CROSSWIND ROSETTI MARINO

TITLE : BASE LOAD POWER HUB (BLPH)
SAFETY SYSTEMS CABINET (SIS & FGS) GEN. ARR. DRW AND INT. LAYOUT
DATA SHEET

CONTRACT NO./TITLE CW-I-WP4-2023-05/HOLLANDSE KUST NOORD WIND PARK | SCALE : 1

A3 | DRAWING NO. 1724000594-IN-DA-00010 | SHEET 003 | REV. 4

A - PANEL CONTROL CABLES

CABLE FUNCTION	CONDUCTOR SIZE	CONDUCTOR COLORS	OUTER SHEATH COLOR NON Intrinsically Safe Circuit	OUTER SHEATH COLOR Intrinsically Safe Circuit
BIPOLAR ANALOG SIGNALS (NOTE A1)	(2x0.5) + Shield	BLACK (BK) - WHITE (WH)	GREY (GR)	BLUE (BL)
TRIPOLAR ANALOG SIGNALS (NOTE A1)	(3x0.5) + Shield	BLACK (BK) - WHITE (WH) RED (RD)	GREY (GR)	BLUE (BL)

NOTE A1 : FOR THE ABOVE MENTIONED ANALOG SIGNALS, PAIRS OR TRIADS SHIELDED SPIRAL CABLES SHALL BE USED, WITH THE EXCEPTION OF THOSE "SINK" INPUTS OR OUTPUTS OF THE CONTROLLER WHERE AN EXTERNAL FEED IS NEEDED. ONLY FOR THIS SPECIFIC CASE, SINGLE WIRE CABLE SHALL BE USED.

C-GROUNDING CONNECTIONS

EARTH TYPE	CONDUCTOR SIZE Cable size shall not exceed max allowable section as per device's manufacturer recommendation	WIRE COLOR	ID RING COLOR
P.E. (PROTECTIVE EARTH)	(1x2.5) - (1x6) - (1x16) - (1x25)	YELLOW/GREEN (YG)	-
I.E. (INSTRUMENT EARTH)	(1x2.5) - (1x6) - (1x16) - (1x25)	GREEN (GN)	-
I.S.E. (INTRINSICALLY SAFE EARTH)	(1x2.5) - (1x6) - (1x16) - (1x25)	WHITE (WH)	-

B -PANEL SINGLE-CORE CABLES

SINGLE-CORE CABLE FUNCTION	CONDUCTOR SIZE Cable size shall not exceed max allowable section as per device's manufacturer recommendation	WIRE COLOR NON Intrinsically Safe Circuit	WIRE COLOR Intrinsically Safe Circuit
AC LINE	(1x2.5) - (1x4) - (1x6)	BROWN (BR)	N/A
AC NEUTRAL	(1x2.5) - (1x4) - (1x6)	LIGHT BLUE (LB)	N/A
DC 24Vdc (POSITIVE)	(1x2.5) - (1x4) - (1x6)	RED (RD)	N/A
DC 24Vdc (NEGATIVE)	(1x2.5) - (1x4) - (1x6)	BLUE (BU)	N/A
DIGITAL SIGNALS (POSITIVE)	(1x0.5)	BLACK (BK)	N/A
DIGITAL SIGNALS (NEGATIVE)	(1x0.5)	WHITE (WH)	N/A
ANALOG SIGNALS (2 WIRE POSITIVE)	(1x0.5)	BLACK (BK)	N/A
ANALOG SIGNALS (2 WIRE NEGATIVE)	(1x0.5)	WHITE (WH)	N/A
ANALOG SIGNALS (3 WIRE POSITIVE)	(1x0.5)	BLACK (BK)	N/A
ANALOG SIGNALS (3 WIRE NEGATIVE)	(1x0.5)	RED (RD)	N/A
ANALOG SIGNALS (3 WIRE SIGNAL)	(1x0.5)	WHITE (WH)	N/A

GENERAL NOTE : MINIMUM SECTION 1.5 mm² FOR CPU PANEL INTERNAL LAMPS, LIMIT SWITCHES, FANS, THERMOSTATS, ISOLATORS POWER SUPPLY

REV. 4

A - GENERAL DATA

A1	TYPE	☐ MANUFACTURER STANDARD	■ AUGER	
A2	REFERENCE CODE	■ IEC	☐ IEC NORTH AMERICA SUITABLE (THIRD PARTY CERTIFIED)	
A3	CONTRACTUAL LANGUAGE	■ ENGLISH	☐	
A4	INSTALLATION	SAFE AREA, AIR CONDITIONING CONTROL ROOM/CAB HEAVY INDUSTRY ENVIRONMENT		
A5	OPERATING TEMPERATURE	+5°C TO +45 °C		
A6	OPERATING HUMIDITY	10 TO 93 % RH NOT CONDENSING		
A7	MARSHALLING TERMINAL STRIP	■ WITH	☐ WITHOUT	
A8	TERMINAL STRIP	■ MIRROR OF JUNCTION BOX	☐ NOT MIRROR OF JUNCTION BOX	
A9	SPARE TERMINALS	☐ NO	■ YES, NOT WIRED	☐ YES, JUMPERED TO I.E. OR I.S. BAR
A10	CABLES & CABLE TRAYS	☐ PVC	■ HALOGEN FREE AND LOW SMOKE	
A11	INTRINSICALLY SAFE BARRIERS/ISOLATORS	■ NO	☐ YES	
A12	SURGE ARRESTORS	■ NO	☐ YES, ONLY FOR POWER SUPPLY LINE IN	
A13	POLLUTION DEGREE	■ 2 AS PER IEC60664-1		
A14	STORAGE TEMPERATURE	-20°C TO 50°C UP TO 80% HUMIDITY		
A15	MATERIAL	■ CARBON STEEL	☐ STAINLESS STEEL AISI 304	☐ STAINLESS STEEL AISI 316

B - MECHANICAL DATA

B1	OVERALL DIMENSION	800 mm x 1000mm x 2100mm (L x D x H) 800 mm x 800 mm x 2100 mm (L x D x H)	(NOTE B1)		
B2	PROTECTION DEGREE	■ IP 43	☐ IP 55		
B3	STEEL THICKNESS	■ STRUCTURE: 1.5 mm	■ DOORS: 2 mm		
B4	CABLE ENTRY	■ TOP	☐ BOTTOM		
B5	CABLE ENTRY FIXING	☐ REMOVABLE PLATES	☐ CLAMPS	■ MCTs	(NOTE B2)
B6	ACCESSIBILITY	■ FRONT ONLY	☐ FRONT / REAR		
B7	LIFTING SYSTEM	■ EYE BOLTS	☐ LIFTING BAR "L" TYPE		
B8	BASE PLINTH	■ SEPARATE PIECES			
B9	DOOR LOCKS	■ KEY LOCKED WITH UNIQUE KEY PER UCP			
B10	APPROXIMATIVE WEIGHT	400 Kg for each panel			

NOTE B1 : ALLOWED TOLERANCE FOR PANEL HEIGHT/DEPTH: +/-5mm;
ALLOWED TOLERANCE FOR PANEL STRUCTURES AND SUPPORTS: +/-2mm;
ALLOWED TOLERANCE FOR TOTAL PANEL LENGTH : +/-2% OF TOTAL PANEL LENGTH;
(IN ANY CASE, MAXIMUM LENGTH TOLERANCE ALLOWED FOR PANEL WITH 2 OR MORE COLUMNS IS +/-50mm)

NOTE B2 : MCTs ON TOP OF THE PANEL
REMOVABLE BOTTOM PLATE, FOR PANEL FIXING ON CUSTOMER COUNTER FRAME, SHALL BE PROVIDED

C - PAINTING

C1	REFERENCE SPECIFICATIONS	■ AUGER STANDARD	☐ JOB SPECIFIC	☐ MFR STANDARD	
C2	EXTERIOR TYPE	☐ SMOOTH	■ PEEL TYPE		
	EXTERIOR COLOUR	■ RAL 7035	☐ RAL 7032	☐ RAL 7030	
C3	BASE PLINTH	■ AS EXTERIOR			
C4	INTERIOR	■ GALVANISED (ALUZINC)			
C5	INTERNAL MOUNTING PLATES	■ GALVANISED (ALUZINC)			

D - ELECTRICAL DATA

.	SUPPLY LINE	UPS LINE 1	UPS LINE 2	NON-UPS LINE 3
D1	SUPPLY VOLTAGE	230Vac	230Vac	230Vac
D2	FREQUENCY	50Hz	50Hz	50Hz
D3	LOAD	1kW	1kW	0,6kW
D4	INTERNAL LIGHTING WITH DOOR LIMIT SWITCH OPERATION	■ LED (230Vac - 50Hz)		
D5	ANTI CONDENSING HEATER WITH TEMPERATURE THERMOSTAT	■ YES		
D6	VENTILATION FAN WITH FLOW SWITCH AND TEMPERATURE THERMOSTAT	■ YES		
D7	SERVICE SOCKET	■ YES		

E - NAMEPLATES

.	.	EXTERNAL PANEL	INTERNAL PANEL
E1	MATERIAL	■ TRAFFOLYTE	■ TAPE
E2	BACKGROUND COLOUR	■ WHITE	■ WHITE

A - PANEL CONTROL CABLES

CABLE FUNCTION	CONDUCTOR SIZE	CONDUCTOR COLORS	OUTER SHEATH COLOR NON Intrinsically Safe Circuit	OUTER SHEATH COLOR Intrinsically Safe Circuit
BIPOLAR ANALOG SIGNALS (NOTE A1)	(2x0.5) + Shield	BLACK (BK) - WHITE (WH)	GREY (GR)	BLUE (BL)
TRIPOLAR ANALOG SIGNALS (NOTE A1)	(3x0.5) + Shield	BLACK (BK) - WHITE (WH) RED (RD)	GREY (GR)	BLUE (BL)

NOTE A1 : FOR THE ABOVE MENTIONED ANALOG SIGNALS, PAIRS OR TRIADS SHIELDED SPIRAL CABLES SHALL BE USED,
WITH THE EXCEPTION OF THOSE "SINK" INPUTS OR OUTPUTS OF THE CONTROLLER WHERE AN EXTERNAL FEED IS NEEDED.
ONLY FOR THIS SPECIFIC CASE, SINGLE WIRE CABLE SHALL BE USED.

C-GROUNDING CONNECTIONS

EARTH TYPE	CONDUCTOR SIZE Cable size shall not exceed max allowable section as per device's manufacturer recommendation	WIRE COLOR	ID RING COLOR
P.E. (PROTECTIVE EARTH)	(1x2.5) - (1x6) - (1x16) - (1x25)	YELLOW/GREEN (YG)	-
I.E. (INSTRUMENT EARTH)	(1x2.5) - (1x6) - (1x16) - (1x25)	GREEN (GN)	-
I.S.E. (INTRINSICALLY SAFE EARTH)	(1x2.5) - (1x6) - (1x16) - (1x25)	WHITE (WH)	-

B -PANEL SINGLE-CORE CABLES

SINGLE-CORE CABLE FUNCTION	CONDUCTOR SIZE Cable size shall not exceed max allowable section as per device's manufacturer recommendation	WIRE COLOR NON Intrinsically Safe Circuit	WIRE COLOR Intrinsically Safe Circuit
AC LINE	(1x2.5) - (1x4) - (1x6)	BROWN (BR)	N/A
AC NEUTRAL	(1x2.5) - (1x4) - (1x6)	LIGHT BLUE (LB)	N/A
DC 24Vdc (POSITIVE)	(1x2.5) - (1x4) - (1x6)	RED (RD)	N/A
DC 24Vdc (NEGATIVE)	(1x2.5) - (1x4) - (1x6)	BLUE (BU)	N/A
DIGITAL SIGNALS (POSITIVE)	(1x0.5)	BLACK (BK)	N/A
DIGITAL SIGNALS (NEGATIVE)	(1x0.5)	WHITE (WH)	N/A
ANALOG SIGNALS (2 WIRE POSITIVE)	(1x0.5)	BLACK (BK)	N/A
ANALOG SIGNALS (2 WIRE NEGATIVE)	(1x0.5)	WHITE (WH)	N/A
ANALOG SIGNALS (3 WIRE POSITIVE)	(1x0.5)	BLACK (BK)	N/A
ANALOG SIGNALS (3 WIRE NEGATIVE)	(1x0.5)	RED (RD)	N/A
ANALOG SIGNALS (3 WIRE SIGNAL)	(1x0.5)	WHITE (WH)	N/A

GENERAL NOTE :MINIMUM SECTION 1.5 mm² FOR CPU PANEL INTERNAL LAMPS, LIMIT SWITCHES, FANS, THERMOSTATS, ISOLATORS POWER SUPPLY

MANUFACTURERS RECORD BOOK (FINAL DOSSIER)

A - GENERAL DATA

A1	TYPE	☐ MANUFACTURER STANDARD	■ AUGER	
A2	REFERENCE CODE	■ IEC	☐ IEC NORTH AMERICA SUITABLE (THIRD PARTY CERTIFIED)	
A3	CONTRACTUAL LANGUAGE	■ ENGLISH	☐	
A4	INSTALLATION	SAFE AREA, AIR CONDITIONING CONTROL ROOM/CAB HEAVY INDUSTRY ENVIRONMENT		
A5	OPERATING TEMPERATURE	+5°C TO +45 °C		
A6	OPERATING HUMIDITY	10 TO 93 % RH NOT CONDENSING		
A7	MARSHALLING TERMINAL STRIP	■ WITH	☐ WITHOUT	
A8	TERMINAL STRIP	☐ MIRROR OF JUNCTION BOX	■ NOT MIRROR OF JUNCTION BOX	
A9	SPARE TERMINALS	☐ NO	■ YES, NOT WIRED	☐ YES, JUMPERED TO I.E. OR I.S. BAR
A10	CABLES & CABLE TRAYS	☐ PVC	■ HALOGEN FREE AND LOW SMOKE	
A11	INTRINSICALLY SAFE BARRIERS/ISOLATORS	■ NO	☐ YES	
A12	SURGE ARRESTORS	■ NO	☐ YES, ONLY FOR POWER SUPPLY LINE IN	
A13	POLLUTION DEGREE	■ 2 AS PER IEC60664-1		
A14	STORAGE TEMPERATURE	-20°C TO 50°C UP TO 80% HUMIDITY		
A15	MATERIAL	■ CARBON STEEL	☐ STAINLESS STEEL AISI 304	☐ STAINLESS STEEL AISI 316

B - MECHANICAL DATA

B1	OVERALL DIMENSION	800 mm x 800 mm x 2100 mm (L x D x H) (NOTE B1)		
B2	PROTECTION DEGREE	■ IP 43	☐ IP 55	
B3	STEEL THICKNESS	■ STRUCTURE: 1.5 mm	■ DOORS: 2 mm	
B4	CABLE ENTRY	■ TOP	☐ BOTTOM	
B5	CABLE ENTRY FIXING	☐ REMOVABLE PLATES	☐ CLAMPS	■ MCT
B6	ACCESSIBILITY	■ FRONT ONLY	☐ FRONT / REAR	
B7	LIFTING SYSTEM	■ EYE BOLTS	☐ LIFTING BAR "L" TYPE	
B8	BASE PLINTH	■ SEPARATE PIECES		
B9	DOOR LOCKS	■ KEY LOCKED WITH UNIQUE KEY PER UCP		
B10	APPROXIMATIVE WEIGHT	250 Kg		

NOTE B1 : ALLOWED TOLERANCE FOR PANEL HEIGHT/DEPTH: +/-5mm;
ALLOWED TOLERANCE FOR PANEL STRUCTURES AND SUPPORTS: +/-2mm;
ALLOWED TOLERANCE FOR TOTAL PANEL LENGTH : +/-2% OF TOTAL PANEL LENGTH;
(IN ANY CASE, MAXIMUM LENGTH TOLERANCE ALLOWED FOR PANEL WITH 2 OR MORE COLUMNS IS +/-50mm)
REMOVALE BOTTOM PLATES SHALL BE PROVIDED

1 INTRODUCTION

1.1 PROJECT OVERVIEW

Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.

Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.1.1 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

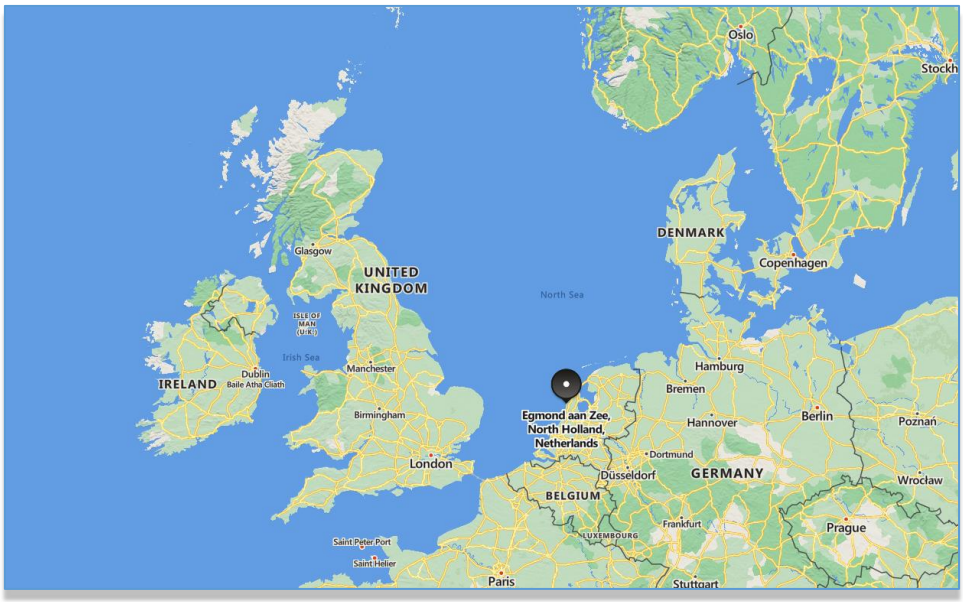

Figure 1 HOLLANDSE KUST NOORD WIND PARK Location Map

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

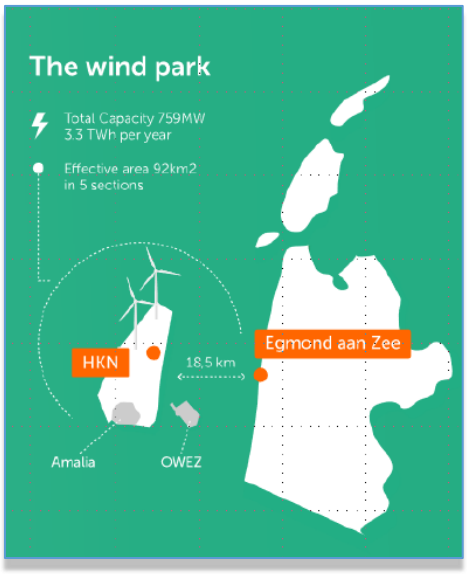

Figure 2 - Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile located on coordinates E 590719.1, N 5841602.3 is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

1.1.2 Project Concept

All components included in the BLPH will be integrated onshore on a topsides and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

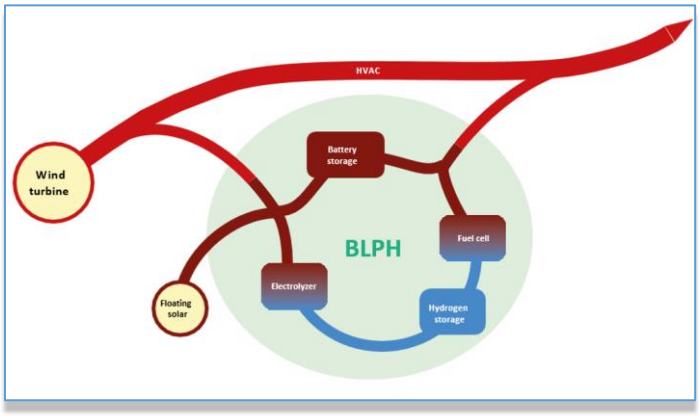

Figure 3 – BLPH Concept

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.

The purpose of the BLPH s to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

2 DOCUMENT SCOPE

This document describes the List of Human Machine Interface (HMI) Screens for the Yokogawa PCS, SIS and FGS.

The aim of this document is to ensure that the Human Machine Interface (HMI) is equipped with the facilities and functionalities needed by the operators to perform supervisory and control tasks in an efficient and effective way. The functionality of HMI is limited to graphics.

3 HMI SCREENS

Process operators monitor and control their respective units through the Yokogawa Human Machine Interface (HMI). SCADA shall is configured so that the operator can work simultaneously in the following two modes:

Proactive mode

This mode requires the proactive role of the operator in controlling the plant. Operator monitors the status of the plant by paging through displays, watching trends and deviations, and acting when required or appropriate. Awareness is improved by a well-designed hierarchical arrangement and a logical and understandable grouping of the HMI displays.

Reactive mode

This reactive mode is triggered by events such as alarms. The operator's attention is demanded and directed by the system to displays where he can see what has happened and can take appropriate corrective action. Visualization of alarms and access to corrective controls depend on the urgency of action required.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

3.1 GENERAL GUIDELINES

HMI Screens provides a wide range of user-defined views, for operation and monitoring, as well as for system maintenance. Operation and monitoring functions are functions such as receiving and acknowledging of alarms, set point control, output manipulation, process data monitoring, trending, reporting, controller mode changing, etc.

The layout of the graphics conforms the following guidelines:

Layout Standard:

- All Graphic displays contain, as a minimum, Graphic Title, Navigation arrows and Navigation bar.
- Graphic title is in the top middle of the graphic. It includes operating unit name, as well as specific graphic function description.
- The bar has max. 21 configurable navigation targets that facilitates operator to navigate to Unit menu, FGS display, SIS display and process displays.

Process and Instrument Lines:

- Are laid out in a way to minimize distracting clutter and to provide a simplified process flow view.
- Process flow is from left to right in a process graphic page.
- Layout minimizes piping (line) crossovers. The vertical line is broken in case of cross over.
- Lines are separated (both vertically and horizontally) by enough gap based on the line thickness.
- Layout minimizes the number of turns in a line.
- Directional arrows are placed only where process line enters equipment, at pipe corners or where lines leave the page.
- Process lines are of a thickness such that they are easily distinguishable from signal lines.
- Do not join lines in an X-pattern (four lines meeting at a point). Exception is where a single line splits into an odd number of branches.
- All control signal lines connected to another graphic shall have a dynamic “connector” target.
- Single color and pattern are used for all process lines.
- When process lines are continued in a separate graphic, both source and destination graphics will have dynamic connector arrows. Pipeline / process lines leaving a graphic will enter at the same height on the destination graphic.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as “NOT CONTROLLED” copy

Graphic Parts & Symbols:

- All shapes are two-dimensional.
- Balance equipment on screen distribution to prevent density clusters.
- Dynamic shapes are not re-sized.
- As much as possible place control and on/off valves on horizontal lines only.
- Place valves symmetrically (aligned with each other).
- Do not show details to match operational requirement (e.g., do not show trays in a distillation tower).

Process Values & Tag Names:

- All analog values associated with field instrumentation are displayed next to the measuring point. The number of process digits to be displayed is based on the engineering range. The Instrument line connection to the process line is situated between the engineering unit and measuring point.
- Measurements from externally mounted instruments, inferred differentials, calculations, etc., are located adjacent to the process line or vessel and connected to the process line or vessel.
- Equipment names are placed inside the equipment symbol.
- Where there is logic associated with the starting and stopping of pumps by level or pressure measurement, the motor symbol is joined to the display value via an instrument line.
- Only acronyms and tag names are displayed in all capital letters. Engineering units are displayed as per the standard. Other texts are displayed using leading capitals (title case). When there is more than one word, the leading letter of each word is capitalized. This applies to tag comments, menu option, Graphic title and equipment labels.

General:

- In general, only process lines (or areas) that show PCS, SIS, and FGS instrumentation are shown on displays, although other lines may be shown to specify the position of field instruments.
- Graphic representation of dynamic shapes is consistent with that of static shapes.
- Local pneumatic loops, relief valves, steam traps, hand valves without position indication, etc., do not appear on displays.
- Graphics are to be distinguishable and readable from a distance of 1 meter from the screen
- Dynamic color modifier based on status and alarm are available in Appendix -5 HMI Graphic Objects
- EMCS Current Mode indication is shown in Hydrogen storage vessel graphics and Electrical graphics, which shall be navigating to EMCS overview template.
- Alarm Severities

There are 4 severities defined for Alarms. Two severity types are defined for “Logging” events and the return to “Normal” function. The severities are linked to CI Server priorities. The priority levels in CI Server are used for filtering and assigning alarm colors. The internal CI Server priorities and associated colors are provided in the table below.

ATTACHMENT-1

SMART Transmitter Power Supply

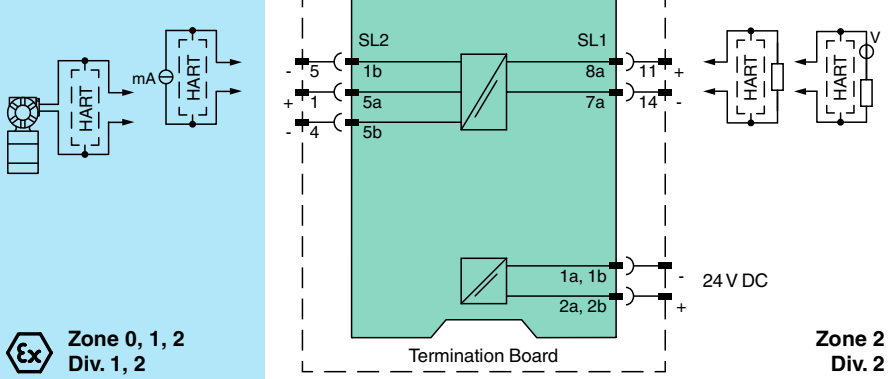
HiC2025

- 1-channel isolated barrier
- 24 V DC supply (bus powered)
- Input for 2-wire SMART transmitters and current sources
- Output for 4 mA ... 20 mA or 1 V ... 5 V
- Low power dissipation
- Up to SIL 2 (SC 3) acc. to IEC/EN 61508

SIL 2

HART COMMUNICATION PROTOCOL

Function



This isolated barrier is used for intrinsic safety applications.
The device supplies 2-wire transmitters in the hazardous area, and can also be used with current sources.
It transfers the analog input signal to the safe area as an isolated current value.
Bi-directional communication is supported for SMART transmitters that use current modulation to transmit data and voltage modulation to receive data.
The output is selected as a current source, current sink, or voltage source via DIP switches.
This device mounts on a HiC Termination Board.

Application

The device supports the following SMART protocols:

- HART
- BRAIN

Connection

Technical Data

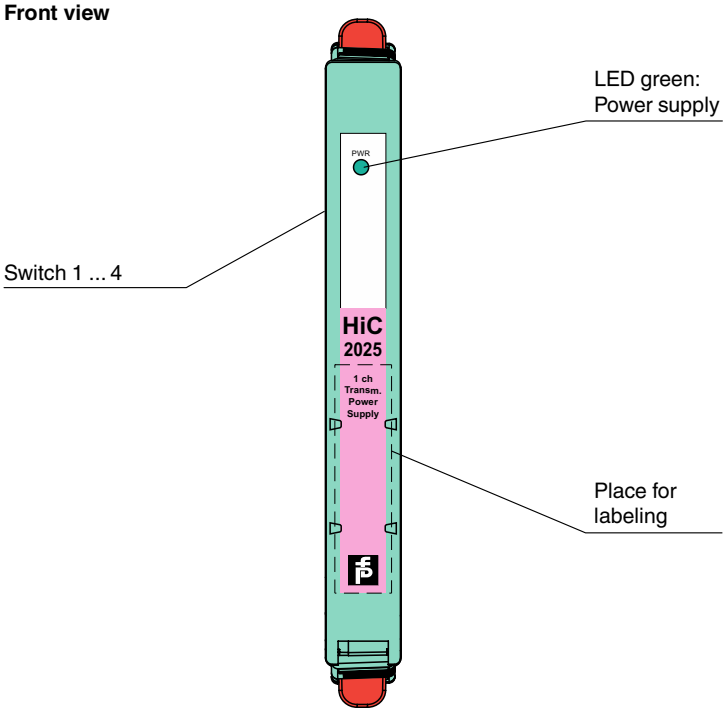
General specifications	
Signal type	Analog input

Release date: 2023-06-01 Date of issue: 2023-06-01 Filename: 321423_eng.pdf

Technical Data

Functional safety related parameters		
Safety Integrity Level (SIL)		SIL 2
Systematic capability (SC)		SC 3
Supply		
Connection		SL1: 1a, 1b(-); 2a, 2b(+)
Rated voltage	U_r	19 ... 30 V DC bus powered via Termination Board
Ripple		≤ 10 %
Rated current	I_r	≤ 45 mA at 24 V and 20 mA source mode output
Power dissipation		≤ 800 mW
Power consumption		≤ 1.1 W
Input		
Connection side		field side
Connection		SL2: 5a(+), 1b(-); 5a(+), 5b(-)
Input signal		4 ... 20 mA limited to approx. 26 mA
Voltage drop		approx. 5 V on SL2: 5a(+), 1b(-)
Available voltage		≥ 15 V at 20 mA , ≥ 18 V at 4 mA on SL2: 5a(+), 5b(-)
Output		
Connection side		control side
Connection		SL1: 8a(+), 7a(-)
Load		0 ... 350 Ω (source mode)
Output signal		source mode: 4 ... 20 mA or 1 ... 5 V (internal resistor: 250 Ω, 0.1 %) sink mode: 4 ... 20 mA, operating voltage 10 ... 30 V For additional internal or external loads the voltage drop has to be considered, e. g. 250 Ω x 20 mA = 5 V.
Ripple		20 mV $_{rms}$
Transfer characteristics		
Deviation		at 20 °C (68 °F) < 0.1 % of full scale, incl. non-linearity and hysteresis (source mode and sink mode 4 ... 20 mA) ≤ ± 0.2 % incl. non-linearity and hysteresis (source mode 1 ... 5 V)
Influence of ambient temperature		< 2 µA/K (-20 ... 70 °C (-4 ... 158 °F)); < 4 µA/K (-40 ... -20 °C (-40 ... -4 °F)) (source mode and sink mode 4 ... 20mA) < 0.5 mV/K (-20 ... 70 °C (-4 ... 158 °F)); < 1 mV/K (-40 ... -20 °C (-40 ... -4 °F)) (source mode 1...5 V)
Frequency range		field side into the control side: bandwidth with 0.5 V_{pp} signal 0 ... 3 kHz (-3 dB) control side into the field side: bandwidth with 0.5 V_{pp} signal 0 ... 3 kHz (-3 dB)
Settling time		≤ 50 ms
Rise time/fall time		≤ 10 ms
Galvanic isolation		
Input/Output		safe electrical isolation acc. to IEC/EN 60079-11, voltage peak value 375 V
Input/power supply		safe electrical isolation acc. to IEC/EN 60079-11, voltage peak value 375 V
Output/power supply		basic insulation according to IEC/EN 61010-1, rated insulation voltage 60 V_{eff}
Indicators/settings		
Display elements		LED
Control elements		DIP switch
Configuration		via DIP switches
Labeling		space for labeling at the front
Directive conformity		
Electromagnetic compatibility		
Directive 2014/30/EU		EN 61326-1:2013 (industrial locations)
Conformity		
Electromagnetic compatibility		NE 21:2017 EN 61326-3-2:2018 For further information see system description.
Degree of protection		IEC 60529:2001
Protection against electrical shock		UL 61010-1:2012
Ambient conditions		

Release date: 2023-06-01 Date of issue: 2023-06-01 Filename: 321423_eng.pdf



Technical Data

Ambient temperature		-40 ... 70 °C (-40 ... 158 °F)
Mechanical specifications		
Degree of protection		IP20
Mass		approx. 100 g
Dimensions		12.5 x 106 x 128 mm (0.5 x 4.2 x 5.1 inch) (W x H x D)
Mounting		on termination board
Coding		pin 1 and 3 trimmed For further information see system description.

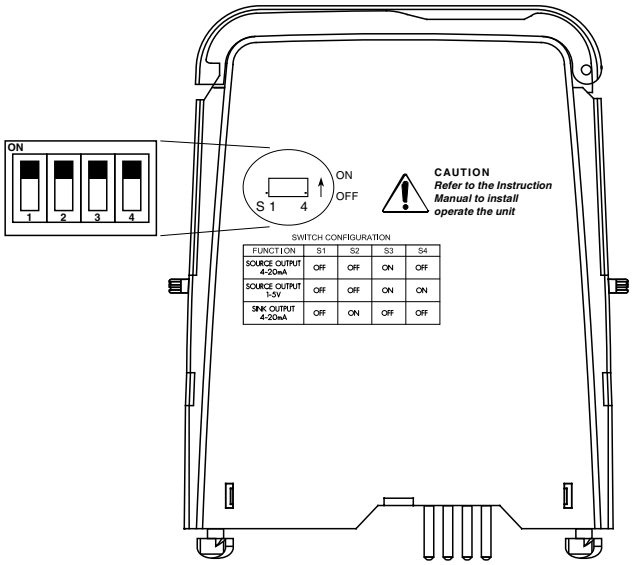
Assembly

Front view

Configuration



Configure the device in the following way:

- Push the red Quick Lok Bars on each side of the device in the upper position.
- Remove the device from termination board.
- Set the switches according to the figure in the **Configuration** section.

Note
The pins for this device are trimmed to polarize it according to its safety parameters. Do not change the setting. For further information see system description.

Schema di certificazione CESI-ATEX

[1] SUPPLEMENTARY EU-TYPE EXAMINATION CERTIFICATE

[2] **Equipment or Protective System intended for use in potentially explosive atmospheres Directive 2014/34/EU**

[3] Supplementary EU-Type Examination Certificate number:

CESI 06 ATEX 017 /02

[4] Product: Galvanically isolated barrier type: **HiC2025, HiC2025A** and **HiC2031**

[5] Manufacturer: **Pepperl+Fuchs GmbH**

[6] Address: **Lilienthalstrasse 200, 68307 - Mannheim - Germany**

[7] This supplementary certificate extends EC–Type Examination Certificate CESI 06 ATEX 017 to apply to products designed and constructed in accordance with the specification set out in the Schedule of the said certificate but having any variations specified in the Schedule attached to this certificate and the documents therein referred to..

[8] CESI, notified body n. 0722 in accordance with Article 17 of the Directive 2014/34/EU of the Parliament and Council of 26 February 2014, certifies that this equipment or protective system has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of equipment and protective systems intended for use in potentially explosive atmospheres given in Annex II to the Directive.

The examination and test results are recorded in confidential report n. EX-B9011911.

[9] In accordance with Article 41 of Directive 2014/34/EU, EC-Type Examination Certificates referring to 94/9/EC that were in existence prior to the date of application of 2014/34/EU (20 April 2016) may be referenced as if they were issued in accordance with Directive 2014/34/EU. Supplementary certificates to such EC-Type Examination Certificates, and new issues of such certificates, may continue to bear the original certificate number issued prior to 20 April 2016

[10] If the sign "X" is placed after the certificate number, it indicates that the equipment or protective system is subject to special conditions for safe use specified in the schedule to this certificate.

[11] This EU-TYPE EXAMINATION CERTIFICATE relates only to the design, examination and tests of the specified equipment or protective system in accordance to the Directive 2014/34/EU. Further requirements of the Directive apply to the manufacturing process and supply of this equipment or protective system. These are not covered by this certificate.

[12] The marking of the equipment or protective system shall include the following:

I (M1) [Ex ia Ma] I
II (1) G [Ex ia Ga] IIC
II (1) D [Ex ia Da] IIIC

This certificate may only be reproduced in its entirety and without any change, schedule included.

Date 14.06.2019 - Translation issued the 14th 06.2019

[13] # Schedule

[14] **SUPPLEMENTARY EU-TYPE EXAMINATION CERTIFICATE n. CESI 06 ATEX 017 /02**

[15] **Description of the variation to the product**

Variation 2.1: Constructive modifications concerning the improvement of the thermal dissipation of the infallible components, considering the maximum service temperature of +94 °C.

Variation 2.2: Extended the ambient temperature range from -20 °C ÷ +60°C up to -40 °C ÷ +70 °C.

Variation 2.3: Added new alternative I.S. components.

Variation 2.4: Added a new device called HiC2025A with new safety parameters.

Variation 2.5: The product denomination has been updated, introducing asterisks at the end of name.

Variation 2.6: Standards updating.

Variation 2.7: Update to Directive 2014/34/EU.

Description of equipment

The SMART Transmitter Power Supply **HiC2025**, **HiC2025A** and SMART Current Driver **HiC2031** are, galvanically isolated, associated apparatus.

The **HiC2025** and HiC2025A devices are suitable for supply/interface signal transmitter placed in hazardous area and transfer the analog signal to a safe area. The hazardous area connections *(Input circuit)* are for "Sink Input" *(2-wire transmitters)* or 4-wire transmitters.

The **HiC2031** device is suitable to repeat a current signal coming from a safe area to drive smart I/P converter, valve actuator and displays placed in hazardous area.

For all equipmet, a SMART digital communication can be superimposed on the measurement signal of the transmitter, as input or output and can be transferred in both directions.

The products have a plastic enclosure, the boards are equipped with two DIN 41612 B/3 connectors, suitable for direct insertion in the ATEX certified Termination Boards HiC series, produced by Pepperl+Fuchs.

For particular variants, the equipment's name can be extended with additional characters at the end of the name *(es. HiC2025(A)** or HiC2031**)*. These variants do not change the function or the type of protection of the products in any way.

The equipment has been, previously, assessed and marked in compliance with the following standards: EN 60079-0:2009, EN 60079-11:2007, EN60079-26: 2007, EN 61241-11:2006 and EN 50303:2000.

With this Supplement the products are re-assessed and marked on the basis of the standards:
EN 60079-0:2012/A11:2013 and EN 60079-11:2012

Electrical characteristics

Non-intrinsically safe circuits

Um:	250 Vac
Power supply *[connettor SL1 pins: 2a,2b (+) and 1a,1b (-)]:*	Un: 24 Vdc *(19 ÷ 30 Vdc)*
Analog Input/Output *[connector SL1 pins: 8a (+) and 7a (-)]*:	Un: up to 30 Vdc
Tamb.:	from -40 °C up to +70 °C

*Intrinsically safe circuits – equipment **HiC2025***

Connector SL2 pins	Uo	Io	Po	Gas Groups	Co (µF)	Lo (mH)	Lo/Ro (µH/Ω)

				I	1000	46	18

Ci = 5.7nF Li = negligible Output characteristic: diodes blocking barrier.

Intrinsically safe circuits – equipment ***HiC2031***

Connector SL2 pins	Uo	Io	Po	Gas Groups	Co (µF)	Lo (mH)	Lo/Ro (µH/Ω)
5a(+); 5b(-)	25.2 V	100 mA	630 mW	IIC	0.100	3.5	55
				IIB	0.81	14	222
				IIA	2.8	28	444
				I	4.14	46	743

Ci = 5.7nF Li = negligible Output characteristic: linear.

Note: External circuits with both inductance and capacitance

The above maximum Lo and Co parameters apply where:
- the total Ci of the external circuit (excluding the cable) is < 1% of the Co value or
- the total Li of the external circuit (excluding the cable) is < 1% of the Lo value.

The above Lo and Co parameters shall reduce to 50% when both of the two conditions below are given:
- the total Li of the external circuit (excluding the cable) > 1% of the Lo value and
- the total Ci of the external circuit (excluding the cable) > 1% of the Co value.

The reduced capacitance of the external circuit (including cable) shall not be greater than 1 µF for Groups I, IIA, IIB and 600 nF for Group IIC.

The intrinsically safe systems shall be realized according to EN 60079-25 standard. The interconnection with active intrinsically safe transmitters must also respect the output parameters of these transmitters.

This certificate may only be reproduced in its entirety and without any change, schedule included.

[14] **SUPPLEMENTARY EU-TYPE EXAMINATION CERTIFICATE n. CESI 06 ATEX 017 /02**

Warning label
None

[16] **Report n.** EX-B9011911

Routine tests
The Manufacturer shall carry out the routine tests provided to clause 27 on the of EN 60079-0 standard and furthermore, the tests prescribed in clause 11.2 of the EN 60079-11 standard.

[17] **Special conditions for safe use**
None

[18] **Essential Health and Safety Requirements**
Compliance with the Essential Health and Safety Requirements is not affected by these variations and are assured by compliance to the following standards:

- EN 60079-0:2012+A11:2013 – Explosive atmospheres – Part 0: Equipment – General requirements.
- EN 60079-11:2012 - Explosive atmospheres – Part 11: Equipment protection by intrinsic safety "i".

In addition, the following EHSRs *(ref. ANNEX II of the Directive)* are considered relevant for this product:

Clause	Subject	Compliance
1.2.7.	Protection against other hazards	Manufacturer responsibility
1.2.8	Overloading of equipment	User/Installer responsibility
1.4.	Hazards arising from external effects	User/Installer responsibility

Pepperl+Fuchs SE declares that the products are only affected by minor or formal changes with respect to the new edition of the standards. These changes are not relevant for compliance with the essential health and safety requirements. The products still comply with the ATEX Directive. This declaration is also valid if the marking and the certificates of the listed devices correspond to previous editions of standards.
Die Pepperl+Fuchs SE erklärt hiermit, dass die Produkte nur von kleineren oder formalen Änderungen in Bezug auf die neue Ausgabe der Normen betroffen sind. Diese Änderungen sind nicht relevant für die Konformität mit den wesentlichen Gesundheits- und Sicherheitsanforderungen. Die Produkte erfüllen nach wie vor die ATEX-Richtlinie. Diese Erklärung gilt auch, wenn die Kennzeichnung und die Zertifikate der aufgeführten Geräte vorangegangenen Normenständen entsprechen.

1 Introduction

1.1 Purpose and Scope

This document describes the principal activities in the life cycle of the project to be executed by Yokogawa relating to the verification and validation of the functional safety and safety integrity of the Safety Instrumented System. The two objectives of this document are firstly to support that the Safety Instrumented System(s) is realised according to the safety regulations as per international standards IEC 61508 and IEC 61511, and secondly to verify that the required safety integrity level is achieved.
Section 2 describes briefly the verification and validation process of the SIS
Section 3 contains an analysis of the requirements on the SIS
Section 4 contains an assessment of the safety functions.

This document has been prepared by Yokogawa with the assistance and approval of an independent functional safety assessor appointed by GMS-600-14-01-GB. This assessor is responsible for internal safety validation, therefore this assessor has to consider that the project team has correctly stated the specified requirements in this SVP.

Although not being part of Yokogawa's scope and responsibility, inconsistencies and deficiencies within client's safety requirements will be recorded in this SVP as far as they can be identified. It is Yokogawa's policy to present these at an early stage.

In case the SVP is marked as a lifecycle document by the end-user, later (site) modifications might necessitate the update of this document. (IEC: "back to the appropriate phase").

1.4 Product certificate for ProSafe-RS

ProSafe-RS is certified by TÜV Rheinland to be used in applications up to and including SIL3 (IEC 61508)

Certificate

Product Safety
Functional Safety

TÜVRheinland CERTIFIED

www.tuv.com
ID 0600000000

No.: 968/EZ 196.58/24

Product tested	Safety Control System ProSafe-RS	**Certificate holder**	Yokogawa Electric Corporation 2-9-32 Nakacho Musashino-shi Tokyo 180-8750 Japan
Type designation	ProSafe-RS, R4.10 The actual revision and official list of the product documentation, hardware components and software modules have to be considered. Please refer to the "Revision Release List" published on https://fs-products.tuvasi.com/.		
Codes and standards	IEC 61508 Parts 1-7:2010 IEC 61131-2:2017		IEC 61326-3-1:2017 (non accred.) EN IEC 61000-6-2:2019
Intended application	Safety related and high availability applications such as: Emergency Shutdown System (ESD), Process Shutdown System (PSD), Burner Management System (BMS), where the safe state is the de-energized state. Fire and Gas System (F&G) applications, where the demand state is the de-energized or the energized state. The safety control system complies with the requirements of the relevant standards (SIL 3 / Systematic Capability SC 3 acc. to IEC 61508) and can be used in applications up to SIL 3. The product was also reviewed in reference to the applicable requirements of EN IEC 62061:2021, IEC 61511-1:2016 + Corr.1:2016 + AMD1:2017 and EN 50156-1:2015 up to SIL 3. The product meets also the applicable requirements of EN 298:2022, NFPA 72:2022, NFPA 85:2023, NFPA 86:2023 and EN 54-2:1997 + AC:1999 + A1:2006.		
Specific requirements	The instructions of the associated Installation and Operating Manuals shall be considered.		

The issue of this certificate is based upon an examination, whose results are documented in Report No. 968/EZ 196.58/24 dated 2024-02-15.
This certificate is valid only for products which are identical with the product tested.

2 Functional Safety Management

2.1 Introduction

The main requirement with respect to Functional Safety Management (FSM) is to assure the execution of all steps of the lifecycle and to record this, so that it can be verified and audited at any time.

- Considering that the IEC 61508 and 61511 standards are internationally accepted in industrial safety nowadays, Yokogawa integrated the standards into the ISO 9001 quality system, which is subject to a periodical audit by a recognised certification body. The result of this integration is the Yokogawa Quality Management System includes an FSM system in accordance with the standards IEC 61508 and 61511.

2.2 The Safety Life Cycle

Requirements on the realisation of safety instrumented systems are given in IEC 61508 part 2 and IEC 61511 Clauses 11, 12 and 13.
Being a system integrator of industrial safety systems, these sections are of most interest in Yokogawa. The needed steps are included in the Yokogawa safety lifecycle model as illustrated in figure 2. This figure presents how Yokogawa has implemented this realisation phase into the organisation. Verification of all steps is done, enabling a continuous monitoring of working practices.

The steps to be taken for the realisation of the project are derived directly from the standard. Following figure 2, the (Basic) Design phase is of most interest. Here the Safety Validation Plan (SVP) will be produced, (this document) which is a comparison between the design and the Safety Requirement Specification (SRS).

The outputs (deliverables) of the realisation steps are called living documents. This means that, when needed, these documents will be updated/revised after any verification (review). After validation the documents are considered as being final.

2.3 Safety Verification, Assessment and Validation

2.3.1 Introduction

In accordance with the procedures in the Quality System, safety verification will be an on-going process to fulfil the functional safety requirements during the realisation phase of the project. Because no SIFs and target SILs are provided as part of the SRS or a separate document part of the project specification, no PFDavg calculation will be performed. A table with PFDavg values for the logic solver is provided in section 4.

2.3.2 Verification

Verification will be done by means of document review, visual inspection and system tests. At the end of each project phase a review on deliverables and/or phase-related tests will be carried out. Applicable GES DRCs and phase gate check sheets will used for document reviews and project phase reviews. Verification will be done by a person independent from designer / originator. Details of applicable DRCs and Phase gate check sheets in each phase of the safety lifecycle are referenced in the local FSM procedures. For document review a review log will be kept. Applicable Test Specifications and/or checklists will be used to verify whether the system(s) complies/comply with the design documents.

2.3.3 Functional Safety Assessment

During the realisation of the safety related system usually two safety assessments will be carried out by a functional safety assessor, one after the design phase and one after the FAT. Details depend on the project phase and are defined in the checksheet FSAC. When a check fails, it will be documented in the checksheet. The functional safety assessor will verify the solution of the item during his next assessment.

2.3.4 Validation

The Test procedures combined with applicable test records, and/or checklists will be used to demonstrate the functioning of the system is in accordance with the customer requirement specifications. After the FAT the functional safety assessor carries out a validation assessment to ensure that the system is engineered and tested in accordance with the Quality System and the IEC requirements. At that time, when all outstanding items have been cleared, the FSAC will be signed by the Lead or Project Engineer and the Project Manager and countersigned by the functional safety assessor. Together with the approved SVP, this will be the basis on which the Declaration of Conformance of Functional Safety (DoC(FS)) will be issued. This DoC(FS) will be valid during the life cycle of the system on the condition that the operation and maintenance of the system will be in accordance with the required procedures.
The functional safety assessor is appointed by the GMS-600-14-01-GB and operates independently (which is highly recommended by the IEC 61508 and 61511 standards) from the project execution departments.

2.4 Systematic safety integrity

In IEC 61508 Ed 2 several ways are defined to achieve systematic safety integrity.
Yokogawa will apply Route 1S: avoidance of systematic faults and control of systematic faults.

Copyright © Yokogawa Electric Corporation

Yokogawa has their Functional Safety Management system in accordance with the requirements of IEC 61508 and IEC 61511. As such the Yokogawa organisation has a Systematic Capability 3 as per IEC 61508, part 2, 7.4.3.

2.5 Availability Calculations

As mentioned before, PFDavg calculations are not part of the functional safety assessment. Yokogawa uses the ProSafe-RS Safety Verifier (RSV) to assess the availability of the system. This report provides among others the following assessment results:

- The Mean Time Between Failures: MTBF
- The system (operational) Availability: A

The calculation takes place during the design phase. When necessary, the calculation will be repeated and presented in the re-issued SVP at the next project phases.

2.6 Installation and Commissioning

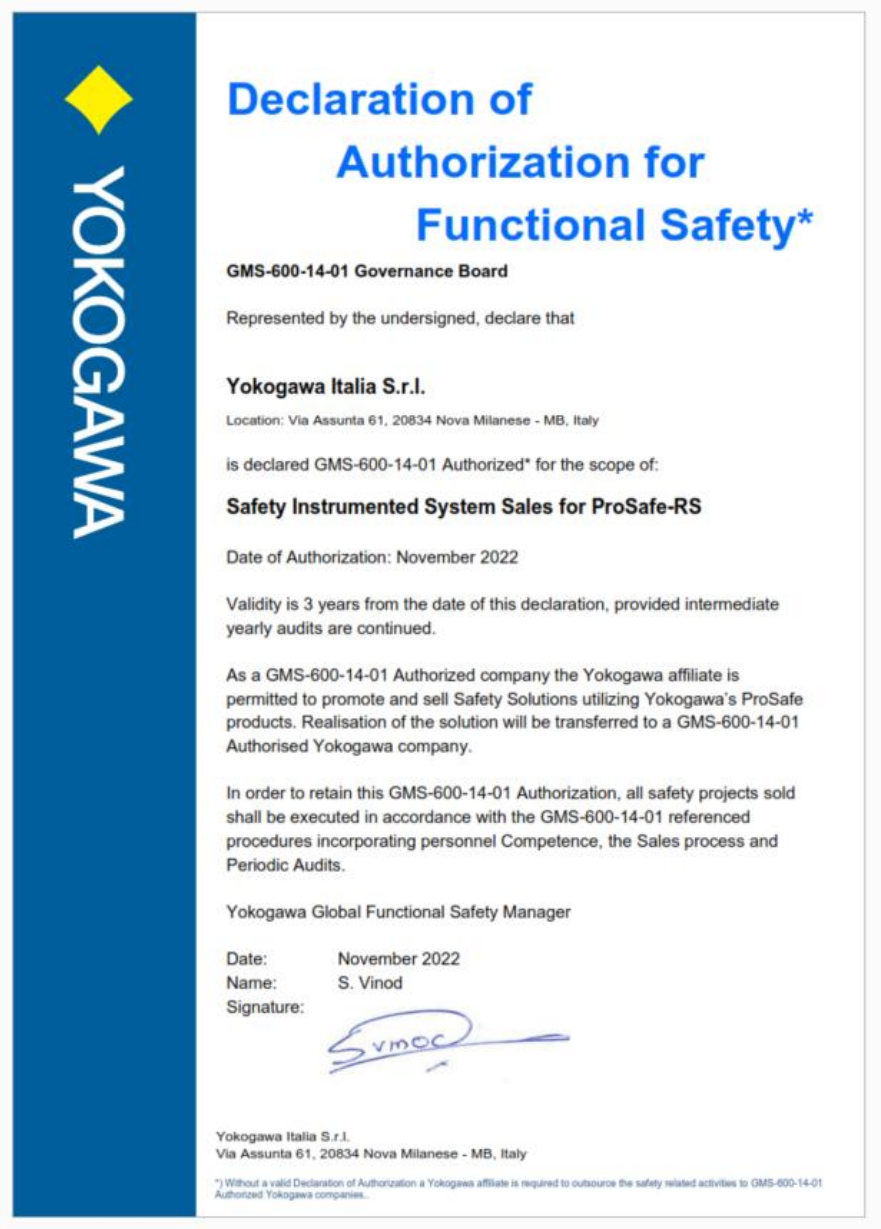
After delivery the system must be installed and commissioned, after which it can be operated. Yokogawa instructions to be considered for these activities are referred to in 1.2.3.

2.7 Operation and Maintenance

Operation and maintenance is the end-user's responsibility. Yokogawa instructions to be considered for these activities are referred to in 1.2.3. Yokogawa provides the combined document: Instructions for Operation and Maintenance (IOM). This document provides typical maintenance override and system information. The IOM can be used by the client to develop plant maintenance and testing procedures. The maintenance activities and proof testing shall be executed by safety competent personnel.

2.8 Modifications

For the execution of modifications Yokogawa provides the document: Procedure for Site Modifications and Test (PSMT). The execution of modifications shall be by safety trained and skilled engineers. Safety validation must be done after implementation and testing of the modification on site.



2.9 Decommissioning

De-commissioning will not be Yokogawa's responsibility.

Copyright © Yokogawa Electric Corporation

2.10 GMS-600-14-01 Authorization

Yokogawa's Governance Board (GMS-600-14-01) has appointed several local Yokogawa Offices worldwide for execution of safety projects. These offices are therefore obliged to have their Local Functional Safety Management System in accordance with IEC 61511 and IEC 61508 and are internally audited every year.
The GMS-600-14-01 Declaration of Authorization for Functional Safety for realization certificate (DoA(FS)R) will indicate which ProSafe products apply to the authorization.
Please note that the FSM system of the local office may be identical to the FSM system of a TÜV Rheinland certified office.

YOKOGAWA

Declaration of Authorization for Functional Safety*

GMS-600-14-01 Governance Board

Represented by the undersigned, declare that

Yokogawa Italia S.r.l.

Location: Via Assunta 61, 20834 Nova Milanese - MB, Italy

is declared GMS-600-14-01 Authorized* for the scope of:

Safety Instrumented System Sales for ProSafe-RS

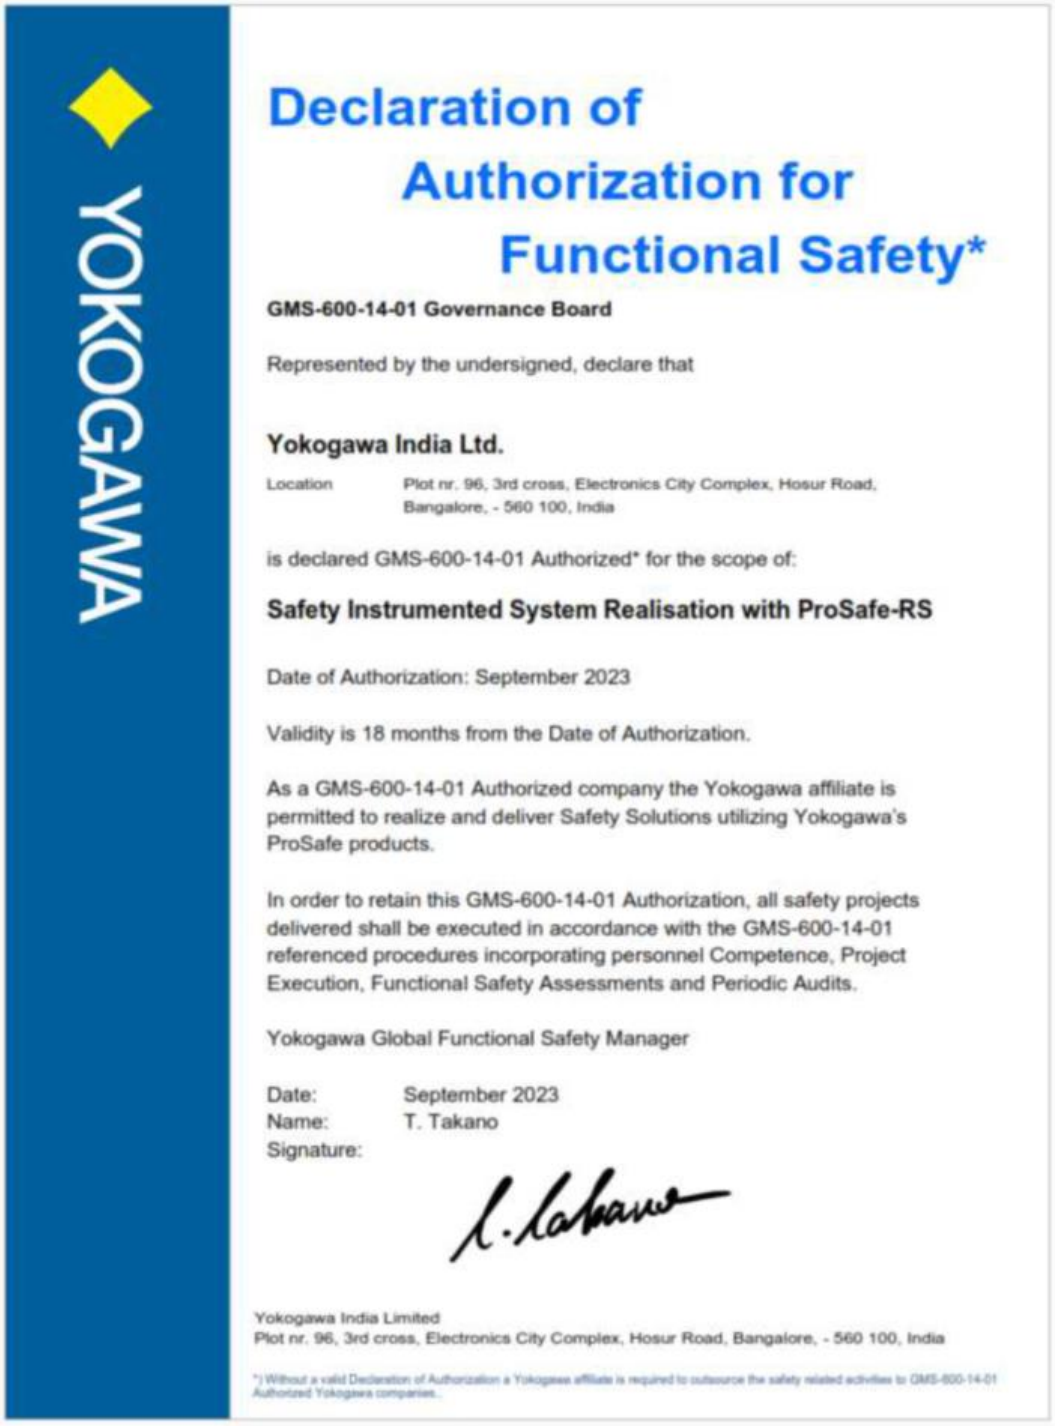
Date of Authorization: November 2022

Validity is 3 years from the date of this declaration, provided intermediate yearly audits are continued.

As a GMS-600-14-01 Authorized company the Yokogawa affiliate is permitted to promote and sell Safety Solutions utilizing Yokogawa's ProSafe products. Realisation of the solution will be transferred to a GMS-600-14-01 Authorised Yokogawa company.

In order to retain this GMS-600-14-01 Authorization, all safety projects sold shall be executed in accordance with the GMS-600-14-01 referenced procedures incorporating personnel Competence, the Sales process and Periodic Audits.

Yokogawa Global Functional Safety Manager



Date: November 2022
Name: S. Vinod
Signature:

Yokogawa Italia S.r.l.
Via Assunta 61, 20834 Nova Milanese - MB, Italy

*) Without a valid Declaration of Authorization a Yokogawa affiliate is required to outsource the safety related activities to GMS-600-14-01 Authorized Yokogawa companies.

YOKOGAWA

Declaration of Authorization for Functional Safety*

GMS-600-14-01 Governance Board

Represented by the undersigned, declare that

Yokogawa India Ltd.

Location Plot nr. 96, 3rd cross, Electronics City Complex, Hosur Road, Bangalore, - 560 100, India

is declared GMS-600-14-01 Authorized* for the scope of:

Safety Instrumented System Realisation with ProSafe-RS

Date of Authorization: September 2023

Validity is 18 months from the Date of Authorization.

As a GMS-600-14-01 Authorized company the Yokogawa affiliate is permitted to realize and deliver Safety Solutions utilizing Yokogawa's ProSafe products.

In order to retain this GMS-600-14-01 Authorization, all safety projects delivered shall be executed in accordance with the GMS-600-14-01 referenced procedures incorporating personnel Competence, Project Execution, Functional Safety Assessments and Periodic Audits.

2.11 TÜV Rheinland Certification

On top of the GMS-600-14-01 authorization, several offices have applied for individual certification by TÜV Rheinland for having their Functional Safety Management system in accordance with IEC 61511 and IEC 61508:

- Yokogawa Europe Solutions B.V, The Netherlands
- Yokogawa Romania, Bucharest
- Yokogawa Industrial Safety Systems Sdn. Bhd., Malaysia
- Yokogawa India Ltd, Bangalore
- Yokogawa Engineering Asia Pte Ltd, Singapore
- Yokogawa Electric International Pte Ltd, Singapore
- Yokogawa Middle East & Africa B.S.C. (c), Kingdom of Bahrain
- Yokogawa Corporation of America
- Yokogawa Electric Korea Co. Ltd.
- Yokogawa Solution Service Corporation, Japan

3 Safety Requirements - Safety Solutions

3.1 Introduction

The verification of the system design is carried out by comparing it with the safety requirements, as explained before. The comparison is based on splitting up the safety requirements into a number of significant items, such as logic solver integrity level, field interfaces, etc., which is presented in section 3.4.

3.2 Safety Requirement Specification

IEC61511-1 (2016) requires a description of all the SIFs necessary to achieve the required functional safety. In this case client did not specify any SIFs. The relevant safety requirement items of the system are derived from the specification document refer section 1.2.2 [a].

3.3 System Design

3.3.1 System Overview

BLPH is intended to be a greenfield platform whose purpose is to balance the power supply from HKN wind farm primarily through hydrogen generation and storage. The platform shall provide short-term energy storage through a BESS and long-term energy production and storage by producing and storing green hydrogen through electrolysis.

The facility shall receive power by external means from the Dutch grid (through the HKN wind park) and a floating solar farm. The facility is directly coupled to WTG57 through an inter array cable string that connects to the Dutch grid.

Power production from BLPH will be governed by the real-time forecast out data signals coming from Wind.

Turbine Generator number 57 (WTG57).

Additionally, BLPH shall receive power from an external floating solar farm, by others.

The PACO control system developed for BLPH shall comprise of two (2) interconnected, but independent systems:

- A Central Control System (PCS); and
- A combined Fire and Gas System (FGS) and Safety Instrumented System (SIS), which shall be referred to collectively as the Safety System.

The PCS shall be responsible for the monitoring and control of the facility, whilst the Safety System shall be responsible for the overall safeguarding of BLPH.

The wind farm system is operated by an independent SCADA system called CI Server (Collaborative Information Server). The PCS and the Safety System shall operate independently but shall interface fully with the CI Server. via the Vnet/IP Yokogawa network.

Yokogawa's Integrated Control and Safety System consists of Operator Workstations, Engineering Workstations, Field Control Stations, Safety Control Stations, etc., connected via the Vnet/IP control bus and

Copyright © Yokogawa Electric Corporation

collectively call a domain. PCS, SIS, FGS and CI server will be in same domains depending on the total number of stations and/or process segregation (or other) requirements.

Domain segregation is as below,

Domain/Station	System
SCS0110	SIS
SCS0120	FGS

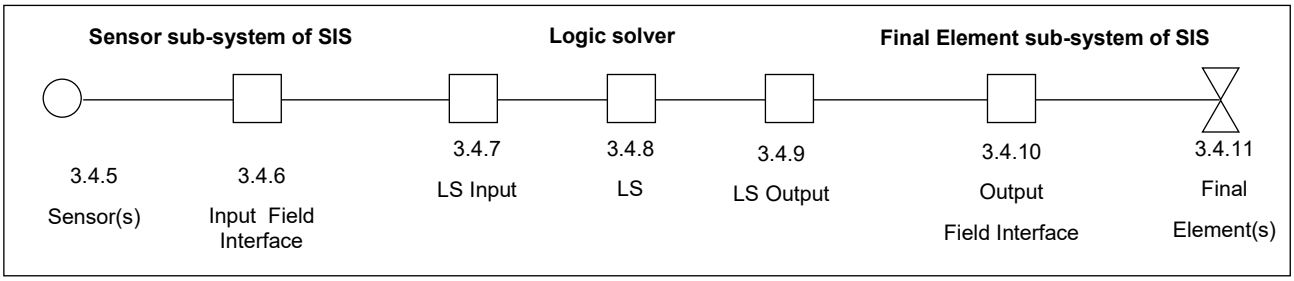
Table 1 – Domain Segregation

Refer Attachment-1 for PACO network configuration and major components is shown in the overall System Architecture Drawing (Doc No - 1724000594-IN-DD-00015).

3.3.2 Design Principles

Safety Instrumented System (SIS) / Fire and Gas (FGS) Design is based on the following principles:

- The scan time of the SIS and FG logic solver shall be a maximum of 300 msec and 500msec.
- Integrated PCS, SIS and FGS with CI server SCADA function.
- Sequence of events (SOE) recording and analysis via CI server (In build Historian) and EWS.
- The SIS shall be fail-safe, normally energized, de-energized to trip and any energise to trip SIS/FGS field circuits shall be continuously line monitored by the system for fault conditions, i.e., device faults, open and short circuit faults, etc. EPC to provide detailed information.
- Proof test will be standardized, the test intervals for proof testing the sensors, logic solver and final elements shall be detailed out by the EPCC contractor.
- SIS/FGS shall create “First up fault” alarm that allow control room operator to quickly interrogate trips through HMI with one Keystroke.
- Each SIS/FGS input shall have the facility for a maintenance inhibit to enable testing without causing a shutdown. The inhibits shall be selected and applied through the operator workstation displays. The inhibit shall only become active when the CAP is enabled. The inhibit state shall be indicated on the SIS/FGS Graphic displays. Input inhibits shall only affect SIS/FGS logic, not input alarming, i.e., inhibited inputs shall alarm to the operator.
- The FGS will be designed as a normally de-energized system with line monitoring (as per input from EPC on requirements of line monitoring functionality, including discrete alarm inputs, such as detector or manual call points).
- All relevant subsystems and Field I/O shall interface with FGS through hardwired signals.



Copyright © Yokogawa Electric Corporation

- Any single system fault shall not cause unwanted and unsafe actions, and such faults shall be revealed on occurrence.
- Every possible dangerous failure (fault detected only when the system is called upon to operate), which shall prevent an executive action from taking place in the event of a genuine trip input, shall be identified and exterminated.
- No single fault shall prevent the entire system from working normally i.e. no common mode failures.
- Replacement of I/O modules shall not require any kind of bypassing, either in hardware or software. To achieve such capability, it shall not be necessary to externally wire inputs and outputs to multiple I/O modules. Programming must be for the single I/O point only. Explicit programming of voting and module replaceability shall be unacceptable.
- Input and output signals shall be voted independently. The output-voting network shall be automatically tested at a regular interval.
- Maintenance inhibits, with only one input to any voted system being allowed to be overridden at any one time (Maintenance overrides shall not be provided on output devices).
- The FGS shall have the capability of on-line software download from the programming terminal without shutdown of the process. This capability shall be approved by EPC for class SIL 3 applications. Live/On-line download shall require security password to avoid unauthorized access.
- The FGS shall be provided with redundant communication and processor architecture to provide uninterrupted automatic Fire & Gas Detection and Protection and increased reliability.
- The FGS shall seamlessly interface with the PCS system. This will allow the operator to monitor the Fire & Gas detection status of the entire OGP Complex via PCS operator consoles located in the CCR.
- Fire protection operator commands (e.g. starting fire water pumps, initiating extinguishing agent discharge, deluge system, etc.) that may be required in case of black out of all operator workstations.
- The FGS system hardware will be separated from all other control and safety systems (PCS, SIS, etc.) and will not require the correct operation of any other system to fulfil its own function. However, to optimize facilities spare inventory and ease maintenance, the FGS shall use the same hardware as the SIS system.

Further detailed information on the system is given in the FDS (E366772C00-FDS_SW).

Copyright © Yokogawa Electric Corporation

3.4 Requirements versus Solutions

Model to clarify the used terms

Safety Instrumented Functions/Loops

Requirement	Solution
No Safety Instrumented Functions (SIFs) with SIL targets are specified by the client.	A quantitative assessment (PFDavg calculation) is not carried out as there is no customer specified safety requirement for the project. General PFDavg values for the logic solver can be found in section 4.

3.4.1 Safety Parameters

Requirement	Solution
Logic solver ▪ SIL = 3 (Refer section 1.2.2. [a])	The ProSafe-RS is certified by TÜV Rheinland for use in applications up to and including SIL3 according to IEC 61508. See 1.4.
▪ Proof test interval T = n.s.	Proof test interval of 1 year is assumed for the calculation purpose.
Overall ▪ System life time T_L = n.s	System Life Time TL of 10 year is assumed for the calculation purpose.

Copyright © Yokogawa Electric Corporation

3.4.2 Safety Related Parameters

Requirement	Solution
▪ System availability A = n.s ▪ MTTR = n.s ▪ MTBF = n.s ▪ LS scan time = n.s ▪ LS response time = n.s ▪ Process safety time = n.s	See section 4.3 for the availability calculation result. MTTR of 8 hours is assumed for the calculation purpose. The SIS & FGS ProSafe-RS scan time is set to 300msec and 500msec respectively. The SIS ProSafe-RS response time is (worst case) twice the scan time, being 300 msec scan time, LS Response time is 600 msec. The FGS ProSafe-RS response time is (worst case) twice the scan time, being 500 msec scan time, LS Response time is 1000 msec. For SIS to FGS SCS Link transmission safety communication, Transmission delay is 100 ms. The LS response time is (Considering Link transmission communication) Sender Tscan x 2 + Receiver Tscan x 2 + Transmission Delay, which is 300 x 2 + 500 x 2 + 100 = 1700 msec For FGS to SIS SCS Link transmission safety communication, Transmission delay is 100 ms. The LS response time is (Considering Link transmission communication) Sender Tscan x 2 + Receiver Tscan x 2 + Transmission Delay, which is 500 x 2 + 300 x 2 + 100 = 1700 msec Yokogawa is only responsible for the SIF response time with respect to logic solver and interfaces. However this SIF response time is mostly determined by the selection of the sensors and final elements. It is client responsibility to check the SIF response time with the inclusion of sensors and valves against the process safety time.

Copyright © Yokogawa Electric Corporation

3.4.3 Segregation

Requirement	Solution
Functional separation: ▪ Subsystems: n.s ▪ BPCS: Yokogawa Centum VP	SIS and FGS Systems are implemented in separate controllers. The Prosafe-RS is integrated over Vnet/IP network with Centum-VP, EMCS and CI serve. CI server is used to control and monitor the status on SCADA.
Galvanic isolation: ▪ I/O-groups: n.s ▪ SIS I/O channels: n.s ▪ FGS I/O channels: Yes (Refer section 1.2.2. [e]))	For FGS - AI IS signal barriers (Smoke Detector Signals) are used & For SIS - DO VFC IO's are used. Barriers and Relays are assigned based on customer Instrument I/O List (123A90-DDL-IN-LIS-40089) requirement. Based on FGS C&E, voting has segregated with different channel/module.
▪ Power supplies: Power supplies shall be considered for system, IS barriers and field instruments.	SIS and FGS Marshalling Cabinets are equipped with external 24VDC Redundant Power Supply units which serve as external source for Terminal Boards.

3.4.4 Sensors

Requirement	Solution
▪ Analogue: 4-20mA with HART ▪ Digital: VFC and NO/NC contacts ▪ Type transmitters: Pressure	The sensors are not in the scope of supply and not included in the safety assessment.
▪ FGS Safety architecture: Yes	Based on FGS, Refer section 1.2.2. [f], voting signals has segregated.
▪ SIS Safety architecture: n.s	

Copyright © Yokogawa Electric Corporation

3.4.5 Input Field Interfaces

Requirement	Solution
▪ IS isolators/barriers: Yes (Refer section 1.2.2.[d])	Following IS Barriers are used for FGS system: Make: P&F Model: P+F - HIC2025 IS barrier for AI
▪ Signal splitters: n.s	No Signal Splitters are used.
▪ HART interfaces: n.s ▪ Interposing relays: n.s	
▪ Line monitoring: Yes	Diagnostics included: Yes Line Monitoring will be achieved for IS and NIS signal up to the System from Field. Isolators used for DI and AI have pass through capability for line monitoring. For SIS & FGS Line monitoring has enabled based on customer Instrument I/O List (123A90-DDL-IN-LIS-40089) Safety certificates and/or safety manuals of the applied interfaces are included in Appendix II.

Copyright © Yokogawa Electric Corporation

3.4.6 LS Input Channels

Requirement	Solution
▪ Analogue: 4-20mA with HART	SAI143-H is used for all Analogue Inputs. Analogue inputs module SAI143-H are HART compatible. Analogue Input barriers used are HART compatible.
▪ Digital: VFC and NO/NC contacts	SDV144 is used as Digital Input Card. All Digital Inputs to the system are potential free contacts.
▪ Line monitoring: Yes	Line Monitoring for AI is enabled at IO Parameter builder using Detect IOP. Line Monitoring for DI enabled at IO Parameter for NO signals using Detect disconnection and Detect short Circuit. Diagnostics included: Yes For Analog inputs, line monitoring shall be provided by configuring over and under range using ProSafe-RS IO parameter builder. For Non-IS digital inputs, line monitoring shall be provided by using Yokogawa SCB100 and SCB110 end of line devices. For SIS & FGS Line monitoring has enabled based on customer Instrument I/O List (123A90-DDL-IN-LIS-40089)
▪ Fusing: n.s	Fuse terminal provided for the field input (NIS signal) for AI 250 mA and for DI 250 mA fuse.

Copyright © Yokogawa Electric Corporation

3.4.7 Logic Solver(s)

Requirement	Solution
▪ Dual Inputs ▪ Dual CPU ▪ Dual Outputs	ProSafe-RS is used in a configuration with dual Inputs, dual CPU and dual Outputs. The safety manuals of the ProSafe-RS are included in the Workbench installation package.

3.4.8 LS Output Channels

Requirement	Solution
▪ Power: 24VDC ▪ Lamp driver: n.s ▪ VFC:Yes (Refer section 1.2.2. [a] and [c]) ▪ Line monitoring: Yes ▪ Fusing: n.s	SDV541 module is used for the DOs of the Safety Systems. Relays are used to provide volt free contact to interface signals. Diagnostics included: Yes Line diagnostics (detect disconnection / short circuit) will be enabled for Normally De-energized DO signals. Field DO's are Line monitored up to the field Device. For SIS & FGS Line monitoring has enabled based on customer Instrument I/O List (123A90-DDL-IN-LIS-40089) Wherever relays are used for any Digital Outputs, then Line Monitoring shall be provided only up to Relay Coil and not up to the field device.

Copyright © Yokogawa Electric Corporation

3.4.9 Output Field Interfaces

Requirement	Solution
▪ IS isolators/barriers: n.s	Interposing relay used for SIS Interface signals. Make: P&F Model: KFD0-RSH-1.4S.PS2
▪ Interposing relays: Yes	Relays are used to provide volt free contact to interface signals.
▪ Line monitoring: Yes	Diagnostics included: Yes Line diagnostics (detect disconnection / short circuit) will be enabled for Normally De-energized DO signals. Field DO's are Line monitored up to the field Device. Wherever relays are used for any Digital Outputs, then Line Monitoring shall be provided only up to Relay Coil and not up to the field device. Safety certificates and/or safety manuals of the applied interfaces are included in Appendix II
▪ Fusing: n.s ▪ Surge protection: n.s	

Copyright © Yokogawa Electric Corporation

3.4.10 Final Elements

Requirement	Solution
▪ Solenoid(s): Yes Safety architecture: n.s ▪ Valve(s): Yes Safety architecture: n.s Is Partial Stroke testing applied: NO ▪ Contactors: n.s Safety architecture: n.s ▪ Alarms indicators: n.s Safety architecture: n.s	The final elements are not in the scope of supply and not included in the safety assessment.

Copyright © Yokogawa Electric Corporation

3.4.11 Overrides and Inhibits

Requirement	Solution
▪ Input overrides: Yes (Refer section 1.2.2. [a]),section 6.5) ▪ Input inhibits: n.s ▪ Output overrides: n.s	**MAINTENANCE OVERRIDE FUNCTION**: Throughout the operational lifetime of the SIS/FGS overrides for sensors and other input devices are required from time to time. Maintenance override switches (MOS) shall be used to inhibit trip initiators to enable maintenance or on-line functional testing. For safety reasons, these maintenance overrides shall be allowed for input signals with only one and not for output signals. Maintenance overrides should not prevent actual input status from being alarmed.
▪ Start up override: Yes ▪ (Refer section 1.2.2. [a]), section 6.5)	**START UP OVERRIDE:** The start-up overrides shall normally be automatic reset type. Some services will require manual start up overrides. Failure of a start-up override to reset shall be alarmed to the operator. Whenever an override is placed the safety function in question no longer offers protection. Operational precautions must be taken in line with the requirements of the standards. This is not in Yokogawa's scope or responsibility.
▪ Override groups: n.s ▪ HW override: …n.s ▪ Override from BPCS: n.s ▪ Override enable: n.s	

Copyright © Yokogawa Electric Corporation

3.4.12 Environment

Requirement	Solution
Environmental conditions and EMC requirements, as per client specification. In the event of a failure of the HVAC system the conditions will be more severe. The equipment shall therefore be designed to operate under the following conditions: • Design Temperature range: 5 to 45 ºC • Design Relative Humidity :10 to 93% RH	ProSafe-RS modules are Compliant with the requirements (Refer Hardware FDS). ProSafe-RS Hardware: Temperature: -20 to 70˚C and Relative humidity: 5 to 95% EMC Compliance meets EN55011, Class A, Group 1, EN61000-6-2, EN61000-3-2, EN61000-3-3 - RFI is 10 V/m maximum (80 MHz to 1 GHz) Power supply and Diode unit: Puls:Temperature: -25 to 70˚C (>60 derating) Relative Humidity: < 95% (at 25˚C, no condensation) Isolator: Temperature: -40 to 70˚C and Relative humidity: 5 to 95% (at 25˚C, no condensation) EMC Compliance: EN61326 Safety Relay: Temperature: -20 to 60˚C Relative humidity: 5 to 95% (at 25˚C, no condensation) The SIS & FGS System and Marshalling cabinets are designed to operate at an optimal temperature of 26°C. In the event of HVAC failure, internal temperature exceeds this threshold, a temperature alarm will be triggered, requiring immediate attention and corrective action by the operator to restore safe operating conditions.

Copyright © Yokogawa Electric Corporation

3.4.13 Communication Interfaces

Requirement	Solution
▪ BPCS communication: Yes (Refer section 1.2.2. [a]), section 6.7)	All the stations on the V-net/IP platform will be connected and communication with each other via redundant Vnet/IP. No safety related information will be communicated over this connection. No subsystem interface via Modbus communication is applicable in this project Remote I/O Communication is not used in this project Critical Action Panel (CAP) IO's are provided as software based IO's as part of SCADA/HMI (CI View). It consists of soft signals pushbutton, switches and lamps.
▪ Comm. between sub-systems: n.s ▪ Remote I/O communication: n.s ▪ Matrix panels: n.s ▪ Mimic panels: n.s	

Copyright © Yokogawa Electric Corporation

3.4.14 Application Programming

Requirement	Solution
▪ Ladder diagram, acc. IEC 61131-3: n.s ▪ Function blocks, acc. IEC 61131-3: Yes (Refer section 1.2.2. [a]), section 6.4) ▪ Structured text, acc. IEC 61131-3: n.s	The ProSafe-RS engineering tools and application programming (Ladder diagram, Function block and Structured text), are approved by TÜV Rheinland (ref. ProSafe-RS Safety Manual and Engineering guide) and are in accordance with IEC 61131. In this system FB programming is used. For the obvious non-safety related application logic function blocks/parts may be used which is not part of the SIL3 certified function block library. Examples of obvious non-safety related application logic are: Totalizers, Alarms, Diagnostics, Matrix panel outputs etc.

3.4.15 Security

Requirement	Solution
To protect against cyber-attacks it is required to	
▪ Install a switch to inhibit downloads: Yes	A hardwired (key) switch has been implemented to inhibit changing the security level of the SIS so that an unauthorised download to a ProSafe-RS controller is prevented
▪ Install a virus scanner: Yes	Virus scanner provided in all PC.
▪ Install a firewall:Yes (Refer section 1.2.2. [a]), section 7)	Firewall deployed between control (PCS) and safety(SIS and FGS) network.

Copyright © Yokogawa Electric Corporation

4 Safety Assessment Notes for the SIS system

4.1 Introduction

In 0 and 3.4.1 it was concluded that no Safety Instrumented Functions are specified.

One of the few safety related specifications is “Safety PLC to be SIL 3 compliant”
The ProSafe-RS logic solver meets that specification (see 1.4).

4.2 Safety Architecture

As no SIFs are specified Yokogawa has no possibilities to assess the hardware fault tolerance. Whenever certain SIL requirements arise the hardware fault tolerance has to be re-assessed.

4.3 Reliability Calculations

4.3.1 Scope

As no SIFs are specified Yokogawa has no possibilities to assess the PFDavg in detail.

For reference, typical values for the PFDavg of the logic solver can be found in 4.3.2

Based on the assumptions and restrictions as indicated in this SVP the Availability of the logic solver has been calculated using the Yokogawa RSV tool.

4.3.2 Results

Typical values for the PFDavg of the logic solver, based on one year proof test interval, can be found in the table below.

Loop structure	Input	CPU	Output	PFDavg
DI－CPU－DO	SDV144	S2CP471	SDV541	6.623E-07
AI－CPU－DO	SAI143-H	S2CP471	SDV541	6.754E-06

The results of the Availability calculations can be found in the calculation report (appendix 1)

Availability of logic solver (excluding field interfaces): 99.99996
Availability of logic solver (including field interfaces): 99.99991

Copyright © Yokogawa Electric Corporation

5 Safety Assessment Notes for FGS Systems

5.1 Introduction

In 0 and 3.4.1 it was concluded that no Safety Instrumented Functions for FGS are specified.

Since FGS are mainly mitigation systems, where both sensor coverage and human factor are dominant, no assumed loops are considered for calculation purposes.

One of the few safety related specifications is “Safety PLC to be SIL 3 compliant”
The ProSafe-RS logic solver meets that specification (see 1.4).

5.2 Safety Architecture

As no SIFs are specified Yokogawa has no possibilities to assess the hardware fault tolerance. Whenever certain SIL requirements arise the hardware fault tolerance has to be re-assessed.

5.3 Reliability Calculations

5.3.1 Scope

As no SIFs are specified Yokogawa has no possibilities to assess the PFDavg in detail.

For reference, typical values for the PFDavg of the logic solver can be found in 5.3.2

Because no target for Availability has been specified, calculations have not been performed.

5.3.2 Results

Typical values for the PFDavg of the logic solver, based on one year proof test interval, can be found in the table below.

Loop structure	Input	CPU	Output	PFDavg
DI－CPU－DO	SDV144	S2CP471	SDV541	6.623E-07
AI－CPU－DO	SAI143-H	S2CP471	SDV541	6.754E-06

The results of the Availability calculations can be found in the calculation report (appendix 1)

Availability of logic solver (excluding field interfaces): 99.99993
Availability of logic solver (including field interfaces): 99.99680

6 Miscellaneous

Reliability Data
Yokogawa's independent group of Functional Safety specialists has assessed the reliability data from manufacturers of devices and prepared a Reliability Datasheet per device with reliability data to be used in the calculations performed by Yokogawa.
Yokogawa's approach is to use the reliability data provided by manufacturers of devices in a conservative way, thus minimizing the chance of a too optimistic calculation.

Installation
All installation instructions as stated in the Installation Manuals, Instructions for Operation and Maintenance Manuals and/or Safety Manuals have to be followed up to ensure the validity of their associated failure rates.

Proof Testing
Procedures for testing of Yokogawa's logic solver can be found in the Instructions for Operation and Maintenance. It is end-user's responsibility to execute the tests and to keep records thereof.

System alarms
System alarms like line fault message, module failures, etc. have to be followed up by operators and/or maintenance engineers. Procedures for this must be developed by the end-user, some guidance for the Yokogawa equipment can be found in the Instructions for Operation and Maintenance.

Configurable system parts
For all configurable system parts, such as transmitters (HART), protection against unauthorised modification should be used at all times.

Life time restrictions
An overall life time has been specified in section 3.4.1. For certain, mostly mechanical, devices a shorter life time might apply. It is end-user's responsibility to identify and replace these devices at the end of their specified life time to ensure the validity of their associated failure rates. The Yokogawa Power supply modules in the rack have an expected life time of 8 years. The replacement of devices within the expected life time will not affect the associated failure rates and the overall life time of the SIS.

Overrides
The human factor will not be included in the Yokogawa reliability calculations. As a consequence unsafe operating of overrides as far as they may be caused by mistake and/or wrong procedures are not part of the safety assessment.

Contents

1 Introduction

1.1 Content of this Document

This document contains information for usage of the device in functional safety-related applications. You need this information to use your product throughout the applicable stages of the product life cycle. These can include the following:

- Product identification
- Delivery, transport, and storage
- Mounting and installation
- Commissioning and operation
- Maintenance and repair
- Troubleshooting
- Dismounting
- Disposal

Note

This document does not substitute the instruction manual.

Note

For full information on the product, refer to the instruction manual and further documentation on the Internet at www.pepperl-fuchs.com.

The documentation consists of the following parts:

- Present document
- Instruction manual
- Manual
- Datasheet

Additionally, the following parts may belong to the documentation, if applicable:

- EU-type examination certificate
- EU declaration of conformity
- Attestation of conformity
- Certificates
- Control drawings
- FMEDA report
- Assessment report
- Additional documents

For more information about Pepperl+Fuchs products with functional safety, see www.pepperl-fuchs.com/sil.

1.2 Safety Information

Target Group, Personnel

Responsibility for planning, assembly, commissioning, operation, maintenance, and dismounting lies with the plant operator.

Only appropriately trained and qualified personnel may carry out mounting, installation, commissioning, operation, maintenance, and dismounting of the product. The personnel must have read and understood the instruction manual and the further documentation.

Intended Use

The device is only approved for appropriate and intended use. Ignoring these instructions will void any warranty and absolve the manufacturer from any liability.

The device is developed, manufactured and tested according to the relevant safety standards.

Use the device only

- for the application described
- with specified environmental conditions
- with devices that are suitable for this safety application

Improper Use

Protection of the personnel and the plant is not ensured if the device is not used according to its intended use.

1.3 Symbols Used

This document contains symbols for the identification of warning messages and of informative messages.

Warning Messages

You will find warning messages, whenever dangers may arise from your actions. It is mandatory that you observe these warning messages for your personal safety and in order to avoid property damage.

Depending on the risk level, the warning messages are displayed in descending order as follows:

Danger!

This symbol indicates an imminent danger.

Non-observance will result in personal injury or death.

Warning!

This symbol indicates a possible fault or danger.

Non-observance may cause personal injury or serious property damage.

Caution!

This symbol indicates a possible fault.

Non-observance could interrupt the device and any connected systems and plants, or result in their complete failure.

Informative Symbols

Note

This symbol brings important information to your attention.

Action

This symbol indicates a paragraph with instructions. You are prompted to perform an action or a sequence of actions.

2 Product Description

2.1 Validity

This manual is only valid for devices with a part number **greater than #310000**.

Contact your Pepperl+Fuchs representative for information about older devices.

2.2 Function

KCD2-STC-1(.SP)

This signal conditioner provides the galvanic isolation between field circuits and control circuits.

The device supplies 2-wire transmitters in the field, and can also be used with current sources.

The device transfers the analog input signal to the control side as an isolated current value.

Bi-directional communication is supported for SMART transmitters that use current modulation to transmit data and voltage modulation to receive data. If the HART communication resistance in the loop is too low, the internal resistance can be used.

Test sockets for the connection of HART communicators are integrated into the terminals of the device.

The output is selected as a current source, current sink, or voltage source via DIP switches.

The device is mounted on a 35 mm DIN mounting rail according to EN 60715.

SP version

The devices are available with screw terminals or spring terminals. The type code of the versions of the devices with spring terminals has the extension ".SP".

KCD2-STC-Ex1(.SP)

This isolated barrier is used for intrinsic safety applications.

The device supplies 2-wire transmitters in the hazardous area, and can also be used with current sources.

The device transfers the analog input signal to the non-hazardous area as an isolated current value.

Bi-directional communication is supported for SMART transmitters that use current modulation to transmit data and voltage modulation to receive data. If the HART communication resistance in the loop is too low, the internal resistance can be used.

Test sockets for the connection of HART communicators are integrated into the terminals of the device.

The output is selected as a current source, current sink, or voltage source via DIP switches.

The device is mounted on a 35 mm DIN mounting rail according to EN 60715.

SP version

The devices are available with screw terminals or spring terminals. The type code of the versions of the devices with spring terminals has the extension ".SP".

HiC2025(A)

This isolated barrier is used for intrinsic safety applications.

The device supplies 2-wire transmitters in the hazardous area, and can also be used with current sources.

The device transfers the analog input signal to the non-hazardous area as an isolated current value.

Bi-directional communication is supported for SMART transmitters that use current modulation to transmit data and voltage modulation to receive data.

The output is selected as a current source, current sink, or voltage source via DIP switches.

This device mounts on a HiC termination board.

A version

Device version A has reduced intrinsically safe parameters.

2.3 Interfaces

The device has the following interfaces.

- Safety relevant interfaces: input I, output I
- Non-safety relevant interfaces: none
  The HART communication is not relevant for functional safety.

Note

For corresponding connections see datasheet.

2.4 Marking

Pepperl+Fuchs Group Lilienthalstraße 200, 68307 Mannheim, Germany

2.5 Standards and Directives for Functional Safety

Device specific standards and directives

Functional safety	IEC/EN 61508, part 1 – 7, edition 2010: Functional safety of electrical/electronic/programmable electronic safety-related systems (manufacturer)

System-specific standards and directives

Functional safety	IEC 61511-1:2016+COR1:2016+A1:2017 EN 61511-1:2017+A1:2017 Functional safety – Safety instrumented systems for the process industry sector (user)

3 Planning

3.1 System Structure

3.1.1 Low Demand Mode of Operation

If there are two control loops, one for the standard operation and another one for the functional safety, then usually the demand rate for the safety loop is assumed to be less than once per year.

The relevant safety parameters to be verified are:

- the PFD_{avg} value (average **P**robability of dangerous **F**ailure on **D**emand) and the T_1 value (proof test interval that has a direct impact on the PFD_{avg} value)
- the SFF value (**S**afe **F**ailure **F**raction)
- the HFT architecture (**H**ardware **F**ault **T**olerance)

3.1.2 High Demand or Continuous Mode of Operation

If there is only one safety loop, which combines the standard operation and safety-related operation, then usually the demand rate for this safety loop is assumed to be higher than once per year.

The relevant safety parameters to be verified are:

- the PFH value (**P**robability of dangerous **F**ailure per **H**our)
- Fault reaction time of the safety system
- the SFF value (**S**afe **F**ailure **F**raction)
- the HFT architecture (**H**ardware **F**ault **T**olerance)

3.1.3 Safe Failure Fraction

The safe failure fraction describes the ratio of all safe failures and dangerous detected failures to the total failure rate.

$SFF = (\lambda_s + \lambda_{dd}) / (\lambda_s + \lambda_{dd} + \lambda_{du})$

A safe failure fraction as defined in IEC/EN 61508 is only relevant for elements or (sub)systems in a complete safety loop. The device under consideration is always part of a safety loop but is not regarded as a complete element or subsystem.

For calculating the SIL of a safety loop it is necessary to evaluate the safe failure fraction of elements, subsystems and the complete system, but not of a single device.

Nevertheless the SFF of the device is given in this document for reference.

3.2 Assumptions

The following assumptions have been made during the FMEDA:

- Failure rate based on the Siemens standard SN 29500.
- Failure rates are constant, wear is not considered.
- External power supply failure rates are not included.
- The safety-related device is considered to be of type **A** device with a hardware fault tolerance of **0**.
- The device will be used under average industrial ambient conditions comparable to the classification "stationary mounted" according to MIL-HDBK-217F.

  Alternatively, operating stress conditions typical of an industrial field environment similar to IEC/EN 60654-1 Class C with an average temperature over a long period of time of 40 °C may be assumed. For a higher average temperature of 60 °C, the failure rates must be multiplied by a factor of 2.5 based on experience. A similar factor must be used if frequent temperature fluctuations are expected.
- The application program in the programmable logic controller (PLC) is configured to detect underrange and overrange failures.
- The device do not has a fault bus.

SIL 2 Application

- To build a SIL safety loop for the defined SIL, it is assumed as an example that this device uses 10 % of the available budget for PFD_{avg}/PFH.
- For a SIL 2 application operating in low demand mode the total PFD_{avg} value of the SIF (**S**afety **I**nstrumented **F**unction) should be smaller than 10^{-2}, hence the maximum allowable PFD_{avg} value would then be 10^{-3}.
- For a SIL 2 application operating in high demand mode the total PFH value of the SIF should be smaller than 10^{-6} per hour, hence the maximum allowable PFH value would then be 10^{-7} per hour.
- Since the safety loop has a hardware fault tolerance of **0** and it is a type **A** device, the SFF must be > 60 % according to table 2 of IEC/EN 61508-2 for a SIL 2 (sub) system.

3.3 Safety Function and Safe State

Safety Function

The device transfers analog signals from the input to the output with a tolerance of 2 % related to the full signal range.

Use the following DIP switch settings for safety-relevant applications:

DIP Switch Settings KCD2-STC-(Ex)1(.SP)

Function	S1	S2	S3	S4
Current source 4 mA to 20 mA	II	II	I	II
Voltage source 1 V to 5 V	II	II	I	I
Current sink 4 mA to 20 mA	II	I	II	II

Table 3.1

DIP Switch Settings HiC2025(A)

Function	S1	S2	S3	S4
Current source 4 mA to 20 mA	OFF	OFF	ON	OFF
Voltage source 1 V to 5 V	OFF	OFF	ON	ON
Current sink 4 mA to 20 mA	OFF	ON	OFF	OFF

Table 3.2

Safe State

In the safe state, the following values must be reached at the output:

- < 3.6 mA or > 21.5 mA,
- < 0.9 V or > 5.375 V,

Reaction Times

The safety reaction time is the maximum time required from the occurrence of the fault to the reaction of the outputs in normal operation without faults.

The combined fault detection and fault reaction time is the time in which the device outputs react to an occurred fault. See chapter 3.4.

Note

See corresponding datasheets for further information.

2020-04

3.4 Characteristic Safety Values

Parameters	Characteristic values
Assessment type	Full assessment
Device type	A
Mode of operation	Low demand mode or high demand mode
HFT	0
SIL	2
SC	3
Safety function	Transfer of the analog signals
λ_s [1]	0 FIT
λ_{dd}	163 FIT
λ_{du}	40.9 FIT
$\lambda_{total\ (safety\ function)}$ [1]	204 FIT
$\lambda_{not\ part}$	18.6 FIT
SFF [1]	79 %
MTBF [2]	276 years
PFH	4.09×10^{-8} 1/h
PFD_{avg} for T_{proof} = 1 year	1.79×10^{-4}
PFD_{avg} for T_{proof} = 2 years	3.58×10^{-4}
PFD_{avg} for T_{proof} = 5 years	8.96×10^{-4}
PTC	100 %
Safety reaction time Fault reaction time [3]	< 20 ms < 100 ms

Table 3.3

1 "No effect failures" are not influencing the safety function and are therefore not included in SFF and in the failure rates of the safety function.

2 acc. to SN29500. This value includes failures which are not part of the safety function/MTTR = 24 h.

3 Time between fault occurence and fault reaction

The characteristic safety values like PFD, SFF, HFT and T_1 are taken from the SIL report/FMEDA report. Observe that PFD and T_1 are related to each other.

The function of the devices has to be checked within the proof test interval (T_1).

2020-04

3.5 Useful Lifetime

Although a constant failure rate is assumed by the probabilistic estimation this only applies provided that the useful lifetime of components is not exceeded. Beyond this useful lifetime, the result of the probabilistic estimation is meaningless as the probability of failure significantly increases with time. The useful lifetime is highly dependent on the component itself and its operating conditions – temperature in particular. For example, electrolytic capacitors can be very sensitive to the operating temperature.

This assumption of a constant failure rate is based on the bathtub curve, which shows the typical behavior for electronic components.

Therefore it is obvious that failure calculation is only valid for components that have this constant domain and that the validity of the calculation is limited to the useful lifetime of each component.

It is assumed that early failures are detected to a huge percentage during the installation and therefore the assumption of a constant failure rate during the useful lifetime is valid.

However, according to IEC/EN 61508-2, a useful lifetime, based on general experience, should be assumed. Experience has shown that the useful lifetime often lies within a range period of about 8 to 12 years.

As noted in DIN EN 61508-2:2011 note N3, appropriate measures taken by the manufacturer and plant operator can extend the useful lifetime.

Our experience has shown that the useful lifetime of a Pepperl+Fuchs product can be higher if the ambient conditions support a long life time, for example if the ambient temperature is significantly below 60 °C.

Please note that the useful lifetime refers to the (constant) failure rate of the device. The effective life time can be higher.

The estimated useful lifetime is greater than the warranty period prescribed by law or the manufacturer's guarantee period. However, this does not result in an extension of the warranty or guarantee services. Failure to reach the estimated useful lifetime is not a material defect.

4 Mounting and Installation

Mounting and Installing the Device

1. Observe the safety instructions in the instruction manual.
2. Observe the information in the manual.
3. Observe the requirements for the safety loop.
4. Connect the device only to devices that are suitable for this safety application.
5. Check the safety function to ensure the expected output behavior.

4.1 Configuration

Configuring the Devices with DIP Switches on the Device Side

The device is configured via DIP switches. The DIP switches for setting the safety functions are on the side of the device.

1. De-energize the device before configuring the device.
2. Remove the device.
3. Configure the device for the required safety function via the DIP switches, see chapter 3.3.
4. Secure the DIP switches to prevent unintentional adjustments.
5. Mount the device.
6. Connect the device again.

Configuring the Devices with DIP Switches on the Front Side

The device is configured via DIP switches. The DIP switches for setting the safety functions are on the front of the device.

1. De-energize the device before configuring the device.
2. Open the cover.
3. Configure the device for the required safety function via the DIP switches, see chapter 3.3.
4. Close the cover.
5. Secure the DIP switches to prevent unintentional adjustments.
6. Connect the device again.

Note

See corresponding datasheets for further information.

5 Operation

Danger!

Danger to life from missing safety function

If the safety loop is put out of service, the safety function is no longer guaranteed.

- Do not deactivate the device.
- Do not bypass the safety function.
- Do not repair, modify, or manipulate the device.

Operating the device

1. Observe the safety instruction in the instruction manual.
2. Observe the information in the manual.
3. Use the device only with devices that are suitable for this safety application.
4. Correct any occurring safe failures within 24 hours. Take measures to maintain the safety function while the device is being repaired.

5.1 Proof Test Procedure

This section describes a possible proof test procedure. The user is not obliged to use this proposal. The user may consider different concepts with an individual determination of the respective effectiveness, e. g. concepts according to NA106:2018.

According to IEC/EN 61508-2 a recurring proof test shall be undertaken to reveal potential dangerous failures that are not detected otherwise.

Check the function of the subsystem at periodic intervals depending on the applied PFD_{avg} in accordance with the characteristic safety values. See chapter 3.4.

It is under the responsibility of the plant operator to define the type of proof test and the interval time period.

Equipment required:

- Digital multimeter with an accuracy better than 0.1 %

  Use for the proof test of the intrinsic safety side of the device a special digital multimeter for intrinsically safe circuits.

  If intrinsically safe circuits are operated with non-intrinsically safe circuits, they must no longer be used as intrinsically safe circuits.
- Power supply set to nominal voltage of 24 V DC
- Process calibrator with current source and current sink function with an accuracy better than 20 µA

Proof Test Procedure

1. Put out of service the entire safety loop. Protect the application by means of other measures.
2. Prepare a test set-up, see figures below.
3. Test the devices. Verify the current values as given in table below.
4. Set back the device to the original settings for the application after the test.

Step No.	Input	Output		
	Input value (mA)	Output value (mA)	Output value for 2-wire Tx (V)	Output value for 4-wire Tx (V)
1	20.00	20.00 ± 0.4	15.3 ± 0.6	4.1 ± 1.5
2	12.00	12.00 ± 0.4	17.3 ± 0.6	4.1 ± 1.5
3	4.00	4.00 ± 0.4	19.3 ± 0.6	4.1 ± 1.5
4 [1]	23.00	23.00 ± 0.4	14.4 ± 0.6	4.1 ± 1.5
5 [1]	0	< 0.2	22.0 ± 2.0	n. a.
6	12.00			

Table 5.1 Steps to be performed for the proof test

[1] The output shall detect a fail high or fail low condition.

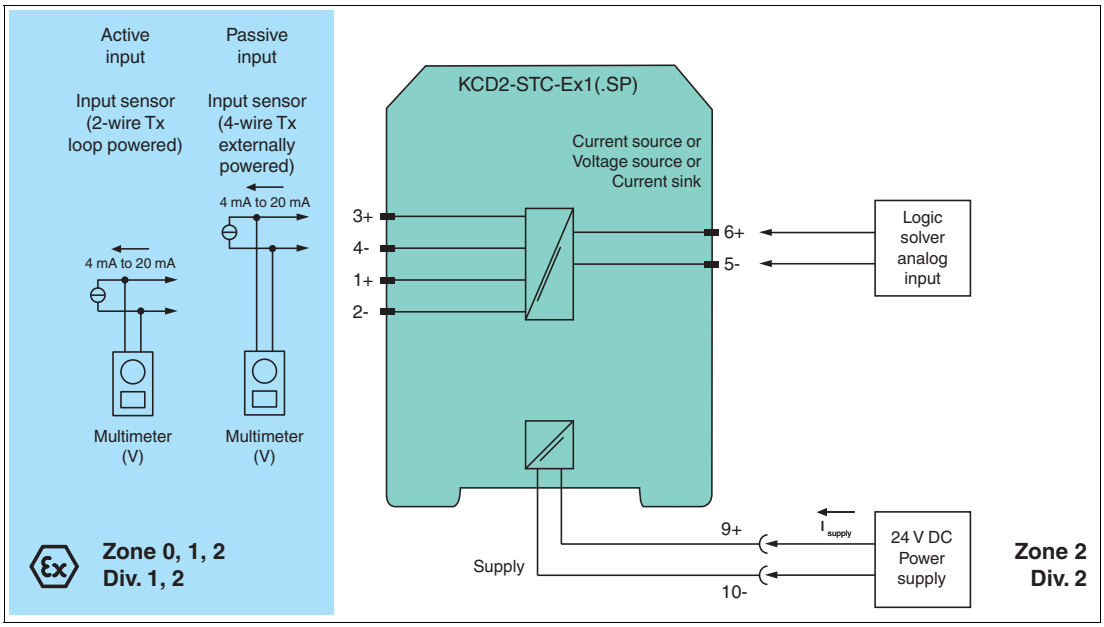

Figure 5.1 Proof test set-up for KCD2-STC-(Ex)1(.SP)

Usage in Zone 0, 1, 2/Div. 1, 2 only for KCD2-STC-Ex1(.SP)

2020-04

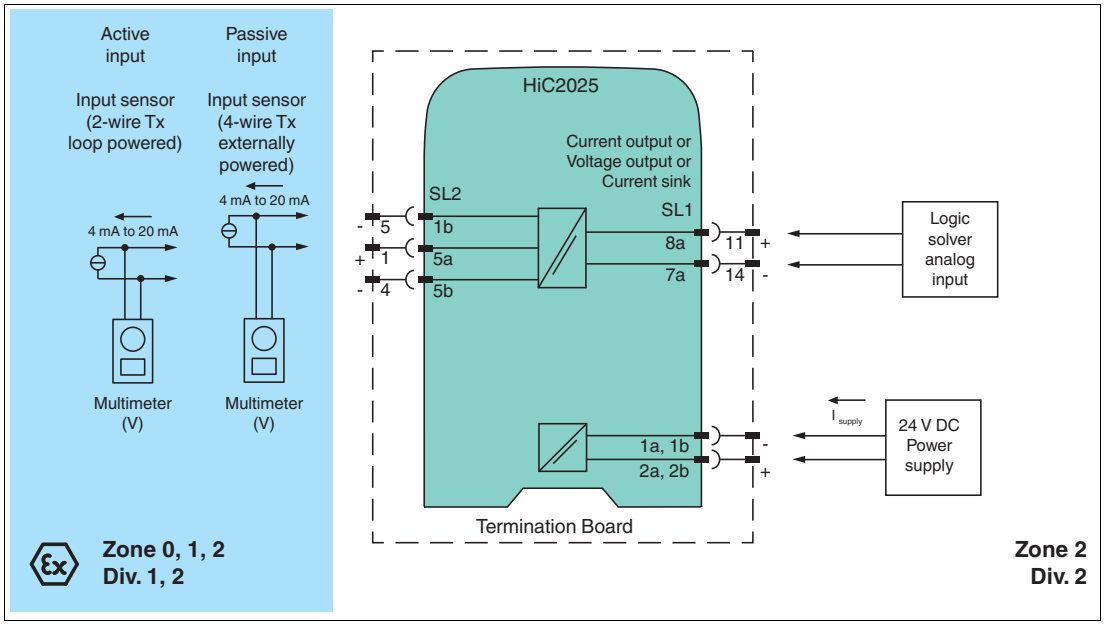

Figure 5.2 Proof test set-up for HiC2025(A)

Tip

The easiest way to test HiC devices is by using a stand-alone HiCTB**-SCT-***-**-** termination board. In this test, it is not necessary to disconnect the wiring of the existing application. Faults in a subsequent wiring can be avoided.

2020-04

6 Maintenance and Repair

Danger!

Danger to life from missing safety function

Changes to the device or a defect of the device can lead to device malfunction.
The function of the device and the safety function is no longer guaranteed.

Do not repair, modify, or manipulate the device.

Maintaining, Repairing or Replacing the Device

In case of maintenance, repair or replacement of the device, proceed as follows:

1. Implement appropriate maintenance procedures for regular maintenance of the safety loop.
2. While the device is maintained, repaired or replaced, the safety function does not work.
   Take appropriate measures to protect personnel and equipment while the safety function is not available.
   Secure the application against accidental restart.
3. Do not repair a defective device. A defective device must only be repaired by the manufacturer.
4. If there is a defect, always replace the device with an original device.

Safety Assessment
by Safety Assurance

Device Front Sheet: Revision 5

Pepperl+Fuchs - Relay Module				
Device Type No. KFD0-RSH-1.4S.PS2				
Doc. ref.	Document name	Date	Revision	Institute
225538	Safety Manual SIL	04-01-2011	-	P+F
P+F 100397R1C P0006 C04.2	Certificate	03-05-2011	-	Exida

Yokogawa's independent group of Safety Experts has assessed the reliability data in the attached report and proposes to use these data as follows (values in E-06/hr):

Manufacturer	Model	Type	λ_S (*)	λ_{DD} (*)	λ_{DU} (*)
Pepperl+Fuchs	KFD0-RSH-1.4S.PS2 **DTS**	A	3.50E-02	0	1.83E-03
Pepperl+Fuchs	KFD0-RSH-1.4S.PS2 **ETS**	A	5.71E-02	0	7.10E-03

(*) The listed failure rates are valid for operating stress conditions typical of an industrial field environment similar to IEC 60541-1 class C (sheltered location) with an average temperature of 40°C. For a higher average temperature of 60°C, the failure rates should be multiplied by 2,5. A similar multiplier should be used if frequent temperature fluctuation must be assumed.

Yokogawa's approach is to use the reliability data in a conservative way, thus minimizing the chance of a too optimistic calculation. On request the calculation can always be repeated with less conservative data.

Manufacturer claims compliance to Systematic Capability: SC3(*)
(*) P+F 090535 P0006 C011.2, Exida (or more recent)

Considerations

The attached report clearly refers to IEC61508:2000 (see 1.4)

Currently the reference should be to IEC61508: 2010 and consequently some failures that have been included in the λ_{total} should be left out of the calculation (this results in the value of λ_S above).

The failures that have been left out of the calculation were established in a discussion with P&F in November 2010; however they did not find their way into above report of April 2011.

1 Introduction

1.1 General Information

This manual contains information for application of the device in functional safety related loops.

The corresponding data sheets, the operating instructions, the system description, the Declaration of Conformity, the EC-Type-Examination Certificate, the Functional Safety Assessment and applicable Certificates (see data sheet) are integral parts of this document.

The documents mentioned are available from **www.pepperl-fuchs.com** or by contacting your local Pepperl+Fuchs representative.

Mounting, commissioning, operation, maintenance and dismounting of any devices may only be carried out by trained, qualified personnel. The instruction manual must be read and understood.

When it is not possible to correct faults, the devices must be taken out of service and action taken to protect against accidental use. Devices should only be repaired directly by the manufacturer. De-activating or bypassing safety functions or failure to follow the advice given in this manual (causing disturbances or impairment of safety functions) may cause damage to property, environment or persons for which Pepperl+Fuchs GmbH will not be liable.

The devices are developed, manufactured and tested according to the relevant safety standards. They must only be used for the applications described in the instructions and with specified environmental conditions, and only in connection with approved external devices.

1.2 Intended Use

This signal conditioner is a loop powered safety relay module with a logic input and two different relay outputs:

It can be used as an interface in output loops for fire and gas systems classified as SIL3. The safe state in this application is **e**nergized **t**o **s**afe (ETS). Output I with two relays in parallel must be used, no fuse available.

It can also be used as an interface in output loops for ESD (**E**mergency **S**hut **D**own) systems classified as SIL3. The safe state in this application is **d**e-energized **t**o **s**afe (DTS). Output II with two relays in series must be used. An additional fuse in series to the relay contacts is available (see chapter 3).

With both outputs in combination a non safety application for dual pole switching (DPS) is possible.

Additionally a test input for proof tests is available. The proof test checks if each single relay is working correctly.

The device is usually mounted on a DIN rail in cabinets with access for qualified personnel only.

225538 2011-04

1.3 Manufacturer Information

Pepperl+Fuchs GmbH

Lilienthalstrasse 200
68307 Mannheim/Germany

KFD0-RSH-1.4S.PS2

Up to SIL3 (for DTS), up to SIL3 (for ETS)

1.4 Relevant Standards and Directives

Device specific standards and directives

- Functional safety IEC 61508 part 1 – 7, edition 2000:
  Standard of functional safety of electrical/electronic/programmable electronic safety-related systems (product manufacturer)
- Electromagnetic compatibility:
  - EN 61326-1:2006
  - NE 21:2006

System specific standards and directives

- Functional safety IEC 61511 part 1 – 3, edition 2003:
  Standard of functional safety: safety instrumented systems for the process industry sector (user)

2 Planning

2.1 System Structure

2.1.1 Low Demand Mode

If there are two loops, one for the standard operation and another one for the functional safety, then usually the demand rate for the safety loop is assumed to be less than once per year.

The relevant safety parameters to be verified are:

- the PFD_{avg} value (average **P**robability of **F**ailure on **D**emand) and T_{proof} (proof test interval that has a direct impact on the PFD_{avg})
- the SFF value (**S**afe **F**ailure **F**raction)
- the HFT architecture (**H**ardware **F**ault **T**olerance architecture)

2.1.2 High Demand Mode

If there is only one loop, which combines the standard operation and safety related operation, then usually the demand rate for this loop is assumed to be higher than once per year.

The relevant safety parameters to be verified are:

- PFH (**P**robability of dangerous **F**ailure per **H**our)
- Fault reaction time of the safety system
- the SFF value (**S**afe **F**ailure **F**raction)
- the HFT architecture (**H**ardware **F**ault **T**olerance architecture)

225538 2011-04

2.2 Assumptions

The following assumptions have been made during the FMEDA analysis:

- Failure rates are constant, wear out mechanisms are not included.
- The stress levels are average for an industrial environment and can be compared to the Ground Fixed Classification of MIL-HNBK-217F. Alternatively, the assumed environment is similar to:
  - IEC 60654-1 Class C (sheltered location) with temperature limits within the manufacturer's rating and an average temperature over a long period of time of 40 °C. Humidity levels are assumed within manufacturer's rating. For a higher average temperature of 60 °C, the failure rates should be multiplied with an experience based factor of 2.5. A similar multiplier should be used if frequent temperature fluctuation must be assumed.
- Failure rate based on the Siemens SN29500 data base.
- It was assumed that the appearance of a safe error (e. g. output in safe state) would be repaired within 8 hours.
- During the absence of the device for repairing, measures have to be taken to ensure the safety function (for example: substitution by an equivalent device).
- For high currents and high ambient temperature the de-rating given in the data sheet needs to be considered.
- The input of the device must be connected to a safety PLC which has minimum the SIL needed in the loop.
- The device shall claim less than 10 % of the total failure budget for a SIL3 safety loop.
- For a SIL3 application operating in Low Demand Mode the total PFD_{avg} value of the SIF (**S**afety **I**nstrumented **F**unction) should be smaller than 10^{-3}, hence the maximum allowable PFD_{avg} value would then be 10^{-4}.
- For a SIL3 application operating in High Demand Mode of operation the total PFH value of the SIF should be smaller than 10^{-7} per hour, hence the maximum allowable PFH value would then be 10^{-8} per hour.
- Since the circuit has a Hardware Fault Tolerance of **0** and it is a type **A** component, the SFF must be > 90 % according to table 2 of IEC 61508-2 for SIL3 (sub)system.

2.3 Safety Function and Safe State

DTS

Safety Function

The safety function of the device is defined: Whenever the input of the device is de-energized, the DTS output is not conducting.

Safe State

For the DTS safety function the safe state is defined as the DTS output being open (not conducting).

Reaction Time

The reaction time is < 20 ms.

ETS

Safety Function

The safety function of the device is defined: Whenever the input of the device is energized, the ETS output is conducting.

Safe State

For the ETS safety function the safe state is defined as the ETS output being closed (conducting).

Reaction Time

The reaction time is < 20 ms.

DPS

The dual pole switching application is no safety application.

General

For all applications the maximum switching frequency is limited to 10 Hz.

225538 2011-04

2.4 Characteristic Safety Values

Parameters acc. to IEC 61508	Variables	
Assessment type and documentation	Full assessment	
Pepperl+Fuchs FMEDA report [1]	FS-0042EA-20A	
Device type	A	
Demand mode	Low Demand Mode or High Demand Mode	
Safety function [2]	ETS [4]	DTS
HFT	0	0
SIL	3	3
$\lambda_{sd} + \lambda_{su}$	139.7 FIT	144.77 FIT
λ_{dd}	0 FIT	0 FIT
λ_{du}	7.1 FIT	1.83 FIT
$\lambda_{total\ (safety\ function)}$	146.6 FIT	146.6 FIT
SFF	95.2 %	98.7 %
MTBF [3]	639 years	560 years
PFH	7.1×10^{-9} 1/h	1.83×10^{-9} 1/h
PFD_{avg} for T_1 = 1 year	3.1×10^{-5}	8.01×10^{-6}
T_{proof} max.	3 years	12 years
Reaction time	< 20 ms	

[1] Pepperl+Fuchs documentation number

[2] The device can be used in two safety functions, ETS (energized to safe) and DTS (de-energized to safe).

[3] acc. to SN29500. This value includes failures which are not part of the safety function/MTTR = 8 h.

[4] For ETS in SIL2 applications no proof test has to be carried out, the calculated proof time is higher than the useful time (T_{proof} max. for ETS SIL2 is 32 years).

The characteristic safety values like PFD/PFH, SFF, HFT and T_{proof} are taken from the SIL report/FMEDA report. Please note, PFD and T_{proof} are related to each other.

The function of the devices has to be checked within the proof test interval (T_{proof}).

3 Safety Recommendation

3.1 Interfaces

The device has the following interfaces. For corresponding terminals see data sheet.

- Safety relevant interfaces: input, output I (ETS), output II (DTS)
- To avoid contact welding in DTS application we recommend to use a serial fuse in the load circuit. This can be the internal fuse F1 or any external fuse of max. 5 A nominal value.
- Test input interface may not be used during normal operation (only for proof test)

3.2 Configuration

A configuration of the device is not necessary and not possible.

ETS, DTS and DPS can be selected by using the referring terminals. See data sheet. The fuse in delivery status (2.5 A) can be changed to max 5 A. Please note the temperature derating according to the data sheet.

3.3 Useful Life Time

Although a constant failure rate is assumed by the probabilistic estimation this only applies provided that the useful life time of components is not exceeded. Beyond this useful life time, the result of the probabilistic calculation is meaningless as the probability of failure significantly increases with time. The useful life time is highly dependent on the component itself and its operating conditions – temperature in particular (for example, the electrolytic capacitors can be very sensitive to the working temperature).

This assumption of a constant failure rate is based on the bathtub curve, which shows the typical behavior for electronic components.

Therefore it is obvious that failure calculation is only valid for components that have this constant domain and that the validity of the calculation is limited to the useful life time of each component.

It is assumed that early failures are detected to a huge percentage during the installation period and therefore the assumption of a constant failure rate during the useful life time is valid.

However, according to IEC 61508-2, a useful life time, based on experience, should be assumed. Experience has shown that the useful life time often lies within a range period of about 8 ... 12 years.

Our experience has shown that the useful life time of a Pepperl+Fuchs product can be higher

- if there are no components with reduced life time in the safety path (like electrolytic capacitors, relays, flash memory, opto coupler) which can produce dangerous undetected failures and
- if the ambient temperature is significantly below 60 °C.

Please note that the useful life time refers to the (constant) failure rate of the device. The effective life time can be higher.

Maximum Switching Power of Output Contacts

The useful life time is limited by the maximum switching cycles under load conditions. You can see the relationship between the maximum switching power and the load conditions in the diagram below.

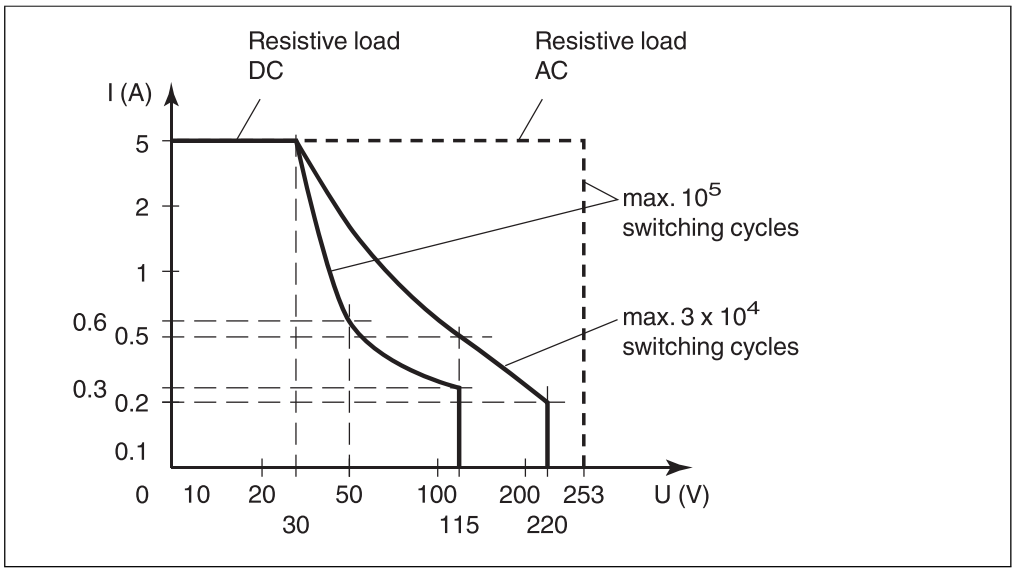

Figure 3.1

3.4 Installation and Commissioning

Installation has to consider all aspects regarding the SIL level of the loop. During installation or replacement of the device the loop has to shut down. Devices have to be replaced by the same type of devices.

4 Proof Test

4.1 Proof Test Procedure

According to IEC 61508-2 a recurring proof test shall be undertaken to reveal potential dangerous fails that are otherwise not detected by diagnostic test.

The functionality of the subsystem must be verified at periodic intervals depending on the applied PFD_{avg} in accordance with the data provided in see chapter 2.4.

It is under the responsibility of the operator to define the type of proof test and the interval time period.

The ancillary equipment required:

- A digital multimeter (without special accuracy) will be used as ohmmeter (mid range recommended) to check the relay outputs. Closed contacts are shown with 0 Ω (low impedance), open contacts are shown with OL (overload/high impedance).
- Power supply set at nominal voltage of 24 V DC

Procedure:

For the proof test five tests have to be done as shown in the following table and pictures:

Test No.	Input or Test Input	Output (mA)
1	$V_{test\ input}$ = 24 V DC between terminals 10+, 11-	■ DTS output (terminals 5, 6): OL (overload) ■ ETS output (terminals 2, 3): shows 0 Ω ■ Red LED TST1 is flashing.
2	$V_{test\ input}$ = 24 V DC between terminals 11-, 12+	■ DTS output (terminals 5, 6): OL (overload) ■ ETS output (terminals 2, 3): shows 0 Ω ■ Red LED TST2 is flashing.
3	$V_{test\ input}$ = 24 V DC between terminals 10+, 11- and between terminals 11-, 12+	■ DTS output (terminals 5, 6): shows 0 Ω ■ ETS output (terminals 2, 3): shows 0 Ω ■ Both red LEDs are flashing.
4	$V_{test\ input}$ = 0 V DC between terminals 10+, 11- and between terminals 11-, 12+	■ DTS output (terminals 5, 6): OL (overload) ■ ETS output (terminals 2, 3): OL (overload) ■ Both red LEDs are off.
5	V_{input} = 24 V DC between terminals 7+ and 8- and with changed input polarity between terminals 7-, 8+	■ DTS output (terminals 5, 6): shows 0 Ω ■ ETS output (terminals 2, 3): shows 0 Ω ■ Yellow LED is on.

exida® CERTIFICATION

CERTIFICATE

P+F 100397R1C P0006 C04.2

exida Certification S.A. hereby confirms that the

Relay Module KFD0-RSH-1.4S.PS2

Product Version: 05-6166

Pepperl+Fuchs GmbH

Mannheim, Germany

Has been assessed per the relevant requirements of

IEC 61508:2000

Parts 1 - 2, and meets requirements providing a level of integrity to

Systematic Integrity : SIL 3 Capable

Random Integrity : SIL 3 Capable

Safety function

The Relay Module KFD0-RSH-1.4S.PS2 shall provide the following two Type A safety functions for applications in low or high demand mode of operation:

1. DTS - De-energize To trip (Safe) the relay output when the input is de-energized..
2. ETS - Energize To activate (Safe) the relay output when the input is energized.

Application Restrictions

The unit must be properly designed and validated in a Safety Instrumented Function per the requirements in the Safety Manual.

Systematic Integrity: SIL 3 Capable

SIL 3 Capability

The product has met manufacturer design process requirements of Safety Integrity Level (SIL) 3. These are intended to achieve sufficient integrity against systematic errors of design by the manufacturer. A Safety Instrumented Function (SIF) designed with this product must not be used at a SIL level higher than the statement.

Random Integrity: SIL 3 Capable

Summary for KFD0-RSH-1.4S.PS2
Type A device,
IEC 61508 failure rates:

Failure category	DTS	ETS
Fail Safe (λ_{SAFE})	144.77	139.5
Fail Dangerous Detected (λ_{DD})	0	0
Fail Dangerous Undetected (λ_{DU})	1.83	7.1
Total failure rate (safety function)	146.6	146.6
SFF	98.7 %	95.2 %

All failure rates are given in FIT=10^{-9}/h

SIL Verification:

The Safety Integrity Level (SIL) of an entire Safety Instrumented Function (SIF) must be verified via a calculation of PFD_{AVG} / PFH considering the architecture, proof test interval, proof test effectiveness, any automatic diagnostics, average repair time and the specific failure rates of all products included in the SIF. Each subsystem must be checked to assure compliance with minimum hardware fault tolerance (HFT) requirements.

1 Introduction

1.1 General

The purpose of this document is to define the methods and documentation that will be used to carry out the Factory Acceptance Test (FAT) on YOKOGAWA's PCS, SIS , FGS and SCADA. The FAT is performed to ensure that the system is properly configured, assembled and functional in accordance with the intended design as specified in the approved documents.

The objective of FAT is to demonstrate to CROSSWIND that the system hardware and software is built in accordance to requirements as specified in the approved documents.

Crosswind and Rosetti Marino would witness to verify the test. Upon successful completion of the test, a FAT Test Certificate and Shipping Release Notice would be signed by both YOKOGAWA as MAC and Crosswind /Rosetti Marino to signify the acceptance of the test and approval of shipment of the equipment.

1.2 Scope and Objective

The Factory Acceptance Test referred to as FAT applies to the PCS, SIS , FGS and SCADA Hardware and Software supplied by Yokogawa.

The objective of the FAT is to verify the conformance of the system against the approved specifications and FAT procedure before delivery to site. The FAT shall be conducted to test and verify the main items listed below:

- System Hardware
- Network and Communication Tests
- Cabinets (system, network, server)
- Other Hardware (KVM, etc..)

2 Reference Documents

2.1 Input Documents

The PCS, SIS and F&G systems are configured using input documents such as IO Database, P&IDs, Cause & Effect Diagrams, F&G Layouts, Process Control Narratives, etc. These input documents shall be used as reference documents for FAT. These documents are listed in Appendix 8.3 – Approved Document List.

Copyright © Yokogawa Electric Corporation

2.2 Codes, Standards and References

[1] IEC 60529: Specification for Degrees of protection provided by enclosures (IP Code)

[2] IEC 61000: Electromagnetic Compatibility of Industrial - Process Measurement and Control Equipment

[3] IEEE 802.3: Information Processing Systems – Local Area Networks

[4] IEC 61508 Functional Safety of Electrical/Electronic/Programmable Electronic Safety – Related Systems

[5] IEC 61511 Functional Safety- Safety instrumented systems for the process industry sector

2.5 Approved Document List (Detail Design Specification)

The Detail Design Specification used for construction shall be listed in this approved document list, and shall be used as reference in the FAT. In principle, the Detail Design Specification documents as included in this list shall form the basis for checking the PCS, SIS, FGS and SCADA system. The approved Detail Design Specification document list used for construction is listed in Appendix-3.

Hold-1: Appendix-8.3 To be provided during the project execution phase.

3 Definitions and Abbreviations

PROJECT:	HOLLANDSE KUST NOORD WIND PARK PROJECT
CONTRACTOR (CTR):	ROSETTI MARINO S.p.A.
COMPANY or Client (CPY):	CROSSWIND

4 Responsibility

Responsibilities for each party involved in the FAT are defined here-under to ensure that the FAT is carried out in accordance with an agreed procedure. It also ensures that there shall be authorized personnel(s) from CROSSWIND, ROSETTI MARINO and YOKOGAWA to facilitate any decisions and schedule changes resulted from the FAT.

4.1 CROSSWIND

The full participation of CROSSWIND in the FAT is essential. CROSSWIND shall appoint an Inspector cum Test Approver to witness the FAT. The Test Approver would have the authority to sign-off upon the successful completion of all tests. Once signed off, the test will be deemed accepted and the decision will be final. The Inspector shall participate in the test and observe the test results on a daily basis. The Test Approver shall approve the inspection items based on the approved specification and the test results recorded.

4.2 ROSETTI MARINO

ROSETTI MARINO shall appoint a FAT Manager for the FAT. The FAT Manager representing ROSETTI MARINO shall co-ordinate with CROSSWIND and YOKOGAWA FAT Managers and to facilitate the smooth implementation of the FAT activities and schedule. The role of the FAT Manager is also to resolve FAT issues on a regular basis.

ROSETTI MARINO representatives will participate in the FAT for the complex controls, sequences and logics. For PCS controlled equipment packages containing complex controls, sequences and logics, ROSETTI MARINO at their discretion, may invite their package equipment supplier representatives to participate in the testing.

4.3 MAC

YOKOGAWA as MAC shall appoint a Test Conductor to organize and manage all aspects of the FAT. YOKOGAWA shall carry out the testing and record the test results on a daily basis together with CROSSWIND Inspector and ROSETTI MARINO representative.

The Project Manager representing YOKOGAWA shall be the FAT Manager. The FAT Manager shall co-ordinate with ROSETTI MARINO's FAT Manager and shall amend the test schedule whenever necessary to ensure the smooth running of the FAT. The FAT Manager shall also ensure that all tests are conducted in accordance with the approved FAT documents. If changes/modifications are required in the implementation, the FAT Managers of Yokogawa and ROSETTI MARINO shall discuss and arrive at the action plan.

Copyright © Yokogawa Electric Corporation

5 General Administration

5.1 FAT Venue

All the PCS, SIS and FGS equipment's will be staged at YOKOGAWA Sub-contractor Staging area, equipped with all needs for FAT (Tools, Instruments, power supply, grounding connections, etc):

PREI srl

Via Pascoli, 150

22040 Alzate Brianza – COMO (Italy)

5.2 FAT Organization Chart

A specific detailed Organization Chart shall be issued for each project, with all positions and names filled in. In addition, a FAT roster of the participants shall be issued, with following details for each person; full name, company, responsibility, samples of the signature and initials, actual start and finish date of participation in the FAT. The FAT Managers (one from RM and one from Yokogawa) will be responsible for maintaining the roster and keeping it updated.

Refer to Appendix-1 for FAT organization chart and FAT roster.

5.3 Kick-off Meeting

An initial kick-off meeting will be held prior to starting the FAT to brief the participants, confirm the organization and responsibilities, and review the FAT schedule. At the same time, HSE briefing for all participants will be provided by YOKOGAWA. YOKOGAWA FAT Manager will prepare the presentation and explain the organization and work practices. All FAT documentation prepared by YOKOGAWA prior to FAT will be inspected for completeness.

5.4 Daily Working Schedule

The FAT will be conducted in YOKOGAWA premises from Monday to Friday (working days).

The following timing is recommended for the testing:

0915 to 1200 hrs	Inspection and test
1200 to 1300 hrs	Lunch
1300 to 1700 hrs	Inspection and test
1700 to 1730 hrs	Daily review meeting including next day's schedule planning

Table 2 – Daily Working Time

Copyright © Yokogawa Electric Corporation

5.5 Daily Review Meeting

YOKOGAWA FAT Manager shall conduct a daily review meeting at the end of each FAT day. The meeting will involve all the parties taking part in the FAT. The purpose of this review meeting is to update all parties the progress and status of the FAT.

The punch list will be reviewed during the daily meeting and the action to be taken will be discussed and finalized. If the recovery work involved is minor (identified in the daily meeting) and agreed by all parties, the work will be carried out on the same day and will be verified the following day by all the concerned parties and signed off in the punch list. If the recovery work involves major change/modification, The FAT Manager will advise the schedule for retesting.

Refer to section 6.4 for details in punch record.

The FAT Manager should also ensure that PCS Engineers make a backup of the application program to an external storage every day after the daily review meeting, so that old backups can be retrieved, if necessary.

5.6 Weekly Progress Meeting

YOKOGAWA FAT Managers shall conduct weekly progress meeting every Friday. The purpose of the weekly meeting is to report the progress of the FAT in the same week and planned activity the following week. It shall also be the forum for resolving any issue arises from punch list.

In the weekly progress meeting, The FAT Manager will present detailed weekly progress report, containing details of activities and achievements for the week, plan for the next week, area of concern, list of punches raised (solved and open) and detailed formal overall progress assessment. The format and content details of the weekly progress report and the underlining planning, progress monitoring and measurement methodology shall be in accordance with the FAT planning, Progress Monitoring Report. After the joint review in the weekly progress meeting and any necessary amendments, The FAT Manager will issue the weekly progress report.

All FAT roster will be invited to the meeting.

5.7 FAT Wrap-up Meeting

At the completion of the FAT, a final wrap-up meeting will be held. The overall status of the FAT shall be reported. Upon all parties' agreement that the FAT is completed satisfactorily, the FAT Completion Certificate and Shipping Release Notes shall be signed off by CROSSWIND/ROSETTI MARINO.

Copyright © Yokogawa Electric Corporation

5.8 Integrated Factory Acceptance Test (IFAT)

Upon completion of Hardware FAT, the testing moves to the next stage, the Integrated Factory Acceptance Test that will be part of Software FAT. At this stage, integrity of infrastructures or interfaces that are shared by multiple systems, components and/or applications within the scope of Yokogawa will be demonstrated. 3rd party sub-systems I/O mapping will be simulated using existing options in YOKOGAWA system/Tools for HMI and control functions. No dedicated IFAT shall be conducted, 3rd party Sub-systems connected with CI Server shall be simulated and demonstrated as a part of Software FAT.

Copyright © Yokogawa Electric Corporation

6 FAT Report Documentation

The Factory Acceptance Test (FAT) shall be conducted in accordance with the test procedures detailed in this document. The test results shall be recorded in the check sheet. To prevent from any check sheet getting lost, each Check sheet shall be given a unique reference number.

6.1 FAT Documentation

All FAT documentation shall be prepared by YOKOGAWA prior to the start of the FAT. All forms, check sheets, sign-off sheets, drawings, etc. as listed in this procedure shall be organized in indexed binders. A master index for the FAT will be provided and maintained by YOKOGAWA FAT Manager.

The documentation for hardware checks shall include all relevant documents for each individual cabinet in a separate indexed binder or a binder section. This shall include Internal hardware check and test records performed during internal Factory Hardware Test.

The documentation for software checks shall be organized by individual process units in indexed binders. The documentation for graphics checks shall also be organized, separately by individual process units in indexed binders.

All FAT reference documents (latest issue) as listed in this procedure originated by other parties (CROSSWIND, ROSETTI MARINO), which were issued formally to YOKOGAWA will form a part of the FAT documentation and shall be printed out, and organized in indexed binders by YOKOGAWA.

All FAT reference documents as mentioned above shall be stamped "FAT MASTER" on every page/sheet. Any additional documents that may be necessary and generated later during FAT shall also be stamped, and indexes amended accordingly.

The structure of the FAT folders and typical indices shall be defined by YOKOGAWA, issued for approval and included in the Appendix-8.3.

6.2 Internal Test/Pre-FAT

Prior to the FAT, YOKOGAWA shall conduct internal test (Pre-FAT) to verify the system and application software. The internal test shall be based on the approved FAT procedure and covers the complete system functionality check, hardware healthiness check and 100% I/O check of marshalled cross-wirings.

The internal test result will be recorded and documented. CROSSWIND/ROSETTI MARINO may review/reference the test records of these internal tests before or during the FAT.

Copyright © Yokogawa Electric Corporation

Complex control loops, specialized sequential controls and batch control applications shall also be completely tested during Pre-FAT. The result of the test shall be recorded and made available for reference before or during FAT.

As a part of the pre-FAT, the project team consisting of application engineers from YOKOGAWA, ROSETTI MARINO and CROSSWIND conduct electronic (paper) check using the PCS tag/tuning report generated from the system. During this paper check pre-FAT, ROSETTI MARINO/ CROSSWIND will verify the configuration parameters by using engineering documents. This will enable the FAT crew to concentrate on the control functions and Graphic functionality during the actual FAT and will also help in reducing the duration of the FAT.

Refer to PCS application software sections for detail procedure on paper check.

It is also preferred that CROSSWIND and ROSETTI MARINO representatives participate in the pre-FAT for complex controls, sequences and logics checks, especially in projects that has multiple equipments with identical control strategy, to facilitate smooth execution of the FAT.

6.3 Method of Testing

Detailed test procedure for each test item is described in this document. Check sheet shall be provided, listing the equipment to be tested. All test results shall be recorded in the Check sheets. The following color codes shall be used in the testing:

a) Yellow marker – Items that were checked and cleared

b) Pink marker – Items that were having problems.

c) Green marker – Items that were checked after completion of recovery.

The color marking will be used on the print-outs of the control drawings, graphics and supporting design documents such as P&IDs, narratives, etc.

For PCS Hardware, 10% I/O check shall be done for conventional I/O (including HART) using signal injector.

The internal test records will be inspected prior to FAT. In the event that the records are deficient, retest will be performed.

PCS, SIS and FGS Software Function Test will be conducted using Test Function tool, without connection to any physical I/O. Test Function will be used to simulate process input, digital signal and alarms to FCS so that typical loops, logic sequence blocks can be tested without connecting to physical input and output devices. Dynamic graphics check shall be a part of the PCS, SIS and FGS Software function test.

Copyright © Yokogawa Electric Corporation

6.4 Punch Record

All shortcomings found during the test shall be noted in the FAT Punch Record (Appendix-8.9). Each punch Record shall cover one punch item/fault. A Punch Record Ledger shall be used to summarize all the punch records.

Punch record items shall be classified as follows:

M = Modification, item is to be modified, deleted, added due to design input changes.

C = Correction, item is to be corrected by YOKOGAWA.

If the recovery work involves change/modification, it is to be recorded on the punch record and the recovery undertaken as soon as possible after the agreement of both the FAT Managers after signing of the punch record. YOKOGAWA shall clear all correction items (Code C) at factory before shipment, informing RM and CW for each solved items. For recovery work that involves modification (Code M), it will be regularly jointly reviewed by all parties involved in FAT, on at least weekly basis and resolved whether to be implemented during FAT or later, depending on complexity and potential schedule and/or cost impact. After verification, the same will be signed off by all concerned parties in the punch record.

The punch record will be reviewed during the daily meeting and the action to be taken will be discussed and finalized. If the modification request were deemed deviated from the original design, it would be considered as change order.

6.5 FAT Completion Certificate & Shipping Release Note

Upon completion of the FAT, FAT Completion Certificate and Shipping Release Note will be signed by CROSSWIND, ROSETTI MARINO and YOKOGAWA. The purpose of these two documents is to certify that the FAT has been completed and accepted by CROSSWIND. Both CROSSWIND and YOKOGAWA agree that the system is in order and can be released for shipment to site. However, if the tested system is to be shipped out in partial, CROSSWIND/ROSETTI MARINO shall advise and issue the Shipping Release Note accordingly. Refer to Appendix-8.10 for a FAT Completion Certificate and to Appendix-8.11 for a Shipping Release Note.

Note: Once the FAT completion certificate and Shipping release note signatures are in place, no internal cabinet wiring, labeling, reconfiguration, or hardware swap outs shall be carried out unless the signatory parties are notified in advance and given an opportunity to inspect any recommended changes.

Copyright © Yokogawa Electric Corporation

6.6 Test Equipment

YOKOGAWA will provide all test equipments (e.g. Digital Multimeter, Signal Generators etc.) for the FAT. The details of the test equipment for FAT with certification (if necessary) shall be provided using format attached in Appendix-8.4.

Copyright © Yokogawa Electric Corporation

7 Testing Description for Hardware

7.1 General Hardware Check – Earthing Check (valid for all cabinets)

Outline	The Earthing connections shall be verified in all the System/Marshalling cabinets and Network/Server.
Objective	Verify that all Earthing connections are wired as per the specification.
Reference	SIS/FGS, EMCS and PCS System/Marshalling Cabinet GA/IA Drawing Refer Appendix 8.3 - Approved Document List
Procedure	This test shall be carried out using a Multimeter or Ohm-meter to confirm the continuity of the following: a. P.E. – Protection earth • To verify continuity between the earth and all part of the cabinet including instrument chassis. b. IE - Instrument Earth • To verify continuity between the instrument earth bar connection and instrument cable screens. c. I.S.E. – Intrinsically Safe Earth (if present) • To verify continuity between the instrument safe earth bar connection and instrument safe cable screens. The test can be considered acceptable if the resistance measured is < 1 Ohm. Also using a Multimeter or Ohm-meter the P.E., I.E. and I.S.E. earth bars are to be confirmed isolated from each other. I.E. and I.S.E. bars must be isolated from the external cabinet chassis. The test can be considered acceptable if the resistance measured is > 10 MOhm.
Test Record Reference	- GA/IA Drawings - Refer Appendix 8.5 – FAT Check sheet

TEST RESULT: PASS / FAIL

7.2 PCS Physical Hardware Check

7.2.1 PCS System/Marshalling Appearance, Construction and Wiring Check

Outline	All the System/Marshalling cabinets and installed components are to be checked and verified for their appearance and construction.
Objective	- Verify that all the cabinets are manufactured as per the specification. - Verify that all the components and accessories installed in the cabinets are manufactured as per the specification. - Verify cabinet high temperature alarm. - Verify proper functioning of the redundant power supply units. This test ensures that the interface board functions properly upon Power up.
Reference	- Bill of Material - PCS System/Marshalling Cabinet GA/IA Drawing Refer Appendix 8.3 - Approved Document List
Procedure	Visually check that all the SYSTEM/MARSHALLING CABINET are as per the GA/IA drawings. Check items as follows: 1. General Cabinet Construction – lifting construction, Plinth, cabinet color and side panel (if applicable). - enclosure damages (scratches, dents) - cleaning and absence of burning marks or other residue - connection tightness (spot-on pull test) - labeling of devices and cables - IP rating - wiring separation (different voltage levels as per specs) 2. Layout – components layout on the front, rear and sides of cabinet. • FCU – mounting and termination. • ESB Node Unit – I/O module quantity. • Power Supply Unit (PSU) rating. 3. Interface Boards – mounting, termination, installed spare and space for spare. 4. Doors – handle, lock with key and document pocket. 5. Labeling – cabinet, terminals, devices, earth bars, attention symbols and cable marker.

Copyright © Yokogawa Electric Corporation

	6. Earthing – bolt types, location, wiring type, screen terminals, grounding of devices and doors. 7. Cable handling – routing, trays/duct, clamp rails and termination. • Control Bus (Vnet/IP) • ESB Bus, Optical ESB Bus • System cables • Field cables from junction boxes 8. Signal termination • Terminal – terminal and wiring types, installed spare and space for spare. 9. Power distribution – isolator and circuit breakers rating, fused terminal types and wiring sizes. 10. Others: Fans, thermostat and if applicable, utility socket. Temperature Alarm Check 11. Note Thermostat setting in the cabinet. Check that the contact at the terminal is closed circuit. 12. Set the Temperature setting of thermostat to a lower setting (e.g. 18 DegC). 13. Check that the contact is now open. Verify alarm at the OWS. 14. Recover the alarm by setting the temperature setting back to above room temperature. Power Supply Check 15. Take measurement of voltage output from PSU individually. The voltage should be 24 ~ 26VDC. 16. Measure voltage output from PSU02 and switch "OFF" circuit breaker for PSU01. 17. The voltage measured at PSU02 output should remain within the voltage limit (24 ~ 26VDC). Verify PSU fail alarm at the OWS. 18. Measure and record the DC voltage ripple with an oscilloscope. 19. Recover PSU01. Verify PSU alarm recovery at the OWS. 20. Repeat test for PSU01 by switching "OFF" PSU02. Functional Check (for all equipments) 21. Switch on the 24VDC power supply to the interface board one-by-one. 22. Observe the LED indication on the interface board.

Copyright © Yokogawa Electric Corporation

	23. Check that the contact is now returned to closed position. Verify alarm recovery at the OWS.
Criteria	The quantity, type and location of all the cabinets and installed components should match the Bill of Material, GA/IA Drawings and I/O Assignment without any scratches and deformations.
Test Record Reference	- GA/IA Drawings - Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted for all Field Control Station cabinets and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

YOKOGAWA Representative : _____ Date: _____

ROSETTI MARINO Representative : _____ Date: _____

CROSSWIND Representative : _____ Date: _____

7.2.2 Field Control Station (FCS) Module Assignment Check

Outline	All ESB Bus Node Units, I/O Modules (for FIO), ESB Bus Coupler Modules and ESB Bus Repeater Modules are assigned according to the I/O assignments. The position and quantity of these items in the Field Control Station and expansion cabinets shall be verified.
Objective	- Verify that all the ESB Bus Node Units, I/O Modules (for FIO) and ESB Bus Coupler Modules and ESB Bus Repeater Modules are correctly supplied and installed.
Reference	- I/O Assignment Documents Refer to Approved Document List
Procedure	Visually check that all ESB Bus Node Units, I/O Modules (for FIO), ESB Bus Coupler Modules and ESB Bus Repeater Modules are installed in each of the Field Control Stations according to the PCS I/O Assignments for various areas as per reference documents.
Criteria	The quantity, type and location of all ESB Bus Node Units, I/O Modules (for FIO), ESB Bus Coupler Modules and ESB Bus Repeater Modules including the spares must match the approved I/O Assignment documents.
Test Record Reference	- I/O Assignment Documents

The above checks are conducted for all Field Control Stations and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.2.3 PCS System Architecture and BOM Check

Outline	The PCS System is configured as per System Architecture Drawing and the associated BOM is derived accordingly.
Objective	- Verify that the PCS System staged for testing is as per the System Architecture Drawing and corresponding BOM.
Reference	- System Architecture Drawing - BOM Refer to Approved Document List
Procedure	1. Visually check that all the PCS components are staged as per System Architecture. 2. Verify the BOM. • PCS Hardware • PCS Software
Criteria	The quantity and model of the components should match the BOM.

The above checks are conducted for all PCS equipments and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.2.4 PCS System Cables Check

Outline	The PCS System cables are supplied as per the PCS System Cable Schedule document. The supplied cables are to be physically checked.
Objective	- Verify that the PCS System cables are supplied and installed as per the System Cable Schedule document.
Reference	- PCS System Cable Schedule Refer to Approved Document List
Procedure	1. Visually check that all the PCS System Cables are supplied and installed as per the System Cable Schedule. The following shall be checked: • Cable Model • Length • Cable markers
Criteria	The Cable model, length and markers shall be as per the PCS System Cable Schedule.

The above checks are conducted for all PCS System Cables and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.3 PCS Standard System Function Check

7.3.1 System Start-up Test (FCS and EWS/OWS)

Outline	Field Control Stations (FCS) and Operator Work Stations (OWS) go to the operating state automatically upon powering up, provided that all application software and image are properly loaded in the system.
Objective	- Verify that the above components automatically boot up when going from 'stop' state to 'operating' state.
Reference	- System Architecture Drawing Refer to Approved Document List - CENTUM VP Instruction Manual
Procedure	1. Power down components individually or for the whole system. 2. Power up each component individually and observe its boot up sequence. 3. Check station status from EWS0164 System Maintenance panel when each station boots up. Note: For each FCS, verify the random IO state and tuning data prior to power down. After power up, verify that the FCS initializes the application program as desired and retains the tuning data.
Criteria	1. Each component must boot up automatically. 2. Station status indication on HIS(EWS0164) System Maintenance panel should change from red to green.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted on random basis for selected FCS/HIS(EWS0164) and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.3.2 FCS CPU Backup Function Test

Outline	The two CPUs in the FCS back up each other. During operation, one CPU is active while the other CPU is on hot standby. The standby CPU is updated at every memory write-cycle.
Objective	- Verify that FCS operation is uninterrupted when the active CPU fails and the standby CPU takes over.
Reference	- CENTUM VP Instruction Manual
Procedure	1. Display a tuning panel of a selected PID tag (from related FCS) And change the output value (MV) to view tuning trend. 2. Display FCS station status panel (system maintenance panel) on OWS. 3. Stop the active CPU by using the 'Start/Stop' button on the front panel from FCS. 4. Check the system alarm messages at the OWS. 5. Check the tuning panel data for the selected tag to confirm FCS control functions are normal. 6. Check the actual output at the I/O module. 7. Start the CPU by using the 'Start/Stop' button on the front panel from FCS 8. Wait for the copy to finish. 9. Repeat the test for other CPU module.
Criteria	1. FCS control functions should be unaffected. 2. All data in the related FCS should be unaffected. 3. All control loops continue to perform normally. 4. FCS run status remains unaffected as observed at HIS (EWS0164) System Maintenance panel. 5. The output of I/O module will remain unaffected.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

Copyright © Yokogawa Electric Corporation

The above checks are conducted on random basis for selected FCS and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.3.3 FCS ESB Bus Redundancy Test

Outline	1. The ESB Bus that facilitates data communication between FCU and each of the ESB Bus Node Unit is dual redundant. 2. The ESB Bus Coupler module (EC401 or EC402 in FCU) and ESB Bus Interface Slave module (SB401 in Local ESB Bus Node Unit) facilitate data communication between the FCU and each local ESB Bus Node Unit. The following operations apply : - Normally, redundant ESB Buses are used in an alternating fashion. - If an error occurs in a ESB Bus module on one side, the error is notified to the user via a diagnostic information message. If both interface modules fail, the error is treated as a node failure. - If an error occurs in one ESB Bus or ESB Bus module, the FCU continues communication using the other normal ESB Bus. - An erroneous ESB Bus is monitored for recovery at regular intervals.
Objective	- Verify that FCS operation is uninterrupted when one ESB Bus module fails and the other interface module takes over.
Reference	- CENTUM VP Instruction Manual
Procedure	1. Disable one of the EC401 or EC402 (ESB Bus Coupler module) by removing it from the FCU. 2. Check the system alarm messages at the OWS. 3. Check the FCS control functions are normal. 4. Revive the ESB Bus to normal condition. 5. Repeat the test for the other ESB Bus Coupler module. 6. Disable one of the SB401 (ESB Bus Interface Slave module) by removing it from the node. 7. Check the system alarm messages at the OWS. 8. Check the FCS control functions are normal. 9. Revive the ESB Bus to normal condition. 10. Repeat the test for the other SB401. 11. If necessary, repeat the above procedures for the pair of Optical ESB Bus Repeater modules.
Criteria	1. Operation shall not be affected when either one of the ESB Bus fails. 2. The FCS control function should not be interrupted.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

Copyright © Yokogawa Electric Corporation

Note	- EC40x is installed in FCU - SB401 is installed in Local ESB Bus Node Unit

The above checks are conducted on random basis for selected FCS and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.3.4 FCU/Node Unit Power Supply Module Redundancy Test

Outline	The dual redundant power supply modules on the Field Control Unit and the ESB Node Unit supply power to the respective nodes.
Objective	- Verify the redundant functionality of the power supply modules.
Reference	- CENTUM VP Instruction Manual
Procedure	1. Wire up one control loop, output to input, to make a closed loop. (*Recommendation is to use long jumper yellow wire that can be easily identified)* 2. Display the tuning panel for this tag to observe the control action. 3. Put the loop in "AUTO" mode. 4. Change the set point and observe the control action of the controller. 5. Remove the power to the FCU power supply module by removing the power from UPS power source. 6. Check the system alarm messages at the OWS. 7. Check the control action of the test controller at the OWS, to confirm FCS control functions are normal during removal of power supply. 8. Revive the Power supply module to normal operation condition. 9. Repeat for the other FCU power supply module by removing the power from UPS power source. 10. Repeat the test for ESB Node Unit power supply modules.
Criteria	1. The FCS should be unaffected by the failure of any one power supply module. 2. FCS control functions should remain unaffected. 3. STATUS LED on each I/O module should remain ON.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet
Note	Power Supply Unit for CPU Node/ESB Node Unit - PW482 (220-240V AC)

7.3.5 I/O Module Redundancy Test (for FIO)

Outline	The PCS I/O modules are configured as redundant depending on the project requirement. Typically, all I/O related to control points are assigned to redundant modules and I/O related to Indication only are assigned to non-redundant modules. In an FCS for FIO, it is possible to mount input/output modules of the same type in two adjacent slots to make them redundant. In the case of redundant configuration, one side becomes the control side and the other becomes the standby side. Switching of the control right is performed by input/output modules. The switching has no influence on the application program.
Objective	- Verify the redundant functionality of the redundant modules.
Reference	- PCS I/O Assignment Refer to Approved Document List - CENTUM VP Instruction Manual
Procedure	1. Wire up one control loop (input and output) device to the I/O module and setup the controller to be in AUTO mode and normal operation. 2. Remove one of the redundant modules from the FCU or ESB Bus Node Unit. 3. Check the system alarm messages at the OWS. 4. Check that the status of the controller on the OWS is maintained. 5. Install back the removed I/O module. 6. Check the I/O module recovery messages at the OWS. 7. Repeat the test by removing the other redundant module.
Criteria	1. The FCS should be unaffected by the failure of one of the redundant modules. 2. FCS control functions should remain unaffected.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

Copyright © Yokogawa Electric Corporation

The above checks are conducted on random basis for selected pair of I/O modules in each FCS and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.3.6 Vnet/IP Bus Redundancy Test

Outline	The Vnet/IP bus is the communication channel for communication between the HIS(EWS0164) and the FCS. The Vnet/IP bus is dual redundant. This test will be carried out for the PCS system that is set up as per system configuration.
Objective	- Verify the redundant functionality of the system communication network Vnet/IP bus.
Reference	- CENTUM VP Instruction Manual
Procedure	For FCS: 1. For FCS CPU-1: Remove the cable that is connected to Bus-1. 2. Check the system alarm messages at the OWS. 3. Observe whether there is any break in trend gathering for any signal. 4. Re-connect the cable and check that the Bus-1 is healthy. 5. Repeat the above tests for CPU-1 Bus-2 and for CPU-2 Bus-1/2. For HIS(EWS0164): 1. For HIS(EWS0164): Remove the cable that is connected to Bus-1. 2. Check the system alarm message at the OWS. 3. Observe whether there is any break in trend gathering for any signal. 4. Re-connect the cable and check that the Bus-1 is healthy 5. Repeat the above for Bus-2. For Layer2 switch: 1. Fail one of the L2 switches that is connected on Vnet/IP Bus-1. 2. Check the system alarm messages at the OWS. 3. Observe whether there is any break in trend gathering for any signal. 4. Power back the L2 switch and check that the switch and the connected Vnet/IP network are healthy. 5. If applicable, repeat the test for the other L2 switch that is connected to Vnet/IP Bus-1. 6. Repeat the test for the L2 switch connected on Vnet/IP Bus-2.
Criteria	1. The HIS(EWS0164) should be able to monitor and operate loops in the FCS without interruption even on a single Vnet/IP bus. 2. System alarm messages should be correctly displayed. 3. There should not be any break in trend gathering for any of the signals.

Copyright © Yokogawa Electric Corporation

Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted on random basis for selected FCS/HIS/L2SW and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.3.7 FCS Resource Capacity Check

Outline	FCS Resources refers to the FCS memory usage. Sufficient spare capacity for future expansion should be available at each FCS. The Field Control Station resource usage depends on the application software configured in that particular FCS.
Objective	- Verify that overall FCS resource capacity is sufficient. This result can be used as a reference while checking the FCS memory usage at the completion of commissioning.
Reference	- PCS Technical Specification - PCS FDS Software Refer to Approved Document List
Procedure	1. The check will be carried out for the related FCS. 2. Call up the FCS resources information panel at the engineering station. 3. Confirm the FCS resources consumed and the remaining resources available at the related FCS.
Criteria	The overall FCS resources consumed should meet project requirement.
Test Record Reference	- The printout from the system for each FCS resources. - Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted for all FCS and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.3.8 FCS CPU Loading Check

Outline	The loading of the CPU of the Field Control Station depends on the application software configured in the FCS and communication loads with other devices (HIS/FCS/OPC). CPU loading of the FCS is an important factor for deciding the system performance.
Objective	- Record the loading of the CPU of the FCS at the completion of FAT. This result can be used as a reference while checking the FCS CPU idle time at the completion of commissioning.
Reference	- PCS Technical Specification - FDS Software Refer to Approved Document List
Procedure	1. Select an FCS for which the CPU load needs to be verified. 2. On each of the HIS, belonging to that FCS operation group, call up 4 Graphic windows (no screens configured in EWS0164 so Not Applicable), a faceplate or a tuning window. The selected Graphic windows should predominantly have tags from the selected FCS for which the CPU load is being measured. 3. Call up the status display of the FCS, for which the CPU idle time is being measured and note down the displayed CPU idle time 4. Printout a hardcopy of the FCS status display for records.
Criteria	The CPU idle time shown on the System Maintenance panel for each FCS should meet project requirement.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted for all FCS and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.3.9 FCS Online/Offline Loading Test

Outline	During the course of plant operation, it may become necessary to modify certain tag definitions, parameters, loop configurations, sequence tables, etc. There are two types of loading procedures. These are: • On-line loading • Off-line loading (save tuning parameters) Modifications made at the engineering station followed subsequently by on-line loading to the FCS have no effect on FCS operation. The modifications become effective on completion of the loading procedure. Modifications made at the engineering station followed subsequently by off-line loading to the FCS will cause the FCS to go off-line for the duration of the loading procedure. The modifications become effective on completion of the loading procedure, and the FCS returns to normal on-line status.
Objective	- Verify FCS on-line and off-line loading function
Reference	- CENTUM VP Instruction Manual
Procedure (On-line)	1. Modify any of the parameters permitted for on-line loading. 2. Execute FCS on-line loading via engineering workstation. 3. Observe FCS trend, look for any effect to FCS operation during FCS on-line loading. 4. Confirm that the modified parameters are loaded and functioning properly. 5. Confirm that all the HIS(EWS0164) are equalized properly.
Criteria (On-line)	1. There should be no effect on FCS operation during FCS on-line loading. 2. The modified parameters should be loaded without any errors and the post download changes are reflected as desired.
Procedure (Off-line)	1. Modify any system parameters (e.g. FCS properties). 2. Change some tag tuning parameters (e.g. alarm setting) and the execute FCS off-line loading via engineering workstation. 3. When “Save tuning parameters of project” prompt appear, click “Yes” to save tuning parameters. 4. Observe FCS fail status from system panel during off-line loading. 5. Confirm that the modified FCS parameters are effectively loaded and functioning properly. 6. Verify the new alarm setting is retained, which confirms that the tuning parameters were successfully saved by the system. 7. Confirm that all the HIS(EWS0164) are equalized properly.

Copyright © Yokogawa Electric Corporation

Criteria (Off-line)	1. The modified FCS parameters should be effectively loaded and functioning properly. 2. The tuning parameters was successfully saved and loaded to the FCS.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted on selected FCS and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

YOKOGAWA Representative : _____ Date: _____

ROSETTI MARINO Representative : _____ Date: _____

7.3.10 Media Backup/Restore Function Test (VP Project)

Outline	The CENTUM VP EWS PC is equipped with backup storage device for application program backup onto backup storage/media.
Objective	- Verify that the backup storage/media will back-up/restore CENTUM VP project database.
Reference	- CENTUM VP Instruction Manual - Workstation/Server Instruction Manual
Procedure (Backup)	Backup the project application database in EWS PC to backup storage/media.
Criteria (Backup)	The project folder is copied onto the backup storage/media without interruption and any errors.
Procedure (Restore)	Restore the project application database backup files in the backup storage/media to EWS PC.
Criteria (Restore)	The project folder is restored back to the desired location in EWS PC without interruption and any errors.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted the CENTUM VP project folder and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.4 Other Cabinets

7.4.1 Server/Network Cabinet Check

Outline	The Server/Network Cabinet contains Rackmount Workstation/ Server PCs, KVM Console/Extender, FO converter, Switches and other Network components.
Objective	- Verify that the Server/Network Cabinet is manufactured as per the specification. - Verify cabinet high temperature alarm. - Verify functioning of redundant AC power source - Verify that FO Converters and all other Network components are functioning properly.
Reference	- Server/Network Cabinet GA/IA Drawing. - System Architecture Drawing Refer to Approved Document List
Procedure	A. Visual Check Visually check that the Server Cabinet is as per the GA/IA drawings. Check items as follows: 1. General Cabinet Construction – lifting construction, Plinth & Bakelite, cabinet color and side panel (if applicable). - enclosure damages (scratches, dents) - cleaning and absence of burning marks or other residue - connection tightness (spot-on pull test) - labeling of devices and cables - IP rating - wiring separation (different voltage levels as per specs) 2. Layout – components layout on the front, rear and sides of cabinet. • Rackmount Workstation/Server PCs • KVM Console/Extender • Network Components 3. Doors – handle, lock with key and document pocket. 4. Labeling – cabinet, terminals, devices, earth bars, attention symbols and cable marker.

Copyright © Yokogawa Electric Corporation

5. Earthing – bolt types, location, wiring type, screen terminals, grounding of devices and doors.
6. Cable handling – routing, trays/duct, clamp rails and termination.
   - System cables – Vnet, Vnet/IP, Ethernet etc.
   - Power supply cables.
7. Signal termination
   - Terminal – terminal and wiring types, installed spare and space for spare.
8. Power distribution – isolator and circuit breakers rating, power sockets/receptacles, fused terminal types and wiring sizes.
9. Others
   - For FO/Network – mounting and termination.
     - FO converter
     - Ethernet Switches.
     - L2/L3 switches
     - Fiber Optic Patch Panel

B. Power Supply Check

1. Remove UPS power source to Server Cabinet by turning off UPS feed circuit breaker.
2. Verify power supply 1 fail indication on all server PCs and other network components that is powered from UPS source.
3. Verify power supply fail on L2/L3 Switches that is powered from UPS source and check for appropriate messages at the OWS.
4. Turn ON the UPS feed circuit breaker; check the power supply recovery on Server PCs and L2/L3 switches.

   Repeat the test for Normal power source by turning ON & OFF the Normal feed circuit breaker.

C. Functional Check (for KVM Console/Extender)

1. KVM Console: Verify monitoring and operation of the selected workstation/server from KVM Console.
2. KVM Extender: Verify monitoring and operation of the KVM extended workstation/server from remote KVM via KVM Extender.

D. Functional Check (for Network)

1. Ethernet Switches

Copyright © Yokogawa Electric Corporation

	- Verify the Port connection is as per design, connection/speed LED is lit. - Execute "ping" command between two OWS connected to the Ethernet switches. a. Ethernet switch powered "ON": Normal reply from the OWS. b. Ethernet switch powered "OFF": Time out reply from OWS. If applicable, c. FO convertor powered "ON": Normal reply from the OWS. d. FO convertor powered "OFF": Time out reply from OWS. 2. L2 /L3 Switches (Vnet/IP) - Verify the Port connection is as per design, connection/speed LED is lit. - Disconnect each cable from port and verify system alarm and System Status Overview on EWS/OWS.
Criteria	Server PCs, L2/L3 switches, FO converter and all other network components should function properly.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted for all server/network cabinets and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

7.5 PCS I/O Check

7.5.1 PCS I/O Check Procedure

Outline	Functionality of All I/O modules installed in the Field Control Station. During internal test, 10% sample checks for selected I/O will be conducted without marshalled cross-wiring. With marshalled cross-wirings, 100% I/O tests are carried out and records for the same are maintained. During FAT, these records will be reviewed and 10% sample checks for selected I/O will be conducted. The I/O check is performed to verify circuit integrity within individual panels and also between panels. The I/O check is also performed to verify that the I/O is correctly assigned in the FCS.
Objective	- Verify Pre-FAT record to confirm all I/O modules are checked. - Perform random IO check (1 channel per module).
Reference	- I/O Assignment Documents Refer to Approved Document List
Procedure	1. Input signals to be simulated from terminals at MDF. 2. Output measurements to be taken from terminals at MDF. 3. Refer to procedure below.
Criteria	- For Analog Inputs: Reading should be within +/- 0.1 of scale*. - For Analog Outputs: Reading should be within +/- 0.3 of scale*. - For Digital Inputs: The correct faceplate indication to be checked on the OWS. - For Digital Outputs: The correct contact status/voltage to be checked at the MDF field terminals. Note*: Accuracy of Yokogawa I/O Modules at normal condition (23°C ± 2 °C)
Test Record Reference	- Pre-FAT Test Record (Internal I/O check test record) Refer Appendix 8.6 – I/O Check sheet (Check sheet are generated from master database to ensure that there is no I/O tags been left out).

Copyright © Yokogawa Electric Corporation

➢ Analog input (Conventional 4 to 20mA):

Simulate appropriate analog input signals to the PCS using the portable calibrator and record PCS reading displayed in the corresponding faceplate at the OWS.

For Analog Input points, 3 input signals shall be simulated:

- Signal 1 = 4.00mA, corresponding to 0% at OWS.
- Signal 2 = 12.00mA, corresponding to 50% at OWS.
- Signal 3 = 20.00mA, corresponding to100% at OWS.

The result shall be recorded in I/O Check sheet Appendix-7 Analog.

Note: If applicable, verify the FIO Analog IO module dip switch setting for all 4 wire transmitters. Instrument Index to provide the list of all field powered transmitters.

➢ Analog output:

From the faceplate at the OWS, set the output (MV) of the tag and measure the corresponding signal output at the output terminals using an ammeter. For Analog Output points, 3 output signals shall be set:

- Signal 1 = 0.1%, corresponding to 4mA at output terminals.
- Signal 2 = 50%, corresponding to 12mA at output terminals.
- Signal 3 = 99.9%, corresponding to 20mA at output terminals.

The result to be recorded in I/O Check sheet Appendix-7 Analog.

➢ Digital input:

Open or close the input point at the input terminals and record the PCS status indication for the corresponding tag faceplate at the OWS. For Digital Input points, 2 input states shall be simulated:

- Signal 1 = 0 or open contact input signal.
- Signal 2 = 1 or close contact input signal.

The result to be recorded in I/O Check sheet Appendix-7 Digital.

➢ Digital output:

Set or reset the PCS output point through the faceplate at the OWS and observe the status of the output point on the PCS IO module. The channel number shall be displayed on the PCS IO module when that channel is turned ON. For Digital Output points, 2 output states shall be set:

- Signal 1 = 0 or open contact output signal.
- Signal 2 = 1 or close contact output signal.

The result to be recorded in I/O Check sheet Appendix-7 Digital.

Copyright © Yokogawa Electric Corporation

Note: For non-Yokogawa terminal boards, verify the board jumper settings for each channel to ensure the channels are properly set for wet or dry contact depending on the application requirement. Instrument Index to provide the list of all PCS and field powered field devices.

The above checks are conducted for the randomly selected I/O (one channel per module).

TEST RESULT: PASS / FAIL

7.6 SIS & FGS Physical Hardware Check

7.6.1 System/Marshalling Cabinets Appearance, Construction & Wiring Check

Outline	All the System/Marshalling cabinets and installed components are to be checked and verified for their appearance and construction.
Objective	1. To verify that all the System and Marshalling cabinet are manufactured as per the specification. 2. To verify Cabinet high temperature alarm. 3. To verify the proper function of the redundant power supply units. 4. This test ensures that the interface boards function properly upon power up.
Reference	System and Marshalling cabinet GA/IA Drawing. - Refer Appendix 8.3 - Approved Document List
Procedure	A. Visual Check. (all cabinets) Visually check that all the Marshalling cabinet are as per the GA/IA drawings. Check items as follows: 1. General Cabinet Construction – lifting construction, Plinth & Insulation, cabinet color and side panel (if applicable). - enclosure damages (scratches, dents) - cleaning and absence of burning marks or other residue - connection tightness (spot-on pull test) - labeling of devices and cables - IP rating - wiring separation (different voltage levels as per specs) 2. Layout – components layout on the front, rear and sides of cabinet. • Power Supply Unit (PSU) rating. • Interface Boards – mounting, termination, installed spare and space for spare. • I.S./Proximity Switch interface board. 3. Doors – handle, lock with key and document pocket. 4. Labeling – cabinet, terminals, devices, earth bars, attention symbols and cable marker. 5. Earthing – bolt types, location, wiring type, screen terminals, grounding of devices and doors. 6. Cable handling – routing, trays/duct, clamp rails and termination. • System cable. • Field cables from junction boxes. • Power supply cables. 7. Signal termination.

Copyright © Yokogawa Electric Corporation

	• Terminal – terminal and wiring types, installed spare and space for spare. • Surge arrestor (if applicable) – termination, installed spare and space for spare. 8. Power distribution – isolator and circuit breakers rating, fused terminal types and wiring sizes. 9. Others: Fans, thermostat and if applicable, utility socket. B. Temperature Check (for all cabinets) 1. Note Thermostat setting in the cabinet. Check that the contact at the terminal is closed circuit. 2. Set the Temperature setting of thermostat to a lower setting (e.g. 18 ^{0}C). 3. Check that the contact is now open. 4. Recover the alarm by setting the temperature setting back to above room temperature. 5. Check that the contact is now returned to closed position. C. Power Supply and (if applicable) ELM Check 1. Take measurement of voltage output from PSU individually. The voltage should be 24 ~ 26VDC. 2. Measure voltage output from PSU02 and switch "OFF" circuit breaker for PSU01. 3. The voltage measured at PSU02 output should remain within the voltage limit (24 ~ 26VDC). 4. Measure and record the DC voltage ripple with an oscilloscope. 5. Recover PSU01. 6. Repeat test for PSU01 by switching "OFF" PSU02. 7. Reset ELM alarm if any. Ensure that the contact is closed. 8. Activate earth fault by using a jumper wire to short one of the field connection terminals to earth bar. 9. Check alarm status at ELM and verify open contact. 10. Remove the jumper wire and reset the ELM as necessary. 11. Ensure the alarm status at ELM and contact returns to close. D. Functional Check (for all equipment) 1. Switch on the 24VDC power supply to the interface board one-by-one. 2. Observe the LED indication on the interface board.
Criteria (Expected Results)	1. Quantity, type, Model and location match with the approved / final GA/IA Drawings 2. Cabinet temperature switch contact opens when thermostat is set to a lower setting

Copyright © Yokogawa Electric Corporation

	3. PSU voltages remain within the voltage limit (24 ~ 26VDC) in single operation. 4. ELM is activated on a simulated ground fault. (if ELM is applicable) 5. The LED indication on the respective interface board is lighted up, when 24V is applied.
Test Record Reference	GA/IA Drawings (Approved Document List) Refer Appendix 8.7 – FAT Check sheet

The above checks are conducted for all SCS Cabinets and witnessed by the following representatives:

TEST RESULT: PASS / FAIL

7.6.2 Safety Control Station (SCS) Nest Loading Check

Outline	All Safety I/O nodes and modules are assigned according to the I/O assignments. The position and quantity of these items in the Safety Control Station shall be verified.
Objective	To verify that all the Safety I/O nodes and modules are correctly supplied and installed.
Reference	I/O Assignment Documents Refer Appendix 8.3 - Approved Document List
Procedure	Visually check that all the Safety I/O nodes and modules are installed in each of the Safety Control Stations according to the I/O Assignments for various areas as per reference documents.
Criteria (Expected Result)	The quantity, type and location of all the Safety Control Units (SCU), Safety I/O nodes and modules including the spares must match the approved / Final I/O Assignment documents.
Test Record Reference	I/O Assignment Refer Appendix 8.7 – FAT Check sheet

The above checks are conducted for all Safety Control Stations and witnessed by the following representatives:

TEST RESULT: PASS / FAIL

7.6.3 EWS/SOE Workstation Check

Outline	The EWS/SOE PC is supplied in accordance with the Bill of Materials along with applicable system software licenses.
Objective	To verify the EWS/SOE PC is supplied in accordance with the approved Bill of Materials and installed with applicable system software licenses.
Reference	- Bill of Material - System Architecture Drawing - Software Licenses Refer Appendix 8.3 - Approved Document List
Procedure	Visually check that the EWS/SOE PC is as per the Reference documents and verify the following. • Domain and Station Number • Quantity, Model number, Make, Type, Revision • System software revisions • Installed System software • Installed Software Licenses
Criteria (Expected Results)	1. Domain and Station settings must match the Approved / Final System Architecture Drawing. 2. Installed software revision numbers must be as per the Approved / Final BOM. 3. Installed /Assigned software license must be as per the Approved / Final BOM. 4. Model number of the EWS/SOE workstation must be as per the Approved / Final BOM
Test Record Reference	Bill of Material. Refer Appendix 8.7 – FAT Check sheet

The above check will be conducted for all EWS/SOE PCs and witnessed by the following representatives:

TEST RESULT: PASS / FAIL

YOKOGAWA Representative : _____ Date: _____

ROSETTI MARINO Representative : _____ Date: _____

CROSSWIND Representative : _____ Date: _____

7.6.4 System Architecture and BOM Check

Outline	The SIS system is configured as per the System Architecture Drawing and the associated BOM is derived accordingly.
Objective	Verify that the SIS system staged for testing is as per the System Architecture Drawing and corresponding BOM.
Reference	- SIS BOM - System Architecture Drawing - Safety Validation Plan (SVP) Refer Appendix 8.3 - Approved Document List
Procedure	1. Visually check that all the SIS components are staged as per the System Architecture. 2. Verify the BOM. • SIS Hardware. • SIS Software. 3. Verify Domain and Station numbers according to System Architecture. 4. Confirm that components (Model/Revision numbers) as built are in accordance with reliability calculation of SVP for specified SIFs.
Criteria (Expected Results)	1. SIS components staged must be as per the approved / Final System Architecture drawing. 2. Components (Model/ Revision numbers) used for SIFs should be in accordance to the SVP reliability calculations 3. Make and Model of SIS hardware and SIS software must match the approved / final BOM and SVP
Test Records	Refer Appendix 8.7 - System Architecture and Bill of Material. (BOM checks are done separately for hardware and Software) Refer Appendix 8.7 – FAT Check sheet

The above check has been conducted for all SIS equipment's and witnessed by the following:

TEST RESULT: PASS / FAIL

YOKOGAWA Representative : _____ Date: _____

ROSETTI MARINO Representative : _____ Date: _____

CROSSWIND Representative : _____ Date: _____

7.6.5 System Cables Check

Outline	The System cables are manufactured as per the System Cable Schedule document. The manufactured cables are to be physically checked.
Objective	Verify that the SIS System is manufactured as per the System Cable Schedule document.
Reference	System Cable Schedule Refer Appendix 8.3 - Approved Document List
Procedure	Visually check that all the System Cables are manufactured according to the specification. The following shall be checked: • Cable Model. • Length. • Cable markers
Criteria (Expected Results)	1. Cable model and length must be as per the final Cable schedule. 2. Every cable must have cable markers at both ends.
Test Records	System Cable Schedule Refer Appendix 8.7 – FAT Check sheet

The above checks are conducted for all SIS System Cables and witnessed by the following representatives:

TEST RESULT: PASS / FAIL

7.7 Standard System Function Check

7.7.1 System Start-up Test (SCS and I/O cards)

Outline	Each of the Safety Control Stations and its I/O cards shall go to their operating mode 'Waiting' automatically upon powering up, provided that the application software is properly loaded in the system. Regardless of the duration of a power failure, the initial cold start processing is performed when power is supplied to the CPU nodes. On SCS power up, input/output module startup processing is performed, and the operating mode shifts to the Waiting mode and '0' is output from the DO modules. The user should perform the output enable operation from the EWS after confirming that all output modules have been started successfully. Once the output enable operation is completed, output values of the application logic are output to the field. When all outputs are placed in the Output Enable status, the operating mode shifts to the Running mode.
Objective	To verify that the above components automatically boot up when going from power-off state to 'Waiting' mode.
Reference	- System Architecture Drawing - ProSafe-RS Instruction Manual (Safety Control Station) - SIS Instruction for Operation and Maintenance Refer Appendix 8.3 - Approved Document List
Procedure	1. Power down the whole system. 2. Power up and observe its boot up sequence until 'Waiting' mode is confirmed. 3. Check status/operating mode from SCS State Management panel on EWS PC after each station completes the boot up. 4. Check one or two IO loops by hardwired signal injection to check the status of the system after boot-up is completed. 5. Perform output enable operation after all output modules have been started successfully
Criteria (Expected Results)	1. System should boot up automatically. 2. System status indication on SCS State Management panel should show 'Ready'/'Waiting'. 3. The status of IO loops after system boot up must reflect the signal values injected and changes thereafter.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

Copyright © Yokogawa Electric Corporation

The above checks are conducted on random basis for selected SCS and witnessed by the following representatives:

TEST RESULT: PASS / FAIL

YOKOGAWA Representative : _____ Date: _____

ROSETTI MARINO Representative : _____ Date: _____

CROSSWIND Representative : _____ Date: _____

7.7.2 SCS CPU Backup Function Test

Outline	The two CPUs in the SCS back up each other. During operation, one CPU is active while the other CPU is on hot standby. The standby CPU is updated at every memory write-cycle.
Objective	To verify that SCS operation is uninterrupted when the active CPU fails and the standby CPU takes over.
Reference	- ProSafe-RS Instruction Manual (Safety Control Station)
Procedure	1. Wire up one test logic block with trip reset / latch function, inject hardwired signal input, and measure / monitor the output. 2. Display the POU in Debug mode on EWS PC for this logic block as applicable to observe the logic control action and status. 3. Energize the logic block (i.e. create status "trip") 4. Stop the active CPU by using the 'Start/Stop' button on the front panel (Switchover the CPU). 5. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS) 6. Check the "trip" status of the test logic block on the EWS to confirm SCS logic functions are normal. 7. Revive the CPU to normal operation mode. 8. Repeat for the test for the other CPU card.
Criteria (Expected Results)	1. The SCS Logic functions and data must be unaffected on simulation of active CPU failure. 2. SCS State Management panel shows SCS status.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

The above checks are conducted on random basis for selected SCS and witnessed by the following representatives:

TEST RESULT: PASS / FAIL

7.7.3 SCS ESB Bus Redundancy Test

Outline	The dual redundant ESB Bus interface modules, allow I/O data to be communicated between the Safety Control Unit and each Safety Node Unit. The following operations apply : - Normally, redundant ESB Buses are used in an alternating fashion. - If an error occurs in an ESB Bus interface module on one side, the error is notified to the user via a diagnostic information message. If both interface modules fail, the error is treated as a node failure. - If an error occurs in one ESB Bus or interface module, the SCU continues communication using the other normal ESB Bus. - An erroneous bus is monitored for recovery at regular intervals. - Errors in communication with all I/O nodes, except CPU node, are related to ESB Bus error.
Objective	To verify that SCS operation is uninterrupted when one ESB Bus interface module fails and the other interface module takes over.
Reference	- ProSafe-RS Instruction Manual (Safety Control Station)
Procedure	1. Wire up one test logic block with trip reset / latch function, inject hardwired signal inputs, and monitor the output, preferably in the Safety Node Unit than in the Safety Control Unit Node. 2. Display the POU in Debug mode on EWS PC for this logic block as applicable to observe the logic control action and status. 3. De-Energize or Energize the logic block (i.e. create status "trip"). 4. Disconnect the connector unit of one of the ESB Bus interface module in the SCU. 5. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS) 6. Check the "trip" status of the test logic block on the EWS to confirm SCS logic functions are normal. 7. Revive the ESB Bus to normal operation condition. 8. Repeat the same test procedure by disconnecting the connector unit of the other ESB Bus Interface module.
Criteria (Expected Result)	The SCS Logic functions and data must be unaffected on simulation on single ESB Bus failure.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

Copyright © Yokogawa Electric Corporation

7.7.4 SCS Power Supply Module Redundancy Test

Outline	The dual redundant power supply modules on the Safety Control Unit and the Safety Node Unit supply power to the respective nodes.
Objective	To verify the redundant functionality of the power supply cards.
Reference	- ProSafe-RS Instruction Manual (Safety Control Station)
Procedure	1. Wire up one test logic block, with hardwired signal injection input, and monitor the output. 2. Display the POU in Debug mode on EWS PC for this logic block as applicable to observe the logic control action and status. 3. De-Energize or Energize the logic block (i.e., make status "trip"). 4. Remove the power to the active CPU nest power supply card by removing power from the UPS power source. 5. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS) 6. Check the "trip" status of the test logic block on the EWS to confirm SCS logic functions are normal. 7. Revive the Power Supply Card to normal operation condition. 8. Repeat for the other CPU nest power supply card by removing the power from normal power source. 9. Repeat the test for Safety Node unit power supply cards.
Criteria (Expected Result)	The SCS Logic functions must be unaffected on simulation on failure of single Power Supply module in SCS.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

The above checks are conducted on random basis for selected SCS and witnessed by the following representatives:

TEST RESULT: PASS / FAIL

YOKOGAWA Representative : _____ Date: _____

ROSETTI MARINO Representative : _____ Date: _____

7.7.5 I/O Module Redundancy Test

Outline	The SIS I/O modules are configured as redundant for all I/O. In an SCS, it is possible to mount input/output modules of the same type in two adjacent slots to make them redundant. In the case of redundant configuration, one side becomes the control side and the other becomes the standby side. When control side fails, the standby automatically takes over, when standby module fails, it will be alarmed.
Objective	To verify the redundancy of I/O modules.
Reference	- I/O Assignment - ProSafe-RS Instruction Manual
Procedure	1. Wire up one test logic block with trip reset / latch function, inject hardwired signal input, and monitor the output. 2. Display the POU in Debug mode on the EWS PC for this logic block as applicable, to observe the logic control action and status. 3. De-Energize or Energize the logic block (i.e., create status "trip"). 4. Remove the active I/O module which has the I/O that has been set up for the logic block function monitoring as per Step 1. 5. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS) 6. Check the "trip" status of the test logic block on the EWS to confirm SCS logic functions are normal. 7. Install back the removed I/O module. 8. Check the I/O module recovery messages at the OWS. 9. Repeat the test by removing the other IO module
Criteria (Expected Result)	The SCS Logic functions must be unaffected on simulation of failure of active IO module in a redundant configuration.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

7.7.6 Field Power Supply Redundancy Test

Outline	SIS 24V DC Field Power supplies provide power to field input and output devices. The Field power supplies are installed in redundant configuration with each field power supply designed to cater field power to 100% of the IO in that cabinet
Objective	To verify the redundancy of 24V DC Field power supplies Refer Appendix 8.3 - Approved Document List
Reference	- SIS Cabinet power distribution drawings
Procedure	1. Select an SCS controller and reset all logics in that controller. 2. Remove AC power input to one of the 24V DC Power supply 3. Verify that the power to Terminal Board (TB)/Field IO is still normal. 4. Verify SIS System common trouble alarm in OWS is normal. 5. Revive AC power input and verify recovery of system common trouble alarm. 6. Repeat the test by removing AC power input to other 24V DC power supply.
Criteria (Expected Result)	Field power to SCS IO must be unaffected on simulation on failure of single 24V DC Field Power Supply unit.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

The above checks are conducted for all Marshalling cabinets equipped with 24DC power supplies.

TEST RESULT: PASS / FAIL

7.7.7 System Key Function Test

Outline	The SIS systems are equipped with a System Key. The System Key provides protections against unauthorized access and modification to system logics. • System key is normally set to Disable position. The ProSafe-RS logic security level is set and locked in at level 2, which is read only mode. • When System key is set to Enable position, security level remains at 2 but can be changed by user to 1 or 0 for online or offline download respectively. When System key is switched from Enable to Disable position, the logic will enable all locked or disabled variables then set security level back to 2. Enabling disabled variables is necessary to ensure that System key input will not be kept in locked state which will cause security level and variable enable locked down.
Objective	To verify: System key REMOTE (Disable) & PROGRAM (Enable) functionality
Reference	SIS Cabinet wiring drawings Refer Appendix 8.3 - Approved Document List
Procedure	1. Verify security level is set to 1 and at least one variable is locked. Turn System key position to DISABLE (REMOTE) position. • Verify lock variable is enabled and security level is set to 2 • Verify that the System Common Trouble alarm is cleared. 2. Return System key position to ENABLE (PROGRAM) position. • Verify security level remains at 2 • Verify System Common Trouble alarm in OWS 3. Change security level to 1 and verify that online download is possible. 4. Change security level to 0 and verify that offline load is possible.
Criteria (Expected Result)	SCS Security level change is possible only in Enable position. Switching from Enable to Disable position enables all locked or disabled variables and set security level to 2.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

7.7.8 Vnet/IP Bus Redundancy Test

Outline	The Vnet/IP bus is an important communication channel for communication between the EWS/OWS and the SCS/FCS. It also provides peer-to-peer communication between SCS/FCS. The Vnet/IP bus is dual redundant. This test will be carried out for the SIS system that is set up as per system configuration.
Objective	To verify the redundant functionality of the system communication network Vnet/IP bus.
Reference	ProSafe-RS Instruction Manual. Centum VP Instruction Manual
Procedure	For SCS: 1. For SCS CPU-1: Remove the cable that is connected to Bus-1. 2. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS). 3. Observe whether there is any break in trend gathering for any signal. 4. Re-connect the cable and check that the Bus-1 is healthy. 5. Repeat the above tests for CPU-1 Bus-2 and for CPU-2 Bus-1/2. For Layer2 switch: 7. Fail one of the L2 switches that is connected on Vnet/IP Bus-1. 8. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS) 9. Observe whether there is any break in trend gathering for any signal. 10. Power back the L2 switch check that the switch and the connected Vnet/IP network are healthy 11. If applicable, repeat the test for the other L2 switch that is connected to Vnet/IP Bus-1. 12. Repeat the test for the L2 switch connected on Vnet/IP Bus-2.
Criteria (Expected Results)	1. The SCS should be monitored from EWS and/or OWS without interruption even on a single Vnet/IP bus. 2. System alarm messages should be correctly displayed. 3. There should not be any break in trend gathering for any of the signals.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

7.7.9 SCS Resource Capacity Check

Outline	SCS Resources refers to the SCS memory usage. Sufficient spare capacity for future expansion should be available at each SCS. The Safety Control Station resource usage depends on the application software configured in that particular SCS.
Objective	To verify that overall SCS resource capacity is sufficient. This result can be used as a reference while checking the SCS memory usage at the completion of commissioning.
Reference	- ProSafe-RS Instruction Manual (Engineering Guide) - SIS FDS Software Refer Appendix 8.3 - Approved Document List
Procedure	1. The check will be carried out for the related SCS. 2. Call up the SCS Information panel at the EWS. 3. Confirm the SCS resources consumed and the remaining resources available at the related SCS.
Criteria (Expected Result)	The overall SCS resources consumed must meet project requirement.
Test Record Reference	The printout from the system for each SCS Information. Refer Appendix 8.7 – FAT Check sheet

The above check will be conducted for all SCS and witnessed by the following representatives:

TEST RESULT: PASS / FAIL

7.7.10 SCS CPU Loading Check

Outline	The loading of the CPU of each Safety Control Station depends on the size and complexity of the application software configured in that particular SCS, the specified scan cycle and communication loads with other devices (EWS / OWS / FCS / SCS). CPU loading of the SCS is an important factor for deciding the system performance.
Objective	To record the loading of the CPU of the SCS at the completion of FAT. This result can be used as a reference while checking the SCS CPU idle time at the completion of commissioning.
Reference	- ProSafe-RS Instruction Manual (Engineering Guide) - SIS FDS Software Refer Appendix 8.3 - Approved Document List
Procedure	1. Select an SCS for which the CPU load needs to be verified. 2. (If the system is integrated with the PCS), on each of the OWSs, belonging to that SCS operation group, call up 4 Graphic windows, a faceplate or a tuning window. The selected Graphic windows should pre-dominantly have tags from the selected SCS for which the CPU load is being measured. 3. Call up the status display of the SCS, for which the CPU idle time is being measured and note down the displayed CPU idle time 4. Printout a hardcopy of the SCS status display for records.
Criteria (Expected Result)	The CPU idle time shown on the System Maintenance panel for each SCS should meet the project requirement.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

The above check will be conducted for all other SCSs.

TEST RESULT: PASS / FAIL

7.7.11 SCS Online/Offline Loading Test

Outline	During the course of plant operation, it may become necessary to modify certain tag definitions, parameters and logic configurations etc. There are two types of loading procedures. These are: • On-line loading. • Off-line loading Modifications (within specified restrictions as per engineering guide) made at the EWS followed subsequently by on-line loading to the SCS have no effect on SCS operation. The modifications become effective on completion of the loading procedure. Modifications made at the EWS followed subsequently by off-line loading to the SCS will cause the SCS to go off-line for the duration of the loading procedure. The modifications become effective on completion of the loading procedure, and the SCS returns to normal on-line status.
Objective	To verify SCS on-line and off-line loading function.
Reference	- ProSafe-RS Instruction Manual (Engineering Guide)
Procedure. (On-line Load).	1. Modify any of the parameters permitted for on-line loading. 2. Execute SCS on-line loading via the EWS. 3. Observe whether any effect to SCS operation during SCS on-line loading. 4. Confirm that the modified parameters are loaded and functioning properly.
Criteria. (Expected Results) (On-line).	1. SCS operation is not affected during SCS on-line loading. 2. The modified parameters should be loaded without any errors and the post download changes are reflected as desired
Procedure. (Off-line Load).	1. Modify any of the logics required for off-line load. 2. Execute SCS off-line loading via the EWS. 3. Observe SCS fail status from the system panel during off-line loading. 4. Confirm that the modified logics are effectively loaded and functioning properly.
Criteria. (Expected Result) (Off-line).	The modified parameters should be loaded without any errors and the post offline load changes are reflected as desired.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

7.7.12 Media Backup/Restore Function Test (ProSafe-RS Project)

Outline	The ProSafe-RS EWS PC is equipped with backup storage device for application program backup onto backup storage/media.
Objective	- Verify that the backup storage/media will back-up/restore ProSafe-RS project database.
Reference	- ProSafe-RS Instruction Manual
Procedure (Backup)	Backup the project application database in EWS PC to backup storage/media.
Criteria (Backup)	The project folder is copied onto the backup storage/media without interruption and any errors.
Procedure (Restore)	Restore the project application database backup files in the backup storage/media to EWS PC.
Criteria (Restore)	The project folder is restored back to the desired location in EWS PC without interruption and any errors. There should be no effect on ProSafe-RS generation after restoration
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

The above checks are conducted the ProSafe-RS project folder and witnessed by the following representatives.

7.8 SIS & FGS I/O Check

7.8.1 I/O Check Procedure

Outline	During the internal test, 100% I/O tests are carried out and records for the same are maintained. During FAT, 100% IO checks are performed to verify that the I/O is correctly assigned in the SCS.
Objective	1. To verify all the SIS input and output signals and circuits and their assignment in the SCS. 2. To verify IO parameter settings in the SCS with I/O tag list. 3. To verify Trip points /Dead band /Range of analog signals on logic sheet against project requirement. 4. To verify Tag number, tag comment, range, and engineering unit on OWS faceplate (If the system is integrated with the PCS). 5. To verify SOE records on the SOE viewer installed in the EWS PC.
Reference	- I/O Assignment - Termination Wiring Drawing Refer Appendix 8.3 - Approved Document List
Procedure	1. Analog Input signals to be simulated at test panel or at the Marshalling terminals using signal generators (For redundant modules, switch over to standby module and test redundant path). 2. Digital Input signals to be simulated using test panel and/or switches hardwired to terminals at Marshalling (For redundant modules, switch over to standby module and test redundant path). 3. Digital Output signals shall be tested by forcing the output from the EWS and observing the LEDs on test panel and/or voltage hardwired to terminals at Marshalling (For redundant modules, switch over to standby module and test redundant path).
Criteria (Expected Results)	1. The circuit for every I/O point is completed from simulator test panel (or terminals at Marshalling if test panel is not used) to SCS. 2. Signal values of all I/Os are correct. 3. Tag number, tag comment, alarm/trip settings, range and engineering units are configured correctly and match the data in Instrument Index.
Test Record Reference	1. Pre-FAT Test Record (100% of I/O). 2. Refer Appendix 8.8 – I/O Check sheet (Check sheet are generated from master database to ensure that there is no I/O tag been left out).

Copyright © Yokogawa Electric Corporation

Analog input:

Simulate appropriate analog input signals using the hardware simulation test panel or the signal generator and record SCS reading displayed in the corresponding workbench at EWS and/or faceplate at the OWS. For Analog Input points, the following signal levels shall be injected and verified:

- Signal 1 = 0%
- Signal 2 = 50%
- Signal 3 = 100%
- Out of range IOP+
- Out of range IOP-
- Trans+
- Trans-

Additional points for FGS Detectors:

- Calibration
- Beam block
- Dirty Optics

Verify the tag number, tag comment, range and engineering unit on OWS faceplate.

Verify the Process Alarms on the OWS.

Verify the alarm & trip related setting, transmitter fault, failsafe value, etc. on the EWS and annunciation of the same on the OWS.

Verify alarm and trip signals on the SOE and time stamps as applicable.

The result shall be recorded in the I/O Check sheet.

Note: If applicable, verify the IO card dip switch setting for all 4 wire transmitters. Instrument Index to provide the list of all field powered transmitters.

Analog output:

From the workbench at EWS, force the output (MV) of the tag and measure the corresponding signal output at the output terminals using an ammeter. For Analog Output points, 3 output signals shall be set:

- Signal 1 = 0.1%, corresponding to 4mA at output terminals.
- Signal 2 = 50%, corresponding to 12mA at output terminals.
- Signal 3 = 99.9%, corresponding to 20mA at output terminals.

The result to be recorded in I/O Check sheet.

Digital input:

- Open or close the input point using the toggle switches on the Simulator test panel and record the input status indication in the corresponding logic display at EWS. For Digital Input points, the following input states shall be simulated:
  - Signal 1 = 0 or open contact input signal.
  - Signal 2 = 1 or close contact input signal.

Copyright © Yokogawa Electric Corporation

  - Signal Fault : Wire break and / or short circuit as applicable for line monitored inputs
- Verify the Trip Signals on the SOE and SOE time stamps as applicable.
- The result to be recorded in the I/O Check sheet.

Digital output:

Using EWS, force the Digital output point to ON and confirm that the LED on the test panel is turned ON. Force the Digital output point to OFF and confirm that the LED on the test panel is turned OFF. Short the wires at the LED and confirm that the System automatically disables the DO channel.

If applicable, verify the Trip Signals on the SOE and SOE time stamps.

The result to be recorded in the I/O Check sheet.

The above check will be conducted for 100% of the IO and witnessed by the following representatives:

TEST RESULT: PASS / FAIL

8 EMCS Physical Hardware Check

8.1 Test purposes

The tests covered in this document are related only to acquire and generate the IO hardwired signals provided by EMCS and the hardware redundancy.

8.2 Test prerequisites EMCS

The test must check:

- the correct wiring of the signals of the IO card to terminal strips
- the correct acquisition of input signals (digital and analog) by the control system
- the correct generation of output signals (digital and analog) by the control system
- the hardware redundancy in case of one control system fault or network failure

To perform the test, Yokogawa will use laptop PC to connect, through software to programming SEL Industrial PC, at the control system with the scope to verify the correct internal status of the signals.

Availability of documents concerning the communication interface is a necessary prerequisite, in order to proceed with the actual test. The minimum provided information is :

- Communication parameters (IP address, subnet mask, device parameters, device tag when applicable, communication speed when applicable).
- IO signal maps, specifying for each signal to be tested :
  - Tag
  - Address
  - Description
  - Data type
  - Data access (read/write)
  - Range
  - Scale
  - Offset
  - Engineering Unit (if applicable)

8.3 Hardware link validation

This chapter describes the tests that will be executed during the “Hardware Link Communication tests”. The following tests shall be performed for each IO card in the EMCS and for each control system component.

Copyright © Yokogawa Electric Corporation

8.3.1 TEST Form 1.1 - Communication and configuration check				
Vendor REFERENCE :				
PROJECT :		**System :**	EMCS	Rev. 0
Item Description:	Communication and configuration check			
PRELIMINARY				
SCOPE	Verify the correct connectivity between EMCS and Engineering Workstation interface.			
REF. DOCUMENTS				
PROCEDURE	After the connection, using Engineering Workstation interface, is established, verify that the connections are Healthy and permanent for each component of the EMCS.			

Copyright © Yokogawa Electric Corporation

EXPECTED RESULT	Observe that there is no communication fault on each component of the EMCS. For each component, diagnostics information indicates no errors.			
TEST RESULTS	PASS ☐		FAI☐

8.3.2 TEST Form 1.2 - **Hard Link Digital Input/Output test**				
Vendor REFERENCE :				
PROJECT :		**System :**	EMCS	Rev. 0
Item Description:	Hard Link Digital Input/Output test			
PRELIMINARY				
SCOPE	Verify the communication for all digital signals acquired and generated by EMCS on Engineering Workstation interface. Verify that it is possible to read and write signals as specified in Signal List: • "read" signals will be generated/forced by an external electrical jump on the terminal strip and checked the corresponding internal signal on Engineering Workstation interface. • "write" signals will be generated/forced through Engineering Workstation interface and checked, using proper electrical instrumentation, the status of the signal on the corresponding terminal strip.			
REF. DOCUMENTS				
PROCEDURE	Verify that each digital input signal value corresponds to the same internal signal value on Engineering Workstation interface. Verify that each digital output			

Copyright © Yokogawa Electric Corporation

	signal value generated on Engineering Workstation interface corresponds to the value measured on corresponding terminal strip.			
EXPECTED RESULT	No mismatch occurs during acquisition and generation of digital signals.			
TEST RESULTS	PASS ☐	FAI☐

8.3.4 TEST Form 1.4 - **Redundancy EMCS test**				
Vendor REFERENCE :				
PROJECT :		**System :**	EMCS	Rev. 0
Item Description:	Redundancy EMCS test			
PRELIMINARY	The EMCS is composed by two different Control System working in redundant mode.			
SCOPE	Verify the EMCS can work properly during a fault of one of its control system. Verify that the alive control system ensures the proper operations of the EMCS trying to write digital and analog output signals and check, using proper electrical instrumentation, if the signals are generated properly.			
REF. DOCUMENTS				
PROCEDURE	Write the digital and analog output signals through Engineering Workstation interface and verify that them are generated properly, measuring them with an

1 INTRODUCTION

1.1 GENERAL

The purpose of this document is to define the methods and documentation that will be used to carry out the Integration Factory Acceptance Test (FAT) using Virtual Machine (VM)/Remote Access on Yokogawa's Distributed Control System (PCS) CENTUM VP, ProSafe-RS (SIS and FGS), SCADA (CI Servers) and EMCS. The FAT is performed to ensure that the system is properly configured, assembled and functional in accordance with the intended design as specified in the approved documents. The objective of FAT is to demonstrate to Crosswind that the system hardware and software is built in accordance to requirements as specified in the approved documents. Crosswind and Rosetti Marino (RM) would witness to verify the test. Upon successful completion of the test, a FAT Test Certificate and Shipping Release Notice would be signed by both Yokogawa as MAC and Crosswind/RM to signify the acceptance of the test and approval of shipment of the equipment.

1.2 SCOPE AND OBJECTIVE

The Factory Acceptance Test referred to as FAT applies to the PCS, SIS , FGS and EMCS Software supplied by Yokogawa . The objective of the FAT is to verify the conformance of the system against the approved specifications and FAT procedure before delivery to site. The FAT shall be conducted to test and verify the main items listed below:

- System Software

PCS- CentumVP Version R6 Software
SIS and FGS - Prosafe-RS Version R4 Software
SCADA – Collaborative Information (CI) Server R1

- Operator Station Application Software

SCADA – Collaborative Information (CI) Server R1

- Control Station Application Software

PCS, SIS, FGS and EMCS

- Alarm Management

SCADA – Collaborative Information (CI) Server R1

<u>Exclusion of test during this FAT</u>

- 3rd Party Package Communication Testing, EMCS integration test with CI-Server and PCS

Table 2 – Yokogawa Reference Documents.

2.2 DEFINITIONS AND ABBREVIATIONS

ALE	Yokogawa Ethernet Communication Module
AMS	Alarm Management System
BLPH	Base Load Power Hub
CAP	Critical Action Panel
Centum VP	Yokogawa's DCS Product
PCS	Process Control System
CI	Collaborative Information
COMPANY	Crosswind
CONTRACTOR (CTR)	ROSETTI MARINO S.p.A.
DCS	Distributed Control System
DEP	Design and Engineering Practice
DOCUMENT NAME	Document Title
EMCS	Electrical Monitoring and Control System
EPC	Engineering, Procurement Construction

EWS	Engineering Workstation
FCS	Field Control Station
FGS	Fire & Gas System
GSD	General Station Description
HART	Highway Addressable Remote Transducer
HKN	Hollandse Kust Noord
HMI	Human Machine Interface
HV	High Voltage
HVAC	Heating, Ventilation and Air Conditioning
HV-SCADA	The given name for the COMPANY's control system for the HKN wind farm infrastructure. BLPH's control system shall operate autonomously but will interface with HV-SCADA.
IAMS	Instrument Asset Management System
IEC	International Electrotechnical Commission
ISO	International Organization for Standardization
ITER	Instrument & Telecoms Equipment Room
ITP	Inspection and Test Plan
MAC	Main Automation Contractor
MCC	Motor Control Centre
NA	Not Applicable
OER	Onshore Equipment Room
OPC	OLE (Object Linking Embedded) for Process Control
P&ID	Piping and Instrument Diagram
PCS	Process Control System
PIN	Plant Information Network
PRM	Plant Resource Manager
PROJECT	HOLLANDSE KUST NOORD WIND PARK Project
SCADA	Supervisory Control and Data Acquisition
SHALL	An absolute requirement.
SHOULD	This word indicates a recommendation that whilst preferred may not be implemented provided some equivalent is proposed and agreed by COMPANY. The full implications must be understood and carefully weighed before choosing a different course.
SIF	Safety Instrumented Function

SIL	Safety Instrumented Level
SIS	Safety Instrumented System
TCP/IP	Transmission Control Protocol/Internet Protocol
Vnet/IP	Yokogawa Virtual Network
WSUS	Window Security Update Services

Table 3 – Definitions and Abbreviations

2.3 APPLICABLE DESIGN ENGINEERING PRACTICES

Design Engineering Practices (DEP) have a limited rollout on BLPH.

2.3.1 Fully Applicable DEP

The following DEP are identified as being fully applicable to the project.

Document Name	Document Title
DEP 32.01.20.12	Industrial Automation and Control Systems (IACS) Security
DEP 30.00.60.15	Humans Factors Engineering – Control Room Design
DEP 33.64.10.32	Electrical Network Monitoring and Control System for Global Application
DEP 37.76.10.10	HVAC for Offshore Installations (Amendments/Supplements to ISO 15138)

Table 4 – Applicable DEPs

DEP 32.01.20.12 shall be applied to the project in full, in conjunction with IEC 62443, for the cybersecurity design.

2.3.2 DEM-1 Process Safety Only DEP

The following DEPs shall have the DEM-1 'Process Safety' requirements applied to the project.

Document Name	Document Title
DEP 32.30.20.11	Fire, Gas and Smoke Detections
DEP 32.80.10.10	Safety Instrumented Systems
DEP 32.80.10.14	Alarm Management (Amendment/Supplements to IEC 62682)
DEP 62.10.08.11	Inspection and Function Testing of Instruments

Table 5 – Applicable DEPs

2.4 INDUSTRY STANDARDS

Document Name	Document Title
IEC 61508	Functional safety of electrical/electronic/programmable electronic safety-related systems
IEC 61511	Functional Safety – Safety Instrumented Systems for the Process Industry Sector – Framework, Definitions, System, Hardware, and Application Programming Requirements
IEC 61850	Communication Networks and Systems for Power Utility Automation

IEC 62443	Cyber Security for Industrial Automation and Control Systems
IEC 62682	Management of Alarm Systems for the Process Industries
ISO 9001	Certifications of Quality Management System

Table 6 – Industry Standards

3 RESPONSIBILITY

Responsibilities for each party involved in the FAT are defined here-under to ensure that the FAT is carried out in accordance with an agreed procedure. It also ensures that there shall be authorized personnel(s) from Crosswind, RM and YOKOGAWA to facilitate any decisions and schedule changes resulted from the FAT as per ITP.

3.1 CROSSWIND

The full participation of Crosswind in the FAT is essential. Crosswind shall appoint an Inspector cum Test Approver to witness the FAT. The Test Approver would have the authority to sign-off upon the successful completion of all tests. Once signed off, the test will be deemed accepted and the decision will be final. The Inspector shall participate in the test and observe the test results on daily basis. The Test Approver shall approve the inspection items based on the approved specification and the test results recorded.

3.2 ROSETTI MARINO (RM)

RM shall appoint a FAT Manager for the FAT. The FAT Manager representing RM shall coordinate with Crosswind and YOKOGAWA FAT Managers and to facilitate the smooth implementation of the FAT activities and schedule. The role of the FAT Manager is also to resolve FAT issues on a regular basis. RM representatives will participate in the FAT for the complex controls, sequences and logics. For PCS controlled equipment packages containing complex controls, sequences and logics, RM at their discretion, may invite their package equipment supplier representatives to participate in the testing.

3.3 MAC SUPPLIER

YOKOGAWA as MAC shall appoint a Test Conductor to organize and manage all aspects of the FAT. YOKOGAWA shall carry out the testing and record the test results daily basis together with Crosswind Inspector and RM representative. The Project Manager representing YOKOGAWA shall be the FAT Manager. The FAT Manager shall coordinate with RM's FAT Manager and shall amend the test schedule whenever necessary to ensure the smooth running of the FAT. The FAT Manager shall also ensure that all tests are conducted in accordance with the approved FAT documents. If changes/modifications are required in the implementation, the FAT Managers of YOKOGAWA and RM shall discuss and arrive at the action plan.

4 GENERAL ADMINISTRATION

4.1 FAT VENUE

Remote FAT shall be carried out using Virtual Machine (VM)/Remote Access on Yokogawa's Distributed Control System (PCS) CENTUM VP HMI, Controller, EMCS, Prosafe-RS (SIS and FGS) and SCADA (CI Servers) OWS, CI Servers.

4.2 ORGANIZATION CHART

A specific detailed Organization Chart shall be issued for each project, with all positions and names filled in. In addition, a FAT roster of the participants shall be issued, with the following details for each person; full name, company, responsibility, samples of the signature and initials, actual start and finish date of participation in the FAT. The FAT Manager will be responsible for maintaining the roster and keeping it updated.

4.3 KICK-OFF MEETING

An initial kick-off meeting will be held prior to starting the FAT to brief the participants, confirm the organization and responsibilities, and review the FAT schedule. At the same time, HSE briefing for all participants will be provided by YOKOGAWA. YOKOGAWA FAT Manager will prepare the presentation and explain the organization and work practices. All FAT documentation prepared by YOKOGAWA prior to FAT will be inspected for completeness.

4.4 DAILY WORKING SCHEDULE

The FAT will be conducted using Virtual Machine (VM)/Remote Access from YOKOGAWA premises from Monday to Friday (working days).

The following timing (CET) is recommended for the testing:

0900 to 1230 hrs	Inspection and test
1230 to 1330 hrs	Lunch
1330 to 1530 hrs	Inspection and test
1530 to 1600 hrs	Daily review meeting including next day's schedule planning

4.5 DAILY REVIEW MEETING

YOKOGAWA FAT Manager shall conduct a daily review meeting at the end of each FAT day. The meeting will involve all the parties taking part in the FAT. The purpose of this review meeting is to update all parties the progress and status of the FAT. The punch list will be reviewed during the daily meeting and the action to be taken will be discussed and finalized. If the recovery work involved is minor (identified in the daily meeting) and agreed by all parties, the work will be carried out on the same day and will be verified the following day by all the concerned parties and signed off in the punch list. If the recovery work involves major change/modification, The FAT Manager will advise the schedule for retesting.
Refer to section 5.4 for details in punch record.
The FAT Manager should also ensure that PCS, SIS, FGS, SCADA and EMCS Engineers make a backup of the application program to an external storage & other PC every day after the daily review meeting, so that old backups can be retrieved, if necessary.
White board will be provided to record progress & pending item.

4.6 WEEKLY PROGRESS MEETING

YOKOGAWA FAT Managers shall conduct weekly progress meeting every Friday. The purpose of the weekly meeting is to report the progress of the FAT in the same week and planned activity the following week. It shall also be the forum for resolving any issue arises from punch list. In the weekly progress meeting, The FAT Manager will present detailed weekly progress report, containing details of activities and achievements for the week, plan for the next week, area of concern, and detailed formal overall progress assessment. The format and content details of the weekly progress report and the underlining planning, progress monitoring and measurement methodology shall be in accordance with the FAT planning, Progress Monitoring Report. After the joint review in the weekly progress meeting and any necessary amendments, The FAT Manager will issue the weekly progress report.

4.7 FAT WRAP-UP MEETING

At the completion of the FAT, a final wrap-up meeting will be held. The overall status of the FAT shall be reported. Upon all parties' agreement that the FAT is completed satisfactorily, the FAT Completion Certificate and Shipping Release Notes shall be signed off by Crosswind/RM.

5 FAT DOCUMENTATION

The Factory Acceptance Test (FAT) shall be conducted in accordance with the test procedures detailed in this document. The test results shall be recorded in the check sheet. To prevent from any check sheet getting lost, each Check sheet shall be given a unique reference number.

5.1 FAT WRAP-UP MEETING

All FAT documentation shall be prepared by YOKOGAWA prior to the start of the FAT. All forms, check sheets, sign-off sheets, drawings, etc. as listed in this procedure shall be organized in indexed binders. A master index for the FAT will be provided and maintained by YOKOGAWA FAT Manager.
The documentation for software checks shall be organized by individual process units in indexed binders. The documentation for graphics checks shall also be organized, separately by individual process units in indexed binders.
All FAT reference documents (latest issue) as listed in this procedure originated by other parties (Crosswind, RM), which were issued formally to YOKOGAWA will form a part of the FAT documentation and shall be printed out and organized in indexed binders by YOKOGAWA.
All FAT reference documents as mentioned above shall be stamped "FAT MASTER" on every page/sheet. Any additional documents that may be necessary and generated later during FAT shall also be stamped, and indexes amended accordingly.

5.2 INTERNAL TEST/PRE-FAT WRAP

Prior to the FAT, YOKOGAWA shall conduct internal test (Pre-FAT) to verify the system and application software.

PCS Complex control loops, specialized sequential controls and batch control applications shall also be completely tested during Pre-FAT using Simulation Software (Test Function) in VMs.

The entire SIS, FGS application software will also be completely tested during Pre-FAT using Simulation Software (Test function) in VMs.

The result of the test shall be recorded and made available for reference before or during FAT. As a part of the pre-FAT, the project team consisting of application engineers from YOKOGAWA, RM and Crosswind conduct electronic (paper) check using the PCS tag/tuning report generated from the system.

During this paper check Pre-FAT, Crosswind/RM will verify the configuration parameters by using engineering documents. This will enable the FAT crew to concentrate on the control functions and Graphic functionality during the actual FAT and will also help in reducing the duration of the FAT.

Refer to PCS, SIS, FGS and SCADA application software sections for detailed procedure on paper check. It is also preferred that Crosswind and RM representatives participate in the pre-FAT for complex controls, sequences and logics checks, especially in projects that has multiple equipment's with identical control strategy, to facilitate smooth execution of the FAT.

5.3 METHOD OF TESTING

Detailed test procedure for each test item is described in this document. Check sheet shall be provided, listing the equipment to be tested. All test results shall be recorded in the Check sheets. The following color codes shall be used in the testing:

a) Yellow marker/highlighter – Items that were checked and cleared

b) Pink marker/highlighter – Items that were having problems.

c) Green marker/highlighter – Items that were checked after completion of recovery.

The color marking on the printouts or pdf file highlighting shall be done on the control drawings, graphics and supporting design documents such as P&IDs, narratives, etc.

During PRE-FAT/FAT sample check of SIS, FGS Logics can be demonstrated with target hardware. Complete software and Hardware Integration Test shall be performed during SAT.

PCS/SIS/FGS/EMCS Software Function Test will be conducted using Test Function tool/applicable simulation software's, without connection to any physical I/O. Simulation Software (PCS/SIS/FGS/SCADA Specific) will be used to simulate process input, digital signal and alarms to FCS/SCS so that typical loops, logic sequence blocks can be tested without connecting to physical input and output devices. Dynamic graphics check shall be a part of the PCS/SIS/FGS/SCADA Software function test. In case of EMCS application simulations shall be done to demonstrate the functionality.

5.4 PUNCH RECORD

All shortcomings found during the test shall be noted in the FAT Punch Record. Each punch Record shall cover one punch item/fault. A Punch Record Ledger shall be used to summarize all the punch records. Punch record items shall be classified as follows:

M = Modification, item is to be modified, deleted, added due to design input changes.

C = Correction, item is to be corrected by YOKOGAWA.

If the recovery work involves change/modification, it is to be recorded on the punch record and the recovery undertaken as soon as possible after the agreement of both the FAT Managers after signing of the punch record. YOKOGAWA shall clear all correction items (Code-C) at factory before shipment. For recovery work that involves modification (Code-M), it will be regularly jointly reviewed by all parties on at least weekly basis and resolved whether to be implemented during FAT or later, depending on complexity and potential schedule and/or cost impact. After verification, the same will be signed off by all concerned parties in the punch record.

Each Punch Record Shall include the expected completion Date within which the punch shall be implemented and ready for re-testing.

-Each "Code-M" punch requiring a minor or negligible effort to be cleared and shall be considered as included in lump-sum.

-Each" Code-M" punch deemed not included in lump-sum Yokogawa scope shall be subject to preliminary agreement between the parties before proceeding for implementation.

-Such Classification of "Code-M" punches shall be reflected either in FAT punch record sheets or in FAT punch ledger/SIS Punch Record Summary.

5.5 FAT COMPLETION CERTIFICATE & SHIPPING RELEASE NOTE

Upon completion of the FAT, FAT Completion Certificate and Shipping Release Note will be signed by Crosswind, Rosetti Marino and YOKOGAWA. The purpose of these two documents is to certify that the FAT has been completed and accepted by Rosetti Marino . Both Rosetti Marino and YOKOGAWA agree that the system is in order and can be released for software to site. The software will be accepted and released by Rosetti Marino. In any case, the release note will be issued by Rosetti Marino using its own template .

5.6 TEST EQUIPMENT

For SW FAT Virtual Machines with required software shall be used to demonstrate software applications configured using screen sharing and audio. Hence no dedicated measuring/Calibrating Test equipment shall be used.

6 PCS APPLICATION SOFTWARE

6.1 PROJECT OVERALL FUNCTION

6.1.1 Project Common Setting Check

Outline	Application inspection of project overall function include verifying project common configuration like plant hierarchy, alarm table, operation mark, and FCS properties/constants.
Objective	- Verify that the project overall function of CENTUM VP project is defined according to the FDS requirements.
Reference	- Functional Specifications like; - 1724000594-IN-DD-00015- System Architecture Drawing - 1724000594-IN-SP-00018- PCS and SAFETY SYSTEMS Software FDS-SW - CENTUMVP system view - 123A90-DDL-IN-SP-40097 Rev.00 System Specification for Main Automation Contractor - 123A90-DDL-IN-SP-40098 Rev.00 Control System (PCS) Specification - 123A90-DDL-IN-RE-40093 Rev. 00 Control System Philosophy - 123A90-DDL-IN-DD-40096 Rev.00 Control System Architecture Detailed Drawings - K559-2254-IC-SPE-001 Rev.00 SYSTEM SPECIFICATION FOR MAIN AUTOMATION CONTRACTOR - K559-2254-PR-BLD-001 Rev.01 BLOCK FLOW DIAGRAM SYSTEM OVERVIEW - K559-2254-EL-LST-001 Rev.00 CONTROL ALARM AND MONITORING TABLE - 123A90-DDL-IN-SP-40024_Rev.00 Alarm System Requirements Specification - 123A90-DDL-IN-DD-40019 Rev.00 Data Network Architecture Drawings
Procedure	Verify following CENTUM VP configuration files as a part of paper check during pre-FAT; • Plant hierarchy • Alarm table • Operation mark • FCS properties/constants
Criteria	Plant hierarchy, alarm table, operation mark, and FCS properties/constants are configured according to the FDS.

The above checks are conducted and witnessed by following representatives.

TEST RESULT: PASS / FAIL

RM Representative : _____ Date: _____

Crosswind Representative : _____ Date: _____

6.2 FCS FUNCTION

6.2.1 Application Software Test for Typical Loops

Outline	This application inspection includes typical loops such as simple indicators, simple control loops, manual loader, etc. Therefore, the accuracy of the PCS configuration relies on the accuracy of the data entry in the database.
Objective	- Verify that that regulatory control loops are configured according to the database and FDS requirements.
Reference	Functional Specifications like; - 1724000594-IN-SP-00018- PCS and SAFETY SYSTEMS Software FDS-SW - 1724000594-IN-LIS-00004- PCS and Safety System IO List (HW and SW) Refer to Documents - 123A90-DDL-IN-LIS-40089 Instrument IO List - P&IDs of Process and third-party communication packages (WTP, HVAC, LV SWGR, UPS) - 123A90-DDL-IN-RE-40095 Process Control Logic Description - 123A90-DDL-IN-CE-40000 ESD/PSD Cause and Effect Diagram - 123A90-DDL-IN-LIS-40027 Master Alarm Database PCS I/O Database - 123A90-DDL-IN-RE-40093 Rev. 00 Control System Philosophy
Procedure	1. Identify each type of application module from P&IDs and FDS. 2. If necessary, perform function test for selected application modules. 3. Verify configuration data for application, by reviewing CENTUM VP system view. Sample tags checked during FAT shall be logged for test record. The accuracy of the PCS configuration relies on the accuracy of the data in the I/O List.
Criteria	Each loop in control drawing should be configured in accordance to the functional specifications, control narrative, P&IDs, and PCS I/O Database.

The above checks are conducted and witnessed by following representatives.

TEST RESULT: PASS / FAIL

YOKOGAWA Representative : _____ Date: _____

RM Representative : _____ Date: _____

Crosswind Representative : _____ Date: _____

6.2.2 Application Software Test for Complex Loops

Outline	PCS application test involves functionality check for all complex loops that is described in the functional specification, control narratives and P&IDs.
Objective	Verify that the complex control configuration functions as defined in the approved functional specifications.
Reference	Functional Specifications like; - 1724000594-IN-SP-00018 PCS and SAFETY SYSTEMS Software FDS-SW - 1724000594-IN-LIS-00004 PCS and Safety System IO List (HW and SW) Refer to Documents - 123A90-DDL-IN-LIS-40089 Instrument IO List - P&IDs of Process and third-party communication packages (WTP, - HVAC, LV SWGR, UPS) - 123A90-DDL-IN-RE-40095 Process Control Logic Description - 123A90-DDL-IN-CE-40000 ESD/PSD Cause and Effect Diagram - 123A90-DDL-IN-LIS-40027 Master Alarm Database
Procedure	1. Using Test function tool, simulate process input signals to check control loop functions. 2. Check following applicable control functions for each complex loop. • Control Action • Bumpless transfer • Tracking functions • Ratio/Calculations • Annunciator message output • Data quality Propagation • ESD/PSD Interlock Shutdown Controller action • Operational Interlock Controller action • Initial functional status of loops on FCS startup • Operator Graphical Interface • Alarm & Trip settings • Other specific functional requirements according to complex loop description
Criteria	Complex loops in control drawing should be configured in accordance to the functional specifications, control narrative, P&IDs, C&E and PCS I/O Database.

The above checks are conducted and witnessed by following representatives.

TEST RESULT: PASS / FAIL

YOKOGAWA Representative : _____ Date: _____

RM Representative : _____ Date: _____

Crosswind Representative : _____ Date: _____

6.2.3 Application Software Test for Sequence and Logic

Outline	FCS sequence control functions include sequence table, logic chart or SEBOL (Sequence and Batch Oriented Language) configuration. These are configured in accordance with plant logic requirements as described in the FDS, control narrative and any sequence/logic diagrams. Sequence control functions are checked by simulating field inputs using the test function software tool and confirming the corresponding expected outputs.
Objective	Verify that the specified functions perform control as defined in the approved functional specifications.
Reference	Functional Specifications like; - 1724000594-IN-SP-00018 PCS and SAFETY SYSTEMS Software FDS-SW - 1724000594-IN-LIS-00004 PCS and Safety System IO List (HW and SW) Refer to Documents - 123A90-DDL-IN-LIS-40089 Instrument IO List - P&IDs of Process and third-party communication packages (WTP, HVAC, LV SWGR, UPS) - 123A90-DDL-IN-RE-40095 Process Control Logic Description - 123A90-DDL-IN-CE-40000 ESD/PSD Cause and Effect Diagram
Procedure	1. Using Test function tool, simulate process input signals to check logic/sequence configuration. 2. Check that the sequence/logic performs correctly, and the correct digital outputs are set. 3. Check valves open/shut, pumps start/stop, appropriate alarm message display etc. 4. Check the initial functional status of sequence logics on FCS start-up. 5. For each sequence/logic, check operator interface Graphic functions. Detail checklists are described on the Check sheet.
Criteria	Sequence and logic should be configured in accordance to the functional specifications, Control/Logic narrative, P&IDs, SLDs, C&E and PCS I/O Database and any sequence or logic diagram.

The above checks are conducted and witnessed by following representatives.

TEST RESULT: PASS / FAIL

RM Representative : _____ Date: _____

Crosswind Representative : _____ Date: _____

6.2.4 Application Software Test for non-Typical Loops

Outline	This application inspection includes non-typical loops such as control loops, etc. that are generated. Non-Typical loops can be simple Analog outputs, Value comparison, average, deviation alarm or process alarm based on analog values etc.
Objective	- Verify that that regulatory control loops are configured according to the FDS requirements.
Reference	Functional Specifications like; - 1724000594-IN-SP-00018 PCS and SAFETY SYSTEMS Software FDS-SW - 1724000594-IN-LIS-00004 PCS and Safety System IO List (HW and SW) Refer to Documents Refer to Documents - 123A90-DDL-IN-LIS-40089 Instrument IO List - P&IDs of Process and third-party communication packages (WTP, HVAC, LV SWGR, UPS) - 123A90-DDL-IN-RE-40095 Process Control Logic Description - 123A90-DDL-IN-CE-40000 ESD/PSD Cause and Effect Diagram
Procedure	1. Identify each type of Typical from P&IDs and FDS. 2. If necessary, perform function test for selected loops. Detail checklists are described on the check sheet. Sample tags checked during FAT shall be logged in this check sheet for test record. The check sheet used for this test shall be from the Excel spreadsheet as the test record. Non-Typical loop Pre-FAT paper check will be sufficient to test all the application loops. The accuracy of the PCS configuration relies on the accuracy of the data in the I/O List. Detail checklists are described on the Check sheet.
Criteria	Each loop in control drawing should be configured in accordance to the functional specifications, control narrative, P&IDs, and PCS I/O Database.

The above checks are conducted and witnessed by following representatives.

TEST RESULT: PASS / FAIL

6.2.5 Alarm and Trip Setpoints

Outline	This application inspection includes non-typical loops such as control loops, etc. that are generated.
Objective	- Verify that alarm and setpoints are as per Alarm/Trip Setpoints.
Reference	Functional Specifications like - 1724000594-IN-SP-00018- PCS and SAFETY SYSTEMS Software FDS-SW - CENTUMVP system view - 123A90-DDL-IN-SP-40097 Rev.00 System Specification for Main Automation Contractor - 123A90-DDL-IN-SP-40098 Rev.00 Control System (PCS) Specification - 123A90-DDL-IN-RE-40093 Rev. 00 Control System Philosophy - K559-2254-IC-SPE-001 Rev.00 SYSTEM SPECIFICATION FOR MAIN AUTOMATION CONTRACTOR - K559-2254-PR-BLD-001 Rev.01 BLOCK FLOW DIAGRAM SYSTEM OVERVIEW - K559-2254-EL-LST-001 Rev.00 CONTROL ALARM AND MONITORING TABLE Refer to Documents - 123A90-DDL-IN-SP-40024_Rev.00 Alarm System Requirements Specification - 123A90-DDL-IN-LIS-40089 Instrument IO List - 123A90-DDL-IN-LIS-40027 Master Alarm Database
Procedure	1. Identify each Alarm/trip for each required Tag. 2. Simulate the value to create alarm 3. Verify the alarm/trip setpoints on the check sheet. Detail checklists are described on the check sheet.
Criteria	Each loop in control drawing should be configured in accordance to the functional specifications, control narrative, P&IDs, and PCS I/O Database.

The above checks are conducted and witnessed by following representatives.

TEST RESULT: PASS / FAIL

7 CI SERVER CONFIGURATION

7.1 NAMING CONVENTION

Outline	To verify the agreed naming conventions are implemented
Objective	To confirm that the naming conventions is correctly implemented for the following: ▪ Plant hierarchy ▪ Item names ▪ Displays ▪ Symbols (static and dynamic)
Reference	Functional Specifications - 1724000594-IN-DD-00015- System Architecture Drawing - 1724000594-IN-SP-00018- PCS and SAFETY SYSTEMS Software FDS-SW - CENTUMVP system view - 123A90-DDL-IN-SP-40097 System Specification for Main Automation Contractor - 123A90-DDL-IN-SP-40098 Control System (PCS) Specification - 123A90-DDL-IN-RE-40093 Control System Philosophy - 123A90-DDL-IN-DD-40096 Control System Architecture Detailed Drawings - K559-2254-IC-SPE-001 SYSTEM SPECIFICATION FOR MAIN AUTOMATION CONTRACTOR - K559-2254-PR-BLD-001 BLOCK FLOW DIAGRAM SYSTEM OVERVIEW - K559-2254-EL-LST-001 CONTROL ALARM AND MONITORING TABLE - 123A90-DDL-IN-SP-40024 Alarm System Requirements Specification - 123A90-DDL-IN-DD-40019 Data Network Architecture Drawings System Architecture Drawing Refer documents - 1724000594-IN-LIS-00003 Bill Of Material - Section 8.3,9, 24, 28.5.2, 28.10.1 of Reference PCS and SAFETY SYSTEMS Software Functional Design Specification (FDS-SW) 1724000594-IN-SP-00018 - Instrument IO list 1724000594-IN-LIS-00004
Procedure	Check the naming conventions for the following are in accordance with the FDS: ▪ Plant hierarchy – check the section naming and structure under the node in CI Server Engineering module and confirm that it conforms to the FDS plant hierarchy convention. ▪ Items – review the item names under the sections and confirm that the naming conforms to the FCS tag naming convention (e.g.: A, SH, SL). ▪ Displays – check the graphic names in the Edit Module and confirm that they conform to the FDS graphic naming convention. The display name shall be followed as per the P&ID/SLDs.

	▪ Static and dynamic symbols – check the symbol names in the Edit Module and confirm that they conform to the FDS graphics naming convention.
Criteria	The naming conventions match the customer convention requirements
Test Record Reference	HMI Screen and Engineering Module Printout

The above checks are conducted and witnessed by the following representatives.

7.2 AUDIT TRAIL

Outline	The generated events are recorded and can be traced
Objective	To verify the event generated by the operator can be traced
Reference	Functional Specifications - Section 14.8, 28.5.7 of Reference PCS and SAFETY SYSTEMS Software Functional Design Specification (FDS-SW) 1724000594-IN-SP-00018 Refer Documents - 123A90-DDL-IN-SP-40097 System Specification for Main Automation Contractor - 123A90-DDL-IN-SP-40098 Control System (PCS) Specification - 123A90-DDL-IN-SP-40100 Safety System (ESD, Fire and Gas) Specification - 123A90-DDL-IN-RE-40093 Control System Philosophy - 123A90-DDL-IN-SP-40024 Alarm System Requirements Specification - 123A90-DDL-PR-RE-80031 Process Control, Operation, Start-up and Shutdown Philosophy
Procedure	Generate some events which have to be recorded in the audit trail window in the operator interface.
Criteria	The generated events are logged in the respective display.
Test Record Reference	Audit Trail Window printout

The above checks are conducted and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

Representative : _____ Date: _____

7.3 HISTORISATION

Outline	History data is acquired for applications like reporting, alarm pages and trending and therefore the correct configuration is very important to trace significant events in the past.
Objective	To verify the history configuration meets the customer requirements.
Reference	Functional Specifications - Section 28.5.1 of Reference PCS and SAFETY SYSTEMS Software Functional Design Doc.No. 1724000594-IN-SP-00018 - History Storage calculation sheet Refer Documents - 123A90-DDL-IN-SP-40097 System Specification for Main Automation Contractor - 123A90-DDL-IN-SP-40098 Control System (PCS) Specification - 123A90-DDL-IN-SP-40100 Safety System (ESD, Fire and Gas) Specification - 123A90-DDL-IN-RE-40093 Control System Philosophy - 123A90-DDL-IN-SP-40024 Alarm System Requirements Specification - 123A90-DDL-PR-RE-80031 Process Control, Operation, Start-up and Shutdown Philosophy
Procedure	▪ Verify the history storage path ▪ Check the lifetime for the following history groups: - Item storage groups: SCAN/ITEM EVENT/EVENT EVENT/ITEM Generate randomly events for items in each storage groups to verify the timestamp of the generated events.
Criteria	The storage drive has enough space to match the size of the total history lifetime. This could be verified by using a history calculation sheet. The lifetime of the history groups is correctly implemented. Generated events could be observed using reports or trend displays.
Test Record Reference	Trend Display printout and generated csv report file

The above checks are conducted and witnessed by the following representatives.

7.4 AUTHORIZATION

Outline	The level of authorization for the typical is verified in typical FAT prior to the FAT. E.g., the operator can modify a setpoint but is not able to set the tag in calibration mode. In this test case the general CI Server configuration part will be tested which is the framework for the application typical.
Objective	Verify if all authorization groups and users are configured according to the design documentation
Reference	Functional Specifications - Section 28.8 of Reference PCS and SAFETY SYSTEMS Software Functional Design Doc.No. 1724000594-IN-SP-00018 Refer Documents - 123A90-DDL-IN-SP-40097 System Specification for Main Automation Contractor - 123A90-DDL-IN-SP-40098 Control System (PCS) Specification - 123A90-DDL-IN-SP-40100 Safety System (ESD, Fire and Gas) Specification - 123A90-DDL-IN-RE-40093 Control System Philosophy - 123A90-DDL-IN-SP-40024 Alarm System Requirements Specification - 123A90-DDL-PR-RE-80031 Process Control, Operation, Start-up and Shutdown Philosophy
Procedure	▪ Authorization groups are configured correctly. ▪ All the required users are added in CI Server with the proper authorization groups. ▪ Users are authorized to modify items within their process area (e.g., acknowledge, value) ▪ Users are authorized to open displays within their process area
Criteria	All Authorization levels are configured properly. All required users are configured properly. Users have (only) access to their process area
Test Record Reference	NA

The above checks are conducted and witnessed by the following representatives.

8 GRAPHICAL USER INTERFACE

8.1 GENERAL LAYOUT AND NAVIGATION

Outline	CI Server graphics are used as the Human-Machine Interface for operating the plant. The live status of the plant can be observed on the graphics and these data are obtained from the Centum VP and SIS controller.
Objective	The purpose of this test is to confirm that the frames of the general layout are configured according to the design specification.
Reference	Functional Specifications - Section 30 of Reference PCS and SAFETY SYSTEMS Software Functional Design Doc. No. 1724000594-IN-SP-00018 Refer Documents - 123A90-DDL-IN-SP-40097 System Specification for Main Automation Contractor - 123A90-DDL-IN-SP-40098 Control System (PCS) Specification - 123A90-DDL-IN-RE-40093 Control System Philosophy - 123A90-DDL-IN-SP-40024 Alarm System Requirements Specification - 123A90-DDL-IN-DD-40096 Rev.00 Control System Architecture Detailed Drawings - 123A90-DDL-IN-DD-40029 Rev.00 Automation Detailed Design and Construction Package - P&IDs and Single line diagrams
Procedure	Verify the general layout of the display area: ▪ Windows heading ▪ Menu area ▪ Toolbar area ▪ Display area ▪ Display Navigation Verify the display navigation is in accordance with the design document.
Criteria	Graphics layout, display navigation are according to what was approved and correctly displayed as specified in the reference document.
Test Record Reference	Graphic printouts.

The above checks are conducted and witnessed by the following representatives.

8.2 PROCESS DISPLAYS

Outline	CI Server graphics are used as the Human-Machine Interface for operating the plant. The live status of the plant can be observed on the graphics and these data are obtained from the CENTUM VP and SIS controller. All dynamic process data and alarms shall be simulated from the test panels or from software (forcing).
Objective	The purpose of this test is to confirm that: ▪ Correct process flow is shown on the process displays and popups. ▪ Correct process data is shown on the process displays and popups.
Reference	Functional Specifications - Reference PCS and SAFETY SYSTEMS Software Functional Design 1724000594-IN-SP-00018 - Reference Instrument IO List 1724000594-IN-LIS-00004 - Reference HMI screens print out 1724000594-QC-PRO-00032 - P&IDs & SLDs. Refer Documents - 123A90-DDL-IN-SP-40097 System Specification for Main Automation Contractor - 123A90-DDL-IN-SP-40098 Control System (PCS) Specification - 123A90-DDL-IN-RE-40093 Control System Philosophy - 123A90-DDL-IN-SP-40024 Alarm System Requirements Specification - 123A90-DDL-IN-DD-40096 Rev.00 Control System Architecture Detailed Drawings - 123A90-DDL-IN-DD-40029 Rev.00 Automation Detailed Design and Construction Package - P&IDs and Single line diagrams
Procedure	The test environment shall include Test Function FCSs with project configuration to provide data to the tags on each display. Check the following for the process display: ▪ Correct representation of the process flow ▪ Correct representation of the process data points. ▪ Dynamic data and element modifiers by simulating process data.
Criteria	All process displays and popups are according to what was approved and correctly implemented as specified in the reference document(s).
Test Record Reference	Graphic printouts.

The above checks are conducted and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

8.3 SYMBOLS AND FACEPLATES

Outline	CI Server graphics are used as the Human-Machine Interface for operating the plant. The live status of the plant can be observed on the graphics and these data are obtained from the CENTUM VP controller. All dynamic process data and alarms shall be simulated from the test panels or from software (forcing).
Objective	The purpose of this test is to confirm that: ▪ Symbols, faceplates, and tuning panels are generated and functioning according to specifications.
Reference	Functional Specifications - Reference PCS and SAFETY SYSTEMS Software Functional Design Doc. No. 1724000594-IN-SP-00018 Refer Documents - 123A90-DDL-IN-SP-40097 System Specification for Main Automation Contractor - 123A90-DDL-IN-SP-40098 Control System (PCS) Specification - 123A90-DDL-IN-RE-40093 Control System Philosophy - 123A90-DDL-IN-SP-40024 Alarm System Requirements Specification - 123A90-DDL-IN-DD-40096 Rev.00 Control System Architecture Detailed Drawings - 123A90-DDL-IN-DD-40029 Rev.00 Automation Detailed Design and Construction Package - P&IDs and Single line diagrams
Procedure	The test environment shall include Test Function FCSs with project configuration to provide data to the tags on each display. Check the following for the symbols and faceplates: ▪ The sizes, colours, lines, fonts and shapes for the symbols, faceplates. ▪ Process Value and Engineering unit. ▪ Forcing the value from HMI, by changing the operation Modes. ▪ Alarm and status indication.
Criteria	All static and dynamic symbols and related faceplates are according to what was approved and correctly implemented as specified in the reference document.
Test Record Reference	Graphic printouts.

The above checks are conducted and witnessed by the following representatives.

8.4 ALARMS PAGES

Outline	CI Server graphics are used as the Human-Machine Interface for operating the plant. The related graphics shall show the generated alarm, time-stamp, Alarm text and Priority upon forcing the values from test panels.
Objective	The purpose of this test is to confirm that: ▪ The layout and function of the alarm pages is according to specifications.
Reference	Functional Specifications: - - 1724000594-IN-SP-00018 PCS and SAFETY SYSTEMS Software Functional Design. Section 28.6 - 1724000594-IN-LIS-00004 - Reference Instrument IO List Input documents - 123A90-DDL-IN-SP-40097 Reference Documents - 123A90-DDL-IN-SP-40098 System Specification for Main Automation Contractor - 123A90-DDL-IN-SP-40024 Control System (PCS) Specification - 123A90-DDL-IN-LIS-40027 Alarm System Requirements Specification - 1724000594-IN-LIS-00004 Reference Instrument IO List - Section Master Alarm Database 123A90-DDL-IN-LIS-40027 - P&IDs & SLDs
Procedure	Check the following for the process display: ▪ Layout ▪ Colours and priorities ▪ Alarm sorting ▪ Available columns ▪ Column width ▪ Alarm time format ▪ Available filters (fixed or changeable) ▪ Alarm line layout (for different state transitions) ▪ Alarm Description
Criteria	The alarm overview displays are according to what was approved and correctly implemented as specified in the reference document(s).
Test Record Reference	Graphic printouts.

The above checks are conducted and witnessed by the following representatives.

TEST RESULT: PASS / FAIL

8.5 ALARM FUNCTION

Outline	All the alarm functions within CI Server and the related project specific configuration are implemented.
Objective	To verify all the alarm requirements are correctly implemented.
Reference	Functional Specifications: - 1724000594-IN-SP-00018 PCS and SAFETY SYSTEMS Software - Functional Design. Section 30.2.5 - 1724000594-IN-LIS-00004 Reference Instrument IO List Refer documents - 123A90-DDL-IN-SP-40097 System Specification for Main Automation Contractor - 123A90-DDL-IN-SP-40098 Control System (PCS) Specification - 123A90-DDL-IN-SP-40024 Alarm System Requirements Specification - 123A90-DDL-IN-LIS-40027 Master Alarm Database
Procedure	Verify the following is implemented correctly: ▪ Acknowledgement types ▪ Alarm collection behaviour ▪ First-out group behaviour ▪ Alarm group behaviour ▪ Alarm Selection area ▪ Areas of interest ▪ Alarm priority ▪ Alarm destinations e.g., audible alarm annunciation, alarm notification SMTP, alarm pages, alarm printers, … ▪ Historical alarm lifetime
Criteria	The alarm portion within CI Server is configured in accordance with the reference document
Test Record Reference	Graphic printouts.

The above checks are conducted and witnessed by the following representatives.

8.6 TREND FUNCTION

Outline	All the trend functions within CI Server and the related project specific configuration are implemented.
Objective	To verify all the Trend Group requirements are correctly implemented. ▪ Group ▪ Label ▪ Description ▪ Sampling Time ▪ Duration ▪ Pen assignment
Reference	Functional Specifications: ▪ Section 30.2.5 of Reference PCS and SAFETY SYSTEMS Software Functional Design Doc.No. 1724000594-IN-SP-00018 ▪ Reference Instrument IO List 1724000594-IN-LIS-00004 Refer documents ▪ System Specification for Main Automation Contractor 123A90-DDL-IN-SP-40097 ▪ 123A90-DDL-IN-SP-40098 Control System (PCS) Specification ▪ 123A90-DDL-IN-SP-40024 Alarm System Requirements Specification ▪ 123A90-DDL-IN-LIS-40027 Master Alarm Database
Procedure	Verify the following is implemented correctly as per the "Trend Group" in latest Project database Tag List Reference Document. The trend group shall be as per the P&ID ▪ Trend generation for over a period by selecting the date and time range.
Criteria	The trend groups within CI Server are implemented in accordance with the reference document.
Test Record Reference	Graphic Printout

9 SIS AND FGS APPLICATION SOFTWARE

9.1 SCS PROJECT OVERALL FUNCTION

Outline	Application inspection of project overall function include verifying SCS Resource Properties, SCS Project Properties and SCS Constants Builder.
Objective	To verify that the project overall function of SCS project is defined according to the FDS requirements.
Reference	1. SW Functional Design Specifications 2. ProSafe-RS system print out (Self documentation)
Procedure	Verify ProSafe-RS Project configuration files for SCS Resource properties, SCS Project Properties, and SCS Constants Builder as a part of paper check during pre-FAT. Refer to detail checklists are in Check sheet Appendix-10.5
Criteria (Expected Result)	The SCS Resource Properties, SCS Project Properties and SCS Constants Builder are defined according to the FDS. Refer attached highlighted printout.
Test Record Reference	Appendix-10.5 Application Software Test Case & Record (Project Overall Check)

The above check will be conducted for all SCSs and witnessed by the following representatives:

9.2 SCS FUNCTION

9.2.1 Application Software Test for Typical Logics

Outline	Typical logic functions are those which are defined under software Typicals such as MOS logic, Reset logic, AI blocks, Voted input blocks, Gas detector typical logic etc. as listed in the software typical design specification document. These are checked by selecting a sample loop and simulating inputs using the test panel (and/or software simulation tool as option) and observing the behavior of the logic / outputs.
Objective	To verify that the software typical logic functions are configured according to the project requirement.
Reference	1. Software Functional Design Specifications 2. Instrument I/O List 123A90-DDL-IN-LIS-40089 3. P&IDs
Procedure	1. Verify the latest Typicals are used by document check. 2. Simulate input signals to check software typical logic function. 3. Check other related functions: • Trips • Communication signals to PCS. • First Up Alarm, Process Alarms / Annunciator messages on HIS • SOE output • IOP (Bad Status) 4. Check other specific functions, if any. Detail checklists are described on the Check sheet Appendix-10.5
Criteria (Expected Result)	The logic functionalities are achieved in accordance to Typical Software Design Specifications. Refer attached highlighted logic printout.
Test Record Reference	Appendix-10.5 Application Software Test Case & Record (Typical Logic Check)

The above check will be conducted for all Typical logics and witnessed by the following representatives:

TEST RESULT: PASS / FAIL

Representative : _____ Date: _____

9.2.2 Application Software Test for Logics

Outline	SCS Application Logic functions are implemented using the FBD (Functional Block Diagram) language. These are configured in accordance with plant logic requirements as described in the C&E (Cause & Effect) Matrix prepared by the RM. Logic functions are checked by simulating field inputs using the test panel (and/or software simulation tool as option) and confirming the logic functions together with expected outputs.
Objective	To verify that the application logic functions are configured according to C&E Matrix and/or Safeguarding narratives.
Reference	1. Cause & Effect Matrix 2. Safety validation Plan 3. Software Functional Specification.
Procedure	1. Check the initial functional status of logic upon SCS startup. 2. Normalize all inputs with simulation signals by the test panel (and/or software simulation tool as option) and reset logic to energize output(s) in the case of De-energize to trip logic. (In case of Energize to trip logic, the outputs are de-energized when normalized) 3. Simulate trip condition for a trip input signal using the test panel (and/or software simulation tool as option). 4. Check output trip status, appropriate alarm messages, etc. 5. Normalize and Repeat test for all trip inputs one after another. 6. Check Bypass functions and abnormal situations (Fault conditions). 7. Check the status on Interlock and/or Cause & Effects Graphics 8. Voted logic configuration is as per identified Safety Analysis Function Evaluation (SAFE) charts as per requirements in SVP. Note: For Projects using T/C and/or RTD input modules, the field signals shall be simulated using software simulation for logic test. If the logic test is done using hardwired test panel, the SIS will run in simulation mode with T/C and/or RTD input modules disconnected to facilitate software simulation and rest of the IO modules connected for simulation from test panel. Detail checklists are described on the Check sheet Appendix-10.5
Criteria (Expected Results)	1. Logic functions is functioning correctly according to Cause & Effects. Refer attached highlighted logic printout
Test Record Reference	Appendix-10.5 Application Software Test Case & Record (Safety Logic check)

The above check will be conducted for all Safety Logics/Interlocks

TEST RESULT: PASS / FAIL

9.2.3 Application Software Test for Non-Safety Logics

Outline	The IEC standards 61508 and 61511 require ensuring that program logic has been programmed in a safe way. Checks below are additional tests to the build-in checks in the ProSafe-RS workbench.
Objective	To verify that the application logic functions are configured according to C&E Matrix.
Reference	Cause & Effect Matrix
Procedure	1. Check if any inverter blocks are used and if any check the logic is programmed fail-safe. 2. Check if DIV blocks are not or cannot be divided by zero (0). Variables used should not be allowed to get to zero (0) 3. Check if SR and RS blocks are chosen correctly. The trip condition should always have a higher priority than the reset of that trip. 4. Check on F_TRIG and R_TRIG blocks in trip functions that trips are latched or extended by a timer function. 5. Safety communication blocks or field input channels should not be configured to go to "HOLD" in case of a failure. 6. Structured text, preferably avoided, and if used well documented and preferably only in non-safety related applications. 7. Has diagnostic information from logic solver, sensors, inputs, outputs and final elements been followed-up with alarming to the operator, sequence of event recording or a system trip? 8. The results of the Cross-reference check should be checked for secondary write actions on variables. Detail checklists are described on the Check sheet Appendix-10.5
Criteria (Expected Results)	Logic functions is functioning correctly according to Cause & Effects. Refer attached highlighted logic printout
Test Record Reference	Appendix-10.5 Application Software Test Case & Record (Non – Safety Logic Check)

The above check will be conducted for all Non Safety Logics

TEST RESULT: PASS / FAIL

YOKOGAWA Representative : _____ Date: _____

Rosetti Marino Representative : _____ Date: _____

Crosswind Representative : _____ Date: _____

9.2.4 Inter-SCS Safety Communication and Interference-free Communication between SCS & FCS

Outline	For some applications, the Safety Instrumented Function may include I/Os from different SCS and the logic may extend from one SCS to another SCS. In such cases, safety data need to be exchanged between different SCSs while maintaining the SIL as part of the Safety Loop. This can be achieved via SCS Link Transmission function within domain. Such safety communication is TÜV certified up to SIL3. For other applications, non-safety related data may be required to be exchanged between SCS and FCS. In this case, the SCS Global Switch Communication and the External Communication Function Blocks can also be used for interference-free Communications.
Objective	To verify that both the Inter-SCS Safety Communication and Interference-free Communication function properly and the associated logic is executed as desired.
Reference	1. ProSafe-RS Instruction Manual (Safety Manual, Safety Control Station and Engineering Reference) 2. Cause & Effect Matrix 3. SW FDS 4. ProSafe-RS system print out
Procedure	1. From SENG/HIS, monitor the "NORMAL" state of logic for which trip inputs/outputs comprise of Inter-SCS Safety Communication. 2. Trigger the logic / value changes on the Sending Side either through direct IO injection or forcing to simulate a 'Trip' condition. 3. From SENG/HIS, monitor the "TRIP" state of logic on the receiver side of the Destination SCS 4. Repeat the same steps above for SCS with Redundant CPUs while one CPU is in 'STOP' mode. (Both CPUs to be tested alternately). 5. From HIS logic chart or sequence table display, monitor the Normal state of a Trip bit of an SCS Interlock that is referenced in an FCS. 6. By using SENG IO force function, force the Interlock Trip bit to "Trip" state and verify that the FCS reads the Trip bit status change and execute the desired logic. 7. Fail both the redundant V net or Vnet/IP buses and test the Safety Communication Timeout/Delay and Failsafe Value settings to examine safe state is achieved. Detail checklists are described on the Check sheet Appendix-10.5
Criteria (Expected Results)	1. The Inter-SCS Safety / Interference-free Communications are configured and executed as per application requirement. 2. Failsafe values are output on failure of both buses of V net or Vnet/IP
Test Record Reference	Appendix-10.5 Application Software Test Case & Record (Inter-SCS, SCS_FCS Comm. Check)

The above check will be conducted for all applicable Safety Logics/Interlocks and witnessed by the following representatives:

TEST RESULT: PASS / FAIL

9.3 APPLICATION REVISION CHECK

Outline	Register the revision of the safety application at the end of internal FAT and End of FAT.
Objective	Register final application revision at end of FAT. Register FAT starting application revision
Reference	n/a
Procedure	1. In the workbench open the revision control sheet of the controller and update the revision 2. Open Database validity check tool and record the CRC. 3. Record the application revision in Appendix- 10.4 Application revision Record.
Criteria (Expected Results)	End of Internal-FAT revision and CRC will be used to verify at start of FAT. End of FAT revision and CRC will be used to verify at start of SAT. Refer attached highlighted printout (Revision control and database validity tool result).

The above check will be conducted for all the controllers and witnessed by following representatives.

10 EMCS APPLICATION SOFTWARE

10.1 PROJECT OVERALL FUNCTION

10.1.1 Project Common Setting Check

Outline	Inspection of project overall function include verifying project common configuration like OPC UA interface Signals, Data exchange/Receive from OPC UA server to CCS SCADA, Transition of Modes, and Configuration of parameters.
Objective	- Verify that the project overall SW function of RTAC is defined according to the EMCS FDS-SW requirements.
Reference	- Functional Specifications like; - 1724000594-IN-DD-00015- System Architecture Drawing - 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW - 1724000594-IN-LIS-00005_R00- EMCS_IO_List
Procedure	Verify following configuration as a part of paper check during FAT: • Software Test for OPC UA interface Signals • Software Test for Data exchange/Receive from OPC UA server to CCS SCADA Operation mark • Software Test for Transition of Modes Sequence & Logic • Software Test for Configuration of Parameters
Criteria	OPC UA interface Signals, Data exchange/Receive from OPC UA server to CCS SCADA, Transition of Modes, and Configuration test of parameters are configured according to the EMCS FDS-SW.

The above checks are conducted and witnessed by following representatives.

TEST RESULT: PASS / FAIL

YEF-I Representative : _____ Date: _____

RM Representative : _____ Date: _____

Crosswind Representative : _____ Date: _____

10.2 EMCS FUNCTION

10.2.1 Software Test for OPC UA Interface Signals

Outline	OPC UA interface signals match the signals that have been identified in the EMCS IO list.
Objective	- Visualize and compare the matching signals in the OPC UA server address space
Reference	- Functional Specifications like; - 1724000594-IN-DD-00015- System Architecture Drawing - 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW - 1724000594-IN-LIS-00005_R00- EMCS_IO_List
Procedure	By browsing the OPC UA server address space, it is possible to visualize all the available signals of the EMCS and compare them with the signals defined in the EMCS IO list.
Criteria	The signals in the OPC UA address space are the same as those defined in the EMCS IO list

The above checks are conducted and witnessed by following representatives.

TEST RESULT: PASS / FAIL

RM Representative : _____ Date: _____

Crosswind Representative : _____ Date: _____

10.2.2 Software Test for Data Exchanged from OPC UA server to CCS SCADA

Outline	EMCS has an OPC UA server that provides data to the CCS SCADA and receives commands from the CCS SCADA. A test dashboard, developed on purpose, will be connected to the OPC UA server. The test dashboard tool is intended to be used only for FAT and IFAT.
Objective	Verify that the complex control configuration functions work as defined in the approved functional specifications.
Reference	- Functional Specifications like; - 1724000594-IN-DD-00015- System Architecture Drawing - 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW - 1724000594-IN-LIS-00005_R00- EMCS_IO_List
Procedure	Visualize the test dashboard and simulate the change of the process variables using the GUI. Follow the change of the EMCS state machine, and verify the actuations performed in each company provided package. Visualize each package in terms of setpoints and measurements.
Criteria	The modes and status of the EMCS match what is mentioned in the EMCS FDS-SW

The above checks are conducted and witnessed by following representatives.

10.2.3 Software Test for Transition of Modes Sequence & Logic

Outline	Transitions in the modes of the EMCS software logic, both Automatic and Manual, change the status of the current mode following the transition in each package.
Objective	Performing the TEST to verify the logic for the transition from EMCS Automatic to EMCS Manual (Maintenance & Research)
Reference	- Functional Specifications like; - 1724000594-IN-DD-00015- System Architecture Drawing - 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW - 1724000594-IN-LIS-00005_R00- EMCS_IO_List
Procedure	- Using the test GUI, change the EMCS mode from automatic to manual (Maintenance & Research) and verify the correctness of the reached mode.
Criteria	The modes and status of the EMCS match what is mentioned in the EMCS FDS-SW

The above checks are conducted and witnessed by following representatives.

TEST RESULT: PASS / FAIL

YEF-I Representative : _____ Date: _____

RM Representative : _____ Date: _____

Crosswind Representative : _____ Date: _____

10.2.4 Software Test for Configuration of Parameters

Outline	The configuration test of the EMCS parameters.
Objective	- Verify the configuration test of the EMCS parameters identifying that EMCS can be configured via the OPC UA interface
Reference	- Functional Specifications like; - 1724000594-IN-DD-00015- System Architecture Drawing - 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW - 1724000594-IN-LIS-00005_R00- EMCS_IO_List
Procedure	Using the GUI, or directly an OPC-UA client, change the parameters of the EMCS. The parameter change directly affects the control logic.
Criteria	Verify that the changed parameters will affect the control logic accordingly the EMCS FDS.

The above checks are conducted and witnessed by following representatives.

TEST RESULT: PASS / FAIL

YEF-I Representative : _____ Date: _____

RM Representative : _____ Date: _____

Crosswind Representative : _____ Date: _____

EMCS APPLICATION SOFTWARE

1.1 PROJECT OVERALL FUNCTION

1.1.1 Project Common Setting Check

Outline	Inspection of project overall function include verifying project common configuration like OPC UA interface Signals, Data exchange/Receive from OPC UA server to CCS SCADA, Transition of Modes, and Configuration of parameters.
Objective	- Verify that the project overall SW function of RTAC is defined according to the EMCS FDS-SW requirements.
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Verify following configuration as a part of paper check during FAT: • Software Test for OPC UA interface Signals • Software Test for Data exchange/Receive from OPC UA server to CCS SCADA Operation mark • Software Test for Transition of Modes Sequence & Logic • Software Test for Configuration of Parameters
Criteria	OPC UA interface Signals, Data exchange/Receive from OPC UA server to CCS SCADA, Transition of Modes, and Configuration test of parameters are configured according to the EMCS FDS-SW.

1.2 EMCS FUNCTION

1.2.1 Software Test for OPC UA Interface Signals

Outline	OPC UA interface signals match the signals that have been identified in the EMCS IO list.
Objective	- Visualize and compare the matching signals in the OPC UA server address space
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	By browsing the OPC UA server address space, it is possible to visualize all the available signals of the EMCS and compare them with the signals defined in the EMCS IO list.
Criteria	The signals in the OPC UA address space are the same as those defined in the EMCS IO list

The above checks are conducted and witnessed by following representatives.

1.2.2 Software Test for Data Exchanged from OPC UA server to CCS SCADA

Outline	EMCS has an OPC UA server that provides data to the CCS SCADA and receives commands from the CCS SCADA. A test dashboard, developed on purpose, will be connected to the OPC UA server. The test dashboard tool is intended to be used only for FAT and IFAT.
Objective	Verify that the complex control configuration functions work as defined in the approved functional specifications.
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Visualize the test dashboard and simulate the change of the process variables using the GUI. Follow the change of the EMCS state machine, and verify the actuations performed in each company provided package. Visualize each package in terms of setpoints and measurements.
Criteria	The modes and status of the EMCS match what is mentioned in the EMCS FDS- SW

The above checks are conducted and witnessed by following representatives.

1.2.3 Software Test for Transition of Modes Sequence & Logic

Outline	Transitions in the modes of the EMCS software logic, both Automatic and Manual, change the status of the current mode following the transition in each package.
Objective	Performing the TEST to verify the logic for the transition from EMCS Automatic to EMCS Manual (Maintenance & Research)
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906

1.2.4 Software Test for Configuration of Parameters

Outline	The configuration test of the EMCS parameters.
Objective	- Verify the configuration test of the EMCS parameters identifying that EMCS can be configured via the OPC UA interface
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Using the GUI, or directly an OPC-UA client, change the parameters of the EMCS. The parameter change directly affects the control logic.
Criteria	Verify that the changed parameters will affect the control logic accordingly the EMCS FDS.

The above checks are conducted and witnessed by following representatives.

1.2.5 Software Test for Configuration of Electrolyzer State Machine

Outline	The configuration test of the Electrolyzer Package State Machine.
Objective	- Verify the configuration test of the Electrolyzer State Machine identifying that State Machine is configured as per transitions between these states based on conditions like running duration and PCS permission.(For Example: the system will transition to Stop state if PCS permission is revoked (i.e., Tanks are full).
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Using the GUI, or directly an OPC-UA client, change the parameters of the EMCS. The parameter change directly affects the control logic, The BLPH State Machine will correspond with Electrolyzer State Machine, to do the following: • EMCS requires permissive signal from PCS to start the Electrolyzer. (i.e. PCS.PermToStartEL). • EMCS shall not partialize the Electrolyzer, requiring it either to not produce or to produce at full power (EL_MAX_SET_POINT). • If the PCS.PermToStartEL is not fulfilled the Electrolyzer will be stopped by EMCS.
Criteria	Verify that the changed parameters will affect the control logic accordingly the EMCS FDS reference 4.2.1.6.

The above checks are conducted and witnessed by following representatives.

1.2.6 Software Test for Configuration of Fuel Cell State Machine

Outline	The configuration test of the Fuel Cell Package State Machine.
Objective	- Verify the configuration test of the Fuel Cell State Machine identifying that State Machine is configured as per transitions between these states including Running, Stoppable, Unstoppable, Start-able, Unstart-able, and Stop. Transitions are dictated by conditions such as PCS permission (i.e., hydrogen level). The Fuel Cell can start if the PCS permission is granted, while the system will stop if PCS permission is revoked.
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Using the GUI, or directly an OPC-UA client, change the parameters of the EMCS. The parameter change directly affects the control logic, The BLPH State Machine will correspond with Fuel Cell State Machine.
Criteria	Verify that the changed parameters will affect the control logic accordingly the EMCS FDS reference 4.2.1.7.

The above checks are conducted and witnessed by following representatives.

1.2.7 Software Test for Configuration of BESS State Machine

Outline	The configuration test of the BESS Package State Machine.
Objective	- Verify the configuration test of the BESS State Machine identifying that State Machine is configured as per transitions between these States include Charging, Discharging, and Idle, influenced by the State of Charge (SoC) and PCS permissions via EMCS. The system will charge if the SoC is below the maximum threshold and PCS permission is granted via EMCS, and it will discharge if the SoC is above the minimum threshold and PCS permission is granted via EMCS. The system transitions to Idle if PCS permission is revoked via EMCS.
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Using the GUI, or directly an OPC-UA client, change the parameters of the EMCS. The parameter change directly affects the control logic, The BLPH State Machine will correspond with BESS State Machine to do the following: • Charge Transition • Discharge Transition • Stop Transition
Criteria	Verify that the changed parameters will affect the control logic accordingly the EMCS FDS reference 4.2.1.8.

The above checks are conducted and witnessed by following representatives.

1.2.8 Software Test for Configuration of Solar Farm State Machine

Outline	The configuration test of the Solar Farm Package State Machine.
Objective	- Verify the configuration test of the Solar Farm State Machine identifying that State Machine is configured as per transitions between these States include transitions between "Started" and "Stopped" states within the broader context of "Operating." The "Started" state the system is actively managing or generating energy, whereas the "Stopped" state signifies that the system is not operating and has been shut down. the "Started" state, there is a loop indicating the "Curtail" action (EMERGENCY MODE only),
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Using the GUI, or directly an OPC-UA client, change the parameters of the EMCS. The parameter change directly affects the control logic, The BLPH State Machine will correspond with Solar Farm State Machine.
Criteria	Verify that the changed parameters will affect the control logic accordingly the EMCS FDS reference 4.2.1.9.

The above checks are conducted and witnessed by following representatives.

Outline	The configuration test of the BLPH MODE 4 = COLD STANDBY
Objective	- Verify the configuration test of the MODE 4 = COLD STANDBY, BLPH shall enter in the COLD STANDBY MODE if: • It is Grid Tied • Supply Guarantee is Active • HNA5 is produce less than 1 MW for one minute • BESS is NOT able to operate in Export (BESS Fault)
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Using the GUI, or directly an OPC-UA client, change the parameters of the EMCS. The parameter change directly affects the control logic and transit to COLD STANDBY MODE.
Criteria	Verify that the changed parameters will affect the control logic accordingly the EMCS FDS reference 4.2.1.7.7.

The above checks are conducted and witnessed by following representatives.

1.2.16 Software Test for Configuration of BLPH MODE 4A = EMERGENCY (ISLAND)

Outline	The configuration test of the BLPH MODE 4A = EMERGENCY (ISLAND)
Objective	- Verify the configuration test of the MODE 4A = EMERGENCY, BLPH shall enter in the EMERGENCY MODE if: • It is Islanded (off-gid) • BESS is Healthy (NO Fault) • The BESS charge level is above the BESS-MINIMUM-OPERATING- RESERVE threshold.
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Using the GUI, or directly an OPC-UA client, change the parameters of the EMCS. The parameter change directly affects the control logic and transit to EMERGENCY MODE.
Criteria	Verify that the changed parameters will affect the control logic accordingly the EMCS FDS reference 4.2.1.7.8.

The above checks are conducted and witnessed by following representatives.

1.2.17 Software Test for Configuration of BLPH MODE 5 = POWER OUT (Black Out)

Outline	The configuration test of the BLPH MODE 5 = POWER OUT (Black Out)
Objective	- Verify the configuration test of the MODE 5 = POWER OUT, BLPH shall enter in the POWER OUT MODE if: • It is Islanded (off grid) • Either the BESS charge level is below the BESS-MINIMUM- OPERATING-RESERVE threshold (BESS FAULT) or the SG-100D1 voltage measure on the BLPH 6.6kV distribution bus is absent. • EMCS is informed of ESD-1D activation (reference doc. "Process Safety Cause & Effect Matrix"). • BESS is NOT Healthy.
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906

1.2.18 Software Test for Configuration of BLPH MODE 6 = MAINTENANCE

Outline	The configuration test of the BLPH MODE 6 = MAINTENANCE
Objective	- Verify the configuration test of the MODE 6 = MAINTENANCE, BLPH shall enter and remain in this MODE if receives the request to enter from CCS SCADA. The BLPH shall exit from the MAINTENANCE MODE if, and only if, the EMCS receives the request to return in automatic identification of the MODE from the data interface of the CCS SCADA through a software exit button. In MAINTENANCE MODE the EMCS shall not dispatch any command required by any automatic logic in the EMCS, including any open/close command, load shedding command, change in power setpoint. - Transition Conditions: Entrance on a command to get in the MANTENANCE MODE, Exit on a command to return in automation identification of the MODE.
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Using the GUI, or directly an OPC-UA client, change the parameters of the EMCS. The parameter change directly affects the control logic and transit to MAINTENANCE MODE.
Criteria	Verify that the changed parameters will affect the control logic accordingly the EMCS FDS reference 4.2.1.7.10.

The above checks are conducted and witnessed by following representatives.

1.2.20 Software Test for Configuration of OPC-UA Communication Loss Between HV- SCADA & EMCS

Outline	The configuration test for the loss of OPC-UA communication between HV-SCADA & EMCS
Objective	- Verify the configuration test of the EMCS, in case of OPC-UA communication between the HV-SCADA and EMCS is lost, the EMCS does not take any automatic action on 66kV GIS. In conjunction with this communication loss, the EMCS will immediately command the platform in IDLE MODE "PCS.EnterMode(IDLE)"
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Using the GUI, or directly interrupting an OPC-UA client communication, change the parameters of the EMCS. The parameter change directly affects the control logic and transit to IDLE MODE with "PCS.EnterMode(IDLE)".
Criteria	Verify that the changed parameters will affect the control logic accordingly the EMCS FDS reference 4.4.

The above checks are conducted and witnessed by following representatives.

1.2.21 Software Test for Configuration of 66kV GIS

Outline	The configuration test for the status of signals & electrical sequence to manage the closing of GIS on BLPH.
Objective	- Verify the configuration test of the EMCS, to manage the closing of GIS on BLPH, Wind Farm will have a direct connection to the BLPH 66 kV GIS CB for control & monitoring, the electrical sequence is as follows: • Q0(QA1) "CB Open" command, directly to the BLPH GIS from HV- SCADA • Q0(QA1) "Ready to close" permissive to EMCS from HV-SCADA • Full control of QZ92 line and earthing switches from HV-SCADA (not controlled by EMCS) BLPH Q0(QA1) "CB Close" command and "CB Open" commands will also be available to BLPH GIS by the EMCS.
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00019- EMCS Software Functional Design Specification FDS-SW • 1724000594-IN-LIS-00005_R00- EMCS_IO_List • 123A90-DDL-IN-RE-40095 Process Control Logics Description • 1724000594-IN-DD-00028 HMI screen print out • 1723002197-EL-LIS-00043 - SG-200D2 I/O List Lv Switchgear • 23A2007_240628_PROFINET_Register BESS_V1_0_0_3 • 1723002197-EL-LIS-00041 - SG-100D1 I/O LIST HV Switchgear • 1723002197-EL-LIS-00042 - SG-200N1 I/O LIST Lv Switchgear • 1724000372-EL-LIS-00014 - I/O LIST • C63-AUT-002_03_Communication table • Crosswind Modbus Table - Main PLC - External Cut v3_comTest_Denmark • BAL_8249889_001_00_1_EN • EMCS-HNA5-SignalList-20240906
Procedure	Using the GUI, or directly an OPC-UA client, change the parameters of the EMCS. The parameter change directly affects the control logic
Criteria	Verify that the changed parameters will affect the control logic accordingly the EMCS FDS reference 4.5.

The above checks are conducted and witnessed by following representatives.

1 INTRODUCTION

1.1 PROJECT OVERVIEW

Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.

Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.1.1 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

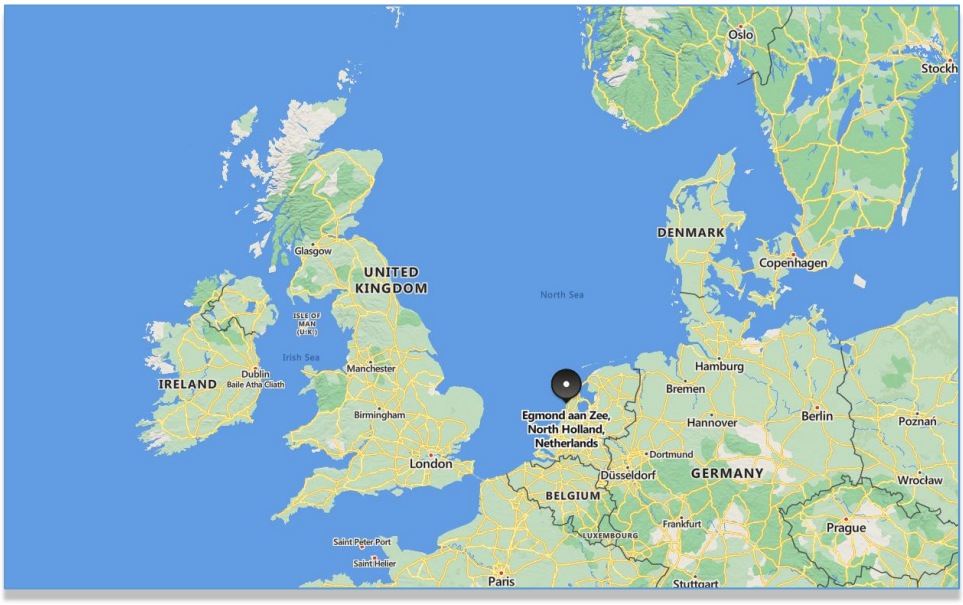

Figure 1 HOLLANDSE KUST NOORD WIND PARK Location Map

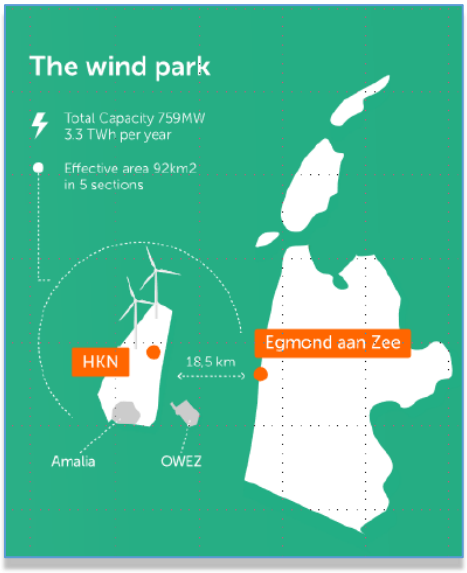

Figure 2 - Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile located on coordinates E 590719.1, N 5841602.3 is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

1.1.2 Project Concept

All components included in the BLPH will be integrated onshore on a topsides and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

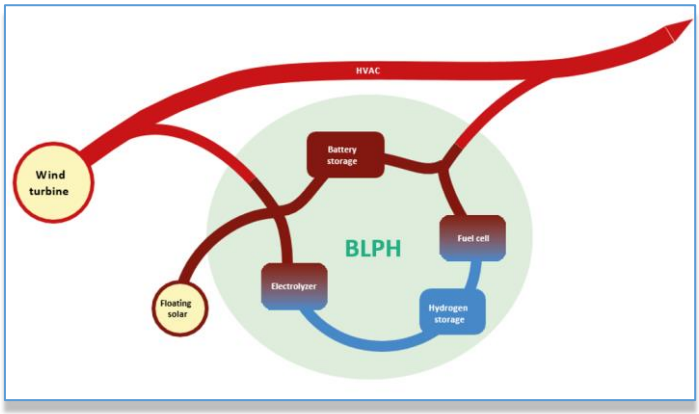

Figure 3 – BLPH Concept

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.

The purpose of the BLPH s to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

2 DOCUMENT SCOPE

The purpose of this package communication test procedure document is to define the check and test activities to be performed, in order to test communication of subsystem packages with Yokogawa PAS.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

5 TEST PURPOSE

This Test Procedure is organized in a collection of Inspection Data Sheets that cover the test to be executed in customer or subsystem vendor premises.

The tests covered in this document are related only to serial communication between Yokogawa PAS (Process Automation System, including EMCS) and 3rd party systems.

6 TEST PREREQUISITES PCS

In order to perform the test, Yokogawa will use a demo system consisting of the subsequent components:

- Engineering Workstation (with CENTUM VP software) and monitor.
- AFV30D DCS rack with single CPU.
- Single or redundant communication card (ALE111 for Modbus TCP, A2PL131 for Profinet).

If the test will be performed at subsystem vendor premises, Yokogawa is expecting to have availability of :

- 240V 50Hz power supply.
- CAT5E or CAT6 network cables.
- Network apparatus (e.g. switches), if deemed necessary for the specific test.

Moreover, availability of documents concerning the serial link to be tested is a necessary prerequisite, in order to proceed with the actual test. The minimum required information is :

- Interface protocol to be used.
- Communication parameters (IP address, subnet mask, device parameters, device tag when applicable, communication speed when applicable).
- Communication maps, specifying for each signal to be tested :
  - Tag
  - Address
  - Description
  - Data type
  - Data access (read/write)
  - Range
  - Scale
  - Offset
  - Engineering Unit (if applicable)

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

Document Title:	THIRD PARTY COMMUNICATION TEST PROCEDURE	Sheet 15 of 53 Date: 14/05/2025 Rev: 02

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

7 TEST PREREQUISITES EMCS

The test must check the connection and the data exchange between the EMCS and the BLPH packages and WindFarm server.

To perform the test, Yokogawa will use a system equivalent to the final system consisting of an industrial PC and the required protocol clients: MODBUS TCP, OPC-UA, PROFINET, IEC-61850.

If the test will be performed at subsystem vendor premises, Yokogawa is expecting to have availability of :

- 240V 50Hz power supply.
- CAT5E or CAT6 network cables.
- Network apparatus (e.g. switches), if deemed necessary for the specific test.

Availability of documents concerning the communication interface is a necessary prerequisite, in order to proceed with the actual test. The minimum required information is :

- Interface protocol to be used.
- Communication parameters (IP address, subnet mask, device parameters, device tag when applicable, communication speed when applicable).
- Communication maps, specifying for each signal to be tested :
    - Tag
    - Address
    - Description
    - Data type
    - Data access (read/write)
    - Range
    - Scale
    - Offset
    - Engineering Unit (if applicable)

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

8 SERIAL LINK VALIDATION

This chapter describes the tests that will be executed during the "Serial Link Communication tests".

To perform the complete test, the subsystem Vendor's presence (and relevant hardware) is required.

The following tests shall be performed for each Serial Link Communication.

The protocols considered will be Modbus TCP, Profinet, and IEC61850.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

TEST Form 2.1				
Vendor REFERENCE :				
PROJECT :		**System :**	PAS	Rev. 0
Item Description:	Configuration capabilities file to be verified (applicable to Profinet and IEC61850)			
PRELIMINARY	The Capabilities file of the subsystem vendor should be available. It is recommended to make the file available before the actual test, for preliminary checks and configuration.			
SCOPE	Availability of correct capabilities file (i.e. GSDML file) should be verified.			
REF. DOCUMENTS	Relevant vendor document indicating the file name and version.			
PROCEDURE	The import of the correct capabilities file should be verified in PAS engineering station			

EXPECTED RESULT	The file is correct, and the revision is the same indicated by the subsystem vendor.			
TEST RESULTS	PASS ☐ FAIL ☐			
COMMENTS				
TEST DATE :				
CLOSED DATE :				
	Vendors			
	Signature	Signature	Signature	Signature

TEST Form 2.2				
Vendor REFERENCE :				
PROJECT :		**System :**	PAS	Rev. 0
Item Description:	Communication and configuration check			
PRELIMINARY	To perform this test, it is necessary that the Vendor's subsystem with the hardware necessary for communication is present; otherwise, the test cannot proceed.			
SCOPE	Verify the correct connectivity between PAS and subsystem.			
REF. DOCUMENTS	Relevant Signal List			
PROCEDURE	After subsystem soft link connection is established, verify that the connections are Healthy and permanent for both sides.			

EXPECTED RESULT	Observe that there is no communication fault on PCS and on subsystem. For both systems, diagnostics information indicates no errors.			
TEST RESULTS	PASS ☐	FAIL ☐		
COMMENTS				
TEST DATE :

TEST Form 2.3				
Vendor REFERENCE :				
PROJECT :		**System :**	PAS	Rev. 0
Item Description:	Soft Link Digital Input/Output test (if any)			
PRELIMINARY	The test should be performed with subsystem vendor assistance.			
SCOPE	Verify the communication for all digital signals between PAS and subsystem on Engineering Workstation interface. Verify that it is possible to read and write signals as specified in Signal List: • "read" signals will be generated/forced by 3rd party and checked on Yokogawa test equipment side; • "write" signals will be generated/forced by Yokogawa and checked on 3rd party's side.			
REF. DOCUMENTS	Relevant Signal List Relevant Control Narrative			
PROCEDURE	With the subsystem vendor's assistance, verify that each subsystem digital signal corresponds to the same PAS digital signal.			

EXPECTED RESULT	No mismatch occurs between subsystem and PAS signals.			
TEST RESULTS	PASS ☐ FAIL ☐			
COMMENTS

TEST Form 2.4				
Vendor REFERENCE :				
PROJECT :		**System :**	PAS	Rev. 0
Item Description:	Soft Link analog Input/Output test (if any)			
PRELIMINARY	The test should be performed with subsystem Vendor assistance.			
SCOPE	Verify the communication for all analog signals between PAS and subsystem on Engineering Workstation interface. Verify that it possible to read and write signals as specified in Signal List: • "read" signals will be generated/forced by 3rd party and checked on Yokogawa test equipment side; • "write" signals will be generated/forced by Yokogawa and checked on 3rd party's side.			
REF. DOCUMENTS	Relevant Signal List Relevant Control Narrative			
PROCEDURE	With the subsystem vendor's assistance, verify that each subsystem analog signal corresponds to the same PAS analog signal.			

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

TEST Form 2.5				
Vendor REFERENCE :				
PROJECT :		**System :**	PAS	Rev. 0
Item Description:	Diagnostic routines, System alarms check			
PRELIMINARY	The PAS Engineering Workstation shall be available. The presence of subsystem Vendor is necessary to perform this test.			
SCOPE	Verify the correct detection of any fault of system under test.			
REF. DOCUMENTS	Yokogawa Instruction Manuals Vendor manuals			
PROCEDURE	Verify that in case of any fault/disconnection related to the communication with the package, the Yokogawa PAS generates an alarm that is available in PAS system alarm list. This will be verified on Engineering Workstation interface.			

EXPECTED RESULT	Each failure will be correctly identified and alarmed in the System Alarm view.			
TEST RESULTS	PASS ☐ FAIL ☐

TEST Form 2.6				
Vendor REFERENCE :				
PROJECT :		**System :**	PAS	Rev. 0
Item Description:	Redundancy test (applicable only for Floating Solar Farm)			
PRELIMINARY	The PAS engineering test station shall be available. The presence of Subsystem Vendor is necessary to perform this test.			
SCOPE	Verify the correct functionality of the system in case one of the redundant communication components fails.			
REF. DOCUMENTS	-			
PROCEDURE	1. Power off any redundant communication component any verify that the communication is still up. 2. Remove the Ethernet cable from Primary PAS card and observe that there is no failure in communication.			

EXPECTED RESULT	The redundancy functionality is achieved if there is no failure.			
TEST RESULTS	PASS ☐ FAIL ☐			
COMMENTS	The test will pass if the above functionality is achieved.

1 Introduction

1.1 General

The purpose of this document is to define the methods and documentation that will be used to carry out the Factory Acceptance Test (FAT) on YOKOGAWA's PCS, SIS , FGS and SCADA. The FAT is performed to ensure that the system is properly configured, assembled and functional in accordance with the intended design as specified in the approved documents.

The objective of FAT is to demonstrate to CROSSWIND that the system hardware and software is built in accordance to requirements as specified in the approved documents.

Crosswind and Rosetti Marino would witness to verify the test. Upon successful completion of the test, a FAT Test Certificate and Shipping Release Notice would be signed by both YOKOGAWA as MAC and Crosswind /Rosetti Marino to signify the acceptance of the test and approval of shipment of the equipment.

1.2 Scope and Objective

The Factory Acceptance Test referred to as FAT applies to the PCS, SIS , FGS and SCADA Hardware and Software supplied by Yokogawa.

The objective of the FAT is to verify the conformance of the system against the approved specifications and FAT procedure before delivery to site. The FAT shall be conducted to test and verify the main items listed below:

- System Hardware
- Network and Communication Tests
- Cabinets (system, network, server)
- Other Hardware (KVM, etc..)

2 Reference Documents

2.1 Input Documents

The PCS, SIS and F&G systems are configured using input documents such as IO Database, P&IDs, Cause & Effect Diagrams, F&G Layouts, Process Control Narratives, etc. These input documents shall be used as reference documents for FAT. These documents are listed in Appendix 8.3 - Approved Document List.

Copyright © Yokogawa Electric Corporation

2.2 Codes, Standards and References

[1] IEC 60529: Specification for Degrees of protection provided by enclosures (IP Code)

[2] IEC 61000: Electromagnetic Compatibility of Industrial - Process Measurement and Control Equipment

[3] IEEE 802.3: Information Processing Systems – Local Area Networks

[4] IEC 61508 Functional Safety of Electrical/Electronic/Programmable Electronic Safety – Related Systems

[5] IEC 61511 Functional Safety- Safety instrumented systems for the process industry sector

2.5 Approved Document List (Detail Design Specification)

The Detail Design Specification used for construction shall be listed in this approved document list, and shall be used as reference in the FAT. In principle, the Detail Design Specification documents as included in this list shall form the basis for checking the PCS, SIS, FGS and SCADA system. The approved Detail Design Specification document list used for construction is listed in Appendix-3.

Hold-1: Appendix-8.3 To be provided during the project execution phase.

4 Responsibility

Responsibilities for each party involved in the FAT are defined here-under to ensure that the FAT is carried out in accordance with an agreed procedure. It also ensures that there shall be authorized personnel(s) from CROSSWIND, ROSETTI MARINO and YOKOGAWA to facilitate any decisions and schedule changes resulted from the FAT.

4.1 CROSSWIND

The full participation of CROSSWIND in the FAT is essential. CROSSWIND shall appoint an Inspector cum Test Approver to witness the FAT. The Test Approver would have the authority to sign-off upon the successful completion of all tests. Once signed off, the test will be deemed accepted and the decision will be final. The Inspector shall participate in the test and observe the test results on a daily basis. The Test Approver shall approve the inspection items based on the approved specification and the test results recorded.

4.2 ROSETTI MARINO

ROSETTI MARINO shall appoint a FAT Manager for the FAT. The FAT Manager representing ROSETTI MARINO shall co-ordinate with CROSSWIND and YOKOGAWA FAT Managers and to facilitate the smooth implementation of the FAT activities and schedule. The role of the FAT Manager is also to resolve FAT issues on a regular basis.

ROSETTI MARINO representatives will participate in the FAT for the complex controls, sequences and logics. For PCS controlled equipment packages containing complex controls, sequences and logics, ROSETTI MARINO at their discretion, may invite their package equipment supplier representatives to participate in the testing.

4.3 MAC

YOKOGAWA as MAC shall appoint a Test Conductor to organize and manage all aspects of the FAT. YOKOGAWA shall carry out the testing and record the test results on a daily basis together with CROSSWIND Inspector and ROSETTI MARINO representative.

The Project Manager representing YOKOGAWA shall be the FAT Manager. The FAT Manager shall co-ordinate with ROSETTI MARINO's FAT Manager and shall amend the test schedule whenever necessary to ensure the smooth running of the FAT. The FAT Manager shall also ensure that all tests are conducted in accordance with the approved FAT documents. If changes/modifications are required in the implementation, the FAT Managers of Yokogawa and ROSETTI MARINO shall discuss and arrive at the action plan.

Copyright © Yokogawa Electric Corporation

5 General Administration

5.1 FAT Venue

All the PCS, SIS and FGS equipment's will be staged at YOKOGAWA Sub-contractor Premises:

PREI srl

Missing description of the premises and relevant requirement (e.g. tools, power supply, grounding etc)

Via Pascoli, 150

22040 Alzate Brianza – COMO (Italy)

5.2 FAT Organization Chart

A specific detailed Organization Chart shall be issued for each project, with all positions and names filled in. In addition, a FAT roster of the participants shall be issued, with following details for each person; full name, company, responsibility, samples of the signature and initials, actual start and finish date of participation in the FAT. The FAT Manager will be responsible for maintaining the roster and keeping it updated.

there are 2 managers, one for RM and one for MAC

Refer to Appendix-1 for FAT organization chart and FAT roster.

5.3 Kick-off Meeting

An initial kick-off meeting will be held prior to starting the FAT to brief the participants, confirm the organization and responsibilities, and review the FAT schedule. At the same time, HSE briefing for all participants will be provided by YOKOGAWA. YOKOGAWA FAT Manager will prepare the presentation and explain the organization and work practices. All FAT documentation prepared by YOKOGAWA prior to FAT will be inspected for completeness.

5.4 Daily Working Schedule

The FAT will be conducted in YOKOGAWA premises from Monday to Friday (working days). update

The following timing is recommended for the testing:

0915 to 1200 hrs	Inspection and test
1200 to 1300 hrs	Lunch
1300 to 1700 hrs	Inspection and test
1700 to 1730 hrs	Daily review meeting including next day's schedule planning

Table 2 - Daily Working Time

Copyright © Yokogawa Electric Corporation

5.5 Daily Review Meeting

YOKOGAWA FAT Manager shall conduct a daily review meeting at the end of each FAT day. The meeting will involve all the parties taking part in the FAT. The purpose of this review meeting is to update all parties the progress and status of the FAT.

The punch list will be reviewed during the daily meeting and the action to be taken will be discussed and finalized. If the recovery work involved is minor (identified in the daily meeting) and agreed by all parties, the work will be carried out on the same day and will be verified the following day by all the concerned parties and signed off in the punch list. If the recovery work involves major change/modification, The FAT Manager will advise the schedule for retesting.

Refer to section 6.4 for details in punch record.

The FAT Manager should also ensure that PCS Engineers make a backup of the application program to an external storage every day after the daily review meeting, so that old backups can be retrieved, if necessary.

5.6 Weekly Progress Meeting

it doesn't make much sense, considering that the FAT starts on Friday and ends on Friday...

YOKOGAWA FAT Managers shall conduct weekly progress meeting every Friday. The purpose of the weekly meeting is to report the progress of the FAT in the same week and planned activity the following week. It shall also be the forum for resolving any issue arises from punch list.

In the weekly progress meeting, The FAT Manager will present detailed weekly progress report, containing details of activities and achievements for the week, plan for the next week, area of concern, list of punches raised (solved and open) and detailed formal overall progress assessment. The format and content details of the weekly progress report and the underlining planning, progress monitoring and measurement methodology shall be in accordance with the FAT planning, Progress Monitoring Report. After the joint review in the weekly progress meeting and any necessary amendments, The FAT Manager will issue the weekly progress report.

All FAT roster will be invited to the meeting.

5.7 FAT Wrap-up Meeting

At the completion of the FAT, a final wrap-up meeting will be held. The overall status of the FAT shall be reported. Upon all parties' agreement that the FAT is completed satisfactorily, the FAT Completion Certificate and Shipping Release Notes shall be signed off by CROSSWIND/ROSETTI MARINO.

Copyright © Yokogawa Electric Corporation

5.8 Integrated Factory Acceptance Test (IFAT)

Upon completion of Hardware FAT, the testing moves to the next stage, the Integrated Factory Acceptance Test that will be part of Software FAT. At this stage, integrity of infrastructures or interfaces that are shared by multiple systems, components and/or applications within the scope of Yokogawa will be demonstrated. 3rd party sub-systems I/O mapping will be simulated using existing options in YOKOGAWA system/Tools for HMI and control functions. No dedicated IFAT shall be conducted, 3rd party Sub-systems connected with CI Server shall be simulated and demonstrated as a part of Software FAT.

Copyright © Yokogawa Electric Corporation

6 FAT Report Documentation

The Factory Acceptance Test (FAT) shall be conducted in accordance with the test procedures detailed in this document. The test results shall be recorded in the check sheet. To prevent from any check sheet getting lost, each Check sheet shall be given a unique reference number.

6.1 FAT Documentation

All FAT documentation shall be prepared by YOKOGAWA prior to the start of the FAT. All forms, check sheets, sign-off sheets, drawings, etc. as listed in this procedure shall be organized in indexed binders. A master index for the FAT will be provided and maintained by YOKOGAWA FAT Manager.

The documentation for hardware checks shall include all relevant documents for each individual cabinet in a separate indexed binder or a binder section. This shall include Internal hardware check and test records performed during internal Factory Hardware Test.

The documentation for software checks shall be organized by individual process units in indexed binders. The documentation for graphics checks shall also be organized, separately by individual process units in indexed binders.

All FAT reference documents (latest issue) as listed in this procedure originated by other parties (CROSSWIND, ROSETTI MARINO), which were issued formally to YOKOGAWA will form a part of the FAT documentation and shall be printed out, and organized in indexed binders by YOKOGAWA.

All FAT reference documents as mentioned above shall be stamped "FAT MASTER" on every page/sheet. Any additional documents that may be necessary and generated later during FAT shall also be stamped, and indexes amended accordingly.

The structure of the FAT folders and typical indices shall be defined by YOKOGAWA, issued for approval and included in the Appendix-8.3.

6.2 Internal Test/Pre-FAT

Prior to the FAT, YOKOGAWA shall conduct internal test (Pre-FAT) to verify the system and application software. The internal test shall be based on the approved FAT procedure and covers the complete system functionality check, hardware healthiness check and 100% I/O check of marshalled cross-wirings.

The internal test result will be recorded and documented. CROSSWIND/ROSETTI MARINO may review/reference the test records of these internal tests before or during the FAT.

Copyright © Yokogawa Electric Corporation

Complex control loops, specialized sequential controls and batch control applications shall also be completely tested during Pre-FAT. The result of the test shall be recorded and made available for reference before or during FAT.

As a part of the pre-FAT, the project team consisting of application engineers from YOKOGAWA, ROSETTI MARINO and CROSSWIND conduct electronic (paper) check using the PCS tag/tuning report generated from the system. During this paper check pre-FAT, ROSETTI MARINO/ CROSSWIND will verify the configuration parameters by using engineering documents. This will enable the FAT crew to concentrate on the control functions and Graphic functionality during the actual FAT and will also help in reducing the duration of the FAT.

Refer to PCS application software sections for detail procedure on paper check.

It is also preferred that CROSSWIND and ROSETTI MARINO representatives participate in the pre-FAT for complex controls, sequences and logics checks, especially in projects that has multiple equipments with identical control strategy, to facilitate smooth execution of the FAT.

6.3 Method of Testing

Detailed test procedure for each test item is described in this document. Check sheet shall be provided, listing the equipment to be tested. All test results shall be recorded in the Check sheets. The following color codes shall be used in the testing:

a) Yellow marker - Items that were checked and cleared

b) Pink marker - Items that were having problems.

c) Green marker - Items that were checked after completion of recovery.

The color marking will be used on the print-outs of the control drawings, graphics and supporting design documents such as P&IDs, narratives, etc.

For PCS Hardware, 10% I/O check shall be done for conventional I/O (including HART) using signal injector.

The internal test records will be inspected prior to FAT. In the event that the records are deficient, retest will be performed.

PCS, SIS and FGS Software Function Test will be conducted using Test Function tool, without connection to any physical I/O. Test Function will be used to simulate process input, digital signal and alarms to FCS so that typical loops, logic sequence blocks can be tested without connecting to physical input and output devices. Dynamic graphics check shall be a part of the PCS, SIS and FGS Software function test.

All the panels will be available for test and connected to recreate as much as possible the final configuration.

Copyright © Yokogawa Electric Corporation

6.4 Punch Record

All shortcomings found during the test shall be noted in the FAT Punch Record (Appendix-8.9). Each punch Record shall cover one punch item/fault. A Punch Record Ledger shall be used to summarize all the punch records.

Punch record items shall be classified as follows:

M = **Modification**, item is to be modified, deleted, added due to design input changes.

C = **Correction**, item is to be corrected by YOKOGAWA.

If the recovery work involves change/modification, it is to be recorded on the punch record and the recovery undertaken as soon as possible after the agreement of both the FAT Managers after signing of the punch record. YOKOGAWA shall clear all correction items (**Code C**) at factory before shipment, informing RM and CW for each solved items. For recovery work that involves modification (**Code M**), it will be regularly jointly reviewed by all parties involved in FAT, on at least weekly basis and resolved whether to be implemented during FAT or later, depending on complexity and potential schedule and/or cost impact. After verification, the same will be signed off by all concerned parties in the punch record.

The punch record will be reviewed during the daily meeting and the action to be taken will be discussed and finalized. If the modification request were deemed deviated from the original design, it would be considered as change order.

6.5 FAT Completion Certificate & Shipping Release Note

Upon completion of the FAT, FAT Completion Certificate and Shipping Release Note will be signed by CROSSWIND, ROSETTI MARINO and YOKOGAWA. The purpose of these two documents is to certify that the FAT has been completed and accepted by CROSSWIND. Both CROSSWIND and YOKOGAWA agree that the system is in order and can be released for shipment to site. However, if the tested system is to be shipped out in partial, CROSSWIND/ROSETTI MARINO shall advise and issue the Shipping Release Note accordingly. Refer to Appendix-8.10 for a FAT Completion Certificate and to Appendix-8.11 for a Shipping Release Note.

Note: Once the FAT completion certificate and Shipping release note signatures are in place, no internal cabinet wiring, labeling, reconfiguration, or hardware swap outs shall be carried out unless the signatory parties are notified in advance and given an opportunity to inspect any recommended changes.

Copyright © Yokogawa Electric Corporation

6.6 Test Equipment

YOKOGAWA will provide all test equipments (e.g. Digital Multimeter, Signal Generators etc.) for the FAT. The details of the test equipment for FAT with certification (if necessary) shall be provided using format attached in Appendix-8.4.

Copyright © Yokogawa Electric Corporation

7 Testing Description for Hardware

7.1 General Hardware Check – Earthing Check (valid for all cabinets)

Outline	The Earthing connections shall be verified in all the System/Marshalling cabinets and Network/Server.
Objective	Verify that all Earthing connections are wired as per the specification.
Reference	SIS/FGS, EMCS and PCS System/Marshalling Cabinet GA/IA Drawing Refer Appendix 8.3 - Approved Document List
Procedure	This test shall be carried out using a Multimeter or Ohm-meter to confirm the continuity of the following: a. P.E. – Protection earth • To verify continuity between the earth and all part of the cabinet including instrument chassis. b. IE - Instrument Earth • To verify continuity between the instrument earth bar connection and instrument cable screens. c. I.S.E. – Intrinsically Safe Earth (if present) (ONLY FOR B400-FGS-001/213) • To verify continuity between the instrument safe earth bar connection and instrument safe cable screens. The test can be considered acceptable if the resistance measured is < 1 Ohm. Also using a Multimeter or Ohm-meter the P.E., I.E. and I.S.E. earth bars are to be confirmed isolated from each other. I.E. and I.S.E. bars must be isolated from the external cabinet chassis. The test can be considered acceptable if the resistance measured is > 10 MOhm.
Test Record Reference	- GA/IA Drawings - Refer Appendix 8.5 – FAT Check sheet

TEST RESULT: PASS / FAIL

7.2 PCS Physical Hardware Check

7.2.1 PCS System/Marshalling Appearance, Construction and Wiring Check

Outline	All the System/Marshalling cabinets and installed components are to be checked and verified for their appearance and construction.
Objective	- Verify that all the cabinets are manufactured as per the specification. - Verify that all the components and accessories installed in the cabinets are manufactured as per the specification. - Verify cabinet high temperature alarm. - Verify proper functioning of the redundant power supply units. This test ensures that the interface board functions properly upon Power up.
Reference	- Bill of Material - PCS System/Marshalling Cabinet GA/IA Drawing Refer Appendix 8.3 - Approved Document List
Procedure	Visually check that all the SYSTEM/MARSHALLING CABINET are as per the GA/IA drawings. Check items as follows: 1. General Cabinet Construction – lifting construction, Plinth, cabinet color and side panel (if applicable). 2. Layout - components layout on the front, rear and sides of cabinet. • FCU – mounting and termination. • ESB Node Unit – I/O module quantity. • Power Supply Unit (PSU) rating. 3. Interface Boards – mounting, termination, installed spare and space for spare. 4. Doors - handle, lock with key and document pocket. 5. Labeling – cabinet, terminals, devices, earth bars, attention symbols and cable marker. 6. Earthing – bolt types, location, wiring type, screen terminals, grounding of devices and doors. 7. Cable handling – routing, trays/duct, clamp rails and termination. • Control Bus (Vnet/IP) • ESB Bus, Optical ESB Bus • System cables (*)

Check:
- enclosure damages (scratches, dents)
- cleaning and absence of burning marks or other residue
- connection tightness (spot-on pull test)
- labeling of devices and cables
- IP rating
- wiring separation (different voltage levels as per specs)

Copyright © Yokogawa Electric Corporation

	• Field cables from junction boxes (+) 8. Signal termination • Terminal - terminal and wiring types, installed spare and space for spare. 9. Power distribution - isolator and circuit breakers rating, fused terminal types and wiring sizes. 10. Others: Fans, thermostat and if applicable, utility socket. **Temperature Alarm Check** 11. Note Thermostat setting in the cabinet. Check that the contact at the terminal is closed circuit. 12. Set the Temperature setting of thermostat to a lower setting (e.g. 18 DegC). 13. Check that the contact is now open. Verify alarm at the OWS. 14. Recover the alarm by setting the temperature setting back to above room temperature. **Power Supply Check** 15. Take measurement of voltage output from PSU individually. The voltage should be 24 ~ 26VDC. 16. Measure voltage output from PSU02 and switch "OFF" circuit breaker for PSU01. 17. The voltage measured at PSU02 output should remain within the voltage limit (24 ~ 26VDC). Verify PSU fail alarm at the OWS. N.A 18. Measure and record the DC voltage ripple with an oscilloscope. 19. Recover PSU01. Verify PSU alarm recovery at the OWS. 20. Repeat test for PSU01 by switching "OFF" PSU02. **Functional Check** (for all equipments) 21. Switch on the 24VDC power supply to the interface board one-by-one. 22. Observe the LED indication on the interface board. 23. Check that the contact is now returned to closed position. Verify alarm recovery at the OWS.
Criteria	The quantity, type and location of all the cabinets and installed components should match the Bill of Material, GA/IA Drawings and I/O Assignment without any scratches and deformations.

7.2.2 Field Control Station (FCS) Module Assignment Check

Outline	All ESB Bus Node Units, I/O Modules (for FIO), ESB Bus Coupler Modules and ESB Bus Repeater Modules are assigned according to the I/O assignments. The position and quantity of these items in the Field Control Station and expansion cabinets shall be verified.
Objective	- Verify that all the ESB Bus Node Units, I/O Modules (for FIO) and ESB Bus Coupler Modules and ESB Bus Repeater Modules are correctly supplied and installed.
Reference	- I/O Assignment Documents Refer to Approved Document List
Procedure	Visually check that all ESB Bus Node Units, I/O Modules (for FIO), ESB Bus Coupler Modules and ESB Bus Repeater Modules are installed in each of the Field Control Stations according to the PCS I/O Assignments for various areas as per reference documents.
Criteria	The quantity, type and location of all ESB Bus Node Units, I/O Modules (for FIO), ESB Bus Coupler Modules and ESB Bus Repeater Modules including the spares must match the approved I/O Assignment documents.
Test Record Reference	- I/O Assignment Documents

The above checks are conducted for all Field Control Stations and witnessed by the following representatives.

7.3 PCS Standard System Function Check

7.3.1 System Start-up Test (FCS and EWS/OWS)

Outline	Field Control Stations (FCS) and Operator Work Stations (OWS) go to the operating state automatically upon powering up, provided that all application software and image are properly loaded in the system.
Objective	- Verify that the above components automatically boot up when going from 'stop' state to 'operating' state.
Reference	- System Architecture Drawing Refer to Approved Document List - CENTUM VP Instruction Manual
Procedure	1. Power down components individually or for the whole system. 2. Power up each component individually and observe its boot up sequence. 3. Check station status from EWS0164 System Maintenance panel when each station boots up. **Note: For each FCS, verify the random IO state and tuning data prior to power down. After power up, verify that the FCS initializes the application program as desired and retains the tuning data.**
Criteria	1. Each component must boot up automatically. 2. Station status indication on HIS(EWS0164) System Maintenance panel should change from red to green.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted on random basis for selected FCS/HIS(EWS0164) and witnessed by the following representatives.

7.3.2 FCS CPU Backup Function Test

Outline	The two CPUs in the FCS back up each other. During operation, one CPU is active while the other CPU is on hot standby. The standby CPU is updated at every memory write-cycle.
Objective	- Verify that FCS operation is uninterrupted when the active CPU fails and the standby CPU takes over.
Reference	- CENTUM VP Instruction Manual
Procedure	1. Display a tuning panel of a selected PID tag (from related FCS) And change the output value (MV) to view tuning trend. 2. Display FCS station status panel (system maintenance panel) on OWS. 3. Stop the active CPU by using the 'Start/Stop' button on the front panel from FCS. 4. Check the system alarm messages at the OWS. 5. Check the tuning panel data for the selected tag to confirm FCS control functions are normal. 6. Check the actual output at the I/O module. 7. Start the CPU by using the 'Start/Stop' button on the front panel from FCS 8. Wait for the copy to finish. 9. Repeat the test for other CPU module.
Criteria	1. FCS control functions should be unaffected. 2. All data in the related FCS should be unaffected. 3. All control loops continue to perform normally. 4. FCS run status remains unaffected as observed at HIS (EWS0164) System Maintenance panel. 5. The output of I/O module will remain unaffected.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

7.3.3 FCS ESB Bus Redundancy Test

Outline	1. The ESB Bus that facilitates data communication between FCU and each of the ESB Bus Node Unit is dual redundant. 2. The ESB Bus Coupler module (EC401 or EC402 in FCU) and ESB Bus Interface Slave module (SB401 in Local ESB Bus Node Unit) facilitate data communication between the FCU and each local ESB Bus Node Unit. The following operations apply : - Normally, redundant ESB Buses are used in an alternating fashion. - If an error occurs in a ESB Bus module on one side, the error is notified to the user via a diagnostic information message. If both interface modules fail, the error is treated as a node failure. - If an error occurs in one ESB Bus or ESB Bus module, the FCU continues communication using the other normal ESB Bus. - An erroneous ESB Bus is monitored for recovery at regular intervals.
Objective	- Verify that FCS operation is uninterrupted when one ESB Bus module fails and the other interface module takes over.
Reference	- CENTUM VP Instruction Manual
Procedure	1. Disable one of the EC401 ~~or EC402~~ (ESB Bus Coupler module) by removing it from the FCU. 2. Check the system alarm messages at the OWS. 3. Check the FCS control functions are normal. 4. Revive the ESB Bus to normal condition. 5. Repeat the test for the other ESB Bus Coupler module. 6. Disable one of the SB401 (ESB Bus Interface Slave module) by removing it from the node. 7. Check the system alarm messages at the OWS. 8. Check the FCS control functions are normal. 9. Revive the ESB Bus to normal condition. 10. Repeat the test for the other SB401. 11. If necessary, repeat the above procedures for the pair of Optical ESB Bus Repeater modules.
Criteria	1. Operation shall not be affected when either one of the ESB Bus fails. 2. The FCS control function should not be interrupted.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

Copyright © Yokogawa Electric Corporation

Note	- EC40x is installed in FCU - SB401 is installed in Local ESB Bus Node Unit

The above checks are conducted on random basis for selected FCS and witnessed by the following representatives.

7.3.4 FCU/Node Unit Power Supply Module Redundancy Test

Outline	The dual redundant power supply modules on the Field Control Unit and the ESB Node Unit supply power to the respective nodes.
Objective	- Verify the redundant functionality of the power supply modules.
Reference	- CENTUM VP Instruction Manual
Procedure	1. Wire up one control loop, output to input, to make a closed loop. *(Recommendation is to use long jumper yellow wire that can be easily identified)* 2. Display the tuning panel for this tag to observe the control action. 3. Put the loop in "AUTO" mode. 4. Change the set point and observe the control action of the controller. 5. Remove the power to the FCU power supply module by removing the power from UPS power source. 6. Check the system alarm messages at the OWS. 7. Check the control action of the test controller at the OWS, to confirm FCS control functions are normal during removal of power supply. 8. Revive the Power supply module to normal operation condition. 9. Repeat for the other FCU power supply module by removing the power from UPS power source. 10. Repeat the test for ESB Node Unit power supply modules.
Criteria	1. The FCS should be unaffected by the failure of any one power supply module. 2. FCS control functions should remain unaffected. 3. STATUS LED on each I/O module should remain ON.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet
Note	Power Supply Unit for CPU Node/ESB Node Unit - PW482 (220-240V AC)

7.3.5 I/O Module Redundancy Test (for FIO)

Outline	The PCS I/O modules are configured as redundant depending on the project requirement. Typically, all I/O related to control points are assigned to redundant modules and I/O related to Indication only are assigned to non-redundant modules. In an FCS for FIO, it is possible to mount input/output modules of the same type in two adjacent slots to make them redundant. In the case of redundant configuration, one side becomes the control side and the other becomes the standby side. Switching of the control right is performed by input/output modules. The switching has no influence on the application program.
Objective	- Verify the redundant functionality of the redundant modules.
Reference	- PCS I/O Assignment Refer to Approved Document List - CENTUM VP Instruction Manual
Procedure	1. Wire up one control loop (input and output) device to the I/O module and setup the controller to be in AUTO mode and normal operation. 2. Remove one of the redundant modules from the FCU or ESB Bus Node Unit. 3. Check the system alarm messages at the OWS. 4. Check that the status of the controller on the OWS is maintained. 5. Install back the removed I/O module. 6. Check the I/O module recovery messages at the OWS. 7. Repeat the test by removing the other redundant module.
Criteria	1. The FCS should be unaffected by the failure of one of the redundant modules. 2. FCS control functions should remain unaffected.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

7.3.6 Vnet/IP Bus Redundancy Test

Outline	The Vnet/IP bus is the communication channel for communication between the HIS(EWS0164) and the FCS. The Vnet/IP bus is dual redundant. This test will be carried out for the PCS system that is set up as per system configuration.
Objective	- Verify the redundant functionality of the system communication network Vnet/IP bus.
Reference	- CENTUM VP Instruction Manual
Procedure	**For FCS:** 1. For FCS CPU-1: Remove the cable that is connected to Bus-1. 2. Check the system alarm messages at the OWS. 3. Observe whether there is any break in trend gathering for any signal. 4. Re-connect the cable and check that the Bus-1 is healthy. 5. Repeat the above tests for CPU-1 Bus-2 and for CPU-2 Bus-1/2. **For HIS(EWS0164):** 1. For HIS(EWS0164): Remove the cable that is connected to Bus-1. 2. Check the system alarm message at the OWS. 3. Observe whether there is any break in trend gathering for any signal. 4. Re-connect the cable and check that the Bus-1 is healthy 5. Repeat the above for Bus-2. **For Layer2 switch:** 1. Fail one of the L2 switches that is connected on Vnet/IP Bus-1. 2. Check the system alarm messages at the OWS. 3. Observe whether there is any break in trend gathering for any signal. 4. Power back the L2 switch and check that the switch and the connected Vnet/IP network are healthy. 5. If applicable, repeat the test for the other L2 switch that is connected to Vnet/IP Bus-1. 6. Repeat the test for the L2 switch connected on Vnet/IP Bus-2.
Criteria	1. The HIS(EWS0164) should be able to monitor and operate loops in the FCS without interruption even on a single Vnet/IP bus. 2. System alarm messages should be correctly displayed. 3. There should not be any break in trend gathering for any of the signals.

7.3.7 FCS Resource Capacity Check

Outline	FCS Resources refers to the FCS memory usage. Sufficient spare capacity for future expansion should be available at each FCS. The Field Control Station resource usage depends on the application software configured in that particular FCS.
Objective	- Verify that overall FCS resource capacity is sufficient. This result can be used as a reference while checking the FCS memory usage at the completion of commissioning.
Reference	- PCS Technical Specification - PCS FDS Software Refer to Approved Document List
Procedure	1. The check will be carried out for the related FCS. 2. Call up the FCS resources information panel at the engineering station. 3. Confirm the FCS resources consumed and the remaining resources available at the related FCS.
Criteria	The overall FCS resources consumed should meet project requirement.
Test Record Reference	- The printout from the system for each FCS resources. - Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted for all FCS and witnessed by the following representatives.

7.3.8 FCS CPU Loading Check

Outline	The loading of the CPU of the Field Control Station depends on the application software configured in the FCS and communication loads with other devices (HIS/FCS/OPC). CPU loading of the FCS is an important factor for deciding the system performance.
Objective	- Record the loading of the CPU of the FCS at the completion of FAT. This result can be used as a reference while checking the FCS CPU idle time at the completion of commissioning.
Reference	- PCS Technical Specification - FDS Software Refer to Approved Document List
Procedure	1. Select an FCS for which the CPU load needs to be verified. 2. On each of the HIS, belonging to that FCS operation group, call up 4 Graphic windows (no screens configured in EWS0164 so Not Applicable), a faceplate or a tuning window. The selected Graphic windows should predominantly have tags from the selected FCS for which the CPU load is being measured. 3. Call up the status display of the FCS, for which the CPU idle time is being measured and note down the displayed CPU idle time 4. Printout a hardcopy of the FCS status display for records.
Criteria	The CPU idle time shown on the System Maintenance panel for each FCS should meet project requirement.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted for all FCS and witnessed by the following representatives.

7.3.9 FCS Online/Offline Loading Test

Outline	During the course of plant operation, it may become necessary to modify certain tag definitions, parameters, loop configurations, sequence tables, etc. There are two types of loading procedures. These are: • On-line loading • Off-line loading (save tuning parameters) Modifications made at the engineering station followed subsequently by on-line loading to the FCS have no effect on FCS operation. The modifications become effective on completion of the loading procedure. Modifications made at the engineering station followed subsequently by off-line loading to the FCS will cause the FCS to go off-line for the duration of the loading procedure. The modifications become effective on completion of the loading procedure, and the FCS returns to normal on-line status.
Objective	- Verify FCS on-line and off-line loading function
Reference	- CENTUM VP Instruction Manual
Procedure (On-line)	1. Modify any of the parameters permitted for on-line loading. 2. Execute FCS on-line loading via engineering workstation. 3. Observe FCS trend, look for any effect to FCS operation during FCS on-line loading. 4. Confirm that the modified parameters are loaded and functioning properly. 5. Confirm that all the HIS(EWS0164) are equalized properly.
Criteria (On-line)	1. There should be no effect on FCS operation during FCS on-line loading. 2. The modified parameters should be loaded without any errors and the post download changes are reflected as desired.
Procedure (Off-line)	1. Modify any system parameters (e.g. FCS properties). 2. Change some tag tuning parameters (e.g. alarm setting) and the execute FCS off-line loading via engineering workstation. 3. When "Save tuning parameters of project" prompt appear, click "Yes" to save tuning parameters. 4. Observe FCS fail status from system panel during off-line loading. 5. Confirm that the modified FCS parameters are effectively loaded and functioning properly. 6. Verify the new alarm setting is retained, which confirms that the tuning parameters were successfully saved by the system. 7. Confirm that all the HIS(EWS0164) are equalized properly.

Copyright © Yokogawa Electric Corporation

Criteria (Off-line)	1. The modified FCS parameters should be effectively loaded and functioning properly. 2. The tuning parameters was successfully saved and loaded to the FCS.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted on selected FCS and witnessed by the following representatives.

7.3.10 Media Backup/Restore Function Test (VP Project)

Outline	The CENTUM VP EWS PC is equipped with backup storage device for application program backup onto backup storage/media.
Objective	- Verify that the backup storage/media will back-up/restore CENTUM VP project database.
Reference	- CENTUM VP Instruction Manual - Workstation/Server Instruction Manual
Procedure (Backup)	Backup the project application database in EWS PC to backup storage/media.
Criteria (Backup)	The project folder is copied onto the backup storage/media without interruption and any errors.
Procedure (Restore)	Restore the project application database backup files in the backup storage/media to EWS PC.
Criteria (Restore)	The project folder is restored back to the desired location in EWS PC without interruption and any errors.
Test Record Reference	- Refer Appendix 8.5 - FAT Check sheet

The above checks are conducted the CENTUM VP project folder and witnessed by the following representatives.

7.4 Other Cabinets

7.4.1 Server/Network Cabinet Check

Outline	The Server/Network Cabinet contains Rackmount Workstation/ Server PCs, KVM Console/Extender, FO converter, Switches and other Network components.
Objective	- Verify that the Server/Network Cabinet is manufactured as per the specification. - Verify cabinet high temperature alarm. - Verify functioning of redundant AC power source - Verify that FO Converters and all other Network components are functioning properly.
Reference	- Server/Network Cabinet GA/IA Drawing. - System Architecture Drawing Refer to Approved Document List
Procedure	**A. Visual Check** Visually check that the Server Cabinet is as per the GA/IA drawings. Check items as follows: 1. General Cabinet Construction – lifting construction, Plinth & Bakelite, cabinet color and side panel (if applicable). 2. Layout – components layout on the front, rear and sides of cabinet. • Rackmount Workstation/Server PCs • KVM Console/Extender • Network Components 3. Doors – handle, lock with key and document pocket. 4. Labeling – cabinet, terminals, devices, earth bars, attention symbols and cable marker. 5. Earthing – bolt types, location, wiring type, screen terminals, grounding of devices and doors. 6. Cable handling – routing, trays/duct, clamp rails and termination. • System cables – Vnet, Vnet/IP, Ethernet etc. • Power supply cables. 7. Signal termination

Copyright © Yokogawa Electric Corporation

- Terminal – terminal and wiring types, installed spare and space for spare.

8. Power distribution – isolator and circuit breakers rating, power sockets/receptacles, fused terminal types and wiring sizes.
9. Others
   - For FO/Network – mounting and termination.
     - FO converter
     - Ethernet Switches.
     - L2/L3 switches
     - Fiber Optic Patch Panel

B. Power Supply Check

1. Remove UPS power source to Server Cabinet by turning off UPS feed circuit breaker.
2. Verify power supply 1 fail indication on all server PCs and other network components that is powered from UPS source.
3. Verify power supply fail on L2/L3 Switches that is powered from UPS source and check for appropriate messages at the OWS.
4. Turn ON the UPS feed circuit breaker; check the power supply recovery on Server PCs and L2/L3 switches.

   Repeat the test for Normal power source by turning ON & OFF the Normal feed circuit breaker.

C. Functional Check (for KVM Console/Extender)

1. KVM Console: Verify monitoring and operation of the selected workstation/server from KVM Console.
2. KVM Extender: Verify monitoring and operation of the KVM extended workstation/server from remote KVM via KVM Extender.

D. Functional Check (for Network)

1. Ethernet Switches

- Verify the Port connection is as per design, connection/speed LED is lit.
- Execute "ping" command between two OWS connected to the Ethernet switches.
  a. Ethernet switch powered "ON": Normal reply from the OWS.
  b. Ethernet switch powered "OFF": Time out reply from OWS.

Copyright © Yokogawa Electric Corporation

	If applicable, c. FO convertor powered "ON": Normal reply from the OWS. d. FO convertor powered "OFF": Time out reply from OWS. 2. L2 /L3 Switches (Vnet/IP) - Verify the Port connection is as per design, connection/speed LED is lit. - Disconnect each cable from port and verify system alarm and System Status Overview on EWS/OWS.
Criteria	Server PCs, L2/L3 switches, FO converter and all other network components should function properly.
Test Record Reference	- Refer Appendix 8.5 – FAT Check sheet

The above checks are conducted for all server/network cabinets and witnessed by the following representatives.

7.5 PCS I/O Check

7.5.1 PCS I/O Check Procedure

Outline	Functionality of All I/O modules installed in the Field Control Station. During internal test, 10% sample checks for selected I/O will be conducted without marshalled cross-wiring. With marshalled cross-wirings, 100% I/O tests are carried out and records for the same are maintained. During FAT, these records will be reviewed and 10% sample checks for selected I/O will be conducted. The I/O check is performed to verify circuit integrity within individual panels and also between panels. The I/O check is also performed to verify that the I/O is correctly assigned in the FCS.
Objective	- Verify Pre-FAT record to confirm all I/O modules are checked. - Perform random IO check (1 channel per module).
Reference	- I/O Assignment Documents Refer to Approved Document List
Procedure	1. Input signals to be simulated from terminals at MDF. 2. Output measurements to be taken from terminals at MDF. 3. Refer to procedure below.
Criteria	- For Analog Inputs: Reading should be within +/- 0.1 of scale*. - For Analog Outputs: Reading should be within +/- 0.3 of scale*. - For Digital Inputs: The correct faceplate indication to be checked on the OWS. - For Digital Outputs: The correct contact status/voltage to be checked at the MDF field terminals. Note*: Accuracy of Yokogawa I/O Modules at normal condition (23°C ± 2 °C)
Test Record Reference	- Pre-FAT Test Record (Internal I/O check test record) Refer Appendix 8.6 – I/O Check sheet (Check sheet are generated from master database to ensure that there is no I/O tags been left out).

Copyright © Yokogawa Electric Corporation

➢ **Analog input (Conventional 4 to 20mA):**

Simulate appropriate analog input signals to the PCS using the portable calibrator and record PCS reading displayed in the corresponding faceplate at the OWS.

For Analog Input points, 3 input signals shall be simulated:

- Signal 1 = 4.00mA, corresponding to 0% at OWS.
- Signal 2 = 12.00mA, corresponding to 50% at OWS.
- Signal 3 = 20.00mA, corresponding to100% at OWS.

The result shall be recorded in I/O Check sheet Appendix-7 Analog.

Note: If applicable, verify the FIO Analog IO module dip switch setting for all 4 wire transmitters. Instrument Index to provide the list of all field powered transmitters.

➢ **Analog output:**

From the faceplate at the OWS, set the output (MV) of the tag and measure the corresponding signal output at the output terminals using an ammeter. For Analog Output points, 3 output signals shall be set:

- Signal 1 = 0.1%, corresponding to 4mA at output terminals.
- Signal 2 = 50%, corresponding to 12mA at output terminals.
- Signal 3 = 99.9%, corresponding to 20mA at output terminals.

The result to be recorded in I/O Check sheet Appendix-7 Analog.

➢ **Digital input:**

Open or close the input point at the input terminals and record the PCS status indication for the corresponding tag faceplate at the OWS. For Digital Input points, 2 input states shall be simulated:

- Signal 1 = 0 or open contact input signal.
- Signal 2 = 1 or close contact input signal.

The result to be recorded in I/O Check sheet Appendix-7 Digital.

➢ **Digital output:**

Set or reset the PCS output point through the faceplate at the OWS and observe the status of the output point on the PCS IO module. The channel number shall be displayed on the PCS IO module when that channel is turned ON. For Digital Output points, 2 output states shall be set:

- Signal 1 = 0 or open contact output signal.
- Signal 2 = 1 or close contact output signal.

The result to be recorded in I/O Check sheet Appendix-7 Digital.

Copyright © Yokogawa Electric Corporation

Note: For non-Yokogawa terminal boards, verify the board jumper settings for each channel to ensure the channels are properly set for wet or dry contact depending on the application requirement. Instrument Index to provide the list of all PCS and field powered field devices.

The above checks are conducted for the randomly selected I/O (one channel per module).

TEST RESULT: PASS / FAIL

7.6 SIS & FGS Physical Hardware Check

7.6.1 System/Marshalling Cabinets Appearance, Construction & Wiring Check

Outline	All the System/Marshalling cabinets and installed components are to be checked and verified for their appearance and construction.
Objective	1. To verify that all the System and Marshalling cabinet are manufactured as per the specification. 2. To verify Cabinet high temperature alarm. 3. To verify the proper function of the redundant power supply units. 4. This test ensures that the interface boards function properly upon power up.
Reference	System and Marshalling cabinet GA/IA Drawing. - Refer Appendix 8.3 - Approved Document List
Procedure	**A. Visual Check**. (all cabinets) Visually check that all the Marshalling cabinet are as per the GA/IA drawings. Check items as follows: 1. General Cabinet Construction – lifting construction, Plinth & Insulation, cabinet color and side panel (if applicable). 2. Layout – components layout on the front, rear and sides of cabinet. • Power Supply Unit (PSU) rating. • Interface Boards – mounting, termination, installed spare and space for spare. • I.S./Proximity Switch interface board. 3. Doors – handle, lock with key and document pocket. 4. Labeling – cabinet, terminals, devices, earth bars, attention symbols and cable marker. 5. Earthing – bolt types, location, wiring type, screen terminals, grounding of devices and doors. 6. Cable handling – routing, trays/duct, clamp rails and termination. • System cable. • Field cables from junction boxes. } (*) • Power supply cables. 7. Signal termination. • Terminal – terminal and wiring types, installed spare and space for spare. • Surge arrestor (if applicable) – termination, installed spare and space for spare. 8. Power distribution – isolator and circuit breakers rating, fused terminal types and wiring sizes.

Copyright © Yokogawa Electric Corporation

	9. Others: Fans, thermostat and if applicable, utility socket. B. **Temperature Check** (for all cabinets) 1. Note Thermostat setting in the cabinet. Check that the contact at the terminal is closed circuit. 2. Set the Temperature setting of thermostat to a lower setting (e.g. 18 ^{0}C). 3. Check that the contact is now open. 4. Recover the alarm by setting the temperature setting back to above room temperature. 5. Check that the contact is now returned to closed position. C. **Power Supply and (if applicable) ELM Check** 1. Take measurement of voltage output from PSU individually. The voltage should be 24 ~ 26VDC. 2. Measure voltage output from PSU02 and switch "OFF" circuit breaker for PSU01. 3. The voltage measured at PSU02 output should remain within the voltage limit (24 ~ 26VDC). 4. Measure and record the DC voltage ripple with an oscilloscope. 5. Recover PSU01. 6. Repeat test for PSU01 by switching "OFF" PSU02. 7. Reset ELM alarm if any. Ensure that the contact is closed. 8. Activate earth fault by using a jumper wire to short one of the field connection terminals to earth bar. 9. Check alarm status at ELM and verify open contact. 10. Remove the jumper wire and reset the ELM as necessary. 11. Ensure the alarm status at ELM and contact returns to close. D. **Functional Check** (for all equipment) 1. Switch on the 24VDC power supply to the interface board one-by-one. 2. Observe the LED indication on the interface board.
Criteria (Expected Results)	1. Quantity, type, Model and location match with the approved / final GA/IA Drawings 2. Cabinet temperature switch contact opens when thermostat is set to a lower setting 3. PSU voltages remain within the voltage limit (24 ~ 26VDC) in single operation. 4. ELM is activated on a simulated ground fault. (if ELM is applicable) 5. The LED indication on the respective interface board is lighted up, when 24V is applied.

7.6.2 Safety Control Station (SCS) Nest Loading Check

Outline	All Safety I/O nodes and modules are assigned according to the I/O assignments. The position and quantity of these items in the Safety Control Station shall be verified.
Objective	To verify that all the Safety I/O nodes and modules are correctly supplied and installed.
Reference	I/O Assignment Documents Refer Appendix 8.3 - Approved Document List
Procedure	Visually check that all the Safety I/O nodes and modules are installed in each of the Safety Control Stations according to the I/O Assignments for various areas as per reference documents.
Criteria (Expected Result)	The quantity, type and location of all the Safety Control Units (SCU), Safety I/O nodes and modules including the spares must match the approved / Final I/O Assignment documents.
Test Record Reference	I/O Assignment Refer Appendix 8.7 – FAT Check sheet

The above checks are conducted for all Safety Control Stations and witnessed by the following representatives:

7.6.3 EWS/SOE Workstation Check

Outline	The EWS/SOE PC is supplied in accordance with the Bill of Materials along with applicable system software licenses.
Objective	To verify the EWS/SOE PC is supplied in accordance with the approved Bill of Materials and installed with applicable system software licenses.
Reference	- Bill of Material - System Architecture Drawing - Software Licenses Refer Appendix 8.3 - Approved Document List
Procedure	Visually check that the EWS/SOE PC is as per the Reference documents and verify the following. ✓ • Domain and Station Number ✓ • Quantity, Model number, Make, Type, Revision ✓ • System software revisions ✓ • Installed System software • Installed Software Licenses TO BE VERIFIED AT YARD
Criteria **(Expected Results)**	1. Domain and Station settings must match the Approved / Final System Architecture Drawing. 2. Installed software revision numbers must be as per the Approved / Final BOM. 3. Installed /Assigned software license must be as per the Approved / Final BOM. 4. Model number of the EWS/SOE workstation must be as per the Approved / Final BOM
Test Record Reference	Bill of Material. Refer Appendix 8.7 – FAT Check sheet

The above check will be conducted for all EWS/SOE PCs and witnessed by the following representatives:

7.6.4 System Architecture and BOM Check

Outline	The SIS system is configured as per the System Architecture Drawing and the associated BOM is derived accordingly.
Objective	Verify that the SIS system staged for testing is as per the System Architecture Drawing and corresponding BOM.
Reference	- SIS BOM - System Architecture Drawing - Safety Validation Plan (SVP) Refer Appendix 8.3 - Approved Document List
Procedure	1. Visually check that all the SIS components are staged as per the System Architecture. 2. Verify the BOM. • SIS Hardware. • SIS Software. 3. Verify Domain and Station numbers according to System Architecture. 4. Confirm that components (Model/Revision numbers) as built are in accordance with reliability calculation of SVP for specified SIFs.
Criteria (Expected Results)	1. SIS components staged must be as per the approved / Final System Architecture drawing. 2. Components (Model/ Revision numbers) used for SIFs should be in accordance to the SVP reliability calculations 3. Make and Model of SIS hardware and SIS software must match the approved / final BOM and SVP
Test Records	Refer Appendix 8.7 - System Architecture and Bill of Material. (BOM checks are done separately for hardware and Software) Refer Appendix 8.7 – FAT Check sheet

The above check has been conducted for all SIS equipment's and witnessed by the following:

7.6.5 System Cables Check

Outline	The System cables are manufactured as per the System Cable Schedule document. The manufactured cables are to be physically checked.
Objective	Verify that the SIS System is manufactured as per the System Cable Schedule document.
Reference	System Cable Schedule Refer Appendix 8.3 - Approved Document List
Procedure	Visually check that all the System Cables are manufactured according to the specification. The following shall be checked: • Cable Model. • Length. • Cable markers
Criteria (Expected Results)	1. Cable model and length must be as per the final Cable schedule. 2. Every cable must have cable markers at both ends.
Test Records	System Cable Schedule Refer Appendix 8.7 - FAT Check sheet

The above checks are conducted for all SIS System Cables and witnessed by the following representatives:

7.7 Standard System Function Check

7.7.1 System Start-up Test (SCS and I/O cards)

Outline	Each of the Safety Control Stations and its I/O cards shall go to their operating mode 'Waiting' automatically upon powering up, provided that the application software is properly loaded in the system. Regardless of the duration of a power failure, the initial cold start processing is performed when power is supplied to the CPU nodes. On SCS power up, input/output module startup processing is performed, and the operating mode shifts to the Waiting mode and '0' is output from the DO modules. The user should perform the output enable operation from the EWS after confirming that all output modules have been started successfully. Once the output enable operation is completed, output values of the application logic are output to the field. When all outputs are placed in the Output Enable status, the operating mode shifts to the Running mode.
Objective	To verify that the above components automatically boot up when going from power-off state to 'Waiting' mode.
Reference	- System Architecture Drawing - ProSafe-RS Instruction Manual (Safety Control Station) - SIS Instruction for Operation and Maintenance Refer Appendix 8.3 - Approved Document List
Procedure	1. Power down the whole system. 2. Power up and observe its boot up sequence until 'Waiting' mode is confirmed. 3. Check status/operating mode from SCS State Management panel on EWS PC after each station completes the boot up. 4. Check one or two IO loops by hardwired signal injection to check the status of the system after boot-up is completed. 5. Perform output enable operation after all output modules have been started successfully
Criteria (Expected Results)	1. System should boot up automatically. 2. System status indication on SCS State Management panel should show 'Ready'/'Waiting'. 3. The status of IO loops after system boot up must reflect the signal values injected and changes thereafter.
Test Record Reference	Refer Appendix 8.7 - FAT Check sheet

7.7.2 SCS CPU Backup Function Test

Outline	The two CPUs in the SCS back up each other. During operation, one CPU is active while the other CPU is on hot standby. The standby CPU is updated at every memory write-cycle.
Objective	To verify that SCS operation is uninterrupted when the active CPU fails and the standby CPU takes over.
Reference	- ProSafe-RS Instruction Manual (Safety Control Station)
Procedure	1. Wire up one test logic block with trip reset / latch function, inject hardwired signal input, and measure / monitor the output. 2. Display the POU in Debug mode on EWS PC for this logic block as applicable to observe the logic control action and status. 3. Energize the logic block (i.e. create status "trip") 4. Stop the active CPU by using the 'Start/Stop' button on the front panel (Switchover the CPU). 5. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS) 6. Check the "trip" status of the test logic block on the EWS to confirm SCS logic functions are normal. 7. Revive the CPU to normal operation mode. 8. Repeat for the test for the other CPU card.
Criteria (Expected Results)	1. The SCS Logic functions and data must be unaffected on simulation of active CPU failure. 2. SCS State Management panel shows SCS status.
Test Record Reference	Refer Appendix 8.7 - FAT Check sheet

The above checks are conducted on random basis for selected SCS and witnessed by the following representatives:

7.7.3 SCS ESB Bus Redundancy Test

Outline	The dual redundant ESB Bus interface modules, allow I/O data to be communicated between the Safety Control Unit and each Safety Node Unit. The following operations apply : - Normally, redundant ESB Buses are used in an alternating fashion. - If an error occurs in an ESB Bus interface module on one side, the error is notified to the user via a diagnostic information message. If both interface modules fail, the error is treated as a node failure. - If an error occurs in one ESB Bus or interface module, the SCU continues communication using the other normal ESB Bus. - An erroneous bus is monitored for recovery at regular intervals. - Errors in communication with all I/O nodes, except CPU node, are related to ESB Bus error.
Objective	To verify that SCS operation is uninterrupted when one ESB Bus interface module fails and the other interface module takes over.
Reference	- ProSafe-RS Instruction Manual (Safety Control Station)
Procedure	1. Wire up one test logic block with trip reset / latch function, inject hardwired signal inputs, and monitor the output, preferably in the Safety Node Unit than in the Safety Control Unit Node. 2. Display the POU in Debug mode on EWS PC for this logic block as applicable to observe the logic control action and status. 3. De-Energize or Energize the logic block (i.e. create status "trip"). 4. Disconnect the connector unit of one of the ESB Bus interface module in the SCU. 5. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS) 6. Check the "trip" status of the test logic block on the EWS to confirm SCS logic functions are normal. 7. Revive the ESB Bus to normal operation condition. 8. Repeat the same test procedure by disconnecting the connector unit of the other ESB Bus Interface module.
Criteria (Expected Result)	The SCS Logic functions and data must be unaffected on simulation on single ESB Bus failure.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

7.7.4 SCS Power Supply Module Redundancy Test

Outline	The dual redundant power supply modules on the Safety Control Unit and the Safety Node Unit supply power to the respective nodes.
Objective	To verify the redundant functionality of the power supply cards.
Reference	- ProSafe-RS Instruction Manual (Safety Control Station)
Procedure	1. Wire up one test logic block, with hardwired signal injection input, and monitor the output. 2. Display the POU in Debug mode on EWS PC for this logic block as applicable to observe the logic control action and status. 3. De-Energize or Energize the logic block (i.e., make status "trip"). 4. Remove the power to the active CPU nest power supply card by removing power from the UPS power source. 5. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS) 6. Check the "trip" status of the test logic block on the EWS to confirm SCS logic functions are normal. 7. Revive the Power Supply Card to normal operation condition. 8. Repeat for the other CPU nest power supply card by removing the power from normal power source. 9. Repeat the test for Safety Node unit power supply cards.
Criteria (Expected Result)	The SCS Logic functions must be unaffected on simulation on failure of single Power Supply module in SCS.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

The above checks are conducted on random basis for selected SCS and witnessed by the following representatives:

7.7.5 I/O Module Redundancy Test

Outline	The SIS I/O modules are configured as redundant for all I/O. In an SCS, it is possible to mount input/output modules of the same type in two adjacent slots to make them redundant. In the case of redundant configuration, one side becomes the control side and the other becomes the standby side. When control side fails, the standby automatically takes over, when standby module fails, it will be alarmed.
Objective	To verify the redundancy of I/O modules.
Reference	- I/O Assignment - ProSafe-RS Instruction Manual
Procedure	1. Wire up one test logic block with trip reset / latch function, inject hardwired signal input, and monitor the output. 2. Display the POU in Debug mode on the EWS PC for this logic block as applicable, to observe the logic control action and status. 3. De-Energize or Energize the logic block (i.e., create status "trip"). 4. Remove the active I/O module which has the I/O that has been set up for the logic block function monitoring as per Step 1. 5. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS) 6. Check the "trip" status of the test logic block on the EWS to confirm SCS logic functions are normal. 7. Install back the removed I/O module. 8. Check the I/O module recovery messages at the OWS. 9. Repeat the test by removing the other IO module
Criteria (Expected Result)	The SCS Logic functions must be unaffected on simulation of failure of active IO module in a redundant configuration.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

7.7.6 Field Power Supply Redundancy Test

Outline	SIS 24V DC Field Power supplies provide power to field input and output devices. The Field power supplies are installed in redundant configuration with each field power supply designed to cater field power to 100% of the IO in that cabinet
Objective	To verify the redundancy of 24V DC Field power supplies Refer Appendix 8.3 - Approved Document List
Reference	- SIS Cabinet power distribution drawings
Procedure	1. Select an SCS controller and reset all logics in that controller. 2. Remove AC power input to one of the 24V DC Power supply 3. Verify that the power to Terminal Board (TB)/Field IO is still normal. 4. Verify SIS System common trouble alarm in OWS is normal. 5. Revive AC power input and verify recovery of system common trouble alarm. 6. Repeat the test by removing AC power input to other 24V DC power supply.
Criteria (Expected Result)	Field power to SCS IO must be unaffected on simulation on failure of single 24V DC Field Power Supply unit.
Test Record Reference	Refer Appendix 8.7 - FAT Check sheet

The above checks are conducted for all Marshalling cabinets equipped with 24DC power supplies.

7.7.7 System Key Function Test

Outline	The SIS systems are equipped with a System Key. The System Key provides protections against unauthorized access and modification to system logics. • System key is normally set to Disable position. The ProSafe-RS logic security level is set and locked in at level 2, which is read only mode. • When System key is set to Enable position, security level remains at 2 but can be changed by user to 1 or 0 for online or offline download respectively. When System key is switched from Enable to Disable position, the logic will enable all locked or disabled variables then set security level back to 2. Enabling disabled variables is necessary to ensure that System key input will not be kept in locked state which will cause security level and variable enable locked down.
Objective	To verify: System key REMOTE (Disable) & PROGRAM (Enable) functionality
Reference	SIS Cabinet wiring drawings Refer Appendix 8.3 - Approved Document List
Procedure	1. Verify security level is set to 1 and at least one variable is locked. Turn System key position to DISABLE (REMOTE) position. • Verify lock variable is enabled and security level is set to 2 • Verify that the System Common Trouble alarm is cleared. 2. Return System key position to ENABLE (PROGRAM) position. • Verify security level remains at 2 • Verify System Common Trouble alarm in OWS 3. Change security level to 1 and verify that online download is possible. 4. Change security level to 0 and verify that offline load is possible.
Criteria (Expected Result)	SCS Security level change is possible only in Enable position. Switching from Enable to Disable position enables all locked or disabled variables and set security level to 2.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

7.7.8 Vnet/IP Bus Redundancy Test

Outline	The Vnet/IP bus is an important communication channel for communication between the EWS/OWS and the SCS/FCS. It also provides peer-to-peer communication between SCS/FCS. The Vnet/IP bus is dual redundant. This test will be carried out for the SIS system that is set up as per system configuration.
Objective	To verify the redundant functionality of the system communication network Vnet/IP bus.
Reference	ProSafe-RS Instruction Manual. Centum VP Instruction Manual
Procedure	**For SCS:** 1. For SCS CPU-1: Remove the cable that is connected to Bus-1. 2. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS). 3. Observe whether there is any break in trend gathering for any signal. 4. Re-connect the cable and check that the Bus-1 is healthy. 5. Repeat the above tests for CPU-1 Bus-2 and for CPU-2 Bus-1/2. **For Layer2 switch:** 7. Fail one of the L2 switches that is connected on Vnet/IP Bus-1. 8. Check the diagnostic information message on the EWS or the system alarm message from the OWS. (If the system is integrated with the PCS) 9. Observe whether there is any break in trend gathering for any signal. 10. Power back the L2 switch check that the switch and the connected Vnet/IP network are healthy 11. If applicable, repeat the test for the other L2 switch that is connected to Vnet/IP Bus-1. 12. Repeat the test for the L2 switch connected on Vnet/IP Bus-2.
Criteria (Expected Results)	1. The SCS should be monitored from EWS and/or OWS without interruption even on a single Vnet/IP bus. 2. System alarm messages should be correctly displayed. 3. There should not be any break in trend gathering for any of the signals.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

7.7.9 SCS Resource Capacity Check

Outline	SCS Resources refers to the SCS memory usage. Sufficient spare capacity for future expansion should be available at each SCS. The Safety Control Station resource usage depends on the application software configured in that particular SCS.
Objective	To verify that overall SCS resource capacity is sufficient. This result can be used as a reference while checking the SCS memory usage at the completion of commissioning.
Reference	- ProSafe-RS Instruction Manual (Engineering Guide) - SIS FDS Software Refer Appendix 8.3 - Approved Document List
Procedure	1. The check will be carried out for the related SCS. 2. Call up the SCS Information panel at the EWS. 3. Confirm the SCS resources consumed and the remaining resources available at the related SCS.
Criteria **(Expected Result)**	The overall SCS resources consumed must meet project requirement.
Test Record Reference	The printout from the system for each SCS Information. Refer Appendix 8.7 – FAT Check sheet

The above check will be conducted for all SCS and witnessed by the following representatives:

7.7.10 SCS CPU Loading Check

Outline	The loading of the CPU of each Safety Control Station depends on the size and complexity of the application software configured in that particular SCS, the specified scan cycle and communication loads with other devices (EWS / OWS / FCS / SCS). CPU loading of the SCS is an important factor for deciding the system performance.
Objective	To record the loading of the CPU of the SCS at the completion of FAT. This result can be used as a reference while checking the SCS CPU idle time at the completion of commissioning.
Reference	- ProSafe-RS Instruction Manual (Engineering Guide) - SIS FDS Software Refer Appendix 8.3 - Approved Document List
Procedure	1. Select an SCS for which the CPU load needs to be verified. 2. (If the system is integrated with the PCS), on each of the OWSs, belonging to that SCS operation group, call up 4 Graphic windows, a faceplate or a tuning window. The selected Graphic windows should pre-dominantly have tags from the selected SCS for which the CPU load is being measured. 3. Call up the status display of the SCS, for which the CPU idle time is being measured and note down the displayed CPU idle time 4. Printout a hardcopy of the SCS status display for records.
Criteria (Expected Result)	The CPU idle time shown on the System Maintenance panel for each SCS should meet the project requirement.
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

The above check will be conducted for all other SCSs.

7.7.11 SCS Online/Offline Loading Test

Outline	During the course of plant operation, it may become necessary to modify certain tag definitions, parameters and logic configurations etc. There are two types of loading procedures. These are: • On-line loading. • Off-line loading Modifications (within specified restrictions as per engineering guide) made at the EWS followed subsequently by on-line loading to the SCS have no effect on SCS operation. The modifications become effective on completion of the loading procedure. Modifications made at the EWS followed subsequently by off-line loading to the SCS will cause the SCS to go off-line for the duration of the loading procedure. The modifications become effective on completion of the loading procedure, and the SCS returns to normal on-line status.
Objective	To verify SCS on-line and off-line loading function.
Reference	- ProSafe-RS Instruction Manual (Engineering Guide)
Procedure. (On-line Load).	✓1. Modify any of the parameters permitted for on-line loading. ✓2. Execute SCS on-line loading via the EWS. ✓3. Observe whether any effect to SCS operation during SCS on-line loading. ✓4. Confirm that the modified parameters are loaded and functioning properly.
Criteria. (Expected Results) (On-line).	✓1. SCS operation is not affected during SCS on-line loading. ✓2. The modified parameters should be loaded without any errors and the post download changes are reflected as desired
Procedure. (Off-line Load).	✓1. Modify any of the logics required for off-line load. ✓2. Execute SCS off-line loading via the EWS. ✓3. Observe SCS fail status from the system panel during off-line loading. ✓4. Confirm that the modified logics are effectively loaded and functioning properly.
Criteria. (Expected Result) (Off-line).	The modified parameters should be loaded without any errors and the post offline load changes are reflected as desired.

7.7.12 Media Backup/Restore Function Test (ProSafe-RS Project)

Outline	The ProSafe-RS EWS PC is equipped with backup storage device for application program backup onto backup storage/media.
Objective	- Verify that the backup storage/media will back-up/restore ProSafe-RS project database.
Reference	- ProSafe-RS Instruction Manual
Procedure (Backup)	Backup the project application database in EWS PC to backup storage/media.
Criteria (Backup)	The project folder is copied onto the backup storage/media without interruption and any errors.
Procedure (Restore)	Restore the project application database backup files in the backup storage/media to EWS PC.
Criteria (Restore)	The project folder is restored back to the desired location in EWS PC without interruption and any errors. There should be no effect on ProSafe-RS generation after restoration
Test Record Reference	Refer Appendix 8.7 – FAT Check sheet

The above checks are conducted the ProSafe-RS project folder and witnessed by the following representatives.

7.8 SIS & FGS I/O Check

7.8.1 I/O Check Procedure

Outline	During the internal test, 100% I/O tests are carried out and records for the same are maintained. During FAT, 100% IO checks are performed to verify that the I/O is correctly assigned in the SCS.
Objective	1. To verify all the SIS input and output signals and circuits and their assignment in the SCS. 2. To verify IO parameter settings in the SCS with I/O tag list. 3. To verify Trip points /Dead band /Range of analog signals on logic sheet against project requirement. 4. To verify Tag number, tag comment, range, and engineering unit on OWS faceplate (If the system is integrated with the PCS). 5. To verify SOE records on the SOE viewer installed in the EWS PC.
Reference	- I/O Assignment - Termination Wiring Drawing Refer Appendix 8.3 - Approved Document List
Procedure	1. Analog Input signals to be simulated at test panel or at the Marshalling terminals using signal generators (For redundant modules, switch over to standby module and test redundant path). 2. Digital Input signals to be simulated using test panel and/or switches hardwired to terminals at Marshalling (For redundant modules, switch over to standby module and test redundant path). 3. Digital Output signals shall be tested by forcing the output from the EWS and observing the LEDs on test panel and/or voltage hardwired to terminals at Marshalling (For redundant modules, switch over to standby module and test redundant path).
Criteria (Expected Results)	1. The circuit for every I/O point is completed from simulator test panel (or terminals at Marshalling if test panel is not used) to SCS. 2. Signal values of all I/Os are correct. 3. Tag number, tag comment, alarm/trip settings, range and engineering units are configured correctly and match the data in Instrument Index.
Test Record Reference	1. Pre-FAT Test Record (100% of I/O). 2. Refer Appendix 8.8 – I/O Check sheet (Check sheet are generated from master database to ensure that there is no I/O tag been left out).

Analog input: ✓FGS ✓SIS (PENDING PONCH 5003)

Simulate appropriate analog input signals using the hardware simulation test panel or the signal generator and record SCS reading displayed in the corresponding workbench at EWS and/or faceplate at the OWS. For Analog Input points, the following signal levels shall be injected and verified:

- Signal 1 = 0%
- Signal 2 = 50%
- Signal 3 = 100%
- Out of range IOP+
- Out of range IOP-
- Trans+
- Trans-

Additional points for FGS Detectors:

- Calibration
- Beam block
- Dirty Optics

Verify the tag number, tag comment, range and engineering unit on OWS faceplate.

Verify the Process Alarms on the OWS.

Verify the alarm & trip related setting, transmitter fault, failsafe value, etc. on the EWS and annunciation of the same on the OWS.

Verify alarm and trip signals on the SOE and time stamps as applicable.

The result shall be recorded in the I/O Check sheet.

Note: If applicable, verify the IO card dip switch setting for all 4 wire transmitters. Instrument Index to provide the list of all field powered transmitters.

N.A. **Analog output:**

From the workbench at EWS, force the output (MV) of the tag and measure the corresponding signal output at the output terminals using an ammeter. For Analog Output points, 3 output signals shall be set:

- Signal 1 = 0.1%, corresponding to 4mA at output terminals.
- Signal 2 = 50%, corresponding to 12mA at output terminals.
- Signal 3 = 99.9%, corresponding to 20mA at output terminals.

The result to be recorded in I/O Check sheet.

Digital input: ✓ FGS ✓SIS

- Open or close the input point using the toggle switches on the Simulator test panel and record the input status indication in the corresponding logic display at EWS. For Digital Input points, the following input states shall be simulated:
  - Signal 1 = 0 or open contact input signal.
  - Signal 2 = 1 or close contact input signal.

Copyright © Yokogawa Electric Corporation

- Signal Fault : Wire break and / or short circuit as applicable for line monitored inputs
- Verify the Trip Signals on the SOE and SOE time stamps as applicable.
- The result to be recorded in the I/O Check sheet.

Digital output: ✓FGS ✓SIS

Using EWS, force the Digital output point to ON and confirm that the LED on the test panel is turned ON. Force the Digital output point to OFF and confirm that the LED on the test panel is turned OFF. Short the wires at the LED and confirm that the System automatically disables the DO channel.

If applicable, verify the Trip Signals on the SOE and SOE time stamps.

The result to be recorded in the I/O Check sheet.

The above check will be conducted for 100% of the IO and witnessed by the following representatives:

9 EMCS

please redo all the paragraph according to the other section of this procedure and according to comments on sheet 5 (comment are not hexaustive)

9.1 Test purposes

The tests covered in this document are related only to acquire and generate the IO hardwired signals provided by EMCS and the hardware redundancy.

9.2 Test prerequisites EMCS

The test must check:

- the correct wiring of the signals of the IO card to terminal strips
- the correct acquisition of input signals (digital and analog) by the control system
- the correct generation of output signals (digital and analog) by the control system
- the hardware redundancy in case of one control system fault or network failure

To perform the test, Yokogawa will use laptop PC to connect, through software to programming SEL Industrial PC, at the control system with the scope to verify the correct internal status of the signals.

Availability of documents concerning the communication interface is a necessary prerequisite, in order to proceed with the actual test. The minimum provided information is :

- Communication parameters (IP address, subnet mask, device parameters, device tag when applicable, communication speed when applicable).
- IO signal maps, specifying for each signal to be tested :
  - Tag
  - Address
  - Description
  - Data type
  - Data access (read/write)
  - Range
  - Scale
  - Offset
  - Engineering Unit (if applicable)

9.3 Hardware link validation

This chapter describes the tests that will be executed during the "Hardware Link Communication tests". The following tests shall be performed for each IO card in the EMCS and for each control system component.

1 INTRODUCTION

1.1 GENERAL

The purpose of this document is to define the methods and documentation that will be used to carry out the Integration Factory Acceptance Test (FAT) using Virtual Machine (VM)/Remote Access on Yokogawa's Distributed Control System (PCS) CENTUM VP, ProSafe-RS (SIS and FGS), SCADA (CI Servers) and EMCS. The FAT is performed to ensure that the system is properly configured, assembled and functional in accordance with the intended design as specified in the approved documents. The objective of FAT is to demonstrate to Crosswind that the system hardware and software is built in accordance to requirements as specified in the approved documents. Crosswind and Rosetti Marino (RM) would witness to verify the test. Upon successful completion of the test, a FAT Test Certificate and Shipping Release Notice would be signed by both Yokogawa as MAC and Crosswind/RM to signify the acceptance of the test and approval of shipment of the equipment.

1.2 SCOPE AND OBJECTIVE

The Factory Acceptance Test referred to as FAT applies to the PCS, SIS , FGS and EMCS Software supplied by Yokogawa . The objective of the FAT is to verify the conformance of the system against the approved specifications and FAT procedure before delivery to site. The FAT shall be conducted to test and verify the main items listed below:

- System Software

PCS- CentumVP Version R6 Software
SIS and FGS - Prosafe-RS Version R4 Software
SCADA – Collaborative Information (CI) Server R1

- Operator Station Application Software

SCADA – Collaborative Information (CI) Server R1

- Control Station Application Software

PCS, SIS, FGS and EMCS

- Alarm Management

SCADA – Collaborative Information (CI) Server R1

<u>Exclusion of test during this FAT</u>

- 3rd Party Package Communication Testing, EMCS integration test with CI-Server and PCS

Table 2 – Yokogawa Reference Documents.

2.2 DEFINITIONS AND ABBREVIATIONS

ALE	Yokogawa Ethernet Communication Module
AMS	Alarm Management System
BLPH	Base Load Power Hub
CAP	Critical Action Panel
Centum VP	Yokogawa's DCS Product
PCS	Process Control System
CI	Collaborative Information
COMPANY	Crosswind
CONTRACTOR (CTR)	ROSETTI MARINO S.p.A.

DCS	Distributed Control System
DEP	Design and Engineering Practice
DOCUMENT NAME	Document Title
EMCS	Electrical Monitoring and Control System
EPC	Engineering, Procurement Construction
EWS	Engineering Workstation
FCS	Field Control Station
FGS	Fire & Gas System
GSD	General Station Description
HART	Highway Addressable Remote Transducer
HKN	Hollandse Kust Noord
HMI	Human Machine Interface
HV	High Voltage
HVAC	Heating, Ventilation and Air Conditioning
HV-SCADA	The given name for the COMPANY's control system for the HKN wind farm infrastructure. BLPH's control system shall operate autonomously but will interface with HV-SCADA.
IAMS	Instrument Asset Management System
IEC	International Electrotechnical Commission
ISO	International Organization for Standardization
ITER	Instrument & Telecoms Equipment Room
ITP	Inspection and Test Plan
MAC	Main Automation Contractor
MCC	Motor Control Centre
NA	Not Applicable
OER	Onshore Equipment Room
OPC	OLE (Object Linking Embedded) for Process Control
P&ID	Piping and Instrument Diagram
PCS	Process Control System
PIN	Plant Information Network
PRM	Plant Resource Manager
PROJECT	HOLLANDSE KUST NOORD WIND PARK Project
SCADA	Supervisory Control and Data Acquisition

SHALL	An absolute requirement.
SHOULD	This word indicates a recommendation that whilst preferred may not be implemented provided some equivalent is proposed and agreed by COMPANY. The full implications must be understood and carefully weighed before choosing a different course.
SIF	Safety Instrumented Function
SIL	Safety Instrumented Level
SIS	Safety Instrumented System
TCP/IP	Transmission Control Protocol/Internet Protocol
Vnet/IP	Yokogawa Virtual Network
WSUS	Window Security Update Services

Table 3 – Definitions and Abbreviations

2.3 APPLICABLE DESIGN ENGINEERING PRACTICES

Design Engineering Practices (DEP) have a limited rollout on BLPH.

2.3.1 Fully Applicable DEP

The following DEP are identified as being fully applicable to the project.

Document Name	Document Title
DEP 32.01.20.12	Industrial Automation and Control Systems (IACS) Security
DEP 30.00.60.15	Humans Factors Engineering – Control Room Design
DEP 33.64.10.32	Electrical Network Monitoring and Control System for Global Application
DEP 37.76.10.10	HVAC for Offshore Installations (Amendments/Supplements to ISO 15138)

Table 4 – Applicable DEPs

DEP 32.01.20.12 shall be applied to the project in full, in conjunction with IEC 62443, for the cybersecurity design.

2.3.2 DEM-1 Process Safety Only DEP

The following DEPs shall have the DEM-1 'Process Safety' requirements applied to the project.

Document Name	Document Title
DEP 32.30.20.11	Fire, Gas and Smoke Detections
DEP 32.80.10.10	Safety Instrumented Systems
DEP 32.80.10.14	Alarm Management (Amendment/Supplements to IEC 62682)
DEP 62.10.08.11	Inspection and Function Testing of Instruments

Table 5 – Applicable DEPs

2.4 INDUSTRY STANDARDS

Document Name	Document Title
IEC 61508	Functional safety of electrical/electronic/programmable electronic safety-related systems
IEC 61511	Functional Safety – Safety Instrumented Systems for the Process Industry Sector – Framework, Definitions, System, Hardware, and Application Programming Requirements
IEC 61850	Communication Networks and Systems for Power Utility Automation
IEC 62443	Cyber Security for Industrial Automation and Control Systems
IEC 62682	Management of Alarm Systems for the Process Industries
ISO 9001	Certifications of Quality Management System

Table 6 – Industry Standards

3 RESPONSIBILITY

Responsibilities for each party involved in the FAT are defined here-under to ensure that the FAT is carried out in accordance with an agreed procedure. It also ensures that there shall be authorized personnel(s) from Crosswind, RM and YOKOGAWA to facilitate any decisions and schedule changes resulted from the FAT as per ITP.

3.1 CROSSWIND

The full participation of Crosswind in the FAT is essential. Crosswind shall appoint an Inspector cum Test Approver to witness the FAT. The Test Approver would have the authority to sign-off upon the successful completion of all tests. Once signed off, the test will be deemed accepted and the decision will be final. The Inspector shall participate in the test and observe the test results on daily basis. The Test Approver shall approve the inspection items based on the approved specification and the test results recorded.

3.2 ROSETTI MARINO (RM)

RM shall appoint a FAT Manager for the FAT. The FAT Manager representing RM shall coordinate with Crosswind and YOKOGAWA FAT Managers and to facilitate the smooth implementation of the FAT activities and schedule. The role of the FAT Manager is also to resolve FAT issues on a regular basis. RM representatives will participate in the FAT for the complex controls, sequences and logics. For PCS controlled equipment packages containing complex controls, sequences and logics, RM at their discretion, may invite their package equipment supplier representatives to participate in the testing.

3.3 MAC SUPPLIER

YOKOGAWA as MAC shall appoint a Test Conductor to organize and manage all aspects of the FAT. YOKOGAWA shall carry out the testing and record the test results daily basis together with Crosswind Inspector and RM representative. The Project Manager representing YOKOGAWA shall be the FAT Manager. The FAT Manager shall coordinate with RM's FAT Manager and shall amend the test schedule whenever necessary to ensure the smooth running of the FAT. The FAT Manager shall also ensure that all tests are conducted in accordance with the approved FAT documents. If changes/modifications are required in the implementation, the FAT Managers of YOKOGAWA and RM shall discuss and arrive at the action plan.

4 GENERAL ADMINISTRATION

4.1 FAT VENUE

All the PCS equipment's will be staged at YOKOGAWA and shall be carry out using Virtual Machine (VM)/Remote Access on Yokogawa's Distributed Control System (PCS) CENTUM VP, Prosafe-RS (SIS and FGS) and SCADA (CI Servers).

4.2 ORGANIZATION CHART

A specific detailed Organization Chart shall be issued for each project, with all positions and names filled in. In addition, a FAT roster of the participants shall be issued, with the following details for each person; full name, company, responsibility, samples of the signature and initials, actual start and finish date of participation in the FAT. The FAT Manager will be responsible for maintaining the roster and keeping it updated.

4.3 KICK-OFF MEETING

An initial kick-off meeting will be held prior to starting the FAT to brief the participants, confirm the organization and responsibilities, and review the FAT schedule. At the same time, HSE briefing for all participants will be provided by YOKOGAWA. YOKOGAWA FAT Manager will prepare the presentation and explain the organization and work practices. All FAT documentation prepared by YOKOGAWA prior to FAT will be inspected for completeness.

4.4 DAILY WORKING SCHEDULE

The FAT will be conducted using Virtual Machine (VM)/Remote Access from YOKOGAWA premises from Monday to Friday (working days).

The following timing (CET) is recommended for the testing:

0900 to 1230 hrs	Inspection and test
1230 to 1330 hrs	Lunch
1330 to 1530 hrs	Inspection and test
1530 to 1600 hrs	Daily review meeting including next day's schedule planning

4.5 DAILY REVIEW MEETING

YOKOGAWA FAT Manager shall conduct a daily review meeting at the end of each FAT day. The meeting will involve all the parties taking part in the FAT. The purpose of this review meeting is to update all parties the progress and status of the FAT. The punch list will be reviewed during the daily meeting and the action to be taken will be discussed and finalized. If the recovery work involved is minor (identified in the daily meeting) and agreed by all parties, the work will be carried out on the same day and will be verified the following day by all the concerned parties and signed off in the punch list. If the recovery work involves major change/modification, The FAT Manager will advise the schedule for retesting.
Refer to section 5.4 for details in punch record.
The FAT Manager should also ensure that PCS, SIS, FGS, SCADA and EMCS Engineers make a backup of the application program to an external storage & other PC every day after the daily review meeting, so that old backups can be retrieved, if necessary.
White board will be provided to record progress & pending item.

4.6 WEEKLY PROGRESS MEETING

YOKOGAWA FAT Managers shall conduct weekly progress meeting every Friday. The purpose of the weekly meeting is to report the progress of the FAT in the same week and planned activity the following week. It shall also be the forum for resolving any issue arises from punch list. In the weekly progress meeting, The FAT Manager will present detailed weekly progress report, containing details of activities and achievements for the week, plan for the next week, area of concern, and detailed formal overall progress assessment. The format and content details of the weekly progress report and the underlining planning, progress monitoring and measurement methodology shall be in accordance with the FAT planning, Progress Monitoring Report. After the joint review in the weekly progress meeting and any necessary amendments, The FAT Manager will issue the weekly progress report.

4.7 FAT WRAP-UP MEETING

At the completion of the FAT, a final wrap-up meeting will be held. The overall status of the FAT shall be reported. Upon all parties' agreement that the FAT is completed satisfactorily, the FAT Completion Certificate and Shipping Release Notes shall be signed off by Crosswind/RM.

5 FAT DOCUMENTATION

The Factory Acceptance Test (FAT) shall be conducted in accordance with the test procedures detailed in this document. The test results shall be recorded in the check sheet. To prevent from any check sheet getting lost, each Check sheet shall be given a unique reference number.

5.1 FAT WRAP-UP MEETING

All FAT documentation shall be prepared by YOKOGAWA prior to the start of the FAT. All forms, check sheets, sign-off sheets, drawings, etc. as listed in this procedure shall be organized in indexed binders. A master index for the FAT will be provided and maintained by YOKOGAWA FAT Manager.
The documentation for software checks shall be organized by individual process units in indexed binders. The documentation for graphics checks shall also be organized, separately by individual process units in indexed binders.
All FAT reference documents (latest issue) as listed in this procedure originated by other parties (Crosswind, RM), which were issued formally to YOKOGAWA will form a part of the FAT documentation and shall be printed out and organized in indexed binders by YOKOGAWA.
All FAT reference documents as mentioned above shall be stamped "FAT MASTER" on every page/sheet. Any additional documents that may be necessary and generated later during FAT shall also be stamped, and indexes amended accordingly.

5.2 INTERNAL TEST/PRE-FAT WRAP

Prior to the FAT, YOKOGAWA shall conduct internal test (Pre-FAT) to verify the system and application software.

PCS Complex control loops, specialized sequential controls and batch control applications shall also be completely tested during Pre-FAT using Simulation Software (Test Function) in VMs.

The entire SIS, FGS application software will also be completely tested during Pre-FAT using Simulation Software (Test function) in VMs.

The result of the test shall be recorded and made available for reference before or during FAT. As a part of the pre-FAT, the project team consisting of application engineers from YOKOGAWA, RM and Crosswind conduct electronic (paper) check using the PCS tag/tuning report generated from the system.

During this paper check Pre-FAT, Crosswind/RM will verify the configuration parameters by using engineering documents. This will enable the FAT crew to concentrate on the control functions and Graphic functionality during the actual FAT and will also help in reducing the duration of the FAT.

Refer to PCS, SIS, FGS and SCADA application software sections for detailed procedure on paper check. It is also preferred that Crosswind and RM representatives participate in the pre-FAT for complex controls, sequences and logics checks, especially in projects that has multiple equipment's with identical control strategy, to facilitate smooth execution of the FAT.

5.3 METHOD OF TESTING

Detailed test procedure for each test item is described in this document. Check sheet shall be provided, listing the equipment to be tested. All test results shall be recorded in the Check sheets. The following color codes shall be used in the testing:

a) Yellow marker – Items that were checked and cleared

b) Pink marker – Items that were having problems.

c) Green marker – Items that were checked after completion of recovery.

The color marking will be used on the print-outs of the control drawings, graphics and supporting design documents such as P&IDs, narratives, etc.

During PRE-FAT/FAT sample check of SIS, FGS Logics can be demonstrated with target hardware. Complete software and Hardware Integration Test shall be performed during SAT.

PCS Software Function Test will be conducted using Test Function tool, without connection to any physical I/O. Simulation Software (PCS/SIS/FGS/SCADA Specific) will be used to simulate process input, digital signal and alarms to FCS so that typical loops, logic sequence blocks can be tested without connecting to physical input and output devices. Dynamic graphics check shall be a part of the PCS/SIS/FGS/SCADA Software function test.

5.4 PUNCH RECORD

All shortcomings found during the test shall be noted in the FAT Punch Record. Each punch Record shall cover one punch item/fault. A Punch Record Ledger shall be used to summarize all the punch records. Punch record items shall be classified as follows:

M = Modification, item is to be modified, deleted, added due to design input changes.

C = Correction, item is to be corrected by YOKOGAWA.

If the recovery work involves change/modification, it is to be recorded on the punch record and the recovery undertaken as soon as possible after the agreement of both the FAT Managers after signing of the punch record. YOKOGAWA shall clear all correction items (Code-C) at factory before shipment. For recovery work that involves modification (Code-M), it will be regularly jointly reviewed by all parties on at least weekly basis and resolved whether to be implemented during FAT or later, depending on complexity and potential schedule and/or cost impact. After verification, the same will be signed off by all concerned parties in the punch record.

The punch record will be reviewed during the daily meeting and the action to be taken will be discussed and finalized. If the modification request were deemed deviated from the original design, it would be considered as change order. Punch will be recorded into punch list system.

5.5 FAT COMPLETION CERTIFICATE & SHIPPING RELEASE NOTE

Upon completion of the FAT, FAT Completion Certificate and Shipping Release Note will be signed by Crosswind, RM and YOKOGAWA. The purpose of these two documents is to certify that the FAT has been completed and accepted by RM. Both RM and YOKOGAWA agree that the system is in order and can be released for software to site. The software will be accepted and released by RM in any case, the release note will be issued by RM using its own template.

5.6 TEST EQUIPMENT

For SW FAT Virtual Machines with required software shall be used to demonstrate software applications configured using screen sharing and audio. Hence no dedicated measuring/Calibrating Test equipment shall be used.

6 PCS APPLICATION SOFTWARE

6.1 PROJECT OVERALL FUNCTION

6.1.1 Project Common Setting Check

Outline	Application inspection of project overall function include verifying project common configuration like plant hierarchy, alarm table, operation mark, and FCS properties/constants.
Objective	- Verify that the project overall function of CENTUM VP project is defined according to the FDS requirements.
Reference	- Functional Specifications like; • 1724000594-IN-DD-00015- System Architecture Drawing • 1724000594-IN-SP-00018- PCS and SAFETY SYSTEMS Software FDS-SW • CENTUMVP system view
Procedure	Verify following CENTUM VP configuration files as a part of paper check during pre-FAT; • Plant hierarchy • Alarm table • Operation mark • FCS properties/constants
Criteria	Plant hierarchy, alarm table, operation mark, and FCS properties/constants are configured according to the FDS.

The above checks are conducted and witnessed by following representatives.

OPMARK NOT USED

TEST RESULT: PASS / FAIL

YOKOGAWA Representative : Kamalnath S Date: 20-12-2024.

6.2 FCS FUNCTION

6.2.1 Application Software Test for Typical Loops

Outline	This application inspection includes typical loops such as simple indicators, simple control loops, manual loader, etc. Therefore, the accuracy of the PCS configuration relies on the accuracy of the data entry in the database.
Objective	- Verify that that regulatory control loops are configured according to the database and FDS requirements.
Reference	• Functional Specifications like; • 1724000594-IN-SP-00018- PCS and SAFETY SYSTEMS Software FDS-SW • 1724000594-IN-LIS-00004- PCS and Safety System IO List (HW and SW) Refer to Approved Document List for • PCS I/O Database • P&IDs • Control Narratives
Procedure	1. Identify each type of application module from P&IDs and FDS. 2. If necessary, perform function test for selected application modules. 3. Verify configuration data for application, by reviewing CENTUM VP system view. Sample tags checked during FAT shall be logged for test record. The accuracy of the PCS configuration relies on the accuracy of the data in the I/O List.
Criteria	Each loop in control drawing should be configured in accordance to the functional specifications, control narrative, P&IDs, and PCS I/O Database.

The above checks are conducted and witnessed by following representatives.

PROVIDED THAT ALL PUNCHES RECORDED DURING FAT WILL BE FIXED BEFORE SAT

6.2.2 Application Software Test for Complex Loops

Outline	PCS application test involves functionality check for all complex loops that is described in the functional specification, control narratives and P&IDs.
Objective	Verify that the complex control configuration functions as defined in the approved functional specifications.
Reference	- Functional Specifications like; • 1724000594-IN-SP-00018- PCS and SAFETY SYSTEMS Software FDS-SW • 1724000594-IN-LIS-00004- PCS and Safety System IO List (HW and SW) Refer to Approved Document List for - I/O Database - P&IDs & PFD - Control Narratives - ESD/PSD Cause and Effect Diagram
Procedure	1. Using Test function tool, simulate process input signals to check control loop functions. 2. Check following applicable control functions for each complex loop. • Control Action • Bumpless transfer • Tracking functions • Ratio/Calculations • Annunciator message output • Data quality Propagation • ESD/PSD Interlock Shutdown Controller action • Operational Interlock Controller action • Initial functional status of loops on FCS startup • Operator Graphical Interface • Alarm & Trip settings • Other specific functional requirements according to complex loop description
Criteria	Complex loops in control drawing should be configured in accordance to the functional specifications, control narrative, P&IDs, C&E and PCS I/O Database.

The above checks are conducted and witnessed by following representatives.

6.2.3 Application Software Test for Sequence and Logic

Outline	FCS sequence control functions include sequence table, logic chart or SEBOL (Sequence and Batch Oriented Language) configuration. These are configured in accordance with plant logic requirements as described in the FDS, control narrative and any sequence/logic diagrams. Sequence control functions are checked by simulating field inputs using the test function software tool and confirming the corresponding expected outputs.
Objective	Verify that the specified functions perform control as defined in the approved functional specifications.
Reference	- Functional Specifications like; ▪ 1724000594-IN-SP-00018- PCS and SAFETY SYSTEMS Software FDS-SW ▪ 1724000594-IN-LIS-00004- PCS and Safety System IO List (HW and SW) Refer to Approved Document List for - I/O Database - P&IDs & SLDs - Control Narratives - ESD/PSD Cause and Effect Diagram
Procedure	1. Using Test function tool, simulate process input signals to check logic/sequence configuration. 2. Check that the sequence/logic performs correctly, and the correct digital outputs are set. 3. Check valves open/shut, pumps start/stop, appropriate alarm message display etc. 4. Check the initial functional status of sequence logics on FCS start-up. 5. For each sequence/logic, check operator interface Graphic functions. Detail checklists are described on the Check sheet.
Criteria	Sequence and logic should be configured in accordance to the functional specifications, Control/Logic narrative, P&IDs, SLDs, C&E and PCS I/O Database and any sequence or logic diagram.

PROVIDED THAT ALL PUNCHES RECORDED DURING FAT WILL BE FIXED BEFORE SAT

6.2.4 Application Software Test for non-Typical Loops

Outline	This application inspection includes non-typical loops such as control loops, etc. that are generated. Non-Typical loops can be simple Analog outputs, Value comparison, average, deviation alarm or process alarm based on analog values etc.
Objective	- Verify that that regulatory control loops are configured according to the FDS requirements.
Reference	- Functional Specifications like; ▪ 1724000594-IN-SP-00018- PCS and SAFETY SYSTEMS Software FDS-SW ▪ 1724000594-IN-LIS-00004- PCS and Safety System IO List (HW and SW) Refer to Approved Document List. - PCS I/O Database - P&IDs - Control Narratives
Procedure	1. Identify each type of Typical from P&IDs and FDS. 2. If necessary, perform function test for selected loops. Detail checklists are described on the check sheet. Sample tags checked during FAT shall be logged in this check sheet for test record. The check sheet used for this test shall be from the Excel spreadsheet as the test record. Non-Typical loop Pre-FAT paper check will be sufficient to test all the application loops. The accuracy of the PCS configuration relies on the accuracy of the data in the I/O List. Detail checklists are described on the Check sheet.
Criteria	Each loop in control drawing should be configured in accordance to the functional specifications, control narrative, P&IDs, and PCS I/O Database.

6.2.5 Alarm and Trip Setpoints

Outline	This application inspection includes non-typical loops such as control loops, etc. that are generated.
Objective	- Verify that alarm and setpoints are as per Alarm/Trip Setpoints.
Reference	▪ Functional Specifications like; ▪ 1724000594-IN-SP-00018- PCS and SAFETY SYSTEMS Software FDS-SW ▪ 1724000594-IN-LIS-00004- PCS and Safety System IO List (HW and SW) ▪ K559-2254-EL-LST-001- Control Alarm and Monitoring Table Refer to Approved Document List for ▪ PCS I/O Database ▪ P&IDs ▪ Control Narratives
Procedure	1. Identify each Alarm/trip for each required Tag. 2. Simulate the value to create alarm 3. Verify the alarm/trip setpoints on the check sheet. Detail checklists are described on the check sheet.
Criteria	Each loop in control drawing should be configured in accordance to the functional specifications, control narrative, P&IDs, and PCS I/O Database.

The above checks are conducted and witnessed by following representatives.

7 CI SERVER CONFIGURATION

7.1 NAMING CONVENTION

Outline	To verify the agreed naming conventions are implemented
Objective	To confirm that the naming conventions is correctly implemented for the following: ▪ Plant hierarchy ▪ Item names ▪ Displays ▪ Symbols (static and dynamic)
Reference	▪ Section 8.3,9, 24, 28.5.2, 28.10.1 of Reference PCS and SAFETY SYSTEMS Software Functional Design Specification (FDS-SW) 1724000594-IN-SP-00018 ▪ Refer Instrument IO list 1724000594-IN-LIS-00004_R02
Procedure	Check the naming conventions for the following are in accordance with the FDS: ▪ Plant hierarchy – check the section naming and structure under the node in CI Server Engineering module and confirm that it conforms to the FDS plant hierarchy convention. ▪ Items – review the item names under the sections and confirm that the naming conforms to the FCS tag naming convention (e.g.: A, SH, SL). ▪ Displays – check the graphic names in the Edit Module and confirm that they conform to the FDS graphic naming convention. The display name shall be followed as per the P&ID/SLDs. ▪ Static and dynamic symbols – check the symbol names in the Edit Module and confirm that they conform to the FDS graphics naming convention.
Criteria	The naming conventions match the customer convention requirements
Test Record Reference	HMI Screen and Engineering Module Printout

7.2 AUDIT TRAIL

Outline	The generated events are recorded and can be traced
Objective	To verify the event generated by the operator can be traced
Reference	▪ Section 14.8, 28.5.7 of Reference PCS and SAFETY SYSTEMS Software Functional Design Specification (FDS-SW) 1724000594-IN-SP-00018
Procedure	Generate some events which have to be recorded in the audit trail window in the operator interface.
Criteria	The generated events are logged in the respective display.
Test Record Reference	Audit Trail Window printout

The above checks are conducted and witnessed by the following representatives.

TEST RESULT: PASS ✓ / FAIL

PROVIDED THAT ALL PUNCHES RECORDED DURING FAT WILL BE FIXED BEFORE SAT

7.3 HISTORISATION

Outline	History data is acquired for applications like reporting, alarm pages and trending and therefore the correct configuration is very important to trace significant events in the past.
Objective	To verify the history configuration meets the customer requirements.
Reference	▪ Section 28.5.1 of Reference PCS and SAFETY SYSTEMS Software Functional Design Doc.No. 1724000594-IN-SP-00018 ▪ History Storage calculation sheet
Procedure	▪ Verify the history storage path ▪ Check the lifetime for the following history groups: - Item storage groups: SCAN/ITEM EVENT/EVENT EVENT/ITEM Generate randomly events for items in each storage groups to verify the timestamp of the generated events.
Criteria	The storage drive has enough space to match the size of the total history lifetime. This could be verified by using a history calculation sheet. The lifetime of the history groups is correctly implemented. Generated events could be observed using reports or trend displays.
Test Record Reference	Trend Display printout and generated csv report file

The above checks are conducted and witnessed by the following representatives.

7.4

7.4 AUTHORIZATION

Outline	The level of authorization for the typical is verified in typical FAT prior to the FAT. E.g., the operator can modify a setpoint but is not able to set the tag in calibration mode. In this test case the general CI Server configuration part will be tested which is the framework for the application typical.
Objective	Verify if all authorization groups and users are configured according to the design documentation
Reference	▪ Section 28.8 of Reference PCS and SAFETY SYSTEMS Software Functional Design Doc.No. 1724000594-IN-SP-00018
Procedure	▪ Authorization groups are configured correctly. ▪ All the required users are added in CI Server with the proper authorization groups. ▪ Users are authorized to modify items within their process area (e.g., acknowledge, value) ▪ Users are authorized to open displays within their process area
Criteria	All Authorization levels are configured properly. All required users are configured properly. Users have (only) access to their process area
Test Record Reference	NA

The above checks are conducted and witnessed by the following representatives.

NOTE: CI Server default Authorisation and user groups are available ✓

8 GRAPHICAL USER INTERFACE

8.1 GENERAL LAYOUT AND NAVIGATION

Outline	CI Server graphics are used as the Human-Machine Interface for operating the plant. The live status of the plant can be observed on the graphics and these data are obtained from the Centum VP and SIS controller.
Objective	The purpose of this test is to confirm that the frames of the general layout are configured according to the design specification.
Reference	▪ Section 30 of Reference PCS and SAFETY SYSTEMS Software Functional Design Doc. No. 1724000594-IN-SP-00018
Procedure	Verify the general layout of the display area: ▪ Windows heading ▪ Menu area ▪ Toolbar area ▪ Display area ▪ Display Navigation Verify the display navigation is in accordance with the design document.
Criteria	Graphics layout, display navigation are according to what was approved and correctly displayed as specified in the reference document.
Test Record Reference	Graphic printouts.

The above checks are conducted and witnessed by the following representatives.

8.2 PROCESS DISPLAYS

Outline	CI Server graphics are used as the Human-Machine Interface for operating the plant. The live status of the plant can be observed on the graphics and these data are obtained from the CENTUM VP and SIS controller. All dynamic process data and alarms shall be simulated from the test panels or from software (forcing).
Objective	The purpose of this test is to confirm that: ▪ Correct process flow is shown on the process displays and popups. ▪ Correct process data is shown on the process displays and popups.
Reference	▪ Reference PCS and SAFETY SYSTEMS Software Functional Design Doc. No. 1724000594-IN-SP-00018 ▪ Reference Instrument IO List 1724000594-IN-LIS-00004_R02 ▪ Reference HMI screens print out 1724000594-QC-PRO-00032 ▪ P&IDs & SLDs.
Procedure	The test environment shall include Test Function FCSs with project configuration to provide data to the tags on each display. Check the following for the process display: ▪ Correct representation of the process flow ▪ Correct representation of the process data points. ▪ Dynamic data and element modifiers by simulating process data.
Criteria	All process displays and popups are according to what was approved and correctly implemented as specified in the reference document(s).
Test Record Reference	Graphic printouts.

The above checks are conducted and witnessed by the following representatives.

8.3 SYMBOLS AND FACEPLATES

Outline	CI Server graphics are used as the Human-Machine Interface for operating the plant. The live status of the plant can be observed on the graphics and these data are obtained from the CENTUM VP controller. All dynamic process data and alarms shall be simulated from the test panels or from software (forcing).
Objective	The purpose of this test is to confirm that: ▪ Symbols, faceplates, and tuning panels are generated and functioning according to specifications.
Reference	▪ Reference PCS and SAFETY SYSTEMS Software Functional Design Doc. No. 1724000594-IN-SP-00018
Procedure	The test environment shall include Test Function FCSs with project configuration to provide data to the tags on each display. Check the following for the symbols and faceplates: ▪ The sizes, colours, lines, fonts and shapes for the symbols, faceplates. ▪ Process Value and Engineering unit. ▪ Forcing the value from HMI, by changing the operation Modes. ▪ Alarm and status indication.
Criteria	All static and dynamic symbols and related faceplates are according to what was approved and correctly implemented as specified in the reference document.
Test Record Reference	Graphic printouts.

The above checks are conducted and witnessed by the following representatives.

8.4 ALARMS PAGES

Outline	CI Server graphics are used as the Human-Machine Interface for operating the plant. The related graphics shall show the generated alarm, time-stamp, Alarm text and Priority upon forcing the values from test panels.
Objective	The purpose of this test is to confirm that: ▪ The layout and function of the alarm pages is according to specifications.
Reference	▪ Section 28.6 of Reference PCS and SAFETY SYSTEMS Software Functional Design Doc.No. 1724000594-IN-SP-00018 ▪ Reference Instrument IO List 1724000594-IN-LIS-00004_R02 ▪ Section Master Alarm Database 123A90-DDL-IN-LIS-40027 ▪ P&IDs & PFS. ▪ Alarm management information / alarm narratives
Procedure	Check the following for the process display: ▪ Layout ▪ Colours and priorities ▪ Alarm sorting ▪ Available columns ▪ Column width ▪ Alarm time format ▪ Available filters (fixed or changeable) ▪ Alarm line layout (for different state transitions) ▪ Alarm Description
Criteria	The alarm overview displays are according to what was approved and correctly implemented as specified in the reference document(s).
Test Record Reference	Graphic printouts.

The above checks are conducted and witnessed by the following representatives.

8.5 ALARM FUNCTION

Outline	All the alarm functions within CI Server and the related project specific configuration are implemented.
Objective	To verify all the alarm requirements are correctly implemented.
Reference	▪ Reference 28.6 of PCS and SAFETY SYSTEMS Software Functional Design Specification (FDS-SW) 1724000594-IN-SP-00018
Procedure	Verify the following is implemented correctly: ▪ Acknowledgement types ▪ Alarm collection behaviour ▪ First-out group behaviour ▪ Alarm group behaviour ▪ Alarm Selection area ▪ Areas of interest ▪ Alarm priority ▪ Alarm destinations e.g., audible alarm annunciation, alarm notification SMTP, alarm pages, alarm printers, … ▪ Historical alarm lifetime
Criteria	The alarm portion within CI Server is configured in accordance with the reference document
Test Record Reference	Graphic printouts.

The above checks are conducted and witnessed by the following representatives.
NOTE: First out Behaviour shall be configured at site

8.6 TREND FUNCTION

Outline	All the trend functions within CI Server and the related project specific configuration are implemented.
Objective	To verify all the Trend Group requirements are correctly implemented. ▪ Group ▪ Label ▪ Description ▪ Sampling Time ▪ Duration ▪ Pen assignment
Reference	▪ Section 30.2.5 of Reference PCS and SAFETY SYSTEMS Software Functional Design Doc.No. 1724000594-IN-SP-00018 ▪ Reference Instrument IO List 1724000594-IN-LIS-00004_R02
Procedure	Verify the following is implemented correctly as per the "Trend Group" in latest Project database Tag List Reference Document. The trend group shall be as per the P&ID ▪ Trend generation for over a period by selecting the date and time range.
Criteria	The trend groups within CI Server are implemented in accordance with the reference document.
Test Record Reference	Graphic Printout

The above checks are conducted and witnessed by the following representatives.

NOTE: Configured for all the process screen, and the electrical screen-respective trend information is available from Tuning plates. ✓

1 INTRODUCTION

1.1 GENERAL

The purpose of this document is to define the methods and documentation that will be used to carry out the Site Acceptance Test (SAT) on YOKOGAWA's Network Security. The SAT is performed to ensure that the system is properly configured, assembled and functional in accordance with the intended design as specified in the approved documents.

The Objective of SAT is to demonstrate to CROSSWIND that the system hardware and software is built in accordance with requirements as specified in the approved documents.

CROSSWIND and Rosetti Marino would witness to verify the test. Upon successful completion of the test, a SAT Test Certificate to be signed for the acceptance of the test.

1.2 SCOPE AND OBJECTIVE

The Site Acceptance Test referred to as SAT applies to the Network Hardware and Software supplied by YOKOGAWA.

The objective of the SAT is to verify the conformance of the system against the approved specifications and SAT procedure before delivery to site. The SAT shall be conducted to test and verify the main items listed below:

- Security and Administration
- Windows Domain and Account Management
- Antivirus Management
- OS Patch Management
- Backup and Recovery Management
- Network Management System
- Network Infrastructure
- Application Whitelisting
- Firewall
- Switch
- Remote Access Facility

2 REFERENCE DOCUMENTS

2.1 INPUT DOCUMENTS

The OT Network and Systems security is configured by the reference of these documents in the below listed table.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

2.2 APPROVED DOCUMENT LIST (DETAIL DESIGN SPECIFICATION)

The Detail Design Specification used for construction shall be listed in this approved document list, and shall be used as reference in the SAT. In principle, the Detail Design Specification documents as included in this list shall form the basis for checking the Network system. The approved Detail Design Specification document list used for construction is listed in 2.1.2.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

4 RESPONSIBILITY

Responsibilities for each party involved in the SAT are defined here-under to ensure that the SAT is carried out in accordance with the agreed procedure. It also ensures that there shall be authorized personnel(s) from Rosetti Marino, CROSSWIND and YOKOGAWA to facilitate any decisions and schedule changes that have resulted from the SAT.

4.1 CUSTOMER

The full participation of CROSSWIND in the SAT is essential. CROSSWIND shall appoint an Inspector cum Test Approver to witness the SAT. The Test Approver would have the authority to sign-off the check sheets on successful completion of all tests. Once signed off, the test will be deemed accepted and the decision will be final. The Test Approver shall participate in the test and observe the test results daily. The Test Approver shall approve the inspection items based on the test results recorded.

4.2 CONTRACTOR

Rosetti Marino shall appoint a SAT Manager for the SAT. Rosetti Marino SAT manager shall co-ordinate with CROSSWIND and YOKOGAWA SAT Managers to facilitate the smooth execution of the SAT activities and schedule. The role of the SAT Manager is also to resolve SAT issues on a regular basis.

4.3 MAC

YOKOGAWA as MAC shall appoint a Test Conductor to organize and manage all aspects of SAT. Yokogawa shall be responsible for carrying out the testing and recording the test results on a daily basis together with Rosetti Marino representative and CROSSWIND Inspector.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

The Site Manager representing YOKOGAWA shall be the SAT Manager and co-ordinate with Rosetti Marino SAT Manager and adjusts the test schedule whenever necessary to ensure the smooth running of the SAT. The SAT Manager shall also ensure that all tests are conducted in accordance with the SAT documents. If changes / modifications are required, the SAT Managers from YOKOGAWA and Rosetti Marino shall discuss and determine the action plan YOKOGAWA

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

5 GENERAL ADMINISTRATION

5.1 SAT VENUE

All the Network Security equipment will be installed by Site Construction Contractor selected by Rosetti Marino. The tests shall be conducted on-site.

5.2 SAT ORGANIZATION CHART

A detailed Organization Chart shall be issued for SAT, with all positions and names filled in. In addition, a SAT roster of the participants shall be issued, with following details for each person: full name, company, responsibility, samples of the signature and initials, actual start and finish date of participation in the SAT. Rosetti Marino shall be responsible for maintaining the roster and keeping it updated.

Refer to Appendix-19.1 for SAT organization chart and SAT roster.

5.3 KICK-OFF MEETING

An initial kick-off Meeting will be held prior to starting the SAT to brief the participants, confirm the organization and responsibilities, and review the SAT schedule. At the same time HSE briefing for all participants will be provided by Rosetti Marino/CROSSWIND. YOKOGAWA SAT Manager will prepare the presentation and explain the organization and work practices.

All SAT documentation prepared by Rosetti Marino/CROSSWIND prior to SAT will be inspected for completeness.

5.4 DAILY WORKING SCHEDULE

The SAT will be conducted in Project Site premises from Monday to Friday (working days). The following timing is recommended for the testing:

0900 to 1200 hrs	Inspection and test
1200 to 1300 hrs	Lunch
1300 to 1700 hrs	Inspection and test
1700 to 1730 hrs	Daily review meeting including next day's schedule planning

Table 2 - Daily Working Time

5.5 SAT WRAP-UP MEETING

At the completion of the SAT, a final wrap-up meeting will be held. The overall status of the SAT shall be reported. Upon all parties' agreement that the SAT is completed satisfactorily, Rosetti Marino/CROSSWIND shall sign off SAT Completion Certificate and System Acceptance Certificate.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

6 SAT OVERVIEW

Cyber security solutions is a part of SAT. This SAT procedure describes the activities and the requirements that are necessary to confirm that all the cyber security solutions installed on-site meets the project standards and functions as per the approved design engineering / construction drawings. The main objectives of performing the SAT is to facilitate Rosetti Marino/CROSSWIND to check and verify the following.

There are no physical (visible) damages (during shipping and installation) to the system that was inspected during FAT and IFAT.

All manufacturing and assembly that were inspected during the FAT and IFAT remain so and are not affected during the shipment.

The Network components that were inspected during FAT and IFAT do function properly and are not affected during the shipment.

To ensure that all carried over punch items identified as per FAT and IFAT report are addressed.

The Software with proper revisions has been loaded on the respective systems.

All equipment and system cables that have been disconnected for shipment are properly reconnected and is working as expected.

The Site Acceptance Test (SAT) shall be conducted in accordance with the test procedures detailed in this document. The test results shall be recorded in the Check sheet. Each Check sheet shall be given a unique reference number.

6.1 SAT DOCUMENTATION

YOKOGAWA shall prepare all SAT documentation prior to the start of SAT of a particular plant or area. All forms, Check-sheets, sign off sheets, drawings, etc. as listed in this procedure shall be organized in indexed binders. A master index for the area will be provided and maintained by the individual site team(s).

The documentation for hardware checks shall include all relevant documents for each individual cabinet in a separate indexed binder or a binder section.

All SAT reference documents (latest issue) as listed in this procedure originated by other parties, which were issued formally to YOKOGAWA, will form a part of the SAT documentation and shall be printed out, and organized in indexed binders by YOKOGAWA.

All SAT reference documents as mentioned above shall be stamped "SAT MASTER" on every page/sheet (or printed with a watermark). Any additional documents as may be necessary and generated later during SAT shall also be stamped, and indexes amended accordingly.

6.2 METHOD OF TESTING

Detailed test procedure for each test item is described in this document. Check-sheet shall be provided, listing the equipment to be tested. All test results shall be recorded in the Check-sheets. The following color codes shall be used in the testing:

a) Yellow marker – Items that were checked and cleared

b) Pink marker – Items that were having issues

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

c) Green marker – Items that were checked after completion of recovery/resolution of issue

6.3 PUNCH RECORD

Any deficiency found during the test shall be noted in the SAT Punch Record. Each punch Record shall cover one punch item/fault. A Punch Record Ledge shall be used to summarize all the punch records. Punch record items shall be classified as follows:

M = Modification, item is to be modified, deleted, added due to design input changes.

C = Correction, item is to be corrected by YOKOGAWA.

If the recovery work involves change/modification, it is to be recorded on the punch record and the recovery shall be carried out after the agreement of both the SAT managers. YOKOGAWA shall clear all correction items (**Code C**) as per the identified resolutions. For recovery work that involves modification (**Code M**), the item will be jointly reviewed by all parties on a daily basis and determined whether to be implemented during SAT or later, depending on complexity and potential schedule and/or cost impact. After verification, all concerned parties in the punch record will sign off the same.

The punch record will be reviewed during the daily meeting and the action to be taken will be discussed and finalized. If the modification request were deemed deviated from the original design, it would be considered as variation order.

6.4 SAT COMPLETION CERTIFICATE & SYSTEM ACCEPTANCE CERTIFICATE

Upon completion of the SAT, a SAT Completion Certificate and System Acceptance Certificate will be signed by CROSSWIND, Rosetti Marino and YOKOGAWA. The purpose of these two documents is to certify that the SAT has been completed and accepted by Rosetti Marino/CROSSWIND. Both Rosetti Marino/CROSSWIND and YOKOGAWA agree that the system is in order and can be released for the next stage of site activities. However, if the tested system is to be accepted in partial for whatever reasons, Rosetti Marino shall advise and issue the SAT documents accordingly.

6.5 SAFETY AT WORK

CROSSWIND site safety procedures shall form the basis for YOKOGAWA to conduct the SAT. Rosetti Marino/CROSSWIND shall provide necessary safety orientation to YOKOGAWA site team so that YOKOGAWA site engineers can follow the safety rules while working on-site.

6.6 TEST EQUIPMENT

Rosetti Marino/CROSSWIND will provide all test equipment (e.g. Digital Multimeter, Calibrator, Signal Generators, etc.) for the SAT.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

7 WINDOWS DOMAIN ENVIRONMENT SAT PROCEDURES

7.1 DOCUMENT UPDATE AND CONFIGURATION VERIFICATION

Objective	To verify that FDS is up-to-date and is compliant with the actual configuration.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Check FDS used is the latest version and approved by EPC or End User. 2. Check that current Domain Controller configurations are compliant with FDS documents.
Criteria	1. The following is true; FDS is of the latest version

TEST RESULT: PASS / FAIL

Remarks:

12/06/2025 FINAL FDS TO BE ISSUED. ('SEE PUNCH CS-01)

26/7: PASS

YOKOGAWA Representative : A. BERRA Date: 26/7/2025

Rosetti Marino Representative : Date: 26/7/2025

Crosswind Representative : Date:

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

7.2 DOMAIN AND FOREST FUNCTIONAL LEVEL

Objective	To verify the Domain and Forest functional level.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. In the Domain controller, go to **Start -> All Programs -> Administrative Tools -> Active Directory Domains and Trusts.** 2. Right-click on the name of the domain -> click Properties. 3. Verify the Domain and Forest Functional Level.
Criteria	The result should show that the Domain and forest Functional level is Windows Server 2016

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Rosetti Marino Representative : FABIO SURIGAN Date: 12/06/2025

Crosswind Representative : E. Hu - Date: 12/06/2025

Document Title:	CYBERSECURITY SAT PROCEDURE	Sheet 18 of 74 Date: 27/05/2025 Rev: 00

7.3 FORWARD LOOKUP AND REVERSE LOOKUP ZONE

Objective	To verify that DNS is installed on the domain controllers and the Forward and Reverse Lookup Zone is integrated to Active Directory.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	**Forward Lookup Zone** 1. On the Domain controller, go to **Start -> All Programs -> Administrative Tools -> DNS -> Forward Lookup Zone.** 2. Right-click on the zone which is the name of the domain and select properties. 3. Repeat steps on the redundant domain controller 4. Also check whether dynamic updates are in secure only mode **Reverse Lookup Zone** 1. On Domain controller, go to **Start -> All Programs -> Administrative Tools -> DNS -> Reverse Lookup Zone.** 2. Right-click on the zone which is the name of the domain and select properties. 3. Click on the Reverse Lookup Zone>[IP].in-addr.arpa 4. Repeat steps on the redundant domain controller. 5. Also check whether dynamic updates are in secure only mode
Criteria	1. The zone, which is the name of the domain, should be present under Forward Lookup Zone. ✓ 2. The properties of the zone, which is the name of the domain, should show Active Directory-Integrated. ✓ 3. The properties of the zone, which is the name of the domain, should show that it is configured to replicate to all DNS servers in the same Active Directory domain. ✓ 4. Hostname and IP should match as mentioned in FDS ✓ 5. Verify that all IP subnets should show in-addr.arpa under Reverse Lookup Zones ✓ 6. Verify whether dynamic updates are in secure only mode ✓

TEST RESULT: (PASS) / FAIL

Remarks: 12/06 REMOVE TEMPORARY STATIONS FROM DNS (SEE PUNCH CS_02)

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Rosetti Marino Representative : FABIO SPAGNOLI Date: 12/06/2025

Crosswind Representative : E Klom Date: 14/06/2025

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

7.4 NAME RESOLUTION

Objective	To verify that hostnames can be resolved by the Active Directory DNS.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Open the command prompt on one of the domain controllers. 2. Type nslookup <LookupName/IP> <Nameserver/IP> 3. Type the name of the other domain controller. 4. Type the name of any other domain members. 5. Type in the IP address of the other domain controller. 6. Type the IP address of any other domain members.
Criteria	1. The nslookup should be able to resolve the name of the domain controller and other domain members to their correct IP addresses. 2. The nslookup should be able to resolve the IP address of the other domain controller and other domain members to its correct hostnames.

TEST RESULT: PASS / ~~FAIL~~

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Rosetti Marino Representative : FABIO SPIGAI Date: 12/06/2025

Crosswind Representative : E. Ilom Date: 12/06/25

7.5 ACTIVE DIRECTORY REPLICATION

Objective	To verify that replication can occur between 2 domain controllers.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. On domain controllers, go to **Start -> All Programs -> Administrative Tools -> Active Directory Sites and Services.** 2. Go to Default-First-Site-Name -> Servers 3. Expand the icon of the domain controller and select NTDS Settings. 4. On the right pane, right-click on the Automatically Generated connection -> Replicate Now. 5. Expand the icon of the redundant domain controller and select NTDS Settings. 6. On the right pane, right-click on the Automatically Generated connection -> Replicate Now.
Criteria	The dialog box "Active Directory has replicated the connections" should pop up when replication is successful.

TEST RESULT: (PASS) / FAIL

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Rosetti Marino Representative : FABIO SURIGA Date: 12/06/2025

Crosswind Representative : Ekkon Date: 12/06/25

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

7.6 ACTIVE DIRECTORY REDUNDANCY

Objective	To verify that a user account can still log on to domain members if one of the domain controllers fails.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Shut down any one of the domain controllers. 2. Use a created account to log on to any of the domain members. 3. Log off the test account from the domain member. 4. Turn on the domain controller used in step 1.
Criteria	The test account should still be able to log on to the domain members.

TEST RESULT: PASS / ~~FAIL~~

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA, QB Date: 12/6/2025

Rosetti Marino Representative : FABIO SARIGU Date: 12/06/2025

Crosswind Representative : E Ilkan Date: 12-6-25

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

7.7 NAME RESOLUTION REDUNDANCY

Objective	To verify that hostnames and IP addresses can still be resolved even if one of the DNS fails.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Shut down any one of the domain controllers. 2. On any of the domain members, open a command prompt and run "ipconfig /flushdns" to clear any cached entries. 3. Type ping. 4. Type the Hostname of any other domain member. 5. Type ping. 6. Type the IP address of any other domain member. 7. Turn on the shut domain controller.
Criteria	The host names and IP addresses should be resolved if either of them fails.

TEST RESULT: PASS / ~~FAIL~~

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Rosetti Marino Representative : FABIO SURIGU Date: 12/06/2025

Crosswind Representative : Ehlen Date: 12-6-25

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

7.8 ORGANIZATIONAL UNIT AND GROUP STRUCTURE

Objective	To verify that the OU and group structure is according to the project requirement as defined in the FDS.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Open the Active Directory Users and Computers tool on one of the domain controllers. 2. Verify that the structure of the OU is as mentioned in the FDS. 3. Navigate to the OU containing groups. 4. Verify that the proper descriptions are given under each of the group properties. 5. Verify proper group nesting as per FDS. 6. Verify that specified users as per FDS are created in the system
Criteria	1. The OU structure should be the same as what mentioned in the FDS. 2. All Microsoft OS workstations and servers are part of the domain. 3. Description of group and group nesting should be as per FDS. 4. Make evidence that there are no temporary users in the system.

TEST RESULT: (PASS) / FAIL

Remarks:

YOKOGAWA Representative : A. BERRA AB Date: 26/7/2025

Rosetti Marino Representative : FSURIGA Date: 26/7/2025

Crosswind Representative : Date:

7.9 VERIFY USER ACCOUNT COMPLIANCY, INCLUDING NON-REPUDIATION

Objective	Verification of user account compliance and non-repudiation.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	To verify that the current system user account and password are equal to the specification document, generic accounts are not created (default generic accounts are disabled). * Check: Login all account
Criteria	The current system user account and password tally with the specification document, no generic account is present.

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 3/7/2025

Rosetti Marino Representative : FSWRIGHT Date: 3/7/25

Crosswind Representative : E. Klom Date: 3-7-25

7.10 GROUP POLICY OBJECT STRUCTURE

Objective	To verify that the GPO structure is created according to the project requirement as defined in the FDS.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Open the Group Policy Management Console (GPMC) tool on the domain controllers. 2. Verify that the naming conventions of the GPOs are as per FDS. 3. Verify that the unneeded GPO configuration category (Computer configurations or User Configurations) is disabled. 4. Verify that the default GPOs (default Domain and Domain Controllers GPOs) are not linked to any OUs and be modified upon. 5. Verify that the GPOs are linked to the appropriate OUs in the OU structure.
Criteria	1. The naming convention of the GPOs should be as per the FDS. 2. Unneeded GPO configuration category should be disabled to allow faster GPO processing. 3. Default Domain and Domain Controllers GPOs should not be modified and assigned to any OUs. 4. All GPOs should be linked to the appropriate OUs as per FDS for correct IT environment hardening on domain members.

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 3/7/2025

Rosetti Marino Representative : [signature] Date: 3/7/25

Crosswind Representative : [signature] Date: 3-7-25

8 YOKOGAWA ANTIVIRUS SOFTWARE SAT PROCEDURES

8.1 DOCUMENT UPDATE AND CONFIGURATION VERIFICATION

Objective	To verify that the FDS document is up-to-date and are compliant with the actual configuration.
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	1. Verify that the FDS used is the latest version and approved by EPC or End User. 2. Verify that the current anti-virus server and client configuration are compliant with FDS documents.
Criteria	1. The FDS is the latest version. 2. Anti-virus server and client configuration are compliant with the FDS document.

TEST RESULT: PASS / FAIL

Remarks:

12/06 FINAL FDS TO BE ISSUED (SEE PUNCH CS_06)

26/7 PASS

YOKOGAWA Representative	: A. BERRA	Date:	26/7/2025
Rosetti Marino Representative	: FSWRUGH	Date:	26/7/2025
Crosswind Representative	:	Date:	

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

8.2 VIRUS DEFINITION UPDATE

8.2.1 The Trellix ePO Server (DMZ) and source site Synchronization

Objective	To verify that the Trellix ePO Server (DMZ) can synchronize the virus definition update from the defined source sever(Crosswind)
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	Verifying virus definition download between Trellix ePO Server (DMZ) and Trellix ePO Server (Office Domain) 1. On the Trellix ePO Server (DMZ), launch the Trellix ePolicy Orchestrator Console. 2. Go to the Master Repositor and click the "Pull Now" button. 3. Select the AMCore Content Package for YOKOGAWA Antivirus Software Management under the Signatures and Engines of Package Types. 4. Click Next and run the Update.
Criteria	The AMCore Content Package of the Trellix ePO Server (DMZ) Master Repository shall be updated following the Trellix ePO Server source site server version.

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 13/6/2025

Rosetti Marino Representative : FABIO SURIGA Date: 13/06/2025

Crosswind Representative : E. Hum Date: 13-6-25

8.2.2 YOKOGAWA Antivirus Software Management Virus Definition Update

Objective	To verify that the YOKOGAWA Antivirus Software Management on the PIN and DMZ clients can download the virus definition update from the Trellix ePO Server (DMZ)
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	Verifying virus definition download between YOKOGAWA Antivirus Software Management PIN, DMZ clients and Trellix ePO Server (DMZ) 1. On the client, launch the YOKOGAWA Antivirus Software Console. 2. Open YOKOGAWA Antivirus Software Console. 3. Click the "Update Now" button. 4. Go to Server task menu in order to check whether updates are pushed to the systems
Criteria	The virus definition update on the PIN, DMZ client must be updated following the AV Server (DMZ) virus definition update version.

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 13/6/2025

Rosetti Marino Representative : FABIO SIRIGU Date: 13/06/2025

Crosswind Representative : E. Klom Date: 13-6-25

8.3 YOKOGAWA ANTIVIRUS SOFTWARE MANAGEMENT

8.3.1 YOKOGAWA Antivirus Software Clients Communication

Objective	To verify that the YOKOGAWA Antivirus Software Management clients are reporting to the Trellix ePO Server (DMZ)
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	Verifying communication between YOKOGAWA Antivirus Software Management DMZ, PIN clients and Trellix ePO Server (DMZ) 1. On the Trellix ePO Server (DMZ), launch the ePolicy Orchestrator Console. 2. Go to the System Tree view. 3. Click the System Properties tab and select the target client, 4. Verify the "Last Communication" value.
Criteria	The last communication shows the client's last reporting scheduled date and time. The last communication value should show a recent date (approx. +/- 1 day) to confirm that the clients are communicating with the Trellix ePO server. ✓

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Rosetti Marino Representative : FABIO SURIGA Date: 12/06/2025

Crosswind Representative : E. Kelen Date: 12-6-25

8.3.2 ePolicy Orchestrator Exclusion List

Objective	To verify that exclusion policy is configured in the AV Server
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Go to AV Server, and open the ePO console 2. Check the exclusion policy configuration.
Criteria	The current McAfee Product Version is tally with Project FDS.

TEST RESULT: (PASS) / FAIL

Remarks:
12/06- OPEN EXCLUSION SEEM TO BE TOO WIDE

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Rosetti Marino Representative : FABIO SURIGU Date: 12/06/2025

Crosswind Representative : E. Klom Date: 12-06-2025

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

8.3.3 YOKOGAWA Antivirus Software Full Scan Impact

Objective	To verify that YOKOGAWA Antivirus Software Management Full Scan impact is at an acceptable level.
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	Verifying virus definition download between YOKOGAWA Antivirus Software Management of DMZ, PIN clients and Trellix ePO Server (DMZ) 1. On the DMZ & PIN client, launch the YOKOGAWA Antivirus Software Console. 2. Open YOKOGAWA Antivirus Software Console. 3. Click the "Scan System" button and run a "Full Scan". 4. Using the Windows inbuilt Performance monitor. 5. Check the Memory and CPU utilization.
Criteria	Confirm that the YOKOGAWA Antivirus Software Full scan impact is at an acceptable level following the FDS document.

TEST RESULT: PASS / FAIL

Remarks:

12/06 – NO FULL SCAN IS SCHEDULED FOR ALL MACHINES
– REMOTE TASKS ON REMOTE IS NOT EXECUTED

YOKOGAWA Representative : ALESSANDRO BERRA Date: 3/7/2025

Rosetti Marino Representative : Date: 3/7/25

Crosswind Representative : Date: 3-7-25

8.4 TRELLIX EPOLICY ORCHESTRATOR SERVER

8.4.1 Trellix ePO Server Policy Verification

Objective	To verify the YOKOGAWA Antivirus Software Policy is assigned to the YOKOGAWA System Group
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	Verifying the required YOKOGAWA Antivirus Software policy is assigned to the YOKOGAWA System Group 1. On the Trellix ePO Server (DMZ), launch the ePolicy Orchestrator Console. 2. Under the System Tree, click the YOKOGAWA System group. 3. Click the Assigned Policies tab and verify that the YOKOGAWA Advanced policy is applied.
Criteria	The YOKOGAWA Advanced policy is applied to the YOKOGAWA system group following the FDS document

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Rosetti Marino Representative : FABIO SARIGU Date: 12/06/2025

Crosswind Representative : E. Holm Date: 12-6-25

9 YOKOGAWA APPLICATION WHITELISTING SAT PROCEDURES

9.1 DOCUMENT SPECIFICATION AND CONFIGURATION VERIFICATION

Objective	To verify that FDS is up-to-date and is compliant with the actual configuration.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Verify that the FDS used is the latest version and approved by EPC or End User. 2. Verify that the current application whitelisting configuration is compliant with FDS document.
Criteria	FDS is of the latest version.

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : A. BERRA QB Date: 26/7/2025

Rosetti Marino Representative : FERIGN Date: 26/7/2025

Crosswind Representative : Date:

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

9.2 PROTECTION FROM EXECUTION OF UNMANAGED PROGRAM IN ENABLE MODE

Objective	To verify that the Whitelisting service can prohibit from execution of unmanaged programs during Enable Mode
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	Verify to execute additional program 1. On the client machine, copy a test program/installer to the target machine's hard drive. (Ensure Solidcore status is enabled) 2. Execute the program. 3. Check the result
Criteria	The test program cannot execute

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : A. BtRRs QD Date: 3/7/2025

Rosetti Marino Representative : Fsuccm Date: 3/7/25

Crosswind Representative : E. Klom Date: 3-7-25

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

9.4 TRELLIX EPOLICY ORCHESTRATOR SERVER

9.4.1 Trellix ePO Server Policy Verification

Objective	To verify the YOKOGAWA Application Whitelisting policy is assigned to the YOKOGAWA System Group
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	Verifying the required YOKOGAWA Application Whitelisting policy is assigned to the YOKOGAWA System Group 1. On the Trellix ePO Server, launch the ePolicy Orchestrator Console. 2. Under the System Tree, click the YOKOGAWA System Group
Criteria	The Standard YOKOGAWA policy is applied to the YOKOGAWA system group following the FDS.

TEST RESULT: (PASS) / FAIL

Remarks:

YOKOGAWA Representative : A. BERRO Date: 3/7/2025

Rosetti Marino Representative : Date: 3/7/25

Crosswind Representative : E. Klom Date: 3-7-25

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

9.3 CHANGE OPERATION MODE OF WHITELISTING

9.3.1 Changing to Observe Mode and Enable Mode

Objective	To verify that the Whitelisting status changes to update mode
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	**Verify Whitelisting status mode changes to "Observe Mode"** 1. Open the System Tree from the ePO management console and select the target machine from the System Tree. 2. Run a client task (YOKOGAWA Standard WL – Begin Update) on the selected station. 3. Once the agents apply the new policy, confirm that the systems have moved to observe mode. 4. Review the system's Solidcore status in the **ePO Console**. **Verify Whitelisting status mode changes to "Enable Mode"** 1. Open the System Tree from the ePO management console and select the target machine from the System Tree. 2. Run a client task (YOKOGAWA Standard WL – Begin Update) on the selected station. 3. Once the agents apply the new policy, confirm that the systems have moved to Enable mode. 4. Review the system's Solidcore status in the **ePO Console**.
Criteria	Verify if **Whitelisting Status** changes to Observe mode and Enable Mode

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative	: ALESSANDRO BERRA JP	Date:	3/4/2025
Rosetti Marino Representative	: FRANCESCO	Date:	3/4/25
Crosswind Representative	: E. Klom	Date:	3-3-25

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

10 PATCH MANAGEMENT SAT PROCEDURES

10.1 DOCUMENT UPDATE AND CONFIGURATION VERIFICATION

Objective	To verify that FDS is up-to-date and is compliant with the actual configuration.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Check FDS used is the latest version and approved by EPC or End User. 2. Check that current WSUS servers and client's configurations are compliant with FDS.
Criteria	1. FDS is of the latest version. 2. WSUS servers and client's configurations are compliant with FDS.

TEST RESULT: PASS / FAIL

Remarks:

12/06 FINAL FDS TO BE ISSUED (SEE PUNCH CS_12)

YOKOGAWA Representative : A. BERRA Date: 26/6/2025

Rosetti Marino Representative : Date: 26/6/2025

Crosswind Representative : Date:

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

10.2 OS PATCH MANAGEMENT SERVER

10.2.1 OS Patch Management Server Verification

Objective	To verify the WSUS server product version
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	WSUS Downstream Server Version Verification 1. On the WSUS server, click on Start and go to All Programs 2. Go to Administrative Tools and click on Windows Server Update Services. 3. Go to Help. 4. Click on the About Update Services 5. Look for the version number. WSUS Upstream Server Version Verification 1. On the WSUS server, click on Start and go to All Programs 2. Go to Administrative Tools and click on Windows Server Update Services. 3. Go to Help. 4. Click on the About Update Services 5. Look for the version number.
Criteria	The current WSUS server tallys with the project FDS.

TEST RESULT (PASS) / FAIL

Remarks:

NEWER VERSION ALREADY INSTALLED

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Rosetti Marino Representative : FABIO SURIGUI Date: 12/06/2025

Crosswind Representative : E. Hom Date: 12-6-2025

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

10.2.2OS Patch Management Server Configuration Verification

Objective	To verify the WSUS Server (DMZ) configuration
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	1. Log on to the AV/WSUS Server. 2. From Start menu navigate to All Programs > Administrative Tools and click on Windows Server Update Services. 3. Click on Options > Product and Classifications 4. Verify the configuration setup.
Criteria	The current WSUS server setup tallys with the project FDS.

TEST RESULT (PASS) / FAIL

Remarks:

12/06 TEST FAILED BECAUSE FDS IS NOT UPDATED, BUT CONFIGURATION IS DONE CS_14

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Rosetti Marino Representative : FABIO SURIGU Date: 12/06/2025

Crosswind Representative : e.h.lam Date: 12-6-25

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

10.2.3WSUS Synchronization Check

Objective	To verify that the WSUS servers are synchronized;
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	**Login to the WSUS Upstream Server** 1. Start the WSUS Administration Console. 2. From the Update Services menu, click on Synchronizations. 3. From Synchronizations, check that all scheduled synchronizations have been completed. **Login to the WSUS Downstream Server** 1. Start the WSUS Administration Console. 2. From the Update Services menu, click on Synchronizations. 3. From Synchronizations, check that all scheduled synchronizations have been completed.
Criteria	Automatic or manual synchronizations should be successful if the configuration has been done properly.

TEST RESULT: PASS / FAIL

Remarks:

12/06 - FINAL UPSTREAM SERVER TO BE CONFIGURED

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Crosswind Representative : E. Islam Date: 12-6-2025

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

10.3 OS PATCH MANAGEMENT CLIENT

10.3.1 Client Configuration

Objective	To verify that all clients have been configured properly and report back to the dedicated WSUS server.
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	**Login to the WSUS Downstream Server** 1. Start the WSUS Administration console. 2. Click on All Computers on the submenu of Computers. 3. From the list, verify that all clients have reported back to a WSUS Server based on the last maintenance window time. **Login to the WSUS Upstream Server** 1. Start the WSUS Administration console. 2. Click on All Computers on the submenu of Computers. 3. From the list, verify that all clients have reported back to the WSUS Server based on the last maintenance window time.
Criteria	The clients should report to WSUS servers based on project requirements.

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 12/6/2025

Rosetti Marino Representative : FABIO SURIANO Date: 12/06/2025

Crosswind Representative : E Mon Date: 12-6-25

10.3.2 Patch Approval

Objective	To verify that the selected patch can be downloaded into clients and that clients are notified for installation.
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	1. From the approved YOKOGAWA Validation Report, Select one patch for approval to the client-server and client workstation. 2. From the Updates menu, search for the selected patch on the WSUS server. 3. Right-click on the selected patch and approve the groups that the client-server and client workstation are members of. 4. Login to the client server and client workstation. 5. Click on Start and Run, type CMD, and enter the command prompt window. 6. Type wuauclt.exe /detect now to force the client-server and client workstation to detect the approved patch. 7. Wait for the Windows Update Icon [Yellow Icon] to appear on the right-hand side of the taskbar. 8. Verify that the downloaded patch is the correct patch. 9. Install the downloaded patch onto the Client Server and Client Workstation. 10. Check from Add and Remove Software that the patch has been installed.
Criteria	The patch should be available and can be approved for installation onto selected clients.

TEST RESULT: (PASS) / FAIL

Remarks:
12/06 NEW XML FILE TO BE IMPORTED (SEE PUNCH CS_16)

YOKOGAWA Representative	: A. BERRA AB	Date:	26/7/2025
Rosetti Marino Representative	: FSMRIGN	Date:	26/7/2025
Crosswind Representative	:	Date:	

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

10.3.3 Installed Patch Verification

Objective	To verify that all recommended patches are installed on all clients.
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • 1724000594-IN-MAN-00037_R01
Procedure	1. From the approved YOKOGAWA Validation Report, list up all relevant patches whose recommended status is "Install". 2. Compare the above list with installed patches in all clients from the WSUS Administration Console or each client's control panel to verify that all the applicable patches are installed to the clients properly. 3. Create all installed patches list in all clients. Note: • If a new patch or not installed patch update is required while SAT is based on the site contract, a patch update list for each client should be created or updated and approved by the EPC or end user before installing the patches. • If the above new or not installed patch will require a reboot machine, confer with the EPC or end user about how to handle that patch before installing that patch.
Criteria	All recommended patches should be installed to all clients correctly.

TEST RESULT: PASS / FAIL

11 BRS (BACKUP RECOVERY SYSTEM)

11.1 DOCUMENT VERIFICATION

Objective	To verify that FDS document is up-to-date and is compliant with the actual configuration.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Check FDS used is the latest version 2. Check that the current BRS configuration is compliant with FDS document.
Criteria	FDS is of the latest version.

TEST RESULT: (PASS) / FAIL

Remarks:

12/06 FINAL FDS TO BE ISSUED

YOKOGAWA Representative : A. BERRA AB Date: 26/7/2025

Rosetti Marino Representative : FSURIGU Date: 26/7/2025

Crosswind Representative : Date:

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

File: 1724000594-QC-PRO-00044_R00

11.2 BACKUP SOFTWARE VERSION VERIFICATION

Objective	To verify the backup software product version.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Open Veeam backup and replication console 2. Connect as local host. 3. Click on Help at the left top most corner>click on 'about'. 4. Verify the version
Criteria	The result should display Veeam backup software product & version.

TEST RESULT: (PASS) / FAIL

Remarks: 13/06: BUILD 12.2.0.334

YOKOGAWA Representative : ALESSANDRO BERRA Date: 13/6/2025

Rosetti Marino Representative : FABIO SERIGNI Date: 13/06/2025

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

11.3 BACKUP AND RECOVERY SYSTEM - SCHEDULE BACKUP POLICIES

Objective	To verify that all the systems deployed with backup agent are covered under Backup Policies.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. Launch the Veeam Backup console. 2. Verify the Image backup policies and their schedules as well as their retention rules.
Criteria	All the systems shall be covered under backup policies.

TEST RESULT: PASS / ~~FAIL~~ PASS

Remarks:

13/06 - BACKUP JOBS ARE NOT SCHEDULED YET

- RETENTION TIME : 60 DAYS

16/07 PASS

YOKOGAWA Representative : ALESSANDRO BERRA Date: 16/7/25

Rosetti Marino Representative : FIRMA Date: 16/7/2025

Crosswind Representative : PP PAUL WILLIAMSON Date: 16/7/25

11.4 BACKUP AND RECOVERY SYSTEM - IMAGE BACKUPS

Objective	Objective is to create image backup plans.
Reference	**1724000594-IN-RE-00043-Cyber Security Settings**
Procedure	1. Select the desired machine in the list which you need to take the backup. 2. For full backup select the desired machine, right click and select active full. 3. For incremental backup select the desired machine, right click and select start button 4. The backup will be scheduled.
Criteria	System Image Backup plan created, and backup job completed.

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : ALESSANDRO BERRA Date: 13/6/2025

Crosswind Representative : E. Inbom Date: 13-6-25

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

12 NETWORK MANAGEMENT SAT PROCEDURES

12.1 WUG SOFTWARE VERSION & LICENSE

Objective	To verify the Whatsup Gold product Version & License.
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings • E366772C00-BOM_Rev.03
Procedure	1. Login to NMS Server using administrator privilege. 2. Run the 'WhatsUp Gold Admin Console' from desktop. 3. Click on 'Help' and select 'About Whatsup'. 4. Verify the followings. 5. License Type: WhatsUp Gold Total Plus 6. Version: 24.x.x
Criteria	The shown Whatsup Gold software version should match as per BOM.

TEST RESULT: PASS / (FAIL)

Remarks:

13/06: VERSION IS "GOLD BUSINESS" AND IT WILL EXPIRE IN 99 DAYS (SEE PUNCH CS_22)

YOKOGAWA Representative : _____ Date: _____

Rosetti Marino Representative : _____ Date: _____

Crosswind Representative : _____ Date: _____

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

12.2 NMS LOG MANAGEMENT

Objective	To verify that the NMS Server is implemented with Log Management.
Reference	• 1724000594-IN-RE-00043-Cyber Security Settings
Procedure	Verifying the NMS Server (PIN) is using Log Management. 7. Login to the host server where WhatsUp® Gold is hosted. 8. Go to Settings>Log management>Log Management Source setup and check that all devices and software are configured. 9. Go to ANALYZE>Log Management>Log Viewer or Log Management dashboard to verify the logs from the assigned device.
Criteria	1. Confirm that the NMS Server is implemented with a Log Management Feature. 2. Validate that unsuccessful login attempts are logged by the Log Management Feature. 3. Validate that all used devices and software send the logs to NMS Log Management.

TEST RESULT: PASS / (FAIL)

Remarks:

13/06: LOG MANAGEMENT NOT INCLUDED, TO BE CHECKED WITH CORRECT VERSION (SEE PUNCH CS_23)

YOKOGAWA Representative : _____ Date: _____

Rosetti Marino Representative : _____ Date: _____

Crosswind Representative : _____ Date: _____

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

12.3 NETWORK STATUS

Objective	To verify network status alert will be captured by NMS.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	Network Interconnection Test 1. Physically disconnect cables that are specified as monitoring targets. 2. Check if the Network icon on the System Architecture Network 3. Explorer window will change its color from Green to Red color. 4. Check the Web Alarm list of alerts. 5. Physically reconnect the cable. Check the Web Alarm if there is a list with a UP message or status, and the System Architecture screen will back to green color. 6. Repeat the above steps for all the target cables of respective monitoring targets specified in the FDS.
Criteria	NMS should be able to display the device interface; UP or DOWN, and its detailed information.

TEST RESULT: PASS / FAIL

Remarks:

YOKOGAWA Representative : A. BERRA AB Date: 26/7/2025

Rosetti Marino Representative : FSWRGM Date: 26/7/2025

Crosswind Representative : Date:

12.4 RESOURCE MANAGEMENT AND UTILIZATION

Objective	To verify server resource management and utilization will be captured by NMS.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	Monitoring the CPU/Memory/Hard Disk Utilization 1. Select DC01 on the Network Explorer right-click and select Device Status Report. 2. Open the task manager select the performance tab on the DC01 and confirm the CPU and memory usage. 3. Open Windows Explorer on DC01 and confirm the HDD usage. 4. Confirm the CPU/Memory/Hard Disk usage shown in the Device Status Report under Performance Monitor. 5. Repeat the above steps for all the target servers respectively which are specified in the FDS.
Criteria	NMS should be able to display the server's CPU, Memory, and Hard Disk usage on the NMS Device Status Window – Utilization Window.

TEST RESULT: PASS / ~~FAIL~~ PASS

Remarks:

13/06: - SERVICE NETWORK FW NOT RESPONDING
- TIME SERVER NOT CONFIGURED

16/07 PASS

12.8 NETWORK SCAN TO DISCOVER SYSTEMS

Objective	To verify the network is not connected with unnecessary network devices or computers.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	Network Scan 1. Before starting the network scan, obtain the approval of the NMS network scan function from the EPC or END User. The approval should include the possible impact caused by network scan such as network delay or application delay. 2. Select "Discover Devices" from File in the toolbar. Set the proper IP address range. Click "Start a discovery session". 3. Check all existing devices are shown and any newly discovered devices in the Devices Discovered Window. 4. If there is a newly discovered device, MAC should verify the reason.
Criteria	The network should not have unnecessary devices.

TEST RESULT: (PASS) / FAIL

Remarks:

13-6-25 : Skipped due to state of wwg config

Crosswind Representative : E. Klom Date: 13-6-25

13.4 VLANS

Objective	To verify that VLANs are implemented according to Cyber Security Settings FDS specifications.
Reference	1724000594-IN-RE-00043-Cyber Security Settings
Procedure	1. From Network FDS VLANs properties, test one VLAN implementation at a time. For each VLAN, check that the IP addresses of all devices connected to the respective VLAN are part of the Network IPs defined in the table. 2. Check IP Address in the Firewalls, Switches, Workstations, Servers, Printers, and Time Synchronization GPS Clock.
Criteria	1. The network devices are assigned to the proper VLAN based on Network Segmentation specifications. 2. All network devices and components (Firewalls, Switches, Workstations, Servers, Printers, and Time Synchronization GPS Clock) have an assigned IP address for communication and/or management purposes.

TEST RESULT: PASS / FAIL

Remarks:

13-6 : IPNAC is not configured CS_29
