SECTION 2

Declaration of Conformity

CE

EC Conformity Declaration

Manufacturer:	EnviroFALK GmbH Prozesswasser-Technik Gutenbergstrasse 7 Industriegebiet Sainscheid D 56457 Westerburg, Germany Phone: +49 2663 9908-0 Fax: +49 2663 9908-50
Name of the unit:	Reverse osmosis system RO + EDI 500 with water supply system
Item no.:	23004680
Applicable EC directives:	2006/42/EC, Appendix II, Part 1A (complete machines in compliance with the directive) 2014/30/EC (EMV) 2011/65/EU (RoHS)
Harmonized standards applied in full or in part:	EN 60204-1:2019-06 DIN EN ISO 12100:2011-03 DIN EN 82079-1 DIN EN 61000-6-4:2011-09
Documentation Authorized representative:	Julian Barendt, Willy Sui *(Department: Technical Editing)*

We hereby declare that the design and construction of the above-mentioned equipment, as well as the design that we have placed on the market, comply with the basic safety and health requirements of the EC Directives.
The safety aims of the low voltage directive 2014/35/EU have been observed in accordance with Annex I, No. 1.5.1 of the Machinery Directive 2006/42/EC.
This declaration will lose its validity in the event that any changes are made to the unit without our prior consent.

22.07.2024

Equipment Factory Acceptance Test Plan Rev A

Factory acceptance testing of the modular demineralizer system will consist first of a "dry" test, followed by a "wet" functional demonstration of flowing water through the system.

Dry Check Out:

1. General Inspection:
   - ☐ Completeness based on installation plan
   - ☐ Type plate present
   - ☐ Hydrostatic tests completed and reports reviewed.
   - ☐ P&ID walk down completed to verify completeness and accuracy of the assembled system. *Refer to drawings.*
   - ☐ Assembly walk down completed to verify completeness and accuracy of the assembled system. *Refer to drawings*
   - ☐ Control software development completed.
   - ☐ Panel checkouts completed and software uploaded.
   - ☐ Wiring to transformers, EDI module, motors, in-line heaters, and HVAC inspected and EDI controller
   - ☐ Power to the EDI locked out so that it cannot be energized during testing.

   Verified by: Peter Kasperski / 06.08.24 [name, title, date]

2. Physical and electrical Set Up:
   - ☐ Electrical check present
   - ☐ Three-phase power connection
   - ☐ Clockwise rotating field
   - ☐ Switch cabinet and rack grounded – grounding signs present
   - ☐ Circuit diagram and nameplate inside control cabinet
   - ☐ Voltage arrows present
   - ☐ All cables checked for sufficient strain relief
   - ☐ Correct setting of all rated currents on motor-protective circuit breakers
   - ☐ Contact hazard protection cover on main switch and control terminal strip (X1) present
   - ☐ Component labeling in the control cabinet outside checked for correctness
   - ☐ Temporary plugs installed in the sample connections for ORP and pH probes. ORP and pH probes wired but not installed in the sample lines.
   - ☐ Temporary power connected to the Main Control Panel.
   - ☐ Temporary interconnecting power and communications cables connected from the Main Control Panel to other users.
   - ☐ Temporary connections made without punching holes in enclosures.
   - ☐ Presence of all defined IO's and control system.

   Verified by: Simon Müller, 06.08.2024 [name, title, date]

Steps 1 & 2 must be completed prior to energizing the system.

3. Controls Set up:
   - ☐ IP addresses set up and network communications established between the PLC controllers and devices.
   - ☐ VFDs set up and parameters stored.
     - VFD output to the 1st Pass RO Pump limited if required.
     - VFD output to the 2nd Pass RO Pump limited if required.
   - ☐ EDI controller set up and parameters stored.
   - ☐ Instrument ranges and scaling set to match PLC/HMI.

   Verified by: Simon Müller, 06.08.2024 [name, title, date]

4. Manual Verification:
   - ☐ In manual operation, each actuated valve responds to the HMI open/close push buttons. HMI status of actuated valve matches actual status. Speed controls adjusted for smooth operation.
   - ☐ The HMI displayed value for each transmitter matches the local instrument display.
   - ☐ The HMI displayed status for each switch matches the status of the switch. Switch status manually manipulated to verify both states.

   Verified by: Simon Müller, 06.08.2024 [name, title, date]

Wet Functional Demonstration:

1. Feedwater quality:
   - ☐ Conductivity raw water 124 µS/cm
   - ☐ Total hardness of raw water 0 °dH
   - ☐ Inlet pressure of raw water 4 bar
   - ☐ Temperature of raw water 25.1 °C

2. Set Up:
   - ☐ RO housings and RO membranes installed.
   - ☐ Temporary connections made to bypass the EDI module.
   - ☐ Temporary connections made:
     - for recirculation to the raw water connection
     - from the 1st pass reject connection to the recirculation tank
     - from the demineralized water connection to the recirculation tank

   Verified by: Peter Wagner / 06.08.24 [name, title, date]

3. Manual Verification:
   - ☐ In manual operation, each VFD-driven pump responds to the HMI run/stop push buttons #and speed settings. HMI status of each VFD-driven pump matches actual status. VFD output cannot be forced to exceed the limits defined above. Direction of motor rotation verified.
   - ☐ In manual operation, each straight speed pump responds to the HMI run/stop push buttons. HMI status of each straight speed pump matches actual status. Direction of motor rotation verified.

   Verified by: Simon Müller, 06.08.2024 [name, title, date]

4. Functional Demonstration:
   - ☐ With shortened timers and reduced settings, the system performs the sequences in automatic operation as described in the Software Detailed Description.
   - ☐ Using forced conditions, alarms and interlocks verified to interrupt operating sequences as described in the Software Detailed Description.
   - ☐ Software calculated variables verified to be accurate.
   - ☐ Hardwired inputs from the DCS (permissive and run command) verified using jumpers and/or forced bits.
   - ☐ Hardwired outputs to the DCS verified at the output terminals.
   - ☐ All indicator lights in order
   - ☐ Potential free contacts and fault signals controlled
   - ☐ Restart after emergency stop and main switch off
   - ☐ Error messages of the program checked.

   Verified by: Peter Wagenseil / 06.08.24 [name, title, date]

Ovivo UK Ltd
i10 Building Railway Drive,
Wolverhampton, UK, WV1 1LH

5. Client Witnessed Demonstration:
   - Present the inspection and test documentation for the Client's review.
   - Demonstrate the automatic operating sequences using shortened timers and reduced settings.
   - Demonstrate a random sampling of alarms and interlock conditions, up to 10% of the total alarms.
   - Demonstrate functionality of hardwired inputs from the DCS.
   - Demonstrate functionality outputs to the DCS.

   Witnessed by: Hassan HAMMANT [name, title, date]

6. Prepare for Shipping:
   - ☐ Valves used for throttling flow during testing returned to normal positions.
   - ☐ Temporary piping removed. System fully drained.
   - ☐ Plant preserved
   - ☐ Cartridge filter elements put in package with plant.
   - ☐ Any limitations on VFD outputs removed. Default settings entered and stored. Final software version saved.
   - ☐ Temporary power and communications cables removed. Lockout to the EDI removed. Electrical panels sealed.
   - ☐ Pictures taken
   - ☐ Cover panels installed over terminal point locations.
   - ☐ Temporary bracing installed as needed.
   - ☐ Equipment cleaned and secured for shipment.

Melted and manufactured in Italy — No welding or weld repair — Material free from Mercury contamination

We declare that the finished product is checked for radioactive contamination through Portal System when it leaves the production plant.

QUALITY MANAGEMENT SYSTEM CERTIFIED BY LLOYD'S REGISTER ACCORDING TO ISO 9001 : 2015, IATF 16949 : 2016, AS 9100D

The Quality Management System is Certified acc. Pressure Equipment Directive ['97/23/EC'] Annex 1,s.,4.3 and 2014/68/EU by TUEV and LLOYD`S

Any act of tampering, modification, alteration, counterfeiting and/or falsification and/or any other action which modifies the contents of this test certificate shall constitute a violation of applicable civil and criminal laws. Acciaierie Valbruna shall protect its rights and interests before any competent court, authority and jurisdiction.

Maxival and/or Valplus grades/products are manufactured with ladle techniques to control composition, distribution, size and shape of non-metallic inclusions for improved machinability.

The supplied product conforms to requirements expressly requested by the purchaser and conforms to requirements specified by certified norms and standards. Should the product be used for more severe, critical and/ or in any case different applications than those the material is generally intended for, any different and/or supplementary requirements shall be specifically demanded, at least, upon order of the Product by the Purchaser. Acciaierie Valbruna SpA shall not be responsible for any improper use of the Products.

Bemerkungen

Außenfläche der Rohre mit Korn 400 geschliffen.

Überprüft nach AD2000-Merkblatt W0 und zertifiziert nach Richtlinie
97/23/EG, Anhang I, Ziffer 4.3 durch die TÜV CERT-Zertifizierungsstelle
für Druckgeräte der TÜV Nord Gruppe, Benannte Stelle, Kenn-Nr. 0045 mit
Zertifikat-Nr. 07 202 4211/Z/0002/1/H
Das zur Anwendung gekommene Schweißverfahren gem. Druckgeräterichtlinie
97/23/EG, AD2000 HP2/1 / EN 288-3 und die Schweißerqualifikation
gem. EN 1418 sind Zertifiziert durch die TÜV CERT-Zertifizierungsstelle
für Druckgeräte der TÜV Nord Gruppe, Benannte Stelle, Kenn-Nr. 0045.

Die Anforderungen an den Hersteller nach AD 2000-Merkblatt W0/HP0 sind erfüllt. Auf eine Gegenzeichnung wird verzichtet.
Das eingesetzte Schweiß- und Prüfpersonal erfüllt die Anforderungen der EN 10217-7.
Die Anforderungen sind erfüllt.

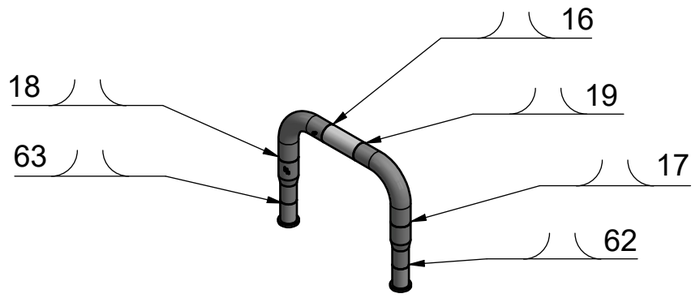
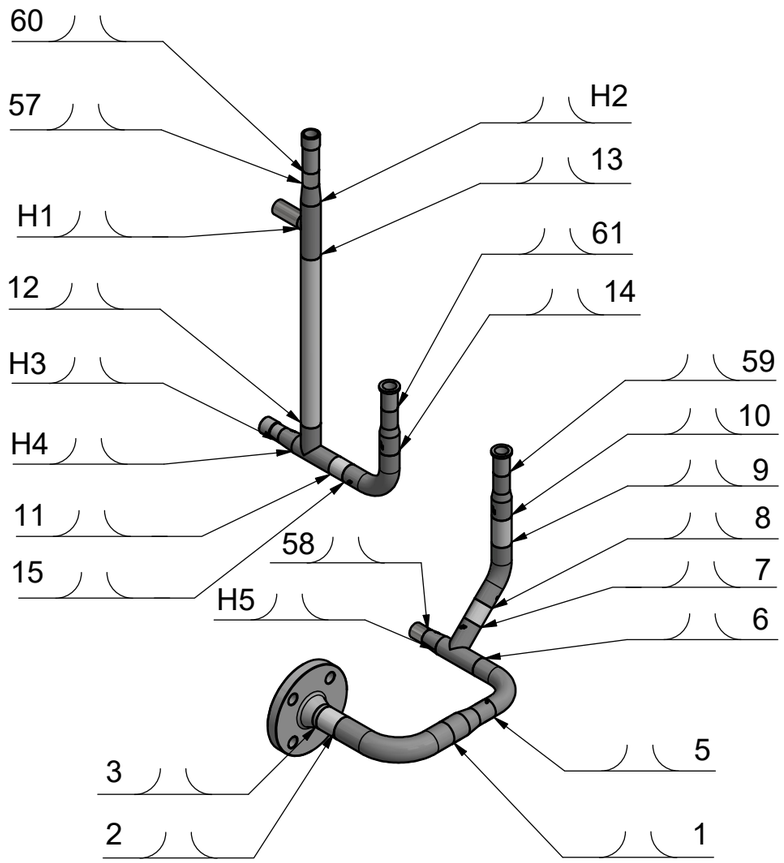
We certify that the above listed articles comply with the following requirements:

	No.	Test method	Test standard	Conditions	Unit	Typical values
Material	1.	OIT	ISO/TR 10837	> 15 min, DSC / 210°C		
	2.	Melt mass-flow rate 230°/2,16kg	EN ISO 15494		g/10 min	0.18 – 0.40
	3.	Density	EN ISO 1183-1		g/cm^3	0.900 – 0.910
Component	4.	Dimensions and acceptable deviations	EN ISO 15494	within admissible tolerances		
	5.	Delivery condition	EN ISO 15494	no voids, blisters, burrs or inhomogenities that affect the function		
	6.	Surface finish	EN ISO 15494	within admissible tolerances		
	7.	Internal pressure test	EN ISO 15494	3.5 N/mm2/ 95°C/ withstanding > 1000h		

The production code of the part can be read off the marking of the article.
Georg Fischer Piping Systems possesses a quality management system according to EN ISO 9001:2000 as well as EN ISO 14001:1996.



The above mentioned products are manufactured in Europe.



This document is issued electronically and is valid without signature.

Pickle and Passivation Records

Elektrolytbeiz- und Passivierungsprotokoll
Electrolytic pickling and passivation protocol

Hersteller / *Manufacturer*	EnviroFALK PharmaWaterSystems		
Vertreiber / *Distributor*	EnviroFALK PharmaWaterSystems		
Bauteil / *Component*	Edelstahlrohrleitungen & Rahmengestelle *SS Piping & Frame Rack*	**Seriennummer:** *Serial no.:*	240313 - 1
Zeichnungs-Nr.: *Drawing no.:*	EF-W-00043446, EF-W-00043476, EF-W-00033705		

1. Allgemeines / *General*

Um gefertigte Rohrleitungen oder Anlagengestelle von Beginn an gegen Korrosion zu schützen, werden alle Schweißnähte manuell elektrolytisch gebeizt und passiviert. *In order to protect manufactured pipelines or system frames against corrosion right from the start, all weld seams are manually electrolytically pickled and passivated.*

2. Durchführung der elektrochemischen Beizung und Passivierung / *Electrochemical Pickling & Passivation Process*

Die Schweißnähte von Gestellen und Rohrleitungen werden mittels Pinselverfahren elektrolytisch gebeizt. Als Elektrolyt wird eine spezielle Elektrolytbeize verwendet. Das Elektrolyt bildet in Verbindung mit Sauerstoff eine schützende Passivschicht auf dem behandeltem Werkstück aus. Die behandelte Schweißverbindung wird nach dem Reinigungsprozess wieder mit VE-Wasser abgespült. *The weld seams of frames and pipelines are electrolytically pickled using a brush process. A special electrolytic pickling agent is used as the electrolyte. In combination with oxygen, the electrolyte forms a protective passive layer on the treated workpiece. After the cleaning process, the treated welded joint is rinsed again with demineralized water.*

Equipment:

- Inverter: Greising Brush IT 800W
- Beizelektroly / Pickling Electrolyte: Greinox TF
- Spülmedium / Rinsing Agent: VE-Wasser < 5µS/cm / Demineralized Water <5µS/cm

3. Bestätigung / *Confirmation*

Hiermit bestätigt die mit dem Schweißen der Anlage beauftragte Firma EnviroFALK PharmaWaterSystems GmbH, dass alle Schweißnähte, der oben genannten Anlagenteile gemäß obiger Anweisung gebeizt, gespült und passiviert hat.

Hereby the company EnviroFALK PharmaWaterSystems GmbH commissioned with the welding of the copmponents, confirms: We pickled, rinsed and passivated all seam welds of the components mentioned above in accordance to this procedure.

CONFORMITY STATEMENT – FAT

OVIVO UK LIMITED of I10 Building, Railway drive, Wolverhampton, UK, WV1 1LH, United Kingdom, hereby certify that the equipment detailed above, supplied on the above referenced Purchase Order Number has been manufactured, inspected, assembled and tested in accordance with the relevant and specific contract requirements.

Final inspection has been monitored by OVIVO UK LIMITED and sub-suppliers Quality Control and all items were found to comply and conform to the relevant drawings and specifications.

OVIVO UK LIMITED also hereby certifies that the above referenced equipment has been run for a maximum of xxx minutes to ensure satisfactory operation. The test was overseen by OVIVO UK LIMITED/ELOGEN and Ovivo UK sub-suppliers Quality Assurance and was found to be satisfactory

1. General

1.1 About this document

The language of the original operating instructions is English. All other languages of these instructions are translations of the original operating instructions.

These installation and operating instructions are an integral part of the product. They must be kept readily available at the place where the product is installed. Strict adherence to these instructions is a precondition for the proper use and correct operation of the product.

These installation and operating instructions correspond to the relevant version of the product and the underlying safety standards valid at the time of going to print.

2. Safety

These operating instructions contain basic information which must be adhered to during installation, operation and maintenance. For this reason, these operating instructions must, without fail, be read by the service technician and the responsible specialist/operator before installation and commissioning.

It is not only the general safety instructions listed under the main point "safety" that must be adhered to but also the special safety instructions with danger symbols included under the following main points.

2.1 Symbols and signal words in the operating instructions

Symbols

General safety symbol

Danger due to electrical voltage

NOTICE: ....

Signal words:

DANGER! Acutely dangerous situation. Non-observance results in death or the most serious of injuries.

WARNING! The user can suffer (serious) injuries. 'Warning' implies that (serious) injury to persons is probable if this information is disregarded.

CAUTION! There is a risk of damaging the product/unit. 'Caution' implies that damage to the product is likely if this information is disregarded.

NOTICE: Useful information on handling the product. It draws attention to possible problems.

2.2 Personnel qualifications

The installation, operating and maintenance personnel must have the appropriate qualifications for this work. Area of responsibility, terms of reference and monitoring of the personnel are to be ensured by the operator. If the personnel are not in possession of the necessary knowledge, they are to be trained and instructed. This can be accomplished if necessary by the manufacturer of the product at the request of the operator.

2.3 Danger in the event of non-observance of the safety instructions

Non-observance of the safety instructions can result in risk of injury to persons and damage to the environment and the product/unit. Non-observance of the safety instructions results in the loss for any claims to damages.

In particular, non-observance can, for example, result in the following risks:

- Danger to persons due to electrical, mechanical and bacteriological factors
- Damage to the environment due to leakage of hazardous materials
- Property damage
- Failure of important product/unit functions
- Failure of required maintenance and repair procedures.

2.4 Safety consciousness on the job

The safety instructions included in these installation and operating instructions, the existing national regulations for accident prevention together with any internal working, operating and safety regulations of the operator are to be complied with.

2.5 Safety instructions for installation and maintenance work

This appliance is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety. Children should be supervised to ensure that they do not play with the appliance.

- If hot or cold components on the product/unit lead to hazards, local measures must be taken to guard them against touching.
- Guards which protect personnel from coming into contact with moving components (e.g. the coupling) must not be removed while the product is in operation.
- Leakages (e.g. from the shaft seals) of hazardous fluids (which are explosive, toxic or hot) must be led away so that no danger to persons or to the environment arises. National statutory provisions are to be complied with.
- Highly flammable materials are always to be kept at a safe distance from the product.
- Danger from electrical current must be eliminated. Local directives or general directives [e.g. IEC, VDE etc.] and local power supply companies must be adhered to.

2.6 Safety instructions for installation and maintenance work

The operator must ensure that all installation and maintenance work is carried out by authorised and qualified personnel, who are sufficiently informed from their own detailed study of the operating instructions.

Work on the product/unit must only be carried out when at a standstill. It is mandatory that the procedure described in the installation and operating

instructions for shutting down the product/unit be complied with.
Immediately on conclusion of the work, all safety and protective devices must be put back in position and/or recommissioned.

2.7 Unauthorised modification and manufacture of spare parts

Unauthorised modification and manufacture of spare parts will impair the safety of the product/ personnel and will make void the manufacturer's declarations regarding safety.
Modifications to the product are only permissible after consultation with the manufacturer. Original spare parts and accessories authorised by the manufacturer ensure safety. The use of other parts will absolve us of liability for consequential events.

2.8 Improper use

The operating safety of the supplied product is only guaranteed for conventional use in accordance with Section 4 of the operating instructions. The limit values must on no account fall under or exceed those values specified in the catalogue/data sheet.

3. Transport and interim storage

When receiving the material, check that there has been no damage during the transport. If shipping damage has occurred, take all necessary steps with the carrier within the allowed time.

CAUTION! Outside influences may cause damages. If the delivered material is to be installed later on, store it in a dry place and protect it from impacts and any outside influences (humidity, frost etc.).
The product should be cleaned thoroughly before it is put into temporary storage. The product can be stored for at least one year.

Handle the pump carefully so as not to damage the unit prior to installation.

4. Application

This pump's basic function is to pump hot or cold water, water with glycol or other low viscosity fluids that contain no mineral oil, solid or abrasive substances, or materials having long fibres. The manufacturer's approval is required for use to pump corrosive chemicals.

CAUTION! Risk of explosion!
Do not use this pump to handle flammable or explosive liquids.

4.1 Applications areas

- water distribution and pressure boosting,
- industrial circulation systems,
- process fluids,
- cooling-water circuits,
- fire-fighting and washing stations,
- irrigation systems, etc.

5. Technical data

5.1 Pump designation

Example: Helix V1605-1/16/E/KS/400-50xxxx				
Helix V(F) **Helix FIRST V(F)**	Vertical high-pressure multistage centrifugal pump in in-line design (F) = VdS certified pump version			
16	Nominal volume flow in m³/h			
05	Number of impellers			
1	Pump material code 1 = Pump housing stainless steel 1.4301 (AISI 304) + hydraulics 1.4307 (AISI 304) 2 = Pump housing stainless steel 1.4404 (AISI 316L) + hydraulics 1.4404 (AISI 316L) 5 = Pump housing cast Iron EN-GJL-250 (standard coating) + hydraulics 1.4307 (AISI 304)			
16	Pipe connection 16 = oval flanges PN16 25 = round flanges PN25 30 = round flanges PN40			
E	Seal type code E = EPDM V = FKM			
KS	K = Cartridge seal, versions without "K" are equipped with simple mechanical seal S = Lantern orientation align with suction pipe X = X-Care version			
With motor		OR	**Bare-shaft pump (without motor)**	
400 - 460	Motor electrical voltage (V)		**50 - 60**	Motor frequency (Hz)
50 - 60	Motor frequency (Hz)		**-38FF265**	Ø motor shaft – lantern size
xxxx	Options code (if any)			

5.2 Data table

Maximum operating pressure																	
Pump casing	16, 25 ou 30 bars depend on the model																
Maximum suction pressure	10 bars Note : real inlet pressure (Pinlet)+ pressure at 0 flow delivered by the pump must be below the maximum operating pressure of the pump. In case of exceeding maximum operating pressure, the ball bearing and the mechanical seal could be damaged or lifetime could decrease. P Inlet + P at 0 flow ≤ Pmax pump See pump nameplate to know the maximum operating pressure: Pmax																
Temperature range																	
Liquid temperatures	–30°C to +120°C –15°C to +90°C (wiht FKM seal) –20°C to + 120°C (with cast iron casing)																
Ambient temperature	–15° to +40°C Other temperature on request																
Electrical data																	
Motor efficiency	Motor according to IEC 60034–30																
Motor Protection index	IP55																
Insulation class	155 (F)																
Frequency	See motor's rating plating																
Electrical voltage	See motor's rating plating																
Other data																	
Humidity	< 90% sans condensation																
Altitude	< 1000 m (> 1000m on request)																
Maximum suction head	according to pump's NPSH																
Sound pressure level dB(A) 0/+3 dB(A)		**Power (kW)**															
		0.37	0.55	0.75	1.1	1.5	2.2	3	4	5.5	7.5	11	15	18.5	22	30	37	45
	50Hz	56	57		58		62	64	68	69		71		74		76		
	60Hz	60	61		63		67	71	72	74		78		81		84		

5.3 Scope of deliveryt

- Multistage pump.
- Installation and operating instructions.
- Counterflange + screws and o'rings for PN16 configuration.

5.4 Accessories

Original accessories are available for HELIX range:

Designation	Article nº.
2x oval counterflanges, stainless steel 1.4301 (screwing) (PN16 – 1")	4016168
2x round counterflanges in stainless steel 1.4404 (screwing) (PN40 – DN25)	4016165
2x round counterflanges in steel (welding) (PN40 – DN25)	4016162
2x oval counterflanges in stainless steel 1.4301 (screwing) (PN16 – 1" 1/4)	4016169
2x round counterflanges in stainless steel 1.4404 (screwing) (PN40 – DN32)	4016166
2x round counterflanges in steel (welding) (PN40 – DN32)	4016163
2x oval counterflanges in stainless steel 1.4301 (screwing) (PN16 – 1" 1/2)	4016170
2x round counterflanges in stainless steel 1.4404 (screwing) (PN40 – DN40)	4016167
2x round counterflanges in steel (welding) (PN40 – DN40)	4016164
2x oval counterflanges in stainless steel 1.4301 (screwing) (PN16 – 2")	4055063
2x round counterflanges in stainless steel 1.4404 (screwing) (PN40 – DN50)	4038589
2x round counterflanges in steel (welding) (PN40 – DN50)	4038588
Bypass kit 25 bar	4146786
Bypass kit (with pressure gauge 25 bar)	4146788
Baseplate with dampers for pumps up to 5,5 kW	4157154

The use of new accessories is recommended.

6. Description and function

6.1 Product description

Fig. 1

1 – Motor connection bolt
2 – Coupling guard
3 – Mechanical seal
4– Hydraulic stage casing
5 – Impeller
6 – Pump shaft
7 – Motor
8 – Coupling
9 – Lantern
10 – Liner
11 – Flange
12 – Pump housing
13 – Base plate

Fig. 2, 3

1 – Strainer
2 – Pump suction valve
3 – Pump discharge valve
4 – Check valve
5 – Drain + priming plug
6 – Air bleed screw + Filling plug
7 – Tank
8 – Foundation block
10 – Lifting hook

6.2 Design of product

- The Helix pumps are vertical high pressure non-self priming pumps with in-line connection based on multistage design.
- The Helix pumps combine use of both high efficiency hydraulics and motors.
- All metallic parts in contact with water are made of stainless steel.
- For models equipped with heaviest motor (>40 kgs), a specific coupling allows to change the seal without removing the motor. A cartridge seal is then used in order to ease maintenance.
- Special handling devices are integrated in order to facilitate pump installation (Fig. 7).

7. Installation and electrical connection

Installation and electrical work in compliance with any local codes and by qualified personnel only.

WARNING! Bodily injury!
Existing regulations for the prevention of accidents must be observed.

WARNING! Electrical shock hazard!
Dangers caused by electrical energy must be excluded.

7.1 Commissioning

Unpack the pump and dispose of the packaging in an environmentally-responsible manner.

7.2 Installation

The pump must be installed in a dry, well-ventilated and frost-free place.

CAUTION! Possible damage of the pump!
Dirt and solder drops in to the pump body can effect the pump operation.
- It is recommended that any welding and soldering work be done before installing the pump.
- Thoroughly flush the system out before installing the pump.

- The pump must be installed in an easily accessible position to facilitate inspection or replacement.
- For heavy pumps, install a lifting hook (Fig. 2, item 10) above the pump in order to ease its disassembly.

WARNING! Risk of accident by hot surfaces!
The pump must be positioned so that someone cannot come into contact with the hot pump surfaces while operation.

- Install the pump in a dry place protected from frost, on a flat concrete block using appropriate accessories. If possible, use an insulating material under the concrete block (cork or reinforced rubber) to avoid any noise and vibration transmission into the installation.

WARNING! Risk of fall!
The pump must be correctly screwed to the ground.

- Install the pump in a dry and frost-free place on a flat concrete block using appropriate accessories. If possible, use an insulating material under the concrete block (cork or reinforced rubber) to avoid any noise and vibration transmission into the installation.

CAUTION! Risk of parts inside the pump!
Take care to remove closure members of the pump housing before installation.

NOTE: Each pumps could be tested regarding hydraulic features in factory, some water may remain in them. It is recommended for hygienic purposes, to carry out a rinsing of the pump before any using with potable water supply.

- The installation and connection dimensions are given § 5.2.
- Lift the pump carefully by using the integrated hooks rings, if necessary with a hoist and suitable slings according to the current hoist guidelines.

WARNING! Risk of fall!
Take care to pump fixations especially for the highest pumps whose centre of gravity may lead to risk during pump handling.

WARNING! Risk of fall!
Use integrated rings only if they are not damaged (no corrosion ...). Replace them if needed.

WARNING! Risk of fall!
The pump must be never carried by using motor hooks: these are only designed to lift the motor alone.

7.3 Pipe connection

- Connect the pump to the pipes by using appropriate counterflanges, bolts, nuts and gaskets.

CAUTION!
Tightening of screws or bolts must not exceed.

Configuration PN16 / PN25	
M10 – 20 N.m	M12 – 30 N.m
Configuration PN40	
M12 – 50 N.m	M16 – 80 N.m

Use of impact wrench is prohibited.

- The circulation sense of the fluid is indicated on the identification label of the pump.
- Pump must be installed in such a way that it is not stressed by the pipework. The pipes must be attached so that the pump does not bear their weight.
- It is recommended that isolation valves be installed on the suction and discharge side of the pump.
- Use of expansion joints may mitigate noise and vibration of the pump.
- As regards the nominal cross-section of the suction pipe, we recommend a cross-section at least as large as that of the pump connection.
- A check valve could be placed on the discharge pipe in order to protect the pump against hammer shock.
- For direct connection to a public drinking water system, the suction pipe must also have a check valve and a guard valve.
- For indirect connection via a tank, the suction pipe must have a strainer to keep any impurities out of the pump and a check valve.

7.4 Motor connection for bare-shaft pump (without motor)

- Remove coupling guards.

NOTE: Coupling guards can be removed without entirely unscrewing screws.

- Install the motor on the pump by using screws (FT lantern size – see product designation) or bolts, nuts and handling devices (FF lantern size – see product designation) provided with the pump : check motor power and dimension in WILO catalogue.

NOTE: Depending on fluid characteristics, motor power could be modified. Contact The Wilo Customer Services if necessary.

- Close the coupling guards by screwing all screws provided with the pump.

7.5 Electrical connection

WARNING! Electrical shock hazard!
Dangers caused by electrical energy must be excluded.

- Electrical work by a qualified electrician only!
- All electrical connections must be performed after the electrical supply has been switched off and secured against unauthorized switching.
- For safe installation and operation a proper grounding of the pump to the power supply's grounding terminals is required.

- Check that operating current, voltage and frequency used comply with motor plating data.
- The pump must be connected to the power supply by a solid cable equipped with a grounded plug-connection or a main power switch.
- Three-phase motors must be connected to an approved motor starter. The set nominal current must correspond to the electrical data on the pump motor name plate.
- The supply cable must be laid so that it never touches the pipework and/or the pump and motor casing.
- The pump/installation should be grounded in compliance with local regulations. A ground fault interrupter can be used as extra protection.
- The connection to the network must be in accordance with the connection plan (Fig. 5).

7.6 Operation with frequency converter

- Motors used can be connected to a frequency converter in order to adapt pump performance to duty point.
- The converter must not generate voltage peaks at motor terminals higher than 850V and dU/dt slope higher than 2500 V/µs.
- In case of higher value, an appropriate filter must be used: contact converter manufacturer for this filter definition and selection.
- Strictly follow instructions provided by the converter manufacturer data sheet for installation.
- Minimum variable speed should not be set below 40% of pump nominal speed.

8. Commissioning

8.1 System filling – Venting

CAUTION! Possible damage of the pump!
Never operate the pump dry.
The system must be filled before starting the pump.

8.1.1 Air evacuation process – Pump with sufficient supply pressure (Fig. 3)

- Close the two guard valves (2, 3).
- Unscrew the venting screw from filling plug (6a).
- Slowly open the guard valve on the suction side (2).
- Retighten the venting screw when air escapes at the venting screw and the pumped liquid flows (6a).

WARNING!
When the pumped liquid is hot and the pressure high, the stream escaping at the venting screw may cause burns or other injuries.

- Open the guard valve on the suction side completely (2).
- Start the pump and check if direction of rotation matches the one printed on pump plating. If this is not the case, interchange two phases in the terminal box.

CAUTION!
A wrong direction of rotation will cause bad pump performances and possibly coupling damage.

- Open the guard valve on the discharge side (3).

8.1.2 Air evacuation process – Pump in suction (Fig. 2)

- Close the guard valve on the discharge side (3). Open the guard valve on the suction side (2).
- Remove the filling plug (6b).
- Open the drain-priming plug not completely (5b).
- Fill the pump and the suction pipe with water.
- Make sure that there is no air in the pump and in the suction pipe : refilling until complete removal of air is required.
- Close the filling plug with air bleed screw (6b).
- Start the pump and check if direction of rotation matches the one printed on pump plating. If this is not the case, interchange two phases in the terminal box.

CAUTION!
A wrong direction of rotation will cause bad pump performances and possibly coupling damage.

- Open the guard valve on the discharge side a little (3).
- Unscrew the air bleed screw from filling plug for air venting (6a).
- Retighten the air-bleed screw when air escapes at the air bleed screw and the pumped liquid flows.

WARNING!
When the pumped liquid is hot and the pressure high, the stream escaping at the air bleed screw may cause burns or other injuries.

- Open the guard valve on the discharge side completely (3).
- Close the drain-priming plug (5a).

8.2 Starting up

CAUTION!
The pump must not operate at zero flow (closed discharge valve).

WARNING! Risk of injury!
When the pump runs, coupling guards must be in place, tightened with all appropriate screws.

WARNING! Important noise!
Noise emitted by most powerful pumps could be very high : protection must be used in case of long stay close to the pump.

WARNING!
Installation must be designed in order that no one could be hurt in case of fluid leakage (mechanical seal failure ...).

9. Maintenance

All servicing should be performed by an authorized service representative!

WARNING! Electrical shock hazard!
Dangers caused by electrical energy must be excluded.
All electrical work must be performed after the electrical supply has been switched off and secured against unauthorized switching.

WARNING! Risk of scalding!
At high water temperatures and system pressure close isolating valves before and after the pump. First, allow pump to cool down.

- These pumps are maintenance free. Nevertheless a regular check is recommended every 15 000 hours.
- In option, mechanical seal could be easily replace on some models thanks to its cartridge seal design. Insert its adjusting wedge in its housing (Fig. 6) once mechanical seal position is set.
- Always keep the pump perfectly clean.
- Pumps which are not being used during periods of frost should be drained to avoid damage: Close the guard valves, open completely the drain-priming plug and the air bleed screw.
- Service life: 10 years depending on the operating conditions and whether all requirements described in the operation manual have been met.

10. Faults, cause and remedies

WARNING! Electrical shock hazard!
Dangers caused by electrical energy must be excluded.
All electrical work must be performed after the electrical supply has been switched off and secured against unauthorized switching.

WARNING! Risk of scalding!
At high water temperatures and system pressure close isolating valves before and after the pump. First, allow pump to cool down.

Faults	Cause	Remedies
Pump does not run	No current	Check the fuses, the wiring, and the connectors
	The thermistor tripping device has tripped out, cutting off power	Eliminate any cause of overloading of the motor
Pump runs but delivers too little	Wrong direction of rotation	Check the direction of rotation of the motor and correct it if necessary
	Parts of the pump are obstructed by foreign bodies	Check and clean the pipe
	Air in suction pipe	Make the suction pipe airtight
	Suction pipe too narrow	Install a larger suction pipe
	The valve is not open far enough	Open the valve properly
Pump delivers unevenly	Air in pump	Evacuate the air in the pump; check that the suction pipe is airtight. If required, start the pump 20–30s – open the air bleed screw in order to move air away – close the air bleed screw and repeat it several times until no more air is going out of the pump
Pump vibrates or is noisy	Foreign bodies in pump	Remove the foreign bodies
	Pump not properly attached to ground	Retighten the screws
	Bearing damaged	Call the Wilo Customer Service
Motor overheats, its protection trips out	A phase is open-circuit	Check the fuses, the wiring, and the connectors
	Ambient temperature too high	Provide cooling
Mechanical seal is leaking	Mechanical seal is damaged	Replace the mechanical seal

If the fault cannot be solved, please contact the Wilo customer services.

11. Spare parts

Spare parts may be ordered via the Wilo customer service.
To avoid queries and incorrect orders, all data from the rating plate must be specified with every order.
The spare parts catalogue is available at www.wilo.com.

12. disposal

Information on the collection of used electrical and electronic products

Proper disposal and appropriate recycling of this product prevents damage to the environment and dangers to your personal health.

NOTICE: Disposal in domestic waste is forbidden !
In the European Union, this symbol can appear on the product, the packaging or the accompanying documentation. It means that the electrical and electronic products in question must not be dis- posed of along with domestic waste.

To ensure proper handling, recycling and disposal of the used products in question, please note the following points:

- Only hand over these products at designated, certified collecting points.
- Observe the locally applicable regulations! Please consult your local municipality, the nearest waste disposal site, or the dealer who sold the product to you for information on proper disposal. For further information on recycling, go to www.wilo-recycling.com.

Subject to technical alterations!

GARANTİ BELGESİ

Bu belge 6502 sayılı Tüketicinin Korunması Hakkında Kanun ve Garanti Belgesi Yönetmeliği'ne uygun olarak düzenlenmiştir.

GARANTİ ŞARTLARI

1. Garanti süresi, malın teslim tarihinden itibaren başlar ve 2 **yıldır.**

2. Malın bütün parçaları dahil olmak üzere tamamı garanti kapsamındadır.

3. Malın ayıplı olduğunun anlaşılması durumunda tüketici, 6502 sayılı Tüketicinin Korunması Hakkında Kanunun 11 inci maddesinde yer alan;

a- Sözleşmeden dönme,

b- Satış bedelinden indirim isteme,

c- Ücretsiz onarılmasını isteme,

d- Satılanın ayıpsız bir misli ile değiştirilmesini isteme, haklarından birini kullanabilir.

4. Tüketicinin bu haklardan ücretsiz onarım hakkını seçmesi durumunda satıcı; işçilik masrafı, değiştirilen parça bedeli ya da başka herhangi bir ad altında hiçbir ücret talep etmeksizin malın onarımını yapmak veya yaptırmakla yükümlüdür. Tüketici ücretsiz onarım hakkını üretici veya ithalatçıya karşı da kullanabilir. Satıcı, üretici ve ithalatçı tüketicinin bu hakkını kullanmasından müteselsilen sorumludur.

5. Tüketicinin, **ücretsiz onarım hakkını** kullanması halinde malın;

- Garanti süresi içinde tekrar arızalanması,
- Tamiri için gereken azami sürenin aşılması,
- Tamirinin mümkün olmadığının, yetkili servis istasyonu, satıcı, üretici veya ithalatçı tarafından bir raporla belirlenmesi durumlarında;

tüketici malın bedel iadesini, ayıp oranında bedel indirimini veya imkân varsa malın ayıpsız misli ile değiştirilmesini satıcıdan talep edebilir. Satıcı, tüketicinin talebini reddedemez. Bu talebin yerine getirilmemesi durumunda satıcı, üretici ve ithalatçı müteselsilen sorumludur.

6. Malın tamir süresi **20 iş gününü** geçemez. Bu süre, garanti süresi içerisinde mala ilişkin arızanın yetkili servis istasyonuna veya satıcıya bildirimi tarihinde, garanti süresi dışında ise malın yetkili servis istasyonuna teslim tarihinden itibaren başlar. Malın arızasının **10 iş günü** içerisinde giderilememesi halinde, üretici veya ithalatçı; malın tamiri tamamlanıncaya kadar, benzer özelliklere sahip başka bir malı tüketicinin kullanımına tahsis etmek zorundadır. Malın garanti süresi içerisinde arızalanması durumunda, tamirde geçen süre garanti süresine eklenir.

7. Malın kullanma kılavuzunda yer alan hususlara aykırı kullanılmasından kaynaklanan arızalar garanti kapsamı dışındadır.

8. Tüketici, garantiden doğan haklarının kullanılması ile ilgili olarak çıkabilecek uyuşmazlıklarda yerleşim yerinin bulunduğu veya tüketici işleminin yapıldığı yerdeki **Tüketici Hakem Heyetine veya Tüketici Mahkemesine** başvurabilir.

9. Satıcı tarafından bu **Garanti Belgesinin** verilmemesi durumunda, tüketici **Gümrük ve Ticaret Bakanlığı Tüketicinin Korunması ve Piyasa Gözetimi Genel Müdürlüğüne** başvurabilir.

1 General

1.1 About this document

The installation and operating instructions are an integral part of the product. Read these instructions before carrying out any work and keep them at hand at all times. Strict adherence to these instructions is a precondition for the correct installation and application of the product. Comply with all indications and signs appearing on the product.

The language of the original installation and operating instructions is English. All other languages of these instructions are translations of the original installation and operating instructions.

EC-Declaration of conformity:
- → A copy of the EC-Declaration of conformity is an integral part of these installation and operating instructions.
- → If a technical modification is made to the series named herein without our agreement, this declaration loses its validity.

2 Safety

This chapter contains essential instructions that must be followed during the different phases of the pump's service life. Non-observance of these instructions may constitute a danger to persons, the environment and the product, and may invalidate the warranty. Non-observance may lead to the following hazards:
- → Injuries due to electrical, mechanical and bacteriological factors and electromagnetic fields.
- → Damage to the environment due to leakage of hazardous materials.
- → Damage to the installation.
- → Failure of important product functions.

Also comply with the indications and safety instructions in other chapters!

2.1 Symbols

Symbols:

WARNING
General safety symbol

WARNING
Electrical risks

NOTICE
Notes

Warnings:

DANGER
Imminent danger.
May result in death or severe injuries if the hazard is not prevented.

WARNING
Non-observance may result in (very) severe injury.

CAUTION
The product risks becoming damaged. "Caution" is used when there is a risk to the product if the user does not observe procedures.

NOTICE
Note containing useful information for the user about the product. It assists the user in the case of an issue.

2.2 Personnel qualifications

The installation, application and maintenance personnel must have the appropriate qualifications to complete this work. The operator must ensure the personnel's areas of responsibility, terms of reference and their supervision. If the personnel are not in possession of the necessary knowledge, they are to be trained and instructed. If necessary, this training can be carried out by the product's manufacturer on the operator's behalf.

2.3 Safety consciousness on the job

The existing directives for accident prevention must be adhered to. Danger from electrical current must be eliminated. Local directives or general directives [e.g. IEC, VDE etc.] and instructions from local energy supply companies must be respected.

2.4 Safety instructions for the operator

This device is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or a lack of experience or knowledge, unless they are monitored or have been given detailed instructions concerning use of the device by a person responsible for their safety.

Children must be supervised to ensure that they do not play with the device.

- → If hot or cold components of the product or installation pose a danger, it is the customer's responsibility to guard them against being touched.
- → Guards protecting against touching moving components (such as the coupling) must not be removed whilst the product is in operation.
- → Hazardous fluids (i.e. which are explosive, toxic or hot) which have leaked (e.g. from the shaft seals) must be disposed of so that they pose no danger to persons or to the environment. National statutory provisions must be respected.
- → Danger from electrical current must be eliminated. Local directives or general directives [e.g. IEC, VDE etc.] and instructions from local energy supply companies must be respected.

2.5 Safety instructions for installation and maintenance work

The operator must ensure that all maintenance and installation work is carried out by authorised and qualified personnel, who are sufficiently informed from their own detailed study of the installation and operating instructions. Work on the product/unit must only be carried out when at a standstill. The procedures described in the installation and operating instructions for deactivating the product/installation must always be complied with.

Immediately on conclusion of the work, all safety and protective devices must be put back in position and recommissioned.

2.6 Unauthorised modification of components and use of unauthorised spare parts

Unauthorised modification of components and use of unauthorised spare parts will impair the safety of the product/personnel, and will render the manufacturer's declarations regarding safety void. Modifications to the product are only permissible following consultation with the manufacturer.

Original spare parts and accessories authorised by the manufacturer ensure safety. The use of other parts absolves the manufacturing company of any and all liability.

2.7 Improper use

The operational reliability of the supplied product is only guaranteed for conventional use in accordance with Chapter 4 of the Installation and operating instructions. The limit values must on no account fall below or exceed the values specified in the catalogue/data sheet.

3 Product information

3.1 Type key

Example:	Medana CH1-L.602-1/E/A/10T
Wilo	Brand
Medana	Multistage centrifugal pump
C	Commercial series
H	Horizontal pump

Example:	Medana CH1-L.602-1/E/A/10T
1	Series level (1 = entry level, 3 = standard level, 5 = premium level)
L	L = Long shaft E = Electronic control
6	Delivery rate in m^3/h
02	Number of impellers
1	1 = Pump housing in 1.4308 stainless steel + hydraulics in 1.4307 stainless steel 2 = Pump housing in 1.4409 stainless steel + hydraulics in 1.4404 stainless steel
E	E = EPDM seal V = FKM seal
A	A = Frequency 50 Hz / single-phase / 230 V B = Frequency 60 Hz / single-phase / 220 V C = Frequency 60 Hz / single-phase / 230 V D = Frequency 50 Hz / three-phase / 400 V E = Frequency 50 Hz / three-phase / 230 – 400 V F = Frequency 60 Hz / three-phase / 220 – 380 V G = Frequency 60 Hz / three-phase / 265 – 460 V I = Frequency 60 Hz / three-phase / 460 V
10	Maximum pressure of the pump in bar
T	T = Screwed connections P = Victaulic connections N = Connections with captive nut

3.2 Data table

Maximum utilisation pressure	
Maximum operating pressure	See pump type key on rating plate and paragraph 3.1
Maximum suction pressure	6 bar
Notice: the suction pressure (P input) + the pressure at zero delivery rate (P zero delivery rate) must always be lower than the maximum authorised operating pressure (P max). P input + P zero delivery rate ≤ P max. Refer to the pump rating plate for the maximum operating pressure: P max.	
Temperature range	
Fluid temperature	-20 °C to +120 °C with EPDM seals -20 °C to +90 °C with VITON seals (only on version L)
Ambient temperature	-15 °C to +50 °C
Electrical data	
Motor protection rating	See plate
Insulation class	See plate
Frequency	See plate
Voltage	See plate
Motor efficiency	See plate
Other characteristics	
Humidity	< 90 % without condensation
Altitude	≤ 1000 m (> 1000 m on request)

Noise level

Motor power (kW)	Frequency (Hz)	Phase	dB(A) at 1 m, BEP tolerance 0 – 3 dB(A)

0.37	50	3	54
0.55	50	3	54
0.75	50	3	55
1.1	50	3	55
1.5	50	3	56
1.85	50	3	57
2.5	50	3	58
3	50	3	59
4.2	50	3	61

5.5	60	3	66
0.37	50	1	52
0.55	50	1	53
0.75	50	1	53
1.1	50	1	54
1.5	50	1	56

3.3 Scope of delivery

→ High-pressure multistage centrifugal pump
→ Installation and operating instructions

3.4 Accessories

Please consult Wilo catalogue for the list of accessories.

4 Transport and interim storage

When receiving the product, check that it has not been damaged during transport. If any damage is found, take all necessary measures with the carrier in the time provided.

CAUTION

Risk of material damage

If the delivered material is to be installed at a later date, store it in a dry place and protect it from impacts and any external influences (humidity, frost etc.). Temperature range for transport and storage: -30 °C to +60 °C.

Handle the product with care so as not to damage it prior to installation.

5 Application

This product has been designed to pump hot or cold water, water/glycol mixtures or other low-viscosity fluids that are free of mineral oil, solid or abrasive substances, or materials containing long fibres.

CAUTION

Risk of motor heating

A technical opinion is required prior to pumping fluid that is denser than water.

DANGER

Risk of explosion

Do not use this pump to convey flammable or explosive liquids.

Fields of application:

Version with stainless steel housing:

MEDANA CH1-L
Distribution and boosting
Industrial systems
Cooling water circulation systems
Irrigation systems

6 Description and function

6.1 Description of the product

See Fig. 1

1. Suction port
2. Pressure port
3. Filler screw
4. Drainage screw
5. Stage casing
6. Impeller
7. Hydraulic shaft
8. Suction housing
9. Mechanical seal
10. Terminal box
11. Lantern
12. Condensate plugs

See Fig. 3a

1. Valve on the suction side
2. Valve on the end pressure side
3. Non-return valve
4. Filler screw
5. Drainage screw
6. Piping or clamp holders
7. Strainer
8. Tank
9. Mains water supply
10. Motor protection switch
11. Lifting hook

6.2 Product characteristics

→ Multistage centrifugal pump with horizontal axle (2 to 7 stages depending on the model), non self-priming.
→ Suction/pressure ports with screwed connections. Axial suction, radial discharge upwards.
→ Shaft sealing with standardised mechanical seal.
→ Integrated thermal motor protection (single-phase version), automatic reset.
→ Condenser integrated into the terminal box (single-phase version).

7 Installation and electrical connection

All installation and electrical connection work must be carried out solely by authorised and qualified personnel, in accordance with applicable regulations.

WARNING
Physical injuries
The applicable regulations for the prevention of accidents must be complied with.

WARNING
Risk of electric shock
Hazards from electric current must be prevented.

7.1 Receipt of the product

Unpack the pump and recycle or dispose of the packaging in an environmentally responsible manner.

7.2 Installation

The pump must be installed in a dry, well-ventilated location free of frost on a flat, rigid surface using the appropriate screws.

CAUTION
Risk of damaging the pump
The presence of foreign matter or impurities in the pump housing may affect the functioning of the product.
It is recommended to perform any welding and soldering work before installing the pump.
Rinse the circuit completely before installing and commissioning the pump.

- → The pump must be installed in a place easy to access for the purposes of inspection or replacement.
- → Install the pump on a smooth floor.
- → The pump must be fixed in place using the 2 holes on the bearing bracket (Ø M8 screw) (Fig. 2).
- → Ensure there is a minimum distance between the motor fan and any surfaces (Fig. 4).
- → For heavy pumps, install a lifting hook (Fig. 3a , pos. 11) in line with the pump axis to facilitate its disassembly.
- → Remove the condensate plugs (Fig. 1, pos. 12) when the pump is in a condensing environment. In this case, the motor protection class IP55 will no longer be guaranteed.

WARNING
Risk of accident due to hot surfaces!
The pump must be installed in such a way that no one can touch the hot surfaces of the product when it is in operation.

WARNING
Risk of tipping
Ensure that the pump is secured to a flat, rigid surface.

CAUTION
Risk of foreign matter in the pump
Ensure that all blanking plugs are removed from the pump housing before installation.

NOTICE
Each pump may have been factory-tested to verify its hydraulic performance, and water may be present in the product. For hygiene purposes, the pump should be rinsed before use.

Install insulating material (cork or reinforced rubber) under the pump to avoid noise pollution and vibrations being transmitted to the installation.

7.3 Mains connection

- → The weight of the piping should not be borne by the pump (Fig. 5).
- → Permitted pump installation positions (Fig. 9).
- → We recommend installing gate valves on the suction and pressure sides of the pump.
- → Use expansion joints to mitigate noise and vibration from the pump if required.
- → The pipe cross-section must be at least equal to the diameter of the suction port on the pump housing.
- → The installation of a non-return valve in the discharge pipe is recommended to protect the pump against pressure surges.
- → If connected directly to the public potable water mains, the suction pipe socket must also be fitted with a non-return valve and a stop valve.
- → If connected indirectly via a tank, the suction pipe socket must be fitted with a suction strainer to stop impurities from entering the pump, and a non-return valve.

7.4 Electrical connection

DANGER

Risk of electrocution

In case of a non-compliant electrical connection, there is a risk of electrocution.

■ Have the electrical connection established by an electrician approved by the local energy supply company in accordance with local regulations.

■ Prior to the electrical connection, the pump must be voltage-free and protected against unauthorised restart.

■ To ensure safe installation and operation, the pump must be earthed correctly with the earth terminals of the power supply (Fig. 6).

- → Verify that the rated current, voltage and frequency used match the information on the pump's rating plate.
- → The pump must be connected to the power supply using a cable fitted with a socket or a main switch.
- → The three-phase motors must be connected to an authorised protection system. The setting rated current must match the value indicated on the motor's sticker.
- → Single-phase motors are equipped as standard with thermal motor protection, which stops the pump if the permissible winding temperature is exceeded and starts it up again automatically once it has cooled down.
- → The connection cable must be placed in such a way that it never comes into contact with the main sewer system and/or the pump housing and motor frame.
- → The pump/installation should be earthed in accordance with local regulations. A circuit breaker can be used as additional protection.
- → The power supply connection must comply with the wiring diagram (Fig. 6).

WARNING

Risk of injuries and water penetration in the connection area

Observe the tightening torques (Fig. 7)

Observe the diameter value of the cable gland wiring to ensure IP55 protection (see Fig. 7 [E]):

M20 = min. Ø6 – max. Ø12

M25 = min. Ø13 – max. Ø18

7.5 Operation with a frequency converter

It is possible to adjust the speed of the pump using a frequency converter. The limit values for adjusting the speed are as follows:

40 % rated ≤ n ≤ 100 % rated. The installation and commissioning instructions for the frequency converter must be followed when connecting it and starting operation. To avoid overloading the motor winding, which could lead to damage and unwanted noise, the frequency converter cannot produce voltage rise speed stages higher than 500 V/µs or voltage spikes U > 650 V.

To make such voltage rise speed stages possible, an LC filter (motor filter) should be installed between the frequency converter and the motor. The specifications for this filter must be provided by the manufacturer of the frequency converter / filter. Control devices with a frequency converter delivered by Wilo have an integrated filter.

8 Commissioning

8.1 Filling and deaeration

Check whether the water level in the tank and the inlet pressure are sufficient.

CAUTION

Risk of infection

Our pumps may be factory-tested to verify their hydraulic performance. If some water remains, the pump should be rinsed before use for hygiene reasons.

CAUTION

Risk of damage to the pump

Never run the pump dry. The pump must be filled before starting.

Pump in horizontal position below the water line (Fig. 3a)

Close the gate valves (pos. 1+2).

Unscrew the filler screw (pos. 4).

Slowly open the valve on the suction side (pos. 1).

Close the filler screw again once the water has exited via the screw port (air removed) (pos. 4).

Open the valve on the suction side completely (pos. 1).

Open the valve on the end pressure side (pos. 2).

Pump in horizontal position in suction mode (Fig. 3b)

NOTICE

Ensure that the suction pipe does not trap air at the transitions and bends.
It may take a long time for the pump and suction pipe to fill.

Close the gate valve (pos. 2).

Open the gate valve (pos. 1).

Unscrew the filler screw (pos. 4).

Using a funnel inserted into the filling port, slowly and completely fill the pump and the suction pipe. Close the filler screw once the air has escaped and the liquid is flowing in the pump (pos. 4).

After checking the deblocking function and the direction of rotation of the motor:

→ Briefly start the motor with an impulse then wait for a few seconds to allow the air to settle.
→ Slightly unscrew the filler screw (pos. 4) to remove the air. If a trickle of water does not appear, remove this screw to fill the right water level in the pump. Put this screw back in place before restarting.
→ If necessary, repeat this operation.

Pump in vertical position in inlet mode (Fig. 3c)

Close the gate valves (pos. 1+2).

Unscrew the filler screw (pos. 4).

Slowly open the valve on the suction side (pos. 1).

Close the filler screw again once the water has exited via the screw port (air removed) (pos. 4).

Open the valve on the suction side completely (pos. 1).

Open the valve on the end pressure side (pos. 2).

8.2 Starting

CAUTION

Risk of damaging the pump

The pump must not be operated at a zero flow rate flow (valve on the end pressure side closed) for more than 10 minutes.

We recommend maintaining a minimum discharge of 10 % of rated discharge.

WARNING

Risk of injury

Depending on the operating conditions of the pump or the installation (the temperature of the discharged liquid and the volume flow), the pump assembly including the motor may become extremely hot. There is a real risk of burns when coming into contact with the pump.

CAUTION

Direction of rotation

An incorrect direction of rotation will cause poor pump performance and may overload the motor.

Checking the direction of rotation (only for three-phase current motors)

By starting the pump up briefly, check whether the direction of rotation of the pump matches the arrow on the pump's rating plate. If the direction of rotation is incorrect, swap 2 phases in the pump's terminal box.

NOTICE

Single-phase motors are intended to operate in the correct direction of rotation.

Open the valve on the end pressure side and stop the pump.

9 Maintenance

All maintenance work must be carried out by authorised and qualified personnel!

WARNING

Risk of electric shock

Danger from electrical current must be eliminated. Ensure that the pump's power supply is switched off and secured against unauthorised reactivation before performing any work on the electric system.

WARNING

Risk of burns

In case of high water temperatures and high system pressures, close the guard valves upstream and downstream of the pump. First, allow pump to cool down.

WARNING

Risk of injury

Depending on the operating conditions of the pump or the installation (the temperature of the discharged liquid and the volume flow), the pump assembly including the motor may become extremely hot. There is a real risk of burns when coming into contact with the pump.

→ No special maintenance required during operation.
→ Pumps that are not being used during periods of frost should be drained to avoid damage.
Close the gate valves, fully open the drainage and filler screws (Fig. 1 , pos. 3 and 4) and empty the pump.

CAUTION
Risk of damaging the pump
Observe the tightening torques of the filler screw and drain plug (Fig. 3a [4-5]).

10 Faults, causes and remedies

WARNING
Risk of electric shock
Danger from electrical current must be eliminated. Ensure that the pump's power supply is switched off and secured against unauthorised reactivation before performing any work on the electric system.

WARNING
Risk of burns
In case of high water temperatures and high system pressures, close the guard valves upstream and downstream of the pump. First, allow pump to cool down.

WARNING
Risk of injury
Depending on the operating conditions of the pump or the installation (the temperature of the discharged liquid and the volume flow), the pump assembly including the motor may become extremely hot. There is a real risk of burns when coming into contact with the pump.

Faults	Causes	Remedies
The pump is not functioning	No electrical power supply	Check fuses, switches and wiring
	The motor protection device has cut off the power	Eliminate any motor overload
The pump operates but does not discharge any fluid	Wrong direction of rotation	Swap 2 phases in the power supply
	The piping or parts of the pump are obstructed by foreign matter	Check and clean the piping and the pump
	Presence of air in the suction pipe	Make the suction pipe air-tight
	Suction pipe too narrow	Install wider suction pipe
	The pressure at the pump inlet is insufficient	Review the installation conditions and recommendations described in this manual
The pump discharges irregularly	The suction pipe has a smaller diameter than that of the pump	The suction pipe must have the same diameter as the pump suction opening
	The strainer and the suction pipe are partially blocked	Dismantle and clean them
	Incorrect choice of pump	Install more powerful pumps
	Wrong direction of rotation	For the three-phase current version, swap 2 phases in the power supply
Insufficient pressure	The flow rate is too low, the suction pipe is blocked	Clean the suction filter and the suction pipe
	The valve is not sufficiently open	Open the valve

Faults	Causes	Remedies
	The pump is obstructed by foreign matter	Clean the pump
The pump is vibrating	Foreign matter in the pump	Remove all foreign matter
	The pump is not firmly secured	Tighten the anchor screws
The motor is overheating, the motor protection engages	Insufficient voltage	Check the fusible cut-outs, the wiring and the connections
	Foreign matter present, bearing damaged	Clean the pump Get the pump repaired by customer service
	Ambient temperature too high	Provide cooling

If the fault cannot be resolved, please contact the Wilo customer service.

11 Spare parts

All spare parts should be ordered directly from the Wilo customer service. To prevent errors, always quote the data on the pump's rating plate when making an order. The spare parts catalogue is available at www.wilo.com

12 Disposal

Information on the collection of used electrical and electronic products.

Proper disposal and appropriate recycling of this product prevents damage to the environment and dangers to your personal health.

NOTICE

Disposal as domestic waste is forbidden!

In the European Union, this symbol can appear on the product, the packaging or the accompanying documentation. It means that the electrical and electronic products in question must not be disposed of along with domestic waste.

To ensure proper handling, recycling and disposal of the used products in question, please note the following points:

→ Only hand over these products at designated, certified collecting points.

→ Observe the locally applicable regulations! Please consult your local municipality, the nearest waste disposal site, or the dealer who sold the product to you for information on proper disposal. For further information on recycling, go to www.wilo-recycling.com.

Subject to change without prior notice.

ПРИЛОЖЕНИЕ

I. Информация о дате изготовления

Дата изготовления указана на заводской табличке оборудования. Разъяснения по определению даты изготовления: Например: YYwWW = 19w30

YY = год изготовления w = символ «Неделя» WW= неделя изготовления

II. Сведения об обязательной сертификации.

Сертификат соответствия №	**№ ЕАЭС N RU Д-DE.PA01.B.61133/21**
срок действия	**01.02.2021-25.01.2026**
выдан органом по сертификации	**Не применимо для декларации соответствия**

III. Информация о производителе и официальных представительствах.

1. 1. Информация об изготовителе

Изготовитель: WILO SE (ВИЛО СЕ)

Страна производства указана на заводской табличке оборудования.

2. 2. Официальные представительства на территории Таможенного Союза.

IV Дополнительная информация к инструкции по монтажу и эксплуатации.

Срок хранения:

Новое оборудование может храниться как минимум в течение: ***1 года***

Оборудование должно быть тщательно очищено перед помещением на временное хранение. Оборудование следует хранить в чистом, сухом, защищенном от замерзания месте.

Техническое обслуживание:

Оборудование не требует обслуживания. Рекомендуется регулярная проверка каждые ***15000 ч***

Срок службы:

При правильном режиме эксплуатации, соблюдении всех указаний Инструкции по монтажу и эксплуатации и при своевременном выполнении планово-предупредительных ремонтов, срок службы оборудования **10 лет**

Уровень шума:

Уровень шума оборудования составляет не более ***80 дБ(А)***

В случае превышения указанного значения информация указывается на наклейке оборудования или в инструкции по монтажу и эксплуатации.

Безопасная утилизация:

Благодаря правильной утилизации и надлежащему вторичному использованию данного изделия предотвращается нанесение ущерба окружающей среде и опасности для здоровья персонала. Правила утилизации требуют опорожнения и очистки, а также демонтажа оборудования.
Собрать смазочный материал. Выполнить сортировку деталей по материалам (металл, пластик, электроника).
1. Для утилизации данного изделия, а также его частей следует привлекать государственные или частные предприятия по утилизации.
2. Дополнительную информацию по надлежащей утилизации можно получить в муниципалитете, службе утилизации или в месте, где изделие было куплено.

Критерии предельного состояния:

Основным критерием предельного состояния изделия является отказ одной или нескольких составных частей, ремонт или замена которых не предусмотрены или является экономически нецелесообразным.

DECLARATION OF CONFORMITY
KONFORMITÄTSERKLÄRUNG
DECLARATION DE CONFORMITE

(BG) - български език
ДЕКЛАРАЦИЯ ЗА СЪОТЕТСТВИЕ ЕС/ЕО

WILO SE декларират, че продуктите посочени в настоящата декларация съответстват на разпоредбите на следните европейски директиви и приелите ги национални законодателства:

Машини 2006/42/ЕО; Продукти, свързани с енергопотреблението 2009/125/ЕО; относно ограничението за употребата на определени опасни вещества 2011/65/UE + 2015/863 ;

както и на хармонизираните европейски стандарти, упоменати на предишната страница.

(CS) - Čeština
EU/ES PROHLÁŠENÍ O SHODĚ

WILO SE prohlašuje, že výrobky uvedené v tomto prohlášení odpovídají ustanovením níže uvedených evropských směrnic a národním právním předpisům, které je přejímají:

Stroje 2006/42/ES; Výrobků spojených se spotřebou energie 2009/125/ES; Omezení používání některých nebezpečných látek 2011/65/UE + 2015/863 ;

a rovněž splňují požadavky harmonizovaných evropských norem uvedených na předcházející stránce.

(DA) - Dansk
EU/EF-OVERENSSTEMMELSESERKLÆRING

WILO SE erklærer, at produkterne, som beskrives i denne erklæring, er i overensstemmelse med bestemmelserne i følgende europæiske direktiver, samt de nationale lovgivninger, der gennemfører dem:

Maskiner 2006/42/EF; Energirelaterede produkter 2009/125/EF; Begrænsning af anvendelsen af visse farlige stoffer 2011/65/UE + 2015/863 ;

De er ligeledes i overensstemmelse med de harmoniserede europæiske standarder, der er anført på forrige side.

(EL) - Ελληνικά
ΔΗΛΩΣΗ ΣΥΜΜΟΡΦΩΣΗΣ ΕΕ/ΕΚ

WILO SE δηλώνει ότι τα προϊόντα που ορίζονται στην παρούσα ευρωπαϊκά δήλωση είναι σύμφωνα με τις διατάξεις των παρακάτω οδηγιών και τις εθνικές νομοθεσίες στις οποίες έχει μεταφερθεί:

Μηχανήματα 2006/42/ΕΚ; Συνδεόμενα με την ενέργεια προϊόντα 2009/125/ΕΚ; για τον περιορισμό της χρήσης ορισμένων επικίνδυνων ουσιών 2011/65/UE + 2015/863 ;

και επίσης με τα εξής εναρμονισμένα ευρωπαϊκά πρότυπα που αναφέρονται στην προηγούμενη σελίδα.

(ES) - Español
DECLARACIÓN DE CONFORMIDAD UE/CE

WILO SE declara que los productos citados en la presenta declaración están conformes con las disposiciones de las siguientes directivas europeas y con las legislaciones nacionales que les son aplicables :

Máquinas 2006/42/CE; Productos relacionados con la energía 2009/125/CE; Restricciones a la utilización de determinadas sustancias peligrosas 2011/65/UE + 2015/863 ;

Y igualmente están conformes con las disposiciones de las normas europeas armonizadas citadas en la página anterior.

(ET) - Eesti keel
EL/EÜ VASTAVUSDEKLARATSIOONI

WILO SE kinnitab, et selles vastavustunnistuses kirjeldatud tooted on kooskõlas alljärgnevate Euroopa direktiivide sätetega ning riiklike seadusandlustega, mis nimetatud direktiivid üle on võtnud:

Masinad 2006/42/EÜ; Energiamõjuga toodete 2009/125/EÜ; teatavate ohtlike ainete kasutamise piiramise kohta 2011/65/UE + 2015/863 ;

Samuti on tooted kooskõlas eelmisel leheküljel ära toodud harmoniseeritud Euroopa standarditega.

(FI) - Suomen kieli
EU/EY-VAATIMUSTENMUKAISUUSVAKUUTUS

WILO SE vakuuttaa, että tässä vakuutuksessa kuvatut tuotteet ovat seuraavien eurooppalaisten direktiivien määräysten sekä niihin sovellettavien kansallisten lakiasetusten mukaisia:

Koneet 2006/42/EY; Energiaan liittyvien tuotteiden 2009/125/EY; tiettyjen vaarallisten aineiden käytön rajoittamisesta 2011/65/UE + 2015/863 ;

Lisäksi ne ovat seuraavien edellisellä sivulla mainittujen yhdenmukaistettujen eurooppalaisten normien mukaisia.

(GA) - Gaeilge

Technical data, approvals, accessories and further information at www.ifm.com.

1 Safety instructions

- Please read this document prior to set-up of the unit. Ensure that the product is suitable for your application without any restrictions.
- If the operating instructions or the technical data are not adhered to, personal injury and/or damage to property can occur.
- Improper or non-intended use may lead to malfunctions of the unit or to unwanted effects in your application. That is why installation, electrical connection, set-up, operation and maintenance of the unit must only be carried out by qualified personnel authorised by the machine operator.
- In order to guarantee the correct condition of the device for the operating time it is necessary to use the device only for media to which the wetted materials are sufficiently resistant (→ Technical data).
- The responsibility whether the measurement devices are suitable for the respective application lies with the operator. The manufacturer assumes no liability for consequences of misuse by the operator. Improper installation and use of the units result in a loss of the warranty claims.

⚠ CAUTION

For medium temperatures above 50 °C (122 °F) some parts of the housing can heat up to over 65 °C (149 °F). Risk of burns.

▶ In this case do not touch the unit.

▶ Protect the housing against contact with flammable substances and unintentional contact.

▶ Do not press the pushbuttons manually; instead use another object (e.g. ballpoint pen).

2 Functions and features

The unit monitors water-based fluids (water, deionised water, cooling water).

It detects the two process categories volumetric flow and medium temperature.

Pressure Equipment Directive (PED):
The units comply with the Pressure Equipment Directive and are designed and manufactured for group 2 fluids in accordance with the sound engineering practice. Use of group 1 fluids on request.

3 Function

- The unit detects the volumetric flow quantity based on the Vortex measuring principle.
- It features an IO-Link interface.
- The unit displays the current flow and temperature. It generates 2 output signals according to the parameter setting:

OUT1/IO-Link: 2 selection options

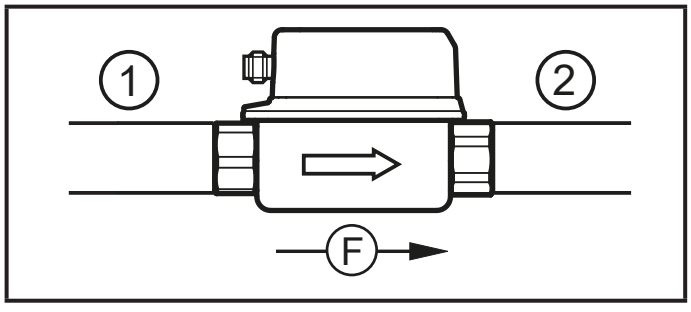
- switching signal for volumetric flow quantity limit value
- or frequency signal for volumetric flow quantity

OUT2: 4 selection options

- switching signal for volumetric flow quantity limit value
- or switching signal for temperature limit value
- or frequency signal for volumetric flow quantity
- or frequency signal for temperature

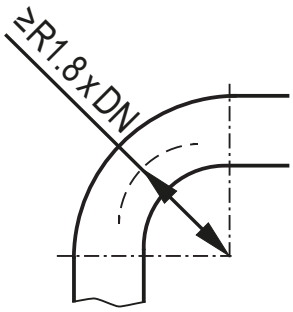
4 Installation

▶ Flow in the direction of the arrow. Observe the installation direction.



▶ Make sure that pipe and sensor have the same internal diameter.

▶ Avoid deposits, accumulated gas and air in the pipe system. Install the unit so that the measuring pipe is always completely filled with medium.



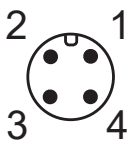
▶ Install in front of or in a rising pipe.

▶ Recommended tightening torque: 30 Nm

▶ Avoid disturbances on the inlet and outlet side. To do so, provide for the following inlet and outlet pipe lengths:

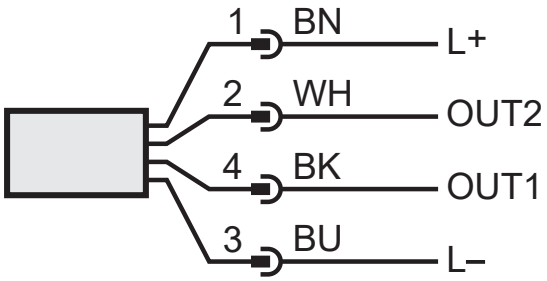
DN = nominal width of the pipe
R = radius

Disturbance	Inlet pipe length (1)	Outlet pipe length (2)
Non-ideal bend	≥ 5 x DN	≥ 1 x DN
Ideal bend 	≥ 0.5 x DN	
Multiple bends (2 x 90°)	≥ 15 x DN	
Reduction of internal pipe diameter	≥ 15 x DN	≥ 15 x DN
Valve or pump	≥ 25 x DN	



- ▶ Mount the unit in a way that no mechanical forces are exerted on the pipe. To do so, use angle brackets if required.
  - For direct installation, fix the unit on the surface using 4 self-tapping screws M4 DIN 7500. Maximum insertion depth in the housing: 5.5 mm.
  - For installation using the fixing element: ifm mounting accessories at www.ifm.com.
- ▶ Avoid the following installation positions:
  - Directly in front of a falling pipe.
  - In a falling pipe.
  - At the highest point of the pipe system.
  - Directly in front of the spout of the pipe.
  - On the suction side of a pump.

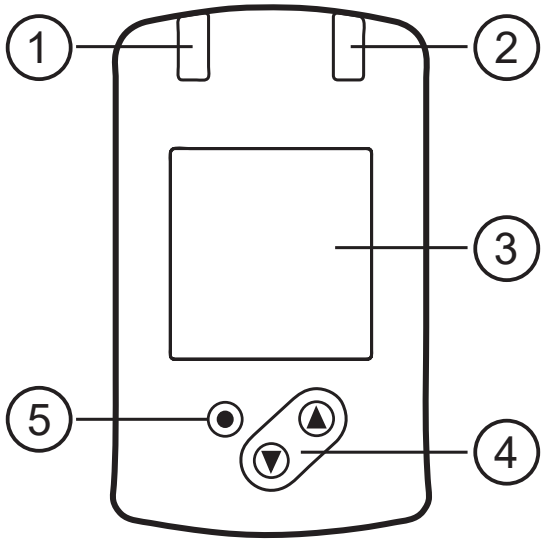
5 Electrical connection



The unit must be connected by a qualified electrician.
The national and international regulations for the installation of electrical equipment must be adhered to.
Voltage supply according to EN 50178, SELV, PELV.

▶ Disconnect power.

▶ Connect the unit as follows:

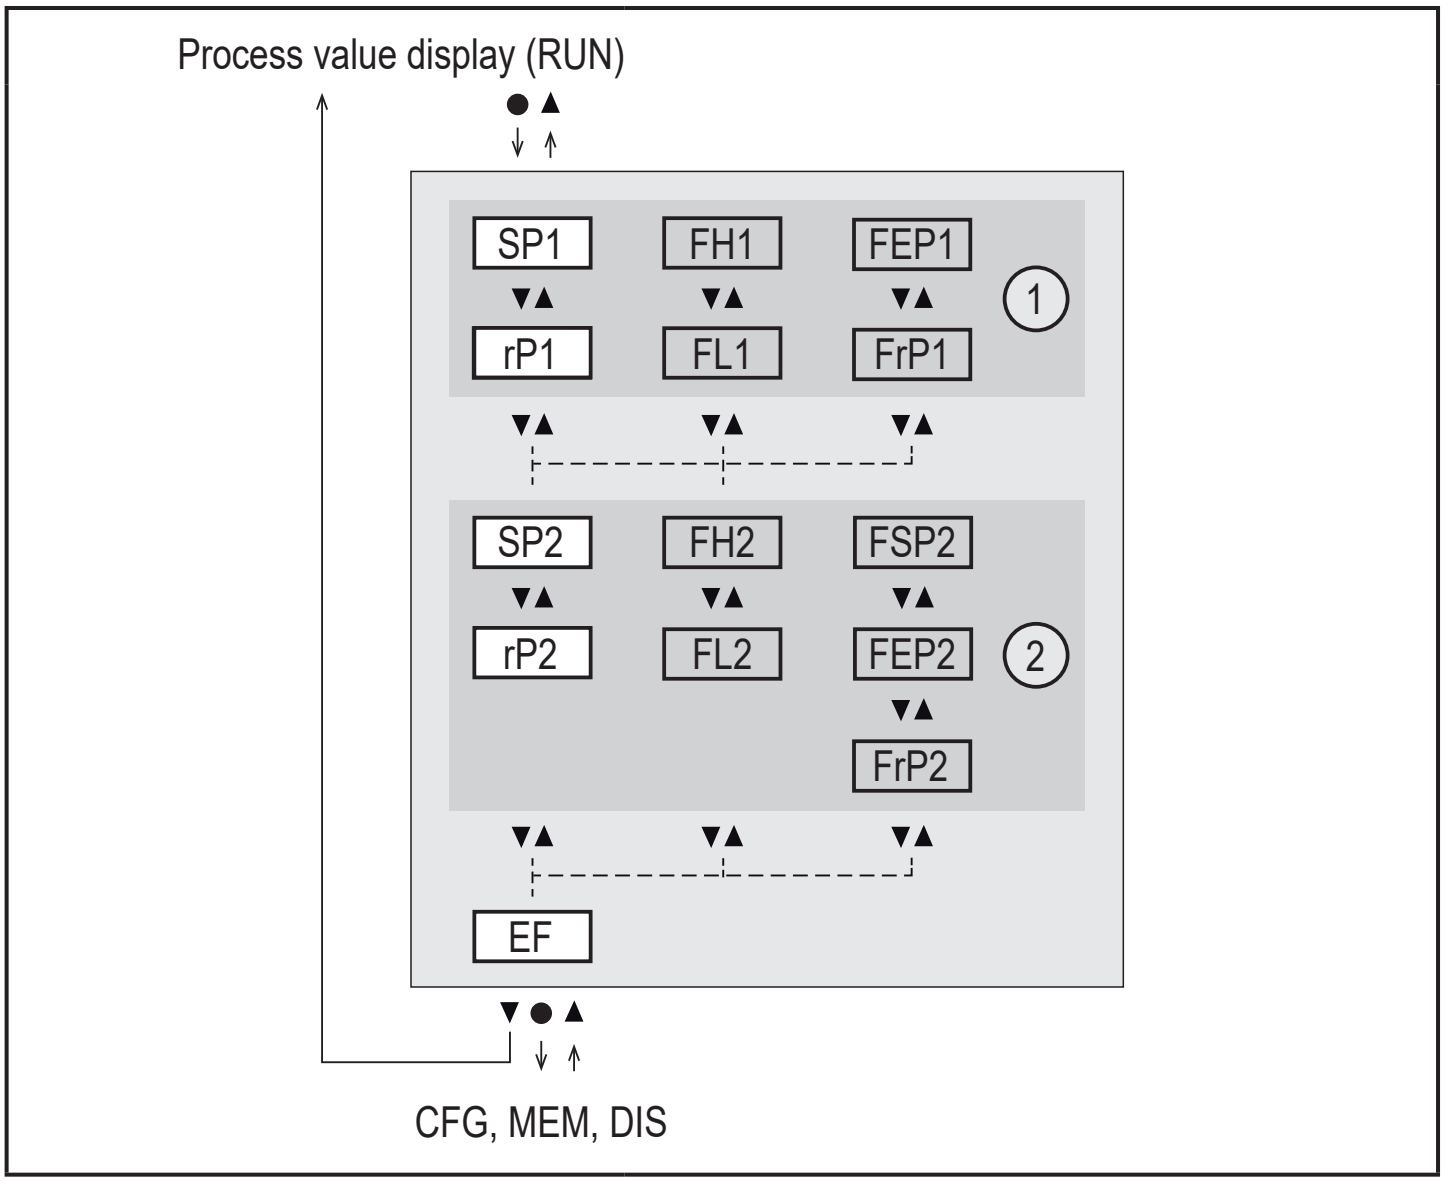


BK: black
BN: brown
BU: blue
WH: white

Colours to DIN EN 60947-5-2

Pin 1	L+
Pin 3	L-
Pin 4 (OUT1)	• Switching signal: limit values for volumetric flow • Frequency signal for volumetric flow quantity • IO-Link
Pin 2 (OUT2)	• Switching signal: limit values for volumetric flow • Switching signal: limit values for temperature • Frequency signal for volumetric flow quantity • Frequency signal for temperature

6 Operating and display elements



UK

1 and 2: switching status LEDs
• LED 1 = switching status OUT1 (lights when output 1 is switched) • LED 2 = switching status OUT2 (lights when output 2 is switched)
3: TFT display
• Display of current process values (volumetric flow quantity, temperature) • Display of the parameters and parameter values
4: Buttons [▲] and [▼]
• Select parameters • Change parameter values (hold button pressed) • Change of the process value display in the normal operating mode (Run mode) • Locking / unlocking (press buttons simultaneously > 10 seconds)
5: Button [●] = Enter
• Change from RUN mode to the main menu • Change to setting mode • Acknowledgement of the set parameter value

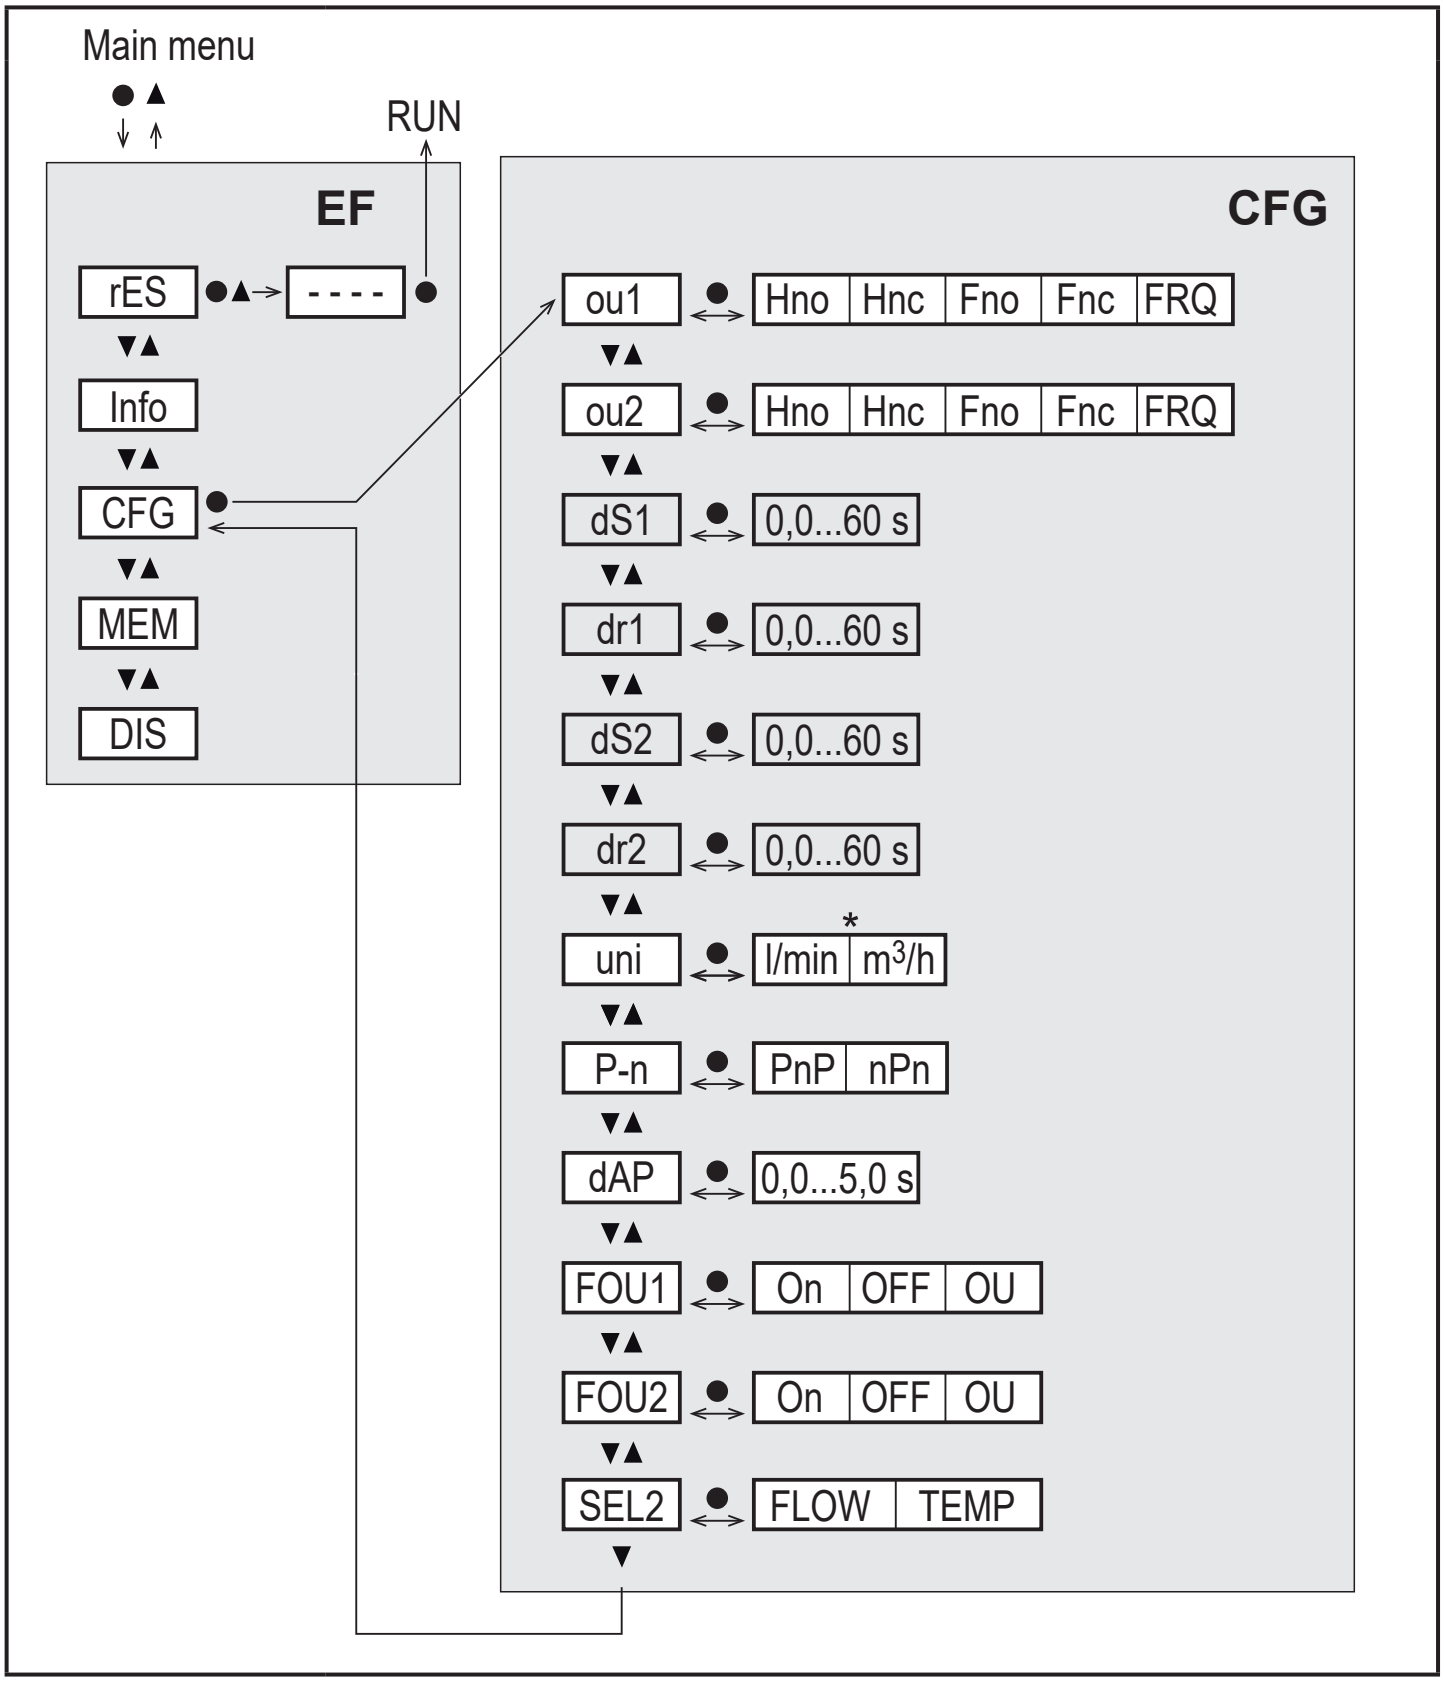
7 Menu

7.1 Main menu

1: Output functions ou1 (→ 7.2.1)
2: Output functions ou2 (→ 7.2.1)

The parameters are only displayed when selected at ou1 / ou2.

7.1.1 Explanation main menu



Switching output with hysteresis function	
SP1	Set point 1 = upper limit value at which OUT1 switches.
rP1	Reset point 1 = lower limit value at which OUT1 switches off.
SP2	Set point 2 = upper limit value at which OUT2 switches.
rP2	Reset point 2 = lower limit value at which OUT2 switches off.

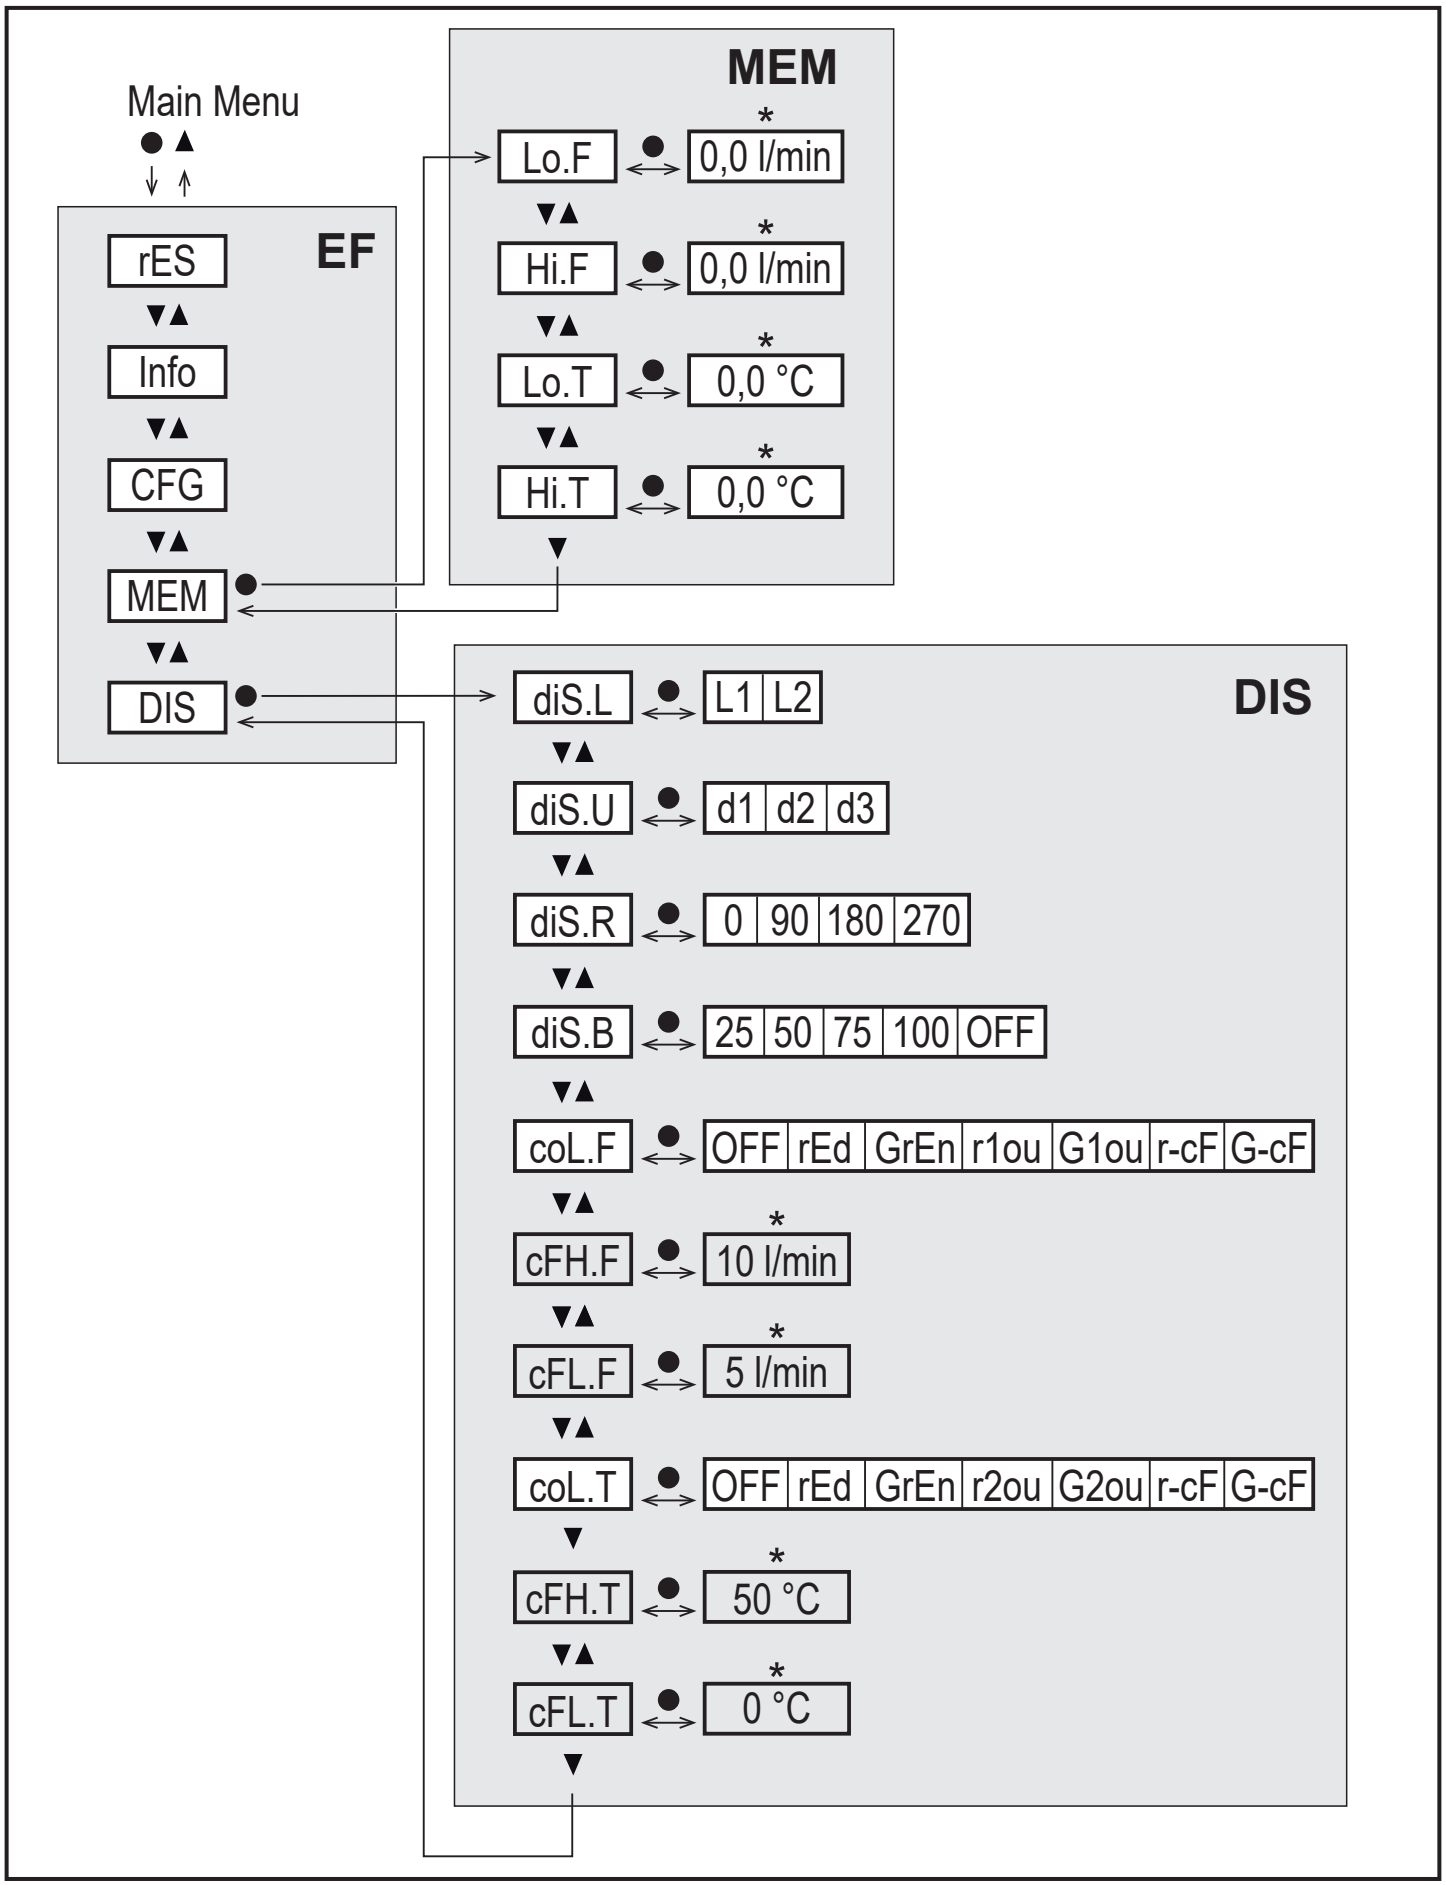
Switching output with window function	
FH1	Set point 1 = upper limit value at which OUT1 switches.
FL1	Reset point 1 = lower limit value at which OUT1 switches.
FH2	Set point 2 = upper limit value at which OUT2 switches.
FL2	Reset point 2 = lower limit value at which OUT2 switches.

Frequency output	
FEP1	Process value end point on OUT1.
FrP1	Frequency at process value end point (FEP1) on OUT1.
FSP2	Process value start point on OUT2 (only if SEL2 = TEMP).
FEP2	Process value end point on OUT2.
FrP2	Frequency at process value end point (FEP2) on OUT2.

Extended functions	
EF	Opening of the lower menu level.

7.2 Extended functions – basic settings

* For SVx6xx units: gpm / gph



The parameters are only displayed when oux = Hno, Hnc, Fno, Fnc.

rES	Restoring the factory settings
Info	Device information
CFG	Submenu basic settings
MEM	Submenu min/max memory
DIS	Submenu display settings

7.2.1 Explanation basic settings (CFG)

ou1	Output function OUT1 • Flow: Hno, Hnc, Fno, Fnc, FRQ	
ou2	Output function OUT2 • Flow: Hno, Hnc, Fno, Fnc, FRQ • Temperature: Hno, Hnc, Fno, Fnc, FRQ	
Hno	Hysteresis function normally open	
Hnc	Hysteresis function normally closed	
Fno	Window function normally open	
Fnc	Window function normally closed	
FRQ	Frequency output	
dS1	Switching delay on OUT1 in seconds	Only in case of oux = Hno, Hnc, Fno, Fnc
dr1	Switch-off delay on OUT1 in seconds	
dS2	Switching delay on OUT2 in seconds	
dr2	Switch-off delay on OUT2 in seconds	
uni	Standard unit of measurement for volumetric flow	
P-n	Output logic: pnp / npn	
dAP	Measured value damping in seconds (only for volumetric flow)	
FOU1	Behaviour of output OUT1 in case of an error	
FOU2	Behaviour of output OUT2 in case of an error	
SEL2	Standard measured variable for evaluation by OUT2: Volumetric flow quantity or medium temperature	

7.3 Extended functions – min / max memory – display

* For SVx6xx units: gpm, °F

The parameters are only displayed when selected r-cF oder G-cF.

7.3.1 Explanation min/max memory (MEM)

Lo.F	Minimum value of the flow measured in the process
Hi.F	Maximum value of the flow measured in the process
Lo.T	Minimum value of the temperature measured in the process
Hi.T	Maximum value of the temperature measured in the process

7.3.2 Explanation display function (DIS)

diS.L	Standard layout of the display(L1: flow or L2: flow and temperature)	
diS.U	Update rate of display	
diS.R	Display rotation	
diS.B	Display brightness	
coL.F	Colour configuration volumetric flow	
coL.T	Colour configuration temperature	
OFF	No colour change	
rEd	Process value always red, irrespective of the output function	
GrEn	Process value always green, irrespective of the output function	
r1ou / r2ou	Process value red in case of switched output OUT1 / OUT2	
G1ou / G2ou	Process value green in case of switched output OUT1 / OUT2	
r-cF	Display red if measured value between limit values cFL...cFH, irrespective of the output function	
G-cF	Display green if measured value between limit values cFL...cFH, irrespective of the output function	
cFH.F	Upper limit value for colour change flow	Only if r-cF or G-cF is selected.
cFL.F	Lower limit value for colour change flow	
cFH.T	Upper limit value for colour change temperature	
cFL.T	Lower limit value for colour change temperature	

UK

8 Parameter setting

Parameters can be set before installation and set-up of the unit or during operation.

If you change parameters during operation, this will influence the function of the plant.

▶ Ensure that there will be no malfunctions in your plant.

The parameters can also be set via the IO-Link interface.

8.1 Parameter setting in general

1. Change from RUN mode to the main menu	[●]
2. Selection of the requested parameter	[▲] or [▼]
3. Change to setting mode	[●]
4. Modification of the parameter value	[▲] or [▼] > 1 s
5. Acknowledgement of the set parameter value	[●]
6. Return to the RUN mode	> 30 seconds (timeout) or press [▲] + [▼] simultaneously until the RUN mode is reached.

9 Factory setting

Parameter		Factory setting	User setting
SP1	(FLOW)	**20 % ***	
rP1	(FLOW)	**18.5 % ***	
FH1	(FLOW)	**20 % ***	
FL1	(FLOW)	**18.5 % ***

Information
Supplementary note

2 Safety instructions

- The device described is a subcomponent for integration into a system.
  - The manufacturer is responsible for the safety of the system.
  - The system manufacturer undertakes to perform a risk assessment and to create a documentation in accordance with legal and normative requirements to be provided to the operator and user of the system. This documentation must contain all necessary information and safety instructions for the operator, the user and, if applicable, for any service personnel authorised by the manufacturer of the system.
- Read this document before setting up the product and keep it during the entire service life.
- The product must be suitable for the corresponding applications and environmental conditions without any restrictions.
- Only use the product for its intended purpose (→ Functions and features).
- Only use the product for permissible media (→ Technical data).
- If the operating instructions or the technical data are not adhered to, personal injury and/or damage to property may occur.
- The manufacturer assumes no liability or warranty for any consequences caused by tampering with the product or incorrect use by the operator.
- Installation, electrical connection, set-up, operation and maintenance of the product must be carried out by qualified personnel authorised by the machine operator.
- Protect units and cables against damage.
- If the units are used in gas applications > 25 bar the metal seal must be used, not an elastomer seal.

3 Functions and features

The device monitors the system pressure of machines and installations.
2 outputs are available:

3.1 Applications

Type of pressure: Relative pressure

Information on pressure rating and bursting pressure → data sheet.

Avoid static and dynamic overpressure exceeding the indicated pressure rating by taking appropriate measures.

The indicated bursting pressure must not be exceeded.

Even if the bursting pressure is exceeded only for a short time, the unit may be destroyed.
ATTENTION: Risk of injury!

Not suitable for use where the criteria for paragraph E1.2/63-03 of the 3A standard 63-03 have to be met.

The units are vacuum resistant. Adhere to the specifications in the data sheet!

4 Function

- The system pressure is detected by a ceramic-capacitive measuring system, the measured signals are evaluated electronically.
- The unit converts the system pressure into an analogue output signal (4...20 mA).
- The unit has an IO-Link interface which allows to provide additional values:
  - OUT1: Measured pressure value via IO-Link.
    - Measured pressure value (cyclic output mode)
    - Measured temperature value medium (cyclic output mode)
    - Measured temperature value housing (A-cyclic output mode)
    - Diagnostic values
  - OUT2: Analogue signal proportional to pressure 4...20 mA

4.1 IO-Link

4.1.1 General information

The device has an IO-Link communication interface which requires an IO-Link-capable module (IO-Link master).

The IO-Link interface enables direct access to the process and diagnostic data and provides the possibility to set the parameters of the unit during operation.

In addition, communication is possible via a point-to-point connection with a USB adapter cable.

The IODDs necessary for the configuration of the unit, detailed information about process data structure, diagnostic information, parameter addresses and the necessary information about the required IO-Link hardware and software can be found at www.ifm.com.

4.1.2 Functions only available via IO-Link communication

- Device temperature: The internal temperature of the sensor can be read via the A-cyclic IO-Link channel. Measuring range:-25...125°C (-13...257°F), resolution 1°C (1.8°F), precision +/- 5°C (9°F).
- Application-specific tag: freely definable text assigned to the unit.
- Function tag: freely definable text describing the device function in the plant.
- Location tag: freely definable text describing the installation location in the plant.

For more detailed information refer to the device-specific IO Device Description PDF at www.ifm.com.

4.1.3 Set-up via IO-Link

The device parameters can be set via IO-Link:

- The device parameters are set via the IO-Link interface (→ 4.1 and → 7).
- All settings can also be carried out before installation of the device.

4.1.4 Process data via IO-Link

All process data is available via IO-Link:

- The unit is designed for fully bidirectional communication.
- The following options are available:
  - Remote display:
    reading and displaying the current system pressure and the medium temperature.
  - Remote parameter setting:
    reading and changing the current parameters via IO-Link parameter setting (→ 4.1).

4.2 Defined state in case of a fault

- If a fault is detected, the analogue output passes into a defined state (= 21.5 mA).

In case of a fault indication (= 21.5 mA)

▶ Read parameters via IO-Link or contact the manufacturer

4.3 Operating modes

The operating mode is defined by the wiring (→ 6 Electrical connection) and automatically recognised by the device.

4.3.1 2-wire operation

OUT2 (pin 2)	Analogue signal proportional to pressure 4...20 mA

4.3.2 3-wire operation

OUT1 (pin 4)	Communication via IO-Link
OUT2 (pin 2)	Analogue signal proportional to pressure 4...20 mA

4.4 Analogue output

The device provides an analogue signal proportional to the pressure.

Within the measuring range the analogue signal is between 4 and 20 mA.

The measuring range is scalable:

- [ASP2] determines at which measured value the output signal is 4 mA.
- [AEP2] determines at which measured value the output signal is 20 mA.

Minimum distance between [ASP2] and [AEP2] = 20 % of the final value of the measuring range.

If the measured value is outside the measuring range or in the event of an internal error, the current signal indicated in figure 1 is provided.

In case of a fault the analogue signal is adjustable:

- [FOU] = On determines that the analogue signal goes to the upper final value (21.5 mA) in case of a fault.
- [FOU] = OU defines that in case of a fault the analogue signal reacts as defined by the current parameters.

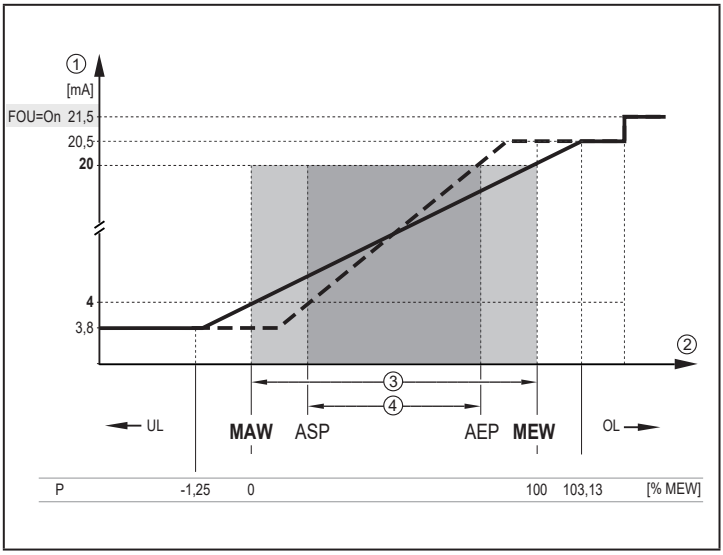

Fig. 1: Output characteristics of the analogue output to Namur

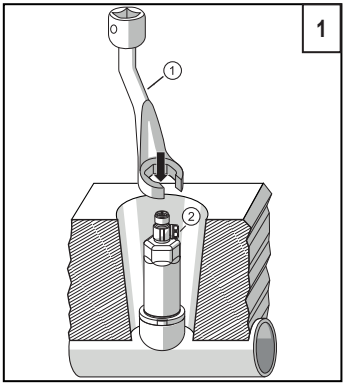
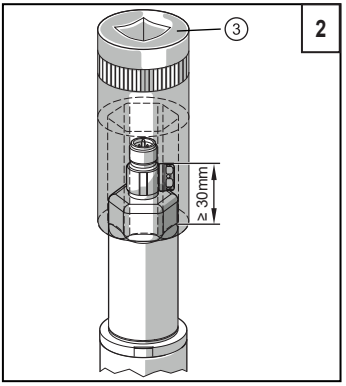
① Analogue signal
② Measured value
③ Measuring range
④ Scaled measuring range

P: Pressure
MAW: Initial value of the measuring range for non-scaled measuring range.
MEW: Final value of the measuring range for non-scaled measuring range
ASP: Analogue start point for scaled measuring range
AEP Analogue end point for scaled measuring range
UL: Below the display range
OL: Above the display range



5 Installation



Before installing and removing the unit:
Make sure that no pressure is applied to the system.

In case of a recessed sensor installation, please use an open ring spanner or a hexagon socket with the corresponding inside contour.

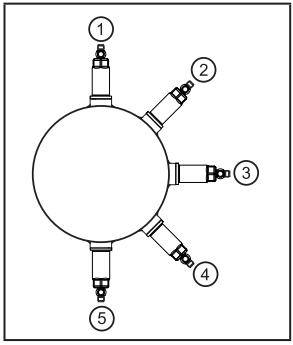
During sensor installation, do not exert any axial leverage with the tool (1) on the rotatable filter cover (2) (→ Fig. 1).

In case of installation by means of a hexagon socket (3), make sure that the tool's spanner flat has an inner height of at least 30 mm (→ Fig. 2). Align the rotatable filter cover so that it is flush with one of the spanner flats.

▶ Insert the unit in a process connection.

▶ Tighten firmly. Recommended tightening torque:

Process connection	Tightening torque in Nm
G ½	20
Depends on the lubrication.	



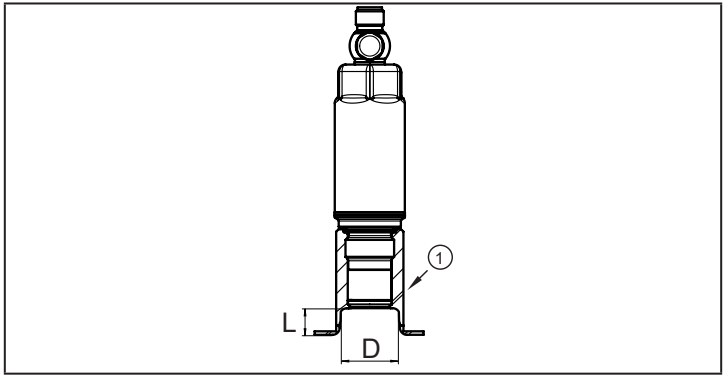
A zero-point calibration of the measured value is possible via the teach function (→ 7.3 Teach offset with the teach button)

5.1 Use in hygienic areas to 3A

Orientation of the unit in pipes and tanks

Please note for optimised cleaning of the measuring element according to the 3A criteria for hygienic areas:

Do not install the unit at the lowest point of the pipe or tank (see fig., position 5) in order that the medium can run off the area of the measuring element completely.



5.2 Use in hygienic areas to EHEDG

The sensor is suited for CIP (cleaning in process) when installed correspondingly.

Observe the application limits (temperature and material resistance) according to the data sheet.

- ▶ Make sure that the sensor is integrated into the system according to EHEDG:
- ▶ Adhere to the dimensions L < D to avoid dead space.

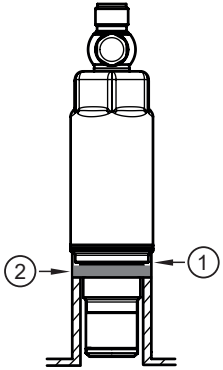
1: Leakage port

- ▶ Use self-draining installation
- ▶ Only use process adapters permitted according to EHEDG with special seals required by the EHEDG position paper

  The gasket of the system interface must not be in contact with the sealing point of the sensor.

- ▶ In case of structures in a tank, the installation must be flush mount. If not possible then direct water jet cleaning and cleaning of dead spaces must be possible.
- ▶ Leakage ports must be clearly visible and must be installed facing downwards for vertical pipes.

5.3 PM15xx with G ½



The device can be adapted to standard process connections using two sealing versions:

1	**Flush mount hygienic zero-leak using PEEK gasket**
	The process connection is supplied with a long-term stable and maintenance-free PEEK sealing ring and is suited for use in hygienic installations to EHEDEG and 3A. ▶ If required: Lightly grease the contact areas using a suitable lubricating paste which has been approved for this application. The PEEK sealing ring has been rated for ifm adapters with end stop towards the medium. The sealing between the housing and the process connection can compensate for variable insertion depths but not for the system pressure. If the sealing between the housing and the process connection is to withstand the system pressure→ Installation no. 3. For a hygienic installation to 3A and EHEDG, use adapters with leakage ports. Information on the installation process → Installation instructions enclosed to the adapter. ▶ When the PEEK gasket is mounted several times, check and replace it if necessary.

2	**Flush mount zero-leak using metal-to-metal seal**
	▶ Remove the clipped on PEEK gasket with a tool (screwdriver) using the existing cut-out above the gasket. Do not damage the sealing area during removal. ▶ If required: Lightly grease the contact areas using a suitable lubricating paste which has been approved for this application. ▶ Screw the sensor into the adapter. Only use accessories from ifm electronic gmbh! The optimum function is not ensured when using components from other manufacturers. The seal between the housing and the process connection can compensate for variable insertion depths / tolerances and provides protection against the ingress of media in the thread area. This seal cannot compensate for the system pressure. If required → Installation no. 3. A long-term stable and maintenance-free fitting without bug traps in the sealing is only valid for once-only mounting. If the sealing has to be installed several times, use a PEEK gasket → Installation no. 1.

3	**Installation to G ½ flange / G ½ threaded ferrule**

▶ Prerequisite: high-quality sensing face (1).

When pressure is applied, the customer has to replace the gasket (2) by a gasket according to DIN EN ISO 1179-2.

▶ If required: Lightly grease the contact areas using a suitable lubricating paste which has been approved for this application.

If the seal between the housing and the process connection is replaced by a gasket according to DIN EN ISO 1179-2, the sensor can be installed in existing through-holes or other G ½ threads.

In this case no end stop for the flush mount sealing area exists and the PEEK gasket has to be removed.

5.3.1 Installation in drinking water applications to ACS and WRAS

1	Installation of the sensor with PEEK gasket (as supplied).
2	Remove the PEEK gasket and mount the metal sealing edge to the adapter with metal end stop (ifm accessory).
3	Installation to G1/2 flange (without flush mount sealing edge) with sealing between the housing and the process connection (→ 5.3), Installation 3. ▶ Replace the gasket by a gasket described in DIN EN ISO 1179-2, as well as in ACS, or WRAS.

▶ Operating conditions:
Observe pressure, temperature and chemical resistance (→ Data sheet).

5.4 Ventilation diaphragm with protective cap

5.4.1 Function ventilation diaphragm

The ventilation diaphragm enables the relative pressure measurement since barometric and temperature-dependent pressure fluctuations between the measuring cell and the environment are compensated for.

The ventilation diaphragm is protected against damage by a screwed cap with circumferential ports.

For a correct functioning of the diaphragm please take the following into account:

- ▶ Remove soiling and cleaning agents immediately using plenty of lime-deficient splash water.

If the sensor is in a cooling stage:

- ▶ Avoid contact of the diaphragm with liquids to avoids negative pressure in the measuring system resulting in a slightly falsified measured value and additional strain on the diaphragm.

5.4.2 Orientation of the filter cover

The filter cover is freely rotatable around the sensor's axis and thus adaptable to the environmental conditions.

When the sensor is mounted in a vertical position, the condensate escapes through the ports in the protective cap due to gravity.

When the sensor is mounted in a horizontal position or similar, the filter protection cap must be rotated towards one of the two lateral faces to bring the ventilation diaphragm into a vertical position. This guarantees the optimum drainage for liquids.

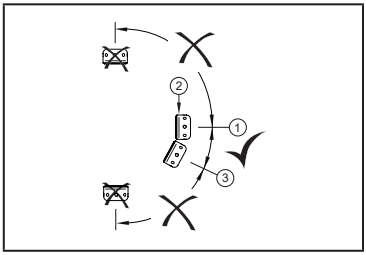


Fig. 1: Orientation

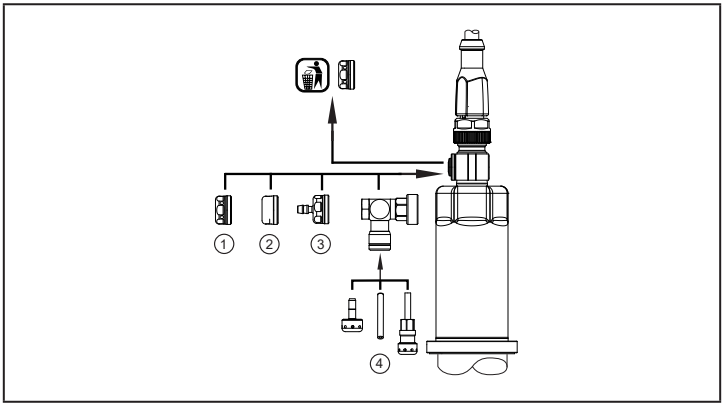


- ▶ Ideal orientation (1):
  Filter cover in horizontal position.
  The ventilation diaphragm (2) in the filter cover is in a vertical position.
- ▶ Maximum inclination: 30° (3)

5.5 Improve the protection of the filter cover

For rough operating conditions, the sensor protection can be improved by using ifm accessories.

1	Exchange the filter cover incl. ventilation diaphragm (E30142).
2	Replace the filter cover with a closed cover cap (E30148).
3	Replace the filter cover with a cover cap with a tube fitting and a vent tube that ends in a protected and dry area (E30139).
4	Set of accessories (E30467) with integrated ventilation diaphragm, for high degree of soiling and / or high climate pollution. Function → Installation instructions E30467

- ▶ Avoid soiling and moisture during the exchange
- ▶ Clean the thread carefully and without residues
- ▶ Do not damage the adhesive area of the sensor
- ▶ Observe the orientation of the filter cover → Installation instructions E30467

When using the closed cover cap, there is no pressure compensation of the measuring cell any more. This results in measurement deviations caused by:

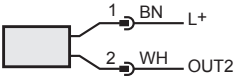
- fluctuations of the atmospheric pressure
- pressure fluctuations inside the unit in case of temperature fluctuations (Δ 10 K ≤ 30 mbar).

6 Electrical connection

The unit must be connected by a qualified electrician.

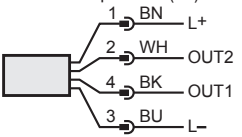
The national and international regulations for the installation of electrical equipment must be adhered to.

Voltage supply according to EN 50178, SELV, PELV.



▶ Disconnect power.

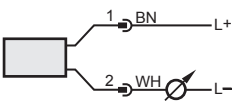
▶ Connect the unit as follows:



Core colours		
1	BN	brown
2	WH	white
3	BU	blue
4	BK	black

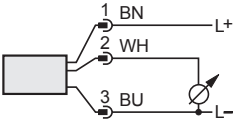
2-wire operation (2L)

3-wire operation (3L)



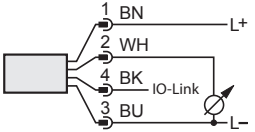
OUT1: communication via IO-Link

OUT2: analogue output

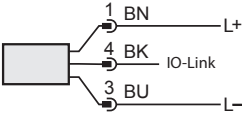


Colours to DIN EN 60947-5-2

Wiring example



(2L) 1 x analogue



(3L) 1 x analogue

(3L) 1 x analogue / 1 x IO-Link

(3L) 1 x IO-Link

EMC test to EN 61000-4-5 Surge: 0.5 kV

7 Parameter setting

The unit can be configured via the IO-Link function.

- ▶ Prepare IO-Link hardware and software for parameter setting.
- ▶ Connect the unit with e.g. an IO-Link interface (→ 7.1) or a programmed memory plug (→ 7.2).
- ▶ Set the parameters.
- ▶ Put the unit into operation.

The parameters can be set before installation or during operation.

Changing parameters during operation can influence the function of the plant.

- ▶ Ensure that there will be no malfunctions in your plant.

7.1 Parameter setting via PC

For parameter setting, an IO-Link-capable software is necessary (e.g. LINERECORDER DEVICE). IO-Link interfaces from ifm are available for the connection of the unit via the USB interface of a computer → www.ifm.com.

- ▶ Prepare computer, software and interface.
- ▶ Connect the unit with the IO-Link interface.
- ▶ Follow the menu of the IO-Link software.
- ▶ Set the parameters.
- ▶ Put the unit into operation.

7.2 Parameter setting via the memory plug

A parameter set can be written to the unit / can be recorded by the unit via a memory plug (ifm storage module) → www.ifm.com.

In order to allow for data to be written from the memory plug to the sensor, the sensor must have the factory setting.

If the sensor has been configured, the memory plug records the parameter set which can then be transferred to other sensors of the same type.

- ▶ Load a suitable parameter set (e.g. from a PC or from a sensor of the same type) to the memory plug.
- ▶ Connect the memory plug between sensor and socket.
- > Sensor with factory setting:
  When voltage is applied, the parameter set is transferred from the memory plug to the sensor.
- > Sensor with changed settings:
  When voltage is applied, the memory plug records the sensor's parameter set.
- ▶ Remove the memory plug.
- ▶ Put the unit into operation.

Adjustable parameters (→ 7.5).

You can find more information about the memory plug in the corresponding technical documentation → www.ifm.com.

7.3 Teach offset with the teach button

An external teach button (E30425) allows for a zero-point calibration (calibration offset). The current measured value is taken as internal zero point if it lies within a range of +/- 3% of the final value of the measuring range.

For connection information see data sheet of E30425
If a teach button is connected, no IO-Link communication is possible

- ▶ Integrate the teach button between the installed sensor and the supply cable.
- ▶ Maintain the plant pressure constantly at zero (configurable range = +/- 3% of the measuring span).
- ▶ Press the button for > 2 ... < 10 s.
- > When voltage is supplied, the LED in the button flashes at 2 Hz and configures the zero point (calibration offset).
- > In case of a fault, the LED flashes at 8 Hz.

7.3.1 Scaling of the analogue value

▶ Select [ASP2] and set the value at which 4 mA is provided.	[ASP2]
▶ Select [AEP3] and set the value at which 20 mA is provided. Minimum distance between ASP2 and AEP2 = 20 % of the measuring span (scaling factor 5).	[AEP2]

7.3.2 Select the standard unit of measurement (option)

▶ Select [uni.P] and set the unit of measurement: [bAr] / [mbar] / [MPA] / [kPA] / [PSI] / [mWS] / [inH2O] The selectable units of measurement depend on the respective unit.	[uni.P]

7.3.3 Standard unit of measurement for medium temperature

▶ Select [uni.T] and set the unit of measurement:[°C] / [°F]	[uni.T]

7.4 User settings (optional)

7.4.1 Define the status of output 2 in case of a fault

Status of OUT2 in case of an internal fault: ▶ Select [FOU2] and set the value: - OU = The analogue signal behaves as defined by the current parameters. - On = The analogue signal goes to the upper end stop value (21.5 mA).	[FOU2]

7.4.2 Set damping for the analogue output

▶ Select [dAA] and set the damping constant (rise time 10...90 %) in seconds. Setting range: 0.000...4.000 s. Damping [dAA] only influences the analogue output / analogue signal path.	[dAA]

7.4.3 Set damping for the switching signal

▶ Select [dAP] and set the damping constant in seconds (t value: 63 %). Setting range: 0.000...4.000 s. The damping [dAP] influences the process data flow (IO-Link communication).	[dAP]

7.4.4 Zero-point calibration

▶ Select [tcof] Compared to the real measured value, the internal measured value (operating value of the sensor) is shifted. • Teach range: - 3...+ 3 % of the measuring span	[tcof]

7.5 List of the parameters

Parameter	Function
ASP2	Analogue start point Measured value at which 4 mA is provided.
AEP2	Analogue end point Measured value at which 20 mA is provided. Minimum distance between ASP and AEP = 20 % of the measuring span.
uni.P	Standard unit of measurement for system pressure (display): [bAr] / [mbar] / [MPA] / [kPA] / [PSI] / [mWS] / [inH2O] The selectable units of measurement depend on the respective unit.
uni.T	Standard unit of measurement for medium temperature: [°C] / [°F]
FOU2	Status of output 2 in case of a fault.
tcoF	Zero-point calibration (calibration offset) Compared to the real measured value, the internal measured value (operating value of the sensor) is shifted. • Teach range: - 3...+ 3 % of the measuring span
dAA	Damping for the analogue output Pressure peaks of short duration or high frequency can be filtered out using this function.
dAP	Damping of the process value (only applies to IO-Link evaluation)

Parameter	Function
Lo.P	Minimum value memory for system pressure (irrespective of the set damping)
Hi.P	Maximum value memory for system pressure. (irrespective of the set damping)
Lo.T	Minimum value memory for medium temperature
Hi.T	Maximum value memory for medium temperature

7.6 Diagnostic functions

7.6.1 Read min/max values for the system pressure

▶ Select [Hi.P] or [Lo.P.] to display the highest or lowest measured process value: - [Hi.P] = Maximum value system pressure - [Lo.P] = Minimum value system pressure The memory can be reset.	[Hi.P] [Lo.P]

7.6.2 Read min/max values for the medium temperature

▶ Select [Hi.P] or [Lo.P.] to display the highest or lowest measured process value: - [Hi.T] = Maximum value medium temperature - [Lo.T] = Minimum value medium temperature The memory can be reset.	[Hi.T] [Lo.T]

Diagnostic possibilities, unit temperature in chapter IO-Link.

8 Operation

After power-on and expiry of the power-on delay time of approx. 0.5 s the unit is in the RUN mode (= normal operating mode). It carries out its measurement and evaluation functions and generates output signals according to the set parameters.

9 Troubleshooting

The unit has many self-diagnostic options.
It monitors itself automatically during operation.
Warnings and faults are signalled via IO-Link.
If one process value fails, the other process values are still available.

Additional diagnostic functions are available via IO-Link.
→ IODD interface description at www.ifm.com.

IO-Link error codes are contained in the IODD

Type	Description	Output status	Troubleshooting
Error	Unit faulty / malfunction	FOU	Replace device.
Error	Supply voltage too low	off	Check supply voltage.
Error	Parameter setting outside the valid range	FOU	Repeat parameter setting.
Error	Error in pressure measurement	FOU	Check pressure measurement. Replace device.
Error	Error in temperature measurement	FOU	Check temperature measurement. Replace device.
Error	Upper limit temperature value reached (<= 111.4 %MEW*)	FOU	Check temperature range.
Error	Lower limit temperature value reached (<= -8.6 %MAW**)	FOU	Check temperature range.
Warning	Value above the pressure range (>= 105 % MEW*) or value above the temperature range (>= 105.7 % MEW*)	OU	Check pressure range / temperature range.
Warning	Value below the pressure range (>= -5 %MEW*) or below the temperature range (>= -2.9 %MEW*)	OU	Check temperature range.
Warning	Device temperature too high (> 125°C / 257°F)	OU	Check device temperature.

Type	Description	Output status	Troubleshooting
Warning	Device temperature too low (> -25°C / -13°F)	OU	Check device temperature.

*MEW = final value of the measuring range, **MAW = initial value of the measuring range
Output status: In case of a fault the analogue output behaves according to [FOU2] set.
In case of a warning the analogue signal is as defined in the parameters [OU].

10 Technical data and scale drawing

Technical data and scale drawing at www.ifm.com

11 Maintenance, repair, disposal

- ▶ It is not possible to repair the unit.
- ▶ After use dispose of the unit in an environmentally friendly way in accordance with the applicable national regulations.
- ▶ In case of returns ensure that the unit is free from dangerous and toxic substances.

12 Factory setting

	Factory setting	User setting
ASP2	**0% MEW***	
AEP2	**100% MEW***	
uni.P	**bar / mbar**	
uni.T	**°C**	
FOU2	**OU**	
tcof	**0.0**	
dAA	**0.1**	
dAP	**0.06**	

MEW final value of the measuring range
* = The indicated percentage of the final value of the measuring range (MEW) of the corresponding sensor in bar / mbar is set.

CAUTION

Warning of personal injury.
Slight reversible injuries may result.

2 Safety instructions

- The device described is a subcomponent for integration into a system.
  - The manufacturer is responsible for the safety of the system.
  - The system manufacturer undertakes to perform a risk assessment and to create a documentation in accordance with legal and normative requirements to be provided to the operator and user of the system. This documentation must contain all necessary information and safety instructions for the operator, the user and, if applicable, for any service personnel authorised by the manufacturer of the system.
- Read this document before setting up the product and keep it during the entire service life.
- The product must be suitable for the corresponding applications and environmental conditions without any restrictions.
- Only use the product for its intended purpose (→ Functions and features).
- Only use the product for permissible media (→ Technical data).
- If the operating instructions or the technical data are not adhered to, personal injury and/or damage to property may occur.

- The manufacturer assumes no liability or warranty for any consequences caused by tampering with the product or incorrect use by the operator.
- Installation, electrical connection, set-up, programming, configuration, operation and maintenance of the product must be carried out by personnel qualified and authorised for the respective activity.
- Protect units and cables against damage.

CAUTION

For medium temperatures above 40 °C, parts of the unit may heat up to over 70 °C.

> Risk of burns

▶ Do not touch the unit

▶ Protect the housing against contact with flammable substances and unintentional contact.

3 Functions and features

The unit measures and monitors the system pressure and the medium temperature of machines and installations.

3.1 Applications

- Medium temperature Measuring range of all sensors -40...90°C / -40...194°F
- Type of pressure: relative pressure

Order number	Measuring range		Pressure rating		Bursting pressure	
Pressure sensor with G¼ external thread						
	bar	psi	bar	psi	bar	psi
PV8060	0...600	0...8702	1500	21755	2500	36255
PV8000	0...400	0...5802	1000	14500	1700	25655
PV8001	0...250	0...3626	625	9060	1200	17400
PV8002	0...100	0...1450.5	250	3625	1000	14500
PV8023	0...60	0...870	150	2175	900	13050
PV8003	-1...25	-14.6...362.6	65	940	600	8700
PV8004	-1...10	-14.6...145.05	25	360	300	4350
MPa = (measured value in bar) ÷ 10 kPa = (measured value in bar) x 100						

Avoid static and dynamic overpressure exceeding the indicated pressure rating by taking appropriate measures. The indicated bursting pressure must not be exceeded. Even if the bursting pressure is exceeded only for a short time, the unit may be destroyed. ATTENTION: Risk of injury!

Pressure Equipment Directive (PED):
The units with a pressure rating of ≤ 1000 bar comply with the Pressure Equipment Directive. They are designed for group 2 fluids and are manufactured in accordance with sound engineering practice.
Use of group 1 fluids on request.

Pressure Equipment Directive (PED):
The units with a final value of the measuring range of 600 bar comply with the Pressure Equipment Directive. They are designed for group 2 fluids and are manufactured and tested according to module A.
Use of group 1 fluids on request.

The units are vacuum resistant.

If the cable length exceeds 30 m or if used outside buildings, there is a risk of overvoltage pulses from external sources. We recommend to use the unit in protected operating environments and to limit overvoltage pulses to max. 500 V.

3.2 Use in hydraulic systems

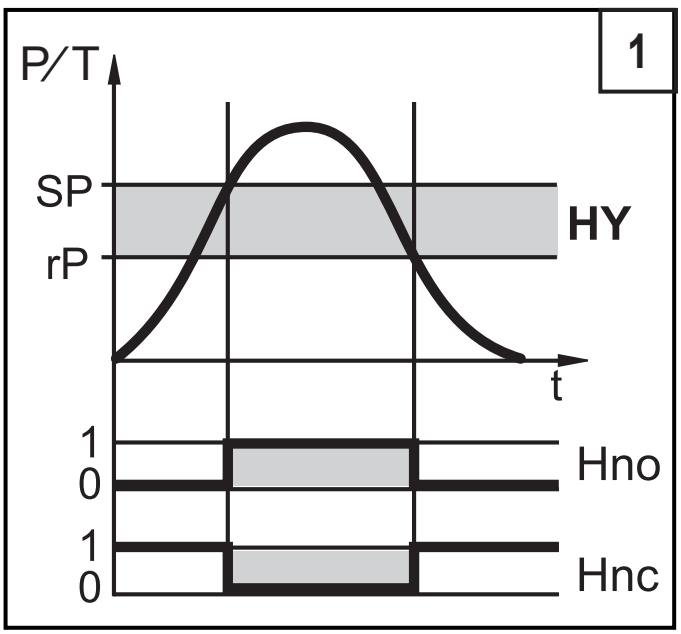
Restrictor in the process connection:
In hydraulic systems, highly dynamic effects such as pressure peaks, cavitation etc. may arise depending on the operating conditions. To reduce these effects on the measuring element of the sensor, a diaphragm attachment is integrated into the process connection. The specific thread pitch of the diaphragm attachment has the effect of a hole of 0.3 mm.

Please note: High viscosity may reduce the response time by some milliseconds. Heavy soiling may affect the functionality.

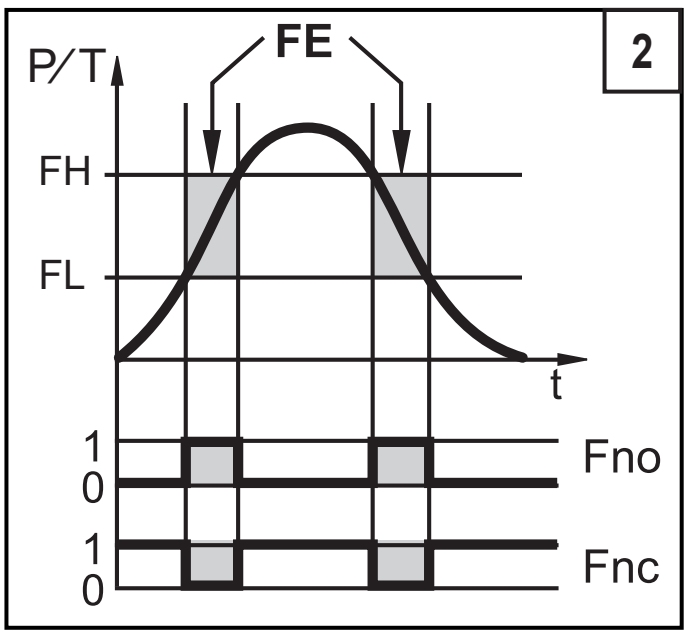
4 Function

- The unit generates output signals according to the operating mode and the parameter setting.
- It also provides the process data, output signals and diagnostic messages via IO-Link.

4.1 Communication, parameter setting, evaluation



OUT1 (pin 4)	• Switching signal for system pressure limit • Communication via IO-Link
OUT2 (pin 2)	• Switching signal for system pressure limit or medium temperature limit



4.2 Switching function

OUTx changes its switching status if it is above or below the set switching limits (SPx, rPx). The following switching functions can be selected:

- Hysteresis function / normally open: [ou1] / [ou2] = [Hno] (→ Fig. 1).
- Hysteresis function / normally closed: [ou1] / [ou2] = [Hnc] (→ Fig. 1).

  First the set point (SPx) is set, then the reset point (rPx).
  The hysteresis defined remains even if SPx is changed again.
- Window function / normally open: [ou1] / [ou2] = [Fno] (→ Fig. 2).
- Window function / normally closed: [ou1] / [ou2] = [Fnc] (→ Fig. 2).
  The width of the window can be set by means of the difference between FHx and FLx. FHx = upper value, FLx = lower value.

P = system pressure; T = medium temperature; HY = hysteresis; FE = window

When set to the window function the set and reset points have a fixed hysteresis of 0.25 % of the measuring span.

4.3 IO-Link

4.3.1 General information

The unit has an IO-Link communication interface which requires an IO-Link-capable module (IO-Link master).

The IO-Link interface enables direct access to the process and diagnostic data and provides the possibility to set the parameters of the unit during operation.

In addition, communication is possible via a point-to-point connection with a USB adapter cable.

The IODDs necessary for the configuration of the unit, detailed information about process data structure, diagnostic information, parameter addresses and the necessary information about the required IO-Link hardware and software can be found at www.ifm.com.

4.3.2 Functions only available via IO-Link communication

- Switching cycles counter: The switching cycles on OU1 and OU2 are counted. Both counters can be read via a sub-index and reset via a system command.
- Operating hours counter: If the sensor is in the operating mode (connected to the power supply), this counter is incremented by 1 at an interval of 60 minutes. If the power supply is interrupted during an interval, this interval will not be counted. When the connection is re-established, the interval starts again from the first minute. The operating hours counter cannot be reset.
- Device temperature: The internal temperature of the sensor can be read via the A-cyclic IO-Link channel. Measuring range: -40...95° C (-40...203° F).
- Application Specific Tag: freely definable text assigned to the unit.
- Function Tag: freely definable text describing the device function in the plant.
- Location Tag: freely definable text describing the installation location in the plant.

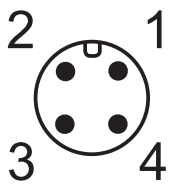
For detailed information, please refer to the device-specific
IO Device Description PDF at www.ifm.com.

5 Installation

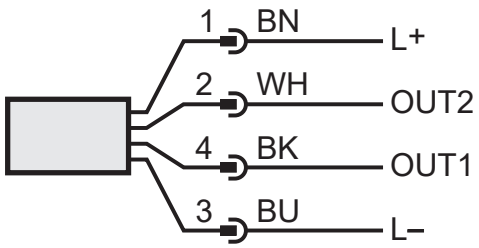
Before installing and removing the unit:Make sure that no pressure is applied to the system.

▶ Insert the unit in a G¼ process connection.

▶ Tighten firmly. Recommended tightening torque:



Pressure range in bar	Tightening torque in Nm
up to 400	25...35
600	30...50
Depends on lubrication, seal and pressure load!	

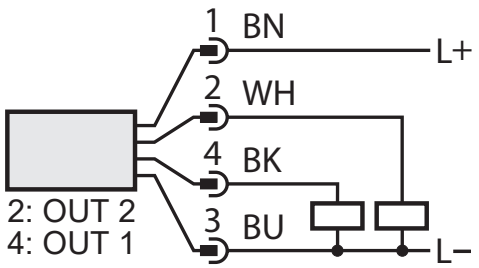


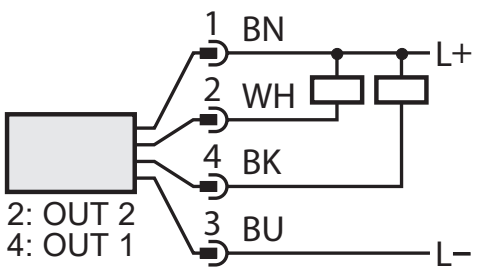
6 Electrical connection

The unit must be connected by a qualified electrician.
The national and international regulations for the installation of electrical equipment must be adhered to.
Voltage supply to EN 50178, SELV, PELV.

- ▶ Disconnect power.
- ▶ Connect the unit as follows:

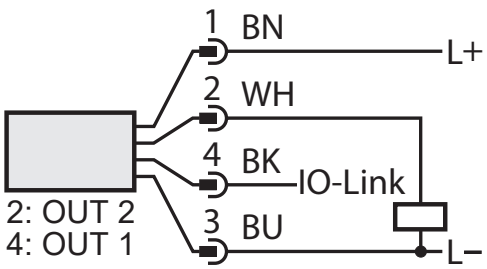
Core colours	
BK	black
BN	brown
BU	blue
WH	white



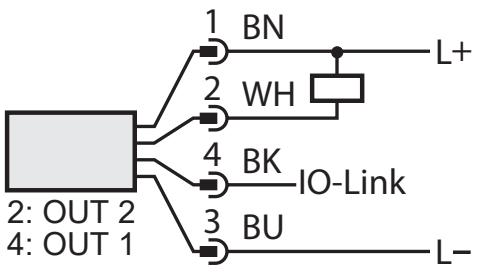


OUT1: Switching output or IO-Link
OUT2: Switching output
Colours to DIN EN 60947-5-2

Example circuits



2 x positive switching



2 x negative switching

1 x positive switching, 1 x IO-Link

1 x negative switching, 1 x IO-Link

7 Parameter setting

The unit can only be configured via the IO-Link function.

- ▶ Prepare IO-Link hardware and software for parameter setting.
- ▶ Connect the unit with e.g. an IO-Link interface (→ 7.1) or a programmed memory plug (→ 7.2).
- ▶ Set the parameters.
- ▶ Put the unit into operation.

The parameters can be set before installation or during operation.

Changing parameters during operation can influence the function of the plant.

- ▶ Ensure that there will be no malfunctions in your plant.

7.1 Parameter setting via PC

For parameter setting, an IO-Link-capable software is necessary (e.g. LINERECORDER DEVICE). IO-Link interfaces from ifm are available for the connection of the unit via the USB interface of a computer → www.ifm.com.

- ▶ Prepare computer, software and interface.
- ▶ Connect the unit with the IO-Link interface.
- ▶ Follow the menu of the IO-Link software.
- ▶ Set the parameters.
- ▶ Put the unit into operation.

Adjustable parameters (→ 7.3).

7.2 Parameter setting via the memory plug

A parameter set can be written / transferred to the unit via a memory plug (storage module) → www.ifm.com.

▶ Load suitable parameter set (e.g. using a PC) to the memory plug.

▶ Connect the memory plug between sensor and socket.

> When voltage is supplied, the parameter set is transferred from the memory plug to the sensor.

▶ Remove the memory plug.

▶ Put the unit into operation.

Adjustable parameters (→ 7.3).

The memory plug can also be used to save the current parameter setting of a unit and to transfer it to other units of the same type.

You can find more information about the memory plug in the corresponding technical documentation → www.ifm.com.

7.3 List of parameters

Parameter	Function
SP1/rP1	Upper / lower limit for system pressure at which OUT1 switches with hysteresis setting. Requirement: OUT1 setting is [Hno] or [Hnc].
FH1/FL1	Upper / lower limit for system pressure at which OUT1 switches with window setting. Requirement: OUT1 setting is [Fno] or [Fnc].
SP2/rP2	Upper / lower limit value for system pressure or medium temperature at which OUT2 switches with hysteresis setting. Requirement: OUT2 setting is [Hno] or [Hnc].
FH2/FL2	Upper / lower limit for system pressure or medium temperature at which OUT2 switches with window setting. Requirement: OUT2 setting is [Fno] or [Fnc].
ou1	Output function for OUT1: Switching signal for the pressure limits: hysteresis function [H ..] or window function [F ..], either normally open [. no] or normally closed [. nc], output off [OFF].

Parameter	Function
ou2	Output function for OUT2: Switching signal for pressure limit values or medium temperature limit values: Hysteresis function [H ..] .] or window function [F ..], either normally open [. no] or normally closed [. nc], output off [OFF].
SEL2	Standard measured variable for evaluation by OUT2: PRES (pressure) or TEMP (temperature).
uni.P	Standard unit of measurement for system pressure: [bAr] / [MPA] / [PSI]
uni.T	Standard unit of measurement for medium temperature: [°C] / [°F]
FOU1	Behaviour of output 1 in case of an internal fault
FOU2	Behaviour of output 2 in case of an internal fault
dS1 / dS2	Switch-on delay for OUT1 / OUT2
dr1 / dr2	Switch-off delay for OUT1 / OUT2
P-n	Output logic: pnp / npn
dAP	Damping of the standard measured variable pressure
Lo.P	Minimum value memory for system pressure (memory can be reset)
Hi.P	Maximum value memory for system pressure (memory can be reset)
Lo.T	Minimum value memory for medium temperature (memory can be reset)
Hi.T	Maximum value memory for medium temperature (memory can be reset)
HIPS	Setting of the pressure limit for the counter [HIPC]
HIPC	Number of times the pressure limit is exceeded [HIPS] (the limit must be exceeded for at least 0.5 s)
HITS	Setting of the temperature limit for the counter [HITC]
HITC	Number of times the temperature limit is exceeded [HITS] (the limit must be exceeded for at least 0.5 s)
coF	Zero-point calibration

For more information refer to the IODD description or the context-specific parameter descriptions of the used IO-Link software.

8 Maintenance, repair, disposal

- ▶ It is not possible to repair the unit.
- ▶ After use dispose of the unit in an environmentally friendly way in accordance with the applicable national regulations.
- ▶ In case of returns ensure that the unit is free from dangerous and toxic substances.

9 Factory setting

	Factory setting	User setting
SP1	25% MEW*	
rP1	23% MEW*	
ou1	Hno	
ou2	Hno	
SP2	75% MEW*	
rP2	73% MEW*

2 Safety instructions

- The unit described is a subcomponent for integration into a system.
  - The system architect is responsible for the safety of the system.
  - The system architect undertakes to perform a risk assessment and to create documentation in accordance with legal and normative requirements to be provided to the operator and user of the system. This documentation must contain all necessary information and safety instructions for the operator, the user and, if applicable, for any service personnel authorised by the architect of the system.
- Read this document before setting up the product and keep it during the entire service life.
- The product must be suitable for the corresponding applications and environmental conditions without any restrictions.
- Only use the product for its intended purpose (→ Intended use).
- If the operating instructions or the technical data are not adhered to, personal injury and/or damage to property may occur.
- The manufacturer assumes no liability or warranty for any consequences caused by tampering with the product or incorrect use by the operator.
- Installation, electrical connection, set-up, operation and maintenance of the product must be carried out by qualified personnel authorised by the machine operator.
- Protect units and cables against damage.
- Only use the product for permissible media (→ Technical data).
- The unit complies with the standard EN 61000-6-4 and is a class A product. The unit may cause radio interference in domestic areas. If interference occurs, the user must take appropriate actions.

3 Intended use

The device measures the conductivity and temperature of purified and highly purified water, e.g. in water treatment plants for the beverage or pharmaceutical industry. The unit is designed for direct contact with the medium.

3.1 Application area

- Purified and highly purified water applications.
- Electrically hardly conductive media (→ Technical data sheet).

Application examples:

- Ion exchanger
- Reverse osmosis
- Distillation monitoring
- Water for injection (WFI)
- Semiconductor production
- Production of solar modules (surface cleaning)
- Desalination plants

3.2 Restriction of the application area

- Use the unit only for media to which the wetted materials are sufficiently resistant (→ Technical data sheet).
- The unit is not suitable for liquids with a medium to high electrical conductivity (e.g. industrial water, wastewater, sea water, acids, alkalis).
- The unit is not suitable for applications where the probe is subjected to permanent and high mechanical stress (e.g. abrasive media or fast flowing media containing solid particles).
- Not suited for media prone to formation of deposit.
- Do not expose the probe tip to direct sun radiation (UV radiation).

4 Function

4.1 Measuring principle

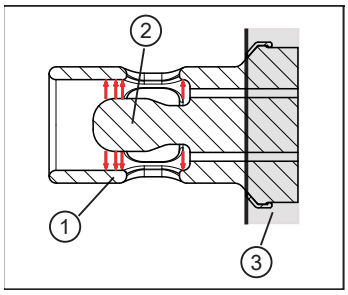

Fig. 1: Sectional view of measuring element

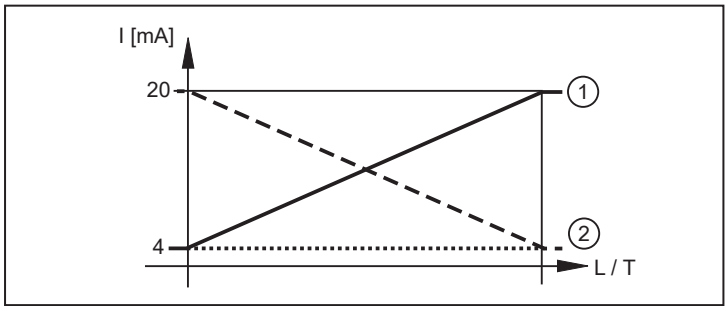
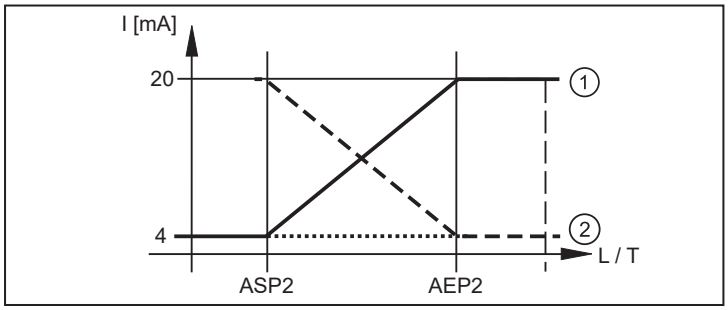
1: Outer electrode
2: Inner electrode
3: Mounting adapters

The unit operates on the conductive measuring principle. It measures the electrical conductivity of the medium to be monitored by means of a current flow between the inner electrode and the outer electrode.



The sensor head must be in contact with the process liquid from the sensor tip to the mounting adapter. Otherwise there is no electrical connection so that no measurement can be made.

To compensate the influence of the temperature, the process temperature is detected by a temperature probe in the sensor tip.



4.2 Analogue function

The unit provides an analogue signal proportional to the conductivity or (as option) the temperature. The analogue output (OUT2) can be configured.

Curve of the analogue signal (factory setting):

Curve of the analogue signal (measuring range scaled):

L: conductivity:
T: temperature
1: [ou2] = [I]
2: [ou2] = [InEG]
ASP2: analogue start point
AEP2: analogue end point

4.3 Defined state in case of a fault

If a fault is detected or if the signal quality is below a minimum value, the output OUT2 passes into a defined state according to Namur recommendation (NE43).

For this case, the response of the output can be set via the parameter [FOU2].

4.4 IO-Link communication interface

The device has an IO-Link communication interface which requires an IO-Link-capable module.

The IO-Link interface allows:

- direct access to process and diagnostic data,
- parameter setting of the unit outside the plant via the IO-Link interface,
- parameter setting of the unit via the IO-Link master during operation.

The IODDs necessary for the configuration of the unit, detailed information about process data structure, diagnostic information, parameter addresses and the necessary information about the required IO-Link hardware and software can be found at www.ifm.com.

5 Installation

CAUTION

If the medium temperature is above 50 °C (122 °F) parts of the housing can increase in temperature to over 65 °C (149 °F).

▷ Risk of burns

▶ Do not touch the unit.

▶ Protect the housing against contact with flammable substances and unintentional contact.

▶ Allow the unit and process adapter to cool down before maintenance.

Before installing and removing the unit:

▶ Make sure that no pressure is applied to the system and there is no medium in the pipe or tank. Also always take into account the potential dangers related to extreme machine and medium temperatures.

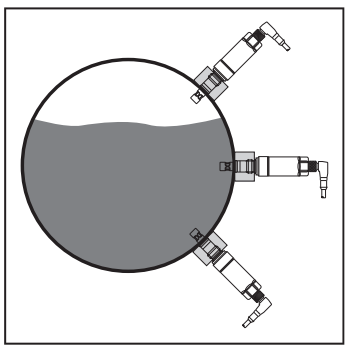
The sensor is supplied without installation / connection accessories.

Only use accessories from ifm electronic gmbh! The optimum function is not ensured when using components from other manufacturers.

Available accessories: www.ifm.com.

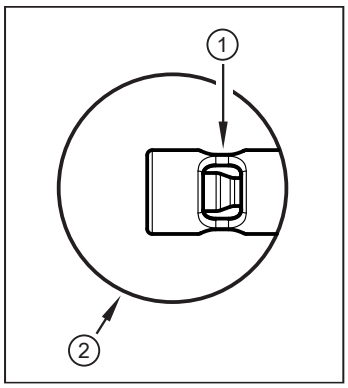
Before using the sensor for the first time, it must be cleaned with an appropriate cleaning agent that is approved for the application.

5.1 Installation location / environment



A correct fit and function of the unit and ingress resistance of the connection are only ensured using ifm adapters.

▶ Observe the following for applications in hygienic areas:
Notes on the use according to EHEDG, Notes on the use according to 3-A® (→ 🗋 11).



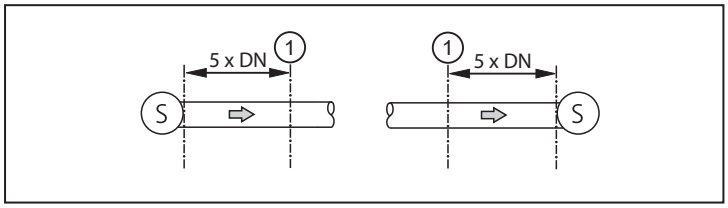
For installation in tanks and pipes:

▶ Install the unit (in particular in horizontal pipes) laterally or at an angle of max. 45 ° to the horizontal.

▷ Avoidance of influence by air bubbles and deposits.

5.1.1 Installation in pipes

1: Measuring element
2: Pipe



▶ Sensor and measuring element (1) must completely reach into the pipe (2).
▷ Unhindered flow through the measuring element is ensured.

▶ Avoid installation in a clamp adapter as this does not guarantee optimum flow through the measuring element. If installation in a clamp adapter cannot be avoided: adhere to the dimensions, see: Notes on the use according to EHEDG (→ 🗋 10)

▶ Installation preferably before or in rising pipes.

▶ Provide for inlet and outlet pipe lengths (5 x DN).

▶ Disturbances caused by bends, valves or pipe reductions, etc. are then eliminated.

S: Disturbance
DN: Pipe diameter
1: Sensor

5.2 Installation procedure

The unit is installed by means of a G 1/2 adapter (→ Accessories).

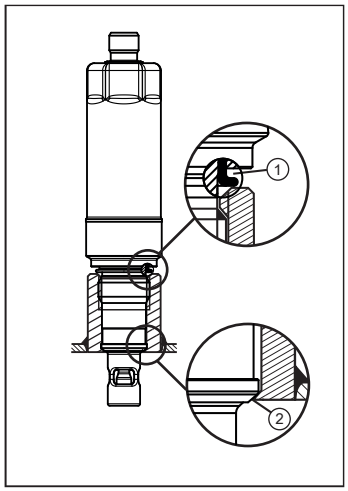
5.3 Installation procedure of the adapter

▶ Observe the operating instructions of the adapter used.

▶ Ensure cleanliness of the sealing areas.

▶ Remove protective packaging only just before mounting.

▶ In case of damaged sealing areas replace the unit or the adapter.



▶ Weld or screw the adapter into the tank / pipe. For welding adapters make sure that the adapter does not warp during the welding process.

With clamp adapters etc. the order of the installation steps differs. Observe the notes in the installation instructions of the respective adapter.

5.4 Installation procedure of the sensor

▶ Slide the supplied seal (gasket) (1) over the thread onto the sensor or check for correct position if it is already mounted.

▷ It seals the gap on the back between the sensor and the adapter.

1: Rear seal (gasket).
2: Sealing cone / sealing PEEK on metal* or metal-to-metal.

* The unit can be used with or without a PEEK sealing ring (pre-mounted on the sealing cone (2)).

For applications in hygienic areas to EHEDG or 3A:

▶ Ensure that the PEEK sealing ring is mounted on the sealing cone (2).

▶ Lightly grease the thread of the sensor using a lubricating paste which is suitable and approved for the application.

▶ Screw the sensor into the respective process connection and tighten it.
Tightening torque: 20 Nm

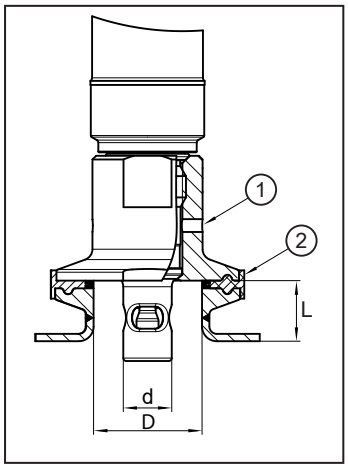
▶ After installation check the tank / pipe for ingress resistance.

5.5 Notes on the use according to EHEDG

In case welded adapters are used, the food contact surface must be smooth (surface roughness Ra < 0.8 µm) and the welding has to be done according to EHEDG Guideline 9 and 35.

The device is suited for CIP (cleaning in process) when installed correctly.

▶ Observe the application limits (temperature and material resistance) according to the data sheet.



▶ Ensure that the installation of the device in the system complies with EHEDG guidelines.

▶ Use self-draining installation.

▶ Only use process adapters permitted according to EHEDG with special seals required by the EHEDG position paper.

▶ When mounted in a tank, the installation must be flush mount. If not possible then direct water jet cleaning and cleaning of dead spaces must be possible.

▶ Leakage ports must be clearly visible and must be installed facing downwards for vertical pipes.

1: Leakage port
2: Seal

▶ To avoid dead space adhere to the dimensions: L < (D - d).

5.6 Notes on the use according to 3-A®

▶ Make sure that the sensor is integrated into the system according to 3-A.

▶ Use only adapters with 3-A qualification and marked with the 3-A symbol. Available accessories: www.ifm.com.

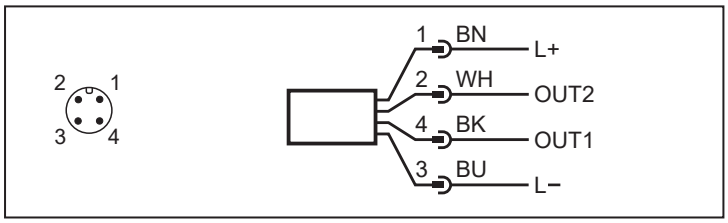
The process connection must be provided with a leakage port. This is ensured when installed using adapters with 3-A approval.

▶ Leakage ports must be clearly visible and must be installed facing downwards for vertical pipes.

For use according to 3-A, special regulations apply for cleaning and maintenance.

Not suitable for systems that have to meet the criteria of E9.2 of the 3A standard 63-04.

6 Electrical connection



The unit must be connected by a qualified electrician.

The national and international regulations for the installation of electrical equipment must be adhered to.

Supply voltage to EN 50178, SELV, PELV according to the technical data sheet.

▶ Disconnect power.

▶ Connect the unit as follows:

Pin	Core colour	
1:	BN	brown
2:	WH	white
3:	BU	blue
4:	BK	black
OUT1: • IO-Link		
OUT2: • analogue output		
Colours to DIN EN 60947-5-2		

6.1 For the cULus scope of validity

The electrical supply must only be made via SELV/PELV circuits.
A class 2 power supply can also be used and is not excluded.
The device must be supplied via a limited energy circuit according to section 9.4 of UL standard 61010-1, 3rd issue, or equivalent.
The external circuits connected to the device must be SELV/PELV circuits.
The device is designed to be safe at least under the following conditions:

- Indoor use
- Altitude up to 2000 m
- Relative air humidity up to max. 90%, non condensing
- Pollution degree 3
- Use UL-certified approved cables of category PVVA or CYJV with data suitable for the application.
- No special treatment is needed for cleaning the device.

7 Parameter setting

A PC with USB IO-Link master or a configured IO-Link environment is required to set the parameters.

If you change parameters during operation, this will influence the function of the plant.

- ▶ Make sure that there will be no malfunctions or dangerous operation in your plant.
- ▶ Note the potential dangers related to extreme plant conditions.

7.1 IO-Link communication interface

The device has an IO-Link communication interface which requires an IO-Link-capable module.

The IO-Link interface allows:

- direct access to process and diagnostic data,
- parameter setting of the unit outside the plant via the IO-Link interface,
- parameter setting of the unit via the IO-Link master during operation.

The IODDs necessary for the configuration of the unit, detailed information about process data structure, diagnostic information, parameter addresses and the necessary information about the required IO-Link hardware and software can be found at www.ifm.com.

7.2 Parameter setting using PC and USB IO-Link master

- ▶ Preparing the PC, software and master. Observe the → Operating instructions of the respective units / software.
- ▶ Connect the unit to the USB IO-Link master (→ Accessories).
- ▶ Follow the menu of the IO-Link software.
- ▶ Set the parameters; adjustable parameters(→ Parameters).
- ▶ Check if the unit has accepted the parameter settings. If necessary, read sensor again.
- ▶ Remove the USB IO-Link master and put the unit into operation.

7.3 Parameter setting during operation

Parameter setting during operation is only possible with an IO-Link-capable module (master).

Setting parameters can be directly adjusted via the controller.
Example: Media-specific parameters such as temperature coefficient [T.Cmp] can be adjusted to improve accuracy.

Recipes and settings can be stored in the controller during operation.

By parameter setting via the controller, a check of the units via a bit in parameter setting is ensured.

7.4 Adjustable parameters

7.4.1 Basic settings

Reset to factory settings	Restore the factory settings (button to activate the system command)
rEF.T	Standard temperature (25 °C) = reference temperature for measuring the conductivity. The standard temperature can be adjusted by the user, if necessary. Setting range: 15...35 °C

T.Cmp	Temperature compensation. The conductivity is determined according to the standard temperature ([rEF.T]) when the temperature coefficient (medium-specific characteristic value) is entered. Setting range: 0...5 %
	 • The temperature compensation is freely adjustable over 10 µS/cm in the corresponding value range and is linear. • Temperature compensation below 10 µS/cm is non-linear according to ASTM D 1125. • If the parameter T.Cmp = 0 is set, the temperature compensation is switched off.
uni.T	Selection of temperature unit [°C] = temperature is displayed in °C (degrees Celsius) [°F] = temperature is displayed in °F (degrees Fahrenheit)
CGA	Calibration gain (cell constant correction factor) With this factor the sensor can be adapted to a present system, or optimised to a certain conductivity value, or corrected. Setting range: 80…120 %.

7.4.2 More settings

ou2	Output configuration for analogue output (OUT2): [I] = measuring range is provided as 4...20 mA [InEG] = measuring range is provided as 20...4 mA [OFF] = output OFF (high impedance)
SEL2	Assignment of the analogue output to the process value: [COND] = conductivity [TEMP] = temperature
ASP2-TEMP	Analogue start point temperature; Setting range: -25...115 °C hysteresis of AEP2-TEMP > 20 % of AEP2-TEMP, min. 35 °C
AEP2-TEMP	Analogue end point temperature; Setting range: 10...150 °C hysteresis of ASP2-TEMP > 20 % of ASP2-TEMP, min. 35 °C
Offset TEMP	Zero-point calibration (calibration offset) / temperature; Setting range: +/- 5 K
ASP2-COND	Analogue start point conductivity; Setting range: 0...1500 µS/cm. Hysteresis of AEP2-COND > 50 % of AEP2-COND.
AEP2-COND	Analogue end point conductivity; Setting range: 1....3000 µS/cm. Hysteresis of ASP2-COND > 50 % of ASP2-COND.
Lo.T	Minimum value memory for the temperature
Hi.T	Maximum value memory for the temperature
Reset [Hi.T] and [Lo.T]	Reset maximum and minimum value memory (button to activate the system command)
Lo.C	Minimum value memory for conductivity
Hi.C	Maximum value memory for conductivity
Reset [Hi.C] and [Lo.C]	Reset maximum and minimum value memory (button to activate the system command)
FOU2	Response of OUT2 in case of a fault: [OU] = analogue output reacts according to process value, if possible. Otherwise: analogue output goes to [OFF]. [On] = analogue output switches to value > 21 mA in case of a fault [OFF] = analogue output switches to value < 3.6 mA in case of a fault
dAP	Damping of the measured signal. Setting range: 0...20 s
S.Tim	Simulation; entering the simulation time Setting range: 1...60 min
S.On	Simulation; status of the simulation: [OFF] = simulation OFF [On] = simulation ON
Start simulation	Start simulation (button to activate the system command)
Stop simulation	Stop simulation (button to activate the system command)

S.TMP	Simulation; selection of the temperature value to be simulated Setting range: -35...160 °C
S.CND	Simulation; selection of the conductivity value to be simulated Setting range: 0... 3150 µS/cm
Unit temperature	Current temperature of the unit Measuring range: -40...110 °C

For further information, please refer to the IODD description (www.ifm.com) or to the context-specific parameter descriptions of the used parameter setting software.

7.4.3 Example parameter setting

▶ Set the temperature compensation (parameter [T.Cmp]) to a medium with the temperature coefficient 3.0 %/K. Example: [T.Cmp] = [3.0].

▶ Make all other settings.

▶ Transfer the sensor data to the unit.

7.5 Temperature influence and temperature coefficient

7.5.1 Influence of the medium on the temperature

The conductivity depends on the temperature. When the temperature increases, the conductivity changes. This temperature influence depends on the respective medium and can be compensated by the unit if the temperature coefficient (tempco) of the medium is known. The temperature compensation is set via the parameter [T.Cmp]. Then the temperature-compensated conductivity value corresponds to the conductivity at standard temperature (25 °C; factory setting of the parameter [rEF.T]).

For medium that is not changed the same tempco value has to be set for all sensors (unit-independent characteristic value). There is no further dependence on the measuring principle, the lot or the manufacturer of the sensors.

If the temperature coefficient of the medium is not known, it can be determined.
See: Determination of the temperature coefficient tempco (→ 🗋 15)

In an IO-Link environment, existing tempcos of the media can be stored as recipe in the controller so that the accuracy of the values to be detected is improved.

7.6 Determination of the temperature coefficient tempco

1. Set the parameters [T.Cmp] and [dAP] to zero: [T.Cmp] = [0], [dAP] = [0].

▶ Write the changed values to the sensor.

1. Adjust the medium to 25 °C, for example, and take down the value of the conductivity after 2 min.
2. Heat up the medium to 45 °C, for example, and take down the value of the conductivity after 2 min.

Example of values taken down:
Medium at 25°C = 500 µS/cm; medium at 45°C = 800 µS/cm
Temperature change = 20 K

1. Calculate the change of the conductivity in percent.
   The conductivity has increased by 300 µS/cm.
   The percentage change is 300/500 = 60 %.
2. Calculate the temperature coefficient tempco: The tempco is calculated from the change in percent and the temperature change: Tk = 60 % / 20 K = 3 % / K

3. The calculated tempco can now be adopted into the parameter [T.Cmp].
   Example: [T.Cmp] = [3]. If necessary, set the damping (parameter [dAP]) again.

▶ Write values to the sensor.

8 Operation

8.1 Function check

After power-on the device is in the operating mode. It carries out its measurement and evaluation functions and generates process data (via IO-Link) according to the set parameters.

▶ Check whether the unit operates correctly.

8.2 Operating and diagnostic messages via IO-Link

IODD and IODD descriptive text as a PDF file at: www.ifm.com

8.3 Output response in different operating states

	OUT1 *)	OUT2
Initialisation	process value invalid	OFF
Normal operation	process value according to conductivity / temperature	according to conductivity / temperature and setting [ou2]
Fault	process value invalid	< 3.6 mA at [FOU2] = [OFF] > 21 mA at [FOU2] = [On] no change at [FOU2] = [OU]

*) process value via IO-Link

9 Maintenance, repair, transport and disposal

- ▶ Avoid the formation of deposits and soiling at the sensor element.
- ▶ To avoid damage to the sensor, no hard or sharp objects must be used when cleaning the sensor manually.

When the medium is changed, it may also be necessary to adapt the unit settings for a higher accuracy (parameter [T.Cmp]).

- ▶ It is not possible to repair the unit.
- ▶ After use dispose of the unit in an environmentally friendly way in accordance with the applicable national regulations.
- ▶ In case of return shipment, ensure that the unit is free from soiling, especially from dangerous and toxic substances.
- ▶ For transport only use appropriate packaging to avoid damage of the unit.

10 Factory setting

	Factory setting	User settings
rEF.T	25 (°C)	
T.Cmp	2 (%)	
uni.T	°C	
CGA	100 (%)

Customer	Place of installation	Manufacturer
		EnviroFALK GmbH PROZESSWASSER-TECHNIK Industriegebiet Sainscheid 56457 Westerburg www.falk-gmbh.com Telefon: (0)2663 / 99 08 - 0 Telefax: (0)2663 / 99 08 - 50

Read the operating instructions through carefully before commissioning the installation. EnviroFALK shall not be liable for malfunctions due to faulty operation and disregard of this operating manual.

EnviroFALK GmbH , Westerburg retains the copyrights of this documentation.

Please keep for later reference!

General Notes

1. **Before commissioning and/or using the installation:** Please observe the respective installation and operation instructions in this manual.
2. **Please note:** Incorrect usage and improper operation shall void the manufacturer's liability.
3. Changes in the installation may not be carried out without consultation and sanction with us, otherwise damages are not covered by our guarantee.
4. The temperature in the operating room of the unit must be at least **5 °C**.
5. Observe all valid, general decrees and regulations on the installation site. **Accident prevention regulations** also apply.
6. In case of queries and orders for replacement parts, it is vital to state the correct installation name and the installation no. in order to facilitate correct and quick order processing.

Shipment and packaging

FALK installations are carefully packaged and tested before shipment. Since damages caused during transit may nevertheless occur, it is indispensable to **check the installation upon receipt**.

- Check the delivery for **completeness** against the bill of delivery.
- If the packaging is **damaged,** the goods must immediately be **inspected visually**. This is to be **noted** on the haulage company's **transportation documents**. In addition, please observe the fact that you are responsible for **hidden damages** that only appear during start-up. **Contact the haulage company immediately,** otherwise transportation insurance cannot be claimed. Keep the packaging, in case of any possible checks by the haulage or insurance companies.
- Pack up the goods so they are shock-proof for returning them.
- **Drain the installation** before shipment in order to save packaging weight and cost and to prevent spilled water soaking the packaging.

EnviroFALK helpline

Good advice is just a phone call away!

The EnviroFALK GmbH in Westerburg (Germany) helpline EnviroFALK is at hand to offer advice and practical help to EnviroFALK operators. Just give us a call.

Germany: +49 2663 9908 - 22

The FALK team is available during business hours. Our Customer Service is happy to answer any engineering issues.

Business hours:

Monday to Thursday:	8:00 am to 12:00 pm and 12:30 pm to 04:00 pm
Friday:	8:00 am to 12:00 pm and 12:30 pm to 03:00 pm

Safety instructions

- Before actuation, check corrective maintenance to ensure all protective enclosures are fastened.
- In all respects, local safety and accident prevention regulations apply for the operation of the installation.

- The consumption of conditioned water poses a health danger.

- Use caution when tubes are loose. Danger of injuries. Floor may be slippery.
- Pumps must not operate within the installation on the outlet side against closed valves. There is a danger of destruction if overloaded.
- Only tighten tube connections by hand.
- Leaks must be eliminated immediately. Danger of water damage and injuries due to slippery floors.

- Note: Observe valid safety regulations when handling chemical products (e.g. cleaning agents).
- Wear protective clothes!
- If skin or eyes are contacted with chemicals: flush with clean water. Visit your doctor.

Description

The system protects tanks against bacteries or other biological dirts coming out of the drain pipe/overflow pipe.

EnviroFALK GmbH sells you a perfect media for use in the unit:
Colored solution for tank overflow indication, Article No. **475196**
pH: 9.0 – 9.5
without UN-number

Accident prevention regulations also apply.

Fill the media art. No. 475196 into the Overflow pipe preventer

Service and maintenance

- Refill media if necessary.
- Replace filling one time a year.
- For all your questions: **Service-Hotline +49 2663 99 08 22.**

1. Identification of the substance/mixture and of the company/undertaking

1.1 Product identifier

Article number: 475196
Product name: indicator solution for industrial use

1.2 Relevant identified uses of the substance or mixture and uses advised against:

Colored solution for use in tank overflow, with bactericide

1.3 Details of the supplier of the safety data sheet:

EnviroFALK GmbH
Prozesswasser-Technik
Gutenbergstraße 7
56457 Westerburg
Germany
Tel.: +49 2663 9908-0
Fax.: +49 2663 9908-50
http://www.envirofalk.com
Email: sdb@envirofalk.com

Office hours:	Monday - Thursday:	7:45 am – 16:45 pm
	Friday:	7:45 am – 15:15 pm

1.4 Emergency telephone number:

+49 (0) 2663 9908-23 (EnviroFALK hotline only during office hours)

2. Hazards identification

2.1 Classification of the substance or mixture

Classification according EC regulation 1272/2008: none required
Classification according to CEE regulation 1272/2008: none required
No cat 1 or 2 or 3 or 4 ATE.

2.2 Label elements:

GHS 07
Signal word: WARNING
0.2 % of the product are substances with unknown toxicity.
0.002 ‰ oft he product is a dye that is not classified as acut toxic.
H302+H312+H332: Harmful if swallowed, in contact with skin or if inhaled.
P280: Wear protective gloves/protective clothing/eye protection/face protection.
P302+352: IF ON SKIN: Rinse with water

P314: Get medical advice/attention if you feel unwell.

2.3 Other hazards:
PBT: no
vPvB: no

3. Composition/information on ingredients

3.1 Substance:
The product is a mixture

3.2 Mixture:
The mixture contents:

CAS: 26172-55-4 EINECS: 2475007	5-Chlor-2-methyl-2H-isothiazol-3-one	< 0,25 %
CAS: 2682-20-4 EINECS: 2202396	2-Methyl-2H-isothiazol-3-one	< 0,25 %
CAS: 1310-73-2 EINECS:	Natrium hydroxide	< 0,02 %
CAS: 81-88-9 EINECS: 201-383-9	Rhodamin B	< 0,002 %

4. First aid measures

4.1 Description of first aid measures:
After inhalation: supply fresh air.
In case of skin contact: Rinse with water. Remove contaminated clothes.
After eye contact: Rinse opened eye with water. Contact doctor.
After swallowing: Drink water. Contact the doctor.

4.2 Most important symptoms and effects, both acute and delayed:
Headache, nausea, skin and eye irritation

4.3 Indication of any immediate medical attention and special treatment needed:
No additional information available.

5. Firefighting measures

5.1 Extinguishing media:
Water, CO_2, foam, powder. Adapt extinguishing measures to suit the environment.
5.2 Special hazards arising from the substance or mixture:
Mixture is non-flammable.
5.3 Advice for firefighters:
Do not allow fire water to penetrate into surface or ground water.

6. Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures:
Avoid substance contact.

Wear protective clothing (Skin, hand, face and body protection).
Keep unprotected persons away from the product.

6.2 Environmental precautions:
Do not empty into drains or groundwater or surface water.

6.3 Methods and materials for containment and cleaning up:
For small amounts: Pick up with suitable appliance and dispose of.
For larger amounts: Pick up with suitable appliance, store into a suitable container. and dispose of.
Rinse contaminated surfaces with water or cleaning agent with a water content. Use neutralising agent.
Dispose contaminated as waste according chap.13. Ensure sufficient ventilation.

6.4 Reference to other sections:
Sections 8 and 13

7. Handling and storage

7.1 Precautions for safe handling:
Wear protective clothing. Avoid any contact with the product.
For transport and storage: Keep container tightly closed.
Don’t smoke. Keep away from sources of ignition.

7.2 Conditions for safe storage, including any incompatibilities:
Requirements to be met by storerooms and receptacles: Store in a cool and ventilated location.
Store not longer than 6 month after delivery.
Keep container tightly closed.
Freezing and thawing reduces the effectiveness oft he product.
German regulations Storage class VCI: 12.

7.3 Specific end use(s):
Colored solution for use in tank overflow, with bactericide, only for industrial use.

8. Exposure controls/personal protection

8.1 Control parameters:

26172-55-4	5-Chlor-2-methyl-2H-isothiazol-3-on	AGW = 0,05 mg/m³
2682-20-4	2-Methyl-2H-isothiazol-3-on	AGW = 0,05 mg/m³

German national occupational exposure limit value AGW

8.2 Exposure controls:
Engineering measures:
Priority is to be given to organisational and technical measures. Use protective clothing for case of residual danger.

Individual protection measures:
Hygienic measures: Immediately change contaminated clothing.
Use skin cleaning agents and skin care agents after cleaning the skin at the end of the work.

Hand protection: Protective gloves (nitrile rubber, 0,11 mm, penetration time > 480 minutes). Replace used gloves periodically.

Other measures: protective clothing.

Respiratory protection: not necessary.

9. Physical and chemical properties

9.1 Information on basic physical and chemical properties

Form:	liquid
Colour:	red
Odour:	acrid smell
pH:	10,5 (at 20 °C)
Melting point:	approx. -5 °C
Boiling point/boiling range:	approx. 100 °C
Flash point:	no information available
Flammability (solid, gas):	no information available
Lower explosion limit:	no information available
Upper explosion limit:	no information available
Vapour pressure:	no information available
Relative vapour density:	no information available
Density:	1,05 g/cm³ (at 20 °C)
Water solubility:	unrestricted water-soluble
Auto-ignition temperature:	no information available
Decomposition temperature:	no information available
Viscosity, dynamic:	no information available
Explosive properties:	no information available
Oxidizing properties:	no information available

9.2 Other data:

No further data available

10. Stability and reactivity

10.1 Reactivity:

Reacts with oxidizing agents, Amine, reducing agents under heat.

10.2 Chemical stability:

This material is considered stable under normal ambient and anticipated storage and handling conditions of temperature and pressure.

10.3 Possibility of hazardous reactions:

There are expected no hazardous reactions for intended use.

10.4 Conditions to avoid:
Avoid temperatures < 0 °C.

10.5 Incompatible materials:
Oxidizing agents, Amine, reducing agents.

10.6 Hazardous decomposition products:
In case of fire (see chapt. 5): NOx, SOx, HCl

11. Toxicological information

LD50 (oral) = 3350 mg 5-Chlor-2-methyl-4-isothiazolin-3-on / kg Rat
LD50 (oral) = 550 mg 2-Methyl-4-isothiazolin-3-on / kg Rat

Skin irritation: possible
Eye irritaition: possible

Further dangerous properties possible. Observe the common safety rules fort he working with chemicals.

12. Ecological information

12.1 Toxicity:
We have no quantitative data concerning the ecological effects of this product.

12.2 Persistence and degradability:
We have no data concerning the persistence effects of this product. The product is biotic degradable only below microbicidal effect concentration.
Abicidal degradability is possible.
With the appropriate introduction of low concentrations into adapted biological wastewater treatment plants, trouble is not to be expected in the decomposition activity of activated sludge.
AOX concentration possible, contents organic halogene.

12.3 Bioaccumulative potential:
No information available.

12.4 Mobility in soil:
No information available.

12.5 Results of PBT and vPvB assessment:
PBT/vPvB assessment not available as chemical safety assessment not required/not conducted.

12.6 Other adverse effects:
No environmental problems can be expected when the product is handled and used properly.

13. Disposal considerations

13.1 Waste treatment methods

The allocation of waste identity numbers/waste descriptions must be carried out according to the EEC, specific to the industry and process.
Dispose according to legislation.
Waste code (91/689/EEC) : 16 10 03* aqueous concentrates containing dangerous substances

Product/Packaging disposal

Packing which cannot be properly cleaned must be disposed of.

13.2 Additional information

Do not allow uncontrolled discharge of product into the environment.

14. Transport information

Not classified as dangerous in the meaning of transport regulations.

14.1 UN Number:

No UN number

14.2 UN proper shipping name:

No proper common shipping name.

14.3 Transport hazard class(es):

No information

14.4 Packing group:

No data available.

14.5 Environmental hazards:

No further data available.

14.6 Special precautions for user:

No information.

14.7 Bulk goods transport (MAPROL) and IBC-Code:

No information.

15. Regulatory information

15.1 Safety, health and environmental regulations/legislation specific for the substance or mixture:

Please consider possible restrictions of occupation after maternity protection guideline regulation or law for the protection of young workers.
German regulations Storage class VCI: 12.
The product is considered as low hazardous to waters WGK1, self-classification according to VCI (chemical industry association) concept.

15.2 Chemical safety assessment:

A Chemical Safety Assessment has not been carried out.

16. Other information

The information contained herein is based on the present state of our knowledge. It characterises the product with regard to the appropriate safety precautions. It does not represent a guarantee of any properties of the product.

AOAC = AOAC International (formerly Association of Official Analytical Chemists)
aq. = Aqueous
ASTM = American Society of Testing and Materials (US)
atm = Atmosphere(s)
B.V. = Beperkt Vennootschap (Limited)
BCF = Bioconcentration Factor
bp = Boiling point at stated pressure
bw = Body weight
ca = (Circa) about
CAS No = Chemical Abstracts Service Number (see ACS - American Chemical Society)
CEFIC = European Chemical Industry Council (established 1972)
CIPAC = Collaborative International Pesticides Analytical Council
CLP = REGULATION (EC) No 1272/2008 on classification, labelling and packaging of substances and mixtures.
Conc = Concentration
cP = CentiPoise
cSt = Centistokes
d = Day(s)
DIN = Deutsches Institut für Normung e.V.
DNEL = Derived No-Effect Level
DT50 = Time for 50% loss; half-life
EbC50 = Median effective concentration (biomass, e.g. of algae)
EC = European Community; European Commission
EC50 = Median effective concentration
EINECS = European Inventory of Existing Commercial Chemical Substances (EU, outdated, now replaced by EC Number)
ELINCS = European List of Notified (New) Chemicals (see Tab 7, Background - Guide)
ErC50 = Median effective concentration (growth rate, e.g. of algae)
EU = European Union
EWC = European Waste Catalogue
FAO = Food and Agriculture Organization (United Nations)

GIFAP = Groupement International des Associations Nationales de Fabricants de Produits Agrochimiques (now CropLife International)
h = Hour(s)
hPa = HectoPascal (unit of pressure)
IARC = International Agency for Research on Cancer
IATA = International Air Transport Association
IC50 = Concentration that produces 50% inhibition
IMDG Code = International Maritime Dangerous Goods Code
IMO = International Maritime Organization
ISO = International Organization for Standardization
IUCLID = International Uniform Chemical Information Database
IUPAC = International Union of Pure and Applied Chemistry
kg = Kilogram
Kow = Distribution coefficient between n-octanol and water
kPa = KiloPascal (unit of pressure)
LC50 = Concentration required to kill 50% of test organisms
LD50 = Dose required to kill 50% of test organisms
LEL = Lower Explosive Limit/Lower Explosion Limit
LOAEL = Lowest observed adverse effect level
mg = Milligram
min = Minute(s)
ml = Milliliter
mmHg = Pressure equivalent to 1 mm of mercury (133.3 Pa)
mp = Melting point
MRL = Maximum Residue Limit
MSDS = Material Safety Data Sheet
n.o.s. = Not Otherwise Specified
NIOSH = National Institute for Occupational Safety and Health (US)
NOAEL = No Observed Adverse Effect Level
NOEC = No observed effect concentration
NOEL = No Observable Effect Level
NOx = Oxides of Nitrogen
OECD = Organization for Economic Cooperation and Development
OEL = Occupational Exposure Limits
Pa = Pascal (unit of pressure)
PBT = Persistent, Bioaccumulative or Toxic
pH = -log10 hydrogen ion concentration
pKa = -log10 acid dissociation constant
PNEC = Previsible Non Effect Concentration
POPs = Persistent Organic Pollutants
ppb = Parts per billion
PPE = Personal Protection Equipment
ppm = Parts per million
ppt = Parts per trillion
PVC = Polyvinyl Chloride
QSAR = Quantitative Structure-Activity Relationship
REACH = Registration, Evaluation and Authorization of CHemicals (EU, see NCP) SI = International System of Units
STEL = Short-Term Exposure Limit

tech. = Technical grade
TSCA = Toxic Substances Control Act (US)
TWA = Time-Weighted Average
vPvB = Very Persistent and Very Bioacccumulative
WHO = World Health Organization = OMS
y = Year(s)

Gut zu wissen!

- **Bevor Sie die Installation vornehmen und das Gerät benutzen:** Beachten Sie bitte die entsprechenden Installations- und Bedienhinweise in dieser Bedienungsanleitung.
- **Bitte beachten Sie:** Bei nicht bestimmungsgemäßem Gebrauch und unsachgemäßer Bedienung ist der Hersteller von jeglicher Haftung freigestellt.
- Veränderungen an der Anlage dürfen ohne die Rücksprache und Zustimmung mit uns nicht vorgenommen werden, bei Schäden übernehmen wir sonst keine Gewährleistung.
- Die Überprüfung der qualitativen Merkmale obliegt dem Betreiber der Anlage. Ebenso eine umgehende Abschaltung bei Überschreitung der Grenzwerte.
- Die Temperatur im Betriebsraum der Anlage muss **mindestens 5 °C** betragen.
- Vor Montagebeginn prüfen Sie bitte die Statik der Wände, Decken und Böden. Diese müssen statisch belastbar sein.
- Beachten Sie die am Aufstellort der Anlage jeweils gültigen allgemeinen Verordnungen und Vorschriften. Ebenso gelten die **Unfallverhütungsvorschriften**.
- Der Aufstellort muss so beschaffen sein, dass keine Wasserschäden verursacht werden (z.B. durch einen vorhandenen **Bodenablauf**). Diese werden nicht vom Hersteller getragen.
- Wichtig für alle Rückfragen und Ersatzteilbestellungen ist die richtige Angabe der Gerätebezeichnung. Nur so ist eine einwandfreie und schnelle Bearbeitung möglich.
- Wasserberührende Teile nach der Wasseraufbereitung müssen aus einem beständigen Material wie PE, PP oder V2A / V4A sein und in Verarbeitung und Verlegung den Anforderungen entsprechen.

1. Sicherheitshinweise

Bitte beachten Sie während aller Arbeiten an dieser Anlage zu Ihrem eigenen Schutz die auf der folgenden Seite aufgeführten Sicherheitshinweise. Jede Person, die im Betrieb des Anwenders mit der Montage, Inbetriebnahme, Bedienung und Instandhaltung der Anlage befasst ist, muss die komplette Bedienungsanleitung gelesen und verstanden haben. Die Anlage darf nur von autorisiertem, ausgebildetem und eingewiesenem Personal bedient, gewartet und instandgesetzt werden.

Wartungen und Reparatur dürfen nur von ausgebildetem autorisiertem Fachpersonal (Installateure und Elektrofachkräfte) ausgeführt werden.

	**Gefahr eines elektrischen Stromschlages!** **(bei Option Leitfähigkeits-Messgerät)**
GEFAHR	Installations- und Reparaturarbeiten dürfen nur von einer Elektrofachkraft ausgeführt werden! Vor Installationsarbeiten die Stromversorgung vom Netz trennen! Vorsicht bei offenen Abdeckungen. Es können Teile unter gefährlichen Spannungen stehen!

	**Kein Trinkwasser!**
WARNUNG	Der Verzehr von aufbereitetem Wasser ist gesundheitsschädlich!

	**Rutschgefahr!** **Vorsicht bei losen Schläuchen. Verletzungsgefahr!** **Rutschgefahr!**
VORSICHT	Wechseln Sie defekte Dichtungsringe gegen passende Dichtungsringe aus. Undichtigkeiten umgehend beseitigen. Rohrverschraubungen nur handfest anziehen.

2. Transport und Verpackung

EnviroFALK-Systeme und -Anlagen werden vor Versand sorgfältig verpackt und geprüft, jedoch sind Beschädigungen durch den Transport nicht auszuschließen. Daher sind **Eingangskontrollen** unbedingt erforderlich.

- Bei beschädigter **Verpackung** sofort eine **Sichtprüfung** der Ware durchführen. Dies auf den **Versandpapieren** der Spedition **vermerken**. Machen Sie bitte den Zusatz, dass Sie sich das Recht für **verdeckte Schäden** offen halten, die sich erst bei der Inbetriebnahme zeigen. Setzen Sie sich **sofort mit der Spedition in Verbindung.** Ansonsten kann die Transportversicherung nicht herangezogen werden. Bewahren Sie die Verpackung für eine eventuelle Überprüfung durch den Spediteur oder die Versicherung auf.
- Kontrollieren Sie die **Vollständigkeit** der Warenlieferung anhand des Lieferscheins.
- Verpacken Sie die Ware für den Rückversand stoßsicher.
- Für den Versand das Wasser aus dem System entfernen. Dadurch können Sie Versandkosten sparen.

3. Wasseraufbereitungsanlagen vom Typ DIA

Überall dort, wo Reinwasser unter Druck zu einer Anwendung oder einem Verbraucher geführt werden muss, sind druckfeste Patronen erforderlich. Unsere aus korrosionsbeständigem V_4A- Edelstahl oder glasfaserverstärktem Kunststoff (GKF) gefertigten Patronen entsprechen diesen Anforderungen vollständig.

3.1 Wasser- Vollentsalzung

Die **Wasser- Vollentsalzer vom Typ DIA** entfernen Wasserinhaltsstoffe (d.h. leitfähige Salze und Mineralien wie beispielsweise Kalzium, Magnesium, Sulfate, etc.) aus dem Wasser und senken somit dessen Leitfähigkeit. Sie sind mit regenerierfähigem Mischbett-Ionenaustauscherharz höchster Qualität gefüllt und entfernen die ionogen vorliegenden Wasserinhaltsstoffe zuverlässig. Je nach Mineralgehalt des aufzubereitenden Wassers (i.d.R. Trinkwasser oder Brunnenwasser) wird der Wasservollentsalzer beladen. Das aufbereitete Wasser wird VE-Wasser (voll-entsalztes Wasser) genannt.

3.2 Bestimmung der Wasserqualität- die Messung der Leitfähigkeit (DIA MB)

Die Wasserqualität wird mit Hilfe der sog. Leitfähigkeit gemessen. Sie ist ein Maß für die im Wasser enthaltenen Inhaltsstoffe. Je geringer die Leitfähigkeit ist, desto besser ist die Wasserqualität. Typische Leitfähigkeitswerte nach der Aufbereitung mit einem Wasser-Vollentsalzer vom Typ DIA MB sind Werte < 1 µS/cm erreichbar. Steigt die Leitfähigkeit über den durch den Anwender festgelegten Wert, müssen die Entsalzungs-Patronen gewechselt werden, zum Schutz vor Verkeimung aber spätestens halbjährlich.

Option: Leitfähigkeits-Messgerät

Zum Wasser-Vollentsalzer kann optional das für Ihre Anwendung notwendige Gerät separat bestellt werden. Weitere Informationen zu diesem Gerät finden sich in der Messgeräte- Anleitung.

3.2.1 Bestimmung der Wasserqualität- die Messung der Leitfähigkeit (DIA KR)

Die Wasserqualität wird mit Hilfe der sog. Leitfähigkeit gemessen. Sie ist ein Maß für die im Wasser enthaltenen Inhaltsstoffe. Je geringer die Leitfähigkeit ist, desto besser ist die Wasserqualität. Typische Leitfähigkeitswerte nach der Aufbereitung mit einem Wasser-Vollentsalzer vom Typ DIA KR sind Anfangswerte von 0,055 µS/ cm erreichbar. Steigt die Leitfähigkeit über den durch den Anwender festgelegten Wert, müssen die Entsalzungs- Patronen gewechselt werden, zum Schutz vor Verkeimung aber spätestens halbjährlich.

Option: Leitfähigkeits-Messgerät

Zum Wasser-Vollentsalzer kann optional das für Ihre Anwendung notwendige Gerät separat bestellt werden. Weitere Informationen zu diesem Gerät finden sich in der Messgeräte- Anleitung

4. Montage und Betrieb

Die Anlage wird wie folgt in Betrieb genommen. Sollten Sie bei der beschriebenen Prozedur unsicher sein oder Fragen haben, so wenden Sie sich bitte an unseren Customer- Service (Telefon: 02663- 9908-22).

4.1 Montage- Vorbereitung

1. Alle Anschlüsse (Wasser, Elektrizität) anschlussbereit herstellen.
2. Die Anlage waagerecht aufstellen.

4.2 Montage des Leitfähigkeits-Messgerätes (optional)

Das Messgerät wird mit einem Anschluss-Stück geliefert, welches auf die Vollentsalzer- Patrone montiert wird.

1. Das Messgerät gerade auf den **AUSGANG** des Anschlussgewindes setzen und handfest andrehen. Ein- und Ausgang der Patronen sind markiert (s. Abb.).
2. Bei der Montage auf den korrekten Sitz der Dichtung achten (sofern im Lieferumfang enthalten). U.U. das Gewinde der Patrone zusätzlich mit Teflonband umwickeln.
3. Messgerät mit einer Steckdose verbinden. Das Messgerät ist nun eingeschaltet.
4. Optional: Am Messgerät - sofern möglich (ist geräteabhängig) - den Wert (Grenzwert) festlegen, ab welchem die Wasserqualität zu schlecht ist und die Patrone gewechselt werden muss. Dazu die separate Anleitung zum Messgerät beachten!

Eingang und Ausgang sind markiert

4.3 Inbetriebnahme

1. Die Zuleitung für das aufzubereitende Wasser am **EINGANG** anschließen.
2. Die Ableitung für das aufbereitete Wasser (VE-Wasser) am **Ausgang des Messgerätes** anschließen.
3. Patrone entlüften: Entlüftungsschraube vorsichtig lösen. Sobald ein konstanter Wasserstrahl austritt die Entlüftungsschraube wieder schließen.
4. Die korrekte Leitfähigkeit wird erst nach einigen Minuten angezeigt.

Anschluss- Beispiel: Edelstahl-Patrone mit Messgerät Typ D100

Entlüftungsschrauben

➔ Weitere Informationen zum Messgerät finden sich in der separaten Anleitung.

4.4 Tausch der Patronen

Übersteigt die Leitfähigkeit im aufbereiteten Wasser den eingestellten Grenzwert, so ist die Vollentsalzer- Patrone erschöpft und muss getauscht werden. Kontaktieren Sie dazu den Hersteller EnviroFALK. Er wird den Wechsel der Patronen für Sie organisieren.

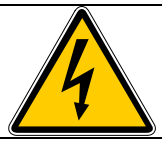
4.3 Commissioning 17
4.4 Exchange of Cartridges 17



General Notes

- **Before commissioning and/or using the installation:** Please observe the respective installation and operation instructions in this manual.
- **Please note:** Incorrect usage and improper operation shall void the manufacturer's liability.
- Changes in the installation may not be carried out without consultation and sanction with us, otherwise damages are not covered by our guarantee.
- The temperature in the operating room of the unit must be at least **5 °C**.
- The static suitability of walls, ceilings and floors must be proven before assembling the installation.
- Respect all valid, general decrees and regulations on the installation site. **Accident prevention regulations** also apply.
- The installation site must be constructed so that no water damage arises (e.g. by means of an existing **floor drain**). The manufacturer may not be held responsible for water damage.
- In case of queries and orders for replacement parts, it is vital to state the correct installation name and the installation no. in order to facilitate correct and quick order processing.
- Parts exposed to treated water must be made of a pure water resistant material, like PE, PP or V2A / V4A.

1. Safety Instructions

The operating instructions given here are to be regarded as part of the product and are to be kept for the complete life duration of the product.
The installation may only be serviced, maintained and repaired by authorised, qualified and responsible staff.
Any member of the technical staff instructed by the plan operator must be able to operate the installation and to maintain it in operating condition. Make operating staff aware of the consequences of wrong settings.

Maintenance and repair work may only be carried out by qualified and approved technical staff (fitters and electricians).

	**Danger of high voltage! (for optional conductivity meter)**
DANGER	Use caution when handling electric installation parts. Only qualified electricians are authorised to carry out these tasks. Use caution when covers are open: Components may be live. Before operating the installation, disconnect the power supply from the National Grid. Before commencing maintenance work, the installation must be switched off and there must be no tension in the pipe system.

	**The consumption of conditioned water poses a health danger!**
WARNING	Don’t drink water of the system.

	**Danger of wet floors!**
CAUTION	Use caution when tubes are loose. Danger of injuries. Floor may be slippery. Only tighten tube connections by hand. Eliminate leaks immediately. Danger of water damage/ injuries on slippery floors. Defective O-rings must be replaced by appropriate, new O-rings.

2. Shipment and Packaging

Our installations are carefully packaged and tested before shipment. Since damages caused during transit may nevertheless occur, it is indispensable to **check the installation upon receipt**.

- If the packaging is damaged, the goods must **immediately be inspected** visually. This is to be noted on the haulage company's transportation documents. Keep in mind that you are responsible for hidden damages that only appear during start-up. Contact the haulage company immediately, otherwise transportation insurance cannot be claimed. Keep the packaging, in case of any possible checks by the haulage or insurance companies.
- Check the delivery for **completeness** against the bill of delivery.
- Pack up the goods so they are shock-proof for returning them.
- Drain the installation before shipment in order to save packaging weight.

3. Water Treatment Plants Type DIA

Wherever pure water needs to be delivered to technical applications or other consumers by the use of pressure, pressure-proof cartridges are necessary. Our pressure-proof cartridges made of corrosion-resistant V_4A-high quality stainless steel or glass-fibre reinforced plastic (GFK) completely comply to these requirements.

3.1 Water Demineralization

The **water demineralisation cartridges type DIA** remove conductive matter (salts and minerals like calcium, magnesia, sulphate, etc.) from water, thus decreasing its conductivity. All cartridges are filled with high quality regenerable mixed-bed cation exchange resin, reliably removing the ionogenic water components. The higher the quantity of water components materials, the quicker the water demineralisation cartridge becomes depleted.

3.2 Determination of the Water Quality- Measuring the Conductivity (DIA MB)

The water quality is measured by means of the so called conductivity. It is an indicator of the amount of substances contained in the water. The lower the conductivity, the better the water quality. Typical conductivity values after treatment with a water demineralization of type DIA MB are values <1 µS / cm. As soon as the conductivity has exceeded the limit (defined by the operator), the demineralisation cartridges have to be replaced. Replace them at least every 6 months in order to avoid bacterial contamination.

Option: Conductivity Meter:

The conductivity meter required for your application can be ordered separately. More information about this device can be found in the **separate conductivity meter manual.**

3.2.1 Determination of the Water Quality- Measuring the Conductivity (DIA KR)

The water quality is measured by means of the so called conductivity. It is an indicator of the amount of substances contained in the water. The lower the conductivity, the better the water quality. Typical conductivity values after treatment with a water demineralization of type DIA KR are values 0,055 µS / cm. As soon as the conductivity has exceeded the limit (defined by the operator), the demineralisation cartridges have to be replaced. Replace them at least every 6 months in order to avoid bacterial contamination.

Option: Conductivity Meter:

The conductivity meter required for your application can be ordered separately. More information about this device can be found in the **separate conductivity meter manual.**

4. Assembly Installation and Operation

Commission the plant as explained in the following sections. If unsure about the procedure or you have questions, please call our Customer Service at +49 2663 99 08 22.

4.1 Preparations

1. All supply connections (water, electricity) are to be set up, ready for installation.
2. Set up the installation so that it is level.

4.2 Mounting the conductivity Meter (optional)

The meter is delivered with a connection piece, which has to be mounted on the cartridge.

1. Place the meter straight on the OUTLET of the connection thread and turn it hand-tight. The cartridge's input and output are marked (see figure).

2. When mounting, ensure that the sealing (if included in the delivery of the meter) is correctly seated. If necessary apply additional teflon tape.

4. Connect the meter to an electrical outlet . The meter is now switched on.

5. Option: Depending on the type of conductivity meter is used: Set the value (limit value) of the meter at which the water quality is too bad and the cartridge has to be replaced. Please observe the separate instructions for the measuring instrument!

Inlet and outlet are clearly marked

4.3 Commissioning

1. Connect the inlet piping to the cartridge INLET.
2. Connect the pure water piping to the outlet of the conductivity meter.
3. Ventilating the cartridge: Carefully open the air bleed valve on the cartridges' lid. As soon as a constant water jet flows out, close the air bleed valve again.
4. Correct conductivity is displayed after a few minutes.

Example: connection of stainless steel cartridge with meter type “D100”

air bleed valves

➔ Further information on the measuring instrument can be found in the separate manual.

4.4 Exchange of Cartridges

If the conductivity in the treated water exceeds the set limit value, the demineralization cartridge is exhausted and must be replaced. Please contact the manufacturer EnviroFALK. He will organize the exchange of cartridges for you.

4.3 Mise en service 25
4.4 Remplacement des cartouches 25

Remarques générales

- **Avant la mise en service et/ou l'utilisation de l'installation :** Veuillez respecter les instructions d'installation et d'utilisation contenues dans ce manuel.
- **Important :** Le fabricant ne peut être tenu responsable de toute utilisation incorrecte du produit.
- Toute modification de l'installation ne peut être effectuée qu'après nous avoir consultés et avoir obtenu notre accord préalable, sans quoi les dommages éventuels ne sont pas couverts par notre garantie.
- Installer l'unité dans un espace à une température d'au moins **5 °C**.
- Vérifier la stabilité des murs, des plafonds et des sols avant le montage de l'installation.
- Respecter la réglementation en vigueur sur le site d'installation. Les **règles de prévention des accidents** s'appliquent également.
- Le site d'installation doit être aménagé de manière à éviter tout dégât des eaux (par exemple au moyen d'un **siphon de sol**). Le fabricant ne peut être tenu responsable des dommages causés par l'eau.
- En cas de questions ou de commandes de pièces de rechange, indiquer impérativement le nom et le numéro de l'installation afin de faciliter le traitement de la commande.
- Les pièces exposées à l'eau traitée doivent être fabriquées dans un matériau résistant à l'eau pure, comme le PE, le PP ou le V2A/V4A.

1. Consignes de sécurité

La présente notice d'utilisation fait partie intégrante du produit et doit être conservée pendant toute la durée de vie du produit.
L'entretien, la maintenance et la réparation de l'installation ne peuvent être réalisés que par du personnel habilité, qualifié et responsable.
Le personnel technique chargé de l'exploitation doit être en mesure de faire fonctionner l'installation et de la maintenir en état de marche. Le personnel d'exploitation doit être sensibilisé aux conséquences de mauvais réglages.

Les travaux d'entretien et de réparation ne peuvent être effectués que par du personnel technique qualifié et agréé (monteurs et électriciens).

	**Danger : haute tension ! (concerne l'appareil de mesure de la conductivité, en option)**
DANGER	Manipulez les pièces de l'installation électrique avec précaution. Ces tâches ne doivent être effectuées que par des électriciens qualifiés. Soyez prudent lorsque les couvercles sont ouverts : les composants peuvent être sous tension. Avant de faire fonctionner l'installation, coupez l'alimentation électrique du réseau. Avant de commencer les travaux d'entretien, veillez à ce que l'installation soit arrêtée et qu'il ne subsiste pas de tension dans les conduites.

	**La consommation d'eau conditionnée présente un danger pour la santé !**
AVERTISSEMENT	Ne buvez pas l'eau du système.

	**Risque de sols mouillés !**
ATTENTION	Soyez prudent lorsque les tubes sont desserrés. Risque de blessures. Le sol peut être glissant. Serrez les raccords de tubes uniquement à la main. Éliminez les fuites immédiatement. Risque de dégâts des eaux / de blessures sur les sols glissants. Remplacez les joints toriques défectueux par des joints toriques neufs appropriés.

2. Expédition et emballage

Nos installations sont soigneusement emballées et testées avant expédition. Des dommages pouvant néanmoins survenir lors du transport, **vérifiez impérativement l'installation dès sa réception**.

- Si l'emballage est endommagé, **procédez immédiatement à un contrôle** visuel des marchandises, comme indiqué sur les documents du transporteur. Gardez à l'esprit que vous êtes responsable des dommages cachés qui n'apparaissent qu'au moment de la mise en service. Contactez immédiatement le transporteur, faute de quoi l'assurance transport ne pourra pas être invoquée. Conservez l'emballage en cas de contrôle de la part du transporteur ou de la compagnie d'assurance.
- Vérifiez que la livraison est **complète** par rapport au bordereau de livraison.
- Emballez soigneusement les marchandises avant de les renvoyer.
- Vidangez l'installation avant expédition afin de réduire le poids de l'emballage.

3. Dispositifs de traitement de l’eau de type DIA

Partout où des installations techniques ou d’autres consommateurs nécessitent un approvisionnement par de l’eau pure sous pression, des cartouches résistantes à la pression sont requises. Nos cartouches répondent parfaitement à cette exigence : elles sont fabriquées en acier inoxydable de haute qualité V_4A résistant à la corrosion ou en plastique renforcé de fibres de verre (GFK).

3.1 Déminéralisation de l’eau

Les **cartouches de déminéralisation de l’eau de type DIA** éliminent les matières conductrices (sels et minéraux tels que le calcium, la magnésie, le sulfate, etc.) de l’eau, réduisant ainsi sa conductivité. Toutes les cartouches sont remplies de résine échangeuse de cations à lit mixte régénérable de haute qualité, qui élimine de manière fiable les composants ionogènes de l’eau. Plus il y a de composants dans l’eau, plus la cartouche de déminéralisation de l’eau s’épuise rapidement.

3.2 Détermination de la qualité de l’eau – Mesure de la conductivité (DIA MB)

La conductivité permet de mesurer la qualité de l’eau. Il s’agit d’un indicateur de la quantité de substances contenues dans l’eau. Plus la conductivité est faible, meilleure est la qualité de l’eau. Après un traitement de déminéralisation de l’eau de type DIA MB, les valeurs de conductivité sont généralement inférieures à <1 µS/cm. Dès que la conductivité dépasse la limite définie par l’opérateur, les cartouches de déminéralisation doivent être changées. Remplacez-les au moins tous les 6 mois afin d’éviter toute contamination bactérienne.

<u>En option : Conductimètre</u>

Le conductimètre nécessaire à votre installation peut être commandé séparément. Vous trouverez plus d’informations sur cet appareil dans le **manuel dédié**.

3.2.1 Détermination de la qualité de l’eau – Mesure de la conductivité (DIA KR)

La conductivité permet de mesurer la qualité de l’eau. Il s’agit d’un indicateur de la quantité de substances contenues dans l’eau. Plus la conductivité est faible, meilleure est la qualité de l’eau. Après un traitement de déminéralisation de l’eau de type DIA KR, les valeurs de conductivité sont généralement de 0,055 µS/cm. Dès que la conductivité dépasse la limite définie par l’opérateur, les cartouches de déminéralisation doivent être changées. Remplacez-les au moins tous les 6 mois afin d’éviter toute contamination bactérienne.

En option : Conductimètre

Le conductimètre nécessaire à votre installation peut être commandé séparément. Vous trouverez plus d’informations sur cet appareil dans le **manuel dédié**.

4. Installation et fonctionnement

Mettez le dispositif en service comme expliqué dans les sections suivantes. En cas de doute sur la procédure à suivre ou si vous avez des questions, veuillez contacter notre service clientèle au +49 2663 99 08 22.

4.1 Préparations

3. Tous les raccordements (eau, électricité) doivent être prêts pour l'installation.
4. L'installation doit être de niveau.

4.2 Montage du conductimètre (en option)

Le conductimètre est livré avec un raccord à monter sur la cartouche.

1. Placez le conductimètre droit sur la SORTIE du filetage de raccordement et serrez-le à la main. L'entrée et la sortie de la cartouche sont marquées (voir image).

2. Lors du montage, assurez-vous que le joint d'étanchéité (s'il est inclus dans la livraison) est correctement placé. Appliquez une bande de Téflon supplémentaire si nécessaire.

4. Branchez le conductimètre sur une prise électrique. Le conductimètre est maintenant allumé.

5. <u>En option :</u> Selon le type de conductimètre utilisé : Réglez la valeur (valeur limite) à partir de laquelle la qualité de l'eau est trop faible et la cartouche doit être remplacée. Respectez également le mode d'emploi de l'appareil de mesure !

L'entrée et la sortie sont clairement indiquées

4.3 Mise en service

5. Raccordez le tuyau d'entrée à l'ENTRÉE de la cartouche.
6. Raccordez le tuyau d'eau pure à la sortie du conductimètre.
7. Ventilation de la cartouche : ouvrez avec précaution le robinet de purge situé sur le couvercle de la cartouche. Dès qu'un jet d'eau continu s'écoule, refermez le robinet de purge.
8. La conductivité correcte s'affiche après quelques minutes.

Exemple : raccordement de cartouches de purge d'air en acier inoxydable avec un conductimètre de type D100

➔ Vous trouverez plus d'informations sur l'appareil de mesure dans le manuel dédié.

4.4 Remplacement des cartouches

Si la conductivité de l'eau traitée dépasse la valeur limite fixée, la cartouche de déminéralisation est épuisée et doit être remplacée. Veuillez contacter le fabricant EnviroFALK, qui organisera pour vous le remplacement des cartouches.

Further emergency information Germany: +49 (0) 2663 9908-23 (EnviroFALK hotline only during office hours)

2. Hazards identification

2.1 GHS-Classification of the mixture

SERIOUS EYE DAMAGE/ EYE IRRITATION - Category 1; H318 Causes serious eye damage

2.2 Label elements:

GHS05

Signal word: DANGER
Hazard statements: H318 - Causes serious eye damage

Precautionary statements
P280 Prevention: Wear protective gloves and eye/face protection. Wash hands thoroughly after handling.
P305+P351+P338+P310 Response: IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER or doctor/physician.
Storage: Not applicable.
Disposal: Dispose of contents and container in accordance with all local, regional, national and international regulations

2.3 Other hazards:
Physical and chemical hazards
Not classified based on available information.
Health hazards
Causes serious eye damage.
Environmental hazards
Not classified based on available information.
Other hazards which do not result in classification
None known.

3. Composition/information on ingredients

3.1 Substance:
The product is a mixture.

3.2 Mixture:

Ingredient name	% (w/w)	CAS number
Benzene, diethenyl-, polymer with ethenylbenzene and ethenylethylbenzene, chloromethylated, trimethylamine-quaternized	20 - 50	69011-18-3
styrene-divinylbenzene-copolymer with sulphonic acid groups in H-form	20 - 30	69011-20-7
Water	20 - 60	7732-18-5

There are no additional ingredients present which, within the current knowledge of the supplier and in the concentrations applicable, are classified as hazardous to health or the environment and hence require reporting in this section.
Occupational exposure limits, if available, are listed in Section 8.

4. First aid measures

4.1 Description of first aid measures:
General advice: Do not leave the victim unattended.
After inhalation: Get medical attention immediately. Call a poison center or physician. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If it is suspected that fumes are still present, the rescuer should wear an appropriate mask or self-contained breathing

apparatus. If not breathing, if breathing is irregular or if respiratory arrest occurs, provide artificial respiration or oxygen by trained personnel. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation. If unconscious, place in recovery position and get medical attention immediately. Maintain an open airway. Loosen tight clothing such as a collar, tie, belt or waistband. In case of inhalation of decomposition products in a fire, symptoms may be delayed. The exposed person may need to be kept under medical surveillance for 48 hours.

In case of skin contact: Get medical attention immediately. Call a poison center or physician. Flush contaminated skin with plenty of water. Remove contaminated clothing and shoes. Continue to rinse for at least 10 minutes. Chemical burns must be treated promptly by a physician. Wash contaminated clothing before reuse. Clean shoes thoroughly before reuse.

After eye contact: Get medical attention immediately. Immediately flush eyes with plenty of water, occasionally lifting the upper and lower eyelids. Check for and remove any contact lenses. Continue to rinse for at least 10 minutes. Chemical burns must be treated promptly by a physician.

After swallowing/ingestion: Get medical attention immediately. Call a poison center or physician. Wash out mouth with water. Remove dentures if any. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If material has been swallowed and the exposed person is conscious, give small quantities of water to drink. Stop if the exposed person feels sick as vomiting may be dangerous. Do not induce vomiting unless directed to do so by medical personnel. If vomiting occurs, the head should be kept low so that vomit does not enter the lungs. Chemical burns must be treated promptly by a physician. Never give anything by mouth to an unconscious person. If unconscious, place in recovery position and get medical attention immediately.

Maintain an open airway. Loosen tight clothing such as a collar, tie, belt or waistband.

4.2 Most important symptoms and effects, both acute and delayed:

Eye contact: Causes serious eye damage.

Inhalation: May give off gas, vapour or dust that is very irritating or corrosive to the respiratory system.

Skin contact: No known significant effects or critical hazards.

Ingestion: No known significant effects or critical hazards.

4.3 Indication of any immediate medical attention and special treatment needed:

Notes to physician : No specific treatment.

Specific treatments : No specific treatment

Protection of first-aiders : No action shall be taken involving any personal risk or without suitable training. If it is suspected that fumes are still present, the rescuer should wear an appropriate mask or self-contained breathing apparatus. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation. Wash contaminated clothing thoroughly with water before removing it, or wear gloves.

See toxicological information (Section 11).

5. Firefighting measures

5.1 Suitable extinguishing media:

In case of fire, use water spray (fog), foam, dry chemical or CO_2.
Unsuitable extinguishing media: None known.

5.2 Special hazards arising from the substance or mixture:

No specific fire or explosion hazard.
Decomposition products may include the following materials: carbon dioxide, carbon monoxide, nitrogen oxides.

5.3 Advice for firefighters:

Promptly isolate the scene by removing all persons from the vicinity of the incident if there is a fire. No action shall be taken involving any personal risk or without suitable training.
Specific extinguishing methods: Standard procedure for chemical fires.
Fire-fighters should wear appropriate protective equipment and self-contained breathing apparatus (SCBA) with a full face-piece operated in positive pressure mode.

6. Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures:

For non-emergency personnel: No action shall be taken involving any personal risk or without suitable training. Evacuate surrounding areas. Keep unnecessary and unprotected personnel from entering. Do not touch or walk through spilt material. Provide adequate ventilation. Put on appropriate personal protective equipment.
For emergency responders: If specialized clothing is required to deal with the spillage, take note of any information in Section 8 on suitable and unsuitable materials. See also the information in "For non-emergency personnel".

6.2 Environmental precautions:

Avoid dispersal of spilt material and runoff and contact with soil, waterways, drains and sewers. Inform the responsible authorities if the product has caused environmental pollution (sewers, waterways, soil or air) and or in case of gas leakage.

6.3 Methods and materials for containment and cleaning up:

Move containers from spill area. Approach the release from upwind. Prevent entry into sewers, water courses, basements or confined areas. Vacuum or sweep up material and place in a designated, labelled waste container. Dispose of wastes in an approved waste disposal facility.

6.4 Reference to other sections:

Sections 8 and 13

7. Handling and storage

7.1 Precautions for safe handling:

Protective measures: Put on appropriate personal protective equipment (see Section 8). Do not get in eyes or on skin or clothing. Do not ingest. If during normal use the material presents a respiratory hazard, use only with adequate ventilation or wear appropriate respirator. Keep in the original container or an approved alternative made from a compatible material, kept tightly closed when not in use. Empty containers retain product residue and can be hazardous.

Advice on general occupational hygiene: Eating, drinking and smoking should be prohibited in areas where this material is handled, stored and processed. Workers should wash hands and face before eating, drinking and smoking. Remove contaminated clothing and protective equipment before entering eating areas. See also Section 8 for additional information on hygiene measures.

Avoidance of contact: No specific data.

7.2 Conditions for safe storage, including any incompatibilities: Store between the following temperatures: -10 to 40°C (14 to 104°F). Store in accordance with local regulations. Store in original container protected from direct sunlight in a dry, cool and well-ventilated area, away from incompatible materials (see Section 10) and food and drink. Store locked up. Keep container tightly closed and sealed until ready for use. Containers that have been opened must be carefully resealed and kept upright to prevent leakage. Do not store in unlabelled containers. Use appropriate containment to avoid environmental contamination.

7.3 Specific end use(s):

Ion exchange, resins and catalysts, only for industrial use.

Remarks: Take precautionary measures against electrostatic discharges. Do not allow the resin to dry out.

8. Exposure controls/personal protection

8.1 Control parameters:

Components with workplace control parameters

Contains no substances with occupational exposure limit values.

Engineering measures: Good general ventilation should be sufficient to control work-er exposure to airborne contaminants.

8.2 Exposure controls:

Individual protection measures:

Hygiene measures: Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period.

Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location

Eye/face protection: Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary to avoid exposure to liquid splashes, mists, gases or dusts.
Recommended: safety glasses with side-shields.

Skin protection:

Hand protection: Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary. After contamination with product change the gloves immediately and dispose of them according to relevant national and local regulations Recommended: (< 1 hour) Polyvinyl chloride - PVC , Nitrile rubber - NBR , Polychloroprene – CR.

Body/other skin protection: Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.
Recommended: Wear protective clothing.

Respiratory protection: Use a properly fitted, air-purifying or air-fed respirator complying with an approved standard if a risk assessment indicates this is necessary. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator.
Recommended: Dust-protection mask if there is a risk of dust formation.

9. Physical and chemical properties

9.1 Information on basic physical and chemical properties

Form and ohysical state:	solid beats
Colour:	Black. Brown. Light
Odour:	not available.
pH:	6 to 9 [Conc. (% w/w): 10%]
Melting point:	not available
Boiling point/boiling range:	not available
Flash point:	Closed cup: >150°C (>302°F)
Flammability (solid, gas):	not available
Lower explosion limit:	not available
Upper explosion limit:	not available
Vapour pressure:	not available
Relative vapour density:	not available
Density:	1,1 kg/L (20℃)
Bulk density:	650 - 750 kg/m³
Water solubility:	Insoluble in the following materials: cold water.
Auto-ignition temperature:	>500°C (>932°F)
Viscosity, dynamic:	Not available
Explosive properties:	Not available
Oxidizing properties:	Not available

9.2 Other data:
Not available.

10. Stability and reactivity

10.1 Reactivity:
No specific test data related to reactivity available for this product or its ingredients.
10.2 Chemical stability:
The product is chemically stable.
10.3 Possibility of hazardous reactions:
No dangerous reaction known under conditions of normal use.
10.4 Conditions to avoid:
Take precautionary measures against static discharges. Contact with strong oxidizing agents may cause hazardous reactions.
10.5 Incompatible materials:
No specific data.
10.6 Hazardous decomposition products:
Stable under normal conditions of storage and use, hazardous decomposition products should not be produced.

11. Toxicological information

Information on toxicological effects+
Acute toxicity
Product:
Acute oral toxicity: LD50 (Rat): > 5,000 mg/kg
Remarks: Test results on an analogous product
Components:
Benzene, diethenyl-, polymer with ethenylbenzene and ethenylethylbenzene, chlorometh-ylated, trimethylamine-quaternized, hydroxide:
Acute oral toxicity: LD50 (Rat): > 5,000 mg/kg
Benzene, diethenyl-, polymer with ethenylbenzene and ethenylethylbenzene, sulphonated:
Acute oral toxicity: LD50 (Rat): > 5,000 mg/kg

Skin corrosion/irritation
Not classified based on available information.
Product:
Result: No skin irritation
Remarks: Test results on an analogous product
Components:
Benzene, diethenyl-, polymer with ethenylbenzene and ethenylethylbenzene, chlorometh-ylated, trimethylamine-quaternized, hydroxide:
Result: No skin irritation
Remarks: Test results on an analogous product

Benzene, diethenyl-, polymer with ethenylbenzene and ethenylethylbenzene, sulphonated:
Result: No skin irritation
Remarks: Test results on an analogous product

Serious eye damage/eye irritation
Causes serious eye damage.
Product:
Result: Risk of serious damage to eyes.
Remarks: Test results on an analogous product

Components:
Benzene, diethenyl-, polymer with ethenylbenzene and ethenylethylbenzene, chlorometh-ylated, trimethylamine-quaternized, hydroxide:
Assessment: Risk of serious damage to eyes.
Remarks: Test results on an analogous product

Benzene, diethenyl-, polymer with ethenylbenzene and ethenylethylbenzene, sulphonated:
Assessment: Risk of serious damage to eyes.
Remarks: Test results on an analogous product

Respiratory or skin sensitisation
Skin sensitisation
Not classified based on available information.
Respiratory sensitisation
Not classified based on available information.
Germ cell mutagenicity
Not classified based on available information.
Carcinogenicity
Not classified based on available information.
Reproductive toxicity
Not classified based on available information.
STOT - single exposure
Not classified based on available information.
STOT - repeated exposure
Not classified based on available information.
Aspiration toxicity
Not classified based on available information.

12. Ecological information

12.1 EcoToxicity:
No data available.
12.2 Persistence and degradability:
No data available
12.3 Bioaccumulative potential:
No data available

12.4 Mobility in soil:
Soil/water partition coefficient (K_{OC}): Not available
12.5 Results of PBT and vPvB assessment:
Results of PBT and vPvB assessment: Not applicable.
12.6 Other adverse effects:
No known significant effects or critical hazards.
Remarks: Ecotoxicological studies on the product are not available. No known significant effects or critical hazards.

13. Disposal considerations

The generation of waste should be avoided or minimised wherever possible.
Disposal methods
Waste from residues:
Examine possibilities for re-utilisation.
Product residues and uncleaned empty containers should be packaged, sealed, labelled, and disposed of or recycled according to relevant national and local regulations.
Where large quantities are concerned, consult the supplier.
Do not dispose of waste into sewer.
Do not contaminate ponds, waterways or ditches with chemical or used container.
Send to a licensed waste management company.
Where possible recycling is preferred to disposal or incineration.
This material and its container must be disposed of in a safe way.
Avoid dispersal of spilt material and runoff and contact with soil, waterways, drains and sewers.

Contaminated packaging:
The generation of waste should be avoided or minimized wherever possible.
If recycling is not practicable, dispose of in compliance with local regulations.

14. Transport information

Not classified as dangerous in the meaning of transport regulations.
International Regulations
IATA-DGR
Not regulated as a dangerous good
IMDG-Code
Not regulated as a dangerous good
Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code
Not applicable for product as supplied.
National Regulations China
GB 6944/12268

Hazard notes:
Not dangerous cargo.
Risk of serious damage to eyes. Avoid heat above +40 °C.
Avoid temperatures below -10 °C. Keep separated from foodstuffs.

14.7 Bulk goods transport (MAPROL) and IBC-Code:
Not available

15. Regulatory information

15.1 Safety, health and environmental regulations/legislation specific for the substance or mixture:
Standard Uniform Schedule of Medicine and Poisons
Not regulated.

Model Work Health and Safety Regulations - Scheduled Substances
No listed substance.
Australia inventory (AICS): All components are listed or exempted.

15.2 Chemical safety assessment (Europe):
For Europe: For this product a chemical safety assessment was not carried out.

15.3 National regulatory information China

Hazardous Chemicals for Priority Management under SAWS:

Not applicable

China Severely Restricted Toxic Chemicals for Import and Export:

Not applicable

Catalogue of Hazardous Chemicals:

Not applicable

Catalogue of Highly Toxic Chemicals:

Not applicable

Regulations on Safety Management of Hazardous Chemicals
Identification of Major Hazard Installations for Hazardous Chemicals (GB 18218)

Not applicable

The components of this product are reported in the following inventories:

China. Inventory of Existing Chemical Substances in China (IECSC):

On the inventory, or in compliance with the inventory.

16. Other information

The information contained herein is based on the present state of our knowledge. It characterises the product with regard to the appropriate safety precautions. It does not represent a guarantee of any properties of the product.

Revision/edition 1.03 is completely revised with the new data of the manufacturer.

Abbreviations and acronyms

AIIC - Australian Inventory of Industrial Chemicals; ANTT - National Agency for Transport by Land of Brazil; ASTM - American Society for the Testing of Materials; bw - Body weight; CMR - Carcinogen, Mutagen or Reproductive Toxicant; DIN - Standard of the German Institute for Standardisation; DSL - Domestic Substances List (Canada); ECx - Concentration associated with x% response; ELx - Loading rate associated with x% response; EmS - Emergency Schedule; ENCS - Existing and New Chemical Substances (Japan); ErCx - Concentration associated with x% growth rate response; ERG - Emergency Response Guide; GHS - Globally Harmonized Sys-tem; GLP - Good Laboratory Practice; IARC - International Agency for Research on Cancer; IATA - International Air Transport Association; IBC - International Code for the Construction and Equipment of Ships carrying Dangerous Chemicals in Bulk; IC50 - Half maximal inhibitory con-centration; ICAO - International Civil Aviation Organization; IECSC - Inventory of Existing Chemi-cal Substances in China; IMDG - International Maritime Dangerous Goods; IMO - International Maritime Organization; ISHL - Industrial Safety and Health Law (Japan); ISO - International Or-ganisation for Standardization; KECI - Korea Existing Chemicals Inventory; LC50 - Lethal Con-centration to 50 % of a test population; LD50 - Lethal Dose to 50% of a test population (Median Lethal Dose); MARPOL - International Convention for the Prevention of Pollution from Ships; n.o.s. - Not Otherwise Specified; Nch - Chilean Norm; NO(A)EC - No Observed (Adverse) Effect Concentration; NO(A)EL - No Observed (Adverse) Effect Level; NOELR - No Observable Effect Loading Rate; NOM - Official Mexican Norm; NTP - National Toxicology Program; NZIoC - New Zealand Inventory of Chemicals; OECD - Organization for Economic Co-operation and Develop-ment; OPPTS - Office of Chemical Safety and Pollution Prevention; PBT - Persistent, Bioaccumu-lative and Toxic substance; PICCS - Philippines Inventory of Chemicals and Chemical Substanc-es; (Q)SAR - (Quantitative) Structure Activity Relationship; REACH - Regulation (EC) No 1907/2006 of the European Parliament and of the Council concerning the Registration, Evalua-tion, Authorisation and Restriction of Chemicals; SADT - Self-Accelerating Decomposition Tem-perature; SDS - Safety Data Sheet; TCSI - Taiwan Chemical Substance Inventory; TDG - Trans-portation of Dangerous Goods; TSCA - Toxic Substances Control Act (United States); UN - Unit-ed Nations; UNRTDG - United Nations Recommendations on the Transport of Dangerous Goods; vPvB - Very Persistent and Very Bioaccumulative; WHMIS - Workplace Hazardous Materials In-formation System

1. Identification of the substance/mixture and of the company/undertaking

1.1 Product identifier

Article number: 475254
Product name: CO2 adsorber

1.2 Relevant identified uses of the substance or mixture and uses advised against:

Carbon dioxide absorbent
For industrial use only.

1.3 Details of the supplier of the safety data sheet:

EnviroFALK GmbH
Prozesswasser-Technik
Gutenbergstraße 7
56457 Westerburg
Germany
Tel.: +49 2663 9908-0
Fax.: +49 2663 9908-50
http://www.envirofalk.com
Email: sdb@envirofalk.com

Office hours:	Monday - Thursday:	7:45 am – 16:45 pm
	Friday:	7:45 am – 15:15 pm

1.4 Emergency telephone number:

+49 (0) 2663 9908-23
(EnviroFALK hotline only during office hours)

2. Hazards identification

2.1 Classification of the substance or mixture

Classification in accordance with paragraph (d) of 29 CFR 1910.1200. and EU No.1272/2008 CLP:
H318 Causes serious eye damage
H315 Causes skin irritation
Skin Corrosion/Irritation - Category 2
Serious Eye Damage/Eye irritation - Category 1

2.2 Label elements:

Signal word: DANGER
Hazard Statement(s)
H315 Causes skin irritation.

H318 Causes serious eye damage
Precautionary Statement(s)
P102: Keep out of reach of children.
P103: Read label before use.

Prevention
P280 Wear protective gloves/protective clothing/eye protection/face protection
Wash thoroughly after handling
P260: Do not breathe dust/fumes/gas/mist/vapours/spray

Response
P301+330+331: IF SWALLOWED: Rinse mouth. Do NOT induce vomiting.
P302+352: IF ON SKIN: Wash with plenty of water
P305+351+338: IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses if present and easy to do –continue rinsing.

Storage
P410: Protect from sunlight.
P411: Store at temperatures not exceeding 50 °C.

Disposal
Dispose of contents/container in accordance with local/regional/national/international regulations

2.3 Other hazards:
No information available.

3. Composition/information on ingredients

3.1 Substance:

Product is a mixture

3.2 Mixture:

CAS-No.	EG-No.		Weight%	Class.	REACH No.
2390-59-2	219-231-5	Ethylviolett	< 0.1%	STOT SE3, R335/ Skin Irrit. 2 H315 / Eye Dam. 1 H318	-
7732-18-5	231-791-2	Water	14 – 18	-	-
1305-62-0	215-137-3	Calciumhydroxid	78 – 84	Skin Irrit. 2 H315/ Eye Dam. 1 H318 / STOT SE 3 H335	01-2119475151-45-033
1305-73-2	215-185-5	Natriumhydroxid	2 – <4	Skin Corr 1A H314 / Metal Corr. 1 H290	01-2119457892-27-xxxx Skin Corr. 1A; H314: C>=5% Skin Corr. 1B; H314: 2%<=C<5% Skin Irrit. 2; H315: 0.5%<=C<2% Eye Irrit. 2; H319: 0.5%<=C<2%

Notes: no further notes.

4. First aid measures

4.1 Description of first aid measures:

After inhalation: Remove person to fresh air and keep comfortable for breathing. Call a POISON CENTER or doctor if you feel unwell.

In case of skin contact: Wash with plenty of water. If skin irritation occurs: Get medical advice/attention. Take off contaminated clothing and wash before reuse.

After eye contact: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Get medical attention immediately.

After swallowing: Rinse mouth. Do NOT induce vomiting.

4.2 Most important symptoms and effects, both acute and delayed:

Acute

Causes serious eye damage. Causes skin irritation.

Delayed

No information on significant adverse effects.

4.3 Indication of any immediate medical attention and special treatment needed:

Note to Physicians

May cause perforation of esophagus and stomach.

5. Firefighting measures

5.1 Extinguishing media:

Suitable Extinguishing Media

Use any media suitable for the surrounding fires.

Unsuitable Extinguishing Media

carbon dioxide.

5.2 Special hazards arising from the substance or mixture:

Non reported.

5.3 Advice for firefighters:

Fire Fighting Measures

Move container from fire area if it can be done without risk. Dike for later disposal. Do not scatter spilled material with high-pressure water streams. Collect contaminated fire extinguishing water separately. This must not be discharged into drains.

Special Protective Equipment and Precautions for Firefighters

Wear full protective fire fighting gear including self contained breathing apparatus (SCBA) for protection against possible exposure.

6. Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures:

Avoid generation of dust. Wear personal protective clothing and equipment, see Section 8.

6.2 Environmental precautions:

Collect contaminated fire extinguishing water separately. This must not be discharged into drains. Avoid release to the environment. Collect spillage.

6.3 Methods and materials for containment and cleaning up:

Avoid generation of dust. Eliminate all sources of ignition. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if safe to do so. Prevent entry into waterways, sewers, basements, or confined areas.

6.4 Reference to other sections:

Sections 13.

7. Handling and storage

7.1 Precautions for safe handling:

Wear protective gloves/protective clothing/eye protection/face protection. Wash thoroughly after handling. Avoid generation of dust. Do not return to original containers. Avoid contact with eyes, skin and clothing.

7.2 Conditions for safe storage, including any incompatibilities:

None needed according to classification criteria

Keep only in original container. Store in a well-ventilated place. Keep cool. Do not store together with acids. Keep container tightly closed. Store below 50 C. Lagerklasse (VCI): 10 – 13.

7.3 Specific end use(s):
Carbon dioxide absorbent, only for industrial use.

8. Exposure controls/personal protection

8.1 Control parameters:
Component Exposure Limits

Calcium hydroxide Ca(OH)2	1305-62-0
ACGIH:	5 mg/m³ TWA
NIOSH:	5 mg/m³ TWA
Europe:	5 mg/m³ TWA (existing scientific data on health effects appear to be particularly limited)
OSHA (US):	15 mg/m³ TWA total dust; 5 mg/m³ TWA respirable fraction
Mexico:	5 mg/m³ TWA LMPE-PPT
Sodium hydroxide NaOH	1310-73-2
ACGIH:	2 mg/m³ Ceiling
NIOSH:	2 mg/m³ Ceiling 10 mg/m³ IDLH
OSHA (US):	2 mg/m³ TWA
Mexico:	2 mg/m³ Ceiling

8.2 Exposure controls:

Individual protection measures:
Biological limit value
There are no biological limit values for any of this product's components.
Engineering Controls
Provide local exhaust ventilation system. Ensure compliance with applicable exposure limits.
Individual Protection Measures, such as Personal Protective Equipment
Eye/face protection
Wear safety goggles with a faceshield. Do not wear contact lenses. Provide an emergency eye wash
fountain and quick drench shower in the immediate work area.
Skin Protection
Wear appropriate chemical resistant clothing.
Respiratory Protection
A NIOSH approved respirator with a dust, mist, and fume filter may be permissible under ce1iain circumstances where airborne concentrations are expected to exceed exposure limits or when symptoms have been observed that are indicative of overexposure.
Glove Recommendations
Wear appropriate chemical resistant gloves.

9. Physical and chemical properties

9.1 Information on basic physical and chemical properties

Form:	solid
Colour:	white
Odour:	no
pH:	12 in suspension with water
Melting point:	not available
Boiling point/boiling range:	not available
Flash point:	not available
Flammability (solid, gas):	not available
Lower explosion limit:	not available
Upper explosion limit:	not available
Vapour pressure:	not available
Relative vapour density:	not available
Density:	not available
Bulk density:	approx.. 730 – 930 kg/m³
Water solubility:	1g/l
Auto-ignition temperature:	not available
Decomposition temperature:	not available
Viscosity, dynamic:	not available
Explosive properties:	not available
Oxidizing properties:	not available
Water content:	approx.. 14 – 18 %

9.2 Other data:

not available

10. Stability and reactivity

10.1 Reactivity:

not determined

10.2 Chemical stability:

not determined

10.3 Possibility of hazardous reactions:

not determined

10.4 Conditions to avoid:

Avoid contact with incompatible materials. Exothermic reaction with strong acids. The product develops hydrogen in an aqueous solution in contact with metals.

10.5 Incompatible materials:

Light metals, acids, base metals.

10.6 Hazardous decomposition products:

No data available.

11. Toxicological information

11.1 Acute and Chronic Toxicity

Component Analysis - LDSO/LCSO

The components of this material have been reviewed in various sources and the following selected endpoints are published:

Immediate Effects

Causes serious eye damage: (rabbit) OECD 405.

No significant skin irritating (rabbit) OECD 404

Delayed Effects

No information on significant adverse effects.

Irritation/Corrosivity Data

Causes skin irritation. Causes serious eye damage.

Respiratory Sensitization

No information available for the product.

Dermal Sensitization

No information available for the product.

Component Carcinogenicity

None of this product's components are listed by ACGIH, IARC, NTP, DFG or OSHA

Germ Cell Mutagenicity

No information available for the product.

Tumorigenic Data

No information available for the product.

Reproductive Toxicity

No information available for the product.

Specific Target Organ Toxicity - Single Exposure

No target organs identified

Specific Target Organ Toxicity - Repeated Exposure

No target Organs identified

Aspiration hazard

No information available for the product.

Medical Conditions Aggravated by Exposure

No data available.

12. Ecological information

12.1 Eco toxicity

No data available.

12.2 Persistence and degradability:

Data about degradability is not available.

12.3 Bioaccumulative potential:

Due to the consistency, disperse distribution in the environment is not possible. Negative ecological effects are therefore not to be expected; due to the consistency and the low water solubility, bioavailability is not likely.

12.4 Mobility in soil:

No data available.

12.5 Results of PBT and vPvB assessment:
No PBT and vPvB assessment available.
12.6 Other adverse effects:
During intended use no ecologically problems are expected.
Further data about component Analysis - Aquatic Toxicity

Calcium chloride CaC12	10043-52-4
Fish	LC50 96 h Lepomis macrochirus 10650 mg/L [static]
Inveliebrate	LC50 48 h Daphnia magna 2400 mg/L ECHA
Sodium hydroxide NaOH	1310-73-2
Fish	LC50 96 h Oncorhynchus mykiss 45.4 mg/L [static]

13. Disposal considerations

Disposal Methods
Dispose of contents/container in accordance with local/regional/national/ international regulations.

For Germany:

160303	inorganic wastes containing dangerous substances.
160507	used inorganic chemicals that consist of or contain dangerous substances.
180106	Chemicals that consist of or contain dangerous substances.

Waste is dangerous waste according to 2008/98/EU.

14. Transport information

No dangerous goods in the sense of the transport regulations.
14.1 UN-No:

14.2 UN proper shipping name:

14.3 Transport hazard class(es):

14.4 Packing group:

14.5 Environmental hazards:

14.6 Special precautions for user:
no
14.7 Bulk goods transport (MAPROL) and IBC-Code:
Not applicable. For all transport ADR/RID; IMDG ; ICAO-TI/IATA-DGR not classified. Product contents less 4% NaOH. It is not regulated under UN1907.

US DOT Information: UN/NA #: Not Regulated

TDG Information: UN#: Not Regulated.

D-1 WARNHINWEISE

Sicherheitshinweise

Diese Anlage arbeitet mit UV-Strahlung. Die Strahlung kann Schäden an Augen und Haut verursachen, die Anlage darf daher nur betrieben werden, wenn der Reaktormantel unversehrt ist. Niemals ungeschützt in die Strahlung blicken und die Haut nicht der Strahlung aussetzen!

Das Öffnen und Installieren des Gerätes darf nur im strom- und drucklosen Zustand erfolgen!
Der Reaktor steht unter Druck. Bei unsachgemäßer Handhabung besteht die Gefahr des Berstens des Tauchrohres und des Austrittes des Mediums aus dem Reaktor.
Vor der Reinigung, Wartung oder Austauschen von Teilen, muss das Gerät von allen Spannungsquellen getrennt werden.
Die Anlage nie im ungefüllten Zustand oder bei unterbrochenem Wasserzufluss betreiben.
Die einschlägigen Vorschriften über den Umgang mit elektrischen Geräten sind einzuhalten.

Das zu behandelnde Wasser/Abwasser kann gefährliche Inhaltsstoffe enthalten. Bitte beachten Sie die entsprechenden Handhabungs- und Sicherheits-vorschriften!
Das zu behandelnde Medium darf keinen schädigenden Einfluss (z. Bsp. Korrosion) auf die UV-Anlage haben. Schäden unterliegen nicht der Gewährleistung. Materialspezifikationen entnehmen Sie dem Datenblatt!

Im Betrieb kommt es zu einer Erwärmung der Komponenten und des Mediums – Betrieb nur mit Durchfluss und ordnungsgemäßer Entlüftung des Reaktors! Schäden an der UV-Anlage oder an fremden Komponenten durch Übertemperatur unterliegen nicht der Gewährleistung oder Garantie!

HINWEIS

Lesen Sie die Betriebsanleitung gründlich und vor der Installation!

Keine Garantie bei falscher Betriebsweise oder falscher Bedienung!

WICHTIG

Die technologische Auslegung und korrekte Funktion der Anlage gilt nur für die vom Hersteller verwendeten Komponenten.

Beim Einsatz von Fremdteilen (auch Ersatz- und Verschleißteile) erlischt jeglicher Anspruch auf eine technologisch korrekte Funktion der Anlage.

D-2 ALLGEMEINE HINWEISE

Diese Betriebsanleitung beinhaltet Informationen, die benötigt werden, um die UV-Anlage korrekt und sicher in Betrieb zu nehmen und zu betreiben. Lesen Sie bitte die gesamte Betriebsanleitung, bevor Sie die Anlage nutzen. Beachten Sie bei Arbeiten an der Anlage immer die Sicherheitshinweise in der Betriebsanleitung, darüber hinaus die allgemein gültigen Sicherheitsvorschriften sowie Vorschriften und Hinweise zum Arbeitsschutz. Bei unsachgemäßer Handhabung oder Installation kann die Lieferfirma keine Gewährleistungs- und Garantieansprüche annehmen.

Für den Betrieb der Anlage gelten die folgenden Grundsätze:

- Sollten durch den Transport Schäden an der Anlage entstanden sein, so nehmen Sie ein Schadensprotokoll mit der Lieferfirma auf und senden Sie dies binnen 24 Stunden an den Hersteller.
- Der Anlagenbetreiber ist für die ordnungsgemäße Montage und Installation der Anlage entsprechend den Installationsvorschriften verantwortlich. Er trägt die Verantwortung dafür, dass die Anlage stets in betriebssicherem Zustand gehalten wird.
- Inbetriebnahme, Bedienung und Reparaturen der Anlage dürfen nur durch befugtes und dafür unterwiesenes Personal erfolgen.
- Sollte eine in dieser Betriebsanleitung enthaltene Vorschrift, insbesondere in Bezug auf Sicherheit nicht den örtlichen gesetzlichen Bestimmungen entsprechen, so gilt die jeweils strengere Vorschrift.

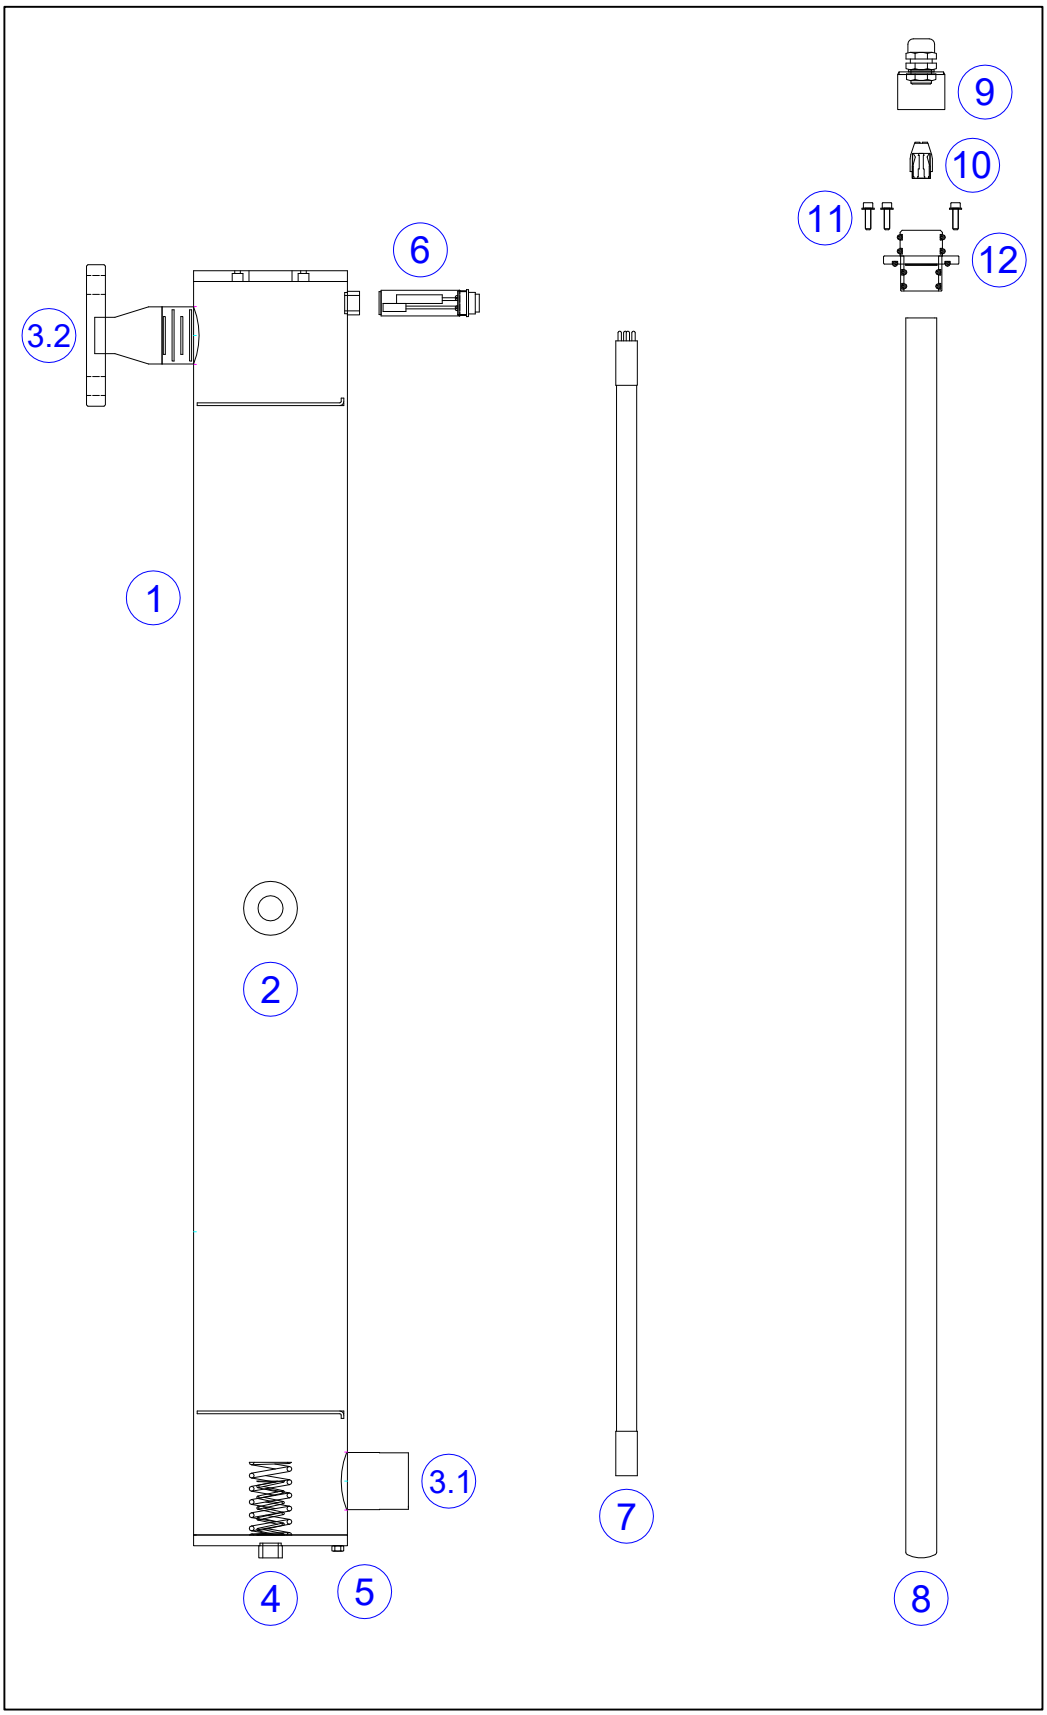
D-3 ANLAGENTYPEN

D-3.1 Bestimmungsgemäßer Gebrauch

Die UV-Anlagen vom Typ „MIP / VAP“ und vom Typ „EL“ können für die Behandlung von Wasser auf folgenden Gebieten eingesetzt werden:

1. Desinfektion
   UV-Strahlung mit einer Wellenlänge von 254 nm inaktiviert Mikroorganismen.
2. Restozonvernichtung
   UV-Strahlung mit einer Wellenlänge von 254 nm zerstört im Wasser befindliches Ozon.
3. TOC-Abbau
   Durch den Einsatz ozonbildender UV-Strahler werden im Wasser befindliche organische Stoffe oxidiert.

Die erreichbare Reduzierung von Keimen, Restozon bzw. TOC ist von verschiedenen Faktoren abhängig:

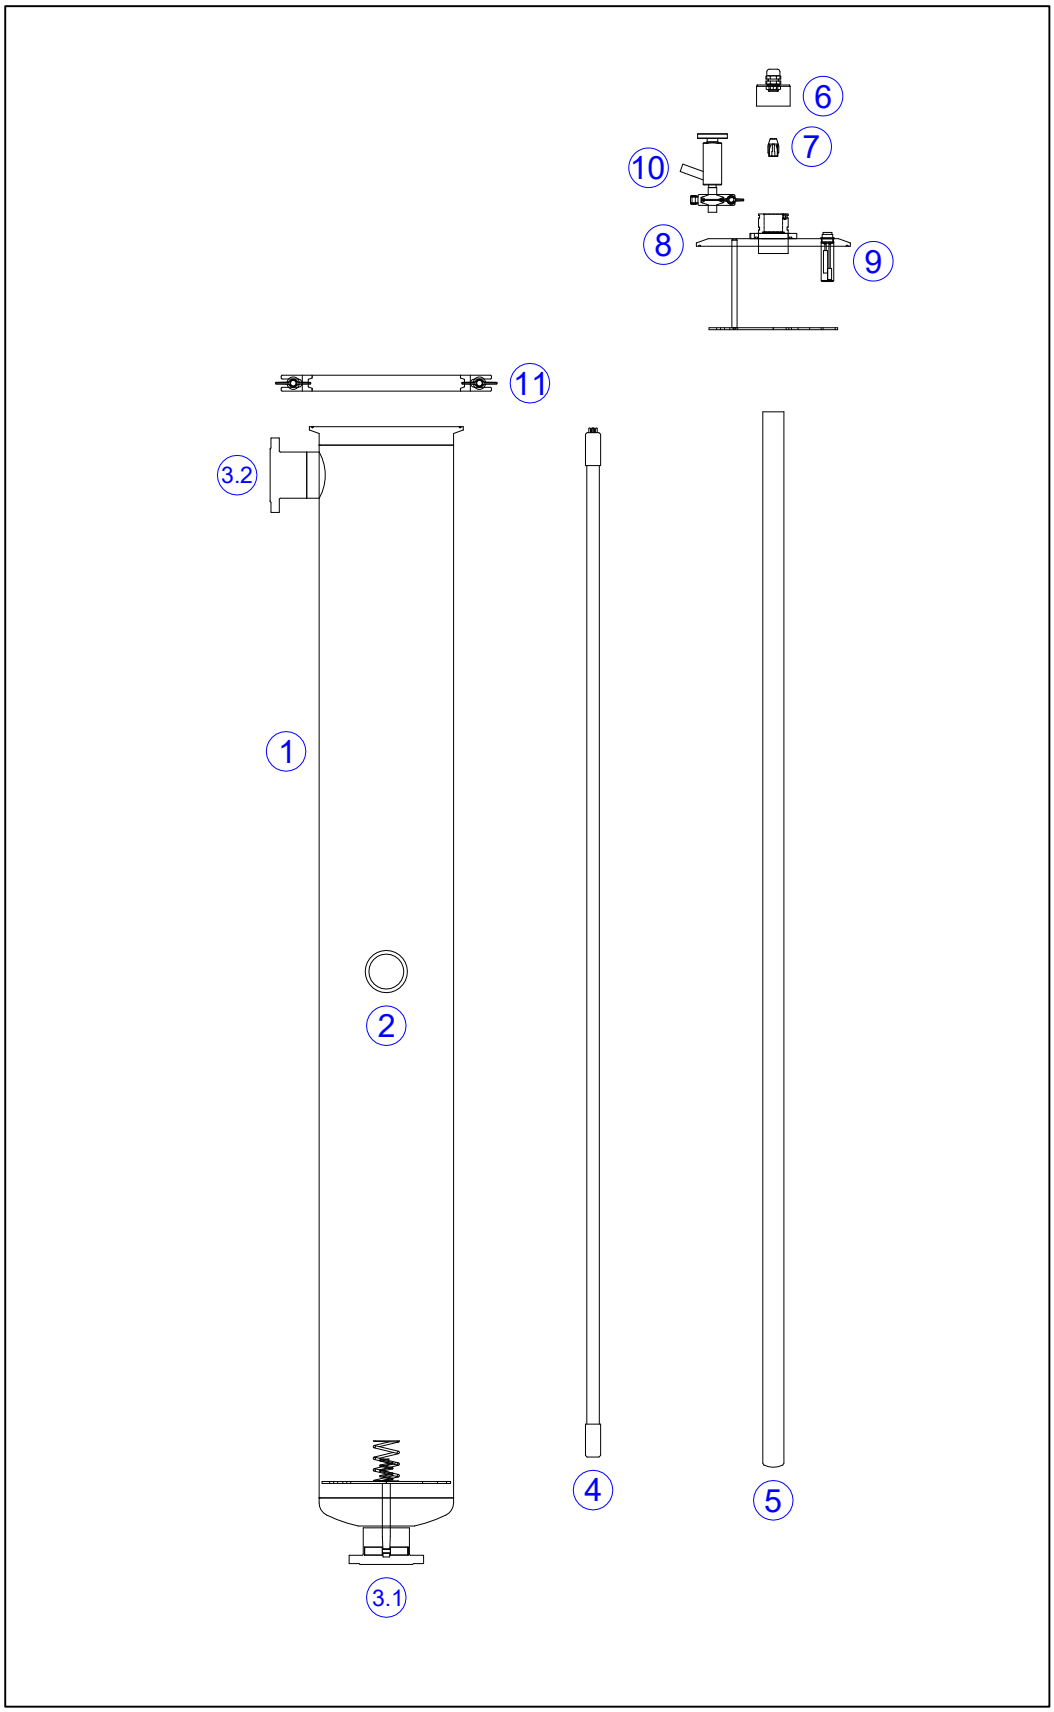


- Trübung und UV-C-Transmission des Wassers
- Durchflussmenge des zu behandelnden Wassers
- Betriebsstundenzahl / Lebensdauer der Strahler
- Reinigungszustand des Tauchrohrs
- Keimzahl, Ozon-Konzentration bzw. TOC-Konzentration im zu behandelnden Wasser.

Eine Wirkung ist nur gegeben, wenn die UV-Anlage kontinuierlich betrieben wird.

D-3.2 UV-Anlagen vom Typ „MIP / VAP“

D-3.2.1 prinzipieller Reaktoraufbau



1	Reaktor – genaue Abmaße und Aufbau sind der Reaktorzeichnung bzw. dem Datenblatt zu entnehmen (siehe Anhang)
2	Muffe für Sensor (1/4“) bzw. für Messfenster (1“) – je nach Typ der UV-Überwachungseinheit und UV-Anlage
3	Anschlüsse des Reaktors – Größe, Art und Position kundenspezifisch
3.1	Zulauf Medium Beispiel für Anschluss Innen/Außengewinde ohne Lichtfalle
3.2	Ablauf Medium Beispiel für Anschluss Glattflansch mit Lichtfalle zum direkten Übergang auf Kunststoffleitungen
4	Entleerung 1/4" – bei vertikalem Einbau Ohne Funktion – bei horizontalem Einbau
5	Angeschweißte Sechskantmutter zum Anschluss des Erdungskabels – Falls nicht vorhanden oder schwer erreichbar, ist ein Erdungsband zur Erdung des Reaktors zu verwenden!
6	Temperatursensor – Notabschaltung bei Temperatur Medium über 70°C. Standard ab 300W Strahlerleistung oder auf Anfrage.
7	UV-Strahler
8	Tauchrohr aus Quarzglas
9	Strahlerkappe zur Abschirmung der UV-Strahlung nach Außen und zur Realisierung des IP-Schutzgrades
10	Strahlerstecker ist verpolungssicher, da rechteckig
11	Innensechskantschrauben (3 Stück) – zur Befestigung des Tauchrohrkopfes **(12)**
12	Tauchrohrkopf zur Halterung des Tauchrohres **(8)** inkl. Dichtungen

D-3.2.2 Schaltkasten

Technische Daten entnehmen Sie bitte den elektrotechnischen Unterlagen (siehe Anhang) und der Betriebsanleitung der UV-Überwachungseinheit (optional).

D-3.3 UV-Anlagen vom Typ „EL“

D-3.3.1 prinzipieller Reaktoraufbau

1	Reaktor – genaue Abmaße und Aufbau sind der Reaktorzeichnung bzw. dem Datenblatt zu entnehmen (siehe Anhang)
2	Muffe für Sensor (1/4“) bzw. für Messfenster (bei kalibriertem Sensor) – je nach Typ der UV-Überwachungseinheit und UV-Anlage
3	Anschlüsse des Reaktors – Größe, Art und Position kundenspezifisch
3.1	Zulauf Medium: Lichtfalle zum direkten Übergang auf Kunststoffleitungen kann integriert werden
3.2	Ablauf Medium: Lichtfalle zum direkten Übergang auf Kunststoffleitungen kann integriert werden
4	UV-Strahler
5	Tauchrohr aus Quarzglas
6	Strahlerkappe zur Abschirmung der UV-Strahlung nach Außen und zur Realisierung des IP-Schutzgrades
7	Strahlerstecker ist verpolungssicher, da rechteckig
8	Reaktordeckel mit integriertem Strömungsblech und Tauchrohraufnahme inkl. Dichtungen
9	Temperatursensor – Notabschaltung bei Temperatur Medium über 70°C. Standard ab 300W Strahlerleistung oder auf Anfrage. In Abhängigkeit vom Analgentyp auch mit Voralarmschwelle bei 50°C möglich (siehe Datenblatt).
10	Entlüftungsventil – kann je nach Anlagentyp von Zeichnung abweichen.
11	TriClamp-Klammer inkl. Dichtung zur Befestigung und Abdichtung von Reaktordeckel **(8)**

D-3.3.2 Schaltkasten

Technische Daten entnehmen Sie bitte den elektrotechnischen Unterlagen (siehe Anhang) und der Betriebsanleitung der UV-Überwachungseinheit (optional).

D-4 INSTALLATION / INBETRIEBNAHME

D-4.1 Installations- und Betriebshinweise

Die Installations- und Inbetriebnahmearbeiten dürfen nur durch unterwiesenes Fachpersonal vorgenommen werden. Der Betreiber ist verpflichtet, die ordnungsgemäße Installation zu ermöglichen.

Vor der erstmaligen Inbetriebnahme ist die Anlage auf Dichtheit zu prüfen, die elektrische Verbindung zum Netz herzustellen sowie ein Probelauf durchzuführen.

Hinweis für den Einsatz im Desinfektionsbereich:

Die gewünschte Keimreduzierung im gesamten System (einschließlich Rohrleitungen, Vorlagebehälter) kann erst nach einer Einlaufphase der UV-Anlage erreicht werden. U. U. kann es notwendig sein, vor der Erstinbetriebnahme das Rohrleitungssystem einmalig zu desinfizieren (thermisch oder chemisch).

- Bei der Platzauswahl auf Freiraum für den Strahlerwechsel achten (siehe Technisches Datenblatt der Anlage).
- Anlage vor direkter Sonneneinstrahlung und vor Frost schützen.
- Die Anlage darf nicht im Freien aufgestellt werden!
- Der Standort für die Anlage sollte so gewählt werden, dass Wasser, welches u.a. beim Entleeren oder Spülen der Anlage anfällt, abfließen kann.
- Ein direkter Übergang vom Reaktor auf Kunststoffrohrleitungen sollte vermieden werden. UV-Strahlung schädigt das Material. Im Falle von Übertemperaturen durch Störungen kann es ebenfalls zu Schäden am Rohrleitungssystem kommen.
- In Abhängigkeit von Länge und Zustand des Rohrleitungssystems sollte vor Erstinbetriebnahme eine ausreichende Reinigung/Spülung durchgeführt werden.
- Eine ausreichende elektrische Versorgung sollte sichergestellt sein.
- Das Kabel vom Strahler zum Schaltschrank hat eine standardmäßige Länge von 2,9 m. Die mitgelieferten Kabel dürfen nicht verlängert oder gekürzt werden (dies stellt einen unsachgemäßen Eingriff in die Anlage dar und führt zum Erlöschen der Garantie). Ein Aufrollen von Kabeln, sowie das Einziehen von übriger Kabellänge in den Schaltkasten sind zu unterlassen. Selbiges gilt für das optional mitgelieferte Sensorkabel der Überwachungseinheit. Grundsätzlich sollten keine Kabel miteinander verdrillt werden.

- Bei erforderlichem Entfernen von Kabeln aus dem Schaltschrank (z.B. für Verlegearbeiten der Kabel im Kabelschacht) ist unbedingt darauf zu achten, dass die Anschlüsse des Kabels beim Wiederanklemmen nicht verwechselt werden, da dies definitiv zu einer Schädigung elektronischer Komponenten führt.
- Der Strahlerstecker ist verpolungssicher, da das Steckerbild nicht quadratisch ist. Wird der Stecker um 90° gedreht, passt er nicht mehr! Eine Verpolung verursacht Schäden am Vorschaltgerät und Strahler!
- Informationen über die Anschlüsse des Strahlekabels am Vorschaltgerät, des optionalen UV-Sensors an der Überwachungs-einheit und des optionalen Kabels der Temperaturüberwachung finden Sie in den Schaltunterlagen.

  Bei Unklarheiten/Rückfragen oder im Zweifelsfall ist der Hersteller zu kontaktieren!
- **Der Zugang für notwendige Arbeiten während Betrieb und Wartung muss jederzeit gewährleistet sein.**
- Beim Betrieb des Strahlers kommt es zu einer Erwärmung. Die Wärme muss unbedingt abgeführt werden. Bei einem Wärmestau heizt sich das System auf und eine Schädigung des Strahlers, elektronischen Vorschaltgerätes (EVG) und der optionalen UV-Überwachungseinheit ist die Folge.

- Für den optional mitgelieferten Sensor darf die Temperatur des Reaktors 70° C nicht überschreiten. Übertemperaturen führen zur Schädigung des Überwachungssystems.

  Daher gilt folgendes:

  Bei Strahlerbetrieb ständige Wärmeabfuhr über die Reaktorwand (Reaktormantel nicht isolieren!) und das Medium (permanente Durchströmung im Betrieb!) gewährleisten.

  Der Testbetrieb ohne Medium sollte vermieden oder so gering wie möglich gewählt und nur unter Aufsicht durchgeführt werden.
- Für den störungsfreien und zuverlässigen Betrieb ist es wichtig, dass Schwingungen erzeugende Maschinen (z. Bsp. Pumpen) vom Rohrleitungsnetz entkoppelt werden.

  Schwingungen die sich auf die UV-Anlage übertragen, können zum frühzeitigen Ausfall oder zu verminderter UVC-Ausbeute des Strahlers führen. Eine ausreichende Wirkung der UV-Anlage ist dann nicht mehr gegeben.

  Neben dem Ausfall des Strahlers kann es außerdem zu mechanischen Schäden an der UV-Anlage kommen:

  Bildung von Rissen im Tauchrohr durch Stöße des Strahlers gegen das Quarzglas, somit Wasseraustritt zum Strahler hin und Gefahr von Kurzschlüssen sowie Beschädigungen an der Elektronik

Übermäßiger Beanspruchung der Schweißnähte des UV-Reaktors sowie der Rohrleitungen, bis hin zum Aufbrechen der Nähte.

- Der Schaltkasten ist vor Über- und Unterspannung, starken Störimpulsen und Netzrückwirkungen (z. Bsp.: Oberschwingungen) zu schützen.
- Die Umgebungsparameter für Reaktor und Schaltkasten sind einzuhalten (siehe Datenblatt)
- Bei chemischer Reinigung des Reaktors oder der Rohrleitungen ist unbedingt der UV-Strahler abzuschalten. Chemische Reinigungsmittel in Kombination mit UV-Strahlung schädigen die verbauten Dichtungen der UV-Anlage!
- Während einer Sanitisierung ist die Gesamte UV-Anlage abzuschalten. Zusätzlich ist der UV-Sensor aus dem Messfenster zu entnehmen (bei kalibrierter UV-Überwachung)!

D-4.2 Installation und Inbetriebnahme

1. Einbinden der UV-Anlage in das bestehende Rohrleitungssystem.

   Vor der Einbindung ist das Tauchrohr zu entnehmen um Glasschäden zu verhindern! (Hinweise siehe Tauchrohrwechsel)

   Beim Einbau des Reaktors ist darauf zu achten, dass sich das Entlüftungsventil oben befindet. Die Durchströmungsrichtung des Mediums von unten nach oben muss gewährleistet sein.

   Wird der Reaktor horizontal eingebaut, darf der UV-Sensor (optionale Ausführung) nicht oben stehen, da Luftblasen das Messsignal verfälschen können.

   Um die Bildung unerwünschter Luftblasen zu verhindern sowie eine optimale Entlüftung zu gewährleisten, ist bei der horizontalen Einbauweise des Reaktors eine Neigung von ca. 2° von Vorteil. Das System entlüftet sich dann selbst.

2. Das Tauchrohr ist vorsichtig in den Reaktor einzuführen. (Hinweise siehe Tauchrohrwechsel)

HINWEIS Bei Verschraubungen von Edelstahl in Edelstahl ist die Verwendung eines geeigneten Schmiermittels erforderlich.

3. Prüfung, ob das Tauchrohr in der Führung liegt. Es muss ein leichter Gegendruck der Aufnahmefeder (siehe Zeichnung) spürbar sein.

   Bei „MIP/VAP-Anlagen“ muss der O-Ring des Tauchrohrkopfes komplett in der Nut liegen und darf nicht herausquetschen.

Bei „EL-Anlagen“ mit fester Verbindung von Tauchrohraufnahme und Deckel ist darauf zu achten, dass die Dichtung des Tri-Clamp-Flansches exakt in der Nut liegt.

4. System auf hydraulische Dichtheit überprüfen!
5. Strahler mit elektrischer Verkabelung vorsichtig in das Tauchrohr einführen (Siehe nachfolgende Hinweise!)

ACHTUNG

Schon durch geringe Luftfeuchtigkeit kann es zu Kondensationsvorgängen im Tauchrohr kommen. (Während des Betriebes erwärmte Luft strömt am Strahler nach oben und kondensiert oberhalb des Strahlers am Stecker. Kurzschlüsse können die Folge sein).

ACHTUNG

Tauchrohr und Strahler müssen vor Inbetriebnahme trocken sein. Es wird empfohlen, dass Tauchrohr mit Stickstoff oder trockener Luft zu spülen bzw. sollte die Anlage einige Minuten ohne Schutzkappe betrieben werden um die Feuchtigkeit auszutragen (Achtung: Während dieser Zeit kein IP-Schutz!).

6. Schutzkappe mit leichter Drehbewegung bis zum Anschlag aufstecken. Kabelverschraubung fest verschrauben um den IP-Schutzgrad zu realisieren.

   Beim Einsatz einer UV-Überwachungseinheit ist darauf zu achten, dass die Rückführlitzen des Strahlers nicht in Richtung Sensor liegen. Die UV-Intensitätsmessung wird sonst beeinträchtigt!
7. Erdungskabel des Schaltkastens am **Reaktor** anbringen!

   An vorgesehener Erdungsmutter (MIP/VAP-Anlagen) oder über Erdungsschelle (EL-Anlagen).
8. UV-Sensor und Temperatursensor (wenn vorhanden) anschließen.

9. Netzverbindung herstellen! Eine Festverdrahtung der Anlage darf nur durch eine Elektrofachkraft erfolgen! Seitens des Betreibers ist die Anlage mit einem FI-Schutzschalter abzusichern.
10. Anlage einschalten! Schalter befindet sich an der rechten Seite des Kastens (bei Thermoplastkasten) oder in der Tür (Stahlblechkästen).

    Verfügt die Anlage über eine Remote-Ansteuerung ist vor dem Einschalten der Wahlschalter auf Handmodus oder auf Automodus (Remote) zu stellen. Ein Schalten während des Betriebes ist zu unterlassen!
11. Funktion überprüfen! Die Belegung der Fehlerkontakte ist den Schaltunterlagen zu entnehmen oder beim Hersteller zu erfragen.

Vor der Inbetriebnahme des Gerätes muss sichergestellt sein, dass alle Verschraubungen und Anbindungen montiert sind und somit keine UV-C-Strahlung an Haut und Augen gelangen kann.

Die Funktionskontrolle der UV-Anlage erfolgt je nach Ausführung über die LED am Schaltkasten oder direkt am EVG. Bei Einsatz einer UV-Überwachungseinheit sind die entsprechenden Hinweise der zugehörigen Betriebsanleitung zu beachten.

Der Schaltkasten wird je nach verwendetem EVG mit bis zu zwei verschiedenen LED´s ausgerüstet:

Anlage	***LED EVG – grün***	***LED EVG – rot***
EVG 11/16W	-	-
EVG 25W	x	x
EVG 36 W	x	-
EVG (übrige)	x	x

Abweichungen im Sinne des technischen Fortschrittes oder zum Erhalt der Lieferfähigkeit vorbehalten.

LED	***Bedeutung***
LED grün - blinkt	Strahler wird vorgeheizt
LED grün - leuchtet	Strahler gezündet und in Betrieb
LED rot - leuchtet	Strahlerausfall / kein Strahler angeschlossen

Nach einer Anlaufzeit von mehreren Minuten (abhängig von Umgebungsbedingungen) erreicht der Strahler seine in Abhängigkeit der Betriebsstunden volle UV-Intensität.

Die erreichte UV-Bestrahlung ist vom Reinigungszustand des Tauchrohres (Belagbildung!) und der UV-Transmission des Mediums abhängig. Zudem sinkt die UV-C-Leistung des Strahlers mit zunehmender Betriebsdauer. Ein Wechsel des Strahlers nach der im Datenblatt angegebenen Betriebsstunden wird empfohlen. Eine Reinigung sollte in sinnvollen und regelmäßigen Abständen erfolgen.

Bevor an der UV-Anlage Arbeiten durchgeführt werden (z.B. Wartung), ist diese unbedingt abzuschalten und gegen Wiedereinschalten zu sichern. Dasselbe gilt für den Havariefall. Wird ein Fehler an der UV-Anlage festgestellt, gleich welcher Art (Wasseraustritt, Schaden an der Elektrik, etc.), ist die Anlage sofort außer Betrieb zu setzen und der Schaden durch eine Fachkraft zu beheben.

Bei chemischer Reinigung des Reaktors oder der Rohrleitungen ist unbedingt der UV-Strahler abzuschalten. Chemische Reinigungsmittel in Kombination mit UV-Strahlung schädigen die verbauten Dichtungen der UV-Anlage!

Während einer Sanitisierung ist die Gesamte UV-Anlage abzuschalten. Zusätzlich ist der UV-Sensor aus dem Messfenster zu entnehmen (bei kalibrierter UV-Überwachung)!

D-4.3 Anlage außer Betrieb nehmen

1. Anlage am Hauptschalter ausschalten.
2. Anlage vom Stromnetz trennen – Sicherheitsvorschriften beachten!
3. Anlage ausreichend abkühlen lassen.
4. Durchfluss unterbrechen und Reaktor entleeren.
5. Reinigung durchführen.

D-5 INSTANDHALTUNG / WARTUNG / STÖRUNGEN

Die Anlage ist abgesehen von der in Abhängigkeit der Wasserqualität notwendigen regelmäßigen Reinigung des Tauchrohrs und des Messfenster des Sensors (kalibriert), sowie dem Strahlerwechsel weitgehend wartungsfrei.

Für einen störungsfreien Betrieb ist auf Folgendes zu achten:

- Die Anschlüsse dürfen mechanischen Scherkräften nicht ausgesetzt werden.
- Mechanische Beschädigungen der Anlage sind auszuschließen.
- Regelmäßige Kontrolle des Reaktors bzw. des Tauchrohres und Reinigung von visuell erkennbaren Verschmutzungen mittels Bürste bzw. mittels Reinigungsmittel.
- Regelmäßige Kontrolle auf Dichtheit der Anlage. Bei UV-Anlagen mit kalibrierter UV-Überwachung ist das Messfenster regelmäßig auf Dichtheit zu überprüfen. Andernfalls kann der UV-Sensor geschädigt werden.
- Strahlerwechsel nach empfohlener Betriebsstundenzahl bzw. Ausfall vornehmen.
- Bei Anlagen zum TOC-Abbau ist das Tauchrohr, sowie der zugehörige Dichtungssatz spätestens nach 2 Jahren Betrieb zu tauschen!
- Kommt ein Kunststoff-Schauglas zum Einsatz, so wird empfohlen dies bei jedem Strahlerwechsel mit zu wechseln.

HINWEIS Beachten Sie zusätzlich die Hinweise aus der Betriebsanleitung für die optional gelieferte Überwachungseinheit!

D-5.1 Elektrische Komponenten

An den elektrischen Komponenten ist eine Wartung nicht erforderlich. Um eine hohe Lebensdauer und Effizienz zu erreichen sollte die Temperatur des Schaltkastens nicht über 40°C liegen. Schaltvorgänge sollten so gering wie möglich gehalten werden.

Der Schaltkasten sollte vor Über- und Unterspannung geschützt und mit einem FI-Schutzschalter abgesichert werden.

Die Erdung des Systems ist regelmäßig zu kontrollieren.

D-5.2 Strahlerwechsel

Um die Funktion der UV-Anlage und die notwendige UV-Intensität zu gewährleisten, sollte der Strahler regelmäßig getauscht werden (Empfehlung: nach der im Datenblatt angegebenen Betriebsstundenzahl). Sofern keine UV-Überwachungseinheit integriert ist, sollten die Strahler nicht länger als empfohlen betrieben werden.

Ein Strahlerausfall kann über die rote LED am Schaltschrank (oder das Alarmsignal bei optionaler Ausführung mit UV-Überwachungseinheit) festgestellt werden.

Ersatzstrahler können beim Hersteller dieser Anlage als Ersatzteil bestellt werden. Für einen ordnungsgemäßen Betrieb der Anlage dürfen nur die vom Hersteller vorgesehenen Strahler eingesetzt werden. Bei Verwendung anderer als der vom Hersteller vorgesehenen Strahler erlischt jeglicher Garantie- und Gewährleistungsanspruch.

Im Zuge eines Strahlerwechsels sollte eine Wartung und Reinigung der gesamten UV-Anlage eingeplant werden.

ACHTUNG Die maximalen Betriebsstunden für den Strahler gelten nur bei maximal einem Schaltvorgang pro 8 h Betriebsdauer. Bei häufigeren Ein- und Ausschaltvorgängen verkürzt sich die Strahlerlebensdauer drastisch.

VORSICHT Beim Betrieb der Anlage kommt es zur Erwärmung der Komponenten. Wird unmittelbar nach dem Abschalten ein Strahlerwechsel durchgeführt, ist darauf zu achten, dass der Strahler noch heiß ist!

Strahlerwechsel durchführen:

1. Anlage ausschalten und von der Stromversorgung trennen bzw. spannungsfrei schalten und gegen Wiedereinschalten sichern.

2. Anlage ausreichend abkühlen lassen.
3. Kabelverschraubung **vorsichtig** an der Kappe des Tauchrohres lösen.
4. Schutzkappe mit leichter Drehbewegung vom Strahlerkopf abziehen.
5. Strahler ca. 20 cm vorsichtig (Bruchgefahr) herausziehen und vom Steckkontakt lösen.
6. Strahler entnehmen; vorsichtig und sicher Ablegen.

VORSICHT Verletzungsgefahr beim Brechen des Quarzrohres!

HINWEIS Es wird empfohlen, auch bei einem Strahlerwechsel, den Durchfluss durch den Reaktor zu unterbrechen.

ACHTUNG Ein plötzliches Herabfallen des Strahlers kann zur Zerstörung des Tauchrohres führen!

7. Neuen Strahler an den Enden (nicht am Glas!) umfassen. Direkte Berührung mit dem Quarzmaterial sollte vermieden werden oder nur mit sauberen Baumwollhandschuhen geschehen. Verschmutzungen des Strahlers führen zu einer Beeinträchtigung der Funktion. Verschmutzungen auf dem Strahler brennen sich in das Quarzglas ein.
8. Strahler geradlinig in das Tauchrohr einführen.
9. Strahler mit dem 4-Stiftstecker fest verbinden.

HINWEIS Das Steckerbild ist nicht quadratisch, d. h. eine axiale 90° Drehung kann notwendig sein!

HINWEIS Bei Verwendung einer UV-Überwachungseinheit darf die Rückführlitze des Strahlers nicht vor dem UV-Sensor liegen. Dies beeinträchtigt die Messung der UV-Intensität!

10. Strahler bei vertikalem Einbau des Reaktors vorsichtig auf dem Boden des Tauchrohres aufsetzen.
11. Schutzkappe mit gelockerter Kabelverschraubung mittels Drehbewegung auf den Tauchrohrflansch aufbringen.
12. Strahlerkabel fixieren, Kabelverschraubung bis zum festen Haften des Kabels anziehen.
13. Kontrolle auf Dichtheit und feste Schraubverbindungen.
14. Inbetriebnahme des Gerätes; Funktionstest der Anlage kann durchgeführt werden.

Vor der Wiederinbetriebnahme des Gerätes muss sichergestellt sein, dass alle Verschraubungen und Anbindungen montiert sind und somit keine UV-C-Strahlung an Haut und Augen gelangen kann.

D-5.3 Reinigung und Wechsel Tauchrohr

Feste Reinigungszyklen können nicht vorgegeben werden, da die Belagbildung am Tauchrohr wesentlich von der Qualität des zu behandelnden Wassers abhängt.

Das Tauchrohrsystem ist über 3 Schrauben mit dem Reaktordeckel verschraubt oder direkt mit diesem verschweißt. Das Tauchrohr wird auf einer Feder, die sich auf dem Reaktorboden befindet, gelagert (siehe Zeichnung). Es steht damit unter einem leichten Druck.

Bei Anlagen zum **TOC**-Abbau sind das Tauchrohr, sowie der zugehörige Dichtungssatz **spätestens nach 2 Jahren Betrieb** zu tauschen!

Bei der Reinigung ist wie folgt vorzugehen:

1. Vorgang wie Strahlerwechsel Pos. 1 – 6.
2. Durchfluss unterbrechen, Druck von der Anlage nehmen und entleeren.
3. Verschraubung (3 Innensechskantschrauben) mit geeignetem Werkzeug vorsichtig lösen/entfernen. Dabei den Flansch parallel zur Dichtfläche des Reaktors halten. Das Tauchrohr bewegt sich durch den Federdruck nach außen.

   Bei einer festen Verbindung von Tauchrohraufnahme und Deckel ist die Klammer zu öffnen. Der Deckel drückt durch den Federdruck nach außen.
4. Tauchrohrsystem vorsichtig aus Reaktor nehmen.

VORSICHT Verletzungsgefahr beim Brechen des Quarzrohres!

HINWEIS Direkte Berührung mit dem Quarzmaterial sollte vermieden werden. Das kann zu einer Verschmutzung des Strahlers/Tauchrohres führen und damit zu einer Beeinträchtigung der Funktion.

5. Tauchrohr unter Verwendung einer milden Seifenlösung oder organischen Säure (Zitronensäure) reinigen.

   Spezielle Reinigungsmittel können beim Hersteller der Anlage bestellt werden (Gebindegröße: 1 Liter-Flasche zum Sprühen oder 5 Liter-Kanister für eine Umwälzreinigung).
6. Muss das Tauchrohr getauscht werden, sollte dies nur von geschultem Personal ausgeführt werden. VERLETZUNGSGEFAHR!

   Das Tauchrohr ist durch leichte Drehbewegungen aus dem Tauchrohrkopf zu lösen. Durch längeren Betrieb kann es vorkommen, dass sich das Tauchrohr nicht löst. In diesem Falle muss es aus dem Tauchrohrkopf ausgeschlagen werden. Dies darf nur mit Handschuhen und Schutzbrille geschehen!

   Bei jedem Tauchrohrwechsel sollten die Dichtungen getauscht werden! Die Dichtungen sind mit einem geeigneten Schmiermittel zu benetzen.

Das neue Tauchrohr wird mit einer leichten Drehbewegung in den Tauchrohrkopf eingebracht. Anschließend ist es zu reinigen.

7. Montage des Tauchrohrsystems in umgekehrter Reihenfolge:

   Nach dem geradlinigen zentrischen Einführen des Tauchrohres wird dieses mit einer Hand vorsichtig niedergedrückt, und wieder befestigt (Schrauben bzw. Klammer).

ACHTUNG

- Tauchrohr nicht zerkratzen!
- Reinigung nur mit weichem Tuch!
- Das Tauchrohr muss vor dem Wiedereinbau sowohl Innen als auch Außen trocken und sauber sein.

D-5.4 Wartungsplan

	monatlich	6 – 12 Monate	12 – 24 Monate
Visuelle Kontrolle			
- UV-Intensität und Betriebsstunden ablesen und hinterlegen	■		
- Dichtheit der Anlage und Leitungsanschlüsse überprüfen	■		
- Dichtheit des Messfensters überprüfen (bei kalibrierter UV-Überwachungseinheit)	■		
- Zustand des Kunststoffschauglases überprüfen, ggf. Tausch	■		
- Betriebszustand der Anlage überprüfen	■		
UV-Strahler			
- Überprüfen der Intensität	■		
- Ersetzen (nach erreichter Betriebstundenzahl oder Ausfall)		■	
Reinigen der Anlage			
- Reinigen des Reaktors		■	
- Wechsel/Reinigen des Tauchrohres		■	■
- Reinigen des Messfensters		■	
Dichtungen			
- Ersetzen (oder bei Tauchrohrwechsel)			■
UV-Sensor			
- Überprüfen der Messung		■	
- Nachkalibrierung			■
Messfenster (bei kalibrierter UV-Überwachung)			
- Auf Dichtheit prüfen	■		
- Ersetzen (oder bei Undichtigkeit)			■

Je nach Betriebsbedingungen kann es notwendig sein, die Wartungsarbeiten öfters als im Plan angegeben durchzuführen.

HINWEIS

Verwenden Sie ausschließlich Originalersatzteile. Bei Verwendung fremder Ersatzteile (inkl. UV-Strahler) erlischt jeder Gewährleistungsanspruch. Der Hersteller kann für den ungenügenden Wirkungsgrad der UV-Anlage bei mangelnder Wartung der Anlage oder Verwendung fremder Ersatzteile nicht haftbar gemacht werden.

D-6 LAGERUNG UND TRANSPORT

Die UV-Anlage ist sicher vor Stoß, Schlag und mechanischer Beanspruchung zu transportieren. Der Strahler ist bei jedem Transport dem Reaktor zu entnehmen.

VORSICHT Verletzungsgefahr beim Brechen von Glasbauteilen!

Die Reaktor und das Tauchrohr sind vor der Lagerung gründlich zu reinigen. Alle Komponenten der UV-Anlage sind trocken, staubfrei und geschützt vor mechanischer Beschädigung aufzubewahren. Es empfiehlt sich das Tauchrohr außerhalb des Reaktors und losgelöst vom Tauchrohrkopf zu lagern.
Besonders die elektrotechnischen Komponenten sind bei einer möglichst konstanten Temperatur aufzubewahren. Empfehlung 15-25°C.

D-7 GEWÄHRLEISTUNG UND HAFTUNG

Grundsätzlich gelten für Gewährleistungen unsere AGB.

Ein Gewährleistungsanspruch besteht für 12 Monate ab Lieferung bzw. ab Inbetriebnahme, wenn diese durch den Hersteller erfolgt ist.

Gewährleistungs- und Haftungsansprüche bei Personen- und Sachschäden sind ausgeschlossen, wenn sie auf eine oder mehrere der folgenden Ursachen zurückzuführen sind:

- Nicht bestimmungsgemäße Verwendung der Anlage
- Nichtbeachten der Hinweise in der Betriebsanleitung bezüglich Transport, Lagerung, Montage, Inbetriebnahme und Wartung der Anlage
- Mangelhafte Überwachung des Anlagenbetriebes bzw. unsachgemäße Eingriffe in den Anlagenbetrieb
- Unsachgemäß durchgeführte Reparaturen, Wartung und Instandhaltungsmaßnahmen
- Katastrophenfälle durch Fremdkörpereinwirkung und höhere Gewalt
- Umbauarbeiten oder sonstige Eingriffen ohne Rücksprache und Genehmigung des Herstellers.

HINWEIS Verwenden Sie ausschließlich Originalersatzteile.

HINWEIS

Bei Störungen kontaktieren Sie bitte unseren Kundendienst unter Angabe des aufgetretenen Fehlers.

Halten Sie den Anlagentyp und die Seriennummer der Anlage bereit.

E-1 WARNINGS

Safety notices

This facility works with UV radiation. Radiation may harm eyes and skin; hence, the facility must only be operated if the reactor shell is undamaged. Do not look into the radiation unprotected and do not expose skin to radiation!

Open and install the device only with power OFF and in its non-pressurised state! The reactor is pressurised. If handled inappropriately, there is the risk for the quartz tube to burst and the medium may leak from the reactor.
Prior to cleaning, maintenance or the replacement of parts, the device must be disconnected from all sources of power supply.
Do not operate the facility in a condition when it is not filled with water or when water supply is interrupted.
Respectively applicable regulations for the handling of electrical devices must be observed.

The water to be treated/waste water may contain hazardous substances. Please follow the respective handling and safety regulations!
The medium to be treated must not have any damaging influence (e.g. corrosion) on the UV system. Damage is not covered by the warranty. Material specifications can be found in the data sheet!

During operation, components and the medium will heat up. Use it only in flowing operation and with proper venting of the reactor! Damage to the system or to other components by overheating is not covered by warranty or guarantee!

HINT

Read this operation manual carefully and before installation!

No warranty in case of wrong operation mode or incorrect use!

IMPORTANT

The technological dimensioning and proper functioning of the system only applies to the components used by the manufacturer.

The use of 3rd party material (including spare parts and wear parts) will void any claim to a technologically correct function of the system.

E-2 GENERAL REMARKS

This Operating Manual contains information that is required to correctly and safely take the UV facility into operation and handle it Please read the entire Operating Manual prior to operating the facility. When working on the facility, always observe the safety notices in the Operating Manual as well as the additionally and generally applicable safety regulations and notices on safety at work. In the event of inappropriate operation or installation, the supplying company cannot be held liable for any warranty and guaranty claims.

The following principles apply to operating the facility:

- If there is a damage in case of the transport, a damage report has to be written with the supplier and sent via fax or e-mail to the seller within 24 hours.
- The facility operator is responsible for proper assembly and installation of the facility in accordance with the Installation Instructions. He bears responsibility for maintaining the facility in an operationally safe state at all times.
- The facility must only be commissioned, operated and repaired by authorised and appropriately instructed personnel.
- Should any regulation contained in this Operating Manual, particularly with regard to safety, not correspond with local statutory provisions, the respectively more stringent provision will apply.

E-3 TYPES OF SYSTEMS

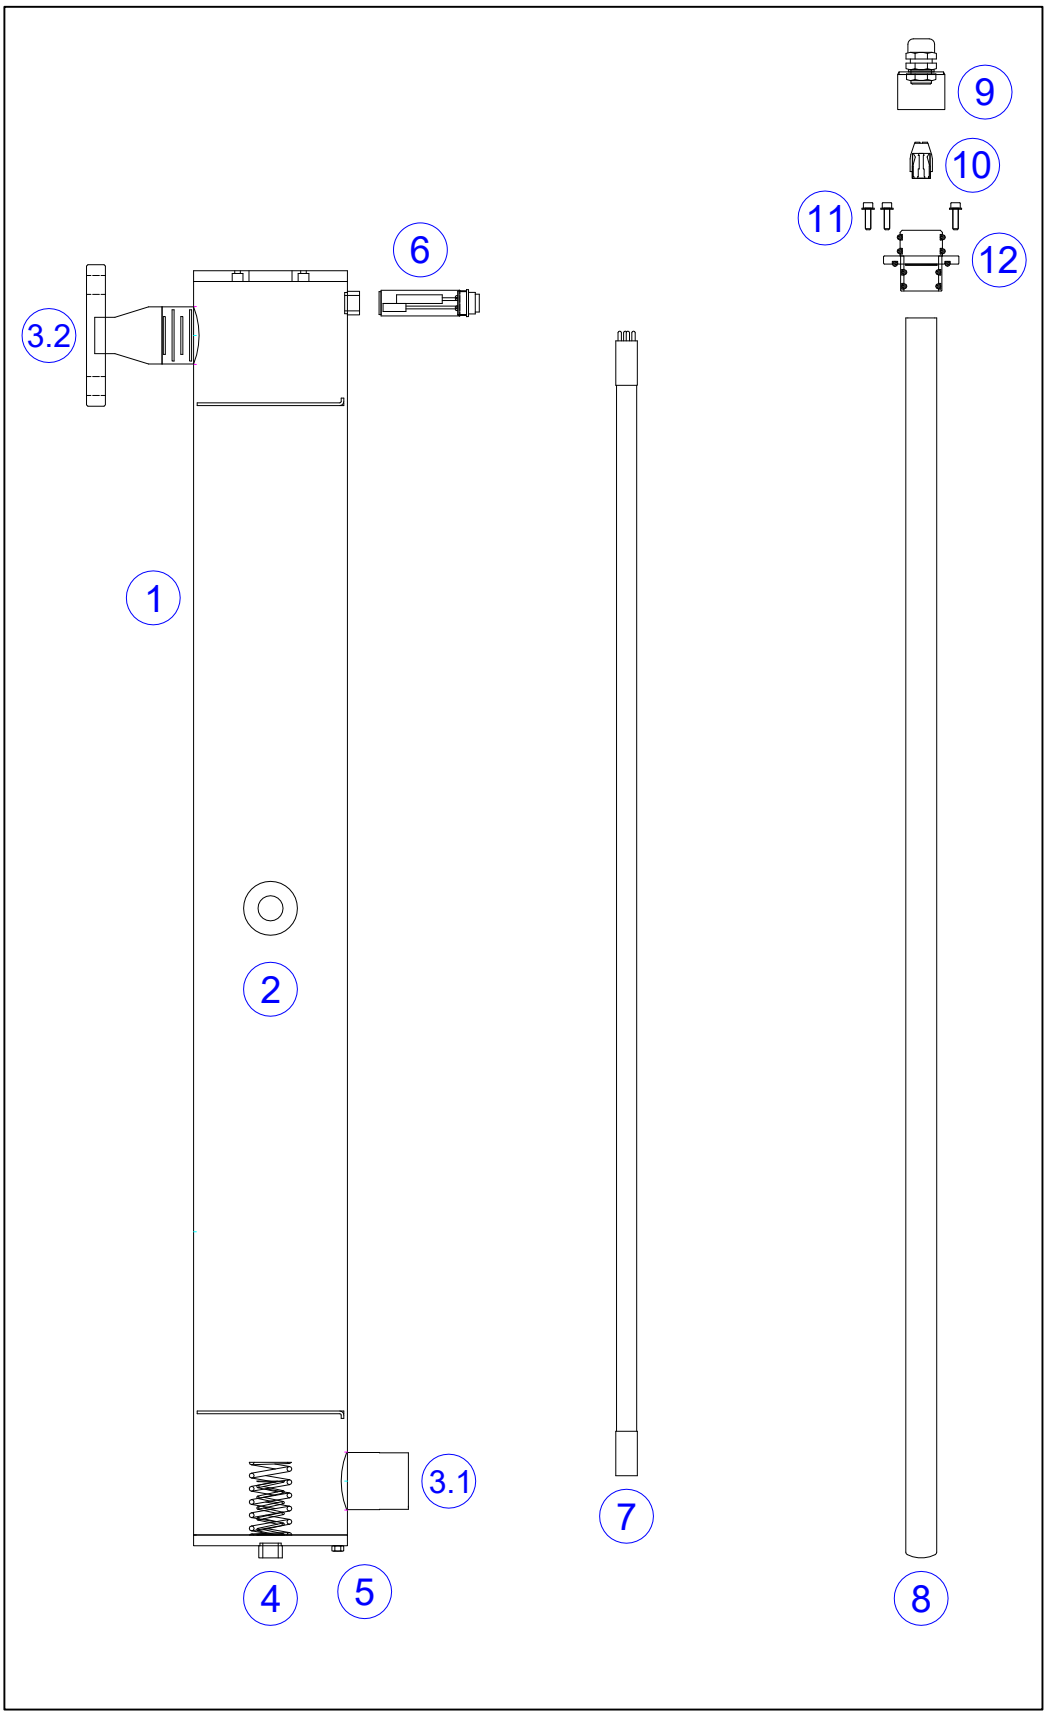
E-3.1 Intended Use

The UV facilities of the type “MIP / VAP” and of the type “EL” can be used for water treatment in the following areas:

4. Disinfection
   UV radiation of a wavelength of 254 nm deactivates microorganisms

5. elimination of remaining ozone
   UV radiation of a wavelength of 254 nm destroys water-borne ozone
6. TOC degradation
   ozone-generating UV lamps oxidise organic compounds suspended in water

The achievable reduction of germs, remaining ozone and TOC is dependent on several factors:

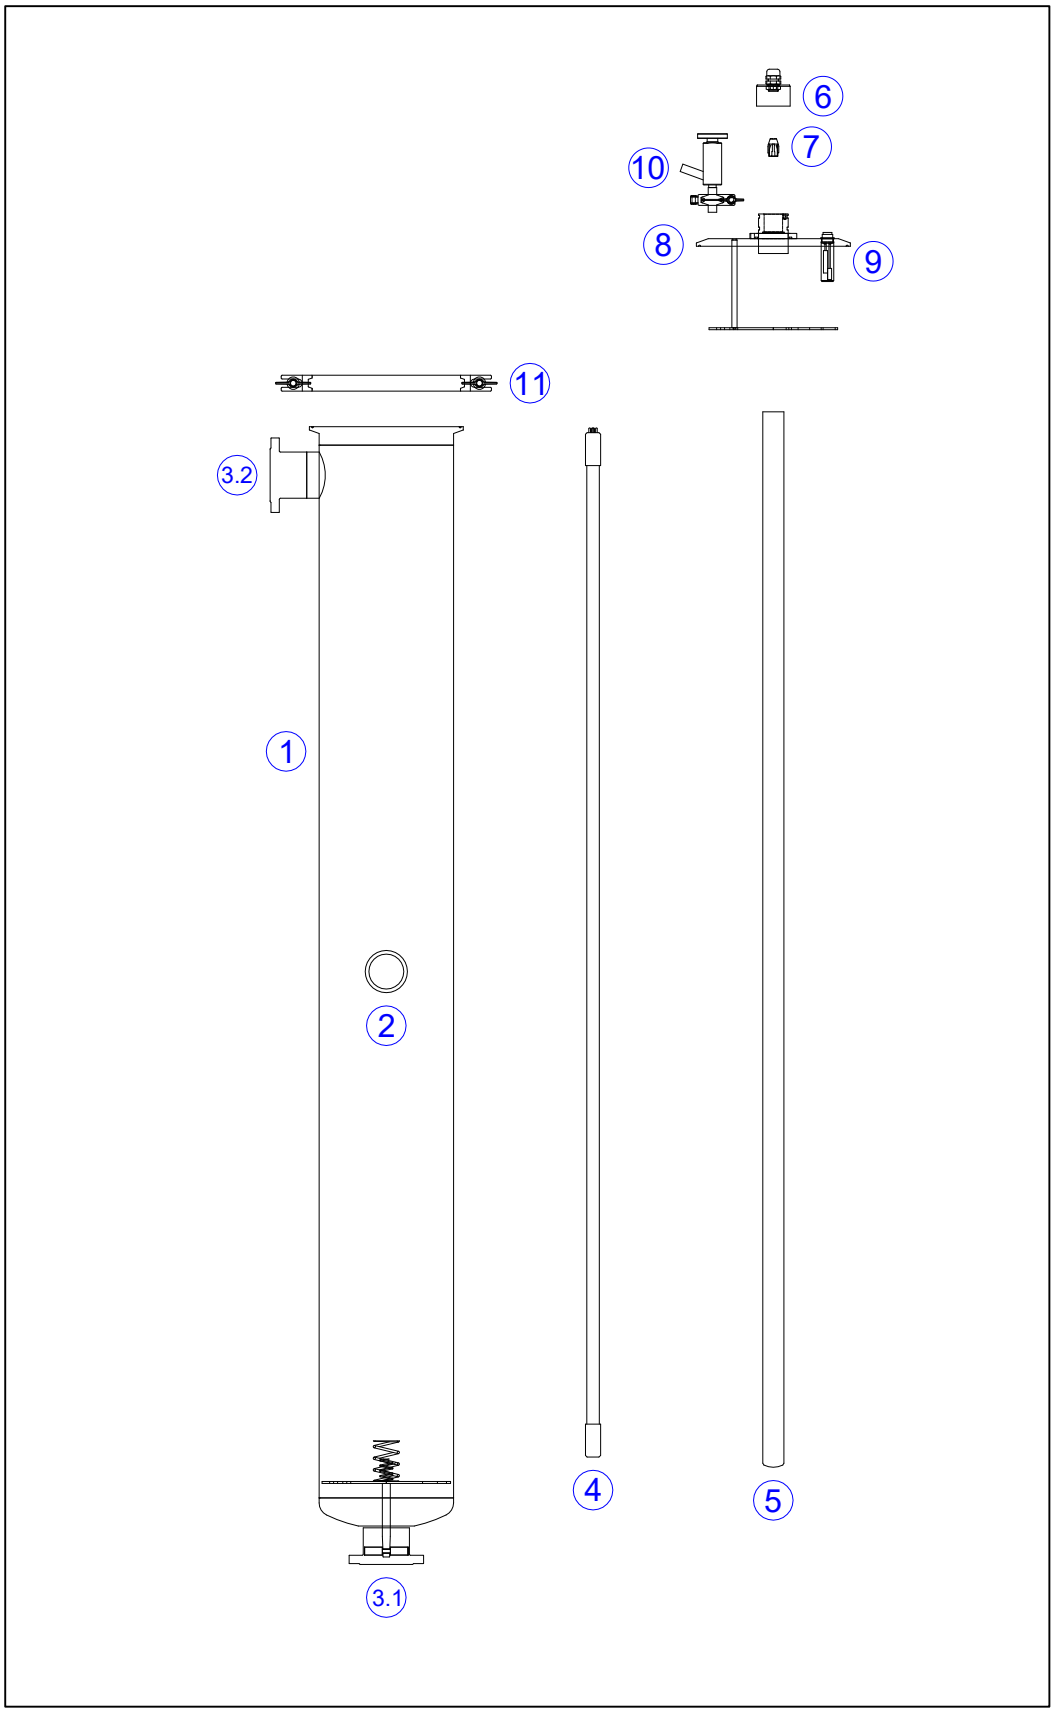


- turbidity and UV-C transmission of the water
- The flowrate of the water to be treated
- The number of operating hours / life-time of the UV lamp
- The state of cleanliness of the quartz tube
- The germ count in the water to be treated; the ozone concentration or TOC concentration, respectively.

The UV facility is only effective if operated continuously.

E-3.2 UV systems of Type „MIP / VAP“

E-3.2.1 Basic Structure of the UV reactor



1	UV reactor – exact dimensions and construction can be found on the reactor drawing or the data sheet (see appendix)
2	Fitting for UV sensor (1/4”) or measurement window (1”) – according to the used UV monitoring unit and UV system
3	Connections of the UV reactor – size, type and position customized
3.1	Input medium Example for connection: fitting with internal/external thread without light trap
3.2	Output medium Example for connection: flange with light trap for direct connection to a plastic pipe
4	Draining 1/4" – for vertical use of the UV reactor Without function – for horizontal use of the UV reactor
5	Hex nut welded at UV reactor for connection of the earthing cable – if not available or difficult to achieve, use an earth strip at the UV reactor for earthing!
6	Temperature sensor – emergency off if temperature of medium over 70°C. Standard at UV systems with power up to 300W.
7	UV lamp
8	Quartz tube
9	Cap at lamp cable to realize the degree of protection.
10	Lamp plug - is reverse-pole protected, because rectangular.
11	Allen screws (3 pieces) – for mounting of the quartz tube insertion (12)
12	quartz tube insertion incl. seals to hold the quartz tube (8)

E-3.2.2 Switch Box

Technical dates can be found in the circuit documents (see appendix) and in the operating manual of the UV monitoring (optional).

E-3.3 UV Systems of the Type „EL“

E-3.3.1 Basic Structure of the UV Reactor

1	UV reactor – exact dimensions and construction can be found on the reactor drawing or the data sheet (see appendix)
2	Fitting for UV sensor (1/4”) or measurement window (calibrated sensor) – according to the used UV monitoring unit and UV system
3	Connections of the UV reactor – size, type and position customized
3.1	Input medium: Light trap for direct connection to a plastic pipe can be integrated.
3.2	Output medium: Light trap for direct connection to a plastic pipe can be integrated.
4	UV lamp
5	Quartz tube
6	Cap at lamp cable to realize the degree of protection.
7	Lamp plug - is reverse-pole protected, because rectangular.
8	Clamp cover with integrated flow plate and quartz tube insertion incl. seals.
9	Temperature sensor – emergency off if temperature of medium over 70°C. Standard at UV systems with power up to 300W. Depending on the type of UV system a pre alarm at 50°C temperature of medium is available (see data sheet).
10	Air valve – according to the UV system differences are possible.
11	Clamp clip and seals to fix and seal the clamp cover (8).

E-3.3.2 Switch Box

Technical dates can be found in the circuit documents (see appendix) and in the operating manual of the UV monitoring (optional).

E-4 INSTALLATION / START-UP

E-4.1 Installation and operating instructions

Installation and commissioning must only be performed by instructed specialists. The operator is obliged to provide for proper installation.

Prior to its first taking into operation, the facility is to be checked for leak tightness, it is to be connected to power supply and a test run is to be performed.

Note on application in the field of disinfection:

The desired reduction in the germ count in the entire system (including piping, reservoir) can only be achieved after a running-in phase of the UV facility. It may be necessary to disinfect the piping system once before taking the facility into operation (thermally or chemically).

- When choosing a site of installation, provide for sufficient space for exchanging UV lamp (please refer to Technical Specifications as annexed)!
- Keep protected against direct sun radiation and frost!
- The facility must not be set up outdoors!
- Such site should be selected for the facility that allows water which accumulates during draining or rinsing, for example, to flow off.
- A direct transition from the reactor to plastic pipes should be avoided. UV radiation damages the material. In the case of excessive temperatures because of failures, it can also cause damages at the piping system.
- Depending on the length and condition of the piping system, it should be cleaned/rinsed thoroughly prior to commissioning.
- Sufficient electrical supply should be provided for.
- The lamp cable has a length of 2,9m. The included cables must not be extended or shortened (this represents an inappropriate interference with the facility and results in guaranty to expire). Do not roll up any cable and do not pull any excess lengths of cable into the switch box. The same applies to the included sensor cable for the monitoring unit. Cables should principally not be twisted with each other.

- If removal of the lamp cable from the switch box is required (e.g., when laying the cable in a cable duct) extreme care must be taken that the cable ends will not get mixed up when re-connecting them, since this may result in damaging electronic components.
- The UV lamp plug is reverse-pole protected, since the plug is not square. Turned by 90°, the plug does not fit any more. Reverse poling causes damage to the electronic ballast and the UV lamp!
- Information's about connection of lamp cable at the electronic ballast, the optional UV sensor at the UV monitoring and the cable of the temperature sensor can be found in the circuit documents.

  If anything is unclear or if you have questions, please contact the manufacturer.
- **Access must be guaranteed at any time during operation and maintenance.**
- Operating the UV lamp results in heating up. This heat must at any rate be allowed to escape. If heat builds up, the device will heat up resulting in damaging the UV lamp, electronic ballast and the optional UV monitoring unit.

- Regarding the included UV sensor, the temperature of the reactor must not exceed 70°C. Excess temperature leads to damaging the UV monitoring.

  Therefore, the following applies:

  During operation of the UV lamp, guaranty permanent heat removal via the reactor wall (Do not insulate the reactor shell!) and allow the medium to permanently flow.

  Select the time for the test run without the medium as short as possible and perform it under supervision.
- For trouble-free and reliable operation, it is important that vibrations generating equipment (eg. Pumps) are decoupled from the pipe network.

  Vibrations which are transmitted to the UV system can lead to premature failure or to reduced UVC output of the UV lamp. Flawless operation of the UV system is not guaranteed anymore.

  In addition to the failure of the UV lamp, it may also lead to mechanical damage to the UV system:

  Formation of cracks in the quartz tube by knocks of the UV lamp against the quartz tube. As a result, water leakage and cause a short circuit and may damage the electronics.

  Excessive stress on the welds of the UV reactor and the pipes, to the breaking of the seams.
- The switch box is from over- and undervoltage, strong glitches and system perturbations (eg.: Harmonics) to protect.

- Ambient temperatures of UV reactor and switch box must be observed (see data sheet)
- If chemical cleaning of the piping or of the reactor is performed, the UV facility or the UV lamps, respectively, must be taken out of operation. Chemical cleaning agents in combination with UV radiation accelerate the ageing process of seals to a great extent!
- In the event of sanitising, the UV-system also has to be switched OFF (overheating). And the UV sensor has to be removed from the measurement window (in case of calibrated UV monitoring unit)!

E-4.2 Installation and Start-Up

1. Hook-up the UV facility with the existing piping system.

   Before linking it in, the quartz tube is to be disassembled in order to avoid damage! (see – Replacement of the quartz tube)

   When installing the reactors, care must be taken that the bleeding valve is at the top. The flow direction of the medium from the bottom up must be ensured.

   If the reactor is mounted horizontal, it is not allowed that the UV sensor is at the top of the UV reactor. Air bubbles can influence the UV measurement.

   In order to prevent undesired air bubbles and to guarantee optimal bleeding, a slant of 2° is of advantage when mounting the UV reactor horizontally. The system vent by its own.

2. The quartz tube is to be inserted carefully into the reactor. (see – Replacement of the quartz tube)

HINT

Bolting stainless steel into stainless steel requires the use of an appropriate lubricant.

3. Check whether the quartz tube is exactly positioned in its guidance. At the bottom of the reactor, there is a spring system that serves as a counter bearing for the quartz tube.

   At “MIP/VAP systems” the O-ring between UV reactor and quartz tube insertion must fit tightly.

   At “EL systems“ the tri-clamp seal between UV reactor and clamp cover must fit tightly.

4. Check the facility for hydraulic tightness!
5. Carefully insert the UV lamp with its electrical wiring into the quartz tube (cf. the following notes!)

WARNING

Even low humidity can cause condensation processes occur in the quartz tubes. (Air heated during operation moves along the UV lamp to the top and condenses above the UV lamp at the plug, which may result in short-circuiting).

WARNING

The quartz tube and the UV lamp must be dry prior to commissioning. The quartz tube and the UV lamp must be dry prior to commissioning. It is recommended to rinse the quartz tube with nitrogen or dried air or to run the facility for a few minutes with the protection cap off in order to allow humidity to escape (Warning: During this process, there is no IP protection!).

6. Attach the protection cap by careful rotational movement until it stops. The PG-threaded connector must be firmly bolted.

   In case of using an UV monitoring, check that the cords of the UV lamp don't show to the UV sensor. Otherwise the measurement is influenced.

7. Connect the earthing cable with the reactor.

   Use the screw at the reactor (MIP/VAP systems) or an earthing strip (EL systems).

8. Connect UV sensor and temperature sensor, if available.

9. Connect UV sensor and temperature sensor, if available.

10. Connect to power supply! A permanent connection must only be performed by an expert electrician! The operator has to fuse the UV system with an RCD.

11. Switch ON the UV system. In case of a thermoplastic switch box is a green switch on the right side. In case of a steel sheet switch box you find the switch in the front.

    In case of remote control, choose your mode (HAND or AUTO) before start. Don't switch during operation!

12. Check functionality! To connect Potential free fault contacts look at the circuit diagrams or contact the manufacturer.

Prior to taking the device into operation, make sure that all threaded connections and tie-ins have been fitted and, therefore, skin and eyes will not be exposed to any UV-C radiation.

The functional check of the UV system is (depending on type) made visually via LED at the front of the switch box or at the electronic ballast. In case of using an UV monitoring look at the operating manual of UV monitoring.

According to the used electronic ballast, the electronic ballast (EVG) can have two different LEDs.

UV system	***LED EVG – green***	***LED EVG – red***
EVG 11/16W	-	-
EVG 25W	x	x
EVG 36 W	x	-
EVG (rest)	x	x

Changes of construction and/or technical characteristics of the products in favor of technical progress or for the preservation of deliverability are reserved.

LED	***meaning***
LED green - blinks	UV lamp heats up
LED green - lights	UV lamp works
LED red - lights	UV lamp not connected / defect

After a run-up time of several minutes (depending on the operating parameters and on the operating hours), the UV lamp reaches its full UV intensity.

The achieved UV radiation is dependent on the state of cleanliness of the quartz tube (formation of deposits!). The UV-C performance of the UV lamp decreases with increasing operating time. Exchange the UV lamp after the maximum operating hours, as written in the data sheet. Cleaning should be done in a reasonable and regular intervals.

Before works are carried out on the UV system (e.g., maintenance), it is imperative to switch it OFF. The same applies to cases of emergency. If a fault of whatever nature is detected in the UV system, (leaking water, damage in the electrical system, etc.), the system must be taken out of operation.

If chemical cleaning of the piping or of the reactor is performed, the UV facility or the UV lamps, respectively, must be taken out of operation. Chemical cleaning agents in combination with UV radiation accelerate the ageing process of seals to a great extent!

In the event of sanitising, the UV-system also has to be switched OFF (overheating). And the UV sensor has to be removed from the measurement window (in case of calibrated UV monitoring unit)!

E-4.3 Switch the UV system OFF

1. Switch the UV system OFF by the main switch.
2. Disconnect the system from the power supply – Keep attention to security instructions!
3. Let the system cool down.
4. Interrupt the flow of the medium and drain the UV reactor.
5. Clean the UV system.

E-5 MAINTENANCE / CARE / FAULTS

The UV system is except for cleaning of the quartz tube and the measurement window of the UV sensor (calibrated) in dependence of the water quality largely maintenance-free.

For a trouble-free operation has to be respected the following:

- The flanges may not be exposed to mechanical lateral forces.
- Mechanical damages of the installation have to be excluded.
- Regular control of the reactor, quartz tube and cleaning of visually recognizable fouling by a brush or by cleaner.
- Regular control of tightness of reactor. The measurement window for systems with UV measurement unit (calibrated) must be checked periodically for leaks. Otherwise the UV sensor may be damaged.
- Change UV lamp after maximum of operating hours.
- The quartz tube and the seals of UV systems for TOC decomposition are to exchange after no more than 2 years!
- If a plastic sight glass is used, it is recommended that you replace this with every UV lamp change.

HINT Please observe the hints of the operating manual for the UV monitoring unit.

E-5.1 Electronic Components

Maintenance of the electronic components is not necessary For a higher lifetime and a high efficiency it is necessary, that the temperature of the switch box should not rise above 40°C. Avoid too much switching operations.

Protect the switch box against overvoltage and undervoltage and fuse the UV system with an RCD.

Check the earthing at regular intervals.

E-5.2 Replace UV lamp

To ensure the function of the UV system and the necessary UV intensity, the lamp should be changed regularly (Recommendation: by the number of hours specified in the data sheet). If no UV control unit is integrated, the lamps should not be operated for longer than recommended.

Failure of a lamp can be detected by the LED at the switch box or electronic ballast. If using an UV monitoring you get an alarm signal.

Spare UV lamps can be ordered from the manufacturer of this facility as spare parts. For proper operation of the facility, only UV lamps as specified by the manufacturer must be used. In the event of using other UV lamps than those as specified by the manufacturer, any claims for reasons of warranty or guaranty will expire.

If the UV lamp has to be replaced, it is recommended to clean and check the whole UV system.

WARNING The maximum operating hours for UV lamps apply with a maximum of one switching process per 8 hrs of operating time. If switched ON and OFF more frequently, the lifetime of UV lamps will drastically decrease.

CAUTION When operating the facility, components will heat up. Should a UV lamp be replaced immediately after shutting the facility OFF, be aware that the UV lamp is still hot!

Replace UV lamp:

1. Shut OFF the module and disconnect it from power or voltage supply, and make sure it cannot be switched ON again.
2. Let the system cool down.
3. **Carefully** loosen the screwed cable gland at the cap of the quartz tube and withdraw it.
4. Pull the protector cap from the UV lamp head by slightly turning it.
5. Pull the UV lamp carefully 20 cm out (risk of rupture) and disconnect it from the plug contact.
6. Put the UV lamp aside carefully and store it safely!

CAUTION There is a hazard of injury if the quartz pipe breaks!

HINT It is recommended to interrupt the flow through the reactor, even when a UV lamp needs to be replaced.

WARNING Suddenly dropping the UV lamp when removing it may result in destroying the quartz tube!

7. Grip the new UV lamp at its base only. Use textile gloves! Direct contact with the quartz material should be avoided. This may lead to soiling the UV lamp impairing its function. Soil on the UV lamp will burn in into the quartz glass!
8. Insert the new UV lamp into the quartz tube in a straight movement.
9. Tightly connect the new UV lamp to the 4-pin plug.

HINT The plug is reverse-pole protected. If the plug does not fit the UV lamp, it might be required to turn the plug axially by 90°!

HINT If an UV monitoring is used, the cords of the lamp should not lie in front of the UV sensor, otherwise the measurement is influenced.

10. Place the lamp carefully on the bottom of the quartz tube, if the reactor is mounted vertical.
11. The protection cap is put on the quartz tube flange by means of a loosened screwed cable gland and by turning it.
12. Fix the UV lamp cable and tighten the screwed cable gland until the cable is properly fastened.
13. Check for tightness and fastened screwed connections.
14. Commissioning of the device; a functional test of the facility can be performed.

Prior to recommissioning the device, it must be made sure that all screwed connections and tie-ins have been assembled and thus no UV-C radiation can come in contact with skin and eyes.

E-5.3 Cleaning and Replacement of the Quartz Tube

Depending on the water quality, the quartz tube needs to be cleaned at different intervals.

The quartz tube system is bolted to the reactor lid by three bolts or welded with the reactor lid. The quartz tube is suspended on a counter spring at the bottom of the reactor (see drawings). Because of this, the quartz tube is pressurized.

The quartz tube and the seals of UV systems for TOC decomposition are to exchange after no more than 2 years!

For cleaning purposes, proceed as follows:

1. As for replacement of the UV lamp, steps 1 – 6.

2. Interrupt flow and depressurise the facility.
3. Carefully loosen and remove the bolting (three hexagon socket head screws) using appropriate tools. While keeping the flange parallel to the sealing surface of the reactor. Forced by the spring, the quartz tube system is pressed upwards.

   If the quartz tube system is welded with the lid, open the clamp and remove the whole system. Forced by the spring, the quartz tube system is pressed upwards.
4. Carefully remove the quartz tube system from the reactor.

CAUTION There is a hazard of injury if the quartz pipe breaks!

HINT Directly touching the quartz material should be avoided. This can result in soiling the quartz tube, thus impairing the function of the facility.

5. Clean the quartz tube using an appropriate cleaning agent.

   A special cleaning agent for UV systems can be ordered from the manufacturer (batch: 1 litre bottle for spraying or 5 liter canister for circulating).
6. If the quartz tube does not allow cleaning any more, a new one needs to be installed. Repairs may be carried out by qualified persons only. RISC OF INJURY!

   Loosen the quartz tube by slightly turning and pulling it from the quartz tube head. After a long period of working, it is possible that the quartz tube do not solve. In that case, the quartz tube needs to be destroyed. Just do it with gloves and safety glasses!

   Thereby it is also imperative to replace the seals. Cover seals in permissible lubricant.

   Push the new quartz tube, by slightly turning and pressing it, into the quartz tube head. Afterwards clean the quartz tube.
7. Assembly inside the reactor in reverse sequence:

   After inserting it in a straight line and centrally, the quartz tube is gently pressed down and fixed again (bolted or with clamp).

WARNING

- Do not scratch the quartz tube!
- Clean it by using only soft cloth or kitchen towel tissue!
- Prior to re-inserting, the quartz tube must be dry (especially in its interior) and clean.

E-5.4 Maintenance Schedule

	monthly	6 – 12 month	12 – 24 month
Visual check			
- read off UV intensity and operating hours and file them	■		
- check tightness of the facility and pipe connections	■		
- check tightness of the measurement window (calibrated sensor)	■		
- Check the condition of the plastic sight glass, replace if necessary	■		
- check operating state of the facility	■		
UV lamp			
- check intensity	■		
- replace (after reaching operating hours or failure)		■	
Cleaning of the facility			
- clean the reactor		■	
- replace/clean the quartz tube		■	■
- clean the measurement window		■	
Seals			
- replace (or when exchanging the quartz tube)			■
UV sensor			
- check the measurement		■	
- recalibrate			■
Measurement window (calibrated sensor)			
- check for tightness	■		
- replace (or when leaking)			■

Depending on operating conditions, it might be required to perform maintenance more frequently than scheduled.

HINT

Use genuine spare parts only. Upon the use of third-party spare parts (incl. the UV lamp), any warranty claim expires. The manufacturer cannot be held liable for the insuffient efficiency of the UV facility due to deficient maintenance of the facility or to the use of third-party spare parts.

E-6 STORAGE AND TRANSPORT

Transport the UV system carefully. Beware for chock, strokes and mechanical stress. Before every transport, remove the UV lamp.

CAUTION There is a hazard of injury if the glass components break!

Clean the reactor and the quartz tube before storage. All components of the UV system have to be stored dry, dust-free and protected against mechanical damage. It recommends storing the quartz tube solved from the quartz tube head and outside of the reactor.
Electronic components should be stored at constant conditions (temperature 15-25°C).

E-7 WARRANTY AND LIABILITY

Principally, our General Terms and Conditions apply to warranty.

Claims for reasons of warranty can be made for twelve months from delivery or commissioning, respectively, if it has been commissioned by the manufacturer.

Warranty and liability claims for personal and material damage are excluded, if they can be traced back to one or several of the following causes:

- Inappropriate use of the facility
- Non-observance of the notes in the Operating Manual with view of transport, storage, assembly, commissioning and maintenance of the facility
- Faulty monitoring of facility operation or inappropriate interference with facility operation
- Inappropriately performed repair and maintenance works
- Emergencies caused by foreign matter and force majeure
- Retrofitting or other interference, without consultation the manufacturer or obtaining approval from him.

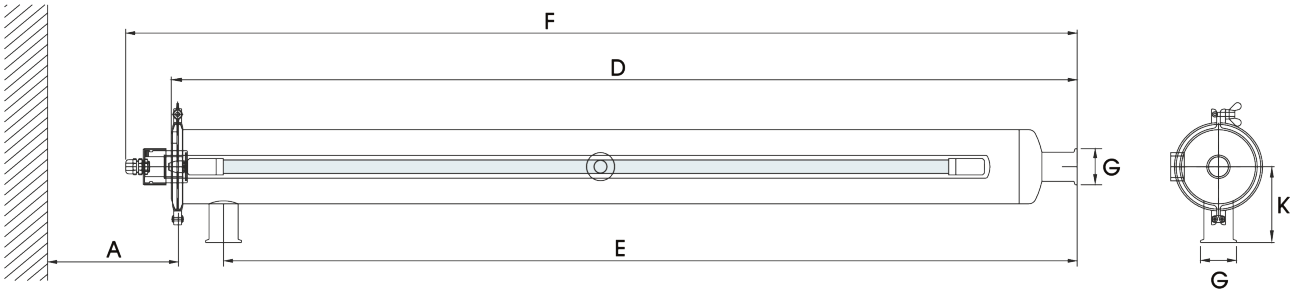
HINT Use genuine spare parts only.

HINT In the event of disturbances, please contact our Customer Service by specifying the fault occurred.

Keep the system type and serial number ready.

Datenblatt / Data Sheet

Anlagentyp / Type: EL-TOC 038



Kenndaten / Specifications

Hauptanwendung main application		TOC-Abbau TOC reduction
Fluenz fluence		1200 J/m² [1]
Maximaler Volumenstrom bei einer UV-Transmission von: max. flow rate at the transmission of:	**98 %/cm** [2]	3,80 m³/h

D-1. WARNHINWEISE

Sicherheitshinweise

Diese Anlage arbeitet mit UV-Strahlung. Die Strahlung kann Schäden an Augen und Haut verursachen, die Anlage darf daher nur betrieben werden, wenn der Reaktormantel unversehrt ist. Niemals ungeschützt in die Strahlung blicken und die Haut nicht der Strahlung aussetzen!

Das Öffnen und Installieren des Gerätes darf nur im strom- und drucklosen Zustand erfolgen!
Der Reaktor steht unter Druck. Bei unsachgemäßer Handhabung besteht die Gefahr des Berstens des Tauchrohres und des Austrittes des Mediums aus dem Reaktor.
Vor der Reinigung, Wartung oder Austauschen von Teilen, muss das Gerät von allen Spannungsquellen getrennt werden.
Die Anlage nie im ungefüllten Zustand oder bei unterbrochenem Wasserzufluss betreiben.
Die einschlägigen Vorschriften über den Umgang mit elektrischen Geräten sind einzuhalten.

Das zu behandelnde Wasser/Abwasser kann gefährliche Inhaltsstoffe enthalten. Bitte beachten Sie die entsprechenden Handhabungs- und Sicherheitsvorschriften!

Im Betrieb kommt es zu einer Erwärmung der Komponenten und des Mediums – Betrieb nur mit Durchfluss!

Bei Verschraubungen von Edelstahl in Edelstahl (Sensor/Messfenster in Reaktor) ist die Verwendung eines geeigneten und für den Anwendungszweck zulässigen Schmiermittels erforderlich! Ansonsten kann es dazu kommen, dass sich die Verbindung nicht mehr lösen lässt.

Die Messfenster dürfen nicht im Unterdruckbereich eingesetzt werden, z.B. Saugleitungsbereich einer Pumpe, die ist auch bei der Sanitisierung bei Pharmaanlagen zu beachten.

HINWEIS

Lesen Sie die Betriebsanleitung gründlich und vor der Installation!
Keine Garantie bei falscher Betriebsweise oder falscher Bedienung!

D-2. ANWENDUNG

Die UV-Überwachungseinheit bestehend aus einem UV-Monitor, einem UV-Sensor und ggf. einem Messfenster (bei kalibriertem Sensor noch ÖNORM) ist ein abgestimmtes System zur komfortablen Überwachung der UV-Intensität von UV-Anlagen.

Der Sensor misst die Bestrahlungsstärke. Dessen Signal wird vom Monitor ausgewertet und visualisiert. Damit werden Verschmutzungen, Alterung der Strahlungsquelle und andere Veränderungen angezeigt, so dass entsprechende Gegenmaßnahmen eingeleitet werden können.

Der UV-Monitor beinhaltet als Zusatzfunktion einen digitalen Betriebsstundenzähler für den Strahler und die Gesamtstunden der UV-Anlage, sowie einen digitalen Zähler für die Einschaltvorgänge.

Neben einem UV-Hauptalarm, gibt es zusätzlich einen UV-Voralarm. Je nach Monitor können die Alarme über einen Relaiskontakt abgegriffen werden.

Alle Monitore verfügen über einen aktiven Analogausgang mit 4-20mA. Die genauen Kontakte zum Abgriff des Signals sind dem Schaltplan der jeweiligen Anlage zu entnehmen.

D-3. ÜBERSICHT UV-ÜBERWACHUNGSEINHEITEN

Je nach verbauter UV-Überwachungseinheit besteht das System aus unterschiedlichen Komponenten. Dementsprechend verfügt die Einheit über unterschiedliche Eigenschaften. Die nachfolgende Tabelle zeigt einen Überblick der UV-Überwachungseinheiten und deren einzelner Komponenten.

Bezeichnung	UE-D1-LPFK	UE-DZ-LPFK	UE-D1-LP11	UE-DZ-LP11
Monitor	 Bedienung an Front-seite	 Bedienung an Frontseite	 Bedienung an Front-seite	 Bedienung an Frontseite
UV-Sensor	 ¼“ Einschraubgewinde ohne Messfenster	 Kalibrierter Sensor nach ÖNORM mit Messfenster	 ¼“ Einschraub-gewinde ohne Messfenster	 Kalibrierter Sensor nach ÖNORM mit Messfenster

Bezeichnung	UE-D1-LP30	UE-DZ-LP30
Monitor	 Bedienung im Schalt-kasten	 Bedienung im Schaltkasten
UV-Sensor	 ¼“ Einschraub-gewinde ohne Messfenster	 Kalibrierter Sensor nach ÖNORM mit Messfenster

D-4. BEDIENUNG DER UV-ÜBERWACHUNG

Nach Zuschalten der Netzversorgung erfolgt der Funktionstest des UV-Monitors. Danach geht das Gerät selbständig in die Normalfunktion über, sofern keine Verzögerungszeit eingestellt ist (siehe Monitormenü).

Nach Ablauf der Verzögerung beginnt die UV-Messung. Kurz nach dem Einschalten ist die UV-Emission des Strahlers noch gering, es findet ein Einbrennvorgang statt, der einige Minuten dauern kann. Die UV-Emission des Strahlers steigt auf den Nennwert (abh. von Strahleralter, Verschmutzung Anlage,…). Der vom Sensor gemessene Wert ist der, der unter den gegebenen Bedingungen (Verschmutzungsgrad Tauchrohr/Quarzfenster) an der Reaktorwand eintrifft.

Mit sinkender Intensität werden bei Unterschreitung der eingestellten Alarmschwelle erst der Voralarm (sofern eingestellt, Display gelb blinkend, ggf. Relaiskontakt) und später der Hauptalarm ausgelöst (Display rot/ Relaiskontakt schaltet).

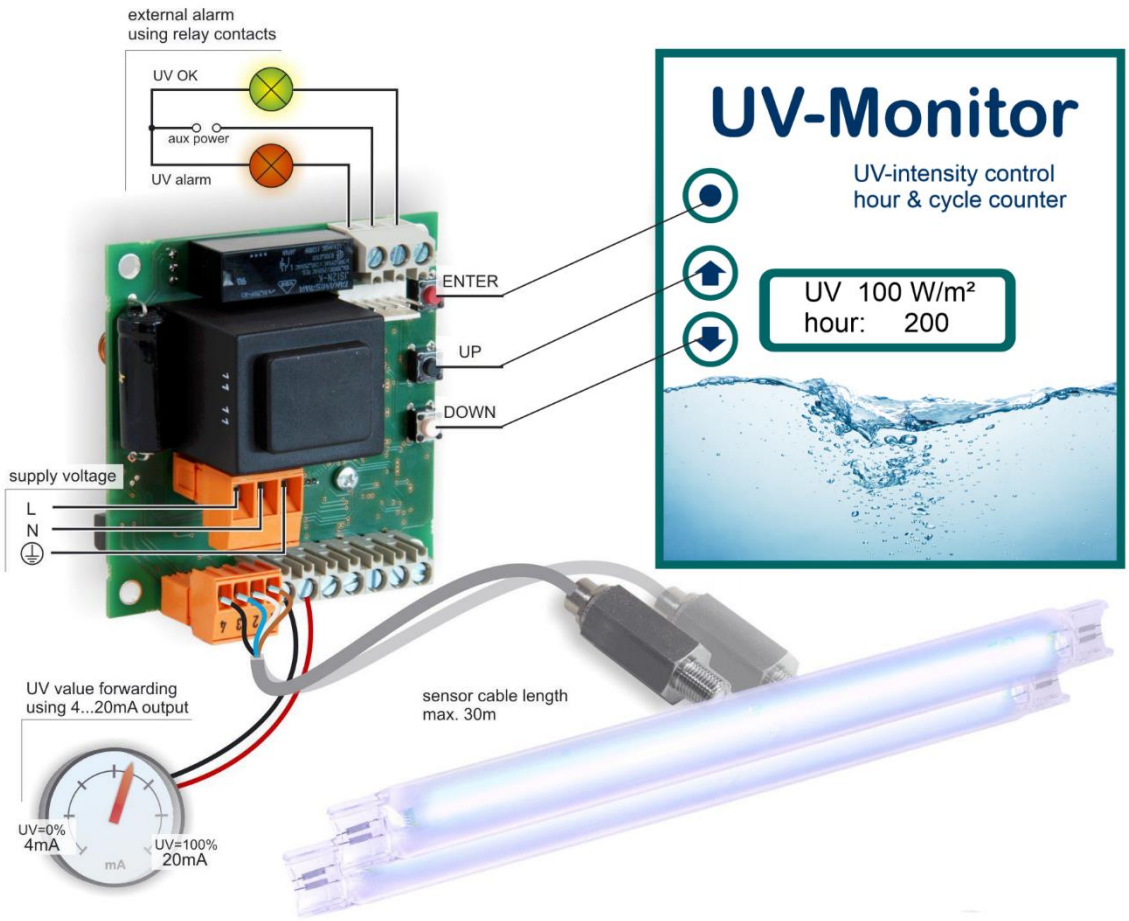
In Zeile 1 des Displays wird die aktuelle UV-Intensität angezeigt. Die Betriebsstunden werden in Zeile 2 des Displays permanent dargestellt. Zur Anzeige der Schaltvorgänge ist im Menü der entsprechende Punkt auszuwählen. Liegt ein Fehler an, so wird dieser im Wechsel mit der Standardanzeige dargestellt. Das Display hat dann eine andere Hintergrundfarbe.

Die Überwachungseinheit ist durch einen 4-stelligen Code gegen Manipulationen geschützt. Dieser kann durch den autorisierten Bediener frei gewählt werden (bei Auslieferung „**0602**“).

Die Monitore verfügen über eine im Menü eingestellte Haupt-Alarmschwelle die an die gewählte UV-Bestrahlungsstärke gebunden ist. Diese schaltet den Relaiskontakt – WECHSLER, potenzialfrei. Voreingestellt ist diejenige Bestrahlungsstärke ab der eine ausreichende Bestrahlung nicht mehr gewährleistet ist – in [%] bezogen auf den 100%-Wert der UV-Intensität bei Inbetriebnahme.

Über den Relaiskontakt kann eine Alarmmeldung abgegriffen werden (Hupe, Leuchtmelder am Schaltschrank bzw. in ein Prozessleitsystem). Für den Störmeldekontakt gelten folgende Belastungsgrenzen: **50 - 500mA bei 5 - 60VDC**

Weitere technische Angaben sind dem Schaltplan der jeweiligen Anlage zu entnehmen.



Alle Monitore verfügen über einen aktiven Analogausgang mit **4-20mA** und einer maximalen Bürde von **180 Ω**.

Die genauen Kontakte zum Abgriff des Signals sind dem Schaltplan der jeweiligen Anlage zu entnehmen.

Für die Nutzung des Signals, ist ein geeigneter Signalaufnehmer in Abhängigkeit der jeweils übergeordneten Steuerung zu verwenden.

D-4.1 UE-D1-LPFK

Prinzipdarstellung:

Bedienung:

Zugriff über das Menü erhält man über die drei Tasten auf der Frontseite des Monitors. Der Monitor muss dazu eingeschaltet sein. Wird der Taster ⊙ für mindestens 3 Sekunden gedrückt, erscheint der erste Menüpunkt.

Funktion der Taster:

- ⊙ - Aktivieren des Menüs / nächster Menüpunkt / geänderten Wert bestätigen
- ▲ - Wert erhöhen, Optionswahl
- ▼ - Wert vermindern, Optionswahl

Menüpunkte:

Die Menüpunkte des Monitors sind fortlaufend. Durch drücken des Tasters gelangt man zum nächsten Punkt und kann diesen mit dem oder Taster ändern. Änderungen werden erst nach Durchlaufen des letzten Menüpunktes gespeichert.

Bei einer Wartezeit von >20 s erfolgt eine Umschaltung in den Betriebsmodus. Änderungen (Werte) werden nicht gespeichert. Änderungen treten erst in Kraft, wenn das Menü nach dem Durchlaufen aller Punkte beendet wurde (Display: „config o.k.“)

Nummer	Menüpunkt/Anzeige	Beschreibung
1	Freigabe 0000	Eingabe des Zugriffscodes **0602** mittels oder Taster. Um in das weitere Menü zu gelangen ist die Eingabe mit zu bestätigen.
2	Messpause	Bei JA wird das aktuell anliegende Sensorsignal eingefroren. Fehlermeldungen werden nicht ausgelöst. Sensor kann zur Überprüfung demontiert werden.
3	Sprache	Deutsch oder Englisch
4	Zeit	Zeit + Datum Damit die Betriebsstunden gezählt werden, müssen die aktuelle Zeit und das aktuelle Datum eingestellt sein.
5	Freigabe ändern	Ändern des Zugriffscodes (Voreinstellung **0602**) Bei Einstellung eines Codes, unbedingt sicher-stellen, dass dieser jederzeit verfügbar ist. Bei Vergessen des Codes muss der Monitor kostenpflichtig beim Hersteller freigeschaltet werden!
6	Ein-Anzahl	Zählung der Einschaltvorgänge
7	Anlaufzeit	Verzögerung der Alarme nach Einschalten (Voreinstellung 5 Sek.)
8	Kontrast	Display-Einstellung
9	Nutzer-h	Entspricht der Laufzeit des UV-Strahlers / **muss nach Strahlerwechsel rückgesetzt werden um die Fehlermeldung zu löschen.** Dazu diesen Punkt aufrufen und mit / Taster auf JA umstellen und mit bestätigen.
10	Gesamt-h	Gesamtbetriebsstunden UV-Anlage/Monitor
11	Lampentausch	Einstellung Lampenlebensdauer (siehe Datenblatt – nach Ablauf der eingestellten Stunden wird ein Alarm am Relaiskontakt und im Display auf Zeile 2 ausgelöst)

12	Eingang	„digital“ anwählen
12.1	Digital-Eingang	
12.2	Anzahl Sensoren	„**1**“ auswählen (an einem Monitor können bis 2 Sensoren angeschlossen werden)
12.3	Sensor ID	AUTOMATISCH: Beim Anschluss von nur einem Sensor wird dessen ID-Nummer automatisch erkannt. MANUELL: Falls die automatische Erkennung nicht funktioniert oder 2 Sensoren angeschlossen sind, ist die ID-Kennnummer des Sensors einzugeben. Die Nummer befindet sich auf dem Sensor.
12.4	Sensortyp	Nur bei Sensor-ID MANUELL nötig: Sensortyp D-SiC einstellen, sonst Fehlmessungen und Fehleralarme
12.5	Maßeinheit	Einheit: [%] oder [W/m²] – **%** durch Hersteller voreingestellt
12.6	100 %-Wert	Zum Abgleich des Analogausganges und der Anzeige – siehe „Abgleich UV-Monitor bei Inbetriebnahme/Strahlerwechsel“
13	Hauptalarm	Unterer Grenzwert der Bestrahlungsstärke in %, bezieht sich auf den 100 % Wert (Punkt 12.6), im Fehlerfall ist Display rot hinterlegt, der Relaiskontakt für Hauptalarm schaltet (siehe Stromlaufplan). Die UV-Intensität ist nicht mehr ausreichend um den Zweck der Anlage zu erfüllen!
14	Verzögerungszeit Alarm	Unterdrückt den Alarm während der eingestellten Zeit. Einstellbar zw. 0 und 600 Sekunden.
15	Voralarm	Alarmstufe zur Vorwarnung (Wert frei wählbar), im Fehlerfall blinkt Display gelb
16	Verzögerungszeit Alarm	Unterdrückt den Alarm während der eingestellten Zeit. Einstellbar zw. 0 und 600 Sekunden.
17	Konfig schreiben	Speicherung aller Einstellungen Wird dieser Punkt nicht durchlaufen, gehen alle Einstellungen verloren.

Damit die Zählung der Betriebsstunden erfolgt, ist unbedingt die Uhrzeit einzustellen. Die Uhr ist für eine Laufzeit von 8 Jahren ausgelegt (Batterie!).

Wird der UV-Sensor getauscht, muss das Menu des Monitors einmal vollständig durchlaufen werden. Erst während der Meldung „Konfig Schreiben!“ wird die ID des Sensors eingelesen.

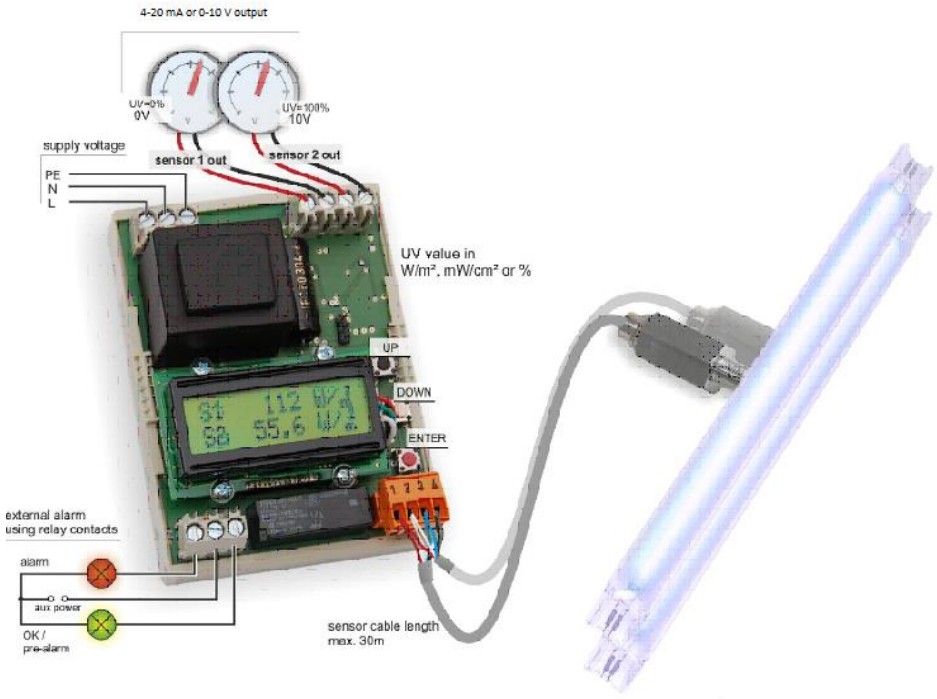
Bei Einstellung eines Codes, unbedingt sicherstellen, dass dieser jederzeit verfügbar ist. Bei Vergessen des Codes muss der Monitor kostenpflichtig beim Her-steller freigeschaltet werden!

Abgleich des UV-Monitors bei Inbetriebnahme/Strahlerwechsel:

Um eine korrekte Anzeige der UV-Intensität zu erhalten, die Grenzwerte zu fixieren sowie den Analogausgang einzustellen, muss das UV-Messsystem an die örtlichen Gegebenheiten angepasst werden. Dazu wie folgt vorgehen:

- UV-Strahler einschalten und einbrennen lassen (bis Wert stabil)
- Im Monitormenu den Punkt „100%-Wert“ aufrufen und den Wert „automatisch“ abrufen - aktueller UV-Wert wird nun angezeigt
- Mit dem Taster ⦿bis Punkt „Config schreiben“

Funktioniert der automatische Abruf nicht, wie folgt vorgehen:



- UV-Strahler einschalten und einbrennen lassen (bis Wert stabil)
- Im Monitormenu unter Punkt „Maßeinheit“ auf [W/m²] umstellen
- mit Taster ⦿bis Punkt „Config schreiben“
- angezeigten Messwert ablesen und notieren
- im Monitormenu unter Punkt „100% Wert“ den notierten Wert eintragen
- „Maßeinheit“ auf [%] umstellen
- Mit Taster ⦿ bis Punkt „Config schreiben“

Auf dem Display werden 100 % angezeigt, der Analogausgang gibt nun 20 mA aus. Die Alarme werden nun korrekt ausgelöst. Nach einem Strahlerwechsel wird der Ursprungswert wieder gemessen, sofern die Bedingungen (Reinigungszustand, Transmission) noch den Vorgaben entsprechen. Ist dies nicht der Fall, muss die Anlage gereinigt werden und der Abgleich wiederholt werden.

Die Strahler unterliegen Fertigungstoleranzen, die sich auf deren Emission auswirken. Dies kann ebenfalls zu Abweichungen im Vergleich zur Inbetriebnahme führen.

D-4.2 UE-D1-LP30

Prinzipdarstellung:

Bedienung:

Zugriff über das Menü erhält man über die drei Taster an der Frontseite des Monitors. Der Monitor muss dazu eingeschaltet sein. Wird der **rote Taster** für mindestens 3 Sekunden gedrückt, erscheint der erste Menüpunkt.

Funktion der Taster:

ROT	-	Aktivieren des Menüs / nächster Menüpunkt / geänderten Wert bestätigen
SCHWARZ	-	Wert erhöhen, Optionswahl
WEISS	-	Wert vermindern, Optionswahl

Menüpunkte:

Die Menüpunkte des Monitors sind fortlaufend. Durch Drücken des roten Tasters gelangt man zum nächsten Punkt und kann diesen mit dem schwarzen und weißen Taster ändern. Änderungen werden erst nach Durchlaufen des letzten Menüpunktes gespeichert.

Bei einer Wartezeit von >20 s erfolgt eine Umschaltung in den Betriebsmodus. Änderungen (Werte) werden nicht gespeichert. Änderungen treten erst in Kraft, wenn das Menü nach dem Durchlaufen aller Punkte beendet wurde (Display: „config o.k.“)

Nummer	Menüpunkt/Anzeige	Beschreibung
1	Freigabe 0000	Eingabe des Zugriffscodes **0602** mittels schwarzem und weißen Taster. Um in das weitere Menü zu gelangen ist die Eingabe mit Rot zu bestätigen.
2	Messpause	Bei JA wird das aktuell anliegende Sensorsignal eingefroren. Fehlermeldungen werden nicht ausgelöst. Sensor kann zur Überprüfung demontiert werden.
3	Sprache	Deutsch oder Englisch
4	Zeit	Zeit + Datum Damit die Betriebsstunden gezählt werden, müssen die aktuelle Zeit und das aktuelle Datum eingestellt sein.
5	Freigabe ändern	Ändern des Zugriffscodes (Voreinstellung **0602**) Bei Einstellung eines Codes, unbedingt sicherstellen, dass dieser jederzeit verfügbar ist. Bei Vergessen des Codes muss der Monitor kostenpflichtig beim Hersteller freigeschaltet werden!
6	Ein-Anzahl	Zählung der Einschaltvorgänge
7	Anlaufzeit	Verzögerung der Alarme nach Einschalten (Voreinstellung 5 Sek.)
8	Kontrast	Display-Einstellung
9	Nutzer-h	Entspricht der Laufzeit des UV-Strahlers / **muss nach Strahlerwechsel rückgesetzt werden um die Fehlermeldung zu löschen.** Dazu diesen Punkt aufrufen und mit schwarzem/weißem Taster auf JA umstellen und mit Rot bestätigen.
10	Gesamt-h	Gesamtbetriebsstunden UV-Anlage/Monitor
11	Lampentausch	Einstellung Lampenlebensdauer (siehe Datenblatt – nach Ablauf der eingestellten Stunden wird ein Alarm am Relaiskontakt und im Display auf Zeile 2 ausgelöst)
12	Eingang	„digital“ anwählen
12.1	Digital-Eingang	
12.2	Anzahl Sensoren	„**1**“ auswählen (an einem Monitor können bis 2 Sensoren angeschlossen werden)
12.3	Sensor ID	AUTOMATISCH: Beim Anschluss von nur einem Sensor wird dessen ID-Nummer automatisch erkannt. MANUELL: Falls die automatische Erkennung nicht funktioniert oder 2 Sensoren angeschlossen

		sind, ist die ID-Kennnummer des Sensors einzugeben. Die Nummer befindet sich auf dem Sensor.
12.4	Sensortyp	Nur bei Sensor-ID MANUELL nötig: Sensortyp D-SiC einstellen, sonst Fehlmessungen und Fehleralarme
12.5	Maßeinheit	Einheit: [%] oder [W/m²] – **%** durch Hersteller voreingestellt
12.6	100 %-Wert	Zum Abgleich des Analogausganges und der Anzeige – siehe „Abgleich UV-Monitor bei Inbe-triebnahme/Strahlerwechsel“
13	Hauptalarm	Unterer Grenzwert der Bestrahlungsstärke in %, bezieht sich auf den 100 % Wert (Punkt 12.6), im Fehlerfall ist Display rot hinterlegt, der Relaiskontakt für Hauptalarm schaltet (siehe Stromlaufplan). Die UV-Intensität ist nicht mehr ausreichend um den Zweck der Anlage zu erfüllen!
14	Verzögerungszeit Alarm	Unterdrückt den Alarm während der eingestellten Zeit. Einstellbar zw. 0 und 600 Sekunden.
15	Voralarm	Alarmstufe zur Vorwarnung (Wert frei wählbar), im Fehlerfall blinkt Display gelb
16	Verzögerungszeit Alarm	Unterdrückt den Alarm während der eingestellten Zeit. Einstellbar zw. 0 und 600 Sekunden.
17	Konfig schreiben	Speicherung aller Einstellungen Wird dieser Punkt nicht durchlaufen, gehen alle Einstellungen verloren.

Damit die Zählung der Betriebsstunden erfolgt, ist unbedingt die Uhrzeit einzustellen. Die Uhr ist für eine Laufzeit von 8 Jahren ausgelegt (Batterie!).

Wird der UV-Sensor getauscht, muss das Menu des Monitors einmal vollständig durchlaufen werden. Erst während der Meldung „Konfig Schreiben!“ wird die ID des Sensors eingelesen.

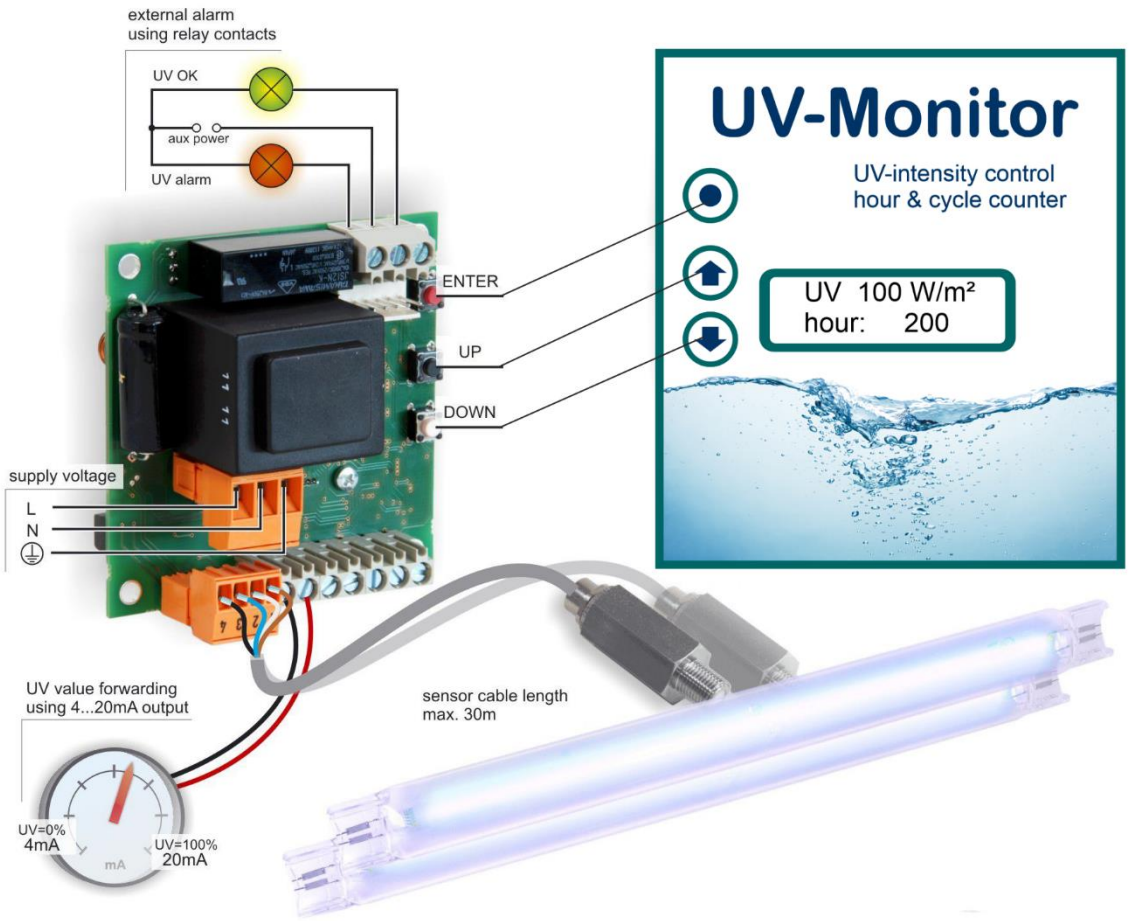
Bei Einstellung eines Codes, unbedingt sicherstellen, dass dieser jederzeit verfügbar ist. Bei Vergessen des Codes muss der Monitor kostenpflichtig beim Hersteller freigeschaltet werden!

Abgleich des UV-Monitors bei Inbetriebnahme/Strahlerwechsel:

Um eine korrekte Anzeige der UV-Intensität zu erhalten, die Grenzwerte zu fixieren sowie den Analogausgang einzustellen, muss das UV-Messsystem an die örtlichen Gegebenheiten angepasst werden. Dazu wie folgt vorgehen:

- UV-Strahler einschalten und einbrennen lassen (bis Wert stabil)
- Im Monitormenu den Punkt „100%-Wert“ aufrufen und den Wert „automatisch“ abrufen - aktueller UV-Wert wird nun angezeigt
- Mit roten Taster bis Punkt „Config schreiben“

Funktioniert der automatische Abruf nicht, wie folgt vorgehen:



- UV-Strahler einschalten und einbrennen lassen (bis Wert stabil)
- Im Monitormenu unter Punkt „Maßeinheit“ auf [W/m²] umstellen
- mit rotem Taster bis Punkt „Config schreiben“
- angezeigten Messwert ablesen und notieren
- im Monitormenu unter Punkt „100% Wert“ den notierten Wert eintragen
- „Maßeinheit“ auf [%] umstellen
- Mit roten Taster bis Punkt „Config schreiben“

Auf dem Display werden 100 % angezeigt, der Analogausgang gibt nun 20 mA aus. Die Alarme werden nun korrekt ausgelöst. Nach einem Strahlerwechsel wird der Ursprungswert wieder gemessen, sofern die Bedingungen (Reinigungszustand, Transmission) noch den Vorgaben entsprechen. Ist dies nicht der Fall, muss die Anlage gereinigt werden und der Abgleich wiederholt werden.

Die Strahler unterliegen Fertigungstoleranzen, die sich auf deren Emission auswirken. Dies kann ebenfalls zu Abweichungen im Vergleich zur Inbetriebnahme führen.

12.3	Sensor ID	AUTOMATISCH: Beim Anschluss von nur einem Sensor wird dessen ID-Nummer automatisch erkannt. MANUELL: Falls die automatische Erkennung nicht funktioniert oder 2 Sensoren angeschlossen sind, ist die ID-Kennnummer des Sensors einzugeben. Die Nummer befindet sich auf dem Sensor.
12.4	Sensortyp	Nur bei Sensor-ID MANUELL nötig: Sensortyp D-SiC einstellen, sonst Fehlmessungen und Fehleralarme
12.5	Maßeinheit	Einheit: [%] oder [W/m²] – **W/m²** durch Hersteller voreingestellt
12.6	100 %-Wert	Zum Abgleich des Analogausganges und der Anzeige – siehe „Abgleich UV-Monitor bei Inbetriebnahme/Strahlerwechsel“
13	Hauptalarm	Unterer Grenzwert der Bestrahlungsstärke in %, bezieht sich auf den 100 % Wert (Punkt 12.6), im Fehlerfall ist Display rot hinterlegt, der Relaiskontakt für Hauptalarm schaltet (siehe Stromlaufplan). Die UV-Intensität ist nicht mehr ausreichend um den Zweck der Anlage zu erfüllen!
14	Verzögerungszeit Alarm	Unterdrückt den Alarm während der eingestellten Zeit. Einstellbar zw. 0 und 600 Sekunden.
15	Voralarm	Alarmstufe zur Vorwarnung (Wert frei wählbar), im Fehlerfall blinkt Display gelb
16	Verzögerungszeit Alarm	Unterdrückt den Alarm während der eingestellten Zeit. Einstellbar zw. 0 und 600 Sekunden.
17	Konfig schreiben	Speicherung aller Einstellungen Wird dieser Punkt nicht durchlaufen, gehen alle Einstellungen verloren.

Damit die Zählung der Betriebsstunden erfolgt, ist unbedingt die Uhrzeit einzustellen. Die Uhr ist für eine Laufzeit von 8 Jahren ausgelegt (Batterie!).

Wird der UV-Sensor getauscht, muss das Menu des Monitors einmal vollständig durchlaufen werden. Erst während der Meldung „Konfig Schreiben!“ wird die ID des Sensors eingelesen.

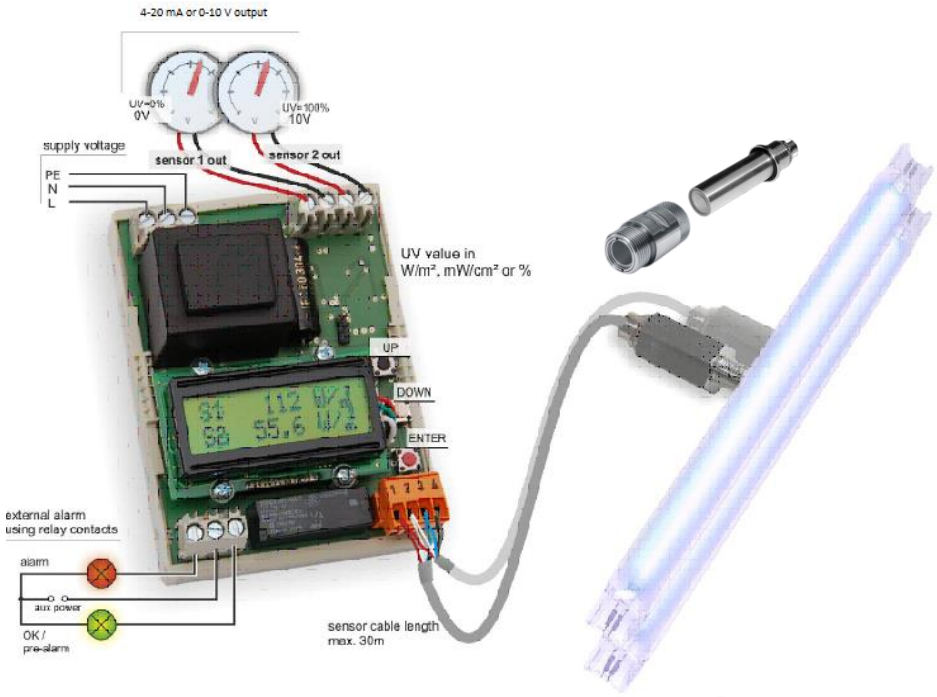
Bei Einstellung eines Codes, unbedingt sicherstellen, dass dieser jederzeit verfügbar ist. Bei Vergessen des Codes muss der Monitor kostenpflichtig beim Her-steller freigeschaltet werden!

Abgleich des UV-Monitors bei Inbetriebnahme/Strahlerwechsel:

Um eine korrekte Anzeige der UV-Intensität zu erhalten, die Grenzwerte zu fixieren, sowie den Analogausgang einzustellen, muss das UV-Messsystem an die örtlichen Gegebenheiten angepasst werden. Dazu wie folgt vorgehen:

- UV-Strahler einschalten und einbrennen lassen (bis Wert stabil)
- Im Monitormenu den Punkt „100%-Wert“ aufrufen und den Wert „automatisch“ abrufen - aktueller UV-Wert wird nun angezeigt
- Mit Taster bis Punkt „Config schreiben“

Funktioniert der automatische Abruf nicht, wie folgt vorgehen:



- UV-Strahler einschalten und einbrennen lassen (bis Wert stabil)
- angezeigten Messwert ablesen und notieren
- im Monitormenu unter Punkt „100% Wert“ den notierten Wert eintragen
- Mit Taster bis Punkt „Config schreiben“

Der Analogausgang gibt nun 20 mA aus. Die Alarme werden nun korrekt ausgelöst. Nach einem Strahlerwechsel wird der Ursprungswert wieder gemessen, sofern die Bedingungen (Reinigungszustand, Transmission) noch den Vorgaben entsprechen. Ist dies nicht der Fall, muss die Anlage gereinigt werden und der Abgleich wiederholt werden.

Die Strahler unterliegen Fertigungstoleranzen, die sich auf deren Emission auswirken. Dies kann ebenfalls zu Abweichungen im Vergleich zur Inbetriebnahme führen.

D-4.4 UE-DZ-LP30

Prinzipdarstellung:

Bedienung:

Zugriff über das Menü erhält man über die drei Taster an der Front des Monitors. Der Monitor muss dazu eingeschaltet sein. Wird der rote Taster für mindestens 3 Sekunden gedrückt, erscheint der erste Menüpunkt.

Funktion der Taster:

ROT	-	Aktivieren des Menüs / nächster Menüpunkt / geänderten Wert bestätigen
SCHWARZ	-	Wert erhöhen, Optionswahl
WEISS	-	Wert vermindern, Optionswahl

Menüpunkte:

Die Menüpunkte des Monitors sind fortlaufend. Durch drücken des **roten Tasters** gelangt man zum nächsten Punkt und kann diesen mit dem schwarzen und weißen Taster ändern. Änderungen werden erst nach Durchlaufen des letzten Menüpunktes gespeichert.

Bei einer Wartezeit von >20 s erfolgt eine Umschaltung in den Betriebsmodus. Änderungen (Werte) werden nicht gespeichert. Änderungen treten erst in Kraft, wenn das Menü nach dem Durchlaufen aller Punkte beendet wurde (Display: „config o.k.“)

Nummer	Menüpunkt/Anzeige	Beschreibung
1	Freigabe 0000	Eingabe des Zugriffscodes **0602** mittels schwarzem und weißen Taster. Um in das weitere Menü zu gelangen ist die Eingabe mit Rot zu bestätigen.
2	Messpause	Bei JA wird das aktuell anliegende Sensorsignal eingefroren. Fehlermeldungen werden nicht ausgelöst. Sensor kann zur Überprüfung demontiert werden.
3	Sprache	Deutsch oder Englisch
4	Zeit	Zeit + Datum Damit die Betriebsstunden gezählt werden, müssen die aktuelle Zeit und das aktuelle Datum eingestellt sein.
5	Freigabe ändern	Ändern des Zugriffscodes (Voreinstellung **0602**) Bei Einstellung eines Codes, unbedingt sicherstellen, dass dieser jederzeit verfügbar ist. Bei Vergessen des Codes muss der Monitor kostenpflichtig beim Hersteller freigeschaltet werden!
6	Ein-Anzahl	Zählung der Einschaltvorgänge
7	Anlaufzeit	Verzögerung der Alarme nach Einschalten (Voreinstellung 5 Sek.)
8	Kontrast	Display-Einstellung
9	Nutzer-h	Entspricht der Laufzeit des UV-Strahlers / **muss nach Strahlerwechsel rückgesetzt werden um die Fehlermeldung zu löschen.** Dazu diesen Punkt aufrufen und mit schwarzem/weißem Taster auf JA umstellen und mit Rot bestätigen.
10	Gesamt-h	Gesamtbetriebsstunden UV-Anlage/Monitor
11	Lampentausch	Einstellung Lampenlebensdauer (siehe Datenblatt – nach Ablauf der eingestellten Stunden wird ein Alarm am Relaiskontakt und im Display auf Zeile 2 ausgelöst)
12	Eingang	„digital“ anwählen
12.1	Digital-Eingang	
12.2	Anzahl Sensoren	„**1**“ auswählen (an einem Monitor können bis 2 Sensoren angeschlossen werden)
12.3	Sensor ID	AUTOMATISCH: Beim Anschluss von nur einem Sensor wird dessen ID-Nummer automatisch erkannt. MANUELL: Falls die automatische Erkennung nicht funktioniert oder 2 Sensoren angeschlossen

		sind, ist die ID-Kennnummer des Sensors einzugeben. Die Nummer befindet sich auf dem Sensor.
12.4	Sensortyp	Nur bei Sensor-ID MANUELL nötig: Sensortyp D-SiC einstellen, sonst Fehlmessungen und Fehleralarme
12.5	Maßeinheit	Einheit: [%] oder [W/m²] – **W/m²** durch Hersteller voreingestellt
12.6	100 %-Wert	Zum Abgleich des Analogausganges und der Anzeige – siehe „Abgleich UV-Monitor bei Inbe-triebnahme/Strahlerwechsel“
13	Hauptalarm	Unterer Grenzwert der Bestrahlungsstärke in %, bezieht sich auf den 100 % Wert (Punkt 12.6), im Fehlerfall ist Display rot hinterlegt, der Relaiskontakt für Hauptalarm schaltet (siehe Stromlaufplan). Die UV-Intensität ist nicht mehr ausreichend um den Zweck der Anlage zu erfüllen!
14	Verzögerungszeit Alarm	Unterdrückt den Alarm während der eingestellten Zeit. Einstellbar zw. 0 und 600 Sekunden.
15	Voralarm	Alarmstufe zur Vorwarnung (Wert frei wählbar), im Fehlerfall blinkt Display gelb
16	Verzögerungszeit Alarm	Unterdrückt den Alarm während der eingestellten Zeit. Einstellbar zw. 0 und 600 Sekunden.
17	Konfig schreiben	Speicherung aller Einstellungen Wird dieser Punkt nicht durchlaufen, gehen alle Einstellungen verloren.

- Mit Enter-Taster bis Punkt „Config schreiben“

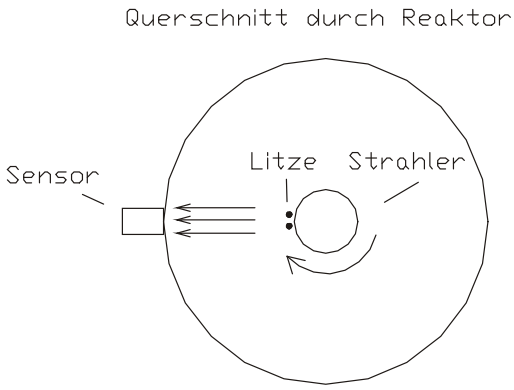
Der Analogausgang gibt nun 20 mA aus. Die Alarme werden nun korrekt ausgelöst. Nach einem Strahlerwechsel wird der Ursprungswert wieder gemessen, sofern die Bedingungen (Reinigungszustand, Transmission) noch den Vorgaben entsprechen. Ist dies nicht der Fall, muss die Anlage gereinigt werden und der Abgleich wiederholt werden.

Die Strahler unterliegen Fertigungstoleranzen, die sich auf deren Emission auswirken. Dies kann ebenfalls zu Abweichungen im Vergleich zur Inbetriebnahme führen.

D-5. FEHLERAUSWERTUNG

Neben den Fehlermeldungen im Display stehen dem Nutzer je nach Überwachungseinheit verschiedene Relaiskontakte zur Nutzung für eine übergeordnete Steuerung zur Verfügung. Diese können an der Klemmleiste (siehe Schaltplan) abgegriffen werden.

Alarmmeldung	**Information**
UV-Voralarm	Tritt auf bei Unterschreitung des eingestellten Grenzwertes. Der Grenzwert sollte kundenseitig definiert werden und über dem Hauptalarm liegen. Im Fehlerfall blinkt das Display gelb und das Relais für den Voralarm schaltet - wenn vorhanden (siehe Schaltplan).
UV-Hauptalarm	Erscheint bei Unterschreitung der minimal benötigten Bestrahlungsstärke zur Desinfektion. (Grenzwert voreingestellt, darf nicht verändert werden!) Im Fehlerfall ist das Display rot und das Relais für den Hauptalarm schaltet.
Lampe NEU!	Strahler hat eingestellte Betriebsstundenzahl überschritten. Strahler muss getauscht werden und „Nutzer-h“ muss zurückgesetzt werden um Fehler zu löschen. Im Fehlerfall schaltet das Relais für den Hauptalarm.



Analogausgang	**Information**
4-20 mA, aktiv, 180 Ω	Ausgabe eines 4-20mA-Signals entsprechend der gemessenen UV-Bestrahlungsstärke: - 4 mA = 0 W/m² bzw. 0% - 20 mA = eingetragener „100%-Wert“

Wird eine Fehlermeldung ausgelöst, so schalten die Relais (siehe Schaltplan). Über den Relaiskontakt werden keine direkten Fehlermeldungen bezüglich der abgelaufenen Lebensdauer des Strahlers oder von fehlerhaften elektronischen Bauteilen ausgegeben. Diese Fehlerbilder sind im Hauptalarm enthalten.

D-5.1 Mögliche Ursachen für einen Voralarm

- Transmissionswerte entsprechen nicht den Auslegungsgrößen
- Einbrennvorgang nach Einschalten noch nicht abgeschlossen
- Verschmutzung des Quarzes am Sensor/Messfenster (Anlage reinigen)
- Verschmutzung des Tauchrohres (Anlage reinigen)
- Strahler hat das Ende seiner Lebensdauer erreicht (siehe Datenblatt)
- Litze des Strahlers liegt zwischen Sensor und Strahler (Strahler um Längsachse verdrehen (vgl. Skizze))

D-5.2 Mögliche Ursachen für einen Hauptalarm

- Siehe Voralarm
- UV-Anlage nicht eingeschaltet (Prüfen der Netzzuleitung, Schalter)
- Strahler defekt oder am Ende seiner Lebensdauer (Strahlerwechsel)
- Elektronisches Vorschaltgerät defekt (Wechsel des Vorschaltgerätes)
- Sensor defekt oder falsch angeschlossen (Tausch des Sensors, Kontrolle der Anschlüsse)
- Monitor defekt (Tausch des Monitors und Neueinstellung der Parameter)
- Strahler hat die eingestellten Betriebsstunden überschritten (Strahlertausch und „Nutzer-h“ zurücksetzen)

D-6. ANLAGEN

- Technisches Datenblatt
- Ersatzteilliste

E-1. WARNINGS

Safety notices

This facility works with UV radiation. Radiation may harm eyes and skin; hence, the facility must only be operated if the reactor shell is undamaged. Do not look into the radiation unprotected and do not expose skin to radiation!

Open and install the device only with power OFF and in its non-pressurised state! The reactor is pressurised. If handled inappropriately, there is the risk for the quartz tube to burst and the medium may leak from the reactor.
Prior to cleaning, maintenance or the replacement of parts, the device must be disconnected from all sources of power supply.
Do not operate the facility in a condition when it is not filled with water or when water supply is interrupted.
Respectively applicable regulations for the handling of electrical devices must be observed.

The water to be treated/waste water may contain hazardous substances. Please follow the respective handling and safety regulations!

During operation, components and the medium will heat up. Use it only in flowing operation!

Bolting stainless steel into stainless steel (sensor / measurement window in reactor) requires the use of an appropriate and approved lubricant. Otherwise it may happen that the connection can no longer be solved.

HINT

Read this operation manual carefully and before installation!

No warranty in case of wrong operation mode or incorrect use!

E-2. USAGE

The UV monitoring unit consists of an UV monitor, an UV sensor and optionally a measurement window (if a calibrated sensor is used). It is an aligned system for a comfortable measuring of the UV intensity at UV systems.

The sensor measures the UV irradiance. This signal is evaluated and displayed by the monitor. So pollution, aging of the UV lamp and other changes can be noticed.

Additionally the monitor has the features counting operation hours from the lamp and the UV system, and counting of switching cycles.

The monitor has an UV main alarm and an UV pre alarm. Depending on the monitor, the alarms can be picked up via a relay contact.

All monitors have an analogues output signal from 4-20mA. The clamps for the connection can find in the circuit documents.

E-3. OVERVIEW UV MONITORING UNITS

Depending on the used UV monitoring unit, the system consists of different parts. So the units have different features. The table below provides an overview of the UV monitoring units and the different components.

description	UE-D1-LPFK	UE-DZ-LPFK	UE-D1-LP11	UE-DZ-LP11
monitor	 Buttons on the front side	 Buttons on the front side	 Buttons on the front side	 Buttons on the front side
UV sensor	 ¼“ thread without measurement window	 Calibrated sensor according ÖNORM with measurement window	 ¼“ thread without measurement window	 Calibrated sensor according ÖNORM with measurement window

Bezeichnung	UE-D1-LP30	UE-DZ-LP30
monitor	 Botton inside	 Botton inside
UV sensor	 ¼“ thread without measurement window	 Calibrated sensor according ÖNORM with measurement window

E-4. HANDLING OF THE UV MONITORING UNIT

After switch ON the system, the monitor completes a self test. Then the monitor automatically goes into the normal function, if no delay time is set (see menu of the monitor).

The UV monitor starts measuring the UV intensity. Immediately after switching ON, the UV emission of the lamp is still low. There is a warm-up process that may take a few minutes. In this time the UV intensity increases to nominal value (depending on aging). The measured value represents the UV intensity at the reactor wall (depending on pollution and UV transmission).

When UV intensity decreases falling below the defined threshold level, a pre-alarm will be triggered first (if adjusted, display blinks yellow, if applicable a relay contact switches), subsequently followed by the main alarm (display is red / relay switches).

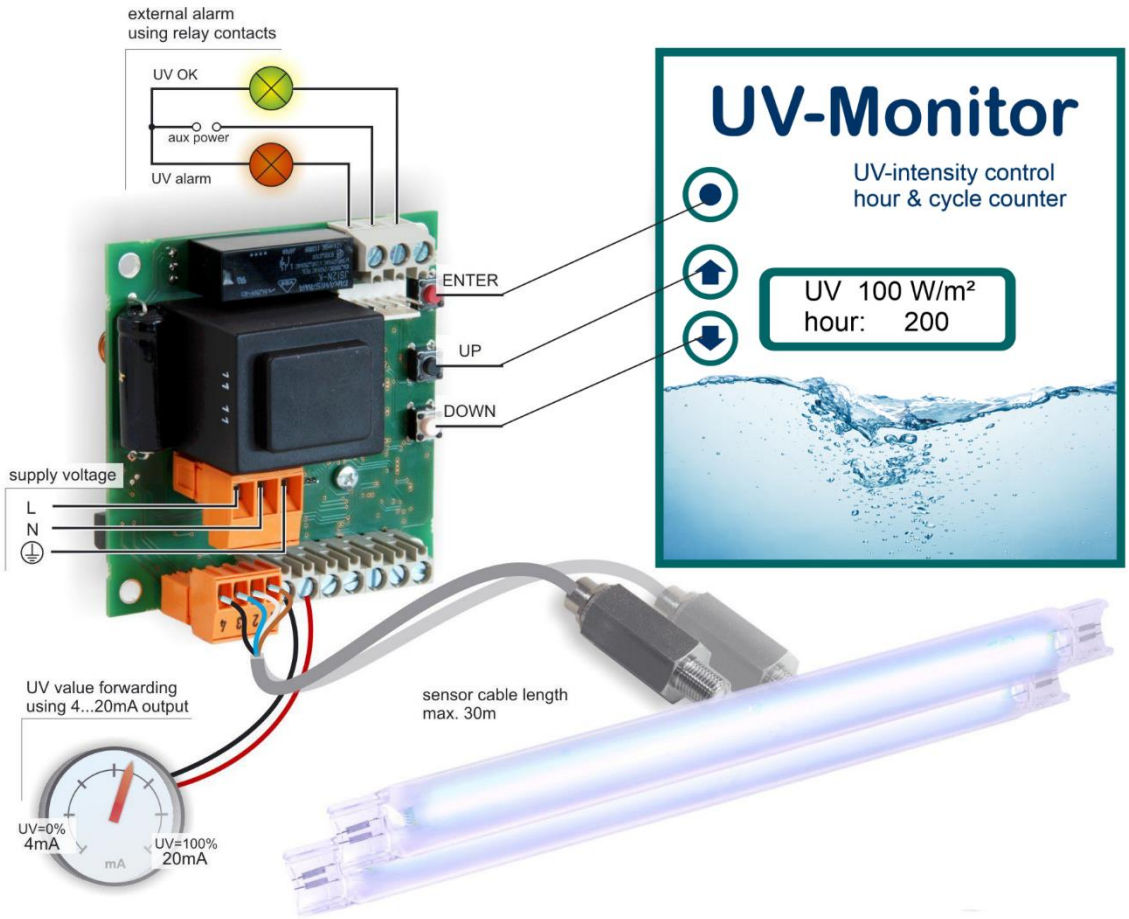
In the first line of the display the UV intensity is shown. The operating hours are shown at line 2. To see the switch cycles you have to look in the menu of the monitor. In case of a failure, a message is shown in the display and the colour of the display is changed.

The Monitor can be protected against manipulation. Choose menu item 4, to change the lock-code (default **“0602”).**

The UV monitors have an UV main alarm, which belongs to the UV intensity. The threshold switches the relay contact - changer, potential free. The main alarm is this value, where the UV intensity is too low for a correct function of the UV system – the threshold [%] accords to the 100% value of the UV intensity at start up.

The relay contact can be used for a process control system, indication light or a horn. The burden of the contacts: **50 - 500mA at 5 - 60VDC.**

Further technical details can be found in the circuit documents of the UV system.



All monitors have an active analogues output **4-20mA**. The burden is maximum **180 Ω**.

More technical details can be found in the circuit documents of the UV system.

If using the analogous signal for a superior control, use an applicable reading recorder.

E-4.1 UE-D1-LPFK

Principle illustration:

Handling:

Access on the menu is achieved with three buttons at the front side of the monitor. The Monitor has to be switched on. If the ⦿ button is pressed for 3 seconds, the first menu point appears.

Function of the buttons:

⦿ - enter menu / select next item / accept changed parameter

🔼 - value increase / change option

🔽 - value decrease / change option

Menu points:

The menu of the monitor is continuous. By pressing the ⊙ button of the monitor the next point appears. The point can be changed through pressing the ⊙ or ⊙ button. Settings will be saved after reaching the last menu point.

☞ Is the attendance time > 20 s the monitor switches into the operation mode. Modifications (parameters) will not be saved. Modifications come into force at a complete pass-through and termination of the menu (display: „config o.k.“).

number	Menu point / display	description
1	lock code 0000	Enter the lock code (‘**0602**’ at delivery) with ⊙ and ⊙ buttons. Confirmation with ⊙. Next menu point appears.
2	freeze	If „YES“ is chosen, the value is freeze. Alarms will not release. Sensor can be dismounted for inspection.
3	language	German or English
4	time	Time + date If time and date are not adjusted, the operating hours will not count.
5	change lock code	Lock code can be changed (‘0602’ at delivery). In case of changing the standard code, note the code so that he is available at every time. Without the code you can’t change parameters in the menus. Monitor has to send back to the producer and unlock at the owner’s expense!!!
6	Switch cycles	Counting of switching cycles
7	start up time	Delay in switching of the alarms (default 5 sec.)
8	contrast	Display-settings
9	user counter	Complies with the runtime of the UV lamp. Set to zero after change the UV lamp to delete the shown failure. For set to zero: go to this menu point and press the ⊙/⊙ button. YES appears. Confirm with ⊙.
10	abs. counter	Total operation hours of the UV system.
11	lamp	Lamp lifetime (see datasheet – after these operation hours a failure appears at display and relay contact – change lamp!)

12	Input	chose „digital“
12.1	digital input	
12.2	number of sensors	„**1**“ (at one monitor can be connected two sensors)
12.3	sensor ID	AUTOMATICALLY: If a digital sensor is connected, the system finds the ID by itself. MANUAL: If the automatically indication does not work or 2 sensors are connected, enter the ID number of the UV sensor manual. The ID is written on the body of the sensor.
12.4	sensortype	Necessary if the sensor ID is adjusted manual. Choose D-SiC, otherwise failure of measurement and alarms can happen.
12.5	Scale unit	Unit: [%] or [W/m²] – default **[%]**
12.6	100 % value	For setting the analogues output and the display – see: „Adjustment of the UV monitor after Start-up/ replacement UV lamp“
13	main alarm	Lower limit of the irradiance in %, refers to the 100 % value (point 12.6), in case of failure the display is red and the relay contact is switched (see circuit diagram) The UV intensity is too low for a correct function of the UV system.
14	delay alarm	Suppresses the alarm for the set time. Adjustable between. 0 and 600 seconds.
15	pre alarm	Threshold for pre alarm (value can be chosen by customer); in case of failure the display blinks yellow.
16	delay alarm	Suppresses the alarm for the set time. Adjustable between. 0 and 600 seconds.
17	config write	Safe all settings If you don’t reach this point all done settings will not be saved!

For counting the operation hours synchronize watch time. The battery (watch) has a life time of 8 years.

If the UV sensor is changed, you have to go through the whole menu of the UV monitoring. After passing the point “config write!” the ID of the UV sensor is implemented in to the software and the system works.

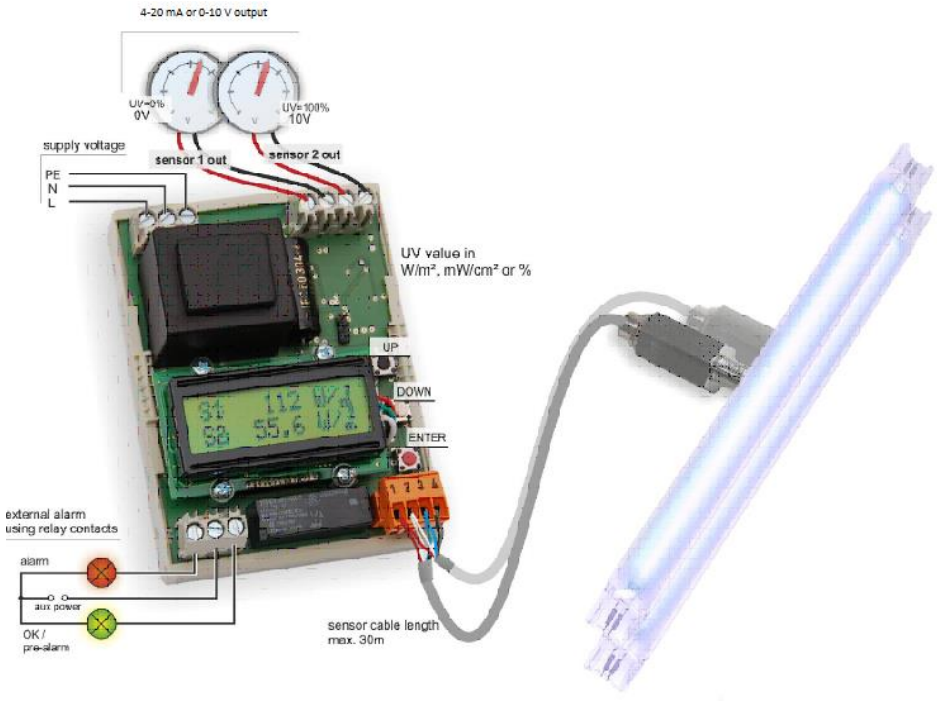
In case of changing the standard code, note the code so that he is available at every time. Without the code you can’t change parameters in the menus. Monitor has to send back to the producer and unlock at the owner’s expense!!!

Adjustment of the UV monitor after Start-up / replacement UV lamp:

For correctly displaying UV intensity, for fixing the threshold levels and setting the analog output, the UV measuring system needs to be adjusted to on-site conditions:

- Switch ON the UV system and wait till value is stable (burn in cycle of the lamp)
- Go to menu point “100%-value” and retrieve value “automatically” – the actual value will be shown
- Go with the ⊙ button to “Config write” and save the setting.

If it does not work automatically, try it this meadow:



- Switch ON the UV system and wait till value is stable (burn in cycle of the lamp)
- Change menu point “value” from [%] to [W/m²]
- Go with the ⊙ button to “Config write” and save the setting.
- Note the shown value [W/m²] you see at the display
- Enter the noted value at menu point “100% value”
- Change menu point “value” from [W/m²] to [%]
- Go with the ⊙ button to “Config write” and save the setting.

After this the display shows 100% and the analogues output has now 20mA. The pre and main alarm are working now correct. After replace of the UV lamp the display shows 100% again, unless the ambient conditions are the same (system is clean, water quality is the same) If not, clean the system and repeat the adjustment.

The UV lamp is subject to production tolerances, which influences the UV intensity. This can also be a deviation to the start up.

E-4.2 UE-D1-LP30

Principle illustration:

Handling:

Access on the menu is achieved with three buttons inside switch cabinet. Pro 30. The Monitor has to be switched on. If the red button is pressed for 3 seconds, the first menu point appears.

Function of the buttons:

RED	-	enter menu / select next item / accept changed parameter
BLACK	-	value increase / change option
WHITE	-	value decrease / change option

Menu points:

The menu of the monitor is continuous. By pressing the red button of the monitor the next point appears. The point can be changed through pressing the white or black button. Settings will be saved after reaching the last menu point.

☞ Is the attendance time > 20 s the monitor switches into the operation mode. Modifications (parameters) will not be saved. Modifications come into force at a complete pass-through and termination of the menu (display: „config o.k.“).

number	Menu point / display	description
1	lock code 0000	Enter the lock code (‘**0602**’ at delivery) with black and white buttons. Confirmation with red. Next menu point appears.
2	freeze	If „YES“ is chosen, the value is freeze. Alarms will not release. Sensor can be dismounted for inspection.
3	language	German or English
4	time	Time + date If time and date are not adjusted, the operating hours will not count.
5	change lock code	Lock code can be changed (‘0602’ at delivery). In case of changing the standard code, note the code so that he is available at every time. Without the code you can’t change parameters in the menus. Monitor has to send back to the producer and unlock at the owner’s expense!!!
6	Switch cycles	Counting of switching cycles
7	start up time	Delay in switching of the alarms (default 5 sec.)
8	contrast	Display-settings
9	user counter	Complies with the runtime of the UV lamp. Set to zero after change the UV lamp to delete the shown failure. For set to zero: go to this menu point and press the white/black button. YES appears. Confirm with red.
10	abs. counter	Total operation hours of the UV system.
11	lamp	Lamp lifetime (see datasheet – after these operation hours a failure appears at display and relay contact – change lamp!)
12	Input	chose „digital“
12.1	digital input	
12.2	number of sensors	„**1**“ (at one monitor can be connected two sensors)
12.3	sensor ID	AUTOMATICALLY: If a digital sensor is connected, the system finds the ID by itself. MANUAL: If the automatically indication does not work or 2 sensors are connected, enter the ID number of the UV sensor manual. The ID is written on the body of the sensor.

12.4	sensortype	Necessary if the sensor ID is adjusted manual. Choose D-SiC, otherwise failure of measurement and alarms can happen.
12.5	Scale unit	Unit: [%] or [W/m²] – default **[%]**
12.6	100 % value	For setting the analogues output and the display – see: „Adjustment of the UV monitor after Start-up/ replacement UV lamp“
13	main alarm	Lower limit of the irradiance in %, refers to the 100 % value (point 12.6), in case of failure the display is red and the relay contact is switched (see circuit diagram) The UV intensity is too low for a correct function of the UV system.
14	delay alarm	Suppresses the alarm for the set time. Adjustable between. 0 and 600 seconds.
15	pre alarm	Threshold for pre alarm (value can be chosen by customer); in case of failure the display blinks yellow.
16	delay alarm	Suppresses the alarm for the set time. Adjustable between. 0 and 600 seconds.
17	config write	Safe all settings If you don’t reach this point all done settings will not be saved!

For counting the operation hours synchronize watch time. The battery (watch) has a life time of 8 years.

If the UV sensor is changed, you have to go through the whole menu of the UV monitoring. After passing the point “config write!” the ID of the UV sensor is implemented in to the software and the system works.

In case of changing the standard code, note the code so that he is available at every time. Without the code you can’t change parameters in the menus. Monitor has to send back to the producer and unlock at the owner’s expense!!!

Adjustment of the UV monitor after Start-up / replacement UV lamp:

For correctly displaying UV intensity, for fixing the threshold levels and setting the analog output, the UV measuring system needs to be adjusted to on-site conditions:

- Switch ON the UV system and wait till value is stable (burn in cycle of the lamp)

Adjustment of the UV monitor after Start-up / replacement UV lamp:

For correctly displaying UV intensity, for fixing the threshold levels and setting the analog output, the UV measuring system needs to be adjusted to on-site conditions:

- Switch ON the UV system and wait till value is stable (burn in cycle of the lamp)
- Go to menu point "100%-value" and retrieve value "automatically" – the actual value will be shown
- Go with the red button to "Config write" and save the setting.

If it does not work automatically, try it this meadow:

- Switch ON the UV system and wait till value is stable (burn in cycle of the lamp)
- Note the shown value [W/m²] you see at the display
- Enter the noted value at menu point "100% value"
- Go with the enter button to "Config write" and save the setting.

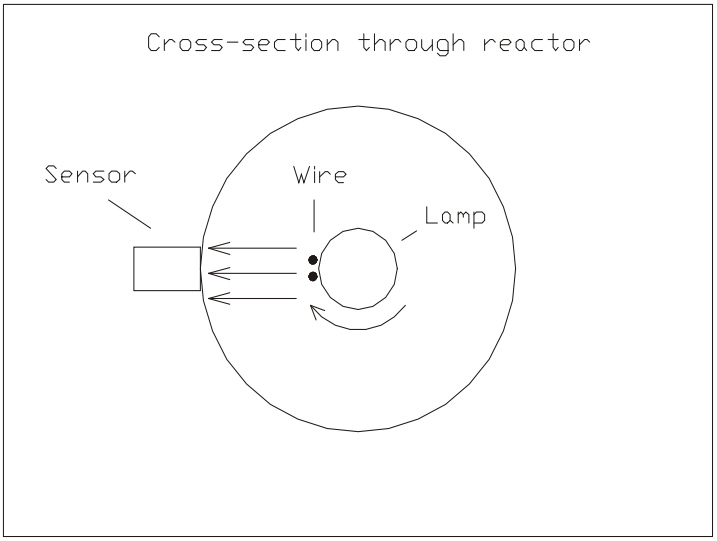
After this the analogues output has now 20mA. The pre and main alarm are working now correct. After replace of the UV lamp the display shows 100% again, unless the ambient conditions are the same (system is clean, water quality is the same) If not, clean the system and repeat the adjustment.

The UV lamp is subject to production tolerances, which influences the UV intensity. This can also be a deviation to the start up.

E-5. ERROR ANALYSIS

Additionally to the failures at the display, the user has relay contacts for a process control system. More information's can be found in the circuit diagram.

failure	**information**
UV pre alarm	Appears if the UV intensity has fallen below the preset threshold pre alarm. The threshold can set by the customer. It should be higher than the main alarm. The display blinks yellow in case of a failure and the optionally relay for the pre alarm switches (see circuit diagram).
UV main alarm	Appears if the UV intensity is not enough for a correct function of the UV system. (Threshold should not be changed by the costumer!) The display is red in case of a failure and the relay for the main alarm switches (see circuit diagram).
Lamp NEW!	Lamp life time is exceeded. Replace UV lamp and set the user counter back to zero. The display is red in case of a failure and the relay for the main alarm switches (see circuit diagram).



analogues output	**information**
4-20 mA, active, 180 Ω	Output of an active analogues signal according to the UV intensity: - 4 mA = 0 W/m² or 0% - 20 mA = entered „100%-value“

In case of a failure the relay for the alarm switches (see circuit diagram). Failures according to lamp life time or a defect of electronic components are integrated in the UV main alarm relay.

E-5.1 Reasons for pre alarm

- Lower transmission as calculated
- Burn-in after switching on not ended up yet
- Pollution of the quartz window (clean plant)
- Pollution of the quartz tube (clean plant)
- UV lamp is older than the defined life time (see datasheet)
- Wire of the lamp between sensor and lamp – turn the lamp around long axis

E-5.2 Reasons for main alarm

- Look at pre-alarm
- UV facility is not switched on. (check the mains supply)
- UV lamp defect or at the end of the life time (replace UV lamp)
- Electronic ballast defect (replace electronic ballast)
- Sensor defect or incorrectly connected (replace UV sensor, check the connections)
- Monitor defect (replace monitor and new setting of parameters)

E-6. APPENDICES

- Technical data sheet
- Spare part list

Datenblatt / Data Sheet

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Changes in this manual

1

Changes to this manual - Edition 09/22

Listed below and the specific changes that have been incorporated in this new version of the IOP-2 Operating Instructions.

Changes

- The Jog function in the Control Menu as been updated:  Jog (Page 43)
- I/O simulation guidance has been updated in the Diagnostics Menu:  Diagnostics (Page 52)

Fundamental safety instructions 2

2.1 General safety instructions

⚠ WARNING

Danger to life if the safety instructions and residual risks are not observed

If the safety instructions and residual risks in the associated hardware documentation are not observed, accidents involving severe injuries or death can occur.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

2.2 Warranty and liability for application examples

Application examples are not binding and do not claim to be complete regarding configuration, equipment or any eventuality which may arise. Application examples do not represent specific customer solutions, but are only intended to provide support for typical tasks.

As the user you yourself are responsible for ensuring that the products described are operated correctly. Application examples do not relieve you of your responsibility for safe handling when using, installing, operating and maintaining the equipment.

2.3 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit
https://www.siemens.com/industrialsecurity (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under
https://www.siemens.com/cert (https://www.siemens.com/cert).

Further information is provided on the Internet:

Industrial Security Configuration Manual
(https://support.industry.siemens.com/cs/ww/en/view/108862708)

⚠ WARNING

Unsafe operating states resulting from software manipulation

Software manipulations, e.g. viruses, Trojans, or worms, can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a holistic, state-of-the-art industrial security concept for the installation or machine.
- Make sure that you include all installed products into the holistic industrial security concept.
- Protect files stored on exchangeable storage media from malicious software by with suitable protection measures, e.g. virus scanners.
- On completion of commissioning, check all security-related settings.

Safety notes 3

3.1 Warnings and cautions

Warnings and cautions

⚠DANGER

Ensuring a safe and stable state

During commissioning of the converter it is essential to ensure that the system is in a safe and stable state, as some commissioning processes have the potential to start the motor. Therefore it is important to secure any loads and ensure that should the motor start, no potentially dangerous conditions exist.

⚠WARNING

The converter will stop if the IOP-2 is removed when in Hand mode

When the IOP-2 is in Hand mode, that is, when the command source is switched to Hand and all OFF and RUN commands are given via the IOP-2 buttons.

When in the Hand mode, if the IOP-2 is removed from the converter, the converter will stop within a few seconds of the IOP-2 being removed.

Before removing the IOP-2, ensure that the IOP-2 is placed in AUTO mode and receiving its command source from the PLC.

⚠WARNING

Risk of death due to software manipulation when using exchangeable storage media

Storing files onto exchangeable storage media amounts to an increased risk of infection of the commissioning PCs, e.g. with viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect files stored on exchangeable storage media from malicious software using appropriate protection measures, e.g. virus scanners.

⚠WARNING

Risk of death due to software manipulation when using exchangeable storage media

Storing the parameterization (incl. Safety Integrated parameterization) on exchangeable storage media carries the risk that the original parameterization (with Safety Integrated) will be overwritten, for example, by the IOP-2 of another drive without Safety Integrated. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Ensure that only the IOP-2 that belongs to the respective converter is used.
- Ensure that only trained or authorized personnel have access to the enclosures, cabinets or electrical equipment rooms.

Note

- The IOP-2 can be fitted to and removed from the converter while power is applied.
- The IOP-2 will set the USS PZD (P2012) length to 4 when connected to the converter.

Overview

4

4.1 Introduction

Compatibility

The Intelligent Operator Panel 2 (IOP-2) has been designed to enhance the interface and communications capabilities of SINAMICS Inverters.

The IOP-2 connects to the Inverter through an RS232 interface. It has been designed to automatically recognize the following devices from the SINAMICS range:

- SINAMICS G120 CU230P-2
- SINAMICS G120 CU240B-2
- SINAMICS G120 CU240E-2
- SINAMICS G120 CU250S-2
- SINAMICS G120C
- SINAMICS G120D-2 CU240D-2*
- SINAMICS G120D-2 CU250D-2*
- SINAMICS ET 200pro FC-2*
- SINAMICS G110D*
- SINAMICS G110M*
- SINAMICS G120X
- SINAMICS G120XA

*Denotes Control Units that require the IOP-2 Hand-Held Kit and the optical cable to connect the IOP to the Control Unit.

Hand-Held Kit order number: 6SL3255-0AA00-4HA1.
Optical cable order number: 3RK1922-2BP00

For information on firmware and language updates, please see  Updating the IOP-2 firmware (Page 27).

Note

IOP functional support

- Drives with SINAMICS firmware 4.7 SP3 or above will support the new commission processes of "Quick Setup" and "Advanced Setup".
- Drives with GP firmware prior to version 3.4 are not fully supported by the IOP-2.
- The actual menu structure and functionality of the IOP-2 will be influenced by the following factors:
  - The software version and type of Control Unit and Power Module to which the IOP-2 is fitted.
  - The firmware and software version of the IOP-2.
  - The selected functional group filtering of the parameters.

General Data Protection Regulation (GDPR) compliance

Siemens observes the principles of data protection, in particular the principle of data minimization (privacy by design). For this product, the IOP-2, this means: The product does not process / store any personal data, only technical functional data (e.g. time stamp). If the user links this data with other data (e.g. shift plans) or stores personal data on the same medium (e.g. hard disk) and thus establishes a personal reference, the user must ensure compliance with data protection regulations.

4.2 Layout and functions

Overview

The physical layout of the IOP-2 is shown below:

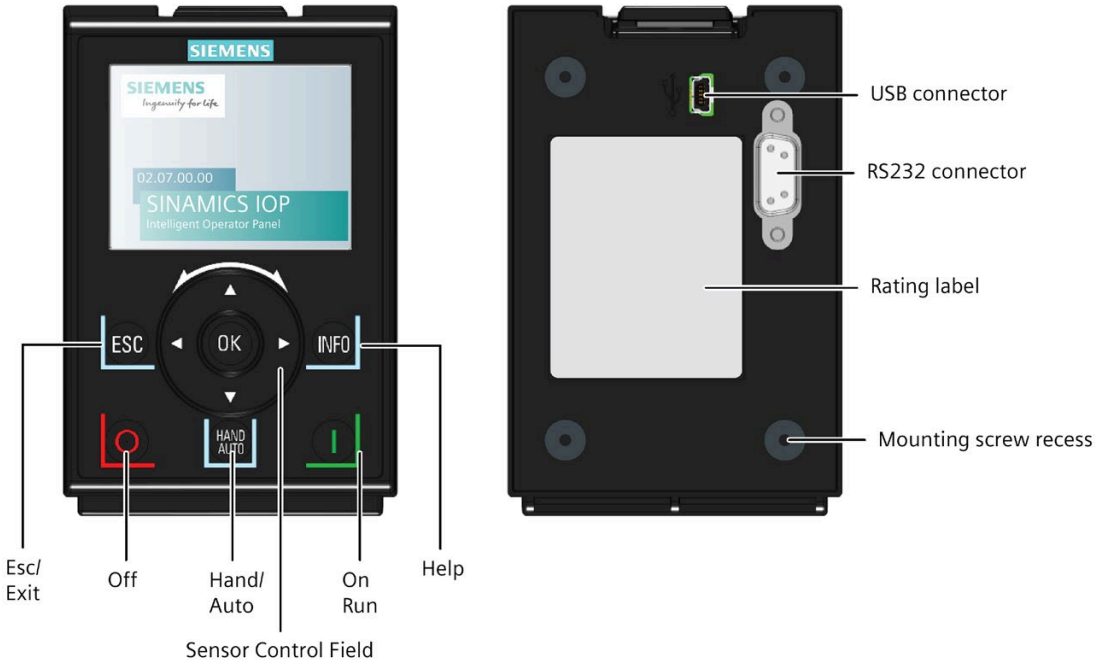

Figure 4-1 Layout of the IOP-2

The IOP-2 is operated by using a Sensor Control Field and five additional buttons. The specific functions of the Sensor Control Field and buttons are shown in the table below.

Table 4- 1 Function of the IOP-2 controls

Key	Function
	The Sensor Control Field has the following functions: • In a menu, sliding your finger around the Sensor Control Field changes the selection. • When a selection is highlighted, pressing the OK button in the centre of the Sensor Control Field confirms the selection. • When editing a parameter, sliding your finger around the Sensor Control Field changes the displayed value; clockwise increases the value and anti-clockwise decreases the displayed value. • When editing parameter or search values there is a choice to edit individual digits using the arrow keys or an entire value using the Sensor Control Field. The speed with which you slide your finger around the Sensor Control Field increases or decreases the speed of movement of the cursor. • The Sensor Control Field has integrated arrows which can be used to navigate through the menus and individual digits in the inputs fields.
	The ON key has the following functions: • In AUTO mode can be changed by pressing the HAND/AUTO key. • In HAND mode the converter is started - the converter status icon starts turning. Notes: For Control Units with firmware versions less than 4.0: When running in AUTO mode, HAND mode cannot be selected unless the converter is stopped. For Control Units with firmware versions 4.0 or greater: When running in AUTO mode, HAND mode can be selected and the motor will continue to run at the last selected setpoint speed. When the converter is running in HAND mode, the motor stops when switched to AUTO.
	The OFF key has the following functions: • If pressed for longer than 3 seconds the converter will perform an OFF2; the motor will then coast down to a standstill. Note: 2 presses of the OFF key within 3 seconds will also perform and OFF2. • If pressed for less than 3 seconds the following actions will be performed: – If in AUTO mode the screen will display an information screen stating that the command sources is AUTO and can be changed using the HAND/AUTO key. The converter will not be stopped. – If in HAND mode the converter will perform an OFF1; the motor will come to a standstill in the ramp-down time set in parameter P1121.
	The ESC key has the following functions: • If pressed for less than 3 seconds the IOP-2 returns to the previous screen or if a value has been edited, the new value is not saved. • If pressed longer than 3 seconds the IOP-2 returns to the status screen. When using the ESC key in the parameter editing mode, no data is saved unless the OK key is pressed first.

Key	Function
	The INFO key has the following functions: • Displays additional information for the currently selected item. • Pressing the INFO key again will display the previous screen. • Pressing the INFO key for >= 2 seconds will display the "Footer Symbol Guide" with more icon descriptions on most screens.
	The HAND/AUTO key switches the command source between HAND and AUTO mode. • HAND sets the command source to the IOP-2. • AUTO sets the command source to an external source, for example, fieldbus. Note: When switching from the HAND mode back to the AUTO mode, the setpoint screen will change back to the standard status screen.

Locking and unlocking the keypad

The keypad can only be locked once the power-up cycle has been completed. If the keys are activated before the power-up cycle is completed, the IOP-2 will enter the DEMO mode.

To lock the IOP-2 keypad press **ESC** and **INFO** simultaneously for 3 seconds or more. To unlock the keypad press **ESC** and **INFO** simultaneously for 3 seconds or more.

4.3 Screen icons

Overview

The IOP-2 displays a number of icons at the top right-hand edge of the display to indicate various states or current conditions of the converter. These icons are explained in the table below.

Table 4- 2 Screen icons

Function	Icon	Remarks
Command source		Auto - the converter receives the command signals from the network controller
	JOG	Displayed when the JOG function is active
		Hand - the converter is under control of the IOP-2
Inverter status		
		Icon rotates when the motor is running
Fault pending		
Alarm pending		
Saving to RAM		Indicates that all recent changes to parameters have been saved in RAM only. In the event of a power failure, then all recent changes saved to RAM will be lost. To prevent loss of parameter data a RAM-to-ROM save must be performed.

Function	Icon	Remarks
PID autotuning		
Hibernation mode		
Write Protection		Parameters cannot be modified.
Know How Protection		Parameters cannot be viewed or modified.
ESM		Essential Services Mode
Battery condition		The battery status is only shown when the IOP-2 Hand-held kit is used.

Screen faults and alarm indicators

When a fault or an alarm is active on the converter the top label on the screen will change. The top label will remain red until the fault or warning has been acknowledged or rectified.

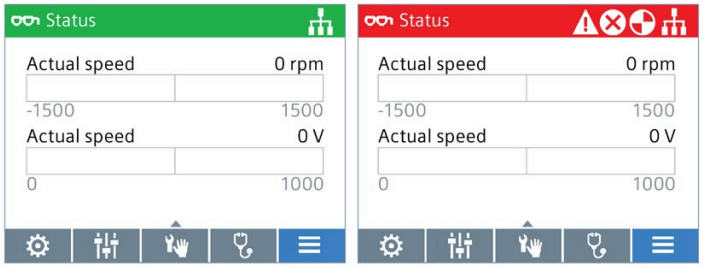

Figure 4-2 Fault and alarm notifications

Use of screen colours

A brief explanation of the use of the different colours on the screen is given below:

Red Error status: Indicates a fault is active and the Control Unit is in an error condition.

White Neutral status: The IOP-2 has no connection to the Control Unit.

Green Run status: The converter is running with no active faults. Active alarms will be displayed on the status bar.

Blue Blue denotes the selected item on the screen.

4.4 Menu structure

Overview

The Menu structure of the IOP-2 is shown in the figure below.

NOTICE
Variation of menu structure The structure and content of the menus will vary depending on the firmware version of the IOP-2 and the Control Unit and Power Module to which the IOP-2 is attached.

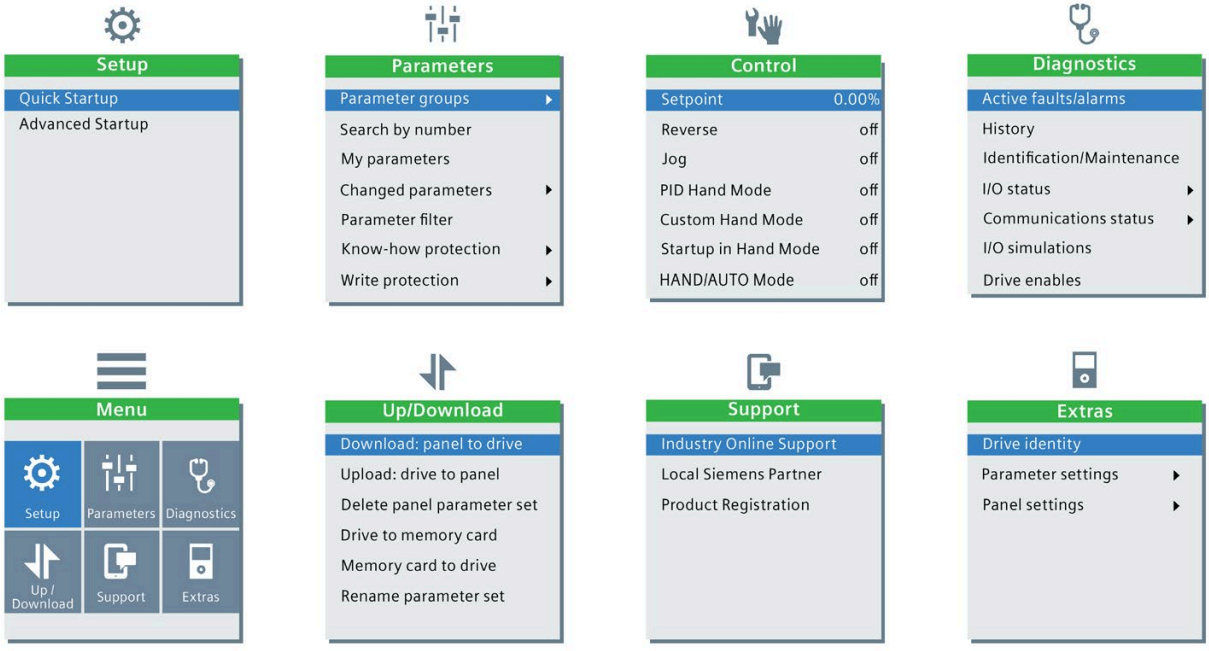

Figure 4-3 IOP-2 menu structure

Installation

5

5.1 Fitting the IOP-2

Fitting the IOP-2 to the Control Unit

Note

IOP-2 power supply

The IOP-2 has no internal power supply and derives its power directly from the Control Unit of the converter through the RS232 interface. The IOP-2 can also be connected to a PC and derives its power through the USB connection.

To fit the IOP-2 to the converter Control Unit the following procedure should be performed:

1. Place the bottom edge of the IOP-2 casing into the lower recess of the Control Unit housing.
2. Push the IOP-2 forward until the top fastening clicks into place on the Control Unit housing.

To use the IOP-2 with a decentralized drive, for example an ET200pro FC-2, an IOP-2 Handheld kit is required and an optical cable. The IOP-2 Handheld kit and optical cable are fitted as shown in the following figure.

The order details of both the IOP-2 Handheld kit and the optical cable are given in the Introduction (Page 11).

Figure 5-1 Fitting IOP-2 on CU and ET200pro FC-2

5.2 Initial set-up

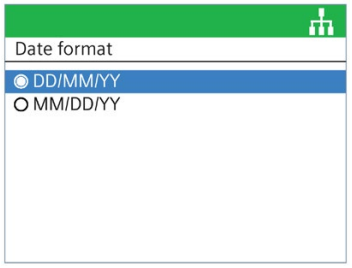
Initial set-up sequence

Once the IOP-2 is fitted and powered-up it will automatically detect the type of Control Unit and Power Module to which it has been fitted. On first-time use, the IOP-2 automatically displays the option to select the default language and allow the time and date to be set (if the Control Unit to which the IOP-2 is fitted has a real-time clock). The IOP-2 will then display the choice between "Quick Setup" or Advanced Setup"; "Quick Setup" is the recommended selection. The procedure is outlined below.

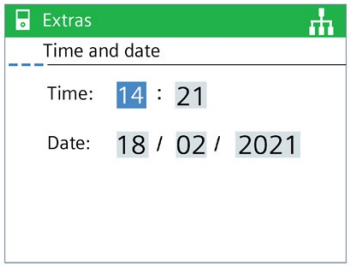
Note

Saving and cloning of the IOP-2 configuration data

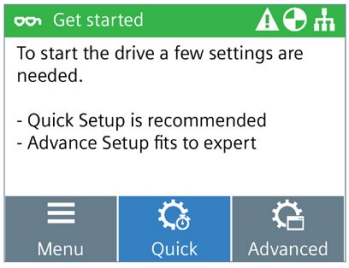
All changes made to an IOP-2 configuration, included all saved parameter sets, are stored in the IOP-2 file structure in the "user" folder.



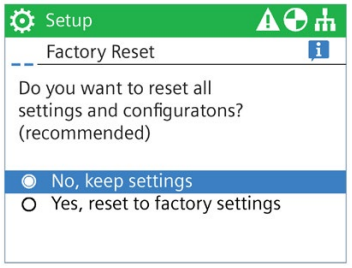
To copy/clone all this data to another, or multiple IOP-2s, the procedures are shown in  Customer parameter sets (Page 71).



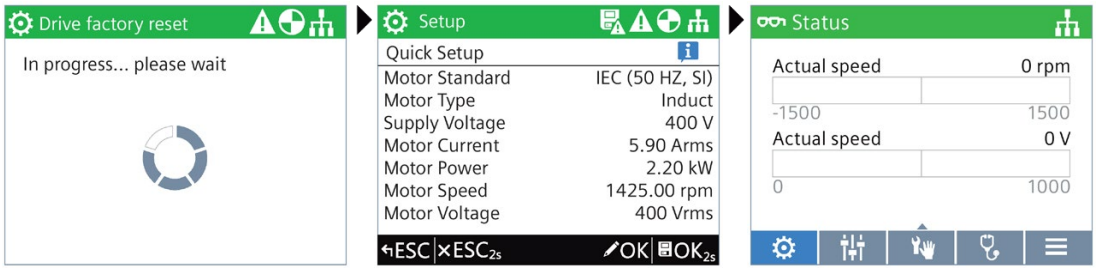
Splash screen is displayed



Select the required language



Select date format



Set correct date and time

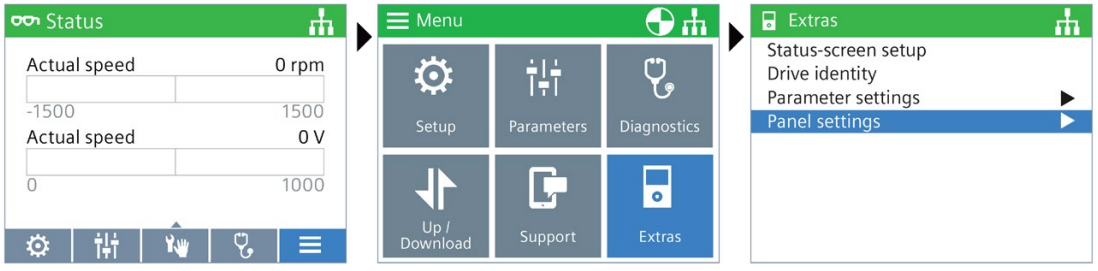
Select Quick Setup

Select "Yes, reset to factory settings"

Wait until the factory reset is finished

Change or confirm settings

Status screen on completion

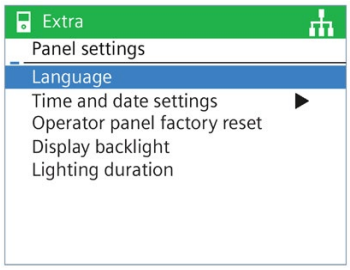


Note

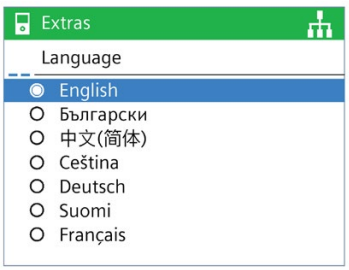
The IOP-2 is delivered with all available languages and the Quick Setup and Advanced Setup functions. For information on Firmware upgrades, please see Updating the IOP-2 firmware (Page 27).

The status screen can be reconfigured to show a number of different views and types of values; these can be configured using the "Status Screen Setup" in the "Extras" menu, see Extras Menu (Page 76).

Language selection

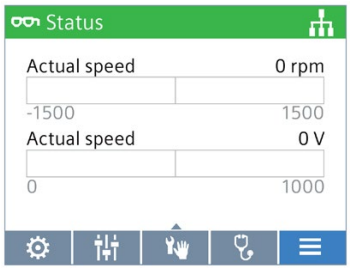


The IOP-2 on first start-up will display the language screen for the user to select their required language, should you wish to select your language manually, the following actions should be performed:



Select Menu

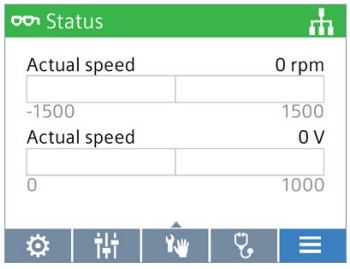
Select Extras



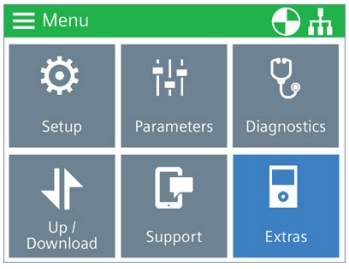
Select Panel settings

Select language

Select required language

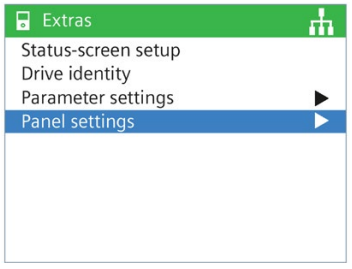


Press and hold down ESC for Status Screen

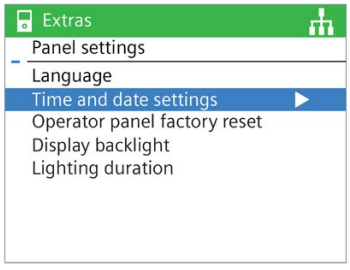


All available languages are delivered with the IOP-2.

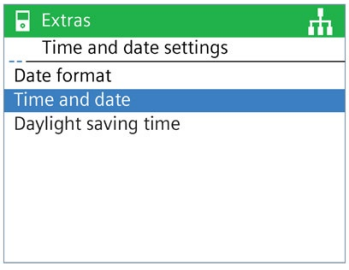
Setting time and date



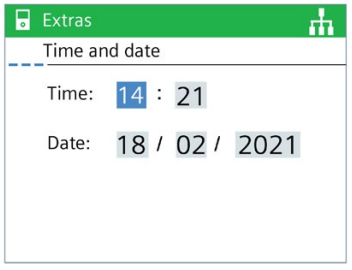
When the IOP-2 is first fitted to a Control Unit, which has a real-time clock, it will automatically display the time and date screen. Should you wish to manually set the time on the IOP-2, the following actions should be performed:



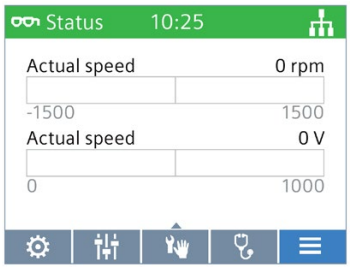
Select Menu



Select Extras



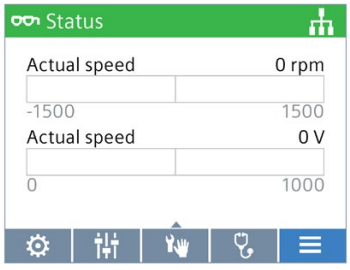
Select Panel settings



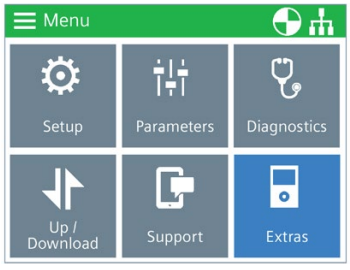
Select Time and date settings

Set the Time and date settings

Set time and date

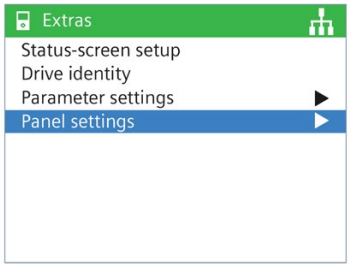


Press and hold down ESC for Status Screen

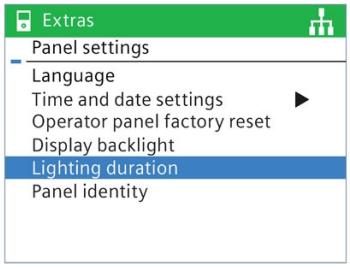


The settings for time are normally done on the Control Unit if it has a Real-time Clock (RTC). If the Inverter has an RTC the IOP-2 will take its settings from the Control Unit.

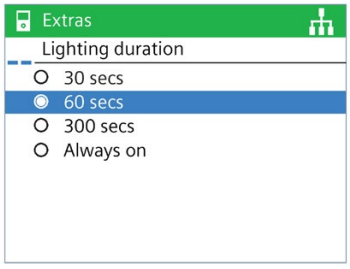
Lighting duration



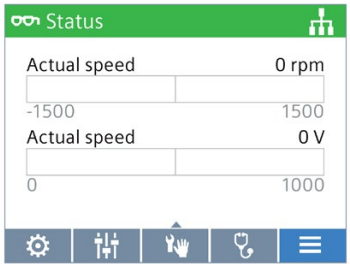
To set the length of time that the display remains lit, the following actions should be performed:



Select Menu



Select Extras

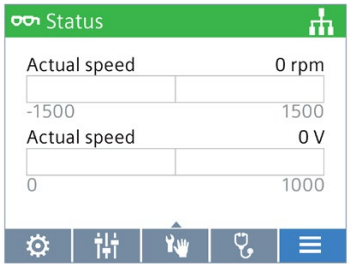


Select Panel settings

Select Lighting duration

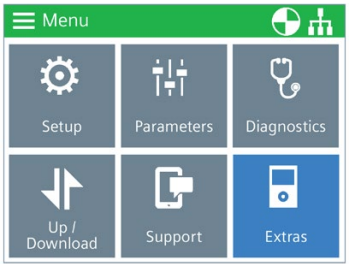
Select Lighting duration time

Press and hold down ESC for Status Screen



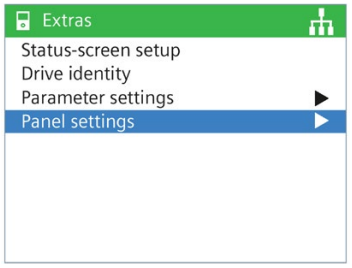
Note

Screen will flash when an active fault condition exists

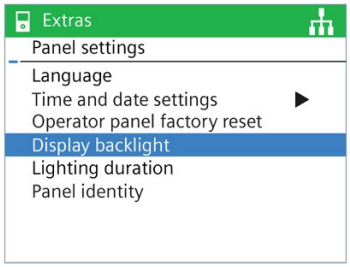


When an active fault condition exists on the IOP-2, the screen will only flash when the IOP-2 is displaying either the status screen or the active fault and alarm screen.

Display backlight

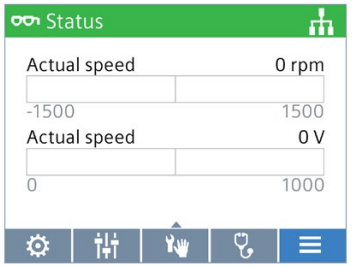


To change the intensity of the backlight, the following actions should be performed:



Select Menu

Select Extras



Select Panel settings

Select Display backlight

Select display backlight level

Press and hold down ESC for Status Screen

The display backlight setting will be automatically changed to the "Low" setting after 60 seconds from the last key press to extend the life of the display. When any key is pressed the backlight setting will automatically return to the user setting.

5.3 Changing the Status screens

Changing the status screens

The status screens of the IOP-2 can show three different styles of screens.

- **Bar graph view** - This shows the selected data on up to two separate sliding bar scales.
- **Scalar view** - This shows the selected data as numerical values in four separate quadrants on the screen.
- **Trend view** - This shows the selected data as two separate real-time plots on the screen.

Select a different status screen

To select a different status screen the following procedure should be performed:

1. When the status screen is displayed, use the UP arrow key to enter the screen selected mode.
2. Using the LEFT and RIGHT arrow keys, select the required status screen.
3. Press ESC or the DOWN arrow key to accept the new status screen and exit the screen selection mode.

Modify the display data

To modify the data that is displayed on the status screen, the following procedure should be performed:

1. Use the UP key to enter the status screen selection mode.
2. Press OK to edit the displayed data.
3. Use the arrow keys to navigate around the screen until the data you wish to change is highlighted. Press OK to edit the highlighted data.
4. Press OK to edit the parameter to be displayed.
5. Select the new parameter you wish to be displayed. Press OK to accept the new selection.
6. The new parameter selection is shown in the list. Press ESC or the DOWN arrow key to return to normal functions of the IOP-2.
7. The status screen is shown with the new data values and the screen menu is shown.

An overview of the basic procedures is shown in the figure below.

Figure 5-2 Selecting and modifying the IOP-2 status screens

5.4 User definable labels on status screen

User definable labels

User defined labels allow the user to customize the labels that appear on the status screen of the IOP-2.

There are a maximum of four labels that can be defined and they are located on the IOP-2 in the "config" folder. The IOP-2 must be connected to the PC via the USB connection to access

the files on the IOP-2.The files are basic text files and can be opened with any basic text editor. The default label names are "default", when the labels have the "default" text, the IOP-2 will ignore the labels. There are the following restrictions when creating your own labels:

- A maximum of 20 characters for each label name.
- The characters that can be used conform to the normal windows file naming conventions.

The four files are named:

- BotLeft.txt
- BotRight.txt
- TopLeft.txt
- TopRight.txt

The file names relate to the area of the status where they will appear.

Simply selected the file you wish to use as a label; open it with a text editor, change the name and then save it back to the same location in the IOP-2 file system. If the file name itself is changed the IOP-2 will not recognize the label.

An example of the status screen with new label names (using all four text files) is shown in the figure below.

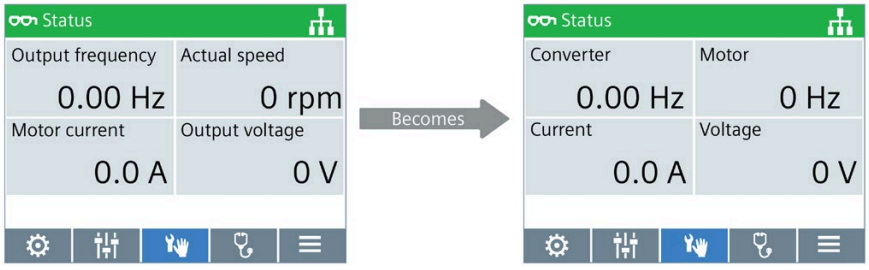


Figure 5-3 Example of defining your own labels

5.5 Updating the IOP-2 firmware

Updating the IOP-2 firmware

The IOP-2 contains firmware, which can be updated by the user by means of a firmware update. To perform the update of the IOP-2 firmware the following steps should be performed.

1. Plug the IOP-2 into a PC using the USB connection. Note: Connect the IOP-2 only to an internal USB interface. Do not use an USB interface which is connected to your PC externally (e.g. via a docking station, external USB-Hub or desktop PCs with front sockets).
2. The IOP-2 will automatically enter the "Mass Storage" mode.
3. Open the file explorer on the PC.

4. Navigate to the IOP-2 (removable media). Note: Back up data (e.g., readme, parameter records) that you will need later on the connected PC.
5. Format the IOP-2 (do not use quick formatting). Set the size of the allocation units to 2048 bytes (FAT Standard).
6. Go to the Service and Support site at the link shown below.
7. Download the zip file with the current firmware of the IOP-2 into a folder on the PC and unpack it into a separate directory.
8. Copy the downloaded files from the PC directory directly into the IOP-2 folder (the copying process takes approximately 6 minutes).
9. When the copying has been completed, wait approximate 5 seconds before disconnecting the IOP-2 from the USB port. The new firmware is now available on the IOP-2 and you can now connect the IOP-2 to a SINAMICS G inverter.
10. When you turn on the SINAMICS G inverter, the IOP-2 will automatically update.

Only IOP-2 firmware update packages obtained through the Siemens Service and Support website at the following link should be used:

IOP-2 firmware download: IOP-2 Firmware update (https://support.industry.siemens.com/cs/ww/en/view/109762019)

Reading the OSS License

The IOP-2 contains open-source software (OSS). The OSS comprises open-source text and satisfies special license terms. If you wish to read the license terms, see: efs/readme_OSS.zip on the IOP-2.

Setup Menu

6

Overview

The IOP-2 Setups are question-driven environment that assist the user to set-up various functions and applications of the converter.

⚠WARNING

Motor Identification (Motor ID) function will run automatically

Using the "Standard Drive Control" or "Dynamic Drive Control" in Quick Setup, the Motor ID function, if selected, is activated at the end of the commissioning sequence.

The motor identification (motor ID) function, after the completion of the Quick Setup, upon the first startup, will start automatically after approx. 8 to 30 s and accelerate the motor to the setpoint speed.

This action must be taken into account when the Quick Setup procedure has been completed, to ensure that the first ON/RUN command when given for your application, does not produce an unpredicted or unsafe effect on personnel, equipment or premises.

⚠WARNING

Safe and stable state of the converter

During the setup of the converter it is essential to ensure that the system is in a safe and stable state, as some setup processes have the potential to start the motor. Therefore it is important to secure any loads and ensure that should the motor start, no potentially dangerous conditions exist.

⚠CAUTION

Default datasets

The Setups use the default Drive datasets (DDS0 and CDS0), if the default datasets are changed to the other datasets, the Setups may not function correctly.

6.1 Example Setups

Overview of Setup

The following examples of how Setup works on the IOP-2 are purely for demonstration purposes only.

⚠ CAUTION
Before setting up an application Prior to using Setup, it is essential that the user's Control Unit and Power Module have been installed and wired correctly, in accordance with the requirements of the user's application. This is extremely important in the case of setting up safety-integrated applications. All inputs and outputs must be defined and configured before any setting up can take place, including the observation and adherence of all local, national and international safety regulations required for the user's application and all devices utilized by the user's application.

Quick Setup/Advanced Setup

Quick Setup

The Quick Setup procedure is all the user needs to setup the converter quickly and easily. The Quick Setup allows the user to configure the following converter data:

- Motor Standard
- Motor Type
- Supply Voltage
- Motor Current
- Motor Power
- Motor Speed
- Motor Voltage
- Motor Frequency
- Minimum Frequency
- Maximum Frequency
- Ramp-up Time
- Ramp-down Time
- I/O Setup

The default settings of the converter will be automatically read into the IOP-2, but it is recommended that you check that these settings are correct for your converter by comparing the settings with the data from the converter and motor rating labels.

Advanced Setup

The Advanced Setup provides the user with a more comprehensive range of settings that can be configured for specific requirements and applications. The settings that are available are as follows:

- Drive Information: This displays detailed information about the connected Control Unit and Power Module.
- Factory Reset: This allows the converter to be reset to the factory default settings.
- Hardware options: This allows the configuring of an Output Filter and a Braking Resistor.
- Control Type: This allows the selection of the control types, Standard Drive Control, Dynamic Drive Control and Expert. A brief explanation of each Control Type is given below.
- Motor Data: This allows the user to configure the Motor settings which consist of the data presented in the Quick Setup.
- Limit Settings: This gives the user the opportunity to setup the dynamic settings of the converter.
- Optimization: This allows the user to optimize the converter for technological applications and ensure that the correct motor data will be used.
- I/O Setup: The I/O configuration is pre-assigned using macros so that no further settings are necessary. Should the user want to reconfigure the Input and Output settings of the converter, the I/O Setup can be used to perform this function.
- Fieldbus Setup: This allows the user to configure the interface settings.
- Application Setup: This allows the user to configure the application specific functions of the converter.

For more detailed information of the application classes, see the document at the link below:

Application classes (https://support.industry.siemens.com/cs/ww/en/view/109480663)

Control Types

Standard Drive Control

- Standard Drive Control is preset for the Power Modules PM240, PM240-2 and G120C in frame sizes FSA-C. This application class can, for example, be used for the following applications:
  - Pumps, fans and compressors with flow characteristic
  - Wet or dry beam technology, mills, mixers, kneaders, crushers, agitators
  - Horizontal conveyor technology (conveyor belts, roller conveyors, chain conveyors)
  - Basic spindles

Dynamic Drive Control

- Dynamic Drive Control is preset for the Power Modules PM240, PM240-2 and PM330 in frame sizes ≥ FSD. This application class can, for example, be used for the following applications:
  - Pumps and compressors with displacement machine
  - Rotary furnaces
  - Extruders
  - Centrifuges

Expert

- Expert is fixed assigned configuration for the Power Modules PM230, PM250 and PM260 and will soon be available for the G120D, G110M and ET200pro FC-2. This setting corresponds to the existing Setup and will also be assigned to existing projects. It allows the flexible setup of the converter, but requires a detailed understanding of the drive.

⚠WARNING

Motor data identification (motor ID)

When selecting motor data identification (motor ID) with subsequent ramp-up to the setpoint speed (p1900 = 11 or 12; 12 = standard setting based on SINAMICS Firmware V4.7 SP3 with "Standard Drive Control" and "Dynamic Drive Control"), the motor is, upon the first Power ON command, directly accelerated to the setpoint speed, following a short delay time caused by the motor ID (approx. 15 to 30 s). From SINAMICS Firmware V4.7 SP6 the default setting for p1900 = 2.

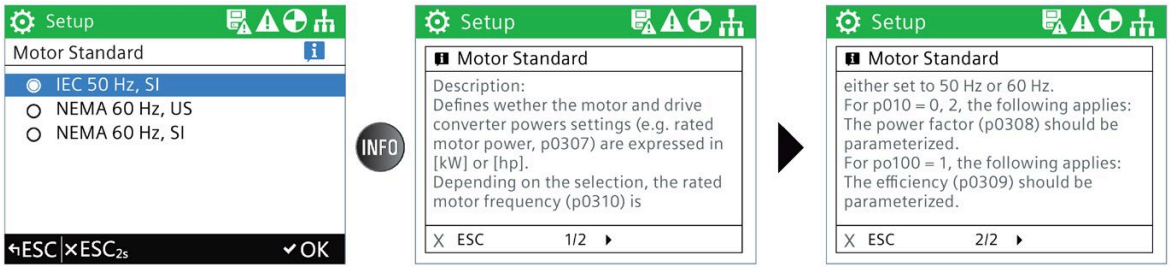
Note

Macro source selection

During the Quick Setup process, the user will be presented with a list of preset macros that determine the configuration of the converter. Every Control Unit Operating Instructions contain a list of the macros that are specific for that particular Control Unit and show the wiring configurations for each macro. For further information, see the relevant Operating Instructions.

INFO Screens

INFO Screens (Information Screens) are accessed with a press of the INFO button. There may be multiple INFO screens and you can navigate between each screen using the arrow keys.



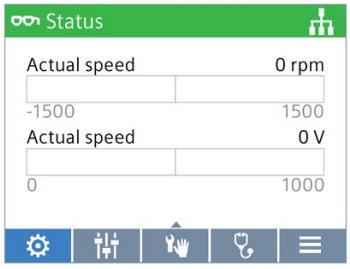


Figure 6-1 Using the INFO button

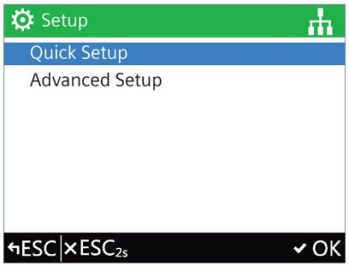
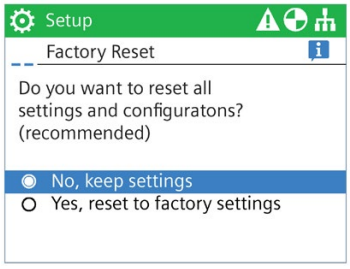
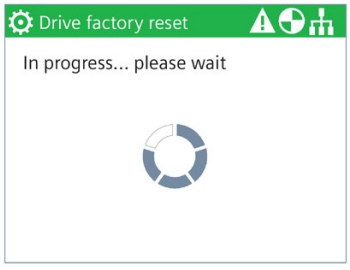


6.1.1 Quick Setup with the IOP-2

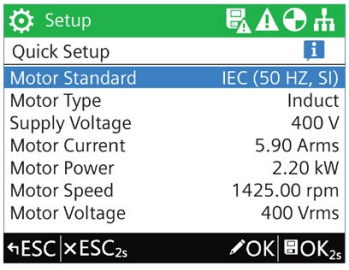
Quick Setup



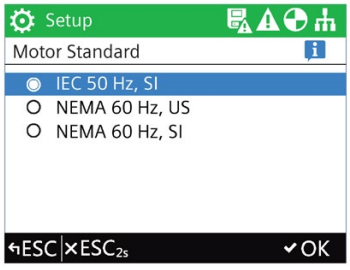
NOTICE
Requirements prior to using the Quick Setup • The user must be fully conversant with all safety instructions as detailed in the "Fundamental Safety Instructions" section of the Operating Instructions for your converter. • The converter must be installed and checked as per the relevant instructions in the "Installation" sections of the converter Operating Instructions. • Macro source selection: During the Quick Setup process, the user will be presented with a list of preset macros that determine the configuration of converter. Every Control Unit Operating Instructions contain a list of the macros that are specific for that particular Control Unit and show the wiring configurations for each macro. For further information, see the relevant Operating Instructions. • The information required to be input into the Quick Setup process can be found on the motor rating label, an example of which is included in the Operating Instructions for your converter. • If the motor is to operate with the "87 Hz characteristic"; You need to use the "Advanced Setup" process and you need to connect the motor in Delta (Δ), this is shown in the "Installation" section of the Operating Instructions for your converter.



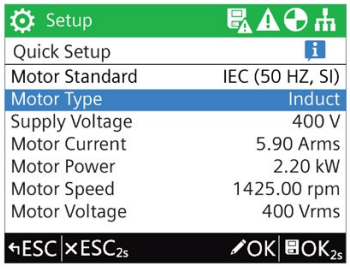
Select Setup



Select Quick Setup



Select Factory Reset (yes or no)



Factory Reset begins

Setup up completed

6.1.2 Advanced Setup with the IOP-2

Advanced Setup overview

Advanced Setup is a commissioning process for all applications which provides a high degree of flexibility when dealing with the converter settings. The provided settings allow an optimized adaption of the converter to the target application.

The setup process will guide the user through the commissioning process by presenting a number of categories where the user can choose the necessary options and values to commission the converter and motor.

At the conclusion of the setup process, the data can be saved to the converter's memory.

Setup Icons

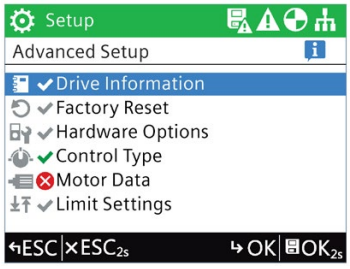
The setup process uses a number of very important icons to indicate the status of the settings. A description of the various icons is given below.

The settings for the function at the default settings.

The settings for the function have been changed and saved.

The settings for the function must be checked to ensure the safety settings are correct.

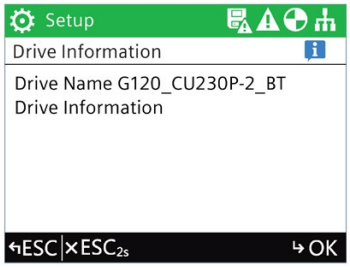
The settings for the function must be checked and corrected if necessary.



This icon indicates that information is available on the selected function by pressing the INFO key.

Advanced Setup

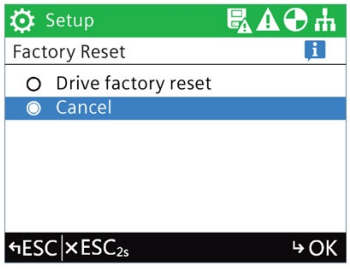
The Advanced Setup process is outlined below and it should be remembered that the screenshots are for example purposes only and may vary from your own IOP-2 display, depending on the firmware version and the actual converter that is being commissioned.



Advanced Setup Menu

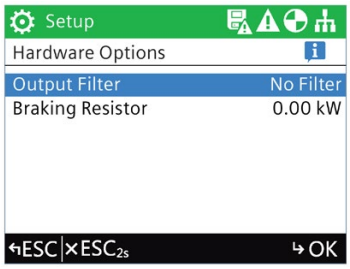
This screen lists all the advanced settings that are available for the user to modify for their specific application.

Drive Information



This screen provides general information concerning the used converter configuration (Power Module, Control Unit and the Intelligent Operator Panel IOP-2).

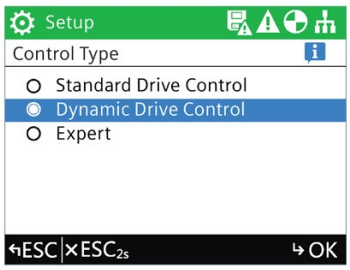
Factory Reset



This function resets all the parameters to their factory default settings. Any safety parameters that have been modified will not be reset.

It is recommended that you reset to the factory settings before commissioning the converter.

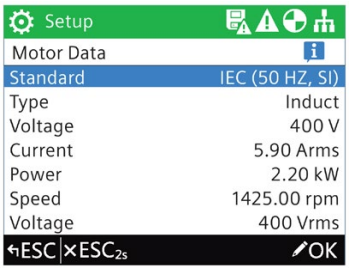
Hardware Options



This screen gives the user the opportunity to setup the converter options, for example, an Output Filter or a Braking Resistor.

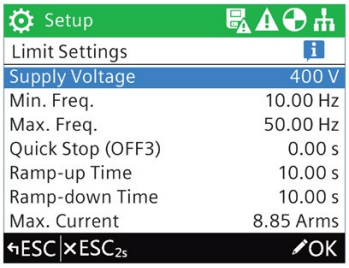
Control Type

This screen allows the application class to be set.



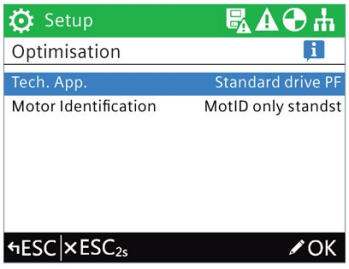
Depending on the particular Power Module, the converter selects the right application class and assigns the motor control the appropriate default settings.

Motor Data



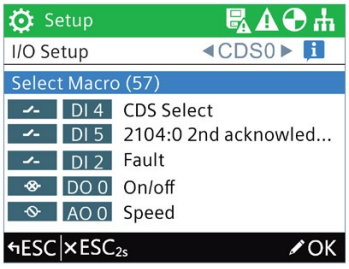
The motor data stored here corresponds to the 4-pole SIEMENS standard motor with the same converter power.

For dynamic applications and when other OEM motors are in operation, adaptation of the settings will need to be made.



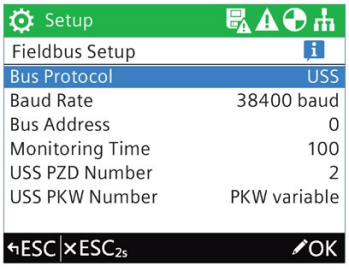
Limit Settings

This screen gives the user the opportunity to setup the dynamic settings of the motor, for example, minimum and maximum motor speed, ramp-up and ramp-down timings and OFF-3 ramp-down time.



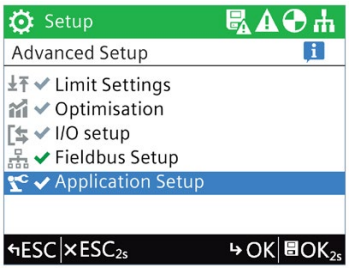
Optimization

This screen allows the optimization the converter for the technological applications and ensures that the correct motor data will be used.



I/O Setup

The I/O Setup allows the pre-assigned configurations (macros) to be modified if necessary.

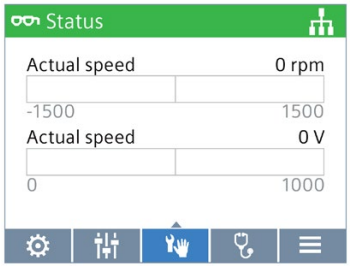


Fieldbus Setup

This screen allows the communications interface settings on the converter to be configured.

Application Setup

This screen allows the application specific functions to be configured. When "Application Setup" is selected, the user is presented with some default application functions, depending on the type of Control Unit that is being used. A grey tick is displayed beside the functions that have not been configured using the IOP-2 and when a function has been configured using the IOP-2, a green tick is shown beside the function in the list.



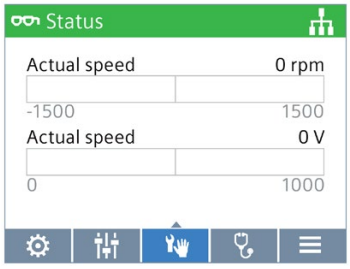
Control menu 7

Overview

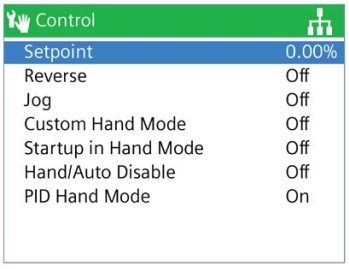
The Control menu allows the user to change the following settings in real-time:

- Setpoint
- Reverse
- Jog
- Custom Hand mode
- Startup in Hand mode
- Hand/Auto disable
- PID Hand Mode

The control menu is accessed from the menu at the bottom-centre of the Status screen, as shown below.

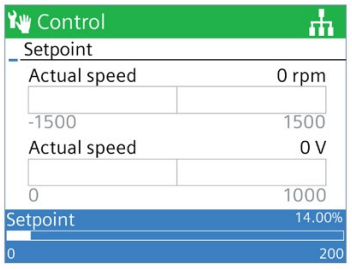


7.1 Setpoint



Setting the Setpoint

The setpoint value determines the speed at which the motor runs as a percentage of its full range of motion.



To change the setpoint, the following actions should be performed:

Select Control

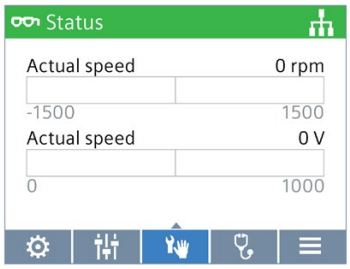
Select Setpoint

Use Touch-wheel to set the Setpoint

Note

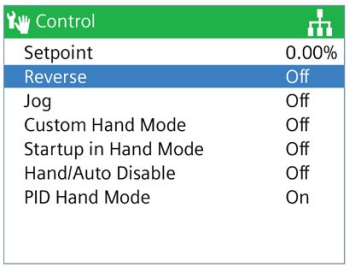
Setpoint in Hertz (Hz) for SINAMICS CU230P-2

The setpoint screen by default displays the motor speed as a percentage of the total possible speed of the motor.



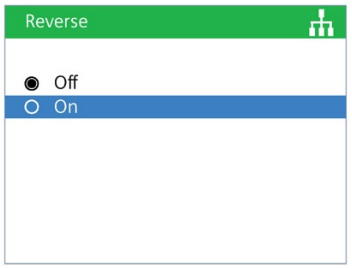
This behaviour changes for the SINAMICS CU230P-2 and SINAMICS G120X where the default setpoint value is displayed in Hertz (Hz).

7.2 Reverse



Setting Reverse

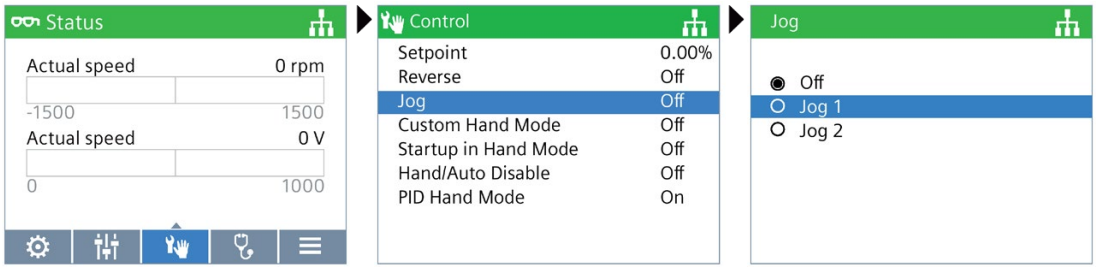
The function of the reverse command is to set the direction of rotation of the motor from its normal forward motion.



To reverse the direction of the motor, the following actions should be performed:

Select Control

Select Reverse



Select Off or On

7.3 Jog

Setting Jog

The Jog function, when selected will allow the motor to be manually rotated by a pre-determined value with each press of . If is pressed continuously, the motor will rotate continuously until is released.

To enable or disable the Jog function, the following actions should be performed:

Select Control | Select Jog | Select Off or On

Note

Selection of Jog frequencies / rpm

It is important that the Jog parameters P1058 and P1059 are set to the required frequencies / rpm for the users application.

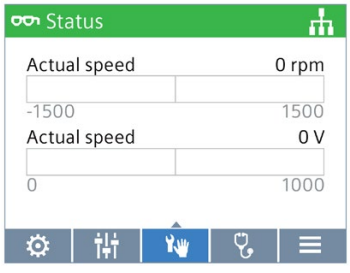
7.4 Custom Hand mode

Overview

The custom hand mode allows the user to setup a command source and setpoint source directly from the Intelligent Operator Panel 2 (IOP-2).

When the custom hand mode has been set, the IOP-2 Sensor Control Field can be used as the setpoint source.

The Auto mode is unaffected by any changes made by the custom hand mode function.



A breakdown of all the interconnection inputs is given in the table below.

An example of setting up the custom hand mode is given in the instructions below.

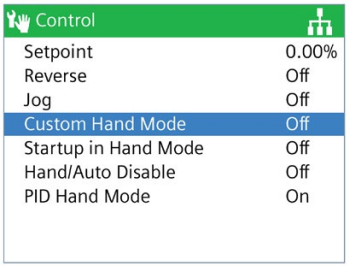


Table 7- 1 Interconnection inputs for Status Word 1 in Custom Hand mode

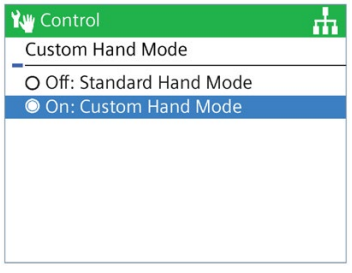
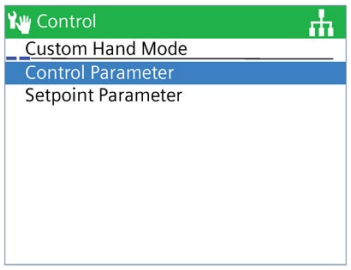
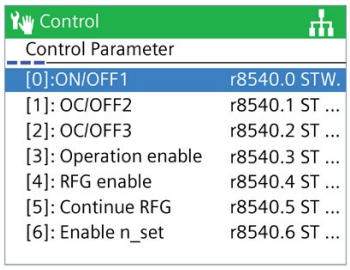
Standard interconnection				
r8540	**STW 1 from IOP-2**	**Binector Inputs (BI)**	**p8542**	**Effective STW1 in Custom Hand mode**
Bit0	ON/OFF key	->	Bit0	ON/OFF1
Bit1	Two quick press of the OFF key	->	Bit1	OFF2
Bit2	A long press of the OFF key	->	Bit2	OFF3
Bit3	Reserved	->	Bit3	Inhibit/enable operation
Bit4	Reserved	->	Bit4	Ramp-function generator enable
Bit5	Reserved	->	Bit5	Continue ramp-function generator
Bit6	Reserved	->	Bit6	Setpoint enable
Bit7	Alarms menu acknowledge all faults	->	Bit7	Acknowledge faults
Bit8	Jog 1 (Control menu)	->	Bit8	Jog 1
Bit9	Jog 2 (Control menu)	->	Bit9	Jog 2
Bit10	Reserved	->	Bit10	Control by PLC
Bit11	Change direction (Control menu)	->	Bit11	Direction of rotating - reversed
Bit12	Reserved	->	Bit12	Speed control enable
Bit13	Reserved	->	Bit13	Motorized potentiometer, setpoint, increase
Bit14	Reserved	->	Bit14	Motorized potentiometer, setpoint, decrease
Bit15	Reserved	->	Bit15	CDS selection
Standard interconnection				
r8541	**Speed setpoint from IOP-2**	**Connector Inputs (CI)**	**p8543**	**Effective speed setpoint in Custom Hand mode**
	N_soll OP	->		Speed setpoint



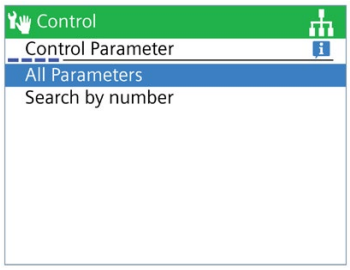
Setting up Custom Hand mode example



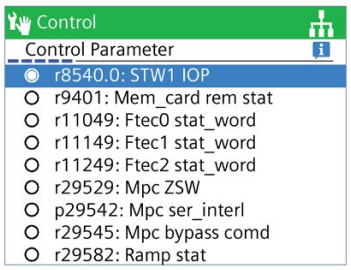
Select Control



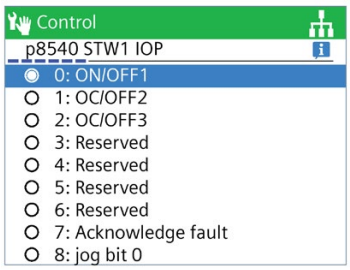
Select Custom Hand Mode



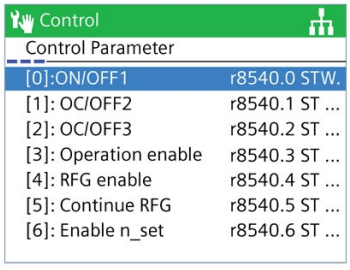
Select On: Custom Hand Mode



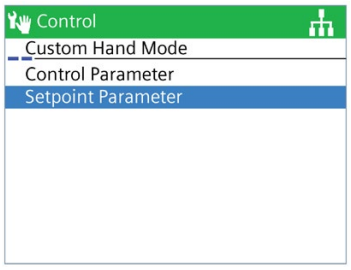
Select Control Parameter



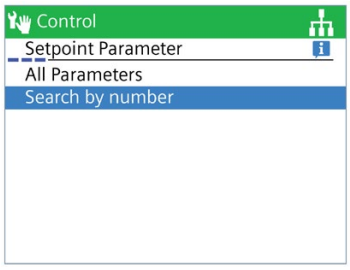
Press OK to search for parameter



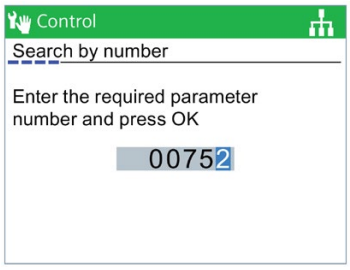
Select All parameters



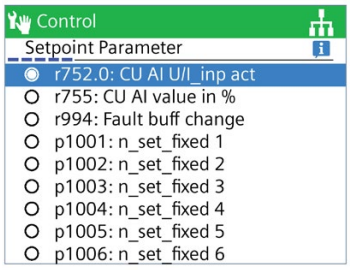
Select the required control parameter



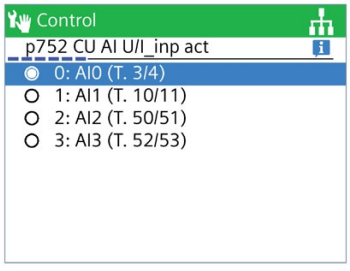
Select the required digital input



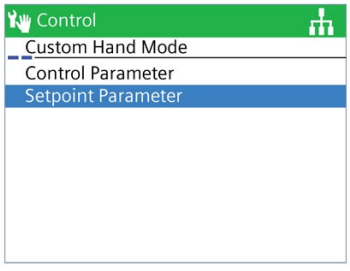
Select another control parameter or press ESC to return to the control parameter screen



Select Setpoint Parameter



Select search by number



Enter the required parameter number and press OK

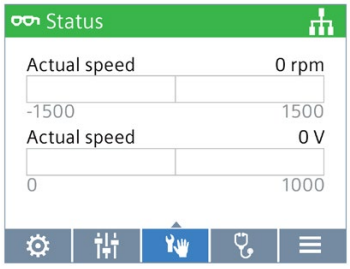
Select the setpoint parameter input

Select the required setpoint parameter input signal

Press ESC to finish editing and return to the Control Menu

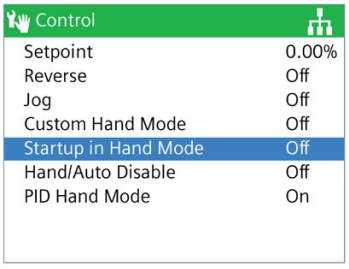
Once the setpoint signal input has been selected, the IOP-2 will return to the Custom Hand Mode screen then press ESC for >3 secs, to return to the status screen..

In this example, the converter is now setup to receive the ON/OFF1 command from p8540[0] and the speed setpoint from Analog Input 0 (AI0), from the controlling PLC.



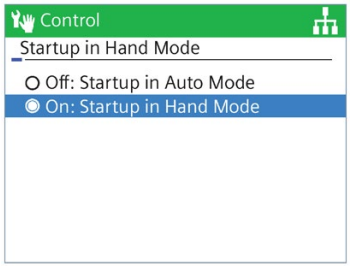
7.5 Startup in Hand mode

Overview

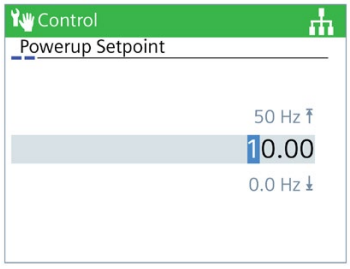


Startup in Hand mode allows the converter, under the control of the Intelligent Operator Panel (IOP-2), to startup in Hand mode automatically. The command source is then taken from the off and on buttons of the IOP-2.

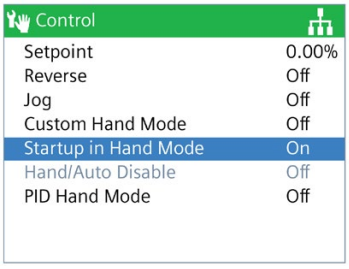
An example of setting up the Startup in Hand mode is given in the instructions below.



Startup in Hand mode example



Select Control



Select Startup in Hand Mode

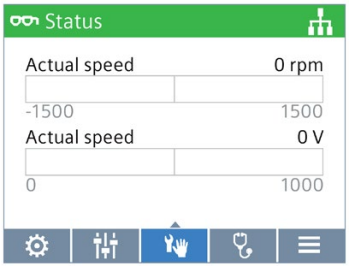
Select On: Startup in Hand Mode

Set the required Powerup Setpoint speed

Startup in Hand Mode is "On" and Hand/Auto Disable is not selectable

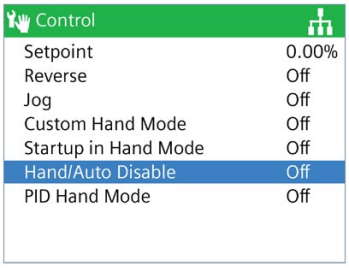
The IOP-2 will automatically return to the Control menu and show that "**Startup in Hand Mode**" is "**On**". "Hand/Auto Disable" is greyed out as it cannot be enabled when "Startup in Hand Mode" has been configured.

The converter, after a power-cycle will automatically startup in Hand mode, but the attached motor will not run until the run command is given by the buttons on the IOP-2.



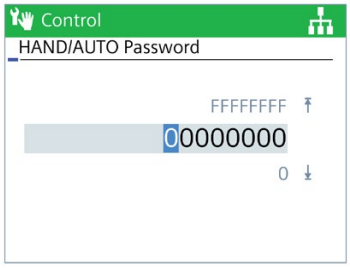
7.6 HAND/AUTO disable

Overview

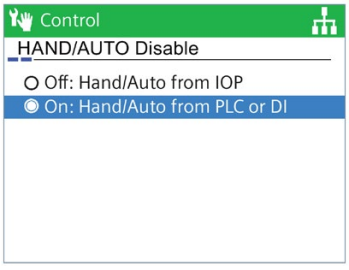


The HAND/AUTO disable function disables the HAND/AUTO key on the Intelligent Operator Panel (IOP-2) and pressing the key will not produce any action by the IOP-2.

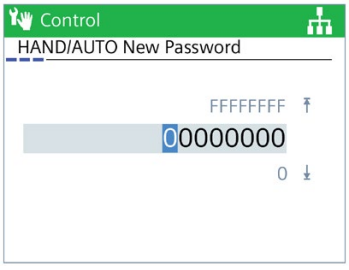
An example of setting up the Hand/Auto disable mode is given in the instructions below.



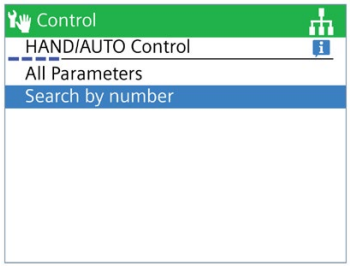
Setting up the HAND/AUTO disable function



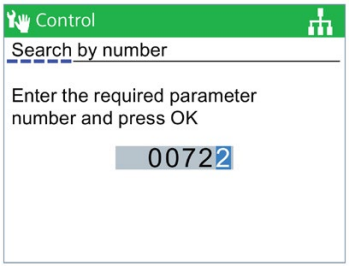
Select Control



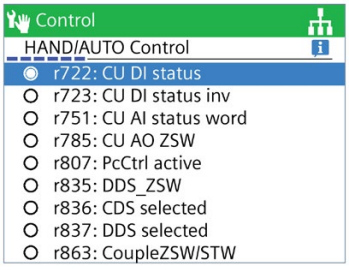
Select Hand/Auto Disable



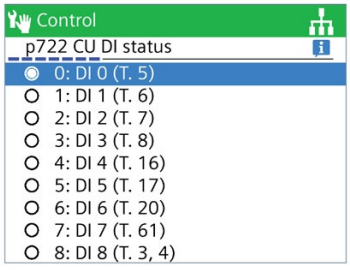
Enter password (default: 00000000)



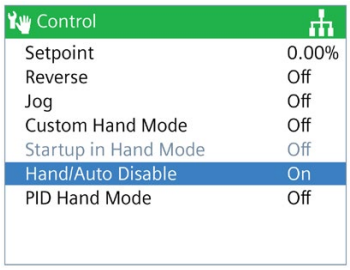
Select On: Hand/Auto from PLC or DI



Enter password again or create a new password



Select Search by number



Enter the signal source parameter

Select the signal source

Select the digital input source

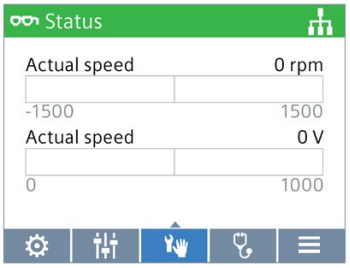
Hand/Auto is now enabled. Startup in Hand Mode cannot be selected

The HAND/AUTO button is now disabled and local control of the IOP-2 cannot be activated by the HAND/AUTO button. In this example, the converter is now setup to receive the HAND/AUTO command from Digital Input 0 (DI0).

Note

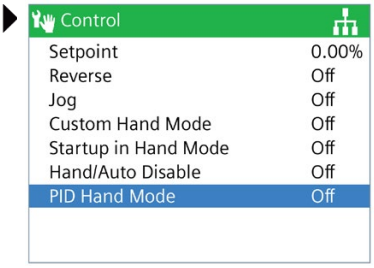
Power-cycle required to complete the HAND/AUTO disable function

When the HAND/AUTO disable function is initiated the function will not become active until a power-cycle of the IOP-2 has been performed. When the HAND/AUTO disable function is turned off, again, a power-cycle of the IOP-2 is required to complete the deactivation of the function.



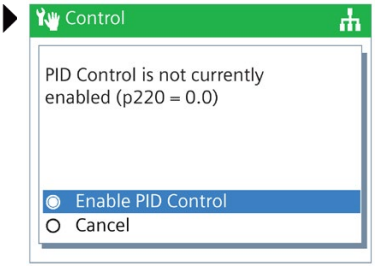
7.7 PID Hand Mode

Overview

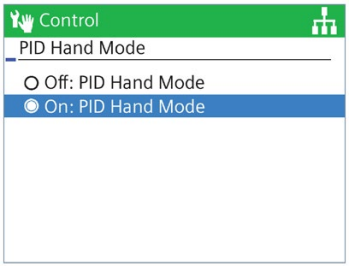


NOTICE
PID Hand Mode is only available for the SINAMICS G120X range of products Currently PID Hand Mode is only available for the SINAMICS G120X (firmware version 1.04 or later) range of products. If you are not using an SINAMICS G120X product, the PID Hand Mode will not be visible on your IOP-2.

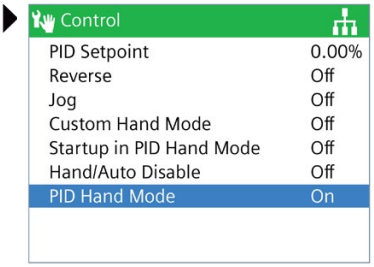
The PID Hand Mode of the IOP-2 allows the setting up of a precise process control utilizing the PID controller within the Converter that is driving a motor. The PID loop is used to maintain a process variable, such as the speed setpoint. The desired setpoint speed can be set using the IOP-2 PID Hand Mode function as shown in the example procedure.



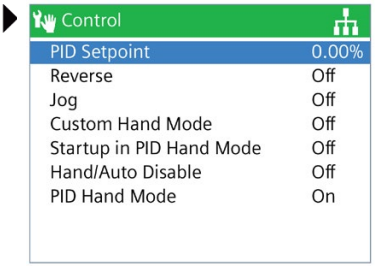
Setting up the PID Hand Mode example



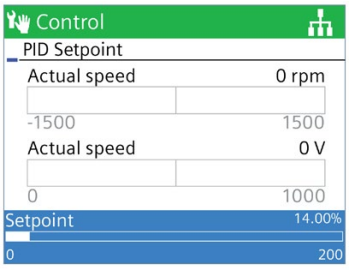
Select Control Menu



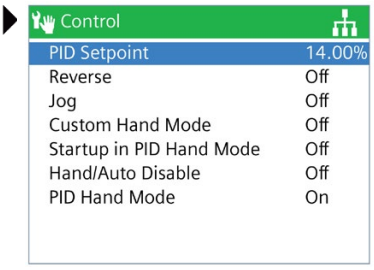
Select PID Hand Mode



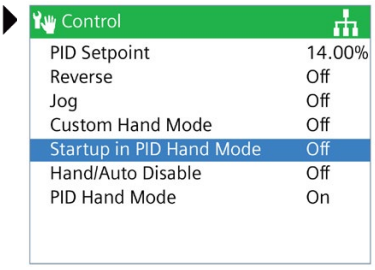
Select Enable PID Control



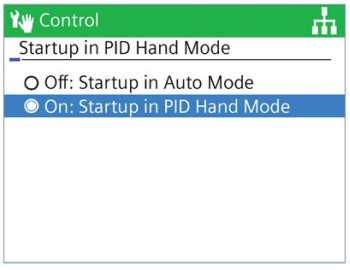
Select On: PID Hand Mode



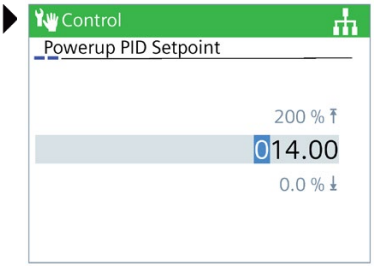
IOP-2 returns to Control Menu



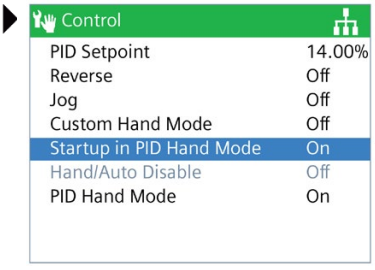
Select PID Setpoint



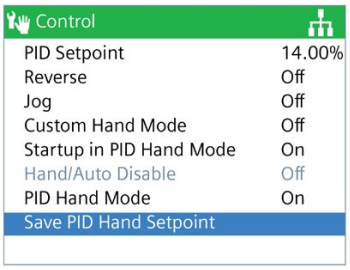
Set the required PID Setpoint



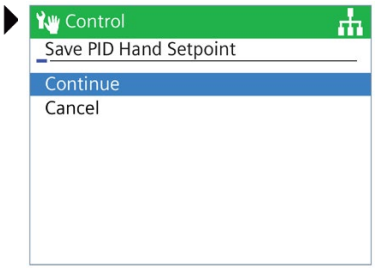
IOP-2 returns to Control Menu



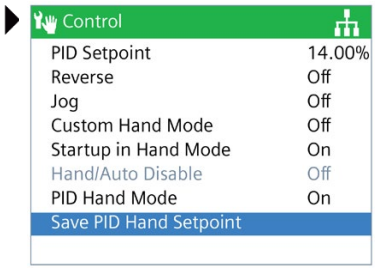
Select Startup in PID Hand Mode



Select On: Startup in PID Hand Mode



Set the required Powerup PID Setpoint



IOP-2 returns to Control Menu

Select save PID Hand Setpoint[1]

Select Continue

IOP-2 returns to the Control Menu

To cancel all PID Hand Mode functions, select PID Hand Mode and turn the function OFF. This will cancel all PID Setpoint functions, including Startup in PID Hand Mode.

[1]"Save PID Hand Setpoint" – This saves the current PID hand setpoint as the Startup in PID Hand setpoint. For example, if the customer has already set a Startup in PID Hand setpoint and has started up their drive and tweaked the setpoint from the PID setpoint screen, this option would save the tweaked value as the new Startup in PID Hand setpoint.

Menu 8

8.1 Menu overview

Overview

⚠ WARNING

Protection of project data files from unauthorized usage

Transportation of project data files have to be secured by technical means, for example, encrypted/signed emails, encrypted/signed USB-sticks etc., especially in the public internet.

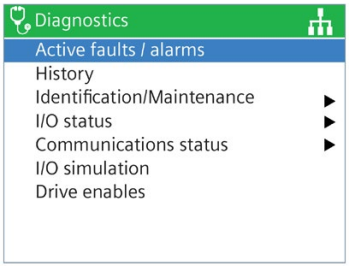
Project data files have to be stored with restricted access within the OEM/end customer area, for example, access restrictions to SharePoints, databases, etc. by user management with, for example, the use of credentials.

The "Menu" is selected from the five menu options at the bottom of the IOP-2 screen.

When the "Menu" option is selected the following functions are displayed:

- Setup
- Parameters
- Diagnostic
- Up/Download
- Support
- Extras

By sliding your finger around the Sensor Control Field or using the arrow keys, the required function can be highlighted. Pushing the OK confirms the selection and further sub-menus will be displayed. Pressing ESC once will return the IOP-2 to the previous screen, a longer press will return the display to the "Status" screen.

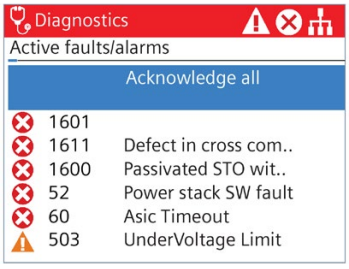


For information on the IOP-2 compatibility, see  Introduction (Page 11).

8.2 Diagnostics

Diagnostics menu

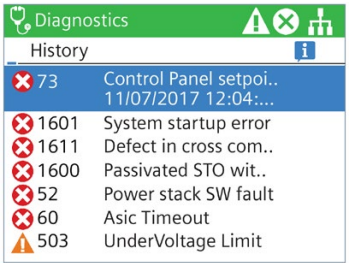
When the diagnostic function is selected the following options are presented:



- Active faults/alarms
- History
- Identification/Maintenance
- I/O status
- Communications status
- I/O simulation
- Drive enables

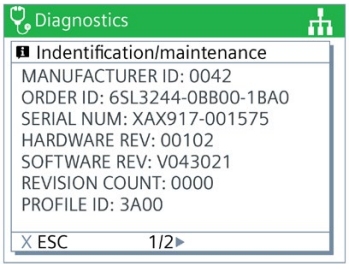
Active faults/alarms

When this option is selected the screen will display any active faults and alarms that have not yet been acknowledged.



Each fault and alarm can be selected and by pressing the INFO key or the OK key, an explanation of the fault or alarm will be displayed.

History

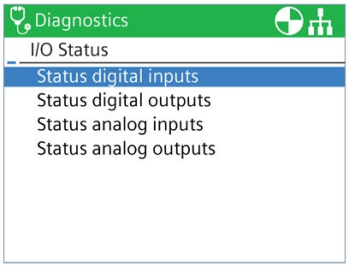


When this option is selected the screen will display a list of all previous faults and alarms with the time that they occurred.

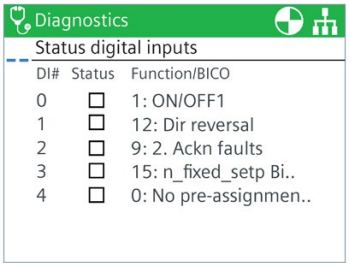
Each fault and alarm can be selected and by pressing the INFO key or the OK key, an explanation of the fault or alarm will be displayed.

Identification/Maintenance

Displays specific technical information regarding the Control Unit and Power Module to which the IOP-2 is attached will be displayed. The actual information displayed depends on the type of Control Unit and Power Module to which the IOP-2 is connected.



I/O status

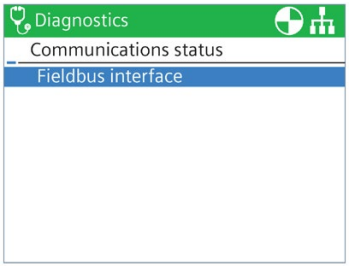


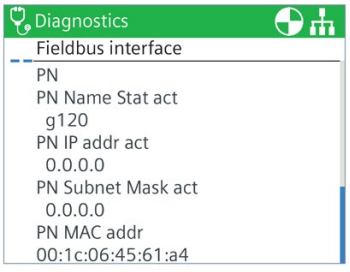
This option displays a list of the digital and analog inputs and outputs of the converter and their current status.

This is an information screen and cannot be changed.

Pressing ESC will return the display to the previous menu.

In the example shown opposite, the status of the digital inputs are displayed.

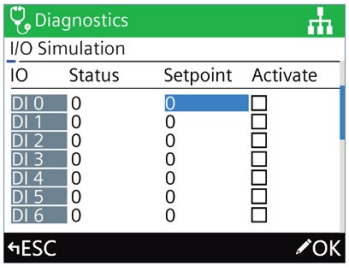




Communications status

This option displays the status of the fieldbus interface and the details of the settings for the data exchange, for example status words and control word lengths.

In the example shown opposite, the status of the fieldbus communications is shown.



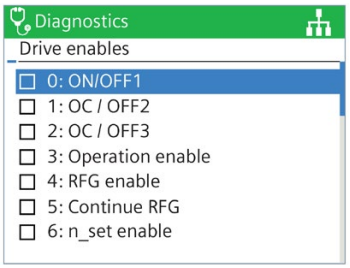
I/O simulation

⚠ WARNING

Loss of control of the converter

- If the converter is started using the I/O simulation and the IOP-2 is removed from the converter it will not be possible to stop the converter running the motor. If the I/O simulation is activated, then only the I/O simulation can be used to stop the converter.
- The simulation is performed in the converter itself and is also retained when the connection with the IOP-2 is interrupted. Therefore, there must be an emergency stop circuit in the hardware. The appropriate measures must be taken by the user.
- Parameter connections for the Analog Outputs and Digital Outputs will be overwritten by the I/O simulation. These parameters should be checked to ensure they have been reinstated after leaving the I/O simulation.

The IOP-2 simulation screen allows digital and analog I/Os to be simulated without the requirement for external signals. These features are of great benefit during commissioning and fault finding, as the user can quickly simulate a situation without using wires, tools and external equipment.



For example:

- A digital input can be made high without any wires in the terminals.
- An analog input or output can be driven to any value without any wires in the terminals.
- A simulation can be overridden and made high.

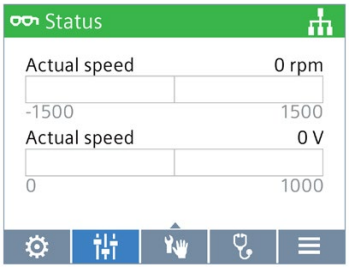
The screen presents the following options:

- I/O - all I/Os can be simulated individually.
- Status - this indicates the real-time status of the input or output.
- Setpoint - this column displays the editable value that will be simulated.
- Activate - this column will activate / deactivate the simulation for the corresponding I/O.

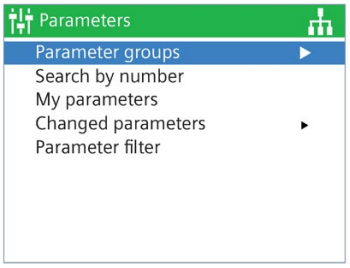
Drive enables

The drive enables screen displays a list of all the current enabling signals for the converter. If the enable signal is present and active it will be selected ■. If the enable signal is not present and is not active it will be unselected ☐.

This screen is read-only and is for information purposes only.



8.3 Parameters

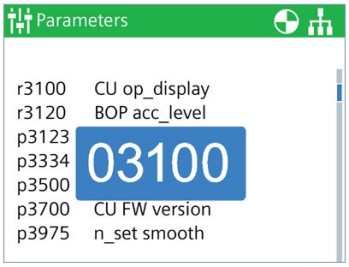


Parameter menu

For information on IOP-2 compatibility, see Introduction (Page 11).

The parameter menu allows the user extensive functionality and access to all the converter parameters. When this option is selected the user is given the opportunity to perform parameter orientated functions grouped in the following manner:

- Parameter groups
- Search by number
- My parameters
- Changed parameters
- Parameter filter



Fast scroll

When searching through any large parameter list, the Fast scroll function will automatically start when the user slides their finger around the Sensor Control Field in a fast motion.

A large blue box will appear on the screen, showing the current parameter number, with each scroll the number will increase by 1000. When the user stops scrolling, the parameter number nearest to the number displayed will be selected.

Parameter groups

All parameters

This option allows the user access to the individual parameters of the converter. The default filter is "Standard" which allows the user access to the most frequently used parameters.

Commissioning

This screen displays a complete listing of all the parameters required for quick commissioning. The parameters are listed in numerical order and can be accessed to either confirm the set values or modified should there be a need to fine tune the application or correct any errors in the parameter values.

Commissioning interface

Allows the communications settings to be configured for the commissioning interface.

Saving & reset

This option allows the user access to all the parameters regarding the saving and reset functions of the converter. Each parameter displays it's currently set value and these can be modified if required.

System information

This screen displays all the parameters that contain system information regarding the converter. The majority of these parameters are read-only and are for information purposes only.

Basic settings

Displays the effective Drive Data Set (DDS). Each basic setting can be selected and modified if necessary.

Inputs/outputs

This option allows access to all the available parameters to configure the digital and analog I/Os.

The user can navigate through the various inputs and outputs to see the current configuration of the inputs and outputs and, if necessary access the parameters directly to modify their values.

Setpoint channels

This option allows the user to display and modify the setpoint parameters.

Operating mode

This option allows the user to display and modify the operating mode parameters.

Drive functions

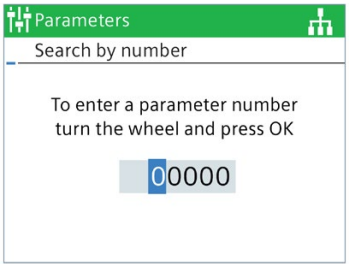
This option allows the user direct access to the parameters regarding the drive functions.

It is important that if any parameters concerning the above mentioned functions are to be modified, that the converter/motor system is in a safe state prior to the parameter changes.

Communications

This option allows the user direct access to the parameters that control and configure the communications fieldbus of the converter. The parameters can be viewed to confirm their settings and values, they can also be modified if they are not read-only parameters.

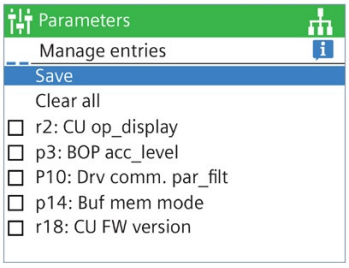
Diagnostics



This option allows the user direct access to the parameters that monitor the state of the system.

All the parameters under these groupings are read-only and cannot be modified.

Search by number

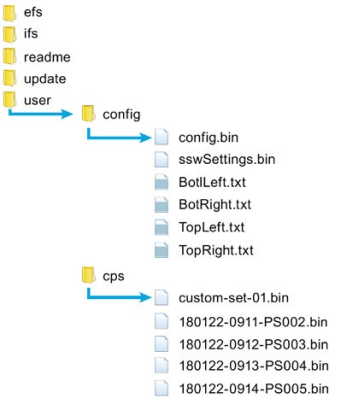


This option allows the user to search for a specific parameter number.

If the parameter number does not exist, the screen will display a choice between "Select a new number" or "Go to the nearest parameter number".

My parameters

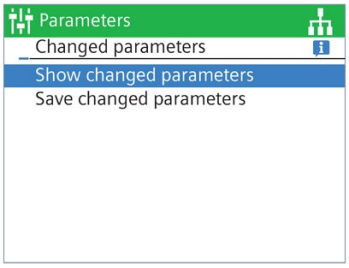
This option allows the user to select the parameters that they wish to list. The user is presented with a list of parameters that can be selected. Once selected - only those parameters are displayed when the "My Parameters" option is selected. There are additional options that allow the user to manage their list of parameters.



Copying the "My Parameters" list to another IOP-2

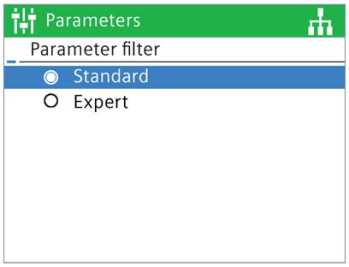
When a "My Parameters" list is created, it saves the lists in the **config.bin** file on the IOP-2.

To copy the config.bin, the following procedure should be performed:



1. Connect the IOP-2 via the USB to your PC (the IOP-2 will enter "Mass Storage" mode.
2. Navigate to the **config** folder (shown in the screenshot).
3. Copy the **config.bin** file to a suitable location on your PC.
4. Disconnect the IOP-2 and connect a new IOP-2 and copy the **config.bin** file to the new IOP-2.

Changed parameters



When the "Changed parameters" option is selected the IOP-2 will search the converter parameter list for all the parameters that have had their values changed from the factory default settings.

The list of changed parameters can either be displayed on the IOP-2 screen or it can be saved to a ".CSV" file in the "\user\cps\" folder on the IOP-2.

Parameter filter

This option allows the user to select the parameter access level. Standard is the default access level, which gives the user access to the most frequently used parameters. Expert level gives access to all available parameters.

8.4 Protecting the converter settings

Overview

Once the converter has been fully commissioned for the required application, it is possible to protect the final settings with one of the three different protection modes:

- Know-how protection - Allows the settings of the converter to be protected against unauthorized viewing or changes. It can be configured in a number of different ways, which will be explained in the relevant section in this chapter.
- Absolute Know-protection - Allows the settings of the converter to be permanently protected against unauthorized viewing or changes. Once configured you can only gain access to the settings by performing a drive factory reset; causing all settings to be returned to their factory default setting.
- Write protection - Prevents accidental changes to the settings of the converter.

Know-how protection

CAUTION

Know-how protection should be enabled last

Before enabling the Know-how protection function, all commissioning and configuration of the converter must first be completed. If Know-how protection is enabled prior to the completion of all the necessary commissioning and configuration steps, it may prohibit the completion of the commissioning and configuration process.

Know-how protection is designed to prevent unauthorized viewing or changes to the parameter settings of the converter. It can also be configured to allow or prohibit the copying of the parameters from one converter to another converter.

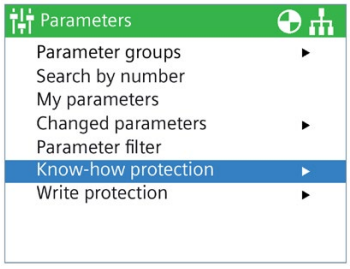
There are four different types of protection available in the configuration menu:

- **Know-how protection without copy protection** - You can transfer the converter settings to other converter using a memory card (MMC), If no selection is made in the 'Configure' screen, then 'Know-how protection without copy protection' is the default method that will be implemented.
- **Know-how protection with basic copy protection** - After replacing a converter, to be able to operate the new converter with the settings of the replaced converter without knowing the password, the memory card must be inserted in the new converter.
- **Know-how protection with extended copy protection** - It is not possible to insert and use the memory card in another converter without knowing the password.
- **Permit trace** - Allows the diagnostic trace and measurement functions to be performed on the converter. This option will only appear if your converter has trace function capability.

When know-how protection is active the following protections are provided:

- The values and setting of parameters are invisible.
- Read-only (r) parameters remain visible.
- In addition, you can define an exception list which will allow parameters to be viewed or changed by the user.
- Adjustable parameters cannot be changed using any of the commissioning tools
- Locked functions:
  - Automatic controller optimization
  - Stationary or rotating measurement of the motor data identification
  - Deleting the alarm history and the fault history
  - Generating acceptance documents for safety functions
- Executable functions:
  - Restoring factory settings
  - Acknowledge faults
  - Displaying faults, alarms, fault history and alarm history
  - Reading out the diagnostic buffer

When know-how protection is active, support can only be provided (from Technical Support) after prior agreement from the machine manufacturer (OEM).

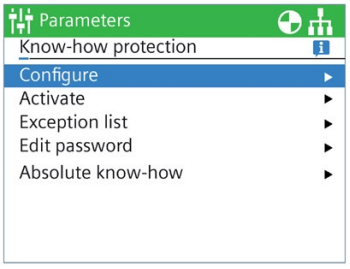


⚠CAUTION

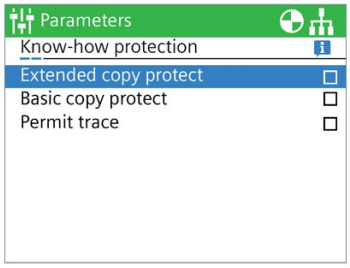
Copy protection will not work without the correct memory card

If the copy protection functions are selected/enabled and the correct type of memory card is not inserted into the converter, the copy protection function will fail.

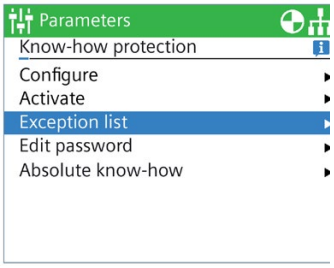
To use copy protection the following memory card must be used: **Siemens MMC card, order number: 6SL3054-4AG00-2AA0**



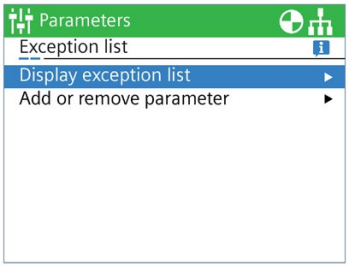
Example of enabling Know-how protection



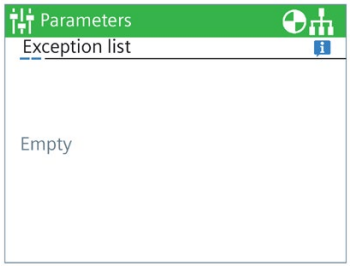
Select 'Know-how protection'



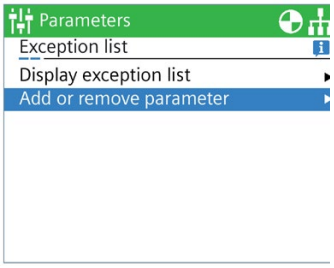
Password warning is displayed. Press OK to continue



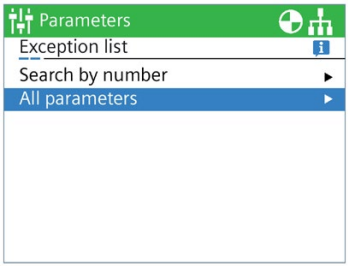
Select 'Configure'



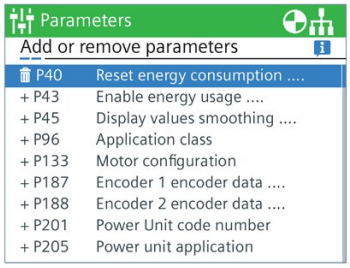
Select the required functions. Press OK to continue



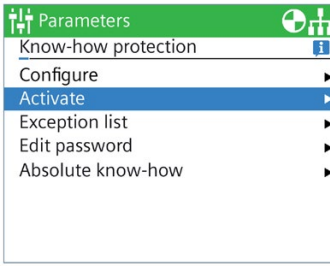
Select 'Exception list'

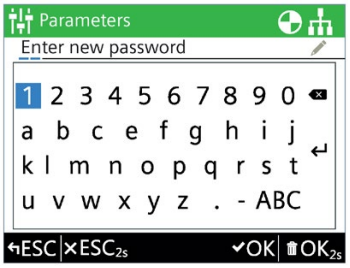


Select 'Display exception list'



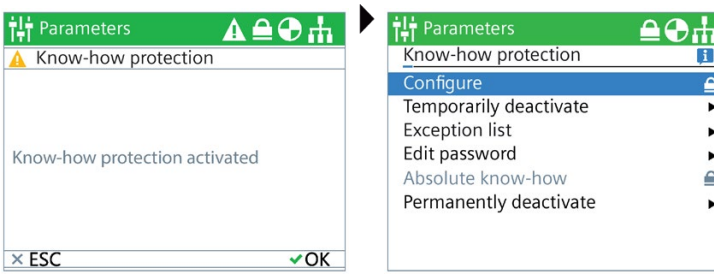
Parameters contained in the exception list are displayed. Press ESC





Select 'Add or remove parameter'

Select 'All parameters'



Select required parameters and add or delete by pressing OK

Select 'Activate'

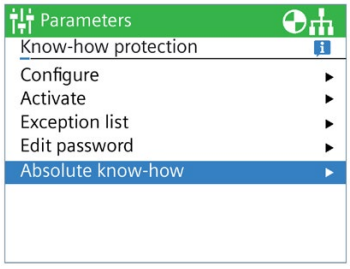
Enter a new password and then confirm password

Know-how protection is now activated. Press OK

Menu now contains additional options that can be selected.

Temporarily deactivate and Permanently deactivate Know-how protection

Once Know-how protection has been activated two additional options appear in the menu, these are:

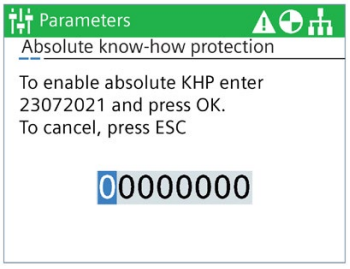


- Temporarily deactivate - This allows the Know-how protection to be deactivated, for example, a parameter change is required. When the converter is restarted, Know-how protection will be fully activated.
- Permanently deactivate - This allows the Know-how protection to be deactivated as if know-how protection was never active.

If you select 'Temporarily deactivate' the password must be entered before deactivation can occur. If you then select 'Permanently deactivate' the password is not required. If you only select 'Permanently deactivate' the password is required.

Absolute Know-how protection

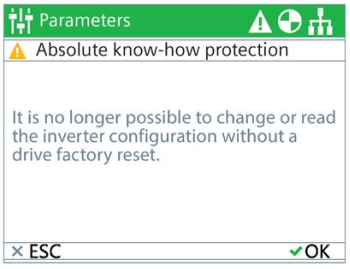
Absolute Know-protection allows the settings of the converter to be permanently protected against unauthorized viewing or changes. Once configured you can only gain access to the setting by performing a drive factory reset; causing all settings to be returned to their factory default setting.



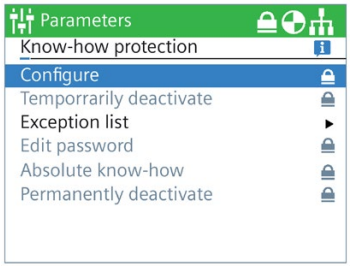
Example of enabling Absolute Know-how protection

Select 'Absolute Know-how'

Absolute KHP warning is displayed

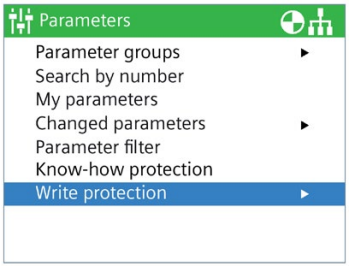


Enter 23072021 to confirm activation

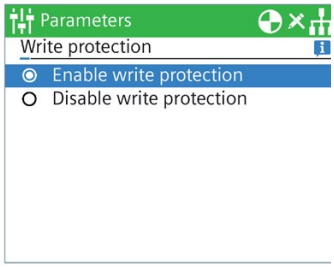


Absolute KHP warning is displayed. Press OK to continue

Enter password and confirm password

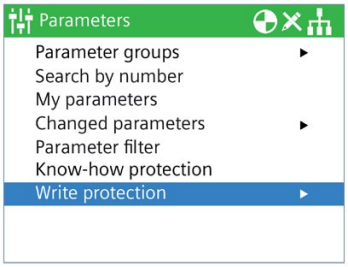


Absolute KHP notice is displayed. Press OK to continue



KHP menu is now displayed with the locked functions greyed out.

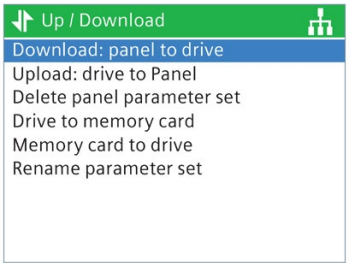
Write protection



Write protection, when enabled, stops all writeable parameters from being changed. All parameters can still be viewed and no password is required to activate or deactivate this function. Write protection can be turned off by selecting 'Disable write protection'.

Select 'Write Protection'

Select 'Enable write protection' and press ESC



Write protection is activated and the write protect symbol is displayed

8.5 Up/Download

Overview

The upload and download options allow the user to save parameter sets to the various memory storage that is available to the system.

For further information on saving, copying, cloning and creating custom parameter sets, see Customer parameter sets (Page 71).

⚠WARNING

Unexpected behavior of converter

During the transfer of data to and from the converter, it is essential that the transfer is not interrupted and the process is allowed to be completed. If the process is interrupted, it is possible that the data could be corrupted and the system may behave in an unexpected manner. Should an interruption of the transfer process occur, then it is highly recommended that a factory reset of the converter is performed prior to any further parameterization or giving the converter control of the application.

Fault screen during up/download

If during the up/download process a fault occurs and the fault screen is displayed, press ESC if you wish the up/download to be continued. If OK is pressed, it will cancel the up/download process.

Safety Parameters

If safety parameters are to be downloaded a function test of the safety functions has to be performed. Please refer to the "Safety Integrated Function Manual" which can be found at the hyperlink below:

Safety Integrated Function Manual
(http://support.automation.siemens.com/WW/view/en/50736819)

Using the IOP-2

The IOP-2 must be handled with particular care for all SINAMICS devices that use an IOP-2 so that no malicious software or erroneous parameterizations are spread between different commissioning PCs or inverters.

⚠WARNING

Risk of death due to software manipulation when using exchangeable storage media

Storing files onto exchangeable storage media amounts to an increased risk of infection of the commissioning PCs, e.g. with viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect files stored on exchangeable storage media from malicious software using appropriate protection measures, e.g. virus scanners.

⚠WARNING

Risk of death due to software manipulation when using exchangeable storage media

Storing the parameterization (incl. Safety Integrated parameterization) on exchangeable storage media carries the risk that the original parameterization (with Safety Integrated) will be overwritten, for example, by the IOP-2 of another drive without Safety Integrated. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Ensure that only the IOP-2 that belongs to the respective converter is used.
- Ensure that only trained or authorized personnel have access to the enclosures, cabinets or electrical equipment rooms.

NOTICE

Only changed parameters will be copied

When using the 'Panel to drive' or the 'Drive to panel' functions of the IOP-2, only those parameters that have been changed/modified will be copied. Parameters that are set at their default settings will not be copied.

Command Line Interface (CLI)

Overview

The CLI function allows the user to create a custom parameter listing and download the listing directly to the drive using the IOP-2 download process.

The CLI file can be created using a suitable text editor, for example, the Windows Notepad application. The format of the CLI is as follows:

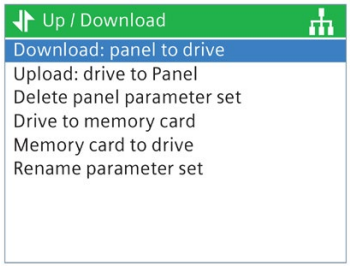
wrp <number> <index> <value>

Where wrp is the command to write a parameter, followed by the parameter number, the parameter index and the parameter value. For example, to write a parameter to the drive to set the Ramp-up time to 5 seconds, the following format would be used:

wrp 1120 0 5.0

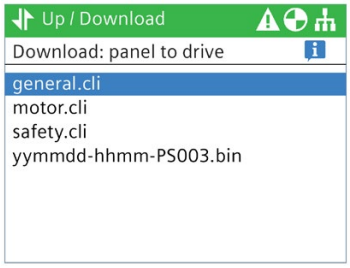
Each parameter in the listing must be on its own line, with no excess spaces between the individual components of the command line, followed by a return.

Once the file has been created, the file should be stored on the IOP-2 in the "*user/cps*" folder with the file extension cli, for example, ramp.cli.



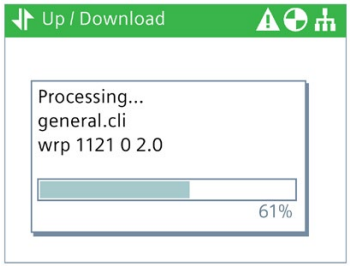
The naming of the file follows the normal conventions and is restricted to only the ASCII character set, but it is suggested that the file name should be in lower case with only numbers and letters without spaces, followed by the correct file extension.

List of commands

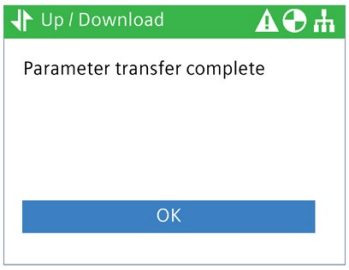


Command	Format	Example	Remarks
Write a parameter	wrp <number> <index> <value>	wrp 1120 0 5.0	Set P1120 to 5 seconds
Read a parameter	rdpw <param> <index> <value> <timeout ms>	rdpw 10 0 0 5000	Wait 5 seconds for p10 to go back to 0
Read a BICO parameter	rdpw <param> <index> <param> <index> < timeout ms>	rdpw 840 0 722 5 1	Allows 1 ms to confirm the OFF1 signal is set to Digital Input 5
Write a BICO parameter	wrp <param> <index> <param> <index/bit>	wrp 840 0 722 0	Set on/off to Digital Input 0
Write a BICO parameter 1 or 0	wrp <param> <index> <1/0>	wrp 1070 0 1 1	Set signal source is set 100%
To set parameter index bit high or low	<wrpbit><param><index><bit><0/1>	wrpbit 108 0 18 1	Activate Free Function Blocks
Comment	rem <text>	rem This is a comment line	Only one comment on each line

Downloading procedure

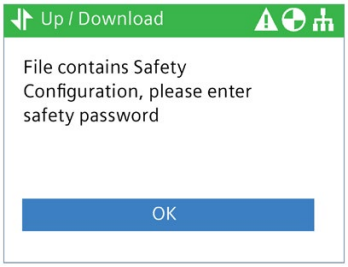


1. Navigate to the Up/Download screen and select "Download: panel to drive".

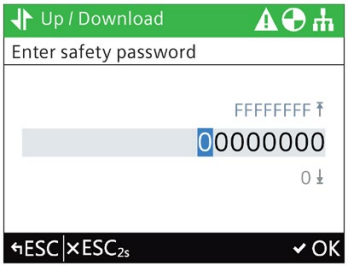


2. Select the CLI file to be downloaded to the drive.

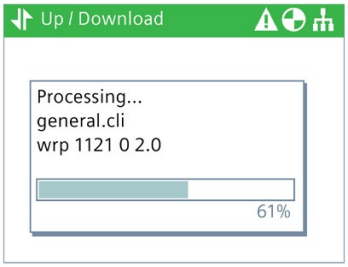
3. A progress screen will be displayed, indicating the status of the download.



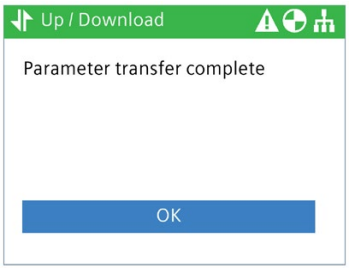
4. When the download is completed, the "Parameter transfer completed" will be displayed. Press OK to return to the main download screen.



Safety parameter download

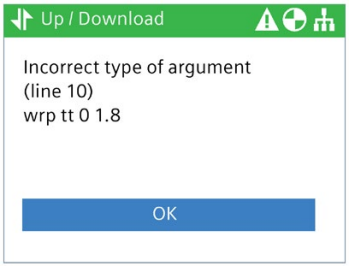


1. If Safety parameters are contained within the CLI file, the user will be prompted to enter the safety password.

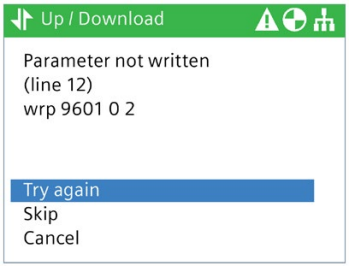


2. Enter the safety password and press OK.
   If the correct password has not been entered, the download process will be stopped.

3. A progress screen will be displayed, indicating the status of the download.

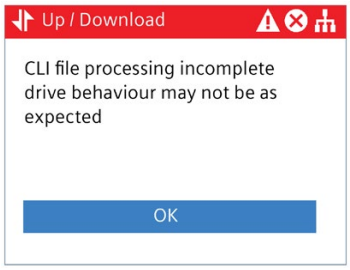


4. When the download is completed, the "Parameter transfer completed" with be displayed.
   Press OK to return to the main download screen.



Error messages

> **WARNING**
>
> **Unexpected behavior**
>
> If the download process is canceled for any reason, all parameters that have been overwritten by the download process will remain changed. The drive may be in an unknown state and its behavior may not be as expected. A factory reset should be performed to ensure that the drive is in a known, safe state.



1. **Incorrect type of argument**
   The format of the parameter in the file does not conform to the required format.
   Press OK will return the IOP-2 to the download screen.
   Remedy
   Edit the CLI file and correct the formatting of the parameter, in this case, delete the "tt" and replace it with the correct parameter number then restart the download process.

2. **Parameter not written**
   The parameter could not be written to the drive because the parameter was not set to the correct value or range of the index.
   The user has three options:
   Try again: The IOP-2 will attempt to write the parameter to the drive again, but if it is a restricted parameter it will fail again. If successfully written, the download process will continue until it has completed.
   Skip: Ignore the parameter and do not attempt to write it to the drive. The download will continue until it is completed.
   Cancel: The download process will be canceled and the IOP-2 will return to the normal download screen.

3. The download of the parameters to the drive was not completed successfully.
   Press OK to return to the normal download screen.

8.6 Support

Overview

The Support function on the IOP-2 allows the user to access Siemens Customer Support assistance and information in a number of ways depending upon the individual requirements.

Industry Online Support

The Online Support option gives the user the ability to gather technical information about the connected whole system, or an individual component of the system, such as Order number, Serial number, firmware version, active alarms.

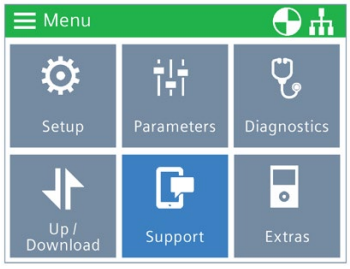
When the generated 2D matrix code is scanned (in the example below, using the Siemens app) the user is presented with all the available technical information for their device, for example, Serial numbers, Version numbers, FAQs, Manuals, Certificates, Product Notes, Downloads and Application examples, plus the ability to initiate a Technical Support request.

Local Siemens Partner Support

This option takes the user to the Siemens online Industrial automation help site.

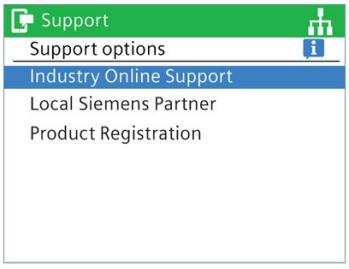
After completing some very simple dropdown menu selections, the contact details of the Local Siemens Partner for your region is displayed.

Download the Siemens App



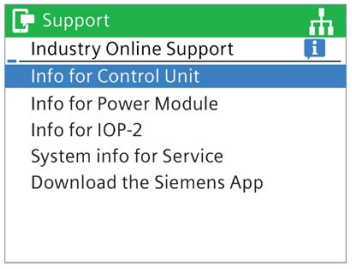
You can download the necessary Siemens app using the menu item "Download the Siemens App" which will take you to the appropriate Siemens site that will direct the user to the correct site for either Android or iPhone Smartphone platforms.

The Siemens mobile app site is given at the link below:

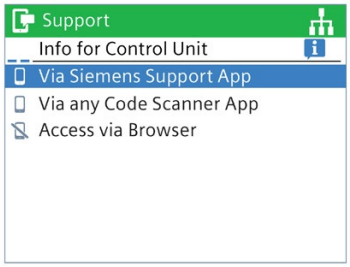


Siemens mobile app (https://support.industry.siemens.com/cs/ww/en/sc/2067)

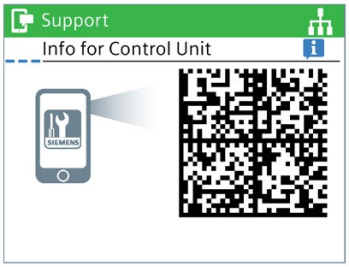
Industry Online Support example



A brief example of the various options is shown below:



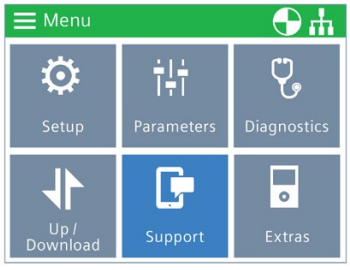
Select "Support" option from menu



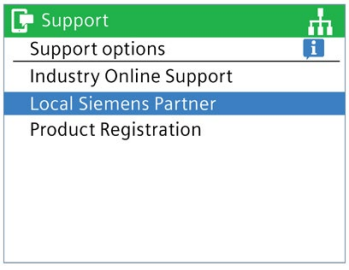
Select "Industry Online Support"

Select the information you wish to provide

Select the device used to scan the code



Scan the code

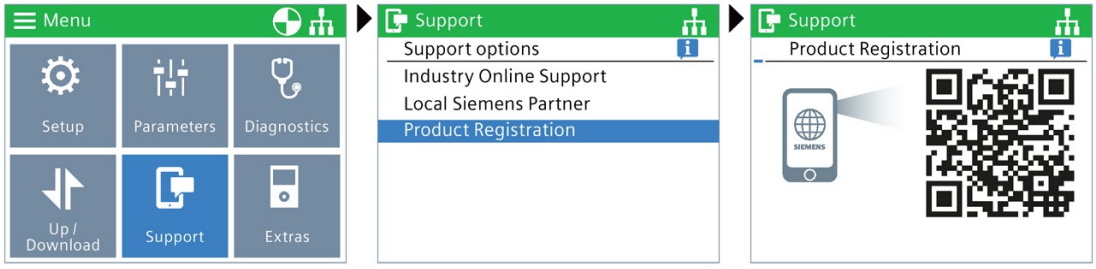


Once scanned with the Siemens app, the user is presented with the product information for their device.

The product information includes, Serial numbers, Version numbers, FAQs, Manuals, Certificates, Product Notes, Downloads and Application examples, plus the ability to initiate a Technical Support request.

Local Siemens Partner example

Select "Support" option from menu



Select "Local Siemens Partner"

Scan the QR code

When the QR code is scanned, the user is taken to the Siemens Industrial support site. After selecting the correct country, region, the user is given the contact details of their Local Service Partner.

Product Registration example

Select "Support" option from menu

Select "Product Registration"

Scan the QR code

When the QR code is scanned, the user is taken to the Siemens Industrial support site, where the registration information for your product can be entered and submitted to complete the registration process.

8.7 Customer parameter sets

Overview

Custom parameter sets can now be created and stored on the Intelligent Operator Panel (IOP-2).

The IOP-2 can store up to 255 parameter sets with customized names.

The steps to create and store a custom parameter set on the IOP-2 is given in the procedure outlined below.

Note

Custom parameter set filename limitations

Although the filename for a custom parameter set can be up to 96 characters in length, if all the filenames are 96 characters long, it will eventually limit the number of parameter sets that can be saved on the IOP-2.

This is due to the specialized nature of the IOP-2's internal memory system.

Standard parameter set access

New standard parameter sets can be uploaded from the drive to the IOP-2, these files will be stored in the "user/cps" folder on the IOP-2.

Parameter set naming convention

The IOP-2 automatically names the uploaded parameter sets using the following naming convention:

yymmdd-hhmm-PS???, where ??? is the sequential parameter set number.

When the IOP-2 is connected to a Control Unit with a Real-Time Clock (RTC), it will display the parameter set filename with the current time and date stored on the IOP-2, for example, 180125-1126-PS001.

When the IOP-2 is connected to a Control Unit without a RTC, it will display the parameter set filename as yymmdd-hhmm-PS001, so only the parameter set number will be changed.

Deletion of characters or filename

When editing the filename with the on-screen keyboard the following actions should be noted:

- When the name is displayed, typing any character will append the character to the filename automatically.
- When the filename is first displayed, the whole filename can be deleted by a two second press of the OK button.
- If individual characters need to be deleted, then use the on-screen keyboard backspace icon.

Using the IOP-2

The IOP-2 must be handled with particular care for all SINAMICS devices that use an IOP-2 so that no malicious software or erroneous parameterizations are spread between different commissioning PCs or inverters.

WARNING

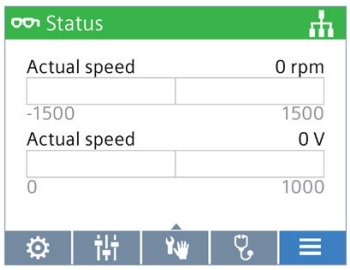
Risk of death due to software manipulation when using exchangeable storage media

Storing files onto exchangeable storage media amounts to an increased risk of infection of the commissioning PCs, e.g. with viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect files stored on exchangeable storage media from malicious software using appropriate protection measures, e.g. virus scanners.

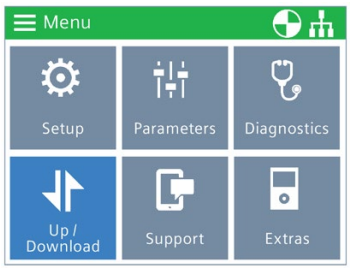
WARNING

Risk of death due to software manipulation when using exchangeable storage media



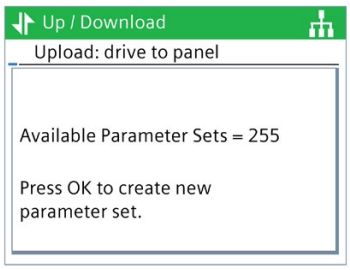
Storing the parameterization (incl. Safety Integrated parameterization) on exchangeable storage media carries the risk that the original parameterization (with Safety Integrated) will be overwritten, for example, by the IOP-2 of another drive without Safety Integrated. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Ensure that only the IOP-2 that belongs to the respective converter is used.
- Ensure that only trained or authorized personnel have access to the enclosures, cabinets or electrical equipment rooms.

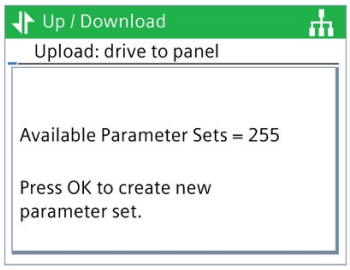


Creating a custom parameter set

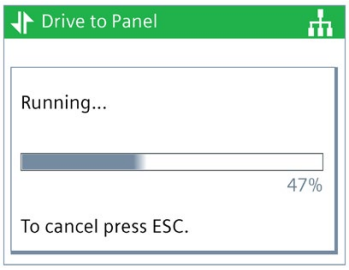
This procedure makes the following assumptions:



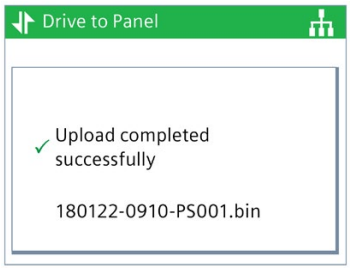
- The user is conversant with the copying and renaming of files in the Windows environment
- The user is conversant with commissioning the converter
- The user has already changed all the relevant parameters for their application



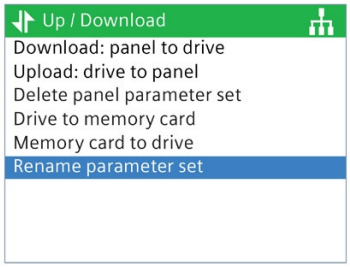
Select Menu



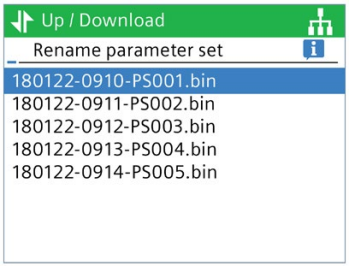
Select Up/Download



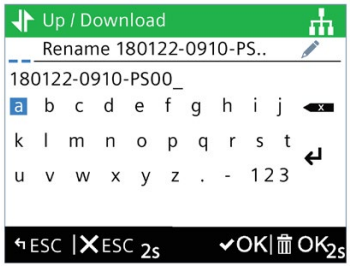
Select Upload: Drive to Panel



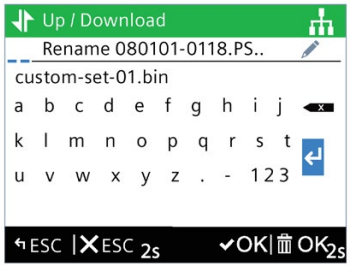
The number of available parameter sets are displayed



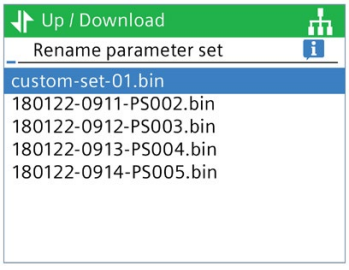
The drive parameter settings are uploaded



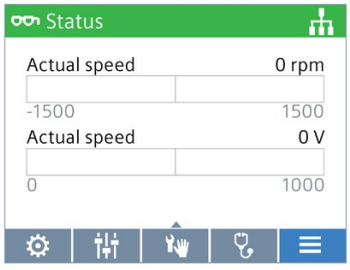
The filename of the parameter set is displayed



Select rename parameter set



Select the parameter set to be renamed



Rename the file using on-screen keyboard

Select return icon to accept new name

The new file name is displayed

Long press of ESC returns user to Status Screen

Copying IOP-2 parameter sets and configuration data

WARNING

Risk of death due to software manipulation when using exchangeable storage media

Storing files onto exchangeable storage media amounts to an increased risk of infection of the commissioning PCs, e.g. with viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect files stored on exchangeable storage media from malicious software using appropriate protection measures, e.g. virus scanners.

WARNING

Risk of death due to software manipulation when using exchangeable storage media

Storing the parameterization (incl. Safety Integrated parameterization) on exchangeable storage media carries the risk that the original parameterization (with Safety Integrated) will be overwritten, for example, by the IOP-2 of another drive without Safety Integrated. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Ensure that only the IOP-2 that belongs to the respective converter is used.
- Ensure that only trained or authorized personnel have access to the enclosures, cabinets or electrical equipment rooms.

The IOP-2 file structure has been designed to allow the easy copying of parameter sets and other configuration data from one IOP-2 to another by using the Windows File Explorer function.

This is accomplished by simply copying the "user" folder from the IOP-2 to any number of other IOP-2 operator panels. The IOP-2 file structure is shown below.

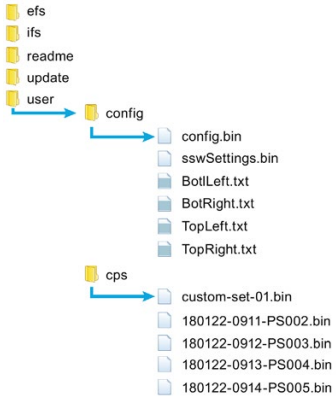


Figure 8-1 File structure of the IOP2

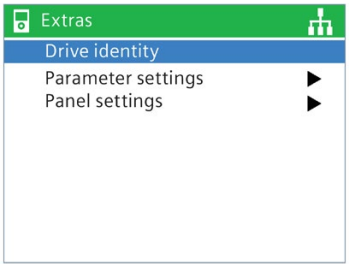
The "config" folder contains all the settings that have been changed on the IOP-2 itself, for example, the language settings, lighting duration and the date/time settings, etc.

The "cps" folder contains all the downloaded or customised parameters sets and the text files used for customising the screen labels when using the Screen Wizard.

Copying specific parameter sets

When you have saved a number of parameter sets to an IOP-2, it is possible to copy your saved parameter sets to another IOP-2 using the simple process outlined below.

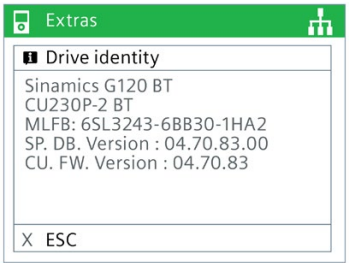
1. Connect the IOP-2 via the USB connector to a PC.
2. The IOP-2 will enter the "Mass Storage Device" Mode.
3. On the PC, navigate to the "user/cps" folder.
4. Select the parameter sets you require and save them to a new folder on the local drive of the PC.



5. Disconnect the IOP-2 from the PC.
6. Connect another IOP-2 and copy the saved parameter sets to the "user/cps" on the new IOP-2.

This procedure can be repeated for any number of IOP-2s.

8.8 Extras Menu

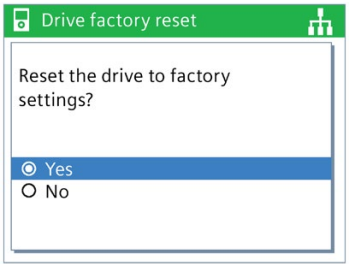


Overview

The Extras menu presents a number of options for the configuration of the IOP-2, these are explained in this section.

Drive identity

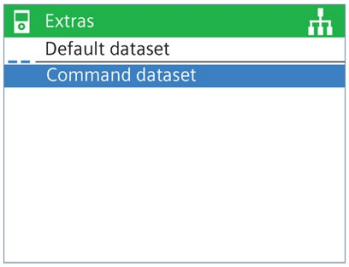
This option allows the user to display the technical details of the components that comprise the converter system. This includes the details of the Control Unit and Power Module. This is a read-only screen and cannot be modified.



Parameter settings

Drive factory reset

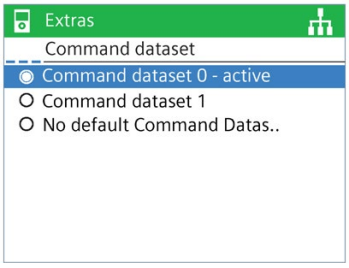
There are two factory reset options:



Factory reset - This option resets all parameters to their factory default settings. Any safety parameters that have been modified will not be reset.

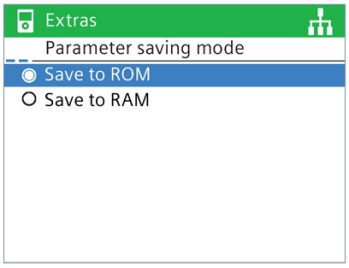
Safety factory reset - This option resets all the safety parameters back to the factory default settings. No other parameters will be changed.

Default dataset



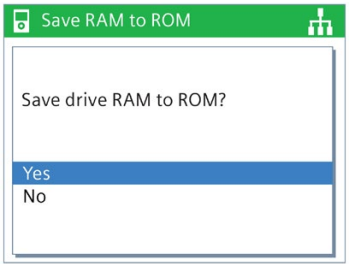
This option allows the user to determine which is the default command dataset when viewing or selecting a new default dataset from the options provided.

Note:



Some applications require that both command datasets be used at the same time. On the IOP-2 to access the parameters for both command datasets, then the command datasets screen must be set to "No default Command Dataset".

If the IOP-2 is not set to "No default Command Dataset" then only one command dataset will be visible to the IOP-2 in the parameter settings.



Parameter saving mode

This option allows the user to set the default location for any save function performed on the converter.

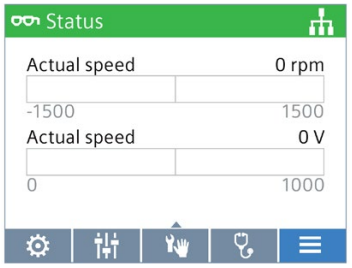
Save RAM to ROM

This option allows the user to manually save all drive data from the converters internal memory to the internal non-volatile memory - allowing the data to be retained until it is overwritten.

Panel settings

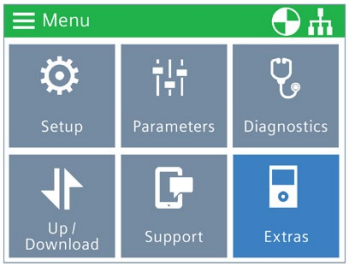
Language

This option allows the user to select the language that will be used to display information and text on the IOP-2. This option has been previously described in the initial set-up section of this manual.



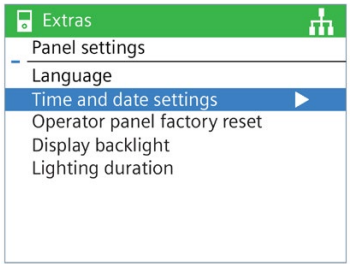
For details of selecting this function see Initial set-up (Page 20)

Time and date settings (including Daylight saving time)

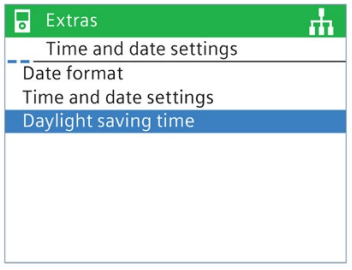


If the CU to which the IOP-2 is fitted has a real-time clock, then the option to set the correct date and time (including daylight saving time) is presented in the "Panel settings" menu.

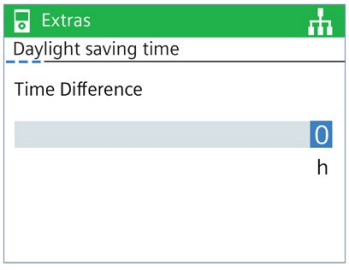
The Time and date settings allow you to setup up the following:



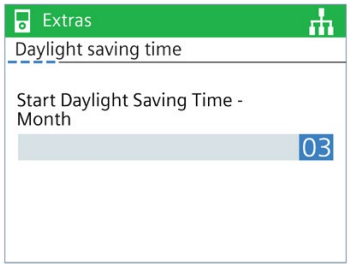
- **Date format**- This allows the date format to be select either DD/MM/YY or MM/DD/YY.
- **Time and date settings**- This allows the user to set the required date and time of the internal real-time clock of the Control Unit.
- **Daylight saving time**- This allows the user to setup the daylight saving time difference on the Control Unit (CU230P-2) real-time clock. The daylight saving time is set to take into account not only the time difference but also the date and time of the change to and from daylight saving time. The setup of the DST function is shown in the following procedure.



Select Menu

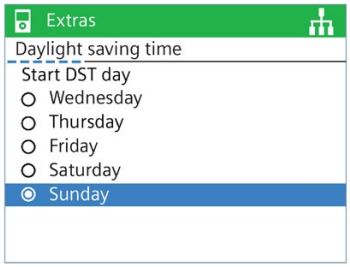


Select Extras

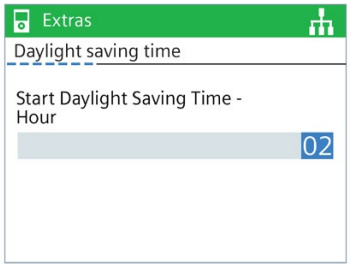


Select Time and date settings

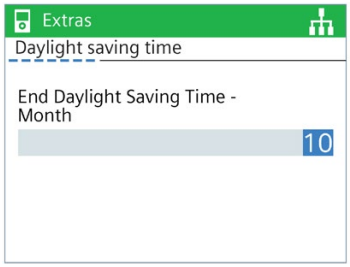
Select Daylight saving time



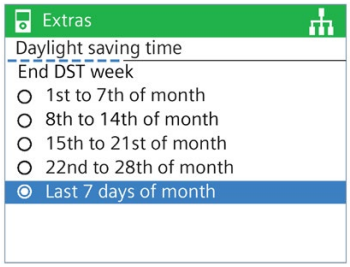
Set DST time difference



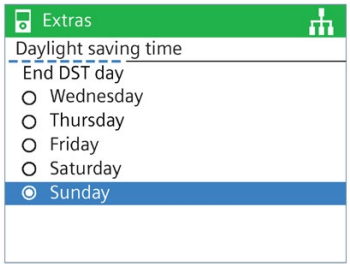
Set month DST starts



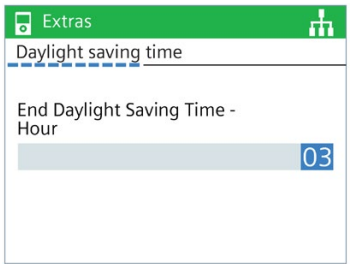
Set week DST starts



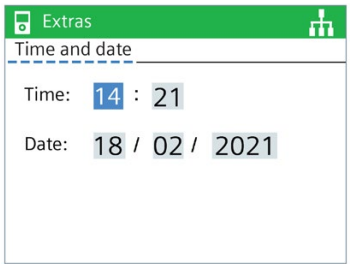
Set day DST starts



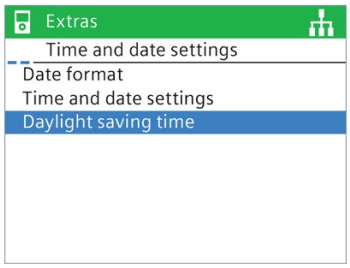
Set time DST starts



Set month DST ends

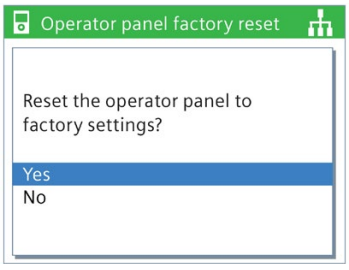


Set week DST ends



Set day DST ends

Set time DST ends



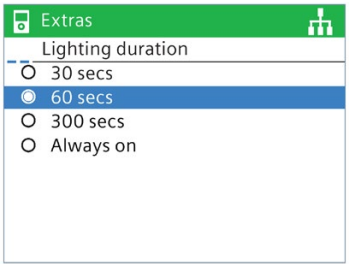
Set date and time

IOP-2 returns to previous screen (this may take a few seconds)

Operator panel factory reset

This option resets the IOP-2 to its default factory settings. All previous settings stored on the IOP-2 will be lost. Any parameter sets stored on the IOP-2 will not be deleted.

Display backlight

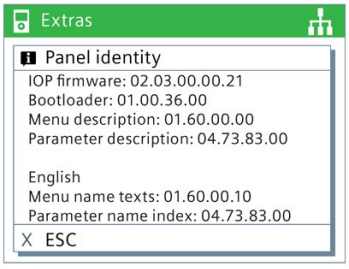


This option allows the user to change intensity of the display lighting.

For details of selecting this function see Initial set-up (Page 20)

Lighting duration

The backlight display, by default, is set to automatically dim after 60 seconds from the last key press. This time can be adjusted to 30 seconds, 60 seconds, 300 seconds or permanently on.



For details of selecting this function see Initial set-up (Page 20)

Panel identity

The panel identity screen displays the following technical information regarding the IOP-2:

- IOP-2 firmware version
- Bootloader version
- menu description version
- Parameter description version
- Menu texts version
- Parameter name index version
- Wizard description version.

Options

9

9.1 Door mounting kit

Door mounting kit

The door mounting kit (DMK) has been designed to allow the IOP, IOP-2 or BOP-2 to be mounted into the door of a cabinet.

The Operator Panels (OP), when installed correctly in the door of the cabinet, provide the following IP ratings around the DMK:

- IOP: IP54
- IOP-2: IP55
- BOP-2: IP55

There are two types of mounting screws, one is designed for use with the brass insert on the back of the OP and the other is thread-forming screws which is to be used on the OP without the Brass inserts.

The fitting of the DMK is accomplished as shown in the figures below.

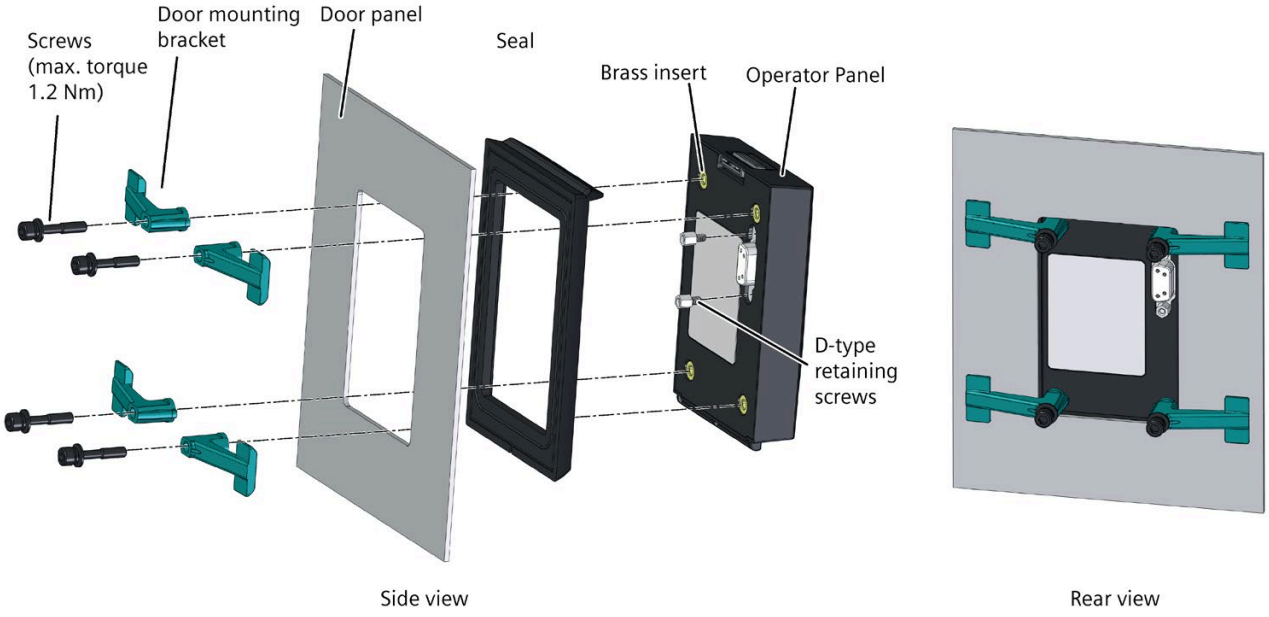


Figure 9-1 Fitting Operator Panel (brass inserts)

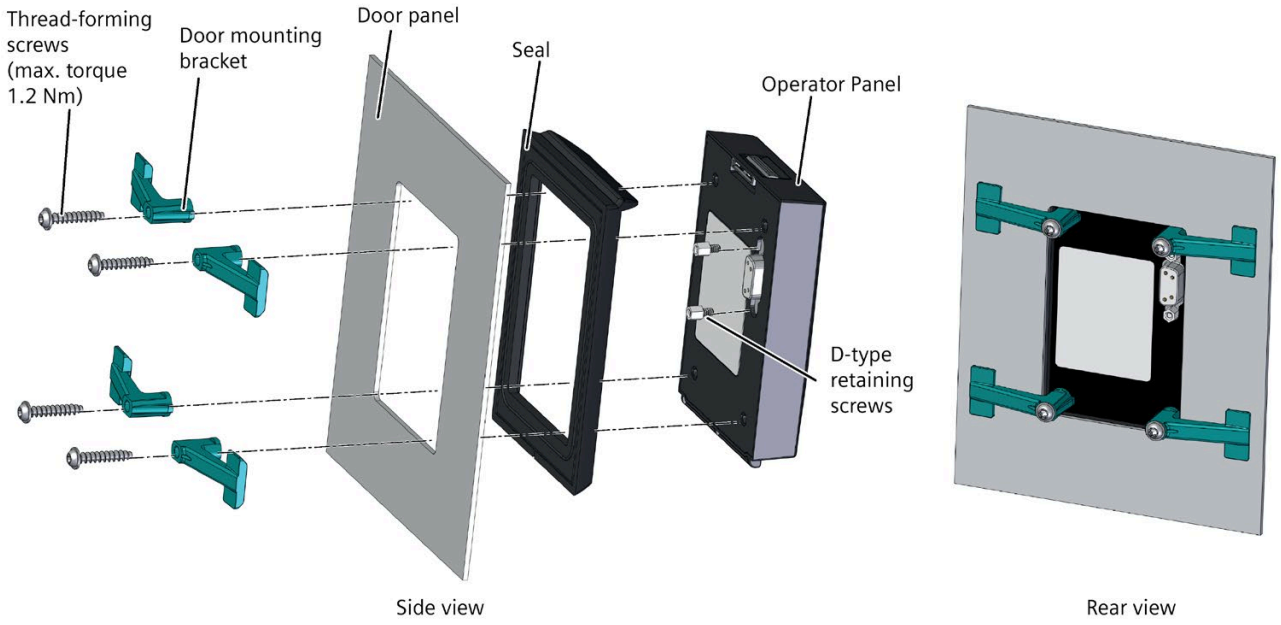

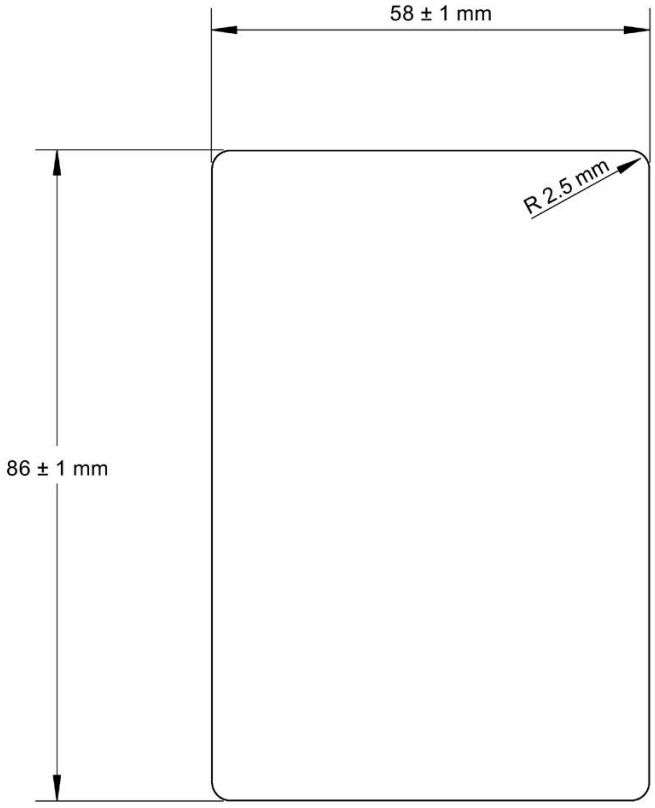

Figure 9-2 Fitting Operator Panel DMK (thread-forming screws)

⚠ CAUTION
Thread-forming screws maximum torques Using a torque greater than 1.2 Nm with the thread-forming screws may lead to permanent damage of the threads. The thread-forming screws must be correctly aligned with the holes on the back of the OP; the thread-forming screws must not be used with the OPs with the brass inserts.

Prior to the installation of the DMK, it is necessary to create a hole in the panel or cabinet with the dimensions as shown in the figure below:

Scale 1:1

Notes:
1. The page must be printed at full size to maintain the 1:1 scale.
2. When printing from a PDF file do not select the "fit to page" option as this will reduce the page to 97% of the true size.

The depth of the panel or cabinet door should be between 1 mm to 3 mm.

The IOP-2 Door Mounting Kit can be ordered using the following order number:

6SL3256-0AP00-0JA0

The DMK contains the following items:

- Door seal
- Door mounting brackets (x 4)
- Retaining screws (x 4)
- RS232 Straight-through cable (5 m)

9.2 Hand-held device

Hand-held device

⚠ WARNING

Charging unit

- The charging unit for the rechargeable batteries is contained within the hand-held device for the sole purpose of charging rechargeable batteries.
- The charging unit contained within the hand-held device should not be used with standard "AA" batteries as this will result in damage to the batteries and the hand-held device.
- Only the supplied power supply unit should be used with the IOP-2. The use of any other power supply units could seriously damage the hand-held kit.

⚠ CAUTION

General precautions

- There is a risk of explosion if battery is replaced by incorrect type.
- Overcharging, short circuiting, reverse charging, mutilation, or incineration of the cells and the batteries must be avoided to prevent one or more of the following occurrences; release of toxic materials, release of hydrogen and/or oxygen gas, rise in surface temperature.
- If a cell or a battery has leaked or vented, it should be replaced immediately using protective gloves.
- If and when necessary, these cells or batteries must be replaced with identical new ones from the same manufacturer. If a cell or a battery to be replaced is connected with other cells or batteries in series, it is recommended that the other cells or batteries be replaced with new ones at the same time.
- Battery compartments containing these cells or batteries must be provided with means of ventilation to prevent possible accumulation of any released gases under abnormal conditions.

Note

Battery lifetime

With the supplied rechargeable batteries in a fully-charged state they should last for approximately 10 hours; the use of normal "AA" batteries may last considerably less time.

Industrial environment

The IOP-2 has been designed for use within a Class A Industrial environment only.

Disposal of batteries

The batteries supplied with the IOP-2 must be disposed of in accordance with local and national environmental policies.

Battery status

The battery status is displayed at the top right-hand corner of the IOP-2 display.

Battery charging

If the batteries are put on charge and the batteries are fully discharged; the charging unit will enter a 'pre-charge' state. During the pre-charge state the LED will not be lit, therefore there may be a delay before the charging LED lights up.

The IOP-2 has no internal power source, so to increase the IOP-2's versatility, the hand-held device has been designed.

The complete list of converters that work with the IOP-2 are listed in  Introduction (Page 11). The following list comprises the converters that require the hand-held kit and the optical cable because the IOP-2 cannot be mounted directly on the converter:

- SINAMICS G120D-2 CU240D-2
- SINAMICS G120D-2 CU250D-2
- SINAMICS ET 200pro FC-2
- SINAMICS G110D
- SINAMICS G110M

Table 9- 1 Hand-held device order information

Order number	Item quantity	Item	Remarks
6SL3255-0AA00-4HA1	1	IOP-2	
	1	Hand-held module	
	1	Power supply unit	
	4	Rechargeable batteries	1.2 V 2100 mAh NiMH (see note below)
	1	RS232 cable	3 m

Note

Battery order information

The batteries supplied with the IOP-2 Hand-held Kit should be replaced with exactly the same type of batteries. The batteries that have been tested for use with the IOP-2 are given below:

Company: GP Batteries

Order Number: GP210AAHC

The batteries can be ordered from the following website: GP Batteries (https://uk.gpbatteries.com/products/recyko-aa-2100mah-rechargeable-battery-pack-of-4)

The layout of the IOP-2 hand-held device is shown in the figure below.

Figure 9-3 IOP-2 Handheld kit layout

1. Intelligent Operator Panel (IOP-2)
2. IOP-2 release catch
3. ON/OFF switch
4. Charging LED - ON when charging, OFF when charged
5. 9-pin Sub-D male connector (RS232)

6. Charging unit input
7. Battery compartment cover
8. IOP-2 retaining screw

Fitting the batteries

The hand-held device is powered by four 'AA' rechargeable batteries; these batteries are supplied with the hand-held kit. The batteries are fitted as shown in the figure below.

Figure 9-4 Installing batteries for handheld kit

1 Background

A factory acceptance test (FAT) has been successfully completed on the equipment in Germany on 6th August 2024 and reference should be made to the issued document detailing the tests completed.

2 Commissioning Schedule

DAY 1	DAY 2	DAY 3	DAY 4	DAY 5	DAY 6
Safety check on site	***Flush the conservation fluid to the drain***	***Filling of the permeate tank***	***Training and troubleshooting the whole day***	***Training and troubleshooting the whole day***	***Take photos of the plant and sign off commissioning***
Check the entire system for completeness and damage	***Start pumps of the RO***	***Start the polishing loop booster pump***			
Check all pipework connections	***Check and adjust the flowrates of RO***	***Check the entire system for leakage***			
Complete plant by install of filter elements and UV-lamps	***Check and adjust the flowrates of EDI***	***Check the quality and flowrates***			
**** Check the feedwater quality***	***Check the water quality of RO and EDI***	***Record quality and flowrates***			

** Feedwater quality to conform to Elogen specification, see extract in section 9 appendix.*

3 Preliminary Checks

3.1 Commissioning Environment

Checks to be made to ensure that,

- the area assigned for the onshore commissioning activities is suitable and is barriered off to control unauthorised access. Signage to be in place to advise of PPE requirements.
- suitable drains are available for disposal of preservation water and drainage of equipment after completion of commissioning tests

- customer has provided utilities required for operation of the plant including, but not limited to, feedwater, power and air.

3.2 Equipment checks

- The positioning and condition of the plant is to be checked to ensure that no damage has occurred during transit from the FAT facility to Italy. Reference should be made to the plant O&M section 2 “Transport, Packaging and Storage” as necessary. Any damage is to be noted and photographic evidence taken.
- Checks are to be made that all ancillary equipment (such as filter elements, reverse osmosis membranes and UV lamps) has been delivered safely and is available for installation.
- All valves and instruments are to be checked against the plant P&IDs (see Appendix 1). It is suggested that these are marked off as correct on a physical set of drawings.
- Ensure that all pipework connections are tight and screwed connections and bolts could have loosened during transit.

3.3 Temporary supplies

Reference should be made to the plant O&M section 4 “Installation” at this point.

- Connect temporary water supply to feed terminal point 1E local to prefilter.
- Connect temporary air supply to terminal point 3E local to membrane degasser.
- Connect temporary pipework to common drain pipework from first pass RO reject and membrane degasser drip separator at terminal point 4A.
- Connect temporary pipework to diaphragm pump discharge at terminal point 3A local to drip separator.
- Connect temporary pipework to final treated water pipework at terminal point 5A.
- Connect temporary pipework to reject tank drain at terminal point 4A.
- Connect power supply (3 phase 400v, 50Hz as shown on P&ID) to Master Control Cabinet at terminal point 1EL.

4 Pre-Commissioning

4.1 Pre-filter element installation

- Open prefilter drain (1F) to ensure that no pressure is contained within the vessel
- Open filter housing (1FEV1).
- Locate and install filter elements to suit housing.
- Close housing (1FEV1) and drain valve (1F).

4.2 Reverse Osmosis membrane installation

- Locate the required membranes for both the first and second pass RO tubes ensuring that the correct element type is installed in the correct location.
- Open first pass RO tubes and install membranes from the feed end.

- Before closing up feed end of tube, ensure that membranes are tightly packed and if not install spacers as required.
- Repeat for 2nd pass RO tubes.

4.3 UV lamp installation

- Install UV lamps according to manufacturer's instructions taking care to not to touch the glass as any fingerprints will reduce the efficiency of the unit.

4.4 EDI unit

- All EDI bolts must be tightened before initial commissioning. Refer to issued plant O&M section 4.4 for full details of procedure and recommended torque. Note – each bolt must only be tightened by a maximum of 2Nm per tightening sequence.

4.5 Centrifugal pumps

- Rotation directions of all centrifugal pumps must be confirmed via a short bump test after connection of power supply. The pumps must not be run dry for any longer than 1 second at this time.
- If any pump motors are found to be rotating in the wrong direction, then Elogen electrical engineers shall correct.

4.6 HMI

- Power up the HMI and check that the unit boots up successfully and is operational.
- Check through each screen to ensure that all individual plant is available and that any standing alarms are cleared.
- Check that all initial setpoints are acceptable.
- Note that full testing of the software was completed during the FAT.

4.7 Temporary feedwater quality

- Check that the temporary softened water supply to be used for the initial onshore start-up of the plant meets the plant design specification.*
- Record the feedwater conductivity, total hardness, supply pressure and temperature. If these are outside of the plant design criteria then the plant will not perform as designed and Ovivo reserves the right to stop tests until a suitable supply is available.

** Feedwater quality to conform to Elogen specification, see extract in section 9 appendix.*

5 Commissioning

5.1 Drain Preservation Fluid from System

- The RO membrane containers are filled with preservation fluid.
- This fluid should be disposed of safely and not passed to the site drains.
- Bypass drain to 100L containers provided by Elogen, to be disposed of by Elogen.
- RO Membrane flush via 1ROBV1 and 2ROBV1 to the 100L tank provided by Elogen.

5.2 Filling of system

- Ensure that any preservation fluid has been drained from the plant by checking that no fluid passes to drain when successive drain valves are opened.
- Check and confirm that the Permeate Demin Tank and the Reject Tank are empty and clean.
- Check and confirm that all valves are in the closed position before proceeding.
- Open valves to allow the temporary softened water supply to enter the plant.
- By using available drains and vents ensure that each section of the plant is flooded before continuing to the next part.
- As the raw water is supplied at a pressure of 4barg (measured on PI 1RO7 at first pass RO inlet) it will be possible to achieve a low permeate flow without the use of the RO booster pumps. Once water is seen at the Permeate tank stop the raw water flow by closing of the automatic plant inlet valve 1EBV1.

5.3 Energise the system

- Coordinate with Elogen for system energisation.
- Visual check of wiring to confirm safe operation.
- When approval / permit in place, turn on supply and main isolator of panel.

5.4 Initial system operation

- From the HMI, select the plant to on-line operation and check that all required valves and equipment enters operation. All automatic operation has been confirmed during the FAT.
- Adjust first pass RO reject (*1ROBV1*) and recycle (*1ROSV3*) valves to obtain design flows.
- Repeat for second pass RO reject and recycle valves.
- Check and record permeate quality and flow together with reject/recycle flows and pressures.*
- Ensure that UV module is operational and there are no lamp warning alarms.
- Ensure that membrane degasser is functional, and air flow is correct. Adjust if required.
- Check that EDI unit is powered up and automatic control is functional. Adjust concentrate flow as required using rate set valve 1EDSV1. Confirm reject flows are *acceptable. Record feed flow, concentrate flows, pressures, supply voltage and current and permeate quality.

** nominal system flows and water qualities listed in extract from IOM in section 9 appendix.*

- Allow the plant to operate to fill the permeate tank with acceptable quality water.
- Ensure that sufficient photographs are taken of plant equipment and operational data.
- Whilst in operation check the plant for any leaks. If minor address whilst plant in operation, if major then the plant should be immediately taken out of service.
- Check that when the Permeate tank reaches high level the plant returns to the standby state.

5.4 Polishing loop operation

- Open up manual valves and flood the polishing loop pipework progressively through to the final 5µm filter (2F) via the UV unit (2Z) and non-regenerable mixed bed (1C).
- Select loop operation from the HMI.
- Check correct operation and control of the booster pump (1PSP1) and UV unit. Both the booster pump and UV unit should be in operation.
- Ensure that sufficient photographs are taken of plant equipment and operational data.
- Whilst in operation check the plant for any leaks. If minor address whilst plant in operation, if major then the plant should be immediately taken out of service.
- Record system flows, pressures and conductivity.

5.5 Plant Functional Operation

- Functional testing of the system has been completed during the FAT but a selection of tests can be repeated as necessary to prove correct operation of the plant under various fault scenarios.
- Record details of any testing completed and outcome of tests.

Flow quantity	Setpoint	actual value
Inlet 1E (soft water) l/h	approx. 670	
Concentrate back flow 1RO (FI1RO6) l/h	approx. 800	
Concentrate flow 1RO (FIR1RO3) l/h	approx. 197	
Permeate flow 2RO (FIR2RO5) l/h	approx. 530	
Concentrate back flow 2RO (FI2RO6) l/h	approx. 800	
Concentrate flow 2RO (FIR1RO3) l/h	approx. 177	
Diluate flow 1ED (FIR1ED1) l/h	approx. 500	
Concentrate flow 1ED (FSA-/FI1ED3 l/h	approx. 50	
Electrode rinsing water 1ED (FI1ED5) l/h	approx. 5	
Feed outlet 1A to 1E l/h	approx. 500	
Feed EDI reject 2A to 4E l/h	approx. 80	
Reject water from 1RF 6A to 2E l/h	approx. 50	

Conductivity values	Setpoint	
Conductivity 1RO (QISA+1RO4) µS/cm	< 20	
Conductivity 2RO (QISA+2RO4) µS/cm	< 10	
Conductivity 1ED (QIA1ED7) µS/cm	< 2	
Conductivity circulation system (QIA1C1) µS/cm	< 0,1	

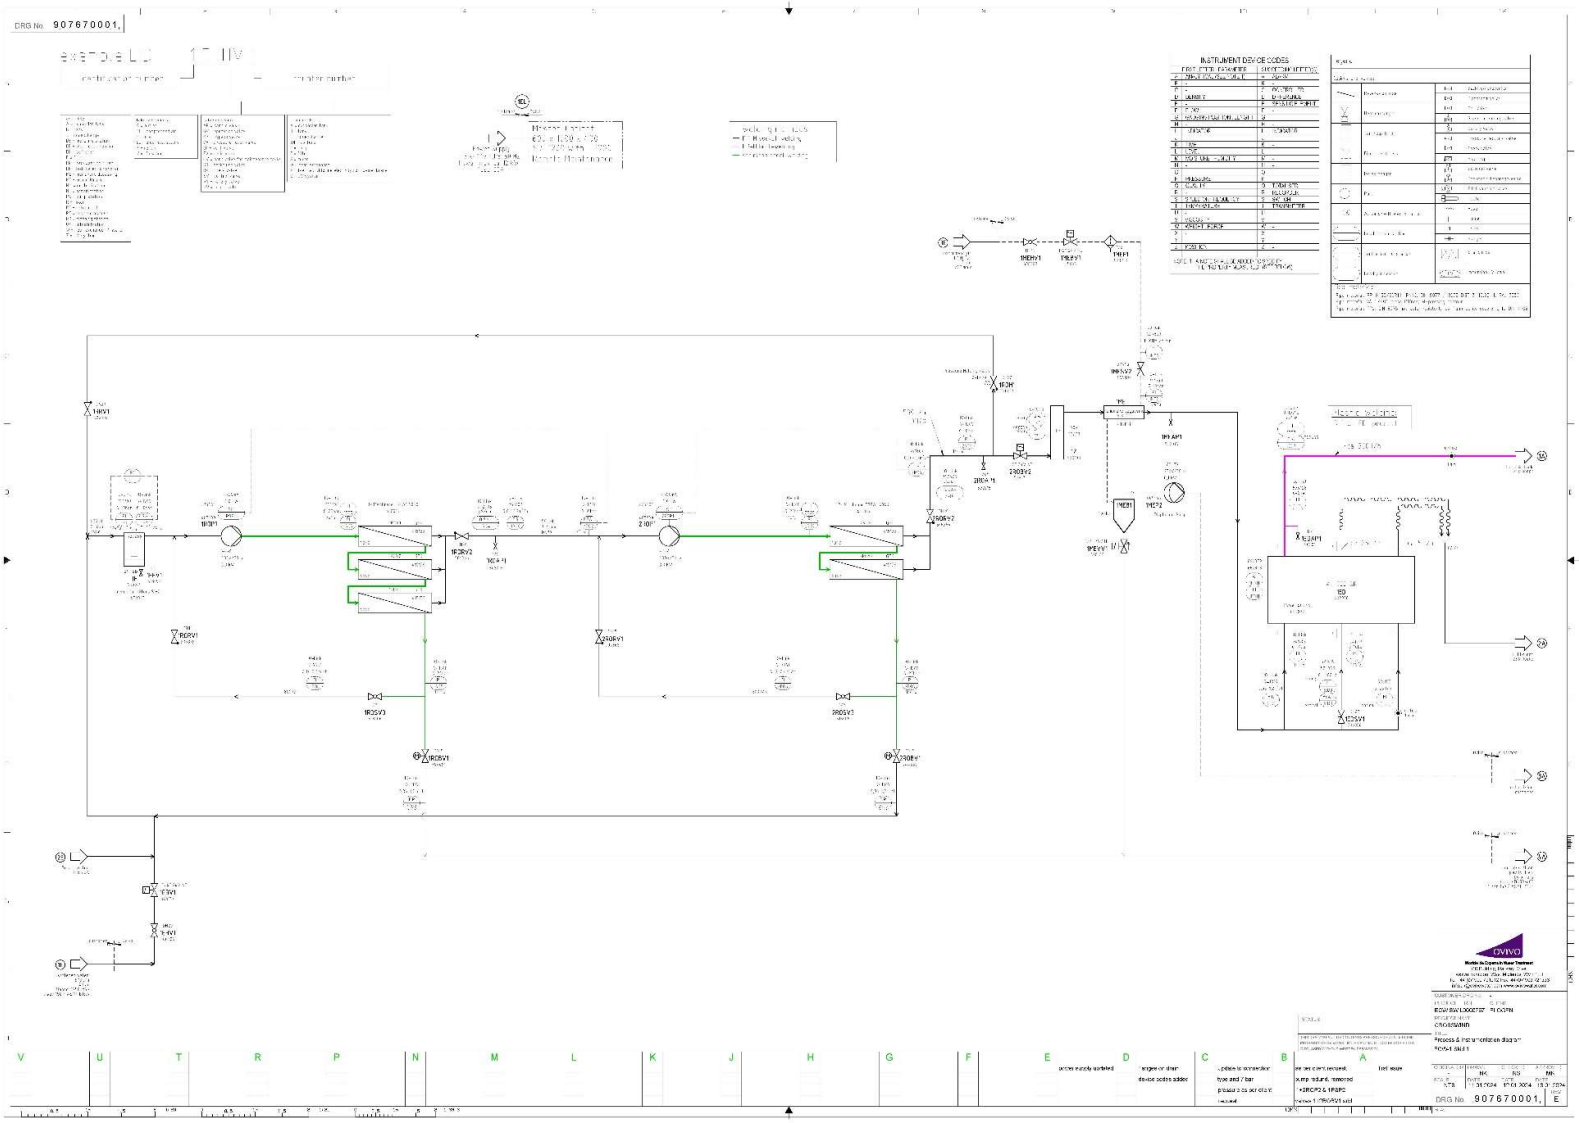
6 Preparation for Long term storage and offshore shipping (if required)

6.1 System draining

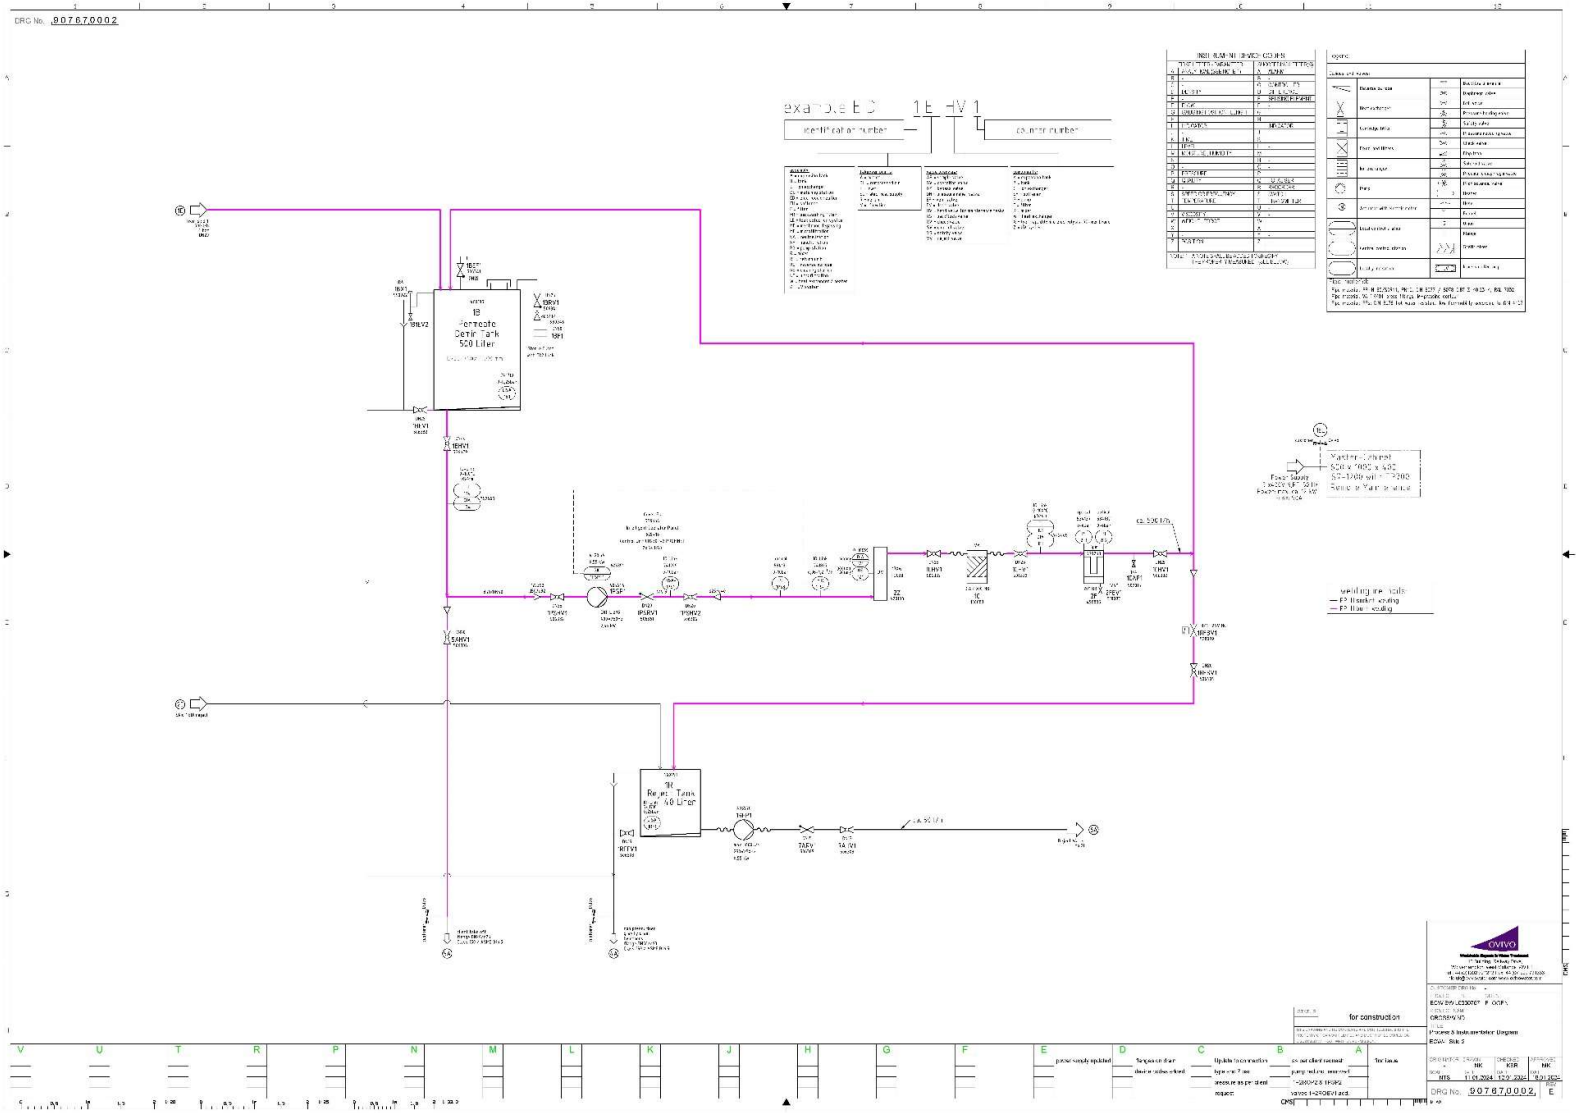
- Ensure that the plant is selected to out of service at the HMI.
- Open drain and vent valves are necessary and allow the plant to drain to the provided local floor drains.
- Disconnect all temporary hoses, power and air supplies.

6.2 Removal of installed elements

- Open pre-filters and remove all installed elements. These can either be dried and stored for later use or disposed of.
- Open all RO tubes and remove installed membranes. These could be re-used if returned to air-tight packaging, but the recommendation is that a new set is installed offshore to prevent the risk of bacteriological contamination.
- Remove installed UV lamps and return to manufacturer's packaging.
- Covers to be fitted at all terminal points in preparation for onward shipping.



7 Commissioning Training acceptance



Upon completion of the onshore commissioning training activities the below should be signed off by all parties to signify acceptance.

Commissioning activities as identified above have been completed successfully and plant operation confirmed as acceptable.

CONFIDENTIALITY AND COPYRIGHT / INTELLECTUAL PROPERTY RIGHTS

In this document, the technical data and drawings contain confidential information and copyright material. It is disclosed in good faith solely for the purposes of the work detailed and in addition on the understanding that its confidentiality will be properly maintained and safeguarded.
Neither it nor any part thereof may be copied, reproduced, or used for any purpose other than that for which it is disclosed, and save as reasonably necessary for the evaluation of the scope of work.
No part thereof may be disclosed to any third party, without our prior consent in writing.

Specific health and safety requirements

Compliance with Ovivo Health and Safety procedures and site-specific requirements are mandatory.

1. All operatives to be site inducted by client.
2. All operatives to sign and adhere to the contents of the method statement.
3. OVIVO Site Manager to review the working area BEFORE PRE-JOB BRIEFING to make sure RAMS are still applicable and correct.
4. RAMS and Working Procedure to be discussed before “Each Stage & Next Step” in the Operational Sequence and/or phase of work.

   Morning Briefing to Include:
   - Review of previous day,
   - Review work for the day.
   - Complete point of work risk assessment.
   - Confirm isolation of water source and electrical supplies are in force.
   - The prevention of pedestrians entering work and laydown areas.
   - OVIVO Site Manager to Confirm MS & RA is signed by all members of the working team and that the days operations including associated risks and control measures are understood.
   - Washing of Hands before eating and drinking.

5. All operatives to be trained and competent in tasks allocated.
6. All personnel to wear the appropriate PPE as per the associated Risk Assessment, to include hard hat, safety boots (steel plate or composite mid sole safety boots), high visibility long-sleeve clothing, suitable gloves (Cut Level 5 minimum where sharp edges/cutting is involved), and eye protection as a minimum. Hearing protection must be available and worn as required by site mandatory signage and as identified in the Risk Assessment.
7. Access to Site Welfare facilities i.e. Toilets, Kitchen, etc. by client. If these are not provided Ovivo reserves the right to stop site works and demobilise.
8. Restoration of Services (ROS) and general permit procedures by client
9. Vehicles and Mobile machinery should be separated from personnel, this is generally achieved by the client by providing designated routes for Vehicles/ mobile machinery and personnel with designated crossing points. During deliveries of material and equipment the client shall ensure temporary procedures are in place to prevent accidents, these include:
   - Exclude setting up temporary barriers to exclude people during deliveries,
   - Banks man to be used from vehicles that are reversing,
   - Ensuring site rules on speed limits are adhered to,
   - Assisting the vehicle driver with positioning and direction for blind spots, and non-visible obstructions.

Compliance with Client and Ovivo procedures are mandatory.

Schedule of portable electrical tools (excluding battery operated)					
All portable electric power tools must be tested by a competent person every three months and have a valid and legible PAT label attached. Each time a tool is used it shall be subjected to a pre-use inspection and only used for its intended purpose, maximum voltage 230v. **NOTE: Tools without a valid PAT label must not be used for work under any circumstance.**

Emergency arrangements, contingency plans / procedures

FIRE ACTION PLAN

Fire Action Plan is operated and managed by the client at all times, and the application of the Fire Action Plan shall be discussed and agreed at the Site Induction.

Ovivo Personnel to raise the alarm for fire when identified and evacuate safely to the nearest safety point and adhere to and follow site rules as advised during site induction.

FIRST AID ACTION PLAN.

Adhere to and follow site rules as advised during site induction including customer appointed first aider(s) contact details.

NEAREST A & E HOSPITAL.

Ovivo will be informed of this at the site induction.

Emergency Preparedness Plan.

Ovivo will be informed of this at the site induction.

Environmental arrangements / waste disposal arrangements

- All waste must be disposed of in the correct waste bins provided by client, locations to be communicated during site induction.
- Area to be kept clean and tidy at all times.
- Use site power supply in preference to use of a portable generator whenever possible.
- Always place a drip tray under a portable generator/compressor
- The waste management plan is documented, actioned and agreed with the client at commencement.
- Turn off vehicle engines as soon as it is practical to do so.
- Impact of noise on the surrounding environment and neighbours to be considered.
- Impact of dust or smoke on the surrounding environment and neighbours to be considered.
- Impact of artificial lighting on the surrounding environment and neighbours to be considered.
- Impact of any site activities on the surrounding flora or fauna to be considered.

Preparatory by others

1. Office induction of site personnel.
2. Availability of personnel to issue permits.
3. Availability of personnel for inspection/witness hold points.
4. Welfare facilities, provided by client.
5. Safe access route will be provided by the client into the working area, where the equipment is installed.
6. Designated laydown areas as defined by the client.
7. Waste handling, segregation, and disposal.
8. Local 220v & 415v supplies (for equipment commissioning and lighting).
9. All water supplies and wastewater removal as required for commissioning.

Site induction of site personnel

This is to include:

- Site specific hazards
- Operation procedures
- Welfare facilities
- Restricted mobile phone use
- Safe system of work
- Method Statement review and sign off
- Permits issued to Ovivo engineers, including hot work etc.

Site Working

Points to note:

- Site Engineers Working time 08:00 to 18:00 Monday to Saturday.
- Weekend working as per contract.
- Working area lighting by client.
- Electrical supplies for equipment commissioning.
- Cables to be run to avoid tripping hazards.

Description of works to be completed

Scope of work: Step by step sequence of the working methods listing all the key stages of site activity including shut down, isolation, and return to duty procedures
(This method statement is to be read in conjunction with the risk assessment)

Any deviations, due to site conditions or other circumstances, should be agreed with the customer and noted in the amendment's pages after Ovivo office authorisation.

IF IN DOUBT, CONTACT OVIVO OFFICE FOR CLARIFICATION

NOTE:	**Each morning, equipment in scope is to be checked to ensure condition of power supplies, isolations and pipe connections are known/safe before commissioning tasks are undertaken.**
NOTE:	**Daily Point of Work Assessment to be completed in conjunction with the above.**
NOTE:	**The following tasks are to be completed in conjunction with SWL0841 Elogen Crosswind – Commissioning Plan.**
Task/ Sequence	**Description**

A	**Pre-commissioning.**
1	Arrive on site & contact Site Representative.
2	Complete any necessary site inductions and site orientation. To include nearest emergency services and emergency preparedness plan.
3	Prior to commencing the works, all personnel are to review the content of the Method Statement and Risk Assessment in the pre-job briefing. Attendees are to record onto a sign on sheet that they have understood the works to be carried out and the sequence as defined and will comply with the Health and Safety requirements as set out. Any personnel arriving later during the works must be similarly briefed and added to the sign on list.
4	Discuss planned activities with client commissioning team, to ensure availability for witness points.
5	Receive permit to work for commissioning activities
6	Check overall system for completeness and any damage.
7	Check all pipework connections.
8	Manual valve operation confirmation. All non-return valves to have installation directions checked.
9	Pneumatic valve operation checks.
10	Pump check and initial commissioning (rotation checks).
B	**Commissioning**
1	Complete plant with filter elements and UV-lamps
2	Check the feedwater quality
3	Flush the conservation fluid to the drain
4	Pre-Energisation checks will be completed in conjunction with client Electrical Commissioning and subcontractor Main Electrical.
5	PLC input/output checks (once HMI installed and operational). PLC communications set up will occur during the above activities to allow completion of I/O checks.
6	Start pumps of the RO
7	Check and adjust the flowrates of osmosis
8	Check and adjust the flowrates of EDI
9	Check the water quality of osmosis and EDI
10	Fill the permeate tank ensuring no spillage. Clean any spillage as required.
11	Start the polishing loop booster pump
12	Check entire system for leakage. Clean any spill and dispose of waste as per site procedure.
13	Check the quality and flow rates
14	Record the quality and flowrates
C	**Post-Commissioning**
1	Document and photograph system noting flowrates

Site activities / hazards with the potential to cause foreseeable harm					
This section identifies hazards involved in working IN/NEAR/ON and is recorded following a site survey, usually with the person responsible for site safety or his/her agent.					
Pressure systems	✓	Excessive noise	✓	Chemicals	✓
Piped services	✓	Moving machinery	✓	Biological hazards	✓

LOLER – Lifting equipment

All lifting equipment used on site shall have a valid test certificate. Prior to use all lifting equipment must be subjected to a user inspection, carry a unique identifying mark and a rating capacity. Defective equipment will not be used. All equipment will be used correctly and within its rated capacity. Complete list of the certified lifting equipment shall be available for review.

Not applicable in scope of work

Control of substances hazardous to health (COSHH)

All substances to which employees are exposed that may be hazardous to health must be used in accordance with a valid COSHH risk assessment. Ovivo subscribes to Sevron CMS, an internet based COSHH risk assessment service, to assist with compliance to these regulations.

An index list and relevant COSHH assessments will be maintained in relevant file. All substances covered by these regulations must be used in accordance with a valid, suitable and sufficient risk assessment and comply with the Integrated Management procedure UK HSEA 23.

Aufstellungsort / *Place of installation*: **The Hollandse Kust Nord (HKN) located 18,5km off the coast of the Netherlands near the town of Egmond aan Zee**.

Auftraggeber / *Buyer (Customer)*: **Ovivo UK Ltd.**

Auftragnehmer / *Supplier*: **EnviroFALK GmbH**

Anlagenbetreiber / *Operator:* **Crosswind / Elogen**

Auftrags-Nr. / *Project No.* **23004680** Datum / *Date:* **15.12.2023**

Nachtrags- Nr. / *Modification No.* _____ Datum / *Date:* __/___/_____

Nachtrags- Nr. / *Modification No.* _____ Datum / *Date:* __/___/_____

Auftragsbestätigung (Datum) / *Order confirmation (date)*: **15.12.2023**

Örtliche Inaugenscheinnahme und Prüfung am / *Visual inspection and walk through on*: 28/01/2025

Teilnehmer bei der Abnahme / *Participants at the Acceptance Test:*:

Auftraggeber / *Buyer (Customer)*: **Mark Cousins - Ovivo**

Auftragnehmer / *Supplier*: **Peter Kasperski – EnviroFALK GmbH**

Anlagenbetreiber / *Operator*: **Martin Taylor - Crosswind / Maxime Lafargue, Luc Paoletti - Elogen**

Verteiler Abnahmeprotokoll / *Mailing List Final Acceptance Certificate (FAC)*: **Gerry McCann – Crosswind / Lancelot di Giulio - Elogen**

Abnahmeprotokoll
Final Acceptance Certificate (FAC)

Probebetrieb durchgeführt ***Test run***	Anlage, Einrichtungen, Komponenten *Plant, equipment and components*	Vertraglich zugesicherte Leistungen *Obligations according to the contract*
29.01.2025 **01.02.2025** von / *from* bis / *until*	Vollständig / *complete* ☒ Nicht vollständig / *incomplete* ☐	Erbracht / fulfilled ☒ Nicht erbracht / *not fulfilled* ☐

Die Anlage wurde gemäß den Festlegungen im Vertrag, einschließlich aller in diesem Dokument benannten Nachtragsaufträge geliefert, montiert und in Betrieb genommen.

The equipment has been delivered, erected and commisioned according to the contract, including all modifications mentioned in this document.

Mängel / *Deficiencies*

Bei der Abnahme wurden folgende Mängel festgestellt (strittige Mängel sind zu markieren):

List of deficiencies reported during the final acceptance test (please mark disputable deficiencies):

Changes updated on the P&ID needed :

- 1CHV1 => 1CHV2, 1CHV1 => 1CHV3, 1RSHV1 => 1AHV1
- Change the P&ID in accordance with the sketch provide by OVIVO

OVIVO needs to provide the tag of 1C tank and tag of conductivity sensor QIA-1B4

Der Auftraggeber besteht auf der Beseitigung der aufgeführten unstrittigen Mängel bis zum:

The customer demands a remediation of the deficiencies above reported by the latest on: ___/___/_____

Abnahmeprotokoll
Final Acceptance Certificate (FAC)

Bemerkungen / *Remarks*:

After commissioning and before transport from Italy to the Netherlands, the entire system must be drained and the membranes removed from the pressure pipes. To drain, all pipe connections must be opened at the lowest point so that the water can escape. A link with access to a cloud will be created by February 5, 2025, on which all photos of the commissioning and the calibration certificate of the reference measuring device can be found.

2 UV Lamp, 3 Filters, 1 filter key was left on site (spares for recommissionning)

Abnahme / *Acceptance*

Das Betriebsmittel/die Anlage gilt als abgenommen:
The plant/equipment shall be considered as accepted (FAC): JA / *YES* ☒ NEIN / *NO* ☐

Ein erneuter Abnahmeversuch ist erforderlich:
A secon final acceptance test has been demanded: JA / *YES* ☐ NEIN / *NO* ☒

Die vom Auftraggeber zur Verfügung gestellten und vom Auftragnehmer benutzten Werkseinrichtungen wurden in ordnungsgemäßem Zustand übergeben.
The equipment supplied by the customer and used by the constructor (supplier) was delivered in proper conditions. JA / *YES* ☒ NEIN / *NO* ☐

Eingewiesenes Personal / *Trained personnel*

Abnahmeprotokoll
Final Acceptance Certificate (FAC)

Das nachstehend aufgeführte Bedienungspersonal ist in die Anlage und die Sicherheitseinrichtungen eingewiesen worden (s. „Protokoll zur Personaleinweisung“)

The following list shows the personnel which has been trained to operate the plant and instructed on all safety questions (please see the “Report on the Instruction of Customer’s Personnel“)

Martin Taylor - CROSSWIND

Jamie Mc Allister - CROSSWIND

Alem Brdakic

Fray Moufouma

Maxime Lafargue

Dokumentation / *Documentation*

Die technischen Unterlagen (Beschreibung der Anlage, Bedienungsanleitung, Wartungsvorschriften etc.) sind gemäß Vertrag geliefert.

All technical documentation (description of the plant, operating manual, maintainance instructions, etc.) has been delivered according to the contract. : JA / *YES* ☒ NEIN / *NO* ☐

Falls nicht, sie werden am ___/___/_____ geliefert (einzeln aufführen).

Should this not be the case, they will be delivered on: ___/___/_____ (please indicate each item)

Abnahmeprotokoll
Final Acceptance Certificate (FAC)

Unterschriften / *Signatures*

Die nachstehenden Unterschriften bestätigen die ordnungsgemäße Abnahme und Übergabe.

The following signatures confirm the final acceptance and a correct end of commissioning.

Remarks on transmittal:	
Document review status (by Engineer / Engineer's Assistant(s)):	**CODE 2 - MINOR COMMENTS**

No.	Reference	Comment	Comment made by	Comment status
1.	CH2, HCU	HCU-400 (Hydraulic Cooling Unit) of Rectifiers are also cooled by HVAC, please include in pre-requisites. Additionally, where is the commissioning for HCU-400 done? Rectifier of part of this scope. **HCU-400 is NIDEC Scope Of Work, Nevertheless I added the note in pre-requisites "HCU-400 (Hydraulic Cooling Unit) of Rectifiers are also cooled by HVAC. Therefore, this equipment must be ready for Commissioning prior to HVAC SAT."**	TP	OPEN
2.	CH2,	For Leak Test, please divide between Gross Air Leak Test and Leak Test and refer to CH4.1. **We only do a leak check that prior to Glycoled water filling. the leak test with dry air is more than enough to prove the tightness of the system prior to glycol filling.** **This HVAC system is a low-pressure system, GALT is the final LT.** **Of course, during operation, the guys on filed should have a look during the service test if any leak is present, it will be visible anyway due the pink color of the fluid.**	TP	OPEN
3.	Section 4.2	Due to potential damage to the heat exchangers and other sensitive parts of the cooling system the glycol/water mix should be dosed with biocide and corrosion inhibitor. Can you please include this as part of the procedure or alternatively justify why these are not required? **Yes, it will be added with glycol, I added it in the procedure** **"1) Add corrosion inhibitor and biocide into the glycoled water mix"**	GM	OPEN

1. Introduction

This document is the SAT document for HVAC as per PAUMIER documentation.
It includes:

- Loop testing: checking that the sensors are working properly with correct wiring and display on the HMI.
- Control for the operation of pump, drive, instrumentation settings, fan drive settings, pressure relief valve setting and all necessary functional and safety tests to be ready for the operational test.
- Leak testing: Control of the tightness of chilled water piping & condensation water piping networks.
- Filling with glycol water for the chilled water & water condensation loops.
- Fill the chillers with R513a.
- Final acceptance tests of all piping & equipment's networks.

2. Pre-requisites

- Wiring of all instrumentation to the electrical cabinet PAU001 & PAU002 has been completed.
- Power is available in all 3 cabinets, and cable communication between the cabinet done.
- All the instruments listed in the list in next section are connected and ready to be powered up.
- All the equipments listed in the next section are connected and ready to be powered up (FCUs, skids pumps, AHU, Chillers, HVAC electrical cabinet, Drycooler, modulating damper, wall heater).
- HCU-400 (Hydraulic Cooling Unit) of Rectifiers are also cooled by HVAC. Therefore this equipment must be ready for Commissioning prior to HVAC SAT.
- Access free to all the installation (including Dry cooler).
- All piping completed, pressure test, cleaning and reinstatement are done.
- Mechanical Completion (RFC) for the sub-system 66-06 has been signed by all parties.
- Assembly of all equipment has been done in accordance with the PID P.0608871.L.02.104.
- The assembly of duct finalized and with its accessories (modulating damper, exhaust damper).
- Presence of Elogen (and CWD if necessary) during the test is necessary to certify their correct execution.

For the filling with glycol water:

- Leak Test has been completed.
- Glycol for network charging has been provided (total volume estimated => 2800 L of MPG 40%).
- Power supply of 230V for connection of the glycol charging pump is available.
- Installation of purges valves at the low point and an airs bleeder at the high point of the pipes are done.
- The chiller at Level 01 is accessible.
- Power supply 230V for connection of refrigerated charging station (Paumier material) is available.
- The charge of R513a is supply scope Paumier.

3. E&I Pre-Commissioning

See the Appendix for the Item List. Proceed with all the necessary individual checks & tests.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

4. Piping & Mechanical Pre-Commissioning

4.1 Leak Testing

All Glycoled water loops must be tested for tightness prior to the filling with Glycoled water.
Follow the steps given by ELOGEN Leak Test Procedure in Method Statement, use a pressure of 2 barg with Dry Air.
Line Up as per the HVAC Leak Test P&ID Mark Up in Appendix.
Fill the ITR given by ELOGEN.

4.2 Glycoled Water Filling

Here the steps:

For the Glycol charge:

1) Add corrosion inhibitor and biocide into the glycoled water mix
2) Checking the tightness of the pipes
3) Glycol filling is done via a filling valve and hose
4) Purge the air from the piping at a high point with the air bleeder.
5) Make sure there are no water leaks.
6) Open the valves of each equipment one by one (AHU, FCU, ..)
7) Let the pumps run for a few hours to continue to purge the air from the piping

Here the procedure Chiller charge:

1) Place the bottle on a scale to check the weight of the charge introduced.
2) Connect the bottle charging tap to the system charging tap without tightening the nut on the latter.
3) Open the bottle tap slightly to expel the air from the connecting pipe, then tighten the nut on the system tap.
4) Open the liquid charging tap on the fluid bottle.

During these operations, monitor the discharge pressure gauge. If the pressure rises abnormally due to an accumulation of fluid in the condenser, check the charge level using the level on the reservoir bottle.

5) Empty the charging pipe before dismantling by loosening its connection on the system charging tap (after closing the bottle tap). Let the compressor run for a few minutes to check the operation of the system.

4.3 Valve Pre-settings

Some manual valves need to be set at a certain position for operation, here the list, completion date is to be filled:

Valve Tag	Setting	Completion Date
MV-152	Set by PAUMIER	
MV-168	Set by PAUMIER	
MV-174	Set by PAUMIER	

This document contains confidential information which is the property of ELOGEN.

Equipment Factory Acceptance Test – FCU :

1. General inspection :

List of point to review	OK	NOK	Comments
External dimension check of each unit	☑	☐	W
Type plate present	☑	☐	W
Hydrostatic tests completed	☑	☐	hydrotest carried out before the FAT
Check the presence of all components (filter, fan, instrumentation)	☑	☐	W
Verification of the datasheets of each component	☑	☐	R (Document code 2 to be prepared for code 1)
Assembly walks down completed to verify completeness and accuracy of the assembled system.	☑	☐	W
The equipment complies with the plans transmitted (position of cable gland, battery drain, air inlet, air blowing …)	☑	☐	R / W (Document code 2 to be prepared for code 1)
Inspection and control of the maintenance manual of the equipment	☑	☐	I
Checking the internal wiring of the equipment	☑	☐	I => checked before the FAT

2. Operation inspection :

☑ Operation check of the fan for one unit (ON/OFF)

☑ Voltage check (230 V / 1P / 50 Hz)

Temperature measurements were not made because the FCUs were not connected to the chilled water network.

Air Flow tests will be controlled during commissioning in the installation environment.

The opening and closing test of the regulation valve will be realised on site.

3. Comments receive from Elogen to consider by Paumier :

Comments	Justifications
Provide the completed and signed manufacturing sheets	See annexe 1.1
Send test procedure commissioning	See document P.0608871.L.02.600
Equipment maintenance sheet to be send	See document P.0608871.L.02.408
Add 3 supports on the FCU suction for the proper operation of the filter	Paumier will supply more resistant filters (on site)
External dimension check of the unit	Paumier has checked compliance with document P.0608871.L.02.201
FCU Internal wiring	See document P.0608871.L.02.304 Folio 17

List of people present:

Paumier	Elogen
Laurent DEGRENNE	Ahmed RAZGUI
Olivier DELAHAIS	Hassan HAMMAMI
Robin LAMBERT	Maxime LAFARGUE
Julie ANQUETIL	
Baptiste CHIROIS	

FAT carried out on Tuesday September 3

Equipment Factory Acceptance Test – Pump skid :

1. General inspection :

List of point to review	OK	NOK	Comments
External dimension check of each unit	☑	☐	W
Type plate present	☐	☑	Pau will place it as per FORES planning
Hydrostatic tests completed	☑	☐	hydrotest carried out before the FAT
Check the presence of all components (pump, speed variator, instrumentation, …)	☑	☐	W
Verification of the datasheets of each component (pump, speed variator	☑	☐	R
Assembly walk down completed to verify completeness and accuracy of the assembled system.	☑	☐	W
The equipment complies with the plans transmitted (position of cable gland, battery drain, air inlet, air blowing …)	☑	☐	W / R
Inspection and control of the maintenance manual of the equipment	☑	☐	I
Checking the internal wiring of the equipment (we opened the interior of the variators)	☑	☐	I => checked before the FAT
Flange bolt tightening control	☑	☐	I
Pipe support strength control	☑	☐	I
Equipment wiring check and junction box connection.	☑	☐	I

2. Operation inspection :

The operation test will be realised on site during the commissioning. For the operation of the pump skid we require :

- the pump skids need to be connected to the chilled water and condensation network.the frequency variator and the junction box need to be wired to the HVAC electrical cabinet.

3. Comments receive from Elogen to consider by Paumier :

Comments	Justifications
Provide the completed and signed manufacturing sheets	See annexe 2.1
Send test procedure commissioning	See document P.0608871.L.02.601
Equipment maintenance manual to be sent	See document P.0608871.L.02.410
Electrical diagrams of the junction box to be sent	See annexe 2.2
Flexible insulation towards the expansion tank to comply with the PID to do	See picture n°1
Sign plate to be installed	Pau will put it as per FORES planning (on site)
Change variator fixation screw too short for the condensation pump skid	See picture n°2
Add a temporary rail to hold the pipes during transport	See picture n°3
Paumier has to confirm the tightening torque for tightening the nuts & add marker trace to be sure that the tightening is always good	See annexe 2.3
Make a calculation note pump support + piping supports the weight well See	See annexe 2.4
External dimension check of the unit	Agreed and implanted, checked by Paumier

List of people present :

Paumier	**Elogen**
Laurent DEGRENNE	Ahmed RAZGUI
Olivier DELAHAIS	Hassan HAMMAMI
Robin LAMBERT	Maxime LAFARGUE
Julie ANQUETIL	
Baptiste CHIROIS	

FAT carried out on Tuesday September 3

Equipment Factory Acceptance Test – duct networks and accessories :

1. General inspection :

List of point to review	OK	NOK	Comments
External dimension check for each piece of duct	☑	☐	W
Check of the assembly of the duct dry assembly on the ground	☑	☐	R
Check the quality of the insulation and the finish in isoxal sheet metal	☑	☐	R
Dimensional control of exhaust damper (regulation damper were not delivered at time for the FAT)	☑	☐	W

2. Comments receive from Elogen to consider by Paumier :

Comments	Justifications
Procedure for mounting sheets to send to help Fores (send Italian translation)	See document P.0608871.L.02.212
Detailed plan of the mounting of ducts to send by Paumier for Fores	See document P.0608871.L.02.212

11. Conclusion: 42

1. Presentation.

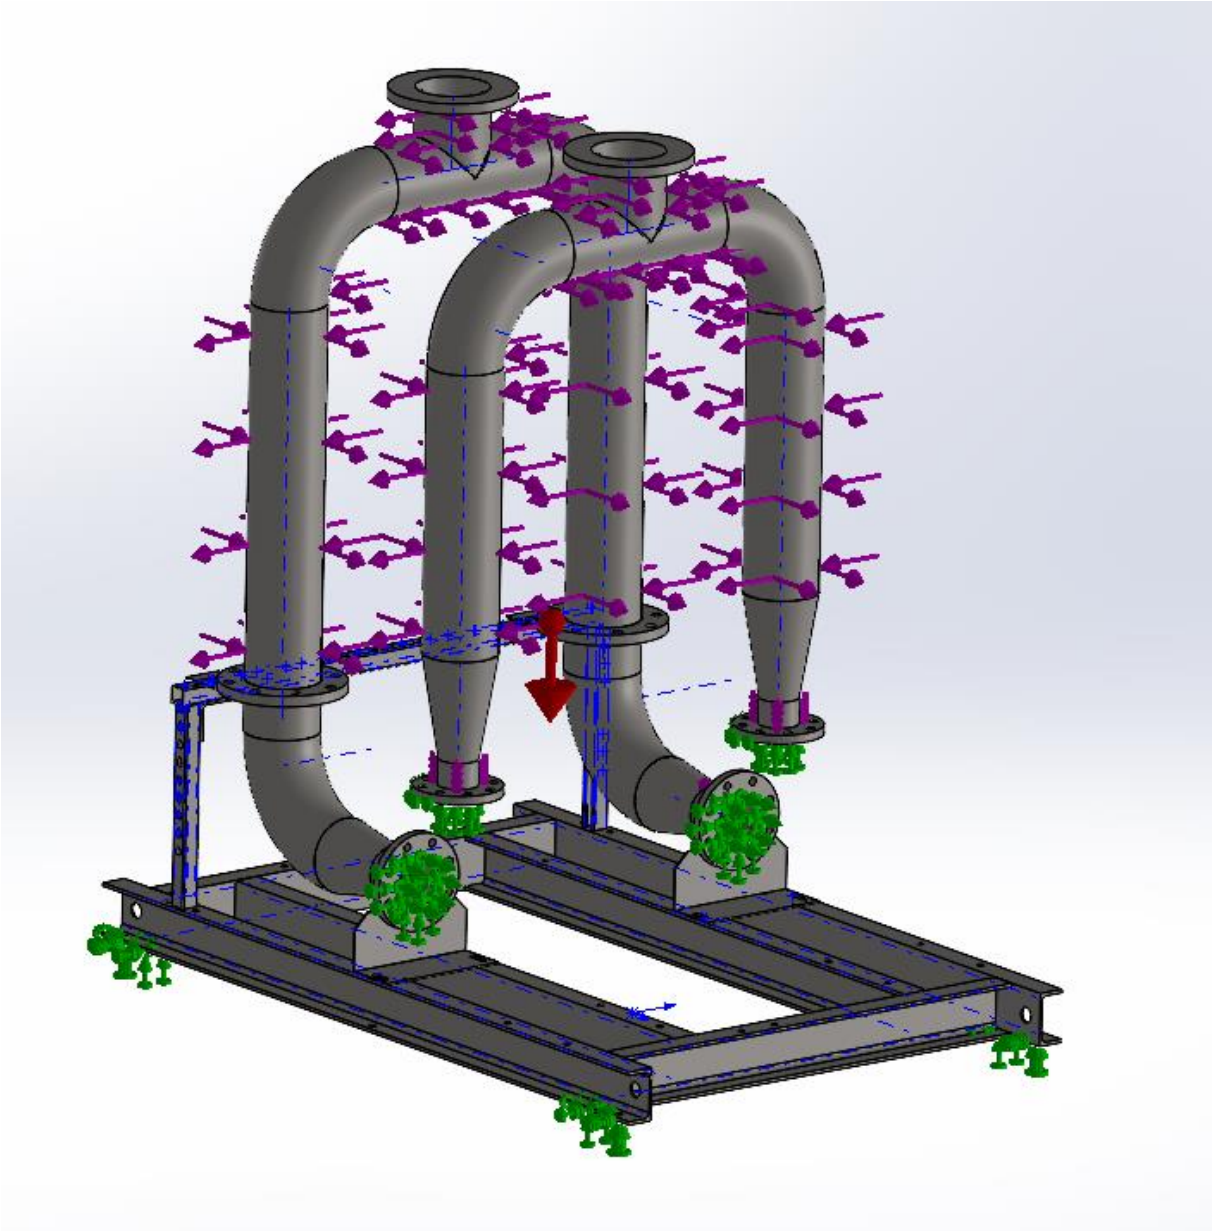
This document deals with the accelerations undergone by the condensation skid, its aim is to demonstrate that the pump body will accept the forces undergone during its movement during transit between the construction site in Italy and the offshore site in the Netherlands.

Photo of the condensation skid.

1.1. Calculation hypothesis .

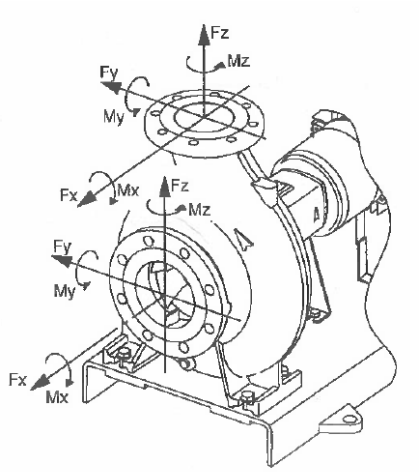
According to the document "CROSSWIND" we have applied the following values

Upper deck – roll	**+ / - 0.70 G**		**1G + / - 0.30 G**
Loadcase 1	-0.70 G in X		1.3 G Vertical
Loadcase 2	-0 .70 G in X		0.7 G vertical
Loadcase 3	+0.70 G in X		1.3 G Vertical
Loadcase 4	+0.70 G in X		0.7 G vertical
Upper deck -pitch		**+ / - 0.40 G**	**1G + / - 0.50 G**
Loadcase 5		-0.40 G in Y	1.5 G Vertical
Loadcase 6		-0.40 G in Y	0.5 G vertical
Loadcase 7		+0.40 G in Y	1.5 G Vertical
Loadcase 8		+0.40 G in Y	0.5 G vertical



Assumption	Direction 1	Direction 2
1	-0.7G in X	-0.4G in Y
2	-0.7G in X	+0.4G in Y
3	+0.7G in X	+0.4G in Y
4	+0.7G in X	-0.4G in y
5	-0.7G in X	+1.5G in Z
6	+0.7G in X	+1.5G in Z
7	-0.4G in Y	+1.5G in Z
8	+0.4G in Y	+1.5G in Z

We will start with a calculation hypothesis without the upper support of the pipes (suction and discharge) but keeping the lower supports on the suction pipe, in order to have values as close as possible to reality.



The efforts are applied to all the pipes

The two upper flanges are free without piping connected on top, the 4 flanges on the pump bodies will be fixed in order to be able to obtain the constraints at the foot of the pumps and to determine by hypothesis the moments applied to the pump body .

The study is carried out according to plan P.0608871.L.02.207.

2.Supplier data on the pump body.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)

3. Condensation pump skid data.

Pipe material: 304L stainless steel with a yield strength of 206.8MPa

Pipe diameter Ø168.3 thickness 2

Pump reference: NB 80-160/151 AASF2KESBQQEOW1

Weight of the vacuum suction pipe 100kg.

Weight of the discharge pipe when empty 40kg

Weight of suction piping with accelerations:

X: 100+(100x0.7) =170kg or 1700N

Y: 100+(100x0.4) =140kg or 1400 N

Z: 100+(100x1.5) = 250 or 2500 N

Weight of the discharge pipe with accelerations:

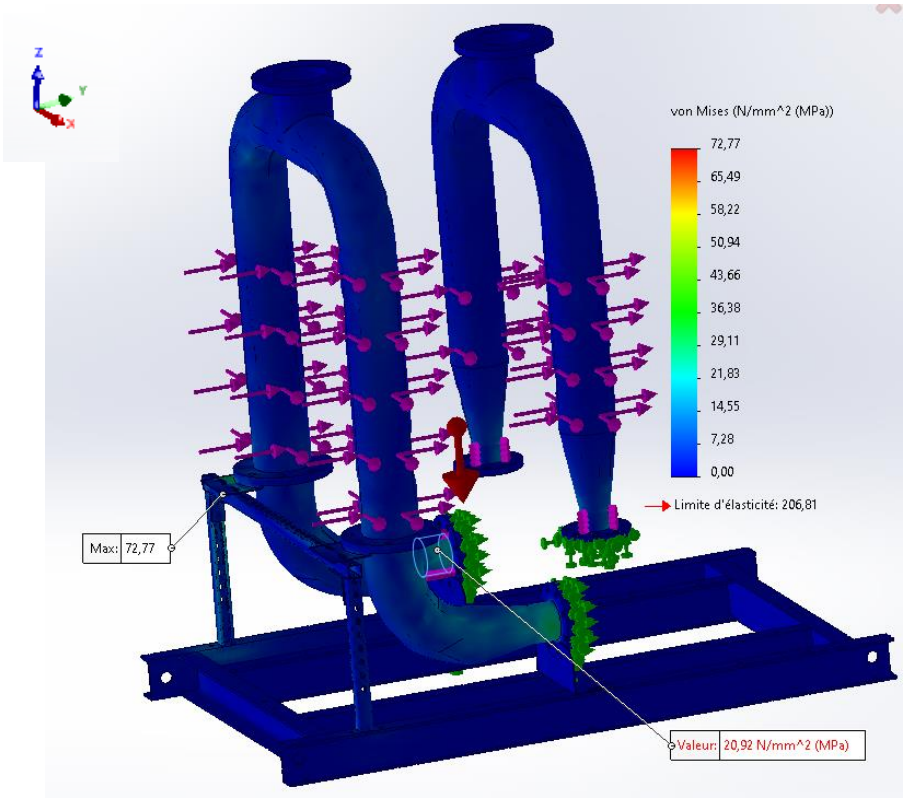
X: 40+(40x0.7) =68kg or 680 N

Y: 40+(40x0.4) =56kg or 560 N

Z: 40+(40x1.5) = 100kg or 1000 N

4. Hypothesis 1 (-X, -Y).

As a reminder, hypothesis 1 = -0.7G in X combined with -0.4G in Y.



Which gives us:

	Suction piping	Discharge piping
X	-1700N	-680N
Y	-1400N	-560N

4.1 Calculation of the maximum stress on the suction pipe:

4.1.1 result on the suction pipe:

We can observe a maximum stress of 72.77 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 20.92 MPa (maximum value exerted on the suction sleeve at the foot of the pump)

4.1.2 Calculation of the moment at the pump body inlet.

Input data:

σ = Maximum stress 20.92MPa or 20.92N/mm2

R= Radius of piping at the foot of the pump R= 57.15mm=0.0571m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 1300 points on a surface of 28008.6mm2

$$A = \frac{28008.6}{218}$$

$$A = 21.5mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 20.92 MPa at the level of the cuff at the foot of the pump applied on a surface of 21.5 mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 20.92 * 21.5$$

$$F = 449.78N$$

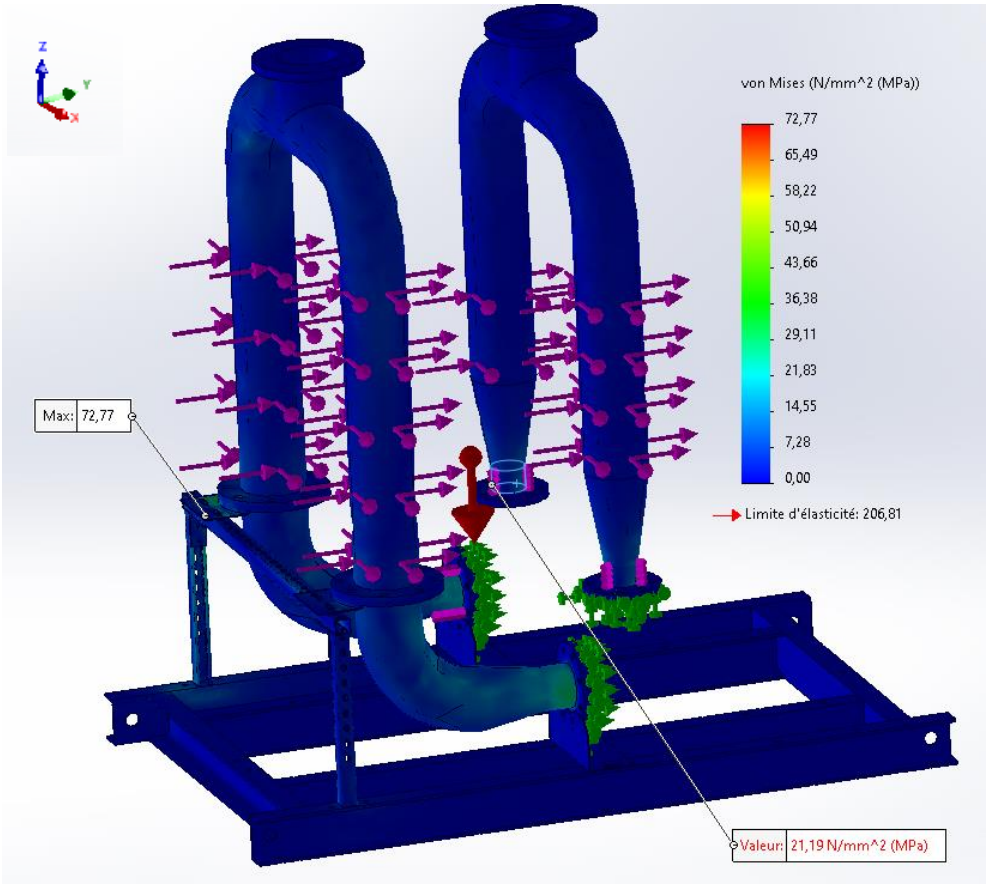
Knowing that the piping at the foot of the pump has a radius of 0.0571m we can deduce the distributed moment:

$$M = F * R$$

$$M = 516 * 0.0571$$

$$M = 25.68N/m$$

4.1.3 conclusions for the suction piping:



We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	100	1890	2345	2100	3675	875	1015	1225	1820

4.2 Calculation of the maximum stress on the discharge pipe:

4.2.1 result on the discharge pipe:

We can observe a maximum stress of 72.77 MPa, the stress is located at a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 21.19 MPa (maximum value exerted on the discharge sleeve at the foot of the pump).

4. 2.2 Calculation of the moment at the pump body inlet .

Input data:

σ = Maximum stress 21.19MPa or 21.19N/mm2

R= Radius of piping at the foot of the pump R= 44.45mm=0.04445m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 816 points on a surface of 16478mm2

$$A = \frac{16478}{816}$$

$$A = 20mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 21.19 MPa at the level of the cuff at the foot of the pump applied on a surface of 20mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 21.19 * 20$$

$$F = 423.8N$$

Knowing that the piping at the foot of the pump has a radius of 0.04445m we can deduce the distributed moment:

$$M = F * R$$

$$M = 423.8 * 0.04445$$

$$M = 18.83N/m$$

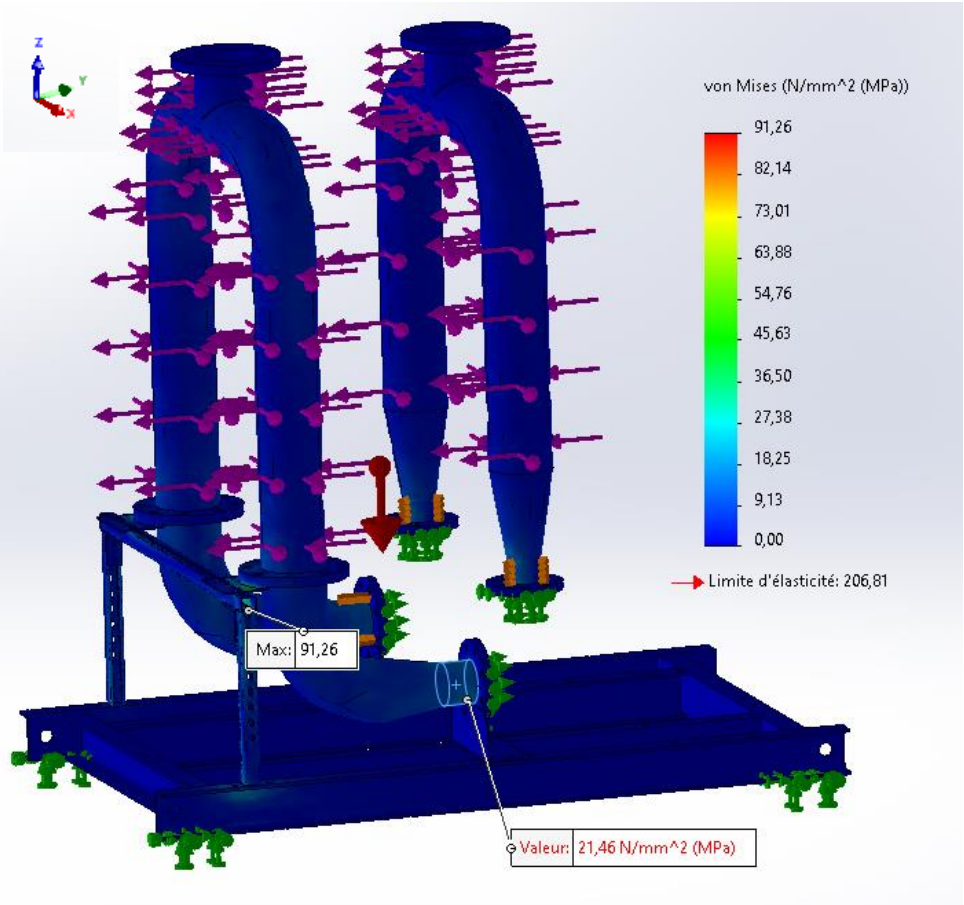
4.2.3 conclusions for the discharge piping:

We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	80	1575	1435	1750	2765	805	910	1120	1645

5. Hypothesis 2 (-X, +Y).

As a reminder, hypothesis 1 = -0.7G in X combined with +0.4G in Y.



Which gives us:

	Suction piping	Discharge piping
X	-1700N	-680N
Y	+1400N	+560N

5.1 Calculation of the maximum stress on the suction pipe:

5.1.1 result on the suction pipe:

We can observe a maximum stress of 91.26 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 21.46 MPa (maximum value exerted on the suction sleeve at the foot of the pump)

5.1.2 Calculation of the moment at the pump body inlet.

Input data:

σ = Maximum stress 21.46MPa or 21.46N/mm2

R= Radius of piping at the foot of the pump R= 57.15mm=0.0571m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 1300 points on a surface of 28008.6mm2

$$A = \frac{28008.6}{1300}$$

$$A = 21.5mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 21.46 MPa at the level of the cuff at the foot of the pump applied on a surface of 21.5mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 21.46 * 21.5$$

$$F = 461.4N$$

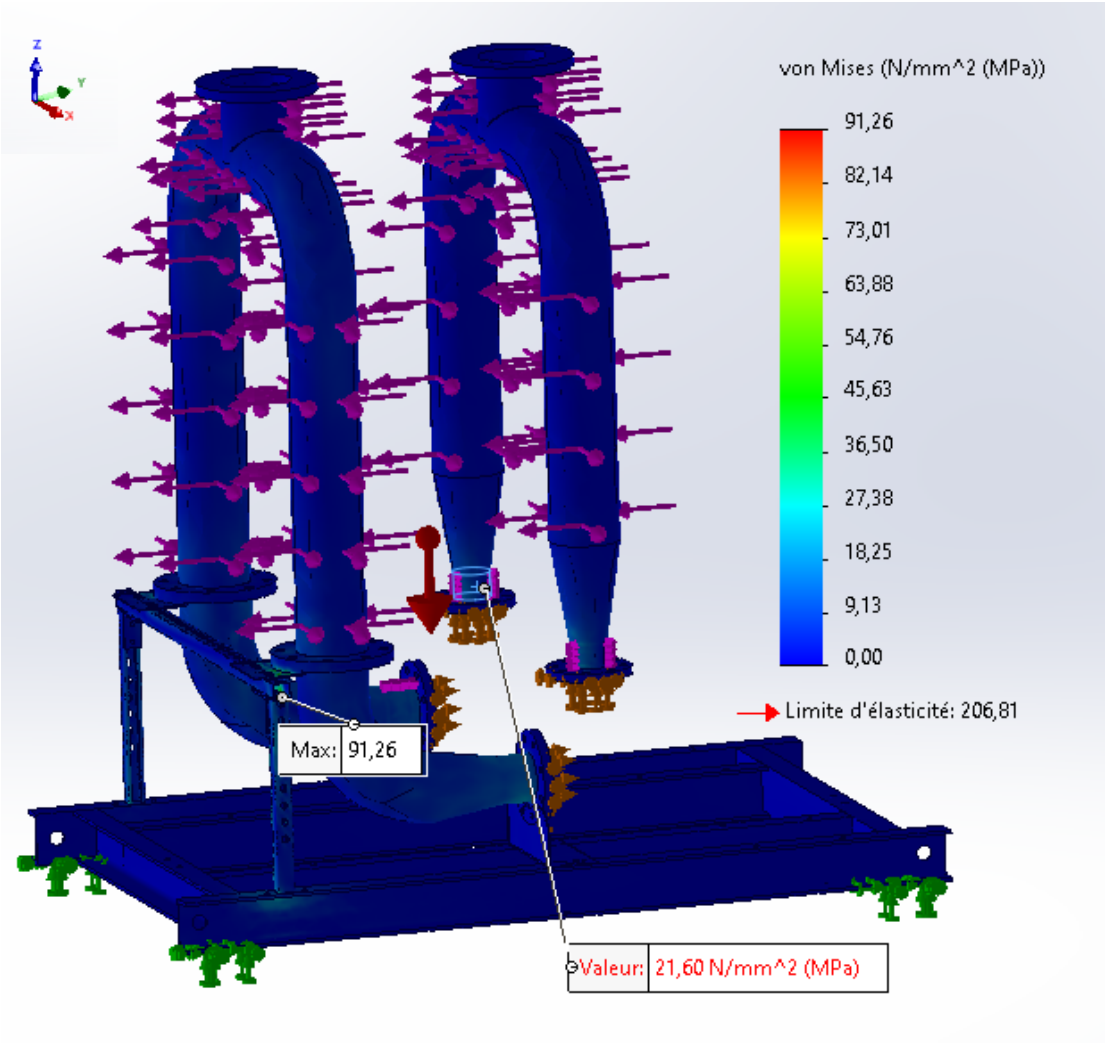
Knowing that the piping at the foot of the pump has a radius of 0.0571m we can deduce the distributed moment:

$$M = F * R$$

$$M = 461.4 * 0.0571$$

$$M = 26.3N/m$$

5.1.3 conclusions for the suction piping:



We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	100	1890	2345	2100	3675	875	1015	1225	1820

5.2 Calculation of the maximum stress on the discharge pipe:

5.2.1 result on the discharge pipe:

We can observe a maximum stress of 91.26 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 21.6 MPa (maximum value exerted on the discharge sleeve at the foot of the pump)

5.2.2 Calculation of the moment at the pump body inlet .

Input data:

σ = Maximum stress 21.6 MPa or 21.6 N/mm2

R= Radius of piping at the foot of the pump R= 44.45mm=0.04445m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 816 points on a surface of 16478mm2

$$A = \frac{16478}{816}$$

$$A = 20.2mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 21.6 MPa at the cuff level on a surface of 20.2mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 21.6 * 20.2$$

$$F = 436.3N$$

Knowing that the piping at the foot of the pump has a radius of 0.04445m we can deduce the distributed moment:

$$M = F * R$$

$$M = 436.3 * 0.04445$$

$$M = 19.39N/m$$

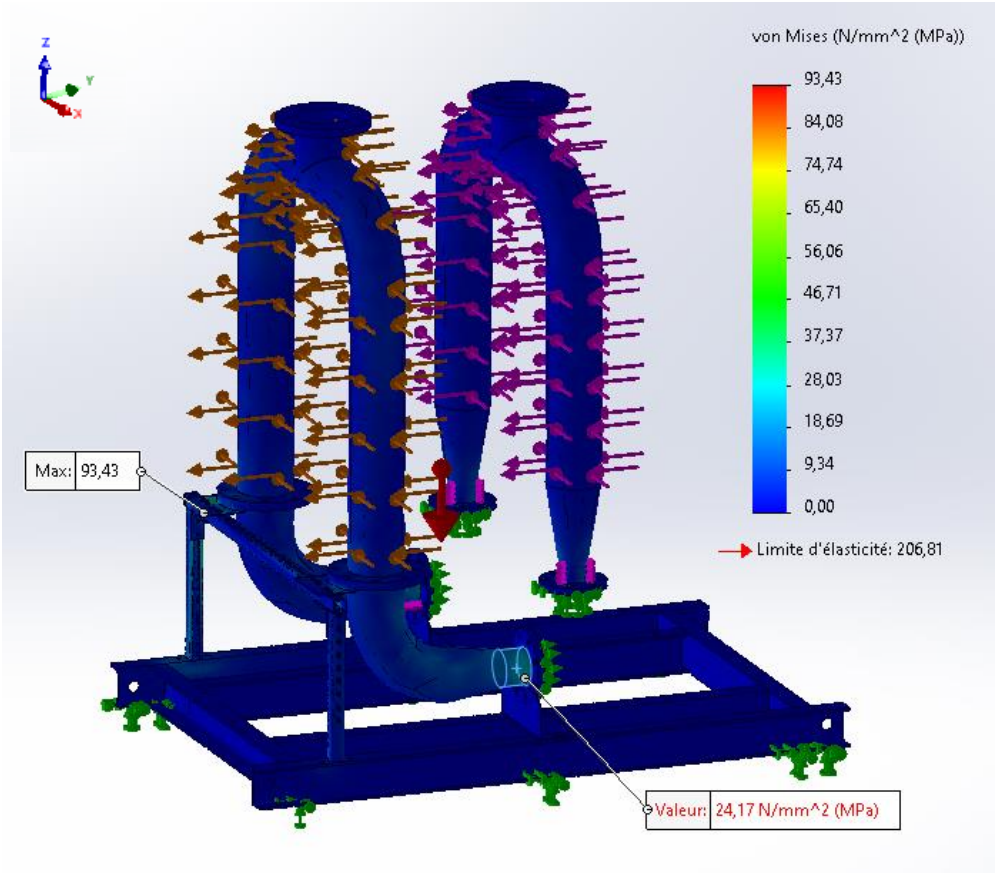
5.2.3 conclusions for the discharge piping:

We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	80	1575	1435	1750	2765	805	910	1120	1645

6. Hypothesis 3 (+X, +Y).

As a reminder, hypothesis 1 = +0.7G in X combined with +0.4G in Y.



Which gives us:

	Suction piping	Discharge piping
X	+1700N	+680N
Y	+1400N	+560N

6.1 Calculation of the maximum stress on the suction pipe:

6.1.1 result on the suction pipe:

We can observe a maximum stress of 93.43 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 24.17 MPa (maximum value exerted on the suction sleeve at the foot of the pump)

6.1.2 Calculation of the moment at the pump body inlet.

Input data:

σ = Maximum stress 24.17MPa or 24.17N/mm2

R= Radius of piping at the foot of the pump R= 57.15mm=0.0571m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 1300 points on a surface of 28008.6mm2

$$A = \frac{28008.6}{1300}$$

$$A = 21.5mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 24.17 MPa at the level of the cuff at the foot of the pump applied on a surface of 21.5mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 24.17 * 21.5$$

$$F = 519.65N$$

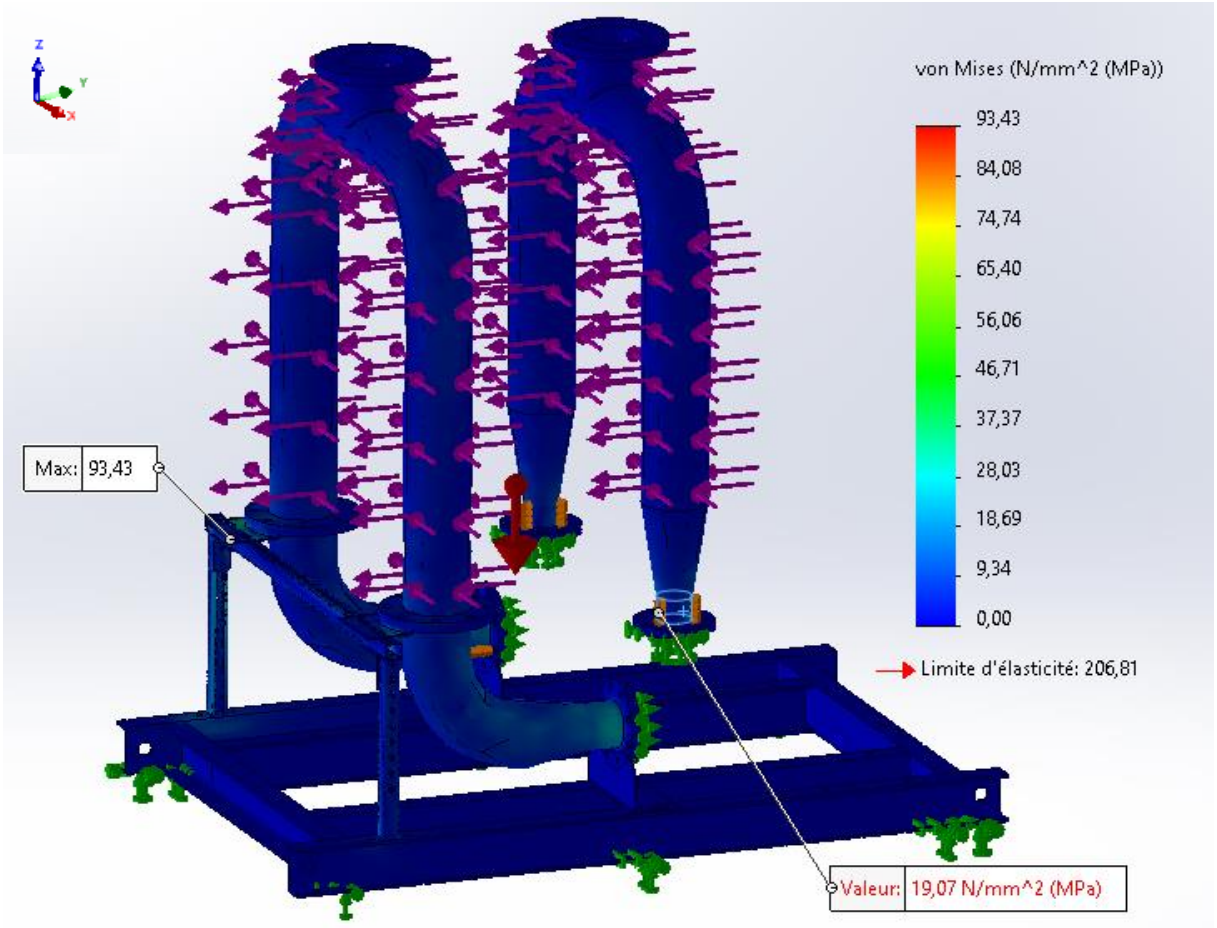
Knowing that the piping at the foot of the pump has a radius of 0.0571m we can deduce the distributed moment:

$$M = F * R$$

$$M = 519.65 * 0.0571$$

$$M = 29.67N/m$$

6.1.3 conclusions for the suction piping:



We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	100	1890	2345	2100	3675	875	1015	1225	1820

6.2 Calculation of the maximum stress on the discharge pipe:

6.2.1 result on the discharge pipe:

We can observe a maximum stress of 93.43 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 19.07 MPa (maximum value exerted on the discharge sleeve at the foot of the pump)

6. 2 . 2 Calculation of the moment at the pump body inlet.

Input data:

σ = Maximum stress 19.07 MPa or 19.07 N/mm2

R= Radius of piping at the foot of the pump R= 44.45mm=0.04445m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 816 points on a surface of 16478mm2

$$A = \frac{16478}{816}$$

$$A = 20.2mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 19.07 MPa at the level of the cuff on a surface of 20.2mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 19.07 * 20.2$$

$$F = 385.2N$$

Knowing that the piping at the foot of the pump has a radius of 0.04445m we can deduce the distributed moment:

$$M = F * R$$

$$M = 385.2 * 0.04445$$

$$M = 17.1N/m$$

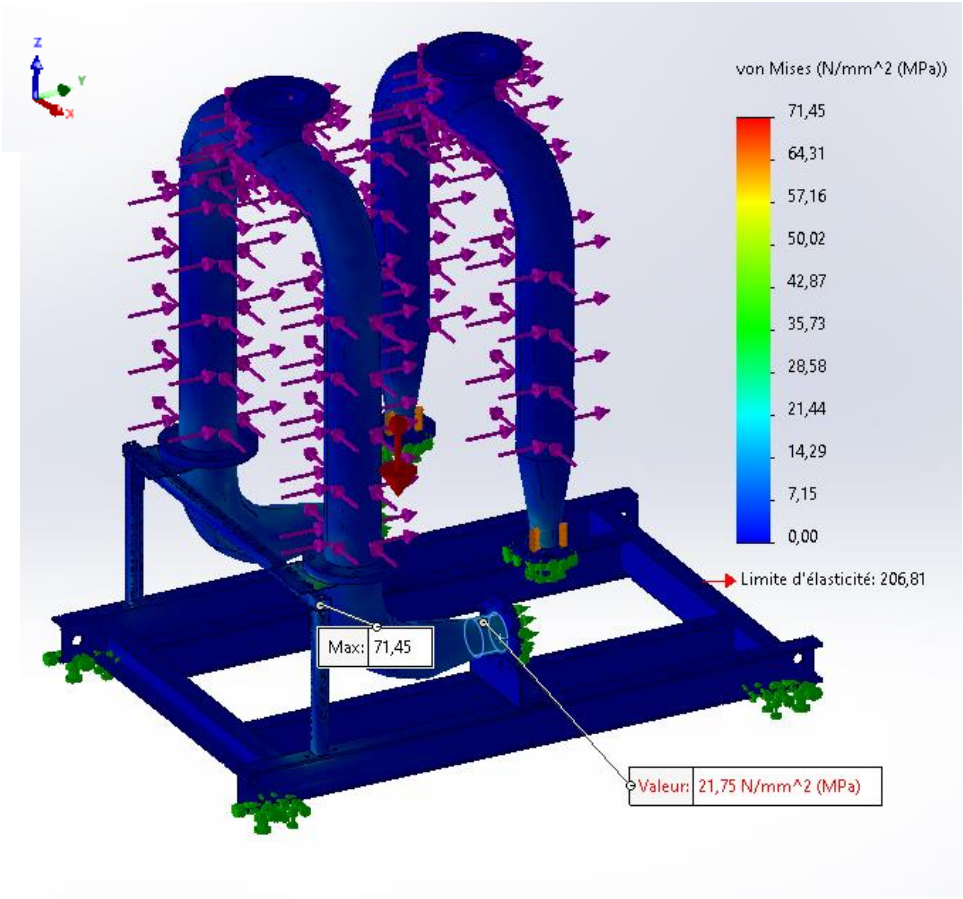
6.2.3 conclusions for the discharge piping:

We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	80	1575	1435	1750	2765	805	910	1120	1645

7. Hypothesis 4 (+X, -Y).

As a reminder, hypothesis 1 = +0.7G in X combined with -0.4G in Y.



Which gives us:

	Suction piping	Discharge piping
X	+1700N	+680N
Y	-1400N	-560N

7.1 Calculation of the maximum stress on the suction pipe:

7.1.1 result on the suction pipe:

We can observe a maximum stress of 71.45 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 21.75 MPa (maximum value exerted on the suction sleeve at the foot of the pump)

7.1.2 Calculation of the moment at the pump body inlet.

Input data:

σ = Maximum stress 21.75MPa or 21.75 N/mm2

R= Radius of piping at the foot of the pump R= 57.15mm=0.0571m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 1300 points on a surface of 28008.6mm2

$$A = \frac{28008.6}{1300}$$

$$A = 21.5mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 24.17 MPa at the level of the cuff at the foot of the pump applied on a surface of 21.5mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 21.75 * 21.5$$

$$F = 467.6N$$

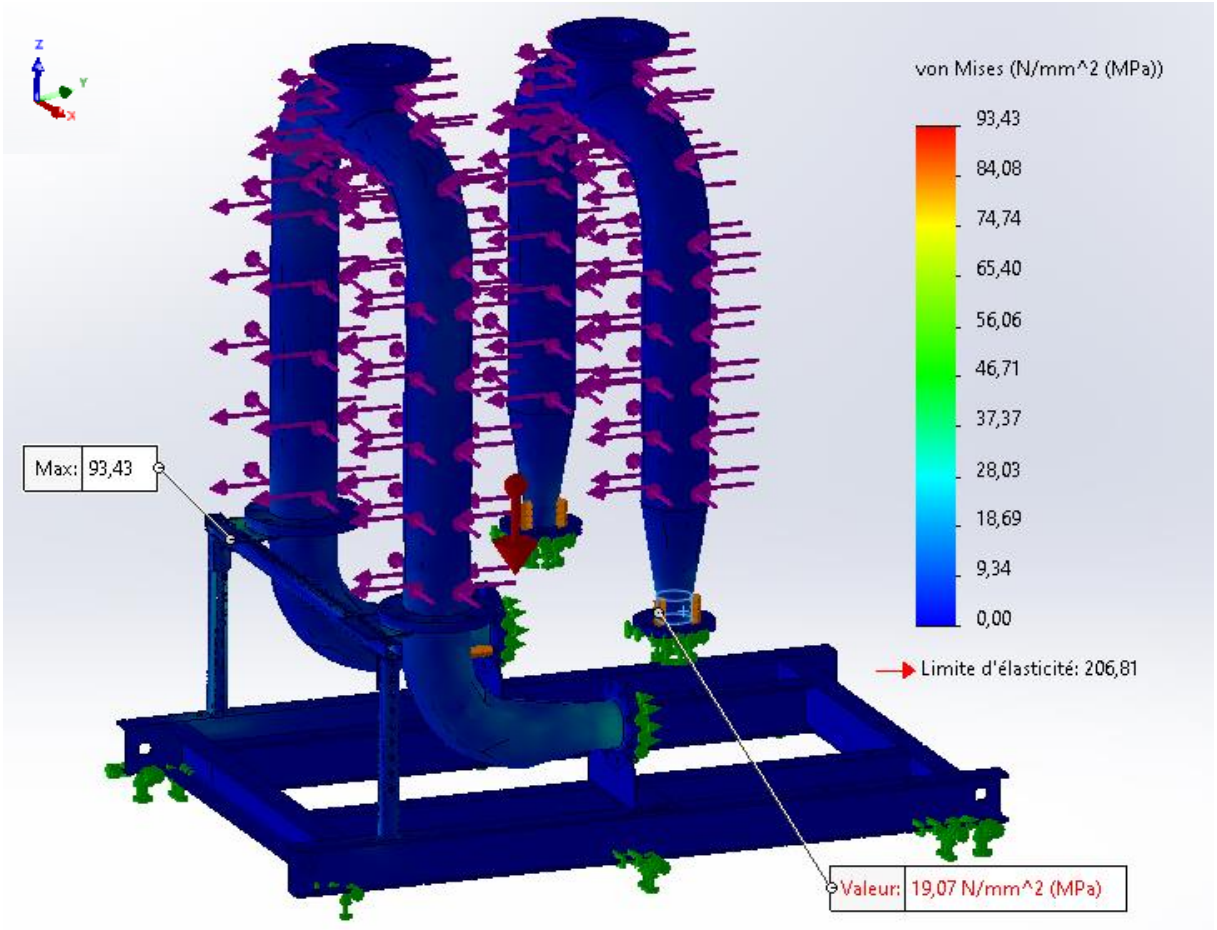
Knowing that the piping at the foot of the pump has a radius of 0.0571m we can deduce the distributed moment:

$$M = F * R$$

$$M = 467.6 * 0.0571$$

$$M = 26.7N/m$$

7.1.3 conclusions for the suction piping:



We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	100	1890	2345	2100	3675	875	1015	1225	1820

7.2 Calculation of the maximum stress on the discharge pipe:

7.2.1 result on the discharge pipe:

We can observe a maximum stress of 71.45 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 19.13 MPa (maximum value exerted on the discharge sleeve at the foot of the pump)

7.2.2 Calculation of the moment at the pump body inlet .

Input data:

σ = Maximum stress 19.13 MPa or 19.13 N/mm2

R= Radius of piping at the foot of the pump R= 44.45mm=0.04445m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 816 points on a surface of 16478mm2

$$A = \frac{16478}{816}$$

$$A = 20.2mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 19.07 MPa at the level of the cuff on a surface of 20.2mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 19.13 * 20.2$$

$$F = 386.4N$$

Knowing that the piping at the foot of the pump has a radius of 0.04445m we can deduce the distributed moment:

$$M = F * R$$

$$M = 386.4 * 0.04445$$

$$M = 17.17N/m$$

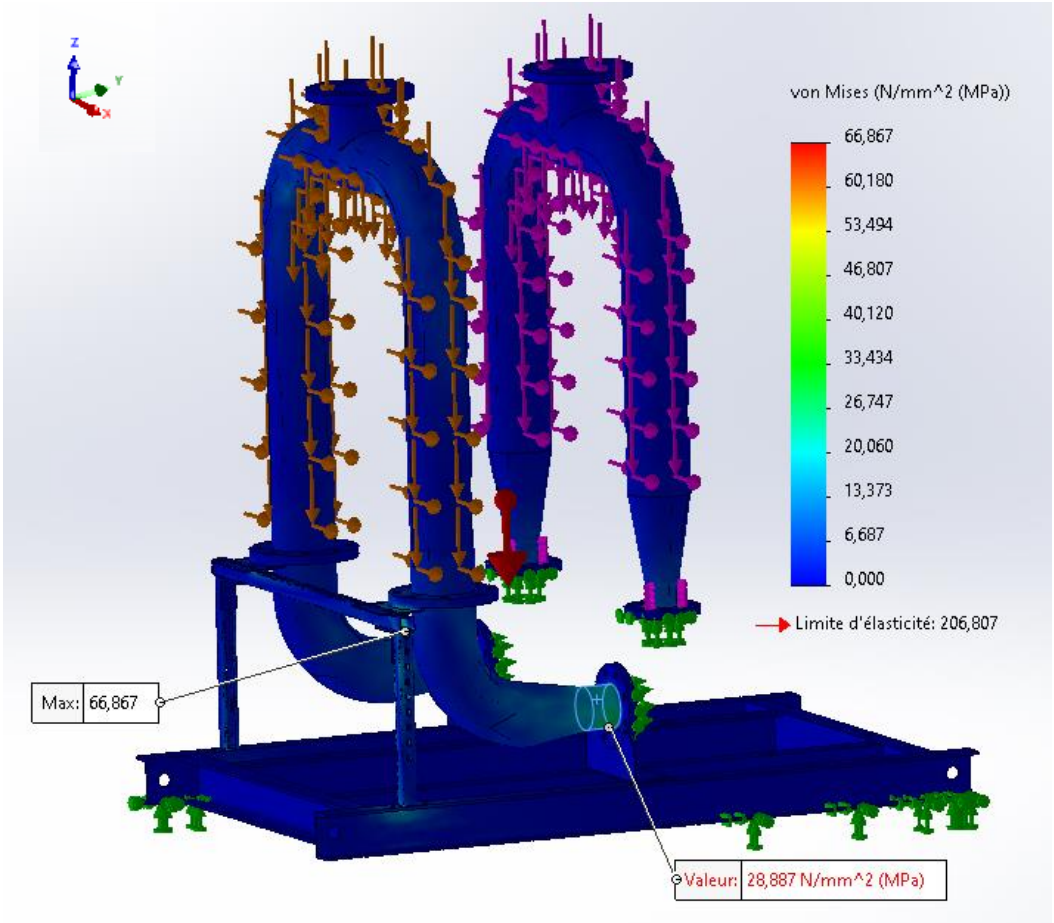
7.2.3 conclusions for the discharge piping:

We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	80	1575	1435	1750	2765	805	910	1120	1645

8. Hypothesis 5 (-X, +Z).

As a reminder, hypothesis 1 = -0.7G in X combined with +1.5G in Z.



Which gives us:

	Suction piping	Discharge piping
X	-1700N	-680N
Z	+2500N	+1000N

7.1 Calculation of the maximum stress on the suction pipe:

7.1.1 result on the suction pipe:

We can observe a maximum stress of 66.87 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 28.89 MPa (maximum value exerted on the suction sleeve at the foot of the pump)

7.1.2 Calculation of the moment at the pump body inlet.

Input data:

σ = Maximum stress 28.89MPa or 28.89 N/mm2

R= Radius of piping at the foot of the pump R= 57.15mm=0.0571m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 1300 points on a surface of 28008.6mm2

$$A = \frac{28008.6}{1300}$$

$$A = 21.5mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 28.89 MPa at the level of the cuff at the foot of the pump applied on a surface of 21.5mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 28.89 * 21.5$$

$$F = 621.1N$$

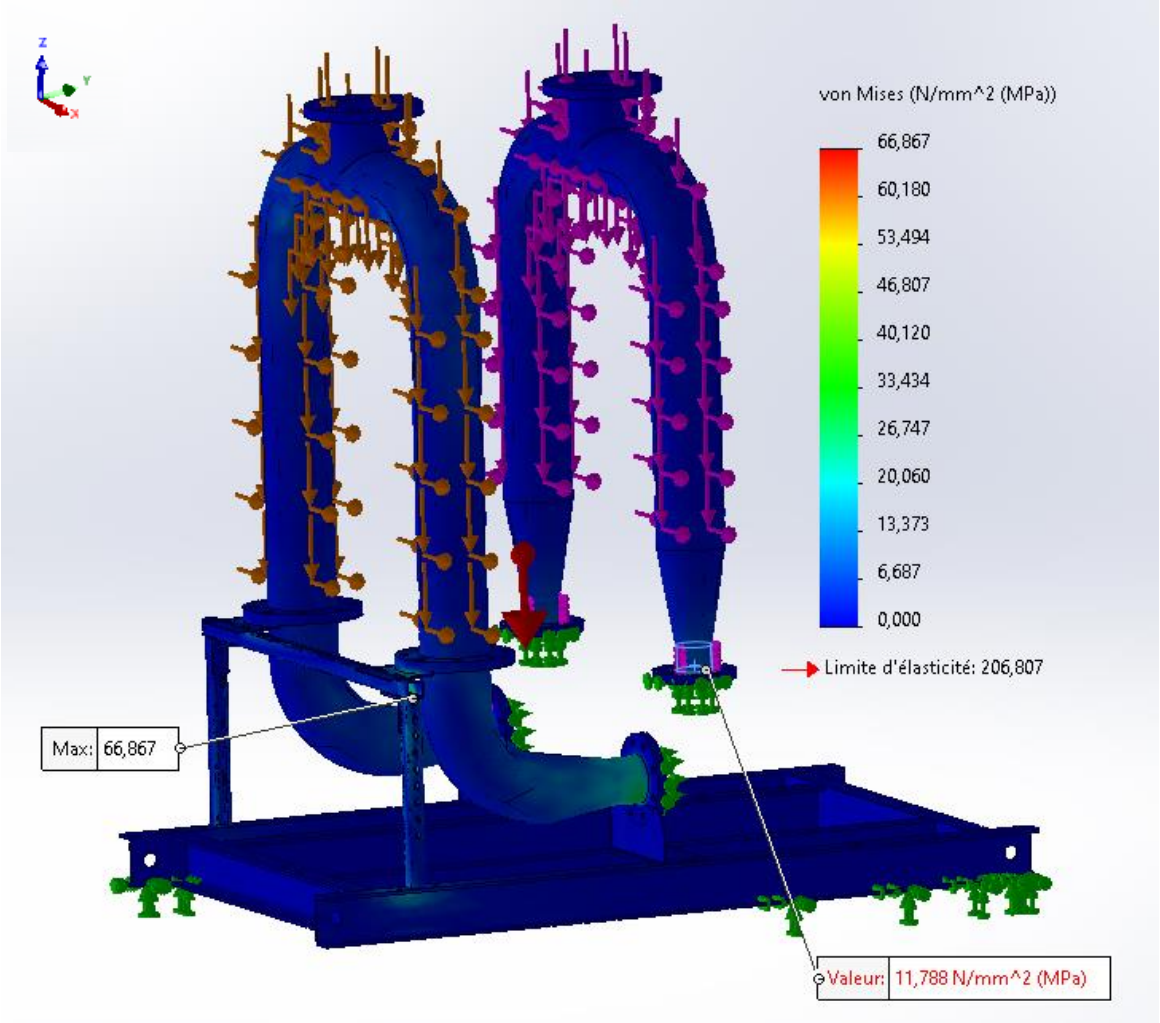
Knowing that the piping at the foot of the pump has a radius of 0.0571m we can deduce the distributed moment:

$$M = F * R$$

$$M = 621.1 * 0.0571$$

$$M = 35.4N/m$$

7.1.3 conclusions for the suction piping:



We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	100	1890	2345	2100	3675	875	1015	1225	1820

7.2 Calculation of the maximum stress on the discharge pipe:

7.2.1 result on the discharge pipe:

We can observe a maximum stress of 66.86 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 11.79 MPa (maximum value exerted on the discharge sleeve at the foot of the pump)

7.2.2 Calculation of the moment at the pump body inlet .

Input data:

σ = Maximum stress 11.78 MPa or 11.78 N/mm2

R= Radius of piping at the foot of the pump R= 44.45mm=0.04445m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 816 points on a surface of 16478mm2

$$A = \frac{16478}{816}$$

$$A = 20.2mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 11.78 MPa at the level of the cuff on a surface of 20.2mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 11.78 * 20.2$$

$$F = 237.96N$$

Knowing that the piping at the foot of the pump has a radius of 0.04445m we can deduce the distributed moment:

$$M = F * R$$

$$M = 386.4 * 0.04445$$

$$M = 10.58N/m$$

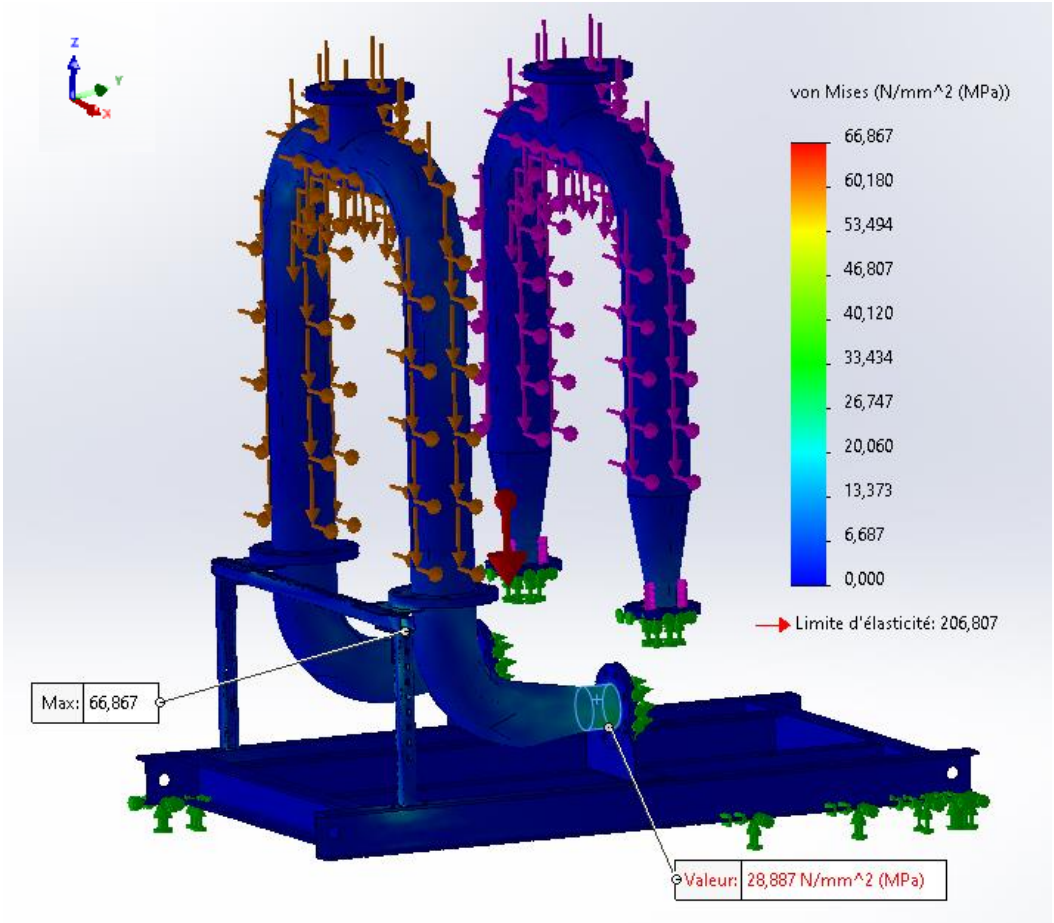
7.2.3 conclusions for the discharge piping:

We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	80	1575	1435	1750	2765	805	910	1120	1645

8. Hypothesis 6 (+X, +Z).

As a reminder, hypothesis 1 = +0.7G in X combined with +1.5G in Z.



Which gives us:

	Suction piping	Discharge piping
X	+1700N	+680N
Z	+2500N	+1000N

8.1 Calculation of the maximum stress on the suction pipe:

8.1.1 result on the suction pipe:

We can observe a maximum stress of 68.05 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 22.18 MPa (maximum value exerted on the suction sleeve at the foot of the pump)

8.1.2 Calculation of the moment at the pump body inlet.

Input data:

σ = Maximum stress 22.18 MPa or 22.18 N/mm2

R= Radius of piping at the foot of the pump R= 57.15mm=0.0571m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 1300 points on a surface of 28008.6mm2

$$A = \frac{28008.6}{1300}$$

$$A = 21.5mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 28.89 MPa at the level of the cuff at the foot of the pump applied on a surface of 21.5mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 22.18 * 21.5$$

$$F = 476.9N$$

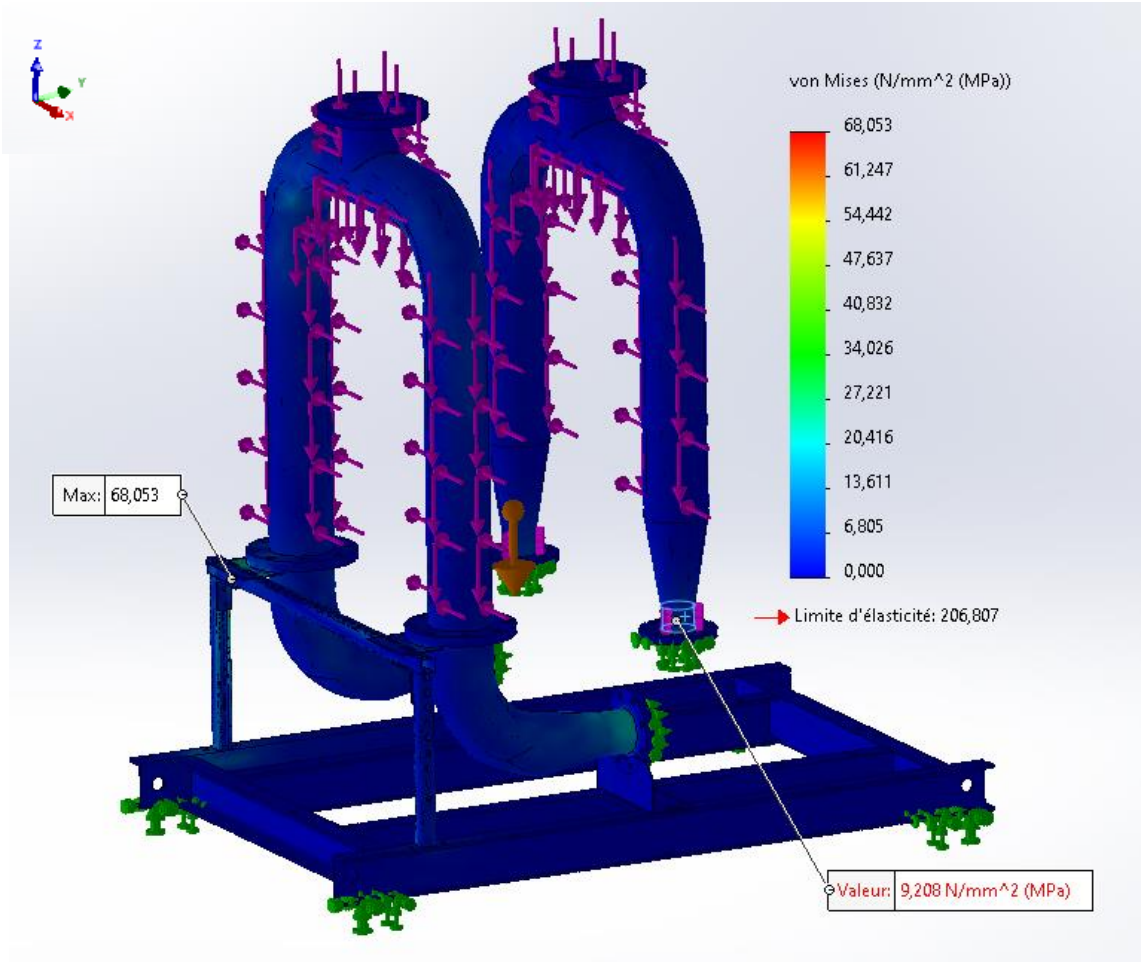
Knowing that the piping at the foot of the pump has a radius of 0.0571m we can deduce the distributed moment:

$$M = F * R$$

$$M = 621.1 * 0.0571$$

$$M = 27.23N/m$$

8.1.3 conclusions for the suction piping:



We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	100	1890	2345	2100	3675	875	1015	1225	1820

8.2 Calculation of the maximum stress on the discharge pipe:

8.2.1 result on the discharge pipe:

We can observe a maximum stress of 68.05 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 9.2 MPa (maximum value exerted on the discharge sleeve at the foot of the pump)

8.2.2 Calculation of the moment at the pump body inlet .

Input data:

σ = Maximum stress 9.2 MPa or 9.2 N/mm2

R= Radius of piping at the foot of the pump R= 44.45mm=0.04445m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 816 points on a surface of 16478mm2

$$A = \frac{16478}{816}$$

$$A = 20.2mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 11.78 MPa at the level of the cuff on a surface of 20.2mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 9.2 * 20.2$$

$$F = 185.8N$$

Knowing that the piping at the foot of the pump has a radius of 0.04445m we can deduce the distributed moment:

$$M = F * R$$

$$M = 185.8 * 0.04445$$

$$M = 8.26N/m$$

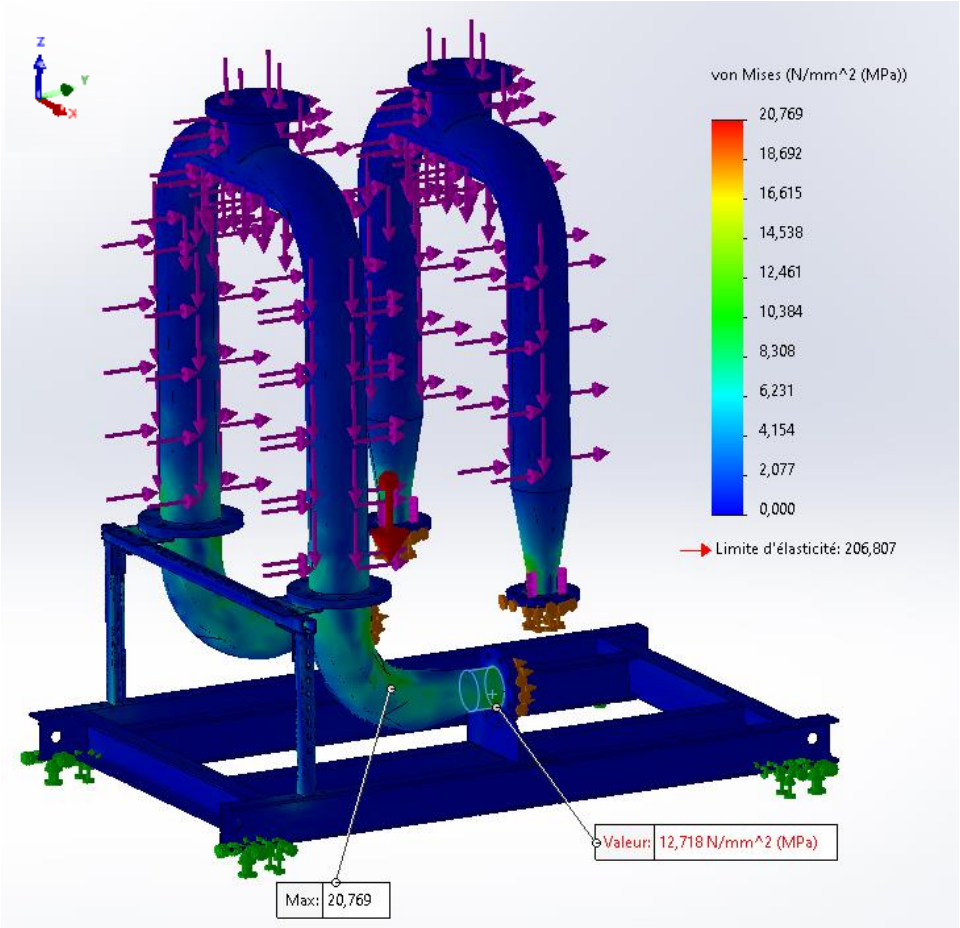
8.2.3 conclusions for the discharge piping:

We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	80	1575	1435	1750	2765	805	910	1120	1645

9. Hypothesis 7 (-Y, +Z).

As a reminder, hypothesis 1 = -0.4G in Y combined with +1.5G in Z.



Which gives us:

	Suction piping	Discharge piping
Y	-1400N	-560N
Z	+2500N	+1000N

9.1 Calculation of the maximum stress on the suction pipe:

9.1.1 result on the suction pipe:

We can observe a maximum stress of 20.77 MPa, the stress is located on the suction elbow, the stress which interests us to determine if the pump body is capable of holding the required stress is 12.72 MPa (maximum value exerted on the suction sleeve at the foot of the pump)

9.1.2 Calculation of the moment at the pump body inlet.

Input data:

σ = Maximum stress 12.72 MPa or 12.72 N/mm2

R= Radius of piping at the foot of the pump R= 57.15mm=0.0571m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 1300 points on a surface of 28008.6mm2

$$A = \frac{28008.6}{1300}$$

$$A = 21.5mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 28.89 MPa at the level of the cuff at the foot of the pump applied on a surface of 21.5mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 12.72 * 21.5$$

$$F = 273.48N$$

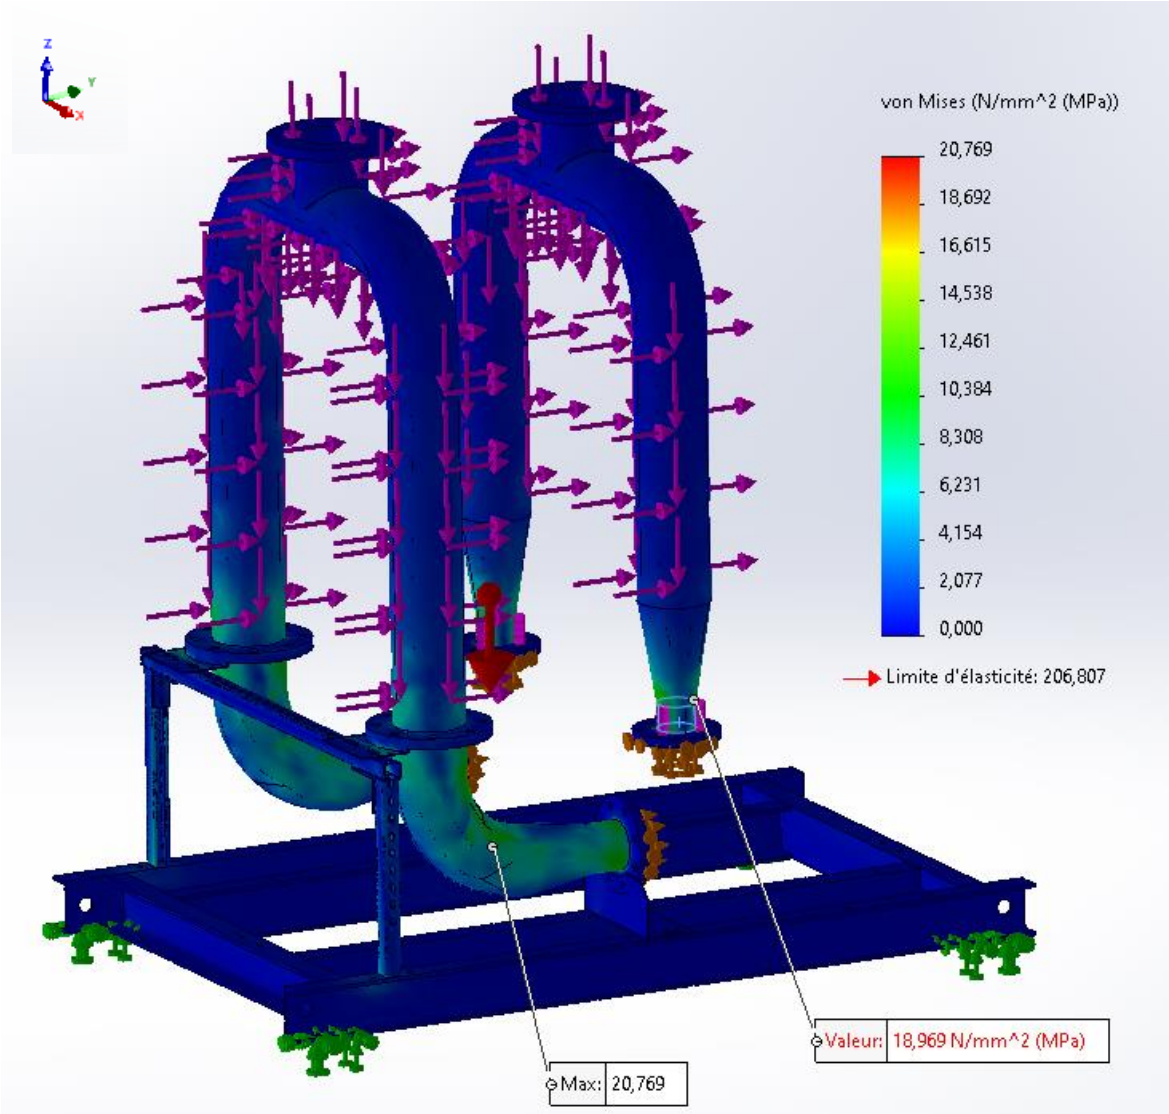
Knowing that the piping at the foot of the pump has a radius of 0.0571m we can deduce the distributed moment:

$$M = F * R$$

$$M = 273.48 * 0.0571$$

$$M = 15.62N/m$$

9.1.3 conclusions for the suction piping:



We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	100	1890	2345	2100	3675	875	1015	1225	1820

9.2 Calculation of the maximum stress on the discharge pipe:

9.2.1 result on the discharge pipe:

We can observe a maximum stress of 20.77 MPa, the stress is located on the suction elbow, the stress which interests us to determine if the pump body is capable of holding the required stress is 18.97 MPa (maximum value exerted on the suction sleeve at the foot of the pump)

9.2.2 Calculation of the moment at the pump body inlet .

Input data:

σ = Maximum stress 18.97 MPa or 18.97 N/mm2

R= Radius of piping at the foot of the pump R= 44.45mm=0.04445m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 816 points on a surface of 16478mm2

$$A = \frac{16478}{816}$$

$$A = 20.2mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 11.78 MPa at the level of the cuff on a surface of 20.2mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 18.97 * 20.2$$

$$F = 383.2N$$

Knowing that the piping at the foot of the pump has a radius of 0.04445m we can deduce the distributed moment:

$$M = F * R$$

$$M = 383.2 * 0.04445$$

$$M = 17N/m$$

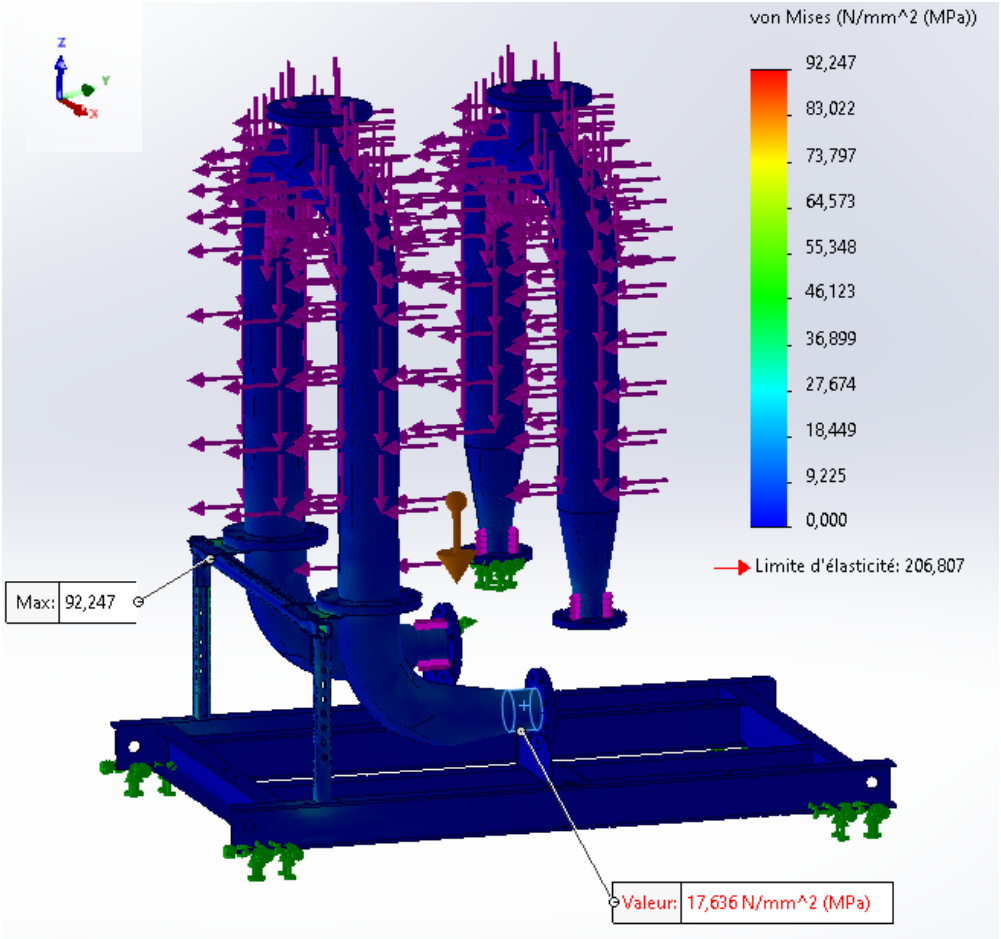
9.2.3 conclusions for the discharge piping:

We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	80	1575	1435	1750	2765	805	910	1120	1645

10. Hypothesis 8 (+Y, +Z).

As a reminder, hypothesis 1 = +0.4G in Y combined with +1.5G in Z.



Which gives us:

	Suction piping	Discharge piping
Y	+1400N	+560N
Z	+2500N	+1000N

10.1 Calculation of the maximum stress on the suction pipe:

10.1.1 result on the suction pipe:

We can observe a maximum stress of 92.2 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 17.6 MPa (maximum value exerted on the discharge sleeve at the foot of the pump)

10.1.2 Calculation of the moment at the pump body inlet.

Input data:

σ = Maximum stress 17.6 MPa or 17.6 N/mm2

R= Radius of piping at the foot of the pump R= 57.15mm=0.0571m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 1300 points on a surface of 28008.6mm2

$$A = \frac{28008.6}{1300}$$

$$A = 21.5mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 28.89 MPa at the level of the cuff at the foot of the pump applied on a surface of 21.5mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 17.6 * 21.5$$

$$F = 378.4N$$

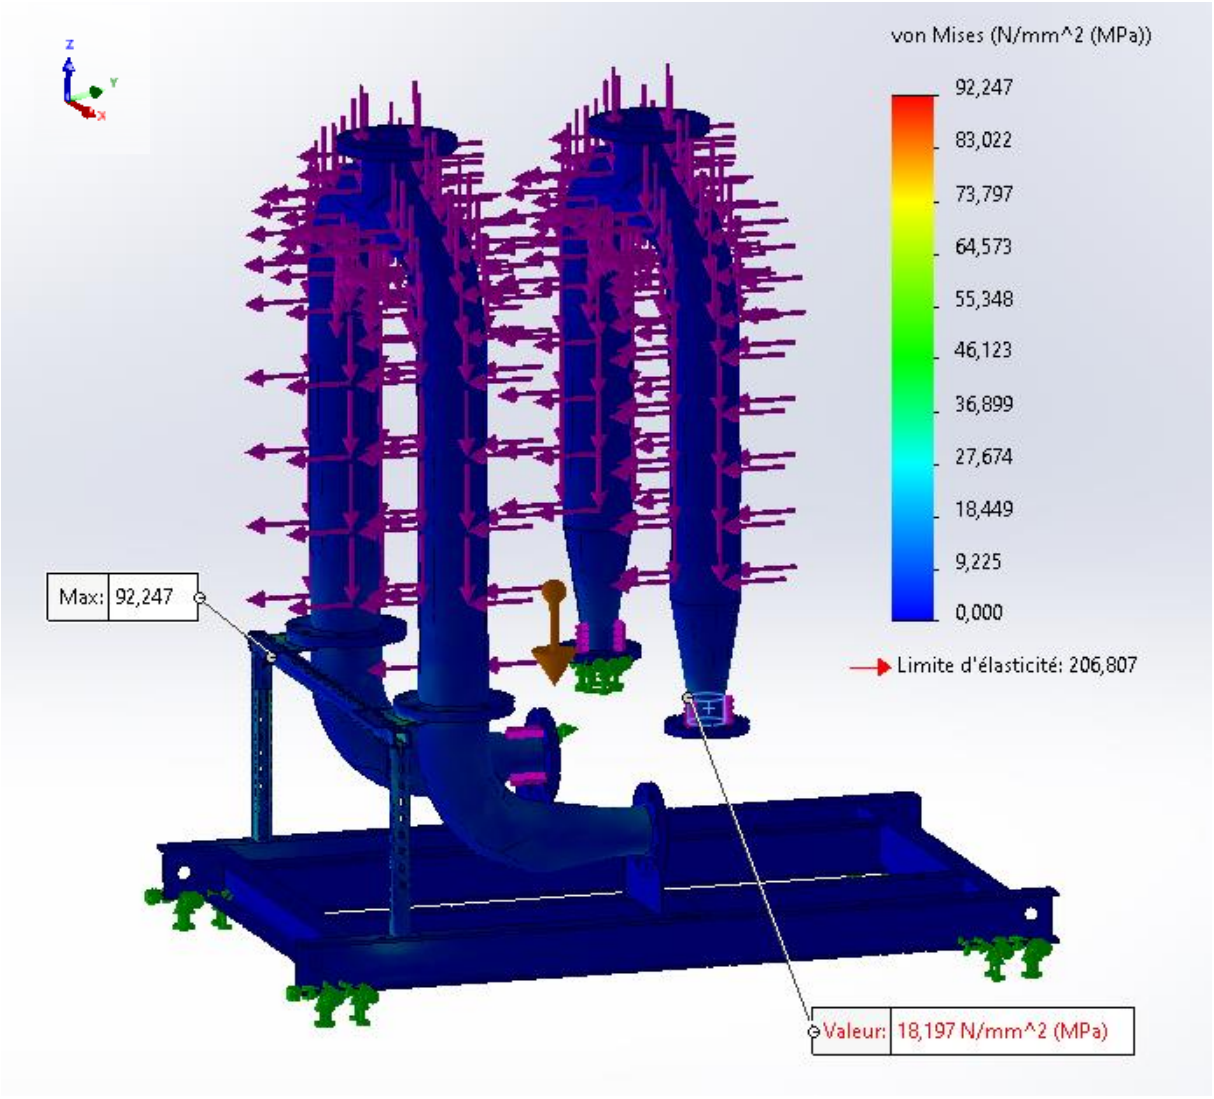
Knowing that the piping at the foot of the pump has a radius of 0.0571m we can deduce the distributed moment:

$$M = F * R$$

$$M = 378.4 * 0.0571$$

$$M = 21.6N/m$$

10.1.3 conclusions for the suction piping:



We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	100	1890	2345	2100	3675	875	1015	1225	1820

10.2 Calculation of the maximum stress on the discharge pipe:

10.2.1 result on the discharge pipe:

We can observe a maximum stress of 92.2 MPa, the stress is located on a single point at the level of the angle iron which assembles the two profiles, the stress which interests us to determine if the pump body is capable of holding the required stress is 18.2 MPa (maximum value exerted on the discharge sleeve at the foot of the pump)

10.2.2 Calculation of the moment at the pump body inlet .

Input data:

σ = Maximum stress 18.2 MPa or 18.2 N/mm2

R= Radius of piping at the foot of the pump R= 44.45mm=0.04445m

M= moment in N/m

Hypothesis for calculating the stress application surface

The number of points distributed on the cuff is 816 points on a surface of 16478mm2

$$A = \frac{16478}{816}$$

$$A = 20.2mm2$$

Calculation hypothesis for determining the moment:

We obtain a maximum stress of 11.78 MPa at the level of the cuff on a surface of 20.2mm2, we can apply the formula:

$$\sigma = \frac{F}{A}$$

The missing value and F which gives us:

$$F = \sigma * A$$

$$F = 18.2 * 20.2$$

$$F = 367.6N$$

Knowing that the piping at the foot of the pump has a radius of 0.04445m we can deduce the distributed moment:

$$M = F * R$$

$$M = 367.6 * 0.04445$$

$$M = 16.3N/m$$

10.2.3 conclusions for the discharge piping:

We can observe in the calculation assumptions that the force (F) as well as the moment (M) is lower than the table provided by the pump supplier on all axes.

Stainless steel flanges	Diameter DN	Force [N]				Torque [N-m]			
		Fy	Fz	Fx	ΣF 2)	My	Mz	Mx	ΣM 2)
	80	1575	1435	1750	2765	805	910	1120	1645

11. Conclusion:

We can conclude that from the results obtained the pump body does not suffer irreversible damage (breakage).

Summary table of results

Hypotheses	Direction	Aspiration		Repression	
		Result in N on cuff at pump foot	Result in N/m on cuff at pump foot	Result in N on cuff at pump foot	Result in N/m on cuff at pump foot
1	-0.7G in X -0.4G in y	449.78 N	25.68 N/m	423.8 N	18.83 N/m

Equipment Factory Acceptance Test – AHU :

1. General inspection :

List of point to review	OK	NOK	Comments
External dimension check of the unit	☑	☐	
Type plate present	☑	☐	
Check the presence of all components : • Pre filter • Filter • Cooling battery • Motorized fan • Speed variator • Temperature sensor on fresh air • Hygrometry and temperature sensor on the blowing • 3-way valves on the chilled water • Differential pressure switch for filter	☑	☐	
Hydrostatic tests on chilled network completed.	☑	☐	
Hydraulic connection conforms to the drawing	☑	☐	
Verification of the datasheets of each component	☑	☐	
The equipment complies with the plans transmitted (position of cable gland, battery drain, air inlet, air blowing …)	☑	☐	
Glands are securely tightened	☑	☐	
Cables are supported correctly	☑	☐	
Earth connection present	☑	☐	
Inspection and control of the maintenance manual of the equipment	☑	☐	
Checking the internal wiring of the equipment (junction box, speed variator of the fan)	☑	☐	
Unit internally and externally clean	☑	☐	
Internal bolts/screws correctly tightened	☑	☐	

2. Operation inspection :

The operation test will be realised on site during the commissioning. For the operation of the AHU we require :

- The variator to be wired to the HVAC electrical cabinet.
- The electrical heater can't operate without the fan in operation for safety reasons.
- The battery needs to be connected to the chilled water network.

3. Comments receive from Elogen to consider by Paumier :

Comments	Justifications
Provide the completed and signed manufacturing sheets	See annexe 1.1
Place a grid in the condensate tray to prevent objects from falling into it.	DONE
External dimension check of the unit	See annexe 1.2
Review the lifting plan	See annexe 1.3
Consider comments on plans	See annexe 1.4
Consider comments on the datasheets	See annexe 1.5

List of people present :

Paumier	Elogen
Olivier DELAHAIS	Ahmed RAZGUI
Robin LAMBERT	Hassan HAMMAMI
Baptiste CHIROIS	

FAT carried out on Tuesday September 20th.

Equipment Factory Acceptance Test – AHU :

1. General inspection :

List of point to review	OK	NOK	Comments
External dimension check of the unit	☑	☐	W
Check the presence of all components : • Circuit breaker Filter • Contactor • Switch on cabinet front • Indicator light • Extender RJ45 • Ethernet switch • Automaton & extension module • HMI screen • lighting	☑	☐	W
The cable glands are present according to the drawing	☑	☐	I => has been completed after the FAT
Cables are supported correctly	☑	☐	I
Earth connection present	☑	☐	I => has been completed after the FAT
Inspection and control of the maintenance manual of the equipment	☑	☐	I
Unit internally and externally clean	☑	☐	I

2. General inspection :

The screen HMI is functional	☐	☐	Has been checked before sending

3. Comments receive from Elogen to consider by Paumier :

Comments	Justifications
Update PAU003 cabinet plan	Agreed and implemented see document P.0608871.L.02.214
Provide pictogram	Agreed and implemented and done after the FAT (see picture attached)
Facade Cabinet light tags	Agreed and implemented and done after the FAT (see picture attached)
Send document to justify no ventilation	See annexe 1.1
Send the internal control document to the cabinet	See annexe 1.2
PAU must cut the whole cabinet not only the relays => Update of the electrical diagram to be provided	Agreed and implemented in the PLC program.
Put the “ground” tag on the cabinet	Have been done during the visit of Paumier in November
Provide SAT HVAC cabinet during commissioning	See document P.0608871.L.603
Put the “CE” logo on the cabinet	Have been done during the visit of Paumier in November
Put the electrical plan in the cabinet before expedition	Done before expedition
Make a CE declaration	See annexe 1.3
Redistribute GA of the HVAC cabinet	Agreed and implemented see document P.0608871.L.02.214
Provide Paumier calibration certificates used during testing	See annexe 1.4

ANNEX n°1.1

The HVAC electrical cabinet does not require a ventilation system to reduce the heat from these. The cabinet is located in an air-conditioned room, eliminating the need for additional heat reduction system.

Also, the electrical component of the cabinet (circuit-breaker, variator, etc …) have a little heat dissipation, which can be dealed with the climatization of the local.

3D model of the local with the HVAC electrical cabinet(in blue).

Equipment Factory Acceptance Test – Chiller :

1. General inspection :

List of point to review	OK	NOK	Comments
	☑	☐	I (Implemented after the FAT)
Nameplate in accordance with approved drawing(s)	☑	☐	W
Unit free from mechanical damage	☑	☐	W
Dimensional check, all measurements in accordance with GA drawing interfaces	☑	☐	W
Unit internally and externally clean	☑	☐	R
Check material datasheets	☑	☐	I (Implemented after the FAT)
CE marking done correctly	☑	☐	W
Warnings lables installed	☑	☐	
Electrical check points			
All instrumentation, including panels, are visible and accessible	☑	☐	W
All interface and termination points are correct and complete	☑	☐	I
Internal bolts/screws correctly tightened	☑	☐	I
Wire numbers are installed correctly	☑	☐	I
Check/verify electrical connections	☑	☐	I
Glands are securely tightend	☑	☐	I
Cables are supported correctly	☑	☐	I (Implemented before the FAT)
Cable numbers are installed correctly	☑	☐	I (Implemented before the FAT)
Switches/instrumentation correctly cabled and supported	☑	☐	I (Implemented before the FAT)

Correct earth bosses	☑	☐	W
Emergency stop	☑	☐	I Hatch has been added before expedition

2. Comments receive from Elogen to consider by Paumier :

Comments	Justifications
Updated ITP to be Provided (following comments)	ITP ind.B transmitted Friday 15/11, reviwed with Hassan the Monday 25/11/24
Close CRS of documents (CODE 2) / quality of documents to be improved	Paumier finalised the update of document
Group GAD drawings in the same document	Paumier finalised the update of document
Complete the number of gauges used for the test	Paumier used 1 manometer, serial number 23846
on the upper part of the envelope Space between central panel and side panels, How to ensure better sealing	PAU: The construction in principle avoids the rise of rainwater, but PAU suggests adding a silicone seal at the time of commissioning (on site)
Non-compliant drilling position, the drilling must be resumed at the position indicated in the GAD, chiller 2 (red cross on the capture: to be moved) Same observation on this drilling on the other side	Paumier will correct and redo drilling in the chassis, see picture attached
Non-compliant drilling position, the drilling must be resumed at the position indicated in the GAD, chiller 2 (red cross on the capture: to be moved) Same observation on this drilling on the other side Drillings to be made, recovery and specific retouching (touch up)	Paumier will correct and redo drilling in the chassis, see picture attached
The distance between the front face of the flange in relation to the wall of the envelope is less than 100mm: see scanned annotated plan (measured between 80 and 91 mm) Concerns all flanges, Furthermore, variations of 2 to 6 mm are noted relative to the axis during the measurements	Waiting for Fores to return on the subject. If this is a problem, as a last resort solution, Paumier can provide a flange with an elbow to connect my Fres piping on site. (on site)
Coiled probe cable, remove excess loop --> to avoid "coil effect"	Paumier will rectify and reduce cable lengths

Emergency stop behind the panel, difficulty of access	PAU: Proposes adding a quickly removable hatch on the plexis, see picture attached
Provide a small assembly guide for the central panel which connects the 2 chiller casings To help Fores assemble the central part of the envelope	See document P.0608871.L.02.220
Notified body plate on chillers missing	on site
Partial enclosure welding, please explain to highlight in the drawings	PAU: "standard " Spot welding type used (doucment internal resposability)
Compressor support/ Calculation note to be provided	On going
Add a message to indicate that HMI will be installed on site during commissioning	Paumier plan a note on the electrical cabinet
General comment : prevent any move or vibration du to transmportation and offshore transport	Paumier will see to put additional reinforcements to secure the installation during transport
Grounding, provide a small detail of mounting the braid between the 2 chassis, and indicate with a label the pressure of the nut for the braid must be fixed	See document P.0608871.L.02.220
Grounding, provide a small detail of mounting the braid	See document P.0608871.L.02.220

AHU TEST SHEET

Customer	ELOGEN
Business numer	P.0608871.L.02.602

Site	C63
Equipment	AHU

Test conditions	ext. T° : 10 °C

Local	Locaux techniques
Local T°	N.C
Plan number	P.0608871.L.02.100
Type	AHU
Fluid	AIR / MPG 40%
Brand	PAUMIER
Serial number	7449
Voltage (V) / single or Triphase	400 V (Tri)
Heating power	22,5 kW
Refrigerating power	36,9 kW

VENTILATEUR	Fan(s)	Fan 1		
	Rotational direction control	OK		
	Fans plaqued nominal current. (A)	10,2 A		
	Thermal circuit breaker fans settings. (A)	Q7 16A		
	Phase(s)	Ph1	Ph2	Ph3
	fans measured current. (A)	4,15 A	4,13 A	4,19 A
	Fans starting current. (A)	VAR	VAR	VAR
	Fans insulation. (MΩ) *see nota	550 MΩ	550 MΩ	550 MΩ
	Speed variation	NO		
	Values (Hz)	50 Hz		
	Intended air flow (m3/h)	3362		
	Measured air flow (m3/h)	3391		
	T° settings	20,0 °C		
	T° measured	21,3 °C		

BATTERIE	T° Air entry (°C)		
	T° Air exit (°C)		
	T° Fluid entry (°C)		
	T° Fluid exit (°C)		
	Control open / close V3V (10V => 100% / 0V => 0%)	OK	OK

Nota *(insulation) : if BTA (50 à 500V) : Z ≥ 500 kΩ, Otherwise 1kΩ /V. No insulation measure if a frequency variator is present. If BV : Z ≥ 1 000 kΩ.*

Section 8 LIST OF MODIFICATIONS

NOT APPLICABLE

Section 8.1 List of changes

Formal queries should be raised as per the table below. Where an activity has been assigned a '**YES**', a commissioning query (CQ) must be raised

Task Description	Required to Consult with Crosswind
Alarm Point change	**NO**
Trip Point Change	**YES**
Set-Point Change	**YES**
Change to Cause & Effects	**YES**
Protection Setting Change	**YES**
Measurement / Range Changes	**YES**
Graphics and or alarm banner information	**NO**
Sequence control changes	**YES**
Wiring mods – corrections	**NO**
Wiring mods - design change	**YES**
Controllers tuning and valve control action (direct/reverse acting)	**NO**
Phase Rotation Change	**NO**
Valve line-up change.	**YES**
Valve position change	**NO**
Leak Test boundaries and or pressure change.	**YES**
Changes to Flushing scopes.	**NO**

If there are any tasks that are not shown above, assume that they require consulting with Crosswind.

BLHP Commissioning Query(CQ) Tracker

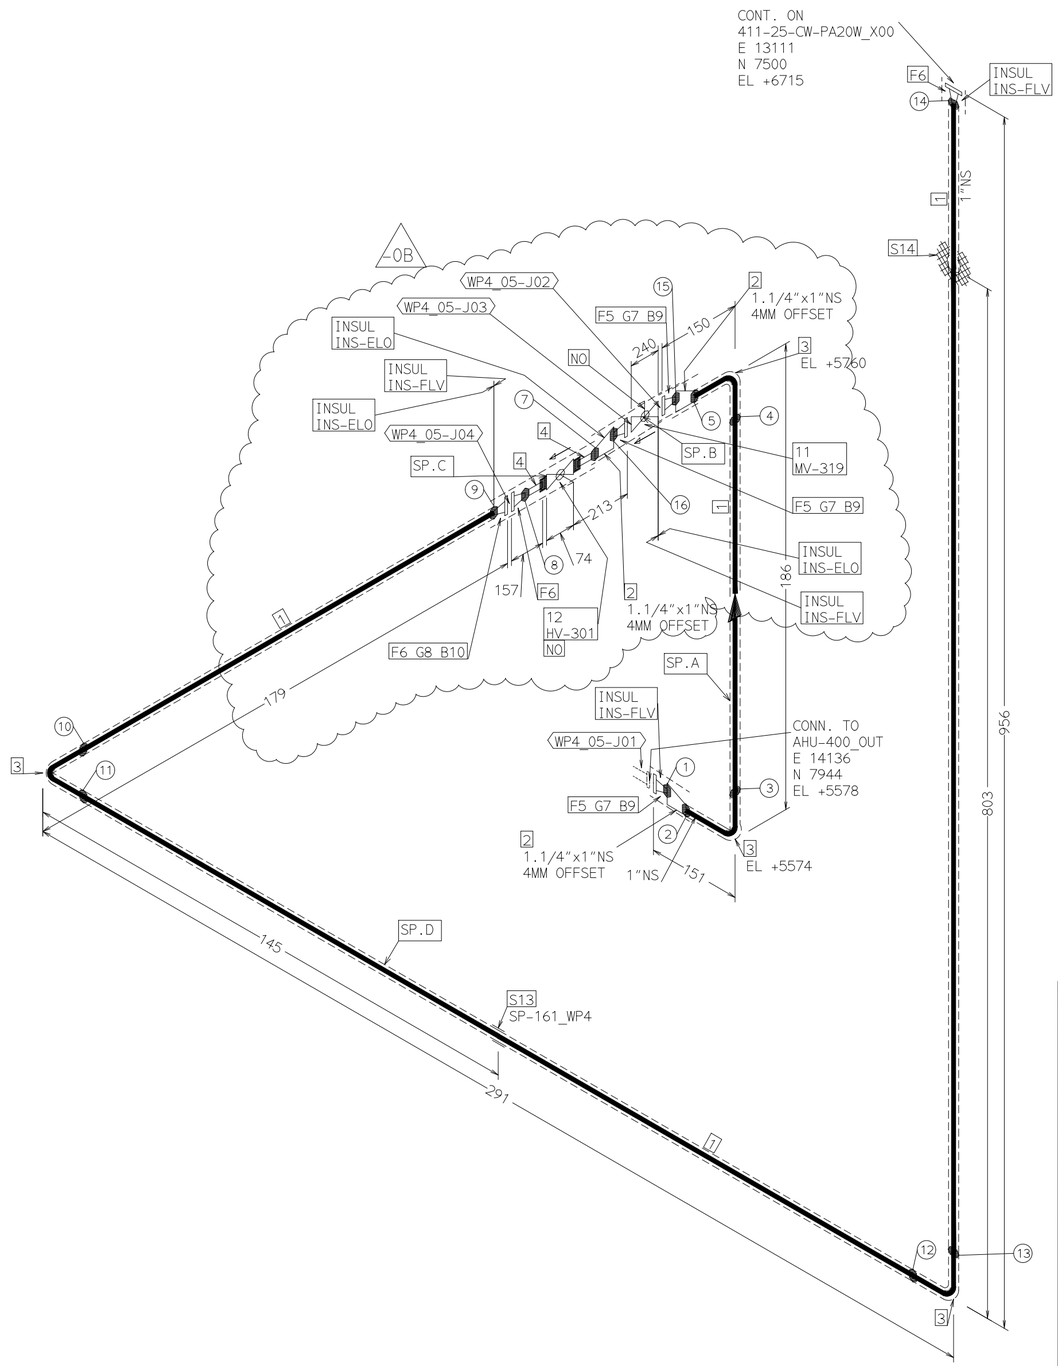
LEGEND

D-OSD	OPTICAL SMOKE DETECTOR
X-OSD	OPTICAL SMOKE DETECTOR ATEX
D-MCP	MANUAL CALL POINT

C&E MATRIX



TYPE	DESCRIPTION
FAULT	if a MCP is in fault status, the SSI panel activate the fault output
	if 1 sensor is in fault status, the SSI panel activate the fault output
	if the SSI panel has an internal fault status (battery fault, card fault ecc..), the SSI panel activate the fault output
FIRE	if a MCP is pressed, the SSI panel activate the fire alarm output
	if 2 sensor in the same zone are in alarm status, the SSI panel activate the fire alarm output
	if 2 sensor in the same zone are in fault status, the SSI panel activate the fire alarm output
	if there is 1 sensor in alarm and 1 sensor in fault in the same zone, the SSI panel activate the fire alarm output

Commissioning Query Form

		QUERY NUMBER	*CQ-005*		
SITE ORIGINATOR TO COMPLETE		**ORIGINATING LOCATION REF. NO**			
		DISCIPLINE:	**Process / HVAC / Supply Chain**	LOCATION:	**Electrolyser**
		WORKPAC K REF:	**HVAC (Paumier) System.**		
		SYSTEM:20-00	*Electrolyser*	SUB SYSTEM:	HVAC
			Print: Gerry MCann	*Sign:*	*Date: 18.02.25*
		DESCRIPTION OF QUERY			
		Prior to commencing Gross Air Leak Test (GALT) lines the system was checked (as per normal practice) and GALT commenced. During GALT there were a few joints found to be leaking, including those at the valve flange to piping interface for MV-319. On further inspection / check of MV-319 the following has been found: - 1 – The valve should have Raised face but doesn't. 2 – The valve size is DN32 when it should be DN25. 3 – The valve flange is ASME where the piping connection is ISO. Initial engagement has been had with Paumier who admit to supplying the wrong valve. Their current response is that replacement "could" be available in around 8 weeks, which is not a satisfactory solution for the project as by then we should have the electrolyser fully operational. *A Non-Conformance=Report has been raised by Elogen – reference number xxx (to be provided by Luc)*			
		LIST OF DOCUMENTS ATTACHED (INCLUDE NAME / DESCRIPTION / REVISION / DATE OR N/A)			
		See attached marked up sketch for solution B. *P&ID reference number C63-PID-001-010 (Page 10 of 16) title HVAC UNIT* *Valve Data Sheet number and tile (to be completed by Elogen)*			
		PROPOSED SOLUTION			
		Options that we require engineering and supply chain to explore: - A – soonest availability of suitable valve, either form Paumier or from elsewhere. B – To change the piping interface to add a coupling piece to allow fitting to the valve flanges – we suggest / request this be given due consideration for prompt response and agreement if possible for us at site to be able to proceed with acting on this proposal with view to getting GALT complete to confirm initial integrity of the completed fitting – see sketch attached to this CQ (Gerry / Luc to get from Luca) If we are to proceed with the use of the current (larger) valve Paumier to review and confirm any possible issues with the system and if they could be deemed acceptable.

		QUERY NUMBER	*CQ-005*		
SITE ORIGINATOR TO COMPLETE		**ORIGINATING LOCATION REF. NO**			
		DISCIPLINE:	**Process / HVAC / Supply Chain**	LOCATION:	**Electrolyser**
		WORKPACK REF:	**HVAC (Paumier) System.**		
		SYSTEM:20-00	*Electrolyser*	SUB SYSTEM:	HVAC
			Print: Gerry MCann	*Sign:*	*Date: 18.02.25*
		DESCRIPTION OF QUERY			
		Prior to commencing Gross Air Leak Test (GALT) lines the system was checked (as per normal practice) and GALT commenced. During GALT there were a few joints found to be leaking, including those at the valve flange to piping interface for MV-319. On further inspection / check of MV-319 the following has been found: - 1 – The valve should have Raised face but doesn't. 2 – The valve size is DN32 when it should be DN25. 3 – The valve flange is ASME where the piping connection is ISO. Initial engagement has been had with Paumier who admit to supplying the wrong valve. Their current response is that replacement "could" be available in around 8 weeks, which is not a satisfactory solution for the project as by then we should have the electrolyser fully operational. *A Non-Conformance=Report has been raised by Elogen – reference number xxx (to be provided by Luc)*			
		LIST OF DOCUMENTS ATTACHED (INCLUDE NAME / DESCRIPTION / REVISION / DATE OR N/A)

		DESCRIPTION OF QUERY				
		When there is no demand from the Ovivo Package the inlet valve will shut, this should in turn send a signal to Yokogawa that should in turn send a signal to the BLPH water treatment package to stop, however this is not currently implemented.				
		LIST OF DOCUMENTS ATTACHED (INCLUDE NAME / DESCRIPTION / REVISION / DATE OR N/A)				
		PROPOSED SOLUTION				
		The proposed solution is to add a signal to the modbus register which flags when the command is sent to close the inlet valve. This signal should be used to stop the BLPH water treatment package. Further to this, to protect against overpressure and/or dead heading the WTP pumps, the manual drain valve at the Ovivo inlet should be remotely actuated to open when the inlet valve is closed.

		DESCRIPTION OF QUERY			
		When an emergency shutdown command is initiated from the electrolyser, the signal is sent to SIS which in turn shutdowns down all non-essential packages, the SIS will then only allow full reset once manual reset has been activated from the package and within a small amount of time accepted on the Scada which allows the SIS to clear the fault and subsequently allows all packages to be re-started. If the trip is not reset on the Scada, SIS then sends a Shutdown signal to the package which then loops back and maintains shutdown signal to all non-essential packages. The current configuration would require an operator to be on BLPH (offshore) and maintain communication with the remote-control operator (onshore) to allow both resets to be activated in the necessary time frame.		
		LIST OF DOCUMENTS ATTACHED (INCLUDE NAME / DESCRIPTION / REVISION / DATE OR N/A)			
		PROPOSED SOLUTION			
		Allow overriding reset from remote operator if no faults persist in the system.

		QUERY NUMBER	*CQ-018*		
SITE ORIGINATOR TO COMPLETE		**ORIGINATING LOCATION REF. NO**			
		DISCIPLINE:	**Process**	LOCATION:	**WTP/WTP-Electrolyser**
		WORKPACK REF:	**A-20000 / A-50000**		
		SYSTEM: 20, 50		SUB SYSTEM:	20-00, 50-00
			Print: *Thijs Philippo*	*Sign:*	*Date: 07.04.25*
		DESCRIPTION OF QUERY			
		To ensure seamless operation of the electrolyser, a consistent water supply is required at its water inlet interface. The specifications for the water at the inlet include a steady feed at a flow rate of 0.81 m^3/hr at 4-6 barg. It is essential that this supply remains available at the specified conditions when the electrolyser is in operation but perhaps not consuming. Currently flows and pressures fluctuate and the package stops, then on restart a time delay is experienced whilst specification is achieved. For example, currently, when the electrolyser closes the inlet valve (1EBV1) due to conditions such as a full ultra-pure water tank, the PSC Water Treatment Package ceases operation, resulting in the loss of the required water specifications at the inlet (e.g., no flow and loss of pressure).

		PROPOSED SOLUTION			
		We propose that RM investigates potential solutions to rectify the issue of maintaining the reliability of the water feed specifications when required by electrolyser. This may involve creating a bypass route to reject surplus water, thereby maintaining pressure and flow rate. Alternatively, optimizing the control logic within the PSC Water Treatment Package or by improving communication between the Water Treatment Packages of the Electrolyser.

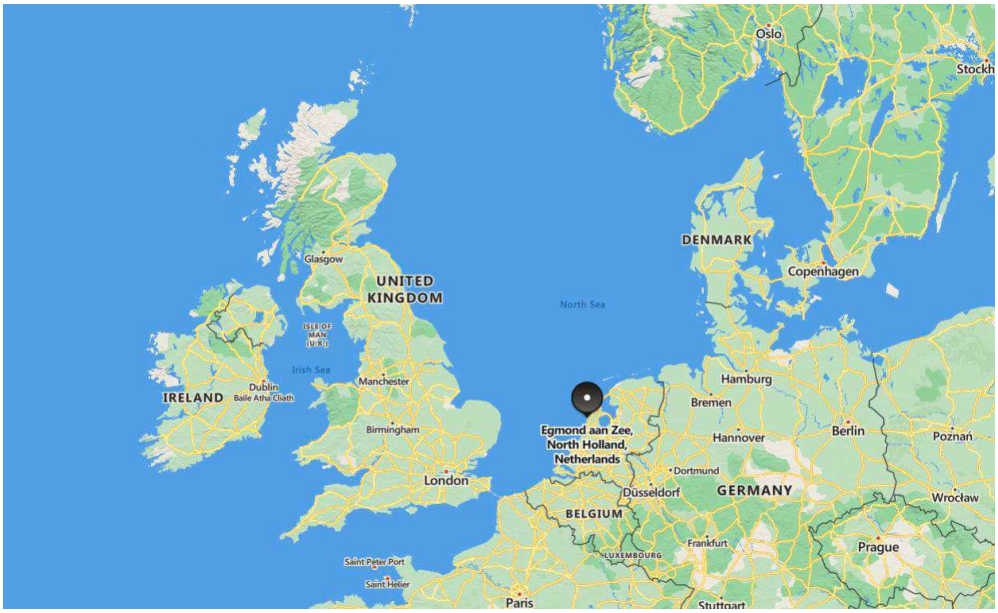
1. Introduction



This document gives Commissioning & Pre-Start-Up requirements for the Commissioning & Start-Up of the ELOGEN hydrogen production unit by water electrolysis for the Crosswind Project. ELOGEN's site supervision is responsible for advising the coordinating on site of all the means and resources required for the Unit Commissioning & Start-Up of the unit in accordance with COMPANY specifications.

1.1 Overview of Project Scope

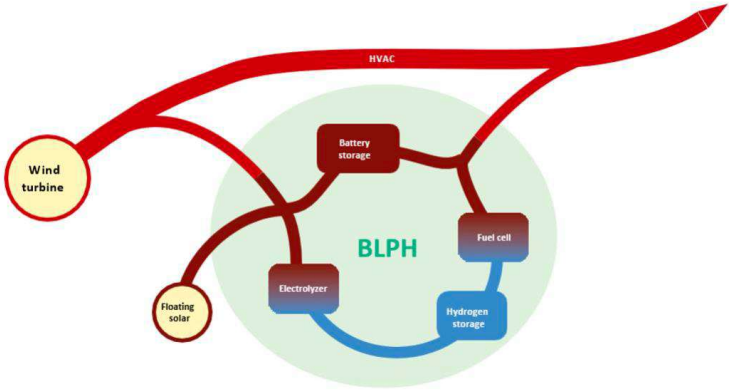
Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.
Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.2 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

HOLLANDSE KUST NOORD WIND PARK Location Map

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.



Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile is located on coordinates E 590719.1, N 5841602.3 and is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

1.3 Project Concept

All components included in the BLPH will be integrated onshore on a topside and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

BLPH Concept

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.
The purpose of the BLPH is to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

2. Document Scope

This document describes the detailed activities scope to perform the Commissioning & Pre-Start-Up activities of the ELOGEN hydrogen production unit by water electrolysis for the Crosswind Project. ELOGEN's site supervision is responsible for advising the follow up of all activities good practices on site required for the Unit Commissioning & Start-Up in accordance with COMPANY specifications. At this point, all Sub-Systems basic functions have been tested. The next steps are Utilities Operational Test and Unit preparation for Start-Up. The main activities are:

- Control Loop Simulation Test
- Cause & Effect Matrix
- Sequence Simulation Test
- Pure Water Purification & Distribution (56-03) Operational Test with WTP Vendor
- Flushing of Water Loops (25-11)
- Resin Filling into the Filters (25-11)
- Flushing with Resin
- Stacks Installation
- Flushing with Stacks
- Final Leak Test

The methodology and guidelines Simulation Tests and Leak Tests are detailed in C063-ELO-PRO-CO-0002 - BLPH Electrolyser CSU Method Statements. All ITR's specific to the project are given in this document.

For packages, vendors provide all the documentation including their own suite of ITR's regarding all remaining tests taking place onsite. FAT reports give all tested elements list. Vendors concerned are:

- OVIVO: for the Water Treatment Package (WTP) – Subsystem 56-03
- PAUMIER: HVAC Glycol Water Loop – Subsystem 66-06: All tests referring to the HVAC System here are tested through HVAC SAT Procedure (See C63-PAU-SAT-001).
- MSA: SSI-1000: Fire Safety System – Subsystem 25-11
- NIDEC: Transformer & Rectifiers – Subsystem 03-04 & 08-01

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- Regarding HPP (25-01), Aquagas mobilization onsite will be at the Start-Up. All items are connected directly to ELOGEN UCP. Commissioning on this package will be performed by CONTRACTOR under ELOGEN supervision. Therefore, this document also includes all 25-01 loops.

Regarding the Control System: the ELOGEN automation engineer will confirm onsite the good connection between the different UCPs by testing all the exchange tables. The simulation tests are done with all systems connected between each other's. At this point all should be communicating properly.

3. Definitions

COMPANY	means CROSSWIND C.V., owner & developer of the offshore WIND FARM Hollandse Kust Noord Wind Park Project.
ELOGEN	means ELOGEN as CONTRACTOR, the contracted party for engineering, and onshore commissioning of the Electrolyzer facilities associated with the PROJECT.
CONTRACTOR	means ROSETTI MARINO S.p.A., and his subcompany FORES for the contracted party for engineering, procurement, construction, offshore installation & commissioning of the facilities associated with the PROJECT.
Pre-Commissioning	Pre-Commissioning relates to the preliminary Commissioning activities to test and check the individual basic functions of individual items within any given system and/or sub-system to confirm they perform as designed.
Commissioning	The phase of the project after Pre-Commissioning. Commissioning consists of a comprehensive series of dynamic and energized Checks and Tests to be carried out in order to demonstrate and ensure that the facilities are ready to operate safely and steadily in compliance with project Documents, Specifications, Standards and Engineering Best Practices.
Commissioning Team	Team established to perform the Commissioning and Handover process from CONTRACTOR Construction Team to COMPANY Operation & Maintenance Team.
Commissioning Spares	"Replacement" and "Consumable" spares required during the final hook-up, Pre-Commissioning, Commissioning and Start-up phases.
Equipment	An item that may be part of a System and be commissioned independently, however, it may or may not be operated independently.
Handover	Transfer of responsibility of the Plant from the Project Team to the Asset Holder.
Inspection Test Records (ITR)	A-ITR – used to record and verify construction scope associated with a tagged item (component). B-ITR – used to record and verify energization and function testing during pre-commissioning of a tagged item
Mechanical Completion	Mechanical Completion is the point in the project when construction is complete, and subsystems are ready to be handed over to the commissioning team. Mechanical Completion is achieved when: - • All ITR-A's for the given system / sub-system have been completed and signed off; • All Category A Punches have been closed. • All open Category B Punches shall be accepted with agreed plan for closure prior to commissioning. • Completion of all documents required to be As-Built Red Line Marked Up.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

	Mechanical Completion for any subsystem is recorded via the completing and signing of the Ready For Commissioning (RFC) certificate.
Operations	Operations include all personnel directly involved with Production Operations and Maintenance of the facility.
Performance Test	The Performance Test takes place following the Commissioning and Site Acceptance Test. A performance test is executed if there is a specific requirement to test performance criteria of an individual piece of equipment, a system, or the plant.
Performance Test Acceptance Certificate	This certificate shall be issued by the CONTRACTOR certifying that the PERFORMANCE TEST CRITERIAS have been achieved during the PERFORMANCE TESTS.
Plant	Refers to the permanent facilities (Base Load Power Hub) being constructed or to be constructed at WORKSITE resulting from the WORK.
Project	Refers to the BASE LOAD POWER HUB project.
Pre-Start Up Audit (PSUA)	The PSUA is a precursor to the PSSR meeting. The intention is to audit the readiness of the facility to commence start up with the findings being used as part of the PSSR and shall be conducted 6 weeks prior to Start-up.
Pre-Start Up Safety Review (PSSR)	Pre-Start-up Safety review (PSSR) meeting is the final determination that all prerequisites have been met to permit the hydrogen production and shall be conducted 4 weeks prior the RFSU.
Procedure	A document that details the execution of an activity.
Punch List	Work not executed as per approved documents and/or not meeting quality, health, safety, environment, operability/maintainability requirement and/or Standard; and recorded as a list for rectification.
Punch List ‘A’ Item	Punch List item that will prevent the safe operation of the Equipment, System and Plant and may jeopardize personnel or environment. Such item, as agreed, shall be cleared before the Equipment/System/Plant can progress to the next stage of the Commissioning and Handover phase.
Punch List ‘B’ Item	Punch List item that will not endanger the safe operation of the Equipment, System and Plant or personnel and/or environment. Such item, as agreed, can be carried over to the next stage and may be cleared later.
Ready For Commissioning Acceptance Certificate (RFC)	RFC is the Proverlis description for a sub-system Mechanical Completion. See definition for Mechanical Completion.
Ready For Operation Acceptance Certificate (RFO)	An RFO Acceptance Certificate shall be raised on the completion of the sub-system commissioning procedure scope.
Ready For Sail Away (RFSA)	All preservation and preparation works are complete.
Ready For Start-up (RFSU)	RFSU applies to the whole or part of the Plant and its associated Facilities and Systems. RFSU signifies that the applicable scopes have been fully commissioned and are ready for safe hydrogen production. RFSU will be authorized with the signing of the RFSU certificate. The RFSU requires that the Pre-Start-Up Audit (PSUA) and the Pre-Start- Up Safety Review have been completed, and all related action/blocking issues have been resolved
SITE	Refers to the offshore location where the PLANT is to be installed and the vicinity thereof (offshore North Sea - Netherlands).
Start-up	The stage at which process fluid is introduced/created into the Plant. It is defined as operation of all the facilities under the project. It can only be performed once

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

	Commissioning of all associated utilities and auxiliaries and Pre-Commissioning activities of the Plant have been completed.
Start-up/Ramp-up	It is the initial start-up of processing equipment after first hydrogen, followed by a staged ramp up to full operating conditions. On completion of ramp-up, and after a period of steady state operations, the facility is ready to be performance tested.
Start Up on Paper (SUOP)	SUOP is an exercise to ensure that the start-up procedure and associated preparations are fit-for-purpose, including risk assessments, controls, mitigating actions and the Emergency Response protocols, procedures and capability are in place.
Site Acceptance Test	An un-interrupted safe operation of equipment, system, or plant, over a certain timeframe usually defined as 72hrs. A prerequisite to the Final Handover Certificate.
Statement of Fitness	As part of the COMPANY's HSE & SP Control Framework, the Statement of Fitness (SoF) before commissioning or introduction of hydrogen / hazardous substances in a New Asset, is a requirement of the Asset Integrity - Process Safety Management Application procedure. The Project and Asset Managers are accountable to develop a SoF to demonstrate asset integrity prior to energization or introduction of hazardous substances.
Sub-Contractor	means any company or person, to whom CONTRACTOR has subcontracted directly or indirectly at any level the performance of any part of the WORK.
System	A System is a major subdivision of a plant, being either process or utility, which performs an operational function of the plant. A System includes all the various equipment that allows it to operate. The division into functional Commissioning Systems corresponds to the prevailing fluids or services.
Sub-system	A Sub-system is a further subdivision of a System, which performs a partial operational function of the System, with little or no interference from the other Sub-systems. The Sub-system is the basic unit for Commissioning.
Systemization	The process of defining Systems for handover. Generally, colour coded on the 'marked up' engineering drawings such as P&IDs, SLD's & Cable Block Diagrams.
Vendor	means any CONTRACTOR's / CPI and/or SUBCONTRACTORS' supplier(s) of CONTRACTOR ITEM(s). VENDORS' presence on WORKSITE & SITE may be required to assist CONTRACTOR and/or COMPANY for the installation, commissioning and startup of such CONTRACTOR ITEMS and during the execution of PERFORMANCE TESTS.
Vendor Package	Skid and Equipment such as hydrogen purification, water purification, chillers, rectifiers, containers, etc.
Workshop(s)	means any location(s), other than WORKSITES, including offices, premises and workshops, where any equipment, materials or manufactured items including CONTRACTOR ITEMS shall be engineered, manufactured and assembled.
WORKSITE	means any construction location(s), where any major parts of the PLANT (such as templates, piles, nodes, jacket structure, modules, decks) shall be fabricated and assembled, excluding all other offices, premises and workshops of CONTRACTOR and SUBCONTRACTORS.
Shall	used to indicate requirements strictly to be followed to conform to the specification and accepted by all involved parties.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Should	used to indicate that among several possibilities one is recommended as particularly suitable without mentioning or excluding others, or that a certain course of action is preferred but not necessarily required.
May	used to indicate a course of action permissible within the limits of the specification.
Can	used for statements of possibility and capability, whether material, physical or casual.
“he”, “him”, “his”	are used in relation to CONTRACTOR.
“it”, “its”	are used in relation to COMPANY.

4. Abbreviations

Acronyms / Abbreviations	Description
E&I	Electrical & Instrumentation
ESD	Emergency Shut Down
FAT	Factory Acceptance Test
FH	Fixed-bed Filter
HSE	Health, Safety, & Environment
ITR	Inspection & Test Record
IP	Interlock Process
IS	Interlock Safety
LC	Locked Closed
LO	Locked Open
MC	Mechanical Completion
NO	Normally Open
NC	Normally Closed
N/A	Non-Applicable
OTP	Operation Test Procedure (Commissioning)
PCS	Process Control System
PL	Punchlist
PID (P&ID)	Piping and Instrumentation Diagram

5. N2 Distribution Panel Service Test

Prior to perform the flushing of the Electrolyser with pure water, the N2 Panel must be operational for purging purposes. The presence of oxygen can affect the efficiency of the flushing required prior to Unit Start-Up.

Steps	Description	Completed By	Witnessed By	Date
01	Ensure Mechanical Completion for N2 sub-system scope described in ELOGEN P&IDs has been completed.			
02	Check that Pre-Commissioning for N2 Distribution has been completed by the CONTRACTOR. The Loop Test ITRs are available for review in ELOGEN supervision on the following items:			

This document contains confidential information which is the property of ELOGEN.

ELOGEN reserves all of its rights.

	- PT-910 / PV-900 / PV-901 / MV-900 / MV-901 / FT-900 / FT-901 / PT-900 / FI-940 / MV-941 / PV-920 / PV-921 / MV-920 / MV-921 / FT-920 / FT-921 / PT-920			
03	Check that BLPH N2 Supply is available at the Battery Limit. (See P&ID 9/16)			
04	Line Up the circuit as per P&ID Mark-Up in Appendix. Close the following valves: - HV-620 / HV-620A / HV-620B / HV-624 - PV-620 / PV-640 / PV-641 / PV-642 / HV-642 / PV-631 / PV-500 / HV-940 / HV-941 - PV-632 / HV-930 / HV-931 / PV-933 / PV-635 - HV-600 / HV-600A / HV-600B / HV-605 - PV-600 / MPV-611 At this stage, all N2 injections are prepared to be routed straight to the vent.			
05	Close also the following valves to ST-600 & ST-620: - To ST-620: PV-920 / MV-920 / PV-921 / MV-921 - To ST-600: PV-900 / MV-900 / PV-901 / MV-601			
06	The goal is now to set the purging flowrate through the Unit to avoid overpressure during Commissioning & Start-Up phases: Open PV-900 & PV-920			
07	Supply N2 at the battery limit & pressurize the N2 header to normal operating pressure. Check that the pressure in the Electrolyser unit is atmospheric pressure (0 barg).			
08	By monitoring carefully FI-900 & FI-920, Open slowly MV-900 & MV-921 & set the following flowrate: - MV-900 set for 46 m3/h at FI-900 - MV-920 set for 4 m3/h at FI-920 Ensure also the pressure is not increasing in the whole unit and a flow is detected at both H2 and O2 vents.			
09	Leave MV-900 & MV-920 on this position, record the % of valve opening for any resetting purposes that happen in the future. Close PV-900 & PV-920			
10	Proceed to the same operation for the bypasses: Open PV-901 & PV-921 By monitoring carefully FI-901 & FI-921, Open slowly MV-901 & MV-921 & set the following flowrate: - MV-901 set for 78 m3/h at FI-900			

This document contains confidential information which is the property of ELOGEN.

ELOGEN reserves all of its rights.

	- MV-921 set for 11.7 m3/h at FI-920 Ensure also the pressure is not increasing in the whole unit.			
11	Leave MV-901 & MV-921 on this position, record the % of valve opening for any resetting purposes that happen in the future. Close PV-901 & PV-921.			

6. Hydrogen Purification Package

The HPU Start-Up is achieved during the Unit Start-Up. Prior to that, some tests and checks are required as per Vendor documentation. Vendor's documentation gives the following steps to be carried out. For more information about the HPU refers to Aquagas documentation DEDR 500/36: Installation, Commissioning, Operation and Maintenance Manual. All LOTO tasks must be performed through CONTRACTOR Procedure.

The Construction & Pre-Commissioning have been done and all ITRs signed off, proceed to the following additional crosschecking if necessary:

- DEDR is properly installed as per above recommendations.
- Check the DEDR sequence by manual operation of the solenoid valves.
- Check the valve limit switches.
- Check that all valves are in the correct position.
- Check that all Hy-Lok connections have the correct torque (green markings are aligned).
- Check the set points of temperature transmitters and temperature switches.
- Check the positioner of valve of flow regulating valve 64-V6.
- Check cooling water flow, temperature, and pressure.
- Check instrument air or nitrogen flow and pressure.
- Check that valves 61-V2, 64-V15 and 64-V16 are open. Put a lock (not included) on them.
- Gross Leak test have been completed during the Pre-Commissioning and a Leak Test at operating pressure will be performed prior to Start-Up: If leakage with a Hylok coupling, retighten until maximum finger tight + ¼ turn with spanner and green markings are aligned. Use Hylok gap inspection tool for checking the torque, if available. Do not over torque!

Once all Pre-Commissioning crosschecking is done, proceed with the Simulation Tests among all simulation tests to be performed in section 6. Fill the corresponding point to the HPU Simulations Tests in section 6.1.

- Without pressure on the system, shut-off fuses for regeneration heater (all fuses except control voltage). Once all signals connected, use the HMI/PLC to step through all sequences, with extra attention to the supplied Control Logic description, to secure that the wiring is correct, and the sequences are working OK without any alarms. Pay extra attention to valves that might open and create a high-pressure peak : 64-V4.1, 64-V4.2, 64-V4.3, 64-V4.4, 64-V5, 64-V6, 64-V7.
  If anything is abnormal, please contact AQUAGAS for advice.

7. Cause & Effect Matrix

The method statement is described in the document C063-ELO-PRO-CO-0002 - BLPH Electrolyser CSU Method Statement at the chapter “6.6.9 Cause & Effect Matrix”.
The following two tables in the two next pages give all triggered effects to observe following the causes activation. IP is for Interlock Process and IS for Interlock Safety.
The table given after are all the triggered causes to activate for the test.

8. Simulation Tests

This section is performed straight after the Basic Function Testing described in the document C063-ELO-PRO-CO-0003 - BLPH Electrolyser Pre-Commissioning Manual. In this section, all complex loops and functional sequences are tested with simulated inputs to validate their correct implementation and physical actions.

8.1 Control Loop & Basic Sequences

The method statement is described in the document C063-ELO-PRO-CO-0002 - BLPH Electrolyser CSU Method Statement at the chapter “6.6.7 Multi Loop or Complex Loop Item”. All functions referring to the HVAC System referred here are tested through HVAC SAT Procedure (See C63-PAU-SAT-001).

9. Flushing, N2 Purging & Leak Test

Once all simulation tests of process and safety loops and sequences have been tested, the pre-start-up activities can take place. The first operation to take place is the flushing. This following chapter provides material list, conditions and detailed method statement for a safe and efficient flushing of both Water/H2 Loop and Water/O2 prior to the unit start-up. The goal is to reach the necessary conductivity specification to ensure a successful unit start-up and to protect the stacks integrity. During this flushing operation, Nitrogen purging is done because the presence of ambient air can affect the conductivity. Also, the first final Leak test is performed without the stacks and then with the stacks connected only in dynamic.

This specific flushing activity is not a classic flushing activity taking place during the end of construction activities. Indeed, mechanical equipment cleaning and piping cleaning by blowing or flushing have been performed prior to the Mechanical Completion. This operation is a commissioning activity due to the livening up of 56-03 WTP System and both 600 and 620 loops included in 25-11 sub-system.

9.1 Conditions

The flushing can be performed when the mechanical completion certificate for the subsystem has been signed by all parties and after the Pre-Commissioning activities:

- The piping has been tested, cleaned, dried and is free of rust before the instruments and valves are fitted.
- The equipments have been cleaned and permanently closed.
- The reinstatement as per P&ID is completed with all piping, equipment, valves and instruments installed and oriented in the correct direction.
- The equipment, valves and instruments have been visually checked and are free of any damage.
- All Punchlist that does not require the system to be reopened are cleared.
- 25-11 Subsystem Mechanical Completion Certificate has been signed.
- The Gross Leak Test has been performed and forms signed by all parties.
- Vent lines are operational.
- Electrical cabinet / Control System is operational (tested and energized).
- Stacks bypasses are installed.
- Valves & Instruments Loop Testing on the systems has been completed; All valves & instruments are operational.
- Alarms & Trips (Process & Safety Interlocks) relevant to the systems have been tested.
- Pump CP-600A / CP-600B / CP-620A / CP-620B are ready for Start-Up.
- 56-03 Subsystem WTP is operational with feed water availability and pumps LP300A/B ready for start-up.
- If there is no feed water, provide IBC tank of water.
- Nitrogen Purging is operational.
- The system 25-11 is pressurized with around 200 mbarg of positive pressure with Nitrogen.
- A Nitrogen Purging shall be achieved in case the system is not preserved with Nitrogen.
- Select maintenance mode on the HMI.
- All necessary tools for the operation are available.
- All relevant documentation is available in the latest revision.

9.2 Safety

These defining rules shall be applied from the initial (total or partial) energizing of the instrumented systems, until the end of the commissioning activities.

- Appropriate PPE must be always worn during the operation.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- A permit to work has been delivered.
- No equipment will be definitively energized without the subsystem Mechanical Completion.
- The piping under pressure is clearly identified

Safety rules in accordance with the risk must be applied (e.g. Fluids, Pressure, Electrical Power, etc.).
Risk assessment must be done prior to any test activity.

9.3 Prerequisites

9.3.1 Required Equipments

- Toolboxes: screwdrivers, spanners, pliers, wrenches, pipe wrenches…
- Portable Conductivity meter
- Portable O2 meter
- Flexible for Stack Bypass
- Field telephone or Walkie-Talkie
- Empty IBC Tank (to route the used water from flushing)
- If water is not available: IBC tank of soft water.
- Spare gasket for F-600 and F-620.
- N2/H2 bottle rack mix for Leak Test.

All equipment used must have a serial number and a valid calibration certificate (if applicable).
Soft water quantity and specifications must be as followed:

- For the first fill-in: 2m3
- For the flushing: between 6 and 14 m3 (depending on pipe condition)

For the type of water, the specifications must be as followed:

- Conductivity: Conductivity <703 µS/cm
- TOC (total organic carbon) <3 mg/l
- SDI (Fouling index) <3
- Free chlorine, Total chlorine <0.5 mg/l
- Average Flow Rate: 0.81m3/h
- Pressure: 4-6 barg
- Temperature: 10-35 °C

9.3.2 Required Documents

- This procedure is approved for use.
- Set of PIDs at the last revision.
- Subsystem Mechanical Completion Certificate including the loop signed by all parties.
- Permit To Work delivered and signed.
- Simulation Tests, Cause & Effects Tests completed. (Chapter 7 & 8 inside this procedure)
- N2 Distribution Test completed. (Chapter 5 inside this procedure)

9.3.3 Manpower (Indicative)

- 1 Elogen Automation Engineer
- 1 Elogen Commissioning Engineer (Responsible for the Operation)
- 1 E&I Supervisor
- 2 Helpers (pipefitter)
- 1 LOTO supervisor

9.4 Flushing Operation of Anode Water Loop / O2 Production

Steps	Description	Completed By	Witnessed By	Date
01	Line Up the valves as per the P&ID Mark Up (See Appendix for Anode Water Loop / O2 Production Flushing P&ID Mark Up): For Water Injection: Check that HV-300, HV-301A, HV-302A, PV-300 are open. Check that the 3ways valve (3WV-320) is open towards the separator tank for the oxygen loop (ST600). Remove the nozzle plate from FH-600. The system is ready to receive pure water from WTP system. Note: as per the design of WTP, it cannot receive tap water to produce pure water as per its specification. There is no softener in WTP package, so a temporary softener should be used upstream of WTP. For Venting: Check that HV-615, MPV-611 are open. Check that PV-610 is closed. The system is connected to the O2 Vent during the filling. The system has been inerted with Nitrogen during Nitrogen Service Test. At this stage 8% O2 is acceptable for a good preservation. Check the O2 % at PT-612 vent with a portable O2 meter. If O2 is more than 8%, perform a Nitrogen purging by opening PV-900. Also put the following valves in the indicated position: Check that HV-600D, HV-600DA, HV-600DB, HV-601D, HV-602DA, HV-603D, PV-640 are closed. Check that HV-600, HV-600A, HV-600B, HV-601A, HV-601B, HV-602A, HV-603A, HV-604 and HV-605 are open.			
02	Check the feed water conductivity from WTP measurement. Conductivity measured shall be below 0.1 µS/cm. Record the conductivity value on the Flushing Report.			

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

03	Start the LP-300A in MANUAL mode. Check that there is no overflow by listening to the pump noise and by checking the pump curve versus the actual pressures (WTP outlet Pressure and PI-300). Fill ST-600 and all piping with water until approximately the middle of tank. During the filling, verify that the air is vented from all dead volumes as much as possible. If needed open some vent to make sure no air below the water level in the ST-600. Monitor ST-600 level on LT-600 during the filling.			
04	Stop LP-300A as soon as the alarm LAH-600 is triggered.			
05	**Start CP-600A at minimum speed** and flush the loop pipes. Check that there is no overflow by listening to the pump noise. If necessary, check the pump curve versus the actual pressures. Slightly close partially the outlet valve HV-603A to create a slight pressure loss if necessary. Check the level on LT-600 at the CP-600A start-up. Fill ST-600 with water when the level will decrease (due to the discharge lines filling near HE-600 heat exchanger).			
06	Monitor the conductivity on the CT/P-600 during the pipes flushing. Record the initial value on the Flushing Report. Check in F-600 if any dirt has been be collected. The goal is to reach a conductivity below **0.5 µS/cm** at the end of the operation.			
07	If necessary, perform conductivity measurements at different purge points. Drain slightly a part of the used water through HV-602DA & HV-602DB, route the used water flow to an empty IBC tank and fill slowly with fresh water. Repeat this operation until the required conductivity in the loop is reached ($\sigma < 0.5\mu S/cm$). Once the conductivity is reached, check that the conductivity measurements are stable.			
08	Proceed to the flushing by switching to **CP-600B.** Once the conductivity is reached ($\sigma < 0.5\mu S/cm$), check that the conductivity measurements are stable. Fill the Flushing Report.			

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

09	Stop the operation for at least 12h.			
10	Recheck all conductivity measurements after 12h the ensure σ < 0.5µS/cm. Proceed to a flushing (Steps 05-08) or troubleshooting if the conductivity is not OK.			
11	Fill the FH-600 with Resin (check the Resin Filling in section 9.)			
12	Fill the system with water until conditions described in Step 03 Perform a Nitrogen purging to remove the Oxygen. At this stage 8% O2 is acceptable for a good preservation.			
13	Start the pump CP-600A or CP-600B and flush the water loop again with the resin filled in the FH-600. Check in F-600 if any dirt or resin has been collected. If resin is collected, do some troubleshooting at the FH. The goal is to reach a conductivity below **0.1 µS/cm** at the end of the operation. Fill the Flushing Report.			
14	Perform the Leak Test at 90% of PSV Pressure by using the P&ID Mark-Up (Leak Test Pack 01) in Appendix: Pure water is left in place and a mix of N2/H2 is injected till 11.7 barg through HV-902. Follow the methodology explained in the Leak Test chapter in the Method Statement. Do a precise leak check with the H2 sniffer. Fill the Leak Test ITR.

9.5 Flushing Operation of Cathode Water Loop / H2 Production

Steps	Description	Completed By	Witnessed By	Date
01	Line Up the valves as per the P&ID Mark Up (See Appendix for Cathode Water Loop / H2 Production Flushing P&ID Mark Up): For Water Injection: Check that HV-300, HV-301B, HV-302B are open. Check that the 3ways valve (3WV-320) is open towards the separator tank for the hydrogen loop (ST620). Remove the nozzle plate from FH-620. The system is ready to receive pure water from WTP system. Note: as per the design of WTP, it cannot receive tap water to produce the pure water as per its specification. There is no softener in WTP package, so a temporary softener should be used upstream of WTP. For Venting: Check that PV-631, PV-642 are open. The system is connected to the H2 Vent during the filling. The system has been inerted with Nitrogen during Nitrogen Service Test. At this stage 8% O2 is acceptable for a good preservation. Check the O2 % at PT-632 vent with a portable O2 meter. If O2 is more than 8%, perform a Nitrogen purging by opening PV-920. Also put the following valves in the indicated position: Check that HV-620D, HV-620DA, HV-620DB, HV-621D, HV-622D, PV-600, PV-620, PV640, PV-641 are closed. Check that HV-620, HV-620A, HV-620B, HV-621A, HV-621B, HV-622, HV-623, HV-624, MV-640 are open.			
02	Check the feed water conductivity from WTP measurement. Conductivity measured shall be below 0.1 µS/cm. Record the conductivity value on the Flushing Report.			

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

03	Start the LP-300B in MANUEL mode. Check that there is no overflow by listening to the pump noise and by checking the pump curve versus the actual pressures (WTP outlet Pressure and PI-300). Fill ST-620 and all piping with water until approximately the middle of tank. During the filling, verify that the air is vented from all dead volumes as much as possible. If needed open some vent to make sure no air below the water level in the ST-620. Monitor ST-620 level on LT-620 during the filling.			
04	Stop LP-300B as soon as the alarm LAH-620 is triggered & Close to the vent by closing PV-631.			
05	Start **CP-620A at minimum speed** and flush the loop pipes. Check that there is no overflow by listening to the pump noise. If necessary, check the pump curve versus the actual pressures. Slightly close partially the outlet valves HV-622 to create a slight pressure loss if necessary. Check the level on LT-620 at the CP-620A start-up. Fill ST-620 with water when the level will decrease.			
06	Monitor the conductivity on the CT/P-620 during the pipes flushing. Record the initial value on the Flushing Report. Check in F-620 if any dirt or resin have been collected. The goal is to reach a conductivity below **0.5 µS/cm** at the end of the operation.			
07	If necessary, perform conductivity measurements at different purge points. Drain slightly a part of the used water through HV-621D, route the used water flow to an empty IBC tank and fill slowly with fresh water. Repeat this operation until the required conductivity in the loop is reached ($\sigma < 0.5\mu S/cm$). Once the conductivity is reached, check that the conductivity measurements are stable.			
08	Proceed to the flushing by switching to **CP-620B.** Once the conductivity is reached ($\sigma < 0.5\mu S/cm$), check that the conductivity measurements are stable. Fill the Flushing Report.			

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

09	The next step is to flush the DG-640: Check that PV-642 is open for DG-640 venting purposes. Check that PRV-640 is fully open. HV-640D is ready to be used for draining purposes. Open PV-640 & then open slowly MV-640 to avoid a sudden pressure drop at the CP-620A Pump outlet. Fill with water when ST-620 level is decreasing excessively during the DG-640 flushing. The alarm LAL-620 can be used as an indication to top up with water in ST-620. Overflow at FT-620 can lead to a trip. Pressurize slightly ST-620 with N2.			
10	Purge also DG-640 with N2 by opening HV-640, HV-641 then by opening slowly MV-941. While opening MV-941, check that flow doesn't exceed 700 NL/h on FI-940. Once conditions of flushing are stable, close PV-642, HV-640 and HV-641. Keep MV-941 at the same position for further inerting purposes.			
11	Monitor the conductivity with a portable conductivity meter on the sampling point HV-640D.			
12	Recheck all conductivity measurements after 12h the ensure $\sigma < 0.5\mu S/cm$. Proceed to a flushing (Steps 05-08) or troubleshooting if the conductivity is not OK. Check again in F-620 if any dirt or resin has been collected. Fill the Flushing Report.			
13	Fill the FH-620 with Resin (check the Resin Filling in section 9.)			
14	Fill the system with water until conditions described in Step 03 Perform a Nitrogen purging to remove the Oxygen. At this stage 8% O2 is acceptable for a good preservation.			
15	Start the pump CP-620A or CP-620B and flush the water loop again with the resin filled in the FH-620. The goal is to reach a conductivity below **0.1 µS/cm** at the end of the operation. Check in F-620 if any dirt or resin has been collected. If resin is collected, do some troubleshooting at the FH. Fill the Flushing Report.			

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

16	Perform the Leak Test at 90% of PSV Pressure by using the P&ID Mark-Up (Leak Test Pack 02) in Appendix: Purge HPP with H2/N2 by opening MV-632 in the beginning. Pure water is left in place and a mix of N2/H2 is injected till 32.4 barg through HV-922. Follow the methodology explained in the Leak Test chapter in the Method Statement. Do a precise leak check with the H2 sniffer. Fill the Leak Test ITR.			

9.6 Flushing with Stacks

Steps	Description	Completed By	Witnessed By	Date
01	Install the Stacks (check the Stack Installation in section 10.)			
Important Note: At this stage, H2/Water Loop Pressure should remain always higher than O2/Water Loop Pressure at all times.				
02	Perform a Nitrogen purging to remove the Oxygen. At this stage 8% O2 is acceptable for a good preservation.			
03	Pressurize with N2 the H2/Water Loop with 2 barg and the O2/Water Loop with 200 mbarg. Note: Each Stack sides are permeable to water.			
04	Start the pumps CP-600A & CP-620A or CP-600B & CP-620B at their normal speed and flush the water loop again with the resin filled in the FH-600 & FH-620 and all the stacks installed. Monitor carefully the pressure. If necessary, inject N2 to H2/Water Loop to keep the pressure higher than O2/Water Loop Pressure. The goal is to reach a conductivity below **0.1 µS/cm in both sides** at the end of the operation. Fill the Flushing Report. Keep the same pressures in both sides systems. Next step is described in chapter 11.			

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

10. Resin Installation

This following section gives the requirements and steps for the insertion of the resin in the filters housing FH-600 and FH-620. The acceptance criteria for this activity are the conductivity measurement to be kept under 0.5µS/cm on both loops after the flushing with resin. It ensures a good particles and ions adsorption.

10.1 Pre-requisites

This operation is performed straight after the flushing, therefore the Flushing Report this procedure steps for 7. Flushing has been completed and filled out.

10.1.1 Required Equipments

- Toolboxes: screwdrivers, spanners, pliers, wrenches, pipe wrenches…
- Field telephone or Walkie-Talkie
- 1 clean shovel for Resin loading
- 3 flange gaskets for RS-603A 6” (DN150)
- 3 EPDM gaskets (815ID/875OD) for FH-600
- 3 EPDM gaskets (750ID/810OD) for FH-600
- 3 flange gaskets for FH-600 cover 36”150# (DN900)
- 3 flange gaskets for RS-622 4” (DN100)
- 3 EPDM gaskets (505ID/565OD) for FH-620
- 3 EPDM gaskets (440ID/500OD) for FH-620
- 3 flange gaskets for FH-620 cover 24” 300# (DN600)
- 508 L of IRN160 Amberlite resin
- 158 L of IRN160 Amberlite resin.
- 1 torque wrench (range up to 2700 Nm)
- 1 sling to install the nozzle plate
- Keys for the hand valves padlocks
- Fitting hoses for FH drain valves (HV-602DA and HV-621D)
- Empty IBC Tank (to route the water from FH section)
- 1 Allen key

All equipment used must have a serial number and a valid calibration certificate (if applicable).

10.1.2 Required Documents

- Flushing Procedures
- Filter housing datasheet
- This procedure is approved for use
- Set of PIDs at the last revision
- Subsystem RFC Certificate signed by all parties
- Permit To Work delivered and signed

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

10.1.3 Manpower (Indicative)

- 1 Elogen Commissioning Engineer
- 2 Mechanical Supervisor
- 2 Helpers (pipefitter)
- 1 LOTO supervisor

The resin filling activities are under the responsibility of the Commissioning Engineer.

10.1.4 Duration

The duration of the activities is 1 day per FH.

10.2 Safety

Main risks during the operation are:

- Slippery floor risk
- Chemical Risks (cf. SDS IRN160 amberlite)
- Heavy load

10.3 Resin Filling Operation

The following procedure is for the FH-600. Same steps are applicable to perform the FH-620 filling. The corresponding tags for FH-620 filling are indicated in brackets.

Steps	Description	Completed By	Witnessed By	Date
01	Isolate the FH-600 (FH-620): remove the padlocks (if present) from the HV-602A (HV-621A and HV-621B) and HV-603A (HV-622). Close these FH upstream and downstream valves.			
02	Connect a hose to FH-600 (FH-620) section to drain valve HV-602DA (HV-621D).			
03	Remove the padlock from the HV-602DA (HV-621D) (if present).			
03	Then, open the HV-602DA (HV-621D) to drain the FH-600 (FH-620).			
06	Once the water draining is completed, close HV-602DA (HV-621D) and put the padlock at its original place.			
07	To remove the FH cover, unscrew the flanges at both ends of the removable pipe section RS-603A (RS-622) and remove it. Unscrew the bolts of the FH cover on the top. Turn the cover by using the mounting arm.			
08	Prepare the upper nozzle plate by placing it on a clean and flat surface ready to be installed.			

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

09	Fill the housing with resin: for this, use the shovel.			
10	Put the upper nozzle plate at its position and tighten to indicated torque with the torque wrench. Be careful with the EPDM Gasket: it must be installed properly without any damage & proper bolt tightening. Otherwise, that affects the integrity of the resin bed.			
11	Replace the original flange gasket of the cover with a new one (if necessary).			
12	Put the FH cover on the FH. Screw the cover bolts and tighten to a proper torque using the torque wrench.			
13	Put the removable pipe section RS-603A (RS-622) at its original position.			
14	If necessary, replace the original flange gaskets with a new one.			
15	Check that all the drain valves are in their original position like it was before the operation.			
16	Open the isolating valves HV-602A (HV-621A and HV-621B) and HV-603A (HV-622).			
17	Reinstall all the padlocks on all valves.			
18	Perform several cycles of flushing, until obtaining a compliant conductivity (0.1µS/cm on both loops) by following the procedure steps in the section 8. Check in F-600 & F-620 if any resin has been collected			
19	Clean and tidy up the equipment.			

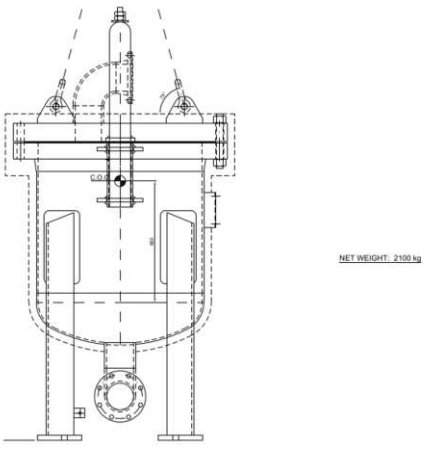

Figure 3. FH-600

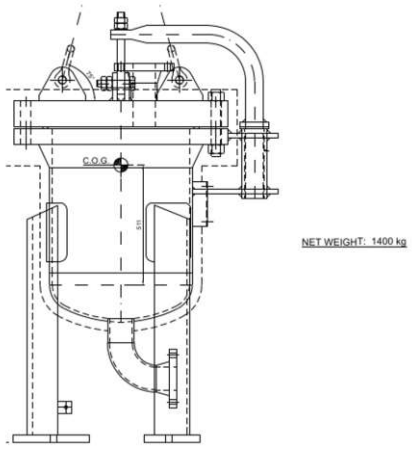

Figure 4. FH-620

11. Stack Connection

This following section gives the requirements and steps for the stack's installation.

11.1Pre-requisites

This operation is performed after both loops flushing with resin. At this stage, the stacks are already in place and connected electrically with all its instrumentation. The goal is to connect it mechanically to the unit.

11.1.1 Required Equipments

- Torque wrench
- Valve padlocks
- Flexible for draining
- 32 Gaskets Kempchen DN50 PN40
- 192 screw, nuts M16 lg 90 A4

11.1.2 Required Documents

- This procedure is approved for use
- Set of PIDs at the last revision
- Subsystem RFC Certificate signed by all parties
- Permit To Work delivered and signed

11.1.3 Manpower (Indicative)

- 1 Elogen Commissioning Engineer
- 2 Mechanical Supervisor
- 1 Electrician
- 2 Helpers (pipefitter)
- 1 LOTO supervisor

The stacks connection activities are under the responsibility of the Commissioning Engineer.

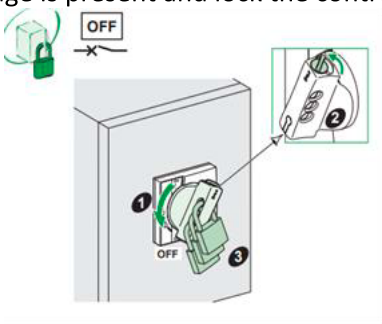
11.1.4 Duration

The duration of the activities is 0.5 to 1 day per Stack.

11.2 Safety

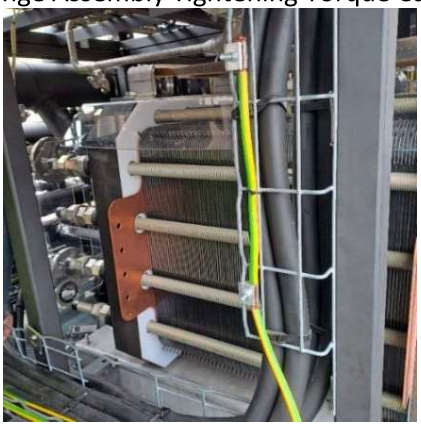
Main risks during the operation are:

- Slippery floor risk
- Electrical Risks
- Mechanical Risks / Heavy load
- Necessary LOTO for electrical and mechanical must be done



11.3 Stack Connection

The 8 stacks required for electrolysis to produce hydrogen are installed in the electrolyser.



This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

All Electrical wiring & Instrumentation are connected
Follow the following Steps to connect the stacks mechanically:

- Check that the unit is stopped via the HMI and switch to maintenance mode.
- Check especially that the pumps CP-600A/B and CP-620A/B are switched off and close 3WV-320 valve.
- Check that the power cables to the stacks are not energized:
    - To isolate the 400Vac, open the circuit-breaker and align the handle with the OFF position.
    - Fit padlocks like in the illustration below.
    - Attach a lockout work card.
    - Check with a VAT that no voltage is present and lock the electrical cabinet.
    - Use a VAT to check that no voltage is present and lock the control cabinet.

- Isolate and drain the stacks section to prepare the installation:
    - Close HV-623, HV-624, HV-604, HV-605
    - Open HV-602D and HV-623D to drain the water
    - Remove the flexible
- If Stacks are preserved with pure water, remove the plugs and drain the water to an IBC tank.
- Place the flexible flanges on the stacks and put protection to preserve them from the outside.
- At this stage E&I Mechanical Completion must be completed (PCA, VM, Ground, EXT, DC Power cables, must all be connected). If not connect them at this step.
- Also, E&I Pre-Commissioning must be completed (PCA, VM, Ground, EXT, DC Power cables, must all be tested). If not, proceed to all tests and fill the relevant ITRs (if any).
- Connect the stacks to the manifold, then tighten to 120 N.m (staggered).
  Caution: Confirm torque value with Flange Assembly Tightening Torque Calculation Note

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- Repeat the previous steps to install stacks 2, 3….
- Protect the bipolar plates of each stack with their dedicated Plexiglas protection panels if not already done.
- Open the stacks' isolation valves once the assembly of the stacks is complete.
- Perform several cycles of flushing, until obtaining a compliant conductivity (0.1µS/cm on both loops) by following the procedure steps in the section 8.6

12. Pre-Start-Up Operations

In this section, a check is made on all Cold Operations that have been performed to make the Unit ready for the Start-Up as described in the following document: C063-ELO-PRO-CO-0005 - BLPH Electrolyser Operational Test Procedure.

- All Simulations Tests have been performed (as per chapter 7.)
- All Causes & Effects Tests have been performed (as per chapter 6.)
- Resin & Stacks are properly installed.
- Nitrogen Purging to 3% O2 have been done.
- Final Flushing below 0.1 µS/cm have been performed.
- All containers and ambient items have been tested.
- Fire & Gas detection is operational.
- HVAC Glycol Loop System is operational. PC&C & Start-Up performed by Vendor.
- Transformers & Rectifiers are not energized.
- H2/Water Loop is pressurized at around 2barg > O2/Water Loop at around 200mbarg.

Steps	Description	Completed By	Witnessed By	Date
01	Perform the Final Leak Test at 90% of PSV Pressure by using the P&ID Mark-Up in Appendix: - First Pressurize gradually the Leak Test Pack 02 at 32.4 barg using an N2/H2 mix as per step 16 in chapter 9.5. HPP must be purged with N2/H2 by opening MV-632 at the beginning. - After & Only After: Pressurize the Leak Test Pack 01 at 11.7 barg by keeping the pressure in the Leak Test Pack 02 using an N2/H2 mix as per step 14 in chapter 9.4 Stacks are not waterproof, therefore, there is a natural pressure transfer from the H2/Water loop system to the O2/Water loop system. Do only a precise leak check in dynamic with the H2 sniffer: pressure holding for 1h is not applicable. Inject N2/H2 into H2/Water side if needed to hold the pressure. Vent N2/H2 from O2/Water side if the pressure increases. Fill the Leak Test ITR & Hold the pressure for the next step.			
02	Set the N2 pressure at 30 barg at H2/Water Loop side and 11 barg at O2/Water Loop side then from its closed position, open the following manual valves: - MV-631: 6.8 turns - MV-632: 6.8 turns - MV-642: 0.8 turns - FICV-610A/B/C: To be set at 60 NL/h and Low Flow Alarm to be set at 40 NL/h same time as FICV-611			

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

	- FICV-611: To be set at 660 NL/h - FICV-800: To be set at 60 NL/h with and High Flow Alarm to be set at 469 NL/h and Low Flow Alarm to be set at 40NL/h - FSH-640: Alarm to be set at 6m3/h with water - MV-640: To be set at 3m3/h using FSH-640			
03	Line-Up the valves as per normal operation. Start-Up the Unit with Transformers & Rectifiers Off. Check that all Utilities have been started up as per the expected sequence. Check that both Water loops (H2 & O2) are working together.			
04	Check that the unit is less than 3% O2 ready for Start-Up and H2 Production. HPP will be purged by H2/N2 coming from the ST-620 once H2 will start to be produced. If necessary, purge very slowly in a control manner to remove the O2 from the unit by opening slightly PV-630 and injecting N2 by opening slightly PV-900. Always monitor carefully that the pressure in H2/Water Loop side remains always higher than O2/Water Loop side.			
05	Once the Unit is considered ready for Start-Up, a PSSR meeting is organized to review all conditions to sign the RFO certificate.

TAG NO.	DG-640
DESCRIPTION	H2 HIGH PRESSURE DEGASSER
DIAMETER (DN)	500
DESIGN PRESSURE (barg)	40 / 0,58 bar(a)
DESIGN TEMPERATURE (°C)	-20 / +80
MATERIAL	SA240 316/316L
VOLUME (L)	300

HYDROGEN GENERAL VENT - SEE DOC. PTN-002

NOTES :

NOTE 1 : TO CONTAINER DRIP PAN
NOTE 2 : COUNTER-CURRENT INSTALLATION
NOTE 3 : CLOSEST TO AHD
NOTE 4 : HIGHEST POINT
NOTE 5 : DESIGNED FOR PSV-640
NOTE 6 : AWAITING 3D DEFINITION
NOTE 7 : USED FOR FILLING DURING START-UP
NOTE 8 : HYDRAULIC GUARD HEIGHT = 600MM. LSLL AND LSL DISTANCE = 200MM. LSL AND LSH DISTANCE = 400MM.
NOTE 9 : SEE PTN-002 FOR ALL THE CONNECTION LOCATION ON HYDROGEN VENT.
NOTE 10 : FOR ATEX PURPOSE, ROSETTI VALVE MV-002 WAS ADDED BEFORE TIE-IN POINT C AND INSIDE THE A10 CONTAINER.

Leak Test 01

Closed Valve

Test pressure : 11.7 barg
Medium : N2/H2 mix

GENERAL NOTES :
- FOR ALL PACKAGES, REFER TO THE SUPPLIER P&ID FOR COMPLETE INFORMATION
- FOR EACH SLO REFERENCE PLEASE REFER TO C63-PUY-001
- DRAIN VALVES TO BE INSTALLED AT LOWEST POINTS
- ALL EQUIPMENTS AND PIPING OUTSIDE CONTAINERS ARE HEATED USING HEATING RIBBONS

NOTES :
NOTE 1 : BRITISH STANDARD PIPE PARALLEL (TO INSTALL BETWEEN FLANGES)
NOTE 2 : COMMISSIONING AND INITIAL START-UP
NOTE 3 : ACCESSIBLE FOR MAINTENANCE
NOTE 4 : DISSIMILAR TECHNOLOGY BETWEEN THE TWO CHECK VALVES/ CHECK VALVE SHALL MEET CLASS 1 REQUIREMENT
NOTE 5 : DISTANCE OF 5*D REQUIRED UPSTREAM AND DOWNSTREAM OF THE EQUIPEMENT
NOTE 6 : REMOVABLE LINE, USED ONLY FOR MAINTENANCE
NOTE 7 : REFER TO WATER TREATMENT PACKAGE DOCUMENTATION FROM OVIVO FOR COMPLETE P&ID - P&ID N° (90767001_02)
NOTE 8 : PACKAGE TO BE SUPPLIED BY ELOGEN
NOTE 9 : SECTION OUTSIDE CONTAINER SHALL BE INSULATED (X00 zone)

Leak Test 02

Closed Valve

Valve to Operate

Test pressure : 32.4 barg
Medium : N2/H2 mix

FACTORY ACCEPTANCE TEST – FINAL REPORT

Celme' order confirmation: **23/00084**
Customer order no: **600045206 Change 5**
Customer: **Nidec ASI S.A.S.**
Project name: **8934**
Transformer under tests:

Model: **TOD3176.001** Serial number: **60258**

T no.	*Sno*	*DESCRIPTION*	*Result*
1	60258	Separate source AC withstand voltage (AV)	passed
2	60258	Short duration induced AC withstand voltage (IVW)	passed
3	60258	Measurement of no-load loss and current	passed
4	60258	Measurement of no-load loss and current at 90 % and 110 % of rated voltage	measured
5	60258	Measurement of winding resistance	measured
6	60258	Measurement of short-circuit impedance and load loss	passed
7	60258	Measurement of voltage ratio and check of phase displacement	passed
8	60258	Auxiliaries: functionality	passed
9	60258	Dimensional Check / Overall Visual Check	passed

Test reviewed

10	60258	Check of core and frame insulation	done during production
11	60258	Fluid leak test under pressure	done during production

FAT outcome: ***SUCCESSFUL***

Test Report

Test performed according Standard:	CEI EN 60076	**Test Date:**	04/10/24	**Order N°:**	23/00084
Transformer type:	TOD3176.001	**Serial number :**	60258	**Customer:**	NIDEC ASI SA

Frequency [Hz]:	50	**Insulating oil:**	Natural ester Cargill FR3
Phases:	3	**Cooling:**	KNAN
Windings material:	Al	**Tap regulation:**	+2 / -2 x 2.5 %
Vector group:	Dy11y11		

Primary Windings	Power [kVA]	Voltage [V]	Current [A]
HV	3200	6600	279.9

Secondary Windings	Power [kVA]	Voltage [V]	Current [A]
LV2	1600	360	2566
LV3	1600	360	2566

INSULATION WITHSTAND TEST

Power frequency applied voltage

Winding	Test Voltage [kV]	Duration [s]
HV	20	60
LV2	3	60
LV3	3	60

Test result: PASSED

Induced voltage withstand test

Volt. Source [V]: 720 f [Hz]: 150 t [s]: 40

Test result: PASSED

MEASUREMENT OF TURNS RATIO

6600 / 360 - 270 V

Tap regulation: +2 / -2 x 2.5 %

Polarity and phase relation tests :

D y 11 : **PASSED** D y 11 : **PASSED**

PEI & kPEI CALCULATION

Standard: EU 548/2014, EU 1783-2019

Transformer ref.

Des	*Value*	*Des*	*Value*
Rated power (Sn) [kVA]	**3200**	P.O.	**23/00084**
Primary Voltage (1U) [V]	6600 ±2x2,5	TRF sno	60258
Secondary (2u) [V]	360/270	Type	TOD3176.001
Tertiary (3u) [V]	360/270	Vector group	Dyn11y11

Formulae

$$PEI = 1 - \frac{2(P_0 + P_{c0} + P_{ck}(k_{PEI}))}{S_r\sqrt{\frac{P_0 + P_{c0} + P_{ck}(k_{PEI})}{P_k}}} = 1 - \frac{2}{S_r}\sqrt{(P_0 + P_{c0} + P_{ck}(k_{PEI}))P_k}\ (\%)$$

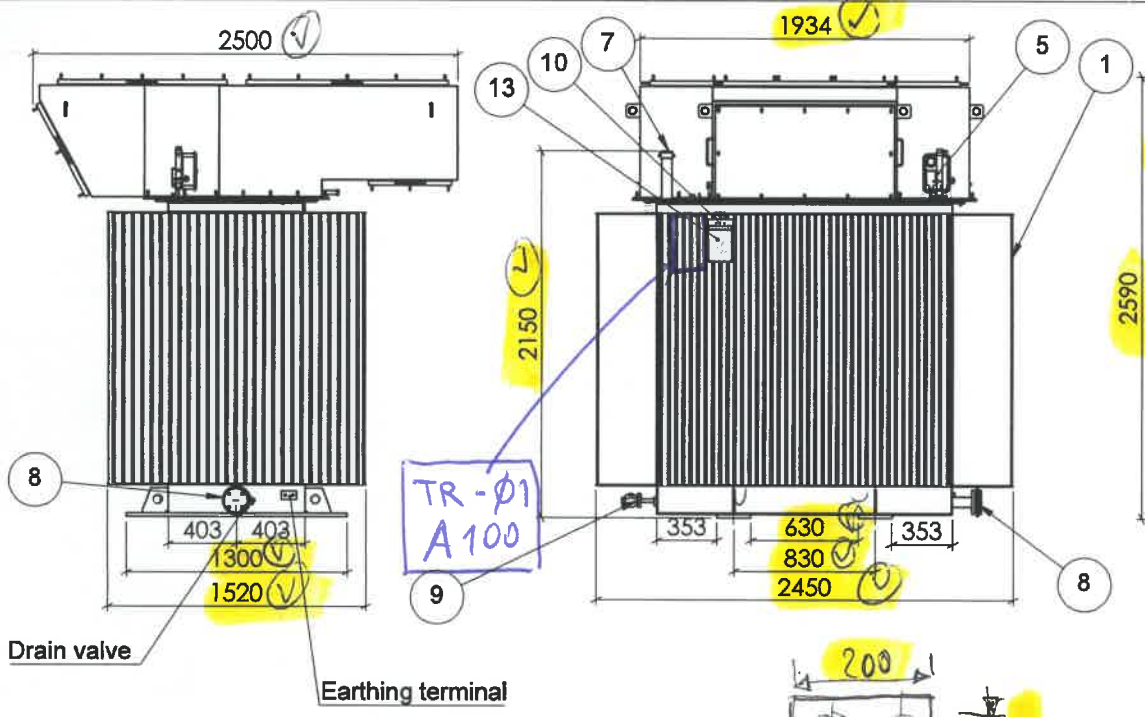
Where:

P_0	is the no load losses measured at rated voltage and rated frequency on the rated tap
P_{c0}	is the electrical power required by the cooling system for no load operation, derived from the type test measurements of the power taken by the fan and liquid pump motors (for ONAN and ONAN/ONAF cooling systems P_{c0} is always zero)
P_{ck} (k_{PEI})	is the electrical power required by the cooling system in addition to P_{c0} to operate at k_{PEI} times the rated load. P_{ck} is a function of the load. P_{ck} (k_{PEI}) is derived from the type test measurements of the power taken by the fan and liquid pump motors (for ONAN cooling systems P_{ck} is always zero).
P_k	is the measured load loss at rated current and rated frequency on the rated tap corrected to the reference temperature
S_r	is the rated power of the transformer or autotransformer on which P_k is based
k_{PEI}	is the load factor at which Peak Efficiency Index occurs';

Measuring & Calculation

Po [W]	Pco [W]	Pck(kPEI) [W]	Pk +75°C [W]	Ptot [W]	PEI meas [%]	Tier	PEI min [%]	kPEI
1364,1	0	0	42093	43457,1	99,526	2	99,519	0,18

Acceptance criteria: PEI meas > PEI min



Result: **COMPLIANCE**

9	Fluid leak test under pressure (11.8)	*	p. 11
10	Dimensional Check / Overall Visual Check		p. 12

* ***Carried out during production: available as review***

Note: Routine tests are performed on every transformer. Type, special and other tests are performed upon previous agreement between manufacturer and customer. Not all tests apply to every transformer type. Different arrangements and tolerances are possible upon previous agreement between manufacturer and customer.

Auxiliaries

Standard: IEC 60076-3 ed. 3.0 (2013-07)
Power transformers
Part 3: Insulation levels, dielectric tests and external clearances in air
§ 9

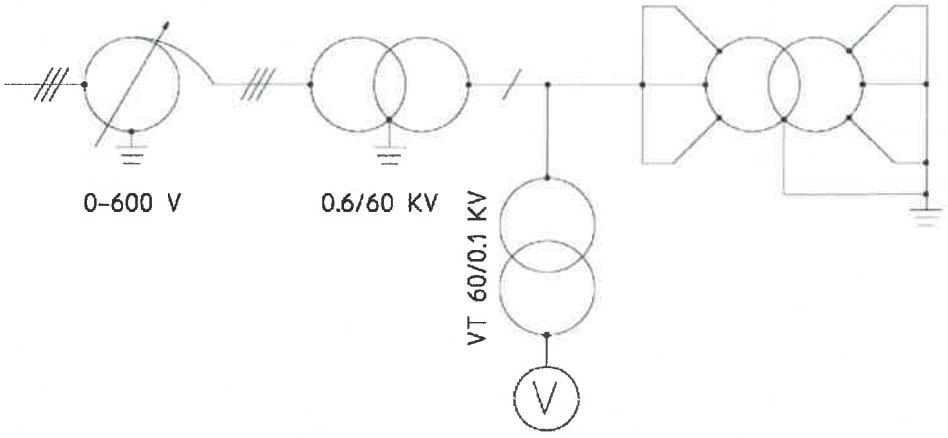
DGPT2+PT100

Surge arresters

A visual control of the placement of the auxiliaries is done, together with a functional check of the alarm and trip contacts and their respective cabling to the marshalling box.
In detail:
1. auxiliary dielectric and insulation resistance test (through relavant terminals on marshalling box); a test voltage of 2 kV is applied for 60 s between the auxiliaries' contacts and earth to verify the adequate insulation and protection.
2. auxiliary functionality (through relevant terminals on marshalling box);
3. accessories check;
4. Thermometer and WTI: calibration and setting on alarm and trip thresholds according to the references indicated on the general arrangement.

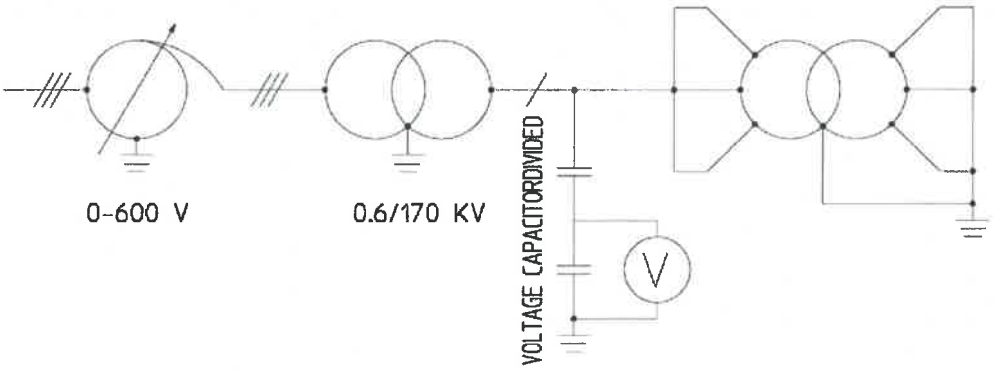
celme	Test Procedure	TP_23_00084 revision A-1

Separate source AC withstand voltage (AV) (11.1.2.1 e)



Standard: IEC 60076-3 ed. 3.0 (2013-07)
Power transformers
Part 3: Insulation levels, dielectric tests and external clearances in air
§ 11

Procedure: The separate source AC withstand test shall be made with single-phase alternating voltage as nearly as possible on **sine-wave form and not less than 80% of the rated frequency. The peak value of voltage divided by √2 shall be equal** to the test value. The full test voltage shall be applied for 60s between all terminals of the winding under test connected together and all terminals of the remaining windings, core, frame and tank connected together at earth. The test is performed on every winding according to its insulation level.



20KV at primary no intervention of protection OK
3KV at 1° secondary OK no intervention of protection
3KV at 2° secondary OK no intervention of protection

Wiring diagram

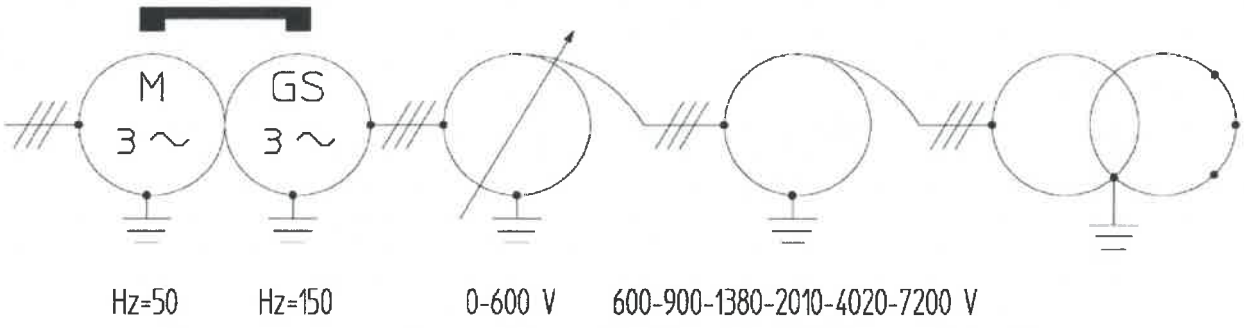
Variant 2:

Results: /

celme	Test Procedure	TP_23_00084 revision A-1



Short duration induced AC withstand voltage (IVW) (11.1.2.1 e)

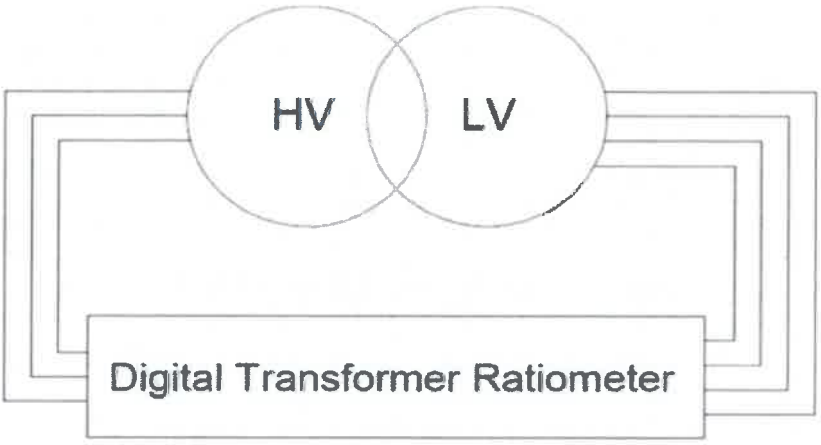
Standard: IEC 60076-3 ed. 3.0 (2013-07)
Power transformers
Part 3: Insulation levels, dielectric tests and external clearances in air
§ 12.2

Procedure: An alternating voltage as close as possible to two times the nominal voltage shall be applied to the terminals of one winding of the transformer. The test time shall be 120x([rated frequency]/[test frequency]) but not less than 15s. The equipment in the test room provides a 150Hz voltage so the duration is: 120x50/150 = 40s.

720V @ 150Hz For 40sec
acceptance criteria: no discharge no intervention of protection
OK passed

Wiring diagram

Results: /



celme	Test Procedure	TP_23_00084 revision A-1

Measurement of voltage ratio and check of phase displacement (11.3)

Standard: IEC 60076-1 ed. 3.0 (2011-04)
Power transformers
Part 1: General
§ 11.3

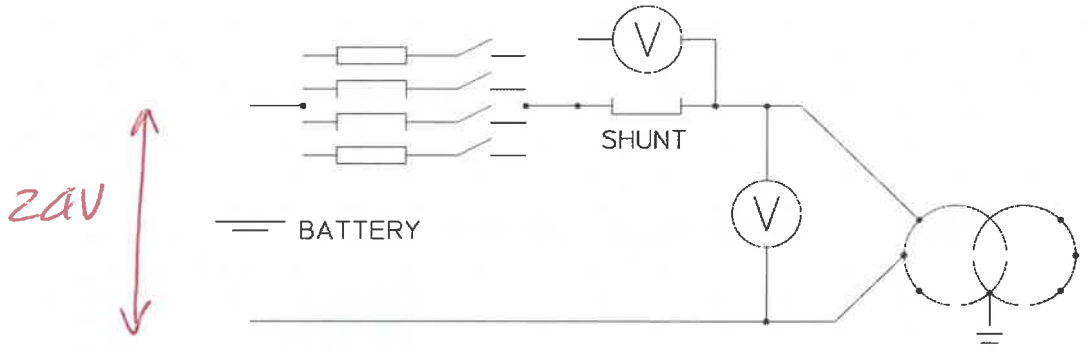
Procedure: The transformer is connected to a portable fully automated three phase turns ratio meter. The group and phase displacement is verified on every tap position.

Wiring diagram

N° 5 position Tap changer (2,5% each)
See Pos on general nameplate
acceptance criteria ±0,5° phase displacement.
±0,5% ratio deviation

Results: /

celme	Test Procedure	TP_23_00084 revision A-1



Measurement of winding resistance (11.2)

Standard: IEC 60076-1 ed. 3.0 (2011-04)
Power transformers
Part 1: General
§ 11.2

Procedure: The transformer shall be at rest in a constant ambient temperature for at least 3 hours. The temperature of the winding is then deemed to be the same as the average oil temperature. A small current is feeded through the each pair of phases in the winding and the voltage is read. The mean value is the resistance of the winding. The value is then corrected to the reference temperature of 75°C.

Temperature 23,7 °C

Wiring diagram

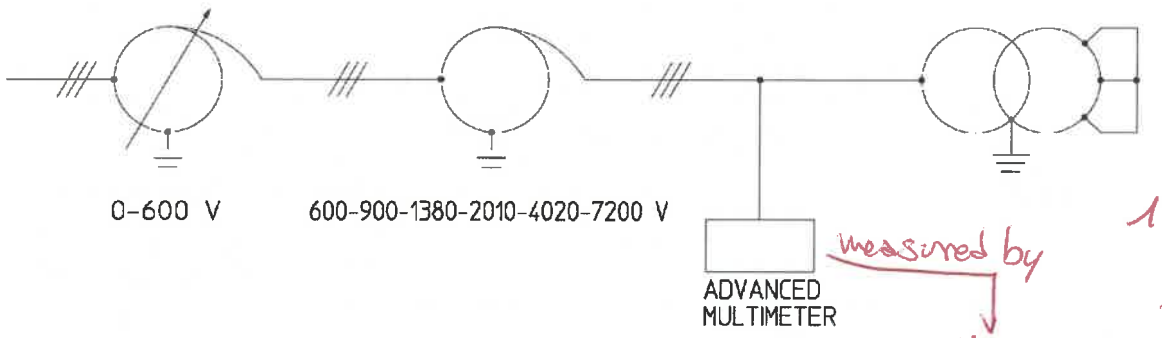
Aluminium winding 225
↙ ref temperature
225 + 75 = 300

225 + 23,7 = 248,7
↖ measured temperature

300 / 248,7 = 1,2 coefficient for temperature compensation to 75°C

Results: /

celme	Test Procedure	TP_23_00084 revision A-1



Measurement of short-circuit impedance and load loss (11.4)

Standard: IEC 60076-1 ed. 3.0 (2011-04)
Power transformers
Part 1: General
§ 11.4

Procedure: The short-circuit impedance and load loss for a pair of windings shall be measured at rated frequency with a voltage applied to the terminals of one winding and the terminals of the other winding short-circuited. All other windings, if present, must be open-circuited. The applied current shall be between 50% and 100% of the rated current. The measurement must be made quickly to avoid any significant error coming from the heating of the windings.

$In' = 279,93A \rightarrow 50\% = 139,96A$

Wiring diagram

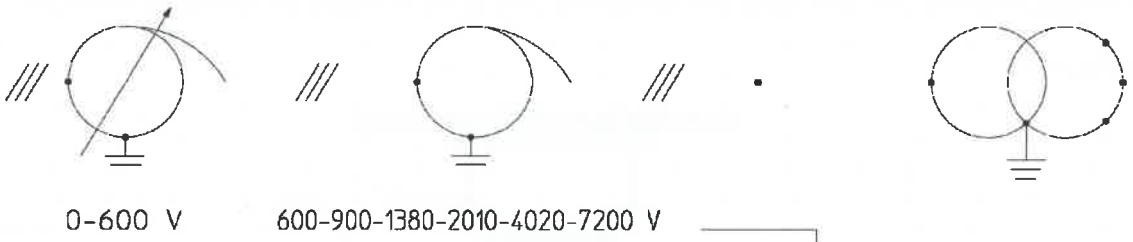
celme	Test Procedure	TP_23_00084 revision A-1



Measurement of no-load loss and current (11.5)

Standard: IEC 60076-1 ed. 3.0 (2011-04)
Power transformers
Part 1: General
§ 11.5

Procedure: The no-load loss and the no-load current shall be measured on one of the windings at rated frequency and rated voltage. The remaining windings shall be left open-circuited. The winding that can be connected in open delta must be in closed. The transformer shall be approximately at factory ambient temperature. This test shall be performed at 90, 100 and 110% of rated voltage, measuring relevant corrent and losses.

celme	Test Procedure	TP_23_00084 revision A-1

Check of core and frame insulation (11.12)

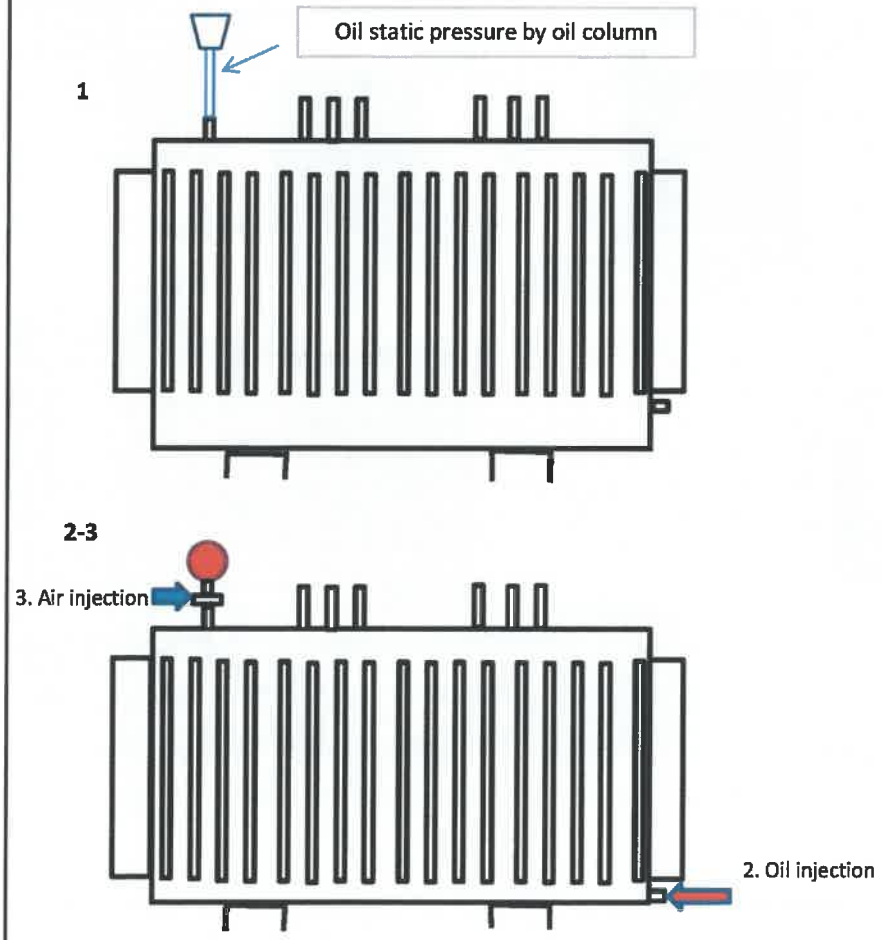
Standard: IEC 60076-1 ed3.0 (2011-04)
Power transformers
Part 1: General
§ 11.12

Procedure: This test shall be carried out on all liquid immersed transformers which incorporate insulation separating core and frame and/or frame and tank.
For transformers where the core and frame earth connections are not accessible when the transformer is liquid filled, the insulation shall be tested at 500 V d.c. for 1 min without breakdown before the active part is installed in the tank.
For transformers where the core and frame earth connections are accessible when the transformer is liquid filled, the insulation shall be tested at 2 500 V d.c. for 1 min without breakdown after the transformer is filled with liquid.

Wiring diagram

Results: /

celme	Test Procedure	TP_23_00084 revision A-1



Fluid leak test under pressure (11.8)

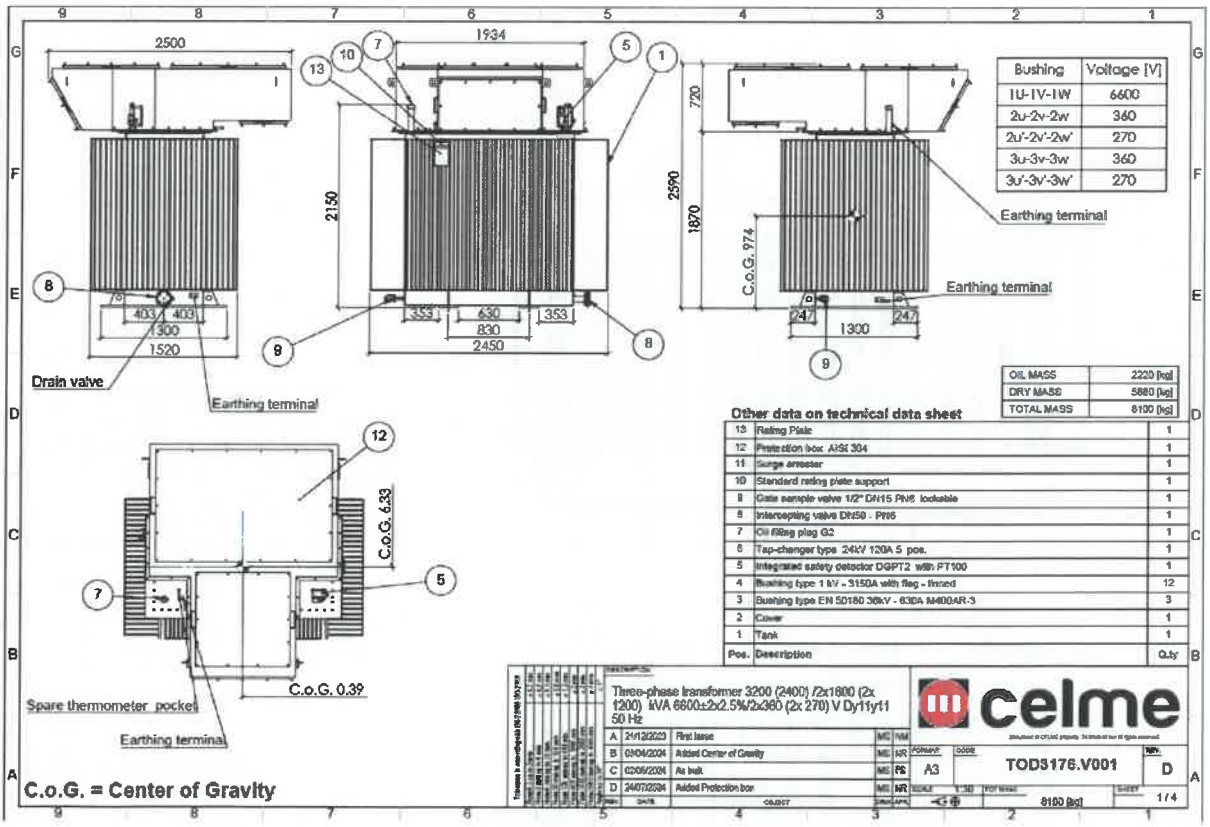
Standard: IEC 60076-1 ed. 3.0 (2011-04)
Power transformers
Part 1: General
§ 11.8

Procedure: If not differently agreed between manufacturer and purchaser, a pressure (by either using a liquid column or gas pressure in the conservator) of at least 30 kPa is applied over the normal liquid pressure. This pressure shall be maintained for 24 hours for transformers greater than 20 MVA or 72,5 kV and 8 hours for transformers with lower rating and voltage. The test is not applicable to hermetic transformers.

Even if this type of transformer is hermetic type (thus not under this test), the agreement between parts is to apply a pressure of 30kPa for 8hs. Celme follows three methods alternately:
1. pipe estension full of oil over the filling pipe up to height at least of mm over the cover surface.
2. injection of oil by a pump controlled by a calibrated pressure gauge installed on the filling pipe.
3. Injection of air controlled by calibrated pressure gauge installed on the filling pipe.

Sketch of test

Results: /



celme	Test Procedure	TP_23_00084 revision A-1

Dimensional Check / Overall Visual Check

Standard: IEC 60076-1 ed. 3.0 (2011-04)
Power transformers
Part 1: General

Procedure: General control is performed using the general arrangement drawing as reference. The tollerances are reported into the relevant drawnings.

Sketch

Results: /

ATTIVITA' ESEGUITE / *Activities Carried Out*

Witnessed test of 3.2MVA Transfomer tag TR-01/A100 according to FAT agenda, and visual and dimensional inspection, according to test notification issued by ELOGEN, ref mail Andreia Vilarinho dated 26/09/2024.
At supplier workshop:
CELME Via Cà Sordis, 30, 36054 Montebello Vicentino VI, Italy.

Before the FAT CELME declare that all internal tests was carried out successfully without punches.

The FAT tests are carried out following the given agenda here attached IR-01-C63-CELME FAT AGENDA, and FAT test procedure IR-01-C63-CELME FAT PROCEDURE, in which are described the procedures to follow, and the acceptance criteria to be respected.

Here attached CELME FAT report ref no 23/00084_241004_FAT, as evidence of carried out tests and results.

Some punch-list items was raised, reference is made to the OWL no IR-02-C63-NIDEC here attached.

Celme informs that before the SAT he will provide the check list for installation.

The Goods are accepted by Elogen, the relevant release note it will be issued by Elogen to Nidec only after closing of punch-list verification, to be done before shipment (expected to be the next Wednesday 9th Thursady 10th October), by sending pictures which as to be reviewed by Nidec/Elogen.

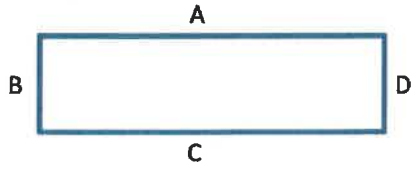
celme	Transformer Technical Datasheet	TDS.TOD3176.V001 revision A/0

Three phase transformer according to IEC 60076 for installation in safe zone with the following features:

natural ester Cargill FR3 (according to IEC 62770)



hermetic type (integral filling)

Type of load

The transformer is designed for continuous duty (THDi considered <3%)

Nominal ratings

Power 3,2 MVA KNAN

	Primary	Secondary
Power [MVA]	3.2/2.4	2 x 1.6/ 2 x 1.2
Rated voltage [V]	6600	2 x 360/ 2 x 270
Rated current [A]	279.93	2 x 2566
Material	AL	AL
Tap-changer	off-circuit	/
Taps	±2x2.5	/
Highest system voltage [kV]	7,2	1,1
Power frequency voltage [kV]	20	3
Impulse voltage [kV]	60	/
Bushing type	plug-in type - int. C 36kV/630A	porcelain 1kV/3150A
Bushing number	3	2 x 3 + 2 x 3
Bushing placement	cover side A	cover side C
Bushing protection	/	/

Electrical data

Frequency [Hz]	50	
Vector group	Dy11y11	
Impedance [%] @75 °C	7	(at Sn/2, 6600/360 V)
No load loss [W]	1400	
Load loss [W] @75 °C	42000	(at Sn/2, 6600/360 V)
Total loss [W] @75 °C	43400	(at Sn/2, 6600/360 V)
No load current [%]	0,5	
PEI [%]	99,52	

		Voltage drop				Efficiency			
Power factor		0,85	0,90	0,95	1,00	0,85	0,90	0,95	1,00
Load	1/4	1,19	1,05	0,86	0,34	99,41	99,44	99,47	99,50
	2/4	2,40	2,13	1,74	0,72	99,13	99,18	99,22	99,26
	3/4	3,63	3,22	2,65	1,12	98,79	98,85	98,91	98,97
	4/4	4,87	4,34	3,58	1,55	98,43	98,52	98,59	98,66

Environmental and working conditions

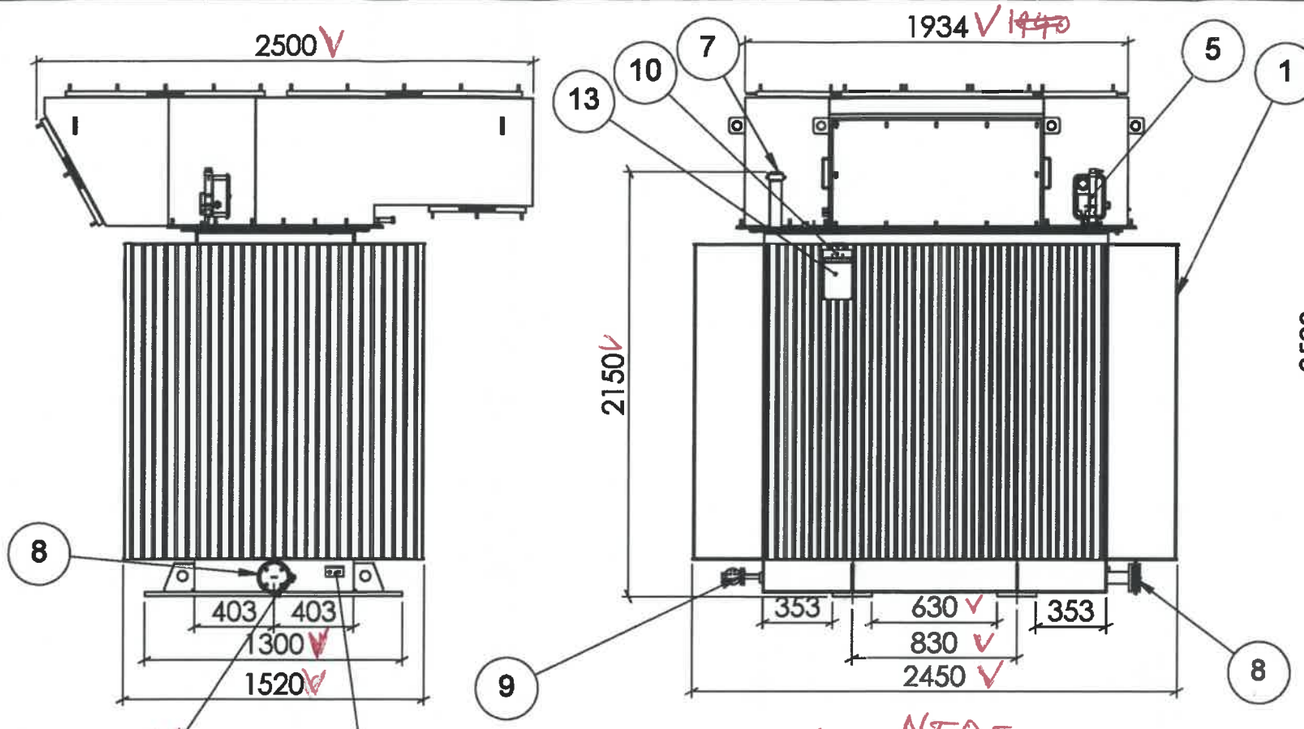
Minimum ambient temperature	-10 °C	
Maximum ambient temperature	40 °C	
Maximum installation altitude	1000 m	
Fluid temperature rise	60 K	
Winding temperature rise	65 K	
Corrosivity category	C5	durability: VH
Lp(A) @ 1m	75 dB(A)	

Mechanical data

Weights		Base
Fluid	2220 kg	Skid
Total	7830 kg	

Overall dimensions

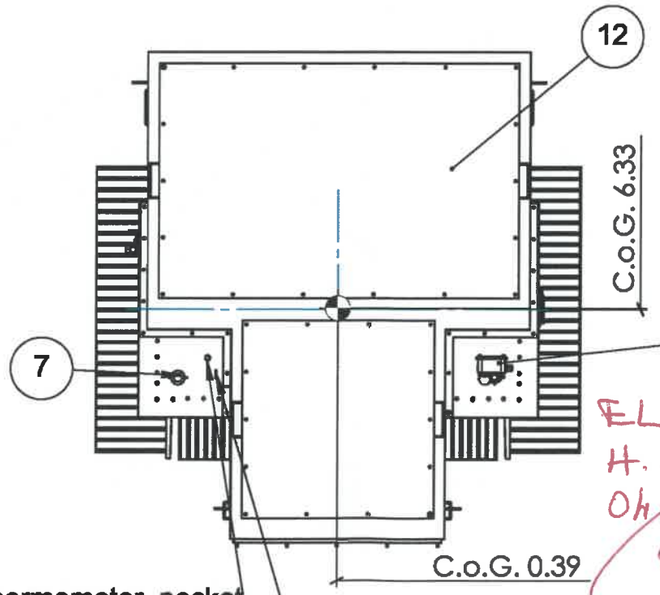
Service conditions



Lenght	2450 mm
Width	1520 mm
Height	2199 mm

Painting

The external protection is suitable for ambient C5. All the metallic surfaces are sandblasted Sa 2½. Tank is hot-dip galvanized (except for stainless steel parts). The paint thickness is 310µm. The color is RAL 7033.



Fittings

1 x Rating plate
2 x Earthing plate
1 x Filling plug
1 x Drain valve
1 x Sampling valve
1 x Spare thermometer pocket
1 x Electrostatic shield
1 x DGPT2 (safety device for hermetic transformers) fitted with PT100
3 x Surge arrester (primary side) - supply as loose material

Bushing	Voltage [V]
1U-1V-1W	6600
2u-2v-2w	360
2u'-2v'-2w'	270
3u-3v-3w	360
3u'-3v'-3w'	270

OIL MASS	2220 [kg]
DRY MASS	5880 [kg]
TOTAL MASS	8100 [kg]

QUALITY CONTROL PLAN

Oil immersed transformers
Mod 04 13

PFC02.2300084
revision A/1

Legend:

INSTRUCTIONS AND PLANS
IT: operative instructions;
SF: supply specifications;
PCA: check-in control plan;
PCQ: quality control plan;
D: drawing.

RECORDS OF P.C.C.
VCNu: magnetic circuit record;
VCCa: tank control record;
VCOl: oil control record;
Vco: test record;
RPF: supplier test record.

OPERATIVE AND CONTROL DATASHEET
SRM: assembly datasheet;
SA: winding datasheet;
SS: pre-spedition check.

OTHER
D.d.C.: supplier's declaration of conformity;
M: marking;
DD: PC record;
F: supplier's check;
AE: external assembler check.

INTERNAL FUNCTIONS
DG: general management;
FQ: quality function;
CQ: quality control;
FT: technical function;
FP: production function;
FC: sale function;
FA: purchase function;
MAG: warehouseman.

PARTICIPANTS
C: customer;
CF: final customer;
TP: third party.

ACTIVITIES
H: must be performed with a witness;
W: should be perfomerd with a witness; the internal record can be requested;
R: the internal record can be requested.

NOTE:
CELME, for some of its actions, doesn't prepare any quality document because the material is approved by the supplier's documents. In case of defective or broken material, a non-conformity record (N.C.) is open.
The column "Record n°" can be compiled upon customer's request with the relevant documents of the single transformer or of the production batch.

GENERAL NOTES :
- FOR ALL PACKAGES. REFER TO THE SUPPLIER P&ID FOR COMPLETE INFORMATION
- FOR EACH SLO REFERENCE PLEASE REFER TO C63-PUY-001
- DRAIN VALVES TO BE INSTALLED AT LOWEST POINTS
- ALL EQUIPMENTS AND PIPING OUTSIDE CONTAINERS ARE HEATED USING HEATING RIBBONS

NOTES :
NOTE 1 : BRITISH STANDARD PIPE PARALLEL (TO INSTALL BETWEEN FLANGES)
NOTE 2 : COMMISSIONING AND INITIAL START-UP
NOTE 3 : ACCESSIBLE FOR MAINTENANCE
NOTE 4 : DISSIMILAR TECHNOLOGY BETWEEN THE TWO CHECK VALVES/ CHECK VALVE SHALL MEET CLASS 1 REQUIREMENT
NOTE 5 : DISTANCE OF 5*D REQUIRED UPSTREAM AND DOWNSTREAM OF THE EQUIPEMENT
NOTE 6 : REMOVABLE LINE. USED ONLY FOR MAINTENANCE
NOTE 7 : REFER TO WATER TREATMENT PACKAGE DOCUMENTATION FROM OVIVO FOR COMPLETE P&ID - P&ID N° (90767001_02)
NOTE 8 : PACKAGE TO BE SUPPLIED BY ELOGEN
NOTE 9 : SECTION OUTSIDE CONTAINER SHALL BE INSULATED (X00 zone)

NOTES
NOTE 1 : TO CONTAINER DRIP PAN
NOTE 2 : COUNTER-CURRENT INSTALLATION
NOTE 3 : CLOSEST TO AHD
NOTE 4 : HIGHEST POINT
NOTE 5 : DESIGNED FOR PV-642 & MV-642 SETTING
NOTE 6 : AWAITING 3D DEFINITION
NOTE 7 : USED FOR FILLING DURING START-UP
NOTE 8 : HYDRAULIC GUARD HEIGHT = 600MM. LSLL AND LSL DISTANCE = 200MM. LSL AND LSH DISTANCE = 400MM.
NOTE 9 : SEE PTN-002 FOR ALL THE CONNECTION LOCATION ON HYDROGEN VENT.
NOTE 10 : FOR ATEX PURPOSE, ROSETTI VALVE MV-002 WAS ADDED BEFORE TIE-IN POINT C AND INSIDE THE A10 CONTAINER.

Bonjour vous venez d'ouvrir la Cause and Effect
Ce document liste les interlocks process et safety
Vous retrouverez les différentes séquences ou actions singulières qui existent dans l'anlayse fonctionnelle
Les codes des séquences sont associés ensuite avec ceux présents dans la table d'alarme, on peut ainsi déterminer quels sont les initiateurs
Le document associé est le CXX - PWI-003- Alarm list

Hello, you just opened the Cause and Effect
This document makes the list of interlocks process and safety
You will find the different sequences or singular actions existing in the functional analysis
The codes of sequences are associated with the one present in the alarm table, then it is possible to determine the initiating cause
The document associated is CXX - PWI-003- Alarm list

Commissioning Query Form

		QUERY NUMBER	*CQ-00*			
SITE ORIGINATOR TO COMPLETE		**ORIGINATING LOCATION REF. NO**				
		DISCIPLINE:	**Instruments**	LOCATION:	**Electrolyser**	
		WORKPACK REF:				
		SYSTEM:20-00		SUB SYSTEM:	N/A	
			Print: Dave Musgrove	*Sign:*	*Date: 14/03/2025*	
		DESCRIPTION OF QUERY				
		While carrying out Inspections of the Atex certified equipment, it has been identified that there is a damaged flame path on the Endress + Hauser pressure transmitter PT-632, this is situated on the Hydrogen vent line 635-50-PWH2-PB22S within the WP3 Zone 2 area. The pressure transmitter PT-632 is for the Hydrogen general vent and is for indication only, this has no executive actions and is designed to read the pressure of the Hydrogen prior to it being vented to atmosphere. Due to the lead time/ETA of the replacement transmitter which is not due until after the target date for Hydrogen introduction, is it acceptable to run the system and introduce Hydrogen on to the BLPH and within the WP3 Zone 2 area without PT-632 being in service?				
		LIST OF DOCUMENTS ATTACHED (INCLUDE NAME / DESCRIPTION / REVISION / DATE OR N/A)				
		Please see attached documents in email				
		PROPOSED SOLUTION				
		Isolate PT-632 both electrically and mechanically to allow the introduction of Hydrogen to the BLPH and the WP3 Zone 2 area. Once the replacement like for like Endress + Hauser pressure transmitter arrives this will be installed and brought into service.

09	Stop the operation for at least 12h.			
10	Recheck all conductivity measurements after 12h the ensure σ < 0.5µS/cm. Proceed to a flushing (Steps 05-08) or troubleshooting if the conductivity is not OK.			
11	Fill the FH-600 with Resin (check the Resin Filling in section 9.)			
12	Fill the system with water until conditions described in Step 03 Perform a Nitrogen purging to remove the Oxygen. At this stage 8% O2 is acceptable for a good preservation.			
13	Start the pump CP-600A or CP-600B and flush the water loop again with the resin filled in the FH-600. Check in F-600 if any dirt or resin has been collected. If resin is collected, do some troubleshooting at the FH. The goal is to reach a conductivity below **0.1 µS/cm** at the end of the operation. Fill the Flushing Report.			
14	Perform the Leak Test at 90% of PSV Pressure by using the P&ID Mark-Up (Leak Test Pack 01) in Appendix: Pure water is left in place and a mix of N2/H2 is injected till 11.7 barg through HV-902. Follow the methodology explained in the Leak Test chapter in the Method Statement. Do a precise leak check with the H2 sniffer. Fill the Leak Test ITR.

800SA - Surge arrester for 480/484/489TB/G, EPDM

CONTACT

Sales contact
Phone: +49 9281 8306 0
kundenzentrum.hof@nexans.com

800SA - Surge arrester for 480/484/489TB/G, EPDM, up to 42 kV - 630 A/1250 A

STANDARDS

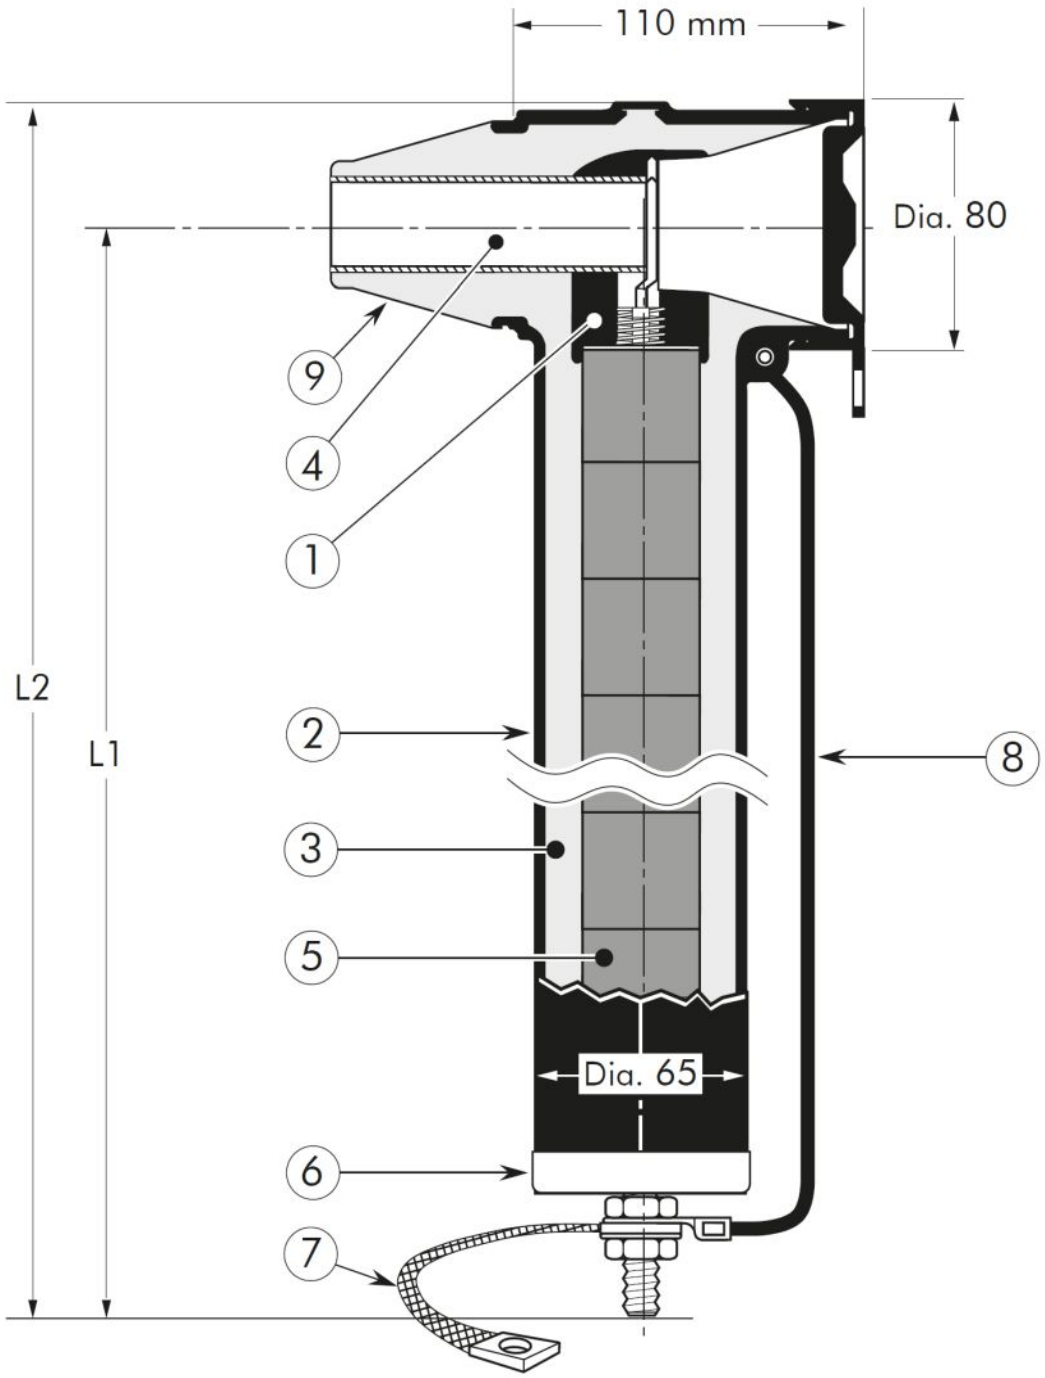
International IEC 60099-4

DESCRIBTION

Application

Surge arrester designed to protect 12, 24, 36 and 42 kV class components, including transformers, equipment, cable and accessories from high voltage surges resulting from lightning or switching.

Technical characteristics



- It has been designed to be used with the 480TB/G, 484TB/G and 489TB/G separable tee connector or 800PB/G, 804PB/G and 809PB/G coupling connector.
- Each arrester is tested for AC withstand, partial discharge and critical voltage prior to leaving the factory.

Specifications and standards

The 800SA surge arresters meet the test requirements of IEC 60099-4. ATEX version can be delivered on request.

All drawings, designs, specifications, plans and particulars of weights, size and dimensions contained in the technical or commercial documentation of Nexans is indicative only and shall not be binding on Nexans or be treated as constituting a representation on the part of Nexans.

DRAWING 800SA

All drawings, designs, specifications, plans and particulars of weights, size and dimensions contained in the technical or commercial documentation of Nexans is indicative only and shall not be binding on Nexans or be treated as constituting a representation on the part of Nexans.

800SA - Surge arrester for 480/484/489TB/G, EPDM

DESIGN 800SA

1. Conductive EPDM insert
2. Conductive EPDM jacket
3. Insulating EPDM layer moulded between the insert and the jacket
4. Receptacle for contact rod
5. Metal oxide valve elements
6. Steel cap
7. Earth connection
8. Earth lead
9. Interface designed to fit 480TB/G, 484TB/G and 489TB/G tee connector, 800PB/G, 804PB/G and 809PB/G coupling connector or 480BE/G bushing extender

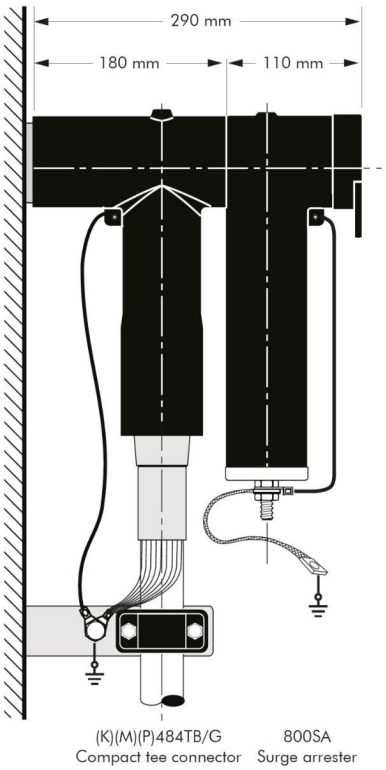
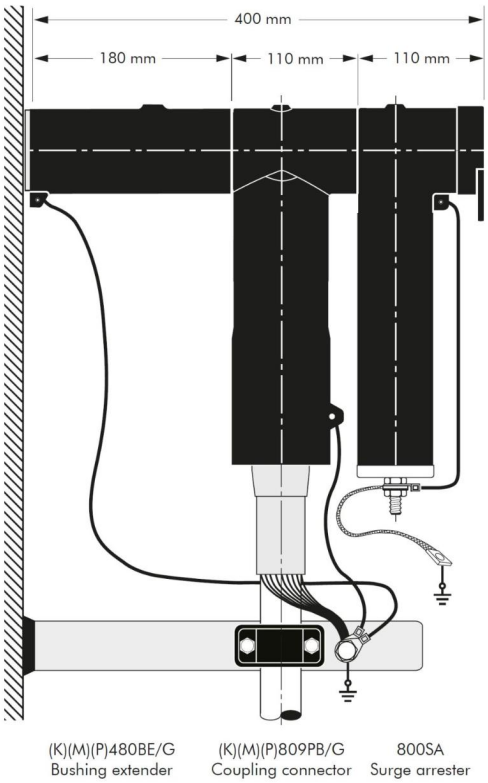
ORDERING INSTRUCTIONS 800SA



Indicate the type of surge arrester when ordering (see table). The part numbers each apply to one kit consisting of three surge arresters.



Order example:
For a max. operating voltage of 24 kV and a nominal discharge current of 10 kA, order according to the table: Surge arrester type 800SA-10-30N with part number 85813.

Note:
The order information only applies to the use in compensated, high-impedance and insulated networks.

All drawings, designs, specifications, plans and particulars of weights, size and dimensions contained in the technical or commercial documentation of Nexans is indicative only and shall not be binding on Nexans or be treated as constituting a representation on the part of Nexans.

TYPICAL APPLICATION AND DIMENSIONS 800SA

All drawings, designs, specifications, plans and particulars of weights, size and dimensions contained in the technical or commercial documentation of Nexans is indicative only and shall not be binding on Nexans or be treated as constituting a representation on the part of Nexans.

TECHNICAL INSTRUCTIONS AND APPLICATION INFORMATION (ACCESSORIES)

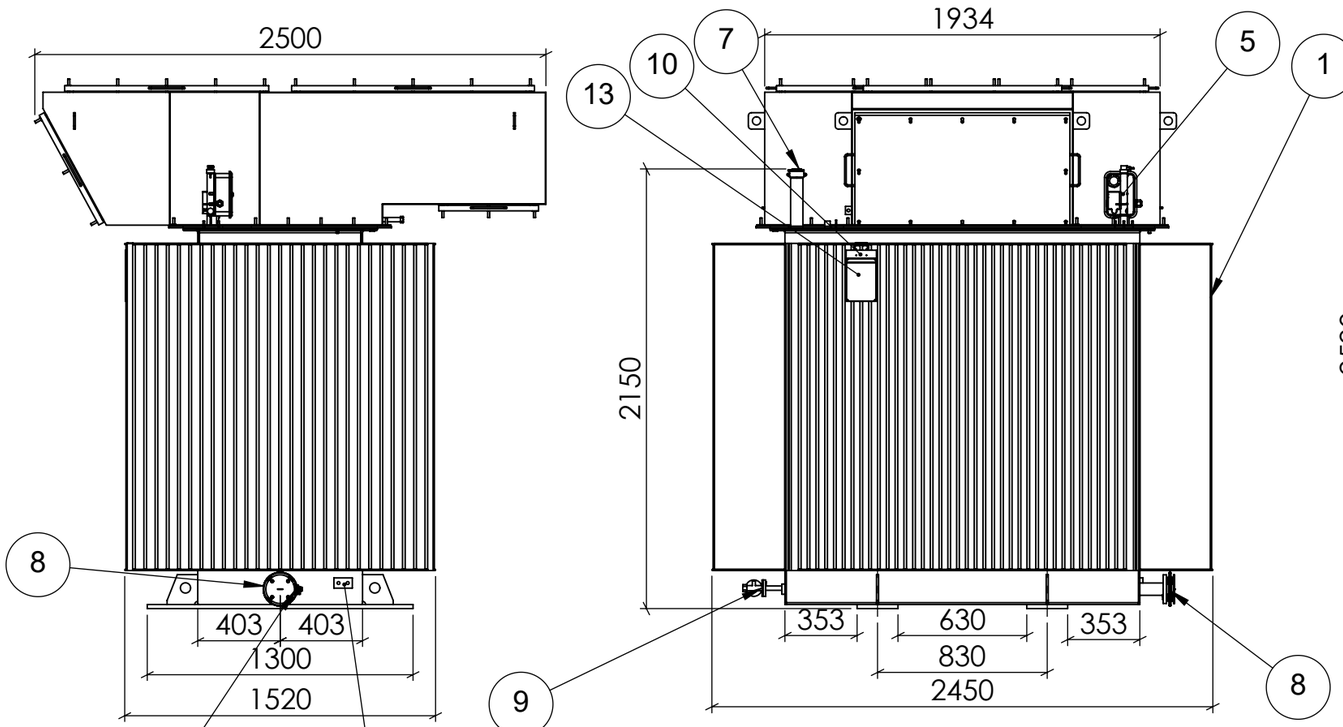
The data given were determined diligently, but do not release our customers of the duty to carry out tests themselves in order to check the suitability of the products delivered by us for the intended use. We reserve the right to modify characteristic and performance data according to the present state of technology. Processing and use of the products cannot be controlled by us and are therefore exclusively in your field of responsibility.

Our products meet the VDE standards respectively correspond to DIN pages and IEC recommendations.

Attention: Before first design in please contact manufacturer.

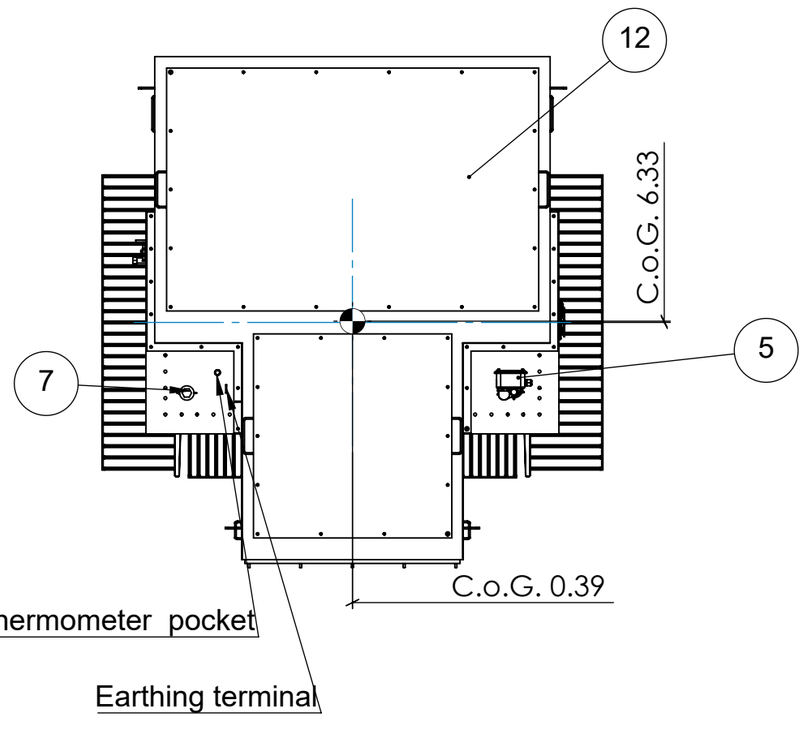
The products, described in this catalogue, are designed for connection of bare energy cable conductors (Class 1 & 2) with description of round solid (RE), round stranded (RM), as well as sector solid (SE), sector stranded (SM) and round stranded compacted (RMV) for conductor temperatures up to 90 °C. All conductor filling materials like tapes, yarn, powder or similar need to be completely removed before the installation. A check on basis of the actual existing conductor dimensions by the user is indispensable. This applies also for the application of Class 6 conductors or other special conductor types.

Impact wrenches have to be approved by Nexans! Depending on different conductor material or conductor type, indicated values may differ from test values acc. to IEC 61238-1. The use of fine stranded conductors has to be approved by Nexans Power Accessories Germany GmbH.



Our responsibilities are only those listed in the latest edition of “General terms and conditions for the supply of products and services of the electrical and electronics industry”. We can provide a copy on request.

Our products are mainly delivered in cartons. We only use package materials able to be recycled due to the latest packing system. Collapsible cardboard boxes are not taken back. Please try to order complete standard packages.



Reprinting, even partial, only with special allowance. We reserve the right to alter or modify the characteristics described. Illustrations and drawings may only show a close reflection and are not decisive. The weights are approximate and include the carton package. This catalogue substitutes all former editions. Types or versions not part of the catalogue are available on request.

Hof, May 2021

All drawings, designs, specifications, plans and particulars of weights, size and dimensions contained in the technical or commercial documentation of Nexans is indicative only and shall not be binding on Nexans or be treated as constituting a representation on the part of Nexans.

1 INTRODUCTION

1.1 Project Overview

Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.

Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.2 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

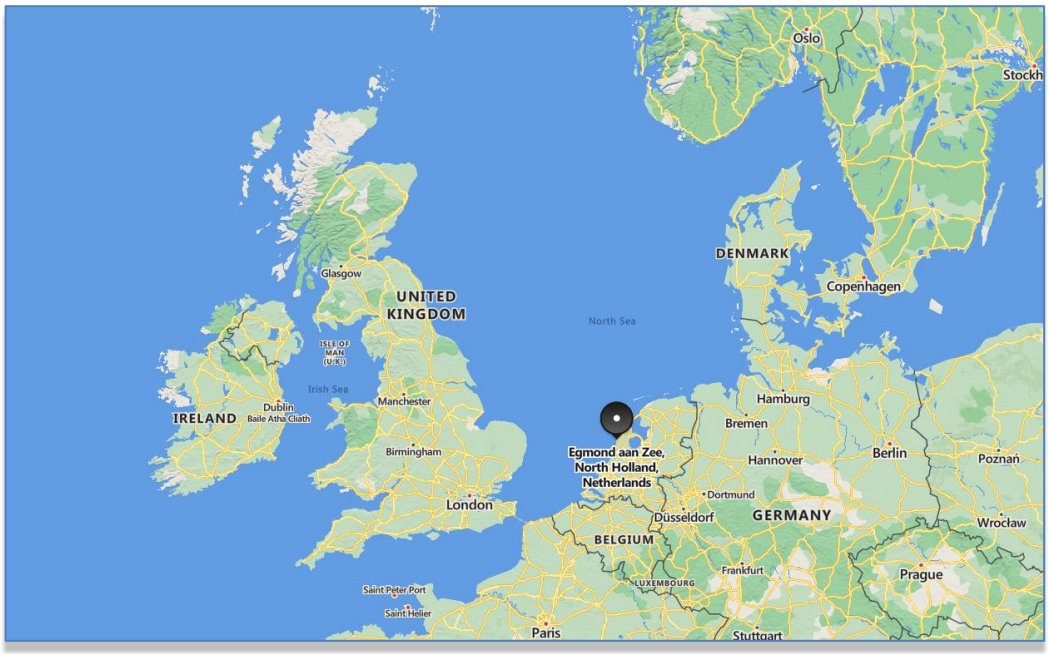

Figure 1 - HOLLANDSE KUST NOORD WIND PARK Location Map

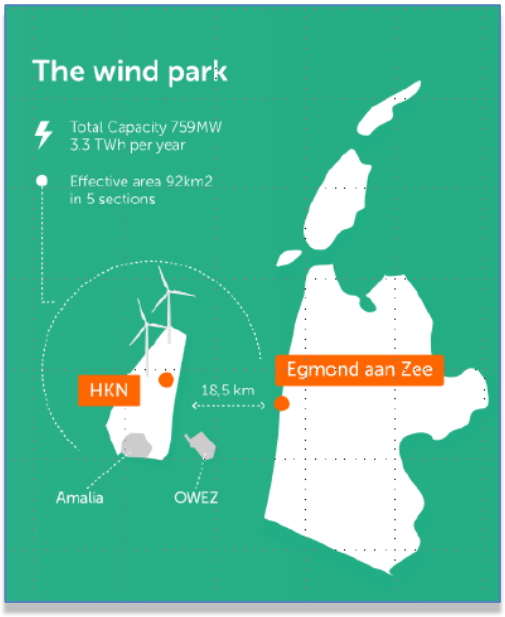

Figure 2 - Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile is located on coordinates E 590719.1, N 5841602.3 and is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

1.3 Project Concept

All components included in the BLPH will be integrated onshore on a topside and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

File: 123A90-PML-COM-PRO-03047

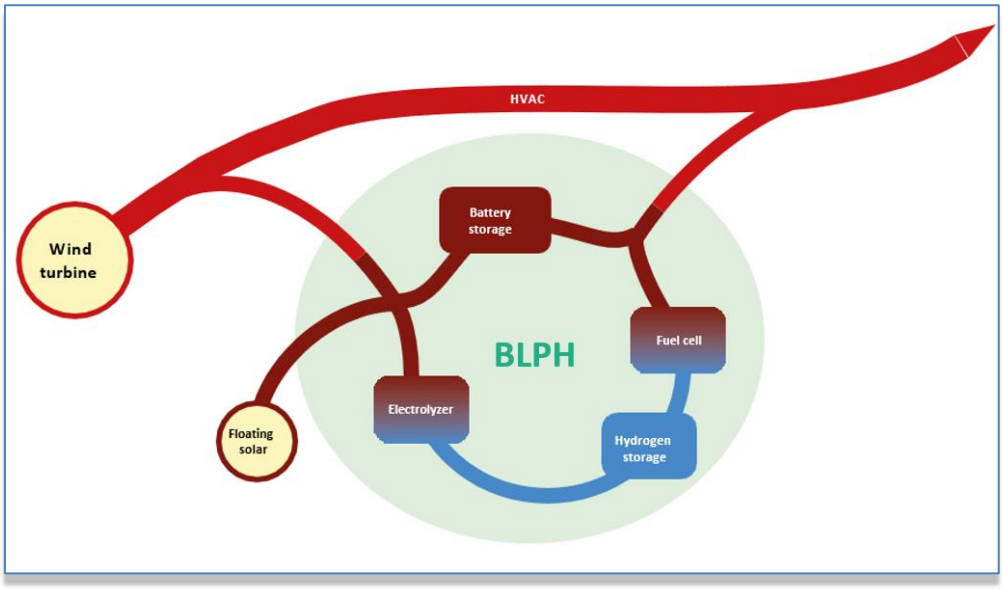

Figure 3 – BLPH Concept

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.

The purpose of the BLPH is to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

2 DOCUMENT SCOPE

This procedure encompasses the Pre-start-up, Start-up, and Ramp-up activities of the BLPH Electrolyser. These activities include the electrolyser's Start-Up and Operation in automatic mode (referred to as 'Start mode' in the User Manual, cf. C63-PMO-001) and the progressive increase in current supplied by the rectifiers to the stacks, thereby enhancing the hydrogen flow rate produced.

For more details about the principle of electrolysis and the operation of the process through the HMI (Human Machine Interfaces) refer to the electrolyser's User Manual (cf. C63-PMO-001).

Despite the distinct categories of activities (i.e. Pre-start up, Start-up and Ramp-up), it has been decided to consolidate all these activities into a single document for practical purposes. This approach is taken because these activities must be performed sequentially, and their scopes overlap.

The prerequisites outlined in Section 3.4 must be ensured prior to initiating the machine in start mode, as specified in Section 6.4.1.2. A comprehensive description of the required activities is provided in Section 6.4.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

3 OTP SUMMARY

3.1 Test Objective

The operating test of the Electrolyser system is executed to ensure that the system is started up in a safe and controlled manner and to verify the correct operation according to the project requirements.

Aim of this document is to provide the sequence and appropriate actions to verify the safety systems of the Electrolyser system along with proving the design intent of the system to produce hydrogen gas (H2).

Prerequisites for proceeding with the OTP:

- The UPS is charged at 100%.
- All Utilities are operational.
- The electrolyser is stopped, depressurized and cold (T < 40 °C).
- Written authorization has been obtained to send hydrogen through the client's installation (**Figure 4** piping highlighted in turquoise, PV-633 open and PV-632 close). In the absence of such authorization, the hydrogen will be directed through the designated hydrogen vent (**Figure 4** piping highlighted in yellow, PV-633 close and PV-632 open).

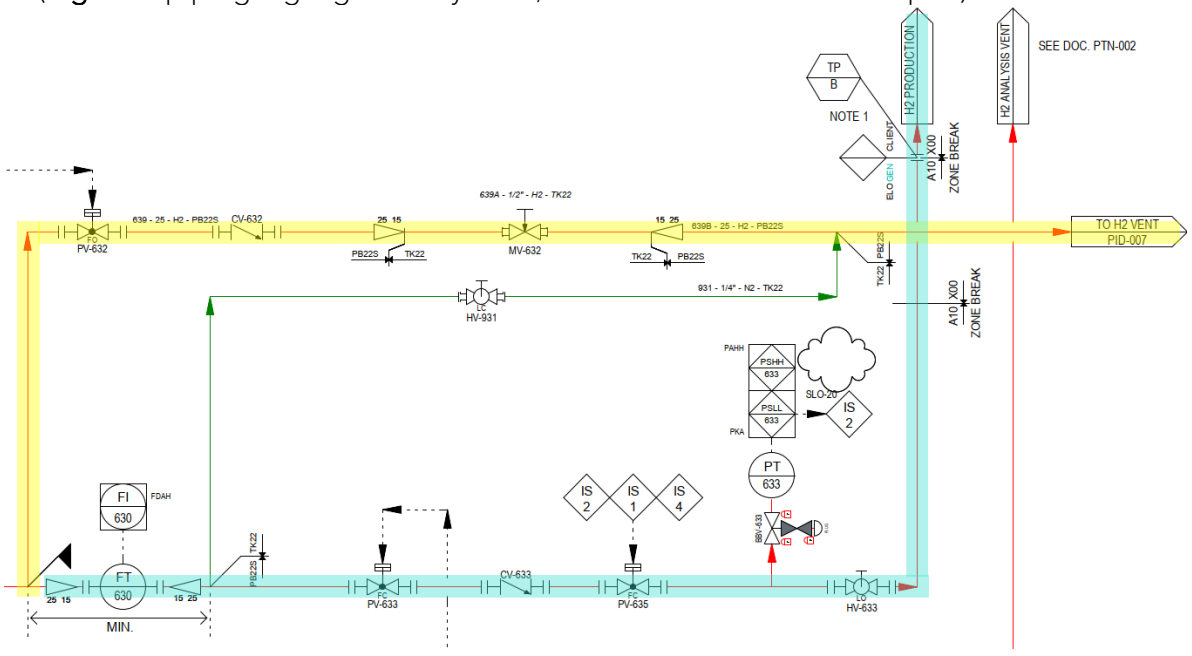

Figure 4. Hydrogen production routing

- All design documentation is approved or relevant TQ / CQ approved to proceed with introduction of combustible gas.
- It is mandatory to have the written authorization to send the hydrogen to the vent during

these activities.

- Onshore pre-commissioning and commissioning activities at Contractor site (WORKSITE)
  a. PHASE 1: Pre-commissioning (powered) activities listed in C063-ELO-PRO-CO- 0003 (NOT PART OF THIS OTP)
  b. PHASE 2: Commissioning (powered) activities listed in C063-ELO-PRO-CO- 0004 (NOT PART OF THIS OTP).
  c. PHASE 3: Vendor SAT & Integrated function test of Electrolyser package including:
     - Confirming Unit Settings on the START mode
     - Stack polarization
     - Hydrogen Setpoint Achievement
     - Functionality of electrolyser's Sequences during Operation
     - Hydrogen Leak Detection
     - Safety Stops at 10%
     - Increasing current by 10% up to 100%
     - Production Settings at 100%

       HPP Start-Up
- Offshore commissioning (SITE)

  PHASE 4: Integrated function test of Electrolyser package (OFFSHORE).

PHASES 1 – 2 are covered by and contained within the vendor documents. PHASES 3 - 4 are included within this OTP document, and the Vendor SAT procedure.

3.2 System Boundary Limits

Please refer to the relevant systems and subsystems outlined below on the Overall Single Line Diagram.

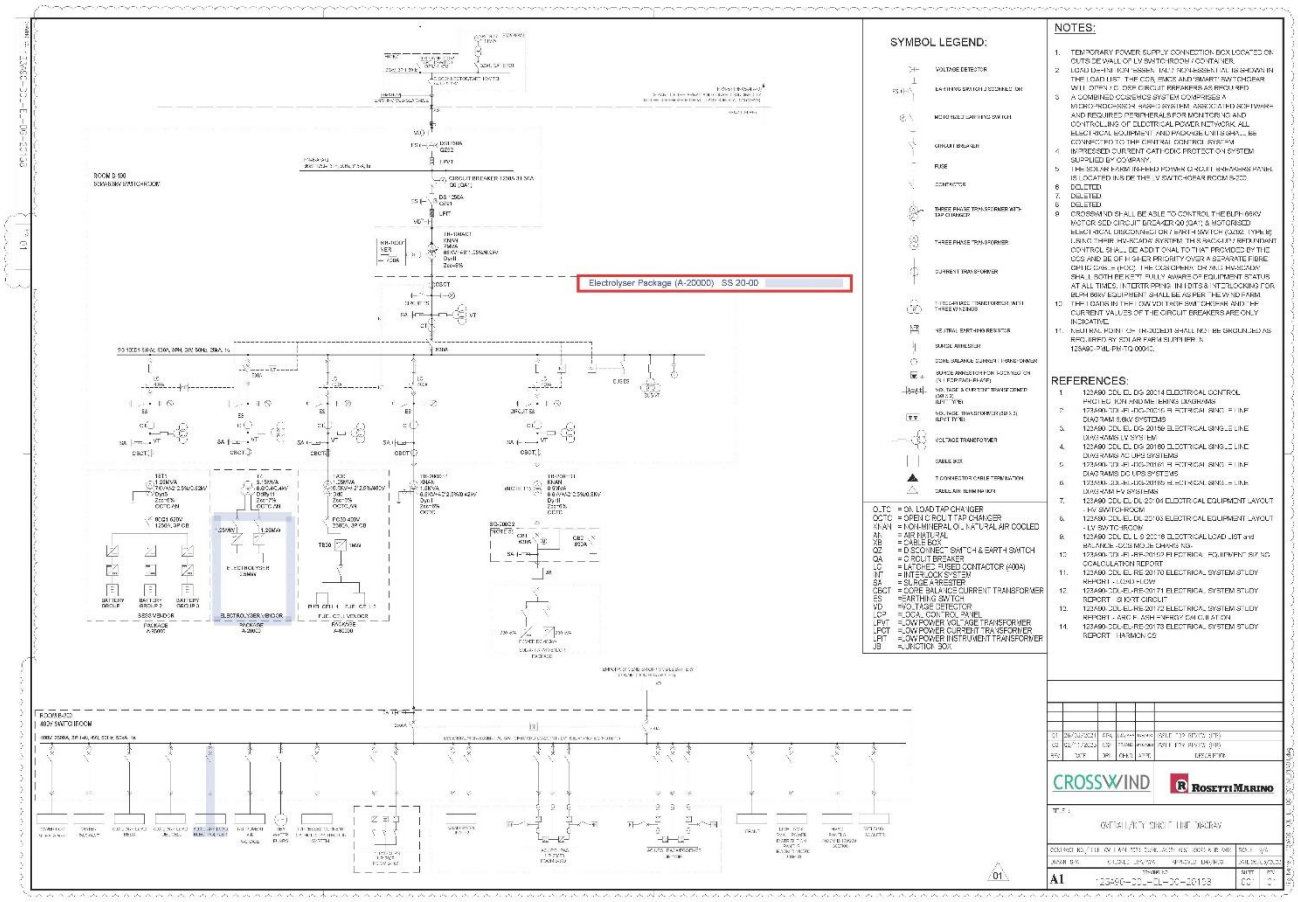

Figure 5. System Boundary Limits in Overall Single Line Diagram

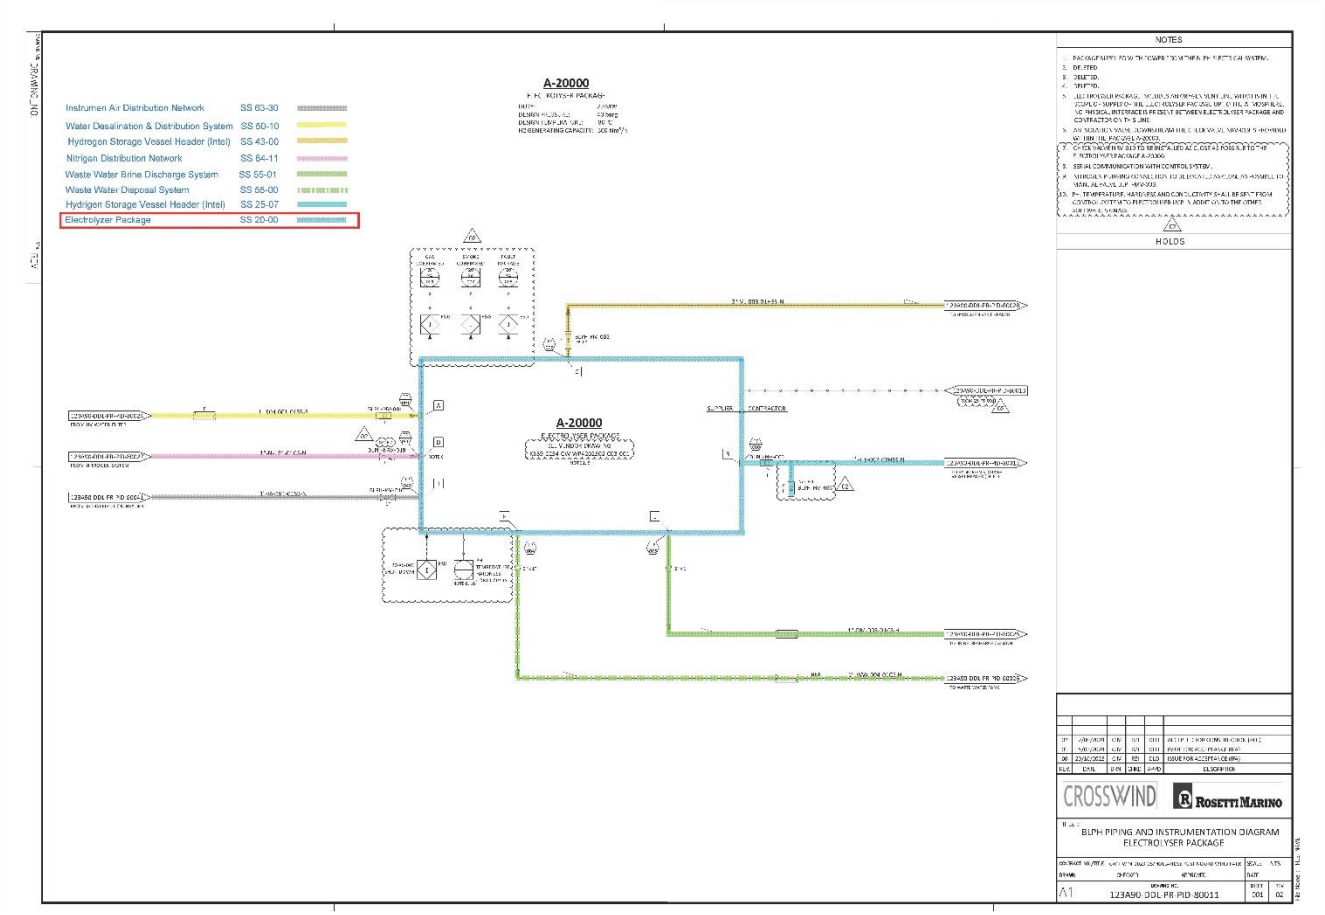

Figure 6. OTP System Boundary Limits

3.3 Test and System Description

Proceeding with this OTP is confirmation that for the following system:

- 20-00 Electrolyser Package (A-20000)

All equipment is installed in accordance with the following vendor documents:

- ELO-INN-BPH-DWG-00008 Process Flow Diagrams
- ELO-INN-BPH-DWG-00009 AQUAGAS Wiring diagram
- ELO-INN-BPH-DWG-00010 NIDEC Detailed Electrical Drawing of PCS units
- ELO-INN-BPH-DWG-00011 OVIVO Electrical Instrument Detailed Drawing Wiring Diagram
- ELO-INN-BPH-DWG-00012 PAUMIER PAU001 & PAU002 Chiller electrical wiring
- ELO-INN-BPH-DWG-00013 PAUMIER PAU003 HVAC electrical cabinet
- ELO-INN-BPH-DWG-00014 NIDEC Mechanical drawing of skid HCU

- ELO-INN-BPH-DWG-00015 NIDEC Rectifier Mechanical Drawing
- ELO-INN-BPH-DWG-00016 NIDEC - SINGLE LINE DIAGRAM
- ELO-INN-BPH-MAN-00007 Handling and Installation Guidance for finalized stacks
- ELO-INN-BPH-OTH-00005 Lines List
- ELO-INN-BPH-OTH-00017 Interfaces and Utility list
- ELO-INN-BPH-PLN-00010 AQUAGAS Electrical Panel & Connections / Wiring Diagram
- ELO-INN-BPH-PLN-00011 NIDEC Detailed Electrical Drawing
- ELO-INN-BPH-REG-00006 CABLE LIST AND INTERCONNECTING DIAGRAM
- ELO-INN-BPH-RPT-00005 Electrical function & protection philosophy
- ELO-INN-BPH-RPT-00008 Safety Loop Design
- ELO-INN-BPH-RPT-00010 Explosion Protection Document
- ELO-INN-BPH-SPC-00006 Technical specification Control cabinet & Electrical wiring
- ELO-INN-BPH-SPC-00008 O2 and H2 Vent Technical specification (Phase 2)
- ELO-INN-BPH-SPC-00010 Electrolyser Network Architecture

3.4 Safety Devices

These defining rules shall be applied from the initial (total or partial) energizing of the instrumented systems, until the end of the commissioning activities.

- Appropriate PPE must be always worn during loop testing.
- A permit to work has been delivered.
- No equipment will be definitively energized without the subsystem Mechanical Completion.
- As soon as a panel is energized (Relay Panel, cabinets, PLC cabinets or local PLC) a sticker "Panel energized - Commissioning in progress" will be suitably displayed on the door in different languages, indicating that it is available for loop checking.
- Testing of electrical/instrumentation interfaces (i.e. I/O serving electrical switchboards for motors control) will be done in conjunction with the power distribution systems lead engineer.
- The on-site equipment area must be visibly marked with a “Test in Progress” sign.
- In any case this procedure shall not conflict with, or supersede, the electrical lock-out procedure. Only electrical system leaders will be authorized to remove padlocks in electrical cabinets.
- Safety rules in accordance with the risk must be applied (e.g. Calibration Gas, Fluids, Pressure, Electrical Power, etc.)
- Risk assessment must be done prior to any test activity.

3.4.1 HSE Management

- All necessary safety precautions must be taken to avoid any risk of personnel injury.
- All personnel involved in this operational test shall be competent for the tasks they will be required to undertake

- Place safety / warning signs and segregate the entire area with barrier tapes (safety barriers) of a colour distinguished (blue and white) from those used for construction activities
- Restrict access into area only to authorized personnel
- Conduct "Toolbox Talk" with all personnel prior to starting test work
- Appropriate Personnel Protective Equipment (PPE) and safety equipment e.g. safety shoes, hand gloves, helmet, earplugs etc. are available and must be used in line with the site requirements
- All activities carried out on the project shall be performed in accordance with the "Permit to Work" system Doc. PRO-HSE-23
- Electrical and mechanical isolations are to be assured as per Doc. PRO-HSE-08 and "Commissioning and start-up operation" procedure.
- Observe and enforce all international codes and regulations to safeguard personnel, plant and environment.
- Ensure that the working area is clean, tidy, well illuminated and that access and escape routes are free from obstructions.

Before starting work on any of the activities in this OTP it is the responsibility of the persons performing the work to:

- Familiarize themselves with the plant/equipment to be worked on
- Ensure they are aware of all other work activities that are taking place, or due to take place
- If necessary, re-plan any situation/activity
- Ensure proper communications between parties involved in the execution of the OTP
- Read the relevant Vendor documentation for the equipment covered by this OTP and observe any special requirements and limitations recommended or imposed by Vendor
- Verify that all personnel involved in the implementation of this procedure are familiar with its content as well as the associated safety requirements (Toolbox Talk)

3.5 Acceptance Criteria

- Before Power ON:

Visual inspection and verification are a crucial step to identify any obvious issues with the installation, such as loose connections, missing components, or damage to the equipment.

Crosschecking the installation with engineering documentation ensures that the installation is done correctly and according to the manufacturer's guidelines. These steps can help identify any missing or incorrect components, and wrong connections.

All package ITRs to be completed & RFC issued for sub-system 20-00.

Apply padlocks on all necessary Breakers per LoTo Procedure (if required)

Phase 1 (Not in the OTP) will prove basic function of individual instruments and equipment which may or may not be on final power supplies.

Phase 2 (Not in the OTP) will prove correct function of auxiliary systems or packages and close out of any punch list A activities prior to unit startup phase.

Phase 3 will prove correct:

- Completion of the Vendor SAT procedures.
- Functionality of the Electrolyser package in coordination with Required Associated Subsystems packages on BLPH. (ONSHORE)

Phase 4 will prove correct:

- Functionality of the Electrolyser package in coordination with the other packages on BLPH (OFFSHORE).

Performing the steps in this OTP as per engineering documents is crucial to ensure that the equipment is operating correctly and that it meets the desired design specifications. Observing the results will help identify any issues that may arise during the operation.

Overall, following these steps shall provide a comprehensive and effective way to verify the equipment installation and functionality.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

5 OTP AT ONSHORE WORKSITE

This chapter refer to the activities on the Contractor worksite (construction yard).

5.1 Planning and Manpower

5.1.1 Planned tasks with estimated manpower

Estimated manpower for the different phases of the OTP are:

Table 5. Estimated manpower ONSHORE Worksite

Activity	Staff qualifications	Advised presence
Unit Settings on the START mode	1 site supervisor, 2 electrical technicians	1 automation engineer
Stack's polarization	1 engineer and 1 automation engineer	1 rectifier specialist from NIDEC
Hydrogen Setpoint Achievement	1 automation engineer	
Functionality of electrolyser's		
Sequences during Operation	1 automation engineer	
Hydrogen Leak Detection	2 piping & mechanical technicians	2 helpers
Safety Stops at 10%	1 engineer and 1 automation engineer	
Increasing current by 10% up to 100%	1 automation engineer	
Production Settings at 100%	1 automation engineer	
HPP Start-Up	1 automation engineer	1 technician from Aquagas

5.1.2 Pre-Commissioning & Commissioning duration estimate prior to Start-Up:

Table 6. Estimated duration for Pre-Commissioning & Commissioning activities

Document ID	Duration [h]
Electrical Transformer SAT	4
Energization Transformer	2
Pre-Commissioning 6.6kV Electrical Supply	4
Pre-Commissioning 400V Electrical Supply	8
Electrolyser Rectifier SAT	8
Electrolyser UCP Electrical Pre-Commissioning	8
Electrolyser HVAC UCP Electrical Pre-Commissioning	8
Electrolyser Water Treatment UCP Electrical Pre-Commissioning	8
Electrolyser VSD Electrical Pre-Commissioning	8
F&G Detector SAT	4
Instrument Air – check HV	1
Non Hazardous Drains – check HV	1
Water Supply – check HV	1
Nitrogen Package Pre-Commissioning / Commissioning	2
Electrolyser HVAC Package SAT	156
Electrolyser Water Treatment Package SAT	214
Electrolyser Hydrogen Purification Package Pre-Commissioning	60
Electrolyser Stacks and BOP Pre-Commissioning & Commissioning	819

5.1.3 Start-Up phases duration estimation

Table 7. Estimated duration for Start-Up activities ONSHORE Worksite

Document ID	Duration [h]
Unit Settings on the START mode	24
Stack's polarization	8
Hydrogen Setpoint Achievement	4
Functionality of electrolyser's Sequences during Operation	46
Hydrogen Leak Detection	40

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.
Once printed shall be considered as "NOT CONTROLLED" copy.
File: 123A90-PML-COM-PRO-03047

Document ID	Duration [h]
Safety Stops at 10%	8
Increasing current by 10% up to 100%	54
Production Settings at 100%	4
HPP Start-Up	48

5.1.4 Vendor Assistance

Vendor Elogen will lead and/or supervise the onshore commissioning activities. For offshore commissioning Elogen will provide remote support.

5.1.5 Summary of interface signals to be tested:

Please refer to the following documents:

- ELO-INN-BPH-OTH-00009 – Communication table
- ELO-INN-BPH-SPC-00010 - Electrolyser Network Architecture

5.2 OTP Test Requirements – Onshore WORKSITE

5.2.1 Pre-Commissioning Achievement

Prior to commencement of commissioning activities, the relevant pre-commissioning documentation be fully signed.

5.2.2 Commissioning Achievement

The commissioning achievement will be the full successful operation, functionality and integration of the Electrolyser package installed on BLPH.

5.2.3 Status of Required Associated Subsystems

- PHASE 3

Subsystems required RFC for Commissioning of the Electrolyser Package

- 25-01 to 25-08 (Partial): Hydrogen Storage Vessels & Header
- 43-00: Hydrogen Vent Header and Drum System
- 50-10: Water Desalination Package & Distribution
- 50-11: Non-Oxidant Biocide
- 55-00: Waste Water Disposal
- 55-01: Waste Water Brine Discharge System
- 63-00: Instrument Air Package (A-63000)
- 63-30: Instrument Air Distribution Network

- 64-00: Nitrogen Generator Package (U64000)
- 64-10: Nitrogen Distribution Network
- 70-00: F&G Control System
- 70-11: F&G Devices FZ-02 (Hydrogen Storage Area)
- 70-12: F&G Devices FZ-03 (Electrolyser Area)
- 79-00: Emergency Shutdown Systems (SIS)
- 79-12: Emergency Shutdown Systems (SIS) – Devices FZ-03 (Electrolyser Area)
- 82-00: MV 6.6 kV Switchboard (SG-100D1)
- 82-20: Power Transformer 3.15 MVA
- 82-99: MV 6.6 kV Temporary Yard Supply Integrated Test
- 83-00 400V Switchboard SG200N1
- 83-20 Distribution board
- 83-99: Temporary Yard 400/230V Main and auxiliary power supplies
- 87-00: EMCS
- 87-10: PCS
- 88-00: Earthing System

5.2.4 Special Tools & Test Equipment

The following special tool and Test Equipment are required:

- Toolboxes: screwdrivers, spanners, pliers, wrenches, pipe wrenches.
- ATEX Field telephone or Walkie-Talkie.
- Leak detector sprays.
- VARIOTEC°460 Tracer gas.
- Chronometer.
- Personal hydrogen detectors for each people on site, calibrated up to date.

All equipment used must have a serial number and a valid calibration certificate up to date (if applicable).

Table 8. Test equipment register ONSHORE activities

TESTING & MEASUREMENT INSTRUMENT USED			
Type	Serial N.	Calibration certificate	Validity

5.2.5 Commissioning Spare Parts

- See reference document ELO-CMM-BPH-PRD-00006 - BLPH Electrolyser Commissioning Start-Up (CSU) Execution Plan.

5.2.6 Temporary Facilities

Phase 3: Temporary emergency stop and/or fire and gas detection may be required if deemed necessary after suitable risk assessment. This will depend on the availability of interacting sub-systems.

5.3 OTP Description – Onshore WORKSITE

5.3.1 OTP Test Preparation

Table 9. OTP requirements Onshore Worksite

Step	Description	Result	Verified by	Date
1	System Ready for Commissioning Certificate (RFC) is issued and approved.			
2	Check related punch list 'B' items and confirm acceptability for start of commissioning activities.			
3	No Mechanical Completion or Pre-commissioning punch list 'A' items are outstanding against the system to be commissioned.			
4	All personnel involved in the implementation of this procedure are familiar with its content as well as with associated safety requirements (Toolbox Talk to be conducted before initiation of activities).			
5	A final walkdown of the system has been completed, to ensure that the system and the area are ready for commissioning.			
6	Check that areas are free for work and escape routes are clear of any obstructions.			
7	All safety barriers and warning signs have been installed.			
8	Ensure that proper communications have been established between parties involved in the implementation of the procedure.			

Step	Description	Result	Verified by	Date
9	Verify availability of test equipment and spares as per Section 5.2.4.			
10	With reference to Commissioning Temporary equipment & Facilities (refer on Doc. 123A90-PML-COM-SP-03014), check that power is available to any temporary equipment or test equipment (if any).			
11	System(s) isolations as per LOTO procedure defined within HSSE Permits to Work and Commissioning procedures duly prepared and approved			
12	All yard personnel have been duly notified by dedicated LUN (Livening Up Notification) that the system(s) is ready for commissioning.			

5.3.2 Electrical Preparation

Table 10. Electrical requirements OTP Onshore Worksite

Step	Description	Result	Verified by	Date
1	Check related punch list 'B' items and confirm acceptability for start of commissioning activities.			
2	Verify that all relevant associated systems / subsystems are completed.			
3	Check that grounding and bonding are in accordance with applicable documents.			
4	Verify and confirm the correct circuit breaker protection settings according to latest documentation.			
5	Verify and confirm the completion of the final connections between the LV 400V Switchboard and the Electrolyser, the MV 6.6kV and Electrolyser, and the EMCS.			
6	Assess the need for additional temporary F&G or E-Stop protection during ONSHORE phases and implement necessary changes.			

5.3.3 Mechanical Preparation

Table 11. Mechanical requirements OTP Onshore Worksite

Step	Description	Result	Verified by	Date
1	Check the correct flow direction of the valves.			
2	Confirm leak testing is complete and documented.			
3	Confirm mechanical alignment of all package pumps & equipment.			
4	Ensure package PSV setpoints are correct for the designed operating pressure.			
5	Ensure all unnecessary isolations are removed and vent system is ready to receive hydrogen.			

5.3.4 Instrument Preparation

Table 12. Instrument OTP requirements Onshore Worksite

Step	Description	Result	Verified by	Date
1	Check related punch list 'B' items and confirm acceptability for start of commissioning activities.			
2	Verify that all relevant associated systems / subsystems are ready.			
3	Check Inhibit and Override register has been prepared and validated.			
4	Verify that relevant equipment/ components are available and in operation for start of commissioning activities.			
5	Verify availability of test equipment as per Section 5.2.4.			

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

5.3.5 Piping Preparation

Table 13. Piping OTP requirements Onshore Worksite

Step	Description	Result	Verified by	Date
1	Ensure Treated Water supply connection is correctly connected to the Rosetti system at TP-001			
2	Ensure Nitrogen supply connection is correctly connected to the Rosetti system at TP-046			
3	Ensure Instrument Air supply connection is correctly connected to the Rosetti system at TP-047			
4	Ensure Hydrogen Vent connection is correctly connected to the Rosetti system at TP-003			
5	Ensure Hydrogen Storage connection is correctly connected to the Rosetti system at TP-006			
6	Ensure Waste Water output connection is correctly connected to the Rosetti system at TP-004			
7	Ensure Brine Discharge output connection is correctly connected to the Rosetti system at TP-005			
8	Review Rosetti flange management and confirm all interface connections have been torqued and leak tested with details recorded and signed for.			
9	Ensure Blind flange/ positive isolation is in place at test boundary.			

5.3.6 Additional Discipline Preparation

Not applicable.

5.4 Test Steps – Onshore WORKSITE - PHASES 1-2 (NOT PART OF THIS OTP)

The previous chapters must be successfully performed prior to commissioning of the Electrolyser Package.

Pre-commissioning (powered) activities listed in ELO-CMM-BPH-PRD-00008 (NOT PART OF THIS OTP).

Commissioning (powered) activities listed in ELO-CMM-BPH-PRD-00010 (NOT PART OF THIS OTP).

5.4.1 OTP Steps WORKSITE - PHASE 3

It is foreseen that previous sections are successfully performed.

In the following steps the functionality of the Electrolyser package shall be tested for operation in all BLPH operating modes.

5.4.1.1 Electrolyser Integrated Testing ONSHORE

This section outlines all the steps required to perform the Unit Start-Up. The Unit Start-Up Test Report Table in Section 7.1 provides the steps that must be followed sequentially. During the procedure, please complete the columns labelled 'Completed by,' 'Witnessed by,' and 'Date.

During the follow-up of the Start-Up Procedure, the current supplied to the electrolysis stacks is gradually increased from 10% to 100%, reaching the maximum hydrogen production capacity of 500 Nm^3/h. The successful execution of this procedure also depends on the correct application of the O&M vendors' package.

Despite the pre-settings established on the valves previously, some tunings can be performed during the ramp-up.

5.4.1.2 Setting the machine at START mode

Put the unit in Local mode via the button displayed on the Main view of the HMI.

Log into the HMI as "Expert": See below an example of pop-up displayed for log into the HMI:

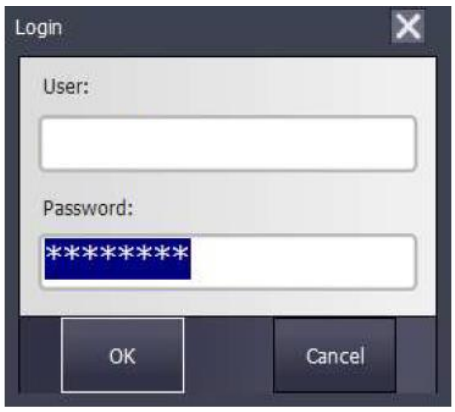

Figure 7. Login popup Electrolyser HMI

⚠	Only Elogen staff is responsible for commissioning and maintenance is allowed to use the "Expert" mode. Elogen cannot be held responsible for any malfunctions resulting from unauthorized access to this operating mode.

Acknowledge all the alarms. Check that the area is clear, and all personnel are ready and in position.

Upon powering on the installation, the user must log in. The electrolyser will automatically be set to 'STOP' mode.

⚠	If a "Major" or Safety" fault is present, do not operate the system until troubleshooting the source of the fault and resetting the systems into its normal status.

The presence of "Minor" faults does not restrain the electrolysis process to start.

To start the hydrogen production the electrolyser must be switched into the "START" mode. To do so, enter a desire hydrogen flowrate on the indicated area (See point 1 in below picture). For the first start enter 10% of the nominal flowrate, hence 50 Nm³/h.

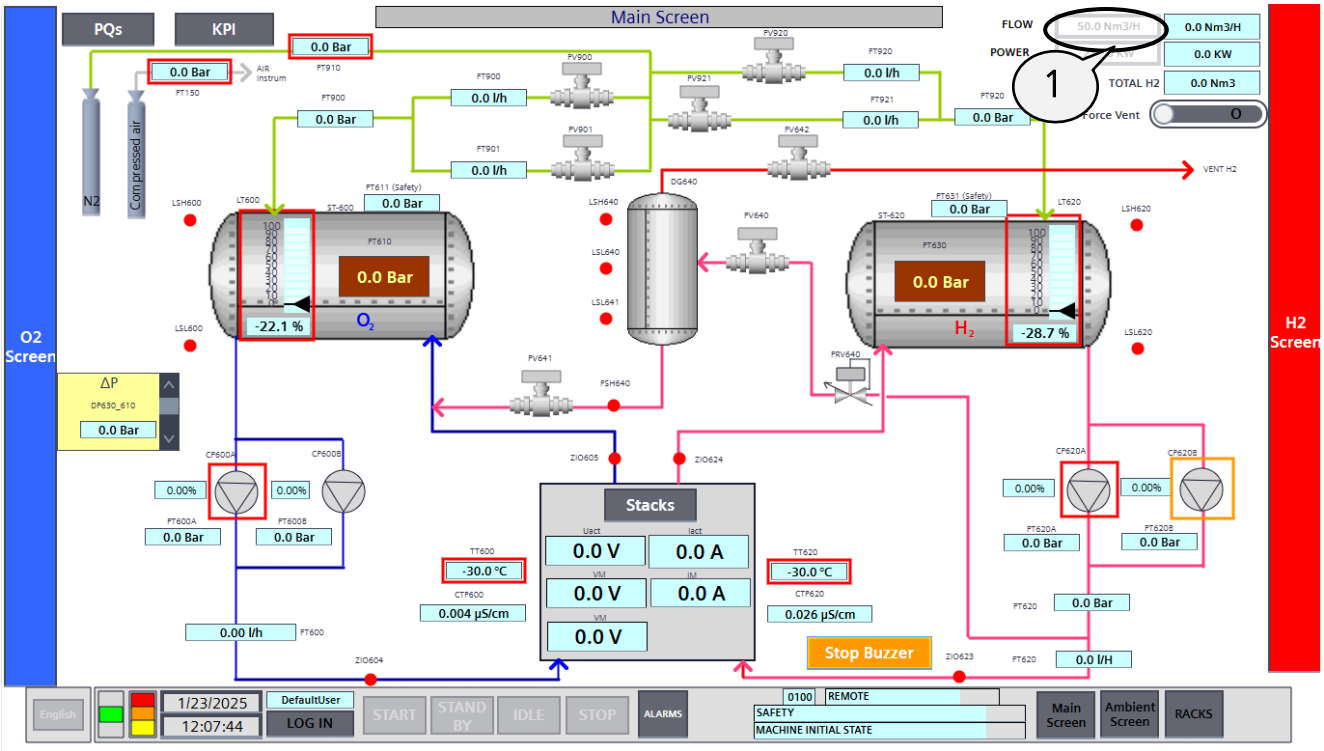

Figure 8. Electrolyser HMI main view

Set admissible pressure range for the hydrogen buffer tank downstream of the hydrogen purification unit (if applicable).

Push the "START" button on the HMI display.

At this point the available oxygen and hydrogen loop pumps (CP-600A or CP-600B and CP-620A or CP-620B) start running automatically according to the regulating function set in the Electrolyser's PLC.

5.4.1.3 Stack's Polarization

Within the start-up sequence, the HVAC system will automatically start-up. The stacks will be polarized as soon as the temperature of 3°C is achieved in the HVAC Loop (HVAC subsystem is used to cool the water passing through the heat exchangers HE-630/631 and HE-600 below its setpoint TT-60X LR). When HVAC Loop is ready, the stacks are polarized at 132.5V (1.25V per cell x 106 cells).

Note: From previous observations, in regard of the possible fluctuations of stacks voltage, it is considered that the polarization point can be achieved once the voltage per stacks is above 119.25 V (so 530 V per rectifier).

5.4.1.4 Hydrogen Production

With the stacks polarised and the 3 °C in the cooling loop reached, the stacks start to produce hydrogen up to the selected setpoint (previously set at 50 Nm^3/h in 10.1). Since the stacks are cold (temperature at inlet TT-600 < 50 °C), the current supplied by the rectifiers to the stacks follows a ramp up limited up to 763 V (and 423 A) at this stage to protect the stacks. This value corresponds to a maximum of 1.8 V per cell (checked through the PCA-00X with X as A, B, C… H). Fluctuations of this value are admissible up to 2.1 V per cell at this stage (890.4 V per rectifier). In case of exceeding the set point stacks inlet temperature (TT-600/TT-620 > 50 °C), the voltage ramp-up is stopped until the temperature goes below 50°C.

Once the temperature of 50 °C is reached (TT-600/TT-620), the electrolyser goes automatically to the "hot start" step. At this stage the operator can set a new hydrogen flowrate set point. During "hot start", the current is incremented by 20A/s.

5.4.1.5 Functional Tests at 10%

From the first molecules produced of hydrogen and oxygen (i.e. current above polarization point), the pressure of both tank separators (ST-600 and ST-620) starts to rise. The delta of pressure between both tanks is managed automatically via a regulation function R-DPC-001. Fill the Check sheet in 11.2. Check the conformity of the control function while the pressure fluctuates (cf. Table in section 7.2). Observe if the corresponding valves open (PV- 631 and MPV-611), and the speed variator VAR-600 is set at the corresponding value, according to the delta pressure.

The regulation of delta pressure keeps on until the pressure at both tank separators reaches the nominal values, 31 barg at hydrogen side (cathodic side), and 11 barg at oxygen side (anodic side). Check the execution of the regulating function R-DPC-001 and take note of the pressurisation time (elapsed from selecting START mode on the HMI until reaching 11 and 31 barg).

While the tank separators are being pressurised, the hydrogen produced on the water / hydrogen loop is sent to the HPP, where the remaining oxygen and water are removed, and this flow is then routed to the vent. In normal operation, the treated hydrogen is then sent to the limit of battery.

Once the operation is stabilised at 10% of nominal flowrate (50 Nm^3/h), some sequences functional test and regulating functions can be achieved. In the Check Sheet, the functions in **bold** required special attention and need to be checked in START mode at 10% of the hydrogen production capacity.

As usual at this stage of Unit Start-Up, some PID (proportional, integral, derivative) tunings can be performed by the automation engineer.

Note: The duration to reach the nominal pressure depends on the flowrate setpoint. The higher the setpoint is, faster is the pressurisation.

5.4.1.6 Leak Checks

While the sequence and regulating functions are being tested, check that there are no leaks on the pipes, vessels, flanges or equipment. Use the hydrogen tracer gas device (Variotec 460 Tracergas). Any leak detected must be repaired immediately. If needed, the unit can be stopped, depressurized and purged with nitrogen.

As a standard procedure, the leak test at this stage should be performed in the same manner as it was prior to Start-up. Particular attention must be given to the HPP, the hydrogen analysis section, and all lines and equipment with tags containing **63X** and **80X** numbers.

5.4.1.7 Safety Stops at 10%

During START mode when hydrogen is being produced at 10% of the nominal flowrate, the safety stops shall be tested. However, since all safety loops were already triggered/simulated during Commissioning phase (cf. ELO-CMM-BPH-PRD-00010), at this stage, the compliance of safety loops in START mode could be checked by triggering one of the emergencies stop buttons (ESD-00X). Check that all the effects represented in the Cause & Effect diagram are performed for the selected ESD (cf. Cause & Effect diagram-C63-PWI-002).

During commissioning and Start-up, the machine is subject to different tests, therefore the circuit breakers are in high demand. For this reason, the number of Safety stops limit that could be trigger within 24 hours is given by the number of cycles till 10% of the components fails (B10D). For these circuit breakers, it is $2x10^7$ cycles (ref. PLC-RSC- 24DC/21). Hence, to limit the wear of the circuit breakers during commissioning and start-up phase, it is recommended to trigger a maximum of 3 safety stops per day during the whole commissioning period (2 months). So, the number of cycles used will be restricted to 0.001% of the total.

5.4.1.8 Increasing current from 10% up to 100%

This section aims to increase slowly the hydrogen production from 10% of nominal capacity up to 100%. Since it is the first ramp up of the unit, the current will be increased by 10% manually. Set the flowrate as explained on Section 6.4.1.2.

Table 14. Hydrogen production stepwise increment

Percentage of nominal capacity	H2 flowrate setpoint [Nm3/h]
10%	50
20%	100
30%	150
40%	200
50%	250
60%	300
70%	350
80%	400
90%	450
100%	500

Once the hydrogen setpoint is changed, the current fed into the stacks start to increase. Follow the voltage ramp-up and take note of this transition duration. Wait until the flowrate of hydrogen produced is stable.

Let the system run at steady state (variations on the flowrate below 2% of the setpoint) at each setpoint for 15 minutes minimum and check for normal operation and the execution of regulating and functional sequences.

5.4.1.9 Setting production at 100%

Once reached the 500 Nm3/h, let the system run at steady state and check for hydrogen leaks as previously explained (see Section 5.4.1.6).

Check the compliance of the regulating sequences at 100% of capacity. Especially the Glycol loop flowrate, the direct balancing regulation and in general good overall control and absence of defaults. Use a copy of table in Appendix Section 7.2 to record these functions compliances.

5.4.1.10 HPP Start-Up

As presented in the Commissioning Manual (cf. C063-ELO-PRO-CO-0004), the HPP must be subject to a series of test before bringing process gas into the system. The activities described in this section must be carried out with hydrogen, since the HPP performance, and particularly the heaters, work differently with hydrogen compared to nitrogen or other inert gas.

Hence, after assuring a hydrogen production up to maximum capacity by the electrolyser (100% of nominal flowrate), the adjustment of the performance of the HPP can be carried out to test the compliance of the global process through the reading of the OIHA-800A/B/C and DPT-800A/B/C.

All instructions and information related to the installation and commissioning of the HPP are detailed in the document DEDR 500/36 Installation, Commissioning, Operation and Maintenance Manual. The activities are summarised and presented in tabular format, including the columns 'Completed by,' 'Witnessed by,' and 'Date,' to assist the staff in verifying compliance with each step during the procedure (Sections 7.3.1, 7.3.2, and 0).

The commissioning and performance procedure for the HPP that requires process gas, and is deployed into three main stages:

a. Start of the Deoxo-Dryer
b. Flow control positioner
c. Setup of pressurized condensation system

Once the performance of the HPP has been tested in all the flowrate range (10-100% of nominal), check the conformity of the hydrogen purity (through the reading of the OIHA-800A/B/C and DPT-800A/B/C). Both measures must be below 5 ppmv (i.e. impurities 10 ppmv which corresponds to 0.001%vol).

At this point, when a hydrogen production at maximum capacity is stabilised, along with the HPP operation, the performance test of the whole unit can be carried out. Follow the respective procedure given in the document C063-ELO-PRO-CO-0006 and complete the control list given on the same document.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

5.4.1.11 Electrolyser Integrated Testing ONSHORE Notes and Remarks

5.4.1.12 Testing of EMCS Operating modes ONSHORE

Table 15. *Test report for EMCS Operating modes Onshore activities*

Step	Description	Result	Verified by	Date
Electrolyser operating modes to be controlled from PCS via ECMS. Gas Production set point of Electrolyser to be agreed prior to test based on current site conditions/limitations.				
1	Confirm on PCS that CCS operating mode is in "IDLE". Confirm Electrolyser Package runs through start up sequence and progresses to H2 production at specified set point.			
2	On PCS, change CCS operating mode to "IMPORT (MODE 1A)". Confirm Electrolyser Package continues to produce H2 at specified set point.			
3	On PCS, change CCS operating mode to "IMPORT (MODE 1B)". Confirm Electrolyser Package progresses to STOP mode, with Unit cooled, depressurised & depolarised, and Chiller OFF.			
4	On PCS, change CCS operating mode to "HOT STANDBY". Confirm Electrolyser remains in STOP.			
5	On PCS, change CCS operating mode to "EXPORT". Confirm Electrolyser remains in STOP.			
6	On PCS, change CCS operating mode to "COLD STANDBY". Confirm Electrolyser remains in STOP.			

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

File: 123A90-PML-COM-PRO-03047

Step	Description	Result	Verified by	Date
7	On PCS, change CCS operating mode to "EMERGENCY (Island Mode)". Confirm Electrolyser remains in STOP.			
8	On PCS, change CCS operating mode to "MAINTENANCE". Confirm Electrolyser can only be operated locally.			
9	On PCS, return CCS operating mode to "IMPORT (MODE 1A)". Confirm Electrolyser Package runs through start up sequence and progresses to H2 production at specified set point.			
10	On PCS, return CCS operating mode to "COLD STANDBY". Confirm Electrolyser Package progresses to STOP mode, with Unit cooled, depressurised & depolarised, and Chiller OFF.

6 OTP AT SITE

6.1 Planning and Manpower

6.1.1 Offshore Site overview

It is expected that all pre-commissioning tests, systems energization and commissioning steps will have been successfully performed during the Onshore Phases.

Consequently, during the offshore SITE phase, the respective systems will be inspected prior to re-energization.

No additional test steps will be required on these items of equipment, correct operation and functioning will be verified.

6.1.2 Planned tasks with estimated manpower

Table 18. Estimated manpower OFFSHORE Worksite

Activity	Staff qualifications	Advised presence
Safety Stops at 10%	1 engineer and 1 automation engineer	
Increasing current by 10% up to 100%	1 automation engineer	
Production Settings at 100%	1 automation engineer	
HPP Start-Up	1 automation engineer	1 technician from Aquagas

6.1.3 Test duration estimate

Table 19. Estimated duration for Start-Up activities OFFSHORE Worksite

Document ID	Duration [h]
Safety Stops at 10%	8
Increasing current by 10% up to 100%	54
Production Settings at 100%	4
HPP Start-Up	48

If necessary, the estimated time can be extended to complete all required pre-commissioning and commissioning activities.

6.1.4 Vendor Assistance

- For offshore commissioning Elogen will provide onsite support.

6.2.3 Special Tools & Test Equipment

The following special tool and Test Equipment are required:

- Toolboxes: screwdrivers, spanners, pliers, wrenches, pipe wrenches.
- ATEX Field telephone or Walkie-Talkie.
- Leak detector sprays.
- VARIOTEC°460 Tracer gas.
- Chronometer.
- Personal hydrogen detectors for each people on site, calibrated up to date.

All equipment used must have a serial number and a valid calibration certificate up to date (if applicable).

6.3 OTP Description – SITE

The SITE test will consist of a repeat of the onshore integration testing with the BLPH now installed in situ to its permanent connections. In the following steps the functionality of the Electrolyser package shall be tested for operation in all BLPH operating modes.

6.3.1 OTP Test Preparation

Table 21. OTP requirements Offshore Worksite

Step	Description	Result	Verified by	Date
1	System Ready for Operation (RFO) Certificate is issued and approved.			
2	No blocking punch list items are outstanding against the system to be commissioned.			
3	System(s), (de)isolations as per LOTO procedure enclosed within commissioning Work Permits procedures prepared and approved			
4	Verify and confirm that all steps performed at WORKSITE of this procedure are completed without any pending issues that would prevent from proceeding with the offshore SITE PROCEDURE			
5	All personnel involved in the implementation of this procedure are familiar with this procedure as well as with associated safety requirements (Toolbox Talk to be conducted before initiation of activities).			

Step	Description	Result	Verified by	Date
6	A final walkdown after hook-up of the system has been completed, any preservation items have been removed and to ensure that the system and the area are ready for energization.			
7	Check that areas are free for work and escape routes are clear of any obstructions.			
8	Ensure that proper communications have been established between parties involved in the implementation of the procedure.			
9	Verify availability of test equipment and consumables as per chapters 6.2.4.			
10	All personnel have been duly notified during dedicated daily SIMOPS meetings that the system(s) is ready for operation.			

6.3.2 Electrical Preparation

Table 22. Electrical requirements OTP Offshore Worksite

Step	Description	Result	Verified by	Date
1	Check related punch list 'B' items and confirm acceptability for start of commissioning activities.			
2	Verify that all relevant associated systems / subsystems are completed.			

6.3.3 Mechanical Preparation

Table 23. Mechanical requirements OTP Offshore Worksite

Step	Description	Result	Verified by	Date
1	No blocking punch list items are outstanding against the system to be commissioned.			
2	Ensure all unnecessary isolations are removed.			

3	Ensure downstream systems are ready to receive H2.			

6.3.4 Instrument Preparation

Table 24. Instrument requirements OTP Offshore Worksite

Step	Description	Result	Verified by	Date
6	Check related punch list 'B' items and confirm acceptability for start of commissioning activities.			
7	Verify that all relevant associated systems / subsystems are ready.			
8	Check Inhibit and Override register has been prepared and validated.			
9	Verify that relevant equipment/ components are available and in operation for start of commissioning activities.			
10	Verify availability of test equipment as per Section 5.2.4.			

6.3.5 Piping Preparation

Not applicable

6.3.6 Additional Discipline Preparation

Not applicable.

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

6.4 OTP Test Steps – Offshore PHASE 4

The previous chapters must be successfully performed prior to commissioning of the Electrolyser Package.

In the following steps the functionality of the Electrolyser package shall be tested for operation in all BLPH operating modes.

6.4.1.1 Electrolyser Integrated Testing OFFSHORE

This section outlines all the steps required to perform the Unit Start-Up. The Unit Start-Up Test Report Table in Section 7.1 provides the steps that must be followed sequentially. During the procedure, please complete the columns labelled 'Completed by,' 'Witnessed by,' and 'Date.

During the follow-up of the Start-Up Procedure, the current supplied to the electrolysis stacks is gradually increased from 10% to 100%, reaching the maximum hydrogen production capacity of 500 Nm^3/h. The successful execution of this procedure also depends on the correct application of the O&M vendors' package.

6.4.1.2 Setting the machine at START mode OFFSHORE

Follow the description given in Section 5.4.1.2.

6.4.1.3 Stack's Polarization

Follow the description given in Section 5.4.1.35.4.1.2.

6.4.1.4 Hydrogen Production

Follow the description given in Section 5.4.1.4.

6.4.1.5 Safety Stops at 10%

Follow the description given in Section 5.4.1.7.

6.4.1.6 Increasing current from 10% up to 100%

Follow the description given in Section 5.4.1.8.

6.4.1.7 Setting production at 100%

Follow the description given in Section 5.4.1.9.

6.4.1.8 Testing of EMCS Operating modes OFFSHORE

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

Table 25. Test report for EMCS Operating modes Offshore activities

Step	Description	Result	Verified by	Date
Electrolyser operating modes to be controlled from PCS via ECMS. Gas Production set point of Electrolyser to be agreed prior to test based on current site conditions/limitations.				
1	Confirm on PCS that CCS operating mode is in "IDLE". Confirm Electrolyser Package runs through start up sequence and progresses to H2 production at specified set point.			
2	On PCS, change CCS operating mode to "IMPORT (MODE 1A)". Confirm Electrolyser Package continues to produce H2 at specified set point.			
3	On PCS, change CCS operating mode to "IMPORT (MODE 1B)". Confirm Electrolyser Package progresses to STOP mode, with Unit cooled, depressurised & depolarised, and Chiller OFF.			
4	On PCS, change CCS operating mode to "HOT STANDBY". Confirm Electrolyser remains in STOP.			
5	On PCS, change CCS operating mode to "EXPORT". Confirm Electrolyser remains in STOP.			
6	On PCS, change CCS operating mode to "COLD STANDBY". Confirm Electrolyser remains in STOP.			

Step	Description	Result	Verified by	Date
7	On PCS, change CCS operating mode to "EMERGENCY (Island Mode)". Confirm Electrolyser remains in STOP.			
8	On PCS, change CCS operating mode to "MAINTENANCE". Confirm Electrolyser can only be operated locally.			
9	On PCS, return CCS operating mode to "IMPORT (MODE 1A)". Confirm Electrolyser Package runs through start up sequence and progresses to H2 production at specified set point.			
10	On PCS, return CCS operating mode to "COLD STANDBY". Confirm Electrolyser Package progresses to STOP mode, with Unit cooled, depressurised & depolarised, and Chiller OFF.			

Full details of the EMCS HMI control graphics can be found in Document Number: 123A90-DDL-EL-SP-20039 Functional and Technical Design Specification, IDS and DDS for Electrical Monitoring and Control System (EMCS)

6.4.1.9 Electrolyser Integrated Testing OFFSHORE Notes and Remarks

6.4.1.10 Electrolyser Integrated Testing OFFSHORE - Certifying Authority Table of Attendances

Table 26. *Certifying Authority Table of Attendances Offshore*

6.5 Post-test Conditions

After functional tests have been completed, system / sub-systems are left in healthy and safety condition and operational.

6.6 Reinstatement tasks

Generally, the system/ sub-system shall be reinstated at its initial condition; and the following activities must be carried out as minimum:

- All inhibition done for the test shall be removed (as per Inhibit / Override List)
- All equipment/devices shall be returned in healthy functional conditions.

7 APPENDICES

7.1 Unit Start-up Test Report

Table 28. Test report Start-up of the Electrolyser

Step	Description	Completed by	Witnessed by	Date
01	Select the LOCAL Mode.			
02	Log-in as "Expert" on the HMI.			
03	Check that all alarms are acknowledged, and all areas are clear.			
04	Check that Electrolyser is in STOP mode.			
05	Set the Hydrogen production at 50 Nm^3/h. (10% of hydrogen production).			
06	Press START and monitor the progression (Check that oxygen and hydrogen pumps CP-600A or B and CP-620A or B, and HVAC system are starting-up).			
07	Check that 3 °C is reached in the HVAC Loop system.			
08	Check that the stacks are polarized at 132.5 V.			

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

File: 123A90-PML-COM-PRO-03047

Step	Description	Completed by	Witnessed by	Date
09	Check that the cold start-up is in good process (TT-600 < 50 °C). Separator tanks (ST-600 and ST-620) are being pressurized by the hydrogen produced. Warning: The voltage per stack must not exceed 222,6 V (890,4 V per rectifier).			
10	Observe that hot start-up reached (TT-600> 50 °C). Ramp-up shifts to 20 A/s automatically.			
11	Check that the Pressure in separator tanks is being regulated via PV-631 and MPV-611, until reaching the nominal pressure on both loops (11 barg at ST-600 and 31 barg ST-620). At this point Hydrogen is routed to the HPP.			
12	Check if the production is stabilized at 50 Nm3/h of hydrogen (monitor FT-630) and the unit is working at its nominal pressure (11 barg at ST-600 and 31 barg at ST-620).			
13	Perform a Leak Check at 10% of nominal production.			
14	Check that all sequences and regulating functions are working as expected at 10 % of nominal flowrate (see table in Section 7.2).			

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

File: 123A90-PML-COM-PRO-03047

Step	Description	Completed by	Witnessed by	Date
15	Proceed to the Safety Test at 10% of nominal production are compliant (One ESD trigger).			
16	Do the ramp up manually and until 100% of Hydrogen production (cell voltage between the range and setting of current according to R-REC-001).			
17	Check that Hydrogen production stabilized at 100% (500 Nm3/h)			
18	Check that the sequences and controls are working as expected within the range of 10-100% of nominal flowrate.			
19	Check that the HPP is working as expected with a hydrogen quality produced as expected. OIHA-800A/B/C < 5 ppmv and DPT-800A/B/C < 5 ppmv			
21	Sequences and regulating functions are working as expected at 100 % of nominal flowrate (11.2 to be completed again for 100%).			
22	Perform a Leak Check at 100% of nominal production.			

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

7.2 Test Report for Functional Test

R-LC-500 – Water Level Control of H2 vent condensates If LSH-500 COVERED, then PV-500 OPEN. If LSL-500 UNCOVERED, then PV-500 CLOSED.				
R-PC-610 – Pressure Control Oxygen Loop If PT-610 > 11,5 barg, then MPV-611 = 100 % OPEN. If PT-610 < 10,8 barg, then MPV- 611 = 0% (CLOSED).				
R-PC-630 – Pressure Control Hydrogen Loop If PT-630 > 31,5 barg, then PV-631 OPEN. If PT-630 < 29,7 barg, then PV-631 CLOSED.				
R-REC-001 – Rectifier setting current. This function can be validated by comparing the hydrogen setpoint entered by the user and the flowrate measured by the FT-630.				
R-TC-600 – O2 Water Temperature Control Loop				

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

Function – Description. Tested at 10% or 100% of nominal flow	Completed by	Witnessed by	Date	Comment
The M3WV-200 is commanded by a PID regulation, where the setpoint is TT-601 = 65 °C. Check that the TT-601 is stable and that the 3WV-200 opens to approach the setpoint.				
S-PC-610 – O2 Depressurisation ΔP > 1 barg & ΔP < 21 barg & LT-600 < 50%, then MPV-611 = 100%. If PT-610 < 0,15 barg & PT-630 < 0,15 barg, then MPV-611 = 0%. If this sequence is still active after 20 minutes, MPV-611 = 0% and displayed "O2 depressurisation failed. Going to safety O2 depressurisation"				
S-PC-630 – H2 Depressurisation If PT-610 > 0,35 barg & ΔP < 21 barg & ΔP > 1 barg & LT-620 < 62%, the PV-631 OPEN. If ΔP < 1 barg, the PV-631 CLOSED. If LT-620 > 62%, then PV-631 CLOSED. If PT-630 < 0,15 barg, then PV-631 CLOSED.				
S-REC-001 – Stack polarization See Section 5.4.1.3				
S-REC-003 – Stop rectifier (decreasing current) This function can be validated by an observed decrease in the hydrogen flowrate (measured by the FT-630)				

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

7.3 HPP Start-Up Test Report

7.3.1 HPP commissioning performance adjustment and test – Start of Deoxo-Dryer

Table 30. Test report HPP Start-up– Start of Deoxo-Dryer

Step	Description	Completed by	Witnessed by	Date	Comment
01	Check inert gas is available and all connections have been checked against leakages.				
02	Check that instruments and electrical power are available.				
03	(If the DEDR has been opened against the atmosphere) Purge it with inert gas before feeding the hydrogen.				
04	Open cooling water to the coolers.				
05	Open the compressed hydrogen gas intake slowly. In case there is no valve to isolate the electrolyser and the HPP, once the previous steps completed, start the hydrogen production through the HMI at 10% of production (50 Nm3/h). And wait until the systems starts to be pressurised as described in previous sections.				
06	Check for leakages.				

7.3.2 HPP Commissioning performance adjustment and test – Flow controller positioner

Table 31. Test report HPP Start-up – Flow controller positioner

Step	Description	Completed by	Witnessed by	Date	Comment
01	Check that the PLC control have a linear output signal (0-100% = 4-20 mA)				
02	Check the positioner's output when no pilot pressure is supplied to the 64-V6. Positioner must indicate 100% open				
03	Test with pilot pressure: 4 mA: Positioner indicates 0% open. 8 mA: Positioner indicates ~10% open. 12 mA: Positioner indicates ~25% open 16 mA: Positioner indicates ~50% open. 20 mA: Positioner indicates ~75% open.				
04	Start the dryer in heating sequence at 100% of hydrogen nominal flow capacity.				
05	Check that positioner FC-64.1 indicates ~75% open.				
06	Adjust the by-pass needle valve 64-V14.1: count the turns from fully open to fully close and set it at 50% open.				
07	Partly close valve 64-V14 to about 50%.				

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

File: 123A90-PML-COM-PRO-03047

Step	Description	Completed by	Witnessed by	Date	Comment
08	Wait 15 minutes and read the regeneration temperature (DR-TT-64-6 or DR-TT-64-8 depending on which tower is in regeneration sequence).				
09	If the temperature is below 155°C, partly close valve 64-V14 step by step until 155-160°C is reached. Wait 10- 15 minutes between every step. You can also use by-pass needle valve 64-V14.1 for fine tuning,				
10	If the temperature is above 165°C, partly open valve 64-V14 step by step until 160-165°C is reached. Wait 10- 15 minutes between every adjustment. Use the by-pass needle valve 64-V14.1 for fine tuning. If 155-160°C cannot be reached, increase the heater set point by 25°C and restart from step 04.				
11	Check the heater ON vs OFF time. If the heater is ON between 75% and 95% of the heating time, proceed to the control of operation at 25-100% capacity If ON time > 95%, then partly close the valve 64-V14 until the heater ON time drops to 75-95% of the time. If ON time < 75%, then partly open the valve 64-V14 until the heater ON time increase up to 75-95% of the time. Use the by-pass needle valve (64-V1431) for fine tuning. (Wait 15 minutes between every adjustment)				

Step	Description	Completed by	Witnessed by	Date	Comment
12	Start the dryer in heating sequence at 75% of hydrogen nominal flow capacity (375 Nm^3/h). From the electrolyser's HMI, as indicated in Section 6.4.1.2.				
13	Check that positioner indicates ~50% open.				
14	Wait 15 minutes and read the regeneration temperature (TT-64.6 or TT-64.8 depending on which tower is in regeneration sequence). If TT-64.6 or TT-64.8 < 155 °C, then remove the cover of the positioner and slightly increase the span until reaching 155-160 °C. If TT-64.6 or TT-64.8 > 165 °C, then slightly decrease the span until reaching 160-165 °C. (Wait 15 minutes between every adjustment)				
15	Start the dryer in heating sequence at 25% of hydrogen nominal flow capacity (125 Nm3/h). From the electrolyser's HMI, as indicated in Section 6.4.1.2. Let it stabilize and run for 15 minutes.				
16	Ramp-up the hydrogen flow every 15 minutes by 25% (i.e. 25%, 50%, 75% and 100%).				
17	Check regeneration temperature (TT-64.6 or TT-64.8). It must be around 160 - 180 °C for the range of flowrates, if not, contact Aquagas for assistance.				

This document undergoes an issuance cycle within EDMS "FusionLive". Its distribution is electronically controlled.

Once printed shall be considered as "NOT CONTROLLED" copy.

7.3.3 HPP commissioning performance adjustment and test - Setup of condensation system

Table 32. Test report HPP Start-up - Setup of condensation system

Step	Description	Completed by	Witnessed by	Date	Comment
01	Start the dryer at 100% of hydrogen nominal flow capacity (500 Nm^3/h) and let the system to stabilise.				
02	If the Pbar factor is set too high. Reduce it by a factor of 0.1 (ex. If initially set at 15 barg, then reduce it at 13.5 barg). If the Pbar factor is set too low. Increase it by a factor of 0.1 (ex. If initially set at 15 barg, then increase it at 16.5 barg). For both cases, repeat with a smaller difference if needed.				
03	Check if there is remaining water to be drained, by activating the solenoid valve 64-V12 and check how much water is coming out.

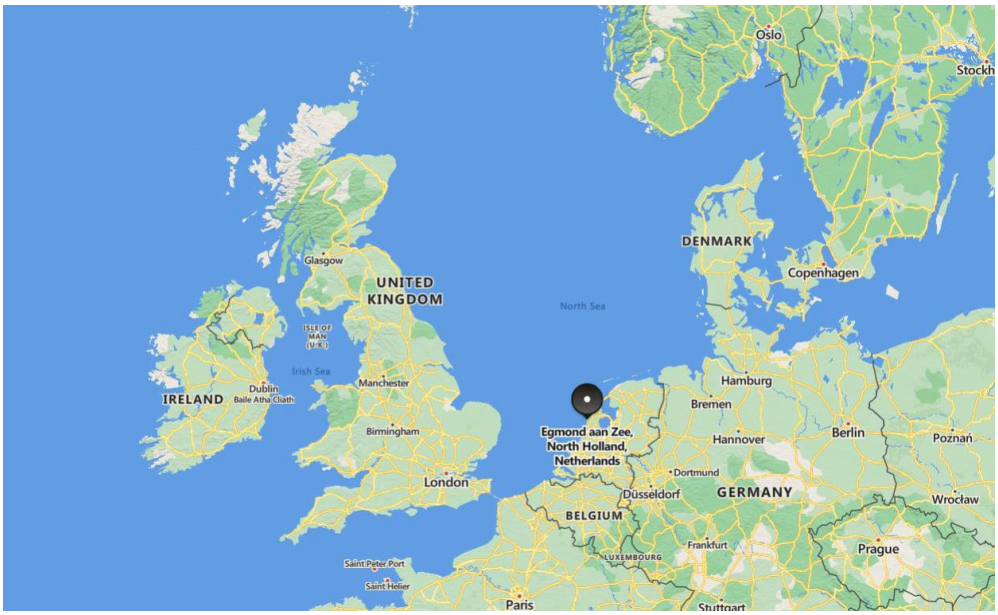
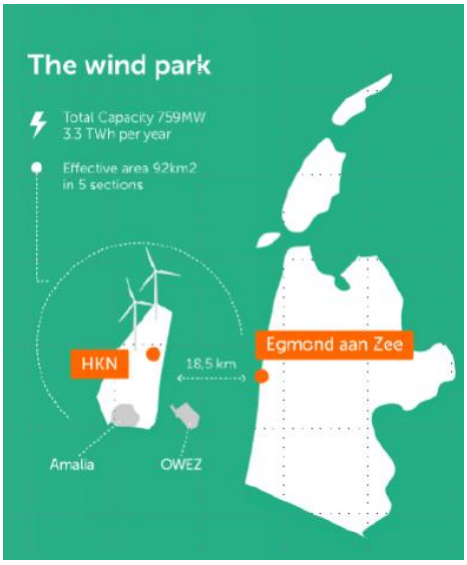
1. Introduction



This document describes the philosophy, organization and milestones required for the Commissioning & Start-Up of the ELOGEN hydrogen production unit by water electrolysis for the Crosswind Project. ELOGEN's site supervision is responsible for advising the coordinating on site of all the means and resources required for the Unit Commissioning & Start-Up of the unit in accordance with COMPANY specifications.

1.1 Overview of Project Scope

Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.
Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

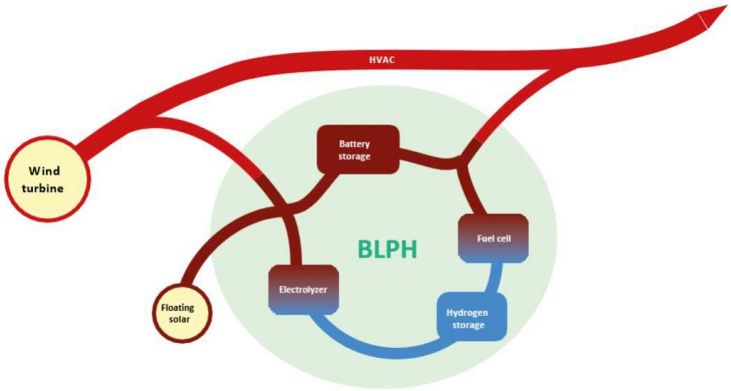


1.2 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

HOLLANDSE KUST NOORD WIND PARK Location Map



Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile is located on coordinates E 590719.1, N 5841602.3 and is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

1.3 Project Concept

All components included in the BLPH will be integrated onshore on a topside and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

BLPH Concept

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.
The purpose of the BLPH is to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

2. Document Scope

This document describes the good practices guidelines through method statement procedures to perform the Pre-Commissioning & Commissioning of the ELOGEN hydrogen production unit by water electrolysis for the Crosswind Project. ELOGEN's site supervision is responsible for advising the follow up of all activities good practices on site required for the Unit Commissioning & Start-Up of the unit in accordance with COMPANY specifications.

The focus is made on:

- Energizing
- Loop Test
- Leak Test
- Nitrogen Purging

3. Definitions

COMPANY	means CROSSWIND C.V., owner & developer of the offshore WIND FARM Hollandse Kust Noord Wind Park Project.
ELOGEN	means ELOGEN as CONTRACTOR, the contracted party for engineering, and onshore commissioning of the Electrolyzer facilities associated with the PROJECT.
CONTRACTOR	means ROSETTI MARINO S.p.A., and his subcompany FORES for the contracted party for engineering, procurement, construction, offshore installation & commissioning of the facilities associated with the PROJECT.
Pre-Commissioning	Pre-Commissioning relates to the preliminary Commissioning activities to test and check the individual basic functions of individual items within any given system and/or sub-system to confirm they perform as designed.
Commissioning	The phase of the project after Pre-Commissioning. Commissioning consists of a comprehensive series of dynamic and energized Checks and Tests to be carried out in order to demonstrate and ensure that the facilities are ready to operate safely and steadily in compliance with project Documents, Specifications, Standards and Engineering Best Practices.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Commissioning Team	Team established to perform the Commissioning and Handover process from CONTRACTOR Construction Team to COMPANY Operation & Maintenance Team.
Commissioning Spares	"Replacement" and "Consumable" spares required during the final hook-up, Pre-Commissioning, Commissioning and Start-up phases.
Equipment	An item that may be part of a System and be commissioned independently, however, it may or may not be operated independently.
Handover	Transfer of responsibility of the Plant from the Project Team to the Asset Holder.
Inspection Test Records (ITR)	A-ITR – used to record and verify construction scope associated with a tagged item (component). B-ITR – used to record and verify energization and function testing during pre-commissioning of a tagged item
Mechanical Completion	Mechanical Completion is the point in the project when construction is complete, and subsystems are ready to be handed over to the commissioning team. Mechanical Completion is achieved when: - • All ITR-A's for the given system / sub-system have been completed and signed off; • All Category A Punches have been closed. • All open Category B Punches shall be accepted with agreed plan for closure prior to commissioning. • Completion of all documents required to be As-Built Red Line Marked Up. Mechanical Completion for any subsystem is recorded via the completing and signing of the Ready For Commissioning (RFC) certificate.
Operations	Operations include all personnel directly involved with Production Operations and Maintenance of the facility.
Performance Test	The Performance Test takes place following the Commissioning and Site Acceptance Test. A performance test is executed if there is a specific requirement to test performance criteria of an individual piece of equipment, a system, or the plant.
Performance Test Acceptance Certificate	This certificate shall be issued by the CONTRACTOR certifying that the PERFORMANCE TEST CRITERIAS have been achieved during the PERFORMANCE TESTS.
Plant	Refers to the permanent facilities (Base Load Power Hub) being constructed or to be constructed at WORKSITE resulting from the WORK.
Project	Refers to the BASE LOAD POWER HUB project.
Pre-Start Up Audit (PSUA)	The PSUA is a precursor to the PSSR meeting. The intention is to audit the readiness of the facility to commence start up with the findings being used as part of the PSSR and shall be conducted 6 weeks prior to Start-up.
Pre-Start Up Safety Review (PSSR)	Pre-Start-up Safety review (PSSR) meeting is the final determination that all prerequisites have been met to permit the hydrogen production and shall be conducted 4 weeks prior the RFSU.
Procedure	A document that details the execution of an activity.
Punch List	Work not executed as per approved documents and/or not meeting quality, health, safety, environment, operability/maintainability requirement and/or Standard; and recorded as a list for rectification.
Punch List 'A' Item	Punch List item that will prevent the safe operation of the Equipment, System and Plant and may jeopardize personnel or environment. Such item, as agreed, shall be

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

	cleared before the Equipment/System/Plant can progress to the next stage of the Commissioning and Handover phase.
Punch List 'B' Item	Punch List item that will not endanger the safe operation of the Equipment, System and Plant or personnel and/or environment. Such item, as agreed, can be carried over to the next stage and may be cleared later.
Ready For Commissioning Acceptance Certificate (RFC)	RFC is the Proverlis description for a sub-system Mechanical Completion. See definition for Mechanical Completion.
Ready For Operation Acceptance Certificate (RFO)	An RFO Acceptance Certificate shall be raised on the completion of the sub-system commissioning procedure scope.
Ready For Sail Away (RFSA)	All preservation and preparation works are complete.
Ready For Start-up (RFSU)	RFSU applies to the whole or part of the Plant and its associated Facilities and Systems. RFSU signifies that the applicable scopes have been fully commissioned and are ready for safe hydrogen production. RFSU will be authorized with the signing of the RFSU certificate. The RFSU requires that the Pre-Start-Up Audit (PSUA) and the Pre-Start- Up Safety Review have been completed, and all related action/blocking issues have been resolved
SITE	Refers to the offshore location where the PLANT is to be installed and the vicinity thereof (offshore North Sea - Netherlands).
Start-up	The stage at which process fluid is introduced/created into the Plant. It is defined as operation of all the facilities under the project. It can only be performed once Commissioning of all associated utilities and auxiliaries and Pre-Commissioning activities of the Plant have been completed.
Start-up/Ramp-up	It is the initial start-up of processing equipment after first hydrogen, followed by a staged ramp up to full operating conditions. On completion of ramp-up, and after a period of steady state operations, the facility is ready to be performance tested.
Start Up on Paper (SUOP)	SUOP is an exercise to ensure that the start-up procedure and associated preparations are fit-for-purpose, including risk assessments, controls, mitigating actions and the Emergency Response protocols, procedures and capability are in place.
Site Acceptance Test	An un-interrupted safe operation of equipment, system, or plant, over a certain timeframe usually defined as 72hrs. A prerequisite to the Final Handover Certificate.
Statement of Fitness	As part of the COMPANY's HSE & SP Control Framework, the Statement of Fitness (SoF) before commissioning or introduction of hydrogen / hazardous substances in a New Asset, is a requirement of the Asset Integrity - Process Safety Management Application procedure. The Project and Asset Managers are accountable to develop a SoF to demonstrate asset integrity prior to energization or introduction of hazardous substances.
Sub-Contractor	means any company or person, to whom CONTRACTOR has subcontracted directly or indirectly at any level the performance of any part of the WORK.
System	A System is a major subdivision of a plant, being either process or utility, which performs an operational function of the plant. A System includes all the various equipment that allows it to operate. The division into functional Commissioning Systems corresponds to the prevailing fluids or services.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Sub-system	A Sub-system is a further subdivision of a System, which performs a partial operational function of the System, with little or no interference from the other Sub-systems. The Sub-system is the basic unit for Commissioning.
Systemization	The process of defining Systems for handover. Generally, colour coded on the 'marked up' engineering drawings such as P&IDs, SLD's & Cable Block Diagrams.
Vendor	means any CONTRACTOR's / CPI and/or SUBCONTRACTORS' supplier(s) of CONTRACTOR ITEM(s). VENDORS' presence on WORKSITE & SITE may be required to assist CONTRACTOR and/or COMPANY for the installation, commissioning and startup of such CONTRACTOR ITEMS and during the execution of PERFORMANCE TESTS.
Vendor Package	Skid and Equipment such as hydrogen purification, water purification, chillers, rectifiers, containers, etc.
Workshop(s)	means any location(s), other than WORKSITES, including offices, premises and workshops, where any equipment, materials or manufactured items including CONTRACTOR ITEMS shall be engineered, manufactured and assembled.
WORKSITE	means any construction location(s), where any major parts of the PLANT (such as templates, piles, nodes, jacket structure, modules, decks) shall be fabricated and assembled, excluding all other offices, premises and workshops of CONTRACTOR and SUBCONTRACTORS.
Shall	used to indicate requirements strictly to be followed to conform to the specification and accepted by all involved parties.
Should	used to indicate that among several possibilities one is recommended as particularly suitable without mentioning or excluding others, or that a certain course of action is preferred but not necessarily required.
May	used to indicate a course of action permissible within the limits of the specification.
Can	used for statements of possibility and capability, whether material, physical or casual.
"he", "him", "his"	are used in relation to CONTRACTOR.
"it", "its"	are used in relation to COMPANY.

5. Energizing

5.1 Introduction

This section serves as a reference to describe the powering-up procedure that must be performed during Pre-Commissioning, Commissioning & Start-Up activities.
This procedure provides the basic definitions and scope of work related to powering-up activities of electrical systems as well as the responsibilities of all parties.

The operations must be carried out with the highest quality of workmanship in accordance with this work instruction, the approved drawings and the applicable standards.
In addition to the above, the operations must also be in accordance with any regulations established by the continental, national or local authorities.

The electrical Ready For Commissioning Certificate has been signed by all parties with the following conditions:

- The electrical system has been received and installed.
- The connection with the electrical power supply subsystem has been made.
- The subsystems to which the equipment to be powered belongs are built.
- The earthing subsystem is installed and operational.
- All reference documents must be in the latest revision.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- The work permit must be issued and signed.

5.2 Prerequisites

5.2.1 Required Equipments

- Toolboxes (e.g. screwdrivers, wrenches, pliers, spanners).
- Specific electrical tools (e.g. hot sticks, insulating mats, insulating stools, etc.).
- Test devices (e.g. multimeters, calibrators, Hart communicators).
- Bulk (fuses, electrical tapes).
- Field telephone or Walkie-Talkie.

5.2.2 Required Documents

- This procedure approved.
- Set of SLDs at the last revision.
- Isolation list at the last revision.
- A work permit has been issued and signed.
- Approved vendor test procedure and documentation.
- FAT report (If any)
- RFC Certificate of all electrical subsystems.

5.2.3 Required Manpower (Indicative)

- 1 Electrical Supervisor.
- 2 Electricians.
- 1 Discipline specialist if required.
- The Vendor if required.
- 1 LOTO & Work Permit Supervisor

Energization activities will be organized by the Site Manager and under the responsibility of the Field Service Engineer.

5.3 Safety

These defining rules shall be applied from the initial (total or partial) energizing of the instrumented systems, until the end of the commissioning activities:

- No equipment will be energized without construction completion and authorization
- Certified and qualified personnel are required for energization.
- Appropriate PPE must be worn.
- As soon as a panel is energized (Switchboards, Relay Panel, cabinets, PLC cabinets or local control panels) a sticker "Panel energized - Commissioning in progress" will be suitably displayed on the door, indicating that it is available for use.
- In any case, this procedure shall not conflict with, or supersede, the electrical lockout procedure. Only electrical system leaders will be authorized to remove padlocks on Breakers, MCCs, etc.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Safety rules established for Electrical Power risks shall be applied.
Risk assessment must be done prior to any energization.
In case of firefighting system not available and in accordance with the risk assessment analysis result, a firewatcher must be mobilized with adequate portable firefighting equipment on each working area to be energized.

5.4 Method Statement

Prior to any energization, all breakers shall be opened to isolate the customer from supply.

- Check no interference with construction and other commissioning activities, this shall have been managed through the Work Permit.
- Open work permit.
- Install barriers with regulatory pictograms or icons around the working areas.
- Check all people inside the restricted perimeter are allowed to be there.
- Check earthing connection and bounding are in place according to earthing specifications, rules and standards.
- Check that there are no bare cores or disconnected cables.
- Check Logbook and Consignation List for review.
- Check that protection devices are available and implemented (Emergency device equipment, fire protection) according to Risk Assessment conducted.
- Check that radio communication devices (walky-talky) with such testing channels are at disposal.
- Check if the power supply is available.
- Remove padlocks.
- Proceed to energization.

<u>VENDOR Package energization</u>

FAT report is mandatory. FAT Punch List is included in the main related subsystem Punch List.
SAT must be done as per vendor procedure.
Packages vendors must carry out the energization of their package under the electrical lead witness and after electrical lead authorization.

<u>Temporary Power Supply</u>

This Energization procedure must be applied whatever the power is coming from a temporary device or the final power supply.

5.5 After Energization

- Check if the item setting is in accordance with stand-by rules, preservation procedure, standards and safety rules.
- Reinstall padlocks if required.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- Update the Consignation List register.
- Close work permit.

6. Loop Test

6.1 Introduction

This section serves as a reference to describe the loop testing that must be performed during the Pre-Commissioning activities.

This procedure provides the basic definitions and scope of work related to Electrical-Instrumentation-Automation (EIA) loop testing activities as well as the responsibilities of all parties. This procedure also covers complex loop simulation testing. A specific ITR must be completed for each test. The project commissioning plan covers all start-up activities.

The cause & effect matrix test, including the process shutdown, emergency shutdown and F&G safety bar logics are also covered by this procedure. They will be tested during the operational tests after completion of all basic functions' tests.

6.2 Definition

A loop is defined as a combination of one or more instruments arranged to measure and/or control a process variable via a piece of equipment or a package (skid) as well as being able to generate alarms or safety triggers (trip).
The loop test must be carried out during the Pre-Commissioning phase before the Commissioning & Start-Up.
The purpose of the loop test is to ensure that all components of the loop are functioning correctly and are operational. It allows to check the correct connection of the instrument in the field with the Process Automation & the Safety Automation (in ELOGEN: BPCS and SIS) as well as the correct retransmission on the HMI (human-machine interface).
This includes:

- Validate the operation of the instrument.
- Check that the wiring is correct.
- Test all field inputs and outputs associated with the various process and utility subsystems via the integrated control panels: BPCS, SIS, F&G (Fire & Gas), MCC (Motor Starter Panel) and various local PLCs.
- Check the display on the HMI, the control from the HMI, the consistency of the physical value displayed on the HMI as well as the associated alarms.
- Validate the accuracy of the measurement ranges (scales), the limits, the physical units. This will allow operational tests to be carried out in a second step, which include the tests of the alarm thresholds and the safety triggers (trip).

A loop test is considered complete when the functional tests of the entire loop (including the regulator or logic) have been carried out with all the documentation duly signed.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

6.3 Conditions

Loop testing can be performed when the RFC certificate for the subsystem has been signed by all parties:

- The piping has been tested, cleaned, dried and is free of rust before the instruments and valves are fitted.
- The equipments have been cleaned and permanently closed.
- The reinstatement as per P&ID is completed with all piping, equipment, valves and instruments installed and oriented in the correct direction.
- The equipment, valves and instruments have been visually checked and are free of any damage.
- The equipment, valves and instruments are correctly fitted and are accessible for observation, adjustment, setting, etc.
- All equipment, valves and instrumentation have their tags installed correctly and visibly with all the required information.
- All electrical, pneumatic and piping connections to the instruments have been made in accordance with the supplier's instructions and the engineering design.
- All PSV's have their calibration certificate up to date.
- All Punchlist that does not require the system to be reopened are cleared.
- At least Gross Leak Test have been performed and forms signed by all parties.
- All relevant documentation is available in latest revision.

Before starting any loop testing activity, the field team must ensure that electrical continuity tests have been performed by the construction team and that no blocking A-type punchlist items are remaining.

The tests will require:

- Air supply (if applicable): air for equipment such as instrumented valves must be supplied from the instrument air distribution facilities. Temporary installations are acceptable (bottle/compressor & dryer) in case the instrument air system is unavailable.
- The pneumatic system tightness tested.
- Permanent or temporary power supply to the electrical distribution panels.
- The integrated control system received and operational.

6.4 Safety

These defining rules shall be applied from the initial (total or partial) energizing of the instrumented systems, until the end of the commissioning activities.

- Appropriate PPE must be always worn during loop testing.
- A permit to work has been delivered.
- No equipment will be definitively energized without the subsystem Mechanical Completion.
- As soon as a panel is energized (Relay Panel, cabinets, PLC cabinets or local PLC) a sticker "Panel energized - Commissioning in progress" will be suitably displayed on the door in different languages, indicating that it is available for loop checking.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- Testing of electrical/instrumentation interfaces (i.e. I/O serving electrical switchboards for motors control) will be done in conjunction with the power distribution systems lead engineer.
- The on-site equipment area must be visibly marked with a “Test in Progress” sign.
- In any case this procedure shall not conflict with, or supersede, the electrical lock-out procedure. Only electrical system leaders will be authorized to remove padlocks in electrical cabinets.

Safety rules in accordance with the risk must be applied (e.g. Calibration Gas, Fluids, Pressure, Electrical Power, etc.) Risk assessment must be done prior to any test activity.

6.5 Prerequisites

The test of each input loop shall be done from the equipment on site to the operator console (HMI). The test of each output loop shall be done from the HMI display via the intermediate panels to the field instrument.

The loop test shall not include the calibration of the instruments. Indeed, the instruments are assumed to be intact, i.e. received as previously calibrated by the manufacturer. This is documented during the FAT for a prefabricated skid, and during pre-commissioning activities (by procurement or construction team) for all other equipment. However, the commissioning team shall check the instrument during the loop test and recalibrate if there is any doubt or if a check needs to be made again for any reason. The calibration certificate and the test sheet including the results shall be included in the loop folder.

Input values should be simulated from the field elements with available tools such as a pressure generator, gas calibration bottle, 4-20mA generator or a Hart communicator. At the end, the loop test is declared “completed” when the instrument concerned is ready to be used for operation. The loop test should also be formalized by a check sheet previously identified and available for use. The functional test can be performed during the loop test in case of a single loop instrument (depending on the transmitter). In case of multi-loop instruments such as on/off valves, control valves, MCCs, etc., the functional test should be performed when all the individual loops are tested.

6.5.1 Required Equipments

- Toolboxes: screwdrivers, spanners, pliers, wrenches, pipe wrenches…
- Calibration devices: multimeters, pressure & temperature sources, calibrators, hart communicators, thermoelectric generator (PJN5208) …
- Fire & Gas testers: smoke generators, heat generators, IR and UV lamps, LEL cylinders, specific filters…
- Field telephone or Walkie-Talkie.
- Bulk (fuses, electrical tapes, leak detector sprays, sealants).

All equipment used must have a serial number and a valid calibration certificate (if applicable).

6.5.2 Required Documents

- This procedure approved for use.
- Set of PIDs at the last revision.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- Set of SLDs at the last revision.
- Approved vendor test procedure and documentation.
- Integrated Control System tested and operational (SAT report signed by all parties).
- Subsystem RFC Certificate including the loop signed by all parties.
- Permit To Work delivered and signed.

6.5.3 Manpower (Indicative)

- 1 EIA Supervisor
- 2 Instrumentation technician
- 1 console operator
- 1 LOTO supervisor
- 1 specialist from another discipline if required
- Vendor if required.

Daily loop testing activities will be organized by the EIA Commissioning Supervisor under the responsibility of the Commissioning Engineer. Before testing, the test sheets are checked and clarified to be applicable to the equipment to be tested. Loop testing requires at least two people, one in the field and one at the HMI in the control room or at the HMI of the package controller, all are equipped with means of communication (walkie-talkie).

6.5.4 Duration

A visual check of approximately 5 min must be carried out (wiring, installation, presence of the tag, etc.) as described in the inspection sheet. Then the average time per loop is approximately 5 min including power-up. The functional test time depends on the complexity of the equipment (refer to the supplier's documentation).

6.6 Method Statement

Before loop testing, all disconnectors, circuit breakers and knives must be opened to isolate the field side of the distribution cabinet (or UCP).

- Verify that the wiring tests of the cabinets have been carried out.
- Verify that all necessary utilities are available for loop testing (instrument air, power supply…).
- Instrument air lines and tubing to the instrument must be blown with air before connection and energization.
- Verify that there is no interference with the construction or other commissioning activities (note: loops including a motor with the cabinet must be tested with the electrical team). The Work Permit has been issued.
- Verify that the control system is complete, powered and available (BPCS, SIS, etc.). For safety and reliability reasons, no subdivision could be accepted
- Verify that radio communication devices (walkie-talkie) with channels specifically assigned to loop testing are available.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- Appropriate test sheets for equipment to be tested are ready for use. These sheets are previously filled with all information.
- Any temporary bypass, strap or bridging devices required must be distinctive, prominent and commented on the sheet and must be removed at the end of the test.
- During the loop test, any cables loosened and removed from the terminal block or instrument must be reconnected.
- The loop test must not start until the instrument has had an adequate warm-up period.
- Some instruments such as analyzers or some fire and gas detectors need to be energized before testing for a longer period. This warm-up time is given by the manufacturer. Analytical instruments must be checked according to the manufacturer's specific instructions.

Regarding the operation's general progress:

- The loop test team will be divided into a control room team and a field team.
- A customer representative may be present in the control room or on site to witness the activities
- An automation engineer or representative of the control system supplier must be present in the control room to simulate or force on-site actions or an output from the PLC. After the functional test, the PLC must be returned to its initial state, so all simulation or forcing states (overrides and bypass) must be removed.
- The control room team communicates to the field team the instrument tag to be tested.
- When the instrument is identified by the field team, the control room team closes the circuit breaker, disconnector or knife at the terminal block in the distribution cabinet according to the wiring diagram.
- The disconnector or circuit breaker can be placed in the closed position only when the loop concerned is ready to be tested. It will remain closed when the loop has been satisfactorily tested with the results reported on the test sheet.
- The control room team selects the loop on the control system screen, then checks the conformity of the display configuration in the static state and then checks the consistency of the value.
- The field team confirms that the instrument is powered on and can proceed with the simulation (input signal) and the functional check (output, valve limit switch, etc.).
- The control room team performs dynamic, and conformity checks related to the display configuration. It is done according with the loop type with all its parameters to be controlled (scale, physical unit, alarm animation, controller action, etc.).
- When a loop has been correctly tested, the representatives must sign the test sheet in the column concerning them: "performed by" and "accepted by" on the test sheets. The customer-side representative witnessing the operation must also sign as having witnessed the operation.
- The results of the loop tests must be recorded in the appropriate test sheet. The loop diagram should also be attached to the corresponding test sheet.
- A duly signed test sheet is proof that an instrument loop has been fully verified and is ready for the next commissioning activities.

In case of troubleshooting:

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- The loop test coordinator (usually the EIA Commissioning Supervisor) should coordinate troubleshooting by calling on the construction team if the wiring needs to be reviewed. The terminal disconnect (or circuit breaker or knives) should remain open until the troubleshooting activity is completed.
- When a loop needs to be removed from the test for troubleshooting, the loop testing team shall continue with another loop testing.
- Any changes made to a loop diagram during troubleshooting shall be marked in red on the master document with the associated test sheet attached.
- At the end of the troubleshooting, the troubleshooting team shall hand over all documentation related to the loop to the test coordinator in order to re-run the test.

6.6.1 Single Loop Item

- **Analog Input**

Item Type: Transmitter, etc.

- Check the status on the HMI.
- If external power supply, power on the loop. (Close the circuit breaker, knife or disconnector at the terminal block). Check loop voltage.
- Check if there is a short cut or if the loop current if less than 20 mA
- Check the loop configuration (sensor: active/passive) and adjust the mode on both sides.
- Check Stand-by status on HMI. Do troubleshooting investigation if wrong status.
- Check Activated Value on HMI:
    - In case of monitored line, apply physical action on the item.
    - In case of transmitter, apply, by simulation with a signal generator, a physical activation at 0%, 25%, 50%, 75%, 100%, 75%, 50%, 25% and 0% of scale.
    - Thermocouple and resistance temperature detector type transmitters must be simulated using a decade box (for resistive such as PT100, PT1000, RTD, etc.) otherwise use the thermocouple generator.
- Adjust if needed.
- Set item on stand-by mode or safety position as per requirement.
- Test sheet must be filled and signed

Notes:

- For temperature measuring instruments, it is recommended to check simply that the temperature indication is at ambient temperature before and after testing.
- For level transmitters with a displacer, the instrument must be checked with water or other suitable liquid before or during the loop test. This is to check that the instrument has been correctly installed and that the displacer has not been damaged during transport or installation. If the displacer is checked with a fluid of different density than its normal operating fluid (to be checked with the data sheet), then special care must be taken to convert the transmitter parameters and range values with the density of the fluid used for testing.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- For pressure measuring instruments, it is recommended to check that the pressure indication is at ambient pressure before and after testing. On the other hand, it can be tested using a pressure test device (bulk aire or druck type) which is used to inject pressure at the primary element of the instrument. This test, if possible, should be performed as part of the pressure probe loop test. If this is not possible, it should be performed separately in the field using appropriate pressure test equipment and a 4-20mA injector or hart communicator to simulate the output signal.

- **Digital Input**

Item Type: Push buttons or switches (pressure, temperature, limit, etc.), Signal from a package, etc.

- Check the status on the HMI.
- Power up the loop (Close the circuit breaker or knife at the terminal block).
- Check the standby status on HMI. Carry out a troubleshooting investigation if wrong status.
- Put the equipment in an activated position:
    - By applying a physical action.
    - By simulation for inaccessible equipment and in all other cases.
- Check the status on the HMI.
- Set the device on standby mode or safety position as required.
- The test sheet must be completed and signed.

For packages, the entire exchange table must have been checked beforehand with a complete return of information to the main HMI (if applicable).

- **Analog Output**

Item Type: Valve Positioner, Set Point Signal, etc.

For control valves, the following methodology is to be completed with the valve-specific steps described in section 6.2:

- Check the status on the HMI.
- If the power supply is external, power up the loop. Check the loop voltage.
- Close the circuit breaker, disconnector or knives at the terminal block.
- Check no action in the field.
- Apply a command value of 0%, 25%, 50%, 75%, 100%, 75%, 50%, 25% and 0% of the scale in the HMI (by setting or forcing).
- Check physical action on the item.
- Adjust if necessary.
- Put the equipment in standby mode or in a safe position as required.
- The test sheet must be completed and signed.

- **Digital Output**

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Item Type: Lamp, Horn, ON/OFF Solenoid, Dry Contacts, Start/Stop Signals, etc.

For ON/OFF valves, the following methodology must be completed with the valve-specific steps described in section 6.2:

- Check the status on the HMI.
- If the power supply is external, power up the loop. Check the loop voltage.
- Close the circuit breaker, disconnector or knives at the terminal block.
- Check no action in the field.
- Check physical OFF position on the Item.
- Apply an ON-position command from the HMI (by setting or forcing).
- Check the physical action on the equipment.
- Adjust if necessary.
- Put the equipment in standby mode or in the safety position as required.
- The test sheet must be completed and signed.

6.6.2 Control Valve

Item Type: ON/OFF Valve

- Check the valve direction and its installation.
- Energize the solenoid.
- During the output control signal test, check and adjust the limit switches.
- Also check the discrepancy of the limit switches, i.e. the position feedback on the HMI.
- Check and record the opening and closing times.
- Check the manual control and the reset control if they exist.
- Check the safety position (FO: Fail Opened or FC: Fail Closed) in the event of a loss of power (air pressure, hydraulic power or electrical power).
- The FAT report is mandatory.
- The test sheet must be completed and signed.

Item Type: Proportional Valve

- Check the valve direction (correct orientation) and its installation.
- Operate the valve from the control room from zero to 100% and back to zero in 25% steps as described in the analog output test method.
- Check and record the actions in case of failure.
- Check and record the opening and closing times.
- Check the safety position (FO or FC) in case of power loss (air pressure, hydraulic power or electrical power).
- Check the linearity of the actuator (linear, square, =%, …).
- Check the actuator action (direct or reverse).
- Check the display function in the control room and the displayed indications are correct.
- The FAT report is mandatory.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- The test sheet must be filled in and signed.

6.6.3 Motor Control

- Verify that the motor control unit in the switchgear room is in test mode; electrician assistance will be required.
- Verify that the emergency stop buttons on site are disengaged and that the manual/remote/stop switch is in the remote position.
- Verify protection settings are the newest revision and correctly inputted.
- Operate the motor from the control room, check all functions (at minimum: stop, start, run, unavailable, fail to start, trip).
- Verify that all indications and displays of all functions in the control room and on the motor electrical panel or at the motor control unit are correct.
- The test sheet must be completed and signed.
- Record the results on the test sheet applied to a digital input or output.

6.6.4 Embedded Software Items

Item Type: Flow meter, Level transmitters, Level Interface detector, etc.

- Test must be done as per vendor procedure and documentation.
- Vendor procedures must be approved.
- Special tool or software is required.
- Setting must be checked and recorded on the test sheet (and save on an appropriate support for future uses (final documentation)
- Interface even communication will be considered like DI/DO/AI/AO Test Loops
- Test sheet must be filled and signed.

6.6.5 Vendor Package (Including Vendor Skid)

- FAT report is mandatory.
- SAT must be done as per vendor procedure.
- Interface even communication will be considered like DI/DO/AI/AO Test Loops
- An exchange table must be created to allow full retransmission from the skid to the main control system.

- **Serial Link (Modbus, Profibus, Profinet…)**

Serial link has been checked during FATs by simulation.
Serial Link support must be checked during UCP SAT.
Interface even communication will be considered like DI/DO/AI/AO Test Loops
Test sheet must be filled and signed.

- **Instrument Loop**

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

During FATs, all loops were tested by simulation on the BPCS & SIS or UCP.
During SATs, loops must be tested in accordance with vendor loop testing procedure and checked from/to the BPCS & SIS or UCP.
Test sheet must be filled and signed when this check is done.

- **Package**

Vendor must carry-out package commissioning activities (SAT, Loop test, functional test and OTP) under commissioning team witness.
Vendor test procedure must be approved.
Test sheet must be filled and signed.

6.6.6 Analyzer

This kind of item must be tested as per vendor test procedure under vendor assistance if required.
Vendor test procedure must be approved.
FAT report is mandatory.
Interface even communication will be considered like DI/DO/AI/AO Test Loops
Test sheet must be filled and signed.

6.6.7 Multi Loop or Complex Loop Item

A control loop is defined as complex when there are at least 2 or more instruments that work in conjunction with each other.

Loop Type: Control loop with transmitter (pressure, temperature, level, etc.) and control valve, Level control with level transmitter and pump start/stop control, Calculations (flow, viscosity, density, etc.), etc.

If a control valve is present:

- If in the failure position, check the limit switch.
- Adjust if necessary.
- Send the Open command.

Then proceed in the following order:

- Start testing the output loop according to the analog or digital output test procedure described in chapter 6.1.
- While testing the input loop according to the analog or digital input test procedure described in chapter 6.1, physically check the expected response of the equipment.
- If it is a combinational logic control, ensure that all aspects of the logic function operate according to the design.
- If it is a PID control type, ensure that the direction of control operates according to the design (direct or indirect direction), the PID parameters will be adjusted by the automation engineer during the Pre-Commissioning for Utilities and during Commissioning & Start-Up for the main Process.
- Record the final PID parameters during operation.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- The test sheet must be completed and signed.

6.6.8 Various

Item Type : PSV, TSV, PI, TI, Gauge, etc.

No functional tests can be performed on this type of equipment. These are purely mechanical equipment.
A calibration certificate is, however, mandatory.

6.6.9 Cause & Effect Matrix

This section covers the test of interlocks, process shutdown, emergency shutdown and Fire & Gas detection.
It is mandatory to perform all these tests prior to unit start-up.
Also, all basic function loop tests concerned with each safety loop must be completed.

For each cause, proceed with the following steps:

- Verify that the latest revision is being used.
- Activate the safety loop trip cause physically on the item
- If not possible, on the HMI, simulate a value to activate the cause by overriding the actual value
- Verify on the field if all the expected effects are triggered
- If all the expected effects are observed, tick OK on the cause & effect test table
- If not, proceed to a troubleshooting

6.7 After Test

Check item setting is in accordance to stand-by rules or preservation procedure and safety rules.

7. Leak Test

7.1 Introduction

After the Electrolyser unit Mechanical Completion and before the Unit Start-Up, a leak detection shall be performed to ensure the good tightness of all systems. A preliminary gross leak test is performed on the different systems to ensure the tightness prior and during the Commissioning operations.
This operation makes it possible to detect leakage on bolted connections, flanges, instrument connections, valve bodies and compressed fittings. The leak detection test is carried out with air or inert gas.
This test is carried out after the construction: all hydrotesting (if any), cleanings and reinstatements (including flange tightening) are completed. The system has passed the Mechanical Completion inspection, and a certificate has been signed. All Punchlist A are cleared. A successful leak test is important for safety reasons as well as for the performance

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

of the unit. Any leaks must be identified and repaired. The leak test during the Pre-Commissioning and Commissioning (prior to Start-Up) are prepared and performed by the CONTRACTOR under ELOGEN supervision.

7.2 Conditions & Preparations

- On-site personnel will be informed of the system's pressurization prior to the start of the operation. (Information will be shared in advance via e-mail and during site meetings).
- The system must be finished and conform to the P&ID: all piping is tested, cleaned and dried; all equipment are cleaned and closed.
- All PSV have their calibration certificates updated.
- All punch items A are cleared, and the system will remain closed after the leak test.
- All instruments are installed and online.
- All equipment, valves and instrumentation have their tag installed correctly and visibly.
- RFC Certificate is issued for the systems to be tested.
- All pipe flanges, valves and instrument connections will be accessible for testing. Scaffolding must be installed for inaccessible points.
- The unit is divided into different sections which will be tested independently of each other. Each section is called a Leak Test Pack and follow (when possible) the subsystem breakdown and respect operating pressures to facilitate the detection of possible leaks.
- P&ID Mark Up of each Leak Test Pack gives the position of all valves and the test battery limit.
- Isolation from other systems is done preferably, when possible, with a positive isolation such as spade or double block and bleed.
- It is recommended to set all valves inside the system to be tested at 50% open position to pressurize and test properly the valve cavity.
- The flanges can be reviewed directly at the bolt. It can also be sealed with tape with a simple hole on the top. A soapy solution will be used to detect the slightest leak. For detection with He or H2 sniffer, it is recommended to use this method.
- The temperature must be noted at each stage because it has an influence on the final pressure measured. Therefore, the final pressure is corrected with a simple calculation.
- Stacks are not integrated for the first leak test (gross leak test) before flushing: stacks connections are either closed or preferably connected with a flexible bypass.
- For the Final Leak Test, the control system is operational, and the interlock table has been tested.
- Packages like Water Purification or Hydrogen Purification Units have already been tested during their FAT, but it is recommended to include it in the test.
- Test Pressure must be respected, and it is important not to exceed it to avoid triggering pressure switches and pressures valves or to damage instruments.
- The final leak test is performed on all gas systems prior to start-up. For 25-11 water loops, leak test can be performed by filling with water till a normal operating level in the vessels and then pressurizing with a mixture of N2/H2 or N2/He to allow a precise leak detection by using a sniffer.
- A functional and calibrated sniffer is used for the final Leak Test at operating pressure.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Note: the 25-11 water loops are also operating at 65°C in normal operation and in some cases, vibrations may occur. The thermal deformation due to a temperature difference temperature can cause stresses and geometrical deformation. This can affect gaskets and consequently create leakages if the system is not properly tightened.

7.3 Safety

Leak Test activities can be potentially hazardous; therefore, every precaution must be taken to ensure the safety of people and equipment. Before starting any activity, all site personnel must be aware of the risks involved and the systems that will be tested, i.e. all pressurized equipment, the extent of the system, the use of inert gas, etc. HSE personnel must be kept informed of the program. All personnel working in the vicinity must be alerted before any pressurization operation begins. Barriers should be put in place where possible with warning of the operations in progress and HSE personnel must be present to ensure the area is clear of unauthorized persons. Leak test activities sometimes involve the use of equipment not normally found in normal operation. The entire system downstream of the air or inert gas source must be capable of withstanding the maximum pressure delivered. The specifications of the lines to be tested must be reviewed. If the pressure is above what the line can support and it does not have an operational on-line PSV, a PSV must be temporarily connected and set below the line pressure design. All air hoses must be certified on site and correspond to the current operation (hose capable of supporting the pressure). All connections must be secured and provided with protection (quick coupling with anti-whip). The connections between the air tank or inert gas bottle rack and the hoses must have an isolation valve and a depressurization valve installed. If an inert gas is used, all safety measures must be taken for the use of the equipment that produces it, and personnel must be equipped with a portable gas detector to measure the ambient air Oxygen content.

7.4 Pre-requisites

7.4.1 Required Equipments

The following material list must be provided to perform the leak test:

- Pipe Fitter toolboxes: Adjustable Spanner, Pipe Wrenches (Stillson), Spanners, Striking Wrench, Torques Wrenches, ...
- A pressure gauge with a certificate added to the test report.
- Dried Air or Inert gas bottle rack (N2, mixture N2/H2 or N2/He).
- Gas regulator at the outlet of the gas bottle.
- Flexible between gas bottles and piping for injections.
- All fittings to the injection point.
- Bubble leak detection bottle.
- Air or N2 bottle for pneumatic valves activation if Instrument Air system is not started yet. Also provide electrical power to activate the motorized valves.
- H2 or He Sniffer
- Field telephone or Walkie-Talkie.
- At least one PSV is online, all PSV's have their calibration certificate up to date.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- If there is no PSV online, a temporary PSV must be installed.

7.4.2 Required Documents

- This procedure approved for use.
- Set of Leak Test Pack with the P&IDs Mark Up at the last revision.
- Approved vendor leak test procedure and documentation.
- Integrated Control System tested and operational.
- Subsystem RFC Certificate signed by all parties.
- Permit To Work delivered and signed.

7.4.3 Manpower (Indicative)

- 1 Piping/Mechanical supervisor
- 1 Piping/Mechanical technician
- 2 Pipe Fitters
- 1 LOTO supervisor
- 1 specialist from another discipline if required
- Vendor if required.

Leak testing activities will be organized by the Piping Mechanical Commissioning Supervisor under the responsibility of the Commissioning Engineer or Superintendent. Before testing, the leak test packs and test sheets are checked and clarified to be applicable to the scope to be tested. Final leak testing requires at least three people, including one in the field and one at the HMI in the control room or at the HMI of the package controller, all are equipped with means of communication (walkie-talkie).

7.4.4 Duration

A walkdown is done prior to start the pressurization to validate the line-up conformity as per the Leak Test Pack. This can take 30 min maximum. Then the operation itself lasts around 1h30 if no leaks are detected. If some leaks are detected and depending on the troubleshooting to perform, the operation can last longer.

7.5 Method Statement

Pressurization should be done slowly and in a controlled manner. Pressurization should be carried out in stages for pressure zones above 300 mbarg: 25%, 50% and 100% of the final pressure. If a major leak is detected during pressure increases, pressurization should stop immediately, and the system should be completely depressurized via the selected vents. If there is no major leak but it is necessary to pressurize to remain at the operational pressure, this may be due to a leak through a valve or via the PSV. In this case, the PSV must be recalibrated or replaced. If it is the valve, another valve can be closed (DBB). During the operation, the following points must be respected:

- The pressure is gradually increased until reaching the next stage.
- Once the stage is reached, see if there is a significant pressure drop.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- If there is no significant pressure drop, inspect for possible leaks by using a soapy solution.
- If a leak is detected, the system must be completely depressurized and then repaired and then retested.

Step	Pressure	Test duration (*)	Check
1	25% Test pressure	Stabilization: 5 min	
2	50% Test pressure	Stabilization: 5 min	
3	75% Test pressure	Stabilization: 5 min	
4	Test pressure	Stabilization: 1h	A check of all connections under gas with the gas detector and/or bubble leak product is required. A water leak check on all water connections is required.
		Test duration without pressure drop at least 1h	

(*): Test duration is for reference only. It will be adjusted on site during the test.

Acceptance Criteria:

The test will be considered successful once all connections have been tested:

- with bubble leak detection product and no bubbles detected
- with gas detector (Sniffer) and no leaks detected
- and no more than 0.1 bar/h (100 mbar) pressure drop has been observed

In case of Temperature variation during the operation, the final pressure can change, therefore we can do a correction on it as per the following calculation:

We consider $P_{adjusted}$, the final pressure considering the constant temperature during the test and the following equations:

$$P_{final}\ V = nRT_{final}$$
$$P_{adjusted}\ V = nRT_{initiale}$$

The volume and the mass are the same (it is a closed system)
Therefore, we get: $\boxed{P_{adjusted} = P_{final}\,(T_{initiale} / T_{final})}$

8. Purging

8.1 Introduction

This section gives the technical specifications and method to be applied to perform a Nitrogen purging. The contexts could be for preservation, priori to first unit start-up or for maintenance.
The purpose of this document is to give the general method, the necessary equipment, and the safety requirements.
The P&ID Mark-Up of the sections to be purged are given in the relevant Purging Pack.
For the use of media frames, refer to the supplier's procedure for details.

8.2 Conditions

The purging can be performed when the RFC certificate for the subsystem has been signed by all parties:

- The piping has been tested, cleaned, dried and is rust free.
- All equipments have been cleaned and closed permanently.
- The equipments, valves and instruments have been visually checked and are free of any damage.
- The instruments are connected to the lines.
- All equipment, valves and instrumentation have their tag installed correctly and visibly.
- At least one PSV is online, all PSV's have their calibration certificate up to date.
- All Punchlist which do not require reopening the system are cleared.
- The reinstatement as per P&ID is completed with all piping, equipment, valves and instruments installed and oriented in the correct direction.
- The Gross Leak Test has been performed and ITR's signed by all parties.
- All necessary tools for the operation are available.
- All relevant documentation is available in the latest revision.

Due to the introduction of Hydrogen into the unit, the objective is to avoid any risk of creating an explosive mixture inside the system. Therefore, the goal is to carry out a purging using an inert media to achieve less than 3% vol of Oxygen. The inert media chosen is Nitrogen (N2).

8.3 Safety

These defining rules shall be applied from the initial (total or partial) nitrogen purging, until the end of the commissioning activities.

- Appropriate PPE must be always worn during loop testing.
- A permit to work has been delivered.
- No equipment will be purged with nitrogen without the subsystem Mechanical Completion.
- The system under pressure is clearly identified
- Safety rules in accordance with the risk must be applied (e.g. Fluids, Pressure, Electrical Power, etc.).
- Risk assessment must be done prior to any test activity.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Before starting the activity, all site personnel must be aware of the risks involved and the systems that will be purged, i.e. all pressurized equipment, the scope of the system, etc. HSE personnel must be kept informed of the program. All personnel working in the nearby area must be alerted before any inerting operation begins. Barriers should be in place where possible with warning of ongoing operations and HSE personnel should be present to ensure the area is clear of people who have no reason to be here.

Nitrogen purging activities can also be dangerous, all precautions must be taken to ensure the safety of people and equipment. It involves the use of N2 frame and hoses usually found in the transitional phases like commissioning or maintenance until Nitrogen utility availability.
Exposure to high concentrations is quickly fatal. It is very important to control the ambient oxygen content. A nitrogen leak in a confined space can be enough to reduce the area of oxygen and create a danger of anoxia which can be fatal.
Inhaling an atmosphere with a too low oxygen content can lead to death by asphyxiation (Anoxia). Below 18% oxygen in the air, the first symptoms of danger to health can be felt: fatigue, yawning, headaches, rapid pulse, discomfort or dizziness and nausea. For oxygen concentrations below the threshold of 18%, there is a risk of rapid fainting without the possibility of reaction until death. To prevent any incident, measuring the oxygen content at all times is an essential preventive action for any intervention in confined spaces where inert gases are present.

8.4 Preparation

- Personnel present on site will be informed of the operation scope before the start. Information will be shared in advance via email and during site meetings.
- The battery limits of the area will be demarcated following the P&ID marking.
- Operators are trained on the procedure, the operation of the purging equipment and the safety instructions.
- N2 frames are available and working properly. They must be labeled, equipped with a regulator and protected against overpressure.
- The N2 frames will be placed in the same location as that provided for maintenance in normal operation.
- The hoses have been dried and cleaned and are ready for use.
- The sections to be inerted will be isolated from other systems by closed valves.
- The drains and vents used for the operation will be labeled and accessible. Otherwise, scaffolding must be put in place.
- The limits of the system placed under N2 must be clearly identified.
- The injection and depressurization points must be marked with tags and barricaded over a 3m diameter.
- Only operators or those responsible for the operation can enter the injection and vent point areas; they must wear a gas detector to check the atmosphere.
- If the pressure online cannot be checked, a Pressure Indicator must be installed and used to check the pressure.
- In the event of rain, protect the event and injection points with a temporary shelter.

8.5 Pre-requisites

8.5.1 Required Equipments

The following material list must be provided to perform the leak test:

- Pipe Fitter toolboxes: Adjustable Spanner, Pipe Wrenches (Stillson), Spanners, Striking Wrench, Torques Wrenches, ...

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- A pressure gauge with a certificate added to the test report.
- Inert gas bottle rack.
- Gas regulator at the outlet of the gas bottle.
- Flexible between gas bottles and piping for injections.
- All fittings to the injection point.
- Air or N2 bottle for pneumatic valves activation if Instrument Air system is not started yet. Also provide electrical power to activate the motorized valves.
- Field telephone or Walkie-Talkie.

8.5.2 Required Documents

- This procedure approved for use.
- Set of Purging Pack with the P&IDs Mark Up at the last revision.
- Approved vendor purging procedure and documentation.
- Integrated Control System tested and operational (for automatic inert gas injection).
- Subsystem RFC Certificate signed by all parties.
- Permit To Work delivered and signed.

8.5.3 Manpower (Indicative)

- 1 Piping/Mechanical supervisor
- 1 Piping/Mechanical technician
- 2 Pipe Fitters
- 1 LOTO supervisor
- 1 specialist from another discipline if required
- Vendor if required.

Purging activities will be organized by the Piping Mechanical Commissioning Supervisor under the responsibility of the Commissioning Engineer or Superintendent. Before testing, the purging packs and test sheets are checked and clarified to be applicable to the scope. Purging requires at least three people, including one in the field and one at the HMI in the control room or at the HMI of the package controller, all are equipped with means of communication (walkie-talkie).

8.5.4 Duration

The duration of the activity should not exceed 1-2h per Purging pack.

8.6 Method Statement

Two different methods will be used to purge a system with an inert gas:

- By Piston Effect.
- With Compressions/Decompressions.

If not injected manually, the inert gas can also be sent to the unit by an operator in the control room.
The method below specifies the necessary means to be implemented as well as the general methodology:

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Piston effect method:

- Check if the barricades and the panels at the injection and vent points are in place (if applicable).
- Check the initial pressure, remove any residual pressure (if applicable).
- Check that the N2 rack is available in sufficient quantity (plan for 5 times the volume of the unit).
- Check the vent points opening located at the unit outlet.
- Put the regulator at sufficient pressure to create a flow through the unit to be purged.
- Start the N2 injection by opening the injection point solenoid valve at the inlet of the unit
- Inject the N2, this will be done slowly and in a controlled manner by increasing the pressure of the regulator to allow a sufficient flow and so that there is no accumulation of pressure in the system.
- Regularly check the O2 level at the vent.
- When the O2 level is less than 3%, the operation is completed.
- Fill in the ITR with the measured O2 level.
- Stop the N2 injection then close immediately all vents.
- If the goal is to put the system on preservation, leave a positive pressure of 100mbarg (pressure must be below PSV relief pressure).

Compression/Decompression method:

- Check that barricades and panels at injection and vent points are in place.
- Check the initial pressure, remove any residual pressure (if applicable).
- Locate vents to be opened during depressurization.
- Inject N2 in a slow, controlled manner until a pressure of 1 barg is reached (or other chosen pressure as per the table showed in the next part).
- Vent all pressure contained in the volume through the vent line or any other vent.
- Repeat the operation another time and check the oxygen level on the last depressurization.
- If the measured O2 level is less than 3%, the operation is completed.
- Fill in the ITR with the measured O2 level.
- Immediately close vents.
- If the goal is to put the system on preservation, leave a positive pressure of 100mbarg (pressure must be below PSV relief pressure).

Calculate the amount of Inert Gas required in the following table :

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Added Pressure	0,5	1	1,5	2	2,5	3	3,5	4	4,5	5
O2 Initial	21%	21%	21%	21%	21%	21%	21%	21%	21%	21%
1	14%	10,50%	8,40%	7%	6%	5,25%	4,67%	4,20%	3,82%	3,50%
2	9,33%	5,25%	3,36%	2,33%	1,71%	1,31%	1,04%	0,84%	0,69%	0,58%
3	6,22%	2,63%	1,34%	0,78%						
4	4,15%	1,31%								
5	2,77%									
6	1,84%									

This table above shows the optimum compression/decompression ratio. This is not applicable for very low-pressure systems. It is then possible to predict the exact quantity of Inert Gas in Nm3.

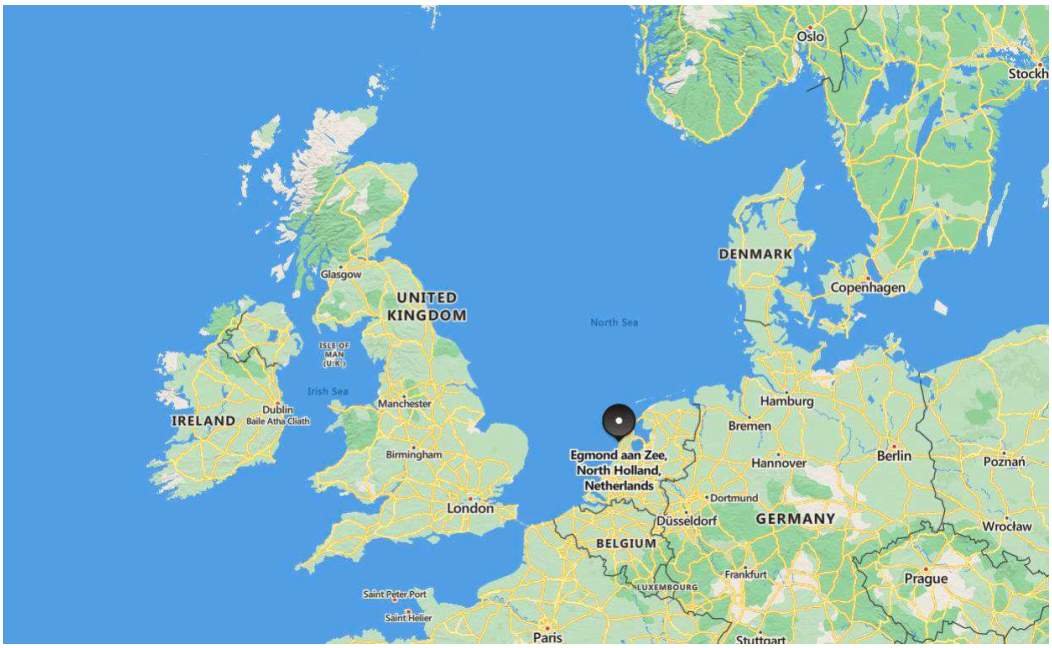
1. Introduction



This document gives Pre-Commissioning requirements for the Commissioning & Start-Up of the ELOGEN hydrogen production unit by water electrolysis for the Crosswind Project. ELOGEN's site supervision is responsible for advising the coordinating on site of all the means and resources required for the Unit Commissioning & Start-Up of the unit in accordance with COMPANY specifications.

1.1 Overview of Project Scope

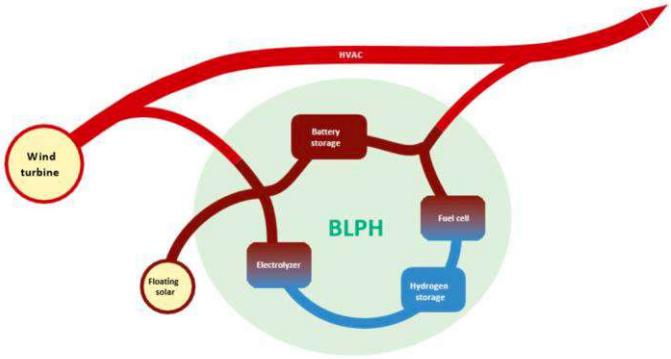
Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.
Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.2 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

HOLLANDSE KUST NOORD WIND PARK Location Map

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.



Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile is located on coordinates E 590719.1, N 5841602.3 and is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

1.3 Project Concept

All components included in the BLPH will be integrated onshore on a topside and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

BLPH Concept

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

The purpose of the BLPH is to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

2. Document Scope

This document describes the detailed activities scope to perform the Pre-Commissioning of the ELOGEN hydrogen production unit by water electrolysis for the Crosswind Project. These operations start straight after the Sub-System Mechanical Completion when the RFC is signed by all parties. ELOGEN's site supervision is responsible for advising the follow up of all activities good practices on site required for the Unit Commissioning & Start-Up in accordance with COMPANY specifications. The main activities are:

- Energizing & Test of Electrical Items such as Pumps, Electrical Heaters, …
- Loop checks of Instrumentation Items such as Pressure Transmitters, Level Transmitters, …
- Package Pre-Commissioning with Vendors (Described in Vendor Documents)
- Gross Leak Test

Electrical & Instrumentation Pre-Commissioning Tests are performed through the Item List follow up: C063-ELO-LST-CO-0001 - BLPH Electrolyser - General Item list. The methodology and guidelines are detailed in C063-ELO-PRO-CO-0002 - BLPH Electrolyser CSU Method Statements. All ITR's specific to the project are given in this document.

For packages, vendors provide all the documentation including their own suite of ITR's regarding all remaining tests taking place onsite. FAT reports give all the tests already completed. Vendors concerned are:

- OVIVO: for the Water Treatment Package (WTP) – Subsystem 56-03
- PAUMIER: HVAC Glycol Water Loop – Subsystem 66-06
- MSA: SSI-1000: Fire Safety System – Subsystem 25-11
- NIDEC: Transformer & Rectifiers – Subsystem 03-04 & 08-01

Regarding the Hydrogen Purification Package HPP (25-01), Aquagas mobilization onsite will be at the Start-Up. All items are connected directly to ELOGEN UCP. Pre-Commissioning on this package will be performed by CONTRACTOR under ELOGEN supervision. Therefore, this document also includes all 25-01 items.
For all other vendors, SAT Procedures must be provided prior to any operation. Task Risk Assessment to be revisited and possibly updated when approved versions of said document are made available

All the mechanical checks including alignments checks, correct installation such as valves & equipments direction have been monitored prior to the Mechanical Completion.
Piping & Mechanical Pre-Commissioning activity is the Gross Leak Test.
The methodology and guidelines are detailed in C063-ELO-PRO-CO-0002 - BLPH Electrolyser CSU Method Statements.
Leak Test Packs with ITR's and P&ID Mark Up are given in this document.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

3. Definitions

COMPANY	means CROSSWIND C.V., owner & developer of the offshore WIND FARM Hollandse Kust Noord Wind Park Project.
ELOGEN	means ELOGEN as CONTRACTOR, the contracted party for engineering, and onshore commissioning of the Electrolyzer facilities associated with the PROJECT.
CONTRACTOR	means ROSETTI MARINO S.p.A., and his subcompany FORES for the contracted party for engineering, procurement, construction, offshore installation & commissioning of the facilities associated with the PROJECT.
Pre-Commissioning	Pre-Commissioning relates to the preliminary Commissioning activities to test and check the individual basic functions of individual items within any given system and/or sub-system to confirm they perform as designed.
Commissioning	The phase of the project after Pre-Commissioning. Commissioning consists of a comprehensive series of dynamic and energized Checks and Tests to be carried out in order to demonstrate and ensure that the facilities are ready to operate safely and steadily in compliance with project Documents, Specifications, Standards and Engineering Best Practices.
Commissioning Team	Team established to perform the Commissioning and Handover process from CONTRACTOR Construction Team to COMPANY Operation & Maintenance Team.
Commissioning Spares	"Replacement" and "Consumable" spares required during the final hook-up, Pre-Commissioning, Commissioning and Start-up phases.
Equipment	An item that may be part of a System and be commissioned independently, however, it may or may not be operated independently.
Handover	Transfer of responsibility of the Plant from the Project Team to the Asset Holder.
Inspection Test Records (ITR)	A-ITR – used to record and verify construction scope associated with a tagged item (component). B-ITR – used to record and verify energization and function testing during pre-commissioning of a tagged item
Mechanical Completion	Mechanical Completion is the point in the project when construction is complete, and subsystems are ready to be handed over to the commissioning team. Mechanical Completion is achieved when: - • All ITR-A's for the given system / sub-system have been completed and signed off; • All Category A Punches have been closed. • All open Category B Punches shall be accepted with agreed plan for closure prior to commissioning. • Completion of all documents required to be As-Built Red Line Marked Up. Mechanical Completion for any subsystem is recorded via the completing and signing of the Ready For Commissioning (RFC) certificate.
Operations	Operations include all personnel directly involved with Production Operations and Maintenance of the facility.
Performance Test	The Performance Test takes place following the Commissioning and Site Acceptance Test. A performance test is executed if there is a specific requirement to test performance criteria of an individual piece of equipment, a system, or the plant.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Performance Test Acceptance Certificate	This certificate shall be issued by the CONTRACTOR certifying that the PERFORMANCE TEST CRITERIAS have been achieved during the PERFORMANCE TESTS.
Plant	Refers to the permanent facilities (Base Load Power Hub) being constructed or to be constructed at WORKSITE resulting from the WORK.
Project	Refers to the BASE LOAD POWER HUB project.
Pre-Start Up Audit (PSUA)	The PSUA is a precursor to the PSSR meeting. The intention is to audit the readiness of the facility to commence start up with the findings being used as part of the PSSR and shall be conducted 6 weeks prior to Start-up.
Pre-Start Up Safety Review (PSSR)	Pre-Start-up Safety review (PSSR) meeting is the final determination that all prerequisites have been met to permit the hydrogen production and shall be conducted 4 weeks prior the RFSU.
Procedure	A document that details the execution of an activity.
Punch List	Work not executed as per approved documents and/or not meeting quality, health, safety, environment, operability/maintainability requirement and/or Standard; and recorded as a list for rectification.
Punch List 'A' Item	Punch List item that will prevent the safe operation of the Equipment, System and Plant and may jeopardize personnel or environment. Such item, as agreed, shall be cleared before the Equipment/System/Plant can progress to the next stage of the Commissioning and Handover phase.
Punch List 'B' Item	Punch List item that will not endanger the safe operation of the Equipment, System and Plant or personnel and/or environment. Such item, as agreed, can be carried over to the next stage and may be cleared later.
Ready For Commissioning Acceptance Certificate (RFC)	RFC is the Proverlis description for a sub-system Mechanical Completion. See definition for Mechanical Completion.
Ready For Operation Acceptance Certificate (RFO)	An RFO Acceptance Certificate shall be raised on the completion of the sub-system commissioning procedure scope.
Ready For Sail Away (RFSA)	All preservation and preparation works are complete.
Ready For Start-up (RFSU)	RFSU applies to the whole or part of the Plant and its associated Facilities and Systems. RFSU signifies that the applicable scopes have been fully commissioned and are ready for safe hydrogen production. RFSU will be authorized with the signing of the RFSU certificate. The RFSU requires that the Pre-Start-Up Audit (PSUA) and the Pre-Start- Up Safety Review have been completed, and all related action/blocking issues have been resolved
SITE	Refers to the offshore location where the PLANT is to be installed and the vicinity thereof (offshore North Sea - Netherlands).
Start-up	The stage at which process fluid is introduced/created into the Plant. It is defined as operation of all the facilities under the project. It can only be performed once Commissioning of all associated utilities and auxiliaries and Pre-Commissioning activities of the Plant have been completed.
Start-up/Ramp-up	It is the initial start-up of processing equipment after first hydrogen, followed by a staged ramp up to full operating conditions. On completion of ramp-up, and after a period of steady state operations, the facility is ready to be performance tested.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Start Up on Paper (SUOP)	SUOP is an exercise to ensure that the start-up procedure and associated preparations are fit-for-purpose, including risk assessments, controls, mitigating actions and the Emergency Response protocols, procedures and capability are in place.
Site Acceptance Test	An un-interrupted safe operation of equipment, system, or plant, over a certain timeframe usually defined as 72hrs. A prerequisite to the Final Handover Certificate.
Statement of Fitness	As part of the COMPANY's HSE & SP Control Framework, the Statement of Fitness (SoF) before commissioning or introduction of hydrogen / hazardous substances in a New Asset, is a requirement of the Asset Integrity - Process Safety Management Application procedure. The Project and Asset Managers are accountable to develop a SoF to demonstrate asset integrity prior to energization or introduction of hazardous substances.
Sub-Contractor	means any company or person, to whom CONTRACTOR has subcontracted directly or indirectly at any level the performance of any part of the WORK.
System	A System is a major subdivision of a plant, being either process or utility, which performs an operational function of the plant. A System includes all the various equipment that allows it to operate. The division into functional Commissioning Systems corresponds to the prevailing fluids or services.
Sub-system	A Sub-system is a further subdivision of a System, which performs a partial operational function of the System, with little or no interference from the other Sub-systems. The Sub-system is the basic unit for Commissioning.
Systemization	The process of defining Systems for handover. Generally, colour coded on the 'marked up' engineering drawings such as P&IDs, SLD's & Cable Block Diagrams.
Vendor	means any CONTRACTOR's / CPI and/or SUBCONTRACTORS' supplier(s) of CONTRACTOR ITEM(s). VENDORS' presence on WORKSITE & SITE may be required to assist CONTRACTOR and/or COMPANY for the installation, commissioning and startup of such CONTRACTOR ITEMS and during the execution of PERFORMANCE TESTS.
Vendor Package	Skid and Equipment such as hydrogen purification, water purification, chillers, rectifiers, containers, etc.
Workshop(s)	means any location(s), other than WORKSITES, including offices, premises and workshops, where any equipment, materials or manufactured items including CONTRACTOR ITEMS shall be engineered, manufactured and assembled.
WORKSITE	means any construction location(s), where any major parts of the PLANT (such as templates, piles, nodes, jacket structure, modules, decks) shall be fabricated and assembled, excluding all other offices, premises and workshops of CONTRACTOR and SUBCONTRACTORS.
Shall	used to indicate requirements strictly to be followed to conform to the specification and accepted by all involved parties.
Should	used to indicate that among several possibilities one is recommended as particularly suitable without mentioning or excluding others, or that a certain course of action is preferred but not necessarily required.
May	used to indicate a course of action permissible within the limits of the specification.
Can	used for statements of possibility and capability, whether material, physical or casual.
"he", "him", "his"	are used in relation to CONTRACTOR.
"it", "its"	are used in relation to COMPANY.

4. Abbreviations

Acronyms / Abbreviations	Description
E&I	Electrical & Instrumentation
ESD	Emergency Shut Down
FAT	Factory Acceptance Test
FT	Functional Test
HSE	Health, Safety, & Environment
ITR	Inspection & Test Record
LC	Locked Closed
LO	Locked Open
MC	Mechanical Completion
NO	Normally Open
NC	Normally Closed
N/A	Non-Applicable
OTP	Operation Test Procedure (Commissioning)
PCS	Process Control System
PL	Punchlist
PID (P&ID)	Piping and Instrumentation Diagram

5. E&I Pre-Commissioning

5.1 Item List

Refer to **C063-ELO-LST-CO-0001 - BLPH Electrolyser - General Item list**
A progress KPI can be calculated by the Item tested divided by the total number of Items.

5.2 ITR's

Here are the ITR's list:

ITR Number	ITR Name
C063-ELO-REP-CO-0001	Analog Input
C063-ELO-REP-CO-0002	Digital Input & Output
C063-ELO-REP-CO-0003	Pump Motor
C063-ELO-REP-CO-0004	On Off Valve
C063-ELO-REP-CO-0005	Proportional Valve
C063-ELO-REP-CO-0006	Air Extractor
C063-ELO-REP-CO-0007	Heating Ribbon
C063-ELO-REP-CO-0008	Electrical Heater

All forms can be found in Appendix.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

6. Piping & Mechanical Pre-Commissioning

6.1 Leak Test Pack List

Here is the Leak Test Packs list for Gross Leak Test:

Leak Test Pack	Description	Medium	Test Pressure
LT-01	Anode Water Loop / O2 Production	N2	3 barg
LT-02	Cathode Water Loop / H2 Production	N2	3 barg
LT-03	H2 Purification & Send Out	N2	3 barg

All utilities tightness is verified during the service tests.
66-06 HVAC system tightness is tested with vendor prior to performing the filling with glycol.
All the leak test packs described in the table are performed during Pre-Commissioning as Gross Leak Test.
Before Unit Start-Up, all listed Leak Test Packs are retested with all Stacks connected at 90% of PSV Pressure (See Commissioning Manual).
All Leak Test Pack P&ID Mark-Up can be found in appendix, ready for use.

6.2 Leak Test ITR

The ITR form for Leak Testing is attached to the Appendix with the rest of Pre-Commissioning ITRs.

7. Appendix

7.1 ITR’s

7.2 Leak Test Pack

7.3 General Item list

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

GENERAL NOTES :
- FOR ALL PACKAGES, REFER TO THE SUPPLIER P&ID FOR COMPLETE INFORMATION
- FOR EACH SLO REFERENCE PLEASE REFER TO C63-PUY-001
- DRAIN VALVES TO BE INSTALLED AT LOWEST POINTS
- ALL EQUIPMENTS AND PIPING OUTSIDE CONTAINERS ARE HEATED USING HEATING RIBBONS

NOTES :
NOTE 1 : BRITISH STANDARD PIPE PARALLEL (TO INSTALL BETWEEN FLANGES)
NOTE 2 : COMMISSIONING AND INITIAL START-UP
NOTE 3 : ACCESSIBLE FOR MAINTENANCE
NOTE 4 : DISSIMILAR TECHNOLOGY BETWEEN THE TWO CHECK VALVES/ CHECK VALVE SHALL MEET CLASS 1 REQUIREMENT
NOTE 5 : DISTANCE OF 5*D REQUIRED UPSTREAM AND DOWNSTREAM OF THE EQUIPEMENT
NOTE 6 : REMOVABLE LINE, USED ONLY FOR MAINTENANCE
NOTE 7 : REFER TO WATER TREATMENT PACKAGE DOCUMENTATION FROM OVIVO FOR COMPLETE P&ID - P&ID N° (90767001_02)
NOTE 8 : PACKAGE TO BE SUPPLIED BY ELOGEN
NOTE 9 : SECTION OUTSIDE CONTAINER SHALL BE INSULATED (X00 zone)

GENERAL NOTES :
- FOR ALL PACKAGES, REFER TO THE SUPPLIER P&ID FOR COMPLETE INFORMATION
- FOR EACH SLO REFERENCE PLEASE REFER TO C63-PUY-001
- DRAIN VALVES TO BE INSTALLED AT LOWEST POINTS
- ALL EQUIPMENTS AND PIPING OUTSIDE CONTAINERS ARE HEATED USING HEATING RIBBONS

NOTES :
NOTE 1 : BRITISH STANDARD PIPE PARALLEL (TO INSTALL BETWEEN FLANGES)
NOTE 2 : COMMISSIONING AND INITIAL START-UP
NOTE 3 : ACCESSIBLE FOR MAINTENANCE
NOTE 4 : DISSIMILAR TECHNOLOGY BETWEEN THE TWO CHECK VALVES/ CHECK VALVE SHALL MEET CLASS 1 REQUIREMENT
NOTE 5 : DISTANCE OF 5*D REQUIRED UPSTREAM AND DOWNSTREAM OF THE EQUIPEMENT
NOTE 6 : REMOVABLE LINE, USED ONLY FOR MAINTENANCE
NOTE 7 : REFER TO WATER TREATMENT PACKAGE DOCUMENTATION FROM OVIVO FOR COMPLETE P&ID - P&ID N° (90767001_02)
NOTE 8 : PACKAGE TO BE SUPPLIED BY ELOGEN
NOTE 9 : SECTION OUTSIDE CONTAINER SHALL BE INSULATED (X00 zone)

This document is the Pre-Commissioning Completion Database for Electrical & Instrumentation
Each Column can be filtered within any characteristic

Item List

This part is used for the follow up of the activities

Column	Definition
Item Tag	Item Tag as per P&ID
Item Type	Item Type as per P&ID Symbol
P&ID	P&ID Number where the Item is represented
Discipline	Electrical or Instrumentation
System Number	System Number as per Subsystem Breakdown Procedure
System Name	System Name as per Subsystem Breakdown Procedure
ITR Form	ITR Form number - Suite of ITR's can be found in the Pre-Commissioning Manual
Completion Date	To be filled with the date when the ITR is filled and signed off by all parties

ITR Form List

This page is for having an overview of the correspondance between ITR form and all Item Type

Column	Definition
Item Type Tag	Item Type Abbreviation as per P&ID Symbol
Item Type	Item Type name as per P&ID Symbol
ITR Number	ITR Form number as per the Pre-Commissioning Manual
ITR Name	Form Name
Discipline	Electrical or Instrumentation

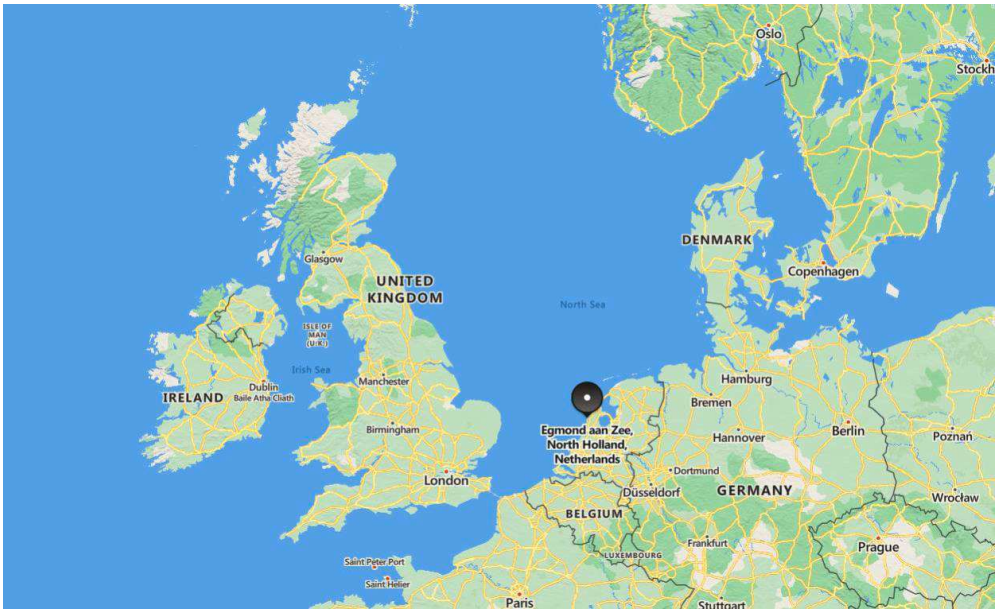
1. Introduction



This document gives Commissioning & Pre-Start-Up requirements for the Commissioning & Start-Up of the ELOGEN hydrogen production unit by water electrolysis for the Crosswind Project. ELOGEN's site supervision is responsible for advising the coordinating on site of all the means and resources required for the Unit Commissioning & Start-Up of the unit in accordance with COMPANY specifications.

1.1 Overview of Project Scope

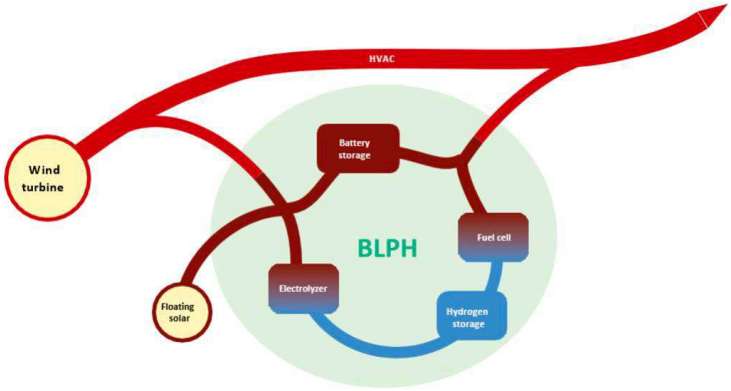
Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.
Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.2 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

HOLLANDSE KUST NOORD WIND PARK Location Map

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.



Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile is located on coordinates E 590719.1, N 5841602.3 and is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

1.3 Project Concept

All components included in the BLPH will be integrated onshore on a topside and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

BLPH Concept

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.
The purpose of the BLPH is to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

2. Document Scope

This document describes the detailed activities scope to perform the Commissioning & Pre-Start-Up activities of the ELOGEN hydrogen production unit by water electrolysis for the Crosswind Project. ELOGEN's site supervision is responsible for advising the follow up of all activities good practices on site required for the Unit Commissioning & Start-Up in accordance with COMPANY specifications. At this point, all Sub-Systems basic functions have been tested. The next steps are Utilities Operational Test and Unit preparation for Start-Up. The main activities are:

- Control Loop Simulation Test
- Cause & Effect Matrix
- Sequence Simulation Test
- Pure Water Purification & Distribution (56-03) Operational Test with WTP Vendor
- Flushing of Water Loops (25-11)
- Resin Filling into the Filters (25-11)
- Flushing with Resin
- Stacks Installation
- Flushing with Stacks
- Final Leak Test

The methodology and guidelines Simulation Tests and Leak Tests are detailed in C063-ELO-PRO-CO-0002 - BLPH Electrolyser CSU Method Statements. All ITR's specific to the project are given in this document.

For packages, vendors provide all the documentation including their own suite of ITR's regarding all remaining tests taking place onsite. FAT reports give all tested elements list. Vendors concerned are:

- OVIVO: for the Water Treatment Package (WTP) – Subsystem 56-03
- PAUMIER: HVAC Glycol Water Loop – Subsystem 66-06: All tests referring to the HVAC System here are tested through HVAC SAT Procedure (See C63-PAU-SAT-001).
- MSA: SSI-1000: Fire Safety System – Subsystem 25-11
- NIDEC: Transformer & Rectifiers – Subsystem 03-04 & 08-01

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- Regarding HPP (25-01), Aquagas mobilization onsite will be at the Start-Up. All items are connected directly to ELOGEN UCP. Commissioning on this package will be performed by CONTRACTOR under ELOGEN supervision. Therefore, this document also includes all 25-01 loops.

Regarding the Control System: the ELOGEN automation engineer will confirm onsite the good connection between the different UCPs by testing all the exchange tables. The simulation tests are done with all systems connected between each other's. At this point all should be communicating properly.

3. Definitions

COMPANY	means CROSSWIND C.V., owner & developer of the offshore WIND FARM Hollandse Kust Noord Wind Park Project.
ELOGEN	means ELOGEN as CONTRACTOR, the contracted party for engineering, and onshore commissioning of the Electrolyzer facilities associated with the PROJECT.
CONTRACTOR	means ROSETTI MARINO S.p.A., and his subcompany FORES for the contracted party for engineering, procurement, construction, offshore installation & commissioning of the facilities associated with the PROJECT.
Pre-Commissioning	Pre-Commissioning relates to the preliminary Commissioning activities to test and check the individual basic functions of individual items within any given system and/or sub-system to confirm they perform as designed.
Commissioning	The phase of the project after Pre-Commissioning. Commissioning consists of a comprehensive series of dynamic and energized Checks and Tests to be carried out in order to demonstrate and ensure that the facilities are ready to operate safely and steadily in compliance with project Documents, Specifications, Standards and Engineering Best Practices.
Commissioning Team	Team established to perform the Commissioning and Handover process from CONTRACTOR Construction Team to COMPANY Operation & Maintenance Team.
Commissioning Spares	"Replacement" and "Consumable" spares required during the final hook-up, Pre-Commissioning, Commissioning and Start-up phases.
Equipment	An item that may be part of a System and be commissioned independently, however, it may or may not be operated independently.
Handover	Transfer of responsibility of the Plant from the Project Team to the Asset Holder.
Inspection Test Records (ITR)	A-ITR – used to record and verify construction scope associated with a tagged item (component). B-ITR – used to record and verify energization and function testing during pre-commissioning of a tagged item
Mechanical Completion	Mechanical Completion is the point in the project when construction is complete, and subsystems are ready to be handed over to the commissioning team. Mechanical Completion is achieved when: - • All ITR-A's for the given system / sub-system have been completed and signed off; • All Category A Punches have been closed. • All open Category B Punches shall be accepted with agreed plan for closure prior to commissioning. • Completion of all documents required to be As-Built Red Line Marked Up.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

	Mechanical Completion for any subsystem is recorded via the completing and signing of the Ready For Commissioning (RFC) certificate.
Operations	Operations include all personnel directly involved with Production Operations and Maintenance of the facility.
Performance Test	The Performance Test takes place following the Commissioning and Site Acceptance Test. A performance test is executed if there is a specific requirement to test performance criteria of an individual piece of equipment, a system, or the plant.
Performance Test Acceptance Certificate	This certificate shall be issued by the CONTRACTOR certifying that the PERFORMANCE TEST CRITERIAS have been achieved during the PERFORMANCE TESTS.
Plant	Refers to the permanent facilities (Base Load Power Hub) being constructed or to be constructed at WORKSITE resulting from the WORK.
Project	Refers to the BASE LOAD POWER HUB project.
Pre-Start Up Audit (PSUA)	The PSUA is a precursor to the PSSR meeting. The intention is to audit the readiness of the facility to commence start up with the findings being used as part of the PSSR and shall be conducted 6 weeks prior to Start-up.
Pre-Start Up Safety Review (PSSR)	Pre-Start-up Safety review (PSSR) meeting is the final determination that all prerequisites have been met to permit the hydrogen production and shall be conducted 4 weeks prior the RFSU.
Procedure	A document that details the execution of an activity.
Punch List	Work not executed as per approved documents and/or not meeting quality, health, safety, environment, operability/maintainability requirement and/or Standard; and recorded as a list for rectification.
Punch List ‘A’ Item	Punch List item that will prevent the safe operation of the Equipment, System and Plant and may jeopardize personnel or environment. Such item, as agreed, shall be cleared before the Equipment/System/Plant can progress to the next stage of the Commissioning and Handover phase.
Punch List ‘B’ Item	Punch List item that will not endanger the safe operation of the Equipment, System and Plant or personnel and/or environment. Such item, as agreed, can be carried over to the next stage and may be cleared later.
Ready For Commissioning Acceptance Certificate (RFC)	RFC is the Proverlis description for a sub-system Mechanical Completion. See definition for Mechanical Completion.
Ready For Operation Acceptance Certificate (RFO)	An RFO Acceptance Certificate shall be raised on the completion of the sub-system commissioning procedure scope.
Ready For Sail Away (RFSA)	All preservation and preparation works are complete.
Ready For Start-up (RFSU)	RFSU applies to the whole or part of the Plant and its associated Facilities and Systems. RFSU signifies that the applicable scopes have been fully commissioned and are ready for safe hydrogen production. RFSU will be authorized with the signing of the RFSU certificate. The RFSU requires that the Pre-Start-Up Audit (PSUA) and the Pre-Start- Up Safety Review have been completed, and all related action/blocking issues have been resolved
SITE	Refers to the offshore location where the PLANT is to be installed and the vicinity thereof (offshore North Sea - Netherlands).
Start-up	The stage at which process fluid is introduced/created into the Plant. It is defined as operation of all the facilities under the project. It can only be performed once

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

	Commissioning of all associated utilities and auxiliaries and Pre-Commissioning activities of the Plant have been completed.
Start-up/Ramp-up	It is the initial start-up of processing equipment after first hydrogen, followed by a staged ramp up to full operating conditions. On completion of ramp-up, and after a period of steady state operations, the facility is ready to be performance tested.
Start Up on Paper (SUOP)	SUOP is an exercise to ensure that the start-up procedure and associated preparations are fit-for-purpose, including risk assessments, controls, mitigating actions and the Emergency Response protocols, procedures and capability are in place.
Site Acceptance Test	An un-interrupted safe operation of equipment, system, or plant, over a certain timeframe usually defined as 72hrs. A prerequisite to the Final Handover Certificate.
Statement of Fitness	As part of the COMPANY's HSE & SP Control Framework, the Statement of Fitness (SoF) before commissioning or introduction of hydrogen / hazardous substances in a New Asset, is a requirement of the Asset Integrity - Process Safety Management Application procedure. The Project and Asset Managers are accountable to develop a SoF to demonstrate asset integrity prior to energization or introduction of hazardous substances.
Sub-Contractor	means any company or person, to whom CONTRACTOR has subcontracted directly or indirectly at any level the performance of any part of the WORK.
System	A System is a major subdivision of a plant, being either process or utility, which performs an operational function of the plant. A System includes all the various equipment that allows it to operate. The division into functional Commissioning Systems corresponds to the prevailing fluids or services.
Sub-system	A Sub-system is a further subdivision of a System, which performs a partial operational function of the System, with little or no interference from the other Sub-systems. The Sub-system is the basic unit for Commissioning.
Systemization	The process of defining Systems for handover. Generally, colour coded on the 'marked up' engineering drawings such as P&IDs, SLD's & Cable Block Diagrams.
Vendor	means any CONTRACTOR's / CPI and/or SUBCONTRACTORS' supplier(s) of CONTRACTOR ITEM(s). VENDORS' presence on WORKSITE & SITE may be required to assist CONTRACTOR and/or COMPANY for the installation, commissioning and startup of such CONTRACTOR ITEMS and during the execution of PERFORMANCE TESTS.
Vendor Package	Skid and Equipment such as hydrogen purification, water purification, chillers, rectifiers, containers, etc.
Workshop(s)	means any location(s), other than WORKSITES, including offices, premises and workshops, where any equipment, materials or manufactured items including CONTRACTOR ITEMS shall be engineered, manufactured and assembled.
WORKSITE	means any construction location(s), where any major parts of the PLANT (such as templates, piles, nodes, jacket structure, modules, decks) shall be fabricated and assembled, excluding all other offices, premises and workshops of CONTRACTOR and SUBCONTRACTORS.
Shall	used to indicate requirements strictly to be followed to conform to the specification and accepted by all involved parties.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

Should	used to indicate that among several possibilities one is recommended as particularly suitable without mentioning or excluding others, or that a certain course of action is preferred but not necessarily required.
May	used to indicate a course of action permissible within the limits of the specification.
Can	used for statements of possibility and capability, whether material, physical or casual.
"he", "him", "his"	are used in relation to CONTRACTOR.
"it", "its"	are used in relation to COMPANY.

4. Abbreviations

Acronyms / Abbreviations	Description
E&I	Electrical & Instrumentation
ESD	Emergency Shut Down
FAT	Factory Acceptance Test
FH	Fixed-bed Filter
HSE	Health, Safety, & Environment
ITR	Inspection & Test Record
IP	Interlock Process
IS	Interlock Safety
LC	Locked Closed
LO	Locked Open

5. N2 Distribution Panel Service Test

Prior to perform the flushing of the Electrolyser with pure water, the N2 Panel must be operational for purging purposes. The presence of oxygen can affect the efficiency of the flushing required prior to Unit Start-Up.

Steps	Description	Completed By	Witnessed By	Date
01	Ensure Mechanical Completion for N2 sub-system scope described in ELOGEN P&IDs has been completed. ; PID en rev 8 ;	MLE		11/03/25
02	Check that Pre-Commissioning for N2 Distribution has been completed by the CONTRACTOR. The Loop Test ITRs are available for review in ELOGEN supervision on the following items:	X OK par MLE.		11/03/25.

Document PID en rev 9.

	- MV-921 set for 11.7 m3/h at FI-920 Ensure also the pressure is not increasing in the whole unit.	FMO	NGT	14/03
11	Leave MV-901 & MV-921 on this position, record the % of valve opening for any resetting purposes that happen in the future. Close PV-901 & PV-921.	FMO	NGT	14/03

6. Hydrogen Purification Package

The HPU Start-Up is achieved during the Unit Start-Up. Prior to that, some tests and checks are required as per Vendor documentation. Vendor's documentation gives the following steps to be carried out. For more information about the HPU refers to Aquagas documentation DEDR 500/36: Installation, Commissioning, Operation and Maintenance Manual. All LOTO tasks must be performed through CONTRACTOR Procedure.

The Construction & Pre-Commissioning have been done and all ITRs signed off, proceed to the following additional crosschecking if necessary:

- DEDR is properly installed as per above recommendations.
- Check the DEDR sequence by manual operation of the solenoid valves.
- Check the valve limit switches.
- Check that all valves are in the correct position.
- Check that all Hy-Lok connections have the correct torque (green markings are aligned).
- Check the set points of temperature transmitters and temperature switches.
- Check the positioner of valve of flow regulating valve 64-V6.
- Check cooling water flow, temperature, and pressure.
- Check instrument air or nitrogen flow and pressure.
- Check that valves 61-V2, 64-V15 and 64-V16 are open. Put a lock (not included) on them.
- Gross Leak test have been completed during the Pre-Commissioning and a Leak Test at operating pressure will be performed prior to Start-Up: If leakage with a Hylok coupling, retighten until maximum finger tight + ¼ turn with spanner and green markings are aligned. Use Hylok gap inspection tool for checking the torque, if available. Do not over torque!

Once all Pre-Commissioning crosschecking is done, proceed with the Simulation Tests among all simulation tests to be performed in section 6. Fill the corresponding point to the HPU Simulations Tests in section 6.1.

- Without pressure on the system, shut-off fuses for regeneration heater (all fuses except control voltage). Once all signals connected, use the HMI/PLC to step through all sequences, with extra attention to the supplied Control Logic description, to secure that the wiring is correct, and the sequences are working OK without any alarms. Pay extra attention to valves that might open and create a high-pressure peak : 64-V4.1, 64-V4.2, 64-V4.3, 64-V4.4, 64-V5, 64-V6, 64-V7.
  If anything is abnormal, please contact AQUAGAS for advice.

7. Cause & Effect Matrix

The method statement is described in the document C063-ELO-PRO-CO-0002 - BLPH Electrolyser CSU Method Statement at the chapter “6.6.9 Cause & Effect Matrix”.
The following two tables in the two next pages give all triggered effects to observe following the causes activation. IP is for Interlock Process and IS for Interlock Safety.
The table given after are all the triggered causes to activate for the test.

8. Simulation Tests

This section is performed straight after the Basic Function Testing described in the document C063-ELO-PRO-CO-0003 - BLPH Electrolyser Pre-Commissioning Manual. In this section, all complex loops and functional sequences are tested with simulated inputs to validate their correct implementation and physical actions.

8.1 Control Loop & Basic Sequences

The method statement is described in the document C063-ELO-PRO-CO-0002 - BLPH Electrolyser CSU Method Statement at the chapter “6.6.7 Multi Loop or Complex Loop Item”. All functions referring to the HVAC System referred here are tested through HVAC SAT Procedure (See C63-PAU-SAT-001).

9. Flushing, N2 Purging & Leak Test

Once all simulation tests of process and safety loops and sequences have been tested, the pre-start-up activities can take place. The first operation to take place is the flushing. This following chapter provides material list, conditions and detailed method statement for a safe and efficient flushing of both Water/H2 Loop and Water/O2 prior to the unit start-up. The goal is to reach the necessary conductivity specification to ensure a successful unit start-up and to protect the stacks integrity. During this flushing operation, Nitrogen purging is done because the presence of ambient air can affect the conductivity. Also, the first final Leak test is performed without the stacks and then with the stacks connected only in dynamic.

This specific flushing activity is not a classic flushing activity taking place during the end of construction activities. Indeed, mechanical equipment cleaning and piping cleaning by blowing or flushing have been performed prior to the Mechanical Completion. This operation is a commissioning activity due to the livening up of 56-03 WTP System and both 600 and 620 loops included in 25-11 sub-system.

9.1 Conditions

The flushing can be performed when the mechanical completion certificate for the subsystem has been signed by all parties and after the Pre-Commissioning activities:

- The piping has been tested, cleaned, dried and is free of rust before the instruments and valves are fitted.
- The equipments have been cleaned and permanently closed.
- The reinstatement as per P&ID is completed with all piping, equipment, valves and instruments installed and oriented in the correct direction.
- The equipment, valves and instruments have been visually checked and are free of any damage.
- All Punchlist that does not require the system to be reopened are cleared.
- 25-11 Subsystem Mechanical Completion Certificate has been signed.
- The Gross Leak Test has been performed and forms signed by all parties.
- Vent lines are operational.
- Electrical cabinet / Control System is operational (tested and energized).
- Stacks bypasses are installed.
- Valves & Instruments Loop Testing on the systems has been completed; All valves & instruments are operational.
- Alarms & Trips (Process & Safety Interlocks) relevant to the systems have been tested.
- Pump CP-600A / CP-600B / CP-620A / CP-620B are ready for Start-Up.
- 56-03 Subsystem WTP is operational with feed water availability and pumps LP300A/B ready for start-up.
- If there is no feed water, provide IBC tank of water.
- Nitrogen Purging is operational.
- The system 25-11 is pressurized with around 200 mbarg of positive pressure with Nitrogen.
- A Nitrogen Purging shall be achieved in case the system is not preserved with Nitrogen.
- Select maintenance mode on the HMI.
- All necessary tools for the operation are available.
- All relevant documentation is available in the latest revision.

9.2 Safety

These defining rules shall be applied from the initial (total or partial) energizing of the instrumented systems, until the end of the commissioning activities.

- Appropriate PPE must be always worn during the operation.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- A permit to work has been delivered.
- No equipment will be definitively energized without the subsystem Mechanical Completion.
- The piping under pressure is clearly identified

Safety rules in accordance with the risk must be applied (e.g. Fluids, Pressure, Electrical Power, etc.).
Risk assessment must be done prior to any test activity.

9.3 Prerequisites

9.3.1 Required Equipments

- Toolboxes: screwdrivers, spanners, pliers, wrenches, pipe wrenches…
- Portable Conductivity meter
- Portable O2 meter
- Flexible for Stack Bypass
- Field telephone or Walkie-Talkie
- Empty IBC Tank (to route the used water from flushing)
- If water is not available: IBC tank of soft water.
- Spare gasket for F-600 and F-620.
- N2/H2 bottle rack mix for Leak Test.

All equipment used must have a serial number and a valid calibration certificate (if applicable).
Soft water quantity and specifications must be as followed:

- For the first fill-in: 2m3
- For the flushing: between 6 and 14 m3 (depending on pipe condition)

For the type of water, the specifications must be as followed:

- Conductivity: Conductivity <703 µS/cm
- TOC (total organic carbon) <3 mg/l
- SDI (Fouling index) <3
- Free chlorine, Total chlorine <0.5 mg/l
- Average Flow Rate: 0.81m3/h
- Pressure: 4-6 barg
- Temperature: 10-35 °C

9.3.2 Required Documents

- This procedure is approved for use.
- Set of PIDs at the last revision.
- Subsystem Mechanical Completion Certificate including the loop signed by all parties.
- Permit To Work delivered and signed.
- Simulation Tests, Cause & Effects Tests completed. (Chapter 7 & 8 inside this procedure)
- N2 Distribution Test completed. (Chapter 5 inside this procedure)

9.3.3 Manpower (Indicative)

- 1 Elogen Automation Engineer
- 1 Elogen Commissioning Engineer (Responsible for the Operation)
- 1 E&I Supervisor
- 2 Helpers (pipefitter)
- 1 LOTO supervisor

9.4 Flushing Operation of Anode Water Loop / O2 Production

Steps	Description	Completed By	Witnessed By	Date
01	Line Up the valves as per the P&ID Mark Up (See Appendix for Anode Water Loop / O2 Production Flushing P&ID Mark Up): For Water Injection: Check that HV-300, HV-301A, HV-302A, PV-300 are open. Check that the 3ways valve (3WV-320) is open towards the separator tank for the oxygen loop (ST600). Remove the nozzle plate from FH-600. → Non. The system is ready to receive pure water from WTP system. Note: as per the design of WTP, it cannot receive tap water to produce pure water as per its specification. There is no softener in WTP package, so a temporary softener should be used upstream of WTP. RM WTP used. For Venting: Check that HV-615, MPV-611 are open. Check that PV-610 is closed. The system is connected to the O2 Vent during the filling. The system has been inerted with Nitrogen during Nitrogen Service Test. At this stage 8% O2 is acceptable for a good preservation. Check the O2 % at PT-612 vent with a portable O2 meter. → Accès difficile à détecter. Complexité HSE de faire remonter son If O2 is more than 8%, perform a Nitrogen purging by opening PV-900. Also put the following valves in the indicated position: Check that HV-600D, HV-600DA, HV-600DB, HV-601D, HV-602DA, HV-603D, PV-640 are closed. Check that HV-600, HV-600A, HV-600B, HV-601A, HV-601B, HV-602A, HV-603A, HV-604 and HV-605 are open.	Start 13/03 bullage avec Alan de 'sam. MLB		13/03
02	Check the feed water conductivity from WTP measurement. Conductivity measured shall be below 0.1 µS/cm. Record the conductivity value on the Flushing Report.	0,068 µS		13/03

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

03	Start the LP-300A in MANUAL mode. Check that there is no overflow by listening to the pump noise and by checking the pump curve versus the actual pressures (WTP outlet Pressure and PI-300). Fill ST-600 and all piping with water until approximately the middle of tank. ✓ During the filling, verify that the air is vented from all dead volumes as much as possible. If needed open some vent to make sure no air below the water level in the ST-600. Monitor ST-600 level on LT-600 during the filling.	Marque d'eau - 13/03. MLE		13/03
04	Stop LP-300A as soon as the alarm LAH-600 is triggered. ?	MLE		13/03
05	**Start CP-600A at minimum speed** and flush the loop pipes. Check that there is no overflow by listening to the pump noise. If necessary, check the pump curve versus the actual pressures. Slightly close partially the outlet valve HV-603A to create a slight pressure loss if necessary. Check the level on LT-600 at the CP-600A start-up. Fill ST-600 with water when the level will decrease (due to the discharge lines filling near HE-600 heat exchanger). + bump test + 60s for check Marq. eau + 300s for avoid air in pipes.	MLE		13/03
06	Monitor the conductivity on the CT/P-600 during the pipes flushing. Record the initial value on the Flushing Report. Check in F-600 if any dirt has been be collected. The goal is to reach a conductivity below **0.5 µS/cm** at the end of the operation.	MLE		08/04
07	If necessary, perform conductivity measurements at different purge points. Drain slightly a part of the used water through HV-602DA & HV-602DB, route the used water flow to an empty IBC tank and fill slowly with fresh water. Repeat this operation until the required conductivity in the loop is reached ($\sigma < 0.5\mu S/cm$). Once the conductivity is reached, check that the conductivity measurements are stable.	MLE		08/04
08	Proceed to the flushing by switching to **CP-600B.** Once the conductivity is reached ($\sigma < 0.5\mu S/cm$), check that the conductivity measurements are stable. Fill the Flushing Report.	MLE		08/04.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

09	Stop the operation for at least 12h.	MLE		08/04
10	Recheck all conductivity measurements after 12h the ensure σ < 0.5µS/cm. Proceed to a flushing (Steps 05-08) or troubleshooting if the conductivity is not OK.	MLE		08/04.
11	Fill the FH-600 with Resin (check the Resin Filling in section 9.)	MLE		08/04
12	Fill the system with water until conditions described in Step 03 Perform a Nitrogen purging to remove the Oxygen. At this stage 8% O2 is acceptable for a good preservation.	MLE		09/04.
13	Start the pump CP-600A or CP-600B and flush the water loop again with the resin filled in the FH-600. Check in F-600 if any dirt or resin has been collected. If resin is collected, do some troubleshooting at the FH. The goal is to reach a conductivity below **0.1 µS/cm** at the end of the operation. Fill the Flushing Report.	MLE		09/04 -
14	Perform the Leak Test at 90% of PSV Pressure by using the P&ID Mark-Up (Leak Test Pack 01) in Appendix: Pure water is left in place and a mix of N2/H2 is injected till 11.7 barg through HV-902. Follow the methodology explained in the Leak Test chapter in the Method Statement. Do a precise leak check with the H2 sniffer. Fill the Leak Test ITR.	FMO	NG	10/04

9.5 Flushing Operation of Cathode Water Loop / H2 Production

Steps	Description	Completed By	Witnessed By	Date
01	Line Up the valves as per the P&ID Mark Up (See Appendix for Cathode Water Loop / H2 Production Flushing P&ID Mark Up): For Water Injection: Check that HV-300, HV-301B, HV-302B are open. ✓ Check that the 3ways valve (3WV-320) is open towards the separator tank for the hydrogen loop (ST620). ✓ Remove the nozzle plate from FH-620. The system is ready to receive pure water from WTP system. ✓ Note: as per the design of WTP, it cannot receive tap water to produce the pure water as per its specification. There is no softener in WTP package, so a temporary softener should be used upstream of WTP. ✓ For Venting: Check that PV-631, PV-642 are open. ✓ The system is connected to the H2 Vent during the filling. ✓ The system has been inerted with Nitrogen during Nitrogen Service Test. ✓ At this stage 8% O2 is acceptable for a good preservation. ✓ Check the O2 % at PT-632 vent with a portable O2 meter. ✓ If O2 is more than 8%, perform a Nitrogen purging by opening PV-920. ✓ Also put the following valves in the indicated position: Check that HV-620D, HV-620DA, HV-620DB, HV-621D, HV-622D, PV-600, PV-620, PV640, PV-641 are closed. ✓ Check that HV-620, HV-620A, HV-620B, HV-621A, HV-621B, HV-622, HV-623, HV-624, MV-640 are open. ✓	MOUFOUMA N.	PACCETTI	11/03/25
02	Check the feed water conductivity from WTP measurement. Conductivity measured shall be below 0.1 µS/cm. Record the conductivity value on the Flushing Report.	MOUFOUMA N.	PACCETTI	11/03/25

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

03	Start the LP-300B in MANUEL mode. ✓ Check that there is no overflow by listening to the pump noise and by checking the pump curve versus the actual pressures (WTP outlet Pressure and PI-300). ✓ Fill ST-620 and all piping with water until approximately the middle of tank. ✓ During the filling, verify that the air is vented from all dead volumes as much as possible. ✓ If needed open some vent to make sure no air below the water level in the ST-620. ✓ Monitor ST-620 level on LT-620 during the filling. ✓	MOUFOUMA NG	PAOLETTI	11/03/25
04	Stop LP-300B as soon as the alarm LAH-620 is triggered & Close to the vent by closing PV-631. ✓	MOUFOUMA NG	PAOLETTI	11/03/25
05	Start **CP-620A at minimum speed** and flush the loop pipes. ✓ Check that there is no overflow by listening to the pump noise. ✓ If necessary, check the pump curve versus the actual pressures. ✓ Slightly close partially the outlet valves HV-622 to create a slight pressure loss if necessary. ✓ Check the level on LT-620 at the CP-620A start-up. Fill ST-620 with water when the level will decrease. ✓	MOUFOUMA NG	PAOLETTI	11/03/25
06	Monitor the conductivity on the CT/P-620 during the pipes flushing. Record the initial value on the Flushing Report. 3.5µS Check in F-620 if any dirt or resin have been collected. The goal is to reach a conductivity below **0.5 µS/cm** at the end of the operation.	MOUFOUMA NG	PAOLETTI	13/03/25
07	If necessary, perform conductivity measurements at different purge points. Drain slightly a part of the used water through HV-621D, route the used water flow to an empty IBC tank and fill slowly with fresh water. Repeat this operation until the required conductivity in the loop is reached (σ < 0.5µS/cm). Once the conductivity is reached, check that the conductivity measurements are stable.	MOUFOUMA NG	PAOLETTI	04/04/25
08	Proceed to the flushing by switching to **CP-620B.** Once the conductivity is reached (σ < 0.5µS/cm), check that the conductivity measurements are stable. Fill the Flushing Report.	MOUFOUMA NG	PAOLETTI	05/04/25

This document contains confidential information which is the property of ELOGEN.

ELOGEN reserves all of its rights.

09	The next step is to flush the DG-640: Check that PV-642 is open for DG-640 venting purposes. ✓ Check that PRV-640 is fully open. ✓ HV-640D is ready to be used for draining purposes. ✓ Open PV-640 & then open slowly MV-640 to avoid a sudden pressure drop at the CP-620A Pump outlet. ✓ Fill with water when ST-620 level is decreasing excessively during the DG-640 flushing. ✓ The alarm LAL-620 can be used as an indication to top up with water in ST-620. ✓ Overflow at FT-620 can lead to a trip. ✓ Pressurize slightly ST-620 with N2. ✓	FMo	PAOLOTTI	04/04
10	Purge also DG-640 with N2 by opening HV-640, HV-641 then by opening slowly MV-941. While opening MV-941, check that flow doesn't exceed 700 NL/h on FI-940. Once conditions of flushing are stable, close PV-642, HV-640 and ~~HV-641~~ n'existe pas HV-642 Keep MV-941 at the same position for further inerting purposes.	FMo	PAOLOTTI	05/04
11	Monitor the conductivity with a portable conductivity meter on the sampling point HV-640D.	FMo		05/04.
12	Recheck all conductivity measurements after 12h the ensure $\sigma < 0.5\mu S/cm$. Proceed to a flushing (Steps 05-08) or troubleshooting if the conductivity is not OK. Check again in F-620 if any dirt or resin has been collected. Fill the Flushing Report.	FMo		08/04.
13	Fill the FH-620 with Resin (check the Resin Filling in section 9.)	MLE		08/04
14	Fill the system with water until conditions described in Step 03 Perform a Nitrogen purging to remove the Oxygen. At this stage 8% O2 is acceptable for a good preservation.	MLE		08/04
15	Start the pump CP-620A or CP-620B and flush the water loop again with the resin filled in the FH-620. The goal is to reach a conductivity below **0.1 µS/cm** at the end of the operation. Check in F-620 if any dirt or resin has been collected. If resin is collected, do some troubleshooting at the FH. Fill the Flushing Report.	MLE		09/04.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

16	Perform the Leak Test at 90% of PSV Pressure by using the P&ID Mark-Up (Leak Test Pack 02) in Appendix: Purge HPP with H2/N2 by opening MV-632 in the beginning. Pure water is left in place and a mix of N2/H2 is injected till 32.4 barg through HV-922. Follow the methodology explained in the Leak Test chapter in the Method Statement. Do a precise leak check with the H2 sniffer. Fill the Leak Test ITR.	FMO	11/04	11/04 NC

9.6 Flushing with Stacks

Steps	Description	Completed By	Witnessed By	Date
01	Install the Stacks (check the Stack Installation in section 10.)	FMO		14/04
Important Note: At this stage, H2/Water Loop Pressure should remain always higher than O2/Water Loop Pressure at all times.				
02	Perform a Nitrogen purging to remove the Oxygen. At this stage 8% O2 is acceptable for a good preservation.	FMO		14/04
03	Pressurize with N2 the H2/Water Loop with 2 barg and the O2/Water Loop with 200 mbarg. Note: Each Stack sides are permeable to water.	FMO		14/04
04	Start the pumps CP-600A & CP-620A or CP-600B & CP-620B at their normal speed and flush the water loop again with the resin filled in the FH-600 & FH-620 and all the stacks installed. Monitor carefully the pressure. If necessary, inject N2 to H2/Water Loop to keep the pressure higher than O2/Water Loop Pressure. The goal is to reach a conductivity below **0.1 µS/cm in both sides** at the end of the operation. Fill the Flushing Report. Keep the same pressures in both sides systems. Next step is described in chapter 11.	FMO		14/04

10. Resin Installation

This following section gives the requirements and steps for the insertion of the resin in the filters housing FH-600 and FH-620. The acceptance criteria for this activity are the conductivity measurement to be kept under 0.5µS/cm on both loops after the flushing with resin. It ensures a good particles and ions adsorption.

10.1 Pre-requisites

This operation is performed straight after the flushing, therefore the Flushing Report this procedure steps for 7. Flushing has been completed and filled out.

10.1.1 Required Equipments

- Toolboxes: screwdrivers, spanners, pliers, wrenches, pipe wrenches...
- Field telephone or Walkie-Talkie
- 1 clean shovel for Resin loading
- 3 flange gaskets for RS-603A 6" (DN150)
- 3 EPDM gaskets (815ID/875OD) for FH-600
- 3 EPDM gaskets (750ID/810OD) for FH-600
- 3 flange gaskets for FH-600 cover 36"150# (DN900)
- 3 flange gaskets for RS-622 4" (DN100)
- 3 EPDM gaskets (505ID/565OD) for FH-620
- 3 EPDM gaskets (440ID/500OD) for FH-620
- 3 flange gaskets for FH-620 cover 24" 300# (DN600)
- 508 L of IRN160 Amberlite resin
- 158 L of IRN160 Amberlite resin.
- 1 torque wrench (range up to 2700 Nm)
- 1 sling to install the nozzle plate
- Keys for the hand valves padlocks
- Fitting hoses for FH drain valves (HV-602DA and HV-621D)
- Empty IBC Tank (to route the water from FH section)
- 1 Allen key

All equipment used must have a serial number and a valid calibration certificate (if applicable).

10.1.2 Required Documents

- Flushing Procedures
- Filter housing datasheet
- This procedure is approved for use
- Set of PIDs at the last revision
- Subsystem RFC Certificate signed by all parties
- Permit To Work delivered and signed

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

10.1.3 Manpower (Indicative)

- 1 Elogen Commissioning Engineer
- 2 Mechanical Supervisor
- 2 Helpers (pipefitter)
- 1 LOTO supervisor

The resin filling activities are under the responsibility of the Commissioning Engineer.

10.1.4 Duration

The duration of the activities is 1 day per FH.

10.2 Safety

Main risks during the operation are:

- Slippery floor risk
- Chemical Risks (cf. SDS IRN160 amberlite)
- Heavy load

10.3 Resin Filling Operation

The following procedure is for the FH-600. Same steps are applicable to perform the FH-620 filling. The corresponding tags for FH-620 filling are indicated in brackets.

Blue FH600 Red - FH620

Steps	Description	Completed By	Witnessed By	Date
01	Isolate the FH-600 (FH-620): remove the padlocks (if present) from the HV-602A (HV-621A and HV-621B) and HV-603A (HV-622). Close these FH upstream and downstream valves.		MLE/MLE	08/04 08/04
02	Connect a hose to FH-600 (FH-620) section to drain valve HV-602DA (HV-621D).		MLE/MLE	08/04 08/04
03	Remove the padlock from the HV-602DA (HV-621D) (if present).		MLE/MLE	08/04 08/04
03	Then, open the HV-602DA (HV-621D) to drain the FH-600 (FH-620).		MLE/MLE	08/04 08/04
06	Once the water draining is completed, close HV-602DA (HV-621D) and put the padlock at its original place.		MLE/MLE	08/04 08/04
07	To remove the FH cover, unscrew the flanges at both ends of the removable pipe section RS-603A (RS-622) and remove it. Unscrew the bolts of the FH cover on the top. Turn the cover by using the mounting arm.		MLE/MLE Voir plus.	08/04 08/04
08	Prepare the upper nozzle plate by placing it on a clean and flat surface ready to be installed.		MLE/MLE	08/04 08/04

on peut utiliser les tuyaux, à placer sur le côté.

09	Fill the housing with resin: for this, use the shovel. 10 cm to the top.		MLE/MLE	08/04
10	Put the upper nozzle plate at its position and tighten to indicated torque with the torque wrench. Be careful with the EPDM Gasket: it must be installed properly without any damage & proper bolt tightening. Otherwise, that affects the integrity of the resin bed.		MLE/MLE	08/04
11	Replace the original flange gasket of the cover with a new one (if necessary).		MLE/MLE	08/04
12	Put the FH cover on the FH. Screw the cover bolts and tighten to a proper torque using the torque wrench. 600 N.m		MLE/MLE.	08/04
13	Put the removable pipe section RS-603A (RS-622) at its original position.		MLE/MLE.	08/04
14	If necessary, replace the original flange gaskets with a new one.		MLE/MLE	08/04
15	Check that all the drain valves are in their original position like it was before the operation.		MLE/MLE	08/04
16	Open the isolating valves HV-602A (HV-621A and HV-621B) and HV-603A (HV-622).		MLE/MLE	08/04
17	Reinstall all the padlocks on all valves.		NA/NA	08/04
18	Perform several cycles of flushing, until obtaining a compliant conductivity (0.1µS/cm on both loops) by following the procedure steps in the section 8. Check in F-600 & F-620 if any resin has been collected	NO	MLE / FMO	09/04 10/04
19	Clean and tidy up the equipment.	MLE./MLE	MLE. /MLE	15/04 15/04

Tight 09/04 - Tight 09/04.

11. Stack Connection

This following section gives the requirements and steps for the stack's installation.

11.1Pre-requisites

This operation is performed after both loops flushing with resin. At this stage, the stacks are already in place and connected electrically with all its instrumentation. The goal is to connect it mechanically to the unit.

11.1.1 Required Equipments

- Torque wrench
- Valve padlocks
- Flexible for draining
- 32 Gaskets Kempchen DN50 PN40
- 192 screw, nuts M16 lg 90 A4

11.1.2 Required Documents

- This procedure is approved for use
- Set of PIDs at the last revision
- Subsystem RFC Certificate signed by all parties
- Permit To Work delivered and signed

11.1.3 Manpower (Indicative)

- 1 Elogen Commissioning Engineer
- 2 Mechanical Supervisor
- 1 Electrician
- 2 Helpers (pipefitter)
- 1 LOTO supervisor

The stacks connection activities are under the responsibility of the Commissioning Engineer.

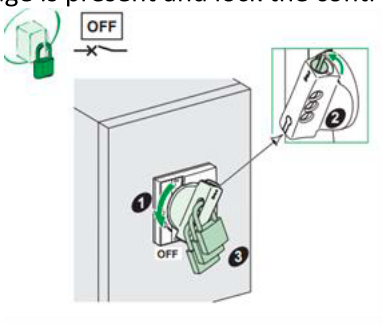
11.1.4 Duration

The duration of the activities is 0.5 to 1 day per Stack.

11.2 Safety

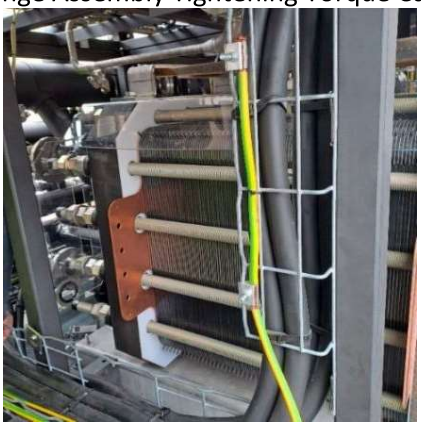
Main risks during the operation are:

- Slippery floor risk
- Electrical Risks
- Mechanical Risks / Heavy load
- Necessary LOTO for electrical and mechanical must be done



11.3 Stack Connection

The 8 stacks required for electrolysis to produce hydrogen are installed in the electrolyser.



This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

All Electrical wiring & Instrumentation are connected
Follow the following Steps to connect the stacks mechanically:

- Check that the unit is stopped via the HMI and switch to maintenance mode.
- Check especially that the pumps CP-600A/B and CP-620A/B are switched off and close 3WV-320 valve.
- Check that the power cables to the stacks are not energized:
    - To isolate the 400Vac, open the circuit-breaker and align the handle with the OFF position.
    - Fit padlocks like in the illustration below.
    - Attach a lockout work card.
    - Check with a VAT that no voltage is present and lock the electrical cabinet.
    - Use a VAT to check that no voltage is present and lock the control cabinet.

- Isolate and drain the stacks section to prepare the installation:
    - Close HV-623, HV-624, HV-604, HV-605
    - Open HV-602D and HV-623D to drain the water
    - Remove the flexible
- If Stacks are preserved with pure water, remove the plugs and drain the water to an IBC tank.
- Place the flexible flanges on the stacks and put protection to preserve them from the outside.
- At this stage E&I Mechanical Completion must be completed (PCA, VM, Ground, EXT, DC Power cables, must all be connected). If not connect them at this step.
- Also, E&I Pre-Commissioning must be completed (PCA, VM, Ground, EXT, DC Power cables, must all be tested). If not, proceed to all tests and fill the relevant ITRs (if any).
- Connect the stacks to the manifold, then tighten to 120 N.m (staggered).
  Caution: Confirm torque value with Flange Assembly Tightening Torque Calculation Note

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- Repeat the previous steps to install stacks 2, 3....
- Protect the bipolar plates of each stack with their dedicated Plexiglas protection panels if not already done.
- Open the stacks' isolation valves once the assembly of the stacks is complete.
- Perform several cycles of flushing, until obtaining a compliant conductivity (0.1µS/cm on both loops) by following the procedure steps in the section 8.6

12. Pre-Start-Up Operations

In this section, a check is made on all Cold Operations that have been performed to make the Unit ready for the Start-Up as described in the following document: C063-ELO-PRO-CO-0005 - BLPH Electrolyser Operational Test Procedure.

- All Simulations Tests have been performed (as per chapter 7.)
- All Causes & Effects Tests have been performed (as per chapter 6.)
- Resin & Stacks are properly installed.
- Nitrogen Purging to 3% O2 have been done.
- Final Flushing below 0.1 µS/cm have been performed.
- All containers and ambient items have been tested.
- Fire & Gas detection is operational.
- HVAC Glycol Loop System is operational. PC&C & Start-Up performed by Vendor.
- Transformers & Rectifiers are not energized.
- H2/Water Loop is pressurized at around 2barg > O2/Water Loop at around 200mbarg.

Not available OTP see

Steps	Description	Completed By	Witnessed By	Date
01	Perform the Final Leak Test at 90% of PSV Pressure by using the P&ID Mark-Up in Appendix: - First Pressurize gradually the Leak Test Pack 02 at 32.4 barg using an N2/H2 mix as per step 16 in chapter 9.5. HPP must be purged with N2/H2 by opening MV-632 at the beginning. - After & Only After: Pressurize the Leak Test Pack 01 at 11.7 barg by keeping the pressure in the Leak Test Pack 02 using an N2/H2 mix as per step 14 in chapter 9.4 Stacks are not waterproof, therefore, there is a natural pressure transfer from the H2/Water loop system to the O2/Water loop system. Do only a precise leak check in dynamic with the H2 sniffer: pressure holding for 1h is not applicable. Inject N2/H2 into H2/Water side if needed to hold the pressure. Vent N2/H2 from O2/Water side if the pressure increases. Fill the Leak Test ITR & Hold the pressure for the next step.			
02	Set the N2 pressure at 30 barg at H2/Water Loop side and 11 barg at O2/Water Loop side then from its closed position, open the following manual valves: - MV-631: 6.8 turns - MV-632: 6.8 turns - MV-642: 0.8 turns - FICV-610A/B/C: To be set at 60 NL/h and Low Flow Alarm to be set at 40 NL/h same time as FICV-611			

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

	- FICV-611: To be set at 660 NL/h - FICV-800: To be set at 60 NL/h with and High Flow Alarm to be set at 469 NL/h and Low Flow Alarm to be set at 40NL/h - FSH-640: Alarm to be set at 6m3/h with water - MV-640: To be set at 3m3/h using FSH-640			
03	Line-Up the valves as per normal operation. Start-Up the Unit with Transformers & Rectifiers Off. Check that all Utilities have been started up as per the expected sequence. Check that both Water loops (H2 & O2) are working together.			
04	Check that the unit is less than 3% O2 ready for Start-Up and H2 Production. HPP will be purged by H2/N2 coming from the ST-620 once H2 will start to be produced. If necessary, purge very slowly in a control manner to remove the O2 from the unit by opening slightly PV-630 and injecting N2 by opening slightly PV-900. Always monitor carefully that the pressure in H2/Water Loop side remains always higher than O2/Water Loop side.			
05	Once the Unit is considered ready for Start-Up, a PSSR meeting is organized to review all conditions to sign the RFO certificate.

1	08/02/2023	LSH	LCS	BCA	FIRST ISSUE

NOTES :
NOTE 1 : TO CONTAINER DRIP PAN
NOTE 2 : COUNTER-CURRENT INSTALLATION
NOTE 3 : CLOSEST TO AHD
NOTE 4 : HIGHEST POINT
NOTE 5 : DESIGNED FOR PSV-640
NOTE 6 : AWAITING 3D DEFINITION
NOTE 7 : USED FOR FILLING DURING START-UP
NOTE 8 : HYDRAULIC GUARD HEIGHT = 600MM. LSLL AND LSL DISTANCE = 200MM. LSL AND LSH DISTANCE = 400MM.
NOTE 9 : SEE PTN-002 FOR ALL THE CONNECTION LOCATION ON HYDROGEN VENT.
NOTE 10 : FOR ATEX PURPOSE, ROSETTI VALVE MV-002 WAS ADDED BEFORE TIE-IN POINT C AND INSIDE THE A10 CONTAINER.

Closed Valve

GENERAL NOTES :
- FOR ALL PACKAGES, REFER TO THE SUPPLIER P&ID FOR COMPLETE INFORMATION
- FOR EACH SLO REFERENCE PLEASE REFER TO C63-PUY-001
- DRAIN VALVES TO BE INSTALLED AT LOWEST POINTS
- ALL EQUIPMENTS AND PIPING OUTSIDE CONTAINERS ARE HEATED USING HEATING RIBBONS

NOTES :
NOTE 1 : BRITISH STANDARD PIPE PARALLEL (TO INSTALL BETWEEN FLANGES)
NOTE 2 : COMMISSIONING AND INITIAL START-UP
NOTE 3 : ACCESSIBLE FOR MAINTENANCE
NOTE 4 : DISSIMILAR TECHNOLOGY BETWEEN THE TWO CHECK VALVES/ CHECK VALVE SHALL MEET CLASS 1 REQUIREMENT
NOTE 5 : DISTANCE OF 5*D REQUIRED UPSTREAM AND DOWNSTREAM OF THE EQUIPEMENT
NOTE 6 : REMOVABLE LINE, USED ONLY FOR MAINTENANCE
NOTE 7 : REFER TO WATER TREATMENT PACKAGE DOCUMENTATION FROM OVIVO FOR COMPLETE P&ID - P&ID N° (90767001_02)
NOTE 8 : PACKAGE TO BE SUPPLIED BY ELOGEN
NOTE 9 : SECTION OUTSIDE CONTAINER SHALL BE INSULATED (X00 zone)

REVISION LIST

REV.	DESCRIPTION
003	*General update as per PID and HAZOP recommendations*
004	*General update*
005	General update according to CRS rev. 04
006	Update following Software implementation to have matching between Software and C&E (and software programming constraints) Adding IS7 following request from customer to separate Gas alarm from Fire Alarm. Gas Alarm will trigger a distinct alarm at Customer side, IS7 will be triggered by AHD-1000, 1001, 1002, 1003, 1004

Bonjour vous venez d'ouvrir la Cause and Effect
Ce document liste les interlocks process et safety
Vous retrouverez les différentes séquences ou actions singulières qui existent dans l'anlayse fonctionnelle
Les codes des séquences sont associés ensuite avec ceux présents dans la table d'alarme, on peut ainsi déterminer quels sont les initiateurs
Le document associé est le CXX - PWI-003- Alarm list

Hello, you just opened the Cause and Effect
This document makes the list of interlocks process and safety
You will find the different sequences or singular actions existing in the functional analysis
The codes of sequences are associated with the one present in the alarm table, then it is possible to determine the initiating cause
The document associated is CXX - PWI-003- Alarm list

INTRODUCTION

This document is the **CAUSE & EFFECT Checklist** of the PLC quoted here below - Please refer to the corresponding item in the "Network Equipement List" for further information about the concerned PLC.

The **CAUSE & EFFECT Checklist** is based on a frozen version of the **CAUSE & EFFECT** - This version number is registered here below.
This document, based on the CAUSE & EFFECT, is used as a checklist to support testing of the effects of alarms during the COLD and HOT commissioning phases.
It is constantly updated throughout the commissioning phases to track the progress of each effects of alarms. It then provides an overview of the progress and overall completion of alarmes cause and effect tests.

DESCRIPTION OF TEST CONDITIONS

PLC CONCERNED

TAG	C63 CPU 1
ITEM	SIEMENS SIMATIC S7-1500F CPU 1516F-3 PN/DP
DESCRIPTION	6ES7516-3FN01-0AB0

REFERENCE DOCUMENTS

CAUSE & EFFECT

FILE NAME	C63-PWI-002_04 - Cause and effect
REVISION	6
DATE	21/03/2025
COMMENTS	6th Issuance (Ph2) - IFC

CAUSE & EFFECT OVERVIEW 19%

CAUSE & EFFECT INTERLOCK	47
NOT TESTED	8
SPARE	0
Partially OK	30
OK	9
% of USED validated	19%

LEGEND

DATE	**Date** when the related Process Block has been tested
STATUS	**Status** of the related Process Block in regards to the Cold and Hot commissioning - Meaning of each status is described below :
NOT TESTED	The Process Block is ready to be tested but has not been tested yet
SPARE	The Process Block is just a spare (it not used in the programme) - then it does not need to be tested
Partially OK	the test is validated with reserve it must be retested later
OK	The Process Block has been tested and is properly working
COMMENTS	**Open comments** about the Process Block, where/when required

PLC ALARMS CHECK

Project Name :	C63 - SHELL	**Version :**	2
Location :	Italie	**Date :**	24/01/2025
		Document code :	C63-PWI-03-Alarm List

REVISION HISTORY

VERSION	DATE	AUTHOR	COMMENTS
2	**24/01/2025**	**SDE**	**MAJ Process**
1	11/01/2025	SDE	Creation

INTRODUCTION

This document is the **PLC ALARMS CHECK LIST** of the PLC quoted here below - Please refer to the corresponding item in the "Network Equipement List" for further information about the concerned PLC.

The **PLC ALARMS CHECK** LIST is based on a frozen version of the PLC Alarm List - This version number is registered here below.
This document, based on the PLC Alarm List, is used as a Checklist and allows to support the follow-up of **PLC Alarms Tests** during FAT & Commissioning/SAT phases.
It is constanly updated along the FAT/SAT Phases to track the progress throught the status of each Alarms - It then gives an **overview of the progress** and global completion of the PLC Alarms List Tested.

DESCRIPTION OF TEST CONDITIONS

PLC CONCERNED

TAG	C63 CPU 1
ITEM	SIEMENS SIMATIC S7-1500F CPU 1516F-3 PN/DP
DESCRIPTION	6ES7516-3FN01-0AB0

ALARMS CHECK OVERVIEW

	Alarm
NOT READY	118
NOT TESTED	0
FAULTY	19
SPARE	0
Partially OK	0
OK	317

DATE	15/01/2025	DATE	24/01/2025
COMMENTS	Issued For Construction	COMMENTS	MAJ Process

LEGEND

DATE	**Date** when the related IO has been tested
STATUS	**Status** of the related IO in regards to the FAT/SAT Tests - Meaning of each status is described below :
NOT READY	Alarm is not ready to be tested ("Equipement not electrically connected" as exemple)
NOT TESTED	Alarm is ready to be tested but has not been tested yet
FAULTY	Alarm has been tested but is faulty - a description of the reason why it is considered as faulty MUST be detailed in the column "COMMENTS"
SPARE	Alarm is just a spare (ie : nothing connected to it) - then it does not need to be tested
OK	Alarm has been tested and is properly working
COMMENTS	**Open comments** about the related Alarm, where/when required

PLC Alarms Check List

(N.B: If this TEMPLATE/Document is used only to create/complement the PLC Alarms Check List and the sections Alarms Trees Checklist (green) is not required at this stage, simply "hide" the green sections or collapse it as well as the Sim S/W).

CONSTANT PARAMETERS TABLE

	Parameter	Value	Unit	Type	Application	Process meaning	Function	Remarks / Tuned values after commissioning
1	**Cells_Number**	106	[-]	INT	Not accessible	Number of cells per stack.	Rectifer setting current	
2	**COUNTER_CP600**	3	[-]	INT	Accessible IHM	The number of attempts to start the **CP-600** pump before triggering the AQA-600 alarm.	Start circulation pump	
3	**COUNTER_CP620**	3	[-]	INT	Accessible IHM	The number of attempts to start the **CP-620** pump before triggering the AQA-620 alarm.	Start circulation pump	
4	**Cycle_PH2**	31	barg	INT	Accessible IHM	Each time the pressure in **ST-620** reaches Cycle_PH2, a counter is incremented in order to consider the stress on the **ST-620**.	Pressure cycle counter	
5	**Cycle_PO2**	11	barg	INT	Accessible IHM	Each time the pressure in **ST-600** reaches Cycle_PO2, a counter is incremented in order to consider the stress on the **ST-600**.	Pressure cycle counter	
6	**Cycle_T**	65	°C	INT	Accessible IHM	Each time the temperature after stacks reaches Cycle_T, an counter is incremented in order to consider the stress on the **ST-600** and **ST-620**.	Temperature cycle counter	
7	**dP_H**	21	barg	FLOAT	Accessible IHM	During depressurisation, it is possible to reach high pressure differential. To avoid triggering the PDAH-001 (and PDAHH-001) alarm improperly, the threshold dP_H is added to reduce the ΔP when needed. First alarm at 21,5 barg	O2 Depresurisation H2 Depresurisation	
8	**dP_min_balance** or **PT630_min_balance**	11	barg	FLOAT	Accessible IHM	Above dP_min_balance, the balancing line become operational. Before, in order to avoid a reverse dP during start_up, the balancing is not authorized. Pressure reducing valve (PRV-640) being passing in reverse flow. Balancing line shall be kept closed while Oxygen loop is not pressurise as a reverse flow from DG-640 could happen and lead to trip with HIOD Remark: by setting dP_min_balance higher, we will delay the first	ST-620 Water Level Control (Direct Balancing)	
9	**DP_reg_arret**	0	barg	FLOAT	Accessible IHM	In STOP state, there is no pressure differential as the machine is depolarised and depressurised.	O2 Depresurisation H2 Depresurisation	
10	**DP_reg_prod_H2**	20	barg	FLOAT	Accessible IHM	During production, a pressure differential needs to be maintain between the anodic and the cathodic side. This help to maintain sealing on large stack.	Delta pressure H_2/O_2 control (START)	
11	**DP_reg_standby**	2	barg	FLOAT	Accessible IHM	In STANDBY press. state the H_2 pressure is lowered but a pressure differencial is still maintained to avoid H_2/O_2 mix.	Delta pressure H_2/O_2 control (STANDBY)	

	Parameter	Value	Unit	Type	Application	Process meaning	Function	Remarks / Tuned values after commissioning
12	**EpsPol**	0.05	[-]	FLOAT	Accessible IHM	The voltage regulation can be not precise. An epsilon is added in order to prevent the code to be interrrupted.	Rectifier setting current Stack polarization Rectifier: setting current Stop rectifier (decreasing current) Rectifier going to Standby from Start (decreasing current)	
13	**I_maxCS**	423	A	FLOAT	Accessible IHM	During a cold start (i.e. water is below 50°C), the stacks are controlled very carefully to avoid degrading them. That is why the intensity through the stacks must not exceed I_maxCS.	Rectifier: setting current	
14	**I_POL**	20	A	INT	Accessible IHM	Max capacitive current allowed to load the electrolysis stack.	Oxygen pump setpoint control Hydrogen pump setpoint control Hydrogen heating before deoxo Air extraction and ambient temperature control loop Stack polarisation Rectifier going to STANDBY from START (decreasing current) IDLE in progress (from START) STANDBY in progress (from STOP) STANDBY in progress (from START) IDLE in progress (from STOP)	
15	**I_PURIFICATION**	0	A	FLOAT	Accessible IHM	The electrolyser needs to warranty that the correct flowrate is produced and injected to the client. The electrolyser needs to overproduce the compensate the H_2 flowrate lost by the regeneration flow of the **HPP-700**. I_PURIFICATION corresponds to the additional current needed to produce the H_2 flowrate which will be vented.	Rectifier setting current	
16	**INERTING_H2_DEPRESS**	86400	s	INT	Accessible IHM	When electrolyser is depressurised, ambient air can enter the piping. To avoid this, a regular inerting must be done every INERTING_H2_DEPRESS.	Regular inerting aigainst air ingress	
17	**INERTING_O2_DEPRESS**	2160	s	INT	Accessible IHM	When electrolyser is depressurised, ambient air can enter the piping and create an explosive mixture if some hydrogen is also present. To avoid this, a regular inerting must be done every INERTING_O2_DEPRESS.	Regular inerting aigainst air ingress	
18	**INERTING_TIME_SAFETY_H2**	1760	s	INT	Accessible IHM	During a safety stop, the hydrogen side of the unit is flushed for INERTING_TIME_SAFETY_H2. It corresponds to the inerting time required for the given nitrogen flowrate to reduce hydrogen concentration from 100%vol to 1%vol.	H2 line inerting	

	Parameter	Value	Unit	Type	Application	Process meaning	Function	Remarks / Tuned values after commissioning
19	**INERTING_TIME_SAFETY_O2**	196	s	INT	Accessible IHM	During a safety stop, the oxygen side of the unit is flushed for INERTING_TIME_SAFETY_O2. It corresponds to the inerting time required for the given nitrogen flowrate to reduce hydrogen concentration from 4%vol to 1%vol.	O2 line inerting	
20	**INERTING_TIME_START_H2**	119	s	INT	Accessible IHM	During a start-up, the hydrogen side of the unit is flushed for INERTING_TIME_START_H2. It corresponds to the inerting time required for the given nitrogen flowrate to reduce hydrogen concentration from 2%vol to 1%vol.	H2 line inerting	
21	**INERTING_TIME_START_O2**	33.8	s	INT	Accessible IHM	During a start-up, the unit is flushed for INERTING_TIME_START_O2. It corresponds to the inerting time required for the given nitrogen flowrate to reduce hydrogen concentration from 2%vol to 1%vol.	O2 line inerting	
22	**INERTING_TIME_STOP_H2**	600	s	INT	Accessible IHM	During a stop, the unit is flushed for INERTING_TIME_STOP_H2. It corresponds to the inerting time required for the given nitrogen flowrate to reduce hydrogen concentration from 2%vol to 1%vol.	H2 line inerting	
23	**INERTING_TIME_STOP_O2**	130	s	INT	Accessible IHM	During a stop, the unit is flushed for INERTING_TIME_STOP_O2. It corresponds to the inerting time required for the given nitrogen flowrate to reduce hydrogen concentration from 2%vol to 1%vol.	O2 line inerting	
24	**K_LM**	2391.5	[-]	FLOAT	Not accessible	Constant defined to convert Nm^3 to Amp.	Rectifier setting current	
25	**LOG_OUT_TIME**	3600	s	INT	Accessible IHM	Log out time on HMI in Maintenance Mode. Maintenance operators will need to press anything on the HMI every LOG_OUT_TIME to prevent logging out. Otherwise, the machine goes automatically in STOP state.	MAINTENANCE in progress (from STOP and NO MODE)	
26	**MinFlow600**	54.222	m^3/h	INT	Accessible IHM	The minimum flow in 600 loop needed to be sure that CP-600 pump have started.	Start circulation pump	
27	**MinFlow620**	28.71	m^3/h	INT	Accessible IHM	The minimum flow in 620 loop needed to be sure that CP-620 pump have started.	Start circulation pump	

	Parameter	Value	Unit	Type	Application	Process meaning	Function	Remarks / Tuned values after commissioning
28	**N1_MAX_CURRENT**	1410	A	INT	Accessible IHM	The electrolyser is sized to handle a certain amount of hydrogen flowrate. Thus, it cannot exceed a certain current. N1_MAX_CURRENT is the maximal current that can deliver each rectifier which operate independtly each train of stacks.	Rectifier setting current Rectifier : setting current	
29	**N1_MIN_CURRENT**	141	A	INT	Accessible IHM	The electrolyser cannot run below 10% of its nominal rated power. Else there is a potential risk of cross permetation (HIOD value will increase) and the electrolyser will not operate safely. N1_MIN_CURRENT is the minimal current that can deliver each rectifier which operate independtly each train of stacks.	Rectifier setting current Rectifier going to Standby from Start (decreasing current)	
30	**nb_stacks_serie**	4	[-]	INT	Not accessible	Number of stack per train of stacks (and so supplied by the same rectifier).	Stack polarization Rectifier: setting current Rectifier going to Standby from Start (decreasing current)	
31	**POLARIZATION_TIME**	600	s	INT	Accessible IHM	If the stack polarization lasts more than POLARIZATION_TIME, it reveals a problem and the VPA-00x alarm is triggered.	Stack polarization	
32	**PT610_DEPRESSURISED**	0.15	barg	FLOAT	Accessible IHM	In order to validate that the unit is depressurised, it is not possible to wait the electrolyser to reach 0 barg it will take age. At PT610_DEPRESSURIZED, it is considered that the unit is depressurised. PT610_DEPRESSURIZED is a little bit lower than PT630_DEPRESSURISED to avoid a reverse dP.	O2 Depressurisation O2 safety depressurisation H2 Depressurisation O2 line inerting Automatic filling of ST-600	
33	**PT611_DEPRESSURISED**	0.15	barg	FLOAT	Accessible IHM	During a Safety Stop, the O2 side is depressurised through the restriction orifice **RO-610** which creates a counter pressure. So, it is considered that the unit is depressurised at PT611_DEPRESSURIZED in case of depressurisation through **RO-610.**	O2 safety depresurisation	

	Parameter	Value	Unit	Type	Application	Process meaning	Function	Remarks / Tuned values after commissioning
34	**PT630_DEPRESSURISED**	0.15	barg	FLOAT	Accessible IHM	In order to validate that the unit is depressurised, it is not possible to wait the electrolyser to reach 0 barg it will take age. At 0,5 barg, it is considered that the unit is depressurised. Due to Rosetti backpresssure additionnal backpressure of 0,15 barg	O2 Depressurisation H2 Depressurisation H2 safety depressurisation H2 line inerting Automatic filling of ST-620	
35	**PT631_DEPRESSURISED**	0.15	barg	FLOAT	Accessible IHM	During a Safety Stop, the H2 side is depressurised through the restriction orifice **RO-630** which creates a counter pressure. So, it is considered that the unit is depressurised at PT631_DEPRESSURIZED in case of depressurisation through **RO-630.**	H2 safety depresurisation	
36	**Rectifier_efficiency**	0.97	[-]	FLOAT	Not accessible	Efficiency of the rectifier (or pair of rectifiers). It is supposed to be the same for all the rectifiers of the same project.	Rectifier setting current	
37	**Rectifier_Number**	2	[-]	INT	Not accessible	Number of rectifiers (or pair of rectifiers) that operate a train of stacks (i.e. nb_stack_serie stacks) independently.	Rectifier setting current Stop rectifiers (decreasing current)	
38	**Rectifier_Number_Stacks**	1	[-]	INT	Not accessible	Number of rectifiers that operate each train of stacks.		
39	**REGENERATION_FLOW**	NA	Nm^3/h	FLOAT	Not accessible	When H_2 purication unit (**HPU-700**) can stop only if regeneration is finished (typically *Sertronic*), the electrolyser must produce at least REGENERTION_FLOW of H_2 to allow **HPU-700** to properly finish its sequence.	STOP in progress (from START/STANDBY/IDLE)	
40	**T_BETWEEN_INERTING**	1800	s	INT	Accessible IHM	If a nitrogen inerting has been done in the last T_BETWEEN_INERTING no inerting is done when the machine goes in START state. Saving nitrogen (as the unit is still safe) is the objective.	H2 line inerting	
41	**T_DEPOLARIZATION**	600	s	INT	Accessible IHM	If the stack depolarization lasts more than T_DEPOLARIZATION, it reveals a problem and the VCA-00x alarm is triggered.	Stop rectifier (decreasing current)	

	Parameter	Value	Unit	Type	Application	Process meaning	Function	Remarks / Tuned values after commissioning
42	**T_DEPRESS_H2**	1200	s	INT	Accessible IHM	If the depressurisation exceed T_DEPRESS_H2 (valve block or other) the safety depressurisation (S-SPC-630 function) is started.	H2 Depressurisation	
43	**T_DEPRESS_O2**	1200	s	INT	Accessible IHM	If the depressurisation exceed T_DEPRESS_O2 (valve block or other) the safety depressurisation (S-SPC-610 function) is started.	O2 Depressurisation	
44	**T_DEPRESS_SAFETY_H2**	2400	s	INT	Not accessible	If the safety depressurisation exceed T_DEPRESS_SAFETY_H2 (valve block or other) the PDAH-630 alarm is triggered. Normally should be around 15 min to depressurise.	H2 Safety depressurisation	
45	**T_DEPRESS_SAFETY_O2**	2400	s	INT	Not accessible	If the safety depressurisation exceed T_DEPRESS_SAFETY_O2 (valve block or other) the PDAH-610 alarm is triggered. Normally should be around 15 min to depressurise.	O2 Safety depressurisation	
46	**T_EVENTAGE**	338	s	INT	Accessible IHM	Hydrogen is vented during T_EVENTAGE at starting in order to remove the nitrogen remaining inside the vessels.	H2 Quality control	
47	**Timer_before_checking**	5	s	INT	Accessible IHM	If the flowrate of the pump remains steady above a minimal value for T1_END time. The pump starting is considered as ok	Start circulation pump	
48	**T3_END**	20	s	INT	Accessible IHM	An attempt to start circulation pumps last about T3_END.	Start circulation pump	

	Parameter	Value	Unit	Type	Application	Process meaning	Function	Remarks / Tuned values after commissioning
49	**Timer_of_work**	86400	s	INT	Accessible IHM	In case of redounded pumps, with pump A on normal operation and pump B the spare pump shut-off, once timer Timer_of_work ends pump A is shut-off while pump B is started.	Start circulation pump	
50	**TIMER_RCG_H2**	86400	s	INT	Accessible IHM	In STOP and IDLE states (where pumps do not run), water in 600 and 620 loops needs to circulate every TIMER_RCG_H2 through ion exchange resins to prevent polution due to stagnation.	Pure Water Recirculation (cathodic loop)	
51	**TIMER_RCG_O2**	86400	s	INT	Accessible IHM	In STOP and IDLE states (where pumps do not run), water in 600 and 620 loops needs to circulate every TIMER_RCG_O2 through ion exchange resins to prevent polution due to stagnation.	Pure Water Recirculation (anodic loop)	
52	**TIMER_RECIRCULATION_H2**	447	s	INT	Accessible IHM	In STOP and IDLE states (where pumps do not run), water in 600 loop needs to circulate every TIMER_RCG_H2 and during TIMER RECIRCULATION_H2 through ion exchange resins to prevent polution due to stagnation.	Pure Water Recirculation (cathodic loop)	

	Parameter	Value	Unit	Type	Application	Process meaning	Function	Remarks / Tuned values after commissioning
53	**TIMER_RECIRCULATION_O2**	472	s	INT	Accessible IHM	In STOP and IDLE states (where pumps do not run), water in 600 loop needs to circulate every **TIMER_RCG_O2** and during **TIMER RECIRCULATION_O2** through ion exchange resins to prevent polution due to stagnation.	Pure Water Recirculation (cathodic loop)	
54	**TIMER_SAFETY**	600	s	INT	Accessible IHM	During a Safety fault, if **AHD-100x** still detects hydrogen in the ambient after TIMER_SAFETY, a message is displayed to indicate that the location is hazardous.	SAFETY in progress (from ALL STATES)	
55	**TIMER_STANDBY**	3600	s	INT	Accessible IHM	The STANDBY press. state lasts at most **TIMER_STANDBY**. (Nota: STANDBY depress. and IDLE states are not limited in time as the machine is depressurised)	STANDBY in progress (from STOP) STANDBY in progress (from IDLE) STANDBY in progress (from START)	

	Parameter	Value	Unit	Type	Application	Process meaning	Function	Remarks / Tuned values after commissioning
56	**U_pol**	132.5	V	INT	Accessible IHM	U_pol is the voltage needed at the terminal of the stack to polarise the electrolysis stack. Above U_pol the stack is polarized that it means it consumes current to produce hydrogen.	Rectifier setting current Stack polarization Stop rectifier (decreasing current) Rectifier going to Standby from Start (decreasing current)	
57	**U_setCS**	763.2	V	FLOAT	Accessible IHM	During a cold start (i.e. water is below 50°C), the stacks are controlled very carefully to avoid degrading them. That is why the stack voltage must not exceed U_setCS.	Rectifier: setting current

2. Introduction

This main subject of the SOFTWARE FAT is to prove the good conception of the program. The SOFTWARE FAT has been performed by ELOGEN site representatives and witnessed by the final customer CWD representatives in reference to C063-ELO-QIX-AU-001_B_IFC – UCP FAT PROCEDURE Part 7 and Part 9.

The C063-ELO-QIX-AU-001_B_IFC – UCP FAT PROCEDURE include both FAT of the SOFTWARE and FAT of the Packages communication with UCP.

The aim of the SOFTWARE FAT is to validate the good conception of the program, hence only refer to Part 7 and Part 9 of the C063-ELO-QIX-AU-001_B_IFC – UCP FAT PROCEDURE.

Note: Part 6 of the C063-ELO-QIX-AU-001_B_IFC – UCP FAT PROCEDURE has been performed too and allows to anticipate the future oncoming complete UCP FAT. The report of theses anticipated tests is attached in appendix of the SOFTWARE FAT.

3. Alarms test

PART 7: Perform a test for each alarm of the UCP:

- Simulate a variation in the relevant variable furthest from the fault generation bloc to trigger the alarm at the expected value. If possible, simulate this triggering by using a 4-20mA injector
- Fill in the table 1 below with in RED MAJOR FAULTS and in ORANGE MINOR FAULTS

_____

Table 1. Check list for alarms

Alarm	Number	OW Variable?	Injecting 4-20 mA?	Record completed by	Witnessed by	Validated on
VERY LOW INSTRUMENT AIR PRESSURE - LL - PT-150	PALL-150 (ISO22)	N/A	N/A	SDE	SBE	05/02/25
VERY HIGH PRESSURE IN OXYGEN SEPARATOR ST-600 (BPCS)- HH - PT-610	PAHH-610 (ISO22)	N/A	N/A	SDE	SBE	05/02/25
VERY HIGH LEVEL ST-600 - HH - LT-600	LAHH-600 (C63)	N/A	N/A	SDE	SBE	05/02/25
POSITION DEVIATION	GDA-611 (ISO22)	N/A	N/A	SDE	SBE	06/02/25

OF MPV-611 - ERR - MPV-611						
LP300 PUMP PRESSURE LOSS - L - PT300	PAL-300 (C63)	N/A	N/A	SDE	SBE	06/02/25
VERY HIGH PRESSURE DOWNSTREAM OF LP300A/B - HH - PT-300	PAHH-300 (C63)	N/A	N/A	SDE	SBE	06/02/25

4. Software simulations

PART 9: Perform Software Simulations

4.1. Simulations scenarios

Table 3. simulation list

Simulation	Record completed by	Witnessed by	Validated on
STARTING SEQUENCE (Stop -> Start)	SDE	SBE	04/02/25
STOPPING SEQUENCE (Start -> Stop)	SDE	SBE	04/02/25
SIMULATION PROCESS BLOCK*	SDE	SBE	05/02/25

*: the following 3Nr. Simulation Process Block listed in the C063-ELO-QIX-AU-001_B_IFC – UCP FAT PROCEDURE cannot be tested as these are not included in the ELO Electrolyser SOFTWARE:

- Ambiant Temperature control (controlled & regulated by HVAC Software, that is loaded on the HVAC separate/dedicated UCP)

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. 1. Introduction

This document describes the philosophy, organization and milestones required for the Commissioning & Start-Up of the ELOGEN hydrogen production unit by water electrolysis for the Crosswind Project. ELOGEN's site supervision is responsible for advising the coordinating on site of all the means and resources required for the Unit Commissioning & Start-Up of the unit in accordance with COMPANY specifications.

1.1 Overview of Project Scope

Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.

Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.2 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

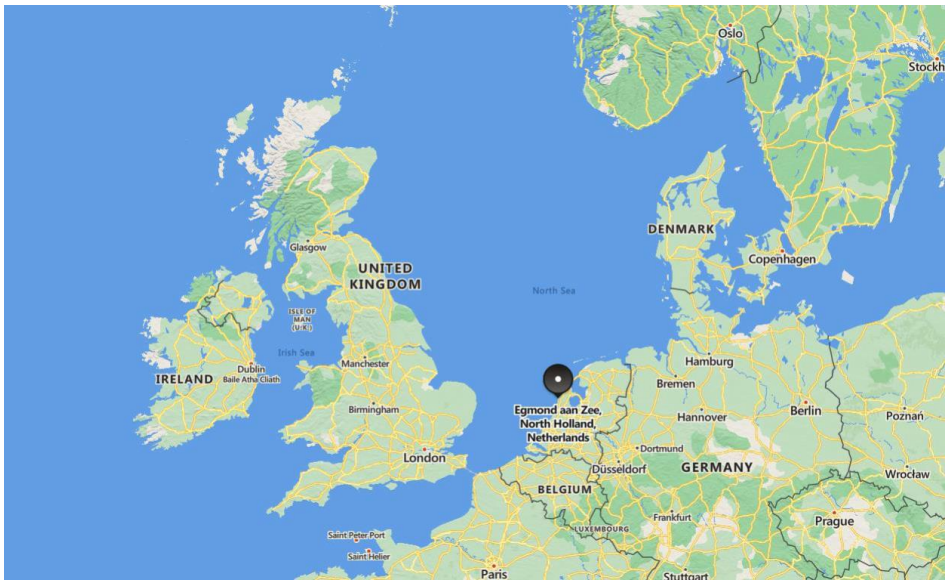

Figure 1. *HOLLANDSE KUST NOORD WIND PARK Location Map*

Figure 2. *Wind Park Details*

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile is located on coordinates E 590719.1, N 5841602.3 and is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

1.3 Project Concept

All components included in the BLPH will be integrated onshore on a topside and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

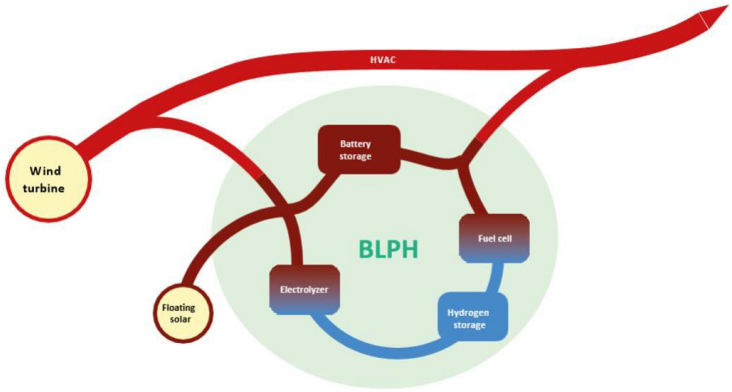

Figure 3. *BLPH Concept*

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.

The purpose of the BLPH is to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

2. Document Scope

In this document are described the activities developed to evaluate the performance of the electrolysis unit. This activities are carried out after achieving completion on the hydrogen production from 10% to 100% of nominal flowrate, which is from 50 Nm^3/h up to 500 Nm^3/h (cf. C063-ELO-PRO-CO-0005).

In the section 0 are given the steps to conclude if the unit performs as expected and established by the contract. In addition to the operation description, are given the prerequisites, acceptance criteria, as well as the time required for each operation.

The performance of the electrolysis unit is evaluated towards the following parameters:

- Hydrogen production rate
- Hydrogen purity
- Efficiency at maximum capacity
- Hot start time
- Energy consumption in hot stand-by
- Cold start time
- Energy consumption in cold stand-by
- Ramp down time
- Ramp up time
- Fresh water consumption

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

3. Definitions

Table 1. Table of definitions

Term	Definition
COMPANY	means CROSSWIND C.V., owner & developer of the offshore WIND FARM Hollandse Kust Noord Wind Park Project.
ELOGEN	means ELOGEN as CONTRACTOR, the contracted party for engineering, and onshore commissioning of the Electrolyzer facilities associated with the PROJECT.
Pre-Commissioning	Pre-Commissioning relates to the preliminary Commissioning activities to test and check the individual basic functions of individual items within any given system and/or sub-system to confirm they perform as designed.
Commissioning	The phase of the project after Pre-Commissioning. Commissioning consists of a comprehensive series of dynamic and energized Checks and Tests to be carried out in order to demonstrate and ensure that the facilities are ready to operate safely and steadily in compliance with project Documents, Specifications, Standards and Engineering Best Practices.
Equipment	An item that may be part of a System and be commissioned independently, however, it may or may not be operated independently.
Inspection Test Records (ITR)	A-ITR – used to record and verify construction scope associated with a tagged item (component). B-ITR – used to record and verify energization and function testing during pre-commissioning of a tagged item
Operations	Operations include all personnel directly involved with Production Operations and Maintenance of the facility.
Performance Test	The Performance Test takes place following the Commissioning and Site Acceptance Test. A performance test is executed if there is a specific requirement to test performance criteria of an individual piece of equipment, a system, or the plant.
Plant	Refers to the permanent facilities (Base Load Power Hub) being constructed or to be constructed at WORKSITE resulting from the WORK.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Term	Definition
Project	Refers to the BASE LOAD POWER HUB project.
Procedure	A document that details the execution of an activity.
Punch List	Work not executed as per approved documents and/or not meeting quality, health, safety, environment, operability/maintainability requirement and/or Standard; and recorded as a list for rectification.
SITE	Refers to the offshore location where the PLANT is to be installed and the vicinity thereof (offshore North Sea - Netherlands).
Start-up	The stage at which process fluid is introduced/created into the Plant. It is defined as operation of all the facilities under the project. It can only be performed once Commissioning of all associated utilities and auxiliaries and Pre-Commissioning activities of the Plant have been completed.
Start-up/Ramp-up	It is the initial start-up of processing equipment after first hydrogen, followed by a staged ramp up to full operating conditions. On completion of ramp-up, and after a period of steady state operations, the facility is ready to be performance tested.
System	A System is a major subdivision of a plant, being either process or utility, which performs an operational function of the plant. A System includes all the various equipment that allows it to operate. The division into functional Commissioning Systems corresponds to the prevailing fluids or services.
Sub-system	A Sub-system is a further subdivision of a System, which performs a partial operational function of the System, with little or no interference from the other Sub-systems. The Sub-system is the basic unit for Commissioning.
WORKSITE	means any construction location(s), where any major parts of the PLANT (such as templates, piles, nodes, jacket structure, modules, decks) shall be fabricated and assembled, excluding all other offices, premises and workshops of CONTRACTOR and SUBCONTRACTORS.
Shall	used to indicate requirements strictly to be followed to conform to the specification and accepted by all involved parties.
Should	used to indicate that among several possibilities one is recommended as particularly suitable without mentioning or excluding others, or that a certain course of action is preferred but not necessarily required.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Term	Definition
May	used to indicate a course of action permissible within the limits of the specification.
Can	used for statements of possibility and capability, whether material, physical or casual.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

4. Abbreviations

Table 2. *Table of abbreviations*

Term	Definition
BLPH	Base Load Power Hub
BOP	Balance of plant
CSU	Commissioning & Start-Up
FT	Functional Transmitter
HMI	Human Machine Interface
HPP	Hydrogen Purification Unit[1]
QHSE	Quality, Health, Safety, & Environment
ITR	Inspection & Test Record
PID (P&ID)	Piping and Instrumentation Diagram
PLC	Programmable Logic Controller
PPE	Personal Protective Equipment
PV	Pneumatic Valve
UPS	Uninterruptible Power Supply

[1] It could also be referred as HPU (Hydrogen Purification Unit) in other documents

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

5. Requirements

Electrolyser's unit performance test activities can be performed when the Start-up report for the entirety of the electrolysis unit has been signed by all parties:

- All Punchlist that does not require the system to be reopened are cleared.
- All relevant documentation is available in the latest revision.
- The UPS is loaded at 100%.
- All Utilities are operational.
- The electrolyzer is stopped depressurized and cold (T < 40 °C).
- Electrolyzer Unit Start-Up & Ramp Up procedure has been completed and the corresponding ITRs have been completed and signed (cf. C063-ELO-PRO-0005).
- All systems are power-up and available to start automatically.
- Appropriate PPE must be always worn during loop testing.
- A permit to work has been delivered.
- In any case this procedure shall not conflict with, or supersede, the electrical lock-out procedure. Only electrical system leaders will be authorized to remove padlocks in electrical cabinets.
- Written authorization has been obtained to send hydrogen through the client's installation (**Figure 4** piping highlighted in turquoise, PV-633 open and PV-632 close). In the absence of such authorization, the hydrogen will be directed through the designated hydrogen vent (**Figure 4** piping highlighted in yellow, PV-633 close and PV-632 open).

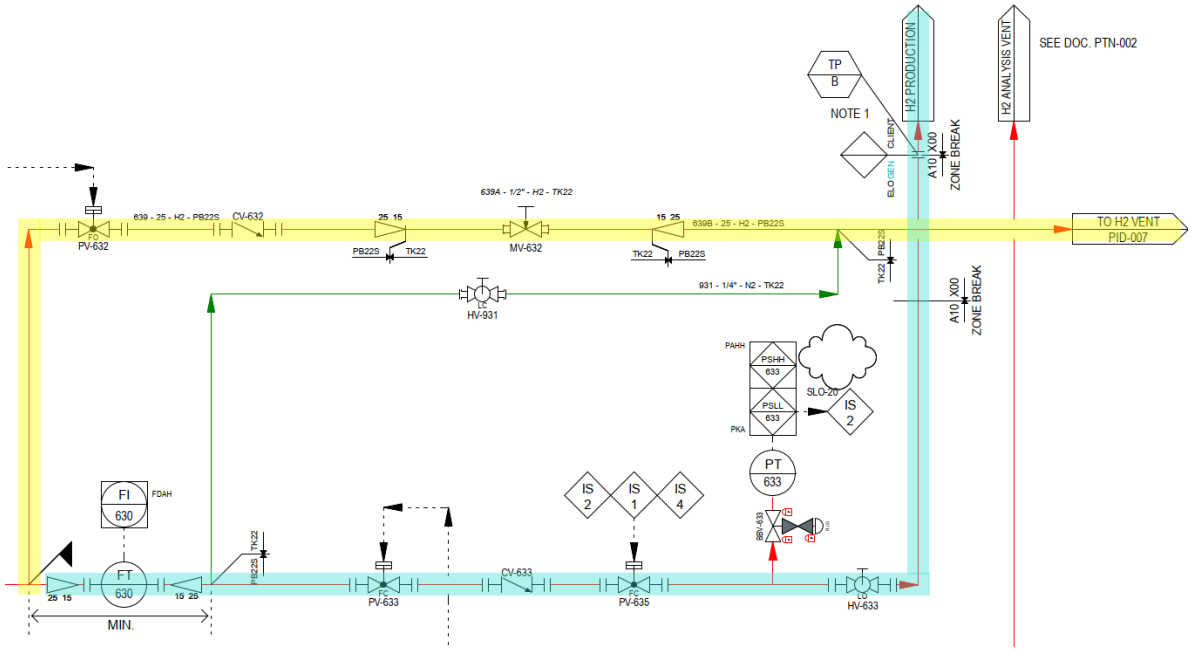

Figure 4. *Hydrogen production routing*

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

5.1 Required Equipment

- Toolboxes (e.g. screwdrivers, wrenches, pliers, spanners).
- ATEX Field telephone or Walkie-Talkie.
- Portable Ultrasonic flow meter Endress+Hauser Prosonic Flow 93T (ref. 500075)[2]
- Chronometer.
- Personal hydrogen detectors for each people on site, calibrated up to date.

All equipment used must have a serial number and a valid calibration certificate up to date (if applicable).

Table 3. Test equipment register

TESTING & MEASUREMENT INSTRUMENT USED			
Type	Serial N.	Calibration certificate	Validity

5.2 Required Documents

- This procedure approved.
- A work permit has been issued and signed.
- Signed report test for the Start-up activities (cf. C063-ELO-PRO-CO-0005).

5.3 Required Manpower (Indicative)

For all the operations it is required the presence of a commissioning engineer and an automation engineer. The presence of the client is optional.

In case of any additional test, maintenance or trouble shooting for one or more components in the unit, it is recommended to count with a mechanical, electrical, piping and instrument technician, as well as the site supervisor.

[2] This reference is provided in case a flowmeter for the freshwater intake is not installed on site.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

6. Risk

6.1 Gas risk

The hydrogen produced in the electrolysis unit is an odorless, colorless and flammable gas, that can be released up to 500 Nm^3/h. The principal risks related to hydrogen are:

- Risk of inflammation or explosion. In the event of inflammation, hydrogen produces a flame invisible to the bare eye.
- Risk of anoxia due to the replacement of oxygen.

The nitrogen used to purge the system during stop and start sequences is an odorless gas, naturally present in the air. The principal risk related to this gas is anoxia due to replacement of oxygen.

6.2 Fire risk

The fire risk is induced by the presence of hydrogen gas in the system, as well as by the presence of electrical equipment. All sources of ignition (electric sparks, hot surfaces, static electricity, mechanical hot spots…), and a presence of hydrogen leak, could lead to a fire risk.

⚠	The external fire case is not covered by the machine safety system and is under the responsibility of the operator.

6.3 Electrical and electrostatic risk

The system is composed of elements operating at voltage higher than the safety voltage (400 Vac for certain auxiliaries) and can therefore cause significant damage to people and property. The design and manufacture of the electrolysis unit is compliant with the CE Low Voltage Directive (2014/35/EU). There are three types of electrical risk:

- Residual polarisation voltage: after a machine's shutdown, and even after electrical lockout, the stacks keep a residual polarisation voltage that can last up to three days.
- Electrostatic: eliminated generally by periodically checking the grounding of the installation and the use of suitable PPE.
- Electrical: controlled by the compliance of the cabling of the installation and the good practice following the recommendations given by the procedures.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

⚠	All elements in the system must be connected to a grounding surface connected to the ground terminal and checked at every intervention.

6.4 Thermal risk

The thermal risk carried is related to burns on contact with hot surfaces. The process globally carries fluids reaching 165 °C[3], which can cause second degree burns. The electric heater presents in the containers (indicated as EH- on the P&ID) can reach even higher surface temperatures.

6.5 Pressure risk

The risk associated with pressure devices is due to the amount of energy released in the event of a device rupturing or bursting due to sudden release of fluid.

6.6 Risk of falling

Maintenance operations on the roof of the electrolyser must be carried out by personnel trained and authorised to work at height. Operators must be attached in such a way as to limit the risk of falling. Operations may be carried out from a platform if necessary.

⚠	Risk of injury. Respect safety measures for working at height when working on the roof of the electrolyser.

[3] particularly on the HPP, the BOP reaches temperatures of 65 °C

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7. Operation description

The validation of the performance tests is concluded through the **Table 7** to **Table 16**, where each step is described in a row and the columns "Completed by", "Witnessed by" and "Date" are used to register the compliance of the activity. Take note of the results obtained, and if it is compliant according to the expected value.

If the test is interrupted by any factor (major or safety fault, or due to an external situation), the test is not longer valid, and it must be re-started.

Despite the independence of the tests, they can be carried out in an optimized circuit, to avoid waiting times and limit the stops of the electrolyser. In **Figure 5** is presented a recommended planning for the activities. The descriptions given in **Table 7** to Table 16 do not consider a continuity between the performance tests, so the operator can perform the test whenever is convenient according to situations presented on site.

The main views of the HMI used during this procedure are presented on **Figure 6**, **Figure 7** and **Figure 8**. The information displayed on the HMI that is referenced in the description of the activities (**Table 7** to **Table 16**) is identified by the numbers 1 to 11.

7.1 Hydrogen production rate

Table 7. *Hydrogen production rate*

Time required	Pre-requisites	Validation criteria
2 hours	Electrolyser initial state displayed on HMI: STOP	Hydrogen production rate at maximum capacity is 500 ± 1,25 Nm^3/h

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the "Expert" mode.			
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [4].			
03	On the HMI, enter 10% of the maximum hydrogen flow rate in Nm^3/h (50 Nm^3/h). (Figure 6 point **1**).			
04	(If applicable) On the hydrogen separator tank view of the HMI, select the button "Force Event" to force the hydrogen production to the vent. (Figure 6 point **2**).			

[4] For more details about the use of the HMI, check the Start-up procedure (cf. C063-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
05	Press the "START" button on the HMI navigator. (Figure 6 point **3**).			
06	Check that the stacks are being polarized at a ramp of 5 V per second up to a voltage equal to 1,25 x Number of Cells for each stack (1,25*106 V=**132.5 V**). The polarization phase ends once the rectifier voltage is higher than or equal to the polarisation point (i.e. **530 V** per rectifier and **1060 V** in total[5]). (Figure 6 point **4**). **Note:** in regard of the possible fluctuations of stacks voltage, it is considered that the polarization point is achieved once the voltage per stacks is above **119.25 V** (i.e. **477 V** per rectifier and **954 V** in total)**.**			
07	Let the electrolyser run at 10% of the maximum production setpoint to heat the water inlet to stacks up to 50°C (TT-600). This value measured can be read directly on the HMI. The operation should last about 30 minutes. (Figure 6 point **5**).			
08	Once the temperature measured by the TT-600, reaches 50 °C, enter the maximum production setpoint on the HMI (500 Nm3/h). (Figure 6 point **1**).			
09	The current passing through the stacks should start to ramp up. The production should reach the setpoint within 30 s to 5 min after setting the process at its maximum production (500 Nm^3/h).			

[5] The systems is constituted by eight stacks of 106 cells each. The stacks are grouped by 4 and each group is supplied by one rectifier.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
	Note: During the current ramp up phase, make sure that no cell in the stacks is subjected to a voltage higher than **2,1 V** (**890,4 V** per rectifier) by checking on the HMI (Figure 6 point **4**). The software will display an alarm and stop production if that is the case.			
10	Monitor the hydrogen production flow rate on the HMI measure by the FT-630. Once it has reached its maximum value, let the system run for 30 minutes to reach stability. Throughout during this period, the hydrogen flow must be within the targeted value with a deviation of 0,25 %. (500 ± 1,25 Nm^3/h). (Figure 6 point **6**).			
11	Record the hydrogen production flow rate measures during 1h for each second (sampling rate of 1 Hz).			
12	Calculate the average value between the measures. The obtained value must be inside the range of uncertainty indicated (500 ± 1,25 Nm^3/h).			

Result						
Hydrogen production rate at maximum capacity: _____ Nm^3/h	Compliant (YES/NO)		Completed by		Date	

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.2 Hydrogen purity

The hydrogen produced by the electrolysis process, after going through the separator and condensation vessels, is polluted by molecules of water and oxygen. The expected purity of 99,999% is reached while the hydrogen goes through the HPP. Hence, at client's stream (flowrate measured by the FT-630), the oxygen and water content are both limited to 5 ppmv. This section describes the method to validate the oxygen and water content in the hydrogen produced at maximum capacity (i.e. 500 Nm^3/h).

Table 8. *Hydrogen purity*

Time required	Pre-requisites	Validation criteria
1 hour and 30 minutes	The electrolyser has run at its maximum capacity recently[6]. Electrolyser initial state displayed on HMI: STOP Temperature of the cold loop TT-60 between 3 and 5 °C. Temperature at the inlet of stacks TT-600 > 50 °C.	Dew point is lower than 5 ± 0,15 ppmv at atmospheric pressure. Oxygen content in the hydrogen is lower than 5 ± 0,1 ppmv.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the "Expert" mode.			

[6] Less than 1 hour, this to guarantee that the systems is pressurized, and the temperature of the stacks is already above 50 °C so the current will ramp up to maximum capacity.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [7].			
03	On the HMI, enter 100% of the maximum hydrogen flowrate in Nm^3/h (500 Nm^3/h). (Figure 6 point **1**).			
04	Press the "START" button on the HMI navigator. (Figure 6 point **3**).			
05	Verify that the hydrogen production flowrate is at a steady state, that is, the hydrogen production flow is according to the setpoint (500 Nm^3/h) for at least 30 minutes. (Figure 6 point **6**).			
06	If the electrolyzer is operating at a steady state, go to the "H2 page" view on the HMI. Read the values of the DPT-800 and OIHA-800 (**Figure 7** point **8**).			
07	For 1 hour, record the values sent by DPT-800 and OIHA-800 every second (sampling rate of 1 Hz).			
08	Calculate the average value of the measurements of DPT-800A/B/C. The obtained value must be lower than 5 ± 0,15 ppmv.			

[7] For more details about the use of the HMI, check the Start-up procedure (cf. C063-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
09	Calculate the average value of the measurements of OIHA-800 A/B/C. The obtained value must be lower than 5 ± 0,1 ppmv.			

Result						
Hydrogen purity at maximum capacity: _____ (average DPT) water ppmv _____ (average OIHA) oxygen ppmv	Compliant (YES/NO)		Completed by		Date	

This document contains confidential information which is the property of ELOGEN.

7.3 Efficiency at maximum capacity

The efficiency of the electrolysis unit is measured as the energy consumed per Nm^3/h of hydrogen produced. This value is directly calculated by the PLC and displayed on the HMI. This procedure described the steps to validate the performance of the electrolysis related to efficiency at its maximum capacity (i.e. 500 Nm^3/h).

Table 9. *Efficiency at maximum capacity*

Time required	Pre-requisites	Validation criteria
1 hour and 30 minutes	The electrolyser has run at its maximum capacity recently[8]. Electrolyser initial state displayed on HMI: STOP Temperature of the cold loop TT-60 between 3 and 5 °C. Temperature of stacks TT-600 > 50 °C.	The power consumed by the electrolyser divided by the produced hydrogen flow rate is lower than 5 ± 0,06 kWh/Nm^3H_2 at its maximum capacity at the beginning of life of the electrolyser.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the “Expert” mode.			

[8] Less than 1 hour, this to guarantee that the systems is pressurized, and the temperature of the stacks is already above 50 °C so the current will ramp up to maximum capacity.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [9].			
03	On the HMI, enter 100% of the maximum hydrogen flow rate in Nm3/h (500 Nm^3/h). (Figure 6 point **1**).			
04	Press the "START" button on the HMI navigator (Figure 6 point **3**).			
05	Verify that the hydrogen production flow rate is at a steady state, that is, the hydrogen production flow is according to the setpoint (500 Nm^3/h) for at least 30 minutes (Figure 6 point **6**).			
06	If the electrolyzer is operating at a steady state, go to the "KPI" view of the HMI. Read the values of the efficiency on the "Conso by production steps" "In start" field (Figure 8 point **9**).			
07	For 1 hour, record the values of the efficiency every second (sampling rate of 1 Hz).			
08	Calculate the average value of the reported values. The result must be lower than 5 ± 0,06 $kWh/Nm^3\ H_2$.			

Result						
Efficiency at maximum capacity _____ kWh/Nm^3H_2	Compliant (YES/NO)		Completed by		Date	

[9] For more details about the use of the HMI, check the Start-up procedure (cf. C063-ELO-PRO-SU-0500)

7.4 Hot start time

The term "Hot Start" stands for the process in which the electrolyzer goes from the "STANDBY" mode to the "START" mode[10]. In "STANDBY" mode the electrolyzer is pressurized (if it has been less than 1 hour that it was running in "START" mode), the oxygen and hydrogen loop pumps (CP-600A/B and CP-620A/B) are running and the stacks are polarized (i.e. 1,25 V per cell, 132.5 V per rectifier). Hence, in a "STANDBY" mode the unit is pre-started, which enables a faster initiation of hydrogen production. In this section, the steps are given to evaluate the duration of a Hot Start.

	The pressurized "*Standby*" mode is limited to 1 hour to avoid an H_2/O_2 mixture.

Table 10. *Hot start time*

Time required	Pre-requisites	Validation criteria
1 hour and 30 minutes	The electrolyser has run at its maximum capacity recently[11]. Temperature of the cold loop TT-60 between 3 and 5 °C. Temperature of stacks TT-600 > 50 °C.	Hot start completed within 5 to 15 minutes.

[10] This time is noted in the contract as "Hot Stand-by to full production", indicating as initial state the pressurized STANDBY mode.

[11] Less than 1 hour, this to guarantee that the systems is pressurized, and the temperature of the stacks is already above 50 °C so the current will ramp up to maximum capacity.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the “Expert” mode.			
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [12].			
03	Set the electrolyzer in “START” mode at 100% of nominal flow (500 Nm^3/h). Let the electrolyzer run at a steady state for at least 15 minutes or until the temperature of the stacks reaches 65 °C (TT-600) (Figure 6 points **1** and **5**).			
04	Press the “STANDBY” button to switch from the maximum hydrogen flow rate to “STANDBY” mode (in this state the machine is pressurized, and the stacks are polarized) (Figure 6 point **3**).			
05	The voltage and current feeding the stacks will drop to the polarization point. Once the "Standby" state is reached (STANDBY button turns green in the HMI screen), let the system run on this state for at least 30 minutes. **During this 30 minutes in STANDBY mode, the Energy consumption in hot stand-by test can be carried out**.			
06	Once the 30 minutes elapsed, enter the maximum hydrogen production setpoint on the HMI (500 Nm3/h).			

[12] For more details about the use of the HMI, check the Start-up procedure (cf. C063-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
07	Press the START button and take note of the time displayed on the HMI (Figure 6 point **7**) (point A). **Time:** _____			
08	The current passing through the stacks should start to ramp up as well as the hydrogen production flow rate (Figure 6 point **6**).			
09	Monitor the produced hydrogen flow rate (FT-630). Once it has reached the maximum setpoint value (500 ± 1,25 Nm^3/h) take note of the time displayed on the HMI (Figure 6 point **7**) (point B). **Time:** _____			
10	The electrolyzer shall remain in START mode for at least 15 minutes. During this time, the produced hydrogen flowrate must remain steady (500 Nm^3/h ±5%). The time interval between point A and point B determines the hot start time.			
11	Verify the hot start was completed within 5 to 15 minutes.			

Result						
Hot start time: _____ min	Compliant (YES/NO)		Completed by		Date

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.5 Energy consumption in hot stand-by

The energy consumption is given by the Power Monitoring Device Control panel present on the unit (**Figure 9**). This value could also be read on the HMI "KPI" view "consommation" area (Figure 8).

This section describes the method to set the unit in Hot Standby (or pressurized STANDBY) and to establish the energy consumed during this state. In Hot Standby the unit is kept pressurized, the pumps (CP-600A/B and CP-620A/B) are running and the stacks are polarized. No hydrogen is being produced.

The aim is to evaluate the energy cost for letting the unit pre-started, as defined in the previous section.

Figure 9. *Reported energy consumption on the Power Monitoring Device onsite.*

⚠	The pressurized "*Standby*" mode is limited to 1 hour to avoid an H_2/O_2 mixture.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Table 11. *Energy consumption in hot stand-by*

Time required	Pre-requisites	Validation criteria
1 hour	The electrolyser has run at its maximum capacity recently[13]. Temperature of the cold loop TT-60 between 3 and 5 °C. Temperature of stacks TT-600 > 50 °C.Hot start time test in progress.	Energy consumption must be 90 ± 1 KWh.

Step	Description	Completed by	Witnessed by	Date
01	Once the "Standby" state is reached (STANDBY button turns green on the HMI screen), go to the “KPI” view “consommation” area, and read the values displayed for the energy consumption (Figure 8 point **10**). This value must correspond to the value displayed by the Power Monitoring Device Control panel (Figure 9). **Note:** Make sure that the initial value of energy consumed is set at zero, to take into consideration just the energy consumed during this test.			
02	For 30 minutes, record the values of the total energy consumed every second (sampling rate of 1 Hz) (Figure 8 point **10**).			
03	Calculate the average energy of the reported values. The result must be 90 ± 1 KWh.			

Result						
Energy consumption in hot stand-by: _____ kWh	Compliant (YES/NO)		Completed by		Date	

[13] Less than 1 hour, this to guarantee that the systems is pressurized, and the temperature of the stacks is already above 50 °C so the current will ramp up to maximum capacity.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.6 Cold start time

The term "Cold Start" stands for the process in which the electrolyzer goes from the "IDLE" mode to the "START" mode[14]. In "IDLE" mode the electrolyzer is depressurized, the oxygen and hydrogen loop pumps (CP-600A/B and CP-620A/B) are stopped and the stacks are polarized (i.e. 1,25 V per cell, 132.5 V per rectifier). Hence, in a "IDLE" mode the unit is pre-started, which enables a faster initiation of the hydrogen production, but in theory longer than the Hot start since the system is depressurized. In this section, the steps are given to evaluate the duration of a Cold Start.

Additionally, since the unit is not pressurized, the duration of this mode is not restricted to 1 hour, compared to the pressurized Standby.

Table 12. *Cold start time*

Time required	Pre-requisites	Validation criteria
1 hour and 30 minutes	Performance test of Hydrogen completed. The temperature of the stacks TT-600 is below 50 °C[15]. Electrolyser initial state displayed on HMI: STOP	Cold start time below 30 minutes.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the "Expert" mode.			

[14] This time is noted in the contract as "Cold Stand-by to full production" indicating as initial state the IDLE mode.

[15] The estimate duration of this transition consider that the temperature of oxygen and hydrogen loop are around 15 °C, and that the cold loop is at 10 °C initially.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [16].			
03	Press the "IDLE" button to switch from "Stop" to "Idle" mode (In this state, the system is depressurized, the stacks are polarized, and no hydrogen is produced) (**Figure 6** point 3). Check that the stacks are being polarized at a ramp of 5 V per second up to a voltage equal to 1,25 x Number of Cells for each stack (1,25*106 V=**132.5 V**). The polarization phase ends once the rectifier voltage is higher than or equal to the polarisation point (i.e. **530 V** per rectifier and **1060 V** in total[17]). (Figure 6 point **4**). **Note:** in regard of the possible fluctuations of stacks voltage, it is considered that the polarization point is achieved once the voltage per stacks is above **119.25 V** (i.e. **477 V** per rectifier and **954 V** in total)**.**			
04	The voltage and current sent to the stacks will be set at the polarization point. Once the "Idle" state is reached (button IDLE turns green in the HMI screen), let the system run on this state for at least 30 minutes. **During this 30 minutes in IDLE mode, theEnergy consumption in cold stand-by test can be carried out.**			

[16] For more details about the use of the HMI, check the Start-up procedure (cf. C63-ELO-PRO-SU-0500)

[17] The systems is constituted by eight stacks of 106 cells each. The stacks are grouped by 4 and each group is supplied by one rectifier.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
05	Once the 30 minutes elapsed, enter the maximum hydrogen setpoint on the HMI (500 Nm^3/h).			
07	Press the START button and take note of the time displayed on the HMI (**Figure 6** point **7**) (point A). **Time: _____**			
08	The current passing through the stacks should start to ramp up and the hydrogen production flowrate should start to increase.			
09	Monitor the produced hydrogen flowrate. Once it has reached its maximum capacity (500 Nm^3/h) take note of the time displayed on the HMI (**Figure 6** point **7**) (point B). **Time: _____**			
10	The electrolyzer shall remain in operation for at least 15 minutes. During this time, the produced hydrogen flow rate must remain steady (500 Nm^3/h). The time interval between point A and point B determines the cold start time.			
11	Verify the cold start takes less than 30 minutes.			

Result						
Cold start time: _____ min	Compliant (YES/NO)		Completed by		Date	

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.7 Energy consumption in cold stand-by

The energy consumption is given by the Power Monitoring Device Control panel present on the unit (Figure 9). This value could also be read on the HMI "KPI" view "consommation" area (Figure 8). This section describes the method to set the unit in Cold Standby (also known as IDLE mode) and read the energy consumed during this. In IDLE mode the unit is depressurized, the pumps (CP-600A/B and CP-620A/B) are stopped and the stacks are polarized. No hydrogen is being produced.

The aim is to evaluate the energy cost of letting the unit polarized, as defined in the previous section.

Table 13. *Energy consumption in cold stand-by*

Time required	Pre-requisites	Validation criteria
1 hour	Performance test of Hydrogen completed. The temperature of the stacks TT-600 is below 50 °C[18]. Cold start time test in progress.	Energy consumption must be around 34 ± 1 kWh.

[18] The estimate duration of this transition consider that the temperature of oxygen and hydrogen loop is around 15 °C, and that the cold loop is at 10 °C initially.

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
01	Once the "Idle" state is reached (confirmed by the IDLE button turning into green on the HMI screen), go to the "KPI" view "consommation" area, and read the values displayed for the energy consumption (Figure 8 point **10**). This value must correspond to the value displayed by the Power Monitoring Device Control panel (Figure 9). The transition from the maximum hydrogen flow rate to "Idle" takes under 10 minutes. **Note:** Make sure that the initial value of energy consumed is set at zero, to take into consideration just the energy consumed during this test.			
02	For 30 minutes, record the values of the total energy consumed every second (sampling rate of 1 Hz) (Figure 8 point **10**).			
03	Calculate the average energy of the reported values. The result must be approximately 34 ± 1 KWh.			

Result						
Energy consumption in cold stand-by: _____ kWh	Compliant (YES/NO)		Completed by		Date	

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.8 Ramp down time

The ramp down time is described as the duration of the transition from START mode at 100% of the nominal flow, to 10% of the nominal flow. In other terms, is the time that takes to decrease the current sent to the electrolysis stacks and consequently, the hydrogen produced by them. In this sections are given the steps to execute this transition and to evaluate its duration.

Table 14. *Ramp down time*

Time required	Pre-requisites	Validation criteria
1 hour	The electrolyser is initially running at its maximum capacity (500 ± 1,25 Nm^3/h)	Ramp down time below 30 seconds.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the “Expert” mode.			
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [19].			

[19] For more details about the use of the HMI, check the Start-up procedure (cf. C63-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
03	Verify that the hydrogen production flow rate is at 500 ± 1,25 Nm^3/h for at least 30 minutes**.** Hydrogen production flow rate can be read directly on the HMI, in the "Hydrogen Process" view.			
04	Once the 30 minutes elapsed, enter the minimal production setpoint on the HMI (10% of the maximum hydrogen flow rate, 50 Nm^3/h) and take note of the time displayed on the HMI (**Figure 6** point **7**) (point A). **Time: _____**			
05	The current passing through the stacks should start to ramp down as well as the hydrogen production flow rate.			
06	Monitor the flow of hydrogen produced. Once it has reached the minimal production (50 ± 0,12 Nm^3/h) take note of the time displayed on the HMI (**Figure 6** point **7**) (point B). **Time: _____**			
07	The electrolyzer shall remain in operation for at least 15 minutes. During this time, the produced hydrogen flow rate must remain steady at a minimum setpoint (50 Nm^3/h). The time elapsed between point A and point B determines the ramp down duration.			
08	Verify that the ramp down takes less than 30 seconds.			

Result						
Ramp down time: _____ seconds	**Compliant (YES/NO)**		**Completed by**		**Date**	

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

7.9 Ramp up time

The ramp up time is described as the duration of the transition from START mode at 10% of the nominal flow, to 100% of the nominal flow. In other terms, is the time that takes to increase the current sent to the electrolysis stacks and consequently, the hydrogen produced by them. In this sections are given the steps to execute this transition and to evaluate its duration.

Table 15. *Ramp up time*

Time required	Pre-requisites	Validation criteria
1 hour	The electrolyser is initially running at its minimum capacity (50 ± 0,12 Nm^3/h).	Ramp up time below 30 seconds.

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the “Expert” mode.			
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms [20].			
03	Verify that the hydrogen production flow rate is at 50 Nm^3/h for at least 30 minutes**.** Hydrogen production flow rate can be read directly on the HMI, in the “Hydrogen Process” view.			

[20] For more details about the use of the HMI, check the Start-up procedure (cf. C63-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

7.10Fresh water consumption

This section aims to describe the method to evaluate freshwater consumption (at WTP inlet) when the electrolysis unit is set at its maximum capacity (500 Nm^3/h).

Table 16. *Fresh water consumption*

Time required	Pre-requisites	Validation criteria
2 hours	The electrolyser is initially running at its maximum capacity (500 ± 1,25 Nm^3/h). If there is no flowmeter installed at the upstream of the WTP, install a portable flowmeter (see Required Equipment) at the proximities of the CV-300 (cf. C63-PID-001).	Fresh water consumption at maximum hydrogen production is 930 ± 5 L/h

Step	Description	Completed by	Witnessed by	Date
01	Login to the HMI in the “Expert” mode.			
02	Check that there are no alarms or faults indicated on the HMI. (If there are, solve them first). Reset the alarms[21].			

[21] For more details about the use of the HMI, check the Start-up procedure (cf. C63-ELO-PRO-SU-0500)

This document contains confidential information which is the property of ELOGEN.

Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN. ELOGEN reserves all its rights.

Step	Description	Completed by	Witnessed by	Date
03	Verify that the hydrogen production is at steady state at 500 Nm^3/h for at least 30 minutes. Hydrogen production flowrate can be read directly on the HMI (**Figure 6** point **6**).			
04	If the electrolyzer is operating at a steady state as explained previously, read on the flowmeter installed onsite (**Figure 8** point **11**), or on the portative one, the freshwater consumed volume or the flowrate measured.			
05	For 1 hour, record the values of the flow (or the volume consumed) every second (sampling rate of 1 Hz), while the electrolyzer is in "Start" mode at its maximum capacity.			
06	Calculate the average of the reported values. The result must be around 930 ± 19 L/h.			

Result						
Freshwater consumption at 500 Nm^3/h H_2: _____ seconds	Compliant (YES/NO)		Completed by		Date	

This document contains confidential information which is the property of ELOGEN.

2. Introduction

This main subject of this FAT is to prove the good conception of the program and the good pre-cabling of the cabinets. It will be performed by ELOGEN team and witnessed by the final customer.

3. Prerequisites

- Control cabinets are exempt of punch list
- 24Vdc of the PLC are working
- Free access to work zones
- Communication cable between various PLC installed and connected

4. Required documents

- Detailed electrical drawings:
    - Control cabinet
    - First PLC
    - Second PLC
    - HVAC PLC
    - Rectifier PLC
    - WTP PLC
- Works Permits

5. Required Tools

- Electrician/instrumentist hand tools: Multimeters / 4-20mA generator or Hart Communicators
- Laptop with dedicated software for program and HMI

6. Input and Output test

Perform input testing by using terminals blocks.

- For the digital inputs, use a wire or turn the element if it's possible.
- For analog inputs, use a 4-20 mA injector
- For digital outputs, overwrite the variable on TIA PORTAL and check the good execution on terminal bloke with a multimeter in position "Ohmeter".
- For analog outputs, overwrite the variable on TIA PORTAL and check the good execution on terminal bloke with a 4-20 mA reader

Fill in the Annex 1: *C63 PLC IOTests Checlist.xlsx*

Expected test duration : 2 days (internal tests Elogen) – Test with client : random check of some Inputs/Output to be witnessed tested with Elogen

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. 7. Alarms test

Perform a test for each alarm of the UCP:

- Simulate a variation in the relevant variable furthest from the fault generation bloc to trigger the alarm at the expected value. If possible, simulate this triggering by using a 4-20mA injector
- Fill in the table 1 below

Precise the serial number and the calibration due to date of the 4-20 mA injector if using:

Expected test duration: 3 days (internal tests Elogen) – Witness test with client : random check of 3 major faults and 3 minor faults from a list)

_____

Table 1. Check list for alarms

Alarm	Number	OW Variable?	Injecting 4-20 mA?	Record completed by	Witnessed by	Validated on

8. UCP Packages connections

Via TIA PORTAL, check the communication of UCP of each package:

Expected test duration : ½ day

Table 2. check list for UCP

UCP	OK/NOK	Serial number	Record completed by	Witnessed by	Validated on
WTP					
Rectifier					
HVAC					

9. Software simulations

9.1. Simulations conditions

The tool is mainly dedicated for automation engineers to simulate, check and valid the coding of the PLC performed and to do an advanced troubleshooting of the regulation and sequences which can be tested in this context. If some concrete results can be observed, some observations could be more “abstract” and require some interpretations. This point must be kept in mind while observing simulations.

Simulation tool set up at Elogen is still under development and allows “simple” tests (“testing at elementary brick level” and not the whole electrolyser on its own). Simulations tools used by Elogen is normally dedicated for internal use only and usually not shown to customer. However, considering the importance of showing proof of good functioning of the PLC coding, the simulations scenarios listed below can be presented to Elogen client.

All of this being considered, the presentation will last around 1 hour. The results will be used to prove the correct operation of the control functions/sequences listed from the Functional Analysis.

9.2. Simulations scenarios

1. **STARTING SEQUENCE (Stop -> Start)**

INITIAL CONDITIONS : Electrolyser stopped

ACTION : push on START

OBSERVATIONS & VALIDATION CRITERIA :

Start-up of pumps (pumps turn green),

Voltage rises to polarization voltage (displayed in Uact and VM boxes),

Switch to production mode (amperage increase in Iact box),

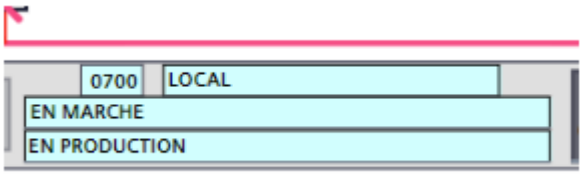
Pressure rise (PT610 and PT630)

2. **STOPPING SEQUENCE (Start -> Stop)**

INITIAL CONDITIONS: Electrolyser in production

ACTION: push on STOP or activation/simulation of a fault

OBSERVATIONS & VALIDATION CRITERIA:



This document is strictly confidential. Rectifier shutdown (displayed in Uact and VM boxes),

ST depressurization (lowering of PT610 and PT630 pressure, opening of MPV611 and SV631),

Pump shutdown, Inerting (opening of sv900 and sv920).

The different stages (=status) of the electrolyser are displayed and indicate the status

3. SIMULATION PROCESS BLOCK

- **Ambiant Temperature control**

  INITIAL CONDITIONS & ACTION: Simulation of high/low ambient temperature

  OBSERVATIONS & VALIDATION CRITERIA: Set HVAC start bit

- **02 Separator Under pressure**

  INITIAL CONDITIONS & ACTION: Simulation of low pressure in the ST600

  OBSERVATIONS & VALIDATION CRITERIA: SV900 opening - ST600 pressure build-up

- **H2 Separator Under pressure**

  INITIAL CONDITIONS & ACTION: Simulation of a pressure drop in the ST620

  OBSERVATIONS & VALIDATION CRITERIA: SV920 opening - ST620 pressure build-up

- **Outside Water Pipe Antifreeze**

  INITIAL CONDITIONS & ACTION: (to be detailed)

  OBSERVATIONS & VALIDATION CRITERIA: (to be detailed)

- **Water level control of H2 event condensates**

  INITIAL CONDITIONS & ACTION: LSH500 and LSL500 status change (level simulation)

  OBSERVATIONS & VALIDATION CRITERIA: Opening the SV500

- **ST600 Water level control direct injection**

  INITIAL CONDITIONS & ACTION: Simulation of ST600 level dropping below LR level

  OBSERVATIONS & VALIDATION CRITERIA: Starting up the LP300

- **ST620 Water level control direct balancing**

  INITIAL CONDITIONS & ACTION: ST620 level raised above HR level

  OBSERVATIONS & VALIDATION CRITERIA: Opening the SV641

- **CS610 Water level control**

  INITIAL CONDITIONS & ACTION: LSH610 and LSL610 status change

  OBSERVATIONS & VALIDATION CRITERIA: Opening the SV600

- **CS630 Water level control**

  INITIAL CONDITIONS & ACTION: LSH630 and LSL630 status change

  OBSERVATIONS & VALIDATION CRITERIA: Opening the SV620

- **Stack fan ctrl**

  INITIAL CONDITIONS & ACTION: Electrolyser in production

  OBSERVATIONS & VALIDATION CRITERIA: Activation of stack fans

- **3°C Loop Temp ctrl**

  INITIAL CONDITIONS & ACTION: (to be detailed)

  OBSERVATIONS & VALIDATION CRITERIA: (to be detailed)

- **Oxygen Pump Setpoint control**

  INITIAL CONDITIONS & ACTION: Electrolyser in production

  OBSERVATIONS & VALIDATION CRITERIA: Pump activation

- **DG640 Hydrogen Purge FB117**

  INITIAL CONDITIONS & ACTION: LSH640 and LSL640 status change

  OBSERVATIONS & VALIDATION CRITERIA: Opening SV642

- **MAJOR FAULT**

  (3 taken at random from a list)

- **MINOR FAULT**

  (3 taken at random from a list)

RISK OF FIRE OR EXPLOSION

FAILURE TO FOLLOW SAFETY INSTRUCTIONS CAN HAVE SERIOUS CONSEQUENCES FOR PROPERTY AND PEOPLE

- Keep away from flames and sparks – Do not smoke.
- Keep away from combustible materials.
- Installation and commissioning must be carried out by trained personnel.
- Do not use in the event of immersion or penetration of water into electrical parts.

IN THE EVENT OF A PROBLEM, CONTACT THE MANUFACTURER.

BEFORE PERFORMING ANY OPERATION, IT IS ESSENTIAL TO READ THE SAFETY RECOMMENDATIONS (SEE §4).

THE FOLLOWING IS STRICTLY PROHIBITED:

- Disassembly and reassembly of (fluid and/or electrical) internal components of the container and of the external components of the container in the absence of ELOGEN staff or personnel from another company designated by ELOGEN.
- The performance of maintenance work without having previously checked/controlled for the absence of voltage and of pure oxygen or hydrogen gas in the pipes and equipment.

						
Risk of electric shock	Automatic start	Hot surface, Risk of burns	Risk of anoxia	Obstacles at height	General hazard	No open flames or smoking

TAKE PRECAUTIONS TO AVOID INJURIES.
It is important to read and understand the service manual before operating this product.

1. TECHNICAL TERMS AND ABBREVIATIONS

AHD	Ambient Hydrogen Detector
ATEX	ATmospheres EXplosibles - Equipment for potentially explosible atmospheres
Bara	Bar absolute (absolute pressure, absolute vacuum equal to 0 bara, atmospheric pressure at sea level is 1.013 bara)
Barg	Bar gauge (relative pressure measured by a manometer, atmospheric pressure is equal to 0 barg)
BOL	Beginning of Life
BPCS	Basic Process Control Systems
BSPP	British Standard Pipe Parallel
CO_2	Carbon dioxide
CP	Circulating Pump
C/TP	Conductivity & Temperature Probe
DPT	Dew Point Transmitter
EOL	End Of Life
ESD	Emergency Shut-Down
ESR	Essential Safety Requirements
F	Mechanical Filter
FH	Filter Housing
FICV	Flow Indicator Control Valve
FS	Flow Switch
H_2	Dihydrogen gas
HIOD	Hydrogen In Oxygen Detector
HMI	Human Machine Interface
Hz	Hertz
HV	Hand Valve
kVA	kilo Volt Ampere
lb	pound
LEL	Low Explosive Limit
LS	Level Switch
LSA	Level Switch Amplifier
O_2	Dioxygen gas
OIHA	Oxygen In Hydrogen Analyser
mm	millimetre
N_2	Dinitrogen gas
Nm^3/h	Normal cubic metre per hour (normal conditions: 1.013 bara and 0 °C)
NC	Normally Closed
NO	Normally Opened
PEM	Proton Exchange Membrane
PLC	Programmable Logic Controller
PS	Pressure Switch
PSV	Pressure Safety Valve
PT	Pressure Transmitter

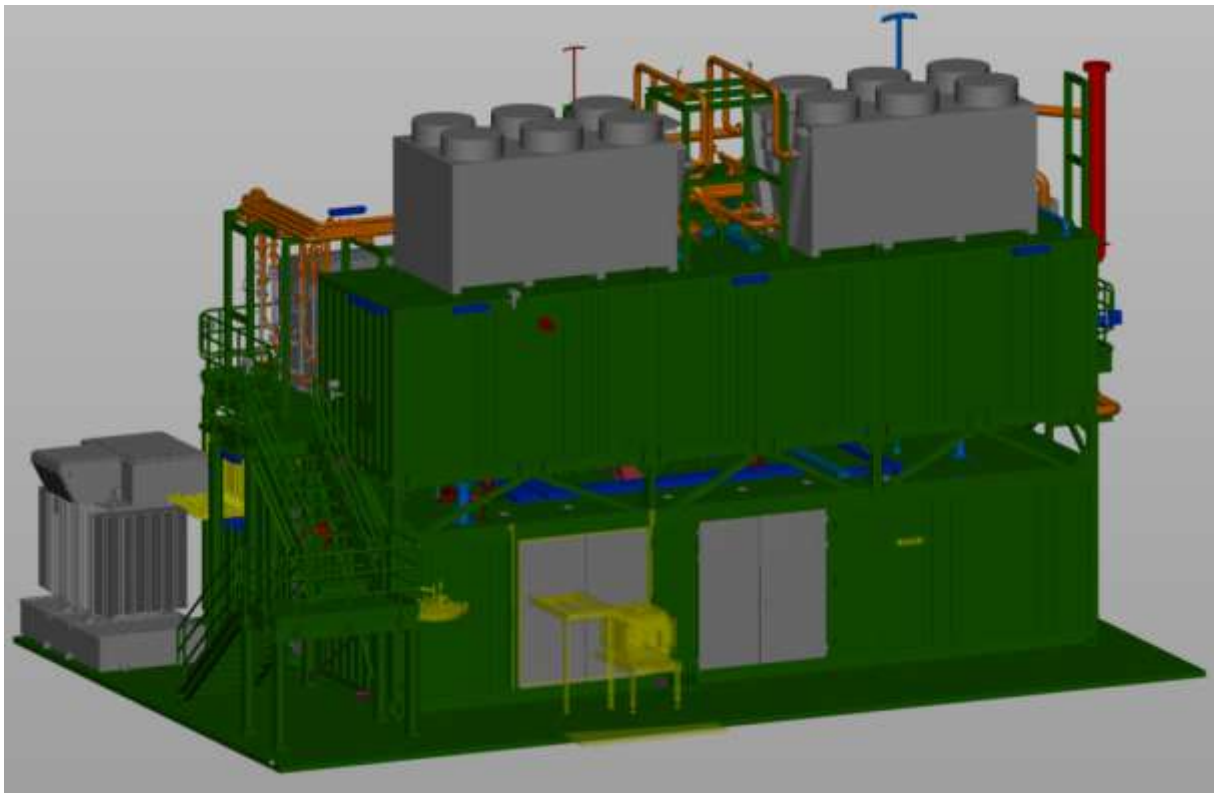

Figure 1: General view of the ELOGEN electrolyser E500.

2. INTRODUCTION

This manual provides information for the installation, operation and maintenance of the machines E500.

The electrolyser is a proton exchange membrane (PEM) water electrolysis system designed for 8 PEM electrolysis stacks producing up to 500 Nm^3/h at a pressure of 30 barg. The purity of the hydrogen at the outlet of the machine is 99.999%.

This electrolyser is used to produce hydrogen. The unit produces hydrogen and oxygen continuously. The oxygen is vented outside without treatment via the vent provided for this purpose. The collection of oxygen-based products from this hydrogen generator is prohibited.

This electrolyser is designed for outdoor operation in a safe environment.

⚠	THIS ELECTROLYSER SHOULD ONLY BE OPERATED AS INTENDED BY THE MANUFACTURER. THE OPERATOR IS RESPONSIBLE FOR THE USE AND INSTALLATION OF THE ELECTROLYSER, WHICH MUST COMPLY WITH THE PROVISIONS OF LOCAL AUTHORITIES AS WELL AS APPLICABLE REGULATIONS.

The system comprises 9 zones:

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. 3. SAFETY RECOMMENDATIONS

The safety recommendations presented here do not cover all situations, and it is essential to refer to good practices for implementing systems using reactive gases, particularly recommendations for implementing storage systems and supply networks.

3.1. GENERAL INFORMATION

The system operation area must be kept free of any combustible materials. Flammable vapours and liquids should especially be avoided.

All system openings must be kept clear.

When the symbol  is present, please refer to this notice for information on the nature of the potential hazard and actions to be taken.

The electrolysis process has undergone a risk assessment in accordance with APPENDIX 1 of the Pressure Equipment Directive 2014/68/UE. The results of this analysis are detailed on document **C63-PED-001**, which includes any information required in the event of non-compliance with ESR.

3.2. EXPLOSIVE ATMOSPHERE AREAS – ATEX

3.2.1. Area Classification

The system is designed to be operated outside ATEX areas.

 The system can intermittently generate explosive atmospheres:

- The compartment A10 is classified as **Zone 2**. An explosive atmosphere may be generated in the event of a leak at a connection (2nd degree release).
- The compartment D01 has two small sections classified as **Zone 2**. An explosive atmosphere may be generated in the event of a leak at one of those connections (2nd degree release). Specifically on the flange connecting the hydrogen piping between containers 1 and 2 and on the flange of the hydrogen outlet to the customer.
- The inside of Hydrogen Analysis Vent is also considered **Zone 2**.

Note: According to Directive 1999/92/EC, **ATEX Zone 2** refers to an area where an explosive atmosphere consisting of gas, vapor, or dust is unlikely to occur under normal operation.

3.2.2. ATEX Area Identification

3.2.2.1. External ATEX Areas

	See C63-DUO-001 – Presentation of ATEX Areas

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

3.2.2.2. Internal ATEX Areas

	See C63-DUO-001 – Presentation of ATEX Areas

This ATEX area is delimited by the signage:

The distance to be kept is indicated and there is a notice of access restriction, such as: “Access restricted to authorised personnel”.

3.3. USE OF GASES

3.3.1. Hydrogen

	• Risk of fire or explosion. • Make sure the system is operated outdoors and is kept away from any source of ignition. • Entry into the process compartment is prohibited during operation.

The hydrogen produced in the system is an odourless, colourless and flammable gas.
The electrolyser can release up to 500 Nm^3/h of hydrogen.

The main risks associated with hydrogen are:
- Risk of ignition or explosion
- Risk of anoxia due to oxygen replacement. In the event of ignition, hydrogen produces a flame that is invisible to a human eye.

To mitigate these risks, the following preventive measures must be implemented:
- Do not enter the process compartment during operation.
- Keep openings and vents clear of any obstacles.
- Follow the installation and operating specifications.

In the event of a hydrogen leak, the system is designed to go into safety mode, stopping electrolysis and depressurising the separators. This operation lasts approximately **9 minutes**.

	The hydrogen purification unit remains pressurised.

In the event of a fire, use type B and E extinguishers (not included) without putting yourself in danger.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN’s rights. This document is part of ELOGEN’s proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN’s trade secrets or know-how is subject to ELOGEN’s prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

	The machine operator is responsible for contracting fire extinguisher maintenance services with a specialised company.

3.3.2. Nitrogen

	Risk of anoxia due to oxygen substitution. Make sure the system is operated outdoors. Do not enter the process compartment during operation.

The system uses nitrogen during the shutdown and startup phases. Nitrogen is an odourless gas that is naturally found in the air.
The electrolyser can release up to 265 Nm^3/h of nitrogen.

The main risk related to nitrogen is anoxia due to oxygen substitution.

To mitigate these risks, the following preventive measures must be implemented:

- Do not enter the process compartment during operation.
- Before carrying out any work on the system, make sure that it is turned off and close the nitrogen bottle valves.
- Utilize a portable O2 and H2 detector mounted on a pole to monitor the container's atmosphere prior to entry or performing any work.
- Keep openings and vents clear of any obstacles.
- Follow the installation and operating specifications.

3.4. FIRE RISK

	Fire risk due to the presence of flammable gas. Make sure the system is operated outdoors and away from any source of ignition.

The risk of fire is created by the presence of hydrogen gas in the system, as well as by the presence of electrical equipment.

To mitigate these risks, the following preventive measures must be implemented:

- Limit potential sources of leaks.
- Remove potential sources of ignition.
- Ensure the availability of appropriate fire extinguishers (classes ABC).
- Provide evacuation instructions and means to sound an alarm.
- Follow the owner's safety instructions, particularly the prohibition against smoking and the storage of flammable materials near the system.

In the event of an incident, please refer to the owner's instructions.
The following can be done, at least:

- Trigger the alert.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

- Notify emergency services.
- Evacuate the hazardous area.

External fire is not covered by the machine's safety system and is the responsibility of the owner.

3.5. ELECTRIC AND ELECTROSTATIC RISK

	Risk of electric shock and electrocution. Make sure the system is properly grounded. Only authorised personnel may enter the machine.

The system is composed of elements operating at voltages higher than the safety voltage (400 VAC for certain auxiliary elements) and can therefore cause significant damage to property and people.

The design and manufacturing of the system comply with the CE Low Voltage Directive.
Find below electrical risks:

3.5.1. Polarization voltage

After stopping the machine, and even after electrical lockout, the stacks retain a residual polarization voltage that can last up to three days. The following recommendations apply:

- Before working in stack areas, check the residual voltage displayed on the VAT-001/002 and stack voltage on HMI.
- Never touch the stacks.
- Only ELOGEN personnel or a subcontractor authorised by ELOGEN may work on the stacks.
- Avoid contact between metal objects and the stacks or dropping metal objects on the stacks.
- Do not remove the protective cover.

3.5.2. Static Electricity

Static electricity risk is generally eliminated by periodically checking the grounding of the installation.

3.5.3. Electricity

Electrical risk is minimised by the following operations and recommendations:

- Do not remove protections during operation.
- Check for the absence of voltage before carrying out any work on the system. In particular, do not top up water in the separator tanks (**ST-600** and **ST-620**) using a system other than the pump (**LP -300**).
- Any work on electrical equipment must be performed by qualified and authorised personnel.
- Grounding of the installation.
- The installation must comply with regulations and be inspected periodically.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

3.5.4. Input electrical characteristics

For 8 stack units:

- ICCmax; 36KA
- General power supply is provided by a circuit breaker 1250A equipped with a protection unit EKIP HI TOUCH LSIG.

Switchboard prefix:	BLPH
Distribution:	FourPoles
Ik Max [kA]:	16,258
Rated operating voltage [V]:	400
Rated insulation voltage[V]:	
Frequency [Hz]:	50
Icw (1s) [kA]:	36
Degree of protection IP:	IP55
Code:	BLPH

Figure 4: Input electrical values [1]

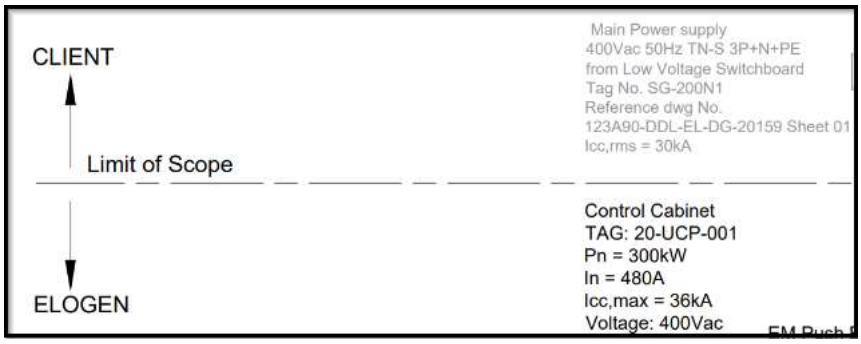

Figure 5: Input electrical values [2]

3.5.5. Lightning protection

To ensure the safety of personnel and equipment, and to minimize the risk of production stoppages and losses due to lightning strikes, it is essential that the installation complies with applicable lightning protection standards and regulations.

The customer's responsibility includes protection of the electrolyser's electrical interfaces, including power supplies upstream of the electrolyser.
The customer is responsible for the design and installation of a lightning conductor, if required, in compliance with local norms and standards. The sizing, supply and installation of this device are not included in the scope of supply, nor are they the responsibility of ELOGEN.

⚠	For the power supply section (rectifier and transformer), please refer to the power supply user manual.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

3.6. THERMAL RISK

⚠	Risk of burns. Avoid any contact with the process during operation and with the thermal skid.

The primary thermal risk is the potential for burns upon contact with hot surfaces. The process involves the distribution of fluids reaching temperatures of up to **65 °C**, which can cause second-degree burns. Additionally, the hydrogen purification unit can attain temperatures around **180 °C** during the regeneration cycle.

To mitigate these risks, the following preventive measures must be implemented:

- Do not enter the process compartment before it has completely cooled.
- Do not touch the equipment or pipes during operation and cooling.
- Do not touch the components of the hydrogen purification unit.
- Do not touch the components of the thermal skid.
- Do not touch water cooler components.
- Do not touch ambient heaters.

Hot surfaces on the process are indicated with the signage in Figure 6.

Figure 6. Thermal hazard signage

3.7. PRESSURE RISK

⚠	Risk of sudden expansion. Depressurise the gas lines before carrying out any work on the system.

The hazard associated with pressure vessels arises from the significant energy release if a vessel ruptures or bursts due to sudden fluid expansion.

The safety measures required to avoid any incidents are:

- Verify the conformity and condition of equipment containing gas: construction code, periodic checks, tests.
- Periodically inspect valves.
- Follow connection/disconnection procedures.
- Check for the absence of pressure before carrying out any work on the system.

3.8. GENERAL OPERATING INSTRUCTIONS

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

The owner is responsible for the implementation of the system. The owner must provide the operator with this manual, in addition to the safety instructions associated with the host facility.

Safety instructions must consider the system's specific characteristics, especially the risks associated with the gases used and the host site.
Safety data sheets are available providing the main safety instructions and recommendations regarding the handling of fluids used during the operation of this electrolyser. The following table provides the reference of these safety data sheets for each fluid used.

Table 1: Safety Datasheet list

Fluid	Document
Hydrogen	C63-SDS-001
Oxygen	C63-SDS-002
Nitrogen	C63-SDS-003
Water	C63-SDS-004
Oil transformer	C63-SDS-005
Demineralized water	C63-SDS-006
MPG 40%	C63-SDS-007
R513-a	C63-SDS-008
Amberlite IRN 160	C63-SDS-010

These safety data sheets must be made available to the operator who is required to read them.

	Operation and maintenance of the electrolyser are restricted to qualified, trained, and authorized personnel only.

	Access to the machine is restricted to authorized personnel only.

	Entry into the A10 area while the machine is in Production, Stand-by, Sleep or Shutdown mode is STRICTLY PROHIBITED.

	Do not smoke near the electrolyser.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

	Do not use mobile phones near the electrolyser.

	Do not use heat or ignition sources near the electrolyser.

Wear protective equipment when working near the machine:

					
Safety goggles	Safety shoes	Safety helmet	Ear plugs/hearing protection	EXAT protective clothing	Gloves

THE FOLLOWING IS MANDATORY: Prior to entering the machine, inspect its interior using a portable oxygen and hydrogen detector. Ensure that sensors are present, functional, and worn by personnel during maintenance operations.

Use only tools suitable for electrical work (insulated tools).

Any modification of the electrolyser or its components is subject to authorisation from Elogen. Any modification without Elogen's authorisation will invalidate the Licensor's warranty.

Do not use the machine outside normal outdoor operating temperatures:
-8.4 °C to + 25 °C.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. 5.1. ELECTROLYSIS STACKS

Objective	Hydrogen production (H_2)
Reference	C63-PID-001, Folio 2/16
Zone	Process

The PEM stacks are supplied with ultra-pure water at anode and cathode. The electrolysis stacks are powered with direct current supplying enough energy to carry out the electrochemical reaction and move protons from anode to cathode through membrane. Hydrogen is produced at the cathode.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

The tension of each stack is monitored by a voltmeter (**VM-00X, X:1-8**) and the tension of each cell of a stack is monitored using the performance cell analyser (**PCA-00X, X:1-8**).

5.2. O_2 LOOP – *600*

Line number	600
Objective	Supply the set flowrate of pure water to the electrolysis stack Ensure thermal regulation of the stack
Reference	C63-PID-001, Folio 2,3&4/16
Zone	Process

The process is exothermic and requires ultra-pure water for its operation. The pumps **CP-600A/B** (2x 100% configuration) ensure a sufficient flowrate of pure water to the electrolysis stacks. The pressure transmitter PT-600 control the discharge pressure of the pumps, **PT-600** will start up the standby pump in case of the failure of the main pump or every 24hrs.

If the Electrolyser is stopped between this period the last pump which was running remains in memory, so the machine restart with the other pump and timer is reset. The pumps are equipped with a variator VAR-600A/B. They start the pump smoothly to prevent pressure surge and water hammer in the piping during every pump start-up.

A level switch low **LSL-600** (SIS) is installed to prevent dry run of the pumps **CP-600A/B**.

The pressure transmitter **PT-600A/B** are downstream each pump and measure the pressure of each pump to avoid exceeding design pressure of the loop.

HE-600 heat exchanger allows heat transfer from process to the secondary cooling loop 200.

The ion exchange resin contained in the filter housing **FH-600** allow to keep water at the set conductivity which is controlled by the combined conductivity and temperature sensor **CT/P-600**.

A flow transmitter **FT-600** (SIS) verifies that the flow rate to the electrolysis stacks is sufficient.

A mechanical filter **F-600** prevents the particles from entering in the flow into the stacks.

At the outlet of the stacks, temperature is controlled by temperature sensors (**TT-601X, X: A-H**).

Stacks can be isolated with the manual valve **HV-604** upstream and the manual valve HV-605 downstream. Those valves are respectively equipped with a limit switch **ZIO-604** and **ZIO-605** to prevent operation of the stacks with those valves closed.

Oxygen separator **ST-600** separates oxygen gas from water. Water level in oxygen separator **ST-600** is controlled by the level transmitter **LT-600**. When water level is low, the separator is filled with pure water thanks to the lift pumps **LP-300A/B** (2x 100% configuration), which pump the water from

This document is strictly confidential. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

storage water tank (included in the water treatment package **WTP-300**) to **ST-600** through the valve **PV-300**. This valve is an ON/OFF pneumatic valve and is controlled by the **LT-600**. The pressure transmitter **PT-300** control the discharge pressure of the pumps, **PT-300** will start up the standby pump in case of the failure of the main pump.

A level switch high **LSH-600** (SIS) is installed to prevent water overfilling of the separator and flooding of the oxygen panel.

A level switch low **LSL-600** (SIS) is installed to prevent any damage to the pumps **CP-600 A/B**.

Pressure monitoring and control

In case of an overpressure in **ST-600**, a first alarm will be triggered when a set pressure, measured by the pressure transmitter **PT-610**, is reached. **PT-610** is mounted on a block and bleed valve (BBV-610) which allows the calibration of the pressure transmitter. If the pressure continues to rise higher than alarm pressure of PT-610, pressure transmitter **PT-611** (SIS) will trigger a safety stop when its set pressure is reached. Consequently, it stops the entire electrolyser (please refer to the cause &effect matrix for further details, C63-PWI-002) . PT-611 is mounted on a block and bleed valve (**BBV-611**) which allows the calibration of the pressure transmitter for safety purpose Finally, the last level of protection is the pressure safety valve **PSV-610**, which cracks at its set pressure.

Depressurization

During a normal stop, the electrolyser is depressurized through the motorized proportional valve **MPV-611**. During a safety stop (in case of an emergency), the electrolyser is slowly depressurized through the solenoid valve **PV-610**. The flow is restricted by the restriction orifice **RO-610** to limit the speed of the depressurization. In case the oxygen vent is obstructed, hence an overpressure is caused, the pressure transmitter PT-612 triggers a warning. A progressive blockage on the oxygen vent during operation occurred. For that, a maintenance operation cleaning is needed.

PT-612 is mounted on a block and bleed valve (**BBV-612**) which allows the calibration of the pressure transmitter.

A demister (**DEM-600**) is installed at the top of the oxygen separator **ST-600** outlet to remove water droplets from the gas flowing to the analysis panel.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

Prior to be either vented, or valorised for production, oxygen is directed through the heat exchanger **HE-610** to condense the residual liquid in the gas stream. Then it is conducted to the condensate separator **CS-610** to separate liquid water (condensate) from the oxygen gas.

The liquid water fills the condensate separator till the level switch high **LSH-610** is reached. This last trigger the opening of the solenoid valve **PV-600**, allowing the transfer of the condensate to the pure water supply, upstream lift pumps **LP-300A/B**, through the restriction orifice **RO-600**. When the level switch low is triggered **LSL-610** the transfer is stopped.
An additional pneumatic valve **PV-601** is closed if the level switch low **LSL-611** (SIS) is triggered to avoid transferring oxygen to the pure water line.

5.3. H_2 LOOP – *620*

Line number	620
Objective	Renew water at cathode
Reference	C63-PID-001, Folio 2,4&6/16
Zone	Process

The pumps **CP-620A/B** (2x 100% configuration) supplies a minimal flow (55% of the pump flowrate) required at the stack cathode. The pump is equipped with a variator **VAR-620A/B**. It starts the pump smoothly to prevent pressure surge and water hammer in the piping during every pump start-up.
The pressure transmitter **PT-620** control the discharge pressure of the pumps, **PT-620** will start up the standby pump in case of the failure of the main pump or every 24hrs. If the Electrolyser is stopped between this period the last pump to run remains in memory, so the machine restart with the other pump and timer is reset.
The pressure transmitter **PT-620A/B** are downstream each pump and measure the pressure of each pump to avoid exceeding design pressure of the loop.
A level switch low **LSL-620** (SIS) is installed in the **ST-620** to prevent a dry run of the pumps **CP-620A/B**.
Like loop 600, conductivity of water is kept at the set value thanks to the ion exchange resin contained in the filter housing **FH-620**. The conductivity is monitored with the combined conductivity and temperature sensor **CT/P-620**.
A mechanical filter **F-620** removes particles from water and a flow transmitter **FT-620** checks that the flow rate to the electrolysis stacks is sufficient.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

Hydrogen separator **ST-620** separates hydrogen from water. Water level in hydrogen separator ST-620 is controlled by the level transmitter **LT-620**. A low level will be detected by level switch low **LSL-620** (SIS).
The water level rise in the **ST-620** due to electro-osmotic flow (transfer from anodic water loop 600 to cathodic water loop 620). The level is controlled with the balancing line loop 640 which transfers the electro-osmotic flow from **ST-620** to **ST-600**.

The condensate separator **CS-630** separates liquid water from the hydrogen gas. The level switch high **LSH-631** on the **CS-630** aims to prevents water overfilling of downstream hydrogen gas lines.

The condensate liquid water fills the condensate separator till the level switch high **LSH-630** is reached. This last trigger the opening of the pneumatic valve **PV-620**, allowing the transfer of condensate liquid to the high-pressure degasser **DG-640** through the restriction orifice **RO-620**. When the level switch low **LSL-630** is triggered **the PV-620** closes stopping the transfer.

Pressure monitoring and control

The pressure in separator **ST-620** is controlled by the pressure transmitter **PT-630**. In case of an overpressure in **ST-620**, a first alarm will be triggered when a set pressure, measured by **PT-630**, is reached. **PT-630** is mounted on a block and bleed valve (**BBV-630**) which allows the calibration of the pressure transmitter. If the pressure rises higher than set pressure of PT-630, the pressure transmitter **PT-631** (SIS) triggers a safety stop when its set pressure is reached. **PT-631** is mounted on a block and bleed valve (**BBV-631**) which allows the calibration of the pressure transmitter for safety purpose. Finally, the last level of protection is the pressure safety valve **PSV-630** which cracks at its set pressure.

Depressurization

During a normal stop, the electrolyser is depressurized through the valve **PV-631** and a metering valve **MV-631**, which limits the flow of fluid. During a safety stop, the electrolyser is slowly depressurized through the valve **PV-630** and the restriction orifice **RO-630**, which regulates the flow and the speed of depressurizing. In case the vent is obstructed, hence an overpressure is caused, the pressure transmitter **PT-632** triggers a warning. **PT-632** is mounted on a block and bleed valve (**BBV-632**) which allows the calibration of the pressure transmitter.

Differential pressure between ST-600 and ST-620

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

Differential pressure between the two separator is kept constant thanks to a control function based on **PT-630** and **PT-610**, which acts on the opening of a motorized proportional valve (**MPV-611**) and the ON/OFF pneumatic valve **PV-631**.

A reverse differential pressure or/and a too high differential pressure can damage the stacks, a safety stop is triggered as well by **PT-631** (SIS) and **PT-611** (SIS) if the differential threshold is exceeded.

5.4. INSTRUMENT PANEL

5.4.1. Oxygen Analysis Panel - 610

Line number[2]	610
Objective	Keep minimum pressure in oxygen gas analysis loop Control hydrogen content in oxygen produced
Reference	C63-PID-001, Folio 3/16
Area	Process

Prior to be analysed, oxygen is cooled down through the **ACO-610**, which condensates residual liquid in the gas stream and traps suspended droplets. The mechanical filter **F-610** removes the last traces of water from the oxygen gas to not distort the analysis measure. This filter can be drained by opening the manual valve **HV-610D**.

Fast loop is pressurized at 11 barg, the flow sent to the vent is 11 NL/min and controlled by the **FICV-611**. The fast loop allows the sample to be drawn under pressure, so that it can be brought more quickly to the analyser. This reduces the response time of the analysis system.

Sample for analysis is taken from this fast loop through the pressure reducing valve **PRV-610**.

The **PRV-610** expands the gas from 11 barg to around 0.5 barg. The pressure of the gas analysis line can be visually controlled with the pressure gauge PG mounting on the **PRV-610**.

The hydrogen in oxygen detectors **HIOD-610A/B/C** (SIS) (2oo3 voting) continuously control hydrogen content in the produced oxygen. A safety stop is triggered when 50% of LEL, which present 2% vol. (according to ISO 22734) is reached on two of the three detectors.

The flow analysed in each of these three detectors is 1 NL/min. This analysis flow is controlled and monitored by the flowrate indicator control valves **FICV-610A/B/C** (SIS), which trigger an alarm and safety stop when flowrate is too low on two of the three flow indicators.

[2] All components located in the oxygen section (oxygen separator's vapor line) are depicted in the fluid diagram with tag numbers beginning with 61X.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. The hydrogen in oxygen detectors **HIOD-610A/B/C** are calibrated thanks to a dedicated line closed by **HV-616**.

The following figure shows the arrangement of the oxygen zone contained in the instrument panel.

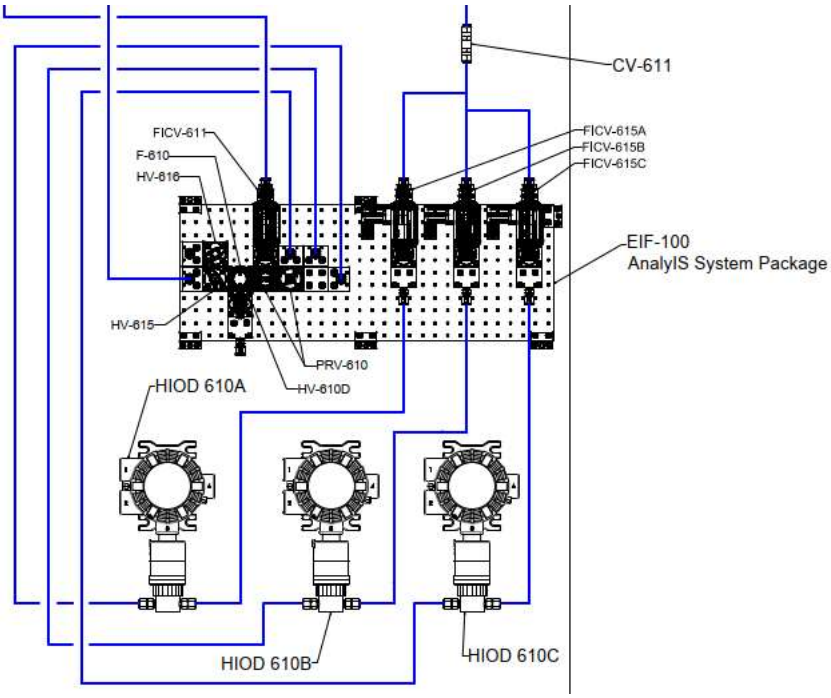

Figure 9: Oxygen section on instrument panel

The HV-616 valve is only used to calibrate the HIOD-610.

5.4.2. Hydrogen Analysis Panel – 800

Line number[3]	800
Objective	Analyze produced hydrogen
Reference	C63-PID-001, Folio 8/16
Zone	Process

The hydrogen is analysed before being sent to the customer's network. Analysed hydrogen is vented.

Pressure is reduced at 0.5 barg with the valve **PRV-800**.

The dew point transmitter **DPT-800A/B/C** (2oo3 voting) determines water content of the gas.

The oxygen content is measured using the oxygen in hydrogen detectors **OIHA-800A/B/C** (2oo3 voting). The control valve **FICV-800** (SIS) ensures a minimal flow analysed through **DPT-800A/B/C** and **OHIA-800A/B/C**.

[3] All components located in the hydrogen analysis section are depicted in the fluid diagram with tag numbers beginning with 80X.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. The 3-way valve **3WV-800** is used to calibrate the detectors **OIHA-800A/B/C**.

The **FICV-800** (SIS) ensures that a maximal hydrogen flow is not exceeded to avoid creating an hazardous area at the outlet of the Hydrogen Analysis Vent, if the rated flow is exceeded (4 NL/min) then the pneumatic valve **PV-800** is closed.

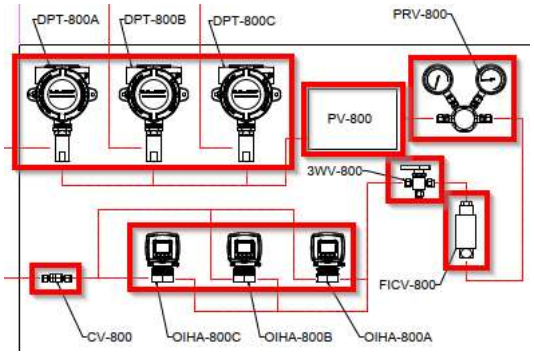

Figure 10: Hydrogen section on instrument panel

The 3-way valve (3WV-800) is used to calibrate the OIHA-800A/B/C.

5.4.3. Instrument air distribution panel – 150/980

Line number	980
Objective	Supply instrument air to pneumatic valves
Reference	C63-PID-001, Folio 9/16
Zone	Process

The actuation of pneumatic valves of both process and hydrogen purification package is insured by compressed air. A compressed air flow between 5 and 7 barg is required for the proper actuation of pneumatic valves. The pressure transmitter **PT-150** enables to check the pressure in the compressed air line, in case of a pressure below the set point, the pressure transmitter will trigger an alarm and stops the electrolyser. **PT-150** is mounted on a block and bleed valve (**BBV-150**).

A compressed air maintenance connection **HV-151** is predicted on the compressed air panel which enables the technician to use compressed air for compressor maintenance or cleaning.

The compressed air is delivered to the buffer tank **BTK-980** via the check valve **CV-980**. Downstream the buffer tank, compressed air is supplied to:

- the pneumatic valves of the hydrogen purification package **HPP-700**,
- the pneumatic valves of the water treatment package **WTP-300**,
- the pneumatic valve island **PVI-980** which is a distributor to **PV-631**, **PV-632**, **PV-632, PV-300**, **PV-901**, **PV-921**, **PV-620**, **PV-642**, **PV-633**, **PV-500** and **PV-640**,

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. - the pneumatic valve island **PVI-900** which is a distributor to all pneumatic valves involved in the stop sequence: **PV-900**, **PV-920**, **PV-601**, **PV-610**, **PV-630**, **PV-635**, **PV-641**, **PV-800**, **PV-501**. Each pneumatic valve is piloted thanks to a solenoid valve. **SV-900**, **SV-920**, **SV-601**, **SV-610**, **SV-630**, **SV-635**, **SV-641**, **SV-800** and **SV-501**.

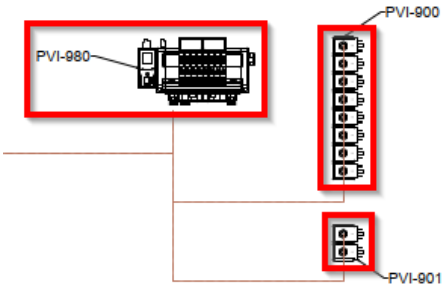

Figure 11: Compressed air section on instrument panel

5.5. H_2 LINE – *630*

Line number	630
Objective	Pre-dry hydrogen by condensation before purification
Reference	C63-PID-001, Folio 6&7/16
Zone	Process

A demister **DEM-620** installed at the top of the hydrogen separator **ST-620** to ensure no water droplet in the outlet hydrogen flow.

The produced hydrogen is directed to the heat exchangers **HE-630** and **HE-631** (2x 50% configuration). These heat exchangers cool down the hydrogen thanks to the secondary cooling fluid flow of loop 400 and also take a part of the water content in the gas by condensation. The condensed water is directed back to the process by means of the condensate separator **CS-630**, where liquid water is separated from the gas.

A demister **DEM-630** installed at the top of the condensate separator **CS-630** to ensure no water droplet in the outlet flow.

5.6. BALANCING LINE - *640*

Line number	640
Objective	Transfer water from hydrogen loop 620 to oxygen loop 600
Reference	C63-PID-001, Folio 7/16
Zone	Process

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

In normal operation, the electrolysis stack transfers water from anode to cathode. This phenomenon, called cross-permeation, regularly increases the water level in the hydrogen loop. To keep the balancing between hydrogen separator and oxygen separator, a water transfer line from hydrogen separator ST-620 to oxygen separator ST-600 should be provided.

The differential pressure between hydrogen loop and oxygen loop is used to direct water from the hydrogen separator **ST-620** to the oxygen separator **ST-600** (differential pressure controlled with two transmitters PT-630 and **PT-610** and secure by two others **PT-631** (SIS) and **PT-610** (SIS)).

The pressure of the water is decreased until 13 barg by the water pressure reducer valve **PRV-640** and its flowrate is manually regulated by the metering valve **MV-640**. A flow switch **FSH-640** helps to set the right flowrate and trigger an alarm if the flowrate is too high. **FSH-640** closes **PV-641** and trigger a safety stop if the rated balancing flowrate is exceeded. It prevents transferring water from hydrogen separator **ST-620** to oxygen separator **ST-600** which has not spent sufficient time in the degasser **DG-640** to remove hydrogen bubbles.

The opening of the valve **PV-640** is controlled by the water levels in **ST-600** and **ST-620**, whereas the opening of the valve **PV-642** is controlled by the water level in the degasser **DG-640**. Hydrogen is flushed to vent through the metering valve **MV-642**.

Due to pressure decrease, the hydrogen dissolved in water is degassed in the **DG-640** and goes upward in the top of the **DG-640** creating a small pocket of hydrogen.

Level control loop is based on **LSH-640** and **LSL-640**. When **LSL-640** is triggered, **PV-642** is opened till the hydrogen gaseous sky reaches **LSH-640**.

The level switch **LSL-641** (SIS) is triggered when the level of water in the degasser **DG-640** is too low. It triggers fault and closes **PV-641** to avoid transferring hydrogen gas (from **DG-640**) to oxygen separator **ST-600**.

5.7. H_2 PURIFICATION – *700*

Line number	700
Objective	Dry and purify produced hydrogen
Reference	C63-PID-001, Folio 11/16
Zone	Process

After the hydrogen/water separation thanks to cooling/condensation, the hydrogen is directed to the hydrogen purification package **HPP-700** to enter the deoxidizer reactor **61** to eliminate oxygen traces by recombining oxygen with hydrogen on a palladium catalyst.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

The hydrogen is then dried up by either drying columns **64A** or **64B**. One column dries up the gas while the other is either regenerated or is in standby.

Each pressure vessel from the purification unit is protected by a pressure safety valve (**PSV 64.1** and **PSV 64.2**)

Please refer to the user manual of the hydrogen purification package (DEDR 500_36 Installation Commissioning Operation and Maintenance Manual Rev.0) for more information about its operation.

5.8. H_2 DISTRIBUTION PANEL – *631*

Line number	631
Objective	Manage the hydrogen distribution to customer at set pressure and purity
Reference	C63-PID-001, Folio 8/16
Zone	Process

The back pressure valve **MPV-630** keeps the hydrogen pressure stable in the electrolyser regardless of the produced hydrogen flowrate.

The check valve **CV-633** prevents hydrogen in downstream network from coming back to the machine.

The controlled isolation valve **PV-633** (SIS) isolates customer installation when machine stops or hydrogen purity unachieved.

The valve **PV-632** evacuates non-compliant hydrogen to vent. Hydrogen is vented through **MV-632**.

The hand valve **HV-931** connects to the vent the flow transmitter **FT-630** to purge it with nitrogen (by opening the hand valve **HV-930**) for replacement/maintenance purposes.

The valve **PV-635** is used to isolate the customer line from the electrolyser in case of a sudden and important pressure drop in hydrogen pressure (leak case). The pressure transmitter **PT-633 (SIS)** measures the pressure of the customer line.

Hydrogen produced flowrate is measured using the flowrate transmitter FT-630.

5.9. WATER SUPPLY – *300*

Line number	300
Objective	Supply pure water: • Loop 600, only in production • Loops 600 and 620 in maintenance mode
Reference	C63-PID-001, Folio 1/16
Zone	Process

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

At the electrolyser inlet, desalinated water is purified by the water treatment package **WTP-300** and is stored in a demineralized tank. Water level of this storage tank is monitored with the level transmitter **LISA-1B1**.

The conductivity of the water stored in the demineralized tank is under 0,1 µS/cm and is controlled by the conductivity indicator **QIA-1B4**. Water in the demineralized tank can be drained by **HV-301D**.

The pumps **LP-300A/B** (2x 100% configuration) feed the oxygen loop 600 through the three-way valve **3WV-320**.

For the first start up, **ST-620** is filled thanks to the same **3WV-320** and **LP-300A/B**.

5.10. N_2 DISTRIBUTION PANEL – *900*

Line number	900
Objective	Supply nitrogen to process for blanketing
Reference	C63-PID-001, Folio 9/16
Zone	Process

The nitrogen flow at a minimum pressure of 7 barg is required for the maintenance and blanketing of the electrolyser. If the inlet nitrogen pressure, measured by the pressure transmitter PT-910, is too low, the electrolyser triggers an alarm and stops. **PT-910** is mounted on a block and bleed valve (BBV-910). Customer shall install the appropriate regulator when needed, for instance downstream a nitrogen cylinder rack.

The pressure safety valve **PSV-900** set to 10 barg protects the nitrogen supply against overpressure in case the regulator installed on the nitrogen rack fails. Should it fail, nitrogen would be flushed to the oxygen vent. The pressure transmitter **PT-910** enables to check the pressure of the nitrogen supply line.

A nitrogen maintenance connection **HV-911** is available on the nitrogen panel which enables the technician to use nitrogen for tooling or cleaning.

Nitrogen can be delivered to:

- O2 separator **ST-600** by two different paths: through **PV-900/MV-900/FT-900** and through **PV-901/MV-901/FT-901** respectively for a safety and a normal blanketing,
- H2 separator **ST-620** by two different paths: through **PV-920/MV-920/FT-920** and through **PV-921/MV-921/FT-921** respectively for a safety and normal blanketing,
- Hydrogen distribution panel (for maintenance of **FT-630**) through the manual valves **HV-930** and **HV-931**,

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

- High pressure degasser **DG-640** through the manual **valve HV-940** (for maintenance)

The nitrogen flowrate for O2 side blanketing can be manually controlled by the metering valves **MV-900** and **MV-901** which can be properly set with the help of the flow transmitters **FT-900** and **FT-901**.

Depending on the type of blanketing (namely normal or safety blanketing), one of the two pneumatic valves **PV-900** and **PV-901** opens (respectively **PV-901** or **PV-900**) allowing the supply of nitrogen to the **ST-600** at the appropriate rate and during the appropriate time for each type of blanketing.

In case of double check valve leak (**CV-900** & **CV-901** – using 2 different technology), the pressure transmitter **PT-900** will indicate a rise in pressure due to oxygen presence and will stop the machine without nitrogen purge. **PT-900** is mounted on a block and bleed valve (**BBV-900**).

The H2 side blanketing is realized with the same method than the O2 side.

5.11. THERMAL LOOPS – *200* & *400*

These secondary loops regulate the temperature of the primary loops:

- Loop 200 (45°C) is used to cool the process and the water cooler condenser.
- Loop 400 (3°C) is used to cool the hydrogen and oxygen gases.

The cooling fluid in loop 200 and loop 400 is Monopropylene glycol (MPG) at 40% containing corrosion inhibitors that protect the loops against freezing to -20°C.

These coolants are managed in the **THS-200** thermal skid and **WC-400** and **WC-401** water coolers. The **DC-200** and **DC-201** air coolers are associated with the cooling loop 200.

Optional: two connections can be made available to collect fluid from the cooling circuit to restore its thermal power.

5.11.1. Process cooling loop – *200*

Line number	200
Objective	Regulates process temperature
Reference	C63-PID-001, Folio 10/16
Zone	Process – Utilities

The cooling fluid circulates through the process heat exchanger **HE-600** to cool down the water injected in the stacks since the electrochemical reaction is exothermic. The cooling fluid comes back from the process skid in a temperature of 45°C and cools down in the dry coolers **DC-200** and **DC-**

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

201 (2x 50% configuration) down to around 35°C. After the dry coolers, the cooling fluid circulates through the condensation water skid where **CP-200A** (PUMP N°3) and **CP-200B** (PUMP N°4) (2x 100% configuration) send it back to **HE-600**.

The motorised three-way valve **M3WV-200** controls the amount of cooling fluid to the heat exchanger **HE-600** and recirculated within the **DC-200/201** and **THS-200**.

The **TS-154** measures the temperature of MPG40% downstream heat exchanger (**HE-600**) and the **TT-126** measures the temperature of MPG40% upstream the **HE-600**.

The relief valve **RV-200** protects the O2 loop cooling loop against overpressure due to dilatation.

5.11.2. Gas cooling loop – *400*

Line number	400
Objective	Cool down the gas H2 and O2 For internal HVAC needs (FCUs, AHU). Cool down the rectifiers via Hydraulic cooling unit. Cooling need for HPP system
Reference	C63-PID-001, Folio 10/16
Zone	Process – Utilities

The cooling loop-400 is composed mainly from skid pump distribution (**THS-400**), and two water chillers **WC-400/401** (2x 50% configuration) with two independent refrigerating circuits (refrigerant fluid: R513a).

This chilled water is used for three different purposes explained below.

- Gas cooling

The oxygen flows out of **ST-600** and passes through heat exchanger **HE-610**, which condensates the residual liquid in the oxygen gas stream.

For the same goal, the hydrogen flows out of **ST-620** is directed to heat exchangers **HE-630** and **HE-631**.

Cooling fluid is cooled down through the water chiller **WC-400** and **WC-401** and directed to **HE-630** and **HE-631** at 5°C via the metering valve **MV-320**. Then the cooling fluid goes to **HE-610** and **ACO-610**. Finally, it goes to the hydrogen purification package **HPP-700** to condensate water in the hydrogen used for regeneration.

The **TT-60** measures the temperature of MPG downstream both **WC-400/401**. The **TT-25** measures the temperature of MPG downstream thermal load.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

The relief valve **RV-400** protects the hydrogen gas cooling loop from overpressure.

An air vent is installed downstream each heat exchanger allowing to degas the bubbles present at the first start or in case of a heat exchanger failure (**AV-400** for **HE-630**, **AV-401** for **HE-631** and **AV-402** for **HE-610**).

- Ambient air cooling (HVAC system)

The electrolyser is equipped with an air handling unit (**AHU-400**) in the HVAC room E01 for the treatment of fresh air in different rooms. It also ensures the overpressure to prevent the air infiltration in rooms.

The **AHU-400** deals with heat dissipation and air renewal in the following rooms:

- A01– Stack room
- B01–Electrical room (Rectifiers+ control cabinets)
- C01–Water Treatment Package room
- E01–HVAC room
- A10 – Hydrogen process container
- A02 – O2 process room
- A03 – H2 process room

The **AHU-400** distribute fresh air to rooms thanks to ductwork.

The B01 room,which has the most important heat load, is equipped also with 4 fan coil units (**FCU-400/401/402/403)**) where heat is transferred to the cooling water. Cold battery of each unit is connected to cooling water network and controlled by a three-way-valve.

- Rectifier cooling

The hydraulic cooling unit **HCU-400** is supplied by cooling water at 5°C through the metering valve **MV-318**. Then the cooling water is divided to cool down the two rectifiers **REC-001** and **REC-002**.

The **HCU-400** allows to avoid cooling down the rectifier's units with too cold temperatures, thus, no condensation are expected.

5.12. DRAIN – *500*

Line number	500
Objective	Collect all drains present in the electrolyser
Reference	C63-PID-001, Folio 1/16
Zone	Utilities – Process

Loop 500 collects, on one hand, the retentate of the water purification package **WTP-300**, condensate water from **FCU-400/401/402/403** and **AHU-400** and, on the other hand, the condensates from hydrogen vent condensates and hydrogen purification condensates

This document is strictly confidential. At the lowest point of the hydrogen vent collector a siphon prevents water to go back to hydrogen vent. Four level switches monitor the level of the collected condensate in the hydrogen vent: **LSH-500** and **LSHH-500** (SIS) for too high level, **LSL-500** and **LSLL-500** (SIS) for too low level.

5.13. AMBIENT – *1000*

Line number	1000
Objective	Monitor hydrogen content in the ambient area Declaring an emergency Monitor minimal ambient temperature in the rooms
Reference	C63-PID-001, Folio 12&13/16
Zone	Process area

5.13.1. Safety devices

The ambient hydrogen detectors AHD-1001 (SIS) and AHD-1004 (SIS) are installed on the level 00. They are respectively located in the H2 process room (A03 area) and in the stack room (A01 area). Both are closed to the ventilation exit to detect any hydrogen leak in these areas.
The AHD-1000 (SIS), AHD-1003 (SIS) and AHD-1002 (SIS) are installed on the level 01. One of them (AHD-1000), catalytic technology, is installed close the hydrogen purification which is the unit full of hydrogen showing the biggest number of fittings. A similar detector (AHD-1003) is located at the opposite side. The entire upper level is finally covered with detection of hydrogen leak thanks to the AHD-1002.

Three light columns **VE** coupled with a buzzer **BUZ** are installed on three prominent extremities of the whole installation. The light column can either be a continuous light or flashing. Its colour and flashing type have different meanings, which are listed hereafter:

Colour	Meaning
STEADY GREEN	Electrolyser powered, off or on standby.
GREEN BLINKING (1 s ON / 1 s OFF)	In production
STEADY ORANGE	Presence of a Warning
BLINKING RED (1 s ON / 1 s OFF)	Presence of a Major Fault
STEADY RED	Presence of a Safety Fault
STEADY BLUE	At least one maintenance task must be performed
BLINKING BLUE (1 s ON / 1 s OFF)	At least one maintenance task will arrive soon
BUZZER ACTIVATED	At least one Safety Fault is present
INTERMITTENT BUZZER (2 s ON / 2 s OFF)	Warning on HIOD-610 Warning on **AHD-100X (X,0:4)**

This document is strictly confidential. SSI-1000 stands for *System Security Incendies*, in case of detected fire by the following devices:

- smoke detectors installed (2oo3 voting) inside:
  - A01 – Stack room: SD-001A/B/C
  - A02 – O2 process room: SD-005A/B/C
  - A03 – H2 process room: SD-003A/B/C
  - **A10** – Hydrogen process container: SD-006A/B/C.
  - **E01** – HVAC container: SD-007A/B/C.
  - **B01** – Electrical room: SD-002A/B/C
  - **C01** – Water treatment package: SD-004A/B/C
  - Control cabinet (in B01 area): SD-008A/B/C

- fire buttons (**FB-00X, X:1,5)** triggered by an operator. They are installed outside and inside containers; the SSI-1000 sends a safety signal to stop the installation.

Emergency Shutdown Devices (ESD-00X, X:1-7). Five of them are present outside the containers and the two others are inside, all triggering a safety shutdown of the installation.

Customer has an **AUC** ("Arret Urgence Client" in French, Emergency Shutdown Customer in English) to trigger a safety stop from their installation. Electrolyser package sends two safety signals to the PLC of client. **ASE-001** for fire and gas case, **ASE-002** for all other safety stop case.
Door switches (**DS-00X, X:1-12**) trigger a normal stop (Major Fault) of the installation when the doors are opened by operator to prevent any physical harm.

5.13.2. Complementary devices

The heating preventing the system from freezing is done by electrical wall heaters (EH-100X, X:1-7) installed in each room. The electrical supply of heater is controlled thanks to the temperature & hydrometry transmitter (**TT/HY**-100X, X:1-7) present inside each room:

- **B01** – Electrical room: **EH-1001** & **TT/HY-1004**
- **C01** – Water treatment package: **EH-1002** & **TT/HY-1001**
- **A01** – Stack room: **EH-1003** &**TT/HY-1003**
- **A02** – O2/H2process room: **EH-1004** & **TT-HY-1002**
- **A10** – Hydrogen process container: **EH-1006** & **TT/HY1006**

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

- **E01** – HVAC container: **EH-1007**& **TT/HY-1005**

All the piping, instrumentation and equipment installed outdoor containing water needs to be protected from freezing. heating ribbons (**HR-xxx**) are installed for that purpose. The heat ribbons are detailed in the C63-PID-001

Water leak detector (**WLD-00X, X:1-6)** installed in lowest point aim to detect any water leak: **WLD-001** for A02, **WLD-002** for A01, **WLD-003** for rectifier room, **WLD-004** for water treatment room, **WLD-005** for process room (level 01), **WLD-006** for HVAC container.

Electric meters **PQ-001/002/003/004** measure the power consumption of the electrolyser.
Rectifiers **REC-001/002** convert alternative to continuous current for the stacks. On these rectifiers, current and tension are monitored with **IM-001/002** and **VM-009/010**.

6. INSTALLATION

6.1. GENERAL RECOMMENDATIONS

The system must be installed outdoors on flat, horizontal ground (slope < 1%) compatible with the loads presented on General Arrangement Drawing (C63-GAD-001).

The installation area must provide a connection point for the containers to be grounded.

All doors and emergency stop buttons must always be clear.

All maintenance easements must be clear and accessible for forklift-type handling equipment.

6.2. TRANSPORTATION, STORAGE AND HANDLING

	The system must be shut down according to the procedure provided for this purpose. Gas and electricity connections must be disconnected from the networks.

Parameter	Values
Transport and storage temperature	+5°C / +50°C
Ambient relative humidity	30 to 95%

6.3. HANDLING & ELECTROLYSER INSTALLATION

6.3.1. Electrolyser & Auxiliaries

	For more details, please refer to the **FORES** Instruction of Lifting and manutention.

6.3.2. Special considerations for Oxygen and Hydrogen vents

6.3.2.1. H_2 Analysis vent

The H_2 vent is secured using the H_2 vent connection plate.

1. First ensure that the protective cap on the H2 vent pipe has been removed.
2. Check that the vent is clean.
3. Check that the vent is properly grounded (resistance < 25 ohms)

	Ground continuity must be ensured at the vent. Resistance must not exceed 25 ohms.

Figure 12: Hydrogen Analysis vent

6.3.2.2. O_2 vent

The O_2 vent is fixed using the O_2 vent connection plate.

This document is strictly confidential. 6.5. ELECTRICAL CONNECTIONS

	BEFORE ANY ATTEMPT TO CONNECT THE ELECTRICAL POWER CABLES, ENSURE THAT: ➢ all fluid connections are properly installed; ➢ all manual valves are properly adjusted; ➢ the main transformer is de-energised.

	BEFORE ANY ATTEMPT TO CONNECT THE ELECTRICAL POWER CABLES, ENSURE THAT: ➢ The main circuit breaker of the machine is turned off.

	USE ONLY ELECTRICALLY INSULATED TOOLS.

This document is strictly confidential. ⚠	ONLY QUALIFIED AND AUTHORISED PERSONNEL CAN WORK ON ELECTRICAL CONNECTIONS.

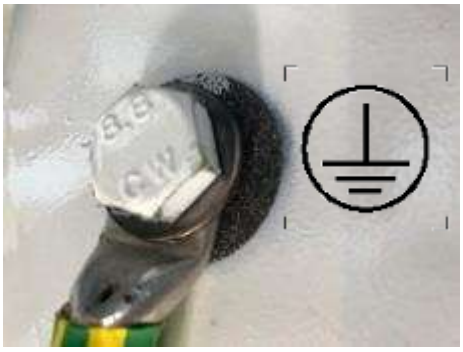
⚠	IT IS THE CUSTOMER'S RESPONSIBILITY TO COMPLY WITH THE ABOVE REQUIREMENTS.

6.5.1. Power

The electrolyser control panel is powered by a main power supply with the following characteristics: 400 VAC, 3P (three-phase) + N (neutral) + PE (protective earthing), 50Hz.

The electrical supply must be protected against an overcurrent/overload of 630A circuit breaker.
The maximal short circuit current of the control panel is 36kA. The earth diagram is TN-S.

6.5.2. Grounding



TYPE	DESCRIPTION
400 VAC power supply	The LV power cables pass between the rectifier container and transformer are connected to the electrolyser at the location provided for this purpose. Refer to the electrical diagram for connecting the cables and the "**Technical Specification for Interconnection Lines**" document. There is a circuit breaker (**1QF3**) on the electrical control cabinet that can be used to turn off and isolate from the general 400 VAC power supply coming from client's LV switchgear. See: "*Appendix B: Electrical Diagram*" ⚠ The installer must provide adequate protection on this power supply. The size of the protection must comply with applicable local standards and installation neutral system guidelines.

The earth bars in the container must be grounded by the customer. The container must also be connected grounded using the earth stakes outdoors (no M12X1.5 screw).

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. 7. SYSTEM OPERATION

7.1. GENERAL REMARKS

	Note: the electrolyser is equipped with a TSA hydrogen purification system. Regeneration is automatically controlled by the PLC and requires no human intervention.

	Caution: In the event of a normal machine shutdown, if regeneration is in progress, the electrolyser will continue to run at reduced output until the column is fully regenerated. Only an IP1 or SIS Fault will stop regeneration.

7.1.1. Operator Training

The system is operated by persons duly trained by Elogen or a company designated by Elogen.

7.1.2. System Commissioning

The system is commissioned by Elogen or a company designated by Elogen.

7.2. FIRST START

7.2.1. Stage

STAGE	ACTION	DESCRIPTION
1	Preliminary checks	1. The system is installed in accordance with paragraph 6 - INSTALLATION. 2. Check the grounding resistance. 3. The installation site meets the above requirements. 4. Close the **HV-300** valve. 5. Open the public water supply to the machine. 6. Check water conductivity. If conductivity is greater than 1000µs/cm, use another water supply. 7. Open the **HV-300** valve. 8. Open manual valves in accordance with the P&ID. 9. Close manual valves in accordance with the P&ID.  Refer to C63-PID-001 – Process and Instrumentation Diagram

This document is strictly confidential. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

7.3. ELECTROLYSER OPERATION

The electrolyser is controlled via an HMI (Human-Machine interface). All of the features needed to operate the machine are accessible on the IHM.

	For more detail, please refer to **C63-PMO-100 – HMI Manual User**

7.3.1. Description of the different operating modes of the electrolyser

The electrolyser can operate in three modes, as described below. Switching from one mode to the other is done exclusively via the selector switch located on the control panel.

Figure 17: Example of selector knob for choosing electrolyser operating mode

7.3.1.1. Local Mode

LOCAL

-The electrolyser is controlled via the HMI (Human-Machine Interface).
- The HMI is located on the control panel.

7.3.1.2. Remote Mode

REMOTE

-The electrolyser is remotely controlled via PROFINET communication.

7.3.1.3. Maintenance Mode

MAINTENANCE

-For maintenance tasks.
-Each piece of equipment can be tested individually (Except Rectifiers).

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

7.3.2. Description of the different connection identifiers

For each mode, the user must log in with a username and password. The electrolyser has two login credentials:

- “Expert” reserved for ELOGEN starters,
- ”Operator” used by the customer.

The difference between these two logins is the possibility of adjusting the value of the control parameters for the “Expert” log-in, which is mainly used when commissioning the electrolyser.

Figure 18: Example of selector knob for choosing electrolyser operating mode

7.3.3. Description of the different operating states of the electrolyser

The electrolyser is in different states depending on its use. These states are described below.

7.3.3.1. POWER OFF

POWER OFF

-The power supply has been cut off, the electrolyser is not switched on.

7.3.3.2. NO MODE

NO MODE

- Initialization of the main control components.
- No production.
- Non-pressurized machine.
- Non-polarized stacks.
- Few control loops activated.

The electrolyser is in NO MODE status on first start-up or after an emergency stop.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN’s rights. This document is part of ELOGEN’s proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

The electrolyser automatically exits NO MODE status (to STOP status) when:

- The power supply (400Vac and 230Vac if present) is connected,
- All alarms have been acknowledged (see section 8.3).

7.3.3.3. Status: Production (START)

START

e in Local and Remote modes.
roduction.
ed machine.
stacks.
rol loops are active

To start hydrogen production, follow the steps described below:

1. Identify yourself on the HMI
2. Acknowledge all alarms (refer to section 8.3).

	If a “Major Fault” (IP1) or “Safety Fault” (IS1 or IS4) is present. Do not operate the machine until you have determined the cause of the fault.

3. Enter a hydrogen flow value and press “Enter”.
4. Select the range of variation of the low-pressure storage tank (Optional)

	During production, if the outlet pressure reaches the maximum pressure of the low pressure storage tank, the electrolyser automatically switches to STANDBY. As soon as the pressure has dropped below the minimum pressure of the low pressure storage tank, the electrolyser will automatically start filling the tank. The electrolyser will adapt its flow rate to fill the external tank in this control mode, the fuller the tank, the lower the flow rate.

5. Press the **Start** button

	The start-up procedure takes approximately 30 minutes after a long shutdown. Hydrogen production rate and buffer tank pressure can be modified at any time.

7.3.3.4. Status: Idle (Cold)

IDLE

- Accessible in Local and Remote modes.
- Non-pressurized machine.
- Polarized stacks.
- Main control loops active.
- Machine ready for rapid cold start (less efficient than STANDBY).

Idle status can be activated from Start or Stop mode.
To do this:

1. Log in to the HMI.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN’s rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

2. Press the **IDLE** button

	When the machine is at a complete stop. Press the IDLE button to prepare the machine for a quick start.

7.3.3.5. Status: Standby (Hot)

STANDBY

- Accessible in Local and Remote mode.
- No production.
- Semi-pressurized machine (13 barg H2).
- Polarized stacks.
- Main control loops active.
- Machine ready for rapid hot start (more efficient).
- Limited to 1 hour (automatic switch to IDLE after this time).

Standby status can be activated from Start or Stop mode.
To do this:

1. Log in to the HMI.
2. Press the **Standby** button

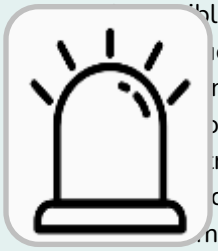
	When the machine is at a complete stop. Press the Standby button to prepare the machine for a quick start.

7.3.3.6. Status: Stop

STOP

- Accessible in Local and Remote modes.
- No production.
- Non-pressurized machine.
- Stacks not polarized.
- Control loops not active (except protection loops).

Stop status can be activated from any other status with the exception of the SAFETY status. To do this:



1. Log in to the HMI.
2. Press the **Stop** button

This document is strictly confidential. 7.3.3.1. Acknowledging alarms or emergency stops

To acknowledge alarms or emergency stops, proceed as follows:

1. Check that any immediate danger has been eliminated and that operating conditions are safe.
2. Disable the emergency stop button(s).
3. Acknowledge alarms on the HMI screen ("RESET"). Press until the button's green light turns off.
4. Press the yellow RESET button on the front of the electric cabinet. This will reset the safety relays.
5. Activate Main Circuit Breaker and Rectifier Breakers.
6. The 400 Vac presence indicator lights up.
7. Wait for the PLC to finish starting.
8. Press the yellow Reset button on the front of the control panel.
9. Acknowledge all the alarms on the HMI again.
10. Press the **Start** button.

	The emergency stop button should only be used in the event of a situation of imminent danger.

	DO NOT USE THE EMERGENCY STOP BUTTON AS A STOP BUTTON

	After an emergency stop, system water levels may need to be readjusted. To do this, refer to the **R1-COM-600** and **R1-COM-620** procedure.

7.3.3.2. Alarms

Most alarm can be categorised in 3 different categories: Minor Fault, Major Fault and Safety Fault.
Each type will trigger the same effects.
Some alarms are triggered special effect. Effects are described in the C63-PWI-002 – Cause & Effect.
The link between effect and alarm is described in C63-PWI-003 – Alarm Table.

7.3.3.2.1. Minor fault (IP9)

These alarms appear when an alert level is reached. It indicates a deviation from the process which has no impact on safety or the machine process (quality/capacity).
This notification must be acknowledged on the IHM.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

7.3.3.2.2. Major fault (IP1)

This alarm appears when a critical level is reached. This error triggers a controlled stop of the electrolyser including the rectifiers.
This error must be acknowledged on the IHM.

7.3.3.2.3. Safety Fault (IS1 and IS4)

“Safety Faults” appear when a hazardous level is reached. This error triggers an emergency stop of the machine and turns off all the electrical equipment, except for signalling, command control and lighting.
This error must be acknowledged on the IHM and the machine must be reset using the YELLOW button on the front of the cabinet.

Note: for more information about the categorization of alarms, please refer to C63-PWI-002 – Cause and Effect

7.4. ELECTROLYSER STORAGE

	The electrolyser must be ALWAYS stored at a temperature above 5°C. Install an electric heater if necessary.

If the electrolyser needs to be stored for a long period (> 3 months), take the following steps:

- Disconnect all “process” connections.
- Replace stoppers on gas and fluids.

	If the electrolyser needs to be for more than 3 months, the electrolysis stacks must be removed and stored in a safe place in a controlled atmosphere (> 5°C). To do this, follow the **R2-COM-004** procedure. Pure water circulation must be maintained in the stack to preserve its performance level and optimise its lifespan.

7.4.1. Inerting the Hydrogen Purification Unit

Refer to procedure **R2-HPU-700**.

	Proceed with caution with hydrogen gas under pressure.

7.4.2. Draining the Process Water Loops

Refer to procedure **R2-COM-004**.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN’s rights. This document is part of ELOGEN’s proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN’s trade secrets or know-how is subject to ELOGEN’s prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

	Before draining all the loops, contact Elogen.

7.4.3. Draining Main Cooling Loop 200

Refer to procedure **R1-COM-200**.

	Even if the level indicated by the level indicator is low, there may still be coolant in the loop.

7.4.3.1. Draining Main Cooling Loop 400

Refer to procedure **R1-COM-400**.

	Even if the level indicated by the level indicator is low, there may still be coolant in the loop.

7.4.3.2. Powering off the electrolyser

Refer to procedure **R2-DEC-002**.
Refer to procedure **R2-DEC-001**.

	Only authorised personnel trained in the use of electrical devices can carry out this procedure.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

8. Description of Human-Machine Interface

Communication between the electrolyser and its user takes place via several elements presented in this section. These are:
- The electrical cabinet, with switches, buttons, indicator lights and dataloggers on its front panel, to ensure safe operation of the electrolyser.
- The light column informing users of the status of the electrolyser.
- The HMI touch screen, enabling the user to control the electrolyser and acquire detailed information.

8.1. ELECTRICAL CABINET

The front panel of the control panel features several buttons and indicator lights, which are described in detail in this section.

	Indicator lights cannot be used as reliable indicators of absence of voltage. No electrical work should be done without previously turning off and locking out the main circuit breakers. Only staff authorised and trained by Elogen can work on electrical equipment.

- Left panel

The left-hand door of the electrical cabinet houses several components shown in Figure 21 and described in the table below:

Item	Element description
A	Meter (**PQ-001**) for measuring electrical quantities on the 400Vac feeder
B	Meter (**PQ-002**) for measuring electrical quantities on the 230Vac feeder of type 2 auxiliaries
C	A joystick (2) dedicated to the switch-disconnector for isolating and disconnecting the 230Vac uninterruptible power supply. This same switch-disconnector isolates and disconnects the UPS feeder, as well as the feeder for type 2 auxiliary circuits

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

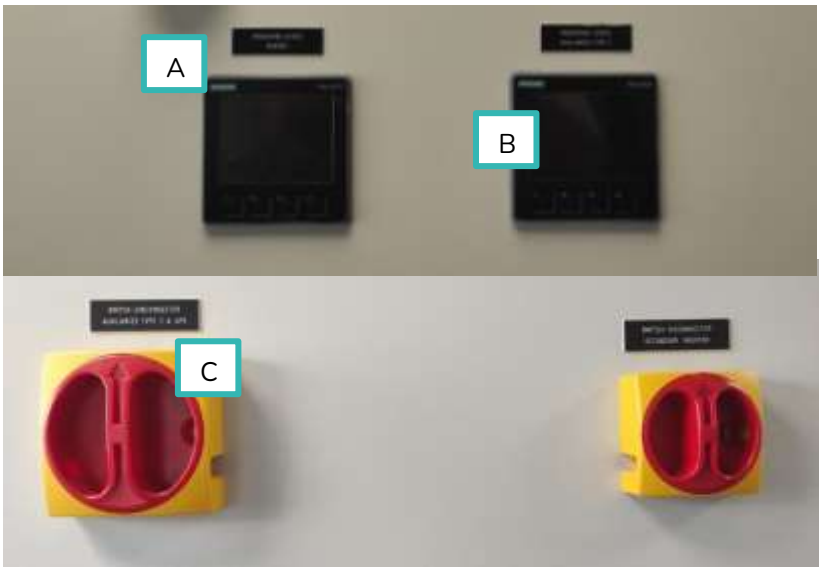

Figure 20: Location of elements on the left-hand front of the electrical cabinet[4]

The **PQ-001** and **PQ-002** dataloggers can be used to monitor and analyze the following electrical quantities:

- Current (phase and neutral)
- Frequency
- Active, reactive and apparent powers and energies
- Power factor

These dataloggers can also be used to monitor network quality parameters such as:

- Overall voltage THD
- Overall current THD

- Right panel

On the right-hand panel, at the top of the cabinet, three indicator lights are installed, as shown in Figure 33 and described in the table below.

Item	Description
A	Indicator light for correct phase sequence L1, L2, L3.
B	System consisting of three LEDs indicating the presence of normal 400Vac mains voltage on phases L1, L2 and L3
C	230Vac auxiliary power supply type 2 indicator light.

[4] PQ-001 and PQ-002 are located inside the control panel.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the import, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

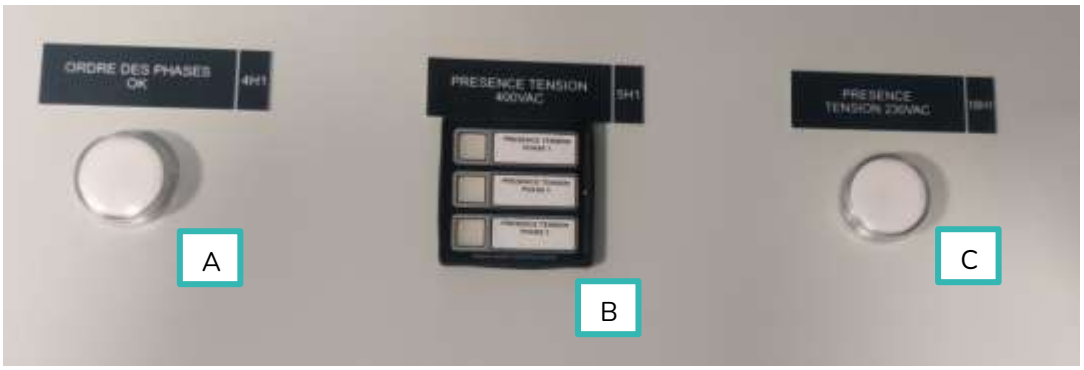

Figure 21: Control cabinet indicator lights (right panel)

Below the indicator lights and the HMI, there are seven elements on the right-hand side of the control panel, as shown in Figure 35 and described in the table below.

Item	Description
A	UPS ON/OFF control selector: allows the user to switch the UPS on and off, powering all safety devices.
B	Yellow Reset button: allows the user to reset the safety module to allow machine start-up.
C	Selector switch to inhibit machine shutdown in the event of a container door opening Process. To be used only in Maintenance mode.
D	Button for testing verrine operation. They light up and buzzers activate when this button is pressed (see §9.2).
E	RJ45 Ethernet communication port under the HMI display for connecting a computer directly to the machine's PLC.
F	Local / Remote / Maintenance mode selector to select the machine control mode (see §8.3).
G	Emergency stop button enables the user to trigger an emergency stop, bringing the machine to an immediate halt.

This document is strictly confidential. Figure 22: Control cabinet knobs (right-hand door)[5]

8.2. LIGHTING COLUMN

The electrolyser is equipped with a glass case (similar to the one shown in Figure 24) in four different colours, and a buzzer emitting an audible signal, to distinguish the different statuses of the electrolyser.

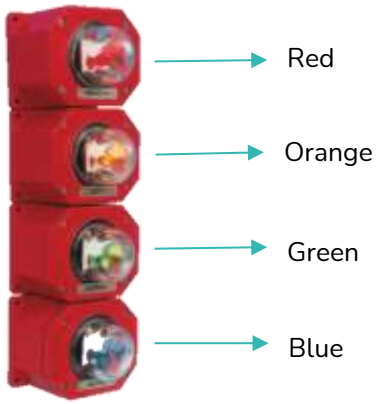

Figure 24: Lighting column

Figure 23: Buzzer

[5] Switch identified as "F" has been replaced in this unit by a button on HMI main page.

This document is strictly confidential. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

The meaning of each colour is described in the table below:

Colour	Meaning
ABANDON	All persons must leave the plant
ALERT	Alarm
NORMAL	Presence of a minor fault
HAZARD	Presence of an "IP1"[6]

8.3. HMI TOUCH SCREEN

	Please refer to the **C63-PMO-100** HMI User Manual.

9. MAINTENANCE

9.1. INTRODUCTION

Appropriate maintenance must be carried out on the electrolyser in order to preserve its performance level and optimise its lifespan.

Maintenance of the electrolyser must be carried out by trained and qualified personnel with the agreement of ELOGEN. There are 2 levels of maintenance detailed below.

Personnel responsible for the operation and maintenance of the electrolyser described in this manual must read, understand and apply the instructions in this manual. Special attention must be paid to the safety chapter.

Failure to carry out a maintenance operation within the scheduled timeframe may result in the loss of the manufacturer's warranty.

	The electrolyser must be stopped, depressurised, inerted with nitrogen and cooled to a temperature below 40°C before carrying out any maintenance operation.

To do this, press the "Stop" button on the machine and wait for it to cool down.

[6] See PWI-002 – Cause and Effect

This document is strictly confidential. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

	Warning: after a stop order is sent, the machine may still undergo depressurisation. Wait until the system indicates a pressure of 0 barg across the entire system and the network temperature has dropped below 40°C.

	Warning: if a maintenance action must be carried out on the hydrogen purification unit or in the surrounding area, follow the procedure detailed in 7.4.1.

9.2. LEVEL 1 MAINTENANCE

Level 1 system maintenance is performed in the context of nominal use of the equipment. It is presented in the Level 1 user manual.

9.2.1. Level 1 Maintenance Operations

First level maintenance operations are described in the paragraph below. These can be carried out by trained personnel, without specific skills.

	See **C63-PMX-001 – Level 1 Service Manual**

9.3. LEVEL 2 MAINTENANCE

Level 2 system maintenance is not performed within the scope of this manual. It consists of the most common troubleshooting operations performed on this type of system.

9.3.1. Operator Training

Level 2 system maintenance must be carried out by operators duly trained by ELOGEN or by a company designated by ELOGEN.

9.3.2. Safety Devices maintenance

To prevent overpressure there are two main protection levels: instrumental and mechanical devices. The first ones are considered as the pressure transmitter and the second ones as the pressure safety valves and rupture discs.

9.3.3. Regulation devices maintenance

To ensure the reliability of the safety loop as defined in the process, the maintenance of the regulatory devices must be performed within the stablished intervals and in accordance with the provided instructions. These are pneumatic and solenoid valves.

This document is strictly confidential. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2025

9.3.4. Safety loop maintenance

The validation, operation, use and maintenance of each safety loop, established on **C63-PUY-001,** are detailed in the procedures compiled in **C63-I1-SIF-00X** and **C63-V1-SIF-00X**.

9.3.5. Level 2 Maintenance Operations

Level 2 system maintenance is carried out by operations described in instruction sheets.

	Note: Before any maintenance action, electrical equipment must be locked out. Lockout must be carried out by qualified and authorised personnel. Lockout must comply with standard NFC 18-510.

	See **C63-PMX-002 – Level 2 Service Manual**

9.4. OTHER OPERATIONS

Any other operation not described in this manual and carried out without the consent of ELOGEN will result in the loss of warranties.

9.5. MAINTENANCE INTERVALS

All maintenance operations are described in document C63-PMO-003. Each operation is detailed in the maintenance procedures or in the manuals for the different components.

	See **C63-PMO-002** (Maintenance)

10. Contraindications

The following is prohibited:

- Installing equipment on the system.
- Obstructing the system air inlets and outlets.
- Operating with one or more system doors open (except for maintenance).
- Operating the system under climate conditions outside the ranges indicated in paragraph **5**.
- Turning off the system if the outside temperature is or may be outside the temperature range specified in paragraph **5**.
- Installing the system on a floor that does not meet the requirements established in paragraph **7**.
- Commissioning the machine in the absence of an ELOGEN operator.
- Removing/reinstalling the internal (fluid and/or electrical) components of the container and the external components of the container without the physical presence of ELOGEN staff or personnel from another company designated by ELOGEN.
- Carrying out maintenance work without first checking for the absence of voltage and the absence of pressure.
- Using tap water that does not meet the criteria established in paragraph **5**.
- Using a cooling fluid that does not meet the criteria specified in this document, and especially replacing the cooling fluid with another fluid.
- Using nitrogen that does not meet the criteria established in paragraph **5** and especially replacing the nitrogen with another fluid.

2. General inspection of the cleanliness of the unit

R1-COM-003	
Objective	**Validation criteria**
• General maintenance of the electrolyser: cleanliness check, cleaning of external parts of components (if necessary), emptying of retention tanks (if necessary)	• Electrolyser is clean • No water in the unit
Required personnel	**Required materials and consumables**
• 2 x people	• 1 submersible pump or water vacuum cleaner • Standard cleaning equipment • 1 bucket
Potential risks (Safety and Environment)	**Prevention and protection measures**
Anoxia risk	• Wear PPE (Personal Protective Equipment) • Personal gas monitor for each operator (calibration and ATEX certificate up to date).

Prerequisites

1. Make sure the electrolyser is stopped, depressurized and wait until the pipes have cooled down.
2. Open all the access doors to the electrolyser.

Operation description

- **Checking the general cleanliness of the electrolyser**

1. Perform an external inspection and cleaning of the electrolyser components (pressurized tanks, piping lines, instrumentation, etc.) present in A10 area.
   a. Check thoroughly if the ATEX component enclosure are not damaged (impact, scratch, …).
   b. Check thoroughly fittings of the hydrogen purification unit
   c. Check if there is no water around Separators & Degasser (**ST-600** / **ST-620** / **DG-640**)
   d. Check drip pan
2. Perform an external inspection and cleaning of the electrolyser components (Pumps, piping, strainer) present in A02 & A03 area
3. Perform an external inspection and cleaning of A01
   a. Check thoroughly cleanliness of stacks (Fitting, cover, electrical wiring)
   b. Check thoroughly instrumentation
4. Perform an external inspection and cleaning of the element in B01
   a. Check presence of moisture in that area
   b. Check if electrical cabinet are not damaged
   c. Check if siphons (**SPH-400**, **SPH-401**, **SPH-402**, **SPH-403**) are cleaned
5. Perform an external inspection and cleaning of the element in C01
   a. Check presence of moisture in that area

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

b. Check thoroughly instrumentation
c. Check that conductivity meter, pressure gauge, etc are not displaying bad value

6. Perform an external inspection and cleaning of the element in E01
   a. Check presence of moisture in that area
   b. Check if there is water in drip pan
   c. Check level indicator and pressure of expansion vessels
7. Perform an external inspection and cleaning of interconnection (X00) and Area between containers (D01)
8. Report any leaks, even minor ones, and degradation of the external parts of the components.
9. Clean dust, residue and other dirt.
10. Remove water if water is detected using submersible pump or water vacuum cleaner

Required time: 4 hours
Periodicity: 6 months

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

3. Topping up and checking fluid quality on the cooling loop at 45°C

<table>
<tr><th colspan="2">C63-R1-COM-200</th></tr>
<tr><td colspan="2"></td></tr>
<tr><th>Objectives</th><th>Validation criteria</th></tr>
<tr><td>• Optimum coolant level in the cooling loop 45°C
• Optimum coolant quality</td><td>• The fluid network must be at 0.5 barg.
• The refractometer shall indicate 40% MPG</td></tr>
<tr><th>Required personnel</th><th>Required materials and consumables</th></tr>
<tr><td>• 1 x person (qualified to work at height)</td><td>• Transfer pump
• Refractometer
• Flexible connection between pump and Dry Coolers
• Storage tank
• Coolant quality (40% monopropylene glycol by weight, with pH between 7.5 and 8.5)</td></tr>
<tr><th>Potential risks (Safety and Environment)</th><th>Prevention and protection measures</th></tr>
<tr><td>Chemical risk: (refer to Safety Data Sheet C63-SDS-007- MPG 40%)
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation.
Electrical risk: Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits.</td><td>• Wearing PPE
• Personal gas monitor for each operator (calibration and ATEX certificate up to date).</td></tr>
<tr><th colspan="2">Prerequisites</th></tr>
<tr><td colspan="2">1. Ensure that the electrolyser is stopped and cold (Stacks temperature under 40 °C – TT-601X) and that its status indicates “Stop”.
2. Log in to “Maintenance” mode.</td></tr>
<tr><th colspan="2">Operation description</th></tr>
<tr><td colspan="2">• Component inspection
All maintenance work must be carried out by qualified, authorized personnel. Before performing any work:
1. Disconnect the power supply from the unit and protect it from being inadvertently reactivated.
2. Perform a visual inspection of all the fitting and control the torque of the fittings
3. A maintenance program with biannual checks for leaks, regulator settings and pipe tightness.
4. Monthly checks of fan bearings, heat transfer fluid condition and level, and for any damage to system components.
5. We recommend running for at least 4 hours after a month's downtime. Do not overload the machine. Do not overload the collectors or use them as lifting points.</td></tr>
</table>

- **Filling lines - Loop 200**

The detailed instructions for filling for the water chiller are given in the document **P.0608871.L.02.406_Ind.B - Operating and maintenance manual for Chiller.**

- **Checking coolant quality (process stopped)**

1. Use a purge valve (**HV-166, HV-167** or equivalent) to extract a sample of cooling water.
2. Take a sample of the coolant.
3. Use the refractometer to check that the fluid has the correct proportion (40% by weight or melting point at -23.3°C).

Warning: Incorrect mixing may cause the loop to freeze and damage the machine.

4. Test conductivity with a pH test strip or conductivity meter. The pH must be between 7.5 and 8.5.
5. If the fluid quality does not meet the criteria, drain the coolant and replace it with a new one.

Required time & periodicity: cf. P.0608871.L.02.406_Ind.B

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

4. Checking the flowrate of cooling fluid – loop 200 (45 °C)

C63-R1-COM-201	
Objective	**Validation criteria**
• Check the compliance of the cooling loop 45 °C flowrate, according to design specifications.	• The flowrate of 45 °C loop, at maximum capacity of skid pump condensation, is around 97.9 m^3/h (1.54 m/s ± 0.14[1]).
Required personnel	**Required materials and consumables**
• 1 technician.	
Potential risks (Safety and Environment)	**Prevention and protection measures**
Chemical risk: (refer to Safety Data Sheet C63-SDS-007- MPG 40%)	• Wear PPE (Personal Protective Equipment) • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**" 3. Make sure that all the HVAC packages are stopped through HVAC Control Unit.	
Operation description	
1. Log in to "**Maintenance**" mode. 2. Go to the Oxygen view on the HMI, select the "THERMAL SKID" page (Figure 1). Completely open the M3WV-200 by setting the PID[2] output at 100%.	

[1] Accuracy of 7% of measured value (c.f. Flow switch datasheet SA5000 SAD10XDBFRKG/US-100)

[2] Proportional-Integral-Derivative feedback control loop

This document contains confidential information which is the property of ELOGEN.

ELOGEN reserves all of its rights.

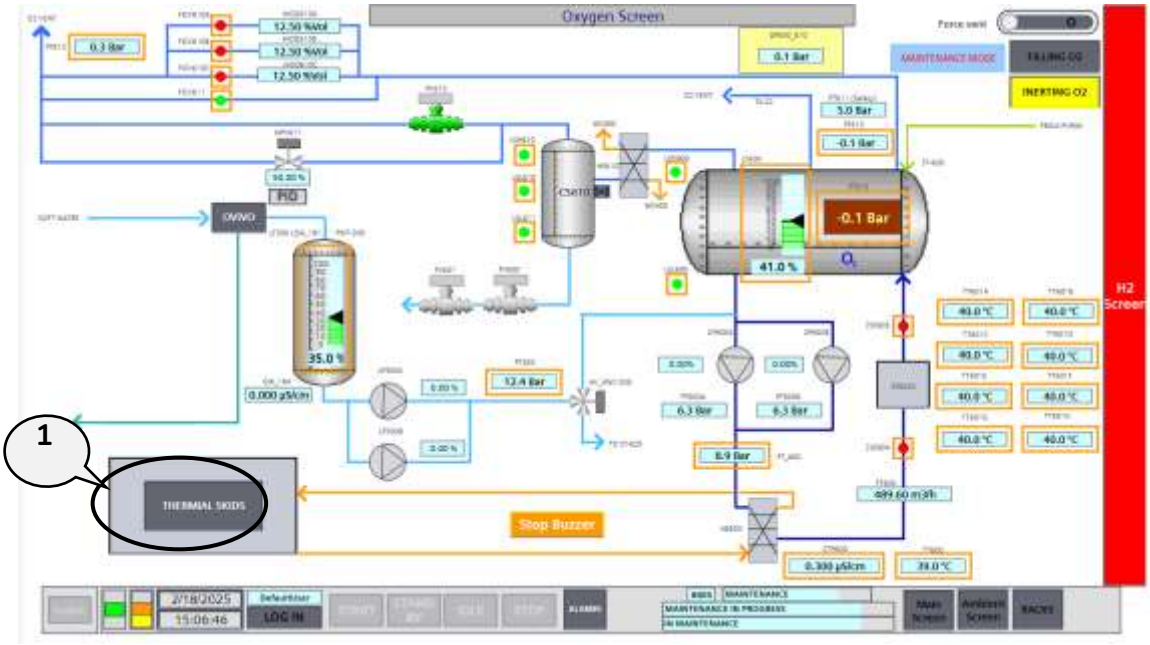

Figure 1. Oxygen view - Access to Thermal Skid view

3. Wait until this valve is fully open.
4. Start one of the CP-200A/B.
5. Check that there is no leakage close to connections.
6. Go to the thermal skid and check on the flow switch display (Figure 2) the flow velocity (given in m/s). The displayed value should be **1,54 m/s** (corresponding to a flow rate **of 97,9 m³/h**).

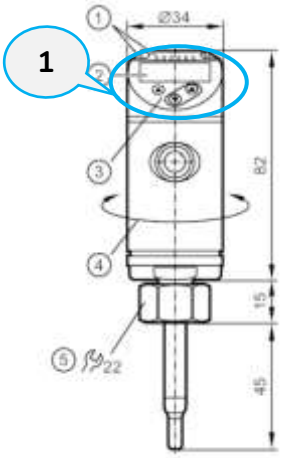

Figure 2. Flow switch on thermal skid 200 loop (45 °C)

7. Once checked the flowrate with the pump selected, stop it via the HMI and start the spare. Repeat steps 6 and stop the pump at once finished the procedure.
8. At the end of the cooling fluid flowrate check, switch from “Maintenance” mode to “Distance” mode via the HMI and observe that the pump is stopped and the **M3WV-200** returns to its normal position.

Required time: 2 hours
Periodicity: 12 months.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

5. Topping up and checking fluid quality on the 5°C cooling loop

<table>
<tr><th colspan="2">C63-R1-COM-400</th></tr>
<tr><td colspan="2"></td></tr>
<tr><th>Objectives</th><th>Validation criteria</th></tr>
<tr><td>• Optimum coolant level in the glycol 5°C cooling loop
• Optimum coolant quality</td><td>• The fluid network must be at 0.5 barg.
• Coolant quality is valid (MPG content in water is 40%, pH must be between 7.5 and 8.5)</td></tr>
<tr><th>Required personnel</th><th>Required materials and consumables</th></tr>
<tr><td>• 1 x person (qualified to work at height)</td><td>• 1 x Refractometer
• 1 x pH strip or conductivity meter
• Detergent / cleaning agent
• Demineralized water supply
• City water supply
• 770 L of 40% MPG mix with inhibitors and demineralized water
• Transfer pump
• Flexible connection
• Storage tank</td></tr>
<tr><th>Potential risks (Safety and Environment)</th><th>Prevention and protection measures</th></tr>
<tr><td>Chemical risk: (refer to Safety Data Sheet C63-SDS-007- MPG 40%)</td><td>• Wear PPE (Personal Protection Equipment)
• Personal gas monitor for each operator (calibration and ATEX certificate up to date).</td></tr>
<tr><th colspan="2">Prerequisites</th></tr>
<tr><td colspan="2">1. Ensure that the electrolyser is stopped and cold, and that its status indicates “Stop”.
2. Log in to “Maintenance” mode.</td></tr>
<tr><th colspan="2">Operation description</th></tr>
<tr><td colspan="2">• Checking coolant quality (process stopped)
1. Use a purge valve (HV-147, HV-139, HV-30, HV-40 or equivalent) to extract a sample of cooling water.
2. Take a sample of the coolant.
3. Use the refractometer to check that the fluid has the correct proportion (40% by weight or melting point at -23.3°C).
Warning: Incorrect mixing may cause the loop to freeze and damage the machine.
4. Test conductivity with a pH test strip or conductivity meter. The pH must be between 7.5 and 8.5.
5. If the fluid quality does not meet the criteria, drain the coolant and replace it with a new one.

Note: If the missing component is water, demineralized water can be added in the correct proportion.

The detailed instructions for filling for the water chiller are given in the document
P.0608871.L.02.406_Ind.B - Operating and maintenance manual for Chiller.
Required time & periodicity: cf. P.0608871.L.02.406_Ind.B</td></tr>
</table>

6. Water top-up for the electrolysis (Oxygen side)

C63-R1-COM-600	
Objective	**Validation criteria**
• The level of water in the oxygen water loop is optimal to start the hydrogen production.	• The level displayed by the LT-600 on the HMI is stable around 43%.
Required personnel	**Required materials and consumables**
• 1 technician.	• Ultra-pure water or water that can be purified with the **WTP-300**
Potential risks (Safety and Environment)	**Prevention and protection measures**
Electrical risk: Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk**	• Wear PPE (Personal Protective Equipment) • Personal gas monitor for each operator (calibration and ATEX certificate up to date).

Prerequisites

1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X).
2. The status displayed on the HMI should be "**STOP**"
3. Log in to "**Maintenance**" mode via the HMI.
4. Check that the Water Treatment Package is available to start in automatic operation. Refer to IOM Manual Crosswind Project – Ovivo in case trouble shooting operation is required.

Operation description

1. Check that the **3WV-320** is open towards oxygen loop.

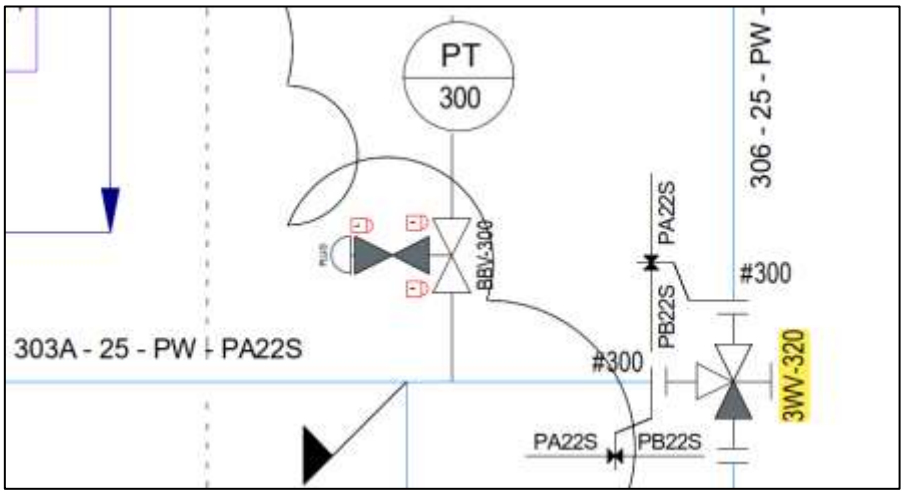

Figure 3. Open position of 3WV-320 towards O2 loop (cf. C63-PID-001).

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

2. Check that all the hand valves locked position present on oxygen loop are as indicated on the P&ID (cf. C63-PID-001).
3. Check that the level on the pure water buffer tank (depicted as DEMIN TANK on the P&ID) is high enough to perform the operation (the LALL-301 is not active) (Figure 4, reference point #1).

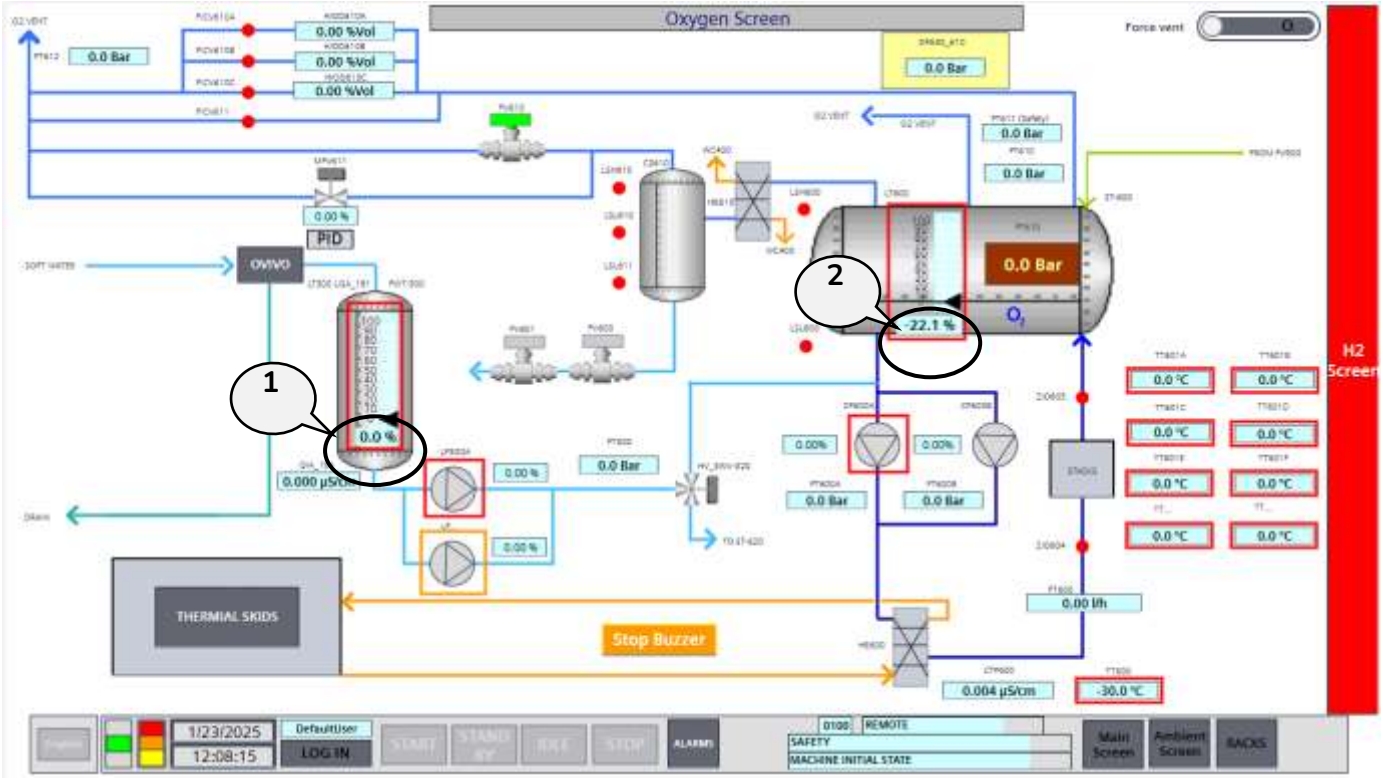

Figure 4. HMI Oxygen view

4. Set the LP-300A/B to **55%** of its speed in case the oxygen separator tank (ST-600) is depressurized to prevent overflows.
5. Follow the increase on the level of ST-600 displayed on the HMI (Figure 4**Erreur ! Source du renvoi introuvable.**, reference point #2).
6. Stop the LP-300 once the LT-600 displays **43%**.
7. Start the CP-600. The water level should decrease.
8. Stop the CP-600.
9. Repeat the sequence from steps #5 to #9, until the water level of ST-600 is stable at **43%**.

Note: Ensure that the CP-600 does not exceed the maximum number of starts per hour. (cf. CR, CRN 95-255 Installation and operating instructions, section: Frequency of starts and stops)

Time required: 1 hour.
Periodicity: As required.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

7. Fluid make-up on water circulation loop (hydrogen side)

C63-R1-COM-620	
Objective	**Validation criteria**
• To have optimum water level in the H2-side water circulation loop	• Water level indicated by **LT-620** water level sensor is at 45%
Required personnel	**Required materials and consumables**
• 1 x person	• Ultra-pure water or water that can be purified with the **WTP-300**
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk**	• Wear PPE (Personal Protective Equipment) • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is depressurized, and its status indicates STOP. 2. Prepare a pure water supply: make sure the **WTP-300** is filled with pure water.	
Operation description	
1. Check that the Water Treatment Package (**WTP-300**) is powered. 2. On the electrolyser control panel, activate “Maintenance” mode, then log on to the HMI. 3. Unlock valve **3WV-320** and move it to the open position from the **LP-300** pump to the **ST-620** hydrogen separator tank.	

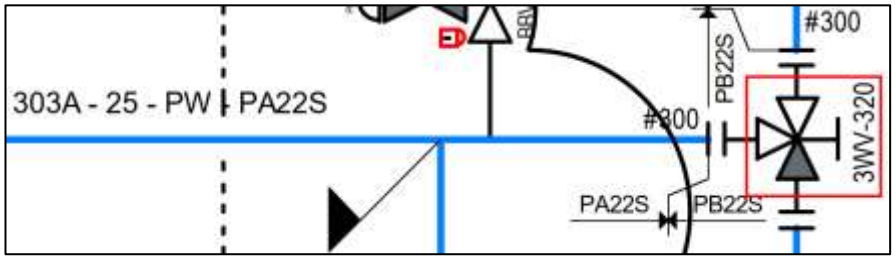

Figure 5. 3WV-320 towards H2 loop (cf. C63-PID-001)

4. Start the **LP-300** pump via the HMI at 55% of its capacity.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

5. When the water level in the **ST-620** separator tank reaches 45%:

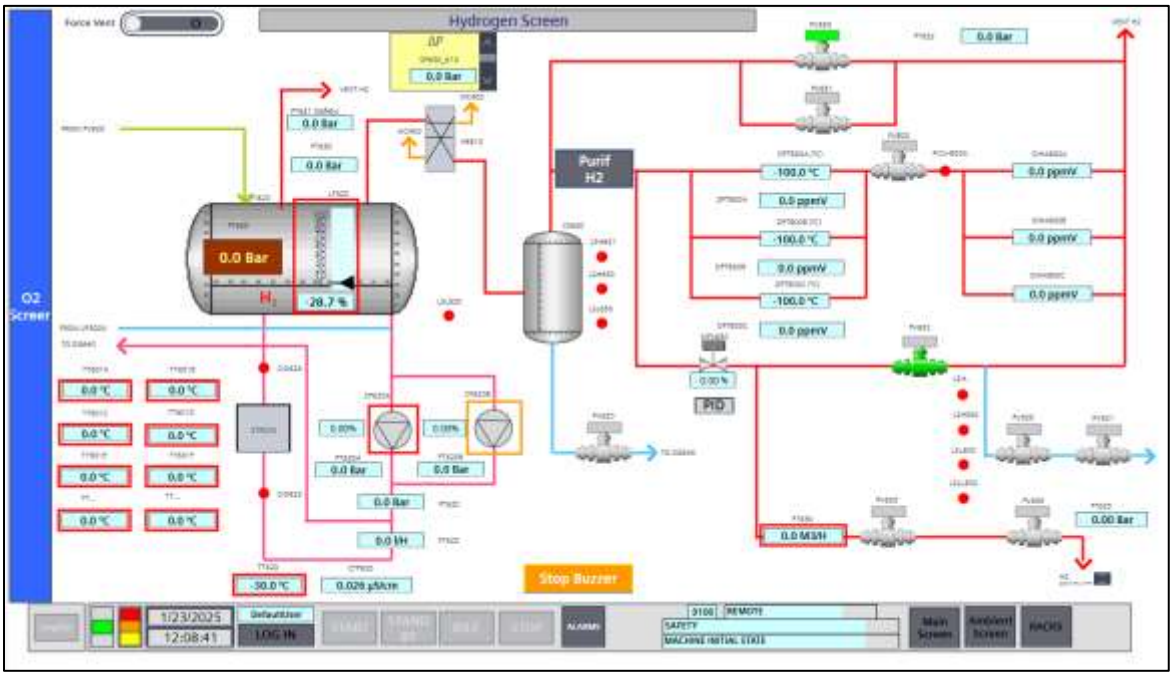

Figure 6. HMI Oxygen view.

6. Stop the **LP-300** pump.
7. Start **CP-620** pump. Water level should drop.
8. Stop **CP-620** pump.
9. Repeat the sequence from step 5 to step 8 until the water level in the **ST-620** separator tank has stabilized at 45%.

If the water level in the **ST-620** separator tank has stabilized at 45%:

10. Return valve **3WV-320** to its normal position, i.e. from the **LP-300** pump to the **ST-600** oxygen separator tank. Lock it.

Time required: 1 hour.
Periodicity: As required or after purging loop 620.

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

8. Filling hydrogen vent siphon

R1-COM-621	
Objective	**Validation criteria**
• Fill the hydrogen siphon with pure water	• Siphon is filled; LSL-500 is triggered
Required personnel	**Required materials and consumables**
• 1 x person	• Watering can • 3 L of pure water • Key of HV-501 • Teflon tape • Wear an Oxygen detector
Potential risks (Safety and Environment)	**Prevention and protection measures**
Anoxia risk	• Wear PPE (Personal Protective Equipment) • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurized and wait until the pipes have cooled down. 2. Make sure the H2 vent is nitrogen flushed 3. Make sure there is no backpressure from general H2 vent 4. Open all the access doors to the electrolyser.	
Operation description	

This document contains confidential information which is the property of ELOGEN.
Disclosure, copying or distribution of this information is strictly prohibited without the prior written consent of ELOGEN.
ELOGEN reserves all of its rights.

- **Checking the general cleanliness of the electrolyser**

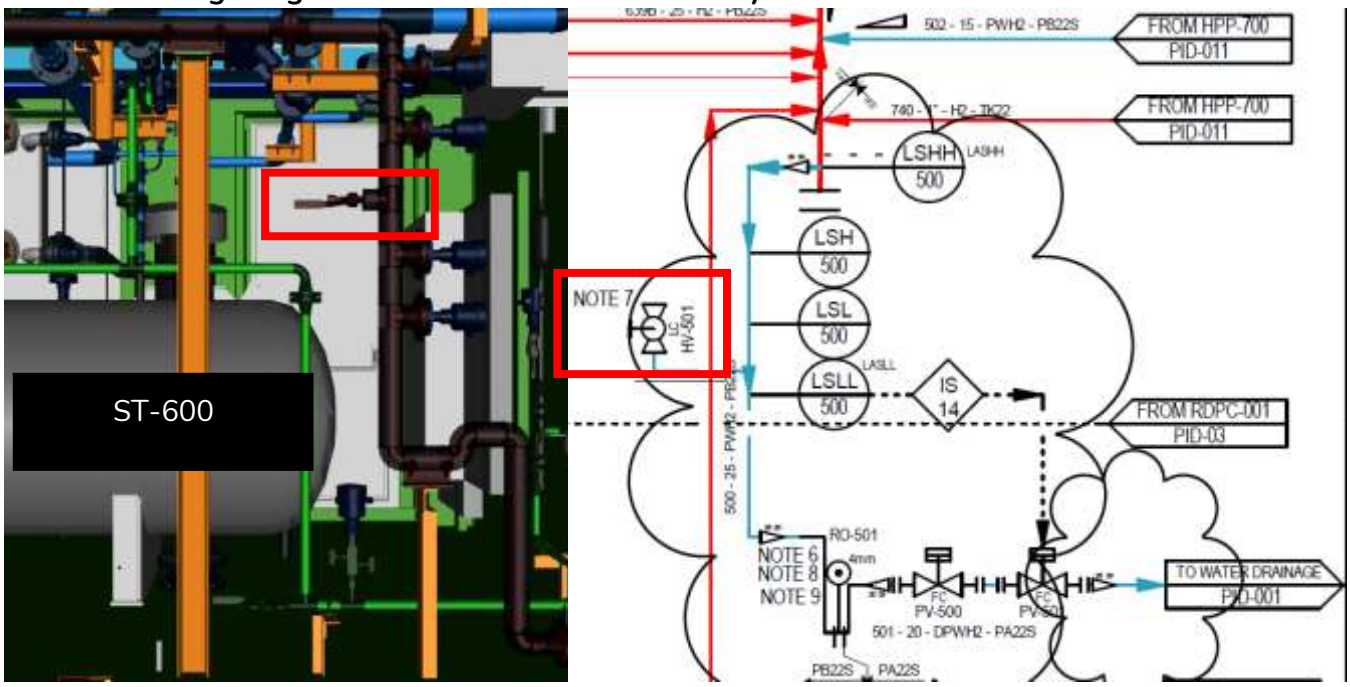

Figure 7. Extract from 3D and PID

1. Unlock HV-501, Remove the plug
2. Open HV-501
3. Fill the siphon till the LSL-500 is triggered (generally 2L are required)
4. Close HV-501 and lock it
5. Reinstall the plug using Teflon tape

Time required: 1 hour
Periodicity: At every Start-up

Table of content

1. C63-R2-ASP-610 - Maintenance of ASP-610 4
2. C63-R2-CAP-001 - Ambient hydrogen sensor calibration 6
3. C63-R2-CAP-002 - Control of temperature sensor deviation 9
4. C63-R2-CAP-003 - Calibration and cell replacement for an oxygen-in-hydrogen analyser 11
5. C63-R2-CAP-004 - Control of pressure sensor deviation 16
6. C63-R2-CAP-005 - Control of the deviation of conductivity sensors 19
7. C63-R2-CAP-610 - Calibration of hydrogen in oxygen sensor 22
8. C63-R2-CAP-800 - Dew point transmitter replacement 24
9. C63-R2-COM-004 - Protection system to avoid freezing 26
10. C63-R2-CTN-001 - Cleaning of the container's ventilation grids 29
11. C63-R2-CTN-004 - Maintenance of vents 31
12. C63-R2-CTN-005 - Drainage System Maintenance 33
13. C63-R2-CTN-006 - Maintenance of restriction orifice 34
14. C63-R2-CTN-007 – Maintenance nitrogen check valves 36
15. C63- R2-ELE-003 - Tightening of electrical connections for Stack's cell voltage monitors (PCA). 38
16. C63-R2-FLE-001- Inspection and replacement of flexible hoses 40
17. C63-R2-FIL-600 - Cleaning the strainer filter on the oxygen loop 42
18. C63-R2-FIL-620 - Cleaning the strainer filter on the hydrogen loop 44
19. C63-R2-FIL-800 - Cleaning or replacing the hydrogen purification outlet filter 46
20. C63-R2-HPU-700 - Inerting of the hydrogen purification unit 48
21. C63-R2-HVAC-001 - Maintenance of HVAC system 50
22. C63-R2-INS-001 - External inspection of pressure vessels 52
23. C63-R2-PROC-002 - Electrical verification of the proper functioning of an analog sensor 53
24. C63-R2-PROC-003 - Electrical check of solenoid valve operation 56
25. C63- R2-PROC-005 - Electrical check of a flow switch 58
26. C63-R2-PSV-001 - Pressure safety valve replacement 60
27. C63-R2-PUM-001 - Oxygen circulation pump maintenance (CP-600A/B) 62
28. C63-R2-PUM-002 - Hydrogen circulation pump maintenance (CP-620A/B) 66
29. C63-R2-PUM-003 - Maintenance of the lift pump (LP-300) 69
30. C63-R2-SSFH-600 - Resin change on the oxygen water loop 71

1. C63-R2-ASP-610 - Maintenance of ASP-610

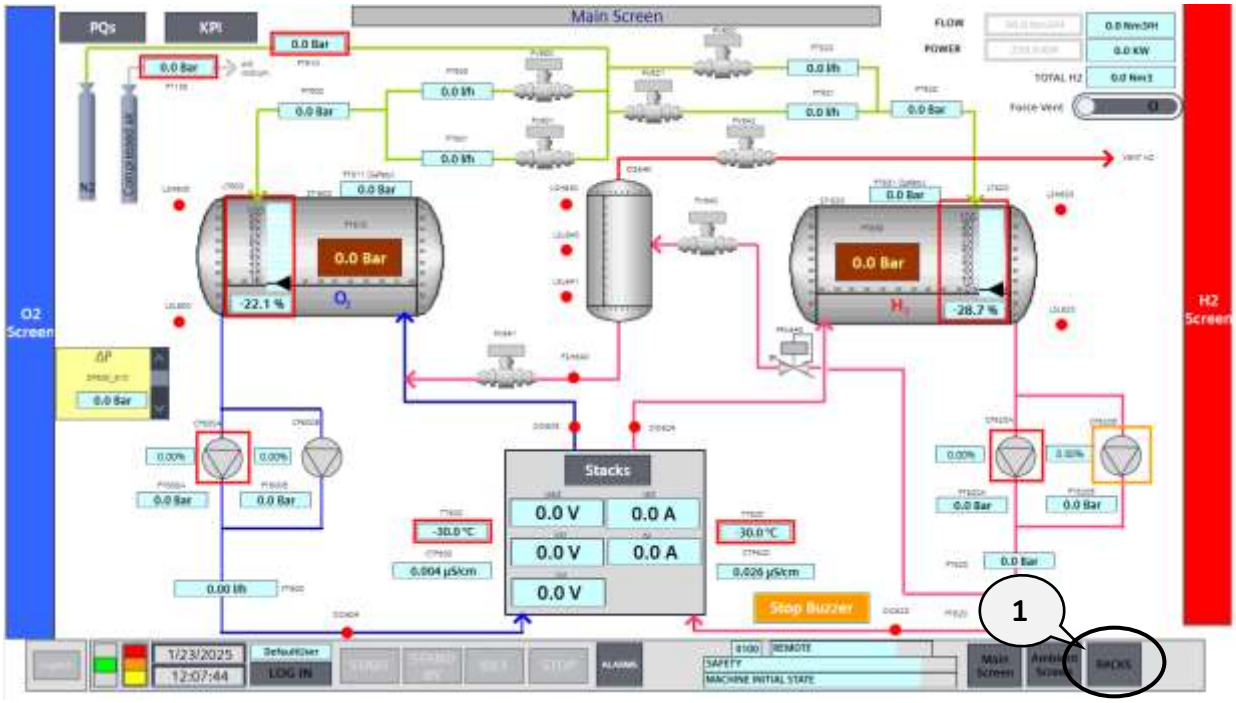
Objective	Validation criteria
• To check the functioning of the Analysis system package.	• The filter is clean, and FICVs function properly.
Required personnel	**Required materials and consumables**
• 1 x technician.	• Adequate wrenches for flanges. • Pure water.
Potential risks (Safety and Environment)	**Prevention and protection measures**
Electrical risk: Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Chemical risk:** Risk associated with the handling of hydrogen. Check the Material Safety Data (C63-SDS-001). **Anoxia risk**	• Wear PPE (Personal Protective Equipment) • Personal gas monitor for each operator (calibration and ATEX certificate up to date)
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to maintenance mode.	
Operation description	
Filter F-610 1. Close the valve HV-615. 2. Remove the plug on the valve HV-610D and open the valve. 3. Open the filter F-610 and check the condition of the filter, replace it if necessary. 4. Put back the filter, close the valve HV-610D, put back the plug, and open the valve HV-615. **Setting of PRV and FICV** 1. Pressurize the ST-600 at 3 barg with nitrogen. 2. Check that the pressure at the outlet of the PRV-610 is 0.5 barg. 3. Check that the FICV-610A/B/C are set at 1 NL/min.	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

4. Check that the FICV-611 is set at 10 NL/min.

Time required: 30 minutes

Periodicity: 6 months



This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

2. C63-R2-CAP-001 - Ambient hydrogen sensor calibration

Objective	Validation criteria
• Check the measuring system related to the ambient hydrogen detectors presents on the electrolysis unit: AHD-1000/1001/1002/1003/1004. • Perform a zero adjustment and a sensibility calibration.	• The analysis cell status is displayed as "Good[1]". • The deviation in the measure is below 100 ppm.
Required personnel	**Required materials and consumables**
1 x technician.	• 1 standard gas cylinder (2% H2 in air) (ref. SPR-1011) • Fixed flow regulator (1.5 L/Mn 1000 psi max)
Potential risks (Safety and Environment)	**Prevention and protection measures**
ATEX atmosphere risk **Thermal Risk:** Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Chemical risk:** Risk associated with the handling of hydrogen bottle at 2%. Check the Material Safety Data (C63-SDS-001). **Anoxia risk**	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.

[1] According to ULTIMA® X5000 Operation & Maintenance instructions, the "Good" state occurs when the currently calibrated scale sensitivity is greater than 50% of the range between the initial calibration sensitivity and the scale sensitivity at the end of its lifespan.

Prerequisites
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**"
Operation description
3. Log in to "**Maintenance**" mode. 4. Check on the "Racks" view that the feedback of the AHD to be calibrated is not in default (value displayed at zero or within the range established in the Setpoint list C63-PWI-001.    *Figure 1. HMI main view.*

3. C63-R2-CAP-002 - Control of temperature sensor deviation

Objective	Validation criteria
• Determine temperature sensor deviation (**TT-621A/B**, **TT-601A/B/C/D/E/F/G/H**)	• Temperature sensor deviation lower than 0.5 °C.
Required personnel	**Required materials and consumables**
• 1 x technician.	• 1 x calibrated ambient temperature sensor. • 1 x spare temperature sensor.
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk**	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to "Maintenance" mode.	
Operation description	
1. Install a calibrated room temperature sensor in the process zone and a room temperature sensor in the utilities zone. 2. Wait 30 minutes for the probes to reach room temperature. 3. At regular intervals of 5 minutes, record the measured values of all the machine's temperature probes. 4. Register any deviations. 5. If need it, replace any sensors.

4. C63-R2-CAP-003 - Calibration and cell replacement for an oxygen-in-hydrogen analyser

Objective	Validation criteria
• To calibrate the OIHA-800A/B/C. • To replace the analysis cell for the OIHA-800A/B/C.	• OIHA calibrated according to this procedure[2]. • There are no leaks on the instrument and analyse cell fittings.
Required personnel	**Required materials and consumables**
• 1 x technician.	• 1 x Analysis cell spare and its user manual (GE Measurement & Control oxy.IQ 910-296). • PTFE tape (oxygen compatible). • 1 calibration cylinder (span gas: 50 ppm of O_2 in N_2) ref. SPR-1017. • 1 x Fixed flow regulator adapted to the span gas cylinder. • 1 x hose. • Adjustable Wrench. • Leak detector (leak detection solution). • Viton® O-ring. • Nitrogen cylinder (for leak test). • Compressed air cylinder (for Air calibration). • 1 x Fixed flow regulator adapted to the compressed air cylinder.
Potential risks (Safety and Environment)	**Prevention and protection measures**
Chemical risk: Risk associated with the handling of oxygen. Refer to Safety Data Sheet C63-SDS-002 - Oxygen. **Thermal Risk:** Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.

[2] Refer to GE Measurement & Control oxy.IQ 910-296 to check the accuracy of the measure at the calibration point.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

Electrical risk: Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk**	

Prerequisites

1. Make sure the electrolyzer is stopped, depressurized and cold (Stacks temperature under 40 °C – TT-601X).
2. The status displayed on the HMI should be "**STOP**".
3. Log in to "**Maintenance**" mode.

Operation description

1. Inert the unit via the HMI. On the Oxygen and Hydrogen via "**Inerting O2**" and "**Inerting H2**" buttons, respectively (Figure 3 and Figure 4 reference point #1).

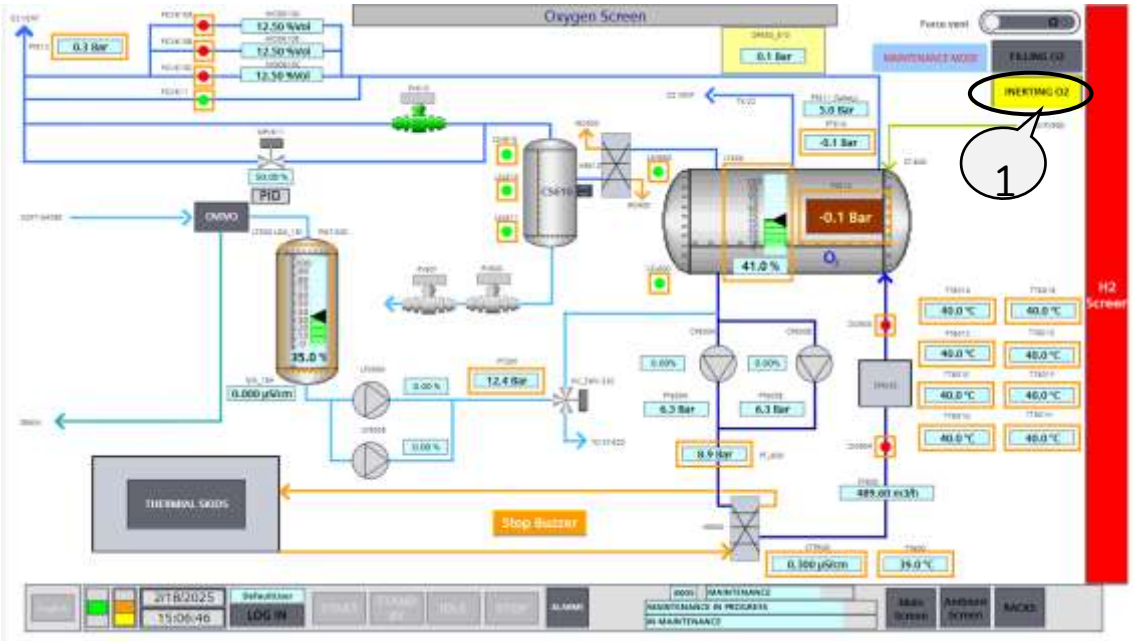

Figure 3. Inerting oxygen side

Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

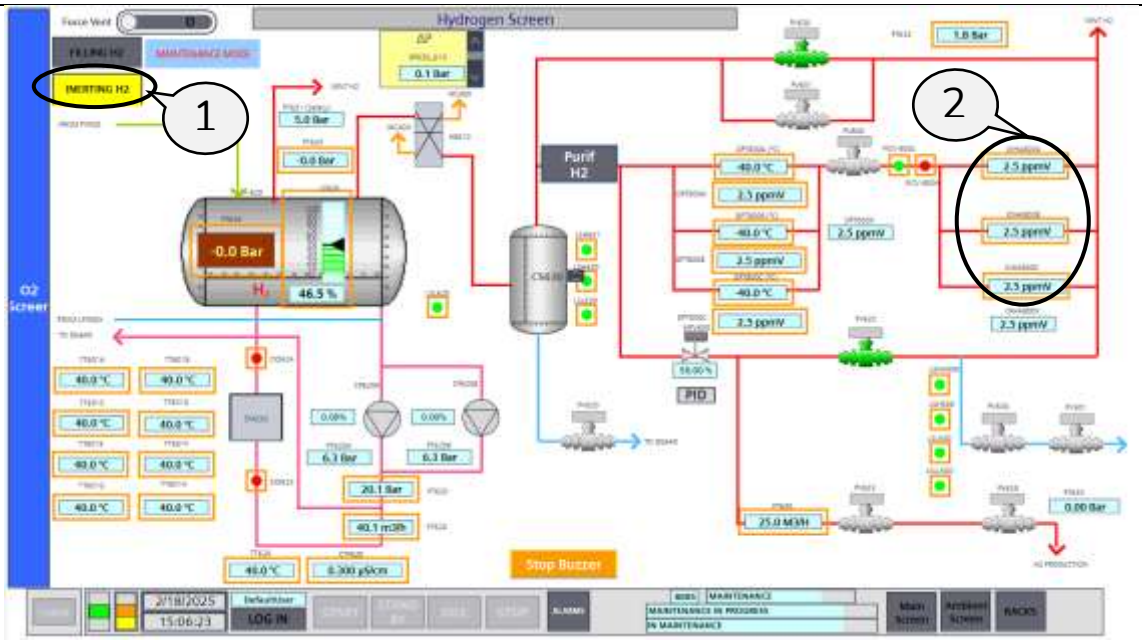

Figure 4. Inerting hydrogen side

Air calibration

1. Make sure the compressed air cylinder is closed (fixed flow regulator properly placed on the cylinder and regulating valve completely closed).
2. Once the inerting is completed, isolate the line by turning the three-way valve (**3WV-800**) towards the calibration cylinder connection (Figure 5).
3. Connect the cylinder of compressed air, via a flexible hose and the fixed flow regulator, to the plug placed on the three-way valve.
4. Follow the instructions given in OIHA user manual (GE Measurement & Control oxy.IQ 910-296) to conduct air calibration (section 3.3.3).
5. Turn the **3WV-800** on its original position (Figure 6).

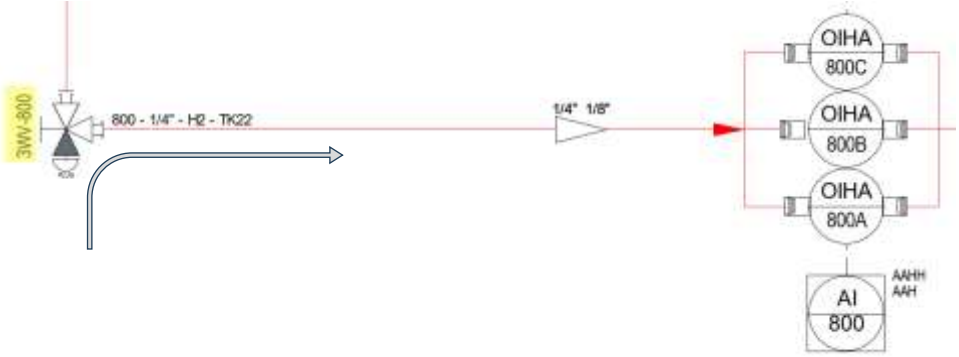

Figure 5. 3MV-800 position for OIHA calibration

Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

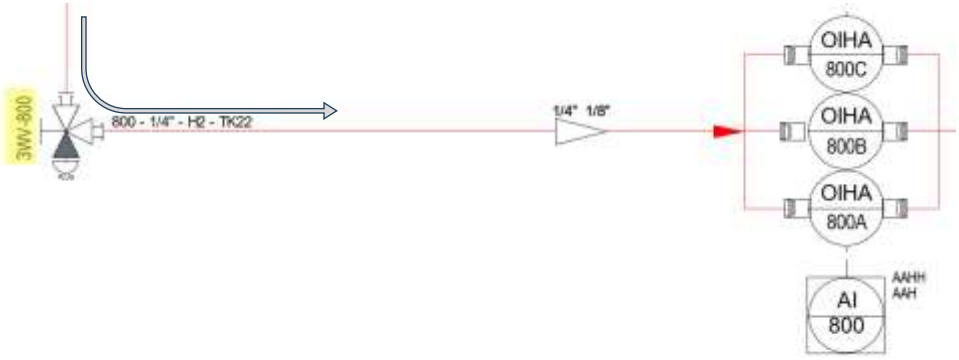

Figure 6. 3MV-800 normal operating position.

Span gas calibration

1. Make sure the pure hydrogen calibration cylinder is closed (fixed flow regulator properly placed on the calibration cylinder and regulating valve completely closed).
2. Isolate the line by turning the three-way valve (**3WV-800**) towards the calibration cylinder connection (Figure 5).
3. Connect the gas calibration cylinder via the hose attached to the fixed flow regulator, to the analysis cell.
4. Follow the instructions given in OIHA user manual (GE Measurement & Control oxy.IQ 910-296) to conduct air calibration (section 3.3.4).
5. Once the calibration is conducted, make sure that the flow regulator on the calibration gas cylinder is closed.
6. Disconnect the cylinder and then turn the **3WV-800** into its original position (Figure 6).

Analysis cell replacement

1. Once the inerting is completed, isolate the line by turning the three-way valve (**3WV-800**) towards the calibration cylinder connection (Figure 5).
2. Check that the **PG-800** shows 0 barg and **FICV-800** 0 L/min otherwise wait.
3. Switch off 400 Vac power supply as described in **C63-R2-DEC-001**.
4. Disconnect electrically the OIHA.
5. Follow the instructions given on the User Manual (GE Measurement & Control oxy.IQ 910-296) to conduct the installation of the new cell, section 2.3.
6. Make sure to replace the O-ring seal when reassembling.
7. Electrically connect the sensor.
8. Perform a leak test.
9. Restore the 400 VAC power supply. Please refer to network lockout procedure **C63-R2-DEC-001.**
10. Check the OIHA feedback on the HMI (Figure 4, reference point #2).

Leak test

1. Apply the bubble solution to the fittings surrounding the OIHA.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

2. Connect the nitrogen cylinder equipped with the fixed flow regulator to the **3WV-800**.
3. Rotate the three-way (**3WV-800**) valve as illustrated in Figure 5 to isolate the OIHA and facilitate the passage of nitrogen through it.
4. Pressurise up to 30 barg.
5. observe the presence of bubbles around the fittings, indicating the presence of a leak.
6. Upon completion of this procedure, return the **3WV-800** to its original position (Figure 6).

Time required: 2 hours

Periodicity: 12 months

5. C63-R2-CAP-004 - Control of pressure sensor deviation

Objective	Validation criteria
• Determine the deviation of **Pressure Transmitters**	• No deviation higher than 0.5 bar registered on pressure sensor
Required personnel	**Required materials and consumables**
• 1 x technician.	• 1 x pressure calibrator. • 1 x PTFE tape roll.
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk**	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to "**Maintenance**" mode.	
Operation description	
1. Inert the machine using the Inert O_2 (Figure 7) and Inert H_2 (Figure 8) buttons on the machine HMI.	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

3. Close the downstream block valve on the BBV associated and remove the vent port plug (drain). Then, open the bleed/vent valve.
4. Once the remaining gas on the PT has been released, connect the pressure source to the vent plug using the suitable fittings.
5. Pressurize the PT by pumping on the Pressure calibrator.
6. Compare the value of the pressure sent with the pressure calibrator to the pressure reflected on the PT. If the pressure is not the same, refer to the Pressure Transmitter manual (c.f. Operating Instructions Cerabar PMP71B).
7. If the pressure is the same, remove the pressure calibrator and return the BBV at its original condition (block valve open and bleed closed).
8. If necessary, replace any sensor.

Time required: 2 hours

Periodicity: 12 months

6. C63-R2-CAP-005 - Control of the deviation of conductivity sensors

Objective	Validation criteria
• Check if there is a deviation on the conductivity sensor.	• The sensor's deviation does not exceed 0.2 µS/cm
Required personnel	**Required materials and consumables**
• 1 x technician.	• 1 x hermetic container or reservoir filled with pure water. • Ultra-pure water supplied by the WTP-300. • Padlock keys for hand valves (if applicable). • 1 x flexible hose for draining. • 1 x Collecting tank for draining.
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk**	• Wear PPE (Personal Protective Equipment) • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**" 3. Log in to "**Maintenance**" mode.	
Operation description	
1. Inert the unit via the HMI. On the Oxygen and Hydrogen via "**Inerting O2**" and "**Inerting H2**" buttons, respectively (Figure 3 and Figure 4 reference point #1). 2. Once the inerting is completed, isolate the conductivity sensors. For CT/P-600 (oxygen side):

Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

1. Close valves **HV-622** and **HV-623.**
2. Connect the flexible hose to the **HV-622D** to prepare for draining the section and filling the designated collection tank for disposal.
3. Open the drain valve **HV-622D** to purge the line section where the conductivity sensor is placed. Close it when it finishes draining and replace the respective padlock on it.

For CT-P-620 (hydrogen side):

1. Close valves **HV-604** and **HV-603A**.
2. Connect the flexible hose to the **HV-603D** to prepare for draining the section and filling the designated collection tank for disposal.
3. Open the drain valve **HV-603D** to purge the line section where the conductivity sensor is placed. Close it when it finishes draining and replace the respective padlock on it.
4. Disconnect the power supply to the conductivity sensor on the local display of the Endress Liquiline. Please refer to the Technical Information Liquiline M CM42.
5. Disconnect electrically the conductivity sensor (**CT/P-600** or **CT/P-620**) and then proceed to unscrew it.

Prepare a pure water sample for the calibration:

1. Rinse the hermetic container with pure water (by opening **HV-303DA** or **HV-303DB**).
2. After three rinses, fill the sealable container with pure water. Close the pure water drain valve used and replace the respective padlock.
3. Note the conductivity value for this sample, displayed on the oxygen view (see **QIA-1B4** transmitter display Figure 9 reference point #1).

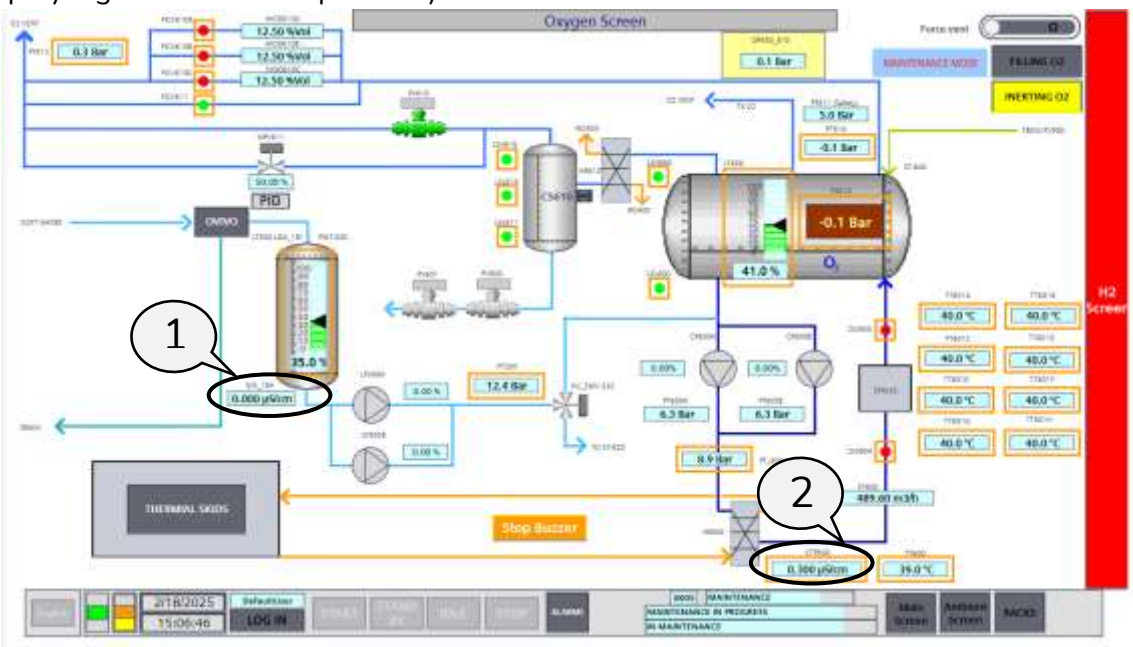

Figure 9. Conductivity sensor display on HMI oxygen view

4. Rinse the conductivity sensor three times with pure water and then energise the transmitter (cf. Technical Information Liquiline M CM42). Check on the HMI that there is feedback from the conductivity sensor being tested (Figure 9 reference point #2 or Figure 10, reference point #1).

This document is strictly confidential. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

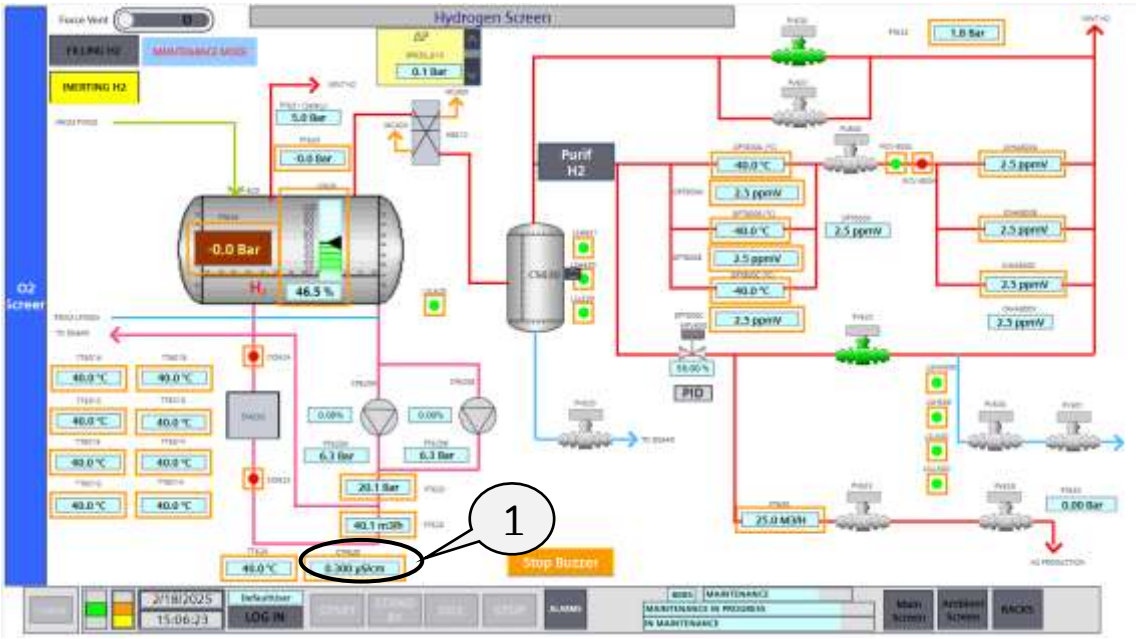

Figure 10. Conductivity sensor display on HMI hydrogen view

5. Test the conductivity sensor in the pure water recollected on the sealable container. Wait until the value displayed stabilizes on the HMI (Figure 9 reference point #2 or Figure 10, reference point #1).
6. By comparing both measures (value displayed by the **QIA-1B4** and the **CT/P-600** or **CT/P-620**), determine if the sensor is deviating. Follow procedures **R2-PROC-002** (Section 23) for an electrical check of the deviating sensor.

<u>Contact Elogen if a sensor needs to be replaced.</u>

7. Disconnect the power supply to the conductivity sensor on the local display of the Endress Liquiline and screw it back on its original position in the piping.
8. Connect electrically the sensor, check that there is feedback on the HMI (Figure 9 reference point #2 or Figure 10, reference point #1).
9. Position the hand valves in their standard operating configuration as specified by P&ID (C63-PID-001). Proceed to open **HV-622** followed by **HV-623**, or **HV-604** followed by **HV-603A**, if the verification is made for the oxygen side. Secure the respective padlocks on the hand valves in their designated positions.
10. Refill the system with pure water following the procedures: **R1-COM-600** and **R1-COM-620**.

Required time: 8 hours

Periodicity: 12 months

7. C63-R2-CAP-610 - Calibration of hydrogen in oxygen sensor

Objective	Validation criteria
• To calibrate the Hydrogen in Oxygen detector	• Calibration has been performed in accordance with this procedure and the value displayed by the transmitter is 2% when testing with the calibration gas.
Required personnel	**Required materials and consumables**
1 technician	• 1 x flexible to connect the cylinder to the calibration valve • 1 x new measuring cell (if necessary) • 1 x pure oxygen cylinder • 1 x 2% H2 in O2 cylinder
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Chemical risk:** Risk associated with the handling of hydrogen. Check the Material Safety Data (C63-SDS-001). **Anoxia risk**	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to maintenance mode.	
Operation description

Zeroing the HIODs

1. Close the valve HV-615.
2. Connect a pure oxygen cylinder to the valve HV-616 and open the valve.
3. Check that the PRV-610 regulate the pressure at 0.5barg and that the FICV-610A/B/C indicate 1NL/h
4. According to the supplier manual, set the HIOD-610A/B/C at 0% H2 in O2.
5. Close the valve HV-616 and disconnect the cylinder.

Calibration at 2% H2 in O2.

1. Connect the 2% H2 in O2 cylinder to the valve HV-616 and open the valve.
2. Check that the PRV-610 regulate the pressure at 0.5barg and that the FICV-610A/B/C indicate 1NL/h
3. According to the supplier manual, set the HIOD-610A/B/C at 0% H2 in O2.
4. Close the valve HV-616 and disconnect the cylinder.
5. Close the valve HV-615.

Time required: 30 minutes

Periodicity: 6 months

8. C63-R2-CAP-800 - Dew point transmitter replacement

Objective	Validation criteria
Replacing the Dew Point Transmitter (**DPT-800A/B/C**)	• New Dew Point Transmitter installed and running • No leaks
Required personnel	**Required materials and consumables**
• 1 x technician.	• 1 x Dew Point Transmitter spare and its user manual • 1 x PTFE tape roll • 1 x nitrogen cylinder • 1 x pressure reducer • 1 x hose • Adjustable Wrench. • Leak detector (leak detection solution).
Potential risks (Safety and Environment)	**Prevention and protection measures**
Chemical risk: (refer to Safety Data Sheet C63-SDS-001 – Hydrogen) **Thermal Risk:** Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk**	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to "Maintenance" mode.	
Operation description	
1. Inert the electrolyser by pressing Inert H_2 on the HMI (Figure 11).	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Figure 11. Hydrogen screen on HMI

2. Once inerting is complete, switch off 400 Vac power supply as described in **C63-R2-DEC-001**.
3. Electrically disconnect the **DPT-800A/B/C** sensor.
4. Check that **PG-800** indicates 0 barg and **FICV-800** indicates 0 L/min, otherwise wait until these values are at 0.
5. Disassemble the Dew Point Transmitter in accordance with the procedure outlined in the sensor's user manual.
6. Install the new Dew Point Transmitter in accordance with the procedure outlined in the sensor's user manual. Ensure that Teflon tape is applied to the thread.
7. Reconnect electrically the transmitter as described in the sensor's user manual.
8. Apply the bubble solution to the fittings surrounding the **DPT-800A/B/C** and then restart the hydrogen production to check any leaks.
9. Let the system to achieve the nominal pressure and observe the presence of bubbles around the fittings.
10. If leakage, return to step 3.
11. Verify the operational status of the newly replaced Dew Point Transmitter.

Time required: 2 hours

Periodicity: 12 months.

9. C63-R2-COM-004 - Protection system to avoid freezing

Objective	Validation criteria
• Safeguard the system in the event of frost and power failure	• Absence water in loops 300, 600 and 620 • Stack disassembled and stored in water in a controlled atmosphere
Required personnel	**Required materials and consumables**
• 1 x technician.	• Adjustable Wrench. • Immersion pump • Blind flanges (for each stack: 4x 2'') • Valve lockout padlock • 1 x Voltage Absence Tester (VAT) • 1 x empty container
Potential risks (Safety and Environment)	**Prevention and protection measures**
Chemical Risk: The presence of hydrogen and oxygen poses a significant risk if not properly inerted with nitrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen. **Thermal Risk:** Risk of burns or damage related to high temperatures or hot surfaces during operation. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. Risk of pressure build-up when disconnecting connections and starting up. **Anoxia risk**	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date)
Prerequisites	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the importation, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X).
2. The status displayed on the HMI should be "**STOP**".
3. Stacks must be depolarized. Check for absence of voltage (0V).

   Reminder: Fatal risk

4. Install the immersion pump in a suitable location to remove water from the stacks. Plug the pump into one of the sockets provided. Do not start the pump.
5. Prepare pure water supply (via **HV-300DA** and **HV-300DB** purge valves).

Operation description

Purge loop 620

1. Remove the plug and connect a flexible hose to the following valves: **HV-620DA**, **HV-620DB**, **HV-621D**, **HV-622D**, **HV-640D.**
2. Unlock and open the valves mentioned in the previous point and drain the remaining liquid in the loop 620.
3. Close all drain valves opened in the previous step, then place their plugs.
4. Dispose of wastewater in accordance with offshore platform regulations.

Purge de la boucle 600

1. Remove the plug and connect a flexible hose to the following valves: **HV-600D**, **HV-600DA**, **HV-600DB**, **HV-601D**, **HV-601D**, **HV-602DA** and **HV-603D.**
2. Unlock and open the valves mentioned in the previous point and drain the remaining liquid in the loop 600.
3. Close all drain valves opened in the previous step, then place their plugs.
4. Dispose of wastewater in accordance with offshore platform regulations.

Purge loop 300

1. Remove the plug and connect a flexible hose to the following valves: **HV-300D**, **HV-300DA**, **HV-300DB**, **HV-303DA** and **HV-303DB**.
2. Unlock and open the valves mentioned in the previous point and drain the remaining liquid in the loop 300.
3. Close all drain valves opened in the previous step, then place their plugs.
4. Dispose of wastewater in accordance with offshore platform regulations.

Purge Y filters (F-600, F-610 and F-620)

1. Prepare a container under the filter (or drain it directly into the drip tray).
2. Open the filter cover.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

3. Drain.
4. Check filters for foreign matter or damage.
5. Replace filter cover.
6. If necessary, pump the water out of the drip tray using an immersion pump.

Container

1. If there is water on the floor of the containers, please refer to C63-R1-COM-003

Bringing the system up to standard

See **R1-COM-600** and **R1-COM-620**.

Time required: 4 hours

Periodicity: when necessary (during prolonged shutdowns of the electrolyser and/or in extreme conditions with temperatures below -20°C)

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

10. C63-R2-CTN-001 - Cleaning of the container's ventilation grids

Objective	Validation criteria
• Ensure the structural integrity and cleanliness of the container's ventilation grids.	• There is no evidence of deterioration on the ventilation grids. • They have been cleaned in accordance with the recommendations outlined in this procedure.
Required personnel	**Required materials and consumables**
• 1 x technician.	• Screwdriver. • New filter cartridge, if replacement is required. Please refer to ventilation grid's technical specifications. • Cleaning tools: High-pressure hoses, compressed air or vacuum cleaner.
Potential risks (Safety and Environment)	**Prevention and protection measures**
• **Exposure to contaminants:** possible release of mold, dust and other harmful particles accumulated on the ventilation grids. This release could cause health risk such as respiratory issues and allergic reactions. • **Fire and explosion risk:** as the ventilation grid is used to evacuate the possible leaks of hydrogen in the container, cleaning these systems without proper precautions can increase the risk of fire or explosion.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to "**Maintenance**" mode.	
Operation description	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

1. Inert the unit via the HMI. On the Oxygen and Hydrogen via "**Inerting O2**" and "**Inerting H2**" buttons, respectively (Figure 3 and Figure 4 reference point #1).
2. Switch off 400 Vac power supply as described in **C63-R2-DEC-001**.
3. From outside the container, unscrew the filter grids. And take out the filter cartridge.
4. Inspect the condition of the filter grid and replace it if it shows signs of corrosion or damage.
5. Clean the filter case and the cartridge with compressed air.
6. If the filter cartridge is clogged, replace it with a new one.
7. Install the cartridge in its housing and securely fasten the grid back into place.
8. store the 400 VAC power supply. Please refer to network lockout procedure **C63-R2-DEC-001**.

Time required: 1 hour.

Periodicity: 24 months.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

11. C63-R2-CTN-004 - Maintenance of vents

Objective	Validation criteria
• Ensure the optimal performance and safety of the venting system.	• There is no evidence of deterioration on the vents. • The pressure readings from the pressure transmitters on the oxygen and hydrogen vents are below 0.5 barg.
Required personnel	**Required materials and consumables**
• 1 x technician.	• 1 adjustable wrench. • 1 cherry picker (aerial work platform). • Grounding straps. • 1 Multimeter. • Pure water for cleaning.
Potential risks (Safety and Environment)	**Prevention and protection measures**
Mechanical risks: Injuries from cuts, impacts, crushes, or entrapments due to the use of tools and machinery. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Chemical risk:** exposure to hydrogen or oxygen present in the venting pipelines. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen. **Work at high risk**	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • Working at high permit and certification of the training to use the cherry picker.
Prerequisites	
1. Ensure the availability of a cherry picker to facilitate work at elevated heights around the venting systems. 2. The venting system must remain accessible throughout the maintenance operation. 3. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – **TT-601X**). 4. Log in to "**Maintenance**" mode.	
Operation description	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

1. Inert the unit via the HMI. On the Oxygen and Hydrogen via "**Inerting O2**" and "**Inerting H2**" buttons, respectively (Figure 3 and Figure 4 reference point #1).
2. Check on the Oxygen and/or Hydrogen view on the HMI, the reading of the **PT-612** (if checking the oxygen vent) and/or **PT-632** (if checking the hydrogen vent). The pressure must not exceed 0,5 barg. If this threshold is surpassed, it will indicate a potential obstruction in the vent.
3. Perform a visual inspection of the vent to identify any cracks or damages on the fittings, welds, supports, and other components.
4. Inspect and verify that the grounding is correct. The resistance must not exceed 25 ohms.
5. Check the grounding cables and their integrity. Replace the cables if necessary.
6. If it is possible, unscrew the vent head and remove the mesh/grid. Clean it with pure water. Once cleaned, reinstall it.

Time required: 1 hour.

Periodicity: 12 months or upon activation of the High oxygen/hydrogen vent pressure H – PT-612/PT-632 alarm.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

12. C63-R2-CTN-005 - Drainage System Maintenance

Objective	Validation criteria
• Ensure the optimal performance and safety of the draining system.	• There is no evidence of deterioration on the vents. • The drainage system is free form obstructions.
Required personnel	**Required materials and consumables**
• 1 x technician.	• High-pressure hoses. • Brushes. • Spare parts: filters, gaskets (if required). • Pipe inspection tools[3]: cameras, flashlights.
Potential risks (Safety and Environment)	**Prevention and protection measures**
• **Environmental Risks:** Improper handling of waste and contaminants can lead to environmental pollution.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to "**Maintenance**" mode.	
Operation description	
1. Inert the unit via the HMI. On the Oxygen and Hydrogen via "**Inerting O2**" and "**Inerting H2**" buttons, respectively (Figure 3 and Figure 4 reference point #1). 2. Conduct periodic inspections to detect accumulations of debris, sludge, or materials that may obstruct the flow. 3. Use high-pressure water to remove accumulated debris from the surface of drains and gutters. 4. Ensure that filters are not saturated or damaged and replace them if necessary. 5. Check that the valves present on the hydrogen vent drain (**PV-500** and **PV-501**) are functioning correctly and perform internal cleanings according to the manufacturer's specifications. 6. Inspect the condition of grates, filters, and other components, and replace them if they show signs of corrosion or damage. **Time required:** 4 hours. **Periodicity:** 12 months.	

[3] Certified for ATEX compliance when operating in ATEX-designated zones.

13. C63-R2-CTN-006 - Maintenance of restriction orifice

Objective	Validation criteria
• To check the condition of the restrictive orifices	• The restriction orifices are cleaned and free of clogs
Required personnel	**Required materials and consumables**
1 x technician.	• Adequate wrenches for flanges • Pure water
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. <u>Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C.</u> **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Chemical Risk:** The presence of hydrogen and oxygen poses a significant risk if not properly inerted with nitrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date)
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to maintenance mode.	
Operation description	
This procedure refers to the RO-600, RO-610, RO-620, RO-630, RO-501, and the orifices included in the FT-900 and FT-920.

To dismantle an orifice:

1. Check that the orifice is cooled down and not under pressure
2. Isolate the orifice with valves upstream and downstream, it can be an automatic valve or a manual valve.
3. Dismantle the flanges by loosening the bolts, then remove the restrictive orifice.
4. Check that the orifice is cleaned and not plugged.
5. If necessary, clean the orifice with pure water.
6. Check the gaskets and replace them if necessary.
7. Put back the restrictive orifice and tighten the bolts.
8. On start up, check the absence of leak.

Time required: 30 minutes per restrictive orifices

Periodicity: 6 months

14. C63-R2-CTN-007 – Maintenance nitrogen check valves

Objective	Validation criteria
• Check the condition of the nitrogen check valves **CV-900/901/920/921**	• The check valves are cleaned and free of clogs
Required personnel	**Required materials and consumables**
• 1 x technician.	• Adequate wrenches for flanges • Pure water • 1 x PTFE tape roll
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. <u>Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C.</u> **Chemical risk:** Risk associated with the handling of nitrogen. Please refer to the Material Safety Data (C63-SDS-003). **Anoxia risk**	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". **3.** Activate Maintenance mode on the control panel, then identify yourself on the HMI.	
Operation description	
4. Disassemble the check valve to be verified. 5. Check that the seat is clean, free of debris, and that the seals are in good condition. 6. Clean the check valve with pure water and reinstall it. 7. If the compliant condition cannot be reestablished through cleaning with pure water, it is necessary to replace the valve with a new one. The same procedure can be applied to the check valve CV-800.	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. 15. C63- R2-ELE-003 - Tightening of electrical connections for Stack's cell voltage monitors (PCA).

Objective	Validation criteria
• Verify electrical lug clamping of cell voltage monitor connections.	• The cabling of the cell voltage monitor is compliant with best practices of wiring. • The lug clamping connected to each cell in the stacks ensures a secure attachment of the cable.
Required personnel	**Required materials and consumables**
• 1 x technician.	• 1 x Voltage Absence Tester (VAT). • Wire stripper. • New lugs (if required).
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to "**Maintenance**" mode.	
Operation description	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

1. Inert the unit via the HMI. On the Oxygen and Hydrogen via "**Inerting O2**" and "**Inerting H2**" buttons, respectively (Figure 3 and Figure 4 reference point #1).
2. Switch off 400Vac power supply as described in C63-R2-DEC-001.
3. Verify that the stacks are depolarized. Confirm the absence of voltage using the VAT (0V).
4. Ensure that all lugs are securely connected to each cell in the stacks. These connections are susceptible to vibrations and unintended movements.
5. If a lug is not compliant and is easily removed from the cell, reinstall the cable lug.
6. Verify the integrity of the cabling on the monitoring device and the compliance regarding the best practice of wiring. Figure 12 provides an example of wiring best practice. In the scenario depicted on the left, the cable terminals lack protection, leading to non-compliant operation of both the device and the associated process. Conversely, the scenario on the right illustrates the proper method for wiring the device.

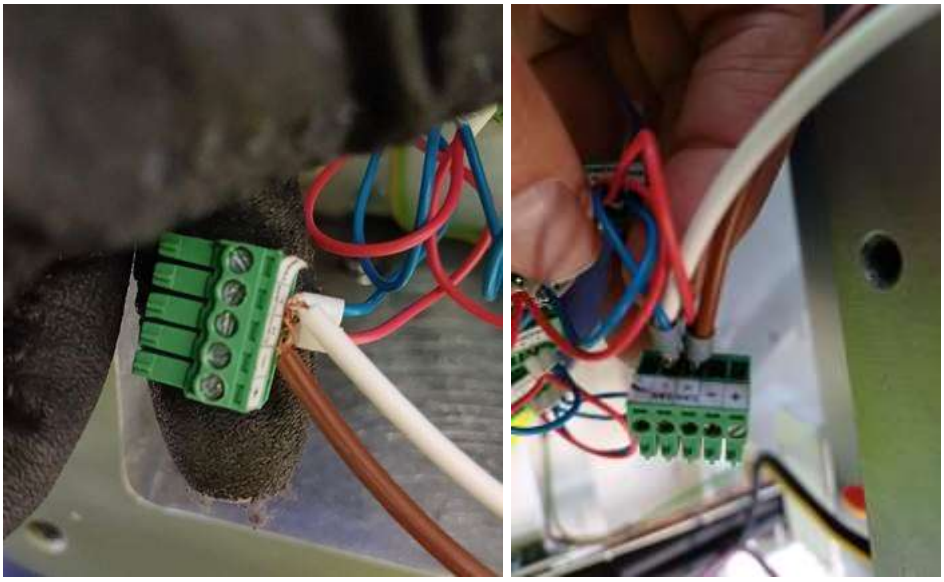

Figure 12. Example of cabling in a cell monitor

Reisntalling a cable lug.

1. Remove the insulation from the cable, place the lug and crimp it.
2. Verify that the lug is tightly attach to the cable.
3. The imprint marking must be aligned with the head of the lug.

Time required: 8 hours

Periodicity: 6 months. Or upon detection of a significant discrepancy between two consecutive cells in a stack.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

16. C63-R2-FLE-001- Inspection and replacement of flexible hoses

Objective	Validation criteria
• Inspection of flexible hoses • Replacement of flexible hoses	• Flexible hoses changed / examined • There are no leaks around the hose's fittings.
Required personnel	**Required materials and consumables**
• 1 x technician	• Flexible Hoses, according to the technical specifications of flexible hoses, and stacks and collector dimensions (DN50 PN40). • Adjustable Wrench. • Padlock keys for hand valves. • Hose Removal Pliers. • 1 x flexible hose for draining. • 1 x Collecting tank for draining.
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Anoxia risk** **Chemical Risk:** The presence of hydrogen and oxygen poses a significant risk if not properly inerted with nitrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date)
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to "**Maintenance**" mode.	
Operation description	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. The production, offering or placing on the market of, the importation, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

1. Inert the unit via the HMI. On the Oxygen and Hydrogen via "**Inerting O2**" and "**Inerting H2**" buttons, respectively (Figure 3 and Figure 4 reference point #1).

Flexible hoses inspection

1. Check the flexible hose around its connections.
2. Check if the hose is damaged or frayed: signs of rupture, swelling, or significant twisting.
3. Check for leaks around the hose.
4. If the flexible hose is damaged, it must be replaced.

Time required: 4 hours

Periodicity: 12 months

Flexible hoses replacement

1. Isolate the flexible hose by closing upstream and downstream closest valves. For hydrogen side: **HV-623** and **HV-624**; for oxygen side: **HV-604** and **HV-605**.
2. Drain the isolated section by opening the drain valves: **HV-623D** if the concerned hose is placed on hydrogen side or **HV-602D** if it is placed on oxygen side.
3. Once the section is completely drained, disconnect the damaged hose using the adjustable wrench and the hose removal pliers.
4. Remove the whiplash protection system.
5. Install the new hose in accordance with ASME standards. Each hose must be stamped with its label, operating pressure, manufacturing date, and assembler's identifier.

Note: Each flexible has specific characteristics such as diameter, length, connection.

6. Reinstall the whiplash protection system.
7. Return all hand valves to their normal positions (Lock open for **HV-623**, **HV-624**, **HV-604** and **HV-605**. Lock close for **HV-623D** and **HV-602D**).
8. Top up the water on oxygen and/or hydrogen side, following the procedures **R1-COM-600**, **R1-COM-620**.
9. Start the circulation pumps (**CP-600A/B** and **CP-620A/B**) and check if there are leaks around the hose replaced.
10. If a leak is detected, stop the pumps, wait for the pressure to decrease (<0.5 barg) and repeat steps from 1 to 4 (Flexible hoses replacement section).
11. Check that the gasket is well placed and verify the torque. If the new joint appears worn or has a manufacturing defect, replace it and reinstall the hose.
12. Repeat steps from 6 to 8.

Time required: 8 hours

Periodicity: 5 years or upon the first indication of early deterioration.

Note: Upon draining the stacks, proceed with the maintenance activity without interruption. The membranes of the stacks must not remain dry for a period exceeding the stipulated time requirement.

Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

17. C63-R2-FIL-600 - Cleaning the strainer filter on the oxygen loop

Objective	Validation criteria
• To check the condition and cleanliness of the inline filter on the 600 loop (**F-600**).	• The filter has been opened, check and replaced if necessary.
Required personnel	**Required materials and consumables**
• 1 x technician.	• Adequate wrenches to open the filter. • 1 new basket (if necessary). • 1 new gasket (if necessary). • Drain lines.
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk** **Chemical Risk:** The presence of oxygen. Please refer to Safety Data Sheet C63-SDS-002 – Oxygen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to maintenance mode.	
Operation description	

This document is strictly confidential. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

Opening of the filter

1. Close the valves **HV-604** and **HV-603A**.
2. Connect a line to the valve **HV-603D** to collect the drain water and open the valve. Open the vent **HV-604V**.
3. Once the pipe is empty of water, open the filter flange according to the user manual.
4. Check the condition of the basket and replace it if it is damaged.
5. If necessary, clean the basket with pure water.

Reinstatement of the filter

1. Reinstall the basket in the filter.
2. Check the good condition of the gasket and close the filter flange.
3. Close the vent **HV-604V**, the drain **HV-603D**, and disconnect the drain line.
4. To fill the pipe with water, first open the valve **HV-603A**, then the valve **HV-604**.
5. Check the water level in the **ST-600** and make up the level if necessary.
6. Start the pump **CP-600** and check the absence of leak.

Time required: 30 minutes

Periodicity: 6 months

18. C63-R2-FIL-620 - Cleaning the strainer filter on the hydrogen loop

Objective	Validation criteria
• To check the condition and cleanliness of the filter on the loop 620 (**F-620**).	• The filter has been opened, check and replaced if necessary.
Required personnel	**Required materials and consumables**
• 1 x technician.	• 1 x water vacuum cleaner • 1 x filter basket (DN100 0.076mm) • Pure water • Brush • Valve padlock key • Water vacuum cleaner
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Anoxia risk** **Chemical Risk:** The presence of hydrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Activate Maintenance mode on the control panel, then identify yourself on the HMI.	
Operation description	
Opening of the filter 1. Close the valves **HV-622** and **HV-623**. 2. Connect a flexible hose to the valve **HV-622D** to collect the drain water. Unlock and open the valve.	

This document is strictly confidential. 3. Once the pipe is empty of water, open the filter flange according to the user manual (User_manual_Spirax_Sarco_FIG36).
4. Check the condition of the basket and replace if it is damaged.
5. If necessary, clean the basket with pure water.

Reinstatement of the filter

1. Reinstall the basket in the filter.
2. Check the good condition of the gasket and close the filter flange.
3. Close the drain **HV-622D** and disconnect the drain line.
4. Open the valve **HV-622** then open the valve **HV-623**.
5. Check the water level in the **ST-620** and make up the level if necessary.
6. Start the pump **CP-620** and check the absence of leak.

Time required: 30 minutes

Periodicity: 6 months

19. C63-R2-FIL-800 - Cleaning or replacing the hydrogen purification outlet filter

Objective	Validation criteria
Clean or replace filter 66 (c.f. 20230443 DEDR-500_36 P&I Diagram Offshore)	• Cleaned or changed filter
Required personnel	**Required materials and consumables**
• 1 x technician.	• Flat wrenches, socket wrenches • 51.230.5S, 2 micron / Viton seal o'ring (Filter 66) Aquagas • P&ID Aquagas
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Anoxia risk** **Chemical Risk:** The presence of hydrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Activate Maintenance mode on the control panel, then identify yourself on the HMI.	
Operation description

1. Start by depressurizing and inerting the HPU according to the following procedure (C63-R2-HPU-700).
2. Open filter 66 on the hydrogen purification unit.
3. Clean basket or replace if necessary.
4. Refit basket and filter with new gasket.
5. For other HPU filters (**64-F1.1**, **64-F1.2**, **64-F2.1**, **64-F2.2, 61-F1.1** and **61-F1.2**), simple cleaning is sufficient. Check that the HPU is depressurized before servicing the filters.
6. Inert the HPU before restart the electrolyser, please refer to **C63-R2-HPU-700**
7. Return the electrolyser to automatic mode.

Time required: 2 hours

Periodicity: 12 months

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. 20. C63-R2-HPU-700 - Inerting of the hydrogen purification unit

Objective	Validation criteria
• To inert the purification unit to make it safe for maintenance.	• The purification unit has been inerted with nitrogen.
Required personnel	**Required materials and consumables**
• 1 x technician.	• Nitrogen supply to the electrolyser available
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk** **Chemical Risk:** The presence of hydrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to maintenance mode.	
Operation description	
1. Make sure to be log in the maintenance mode on the HMI. 2. Manually open the valve **PV-632**, and open at 100% the valve **MPV-630**. 3. On the purification unit, open the valve 64-V5. Open the valve 64-V4.4, this will close the valve 64-V4.3. Open the valve 64-V4.1, this will close the valve 64-V4.2.	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

4. Open the valve **PV-920**.
5. Check the presence of nitrogen flow on the **FT-920,** set the flow at 1044L/h.
6. Inert the unit for 3 hours and 40 minutes.
7. Once the inerting is completed, close the **PV-920**, and wait for the pressure to decrease and be under 0.1barg.
8. Close the valves **PV-632** and **MPV-630**.
9. The purification unit is then safe for maintenance.

Time required: 30 minutes

Periodicity: When necessary

21. C63-R2-HVAC-001 - Maintenance of HVAC system

Objective	Validation criteria
• Refer to Paumier documentation	• Refer to Paumier documentation
Required personnel	**Required materials and consumables**
• 1 x technician.	
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Chemical Risk:** Please refer to Safety Data Sheet C63-SDS-007 – MPG 40%.	• Wear PPE (Personal Protective Equipment).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**". 3. Log in to maintenance mode.	
Operation description

22. C63-R2-INS-001 - External inspection of pressure vessels

Objective	Validation criteria
• External inspection of pressure equipment	• Completed inspection report
Required personnel	**Required materials and consumables**
• 1 person	• Ultrasonic thickness gauge • Periodic inspection report for pressure equipment
Potential risks (Safety and Environment)	**Prevention and protection measures**
Anoxia risk **Chemical Risk:** The presence of hydrogen and oxygen poses a significant risk if not properly inerted with nitrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen. **Pressure risk**	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – **TT-601X**). 2. The status displayed on the HMI should be "**STOP**"	
Operation description	
Follow the PED procedure. Check equipment for thickness and deformation. Any equipment connected to it (valves, gates, etc.) must be inspected. **Time required:** 30 minutes per instrument **Periodicity:** When necessary	

This document is strictly confidential. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

23. C63-R2-PROC-002 - Electrical verification of the proper functioning of an analog sensor

Objective	Validation criteria
• To check the functioning of an analog transmitter	• The transmitter function properly and react to the measured value.
Required personnel	**Required materials and consumables**
• 1 x technician.	• Pressure source • Drain lines • Mix of water and ice • Multimeter
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk** **Chemical Risk:** The presence of hydrogen and oxygen poses a significant risk if not properly inerted with nitrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**" 3. Log in to maintenance mode.	

This document is strictly confidential. The production, offering or placing on the market of, the importation, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

Operation description
Pressure transmitter 1. Check that the transmitter is powered on and that the screen on the transmitter is showing the measured value. 2. On the Endress-Hauser instruments, it is possible to enter a simulation mode to force the current output to the HMI. 3. According to the user manual, enter the simulation mode, and force a value of current, check that the value displayed on the HMI is coherent. 4. To verify the deviation of the pressure sensor, please refer to **C63-R2-CAP-004**. **Level transmitter** 1. Check that the transmitter is powered on and that the screen on the transmitter is showing the measured value. 2. On the Endress-Hauser instruments, it is possible to enter a simulation mode to force the current output to the HMI. 3. According to the user manual, enter the simulation mode, and force a value of current, check that the value displayed on the HMI is coherent. 4. Reinstate the level transmitter. 5. If possible, drain the tank connected to the level transmitter through a drain valve. 6. Check that the level transmitter reacts accordingly. **Temperature transmitter** 1. There is no screen on the temperature transmitter. 2. Check that the transmitter is powered on by measuring the voltage on the transmitter. 3. Dismantle the probe and put it in a mix of liquid water and ice. Check the reading on the HMI, it should indicate 0°C. 4. It is also possible to disconnect the probe, put it in ice and water and measure directly the electrical resistance, it should be 100 Ohm. 5. Reinstate the probe and the transmitter. 6. To verify the deviation of the temperature sensor, please refer to C63-R2-CAP-003. **Flow transmitter** 1. Check that the transmitter is powered on and that the screen on the transmitter is showing the measured value.

2. On the Endress-Hauser instruments, it is possible to enter a simulation mode to force the current output to the HMI.
3. According to the user manual, enter the simulation mode, and force a value of current, check that the value displayed on the HMI is coherent.
4. Reinstate the level transmitter.

Conductivity transmitter

1. Check that the transmitter is powered on and that the screen on the transmitter is showing the measured value.
2. On the Endress-Hauser instruments, it is possible to enter a simulation mode to force the current output to the HMI.
3. According to the user manual, enter the simulation mode, and force a value of current, check that the value displayed on the HMI is coherent.
4. Reinstate the level transmitter.
5. To check the deviation of the conductivity sensor, refer to the procedure C63-R2-CAP-005.

Time required: 30 minutes per instrument

Periodicity: When necessary

24. C63-R2-PROC-003 - Electrical check of solenoid valve operation

Objective	Validation criteria
• Validate the electrical operation of a solenoid valve	• Presence of power supply to solenoid valve when activated • ATEX sealing
Required personnel	**Required materials and consumables**
• 1 x technician.	• 1 x multimeter • Metal screwdriver • Solenoid valve technical documentation
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk** **Chemical Risk:** The presence of hydrogen and oxygen poses a significant risk if not properly inerted with nitrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen.	• The operator performing this operation must have electrical clearance. • Wear PPE (Personal Protective Equipment) • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – **TT-601X**). 2. The status displayed on the HMI should be "**STOP**" 3. Log in to "**Maintenance**" mode.	
Operation description	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

1. Remove the upper part of the solenoid valve to gain access to its connections.
2. Activate the solenoid valve via the HMI.

Note: Activating does not necessarily mean opening the valve, as some are normally open.

3. See P&ID (FO: Fail Opened and FC: Fail Closed). Activating a Fail Opened solenoid valve will cause it to close.
4. Check that power is supplied to the appropriate terminals (see manual).
5. Bring a metal screwdriver close to the solenoid valve.
6. If the screwdriver is magnetized, the solenoid valve is operating correctly. If not, replace solenoid valve.

Time required: 10 minutes per valve

Periodicity: 12 months

25. C63- R2-PROC-005 - Electrical check of a flow switch

Objective	Validation criteria
• Check the electrical operation of a flow switch.	• The electrical supply is detected on the sensor. Presence of a signal on the controller when the sensor is activated.
Required personnel	**Required materials and consumables**
• 1 x technician.	• Multimeter. • Screwdriver.
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Chemical Risk:** The presence of hydrogen and oxygen poses a significant risk if not properly inerted with nitrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**" 3. Log in to "**Maintenance**" mode.	
Operation description	
1. Inert the unit via the HMI. On the Oxygen and Hydrogen via "**Inerting O2**" and "**Inerting H2**" buttons, respectively. 2. Check the integrity of the case coating.	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. The production, offering or placing on the market of, the importation, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

3. Check for any deformation of the case.
4. Open the lid.
5. Spot the contacts and keep a graphic register of the current connections.
6. Disconnect the contacts.
7. Check the presence of the power supply on the dedicated connection terminals. Please refer to the H250 M40 Handbook, Chapter 4 Electrical connections.

Triggering the switch

1. Please refer to Chapter 6.1 of the User Manual (H250 M40 Handbook) to trigger the alarm by simulating a 4 mA signal followed by a 20 mA signal. Upon completion of the test, ensure that the device is in measuring mode, by monitoring the flowrate variations during normal operation of the unit, particularly during the start and stop sequences.
2. If the alarm is not triggered, conduct a check of the electrical connections between the device and the electrical cabinet. Refer to the flow switch's user manual to check the proper setting of the contact pointer.
3. Close the lid making sure the seal is put back or changed if necessary.

Required time: 1 hour.

Periodicity: 12 months.

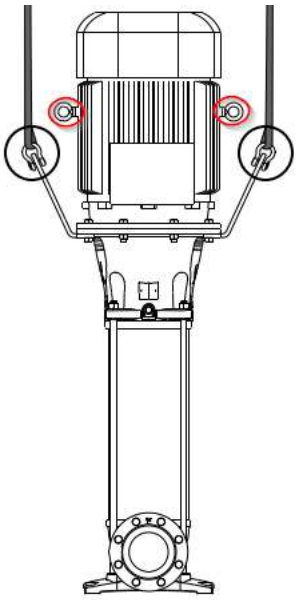
26. C63-R2-PSV-001 - Pressure safety valve replacement

Objective	Validation criteria
• To change the pressure safety valve.	• The pressure safety has been replaced.
Required personnel	**Required materials and consumables**
• 1 x technician.	• Adequate wrenches • New safety valve
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. <u>Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C.</u> **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Chemical Risk:** The presence of hydrogen and oxygen poses a significant risk if not properly inerted with nitrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – **TT-601X**). 2. The status displayed on the HMI should be "**STOP**" **3.** Log in to "**Maintenance**" mode.	
Operation description	
This procedure refers to the PSV-610/630/631/640. **Replacement of a safety valve.**	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

1. Check that the inerting has been done on the **ST-600/620**. For the **DG-640**, the inerting has to be done manually.
2. Open the valves **HV-642/940/941**. Set the nitrogen flow à 1066NL/h, and inert the **DG-640** for 3.5 hours.
3. For the PSV-631, the inerting of the HPU must be done manually. Refer to the procedure **C63-R2-HPU-700**
4. Dismantle the safety valve and replace it.
5. On start up, check the safety valve for leaks.

Time required: 30 per valve



Periodicity: When necessary

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

27. C63-R2-PUM-001 - Oxygen circulation pump maintenance (CP-600A/B)

Objective	Validation criteria
• Carry out maintenance work on the **CP-600A/B** pumps	• Successful maintenance actions • No leaks
Required personnel	**Required materials and consumables**
• 2 x technicians.	• 1 **CP-600** pump spare (optional) • 2 x DN100 flange gaskets • 1 x Voltage Absence Tester (VAT) • 1 x adjustable wrench • 1 x screwdriver • Manual valve padlock key • 1 x HBM 2-tonne folding workshop crane (capacity: 200 kg min, dimensions to be respected as specified in the procedure) • 1 x 200 kg lifting sling. Successful maintenance actions • 1 x flexible hose • 1 x Collecting tank
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk** **Physical risk (handling)** **Chemical Risk:** The presence of hydrogen and oxygen poses a significant risk if not properly inerted with nitrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. It is also protected by Copyright law. The production, offering or placing on the market of, the importation, export or storage of goods or services using ELOGEN's trade secrets or know-how is subject to ELOGEN's prior written consent. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

Prerequisites
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – **TT-601X**). 2. Log in to maintenance mode. 3. Switch off 400Vac power supply as described in C63-R2-DEC-001.
Operation description
Drain the line 1. Isolate the pump to be drained by unlocking and closing valves **HV-600A/B** and **HV-601A/B**. 2. Remove the drain plug containing the valves **HV-600DA/DB**, connect the flexible hose. 3. Drain the water up to the collector tank by opening the valves **HV-600DA/DB**. 4. Wait until the water has finished draining. Dispose of water in accordance with customer regulations. **For a pump exchange** 1. Check that there is no voltage at the pump terminals using the VAT. 2. Disconnect pump power supply cables. 3. Unscrew pump connection flanges. 4. Remove the pump: a. Sling the pump using the eyebolts on the pump (see Figure 13).  *Figure 13. Eyebolts of the pump* b. Bring the workshop crane overhanging the single container door. c. Attach the sling to the workshop crane, lift the pump and remove it from the container. 5. Install the new pump in the same way as the old one was removed and send it to the supplier for repair.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

6. Connect the pump fluidically by reconnecting the hoses to the pump flanges. If signs of wear are observed on the flange gasket, it should be replaced with a new one.
7. Wire the pump electrically. Be careful to respect the phase order.
8. Depending on the pump to be changed, close the valve **HV-600DA or HV-600DB**.
9. Open the valves **HV-600A/B** and **HV-601A/B** to start the pump.
10. If necessary, top up water in **ST-600** tank as per procedure C63-R1-COM-600.
11. Prime pump (unless self-priming)
12. Check that the pump is rotating in the right direction by checking the direction of rotation on the pump body. Vent the pump by opening the vent valve on the pump.

Figure 14. Direction of rotation

13. Start the electrolyser. Wait for the circuit to build up pressure and temperature
14. Check for leaks. In the event of a leak, switch off the 400 Vac power supply. Start again from the beginning of this procedure to dismantle and check the pump.
15. Clean the area.

To be considered:

- Pay attention to bearing noise.
- Check temperatures in the bearing area.
- Check pump for leaks.
- Keep written records of inspections.
- If necessary, carry out preventive maintenance in accordance with the manufacturer's recommendations, or replace the pump with another one and return the removed one to the manufacturer for maintenance.

For more details or any other intervention refer to **Grundfos Instructions -** CRN - GRUNDFOS - O&M - CP600

28. C63-R2-PUM-002 - Hydrogen circulation pump maintenance (CP-620A/B)

Objective	Validation criteria
• Conduct maintenance on the **CP-620A/B** pumps	• Maintenance conducted according to this procedure. • There are no detectable leaks in the vicinity of the pump.
Required personnel	**Required materials and consumables**
• 2 x technicians	• 1 **CP-620** pump spare (optional) • 2 x DN80 flange gaskets • 1 x Voltage Absence Tester (VAT) • 1 x adjustable wrench • 1 x screwdriver • Padlock keys for hand valves (if applicable). • 1 x HBM 2-tonne folding workshop crane (capacity: 200 kg min, dimensions to be respected as specified in the procedure) • 1 x 200 kg lifting sling. • 1 x flexible hose • 1 x Collecting tank
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk** **Physical risk (handling)** **Chemical Risk:** The presence of hydrogen and oxygen poses a significant risk if not properly inerted with nitrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. This document is part of ELOGEN's proprietary know-how and may contain trade secrets protected worldwide by TRIPS and EU Directives against their unlawful acquisition, use and disclosure. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

Prerequisites

1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X).
2. The status displayed on the HMI should be "**STOP**".
3. Log in to "**Maintenance**" mode.

Operation description

1. Inert the unit via the HMI. On the Oxygen and Hydrogen via "**Inerting O2**" and "**Inerting H2**" buttons, respectively (Figure 3 and Figure 4 reference point #1).
2. Switch off the 400Vac power supply as described in C63-R2-DEC-001.

Drain the line

1. Isolate the pump to be drained by unlocking and closing valves **HV-620A/B** and **HV-621A/B**.
2. Remove the drain plug from the valves **HV-620DA/DB** and connect the flexible hose. Direct it towards the collector tank to ensure proper drainage of water.
3. Drain the water up to the collector tank by opening the valves **HV-620DA/DB**.
4. Wait until the water has finished draining. Dispose of water in accordance with customer regulations.

For a pump exchange

1. Check that there is no voltage at the pump terminals using the VAT.
2. Disconnect pump power supply cables.
3. Unscrew pump connection flanges.
4. Remove the pump:
   a. Sling the pump according to the operating instructions given by the fabricant (cf. Original operating instructions Centrifugal pumps Type LEM).
   b. Bring the workshop crane overhanging the single container door.
   c. Attach the sling to the workshop crane, lift the pump and remove it from the container.
5. Install the new pump in the same way as the old one was removed and send it to the supplier for repair.
6. Connect the pump fluidically by reconnecting the hoses to the pump flanges. If signs of wear are observed on the flange gasket, it should be replaced with a new one.
7. Wire the pump electrically. Be careful to respect the phase order.

Warning: Please refer to the operating instructions given by the fabricant, particularly the chapter 6.5. Electrical installation, to get informed about the electrical hazards.

8. Depending on the pump to be changed, close the valve **HV-620DA or HV-620DB**.
9. Open the valves **HV-620A/B** and **HV-621A/B** to start the pump.
10. Switch on the 400Vac power supply as described in C63-R2-DEC-001
11. If necessary, top up water in **ST-620** tank as per procedure C63-R1-COM-620.
12. Prime pump (unless self-priming).

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. Any violation of these obligations may give rise to civil or criminal liability. © ELOGEN, 2010-2025

13. Check that the pump is rotating in the right direction by checking the direction of rotation on the pump body. Vent the pump by opening the vent valve on the pump.

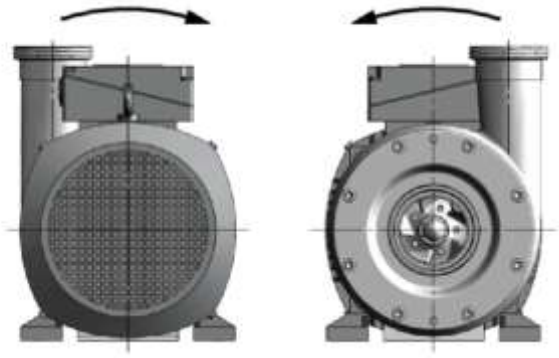

Figure 15. Direction of rotation CP-620A/B

14. Start the electrolyser. Wait for the circuit to build up pressure and temperature
15. Check for leaks. In the event of a leak, switch off 400 Vac power supply as described in **C63-R2-DEC-001**. Start again from the beginning of this procedure to dismantle and check the pump.
16. Clean the area.

To be considered after procedure has been conducted:

- Monitor the bearing noise closely.
- Check temperatures in the bearing area.
- Check pump for leaks.
- Keep written records of inspections.
- If necessary, carry out preventive maintenance in accordance with the manufacturer's recommendations, or replace the pump with another one and return the removed one to the manufacturer for maintenance.

For more details or any other intervention refer to Original operating instructions Centrifugal pumps Type LEM

Time required: 8 hours.

Periodicity: 5 years or according to customer recommendation.

29. C63-R2-PUM-003 - Maintenance of the lift pump (LP-300)

Objective	Validation criteria
• To dismantle and replace the **LP-300**	• The pump has been replaced and commissioned.
Required personnel	**Required materials and consumables**
• 2 x technicians	• Adequate wrenches • Crane • New pump
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk** **Physical risk (handling)** **Chemical Risk:** The presence of hydrogen and oxygen poses a significant risk if not properly inerted with nitrogen. Please refer to Safety Data Sheet C63-SDS-001 – Hydrogen and C63-SDS-002 – Oxygen.	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date). • The operator performing this operation must have electrical clearance.
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – **TT-601X**). 2. The status displayed on the HMI should be "**STOP**" 3. Log in to "**Maintenance**" mode.	
Operation description	

This document is strictly confidential. Removal of the lift pump

1. Open the circuit breaker supplying the VFD of the pump and lock it out.
2. Check the absence of voltage on the pump and disconnect the power cables.
3. Close the valves **HV-301A/B**, **HV-302A/B**.
4. Remove the plugs on the valves **HV-300DA/DB** and connect a line to collect the drained water. Open the valves, then open the vents on the pumps. Refer to the technical documentation of the supplier to locate the vent valve.
5. Once the pump is empty of water, remove the bolts between the pump and the pipe upstream and downstream.
6. Remove the bolts between the pump and the frame.
7. Attach the crane to the lifting points on the pump. To locate the lifting points, refer to the supplier documentation.
8. Lift the pump and remove it from the container.
9. Send it back to the supplier for maintenance.

Installation of a new pump

1. Attach the crane to the lifting points on the pump. To locate the lifting points, refer to the supplier documentation.
2. Lift the pump and install it on the previous pump location
3. Pay attention to the flow direction and install the inlet towards the valves **HV-301A/B**.
4. Install the bolts between the pump and the pipes upstream and downstream.
5. Install the bolts between the pump and the frame.
6. Connect the power cables, paying attention to the order of the phases.
7. Remove the lock on the circuit breaker and close it.
8. Close the valves **HV-300DA/DB**, remove the drain lines and put back the plugs.
9. Open the valves **HV-301A/B**, **HV-302A/B**.
10. Bump start the pump and check the sense of rotation.
11. If the rotation is not correct, lock the circuit breaker, inverse two phases on the pump, close the circuit breaker and redo the rotation check.
12. Start the pump at 55% of speed and check the flow to the **ST-600/620** with the level transmitters **LT-600/620**.

Time required: 4 hours

Periodicity: When necessary

30. C63-R2-SSFH-600 - Resin change on the oxygen water loop

Objective	Validation criteria
• To replace the resin in the FH.	• The resin has been replaced and the filter cleaned. • There are no leaks around the FH fittings. • The conductivity measured by the **CT/P-600** is below 0,1 µS/cm.
Required personnel	**Required materials and consumables**
• 1 x technician.	• 2 x Adjustable Wrenches. • 1x Torque wrench • Resin IRN160 Amberlite • Cleaning brush • Flange gaskets (cf. Pressure vessel detailed drawings C0063-FOR-DWG-MP-001_FH-600). • Padlock keys for hand valves (if applicable). • 1 x Collecting tank. • 1 x vacuum cleaner adapted for Amberlite.
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. <u>Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C.</u> **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk** **Physical risk** (handling). **Chemical risk:** Risk associated with the handling of IRN160 Amberlite (see C63-SDS-010 - IRN160)	• Wear PPE (Personal Protective Equipment). • Personal gas monitor for each operator (calibration and ATEX certificate up to date).
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X).	

This document is strictly confidential. Any unauthorised access to, appropriation of, copying, modification, use or disclosure thereof, in whole or in part, by any means, for any purpose, infringes ELOGEN's rights. 2. The status displayed on the HMI should be "**STOP**".
3. Log in to "**Maintenance**" mode.

Operation description

4. Inert the unit via the HMI. On the Oxygen and Hydrogen via "**Inerting O2**" and "**Inerting H2**" buttons, respectively (Figure 3 and Figure 4 reference point #1).

Removal of resin

1. Remove the padlocks placed on the hand valves at the upstream and downstream of the FH, **HV-602A** and **HV-604**, respectively. Then close them.
2. Remove the plug on the drain valve **HV-602DA** and connect a flexible hose to collect the drained water to the collecting tank. Open the drain valve.
3. Remove the plug on the vent valves **HV-603V** and **HV-604V**, then open it.
4. Once the section is completely drained, remove the spool section **RS-603A**.
5. Open the **FH-600** by lifting the top flange and remove the top tray with the nozzles.

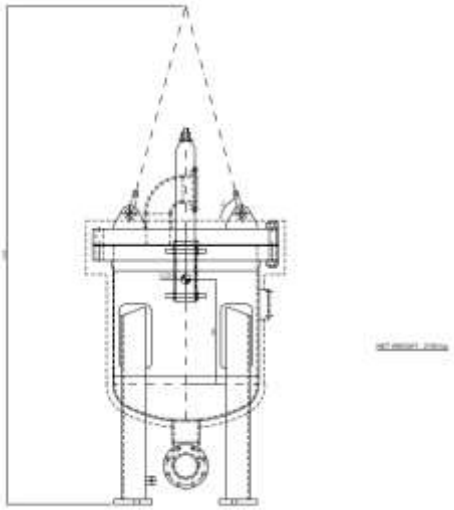

Figure 16. FH-600 lifting drawing

6. With an adequate vacuum cleaner, remove the old resin.

Check of filter strainer

1. Open the **F-600** filter and verify that it is free of resin.
2. In case of presence of resin in the filter, investigate the cause of leak in the FH.
3. Upon resolving the issue, please ensure the filter is thoroughly cleaned and properly closed **F-600**.

Installation of new resin

1. Then deposit the new resin on the **FH-600**. The remaining distance between the top of the resin and the top tray should be around 4cm.
2. Inspect the gasket of the top tray and replace it if necessary. Put back the top tray in the **FH-600**.
3. Inspect the gasket of the FH and replace it if necessary.

4. Put back the top flange, reinstall the bolts and tighten them with a torque wrench. Refer to the bolt tightening procedure to close the FH.
5. Close the valve **HV-602DA**, disconnect the drain line and reinstall the plug.
6. Close the valves **HV-603V** and **HV-604V** and reinstall the plug.
7. Open the valve **HV-602A**, then the valve **HV-604**.
8. Lock the valves in their normal position with the respective padlocks.
9. Check the water level in the **ST-600**, if the level is below the low-level threshold, top up the level with pure water following the procedure R1-COM-600.
10. Start one of the pumps **CP-600A/B** and check the **FH-600** and the **F-600** for any leak.
11. Check the conductivity measured on the **CT/P-600**. It should be below 0,1 µS/cm.
12. Check the flow measured on the **FT-600**, it should be above the low flow threshold (80 m^3/h).

Time required: 4 hours

Periodicity: 6 months

31. C63-R2-SSFH-620 - Resin change on the hydrogen water loop

Objective	Validation criteria
• To replace the resin in the FH	• The resin has been replaced and the filter cleaned
Required personnel	**Required materials and consumables**
• 1 x technician.	• 2 x Adjustable Wrenches. • 1x Torque wrench • Resin IRN160 Amberlite • Cleaning brush • Flange gaskets (cf. Pressure vessel detailed drawings C0063-FOR-DWG-MP-001_FH-620). • Padlock keys for hand valves (if applicable). • 1 x Collecting tank. • 1 x vacuum cleaner adapted for Amberlite.
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk** **Physical risk** (handling). **Chemical risk:** Risk associated with the handling of IRN160 Amberlite (see C63-SDS-010 - IRN160)	5. Wear PPE (Personal Protective Equipment)
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be "**STOP**".

3. Log in to maintenance mode.

Operation description

Removal of resin

1. Close the valves **HV-621A/B**, **HV-623**, and **PV-640**.
2. Remove the plus on the valve **HV-621D** and connect a line to collect the drained water. Open the valve, then remove the plus on the valve **HV-622V** and open the valve.
3. Once the pipe is empty of water, remove the removable spool **RS-622**.
4. Open the **FH-620** by lifting the top flange and remove the top tray with nozzles.
5. With an adequate vacuum cleaner, remove the old resin.

Check of filter

1. Open the filter **F-620** and check the absence of resin in the filter.
2. **In case of presence of resin in the filter, investigate the cause of leak in the FH.**
3. Once the problem is resolved, clean and close the filter **F-620**.

Installation of new resin

1. Then install the new resin on the **FH-620**. The remaining distance between the top of the resin and the top tray should be around 4cm.
2. Inspect the gasket of the top tray and replace it if necessary. Put back the top tray in the **FH-620**.
3. Inspect the gasket of the FH and replace it if necessary.
4. Put back the top flange, reinstall the bolts and tighten them with a torque wrench. Refer to the bolt tightening procedure to close the FH.
5. Close the valve **HV-621D**, disconnect the drain line and reinstall the plug.
6. Close the valve **HV-622V** and reinstall the plug.
7. Open the valves **HV-621A/B**, then the valve **HV-623**.
8. Lock the valves in position with padlocks.
9. Check the water level in the **ST-620**, if the level is below the low-level threshold, make up the level with pure water.
10. Start a **CP-620** and check the **FH-620** and the **F-620** for leak.
11. Check the conductivity measured on the **CT/P-620**. It should be below 0,1 µS/cm.
12. Check the flow measured on the **FT-620**, it should be above the low flow threshold (30m3/h).

Time required: 4 hours

Periodicity: 6 months

32. C63-R2-WTP-001- Maintenance of WTP

Objective	Validation criteria
• To perform the maintenance of the water treatment package	• Refer to the supplier manual
Required personnel	**Required materials and consumables**
• 1 x technician.	• Refer to supplier manual
Potential risks (Safety and Environment)	**Prevention and protection measures**
Thermal Risk: Risk of burns or damage related to high temperatures or hot surfaces during operation. Even with the unit stopped and depressurized, the hydrogen purification unit is kept under hydrogen pressure and could be at temperatures up to 180 °C. **Electrical risk:** Risk associated with handling electrical equipment, including the hazards of electric shocks or short circuits. **Anoxia risk** **Physical risk (handling)** **Chemical Risk:** Refer to the supplier documentation	• Wear PPE (Personal Protective Equipment)
Prerequisites	
1. Make sure the electrolyser is stopped, depressurised and cold (Stacks temperature under 40 °C – TT-601X). 2. The status displayed on the HMI should be “STOP”. **3.** Log in to maintenance mode.

1. Introduction

The gas Deoxo (DE) and Dryer (DR), is designed to purify compressed hydrogen gas through catalytic purification (removal of O2) and subsequent drying by adsorption (removal of H2O).

It´s of outmost importance to carefully read through this complete Operation and Maintenance Manual before commissioning, operating, maintenance or repair on the DEDR.

The DEDR is only intended for the hydrogen gas at specified conditions.
Particles or substances contained in the incoming gas will accumulate in the DE bed, DR bed or in the outlet filter. Gas containing oil or potassium hydroxide (KOH) will lead to poisoning of the Deoxo catalyst and will result in reduced lifetime or bad product gas quality. It´s therefore important that the operator ensures that the composition of the feed gas is conforming to the specification.

AQUAGAS supplies the Control Logic and instructions for operating the DEDR.
The PLC and its programming will be provided by the Customer.
The interfaces are the inlets to the electrical enclosures or Junction Boxes where the Customer connects the control cables in order to be able to control contactors and solenoid valves and to receive signals from the DEDR transmitters. See the Wiring Diagram.

The DEDR has been designed for indoors installation inside an air-conditioned container at an ambient temperature between +0°C and +40°C. Customer will ensure appropriate ventilation of the container to avoid the risks of hydrogen or nitrogen accumulation in case of leakage.

Power supply is provided and installed by the Customer.

When commissioning, operating, maintenance or repair on AQUAGAS equipment, the mechanics are expected to use safe engineering practices and observe all relevant local safety regulations.

Maintenance and repair work shall only be carried out by adequately trained personnel, if required, under supervision of someone qualified for the job.

- Use only correct tools for maintenance and repair. As the area is classified as a hazardous zone, all tools needs to be certified for use in hazardous zone.
- Purge with inert gas (i.e., nitrogen) before opening the system to the atmosphere.
- Before removing any pressurised component, effectively isolate the DEDR from all sources of pressure and relieve the entire system from pressure. Do not rely on non-return valves to isolate the pressure system.
- After the unit has been opened against the atmosphere it must be purged with inert gas before it is filled with hydrogen gas.
- Never weld on, or in any way modify, pressure vessels.

WARNING: When handling inert gas (i.e., nitrogen) secure that the working area is well ventilated and free of leakage to secure the oxygen level (~20%) in the air. Breathing air containing less than 6% oxygen produces convulsions, then apnoea (cessation of breathing), followed by cardiac standstill. These symptoms occur immediately.

2. Design

2.1 Inlet data:

Media:	Hydrogen
Media flow:	500 Nm³/h
Media temperature:	+7°C
Inlet O2 content normal/ design:	< 500 ppm(v)
Inlet H2O content:	Saturated at inlet temperature
Operation range:	10-100%
Operating pressure:	31,1 bar(g)
Inlet oil content:	< 0,01 mg/Nm3
Inlet Potassium hydroxide content:	< 0,01 mg/Nm3

2.2 Outlet data:

Outlet O2 content:	< 5 ppmv (*Note 2.2.1)*
Outlet H2O content:	< 5 ppmv *(Note 2.2.1*
Outlet particle filter:	2 micron
H2 Temperature:	< +40°C
Pressure drop:	< 0,3 bar
Condensate:	approx. 7 kg/24 hours

Note 2.2.1: Measured by Customer at operating pressure.

2.3 Design data:

Design pressure:	36 bar(g)
Design temperature press. vessels:	-20/+270°C
Ambient temperature:	+0 to +40°C
Freezing protection (<1°C):	Not included
Regeneration gas:	Closed loop, no gas losses
Regeneration gas temperature:	~180°C
Dimensions: (LxWxH):	1687 x 1000 x 2300 mm
Weight (in operation) :	~1540 kg
Sound pressure level @ 1m distance:	<82 dB(A)
Cooling water piping design pressure:	>9 bar (g)
Installation:	Indoors

2.4 Operation data:

Cycle time:	6 hours
Heating:	4 hours
Cooling:	2 hours

2.5 Electrical data:

Installed power Deoxo heater:	3 kW
Electrical supply Deoxo heater::	230V, 1 ph, 50 Hz
Installed power Dryer Reg. heater:	6 kW
Electrical supply Dryer Reg. heater:	400V, 3 ph, 50 Hz
Electrical power instruments:	<10 W
Installed supply instruments:	24 V DC

2.6 Consumables:

Catalyst type:	Anco DSL2, approx. 54 kg
Desiccant type:	BASF Sorbead type WS, approx. 30 kg per tower

2.7 Customer utility supply data:

Pilot air / nitrogen pressure:	5-8 bar(g)
Pilot air consumption:	2.5 LPM average, 10 LPM peak
Pilot air quality:	Class 3 acc. ISO 8573 (Dewpoint < -20°C)
Cooling water consumption:	approx. 1,6 m^3/h @ ΔT=10°C
Cooling water inlet temperature:	< 6,8 °C
Cooling water pressure:	3-6 bar(g)

2.8 Interconnections:

Process gas in:	Flange RF 1” class 300, A105, ASME B16.5
Process gas out:	Flange RF 1” class 300, 316L, ASME B16.5
Cooling Water in/out:	Flange RF 1” class 150, A105, ASME B16.5
Condensate drain:	Hy-Lok tube connector Ø 8 mm, 316L
Instrument air:	Ø 6 mm connection for plastic hose
PSV Cooling Water:	G 1/2 ” female threaded connection, brass
H2 vent line (connected to PSV):	Flange RF 1” class 300, A105, ASME B16.5

2.9 Paint system specification

Classification:	ISO-12944-2, C3	
Preparation:	Sandblasted SA 2,5	
Primer:	Temacoat GPL-S	(mini. 70 micron)
Intermediate:	Temacoat GPL-S	(mini. 70 micron)
Top:	Temadur 50	(mini. 60 micron)
Colour:	RAL 7011 (Grey)	
Stainless steel:	pickling of weld seams, no painting

3. Certifications

According to EU Codes & Standards:

3.1 Pressure equipment certification:

DR & DE pressure vessels:	PED Category IV, Module G
Heater pipe:	PED Category III, Module G
Heat exchanger coolers:	PED Category I, Module A
Outlet filer:	PED Category SEP
Piping:	PED Category SEP
Welding procedure:	SS-EN 15614
Welding qualification:	SS-EN ISO 9606
Design & approval:	2014/68/EU PED

If no control system is in scope of the delivery, manufacturer cannot categorize the unit as a PED assembly. This must be done by Customer or user.

3.2 Electrical equipment certification

Temperature class:	T1
Protection for heaters:	ATEX Ex db eb IIC *Note 3.2.1*
Protection instruments :	ATEX Ex ia / d IIC
Zone classification:	Zone 2

Note 3.2.1: The heater head is divided into 2 units, the lower parts with the electrical connections for the heater rods and instruments are EX d, upper part with connection for power supply and signals is EX e.

VAT. No. SE556563726001

4. Preservation and Installation

At delivery the gas DEDR unit is supplied completely mounted ready to be taken into operation. Catalyst and drying desiccant are filled. Please note, that after the catalyst has been filled the unit is not allowed to be operated/pressurized with compressed air.
The unit should always be kept in an upright vertical position.
Please review document *HANDLING INSTRUCTIONS* for appropriate handling before proceeding with installation.

4.1 Preservation:

- The DEDR is designed for indoor installation, and it should be stored in a dry warehouse with an ambient temperature that does not exceed +45°C.
- If the DEDR is to be stored or mothballed for a longer time, it should be sealed, purged, and filled with 0,2 bar(g) inert gas i.e. nitrogen inside.

4.2 Installation:

- Only use the dedicated lifting lugs for positioning the unit at its place. Lifting with a forklift truck is preferred, but the use of a crane is possible for final positioning.
- It is recommended to have minimum space (> 1 meter) in front and at the sides of the unit in order to simplify service and filter element replacement.
- When placed inside a container, the roof should be dismountable so as to have a free overhead access the top of the unit. This is necessary to remove the regeneration heater or access the top flanges of the towers for refilling the catalyst or desiccant materials.
- The Deoxo-Dryer shall be bolted to the floor and wall of the container. It is recommended to use M12 bolts for steel structure or M12x120 mm expander screws for concrete. Fixation to the back wall with M12 bolts is also recommended to avoid tipping over during movements of the container.
- Do not place the unit where it is exposed to vibrations (i.e., close to a compressor).
- Connect the process gas and cooling water piping to the DEDR inlet and outlet connections. Connect the condensation water outlet to the drain disposal grid.
  Connect the flexible instrument air hose to the first solenoid valve.
  Install the discharge line connected to the Cooling Water pressure safety valve PSV-64.3.
  Connect the H2 vent line flange (N10) coming from pressure safety valves PSV-64.1 and PSV-64.2 to hydrogen venting line.
- Blow any welding wastes and other impurities from the upstream and downstream piping before connecting the unit.
- Connect the DEDR to the main power supply via an isolation switch.
- If the H2 gas from the compressor contains oil drops or oil vapour, a de-oiling filter should be installed upstream of the Deoxidiser.
  Note: the de-oiling filter should be checked and drained minimum once per day!
- Downstream of the DEDR, a pressure maintaining valve shall be installed in the product gas line to avoid vacuum or too high gas velocity through the DEDR.
- No forces or loads may be transferred to the interconnecting points of the unit. Flanges and other connections are neutral points.
  Support or modify the upstream or downstream connecting lines if required.

5. Commissioning of the Deoxo-Dryer

5.1 Pre-check

- Check that the DEDR is properly installed as per above recommendations.
- Check the DEDR sequence by manual operation of the solenoid valves.
- Check the valve limit switches.
- Check that all valves are in the correct position.
- Check that all Hy-Lok connections have the correct torque (green markings are aligned).
- Check the set points of temperature transmitters and temperature switches.
- Check the positioner of valve of flow regulating valve 64-V6.
- Check cooling water flow, temperature, and pressure.
- Check instrument air or nitrogen flow and pressure.
- Check that valves 61-V2, 64-V15 and 64-V16 are open. Put a lock (not included) on them.

The above test shall be made with and without pressure.

5.2 Check software and wiring

Without pressure on the system, shut-off fuses for regeneration heater (all fuses except control voltage).

Once all signals connected, use the HMI/PLC (Customer scope) to step through all sequences, with extra attention to the supplied Control Logic description, to secure that the wiring is correct, and the sequences are working OK without any alarms.
Pay extra attention to valves that might open and create a high-pressure peak.
If anything is abnormal, please contact AQUAGAS for advice.

5.3 Leak test

Pressurize with air or nitrogen at design pressure, check for leaks with bubble spray.
If leakage with a Hylok coupling, retighten until maximum finger tight + ¼ turn with spanner and green markings are aligned. Use Hylok gap inspection tool for checking the torque, if available. Do not overtorque !

5.4 Flush with inert gas and process gas

Flush with nitrogen to remove the air.
Beware of choking danger = good ventilation required.
Function test all components and sensors + check signal transmission and alarm functions with the PLC. The first part of the commissioning can be done with nitrogen.

Before final start-up, the unit performance must be adjusted and tested with hydrogen.
Flush with hydrogen to remove nitrogen.
The heaters perform differently with hydrogen (faster heating up of the gas) as with nitrogen. The flow behaviour of hydrogen and nitrogen is different, so the ejector performance during the cooling phase will be different, and the flow regulation through valve 64-V14 and needle valve 64-V14.1 cannot be adjusted as final with nitrogen.
The final commissioning step must be done with hydrogen.

NOTE: Even if it was leak tight in AQUAGAS workshop, the unit has probably been traveling by road and sea or air. Vibrations etc. can make couplings leak.

VAT. No. SE556563726001

5.5 Start of Deoxo-Dryer

- If the DEDR has been opened against the atmosphere, it must be purged with inert gas before feeding the hydrogen. Before starting it is important to ensure that inert gas is available. All connections must have been checked against leakages.
- Make sure that main and instruments electrical power are available.
- Open cooling water to the coolers.
- Open the compressed hydrogen gas intake valve slowly. Check that the pressure maintaining valve (Customer scope) is working. Wait until the working pressure has been reached.
- Check for leakages.

NOTE: The Dryer is sensitive to high gas flow velocities since this might cause lifting of the catalyst and desiccant beads. It is therefore very important that an empty gas system always is filled very slowly. It is recommendable to install a pressure maintaining valve in the discharge pipe downstream of the DEDR.

5.6 Flow control - Positioner

The dryer is equipped with a positioner for the adjustment of the regeneration flow. The flow and temperature are important to optimize the dryer performance, energy consumption and lifetime.

Functional background

The gas inlet flow is divided in two streams: one going to the heater for regeneration and the other going to the active adsorbing tower. During the regeneration phase, independently of the flow rate, ~25% of the full flow capacity shall always be distributed to the heater and the rest of the flow shall be distributed to the adsorbing tower.
This is controlled by positioner FC-64.1.

The positioner is pre-set at delivery according to below:
Zero point: 25%
Span: 50%

5.6.1 Step 1, Control of settings and functions

This is to check the heater/positioner setting and the communication between PLC system and dryer.

- Check that PLC control have a linear output signal 0-100% = 4-20mA.

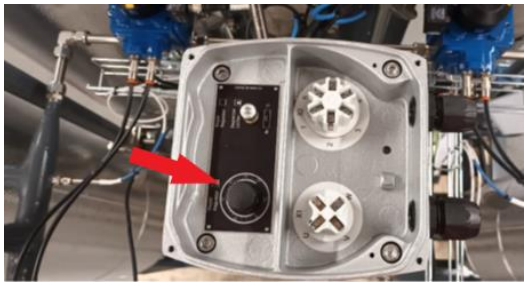
- Check positioner without pilot pressure:
  04-20 mA: Positioner indicates 100% open.

- With pilot pressure:
  4 mA: Positioner indicates 0% open.
  8 mA: Positioner indicates ~10% open.
  12 mA: Positioner indicates ~25% open
  16 mA: Positioner indicates ~50% open.
  20 mA: Positioner indicates ~75% open.

5.6.2 Step 2, Adjust valve 64-V14 and needle valve 64-V14.1
This is to adjust the distribution at full flow and to optimize the energy balance.

- Start the dryer in heating sequence at 100% of hydrogen nominal flow capacity.

- Check that positioner FC-64.1 indicates ~75% open.



- Adjust the by-pass needle valve 64-V14.1: count the turns from fully open to fully close and set it at 50% open.

- Partly close valve 64-V14 to about 50%.
  Wait 15 minutes and read the regeneration temperature (DR-TT-64-6 or DR-TT-64-8 depending on which tower is in regeneration sequence).

  If the temperature is below 155°C, partly close valve 64-V14 step by step until 155-160°C is reached. Wait 10-15 minutes between every step. You can also use by-pass needle valve 64-V14.1 for fine tuning,

  If the temperature is above 165°C, partly open valve 64-V14 step by step until 160-165°C is reached. Wait 10-15 minutes between every adjustment. Use the by-pass needle valve 64-V14.1 for fine tuning.

If 155-160°C cannot be reached, increase the heater set point by 25°C and restart step 2.

Note: the initial setting of the heater temperature in done in our workshop at 280°C. Adjustments can be done inside JB3 by turning the button -see picture.

- Check the heater on vs off time.
  This can be monitored by the PLC software.

  If the heater is on 75% - 95% of the time proceed to step 4.

If the heater is on for more than 95% of the heating time the flow is slightly too high. Partly close valve 64-V14 step by step until it is on for 75 – 95% of the time. Wait 10-15 minutes between every adjustment.
Use the by-pass needle valve for fine tuning.

If the heater is on for less than 75% of the heating time the flow is slightly too low. Partly open valve 64-V14 step by step until it is on for 75 – 95% of the time. Wait 10-15 minutes between every adjustment.
Use the by-pass needle valve for fine tuning.

5.6.3 Step 3, Adjust the span

This is to adjust the distribution at intermediate flow and to optimize the energy balance.

- Start the dryer in heating sequence at 75% of hydrogen nominal flow capacity.
- Check that positioner indicates ~50% open.
- Wait 15 minutes and read the regeneration temperature (TT-64.6 or TT-64.8 depending on which tower is in regeneration sequence).

  If the temperature is below 155°C, remove the cover of the positioner and slightly increase the span until 155-160°C is reached. Wait 10-15 minutes between every adjustment.

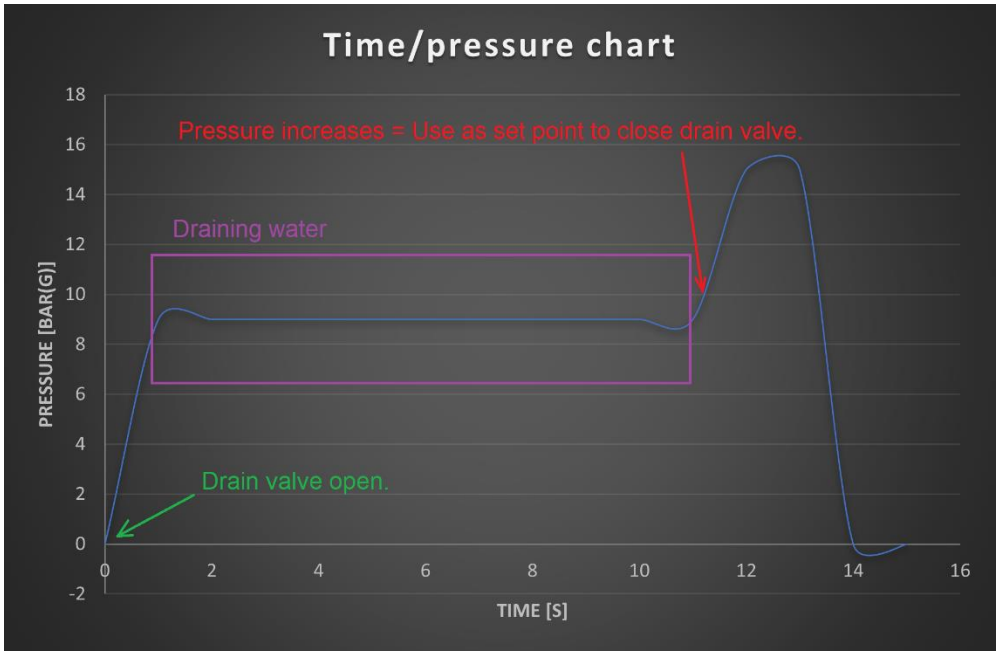
  If the temperature is above 165°C, remove the cover of the positioner and slightly decrease the span until 160-165°C is reached. Wait 10-15 minutes between every adjustment.

5.6.4 Step 4, Control of operation 25-100% capacity

Start the dryer in heating sequence at 25% of hydrogen nominal flow capacity and let it run for 15 minutes, ramp up the flow step by step every 15 minutes to 50%, 75% and 100%. Check that the gas temperature at temperature transmitters DR-TT-64-6 or DR-TT-64-8 depending on which dryer vessel is under regeneration. It should be 160°C - 180°C for all flow rates. If not, please contact Aquagas for assistance.

5.7 Setup of pressurized condensation system

The deoxo-dryer is pre-set for a condensation water drainage system at an operating process gas pressure of approx. 8-36 bar.
The pressure is measured at PT 64.1 and is controlled by a Pbar factor.
Please see the Control Logic Condensate sub-program.
For instance, if your normal working pressure is 40 bar(g), you will start with a Pbar factor of 0,5 x 40 = 20 bar(g), and then adjust in order to find the correct P bar factor.



If the Pbar factor is not reached within the timer setting (see Condensate sub-program), the customer PLC gets a condensate alarm PSA 64.1 L. This means that the system is clogged or the Pbar factor is set too high. Reduce by a factor of 0,1. Repeat with a smaller difference if needed.

If the drain valve closes directly after it has opened but there remains water to be drained, the Pbar factor is set too low. Increase a factor of 0,1.
Repeat with a smaller difference if needed.
To check if there is remaining water to be drained, you can activate solenoid valve 64-V12 and check how much water is coming out.

If the drain valve does not close even if there is no water to be drained, the Pbar factor is set too high. Decrease a factor of 0,1.
Repeat with smaller difference if needed.

A way to find the correct setting is to monitor the PT 64.1 with a Pbar factor at 1. After depressurizing your system, fill the vessel to be drained with 0,5 litre of water. To do this, connect a hose onto 61-V1 or 64-V10 or 64-V11, fill in the water, close the valve. Repressurize and do the time/pressure chart. Monitor the pressure during draining and look for the red market set point below to determine the Pbar factor.

Below is a graph from a lower pressure condensation system to explain the concept.

As this is hydrogen and high pressure, please check that the first draining sequence, begins within approx. 15 minutes after start. Most important is not to get a time out at the start. Only perform this procedure in a ventilated place as a risk of hydrogen leak is possible.

VAT. No. SE556563726001

6. Operation

6.1 Operation of the DEDR unit

The DEDR unit is designed for continuous removal of oxygen and moisture from compressed hydrogen. The Deoxo and adsorption Dryer with internal coolers is working in a closed loop under pressure without any gas losses.

The DEDR unit is a skid-mounted assembly that consists of a pre-cooler, a Deoxo vessel, two Dryer vessels, one regeneration heater, one main cooler composed of two vessels, a condensate system, an outlet particle filter, with interconnecting piping, valves and instruments. The ejector allows for a reversed flow during the cooling of the tower under regeneration without a blower or any rotating equipment.

6.1.1 Operation of the DE (Deoxo)

The gas stream flows to the Deoxo (DE) where O2 reacts with H2 through a catalytic reaction to produce water: $2H_2 + O_2 \Rightarrow 2H_2O$.
To secure that no water will condensate in the deoxo reactor, the vessel is heated with a trace heater.

The Deoxo is pre-filled with catalysts type DSL2 of ANCO. If replacement is required, the catalyst is filled through the top connection and emptying take place through the bottom connection on the DE vessel.

6.1.2 Operation of the DR (Dryer)

The gas Dryer has two drying towers A and B containing desiccant. This desiccant material is kept in place with strainers at the top and bottom connections. The adsorption desiccant consists of drying beads with 2-5 mm diameter, which are capable to adsorb moisture up to 40 % of their own weight. The drying beads have a large number of pores with a certain pore diameter. It is on this internal surface area that the adsorption of moisture takes place. Drying beads can adsorb moisture and be reactivated thousands of times without changing form or shape. The Dryer is pre-filled with desiccant type Sorbead WS of BASF. If a replacement is required, desiccants are filled through the top connections and emptying takes place through the bottom connections of the DR vessels.

The gas stream flows into the dryer (DR) through the main cooler 64-T1A or 64-T1B into tower A or into tower B. One vessel is in adsorption mode and the other in regeneration/stand-by mode. The distribution of the gas flow between the active tower and the tower to be regenerated is controlled with the positioner of 64-V6control valve.

During the heating sequence of regeneration, a fraction of approximately 25% of the gas flow will be heated up in the regeneration heater and flushed through the tower to be regenerated from the top to the bottom. The moisture trapped on the desiccant will be desorbed by the hot gas thus regenerating this adsorber tower. The regeneration gas will be cooled via the cooler and mixed with the main gas flow. This total flow will again be cooled and enter the bottom of the active tower where the condensate water will be collected and drained into athe condensate circuit and then dispensed to the customer drainage system.

It should be noted that the "condensate traps" in the lower part of the Deoxo and Dryer A / B towers must be emptied continuously so that water does not accumulate, which would

cause the active materials to be flooded. Accordingly, the valves 61-V2, 64-V15 and 64-V16 must always be open during operation.

The process gas outlets of the Dryer towers are located at the top and work with a combination of four valves 64-V4.1/ -V4.2/ -V4.3/ -V4.4 that send the gas either through the outlet filter 66 to the customer product line or send it to the Dryer tower to be regenerated.

Before the heater HE 64.1 is a valve 64-V5 that is coupled with DR-AV-64-6. After this valve, the manual valves 64-V14 and 64-V14.1 are used for adjusting the regeneration stream.

After the regeneration with hot gas, the adsorbent bed needs to be cooled down to the optimal adsorption temperature. This cooling is performed by opening valve 64-V7 and closing valve 64-V5. The venturi effect in the 64-T4 ejector is used to reverse the gas flow in the tower being regenerated. The cold feed gas now is flowing from bottom to top through the hot desiccant bed that needs to be cooled down, until the desired temperature is reached. When this stage is reached, the regeneration is completed, and the tower is ready to go into the adsorption phase again.

WARNING: During regeneration the heater pipe and the tower under regeneration are hot. The same is valid for the pipe from the hot tower to the cooler during cooling. Do not touch any unprotected surfaces during these two stages.

6.2 Operation control of the DEDR unit

Please refer to the unit's Control Logic instructions and P&ID for better understanding.

The Customer will program the PLC considering the setting points in the Control Logic and alarms and proceed as follows:

- Read operation of DEDR to get an overview of the operation.
- Add all instruments according to DEDR Input and Output signals list.
- Add DEDR Control Logic Main program.
- Add DR Sub program, sequence 1 to 4.
- Add Condensate system Sub program.
- Add the Safety Switch-off sub program.
- Add all alarms according to DEDR Alarm list.
  Please note that some alarms are active during the complete operation, some alarms are active during one or several sequences, to be considered in the PLC. Some alarms are set according to the Main program, the Dryer Sub program, sequence 1 to 4 and Condensate system Sub program, and Safety Switch-off

The gas Dryer, with its valve positions as in the P&I Diagram shows the dryer tower 64A in adsorption and dryer tower 64B under regeneration. This corresponds to the Dryer control sequence 1 of 4. This position has been reached since the PLC has opened instrument air through the solenoid valve 64-V1, which operates the valves 64-V4.1 and 64-V4.4. Changeover of drying towers will take place automatically.

The gas automatic valves are operated with double acting or spring return pneumatic actuators and the movements are controlled by signals to the solenoid valves from the PLC. The positions of the valves are checked by electrical limit switches.

Please note:

- Wherever in the program the dryer has stopped, it shall restart in the same sequence/position as it was stopped.
- If the heater sequence has been on for more than 15 minutes, it is not allowed to manually switch over the cooling sequence before the tower is completely cooled down. This in order to protect the downstream/discharge equipment from high temperatures.

The DEDR cycle will have the control sequences described hereafter.

WARNING: It is not allowed to switch over towers manually before the cooling cycle is completed as this may render warm compressed hydrogen (~180°C) streaming into the primary hydrogen network.

6.2.1 DEDR Main program

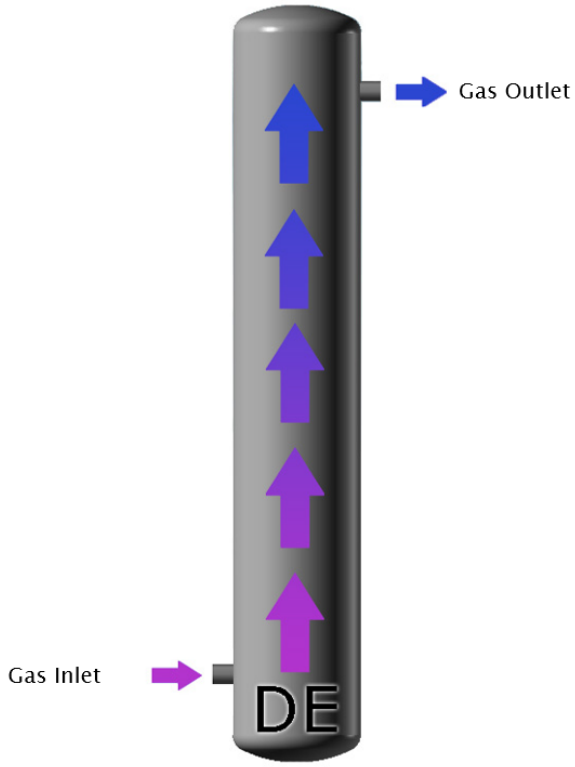
The heat tracing of the Deoxo- vessel is regulated with the temperature transmitter TT 60.1 and protected against high surface temperatures with the temperature transmitters TT 60.2 and TT 60.3. During the catalytic cleaning reaction, the gas temperature will rise depending on the amount of oxygen in the feed gas.
The max temperature increase is 160°C for 1% oxygen in the hydrogen.

If the oxygen concentration exceeds the maximum value, the temperature transmitter TT 61.1 shall give an alarm and later switch off the gas flow through the unit, in order to protect the gas Dryer from a too high inlet temperature.

Deoxidizer

Saturated hydrogen + oxygen
Saturated hydrogen

To remove potential oxygen in the hydrogen, hydrogen and oxygen reacts in a continuous catalytic reaction into water:
$2H_2 + O_2 => 2H_2O$

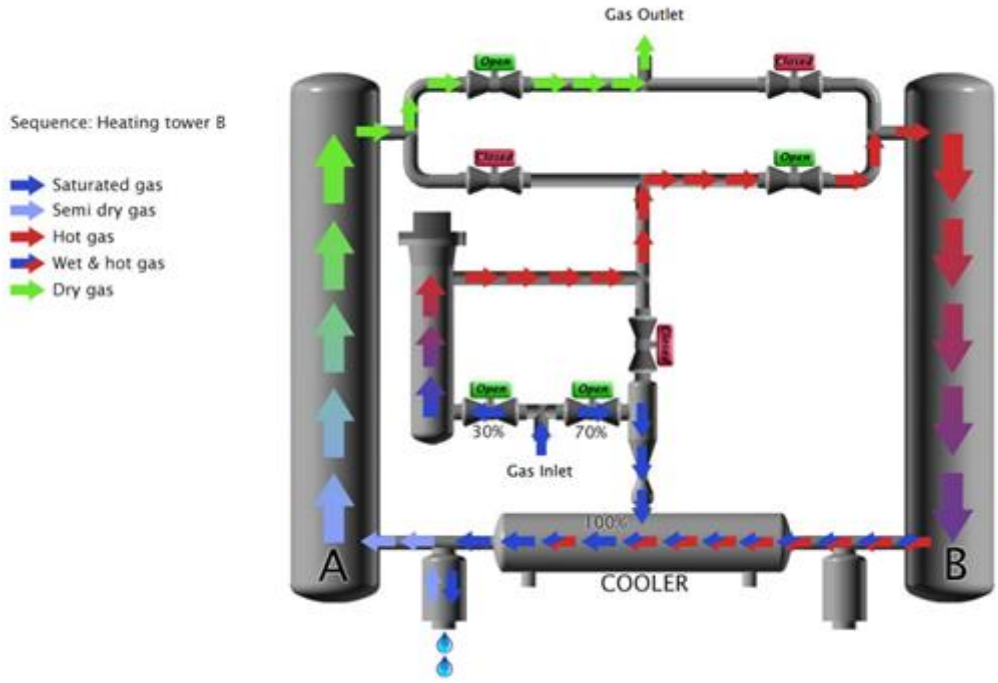


To prevent condensation in the deoxidizer a trace heater is installed on the deoxidizer vessel to increase the gas temperature 10–15°C.

The deoxidizer remove up to 1% of oxygen down to 1–5 ppmv.

Each 0.1% oxygen in hydrogen result in a temperature increase of 16°C. This corresponds to the energy needed to convert water into hydrogen + oxygen.

The catalysts consists of 2–5 mm aluminum oxide spheres coated with 0.2 weight% palladium.



Guaranteed lifetime of the catalyst is 2 years, expected lifetime is +5 years. Poisoning from oil or KOH will reduce the lifetime.

AQUAGAS Sweden AB
Brunnsängsv. 19
15242 Södertälje
SWEDEN
Phone: +46 (8) 554 204 70
info@aquagas.se
www.aquagas.se
Org. No. 556563-7260
VAT. No. SE556563726001

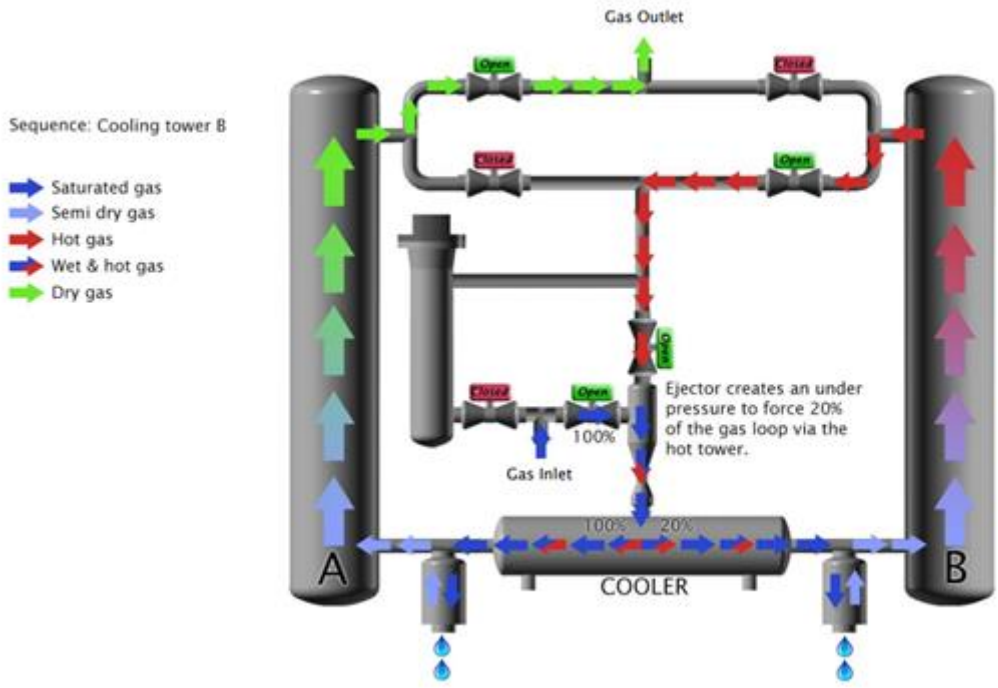
6.2.2 Dryer control sequence 1 of 4

Sequence 1) Switching over to Dryer tower A and heating tower B.

Picture 6.2.2 Simplified schematic of Dryer sequence 1.

Via a signal from the PLC, solenoid valve 64-V1 is activated and instrument air will open valves 64-V4.1 and 64-V4.4. Solenoid valves 64-V2 is deactivated and valves 64-V4.2 and 64-V4.3 are closed. In this position, tower Dryer A is in adsorption mode and tower Dryer B in regeneration mode.
When the valves are in correct position the electrical limit switches GS 64.1.1 and GS 64.1.4 are activated and GS 64.1.2 and GS 64.1.3 are inactive. These signals will be given to the PLC and indicate adsorption in tower Dryer A and regeneration in tower Dryer B. If the limit switches are not activated as specified above in this sequence, an alarm for not correct switching over of the Dryer sequence shall be given.

Instrument air, via solenoid valve 64-V8 will open valve 64-V5 and partly close valve 64-V6. As the valve 64-V3 is inactive the cooling valve 64-V7 is closed.
Under the condition that the Dryer switching over position is correct as per above and that the electrical limit switch GS 64.1.4 is activated and GS 64.1.3 is inactive, the regeneration heater can be switched on. The set positions of the electrical limit switches as per above indicate that the heating phase of the regeneration has started. If any of the electrical limit switches are not correctly activated, an alarm for regeneration failure shall be given by the PLC.



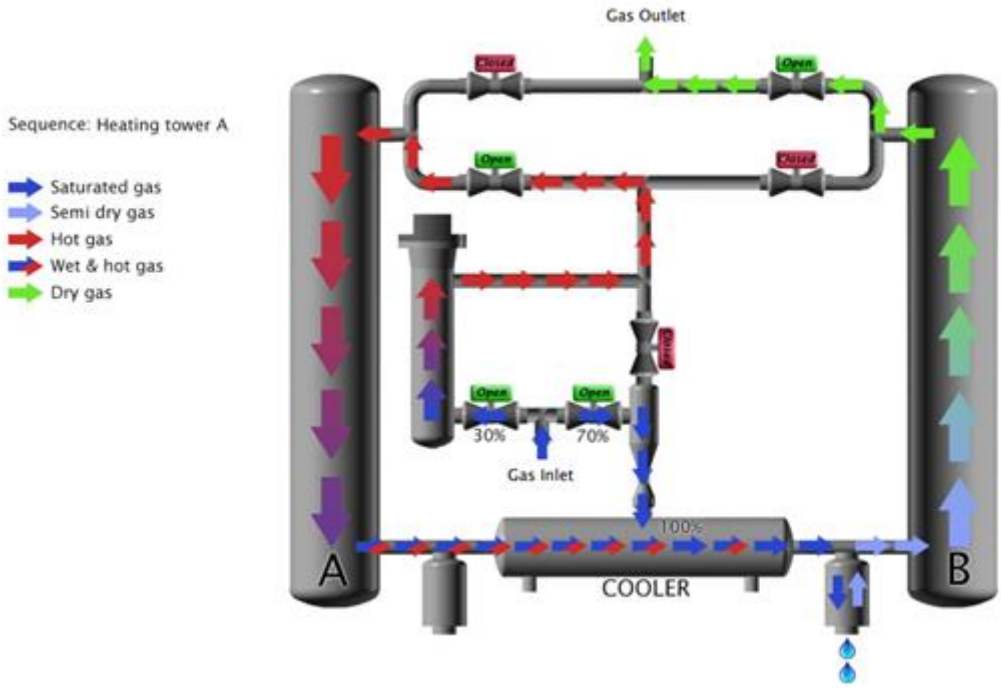
During the regeneration sequence the positioner FC-64.1 will adjust the valve 64-V6 in a partly to fully closed position depending on H2 feed gas flow through the Dryer. It is controlled via a 4-20 mA signal from the electrolyser and will be fully closed (0-10%) in the range 4-8 mA and regulated between 25-75% in the range 12-20 mA. For more info, see part 5.6.

In the heater head there is a temperature control TS 64.1 placed in the power supply line controlling the heater temperature. If the surface temperature is too high the heater will be switched off by TS 64.2 and the PLC will give an alarm signal for overheating. After the heater, there is an additional temperature safety switch TS64.3 that secures against overheating of the regeneration gas.

The first step of the regeneration phase is to check that the correct regeneration temperature has been reached. This is done by checking the tower B top temperature transmitter TT 64.8 after 30 min. If the regeneration temperature has not been reached after 30 min, this means that either the heater is not functioning or that the gas flow is insufficient and will give an alarm for regeneration failure.

If the temperature is correct the next step will be to check when correct bottom temperature has been reached. This is done by the temperature transmitter TT 64.7. If the temperature has not been reached after 3 hours the program will give an alarm for regeneration failure.
If the temperature is reached within the 4 hours the program will go to sequence 2.

6.2.3 Dryer control sequence 2 of 4
Sequence 2) Adsorption tower 64A and cooling tower 64B



Picture 6.2.3 Simplified schematic of Dryer sequence 2.

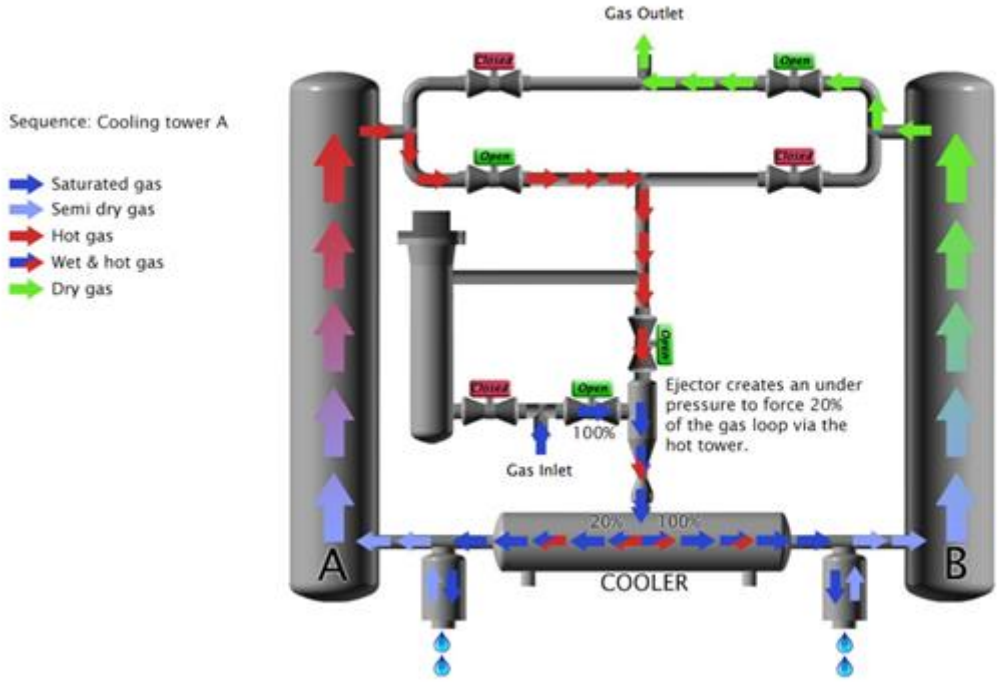
Solenoid valve 64-V8 is switched off which closes valve 64-V5; and solenoid valve 64-V3 is activated, so valve 64-V7 will open. In these valve positions the electrical limit switch GS 64.3 is activated and GS 64.2 is inactive and indicating the correct cooling phase. If any of the above limit switches are not in correct position an alarm signal for cooling failure shall be given.

The first step in the cooling phase is to check that the bottom temperature measured by TT 64.7 decreases to the set point in order to prove correct cooling. This is checked after 0.5 hours. If the max time is reached and the temperature still is too high an alarm for cooling failure will be given.
The next step is to check the top temperature is cooled down by measuring TT 64.8.
If the top temperature is not reached before 5.9 hours an alarm for cooling failure will be given.
If the top temperature is reached the program will close the valve 64-V7 and remain in this position until 5.9 hours have elapsed. The solenoid valve 64-V3 will be closed and depressurised in order to avoid that instrument air pressure remains in the system and prevent movements of valves with double acting actuators in the next step. Now the program will go to sequence 3.

6.2.4 Dryer control sequence 3 of 4
Sequence 3) Switching over to adsorption tower 64B and regeneration tower 64A.

Picture 6.2.4 Simplified schematic of Dryer sequence 3.

Via a signal from the PLC the solenoid valve 64-V2 is activated and instrument air will open the control valves 64-V4.2 and 64-V4.3, resulting in a switch-over of the tower Dryers.
Now tower Dryer B is in adsorption mode and tower Dryer A in regeneration.
When the valves are in correct position the electrical limit switches GS 64.1.2 and GS 64.1.3 are activated and GS 64.1.1and GS 64.1.4 are inactive.
If the limit switches are not activated as specified above in this sequence, an alarm for not correct switching over of the Dryer sequence shall be given.



Instrument air, via solenoid valve 64-V8 will open valve 64-V5 and partly close valve 64-V6.
As the solenoid valve 64-V3 is inactive the cooling valve 64-V7 is closed.

Under the condition that the Dryer switching over position is correct as per above and that the electrical limit switch GS 64.2 is activated and GS 64.3 is inactive, the regeneration heater can be switched on.
The set positions of the electrical limit switches as per above indicates the heating phase of the reactivation period. If any of the electrical limit switches are not correctly activated an alarm for regeneration failure shall be given.

Further this step will follow similarly as step 1 with the difference that the transmitters for the tower Dryer A will be active instead of the transmitters for tower Dryer B.

6.2.5 Dryer control sequence 4 of 4

Sequence 4) Adsorption tower 64B and cooling tower 64A

Picture 6.2.5 Simplified schematic of Dryer sequence 4.

Same as under sequence 2 above but with valves and sensors for Dyer vessel A.

NOTE: Wherever the sequence is stopped the dryer shall restart in the same position as it was stopped.

NOTE: If the heater sequence has been on for more than 15 min, it is not allowed to manually switch over to the adsorbing sequence before the regenerating tower is completely cooled down. This in order to protect the discharge equipment from high temperatures.

6.3 Function of condensation water removal system

The condensate drainage is controlled by a Sub-program in the PLC performing the consecutive purging of the condensate from the Deoxo reactor and from the active Dryer Tower (A or B, as the case may be). The purging sequences are time-based and operated by activating or deactivating the solenoid valves 64-V12 and 64-V17.

When solenoid valve 64-V17 is activated, the 3-way valve 64-V31 is in position for purging the Deoxo reactor – when 64-V17 is deactivated, it is the active Dryer vessel that is being purged. The 3-way valve 64-V31 shall alternatively be switched to empty the condensate of the Deoxo vessel during 15 minutes, and thereafter switch to emptying the active Dryer vessels during 15 minutes. The switch-over is time based.
Depending on practical experiences these timings and set points can be adjusted.

The 3-way valve 64-V13 shall always be open to the active dryer tower that is in adsorption mode, because this is where the condensate accumulates during that phase.

A monitoring is performed by checking the pressure at PT 64.1 after the purge valve 64-T2. When the pressure increases above 50% of the process gas operating pressure, the condensate water at the bottom of the vessel being purged has been emptied, and the purge valve 64-T2 will immediately close. And a switch-over to the next vessel is performed. If the pressure measured at PT 64.1 continues to rise even after 64-T2 has been closed, it can be assumed that 64-T2 is defect or leaking. Triggering of PSA 64.1 HH will lead to shut down of the plant.

When the switch-over pressure conditions at PT 64.1 conditions have not been reached within the pre-set timing, an alarm sequence is started and signalized to the PLC. This alarm means that the amount of condensate water collected in the concerned vessel is exceeding the normal operating conditions. There is a risk of flooding the catalyst or desiccant material, which would severely affect the performance.

Activation of the PSA 64.1 LL alarm shall lead to either have the PLC perform a shut-down of the unit or to reduce the gas flow and check the drainage results again.

If the condensate drainage is insufficient, it is necessary to check the condensate filters for plugging. Before checking any of the condensate filters the plant must be stopped and valves 61-V2, 64-V15 and 64-V16 must be closed. First a pressure equalisation must be done by opening progressively valve 61-V3 or 64-V32 or 64-V33. After cleaning the filters, close and reopen the respective valves slowly to build up pressure again.

7. Maintenance

7.1 Daily under operation

- Check that the hydrogen supply pressure and temperature are correct.
- Check that the hydrogen product temperature and dew point are correct.
- Check that the instrument air/nitrogen pressure and dew point are correct.
- Check that cooling water is at normal pressure and temperature in/out
- Check that the tower under regeneration gets hot when heater on and during cooling that the temperature is below + 40°C before changing over towers.
- Check every shift that the condense traps are functioning and that valves 61-V2, 64-V15and 64-V16are fully open.
- Check that the coolers are working and give the right outlet temperature.

7.2 Monthly

- Check that the working pressure is according to specification.
- Check that the condense traps are functioning and that there is maximum 1 litres of water in each deoxo and dryer vessel.
- Check PLC charts to detect any negative trends i.e. degradation of dew point.

7.3 Annually

- Check all Deoxo-Dryer components.
- Replace worn out parts.
- Measure the heater current consumption.
- Check the set value of regulating thermostats and switches.
- Check, clean or replace particle filter if required.
- Clean condensate filters.
- Check the dew point measurement for trend.
- Check the level and condition of catalyst and desiccant in each tower.
  Add up with new material if required.
  Note: replace the elastagraph gaskets after each opening
- Report results in written protocol.

7.2 During Stop of Deoxo-Dryer

- If the electrolyser is stopped and the gas flow is stopped, the Dryer sequence shall be stopped in order to ensure correct regeneration and cooling.
- Shut off the valves for hydrogen
- Switch off the main and control power
- Close the cooling water flow
- If the Dryer shall be opened. Release the DEDR from pressure and purge it with N2. Be sure that no pressure remains in the system before opening.
- Completely empty condensate circuit if the temperature at site will go below 0°C and heat tracing is stopped.
  Cooling water is supposed to be protected against freezing with Glycol or equivalent.
- If the heater is stopped due to TSA 64.2 HH of heater temperature mechanical switch TS 64.2 which has been cut out, it needs to be reset manually in the regeneration heater head.
  NOTE: This is controlled and monitored by the PLC, if you get any alarm from the PLC control system you shall make actions to avoid it to happen again.
  If you need support, please contact AQUAGAS.

7.4 Change of catalyst and desiccant

Performance of catalyst and desiccant materials should not be affected the first 2 years of operation. But over time, a reduction due to mechanical degradation will occur. An indication is the increase of dust in the particle filter and condensate strainers. Add-up of new material may be necessary to maintain an optimal performance of the DEDR.
It is advisable to replace the catalyst and desiccant materials every 5 years of operation.
Please proceed as follows:

- Stop the unit, purge with nitrogen and depressurize the complete DEDR unit.
- Remove the condensate water from the bottom of the vessels.
- Place a recipient or vacuum cleaner and open the dedicated emptying flange or plug at the bottom of the vessel.
- Open the dedicated flange or plug at the top of the vessel.
- Empty the vessel from the catalyst or desiccant.
- Close the bottom flange or plug.
- Fill the correct volume and type of catalyst.
  Fill desiccant up to 20mm of top nozzle outlet.
- Optionally, connect a vacuum cleaner to the vessel's bottom condensate drain valve and suck out remaining dust. Close the condensate drain valve again and plug.
- Close the top flange/plug.
- Purge with nitrogen, pressurize and restart the DEDR unit.

NOTE: Never use an injector or mechanical device to fill catalyst or desiccant as this might shatter the beads mechanically. The beads should be fed into the towers by gravity using a funnel. A slight under-pressure through connecting a vacuum cleaner to the bottom condensate drain connection of the tower can be used to support the filling process.

NOTE: Before filling the Deoxo DE vessel with new catalyst material, it must be ensured that any remaining hydrogen is vented, and that the vessel is correctly purged. Otherwise, there is a risk that contact with organic and flammable substances can be causes of fire or explosion.

NOTE: Dust from handling desiccant in connection with servicing may be irritating to noses or throats. Use breathing protection when needed.

8. Trouble shooting

Symptom	Possible causes	Corrective action
Poor dew point.	Condensate water accumulated in vessels	Check drain system
	Temperature of inlet gas too high	Check/clean coolers
	Working pressure too low	Check pressure drop in unit
	Poor regeneration	Check the heater element
	Incorrect valve adjustment. Valve leaking	Check function of regeneration valves 64-V5 and 64-V6
	Poor or reduced desiccant	Replace desiccant
	Dryer fails to shift	see below
Dryer fails to shift	Instrument air/nitrogen missing or pressure too low.	Check air pressure. Clean air filter
	Automatic valves do not open / close correctly.	Check solenoid valves. Check valves function.
Deoxo temp too low	Trace Heater failure	Check trace heater and replace
	Too high gas flow	Check and adjust H2 supply.
Reg. temp too low	Heater element failure	Check heater and repair/replace
	Too high regeneration flow	Adjust regulation valve 64-V14
Poor cooling	Cooling valve is not opening	Check function of valve 64-V7
	Plugged injector	Check and clean the injector 64-T4
	Cooling water failure.	Check C.W. supply conditions
Low pressure at PT 64.1	Plugged condensate strainers or orifice.	Check and clean condensate circuit
	Manual valves 61-V2, 64-V15or 64-V16 closed or partially closed.	Check that these valves are in fully open position.
Too high pressure at PT 64.1	Valve 64-T2 leaking or not closing properly.	Replace valve 64-T2.
