged.

The protection and the circuit-breaker function groups contain the block **Reset LED FG**. The block **Reset LED FG** is visible only in the Information routing under the corresponding function group in DIGSI 5. You use the binary input signal *>Reset LED* to reset the stored LEDs in the respective function group. The configured outputs (contacts) are not reset.

# 3.2 Measured-Value Acquisition



### Basic Principle

SIPROTEC 5 devices are equipped with a powerful measured-value acquisition function. In addition to a high sampling frequency, they have a high measurand resolution. This ensures a high degree of measuring accuracy across a wide dynamic range. The 24-bit sigma/delta analog-digital converter represents the core of measured-value acquisition. In addition, the oversampling function supports the high measurand resolution. Depending on the requirements of the individual method of measurement, the sampling frequency is reduced (**Downsampling**).

In digital systems, deviations from the rated frequency lead to additional errors. In order to avoid this, 2 algorithm-dependent processes are used in all SIPROTEC 5 devices:

- Sampling-frequency tracking:
  The analog input channels are scanned for valid signals in cycles. The current power frequency is determined and the required sampling frequency is defined by using a **resampling algorithm**. The tracking is effective in the frequency range between 10 Hz and 90 Hz.
- Fixed sampling frequency – correction of the filter coefficients:
  This method operates in a limited frequency range ($f_{rated}$ +/- 5 Hz). The power frequency is determined and, depending on the degree of the frequency deviation, the filter coefficients are corrected.

The following figure shows the basics of dealing with sampled values (SAV) in the measured-value acquisition chain. *Figure 3-28* shows to whom the various sampling frequencies are made available. In order to limit the bandwidth of the input signals, a low-pass filter (anti-aliasing filter to maintain the sampling theorem) is installed downstream. After sampling, the current input channels are adjusted. Meaning that magnitude, phase, and transformer time constant are corrected. The compensation is designed to ensure that the current transformer terminal blocks can be exchanged randomly between the devices.

[dw_meserf, 2, en_US]

Figure 3-28 Measured-Value Acquisition Chain

| | |
|---|---|
| $f_a$ | Sampling frequency |
| SMV | Sampled measured value |
| CMV | Conventional measured value |
| LPIT | Low-power instrument transformer |

The internal sampling frequency of the SIPROTEC 5 devices is fixed at 16 kHz (sampling rate: 320 samplings per 50 Hz cycle). All current and voltage inputs are sampled. If magnitude, phase, and transformer time

constant are corrected, the sampling frequency is reduced to 8 kHz (160 samplings per 50-Hz cycle). This is the basic sampling frequency to which various processes, such as fault recording, RMS measured values, refer. For the RMS measurement, the measured-value window is adjusted on the basis of the power frequency. For numerous measurement and protection applications , 20 samplings per cycle are sufficient (if $f_{rated}$ = 50 Hz): sampling every 1 ms, at $f_{rated}$ = 60 Hz: sampling every 0.833 ms). This sampling rate is an adequate compromise between accuracy and the parallel processing of the functions (multi-functionality).

The 20 samplings per cycle will be made available to the algorithms processed in the function groups in 2 variants:

- Fixed (not resampled)
- Resampled (frequency range from 10 Hz to 90 Hz)

Depending on the algorithms (see function descriptions), the respective data flow is considered. A higher sampling frequency is used for selected methods of measurement. You can find detailed information in the corresponding function description.

**NOTE**

The **Power-system data** (starting in *6.1 Power-System Data*) contain the measuring points for current and voltage. Each measuring point has its own parameters.

# 3.3 Sampling-Frequency Tracking and Frequency Tracking Groups

## 3.3.1 Overview

Starting from platform version V07.80, you can merge measuring points into **Frequency tracking groups** in SIPROTEC 5 devices. The device operates with a maximum of 6 **Frequency tracking groups**.

The chapter *3.3.2 Sampling-Frequency Tracking* provides the necessary hints on the operating principle of sampling-frequency tracking and its application.

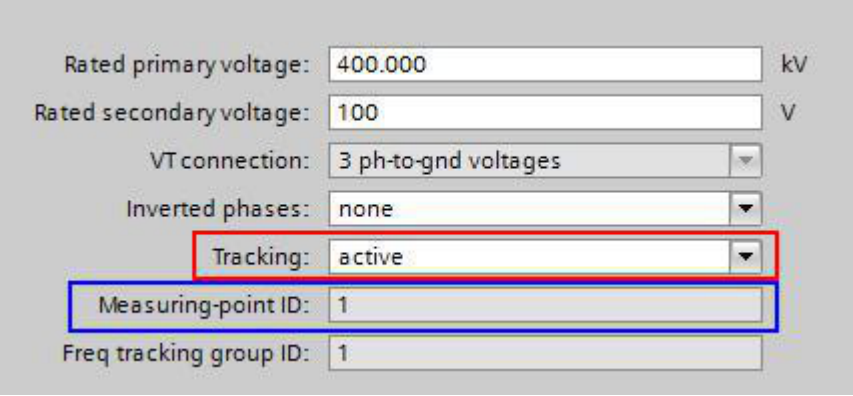
The chapter *3.3.3 Frequency Tracking Groups* describes the principle and application of frequency tracking groups.

## 3.3.2 Sampling-Frequency Tracking

SIPROTEC 5 devices are equipped with powerful sampling-frequency tracking as explained in *3.2 Measured-Value Acquisition* . This ensures high measuring accuracy over a wide frequency operating range (10 Hz to 90 Hz).

To determine the actual sampling frequency, the voltage and current measuring points are checked for valid input signals, the actual power frequency is determined and the tracking frequency (sampling frequency = 20 · tracking frequency) is adapted. The method is implemented in such a way that the number of samplings per actual power frequency or the frequency of the system is always constant. The number of samplings is 20 per cycle, as described in *3.2 Measured-Value Acquisition* .

During engineering, you set the parameters specifying which measuring points are used for frequency tracking. All 3-phase voltage and current measuring points and 1-phase voltage and current measuring points are allowed.



**NOTE**

Using a measuring point for sampling-frequency tracking requires this measuring point to be suitable for reliably determining the power frequency. This is the case, as long as the measuring point has been connected to the power system and the rated voltages and currents are measured. If the measured values for the rated voltages and currents are unavailable, sampling-frequency tracking must be switched off for this measuring point.

Examples of these kind of conditions are as follows:

- 1-phase measuring points: Measuring points that measure zero-sequence voltages or zero-sequence currents must not be used for frequency tracking.
- 3-phase measuring points: Measuring points that measure unbalanced currents and voltages for a capacitor bank must not be used for frequency tracking.

The following figure shows where you set the parameters for the corresponding measuring point and activate sampling-frequency tracking in the DIGSI 5 project tree under **Settings** → **Power-system data**.

[sc_MP_Powersys trackfreq, 1, en_US]

Figure 3-29 Using the Measuring Point to Determine the Sampling Frequency

If the parameter **Tracking** = ***active***, the measuring point is used to determine the actual tracking frequency. If the parameter **Tracking** is set to ***active*** for several measuring points, the ID of the measuring point determines the sequence in which these are checked for valid input signals. The algorithm starts with the lowest ID number, as follows:

- First, the 3-phase measuring points are scanned. If no valid voltage is found, the selected current measuring points are next. In this case, the following sequence applies:

  3-phase voltage measuring point → 3-phase current measuring point → 1-phase voltage measuring point → 1-phase current measuring point

  If a trigger signal comes from a current measuring point, the voltage measuring points are still continuously scanned for valid voltages and switched immediately if a voltage is found.
- If the true RMS value is greater than 2.5 % of the set secondary device rated value, a measuring point is valid. For example, this is 2.5 V at 100 V, 25 mA at 1 A or 125 mA at 5 A.
- A 3-phase measuring point is scanned in the sequence of phase A → phase B → phase C.

  In the case of the voltage measuring points, the phase-to-phase voltage $V_{AB}$, $V_{BC}$, and $V_{CA}$ is always used for evaluation. The phase-to-phase voltage is calculated in the event of a phase-to-ground connection.
- The tracking frequency is tracked using different interval steps. If the tracking frequency deviates only slightly from the measured frequency, the frequency is tracked using small steps of 0.010 Hz. In the case of greater deviations, the interval is 1 Hz. To react faster in the event of larger deviations, for example in switchover conditions, tracking occurs in 5-Hz steps. When switching on measurands immediately the measured tracking frequency is used.
- If no tracking frequency can be determined, the appropriate rated frequency of the electrical power system is used as the tracking frequency. This case occurs before the measurands are switched on, after they are switched off or when the device is powered on. If the measurands are switched on, the starting frequency is the set power frequency, for example 50 Hz or 60 Hz. Since rated-frequency input variables can be assumed for most applications, the measuring algorithms start with the fixed sampling frequency, for example, 1 kHz for 50 Hz and 1.2 kHz for 60 Hz.

*Figure 3-30* shows the behavior of sampling-frequency tracking across the frequency band and at the frequency limits.

The x-axis shows the actual power frequency ($f_{sys}$) and the y-axis shows the set tracking frequency ($f_{track}$). Between 10 Hz and 90 Hz, the relationship is linear. If the actual power frequency is less than 10 Hz, the tracking frequency is kept at 10 Hz. In this case, sampling occurs at 20 · 10 Hz = 200 Hz. If the power frequency is greater than 90 Hz, the tracking frequency is kept constant at 90 Hz.

If the frequency is outside the frequency operating range (10 Hz to 90 Hz), frequency tracking generates the indication ***Freq. out of range***. The individual protection functions evaluate this indication. If an overfunction can occur, the protection functions are blocked internally to avoid a failure.

You can find more detailed information on the behavior of the protection functions in *12 Technical Data*.

[dw_working-area_sampling-frequency-tracking, 2, en_US]

Figure 3-30 Operating Range of Sampling-Frequency Tracking

Siemens recommends routing the calculated power frequency ($f_{sys}$) and the determined tracking frequency ($f_{track}$) as a measured value trace in the fault record. In this way, you can document the behavior of the device in transient conditions. The following figure shows that you find the both measured values in the information routing under **Power-system data → General**:

| Information | | | S | Destination | | |
|---|---|---|---|---|---|---|
| | | | | BO | LED | Recorder |
| Signals | Number | Type | | | | Signal |
| (All) | (All) | ... | | | | (All) |
| General | 91 | | | | | |
| Device | 4171 | | | | | |
| Alarm handling | 5971 | | | | | |
| Time managem. | 8821 | | | | | |
| Time sync. | 8851 | | | | | |
| Res. bin. out. | 4711 | | | | | |
| LED not in FG | 7411 | | | | | |
| Power system | 11 | | | | | * |
| General | 11.2311 | | | | | * |

| f sys | 11.2311.322 | MV | | | | X |
| f track | 11.2311.323 | MV | | | | X |

[sc_rout meas freq, 1, en_US]

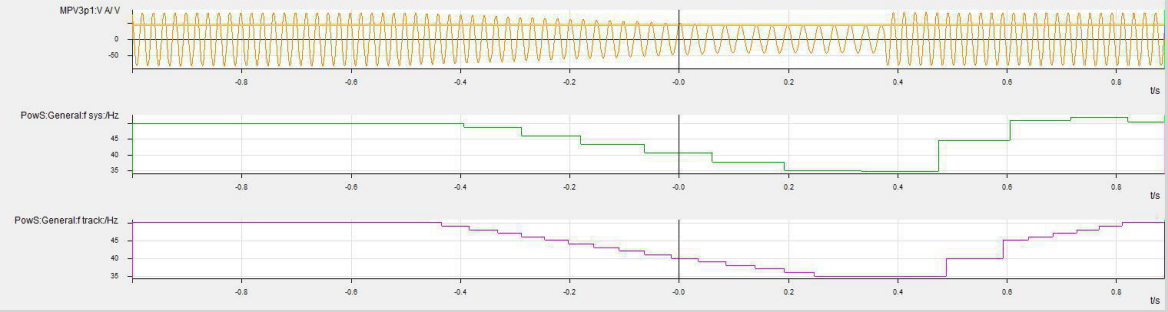

Figure 3-31 Routing of the Frequency Measured Values

**EXAMPLE:**

*Figure 3-32* shows the behavior of sampling-frequency tracking using an example.

The voltage was reduced linearly from 57.7 V (100 V phase-to-phase) to 35 V (60.6 V phase-to-phase) and, at the same time, the frequency was reduced from 50 Hz to 35 Hz, for example motor coasting down. Then, an abrupt switch to the rated values of 57.7 V at 50 Hz was made.

The upper trace shows the power-system voltage on 1 phase (A) as an example. The center trace is the calculated power frequency and the lower trace is the determined tracking frequency. If you multiply the determined tracking frequency of the lower trace by 20, you can determine the sampling frequency.

[sc_example freqtrack, 1, en_US]

Figure 3-32 Example of Frequency Tracking and Reaction to a Step Change in the Input Variable

## 3.3.3 Frequency Tracking Groups

In the SIPROTEC 5 devices before platform version V07.80, sampling-frequency tracking applies to the entire device. This means that the 1st valid measuring point, for example, a 3-phase voltage measuring point, determines the selected tracking frequency based on the detected frequency.

If all measuring points in a system are galvanically coupled to each other, the power frequency is identical for all measuring points.

There are problems with electrical power system states or system states where galvanic separation is possible and measuring points of the separated system parts are connected to the SIPROTEC 5 device. For these problematic electrical power system states or system states, different frequencies are possible for a limited time. Depending on the measuring point set for tracking, the device selects which frequency to use. As a result, measuring errors and a failure of protection functions are possible.

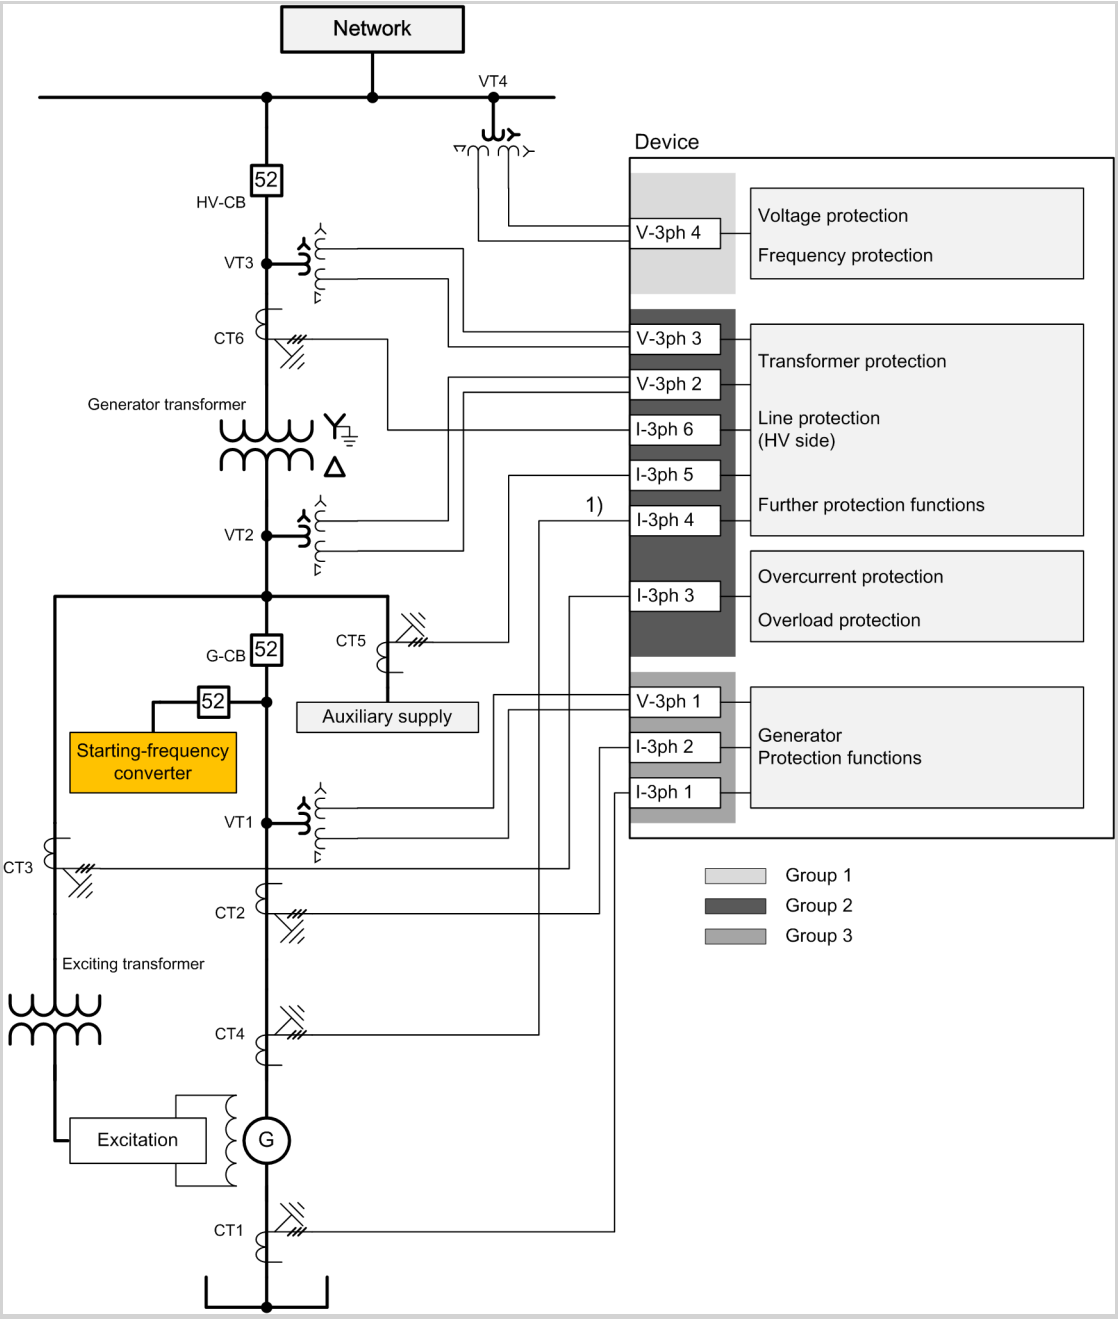
Starting with platform version V7.80, you can assign the measuring points to different frequency tracking groups. This ensures high flexibility and high measuring accuracy for a variety of applications. In this case, every frequency tracking group specifies its own sampling frequency. In the case of galvanic separation and different system frequencies, different sampling frequencies arise as a result. This occurs temporarily in systems with rotating machines, for example. A way to achieve galvanic separation is to use an open circuit breaker.

**NOTE**

In the measured-value acquisition chain in *Figure 3-28* in the chapter *3.2 Measured-Value Acquisition* , only the data stream designated as tracked is adapted. The data stream represented as fixed derives its sampling frequency exclusively from the set rated frequency. In this case, the constant sampling frequency of 1 kHz at $f_{rated}$ = 50 Hz and 1.2 kHz at $f_{rated}$ = 60 Hz is used. This applies to every measuring point, regardless of the frequency tracking group to which it is assigned.

**EXAMPLE:**

*Figure 3-33* shows an example for the necessity of frequency tracking groups. The generator circuit breaker (GCB) and the high-voltage circuit breaker (HVCB) are the galvanic disconnection points. In this way, different switching states are possible. The device uses current measuring points (CTs 1 to 6) and voltage measuring points (VTs 1 to 4) located on different sides of the circuit breakers. In addition, it is assumed that the generator is started using a starting-frequency converter. In a gas-turbine application, the starting-frequency converter accelerates the generator from 0 Hz to about 70 % of the rated speed (roughly 35 Hz at $f_{rated}$ = 50 Hz). After this, the gas turbine is fired up and brings the generator to the rated speed. Then, the voltage is built up to the rated voltage and synchronized. During this start-up operation, the GCB is open and the HVCB is closed. As a result, the measuring points VT 1, CTs 1, 2, 4 have a frequency that deviates from



the other measuring points during start-up operation. The other measuring points are usually at the rated frequency due of the connection to the power system.

Furthermore, protection tripping can result in a switching state where the HVCB is open and the GCB remains closed. In this case, the generator and a generator transformer can assume a frequency that deviates from the power frequency. In the event of load shedding, the generator accelerates before the speed controller intervenes. This is particularly pronounced in hydro generators.

An evaluation of the individual scenarios shows that different frequencies can occur at the different measuring points for a limited time. For this reason, 3 frequency tracking groups are necessary in this example. These groups are marked with different colors in the following figure.

**NOTE**

The measuring point (CT 4) marked with 1) in the following figure will be discussed later.

[dw_example_frequency-tracking-groups, 1, en_US]

Figure 3-33 Example of the Necessity of Frequency Tracking Groups

To strike a balance between application flexibility and the required computing power, the number of additional frequency tracking groups was limited to 5. Together with the basic functionality, a total of 6 frequency tracking groups are possible.

If you wish to use frequency tracking groups, use the following engineering recommendations. Before starting work, make sure you know how many frequency tracking groups are needed. Select only the required number.

If you start with an application template that you have expanded by the necessary measuring points, you must load the necessary number of additional frequency tracking groups from the Global DIGSI 5 Library into the **Power system** folder.

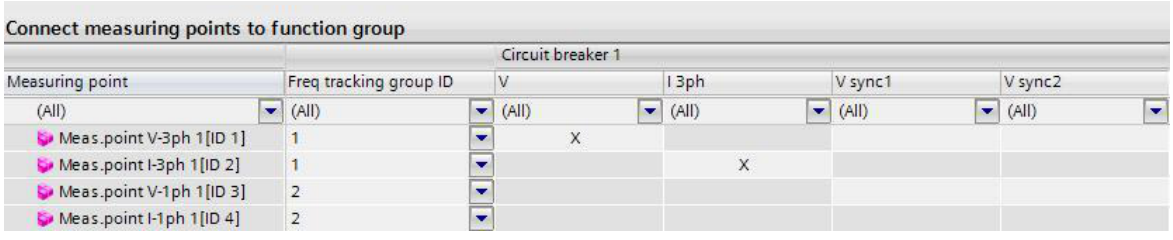
[sc_loading freq group, 1, en_US]

Figure 3-34 Loading the Required Frequency Tracking Groups

If you instantiate an additional frequency tracking group, the system automatically assigns the ID of the frequency tracking group in DIGSI using consecutive numbers. As the device already has 1 frequency tracking group, the ID numbering for additional frequency tracking groups starts with 2.

[sc_ID freqgroup, 1, en_US]

Figure 3-35 ID of the Frequency Tracking Group



**NOTE**

If you have activated several frequency tracking groups during engineering and you then delete a frequency tracking group again later, the assigned ID is also deleted. All other frequency tracking groups retain their assigned IDs.

Try to avoid discontinuities by deleting the frequency tracking group with the highest ID if possible.

You will find the frequency measured values and the indications of the corresponding frequency tracking group in the routing matrix (see *Figure 3-31*).

Assign the measuring points to the frequency tracking groups in the **Function-group connections** Editor. As soon as you have instantiated another frequency tracking group from the Global DIGSI 5 Library, the additional column **Frequency tracking group ID** appears in the routing matrix. In this column, you select the number of the corresponding frequency tracking group for each measuring point using the list box.

[sc_routing MP to freqgroup, 1, en_US]

Figure 3-36 Assignment of the Measuring Point to the Frequency Tracking Group

**NOTE**

Keep the following in mind when assigning the measuring points to the frequency tracking groups:

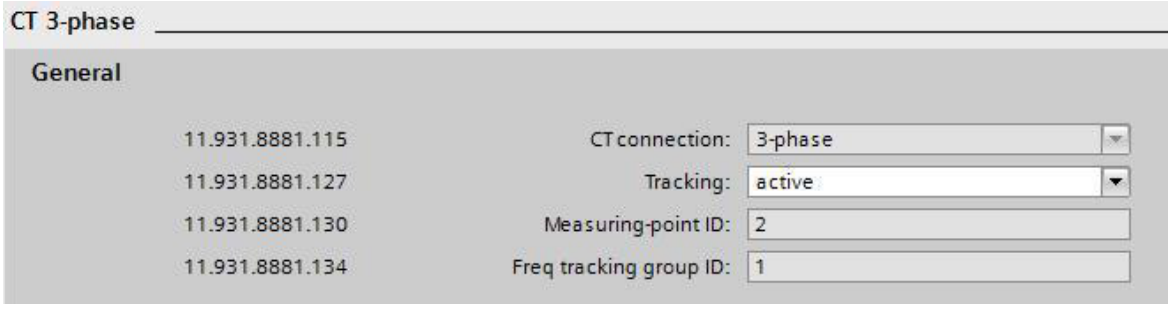
- The function groups (FGs) can operate only with 1 frequency tracking group.
- This applies also to interconnections between the function groups as for the **Transformer differential protection**.

  In the case of the **Transformer differential protection**, the **Transformer side** FG is interconnected with the **Transformer** FG and all **Transformer side** FGs of one transformer must operate in the same frequency tracking group.

  The same applies when the neutral-point current is measured using a 1-phase function group.

There are also exceptions such as the FG **Circuit breaker** (see chapter *5.9 Function-Group Type Circuit Breaker*). The voltage measured values are processed by the **Synchronization function** which operates only with a fixed sampling frequency. In this way, voltage measuring points from different frequency tracking groups can be connected.

The cited rules are checked using scripts and infractions reported during engineering.



Now, you can select the measuring points to be used to determine the tracking frequency for the appropriate frequency tracking group as explained in chapter *3.3.2 Sampling-Frequency Tracking*. If possible, use at least 1 voltage measuring point and 1 current measuring point. Give preference to 3-phase measuring points.

When the tracking frequency has been determined, all measuring points of the frequency tracking group are set to this frequency and the tracked sampling frequency is adapted.

**NOTE**

As described in the chapter *3.2 Measured-Value Acquisition* , the measured-value current with fixed sampling frequency is unaffected by this.

To avoid errors, the ID of the measuring point and the ID of the assigned frequency tracking group are displayed in the setting sheet of the measuring points in DIGSI 5 (see *Figure 3-37*).

[sc_MP additional setting freqgroup, 1, en_US]

Figure 3-37 Example: Settings of the 3-Phase Current Measuring Point; Additional Display of the ID for the Frequency Tracking Group

In addition, the ID of the frequency tracking group is displayed in the function group in the **General** block (see *Figure 3-38*). Here, you can also check the consistency.

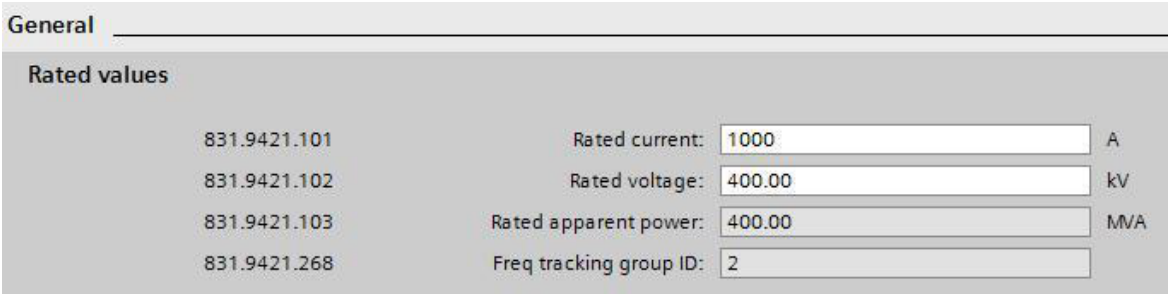


Figure 3-38 Display of the ID for the Frequency Tracking Group in the Block **General** of the Function Group

A special feature is explained using *Figure 3-33* as an example.

The measuring point marked in *Figure 3-33* with **1)** uses a current transformer that is located on the generator side but is used by the transformer differential protection. As a result, this current transformer must be assigned to the frequency tracking group 2 in accordance with the rules above. Since the generator is started using a starting-frequency converter in the application example, the frequency at this measuring point deviates from the frequency at the other measuring points of group 2. For this reason, the measuring point with CT 4 must **not** be used to determine the tracking frequency.

Depending on the application, the current of the CT 4 acts as a disturbance variable when forming the Kirchhoff's current law. As a rule, this current is not particularly strong (< 15 % of $I_{rated}$) so that the disturbance effect remains small. If required, you must set the differential protection to be less sensitive. Decide this for the specific application.

The following table shows the possible assignment of measuring points used to determine the tracked sampling frequency for the example. For this purpose, the parameter **`Tracking`** = ***`active`*** in the corresponding measuring point:

| Frequency Tracking Group | 1 | 2 | 3 |
|---|---|---|---|
| Recommended measuring points for tracking | VT 4 | VT 3<br>VT 2<br>CT 5 | VT 1<br>CT 1 |

## 3.3.4 Frequency Tracking Groups – Interpretation of Measured Values

If you use frequency tracking groups, you must keep in mind special features when interpreting the measured values. The measuring points of a frequency tracking group are to be treated as decoupled for measurement purposes. This means that the complex measured values of a single function group, like phasor measured values, always match. Since phase A of the 1st measuring point is always assumed to be the reference value when representing the measured value, the phasor measured values cannot be compared between frequency tracking groups. This also applies if all measuring points are galvanically connected to one another.

**NOTE**

When selecting the reference variable, a voltage measuring point always takes precedence over a current measuring point. If the frequency tracking group does not contain a voltage measuring point, the 1st current measuring point is used.

**EXAMPLE:**

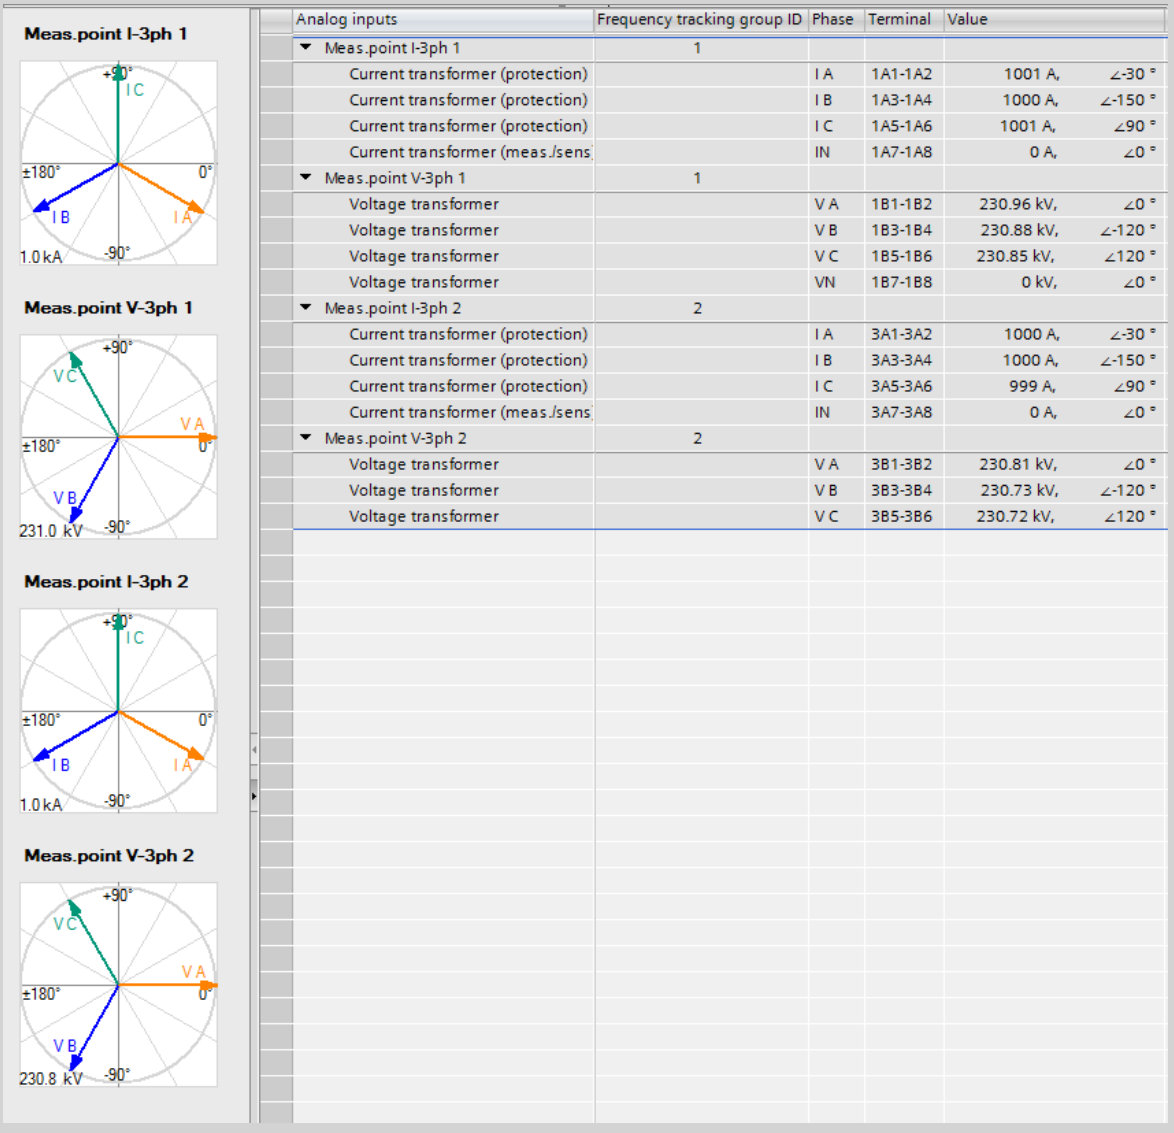

*Figure 3-39* shows an example of the phasor representation of the analog measured values of the measuring points.

The phasor representation of the analog measured values of the measuring points can be found in the DIGSI 5 project tree under **Online access** → **Device** → **Test suite** → **Analog inputs**.

Each of the 2 frequency tracking groups contains one 3-phase voltage measuring point **V-3ph** and one 3-phase current measuring point **I-3ph**.

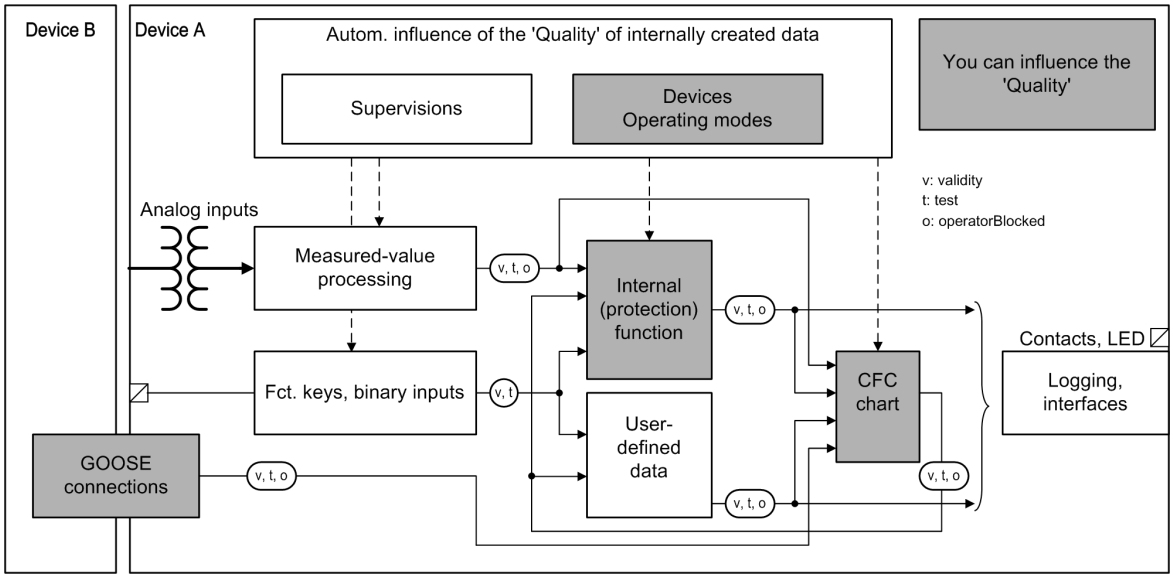
Frequency tracking group **1** contains the measuring points **V-3ph 1** and **I-3ph 1**, frequency tracking group **2** contains the measuring points **V-3ph 2** and **I-3ph 2**. The frequencies between the frequency tracking groups differ by 0.5 Hz. A phase displacement of -30° is set between the voltage and the current.

In *Figure 3-39*, you can see that the fundamental RMS measured values are identical. The phasor measured angles are shown as decoupled (see Phase angle). In this case, $V_A$ is the reference value in the corresponding frequency tracking group. With decoupled sampling-frequency tracking, the measurement of the measurands is exact, even with a different system frequency.

| Analog inputs | Frequency tracking group ID | Phase | Terminal | Value | |
|---|---|---|---|---|---|
| Meas.point I-3ph 1 | 1 | | | | |
| Current transformer (protection) | | I A | 1A1-1A2 | 1001 A, | ∠-30 ° |
| Current transformer (protection) | | I B | 1A3-1A4 | 1000 A, | ∠-150 ° |
| Current transformer (protection) | | I C | 1A5-1A6 | 1001 A, | ∠90 ° |
| Current transformer (meas./sens | | IN | 1A7-1A8 | 0 A, | ∠0 ° |
| Meas.point V-3ph 1 | 1 | | | | |
| Voltage transformer | | V A | 1B1-1B2 | 230.96 kV, | ∠0 ° |
| Voltage transformer | | V B | 1B3-1B4 | 230.88 kV, | ∠-120 ° |
| Voltage transformer | | V C | 1B5-1B6 | 230.85 kV, | ∠120 ° |
| Voltage transformer | | VN | 1B7-1B8 | 0 kV, | ∠0 ° |
| Meas.point I-3ph 2 | 2 | | | | |
| Current transformer (protection) | | I A | 3A1-3A2 | 1000 A, | ∠-30 ° |
| Current transformer (protection) | | I B | 3A3-3A4 | 1000 A, | ∠-150 ° |
| Current transformer (protection) | | I C | 3A5-3A6 | 999 A, | ∠90 ° |
| Current transformer (meas./sens | | IN | 3A7-3A8 | 0 A, | ∠0 ° |
| Meas.point V-3ph 2 | 2 | | | | |
| Voltage transformer | | V A | 3B1-3B2 | 230.81 kV, | ∠0 ° |
| Voltage transformer | | V B | 3B3-3B4 | 230.73 kV, | ∠-120 ° |
| Voltage transformer | | V C | 3B5-3B6 | 230.72 kV, | ∠120 ° |

[sc_measured_val_DIGSI, 1, en_US]

Figure 3-39 DIGSI Online Mode: Phasor Representation of the Measuring Points with 2 Frequency Tracking Groups and a Different Frequency



If the circuit breaker in a system is closed, the measuring points are galvanically connected to one another. If you want to compare the phasor variables of all measuring points to one another when using frequency tracking groups, Siemens recommends starting a fault record. Evaluate the fault record using SIGRA in the **Phasor representation** mode. The comparison is possible here because sampled values that are not frequency-tracked are used in the fault record. If the frequency deviates from the rated frequency, the measured values differ slightly.

# 3.4 Processing Quality Attributes

## 3.4.1 Overview

The IEC 61850 standard defines certain quality attributes for data objects (DO), the so-called Quality. The SIPROTEC 5 system automatically processes some of these quality attributes. In order to handle different applications, you can influence certain quality attributes and also the values of the data objects depending on these quality attributes. This is how you can ensure the necessary functionality.

The following figure describes roughly the general data flow within a SIPROTEC 5 device. The following figure also shows at which points the quality can be influenced. The building blocks presented in the figure are described in more detail in the following.

[lo_quali1, 2, en_US]

Figure 3-40 Data Flow within a SIPROTEC 5 Device

### Supported Quality Attributes

The following quality attributes are automatically processed within the SIPROTEC 5 system.

- **Validity** using the values *good* or *invalid*

  The **Validity** quality attribute shows if an object transferred via a GOOSE message is received (valid, invalid) or not received (invalid). The *invalid* state can be suppressed in the receiver device by also setting a substitute value for the object that is not received (see *3.4.2 Quality Processing/Affected by the User for Received GOOSE Values*). The substitute value is forwarded to the functions.

  If the device receives one of these values, it is replaced by the *invalid* value and thus processed further as *invalid*.

  If one of the detailed quality attributes (detailQual) has the value *TRUE*, then **Validity** is set to the *invalid* value, unless this was already done at the transmitter end.

- **Test** using the values *TRUE*, *FALSE*

  The **Test** quality attribute indicates to the receiver device that the object received via a GOOSE message was created under test conditions and not operating conditions.

- **OperatorBlocked** using the values *TRUE*, *FALSE*

  The **OperatorBlocked** quality attribute indicates whether an object transferred via GOOSE message originates from a device that is in a *functional logoff* state. When the sending device is switched off, the object is no longer being received and assumes the *invalid* state. However, since the **OperatorBlocked** quality was previously identified on the receiver device, the object can be treated differently at the receiving end (see *3.4.2 Quality Processing/Affected by the User for Received GOOSE Values*). At the receiving end, the object may be treated like a dropped signal.

- **Source** using the values *process*, *substituted*

  The **Source** quality attribute indicates whether the object was updated in the sending device.

  You can find more detailed information in *3.9.2 Acquisition Blocking and Manual Updating*.

### Influencing Quality by the Operating Modes

In addition to the normal operation, the device also supports further operating modes that influence quality:

- **Test mode of the device**

  You can switch the entire device to test mode. In this case, all data objects generated in the device (state values and measured values) receive the quality attribute **Test** = *TRUE*.

  The CFC charts are also in test mode and all output data receive the quality attribute **Test** = *TRUE*.

- **Test mode for individual functions, stages, or function blocks**

  You can switch individual functions, stages, or function blocks into test mode. In this case, all data objects generated by the function, stage, or function block (state values and measured values) receive the quality attribute **Test** = *True*.

- **Functional logoff of the device**

  If you take the device out of operation and want to isolate it from the supply voltage, you can functionally log off the device ahead of time. Once you functionally log off the device, all data objects generated in the device (state values and measured values) receive the quality attribute **OperatorBlocked** = *TRUE*. This also applies to the output from CFC charts.

  If objects are transferred via a GOOSE message, the receiver devices can assess the quality. The receiver device detects a functional logoff of the transmitting device. After shutting down the sending device, the receiver device identifies that the sending device has been logged off operationally and did not fail. Now the receiving objects can automatically be set to defined states (see chapter *3.4.2 Quality Processing/Affected by the User for Received GOOSE Values*).

- **Switching off individual functions, stages, or function blocks**

  You can switch off individual functions, stages, or function blocks. In this case, all data objects generated by the function, stage, or function block (state values or measured values) receive the device-internal quality attribute **Off**. The states of the inputs and measured values remain unchanged in this case; input changes are not processed. As the quality attribute **Off** is not provided for in communication protocol IEC 61850, the data objects are transferred with the quality attribute *Invalid*.

### Influencing the Quality through Hardware Supervision

Supervision functions monitor the device hardware (see *8.4 Supervision of the Device Hardware*). If the supervision functions identify failures in the data acquisition of the device, then all recorded data will receive the quality attribute **Validity** = *invalid*.

### Influencing the Quality through Voltage-Transformer Circuit Breakers

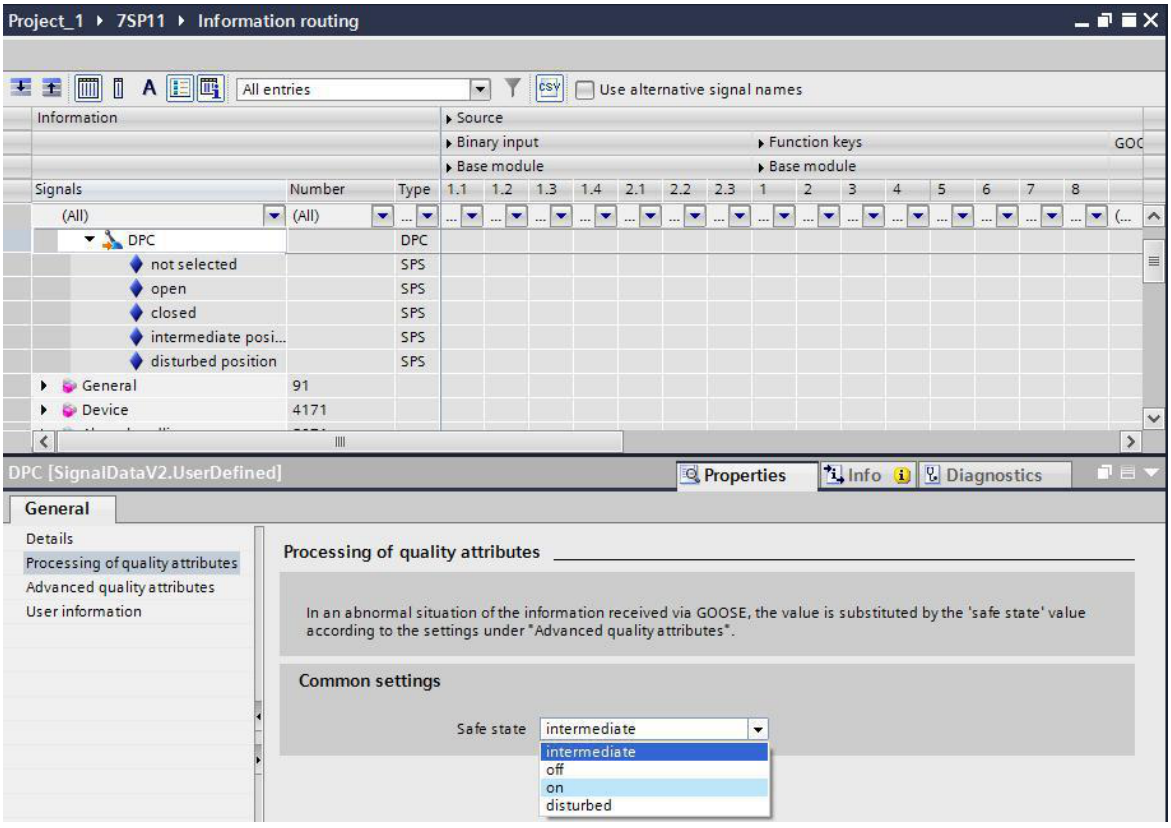
If tripping of the voltage-transformer circuit breaker is detected (see *8.3.4 Voltage-Transformer Circuit Breaker*), all recorded data will receive the quality attribute **Validity** = *invalid*.

**Influencing the Quality by the User**

You can influence the processing of data and their quality differently. In DIGSI 5, this is possible at the following 3 locations:

- In the **Information routing** editor for external signals from GOOSE connections
- In the CFC chart
- In the **Information routing** editor for binary input signals of device-internal functions

The following chapters describe in more detail the options regarding this influence as well as the automatic quality processing.



If a GOOSE connection is the data source of a binary input signal of a device-internal function, you can influence processing of the quality at 2 locations: at the GOOSE connection and at the input signal of the function. This is based on the following: A GOOSE date can be distributed within the receiving device to several functions. The GOOSE connection setting (influence) affects all functions. However, if different functions require customized settings, these are then set directly at the binary input signal of the function.

## 3.4.2 Quality Processing/Affected by the User for Received GOOSE Values

The properties of quality processing have changed with the introduction of GOOSE Later Binding. You can find information about the former quality processing in *Previous Quality Processing/Affected by the User for Received GOOSE Values, Page 122*.

In the **Information Routing** Editor, you can influence the data value and quality of all data types. The following figure shows the possible influence using the example of a DPC data type. All setting options are effective for the device receiving the data.

- In the DIGSI 5 project tree, double-click **Information Routing**.
- Select either the desired signal in the **External Signals** group or the signal of a function activated via the GOOSE column.
- Open the **Properties** window and select the **Processing Quality Attributes** sheet.

[sc_LB_GOOSE_2, 2, en_US]

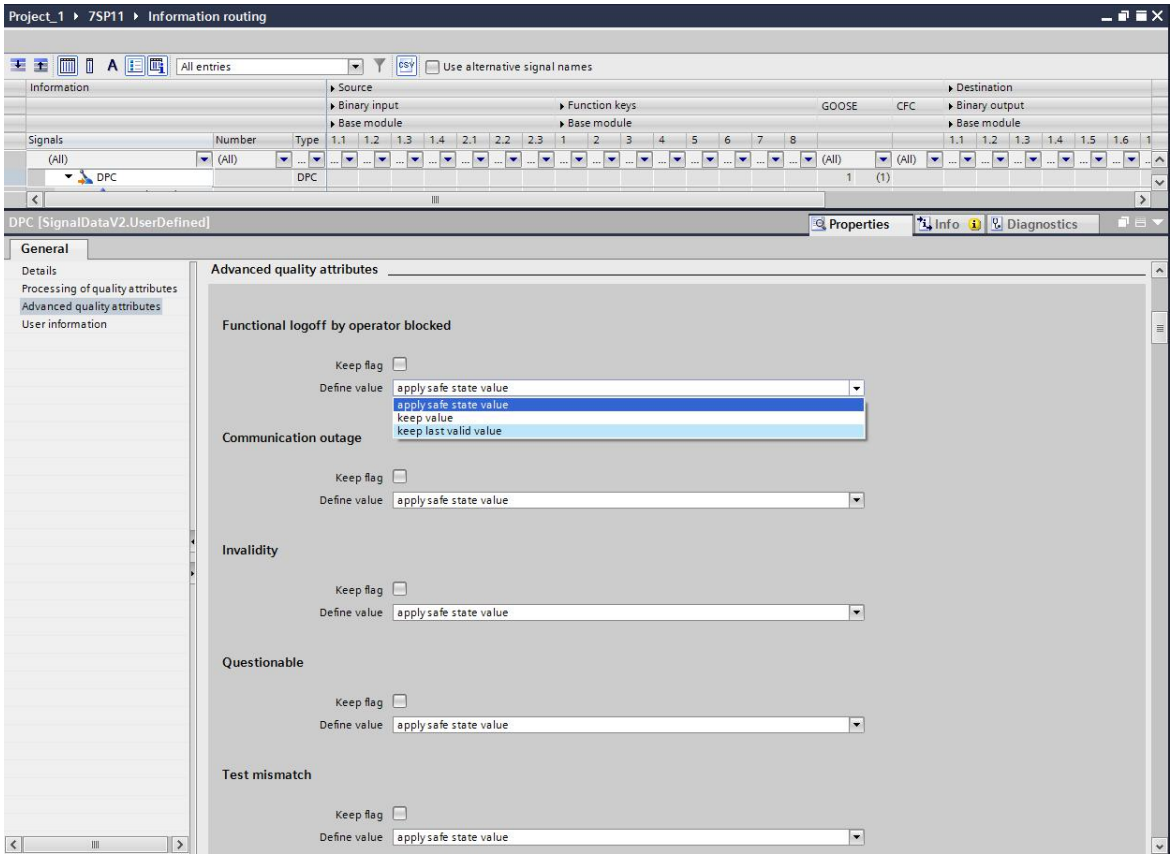


Figure 3-41 Influence Option When Linking a DPC Type Data Object

Depending on the selected data type of the object, various selection options are offered to you for the **Safe state** item in the **Common settings** section. At this point, you select the manually updated values that allow a safe operating state as soon as the data access via the communication path is disturbed.

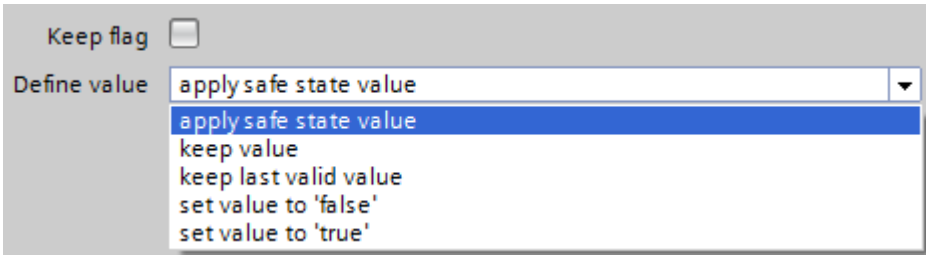
- Select the property for the selected data object.

You can also set the **Advanced quality attributes** of the data object for GOOSE Later Binding.
The following figure shows the advanced quality attributes using the example of a DPC data type.

- Open the **Properties** window and select the **Advanced quality attributes** sheet.

[sc_LB_GOOSE_1, 2, en_US]

Figure 3-42 Advanced Quality Attributes for GOOSE Later Binding



With the following advanced quality attributes, you can filter the transmitted GOOSE indications and check and set their quality. The values that have been adapted, if necessary, are forwarded to the receiver.

For the tests, you can select from the following setting options depending on the data type.

Table 3-9 Value Definitions

| Setting Value | Description |
|---|---|
| ***Apply safe state value*** | The value configured in the **Safe state** is forwarded as valid to the application as soon as communication disturbance occurs. |
| ***Keep value*** | The disturbed quality attribute is overwritten with *good* and the received value is forwarded as valid to the application. If no value was received, the output value is assumed being in safe state. |
| ***Keep last valid value*** | If an invalid quality attribute is received, the last valid value is forwarded to the application. If no value has yet been received, the output value is assumed being in safe state. |
| ***Set value to "false"*** | Applies only to Boolean communication objects. Every invalid quality attribute causes the valid value *false* to be forwarded to the application. |
| ***Set value to "true"*** | Applies only to Boolean communication objects. Every invalid quality attribute causes the valid value *true* to be forwarded to the application. |

These settings of the **Advanced quality attributes** apply to the advanced quality attributes listed below. The selection can vary depending on the data type.

[sc_LB_GOOSE_3, 2, en_US]

Figure 3-43 Value Definition of a Data Object of the SPS Type

You can also forward the quality attributes unchanged. To do this, you must mark the **Keep flag** check box.

**NOTE**

By default, the ***Keep flag*** checkbox is disabled when the signal is routed to the LED or the binary output.

**Functional Logoff by Operator Blocked**

You have set the *Operation mode* to *Device logoff* = *true* in the transmitting device. As a result, every indication issued from the functions and subject to *Device logoff* is transmitted with the quality information *operator blocked* and **Validity** = *good*. The receiver recognizes this for this indication and reacts according to the settings (*Table 3-9*). A different quality processing can take place only once you have set the *Operation mode* to *Device logoff* = *false* in the transmitting device.

**Communication Outage**

There is communication disturbance (time allowed to live) between the transmitter and the receiver indicated by the transmitter. The indication is set in accordance with the settings (*Table 3-9*).

**Invalidity**

The transmitting device sends this indication with the quality information **Validity** = *invalid*. The receiver recognizes this for this indication and reacts according to the settings (*Table 3-9*).

**Questionable**

The transmitting device sends this indication with the quality information **Validity** = *questionable*. The receiver recognizes this for this indication and reacts according to the settings (*Table 3-9*).

**Test Mismatch**

The transmitting device or the function in the transmitting device that issues this indication is in test mode. As a result, the indication is transmitted with the quality information *test*. The receiving function block recognizes this for this indication and reacts, depending on its own test-mode state (specified in IEC 61850-7-4 Annex A), according to the settings (*Table 3-9*).

**NOTE**

Follow the sequence of tests. First, the **Functional logoff by operator blocked** is tested. Then comes **Communication outage** and so on. If a case is recognized as *active*, the test chain is canceled with the configured setting for the active case.

In the case of **Invalidity**, the tests are first performed for **Functional logoff by operator blocked** (not applicable) and then for **Communication outage** (not applicable) and canceled with the configured action for **Invalidity**.

If an indication is routed into the log, manual updating of a value is also logged based on the conditions listed above and on the reason for the manual update. Manually updating a value based on the conditions listed

above causes a change in the *Health Warning* function block, inherited up to *Device health* (specified in IEC 61850-7-4).

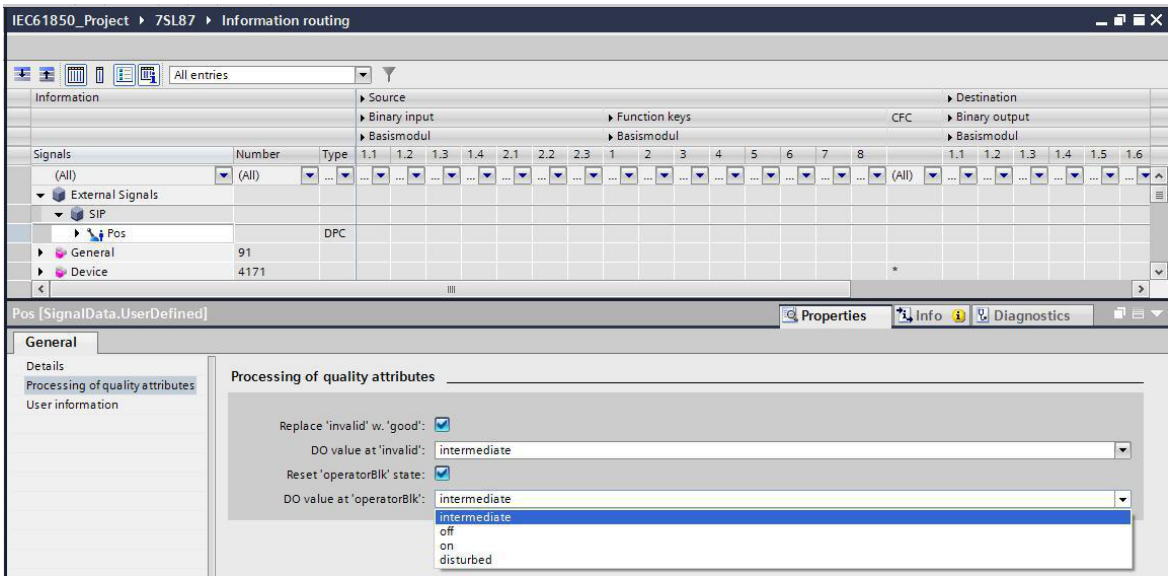
### Keep Flag

The quality attributes and values indicated by the transmitter are accepted without change. Quality processing must be performed by the user via a logic diagram. The outputs of the logic diagram following the user-specific quality processing can be connected to the function-block inputs as before.

### Data Substitute Values

Depending on the data type, different data substitute values must be used.

| Data Type | Possible Data Substitute Values | |
|---|---|---|
| ACD, ACT | general | 0 (False), 1 (True)<br>The directional information is manually updated with *unknown* if the option ***Apply safe state value***, ***Set value to "false"***, and ***Set value to "true"*** are selected; or maintain the received value with the options ***Keep value*** or ***Keep last valid value*** selected.<br>PhsA, phsB, phsC, and neut are manually updated with the same value just like how the general value is set.) |
| BAC, APC | mxVal | Floating-point range and range of values according to IEEE 754 (single precision) |
| BCR | actVal | $-2^{63}$ to $2^{63} - 1$ |
| CMV | mag, ang | Floating-point range and range of values according to IEEE 754 (single precision) |
| DPC, DPS | stVal | 0, 1, 2, 3 (intermediate-state, off, on, bad-state) |
| INC | stVal | –2 147 483 648 to 2 147 483 647 |
| INS | stVal | –2 147 483 648 to 2 147 483 647 |
| ISC, BSC | valWTr.posVal | –64 to 64 |
| | valWTr.transInd | 0 (False), 1 (True) |
| SPC, SPS | stVal | 0 (False), 1 (True) |
| MV | mag | Floating-point range and range of values according to IEEE 754 (single precision) |



For controllable types, the following substitute values apply in addition to the settable state values or measured values:

| | | |
|---|---|---|
| ctlNum | = | 0 |
| stSeld | = | False |
| origin.orIdent | = | Substituted by quality processing |
| origin.orCat | = | AUTOMATIC_BAY |

### Previous Quality Processing/Affected by the User for Received GOOSE Values

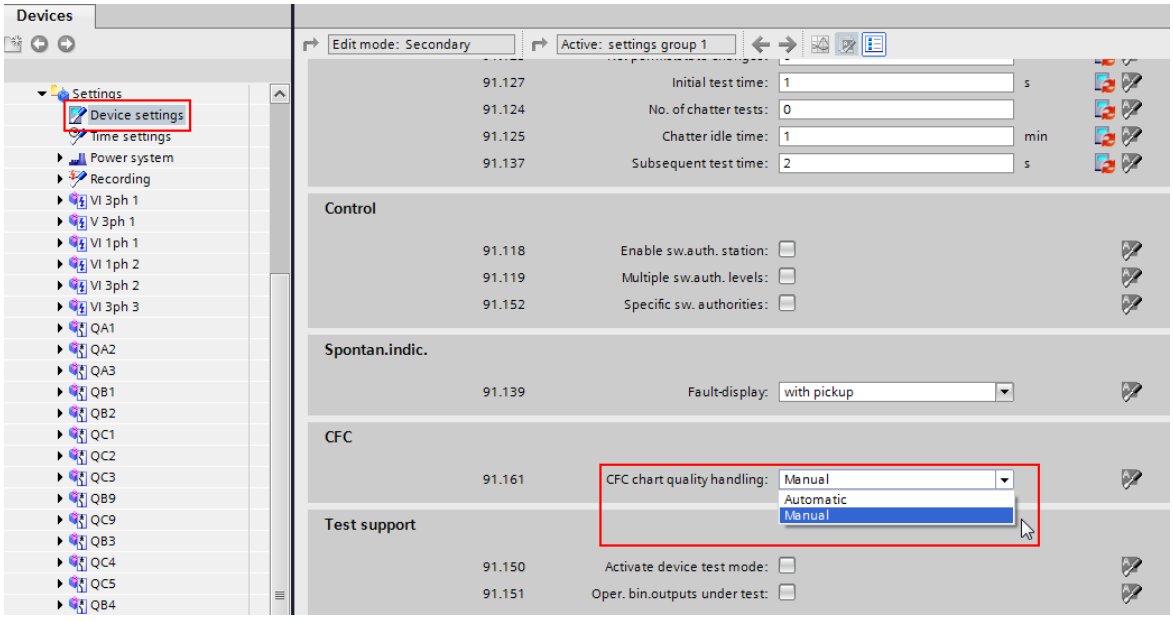
In the **Information Routing** editor, you can influence the data value and quality of all data types. The following figure shows the possible influence using the example of a DPC data type.

- In the DIGSI 5 project tree, double-click **Information Routing**.
- Select the desired signal in the **External Signals** group.
- Open the **Properties** window and select the **Processing Quality Attributes** sheet.

[sc_GOOSE values, 1, en_US]

Figure 3-44 Influence Option When Linking a DPC Type Data Object

The setting options work for the device receiving the data.



| **Quality Attribute: Validity** | |
|---|---|
| The validity values *reserved* and *questionable* are replaced at the receiving end by the *invalid* value. | |
| • Check box is not set.<br>• Check box is set and receipt of **Validity** = *good* | The validity attribute and data value are forwarded without change. |
| Check box is set and receipt of **Validity** = *invalid* is set (also applies to values *reserved* and *questionable*). | • The validity attribute is set to *good* and processed further using this value.<br>• The data value is set to the defined substitute value and processed further using this substitute value. |

| **Quality Attribute: OperatorBlocked (opBlk)** | |
|---|---|
| • Check box is not set.<br>• Check box is set and received **OperatorBlocked** = *FALSE* | The OperatorBlocked attribute and data value are forwarded without change. |
| Check box is set and received **OperatorBlocked** = *TRUE* | • The OperatorBlocked attribute is set to *FALSE* and processed further using this value.<br>• The data value is set to the defined substitute value and processed further using this substitute value. |

| Interaction of the Quality Attribute Validity and OperatorBlocked | |
|---|---|
| OperatorBlocked check box is set and receipt of **OperatorBlocked** = *TRUE* | Regardless of whether the validity check box is set or not, and regardless of the current validity, the validity attribute is set to *good* and the substitute value of the OperatorBlocked data object is set. That is, the OperatorBlocked settings overwrite the Validity settings. |
| OperatorBlocked check box is not set and receipt of **OperatorBlocked** = *TRUE* | The OperatorBlocked attribute remains set and is forwarded.<br>If the Validity check box is set and the receipt of validity = *invalid* is set, the respective data object substitute value is used.<br>For continued signal processing and influence, it must be taken into account that in this configuration the data object substitute value for validity = *invalid* is set, but the quality attribute OperatorBlocked is not yet set. |

## 3.4.3 Quality Processing/Affected by the User in CFC Charts

In DIGSI 5, you can control the quality processing of CFC charts. In the project tree, you can find the **CFC** building block (see the following figure) under **Device name** →, **Settings** → **Device settings** in the editor:

[sc_quali_cfc, 1, en_US]

Figure 3-45 Influencing CFC Quality Handling in DIGSI 5

With the **CFC chart quality handling** parameter, you control whether you want to influence the quality of CFC charts in a ***Manual*** or ***Automatic*** (default setting) manner.

If you select ***Manual***, the quality attribute of the CFC chart is always valid regardless of the quality of individual signals (**Validity** = ***good***)!

Only the **Test** quality attribute of the CFC chart is processed. If the device is in test mode or the input TEST of the CHART_STATE CFC building block is set, the quality attribute of the CFC chart is set to ***Test***.

If you select ***Automatic***, the quality processing of the CFC charts is influenced as follows:

In the case of CFC charts, a distinction has to be made between the general quality processing and certain CFC building blocks that are specifically designed for quality processing.

### General Processing

Most of the CFC building blocks do not have an explicit quality processing. For these building blocks, the following general mechanisms shall apply.

| Quality Attribute: Validity |
|---|
| If one *invalid* signal is received in the case of CFC input data, then **all** CFC output data will also be set to *invalid* if they originate from building blocks without explicit quality processing. In other words, the quality is not processed sequentially from building block to building block but the output data are set globally.<br>This does not apply to CFC output data that originate from building blocks with explicit quality processing (see next section). |

| Quality Attribute: Test | |
|---|---|
| CFC chart is in **normal** state. | CFC input data with the **Test** = *TRUE* attribute are ignored. When the CFC chart is executed, then the data value that was used before the **Test** = *TRUE* attribute is used. The quality of this **old** value is also processed.<br>This means that on the output side, the attribute **Test** = *FALSE*. |
| CFC chart is in **Test**[1)] state. | If the CFC chart is executed, then the attribute **Test** = *TRUE* is set for all data leaving the CFC chart. This does not depend on whether the data are formed via CFC building blocks with or without quality processing. |

[1)]A CFC chart can be switched to the test state by switching the entire device to test mode or the input TEST of the CFC building block CHART_STATE is set.

| Quality Attribute: OperatorBlocked | |
|---|---|
| CFC chart is in **normal** state. | In CFC charts for incoming data, the **OperatorBlocked** attribute is ignored. |
| CFC chart is in **functionally logged off**[1)] state . | In CFC charts for incoming data, the **OperatorBlocked** attribute is ignored. All CFC output data are labeled as functionally logged off. |

[1)] This state only occurs if the device is functionally logged off. In this case, the quality attributes of all CFC outputs are labeled as **functionally logged off**.

### Quality Processing Building Blocks (Condition Processing)

The first 3 building blocks (x_SPS) process the quality automatically according to the stated logic. The other building blocks are used to isolate the quality from a data object and add them back after separate logical processing.

<table>
<tr><th>Building Blocks</th><th colspan="3">Description</th></tr>
<tr><td rowspan="20">OR_SPS<br><br>AND_SPS<br><br>NEG_SPS</td><td colspan="3">The building blocks also process the supported quality attributes according to their logic. The following tables describe the logic using input values in connection with the quality attribute Validity. The input values are 0 or 1, the quality attribute Validity can have the value good (=g) or invalid (=i).<br>x = placeholder for the input value and quality attribute Validity</td></tr>
<tr><td colspan="3">OR_SPS</td></tr>
<tr><td>A (Value, Attribute)</td><td>B (Value, Attribute)</td><td>Q (Value, Attribute)</td></tr>
<tr><td>0, i</td><td>0, x</td><td>0, i</td></tr>
<tr><td>0, g</td><td>0, g</td><td>0, g</td></tr>
<tr><td>1, g</td><td>x, x</td><td>1, g</td></tr>
<tr><td>1, i</td><td>0, x</td><td>1, i</td></tr>
<tr><td>1, i</td><td>1, i</td><td>1, i</td></tr>
<tr><td colspan="3">The output thus has the logical value 1 with Validity = good as soon as at least 1 input has the logical value 1 with Validity = good. Otherwise, the inputs are treated according to the OR operation and the INVALID bit is OR-gated for the quality.</td></tr>
<tr><td colspan="3">AND_SPS</td></tr>
<tr><td>A (Value, Attribute)</td><td>B (Value, Attribute)</td><td>Q (Value, Attribute)</td></tr>
<tr><td>0, g</td><td>x, x</td><td>0, g</td></tr>
<tr><td>0, i</td><td>1, x</td><td>0, i</td></tr>
<tr><td>1, i</td><td>1, x</td><td>1, i</td></tr>
<tr><td>1, g</td><td>1, g</td><td>1, g</td></tr>
<tr><td colspan="3">The output thus has the logical value 0 with Validity = good as soon as at least 1 input has the logical value 0 with Validity = good. Otherwise, the inputs are treated according to the AND operation and the INVALID bit is OR-gated for the quality.</td></tr>
<tr><td colspan="3">NEG_SPS</td></tr>
<tr><td>A (Value, Attribute)</td><td>Q (Value, Attribute)</td><td></td></tr>
<tr><td>0, i</td><td>1, i</td><td></td></tr>
<tr><td>0, g</td><td>1, g</td><td></td></tr>
<tr><td>1, i</td><td>0, i</td><td></td></tr>
<tr><td>1, g</td><td>0, g</td><td></td></tr>
<tr><td>SPLIT_SPS<br><br>SPLIT_DPS<br><br>SPLI_XMV</td><td colspan="3">The building blocks isolate the data value and quality of a data object.<br>The requirement is that the quality is available from the input end. This is the case if the building block is interconnected with CFC input data, or is connected downstream with a quality processing building block (x_SPS). In other cases, the CFC editor does not allow a connection.</td></tr>
<tr><td>SPLIT_Q</td><td colspan="3">The building block performs binary separation of the quality into good, bad (= invalid), test, off and OperatorBlocked.<br>These 5 attributes can then be processed individually in a binary operation. The building block must be connected downstream to a SPLIT_(DO) building block.</td></tr>
</table>

| Building Blocks | Description |
|---|---|
| **BUILD_Q** | The building block enters a binary value for *good* and *bad* (= *invalid*) in each quality structure. Thus, with this building block the quality attributes *good* and *bad* (=*invalid*) can be set explicitly, for example, as the result of a monitoring logic.<br>All other quality attributes are set to the default state, for instance, **Test** = *FALSE*. If, for example, the entire CFC chart is in the test state (*see Quality Attribute: Test Under General Processing*), this default status can again be overwritten on the CFC output side.<br>The building block is normally connected downstream to a BUILD_(DO) building block. |
| **BUILD_ACD**<br>**BUILD_ACT**<br>**BUILD_BSC**<br>**BUILD_DPS**<br>**BUILD_ENS**<br>**BUILD_SPS**<br>**BUILD_XMV** | These building blocks merge data value and quality. The building-block output is generally used as a CFC output.<br>Generally, the BUILD_Q building block is connected upstream from these building blocks. |

CFC charts have a standard behavior in the processing of signals. If an input signal of the CFC chart has the quality *invalid*, all output signals of the CFC chart also get the quality *invalid*. This standard behavior is not desirable in some applications. If you use the building blocks for quality processing, the quality attributes of the input signals in the CFC chart are processed.

**EXAMPLE: Switchgear Interlocking via GOOSE**

The following conditions apply to the example:

- The interlocking condition for switchgear interlocking protection is stored in the device as a CFC chart.
- The removed device sends the release signal for the interlocking condition via a GOOSE telegram.

If the communication connection has been interrupted, the release signal (**GOOSEStr**) incoming via the GOOSE telegram gets the quality *invalid*. If the CFC chart obtains an invalid input signal, there are the following possibilities: The last signal valid before the communication interruption is used (quality = *good*) or a substitute data value with the quality *good* is used (True, False).

To do this, you have to create a separate CFC chart in addition to the interlocking plan of the switchgear interlocking. Use the building blocks for quality processing in a separate CFC chart. With the SPLIT_SPS building block, split the input signal (data type = SPS) into data value and quality information. You can then continue to process these signals separately in the CFC chart. Use the quality information as an input signal for a BUILD_SPS building block and assign the quality *good* to the signal. You obtain an SPS signal as a result, with the quality *good*. You can use this to process release messages correctly. You can process the release messages with the quality *good* in the CFC chart of the actual interlocking. Therefore, the release signal for a switch illustrated in the interlocking logic is available as a valid result with the quality *good*. The following figure shows an example of the CFC chart with the building blocks for quality processing:

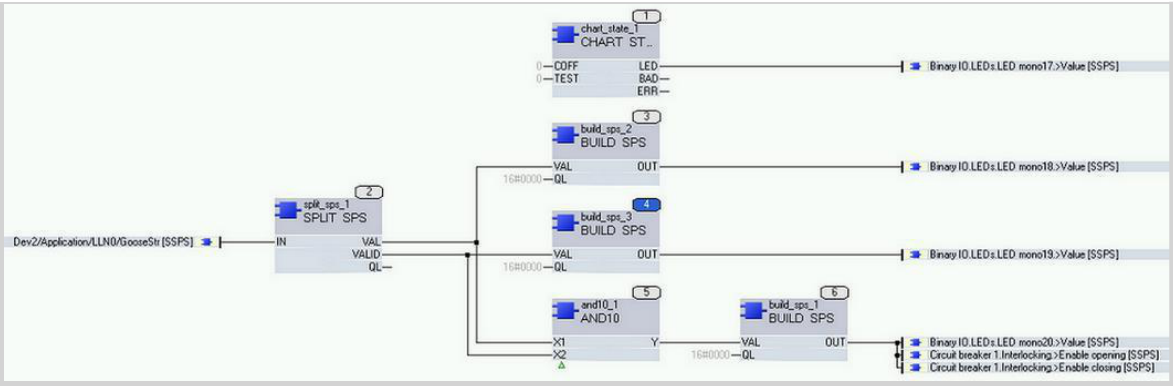


Figure 3-46 CFC Chart with Building Blocks for Quality Processing (Switchgear Interlocking via GOOSE)

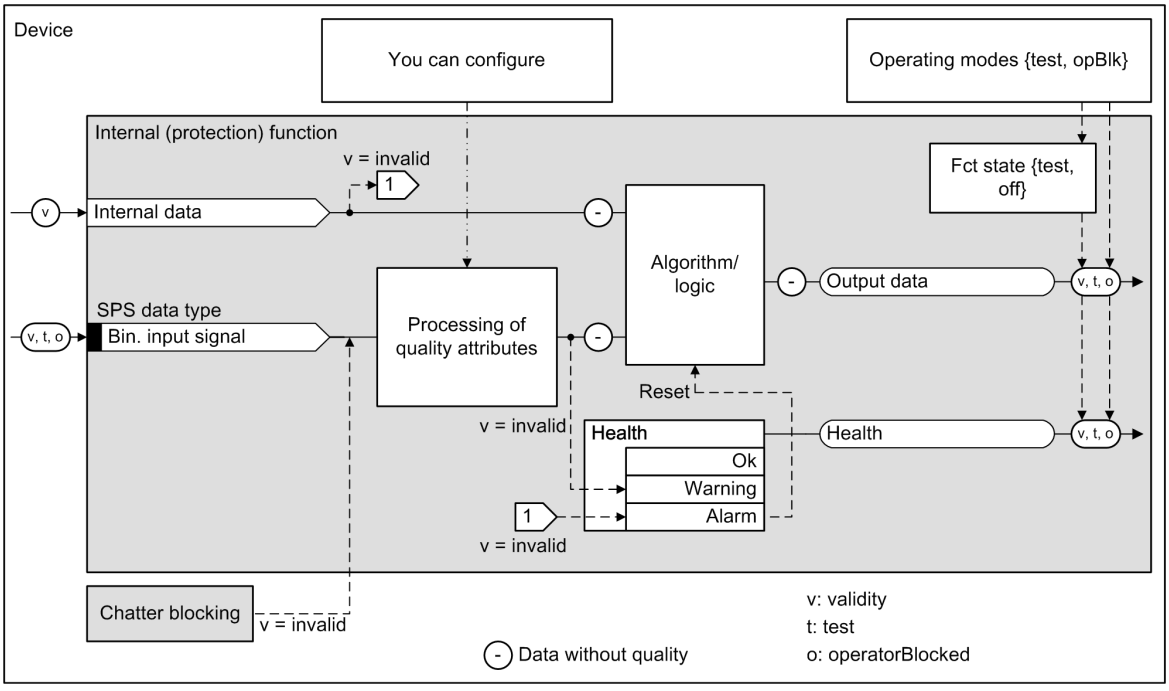
If you do not want to convert the invalid release signal to a valid signal, as described, during the communication interruption, you can also assign a defined data value to the release signal. Proceed as follows: With the SPLIT_SPS building block, split the input signal (data type = SPS) into data value and quality information. Link the VALID output of the SPLIT_SPS building block with the data value of the input signal (AND gate). This way, you can set the value to a non-risk state with the valid input signals. In the example, the output of the CFC chart is set to the value *FALSE* when the input signal is invalid.



## 3.4.4 Quality Processing/Affected by the User in Internal Device Functions

*Figure 3-47* provides an overview for processing the quality of data objects within a device-internal function.

A function can receive internal data or input data that is routable by the user (binary input signal or double commands). The respective quality attributes supported are evaluated by the function on the input side. The attributes are not passed through the specific algorithm/the specific logic of the function. The output data are supplied with a quality that is specified by the function state and device-operating mode.

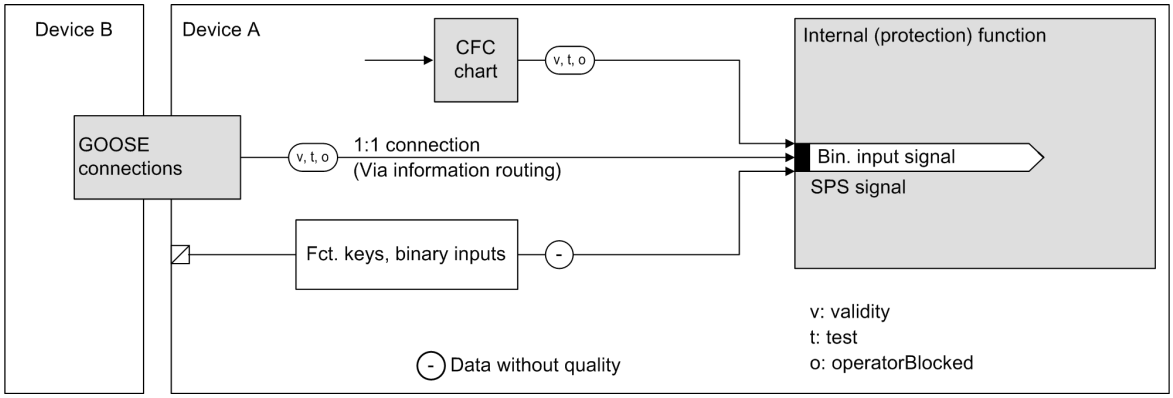
**NOTE**

Take into account that pickup of chatter blocking (see chapter *3.9.1 Signal Filtering and Chatter Blocking for Input Signals*) sets the corresponding **Validity** attribute to *invalid*.

[lo_quali3, 2, en_US]

Figure 3-47 Overview for Processing Quality within an Internal Function

### Internal Input Data



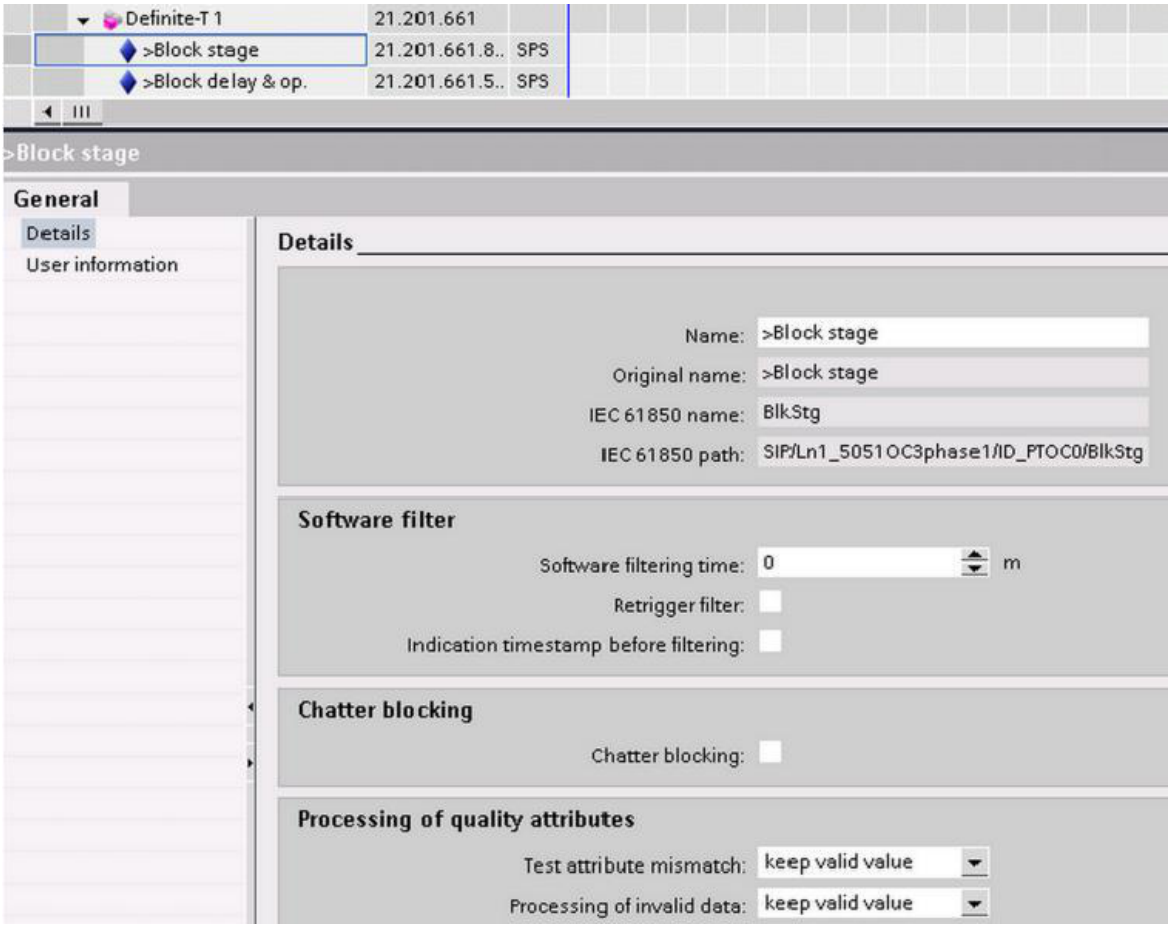
The quality processing is automatic for internal input data.

| Supported Quality Attributes | Description |
|---|---|
| Validity | • At the receiving end, internal values can only be *invalid* or *good*.<br>• If *invalid*, the function health is set to **Alarm** and the function is reset.<br>Causes for invalid internal data are, for example:<br>• The frequency operating range of the device was left.<br>• The device is not calibrated.<br>• The A/D converter monitoring identified an error. |

### Routable Binary Input Signals (SPS Data Type)

*Figure 3-48* shows the possible sources for connecting a binary input signal. Depending on the source, different quality attributes can be set:

- CFC chart: See description in chapter *3.4.3 Quality Processing/Affected by the User in CFC Charts*
- GOOSE connection: See description in chapter *3.4.2 Quality Processing/Affected by the User for Received GOOSE Values*
- Device hardware: No quality attributes are set and supported.



[lo_quali2, 2, en_US]

Figure 3-48 Sources for Connecting a Binary Input Signal

For this signal type (SPS), you can influence the processing of the quality, see overview in *Figure 3-47*.
The following figure shows the possible influence on a binary input signal of a protection stage.

- In the DIGSI 5 project tree, double-click **Information routing**.
- In the operating range, select the desired binary input signal.
- In the **Properties** window, select the **Details** entry. There, you will find the item **Processing quality attributes**.

[sc_influence, 1, en_US]

Figure 3-49 Influence Options for a Binary Input Signal (SPS Input Signal)

| Quality Attribute: Validity | |
|---|---|
| The **Validity** attribute can have the values *good* or *invalid (reserved* and *questionable* were already replaced at the input end of the device by the value *invalid*). | |
| The input signal source is *invalid*. | The current data value of the source signal is ignored. You can select between the following options:<br>• Further process last valid data value of the source signal (this is the default setting with only a few exceptions)<br>• Set the binary value to be processed further to **0**.<br>• Set the binary value to be processed further to **1**.<br>This configuration option is necessary to satisfy different applications.<br>The function health switches to Warning. |
| The input signal source is *good*. | The source signal data value is processed further. |

| Quality Attribute: Test | |
|---|---|
| • The input signal source and processed function are in test state.<br>• The input signal source is not in test state and the function to be processed is in test state. | The source signal data value is processed further. |
| The input signal source is in a test state and the function to be processed is in normal state. | The data value of the source signal is ignored. You can select between the following options:<br>• Further processing of the last valid source signal data value, before the source switches to the test state (that is the default setting)<br>• The binary value to be processed further is set to **0**.<br>• The binary value to be processed further is set to **1**.<br>This configuration option is necessary to satisfy different applications. |

| Quality Attribute OperatorBlocked |
|---|
| The quality cannot be influenced at this position and does not lead to a response within the logic |

### Output Data

The quality is not processed through the actual algorithm/logic of the function. The following table displays the conditions required to set the quality of output signals of a function.

| Cause | D0 Value | Quality Attribute | |
|---|---|---|---|
| | | After **internal** (to the SIPROTEC 5 system, for example, in the direction of a CFC chart) | To the IEC 61850 interface, in buffer |
| Functional state = **Test**<br>(thus, result of device operating mode = **Test** or function mode = **Test**) | Unchanged | **Test** = *TRUE* | **Test** = *TRUE* |
| Functional state = **Off**<br>(thus, result of device operating mode = **Off**) | Function-specific, corresponding to the definition for switched off | **Validity** = *good* | **Validity** = *invalid* |

| Cause | D0 Value | Quality Attribute | |
|---|---|---|---|
| Function health = **Alarm**<br>(for example, result of invalid receive data) | Function-specific, corresponding to the definition for reset | **Validity** = *good* | **Validity** = *invalid* |
| Device operating mode = **functionally logged off** | Unchanged | **Validity** = *good*<br>**OperatorBlocked** = *TRUE* | **Validity** = *good*<br>**detailQual** = *oldData*<br>**OperatorBlocked** = *TRUE* |

# 3.5 Fault Recording

## 3.5.1 Overview of Functions

All SIPROTEC 5 devices have a fault memory in which fault recordings are kept securely. Fault recording documents operations within the power system and the way in which protection devices respond to them. You can read out fault recordings from the device and analyze them afterwards using evaluation tools such as SIGRA.

A fault record contains the following information:

- Sample values of the analog input channels
- Measured values calculated internally
- Any binary signals (for example, pickup signals and trip signals of protection functions)

You can individually configure the signals to be recorded. Furthermore, you can define the starting condition, the record duration, and the saving criterion of a recording. Fault records saved in the device are also available after a loss of auxiliary voltage.

## 3.5.2 Structure of the Function

The **Fault recorder** function is a central device function. Both the recording criterion and the measured-value and binary channels to be recorded are functionally preconfigured through the application templates. You are able to individually adapt the configuration in DIGSI 5. The fault recording and the fault log are subject to the same control. This ensures that real time, relative time, and numbering of the fault data are synchronized.

This means that all fault recordings function on the same real-time and relative-time basis.

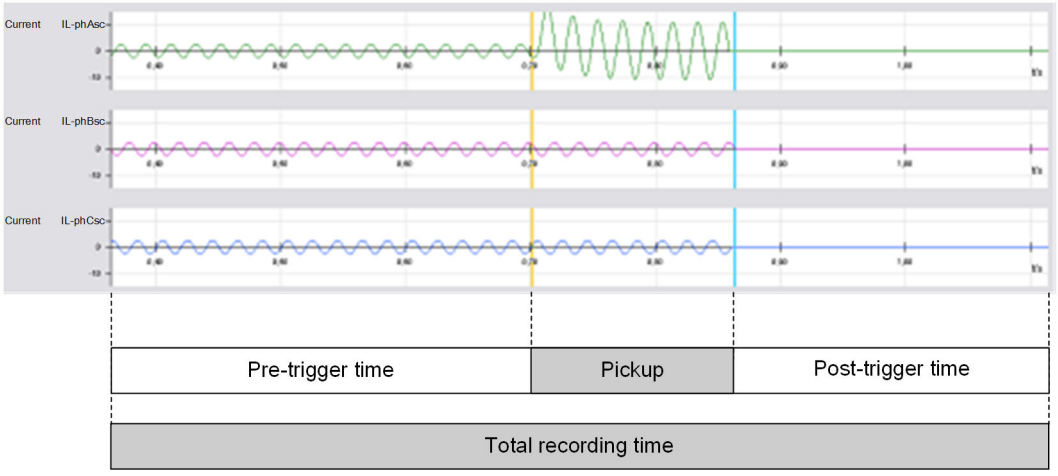
The data read out via the DIGSI-PC are saved in COMTRADE format. Fault recording data can be transferred to the substation automation technology by request in accordance with the standards via existing communication connections (such as IEC 61850, IEC 60870-5-103). The central device analyzes the data using appropriate programs.

## 3.5.3 Function Description

The **Fault recorder** function records the sampled values, specific to each device, of all analog inputs, the internally calculated measured values, and the binary signals. The configuration, which is predefined for each device via an application template, can be adapted individually.

**NOTE**

For detailed information about selecting and deleting fault records, refer to the Operating Manual (C53000-G5040-C003).



The fault memory of the device is automatically updated with every recording. When the fault memory is filled completely, the oldest recordings are overwritten automatically. Thus, the most recent recordings are always stored safely. The maximum number of recordings is 128.

### Sampling Frequency

The analog measuring channels are sampled at a different sampling rate for fault recording. The **`Sampling frequency`** parameter is used to set the desired sampling frequency. Possible setting values are 1 kHz, 2 kHz, 4 kHz, and 8 kHz . This setting value applies only to fault recording and does not affect protection functions or calculated measured values.

### Record Duration

The overall duration of a single fault recording comprises the total duration of the configurable recording criterion, the **Pre-trigger time** and the **Post-trigger time**. You can set the parameters for these components individually.

[dw_sigrar, 2, en_US]

Figure 3-50 Example of a Fault Recording

With the **Fault recording** parameter, you specify the start criterion of the recording.

You can set the following values:

- ***with pickup***:
  The fault recording records the complete fault until dropout. The resulting pickup signals of all function groups are taken into account.
- ***user-defined***:
  With this setting value, you can individually specify the recording criterion for the fault recording in DIGSI 5. Function-specific recording criteria can be realized in this way.

If a recording criterion reoccurs during the pickup time and post-trigger time, the recording which is active is extended to include a new post-trigger time.

For a sampling frequency of 8 kHz and 24 analog channels to be recorded, the duration of one individual fault recording can be up to 20 s.

The maximum record duration can be limited by the **Maximum record time** parameter.

In addition to starting the fault recording via the pickup, the following alternatives are possible:

- Externally via binary input signal *>External start* (for example, from an external protection device without fault recording by an object transferred via a GOOSE message)
- By way of a configurable input signal *>Manual start*, you can start fault records with a configurable length (parameter **Manual record time**).
- From DIGSI 5, you can start test fault records with a fixed length of 1 s.
- With a command from a central device via an existing communication connection (IEC 61850, IEC 60870-5-103)

**NOTE**

If a pickup signal is present continuously, the fault record is closed after the **Maximum record time** expires and the fault recording is not restarted!

### Saving the Recording

Not every fault recording that is started actually needs to be saved. With the **Storage** parameter, you specify whether you want to save the fault recording that has started. You can also save only fault data for which the pickup of a protection function also caused a tripping . With this setting, faults beyond the self-protection range will not lead to replacing fault recordings that have already been saved.

### Configuration of Signals to Be Recorded

All analog inputs of the device that have been configured (currents and voltages) are recorded as sampled channels.

Function-specific binary signals (for example, pickup and trip signals) and measured value channels can be configured individually for recording in the DIGSI information-routing matrix. For this purpose, a separate **Recorder** column is available.

You can rename the signals in the DIGSI Information-routing matrix. You can change the order of the binary signals and measured-value channels to be recorded in DIGSI under **Signal order**. You can find more detailed information on this in the DIGSI 5 Online Help, version V07.50 and higher (Order number: C53000-D5000-C001-D).

The operational measured values and the measured values of the fundamental components and symmetrical components (see the Device Manual, chapters *9.3 Operational Measured Values* and *9.4 Fundamental and Symmetrical Components*) are calculated every 9 cycles (at 50 Hz, this is every 180 ms). However, this can mean that the data are not synchronized with the sampled values of the analog channels. The recording of these measured values can be used to analyze the slowly changing processes.

### Numbering and Time Stamping

All fault recordings saved are automatically numbered in ascending order and assigned a real-time stamp for the start time. The fault recording logs the fault with a relative time. The reference-time point is the start of the recording. Every fault recording has a corresponding fault log with the same number. This ensures that the fault recording can be uniquely assigned to the event log.

**NOTE**

When the **Fault recorder** function detects a negative time stamp of the measurand or the binary signal, an entry is added in the **Device-diagnosis log** in DIGSI. Meanwhile, the fault recording continues. The entry for an incorrect measurand or binary signal shows the prefix **Bad quality**.

### Fault Memory

The device manages its available fault memory dynamically, so that the maximum recording capacity is always available. When exceeding the limits of the fault memory, the oldest recordings are automatically overwritten. This means that the most recent recordings are always available. The sampling rate, type, and number of measured value trends to be recorded are the crucial variables when it comes to restricting the length and number of recordings possible. Parallel to the sampled tracks, up to 50 tracks with function-specific measured values and up to 200 binary tracks can be recorded. The following table provides an overview of the maximum storage capacities, in seconds, for different connection variations of the protection devices.

Table 3-10 Maximum Length of All Stored Recordings

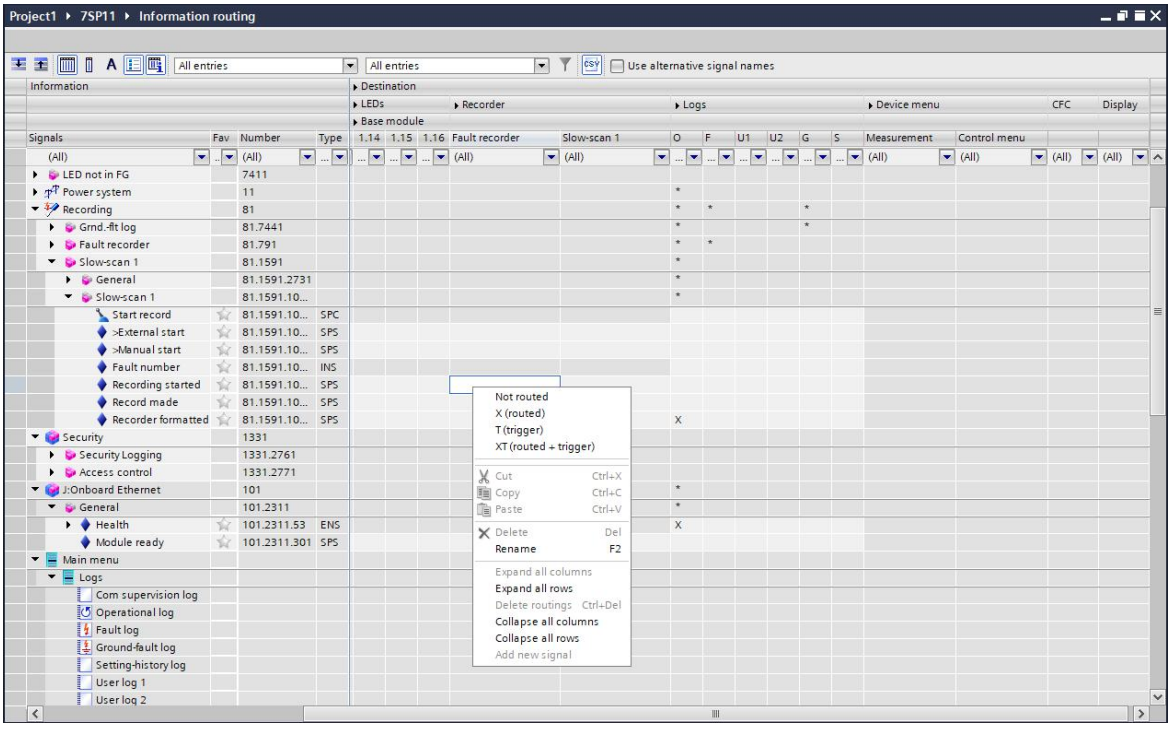
| Connection Examples | Sampling 1 kHz | Sampling 2 kHz | Sampling 4 kHz | Sampling 8 kHz |
|---|---|---|---|---|
| Feeder:<br>4I, 6 measured values, 20 binary tracks | 1365 s | 819 s | 455 s | 241 s |
| Feeder:<br>4I, 4V, 20 binary tracks | 1125 s | 566 s | 284 s | 142 s |

| Connection Examples | Sampling 1 kHz | Sampling 2 kHz | Sampling 4 kHz | Sampling 8 kHz |
|---|---|---|---|---|
| Feeder:<br>4I, 4V, 6 measured values, 20 binary tracks | 890 s | 500 s | 266 s | 137 s |
| Feeder 1.5 CB:<br>8I, 8V, 6 measured values, 20 binary tracks | 525 s | 281 s | 145 s | 74 s |

### Input and Output Signals

The **Fault recorder** function provides several input signals that allow the precise starting, deleting of recordings. The output signals provide information about the function status.

In the following table, you can find input signals of the **Fault recorder** function:



| Name | Type | Description |
|---|---|---|
| Control: Start recording | SPC | Start recording via the function key |
| Control: Reset memory | SPC | Delete all recording via the function key. The error numbers are reset. |
| Control: Delete memory | SPC | Delete all recording via the function key. The error numbers remain as is. |
| Control: >External start | SPS | Start recording with an external binary signal, for example, by the trip command of an external protection device. The set pre-trigger and post-trigger time are taken into account. |
| Control: >Manual start | SPS | Start a recording of fixed duration (parameter **`Manual record time`** ) by way of an external binary signal, for example, manually via the function key or by an external binary signal. |

In the following table, you can find output signals of the **Fault recorder** function:

| Name | Type | Description |
|---|---|---|
| Control: Error number | INS | The indication of the current error number allows a unique allocation of entries in the message buffers for the recorded fault records. |
| Control: Recording started | SPS | Fault recording running |
| Control: Recording done | SPS | Fault recording done |
| Control: Tmax reduced | SPS | Fault recording ends before the set **`Maximum record time`** expires, because the fault log is full. |
| Control: Fault log is full | INS | The fault log is full. |

### Configuring Stored Indications Using DIGSI 5

- In the **Information Routing** of each device set up in DIGSI 5, you can route binary signals to LEDs and output contacts. To do this, open the project tree.
  Project -> Device -> **Information routing**
- Right-click the routing field of your binary indication in the desired LED or binary output column in the routing range of the targets.

[sc_FR_information routing, 1, en_US]

Figure 3-51 Routing of the Signals in the Information Routing

## 3.5.4 Application and Setting Notes

**Parameter: Fault recording**

- Recommended setting value **(_:2761:130) Fault recording** = ***with pickup***

With the **Fault recording** parameter, you define the time interval at which faults are recorded. The total record duration is defined as the duration of the fault plus the total of the parameters **Pre-trigger time**, **Post-trigger time** and is limited by the maximum record duration.

| Parameter Value | Description |
|---|---|
| ***with pickup*** | The fault recording time is determined by the total number of all protection pickups. The resulting pickup signals of all function groups are considered.<br>Note: When the post-trigger time has expired, the indications of an automatic reclosing function are not recorded. Evolving faults after expiry of the post-trigger time can result in the opening of a new fault with its own recording. |
| ***user-defined*** | The fault recording time is defined user-specific.<br>Note: Specify all signals for individual definition of the fault recording time in the DIGSI 5 information-routing matrix. In the information routing matrix in the **Fault record** column, the fault recording has for this purpose a separate column **Trigger**. The record duration is calculated from the logical OR operation of all initiated, configured signals. |

**Parameter: Storage**

- Recommended setting value **(_:2761:131) Storage** = ***always***

With the **Storage** parameter, you define the storage criterion for a fault recording that has already started.

| Parameter Value | Description |
|---|---|
| ***always*** | Each fault recording that has been started is saved. |
| ***with trip*** | If at least one protection function issues an operate indication during the record time, any fault recording that has been started is saved. |

**Parameter: Maximum record time**

- Default setting **(_:2761:111) Maximum record time** = ***5.00 s***

With the **Maximum record time** parameter, you configure the maximum record duration for an individual fault recording. When the time configured expires, an ongoing fault recording is canceled. This parameter merely limits the duration of the fault recording. It does not affect the logging of faults in the fault log.

**Parameter: Pre-trigger time**

- Recommended setting value **(_:2761:112) Pre-trigger time** = ***0.50 s***

With the **Pre-trigger time** parameter, you configure the pre-trigger time for an individual fault recording. The set pre-trigger time is prepended to the actual recording criterion for the fault recording.

**Parameter: Post-trigger time**

- Recommended setting value **(_:2761:113) Post-trigger time**= ***0.50 s***

With the **Post-trigger time** parameter, you configure the post-trigger time for an individual fault recording. The post-trigger time that has been configured is added to the actual recording criterion for the fault recording after the dropout.

The following table shows how the setting range changes for the **Post-trigger time** parameter depending on the **Sampling frequency**.

| Sampling Frequency | Setting Range for the Post-trigger time Parameter |
|---|---|
| 8 kHz | 0.05 s to 4 s |
| 4 kHz | 0.05 s to 8 s |
| 2 kHz | 0.05 s to 16 s |
| 1 kHz | 0.05 s to 24 s |

**Parameter: Manual record time**

- Recommended setting value **(_:2761:116) Manual record time** = ***0.50 s***

With the **Manual record time** parameter, you set the length of a recording if the fault recording is activated dynamically (edge-triggered) via a separately configured input signal *>Manual start*.

In this case, pre-trigger and post-trigger times do not take effect.

**Parameter: Sampling frequency**

- Recommended setting value **(_:2761:140) Sampling frequency** = ***8 kHz***

With the **Sampling frequency** parameter, you define the sampling frequency of fault records that you want to download via DIGSI 5. Possible setting values are 8 kHz, 4 kHz, 2 kHz, and 1 kHz.

**Parameter: Sampl. freq. IEC 61850 rec.**

- Recommended setting value **(_:2761:141) Sampl. freq. IEC 61850 rec.** = ***8 kHz***

With the parameter **Sampl. freq. IEC 61850 rec.**, you define the sampling frequency of the fault record that you want to download using the IEC 61850 communication protocol. Possible setting values are 8 kHz, 4 kHz, 2 kHz, and 1 kHz.

You cannot set the parameter **Sampl. freq. IEC 61850 rec.** to be greater than the set value of the parameter **Sampling frequency**. The setting options of the parameter **Sampl. freq. IEC 61850 rec.** which are greater than the set value of the parameter **Sampling frequency** are invisible.

If the size of the COMTRADE file exceeds the maximum permissible storage capacity of the device, the original recording is truncated. The truncated data are discarded.

**NOTE**

If you have created a fault record with a certain sampling frequency and then set the sampling frequency to a lower value, you can no longer download this fault record using the IEC 61850 communication protocol.

You must reset the sampling frequency to the original value. Then you can download the fault record again using the IEC 61850 communication protocol.

**Parameter: Cal.zero.seq.cur.channel**

- Default setting **(_:2761:129) Cal.zero.seq.cur.channel** = ***no***

With the **Cal.zero.seq.cur.channel** parameter, you determine whether the calculated zero-sequence current ***3I0*** or ***-3I0*** is recorded in a separate channel or not. The separate channel is visible in the DIGSI 5 Information routing under the **I 3-phase** measuring point.

The zero-sequence currents can be calculated only with the following current-transformer connection types:

- ***3-phase + IN-separate***
- ***3-phase + IN***
- ***3-phase***

| Parameter Value | Description |
|---|---|
| ***no*** | The zero-sequence current calculated from the sampled values of the currents is not recorded. |
| ***-3I0*** | The calculated zero-sequence current ***-3I0*** is recorded for each **I 3-phase** measuring point.<br>***-3I0*** is calculated from the sampled current values using the following equation: -3I0 = - ($I_A$ + $I_B$ + $I_C$). |
| ***3I0*** | The calculated zero-sequence current ***3I0*** is recorded for each **I 3-phase** measuring point.<br>***3I0*** is calculated from the sampled current values using the following equation: 3I0 = ($I_A$ + $I_B$ + $I_C$). |

**Parameter: Cal.zero seq.volt.channel**

- Default setting **(_:2761:132) Cal.zero seq.volt.channel** = ***no***

With the **Cal.zero seq.volt.channel** parameter, you determine whether the calculated zero-sequence voltage ***V0*** or ***3V0*** is recorded in a separate channel or not. The separate channel is visible in the DIGSI 5 Information routing under the **V 3-ph** measuring point.

The zero-sequence voltages can be calculated only with the following current-transformer connection types:

- ***3 ph-to-gnd volt. + VN***
- ***3 ph-to-gnd voltages***

| Parameter Value | Description |
|---|---|
| ***no*** | The zero-sequence voltage calculated from the sampled voltage values is not recorded. |
| ***V0*** | The calculated zero-sequence voltage ***V0*** is recorded for each **V 3-ph** measuring point.<br>***V0*** is calculated from the sampled voltage values using the following equation: $V0 = (V_A + V_B + V_C)/3$. |
| ***3V0*** | The calculated zero-sequence voltage ***3V0*** is recorded for each **V 3-ph** measuring point.<br>***3V0*** is calculated from the sampled voltage values using the following equation: $3V0 = (V_A + V_B + V_C)$. |

## 3.5.5 Settings

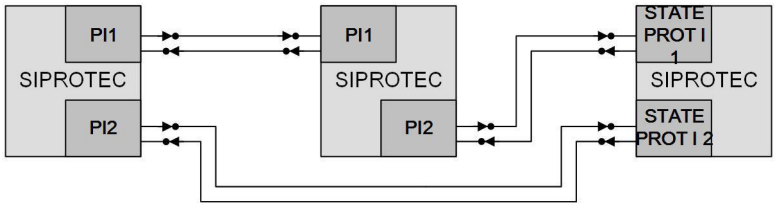
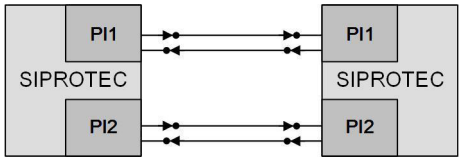
# 3.6 Protection Communication

## 3.6.1 Overview



The **Protection communication** includes all functionalities necessary for data exchange via the protection interface (PI).

Devices that communicate with each other via protection interfaces form a device combination. A device combination consists of 2 to 6 devices. The devices communicate via point-to-point connections (protection connections). In this case, a device has only one connection to another device via a protection interface (PI). With a 2nd protection interface, you can establish a connection to another device or a redundant connection to the same device. With their protection connections, the devices form a protection topology in the form of a redundant ring (ring topology) or as a chain structure (chain topology).



[dw_PDC_chain_3devices, 1, en_US]

Figure 3-52 Device Combination of 3 Devices in a Chain Topology

[dw_PDC_ring_3devices, 1, en_US]

Figure 3-53 Device Combination of 3 Devices in a Ring Topology

[dw_PDC_ring_2devices, 1, en_US]

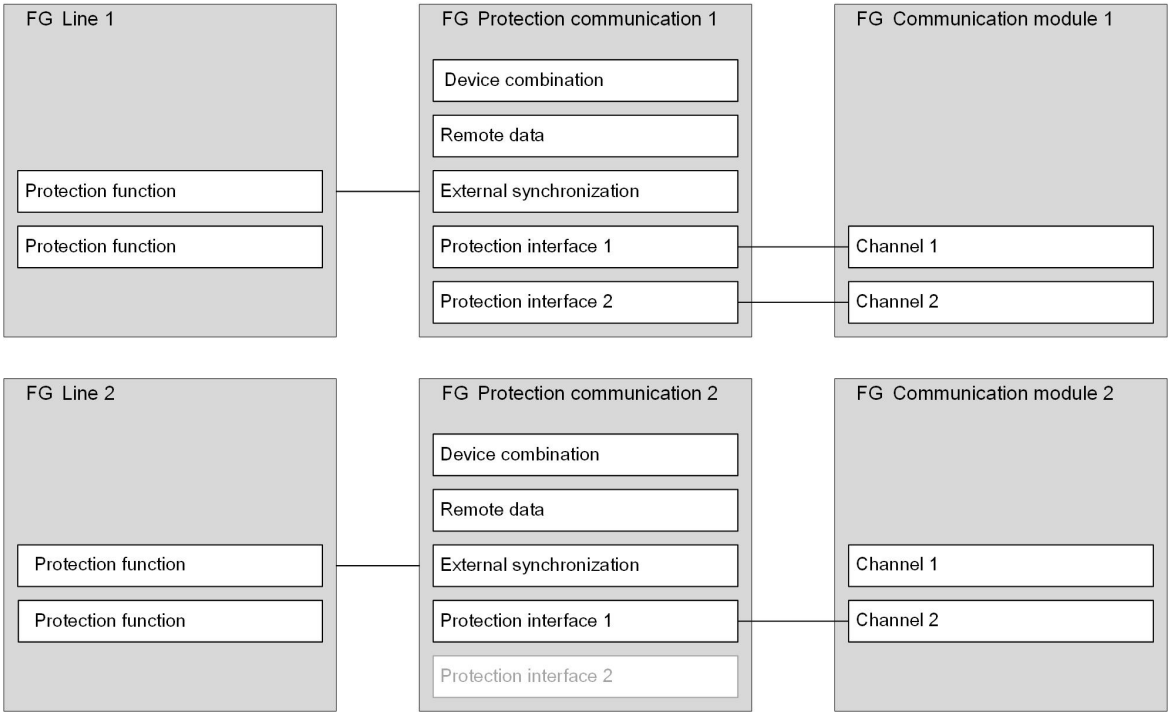
Figure 3-54 Device Combination of 2 Devices in a Ring Topology

Within a device combination, the point-to-point connections can have different bandwidths. Depending on the bandwidth, a certain amount of binary information and measured values can be transmitted bidirectionally between the devices. The connection with the lowest bandwidth defines the amount of binary information and measured values.

The following information is important for protection communication and is transmitted additionally. You cannot change this information:

- Topology data and values are exchanged for monitoring and testing the connection and displayed on the device or with DIGSI 5.
- Protection data and measured values, such as line differential protection data or binary data of the teleprotection schemes for distance protection and ground-fault protection are transmitted.
- The time synchronization of the devices is possible directly via the connection, whereby a device of the protection topology assumes the role of the timing master.

The point-to-point connection between the devices is continuously monitored for data faults and failure and the signal-transit time of the data is measured.



The protection communication is typically used for line differential protection and with the teleprotection schemes for distance protection and ground-fault protection. In SIPROTEC 5, you can configure the protection communication in all devices and use it for further protection applications. At the same time, any binary information and measured values can be transferred between the devices.

**NOTE**

The protection communication is compatible with the successor versions from firmware version V04.00 and higher.

## 3.6.2 Protection Communication in the Overall System

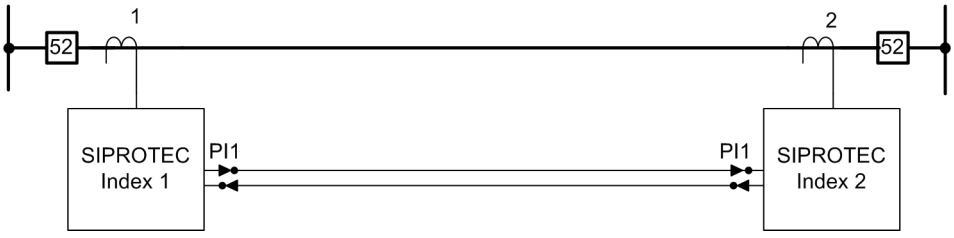
The following figure illustrates the interaction of protection communication, protection function groups, and communication modules. The **Protection communication** is integrated as follows in the overall system:

[dw_protcom_compl_system, 2, en_US]

Figure 3-55 Protection Communication in the Overall System

If protection functions want to use the protection interfaces, their superordinate protection function group, for example, the FG **Line 1**, must be connected to a **Protection communication** function group. With this connection, each protection function in the FG **Line 1** can use protection communication.

In addition, a connection must be configured between the logical protection interface in the FG **Protection communication** and a channel on the physical communication module. The physical communication module must support the protection-interface protocol.



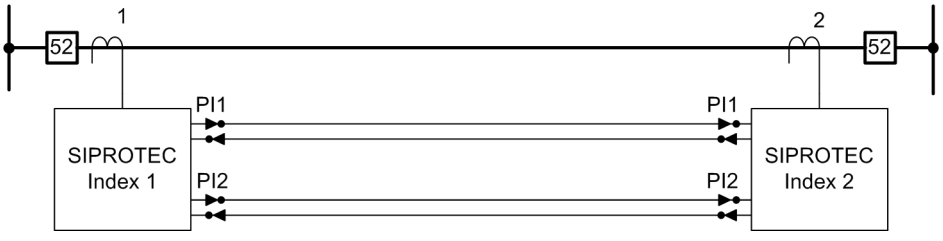
The following chapters describe the configuration of the connections.

## 3.6.3 Function Description

### Device Combination with 2 Devices: Simple or Redundant Transmission

In a device combination with 2 devices, one protection communication with a protection interface is required per device to establish a protection connection (see next figure).

The most frequent application is the point-to-point exchange of data between 2 devices (the protection communication is of type 2), as performed by protection transmission devices. You can create a topology with up to 6 devices.



[dw_interface, 1, en_US]

Figure 3-56 Data Exchange for 2 Devices, Each with Protection Connection

**NOTE**

The index describes the consecutive numbering of the devices in a device combination (see parameter **`(_:5131:101) Local device is device`**).

A maximum of 2 protection interfaces per FG **Protection communication** are possible in one device, see following figure. If the **Protection communication** function groups are connected to each other in the devices via 2 protection connections of the same type, this results in 100 % redundancy regarding the transmission route. The devices then search for the communication connection with the highest bandwidth (for example, optical fiber). If this protection connection fails, the system switches over automatically to the 2nd protection connection until the 1st protection connection is available again. As the protection connection with lower bandwidth defines the maximum amount of transferable information, the same information is exchanged via both protection connections. Both protection communications in the device are then of type 1.

[dw_intera, 1, en_US]

Figure 3-57 Data Exchange for 2 Devices, Each Having 2 Protection Connections, Redundant Transmission Route

### Remote Data

With the **Remote data** function, customer-specific indications and measured values can be communicated via the protection interface with settable update cycles (priorities).

There are 3 different priorities for the transmission of remote data:

- **Priority 1**: Use **Priority 1** for the transmission of fast protection signals that are transferred and updated at a maximum of every 20 ms in a telegram.
- **Priority 2**: Use **Priority 2** for the transmission of fast single-point or double-point indications that are transferred and updated at a maximum of every 40 ms.
- **Priority 3**: Use **Priority 3** for all indications, measured, and metered values that are transferred and updated a maximum of every 100 ms.

### Communication Media

The communication takes place via direct fiber-optic connections, via communication networks or via 2-wire copper conductors. Siemens recommends a direct fiber-optic connection, as this offers a high transmission rate and is immune to failures in the transmission route while offering the shortest transmission time. This

also enables the transmission of a large amount of remote data in line differential protection applications and the remote control of remote devices with DIGSI 5.

The distance to be bridged and the transmission paths (communication media) available determine the settings of the protection interface. External communication converters are used for the connection to communication networks via G703.1-, X21-, or G703.6 interfaces. The connection to 2-wire copper cores also takes place via a communication converter. The C37.94 interface, for example, with 2 MBit/s, offers a direct fiber-optic connection to a multiplexer with the corresponding interface.

*Table 3-11* to *Table 3-12* show examples of communication connections.

In the case of a direct connection, the transmission distance depends on the fiber type of the optical fiber. This distance can also be extended via external repeaters.

The modules in the device can be replaced from outside, so that adaptation to a transmission route is possible. In the case of the 820-nm double module USART-AE-2FO, 2 protection-interface channels can be operated on one module.

The modules can be located at slots E and F in the base device, and at slots N and P in the plug-in module assembly with integrated power supply.

When using communication converters, the connection from the device to the communication converter by a module is established via optical fibers.

Table 3-11 Plug-In Modules for Applications with Protection Communication

| Plug-In Modules | Module Type: USART-AF-1LDFO | Module Type: USART-AW-2LDFO | Module Type: USART-AG-1LDFO | Module Type: USART-AU-2LDFO | Module Type: USART-AK-1LDFO | Module Type: USART-AV-2LDFO | Module Type: USART-AH-1LDFO[5] | Module Type: USART-AJ-1LDFO[6] | Module Type: USART-AX-2LDFO[7] | Module Type: USART-AY-2LDFO[8] | Module Type: ETH-BD-2FO[9] |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **Physical Connection** | | | | | | | | | | | |
| 1 x optical serial, 1300 nm, duplex LC plug, 24 km via 9/125 µm singlemode optical fiber or 4 km via 62.5/125 µm multimode optical fiber | ● | | | | | | | | | | |
| 2 x optical serial, 1300 nm, duplex LC plug, 24 km via 9/125 µm singlemode optical fiber or 4 km via 62.5/125 µm multimode optical fiber | | ● | | | | | | | | | |
| 1 x optical serial, 1300 nm, duplex LC plug, 60 km via 9/125 µm singlemode optical fiber | | | ● | | | | | | | | |
| 2 x optical serial, 1300 nm, duplex LC plug, 60 km via 9/125 µm singlemode optical fiber | | | | ● | | | | | | | |
| 1 x optical serial, 1550 nm, duplex LC plug, 100 km via 9/125 µm singlemode optical fiber | | | | | ● | | | | | | |
| 2 x optical serial, 1550 nm, duplex LC plug, 100 km via 9/125 µm singlemode optical fiber | | | | | | ● | | | | | |
| 1 x optical serial, bidirectional using 1 optical fiber, 1300/1550 nm (Tx/Rx), simplex LC plug, 40 km using 9/125 µm singlemode optical fiber | | | | | | | ● | | | | |

5 USART-AH-1LDFO only pairs with USART-AJ-1LDFO or USART-AY-2LDFO

6 USART-AJ-1LDFO only pairs with USART-AH-1LDFO or USART-AX-2LDFO

7 USART-AX-2LDFO only pairs with USART-AJ-1LDFO or USART-AY-2LDFO

8 USART-AY-2LDFO only pairs with USART-AH-1LDFO or USART-AX-2LDFO

9 Suitable for DIGSI 5, IEC 61850, process bus, busbar protection etc.

| Plug-In Modules | Module Type: USART-AF-1LDFO | Module Type: USART-AW-2LDFO | Module Type: USART-AG-1LDFO | Module Type: USART-AU-2LDFO | Module Type: USART-AK-1LDFO | Module Type: USART-AV-2LDFO | Module Type: USART-AH-1LDFO[5] | Module Type: USART-AJ-1LDFO[6] | Module Type: USART-AX-2LDFO[7] | Module Type: USART-AY-2LDFO[8] | Module Type: ETH-BD-2FO[9] |

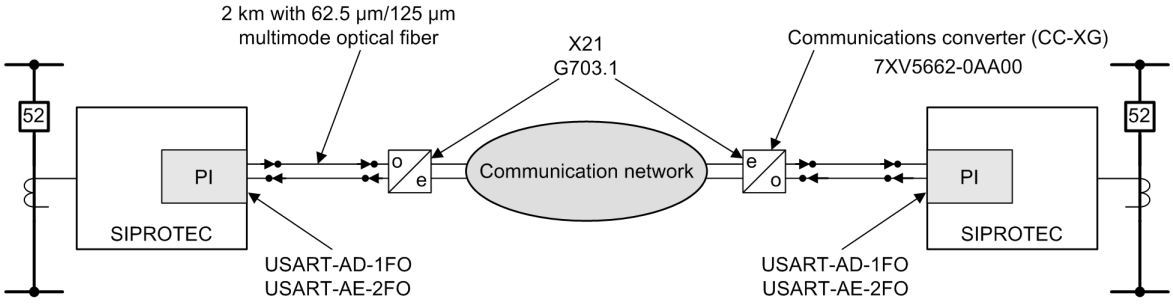
Figure 3-61 Optical Remote Connection with Attenuators

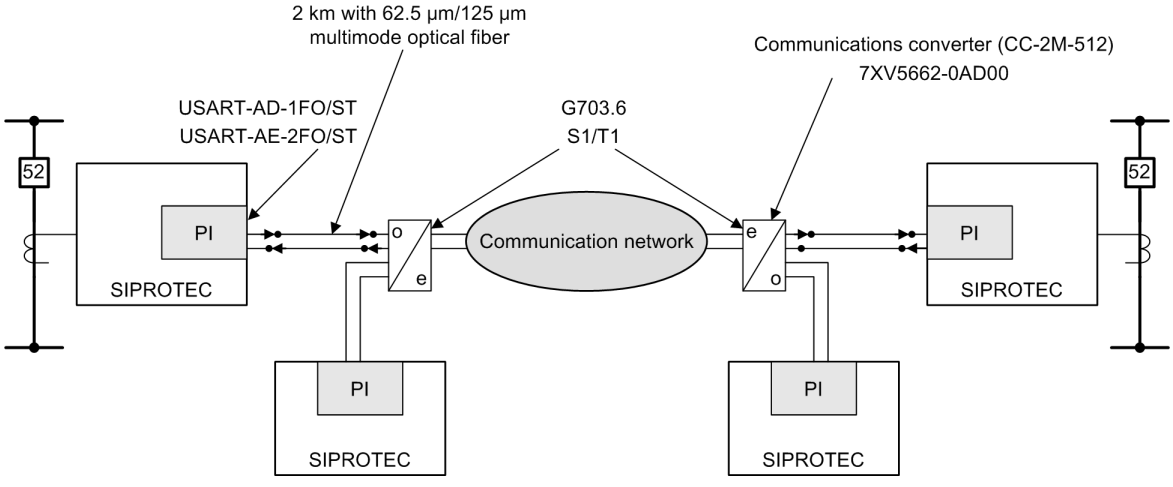


**NOTE**

Connect two 7XV5107-0AA00 attenuators if you use the communication modules USART-AV-2LDFO or USART-AK-1LDFO for transmission routes of less than 30 km. To continue using the duplex LC plug, attach both attenuators to one end of the protection connection (see *Figure 3-61*).

[dw_single, 1, en_US]

Figure 3-62 Connection via Singlemode Optical Fiber

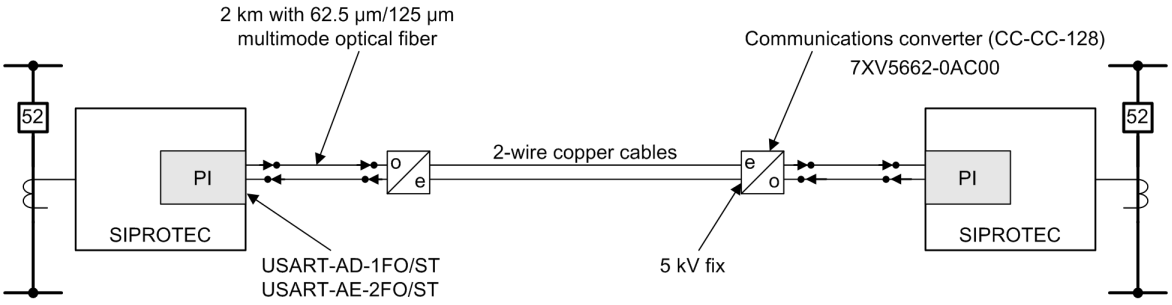


[dw_multim-05, 1, en_US]

Figure 3-63 Connection via Communication Network with a G703.1 Interface

The connection to the multiplexer is established via a communication converter with a G703.1 interface (64 kBit/s) or X21 interface (64 kBit/s to 512 kBit/s). You can set the bit rate for the KU-XG-512 (for X21), KU-XG-256 (for X21), KU-XG-128 (for X21), and KU-XG-64 (for X21 or G703.1) with the parameter **`Connection via`**.

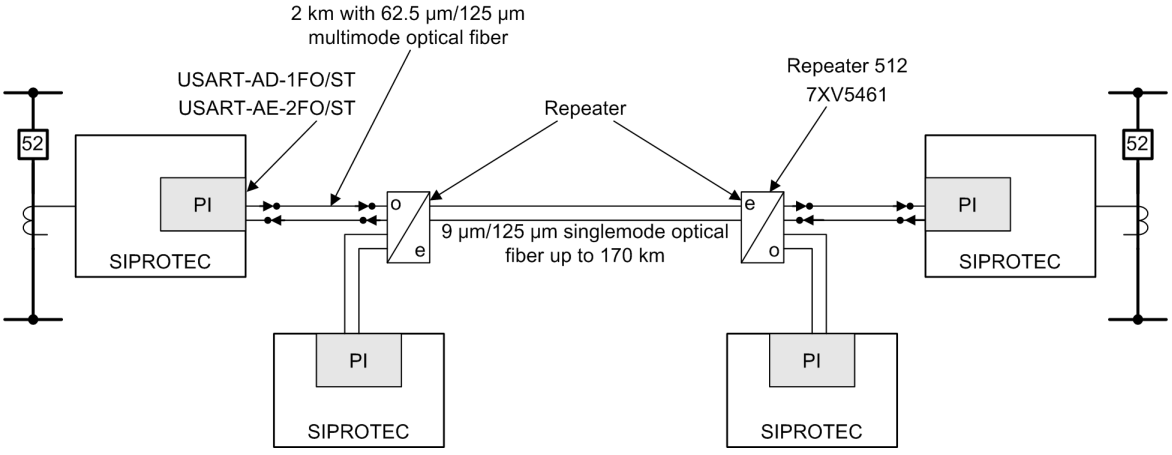
You can find more detailed information in *Table 3-13*.



[dw_multim-06, 1, en_US]

Figure 3-64 Connection via Communication Network with a G703.6 Interface

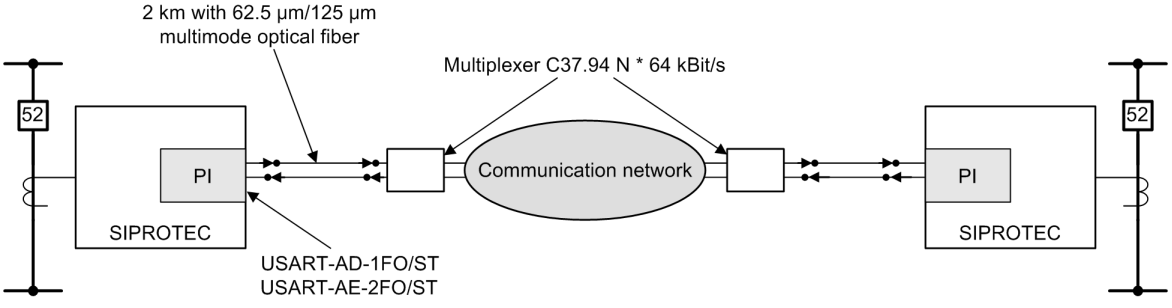
The connection to the multiplexer is established with 512 kBit/s via a communication converter with a G703.6 interface (E1 with 2 MBit/s or T1 with 1.44 MBit/s). The communication converter offers a 2nd interface for connecting an additional protection interface.



Adjust the setting for the bit rate with KU-2M-512 at 512 kBbit/s in accordance with *Table 3-13* with the parameter **`(_:105) Connection via`**.

[dw_multi_7, 1, en_US]

Figure 3-65 Connection via 2-Wire Copper Cables



The connection to a communication converter with an integrated isolation voltage of 5 kV is established with 128 kBit/s (KU-KU-128 setting in accordance with *Table 3-13*). An isolation of 20 kV of the 2-wire connection is possible via an external 7XR9516 isolating transformer.

[dw_repeat, 1, en_US]

Figure 3-66 Direct Fiber-Optic Connection via an External Repeater

The repeater offers an interface for connecting an additional protection interface. The connection to a repeater is established with 512 kBit/s (repeater 512 kBit/s setting in accordance with *Table 3-13*).

[dw_mutip8, 1, en_US]

Figure 3-67 Direct Optical Connection to a Multiplexer with a C37.94 N * 64 kBit/s Interface (Time Slot N = 1; 2 or 8)

**NOTE**

The redundancy of different communication connections (for the ring topology) requires rigorous separation of all devices involved in the communication. Therefore, avoid different transmission routes via the same multiplexer board, as no more substitute paths are possible if the board fails.

### Supervision of the Communication

Communication is continuously monitored by the devices and displayed with indications and measured values.

If a number of defective data telegrams, or no data telegrams at all, are received, this is regarded as a **failure** in the communication as soon as a failure time of 100 ms (default setting can be changed) is exceeded. For each protection interface, a list of the measured values is shown in a window in DIGSI 5 (defective telegrams per minute/hour; transmitted and received telegrams per minute/hour, percentage fault rate per minute/hour). A corresponding failure indication is always available. If no alternative transmission route exists (as in the ring topology), the protection function operating with the protection interface is not operating and remote data is not updated on the receiver side.

If the communication is interrupted for longer than an adjustable time **Data-connection failure**, this is regarded as a communication failure. A corresponding failure indication is always available.

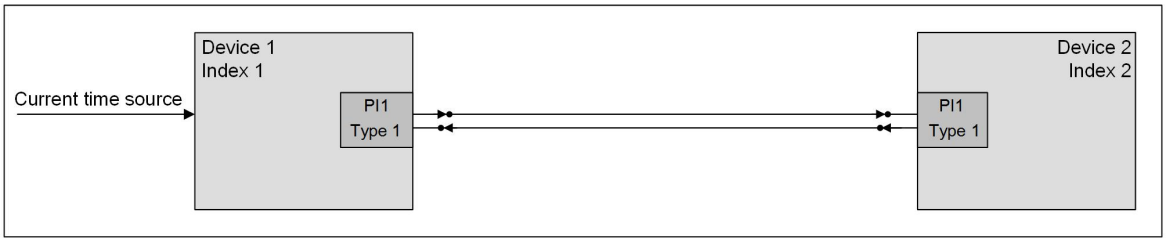
### Time Synchronization via the Protection Interface, Timing Master

All devices in a device combination can synchronize their time with each other. Synchronization is carried out with millisecond accuracy. The synchronization works independently of the protection function and is used exclusively for simultaneous time keeping in the devices of a device combination.

The device you set in the parameter **(_:5131:102) Address of device 1** is the device with index 1. This device functions takes on the role of the timing master in a device combination. If the timing master is logged off and switched off, the device with the next highest device index takes on the function of the timing master. The timing master synchronizes the clocks of the other devices via the protection interfaces.

The time of the timing master itself can be synchronized via the following time sources:

- IRIG B
- DCF77
- IEEE 1588
- SNTP



For this, these time sources must be set as the 1st time source and optionally as the 2nd time source in the timing master. If available, the system switches over to the 2nd time source upon failure of the 1st time source in the timing master.

The following chapters describe how a device is set as a timing master:

- For classic protection communication, see *Parameter: Address of Device x, Page 159*.
- For advanced protection communication, see *Parameter: Device index, Page 197*.

Set the protection interface as the 1st time source in the other devices of the device combination. You can find the setting value in DIGSI 5 via the **Project tree** → **Parameters** → **Time settings** → **Timer** → **Time source 1** → ***PI***.

In this way, all events in the devices of the device combination are recorded with the same time and are time-synchronized even across different switchgears. This simplifies fault analysis and the fault records are recorded with the same time in all devices.

[dw_ti_syst, 2, en_US]

Figure 3-68 Time Synchronization in a Protection Topology

*Figure 3-68* shows how device 1 with index 1 is synchronized with device 2 via the protection interface. Device 1 is the timing master, whose time is synchronized with a selectable, external time source.

### Time Synchronization of the Line Differential Protection Measured Values with Millisecond Accuracy

The measured values of the devices connected via the protection interfaces are synchronized via telegram measurement with microsecond accuracy (1*10E-06 s). The protection interface displays this state with the indication *PI synchronized* RAISING.

If communications problems occur, it is possible that the measured values may not be properly synchronized. In this case, the protection interface generates the indication *PI synchronized* CLEARED. The line differential protection is blocked. This state can be corrected only manually.

**NOTE**

You can reset the synchronization of the protection interface directly in the device. Proceed as follows: **Device functions > x Device protection comm. > Protection interface y > Reset synchron**.

For special line differential protection applications or synchrophasor measuring devices, you can also time-synchronize the measured values with microsecond accuracy as follows:

- Via a high-precision electrical synchronization pulse (**PPS electrical**, 1-second pulse) from a satellite receiver at time-synchronization port G
- Via a high-precision optical synchronization pulse (**PPS optical**, 1-second pulse) from a satellite receiver at a USART communication module
- Via the **IEEE 1588** time-synchronization protocol

This allows you to measure and display the signal-transit time of the transmission route in transmit and receive direction separately. This lets you achieve the maximum responsivity with the line differential protection in communication networks even with differences in the signal-transit time in the transmit and receive direction (unbalanced runtimes). For the transmission of protection data in **type 2** protection communication, different signal-transit times are irrelevant.

### Constellation Measured Values

Constellation measured values are measured values predefined by Siemens with the following properties:

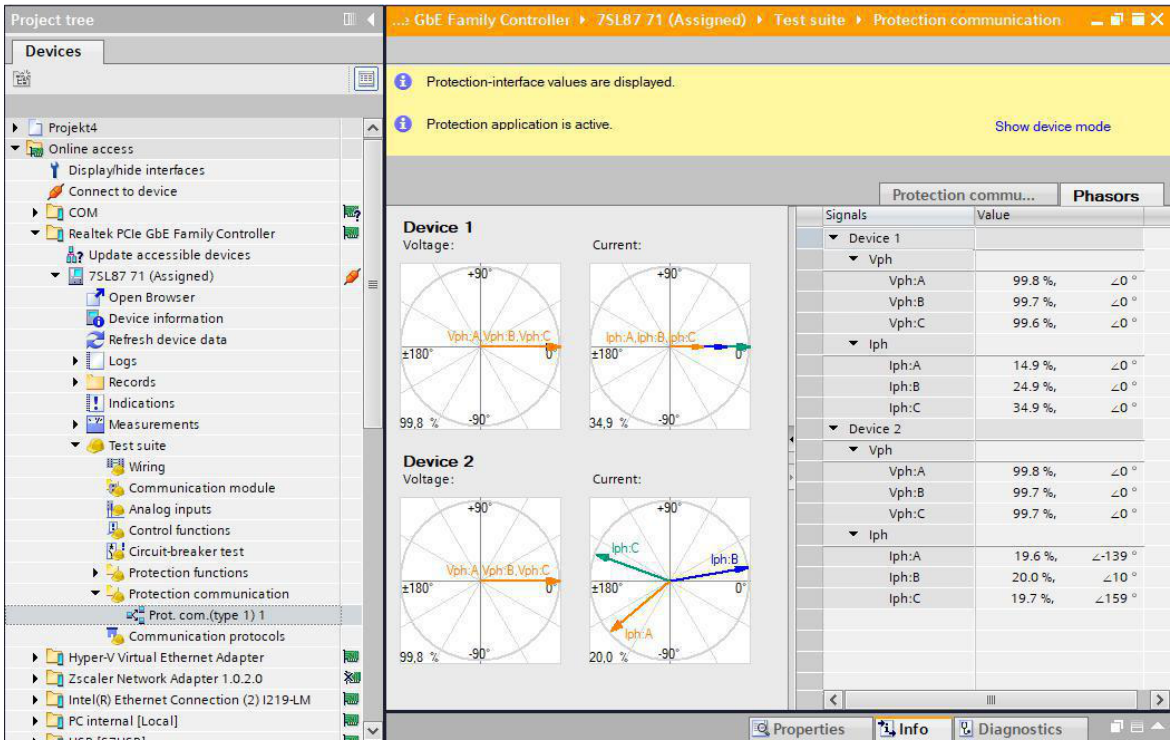
- They are synchronized in the devices in a device combination.
- They are substituted using the protection interface.
- They are available on every device.

You can view the constellation measured values with DIGSI 5.

In the device, current and voltage measured values are displayed in absolute value and phase as a percentage. 100 % conform to the rated current or the rated voltage of the line (see next figure). These measured values are recorded every 2 seconds by the devices participating in the device combination and then sent to the other respective devices. At the same time, the current and voltage values of the different devices are time-synchronous with one another.

When displaying the constellation measured values the local device is prioritized. The device connected directly with DIGSI 5 is the local device.

For the protection communication, the display of the constellation measured values differs between **Type 1** and **Type 2**.



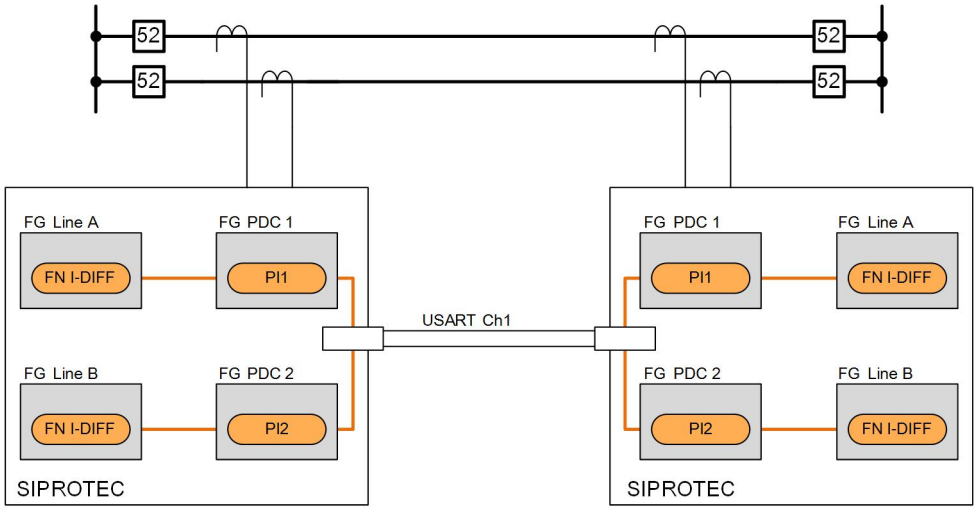
- Protection communication **Type 1**:

  The phasors of the current and voltage measured values of the local device have an angle of 0°. The angles of the measured values of the other devices relate to the local values, meaning that the angle difference to the remote ends is displayed.

- Protection communication **Type 2**:

  The voltage phasor $V_A$ of the local device has an angle of 0°. The angles of the other local measured values and the measured values of the remote devices relate to $V_A$ (0°).

You can find these measured values in the device under the following DIGSI mask:



[sc_const mv, 2, en_US]

Figure 3-69 Example of Constellation Measured Values with Phases

### Multiplex Operation

With extended protection communication, you have the option of having a physical USART channel used by 2 logical protection interfaces. In this way, a transmission route can be double used, for example to implement **Parallel line protection** with **Line differential protection** without additional hardware. To do this, configure the channel according to chapter *3.6.6.4 Configuration of the Advanced Protection Communication in DIGSI 5*.

[dw_channel-mux, 1, en_US]

Figure 3-70 Multiplex Operation

**NOTE**

Note that in case of multiple use of a physical channel, the available bandwidth is divided equally between the logical protection interfaces. Therefore, this operating mode is not suitable for baud rates under 128 kBit/s.

**NOTE**

In case of multiple use of a physical USART connection – for example, for protection of a double line – you must provide further redundancy concepts.

## 3.6.4 Available Variants for the Protection Communication

The following variants are available for protection communication:

- **Classic protection communication**
  The scope of parameterization is small for the classic protection communication. The following constraints exist:
  - IP-based communication protocols are not supported.
  - Increased parameterization effort when changing the number of devices in the device combination subsequently, for example, protection of a multi-terminal line.
- **Advanced protection communication**
  The advanced protection communication provides greater flexibility and is used with IP-based communication protocols. For this purpose, the devices must be equipped with an Ethernet BD module. The following advantages also exist for devices equipped with USART communication modules:
  - Easy subsequent expansion of the number of devices in a device combination
  - Multiple function groups **Protection communication** can be instantiated
  - Multiplex operation of a physical protection connection
  - Hierarchically structured representation in DIGSI 5 project tree

For further information on the 2 variants, refer to *3.6.5 Classic Protection Communication* and *3.6.6 Advanced Protection Communication* .

**NOTE**

Do not confuse the 2 variants of the protection communication with type 1 and type 2 of the protection communication!

**NOTE**

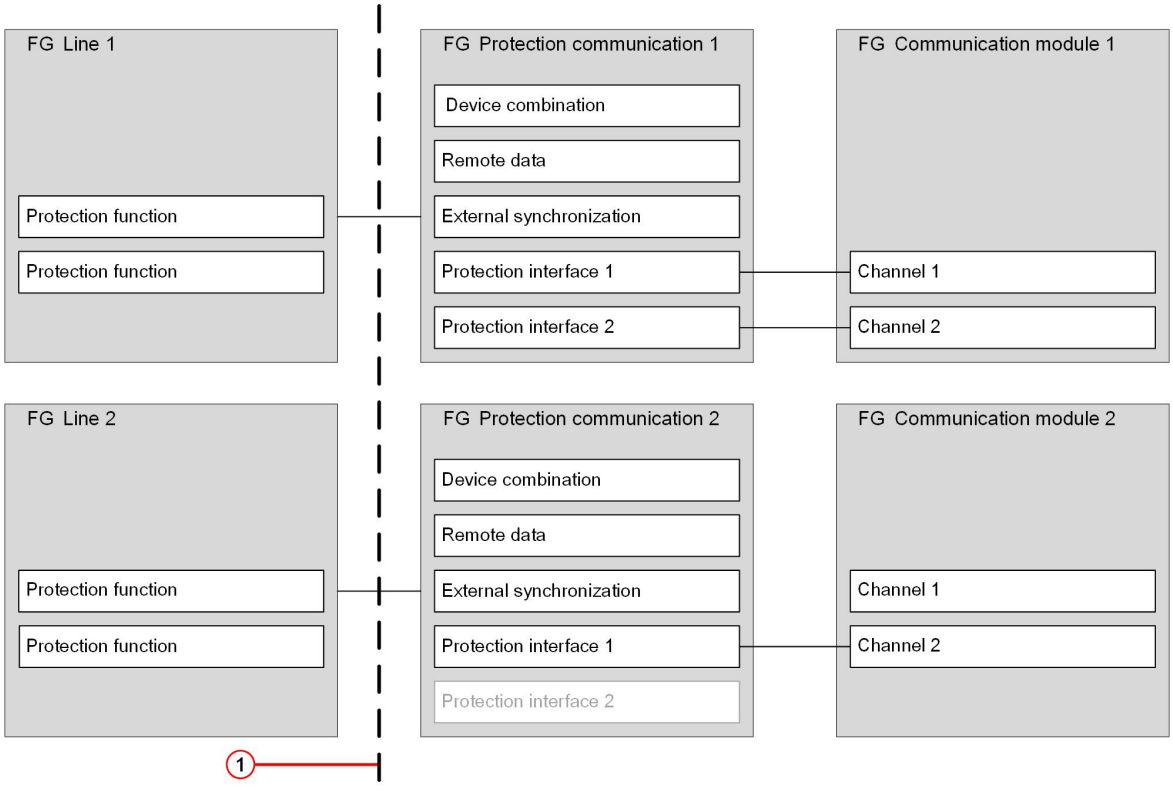
If you are unsure about the suitable variant for your use case during selection, use the advanced protection communication.

**NOTE**

If you want to change an existing classic protection communication to an advanced protection communication or vice versa, a window appears in DIGSI where you are asked whether you want to keep the mapping or not - that is, the communication settings or communication-information routing that has previously been set. In this case, click **No**

## 3.6.5 Classic Protection Communication

### 3.6.5.1 Overview



The classic protection communication enables the data exchange between the devices via synchronous serial point-to-point connections from 64 kBit/s to 2 mBit/s. These connections can be directly via optical fiber or via other communication media, for example, via dedicated lines or via communication networks. IP-based communication is not supported.

The function groups of the classic protection communication always support a fixed number of devices in the device combination:

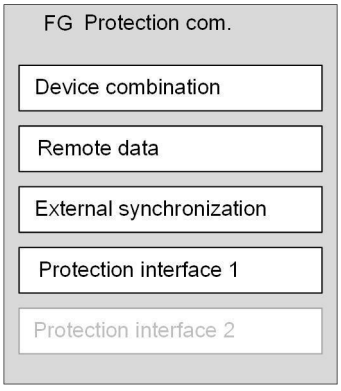
- 2-device protection communication
- 3-device protection communication
- 4-device protection communication
- 5-device protection communication
- 6-device protection communication

### 3.6.5.2 Classic Protection Communication in the Overall System

The classic **protection communication** is integrated as follows in the overall system:

[dw_simple_protcom_compl_system, 2, en_US]

Figure 3-71 Classic Protection Communication in the Overall System



(1) The device automatically routes the connection between the protection FG and the **Protection communication** FG in DIGSI 5.

### 3.6.5.3 Structure of the Function Group

If you select the communication protocol **Protection interface** and the **number of devices** on a channel in the communication module, the classic function group **Protection communication** is automatically created in the DIGSI 5 information routing.

The classic function group **Protection communication** contains the following functionalities and function blocks (FB):

- **Device combination**
- **Protection interface**
- FBs for **Remote data**
- FB **External synchronization** for the synchronization of the transferred data through an external synchronous pulse (1-second-pulse, PPS[10])

[dw_structure_FG_protcom_simple, 1, en_US]

Figure 3-72 Structure of the Classic FG Protection Communication

The function **Device combination** manages the devices that exchange data via protection communication. In the device-combination settings, you set the general settings for the device combination and the device addresses.

The function **Device combination** issues the following indications:

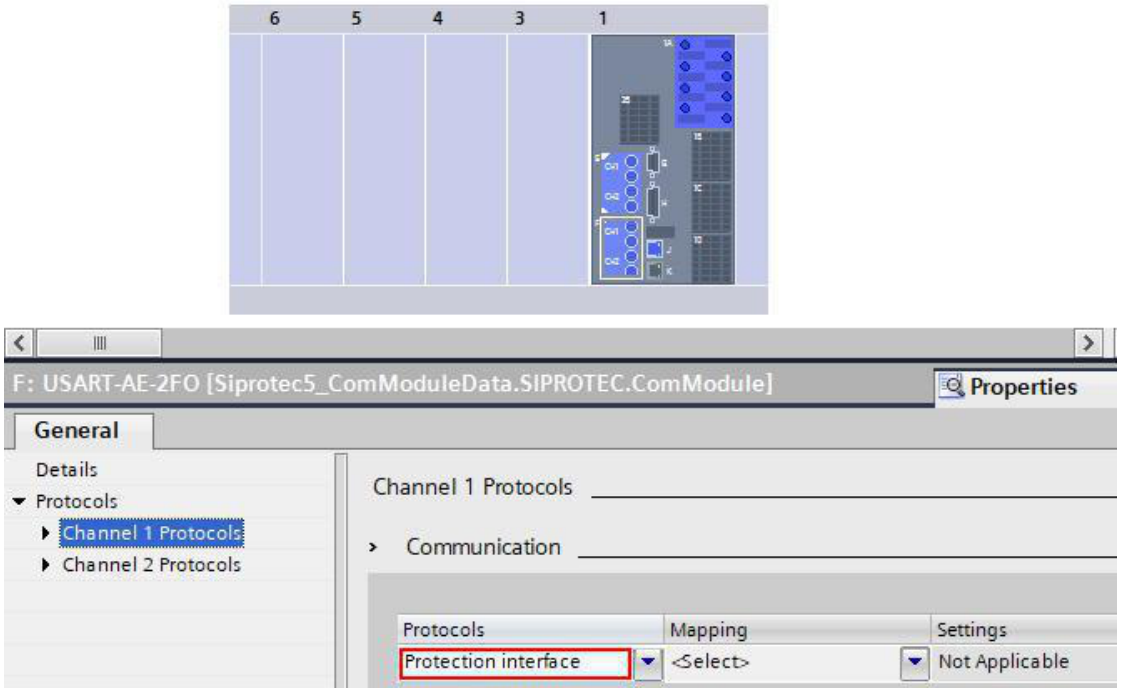
- General indications like the
  - Number of devices
  - Type and status of the device topology
- Indications of the devices in the device combination like:
  - The availability of the device
  - The state of the device, that is whether the device is logged on or off in the device combination

Measured values are transmitted via protection communication and are acquired and exchanged at the same time in the devices. The synchronization of the measured-value acquisition can be done either internally via the telegram measurement or via an external synchronous pulse (1-second pulse, PPS) using the function block **External synchronization**. The external synchronization is switched on in the function block of the protection interface. You can find the indications of the external synchronization in the function block **External synchronization**.

The function block **Remote data** is used to transfer selected and user-specific signals and measured values from the SIPROTEC 5 system. You select the signals and measured values to be transmitted in the communication mapping of DIGSI. The remote data does not issue status indications.

The function block **Protection interface** is automatically connected to a physical channel of a communication module and can therefore send signals and measured values to the neighboring device or receive them from the neighboring device. You can find the status indications of the FB **Protection interface** in the DIGSI 5 information routing in the function group **Protection communication**.

10 PPS - **P**ulse **P**er **S**econd

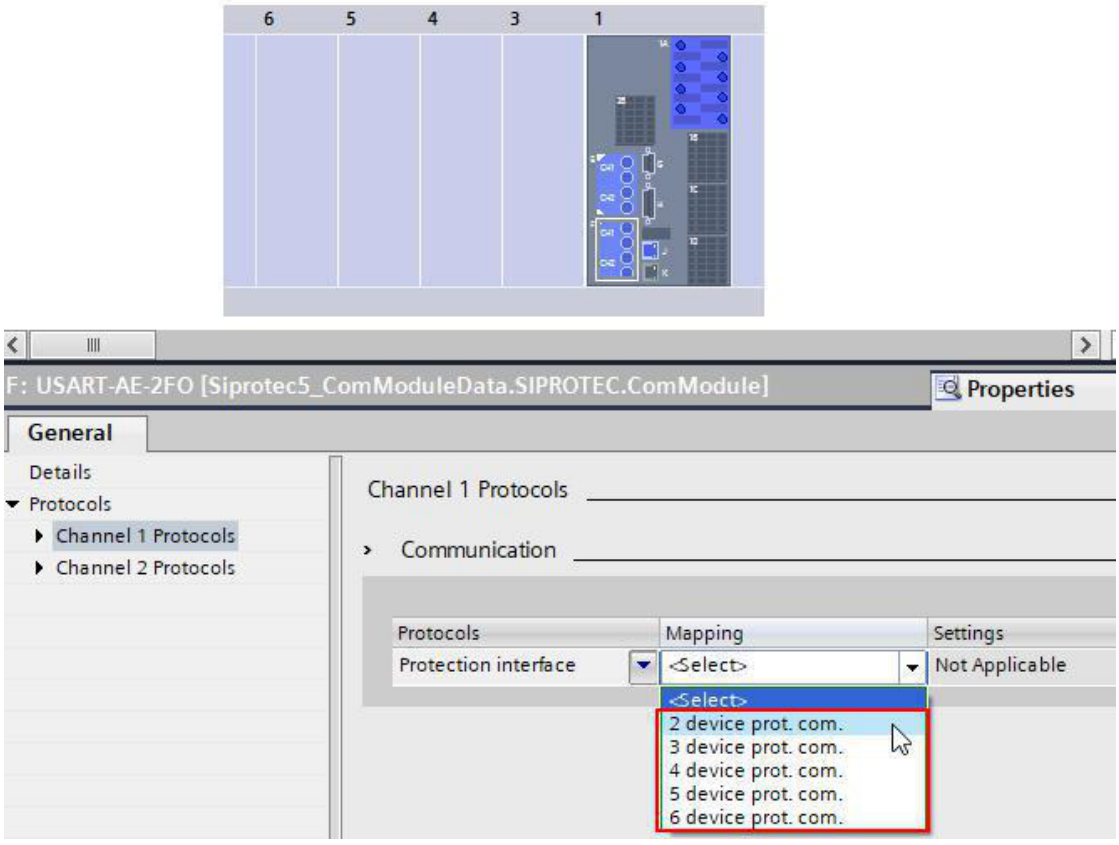


**NOTE**

In contrast to the protection interface in extended protection communication, the protection interface in classic protection communication is automatically connected to a physical channel of the communication module (refer to *Figure 3-71*).

### 3.6.5.4 Configuration of the Protection Interface in DIGSI 5

If the device is provided with modules, proceed as follows:



- Select the desired communication module in the rear view of the device.
- In the **Properties of the communication module** > **Protocols** > **Channel x Protocols**, select the ***Protection interface*** protocol.

[sc_PDC_classic_protocol, 1, en_US]

Figure 3-73 Selection of the Communication Protocol

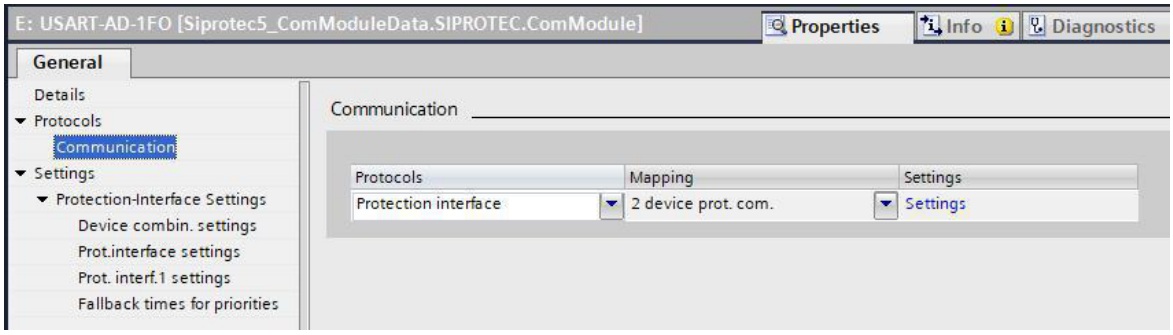
- Then select the number of devices under **Mapping** (see next figure).
  Depending on the device, the selection of device combinations can be restricted to 2 or 3 devices.
  The number of devices is an order option with regard to the line differential protection.

[sc_PDC_classic_mapping, 1, en_US]

Figure 3-74 Selecting the Device Combination

**NOTE**

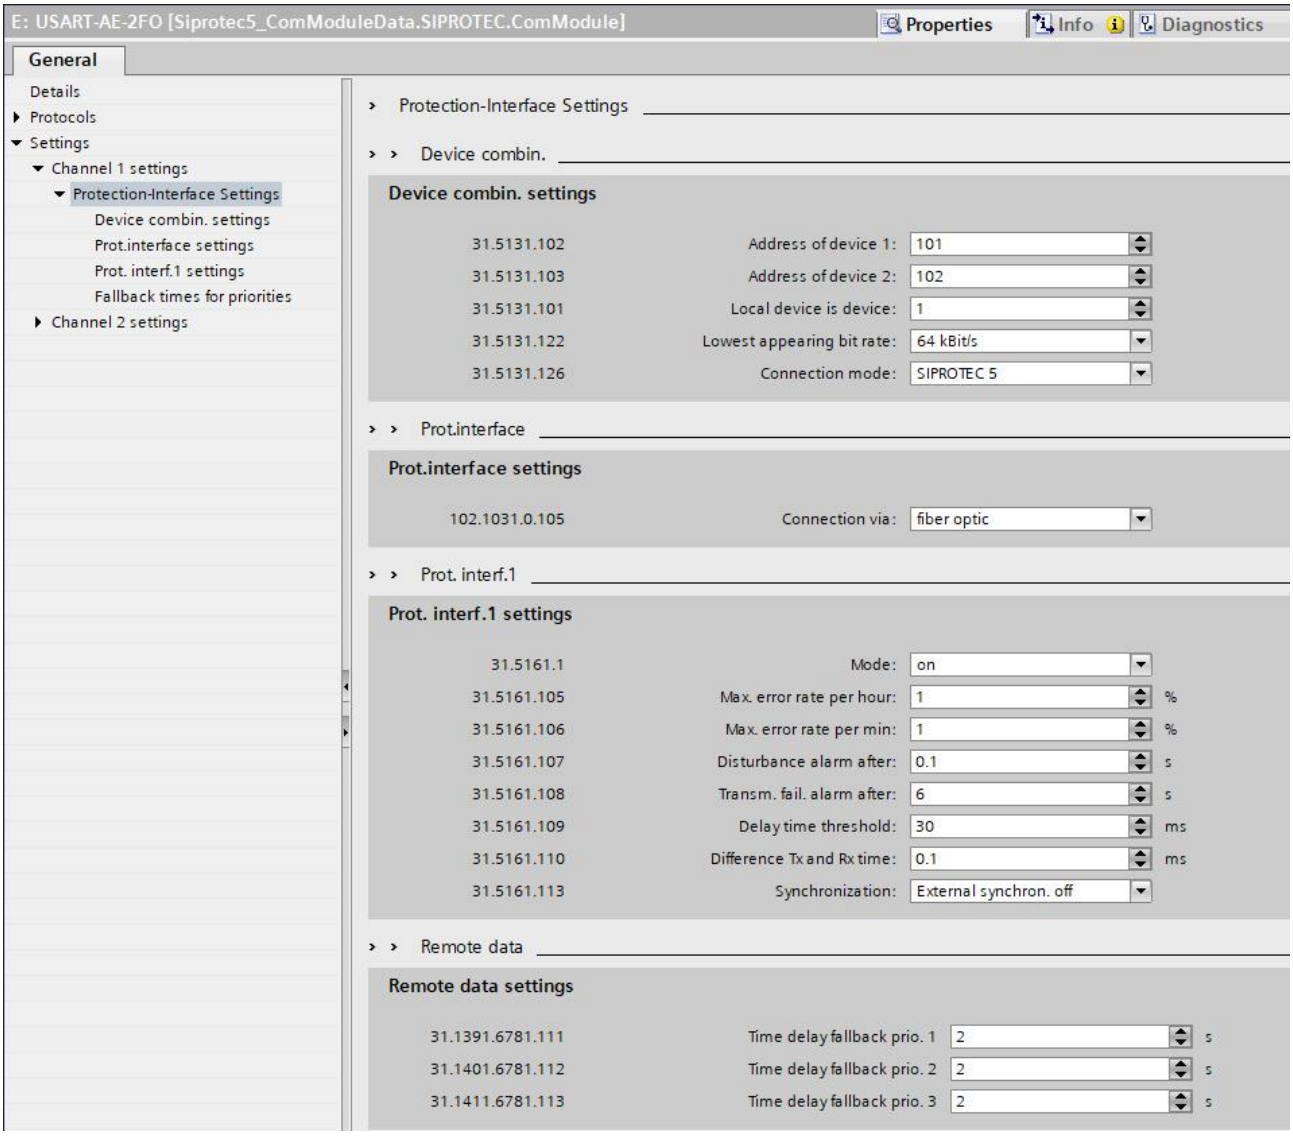
The function groups shown in *Figure 3-74* are not available in the DIGSI library.



If you use the **Line differential protection** function in combination with the classic protection communication, the device only supports 2 line ends. Under **Mapping**, select the option **2 devices prot. comm.**. If you select an option that is not permitted, DIGSI reports an inconsistency.

If the module slot is not yet provided with modules, proceed as follows:

- Select the desired communication module in the rear view of the device.
- Select the module from the catalog and drag it to a channel. Thus is the channel configured with a module. DIGSI 5 indicates whether the module can be used for protection communication under **Device Information**.
- Use the **Protocols** text box to select the ***Protection interface***, see *Figure 3-73*.
- Then use the **Mapping** text box to select the number of devices, for example **2 devices protection com.**, see *Figure 3-74*.



### 3.6.5.5 Setting Notes for the Device Combination

Select the communication module in the **Project tree** > **Hardware and protocols** in the **Device view**. In the properties of the communication module, you can find the setting sheets for the parameterization of the device-combination settings and the settings for protection communication.

[sc_config1, 1, en_US]

Figure 3-75 Selection of the Protocol: Communication via the Protection Interface

[sc_config, 4, en_US]

Figure 3-76 Protection-Interface Initialization and Configuration

Changes in the device-combination settings are always visible on the other channel as well. All further parameters can be set separately for individual channels.

**Parameter: Address of Device x**

- Default setting **(_:5131:102) Address of device 1** = ***101***
- Default setting **(_:5131:103) Address of device 2** = ***102***

With the parameters **Address of device 1** to **Address of device 2**, you give an address to each device. Set a unique and unambiguous address for each device.

**NOTE**

The device **1** is the timing master device in a device combination.

If all other devices in the device combination are to obtain their time from the timing master device, note the following:

- Under **Address of device 1** set the address for the timing master device.
- Parameterize the other devices such that they get their time from the timing master device via the protection connections.

  For more information, refer to *3.7.3 Function Description*. Select as the adjustable synchronization option ***Protection interface***.

  In the timing master device you must **not** set the protection interface as the synchronization source!

**Parameter: Local device is device**

- Default setting **(_:5131:101) Local device is device** = ***1***

With the parameter **Local device is device**, you set the index (number) of your device in the device combination. A maximum of 6 devices can be present in one device combination.

**APPLICATION EXAMPLE**

You have a device combination with 2 devices.

For example, in DIGSI 5, select the parameter setting **Address of device 1** with the parameter value ***101*** for device 1 and the parameter setting **Address of device 2** with the parameter value ***102*** for device 2.

Then, use the **Local device is device** parameter to set the index of the local device. The local device is the device that you parametrize.

The addresses must be set identically for all devices in the device combination. Functional protection communication requires that you also assign the same index in all devices of the device combination for a device with a unique address.

**Parameter: Lowest appearing bit rate**

- Default setting **(_:5131:122) Lowest appearing bit rate** = ***64 kBit/s***

With the parameter **Lowest appearing bit rate**, you set the lowest bit rate occurring in the device group. Set the lowest value in each device with a three-end constellation with 2 fiber-optic connections (2 MBit/s) and one 64 kBit/s connection with the lowest value (64 kBit/s). This value determines the maximum number of selected and self-created signals and measured values which are to be transmitted within the device combination (refer to *3.6.5.9 Remote Data*).

Apart from the default value, you can also set the following bit rates:

- ***128 kBit/s***
- ***512 kBit/s***
- ***2048 kBit/s***

**NOTE**

If you use optical fibers for a connection between the devices, set the value to ***2048 kBit/s***.

**Connection mode**

- Default setting **Connection mode** = ***SIPROTEC 5***

With the parameter **Connection mode**, you select the device type with which the SIPROTEC 5 device is to work in the device combination. As soon as a SIPROTEC 4 device works in the device combination, you must set the parameter **Connection mode** accordingly.

| Parameter Value | Description |
|---|---|
| ***SIPROTEC 5*** | The SIPROTEC 5 device only works with SIPROTEC 5 devices in the device combination. |
| ***SIPROTEC 4 7SD610*** | The SIPROTEC 5 device works with at least one SIPROTEC 4 Differential protection device 7SD610 with firmware version V4.72 and higher in the device combination. |
| ***SIPROTEC 4 7SD5*** | The SIPROTEC 5 device works with at least one SIPROTEC 4 Differential protection device 7SD5x with firmware version V4.72 and higher in the device combination. |
| ***SIPROTEC 4 7SA5/6*** | The SIPROTEC 5 device works with at least one SIPROTEC 4 Distance protection device 7SA522 and 7SA6x with firmware version V4.72 and higher in the device combination. |

### 3.6.5.6 Setting Notes on Selecting the Communication Medium

- Default setting **(_:105) Connection via** = ***fiber optic***

The **Connection via** parameter is used to set the bit rate required for the protection interface. Different discrete values can be entered depending on the means of communication (see following table).

Also refer to *Communication Media, Page 144*

Table 3-13 Means of Communication

| Means of Communication | See | Setting Value | Bit Rate |
|---|---|---|---|
| Fiber-optic direct connection | *Figure 3-58* to *Figure 3-62* | ***fiber optic*** | 2 MBit/s |
| CC-XG-512 communication converter | *Figure 3-63* | ***CCXG 512 kBit/s*** | 512 kBit/s |
| CC-XG-128 communication converter | *Figure 3-63* | ***CCXG 128 kBit/s*** | 128 kBit/s |
| CC-XG-64 communication converter | *Figure 3-63* | ***CCXG 64 kBit/s*** | 64 kBit/s |
| Repeater 512 communication converter | *Figure 3-66* | ***repeater 512 kBit/s*** | 512 kBit/s |

### 3.6.5.7 Setting Notes for the Classic Protection Interface

**Parameter: Max. error rate per hour**

- Default setting **(_:5161:105) Max. error rate per hour** = *1.0%*

If the number of faulty telegrams per hour exceeds the value set in the parameter **Max. error rate per hour**, you receive the error message *Error rate / hour exc.*.

**Parameter: Max. error rate per min**

- Default setting **(_:5161:106) Max. error rate per min** = *1.0%*

If the number of faulty telegrams per minute exceeds the value set in the parameter **Max. error rate per min**, you receive the error message *Error rate / min exc.*.

**Parameter: Disturbance alarm after**

- Default setting **(_:5161:107) Disturbance alarm after** = *100 ms*

With the parameter **Disturbance alarm after**, you determine the time delay after which defective or missing telegrams are signaled as faulty where the indication *Status of lay. 1 and 2* is *PI data fault*.

**Parameter: Transm. fail. alarm after**

- Default setting **(_:5161:108) Transm. fail. alarm after** = *6.0 s*

With the parameter **Transm. fail. alarm after**, you determine the time delay after which a communication failure is signaled where the indication *Status of lay. 1 and 2* is *PI data failure*.

**Parameter: Delay time threshold**

- Default setting **(_:5161:109) Delay time threshold** = *30.0 ms*

The time taken to transmit and receive a signal via a protection connection is the signal-transit time. You can monitor the signal-transit time. For the **Delay time threshold**, the default setting is selected in such a way that normal communication networks do not exceed the signal-transit time. If this signal-transit time is exceeded during operation (for example upon switchover to another transmission route), the indication **Time delay exceeded** is issued.

Increased runtimes only affect the operate time, and therefore the fault-clearing time of the protection functions using the protection interface. If you use the **Line differential protection** function, this remains in effect.

**Parameter: Difference Tx and Rx time**

- Default setting **(_:5161:110) Difference Tx and Rx time** = *0.1 ms*

For time synchronization of the measured values with microsecond accuracy using telegram measurement, the signal-transit times in the send and reception direction must be approximately the same. The device monitors the signal-transit times in the send and reception direction.

With the parameter **Difference Tx and Rx time**, you set a maximum permitted signal-transit time difference between the send and reception paths (runtimes unbalanced). Set the parameter **Difference Tx and Rx time** to the maximum difference expected.

Set this value to *0* for a direct fiber-optic connection. A higher value is necessary for transmission via communication networks. Reference value: *0.1 ms* (recommended setting value).

If the difference in the signal-transit times between the send and reception path exceeds the value set, the indication *Time delay jump* is issued.

If the difference from consecutive measurements of the signal-transit times between the send and reception paths exceeds the set value and remains for more than 5 s, the indication *Time delay different* is issued. The **Line differential protection** function is no longer working properly and is *ineffective*.

**NOTE**

The parameter **Difference Tx and Rx time** only shows when the function **Line differential protection** is instantiated and the parameter **Synchronization** is not set to ***External synch. only***.

**NOTE**

If you use a multiplexer with a C37.94 interface as a means of communication, Siemens recommends a setting value of ***0.25 ms*** to ***0.6 ms***.

**Parameter: Synchronization**

- Default setting **(_:5161:113) Synchronization** = ***External synchron. off***

With the parameter **Synchronization**, you control the time synchronization of the measured values with microsecond accuracy.

If the SIPROTEC device operates with the external synchronization, use the **Synchronization** parameter to define how the protection is activated after restoration of the communication connection (basic state or after transmission fault). See *Figure 3-78*.

| Parameter Value | Description |
|---|---|
| ***External synchron. off*** | The external synchronization is disabled:<br>No external synchronization is performed at the protection interface. Select this setting value if you do not expect any differences between the signal-transit times in the transmission and reception directions. Then the measured values are only synchronized internally with the telegram measurement. |
| ***Telegr. and ext. synch.*** | Synchronization via telegram measurement and external synchronization:<br>The measured values are synchronized internally with the telegram measurement, supported by the external synchronization. You can set the external synchronization with the parameter **External synchronization**. The synchronization is possible via the IEEE 1588 protocol or via the synchronous pulse of a satellite receiver.<br>In this case, an existing line differential protection is only released when a new connection is established and one of the following conditions is met.<br>• The protection connection is synchronized with the help of the external synchronization.<br>• Symmetric signal-transit times are signaled via the binary input signal *>Sync reset* or the controllable *Reset synchronization*. This means that the signal-transit times are the same in the send and receive direction. |

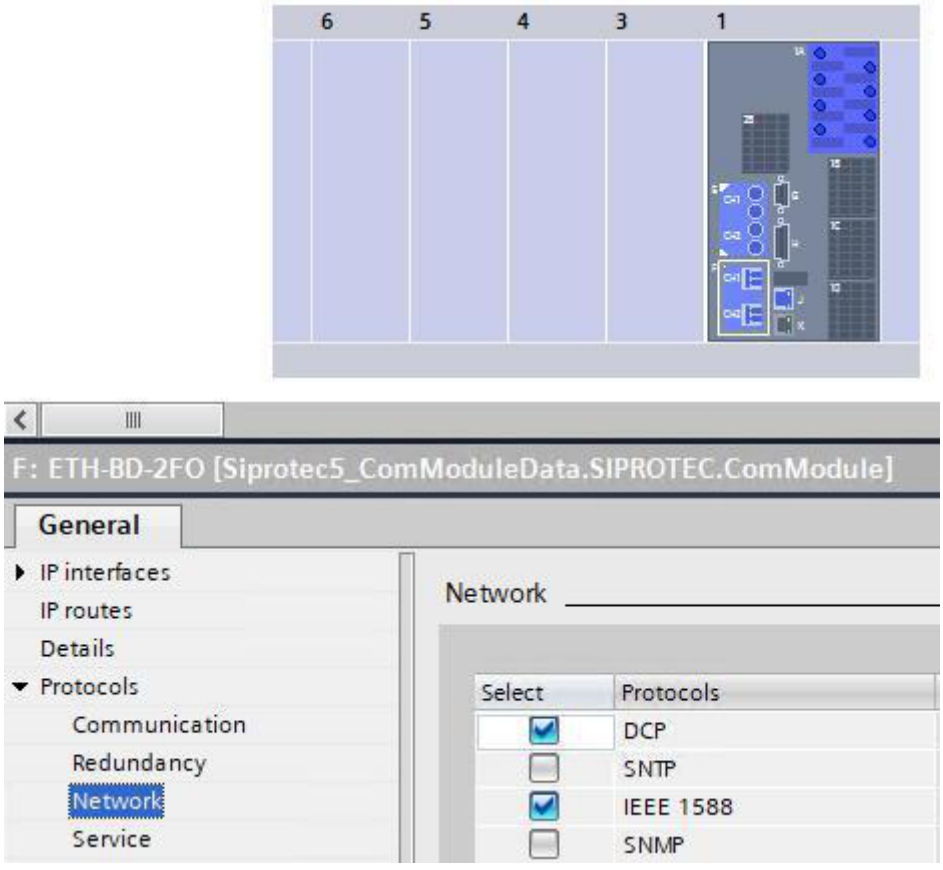
| Parameter Value | Description |
|---|---|
| ***Telegr. or ext. synch.*** | Synchronization via telegram measurement or external synchronization:<br>The measured values are synchronized internally with the telegram measurement, supported by the external synchronization. You can set the external synchronization with the parameter **External synchronization**. The synchronization is possible via the IEEE 1588 protocol or via the synchronous pulse of a satellite receiver.<br>An available line differential protection is enabled immediately upon renewed establishment of connection (data telegrams are received). The internal synchronization is used up to synchronization. |
| ***External synch. only*** | External synchronization only:<br>The measured values are synchronized only through the external synchronization.<br>You can set the external synchronization with the parameter **External synchronization**. The synchronization is possible via the IEEE 1588 protocol or via the synchronous pulse of a satellite receiver. |

**Parameter: External synchronization**

- Default setting **(_:5161:117) External synchronization** = ***PPS electrical (Port G)***

The parameter **External synchronization** is visible only if the parameter **Synchronization** is not set to ***External synchron. off***.

External synchronization is possible separately for each protection interface.



| Parameter Value | Description |
|---|---|
| ***PPS electrical (Port G)*** | The electrical synchronous pulse of a satellite receiver (1-second-pulse, PPS[11]) is the synchronization source on the port **G**, the time synchronization interface. |
| ***IEEE 1588*** | The time synchronization protocol IEEE 1588 for an Ethernet-BD communication module is used for synchronization. |

**NOTE**

The configuration option ***IEEE 1588*** is only visible if the device has an Ethernet-BD communication module and you have selected the communication protocol IEEE 1588, see following figure.

11 PPS - **P**ulse **P**er **S**econd

[sc_BD_1588, 1, en_US]

Figure 3-77 Ethernet-BD Communication Module: Selection of the IEEE 1588 Protocol

**NOTE**

External synchronization takes into account the signal-transit time in the transmission and reception directions. If external synchronization fails for a short time, for example, due to a receiving interference or an unfavorable satellite position for a brief period, internal synchronization via telegram measurement is still active.

**NOTE**

In contrast to the protection interface in extended protection communication, the protection interface in classic protection communication is automatically connected to a channel of a communication module (see *Figure 3-71*).

**Parameter: Max. inaccuracy**

- Default setting **(_:5161:119) Max. inaccuracy** = ***0.500 ms***

With the parameter **Max. inaccuracy**, you configure the maximum expected inaccuracy of the synchronization sourced used. The set value is only effective if the synchronization source used does not supply any information on the current inaccuracy in the synchronization signals. If you have not used any of the information on the inaccuracy of the synchronization source used, use the default setting.

**NOTE**

The inaccuracy of the synchronization source enters the stabilization of the **Line differential protection** as an error signal.

This means that a greater inaccuracy increases the calculated restraining quantity and makes the **Line differential protection** less sensitive.

If **IEEE 1588** is used as the synchronization source in the synchronization status ***SmpSynch*** = ***global***, accuracy values are supplied with the synchronization signals and the parameter **Max. inaccuracy** is not used. If the supplied accuracy values become invalid, the value set in the parameter **Max. inaccuracy** is used.

If the synchronization source **IEEE 1588** works in the synchronization status ***SmpSynch*** = ***local***, then the value set in the parameter **Max. inaccuracy** is used as permanently available inaccuracy.

If the synchronization source **PPS electrical (Port G)** or **PPS optical (USART)** is used, then the value set in the parameter **Max. inaccuracy** is used as permanent inaccuracy.

If a USART communication module with the **PPS** protocol and the **PPS generator**operating mode is also used as a synchronization source at the same time, the value set in the parameter **Max. inaccuracy** is used as permanent inaccuracy.

**Parameter: Check synchron.-source**

- Default setting **(_:5161:121) Check synchron.-source** = ***yes***

With the parameter **Check synchron.-source**, you can switch on or off the synchronization-sources check. During the check of the synchronization sources on the ends of a protection connection, a check is conducted as to whether both synchronization sources are working in the same synchronization status ***SmpSynch***.

If both synchronization sources are working in the synchronization status ***SmpSynch*** = ***global***, the check has been passed.

If both synchronization sources are working in the synchronization status ***SmpSynch*** = ***local***, that is decoupled from a global reference time, an additional check is conducted as to whether the synchronization source (***gmIdentity***) is the same. Synchronicity can only be guaranteed if the synchronization sources are the same.

If the synchronization sources display a different synchronization status, that is one displays the synchronization status ***SmpSynch*** = ***local*** and the other the synchronization status ***SmpSynch*** = ***global***, synchronization cannot be guaranteed.

Siemens recommends using the default setting **Check synchron.-source** = yes.

If you have problems with the synchronization-source check, you can switch off the synchronization-source check. Switch off the synchronization-source check only if the synchronization sources are synchronous at the end of their protection connection.

The parameter **Check synchron.-source** is visible only if the parameter **(_:5161:113) Synchronization** is set to ***External synch. only***.

**NOTE**

If you use **PPS electrical (port G)** as the synchronization source, the synchronization status (***SmpSynch***) is permanently set to ***global***.

If you use **PPS optical (USART)** as the synchronization source, you can use the setting (_:107) **Received. SmpSynch** to set the synchronization status to (***SmpSynch***) ***local*** or ***global***.

For synchronization with microsecond accuracy, for example with **Line differential protection**, adjust the parameter (_:107) **to Accepted. SmpSynch** = ***global***.

### 3.6.5.8 Indications and Measured Values in the Classic Protection Interface

Each individual protection interface provides different indications for commissioning and diagnostics of communication:

### Indication *(_:5161:301) Status of lay. 1 and 2*

The indication *(_:5161:301) Status of lay. 1 and 2* informs you about the status of the connection. The following indications are possible:

Table 3-14 Status Indications Status of lay. 1 and 2

| Indication | Description |
|---|---|
| *initialized*: | The protection interface is not connected and is in the Initial state. |
| *PI connected*: | The protection interface is connected to the protection interface of the partner device. |
| *PI data fault*: | The protection interface has not received any valid telegrams for the time set in parameter **(_:5161:107) Disturbance alarm after** . |
| *PI data failure*: | The protection interface has not received any valid telegrams for the time set in parameter **(_:5161:108) Transm. fail. alarm after** . |
| *not existing*: | The protection interface has not been assigned to a communication channel. |

### Indication *(_:5161:302) Status of lay. 3 and 4*

The indication *(_:5161:302) Status of lay. 3 and 4* informs about errors during the connection establishment. The following indications values are possible:

| Status Indication | Description |
|---|---|
| *no error*: | No errors occurred during the connection establishment. |
| *SW ver.incomp.*: | The connection is not established because the firmware versions of the devices are incompatible.<br>Update the firmware. |
| *wrong dev. ID*: | The connection is not established because the device address of the local device or the partner device is incorrect or set incorrectly.<br>Check the settings for the parameters **Address of device 1** to **Address of device n** (_:5131:102 and following). |
| *const.sett.error*: | The connection is not established because the parameters are set differently.<br>Check whether the parameter **(_:5131:122) Lowest appearing bit rate** has been set the same in all devices in the device combination. |
| *diff.sett error*: | The connection is not established because the parameters are set differently.<br>The line differential protection settings for the connected devices are incompatible. Check whether the devices are set to operate with or without line differential protection.<br>The rated current of the line (parameter **(_:9001:101) Rated current**) must have the same setting in all devices.<br>With a transformer in the line, the **(_:9001:103) Rated apparent power** must be set to the same value in all devices.<br>For further information, see *6.7 Line Differential Protection*. |
| *net mirroring* | The connection is not established. The protection interface is receiving its own data.<br>Check the wiring. |
| *wrong dev. idx.* | The connection is not established because the device index of the local device or the partner device is incorrect.<br>Check the setting for the parameter **(_:5131:101) Local device is device**. |

Furthermore, the following output signals are available:

| Output Signal | Description |
|---|---|
| *(_:5161:303) Connection broken* | The signal *Connection broken* indicates that during a parameterized time (parameter **(_:5161:107) Disturbance alarm after**) no telegrams or faulty telegrams were continuously received. If the indication *Connection broken* is issued, the affected protection connection is reset. This can cause the blocking of an active line differential protection or a ring topology can change to a chain topology. |
| *(_:5161:316) Error rate / min exc.* | The signal *Error rate / min exc.* indicates that the set maximum error rate per minute (parameter **(_:5161:106) Max. error rate per min**) has been exceeded.<br>In this manner, a brief increase of the operate time and thus of the fault-clearing time is possible for the protection functions using the protection interface. If you use the **Line differential protection** function, this remains in effect. |
| *(_:5161:317) Error rate / hour exc.* | The signal *Error rate / hour exc.* indicates that the set maximum error rate per hour (parameter **(_:5161:105) Max. error rate per hour**) has been exceeded.<br>In this manner, a brief increase of the operate time and thus of the fault-clearing time is possible for the protection functions using the protection interface. If you use the **Line differential protection** function, this remains in effect. |
| *(_:5161:318) Time delay exceeded* | The signal *Time delay exceeded* indicates that the threshold value for the set signal-transit time (parameter **(_:5161:109) Delay time threshold**) has been exceeded.<br>Increased transmission times only affect the operate time, and therefore the fault-clearing time of the protection functions using the protection interface. If you use the **Line differential protection** function, this remains in effect. |
| *(_:5161:319) Time delay different* | The signal *Time delay different* indicates that the threshold value for the difference in signal runtimes in the transmission and reception direction (asymmetrical runtimes) has been exceeded. The setting value results from the setting value of the parameter **(_:5161:110) Difference Tx and Rx time**.<br>The indication is visible only if the parameter **(_:5161:113) Synchronization** is not set to ***External synch. only***.<br>If the indication *Time delay different* appears, the **Line differential protection** function is no longer working properly and is ***ineffective***. |
| *(_:5161:320) Time delay jump* | The signal *Time delay jump* indicates that the signal runtimes of the data changed abruptly. This is caused by a switchover of the communication path in the communication network.<br>The indication is visible only if the parameter **(_:5161:113) Synchronization** is not set to ***External synch. only***. |
| *(_:5161:321) PI synchronized* | The signal *PI synchronized* indicates that the synchronization with microsecond accuracy of the measured values transferred between the local device and partner device is working correctly.<br>The indication is visible only if the parameter **(_:5161:113) Synchronization** is not set to ***External synch. only***. |

| Output Signal | Description |
|---|---|
| *(_:5161:340) Telegram lost* | The signal *Telegram lost* indicates that an expected telegram has failed to arrive or a faulty telegram has been received. Reasons for this can be for example switching operations in the primary system or operations on the components of the communication network.<br>If you want to assign the communication failures or faults to other events, route the signal *Telegram lost* temporarily into the operational log.<br>**Note:** If the signal is constantly routed, the operational log can overflow. Siemens recommends routing the signal only for clarification of problems. |
| *(_:5161:343) Partner* | The indication shows the address of the partner device. A value of 0 means that no partner address is available. |
| *(_:5161:323) PPS: time del. unsym.* | This indication is only visible if you are working with a synchronous pulse. The indication shows that the difference in the signal runtimes between the sending and receiving path exceeds the value set with the parameter **(_:5161:110) Difference Tx and Rx time**.<br>**Note:** The **Line differential protection** function remains ***effective***. |
| *(_:5161:324) PI with PPS synchron.* | This indication is only visible if you are working with a synchronous pulse. This indication is only visible if, in parallel to synchronization with the synchronization pulse, you are also working with the synchronization via telegram measurement. If both synchronization methods are working properly, the indication *PI with PPS synchron.* = RAISING is generated. |

### Measured Values of the Protection Interface

The protection interface provides the following measured value for the diagnosis of the protection-interface communication:

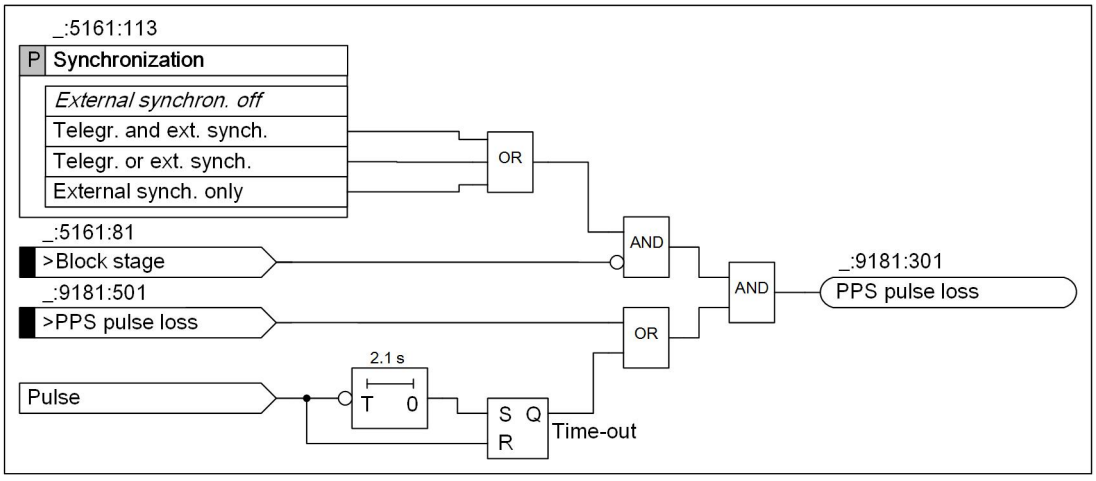
| Measured Value | Description |
|---|---|
| *(_:5161:308) Tx tel/h* | Telegrams transmitted during the last hour |
| *(_:5161:309) Rx tel/h* | Telegrams received during the last hour |
| *(_:5161:310) Tx tel/min* | Telegrams transmitted during the last minute |
| *(_:5161:311) Rx tel/min* | Telegrams received during the last minute |
| *(_:5161:312) Tx err/h* | Transmission failure rate during the last hour |
| *(_:5161:313) Rx err/h* | Receive error rate during the last hour |
| *(_:5161:314) Tx err/min* | Transmission failure rate during the last minute |
| *(_:5161:315) Rx err/min* | Receive error rate during the last minute |
| *(_:5161:325) Aver.Δt* | Average singal runtime (average value of the runtime in transmission and reception path divided by 2, without external synchronization) |
| *(_:5161:326) Rec. Δt* | Signal runtime for reception path (with external synchronization) |
| *(_:5161:327) Sen. Δt* | Signal runtime for transmission path (with external synchronization) |
| *(_:5161:334) Miss.tel/min* | Number of telegram failures within the last minute |
| *(_:5161:335) Miss.tel/h* | Number of telegram failures within the last hour |
| *(_:5161:336) Miss.tel/d* | Number of telegram failures within the last day |
| *(_:5161:337) Miss.tel/w* | Number of telegram failures within the last week |
| *(_:5161:338) M. loss/d* | Longest lasting telegram failure within the last day |
| *(_:5161:339) M. loss/w* | Longest lasting telegram failures within the last week |
| *(_:5161:331) Recept.* | Receipt of a telegram (0 = no receipt, 1 = receipt)<br>You can use this indication to make the telegram exchange visible in the fault record. |

**NOTE**

You can reset the measured values of the protection interface directly in the device. Proceed as follows: **Device functions > x Device protection comm. > Protection interface y > Release measured values**.

### Indications of External Synchronization

The following indications are visible only if the parameter **(_:5161:117) External synchronization** is set to ***PPS electrical (Port G)***.



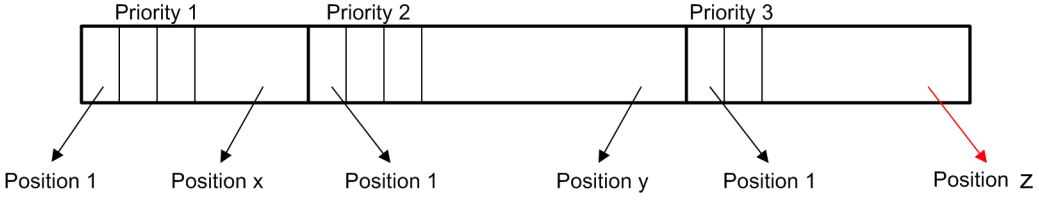
- *(_:9181:501) >PPS pulse loss*
- *(_:9181:301) PPS pulse loss*
- *(_:9181:302) PPS pulse*
- *(_:9181:303) PPS pulse OK*

The following indications are visible only if the parameter **(_:5161:117) External synchronization** is set to ***IEEE 1588***.

- *(_:304) Synchronization loss*
- *(_:305) Synchronization OK*
- *(_:306) Synchronization pulse*

| Indication | Description |
|---|---|
| *(_:9181:500) >Block stage* | This indication shows the blocking of the external synchronization via a binary input. The external synchronization can be set to inactive through this binary input indication. |
| *(_:9181:501) >PPS pulse loss* | The binary input *(_:9181:501) >PPS pulse loss* can be used to signal an externally detected failure in the PPS synchronous pulse (for example, an error message from the satellite receiver). Setting this binary input also leads to the indication *(_:9181:301) PPS pulse loss*. The external synchronization detects immediately that there is a problem with the connected synchronization pulse. Otherwise, the problem will only be noticed after approx. 2.1 s – after the test for synchronous-pulse failure. |
| *(_:9181:301) PPS pulse loss* | This indication shows that the synchronization has failed. This can be due to the following reasons:<br>• The input indication *(_:9181:501) >PPS pulse loss* has occurred.<br>• The synchronous pulse has failed.<br>• The quality of the synchronous pulse is inadequate.<br>• There is another problem with the synchronization source.<br>If no further PPS synchronous pulse is received within 2.1 s, the time-out monitoring responds. If no new second pulse occurs after the expiry of the monitoring time, the indication *(_:9181:301) PPS pulse loss* is issued (see *Figure 3-78*). |
| *(_:9181:302) PPS pulse* | This indication displays the synchronous pulse directly. As a rule, one pulse is generated per second. This indication works well to make the synchronous pulse visible. |
| *(_:9181:303) PPS pulse OK* | This indication shows that the synchronization is working properly. |
| *(_:9181:304) Synchronization loss* | The synchronization has failed. This can be due to a problem with the synchronization source. |
| *(_:9181:305) Synchronization OK* | The synchronization is working properly. |

| Indication | Description |
|---|---|
| *(_:9181:306) Synchroni-zation pulse* | You can use this indication to make the virtual synchronous pulse visible. As a rule, one pulse is generated per second. |
| *(_:9181:307) Synchron. imprecise* | If the set synchronization source operates in the ***global*** synchronization status (SmpSynch) and the time of the synchronization source deviates from the global time by more than 0.5 ms, the indication *Synchron. imprecise* is generated and the **Line differential protection** becomes ineffective.<br>The indication *Synchron. imprecise* is visible only if the parameter **External synchronization** is set to ***IEEE 1588***. |



[lo_pps_syn, 2, en_US]

Figure 3-78 Logic for the Generation of the Indication *PPS pulse loss*

### 3.6.5.9 Remote Data

Between the devices in a device combination, a data bar is exchanged which can be written or read by the devices. It can be used for exchanging various signals between the devices. For this, each signal demands a certain number of data fields.

[dw_data, 1, en_US]

Figure 3-79 Data Bar Exchanged between Devices

The data bar is divided into 3 priorities, which have different transmission rates and data volumes.

For all signals sent, the basic principle is that only pure data contents are transmitted. The quality, for example, *Valid*, is not automatically transmitted as well. If you want to transmit the quality as well, for example, for further processing of GOOSE messages, you must transmit the quality separately, for example, using CFC. If a function is in test mode, all signals of the function are provided with a test flag. If a signal with a test flag is transmitted, all signals on the receiving side are provided with a test flag. If the connection is broken, which means there are devices that cannot be reached anymore, all received signals are flagged with the quality *invalid*. Additionally, the value is set to a predefined state after a selectable dropout time or the last value received can be retained (setting ***Hold***). This can be configured separately for each received signal, refer to *Table 3-18*.

### Behavior When Devices Are Logged Off or Switched Off

If you log off a device, the behavior of the remote data is not affected. A logged-off device sends remote data as well. Logged-off devices can also receive and evaluate remote data.

If you switch off a device in the device combination, the remaining devices in the device combination do not send or receive any remote data. A failsafe state is adopted for the remote data received before that, according to the settings in the communication mapping in DIGSI. The previously received values can be either retained or replaced with a dropout value.

If you switch off a logged-off device, the remaining devices keep sending or receiving remote data. The remote data of a logged-off and switched-off device is no longer available in the communication. The remaining devices behave as if the logged-off and switched-off device has never been part of the device combination.

**NOTE**

For **ACT** type signals, only the phase information is transmitted.

Signals that are transferred data fields of priority 1 are sent with every telegram. They are preferably used for the transmission of rapid signals, for example, release for circuit-breaker intertripping. A strictly deterministic, rapid transmission is required there.

Signals of priority 2 are transmitted with at least every 2nd telegram. For bit rates >256 kbit, there are no differences between priority 1 and priority 2.

Priority 3 signals are transmitted at least every 100 ms. This priority is used for transmission of measured and metered values. Complex values must be routed separately as the real and the imaginary part for transmission. Measured-value thresholds that lead to an updating of a measured value are set centrally as a property of the measured value. These measured-value thresholds apply with the corresponding reporting, for example, also for the transfer via IEC 61850 to a substation automation technology.

Signals which are written to a data area x under a priority on the data bar must be routed to an indication of the same type in the device reading this information. Otherwise, they are processed incorrectly on the receiving side. The data bar is organized in terms of bits. For information on the bit requirement of each signal type, refer to *Table 3-17*.

*Table 3-15* and *Table 3-16* show the number of data areas in the data bar in relation to the available baud rate.

**NOTE**

Adjust the parameter **`(_:5131:122) Lowest appearing bit rate`** in each device for the protection interfaces in a device combination. This determines the number of data areas.

If, for example, in a device combination with 3 devices with a type 2 chain topology 2 devices are connected via direct optical fibers and 2 devices with a bit rate of 64 kBit/s, the 64 kBit/s section is the limiting factor for the entire device combination.

Table 3-15 Available Bits – Minimum Constellation Baud Rate 64/128 kBit/s

| | Priority 1 | Priority 2 | Priority 3 |
|---|---|---|---|
| Type 1 | 8 bits | 24 bits | 128 bits |
| Type 2 | 32 bits | 64 bits | 256 bits |

Table 3-16 Available Bits – Minimum Constellation Baud Rate 512/2048 kBit/s

| | Priority 1 | Priority 2 | Priority 3 |
|---|---|---|---|
| Type 1 | 48 bits | 128 bits | 384 bits |
| Type 2 | 96 bits | 200 bits | 1024 bits |

Table 3-17 Requirement in Bits

| Signal Type | Size in Bits |
|---|---|
| SP (single-point indication) | 1 bit |
| DP (double-point indication) | 2 bits |
| IN (metered values) | 32 bits |
| MW (measured values)[12] | 32 bits |
| ACT | 4 bits |

Table 3-18 Possible Dropout Values

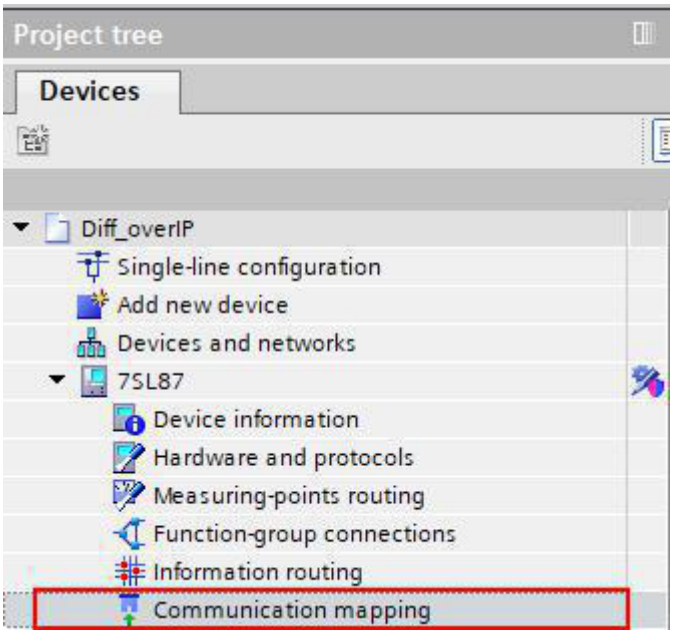
| Signal Type | Dropout Thresholds |
|---|---|
| SP (single-point indication) | Outgoing, Incoming, Hold |
| DP (double-point indication) | On, Off, Intermediate Position, Disturbed Position, Hold |
| IN (metered values) | 0, Hold |
| MW (measured values) | 0, Hold |
| ACT | Hold |

**NOTE**

If the protection link fails, these values can be set on the receiver side.

**EXAMPLE**

2 devices are connected with line differential protection via a 64-kBit channel. This is a type 1 protection communication. There are 8 bits available for priority 1. Now, for example, 4 SPS and 2 DPS can be routed:
4 x 1 Bit + 2 x 2 Bits = 8 Bits



**NOTE**

Measured values are transmitted as primary values.

**Configuration of Remote Data in DIGSI 5:**

To configure remote data, navigate in DIGSI 5 through the project tree to the communication mapping.

12 The complex phasors of a measuring point are prerouted

[sc_comm_select, 1, en_US]

Figure 3-80 Communication Mapping in DIGSI 5

*Figure 3-81* to *Figure 3-85* show the routing for a type 1 protection communication.

To transmit signals to other devices, these signals must be routed in the communication matrix under **Transmit**. Binary inputs 1 and 2 are single-point indications (SPS) and are routed to bit position 1 and bit position 2 of the transmission with the highest priority (priority 1). For 64 kBit/s, for example, only 8 of these data areas are available for type 1 protection communication; they are exchanged between the devices with each telegram. Signals 3 and 4 are double-point indications (DPS), for example, a switch position that is transmitted by device 1. A double-point indication occupies 2 bit positions on the data bar. In addition, a measured and metered value are communicated with priority 3.

As a measured or metered value uses 32 bits, value 2 starts at bit position 33. DIGSI 5 shows the next free bit position.

Figure 3-83 Routing of Metered Values to Protection Communication in Device 1

Device 1 also receives signals (in the communication mapping under **Receive**, see next figure). These signals must be routed with the other devices under **Transmit**. The binary outputs 1 and 2 in device 1 receive their information via the protection communication. This is priority 1 information, which has been routed in another device to position 3 and 4 of the data bar for transmission. The secure state is predefined in the **Fallback value** column. If the protection connection fails, the single-point indication is reset to ***raising*** or **cleared** as the **fallback value** or its value is retained (***Hold***). For signals of the various priorities, you can also set a dropout time after which the reset (see following figure) to the fallback value occurs, in order to retain the original state for a short time in the event of brief interruptions. These 3 dropout times apply for all signals of one transmission priority and are set as parameters.

[sc_remotedata, 2, en_US]

[sc_spsemp, 1, en_US]

Figure 3-85 Routing of Single-Point Indications (Receive) to Protection Communication in Device 1

The following figure shows the routing in the 2nd device. Binary inputs 1 and 2 are routed with priority 1 to bit positions 3 and 4 there. In device 1, bit positions 1 and 2 are already occupied (see *Figure 3-81*). If you also route the signals to bit positions 1 and 2, the signals of both devices are then connected to the corresponding bit position with a logical **OR** operation. If measured and metered values are routed in the same data areas, this results in implausible values for the receivers. As a user, you are therefore responsible for the correct routing.

[sc_baspsr, 1, en_US]

Figure 3-86 Routing of Single-Point Indications to be Sent to Protection Communication in Device 2

The binary outputs 1 and 2 (**Receive**) in the 2nd device are connected to priority 1 signals 1 and 2 from the 1st device. This takes place via the data areas at positions 1 and 2 of the data bar, which transfer the state of the signals. Other devices can also read this information and logically link it to their internal signals. Here, too, the secure state, which is assumed when the protection connection is interrupted, is entered. This state depends on the information. With single-point indications, states 0 or 1 make sense. In the case of double-point indications, bit combinations 00, 01, 10, or 11 are possible to directly signal a disturbed position upon failure of the protection connection, for example.

***Hold*** is used to retain the state before the failure of the protection connection.

Figure 3-89 Routing of Metered Values to Protection Communication in Device 2

### 3.6.5.10 Constellation Measured Values for Type 1 and Type 2

**NOTE**

The constellation measured values are only available for the FG **Line**.

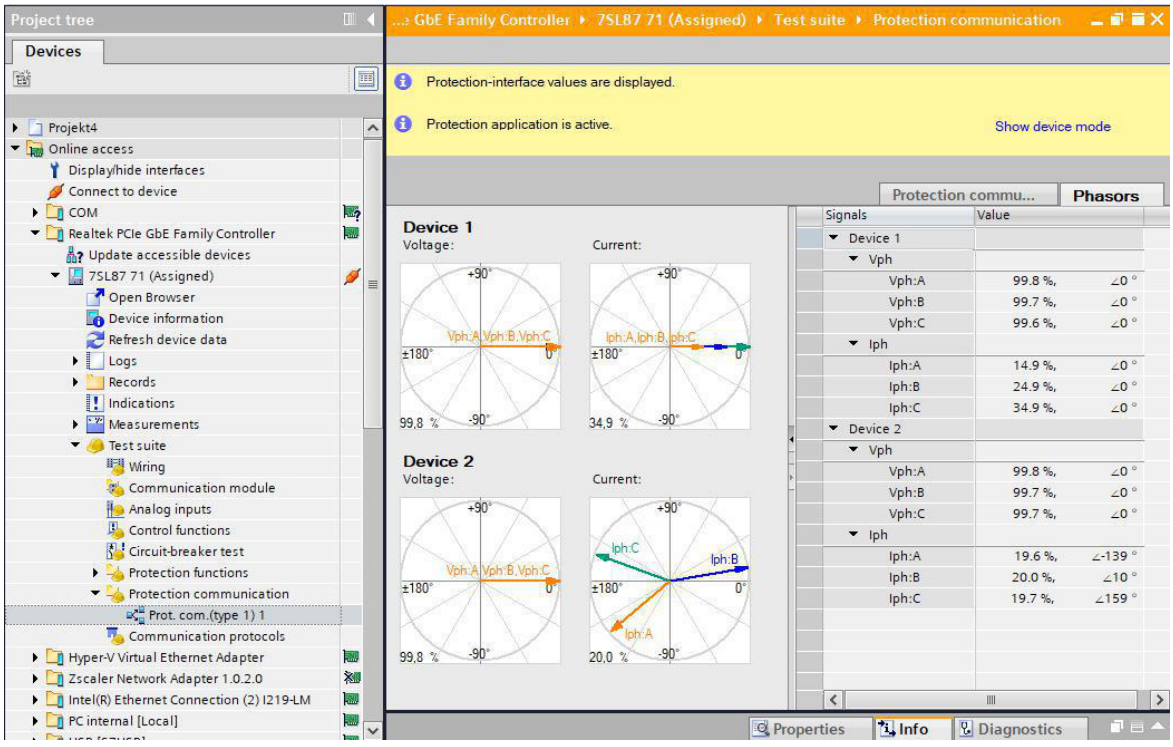
Each device in the device combination determines measured values predefined by Siemens, known as constellation measured values. You can find the constellation measured values in the DIGSI 5 information routing under the FG **n Device protection comm.** > **Constell. measured values**. The following measured values and indications are issued for each device:

| Measured Value | Meaning |
|---|---|
| (_:1351:6811:302) Vph | This measured value shows the voltage of the 3 phases that is synchronized with all devices of the device combination. The absolute value and angle are issued for each phase. |
| (_:1351:6811:303) Iph | This measured value shows the current of the 3 phases that is synchronized with all devices of the device combination. The absolute value and angle are issued for each phase. |
| (_:1351:6811:300) Dev.adr. | This indication shows the device address. This allows you to assign the measured values and the circuit-breaker position in a better way. |
| (_:1351:6811:301) CB | This indication shows the position of the local circuit breaker and can have the following values:<br>• *0*:<br>The switch position of the local circuit breaker is unknown.<br>• *1*<br>The local circuit breaker is open.<br>• *2*<br>The local circuit breaker is closed. |

The constellation measured values have the following properties:

- They are synchronized in the devices in a device combination.
- They are substituted using the protection interface.
- They are available on every device in the device combination.

You can view the constellation measured values with DIGSI 5.



In the device, current and voltage measured values are displayed in absolute value and phase as a percentage. 100 % conform to the rated current or the rated voltage of the line (see *Figure 3-90*). These measured values are recorded every 2 seconds by the devices and then sent to the other respective devices. At the same time, the current and voltage values of the different devices are time-synchronous with one another.

When displaying the constellation measured values, the local device is prioritized. The device connected directly with DIGSI 5 is the local device.

The angle reference depends on the type of the FG **Protection communication** used:

- Protection communication **Type 1**:
  - The angle values of the voltages show the angle difference between the local and the remote voltage. The local voltage serves as the reference with an angle of 0°.
  - The angle values of the currents show the angle difference between the local and the remote current. The local current serves as the reference with an angle of 0°.
- Protection communication **Type 2**:
  The angles of the phase-to-ground voltages and the phase currents relate to the voltage $V_A$ of the remote device.

You can find these measured values in the device under the following DIGSI mask:

[sc_const mv, 2, en_US]

Figure 3-90 Example of Constellation Measured Values with Phases

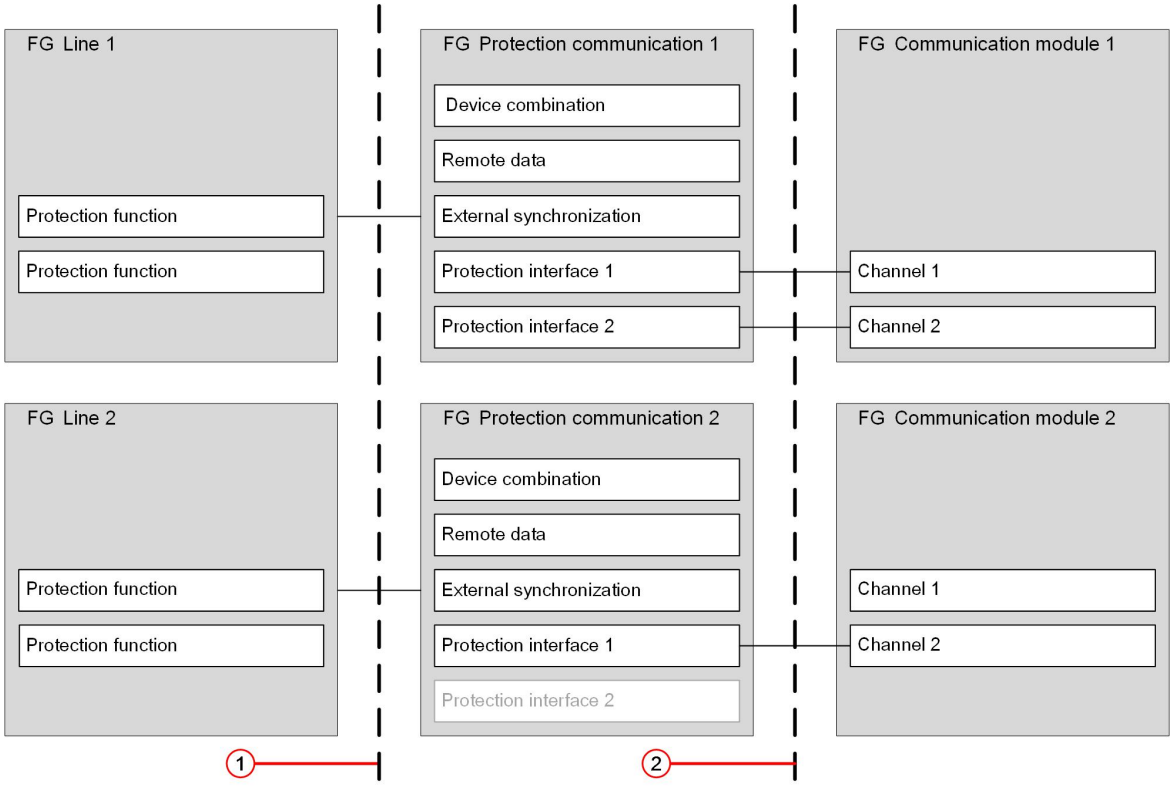
## 3.6.6 Advanced Protection Communication

### 3.6.6.1 Overview

The advanced protection communication contains all functionalities of classic protection communication. The view of parameters and indications is structured differently in DIGSI 5. In addition, the advanced protection communication supports the IP-based communication protocol.

In contrast to the classic protection communication, the advanced protection communication supports more than 2 devices in the device combination.

You can easily change the number of devices in the device combination. Further differences include support for external synchronization sources and an exchange of phase-selective information while sending and receiving.



In the DIGSI 5 library, you can find the available function groups for the advanced protection communication in the **Advanced protection communication** folder. The following function-group types can be instantiated:

- FG **Protection communication type 1 (line differential protection)**
- FG **Protection communication type 2**

For configurations with line differential protection, instantiate the FG **Protection communication type 1 (line differential protection)**. In all other cases, instantiate the FG **Protection communication type 2**.

### 3.6.6.2 Advanced Protection Communication in the Overall System

The **Advanced protection communication** is integrated as follows in the overall system:

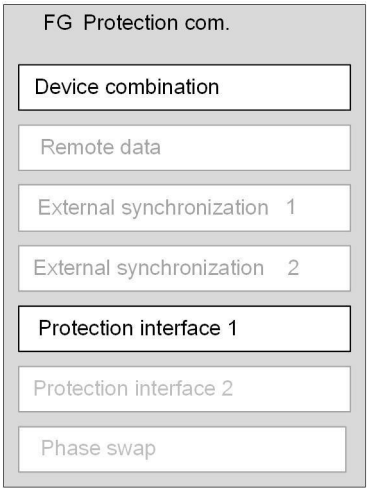
[dw_advanced_protcom_compl_system, 2, en_US]

Figure 3-91 Advanced Protection Communication in the Overall System

(1) The following applies for the FG **Line** and the FG **Voltage/Current 3-phase**: You must route the connection between the protection FG and the FG **Protection communication** in DIGSI 5.

(2) You must assign a channel to the protection interface, see *Parameter: PI assignment, Page 188*.

### 3.6.6.3 Structure of the FG Protection Communication



The instantiated FG **Protection communication** contains the function blocks (FB) for a protection interface and for the device combination. If you need a 2nd protection interface, add another instance.

The FG **Protection communication** contains the following functionalities and function blocks:

- FB **Device combination**
- FB for the **Protection interface**

In addition, the following FBs can be instantiated:

- A 2nd protection interface
  You can find the 2nd protection interface in the Global DIGSI 5 library under **Extended protection communication** > **Second protection interface**.
- 1 or 2 FBs for the **External synchronization** of the transmitted measured values by an external synchronization pulse (1-second pulse, PPS) or via the IEEE 1588 synchronization protocol
  You can find the FB **External synchronization** in the Global DIGSI 5 library under **Extended protection communication** > **Synchronization**.
- The FB **Remote data** is instantiated automatically, as soon as you configure remote data.
- The FB **Phase swap**

[dw_structure_FG_protcom_advanced, 2, en_US]

Figure 3-92 Structure of the FG Extended Protection Communication

### Device Combination

The function **Device combination** manages the devices that exchange data via the protection communication.

The following FBs are preconfigured in the device combination:

- FB **General**
- FBs for each device in the device combination

In the **Device combination**, you configure general settings for the protection communication and the device addresses. The function **Device combination** issues the following indications:

- General indications like the
  - Amount of devices
  - Type and status of the device topology

- Indications of the devices in the device combination like:
  - The availability of the device
  - The state of the device, that is whether the device is logged on or off in the device combination
  - Measured values of the device that have been recorded and synchronized through the device combination (constellation measured values)
  - Test of the function **Line differential protection** in the device combination (only for protection communication type 1)
  - Test of the function **Line differential protection** in the local device (only for protection communication type 1)

#### Protection Interface

The FB **Protection interface** transmits and receives signals and measured values to/from the partner device. For this, the protection interface uses the channel of a communication module.

#### External Synchronization

Measured values that are acquired and exchanged in the devices at the same time, with microsecond accuracy are transmitted via the protection communication. The measured values can be synchronized as follows:

- Internally via the telegram measurement with the Ping-Pong method
- Externally via
  - An external, synchronous pulse 1-second-pulse (PPS)
  - Via the **IEEE 1588** protocol

  If you want to use an external synchronization, you must instantiate the FB **External synchronization**.

  You can use a different synchronization procedure for the 2nd protection interface than for the 1st protection interface.

#### Remote Data

If you want to exchange selected and user-specific data or measured values via the protection communication, you must use the **Remote data** function. If you route a specific signal or a measured value to the protection communication, the device automatically creates the **Remote data** functionality. The routed signals are then transmitted and received via the protection interface. The available bandwidth limits the amount of remote data that can be transmitted.

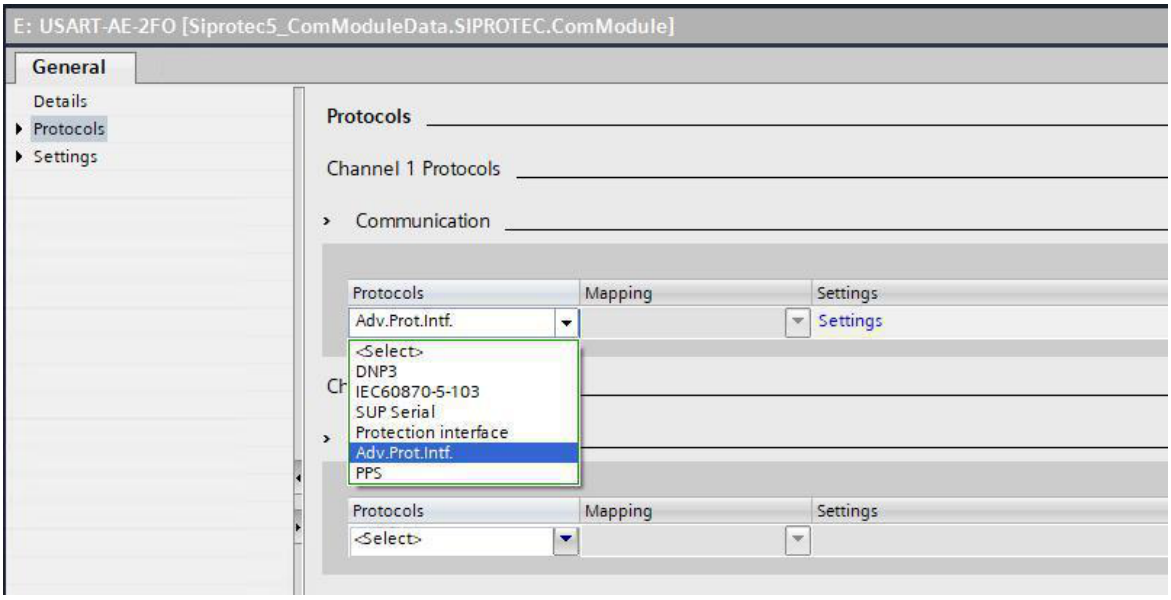
#### Phase Swap

If you want to exchange information via the protection communication with a device showing phases with a different sequence but with the same rotating field as your device, the SIPROTEC 5 device can swap the phase information when sending and receiving. It is no longer necessary to swap phases when connecting the current transformers.

This use case exists on some tie lines of different power-system operators.

For more information, refer to *3.6.6.12 Description Phase Swapping* and *3.6.6.13 Setting Notes for Phase Swapping*.

### 3.6.6.4 Configuration of the Advanced Protection Communication in DIGSI 5

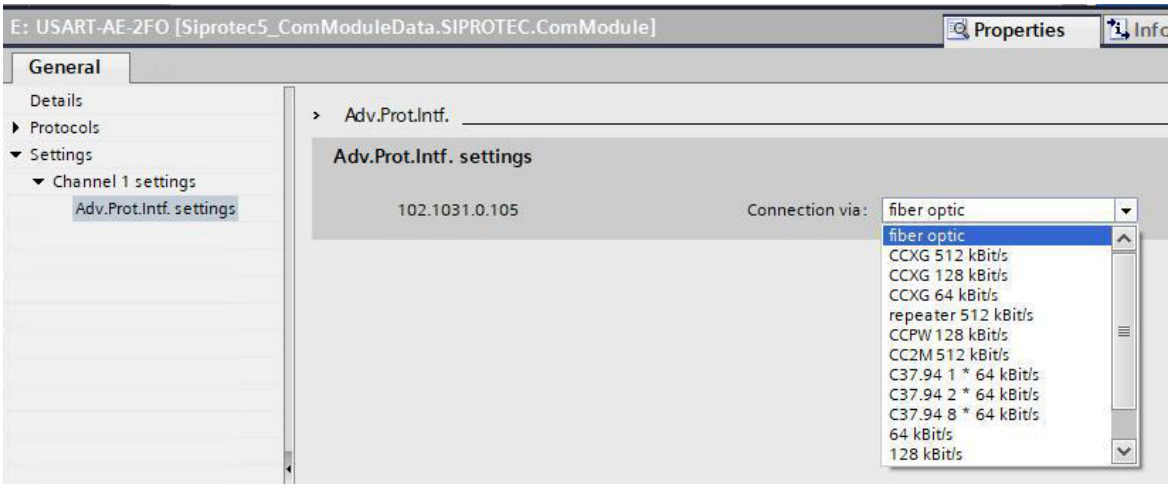


#### Steps during Configuration

Siemens recommends the following procedure when configuring the advanced protection communication:

- Select the desired communication module.
- Select the protocol ***Adv.Prot.Intf.***.

- The further parameterization depends on the selected communication module and is described in the following under:
  - *Advanced Protection Interface for a USART Communication Module, Page 185*
  - *Advanced Protection Interface for an Ethernet-BD Communication Module, Page 187*



### Advanced Protection Interface for a USART Communication Module

[sc_USART_01, 1, en_US]

Figure 3-93 USART Communication Module: Selection of the Protocol Advanced Protection Interface

After selecting the protocol, click **Settings** in the right column to get to the connection settings of the USART protection-interface module for channel 1.

[sc_USART_02, 1, en_US]

Figure 3-94 USART Communication Module: Settings for the Advanced Protection Interface

### Parameter: Connection via

- Default setting **(_:105) Connection via** = ***fiber optic***

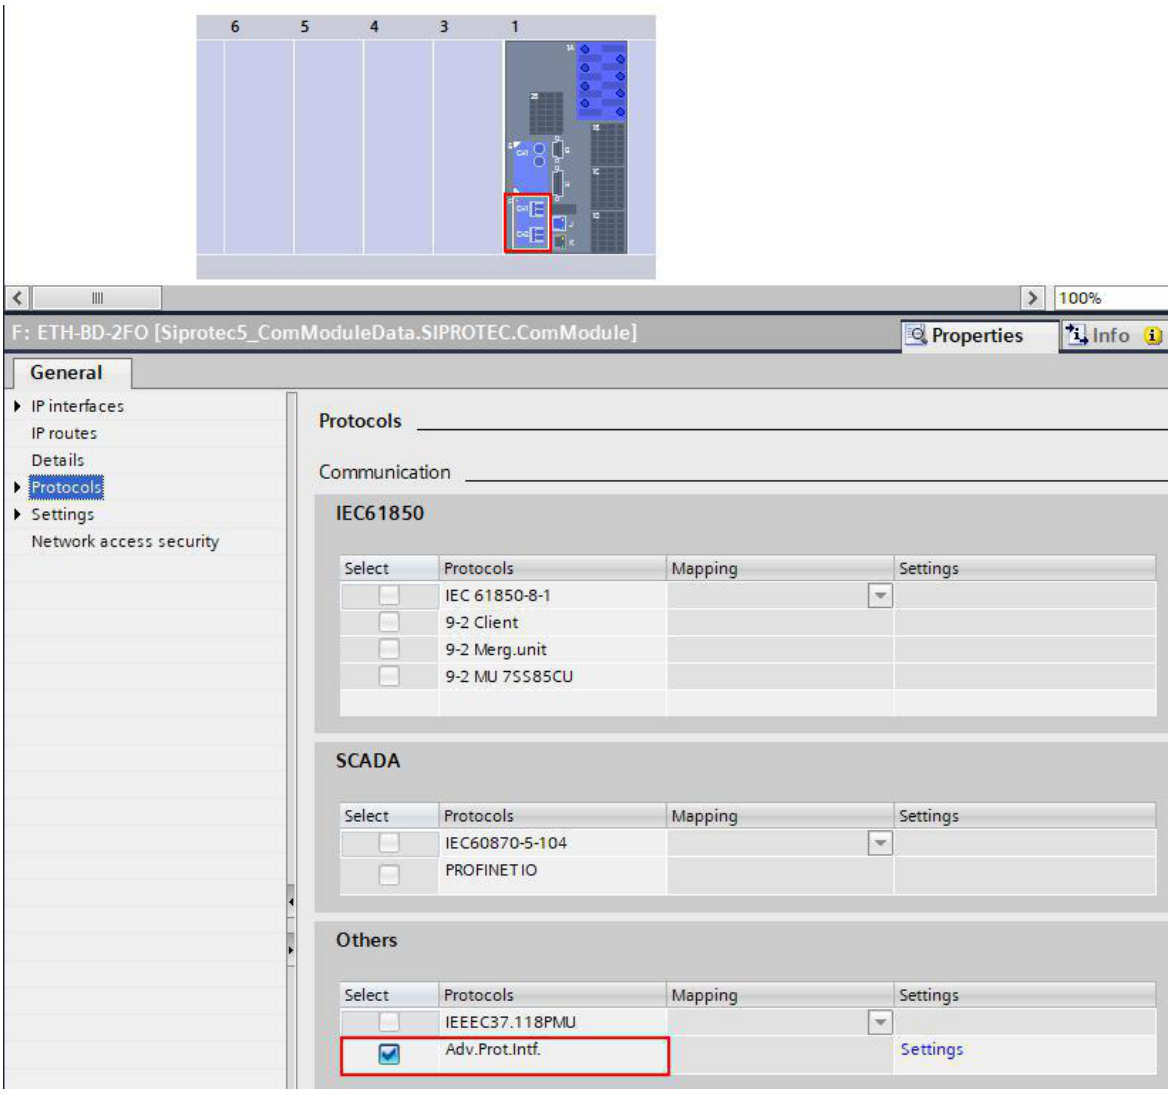
The **Connection via** parameter is used to set the bit rate required for the protection interface. Different discrete values can be entered depending on the means of communication (see following table).

Table 3-19 Communication Media

| Communication Media | See | Setting Value | Bit Rate |
|---|---|---|---|
| Fiber-optic direct connection | *Figure 3-58* to *Figure 3-62* | ***fiber optic*** | 2 MBit/s |
| CC-XG-512 communication converter | *Figure 3-63* | ***CCXG 512 kBit/s*** | 512 kBit/s |
| CC-XG-128 communication converter | *Figure 3-63* | ***CCXG 128 kBit/s*** | 128 kBit/s |
| CC-XG-64 communication converter | *Figure 3-63* | ***CCXG 64 kBit/s*** | 64 kBit/s |
| Repeater 512 communication converter | *Figure 3-66* | ***repeater 512 kBit/s*** | 512 kBit/s |
| CC-CC-128 communication converter | *Figure 3-65* | ***CCPW 128 kBit/s*** | 128 kBit/s |
| CC-2M-512 communication converter | *Figure 3-64* | ***CC2M 512 kBit/s*** | 512 kBit/s |
| Multiplexer with C37.94 interface | *Figure 3-67* | ***C37.94 1 * 64 kBit/s***<br>***C37.94 2 * 64 kBit/s***<br>***C37.94 8 * 64 kBit/s*** | 64 kBit/s<br>128 kBit/s<br>512 kBit/s |
| Other (freely adjustable bit rates for a direct connection for special applications) | | ***64 kBit/s***<br>***128 kBit/s***<br>***512 kBit/s***<br>***2048 kBit/s*** | 64 kBit/s<br>128 kBit/s<br>512 kBit/s<br>2048 kbit/s |

**Parameter: Multiplex operation**

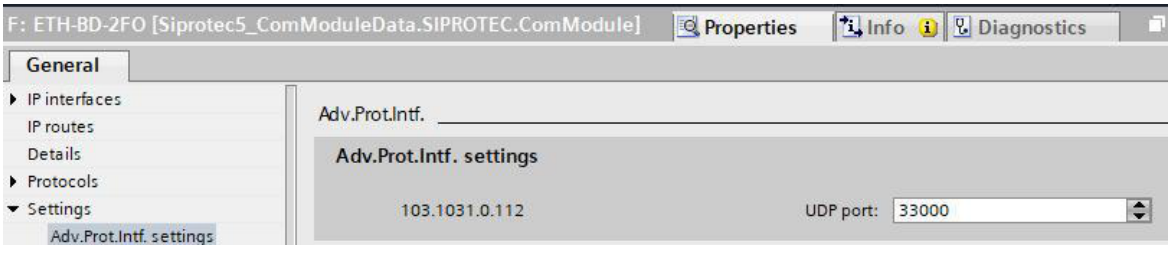
- Default setting **(_:112) Multiplex operation** = ***no***



With the parameter **Multiplex operation**, you can designate the physical channel for multiplex operation. You can then route 2 protection interfaces to this channel.
Refer to *3.6.3 Function Description*.

**NOTE**

For safety reasons, you cannot route 2 protection interfaces from the same device combination to one channel, as this results in apparent redundancy.



### Advanced Protection Interface for an Ethernet-BD Communication Module

[sc_ETH-BD_01, 1, en_US]

Figure 3-95 Ethernet-BD Communication Module: Selection of the Protocol Advanced Protection Interface

After selecting the protocol, click **Settings** in the right column to get to the connection settings of the Ethernet-BD communication module for channel 1.

[sc_ETH-BD_02, 1, en_US]

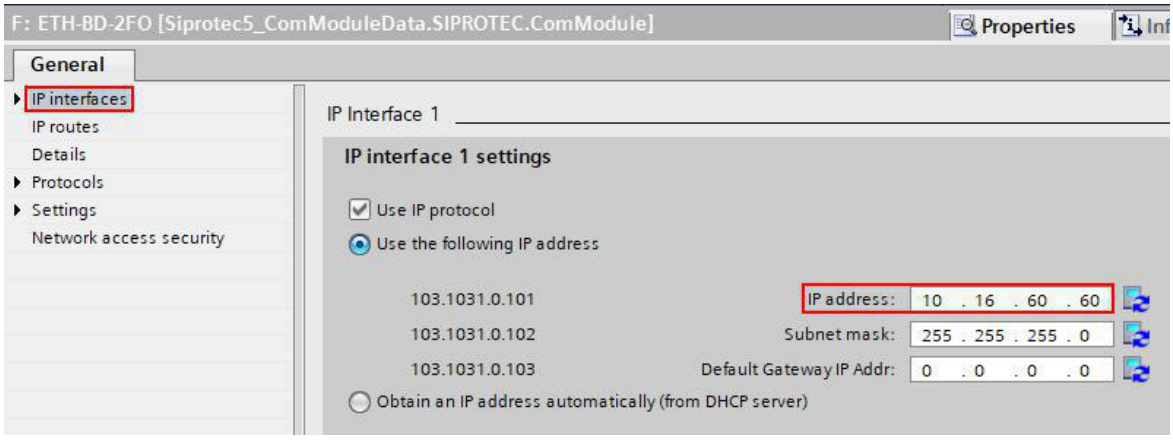


Figure 3-96 Ethernet-BD Communication Module: Settings for the Advanced Protection Interface

### Parameter: UDP Port

- Default setting **(_:112) User port** = ***33000***

With the **UDP port** parameter, you set the value of the destination port in the UDP header of the protection-interface IP messages. You must set the same value for the parameter **UDP port** for all protection devices of a device combination that use the IP-based protection interface. Different device combinations can use the same value for the **UDP port** parameter. Normally, the default setting can always be applied. It can be necessary, for example, due to firewall policies, to configure a UDP port that differs from the default setting.

Parameterize the IP address of the Ethernet-BD communication module in the properties of the module.

[sc_IPadr, 1, en_US]

Figure 3-97 Parameterization of the IP Address for the Ethernet-BD Communication Module

The configuration and parameterization of the protection-interface communication module is now complete.

### 3.6.6.5 Setting Notes for the Protection Interface

The chapter provides setting notes for the logical protection interface (FB **Protection interface**).

**Parameter: PI assignment**

- Default setting **(_:5161:120) PI assignment** = ***Setting options depend on configuration***

In addition, you must select the channel for the protection interface in DIGSI 5 as follows: **Project tree** > **Prot. com.** > **Prot. interf.**.

In the input area under **PI assignment**, select the channel of a communication module that supports the required protection-interface protocol. As a prerequisite for this, you must have selected the protocol ***Advanced protection interface*** for the channel of the desired communication module, see *3.6.6.4 Configuration of the Advanced Protection Communication in DIGSI 5*.

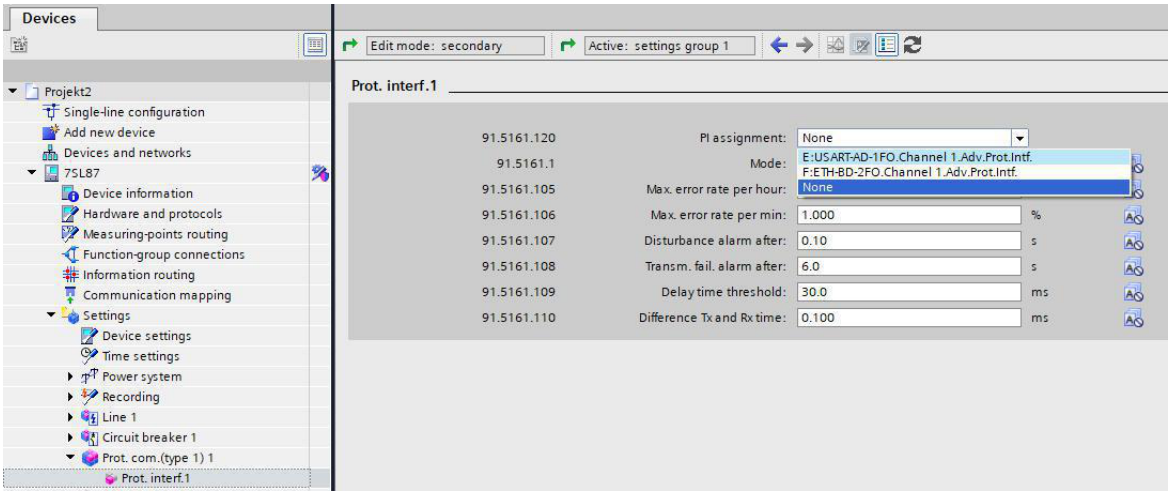

Figure 3-98 Assignment of the Protection-Interface Channel to the Protection Interface

**Parameter: Max. error rate per hour**

- Default setting **(_:5161:105) Max. error rate per hour** = *1.0 %*

If the number of faulty telegrams per hour exceeds the value set in the parameter **Max. error rate per hour**, you receive the error message *Error rate / hour exc.*.

**Parameter: Max. error rate per min**

- Default setting **(_:5161:106) Max. error rate per min** = *1.0 %*

If the number of faulty telegrams per minute exceeds the value set in the parameter **Max. error rate per min**, you receive the error message *Error rate / min exc.*.

**Parameter: Disturbance alarm after**

- Default setting **(_:5161:107) Disturbance alarm after** = *100 ms*

With the parameter **Disturbance alarm after**, you determine the time delay after which faulty or missing telegrams are signaled as disturbed with the indication *Status of lay. 1 and 2 = PI data fault*.

**Parameter: Transm. fail. alarm after**

- Default setting **(_:5161:108) Transm. fail. alarm after** = *6.0 s*

With the parameter **Transm. fail. alarm after**, you determine the time delay after which a communication failure is signaled with the indication *Status of lay. 1 and 2 = PI data failure*.

**Parameter: Delay time threshold**

- Default setting **(_:5161:109) Delay time threshold** = *30.0 ms*

The time taken to transmit and receive a signal via a protection connection is called the signal-transit time. You can monitor the signal-transit time. For the **Delay time threshold**, the default setting is selected in such a way that it is not exceeded by normal communication networks. If the signal-transit time is exceeded during operation (for example, upon switchover to another transmission path), the indication **Time delay exceeded** is issued.

Increased runtimes only affect the operate time, and therefore the fault-clearing time of the protection functions that use the protection interface. If you use the **Line differential protection** function, this remains in effect.

**Parameter: Difference Tx and Rx time**

- Default setting **(_:5161:110) Difference Tx and Rx time** = ***0.1 ms***

For a time synchronization of the measured values with microsecond accuracy by means of telegram measurement, the signal-transit times in the transmission and receive direction must be approximately the same. The device monitors the signal-transit times in the transmission and reception direction.

With the parameter **Difference Tx and Rx time**, you can set a maximum permitted signal-transit time difference between the transmission and reception paths (runtimes unbalanced). Set the parameter **Difference Tx and Rx time** to the maximum difference expected.

Set this value to ***0*** for a direct fiber-optic connection. A higher value is necessary for transmission via communication networks. ***0.1 ms*** (recommended setting value) is the reference value.

If the difference in the signal-transit times between the transmission and reception path exceeds the set value, the indication *Time delay jump* is issued.

If the difference in the signal-transit times between the transmission and reception path exceeds the set value and remains for more than 5 s, the indication *Time delay different* is issued. The **Line differential protection** function is no longer working properly and is ***ineffective***.

**NOTE**

The parameter **Difference Tx and Rx time** is only visible if the **Line differential protection** function is instantiated and the parameter **Synchronization** is not set to ***External synch. only***.

**NOTE**

If you use a multiplexer with a C37.94 interface as a communication medium, Siemens recommends a setting value of ***0.25 ms*** to ***0.6 ms***.

**Parameter: Synchronization**

- Default setting **(_:5161:113) Synchronization** = ***External synchron. off***

With the parameter **Synchronization**, you control the time synchronization of the measured values with microsecond accuracy.

The parameter **Synchronization** is only visible if you have instantiated the FB **External synchronization** from the Global DIGSI 5 library in the FG **Protection communication**.

If you have not instantiated the FB **External synchronization**, the measured values are time-synchronized internally with microsecond accuracy.

| Parameter Value | Description |
|---|---|
| ***External synchron. off*** | The external synchronization is disabled:<br>No external synchronization is performed on the protection interface. Select this setting value if you do not expect any differences between the signal-transit times in the transmission and reception directions. Then, the measured values are only synchronized internally with the telegram measurement. |
| ***Telegr. and ext. synch.*** | Synchronization via telegram measurement and external synchronization:<br>The measured values are synchronized internally with the telegram measurement, supported by the external synchronization. The synchronization is possible via the IEEE 1588 protocol or via the synchronous pulse of a satellite receiver and configurable in the FB **External synchronization**.<br>In this case, an existing line differential protection is only enabled when a new connection is established and one of the following conditions is met.<br>• The protection communication link is synchronized with the help of the external synchronization.<br>• Symmetric signal-transit times are signaled via the binary input signal *>Sync reset* or the controllable *Reset synchronization*. This means that the signal-transit times are the same in the send and receive direction. |
| ***Telegr. or ext. synch.*** | Telegram measurement or external synchronization:<br>The measured values are synchronized internally with the telegram measurement, supported by the external synchronization. The synchronization is possible via the IEEE 1588 protocol or via the synchronous pulse of a satellite receiver and configurable in the FB **External synchronization**.<br>An existing line differential protection is enabled immediately upon renewed establishment of a connection (data telegrams are received). The internal synchronization is used up to synchronization. |
| ***External synch. only*** | External synchronization only:<br>The measured values are synchronized only via the external synchronization.<br>You can set the external synchronization in the FB **External synchronization**. This enables synchronization via the IEEE 1588 protocol or via the synchronous pulse of a satellite receiver. |

**NOTE**

If the protection interface is connected to a channel on a USART communication module (see *Parameter: PI assignment, Page 188*), the external synchronization is used to take into account the signal-transit times in the transmission and receive direction.

If the external synchronization fails for a short time, for example, due to a receiving interference or an unfavorable satellite position for a brief period, the internal synchronization via the telegram measurement is still active.

**NOTE**

If the protection interface is connected to a channel on an Ethernet-BD communication module (see *Parameter: PI assignment, Page 188*), the parameter **Synchronization** is permanently set to ***External synch. only***.

**Parameter: FB External synchron.**

- Default setting **(_:5161:117) FB External synchron.** = ***Ext. synchronization 1***

With the external synchronization, the time synchronization of the measured values with microsecond accuracy is possible through an external synchronization source.

The parameter **FB External synchron.** is only visible if you have instantiated at least 1 FB **External synchronization** from the Global DIGSI 5 library into the FG **Protection communication**. You can instantiate a maximum of 2 FBs for external synchronization.

With the parameter **FB External synchron.**, you specify whether the protection interface uses the FB **Ext. synchronization 1** or the FB **Ext. synchronization 2** for the synchronization. You parameterize the synchronization source in the corresponding FB **External synchronization**, see *3.6.6.9 Setting Notes for External Synchronization*.

**NOTE**

The external synchronization is possible separately for each protection interface.

**Parameter: Check synchron.-source**

- Default setting **(_:5161:121) Check synchron.-source** = ***yes***

With the parameter **Check synchron.-source**, you can switch the synchronization-sources check on or off. During the check of the synchronization sources on the ends of a protection connection, a check is conducted as to whether both synchronization sources are working in the same synchronization status ***SmpSynch***.

If both synchronization sources are working in the synchronization status ***SmpSynch*** = ***global***, the inspection has been passed.

If both synchronization sources are working in the synchronization status ***SmpSynch*** = ***local***, that is decoupled from a global reference time, an additional check is conducted as to whether the synchronization source (***gmIdentity***) is the same. Synchronicity can only be guaranteed if the synchronization sources are the same.

If the synchronization sources display a different synchronization status, that is one displays the synchronization status ***SmpSynch*** = ***local*** and the other the synchronization status ***SmpSynch*** = ***global***, synchronization cannot be guaranteed.

Siemens recommends using the default setting **Check synchron.-source** = ***yes***.

If you have problems with the synchronization-source check, you can switch off the synchronization-source check. Switch off the synchronization-source check only if the synchronization sources are synchronous at the end of their protection connection.

The parameter **Check synchron.-source** is visible only if the parameter **(_:5161:113) Synchronization** is set to ***External synch. only***.

**NOTE**

If you use **PPS electrical (port G)** as the synchronization source, the synchronization status (***SmpSynch***) is permanently set to ***global***.

If you use **PPS optical (USART)** as the synchronization source, you can use the parameter (_:107) **Received. SmpSynch** to set the synchronization status to (***SmpSynch***) ***local*** or ***global***.

For a synchronization with microsecond accuracy, for example, for the **Line differential protection**, set the parameter (_:107) **Received. SmpSynch** = ***global***.

### 3.6.6.6 Indications and Measured Values of the Advanced Protection Interface

Each individual protection interface provides different indications for commissioning and diagnostics of communication:

**Indication** ***(_:5161:301) Status of lay. 1 and 2***

The indication ***(_:5161:301) Status of lay. 1 and 2*** informs you about the status of the connection. The following indications are possible:

Table 3-20 Status Indications Status of lay. 1 and 2

| Indication | Description |
|---|---|
| *initialized*: | The protection interface is not connected and is in the Initial state. |
| *PI connected*: | The protection interface is connected to the protection interface of the partner device. |
| *PI data fault*: | The protection interface has not received any valid telegrams for the time set in parameter **(_:5161:107) Disturbance alarm after**. |
| *PI data failure*: | The protection interface has not received any valid telegrams for the time set in parameter **(_:5161:108) Transm. fail. alarm after**. |
| *not existing*: | The protection interface has not been assigned to a communication channel. |

### Indication *(_:5161:302) Status of lay. 3 and 4*

The indication *(_:5161:302) Status of lay. 3 and 4* informs about errors during the connection establishment. The following indications are possible:

| Status indication | Description |
|---|---|
| *no error*: | No errors occurred during the connection establishment. |
| *SW ver.incomp.*: | The connection is not established because the firmware versions of the devices are incompatible.<br>Update the firmware. |
| *wrong dev. ID*: | The connection is not established because the device address of the local device or the partner device is incorrect or set incorrectly.<br>Check the settings for the parameters **Address of device 1** to **Address of device n** (_:5131:102 and following). |
| *const.sett.error*: | The connection is not established because the parameters are set differently.<br>Check whether the parameter **(_:5131:122) Lowest appearing bit rate** has been set the same in all devices in the device combination. |
| *diff.sett error*: | The connection is not established because the parameters are set differently.<br>The line differential protection settings for the connected devices are incompatible. Check whether both devices are set to operate with or without line differential protection.<br>The rated current of the line (parameter **(_:9001:101) Rated current**) must have the same setting in all devices.<br>With a transformer in the line, the **(_:9001:103) Rated apparent power** must be set to the same value in all devices.<br>For further information, see *6.7 Line Differential Protection*. |
| *net mirroring* | The connection is not established. The protection interface is receiving its own data.<br>Check the wiring. |
| *wrong dev. idx.* | The connection is not established because the device index of the local device or the partner device is incorrect.<br>Check the setting for the parameter **(_:5131:101) Local device is device**. |

Furthermore, the following output signals are available:

| Output Signal | Description |
|---|---|
| *(_:5161:303) Connection broken* | The signal *Connection broken* indicates that during a parameterized time (parameter **(_:5161:107) Disturbance alarm after**) no telegrams or faulty telegrams were continuously received. If the indication *Connection broken* is issued, the affected protection connection is reset. This can cause the blocking of an active line differential protection or a ring topology can change to a chain topology. |
| *(_:5161:316) Error rate / min exc.* | The signal *Error rate / min exc.* indicates that the set maximum error rate per minute (Parameter **(_:5161:106) Max. error rate per min**) has been exceeded.<br>In this manner, a brief increase of the operate time and thus of the fault-clearing time is possible for the protection functions using the protection interface. If you use the **Line differential protection** function, this remains in effect. |
| *(_:5161:317) Error rate / hour exc.* | The signal *Error rate / hour exc.* indicates that the set maximum error rate per hour (Parameter **(_:5161:105) Max. error rate per hour**) has been exceeded.<br>In this manner, a brief increase in operate time and thus the fault-clearing time is possible for the protection functions using the protection interface. If you use the **Line differential protection** function, this remains in effect. |
| *(_:5161:318) Time delay exceeded* | The signal *Time delay exceeded* indicates that the threshold value for the set signal runtime (parameter **(_:5161:109) Delay time threshold**) has been exceeded.<br>Increased runtimes only affect the operate time, and therefore the fault-clearing time of the protection functions using the protection interface. If you use the **Line differential protection** function, this remains in effect. |
| *(_:5161:319) Time delay different* | The signal *Time delay different* indicates that the threshold value for the difference in signal runtimes in the transmission and reception direction (asymmetrical runtimes) has been exceeded. The setting value results from the setting value of the parameter **(_:5161:110) Difference Tx and Rx time**.<br>The indication is visible only if the parameter **(_:5161:113) Synchronization** is not set to ***External synch. only***.<br>If the indication *Time delay different* appears, the **Line differential protection** function is no longer working properly and is ***ineffective***. |
| *(_:5161:320) Time delay jump* | The signal *Time delay jump* indicates that the signal runtimes of the data changed abruptly. This is caused by a switchover of the communication path in the communication network.<br>The indication is visible only if the parameter **(_:5161:113) Synchronization** is not set to ***External synch. only***. |
| *(_:5161:321) PI synchronized* | The signal *PI synchronized* indicates that the synchronization with microsecond accuracy of the measured values transferred between the local device and partner device is working correctly.<br>The indication is visible only if the parameter **(_:5161:113) Synchronization** is not set to ***External synch. only***. |
| *(_:5161:340) Telegram lost* | The signal *Telegram lost* indicates that an expected telegram has failed to arrive or a faulty telegram has been received.<br>If you want to assign the communication failures or faults to other events, route the signal *Telegram lost* temporarily into the operational log. Such events can be switching operations in the primary system or operations on the components of the communication network.<br>**Note:** If the signal is constantly routed, the operational log can overflow. Siemens recommends routing the signal only for clarification of problems. |

| Output Signal | Description |
|---|---|
| *(_:5161:343) Partner* | The indication shows the address of the partner device. A value of 0 means that no partner address is available. |
| *(_:5161:323) PPS: time del. unsym.* | This indication is only visible if you are working with a synchronous pulse. The indication shows that the difference in the signal runtimes between the sending and receiving path exceeds the value set with the parameter **(_:5161:110) Difference Tx and Rx time**.<br>**Note:** The **Line differential protection** function remains ***effective***. |
| *(_:5161:324) PI with PPS synchron.* | This indication is only visible if you are working with a synchronous pulse. This indication is only visible if, in parallel to synchronization with the synchronization pulse, you are also working with the synchronization via telegram measurement. If both synchronization methods are working properly, the indication *PI with PPS synchron.* = RAISING is generated. |

**Measured Values of the Protection Interface**

The protection interface provides the following measured value for the diagnosis of the protection-interface communication:

| Measured Value | Description |
|---|---|
| *(_:5161:308) Tx tel/h* | Telegrams transmitted during the last hour |
| *(_:5161:309) Rx tel/h* | Telegrams received during the last hour |
| *(_:5161:310) Tx tel/min* | Telegrams transmitted during the last minute |
| *(_:5161:311) Rx tel/min* | Telegrams received during the last minute |
| *(_:5161:312) Tx err/h* | Transmission failure rate during the last hour |
| *(_:5161:313) Rx err/h* | Receive error rate during the last hour |
| *(_:5161:314) Tx err/min* | Transmission failure rate during the last minute |
| *(_:5161:315) Rx err/min* | Receive error rate during the last minute |
| *(_:5161:325) Aver.Δt* | Average signal runtime (average value of the runtime in transmission and reception direction divided by 2, without external synchronization) |
| *(_:5161:326) Rec. Δt* | Signal runtime for reception path (with external synchronization) |
| *(_:5161:327) Sen. Δt* | Signal runtime for transmission path (with external synchronization) |
| *(_:5161:334) Miss.tel/min* | Number of telegram failures within the last minute |
| *(_:5161:335) Miss.tel/h* | Number of telegram failures within the last hour |
| *(_:5161:336) Miss.tel/d* | Number of telegram failures within the last day |
| *(_:5161:337) Miss.tel/w* | Number of telegram failures within the last week |
| *(_:5161:338) M. loss/d* | Longest lasting telegram failure within the last day |
| *(_:5161:339) M. loss/w* | Longest lasting telegram failures within the last week |
| (_:5161:331) Recept. | Receipt of a telegram (0 = no receipt, 1 = receipt)<br>You can use this indication to make the telegram exchange visible in the fault record. |

**NOTE**

You can reset the measured values of the protection interface directly in the device. Proceed as follows:
**Device functions > Protection comm. (Type x) > Protection interface y > Reset measured values**.

### 3.6.6.7 Setting Notes for the Device Combination

In the **Project tree** > **Settings** > **Protection comm. (type 1)** or **Protection comm. (type 2)**, select the function block **Device combination**. In the input area, you parameterize the general settings for the device combination, instantiate the number of devices in the device combination, and set the parameters for each device. A device combination consists of at least 2 devices.

**Parameter: Local device is device**

- Default setting **(_:2311:101) Local device is device** = ***1***

With the **Local device is device** parameter, you set the index (number) of your device in the device combination. A maximum of 6 devices can be present in a device combination.

**Parameter: Lowest appearing bit rate**

- Default setting **(_:2311:122) Lowest appearing bit rate** = ***64 kBit/s***

With the parameter **Lowest appearing bit rate**, you set the lowest bit rate occurring in the device combination. This value determines the maximum number of signals and measured values to be transferred in the **Remote data** function within the device combination.

**EXAMPLE:**

For a device combination consisting of 3 devices in a ring topology with 2 fiber-optic connections (2 MBit/s) and a 64-kBit/s connection, set the smallest value (64 kBit/s) in each device.

Apart from the default value, you can set the following bit rates:

- ***128 kBit/s***
- ***512 kBit/s***
- ***2048 kBit/s***

**NOTE**

If you use optical fibers for all protection connections, set the value to ***2048 kBit/s***.

**Connection mode**

- Default setting **(_:2311:126) Connection mode** = ***SIPROTEC 5***

With the parameter **Connection mode**, you select the device type with which the SIPROTEC 5 device works in the device combination via the protection connections.

**NOTE**

As soon as a SIPROTEC 4 device is present in the device combination, the SIPROTEC 5 devices must operate in a compatibility mode. For this reason, the parameter **Connection mode** must be set to the same value in all SIPROTEC 5 devices in the device combination. Select the type of SIPROTEC 4 device from the following table:

| Parameter Value | Description |
|---|---|
| ***SIPROTEC 5*** | The SIPROTEC 5 device works with a SIPROTEC 5 device in the device combination. |
| ***SIPROTEC 4 7SD610*** | The SIPROTEC 5 device works with a SIPROTEC 4 differential protection device 7SD610 with firmware version V4.72 and higher in the device combination. |
| ***SIPROTEC 4 7SD5*** | The SIPROTEC 5 device works with a SIPROTEC 4 differential protection device 7SD5x with firmware version V4.72 and higher in the device combination. |
| ***SIPROTEC 4 7SA5/6*** | The SIPROTEC 5 device works with a SIPROTEC 4 distance protection device 7SA522 and 7SA6x with firmware version V4.70 and higher in the device combination. |

**Parameter: Dev. comb. is time source**

- Default setting **(_:2311:129) Dev. comb. is time source** = ***yes***

The parameter **Dev. comb. is time source** is only visible if you have instantiated several function groups **Protection comm.** and you have selected the setting value ***PI*** for the parameters **Time source 1** or **Time source 2**.

The parameter **Dev. comb. is time source** determines from which FG **Protection comm.** the time is taken over.

**Parameter: Protection com.**

- Default setting **(_:2311:128) Protection com.** = ***Type 1 (Line diff. prot.)***

The parameter **Protection com.** is write-protected and displays only the type of the instantiated device combination.

The device combination ***Type 1 (Line diff. prot.)*** supports the function **Line differential protection**. The device combination ***Type 2 (no Line diff. pr.)*** does not support the function **Line differential protection**.

**NOTE**

In the Global DIGSI 5 library, the function groups **Protection communication type 1 (line diff. protection)** and **Protection com. Type 2** are available for the advanced protection communication. When instantiating the respective function group, the corresponding type of the device combination is automatically pre-instantiated.

**NOTE**

If you have instantiated the FG **Protection com. Type 2**, the **Device combination Type 2** is automatically pre-instantiated in this FG and the **Line differential protection** function is not supported.

If you subsequently want to use the **Line differential protection** function in the device combination of the FG **Protection com. Type 2**, proceed as follows:

- In the DIGSI 5 project tree, delete the function block **Device combination** from the **FG protection comm. (type 2)**.
- Instantiate the function block **Device combination type 1 (line diff. protection)** from the Global DIGSI 5 library into the FG **Protection com. Type 2**.
- Parameterize the **device combination** in the input area again.
- Reroute the indications of the device combination in the DIGSI 5 information routing.

All other parameterizations and routings are retained!

**Parameter: Device index**

- Default setting **(_:22711:101) Device index** = ***1***
- Default setting **(_:22712:101) Device index** = ***2***
- Default setting **(_:22713:101) Device index** = ***3***
- Default setting **(_:22714:101) Device index** = ***4***
- Default setting **(_:22715:101) Device index** = ***5***
- Default setting **(_:22716:101) Device index** = ***6***

The value of the parameter **Device index** is the number of the device in the device combination. Set the device index in all devices of a device combination for the same devices in the same way. The device indices must start with 1 and be incremented continuously. DIGSI 5 assigns the device indices automatically. You can change the device indices if necessary.

**NOTE**

The device with the **Device index** = ***1*** is the timing-master device in a device combination.

If all other devices in the device combination are to obtain their time from the timing-master device, consider the following

- Set the **Device index** to ***1*** for the timing-master device.
- Parameterize the other devices in such a way that they get their time from the timing-master device via the protection connections.
  For more information, refer to *3.7.3 Function Description*. Select ***Protection interface*** as the adjustable synchronization option.
  In the timing-master device, you must **not** set the protection interface as the synchronization source!

**Parameter: Address in Device combi.**

- Default setting **(_:22711:102) Address in Device combi.** = ***101***
- Default setting **(_:22712:102) Address in Device combi.** = ***102***
- Default setting **(_:22713:102) Address in Device combi.** = ***103***
- Default setting **(_:22714:102) Address in Device combi.** = ***104***
- Default setting **(_:22715:102) Address in Device combi.** = ***105***
- Default setting **(_:22716:102) Address in Device combi.** = ***106***

With the parameter **Address in Device combi.**, you assign a unique and unambiguous address for each device.

**NOTE**

If the preset values do not fit, Siemens recommends the following procedure:

Define a number for the device combination that is unambiguous in your area of responsibility and that must be at least 2 digits, for example, 100. The setting value of the parameter **Address in Device combi.** is then calculated as follows: **Number in the device combination** + **Device index**.

For device **2**, this leads to **Address in Device combi.** = ***102***.

**Parameter: IP Address**

- Default setting **(_:22711.103) IP address** = ***0.0.0.0***
- Default setting **(_:22712.103) IP address** = ***0.0.0.0***
- Default setting **(_:22713.103) IP address** = ***0.0.0.0***
- Default setting **(_:22714.103) IP address** = ***0.0.0.0***
- Default setting **(_:22715.103) IP address** = ***0.0.0.0***
- Default setting **(_:22716.103) IP address** = ***0.0.0.0***

The IP address of the local device is taken from the settings of the Ethernet-BD communication module and displayed. The local IP address cannot be edited at this point.

**NOTE**

If all devices of a device combination are equipped with an Ethernet-BD communication module and use the IP communication, you must enter the IP addresses for all other devices in the device combination here. The topology detection automatically sets a ring or chain topology.

**NOTE**

If you have a hybrid configuration, that is not all protection connections of a device combination use the IP communication, you must observe the following when setting the IP addresses:

- The topology detection does not generate the topology automatically.
- First define the order for the communication between the devices. Define chain or ring topologies for this purpose.
  The defined topology results in the partner devices for each device, with which the device communicates directly.
  Only set the IP addresses for the partner devices that are equipped with an Ethernet-BD communication module here.
- You can find examples of the parameterization of the IP addresses in hybrid configurations in the chapters *3.6.8.4 Device Combination of 3 Devices and Hybrid Communication Media* and *3.6.8.5 Device Combination of 6 Devices and Hybrid Communication Media*.

**Indications and Measured Values in the Device Combination**

| Indication | Meaning |
|---|---|
| *(_:3321:2311:301) Status of topo. recog.* | The devices form a topology via the protection connections. This indication shows the status of the topology detection and can have the following values:<br>• *Unknown*:<br>The topology is unknown.<br>• *Invalid*:<br>The detected topology is not supported.<br>• *Transient*:<br>The topology has just been modified.<br>• *Valid*:<br>The topology has been detected. The indication *Devices form* shows the type of the detected topology. |
| *(_:3321:2311:302) Topology is* | The indication shows whether all configured devices in the device combination communicate with each other via the protection connections. The indication can have the following values:<br>• *Unknown*:<br>The topology is unknown.<br>• *Incomplete*:<br>At least one device in the device combination does not communicate via the protection connections.<br>• *Complete*:<br>All configured devices in the device combination communicate via the protection connections. |

| Indication | Meaning |
|---|---|
| *(_:3321:2311:303) Devices form* | This indication shows the type of the detected topology that the devices in the device combination form via the protection connections. The indication can have the following values:<br>• *Unknown topol*:<br>The topology is unknown.<br>• *Chain topology*:<br>The devices and their protection connections form a chain topology.<br>• *Ring topology*<br>The devices and their protection connections form a ring topology. |
| *(_:3321:2311:304) Number of detect. dev.* | The indication shows the number of devices that communicate via the protection connections in the device combination. |

**Indication and Measured Values of the Devices**

The following indications and measured values are displayed for each device in the device combination and are explained using the example of a device.

| Indication | Meaning |
|---|---|
| *(_:22711:300) Dev.addr.* | This indication shows the address of the device. |
| *(_:22711:318) is present* | This indication shows whether the device is involved in protection communication. |
| *(_:22711:317) is logged off* | This indication shows whether the local device has been logged off. If the device has been logged off, it is no longer involved in communication via the protection interfaces. If a device has been logged off, information relevant for the protection functions is no longer exchanged. |
| *(_:22711:301) circuit breaker* | This indication shows the position of the circuit breaker and can have the following values:<br>• *0*:<br>The switch position of the circuit breaker is unknown.<br>• *1*<br>The circuit breaker is open.<br>• *2*<br>The circuit breaker is closed. |
| *(_:22711:328) Line diff. test* [13] | This message indicates whether the function **Line differential protection** is in the state ***Test*** or ***Test/Relay blk.***. |
| *(_:22711:329) Local Line diff. test* [13] | This message indicates whether the function **Line differential protection** is in the special test mode *Test local device*. |

### 3.6.6.8 Constellation Measured Values for Type 1 and Type 2

**NOTE**

The constellation measured values are only available for the FG **Line**.

Each device in the device combination determines measured values predefined by Siemens, known as constellation measured values. You can find the constellation measured values in the DIGSI 5 information routing under the FG **Protection comm. (Type x)** > **Device combination** > **Device x**. The following measured values and indications are issued for each device:

[13] This message is only available in the FG Protection communication type 1 (line diff. protection).

| Measured value | Meaning |
|---|---|
| *(_:3321:22711:302) Vph* | This measured value shows the voltage of the 3 phases that is synchronized with all devices of the device combination. The absolute value and angle are issued for each phase. |
| *(_:3321:22711:303) Iph* | This measured value shows the current of the 3 phases that is synchronized with all devices of the device combination. The absolute value and angle are issued for each phase. |
| *(_:3321:22711:304) f* | The measured value supplies the locally calculated frequency of the measured voltage or the current. |

The constellation measured values have the following properties:

- They are synchronized in the devices in a device combination.
- They are substituted using the protection interface.
- They are available on every device.

You can view the constellation measured values with DIGSI 5.

In the device, current and voltage measured values are displayed in absolute value and phase as a percentage. 100 % conform to the rated current or the rated voltage of the line (see *Figure 3-99*). These measured values are recorded every 2 seconds by the devices involved in the device combination and then sent to the other respective devices. At the same time, the current and voltage values of the different devices are time-synchronous with one another.

When displaying the constellation measured values the local device is prioritized. The device connected directly with DIGSI 5 is the local device.

The reference of the angle information depends on whether a line differential protection has been instantiated in the FG **Line**. If a line differential protection is instantiated, the protection communication is type 1, otherwise type 2.

- Protection communication **Type 1**:
  - The angle values of the voltages show the angle difference between the local and the remote voltage. The local voltage serves as the reference with an angle of 0°.
  - The angle values of the currents show the angle difference between the local and the remote current. The local current serves as the reference with an angle of 0°.
- Protection communication **Type 2**:
  The angles of the phase-to-ground voltages and the phase currents relate to the voltage $V_A$ of the relevant device.

You can find these measured values in the device under the following DIGSI mask:

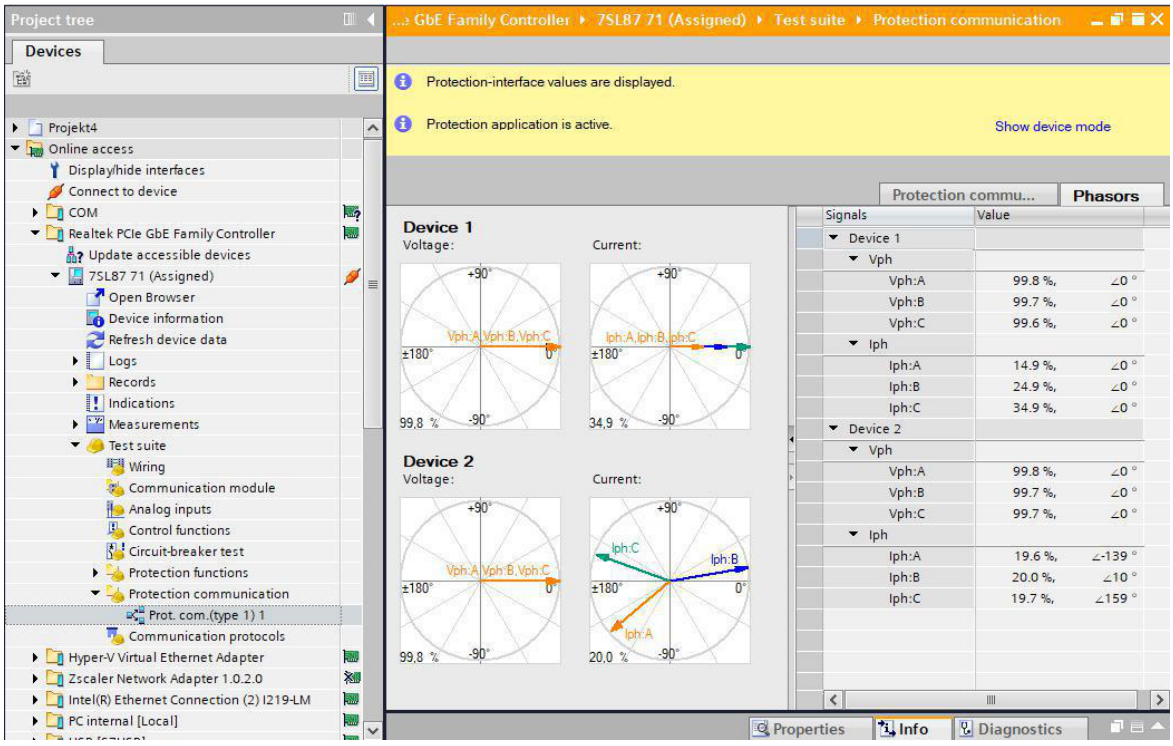

Figure 3-99 Example of Constellation Measured Values with Phases

### 3.6.6.9 Setting Notes for External Synchronization

With the FB **External synchronization**, you can synchronize the measured values of the devices connected via protection connections with microsecond accuracy using external synchronization sources (1*10E-06 s).

The measured values transmitted via protection communication for the line differential protection must be time-synchronized. The synchronization is possible as follows:

- Internally via telegram measurement
- Externally via the IEEE 1588 protocol
- Externally via a synchronous pulse from a satellite receiver

If you use Ethernet-BD communication modules for the protection communication of the line differential protection, the external synchronization of the measured values transmitted via the protection interface is mandatory.

If you use USART communication modules, you can synchronize the transmitted measured values either internally via telegram measurement or via external synchronization. If you do not use the external synchronization, the device automatically uses the internal synchronization.

If you want to use the external synchronization of the measured values, you must instantiate the FB **External synchronization** from the Global DIGSI 5 library into the FG **Protection comm.**. You can find the **External synchronization** in the Global DIGSI 5 library under **Advanced protection communication** > **Synchronization**.

The external synchronization is possible for line differential protection applications or synchrophasor measuring devices as follows:

- Via a high-precision electrical synchronous pulse (***PPS electrical (Port G)***, 1-second pulse) from a satellite receiver at the time-synchronization interface (Port **G**)
- Via a high-precision optical synchronous pulse (***PPS optical (USART)***, 1-second pulse) from a satellite receiver at a USART communication module
- Via the ***IEEE 1588*** time-synchronization protocol

With external synchronization, you can measure and display the signal-transit time of the transmission and receive path separately. This allows you to achieve maximum sensitivity even with unequal (unbalanced) signal-transit times in communication networks with the line differential protection. For the transmission of protection data in the **type 2** protection communication, different signal-transit times do not play a role.

If an FB **External synchronization** is instantiated, the parameter **Synchronization** is visible in the FB **Protection interf.**. With this parameter, you establish the connection between the protection interface and the type of external synchronization. See *3.6.6.5 Setting Notes for the Protection Interface*.

If you use 2 protection interfaces in the FG **Protection comm.**, you can set a different synchronization source for each protection interface if required. For this use case, you must instantiate 2 FBs **External synchronization** into the FG **Protection comm.** and set the desired synchronization source separately.

**Parameter: Name of synchron. block**

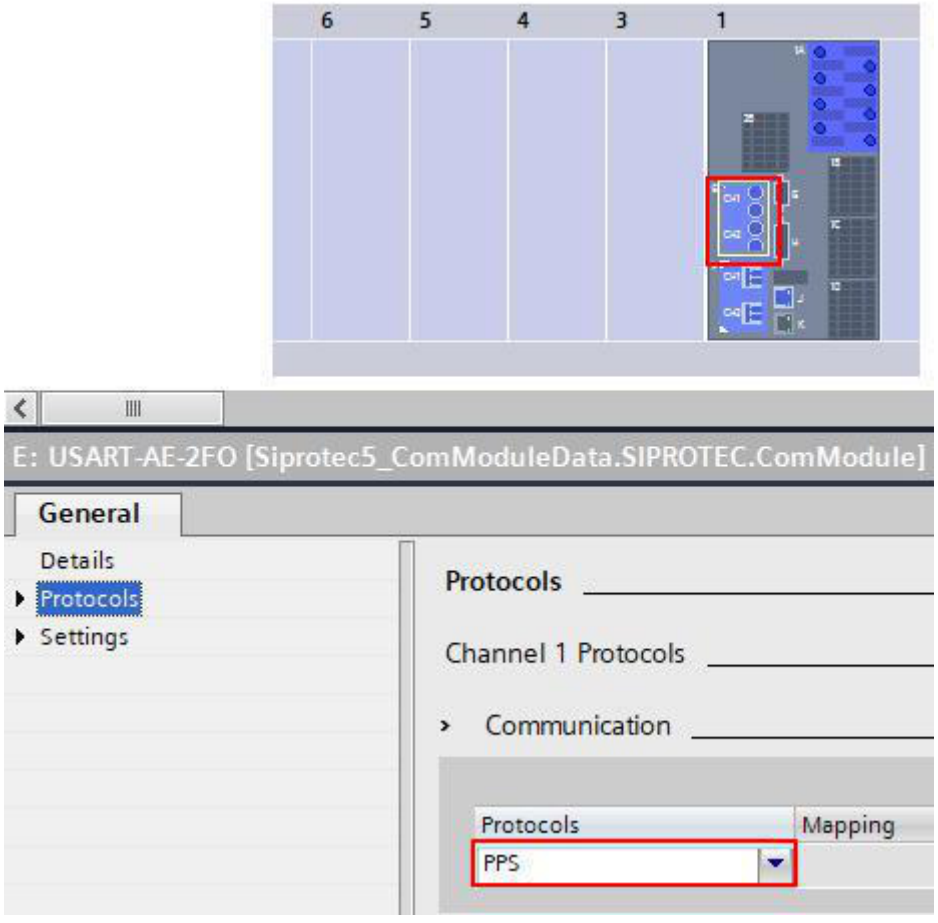
- Default setting **(_:101) Name of synchron. block** = ***Ext. synchronization 1***

The parameter **FB External synchron.** shows the name of the FB **External synchronization**.

If you have instantiated 2 FBs **External synchronization** into the FG **Protection comm.**, you can use this parameter to switch between the FB ***Ext. synchronization 1*** and the FB ***Ext. synchronization 2***.

**Parameter: Synchronization source**

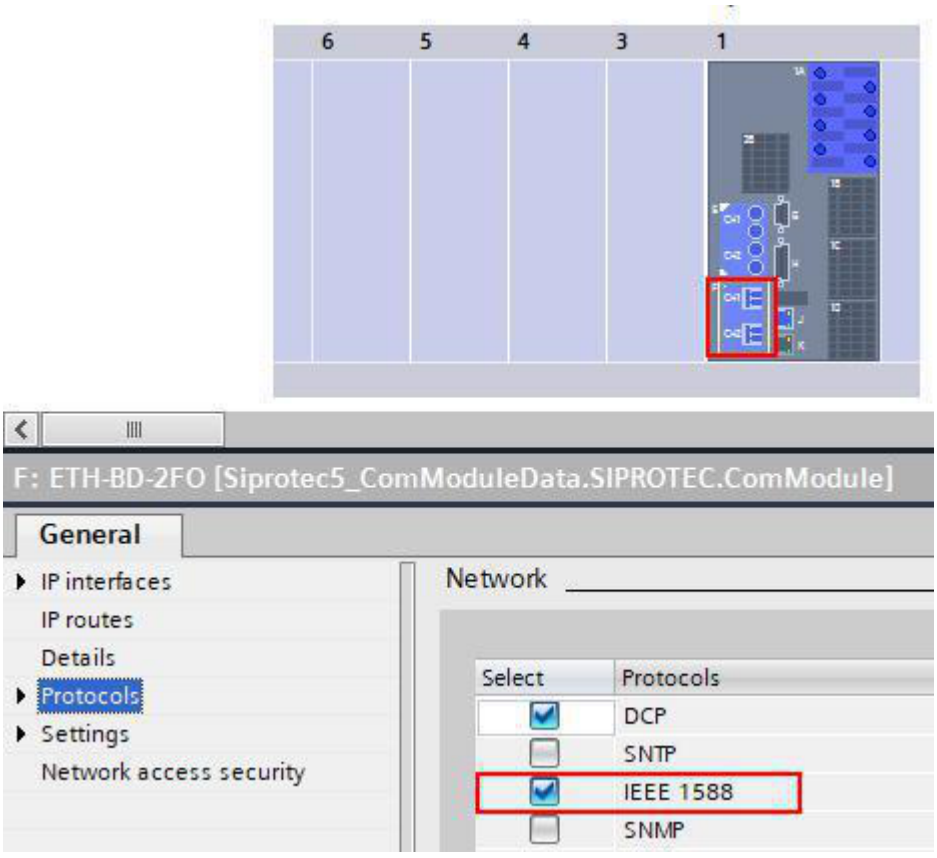
- Default setting **(_:117) Synchronization source** = ***nothing***



With the parameter **Synchronization source**, you select the desired synchronization source for the external synchronization of the measured values.

**NOTE**

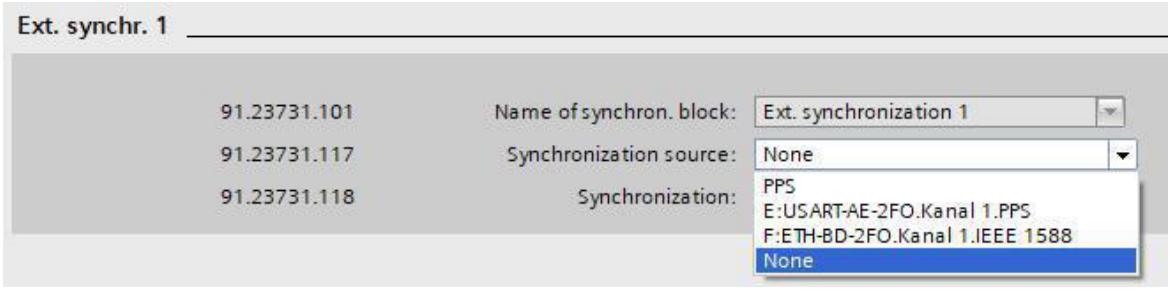
The possible setting options of the parameter **Synchronization source** depend on the configuration of the protocol for the respective channel of the communication module.



To display the selection text for the selection of an optical synchronous pulse, you must configure the protocol **PPS** on a USART communication module as follows:

[sc_PPS, 1, en_US]

Figure 3-100 Configuration of the Optical Synchronous Pulse (PPS) on a Channel of a USART Communication Module



To display the selection text for the selection of the protocol IEEE 1588, you must configure the protocol **IEEE 1588** on an Ethernet-BD communication module as follows:

[sc_1588, 1, en_US]

Figure 3-101 Configuration of the Protocol IEEE 1588 on an Ethernet-BD Communication Module

The setting options for the parameter **`Synchronization source`** then look as follows, for example:

[sc_syncopt, 1, en_US]

Figure 3-102 Possible Setting Options for the Synchronization Source

Depending on the configuration, the following synchronization sources are displayed:

| Parameter Value | Description |
|---|---|
| G:Timesynchron..PPS | The electrical synchronization pulse of a satellite receiver (PPS: 1 Pulse Per Second) at the time-synchronization interface Port G is the synchronization source. |
| [Port]:USART-AD-1FO.Channel 1.PPS | The optical synchronization pulse of a satellite receiver (PPS: 1 Pulse Per Second) on channel 1 of a USART communication module is the synchronization source. |

| Parameter Value | Description |
|---|---|
| [Port]:USART-AE-2FO.Channel 2.PPS | The optical synchronization pulse of a satellite receiver (PPS: 1 Pulse Per Second) on channel 2 of a USART communication module is the synchronization source. |
| [Port]:ETH-BD-2FO.Channel 1.IEEE 1588 | The time-synchronization standard IEEE 1588 on an Ethernet-BD communication module is the synchronization source. |

**NOTE**

You can select different synchronization sources for the same protection connection in the devices involved, for example, the synchronization via the **IEEE 1588** protocol in device **1** and via the protocol **PPS** electrical in device **2**.

Siemens recommends using the same synchronization source for the same protection connection. If it is not possible to use the same synchronization source, check the differential current in the line differential protection in the mode **Test on all devices**. If the differential current is not in the expected range, the set synchronization sources are not synchronous to each other and therefore not usable.

**NOTE**

For detailed information on the communication protocols, refer to the SIPROTEC 5 manual Communication Protocols.

**Parameter: Synchronization using**

- Default setting **(_:118) Synchronization using** = ***nothing***

This parameter **Synchronization using** cannot be adjusted. The parameter shows further information for the selected synchronization source:

| Parameter Value | Description |
|---|---|
| nothing | You have not selected any external synchronization source. |
| PPS electrical (Port G) | The electrical synchronization pulse of a satellite receiver (PPS: 1 Pulse Per Second) at the time-synchronization interface Port **G** is the synchronization source. |
| PPS optical (USART) | The optical synchronization pulse of a satellite receiver (PPS: 1 Pulse Per Second) on channel 1 of a USART communication module is the synchronization source. |
| IEEE 1588 | The time-synchronization standard IEEE 1588 on a BD communication module is the synchronization source. |

**Parameter: Max. inaccuracy**

- Default setting **(_:119) Max. inaccuracy** = ***0,001 ms***

With the **Max. inaccuracy** parameter, you set the maximum expected inaccuracy of the synchronization sourced used. The set value is only effective if the synchronization source used does not supply any information on the current inaccuracy in the synchronization signals. If you no information on the inaccuracy of the synchronization source used, use the default setting.

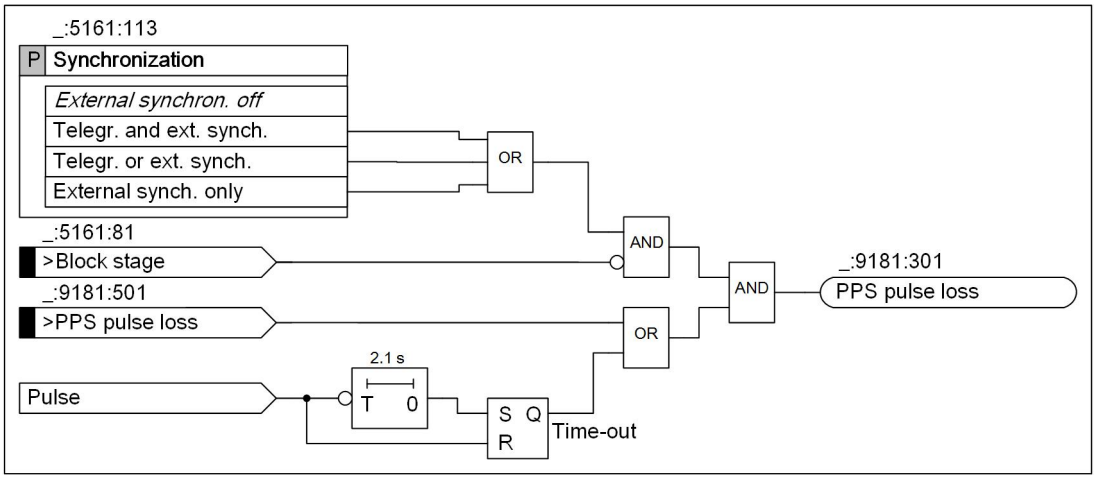
**NOTE**

The inaccuracy of the synchronization source enters the stabilization of the **Line differential protection** as an error signal.

This means that greater inaccuracy increases the calculated stabilization quantity and makes the **Line differential protection** less sensitive.

If **IEEE 1588** is used as the synchronization source in the synchronization status ***SmpSynch*** = ***global***, accuracy values are supplied with the synchronization signals and the parameter **Max. inaccuracy** is not

used. If the supplied accuracy values become invalid, the value set in the parameter **Max. inaccuracy** is used.



If the synchronization source **IEEE 1588** works in the synchronization status ***SmpSynch*** = ***local***, then the value set in the parameter **Max. inaccuracy** is used as permanently available inaccuracy.

If **PPS electrical (Port G)** or **PPS optical (USART)** are used as synchronization source, then the value set in the parameter **Max. inaccuracy** is used as permanently available inaccuracy.

If a USART communication module with the **PPS** protocol and the **PPS generator** operating mode is also used as a synchronization source at the same time, the value set in the parameter **Max. inaccuracy** is used as permanently available inaccuracy.

### 3.6.6.10 Indications and Measured Values of the External Synchronization

| Indication | Description |
|---|---|
| *(_:501) >PPS pulse loss* | The indication *(_:501) >PPS pulse loss* is only visible with the following setting options of the parameter **(_:117) Synchronization source**:<br>• G:Timesynchron.PPS<br>• [Port]:USART-AD-1FO.Channel x.PPS<br>• [Port]:USART-AE-2FO.Channel x.PPS<br>The binary input *(_:501) >PPS pulse loss* can be used to signal an externally detected failure in the PPS synchronous pulse, for example, an error message from the satellite receiver. If the binary input *(_:501) >PPS pulse loss* is set, this leads to the indication *(_:304) Synchronization loss*. The external synchronization detects immediately that there is a problem with the connected synchronization pulse. Otherwise, the problem will only be noticed after approx. 2.1 s – after the test for synchronous-pulse failure. |
| *(_:304) Synchronization loss* | The synchronization has failed. This can be due to a problem with the synchronization source.<br>The indication *(_:304) Synchronization loss* shows that the synchronization has failed. This can be due to the following reasons:<br>• The input indication *(_:501) >PPS pulse loss* has occurred.<br>• The synchronous pulse has failed.<br>• The quality of the synchronous pulse is inadequate.<br>• There is another problem with the synchronization source. |
| *(_:305) Synchronization OK* | The synchronization is operating correctly. |
| *(_:306) Synchronization pulse* | You can use this indication to make the synchronous pulse visible. As a rule, one pulse is generated per second. |
| *(_:307) Synchron. imprecise* | If the set synchronization source operates in the ***global*** synchronization status and the time of the synchronization source deviates from the global time by more than 0.5 ms, the indication *Synchron. imprecise* is generated and the line differential protection becomes ineffective.<br>The indication *Synchron. imprecise* is visible if you select ***ETH-BD-2FO.Channel1.IEEE1588*** in the parameter _:103 Synchronization source. The read-only parameter **(_:118) Synchronization using** then displays ***IEEE 1588***. |

[lo_pps_syn, 2, en_US]

Figure 3-103 Logic for the Generation of the Indication *>PPS pulse loss*

### 3.6.6.11 Setting Notes for the Remote Data

**Parameter: Dropout Time Prio. x**

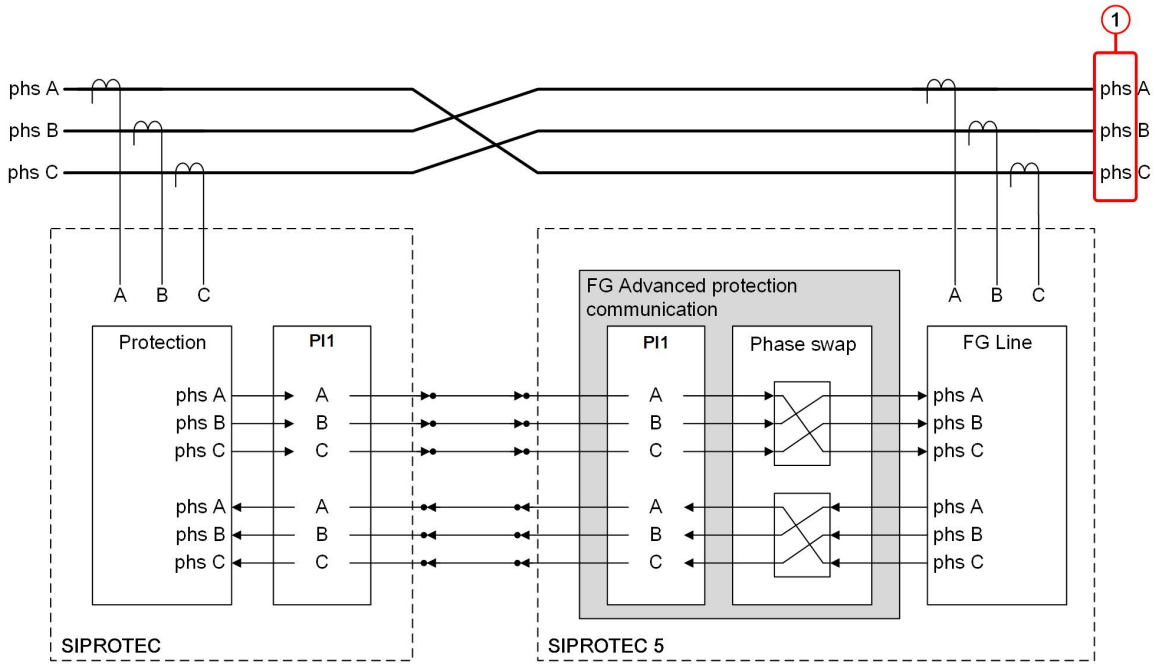
- Default setting **(_:22741:111) Dropout time prio. 1** = ***2.00 s***
- Default setting **(_:22741:112) Dropout time prio. 2** = ***2.00 s***
- Default setting **(_:22741:113) Dropout time prio. 3** = ***2.00 s***

If you use user-specific remote data, you can set how long the last received state of your remote data is held in case of a communication failure. This allows you to bridge short-term communication failures. The time can be set separately for each priority of the remote data.

For further information, refer to *3.6.5.9 Remote Data*.

### 3.6.6.12 Description Phase Swapping

**Phase Swap**



If you want to exchange information via the protection communication with a device showing phases with a different sequence but with the same rotating field as your device, the SIPROTEC 5 device can swap the phase information when sending and receiving. It is no longer necessary to swap phases when connecting the current transformers.

This use case exists on some tie lines of different power-system operators.

*Figure 3-104* shows an example of the different designation of the same phases at the line ends. For example, phase **A** on the left side of the line becomes phase **C** on the right side. If a SIPROTEC 5 device is used on the right side, you can instantiate the FB **Phase swap** in the FG **Advanced protection communication**. Use the FB **Phase swap** to set how the phases are swapped when sending and receiving phase-selective information via the protection interface.

This results in the following SIPROTEC 5 device behavior:

- Connect the current and voltage transformers to the terminals **A**, **B**, and **C** of the protection device as usual.
- Connect the circuit breaker without swapping phases.
- The protection functions in both devices, such as **Line differential protection** or **Teleprotection with distance protection** cooperate without any problems.
- The phase-selective messages and measured values are displayed correctly from the point of view of the respective device.

[dw_different_phs-designation_are_compens_send-receive, 1, en_US]

Figure 3-104 Differing Phase Designations Are Compensated for while Sending and Receiving

(1) Other phase designations than at the opposite end for the same physical phase

**NOTE**

Phase swapping does not support the **I2-DIFF** stage of the function **Line differential protection**.

Swapping of user-specific phase-selective information sent and received using the function **Remote data** is not supported.

### 3.6.6.13 Setting Notes for Phase Swapping

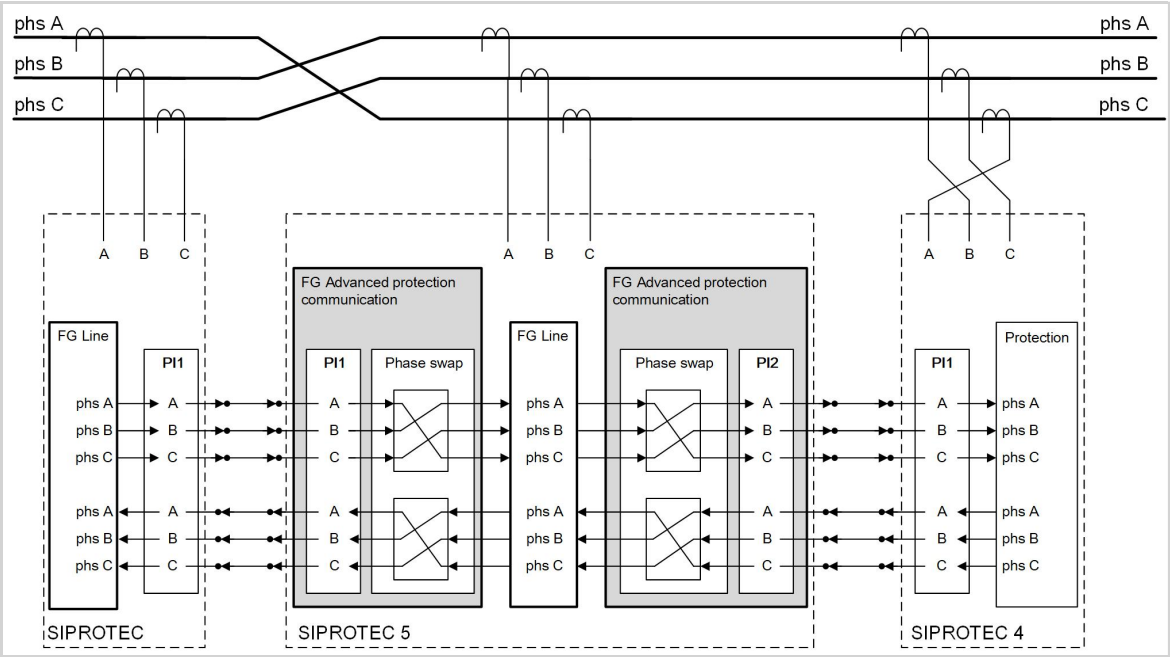
#### Swap in Send Direction

- Default setting **(_:101) Swap in send direction** = ***No phase swap***

With the parameter **Swap in send direction**, you select phase swapping. The phases are swapped from the send direction view. The following options are possible:

| Parameter Value | Description |
|---|---|
| ***No phase swap*** | When sending phase-selective information, there is no phase swap. |
| ***A → B, B → C, C → A*** | The local data such as measured values and status information of the phases are swapped and sent to the neighboring device as follows:<br>• The local data of phase **A** as data of phase **B**<br>• The local data of phase **B** as data of phase **C**<br>• The local data of phase **C** as data of phase **A** |
| ***A → C, B → A, C → B*** | The local data such as measured values and status information of the phases are swapped and sent to the neighboring device as follows:<br>• The local data of phase **A** as data of phase **C**<br>• The local data of phase **B** as data of phase **A**<br>• The local data of phase **C** as data of phase **B** |

### Swap in Receive Direction



Depending on the setting value of the parameter **Swap in send direction**, the reverse swap direction results from the receive direction view. The read-only parameter **(_:102) Swap in receive direction** then indicates the resulting phase swap.

| Parameter Value | Description |
|---|---|
| ***No phase swap*** | When receiving phase-selective information, there is no phase swap. |
| ***A → C, B → A, C → B*** | The data received from the neighboring device such as measured values and status information of the phases are used as follows:<br>• The received data of phase **A** as local data of phase **C**<br>• The received data of phase **B** as local data of phase **A**<br>• The received data of phase **C** as local data of phase **B** |
| ***A → B, B → C, C → A*** | The data received from the neighboring device such as measured values and status information of the phases are used as follows:<br>• The received data of phase **A** as local data of phase **B**<br>• The received data of phase **B** as local data of phase **C**<br>• The received data of phase **C** as local data of phase **A** |

**Examples of a Device Combination with 3 Devices:**

For a device combination with more than 2 devices, you need to mentally divide the device combination into a section using the phase swap and a section not using the phase swap. In the section using the phase swap, you need to instantiate the FB **Phase swap** in the SIPROTEC 5 devices. When using SIPROTEC 4 devices, you need to swap phases when connecting the transformers and the circuit breaker.

The following figure shows a device combination with 3 devices. The device on the left can be a SIPROTEC 4 or SIPROTEC 5 device. There is a SIPROTEC 5 device in the middle and a SIPROTEC 4 device on the right side. The device in the middle swaps phases by using the FB **Phase swap**. The FB **Phase swap** is used for both protection interfaces, but it is instantiated only once for each FG **Advanced protection communication**. In the SIPROTEC 4 device on the right, you can implement the phase swap only by changing the wiring of the current and voltage transformers and of the circuit breaker. You must reinterpret the phase-selective indications accordingly.

## 3.6.7 Assignment of the Protection Function Group to the FG Protection Communication

If protection functions want to use the protection interfaces in a protection function group, you must route the connection of the protection function group, for example, the FG **Line 1**, with a function group **Protection communication** in DIGSI 5. Then, each protection function in the FG **Line 1** can use the protection communication.

Route the connection between the FG **Line** and the FG **Protection communication** in DIGSI 5 as follows:

**Project tree** > **Function-group connections** > Tab **Protection FG** ↔ **Protection FG**. Right-click to route the connection in the desired line/column.

[sc_PDC_rout1, 1, en_US]

Figure 3-106 Routing of the Connection between the Protection FG and the FG Protection Communication in DIGSI 5

**NOTE**

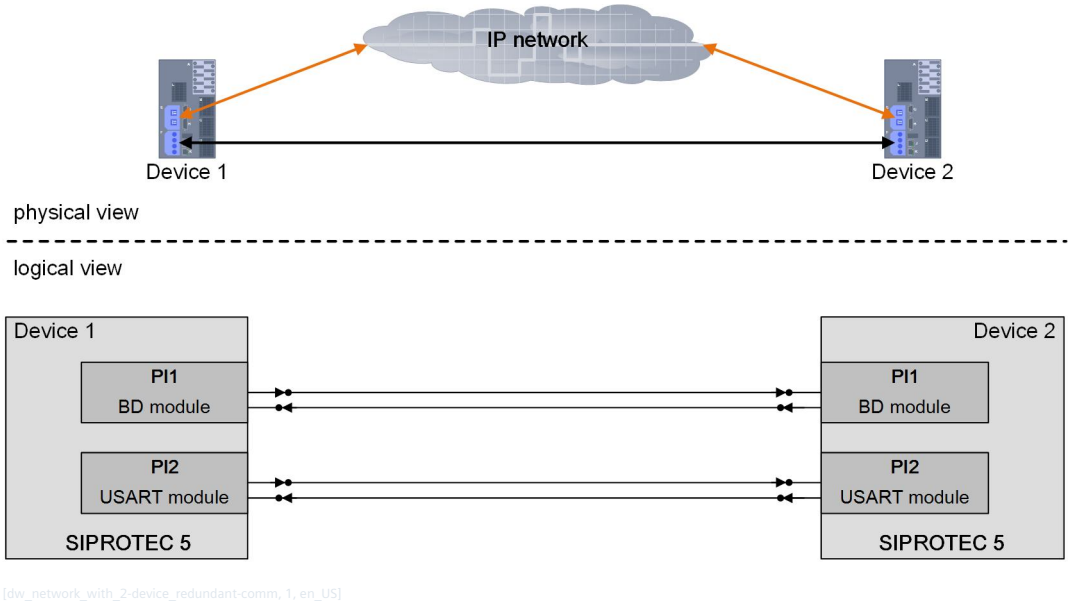
If only one protection function group and one FG **Protection communication** are instantiated in the device, DIGSI 5 connects both function groups automatically.

## 3.6.8 Application Examples and Setting Notes for IP Communication

### 3.6.8.1 Overview

The advanced protection communication supports the IP communication via MPLS[14] communication networks.

- If existing systems are to be upgraded for protection-interface communication via IP, you must retrofit an Ethernet-BD communication module in the respective SIPROTEC 5 devices.
- The protection-interface communication via IP requires an Ethernet-BD communication module per device in the device combination.
- In a device, only one Ethernet-BD communication module can be used per device combination.
- However, another device combination can use the same Ethernet-BD communication module of the device.



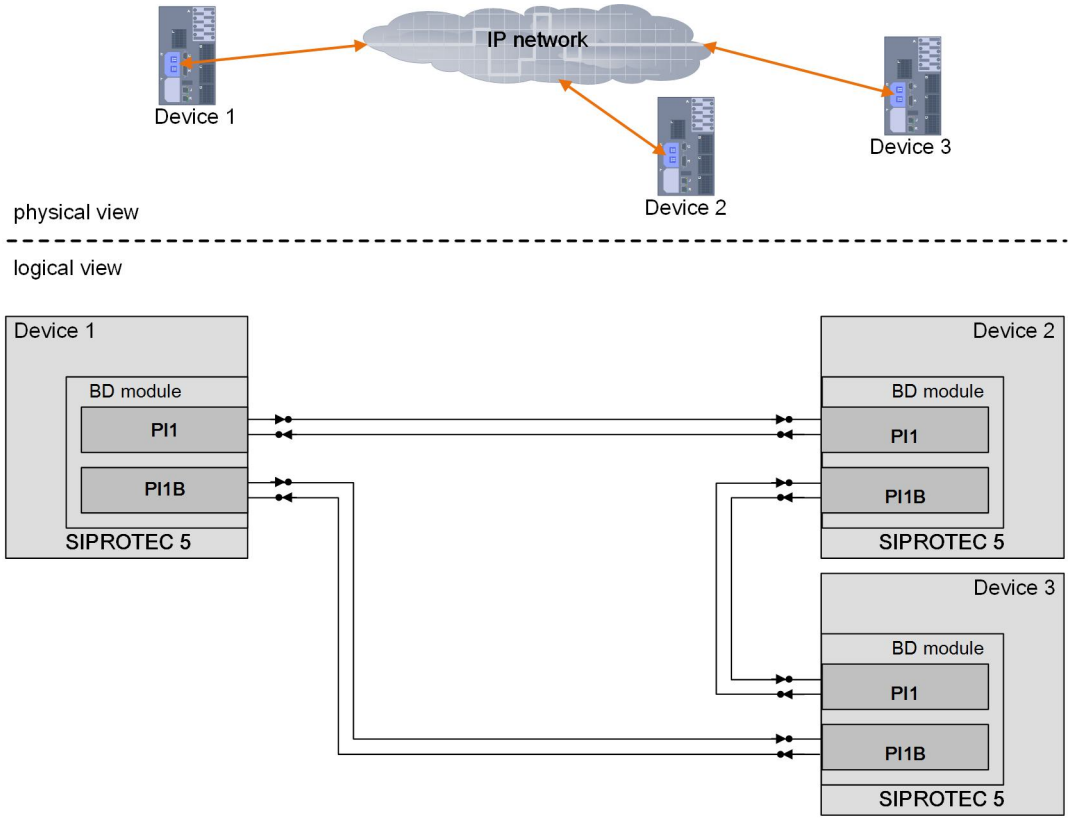
The following application examples show what you must consider when using the IP communication via MPLS communication networks.

### 3.6.8.2 Device Combination of 2 Devices and Redundant Communication Connection

If redundancy of the communication connection is required for a device combination consisting of 2 devices, 2 different procedures are possible:

- You can use the redundancy mechanisms of the LAN and the Ethernet-BD communication module (PRP, HSR, RSTP). In this case, the redundant communication route runs through the same Ethernet-BD communication module.
- You can set up a 2nd communication connection via a physically separate path. It is best to use a different medium for this, for example, a fiber-optic direct connection, a direct cable connection (pilot wire), or a connection based on C37.94. That is, for the 2nd communication connection, you must use another communication module in each device. The following figure shows this case from a physical and logical view:

14 MPLS = Multi-Protocol Label Switching



[dw_network_with_2-device_redundant-comm, 1, en_US]

Figure 3-107 Device Combination with 2 Devices and Redundant Communication Connection

### 3.6.8.3 Device Combination of 3 Devices and Only IP Communication

If you configure a device combination with 3 devices and all devices are using the IP communication, then, from the view of a device, the 2 other devices in the network are visible and reachable. For this, you configure in each device the protocol ***Advanced protection interface*** on the Ethernet-BD communication module and the **Protection interface 1**. The Ethernet-BD communication module is assigned to the **Protection interface 1**.

The special feature of this configuration is that the topology detection automatically generates a 3-device ring topology (logical view). That is, 3 point-to-point communication connections are established between the devices. In addition, another **Protection interface 1B** is automatically visible in each device, which provides the necessary 2nd communication channel for the ring topology, see the following figure:

[dw_network_with_3-device_redundant-comm, 1, en_US]

Figure 3-108 Device Combination with 3 Devices in the IP Communication Network

The **Protection interface 1B** takes over the settings of **Protection interface 1**, that is **Protection interface 1B** does not have its own settings view. The **Protection interface 1B** has its own indications and measured values, which you can see in the information routing.

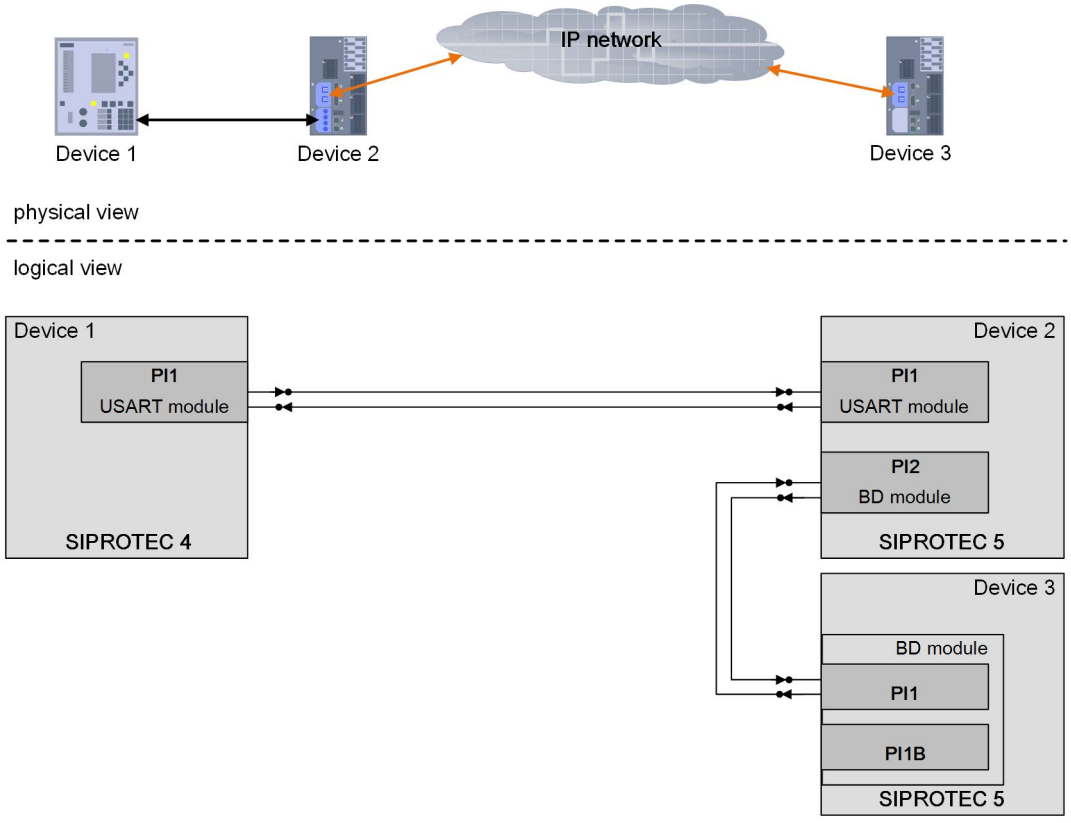
**NOTE**

If you use 3 devices in the device combination with IP communication, the aim of the topology detection is to form a ring topology, as in addition to a redundant connection, shorter transmission times are also possible.

If you have instantiated a 2nd protection interface, for example to establish a communication connection via another medium, the device hides the **Protection interface 1B**.

**NOTE**

In the following cases, the **Protection interface 1B** becomes inactive and does not have any messages or measured values:



- A 2nd protection interface is instantiated.
- Only 2 devices are present in the device combination.
- No protection interface is assigned to an Ethernet-BD communication module.

### 3.6.8.4 Device Combination of 3 Devices and Hybrid Communication Media

If you extend a system, it can be necessary to extend a device combination consisting of 2 existing devices by 1 device, see the following figure.

The previous 2 devices are connected to each other, for example, via a fiber-optic direct connection or via other communication media. The left device, for example, a SIPROTEC 4 device, and the middle SIPROTEC 5

device are the 2 devices previously present in the system. This device combination is to be extended by adding the right SIPROTEC 5 device. The communication between the middle and the right device is to take place via an IP communication network.

[dw_network_with_3-device_mixed-comm, 1, en_US]

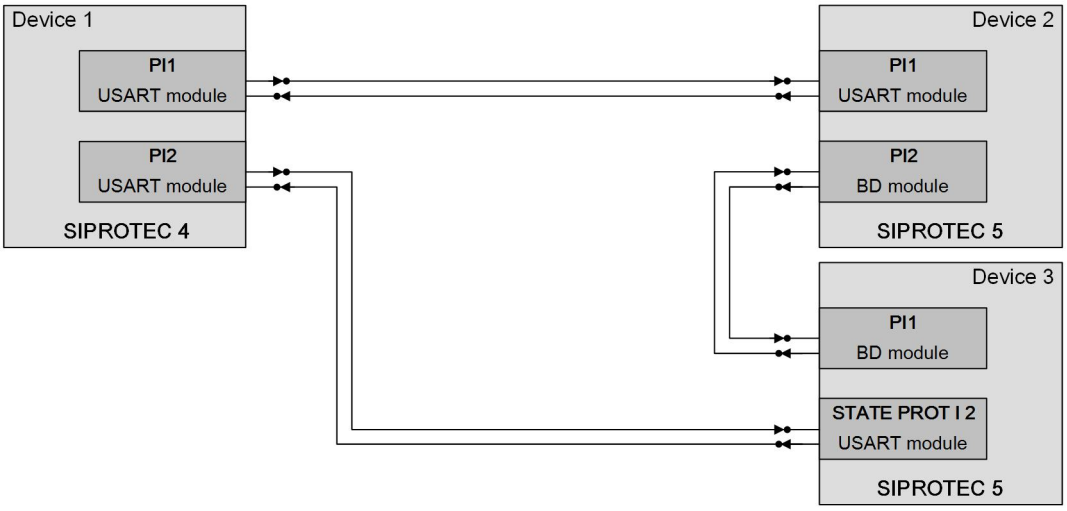


Figure 3-109 Device Combination with 3 Devices and Hybrid Communication Media

For this configuration of a 3-device chain topology, you must configure a **device combination with 3 devices** in all devices.

In the middle device, an Ethernet-BD communication module is additionally required. Configure the protocol ***Advanced protection interface*** in the properties of the Ethernet-BD communication module. Instantiate the function block **Protection interface 2** in the FG **Protection communication**. Assign the Ethernet-BD communication module to the **Protection interface 2**.

The device on the right must also have an Ethernet-BD communication module. Also configure here the protocol ***Advanced protection interface*** in the properties of the Ethernet-BD communication module and assign the Ethernet-BD communication module to the **Protection interface 1**. **Protection interface 1B** is created here as a special feature, but it is not used.

If a redundant communication connection is required for this configuration, Siemens recommends establishing a 3-device ring topology. For this purpose, you must connect the left and right devices via another communication channel. This creates the 3-device ring topology. The following figure shows this configuration:

[dw_3-device_and_mixed-comm, 1, en_US]

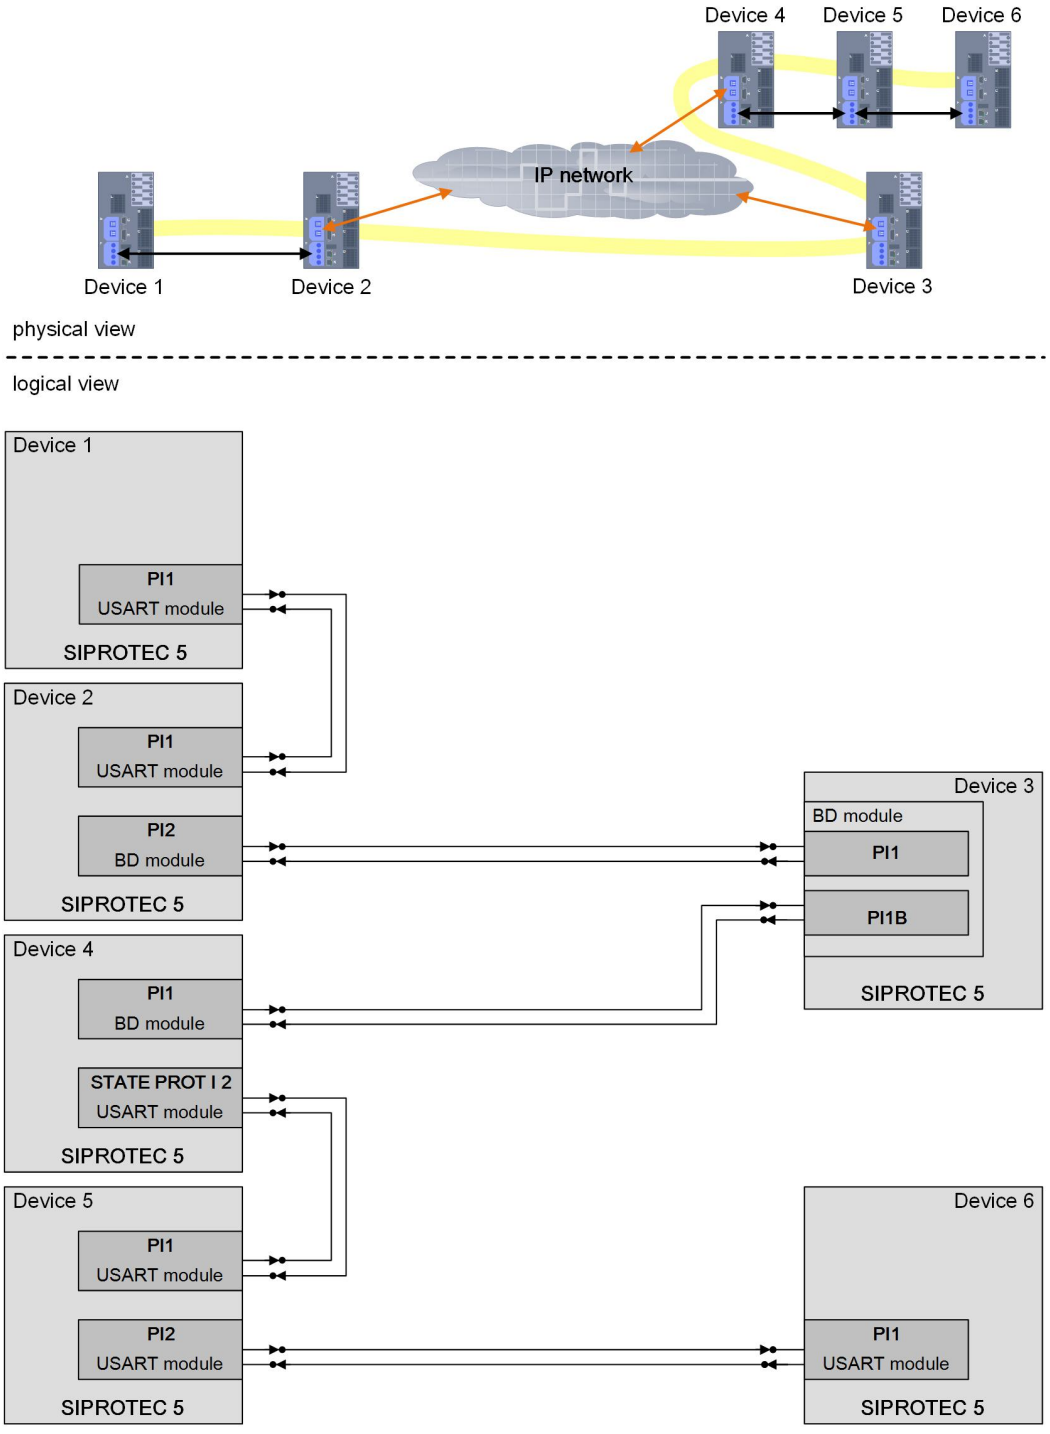
Figure 3-110 Device Combination with 3 Devices and Hybrid Communication Media and Redundant Communication Connection

The SIPROTEC 4 device (left device) does not support any IP communication. In this case, you must switch to another communication medium and retrofit a corresponding SIPROTEC 4 communication module. In any case, the communication medium used is also supported by the SIPROTEC 5 device on the right side, by retrofitting a corresponding equivalent communication module there. Configure this communication module with the protocol ***Advanced protection interface***, add an additional **Protection interface 2** to the FG **Protection communication**. Assign the **Protection interface 2** to the communication module.

### 3.6.8.5 Device Combination of 6 Devices and Hybrid Communication Media

#### IP Addresses in Hybrid Topologies

To ensure redundancy or downward compatibility, the devices also allow a mix of classic and IP-based communication media.



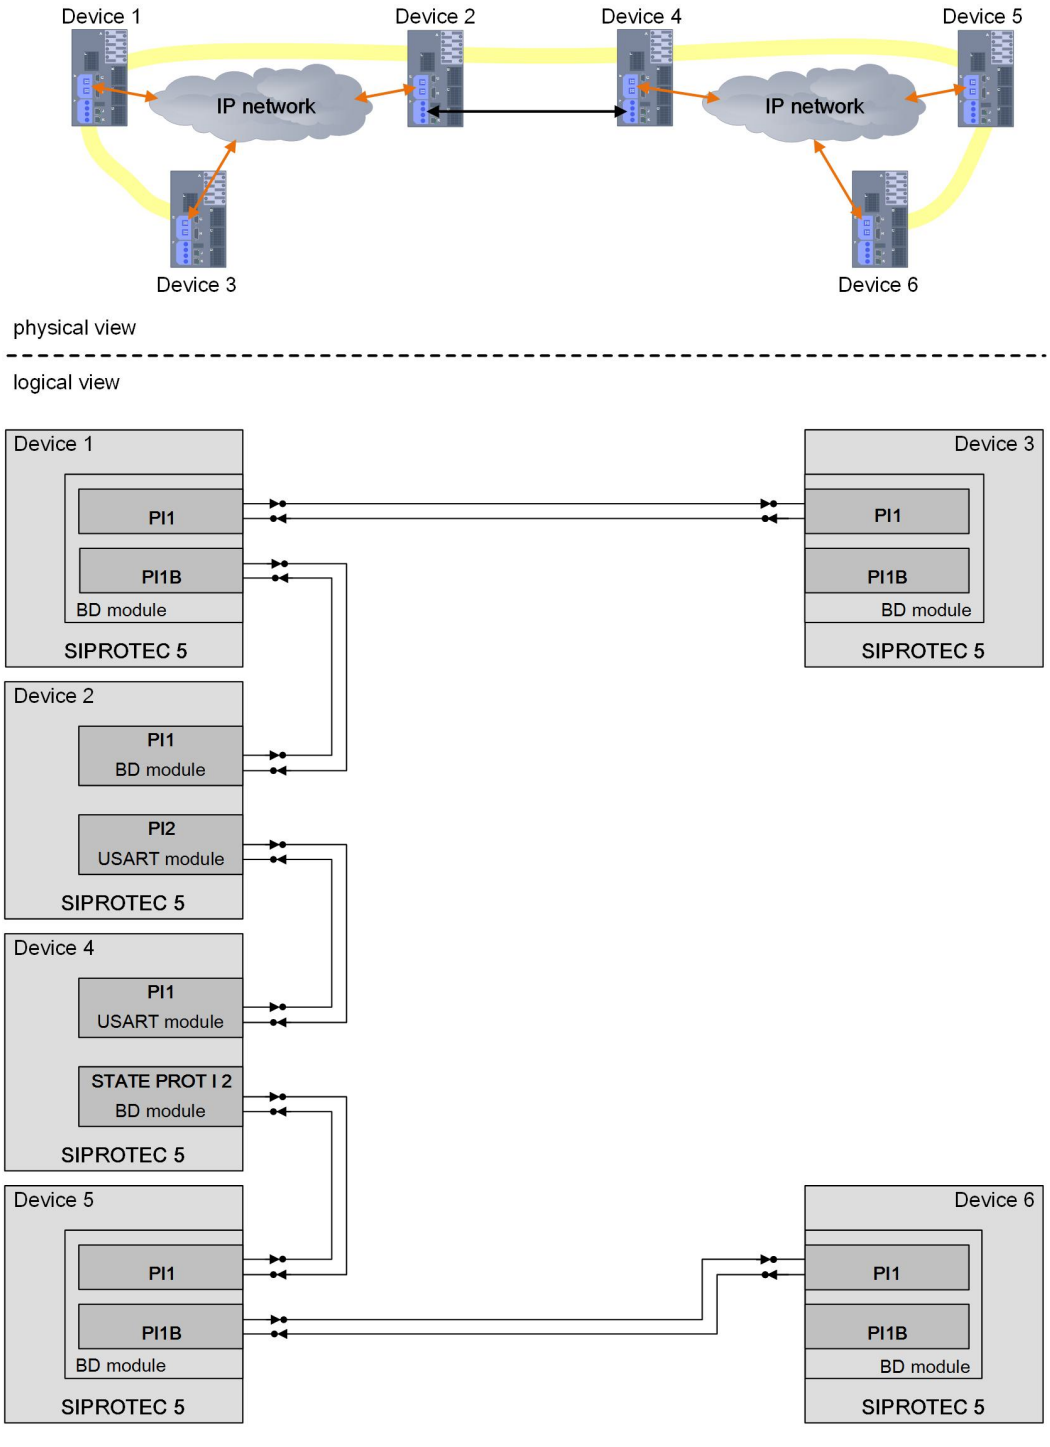
In such applications, special consideration must be given to the configuration of the IP addresses. When parametrizing the devices, you must first clarify which path the communication is to take through the network. That is, it must be clear which devices communicate with each other. To define a route, you may only configure its planned communication partners in a device. The following examples illustrate the correct IP configuration.

For device combinations with more than 3 devices and hybrid communication media, different configurations are possible. If you want to use the IP communication, consider that only one Ethernet-BD communication module per device combination is supported for the protection-interface communication.

The following figure shows a device combination with 6 devices. In the example, several devices are connected by other communication media, which form 3 device groups. The device groups are connected by an IP network. The result is a 6-device chain topology. The yellow line illustrates the communication route.

To establish this communication route, you may only parameterize the IP addresses of their direct communication partners in the devices. The following example applies:

- The devices **2** and **4** only know the IP address of device **3**.
- Device **3** only knows the IP addresses of the devices **2** and **4**.
- Leave all other IP addresses at ***0.0.0.0***.



[dw_network_with_6-device_redundant-comm, 1, en_US]

Figure 3-111 Example 1 of a Device Combination with 6 Devices

Another example shows 2 device groups whose devices are connected to each other via IP networks. The 2 device groups are connected to each other by a different communication medium. The topology detection in turn forms a 6-device chain topology.

To establish this communication route, you may only parameterize the IP addresses of their direct communication partners in the devices. The following example applies:

- Device **1** only knows the IP addresses of the devices **2** and **3**.
- The devices **2** and **3** only know the IP address of device **1**.
- Device **5** only knows the IP addresses of the devices **4** and **6**.
- The devices **4** and **6** only know the IP address of device **5**.
- Leave all other IP addresses at *0.0.0.0*.

[dw_network_with_6-device, 1, en_US]

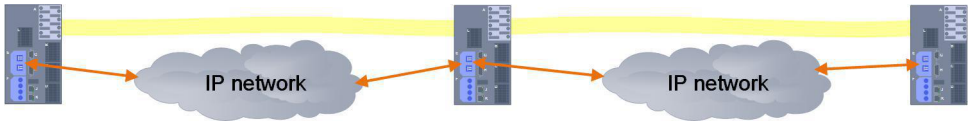


Figure 3-112 Example 2 of a Device Combination with 6 Devices

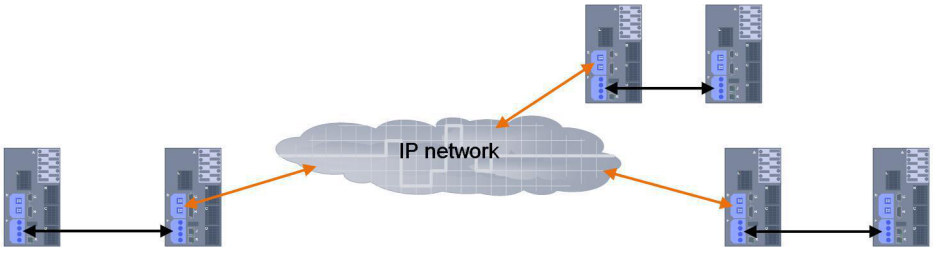
### 3.6.8.6 Unsupported Configurations

The following figure shows an example of a device combination with 3 devices. In the example, all devices use the IP communication. The middle device contains 2 Ethernet-BD communication modules, which are both configured with the ***Advanced protection interface*** protocol.

**NOTE**

You can only use 1 Ethernet-BD communication module in one device!
2 Ethernet-BD communication modules with the ***Advanced protection interface*** protocol are not supported.



[dw_non-supported-confic_network_with_3-device, 1, en_US]

Figure 3-113 Unsupported Configuration of a Device Combination with 3 Devices

**NOTE**

If you use the IP communication, the aim of the topology detection is to form a chain topology if there are 4 or more devices. For certain configurations, the topology detection cannot form a working chain topology.

The following figure shows an example of a device combination with 6 devices and hybrid communication media. In this case, the topology detection cannot form a functioning 6-device chain topology.

[dw_non-supported-confic_network_with_6-device, 1, en_US]

Figure 3-114 Unsupported Configuration of a Device Combination with 6 Devices

# 3.7 Date and Time Synchronization

## 3.7.1 Overview of Functions

Timely recording of process data requires precise time synchronization of the devices. The integrated date/time synchronization allows the exact chronological assignment of events to an internally managed device time that is used to time stamp events in logs, which are then transmitted to a substation automation technology or transferred via the protection interface. A clock module internal to the device and having battery backup is synchronized cyclically with the current device time so that the right device time is available and used even in case of auxiliary-voltage failure. At the same time, this permits hardware-supported monitoring of the device time.

## 3.7.2 Structure of the Function

The integrated date/time synchronization is a supervisory device function. Setting parameters and indications can be found in the following menus for the DIGSI and the device:

**Set date and time:**

- DIGSI: Online access -> Interface -> Device -> Device Information -> **Time Information**
- Device: Main menu → Device functions → **Date & Time**

**Parameter:**

- DIGSI: Project -> Device -> Parameter -> **Time Settings**

**Indications:**

- DIGSI: Project -> Device -> Information routing ->**Time keeping** or **Time Sync.**

## 3.7.3 Function Description

Every SIPROTEC 5 device maintains an internal device time with date. The date and time can also be set on the device via the on-site operation panel or via DIGSI 5. Within a system, or even beyond, it is usually necessary to record the time of process data accurately and to have exact time synchronization of all devices. For SIPROTEC 5 devices, the sources of time and synchronization options can be configured.

**Configurable Synchronization Options:**

- **None** (default setting)
  The device functions without any external time synchronization. The internal time synchronization continues to work with the help of the back-up battery even when the auxiliary voltage is shut down temporarily. The time can be adjusted manually.
- **Telegram**
  The time is synchronized via a telegram with an appropriately configured communication interface in accordance with the IEC 60870-5-103 or DNP3 protocol.
- **Connection to a radio clock**
  The time synchronization takes place with the set time telegram from an external IRIG B or DCF77 receiver via the time synchronization interface of the device.
- **Ethernet**
  The time synchronization is done via Ethernet-based SNTP protocol (Simple Network Time Protocol), for example with IEC 61850 stations or via IEEE 1588. If you enable both services during configuration of Ethernet interfaces, these protocols are available as an option for the time synchronization.

- **Protection interface**
  The time synchronization takes place via the protection interfaces configured for your SIPROTEC 5 device. Here, the timing master takes over the time management.

**Configurable Time Sources:**

- 2 time sources can be taken into consideration with the SIPROTEC 5 devices. For each time source, the synchronization type may be selected based on the options provided.
- **`Time source 1`** takes precedence over **`Time source 2`**, that is, **`Time source 2`** will be effective for the synchronization of the device time only if **`Time source 1`** fails. If only one time source is available and it fails, then only the internal clock continues unsynchronized. The status of the time sources is indicated.
- For every time source, it is possible to define via the **`Time zone time source 1`** parameter (or **`Time zone time source 2`**) if this source transmits its time by UTC (universal time) or if the settings correspond to the local time zone of the device.

**NOTE**

Make sure that the settings for the time sources coincide with the actual hardware configuration of your SIPROTEC 5 device. In any event, incorrect settings cause the status indications of time sources to pick up.

**Configurable Date Format**

Regardless of a feed time-synchronization source, a uniform format is maintained internally within the device. The following options are available for the customary local representation of the date format:

- Day.Month.Year: 24.12.2009
- Month/Day/Year: 12/24/2009
- Year-Month-Day: 2009-12-24

**Taking Local Time Zones into Account**

The internal device time is maintained in universal time (UTC). To display time stamps in DIGSI and on the device display, you can define the local time zone of the device (parameter Offset time zone for GMT), including the applicable daylight saving times (start, end, and offset of daylight saving time) using parameters. This allows the display of the local time.

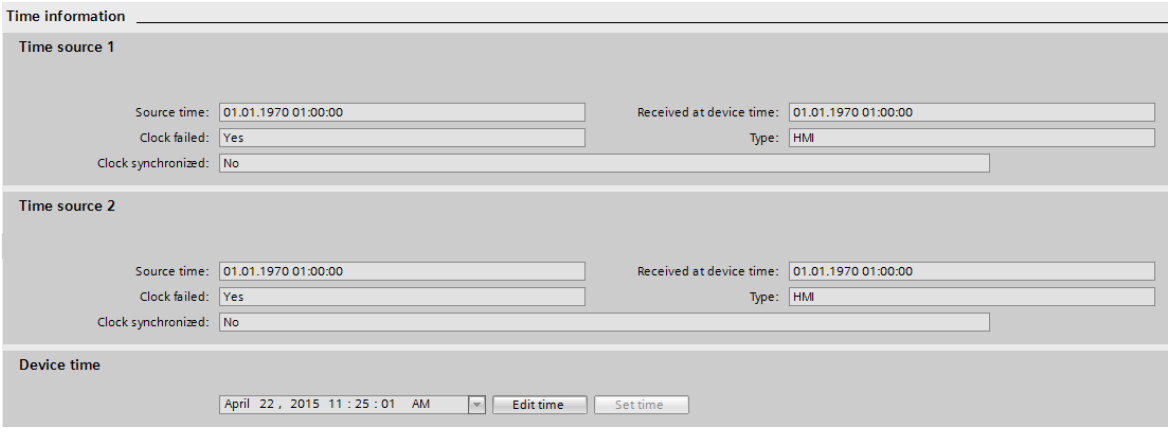
**NOTE**

- For time sources that transmit the status of the switch to daylight saving time, this will be taken into account automatically when creating the internal device time in the UTC format. The differential time of the daylight saving time set in the device (parameter Offset daylight saving time) is taken into consideration. However, in contrast, the settings of the start of daylight saving time and end of the daylight saving times are ignored when converting into the device internal UTC format.
- For active time sources, it is not possible to set the time via the device display or DIGSI 5. An exception is setting the calendar year for active time protocol IRIG B.

**Status, Supervision, and Indications of Time Management**

Your SIPROTEC 5 device generates status and monitoring indications that provide important information regarding the correct configuration of the time source and the status of the internal time management during startup and device operation.

Internal time synchronization is monitored cyclically. Important synchronization processes, the status of the time sources and errors detected are reported. A device time that has become invalid will be marked accordingly so that affected functions can go to a safe state.



| Indication | Description |
|---|---|
| Device:<br>*Clock fail* | This indication signals a high difference between the internally managed time and the time of the clock module that is not permissible. The pickup of the indication can point to a defect in the clock module or to an unacceptable high drift of the system quartz crystal. The time maintained internally is marked as invalid. |
| Time management:<br>*Daylight saving time* | This indication signals whether daylight saving time has been enabled. |
| Time management:<br>*Clock set manually* | This indication signals that the device time has been set manually via the on-site operation panel or via DIGSI 5. |
| Time synchronization:<br>*Status time source 1*<br>*Status time source 2* | These 2 indications signal whether the active time sources are recognized as valid and active from the device point of view. When the indications pick up, it can also be an indication that an incorrect configuration of the port or channel numbers was done at the on-site operation panel. |
| Time synchronization:<br>*Time sync. error* | This indication signals after the parameterized time **Fault indication after** that synchronization using an external time source has failed. |
| Time synchronization:<br>*Leap second* | This indication signals that a Leap second has occurred during time synchronization using an external GPS receiver (protocol variant IRIG B 005(004) with extension according to IEEE C37.118-2005). |
| Time synchronization:<br>*High accuracy* | This indication signals that the device is synchronized with an accuracy better than 1 µs The indication is only of significance when the PMU function is used. |

**NOTE**

In case of a missing or discharged battery, the device starts without active external time synchronization with the device time 2011-01-01 00:00:00 (UTC).

For the device, DIGSI 5 provides a compact overview of the status of the time synchronization of your SIPROTEC 5 device in online mode. All displays are updated continuously. You can access the overview in the project-tree window via Online access.

DIGSI: Online access -> Interface -> Device -> Device Information -> **Time Information**

[sc_time_dg, 1, en_US]

Figure 3-115 Time Information in DIGSI

For every time source, you see the following:

- Last received time (with date)
- Receipt time of the last received time telegram
- Configured type of timer
- Indication of timer outage or failure
- Whether the device time is currently synchronized from the time source

The lower section displays the device time, which is continuously updated. If the internal device time and the infeed time source were synchronous at the time of telegram receipt, both displayed times are identical.

**NOTE**

All times displayed (also the time source) take into consideration the local time settings (zone and daylight saving time of the device) in the form of a numerical offset for UTC (universal time).

## 3.7.4 Application and Setting Notes

**Parameter: Date Format**

- Default setting **`Date format`** = ***`YYYY-MM-DD`***

With the parameter **`Date format`**, you define the local customary format of the date display.

| Parameter Value | Description |
|---|---|
| ***`DD.MM.YYYY`*** | Day.Month.Year: Typical European display<br>Example: 24.12.2010 |
| ***`MM/DD/YYYY`*** | Month/Day/Year: Typical US representation<br>Example: 12/24/2010 |
| ***`YYYY-MM-DD`*** | Year-Month-Day: Typical Chinese display<br>Example: 2010-12-24 |

**Parameter: Time zone time source 1, Time zone time source 2**

- Default setting **`Time zone time source 1`** = ***`local`***, **`Time zone time source 2`** = ***`local`***

With the parameters **`Time zone time source 1`** and **`Time zone time source 2`**, you define the handling of time zones of the external timer.

| Parameter Value | Description |
|---|---|
| ***local*** | Local time zone and daylight saving time are considered as time zone offsets to GMT. |
| ***UTC*** | Time format according to UTC (universal time) |

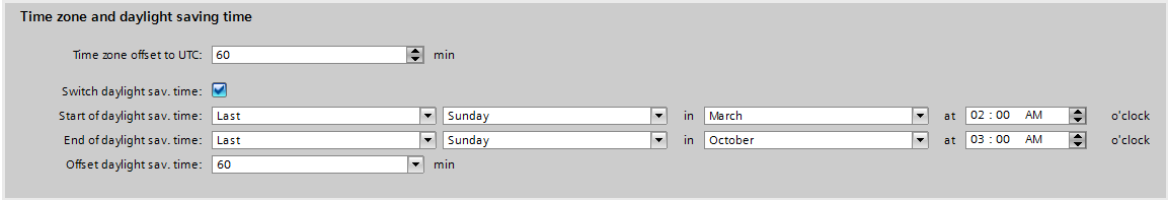
**Parameter: Time source 1, Time source 2**

- Default setting **Time source 1** = ***none***, **Time source 2** = ***none***

With the parameters **Time source 1** and **Time source 2**, you can configure an external timer. The prerequisite is to have the corresponding hardware configuration of the communication interfaces of your SIPROTEC 5 device. This is listed as a prefix when making a selection in DIGSI 5.

| Parameter Value | Description |
|---|---|
| ***none*** | The time source is not configured. |
| ***IRIG-B*** | Time synchronization by an external GPS receiver:<br>SIPROTEC 5 devices support several protocol variants of the IRIG-B standard:<br>• **IRIG-B 002(003)**<br>The control function bits of the signal are not occupied. The missing year is formed from the current device time. In this case, it is possible to set the year via the online access in DIGSI 5.<br>• **IRIG-B 006(007)**<br>The bits for the calendar year are not equal to 00. The calendar year is set automatically by the time protocol.<br>• **IRIG-B 005(004) with extension according to IEEE C37.118-2005**<br>If, in the time signal, other control function bits are occupied in addition to the calendar year, then the device takes the additional information into consideration for leap seconds, daylight saving time, time offset (zone, daylight saving time), and time accuracy.<br>**Time zone time source 1** or **Time zone time source 2**: The value of this setting is not evaluated by the device, since this protocol either transmits in UTC or in the case of local time, specifies the appropriate offset to UTC in each set time telegram. |
| ***DCF77*** | Time synchronization by an external DCF77 receiver<br>**Time zone time source 1** or **Time zone time source 2** = ***local***<br>Note: There are also clocks that generate a DCF77 signal representing UTC. In this case, UTC must be set. |
| ***PI*** | The time synchronization takes place via the protection interfaces configured for your SIPROTEC 5 device. Here, the timing master takes over the time management. Signal-transit times of the protection interface communication are calculated automatically.<br>**Time zone time source 1** or **Time zone time source 2** = ***UTC***<br>A slave that receives a time or a SIPROTEC 5 master, receives its system time kept in UTC. |

| Parameter Value | Description |
|---|---|
| ***SNTP*** | The time synchronization is done via the Ethernet service SNTP (SNTP server or via IEC 61850).<br>SIPROTEC 5 devices support both Edition1 and Edition2 in accordance with IEC 61850-7-2. In Edition2, the logical attributes LeapSecondsKnown, ClockFailure, ClockNotSynchronized, and the value TimeAccuracy are maintained in each time stamp. For Edition1, these signals contain default settings. Thus, the interoperability for substation automation technology is ensured for both editions!<br>The SNTP service must be enabled during configuration of Ethernet interfaces so that it is available as an option for the time synchronization.<br>**Time zone time source 1** or **Time zone time source 2** = ***UTC*** |
| ***IEC 60870-5-103*** | The time is synchronized via telegram with an appropriately configured communication interface in accordance with the IEC 60870-5-103 protocol.<br>**Time zone time source 1** or **Time zone time source 2** = ***local***<br>However, there are also T103 systems that send the UTC. |
| ***DNP3*** | The time is synchronized via telegram with the appropriately configured communication interface in accordance with the DNP3 protocol.<br>2 characteristics are supported in the process:<br>• **Time synchronization via UTC**<br>• **Time synchronization with local time**<br>The daylight saving time status is not transmitted. The device assumes that the DNP3 master follows the same rules for the start and end of the daylight saving time as those that were set for the device.<br>**Time zone time source 1** or **Time zone time source 2** = ***UTC*** is the current implementation, ***local*** concerns older implementations. |
| ***IEEE 1588*** | Time is synchronized via an IEEE 1588 timing master. In this case, SIPROTEC 5 devices operate as slave-only clocks. IEEE 1588 v2 is supported with P2P and Ethernet Transport.<br>The IEEE 1588 service must be enabled during configuration of Ethernet interfaces so that it is available as an option for the time synchronization.<br>**Time zone time source 1** or **Time zone time source 2** = ***UTC***. |



### Parameter: Fault indication after

- Default setting **Fault indication after** = ***600 s***

With the parameter **Fault indication after**, you set the time delay after which the unsuccessful attempts of time synchronization with external time sources configured are indicated.

### Parameter: Time Zone and Daylight Saving Time

This parameter block contains all the settings for the local time zone and daylight saving time of your SIPROTEC 5 device. In addition to the individual parameters, configure the basic settings by preselecting via the option buttons or check box.

[sc_time_zo, 1, en_US]

Figure 3-116 Settings for Time Zone and Daylight Saving Time in DIGSI

| Selection Button | Description |
|---|---|
| Manual settings (local time zone and daylight saving time regulation) | This setting must be selected if you want to select the local time zone and daylight saving time zone regulations of your SIPROTEC 5 device regardless of the PC settings.<br>Input: **Offset time zone for GMT** [min]<br>Selection: **Switchover to daylight saving time** [yes/no] via check box<br><br>• Input: **Start of daylight saving time** [Day and time]<br>• Input: **End of daylight saving time** [Day and time]<br>• Input: **Offset daylight saving time** [min]<br>• Default settings as in the picture above |

| _:306 | Time sync.:Leap second | SPS | O |
| _:307 | Time sync.:High accuracy | SPS | O |

# 3.8 User-Defined Objects

## 3.8.1 Overview

With help from user-defined function groups and user-defined functions you can group user-defined objects, for example user-defined function blocks. 2 user-defined function blocks are available (see following figure).

[sc_udef_lib, 1, en_US]

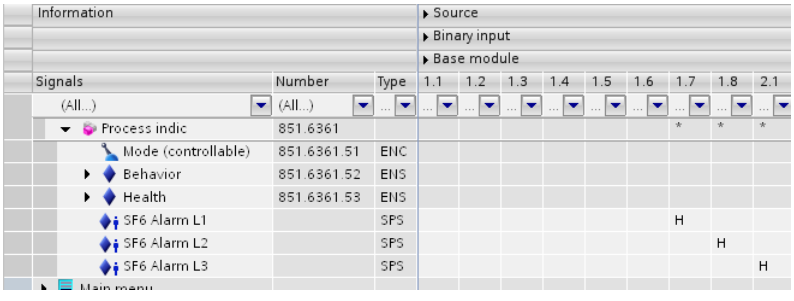

Figure 3-117 User-Defined Objects in the DIGSI 5 Library

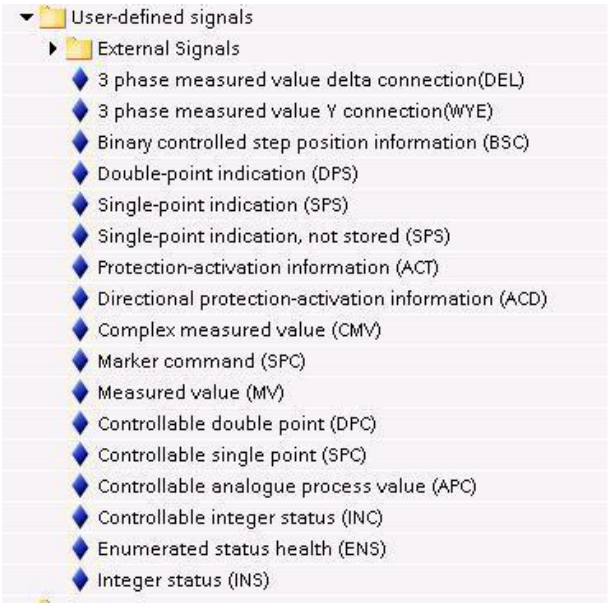
The **user-defined function block** allows you to add (see following figure) single-point indications, pickup indications, operate indications (ADC, ACT), single and double commands, commands with a controllable whole number as well as measured values. You can assign the group a superordinate name (for example **process indications** for a group of single-point indications which are read via binary inputs). This function can be deactivated using the mode. The standby mode is also analyzed or displayed.

The user-defined function blocks can be instantiated at the highest level (alongside other function groups) as well as within function groups and functions.

In addition, there is a **user-defined function block [control]**. Alongside the aforementioned possibilities presented by **user-defined function blocks**, this block offers additional tests for user-defined control signals, for example SPC or DPC.

These are described in chapter *7.6.1 Overview of Functions*.



[sc_user, 1, en_US]

Figure 3-118 Information Routing with Incorporated User-Defined Function Block: Process Indications and some Single-Point Indications

## 3.8.2 Basic Data Types

The following data types are available for user-defined objects in the DIGSI 5 library under the heading **User-defined signals**. Additionally, a folder for external signals is available (see chapter *3.8.5 External Signals*).

### User-Defined Signals

[sc_LB_userdefsig, 1, en_US]

Figure 3-119 User-Defined Signals

### Single-Point Indication (Type SPS: Single-Point Status)

The status of a binary input can be registered in the form of a single-point indication or forwarded as the binary result from a CFC chart.

**EXAMPLE**

Acquisition using binary input, further processing in a CFC and/or signaling using an LED.

### Single-Point Indication (Type SPS unsaved: Single-Point Status Unsaved)

In contrast to **SPS** single-point indications, the state of the **SPS unsaved** indication is not maintained after the device restarts.

For this purpose, go to **Properties > Details > Initialization > Restart** and set the ***Value***.

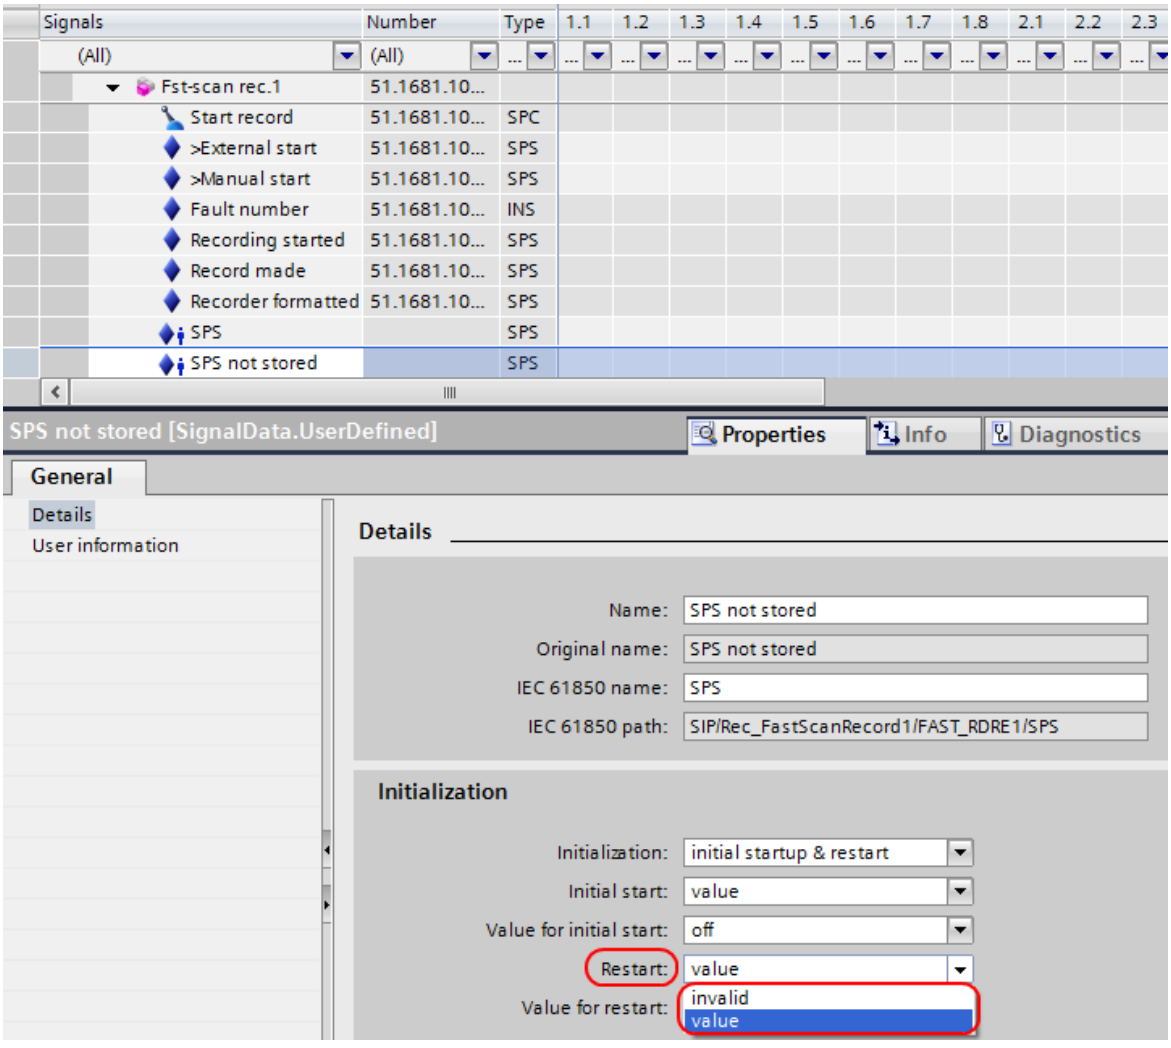


Figure 3-120 Single-Point Indication SPS Unsaved (Example: 7KE85 Fault Recorder)

### Double-Point Indication (Type DPS: Double-Point Status)

When using a double-point indication, the status of 2 binary inputs can be captured simultaneously and mapped in an indication with 4 possible conditions (***ON***, ***Intermediate position***, ***OFF***, ***Disturbed position***).

**EXAMPLE**

Acquisition of a disconnector or circuit-breaker switch position.

### Marker Command (Type SPC, Single-Point Controllable)

This data type can be used as a command without feedback for simple signaling or as an internal variable (marker).

### Integer Status Value (Type INS)

The data type **INS** is used to create a whole number that represents a CFC result.

**EXAMPLE**

The output of the CFC block **ADD_D** can, for example, be connected with the data type **INS**. The result can be shown on the display of the device.

### State of an Enumeration Value (Type ENS)

The data type **ENS** is used to create an enumerated value that represents a CFC result.

### Controllable Single-Point Indication (SPC, Single-Point Controllable)

This can be used to issue a command (to one or several relays, selectable under information routing) that is monitored via a single feedback.

### Command with Double-Point Feedback (DPC, Double-Point Controllable)

This can be used to issue a command (to one or several relays, selectable under information routing) that is monitored via double-point indication as feedback.

### Command with a Whole Number (INC, Controllable Integer Status)

This can be used to issue a command (to one or more relays, selectable under information routing) that is monitored via a whole number as feedback.

### Complex Measured Values (CMV)

This data type provides a complex measured value that can be used as a CFC result, for example.

### Measured Values (MV)

This data type provides a measured value that can be used as a CFC result, for example.

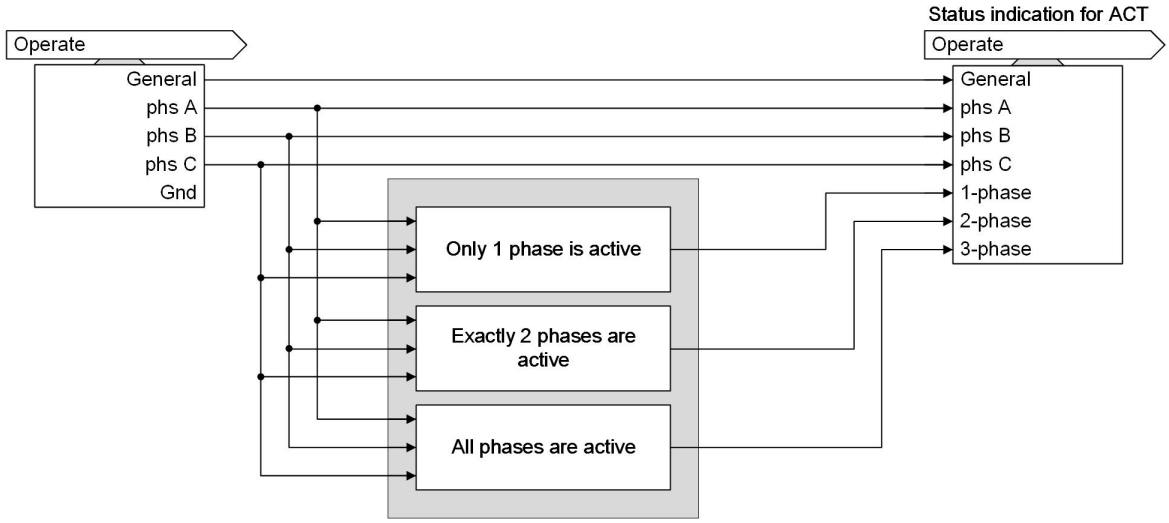
**NOTE**

Additional data types can be found under other headings in the DIGSI 5 library as well as in the corresponding function blocks. This applies to the following data types:

- Pulse-metered values (see **User-defined functions** in the DIGSI 5 library)
- Transformer taps
- Metered values

### Phase-to-Ground Measured Values (WYE)

This data type represents the phase-to-ground measured values of a 3-phase system.



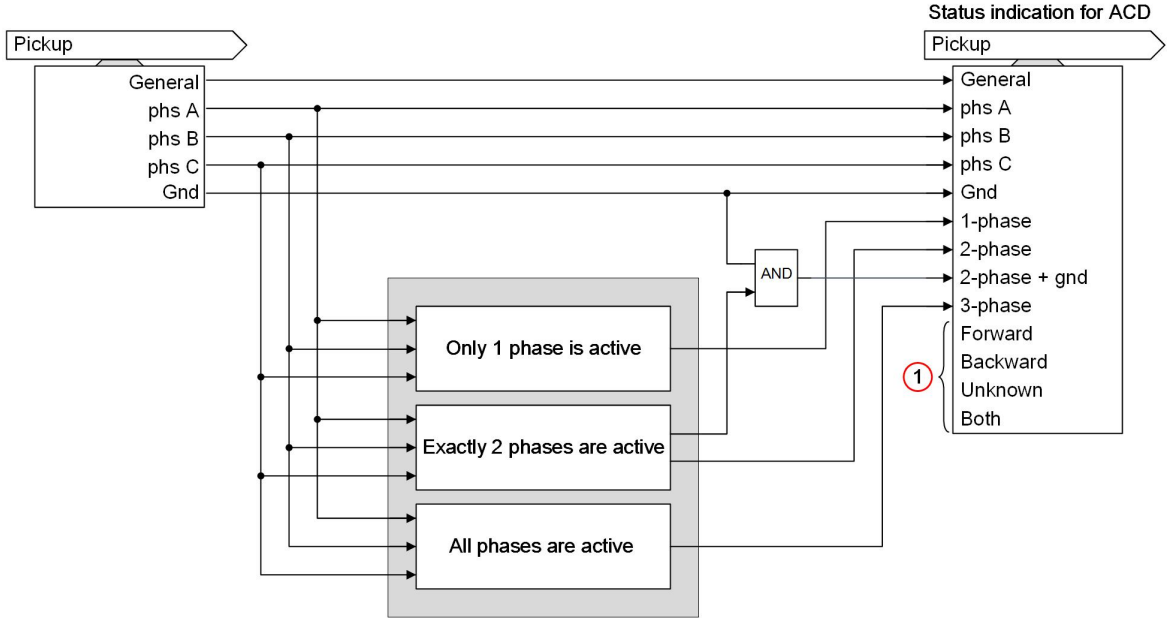
### Phase-to-Phase Measured Values (DEL, Delta)

This data type represents the phase-to-phase measured values of a 3-phase system.

### Protection Activation Information (ACT)

This object type is used by the protection functions for **Tripping**. It is available in the library for receiving protection information via the protection interface, which could also indicate **Tripping**.

The status indications for the **ACT** data type are built as follows:



[lo_ACT-information, 1, en_US]

Figure 3-121 Building of the Status Indications ACT

### Protection Activation Information with Direction (ACD)

This object type is used by the protection functions for **Pickup**. It is available in the library for receiving protection information via the protection interface, which could also indicate **Pickup**. In addition, both ACD and ACT, can be generated and processed by CFC charts.

The status indications for the **ACD** data type are built as follows:

[lo_ACD-information, 1, en_US]

Figure 3-122 Building of the Status Indications ACD

(1) Further information, see *Table 3-21*

Table 3-21 Building of the Direction Information for the Data Type **ACD**

| Direction Information | Description |
|---|---|
| *forward* | All picked up phases have picked up in forward direction. |
| *backward* | All picked up phases have picked up in backward direction. |
| *unknown* | The direction could not be determined for the pickup. |
| *both* | At least 1 phase has picked up in forward direction and at least 1 phase has picked up in backward direction. |

## 3.8.3 Pulse-Metered and Energy-Metered Values

### Pulse-Metered Values

Pulse-metered values are available as data type **BCR** (Binary Counter Reading) in the function group **transformer** as well as the function group**Circuit breaker**. There you will find **Pulse-metered values** under **Measured values**/**User-defined values**/**Pulse-metered value**.

The functionality and the settings of the pulse-metered values can be found in chapter *9.9.1 Function Description of Pulse-Metered Values*.

### Energy Metered Values

Energy metered values no longer need to be created by the user separately. They are available as active and reactive power in each **transformer** function group for reference and output direction. The calculation is based on the current and voltage transformers associated with the transformer.

Detailed information can be found in the **transformer** function group in chapter *9.8.1 Function Description of Energy Values*

## 3.8.4 Additional Data Types

The following data types are also used in the system but are not available for general use as user-defined signals in the library:

- **ENC** (Enumerated Setting Controllable)
  The data type **ENC** models a command with which the user can set predefined values.
- **SEQ** (Sequence)
- **BSC** (Binary Controlled Step Position)
  The data type **BSC** can, for example, be used to control a transformer tap changer. The commands **up**, **down** can be given.

**NOTE**

**Transformer taps** are included in the **Transformer tap changer** switching element. If this switching element is created in the device, the transformer tap position is available as a data object of type **BSC** (binary controlled step position information).

## 3.8.5 External Signals

User-defined signals of different types (see *Figure 3-123*) are available for GOOSE Later Binding. After instantiation in a logical node, an external reference is generated during IID export and provided to a IEC 61850 system tool (for example, System Configurator) for GOOSE Later Binding (according to the Later-Binding procedure specified in IEC 61850-6).

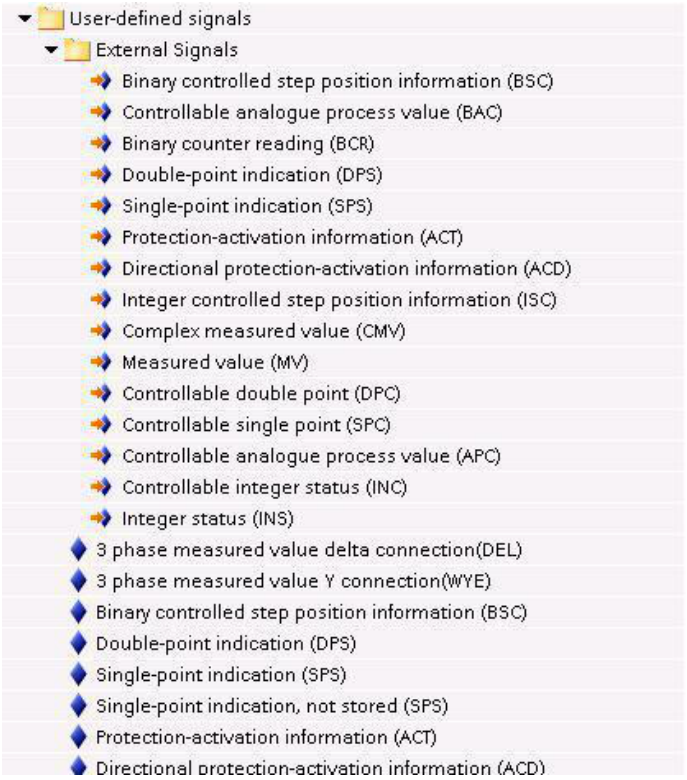


Figure 3-123 External Signals

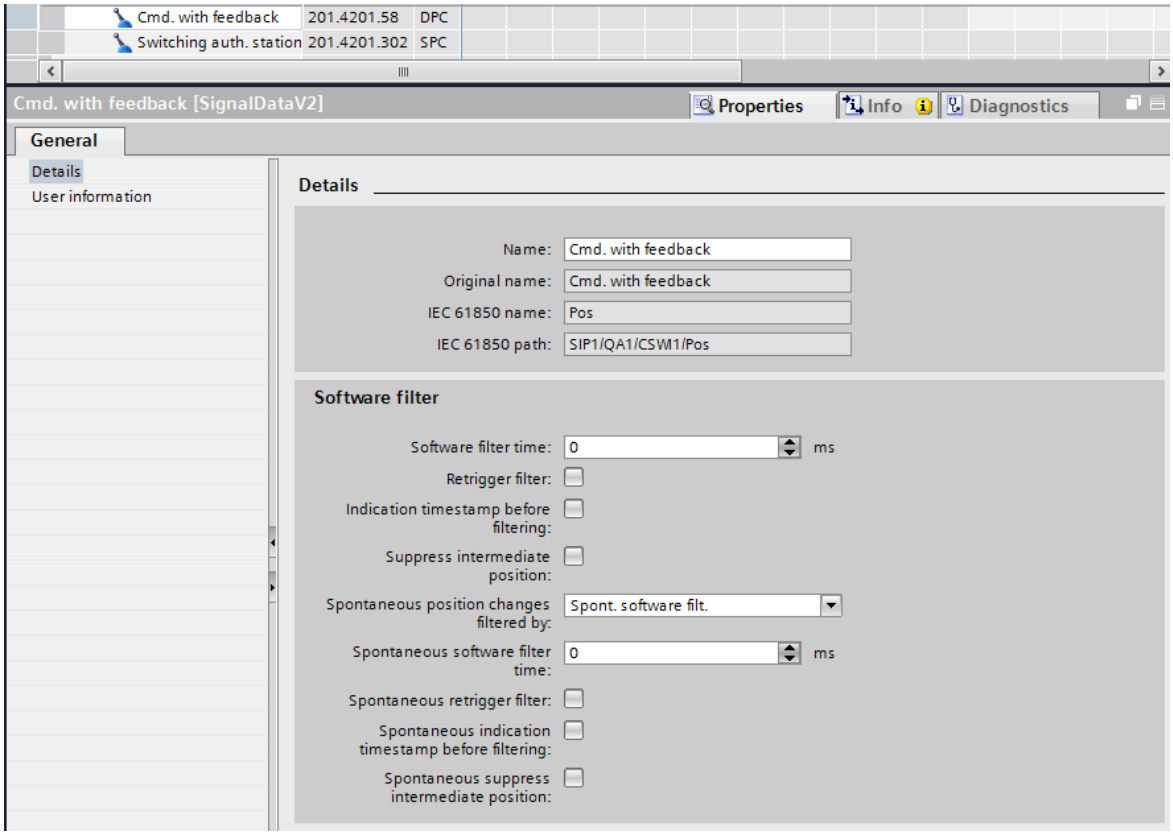
**NOTE**

Consider the chapter on GOOSE Later Binding in the DIGSI Online Help. User-defined signals exist as external signals and as preconfigured inputs that have been activated via the GOOSE column.

# 3.9 Other Functions



## 3.9.1 Signal Filtering and Chatter Blocking for Input Signals

Input signals can be filtered to suppress brief changes at the binary input. Chatter blocking can be used to prevent continuously changing indications from clogging the event list. After an adjustable number of changes, the indication is blocked for a certain period.

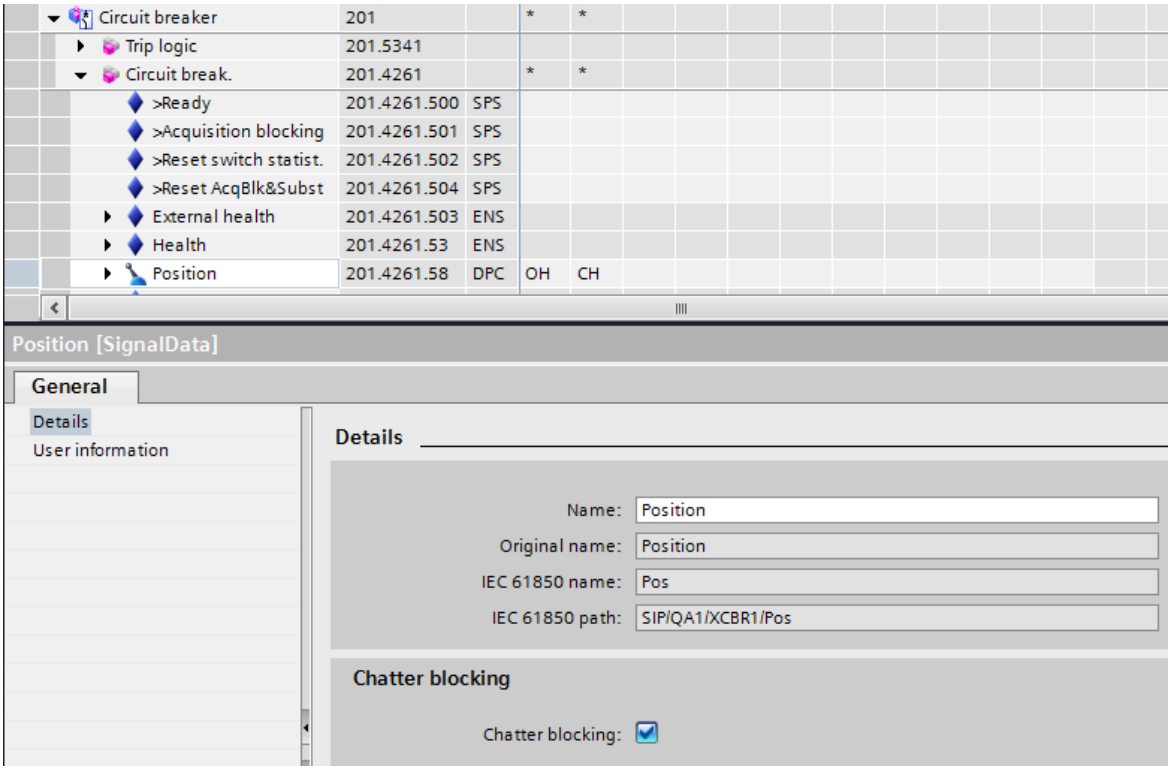
The settings for indication filtering can be found at the individual signals. The next figure shows the settings using the example of a controllable (circuit-breaker switch position).

**NOTE**

The software filtering time is available only for the circuit breaker and disconnector in the controllable **Cmd. with feedback** (**control** function block), as this is used for logging purposes. The controllable **position** (**circuit breaker** or **disconnector** function block) is used for interlocking conditions and must always show the unfiltered position of the switching object.

[sc_lposi, 1, en_US]

Figure 3-124 Settings for Circuit-Breaker Switch Position



The setting range for the **Software filter time** parameter ranges from 0 ms to 100 000 ms in ms increments. The **Retrigger filter** check box can be used to select whether to restart the filtering time whenever a status change is performed within the software filtering time. When activated, the **Indication timestamp before filtering** check box backdates the time stamp by the set software filtering time. In this case, the time stamp corresponds to the actual status change of the signal. If you activate the **Suppress intermediate position** check box, the intermediate position is suppressed for the duration of this software filtering time.

If you leave the software filtering time at 0 ms, the time for the suppression of the intermediate position is also 0 ms. The activated **Suppress intermediate position** check box then remains ineffective.

If you do not activate the **Suppress intermediate position** check box, the software filtering time affects the **on**, **off**, **intermediate**, and **disturbed** positions of the circuit breaker or disconnector switch.

With the parameter **Spontaneous position changes filtered by:**, you set how such position changes are to be filtered. Spontaneous position changes are caused by external switching commands, for example. If you select the ***General software filter*** setting, the general settings for software filtering of spontaneous position changes and for position changes caused by a switching command apply. The settings for spontaneous position changes then cannot be edited. A separate filtering for spontaneous position changes is activated with the ***Spontaneous software filter*** setting and you can edit the settings for this.

Chatter blocking can be activated or deactivated as an input parameter, for example as a parameter of the position in the **Circuit breaker** or **Disconnector** function block.

[sc_flatte, 1, en_US]

Figure 3-125 Setting Chatter Blocking

The settings for the chatter blocking function are set centrally for the entire device in DIGSI. They are accessible as settings in the **General** function group (see the following figure).

The chatter-blocking settings have the following meaning (see also *Figure 3-126* and *Figure 3-127* in the examples shown in the following):

- **No. permis.state changes**

  This number specifies how often the state of a signal may toggle within the chatter-test time and the chatter-checking time. If this number is exceeded, the signal will be or remains blocked.

  Enter a number from 0 to 65535 in this field. If the entry is 0, chatter blocking is essentially inactive.

- **Initial test time**

  During this time, the number of times a signal changes its status is checked. This time is started if chatter blocking is configured for at least one signal and this signal changes its status. If the configured number of permissible status changes is exceeded during the initial test time, the signal is temporarily blocked and the indication *Chatter blocking* is set.

  Enter a number from 1 to 65535 in this field. The number entered corresponds to the time in seconds. When the set time has expired, the timer restarts automatically (cycle time).

- **No. of chatter tests**

  This number specifies the maximum number of test cycles to be run. If the number of permissible status changes of the signal stays exceeded during the initial test time of the last test cycle, the signal is finally blocked. In this case, the indication *Group warning* (**Alarm handling** group and **Device** group) is set additionally to the *Chatter blocking* indication after expiry of the set number. Restarting the devices removes this block again.

  Enter a number from 0 to 32767 in this field. The value Infinite (∞) is also permissible here.

  Enter this value as character string oo.

- **Chatter idle time**

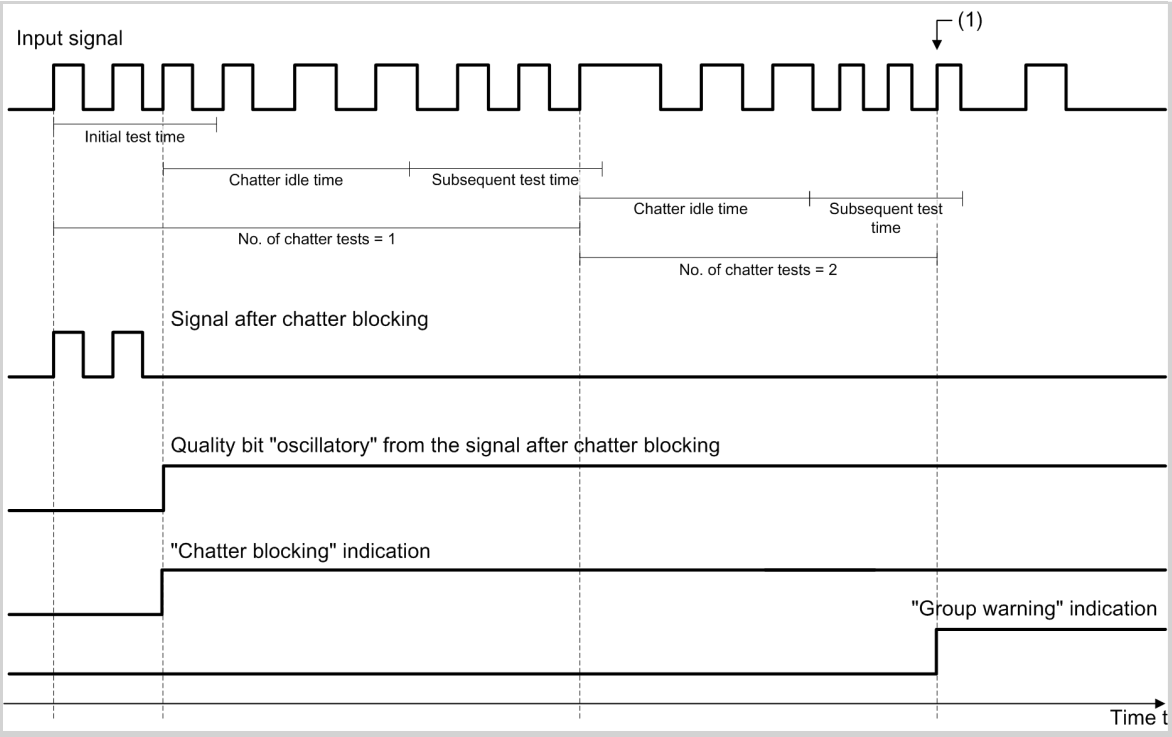
  If the number of permissible status changes for a signal is exceeded during the initial test time or the subsequent test time, the **Chatter idle time** starts. Within this time, this signal is blocked temporarily and the *Chatter blocking* indication is set. The blocked input signal is assigned the **oscillatory** quality.

  Enter a number from 1 to 65535 in this field. The number entered corresponds to the time in minutes. An entry here is only considered if the number of chatter tests does not equal to 0.

- **Subsequent test time**

  During this second test time, the number of times a signal changes its status is checked once again. The time begins when the **Chatter idle time** expires. If the number of status changes is within the permissible limits, the signal is released. Otherwise, an additional dead time begins, unless the maximum number of chatter tests has been reached.

  Enter a number from 2 to 65535 in this field. The number entered corresponds to the time in seconds. An entry here is only considered if the number of chatter tests does not equal 0.



**Example 1: Permanent Blocking**

The chatter-blocking settings are set as follows:

- **No. permis.state changes** = 4
- **No. of chatter tests** = 2

After more than 4 state changes within the **Initial test time**, the input signal is set to the original state by the chatter blocking and the **oscillatory** quality is assigned. Additionally, a corresponding indication is added to the operational log. At the same time, the *Chatter blocking* indication is set. After expiry of the settable **Chatter idle time**, during the following **Subsequent test time**, it is checked whether the input signal is still chattering. This check is repeated, as the **No. of chatter tests** is set to 2 in this example.

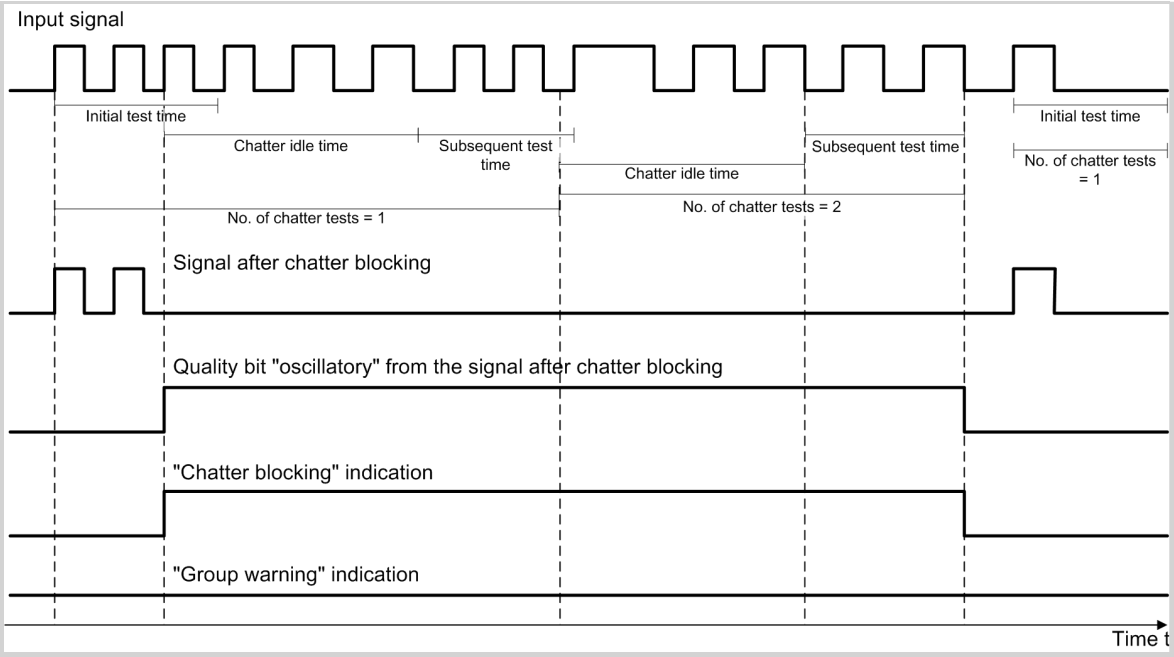
If, during the 2nd **Subsequent test time**, it has been detected that the number of status changes of the input signal exceeds the set **No. permis.state changes**, the chatter blocking detects a persistent violation of the signal stability and sets the *Group warning* indication. The original state of the signal is permanently frozen. Only a device restart removes the chatter blocking again.

[dw_chatter-block-01, 1, en_US]

Figure 3-126 Signal Change during Chatter Blocking with too Important Number of Signal State Changes During 2nd Subsequent Test Time

(1) The input signal is permanently blocked starting from this point in time.

**Example 2: Temporary Blocking**



The chatter-blocking settings are set as follows:

- **No. permis.state changes** = 4
- **No. of chatter tests** = 2

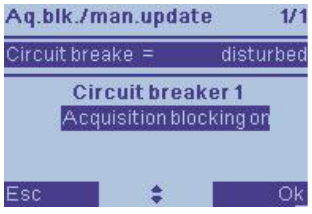
After more than 4 state changes within the **Initial test time**, the input signal is set to the original state by the chatter blocking and the **oscillatory** quality is assigned. Additionally, a corresponding indication is added to the operational log. At the same time, the *Chatter blocking* indication is set. After expiry of the settable **Chatter idle time**, during the following **Subsequent test time**, it is checked whether the input signal is still chattering. This check is repeated, as the **No. of chatter tests** is set to 2 in this example.

If, during the 2nd **Subsequent test time**, it has been detected that the number of state changes of the input signal is within the set **No. permis.state changes**, the temporary blocking of state changes of the signal is removed and the actual signal state is released.

The quality bit **oscillatory** is removed and the *Chatter blocking* indication is reset. As the temporary blocking of the signal is removed, the *Group warning* indication is not set. The chatter test starts again.

[dw_chatter-block-02, 1, en_US]

Figure 3-127 Signal Change during Chatter Blocking with Permissible Number of Signal State Changes During 2nd Subsequent Test Time



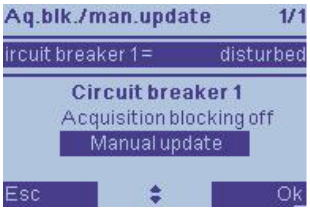
## 3.9.2 Acquisition Blocking and Manual Updating

During commissioning, maintenance, or testing, a brief interruption of the connection between the logical signals and binary inputs may be useful. It allows you to manually update the status of a switching device that is not providing feedback correctly. Before this can take place, you must first set acquisition blocking.

To set the acquisition blocking, proceed as follows:

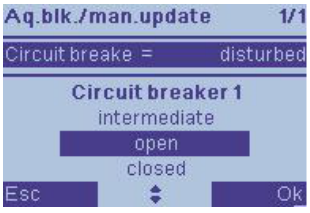
- Using the navigation keys, move in the **main menu** of the device display to **Commands→Equipment→Aq.blkman. update**.
- Select the appropriate device (for example, a circuit breaker) from among the several switching devices using the navigation keys.
- Press the **Change** softkey.
- Enter the confirmation ID (not relevant for active role-based access control (RBAC) in the device).
- Confirm the process with the softkey marked **OK** in the display.

After entering the confirmation ID (only with the RBAC inactive), acquisition blocking is switched on.



[sc_detection, 1, en_US]

Figure 3-128 Activating the Acquisition Blocking



Manual updating of the switching device is possible from within the same menu.

- Select **Manual update** (*Figure 3-129*) using the navigation keys.
- Select the switching device setting to be manually updated using the navigation keys (for example, **off**, *Figure 3-130*).
- Confirm the process with the softkey marked **Ok** in the display.

[sc_status, 1, en_US]

Figure 3-129 Activating Manual Update

[sc_statu2, 1, en_US]

Figure 3-130 Selecting Position

The manually updated position of the switching device will be displayed.

[sc_statu3, 1, en_US]

Figure 3-131 Position of the Switching Device

**NOTE**

For security reasons, manual updating is possible only directly through the on-site operation panel of the device and not through DIGSI 5.

**NOTE**

Setting acquisition blocking and the subsequent manual updating are also possible via the IEC 61850 system interface.

You can set acquisition blocking also via a binary input. If you want to put in the feeder or the switching device in revision, you can set the acquisition blocking with an external toggle switch for one or more switching devices. For this purpose, every switching device in the **Switch** function block (circuit breaker or disconnector switch) has the input signal **`>Acquisition blocking`**. This signal can also be set from the CFC.

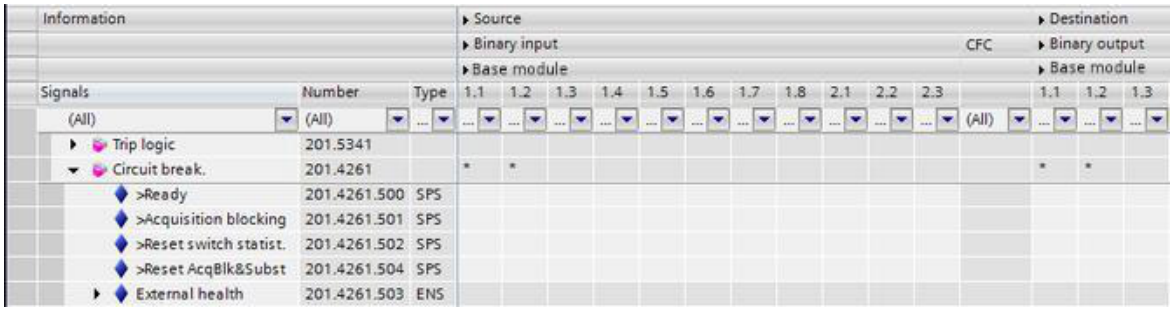


Figure 3-132 Input Signals *>Acquisition Block* and *>Release Acquisition Block & Manual Updating* on the Switching Device

**NOTE**

Interlockings are carried out with the status changes of the switching device. Remove acquisition blocking again manually. Otherwise, position changes of the switching device are not detected and interlockings are ineffective.

If the acquisition blocking and the manually updated position are set using the operation panel of the device or the system interface IEC 61850, these are retained until the acquisition blocking is manually deactivated. When you initially start the device, the acquisition blocking is deactivated.

Except for a restart, the acquisition blocking and the manually updated position are retained.

If the acquisition blocking is activated via the input signal **>Acquisition blocking**, it is retained as long as the binary input is active.

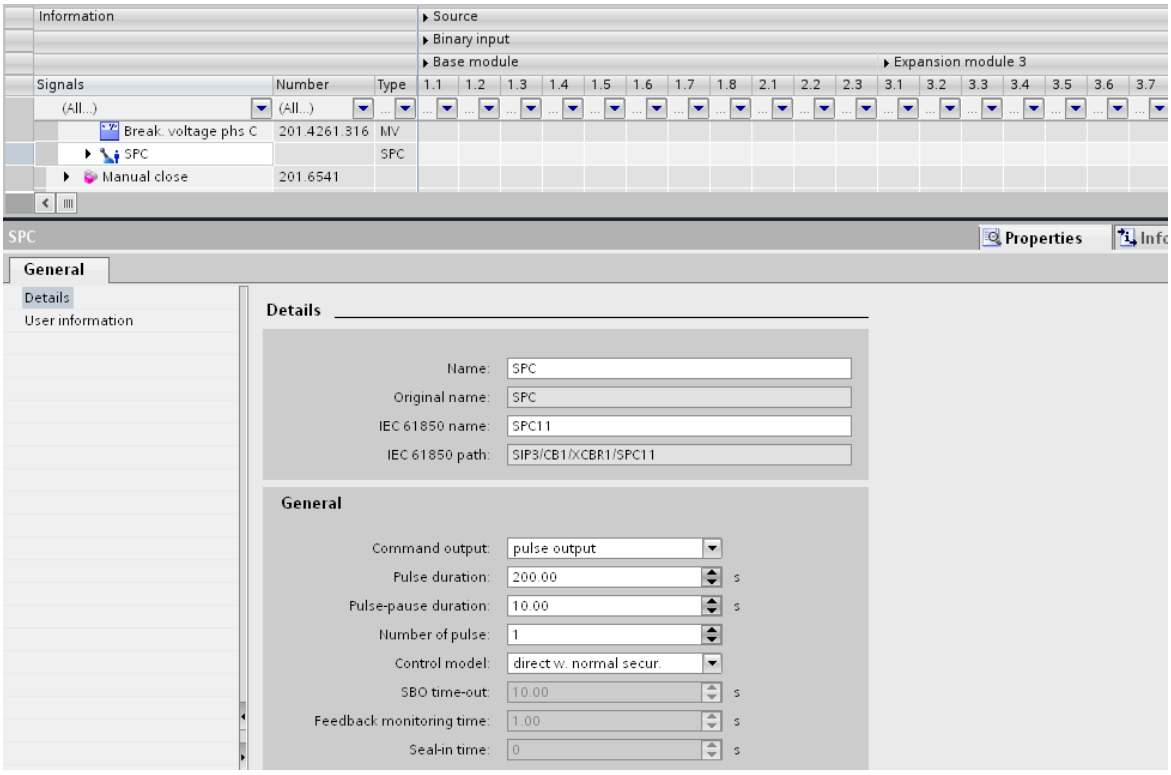
To set the acquisition blocking of a switching device, the following sources are possible:

- Operation panel of the device
- System interface IEC 61850
- Input signal **>Acquisition blocking**

All sources undergo OR operations, that is, the acquisition blocking remains set until all the sources are deactivated.

After deactivation of the acquisition blocking, the actual position of the switching device is adopted and displayed in the operation panel of the device.

**NOTE**



When the acquisition blocking is activated or the switching device updated manually while the entire device or the switching device is in application mode, these states are not saved. The acquisition blocking and the manual updating are not retained after a restart.

The acquisition blocking and the manual update for the circuit breaker, the disconnector, and the tap changer are reset by way of the **>Reset AcqBlk&Subst** binary input. Setting acquisition blocking and manual update is blocked with the input activated.

## 3.9.3 Persistent Commands

In addition to the switching commands, which are issued as pulse commands, and stored for the standard switching devices (circuit breaker, disconnector switch), persistent commands are also possible. In this case, a distinction must be drawn between controllables with the **Continuous output** operating mode and a stored signal output that is immune to reset.

You can change a controllable from pulse to persistent command with the **Command output** parameter.

[sc_command, 1, en_US]

Figure 3-133 Setting the Command Type in DIGSI 5

Select ***Pulse output*** or ***Continuous output*** for the command output type. If a persistent command is selected, the Pulse parameter is irrelevant.

## 3.9.4 Device Logout

### 3.9.4.1 Overview

In the case of multibay functions, a device uses information from one or more other devices. For some applications, it may be necessary for you to remove a device with all effective functions temporarily from the plant and even to switch it off. These applications are, for example:

- Maintenance work
- System upgrades
- Testing the local protection functions, for example, the local line differential protection

The *Device logout* functionality informs the receiver devices about the imminent disconnection of the transmitter devices. To do this, the last valid received information is stored in the receiver devices and used for the multibay functions.

**NOTE**

If you need to remove a device temporarily from the plant, you must log off the device.

Protection functions distributed to several devices operate in a healthy manner with the remaining devices only if you have logged off the device.

You can log off the device as follows:

- Via the on-site operation panel
- Via a communication interface using the *Device logout* (*_:319*) controllable
- Via the binary inputs, general: *>Dev. funct.logout on* (*_:507*) or *>Dev. funct.logout off* (*_:508*)

You can find the controllable and the binary inputs in the DIGSI 5 project tree under **Name of the device** → **Information routing** in the working area in the **General** block.

During the log-off process, the device checks whether all conditions for a logout have been met. If the conditions for the log off have not been met, the logout is rejected.

The logout is rejected under the following conditions:

- The devices are communicating via the protection interface and switching off the device leads to an interruption in protection-interface communication.
- The **Line differential protection** function is operating in the device and the local circuit breaker is still switched on.

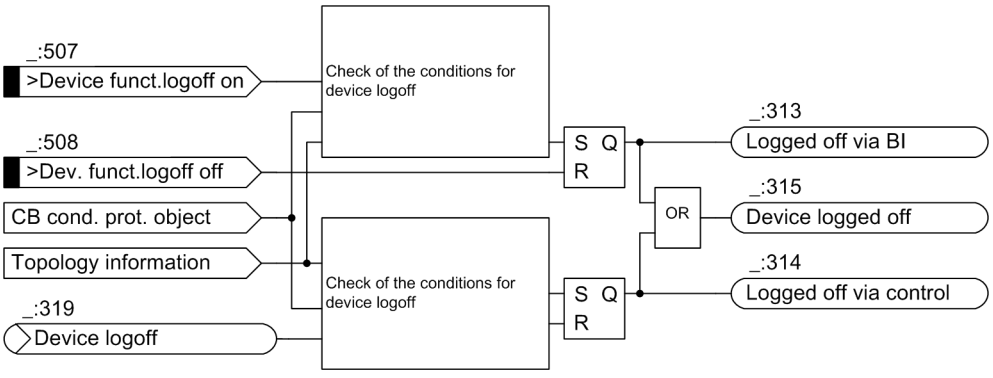
  In this case, you must switch off the local circuit breaker and repeat the log-off process for the device. After the logout, the local **Line differential protection** function is removed from the summation of the currents for the **Line differential protection** of the other devices. The **Line differential protection** function remains active in the other devices.

**NOTE**

The path used to log the device off is stored in the operational log.

Even if you switch off the device after logout, the *Device logged off* (_:315) state is stored.

If you want to establish the initial state again after logging off the device, you must log on the device again. To log on the device, you must use the same option used for logout. For example, if you have logged off the device via binary inputs, you must log it on again via the binary inputs. This applies in similar manner if you have logged off the device via DIGSI or via on-site operation.



### 3.9.4.2 Application and Setting Notes

#### Logoff Options for a Device

You can log a device off as follows:

- Via the on-site operation panel
- Via communication through the controllable *Device logout* (*_:319*)
- Via the binary inputs, general: *>Dev. funct.logout on* (*_:507*) or *>Dev. funct.logout off* (*_:508*)

**Conditions for Logging off the Device**

[lo_functional logoff device, 1, en_US]

Figure 3-134 Logic for Logging off the Device

The conditions for a successful logout of the device result from the conditions for every activated protection function.

**Logoff of a Device from a Device Combination with Communication via the IEC 61850-8-1 (GOOSE) Protocol**

If devices are exchanging data using the IEC 61850-8-1 (GOOSE) protocol – for example in the case of substation interlocking – for each received data point the value of this data point can be set in the receiver device when the transmitter device logs off. This value remains effective in the receiver device until the logout is canceled by the transmitter device, even if the transmitter and/or the receiver are switched off in the meantime.

**Logoff of a Device from a Device Combination Using Protection Communication**

If devices in a device combination communicate via the protection interface, you can only log off a device under the following conditions:

- Logging off and switching off a device in a device combination must not result in an interruption in the protection communication.
- For series-connected topologies, the device must be located at one end of the communication chain as otherwise the protection communication is interrupted when the device is logged off and switched off.

  For this reason, devices not at one of the ends in series-connected topologies cannot be logged off.

**Logging Off a Device from a Protection Application with Line Differential Protection**

If you are using the **Line differential protection** function, you must ensure that the functionality is still effective even after a device in a device combination is logged off and switched off. The following example describes the procedure:

**EXAMPLE:**

The following line formation is protected by the **Line differential protection** with 3 devices.

[dw_example logoff ldiff, 2, en_US]

Figure 3-135 Differential Protection with 3 Devices for a Line with a Feeder

In the example, the feeder is to be decommissioned for maintenance or modification work. Device 3 should therefore also be switched off. Without additional measures, the **Line differential protection** will no longer function and sends an ineffective indication.

For this use case, the **Line differential protection** function must be logged off in Device 3.

**NOTE**

Before logging off, you must de-energize the feeder protected by the local **Line differential protection**.

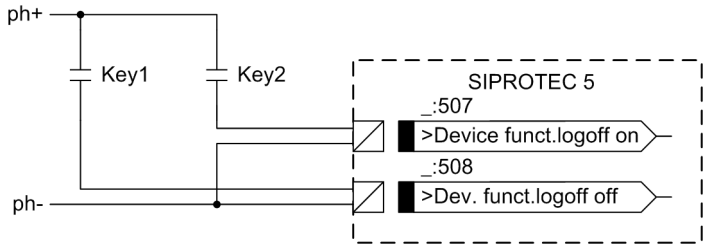
**Line differential protection** in device 3 can only be logged off if no current is flowing through the feeder. Device 3 checks during the log-off process whether the circuit breaker 3 is really switched off.

The **Circuit-breaker position recognition** in the function group **Circuit breaker** (CB) provides the circuit-breaker position using the internal signal *CB state protected obj.*.

If a protected object is supplied via 2 circuit breakers (CBs), for example with the 1 1/2 circuit-breaker layout, then the circuit-breaker position of the protected object must be determined with the aid of both circuit breakers. In this case, the Circuit-breaker position function block performs linking of the individual CB positions for the protected object.

If one of the following 2 conditions is met, the *CB status protected object* internal signal assumes the position *Open*:

- All connected circuit breakers signal internally the position *Open*.
- The binary input signal *>Disconnector open* is active.

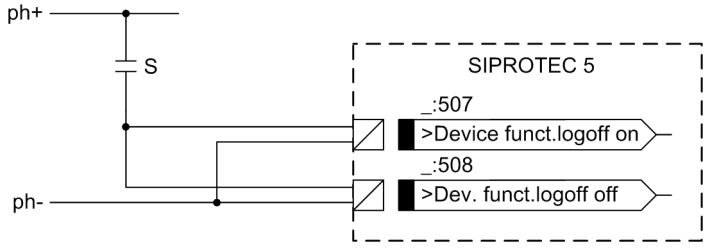


For further information refer to *5.5.4.6 Circuit-Breaker Condition for the Protected Object*.

If the **Line differential protection** is logged off in device 3, the remaining devices 1 and 2 will save this state and the total current for the Kirchoff's current law will then be calculated with the currents in devices 1 and 2 only.

If device 3 is successfully logged off, you can switch it off. The logoff of device 3 will also be saved in the remaining devices after it is switched off. If you switch device 3 on again, you must log it on again in the device combination.

### Logout via Binary Inputs



The following diagrams show potential variants on how to control binary inputs. If you want to use push-buttons, switch on this function as shown in the following figure. Log off the device using the push-button **Key2**; log on the device again with the push-button **Key1**.

[lo_extta logoff device, 1, en_US]

Figure 3-136 External Push-Button Wiring for Logging off the Device

If a switch is being used for control, route the binary input *>Dev. funct.logout on* as ***H (active with voltage)*** and the binary input *>Dev. funct.logout off* as ***L (active without voltage)***. If the switch **S** is closed, the device is logged off.

[lo_extsx logoff device, 1, en_US]

Figure 3-137 External Switch Wiring for Logging off the Device

**Indications**

The logged-off device reports the status (*(_:315) Device logged off*) and cause of the logout.
If you have logged off the device using binary inputs, the indication *(_:313) Logged off via BI* results.
If you have logged off the device using on-site operation, via DIGSI 5 or via the protection interface,the indication *(_:314) Logged off via control* is issued.
The indications are stored in the operational log.

### 3.9.4.3 Information List

| No. | Information | Data Class (Type) | Type |
|---|---|---|---|
| ***General*** | | | |
| _:507 | General:>Dev. funct.logout on | SPS | I |
| _:508 | General:>Dev. funct.logout off | SPS | I |
| _:319 | General:Device logout | SPC | C |
| _:313 | General:Logged off via BI | SPS | O |
| _:314 | General:Logged off via control | SPS | O |
| _:315 | General:Device logged off | SPS | O |

# 3.10 General Notes for Setting the Threshold Value of Protection Functions

## 3.10.1 Overview

You can set the threshold values of protection functions directly on the device or by using DIGSI 5.

An innovative design was implemented for the protection settings.

You can switchover the edit mode between the following setting views:

- Primary
- Secondary
- Percent

If you change settings in a setting view, DIGSI 5 calculates the settings of the 2 inactive views in the background. If you wish to save, for example, conversion to secondary values, then select the primary view. Configure all the settings and switchover to the secondary view.

**Edit Mode: Primary**

The parameters are set as primary values and thus refer directly to the primary system. The manual conversion on the secondary circuit omitted.

**Edit Mode: Secondary**

The settings refer to the secondary circuit of the transformer. This means that the settings must be converted. The secondary setting is the customary setting view. For secondary tests, the pickup values can be read directly.

**Edit Mode: Percent**

This setting type is beneficial for electric machines (generators, transformers, motors, and busbars). The setting values can be standardized regardless of the machine size. The reference values for the percentage settings are the rated values of the function groups, for example, rated voltage and rated current or rated apparent power. The setting values are, thus, related exclusively to the primary settings. If other reference values are used, then this is documented for the respective protection function in the application and setting notes.

If parameters are selected it may happen that they are set only in percent in all 3 setting views.

**Recommendation for Setting Sequence**

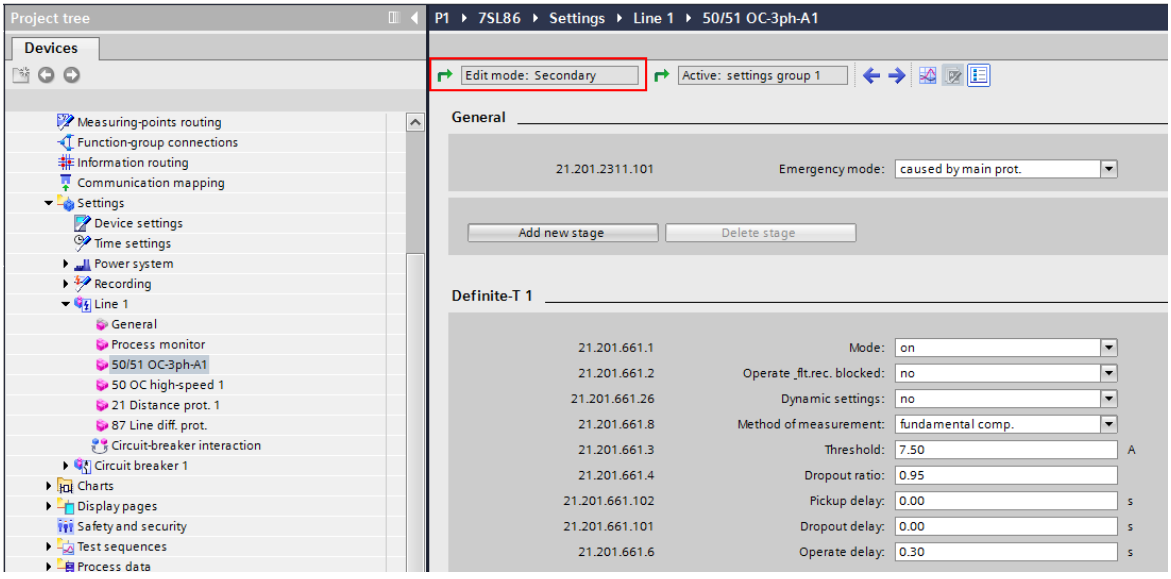
When setting the protection function, Siemens recommends the following procedure:

- First, set the transformation ratios of the transformers. You can find these under **Power-system data**.
- Subsequently, set the reference parameters for the percent setting. You will find these parameters in function group , for example, in function group **Transformer** in General Nodes under Rated Values and Coil Data..
- Next, set the parameter of the protection functions.

  If the transformer data have changed after completing the protection setting, remain in the setting sheet (for example, primary setting) and change the transformer data. In the background, DIGSI 5 obtains the new settings in the inactive setting views (for example, new secondary values).

The following section explains, by way of an example, how to modify the transformer ratios in DIGSI 5 using the corresponding alternatives.

## 3.10.2 Modifying the Transformer Ratios in DIGSI 5

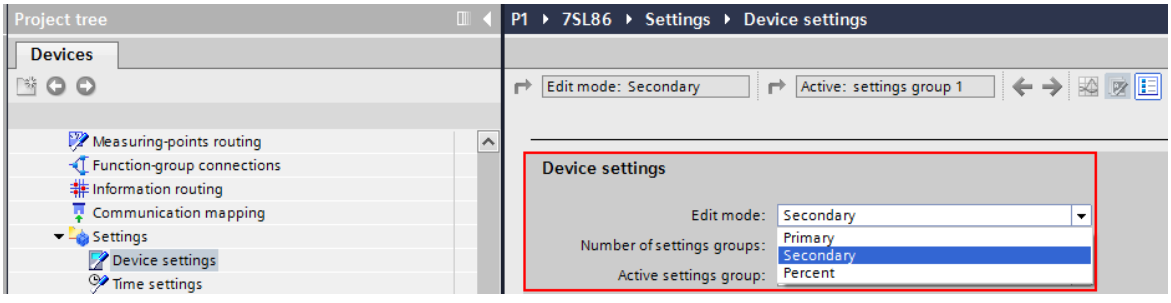


In the delivery setting, DIGSI 5 is set to the edit mode **Secondary**.

The following setting example shows how you can change the transformer ratio in DIGSI 5, and what impact this has on the settings in the setting views **Primary** and **Secondary**. The protection setting is observed in the example of the function **Overcurrent protection**.

The following output data are assumed:

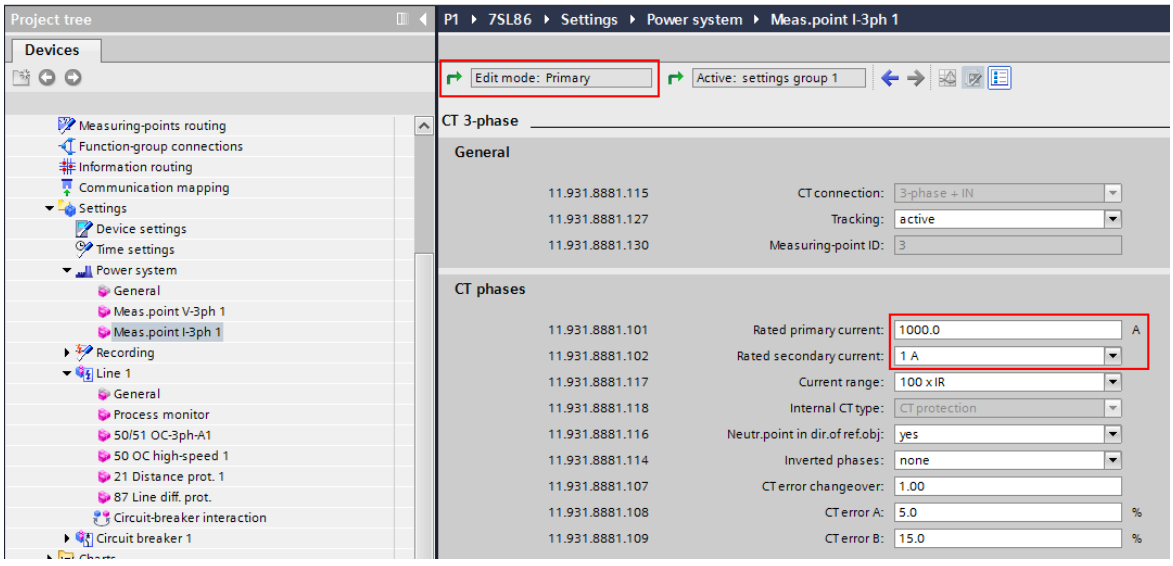
| | |
|---|---|
| Current transformer: | 1000 A/1 A |
| Protection pickup value: | 1.5 A |



The following figure shows the protection setting of the function **Overcurrent protection** in the secondary view. The threshold value of the stage is set to 1.5 A.

[scmodsek_1, 1, en_US]

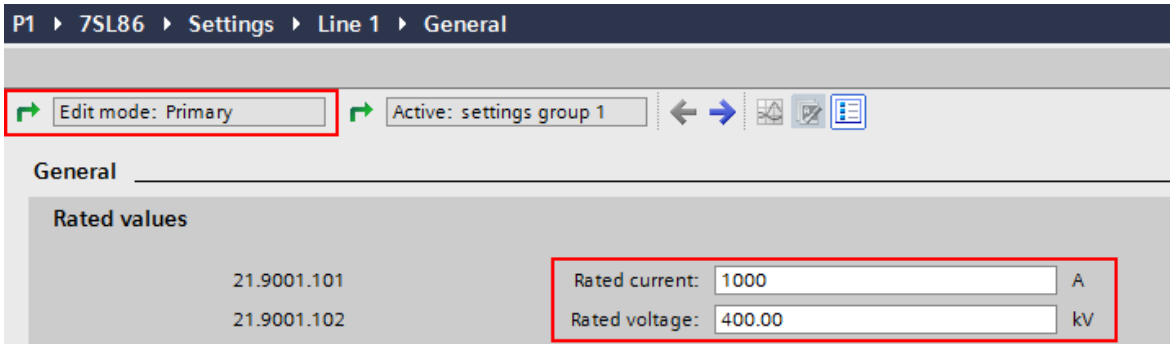
Figure 3-138 Protection Setting, Display of the Active Setting Sheet



When you click the green arrow in the setting sheet at the upper left, you get to the window for switching over to the setting view (see the following figure). Select the setting view you prefer.

[scmodums_2, 1, en_US]

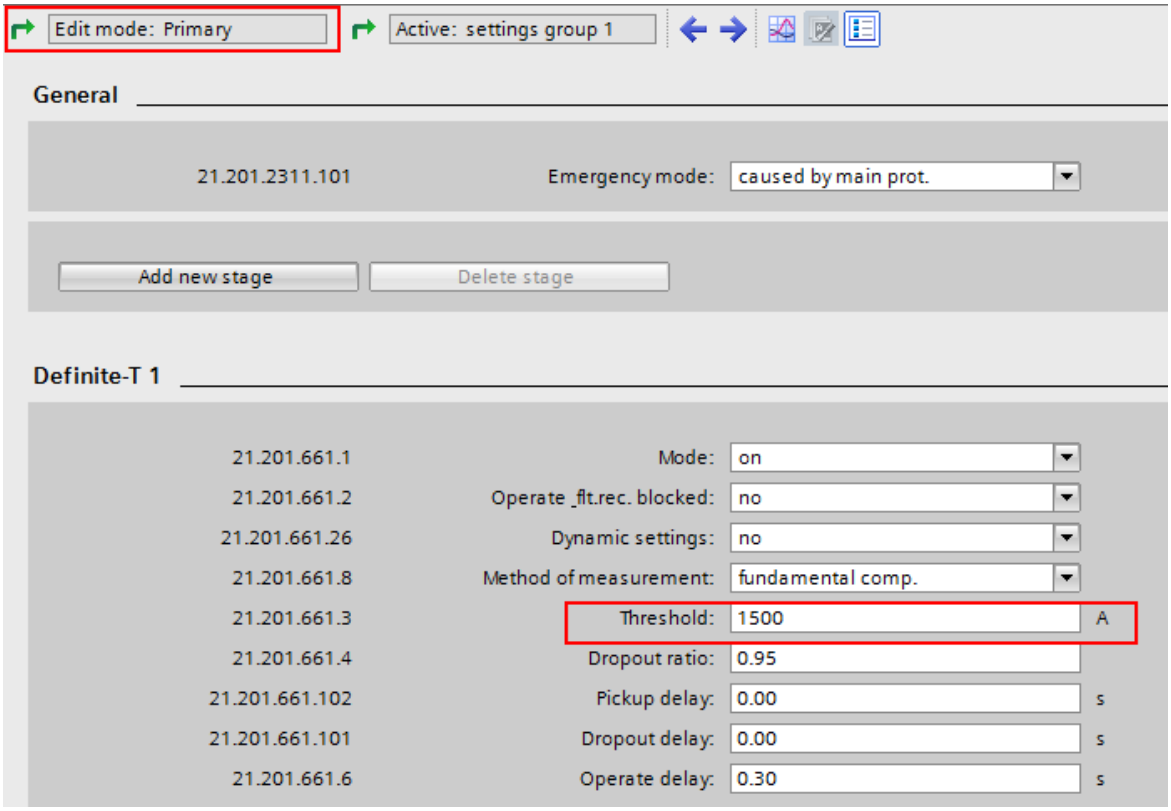
Figure 3-139 Switchover to the Desired Setting View



The following figures show the setting sequence in the edit mode **Primary**. Set the transformer data. In the example, the current transformer has a transformation ratio of 1000 A/1 A.

[scpwandl_3, 1, en_US]

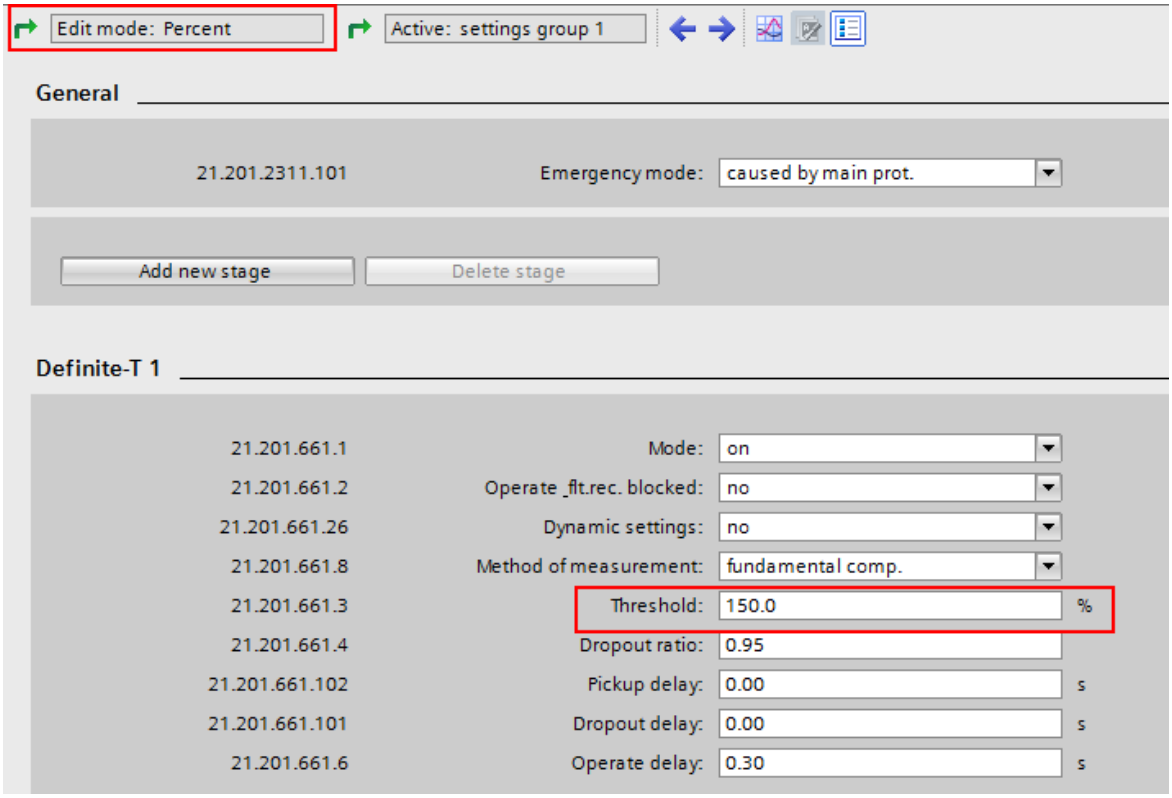
Figure 3-140 Setting Sheet: Transformer Data



In the function group **Transformer**, you set the transformer data (see following figure). Rated current, rated voltage and rated apparent power are the reference variables for the percent setting.

[scproref_4, 1, en_US]

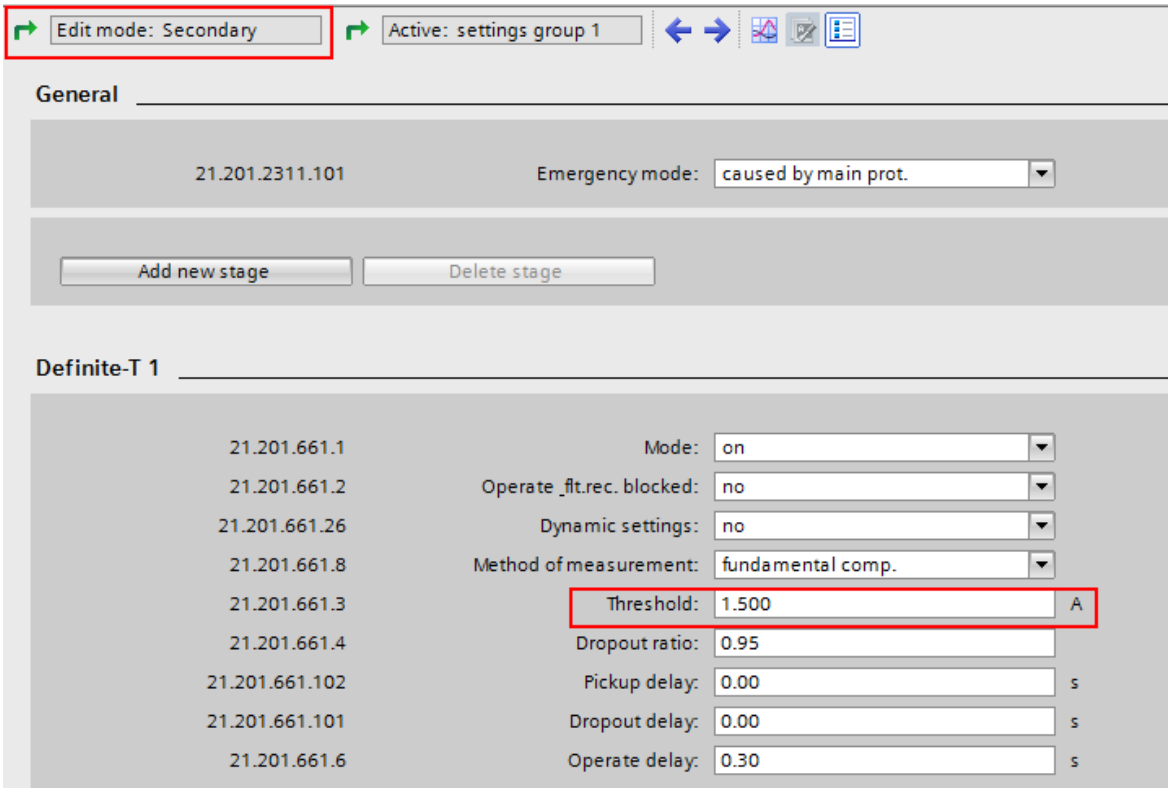
Figure 3-141 Reference Data for Percentage Settings



The following figure shows the threshold value of the function **Overcurrent protection** in the primary view at 1500 A.

[scumzpri_5, 1, en_US]

Figure 3-142 Example of the Threshold Value of the Definite-Time Overcurrent Protection Stage (Edit Mode: Primary)



When switching over to the percent view, the result should be the following value:
1500 A/1000 A · 100 % = 150 %

[scumzpro_6, 1, en_US]

Figure 3-143 Example of the Threshold Value of the Definite-Time Overcurrent Protection Stage (Edit Mode: Percent)

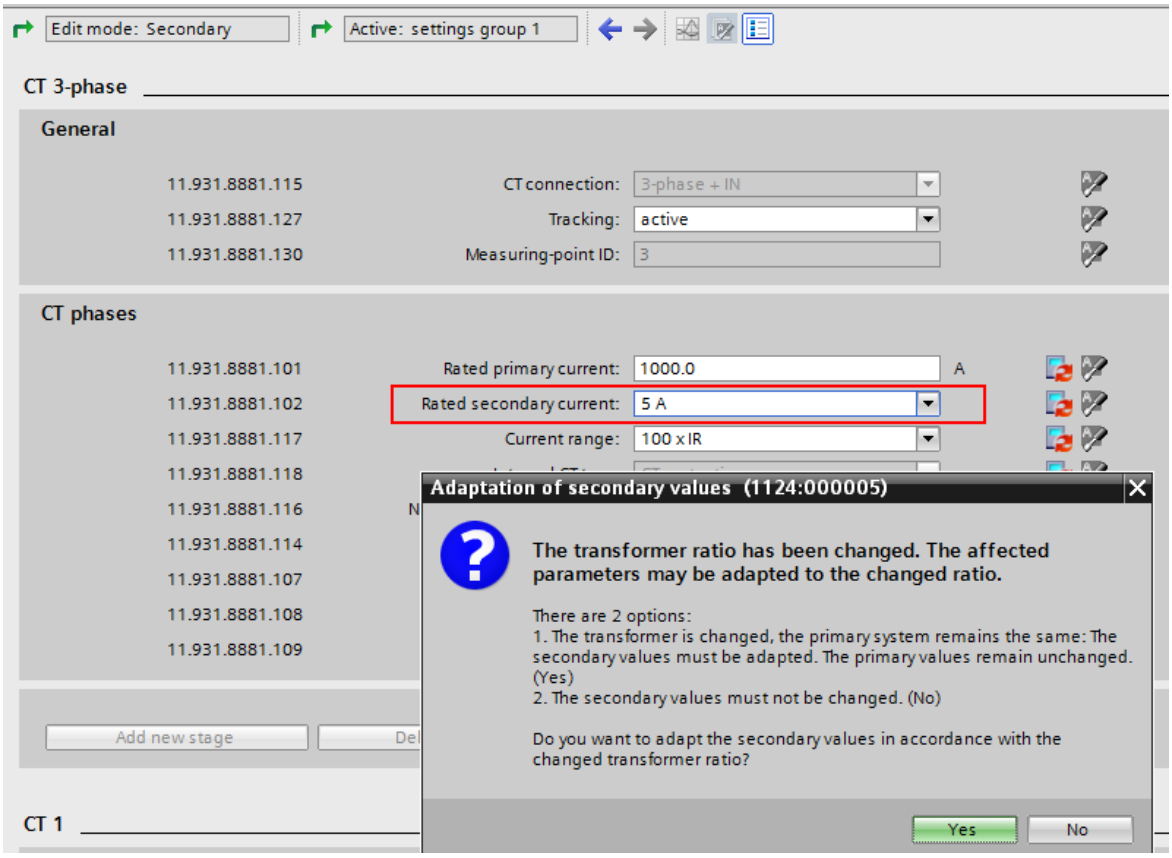
When switching over to the secondary view, the result should be the following value:
1500 A/(1000 A/1 A) = 1.5 A

[scumzsek_7, 1, en_US]

Figure 3-144 Example of the Threshold Value of the Definite-Time Overcurrent Protection Stage (Edit Mode: Secondary)

If you only want to work in the secondary view, DIGSI 5 supports you if the transformer ratio changes during the project phase.

In the example, the current-transformer ratio changes from 1000 A/**1 A** to 1000 A/**5 A**. Change the secondary rated current of the current transformer in the setting sheet of the transformer data from 1 A to 5 A (Edit mode: Secondary). If you change the transformer data, a window will appear (see the following figure) that will ask you for the action desired.



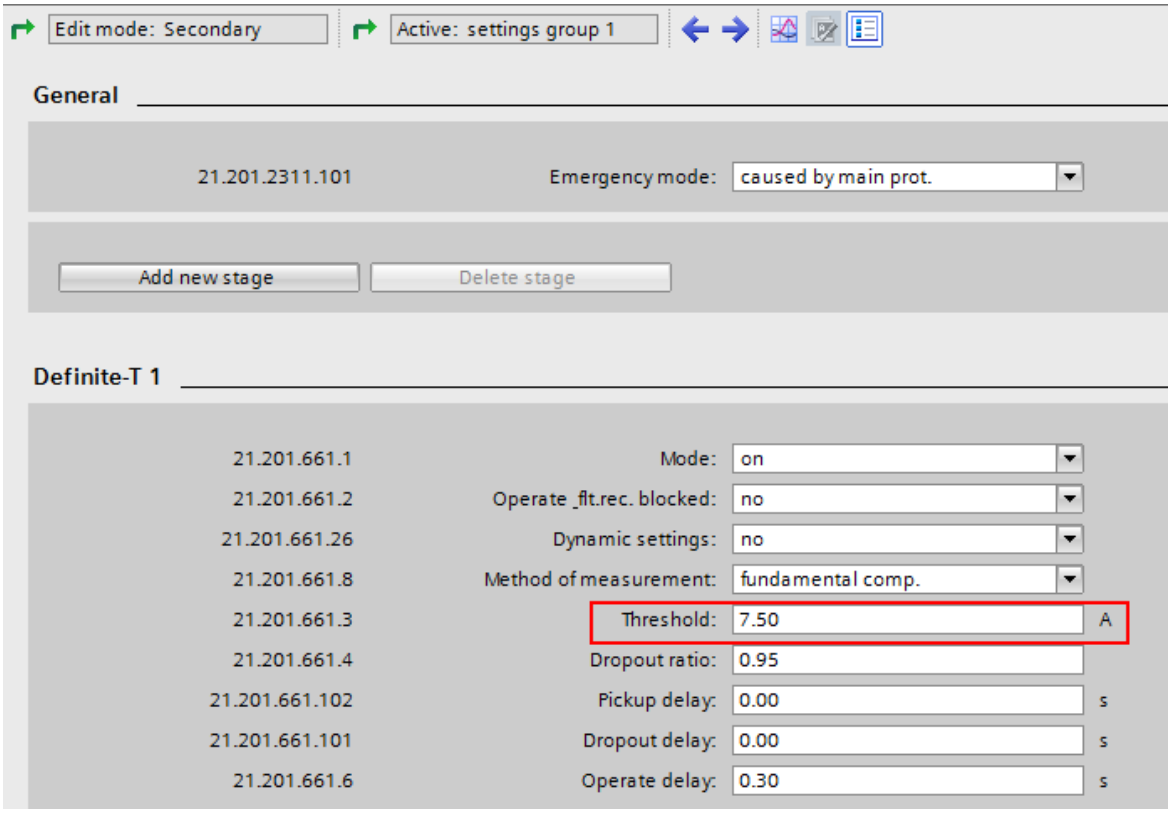


Figure 3-145 Query after Changing the Transformer Data (Setting View: Secondary)

If you answer the question with **Yes**, then DIGSI 5 will recalculate the pickup values (threshold values) in the active secondary view. For the new secondary transformer current 5 A, the new secondary threshold value obtained is 7.5 A (1.5 A * 5 = 7.5 A). The primary and percent values remain unchanged.

The following figure shows the newly calculated threshold value in the secondary view.

[scsekneu_9, 1, en_US]

Figure 3-146 Automatically Recalculated Secondary Values After Changes in the Transformer Data

If you have already set the settings in the secondary view by including the new transformation ratio of the transformer in the calculation, then answer the question with **No**. In this case, the protection settings in the secondary view remain unchanged. DIGSI 5 recalculates the settings (threshold values) of the primary view. In the example, the primary threshold value is then 300 A (1.5 A · 1000 A/5 A = 300 A).

In the example, the current-transformer ratio changes from 1000 A/1 A to 1000 A/5 A. The following table summarizes the pickup values that DIGSI 5 will recalculate in the setting view. The new values (in bold) depend on the reply to your question (refer to *Figure 3-145*).

| | Reply to the Question | |
|---|---|---|
| | **Yes** | **No** |
| Threshold value secondary (active setting view) | **7.5** A | 1.5 A |
| Threshold value primary (covered setting view) | 1500 A | **300** A |

**Changing the Transformer Ratio in the Single-Line Editor**

If you want to change the primary or secondary rated currents of the current transformer in the Single-Line Editor, select the current transformer. You can view and change the currents in the tab **Properties** of the object bar.

If you change the rated currents, the corresponding field has a red border to indicate currents that differ between the Single-Line Editor and the power-system data. During **synchronization** in the Single-Line Editor, these rated currents are adopted into the power-system data.

## 3.10.3 Changing the Transformation Ratios of the Transformer on the Device

In the delivery setting, the device is preset to secondary values. Only secondary values can be set directly on the device.

If you change transformer data directly on the device, it is not followed by a query, like in DIGSI 5 (see *Figure 3-145*). Instead, the device assumes that all settings remain unchanged in the secondary view.

**NOTE**

If the device works with IEC 61850 protocol, then change the transformer data only via DIGSI 5 and not directly on the device. If you change the transformer data directly on the device, the IEC 61850 configuration of the measurement and metered values can be faulty.

# 3.11 Device Settings

## 3.11.1 Settings-Group Switching

### 3.11.1.1 Overview of Functions

For different applications you can save the respective function settings in so-called **Settings groups**, and if necessary enable them quickly.

You can save up to 8 different settings groups in the device. In the process, only one settings group is active at any given time. During operation, you can switch between settings groups. The source of the switchover can be selected via a parameter.

You can switchover the settings groups via the following alternatives:

- Via the on-site operation panel directly on the device
- Via an online DIGSI connection to the device
- Via binary inputs
- Via a communication connection to the substation automation technology.
  The communication protocols IEC 60870-5-103, IEC 60870-5-104, IEC 61850, DNP, or Modbus TCP can be used for switching the settings groups.

A settings group includes all switchable settings of the device. Except for a few exceptions (for example, general device settings such as rated frequency), all device settings can be switched.

For detailed information about the settings groups, refer to the *Operating Manual* and to the *DIGSI 5 Online Help*.

### 3.11.1.2 Structure of the Function

The function of the **Settings group switching** is a supervisory device function. Accordingly, the settings and indications of the settings group switching can be found in DIGSI 5 and at the on-site operation panel of the device, below the general device settings respectively.

If you want to switchover a settings group, navigate to DIGSI 5 or proceed on the on-site operation panel of the device, as follows:

- Via the project tree in DIGSI 5:
  Project -> Device -> Settings -> Device settings
- Via the on-site operation panel of the device:
  Main menu → Settings → General → Group switchover

The indications for the settings group switching can be found in the DIGSI 5 project tree under:
Project → Device → Information routing → General

### 3.11.1.3 Function Description

#### Activation

If you want to use the **Settings group switching** function, you must first set at least 2 settings groups in DIGSI 5 (parameter **Number of settings groups** > 1). You can set up a maximum of 8 settings groups. The settings groups set in DIGSI 5 are subsequently loaded into the device.

#### Mechanism of the Switchover

When switching over from one settings group to another, the device operation is not interrupted. With the parameter **Active settings group** you are either specifying a certain settings group or you allow switching ***via control*** (IEC 60870-5-103, IEC 61850) or ***via binary input***.

### Switching via Control

When using the ***Control*** function for switching, the settings groups can be switched via a communication connection from the substation automation technology or via a CFC chart.

The communication protocols IEC 60870-5-103, IEC 60870-5-104, IEC 61850, DNP, or Modbus TCP can be used for switching the settings groups via a communication connection.

In order to use a CFC chart for switching, you must create a new CFC chart in DIGSI 5. Create the CFC chart in the DIGSI 5 project tree under **Name of the device** →**Charts** →**Add new chart**. Link the signals that control settings group switching in the CFC chart.

### Switching via Binary Input

There are 3 appropriate input signals available for switching via binary inputs. These input signals allow selection of the settings group via a binary code. If one of the 3 signals changes, the signal image present will, after 100 ms (stabilization time), result in switching over to the appropriate settings group. If only 2 settings groups must be switched over, only 1 binary input is required. The following table shows the possible binary codes (BCD) and applicable settings groups (PG).

Table 3-22 Binary Codes of the Input Signals and Applicable Settings Groups

| BCD Code via Binary Inputs | PG 1 | PG 2 | PG 3 | PG 4 | PG 5 | PG 6 | PG 7 | PG 8 |
|---|---|---|---|---|---|---|---|---|
| >PG selection bit 3 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| >PG selection bit 2 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 |
| >PG selection bit 1 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |

### Copying and Comparing Settings Groups

In DIGSI 5, you can copy or compare settings groups with each other.

If you want to copy settings groups, select a source and target parameter group in DIGSI 5 in the device settings, and then start the copy process. The device settings can be found in the DIGSI 5 project tree under Project → Device → Settings → Device settings.

If you want to compare settings groups, it is possible to do so in all setting sheets for settings. You will then select in addition to the active settings group, a 2nd settings group for comparison. Active setting values and the comparable values are displayed next to each other. For settings that cannot be switched over, no comparable values are displayed.

### Indication of Settings Group Switchings

Every settings group shows an applicable binary indication as well as its activation and deactivation. The process of settings group switching is also logged in the log for settings changes.

## 3.11.1.4 Application and Setting Notes

### Parameter: Number settings groups

- Default setting **(_:113) Number settings groups** = ***1***

With the parameter **Number settings groups**, you can set the number of available settings groups; you can switch between these.

### Parameter: Activat. of settings group

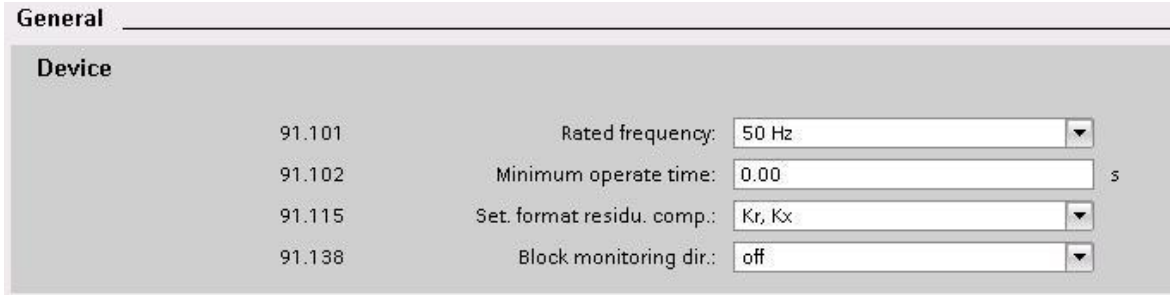
- Default setting **(_:114) Activat. of settings group** = ***settings group 1***

With the parameter **Activat. of settings group**, you specify the settings groups that you want to activate, or the mechanisms via which the switchover is allowed. You can switchover only between the settings groups specified with the parameter **Number settings groups**.

| Parameter Value | Description |
|---|---|
| ***via control*** | The switchover between the settings groups can only be initiated via a communication connection from a substation automation technology or via a CFC chart.<br>The communication protocols IEC 60870-5-103, IEC 60870-5-104, IEC 61850, DNP, or Modbus TCP can be used for switching the settings groups via a communication connection. |
| ***via binary input*** | The switchover between the settings groups functions exclusively via the binary input signals routed to the settings group switching. |
| ***settings group 1***<br>...<br>***settings group 8*** | They define the active settings groups. You can define the active settings groups in DIGSI 5, or directly on the device via the on-site operation. |

### 3.11.1.5 Settings

| Addr. | Parameter | C | Setting Options | Default Setting |
|---|---|---|---|---|
| ***Change group*** | | | | |
| _:113 | General:Number settings groups | | 1 to 8 | 1 |
| _:114 | General:Activat. of settings group | | • via control<br>• via binary input<br>• settings group 1<br>• settings group 2<br>• settings group 3<br>• settings group 4<br>• settings group 5<br>• settings group 6<br>• settings group 7<br>• settings group 8 | settings group 1 |



### 3.11.1.6 Information List

| No. | Information | Data Class (Type) | Type |
|---|---|---|---|
| ***General*** | | | |
| _:500 | General:>SG choice bit 1 | SPS | I |
| _:501 | General:>SG choice bit 2 | SPS | I |

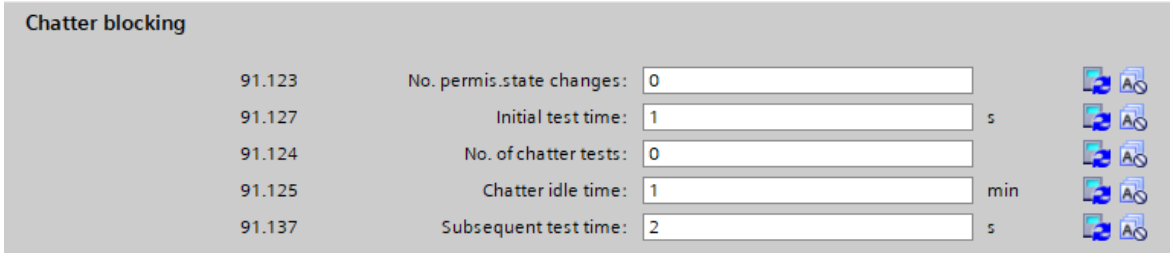
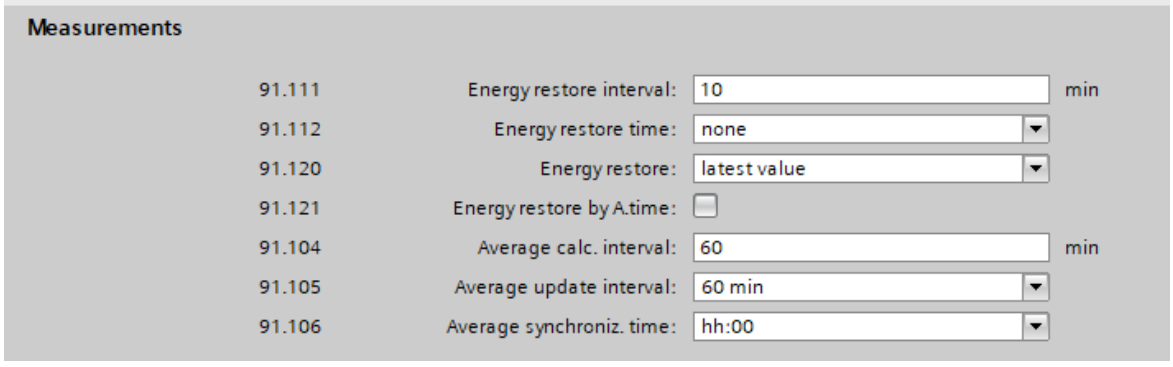
| _:304 | General:Act. settings group 5 | SPC | C |
| _:305 | General:Act. settings group 6 | SPC | C |
| _:306 | General:Act. settings group 7 | SPC | C |
| _:307 | General:Act. settings group 8 | SPC | C |

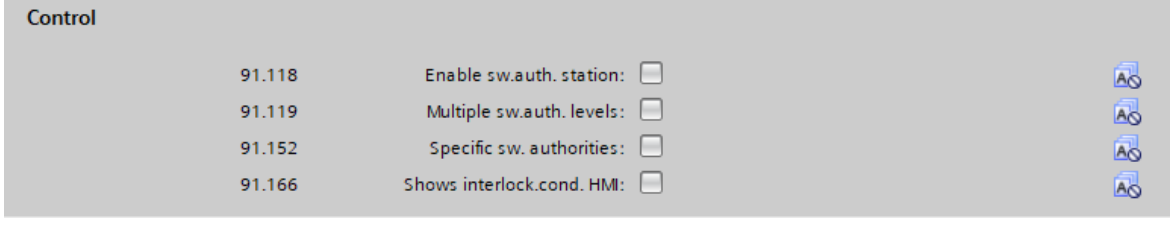


## 3.11.2 General Device Settings

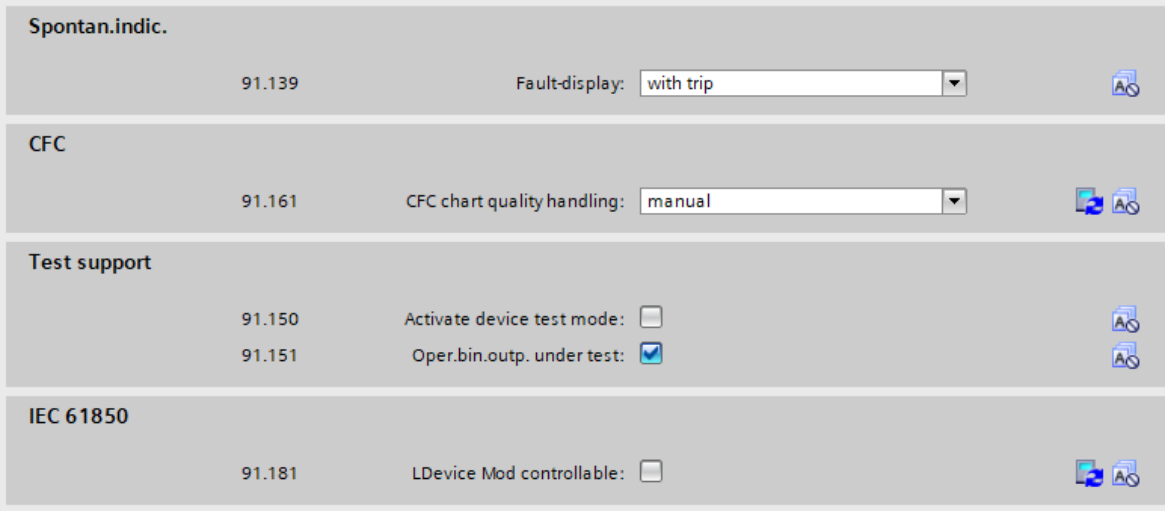
### 3.11.2.1 Overview



In **Device settings** in DIGSI 5, you find the following general settings.



[sc_deSeDe2, 1, en_US]



[sc_deSeAl, 4, en_US]

[sc_measurement, 1, en_US]

[sc_control, 1, en_US]

[sc_deSeBB, 2, en_US]

Figure 3-147 General Device Settings

The following list shows you the chapters containing the desired information.
You can find more about:

- **Chatter blocking** in *3.9.1 Signal Filtering and Chatter Blocking for Input Signals*.
- **Control** in *7.4 Control Functionality*.
- **Measured values** in *9.1 Overview of Functions*
- **Spontaneous indications** in *3.1.7 Spontaneous Indication Display in DIGSI 5*.
- **Continuous Function Chart Quality Treatment** in *3.4.3 Quality Processing/Affected by the User in CFC Charts*.

Under **Device**, you set the parameters for the device that are valid across functions.

With **Test support**, indications issued via communication interfaces are labeled with an additional test bit, if this is supported by the protocol. With this test bit you can determine whether an indication is generated in a test and all or individual functions of the device are in the test mode. In this manner the reactions that are necessary in normal operation due to an indication can be suppressed in other devices that receive these indications. You can also permit, for example, a trip command to close an energized binary output for test purposes. Siemens recommends deactivating the **Test support** again after the test phase.

From version **DIGSI V09.70** on, you can control the state of the logical nodes (LLN0) in a logical device (LD) under **IEC 61850** with the parameter **`LDevice Mod controllable`**. If you want to test and change the behavior of logical nodes individually, place a checkmark on the parameter **`LDevice Mod controllable`**.

### 3.11.2.2 Application and Setting Notes

The major portion of the settings is described in the chapters cited above. Then, the parameters on the section **Device**, **Spontaneous indication** and **Test support** are described.

**Parameter: Rated frequency**

- Default setting **`(_:101) Rated frequency`** = ***`50 Hz`***

With the parameter **`Rated frequency`**, you set the rated frequency of the electrical power system.

**Parameter: Minimum operate time**

- Default setting **`(_:102) Minimum operate time`** = ***`0.00 s`***

With the parameter **`Minimum operate time`**, you set the minimum duration for the trip command of the functions. The trip command is maintained for the set duration.

**Parameter: Set. format residu. comp.**

- Default setting **_:115** = ***Kr, Kx***

With the parameter **Set. format residu. comp.**, you specify the setting format for the residual compensation factors that apply across functions. You can set the residual compensation using the scalar factors ***Kr, Kx*** or as a complex factor using ***K0***.

The setting format controls the visibility of the residual compensation factors in the **Distance protection**.

**Parameter: Block monitoring dir.**

- Default setting **(_:138) Block monitoring dir.** = ***off***

With the parameter **Block monitoring dir.**, you set whether indications are output via the system interface(s) of the SIPROTEC 5 device or not.

If transmission blocking is switched on, no indications are output via the system interface(s) of a SIPROTEC 5 device, except via the IEC 61850 interface(s).

To avoid receiving IEC 61850 data, the corresponding IEC 61850 Client must stop the reporting or freeze the data. You can find more information in the Communication Protocols Manual (C53000-L1840-C055-3).

**Parameter: Fault-display**

- Default setting **(_:139) Fault-display** = ***with pickup***

With the parameter **Fault-display**, you set whether spontaneous fault indications which are signed as ***NT (conditioned latching)*** in the matrix, get stored with every pickup or only for one tripping.

Keep the DIGSI 5 routing options in chapters *3.1.7 Spontaneous Indication Display in DIGSI 5* and *3.1.9 Stored Indications in the SIPROTEC 5 Device* in mind.

**Parameter: Activate device test mode**

- Default setting **(_:150) Activate device test mode** = inactive

With the parameter **Activate device test mode**, you can activate the test mode for the complete device. This means that all indications generated in the device are given a test bit.

For further information, refer to *11.2 Enabling/Disabling the Application/Test Mode for the Entire Device*.

Apart from activating the test mode via this parameter, you can also activate the test mode using the IEC 61850-8-1 protocol. For more information, refer to the manual *SIPROTEC 5 Communication protocol*.

When the test mode is activated for the complete device, but the parameter **Oper.bin.outp. under test** is not, the routed relay outputs of the device are not activated by the generated the indications.

**NOTE**

The device remains in test mode during every restart until you intentionally set the device back into process mode or you have carried out an initial start.

You can set the process mode by switching the parameter **Activate device test mode** to inactive again (removing the check mark) or by deactivating the test mode again via the protocol IEC 61850-8-1.

**NOTE**

Besides the cross device test mode, you also have the option to place an individual function or stage into test mode depending on the supported operating modes of a function or stage. To do this, see the description of the relevant function or stage.

When you place an individual function or stage into the test mode, all indications issued by this function or stage are given a test bit.

When you activate the test mode for an individual function or stage, but not the parameter **Oper.bin.outp. under test**, the routed relay outputs of the function or stage are not activated by the generated indications.

An individual function or stage remains in the test mode during every restart until you have intentionally deactivated the test mode for this function or stage again or carried out an initial start.

**Parameter: Oper.bin.outp. under test**

- Default setting **(_:151) Oper.bin.outp. under test** = inactive

If you activate the parameter **Oper.bin.outp. under test**, the indications generated in the device and marked with a test bit can be issued to a routed relay output of the device, that is, you enable the relay outputs of the device to be opened and closed.

If only one individual function or stage of the device is in test mode, that is, the cross device tested mode has not been activated, only the indications of this function or stage are marked with a test bit and the routed relay outputs of the device are activated.

With the parameter **(_:151) Oper.bin.outp. under test**, you define whether the functions in ***Test*** state can activate relay outputs. If the parameter **(_:151) Oper.bin.outp. under test** and the test mode are activated for the entire device, all functions – including the relay outputs – are in ***Test*** state. If the parameter **(_:151) Oper.bin.outp. under test** is not active and the test mode is activated for the entire device, all functions – except the relay outputs – are in ***Test*** state. The relay outputs adopt the **Test/Relay blk.** state.

**Output Signal: Functions in Test mode**

Normally, the output signal *Functions in Test mode* is prerouted to the last LED of the device base module. If one or more protection or control functions are in test mode, the output signal *Functions in Test mode* is generated and the corresponding LED of the device lights up red.

**Parameter: LDevice Mod controllable**

- Default setting **(_:181) LDevice Mod controllable** = inactive

With the parameter **LDevice Mod controllable**, you control the state of the logical nodes (LLN0) in a logical device (LD). If you want to test and change the behavior of logical nodes individually, place a checkmark on the parameter **LDevice Mod controllable**.

Once the checkmark is placed, the **LLN0:Mode** can be controlled in a logical device.

### 3.11.2.3 Settings

| Addr. | Parameter | C | Setting Options | Default Setting |
|---|---|---|---|---|
| ***Device*** | | | | |
| _:101 | General:Rated frequency | | • 50 Hz<br>• 60 Hz | 50 Hz |

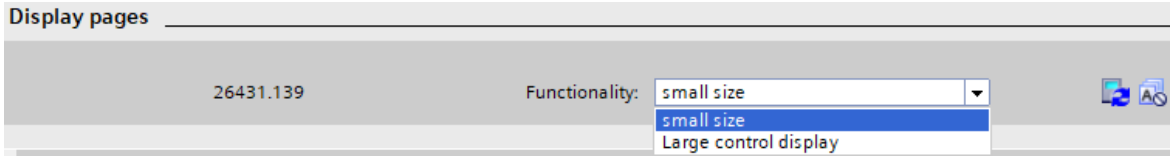
## 3.11.3 Display-Page Setting

### 3.11.3.1 Overview

Specific SIPROTEC 5 devices can be ordered with the operation-panel option **Large display, display-page size config., dual c.LEDs**. In this case, the size of the configurable display pages is settable by the user, and is function-points dependent:



- Small display pages can be configured without extra function points.
- Large display pages for large control displays require extra function points.

For devices with the operation panel **Large display, display-page size config., dual c.LEDs**, you can find the block **Display pages** in **Device settings** in DIGSI 5.

[sc_Display_page_Operation Panels, 1, en_US]

Figure 3-148 Operation Panel **Large display, display-page size config., dual c.LEDs** in DIGSI 5

[sc_Functionality_block1, 2, en_US]

Figure 3-149 Block **Display pages** in DIGSI 5

### 3.11.3.2 Application and Setting Notes

**Parameter: Functionality**

- Default setting **(_:139) Functionality** = ***small size***

With the parameter **Functionality**, you set the size of the display pages that are shown in DIGSI 5 and in the HMI.

| Parameter Value | Description |
|---|---|
| ***small size*** | The size of the display page is 240 x 128 pixels.<br>With this size, usually up to 8 operational values or very small control displays with, for example, up to 3 switches can be configured. |
| ***Large control display*** | The size of the display page is 240 x 320 pixels.<br>With this size, large control displays or a large number of operational values, or a combination of both can be configured. |

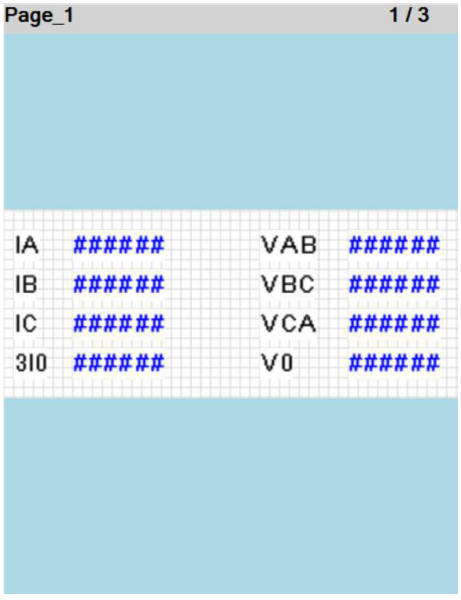


Figure 3-150 Example of Display Page in DIGSI 5 (Small Size)

# 3.12 Using a SIPROTEC 5 Device as a Client or Merging Unit

**Overview with the Distributed Busbar Protection as an Example (IEC 61850 Compliant):**

- Process bus: for cross-device transmission of the measured values for current and voltage
- GOOSE: For cross-device transmission of the position information of disconnectors and circuit breakers, their trip commands and additional signals
- Distributed busbar protection
- Further information

**Process Bus:**

The process bus is available for the modular SIPROTEC 5 devices. The current and voltage measured values can be transmitted across devices using the process bus. Prerequisite: a ETH-BD-2FO communication module with the appropriate communication protocols. In the following figure, you can see the 7SS85 as an example of the client, and the 6MU85 and other modular SIPROTEC 5 devices as merging units.

[dw_bb8_proj-71-star, 2, en_US]

Figure 3-154 Star Structure for Distributed Busbar Protection with Merging Units Connected via Optical Fibers

**Prerequisites for the Merging Units for the Distributed Busbar Protection (IEC 61850 Compliant)**

You can use all modular SIPROTEC 5 devices (except the railway protection devices 7ST8x and 6MD89) and other IEC 61850 compliant devices as merging units. The following prerequisites apply:

- All clients and merging units must have the firmware version V8.0x or higher.
- All clients and merging units must be connected to the ETH-BD-2FO communication module and must use the process-bus protocols. These include:
  - Consistent use of **IEC 61850 Edition 2.x**. Siemens recommends IEC 61850 Edition 2.1.
  - Process-bus protocol **9-2 Merging Unit** for Merging Units and **9-2 Client** for clients
  - Joint time synchronization. Siemens recommends the **IEEE 1588 protocol**.
- The current and voltage transformers suitable for the target application in the client must be present in the merging units.

**GOOSE:**

As an alternative to using the local binary inputs and binary outputs of a SIPROTEC 5 device, you can use the inputs and outputs of other SIPROTEC 5 devices and transmit them via IEC 61850 including GOOSE.

Examples of binary routings for transmission using GOOSE.

- Circuit-breaker and disconnector position information from the transmitters to the receivers
- Circuit-breaker trip commands from the transmitter to the receivers

### Distributed Busbar Protection

The distributed busbar protection is a distributed protection system with the 7SS85 as the central unit (CU) and other SIPROTEC 5 devices, the merging units (MU) as bay units.

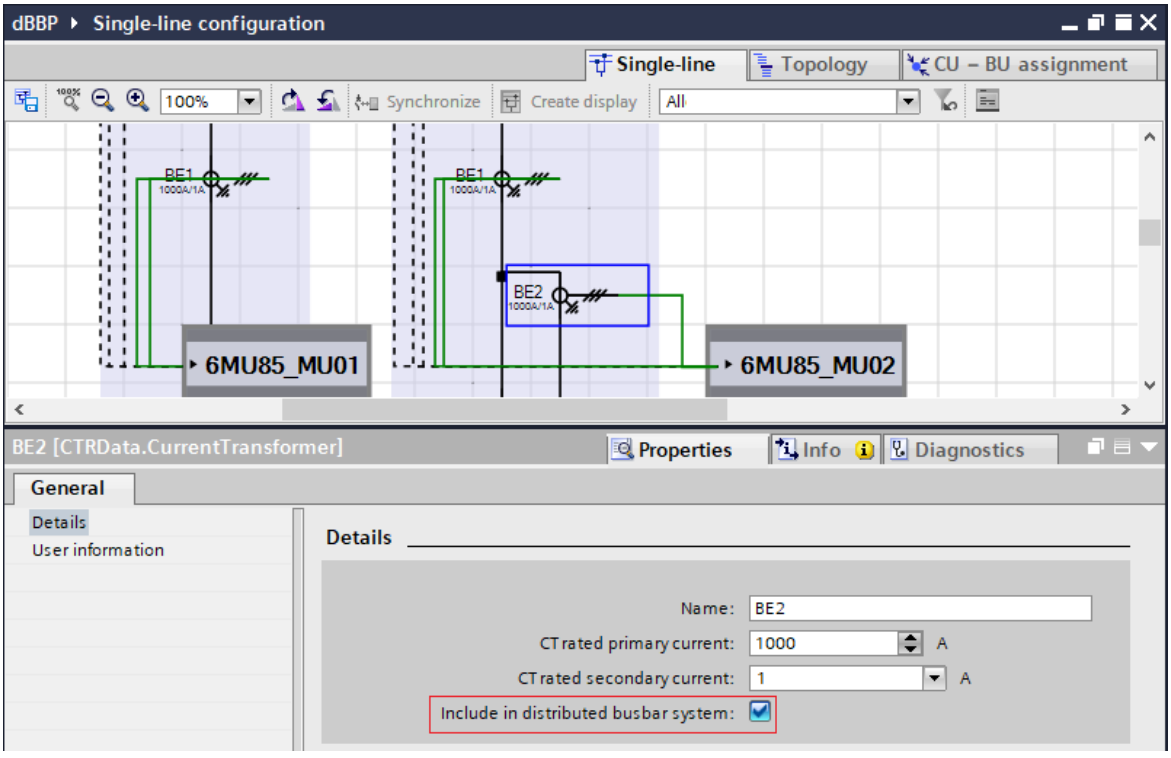
The distributed busbar protection provides the following advantages over the centralized busbar protection or the distributed busbar protection (IEC 61850 compliant):

- Transmission of current measured values (SMV) as per IEC 61850-9-2 (process bus) from the merging units
- Automatic interconnection of current measured values, disconnector-switch and circuit-breaker switch positions
- Local functional enhancements of the merging units
- Maximum number of bays and busbar zones

#### Functional Enhancements in the Devices

Starting with V8.40, the merging units have the following functional enhancements that are especially intended for use with the distributed busbar protection and evaluated there:

- End-fault protection (1-pole/3-pole, 3-pole)
- External tripping
- Inherent circuit-breaker failure protection
- Extension in circuit-breaker failure protection
- Measuring point out of service



**NOTE**

You can find these functional enhancements in the Global DIGSI 5 Library in the respective device, under **FG Circuit breaker** > **dBBP Function extensions**. You can find the function **Measuring point out of service** under **Measuring inputs** > **Current 3-phase** > **dBBP Function extensions** in the respective device.

#### Functional Enhancement in DIGSI 5

If a **distributed busbar protection** is present in the project, the following functional enhancements especially intended for use with the distributed busbar protection are provided in the Single-Line Editor:

- New **CU – BU assignment** tab with the **Update central unit** function.
- Additional **Include in distributed busbar system** check box for current transformers, circuit breakers, and disconnectors in the **Properties** tab.

[sc_bbp8_SLE_incl, 1, en_US]

Figure 3-155 Extension in the **Properties** Tab if the Distributed Busbar Protection is Available

### Further Information

**NOTE**

Analog measured values, binary inputs, and binary outputs are routed across devices in the **IEC 61850 System Configurator**.

For a detailed description of how to use it as a Merging Unit/bay unit for the distributed busbar protection or distributed busbar protection (IEC 61850 compliant), refer to the **Project Engineering** chapter in the **Busbar Protection 7SS85** device manual.

For further information on the process bus, GOOSE, IEC 61850 System Configurator, descriptions of stream types, GOOSE Later Binding, VLAN priority, network redundancies, for example, PRP protocol or the sample and time synchronization using IEEE 1588, refer to the **Process Bus**, **Communication Protocols**, **IEC 61850 System Configurator** and the **DIGSI 5 Help** manuals.

# 4 Applications

| | | |
|---|---|---|
| 4.1 | Overview | 278 |
| 4.2 | Application Templates and Functional Scope of the Device 7UT82 | 279 |
| 4.3 | Application Templates and Functional Scope of the Device 7UT85 | 282 |
| 4.4 | Application Templates and Functional Scope of the Device 7UT86 | 288 |
| 4.5 | Application Templates and Functional Scope of the Device 7UT87 | 298 |

# 4.1 Overview

The Global DIGSI 5 library provides application templates for the applications of the devices. The application template

- Supports the fast realization of complete protection solutions for applications
- Contains the basic configuration for the use case
- Contains functions and default settings for the use case

*EXAMPLE, Page 58* in chapter *2 Basic Structure of the Function* provides an example for the structure of an application template.

When using an application template, note the following:

- Adapt the application template to your specific use (check/adapt default settings, delete/add functions). You can find more detailed information in the *2.1 Embedding of Functions in the Device*.
- Check the routing of binary outputs with respect to fast and normal relays.
- Check the CFC charts for the group-warning indications and group-fault indications.

### Application of the devices 7UT82, 7UT85, 7UT86, and 7UT87

The transformer differential protection **7UT8x** is a selective short-circuit protection for transformers of all voltage series, for longitudinal and shunt reactors, as well as for short lines. The devices contain all functions that you need for protection from transformers and are therefore universally applicable. The main protection function of the devices is the differential protection.

The following describes the application templates and maximum functional scope for the devices 7UT82, 7UT85, 7UT86, and 7UT87.

**NOTE**

The availability of certain settings and setting options depends on the device type and the functions available on the device!

### Number of Measuring Points

The following table shows you the maximum number of device-dependent current and voltage measuring points, which are available to you.

Table 4-1 Number of the Possible Measuring Points per Device

| Device | Number of Measuring Points | | | |
|---|---|---|---|---|
| | I-3ph | I-1ph | V-3ph | V-1ph |
| 7UT82 | 2 | 2 | – | – |
| 7UT85 | 5 | 5 | 5 | 5 |
| 7UT86 | 7 | 7 | 7 | 7 |
| 7UT87 | 20 | 20 | 20 | 20 |

# 4.2 Application Templates and Functional Scope of the Device 7UT82

Application templates are available in **DIGSI 5** for the applications of the device 7UT82. The application templates contain the basic configurations, required functions, and default settings.

The following application templates are available for the device 7UT82 in the **DIGSI 5** function library:

- Two-winding transformer basic (87T)
- Two-winding transformer (87T, 50BF, 87N)
- Motor (87M)

So that the application templates function in the device, the following minimum hardware configuration requirements must be met:

| Application Templates | | Hardware Configuration |
|---|---|---|
| Template 1 | Two-winding transformer basic (87T) | 7 BI, 6 BO, 8 I (base module) |
| Template 2 | Two-winding transformer (87T, 50BF, 87N) | 7 BI, 6 BO, 8 I (base module) |
| Template 3 | Motor (87M) | 7 BI, 6 BO, 8 I (base module) |

The following table shows the functional scope and the required function points of the application templates for device 7UT82:

Table 4-2 Functional Scope of the Application Template for the Device 7UT82

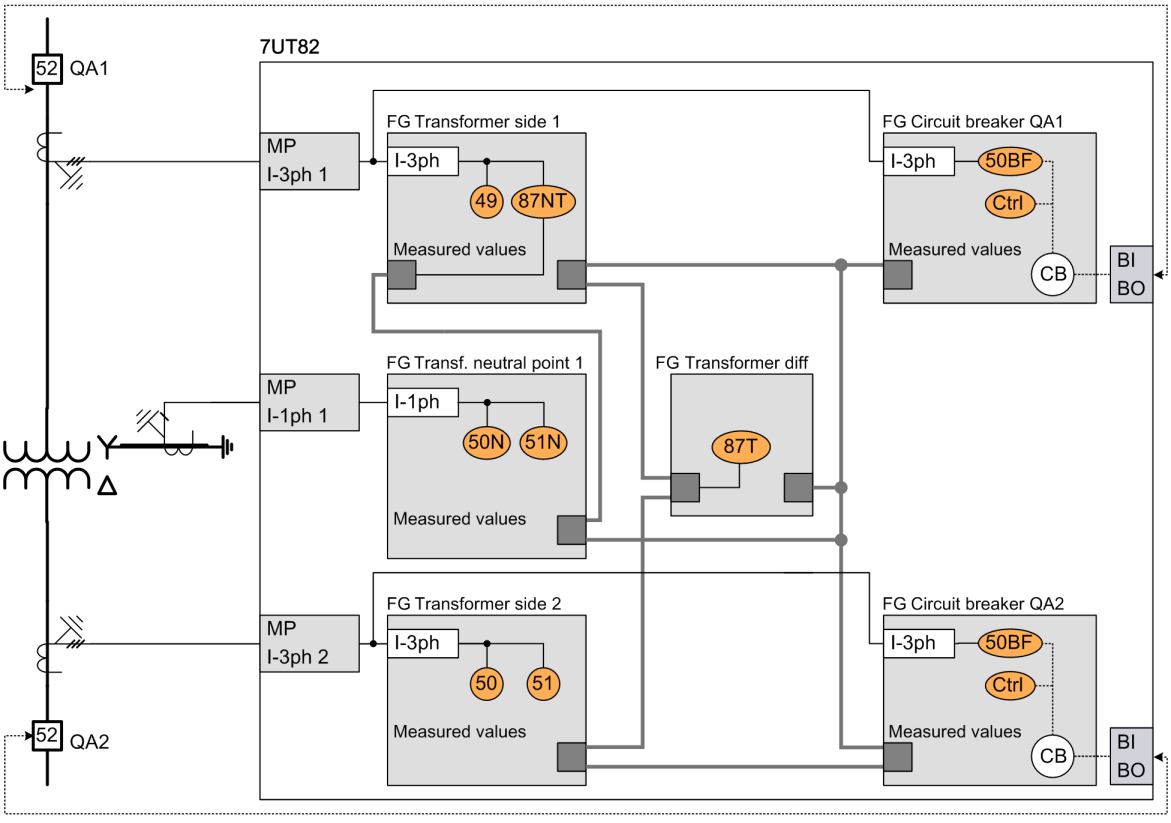
**Application Template: Two-winding transformer basic (87T)**

The **`Two-winding transformer basic (87T)`** application template is preconfigured for the following applications:

- Transformer differential protection (default setting for Yd)
- Overload protection, backup protection for the downstream electrical power system

### Application Template: Two-winding transformer (87T, 50BF, 87N)

The **`Two-winding transformer (87T, 50BF, 87N)`** application template is preconfigured for the following applications:



- Transformer differential protection (default setting for Yd)
- Restricted ground-fault protection on the star side
- Overload protection, backup protection for the downstream electrical power system
- Circuit-breaker failure protection

### Application Template: Motor (87M)

The **`Motor (87M)`** application template is preconfigured for the following applications:

- Differential motor protection
- Overload protection, backup protection for the downstream electrical power system
- Circuit-breaker failure protection

The following *Figure 4-1* shows the structure of the application template **Transformer protection with restricted ground-fault protection**, the measuring points used, the function groups used, their internal circuiting, and the predefined functions.

[dwap2wik82-180314-01, 1, en_US]

Figure 4-1 Protection of a Two-Winding Transformer

# 4.3 Application Templates and Functional Scope of the Device 7UT85

Application templates are available in **DIGSI 5** for the applications of the device 7UT85. The application templates contain the basic configurations, required functions, and default settings.

The following application templates are available for the device 7UT85 in the **DIGSI 5** function library:

- Two-winding transformer basic (87T)
- Two-winding transformer (87T, 50BF, 87N)
- Two-winding transformer 1.5CB (87T, 50BF, 87N)
- Two-winding transformer (87T, 50BF, 90V)
- Motor (87M, 50BF, 59, 27, 81, 46, 49)

So that the application templates function in the device, the following minimum hardware configuration requirements must be met:

| Application Templates | | Hardware Configuration |
|---|---|---|
| Template 1 | Two-winding transformer basic (87T) | 7 BI, 7 BO, 8 I (base module) |
| Template 2 | Two-winding transformer (87T, 50BF, 87N) | 7 BI, 7 BO, 8 I (base module) |
| Template 3 | Two-winding transformer 1.5CB (87T, 50BF, 87N) | Base module + expansion module with current inputs (for example, IO201) |
| Template 4 | Two-winding transformer (87T, 50BF, 90V) | 7 BI, 7 BO, 8 I (base module) |
| Template 5 | Motor (87M, 50BF, 59, 27, 81, 46, 49) | 7 BI, 7 BO, 8 I (base module) |

The following table shows the functional scope and the required function points of the application templates for device 7UT85:

Table 4-3 Functional Scope of the Application Template for the Device 7UT85

| ANSI | Function | Abbr. | Available | Template 1 | Template 2 | Template 3 | Template 4 | Template 5 |
|---|---|---|---|---|---|---|---|---|

**Application Template: Two-winding transformer basic (87T)**

The **`Two-winding transformer basic (87T)`** application template is preconfigured for the following applications:

- Transformer differential protection (default setting for Yd)
- Overload protection, backup protection for the downstream electrical power system

**Application Template: Two-winding transformer (87T, 50BF, 87N)**

The **`Two-winding transformer (87T, 50BF, 87N)`** application template is preconfigured for the following applications:

- Transformer differential protection (default setting for Yd)
- Restricted ground-fault protection on the star side
- Overload protection, backup protection for the downstream electrical power system
- Circuit-breaker failure protection

15 This function is described in the Point-on-Wave Switching Manual

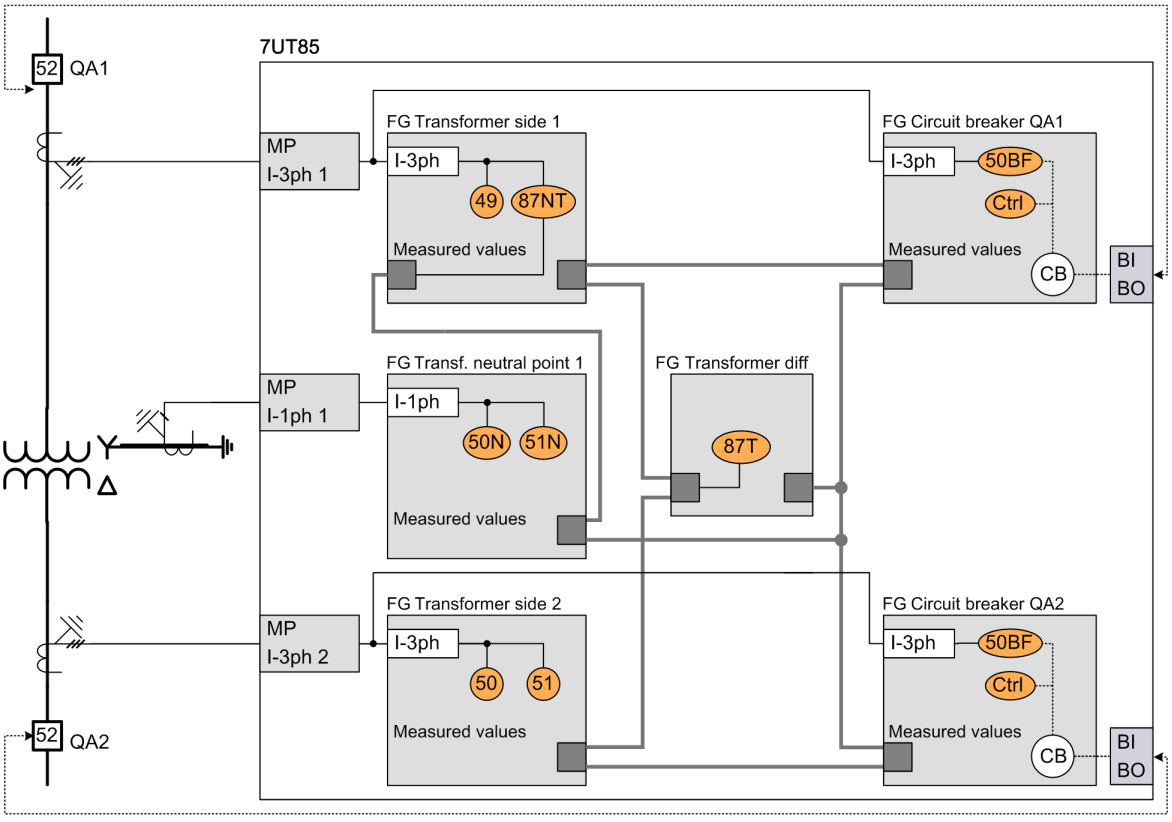
### Application Template: Two-winding transformer 1.5CB (87T, 50BF, 87N)

The **Two-winding transformer 1.5CB (87T, 50BF, 87N)** application template is preconfigured for the following applications:

- Transformer differential protection (default setting for Yd)
- Restricted ground-fault protection on the star side
- Overload protection, backup protection for the downstream electrical power system
- Circuit-breaker failure protection

### Application Template: Two-winding transformer (87T, 50BF, 90V)

The **Two-winding transformer (87T, 50BF, 90V)** application template is preconfigured for the following applications:



- Transformer differential protection (default setting for Yd)
- Overload protection, backup protection for the downstream electrical power system
- Circuit-breaker failure protection
- Voltage controller

### Application Template: Motor (87M, 50BF, 59, 27, 81, 46, 49)

The **Motor (87M, 50BF, 59, 27, 81, 46, 49)** application template is preconfigured for the following applications:

- Differential motor protection
- Overload protection, backup protection for the downstream electrical power system
- Frequency and voltage protection on the upper-voltage side
- Circuit-breaker failure protection

The following *Figure 4-2* shows the structure of the application template **Transformer protection with restricted ground-fault protection**, the measuring points used, the function groups used, their internal circuiting, and the predefined functions.

Figure 4-2 Protection of a Two-Winding Transformer

# 4.4 Application Templates and Functional Scope of the Device 7UT86

Application templates are available in **DIGSI 5** for the applications of the device 7UT86. The application templates contain the basic configurations, required functions, and default settings.

The following application templates are available for the device 7UT86 in the **DIGSI 5** function library:

- Three-winding transformer basic (87T)
- Three-winding transformer 1.5CB (87T, 50BF, 87N)
- Three-winding transformer (87T, 50BF, 87N, 21)
- Auto transformer (87T, 87N, 50BF)
- Auto transformer 1.5CB (2 x 87T, 50BF, 59, 81)

The application templates for a two-winding application can also be used in a 7UT86.

You can find more information in *4.3 Application Templates and Functional Scope of the Device 7UT85*.

So that the application templates function in the device, the following minimum hardware configuration requirements must be met:

| Application Templates | | Hardware Configuration |
|---|---|---|
| Template 1 | Three-winding transformer basic (87T) | 11 BI, 19 BO, 12 I, 4 V |
| Template 2 | Three-winding transformer 1.5CB (87T, 50BF, 87N) | 11 BI, 19 BO, 12 I, 4 V |
| Template 3 | Three-winding transformer (87T, 50BF, 87N, 21) | 11 BI, 19 BO, 12 I, 4 V |
| Template 4 | Auto transformer (87T, 87N, 50BF) | 11 BI, 19 BO, 12 I, 4 V |
| Template 5 | Auto transformer 1.5CB (2 x 87T, 50BF, 59, 81) | 23 BI, 34 BO, 12 I, 4 V |

The following table shows the functional scope and the required function points of the application templates for device 7UT86:

**Application Template: Three-winding transformer basic (87T)**

The **`Three-winding transformer basic (87T)`** application template is preconfigured for the following applications:

- Transformer differential protection (default setting for Ydxdy)

16 This function is described in the Point-on-Wave Switching Manual

**Application Template: Three-winding transformer 1.5CB (87T, 50BF, 87N)**

The **Three-winding transformer 1.5CB (87T, 50BF, 87N)** application template is preconfigured for the following applications:

- Transformer differential protection (default setting for YNdxdx)
- Restricted ground-fault protection on the star side
- Ground current protection on the neutral side as backup protection for the electrical power system
- Overload protection
- Frequency and voltage protection on the neutral side
- Circuit-breaker failure protection

**Application Template: Three-winding transformer (87T, 50BF, 87N, 21)**

The **Three-winding transformer (87T, 50BF, 87N, 21)** application template is preconfigured for the following applications:

- Transformer differential protection (default setting for YNdxdx)
- Restricted ground-fault protection on the star side
- Ground current protection on the neutral side as backup protection for the electrical power system
- Overload protection
- Frequency and voltage protection on the neutral side
- Circuit-breaker failure protection
- Distance protection

**Application Template: Auto transformer (87T, 87N, 50BF)**

The **Auto transformer (87T, 87N, 50BF)** application template is preconfigured for the following applications:

- Transformer differential protection for the entire transformer (auto winding and stabilizing winding)
- Restricted ground-fault protection (neutral point and maximum side current)
- Overload protection, backup protection for the downstream electrical power system
- Circuit-breaker failure protection

**Application Template: Auto transformer 1.5CB (2 x 87T, 50BF, 59, 81)**

The **Auto transformer 1.5CB (2 x 87T, 50BF, 59, 81)** application template is preconfigured for the following applications:

- Transformer differential protection for the entire transformer (auto winding and stabilizing winding)
- Node-point protection for the auto winding for recording ground faults (3-phase recording of the neutral-point current)
- Overload protection, backup protection for the downstream electrical power system
- Frequency and voltage protection on the upper-voltage side
- Circuit-breaker failure protection

To display the different, and at the same time new, options, 5 application templates are described in detail.

**Application Template: Three-Winding Transformer in a Breaker-and-a-half Layout**

The 1st application is the template for protection of a three-winding transformer in a breaker-and-a-half layout. You can recognize the 3 required function groups for the transformer side, the integration of the restricted ground-fault protection as well as the internal circuiting, and selected functions. In addition, a voltage transformer is available on the upper-voltage side. Here, for example, voltage and frequency limits can be monitored. The required protection settings are made depending on the system.

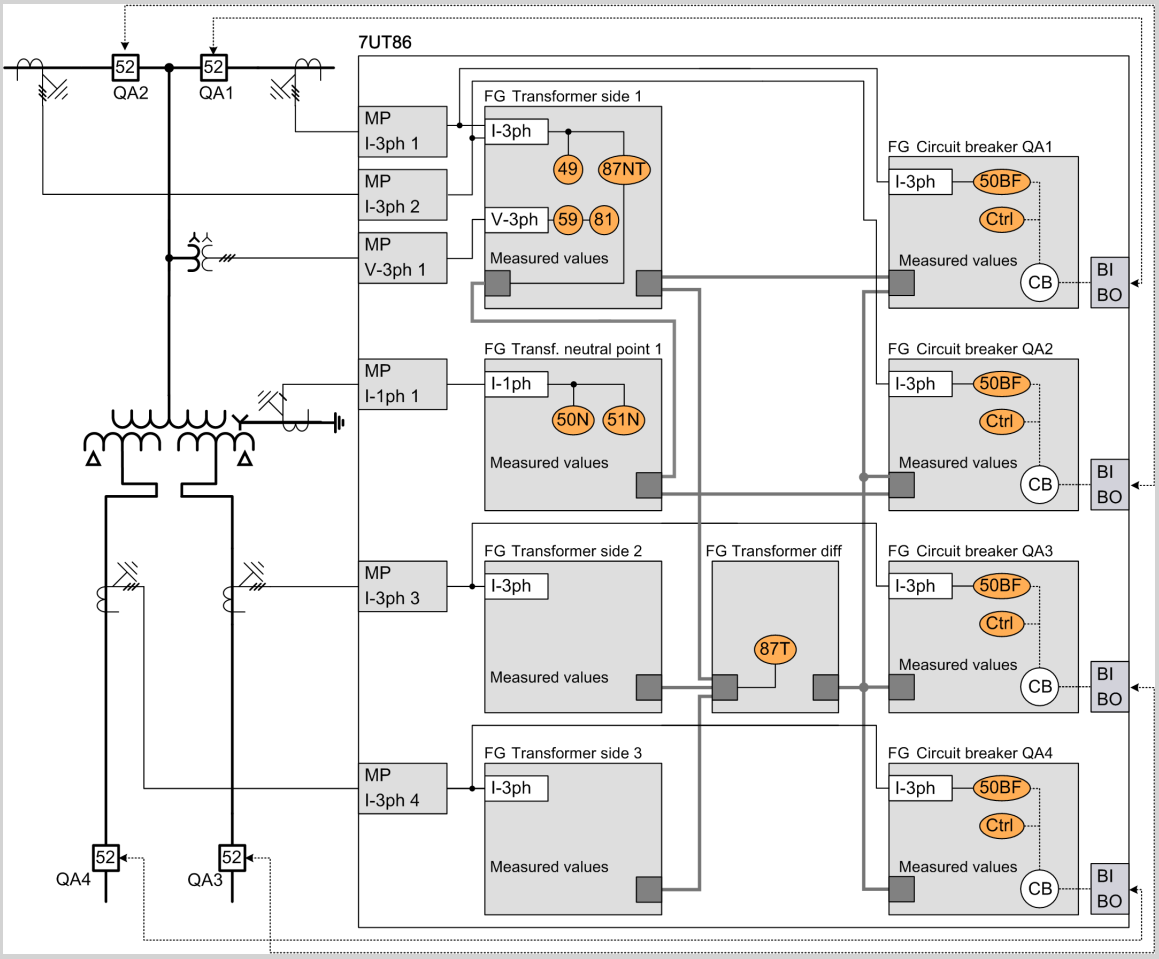

Figure 4-3 Protection of a Three-Winding Transformer

**Application Template: Protection of an Auto-Transformer Bank in a Breaker-and-a-Half Layout**

The 2nd application is the template for protection of an auto-transformer bank, which is connected to a breaker-and-a-half layout. The special feature of this application is that per phase the neutral-point side current is directly recorded. A separate node-point differential protection via the auto winding reliably records ground faults and winding shorts. There are 2 differential protection functions (87T and 87TNode) assigned across the entire transformer (auto and stabilizing winding). Both functions run in the **Auto transformer** function group.

Through this type of execution you have a redundant, differential protection supplemented in sensitivity. A separate restricted ground-fault protection is not required. In addition, a voltage transformer is available on the upper-voltage side. Here, for example, voltage and frequency limits can be monitored. The required protection settings are made depending on the system.

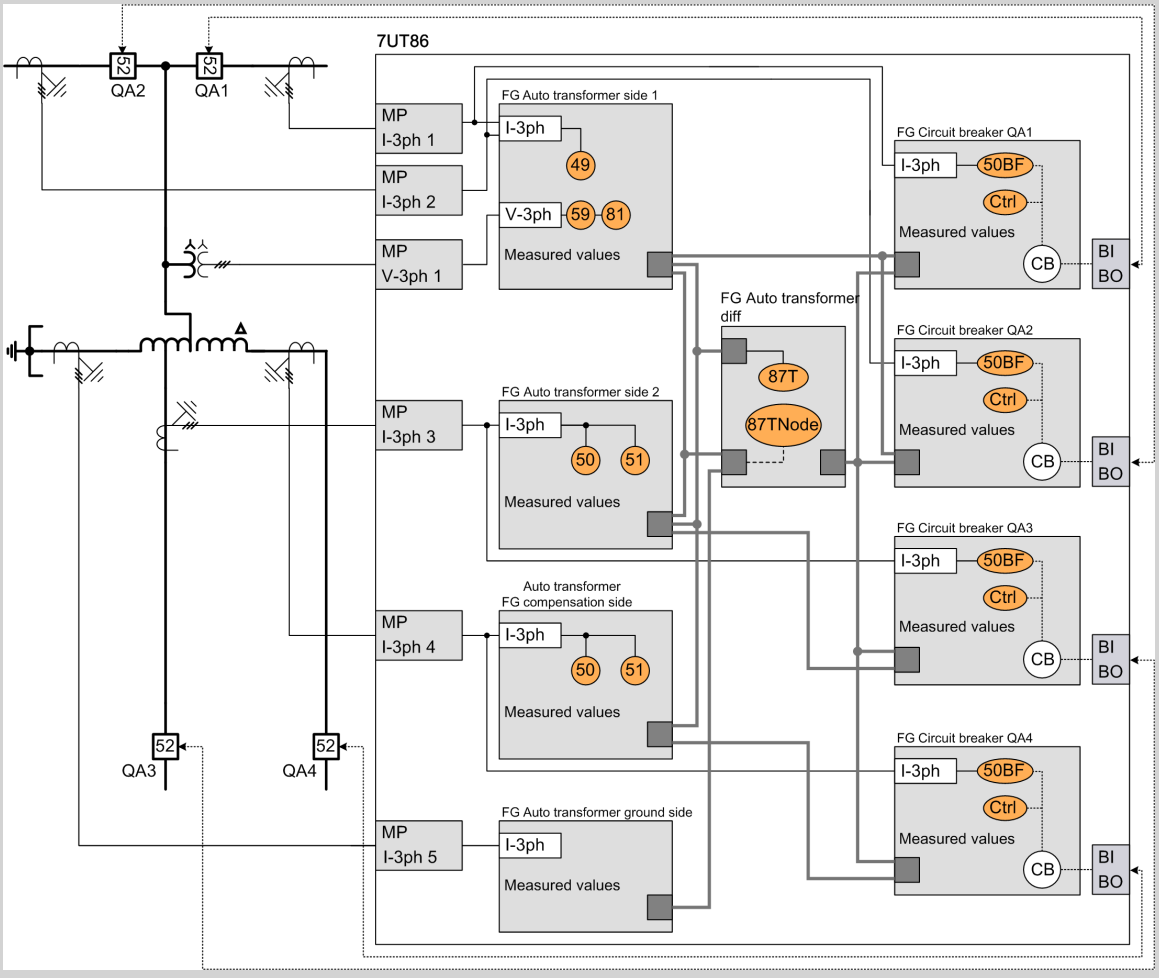

Figure 4-4 Protection of an Auto-Transformer Bank

**Application Template: Motor Protection**

The 3rd application is the template for motor protection. You can see the 2 function groups that are required for the motor sides as well as the circuiting, and selected functions. In addition, a voltage transformer is available on the upper-voltage side. Here, for example, voltage and frequency limits can be monitored. The required protection settings are made depending on the system.

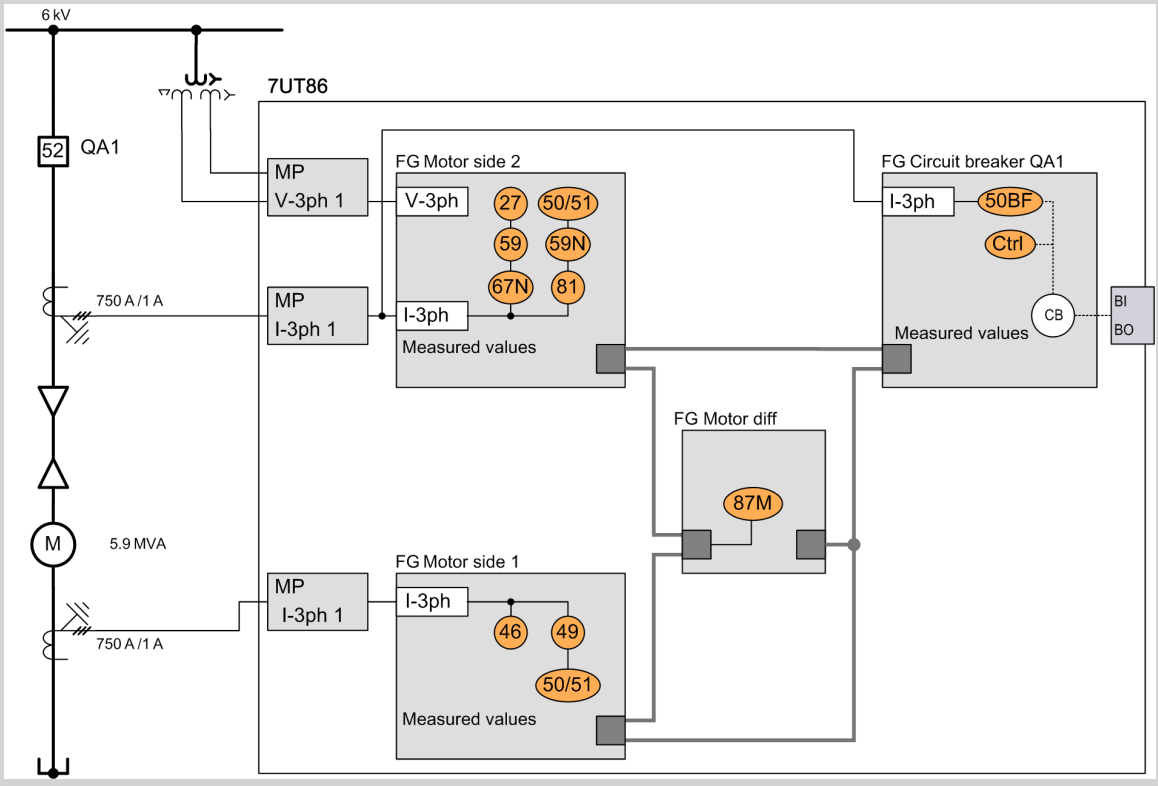

Figure 4-5 Motor Protection

**Application Template: Control/Feedback Control of Power Transformers**

The 4th application is the template for control/feedback control of power transformers (two-winding transformers, three-winding transformers or grid coupling transformers) and auto transformers using a motor-operated tap changer with transformer voltage regulator functionality (ANSI 90 V).

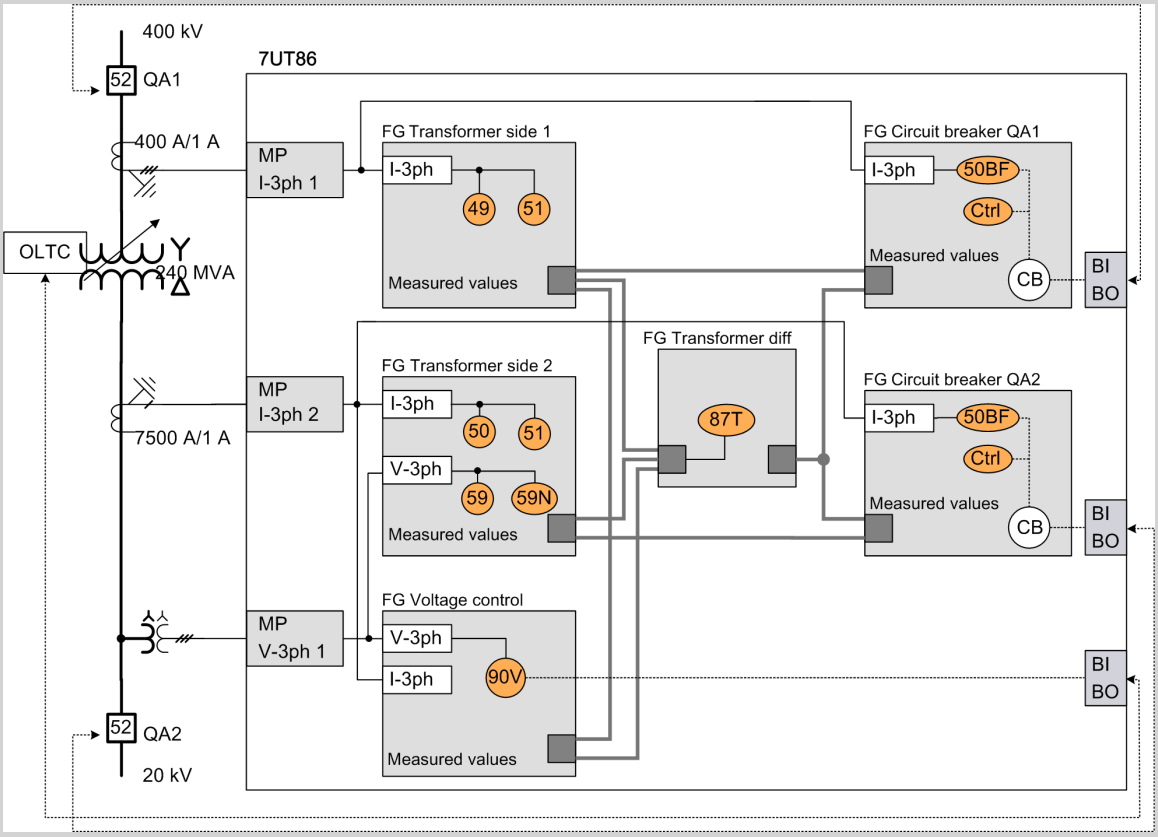

Figure 4-6 Transformer Protection with Voltage Control Functionality

### Application Template: Protection of a Three-Winding Transformer with Distance Protection

The 5th application is the template for protection of a three-winding transformer. The neutral-point current of the upper-voltage side is measured and taken into account for the differential protection. In addition, restricted ground-fault protection is instantiated for the upper-voltage side. A special feature of this application is the additional protection for the feeder on the 3rd side. The distance protection used trips the circuit breaker for this feeder if there is a fault in the line. If the distance protection is only tripped at the tripping stage **Z4 non-directional** due to the power system or error conditions, circuit breaker 1 of the transformer feed is tripped.

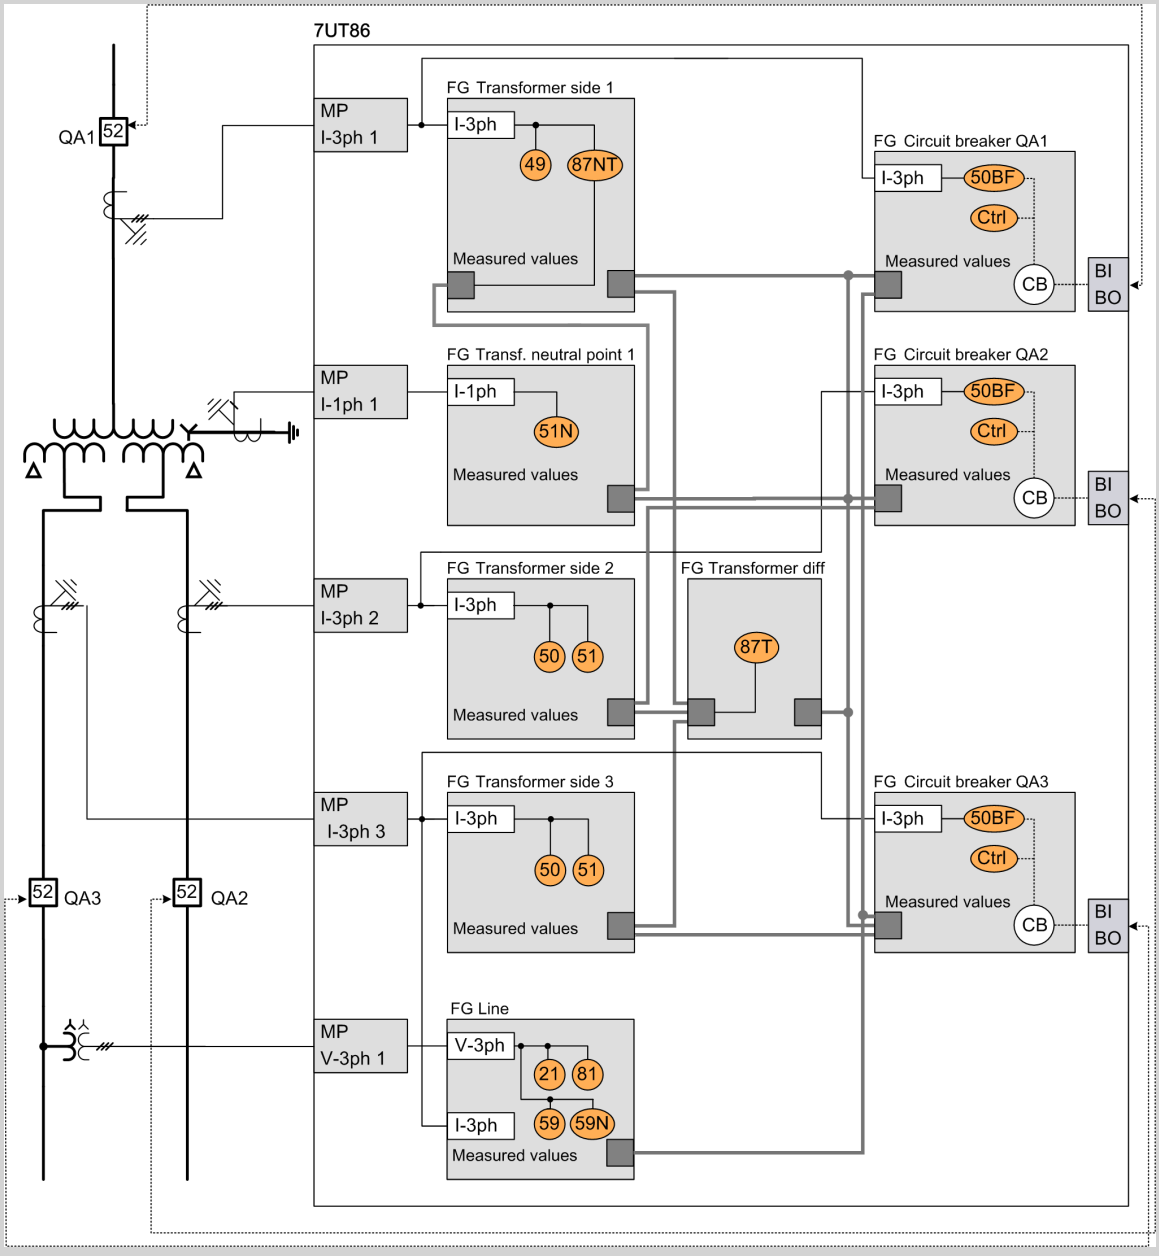

Figure 4-7 Three-Winding Transformer with Distance Protection

# 4.5 Application Templates and Functional Scope of the Device 7UT87

Application templates are available in **DIGSI 5** for the applications of the device 7UT87. The application templates contain the basic configurations, required functions, and default settings.

All application templates, which were described for the devices 7UT82, 7TUT85, and 7UT86, can be implemented in 7UT87.

Besides the functional scope of the 7UT86, the **Differential protection for phase-angle regulating transformers (Two-Core PST)** function is available.

The 7UT87 is intended for special applications (up to 5 sides and 7 measuring points), therefore, create your own application template depending on the application. Save this template with the device. To make your work easier, you can use an available template and modify it. Application suggestions can be taken from the device catalog **Transformer Differential Protection 7UT82, 7UT85, 7UT86, 7UT87**.

# 5.1 Overview Function Group Transformer Differential Protection

## 5.1.1 Function-Group Types

In the following graphic, you can see the structural association of the function-group types.

[dwfguebt-291112-01.tif, 1, en_US]

Figure 5-1 Transformer Diff Function-Group Types

The following function-group types are summarized in the Global DIGSI 5 library:

- **Transf. diff.**
- **Transformer side**
- **Transf. neutral point** (transformer neutral point)

The individual function group types are stored in the **Transformer diff function group** folder and can be selected. In the protection function folders, you find all protection functions which are operational in each function group. A **Transf. diff.** function group always contains 2 **Transformer side** function groups. The **Transf. neutral point** function group can be connected if needed with the **Transformer side** function group.

The following table shows the number of function-group types that can be instantiated depending on the device (7UT82, 7UT85, 7UT86, 7UT87).

**NOTE**

By purchasing 70 or 120 function points, the 7UT85 and 7UT86 can be expanded to a three-winding transformer or a multi-winding transformer. Provide the respective number of measuring inputs that are required for the expansion.

Table 5-1 Function-Group Types in the Device

| Device | Function-Group Type | | |
|---|---|---|---|
| | Transf. Diff. | Transformer Side | Transf. Neutral-Point Function Group |
| 7UT82 | Max. 1 | Max. 2 | Max. 2 |
| 7UT85 | Max. 1 | Max. 3 (2 open) | Max. 2 |
| 7UT86 | Max. 1 | Max. 4 (3 open) | Max. 3 |
| 7UT87 | Max. 3 | Max. 7 | Max. 5 |

In order for the transformer protection to operate properly, switching of the function group is necessary. *Table 5-2* provides an overview of those switching options that are permitted. The Circuit-breaker function group is not listed. The figures shown in the application templates (see *Figure 4-2* to *Figure 4-7*) offer a good overview of the interconnection options.

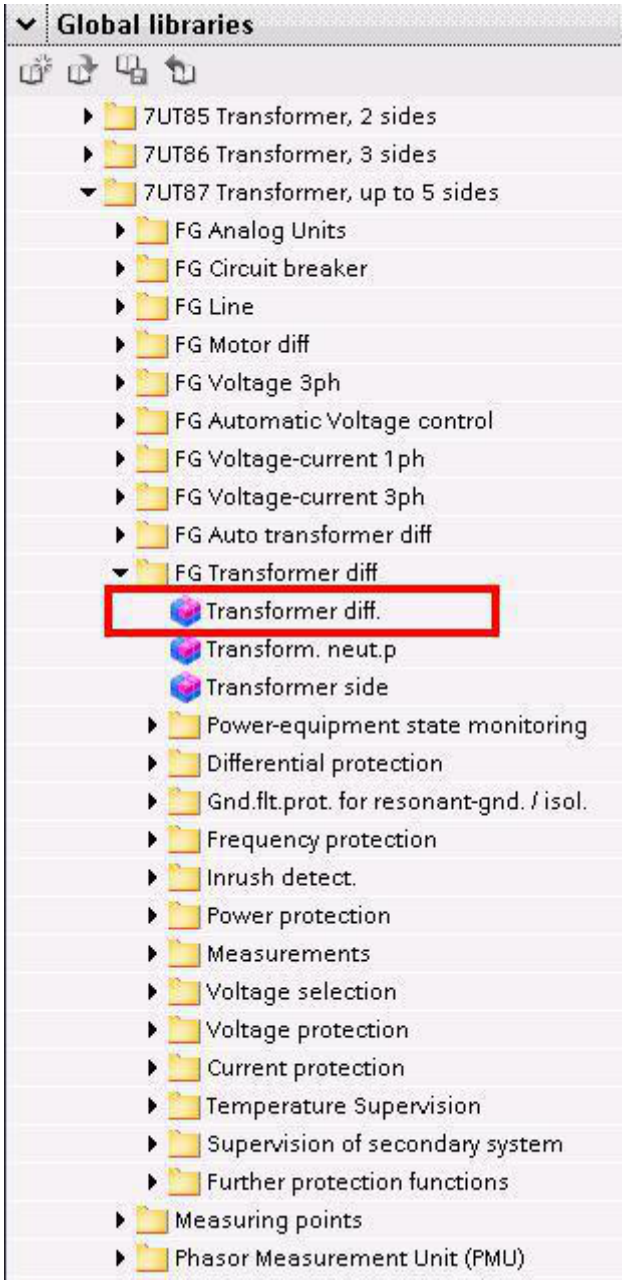
A **Transformer side** function group must always be connected with the **Transformer Diff.** function group. Depending on the application, an interconnection of the **Transf. neutral point** function group with the **Transformer side** function group is required. This is the case, for example, if a restricted ground-fault protection is used or if the neutral point current in the differential protection should be considered (zero-sequence current correction). The reverse can also be the case, that the **Transf. neutral point** needs signals from the **Transf. diff.** function group. A typical case is the inrush-current detection, which can be used for blocking a 1-phase overcurrent protection (with a short time delay set).

Table 5-2 Assignment of Protection Function Groups to Protection Function Groups

| Winding | Transf. Diff. 1 | Transformer Side 1 | Transformer Side 2 |
|---|---|---|---|
| | Side (2 ... 5) | Neutral-Point Function Group (0 ... 1) | Neutral-Point Function Group (0 ... 1) |
| Transformer side 1 | X | - | - |
| Transformer side 2 | X | - | - |
| Transformer side 3 [17] | X | - | - |
| Transformer side 4 [18] | X | - | - |
| Transformer side 5 [19] | X | - | - |
| Transf. neutral point 1 | - | X | |
| Transf. neutral point 2 | - | | X |

The individual function-group types are described in the following.

## 5.1.2 Function-Group Type Transformer Differential Protection



### 5.1.2.1 Overview

The **Transf. diff.** function group contains the differential protection function and protection function relevant measured values.

You can find more information in chapter *9 Measured Values, Energy Values, and Supervision of the Primary System*.

You will find the corresponding function groups and also the folders with the usable protection functions in the Global DIGSI library under each device type. You can only load the Differential protection function in the **Transf. diff.** function group.

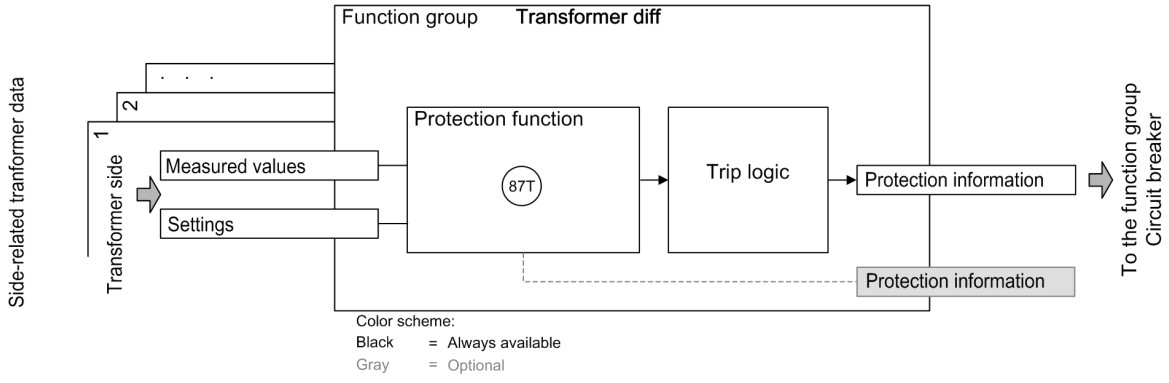
[scpowtrf-230114-01-DE, 1, en_US]

Figure 5-2 Transformer Diff. Function Group - Functional Scope for Device Type 7UT87



For more information about the embedding of the functions in the device, please refer to chapter *2 Basic Structure of the Function*. For information about the overall functional scope of the application templates for the various device types, please refer to chapter *4 Applications*.

### 5.1.2.2 Structure of the Function Group

The **Transf. diff.** function group according to *Figure 5-3* has interfaces with the **Transformer side** and **Circuit breaker** function groups. The **Transf. diff.** function group contains the function blocks:

- Protection function (execution of the differential protection function)
- Trip logic (generation of forwarding of the operate indication)

In order for the protection functionality to be guaranteed, the differential protection function must always be present in the **Transf. Diff.** function group. If you do not use an application template, load this from the Global DIGSI 5 library.

[dwpwrtrf-201112-01.tif, 1, en_US]

Figure 5-3 Structure of the Transformer Differential Function Group

The **Transf. diff.** function group has interfaces to the following function groups:

- **Transformer side** function group
- **Circuit-breaker** function group

### Interface with the Transformer Side Function Group

The **Transf. diff.** function group receives the required measured values via the interface to the **Transformer side** function group. In addition, the required parameters are transferred.

When an application template is used, the **Transf. diff.** function group is connected with the required measuring points.

### Interface to the Circuit-Breaker Function Group

All required data is exchanged between the **Transf. diff.** function group and the **Circuit-breaker** function group via the interface of the **Circuit-breaker** function group. The following data is required:

- Pickup and operate indications of the protection functions in the direction of the Circuit-breaker function group
- Information on the circuit-breaker condition in the direction of the Protection function groups

The **Transf. diff.** function group is connected with one or more circuit-breaker function groups. This connection determines the following data:

- Which circuit breakers are activated by the protection functions of the **Transf. diff.** function group
- Start of the **Circuit-breaker failure protection** function, if available in the circuit-breaker function group, through the protection functions of the connected protection function group **Transf. diff.**

In addition to the general assignment of the **Transf. diff.** function group to the Circuit-breaker function groups, you can configure the interface in detail for specific functionalities. Configure the details in DIGSI 5 using the **Circuit-breaker interaction** editor in the **Transf. diff.** function group.

In the detail configuration of the interface, you define the following:

- Which operate indications of the protection functions are included when the trip command is generated?
- Which protection functions activate the **Circuit-breaker failure protection** function?

If an application template is used, the function groups are connected to each other because this connection is absolutely essential to ensure proper operation. You can modify the connection in DIGSI 5 via the **Function-group connections** Editor. If the connection is missing, DIGSI 5 reports an inconsistency.

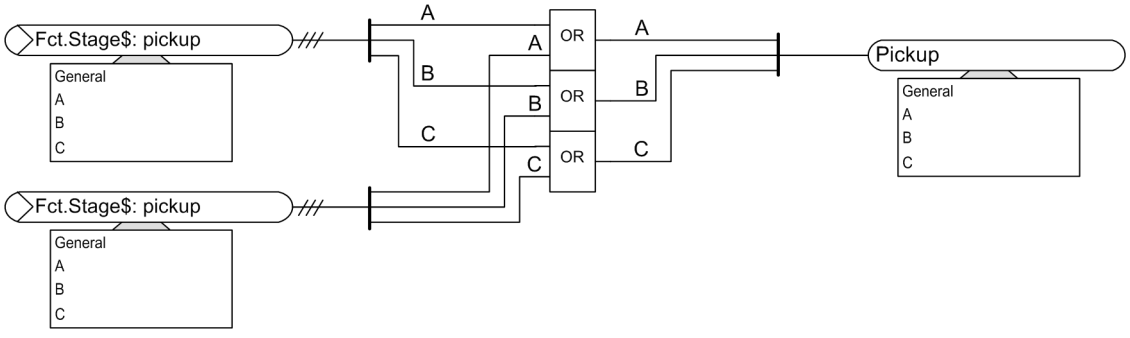
You can find more detailed information in chapter *2.1 Embedding of Functions in the Device*.

### Interface with Protection Communication (Optional)

All required data is exchanged between the protection function group and the protection communication via the interface with **Protection communication** . These data are for example:

- Binary signals
- Measured values
- Complex data

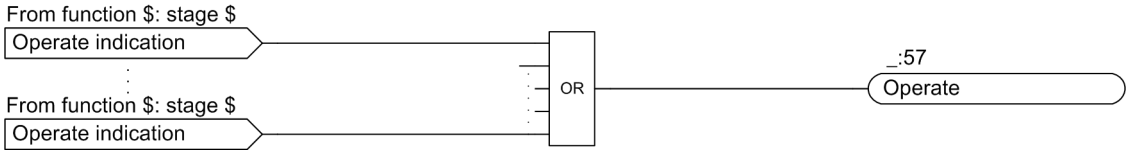
You can find more detailed information in chapter *3.6 Protection Communication*.



### Transformer Data (Side-Related)

The transformer data characterize the data of the transformer to be protected. The **Transf. diff.** function group takes these data from the coupled **Transformer side** function group.

### Output Logic



The output logic treats the pickup and trip signals of the protection and supervision functions in the function group separately, in a pickup logic and an output logic respectively. The pickup and output logic generate the overreaching indications (group signals) of the function group. These group indications are transferred via the **Protection information** interface to the **Circuit-breaker** function group and are processed further there.

The pickup and trip signals of the protection functions in the**Transf. diff.** function group are combined phase-selectively and output as a group indication.

## 5.1.3 Function-Group Type Transformer Side

### 5.1.3.1 Overview

In the **Transformer side** function group, all of the functions that are necessary for protecting and monitoring a transformer side can be used. The **Transformer side** function group also contains the measuring functions. You can find more information in chapter *9 Measured Values, Energy Values, and Supervision of the Primary System*.

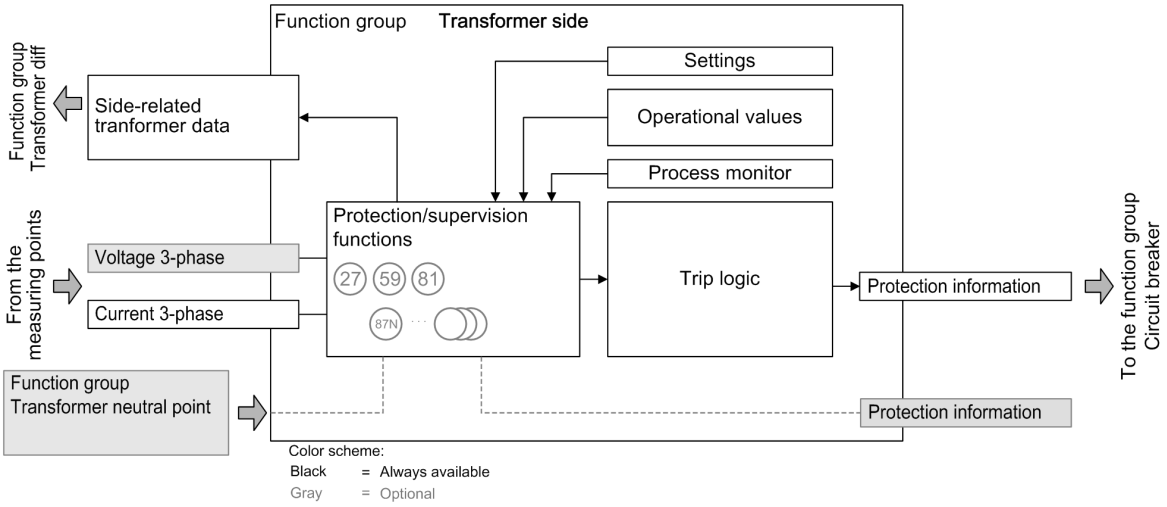
The **Transformer side** function group must always have an interfacing to the **Transformer** function group.

You will find the **Transformer side** function group and the folder with the respective protection functions under each device type in the Global DIGSI 5 library. Depending on the connected measuring points, you can load the respective protection and supervision functions in the **Transformer side** function group. The application templates show you the possible applications. The functions are described in chapter *6 Protection and Automation Functions*.

[scpowsit-230114-01-DE, 1, en_US]

Figure 5-6 Transformer Side Function Group - Functional Scope for Device Type 7UT87

For more information about the embedding of the functions in the device, refer to *2 Basic Structure of the Function*. For information about the overall functional scope of the application templates for the various device types, refer to *4 Applications*.



### 5.1.3.2 Structure of the Function Group

The **Transformer side** function group always contains the following function blocks:

- Side-dependent transformer data
- Operational measured values
- Process monitor
- Output logic of the function group

These blocks are required for the **Transformer side** function group and therefore cannot be loaded or deleted.

You can load the protection and supervision functions required for your application in the **Transformer side** function group. The functions are available in the Global DIGSI 5 library. Functions that are not needed can be deleted from the function group.

[dwpwrsid-291112-01.tif, 1, en_US]

Figure 5-7 Structure of the Transformer Side Function Group

The **Transformer side** function group has interfaces with the following function groups: Measuring points

- **Measuring points**
- **Circuit-breaker** function group
- **Transformer diff.** function group
- **Transformer neutral point** function group

### Interfaces with Measuring Points

The **Transformer side** function group receives the required measured values via its interfaces with the measuring points.

If you are using an application template, the **Transformer side** function group is connected to the necessary measuring points.

If you add functions to the **Transformer side** function group, they will automatically receive the measured values from the correct measuring points. If you add protection functions to the function group but the necessary measuring point is not connected, DIGSI 5 reports an inconsistency. Configure the measuring points in DIGSI 5 via the **Function-group connections** Editor.

You can find more detailed information in chapter *2 Basic Structure of the Function*.

The **Transformer side** function group has the following interfaces with the measuring points:

- **`3-phase voltage`** (optional):

  The measurands from the 3-phase voltage system are supplied via this interface. Different transformer connection types are possible. All values that can be calculated from the measurands are also provided via this interface.

- **`3-phase current`**:

  The measurands from the 3-phase power system are supplied via this interface. Depending on the transformer connection type, these are for example: $I_A$, $I_B$, $I_C$, $I_N$ or $3I_0$. All values that can be calculated from the measurands are also provided via this interface. The **Transformer side** function group must always be linked to the **I-3ph measuring point**.

  You can connect the **`3-phase current`** interface to a maximum of **four** 3-phase current measuring points, for example, for 1 1/2 circuit-breaker layouts, two 3-phase current measuring points are required. If 2 current measuring points have been connected to the **3-phase current** interface, the total current is also determined from measured values from both measuring points in the **Transformer side** function group. All functions in the **Transformer side** function group have access to these total current values.

**NOTE**

The other interfaces can only be connected to one measuring point each!

### Interface to the Circuit-Breaker Function Group

All required data is exchanged between the **Transformer side** function group and the **Circuit-breaker** function group via the interface of the **Circuit-breaker** function group. The following data is required:

- Pickup and operate indications of the protection functions in the direction of the Circuit-breaker function group
- Information on the circuit-breaker condition in the direction of the Protection function groups

The **Transformer side** function group is connected to one or more circuit-breaker function groups. This connection determines the following:

- Which circuit breakers are activated by the protection functions of the **Transformer side** protection function group
- Start of the **Circuit-breaker failure protection** function, if available in the circuit-breaker function group, through the protection functions of the connected **Transformer side** protection function group

Besides the general allocation of the **Transformer side** protection function group to the circuit-breaker function groups, you can also configure the interface for certain functionalities in detail. Configure the details in DIGSI 5 using the **Circuit-breaker interaction** editor in the **Transformer side** function group.

In the detail configuration of the interface, you define the following:

- Which operate indications of the protection functions are included when the trip command is generated?
- Which protection functions activate the **Circuit-breaker failure protection** function?

If an application template is used, the function groups are connected to each other because this connection is absolutely essential to ensure proper operation. You can modify the connection in DIGSI 5 via the **Function-group connections** Editor. If the connection is missing, DIGSI 5 reports an inconsistency.

You can find more detailed information in chapter *2.1 Embedding of Functions in the Device*.

### Interface with Protection Communication (optional)

All required data is exchanged between the protection function group and the protection communication via the interface with **Protection communication**, for example:

- Binary signals
- Measured values
- Complex data

You can find more detailed information in chapter *3.6 Protection Communication*.

### Side-Dependent Transformer Data

The side dependent transformer data characterize the transformer side to be protected. The side dependent transformer data applies for all of the functions in the **Transformer side** function group.

### Process Monitor

The process monitor is always present in the **Transformer side** function group and cannot be removed. The process monitor provides the following information in the **Transformer side** function group:

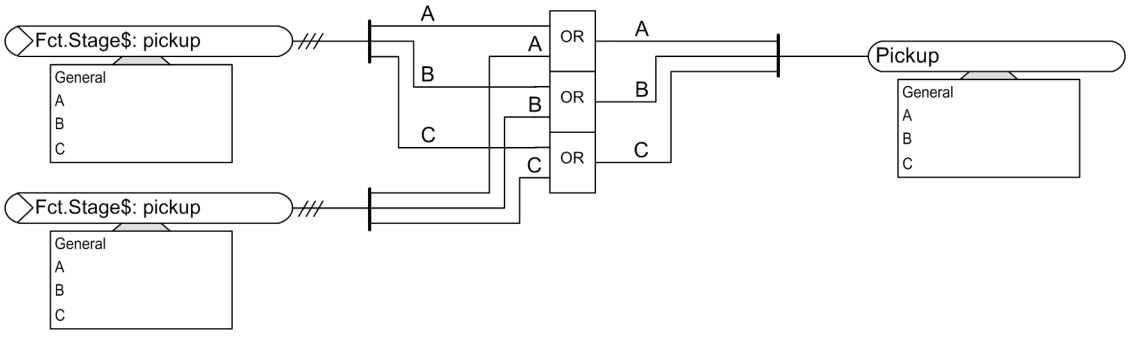
- Current-flow criterion:
  Detection of an open/activated transformer side based on the flow of leakage current
- Closure detection:
  Detection of closure of the transformer side
- Cold-load pickup detection (optional):

This information is in the **Transformer side** function group and is available to all the functions in the function group.
The description of the process monitor begins in chapter *5.14 Process Monitor*.

### Operational Measured Values

The operational measured values are always present in the **Transformer side** function group and cannot be deleted. If a 3-phase voltage measuring point is connected, the following table shows the total scope. Only the first 3 lines apply for exclusive current connection.

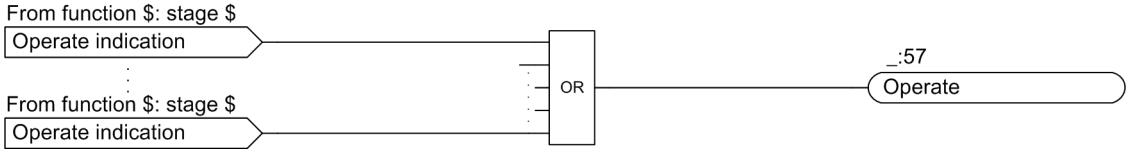
Table 5-3 Possible Operational Measured Values of the Transformer Side Function Group



| Measured Values | | Primary | Secondary | % Referenced to |
|---|---|---|---|---|
| $I_A$, $I_B$, $I_C$ | Phase currents | A | A | Rated operating current of the primary system |
| 3I0 | Calculated zero-sequence current | A | A | Rated operating current of the primary system |
| $I_N$ | Measured zero-sequence current | A | A | Rated operating current of the primary system |
| $V_A$, $V_B$,$V_C$ | Phase-to-ground voltages | kV | V | Rated operating voltage of the primary system/√3 |
| $V_{AB}$, $V_{BC}$, $V_{CA}$ | Phase-to-phase voltages | kV | V | Rated operating voltage of the primary system |
| $V_0$ | Calculated zero-sequence voltage | kV | V | Rated operating voltage of the primary system/√3 |
| $V_N$ | Measured neutral-point displacement voltage | kV | V | Rated operating voltage of the primary system/√3 |
| f | Frequency | Hz | Hz | Rated frequency |
| P | Active power (total power) | MW | – | Active power of the primary system $\sqrt{3} \cdot V_{rated} \cdot I_{rated}$ |
| Q | Reactive power (total power) | Mvar | – | Reactive power of the primary system $\sqrt{3} \cdot V_{rated} \cdot I_{rated}$ |
| S | Apparent power (total power) | MVA | – | Apparent power of the primary system $\sqrt{3} \cdot V_{rated} \cdot I_{rated}$ |
| Cos φ | Active factor | (abs) | (abs) | 100% corresponds to cos φ = 1 |
| $P_A$, $P_B$, $P_C$ | Phase-related active power | MW | – | Active power of the phase $V_{rated\ phsx} \cdot I_{rated\ phsx}$ |

| Measured Values | | Primary | Secondary | % Referenced to |
|---|---|---|---|---|
| $Q_A$, $Q_B$, $Q_C$ | Phase-related reactive power | Mvar | – | Reactive power of the phase $V_{rated\ phsx} \cdot I_{rated\ phsx}$ |
| $S_A$, $S_B$, $S_C$ | Phase-related apparent power | MVA | – | Apparent power of the phase $V_{rated\ phsx} \cdot I_{rated\ phsx}$ |

### Output Logic



The output logic treats the pickup and trip signals of the protection and supervision functions in the function group separately. Pickup logic and output logic are each assigned to the signals. The pickup and output logic generate the overreaching indications (group signals) of the function group. These group indications are transferred via the **Protection information** interface to the **Circuit-breaker** function group and are processed further there.

The pickup and trip signals of the protection and supervision functions in the **Transformer side** function group are combined in a phase-selective manner and output as a group indication.

[lo_auslin, 3, en_US]

Figure 5-9 Generation of an Operate Indication of the Transformer Side Function Group

## 5.1.3.3 Application and Setting Notes

### Interface to the Circuit-Breaker Function Group

Depending on the protection function used and the circuit breakers to be activated, the connection to the corresponding **Circuit breaker** must be provided.

You can find more information in chapter *2 Basic Structure of the Function*.

### Parameter: Rated apparent power

- Default setting **`(_:91:103) Rated apparent power`** = ***692.82 MVA***

With the **`Rated apparent power`** parameter, you can set the primary rated apparent power of the transformer to be protected.

**NOTE**

The windings for transformers with more than 2 windings can have different rated apparent powers. Here the power alone is decisive for the winding, which is assigned to the side.

The **Rated apparent power** parameter is relevant for the main protection function of the device. The **Rated apparent power** set here is the reference value for the percentage-measured values and setting values made in percentages.

**NOTE**

If the device works with the IEC 61850 protocol, then you change the setting value of the parameter only via DIGSI 5 and not directly on the device. If you change the setting value directly on the device, then the IEC 61850 configuration of the metered values can be faulty.

**Parameter: Rated voltage**

- Default setting **(_:91:102) Rated voltage** = ***400.00 kV***

With the **Rated voltage** parameter, you can set the primary rated voltage of the transformer to be protected. The **Rated voltage** parameter is relevant for the main protection function of the device. The **Rated voltage** set here is the reference value for the percentage-measured values and setting values made in percentages.

**NOTE**

If the device works with the IEC 61850 protocol, then you change the setting value of the parameter only via DIGSI 5 and not directly on the device. If you change the setting value directly on the device, then the IEC 61850 configuration of the metered values can be faulty.

**Parameter: Rated current**

- Default setting **(_:91:101) Rated current** = ***1000 A***

The **Rated current** parameter indicates to you the primary rated current of the transformer side. The **Rated current** parameter is relevant for the main protection function of the device. The setting value is formed from the **Rated voltage** and **Rated apparent power** parameters.

**Parameter: Neutral point**

- Default setting **(_:91:149) Neutral point** = ***grounded***

With the **Neutral point** parameter, you specify whether the neutral point is ***grounded*** or ***isolated***. If the neutral point is grounded via a ground current limiting (low-ohmic) or via a arc-suppression coil (high-ohmic), then also set ***grounded***. If there is a neutral point former or a surge arrester within the protection range between the neutral point and ground, the neutral point also is valid as ***grounded***.

**Parameter: Winding configuration**

- Default setting **(_:91:104) Winding configuration** = ***Y (Wye)***

With the **Winding configuration** parameter, you set ***Y (Wye)*** for a star connection of the transformer. Other setting options are ***D (Delta)*** for a delta connection and ***Z (Zig-Zag)*** for a zigzag connection. The **Winding configuration** parameter is relevant for the main protection function of the device.

**Parameter: Vector group numeral**

- Default setting **(_:91:163) Vector group numeral** = ***0***

With the **Vector group numeral** parameter, you set the vector group for the transformer to be protected. Each **Vector group numeral** from 0 to 11 can be set provided it is possible, for example, for Yy, Dd, and Dz only even numerals are possible, for Yd, Yz, and Dy only odd numerals are possible. The **Vector group numeral** parameter is relevant for the main protection function of the device.

**NOTE**

The device also automatically calculates the current adaptation formulas required for the winding rated currents from the rated data of the transformer to be protected and its windings. The currents are converted so that the sensitivity of the protection is based on the rated apparent power of the transformer.

**Parameter: Side number**

- Default setting **(_:91:130) Side number** = ***not assigned***

The **Side number** parameter shows you which transformer side is currently valid for the following parameters. The side number (***Side 1*** to ***Side 5***) is automatically assigned when connecting to a transformer side.

**Parameter: MI3ph1 usesMeasP with ID**

- Default setting **(_:91:210) MI3ph1 usesMeasP with ID** = ***0***

The parameters **MI3ph1 usesMeasP with ID** to **MI3ph4 usesMeasP with ID** show you which 3-phase measuring points (**MI3ph 1** to **MI3ph 4**) are connected to the transformer side. Every measuring point is assigned a unique ID.

**Parameter: M I-1ph uses MeasP with ID**

- Default setting **(_:91:214) M I-1ph uses MeasP with ID** = ***0***

The **M I-1ph uses MeasP with ID** parameter shows you which 1-phase measuring point is connected to the transformer side. Every measuring point is assigned a unique ID.

**Parameter: CT mismatch M I-3ph 1**

- Default setting **(_:91:215) CT mismatch M I-3ph 1** = ***0.000***

The **CT mismatch M I-3ph 1** parameter shows you the magnitude scaling of the phase currents of the 1st assigned measuring point. The numerical value is made up from the ratio of the primary rated current of the current transformer to the transformer rated current of the side.

**Parameter: CT mismatch M I-3ph 1 IN**

- Default setting **(_:91:216) CT mismatch M I-3ph 1 IN** = ***0.000***

The **CT mismatch M I-3ph 1 IN** parameter shows you the magnitude scaling of the ground current of the 1st assigned measuring point.

**Parameter: CT mismatch M I-3ph 2**

- Default setting **(_:91:217) CT mismatch M I-3ph 2** = ***0.000***

The **CT mismatch M I-3ph 2** parameter shows you the magnitude scaling of the phase currents of the 2nd assigned measuring point.

**Parameter: CT mismatch M I-3ph 2 IN**

- Default setting **(_:91:218) CT mismatch M I-3ph 2 IN** = ***0.000***

The **CT mismatch M I-3ph 2 IN** parameter shows you the magnitude scaling of the ground current of the 2nd assigned measuring point.

**Parameter: CT mismatch M I-3ph 3**

- Default setting **(_:91:219) CT mismatch M I-3ph 3** = ***0.000***

The **CT mismatch M I-3ph 3** parameter shows you the magnitude scaling of the phase currents of the 3rd assigned measuring point.

**Parameter: CT mismatch M I-3ph 3 IN**

- Default setting **(_:91:220) CT mismatch M I-3ph 3 IN** = ***0.000***

The **CT mismatch M I-3ph 3 IN** parameter shows you the magnitude scaling of the ground current of the 3rd assigned measuring point.

**Parameter: CT mismatch M I-3ph 4**

- Default setting **(_:91:221) CT mismatch M I-3ph 4** = ***0.000***

The **CT mismatch M I-3ph 4** parameter shows you the magnitude scaling of the phase currents of the 4th assigned measuring point.

**Parameter: CT mismatch M I-3ph 4 IN**

- Default setting **(_:91:222) CT mismatch M I-3ph 4 IN** = ***0.000***

The **CT mismatch M I-3ph 4 IN** parameter shows you the magnitude scaling of the ground current of the 4th assigned measuring point.

**Parameter: CT mismatch M I-1ph**

- Default setting **(_:91:223) CT mismatch M I-1ph** = ***0.000***

The **CT mismatch M I-1ph** parameter shows you the magnitude scaling of the transformer neutral-point current.

### 5.1.3.4 Write-Protected Settings

The settings listed here are used primarily for understanding during configuration of the function groups. They are calculated on the basis of other settings and cannot be directly changed.

| Addr. | Parameters | C | Range of Values | Default Setting |
|---|---|---|---|---|
| ***Rated values*** | | | | |

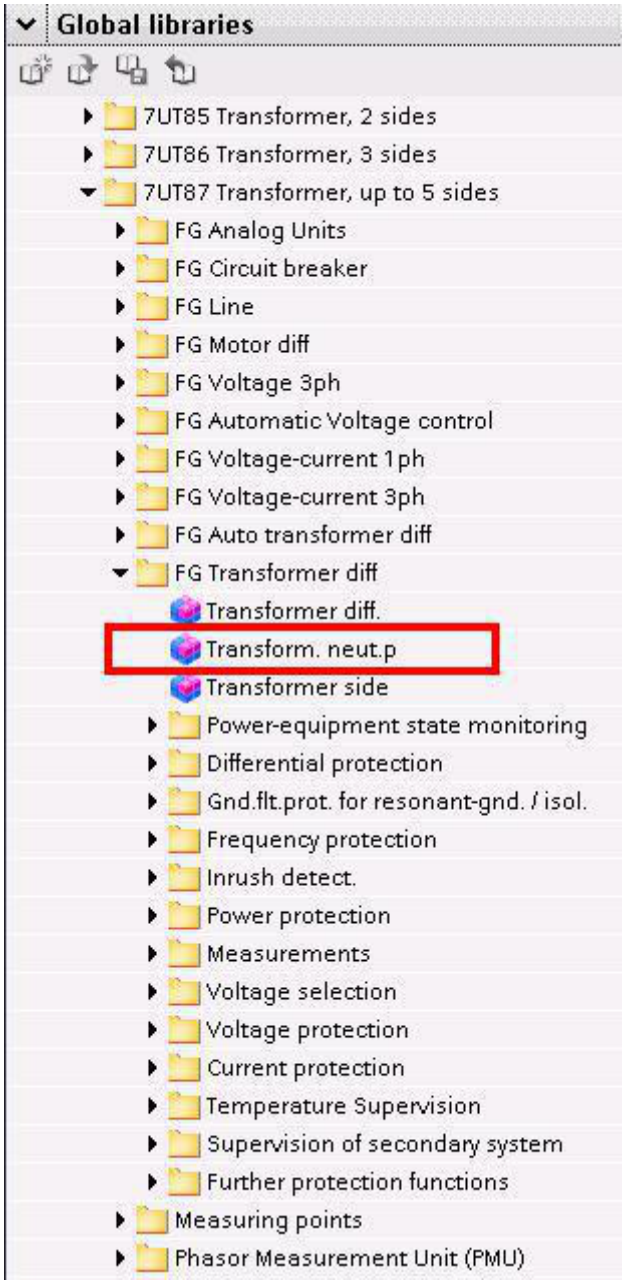
## 5.1.4 Function-Group Type Transformer Neutral Point

### 5.1.4.1 Overview



In the**Transf. neutral point** function group, all the necessary functions for protection and for supervision of a transformer are used, which are related to a neutral-point current. The **Transf. neutral point** function group also includes the measurement functions. You can find more information in chapter *9 Measured Values, Energy Values, and Supervision of the Primary System*.

**NOTE**

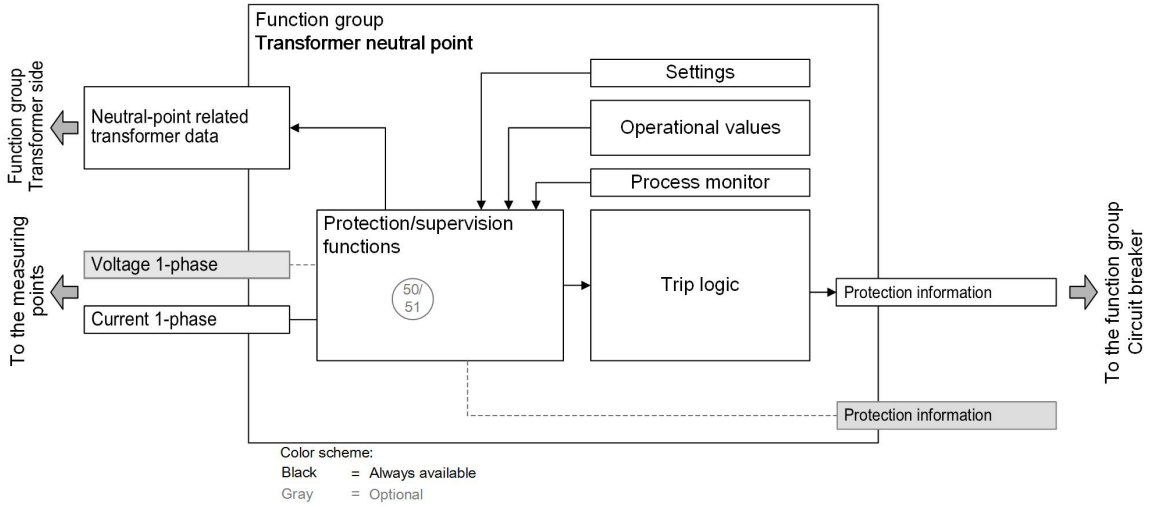
The transformer and restricted ground-fault protection do not work with sensitive ground-current transformers. Responsive transformers go to saturation too fast and generate incorrect differential currents.

In the Global DIGSI 5 library, you will find the **Transf. neutral point** function group under each device type and the folder with the respective protection functions. Depending on the connected measuring points, you can load the respective protection and supervision functions in the **Transf. neutral point** function group. Here you can only load 1-phase current functions or optional 1-phase voltage functions.The functions are described in chapter *6 Protection and Automation Functions*.

[scpowspt-230114-01-DE, 1, en_US]

Figure 5-10 Transformer Neutral Point Function Group – Functional Scope for Device Type 7UT87

For more information about the embedding of the functions in the device, refer to *2 Basic Structure of the Function*. For information about the overall functional scope of the application templates for the various device types, refer to *4 Applications*.



### 5.1.4.2 Structure of the Function Group

The function group **Transf. neutral point** always includes the following function blocks:

- Neutral point oriented transformer data
- Operational measured values
- Output logic of the function group

These blocks are required in the function group **Transf. neutral point** and therefore cannot be loaded or deleted.

You can load the protection and supervision functions required for your application in the function group **Transf. neutral point**. The functions are available in the function library in DIGSI 5. Functions that are not needed can be deleted from the function group.

[dwpwrstp-161012-01.tif, 2, en_US]

Figure 5-11 Structure of the Function Group Transf. Neutral Point

The function group **Transf. neutral point** has interfaces to the following function groups:

- **Measuring points**
- **Circuit breaker**
- **Transformer side**

### Interfaces with Measuring Points

The function group **Transf. neutral point** receives the required measured values via its interfaces with the measuring points.

When an application template is used, the function group **Transf. neutral point** is connected with the required measuring points.

If you insert functions in the function group **Transf. neutral point**, they automatically receive the measured values of the correct measuring points. If you add protection functions to the function group but the necessary measuring point is not connected, DIGSI 5 reports an inconsistency. Configure the measuring points in DIGSI 5 via the **Function-Group connections** Editor.

You can find more detailed information in *2 Basic Structure of the Function*.

The function group **Transf. neutral point** has the following interfaces with the measuring points.

- **`1-phase voltage`** (optional):

  The measurands from the 1-phase voltage system are supplied via this interface. All values that can be calculated from the measurands are also provided via this interface.

  If you want to test or change the connection between the voltages and the **V-1ph measuring point** double-click **Measuring-point routing** (name of the device) in the DIGSI 5 project tree → **7UT87**.

  For more information, refer to the description of the *power-system data* starting from *6.1 Power-System Data*.

  You must connect the **`1-phase voltage`** interface with the **Measuring point V-1ph** only if functions in the function group **Transf. neutral point** work with this measurand.

- **`1-phase current`**:
  The measurands from the 1-phase current system are supplied via this interface. Depending on type of transformer connection, this is, for example $I_x$. All values that can be calculated from the measurands are also provided via this interface. The function group **Transf. neutral point** must always be linked with the **Measuring point I-1ph**.

**NOTE**

You can connect the **`1-phase current`** interface with a maximum of **one** 1-phase current measuring point.
All functions in the function group **Transformer side** have access to these values.

**NOTE**

If you instantiate functions in the function group **Transf. neutral point**, the function **Overcurrent protection 1ph**, the information for the inrush-current detection is taken from the assigned function group **Transformer side**.

### Interface to the Function Group Circuit Breaker

Via the interface of the function group **Circuit breaker**, all necessary data is transferred between the function group **Transf. neutral point** and the function group **Circuit breaker**. The following data is required:

- Pickup and operate indications of the protection functions in the direction of the function group circuit breaker
- Information on the circuit-breaker condition in the direction of the protection function groups

The function group **Transf. neutral point** is connected with one or more function groups Circuit breaker. This connection determines the following:

- Which circuit breakers are activated by the protection functions of the function group **Transf. neutral point**
- Start of the function **Circuit-breaker failure protection**, if available in the function group Circuit breaker, through the protection functions of the connected protection function group **Transf. neutral point**

In addition to the general assignment of the function group **Transf. neutral point** to the function groups Circuit breaker, you can configure the interface for specific functionalities in detail. Configure the details in DIGSI 5 using the **Circuit-breaker interaction** Editor in the function group **Transf. neutral point**.
In the detail configuration of the interface, you define the following:

- Which operate indications of the protection functions are included when the trip command is generated?
- Which protection functions activate the function **Circuit-breaker failure protection**?

If an application template is used, the function groups are connected to each other because this connection is absolutely essential to ensure proper operation. You can modify the connection in DIGSI 5 via the **Function-group connections** Editor. If the connection is missing, DIGSI 5 reports an inconsistency.
You can find more detailed information in *2.1 Embedding of Functions in the Device*.

### Interface with Protection Communication (Optional)

All required data is exchanged between the protection function group and the protection communication via the interface with **Protection communication**, for example:

- Binary signals
- Measured values
- Complex data

You can find more detailed information in *3.6 Protection Communication*.

### Neutral-Point Related Transformer Data

The transformer data characterize the transformer neutral point to be protected. The transformer data applies for all of the functions in the function group **Transf. neutral point**.

### Operational Measured Values

The operational measured values are always available in the function group **Transf. neutral point** and cannot be deleted.

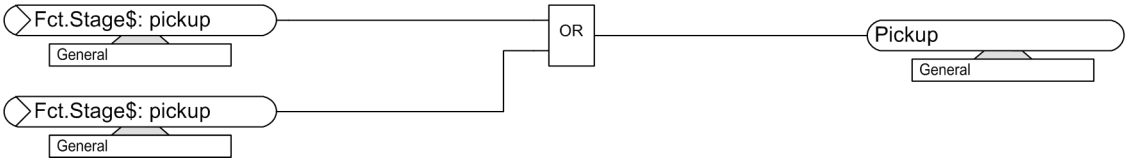


Table 5-4 Operational Measured Values of the Function Group Transformer Neutral Point

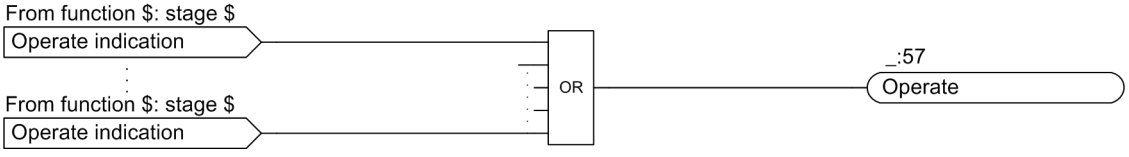
| Measured Values | | Primary | Secondary | % Referenced to |
|---|---|---|---|---|
| I | Neutral-point current | A | A | Rated operating current of the primary system |
| V | Voltage | kV | V | Rated operating voltage of the primary system |

### Output Logic



The output logic treats the pickup and trip signals of the protection and supervision functions in the function group separately. Pickup logic and output logic are each assigned to the signals. The pickup and output logic generate the overreaching indications (group signals) of the function group. These group indications are transferred via the **Protection information** interface to the function group **Circuit breaker** and are processed further there.

The pickup and trip signals of the protection and supervision functions in the function group **Transf. neutral point** are combined phase-selectively and output as group indication.

## 5.1.4.3 Application and Setting Notes

### Parameter: Rated current (Write-Protected)

- Default setting **(_9421:104) Rated current** = ***1000 A***

The **Rated current** parameter indicates the primary rated current of the transformer to be protected. The **Rated current** can correspond to the following variables:

- Rated current of the connected transformer side
- Rated current of the reference side of the connected auto transformer

The **Rated current** cannot be changed.

**Parameter: Rated voltage (Write-Protected)**

- Default setting **(_:9421:105) Rated voltage** = ***400.00 kV***

The **Rated voltage** parameter indicates the primary rated voltage of the transformer to be protected. The **Rated voltage** can correspond to the following variables:

- Rated voltage of the connected transformer side
- Rated voltage of the reference side of the connected auto transformer

The **Rated voltage** cannot be changed.

**Parameter: Rated apparent power**

- Default setting **(_:9421:103) Rated apparent power** = ***692.82 MVA***

The **Rated apparent power** parameter indicates the calculated value from **Rated voltage** and **Rated current**. If current and voltage are available, this value is only displayed for you and cannot be changed.

**Parameter: M I-1ph uses MeasP with ID**

- Default setting **(_:9421:214) M I-1ph uses MeasP with ID** = ***0***

The **M I-1ph uses MeasP with ID** parameter indicates which 1-phase measuring point is connected to the transformer neutral point. Every measuring point is assigned a unique ID.

**Parameter: CT mismatch M I-1ph**

- Default setting **(_:9421:223) CT mismatch M I-1ph** = ***0.000***

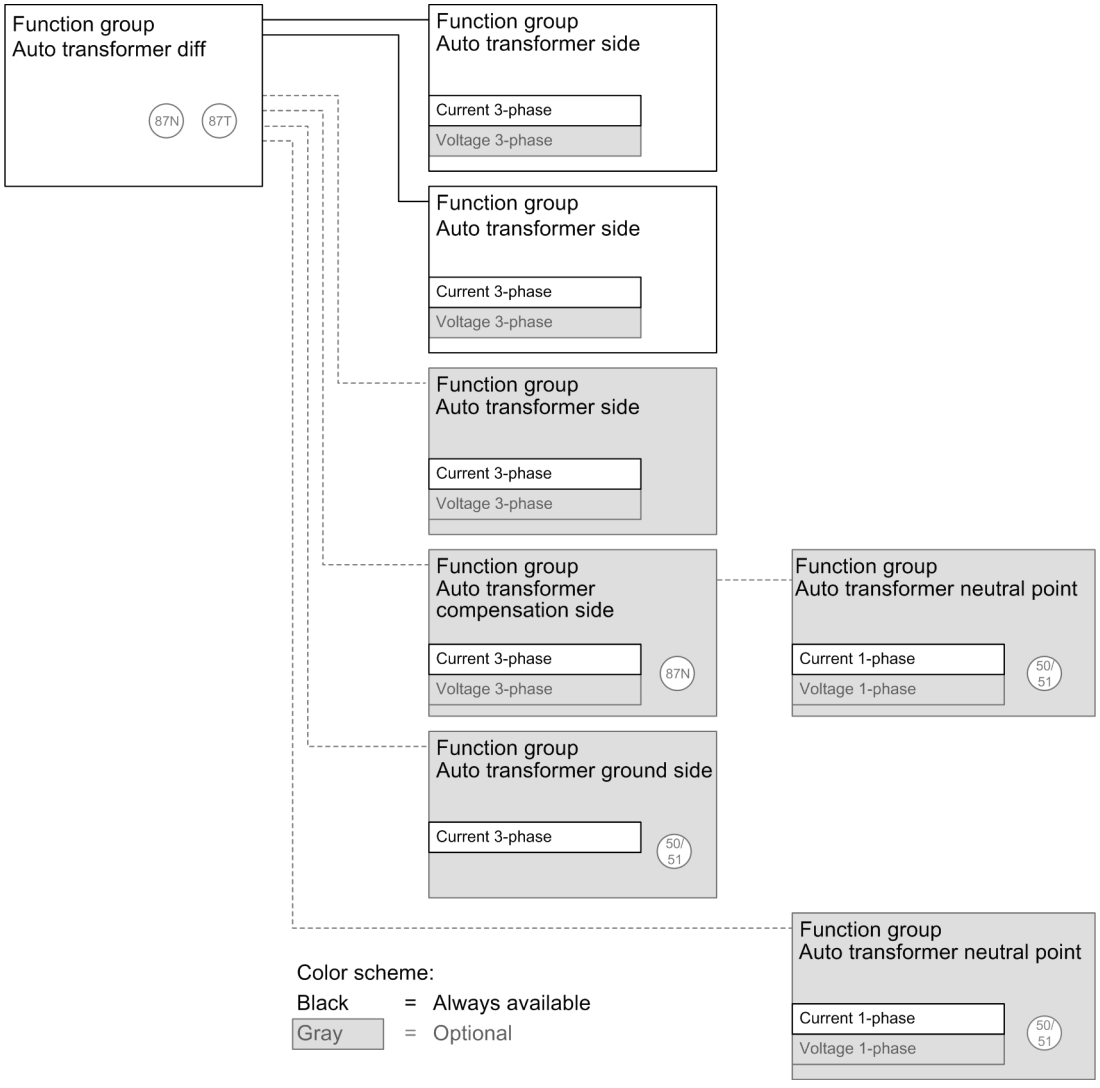
The **CT mismatch M I-1ph** parameter indicates the magnitude scaling of the transformer neutral-point current.

### 5.1.4.4 Write-Protected Settings

The settings listed here are used primarily for understanding during configuration of the function groups. They are calculated on the basis of other settings and cannot be directly changed.

| Addr. | Parameter | C | Range of Values | Default Setting |
|---|---|---|---|---|
| ***Rated values*** | | | | |
| _:9421:103 | General:Rated apparent power | | 0.20 MVA to 5 000.00 MVA | 692.82 MVA |
| _:9421:104 | General:Rated current | | 1 A to 100 000 A | 1 000 A |
| _:9421:105 | General:Rated voltage | | 0.20 kV to 1 200.00 kV | 400 kV |
| ***Power-system data*** | | | | |
| _:9421:214 | General:M I-1ph uses MeasP with ID | | 0 to 100 | 0 |
| _:9421:223 | General:CT mismatch M I-1ph | | 0.00 to 100.00 | 0.000 |

### 5.1.4.5 Information List



| No. | Information | Data Class (Type) | Type |
|---|---|---|---|
| ***General*** | | | |

# 5.2 Function-Group Type Auto Transformer Differential Protection

## 5.2.1 Function-Group Types

The following figure shows the structural association of the function-group types.

[dwfguebs-291112-01.tif, 1, en_US]

Figure 5-14 Function-Group Types Auto Transformer Diff.

The following function-group types are summarized in the Global DIGSI 5 library:

- **Auto transf. diff.** (Auto transformer)
- **Auto transf. auto side** (Auto transformer auto side)
- **Auto transf. comp. side** (Auto transformer compensation side)
- **Auto transf. grd. side** (Auto transformer ground side)
- **Auto transf. neutral point** (Auto transformer neutral point)

The individual function-group types are stored in the **Auto Transformer function group** folder and can be selected. In the protection function folders, you find all protection functions which are operational in each function group. A **Transf. diff.** function group always contains 2 **Auto transf. auto side** function groups. The

**Auto transf. neutral point** function group can be connected if needed with the **Auto transf. comp. side** or directly with the **Auto transf. diff.** function group.

The following table shows the number of function-group types that can be instantiated depending on the device (7UT82, 7UT85, 7UT86, 7UT87).

**NOTE**

By purchasing 70 or 120 function points, the 7UT85 and 7UT86 can be expanded to a three-winding transformer or a multi-winding transformer. Consider to provide the respective number of measuring points that are required for the expansion.

Table 5-5 Function-Group Types in the Device

| Device | Function-Group Type | | | | |
|---|---|---|---|---|---|
| | Auto Transf. Diff. | Auto Transf. Auto Side | Auto Transf. Comp. Side | Auto Transf. Ground Side | Auto Transf. Neutral-Point Function Group |
| 7UT82 | Max. 1 | Max. 2 | - | - | Max. 1 |
| 7UT85 | Max. 1 | Max. 2 | Max. 1 (not open) | Max. 1 | Max. 1 |
| 7UT86 | Max. 1 | Max. 3 (2 open) | Max. 1 | Max. 1 | Max. 2 |
| 7UT87 | Max. 2 | Max. 5[20] | Max. 1 | Max. 1 | Max. 2 |

In order for the transformer protection to operate properly, switching of the function groups is necessary. *Table 5-6* provides an overview of those switching options that are permitted. The Circuit-breaker function group is not listed. The images shown in the application templates (see *Figure 4-2* to *Figure 4-7*) give you a good overview of the connection options.

An **Auto transf. auto side** function group must always be connected to the **Auto transf. diff.** function group. Depending on the application, a connection of the **Auto transf. neutral point** function group with the **Auto transf. comp. side** function group is required. This is the case, for example, if a restricted ground-fault protection is used or if the neutral-point current in the differential protection should be considered (zero-sequence current correction). Conversely, the **Auto transf. neutral point** function group can also require signals from the **Auto transf. diff.** function group. A typical case is the inrush-current detection, which can be used for blocking a 1-phase overcurrent protection (with a short time delay set).

Table 5-6 Assignment of Protection Function Groups to Protection Function Groups

| Winding | Auto Transf. Diff. 1 | | | | Auto Transf. Comp. Side |
|---|---|---|---|---|---|
| | Auto Side (2 ... 3) | Comp. Side (0 ... 1) | Ground Side (0 ... 1) | Neutral Point Function Group (0 ... 1) | Neutral Point Function Group (0 ... 1) |
| Auto transf. auto side 1 | X | – | – | – | – |
| Auto transf. auto side 2 | X | – | – | – | – |
| Auto transformer comp. side | – | X | – | – | – |
| Auto transformer grd. side | – | – | X | – | – |
| Auto transf. neutral point 1 | – | – | – | X | |
| Auto transf. neutral point 2 | – | – | – | | X |

The individual function-group types are described in the following.

20 A maximum of 3 auto sides can be assigned to an auto transformer. The remaining auto sides are available for the 2nd auto transformer.

## 5.2.2 Function-Group Type Auto Transformer Differential Protection

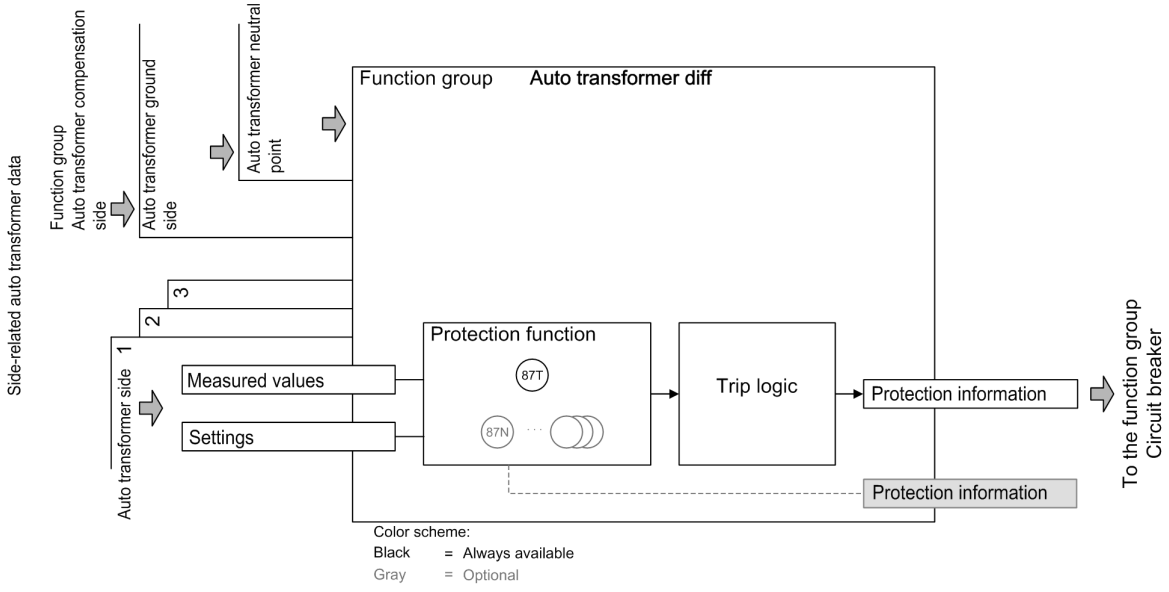
### 5.2.2.1 Overview

The **Auto transf. Diff.** function group contains the differential protection function and protection function relevant measured values. You can find more information in chapter *9 Measured Values, Energy Values, and Supervision of the Primary System*.

You will find the corresponding function groups and also the folders with the usable protection functions in the Global DIGSI library under each device type. You can only load the Differential protection function in the **Auto transf. diff.** function group.

[scauttrf-230114-01-DE, 1, en_US]

Figure 5-15 Auto Transformer Diff. Function Group - Functional Scope for Device Type 7UT87



For more information about the embedding of the functions in the device, refer to chapter *2 Basic Structure of the Function*. For information about the overall functional scope of the application templates for the various device types, please refer to chapter *4 Applications*.

### 5.2.2.2 Structure of the Function Group

The **Auto transf. diff.** function group according to *Figure 5-16* has interfaces with the **Auto transf. auto side** and **Circuit-breaker** function groups. The **Auto transf. diff.** function group contains the function blocks:

- Protection function (execution of the differential protection function)
- Trip logic (generation of forwarding of the operate indication)

In order for the protection functionality to be guaranteed, the differential protection function must always be present in the **Auto transf. diff.** function group. If you do not use an application template, load this from the Global DIGSI 5 library.

[dwauttrf-201112-01.tif, 1, en_US]

Figure 5-16 Structure of the Auto Transf. Diff. Function Group

The **Auto transf. diff.** function group has interfaces to the following function groups:

- The **Auto transf. auto side** function group
- The **Auto transf. comp. side** function group
- The **Auto transf. ground side** function group
- The **Auto transf. neutral point** function group
- **Circuit-breaker** function group

#### Interface to the Auto Transformer Auto Side Function Group

The **Auto transf. diff.** function group receives the required measured values via the interface to the **Auto transf. auto side** function group. In addition, the required settings are transferred.

By using an application template the **Auto transf. diff.** function group is connected with the required measuring points.

#### Interface to the Circuit-Breaker Function Group

All required data is exchanged between the protection and Circuit-breaker function groups via the interface with the **Circuit-breaker** function group. The following data is required:
