FT-630 - HYDROGEN TO PRODUCTION

Field Device	
Field Device Type	E+H PROLINE PROMASS F300
Approved Certificate	Sira 16ATEX2219X
Rating	Ex ia IIC T6 … T1
Max Allowed Voltage - V_i	30 [V]
Max Allowed Current - Ii	100 [mA]
Max Allowed Power - Pi	1250 [mW]
Resistance - R3	300 [ohm]
Inductance - L3	0 [mH]
Capacitance - C3	6 [nF]

Single Pair Cable		
Manufacturer	Sensitherm	
Code	FG16OHM16	
Composition	2x1.5+Sh	
Insulation Voltage	0,6/1 [kV]	
Resistance - R	13,3	[Ω/Km]
Inductance - L	0,9	[mH/Km]
Capacitance - C	200	[nF/Km]
L/R Ratio	0,0676692	[mH/Ω]

Safety Barrier (Galvanic Type)	
Limiting Device Type	PHOENIX MACX MCR-EX-SL-RPSSI-I-UP
Approved Certificate	BVS 08 ATEX E094 X
Rating	II 3 (1) G Ex ec [ia Ga] IIC T4
Max Output Voltage - V_0	25,2 [V]
Max Short Circuit - I_0	93 [mA]
Max Allowed Power - P_0	587 [mW]
Max Allowed Inductance - L_0	3 [mH]
Max Allowed Capacitance - C_0	107 [nF]

NOTES:

1. H250H Variable Area Flow Meter are installed horizontally.
   H250H flowmeters for horizontal installation are to be installed in the pipeline so that the indicator is located on the side of the measuring tube.
2. Process connection: 2 x Flanged DN25 ASME B16.5 CL300 RF

Marshalling	B400-SIS-001	Terminal	04A/04B	Slot	05	Rack 01	Chanel 04

LOOP TEST

1	Check earth isolation of the loop.					OK
2	Connect loop to terminal					OK
3	Energise Loop (close loop) and record status	Normal	Yes	Alarm/trip	No	OK
4	De-Energise Loop (open loop) and record status	Normal	No	Alarm/trip	Yes	OK
5	Record Fail Safe position	Open	NA	Closed	NA	NA

LOOP SERVICE

		Action	Alarm / Control		Display	
		Trip	GA	DCS	SOE	DCS	
6	Loop energized	No		Yes		OK	OK
7	Loop not energized	Yes		Yes		OK	OK
8	Checking of line monitoring	No		No		OK	OK
9	Checking of Maintenance Inhibition	NA		NA		NA	NA
10	Associated safety Level / bar						
11	Associated outputs						

LOOP DOCUMENTATION

12	Loop diagram is marked up and attached to this test sheet	OK
13	Cause and effect chart is highlighted accordingly	
14	Any defect is recorded for punch list issuance	

TESTING & MEASUREMENT INSTRUMENT USED

Type	Serial N.	Calibration Certificate	Validity
MULTIMETER FLUKE	AW1/018 17140769	7715/24	10/07/2025

P&ID Number	C63-PID-001_11

CHARACTERISTICS	
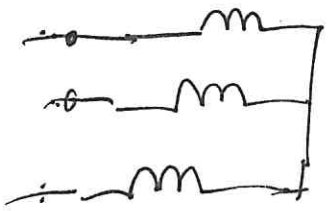
Manufacturer	ELMESS
Serial Number	24-0450-001
Power (kW)	6,0

PRELIMINARY CHECKS	
Verify the Wiring & Earthing	✓
Verify the Correct Installation	✓
Check the Resistance	26,6 / 26,45 / 26,5 Ω.
Bump Check: Motor Rotation Direction	NA OK / NOK

TEST	
Activation	OK / NOK
Intensity (U)	
Intensity (V)	
Intensity (W)	
Voltage	
Thermal Ajustement	

NOTES



300 kW @
101 RFI

2R.

R_{eq1} : 26,6Ω

R_{eq2} : 26,45Ω

R_{eq3} : 26,5Ω

53.2 / 2 = 26,6.
52.9 / 2 = 26,45
53 / 2 = 26,5

Insulation Class	IP 65
Nominal Power	400/690V 11 KW
Nominal Intensity	13.1 A 16,8
Supply Voltage	400
Speed	2955 / 3560
Motor Connection (Star / Delta)	400 Y 690 Δ

PRELIMINARY TESTS				
LUBRICATION SYSTEM & SHAFT FREE ROTATION				
Test Fluid	Lucken			
Measurement Tool	FLUKE 1503			
Winding Resistance	U	V	W	
	Ω	Ω	Ω	
Minimum Insulation between winding (U/V-U/W-V/W)	(U/V = 1417) (U/W = 1360) (V/W = 1498)			MΩ
Earth Insulation (U * V * W) / GND	(U/GND = 1687) (V/GND = 1315) (W/GND = 1253)			MΩ
Magnetic Fuse Rating (Magnetic Protection)	23			A
PTC Value	189			Ω
Bump Check: Motor Rotation Direction	OK / NOK

elogen	PRECOMMISSIONING C63-ELO-REP-CO-0002 – DIGITAL INPUT/OUTPUT	CROSSWIND

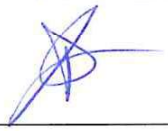
Tag Number	FS 141
System / Subsystem Number	
P&ID Number	

ITEM CHARACTERISTICS	
Manufacturer	IFM electronic
Type	SA5000
Serial Number	X0142106247
Range	18-30 V DC TOR

ELECTRICAL CHECK	
Wiring Check	On
Voltage Measurement	24 V DC



LOOP CHECK		
Input / Output function	(Process)	Safety
Test Equipment Used	Serial Number	Calibration Expiry Date

INPUT CHECK			
Switch Contacts	(NO)	NC	N/A
	Setting (unit) L-MIN		Switch Contact
Switch Trigger	40		(Open - On / Closed - Off)
Reset	24		Open - On / (Closed - Off)

OUTPUT CHECK		
Field Device Off Status	On / Open / ...	(Off) / Closed / ...
Output Signal to On-Position (activation by setting or forcing)		
Field Device Status Change	(On) / Open / ...	Off / Closed / ...
HMI Feedback Display	(Yes) / No	

NOTES

	C063-ELO-REP-CO-0001 – ANALOG INPUT	

Tag Number	101
System / Subsystem Number	PT101
P&ID Number	

ITEM CHARACTERISTICS

Manufacturer	STS Regeltechnik
Type	Premaus-Gard 1121-1
Serial Number	130.1 - 1172 - 0010 - 000
Range	15 ... 36 V DC

ELECTRICAL CHECK

Wiring Check	OK
Voltage Measurement	24 V

LOOP CHECK

Test Equipment Used	Serial Number	Calibration Expiry Date

Input Range Unit: 4 - 20 mA — Indication Range Unit: -300 ÷ 300 Pa

	Rising %					Falling %			
	0	25	50	75	100	75	50	25	0
Input Signal	4	8	12	16	20	16	12	8	4
HMI Indication	-300	-150	0	150	300	150	0	-150	-300

	Trip or Alarm Setting	Actual Trip or Alarm Point	OK / NOK / NA
HI HI Trip	180	150	OK
HI Alarm	120	120	OK
LO Alarm	80	80	OK
LO LO Trip	50	50	OK

1 INTRODUCTION

1.1 Project Overview

Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.

Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.2 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

Figure 1 - HOLLANDSE KUST NOORD WIND PARK Location Map

Figure 2 - Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile is located on coordinates E 590719.1, N 5841602.3 and is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

1.3 Project Concept

All components included in the BLPH will be integrated onshore on a topside and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

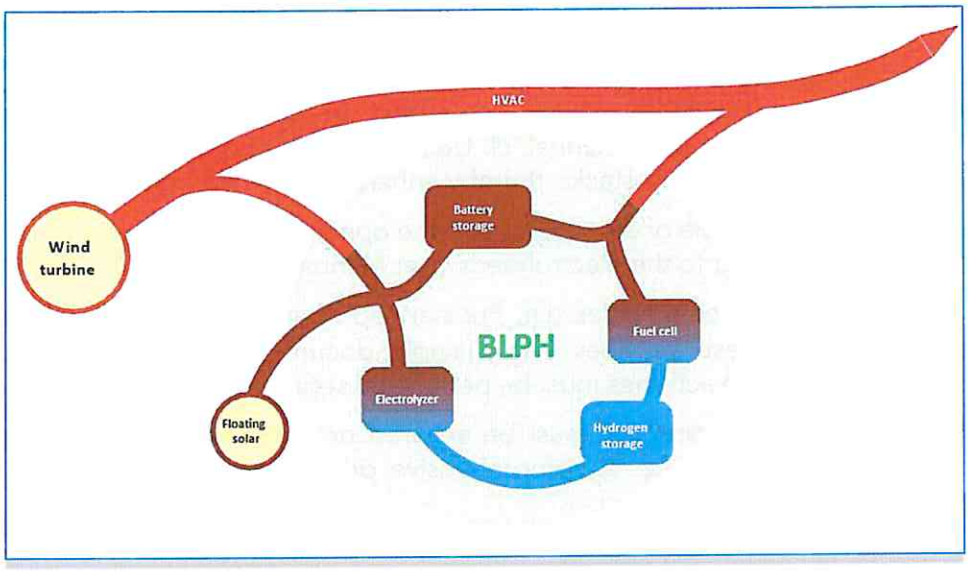

Figure 3 – BLPH Concept

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.

The purpose of the BLPH is to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

2 DOCUMENT SCOPE

This procedure encompasses the Pre-start-up, Start-up, and Ramp-up activities of the BLPH Electrolyser. These activities include the electrolyser's Start-Up and Operation in automatic mode (referred to as 'Start mode' in the User Manual, cf. C63-PMO-001) and the progressive increase in current supplied by the rectifiers to the stacks, thereby enhancing the hydrogen flow rate produced.

For more details about the principle of electrolysis and the operation of the process through the HMI (Human Machine Interfaces) refer to the electrolyser's User Manual (cf. C63-PMO-001).

Despite the distinct categories of activities (i.e. Pre-start up, Start-up and Ramp-up), it has been decided to consolidate all these activities into a single document for practical purposes. This approach is taken because these activities must be performed sequentially, and their scopes overlap.

The prerequisites outlined in Section 3.4 must be ensured prior to initiating the machine in start mode, as specified in Section 6.4.1.2. A comprehensive description of the required activities is provided in Section 6.4.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

3 OTP SUMMARY

3.1 Test Objective

The operating test of the Electrolyser system is executed to ensure that the system is started up in a safe and controlled manner and to verify the correct operation according to the project requirements.

Aim of this document is to provide the sequence and appropriate actions to verify the safety systems of the Electrolyser system along with proving the design intent of the system to produce hydrogen gas (H2).

Prerequisites for proceeding with the OTP:

- The UPS is charged at 100%.
- All Utilities are operational.
- The electrolyser is stopped, depressurized and cold (T < 40 °C).
- Written authorization has been obtained to send hydrogen through the client's installation (**Figure 4** piping highlighted in turquoise, PV-633 open and PV-632 close). In the absence of such authorization, the hydrogen will be directed through the designated hydrogen vent (**Figure 4** piping highlighted in yellow, PV-633 close and PV-632 open).

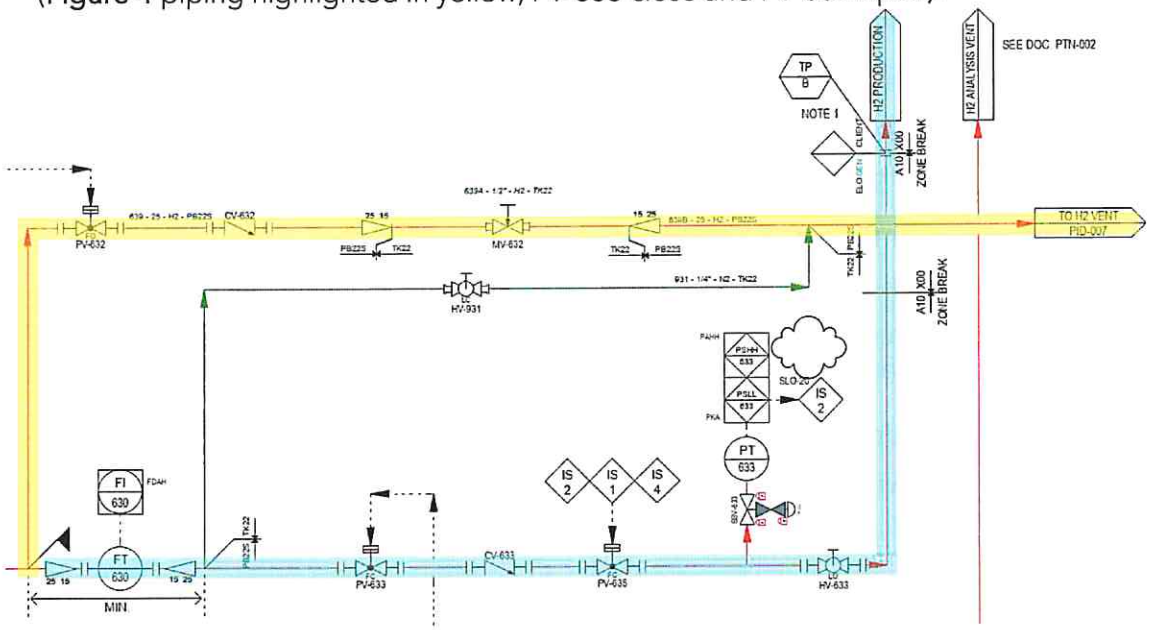

Figure 4. Hydrogen production routing

- All design documentation is approved or relevant TQ / CQ approved to proceed with introduction of combustible gas.
- It is mandatory to have the written authorization to send the hydrogen to the vent during

these activities.

- Onshore pre-commissioning and commissioning activities at Contractor site (WORKSITE)
  a. PHASE 1: Pre-commissioning (powered) activities listed in C063-ELO-PRO-CO- 0003 (NOT PART OF THIS OTP)
  b. PHASE 2: Commissioning (powered) activities listed in C063-ELO-PRO-CO- 0004 (NOT PART OF THIS OTP).
  c. PHASE 3: Vendor SAT & Integrated function test of Electrolyser package including:
     - Confirming Unit Settings on the START mode
     - Stack polarization
     - Hydrogen Setpoint Achievement
     - Functionality of electrolyser's Sequences during Operation
     - Hydrogen Leak Detection
     - Safety Stops at 10%
     - Increasing current by 10% up to 100%
     - Production Settings at 100%

       HPP Start-Up
- Offshore commissioning (SITE)

  PHASE 4: Integrated function test of Electrolyser package (OFFSHORE).

PHASES 1 – 2 are covered by and contained within the vendor documents. PHASES 3 - 4 are included within this OTP document, and the Vendor SAT procedure.

3.2 System Boundary Limits

Please refer to the relevant systems and subsystems outlined below on the Overall Single Line Diagram.

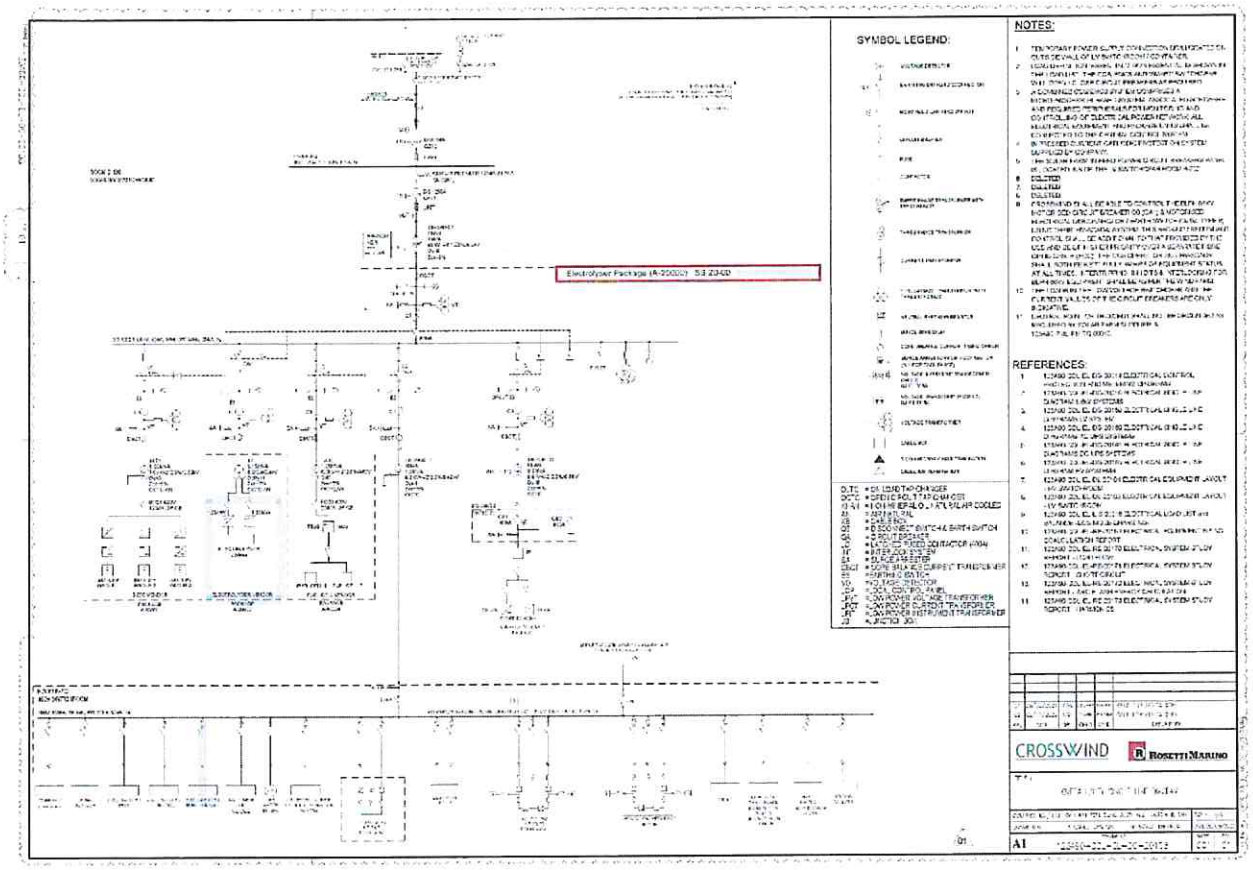

Figure 5. System Boundary Limits in Overall Single Line Diagram

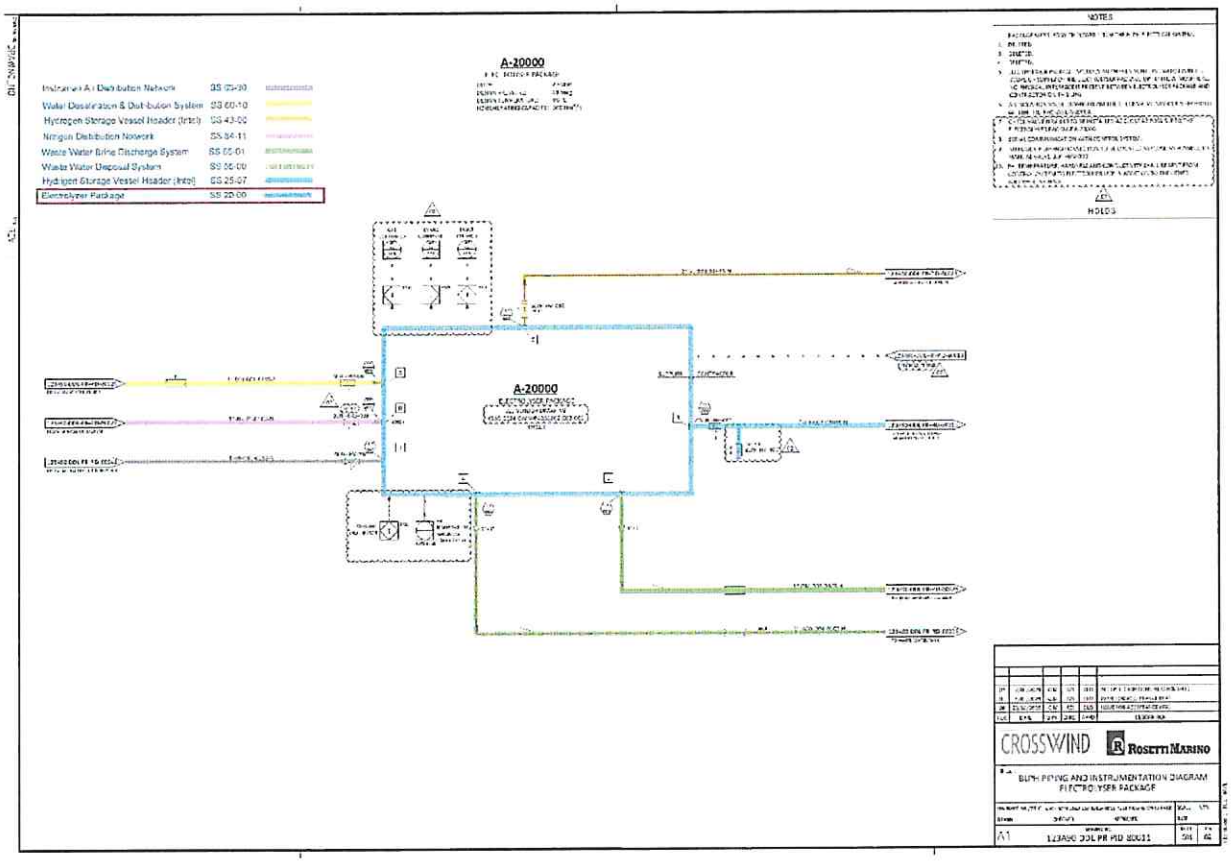

Figure 6. OTP System Boundary Limits

3.3 Test and System Description

Proceeding with this OTP is confirmation that for the following system:

- 20-00 Electrolyser Package (A-20000)

All equipment is installed in accordance with the following vendor documents:

- ELO-INN-BPH-DWG-00008 Process Flow Diagrams
- ELO-INN-BPH-DWG-00009 AQUAGAS Wiring diagram
- ELO-INN-BPH-DWG-00010 NIDEC Detailed Electrical Drawing of PCS units
- ELO-INN-BPH-DWG-00011 OVIVO Electrical Instrument Detailed Drawing Wiring Diagram
- ELO-INN-BPH-DWG-00012 PAUMIER PAU001 & PAU002 Chiller electrical wiring
- ELO-INN-BPH-DWG-00013 PAUMIER PAU003 HVAC electrical cabinet
- ELO-INN-BPH-DWG-00014 NIDEC Mechanical drawing of skid HCU

- ELO-INN-BPH-DWG-00015 NIDEC Rectifier Mechanical Drawing
- ELO-INN-BPH-DWG-00016 NIDEC - SINGLE LINE DIAGRAM
- ELO-INN-BPH-MAN-00007 Handling and Installation Guidance for finalized stacks
- ELO-INN-BPH-OTH-00005 Lines List
- ELO-INN-BPH-OTH-00017 Interfaces and Utility list
- ELO-INN-BPH-PLN-00010 AQUAGAS Electrical Panel & Connections / Wiring Diagram
- ELO-INN-BPH-PLN-00011 NIDEC Detailed Electrical Drawing
- ELO-INN-BPH-REG-00006 CABLE LIST AND INTERCONNECTING DIAGRAM
- ELO-INN-BPH-RPT-00005 Electrical function & protection philosophy
- ELO-INN-BPH-RPT-00008 Safety Loop Design
- ELO-INN-BPH-RPT-00010 Explosion Protection Document
- ELO-INN-BPH-SPC-00006 Technical specification Control cabinet & Electrical wiring
- ELO-INN-BPH-SPC-00008 O2 and H2 Vent Technical specification (Phase 2)
- ELO-INN-BPH-SPC-00010 Electrolyser Network Architecture

3.4 Safety Devices

These defining rules shall be applied from the initial (total or partial) energizing of the instrumented systems, until the end of the commissioning activities.

- Appropriate PPE must be always worn during loop testing.
- A permit to work has been delivered.
- No equipment will be definitively energized without the subsystem Mechanical Completion.
- As soon as a panel is energized (Relay Panel, cabinets, PLC cabinets or local PLC) a sticker "Panel energized - Commissioning in progress" will be suitably displayed on the door in different languages, indicating that it is available for loop checking.
- Testing of electrical/instrumentation interfaces (i.e. I/O serving electrical switchboards for motors control) will be done in conjunction with the power distribution systems lead engineer.
- The on-site equipment area must be visibly marked with a "Test in Progress" sign.
- In any case this procedure shall not conflict with, or supersede, the electrical lock-out procedure. Only electrical system leaders will be authorized to remove padlocks in electrical cabinets.
- Safety rules in accordance with the risk must be applied (e.g. Calibration Gas, Fluids, Pressure, Electrical Power, etc.)
- Risk assessment must be done prior to any test activity.

3.4.1 HSE Management

- All necessary safety precautions must be taken to avoid any risk of personnel injury.
- All personnel involved in this operational test shall be competent for the tasks they will be required to undertake

- Place safety / warning signs and segregate the entire area with barrier tapes (safety barriers) of a colour distinguished (blue and white) from those used for construction activities
- Restrict access into area only to authorized personnel
- Conduct "Toolbox Talk" with all personnel prior to starting test work
- Appropriate Personnel Protective Equipment (PPE) and safety equipment e.g. safety shoes, hand gloves, helmet, earplugs etc. are available and must be used in line with the site requirements
- All activities carried out on the project shall be performed in accordance with the "Permit to Work" system Doc. PRO-HSE-23
- Electrical and mechanical isolations are to be assured as per Doc. PRO-HSE-08 and "Commissioning and start-up operation" procedure.
- Observe and enforce all international codes and regulations to safeguard personnel, plant and environment.
- Ensure that the working area is clean, tidy, well illuminated and that access and escape routes are free from obstructions.

Before starting work on any of the activities in this OTP it is the responsibility of the persons performing the work to:

- Familiarize themselves with the plant/equipment to be worked on
- Ensure they are aware of all other work activities that are taking place, or due to take place
- If necessary, re-plan any situation/activity
- Ensure proper communications between parties involved in the execution of the OTP
- Read the relevant Vendor documentation for the equipment covered by this OTP and observe any special requirements and limitations recommended or imposed by Vendor
- Verify that all personnel involved in the implementation of this procedure are familiar with its content as well as the associated safety requirements (Toolbox Talk)

3.5 Acceptance Criteria

- Before Power ON:

Visual inspection and verification are a crucial step to identify any obvious issues with the installation, such as loose connections, missing components, or damage to the equipment.

Crosschecking the installation with engineering documentation ensures that the installation is done correctly and according to the manufacturer's guidelines. These steps can help identify any missing or incorrect components, and wrong connections.

All package ITRs to be completed & RFC issued for sub-system 20-00.

Apply padlocks on all necessary Breakers per LoTo Procedure (if required)

Phase 1 (Not in the OTP) will prove basic function of individual instruments and equipment which may or may not be on final power supplies.

Phase 2 (Not in the OTP) will prove correct function of auxiliary systems or packages and close out of any punch list A activities prior to unit startup phase.

Phase 3 will prove correct:

- Completion of the Vendor SAT procedures.
- Functionality of the Electrolyser package in coordination with Required Associated Subsystems packages on BLPH. (ONSHORE)

Phase 4 will prove correct:

- Functionality of the Electrolyser package in coordination with the other packages on BLPH (OFFSHORE).

Performing the steps in this OTP as per engineering documents is crucial to ensure that the equipment is operating correctly and that it meets the desired design specifications. Observing the results will help identify any issues that may arise during the operation.

Overall, following these steps shall provide a comprehensive and effective way to verify the equipment installation and functionality.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

5 OTP AT ONSHORE WORKSITE

This chapter refer to the activities on the Contractor worksite (construction yard).

5.1 Planning and Manpower

5.1.1 Planned tasks with estimated manpower

Estimated manpower for the different phases of the OTP are:

Table 5. Estimated manpower ONSHORE Worksite

Activity	Staff qualifications	Advised presence
Unit Settings on the START mode	1 site supervisor, 2 electrical technicians	1 automation engineer
Stack's polarization	1 engineer and 1 automation engineer	1 rectifier specialist from NIDEC
Hydrogen Setpoint Achievement	1 automation engineer	
Functionality of electrolyser's		
Sequences during Operation	1 automation engineer	
Hydrogen Leak Detection	2 piping & mechanical technicians	2 helpers
Safety Stops at 10%	1 engineer and 1 automation engineer	
Increasing current by 10% up to 100%	1 automation engineer	
Production Settings at 100%	1 automation engineer	
HPP Start-Up	1 automation engineer	1 technician from Aquagas

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

5.1.2 Pre-Commissioning & Commissioning duration estimate prior to Start-Up:

5.1.4 Vendor Assistance

Vendor Elogen will lead and/or supervise the onshore commissioning activities. For offshore commissioning Elogen will provide remote support.

5.1.5 Summary of interface signals to be tested:

Please refer to the following documents:

- ELO-INN-BPH-OTH-00009 – Communication table
- ELO-INN-BPH-SPC-00010 - Electrolyser Network Architecture

5.2 OTP Test Requirements – Onshore WORKSITE

5.2.1 Pre-Commissioning Achievement

Prior to commencement of commissioning activities, the relevant pre-commissioning documentation be fully signed.

5.2.2 Commissioning Achievement

The commissioning achievement will be the full successful operation, functionality and integration of the Electrolyser package installed on BLPH.

5.2.3 Status of Required Associated Subsystems

- PHASE 3

Subsystems required RFC for Commissioning of the Electrolyser Package

- 25-01 to 25-08 (Partial): Hydrogen Storage Vessels & Header
- 43-00: Hydrogen Vent Header and Drum System
- 50-10: Water Desalination Package & Distribution
- 50-11: Non-Oxidant Biocide
- 55-00: Waste Water Disposal
- 55-01: Waste Water Brine Discharge System
- 63-00: Instrument Air Package (A-63000)
- 63-30: Instrument Air Distribution Network

- 64-00: Nitrogen Generator Package (U64000)
- 64-10: Nitrogen Distribution Network
- 70-00: F&G Control System
- 70-11: F&G Devices FZ-02 (Hydrogen Storage Area)
- 70-12: F&G Devices FZ-03 (Electrolyser Area)
- 79-00: Emergency Shutdown Systems (SIS)
- 79-12: Emergency Shutdown Systems (SIS) – Devices FZ-03 (Electrolyser Area)
- 82-00: MV 6.6 kV Switchboard (SG-100D1)
- 82-20: Power Transformer 3.15 MVA
- 82-99: MV 6.6 kV Temporary Yard Supply Integrated Test
- 83-00 400V Switchboard SG200N1
- 83-20 Distribution board
- 83-99: Temporary Yard 400/230V Main and auxiliary power supplies
- 87-00: EMCS
- 87-10: PCS
- 88-00: Earthing System

5.2.4 Special Tools & Test Equipment

The following special tool and Test Equipment are required:

- Toolboxes: screwdrivers, spanners, pliers, wrenches, pipe wrenches.
- ATEX Field telephone or Walkie-Talkie.
- Leak detector sprays.
- VARIOTEC°460 Tracer gas.
- Chronometer.
- Personal hydrogen detectors for each people on site, calibrated up to date.

All equipment used must have a serial number and a valid calibration certificate up to date (if applicable).

Table 8. Test equipment register ONSHORE activities

TESTING & MEASUREMENT INSTRUMENT USED			
Type	Serial N.	Calibration certificate	Validity

5.2.5 Commissioning Spare Parts

- See reference document ELO-CMM-BPH-PRD-00006 - BLPH Electrolyser Commissioning Start-Up (CSU) Execution Plan.

5.2.6 Temporary Facilities

Phase 3: Temporary emergency stop and/or fire and gas detection may be required if deemed necessary after suitable risk assessment. This will depend on the availability of interacting sub-systems.

5.3 OTP Description – Onshore WORKSITE

5.3.1 OTP Test Preparation

Table 9. OTP requirements Onshore Worksite

Step	Description	Result	Verified by	Date
1	System Ready for Commissioning Certificate (RFC) is issued and approved.			
2	Check related punch list 'B' items and confirm acceptability for start of commissioning activities.			
3	No Mechanical Completion or Pre-commissioning punch list 'A' items are outstanding against the system to be commissioned.			
4	All personnel involved in the implementation of this procedure are familiar with its content as well as with associated safety requirements (Toolbox Talk to be conducted before initiation of activities).			
5	A final walkdown of the system has been completed, to ensure that the system and the area are ready for commissioning.			
6	Check that areas are free for work and escape routes are clear of any obstructions.			
7	All safety barriers and warning signs have been installed.			
8	Ensure that proper communications have been established between parties involved in the implementation of the procedure.			

Step	Description	Result	Verified by	Date
9	Verify availability of test equipment and spares as per Section 5.2.4.			
10	With reference to Commissioning Temporary equipment & Facilities (refer on Doc. 123A90-PML-COM-SP-03014), check that power is available to any temporary equipment or test equipment (if any).			
11	System(s) isolations as per LOTO procedure defined within HSSE Permits to Work and Commissioning procedures duly prepared and approved			
12	All yard personnel have been duly notified by dedicated LUN (Livening Up Notification) that the system(s) is ready for commissioning.			

5.3.2 Electrical Preparation

Table 10. Electrical requirements OTP Onshore Worksite

Step	Description	Result	Verified by	Date
1	Check related punch list 'B' items and confirm acceptability for start of commissioning activities.			
2	Verify that all relevant associated systems / subsystems are completed.			
3	Check that grounding and bonding are in accordance with applicable documents.			
4	Verify and confirm the correct circuit breaker protection settings according to latest documentation.			
5	Verify and confirm the completion of the final connections between the LV 400V Switchboard and the Electrolyser, the MV 6.6kV and Electrolyser, and the EMCS.			
6	Assess the need for additional temporary F&G or E-Stop protection during ONSHORE phases and implement necessary changes.			

5.3.3 Mechanical Preparation

Table 11. Mechanical requirements OTP Onshore Worksite

Step	Description	Result	Verified by	Date
1	Check the correct flow direction of the valves.			
2	Confirm leak testing is complete and documented.			
3	Confirm mechanical alignment of all package pumps & equipment.			
4	Ensure package PSV setpoints are correct for the designed operating pressure.			
5	Ensure all unnecessary isolations are removed and vent system is ready to receive hydrogen.			

5.3.4 Instrument Preparation

Table 12. Instrument OTP requirements Onshore Worksite

Step	Description	Result	Verified by	Date
1	Check related punch list 'B' items and confirm acceptability for start of commissioning activities.			
2	Verify that all relevant associated systems / subsystems are ready.			
3	Check Inhibit and Override register has been prepared and validated.			
4	Verify that relevant equipment/ components are available and in operation for start of commissioning activities.			
5	Verify availability of test equipment as per Section 5.2.4.			

5.3.5 Piping Preparation

Table 13. Piping OTP requirements Onshore Worksite

Step	Description	Result	Verified by	Date
1	Ensure Treated Water supply connection is correctly connected to the Rosetti system at TP-001			
2	Ensure Nitrogen supply connection is correctly connected to the Rosetti system at TP-046			
3	Ensure Instrument Air supply connection is correctly connected to the Rosetti system at TP-047			
4	Ensure Hydrogen Vent connection is correctly connected to the Rosetti system at TP-003			
5	Ensure Hydrogen Storage connection is correctly connected to the Rosetti system at TP-006			
6	Ensure Waste Water output connection is correctly connected to the Rosetti system at TP-004			
7	Ensure Brine Discharge output connection is correctly connected to the Rosetti system at TP-005			
8	Review Rosetti flange management and confirm all interface connections have been torqued and leak tested with details recorded and signed for.			
9	Ensure Blind flange/ positive isolation is in place at test boundary.			

5.3.6 Additional Discipline Preparation

Not applicable.

5.4 Test Steps – Onshore WORKSITE - PHASES 1-2 (NOT PART OF THIS OTP)

The previous chapters must be successfully performed prior to commissioning of the Electrolyser Package.

Pre-commissioning (powered) activities listed in ELO-CMM-BPH-PRD-00008 (NOT PART OF THIS OTP).

Commissioning (powered) activities listed in ELO-CMM-BPH-PRD-00010 (NOT PART OF THIS OTP).

5.4.1 OTP Steps WORKSITE - PHASE 3

It is foreseen that previous sections are successfully performed.

In the following steps the functionality of the Electrolyser package shall be tested for operation in all BLPH operating modes.

5.4.1.1 Electrolyser Integrated Testing ONSHORE

This section outlines all the steps required to perform the Unit Start-Up. The Unit Start-Up Test Report Table in Section 7.1 provides the steps that must be followed sequentially. During the procedure, please complete the columns labelled 'Completed by,' 'Witnessed by,' and 'Date.

During the follow-up of the Start-Up Procedure, the current supplied to the electrolysis stacks is gradually increased from 10% to 100%, reaching the maximum hydrogen production capacity of 500 Nm^3/h. The successful execution of this procedure also depends on the correct application of the O&M vendors' package.

Despite the pre-settings established on the valves previously, some tunings can be performed during the ramp-up.

5.4.1.2 Setting the machine at START mode

Put the unit in Local mode via the button displayed on the Main view of the HMI.

Log into the HMI as "Expert": See below an example of pop-up displayed for log into the HMI:

Figure 7. Login popup Electrolyser HMI

⚠	Only Elogen staff is responsible for commissioning and maintenance is allowed to use the "Expert" mode. Elogen cannot be held responsible for any malfunctions resulting from unauthorized access to this operating mode.

Acknowledge all the alarms. Check that the area is clear, and all personnel are ready and in position.

Upon powering on the installation, the user must log in. The electrolyser will automatically be set to 'STOP' mode.

⚠	If a "Major" or Safety" fault is present, do not operate the system until troubleshooting the source of the fault and resetting the systems into its normal status.

The presence of "Minor" faults does not restrain the electrolysis process to start.

To start the hydrogen production the electrolyser must be switched into the "**START**" mode. To do so, enter a desire hydrogen flowrate on the indicated area (See point 1 in below picture). For the first start enter 10% of the nominal flowrate, hence **50 Nm³/h**.

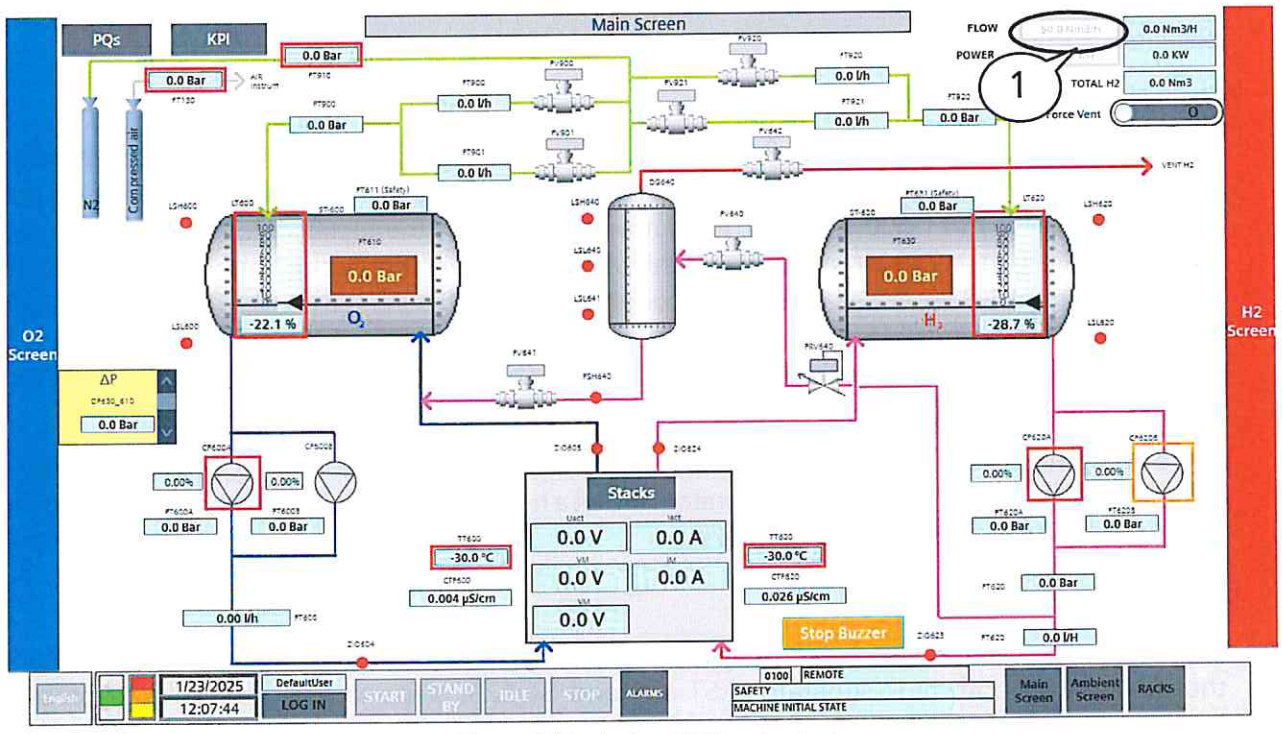

Figure 8. Electrolyser HMI main view

Set admissible pressure range for the hydrogen buffer tank downstream of the hydrogen purification unit (if applicable).

Push the "**START**" button on the HMI display.

At this point the available oxygen and hydrogen loop pumps (**CP-600A** or **CP-600B** and **CP-620A** or **CP-620B**) start running automatically according to the regulating function set in the Electrolyser's PLC.

5.4.1.3 Stack's Polarization

Within the start-up sequence, the HVAC system will automatically start-up. The stacks will be polarized as soon as the temperature of 3°C is achieved in the HVAC Loop (HVAC subsystem is used to cool the water passing through the heat exchangers HE-630/631 and HE-600 below its setpoint TT-60X LR). When HVAC Loop is ready, the stacks are polarized at 132.5V (1.25V per cell x 106 cells).

Note: From previous observations, in regard of the possible fluctuations of stacks voltage, it is considered that the polarization point can be achieved once the voltage per stacks is above **119.25 V** (so **530 V** per rectifier).

5.4.1.4 Hydrogen Production

With the stacks polarised and the 3 °C in the cooling loop reached, the stacks start to produce hydrogen up to the selected setpoint (previously set at 50 Nm^3/h in 10.1). Since the stacks are cold (temperature at inlet TT-600 < 50 °C), the current supplied by the rectifiers to the stacks follows a ramp up limited up to **763 V** (and **423 A**) at this stage to protect the stacks. This value corresponds to a maximum of **1.8 V** per cell (checked through the PCA-00X with X as A, B, C… H). Fluctuations of this value are admissible up to **2.1 V** per cell at this stage (**890.4 V** per rectifier). In case of exceeding the set point stacks inlet temperature (TT-600/TT-620 > 50 °C), the voltage ramp-up is stopped until the temperature goes below 50°C.

Once the temperature of 50 °C is reached (TT-600/TT-620), the electrolyser goes automatically to the "hot start" step. At this stage the operator can set a new hydrogen flowrate set point. During "hot start", the current is incremented by **20A/s**.

5.4.1.5 Functional Tests at 10%

From the first molecules produced of hydrogen and oxygen (i.e. current above polarization point), the pressure of both tank separators (ST-600 and ST-620) starts to rise. The delta of pressure between both tanks is managed automatically via a regulation function R-DPC-001. Fill the Check sheet in 11.2. Check the conformity of the control function while the pressure fluctuates (cf. Table in section 7.2). Observe if the corresponding valves open (PV- 631 and MPV-611), and the speed variator VAR-600 is set at the corresponding value, according to the delta pressure.

The regulation of delta pressure keeps on until the pressure at both tank separators reaches the nominal values, **31 barg** at hydrogen side (cathodic side), and **11 barg** at oxygen side (anodic side). Check the execution of the regulating function R-DPC-001 and take note of the pressurisation time (elapsed from selecting START mode on the HMI until reaching 11 and 31 barg).

While the tank separators are being pressurised, the hydrogen produced on the water / hydrogen loop is sent to the HPP, where the remaining oxygen and water are removed, and this flow is then routed to the vent. In normal operation, the treated hydrogen is then sent to the limit of battery.

Once the operation is stabilised at 10% of nominal flowrate (50 Nm^3/h), some sequences functional test and regulating functions can be achieved. In the Check Sheet, the functions in **bold** required special attention and need to be checked in START mode at 10% of the hydrogen production capacity.

As usual at this stage of Unit Start-Up, some PID (proportional, integral, derivative) tunings can be performed by the automation engineer.

Note: The duration to reach the nominal pressure depends on the flowrate setpoint. The higher the setpoint is, faster is the pressurisation.

5.4.1.6 Leak Checks

While the sequence and regulating functions are being tested, check that there are no leaks on the pipes, vessels, flanges or equipment. Use the hydrogen tracer gas device (Variotec 460 Tracergas). Any leak detected must be repaired immediately. If needed, the unit can be stopped, depressurized and purged with nitrogen.

As a standard procedure, the leak test at this stage should be performed in the same manner as it was prior to Start-up. Particular attention must be given to the HPP, the hydrogen analysis section, and all lines and equipment with tags containing **63X** and **80X** numbers.

5.4.1.7 Safety Stops at 10%

During START mode when hydrogen is being produced at 10% of the nominal flowrate, the safety stops shall be tested. However, since all safety loops were already triggered/simulated during Commissioning phase (cf. ELO-CMM-BPH-PRD-00010), at this stage, the compliance of safety loops in START mode could be checked by triggering one of the emergencies stop buttons (ESD-00X). Check that all the effects represented in the Cause & Effect diagram are performed for the selected ESD (cf. Cause & Effect diagram-C63-PWI-002).

During commissioning and Start-up, the machine is subject to different tests, therefore the circuit breakers are in high demand. For this reason, the number of Safety stops limit that could be trigger within 24 hours is given by the number of cycles till 10% of the components fails (B10D). For these circuit breakers, it is $2x10^7$ cycles (ref. PLC-RSC- 24DC/21). Hence, to limit the wear of the circuit breakers during commissioning and start-up phase, it is recommended to trigger a maximum of 3 safety stops per day during the whole commissioning period (2 months). So, the number of cycles used will be restricted to 0.001% of the total.

5.4.1.8 Increasing current from 10% up to 100%

This section aims to increase slowly the hydrogen production from 10% of nominal capacity up to 100%. Since it is the first ramp up of the unit, the current will be increased by 10% manually. Set the flowrate as explained on Section 6.4.1.2.

Table 14. Hydrogen production stepwise increment

Percentage of nominal capacity	H2 flowrate setpoint [Nm3/h]
10%	50
20%	100
30%	150
40%	200
50%	250
60%	300
70%	350
80%	400
90%	450
100%	500

Once the hydrogen setpoint is changed, the current fed into the stacks start to increase. Follow the voltage ramp-up and take note of this transition duration. Wait until the flowrate of hydrogen produced is stable.

Let the system run at steady state (variations on the flowrate below 2% of the setpoint) at each setpoint for 15 minutes minimum and check for normal operation and the execution of regulating and functional sequences.

5.4.1.9 Setting production at 100%

Once reached the 500 Nm3/h, let the system run at steady state and check for hydrogen leaks as previously explained (see Section 5.4.1.6).

Check the compliance of the regulating sequences at 100% of capacity. Especially the Glycol loop flowrate, the direct balancing regulation and in general good overall control and absence of defaults. Use a copy of table in Appendix Section 7.2 to record these functions compliances.

5.4.1.10 HPP Start-Up

As presented in the Commissioning Manual (cf. C063-ELO-PRO-CO-0004), the HPP must be subject to a series of test before bringing process gas into the system. The activities described in this section must be carried out with hydrogen, since the HPP performance, and particularly the heaters, work differently with hydrogen compared to nitrogen or other inert gas.

Hence, after assuring a hydrogen production up to maximum capacity by the electrolyser (100% of nominal flowrate), the adjustment of the performance of the HPP can be carried out to test the compliance of the global process through the reading of the OIHA-800A/B/C and DPT-800A/B/C.

All instructions and information related to the installation and commissioning of the HPP are detailed in the document DEDR 500/36 Installation, Commissioning, Operation and Maintenance Manual. The activities are summarised and presented in tabular format, including the columns 'Completed by,' 'Witnessed by,' and 'Date,' to assist the staff in verifying compliance with each step during the procedure (Sections 7.3.1, 7.3.2, and 0).

The commissioning and performance procedure for the HPP that requires process gas, and is deployed into three main stages:

a. Start of the Deoxo-Dryer
b. Flow control positioner
c. Setup of pressurized condensation system

Once the performance of the HPP has been tested in all the flowrate range (10-100% of nominal), check the conformity of the hydrogen purity (through the reading of the OIHA-800A/B/C and DPT-800A/B/C). Both measures must be below **5 ppmv** (i.e. impurities 10 ppmv which corresponds to 0.001%vol).

At this point, when a hydrogen production at maximum capacity is stabilised, along with the HPP operation, the performance test of the whole unit can be carried out. Follow the respective procedure given in the document C063-ELO-PRO-CO-0006 and complete the control list given on the same document.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

5.4.1.11 Electrolyser Integrated Testing ONSHORE Notes and Remarks

5.4.1.12 *Testing of EMCS Operating modes ONSHORE*

Table 15. Test report for EMCS Operating modes Onshore activities

Step	Description	Result	Verified by	Date
Electrolyser operating modes to be controlled from PCS via ECMS. Gas Production set point of Electrolyser to be agreed prior to test based on current site conditions/limitations.				
1	Confirm on PCS that CCS operating mode is in "IDLE". Confirm Electrolyser Package runs through start up sequence and progresses to H2 production at specified set point.			
2	On PCS, change CCS operating mode to "IMPORT (MODE 1A)". Confirm Electrolyser Package continues to produce H2 at specified set point.			
3	On PCS, change CCS operating mode to "IMPORT (MODE 1B)". Confirm Electrolyser Package progresses to STOP mode, with Unit cooled, depressurised & depolarised, and Chiller OFF.			
4	On PCS, change CCS operating mode to "HOT STANDBY". Confirm Electrolyser remains in STOP.			
5	On PCS, change CCS operating mode to "EXPORT". Confirm Electrolyser remains in STOP.			
6	On PCS, change CCS operating mode to "COLD STANDBY". Confirm Electrolyser remains in STOP.			

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

Step	Description	Result	Verified by	Date
7	On PCS, change CCS operating mode to "EMERGENCY (Island Mode)". Confirm Electrolyser remains in STOP.			
8	On PCS, change CCS operating mode to "MAINTENANCE". Confirm Electrolyser can only be operated locally.			
9	On PCS, return CCS operating mode to "IMPORT (MODE 1A)". Confirm Electrolyser Package runs through start up sequence and progresses to H2 production at specified set point.			
10	On PCS, return CCS operating mode to "COLD STANDBY". Confirm Electrolyser Package progresses to STOP mode, with Unit cooled, depressurised & depolarised, and Chiller OFF.			

Full details of the EMCS HMI control graphics can be found in Document Number: **123A90-DDL-EL-SP-20039 Functional and Technical Design Specification, IDS and DDS for Electrical Monitoring and Control System (EMCS)**

6 OTP AT SITE

6.1 Planning and Manpower

6.1.1 Offshore Site overview

It is expected that all pre-commissioning tests, systems energization and commissioning steps will have been successfully performed during the Onshore Phases.

Consequently, during the offshore SITE phase, the respective systems will be inspected prior to re-energization.

No additional test steps will be required on these items of equipment, correct operation and functioning will be verified.

6.1.2 Planned tasks with estimated manpower

Table 18. Estimated manpower OFFSHORE Worksite

Activity	Staff qualifications	Advised presence
Safety Stops at 10%	1 engineer and 1 automation engineer	
Increasing current by 10% up to 100%	1 automation engineer	
Production Settings at 100%	1 automation engineer	
HPP Start-Up	1 automation engineer	1 technician from Aquagas

6.1.3 Test duration estimate

Table 19. Estimated duration for Start-Up activities OFFSHORE Worksite

Document ID	Duration [h]
Safety Stops at 10%	8
Increasing current by 10% up to 100%	54
Production Settings at 100%	4
HPP Start-Up	48

If necessary, the estimated time can be extended to complete all required pre-commissioning and commissioning activities.

6.1.4 Vendor Assistance

- For offshore commissioning Elogen will provide onsite support.

6.3 OTP Description – SITE

The SITE test will consist of a repeat of the onshore integration testing with the BLPH now installed in situ to its permanent connections. In the following steps the functionality of the Electrolyser package shall be tested for operation in all BLPH operating modes.

6.3.1 OTP Test Preparation

Table 21. OTP requirements Offshore Worksite

Step	Description	Result	Verified by	Date
1	System Ready for Operation (RFO) Certificate is issued and approved.			
2	No blocking punch list items are outstanding against the system to be commissioned.			
3	System(s), (de)isolations as per LOTO procedure enclosed within commissioning Work Permits procedures prepared and approved			
4	Verify and confirm that all steps performed at WORKSITE of this procedure are completed without any pending issues that would prevent from proceeding with the offshore SITE PROCEDURE			
5	All personnel involved in the implementation of this procedure are familiar with this procedure as well as with associated safety requirements (Toolbox Talk to be conducted before initiation of activities).			

Step	Description	Result	Verified by	Date
6	A final walkdown after hook-up of the system has been completed, any preservation items have been removed and to ensure that the system and the area are ready for energization.			
7	Check that areas are free for work and escape routes are clear of any obstructions.			
8	Ensure that proper communications have been established between parties involved in the implementation of the procedure.			
9	Verify availability of test equipment and consumables as per chapters 6.2.4.			
10	All personnel have been duly notified during dedicated daily SIMOPS meetings that the system(s) is ready for operation.			

6.3.2 Electrical Preparation

Table 22. Electrical requirements OTP Offshore Worksite

Step	Description	Result	Verified by	Date
1	Check related punch list 'B' items and confirm acceptability for start of commissioning activities.			
2	Verify that all relevant associated systems / subsystems are completed.			

6.3.3 Mechanical Preparation

Table 23. Mechanical requirements OTP Offshore Worksite

Step	Description	Result	Verified by	Date
1	No blocking punch list items are outstanding against the system to be commissioned.			
2	Ensure all unnecessary isolations are removed.			

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.
Once printed shall be considered as "NOT CONTROLLED" copy.
File: 123A90-PML-COM-PRO-03047

3	Ensure downstream systems are ready to receive H2.			

6.3.4 Instrument Preparation

Table 24. Instrument requirements OTP Offshore Worksite

Step	Description	Result	Verified by	Date
6	Check related punch list 'B' items and confirm acceptability for start of commissioning activities.			
7	Verify that all relevant associated systems / subsystems are ready.			
8	Check Inhibit and Override register has been prepared and validated.			
9	Verify that relevant equipment/ components are available and in operation for start of commissioning activities.			
10	Verify availability of test equipment as per Section 5.2.4.			

6.3.5 Piping Preparation

Not applicable

6.3.6 Additional Discipline Preparation

Not applicable.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

6.4 OTP Test Steps – Offshore PHASE 4

The previous chapters must be successfully performed prior to commissioning of the Electrolyser Package.

In the following steps the functionality of the Electrolyser package shall be tested for operation in all BLPH operating modes.

6.4.1.1 Electrolyser Integrated Testing OFFSHORE

This section outlines all the steps required to perform the Unit Start-Up. The Unit Start-Up Test Report Table in Section 7.1 provides the steps that must be followed sequentially. During the procedure, please complete the columns labelled 'Completed by,' 'Witnessed by,' and 'Date.

During the follow-up of the Start-Up Procedure, the current supplied to the electrolysis stacks is gradually increased from 10% to 100%, reaching the maximum hydrogen production capacity of 500 Nm^3/h. The successful execution of this procedure also depends on the correct application of the O&M vendors' package.

6.4.1.2 Setting the machine at START mode OFFSHORE

Follow the description given in Section 5.4.1.2.

6.4.1.3 Stack's Polarization

Follow the description given in Section 5.4.1.35.4.1.2.

6.4.1.4 Hydrogen Production

Follow the description given in Section 5.4.1.4.

6.4.1.5 Safety Stops at 10%

Follow the description given in Section 5.4.1.7.

6.4.1.6 Increasing current from 10% up to 100%

Follow the description given in Section 5.4.1.8.

6.4.1.7 Setting production at 100%

Follow the description given in Section 5.4.1.9.

6.4.1.8 Testing of EMCS Operating modes OFFSHORE

Table 25. Test report for EMCS Operating modes Offshore activities

Step	Description	Result	Verified by	Date
Electrolyser operating modes to be controlled from PCS via ECMS. Gas Production set point of Electrolyser to be agreed prior to test based on current site conditions/limitations.				
1	Confirm on PCS that CCS operating mode is in "IDLE". Confirm Electrolyser Package runs through start up sequence and progresses to H2 production at specified set point.			
2	On PCS, change CCS operating mode to "IMPORT (MODE 1A)". Confirm Electrolyser Package continues to produce H2 at specified set point.			
3	On PCS, change CCS operating mode to "IMPORT (MODE 1B)". Confirm Electrolyser Package progresses to STOP mode, with Unit cooled, depressurised & depolarised, and Chiller OFF.			
4	On PCS, change CCS operating mode to "HOT STANDBY". Confirm Electrolyser remains in STOP.			
5	On PCS, change CCS operating mode to "EXPORT". Confirm Electrolyser remains in STOP.			
6	On PCS, change CCS operating mode to "COLD STANDBY". Confirm Electrolyser remains in STOP.			

Step	Description	Result	Verified by	Date
7	On PCS, change CCS operating mode to "EMERGENCY (Island Mode)". Confirm Electrolyser remains in STOP.			
8	On PCS, change CCS operating mode to "MAINTENANCE". Confirm Electrolyser can only be operated locally.			
9	On PCS, return CCS operating mode to "IMPORT (MODE 1A)". Confirm Electrolyser Package runs through start up sequence and progresses to H2 production at specified set point.			
10	On PCS, return CCS operating mode to "COLD STANDBY". Confirm Electrolyser Package progresses to STOP mode, with Unit cooled, depressurised & depolarised, and Chiller OFF.			

Full details of the EMCS HMI control graphics can be found in Document Number: **123A90-DDL-EL-SP-20039 Functional and Technical Design Specification, IDS and DDS for Electrical Monitoring and Control System (EMCS)**

6.4.1.9 Electrolyser Integrated Testing OFFSHORE Notes and Remarks

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.
Once printed shall be considered as "NOT CONTROLLED" copy.

Step	Description	Completed by	Witnessed by	Date
01	Select the LOCAL Mode.	FMO NG		21/06/25
02	Log-in as "Expert" on the HMI.	FMO NG		21/06/25
03	Check that all alarms are acknowledged, and all areas are clear.	FMO NG		21/06/25
04	Check that Electrolyser is in STOP mode.	FMO NG		21/06/25
05	Set the Hydrogen production at 50 Nm^3/h. (10% of hydrogen production).	FMO NG		21/06/25
06	Press START and monitor the progression (Check that oxygen and hydrogen pumps CP-600A or B and CP-620A or B, and HVAC system are starting-up). 08:36	FMO NG		21/06/25
07	Check that 3 °C is reached in the HVAC Loop system.	FMO NG		21/06/25
08	Check that the stacks are polarized at 132.5 V.	FMO NG		21/06/25

Step	Description	Completed by	Witnessed by	Date
09	Check that the cold start-up is in good process (TT-600 < 50 °C). Separator tanks (ST-600 and ST-620) are being pressurized by the hydrogen produced. Warning: The voltage per stack must not exceed 222,6 V (890,4 V per rectifier).	FMO NG		21/06/25
10	Observe that hot start-up reached (TT-600> 50 °C). Ramp-up shifts to 20 A/s automatically.	FMO NG		21/06/25
11	Check that the Pressure in separator tanks is being regulated via PV-631 and MPV-611, until reaching the nominal pressure on both loops (11 barg at ST-600 and 31 barg ST-620). * ST-620 30bar At this point Hydrogen is routed to the HPP.	FMO NG		21/06/25
12	Check if the production is stabilized at 50 Nm3/h of hydrogen (monitor FT-630) and the unit is working at its nominal pressure (11 barg at ST-600 and 31 barg at ST-620).	FMO NG		21/06/25
13	Perform a Leak Check at 10% of nominal production.	FMO NG		21/06/25
14	Check that all sequences and regulating functions are working as expected at 10 % of nominal flowrate (see table in Section 7.2).	FMO NG		21/06/25

* 29,7 bar < PV-631 < 31,5 but MPV-630 at 30 bar

Step	Description	Completed by	Witnessed by	Date
15	Proceed to the Safety Test at 10% of nominal production are compliant (One ESD trigger).	FMO NG		09/05/25
16	Do the ramp up manually and until 100% of Hydrogen production (cell voltage between the range and setting of current according to R-REC-001). 09:50	FMO NG		21/06/25
17	Check that Hydrogen production stabilized at 100% (500 Nm3/h)	FMO NG		21/06/25
18	Check that the sequences and controls are working as expected within the range of 10-100% of nominal flowrate.	FMO NG		21/06/25
19	Check that the HPP is working as expected with a hydrogen quality produced as expected. OIHA-800A/B/C < 5 ppmv and DPT-800A/B/C < 5 ppmv	FMO NG		21/06/25
21	Sequences and regulating functions are working as expected at 100 % of nominal flowrate (11.2 to be completed again for 100%).	FMO NG		21/06/25
22	Perform a Leak Check at 100% of nominal production.	FMO NG		21/06/25

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

7.2 Test Report for Functional Test

Table 29. Test report Functional test for the Electrolyser

Function – Description. Tested at 10% or 100% of nominal flow	Completed by	Witnessed by	Date	Comment
S-A5-001 – STOP in progress (from START/STANDBY/IDLE states)	FMO NG		20/06/25	
S-F2-001 – START in progress (from STOP)	FMO NG		21/06/25	
R-DPC-001 – Delta Pressure H2/O2 control (START) *If ΔP[4] > 21 barg, then PV-631 OPEN. If ΔP < 21 barg, then PV-631 CLOSED.* *If ΔP < 5 barg, then PV-631 CLOSED, MPV-611=100% OPEN, VAR-600 = VAR600_LR*	FMO NG		21/06/25	ΔP ≥ 20bar PV631 OPEN ΔP < 20bar PV631 closed
R-LC-600 – ST-600 Water Level Control (Direct Injection) *If LT-600 < 38% & LT-300 > 20%[5], then LP-300 START. If LT-600 > 48%, then LP-300 STOP*	FMO NG		21/06/25	LP300 start if LT600 < 42% LP300 Stop if LT-600 > 47%
R-LC-610 – CS-610 water level control *If LSH-610 COVERED[6] & VAR-300 = 0%, then SV-600 OPEN. If LSL-610 UNCOVERED or VAR-300 > 0%, then SV-600 CLOSED*	FMO NG		21/06/25	
R-LC-620 – ST-620 Water Level Control (Direct balancing) *If PT-630 > 11 barg & LT-620 > 54%, then SV-640 OPEN.* *If LT-620 < 35% or PT-630 < 11 barg, then SV-640 CLOSED.*	FMO NG		21/06/25	SV-640 always open SV-641 open if PT 630 > 8bar PT 630 > 11 bar LT 620 > 52%
R-LC-630 – CS-630 water level control	FMO NG		21/06/25	

SV-641 closed if LT620 < 4

From 40% → 52% : 3min40 at 100% (500 Nm³/H

If LSH-630 COVERED, then SV-620 OPEN. If LSL-630 UNCOVERED, then SV-620 CLOSED.	FMO NG		21/06/25	
R-LC-642 – DG-640 Hydrogen Purge If LSL-640 UNCOVERED & SV-640 CLOSED & LSH-640 UNCOVERED & PT-630 > 20 barg & → always open ΔP > 2 barg, then SV-642 OPEN. If LSH-640 COVERED, then SV-642 CLOSED.	FMO NG		21/06/25	SV-640 is forced as NO valve
R-LC-500 – Water Level Control of H2 vent condensates If LSH-500 COVERED, then PV-500 OPEN. If LSL-500 UNCOVERED, then PV-500 CLOSED.	FMO NG		21/06/25	
R-PC-610 – Pressure Control Oxygen Loop If PT-610 > 11,5 barg, then MPV-611 = 100 % OPEN. If PT-610 < 10,8 barg, then MPV- 611 = 0% (CLOSED).	FMO NG		21/06/25	MPV-611 Settings KP = 2 TI = 1 TD = 0
R-PC-630 – Pressure Control Hydrogen Loop If PT-630 > 31,5 barg, then PV-631 OPEN. If PT-630 < 29,7 barg, then PV-631 CLOSED.	FMO NG		21/06/25	MPV-630 Settings KP = 3 TI = 10 TD = 0
R-REC-001 – Rectifier setting current. This function can be validated by comparing the hydrogen setpoint entered by the user and the flowrate measured by the FT-630.	FMO NG		21/06/25	
R-TC-600 – O2 Water Temperature Control Loop	FMO NG		21/06/25	

Function – Description. Tested at 10% or 100% of nominal flow	Completed by	Witnessed by	Date	Comment
The M3WV-200 is commanded by a PID regulation, where the setpoint is TT-601 = 65 °C. Check that the TT-601 is stable and that the 3WV-200 opens to approach the setpoint.	FMO NG		21/06/25	PID setting KP = 6 TI = 84,5 TD = 0
S-PC-610 – O2 Depressurisation ΔP > 1 barg & ΔP < 21 barg & LT-600 < 50%, then MPV-611 = 100%. If PT-610 < 0,15 barg & PT-630 < 0,15 barg, then MPV-611 = 0%. If this sequence is still active after 20 minutes, MPV-611 = 0% and displayed "O2 depressurisation failed. Going to safety O2 depressurisation"	FMO NG		21/06/25	
S-PC-630 – H2 Depressurisation If PT-610 > 0,35 barg & ΔP < 21 barg & ΔP > 1 barg & LT-620 < 62%, the PV-631 OPEN. If ΔP < 1 barg, the PV-631 CLOSED. If LT-620 > 62%, then PV-631 CLOSED. If PT-630 < 0,15 barg, then PV-631 CLOSED.	FMO NG		21/06/25	
S-REC-001 – Stack polarization See Section 5.4.1.3	FMO NG		21/06/25	
S-REC-003 – Stop rectifier (decreasing current) This function can be validated by an observed decrease in the hydrogen flowrate (measured by the FT-630)	FMO NG		21/06/25	

7.3 HPP Start-Up Test Report

7.3.1 HPP commissioning performance adjustment and test - Start of Deoxo-Dryer

Table 30. Test report HPP Start-up- Start of Deoxo-Dryer

Step	Description	Completed by	Witnessed by	Date	Comment
01	Check inert gas is available and all connections have been checked against leakages.	FMO NG		06/06/25	
02	Check that instruments and electrical power are available.	FMO NG		06/06/25	
03	(If the DEDR has been opened against the atmosphere) Purge it with inert gas before feeding the hydrogen.	FMO NG		06/06/25	
04	Open cooling water to the coolers.	FMO NG		06/06/25	
05	Open the compressed hydrogen gas intake slowly. In case there is no valve to isolate the electrolyser and the HPP, once the previous steps completed, start the hydrogen production through the HMI at 10% of production (50 Nm3/h). And wait until the systems starts to be pressurised as described in previous sections.	FMO NG		06/06/25	
06	Check for leakages.	FMO NG		21/06/25	

7.3.2 HPP Commissioning performance adjustment and test - Flow controller positioner

Table 31. Test report HPP Start-up - Flow controller positioner

Step	Description	Completed by	Witnessed by	Date	Comment
01	Check that the PLC control have a linear output signal (0-100% = 4-20 mA)	FMO NG		06/06/25	
02	Check the positioner's output when no pilot pressure is supplied to the 64-V6. Positioner must indicate 100% open	FMO NG		06/06/25	
03	Test with pilot pressure: 4 mA: Positioner indicates 0% open. 8 mA: Positioner indicates ~10% open. 12 mA: Positioner indicates ~25% open 16 mA: Positioner indicates ~50% open. 20 mA: Positioner indicates ~75% open.	FMO NG		06/06/25	
04	Start the dryer in heating sequence at ~~100%~~ 10% of hydrogen ~~nominal~~ flow capacity.	FMO NG		21/06/25	Done at 10%
05	Check that positioner FC-64.1 indicates ~75% open.	FMO NG		06/06/25	
06	Adjust the by-pass needle valve 64-V14.1: count the turns from fully open to fully close and set it at 50% open.	FMO NG		06/06/25	
07	Partly close valve 64-V14 to about 50%.	FMO NG		06/06/25	

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

Step	Description	Completed by	Witnessed by	Date	Comment
08	Wait 15 minutes and read the regeneration temperature (DR-TT-64-6 or DR-TT-64-8 depending on which tower is in regeneration sequence).	FMO NG		21/06/25	
09	If the temperature is below 155°C, partly close valve 64-V14 step by step until 155-160°C is reached. Wait 10-15 minutes between every step. You can also use by-pass needle valve 64-V14.1 for fine tuning,	FMO NG		21/06/25	
10	If the temperature is above 165°C, partly open valve 64-V14 step by step until 160-165°C is reached. Wait 10- 15 minutes between every adjustment. Use the by-pass needle valve 64-V14.1 for fine tuning. If 155-160°C cannot be reached, increase the heater set point by 25°C and restart from step 04.	FMO NG		21/06/25	
11	Check the heater ON vs OFF time. If the heater is ON between 75% and 95% of the heating time, proceed to the control of operation at 25-100% capacity If ON time > 95%, then partly close the valve 64-V14 until the heater ON time drops to 75-95% of the time. If ON time < 75%, then partly open the valve 64-V14 until the heater ON time increase up to 75-95% of the time. Use the by-pass needle valve (64-V1431) for fine tuning. (Wait 15 minutes between every adjustment)	FMO NG		21/06/25	

Step	Description	Completed by	Witnessed by	Date	Comment
12	Start the dryer in heating sequence at 75% of hydrogen nominal flow capacity (375 Nm^3/h). From the electrolyser's HMI, as indicated in Section 6.4.1.2.	FMD NG		21/06/25	
13	Check that positioner indicates ~50% open.	FMD NG		21/06/25	
14	Wait 15 minutes and read the regeneration temperature (TT-64.6 or TT-64.8 depending on which tower is in regeneration sequence). If TT-64.6 or TT-64.8 < 155 °C, then remove the cover of the positioner and slightly increase the span until reaching 155-160 °C. If TT-64.6 or TT-64.8 > 165 °C, then slightly decrease the span until reaching 160-165 °C. (Wait 15 minutes between every adjustment)	FMD NG		21/06/25	
15	Start the dryer in heating sequence at 25% of hydrogen nominal flow capacity (125 Nm3/h). From the electrolyser's HMI, as indicated in Section 6.4.1.2. Let it stabilize and run for 15 minutes.	FMD NG		21/06/25	
16	Ramp-up the hydrogen flow every 15 minutes by 25% (i.e. 25%, 50%, 75% and 100%).	FMD NG		21/06/25	
17	Check regeneration temperature (TT-64.6 or TT-64.8). It must be around 160 - 180 °C for the range of flowrates, if not, contact Aquagas for assistance.	FMD NG		21/06/25	

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

7.3.3 HPP commissioning performance adjustment and test - Setup of condensation system

Table 32. Test report HPP Start-up - Setup of condensation system

Step	Description	Completed by	Witnessed by	Date	Comment
01	Start the dryer at 100% of hydrogen nominal flow capacity (500 Nm^3/h) and let the system to stabilise.	FMO NG		21/06/25	
02	If the Pbar factor is set too high. Reduce it by a factor of 0.1 (ex. If initially set at 15 barg, then reduce it at 13.5 barg). If the Pbar factor is set too low. Increase it by a factor of 0.1 (ex. If initially set at 15 barg, then increase it at 16.5 barg). For both cases, repeat with a smaller difference if needed.	FMO NG		21/06/25	
03	Check if there is remaining water to be drained, by activating the solenoid valve 64-V12 and check how much water is coming out.	FMO NG		21/06/25

1. Introduction

This document describes the philosophy, organization and milestones required for the Commissioning & Start-Up of the ELOGEN hydrogen production unit by water electrolysis for the Crosswind Project. ELOGEN's site supervision is responsible for advising the coordinating on site of all the means and resources required for the Unit Commissioning & Start-Up of the unit in accordance with COMPANY specifications.

1.1 Overview of Project Scope

Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.

Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.2 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Figure 1. *HOLLANDSE KUST NOORD WIND PARK Location Map*

Figure 2. *Wind Park Details*

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile is located on coordinates E 590719.1, N 5841602.3 and is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

1.3 Project Concept

All components included in the BLPH will be integrated onshore on a topside and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

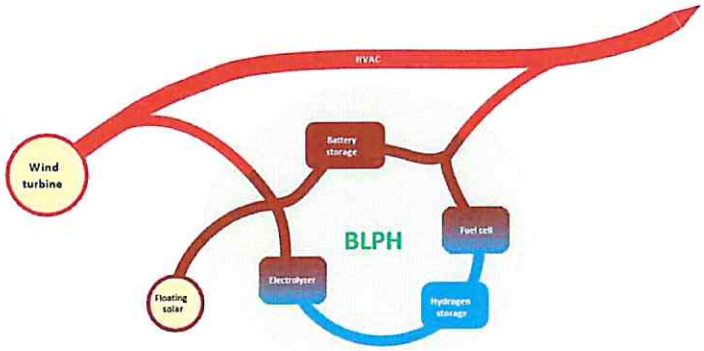

Figure 3. *BLPH Concept*

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.

The purpose of the BLPH is to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

2. Document Scope

In this document are described the activities developed to evaluate the performance of the electrolysis unit. This activities are carried out after achieving completion on the hydrogen production from 10% to 100% of nominal flowrate, which is from 50 Nm^3/h up to 500 Nm^3/h (cf. C063-ELO-PRO-CO-0005).

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

In the section 7 are given the steps to conclude if the unit performs as expected and established by the contract. In addition to the operation description, are given the prerequisites, acceptance criteria, as well as the time required for each operation.

The performance of the electrolysis unit is evaluated towards the following parameters:

- Hydrogen production rate
- Hydrogen purity
- Efficiency at maximum capacity
- Hot start time
- Energy consumption in hot stand-by
- Cold start time
- Energy consumption in cold stand-by
- Ramp down time
- Ramp up time
- Fresh water consumption

3. Definitions

Table 1. Table of definitions

Term	Definition
COMPANY	means CROSSWIND C.V., owner & developer of the offshore WIND FARM Hollandse Kust Noord Wind Park Project.
ELOGEN	means ELOGEN as CONTRACTOR, the contracted party for engineering, and onshore commissioning of the Electrolyzer facilities associated with the PROJECT.
Pre-Commissioning	Pre-Commissioning relates to the preliminary Commissioning activities to test and check the individual basic functions of individual items within any given system and/or sub-system to confirm they perform as designed.
Commissioning	The phase of the project after Pre-Commissioning. Commissioning consists of a comprehensive series of dynamic and energized Checks and Tests to be carried out in order to demonstrate and ensure that the facilities are ready to operate safely and steadily in compliance with project Documents, Specifications, Standards and Engineering Best Practices.
Equipment	An item that may be part of a System and be commissioned independently, however, it may or may not be operated independently.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Term	Definition
Inspection Test Records (ITR)	A-ITR – used to record and verify construction scope associated with a tagged item (component). B-ITR – used to record and verify energization and function testing during pre-commissioning of a tagged item
Operations	Operations include all personnel directly involved with Production Operations and Maintenance of the facility.
Performance Test	The Performance Test takes place following the Commissioning and Site Acceptance Test. A performance test is executed if there is a specific requirement to test performance criteria of an individual piece of equipment, a system, or the plant.
Plant	Refers to the permanent facilities (Base Load Power Hub) being constructed or to be constructed at WORKSITE resulting from the WORK.
Project	Refers to the BASE LOAD POWER HUB project.
Pre-Start Up Audit (PSUA)	The PSUA is a precursor to the PSSR meeting. The intention is to audit the readiness of the facility to commence start up with the findings being used as part of the PSSR and shall be conducted 6 weeks prior to Start-up.
Pre-Start Up Safety Review (PSSR)	Pre-Start-up Safety review (PSSR) meeting is the final determination that all prerequisites have been met to permit the hydrogen production and shall be conducted 4 weeks prior the RFSU.
Procedure	A document that details the execution of an activity.
Punch List	Work not executed as per approved documents and/or not meeting quality, health, safety, environment, operability/maintainability requirement and/or Standard; and recorded as a list for rectification.
Ready For Start-up (RFSU)	RFSU applies to the whole or part of the Plant and its associated Facilities and Systems. RFSU signifies that the applicable scopes have been fully commissioned and are ready for safe hydrogen production. RFSU will be authorized with the signing of the RFSU certificate. The RFSU requires that the Pre-Start-Up Audit (PSUA) and the Pre-Start- Up Safety Review have been completed, and all related action/blocking issues have been resolved

This document contains confidential information which is the property of ELOGEN.

Term	Definition
SITE	Refers to the offshore location where the PLANT is to be installed and the vicinity thereof (offshore North Sea - Netherlands).
Start-up	The stage at which process fluid is introduced/created into the Plant. It is defined as operation of all the facilities under the project. It can only be performed once Commissioning of all associated utilities and auxiliaries and Pre-Commissioning activities of the Plant have been completed.
Start-up/Ramp-up	It is the initial start-up of processing equipment after first hydrogen, followed by a staged ramp up to full operating conditions. On completion of ramp-up, and after a period of steady state operations, the facility is ready to be performance tested.
System	A System is a major subdivision of a plant, being either process or utility, which performs an operational function of the plant. A System includes all the various equipment that allows it to operate. The division into functional Commissioning Systems corresponds to the prevailing fluids or services.
Sub-system	A Sub-system is a further subdivision of a System, which performs a partial operational function of the System, with little or no interference from the other Sub-systems. The Sub-system is the basic unit for Commissioning.
WORKSITE	means any construction location(s), where any major parts of the PLANT (such as templates, piles, nodes, jacket structure, modules, decks) shall be fabricated and assembled, excluding all other offices, premises and workshops of CONTRACTOR and SUBCONTRACTORS.
Shall	used to indicate requirements strictly to be followed to conform to the specification and accepted by all involved parties.
Should	used to indicate that among several possibilities one is recommended as particularly suitable without mentioning or excluding others, or that a certain course of action is preferred but not necessarily required.
May	used to indicate a course of action permissible within the limits of the specification.
Can	used for statements of possibility and capability, whether material, physical or casual.

Term	Definition
SLD	Single Line Diagram
UPS	Uninterruptible Power Supply

5. Requirements

Electrolyser's unit performance test activities can be performed when the Start-up report for the entirety of the electrolysis unit has been signed by all parties:

- All Punchlist that does not require the system to be reopened are cleared. OK
- All relevant documentation is available in the latest revision. OK
- The UPS is loaded at 100%. OK
- All Utilities are operational. OK
- The electrolyzer is stopped depressurized and cold (T < 40 °C). OK
- Electrolyzer Unit Start-Up & Ramp Up procedure has been completed and the corresponding ITRs have been completed and signed (cf. C063-ELO-PRO-0005). OK
- All systems are power-up and available to start automatically. OK
- Appropriate PPE must be always worn during loop testing. OK
- A permit to work has been delivered. OK
- In any case this procedure shall not conflict with, or supersede, the electrical lock-out procedure. Only electrical system leaders will be authorized to remove padlocks in electrical cabinets. OK
- Written authorization has been obtained to send hydrogen through the client's installation (**Figure 4** piping highlighted in turquoise, PV-633 open and PV-632 close). In the absence of such authorization, the hydrogen will be directed through the designated hydrogen vent (**Figure 4** piping highlighted in yellow, PV-633 close and PV-632 open). OK

5.1 Required Equipment

- Toolboxes (e.g. screwdrivers, wrenches, pliers, spanners). OK
- ATEX Field telephone or Walkie-Talkie. OK
- Portable Ultrasonic flow meter Endress+Hauser Prosonic Flow 93T (ref. 500075)[2]
- Chronometer. OK
- Personal hydrogen detectors for each people on site, calibrated up to date. OK

All equipment used must have a serial number and a valid calibration certificate up to date (if applicable).

Table 3. Test equipment register

TESTING & MEASUREMENT INSTRUMENT USED			
Type	Serial N.	Calibration certificate	Validity

5.2 Required Documents

- This procedure approved.
- A work permit has been issued and signed.
- Signed report test for the Start-up activities (cf. C063-ELO-PRO-CO-0005).

5.3 Required Manpower (Indicative)

For all the operations it is required the presence of a commissioning engineer and an automation engineer. The presence of the client is optional.

In case of any additional test, maintenance or trouble shooting for one or more components in the unit, it is recommended to count with a mechanical, electrical, piping and instrument technician, as well as the site supervisor.

6. Risk

6.1 Gas risk

The hydrogen produced in the electrolysis unit is an odorless, colorless and flammable gas, that can be released up to 500 Nm^3/h. The principal risks related to hydrogen are:

- Risk of inflammation or explosion. In the event of inflammation, hydrogen produces a flame invisible to the bare eye.
- Risk of anoxia due to the replacement of oxygen.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

The nitrogen used to purge the system during stop and start sequences is an odorless gas, naturally present in the air. The principal risk related to this gas is anoxia due to replacement of oxygen.

6.2 Fire risk

The fire risk is induced by the presence of hydrogen gas in the system, as well as by the presence of electrical equipment. All sources of ignition (electric sparks, hot surfaces, static electricity, mechanical hot spots...), and a presence of hydrogen leak, could lead to a fire risk.

⚠	The external fire case is not covered by the machine safety system and is under the responsibility of the operator.

6.3 Electrical and electrostatic risk

The system is composed of elements operating at voltage higher than the safety voltage (400 Vac for certain auxiliaries) and can therefore cause significant damage to people and property. The design and manufacture of the electrolysis unit is compliant with the CE Low Voltage Directive (2014/35/EU). There are three types of electrical risk:

- Residual polarisation voltage: after a machine's shutdown, and even after electrical lockout, the stacks keep a residual polarisation voltage that can last up to three days.
- Electrostatic: eliminated generally by periodically checking the grounding of the installation and the use of suitable PPE.
- Electrical: controlled by the compliance of the cabling of the installation and the good practice following the recommendations given by the procedures.

⚠	All elements in the system must be connected to a grounding surface connected to the ground terminal and checked at every intervention.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

6.4 Thermal risk

The thermal risk carried is related to burns on contact with hot surfaces. The process globally carries fluids reaching 165 °C[3], which can cause second degree burns. The electric heater presents in the containers (indicated as EH- on the P&ID) can reach even higher surface temperatures.

6.5 Pressure risk

The risk associated with pressure devices is due to the amount of energy released in the event of a device rupturing or bursting due to sudden release of fluid.

6.6 Risk of falling

Maintenance operations on the roof of the electrolyser must be carried out by personnel trained and authorised to work at height. Operators must be attached in such a way as to limit the risk of falling. Operations may be carried out from a platform if necessary.

⚠	Risk of injury. Respect safety measures for working at height when working on the roof of the electrolyser.

7. Operation description

The validation of the performance tests is concluded through the **Table 7** to **Table 16**, where each step is described in a row and the columns "Completed by", "Witnessed by" and "Date" are used to register the compliance of the activity. Take note of the results obtained, and if it is compliant according to the expected value.

If the test is interrupted by any factor (major or safety fault, or due to an external situation), the test is not longer valid, and it must be re-started.

Despite the independence of the tests, they can be carried out in an optimized circuit, to avoid waiting times and limit the stops of the electrolyser. In **Figure 5** is presented a recommended planning for the activities. The

[3] particularly on the HPP, the BOP reaches temperatures of 65 °C

7.1 Hydrogen production rate

***Table 7.** Hydrogen production rate*

Time required	Pre-requisites	Validation criteria
2 hours	Electrolyser initial state displayed on HMI: STOP	Hydrogen production rate at maximum capacity is 500 ± 1,25 Nm^3/h

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the "Expert" mode.	FMO NG		18/06/25
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [4].	FMO NG		18/06/25
03	On the HMI, enter 10% of the maximum hydrogen flow rate in Nm^3/h (50 Nm^3/h). (Figure 6 point **1**).	FMO NG		18/06/25
04	(If applicable) On the hydrogen separator tank view of the HMI, select the button "Force Event" to force the hydrogen production to the vent. (Figure 6 point **2**).	FMO NG		18/06/25

[4] For more details about the use of the HMI, check the Start-up procedure (cf. C063-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
05	Press the "START" button on the HMI navigator. (Figure 6 point **3**).	FMO NG		18/06/25
06	Check that the stacks are being polarized at a ramp of 5 V per second up to a voltage equal to 1,25 x Number of Cells for each stack (1,25*106 V=**132.5 V**). The polarization phase ends once the rectifier voltage is higher than or equal to the polarisation point (i.e. **530 V** per rectifier and **1060 V** in total[5]). (Figure 6 point **4**). **Note:** in regard of the possible fluctuations of stacks voltage, it is considered that the polarization point is achieved once the voltage per stacks is above **119.25 V** (i.e. **477 V** per rectifier and **954 V** in total).	FMO NG		18/06/25
07	Let the electrolyser run at 10% of the maximum production setpoint to heat the water inlet to stacks up to 50°C (TT-600). This value measured can be read directly on the HMI. The operation should last about 30 minutes. (Figure 6 point **5**).	FMO NG		18/06/25
08	Once the temperature measured by the TT-600, reaches 50 °C, enter the maximum production setpoint on the HMI (500 Nm3/h). (Figure 6 point **1**).	FMO NG		18/06/25
09	The current passing through the stacks should start to ramp up. The production should reach the setpoint within 30 s to 5 min after setting the process at its maximum production (500 Nm^3/h).	FMO NG		18/06/25

[5] The systems is constituted by eight stacks of 106 cells each. The stacks are grouped by 4 and each group is supplied by one rectifier.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
	Note: During the current ramp up phase, make sure that no cell in the stacks is subjected to a voltage higher than **2,1 V** (**890,4 V** per rectifier) by checking on the HMI (Figure 6 point **4**). The software will display an alarm and stop production if that is the case.	FMO NG		18/06/25
10	Monitor the hydrogen production flow rate on the HMI measure by the FT-630. Once it has reached its maximum value, let the system run for 30 minutes to reach stability. Throughout during this period, the hydrogen flow must be within the targeted value with a deviation of 0,25 %. (500 ± 1,25 Nm^3/h). (Figure 6 point **6**). 500.3 Nm^3/h	FMO NG		18/06/25
11	Record the hydrogen production flow rate measures during 1h for each second (sampling rate of 1 Hz).	FMO NG		18/06/25
12	Calculate the average value between the measures. The obtained value must be inside the range of uncertainty indicated (500 ± 1,25 Nm^3/h).	FMO NG		18/06/25

Result						
Hydrogen production rate at maximum capacity: 500.3 Nm^3/h	Compliant (YES/NO)	YES	Completed by	FMO NG	Date	18/06/25

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.2 Hydrogen purity

The hydrogen produced by the electrolysis process, after going through the separator and condensation vessels, is polluted by molecules of water and oxygen. The expected purity of 99,999% is reached while the hydrogen goes through the HPP. Hence, at client's stream (flowrate measured by the FT-630), the oxygen and water content are both limited to 5 ppmv. This section describes the method to validate the oxygen and water content in the hydrogen produced at maximum capacity (i.e. 500 Nm^3/h).

***Table 8.** Hydrogen purity*

Time required	Pre-requisites	Validation criteria
1 hour and 30 minutes	The electrolyser has run at its maximum capacity recently[6]. OK Electrolyser initial state displayed on HMI: STOP OK Temperature of the cold loop TT-60 between 3 and 5 °C. OK Temperature at the inlet of stacks TT-600 > 50 °C. OK	Dew point is lower than 5 ± 0,15 ppmv at atmospheric pressure. Oxygen content in the hydrogen is lower than 5 ± 0,1 ppmv.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the "Expert" mode.			18/06/25

[6] Less than 1 hour, this to guarantee that the systems is pressurized, and the temperature of the stacks is already above 50 °C so the current will ramp up to maximum capacity.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [7].			18/06/25
03	On the HMI, enter 100% of the maximum hydrogen flowrate in Nm^3/h (500 Nm^3/h). (Figure 6 point **1**).			18/06/25
04	Press the "START" button on the HMI navigator. (Figure 6 point **3**).			18/06/25
05	Verify that the hydrogen production flowrate is at a steady state, that is, the hydrogen production flow is according to the setpoint (500 Nm^3/h) for at least 30 minutes. (Figure 6 point **6**).			18/06/25
06	If the electrolyzer is operating at a steady state, go to the "H2 page" view on the HMI. Read the values of the DPT-800 and OIHA-800 (**Figure 7** point **8**).			18/06/25
07	For 1 hour, record the values sent by DPT-800 and OIHA-800 every second (sampling rate of 1 Hz).			18/06/25
08	Calculate the average value of the measurements of DPT-800A/B/C. The obtained value must be lower than 5 ± 0,15 ppmv.			18/06/25

[7] For more details about the use of the HMI, check the Start-up procedure (cf. C063-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
09	Calculate the average value of the measurements of OIHA-800 A/B/C. The obtained value must be lower than 5 ± 0,1 ppmv.	FMO NG		18/06/25

Result						
Hydrogen purity at maximum capacity: 1.68 (average DPT) water ppmv 0.03 (average OIHA) oxygen ppmv	Compliant (YES/NO)	YES	Completed by	FMO NG	Date	18/06/25

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.3 Efficiency at maximum capacity

The efficiency of the electrolysis unit is measured as the energy consumed per Nm^3/h of hydrogen produced. This value is directly calculated by the PLC and displayed on the HMI. This procedure described the steps to validate the performance of the electrolysis related to efficiency at its maximum capacity (i.e. 500 Nm^3/h).

Table 9. *Efficiency at maximum capacity*

Time required	Pre-requisites	Validation criteria
1 hour and 30 minutes	The electrolyser has run at its maximum capacity recently[8]. OK Electrolyser initial state displayed on HMI: STOP OK Temperature of the cold loop TT-60 between 3 and 5 °C. OK Temperature of stacks TT-600 > 50 °C. OK	The power consumed by the electrolyser divided by the produced hydrogen flow rate is lower than 5 ± 0,06 kWh/Nm^3H_2 at its maximum capacity at the beginning of life of the electrolyser.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the "Expert" mode.	FMD NG		18/06/25

[8] Less than 1 hour, this to guarantee that the systems is pressurized, and the temperature of the stacks is already above 50 °C so the current will ramp up to maximum capacity.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [9].	FMO NG		18/06/25
03	On the HMI, enter 100% of the maximum hydrogen flow rate in Nm3/h (500 Nm^3/h). (Figure 6 point **1**).	FMO NG		18/06/25
04	Press the "START" button on the HMI navigator (Figure 6 point **3**).	FMO NG		18/06/25
05	Verify that the hydrogen production flow rate is at a steady state, that is, the hydrogen production flow is according to the setpoint (500 Nm^3/h) for at least 30 minutes (Figure 6 point **6**).	FMO NG		18/06/25
06	If the electrolyzer is operating at a steady state, go to the "KPI" view of the HMI. Read the values of the efficiency on the "Conso by production steps" "In start" field (Figure 8 point **9**).	FMO NG		18/06/25
07	For 1 hour, record the values of the efficiency every second (sampling rate of 1 Hz).	FMO NG		18/06/25
08	Calculate the average value of the reported values. The result must be lower than 5 ± 0,06 $kWh/Nm^3 H_2$.	FMO NG		18/06/25

Result						
Efficiency at maximum capacity 4,7 kWh/Nm^3H_2	Compliant (YES/NO)	YES	Completed by	FMO NG	Date	18/06/25

[9] For more details about the use of the HMI, check the Start-up procedure (cf. C063-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.4 Hot start time

The term "Hot Start" stands for the process in which the electrolyzer goes from the "STANDBY" mode to the "START" mode[10]. In "STANDBY" mode the electrolyzer is pressurized (if it has been less than 1 hour that it was running in "START" mode), the oxygen and hydrogen loop pumps (CP-600A/B and CP-620A/B) are running and the stacks are polarized (i.e. 1,25 V per cell, 132.5 V per rectifier). Hence, in a "STANDBY" mode the unit is pre-started, which enables a faster initiation of hydrogen production. In this section, the steps are given to evaluate the duration of a Hot Start.

⚠	The pressurized "*Standby*" mode is limited to 1 hour to avoid an H_2/O_2 mixture.

Table 10. *Hot start time*

Time required	Pre-requisites	Validation criteria
1 hour and 30 minutes	The electrolyser has run at its maximum capacity recently[11]. OK Temperature of the cold loop TT-60 between 3 and 5 °C. OK Temperature of stacks TT-600 > 50 °C. OK	Hot start completed within 5 to 15 minutes.

[10] This time is noted in the contract as "Hot Stand-by to full production", indicating as initial state the pressurized STANDBY mode.

[11] Less than 1 hour, this to guarantee that the systems is pressurized, and the temperature of the stacks is already above 50 °C so the current will ramp up to maximum capacity.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the "Expert" mode.	FMO NG		18/06/25
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [12].	FMO NG		18/06/25
03	Set the electrolyzer in "START" mode at 100% of nominal flow (500 Nm^3/h). Let the electrolyzer run at a steady state for at least 15 minutes or until the temperature of the stacks reaches 65 °C (TT-600) (Figure 6 points **1** and **5**).	FMO NG		18/06/25
04	Press the "STANDBY" button to switch from the maximum hydrogen flow rate to "STANDBY" mode (in this state the machine is pressurized, and the stacks are polarized) (Figure 6 point **3**).	FMO NG		18/06/25
05	The voltage and current feeding the stacks will drop to the polarization point. Once the "Standby" state is reached (STANDBY button turns green in the HMI screen), let the system run on this state for at least 30 minutes. **During this 30 minutes in STANDBY mode, the Energy consumption in hot stand-by test can be carried out.**	FMO NG		18/06/25
06	Once the 30 minutes elapsed, enter the maximum hydrogen production setpoint on the HMI (500 Nm3/h).	FMO NG		18/06/25

[12] For more details about the use of the HMI, check the Start-up procedure (cf. C063-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
07	Press the START button and take note of the time displayed on the HMI (Figure 6 point **7**) (point A). **Time:** 19:12:00	FMO NG		18/06/25
08	The current passing through the stacks should start to ramp up as well as the hydrogen production flow rate (Figure 6 point **6**).	FMO NG		18/06/25
09	Monitor the produced hydrogen flow rate (FT-630). Once it has reached the maximum setpoint value (500 ± 1,25 Nm^3/h) take note of the time displayed on the HMI (Figure 6 point **7**) (point B). **Time:** 19:13:12	FMO NG		18/06/25
10	The electrolyzer shall remain in START mode for at least 15 minutes. During this time, the produced hydrogen flowrate must remain steady (500 Nm^3/h ±5%). The time interval between point A and point B determines the hot start time.	FMO NG		18/06/25
11	Verify the hot start was completed within 5 to 15 minutes.	FMO NG		18/06/25

Result						
Hot start time: 01 min 12 S	Compliant (YES/NO)	YES	Completed by	FMO NG	Date	18/06/25

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.5 Energy consumption in hot stand-by

The energy consumption is given by the Power Monitoring Device Control panel present on the unit (**Figure 9**). This value could also be read on the HMI "KPI" view "consommation" area (Figure 8).

This section describes the method to set the unit in Hot Standby (or pressurized STANDBY) and to establish the energy consumed during this state. In Hot Standby the unit is kept pressurized, the pumps (CP-600A/B and CP-620A/B) are running and the stacks are polarized. No hydrogen is being produced.

The aim is to evaluate the energy cost for letting the unit pre-started, as defined in the previous section.

Figure 9. *Reported energy consumption on the Power Monitoring Device onsite.*

⚠	The pressurized "*Standby*" mode is limited to 1 hour to avoid an H_2/O_2 mixture.

This document contains confidential information which is the property of ELOGEN.

***Table 11.** Energy consumption in hot stand-by*

Time required	Pre-requisites	Validation criteria
1 hour	The electrolyser has run at its maximum capacity recently[13]. OK Temperature of the cold loop TT-60 between 3 and 5 °C. OK Temperature of stacks TT-600 > 50 °C.Hot start time test in progress. OK	Energy consumption must be 90 ± 1 KWh.

Step	Description	Completed by	Witnessed by	Date
01	Once the "Standby" state is reached (STANDBY button turns green on the HMI screen), go to the "KPI" view "consommation" area, and read the values displayed for the energy consumption (Figure 8 point **10**). This value must correspond to the value displayed by the Power Monitoring Device Control panel (Figure 9). **Note:** Make sure that the initial value of energy consumed is set at zero, to take into consideration just the energy consumed during this test.	FMO NG		18/06/25
02	For 30 minutes, record the values of the total energy consumed every second (sampling rate of 1 Hz) (Figure 8 point **10**).	FMO NG		18/06/25
03	Calculate the average energy of the reported values. The result must be 90 ± 1 KWh.	FMO NG		18/06/25

Result						
Energy consumption in hot stand-by: 37,7 kWh	Compliant (YES/NO)	YES	Completed by	FMO NG	Date	18/06/25

CP600 at 60% CP620 at 70%

[13] Less than 1 hour, this to guarantee that the systems is pressurized, and the temperature of the stacks is already above 50 °C so the current will ramp up to maximum capacity.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.6 Cold start time

The term "Cold Start" stands for the process in which the electrolyzer goes from the "IDLE" mode to the "START" mode[14]. In "IDLE" mode the electrolyzer is depressurized, the oxygen and hydrogen loop pumps (CP-600A/B and CP-620A/B) are stopped and the stacks are polarized (i.e. 1,25 V per cell, 132.5 V per rectifier). Hence, in a "IDLE" mode the unit is pre-started, which enables a faster initiation of the hydrogen production, but in theory longer than the Hot start since the system is depressurized. In this section, the steps are given to evaluate the duration of a Cold Start.

Additionally, since the unit is not pressurized, the duration of this mode is not restricted to 1 hour, compared to the pressurized Standby.

***Table 12.** Cold start time*

Time required	Pre-requisites	Validation criteria
1 hour and 30 minutes	Performance test of Hydrogen completed. OK The temperature of the stacks TT-600 is below 50 °C[15]. OK 40°C Electrolyser initial state displayed on HMI: STOP OK	Cold start time below 30 minutes.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the "Expert" mode.	FMO NG	JD	18/06/23

[14] This time is noted in the contract as "Cold Stand-by to full production" indicating as initial state the IDLE mode.

[15] The estimate duration of this transition consider that the temperature of oxygen and hydrogen loop are around 15 °C, and that the cold loop is at 10 °C initially.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [16].	FMO NG		18/06/25
03	Press the "IDLE" button to switch from "Stop" to "Idle" mode (In this state, the system is depressurized, the stacks are polarized, and no hydrogen is produced) (**Figure 6** point 3). Check that the stacks are being polarized at a ramp of 5 V per second up to a voltage equal to 1,25 x Number of Cells for each stack (1,25*106 V=**132.5 V**). The polarization phase ends once the rectifier voltage is higher than or equal to the polarisation point (i.e. **530 V** per rectifier and **1060 V** in total[17]). (Figure 6 point **4**). **Note:** in regard of the possible fluctuations of stacks voltage, it is considered that the polarization point is achieved once the voltage per stacks is above **119.25 V** (i.e. **477 V** per rectifier and **954 V** in total).	FMO NG		18/06/25
04	The voltage and current sent to the stacks will be set at the polarization point. Once the "Idle" state is reached (button IDLE turns green in the HMI screen), let the system run on this state for at least 30 minutes. **During this 30 minutes in IDLE mode, theEnergy consumption in cold stand-by test can be carried out.**	FMO NG		18/06/25

[16] For more details about the use of the HMI, check the Start-up procedure (cf. C63-ELO-PRO-SU-0500)

[17] The systems is constituted by eight stacks of 106 cells each. The stacks are grouped by 4 and each group is supplied by one rectifier.

7.7 Energy consumption in cold stand-by

The energy consumption is given by the Power Monitoring Device Control panel present on the unit (Figure 9). This value could also be read on the HMI "KPI" view "consommation" area (Figure 8). This section describes the method to set the unit in Cold Standby (also known as IDLE mode) and read the energy consumed during this. In IDLE mode the unit is depressurized, the pumps (CP-600A/B and CP-620A/B) are stopped and the stacks are polarized. No hydrogen is being produced.

The aim is to evaluate the energy cost of letting the unit polarized, as defined in the previous section.

Table 13. *Energy consumption in cold stand-by*

Time required	Pre-requisites	Validation criteria
1 hour	Performance test of Hydrogen completed. OK The temperature of the stacks TT-600 is below 50 °C[18]. OK Cold start time test in progress. OK	Energy consumption must be around 34 ± 1 kWh.

[18] The estimate duration of this transition consider that the temperature of oxygen and hydrogen loop is around 15 °C, and that the cold loop is at 10 °C initially.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
01	Once the "Idle" state is reached (confirmed by the IDLE button turning into green on the HMI screen), go to the "KPI" view "consommation" area, and read the values displayed for the energy consumption (Figure 8 point **10**). This value must correspond to the value displayed by the Power Monitoring Device Control panel (Figure 9). The transition from the maximum hydrogen flow rate to "Idle" takes under 10 minutes. **Note:** Make sure that the initial value of energy consumed is set at zero, to take into consideration just the energy consumed during this test.	FMO NG		18/06/25
02	For 30 minutes, record the values of the total energy consumed every second (sampling rate of 1 Hz) (Figure 8 point **10**).	FMO NG		18/06/25
03	Calculate the average energy of the reported values. The result must be approximately 34 ± 1 KWh.	FMO NG		18/06/25

Result						
Energy consumption in cold stand-by: 33.2 kWh	Compliant (YES/NO)	YES	Completed by	FMO NG	Date	18/06/25

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.8 Ramp down time

The ramp down time is described as the duration of the transition from START mode at 100% of the nominal flow, to 10% of the nominal flow. In other terms, is the time that takes to decrease the current sent to the electrolysis stacks and consequently, the hydrogen produced by them. In this sections are given the steps to execute this transition and to evaluate its duration.

Table 14. *Ramp down time*

Time required	Pre-requisites	Validation criteria
1 hour	The electrolyser is initially running at its maximum capacity (500 ± 1,25 Nm^3/h)	Ramp down time below 30 seconds.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the "Expert" mode.	FMO NG		18/06/25
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [19].	FMO NG		18/06/25

[19] For more details about the use of the HMI, check the Start-up procedure (cf. C63-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
03	Verify that the hydrogen production flow rate is at 500 ± 1,25 Nm^3/h for at least 30 minutes. Hydrogen production flow rate can be read directly on the HMI, in the "Hydrogen Process" view.	FMO NG		18/06/25
04	Once the 30 minutes elapsed, enter the minimal production setpoint on the HMI (10% of the maximum hydrogen flow rate, 50 Nm^3/h) and take note of the time displayed on the HMI (**Figure 6** point **7**) (point A). **Time:** 15:53:00	FMO NG		18/06/25
05	The current passing through the stacks should start to ramp down as well as the hydrogen production flow rate.	FMO NG		18/06/25
06	Monitor the flow of hydrogen produced. Once it has reached the minimal production (50 ± 0,12 Nm^3/h) take note of the time displayed on the HMI (**Figure 6** point **7**) (point B). **Time:** 15:54:04	FMO NG		18/06/25
07	The electrolyzer shall remain in operation for at least 15 minutes. During this time, the produced hydrogen flow rate must remain steady at a minimum setpoint (50 Nm^3/h). The time elapsed between point A and point B determines the ramp down duration.	FMO NG		18/06/25
08	Verify that the ramp down takes less than 30 seconds.	FMO NG		18/06/25

Result						
Ramp down time: 64 **seconds**	**Compliant (YES/NO)**	YES	**Completed by**	FMO NG	**Date**	18/06/25

This document contains confidential information which is the property of ELOGEN.

7.9 Ramp up time

The ramp up time is described as the duration of the transition from START mode at 10% of the nominal flow, to 100% of the nominal flow. In other terms, is the time that takes to increase the current sent to the electrolysis stacks and consequently, the hydrogen produced by them. In this sections are given the steps to execute this transition and to evaluate its duration.

***Table 15.** Ramp up time*

Time required	Pre-requisites	Validation criteria
1 hour	The electrolyser is initially running at its minimum capacity (50 ± 0,12 Nm^3/h). OK	Ramp up time below 30 seconds.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the "Expert" mode.	FMO NG		20/06/25
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [20].	FMO NG		20/06/25
03	Verify that the hydrogen production flow rate is at 50 Nm^3/h for at least 30 minutes. Hydrogen production flow rate can be read directly on the HMI, in the "Hydrogen Process" view.	FMO NG		20/06/25

[20] For more details about the use of the HMI, check the Start-up procedure (cf. C63-ELO-PRO-SU-0500)

7.10Fresh water consumption

This section aims to describe the method to evaluate freshwater consumption (at WTP inlet) when the electrolysis unit is set at its maximum capacity (500 Nm^3/h).

***Table 16.** Fresh water consumption*

Time required	Pre-requisites	Validation criteria
2 hours	The electrolyser is initially running at its maximum capacity (500 ± 1,25 Nm^3/h). If there is no flowmeter installed at the upstream of the WTP, install a portable flowmeter (see Required Equipment) at the proximities of the CV-300 (cf. C63-PID-001).	Fresh water consumption at maximum hydrogen production is 930 ± 5 L/h

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the "Expert" mode.	FMO ~~NCA~~		20/06/25
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms[21].	FMO ~~NCA~~		20/06/25

[21] For more details about the use of the HMI, check the Start-up procedure (cf. C63-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

CAUSE & EFFECT DIAGRAM

MARK UP BCA - 14/04/2025

CAUSES

Effect reference		EFFECTS
INTERLOCK PROCESS	DESCRIPTION	
IP1	Major Fault	DISPLAY alarm
IP2	LALL-600 - Low Level in ST-600	STOP AND SET (Hydrolyser Unit) (Hydrolyser)
IP3	LALL-620 - Low Level in ST-620	DEENERGISE
IP4	Hydrogen Purity not reached or Hydrogen pressure too high	Air solenoid valves Back to rest position
IP5A	Problem on CP-620A requiring start of the CP-620B pump	CLOSE Control valves MPV-611 (FC)
IP5B	Problem on CP-620B requiring start of the CP-620A pump	CLOSE Control valves MPV-630 (FC)
IP6A	Problem on CP-600A requiring start of the CP-600B pump	CLOSE PV-631 (FC)
IP6B	Problem on CP-600B requiring start of the CP-600A pump	CLOSE H2 purification unit pneumatic valves
IP7	Problem on LP 300A/B requiring instant stop of the running pump	CLOSE M3WV-200 (FC)
IP8	Low Temperature in anodic/cathodic water loop and Ambient	CLOSE PV-633 (FC) - CUSTOMER LINE ISOLATED
IP9	Process value out of regular operating value	CLOSE PV-640 (FC)
IP10	*Not Used*	CLOSE PV-642 (FC)
IP11	High Ambient temperature - Loss of AHU	START INTERMITTENTLY (SU2: 1000 / 1001 / 1002 / 1003
IP12	*Not Used*	LIGHT ON CONSTANT VE-002 / 006 / 010 (Orange)
IP13	Hydrogen Ambient Detection High	LIGHT ON FLASHING VE-001 / 005 / 009 (Rouge)
IP17B	Problem on LP 300B requiring start of the LP 300A	STOP IMMEDIATELY CP-200
IP15	*Not Used*	STOP AT THE END OF STOP SEQUENCE CP-200
IP16	Problem on pure water feed to anodic loop	STOP IMMEDIATELY BY SETTING VAR600A/B to 0% (STO) THE RUNNING CP-600 (A or B following status)
IP17A	Problem on LP 300A requiring start of the LP 300B	STOP AT THE END OF STOP SEQUENCE BY SETTING VAR600A/B TO 0% THE RUNNING CP-600 (A or B following status)
IP20	LOSS OF HALF OF THERMAL POWER (THS-400 or THS-200)	STOP IMMEDIATELY BY SETTING VAR620A/B TO 0% THE RUNNING CP-620 (A or B following status)
		STOP AT THE END OF STOP SEQUENCE BY SETTING VAR620A/B TO 0% THE RUNNING CP-620 (A or B following status)
		STOP AT THE END OF STOP SEQUENCE DC-200 - All motors
		STOP IMMEDIATELY H2 purification unit deoxo dryers heating
		STOP IMMEDIATELY BY SETTING VAR300A/B TO 0% THE RUNNING LP-300 (A or B following status)
		STOP IMMEDIATELY WC-400 (CP-400)
		STOP AT THE END OF STOP SEQUENCE WC-400 (CP-400)
		STOP IMMEDIATELY WC-401 (CP-401)
		STOP AT THE END OF STOP SEQUENCE WC-401 (CP-401)
		OPEN MPV-611 (FC) till depressurisation and/or inerting of ST-600 completed. OPEN PV-610 if MPV-611 is failing
		OPEN PV-631 (FC) till depressurisation and/or inerting of ST-620 completed. OPEN PV-630 if PV-631 is failing.
		OPEN PV-901 (FC) till PT-610 reach 0.5 barg
		OPEN PV-901 (FC) till inerting of ST-600 completed
		OPEN PV-921 (FC) till inerting of ST-620 completed
		OPEN PV-921 (FC) till PT-610 reach 0.6 barg
		OPEN IMMEDIATELY PV-631 (FC)
		OPEN IMMEDIATELY PV-630 (FC) till pressure < PT-630 HH
		FORCE STANDBY PRESSURISED TT-1003-1 TAH-1003 or TT-1004-1 TAH-1004 or TT-1005-1 TAH-1005 or TT-1006-1 TAH-1006
		FORCE STANDBY PRESSURISED After 1100s
		SWITCH LP-300 - From A to B or B to A
		SWITCH CP-600 - From A to B or B to A
		SWITCH CP-620 - From A to B or B to A
		GO TO STANDBY PRESSURISED
		REDUCE ELECTROLYSER SETPOINT AT 50%
		Rectifier current is set instantly to 0A (no ramp down)

Country of origin: Portugal
Antimixing checked.
Material is free of mercury and radiation contamination.
No weld repair done.
We confirm that this material meets this specification according the mentioned standards.

Certified acc. PED 2014/68/EU and AD 2000 W0

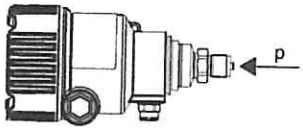
Order information

Customer name	ELOGEN
Customer purchase order	BC0007140
Sales order number / Item	3011154568/0020
Internal order number / Item	3021332622000040

Device information

Description	Cerabar PMP71B
TAG	CPT-1107
Serial number	W707DE01198
Order code	PMP71B-2MFR0/0
Extended order code	PMP71B-BFBADBF6AA3SBI1WBJA1+CCNNZ1

Additional information



Output type	4-20 mA HART
Software version	01.00.06
Sensor range	-1...40 bar rel
Adjusted measuring range	0...40 bar rel
Maximum permissible error	± 0.05 % of span
Output mode	Linear

Procedure

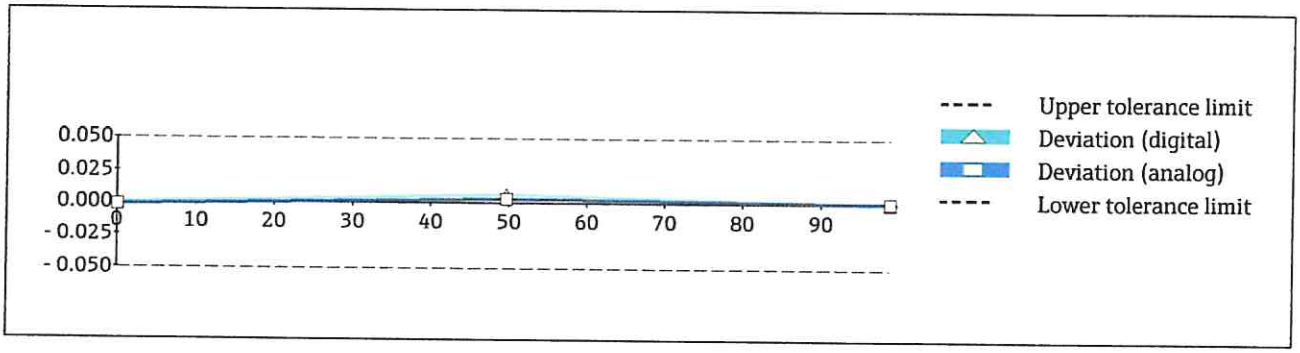
Test specification	160000559 / 160000554, Comparison of unit under test (UUT) with standard
Test rig	15105 / 15106

Measuring condition

Ambient temperature	25.8 °C ±1 °C
Ambient pressure	980.0 mbar ±0.2 mbar
Ambient humidity	48.5 % rel. ±10 % rel.
UUT orientation	

Execution

Maulburg, 2024-07-30, 110714



This document was generated electronically and is valid without signature.

Hereby we confirm that all applicable tests according to the Quality plan (IP00008P) have been performed successfully.

Test	Procedure number	Test description
Contract review	TS00001F	As required in ISO 9001
Incoming goods inspection	TS00003F	Verification of conformance to the specified requirements
Printed circuit boards test	TS00009F	In-circuit test and functional test
High voltage test	TS00002F	The voltage used is chosen depending on operating voltage, terminals and approvals in accordance to the valid national / international standards
Welding inspection	TS00010F	Quality and tightness of the welding seams
Functional test of sensor	TS00022P	Check the sensor function
Calibration of instrument	TS00023P	Measurement, adjustment and verification of lower range value, upper range value and output signal
Final check of instrument	TS00024P	Verification of general functionality and customer specific settings
Outgoing visual check	TS00006F	Visual inspection of completeness and correctness of the instrument and the markings
Logistical verification	TS00005F	Automatic verification in the delivery phase via barcode that the instrument correspond to the order
Pressure test	TS00007F	Test the mechanical stability of the pressure bearing parts

Hereby we confirm that all measuring equipment used to assure the quality of the products has been calibrated and is traceable to national or international standards.

GENERAL NOTES :
- FOR ALL PACKAGES, REFER TO THE SUPPLIER P&ID FOR COMPLETE INFORMATION
- FOR EACH SLO REFERENCE PLEASE REFER TO C03-PUY-001
- DRAIN VALVES TO BE INSTALLED AT LOWEST POINTS
- ALL EQUIPMENTS AND PIPING OUTSIDE CONTAINERS ARE HEATED USING HEATING RIBBONS

NOTES :
NOTE 1 : BRITISH STANDARD PIPE PARALLEL (TO INSTALL BETWEEN FLANGES)
NOTE 2 : COMMISSIONING AND INITIAL START-UP
NOTE 3 : ACCESSIBLE FOR MAINTENANCE
NOTE 4 : DISSIMILAR TECHNOLOGY BETWEEN THE TWO CHECK VALVES/ CHECK VALVE SHALL MEET CLASS TIGHTNESS REQUIREMENT
NOTE 5 : DISTANCE OF 5*D REQUIRED UPSTREAM AND DOWNSTREAM OF THE EQUIPEMENT
NOTE 6 : REMOVABLE LINE, USED ONLY FOR MAINTENANCE
NOTE 7 : REFER TO WATER TREATMENT PACKAGE DOCUMENTATION FROM OWNER FOR COMPLETE P&ID - P&ID N° (90767001_02)
NOTE 8 : PACKAGE TO BE SUPPLIED BY ELOGEN
NOTE 9 : SECTION OUTSIDE CONTAINER SHALL BE INSULATED (XX0 zone)

TAG NO.	HE-630/631
DESCRIPTION	H2 GAS HEAT EXCHANGER
DUTY (kJ/h)	2,4E+04
	HOT SIDE / COLD SIDE
DESIGN PRESSURE (barg)	40 / 6
DESIGN TEMPERATURE (°C)	80 / 80
VOLUME (L)	1,0 / 1,04

TAG NO.	CS-630
DESCRIPTION	H2 CONDENSATE SEPARATOR
DIMENSIONS (DN)	150
DESIGN PRESSURE (barg)	40 / 0,58 barg
DESIGN TEMPERATURE (°C)	-20 / +80
MATERIAL	SA312 TP316/316L
VOLUME (L)	17

TAG NO.	DG-640
DESCRIPTION	H2 HIGH PRESSURE DEGASSER
DIAMETER (DN)	350
DESIGN PRESSURE (barg)	40 / 0,58 barg
DESIGN TEMPERATURE (°C)	-20 / +80
MATERIAL	SA240 316/316L
VOLUME (L)	309

NOTES :
NOTE 1 : TO CONTAINER DRIP PAN
NOTE 2 : COUNTER-CURRENT INSTALLATION
NOTE 3 : CLOSEST TO AHO
NOTE 4 : HIGHEST POINT
NOTE 5 : DESIGNED FOR PSV-640
NOTE 6 : AWAITING 3D DEFINITION
NOTE 7 : USED FOR FILING DURING STARTUP
NOTE 8 : HYDRAULIC GUARD HEIGHT = 600MM, LELL AND LSL DISTANCE = 200MM, LEL AND LSH DISTANCE = 100MM
NOTE 9 : SEE PTN-002 FOR ALL THE CONNECTION LOCATION ON HYDROGEN VENT.
NOTE 10 : FOR ATEX PURPOSE, ROSETTI VALVE MV-002 WAS ADDED BEFORE TIE-IN POINT C AND INSIDE THE A10 CONTAINER.

elogen	PRECOMMISSIONING	CROSSWIND
	C63-ELO-REP-CO-0101 - LEAK TEST	

TEST CONDITIONS	
Leak Test Pack	Pack 01
Tested System	Anode water O2 LOOP 600
Test Pressure (Barg)	11,7
Test Fluid	Nitrogen (N2)

EQUIPEMENT USED		
Test Equipment Used	Serial Number	Calibration Expiry Date
PT-610	W707570119 8	

TEST				
BEGINNING	Date	Time	Pressure (Barg)	Temperature (°C)
	10/04/25	13:50	11,89	17,4
END	Date	Time	Pressure (Barg)	Temperature (°C)
	10/04/25	14:50	11,89	17,7

RESULT			
Test Duration	1 hour	Delta P (Bar)	0
Snoop Detection without Bubbles	(YES) / NO / NA		
Gas Detection Without Leaks	(YES) / NO / NA		
Result	(OK) / NOK		

ATTACHMENTS

- Leak Test Pack P&ID Mark-Up used for System line-up
- Picture of Manometer showing the Pressure and the Time at the beginning and at the end

NOTES

Final Inspection Report

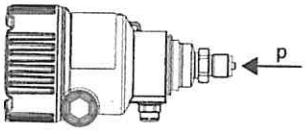
Order information

Customer name	ELOGEN
Customer purchase order	BC0007140
Sales order number / Item	3011154568/0010
Internal order number / Item	3021332622000030

Device information

Description	Cerabar PMP71B
TAG	CPT-1106
Serial number	W7075701198
Order code	PMP71B-4EFQ0/101
Extended order code	PMP71B-BFBADBF6AA3SJI1WBJA1+HANNZ1

Additional information



Output type	4-20 mA HART
Software version	01.00.06
Sensor range	-1...40 bar rel
Adjusted measuring range	0...16 bar rel
Maximum permissible error	± 0.05 % of span
Output mode	Linear

Procedure

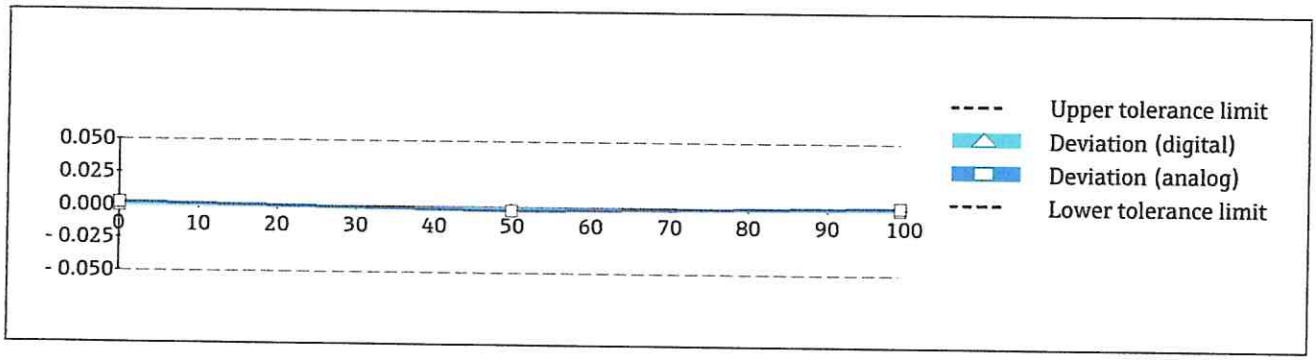
Test specification	160000559 / 160000554, Comparison of unit under test (UUT) with standard
Test rig	15105 / 15106

Measuring condition

Ambient temperature	25.7 °C ±1 °C
Ambient pressure	979.5 mbar ±0.2 mbar
Ambient humidity	51.0 % rel. ±10 % rel.
UUT orientation	

Execution

Maulburg, 2024-07-29, 413570



This document was generated electronically and is valid without signature.

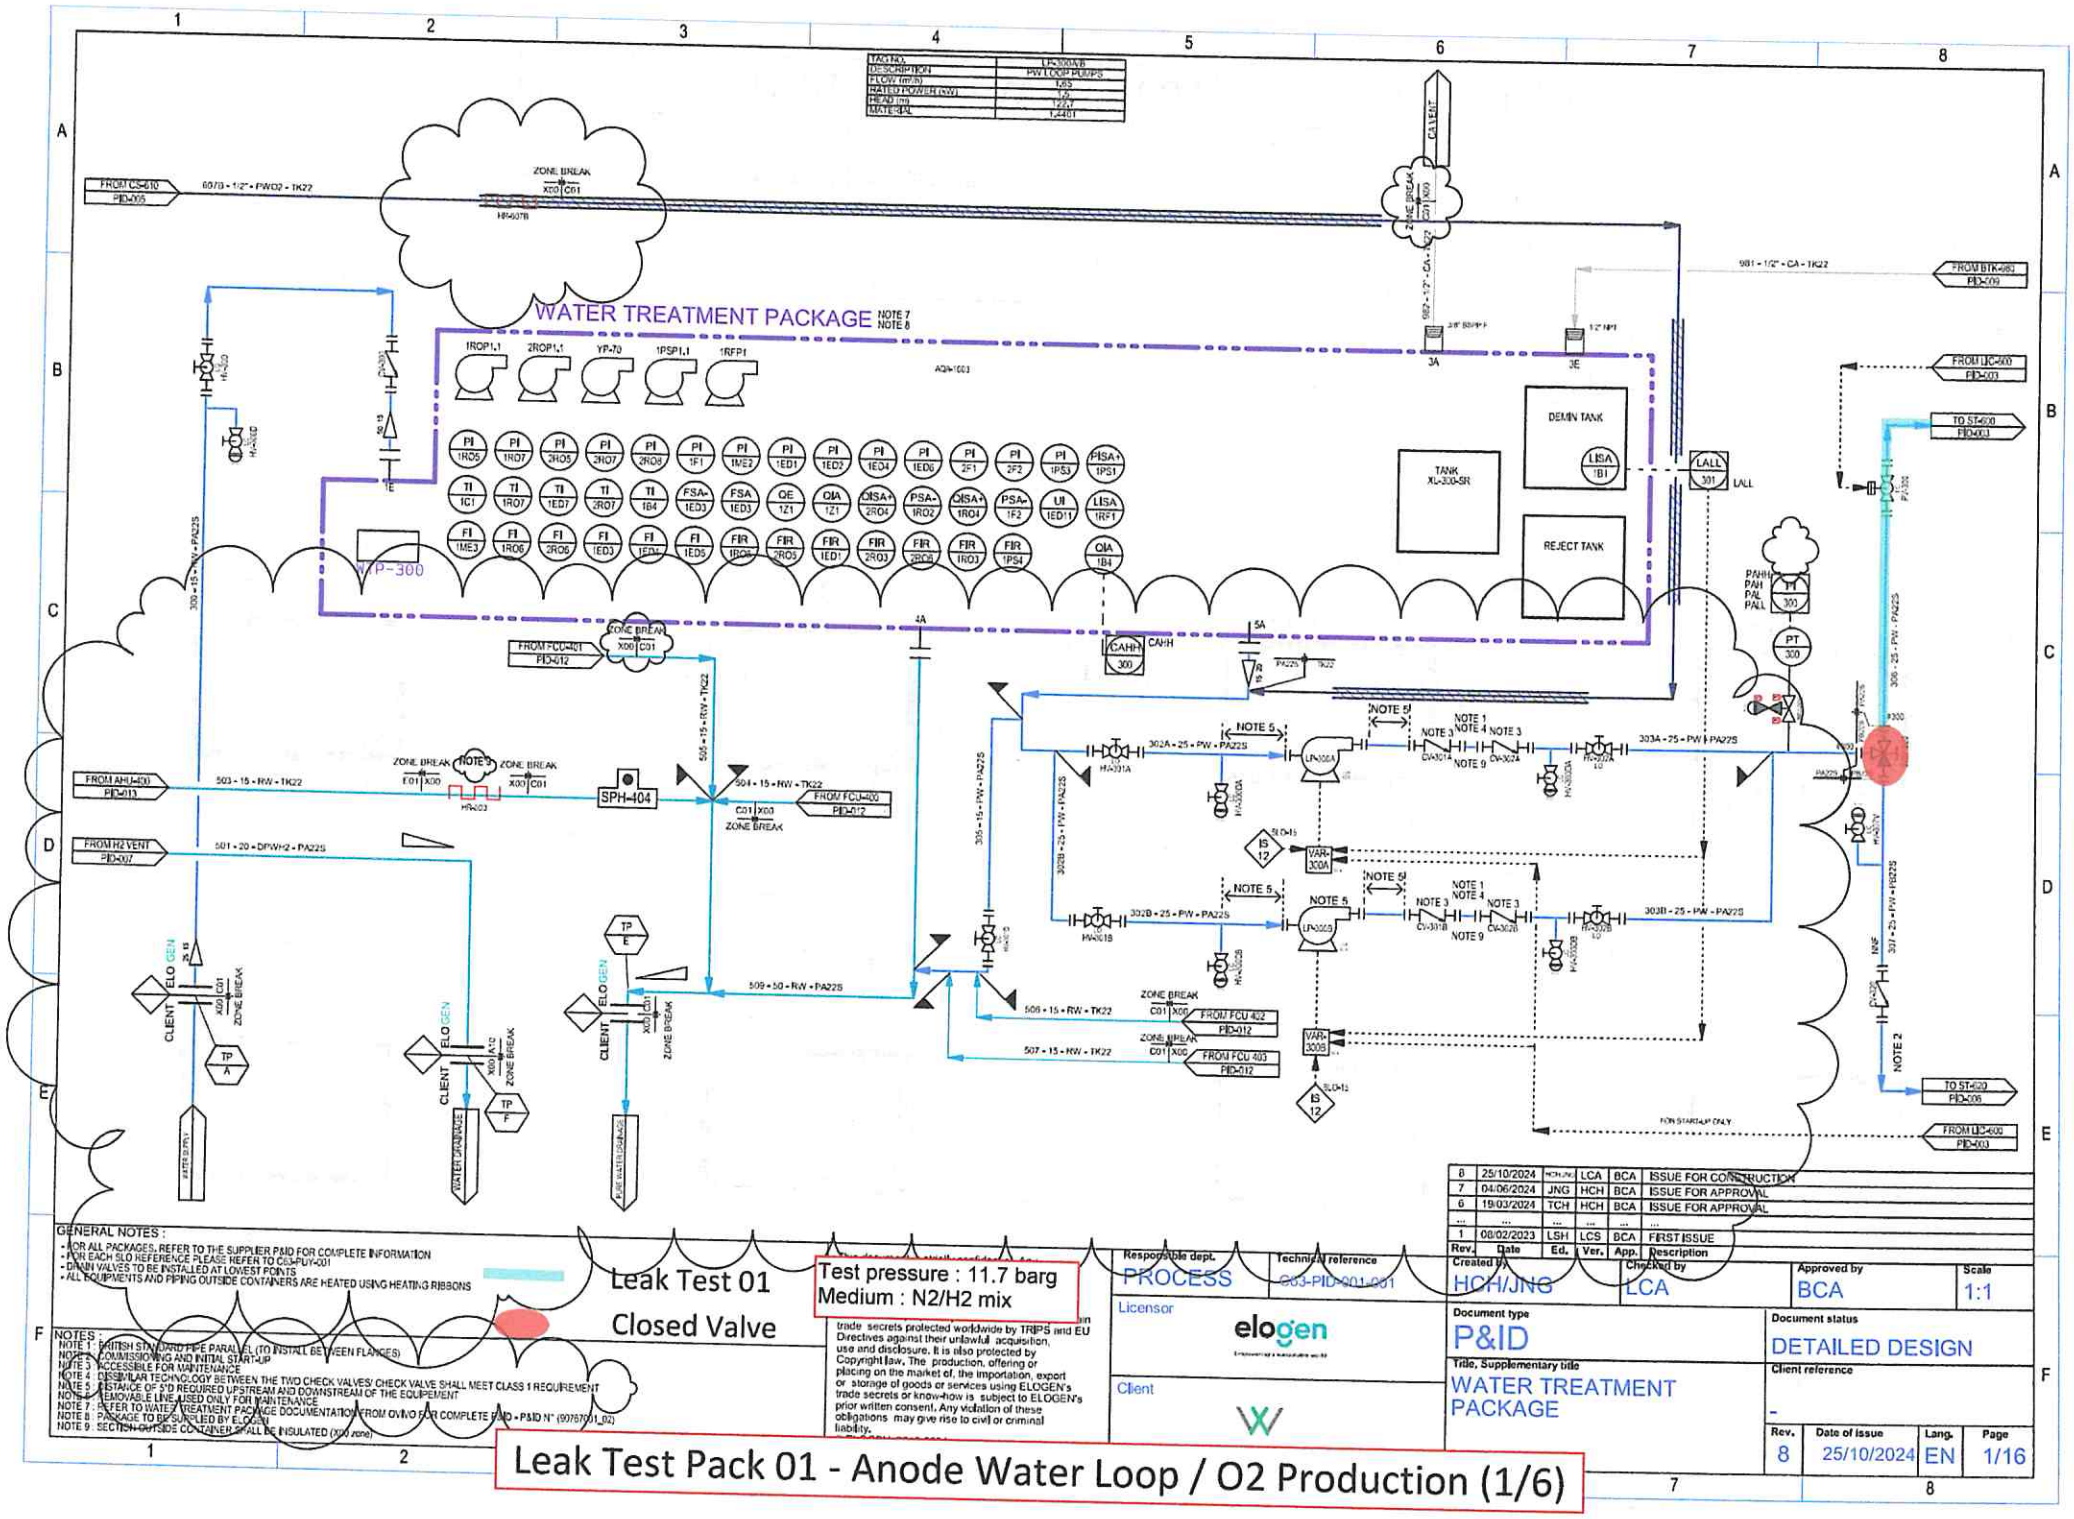
Final Inspection Report

Test result

Deviation
% of span



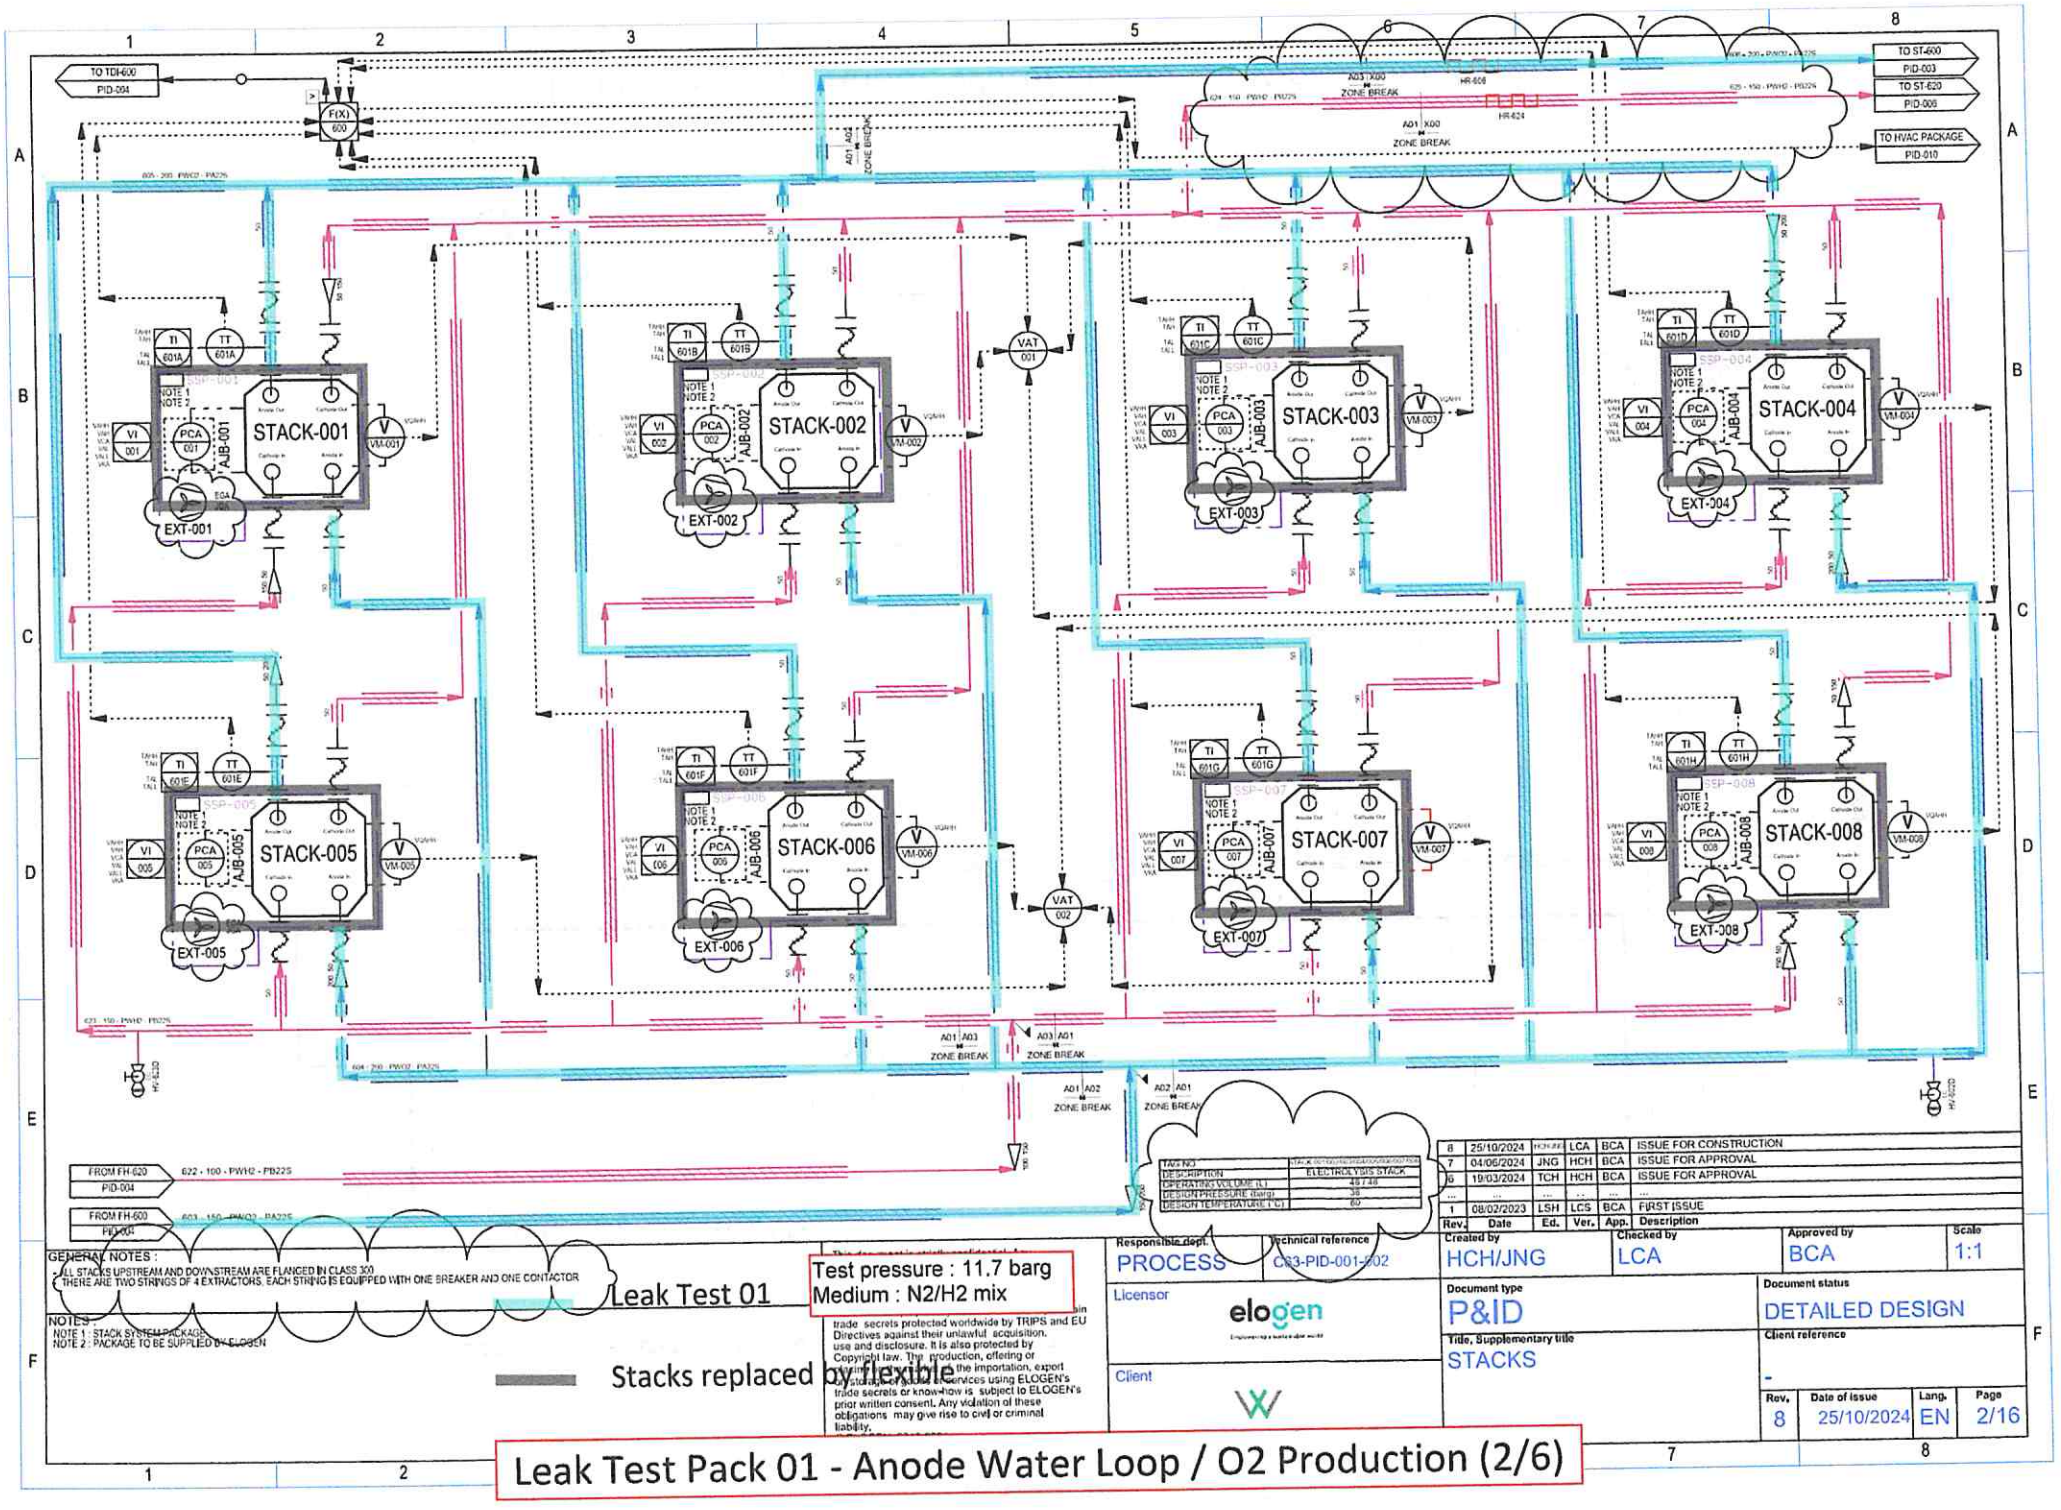
Test point	Reference pressure	UUT output (digital)	Measure-ment error (digital)	Measure-ment error (digital)	Reference pressure (Iout calc.)	UUT output (analog)	Measure-ment error (analog)
[%]	[bar]	[bar]	[% of span]	[bar]	[mA]	[mA]	[% of span]
0	0.00000	0.00000	-0.00000	0.00000	4.00000	4.00031	0.00190
50	7.97078	7.97054	-0.00149	-0.00024	11.9708	11.9704	-0.00249
99	15.8915	15.8915	0.00000	0.00000	19.8915	19.8917	0.00125

Hereby we confirm that all applicable tests according to the Quality plan (IP00008P) have been performed successfully.

Test	Procedure number	Test description
Contract review	TS00001F	As required in ISO 9001
Incoming goods inspection	TS00003F	Verification of conformance to the specified requirements
Printed circuit boards test	TS00009F	In-circuit test and functional test
High voltage test	TS00002F	The voltage used is chosen depending on operating voltage, terminals and approvals in accordance to the valid national / international standards
Welding inspection	TS00010F	Quality and tightness of the welding seams
Functional test of sensor	TS00022P	Check the sensor function
Calibration of instrument	TS00023P	Measurement, adjustment and verification of lower range value, upper range value and output signal
Final check of instrument	TS00024P	Verification of general functionality and customer specific settings
Outgoing visual check	TS00006F	Visual inspection of completeness and correctness of the instrument and the markings
Logistical verification	TS00005F	Automatic verification in the delivery phase via barcode that the instrument correspond to the order
Pressure test	TS00007F	Test the mechanical stability of the pressure bearing parts

Hereby we confirm that all measuring equipment used to assure the quality of the products has been calibrated and is traceable to national or international standards.

GENERAL NOTES :
- FOR ALL PACKAGES, REFER TO THE SUPPLIER P&ID FOR COMPLETE INFORMATION
- FOR EACH SLO REFERENCE PLEASE REFER TO C63-PUY-001
- DRAIN VALVES TO BE INSTALLED AT LOWEST POINTS
- ALL EQUIPMENTS AND PIPING OUTSIDE CONTAINERS ARE HEATED USING HEATING RIBBONS



NOTES :
NOTE 1 : BRITISH STANDARD PIPE PARALLEL (TO INSTALL BETWEEN FLANGES)
NOTE 2 : COMMISSIONING AND INITIAL START-UP
NOTE 3 : ACCESSIBLE FOR MAINTENANCE
NOTE 4 : DISSIMILAR TECHNOLOGY BETWEEN THE TWO CHECK VALVES/ CHECK VALVE SHALL MEET CLASS 1 REQUIREMENT
NOTE 5 : DISTANCE OF 5*D REQUIRED UPSTREAM AND DOWNSTREAM OF THE EQUIPEMENT
NOTE 6 : REMOVABLE LINE, USED ONLY FOR MAINTENANCE
NOTE 7 : REFER TO WATER TREATMENT PACKAGE DOCUMENTATION FROM OVIVO FOR COMPLETE P&ID - P&ID N° (99787001_02)
NOTE 8 : PACKAGE TO BE SUPPLIED BY ELOGEN
NOTE 9 : SECTION OUTSIDE CONTAINER SHALL BE INSULATED (Y00 zone)

MANAGEMENT OF CHANGE

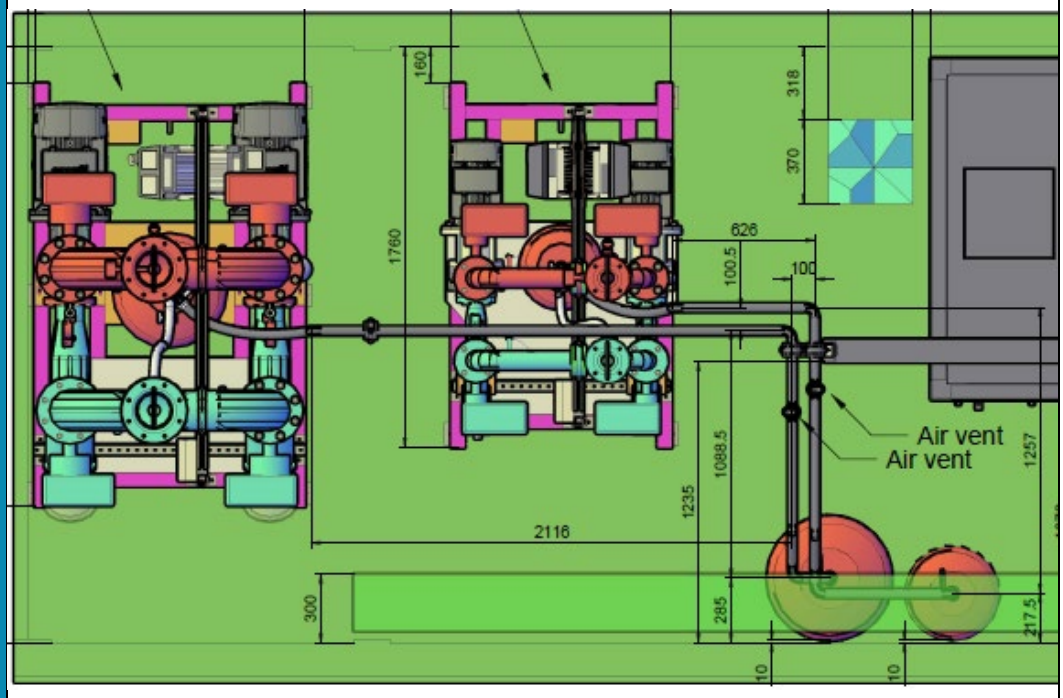
Paumier					**DATE 09/04/25**
WRITTEN BY:	**Baptiste CHIROIS**	**CHECKED BY:**	**XXX**	**APPROVED BY:**	**XXX**

SUPPORT DOCUMENTATION :

- **LIST HERE EVERY DOCUMENTS MENTIONNED OR ANNEXED (reference, name & revision)**
- **P.0608871.L.02.104 Ind.H Hydraulic diagram**
- **XXXX**
- **XXXX**

Appropriate frame

1. BACKGROUND ☐



1.1. Describe the context in which the change proposal is put forward:

- *Why is this change proposed?*
- *What is the change (detailed description)?*

The answer may be based on supporting documentation, drawings, or photos.

The reason for our proposal is that the expansion tank volumes are too small compared to the glycol volumes in the installation. When we performed our calculations, we estimated the pipe lengths because the model was not finalized. In our calculations we omitted to consider the volume of chilled water in the process We had taken some margin in our calculations, but unfortunately not enough.

Below the implantation proposal sent by Paumier :

	1.2. What is the foreseen benefit? What risks are we creating if we don't implement this change? What risks do we create if we implement this change?	
	The consequence is that existing vessels are not able to absorb the large variations in temperature and pressure of the network. The risk is that the valve spits out glycol when the temperature and pressure rise.	
	1.3. What analysis has been done on the matter? Who has been consulted? i.e. Process engineering, safety engineering	
	An entire analysis has been done with Elogen Team, based on the existing installation and the site constraints	
	1.4. Boundaries (Givens vs assumptions and issues) understood.	
	The expansion vase are primordial to absorb temperature and pressure variations in the glycol water network.	
Creative doable alternatives	**2. ALTERNATIVES**	☐
	2.1. Describe one or more alternatives to the proposed change	
	We considered several possibilities. • Change the fluid with a lower glycol concentration, but it will decrease the freezing point temperature. • Replace the 3-bar safety valve with a 5-bar safety valve, but this would involve repeating pressure tests. • Install additional expansion tanks to accommodate temperature and pressure variations in the HVAC room. This is the solution we recommend.	
Useful information & ranges	**3. IDENTIFIED RISKS:**	☐
	3.1. Please indicate if the approval of this change creates a new risk	
	No risk, Paumier will provide the material in advance. The pipes will be prefabricated upstream with the aim of only doing flange-to-flange assembly on site and no welding.	
	3.2. Risks and uncertainties understood, and mitigations agreed	
	One identified risk is the tight schedule for sending equipment in Italia.	
Clear value measures & trade-offs	**4. IMPACT ANALYSIS**	☐
	4.1. Cost & Schedule - Describe potential cost and/or schedule impact	
	Paumier takes care of the cost of the equipment and piping. The task will be completed in W17 in parallel of the endurance tests.	
	4.2. HSSE Impact, impact on interfaces (Engineering-Construction-Commissioning-O&M)	
	No HSE impact	

Sound reasoning	**5. <u>RECOMMENDATION</u>**	☐
	5.1. RECOMENDATION 1: Change the fluid with a lower glycol concentration, but it will decrease the freezing point temperature 5.2. RECOMMENDATION 2: Replace the 3-bar safety valve with a 5-bar safety valve, but this would involve repeating pressure tests 5.3. RECOMMENDATION 3: Install additional expansion tanks to accommodate temperature and pressure variations in the HVAC room. This is the solution recommended by PAUMIER.	
Commitment to action	**6. <u>ACTIONS REQUIRED TO IMPLEMENT CHANGE</u>**	☐
	6.1. Please describe the actions required to implement the change: • What, Who and by when. • Any documents/deliverables to be updated?	
	We book Nicolas Bourgeois and Esteban Daoudal to make the changes on site. We will update the P.0608871.L.02.104 Ind.H Hydraulic diagram. Paumier sent the 3D drawing of the installation on site.

GENERAL NOTES :
- FOR ALL PACKAGES. REFER TO THE SUPPLIER P&ID FOR COMPLETE INFORMATION
- FOR EACH SLO REFERENCE PLEASE REFER TO C63-PUY-001
- DRAIN VALVES TO BE INSTALLED AT LOWEST POINTS
- ALL EQUIPMENTS AND PIPING OUTSIDE CONTAINERS ARE HEATED USING HEATING RIBBONS

NOTES :
NOTE 1 : BRITISH STANDARD PIPE PARALLEL (TO INSTALL BETWEEN FLANGES)
NOTE 2 : COMMISSIONING AND INITIAL START-UP
NOTE 3 : ACCESSIBLE FOR MAINTENANCE
NOTE 4 : DISSIMILAR TECHNOLOGY BETWEEN THE TWO CHECK VALVES/ CHECK VALVE SHALL MEET CLASS 1 REQUIREMENT
NOTE 5 : DISTANCE OF 5*D REQUIRED UPSTREAM AND DOWNSTREAM OF THE EQUIPEMENT
NOTE 6 : REMOVABLE LINE. USED ONLY FOR MAINTENANCE
NOTE 7 : REFER TO WATER TREATMENT PACKAGE DOCUMENTATION FROM OVIVO FOR COMPLETE P&ID - P&ID N° (90767001_02)
NOTE 8 : PACKAGE TO BE SUPPLIED BY ELOGEN
NOTE 9 : SECTION OUTSIDE CONTAINER SHALL BE INSULATED (X00 zone)

TYPICAL EARTHING DETAILS

CARBON STEEL / STAINLESS STEEL

CARBON STEEL / STAINLESS STEEL
TANK

CARBON STEEL / STAINLESS STEEL
GENERAL EQUIPMENT

FLANGED JOINTS IN METALLIC PIPELINES THAT HAVE NEITHER INSULATION KIT NOR PTFE GASKET ARE CONSIDERED INHERENTLY CONTINUOUS.

NOTES:

- ALL DIMENSIONS MUST BE VERIFIED DURING CONSTRUCTION;
- ALL VALVE DIMENSIONS MUST BE CHECKED ON SITE BEFORE ASSEMBLY;
- ALL THE WELDED COMPONENTS WILL BE CHECKED ON SITE BEFORE THE ASSEMBLY;
- VALVE HANDWHEEL ORIENTATION TO BE CHECKED AND DEFINED DURING ERECTION PHASE BY CONSTRUCTION COMPANY.

TYPICAL EARTHING DETAILS

CARBON STEEL / STAINLESS STEEL

CARBON STEEL / STAINLESS STEEL
TANK

CARBON STEEL / STAINLESS STEEL
GENERAL EQUIPMENT

FLANGED JOINTS IN METALLIC PIPELINES THAT HAVE NEITHER INSULATION KIT NOR PTFE GASKET ARE CONSIDERED INHERENTLY CONTINUOUS.

NOTES:

- ALL DIMENSIONS MUST BE VERIFIED DURING CONSTRUCTION;
- ALL VALVE DIMENSIONS MUST BE CHECKED ON SITE BEFORE ASSEMBLY;
- ALL THE WELDED COMPONENTS WILL BE CHECKED ON SITE BEFORE THE ASSEMBLY;
- VALVE HANDWHEEL ORIENTATION TO BE CHECKED AND DEFINED DURING ERECTION PHASE BY CONSTRUCTION COMPANY.

TYPICAL EARTHING DETAILS

CARBON STEEL / STAINLESS STEEL

CARBON STEEL / STAINLESS STEEL
TANK

CARBON STEEL / STAINLESS STEEL
GENERAL EQUIPMENT

FLANGED JOINTS IN METALLIC PIPELINES THAT HAVE NEITHER INSULATION KIT NOR PTFE GASKET ARE CONSIDERED INHERENTLY CONTINUOUS.

NOTES:

- ALL DIMENSIONS MUST BE VERIFIED DURING CONSTRUCTION;
- ALL VALVE DIMENSIONS MUST BE CHECKED ON SITE BEFORE ASSEMBLY;
- ALL THE WELDED COMPONENTS WILL BE CHECKED ON SITE BEFORE THE ASSEMBLY;
- VALVE HANDWHEEL ORIENTATION TO BE CHECKED AND DEFINED DURING ERECTION PHASE BY CONSTRUCTION COMPANY.

CARBON STEEL / STAINLESS STEEL
TANK

CARBON STEEL / STAINLESS STEEL
GENERAL EQUIPMENT

FLANGED JOINTS IN METALLIC PIPELINES THAT HAVE NEITHER INSULATION KIT NOR PTFE GASKET ARE CONSIDERED INHERENTLY CONTINUOUS.

NOTES:

- ALL DIMENSIONS MUST BE VERIFIED DURING CONSTRUCTION;
- ALL VALVE DIMENSIONS MUST BE CHECKED ON SITE BEFORE ASSEMBLY;
- ALL THE WELDED COMPONENTS WILL BE CHECKED ON SITE BEFORE THE ASSEMBLY;
- VALVE HANDWHEEL ORIENTATION TO BE CHECKED AND DEFINED DURING ERECTION PHASE BY CONSTRUCTION COMPANY.

TYPICAL EARTHING DETAILS

CARBON STEEL / STAINLESS STEEL

CARBON STEEL / STAINLESS STEEL
TANK

CARBON STEEL / STAINLESS STEEL
GENERAL EQUIPMENT

FLANGED JOINTS IN METALLIC PIPELINES THAT HAVE NEITHER INSULATION KIT NOR PTFE GASKET ARE CONSIDERED INHERENTLY CONTINUOUS.

NOTES:

- ALL DIMENSIONS MUST BE VERIFIED DURING CONSTRUCTION;
- ALL VALVE DIMENSIONS MUST BE CHECKED ON SITE BEFORE ASSEMBLY;
- ALL THE WELDED COMPONENTS WILL BE CHECKED ON SITE BEFORE THE ASSEMBLY;
- VALVE HANDWHEEL ORIENTATION TO BE CHECKED AND DEFINED DURING ERECTION PHASE BY CONSTRUCTION COMPANY.

● CERTIFICATO EN10204 - 3.2 ◑ CERTIFICATO EN10204 - 3.1 ○ CERTIFICATO EN10204 - 2.2

NOTE GENERALI / GENERAL NOTES

1 -TUTTE LE FLANGE DOVRANNO AVERE LA FACCIA DI ACCOPPIAMENTO CON FINITURA LISCIA 125 ÷ 250 AARH E ALTEZZA ONDULAZIONE MAX.0.05 MM.
ALL FLANGES SHALL HAVE SMOOTH FINISH FACING ROUGHNESS WITH 125 ÷ 250 AARH AND WAVINESS HEIGHT 0.05 MAX.

2 -SALVO DIVERSA INDICAZIONE, LE FLANGE DOVRANNO AVERE I FORI SFALSATI RISPETTO GLI ASSI PRINCIPALI DEL RECIPIENTE
UNLESS OTHERWISE INDICATED, ALL FLANGES HOLES SHALL BE STAGGERED TO MAIN AXES OF VESSEL

3 -TUTTI GLI INTERNI SMONTABILI DEVONO PASSARE ATTRAVERSO UN PASSO D'UOMO AVENTE UN DIAMETRO INTERNO DI 585 mm.
ALL REMOVABLE INTERNAL SHALL PASS THROUGH A MANHOLE HAVING AN INTERNAL DIA. OF 585 mm.

4 -LE FLANGE SARANNO IN ACCORDO AD ASME B16.5 (EDIZIONE 2020).
I TRONCHETTI DA TUBO SENZA SALDATURA SARANNO IN ACCORDO AD ASME B36.10M (EDIZIONE 2018).
I TIRANTI E I DADI AVRANNO FILETTATURA IN ACCORDO AD ASME B1.1 (EDIZIONE 2019).
LE CURVE SARANNO IN ACCORDO AD ASME B16.9 (EDIZIONE 2018).
NOZZLE FLANGES MUST BE IN ACCORDANCE WITH ASME B16.5 (2020 ED.).
NOZZLE NECK FROM SEAMLESS PIPE MUST BE IN ACCORDANCE WITH ASME B36.10M (2018 ED.).
BOLTS AND NUTS THREADS MUST BE IN ACCORDANCE WITH ASME B1.1 (2019 ED.).
ELBOWS MUST BE IN ACCORDANCE WITH ASME B16.9 (2018 ED.).

5 -GLI SPESSORI INDICATI SUL DISEGNO SONO QUELLI MINIMI DOPO FORMATURA
ALL THICKNESS SHOWN ON THE DRAWING MUST BE CONSIDERED AS MINIMUM AFTER FORMING

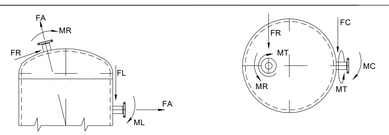
6 -L= LUNGHEZZA NETTA DEL TUBO
L= NET PIPE LENGHT

7 -TOLLERANZE MATERIALI: TUBI ±12.5%, LAMIERE -0.3 mm, FORGIATI -0/+2mm
MATERIAL TOLERANCES: PIPES ±12.5%, PLATES -0.3 mm, FORGING -0/+2 mm

8 -TEMPERATURA MINIMA DI PROGETTO -20 °C A 40 Bar g
MINIMUM DESIGN METAL TEMPERATURE -20 °C AT 40 Bar g

9 -SALVO DIVERSAMENTE INDICATO, LE TOLLERANZE DIMENSIONALI SARANNO IN ACCORDO A QUANTO SEGUE: (FATTA ECCEZIONE PER SALDATURE) DIM. LINEARI ±3mm, DIM. LINEARI PASSI D'UOMO ±6 mm, DIM. LINEARI COMPLESSIVE ±15 mm, DIMENSIONI ANGOLARI ±0.5°, INTERASSI LIVELLI ± 2mm
UNLESS OTHERWISE INDICATED, THE TOLERANCES SHALL BE AS FOLLOW: (EXCEPT FOR WELDING) LINEAR DIM. ±3mm, MANHOLE LINEAR DIM. ±6mm, LINEAR DIM. GLOBAL ±15mm, ANGULAR ±0.5°, LEVEL ±2mm

10-PER DETTAGLI SALDATURA VEDI "WELDING MAP"
FOR JOINT DETAILS SEE "WELDING MAP"



11-TUTTI I MATERIALI AVRANNO "DOPPIA CERTIFICAZIONE" 316 E 316L, SARANNO UTILIZZATE LE PROPRIETA' MECCANICHE DEL 316 E SARANNO SODDISFATTE LE PROPRIETA' CHIMICHE DEL 316L
ALL MATERIALS SHALL BE "DUAL CERTIFIED" 316 AND 316L, MECHANICAL PROPERTIES OF 316 SHALL BE USED AND CHEMICAL PROPERTIES OF 316L SHALL BE SATISFIED.

12-VEDI DOC. N. C0063-FOR-ITP-QA-001 "INSPECTION AND TEST PLAN ITP"

● CERTIFICATO EN10204 - 3.2 ◑ CERTIFICATO EN10204 - 3.1 ○ CERTIFICATO EN10204 - 2.2

NOTE GENERALI / GENERAL NOTES

1 -TUTTE LE FLANGE DOVRANNO AVERE LA FACCIA DI ACCOPPIAMENTO CON FINITURA LISCIA 125 ÷ 250 AARH E ALTEZZA ONDULAZIONE MAX.0.05 MM.
ALL FLANGES SHALL HAVE SMOOTH FINISH FACING ROUGHNESS WITH 125 ÷ 250 AARH AND WAVINESS HEIGHT 0.05 MAX.

2 -SALVO DIVERSA INDICAZIONE, LE FLANGE DOVRANNO AVERE I FORI SFALSATI RISPETTO GLI ASSI PRINCIPALI DEL RECIPIENTE
UNLESS OTHERWISE INDICATED, ALL FLANGES HOLES SHALL BE STAGGERED TO MAIN AXES OF VESSEL

3 -TUTTI GLI INTERNI SMONTABILI DEVONO PASSARE ATTRAVERSO UN PASSO D'UOMO AVENTE UN DIAMETRO INTERNO DI 894 mm.
ALL REMOVABLE INTERNAL SHALL PASS THROUGH A MANHOLE HAVING AN INTERNAL DIA. OF 894 mm.

4 -LE FLANGE SARANNO IN ACCORDO AD ASME B16.5 (EDIZIONE 2020).
I TRONCHETTI DA TUBO SENZA SALDATURA SARANNO IN ACCORDO AD ASME B36.10M (EDIZIONE 2018).
I TIRANTI E I DADI AVRANNO FILETTATURA IN ACCORDO AD ASME B1.1 (EDIZIONE 2019).
LE CURVE SARANNO IN ACCORDO AD ASME B16.9 (EDIZIONE 2018).
NOZZLE FLANGES MUST BE IN ACCORDANCE WITH ASME B16.5 (2020 ED.).
NOZZLE NECK FROM SEAMLESS PIPE MUST BE IN ACCORDANCE WITH ASME B36.10M (2018 ED.).
BOLTS AND NUTS THREADS MUST BE IN ACCORDANCE WITH ASME B1.1 (2019 ED.).
ELBOWS MUST BE IN ACCORDANCE WITH ASME B16.9 (2018 ED.).

5 -GLI SPESSORI INDICATI SUL DISEGNO SONO QUELLI MINIMI DOPO FORMATURA
ALL THICKNESS SHOWN ON THE DRAWING MUST BE CONSIDERED AS MINIMUM AFTER FORMING

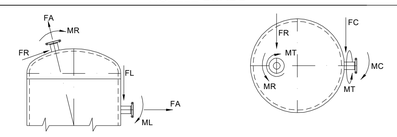
6 -L= LUNGHEZZA NETTA DEL TUBO
L= NET PIPE LENGHT

7 -TOLLERANZE MATERIALI: TUBI ±12.5%, LAMIERE -0.3 mm, FORGIATI -0/+2mm
MATERIAL TOLERANCES: PIPES ±12.5%, PLATES -0.3 mm, FORGING -0/+2 mm

8 -TEMPERATURA MINIMA DI PROGETTO -20 °C A 16 Bar g
MINIMUM DESIGN METAL TEMPERATURE -20 °C AT 16 Bar g

9 -SALVO DIVERSAMENTE INDICATO, LE TOLLERANZE DIMENSIONALI SARANNO IN ACCORDO A QUANTO SEGUE:
(FATTA ECCEZIONE PER SALDATURE) DIM. LINEARI ±3mm, DIM. LINEARI PASSI D'UOMO ±6 mm,
DIM. LINEARI COMPLESSIVE ±15 mm, DIMENSIONI ANGOLARI ±0.5°, INTERASSI LIVELLI ± 2mm
UNLESS OTHERWISE INDICATED, THE TOLERANCES SHALL BE AS FOLLOW: (EXCEPT FOR WELDING)
LINEAR DIM. ±3mm, MANHOLE LINEAR DIM. ±6mm, LINEAR DIM. GLOBAL ±15mm, ANGULAR ±0.5°,
LEVEL ±2mm

10-PER DETTAGLI SALDATURA VEDI "WELDING MAP"
FOR JOINT DETAILS SEE "WELDING MAP"



11-TUTTI I MATERIALI AVRANNO "DOPPIA CERTIFICAZIONE" 316 E 316L, SARANNO UTILIZZATE LE PROPRIETA' MECCANICHE DEL 316 E SARANNO SODDISFATTE LE PROPRIETA' CHIMICHE DEL 316L
ALL MATERIALS SHALL BE "DUAL CERTIFIED" 316 AND 316L, MECHANICAL PROPERTIES OF 316 SHALL BE USED AND CHEMICAL PROPERTIES OF 316L SHALL BE SATISFIED.

12-VEDI DOC. N. C0063-FOR-ITP-QA-001 "INSPECTION AND TEST PLAN ITP"

● CERTIFICATO EN10204 - 3.2 ◑ CERTIFICATO EN10204 - 3.1 ○ CERTIFICATO EN10204 - 2.2

NOTE GENERALI / GENERAL NOTES

1 -TUTTE LE FLANGE DOVRANNO AVERE LA FACCIA DI ACCOPPIAMENTO CON FINITURA LISCIA 125 ÷ 250 AARH E ALTEZZA ONDULAZIONE MAX.0.05 MM.
ALL FLANGES SHALL HAVE SMOOTH FINISH FACING ROUGHNESS WITH 125 ÷ 250 AARH AND WAVINESS HEIGHT 0.05 MAX.

2 -SALVO DIVERSA INDICAZIONE, LE FLANGE DOVRANNO AVERE I FORI SFALSATI RISPETTO GLI ASSI PRINCIPALI DEL RECIPIENTE
UNLESS OTHERWISE INDICATED, ALL FLANGES HOLES SHALL BE STAGGERED TO MAIN AXES OF VESSEL

3 -TUTTI GLI INTERNI SMONTABILI DEVONO PASSARE ATTRAVERSO UN PASSO D'UOMO AVENTE UN DIAMETRO INTERNO DI - mm.
ALL REMOVABLE INTERNAL SHALL PASS THROUGH A MANHOLE HAVING AN INTERNAL DIA. OF - mm.

4 -LE FLANGE SARANNO IN ACCORDO AD ASME B16.5 (EDIZIONE 2020).
I TRONCHETTI DA TUBO SENZA SALDATURA SARANNO IN ACCORDO AD ASME B36.10M (EDIZIONE 2018).
I TIRANTI E I DADI AVRANNO FILETTATURA IN ACCORDO AD ASME B1.1 (EDIZIONE 2019).
LE CURVE SARANNO IN ACCORDO AD ASME B16.9 (EDIZIONE 2018).
NOZZLE FLANGES MUST BE IN ACCORDANCE WITH ASME B16.5 (2020 ED.).
NOZZLE NECK FROM SEAMLESS PIPE MUST BE IN ACCORDANCE WITH ASME B36.10M (2018 ED.).
BOLTS AND NUTS THREADS MUST BE IN ACCORDANCE WITH ASME B1.1 (2019 ED.).
ELBOWS MUST BE IN ACCORDANCE WITH ASME B16.9 (2018 ED.).

5 -GLI SPESSORI INDICATI SUL DISEGNO SONO QUELLI MINIMI DOPO FORMATURA
ALL THICKNESS SHOWN ON THE DRAWING MUST BE CONSIDERED AS MINIMUM AFTER FORMING

6 -L= LUNGHEZZA NETTA DEL TUBO
L= NET PIPE LENGHT

7 -TOLLERANZE MATERIALI: TUBI ±12.5%, LAMIERE -0.3 mm, FORGIATI -0/+2mm
MATERIAL TOLERANCES: PIPES ±12.5%, PLATES -0.3 mm, FORGING -0/+2 mm

8 -TEMPERATURA MINIMA DI PROGETTO -20 °C A 40 Bar g
MINIMUM DESIGN METAL TEMPERATURE -20 °C AT 40 Bar g

9 -SALVO DIVERSAMENTE INDICATO, LE TOLLERANZE DIMENSIONALI SARANNO IN ACCORDO A QUANTO SEGUE: (FATTA ECCEZIONE PER SALDATURE) DIM. LINEARI ±3mm, DIM. LINEARI PASSI D'UOMO ±6 mm, DIM. LINEARI COMPLESSIVE ±15 mm, DIMENSIONI ANGOLARI ±0.5°, INTERASSI LIVELLI ± 2mm
UNLESS OTHERWISE INDICATED, THE TOLERANCES SHALL BE AS FOLLOW: (EXCEPT FOR WELDING) LINEAR DIM. ±3mm, MANHOLE LINEAR DIM. ±6mm, LINEAR DIM. GLOBAL ±15mm, ANGULAR ±0.5°, LEVEL ±2mm

10-PER DETTAGLI SALDATURA VEDI "WELDING MAP"
FOR JOINT DETAILS SEE "WELDING MAP"

11-TUTTI I MATERIALI AVRANNO "DOPPIA CERTIFICAZIONE" 316 E 316L, SARANNO UTILIZZATE LE PROPRIETA' MECCANICHE DEL 316 E SARANNO SODDISFATTE LE PROPRIETA' CHIMICHE DEL 316L
ALL MATERIALS SHALL BE "DUAL CERTIFIED" 316 AND 316L, MECHANICAL PROPERTIES OF 316 SHALL BE USED AND CHEMICAL PROPERTIES OF 316L SHALL BE SATISFIED.

NOTE GENERALI / GENERAL NOTES

1 -TUTTE LE FLANGE DOVRANNO AVERE LA FACCIA DI ACCOPPIAMENTO CON FINITURA LISCIA 125 ÷ 250 AARH E ALTEZZA ONDULAZIONE MAX.0.05 MM.
ALL FLANGES SHALL HAVE SMOOTH FINISH FACING ROUGHNESS WITH 125 ÷ 250 AARH AND WAVINESS HEIGHT 0.05 MAX.

2 -SALVO DIVERSA INDICAZIONE, LE FLANGE DOVRANNO AVERE I FORI SFALSATI RISPETTO GLI ASSI PRINCIPALI DEL RECIPIENTE
UNLESS OTHERWISE INDICATED, ALL FLANGES HOLES SHALL BE STAGGERED TO MAIN AXES OF VESSEL

3 -TUTTI GLI INTERNI SMONTABILI DEVONO PASSARE ATTRAVERSO UN PASSO D'UOMO AVENTE UN DIAMETRO INTERNO DI 374 mm.
ALL REMOVABLE INTERNAL SHALL PASS THROUGH A MANHOLE HAVING AN INTERNAL DIA. OF 374 mm.

4 -LE FLANGE SARANNO IN ACCORDO AD ASME B16.5 (EDIZIONE 2020).
I TRONCHETTI DA TUBO SENZA SALDATURA SARANNO IN ACCORDO AD ASME B36.10M (EDIZIONE 2018).
I TIRANTI E I DADI AVRANNO FILETTATURA IN ACCORDO AD ASME B1.1 (EDIZIONE 2019).
LE CURVE SARANNO IN ACCORDO AD ASME B16.9 (EDIZIONE 2018).
NOZZLE FLANGES MUST BE IN ACCORDANCE WITH ASME B16.5 (2020 ED.).
NOZZLE NECK FROM SEAMLESS PIPE MUST BE IN ACCORDANCE WITH ASME B36.10M (2018 ED.).
BOLTS AND NUTS THREADS MUST BE IN ACCORDANCE WITH ASME B1.1 (2019 ED.).
ELBOWS MUST BE IN ACCORDANCE WITH ASME B16.9 (2018 ED.).

5 -GLI SPESSORI INDICATI SUL DISEGNO SONO QUELLI MINIMI DOPO FORMATURA
ALL THICKNESS SHOWN ON THE DRAWING MUST BE CONSIDERED AS MINIMUM AFTER FORMING

6 -L= LUNGHEZZA NETTA DEL TUBO
L= NET PIPE LENGHT

7 -TOLLERANZE MATERIALI: TUBI ±12.5%, LAMIERE -0.3 mm, FORGIATI -0/+2mm
MATERIAL TOLERANCES: PIPES ±12.5%, PLATES -0.3 mm, FORGING -0/+2 mm

8 -TEMPERATURA MINIMA DI PROGETTO -20 °C A 16 Bar g
MINIMUM DESIGN METAL TEMPERATURE -20 °C AT 16 Bar g

9 -SALVO DIVERSAMENTE INDICATO, LE TOLLERANZE DIMENSIONALI SARANNO IN ACCORDO A QUANTO SEGUE: (FATTA ECCEZIONE PER SALDATURE) DIM. LINEARI ±3mm, DIM. LINEARI PASSI D'UOMO ±6 mm, DIM. LINEARI COMPLESSIVE ±15 mm, DIMENSIONI ANGOLARI ±0.5°, INTERASSI LIVELLI ± 2mm
UNLESS OTHERWISE INDICATED, THE TOLERANCES SHALL BE AS FOLLOW: (EXCEPT FOR WELDING) LINEAR DIM. ±3mm, MANHOLE LINEAR DIM. ±6mm, LINEAR DIM. GLOBAL ±15mm, ANGULAR ±0.5°, LEVEL ±2mm

10-PER DETTAGLI SALDATURA VEDI "WELDING MAP"
FOR JOINT DETAILS SEE "WELDING MAP"

11-TUTTI I MATERIALI AVRANNO "DOPPIA CERTIFICAZIONE" 316 E 316L, SARANNO UTILIZZATE LE PROPRIETA' MECCANICHE DEL 316 E SARANNO SODDISFATTE LE PROPRIETA' CHIMICHE DEL 316L
ALL MATERIALS SHALL BE "DUAL CERTIFIED" 316 AND 316L, MECHANICAL PROPERTIES OF 316 SHALL BE USED AND CHEMICAL PROPERTIES OF 316L SHALL BE SATISFIED.

NOTE GENERALI / GENERAL NOTES

1 -TUTTE LE FLANGE DOVRANNO AVERE LA FACCIA DI ACCOPPIAMENTO CON FINITURA LISCIA 125 ÷ 250 AARH E ALTEZZA ONDULAZIONE MAX.0.05 MM.
ALL FLANGES SHALL HAVE SMOOTH FINISH FACING ROUGHNESS WITH 125 ÷ 250 AARH AND WAVINESS HEIGHT 0.05 MAX.

2 -SALVO DIVERSA INDICAZIONE, LE FLANGE DOVRANNO AVERE I FORI SFALSATI RISPETTO GLI ASSI PRINCIPALI DEL RECIPIENTE
UNLESS OTHERWISE INDICATED, ALL FLANGES HOLES SHALL BE STAGGERED TO MAIN AXES OF VESSEL

3 -TUTTI GLI INTERNI SMONTABILI DEVONO PASSARE ATTRAVERSO UN BOCCHELLO AVENTE UN DIAMETRO INTERNO DI 154 mm.
ALL REMOVABLE INTERNAL SHALL PASS THROUGH A NOZZLE HAVING AN INTERNAL DIA. OF 154 mm.

4 -LE FLANGE SARANNO IN ACCORDO AD ASME B16.5 (EDIZIONE 2020).
I TRONCHETTI DA TUBO SENZA SALDATURA SARANNO IN ACCORDO AD ASME B36.10M (EDIZIONE 2018).
I TIRANTI E I DADI AVRANNO FILETTATURA IN ACCORDO AD ASME B1.1 (EDIZIONE 2019).
LE CURVE SARANNO IN ACCORDO AD ASME B16.9 (EDIZIONE 2018).
NOZZLE FLANGES MUST BE IN ACCORDANCE WITH ASME B16.5 (2020 ED.).
NOZZLE NECK FROM SEAMLESS PIPE MUST BE IN ACCORDANCE WITH ASME B36.10M (2018 ED.).
BOLTS AND NUTS THREADS MUST BE IN ACCORDANCE WITH ASME B1.1 (2019 ED.).
ELBOWS MUST BE IN ACCORDANCE WITH ASME B16.9 (2018 ED.).

5 -GLI SPESSORI INDICATI SUL DISEGNO SONO QUELLI MINIMI DOPO FORMATURA
ALL THICKNESS SHOWN ON THE DRAWING MUST BE CONSIDERED AS MINIMUM AFTER FORMING

6 -L= LUNGHEZZA NETTA DEL TUBO
L= NET PIPE LENGHT

7 -TOLLERANZE MATERIALI: TUBI ±12.5%, LAMIERE -0.3 mm, FORGIATI -0/+2mm
MATERIAL TOLERANCES: PIPES ±12.5%, PLATES -0.3 mm, FORGING -0/+2 mm

8 -TEMPERATURA MINIMA DI PROGETTO -20 °C A 40 Bar g
MINIMUM DESIGN METAL TEMPERATURE -20 °C AT 40 Bar g

9 -SALVO DIVERSAMENTE INDICATO, LE TOLLERANZE DIMENSIONALI SARANNO IN ACCORDO A QUANTO SEGUE: (FATTA ECCEZIONE PER SALDATURE) DIM. LINEARI ±3mm, DIM. LINEARI PASSI D'UOMO ±6 mm, DIM. LINEARI COMPLESSIVE ±15 mm, DIMENSIONI ANGOLARI ±0.5°, INTERASSI LIVELLI ± 2mm
UNLESS OTHERWISE INDICATED, THE TOLERANCES SHALL BE AS FOLLOW: (EXCEPT FOR WELDING) LINEAR DIM. ±3mm, MANHOLE LINEAR DIM. ±6mm, LINEAR DIM. GLOBAL ±15mm, ANGULAR ±0.5°, LEVEL ±2mm

10-PER DETTAGLI SALDATURA VEDI "WELDING MAP"

NOTE GENERALI / GENERAL NOTES

1 -TUTTE LE FLANGE DOVRANNO AVERE LA FACCIA DI ACCOPPIAMENTO CON FINITURA LISCIA 125 ÷ 250 AARH E ALTEZZA ONDULAZIONE MAX.0.05 MM.
ALL FLANGES SHALL HAVE SMOOTH FINISH FACING ROUGHNESS WITH 125 ÷ 250 AARH AND WAVINESS HEIGHT 0.05 MAX.

2 -SALVO DIVERSA INDICAZIONE, LE FLANGE DOVRANNO AVERE I FORI SFALSATI RISPETTO GLI ASSI PRINCIPALI DEL RECIPIENTE
UNLESS OTHERWISE INDICATED, ALL FLANGES HOLES SHALL BE STAGGERED TO MAIN AXES OF VESSEL

3 -TUTTI GLI INTERNI SMONTABILI DEVONO PASSARE ATTRAVERSO UN PASSO DI MANO AVENTE UN DIAMETRO INTERNO DI 146 mm.
ALL REMOVABLE INTERNAL SHALL PASS THROUGH A HANDHOLE HAVING AN INTERNAL DIA. OF 146 mm.

4 -LE FLANGE SARANNO IN ACCORDO AD ASME B16.5 (EDIZIONE 2020).
I TRONCHETTI DA TUBO SENZA SALDATURA SARANNO IN ACCORDO AD ASME B36.10M (EDIZIONE 2018).
I TIRANTI E I DADI AVRANNO FILETTATURA IN ACCORDO AD ASME B1.1 (EDIZIONE 2019).
LE CURVE SARANNO IN ACCORDO AD ASME B16.9 (EDIZIONE 2018).
NOZZLE FLANGES MUST BE IN ACCORDANCE WITH ASME B16.5 (2020 ED.).
NOZZLE NECK FROM SEAMLESS PIPE MUST BE IN ACCORDANCE WITH ASME B36.10M (2018 ED.).
BOLTS AND NUTS THREADS MUST BE IN ACCORDANCE WITH ASME B1.1 (2019 ED.).
ELBOWS MUST BE IN ACCORDANCE WITH ASME B16.9 (2018 ED.).

5 -GLI SPESSORI INDICATI SUL DISEGNO SONO QUELLI MINIMI DOPO FORMATURA
ALL THICKNESS SHOWN ON THE DRAWING MUST BE CONSIDERED AS MINIMUM AFTER FORMING

6 -L= LUNGHEZZA NETTA DEL TUBO
L= NET PIPE LENGHT

7 -TOLLERANZE MATERIALI: TUBI ±12.5%, LAMIERE -0.3 mm, FORGIATI -0/+2mm
MATERIAL TOLERANCES: PIPES ±12.5%, PLATES -0.3 mm, FORGING -0/+2 mm

8 -TEMPERATURA MINIMA DI PROGETTO -20 °C A 40 Bar g
MINIMUM DESIGN METAL TEMPERATURE -20 °C AT 40 Bar g

9 -SALVO DIVERSAMENTE INDICATO, LE TOLLERANZE DIMENSIONALI SARANNO IN ACCORDO A QUANTO SEGUE:
(FATTA ECCEZIONE PER SALDATURE) DIM. LINEARI ±3mm, DIM. LINEARI PASSI D'UOMO ±6 mm,
DIM. LINEARI COMPLESSIVE ±15 mm, DIMENSIONI ANGOLARI ±0.5°, INTERASSI LIVELLI ± 2mm
UNLESS OTHERWISE INDICATED, THE TOLERANCES SHALL BE AS FOLLOW: (EXCEPT FOR WELDING)
LINEAR DIM. ±3mm, MANHOLE LINEAR DIM. ±6mm, LINEAR DIM. GLOBAL ±15mm, ANGULAR ±0.5°,
LEVEL ±2mm

10-PER DETTAGLI SALDATURA VEDI "WELDING MAP"
FOR JOINT DETAILS SEE "WELDING MAP"

11-TUTTI I MATERIALI AVRANNO "DOPPIA CERTIFICAZIONE" 316 E 316L, SARANNO UTILIZZATE LE PROPRIETA' MECCANICHE DEL 316 E SARANNO SODDISFATTE LE PROPRIETA' CHIMICHE DEL 316L
ALL MATERIALS SHALL BE "DUAL CERTIFIED" 316 AND 316L, MECHANICAL PROPERTIES OF 316 SHALL BE USED AND CHEMICAL PROPERTIES OF 316L SHALL BE SATISFIED.

2 -SALVO DIVERSA INDICAZIONE, LE FLANGE DOVRANNO AVERE I FORI SFALSATI RISPETTO GLI ASSI PRINCIPALI DEL RECIPIENTE
UNLESS OTHERWISE INDICATED, ALL FLANGES HOLES SHALL BE STAGGERED TO MAIN AXES OF VESSEL

3 -TUTTI GLI INTERNI SMONTABILI DEVONO PASSARE ATTRAVERSO UN PASSO DI MANO AVENTE UN DIAMETRO INTERNO DI 254 mm.
ALL REMOVABLE INTERNAL SHALL PASS THROUGH A HANDHOLE HAVING AN INTERNAL DIA. OF 254 mm.

4 -LE FLANGE SARANNO IN ACCORDO AD ASME B16.5 (EDIZIONE 2020).
I TRONCHETTI DA TUBO SENZA SALDATURA SARANNO IN ACCORDO AD ASME B36.10M (EDIZIONE 2018).
I TIRANTI E I DADI AVRANNO FILETTATURA IN ACCORDO AD ASME B1.1 (EDIZIONE 2019).
LE CURVE SARANNO IN ACCORDO AD ASME B16.9 (EDIZIONE 2018).
NOZZLE FLANGES MUST BE IN ACCORDANCE WITH ASME B16.5 (2020 ED.).
NOZZLE NECK FROM SEAMLESS PIPE MUST BE IN ACCORDANCE WITH ASME B36.10M (2018 ED.).
BOLTS AND NUTS THREADS MUST BE IN ACCORDANCE WITH ASME B1.1 (2019 ED.).
ELBOWS MUST BE IN ACCORDANCE WITH ASME B16.9 (2018 ED.).

5 -GLI SPESSORI INDICATI SUL DISEGNO SONO QUELLI MINIMI DOPO FORMATURA
ALL THICKNESS SHOWN ON THE DRAWING MUST BE CONSIDERED AS MINIMUM AFTER FORMING

6 -L= LUNGHEZZA NETTA DEL TUBO
L= NET PIPE LENGHT

7 -TOLLERANZE MATERIALI: TUBI ±12.5%, LAMIERE -0.3 mm, FORGIATI -0/+2mm
MATERIAL TOLERANCES: PIPES ±12.5%, PLATES -0.3 mm, FORGING -0/+2 mm

8 -TEMPERATURA MINIMA DI PROGETTO -20 °C A 16 Bar g
MINIMUM DESIGN METAL TEMPERATURE -20 °C AT 16 Bar g

9 -SALVO DIVERSAMENTE INDICATO, LE TOLLERANZE DIMENSIONALI SARANNO IN ACCORDO A QUANTO SEGUE:
(FATTA ECCEZIONE PER SALDATURE) DIM. LINEARI ±3mm, DIM. LINEARI PASSI D'UOMO ±6 mm,
DIM. LINEARI COMPLESSIVE ±15 mm, DIMENSIONI ANGOLARI ±0.5°, INTERASSI LIVELLI ± 2mm
UNLESS OTHERWISE INDICATED, THE TOLERANCES SHALL BE AS FOLLOW: (EXCEPT FOR WELDING)
LINEAR DIM. ±3mm, MANHOLE LINEAR DIM. ±6mm, LINEAR DIM. GLOBAL ±15mm, ANGULAR ±0.5°,
LEVEL ±2mm

10-PER DETTAGLI SALDATURA VEDI "WELDING MAP"
FOR JOINT DETAILS SEE "WELDING MAP"

11-TUTTI I MATERIALI AVRANNO "DOPPIA CERTIFICAZIONE" 316 E 316L, SARANNO UTILIZZATE LE PROPRIETA' MECCANICHE DEL 316 E SARANNO SODDISFATTE LE PROPRIETA' CHIMICHE DEL 316L
ALL MATERIALS SHALL BE "DUAL CERTIFIED" 316 AND 316L, MECHANICAL PROPERTIES OF 316 SHALL BE USED AND CHEMICAL PROPERTIES OF 316L SHALL BE SATISFIED.

FACTORY ACCEPTANCE TEST

Inspected object	
Pressure vessel No.	
Customer Order No./Part No.	
Aquagas Serial No.	
Manufacturer	AQUAGAS Sweden AB
P&ID nr. (Appendix A)	
GA drawing nr. (Appendix B)	
Electrical drawing nr. (Appendix C)	

Check points	**Result**	**Remark / Setpoint**
Build and dimensions		
With P&ID nr. acc. to above, check build and tags		Dryer must correspond to P&ID.
With dimensional drawing nr. acc. to above, check all dimensions.		Dryer must correspond to dimensional drawing.
With Electrical drawing verify amount/size of cable glands and number of terminals installed.		Dryer must correspond to electrical drawing.
All bottom drain points have plugs; Tower A, B, DE, heater pipe and condensate.		
Check all instruments for ATEX or IECEX approval according to spec.		
Cleaning inspections		
Visual inspection of vessels, piping and nozzles. Internal and external		
Cleaning of all surfaces with air		
		B
Electrical test		
Insulation test trace heater HE 61.1 HE 61.2 HE 61.3	Ω Ω Ω	Min 1 M Ω Max: ∞ M Ω
Insulation test regen. heater HE 64.1	…….. Ω	Min: 1 M Ω Max: ∞ M Ω
Resistance over trace heater HE 61.1 HE 61.2 HE 61.3	…….. Ω …….. Ω Ω	L1-0

Resistance over regen. heater HE 64.1	…….. Ω	L1-0
Continuity over temperature switch, TS(TC) 64.1		On/Off at 20°C, test with continuity (pin 3 & 4).
Set point for TS(TC) 64.1 is acc. to spec.		Set value 280°C
Maximum temp. of reg heater, TS 64.2		Maximum T1: 450°C
Note down type of heater		DHG81B03GG-12-T1, 400V, 12kW
Set point for TS 64.3 is according to spec.		Set value 200°C
Continuity over temperature switch, TS 64.3		Test continuity (pin “Common” & “NC”). Should give signal
Set point for TS 64.4 is according to spec.		Set value 60°C
Continuity over temperature switch, TS 64.4		Test continuity (pin “Common” & “NC”). Should give signal
Grounding cables attached on all solenoid valves, ~~level switch~~, pressure sensor, heater, ~~dew point sensor~~ and positioner		Ground cable present on all EX-d/e devices.
All Ex-i cables have blue markings		Check both ends.
Functional test		**Use reference list where applicable**
Solenoid valves acc. to electrical drawing.		On/off electrical with test instrument. Check corresponding valve movement.
Function of all pneumatic valves, check P&ID for reference		Checked open/close with pilot air. Valve axle location should correspond to actuator indicator.
Function of all manually operated valves, check P&ID for reference		Checked open/close. Manually, no resistance should be felt.
Function of all electrical limit switches, check P&ID for reference		On/off electrical with test instrument. Signal acc. to P&ID
Function of flow control by positioner		4mA=Closed 12mA=25% Open 20mA=80% Open Use loop calibrator
Function of all temperature sensors PT100, check P&ID for reference	… to …. mA at °C	Programmed at supplier 0-300°C. Max deviation between all readings is 0,7 mA. Note down min/max mA or Ω @ RT Use loop calibrator
Pressure transmitter PT 64.1	mA	Check signal at pressure. Analog 4-20mA. Use loop calibrator.
Dew point transmitter	N/A	Check signal at pressure. Analog 4-20mA. Use loop calibrator.
Note down type of dew point sensor	N/A	~~Easidew PRO XP~~ Serial No.
Note down type of pressure transmitter		WIKA IS-3 Sr-Nr.

Condensate System test		
Condensate 3-way valves 64-V13 and 64-V31 have seals		Check that 8 mm connections have bonded seals (tredo) installed.
Test condensate trap valves 64-V31 (controlled by 64-V17), 64-V13 (controlled by 64-V2). Open valve 64-T2 (controlled by 64-V12).		Open/close with air, Change tower with 3-way valve and repeat. Change to tower DE with the other 3-way valve and repeat. Isolate units not in use in all steps.
Level Switch LS-64-1	N/A	Check signal with and without water. Digital 1/0. (No water = No signal)
Level sensor LIT-64-1	N/A	Check signal with and without water. Analog 4-20mA.
Condensate valves 61-V2, 64-V15 and 64-V16 in open position.		Locked in open position
Test condensate trap 64-T2		Open with water/close when empty.
Safety valve(s)		
Check correct opening pressure PSV 64.1 and PSV 64.2		36 bar, check opening pressure marking on valve or manufacturer specification.
Check correct opening pressure PSV 64.3		6 bar, check opening pressure marking on valve or manufacturer specification.
Leak test		
Pneumatic test: pressurised and isolated unit to atmosphere and detect leaks at nozzles, fittings, and valves.		23 bar (g) for 1 hour with air. Detect leaks with leak detecting spray. Note: If applicable, open condensate valve and block outlet.
Helium leak test.		Gas mix with ~10% helium + ~90% compressed air at 25 bar (g) for 1 hour. Detect leaks with Helium leak detector.
Pressurised and isolated HEX water side to atmosphere and detect leaks at nozzles, fittings, and valves.		Pressurised and isolated unit to atmosphere and detect leaks at nozzles, fittings, and valves.
Check all fittings with wrench and gap-inspection tool (Hylok).		When approved, draw a line with dedicated green marker to indicate position of the nut on the coupling.
Visual		
Ground sticker attached on grounding point on skid		
Logo, tower designation stickers, warning stickers (all towers and heater) and trace heating warning label		Precaution Heat Dryer A & B, DE, Heater Pipe. Trace Heating cable warning.
Photos taken of all components		Machine type plate, pressure vessel plates and all 4 sides.

Machine and vessel nameplates attached. Vessel nameplates should be stamped.		All pressure vessels and machine type plate attached.
Filling		
Tower A&B filled with drying agent acc. to specification		~ 60 kg/each (BASF WS)
Tower DE filled with deoxo agent acc. to specification		~ 100 kg DSL2
Other		
Bypass valve 64-V14.1 pre-set		Set to approx. 3 turns, ~50%
Thermowell coupling tightened for all temperature transmitters		Approx. 1/8 turn, check by pulling on sensor. Make sure transmitter is seated before tightening.
Cover for position sensor puck screw attached.		Mount after all tests have passed.
Confirm that T-filters have the correct insert		Mesh screen 0,5 mm, not 50µm filter. See marking on filter housing
Note down all serial numbers in below list		

Temporary checks		
Check Habonim actuators for IIC marking		If IIB then take photo of serial number and send to Project manager. Replace nameplate or actuator with IIC.

Serial number list

Equipment tag	Serial number	Manufacturer	Description
Pressure vessels			
Deoxo vessel			Deoxo vessel
Dryer vessel A			Dryer vessel A
Dryer vessel B			Dryer vessel B
Housing for HE 64.1			Heater pipe
64-T1A			HEX Cooler
64-T1B			HEX Cooler
Other components			
HE 61.1			Trace heater DE vessel
HE 61.2			Trace heater DE vessel
HE 61.3			Trace heater condens.
HE 64.1			Regeneration heater
TS 64.3			Temp. switch 200°C
TS 64.4			Temp. switch 60°C
PT 64.1			Pressure transmitter
FC 64.1			Flow Control
66			Particle filter
PSV 64.1			Safety valve on H2
PSV 64.2			Safety valve on H2

Reference list for instrumentation values

Instrument	Analogue mA	Resistance Ω	Physical value
TT (min/max @ RT*)	5,00-5,17	107-109	RT is usually around 19-22 °C
PT (min/max @ pressure)	11,54-11.97	N/A	26-27,5 bar (g)
HX/HE (min/max @ RT) 12kW	N/A	24 – 24.5	*RT is usually around 19-22 °C

Report
on first inspection of pressure equipment
according to Directive 2014/68/EU Modules B / F / G

TÜV THÜRINGEN

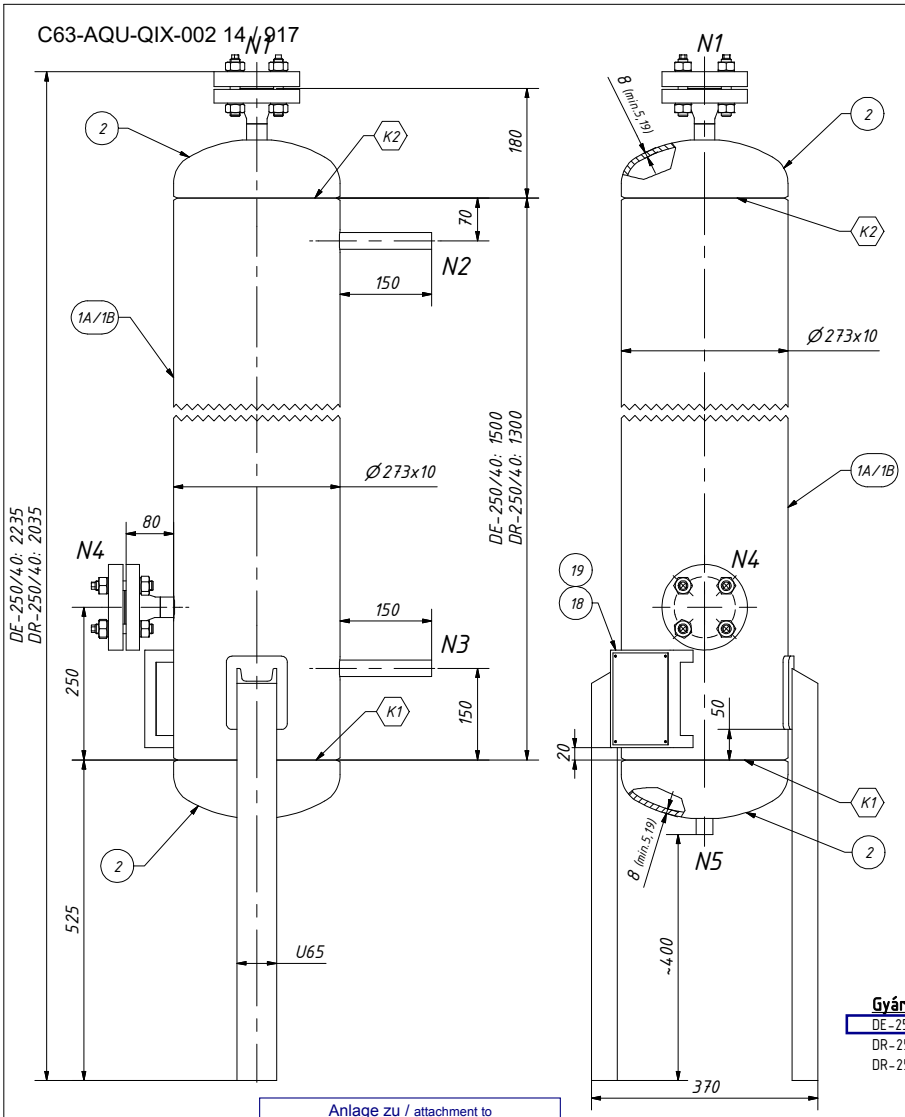
5.5	Module B[B1]: Certificate by Notified Body	---
5.6	The documents are suitable for the evaluation of the pressure equipment.	
6	**Intermediate inspections [Annex I para. 3]**	
6.1	Preparation of materials for joining [Annex I, 3.1.1.]	not applicable
6.2	Internal visual inspection	acceptable, see section 11
7	**Final examination [Annex I para. 3]**	
7.1	Visual inspection and dimensional check	considered, acceptable
7.2	Material test reports and traceability	considered, acceptable
7.3	Approvals for procedures (permanent joining, forming)	considered, acceptable
7.4	Approvals for personnel (permanent joining)	considered, acceptable
7.5	Approvals for NDE-personnel	considered, acceptable
7.6	NDE-personnel - Approval according to PED, Annex I, 3.1.3	considered, acceptable
7.7	Heat treatment	not applicable
7.8	Marking [Annex I, 3.3]	considered, acceptable
8	**Calibration of measuring tools & test resources**	
8.1	Manometer / pressure probe [33866; 33867]	considered, acceptable
8.2	Heat treatment devices [---]	not applicable
8.3	Others [---]	not applicable
9	**Pressure test [Annex I para. 3]**	
9.1	Test pressure, test fluid	considered, acceptable
10	**Examination of fundamental documentary requirements**	
10.1	Declaration of conformity of manufacturer	considered, acceptable
10.2	Reference of declaration to pressure equipment	considered, acceptable
10.3	Operating instructions of manufacturer	considered, acceptable
10.4	Examination of instruction regarding technical parameters	considered, acceptable

11 Remarks

(1) to 1.3: Serial number has been specified on the as-built drawing according to the realized state.
(2) to 3.7: Simplified fatique analysis acc. to EN 13445-3 point 17
(3) to 6.2: only nozzles circumferential welding seams randomly during manufacturing on 13.03.2024 and on 26.03.2024 at final examination.
(4) to 9.1: executed on 26.03.2024 at final examination, result acceptable.
(5) Name plate rivet, detachable parts (blind flanges, nozzles N1, N4) and flange N1 (Item No. 8.) stamped with: T Ü V 15

12 Result of inspection



Report
on first inspection of pressure equipment
according to Directive 2014/68/EU Modules B / F / G

	The inspection of pressure equipment is finished.

Testing Laboratory for Pressure Equipment Notified Body 0090 TÜV Thüringen e.V. Konrad-Zuse-Straße 21 D-99099 Erfurt ped@tuev-thueringen.de	Date	26.03.2024	Place	Salgótarján	Stamp

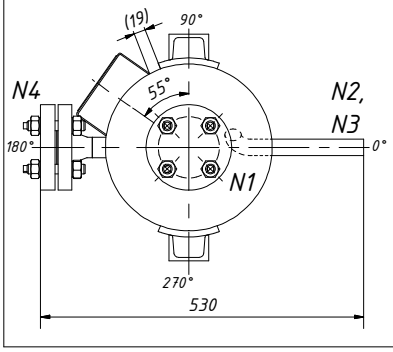
MEGJEGYZÉSEK:

- A csonkok külső erőből adódó terhelésekre nincsenek méretezve.
- Csonk hegesztési varratok az MSZ EN 13445-3:2021 szerint.
- Karima csavarfuratok fő síkba nem eshetnek.
- Felületkikészítés: -
- A 21, 22-es tételeket a megrendelő (AQUAGAS) biztosítja!
- A 21, 22-es tételeket a fenék behegesztése előtt beszerelni!
- A készülék a gyártóműben hőszigetelés nélkül készül.
- Készül: 3 db. (típusonként 1)
- A tervhez tartozó tételjegyzék száma: PL-GYP-243013-01



Note:

- External loads on nozzles are not taken into account
- Nozzles welding seams according to MSZ EN 13445-3:2021.
- Flange bolting holes shall not lie in principal planes
- Surface treatment: -
- Items 21, 22 supplied by AQUAGAS
- Items 21, 22 shall be installed before welding the vessel ends
- The vessel is manufactured without thermal insulation.
- 3 pcs to be made (1 of each)
- Parts list no. associated with the plan: PL-GYP-243013-01

Megjegyzés:
Az N2 és N3 csonkok Pos.4 és Pos.5 csöveit a gyártás során hosszabra kell hagyni! A sikeres nyomáspróbát követően a csonkokat a rajzon megadott méretekre kell visszavágni!

Note:
Pos.4 & 5 shall be installed with allowance for closure during pressure test. After passing the pressure test, nozzle pipes shall be cut back to the protrusion length indicated in the drawing.
