PAS	Process Automation, is the term used to describe all functionality required for the monitoring and controlling of all process, safety and fire and gas systems selected for the project.
PCS	Process Control System
PIN	Plant Information Network
PRM	Plant Resource Manager
PROJECT	HOLLANDSE KUST NOORD WIND PARK Project
PV FARM	Photo Voltaic
PURCHASER	The organisation placing a purchase order for the supply of equipment or services for the Project. The Purchaser could be the COMPANY or the Contractor or some other party appointed by the COMPANY or Contractor.
SCADA	Supervisory Control and Data Acquisition
SHALL	An absolute requirement.
SHOULD	This word indicates a recommendation that whilst preferred may not be implemented provided some equivalent is proposed and agreed by COMPANY. The full implications must be understood and carefully weighed before choosing a different course.
SIF	Safety Instrumented Function
SIL	Safety Instrumented Level
SIS	Safety Instrumented System
SQL	Structured Query Language
TCP/IP	Transmission Control Protocol/Internet Protocol
TQ	Technical Query
UCP	Unit Control Panel
UPS	Uninterruptible Power Supply

VENDOR	Manufacturer/Supplier of equipment and services to perform the duties specified by the Purchaser.
Vnet/IP	Yokogawa Virtual Network
WSUS	Window Security Update Services

Table 3 – Definitions and Abbreviations

3 APPLICABLE CODES, STANDARDS, AND REGULATIONS

3.1 GENERAL

The equipment shall be designed, manufactured, tested, and delivered in accordance with this philosophy and the Project documents, codes, standards, and regulations listed below. It is the MACs responsibility to ensure complete compliance in their design, inclusive of all sub-suppliers. The normative documents listed below contain requirements that, through reference in this text, constitute the requirements of this Project. Latest editions of all referenced documents shall apply.

SYSTEM SECURITY REQUIREMENTS (CWHKN-PMT-PJA-PLN-00009) shall be referred as CW specification document to protect Operational Technology (OT) against unauthorized access or modification and to ensure availability of operational processes. It defines provides core practices for implementing controls and requirements for Suppliers and Third Parties to be used during procurement and contracting of new services as well as during ongoing execution of services in the OT environment are defined in requirements. In SYSTEM SECURITY REQUIREMENTS (CWHKN-PMT-PJA-PLN-00009) document are based on the ISA / IEC 62443 (formerly known as ISA - 99) Series of Standards on Industrial Automation and Control Systems (IACS) Security.

The following requirements shall apply as a minimum with the design being fit for purpose as detailed in this specification.

The project shall apply relevant standards and codes in the following order:

1. Regulations
2. Selected DEM-1 and DEM-2 requirements.
3. Industry Codes and Standards.

The applicable industry codes and standards are detailed in sections 3.2, 3.3 and 3.4.

3.2 REGULATIONS

Document Name	Document Title
1999/92/EC	ATEX 153 Workplace Directive
2011/65/EU	Directive on the restriction of the use of certain hazardous substances in electrical and electronic equipment
2014/30/EU	Electromagnetic Compatibility (EMC) Directive
2014/34/EU	ATEX Directive
2014/35/EU	Low Voltage Directive
94/9/EC	Equipment intended for use in Potentially Explosive Atmospheres
99/92/EC	Minimum requirements for improving the safety and health protection of workers potentially at risk from explosive atmospheres

Table 4 – Applicable Regulations

3.3 APPLICABLE DESIGN ENGINEERING PRACTICES

Design Engineering Practices (DEP) have a limited rollout on BLPH.

3.3.1 Fully Applicable DEP

The following DEP are identified as being fully applicable to the project.

Document Name	Document Title
DEP 32.01.20.12	Industrial Automation and Control Systems (IACS) Security
DEP 30.00.60.15	Humans Factors Engineering – Control Room Design
DEP 33.64.10.32	Electrical Network Monitoring and Control System for Global Application
DEP 37.76.10.10	HVAC for Offshore Installations (Amendments/Supplements to ISO 15138)

Table 5 – Applicable DEPs

DEP 32.01.20.12 shall be applied to the project in full, in conjunction with IEC 62443, for the cybersecurity design.

DEP 30.00.60.15 shall be applied to the project for the design of the Control Room.

The functional requirements of DEP 33.64.10.32 shall be adhered to by MAC to ensure safe and effective operation of all relevant electrical equipment.

DEP 37.76.10.10 and ISO 15138 shall apply for offshore equipment rooms, i.e., the ITER.

3.3.2 DEM-1 Process Safety Only DEP

The following DEPs shall have the DEM-1 'Process Safety' requirements applied to the project.

Document Name	Document Title
DEP 32.30.20.11	Fire, Gas and Smoke Detections
DEP 32.80.10.10	Safety Instrumented Systems
DEP 32.80.10.14	Alarm Management (Amendment/Supplements to IEC 62682)
DEP 62.10.08.11	Inspection and Function Testing of Instruments

Table 6 – Applicable DEPs

3.4 INDUSTRY STANDARDS

Document Name	Document Title
EN 1127	Explosive Atmospheres, Explosion Prevention and Protection, Basic Concepts and Methodology

ISO 11801	Information technology – Generic cabling for customer premises
EN 61131	Programmable Controllers
IEC 60079	Installation & Maintenance of Electrical apparatus for use in Potential explosive atmosphere
IEC 60331	Fire resisting characteristics for electrical cables (all parts)
IEC 60332	Tests on electric cables under fire conditions
IEC 60364	Low-voltage Electrical Installations
IEC 60529	Degrees of Protection Provided by Enclosures (IP Code)
IEC 61158	Industrial communication networks
IEC 61508	Functional safety of electrical/electronic/programmable electronic safety-related systems
IEC 61511	Functional Safety – Safety Instrumented Systems for the Process Industry Sector – Framework, Definitions, System, Hardware, and Application Programming Requirements
IEC 61850	Communication Networks and Systems for Power Utility Automation
IEC 62305	Protection Against lightning
IEC 62443	Cyber Security for Industrial Automation and Control Systems
IEC 62682	Management of Alarm Systems for the Process Industries
ISO 15138	Petroleum and natural gas industries - Offshore production installations - Heating, ventilation and air-conditioning
ISO 14001	Environmental Management System
ISO 9001	Certifications of Quality Management System

Table 7 – Industry Standards

4 PCS COMPONENTS

4.1 HUMAN INTERFACE STATION (HIS)

HIS is an Operator Workstation computer and it is mainly used for control, operation, and monitoring of the plant process. Aside from displaying process graphics and other related displays, this workstation also shows process variables, control parameters and equipment status per System. HIS alerts the operator with necessary alarms with capability to acknowledge and receive messages required for plant operation.

In this project EWS shall have HIS functionality with necessary license. Centum VP screens shall not be provided, whereas SCADA OWS shall have Graphics for Operation and Monitoring. PCS/SIS standard function blocks Faceplates shall be accessible in CentumVP HIS (in this project EWS).

4.2 PCS ENGINEERING WORKSTATION (EWS)

PCS EWS is mainly used for system engineering activities via AD Suite such as configuration and building functions, overall system component definition, building control strategies and graphic displays as well as for system maintenance.

Module less Engineering shall be followed.

4.3 FIELD CONTROL STATION (FCS)

The Field Control Station (FCS) is where the control configuration of the system is downloaded and running. The FCS has its F-IO that interface to the process. F-IO gathers I/O signals and measurements from the field and processes these inputs and subsequently perform control functions based on approved and downloaded control strategies. The online configuration residing in the FCS sends desired outputs to the field final control elements such as valves, relays, etc. based on control algorithm performed or as an input to another control strategy within the database for further processing.

In addition to the control functions, FCS also provides the required interface to another subsystem through FIO MODBUS TCP/IP and PROFINET.

5 PROCESS CONTROL FUNCTIONS

Process control functions for this project shall be listed below with category of control functions (typical & complex control loop, process interlock/shutdown, equipment module, unit supervision and others).

Process Unit/Area	Control Function	Assigned FCS	Category						Remark
			Typical Control Loop	Complex Control Loop	Interlock or PSD	Equipment Module	Unit Supervision	Others	
PCS	x	FCS0101	x	x				x	Safety System for Emergency Shutdown, EMCS for Electrical Monitoring and Control

Table 8 – List of Process Control Functions

5.1 COMMON SPECIFICATIONS FOR CONTROL FUNCTIONS AND SETTINGS

Shall be defined the common specifications for FCS common properties, I/O modules properties, input processing, output processing, alarm processing, control calculation processing, parameter settings, etc.

5.2 CATEGORY OF FCS FUNCTIONS USED FOR CONTROL

Control functions will be designed and implemented by using various functions (function blocks, programs, etc.) in FCS.

5.2.1 Typical Control Loop

Typical control loops are commonly used for regulatory control functions where applicable and Yokogawa I/O list relates the type of typical control loops with tags.

5.2.2 Complex Control Loop

Complex control loops that are not part of Software Typical shall be designed by referring to customer design inputs such as control narratives.

5.2.3 Interlock or Process Shutdown (PSD) Logic

If interlock or process shutdown logic is implemented in FCS, it shall be designed by referring to customer design inputs such as control narratives.

5.2.4 Equipment Module and Unit Supervision

Process units or equipment requiring unit control may involve sequential control in addition to regulatory control. Unit control may include start-up / shutdown sequence for unit or equipment. It shall be designed by referring to customer design inputs such as control narratives.

5.2.5 Others

Custom function blocks may be required to meet the customer specifications. However, use of custom function blocks should be minimized due to maintenance reason. Custom function blocks may not be functioning when the system version of FCS is upgraded, and re-engineering may be required in this case. If custom function blocks are used, sufficient documentation shall be available in the project to ensure proper support.

5.3 PROJECT I/O LICENSE

A Project IO license is required from CENTUM VP R6 to determine the number of logical I/O points that can be used in a single project. The number of usable logical I/O points in a project is determined by the number of Project I/O licenses assigned to that project. Project I/O License is required for all types of I/O such as process I/O, fieldbus I/O, and communication I/O.

Types of I/O	Counting	Remarks
Process I/O	1 point = 1 channel of one I/O Module or one redundant pair of I/O Modules defined in the project database	Points are counted per I/O Module (or redundant pair of I/O Modules). e.g. An I/O Module with 16 Channels = 16 points.
Communication I/O	Ehternet TCP/IP, Profibus-DP, Profinet-250	In this project 1 no. Modbus TCP/IP and 1 no. Profinet module is used = IO points 500.

Table 9 – Counting the number of I/O

A Project I/O License (VP6F3100) is required for every 200 logical I/O points. Place an order for the number of licenses to match the number of logical I/O points to be used in a project.

The number of logical I/O points is checked at creating an I/O module, downloading communication I/O builder, FCS offline downloading.

Software Packages are standard packages available to configure a PCS control system as per project requirement.

S.No	PCS Software Description	Model	Make	ITER	OER	CCR	Total
1	Software Media for Centum VP R6	VP6CKM-V11	Yokogawa	1	0	0	1
2	Product Maintenance License	SV2CPML-V1107-S1112	Yokogawa	1	0	0	1
3	Certificate of Product Maintenance License	SS2CPMLM-V1107-S1112	Yokogawa	1	0	0	1
4	Project ID License	VP6CPJT-V11N01	Yokogawa	1	0	0	1
5	Standard Operation/Monitoring Function (For New installation)	VP6H1100-V11N01	Yokogawa	1	0	0	1
6	Control Drawing Status Display Package (For New installation)	VP6H4410-V11N01	Yokogawa	1	0	0	1

7	Logic Chart Status Display Package	VP6H4420-V11N01	Yokogawa	1	0	0	1

19	Product Maintenance License - CI Server	SV2CPMLC-V1100-S1112/C01	Yokogawa	1	0	0	1
20	End Point Security License (Initial) - For applicable products	LS1SN001-E01/AV	Yokogawa	4	3	3	10
21	End Point Security License (Initial) - For other products	LS1SN001-E01/AVX	Yokogawa	0	7	0	7

Table 10 –PCS Software List

5.4 CENTUM VP SOFTWARE LICENSE INSTALLATION AND VALIDATION

This section explains license management process when building license project for first time. License installation and validation task is performed on Engineering workstation and on all the other workstation only validation and acceptance of license is performed where Centum software is installed.

Following are the steps to be performed on engineering workstation and operator workstation.

- Create a license project. When creating a license project, specify the name of the project.
- Read the license key file from the license key media and register the available licenses.
- Add and specify the stations whose licenses need to be distributed.
- Assign available licenses to each station i.e. EWS, OWS, FCS etc.
- Distribute licenses to assigned stations through network.
- After successful distribution accept the licenses to activate respective software packages

6 COMMON CONTROL FUNCTIONS

6.1 COMMON PROJECT PROPERTIES

There are a set of common properties that need to be defined for the project. These properties need to be assigned from the System View while creating a new CENTUM VP project.

Setting Item	Yokogawa Default	*Project Setting*	Remarks
	Name and Position Tab		
Project	PJT01	BLPH-CW1	Name of the project. Max. of 8 alphanumeric characters.
Position	C:\CENTUMVP\ENG\BkProject/	C:\CENTUMVP\ENG\BkProject/	Project Position in the Hard Disk.
Project Comment	Null	BLPH CROSSWIND	Comment on project. Max. of 32 alphanumeric characters.
Alias of Project	Null	-	Optional. Max. of 8 alphanumeric characters.
User Authentication : Use Windows user names as HIS user names	Unchecked	Checked	Check for single sign-in. Otherwise Uncheck.
	Outline		
Model	Read-only	Read-only	CENTUM VP
User	Null	BLPH	
Organization	Null	Crosswind	
Project Information	Null	BLPH	
	Constant		
Domain Number	01	01	It just shows the default domain number. Actual domain number of a new station shall be manually set according to the project system configuration when creating the station.
	Detailed Setting		
Manually Register Engineering Unit Symbol	Unchecked	Checked	EU symbol shall be registered manually. Automatic registration is not possible.
Manually Register Switch Position Label	Unchecked	Checked	Switch Position Label shall be registered manually. Automatic registration is not possible.

Setting Item	Yokogawa Default	*Project Setting*	Remarks
Plant Hierarchy : Start Number	1	See Remarks	Use the default value unless it is already used by another project. For example, this value is required to change when CENTUM CS is at upper level and CENTUM VP is at lower level.
Plant Hierarchy : Maximum Number of Use	32767	See Remarks	Use the default value.
Plant Hierarchy : Number of in use (Number of custom facilities)	Read-only	Read-only	Number of plant hierarchies that are running in project (Number of plant hierarchies displayed in the plant hierarchy viewer)
Display FF-PID in same style as PID.	Unchecked	Unchecked	Gain, Reset, and Rate for FF-PID shall be represented as P, I and D respectively.
Do not allow online change of alarm detection setting.	Unchecked	Unchecked	Online change of alarm detection setting is allowed.
Enable Advanced Features of Editing Header & Footer for Self-Documentation	Checked	Checked	
Show Guideline for aligning I/O area on FCS builder	Unchecked	Unchecked	
Define Tag Name Hierarchies.	Unchecked	Unchecked	For Hierarchically Handling Tag Name, this option is Checked
Enable Sheet link on HIS	Unchecked	Checked	
Apply same permission level of PV to CPV	Checked	Checked	To apply same operation and monitoring authorities for CPV and PV, this option is Checked
Prohibit setting SV to a value beyond the range of SVL and SVH	Unchecked	Checked	When this option is checked, the value of SV can be prohibited beyond the range of SVL and SVH
Hide the information related to disabled alarms on HIS	Unchecked	Unchecked	
Change the shape of tag marks and alarm marks for each alarm priority	Unchecked	Unchecked	

Table 11 – Common Project Database Properties

6.2 FCS COMMON CONFIGURATION SUMMARY

The following table summarizes the common settings that decide the FCS behavior. All FCSs in this project shall use the settings below:

Configuration Builder	Setting Item	Yokogawa Default	Project Setting	Comment
STNDEF	FCS Start Condition	MAN	TIME	
	Momentary Power Failure Tolerant Time	2 Sec	2 Sec	
	Node Momentary Power Failure Tolerant Time	2 Sec	2 Sec	
	Digital Filter Coefficient 1	0.5	0.5	
	Digital Filter Coefficient 2	0.75	0.75	
	Digital Filter Coefficient 3	0.875	0.875	
	Self-Station : Buffer Size	0	1024	
	Station Scan Transmission	No Scan Transmission	See Comment column	Shall be enabled based on the inter FCS transmission requirement.
	Wind Up Time	60 Sec	60 Sec	
	SEBOL/User-C Ratio	100 %	100 %	
	Interval of Repeated Warning Alarm	600 Sec	600 Sec	
	Alarm Mask for Initial Cold Start	Yes	Yes	
	Inter-station data link communication period	1 Sec	1 Sec	
	Re-transmission skip when inter-station data link error occurs	60 Sec	60 Sec	
	Switch ALF111 modules upon communication errors	Valid	Valid	
	Notification message for status change of batch operations	No	No	
	Function block tracks output module during OOP	Yes	No	
	Color to indicate abnormal subsystem communication	Green/Yellow	Red	
	Enable XL-HKU for Cabinet Address (2) to (4)	No	No	

Configuration Builder	Setting Item	Yokogawa Default	Project Setting	Comment
	I/O Communication Bandwidth Limit Value (SOE)	500	500	
	I/O Communication Bandwidth Limit Value (Device Data Communication)	1000	1000	
CONSTANT tab in FCS Properties	Fast Scan	Not applied	Apply by checking Box (For set value, see Comment)	200 msec
	Medium-Speed Scan Period	Not applied	Apply by checking Box & set value at 500 msec	500 msec
	MC Block Pulse Width	2 Sec	3 Sec	The default value may be too small for e.g. a pulse output used for subsystem communication output.
	MC Block Serial Startup Interval	0 Sec	2 Sec	
	MLD-SW AUT/CAS	CAS	AUT	
	SEBOL "Drive" Statement Action Type	1	3	
	Options	None selected	Add DIOENH (For other options, see Comment)	
	IOM Online updating	"IOP occurs in connected blocks" not applied	"IOP occurs in connected blocks" not applied	
	PID Pulse Width Output: CENTUM-V Compatible MV Display	Unchecked	Unchecked	Used only for CENTUM-V to CENTUM VP migration projects
	PI-HLD Action after hold – CENTUM-XL Compatible	Unchecked	Checked	Used only for CENTUM-XL to CENTUM VP migration projects

Configuration Builder	Setting Item	Yokogawa Default	Project Setting	Comment
	CENTUM-XL Compatible Sequence Tables	Unchecked	Checked	Used only for CENTUM-XL to CENTUM VP migration projects
	Then/Else has Higher Precedence	Unchecked	Checked	Used only for CENTUM-XL to CENTUM VP migration projects
	dPV/dCPV O/P from SUB becomes 0 after IOP	Not applied	Apply by checking the box	
	Accept Batch-End during EMST	Checked	Checked	
CONSTANT2 tab in FCS Properties	SS-DUAL PV update during deviation alarm	Not applied	Not applied	
	Alarm Notify Action when all AOF released	Not applied	Not applied	
	Specify Reference Station Tag List	None selected	See Comment	Required only in case of Multiple Project Connection
	Annunciator Message with Data	Annunciator Message Head Number : 0 Printing Message Head Number : 0	Annunciator Message Head Number : 0 Printing Message Head Number : 0	
	Increase Number of System Common Switches	Enabled	Enabled	Increases number of system common switches from 200 to 400.
	Preset MV Valid Immediately	Preset MV valid at next scan	Preset MV valid at next scan	Options : 1, Preset MV valid by Preset Switch(for systems compliant to CENTUM-V & CENTUM-XL) 2, Preset MV valid at next scan
	MV of Switch/MC Instrument follows its CSV change	Not applied	Not applied	

Configuration Builder	Setting Item	Yokogawa Default	Project Setting	Comment
CONSTANT3 tab in FCS Properties	TM/CTS/CTP blocks hold PALM after CTUP	Not applied	Not applied	
	Raised %AN sends out alarm when AOF released	Not applied	Apply by checking the box	
	Suppress OOP alarms during online maintenance of ALP121 and dual redundant ALP111	Not applied	Not applied	
	CENTUM-XL compatible IOP reactions	Not applied	Apply by checking the box	
	Suppress system alarm when CALCU error occurs	Not applied	Apply by checking the box	
	Use HKU of System Cabinet	Not applied	Not applied	
	Initiate process alarm when CAL is set or released	Not applied	Not applied	
	Allow to change function block to PRD mode while CAL is on (XL compatible)	Not applied	Apply by checking the box	Used only for CENTUM-XL to CENTUM VP migration projects
	LC64-E Starts with its internal status interact when FCS performs an initial start [Except Offline download]	Not applied	Apply by checking the box	
	Enable output limiter in PRD mode (XL compatible)	Not applied	Not applied	Used only for CENTUM-XL to CENTUM VP migration projects
	Pass calculation block's input QST status to CPV	Not applied	Not applied	
	CENTUM-XL compatible IOP reactions: Main input	Unchecked	Unchecked	Used only for CENTUM-XL to CENTUM VP migration projects
	CENTUM-XL compatible IOP reactions: Sub inputs and tag data referenced in the expressions of CALCU	Not applied	Apply by checking the box	
	Set PV of %Z to zero upon failure of a DI module	Unchecked	Unchecked	Used only for CENTUM-XL to CENTUM VP migration projects

Configuration Builder	Setting Item	Yokogawa Default	Project Setting	Comment
	Sebol Group Assignment Statement- Adhere to the order specified in the variable list during data setting	Not applied	Apply by checking the box	

Table 12 – FCS Common Configuration

6.3 FIO NODE PROPERTIES

All FIO nodes in this project shall use the settings below:

Setting Item	Yokogawa Default	*Project Setting*	Comment
Node Type	ESB Bus/Optical ESB Bus	ESB Bus/Optical ESB Bus	ER Bus option not available for FFCS-C/V type FCS.
Node number	1	See Comment column	Select node number as per the system configuration
Power supply unit	Dual redundant power supply with 80W	Dual redundant power supply with 80W	
Optical ESB Bus: Use Optical ESB Bus	No	No	Select Yes when optical ESB bus repeater is used.
Optical ESB Bus: Distance from FCU	5km	See Comment column	Select the maximum distance between FCU and the Node unit in the range of 0km to 50km.
Optical ESB Bus: Slave Module	ANT5x2	See Comment column	Select ANT5x2 or SB401 as per the system configuration
Component Number	Blank	Blank	Optional Entry : Component Number of the node unit
Node Comment	Blank	Blank	Optional Entry: Comment of the node unit

Table 13 – FIO Node Properties

6.4 FCS FUNCTION BLOCKS INITIALIZATION

When the FCS starts up, as a standard, the block mode of function blocks is initialized as follows:

Function block with output to the field or subsystem: MAN

Other function blocks: Last Saved Values

6.5 INPUT PROCESSING

6.5.1 Input Signal Conversion

The input signal conversion shall be configured in accordance with each applicable typical.

Linearization shall be performed either in smart transmitter or PCS as per the project specification. In accordance with this guideline, the input signal conversion can be defined as shown in the following tables.

Transmitter Type	Description	Input Signal Processing	Comments
Flow	DP Flowmeter	SQRT with x% for low flow cut off	Transmitter or PCS, as defined in project specification. Both Square root and low cut-off shall be performed in the same location
	Mechanical Flowmeter	BTHPUL	With Pulse Rate
	Vortex Flowmeter	LINEAR	
	Magnetic Flowmeter	LINEAR	
	Coriolis Flowmeter	LINEAR	With Density
	Ultrasonic Flowmeter	LINEAR	
	Others	As per the transmitter vendor's specification	
Level		LINEAR	If not sure, refer line chart
Pressure		LINEAR	
Temperature		LINEAR	Depends on sensor type, but linearization shall be done in transmitter / I/O module.
Analyzer		LINEAR	
Electric Current		LINEAR	

Table 14 – Input Signal Conversion Table for Conventional I/O

In case of input from a subsystem using an interface such as Modbus, input signal conversion may be required when using 16-bit integer data format. Input signal conversion is configured as SUBSYS in the function block with appropriate data conversion bias and data conversion gain. For a subsystem interface using 32-bit floating data type format, input signal conversion may not be required.

The computational expression for the communication input conversion is shown below.

- PV = GAIN * IN + BIAS
- Where, IN – Subsystem input value
- GAIN – Data conversion gain
- BIAS – Data conversion bias

Data Item	Yokogawa Default	*Project Setting*	Comments
Data Conversion Gain	1.000	Depends on PCS display scale and subsystem communication data value range	
Data Conversion Bias	0.000		

Data Item	Yokogawa Default	*Project Setting*	Comments
Input High Limit Detection Set Value	106.25		Equivalent to 21 mA for detecting IOP+, Subject to change as per project requirement.
Input Low Limit Detection Set Value	-6.25		Equivalent to 3 mA for detecting IOP-, Subject to change as per project requirement.

Table 15 – Input Signal Conversion Table for Subsystem I/O Communication:

6.5.2 Input filtering.

Digital Filter is a function to remove the noise from the process input signal.

The digital filter is defined for each regulatory control block or calculation block connected to analog input in "Input Signal Filtering" on the Control Logic Editor (*1). Input Signal Filtering: None, Auto, 1, 2, and 3. Default is Auto.

Auto: If the IN terminal is connected to I/O module including communication module, "Digital Filter Coefficient 1" is used. If the IN terminal is connected to neither communication module nor I/O module, no filtering process is performed.

None: No Filtering process is performed.

1, 2, and 3: Selected respective Digital Filter Coefficient is used; Digital Filter Coefficient can be set in FCS constant.

Note *1: If you don't use AD Suite, use Function Block Detail Builder.

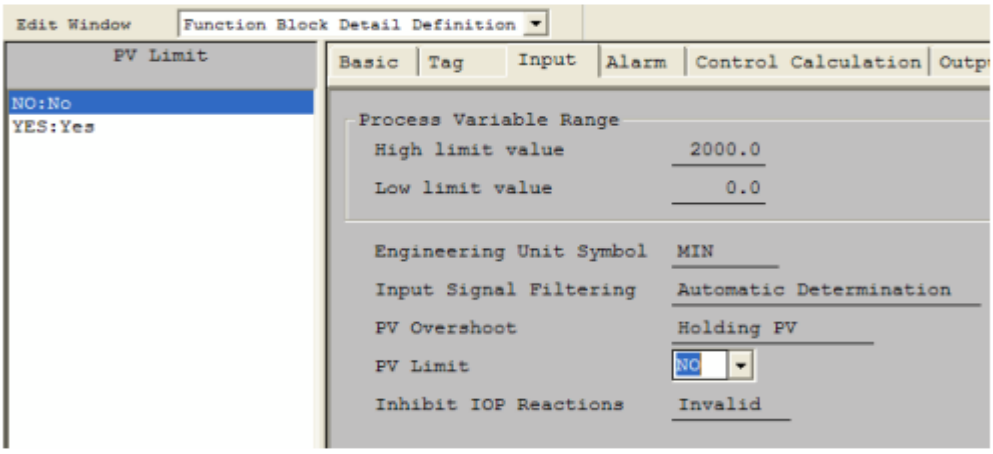

Figure 4 – Example of an Input filtering.

6.5.3 Bad Data Status Detection

The behaviour of function blocks when bad status is detected is described below:

1. Input open (IOP) alarm is generated when this alarm is enabled.

2. Analog input processes such as square root extraction, pulse input conversion, digital filters and totalizer functions are disabled.
3. The process value before IOP alarm occurrence is latched as a process variable (PV) according to the settings for holding last good value in the function blocks. The presence of an IOP alarm is the operator's indication that this value is to be unreliable.
4. In regulatory control blocks that have the MAN fallback function, MAN fallback is activated, and the block mode is switched to "MAN" mode.

The input open detection check for analog signals determines whether the input values read by an I/O module are out of the range of high and low limit input open detection setpoint values. The high and low limit input open detection setpoint values are configured in the IO module. Refer to the section 6.11.1

The input open detection for calculated input values in arithmetic calculation blocks shall be configured with the general principle that an IOP condition is propagated throughout the connected tags unless otherwise specified.

In the case of subsystem communication inputs, bad data status detection is based on the communication healthiness between the subsystem and PCS & based on the data values read from the subsystem.

Note: The calculation block's input QST status is passed to CPV. This feature can be enabled in FCS Properties.

6.5.4 Totalization

Input totalization shall be disabled unless otherwise specified- (e.g., presence of a P&ID tag with function code FQ). For regulatory control blocks, totalization is specified. In case of a bad PV status or IOP+, IOP- alarm detection by the function block, the totalizer function is stopped. Below a configurable low input cut value, totalization is not executed. The totalizer can be reset with or without operator intervention.

6.5.5 Decimal Point Settings

Scale high/low limit value can be set maximum 7 digits including sign and decimal point. Table below lists the general rule for the decimal point setting for this project.

Span	Decimal Point	Example
0 to <10	X.XXX	0.200 KPA
10 to <100	XX.XX	50.00 °C
100 to <1000	XXX.X	100.0 %
>=1000	XXXX	2000 M3/H
Totalizer	XXXXX	50000 t

Table 16 – Decimal Point Settings

6.6 OUTPUT PROCESSING

6.6.1 AFO versus AFC Control Valves

To provide the operator with a consistent display and operation, all control valves will be represented in the same way. Therefore, the closed valve position as MV=0% is indicated at the bottom of the faceplate scale, whereas the open position as MV=100% is indicated at the top of the faceplate scale.

To follow this guideline, hard-wired analog outputs shall be configured in the IOM settings depending on AFC or AFO with disabling MV Reverse Display in the function block.

The setting in IOM for AFC/AFO control valves is as follows:

Control Valve Type	IOM Set Details	Output Current
AFC	Direct Output (1*)	100% MV: 20mA, 0% MV:4mA
AFO	Reverse Output	100% MV: 4mA, 0% MV:20mA

Table 17 – IOM Setting for Non-FF Control Valves

Note *1: Direct output is the default system settings.

For hardwired valve positioner, fully open/Tightly-shut setting in the function block shall be enabled in order to close the valve fully and tightly. If the valve positioner is HART smart type, sufficient mA output at low scale for HART communication shall be set.

Table 18 – Fully-open/Tightly-shut setting

Data Item	Default Setting	Project Setting (for HART smart positioner)
Output Signal Conversion: Output Value for Full-open	106.25 (%)	101.00 (%)
Output Signal Conversion: Output Value for Tight-Shut	-17.19 (%)	-1.00 (%)
Output Signal Conversion: Fully-open/Tightly-shut	Yes	Yes

6.6.2 Output Conversion

The output signal conversion shall be configured depending upon the requirement.

In case of output to a subsystem using an interface such as Modbus, output signal conversion may be required when using 16-bit integer data format. Output signal conversion is configured as SUBSYS in the PCS output block with appropriate data conversion bias and data conversion gain, thus converting the PCS 0 to 100% output to Modbus counts. For a subsystem interface using 32-bit floating data type format, output signal conversion may not be required.

The computational expression for the communication output conversion is shown below.

- OUT = (1/GAIN) * (MV-BIAS)
- Where, OUT – Subsystem output value
- GAIN – Data conversion gain
- BIAS – Data conversion bias

6.6.3 Output Clamp

The positional-type control output actions are always applied to PID control computation. This will cause the occurrence of reset windup (integral saturation) by setting limits to the integral term in PID control computation. To mitigate reset windup during the clamped state, reset limit functions shall be configured to react appropriately in taking account of tracking the output clamp status to the upstream function block.

" Limit Output in Direction when clamped" shall be turned off in all blocks immediately upstream of MLD-SW blocks. This prevents clamping on the upstream blocks when the downstream MLD-SW block is clamped, a situation which would lead to a state in which the output would be limited to a value above 0% or below 100%. For other function blocks, this setting is enabled or disabled based on the application.

6.6.4 Output Tracking

This function is standard for cascaded PID controllers and does not need any special configuration. If a calculation block is used between the primary and the secondary controllers, a back calculation (for bump less transfer) must be implemented unless specified otherwise in the control narrative.

Note: The function block output (MV) tracks the output module during OOP. The enabling of this feature is done in the FCS Constants of the FCS Builder in System View.

6.7 ALARM PROCESSING

All PCS function block alarms are configured as active and set as per alarm setpoints in I/O database. If alarm setpoints are not specified in I/O database, those alarms are set to high/low PV range limits to preventing unnecessary alarms.

The hysteresis of every alarm detection function shall be configured as the following table.

Transmitter Type	Hysteresis Settings
Flow	2 %
Level	2 %
Pressure (Liquid)	2 %
Pressure (Gas)	2 %
Temperature	2% or 4 °F (2 °C) whichever is less

Table 19 – Alarm Hysteresis Setting

The deviation alarm thresholds shall be configured as the following table:

Transmitter Type	Deviation Alarm Settings
Flow	10 % of span
Level	5 % of span
Pressure	2 % of span
Temperature	2 °C or 4 °F

Table 20 – Deviation Alarm Setting

6.8 CONTROL CALCULATION PROCESSING

Control calculation processing is the collection of functions associated with function block execution timing and calculation algorithms.

6.8.1 Scan Period

For all function blocks, the scan period shall be selected as Basic scan (1000 msec) except specified otherwise.

In case of fast scan (50 or 100 msec) applications such as compressor surge control, speed control, etc., High Speed-Read option of the related I/O modules shall also be enabled in I/O module properties. To reduce the load in the FCS these fast scan I/O points are put together in the same I/O modules as much as possible.

6.8.2 Control Period

By default, the regulatory control blocks in the FCS shall be configured to employ the control period of 1000 msec. Therefore, the fixed control period shall be selected, and its period shall be set to 1000 msec except the blocks that are defined as high-speed or medium-speed scan.

Blocks configured with high-speed or medium-speed scan should be configured with control period set to “automatic determination” so that the control period is set to the scan period.

6.8.3 PID Controller Control Action

The EPC Contractor shall provide the control action of the PID controllers in the instrument database or the control narrative.

6.8.4 PID Control Algorithm

By default, the PID controller block shall use the algorithm of "PV derivative type PID control (PI-D)". In case of an override controller in the auto selector control typical, the PID controller shall use the "PV proportional and derivative type PID control (I-PD)" algorithm. Any other exceptions are specified within the typical loop description of control narratives.

6.8.5 Measurement Tracking

Measurement tracking shall be enabled for “MAN mode”, “AUT and CND mode” and “CAS and CND mode” by default. Exceptions will be specified per typical, or by the EPC for classes of controllers.

6.8.6 Reset Limit Function (Anti-Reset Windup)

In PID control computation, the integral action is represented by integrated value of deviation time, When the output is already limited (control computation exceeded the manipulated high-limit or low-limit setpoint (MH, ML) and deviation prolongs, the integral term in PID control computation becomes saturated due to continuous integral action. This condition resulted to “reset windup (integral saturation).” When this situation happens, the control result tends to overshoot thus, process becomes unstable. In order to avoid such condition, the PID output must be set to positional-type in the PID block details and use the reset limit function.

The reset limit values via RLV1 and RLV2 terminal are input data having the same engineering unit and scale range as those of the manipulated output value (MV). These limit values exert directly on the integral term

of the output value (MV). By correcting the computational Manipulated Output Value of the PID, its final output is limited to "RLV1-RLV2" thus, providing anti-reset windup functionality to the PID.

6.9 SETPOINT VALUE LIMITER

The setpoint value limiter function limits the setpoint value (SV) within a range between the setpoint high limit (SVH) and setpoint low limit (SVL).

The action of the setpoint value limiter in automatic (AUT) or manual (MAN) mode varies depending on whether the setpoint value (SV) can be set to a value beyond the range between SVH and SVL or not. This setting can be changed from the option of [Prohibit setting SV to a value beyond the range of SVL and SVH] on the properties sheet of the project.

When the option of [Prohibit setting SV to a value beyond the range of SVL and SVH] is checked, the setpoint value limiter performs the following actions:

1. When try to set a setpoint value (SV) greater than the setpoint high limit (SVH):

   An error message will be displayed and the value beyond the setpoint high limit becomes invalid, the previous setpoint value will be held.

2. When try to set a setpoint value (SV) smaller than the setpoint low limit (SVL):

   An error message will be displayed and the value beyond the setpoint low limit becomes invalid, the previous setpoint value will be held.

When the option of [Prohibit setting SV to a value beyond the range of SVL and SVH] is not checked, the setpoint value limiter performs the following actions:

1. When a setpoint value (SV) greater than the setpoint high limit (SVH) is set:

   An acknowledgment dialog box appears to prompt for the operator's confirmation. When confirms, the operator can set a value greater than the setpoint high limit (SVH) as the setpoint value.

2. When a setpoint value (SV) smaller than the setpoint low limit (SVL) is set:

   An acknowledgment dialog box appears to prompt for the operator's confirmation. When confirms, the operator can set a value smaller than the setpoint low limit (SVL) as the setpoint value.

However, when try to set a setpoint value (SV) to a value beyond the range between the process high alarm setpoint (PH) and the process low alarm setpoint (PL), the setpoint value limiter performs the following actions regardless of if the option of [Prohibit setting SV to a value beyond the range of SVL and SVH] is checked or unchecked:

1. When try to set a setpoint value (SV) greater than the process high alarm setpoint (PH):

   An acknowledgment dialog box appears to prompt for the operator's confirmation. When confirmed, the operator can set a value greater than the process high alarm setpoint (PH) as the setpoint value.

2. When try to set a setpoint value (SV) smaller than the process low alarm setpoint (PL):

   An acknowledgment dialog box appears to prompt for the operator's confirmation. When confirmed, the operator can set a value smaller than the process low alarm setpoint (PL) as the setpoint value.

When the function block is in remote cascade (RCAS) mode and the setpoint value (SV) is defined to automatically follow the remote setpoint value (RSV) received from the supervisory system computer and the option of [Prohibit setting SV to a value beyond the range of SVL and SVH] is checked, the setpoint value limiter performs the following actions:

1. The value exceeds the setpoint high limit (SVH) is forced to be equal to the setpoint high limit (SVH).
2. The value smaller than the setpoint low limit (SVL) is forced to be equal to the setpoint low limit (SVL).

Note1: When integrated to the multiple projects and these setting are different from the project, the operation of the setting SV on HIS follow to the setting of the project belonging to FCS.

6.10 P, I AND D PARAMETER SETTINGS

The set parameters of the PID control algorithms in CENTUM VP:

- Proportional band (P): 0 to 1000 %.
- Integral time (I): 0.1 to 10000 seconds.
- Derivative time (D): 0 to 10000 seconds.

For each individual controller the P, I, and D default tuning parameters are specified to make startup easier. The recommended P, I, and D parameter settings are defined as follows:

PID controller type	P (%)	I (Sec)	D (Sec)
Flow	333	30	0
Pressure (Liquid)	143	30	0
Pressure (Gas)	50	300	0
Level	100	600	0
Temperature	33	600	0
Analyzer	333	2400	0
Others	250	20	0

Table 21 – PID Parameter Setting

Note: These above are the standard tuning parameter settings. Actual tuning values will be configured during commissioning only.

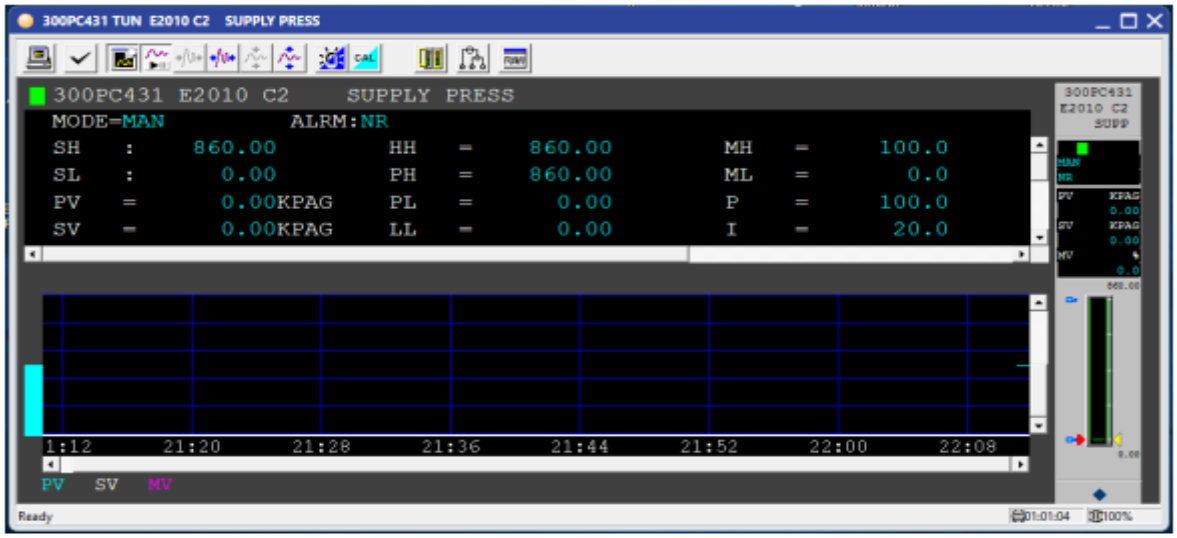

Figure 5 – P, I AND D PARAMETER SETTINGS.

6.11 I/O MODULE SETTINGS

To perform the process input/output function, it is necessary to define process inputs/outputs in I/O Modules. Settings vary with different types of I/O modules. The following sections only explain the main settings applicable to this project.

All settings are generated according to the I/O database unless otherwise specified.

Note: Enable "High Speed Read" for reading data of I/O units at high speed, if an I/O module contains I/O channels connected to high-speed scan control loops. By default, this setting is disabled.

6.11.1 Analog I/O Settings

In case of conventional (4-20mA) analog inputs, high and low input open detection setpoints shall be configured based on the transmitter type. If the transmitter conforms to NAMUR NE 43 standards, then, the input open detection high & low limits shall be set as per transmitter manufacturer specifications between saturation and fault limits. By default, these settings are specified as 3.7 mA (-1.875%) and 20.8 mA (105.0%). In case of non-NAMUR transmitters, the input open detection low limit shall be set as 3 mA (-6.25%) and the input open detection high limit shall be set as 21 mA (106.25 %), that are Yokogawa Default Settings, except as directed otherwise by the EPC.

Setting Item	Selectable Parameter	Remarks
Service comment	A string of up to 40 alphanumeric characters	
Details setting	Pulse Input: No terminal resistance, 200, 500, 1000 Ohm.	Default "No Terminal resistance". To be defined as per input device requirements.
	Output: Direct / Reverse	Default "Direct". Select "Reverse" for AFO valve
P&ID tag name	A string of up to 16 alphanumeric characters	

Setting Item	Selectable Parameter	Remarks
Label	Up to 13 user defined alphanumeric characters	
IOP detection (IOPE)	Yes/No	Default "Yes" [High limit: 106.3, Low limit: -6.3]
Transmitter power supply (VTTSEL)	12 or 24 VDC	For pulse input modules. Default "12"
OOP detection (OOPE)	Yes/No	Default "Yes
Burnout specification (BOEN)	Yes/No. If Yes, Upscale/Downscale	Only "Yes" for Thermocouple signals. Default burnout is "Upscale

Table 22 – Analog I/O Setting

Thermocouple or RTD type shall be configured as a part of the IO Settings. No additional configuration is required in the function blocks for signal conversion since the detailed settings in thermocouple or RTD IO module provide the conversion from physical measurement to temperature.

HART I/O Settings

Setting Item	Selectable Parameter	Remarks
Channel	01 to 16 or 01 to 08 (depend on I/O model)	Set the physical channel number of the I/O module
Data Type	PV, SV, TV or FV	
Polling Address	1 to 63	If multi-drop connections

Table 23 – HART I/O Settings

6.11.2 Digital I/O Settings

Setting Item	Selectable Parameter	Remarks
P&ID tag name	A string of up to 16 alphanumeric characters	
Tag Name	A string of up to 12 alphanumeric characters	
Tag comment	A string of up to 12X2 alphanumeric characters	This is used for service description
Switch position label	As per HMI definition	Default "ON/OFF"
Tag mark	As per HMI definition	Default "2"
Security level	As per HMI definition	Default "4"

Table 24 – Digital I/O Setting

Signal Status Definition

The hardwired digital I/O signal status to PCS system shall generally follow the following definition unless specified otherwise:

Process Status	Relay Contact for Status	Relay Contact for Command	PCS I/O Signal Status	Annunciator Signal Status
Alarm / Normal	CO / CC	N/A	0 / 1	1 / 0
Open / Close Command	N/A	CC / CO	1 / 0	N/A
Open / Not Open State	CC / CO	N/A	1 / 0	N/A
Close / Not Close State	CC / CO	N/A	1 / 0	N/A
Run / Stop State	CC / CO	N/A	1 / 0	N/A
Start / Not Start Command	N/A	CC / CO on energization of relay	1 / 0	N/A
Stop / Not Stop Command	N/A	CC / CO on energization of relay	1 / 0	N/A

Table 25 – Signal Status Definition

Note: CO – Contact Open; CC – Contact Closed

6.11.3 Subsystem Communication I/O Settings

In BLPH project MODBUS TCP-IP and Profinet communication protocol are being used for subsystem integration with PCS.

6.12 SYSTEM FUNCTION BLOCKS

The System diagnostics related function blocks are available from controller type FFCS-C/V. The system function blocks can be used by projects for displaying FCS running status and internal resources on HIS graphic views.

The system function blocks provide the following information.

- CPU Load Information
- Communication Load Information
- IO Load Information
- SEBOL related information

The data of the system function blocks can be configured to view on graphic or trend views on HIS. The system function blocks will be automatically generated when an FCS is created on System View. Users defined tag names cannot be configured for system function blocks.

For displaying the data of the system function blocks on HIS, the syntax for designating the data item is as follows.

- BLnnnnSddmm01.<DataItem>

Where, nnnn is block number, "S" is fixed text, dd is domain number and mm is station number.

The block numbering of system function blocks is as follows;

- %BL0001 – CPU Load Information
- %BL0002 – Communication Load Information
- %BL0003 – I/O Load Information
- %BL0004 – SEBOL Related Information

The system function blocks can be used in the same manner as using the other types of function blocks for displaying the FCS running statuses and internal resource information.

6.12.1 Overview of function blocks

The following table contains a list of the commonly used function blocks in the system.

Note: Following table shall be updated during detailed engineering.

BLOCK NAME	FUNCTION	DESCRIPTION
AS-H	Auto-selector High (Output)	Selects the higher value from 2 or 3 inputs and transfers it to the output.
AS-L	Auto-selector Low (Output)	Selects the lower value from 2 or 3 inputs and transfers it to the output.
AVE	Averaging	Calculate average value for certain input value
CALCU	Calculation	Perform calculation, change alarm levels, etc.
CI	Code input	The CI block is used to read the contact input or internal switch as a binary code or binary coded decimal and display the integer value indicated by the code as the input code value
CO	Code output	The CO block is used to convert the integer value which is set as the setting code value (PV) from the operation and monitoring functions or other function block into the code pattern for output to the contact output or internal switch.
LC64-E	Logic chart	Provides implementation of logic in a logic chart format.
MC-2/3 MC-2E/3E	Motor Control Unit	Contains within one function block most of the functions used in relation with motors and/or motorized valves. MC-2 for 2 position motor control (Stop/Run) and MC-3 for 3 position motor control (Forward/Stop/Reverse)
MLD	Manual Loader	Output an analogue value as set by the operator to the field.
MLD-SW	Cascade/Auto/Manual Station	Basically, same as MLD, but can be cascaded with other function blocks, where it then provides tracking functions. Used for output to valves in a split range configuration and to provide SV ramping in cascade configurations.
NOT	Negation	Negates the input.
PID-STC	PID Controller with Self Tuning Function	This function block is used to automatically adjust PID parameters (P, I, D)

BLOCK NAME	FUNCTION	DESCRIPTION
FF-AI, FF-AO	Foundation Fieldbus Function blocks	These function blocks are used to connect the FF instruments to FCS.
PVI	Input Indicator	Displays an analogue value received from the field directly via I/O modules, from subsystems, or calculation variables within the system.
PVI-DV	Input Indicator with Deviation Alarm	Same as PVI. The additional set point value enables deviations to be monitored and alarmed.
RL	Relational Expression	The RL block is used to judge the numerical relationship or the logical product of two data.
SEBOL	Sequence and Batch Oriented Language	Programming language for process control. Use for sequence control or complex calculation.
S(I)(O)-XX	Switch Instrument	Indication of digital inputs in combination with digital outputs to control discrete devices like valves and motors. Various types are available to support up to 2 inputs and 2 outputs.
SPLIT	Split Range	Split the output of a controller into two outputs with a range conversion function
SS-M	Medium Selector (Process value)	Select the medium value from 3 inputs.
ST16	Sequence table	Provides implementation of logic functions in a table format.
SW-33	3 poles, 3 position switch	3 poles selection between 3 positions.
TM	Timer	It measures time in the unit of seconds or minutes.
VELLIM	Velocity Limiter block	The VELLIM outputs a change per unit time by limiting it within the velocity limits

Table 26 – Function blocks

6.12.2 Data Items

The following table contains a list of common data items that exist in the Yokogawa CENTUM VP system. Most function blocks contain only a limited selection of these data items. On the other hand, some function blocks contain specific data items that are not identified in this table.

DATA ITEM	FUNCTION	DESCRIPTION
PV	Process Value	Input value to the function block. Can be from the field or from another block.
MV	Manipulated Value	Output value from the function block. Can go to the field or to another block.
SV	Set Value	Set-point value indicating the required/expected process value.
FV	Feedback Value	Analogue input value to the MC-2/3 function block.
MODE	Block mode	Functioning mode of the function block: can be MAN, AUT, CAS, etc.
ALM	Alarm status	Alarm status of the function block: NR, HI, LO, IOP, OOP, etc.
DV	Deviation Value	Deviation between SV and PV.

DATA ITEM	FUNCTION	DESCRIPTION
HH	High-high alarm limit	When PV goes over the HH value, a high-high alarm (HH) is triggered.
PH	High alarm limit	When PV goes over the PH value, a high alarm (HI) is triggered.
LL	Low-low alarm limit	When PV goes under the LL value, a low-low (LL) alarm is triggered.
PL	Low alarm limit	When PV goes under the PL value, a low (LO) alarm is triggered.
VL	Velocity alarm limit	When the PV rate of change goes over the VL alarm, a velocity alarm (VEL+, VEL-) is triggered.
DL	Deviation alarm limit	When DV goes over the DL value, a deviation (DV+, DV-) alarm is triggered.
MH	MV high alarm limit	When MV goes over the MH value, an output high alarm (MHI) alarm is triggered.
ML	MV low alarm limit	When MV goes under the ML value, an output low alarm (MLO) alarm is triggered.
P	Proportional band	P setting for the PID algorithm (%).
I	Integral time	I setting for the PID algorithm (s).
D	Derivative time	D setting for the PID algorithm (s).
SH	Scale high	High value of the PV scale.
SL	Scale low	Low value of the PV scale.
ANSP	Answerback set point	When for an MC-2/3 function block with analogue input only, if FV is less than ANSP, PV is set to 0. Else PV is set to 2.
MTM	Answerback timer	If the answerback does not follow the output within the period specified by MTM,

Table 27 – Data Item

6.12.3 Alarm Status

The following table contains a list of the most common alarm status which is available in the Yokogawa CENTUM VP control system. Most function blocks contain only a limited selection of these alarms. On the other hand, some function blocks contain specific alarms that are not identified in this table.

SYMBOL	NAME	DESCRIPTION
ANS+	ON Answerback Error	Answerback does not match the command in time (open/start)
ANS-	OFF Answerback Error	Answerback does not match the command in time (close/stop)
DV+	Deviation Alarm +	The deviation between PV and SV has exceeded the deviation alarm limit (DL) in the positive direction (PV-SV > DL). For MVC, this alarm occurs when the CUSUM value exceeds the limit. DV+ stands for "high deviation" because this alarm results when CUSUM value exceeds the alarm limit.
DV-	Deviation Alarm -	The deviation between PV and SV has exceeded the deviation alarm limit (DL) in the negative direction (SV-PV > DL).
HH	High-high Alarm	The PV has risen above the high-high alarm limit (HH).
LL	Low-low Alarm	The PV has fallen below the low-low alarm limit (LL).
HI	High Alarm	The PV has risen above the high alarm limit (PH).
INT	Interlock Alarm	The interlock input of the function block has become active.
IOP	High Input Open Alarm	The input value to the function block cannot be read due to a failure or connection error at the input module (high input).
IOP-	Low Input Open Alarm	The input value to the function block cannot be read due to a failure or connection error at the input module (low input).

SYMBOL	NAME	DESCRIPTION
LO	Low Alarm	The PV has fallen below the low alarm limit (PL).
MHI	Output High Alarm	The output has almost risen above the output high alarm limit (MH). The actual value is limited to MH.
MLO	Output Low Alarm	The output has almost fallen below the output low alarm limit (ML). The actual value is limited to ML.
NR	Normal	No alarm conditions exist.
OOP	Output Open Alarm	Output value from the function block cannot be transferred to the field due to failure or connection error at the output module.
PERR	Undefined Answerback	Both open/close feedback inputs are active at the same time.
TRIP	Thermal Trip Alarm	The trip input of the function block has become active.
VEL+	Velocity Alarm +	The PV rate of change over a certain period has exceeded the velocity alarm limit (VL) in positive direction (ΔPV > DL) is triggered.
VEL-	Velocity Alarm -	The PV rate of change over a certain period has exceeded the velocity alarm limit (VL) in negative direction (ΔPV < -DL) is triggered.
CNF	Connection Status Failure Alarm	Data status is bad due to device or Card I/O abnormality.

Table 28 – Alarm Status

6.13 SIGNAL ISOLATION METHODS FOR MAINTENANCE

As a part of standard maintenance procedure, the following steps should be followed to isolate I/O signals from the control system when they are invalid (e.g., during calibration). The objectives of this signal isolation exercise are:

- Prevent a faulty signal from adversely affecting closed loop control, operator decision making, and reporting functions on the business network.
- Allow technicians to view the affected transmitter values for troubleshooting purposes.
- Allow the operator access to final control elements.

For both Fieldbus and conventional (4~20mA) devices:

An individual with supervisor or engineering authority places the field-connected function block in "CAL" (Calibration) mode.

In CAL mode, the block's PV holds its last value until manually changed by an operator. If that block is a controller, any control mode other than MAN is disallowed. An operator can adjust final control elements in manual mode, and a technician can view the raw process value by clicking on the RAW button in the tuning window of that block.

Because ExaOPC is configured to mark function blocks in CAL mode with UNCERTAIN data quality, any advanced control or business user is made aware that the function block's data quality is degraded. However,

be aware that CAL status is not automatically propagated to other downstream PCS blocks, such as calculations or selectors. For example, a compensated flow controller will not be forced to manual mode when the raw flow signal is placed in CAL mode. Also, a signal selector could select a block in CAL mode.

If it is necessary to mark a transmitter signal as BAD, then the related function block must be placed in O/S mode, thus causing an IOP condition within all downstream blocks. Please note that, with the function block in O/S mode, it is not possible to read the raw transmitter value in the PCS, and it is not possible to adjust that block's output.

6.14 MISCELLANEOUS ENGINEERING PRACTICES

6.14.1 Engineering Units

In case of incomplete engineering ranges and/or engineering units, the engineering unit of that function blocks shall be assigned to "TBA". This helps in filtering all incomplete tags.

6.14.2 Operator Switches

Common switches have no upper equipment name. Without the upper equipment name, it is not possible to restrict the operation range of the common switches. Either all the operators will get access to all of the common switches in an FCS, or no operators will get access to the common switches. Therefore Common switches (%SW) are NOT used for any operator soft switches (e.g., interlock bypass switches, selection between operating modes, alarm suppression enable/disable switches).

Instead, annunciator tags or function blocks (SO-1, SO-2, PBS5C, etc.) can be used for operator soft switches. The choice of annunciator tag vs. function block depends upon the required status on FCS restart: an annunciator tag always starts up in state 0, while a function block retains its last position.

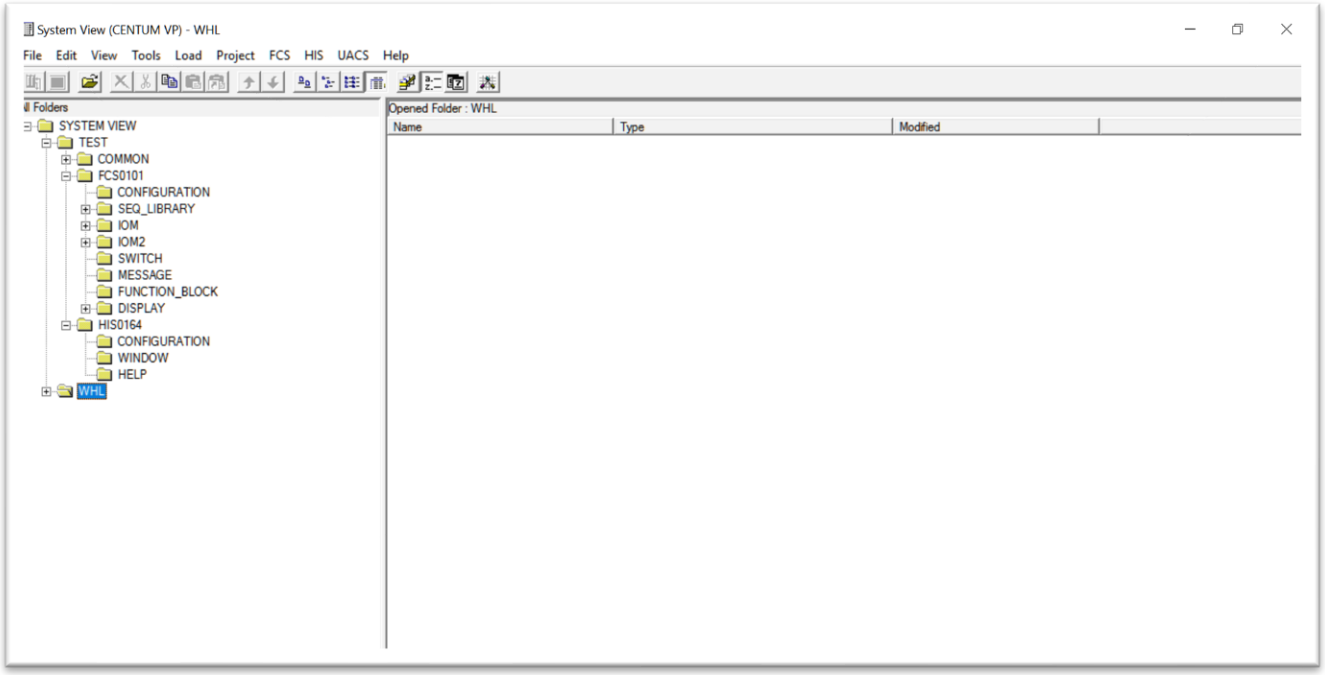

Figure 6 – VP Builder.

7 PCS CONTROL APPLICATIONS

This section describes the design philosophy for PCS control applications.

7.1 GENERAL FCS CONFIGURATION GUIDELINE

7.1.1 FCS Template Database

The FCS template database defines a maximum configurable quantity for each category of function blocks, tags, SFC sequences, etc.

Note: In this project, based on Project requirement general purpose FFCS-V: VP6F1700-V11C01 is used.

There are the following standard FCS (for FFCS-C/V) template databases.

- General-Purpose (Default)
  FFCS-C : VP6F1800-V11C01 (FCS model with Standard Type suffix code) is required.
  FFCS-V : VP6F1700-V11C01 (FCS model with Standard Type suffix code) is required.
- Extended Type
  FFCS-C : VP6F1800-V11C02 (FCS model with Extended Type suffix code) is required.
  FFCS-V : VP6F1700-V11C02 (FCS model with Extended Type suffix code) is required.
- Large Type
  FFCS-C : VP6F1800-V11C03 (FCS model with Large Type suffix code) is required.
  FFCS-V : VP6F1700-V11C03 (FCS model with Large Type suffix code) is required.

Care should be taken that the function block quantity within each category does not exceed the maximum number when assigning I/O tags in a control station.

7.1.2 FCS Resource Information

Using General Purpose FCS template for this project and it is located in Custom Folder of CentumVP Project Database.

Station Common

Category	Maximum Number	Used	Maximum Amount	Capacity	Load Ratio(%)
SEBOL User Function	210	0	430080B	0B	0
SFC Sequence	630	6	5160960B	125184B	2
Unit Procedure	60	0	122880B	0B	0
Tag-List(I/O,Switch)	18000	927	-----	-----	5
FCS-C/Option Area	-----	-----	320KB	64KB	20

Function Block

Category	Maximum Number	Used	Load Ratio(%)
Regulatory Control Blocks / Calculation Blocks	1500	295	19
Sequence	150	53	35
General-Purpose Calculations	310	19	6
SFC Blocks	40	6	15
Operation	200	0	0
Switch Instruments	800	34	4
Sequence Elements 1	500	45	9
Faceplate Blocks	120	10	8
Logic Operation Blocks	100	0	0
Sequence Elements 2	100	10	10
Batch Data	100	0	0
Sequence [M-Size]	100	0	0
Sequence [L-Size]	100	0	0
Unit Operation	0	0	0
Unit Instruments	10	0	0
Total Number of Function Blocks	4130	472	11
Tag-List(Block,Annunciator)	7000	660	9
Inter-station data links	512	1	1
Foundation Fieldbus faceplate	1500	0	0

I/O point
Logical I/O Calculation:Method-2

Category	Number of I/O	Number of logical I/O
Process I/O	256	256
Communication I/O		750
Total		1006

I/O license usage
Standard Engineering Function : 906/Unlimited
Project I/O License : 906/ 20000

Table 29 – FCS Resource Information.

7.1.3 Estimating Required Quantity of Functional Blocks

The quantity of each category of function blocks should be counted to select the required number of FCSs. Once the hard and soft I/O assignment has been finished, the FCS loading calculation will be done during the design, implementation, and testing phases. The FCS loading calculation (depending on CPU load calculation and the maximum number of blocks.

7.1.4 Controller I/O Cards

A PCS field controller (FCS) with model AFV30D is capable of handling multiple I/O types by using universal type I/O module. It consists of redundant Field Control Unit (FCU) and maximum of 32 local/remote nodes. Each node allows install up to 8 N-ESB bus coupler module or communication cards. Each N-ESB bus

coupler module allows install up to 16 Node Interface Unit (NIU) and each NIU allows install up to 6 universal type I/O module. Each universal type I/O module could connect to 16 I/O points.

7.1.5 FCS Application Capacity

The following table lists the application capacity of FCS (AFV30D) with different types of databases:

Note: In this project, we are using Model C01 Standard type.

Item		AFV30□/AFV40□		
		VP6F1700-V1□C01 (Standard)	VP6F1700-V1□C02 (Expanded)	VP6F1700-V1□C03 (Large)
No. of Tags	Elements per FCS (*1)	18000	18000	18000
	Function blocks (*2)	3500	3500	7000
Process I/O	Analog I/O points	1760	1760	1760
	Contact I/O points	4096	4096	4096
Communication I/O (*3)	Data volume (in 16-bit units)	8000	8000	8000
Internal Switches	Common switches	9000	9000	9000
	Global switches	256	256	256
Message Outputs	Annunciator messages	2000	2000	2000
	Print messages	2000	2000	2000
	Operator guide messages	1000	1000	1000
	Sequence message request	200	200	200
	Event messages	1000	1000	1000
Control Functions	Control drawings	200	200 (300/400/500) (*4)	
1 second Trend	Acquisition points	1024	1024	1024
ADL Points	Number of accesses to other stations	512	512	512

Table 30 – Application Capacity

7.1.6 CPU Idle Time

An FCS performs many tasks which include Message Sending, Trend Communication, I/O processing, Control function, System Diagnostic, External communication, and external communication with HIS and ExaOPC which are consuming CPU processing time.

The performance of FCS is measured by the idle time (non-processing time) in seconds in one-minute period. The load will be measured during FAT.

The FCS load is affected by the number of I/O cards installed, function blocks used, trend points and external communication points. FCS CPU load will be estimated / calculated based on the above factors.

7.1.7 Control Drawing Assignment

The application software within an FCS is organized in control drawings. Each FCS contains 200 control drawings, in which all function blocks are defined, as default. The control drawings shall follow the structure below and should only be modified when additional space is required for a specific area:

- DR0001 initialization
- DR0005 inter-FCS communication inputs

- DR0010 ~ DR0020 used for alarm suppression (if any)
- DR0021 ~ DR0100 used for control functions for typical loops generation.
- DR0101 ~ DR0140 used for Subsystem communication (if any)
- DR0141 ~ DR0160 used for control functions for complex loops.
- DR0161 ~ DR0198 used for sequences (if any)
- DR0199 inter-FCS communication outputs
- DR0200 used for idle time measurement.

Control drawings will be sorted by unit number, typical loop and loop name with, as a default, two empty control drawings between different typical loops. In case more drawings are needed the number of empty drawings between the different typical loops can be reduced.

Note: Control drawings in FCS (FFCS-C/V) can be expanded up to 500 with Node Expansion Package, but it is recommended to keep 200 (default), If numbers of control drawings in FCSs are increased, maximum number of FCSs are decreased due to limitation of Plant Hierarchy names.

7.1.8 Control Drawing General Settings

The control drawings contain function blocks and process I/O references, which together form a specific control function. The I/O references or PIO block shall contain either a label (for analogue signals) or a tag name (for digital signals).

General Control Drawing Setting

The setting for each control drawing shall be as indicated in the following table:

Setting Item	Remarks
Control drawing format	1600 x 1072
Control drawing grid size	4

Table 31 – Control Drawing General Settings

7.1.9 Software I/O Definition

Software inputs/outputs are virtual inputs/outputs provided by the FCS system software. They are often referred as "Internal switches" used for the purpose of data exchange and software manipulation between function blocks and control stations in the process control network. Two types of internal switches are defined namely: Common and Global switches.

Common Switches

Common switches are internal switches defined by the configuration design engineer to aid and develop the FCS application software efficiently. The logical state of these switches is used exclusively in the FCS which owns them and cannot be shared by other FCSs in the process control network.

9000 common switches are available in one FCS (FFCS-V) ranging from element number %SW0001 to %SW9000. 9999 common switches are available in one FCS (FFCS-C) ranging from element number

%SW0001 to %SW9999. For ease of maintenance and software trouble shooting the design engineer allocates the switches in a structured manner. A typical structured common switch allocation is shown in Table below.

Common Switch Range	Function
%SW0001 - 1000	FCS Common
%SW1001 - 2000	Unit #1
%SW2001 - 3000	Unit #2
%SW3001 - 4000	Unit #3
%SW4001 - 8000	Reserved for future
%SW8001 - 9000	Reserved by system

Table 32 – Typical Common Switch Allocation in a FCS (FFCS-V)

Common Switch Range	Function
%SW0001 - 1000	FCS Common
%SW1001 - 2000	FCS Common
%SW2001 - 3000	Reserved for future
%SW3001 - 4000	Reserved for future
%SW4001 - 8000	Reserved for future
%SW8001 - 9999	Reserved by system

Table 33 – Typical Common Switch Allocation in a FCS (FFCS-C)

Global Switches

Global switches are internal switches used to transfer signals from SCS to PCS and vice versa. It is defined by the configuration design engineer to share logical data generated in one FCS with other FCSs in the same domain.

256 global switches are defined in one FCS ranging from element number %GS001 to %GS256. For ease of maintenance and software trouble shooting the design engineer will choose to allocate the switches in a structured manner as common switches.

When a global switch is used in logic, its data status should be also monitored in logic for handling the abnormal situation. If the data status of the global switch is "BAD", the PV value of the global switch will stay at the last received value.

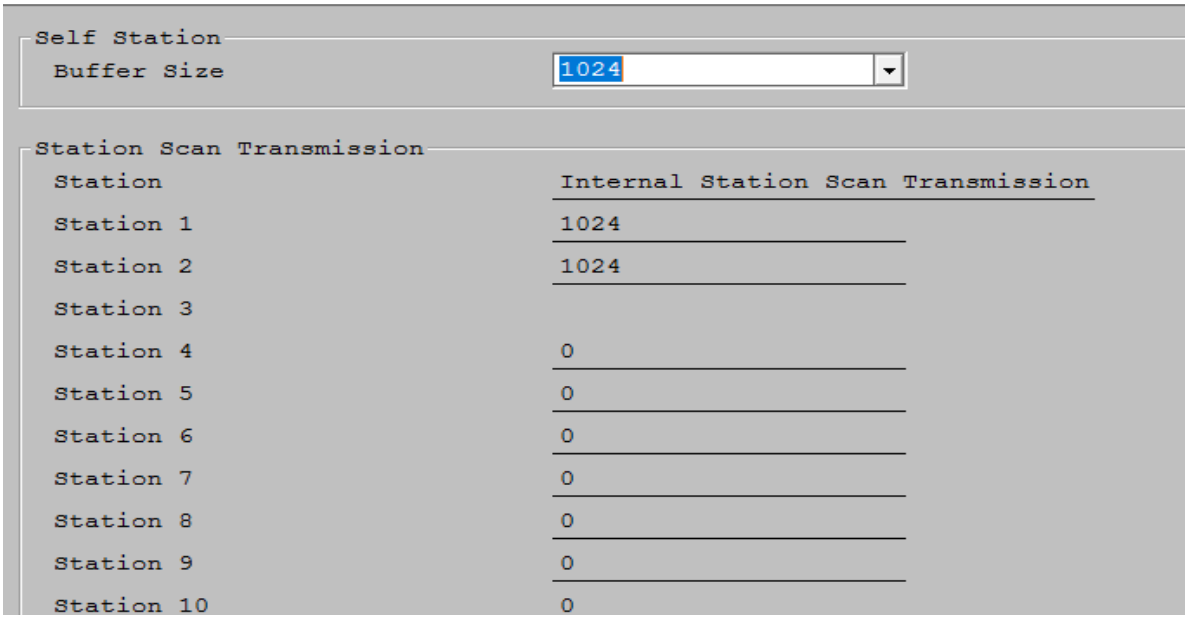

Figure 7 – Scan Transmission Settings

Annunciator Message

These are custom messages generated in one FCS configured by the control design engineer for the purpose of alarm annunciation to alert the operator. 2000 Annunciator Messages can be defined in one FCS (FFCS-C/V) and they are assigned from %AN0001 to %AN2000.

Operator Guidance Message

Operator guidance message outputs an alert to an operator in real-time situations. The operator guidance message is normally used by sequence or batch control.

Printer Message

Printout message outputs the data corresponding to an event that occurred in the process. This is mainly used to record the event that occurred in a process by printing them on paper as well as logging them into a file. The printout message cannot be displayed in the process alarm view.

The printout message is generally not used unless otherwise specified.

7.2 PHILOSOPHY OF DESIGNING CONTROL APPLICATIONS

Module-based engineering should be used when designing control application, and Global Class Module shall be used as many as possible to establish implementation standardization within the project to achieve consistency of deliverables created by project members.

7.2.1 Module-based engineering

Module-based engineering is an approach that subdivides a system into smaller parts (modules) which can be independently created, tested, and accepted before they are used to drive multiple functionalities.

There are two types of modules for control application design: Class module and application module.

Note: Module based engineering is not applicable for this project.

7.2.2 Complex Control Loop Design

When complex control loops are newly designed for the project, the following items need to be taken into consideration in addition to the general guidelines described earlier in this document.

- How to deal with alarm & data status propagation, including other station data.
- Output tracking & bumpless transfer.
- Connecting user-defined data items (SFC & Unit) with regulatory control function blocks.
- Possible modes of operation including crippled mode.
- Block number order (scan order).
- Loop dynamics including terminal-to-terminal response time, reset limiter, etc.

7.2.3 Sequence Control Design

Philosophy of Sequence Design

A policy to design the sequence control should be defined with regard to usage of various function blocks. There are the following two areas where the policy shall apply.

1. To define the structure of the sequence
   - States transition
   - Procedure
2. To configure the execution sequence
   - Condition and action for devices and/or equipment (pump, valve, flow, pressure, temperature, etc.)

Structure of the sequence

There are two methods to define the structure of the sequence as follows.

A. Using SFC block (_SFCPB)

   The standard states transition matrix is only available. If it cannot meet the project requirement, use the method 1A).

B. Using sequence table (ST16)

There is no standard states transition. It shall be manually designed always.

The following table provides a decision matrix to select the method.

Structure of Sequence	1A) SFC block (_SFCPB)	1B) Sequence table
Viewing format	SFC (Sequential Function Chart)	Sequence Table

Structure of Sequence	1A) SFC block (_SFCPB)	1B) Sequence table
Sequence consisting of multiple operations (used for batch sequence)	Not Recommended	Not Recommended
Sequence consisting of multiple operations (used for continuous control)	Not Recommended	Not Recommended
Sequence consisting of single operation	*Recommended*	Applicable

Table 34 – Decision Matrix to Select Function Blocks in Sequence Structure

Execution sequence

To configure the execution sequence, there are three methods.

Using SEBOL

Using sequence table (ST16)

Using logic chart (LC64)

The following table provides a decision matrix to select the method.

Type of Sequence	SEBOL	Sequence table	Logic chart
Step sequence	Recommended	Applicable	Not recommended
Monitoring sequence used as status change such as stopping the sequence	Applicable	Applicable	*Recommended*
Monitoring sequence used for other purposes	Recommended	Applicable	Applicable
(Other FCS data access)	No additional blocks*1	Global switch or Area out connection block required	Global switch or Area out connection block required

Table 35 – Decision Matrix to Select Function Blocks/Programs in Execution Sequence

*1: Performance shall be considered.

Initialization Sequence Design

Initialization for function blocks needs to be properly designed for proper functioning of continuous and sequence control functions. The following items shall be considered as minimum.

- Desired block mode and switch position of the connected function blocks
- Stating of specific SFC blocks
- MV preset value of the function blocks that are connected to field outputs
- Start mode of unit instrument
- Block mode of ST16
- Step number of ST16

7.2.4 Interlock or Process Shutdown Logic Design

Consistent implementation within the project shall also apply to interlock or process shutdown (PSD) logic design.

Recommended Function Block

Recommended function block to implement an interlock or process shutdown logic is LC64-E.

Interlock Condition Signal

When a digital status or an analog value comparison is used as a condition in the logic diagram, use the following guideline.

Digital status

An annunciator message (%AN) is used for a digital alarm and an SI-1 block is used for a non-alarm digital status. Use these as the condition in the logic diagram.

Analog value comparison

When an analog value comparison is required, prepare an additional PVI block where the comparison value is entered in its PH or PL, and use ALRM of the PVI block as the condition in the logic diagram. This is for considering the ease of testing, reviewing, and maintenance. This additional PVI block will have the Logging alarm priority because this does not require an alarm notification.

Point of Design for Interlock Logic

Interlock (PSD) logic may affect the other control functions and it may be used as a start condition, halt condition, unit shutdown condition, etc.

The following table summarizes a point of design for such logic.

Point of view	Method	Point of design
How to reset	Auto reset by process condition	Need to decide how to reset the output from the logic.
	Manual reset	
Action from/to the main sequence	Action to the main sequence	When the interlock logic stops or halts the main sequence, consider how to restart the sequence. • Restarting the sequence is possible anytime regardless of interlock status • Restarting the sequence is only possible when the interlock is reset
	Action from the main sequence	Avoid a situation of simultaneous device manipulation by both the main sequence and interlock logic. • The interlock logic overrides an action from the main sequence by e.g., connecting the output of the interlock logic with the standard interlock connection terminal of a function block. • The main sequence manipulates the function block only when it is not interlocked.
Action type of interlock logic to the main sequence	One-shot action	This is the case that the interlock acts on the main sequence one-shot. This pattern is recommended.
	One-shot action + Operation prohibition	This is the case of the above pattern plus operation prohibition. As a means of operation prohibition, an operation mark may be used.
	Always	This is the case that the interlock always acts on the main sequence. This pattern shall not be used.
Notification to operator	Annunciator message (This may be implemented only when the requirement permits.)	Need to decide if it is held until recovery or automatically reset after a few seconds.
	Operation guidance message (This may be implemented only when the requirement permits.)	Must be always one-shot notification.
	Display	Graphic link parts shall be designed to show the interlock state.

Table 36 – Point of Design for Interlock Logic

7.2.5 SEBOL

SEBOL is useful to configure the process data access, sequence control and calculation processing. There are two types of SEBOL from the execution timing point of view.

- Periodic SEBOL (for FFCS-C/V only)

  Periodic SEBOL executes the codes in one second unless interrupted by codes or system.

- Timeshare SEBOL

  Timeshare SEBOL executes the maximum 20 lines * N times in 1 second when CPU idle time allows.

The following table provides a decision matrix to select the method.

Usage or process	Periodic	Timeshare	Remarks
Calculation processing exceeding CALCU capability	Recommended	Not Recommended	Remark-A)
Other station data access	Recommended	Applicable	Remark-B)
Monitoring (Every second execution)	Recommended	Not Recommended	Remarks-A,B,)
Monitoring (every few second execution)	Recommended	Applicable	Remarks-A,B,)
High speed execution (less than 1sec)	N/A	N/A	Use ST16, LC64, or CALCU

Table 37 – Decision Matrix to Select SEBOL Types

Some limitations and considerations will apply in each case.

A) Periodic SEBOL is executed in 1 second for all processing until interrupted by the system (e.g., wait until, drive, delay statement). Timeshare SEBOL is executed in CPU idle time. When there is not enough CPU idle time in the basic scan period, timeshare SEBOL will be executed in the next basic scan if CPU idle time allows.

B) Periodic SEBOL may affect the CPU load when the quantity of execution lines is too many. Do not create an infinite looping program.

C) Accessing the other FCS data is treated as interruption in periodic SEBOL. Some coding technique (e.g., using a group assignment statement for reading data and copying them to local variables) may be required.

Use the System Function Block to monitor SEBOL information. (For FFCS-C/V only).

7.3 PEER-TO-PEER COMMUNICATION

The peer-to-peer communication among FCSs shall be limited as much as possible. Therefore, FCSs and I/O in them shall be allocated to avoid the peer-to-peer communication as much as possible. In case that this is required, loading estimation shall be made more carefully.

7.3.1 Peer-to-peer Communication Methods

There are following three methods to implement peer-to-peer communication among FCSs; global switch, area data link (ADL) function block, and SEBOL program.

Global switches are effective for digital data communication (up to 256 bits for each FCS) with easy configuration requiring no function blocks. Data transmission delay can be ignored because global switches are exchanged among FCSs at every 100msec, but it can only be used within the same Vnet/IP domain.

ADL's can be used for both the digital and analog data communication and can be used across the different Vnet/IP domains, but additional function blocks are required in receiving FCS. ADL's communication is executed at every second as default setting.

SEBOL programs in SFC or Operation blocks can provide the similar function as the ADL's, using a controller model FFCS-C/V, a periodic SEBOL program is available that is executed in the basic function block scan (one second) and it thus provides every second communication cycle.

In the ADL method, all communication tags and loop connections shall be manually configured on control drawings, but connection can be easily identified on control drawings.

SEBOL programs can be a sequence library so that easy configuration (re-usability) will be available. SEBOL program codes can be re-used in FCSs as they are where program code changes are not required at all.

If many inter-station communications is required, use of the periodic SEBOL method will provide a more value than the ADL method from a perspective of implementation time.

Peer to peer communication between FCS and SCS (safety controller) is also possible by the same methods if safety system (ProSafe-RS System) is integrated with PCS (CENTUM VP System). In this project PCS system & Safety systems are integrated (integrated control and safety system)

7.4 TIME SYNCHRONIZATION

Time Synchronization is required for accurate and consistent time stamping for all event occurrences. Network time synchronization is accomplished by using Network Time Protocol (NTP).

The Vnet/IP Network Time synchronization sets the clock time on every Vnet/IP stations. To ensure consistent time stamping all over the plant, all stations including PCS, ESD and FGS connected to Vnet/IP will be utilizing the Simple Network Time Protocol (SNTP) connected to NTP server.

In a Vnet/IP system, the Vnet/IP clock is the standard. All the stations within a domain allow the time synchronization service program to check for time difference between the Vnet/IP master clock and the computer's clock and adjust the computer's clock when necessary.

7.5 PHILOSOPHY OF APPLICATION TESTING

7.5.1 Application Testing

Application testing is to ensure that the implemented applications function in accordance with the master design document; project functional design documents that have been developed during basic design phase for typical loops and detailed design phase for complex loops/logics/sequences. Those documents shall be approved by a customer prior to the tests.

General Workflow

Testing of project-specific typical software loops

Since the modular design approach is one of the key aspects of the project execution and test strategy, Yokogawa will aim to maximize utilization of the global class module as they do not require dynamic check. When the project-specific typical software loops are designed and implemented, they are subject to rigorous testing, to minimize the probability of errors being propagated. The test includes:

- Full functional test, including all normal and abnormal operating scenarios
- Alarm and event generation
- I/O parameter settings
- Validation of interface with other function blocks
- Verification of the function block documentation, including all the above aspects and any constraints that may apply to the application of the function block

After sign-off by the customer, the approved "typical software loops" become the basis for bulk generation of software configuration, are stored in the project's typical loops library and are subject to rigorous and systematic change management. Replicated typical software loops do not need further dynamic functional testing. During the internal tests and FAT the focus is on correct tag names and interconnections.

Verification of software configuration replicated from typical software loops

Software configuration which can be replicated from the approved typical software loops can be generated in bulk. Testing of such software configuration includes verification of function block parameter settings against I/O definition. The correctness of the software typical used by Yokogawa from the approved typical loops library shall be verified first if in line with control narratives and then with I/O definition supplied by customer.

Next, the tag-specific function block parameter definition shall be verified. Common tag parameter derived from customer, such as Tag name, Service Description, Instrument Range and Engineering Unit etc., will be verified visually through the faceplate or printed system configuration (PCS Self-Documents). Depending on typical loop used, specific function block parameters will additionally be verified (e.g., Alarm Settings, Control Action Direction for PID controllers).

Testing of software configuration for specific loops

Logic, control sequence and algorithm that are specifically defined in the control narrative will be fully tested. Where specified, test of inter-system trips/interlocks will be carried out in an integrated method (e.g., integrated test of ESD trip with the PCS Motor Trip functionality). In general, test procedures shall prescribe all perceived loop-specific tests.

All defects or inconsistencies identified during testing of the sequences or identified with the associated project documentation are entered into Punch-list. The resolution activities are also recorded such that a full audit trail from the original fault through the subsequent recovery actions is established.

Testing Method

Depending upon situations (re-using GES modules, project-specific modules, complexity, etc.), a type of testing method, i.e., static (paper) check or dynamic check, will be selected.

The static (paper) check is used for verifying the static configurations such as tag name, tag comment, instrument range, engineering unit, etc.

The dynamic check is used for verifying complex control functions, project-specific re-usable modules, and/or GES re-usable modules modified by the project.

Application testing will be categorized as below:

1. Individual test

- Control applications that are implemented by re-using the GES typical control loops.
  - ➢ In case that GES typical control loops are re-used as they are
    Perform the static (paper) check for static configurations.

  In case that GES typical control loops are used with functional modifications
    Perform the thorough dynamic check using actual FCS hardware or simulator, including abnormal situation testing.
- Project-specific control applications
  - ➢ Perform the thorough dynamic check using actual FCS hardware or simulator, including abnormal situation testing.
  - ➢ If the same control application is used for the other loops, perform the static (paper) check for replicated objects.

2. Integrated test

Perform the following dynamic checks.

- ➢ With using the test function or dynamic process simulation models (if available), verify PCS control functions, OWS (CI Portal view) and alarm solutions, and Safety functions for a selected process unit including abnormal situation testing.
- ➢ Controller tuning may be performed where appropriate.
- ➢ With following the plant operation procedure (if available), verify that plant start-up and shutdown or other sequential operations are executed as per the master design document, and check effects caused by abnormal situation, e.g. equipment or device failures and recovery from them.
- ➢ Verify integration with 3rd-party systems (including response time)
- ➢ Verify other hardware and/or system if applicable.
- ➢ Verify that spare capacity for application resources for each FCS meets project specification.
- ➢ Verify FCS performance and network loading.

Testing method is summarized as below:

Type	Objects suitable for this testing	General procedure
Static (Paper) check	Objects of which their correctness can be verified through static comparison of objects with master documents. • Detailed specification data for function blocks	Check definitions or gaps between test objects and the master document by self-documentation or any other electronic files.
Dynamic check	Objects that require dynamic verifications by simulating process inputs, changing operation modes, changing values of function blocks, and confirming expected outputs and/or results.	Run the application and check functionality based on the master document.

Table 38 – Type of Testing Method Table

For static & dynamic checks follow project FAT test procedures.

Dynamic check is further classified as below:

Test case	Point of view	Objects suitable for this testing
Normal path testing	Verify that test objects behave as described in the design document.	All objects such as • Complex loop • Calculation • Sequence control • Logic
Abnormal situation testing	List abnormal situations as many as possible and verify that test objects behave as described in the test procedure per listed abnormal situation cases.	• All objects listed above • Internal and external interfaces.
Operation and interface testing (Integrated test)	• With executing several functional components at the same time, verify that test objects behave as described in the test procedure. • Perform irregular operations such as trying illegal operations, repeatedly pushing keyboards, repeating opening/closing many views, and so on, and confirm the system still functions as expected.	Testing is focused on • Executing several modules, complex loop, logic, and sequence control at the same time. • Operator interaction from HMI. • Internal communications from HMI, OPC, and other FCS/SCS. • Interfaces with external components.

Table 39 – Test Cases in Dynamic Check

7.5.2 Criteria for Design

The following criteria of testing will apply.

Static (Paper) Check

Test criteria for static (paper) check are summarized in the table below:

Test object	Criteria
Simple property data defined in I/O database • Tag name, • Comment or description, • Instrument range, • Engineering unit, • Input/output processing spec, • Alarm level, security level, • Control parameters, • etc.	Verify that configured data are identical with those in the master I/O database.
Replicated loop / module / sequence / logic	Verify the replicated configurations are identical with those in the original configurations. Exceptions apply to tag names, descriptions, ranges, etc. Extract such gaps between replicated object and original one, and verify gaps are acceptable.

Table 40 – Test Cases in Dynamic Check

Dynamic Check

Dynamic tests are the functional tests performed to meet the functional requirements specified in the control narratives supplied by the EPC, FAT Procedure document shall BE used for testing the complex/sequence logics generated based on design inputs supplied by EPC (Control narratives, IO List and C&E).

7.5.3 Test Plan

Note- Refer Doc No 1724000594-QC-ITP-00002 (Inspection and Test Plan Structure) for detailed plan.

8 VNET/IP CONTROL NETWORK

The network directly related to Process Control is Vnet/IP.

8.1 VNET/IP COMMUNICATION SPECIFICATIONS

The Vnet/IP control network protocol for process automation, developed by Yokogawa has been unanimously accepted by the International Electro Technical Commission (IEC) as a part of international standard IEC 61784-2 Ed.1.0.

The Vnet/IP plant control network protocol is based on 1 Gbps high-speed Ethernet and features both the openness of Ethernet and the reliability/real-time capability required in plant control, concurrent with Yokogawa's development of the Vnet/IP control network protocol.

Vnet/IP was accepted by the IEC for publication as Publicly Available Specification (PAS) No. IEC/PCS 62405/Ed.1 in April 2005. This was an important step in the direction of being accepted as an international standard. PAS is a mechanism for popularizing new technologies in fields where technological advances occur quite rapidly, allowing for the public disclosure of specifications before the IEC officially certifies the technologies as international standards.

General specifications:

- Topology: Star topology
- Transmission speed: 1 Gbps for Yokogawa Hardware, 100 Mbps for general Ethernet equipment.
- Access control: Full duplex
- Scale: 64 stations per domain
- Bus configuration: Redundant
- Control communication: Functionally compatible with Vnet
- Open communication: TCP/IP
- Network equipment: Commercially available & with proven high reliability switching hubs and routers.
- Cables: CAT6 or higher UTP cables or single-mode fiber optic cables

8.2 VNET/IP ADDRESS

The following Vnet/IP address assignment philosophy has taken into consideration for future expansion and to ensure numbering and design consistency.

8.2.1 IP Address for Control Communications

An IP address for control communications can be automatically set, ranging from 1 to 129 from domain and station numbers. Domain and station numbers are set with a DIP switch for each device. Domain numbers should not overlap in Vnet/IP system. In addition, the time server host address is fixed at 254. Class C private address is used for V-Net/IP communication.

8.2.2 IP Address for Open Communications

IP addresses for open communications in a Vnet/IP station, as well as for general-purpose, open- based communications devices and network devices, are not automatically set. Network addresses should be set

in conformity with an address system for control communications. Addresses 1 to 128 and 254 are set aside for control communications, select from 130 to 253 as the host address for open communications.

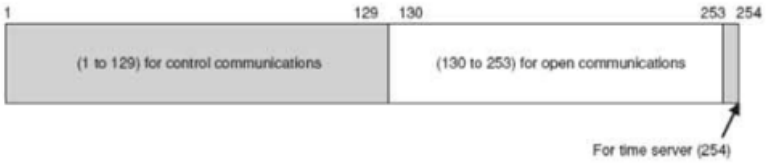

Figure 8 – IP Address Segregation

The following Vnet/IP address assignment philosophy has taken into consideration for future expansion and to ensure numbering and design consistency:

- Vnet/IP Bus1 is used for control purposes (herein called control communication) and Bus2 can connect the general-purpose Ethernet equipment (herein called open communication).
- When IP address is set on Bus1, IP address on Bus2 for control purpose is automatically set.

8.3 STATION NAMING

For stations with Vnet/IP connection, their naming convention will be as following:

Station Type	Station Name	Vnet IP BUS 1 Address	Vnet IP BUS 2 Address	Example
Station Name for EWS (PCS, SIS+FGS)	EWS ddss	Refer table 42	Refer table 42	EWS0164
Station Name for FCS	FCS ddss	*	*	FCS0101
Station Name for Others (PCS, SIS+FGS, EMCS)	STN ddss	Refer table 42	Refer table 42	EWS0163

Table 41 – Vnet/IP Station Naming

Where:

dd: is the Vnet/IP domain (01 to 16)

ss: is the Vnet/IP station number (01 to 64)

"*": Refer to 1724000594-IN-RE-00043 -Cyber Security Settings document.

8.4 IP ADDRESS ASSIGNMENT

Refer to 1724000594-IN-RE-00043 -Cyber Security Settings document.

9 TAG NAMING PHILOSOPHY

ICSS Tag Naming Philosophy Tag name in ICSS refers to the user defined character string that used to call up various control elements such as function block, I/O data, Internal Switch, etc. Each tag name will have an instrument faceplate associated to it when it is called up from the HIS. The ICSS tag name for operation shall be limited to a maximum length of 12 characters for proper display of tag name on the instrument faceplate. However, a maximum length of 16 characters will be used for internal tags. The tag name (including window name) in the whole project database shall be unique. The tag numbering convention shall consider this constraint so that it will not cause any possible duplication of tag name or window name.

9.1 PCS IO TAG

The PCS (CENTUM VP) tag here refers to tags created in PCS stations such as FCS.

1	2	3	4	5	6	7	8	9	10
P	P	M	M	M	-	N	N	N	X

- PP = Process Unit Code:
- MMM = Measured Variable Code
- NNN = Sequence number (Process : 001-499, Package: 501-999)
- X = Identical Equipment No, (A,B,C)

Examples –

IO Type	P&ID Tag Name	IOM Tag	Equipment
Analog Input	25FT-031	%%I25FT-031	Flow Transmitter
Analog Output	25FY-036	%%O25FY-036	Positioner
Digital Input	25ZSH-033	25ZSH-033	Limit Switch
Digital Input	B100TIR-001	B100TIR-001	SWGR HV/MV
Digital Output	25XY-021	25XY-021	Solenoid Valve

Table 42 – Naming Philosophy for PCS IO Tag.

9.1.1 Operator Faceplate Tag

Operator faceplate Tags are defined in P&ID, Instrument Index which are generally too long to fit into PCS system. Reduction (by removing '-'and less important characters from the tag) or conversion of the tag names is required to keep the tag name within the PCS system faceplate constraint of 12 characters. This maintains a consistent and concise tag name philosophy.

PCS Operator Faceplate Tag Name Format that is applied for the project is:

Note: For Digital alarm tag, refer to section 10.2.2

Where:

- PP = Process Unit Code:

- MM = Measured Variable Code
- NNN = Sequence number (As per design input)
- X = Identical Equipment

Examples:

P&ID Tag Name	Function Block	Operator Faceplate Tag
25PT-031B	PVI	25PI-031B
25FIC-032	PID	25FIC-032
25FY-036	MLD	25FY036-ML

Table 43 – Naming Philosophy for Operator Faceplate Tag.

9.1.2 PCS Internal Tag

When function blocks described on P&ID, Instrument Index cannot be directly one to one mapped to PCS function blocks, additional tags in PCS may be required to realize the control function. These tags are directly related to the loop configuration. For example, a split range function block is not shown on P&ID but PCS will configure a SPLIT function block for loop configuration. Normally tags under this category do not need operation access. Therefore, a maximum length of 16 characters will be used

PCS Tag Name Format:

MAIN LOOP TAG	–	S	S	N	N

Where:

- SS = Suffix for Internal Tag identification of function block type
- NN = Sequential Number (Always start from 01).

Examples:

P&ID Tag Name	Suffix	Function Block	PCS Internal Tag
25FIC-032	ST-16	ST16	25FIC032-ST
25FIC-032	RL	RL	25FIC032-RL
25PT-040	AN	%AN	25PI040AN
25ZSL-043	GS	%GS	25ZSL043-GS

25ZSH-043	SW	%SW	25ZSH043-SW
25ZSH-011	IL	%SW	25ZSH011-IL
50TI-002	LC	LC64	50TI002-LC
43FIC-001	CL	CALCU	43FIC001-CL
50TI-001	ADD	50TI001-AD	50TI001-AD
25PIC-040	AS	AS-H/M/L	25PIC040-AS

Table 44 – Naming Philosophy for PCS Internal Tag.

These tags are used to realize the control functions not directly described on the P&ID or in the control narrative. They may also be used for common control functions shared by multiple loops, process units or for PCS internal administrative functions.

PCS Tag Name Format

1	2	3	4	5	6	7	8	9	10	11	12	13
S	D	D	D	D	C	C	C	-	S	S	N	N

Where:

- SDDDD = S + FCS domain and station number
- CCC = Control Drawing No number
- SSNN = For Internal Tag identification of function block type.

Examples:

Controller number	Function Block	PCS Internal Tag
FCS0101	ST16	S0101ST001
FCS0101	RL	S0101RL001
FCS0101	LC	S0101LC001
FCS0101	%GS	S0101GS001
FCS0101	%SW	S0101SW001

Table 45 – Naming Philosophy for PCS Internal Tag for FCS.

9.2 THIRD PARTY COMMUNICATION TAG NAMING

ALE111 Modbus communication cards shall be used for Modbus TCP communication with PCS. CI Server shall be communicating with EMCS Server using OPC UA communication protocol. In few cases vendors provided tag names in mapping lists then same shall be used. In some of the communication packages Tag names shall be configured to meet CentumVP/CI Server HMI/Logic implementation. The following Naming philosophy shall be followed to create unique tag names.

Area	Service1	Separator	Sequence Number 1	Sequence Number 2	E.g. Tag Name	Description (24 Char)
AA	CCCC	-	MM	NN		
Area	Service	Separator		Sequence Number		
20	F3	-	0		20US-5301	Normal Mode
20	F4	-	0		20US-5302	Bypass mode

10 PROJECT COMMON SETTINGS

10.1 SWITCH LABEL

The switch position labels refer to character strings displayed as labels for switches on the Motor Control instruments, the Switch instruments, the digital I/O, the Annunciator, the internal switches, the SFC blocks, the selector switch instruments, and the logic operation blocks.

128 switch position labels can be used for one project. One set consists of three labels (Label 1, Label 2 and Label 3). The label 4-character string is not displayed on the instruments with up to three switches, and also define a unique character string for each set. The switch position label can be defined with up to eight (8) alphanumeric characters.

The following table shows CENTUM VP label sets. Labels 1 and 2 cannot be changed or deleted, No.3~13 are system default. These switch labels are common across PCS and SIS so changes in switch labels are not recommended post design freeze.

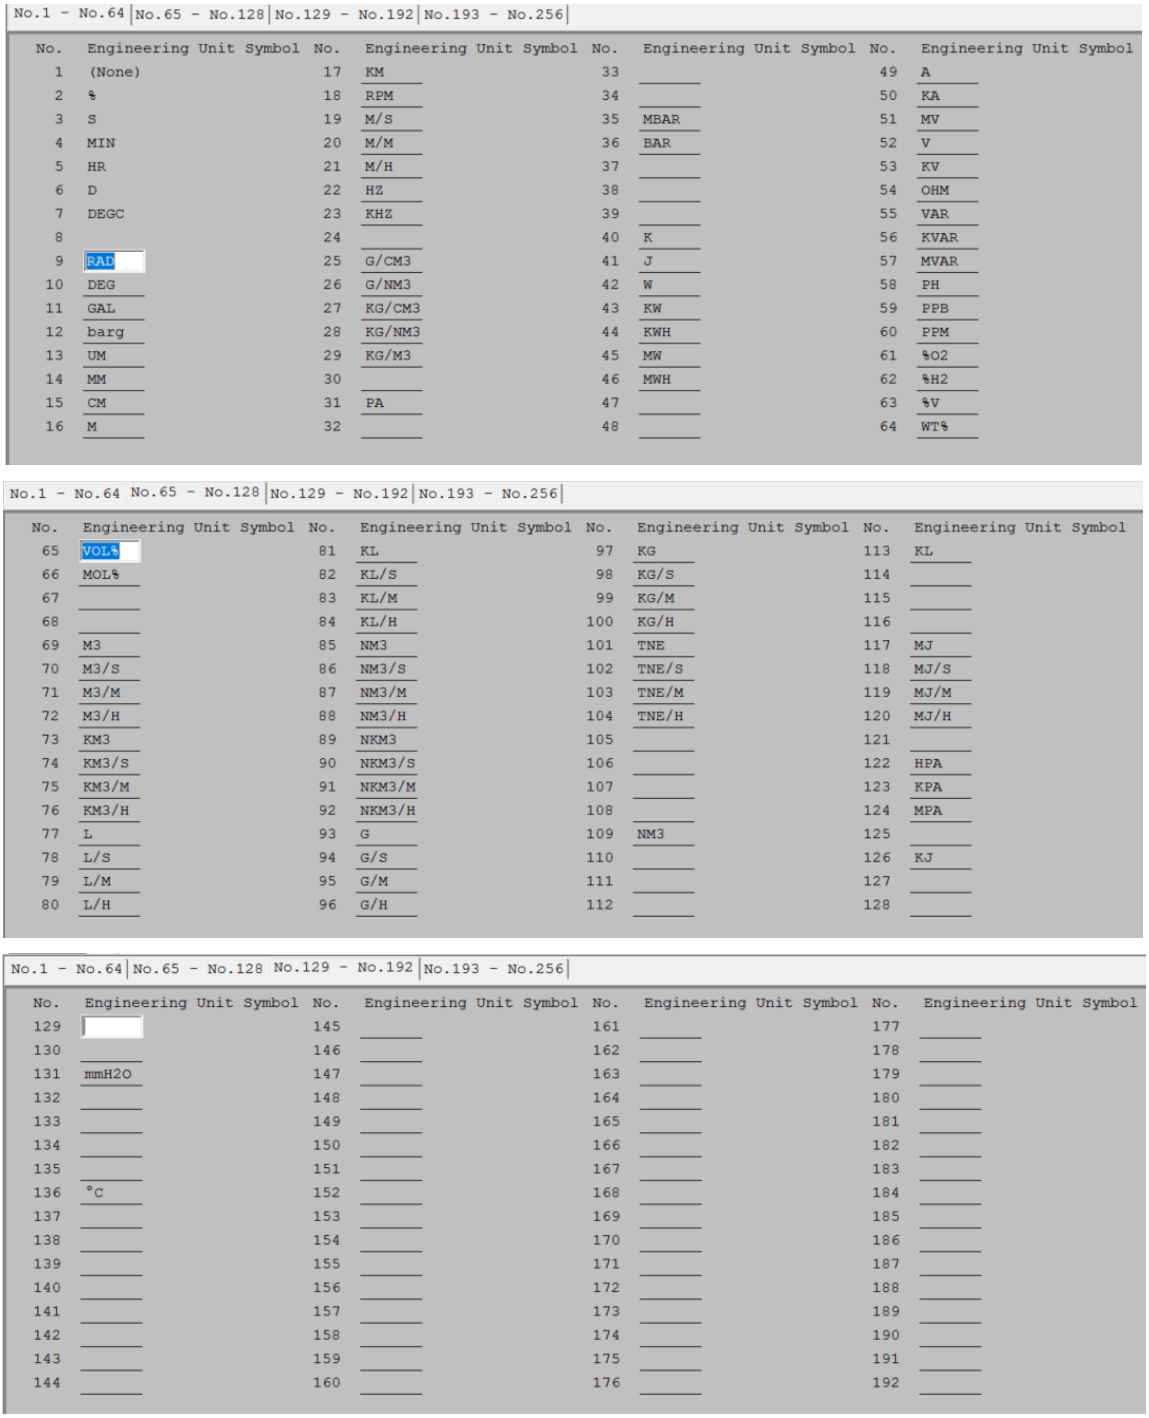
Figure 11 – Switch Label Sample in ON condition.

Figure 12 – Switch Label Sample in OFF condition.

10.2 OPERATION MARK

Note: In this project Operation mark is not envisaged.



The label of the operation mark can be set using the Operation Mark Builder. Up to 8 characters can be entered as the text on the label (string). The non-defined operation mark label may be temporarily changed during the operation on the HIS Setup window. The following table defines the operation marks to be used. No. 33 thru 64 is reserved for operation mark install/remove by application software. No. 1 thru 32 is reserved for install/remove by user. The table below shows operation mark definitions. Individual projects can revise the definition to suit the project requirements.

No.	Tag Label	Color	Tag Level	Install/Remove

10.3 ENGINEERING UNIT

The Engineering Unit is a unit symbol attached to a process data value used within the project. Up to 256 engineering unit symbols can be used for one project. Among the 256 symbols, the first 8 are system fixed. The rest can be user defined. One engineering unit symbol can be defined with up to six alphanumeric characters. The table below shows engineering unit definitions. Individual projects can revise the definition to suit the project requirements.

10.4 PROJECT COMMON PROPERTIES - SETTINGS FOR GRAPHICS

Note: In this project, CI Portal View shall have graphics. PCS has capability of Graphics but shall not be used.

It is recommended for the engineer to follow these settings as shown below on the Project common properties during Brown filed project execution for better graphics display functions.

Graphics tab in the new project creation dialog box consists below three options for the graphic actions.

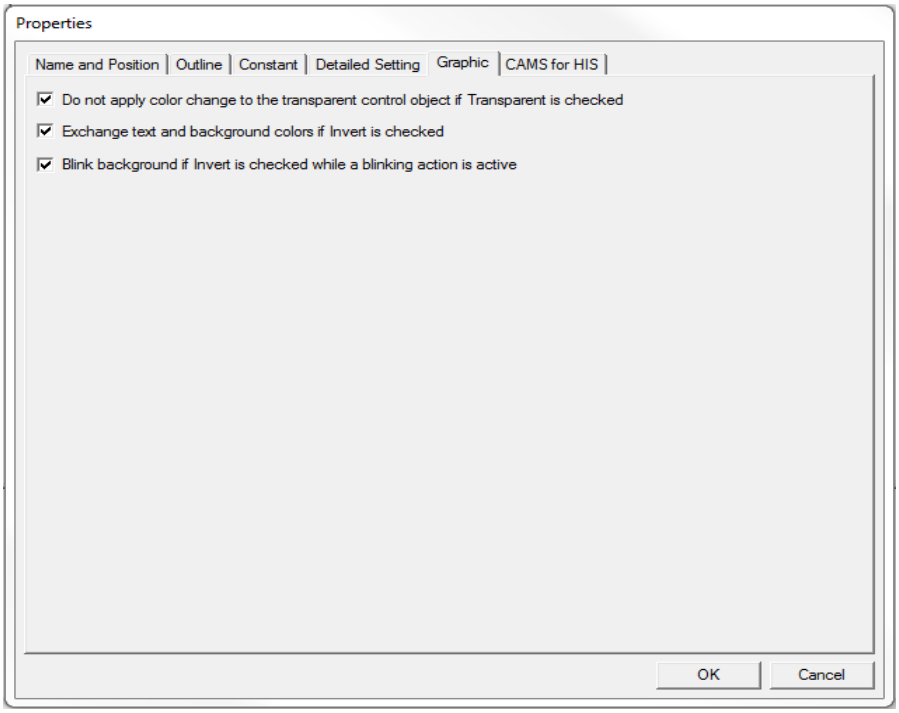

Figure 15 – Project Common Properties - Settings for Graphics

- Do not apply colour change to the transparent object if Transparent is checked.

By checking the above check box, the control with "Transparent" option specified remains transparent even if the modifier condition is met.

- Exchange text and background colours if Invert is checked.

By checking the above check box, the text and the background colours of the following are switched if the modifier condition is met.

- Text control with "Transparent" specified for its background and "Invert" specified as a modifier action.
- Data character control with "Transparent" specified for its background and "Invert" specified as a modifier action.
- Blink background if Invert is checked while a blinking action is active.

By checking the above check box, the background of the following controls blinks if the modifier condition is met.

- Text control with "Blinking" and "Invert" specified together as modifier actions.

- Data character control with “Blinking” and “Invert” specified together as modifier actions.

11 SUBSYSTEM COMMUNICATION- MODBUS TCP/IP

The Ethernet communication module communicates with subsystems at the specified intervals and stores the subsystem data in the communication modules' I/O image. FCS accesses the communication module asynchronously from them and refers to or sets the I/O image. This enables FCS to use the subsystem data through the I/O terminals of the function block in the same way as the general analog and digital I/O signals.

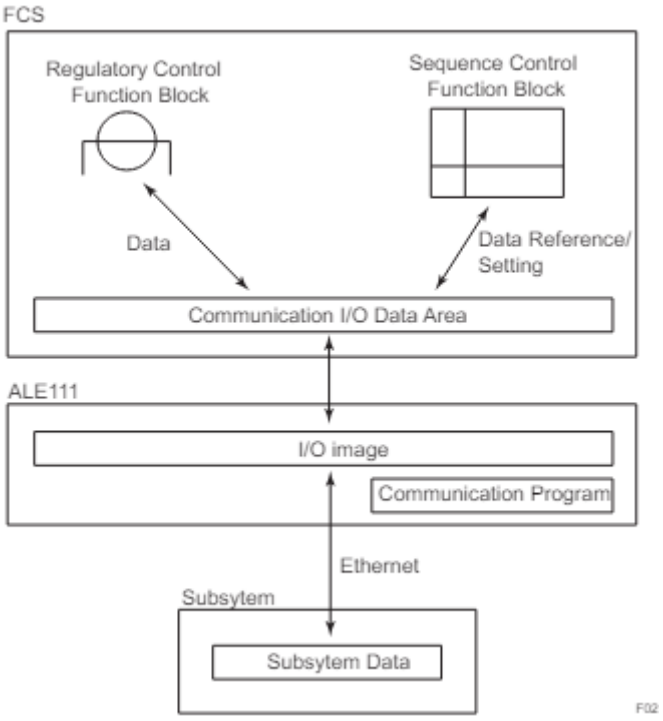

Figure 16 – Flow of data in a Subsystem.

11.1 MODBUS COMMUNICATION CARDS

FCS can communicate with a subsystem by using Ethernet TCP/IP protocol via ALE111 communication module that can be installed on Field Control Unit, ESB Bus Node Unit and Optical ESB Bus Node Unit.

11.2 OVERVIEW

For the CENTUM VP, subsystem communication package for Modbus TCP protocol is offered to allow the basic control function of the FCS to access the subsystem's data via an Ethernet communication module, in the same way as handling signals through other process input/output modules.

11.3 PCS COMMUNICATION CAPACITIES

The capacity specific to Modbus TCP interface when performing subsystem communication with Modbus TCP PLC is indicated below:

Sr. No	Item	Max Amount (For AFV30x / AFV40x / A2FV50X / A2FV70X)	Remark
1	No of Communication modules	Max 32 [16 pairs] per FCS	
2	No. of Communication I/O data	Max 8000 words / FCS	1 word = 16 bits
3	Amount of data those can be communicated with one module	Max 1000 words / Module	ALE111
4	No. of Communication ports / Module	1 port	
5	No of Subsystem for communication	Max 30 Subsystems	Total number of TCP and UDP connections
6	No. of Words per transmission	Max 125 Words (AI/O) Max 8 Words (DI/O)	
7	No of Communication definitions	Max 128 definitions / Module	

Table 49 – PCS Communication Capacity for Modbus TCP/IP

11.4 COMMUNICATION PERFORMANCE

The Communication performance for Modbus TCP protocol is dependent on the following factors:

- Number of words per transmission frame
- Number of communication definitions

Yokogawa recommends that the subsystem Communication data be with contiguous addresses & packed in units of words, to improve the efficiency of communication data acquired and set by the FCS.

Note: When more than 2 Subsystem PLC is communicating with 1 ALE Card, the network cable from each PLC COM port should directly connect to the Modbus L2 switch (PCS side) without any intermediate routers or gateways. To verify this, subsystem vendor to provide the system architecture along with subsystem design inputs.

11.5 COMMUNICATION INTERFACE

ALE111 is an Ethernet communication module that can be installed on Field Control Unit, ESB Bus Node Unit and Optical ESB Bus Node Unit.

11.6 COMMUNICATION SPECIFICATION OF ALE111

The communication specification specific to Modbus/TCP PLCs is listed in the table below:

Item	Description
Data Encoding Setting	Binary
Error Control	NA
Stations that can be communicated with	Modbus/TCP PLC Stations

Table 50 – Modbus TCP/IP Communication Specification

11.7 REDUNDANCY OF COMMUNICATION

11.7.1 Functional Overview

The Ethernet communication module, ALE111, can be made dual-redundant by setting two modules in the adjacent (odd- and even-numbered) slots of the same node unit.

Note: For this project, refer to Section 11.9 for the Interface Package List.

Note: In this Project Redundant and Non-Redundant communication is considered

11.7.2 Data Input Flow

Each of the two ALE111 modules communicates with the subsystem and reads the subsystem input data into the module. An FCS accesses the control communication module to read and use these data; however, it does not access the standby communication module. When the FCS detects a control communication module error or subsystem communication failure, the FCS switches its control to the standby module from which to read data.

11.7.3 Data Output Flow

A control communication module outputs data to a subsystem. The control communication module writes data to the subsystem at the specified intervals when an FCS sets the data in it. Meanwhile, the standby communication module re-reads and retains the output image data when it accesses the subsystem at the specified interval. This equalizes the data between the control and standby communication modules.

When an error is detected, the FCS switches its control to the stand-by module through which the FCS continues to output data to the subsystem.

11.8 CONFIGURATION SETTINGS

For this configuration, the following settings are required:

1. Set IP addresses for the ALE111 modules (Both) in the same network domain.
2. Check “Automatically Set Communication Details” in ALE111 properties.
3. Set IP addresses of the subsystems in the same network domain.

The following example shows the definition of redundant ALE modules in CENTUM VP system.

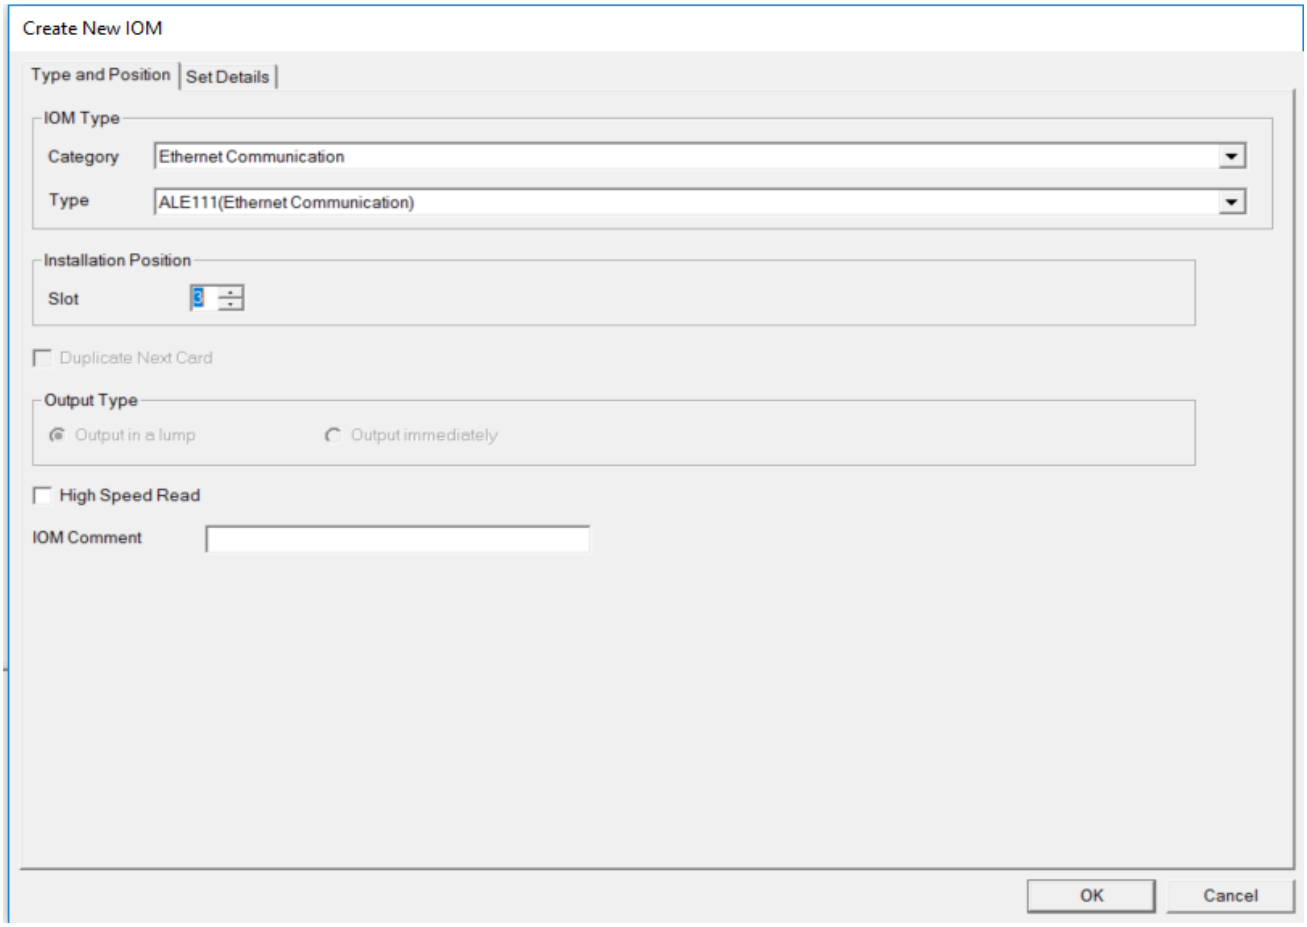

Figure 17 – Non-redundant Communication Module ALE 111 Configuration

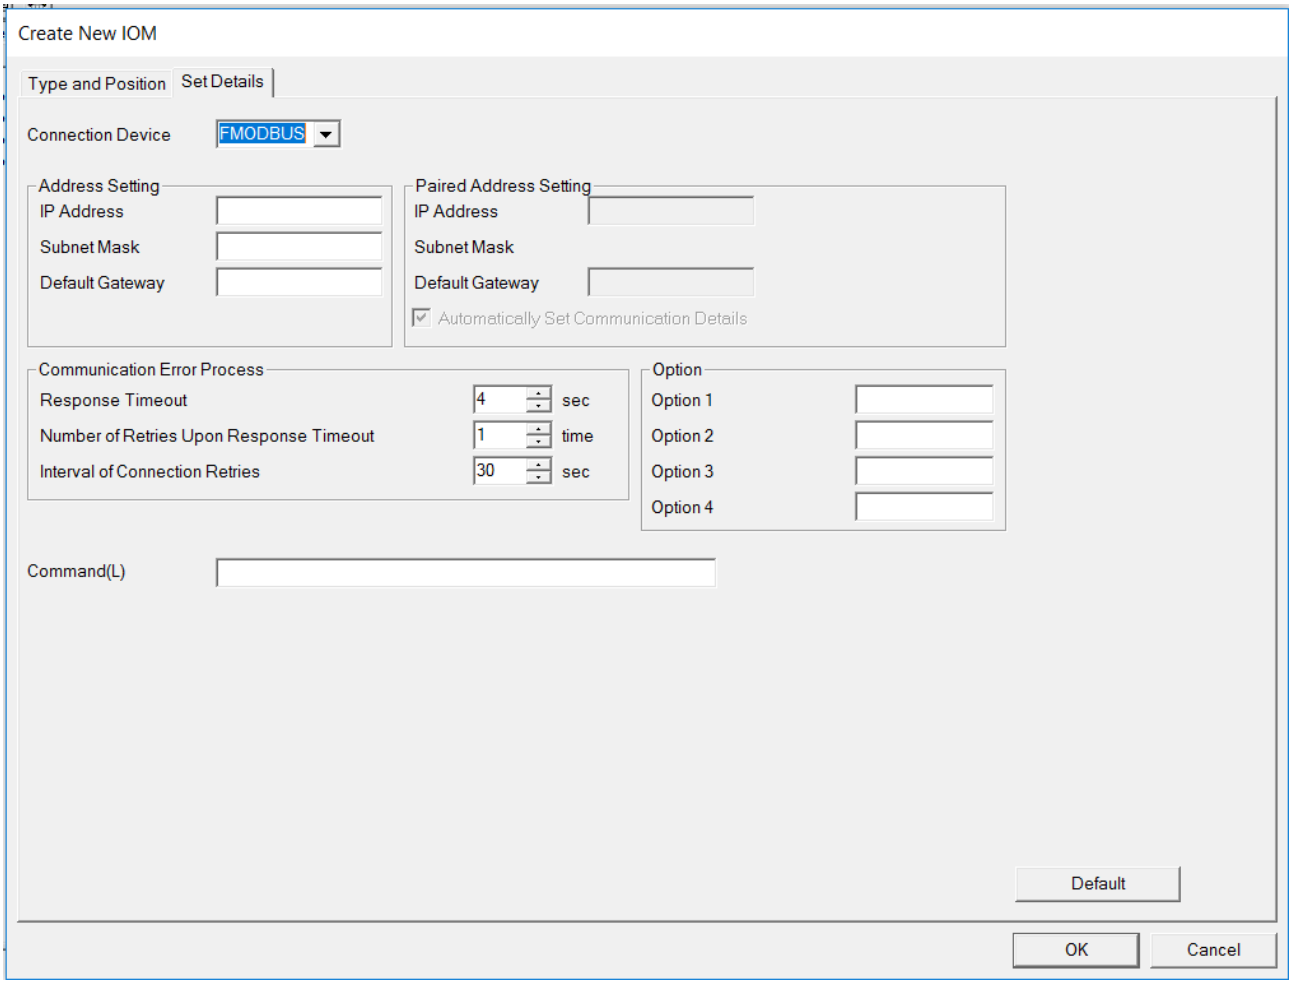

Figure 18 – Non-redundant Communication Module ALE 111 IP Setting

11.9 INTERFACE PACKAGE LIST

Modbus module shall be connected to Network switch which in turn connected will all Package PLCs

S. NO	Package Name	FCS	NODE	SLOT	PORT	Redundancy	Protocol
1	Water Treatment UCP	FCS0101	4	3	1	Non-Redundant	ALE111
2	LV Switchgear	FCS0101	3	7		Non-Redundant	ALE111
3	HVAC	FCS0101	4	3		Non-Redundant	ALE111
4	UPS	FCS0101	4	1		Redundant	ALE111
5	EMCS	FCS0101	4	1		Redundant	ALE111

Table 51 – Interface Package List- ALE111

12 SUBSYSTEM COMMUNICATION- PROFINET

This document describes Model A2LP131 PROFINET Communication Module which performs as the PROFINET IO-Controller to communicate and exchange data with PROFINET IO-Devices.

A2LP131 can be mounted on the following field control units (FCU). It can also be mounted on the ESB bus node unit (ANB10D) and the optical ESB bus node unit (ANB11D) which are connected to the FCU.

List of Applicable FCS: AFV30S, AFV30D, AFV40S, AFV40D, A2FV50S, A2FV50D, A2FV70S, A2FV70D

Note: For this project, refer to Section 12.5 for the Interface Package List.

12.1 HARDWARE SPECIFICATION

Hardware specifications for A2LP131 PROFINET communication module are as shown below.

Item	A2LP131 Specifications
Physical layer interface	IEEE 802.3 100BASE-TX
Connector	RJ-45
Transmission Speed	100 Mbps
Transmission route	2x2 twisted-pair shielded cable (symmetrical)
Transmission distance	1 segment, 100 m
No. of physical ports	One Port
Maximum current consumption	0.8 A
Weight	Approx. 0.31 kg

Table 52 – Communication Module Hardware Specifications

12.2 PROFINET COMMUNICATION SPECIFICATIONS

12.2.1 Communication with Profinet IO-Devices

A2LP131 exchanges data with PROFINET IO-Devices and receives the alarms from PROFINET IO-Devices. The PROFINET I/O-Devices data is stored in the communication modules' I/O Image area. FCU accesses this module, refers to the data stored in the I/O Image of the module, and stores the data in the communication I/O data area. Also, FCU accesses this module and sets the data set in the communication I/O data area by the functional block to this module's I/O Image area.

This enables FCU to use the PROFINET IO-Devices data through the I/O terminals of the function block in the same way as the general analog and digital I/O signals.

The following PROFINET data types can be assigned directly to the CENTUM VP functional block when using A2LP131. Boolean, Integer16, Integer32, Unsigned16, Unsigned32, Float32 In addition, A2LP131 receives the alarm from PROFINET IO-Devices and sends notifications to FCU.

Note: GSD (General Station Description) files shall be supplied by EPC.

12.2.2 Communication Path Dual Redundancy

In CENTUM VP, PROFINET network communication path dual redundancy is facilitated by connecting managed switches that have the Media Redundancy Manager (MRM) function, which is compliant with Media Redundancy Protocol (MRP), and the PROFINET IO-Devices that are the media redundancy clients (MRC) in a ring topology.

Media redundancy is a redundancy specification of PROFINET. For details, refer to the PROFIBUS Organization website. In CENTUM VP, dual redundancy of the communication path is achieved by making the PROFINET network a ring configuration. Consequently, even if communication with one communication path becomes impossible, communication can be continued by using the other communication path.

A2LP131 is placed outside of the media redundancy ring topology.

Note: In this project Dual Path Redundancy is not considered.

12.3 INSTALLATION ENVIRONMENT

No. of ALR111, ALR121, ALE111, ALP111, ALP121, A2LP131, and A2LP141 modules	Max. 32 units/FCS (Max. 16 pairs for dual-redundant operation) (*1)
No. of ALF111 modules	Max. 64 units/FCS (Max. 32 pairs for dual-redundant operation)
No. of all the communication modules	Max. 64 modules/FCS (*1) (*2)
No. of ports	1 port/A2LP131
No. of connectable PROFINET IO-Devices	Max. 128 devices/A2LP131
I/O data capacity for communication	1000 words/A2LP131
No. of communication definitions	200 definitions/A2LP131
No. of communication functions	Max. 8 types/FCS (*1) (*3)
Communication I/O data capacity	Max. 8000 words/FCS (incl. data from other communication functions)

*1: ALP111 and ALP121 cannot be mounted on the same FCS together.
*2: This is the sum of ALR111, ALR121, ALE111, ALF111, ALP111, ALP121, A2LP131, A2LP141, AGS813, and AGP813 modules.
*3: This is the sum of communication functions of ALR111, ALR121, ALE111, ALP111, ALP121, A2LP131, and A2LP141.

Table 53 – Communication Module Installation Environment.

12.4 CONFIGURATION SETTINGS

The following example shows the definition of redundant A2LP131 module in CENTUM VP system.

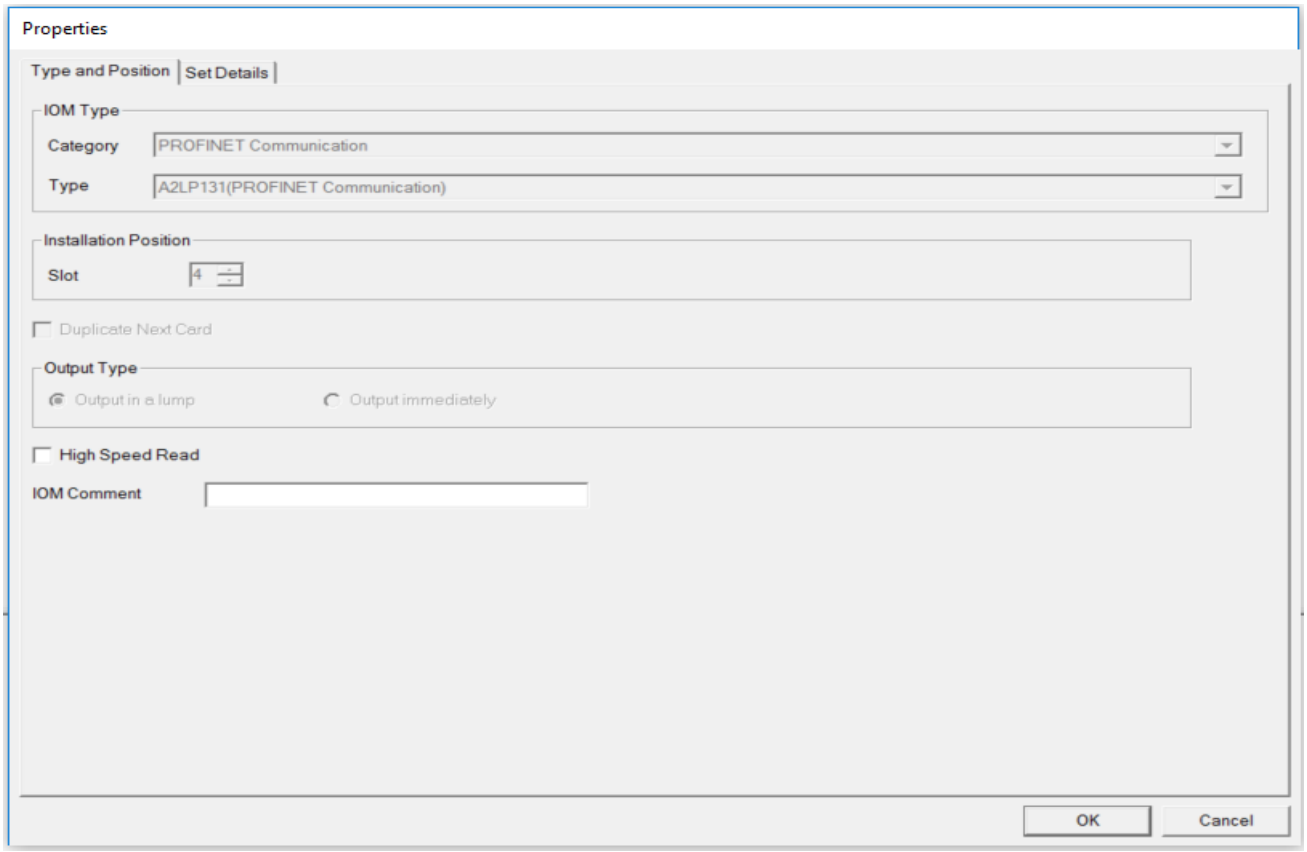

Figure 19 – Communication Module A2LP131 Configuration

12.5 INTERFACE PACKAGE LIST

PROFINET module shall be connected with Network switch and network shall be connected with PROFINET devices.

S. NO	Package Name	FCS	NODE	SLOT	PORT	Redundancy	Protocol
1	Instrument Air UCP	FCS0101	4	4	1	Non-Redundant	A2LP131
2	Nitrogen UCP	FCS0101	4	4		Non-Redundant	A2LP131

Table 54 – Interface Package List- Profinet

13 FUNCTIONAL OVERVIEW OF IAMS (PRM)

13.1 SYSTEM OVERVIEW OF IAMS

Plant Resource Manager (PRM) is Instrument Asset Management System (IAMS) in Yokogawa PCS.

Here after "IAMS" shall be referred as PRM in this Document.

PRM is a key component of YOKOGAWA Asset Excellence initiative, is a centralized asset management system that helps to reduce plant down-time and maintenance costs throughout the plant life cycle.

Being installed as part of Yokogawa ICSS (e.g. CENTUM VP, ProSafe-RS), PRM provides users with the capability to effectively configure and manage intelligent field devices such as Foundation Fieldbus H1 devices, HART devices, PROFIBUS DP and PA devices, ISA100 wireless devices and other FDT compliant devices (herein after referred to as field devices). It also provides users with various diagnostic information from field devices to help identify faults of plant assets in a proactive manner and to maximize production out of assets in the plant life cycle.

13.1.1 System Configuration

PRM consists of following software components, which have the potential to be installed on the same or separate machines. The details of the actual installation and architecture are depicted in System Architecture Drawing Doc.No.1724000594-IN-DD-00015.

Standard (required for all installations)

- PRM Client

PRM Client is a graphical user interface application used to view device information, monitor device status, and perform various operations related to device management throughout the plant life cycle. The PRM Client can be installed alone in one dedicated machine or can be installed along with the other components in the PRM system described in this section or can be installed in the HISs in CENTUM VP system. In this project PRM Server shall have PRM Client.

- PRM Server

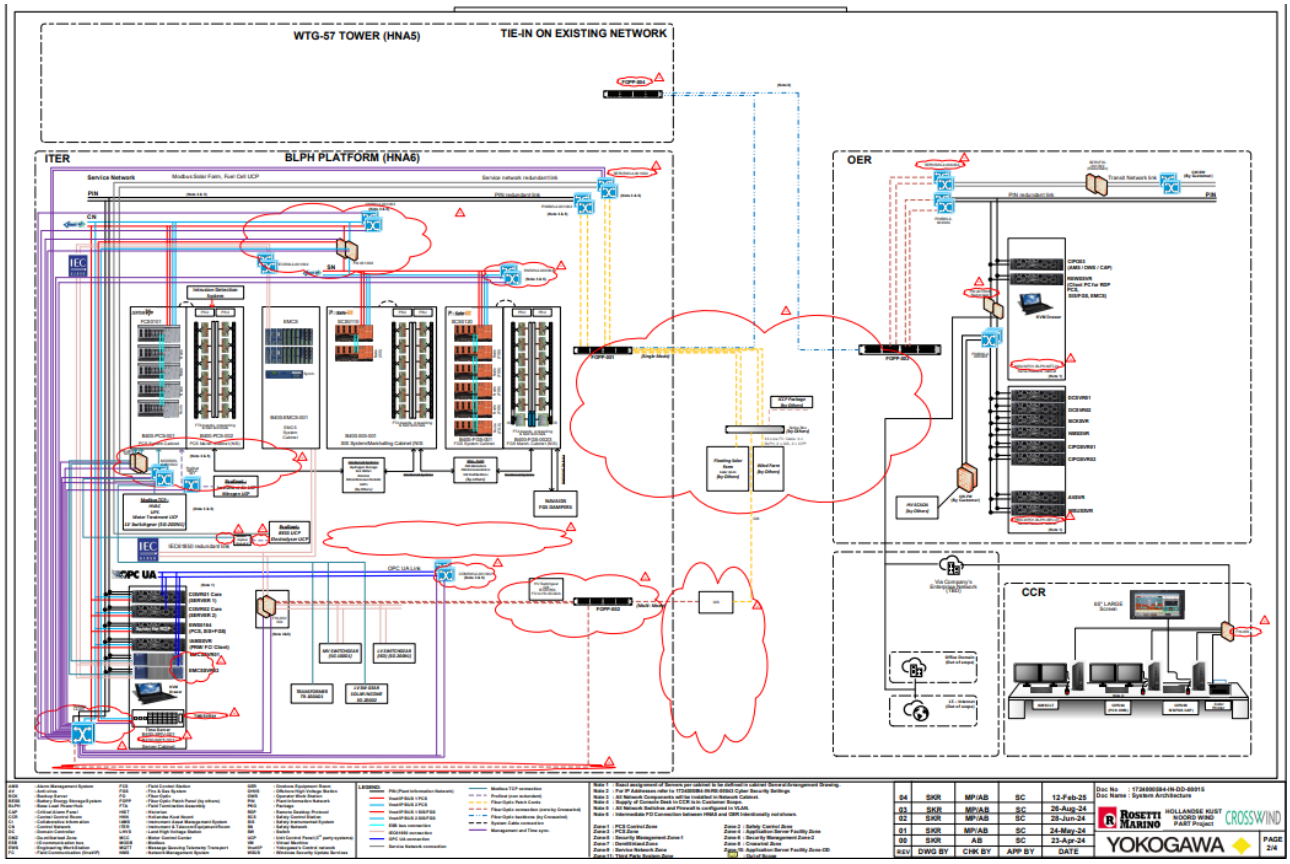
PRM Server serves as a centralized repository which stores information collected from the field devices such as parameters, alarms and events, and diagnostic information. It also provides various tools and configuration templates to allow users to effectively manage the devices.

- PRM Field Communication Server

PRM Field Communication Server serves as a gateway to access fieldbus devices connected to Yokogawa ICSS through Control System Network. It also supports a serial link interface to HART devices through a HART multiplexer and linking/communication devices to interface with field devices such as PROFIBUS devices ISA100 wireless devices, etc. through Ethernet network. The PRM Field Communication Server dedicatedly serves one corresponding PRM Server which has the potential to be installed in the same machine or a separate machine depending on the sizing of whole PRM system.

13.1.2 Network Architecture

The following network architecture diagram shows an example of the PRM related components placed in the plant control network. Refer to System Architecture Drawing Doc. No.1724000594-IN-DD-00015 for the actual PRM software and hardware installation in this project.



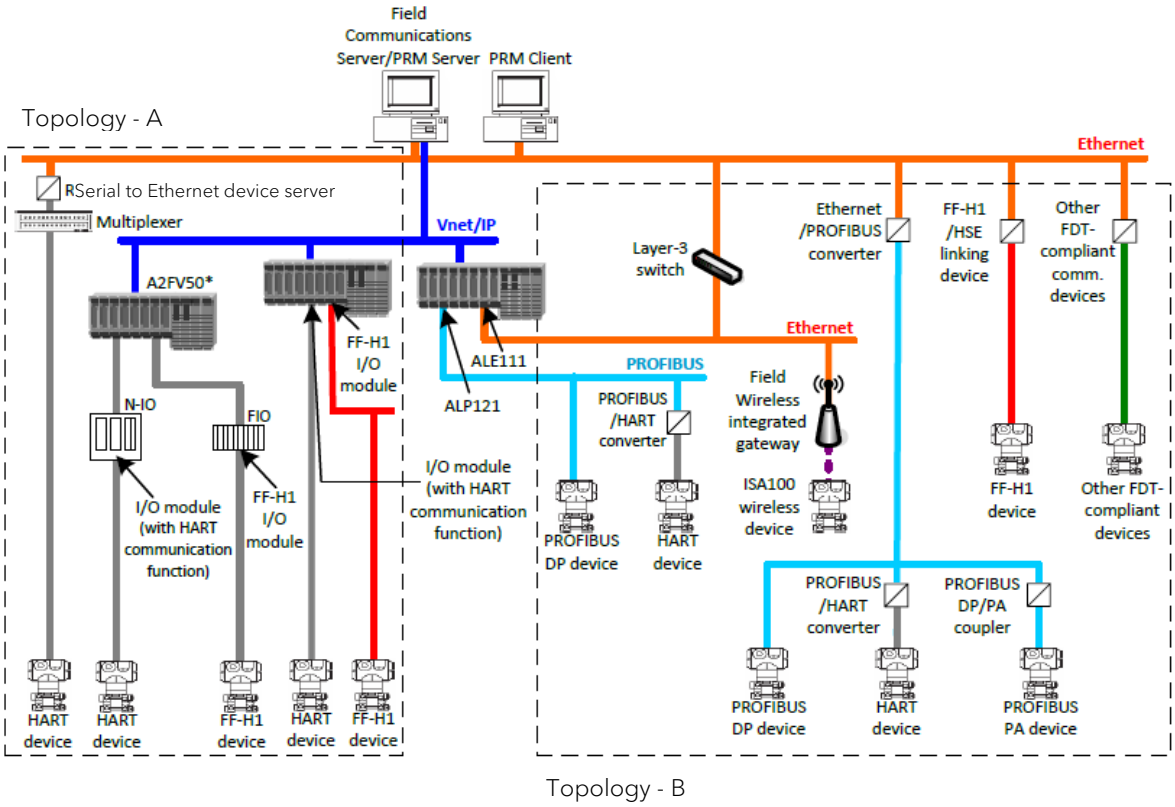


Figure 20 – Example of PRM Network Architecture

13.1.3 Field Device Network Topologies

Various types of field devices can be supported on the PRM:

- FF-H1 devices
- HART devices
- PROFIBUS PA and DP devices
- ISA100.11a devices
- Other FDT compliant devices

The topologies used for the device types above are shown in the following figure as an example:

Topology - A: PRM system collects information from devices through the control bus via host controllers or Multiplexer.

Topology - B: PRM system collects information from devices through Ethernet network.

Figure 21 – Example of Field Device Network Topologies

14 PRM STANDARD FUNCTIONS

The following table shows the main standard functions of PRM available in relation to types of supported devices. The section details the functions.

Categories	Functions	Topology - A *		Topology - B *			
		FF-H1(*5)	HART (*1)	FF-H1 on Linking Device (*5)	HART on PROFIBUS	PROFIBUS (*2)	ISA 100.11a
Basic Setup	Plug & Play	xx	xx	xx	xx	x (*3)	xx
	Device Template	xx	xx	xx	xx	xx	xx
Device Navigation	Plant View	xx	xx	xx	xx	xx	xx
	Network View	xx	xx	xx	xx	xx	xx
	Class View	xx	xx	xx	xx	xx	xx
	Signal View	xx	xx	xx	xx	xx	xx
	Custom View	xx	xx	xx	xx	xx	xx
Maintenance Alarm	Indication on Device Navigation Views	xx	xx	xx	xx	xx	xx
	Message Notification	xx	xx	xx	xx	xx	xx
Diagnosis and Adjustment	Device Viewer	xx	xx	xx	xx	NA	xx
	Parameter Manager	xx	xx	xx	xx	NA	NA
	DTM Works	xx	xx	xx	xx	xx	xx
	DD Menu	xx	NA	xx	NA	NA	NA
Maintenance Operation Assistance	Maintenance Mark	xx	xx	x	xx	xx	xx
Maintenance Information Management	Device Details	xx	xx	xx	xx	xx	xx
	Inspection Memo	xx	xx	xx	xx	xx	xx
	Inspection Schedule	xx	xx	xx	xx	xx	xx
	Parts List	xx	xx	xx	xx	xx	xx
Document Management Assistance	Document Links	xx	xx	xx	xx	xx	xx
Audit Trail Management	Parameter History	xx	xx	xx	xx	xx	xx
	Operation History	xx	xx	xx	xx	xx	xx
	Device Event Message	xx	xx	xx	xx	xx(*4)	NA
Security	PRM Groups and User Management	xx	xx	xx	xx	xx	xx
FieldMate Integration	Synchronization with FieldMate	xx	xx	xx	xx	xx	xx

Table 55 – PRM Standard Functions in relation with Types of Field Devices

xx: supported. x: partially supported. NA: not supported.

*: See section 13.1.3 for the topology of each device type.

*1: HART 5, 6, and 7 are supported on PRM.

*2: To gain full-fledged feature of each function below, it is recommended to follow the designated guideline.

Function	Guideline	Consequence of not following the Guideline
Plug & Play	The device must: • Support both DP V0 and DP V1 • Conform to PA Profile V3.02 or later	Loss of device static information (Device Details) on Plug & Play. This issue may be worked around by manually entering the same information.
Indication on Device Navigation Views	The device must: • Support both DP V0 and DP V1 • Conform to PA Profile V3.02 or later	The associated device icon always displays the "Uncertain" status shown in white.
DTM Works	The device must support both DP V0 and DP V1.	DTM Works not functional.
Device Event Message	A GSD file must be available for the device.	Loss of partial diagnostic information on Maintenance Alarm message.
	The device must: • Support both DP V0 and DP V1 • Conform to PA Profile V3.02 or later, and A GSD file of revision 3 or later must be available for the device.	Loss of partial or whole diagnostic information on Maintenance Alarm message.

Table 56 – Guideline for Profibus related functions on PRM

*3: For PROFIBUS DP (with Non-PA profile), device needs to be manually added to a FDT project before Plug & Play.

*4: PROFIBUS device event message is acquired via ALP111 or ALP121 PROFIBUS-DP Communication Module.

*5: FF Devices are not used in this project.

For general guidance on Profibus technology, visit the web site of PROFIBUS international.

14.1 BASIC SETUP FUNCTIONS

14.1.1 Plug & Play

Plug & Play is an initial setup for the PRM to recognize the devices through the PRM Field Communication Server and register them in its database. A device becomes available for the various PRM functions when it is complete with Plug & Play. In order to perform Plug & Play for the devices, communication must be established between the devices and the host system (e.g. CENTUM VP, ProSafe-RS) or associated gateway devices in advance. Also, the following setup must be completed for the PRM Field Communication Server before Plug & Play:

- Device path configuration for HART devices.
- FDT project configuration for FDT based devices.
- Installation of proper DD/CFF files and DTM files in the designated folder in the PRM.

14.1.2 Manual registration

If User need to prepare the devices before plant commissioning, then manually register the devices in PRM even if they are not connected to the field network. User also can manually register devices that cannot be registered by the other registration methods.

- The devices that you can register manually are as follows:
- Devices that use connection methods not supported by PRM.
- Conventional and static devices.

Devices that can represent and manage an asset on the site, area, process cell, or unit of the plant hierarchy

Offline devices to be connected later using device path configuration.

Manual Registration through PRM Client

Registers devices by adding it manually in the PRM Client.

Supported communication type: FF-H1, HART, ISA100, PROFIBUS, BRAIN, Modbus, Conventional device, Static device and Other.

Manual Registration through Bulk Device Import tool

- Registers multiple devices that belong to YOKOGAWA systems by importing a device registration file.

  Supported communication type: FF-H1, HART.
- Registers multiple devices that belong to Generic systems by importing a device registration file.

  Supported communication type: Conventional device.

14.1.3 Device Template

A PRM device template gives the user a static configuration template that can eliminate manual work for configuring some of the PRM features during the commissioning or maintenance activities. The template allows the user to reuse the following configuration for the field devices of the same make, model and revision:

- Device Details
- Link to the associated Plug-in applications.
- Link to the associated Parts list.
- Document link.

Once a template is configured, it will appear on the Class View as shown in Figure 25.

It should be noted that the PRM device template does not contain configurations of the device itself, i.e. device parameters.

As Number of devices are small so Device Template usage is not envisaged in this project.

14.1.4 Template for Device Parameter

Functionality:

1) Multiple device template can be created for specific vendor, device type and revision for HART device.
2) User is able to configure parameters which are related to template
3) Template can be applied and downloaded to multiple devices.

Key Benefit:

Reduce device commissioning time by preparing the common device parameter template, then bulk download to devices.

As Number of devices are small in number so Device parameter usage is not envisaged in this project.

14.1.5 Device Tag Display Extension

The device tag display extension provides with the user a means to identify a field device by an additional string in addition to its device tag or a string other than its device tag on the PRM. When duplicated device tags are expected in similar process units, this feature allows the user to register those devices by the other means in order to avoid duplicated tags in the PRM Server.

The following configuration options are available. These configurations should be determined during the basic design phase to bring consistency in configurations between the system and field devices.

- Device Tag Display Extension for HART devices

One of the following configuration options can be selected for HART devices. The additional string if used as well as the device tag should be set in each HART device prior to the commissioning phase.

- Tag (Default): Displays the physical device tag.
- Tag + Descriptor: Displays the physical device tag and the descriptor information of the device.
- Descriptor: Displays the user-defined descriptor information for the device.
- Message: Displays the user-defined message information for the device.
- Long Tag (for HART 6 and later): Displays the Long Tag parameter value for HART 6 and later devices.

The following figure shows Device Tag Display Extension Configuration dialog box on the PRM Client window.

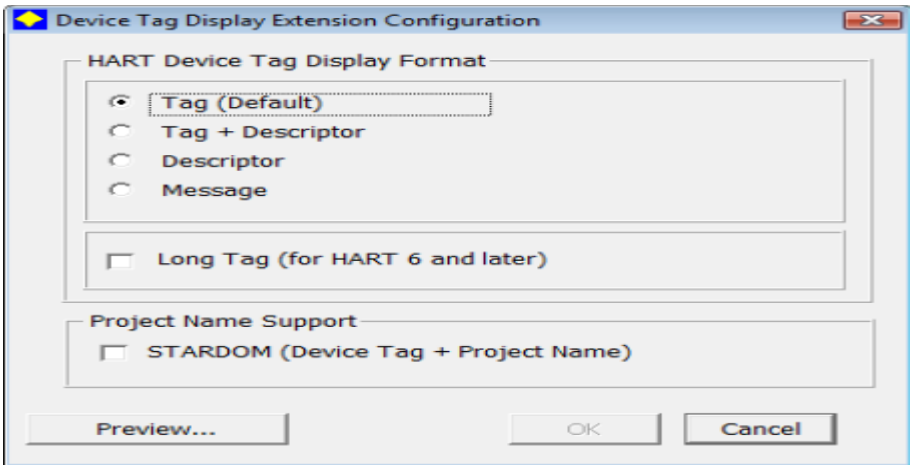

Figure 22 – Device Tag Display Extension Configuration dialog box

14.2 DEVICE NAVIGATION FUNCTIONS

The PRM Client provides the user with the following views for navigating field devices:

- Plant View
- Network View
- Class View
- Signal View
- Custom View

Once a device is complete with Plug & Play, it will appear on the views above as the device status icon and will be shown in the pre-defined color depending on its operating status (e.g. green if normal and red if abnormal). Refer to section 14.3.2 for the color-coding scheme in the PRM.

14.2.1 Plant View

The Plant view displays the devices and equipment modules of the plant in the form of a plant hierarchy structure that may include Site, Area, Process cell, Unit, Equipment modules and Control modules layers as shown in Figure 26.

Devices that are newly created, and those detected by Plug & Play initially appear in the Spare folder. User can customize the structure of the plant hierarchy tree according to the actual structure of your plant. This view also enables user to create new devices manually and delete existing devices.

The devices which are not on service will be under Out of Service folder.

PRM will allow import and export of plant hierarchy for Ease of Engineering.

Refer to section 14.16 for configuration of the plant hierarchy for this project.

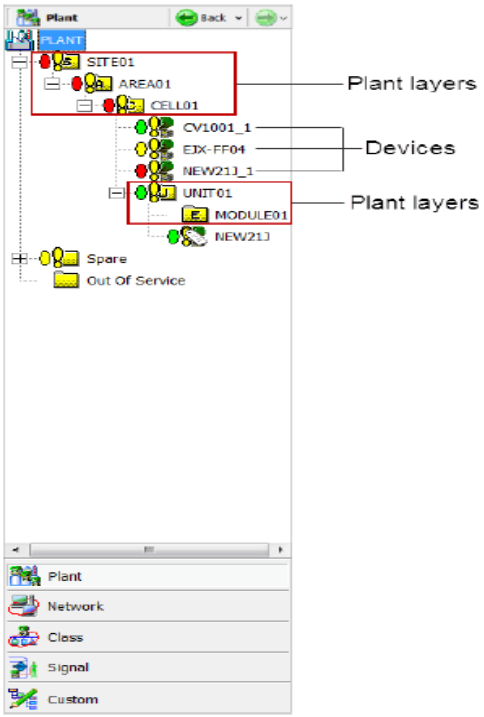

Figure 23 – Example of the Plant View

14.2.2 Network View

The Network View displays the field devices in a hierarchy determined by the location of the devices in relation with the actual hardware architecture of the system. As shown in Figure 27. The field device is shown in the relevant folder at the bottom of the hierarchy under the concerned controller and I/O module.

The initial set up for registering a field device in the PRM will be performed by executing Plug & Play on the Network View.

The information of the actual hardware architecture will be fed by configuring the device path or FDT project depending on the field device types using the PRM Setup Tool. Refer to section 14.15.4.3 for configuration of the device path and FDT project for this project.

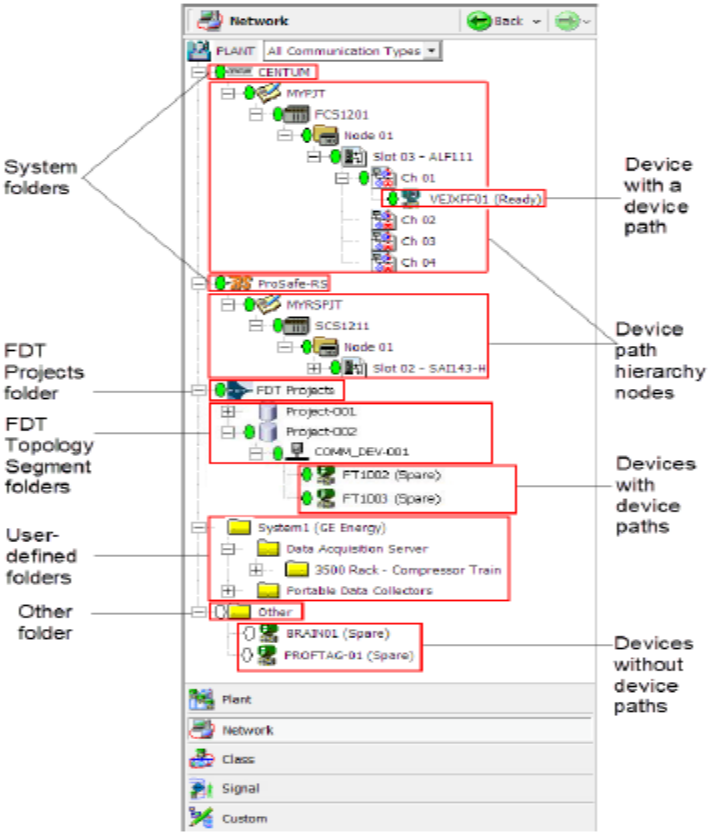

Figure 24 – Example of the Network View

14.2.3 Class View

The Class View displays the field devices in a hierarchy determined by the fixed attributes of the devices such as the communication type (Foundation Fieldbus, HART, PROFIBUS …etc.), category, vendor, model, revision and status of the devices. Each of the attributes is represented by a respective folder in a tree-like view and a field device is located at the bottom of the hierarchy as shown in figure 28.

The status of the devices falls into the following three depending on the operating status of the device on the PRM.

- On-Service
- Spare
- Off-Service

No configuration is required for the Class View.

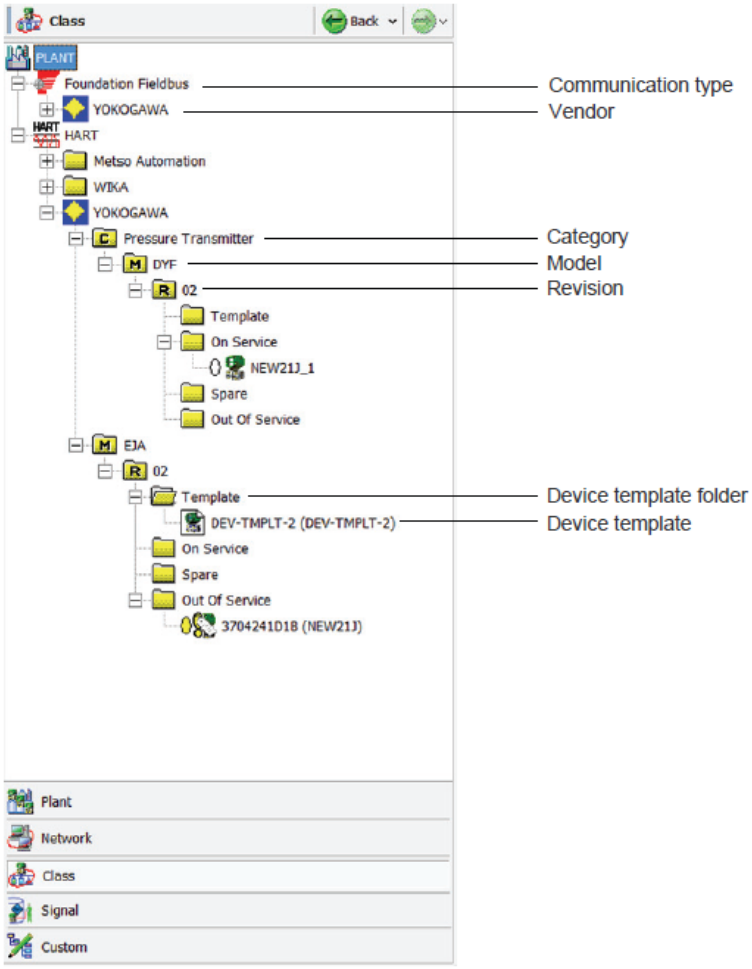

Figure 25 – Example of the Class View

14.2.4 Signal View

The Signal View displays the field devices that require the user's attention for a corrective action in certain priorities determined by NAMUR NE107. The NAMUR NE107 gives a consistent and structured approach to enable delivery of diagnostic information from an individual field device to the asset management system and allows the user to quickly respond to a failure with more meaning full information available.

The field devices are arranged on the signal view per priorities shown below.

Status Signal	Priority	Status Signal Icon	Description	Remark
Failure	1		The device is malfunctioning and must be replaced.	Sensor break, electronics failure..etc.

Check Function	2		The device has incomplete calibration or tuning.	Device not fully configured, calibrated or tuned …etc.
Out of Specification	3		The device is not operating within the specified measurement range.	Bubble formation in flow metering, Valve sticking …etc.
Maintenance Required	4		The device requires short-term or midterm maintenance because it is about to stop functioning.	Build-up of deposits …etc.
(Normal)	N/A	N/A	There is no NAMUR status applicable for field devices in Normal status.	The field devices in this status are not shown on the display.

Table 57 – NAMUR NE107 Status Classification and Description

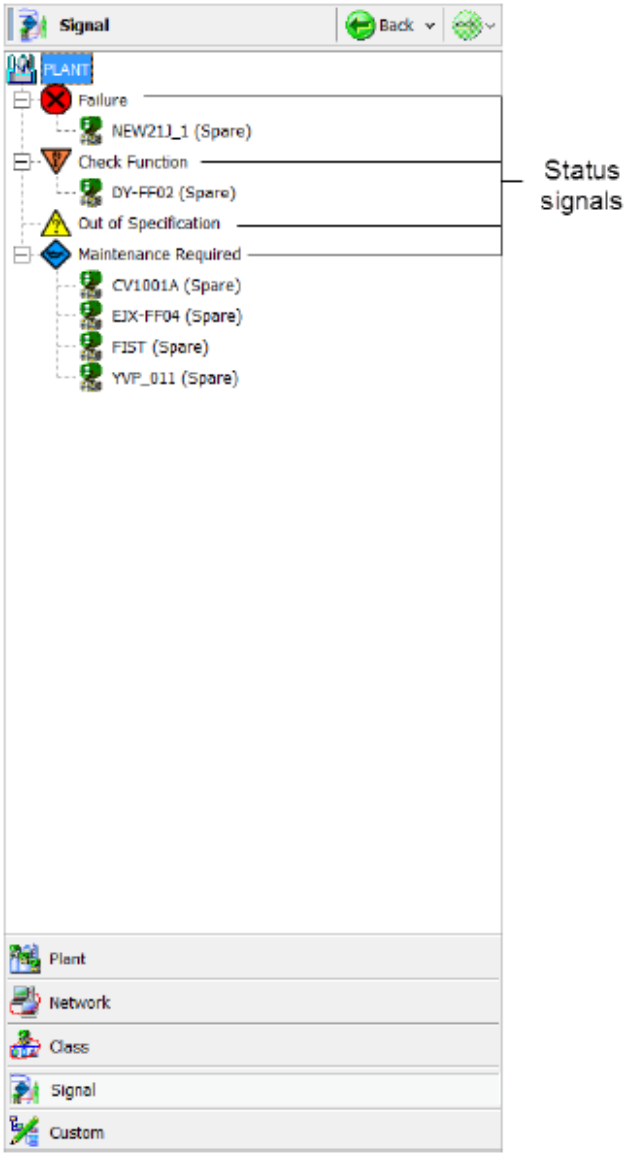

Figure 26 – Example of the Signal View

The NAMUR status signal of a field device is also displayed on other windows such as Device List window, Device Viewer window and History window.

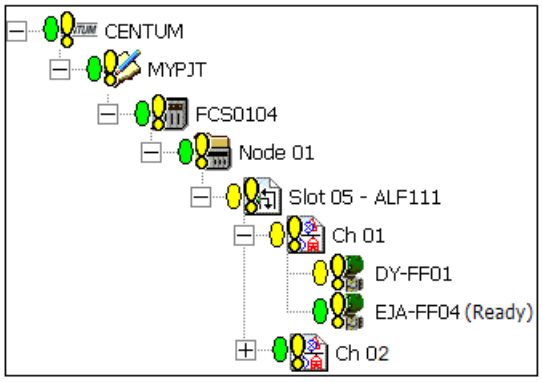
14.2.5 Custom View

The Custom View allows the user to create folders and allocate the field devices to these folders as needed. For instance, the user can create "Need Attention" folder in Custom View and put faulty devices there for the instrument engineer for investigation.

14.3 MAINTENANCE ALARMS

The PRM receives alarms and events from various sources and process them to the meaningful asset related information, which are displayed on History window of the PRM Client and stored in the PRM database. Maintenance Alarms and events are shall not be configured to receive in OWS.

This section describes the following functions:



- Message Acquisition
- Device Patrol
- Message Notification

14.3.1 Message Acquisition

The message acquisition function is an OPC-AE client based standard function. By default, it works to receive alarms and events associated with the field devices through the host systems such as CENTUM VP, ProSafe-RS. Message Acquisition function shall not be configured in this project.

14.3.2 Device Patrol

The Device Patrol function is a means to poll status of the field devices via the host systems such as CENTUM VP, ProSafe-RS or via the gateway devices on the device network. The current status of each field device will be reflected to the respective device status icon with the pre-defined color as shown in the following figure.

GUID-A4A60491-7D13-4279-B4ED-477800D66E87-default-pdf.pdf

Figure 27 – Example of the Device Status Icon on the Network View

When the Device Patrol detects faulty status within a field device, it will generate an alarm (or an event depending on its criticality) and store it in the PRM database with the time stamp. History window on the PRM Client allows the user to view all logged alarms and events in the PRM database. Refer to section 14.8.2 for details of the History window.

The following table shows the color coding scheme for the device status icon:

Color	Status Value	Results	Description
White	10	Uncertain	Indicates that the device status is unknown. This status may be assigned to newly registered devices, which have not yet been scanned by Device Patrol, or to devices that use a communication type not supported by PRM.
Green	20	Normal	Indicates that the device has no errors.
Grey	30	Communication Error	Indicates an error in a communication between the Field Communications Server and the field device. This includes cases of communication errors caused by device failure.
Yellow	40	Warning	Indicates that the device is in a warning state.
Red	50	Abnormal	Indicates that the device has errors.

Table 58 – Device Status Icon Color Coding Scheme

Note: The status value indicates the priority level of each status with a larger number for higher priority. It is internally used within the PRM system.

The polling cycle for the device patrol (device patrol period) can be specified to each of the following object criticality levels that are assigned to the field devices (Note: The default object criticality for all field devices is "Low".):

- Low
- Medium
- High
- High+

The default patrol period is one hour for all criticality levels. Refer to section 7.5.1.1 for configuration of the device patrol period for this project.

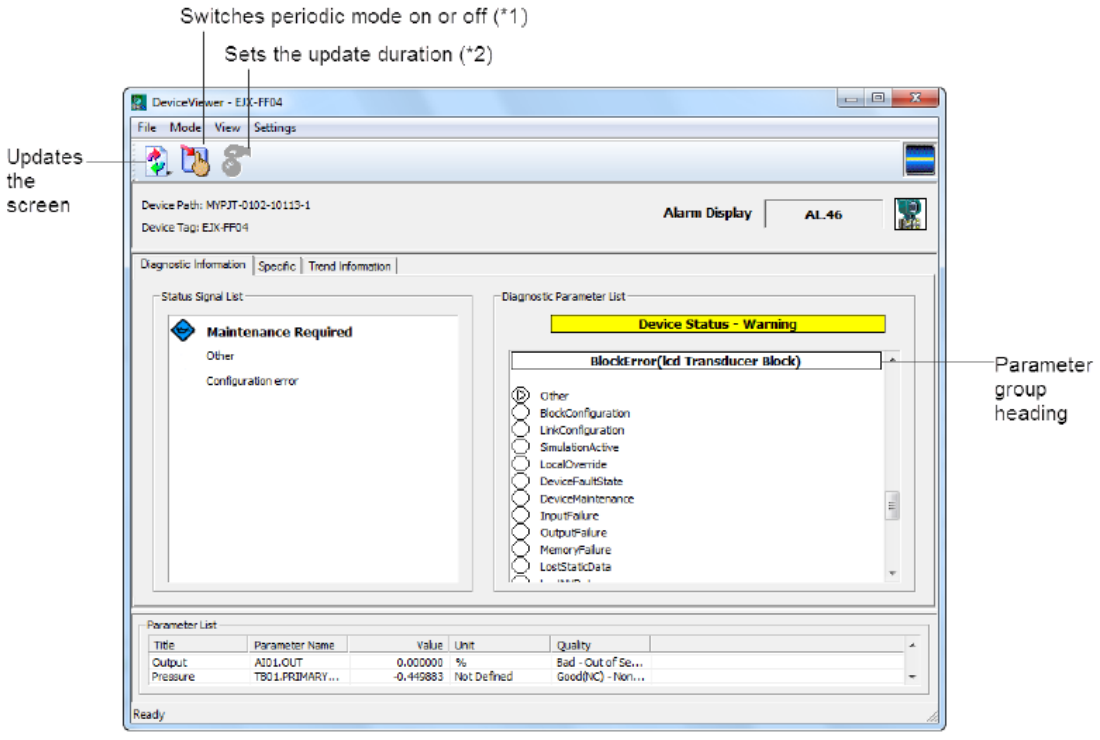
14.3.3 Alarm Management Rules

The alarm management rules allow the user to add meaningful information such as a cause of the problem, corrective actions …etc. to the alarm of a particular device or suppress particular alarms based on pre-configured criteria. Configuration for the alarm management rules can be done using the Alarm Management tool. By default, no alarm management rules are implemented so that the information provided for each alarm is based on the default of each type of the fieldbus devices and that suppression is not applicable to all field devices.

14.3.4 Alarm Notification Rules

The alarm notification rules allow the user to route a particular alarm to the HIS station Configuration for the alarm notification rules can be done using the Notification Configuration tool. By default, no alarm notification rules are implemented so that alarms will not be routed to outside of the PRM system.

14.4 DIAGNOSIS AND ADJUSTMENT



This section describes the following functions used for adjustment and diagnosis for the field devices:

- DeviceViewer
- Parameter Manager
- DTM Works
- DD Menu

14.4.1 DeviceViewer

The DeviceViewer provides the user with a means to display diagnostic alarms and key values of the field devices. The DeviceViewer may display either instrument specific diagnostic information using the associated DD file or common information depending on the DeviceViewer configuration file (xxx.cfg) provided along with the PRM software packages. Refer to Appendix-3 for details of the DeviceViewer configuration files provided for this project.

The following figures show examples of the DeviceViewer windows provided for Yokogawa EJX transmitter. Depending on how it is set up, it retrieves the information on demand or continuously in the specified update duration. If the continuous mode is selected, the values can be displayed in a form of trend graph.

1: A check mark appears next to Periodic mode in the menu bar if it is on.
2: This is only available when Periodic mode is on.

Figure 28 – Example of DeviceViewer (Diagnostic Information tab)

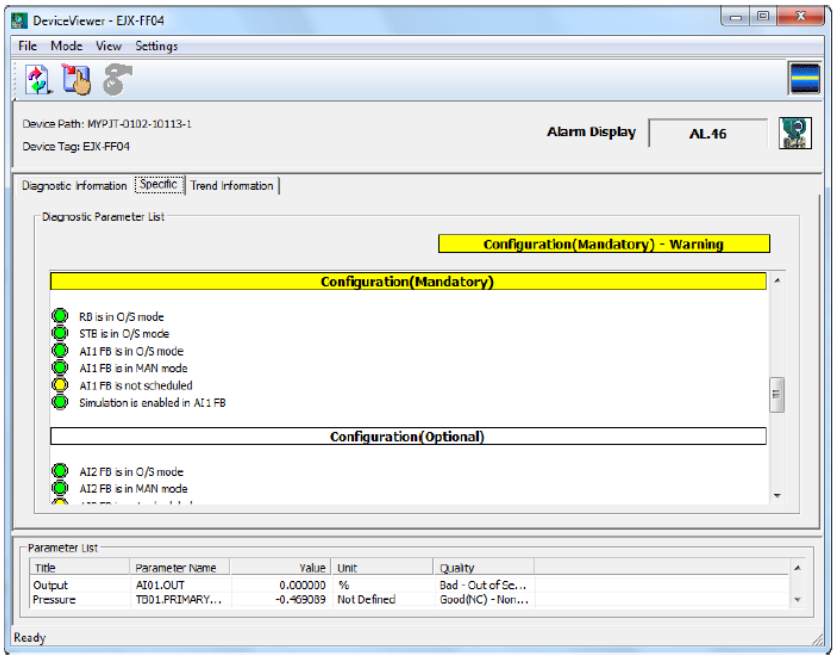


Figure 29 – Example of DeviceViewer (Specific tab)

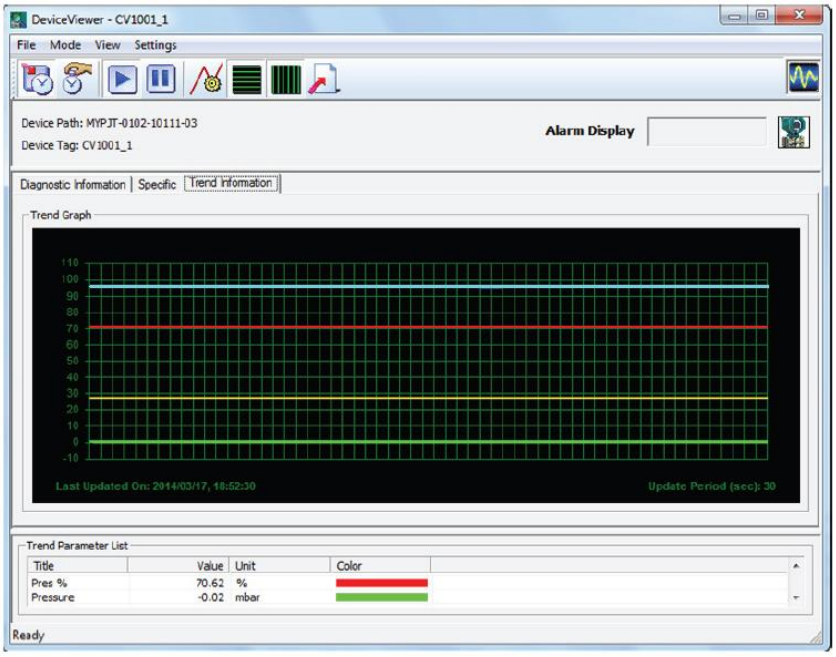

Figure 30 – Example of DeviceViewer (Trend Information tab)

The trend data shown on Trend Information tab can be saved in a CSV file with date/time stamp.

14.4.2 Parameter manager

The Parameter Manager provides the user with a means to display device parameters and adjust them through the dedicated window of the PRM Client using DD files. It allows the user to only browse a specific parameter or a group(s) of the parameters depending on the selected tab.

It also allows the user to historized the parameters captured at a certain time by saving them into the PRM database and compare them with the latest parameters retrieved from the device on the same window. The following figure shows an example of Parameter Manager Window.

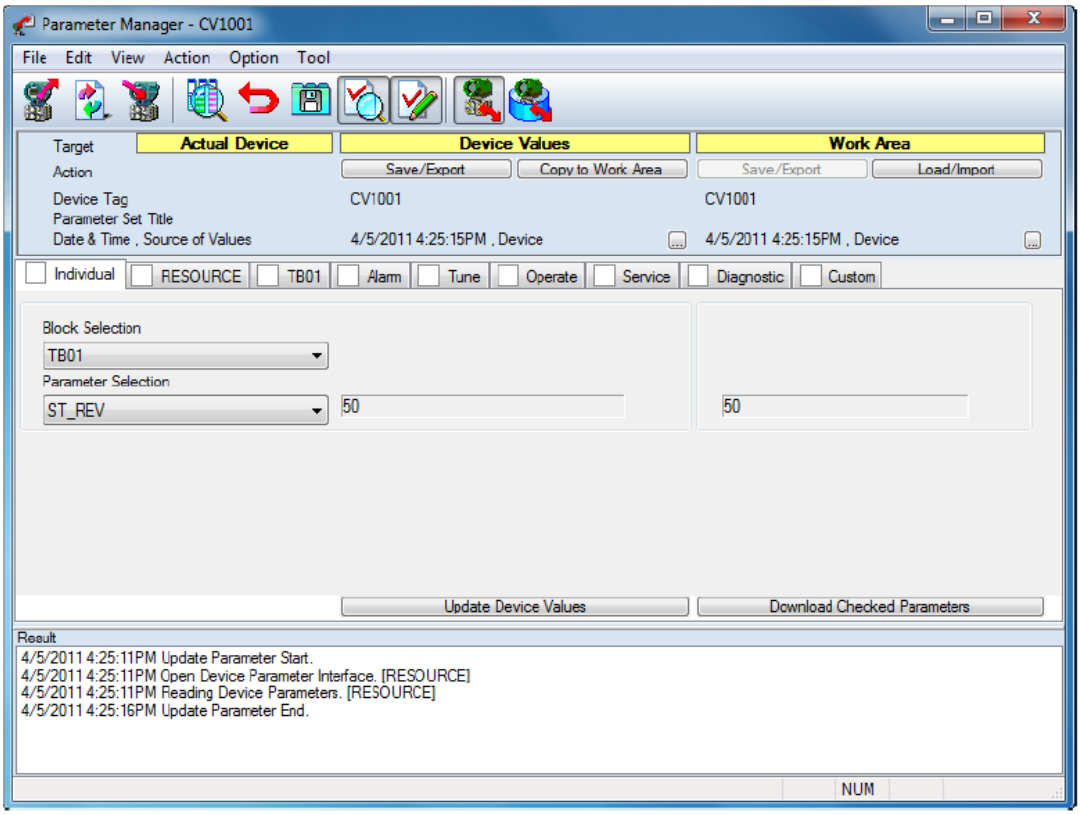

Figure 31 – Example of Parameter Manager

The user has an option to choose the Parameter Manager or the DTM Works described in the next section as the default parameter management tool on the PRM Client.

14.4.3 DTM Works

The DTM Works provides the user with the equivalent function as the Parameter Manager described in the earlier section.

The DTM Works functions based on either the device DTM files provided by the respective device vendor for a particular type of devices or the universal DTM. With the device DTM files installed, the DTM Works gives the user a comprehensive way of configuring, diagnosing and trouble-shooting a particular type of the

devices through the dedicated graphical user interface while it only gives a generic interface with the universal DTM installed.

Note: DTM files supply is not part of Yokogawa Supply.

By following the standard installation procedure, the device DTM for some of Yokogawa instruments will be available in the PRM while the universal DTM will be used instead for the remaining devices.

The user can obtain the device DTM specific to a particular device type from the respective vendor and make use of it by installing it in the specific folder.

Refer to Appendix-3 for details of the List of supported devices and Yokogawa specific DTM files and universal DTM for other vendors provided for this project.

The user has an option to choose the Parameter Manager or the DTM Works as the default parameter management tool on the PRM Client.

The following figure shows an example of the DTM Works for Yokogawa EJA (a pressure transmitter).

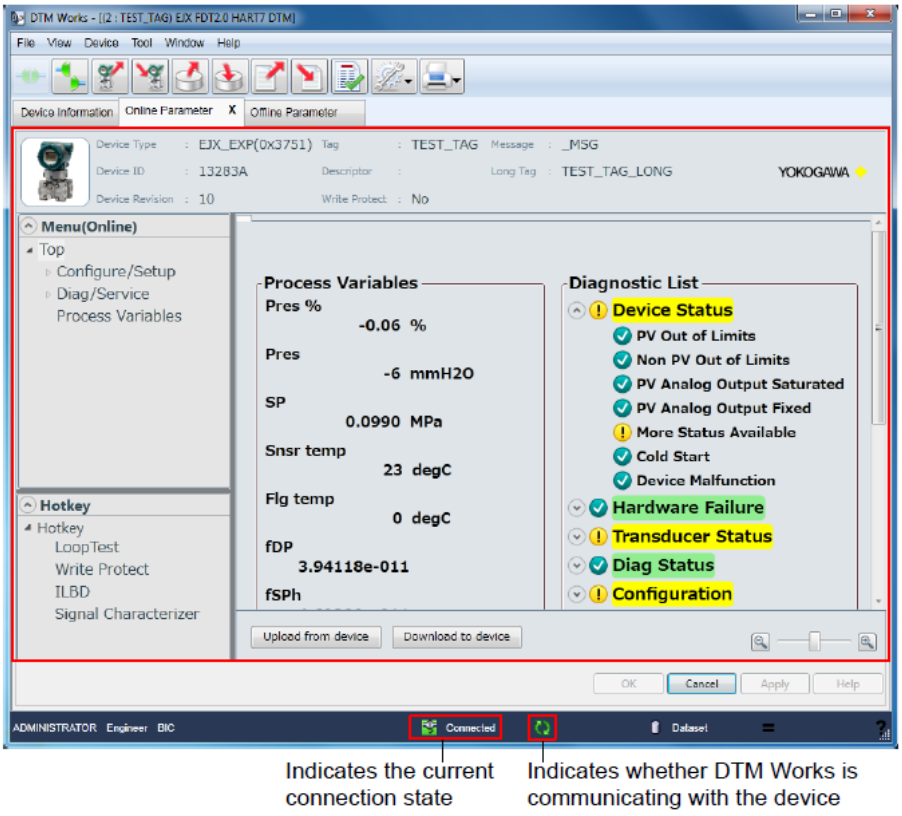

Figure 32 – Example of DTM Works

14.4.4 DD Menu

Aside from the Parameter Manager and DTM Works, the PRM also provides the DD menu for the FF devices to perform the similar function through its text-based user interface. The following figure shows an example of the DD menu for Yokogawa EJA pressure transmitter.

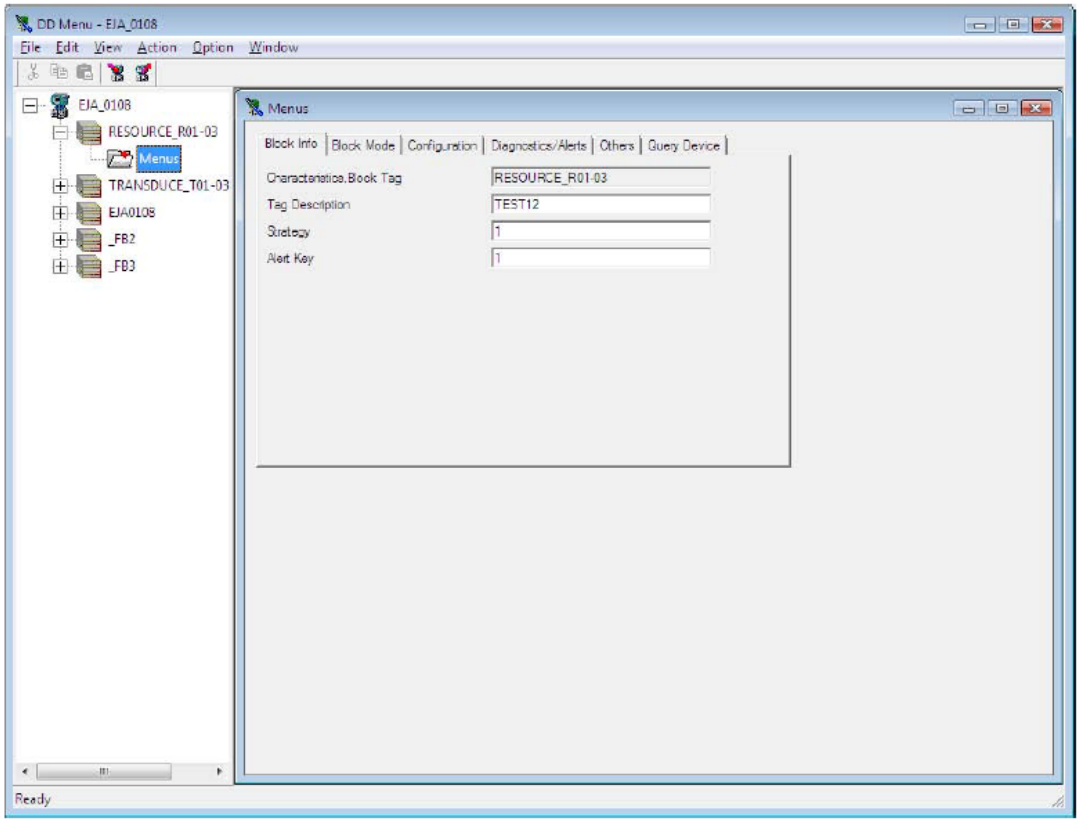

Figure 33 – Example of DD Menu

14.5 MAINTENANCE OPERATION ASSISTANCE

14.5.1 Maintenance Marks

Note: In this project Operation Mark usage is not envisaged.

As a means to assist maintenance activities for the field devices, PRM can provide the user to indicate the maintenance status of a device on the PRM Client, so called the Maintenance Mark. The Maintenance Mark allows the user to share status of the activity undergoing for a particular device with other users on the PRM Clients by having an MTMK icon overlaid on the device status icon as shown in the following example. (The red tag mark shown in the following figure is a maintenance mark.)

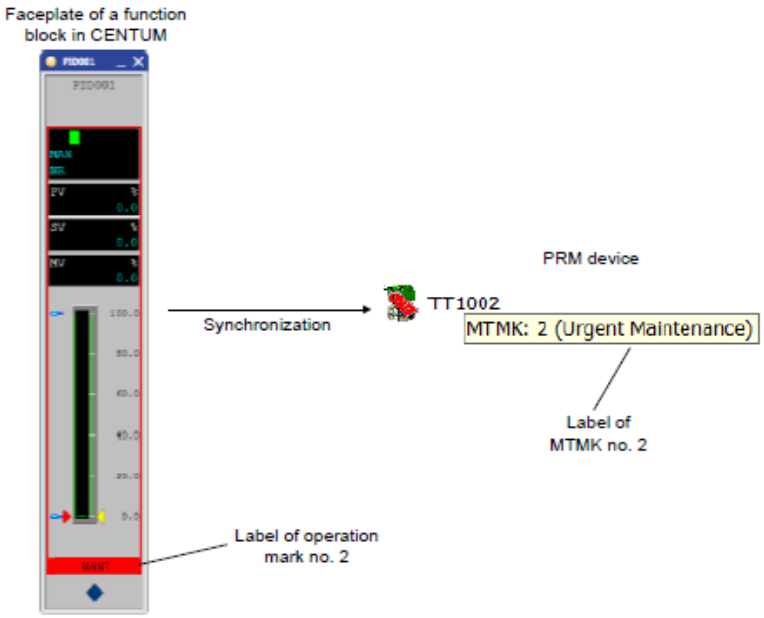

Figure 34 – Example of the Maintenance Mark

Once a Maintenance Mark is attached to a device, it either gives the user access rights to perform adjustment of the parameters for the device, or revokes the access rights or retains the access rights provided when the Maintenance Mark is not attached depending on the configuration of the maintenance mark. When the Maintenance Mark is removed, the access rights pre-defined on the PRM will be retained.

When it is configured to synchronize with a particular Operation Mark on the CENTUM VP system, the operator can initiate an action to automatically assign a pre-defined Maintenance Mark to a device on the PRM Client by attaching the Operation Mark to the respective faceplate of the control loop on the HIS in CENTUM VP system.

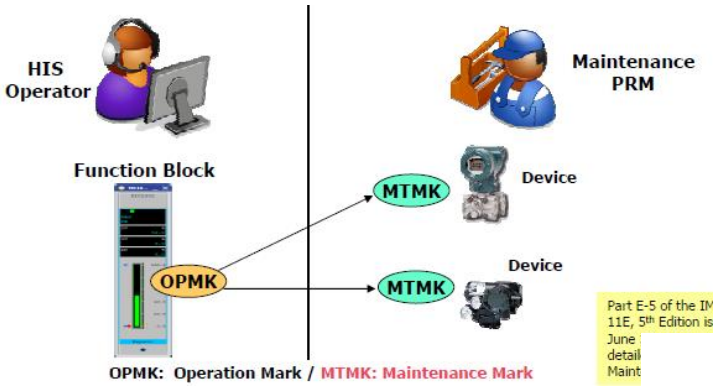

Figure 35 – Example of Operation Mark and Maintenance

14.6 MAINTENANCE INFORMATION MANAGEMENT

The PRM provides the user with the following functions to maintain the devices effectively:

- Device Details (Device Master Information)
- Inspection Memo

- Inspection Schedule
- Parts List

Configuration of the above will be left at the system default.

14.7 DOCUMENT MANAGEMENT ASSISTANCE

14.7.1 Document Links

The PRM provides the user with a means to quickly access the documents associated with the field devices (e.g. manuals, P&IDs, data sheet ...etc.) through the PRM Client using the Document Links. The documents can be stored either in the pre-defined folder in its local hard drive or centralized location over the network. The Document Links can be configured by specifying the location of folders or URL. The PRM supports PDF file format as system default document software.

14.8 AUDIT TRAIL MANAGEMENT

The PRM provides the user with a means to manage and keep track of the asset related information such as historized (saved) parameters, alarms and events of the devices and operation logs on the PRM Client. This section describes the followings available on the PRM Client as the Audit Trail Management functions:

- Parameter History
- History Window

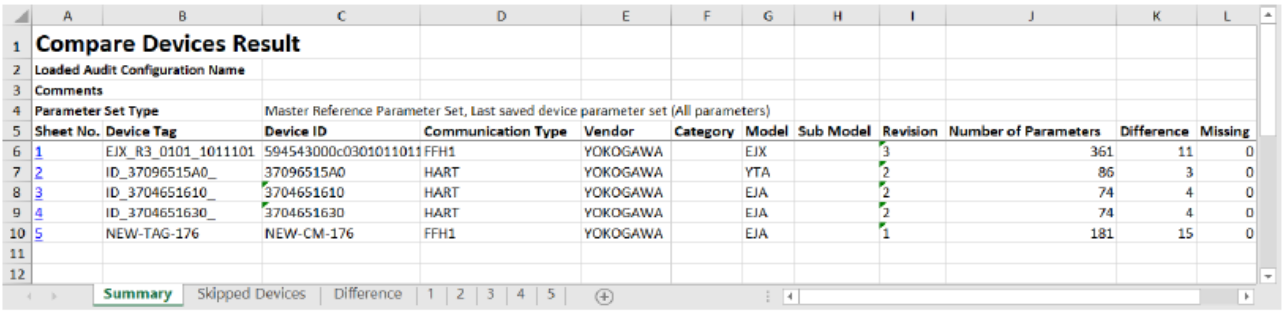
14.8.1 Parameter History

The functions such as the Parameter Manager, DTM Works, and DD Menu (Refer to section 14.4 for details.) allow the user to save the current set of parameters in the field devices in the PRM database. It is saved with the time stamp so that the user can keep track of the changes made at any time and compare one set of the saved parameters with the other or the current set in the devices using these functions.

The saved parameters can be exported in the form of XML format.

Comparing parameter data of multiple devices

User can compare the parameters of multiple devices by using the Audit Device Parameter tool. The tool enables you to perform the following types of comparisons:



- Compare devices

This comparison enables you to compare the actual parameter data or last saved parameter set with the baseline parameter set of a device. The baseline parameter set is either the parameter set assigned with the Master Reference key, or the saved parameter set with an earlier time stamp, depending on the comparison mode that user is using. Multiple devices can be compared at the same time.

- Compare with templates

This comparison enables user to compare the actual parameter data or the last saved parameter set of multiple devices with the baseline parameter set of a device template in the same device class. The baseline parameter set is the last saved parameter set of the device template.

User can use the Audit Device Parameter tool to validate incorrect parameter values in scenarios such as setting up of a new plant, replacing of devices, or shutting down of a plant for maintenance purposes.

Compare Devices Result

Summary | Skipped Devices | Difference | 1 | 2 | 3 | 4 | 5

Figure 36 – Example of the comparison summary sheet

14.8.2 History Window

The History Window allows the user to browse alarms and events of the devices, events generated from the user actions, and system events logged in the PRM database. It comes with various tabs for the user to browse the alarms and events of a particular category of his/her interest. The Maintenance tab displays the alarms and events along with the detailed information such as the cause of the individual problems and corrective actions required. It also allows the user to acknowledge standing alarms for managing alarms on the PRM Client.

The logged alarms and events can be exported in the form of XML format.

The following figure shows an example the History Window:

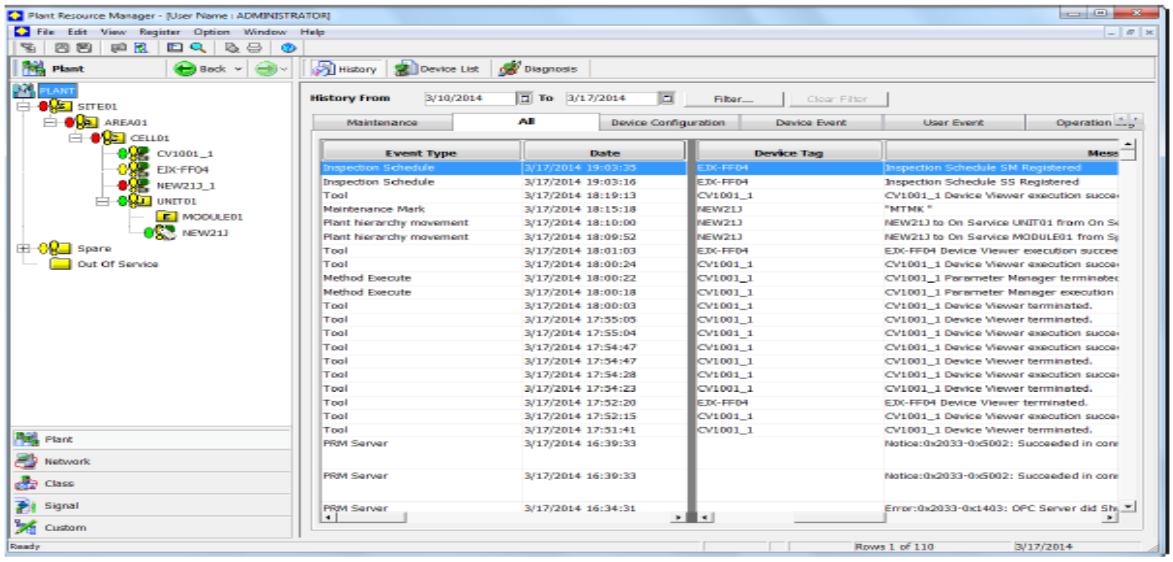

Figure 37 – Example of the History Window

14.9 SECURITY

The PRM provides the user, who performs administrative tasks, with a capability to configure user groups and accounts on the PRM applications with proper access rights depending on users' rolls and responsibilities. Once logging on a specific user account of the PRM applications, the user is granted to perform only the functions allowed under the user account.

The PRM provides two different authentication methods, namely, PRM authentication and Windows authentication. Once a user account is created in the PRM applications with the PRM authentication in use, the respective user will go through two separate authentication process of both Windows system and PRM applications by typing the respective user name and password at each authentication.

With the Windows authentication in use, on the other hand, a user account name created in the Windows environment (e.g. a user account on the domain controller on PIN or on the local computer) can be copied in the PRM applications and assigned to any PRM user group. This provides the user with only the granted access rights to the PRM applications under the Windows user name, allowing for a single sign-in process by the Windows system to meet various password complexity and expiration requirements implemented in the user's network environment.

Refer to section 14.17 for configuration of the user groups and accounts for this project.

14.10 LICENSE MANAGEMENT

PRM applies common license management to provide consistent lifecycle maintenance service for all Yokogawa System Products

PRM adopts license manager and individual Project ID the same as CENTUM VP and Prosafe-RS.

PRM requires product maintenance License (PML) to get standard software support the same as Centum VP and Prosafe -RS.

14.11 SOFTWARE REQUIREMENTS

14.11.1 Software Requirements

PRM Server- Windows Server 2016 Standard Edition (64-bit version)/ Windows Server 2019 Standard Edition (64-bit version)/ Windows Server 2022 Standard Edition (64-bit version).

PRM Client- Windows 10 IoT Enterprise Edition 2021 LTSC (64-bit version)/ Windows Server 2019 Standard Edition (64-bit version)/ Windows 10 Enterprise Edition 2021 LTSC (64-bit version)/ Windows 10 Enterprise Edition 2019 LTSC (64-bit version).

14.12 OTHER PRM OPTIONAL FUNCTIONS

This section describes optional functions available on PRM system. The use of each optional function should be considered by the individual projects. The proper licenses must be purchased depending on the necessities. Refer to the project Bill of Materials Doc No.1724000594-IN-LIS-00003 for the licenses provided for this project.

14.13 PLUG-IN APPLICATIONS

A Plug-in application is a software product that is provided by a third party device vendor to configure, adjust and diagnose a particular device type.

Note: Plug-in applications are not part of Yokogawa Supply.

14.14 FDT/DTM BASED APPLICATIONS

Field Device Tool/Device Type Manager (FDT/DTM) is a standardized program in order to reinforce the interoperability between Yokogawa FDT Frame application supported on the PRM and the DTM of third

party vendors. Recently, device vendors have developed various applications based on the FDT/DTM technology that work for their specific device types to effectively configure, adjust and diagnose the devices. Once installed, these applications allow the PRM to take advantage of those vendor specific features through the PRM Client.

PRM supports FDT/DTM applications developed in compliance with FDT 1.2 and 2.0.

Visit the website <https://www.yokogawa.com/library/documents-downloads/software/list-of-fist-completed-devices/> for the FDT/DTM applications that has been proved operable with the PRM.

Note: FDT/DTM is not part of Yokogawa supply.

14.15 PRM AND GENERIC THIRD-PARTY SYSTEMS INTEGRATION

Integrating PRM with a Generic third-party system enables user to monitor the status and view event messages of third-party devices that are registered in PRM system.

PRM environment

- An existing working installation of PRM R4.03 or later
- License for Interface Package for Generic System

Generic third-party system environment

- The generic third-party system
- OPC Data Acquisition (DA) 3.0 server
- OPC Alarms and Events (A&E) 1.10 server

Note: In this project not envisaged Generic third-party system integration to IAMS.

14.16 PROJECT SCOPE AND CONFIGURATIONS

In this project 1 PRM Server including 1 PRM Client shall be supplied and remote access to PRM Server shall be provided. The PRM Server will be installed in the Server/Network cabinet in the OER and includes KVM extender to 24" LCD screen.

Refer to the project system architecture drawing number 1724000594-IN-DD-00015 for details.

14.16.1 Minimum Hardware Requirements

PRM Server- Minimum Memory requirement is 7 GB and Minimum disk space requirement is 18 GB.

PRM Client- Minimum Memory requirement is 1 GB and Minimum disk space requirement is 2 GB.

14.16.2 Software License and Medium

Refer to the project Bill of Materials Doc. No. 1724000594-IN-LIS-00003 for the software licenses and medium provided to this project.

14.16.3 Supported Devices and Protocols

A DVD, Device Files Media (Model: PM4CDM), provided along with all PRM software packages, includes the DD, DTM and DeviceViewer configuration files for the field devices listed in Appendix-3

. These files are installed in the PRM system for this project.

The following fieldbus protocols are used in this project:

- HART protocol in CENTUM VP
- HART protocol in ProSafe-RS

14.16.4 Configurations for the Project

In projects configuration and testing of sample devices will be done during the FAT phase whereas configuration and thorough testing for all the devices will be done during SAT/Commissioning phase. Refer to the following sections for details of the configurations.

PRM Server

IAMSSVR, domain 1 and station 60 shall be located in ITER.

- Server Set (This item specifies the computer name of PRM Server components in the PRM system.)

  Plant Area: ITER

  PRM Server: IAMSSVR

  Field Communication Server: IAMSSVR

  Advanced Diagnostic Server: IAMSSVR

  Diagnosis Historian Server: IAMSSVR

  No of Field Devices: 1000
- Device Patrol (Device Patrol Period)

  Low: 1 Hour

  Medium: 1 Hour

  High: 1 Hour

  High +: 1 Hour
- Message Acquisition

  CENTUM VP/ProSafe-RS Computer Name: EWS0164

  Message Selection: Default *

  Enable event notification for HART 7 (or later) devices: Not selected

  STARDOM Computer Name: Not Applicable

  Message Selection: Default *

  * Refer to A-3 for details of this configuration.

  (Note: In order to enable the Event Notification method or Polling method described in section 14.3.1, the message number 3401 or 3403 must be selected in the Message Selection window, respectively.)
- Maintenance Mark:

  Enable Synchronization with CENTUM VP: Disabled (Default)

  Maintenance Mark configuration shall not be used.
- Alarm Management: Not configured
- Alarm Notification Configuration: Not configured
- Third-party System: Not configured

PRM Client

IAMSSVR in ITER and remote access from CCR.

- Connection (This item specifies PRM Server computer name(s) that the PRM Client can have access to.)

  Use One PRM Server: IAMSSVR

PRM Server: IAMSSVR

User Multiple PRM Servers: Not selected (Not Applicable)

- Appearance (This item specifies size of fonts and icons used on the PRM Client)

  Font Size: Medium (10 points; Default)

  Icon Size: Medium (24x24 pixels: Default)

  Use Bold characters in Device Navigator: Selected (Default)
- DTM Setup: Default (See Appendix-3 for details.)

Field Communication

IAMSSVR in ITER and remote access from CCR.

- Device Path: Configured based on the project I/O information for the CENTUM VP and ProSafe-RS systems.
- FDT Project Management: Not configured
- DD Copy Tools (This utility specifies location of the folders that contain DD/CFF files for the FF devices and DD files for HART devices.)

  C:\PRM\DD\ (for FF)

  C:\PRM\DD\HART\ (for HART)

Configuration for PST Scheduler (PST Server)

- Connection (PST Scheduler Server): Not Applicable

14.17 OTHER CONFIGURATION FOR PRM OPERATION ENVIRONMENT

- Plant Hierarchy on Plant View: Hydrogen, BESS, F&G
- Custom View: Not configured
- Parameter Tab of Customize Window (Preferred parameter tool): Always Parameter Manager
- Block setting for each type of Devices: FF devices not used
- Document Links: FF devices not used

14.18 SECURITY SETTING UTILITY

Yokogawa IT security tool provides three types of security models, Legacy model, Standard model, and Strengthened model, according to the required security strength, in order to flexibly accommodate system configuration and operation.

Security for Domain Management (Standard Model) is used.

Standard model places importance on operation of the product and collaboration with other systems (Exaopc, ProSafe-RS, and so on) to guard against "attacks over the network" and "direct attack to a system by operating on an HIS or on a computer with system builders." The Standard model does not guard against "Theft of HIS or computer with system builders or theft of data" because its threat is considered minor due to the characteristics of the product.

For more details on security models refer to IM 33J01C30-01EN CENTUM VP Security Guide.

14.19 USER GROUPS AND ACCOUNTS

Refer to Appendix-4 for PRM User groups and Account configuration template.

Baseed on opertation and maintenance requirements User groups with specified previlages shall be configured during commissioning, user list shall be accessed from Domain controller.

14.20 DEVICE TAG DISPLAY EXTENSION SETTINGS

- HART Device Tag Display Format:

  Tag (Default)

  Long tag for HART 6 and later: Not selected

- Project Name Support (for STARDOM system only):

  Device Tag + Project Name: Not selected

A. List of Supported Devices

Refer to Appendix-3 for List of Supported Devices.

B. PRM user groups and Account configuration

Refer to Appendix-4 for PRM User groups and Account configuration template.

C. PRM Message Acquisition Configuration

The following tables show default alarms and events routed from the host systems to the PRM.

Note: Following table shall be updated during detail engineering

Message Number	Description
0089	Subsystem Communication Error (SS-COM Error)
0090	Subsystem Communication Recovery
0491	HART Device Status
3001	Fieldbus Device Failure
3002	Recovery of Fieldbus Device to Normal
3101	Occurrence of a Fieldbus Device Alarm
3102	Recovery of a Fieldbus Device to Normal
3111	Occurrence of process alarm from Fieldbus Devices
3112	Recovery of Fieldbus Device from process alarm
3150	Update of Fieldbus Devices
3160	Change in Write Protection of Fieldbus Device
3171	Fieldbus Device Abnormal
3172	Fieldbus Device Recovered to Normal
3173	Fieldbus Device Detected a process alarm
3174	The process alarm detected by the Fieldbus Device recovered
3175	Fieldbus Device Update Event

Message Number	Description
3176	Enable/Disable Write Protection of Fieldbus Device
3181	Fieldbus Device Failure
3182	Fieldbus Device Recovery
3183	Error Detected by ALF111 Self-diagnosis
3401	HART device event notification
3403	I/O module detected a HART device status change
3405	Communication error when acquiring HART device status (No response)
3407	Communication error when acquiring HART device status
3408	Recovery of communication when acquiring HART device status
4031	HART Device Error
4032	HART Device Recovery
4033	HART Communication Error
4034	HART Communication Recovery
4035	HART Communication Command Error
4036	HART Communication Command Recover
4056	Switching the control rights of a PROFIBUS redundant slave device
4125	I/O module channel error occurred
4126	Recovery from I/O module channel error

Table 59 – Alarms and Events routed from CENTUM VP (ProSafe-RS) to the PRM (Default)

15 PCS SOFTWARE TYPICAL

Note: Equipments those not covered in typical logics shall be configured based in process/operational logic requirments

15.1 TYPICAL LOOP INDEX

No.	Typical Loop No	Functional Description
1	TYP001	Indication of Analog Input and Alarm
2	TYP002	Indication of Subsystem Analog Input and Alarm
3	TYP003	On/Off valve control function block
4	TYP004	Output to subsystem
5	TYP005	Indication of on/off valves of subsystem.

Table 60 – Typical Loop Index

15.2 TYP001- INDICATION OF ANALOG INPUT AND ALARM

15.2.1 Sample P&ID Image

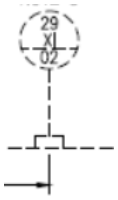

Figure 38 – P&ID representation of Analog Input and Alarm

15.2.2 Description

The Analogue input is indicated on OWS using faceplate/Graphics/Trend using the PVI function block. The value of the process variable is received from the field via FCS analog input module.

15.2.3 PCS Control Drawing

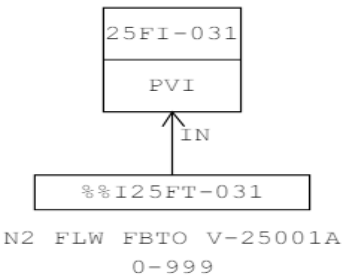

Figure 39 – Control Drawing of Analog input and Alarm.

15.2.4 Alarming Function

In the event of Input Open (IOP), the alarm "IOP" is generated by this block. All other alarms in this block are disabled by default. Alarms are enabled when associated set point values are specified in the IO List.

15.2.5 HMI Items

The following default HMI items are defined for this typical:

Access level PVI function block: 3

15.2.6 Tag Name Structure

Description	P&ID Tag name	IO Tag Name	PCS Tag Name
Input	26FT-031	%%I26FT-031	NA
Indicator Block	NA	NA	26FI-031

Table 61 – Tag Name Structure

15.3 TYP002- INDICATION OF SUBSYSTEM ANALOG INPUT AND ALARM

15.3.1 Sample P&ID Image

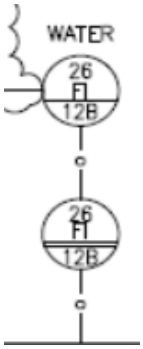

Figure 40 – P&ID representation of Subsystem Analog input and Alarm

15.3.2 Description

The value of the process variable is received from the field via Subsystem to FCS Subsystem input module. The analog input is indicated on HIS using faceplate/Graphics/Trend using the PVI function block.

15.3.3 PCS Control Drawing

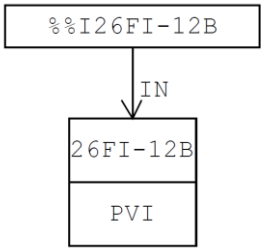

Figure 41 – Control Drawing of Subsystem Analog input and Alarm
Table 62 – Tag Name Structure

15.3.4 HMI Items

The following default HMI items are defined for this typical:

Access level PVI function block: 3

15.3.5 Tag Name Structure

Description	P&ID Tag name	IO Tag Name	PCS Tag Name
Input	26FT-12B	%%I26FT-12B	NA
Indicator Block	NA	NA	26FI-12B

Table 63 – Tag Name Structure

Note: For Gain Bias Setting, refer section 6.5.1

15.4 TYP003- ON/OFF VALVE CONTROL FUNCTION BLOCK

15.4.1 Sample P&ID Image

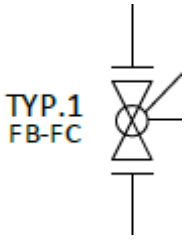

Figure 42 – P&ID representation of ON/OFF Valves

15.4.2 Description

Opened & Closed feedback are received through two different digital inputs and one digital output is used to extend open & close command. SIO-21E function block is used for PCS engineering.

15.4.3 PCS Control Drawing

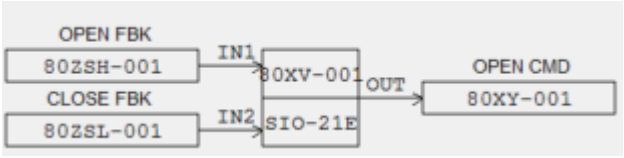

Figure 43 – Control Drawing of ON/OFF valve

Table 64 – Tag Name Structure

15.4.4 Operation & Alarming Function

Opened (IN1) & Closed (IN2) feedback, two different digital inputs are connected with the input terminals of the function block. A digital output is connected with output terminal. SIO-21E function block generates "ANS+" (Failed to Open),"ANS-"(Failed to close) & "PERR"(Concurrency alarm-both opened & closed feedback received together) alarms along with normal operation of the valve.

i) "ANS +": Open command issued but feedback is not received within a specified time, time can be set in the tunning window, parameter is "MTM".

ii) "ANS -": Close command issued but feedback is not received within a specified time, time can be set in the tunning window, parameter is "MTM".

iii) "PERR": Concurrency alarm-both opened & closed feedbacks are received together.

15.4.5 HMI Items

The following default HMI items are defined for this typical:

Access level SIO-21E function block: 3

15.4.6 Tag Name Structure

Description	P&ID Tag name	IO Tag Name	PCS Tag Name
On/Off Valve	25-XV-004	NA	25XV-004
Input	25-ZSH-004	NA	25ZSH-004
	25-ZSL-004	NA	25ZSL-004
Output	25-XY-004	NA	25XY-004

Table 65 – Tag Name Structure

15.5 TYP004-OUTPUT TO SUBSYSTEM

15.5.1 PCS Control Drawing

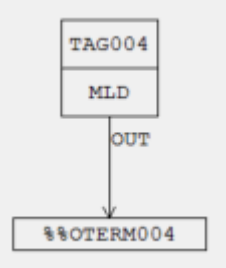

Figure 44 – Control Drawing of Subsystem Analog input and Alarm

15.5.2 Operation & Alarming Function

The function block "MLD" is used to send the Setpoint or any kind of integer/double integer or a real value to the connected subsystem. The out terminal is connected with a specific register address. In case of communication failure "OOP" alarm is generated on the function block faceplate.

15.6 TYP005- INDIACTION OF ON/OFF VALVES OF SUBSYSTEMS

15.6.1 PCS Control Drawing

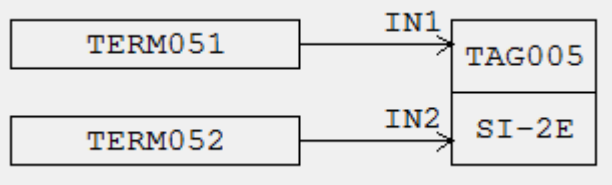

Figure 45 – Control Drawing of Subsystem Analog input and Alarm

15.6.2 Indication & Alarming Function

The function block is used for the indication of manual valves connected with subsystem. Open feedback is connected to IN1 input terminal and Closed feedback to IN2. "PERR" alarm is generated when both Opened & Closed feedbacks are received together.

16 PROCESS CONTROL LOGICS

BLPH Connection Modes logic is configured using SFC function blocks. In SFC(Sequence Flow Chart) are used for process control logics in different Modes, the outputs are issued as conditional logic mentioned the control philosophy.

16.1.1 SNAP OF SFC STEP

17 SIS/FGS DESIGN REQUIREMENTS

17.1 SYSTEM DESCRIPTION

The requirements for SIS / F&G must be considered as part of the overall health, safety, and environmental protection facilities for a plant installation. The fundamental requirements for SIS/F&G are specified in IEC 61508 and IEC 61511. The concepts within the standard are equally applicable where the consequences include asset or environmental loss.

17.2 GENERAL SYSTEM DESIGN REQUIREMENTS

Following general system requirements are specified for the SIS/FGS:

- The SIS/FGS is fed from dual 230Vac 50Hz UPS with a 30 minutes and 8 hours backup capacity.
- The SIS/FGS power supply unit includes 20% spare capacity.
- The SIS/FGS contains as minimum 10% installed spare IO capacity. Installed spare capacity shall include wiring between termination boards and IO modules.
- The final configuration loadings of the CPU's shall not exceed 60%. This means that the actual SCS loading shall not exceed 36 seconds during FAT and the idle time shall not be less than 60-36=24 seconds.
- The SIS/FGS system is suitable for the following environmental conditions; Temperature between -20°C and 45°C. Humidity between 5% and 95% RH Non condensing.
- The SIS/FGS time synchronization resolution is within +/- 25msec.
- The SIS/FGS design is based upon de-energize to trip(SIS) & energize to trip(FGS) principle.
- The SIS system is suited for SIL 3 applications.
- The SIS/FGS system will be designed such to meet an availability of 99.99%.
- The SIS/FGS has as a (maximum) scan rate of 300msec (SIS) and 500msec (FGS)..
- The SIS/FGS analogue IO modules are HART compatible.
- All IO modules are redundant.

The following general functions for the application are specified for the SIS/FGS PLC:

- SIS/FGS system alarms and messages at the CI view to identifying all system faults and failures.
- SIS/FGS PLC system alarms and messages at the CI view are tag based.
- SIS/FGS process alarms at the CI View are tag based.
- First failure alarms are indicated at the CI View

17.3 SAFETY CONTROL SYSTEM (SCS) SIZING REQUIREMENTS

The number and allocation of the ProSafe-RS SCS for a project is based on many factors, some of which are listed below:

SCS physical installation locations in the facility.

- Requirements for local and remote I/O nodes.
- HART functionality.
- Installed spare I/O.
- Installed spare slots.
- Number of I/O's.
- Module redundancy.
- FTA selection, location, and distribution.

Limitations:

- A maximum of 13 I/O nodes shall be installed per SCS. (along with Node extension software package).
- A maximum of 64 stations can be set up in one domain including 16 HISs.
- I/O Modules (redundant) shall be allocated depending on the summation value for each SCS/SNU.
- Ambient temperature conditions need to be considered while installing I/O nodes and the SCS in the same cabinet.
- A maximum of 2000 annunciator blocks can be programmed into one SCS. (Note 2)

18 IEC 61508

The international standard IEC 61508 defines safety integrity levels (SIL) 1 to 4. In order for a safety system to achieve a certain SIL, it has to be shown quantitatively (calculations) in various phases of a project and follow procedures. The quantitatively (calculations) and procedures will be described in a Safety Validation Plan. In here it is shown that the system will achieve the quantitative requirements associated with the relevant SIL. Furthermore, certain application specific system architectural constraints must be taken into account (e.g. redundant configuration for high availability). The complete safety loops, from sensor up to and including the final elements, must be verified this way. The ProSafe-RS in single configuration is approved for use in SIL 3 applications, hence redundancy in CPU & I/O cards is only provided for availability reasons.

Parts of the IEC 61508 requirements used for this document are the steps to be taken for the realization of the project. The relevant steps of section 2 of the IEC standard for EPC phases are shown in Error! Reference source not found.. In this figure it is assumed that Company and Contractor are responsible for step9.1 (safety requirement specification). The TYPICALS, C&E diagrams, DEP's and the IPF requirements will cover step 9.1. The other steps shall be executed during EPC Phase and are described in the Project Implementation Plan.

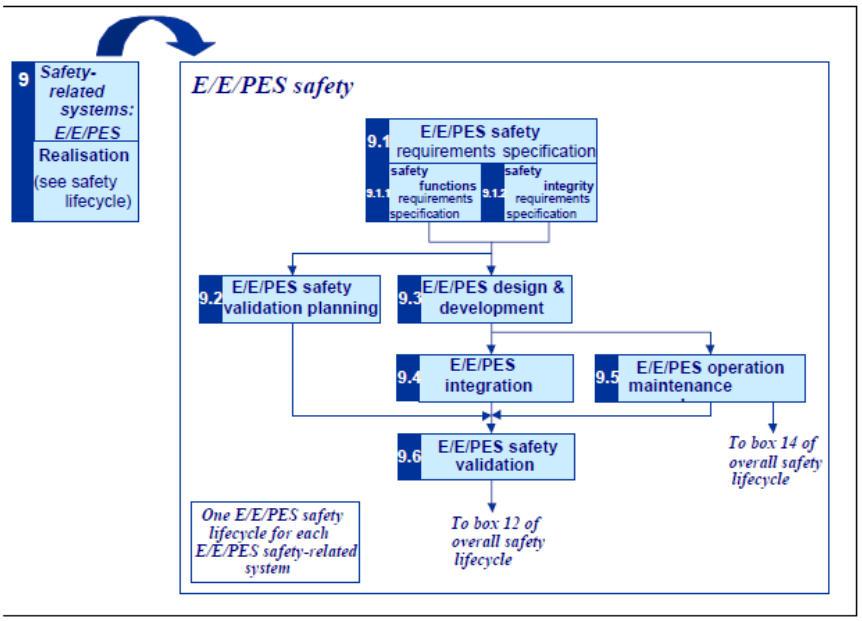

Figure 48 – Example directory.

The steps as mentioned in Figure 44 are included in the Quality Management System (QMS) of Yokogawa. Verification of all steps is done after each design phase.

19 PROSAFE-RS PROJECT CONFIGURATION

A ProSafe-RS project is a set of configuration files accessible from the Workbench Software. The files are organized in a set of folders for each SCS controller.

19.1 RS PROJECT FOLDER STRUCTURE

The project shall be stored on the EWS in the designated folder: C:\RS-Projects.

Under this folder create a folder with the project name. This folder is where the SCS controllers will be created using the Workbench Software. Additional levels of folders can be created to separate units or plants if so desired.

The Project Name folder must be given a valid name with 8 characters maximum. The following naming restrictions apply:

Folder name: Up to 8 characters, starting with an upper case alphabet character. Characters that can be used: Upper case alphabet characters, numerals, underscore, and hyphen.

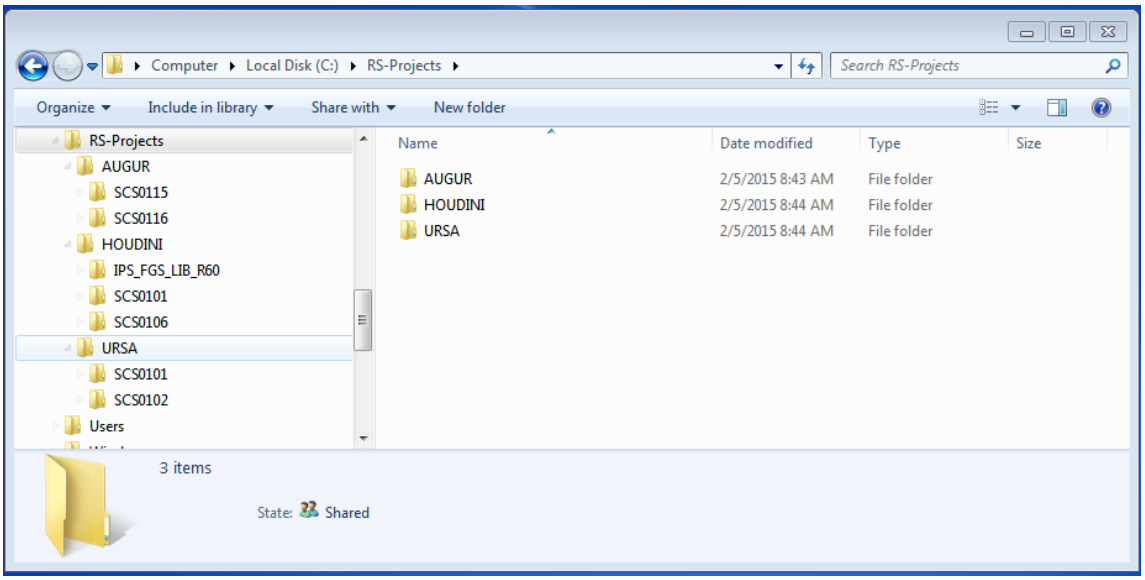

Figure 49 – Example directory

In the example, "AUGUR", "HOUDINI" and "URSA" are the project folders, "SCS0115" and "SCS0116" are folders for each SCS shown for completeness. The controller folders will be created automatically when the controller is created in the Workbench software.

NOTE: The Safety Control Station (SCS) system folder will take the format "SCSddss" where dd = domain number and ss = station number.

19.2 SCS SETUP

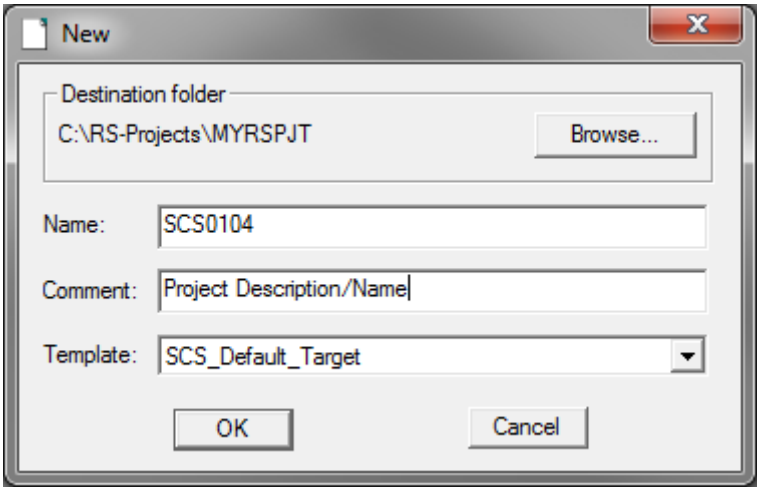

Figure 50 – New Controller Window

Use the Browse button to select the directory in which to create the SCS controller i.e. the correct project.

Name: "SCSddss" as defined in the architecture diagram.

Comment: Project name with a maximum of 24 characters. The project name appears as the caption of the workbench of the currently open project.

Template: Select SCS_Default_Target.

Select OK.

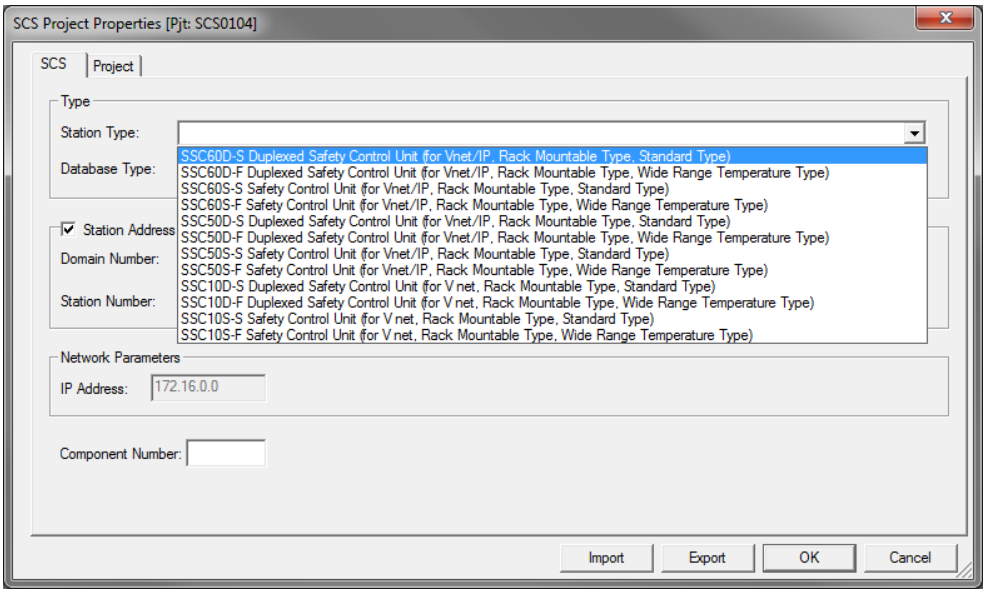

Figure 51 – SCS Project Properties Window – SCS selection.

Select the correct SCS type.

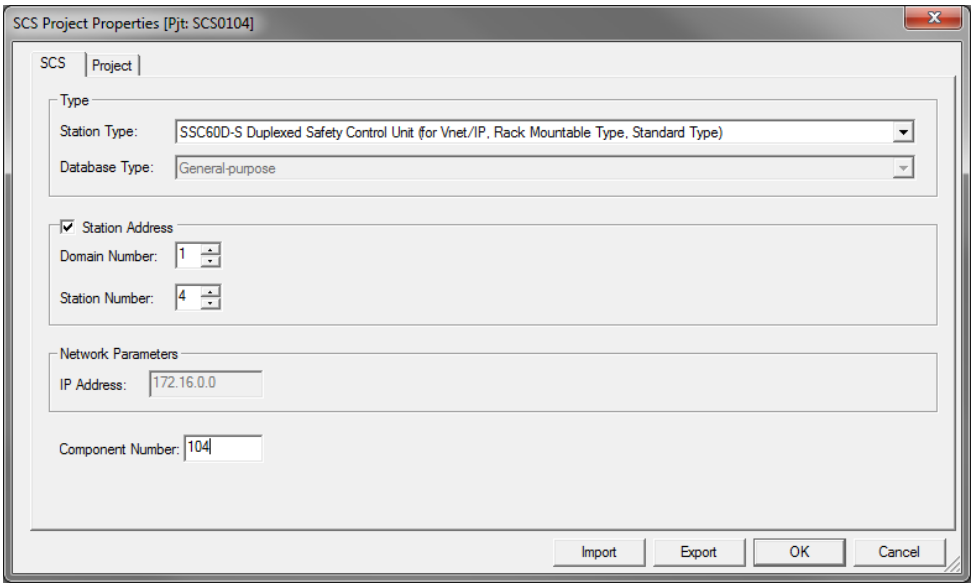

Figure 52 – SCS Project Properties Window – Station Address

Enter the correct Domain and Station Number.

The Component Number is ddss with no leading zeros.

19.3 PROJECT ARCHITECTURE SETUP

The Project architecture will be set-up by selecting the title bar on Link Architecture View (the default view after creation) and then choosing the [Properties] from the Edit menu to display the Resource Properties dialog box. The resource name and the resource number are defined through the General tab.

19.3.1 Link Architecture

Name: Same as project name folder. 8 characters maximum.

Comment: Same as Project Comment. 24 characters maximum.

Resource number: "ddss" (dd: domain number, ss: station number with no leading zeros on the domain).

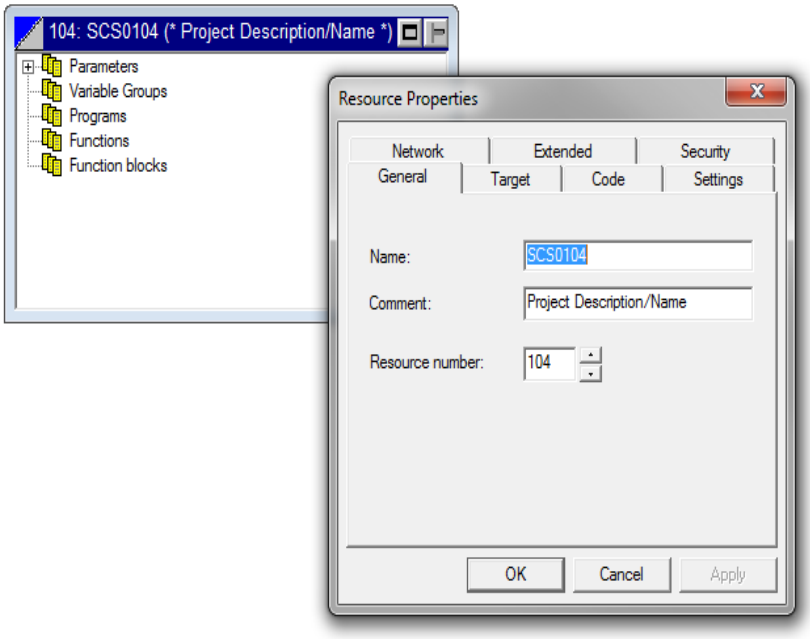

Figure 53 – Resource Properties

19.3.2 Scan Rate

The Scan Rate shall be configured through the settings Tab in the Resource properties window as shown below. The Minimum Scan Rate that can be entered in the Cycle time box is 50 milliseconds. The required Scan rate entered in the Cycle Timing box in milliseconds, depends on Safety Requirement Specification which will meet the required process safety time. The setting for the other tabs will be left at the default values. Refer the online help for additional information.

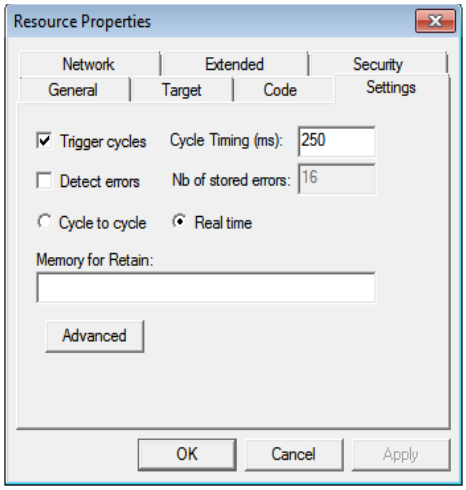

Figure 54 – Scan Rate Setting

19.3.3 Network Parameter

The IP address shall be defined on Hardware Architecture View. From the Windows button toolbar, select the Hardware Architecture view. Double click "Connection" (the line connecting the SCS box to the network line) so as to display Connection - Properties dialog box. The IP address needs to be set for "Value" item.

The IP address sets: 172.16.dd.ss

dd: domain number

ss: station number

E.g.:

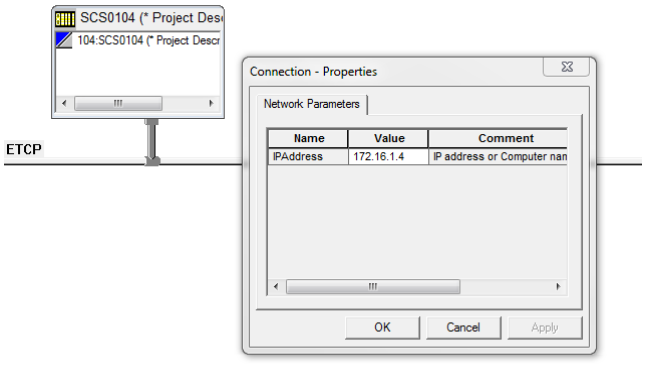

Figure 55 – Network Parameters

Use the Windows menu to return to the Link Architecture view.

19.3.4 ESB Bus Repeater Configuration

If Optical ESB Bus Repeater node is used, Repeater parameters must be configured in SCS Constants Builder and I/O Parameter Builder.

Select SCS Constants Builder from Workbench's Engineering menu

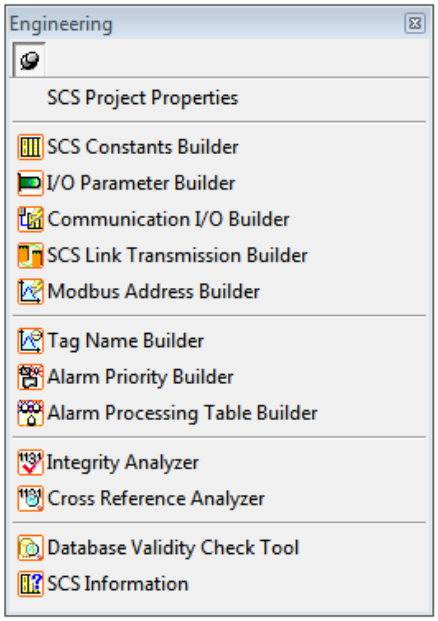

Figure 56 – SCS Engineering Menu Window

Select 1 (Yes) option and Maximum Extension Distance for Optical ESB Bus Repeater from SCS Constants Builder window. This distance value is the maximum distance from processor to the last extended node.

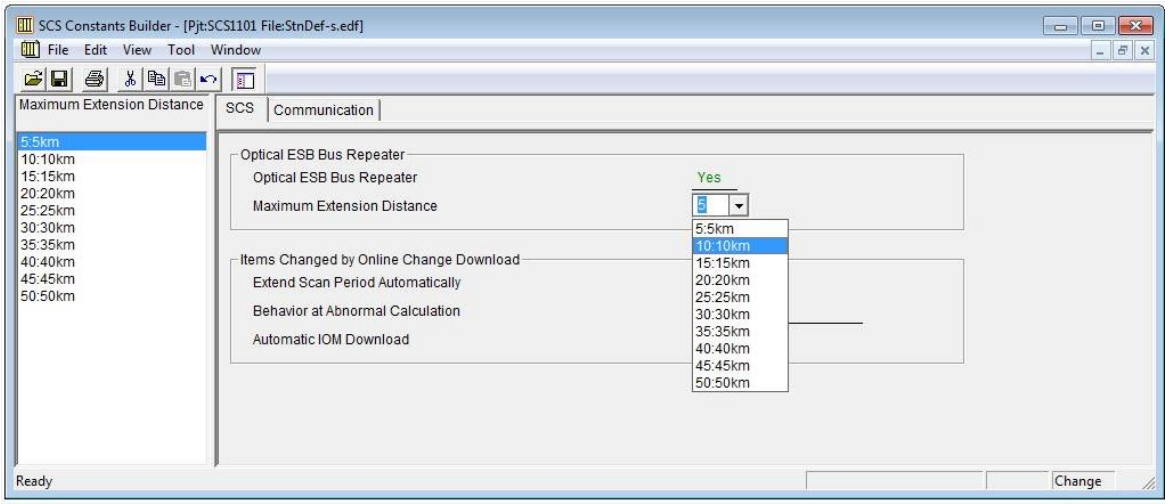

Figure 57 – SCS Constants Builder Window

Once SCS Constants Builder options has been selected and saved, Open I/O Parameter Builder from Engineering menu. Select node number on the left then select 1 (Yes) option and specify repeater node distance.

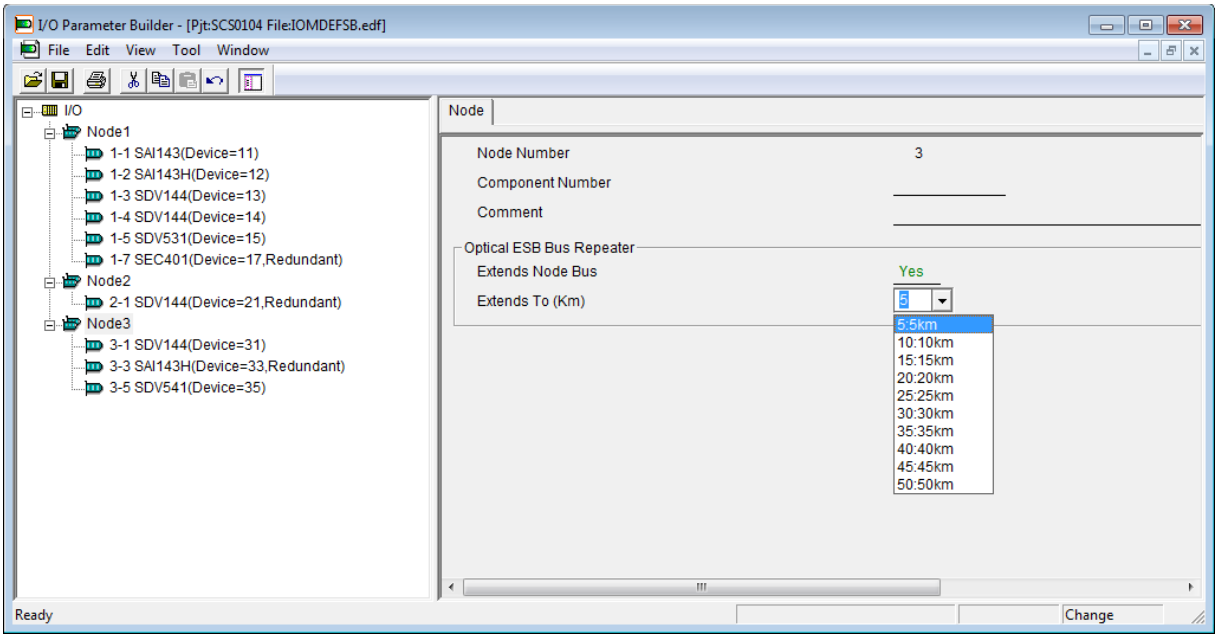

Figure 58 – I/O Parameter Builder Window

19.3.5 Additional SCS Configuration Options

Extend Scan Period Automatically – This function automatically extends the scan period of application logic execution function when the load on SCS becomes high. It is not recommended to enable this option because it can affect the system safety time.

Behavior at Abnormal Calculation – if there is an error in the application logic (i.e. divide by 0) that causes overflow and other abnormal calculations during logic execution, SCS will stop because correct control cannot be continued. Enabling this option (select 'SCS Continues') will allow SCS processor to resume operations and system alarms will be generated. It is recommended to have this option enabled.

Automatic IOM Download – This function will allow automatic execution of IOM download. When a redundant module on standby side is replaced for maintenance, the configuration information is automatically downloaded from the module on control side to the replaced module. It is recommended to enable this option.

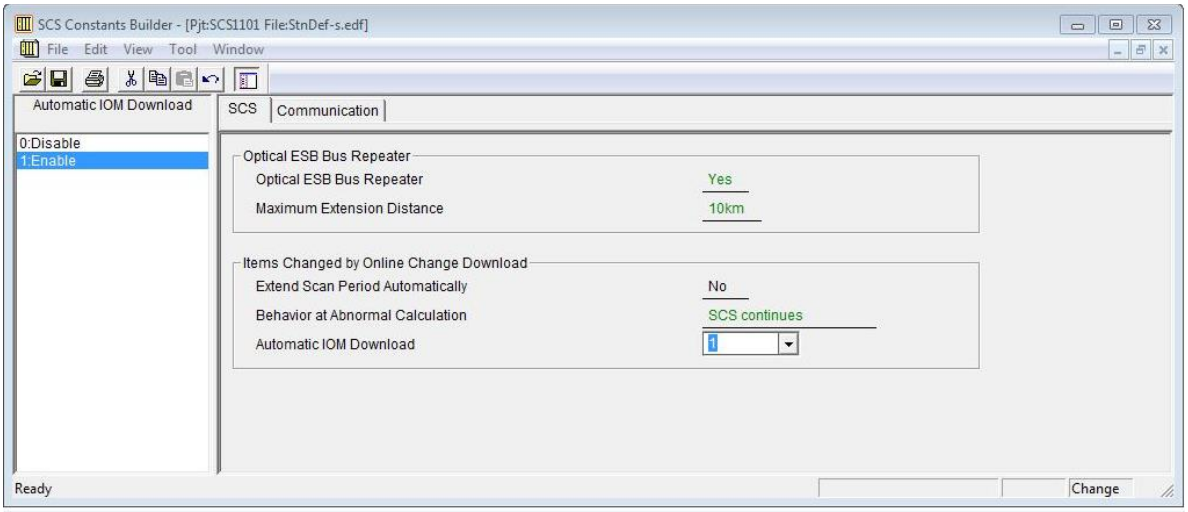

Figure 59 – SCS Engineering Menu Window

20 PROGRAMMING AND INSTRUMENTATION CONVENTION

The following convention shall be used throughout the project:

- SIS Outputs typically de-energize to trip & FGS Outputs typically energize to trip.
- Input trip signals shall occur when de-energized (0 or OFF) for SIS & energized(1 or ON) for FGS.
- Transmitter fault signals shall occur when de-energized (0 or OFF). A fault may or may not be a trip depending on the voting scheme and the actual transmitter configuration.
- FGS detector fault signals shall occur when energized (1 or ON). A fault may or may not be a trip depending on the voting scheme and the actual detector configuration.
- Overrides shall be active when energized.
- Alarms and first outs are indicated as energized when active.
- Constant values shall be used for setting alarm limits and trip set points. These constants shall be accessible only to authorized personnel through the Workbench software and require coding changes.
- SIS Logic shall be programmed to be negative: TRUE is the normal condition; FALSE reflects the tripped state. [De-energize to safe]
- FGS Logic shall be programmed to be positive: FALSE is the normal condition; TRUE reflects the tripped state. [energize to safe]

20.1 DEFAULT CONSTANTS SETTING

- Repeated warning alarms: Project Specific.
- Synchronous mode: Vnet/IP.
- Scan period for external system: one second.
- MODBUS word order: blank (filled in when subsystem defined).

The above SCS communication behaviour can be specified in SCS constants builder independently and the same is explained below in detail.

Figure 60 – SCS Constant Builder-Communication Behavior.

20.2 I/O PARAMETER BUILDER

Set all channel parameters according to the hardware design. Parameters of I/O modules and channels include the specification of action on error detection.

20.2.1 Digital Input Line Monitoring

Line monitoring configuration can detect short circuits, open circuits or both. Provided below are the options and their settings. Exceptions will be justified on a case-by-case basis. The SCB110 is a 5.6V Zener Diode and the SCB100 is a 36kohm, 1%, 25W resistor.

Short & Open Circuit:

SCB110 & SCB100 EOL Device are required for short & open circuit line monitoring.

Open Circuit:

SCB100 EOL Device is required for open circuit line monitoring.

Short Circuit:

SCB110 EOL Device is required for short circuit line monitoring.

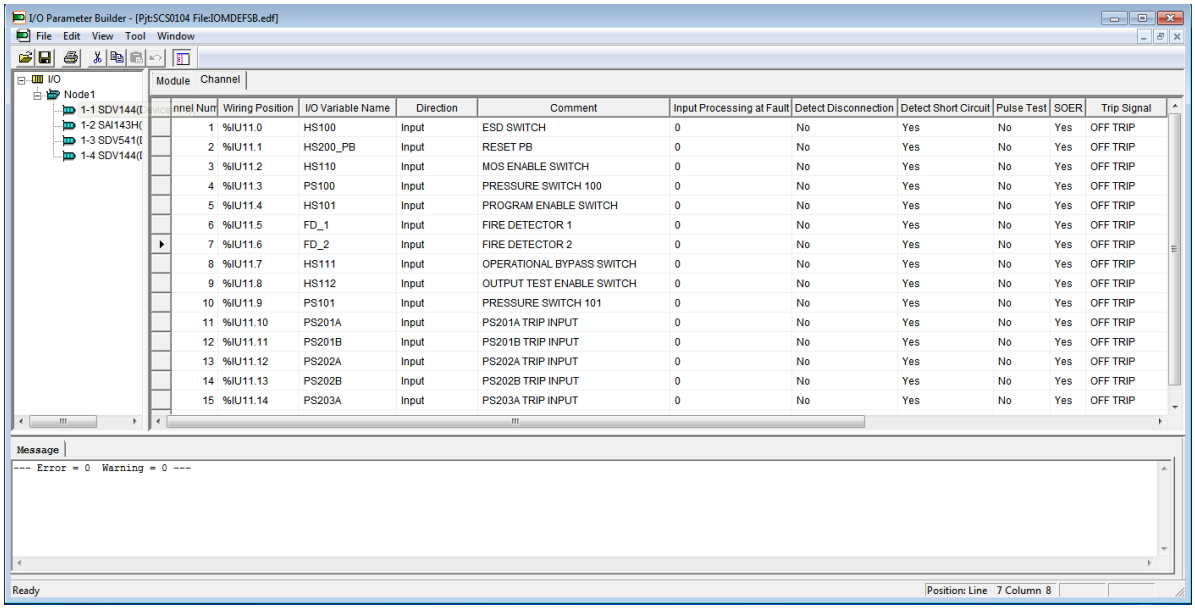
No Monitoring :

Shall have all diagnostics removed.

Trip signal item specifies whether or not to regard an event as a trip occurrence. This setting is only enabled if [Yes] is set for [SOER].

- No (0): Changes are not regarded as a trip signal (default).
  However these are recorded in SOE as event changes.
- OFF TRIP (1):
  A change to OFF is regarded as a trip signal and SOE data before and after a trip is stored in an SCS.
- ON TRIP (2):
  A change to ON is regarded as a trip signal and SOE data before and after a trip is stored in an SCS.

The default background color for trip trigger events in SOE viewer is yellow.



I/O Parameter	Options	Project Setting	
		SIS Setting	FGS Setting
Input Value at Fault :	0, 1, HOLD	0	0
Disconnection Detection:	NO, YES	YES (NOTE 1)	YES (NOTE 1)
Short Circuit Detection:	NO, YES	YES (NOTE 1)	YES (NOTE 1)
Pulse Test:	NO, YES	NO	NO
SOER:	NO, YES	YES	YES
Trip Signal:	NONE, OFF TRIP, ON TRIP	[Trip direction of Point]	[Trip direction of Point]

Table 66 – Discrete Input card settings

Note 1: To be Configured based on IO Lists.

I/O Parameter Builder settings for all wired spare/unwire spare tags shall be disabled for signal/transmitter fault detection to avoid nuisance alarms Example Configuration

Example Configuration

20.2.2 Digital Output Line Monitoring

Line monitoring for DO is available. Prosafe RS outputs shall be configured with the following diagnostics configuration:

IO Parameter	Options	SIS Setting	FGS Setting
Output Shutoff Switch:	DISABLE, ENABLE	ENABLE (Note 1)	ENABLE (Note 1)
Output Processing at Fault:	0, 1, HOLD	0 (1 for BDV)	0
Detect Disconnection:	NO, YES	NO (Note 2)	YES (Note 2)
Pulse Test (OFF):	NO, YES	NO (Note 2)	NO
Pulse Test (ON):	NO, YES	NO	Yes (Note 2)
SOER:	NO, YES	YES	YES
Trip Signal:	NONE, OFF TRIP, ON TRIP	OFF TRIP (ON TRIP for BDV)	ON TRIP

Table 67 – Discrete Output card settings

Note 1: The Output Shutoff Switch should be set to ENABLED. Spares and non-critical points should have Output Shutoff Switch DISABLED. When set to ENABLED, the whole digital output card will be de-energised when a critical fault is detected.

If the project selects the settings to ENABLED, engineering attention shall be given to IO allocation such that when the complete IO card is shut down no dangerous situation shall occur.

Note 2: To be Configured based on IO Lists.

For Lamp outputs & buzzer, disconnection connection and pulse test options will be set to NO.

For relay the line monitoring diagnostics available until coil supply.

For the monitoring to function properly, the normal load must exceed 35mA. If the end device draws less, resistors shall be installed to support the monitoring function.

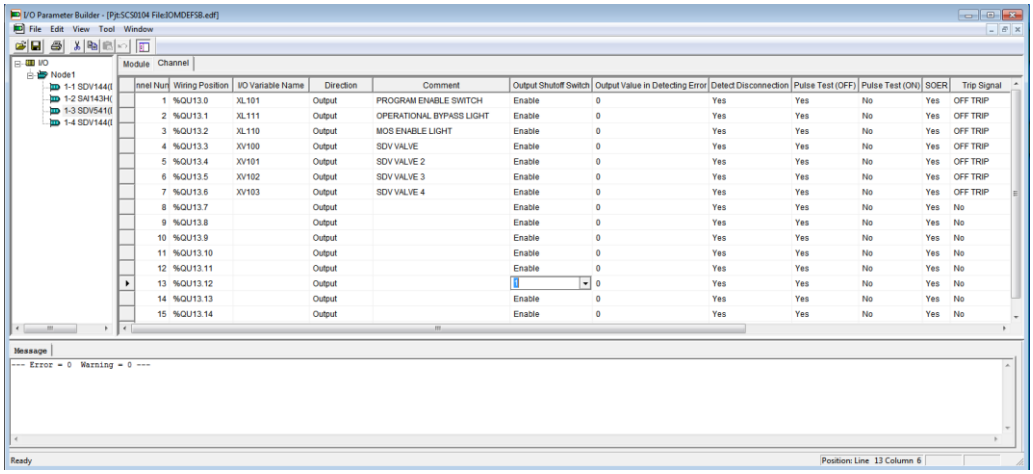

Figure 65 – Discrete Output Parameter Builder

20.2.3 Transmitter Failure Detection

Transmitter failure detection shall be at the channel level producing a system alarm with node slot channel and fault type displayed on the HIS. Diagnostics shall be configured as follows:

IO Parameter	Options	SIS Setting	FGS Setting
Input Processing at Fault:	HOLD, FIXED VALUE	FIXED VALUE Note 1	HOLD Note 4
Input Value at Fault:	-25.0%(0mA) TO 125.0%(24mA)	(Refer IO list for Fail safe value) Note 5	0.0%
Input Processing at Transmitter Fault	Input Processing at Fault, Raw Data	0-Input Processing at Fault	1-Raw data
Signal Conversion	LINEAR, SQRT	LINEAR	LINEAR
IOP Detection (High):	NO, YES	YES (Note 1)	YES (Note 1)
IOP Detection (Low):	NO, YES	YES (Note 1)	YES (Note 1)
Transmitter Fault Detection (High):	NO, YES	YES (Note 1)	NO
Transmitter Fault Detection (Low):	NO, YES	YES (Note 1)	NO
Field Power Diagnosis	None, 2-Wire, 4-Wire	2-Wire or 4 Wire	2-Wire or 4 Wire

Table 68 – Analog Input card settings

Note 1: Fixed value, either high trip or low trip, shall be set based upon project requirements. Correct settings must be evaluated for each individual channels.

The following default set points shall be used to detect faults (The values below are the defaults and need to be verified for the specific field instrument):

Parameter Note 3	High	Low
Transmitter Fault (Note 2)	103.125% (20.5 mA)	-1.25% (3.8mA)
IOP	106.25% (21 mA)	-2.5% (3.6mA)

Table 69 – Analog Input card settings

Note 1: 2-wire and 4-wire signals should be separated when possible for clarity.

Note 2: Setting at instrument in field should be 3.6mA and/or 21.0 mA.

Note 3: Both transmitter fault and Input Open, create IOP on HMI.

Note 4: General fault for various devices shall be generated as per device data sheet and same is summarized in below table of each detector (HOLD-1).

Note 5: Fail Safe Value (input value at fault) Setting for SIS follow below

Voted Configuration	Fail Safe Setting	Remarks
1ooN (1oo1, 1oo2) High Trip Transmitter	100%	Towards the direction of high trip
1ooN (1oo1, 1oo2) Low Trip Transmitter	0%	Towards the direction of low trip
1ooN (1oo1, 1oo2) High/Low Trip Transmitter	0% or 100%	Selection of fault value is toward the higher SIL rated function

Table 70 – Fail safe Value

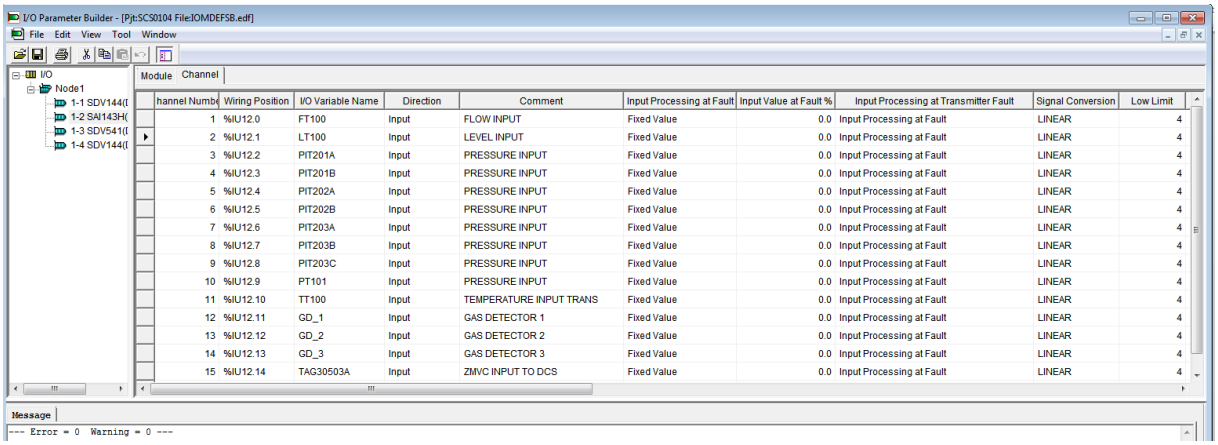

Figure 66 – Analog Input Parameter Builder

20.3 I/O WIRING CONFIGURATION

Configure the I/O modules according to the hardware design.

20.3.1 Device Selection

ESB Bus Coupler Module SEC402 connects safety control units and safety node units via an ESB bus cable.

An SEC401 bus coupler module is required if Safety Node Units (I/O racks) are installed.

The device index shall be numbered as follows:

First two characters are the node number, and the second character is the slot number.

The I/O parameter Builder shall show the actual configuration in the correct order, using the node/slot numbers.

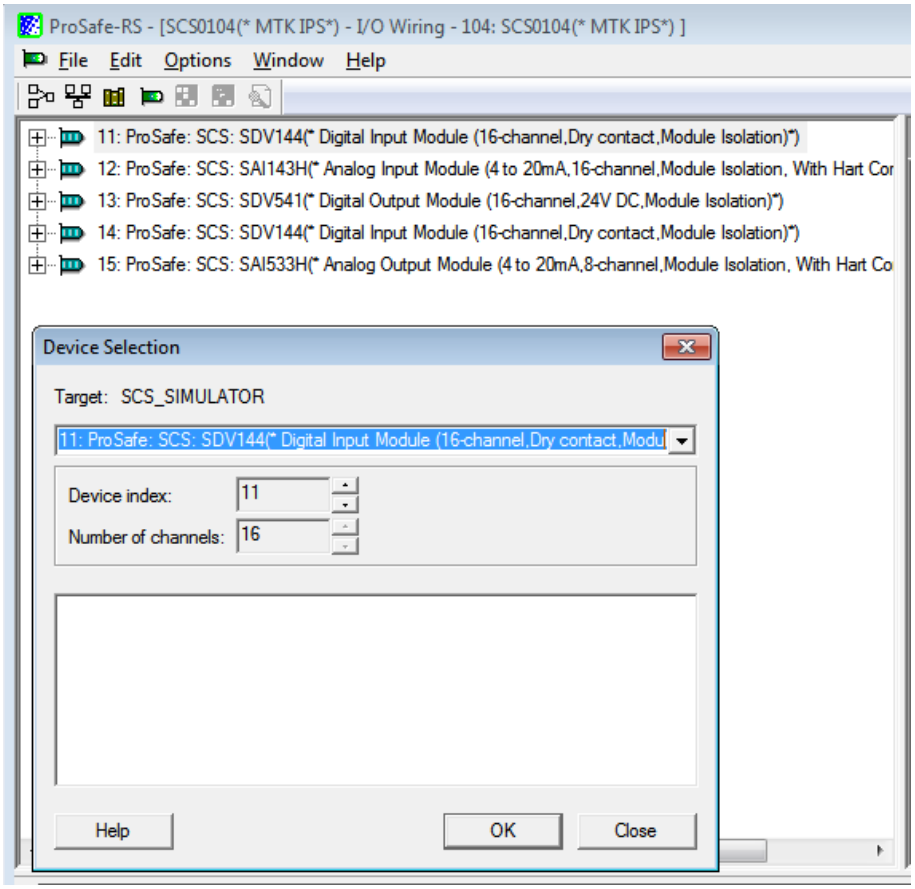

Figure 67 – I/O Module Selection

20.3.2 I/O Parameters

Each module's node and slot numbers shall be entered, and TRUE shall be entered in the Is Redundant field. Non-critical loops such as indication lamps may be assigned to non-redundant modules; in this case the Is Redundant field will be FALSE.

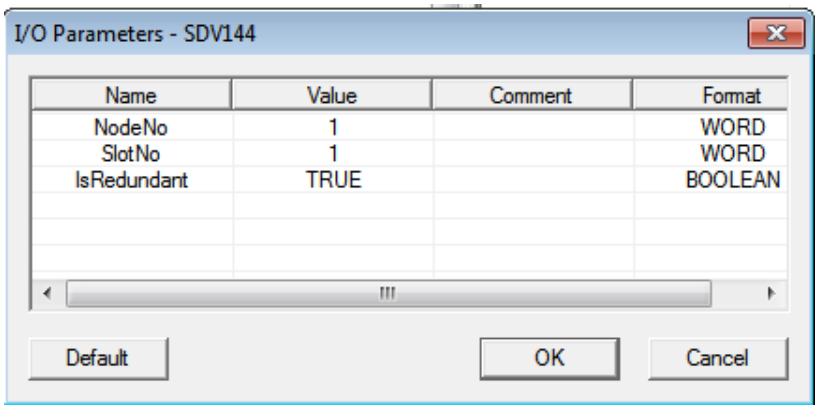

Figure 68 – I/O Module Parameters

Once variables declared as I/O have been created in the dictionary, they shall be listed in the unwired variables table. Only variables of the correct type for the selected I/O module are listed in the unwired variable table, a variable can then be wired to the selected channel.

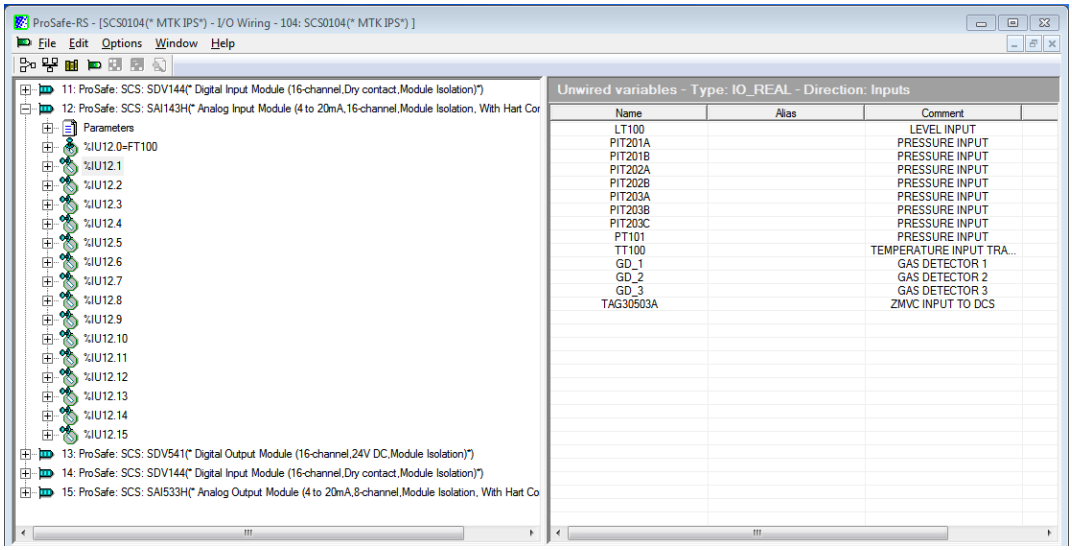

Figure 69 – I/O Wiring

20.4 DEFINED WORDS FOR SOE BLOCKS

Only default words shall be used and are in the Dictionary under the 'Open - True' Tab.

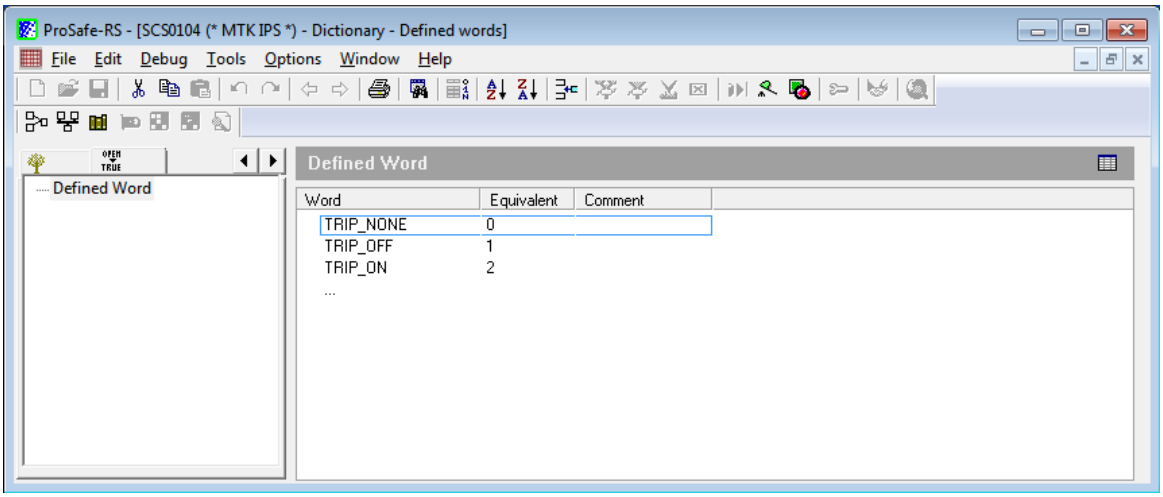

Figure 70 – Defined Words

The Defined Words are used on the SOE block input nubs:

TRIP_NONE is used to signify that a point or event is not a trip.

TRIP_OFF is used to signify that a point or event trip in the OFF or 0 position.

TRIP_ON is used to signify that a point or event trip in the ON or 1 position.

20.4.1 Variable Dictionary

The following fields are required for every I/O point or internal variable:

Field	Description
Name	Variable Name
Type	Variable Type
Group	Variable Group
Attribute	Variable Attribute (Read, Write, or Free)
Scope	Variable Global or Local to Program
Direction	Variable Direction (Input, Output, or Internal)
Comment	Variable Comment (24 character limit)

Figure 71 – Variable Dictionary

Most of these fields shall be imported from the project database.

Name	Alias	Type	[]	Init. value	Dimensi...	Group	Attribute	Scope	Direction	Retain	Wiring	Address	Comment
PPA10200		BOOL				None	Free	Global	Internal	No			PRESSURE PRE ALARM
PPA10300		BOOL				None	Free	Global	Internal	No			PRESSURE PRE ALARM
⊞ PPA10400		ANN				None	Free	Global	Internal	No			PRESSURE PRE ALARM
PPA10400A		BOOL				None	Free	Global	Internal	No			PRESSURE PRE ALARM
PPA10400B		BOOL				None	Free	Global	Internal	No			PRESSURE PRE ALARM
⊞ PPA10500		ANN				None	Free	Global	Internal	No			PRESSURE PRE ALARM
PPA10500A		BOOL				None	Free	Global	Internal	No			PRESSURE PRE ALARM
PPA10500B		BOOL				None	Free	Global	Internal	No			PRESSURE PRE ALARM

Figure 72 – Variable Dictionary

20.4.2 Variable Name

The Variable Name will be the tag from the project database.

20.4.3 Variable Type

This is a drop-down menu with the available I/O types.

20.4.4 Variable group declaration

Variable Groups provide a method of managing variables and logically sorting them within a SCS. The variable groups are shown in the Variables Tree. Their contents are defined within the Dictionary Variables grid. Define the following variable groups:

Name	Functionality
AI_Proc	Analog Input Proc UDFB & Points
AO_Proc	Analog Output Proc UDFB & Points
DI_Proc	Discrete Input Proc UDFB & Points
DO_Proc	Discrete Output Proc UDFB & Points
COMM	Inter SCS UDFB & Points

SYS	System Alarms & Diagnostics

Table 71 – Variable group declaration

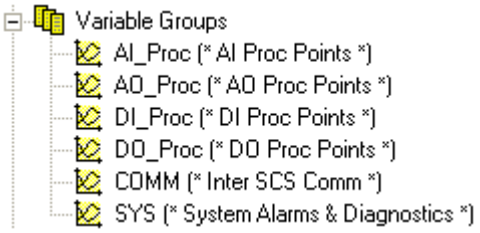

Figure 73 – Variable Groups

20.4.5 Variable Attribute

The Variable Attribute can be one of three settings:

1) Read – used for Inputs.
2) Write – used for Outputs.
3) Free – used for internal variables which are read and write capable.

20.4.6 Variable Scope

The Variable Scope may be one of two values: Global, and Local to Program. A Global Variable may be used and seen by all areas of programming within the SCS. A Local to Program Variable is confined to use within a subprogram or Function Block.

20.4.7 Variable Direction

The Variable Direction can be one of three settings:

1) Input – used for Inputs.
2) Output – used for Outputs.
3) Internal – used for internal variable which are read and write capable.

20.4.8 Variable Comment

Comment field for all points shall be filled with a description of the service and function of the tag.

21 APPLICATION PROGRAMS

21.1 ORGANIZATION / STRUCTURE

21.1.1 Setup

When starting a new controller configuration, certain initial settings for Workbench need to be verified.

In the logic editor:

- Under the options menu ensure that Show I/O Variable Comments and Show Internal Variable Comments are checked.
- In the Tools menu, select Show/Hide Guidelines Area and check that all guidelines are checked.
- In the working area space, the guidelines such that the Inputs area is five “dots” wide, the From area is five “dots” wide, the Logic area is Twenty Five “dots” wide, the To area is five “dots” wide and the Outputs area is five “dots” wide.

21.1.2 Program Sheet Format

The Program shall include a title block as described above. The title block shall be positioned at the top of the page properly sized with extra space for future additional commenting.

Program functionality shall be divided as follows:

Functionality	Program Naming Convention
Auxiliary Alarms such as power supply and fan failure	AUX_ALM
Link Transmission Received from other SCS and FCS	COM_FROM_SCS[Domain][Station] COM_FROM_FCS[Domain][Station]
Serial Communications Blocks	COM_SER
Unit Processing	UNIT_xx[Group or Equipment]
Special Logic Processing such as sequences or trip that span multiple C&Es	SCLxx_[Group or Equipment]
Link Transmission Leaving to other SCS or FCS	COM_OUT

Table 72 – Types of Program Functionality

Further divisions shall be created as needed on a per project basis. The program flow is as follows:

1. The inputs from other systems are read.
2. All of the inputs are processed including scaling and override, creating the appropriate trip flags.
3. The output logic is processed using the trip flags created in the current or previous sheets.
4. Outputs to other systems are sent.
5. The first out (if needed) is generated.

The configuration will be grouped based on Units. Each group of sheets will start with an input processing section (one sheet or more if necessary) a logic section containing the UZ trip and resetting logic and an output processing sheet (one sheet or more if necessary).

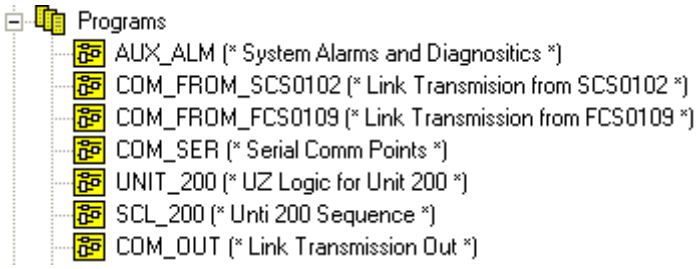

Figure 74 –Program Layout Example

21.1.3 Trip Principle

The trip principle for Safety Instrumented Systems is typically de-energize to trip; exceptions shall be identified in the Project's Safety Requirements Specification. When an SIS/FGS output is tripped, a signal will be sent to the PCS to place any associated loops into manual with a 0% output.

The trip principle for Fire & Gas Systems Shall follow typically energize to trip. Firefighting related system outputs, fire water pump start signals and horn/beacon outputs which are designated energise-to-activate, and for which line monitoring shall be provided. Other requirements shall be identified in the Projects Fire & Gas Safety Requirements Specification. The FGS trip signal sent to SIS to initiate shutdown as required shall be designed fail-safe.

21.1.4 Inter SCS Communication

Communication between different SCS's is possible in following 2 methods.

- Across domains using Inter SCS Safety communication.
- Within same domain using Link transmission function.

Link Transmission

Only BOOL communications will be performed using Link Transmission within a single Domain. This allows each controller to broadcast 128 bits of data to all the other controllers in the domain. Each controller can receive up to 1000 bits from a mix of SCSs and FCSs. The response to loss of communications can be set individually to true, false or hold for each bit in the receiving SCS. Link Transmission allows BOOL type data communication only if the SCS are in the same domain.

Reaction for Link transmission

The three factors that determine response times for link transmission between two controllers are:

- Data execution by the SCS system program for receiving (consumer) controller and transmitting (producer) controller.
- Link transmission repeat time.
- V-net/IP transmission delay.

The data execution by the SCS is maximal two times the scan period for handling the input and output and logic execution. The V-net/IP transmission delay is 10ms (including 2ms switch over time, between bus1 and bus2), for communication within the same domain. The link transmission data is broadcast in a fixed time interval of 100ms. So, the worst-case scenario (theoretical maximum response time) for the response time between two controllers can be determined by applying the following formula;

RTDMAX (Reaction Time on Demand) = 2 x scan periods (producer) + 2 x scan periods (consumer) + 2 x link transmission repeat periods + V-net/IP delay + Link transmission repeat time.

The minimal data execution time is the scan period plus the input handling time plus the output handling time. As a result, the minimum (optimal) response time between two controllers can be determined by applying the following formula.

RTDOPT (Reaction Time on Demand) = 1 x scan period (producer) + 1 x scan period (consumer) + Vnet/IP delay + Link transmission repeat time

The average response time can be calculated by the following formula.

RTDAVG (Reaction Time on Demand) = (RTDMAX + RTDOPT) / 2.

Inter-SCS Safety Communication

If large amounts of data must be communicated between domains, one SCS in each domain will be selected to concentrate the data to be sent/received from the other domain. Consumer and Producer blocks will be used to send the data between these two SCSs. Link Transmission will be used to distribute the received data to other SCSs in the domain.

Reaction for safety communication

The two factors that determine response times for safety communication between two controllers are:

- Data execution by the SCS system program for receiving (consumer) controller and transmitting (producer) controller.
- V-net/IP transmission delay.

The data execution by the SCS is maximal two times the scan period for handling the input and maximal three times for the output handling and logic execution. The V-net/IP transmission delay is 50ms (including 2ms switch over time, between bus1 and bus2), for communication within the different domains. The worst-case scenario (theoretical maximum response time) for the response time between two controllers can be determined by applying the following formula.

RTDMAX (Reaction Time on Demand) = 2 x scan periods (producer) + 3 x scan periods (consumer) + Vnet/IP delay.

The minimal data execution time is the scan period plus the input handling time plus the output handling time. As a result, the minimum (optimal) response time between two controllers can be determined by applying the following formula.

RTDOPT (Reaction Time on Demand) = 1 x scan period (producer) + 1 x scan period (consumer) + Vnet/IP delay.

It is possible to program consumer and producer blocks for REAL or BOOL points, but usage requires Shell approval. System Producer Block (PROD_B for BOOL, PROD_I for DINT, or PROD_R for Real) and Consumer Block (CONS_B for BOOL, CONS_I for DINT, or CONS_R for Real) are used when configuring Inter SCS Communications. The response to loss of communications can be set individually to a preset value for each consumer block.

21.1.5 Analog Input processing

Analog input processing will be performed using one of the analog input typical depending on the voting requirements of the point.

- Scaling: An analog input 4-20 mA signal is normalized to a 0-100% value at the Analog Input card. The percentage is then scaled into engineering units from scale high and low value input nubs at the ANLG_S block.
- Analog Trip Points: There are input nubs for SDL, SDH, high-high, high, low and low-low trip. Pre-trip and trip setpoints are to be documented in the project's Safety Requirements Specification. When a setpoint is not required, the setpoint shall be set to value (99999.0 or -99999.0) to ensure that trip or alarm does not occur.

21.1.6 Discrete Input Processing

Discrete input processing will be performed using one of the discrete input typicals depending on the voting requirements of the point.

21.1.7 Interlock Logic Processing

The logic shall be grouped into UZ (or trip) groups. When one of the input devices associated with a UZ group enters its trip state, the UZ group is tripped, and all of the outputs affected by the group will be driven to their safe state. If the device was the first device in that group to trip, the first out flag for that point will be set true and all subsequent first out flags will be masked. The UZ group can only be reset when all of the input devices have been cleared or overridden. Once the group has been reset the outputs for that group will return to their normal state. If an output is driven by more than one UZ group, it will only return to its normal state if none of the UZ groups are tripped.

21.1.8 Fire and Gas Logic Processing

Fire and gas trip logic shall be grouped in per cause and effect or logic descriptions. Each group normally includes all fire and gas detectors in one unit zone or area. Each trip input is latched and must be reset individually. Once all initiating inputs have been reset the outputs for that zone will return to their normal state automatically. Single input trip or multiple input faults or overrides will initiate fire and gas vote to trip.

21.1.9 Resets

SIS logic and FGS logic has manuals reset only. Resets are initiated from the CI-View by the operator. Only when related trip input is recovered the reset signal will be accepted by the logic.

21.1.10 Output Processing

Output processing is performed by a standard template. Basic operation of the template is as follows:

- SIS Process & FGS manual trip shall cause an output to shut down to a fail-safe position.
- Shutdown outputs shall return to normal state once all trip conditions are cleared, all permissive conditions are satisfied, and the proper reset procedure has been completed.

The inputs for the output processing function block are generic in nature and can be used for many different types of outputs. Multiple outputs can be triggered by one block as long as all outputs share trip, permissive, and reset requirements.

21.1.11 Auxiliary Alarms

The following are cabinet alarms.

Part Alarm-1 : Fan Failure.

Part Alarm-2 : MCB tripped alarm

Part Alarm-3 : PSU Power Failure

Part-Alarm-4 : Earth Fault.

Part-Alarm-5 : Thermostat Alarm

The signals shall be wired fail safe. System alarms shall be configured on a per project basis. All system diagnosis alarms shall be brought to the CI-View alarm banner.

21.1.12 Annunciators

Discrete Alarms shall be programmed with the use of ANN function block. They shall exist throughout the application's function blocks or where process alarms are required. Annunciator messages will be composed of the Tag and the Tag Description for proper display in the alarm window.

21.1.13 Sequence of Events (SOE)

All DI and DO signals that require SOE shall be configured at the channel level of the IO module. Analog input signals shall be configured for SOE in the ANLG_S block. Any other points requiring SOE shall be programmed with the SOE function blocks. Only BOOL points shall be used for SOE. An example would be voted trip. They shall exist throughout the application's user defined function blocks or where the points are programmed. Points configured in the SOE application shall be per project requirements. Time stamping for SOE events shall be within 2 ms of event for Digital IO modules and at system scan rate for all others. Refer section 19.2 for SOE setting for digital inputs and outputs.

21.2 TAG NAME BUILDER

21.2.1 Tag Name Parameter Setting

BOOL / DINT / REAL / ECW TABS:

Points created in the dictionary shall have the Tag Name field the same as the Variable Name field and Tag Comment field the same as the Comment field.

Points from instanced user defined function block outputs shall have the Tag Name field follow the tag naming convention. The Tag Comment shall have as clear a description of the service and description of the point as possible with 24 characters maximum with a space at 12th character. Variable Naming Convention shall have the Tag Name field follow the expanded tag naming convention on a per project basis.

BOOL/ECW_B | DINT/REAL/ECW_I/ECW_R | ANLGI/ANLG_S | VEL | ANN | IO_REAL | IO_BOOL | GOV_B/GOV_IB/OVR_B/OVR_IB | OVR_I/OVR_R/OVR_IR | PASSWD | SCI_B/SCO_B | SCI_I/SCO_I

Variable Name	Tag Name	Type	Tag Comment	Comment
HAS10300	HAS10300	BOOL	PST10300 STARTUP BYPASS	PST10300 STARTUP BYPASS
HAS10600	HAS10600	BOOL	PST10600 STARTUP BYPASS	PST10600 STARTUP BYPASS
HAS10700	HAS10700	BOOL	PST10700 STARTUP BYPASS	PST10700 STARTUP BYPASS
HAS10800	HAS10800	BOOL	PST10800 STARTUP BYPASS	PST10800 STARTUP BYPASS
SDV10850_PST.CONFIRM	SDV10850_CONF	BOOL	CONFIRM REQUEST TO OP	CONFIRM REQUEST TO OP
SDV10850_PST.FBO_PROGRESS	SDV10850_PROG	BOOL	PST IN PROGRESS	PST IN PROGRESS
SDV10850_PST.FBO_COMPLETE	SDV10850_COMP	BOOL	PST COMPLETE FLAG	PST COMPLETE FLAG

Table 73 –Tag Name Builder Example

ANLGI / ANLG_S TAB:

The Tag Name field shall be the transmitter (root) instrument name with the "T" replaced with an "I", i.e. the ANLG_S for analog input PT10300 will be PI10300.

The Tag Comment shall have as clear a description of the service and description of the point as possible with 24 characters maximum in accordance with the customer IO database. The faceplate will display the comment in two 12-character rows so care should be taken to try to generate a comment that can be understood when split.

The Low Limit and High Limit fields shall be the low and high scale ranges associated with the transmitter.

The Unit field shall be the engineering units associated with the transmitter following the engineering units table from the integrated PCS (CENTUM VP) project.

BOOL/ECW_B | DINT/REAL/ECW_I/ECW_R | ANLGI/ANLG_S | VEL | ANN | IO_REAL | IO_BOOL | GOV_B/GOV_IB/OVR_B/OVR_IB | OVR_I/OVR_R/OVR_IR | PASSWD | SCI_B/SCO_B | SCI_I/SCO_I/SCI_F

Variable Name	Tag Name	Tag Comment	Comment	Low Limit	High Limit	Unit
PI10100	PI10100	TANK PRESSURE	TANK PRESSURE	0.0	200.0	BAR
PI10200	PI10200	TANK PRESSURE	TANK PRESSURE	0.0	200.0	BAR

PI10500A	PI10500A	TANK PRESSURE	TANK PRESSURE	0.0	200.0	BAR
PI10500B	PI10500B	TANK PRESSURE	TANK PRESSURE	0.0	200.0	BAR
PI10500C	PI10500C	TANK PRESSURE	TANK PRESSURE	0.0	200.0	BAR

Figure 75 -ANLGI / ANLG_S Tab Example

ANN TAB

Points created in the dictionary shall have the Tag Name field the same as the Variable Name field.

Points from instanced user defined function block outputs shall have the Tag Name field follow the tag naming convention. Variable Naming Convention shall have the Tag Name field follow the expanded tagging convention on a per project basis.

Annunciator Message field shall include the tag name, equipment or group, and description with 80 characters maximum.

BOOL/ECW_B | DINT/REAL/ECW_I/ECW_R | ANLGI/ANLG_S | VEL | ANN | IO_REAL | IO_BOOL | GOV_B/GOV_IB/OVR_B/OVR_IB | OVR_I/OVR_R/OVR_IR | PASSWD | SCI_B/SCO_B

Element Name	Variable Name	Tag Name	Annunciator Message
%AN0016	PXA10400	PXA10400	PST10400 High High Alarm
%AN0017	PXA10500	PXA10500	PST10500 High High Alarm
%AN0018	PI10400.DEV	PDA10400	PST10400 Deviation Alarm
%AN0019	PI10400.PRETRIP	PPA10400	PST10400 High Alarm
%AN0020	PI10400.TRIP	PXA10400	PST10400 High High Alarm

Figure 76 -Annunciator Tab Example

ALL OTHER TABS

Points created in the dictionary shall have the Tag Name field the same as the Variable Name field and Tag Comment field the same as the Comment field.

Points from instanced user defined function block outputs shall have the Tag Name field follow the tag naming convention. The Tag Comment shall have as clear a description of the service and description of the point as possible with 24 characters maximum. If the point has a faceplate, the faceplate will display the comment in two 12-character rows so care should be taken to try to generate a comment that can be understood when split. Variable Naming Convention shall have the Tag Name field follow the expanded tagging convention on a per project basis.

21.2.2 CENTUM VP/ ProSafe-RS integration

ProSafe-RS shall provide all signals required by the CENTUM VP graphics through the Tag Name Builder. These signals shall include analog ANLG_S blocks, trip/shutdown signals, maintenance, startup override feedback, SIS/FGS process alarms, transmitter fault signals and timers included in logic.

21.2.3 Alarm priority building

Alarm Priority Builder setting must match the alarm priority setting in CENTUM VP PCS. If a mismatch occurs a warning shall occur when the program is built or compiled.

21.2.4 Alarm Processing Table Builder

SIS/FGS(SCS)/PCS(FCS) integration, the Alarm Processing Table is used to determine the Alarm Priority of process alarms raised by function blocks (FBs) or mapping blocks. Each block will have the same alarm priority in the Tag Name Builder, but the individual alarms associated with each block can be assigned different priorities in the builder based on that overall priority. The Alarm Processing Table Builder is edited in the CENTUM VP EWS and then imported into Workbench.

The Alarm Processing Table Builder is used to import the 'Alarm Processing Table' defined on CENTUM VP to the SCS project. In the CENTUM VP integration structure, the application of ProSafe-RS needs to be defined with those builders. Furthermore, engineering of CENTUM VP including SCS definition and configuration, and tag list generation needs to be executed on the CENTUM VP EWS.

The following figure shows the outline of CENTUM VP integration application definition.

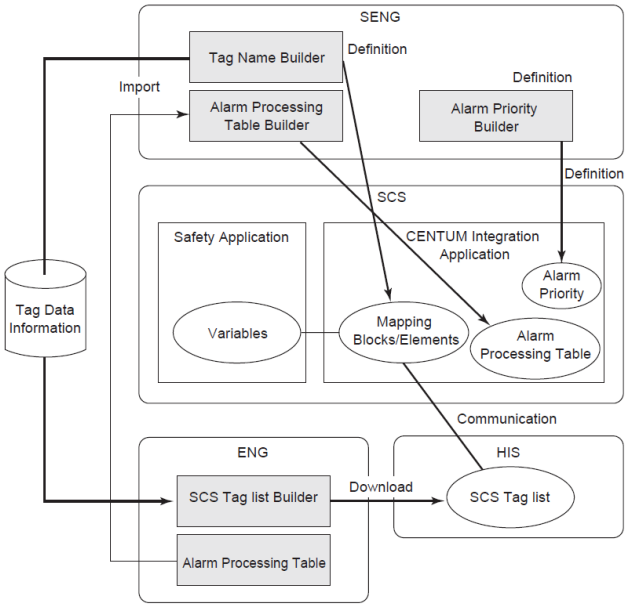

Figure 77 – CENTUM VP Integration

21.3 SECURITY AND PASSWORDS SETTING

21.3.1 Security

All security levels must have passwords configured as per site requirements. Passwords shall be configured during pre-FAT. The security level of SCS indicates how much the memory of SCS is protected from the setting of data from outside. An overview of SCS security level is as follows:

- One SCS has one security level. At any moment of time, the controller can only be in one particular state.
- The security level can be confirmed from an LED on the CPU module and the SCS State Management screen of SCS Maintenance Support Tool.

STATUS lamps	Display	Description
1, 2	Operating Mode	• Running mode: 1 and 2 on • Waiting mode: 1 off, 2 on • Others: 1 and 2 off
3	Security level	Turns on only for security level 2. (*1)
4	Safety control station error (*2)	• Error occurred: off • Normal: on
5, 6, 7	Unused	Always on
8	Writing to flash memories	Writing: off, Otherwise: on

*1: Security level 0 corresponds to offline level and security levels 1 and 2 correspond to online level.
*2: This lamp may be linked to the SYS_DIAG output.

Table 74 – Status Lamps Display Operating Mode and Error Status

- SCS limits changes made online depending on the security level.
- The security level can be referred to by applicable logic.
- The security level can only be changed by an authorized user.
- The system function block (SYS_SEC_CTL) allows control of whether or not security level change operations from a EWS with an external hardware program Enable/Disable key switch.
- The security level can be changed under the following conditions:
  - The SCS is either in the Waiting or Running mode
  - SYS_SEC_CTL is set to allow security level changes or is not used.

There are two classifications of security levels: Online and Offline.

- The Online level is used when the SCS is in normal operation. It can be separated into two levels according to the limits of functions which can be used.
  - Level 2: The highest security level. The SCS runs at this level in normal operation.
  - Level 1: A temporary security level used by authorized users for maintenance of equipment and changing SCS applications online.

- The Offline level is used when SCS is not in normal operation. This is displayed as "Level 0" on the Status Display Window of SCS and EWS. In the Offline Level, the SCS does not limit access to system parameters. Information which was used at test may be stored in SCS databases depending on operations performed by those tools.

Write Operation to SCS	Security Level (*)			Operation
	Level 2	Level 1	Level 0	
Override from OWS	OK	OK	OK	OWS
Operation on password block from OWS	OK	OK	OK	OWS
Operation on manual operation block	OK	OK	OK	OWS
Confirmation of Process alarm	OK	OK	OK	OWS
Setting operation mark on mapping element/mapping block	OK	OK	OK	OWS
Confirmation and Deletion of Diagnostic information	OK	OK	OK	EWS
Setting of system time	OK	OK	OK	OWS /EWS
Change of security level	OK	OK	Error	EWS
IOM Download (**)	OK	OK	OK	EWS
Resetting of Trip signal file	OK	OK	OK	EWS
Change of password for security level	OK	OK	OK	EWS
Lock/unlock variables	Error	OK	OK	EWS
On-demand communication for device management	OK	OK	OK	PRM
Change of variable with forcing function	Error	OK	OK	EWS
Online change download of applications	Error	OK	OK	EWS
I/O lock function	Error	OK	OK	EWS
Communication I/O lock function	Error	OK	OK	EWS
Switching Control right for dual-redundant AIO/DIO modules	Error	OK	OK	EWS
Offline download	Error	Error	OK	EWS
Application Debug function	Error	Error	OK	EWS
Restart of SCS from EWS	Error	Error	OK	EWS
Output Enabled Operation	OK	OK	OK	EWS
Save/Download Operation Marks	OK	OK	OK	EWS
Output module starting operation	OK	OK	OK	EWS

Table 75 – Operations Performed to SCS and Required Security Levels

21.3.2 System Program Enable Switch

System Program Enable Switch is a hard-wired switch and shall be in applicable system cabinet. This Key provides protections against unauthorized access and modification to system logic.

- System key is normally set to REMOTE position. The ProSafe-RS logic security level is set and locked at level 2, which is read only mode.
- When System key is set to PROGRAM position, security level remains at 2 but is allowed to be changed to 1 or 0 for online and offline download.
- When System key is switched from PROGRAM to REMOTE position, the logic will enable all locked or disabled variables then set security level back to 2. Enabling disabled variables is necessary to ensure that System key input will not be kept in locked state, which will cause security level and variable enable feature locked down.

21.3.3 Passwords

- Passwords for the security level are controlled in SCS.
- A password for the security level is set for each security level. Passwords are required to be set for changing to Level 1 and Level 0. A password is not necessary to change to Level 2.
- A password is a maximum of 16 alphanumeric characters and is upper/lower case sensitive.
- Passwords are maintained during a power cut and restart of SCS.
- Security Level Passwords are deleted when SCS Off-line Download is performed. Security level passwords shall be set upon start up.

21.3.4 Setting and Changing Passwords

- Authorized users may change passwords on the SCS Manager in EWS.
- Passwords can be changed when the SCS is online.
- When a password is changed, the person who changes it must enter the old password before it is changed.
- When a password has been changed, the SCS notifies its change with a Diagnostic Information Message.

21.4 SPECIFICATIONS AT STARTUP

A SCS always performs the initial cold start processing when it starts up. It does not have a function that allows it to resume the operating mode as it was before stopping. The operating mode at startup is always the Stop mode. An SCS can start up in one of the following three ways:

- After Power Recovery Start. An SCS starts up in this way when the power supply is resumed after a power failure.
- Start after Off-line Download. An SCS starts up in this way when the user performs off-line download from the EWS. Security Level Passwords are deleted when SCS Off-line Download is performed. Security level passwords shall be set upon start up. Refer IM32P01B10-01EN ProSafe-RS User Guide for detailed configuration.

- Manual Restart. An SCS restarts when the restart switch of the CPU module is pressed, or the user performs SCS restart operation from SCS Manager of the EWS.
- Output Enable. An output enable shall be performed once SCS is Active. The Output Enable Operation will enable the output channels to output the application logic results, initiates inter-SCS safety communication, SCS link transmission and subsystem communication.

21.5 SYSTEM ACTIONS DUE TO ERROR OCCURRENCE

If an error occurs in the system, operations corresponding to the error level must be executed. The following three error levels are specified: fatal error, major error and minor error.

A fatal error disables hardware and/or software so that operation cannot be continued. Both sides of a redundant CPU module stop, and all channels of all output modules will go to the fail-safe state.

A (system) error does not affect the application logic execution function itself. In a redundant hardware device, if an error occurs in one of the devices, the control right is switched to the standby side to continue the processing. Such errors are regarded as minor. The fact that a switch over occurred due to a failure is notified via a diagnostic information message. Since the SCS can continue controlling in this case, the data status is not changed nor is any error status notification to system function blocks performed.

21.6 SOFTWARE AND I/O FORCING

It is possible to force individual inputs and outputs to the logic '0' or '1' state or manipulate analogue and time values or any other types via SCS Manager on the EWS. This is a facility to support off-line field device test and maintenance. The SCS must be in non-secure mode to enable the I/O forcing function. All forces are disabled (removed) if the SCS is switched back to the secure mode. This function can be used to cancel all the forces (locking statuses) in such an emergency as the unavailability of SCS Manager due to a EWS fault.

The presence and total number of forced variables shall be reported to PCS. If variables in the system are forced for more than 4 hours an alarm will be generated every 4 hours, these facts are notified as diagnostic system status information.

21.7 ON-LINE AND OFF-LINE MODIFICATIONS

ProSafe-RS allows both the application to be modified and specific I/O module settings to be changed on-line. The SCS Manager on the EWS is used for editing the work database. The edited work database, when being downloaded to SCS with On-line Change Download, is automatically saved in the master database.

The Master Database Restoration Function deletes the SCS database which is being edited in the work database and replaces it with the master database. Do not Set/Reset Maintenance overrides from HIS while executing an on-line download to SCS.

List of applicable online changes as follows.

Corrected item	Description
Adding/deleting a variable	-
Deleting variables and adding variables with the same names as the deleted variables	-
Changing the types of variables	-
Changing attributes of variables	-
Adding/deleting I/O variables	-
Adding/deleting the standard FB instances	-
Adding/deleting the user-defined FB instances	Including FB defined in the library. A project that is created with the revision earlier than R3.02.00 will be in the same condition as R3.02.00 when clean project is executed. Therefore, you can perform online change download.
Deleting FB instances and adding FB instances with the same names as the deleted ones	
Changing the types of FB instances	

Table 76 – Operations that Can be Changed Online for Variables and Instances Used in Program

Modification	Description
Adding/deleting a variable	-
Deleting variables and adding variables with the same names as the deleted variables	-
Changing the types of variables	-
Changing the attributes of variables	-
Adding/deleting the standard FB instances	-
Adding/deleting the user-defined FB instances	Including FB defined in the library. A project that is created with the revision earlier than R3.02.00 will be in the same condition as R3.02.00 when clean project is executed. Therefore, you can perform online change download. When adding user-defined FU/FB, the added user-defined FU/FB must be tested. When adding pre-validated user-defined FB, testing of the FB itself is not required.
Deleting FB instances and adding FB instances with the same names as the deleted ones	Including FB defined in the library. A project that is created with the revision earlier than R3.02.00 is in the same state as R3.02.00 when clean project is executed. Therefore, it can perform online change download.
Changing the types of FB instances

*2: Displayable only when the version of SCSU1 is R3.02.20 or later
*3: Only for SCSP2

Table 81 – SCS Constants Builder Changeable Online

22 OVERRIDES

The various types of overrides that shall be used in the project are: Operational Override (OOS) and Maintenance(MOS). Overrides are utilized during startup, maintenance, construction and equipment testing. The following is a general description for initiating the overrides and their effects.

22.1 OPERATIONAL OVERRIDE SWITCH (OOS)

To be able to start equipment or sections of process, it shall be necessary to override some inputs of the safety system, as sensor signal may be in an abnormal state prior to start-up and could cause a shutdown. Such overrides are designated as "Start-Up Overrides".

Activation of OOS shall be carried out automatically as far as possible by the SIS system during a start-up sequence, but some OOS may have to be set manually by the operator from the SIS Console. (e.g. automatic = pump discharge low pressure and manual = high level in a compressor scrubber).

Each OOS function shall be reset automatically either by the sensor signal reverting to the normal or healthy status, after a dedicated step of the equipment start-up sequence or after a predetermined time delay, or by a set of process conditions. If cancelled automatically by the sensor signal, the input logic shall prevent spurious trips being caused by oscillation of the input around the reset value.

Indication of the raw statuses of the sensors overridden by automatic start-up shall be shown into the OWS graphic displays and recorded on the event log.

22.2 MAINTENANCE/TESTING DEVICE OVERRIDE (MOS)

During normal unit operating conditions, maintenance and operations personnel shall be required to perform maintenance and testing procedures on safety devices and equipment. During these procedures, the shutdown logic for each device shall be overridden but shall allow the audible and visual alarms for each device to be fully functional. This shall include devices in the SIS/FGS Systems. This shall allow maintenance or operations personnel to complete all testing procedures under safe working conditions.

The MOS will be enabled by signal from SCADA (MOS enable switch) located on CAP. The override signal shall be used in the analog input processing templates to inhibit trip. Return of the MOS enable switch will disable and remove all active Maintenance Overrides. MOS function will override both trip and fault signals of an input.

In the case of 1oo1, the override will inhibit the trip. In the case of 1oo2 and 2oo2, the override will be treated as a negative override to force the logic to 1oo (N-1) or 1oo1. Override logic will be handled in voting logic.

If an overridden transmitter remains in faulty condition while its override function is removed, UZ logic trip will occur. This logic only applies to non-redundant transmitters since override and fault logics for voting transmitters are handled by voting logics.

The Project's SRS shall specify which sensor types will not be provided with a MOS (e.g. manual trip switches and flame sensors).

23 PROSAFE-RS VERSION CONTROL MANAGEMENT

The ProSafe-RS application software comes with a version control tool. It allows progressive tracking through version control of the user application logic at various stages of development and implementation. The version control function is intended for controlling the version History of SCS projects to support users' system update.

The version control tool function serves the following purposes:

Name	Description
Version control of project Data	Save engineering data at a project milestone or at the end of engineering in different hard disks (check-in). Refer section 23.2 of this document for version control procedure which shall be followed for this project.
Backing-up project data	Checked-in data can be used as backup data. Checked-in project data can be checked out and restored
Replacing by revised project with large-scale changes	When making large-scale changes to an SCS project, it is recommended to perform engineering tasks on temporarily copied project data, rather than editing the active project data directly; this way, the active project data can be replaced with the new project data at the end of engineering.

Table 82 – List of ProSafe-RS Version Control Tool Function Overview

23.1 VERSION CONTROL TOOL

The version control tool performs the following functions:

1. Check-in and check-out of project data
2. Deletion of versions and check-in projects
3. Reading and printing of version information
4. Designation of check-in folders and SCS projects to be version controlled

A typical ProSafe-RS version control tool function is described as below.

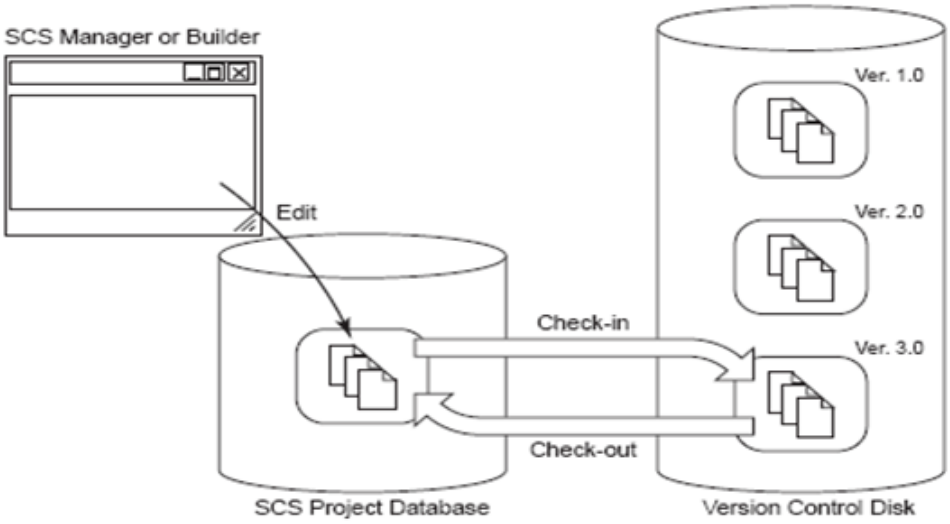

Figure 78 – Version Control Tool Function.

23.2 VERSION CONTROL NUMBERING

This section describes the version control numbering to be applied throughout the code development lifecycle of the application software from the engineering stage to FAT for this project. Beyond SAT and throughout the operational lifetime of the asset, the end-user's version and disaster recovery procedures shall be applied.

Item	Check in Timing	Version Control Number
During Detailed Engineering	Initial SCS Project Creation	-
	Changes in database	-
	End of Detailed Engineering	1.00
	Check-in path	Note 1
During Internal Test	Initial SCS project save during int. test starts	1.00
	Changes in database	Increment second decimal (e.g., 1.01, 1.02 etc.)
	End of Internal FAT	2.0
	Check-in path	Note 1
During FAT	Initial SCS project save during FAT starts	2.00
	Changes in database	Increment second decimal (e.g., 2.01, 2.02 etc.)
	End of FAT	3.00
	Check-in path	Note 1

Item	Check in Timing	Version Control Number
During SAT	Initial SCS project save during SAT starts	3.00
	Changes in database	Increment second decimal (e.g., 3.01, 3.02 etc.)
	End of SAT	4.00
	Check-in path	Note 1

Table 83 – Version Control Numbering

Note 1: The version-controlled databases are to be copied to other location in local EWS immediately after the project check-in activity completion as per the above schedule. The path to maintain the version data in the local EWS shall be

- D:\BLPH\VERSIONCONTROL\SCR XX\SCSddss

  BLPH – Project Name

  SCR XX – SCR Number (E.g., 01, 03...)

  SCSddss – SCS version control backup

This path shall contain the respective Unit's / System's SCS version control backup. The version control path shall be a different folder path than RS Projects.

The check in settings will include 'Engineer Name', 'Comment' and 'Note'. The 'Note' shall refer to the 'Punch List' during internal FAT and FAT phase.

The Punch List shall include the 'Safety Impact Review', 'application version number before modification' and 'application version number after modification' for the respective design change due to the test incidents.

24 TAG NAMING PHILOSOPHY

24.1 PHYSICAL IO VARIABLE NAMING

This section details the naming convention as applied to variables assigned to AI, DI, AO and DO channels and used in the application logic.

All input and output variables such as Analog Inputs (AI), Digital Inputs (DI), Analog Output (AO) and Digital Outputs (DO) shall adopt the same variable naming philosophy as detailed in the following table.

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
_	U	U	U	X	X	X	X	X	S1	S2	S3	Y1	Y2	Y3

Were,

_	Used in the beginning of SIS field signal
UUU	Unit Code (ex: 01, 90)
XXXXX	Instrument type, Minimum 2 characters, and Maximum 5 characters
S1S2S3	Component Number, Minimum 2 characters, and Maximum 3 characters
Y1Y2Y3	Sequence Number

Each physical IO variable will contain a maximum of 16 characters.

Type	Field IO Tag name	ProSafe-RS Variable name	In builder Tag Name
Analog Input	01-FT-012AA	_01FT012AA	01FT-012AA
Digital Input	01-BSL-501A	_01BSL501A	01BSL-501A
Digital Output	114HY0002	_114HY0002	114HY-0002

Table 84 – Physical IO Variable Naming

If the total length exceeds 16 characters, certain portions of the name must be truncated, and a unique identifier added to differentiate them.

The "Unique Identifier" shall be determined in consultation with the Contractor with respect to their acceptable naming format. This is only necessary if the existing tag names in the IO database exceeds 16 characters.

24.2 TAG COMMENTS NAMING

A tag comment can be defined using up to 24 single-byte or 12 double-byte characters. On each faceplate, the Tag Comment will occupy 2x rows of 12-single byte or 6-double byte characters.

Tag Comment Convention shall be: "XXXXXXXXXXXX" (first row) + "YYYYYYYYYYYY" (second row)

where:

XXXXXXXXXXXX	12-Single byte / 6-double byte to describe Equipment Name / Process Area of related tag (TGCOMM)
YYYYYYYYYYYY	12-Single byte / 6-double byte to describe Tag Function (e.g., TGCOMM2, Reset, Shutdown, Override, etc.)

It is suggested to consider use of appropriate spacing and alignment of words to avoid breaking up of descriptions between the two rows to ensure readability. For example,

1. When all the characters are used in the first row, then between the first row and second row characters, there should not be any empty spaces as the faceplate will automatically start the display for the 13th character on the second row.
2. In case the last word on the first row does not end on the last character of the first row, then empty spaces must be added to ensure the first word of the second row starts on the first character of the second row.

The tag comment must be defined as part of the design and engineering inputs for physical I/O tags by CONTRACTORS.

24.3 INTERNAL VARIABLE NAMING

Internal Variables are the most common type of variables or tags to be declared in the Workbench application environment. This section describes the naming convention as applied to any variables used in the application logic for intermediate logic states or temporary storage of calculation results, which maybe independent or related to the Input and Output variables.

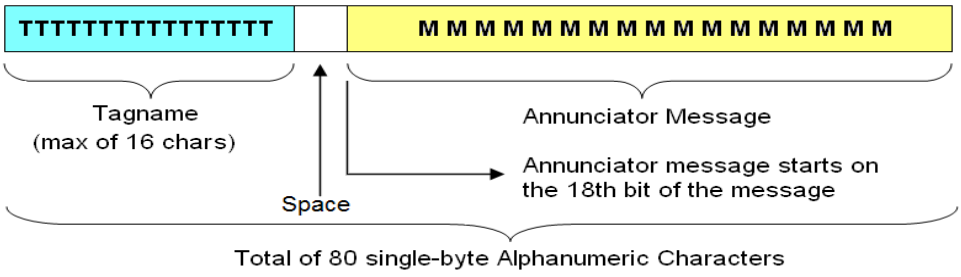
Below naming philosophy is used for internal variables used in applications such as SIS C&E, F&G C&E:

Type	ProSafe-RS Variable name	Internal Variable name	In builder Tag Name
Analog Input	_01FT012AA	_01FT012AA+FB PIN	01FT012AA+ FB PIN
Digital Input	_01BSL501A	_01BSL501A+ FB PIN	01BSL-501A+ FB PIN
Digital Output	_114HY0002	_114HY0002+ FB PIN	114HY0002+ FB PIN

Tag names shall be adjusted due to limitation of 18 characters for internal tag names & 16 characters for HIS tag names in ProSafe-RS.

24.4 FUNCTION BLOCK INSTANCE NAMING

Function blocks are commonly used for specific logical operations and generating intermediate variables for use in the application logic.



Function Block	Prosafe – RS IO Variables	Prefix	Suffix	Instance Name
Analog input UDFB	_01FT012AA	AI	-	AI_01FT012A

Function Block	Prosafe – RS IO Variables	Prefix	Suffix	Instance Name
Digital input UDFB	_01BSL501A	DI	-	DI_01BSL501A
Digital output UDFB	_114HY0002	DO	-	DO_114HY0002
Safeguarding UDFB (per Interlock)	Interlock 01-IS-001 for Unit 01	UZ	-	UZ_01IS001_01
Fire Zone UDFB (per Interlock)	Interlock 04-IF-501 for Unit 04	UZ	-	UZ_04IF501_01
Voting UDFB	02-GD-021-A / B / C	VT23 VT13	HH HI	VT23_02GD021HH (For, HH-2oo3) VT13_02GD021HI (For, HI-1oo3)

Table 85 – Function Block Instance Naming

24.5 ANNUNCIATOR MESSAGE DESIGN

This defines a message notifying a process error. An annunciator message can be defined using an arbitrary character string consisting of up to 80 single-byte characters or 40 double-byte characters. The General message structure is described below in figure.

Pzi

Figure 79 – Annunciator Message Structure.

TTTTTTTTTTTTTT : Tag name

MMMMMMMMMMM : Annunciator message (Tag comments and functions)

The annunciator is usually taken from the IO List (Service Description).

Notes:

1. Tag names are derived from the Tag names defined in IODB & Centum VP Integration Tag name.
2. The abbreviation for instance name defined for ANN function block in UDFB is described subsequently.

SIS:

Type	I/O Type	Annunciation Type	Annunciation Philosophy
Trip Initiator	Digital Input	Trip state (except limit switch)	TAGNAME+ SERVICE +TRP
		Trip state (limit switch)	TAGNAME+SERVICE+OPN (for Open limit switch)
			TAGNAME+SERVICE+CLS (for Close limit switch)
	Analog Input	Trip state	TAGNAME + SERVICE +TRP
Final Control Element	Digital Output	Trip state	TAGNAME + SERVICE
Operation Override		OOS activated warning	TAGNAME + SERVICE + OOS ACT
First Out		First – Out Alarm	TAGNAME + SERVICE + FO

Table 86 – SIS Annunciation Philosophy

FGS:

Type	I/O Type	Annunciation Type	Annunciation Philosophy
Detector / Sensor	Digital Input	Active state	TAGNAME+ SERVICE+TRP
		Signal Fault	TAGNAME+ SERVICE + FLT
	Analog Input	Alarm state	TAGNAME + SERVICE + HH/HI/LO/LL
		Open Loop Fault	TAGNAME + SERVICE + IOP
		Over Range Fault	TAGNAME + SERVICE + OVR
		Dirty Optics	TAGNAME + SERVICE + DIRTY OPTICS
		Beam Block	TAGNAME + SERVICE + BB
		Fault	TAGNAME + SERVICE + FLT
Final Control Element	Digital Output	Active state	TAGNAME + SERVICE
		Signal Fault	TAGNAME + SERVICE + FLT
First Out		First – Out Alarm	TAGNAME + SERVICE + FO
Voting Activation Alarm		Voting Trip Alarm	TAGNAME + ALM(HI/HH/LO/LL) + VOT + TRP
Voting Degradation Alarm		Voting Degradation Alarm	TAGNAME + ALM(HI/HH/LO/LL) + VOT + DEG
Voting All Fault		Voting All Fault Alarm	TAGNAME + ALM(HI/HH/LO/LL) + ALL DET FLT

Table 87 – F&G Annunciation Philosophy

24.6 SEQUENCE OF EVENTS (SOE) MESSAGE PHILOSOPHY

The SOE message for each user-configurable event shall be defined according to the following convention for this project:

1. Maximum of 32-single byte or 16-double byte alphanumeric characters

Event ID to comprise of 3 portions (with empty space in between) and based on:

- Tag name
- Abbreviated equipment name / location

- Functionality

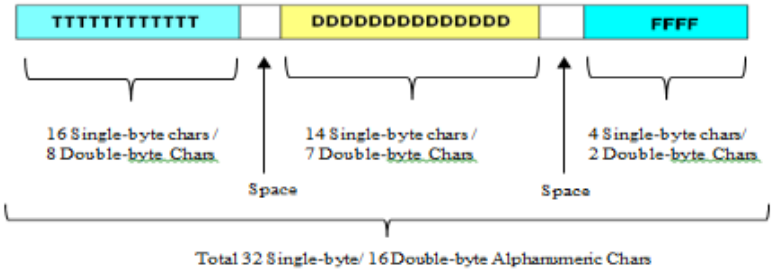


Figure 80 – SOE Message Structure.

- TTTTTTTTTTTT : Tag name
- DDDDDDDDDDDDDD : Description (equipment name / tag comment/ location)
- FFFF : Function (maximum of 4 chars)

Note: The abbreviated equipment name / tag comment / location is defined by the CONTRACTOR as part of the design and engineering inputs.

Type	SOE Type	SOE Philosophy
SIS Analog Input	Analog input trip initiator	Tag Name + Description + "TRP"
F&G Analog Input	Analog input alarm initiator	TAGNAME + SERVICE + HH/HI/LO/LL
F&G Analog Input (Detector)	Analog input open loop fault	TAGNAME + SERVICE + IOP
	Analog input over range fault	TAGNAME + SERVICE + OVR
	Analog input dirty optics	TAGNAME + SERVICE + DIRTY OPTICS
	Analog input beam block	TAGNAME + SERVICE + BB
	Fault	TAGNAME + SERVICE + FLT
Maintenance Override	Maintenance Override activation status	TAGNAME + SERVICE + MOS
Operation Override	Operation Override activation status	TAGNAME + SERVICE + OOS
First-out	First-out alarm events (Trip)	TAGNAME + SERVICE + FO
Voting Activation	Voting Trip activated	TAGNAME + ALM(HI/HH/LO/LL) + VOT + TRP
Voting Degradation	Voting degraded	TAGNAME + ALM(HI/HH/LO/LL) + VOT + DEG
Voting All Fault	All detectors in voting fault	TAGNAME + ALM(HI/HH/LO/LL) + ALL DET FLT

Table 88 – Sequence of Events Message Philosophy

Notes:

SOE for digital I/O's will be module based and not in the function block level. Hence, tag comment in the workbench dictionary will become the SOE for digital I/O's. The SOE philosophy for digital I/O's is as follows:

1. Message should be defined in Dictionary Tag comment for IO_BOOL variables.
2. The abbreviation for SOE instance name defined in UDFB is described subsequently.

The path to maintain the SOE configuration files in the local EWS shall be:

- D:\BLHPREF\SOE

24.7 COMMUNICATION BETWEEN (FCS - SCS) / (SCS – FCS):

In this project, signal sent from SCS to PCS shall be via Vnet/IP using SCS Tag name Builder. Communication naming convention

1. Sending Variable Names
2. Receiving Variable Names

Sending Variable Names:

Sending variables can be IO Variable or Internal Variable and their respective variable naming conventions shall be observed if customer not provided.

The tagging philosophy for the sending tags will be as below:

SddssFddss_DIYY

S – Constant (S – SCS)

F – Constant (F – FCS)

dd – Domain Number

ss – Station Number

DI– DINT

YY – Sequence number

For example – SCS0101 sending set of 16 bits with pack function to FCS0103 with sequence no. 1 is configured as S0101F0103_DI1 in SCS0101. In this case Instance name will be 'P_S0101F0103_DI1'.

Receiving Variable Names:

Receiving variables can be IO Variable or Internal Variable and their respective variable naming conventions shall be observed if customer not provided.

The tagging philosophy for the receiving tags will be as below:

FddssSddss_ECYY

F – Constant (F – FCS)

S – Constant (S – SCS)

dd – Domain Number

ss – Station Number

EC– ECW_I

YY – Sequence number

For example – FCS0104 sending set of 16 bits with pack function to SCS0103 with sequence no. 1 is configured as F0104S0103_EC1 in SCS0104. If 5th bit of this signal must be used in logic, F0104S0103_EC1.5 is to be used. In this case Instance name will be 'U_F0104S0103_EC1'

25 SCS SYSTEM SOFTWARE LICENSE

The following are the software license shall be used for this project.

Description	Software License
Project ID License	RS4CPJT-V11
Safety System Engineering and Maintenance Function & Server Function	RS4E5100-V11
Electronic Instruction Manual	RS4C5400-V11
Software Media	RS4CKM-V11
Project I/O License	RS4F3100-V11
CENTUM VP Integration Package	RS4E5600-V11
Safety Control Function (for S2SC70x)	RS4F1500-V11

Table 89 – ProSafe-RS SCS System Software License

Note:

The Project ID license must be unique for ProSafe-RS system for this project and will be different from PCS.

26 PROSAFE-RS ENGINEERING PROCEDURE FOR CENTUM VP INTEGRATION

In this project, signal sent from safety systems to PCS shall be via Vnet/IP using SCS Tag name Builder.

Signal sent from PCS to safety systems shall be using SEBOL (Periodic Execution).

The CENTUM integration function of ProSafe-RS provides a seamless interface for accessing SCS by Centum VP system. Accessing of SCS data from PCS is also treated the same as the PCS to access other PCS.

In the Centum VP Integration Configuration, engineering needs to be performed both by the EWS functions and the Centum VP Engineering Functions. The figure shows the engineering procedure in the Centum VP Integration Configuration.

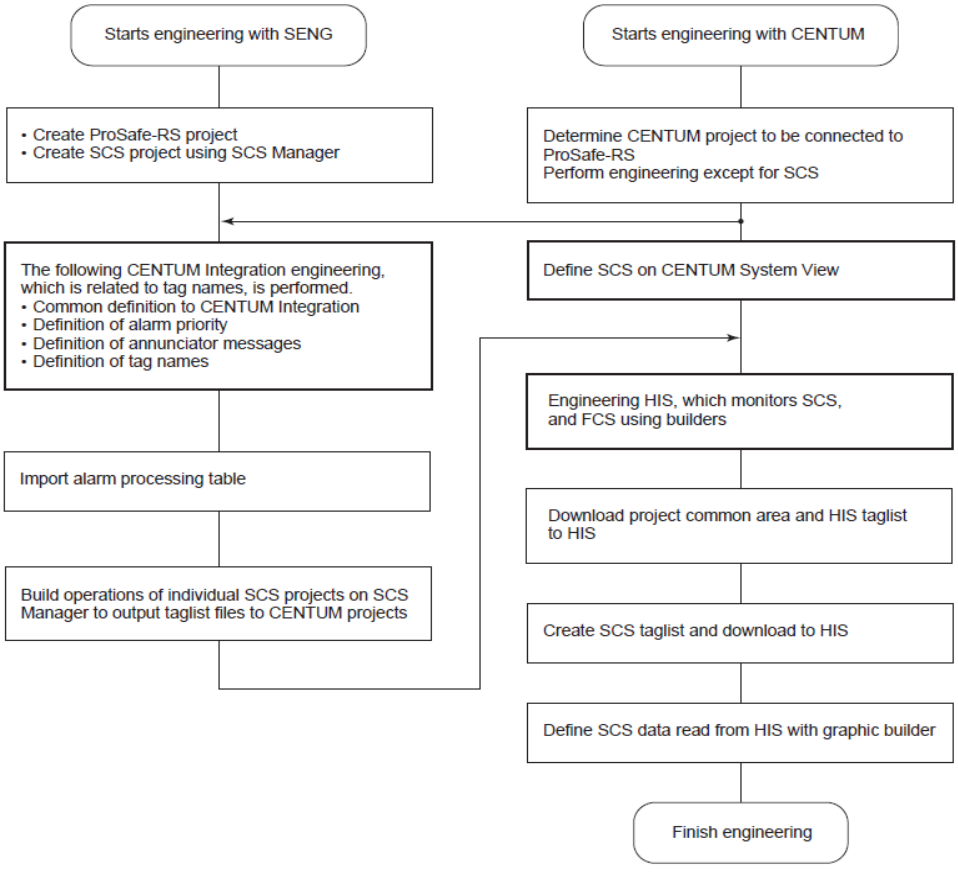

Figure 81 – ProSafe-RS & Centum Integration Engineering Procedure

Engineering Function	Description	ProSafe-RS Builder	Project Definition
Common definition of Centum PV Integration	Defines the top folder of the Centum VP project	SCS project property	Will be finalized during detailed engineering. Refer Functional Design Specifications – PCS Software

Engineering Function	Description	ProSafe-RS Builder	Project Definition
Definition of alarm priority	Defines the handling of SCS process alarms, which appear on OWS	Alarm priority builder	The SIS / F&G alarms are defined as high priority alarm. Refer Functional Design Specifications – PCS Software
Definition of alarm processing table	Import the alarm processing table, which is defined on Centum VP	Alarm processing builder	The definition of alarm processing table in CENTUM database is to be imported to ProSafe-RS Refer Functional Design Specifications – PCS Software
Definition of annunciator messages	Defines the contents of process alarms, which appear on OWS	Tag name builder	Refer section 15.2 for Annunciation Design of this FDS.
Definition of tag names	Allows Centum VP to access the variables of application logic by assigning tag names	Tag name builder	Refer section 15.2 Centum VP Mapping Block/Element Naming of this FDS.
Engg Unit	Import the engineering unit, which is defined on Centum VP	Tag name builder	Refer Functional Design Specifications – PCS Software
Switch Position Label	Import the label, which is defined on Centum VP	Tag name builder	Refer Functional Design Specifications – PCS Software

Table 90 – ProSafe-RS & Centum Integration Settings

27 USER DEFINED FUNCTION BLOCKS

27.1 SIS TYPICALS

27.1.1 General

The following sections will describe the User Defined Functions and Function Blocks that will be used to build the Logic Typicals. The blocks in this section are specifically designed to meet the Shell requirements.

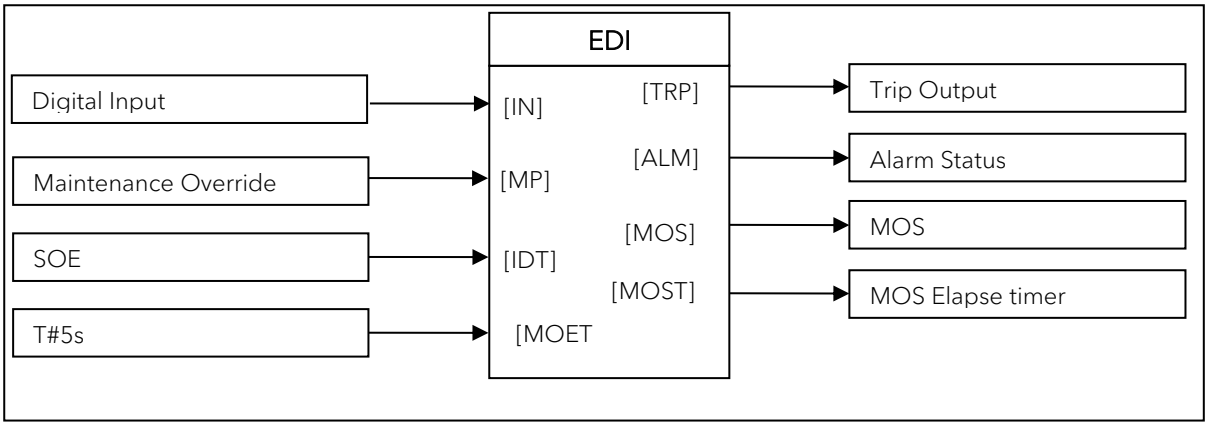
Refer attached Typical test reports for the detailed functionalities.

27.1.2 EDI

Digital input signal for normally open type of inputs without Line Monitoring (EDI)

Purpose

This function is used to process the normally open digital input signal without Line Monitoring.



Functionality:

The EDI function block has the following main functions:

- Trip management with alarming function.
- Optional maintenance override functionality.

The functions of the EDI typical are shown below. This typical is used for normally open digital trip initiator inputs based upon energize to trip function without line monitoring function. The typical has optional maintenance override functionality to override the trip function. The alarm output is independent of the MOS functionality.

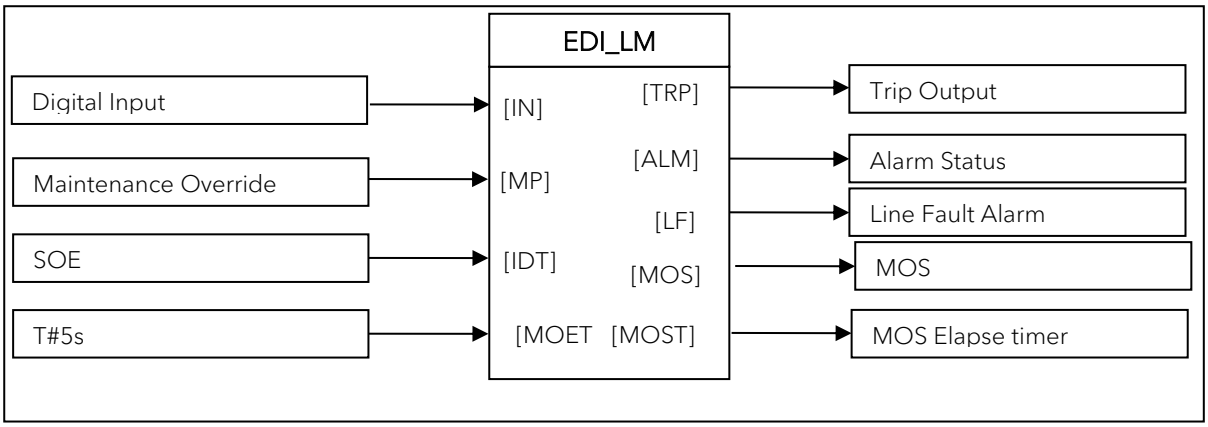
The field signal for the typical is a digital input. The typical has an alarm and trip output. When the input becomes energized the output will be tripped and will remain tripped until the input value becomes de-energized again. The trip output will be used in the SIS application logic and the status will be indicated on the OWS. MOS shall be enabled from the OWS.

27.1.3 EDI_LM

Digital input signal for normally open type of inputs with Line Monitoring (EDI_LM)

Purpose

This function is used to process the normally open digital input signal with Line Monitoring.



Functionality:

The EDI_LM function block has the following main functions:

- Trip management with alarming function.
- Optional maintenance override functionality.
- Line fault detection.

The functions of the EDI typical are shown below. This typical is used for normally open digital trip initiator inputs based upon energize to trip function with line monitoring function. The typical has optional maintenance override functionality to override the trip function. The alarm output is independent of the MOS functionality.

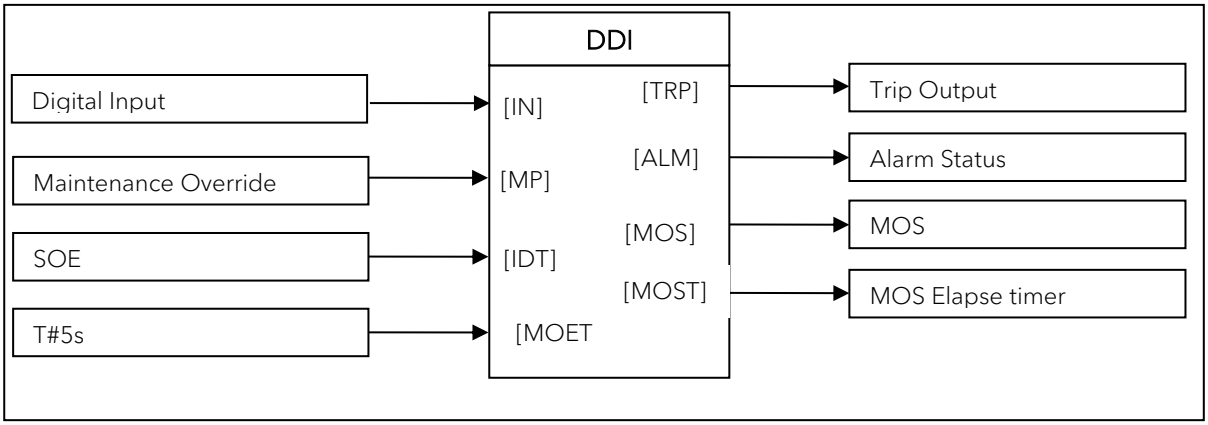
The field signal for the typical is a digital input. The typical has an alarm and trip output. When the input becomes energized the output will be tripped and will remain tripped until the input value becomes de-energized again. The trip output will be used in the SIS application logic and the status will be indicated on the OWS. MOS shall be enabled from the OWS.

27.1.4 DDI

Digital input signal for normally close type of inputs without Line Monitoring (DDI)

Purpose

This function is used to process the normally close digital input signal without Line Monitoring.



Functionality:

The DDI function block has the following main functions:

- Trip management.
- Optional maintenance override function.

The functions of the DDI typical are shown below. This typical is used for digital inputs based upon de-energize to trip function. The typical has optional maintenance override functionality to override the trip function. The alarm output is independent of the MOS functionality.

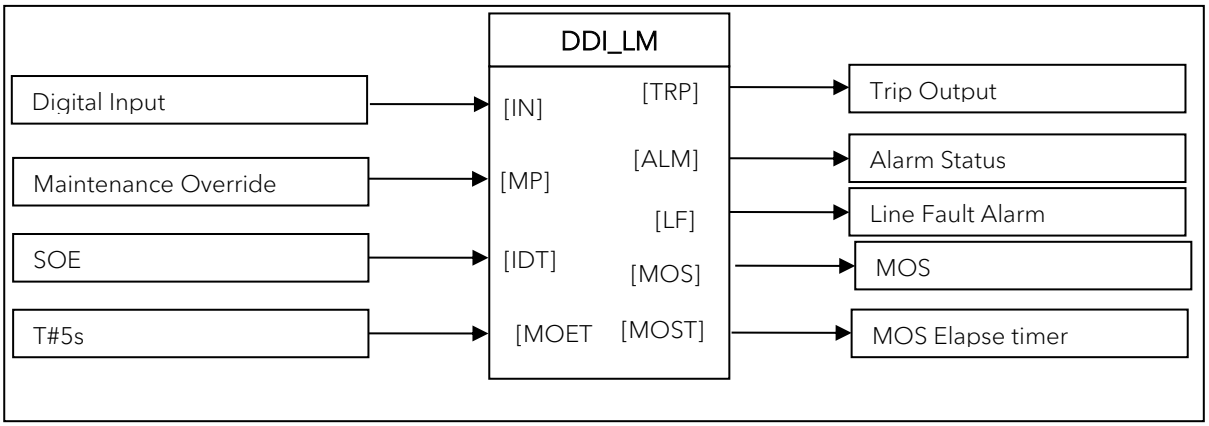
The field signal for the typical is a digital input. This typical is applicable for normally closed field contact. The typical has a trip output. In case the input becomes de-energized the output will be tripped and will remain de-activated until the input value becomes energized again. The trip output status alarm will be indicated on OWS. MOS shall be enabled from the OWS.

27.1.5 DDI_LM

Digital input signal for normally close type of inputs with Line Monitoring (DDI_LM)

Purpose

This function is used to process the normally close digital input signal with Line Monitoring.



Functionality:

The DDI function block has the following main functions:

- Trip management.
- Line fault detection.
- Optional maintenance override function.

The functions of the DDI typical are shown below. This typical is used for digital inputs based upon de-energize to trip function which require line monitoring. The typical has optional maintenance override functionality to override the trip function. The alarm output is independent of the MOS functionality.

The field signal for the typical is a digital input. This typical is applicable for normally closed field contact. The typical has a line fault alarm and trip output. In case the input becomes de-energized the output will be tripped and will remain de-activated until the input value becomes energized again. The trip output status and line fault alarm will be indicated on OWS. MOS shall be enabled from the OWS.

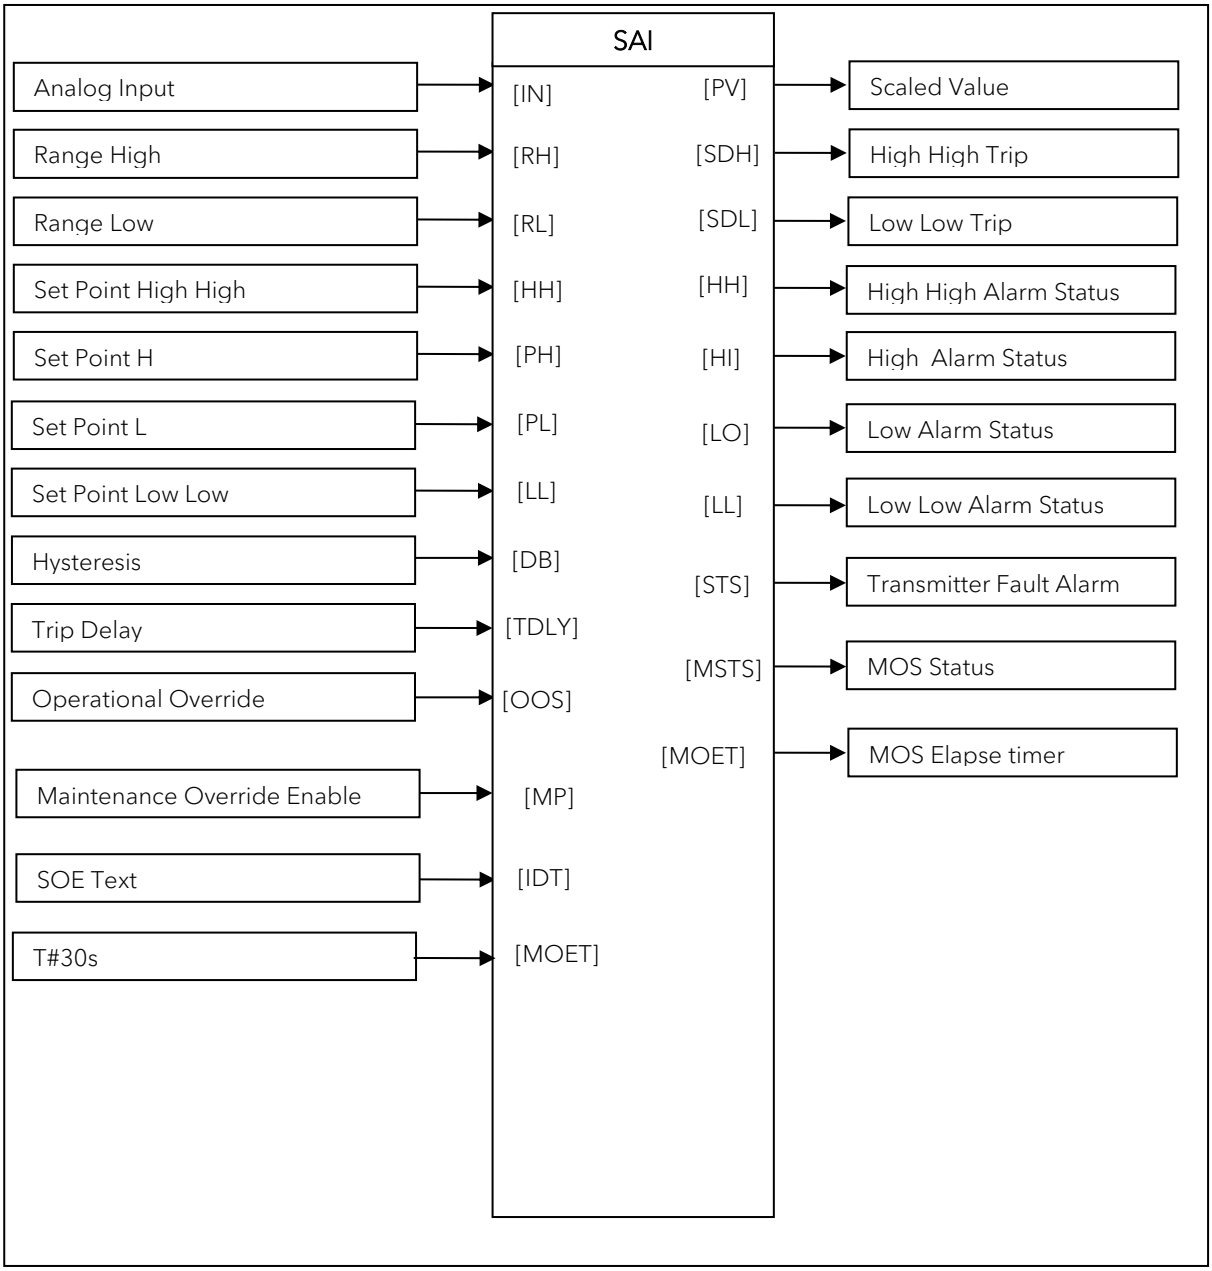
27.1.6 SAI

SAI Function block is used to scale the Input signal to the Engineering value

Purpose

SAI Function block is used to scale the Input signal to the Engineering value and will generate trip signal when input value exceeds the Set points of LOW, LOW LOW, HIGH & HIGH HIGH.

Functionality:



The SAI function block has the following main functions:

- Validity check of the signal.
- Process threshold management.
- Optional functions are maintenance override and operational override functionality

This function block is used in logic applications in order to decide whether the input signal is below the Low, or above the High threshold setting. The image below gives the model for the functions specified for the SAI function block. For the threshold, an optional dead-band DB will be available (hysteresis) when changing from a trip state to a normal state.

When the input value drops below the Low Low set-point, the (LL) alarm and trip (SDL) will be set, and will remain latched until the input value rises above the Low Low set-point plus the dead-band. When the input value exceeds the High High set-point, the (HH) alarm and trip (SDH) will be set, and will remain latched until the input value falls below the High High set-point minus the dead-band.

The trip function can be overridden by the maintenance override. The alarm function is independent of the status of the maintenance override. The trip status and line fault alarm will be indicated on OWS. MOS shall be enabled from the OWS.

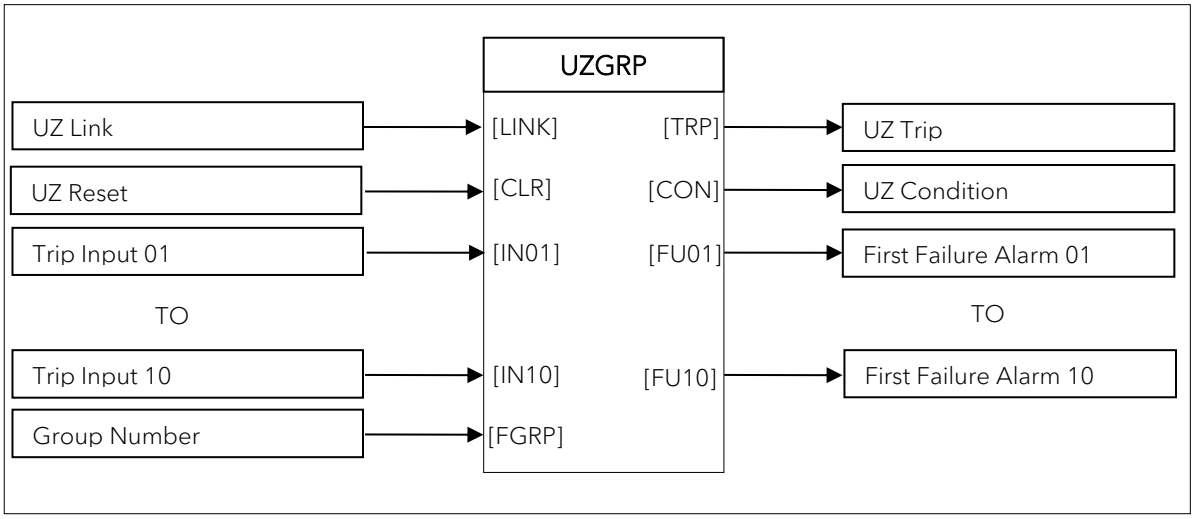
27.1.7 UZGRP

UZGRP typical provides the common functionality for UZ groups in the SIS.

PURPOSE

UZGRP typical provides the common functionality for UZ groups in the SIS. The functions of the typical are trip latching, alarming and first failure identification.

Functionality:



The UZGRP function block has the following main functions:

- Trip the UZ group if one of the inputs is tripped.
- Initiate a First Failure alarm to indicate which trip came first.
- Latch the UZ trip if a trip condition is active and no reset has been applied.

For every process group in the system at least one UZ block is used. The typical UZ block is designed for 10 inputs. Depending on the number of inputs to the group, more UZ blocks may be used for a process group. The UZ block can be linked together in a chain by linking the UZ Link and UZ Condition of the next UZ block together. If only one UZ block is used to trip a UZ group the UZ Link input shall be set to TRUE.

The trip outputs of input typical and/or voting typical in a UZ group are connected to the inputs of the UZ block. A trip condition on an input of the UZ block will trip the UZ group. This will latch the UZ block, further trips on the inputs will be ignored for failure indication, but still affect the UZ group trip. The output of the UZ block will be used in the application logic to the trip related field outputs. The trip alarm and the first failure flag of the tripped input will be shown in the OWS. The Tripped Outputs Latched status will be shown in the OWS until UZGRP is reset.

After all trip conditions are cleared the UZ typical can be reset via the optional UZRST application typical, by a reset signal from SCS. If the UZ group requires an auto-reset function, then the UZ Condition output has to be connected to the Clear input. The Clear input will only react on a positive trigger. The Clear will not only reset the UZ group but also clears the first failure flag, a reset will only have affected if all trip input conditions are normalized (not tripped).

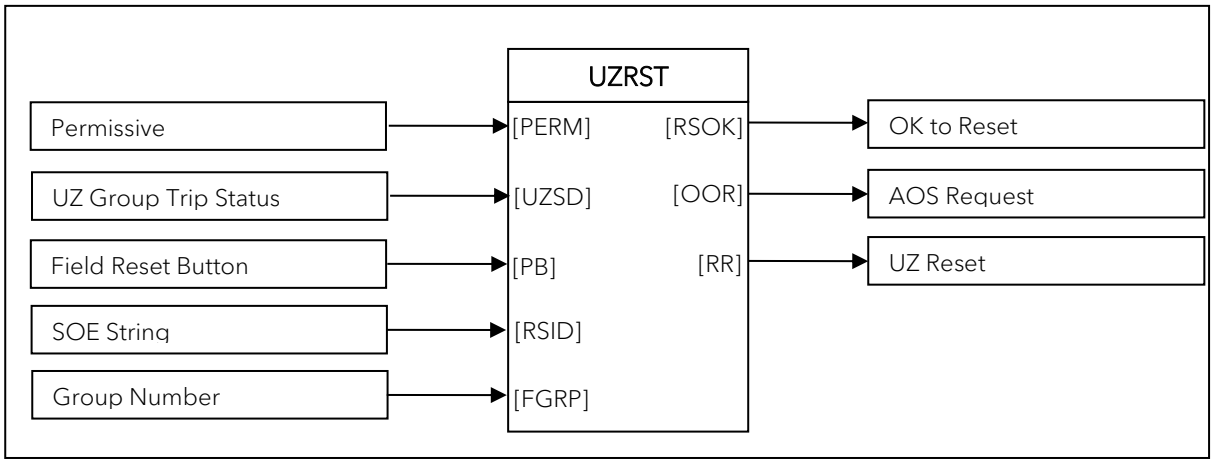
27.1.8 UZRST

UZRST typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip.

Purpose

This typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip. The UZRST block has an input to indicate UZ trip status and an output to reset UZGRP logic.

Functionality:



The UZRST function block has the following main functions:

- Reset UZ groups only when SCS Reset operated from OWS or field reset switch has been applied
- Indicate that SCS reset is allowed.

This typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip. The UZRST block has an input to indicate UZ trip status and an output to reset UZGRP logic.

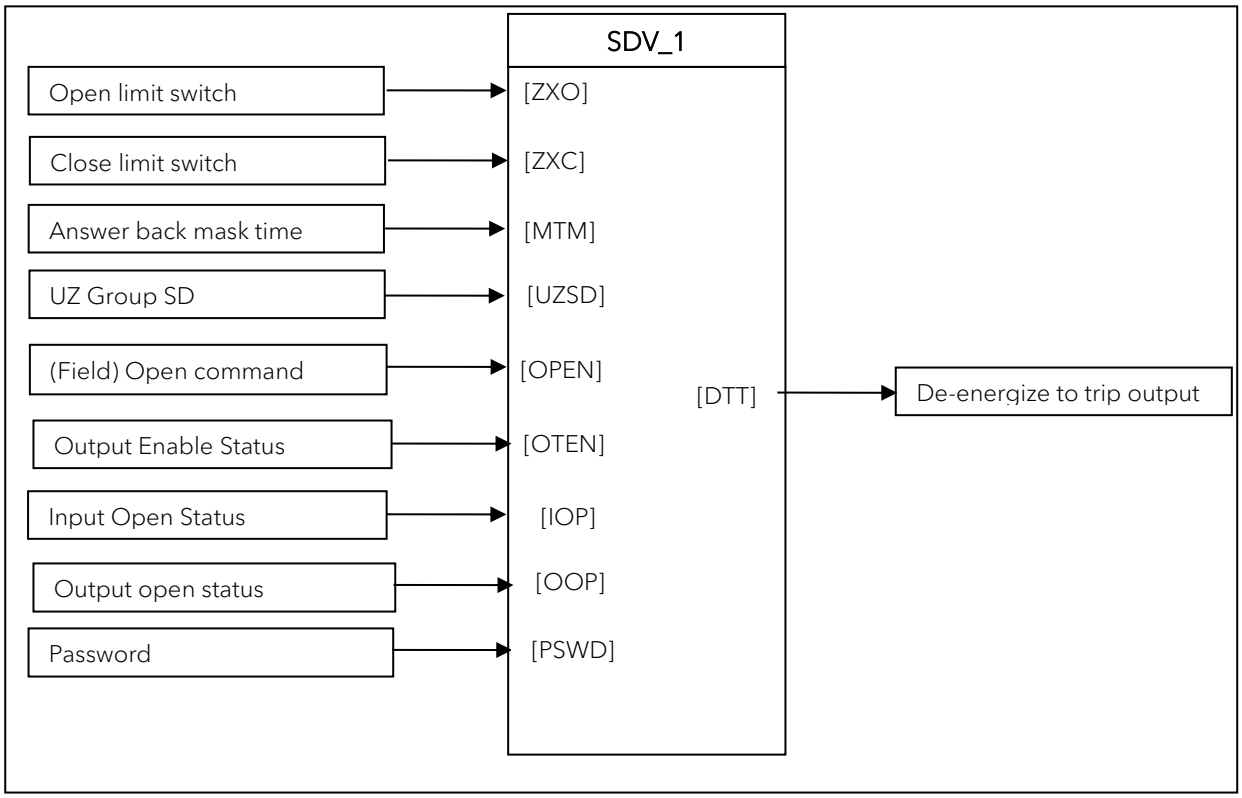
To indicate that a SCS reset is allowed (i.e. Permissive is 'TRUE') the status (Ok to Reset) is sent to OWS. After the reset from OWS, the Ok to Reset status will go off.

Push button field input reset is designed for normally open-momentary closed contacts to reset.

27.1.9 SDV_1

SDV_1 function is used for the Fail to Close Valves with limit switch Feedback

Purpose



This typical, drives the output to safe-state when the UZSD input trips.

Functionality:

The SDV_1 typical has the following features:

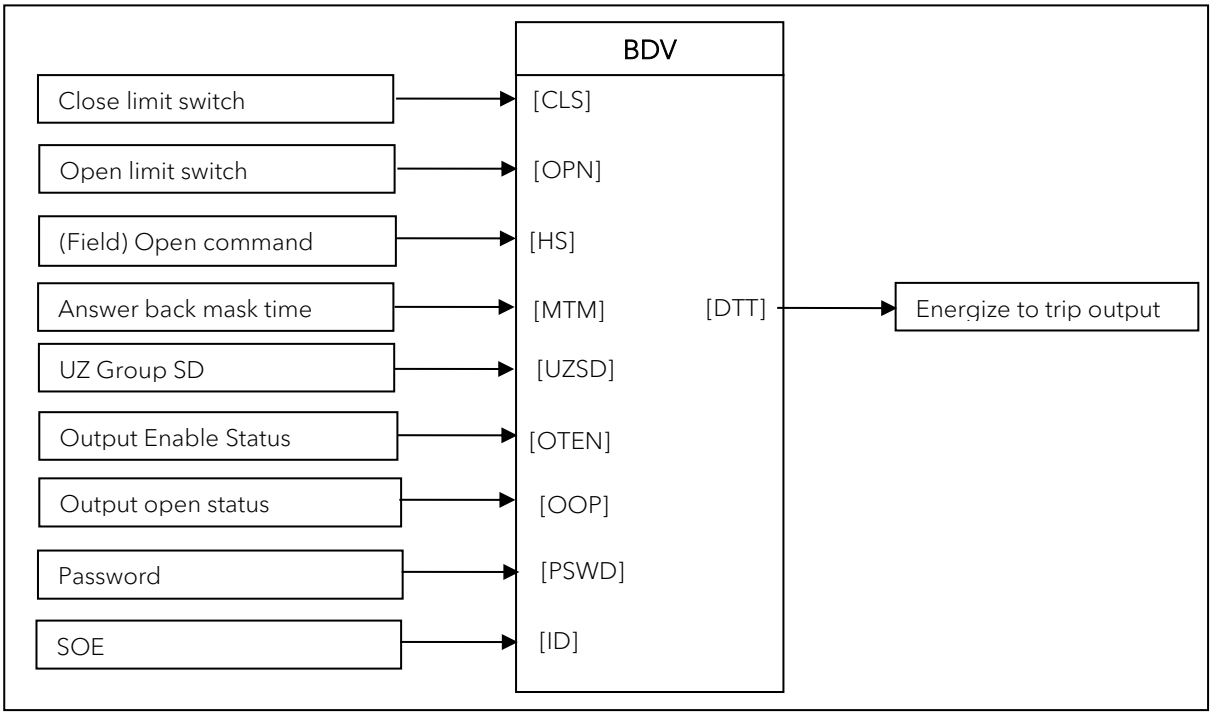
- Valve operation.
- Limit switch feedback (one or two limit switches)

This typical, drives the output to safe-state when the UZSD input trips. When the UZGRP is normal, then open command can be given from the OWS / AUTO open (OPEN nub).

27.1.10 BDV

BDV function is used for the Fail to Open Valves with limit switch Feedback

Purpose



This typical, drives the output to safe-state when the UZSD input trips.

Functionality:

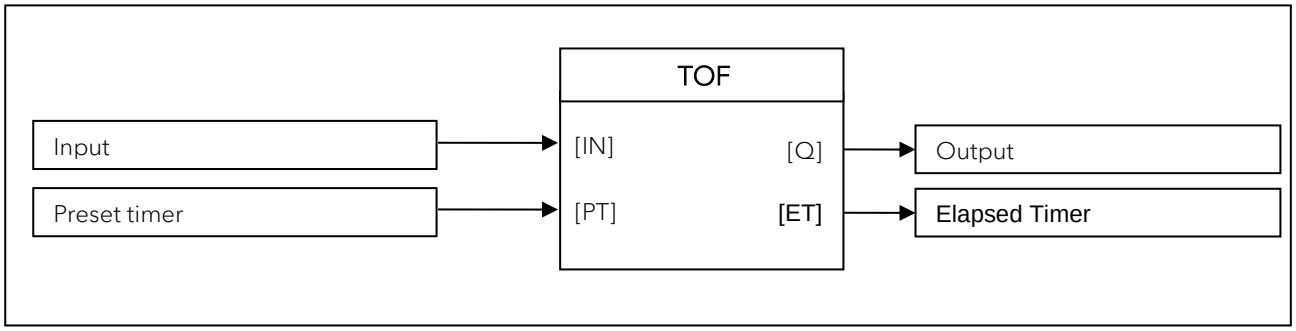
The BDV typical has the following features:

- Valve operation.
- Limit switch feedback (one or two limit switches).

This typical, drives the output to safe-state when the UZSD input trips. Design of the typical is energize to trip (or activate) the output hence line monitoring of the output is essential. MANUAL operations to the Valve from the OWS are prohibited at all times except in a state when the associated UZ group acting on the BDV recovers from trip state and UZ group is reset. CLOSE command shall be issued from the OWS. Field Hand Switch allows opening of the Valve locally when the valve is in CLOSE condition.

27.1.11 TOF

Trip Delay Timer (TOF) timer is used to provide delayed actions or alarms in response to a specific condition.



Purpose

Trip delay timer (TOF) timer is often used to provide delayed actions or alarms in response to a specific condition.

Functionality:

The TOF function block has the following main functions:

1. Activation on Condition: The TOF timer is triggered when a specific condition is met, such as an abnormal process variable exceeding its safe limit (e.g., high pressure, high temperature).
2. Timing Period: Once the condition is met, the TOF timer starts counting. This period is preset and can vary depending on the application. During this time, the condition is monitored continuously.
3. Condition Sustains Beyond the Timer:
    1. If the condition persists beyond the timer period, the SIS initiates the corresponding safety action, such as:
        1. Activating an alarm
        2. Triggering an emergency shutdown (ESD)

27.2 FGS TYPICALS

27.2.1 General

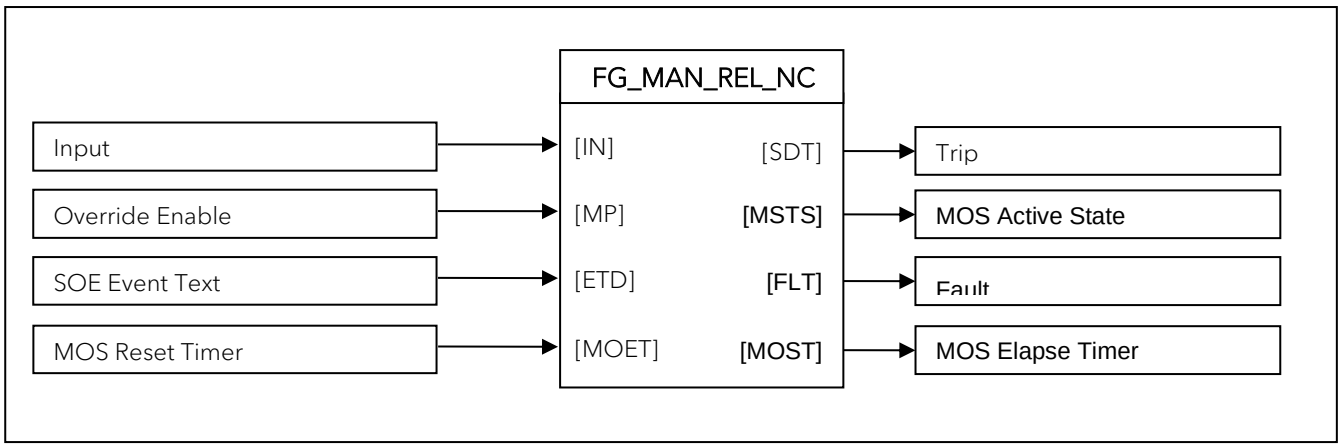
The following sections will describe the User Defined Functions and Function Blocks that will be used to build the Logic Typicals. The blocks in this section are specifically designed to meet the Shell requirements.

Refer attached Typical test reports for the detailed functionalities.

27.2.2 FG_MAN_REL_NC

This typical is used for discrete inputs that are de-energized to trip.

Purpose



This typical is used for discrete inputs that are de-energized to trip such as Heat, Smoke detectors, ESD or Blowdown switches.

Functionality:

- Process Normally Closed digital input
- Manage the maintenance override function (MOS) for each MAN_REL_NC input
- Manage input trip, diagnostic and I/O fault logics
- Manage input trip alarm reset logics
- Optional line monitoring and fault detection
- All diagnostic and I/O alarms will trigger individual Annunciator alarms.

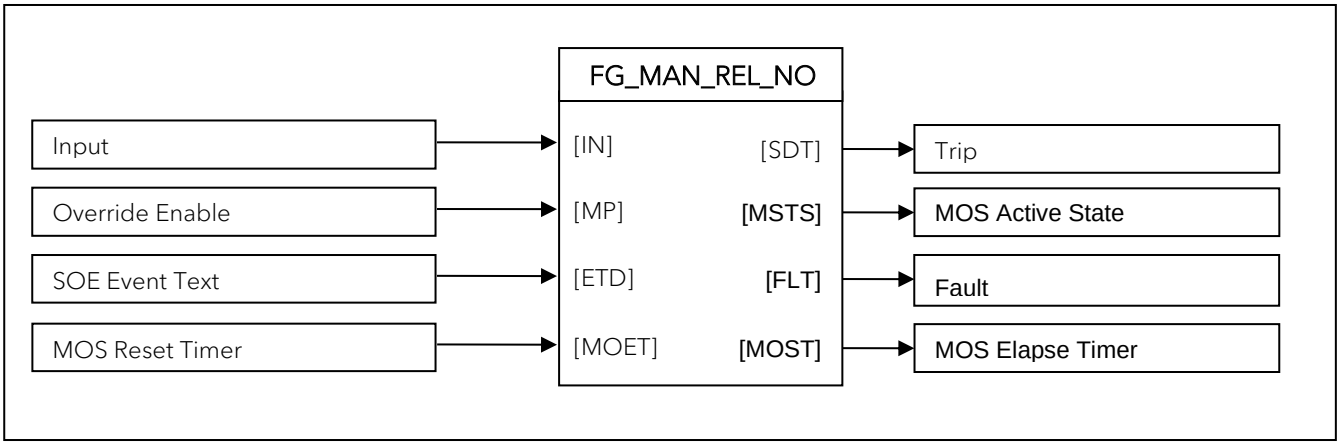
Note: The MOS override function is included inside the function block

MOS function can be disabled by forcing the MOS enable key switch permanently to FALSE.

27.2.3 FG_MAN_REL_NO

This typical is used for discrete inputs that are energized to trip.

Purpose



This typical is used for discrete inputs that are energized to trip such as manual alarm call points.

Functionality:

- Process Normally Open digital input
- Manage the maintenance override function (MOS) for each MAN_REL_NO input
- Manage input trip, diagnostic and I/O fault logics
- Manage input trip alarm reset logics
- Optional line monitoring and fault detection
- All diagnostic and I/O alarms will trigger individual Annunciator alarms.

Note: The MOS override function is included inside the function block

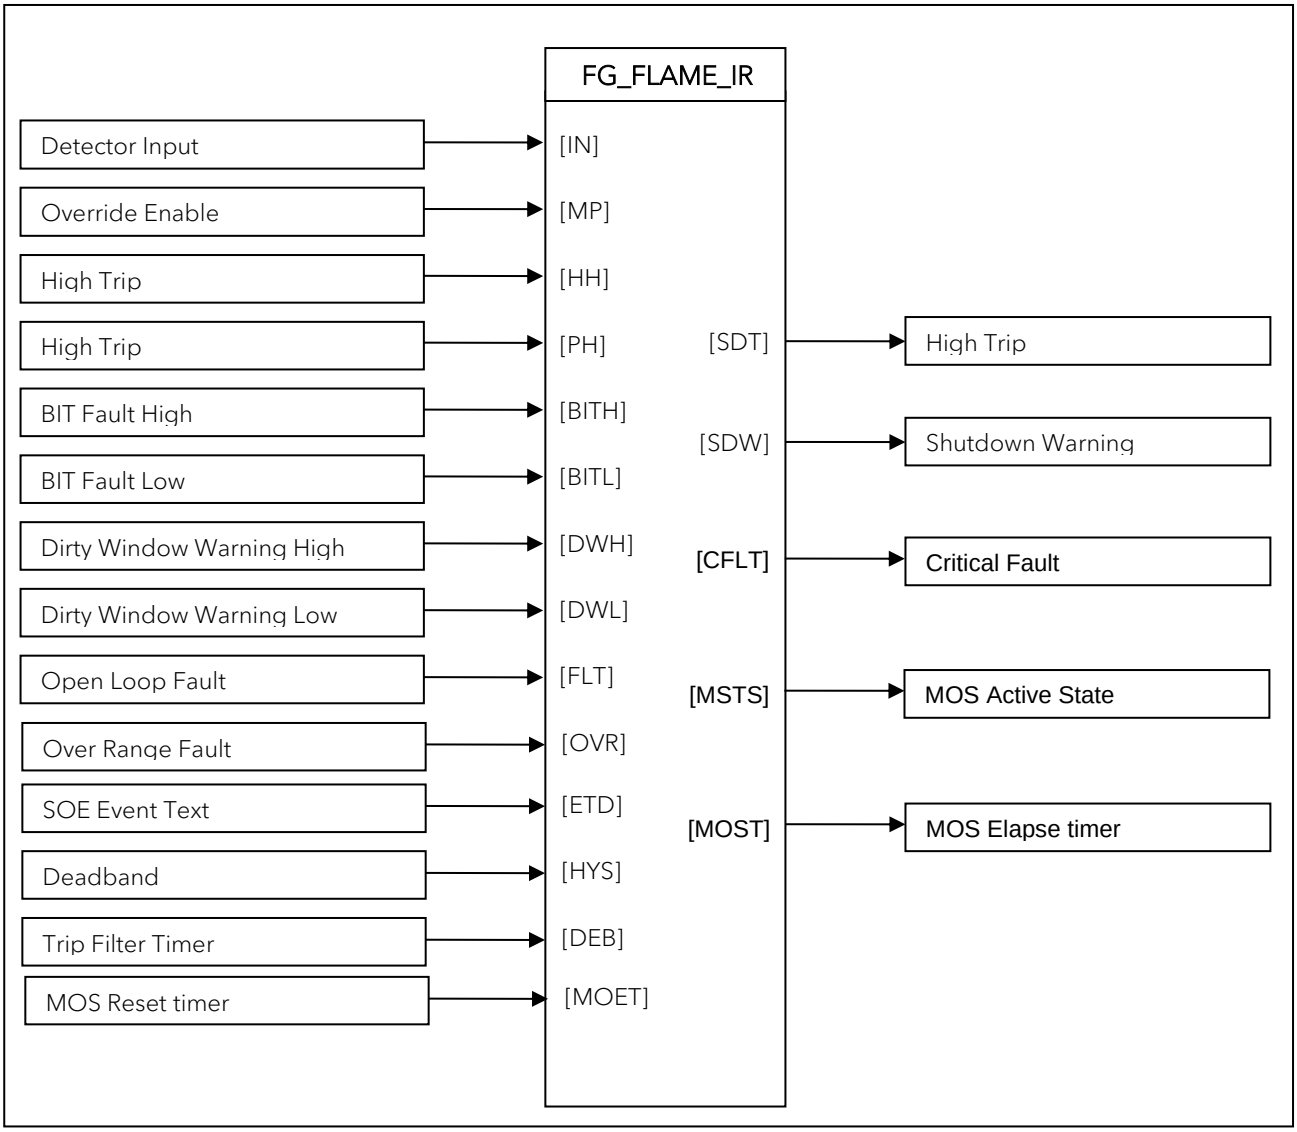
MOS function can be disabled by forcing the MOS enable key switch permanently to FALSE.

27.2.4 FG_FLAME_IR

This typical is used for Flame detector

Purpose

This typical is used for Ultrasonic Flame detector



Functionality:

- Process Flame Ultrasonic type Flame analog gas detectors
- Manage the maintenance override function (MOS) for each FLAME IR detector
- Manage detector trip, diagnostic and I/O fault logics

Note: The MOS override function is included inside the function block.
MOS function can be disabled by forcing the MOS enable key switch permanently to FALSE.

Flame_IR input processing block:

- Trip and general diagnostic setpoints are hardcoded outside the User Defined Function Block (UDFB).
- Scaling setpoints are inside UDFB.
- LL and LTRP values are masked as these provide no function for flame detection.
- HHH value & HTRP values is used for warning and trip.
- All faults are considered critical and result in degraded voting logic.

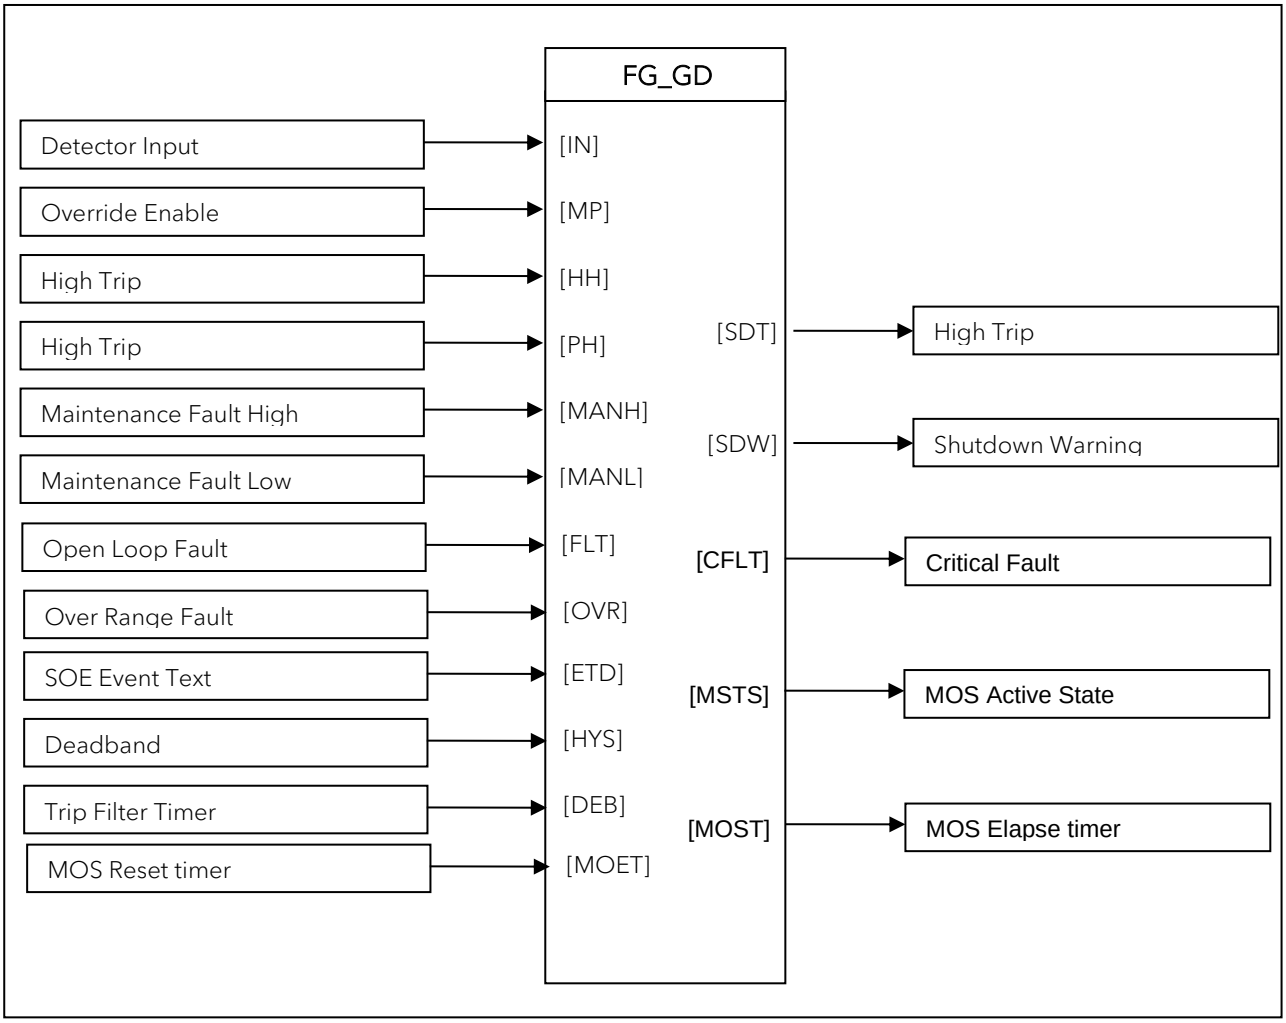
27.2.5 FG_LD/FG_GD

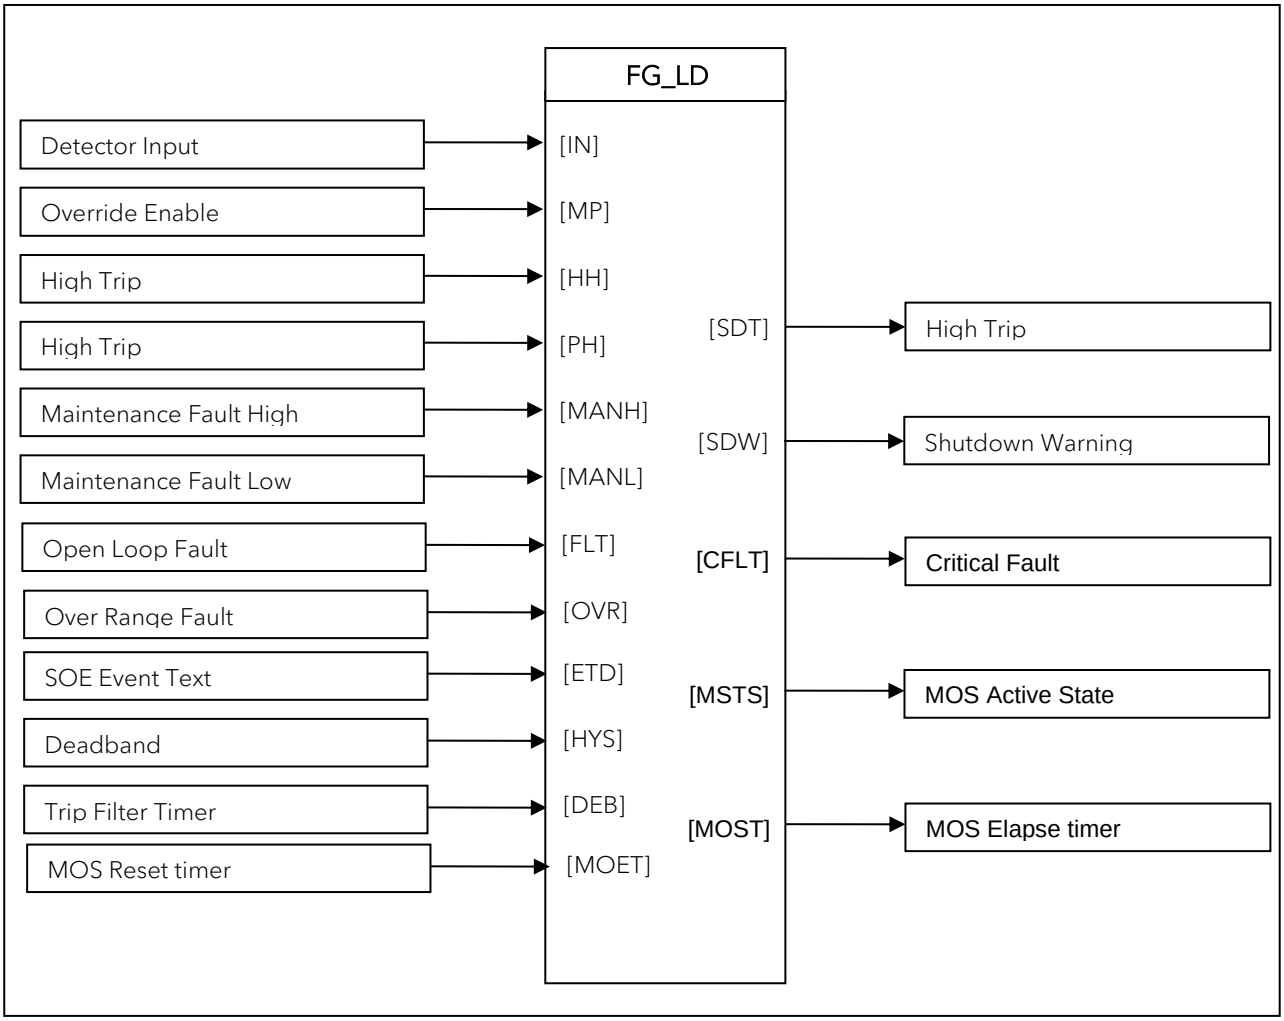
This typical is used for Leak and gas detector.

Purpose

This typical is used for H2 Leak and H2/O2 gas detectors.



Functionality:



- Process Point type gas detectors
- Manage the maintenance override function (MOS) for gas point detector
- Manage detector trip, diagnostic and I/O fault logics

Note: The MOS override function is included inside the function block
MOS function can be disabled by forcing the MOS enable key switch permanently to FALSE.

Gas Point type input processing block:

- Trip and general diagnostic setpoints are hardcoded outside the User Defined Function Block (UDFB).
- Scaling setpoints are inside UDFB.
- LL and LTRP values are masked as these provide no function for flame detection.
- HHH and HTRP values is used for warning and to trip.
- All faults are considered critical and result in degraded voting logic.

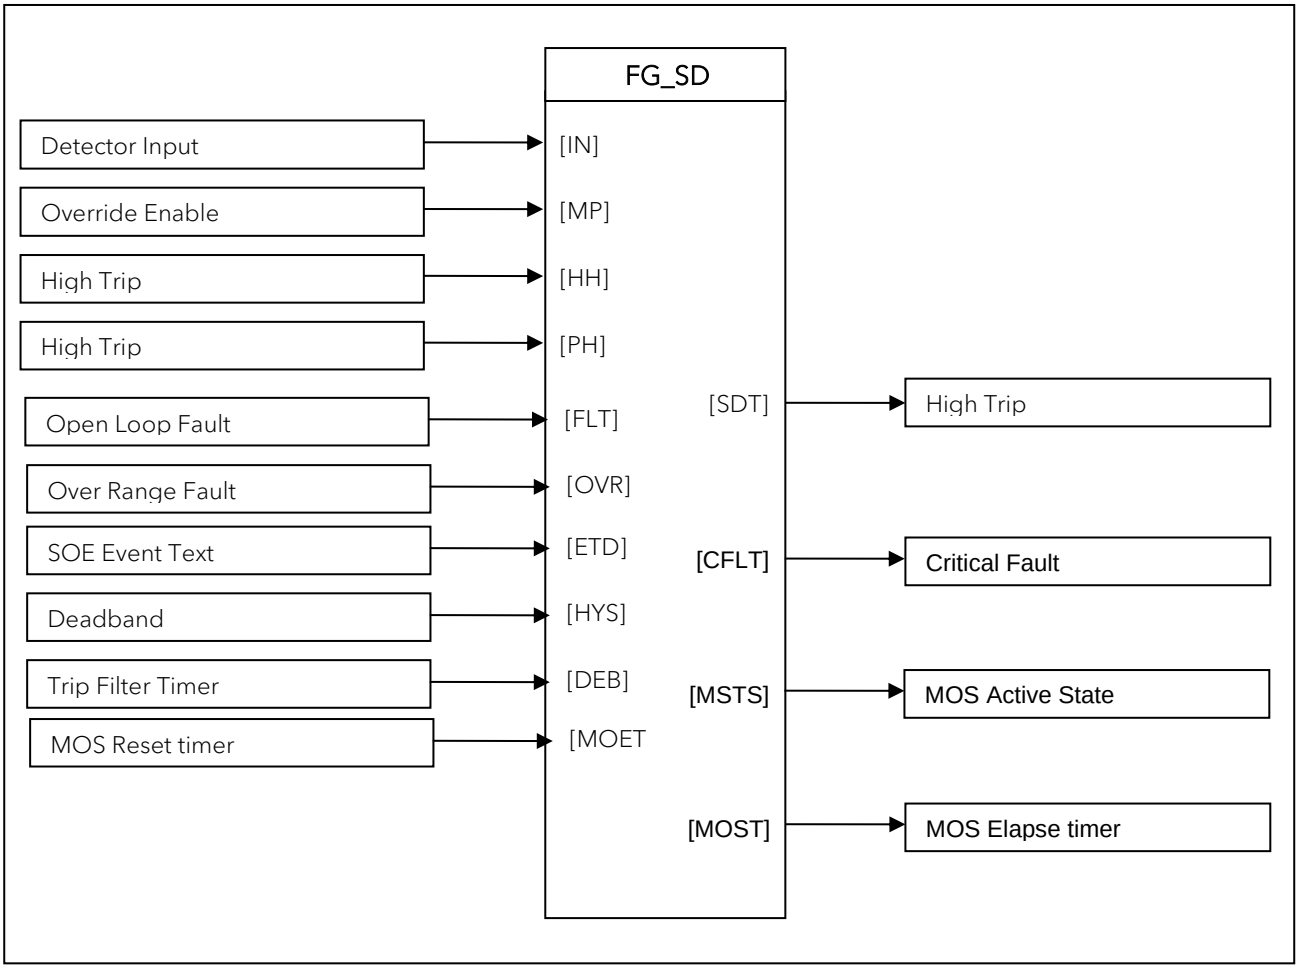
27.2.6 FG_SD

This typical is used for Smoke detector.

Purpose

This typical is used for Smoke detectors.



Functionality:

- Process smoke detectors
- Manage the maintenance override function (MOS) for gas point detector
- Manage detector trip, diagnostic and I/O fault logics

Note: The MOS override function is included inside the function block
MOS function can be disabled by forcing the MOS enable key switch permanently to FALSE.

Smoke Detector input processing block:

- Trip and general diagnostic setpoints are hardcoded outside the User Defined Function Block (UDFB).
- Scaling setpoints are inside UDFB.
- LL and LTRP values are masked as these provide no function for flame detection.
- HTRP values is used to trip.

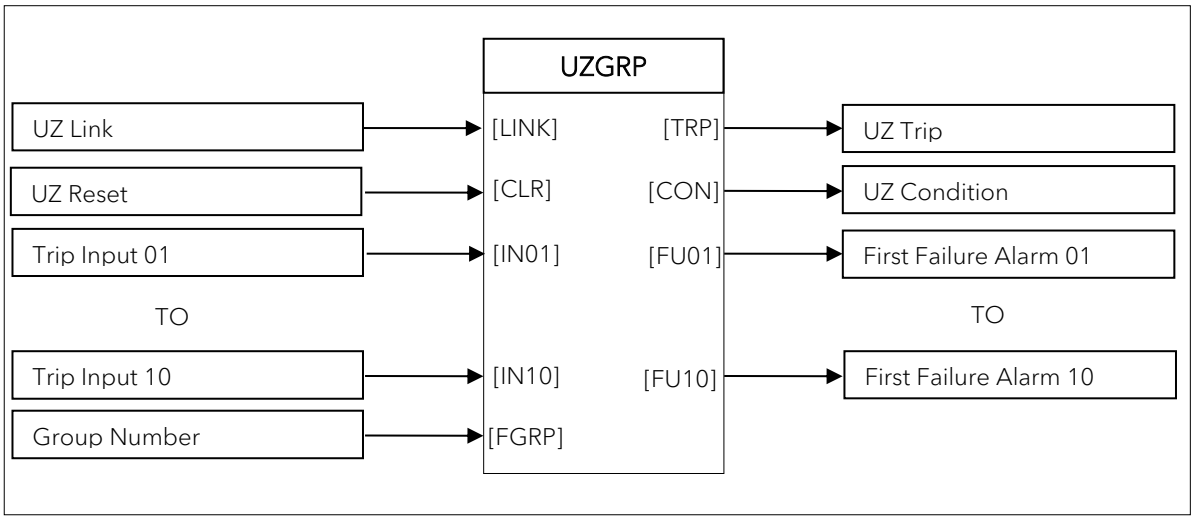
27.2.7 UZGRP

UZGRP typical provides the common functionality for UZ groups in the SIS.

Purpose

UZGRP typical provides the common functionality for UZ groups in the FGS. The functions of the typical are trip latching, alarming and first failure identification.

Functionality:



The UZGRP function block has the following main functions:

- Trip the UZ group if one of the inputs is tripped.
- Initiate a First Failure alarm to indicate which trip came first.
- Latch the UZ trip if a trip condition is active and no reset has been applied.

For every process group in the system at least one UZ block is used. The typical UZ block is designed for 10 inputs. Depending on the number of inputs to the group, more UZ blocks may be used for a process group. The UZ block can be linked together in a chain by linking the UZ Link and UZ Condition of the next UZ block together. If only one UZ block is used to trip a UZ group the UZ Link input shall be set to FALSE.

The trip outputs of input typical and/or voting typical in a UZ group are connected to the inputs of the UZ block. A trip condition on an input of the UZ block will trip the UZ group. This will latch the UZ block, further trips on the inputs will be ignored for failure indication, but still affect the UZ group trip. The output of the UZ block will be used in the application logic to the trip related field outputs. The trip alarm and the first failure flag of the tripped input will be shown in the OWS. The Tripped Outputs Latched status will be shown in the OWS until UZGRP is reset.

After all trip conditions are cleared the UZ typical can be reset via the optional UZRST application typical, by a reset signal from SCS. If the UZ group requires an auto-reset function, then the UZ Condition output has to be connected to the Clear input. The Clear input will only react on a positive trigger. The Clear will not only reset the UZ group but also clears the first failure flag, a reset will only have affected if all trip input conditions are normalized (not tripped).

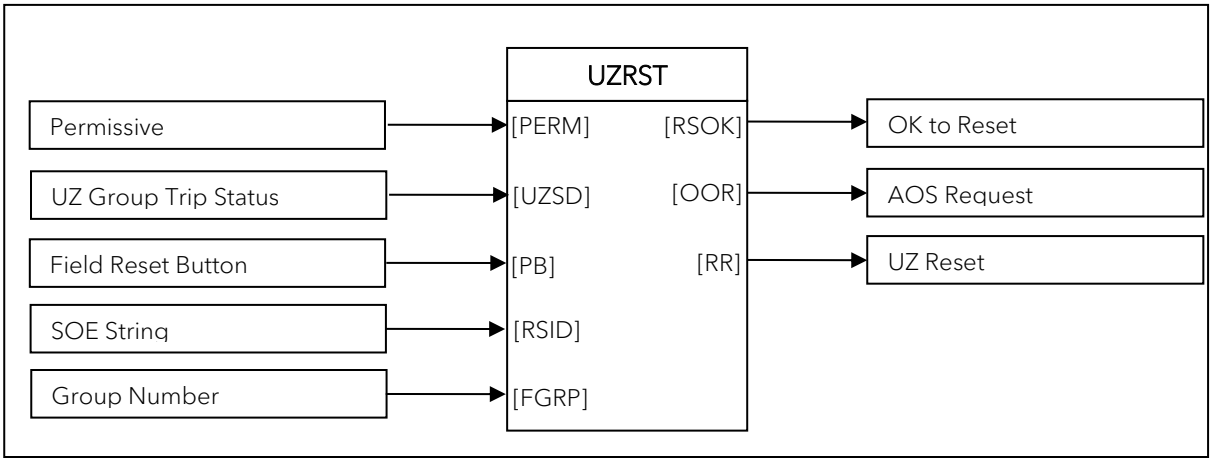
27.2.8 UZRST

UZRST typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip.

Purpose

This typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip. The UZRST block has an input to indicate UZ trip status and an output to reset UZGRP logic.

Functionality:



The UZRST function block has the following main functions:

- Reset UZ groups only when SCS Reset operated from OWS or field reset switch has been applied
- Indicate that SCS reset is allowed.

This typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip. The UZRST block has an input to indicate UZ trip status and an output to reset UZGRP logic.

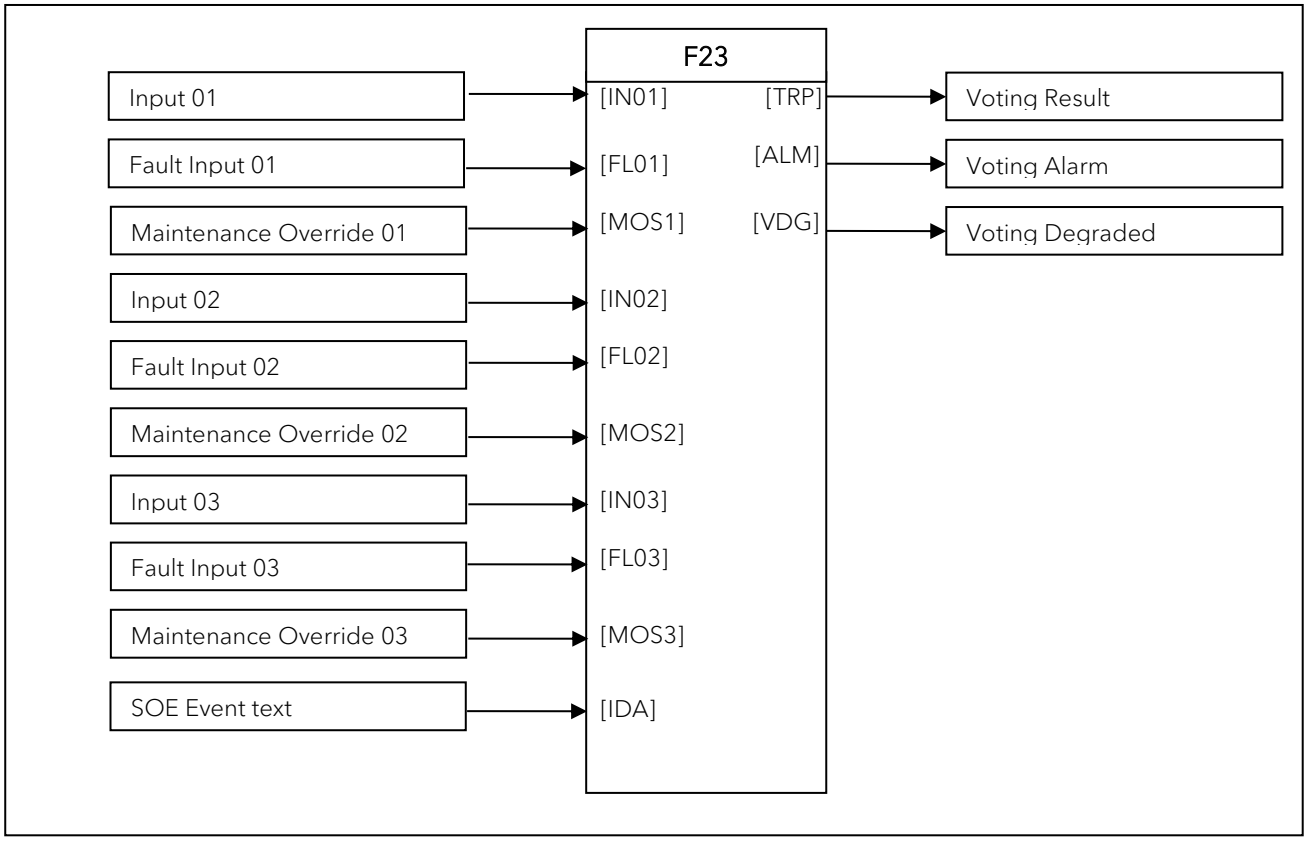
To indicate that a SCS reset is allowed (i.e. Permissive is 'TRUE') the status (Ok to Reset) is sent to OWS. After the reset from OWS, the Ok to Reset status will go off.

Push button field input reset is designed for normally open-momentary closed contacts to reset.

27.2.9 F23

2oo3 Voting typical will be used for Fire and Gas application.

Purpose



This typical is used to Initiate a trip if two of the three inputs are in trip.

Functionality:

The F23 function block has the following main functions:

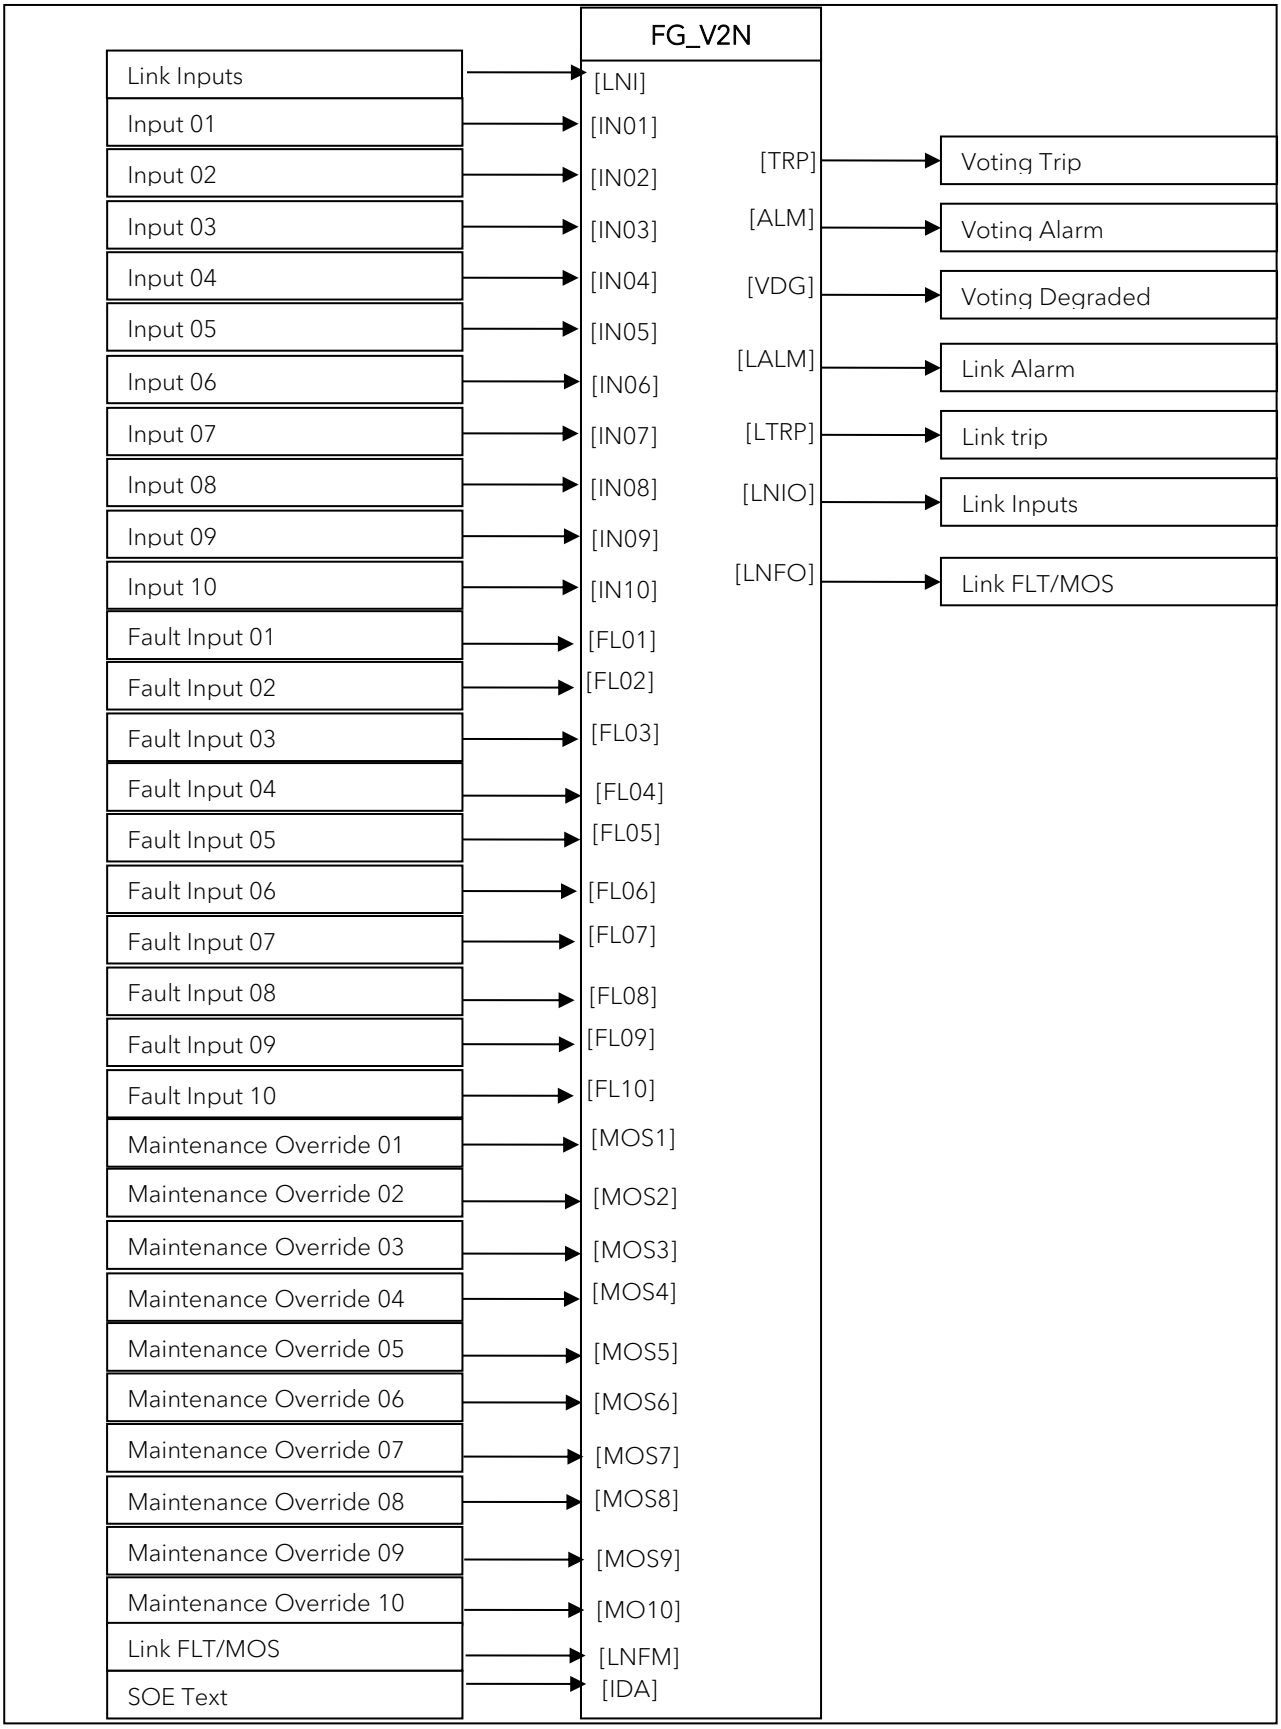
- Initiate a trip if two of the three inputs are in trip state.
- Degrade voting function.

If two of the three inputs are tripped the output TRP of the F23 block will trip. If either one of the three inputs is not valid (detector fault) or a maintenance override is applied the voting function will degrade to 1oo2 and VDG of F23 will become true. If all transmitters are in fault, or if one maintenance override is applied while the other two transmitters are in fault the voting function is disabled.

27.2.10 FG_V2N_Voting

2-out-of-N voting is commonly used in fire and gas system to initiate trip, Process shutdown interlocks and other safety functions. This voting logic requires any two detectors to be in Alarm condition.

Purpose



This typical is used to Initiate a trip if two of the N inputs are in trip.

Functionality:

The FG_V2N function block has the following main functions:

- Initiate a trip if two of the three inputs are in trip state.
- Degrade voting function.

If two of the N inputs are tripped the output TRP of the FG_V2N block will trip. If any one of the N inputs is not valid (detector critical fault) or a maintenance override is applied the voting function will degrade and VDG of FG_V2N will become true. If all transmitters are in fault, or if one maintenance override is applied while the N transmitters are in fault the voting function is disabled.

28 CI SERVER FUNCTION DESIGN

28.1 CI SERVER

28.1.1 CI Server Configuration

CI Server can be flexibly configured according to the plant architecture and business style from standalone configuration, in which single computer provides environment of data collection in real time processes alarms and stores it in the historical database.

- CI Server consists of three functional components. The system configuration is determined by allocating these components on the server computers and client computers.
- CI Core: Collects, stores, and calculates plant operation data, and links data with other CI Core and other systems.
- CI Portal: Provides the data collected and stored by CI Core and predefined screens to CI View.
- CI View: HMI for operation and monitoring

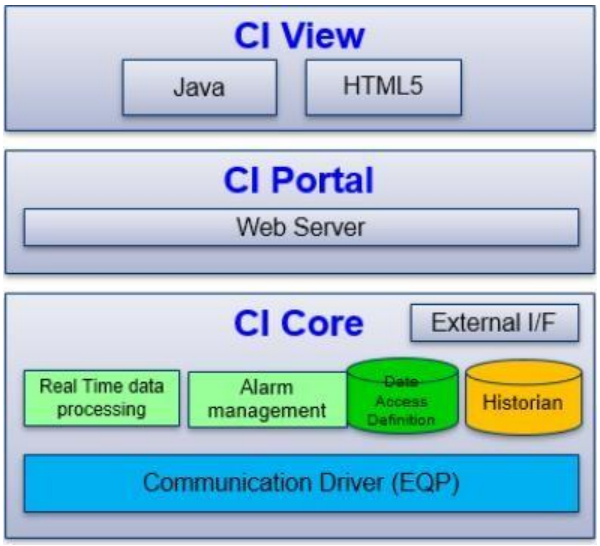

Figure 82 – Functional Component of CI Server

Detailed system design is as follows:

Location	Station	License	Node	Redundancy	Virtualized	Vnet/IP
ITER	CI Core	1	1	YES	NA	YES
ITER	CI Core	1	1	YES	NA	YES
OER	CI Portal VIEW	3	21,22,23	NA	NA	NA
CCR	CI View	2		NA	NA	NA

Table 91 – List of CIX Modules

These components can be installed in computers using the functional component unit. Each of the functional components can be installed in a single computer or can be distributed across computers based on the

plant structure. Therefore, CI Server supports both standalone structure in which data collection and operation maintenance is carried out in a single computer as well as wide area system structure in which multiple servers are installed in a wide area and are integrated.

The system design architecture has 2 Server Modules installed in ITER location and shall have CI -Core redundancy.

28.1.2 Redundancy

CI SERVER comes with several built-in features for supporting high Availability solutions. The purpose of these features is to support redundant Server configuration to reduce down-time.

The high availability features include:

- Redundant server support
- Monitoring CPU levels, queue levels and activity of CI SERVER Processes
- Synchronizing data between redundant servers
- Journaling of changes to CI SERVER databases

In the rest of the document, the CI SERVER High Availability features will be abbreviated to HAC.

Configuring the high availability is performed primarily through the HAC setup file. This file can be accessed from the CI server Setup File Editor.

28.1.3 CI-Core HAC Servers

The CI-Core in the CCR will be configured as a dual-redundant High Availability Computing (HAC).

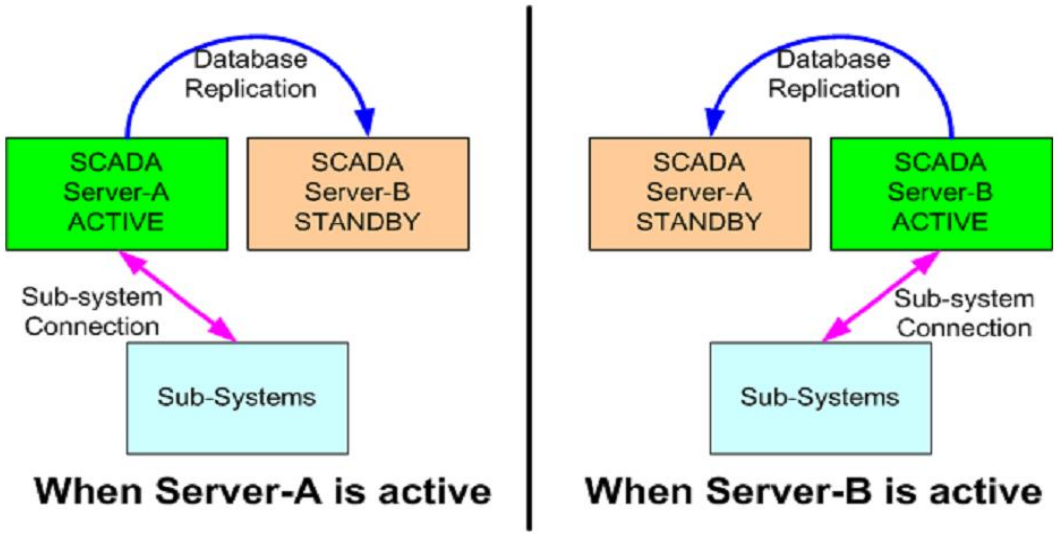

Figure 83 – CI-Core HAC Concept

At start-up, Primary server will become the active server, while the secondary server will take role as the hot standby server. Then HAC module will synchronize the content (files) of the active server to the standby server. Only the differences of the files (delta) will be replicated.

Initial replication to get in sync will take time from a minute to hours depending on network speed and the size of files. After that, the databases are synchronized in real-time.

Whenever there is an abnormality in the active server (such as hardware failure) the standby side will be activated within ~15 seconds (depends on hardware and system size and configuration).

CI-Core HAC system is to synchronize the CI-Core database only.

28.2 FIELD DATA ACQUISITION

28.2.1 Field Controller

28.2.2 Field Data Acquisition

The list of communication line between the field controllers and CI Server (CI-Core) are as follows:

#	Controller	Protocols	Scan rate*	Master / Slave	Communication Link
1	FCS	Vnet/IP	> 1 second	Slave	Vnet/IP bus
2	SCS_SIS	Vnet/IP	> 1 second	Slave	Vnet/IP bus
3	SCS_FGS	Vnet/IP	> 1 second	Slave	Vnet/IP bus
4	EMCS	OPC UA/ Modbus TCP/IP	> 1 second	Slave	Ethernet

Table 92 – Communication Lines

*Actual Scan rates to be finalized once Master Tag list is available.

28.3 FIELD CONTROL

28.3.1 Control Philosophy

CI Server shall be designed to continuously monitor/ access data on real time basis from PCS, SIS & EMCS and operate the entire integrated system on day-to-day basis.

28.4 CI SERVER NETWORK

For Network design overview, network names and subnet, routing and firewall rules, time synchronization (NTP) refer to 1724000594-IN-RE-00043 - Cyber Security Settings.

28.5 CI SERVER SOFTWARE CONFIGURATION

CI Server software configuration covers the main aspect of CI-Server engineering (Database, Visualization, and Interfacing).

28.5.1 CI Server Database (CI-Core)

Real Time Database

The CI Server (CI-Core) collects data from the field through the controllers (FCSs, SCSs, EMCSs, etc.) and stores it in the real-time database and shown in HMI. The data are also simultaneously processed for alarming and stored in the historian database.

The data refresh rate is entirely based on the scan rate (data polling) from CI-Core to field controllers as defined in section 3.2.2.

Tag-set	Tag	I/O	Function Description	Scan Rate
	All AO/DO	Output	All output are sent immediately	1 sec.
PVI	PV	Input	The transmitter value (measured value)	1 sec.
PVI	HH	Feedback Input	Alarm HH limit set-point Also, for HI, LO and LL	5 secs.

Table 93 – Scan rate settings for I/Os example

Historical Data Recording

Historical data from the field are collected as follows

Typically, every AI data (process-value) from transmitters is recorded in every 1 second, while status data are recorded in the event of value change.

The target of historian data storage life cycle is to be kept for up to 1 year. Final settings to be defined after MTL is received.

Historical Data Storage group

History Group	Scan Rate	Avg. (1)	Agg.(2)	Life Cycle	Description
EVENT	Event	-	-	1 year	For all status (DI / DO) tags and event-based AI.
0001_FCS1_EI	Event	-	-	1 year	For AI tags which are involved for process control such as PID-control-loop (PV and MV).
0001_FCS1_ST1	5 sec	60 sec	-	1 Year	For AI tags which are involved for monitoring from PCS Controller
0001_SCS1_EI	Event	-	-	1 year	For DI tags which are related to FO alarms and annunciator
0001_SCS1_ST1	5 sec	60 sec	-	1 year	For AI tags which included timers
TEN_MINUTES	600 sec	-		1 year	For AI tags related to EMCS

Table 94 – History groups

Archiving and De-Archiving

The archive and de-archive functionality is the backup and restore functionality.

There are two types of archiving procedures.

- Automatic Archive: This method archives the history files automatically from the storage groups at a specified time each day.

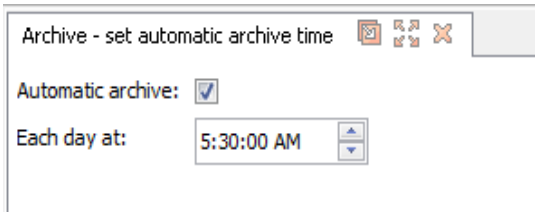

Figure 84 – Automatic Archive

- Manual Archive: This method archives the history files from the storage groups from the start of archive period to end of archive period specified by the user at the time of archiving.

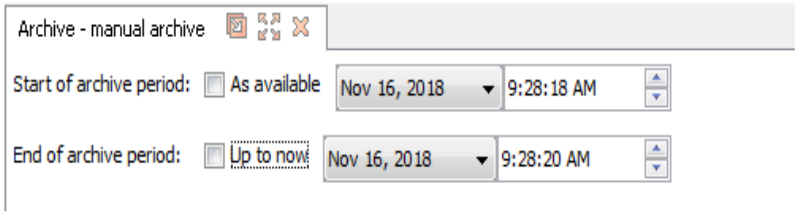

Figure 85 – Manual Archive

The archive supports disk drive, that are accessible via a directory path, and it can be used for archiving purposes on Windows. This means that all read/write storage mediums that are accessible via a directory path can be used by the archive functionality. This includes:

- Local Disk drives.
- Drive access over the network.
- USB Storage devices.
- CD and DVD writers that support Universal Disk Format (UDF) and are loaded with a UDF formatted CD-R, CD-RW, DVD-RAM (or compatible systems).

For disk drives the disk is the archive medium and for CD and DVD drives the CD's and DVD's are the archive mediums.

Drive access over the network shall be configured in backup recovery server and Mass storage devices shall not be used.

CI-Core has its own historical database (online historical) for reporting and trending, then such data will be archived to the specified location.

This method retrieves the information from the archived folders from the storage medium by specifying the start of retrieval period and end of retrieval period time.

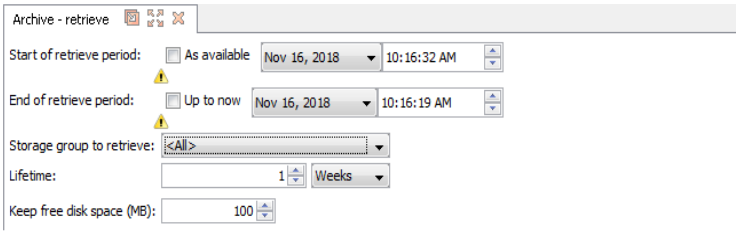

Figure 86 – De-Archive

Refer 1724000594-IN-RE-00043 - Cyber Security Settings for detailed settings of backup recovery server.

28.5.2 Item Naming Convention

In CI SERVER, items are the main definition within the CI Core database. They are the real-time tags that can be configured via points to receive real-time data from the PCS blocks tags, generate alarms, be used in graphics, stored in history, and used in reports.

The items can be placed under Sections and Objects which will define a plant hierarchy structure within the CI Server database.

The layout of an item name is as follows:

SECTION.SECTION..... OBJECT.ITEM

SECTION: can be the location, plant area, subsystem.

- OBJECT: the equipment tag name, usually the PCS block name as well.
- ITEM: the sub tag which relates to the parameter of the PCS block (e.g. PV, ALRM)

When an item is referred to within the CI server database, its name will include the sections and object name and can contain a maximum of 252 characters.

An item is also uniquely identified by an item ID which is automatically generated when the item is defined.

Item Name – 1st layer sections

The following 1st layer sections are defined:

1st Layer Section	Description
BLPH	Base Load Power Hub

Table 95 – 1st layer section example

Item Name – 2nd layer sections

The following 2nd layer sections are defined:

1st Layer Section	2nd Layer Section	Description
BLPH	FCS0110	FCS Controller
	SCS0110	SIS Controller 1
	SCS0120	F&G Controller 2
EMCS		Electrical Monitoring and Control System

Table 96 – 2nd layer section example

Item Name – 2nd layer sections

Item names will change based on the block used for generating the object.

Tag names will be defined in Master Tag List (MTL).

28.5.3 HMI Server (CI-Portal)

CI-Portal role can be as:

CI Portal Function	Description
HMI Web-Server	Serving the HMI request from CI-View clients.
Engineering Workstation (EWS for CI-Server)	In this EWS (desktop), engineer can do: • Configures CI-Core database (with Engineering module) • Creates / modify Graphics HMI (with Edit Module)

Table 97 – CI Portal Roles

CI Portal software is installed on a target machine. The application makes a native CI Server connection to CI Core. Users can open the operator interfaces directly from the target machine.

The lists of CI Portal are:

CI	Node#	Device Type	Location
CI VIEW(OWS)	NA	CIPO04	CCR
CI VIEW (CAP)	NA	CIPO05	CCR
CI PORTAL/VIEW (EWS)	21,22,23	CIPO03	OER

Table 98 – List of CI Portals

28.5.4 HMI Client (CI-View)

CI-View (HMI Client) connection is:

CI View type	Description
Remote-Connect	The Java based CI-View suites which covers the functionality of Engineering, HMI Editing and HMI Viewing.

Table 99 – List of CI Portals

CI View solution is a web-based user interface of CI Server. It can be opened by opening a web browser and connecting either to a CI Portal machine or CI Core. A user license is required to open the operator interface. E.g. if CI Portal is equipped with 2 user licenses, on the native CI Portal machine the operator interface can be opened and via a web browser on the same or another machine a second Operators interface can be

opened as well. This can be useful to give additional users access to the operator interface, e.g. during commissioning or e.g. to provide information to remote users.

Both HMI1 and HMI2 are equipped with an additional CI View license for this purpose.

The functionality as EWS or OWS is only determined by user's right, whereas the engineering capabilities is only available to the specific users in the "system-manager" group of CIX user database.

Machine	Function	# Additional CI View License
HMI 1	Operator Working Station	1
HMI 2	Operator Working Station	1
CI EWS	Engineering Working Station	0

Table 100 – List of CI View Machines

The maximum number of monitors that can be connected to one CI View is 4.

28.5.5 CI Server Presentation

The acquired field data in CI Server database will be presented to the operator in the following forms as:

- Process Schematic HMI
- Trending Chart

Please refer to section 30 for graphics HMI design.

Process Schematic

Reference to section 30.2.

Trending Chart

Trending chart is available for all analog values from sensors or transmitters, for digital signals and for software items.

The "value-display" in HMI can be clicked to show the fluctuation of the historical value in the trending-chart pop-up window.

Reference to section 30.2.5.

28.5.6 Reporting Definitions

NOTE: No inputs received during Development and FAT.

Report Conventions

The layout of a report is configurable. The following figure shows what parameters can be set:

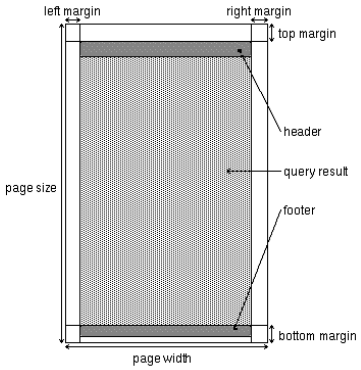

Figure 87 – *Report layout Parameters*

For this project the parameters are defined as follows:

- Page size 72 lines
- Top margin 3 lines
- Bottom margin 6 lines
- Page width 80 characters
- Left margin 3
- Right margin 3

The header of each report will look as follows:

```
--------------------------------------------------------------------------------
                        REPORT DESCRIPTION
Date 7-MAY-2022                                          PAGE NUMBER
--------------------------------------------------------------------------------
```

The header shows the date when the report was generated. Furthermore, it shows a report description. Finally, it shows the report page number.

The footer of the report looks as follows:

```
--------------------------------------------------------------------------------
TOT_PROD                                                 page 1
--------------------------------------------------------------------------------
```

On the left side the CI SERVER name of the report is shown and on the right side the page number.

Report Destinations

The following report destinations are available:

Destination	Device	Output type	Description
REPORT	CI_Core Server	Hardcopy	For all add-hoc generated reports

FILE	< none >	File	For all automatically generated reports

Table 101 – Report Destination

Report Handling

Reports can be generated in the following ways:

- Time based; meaning the report is generated at specific time, such as daily or monthly.
- Event based; meaning the report is generated after it was triggered by tag's events such as a pressure crosses a certain limit, or a digital input signal state was changed.
- Ad-hoc: meaning that the user must press a button to start the generation of the report.

The following table gives an overview of all default delivered reports. The below reports can be ad-hoc generated. Custom reports can be defined as well but require customer input.

Report Name	Report Description
ALARM_COUNT	Alarm counting report
ALARM_CURRENT	Current alarms report
ALARM_HISTORY	Alarm history report
AUDIT_TRAIL	Audit trail of user activity and item/object/class modification
AUTH_GROUP	Authorization groups
ITEM_ACK	Items and related acknowledgement type
ITEM_ALM	Items and related alarm info
ITEM_EQP	Items and related equipment info
ITEM_FO	Items and related first out groups
ITEM_HISTORY	Historical values of an item
ITEM_ID	Items and related item ids
ITEM_ITM	Items with related item table info
ITEM_OTH	Items and related miscellaneous info
ITEM_TYPE	Items in order of item type
ITEM_VAL_STA	Item value and status report
ITEM_VAL_CSV	Export CI SERVER data in csv format.

STATION	Station definitions
SYSTEM_LOG	The contents of the system log
USER	User definitions

Table 102 – Report Destination

Generated reports are stored in history and retained for a certain period (lifetime).

28.5.7 Audit Trail

Audit Trail is a function for recording a log for each action by the CIX users which affecting the CI-Core database. This optional feature was added for this project.

There is no special configuration required; and by default, the following action by CIX users will be logged:

CIX DB Tables	User's Action
CIX System (Engineering, Edit and Operator Interface)	Login and Logout.
Equipment (sub-system) scan (polling) properties	Modify
Station (sub-system) connection	Modify (Scan / Off-scan)
Item (Tag) structures (Installation, Unit, Section)	Insert and delete
Item's properties	Modify
Item's value (manual)	Modify
Class	Insert, Modify and Delete
Class's Objects	Insert, Modify and Delete
Class's Trigger Group	Modify
Users	Insert, Modify and Delete
User's Profiles	Modify

Table 103 – Audit Trails actions and affected objects

28.5.8 System Monitoring

CI Server system components health status and parameters will be monitored, and it will be displayed in HMI.

Device status / Parameters monitoring by PLC

The list of devices and its parameters which are connected and monitored in SCADA:

Device name	Monitored Parameters (MP)			
	MP-1	MP-2	MP-3	MP-4
FCS	Communication	Node and CPU	Battery	BUS Line
SCS_SIS	Communication	Node and CPU	Battery	BUS Line
SCS_FGS	Communication	Node and CPU	Battery	BUS Line
EMCS	Communication	-	-	

Table 104 – List of Monitored Device's Status

Network Device Monitoring

CI Server by means of the utility called INTTCPMON can periodically ping network devices and capture the response and connect this to a tag. The tag can be used for visualization and alarm.

28.5.9 CI Server Licenses

The list of CI Server licenses that being used in this project are:

Software name	Version	Quantity	Computer name
CI Core with FCS Connections: 1 SCS Connections: 2 Number of licensed items: 64000	v.1.03 *	1	CI_Core
CI Portal	v.1.03 *	3	HMI1, HMI2, CI_EWS
CI View	v.1.03*	5	HMI1, HMI2, CI_EWS + 2-browser-based connections
Product Maintenance License (PML)			

Table 105 – CI Server Licenses

*Note: In the project the latest version available will be used (R1.03). Post Integration of all packages item-based license shall be procured to meet the requirements as per project scope.

28.6 SYSTEM ALARMING

CI Server acts as an overall integration package where Operators control the plant on a day-to-day basis. A key element of control are alarms and alarm management.

From a high-level perspective to integrate alarms there are 2 approaches possible:

- Centrally: Alarm management is organized centrally in CI Server: All alarm definitions, alarm generation and acknowledgement are centrally defined and managed.

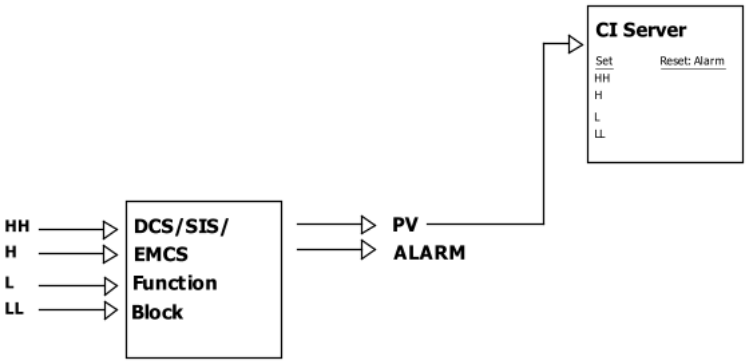

Figure 88 – Central alarm management

- Integrated: Alarm settings and alarm generation are defined in lower system(s), CI Server connects and displays these alarms. Acknowledgement of alarms happens in CI Server, refer to below picture. Typically, it is possible to update alarm limits in CI Server and write those back to the lower system.

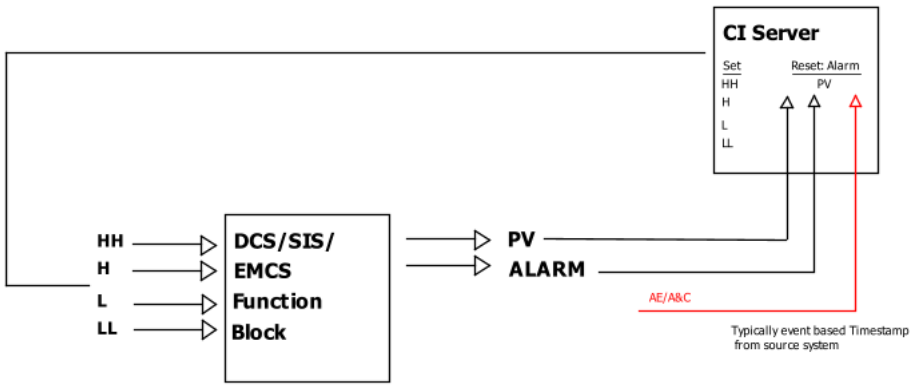

Figure 89 – Integrated alarm management

The process values and alarm status of e.g. Function blocks are polled by CI Server scan based and typically get the timestamp of CI Server. Exception to this rule are systems which use protocols which provide the timestamp as well.

To get alarm information with lower system timestamp either OPC AE or OPCUA A&C is required. Often a combination of scan-based data and the OPC based data are used, which will result in a slight offset in time on Function block status and alarm status in the alarm banner, due to the different moment the information enters CI Server. This typically is not a problem if the difference in time is limited.

Alarm limits and definitions will all be set and maintained in the lower systems.

28.6.1 Alarm concept and features in CI Server

The alarm concept in CI Server can be summarized as follows:

Each tag can be enabled/ disabled for alarming. When a tag is enabled for alarming the status change of the tag is the primary driver for alarming. A status change can be for example from High High to High, or Boolean 1 to Boolean 0, Offline to Normal, etc. In total 255 statuses can be defined in CI Server. With status

e.g. the alarm state & acknowledgement approach, priorities, coloring, etc. can be set. Alarm related features (see below) make use of these settings as well.

	Item status	Description	Status number	Alarm state	Alarm prio...	Alarm color	Mnemonic	Shelve enable
0	CALCULATE	calculate status	1	Normal	0	WH	CALC	☑
1	USE OLD	use old status	2	Normal	0	GR	OLD	☑
2	BLOCKED	BLOCKED	3	Alarm 3	3	BLU	BLKD	☑
3	BOOLEAN 0	FALSE	4	Normal	15	WH	FALSE	☑
4	BOOLEAN 1	TRUE	5	Normal	15	WH	TRUE	☑
5	UNDERRANGED	underranged	6	Alarm 1	0	CY	UNDERR	☑
6	LOW LOW	LOW LOW	7	Alarm 3	1	RED	LL	☑
7	LOW	LOW	8	Alarm 2	2	YEL	LO	☑
8	NORMAL	NORMAL	9	Normal	15	GRI	NR	☑
9	HIGH	HIGH	10	Alarm 2	2	YEL	HI	☑
10	HIGH HIGH	HIGH HIGH	11	Alarm 3	1	RED	HH	☑

Figure 90 – Item Status

These status dependent settings can be set project wide, however each individual tag has the possibility for max 6 individual status to override defaults.

Alarm related features within CI Server are for example:

- Alarm acknowledgement: to acknowledge an alarm.
- First out groups: A mechanism for a group of tags with alarms related to each other.
- Alarm collections: a grouping function.
- Alarm Selection Areas: Filters which can be programmed and used in other features, e.g. to filter on an alarm banner, for audible alarms, etc.
- Acknowledgement types: mechanism which supports automatic or manual alarm acknowledgement definitions.
- Area of interest: To create alarm filtering, more info is given in this chapter.
- Alarm link display: Link a particular tag with alarming to a particular display.
- Alarm notifications: Alarm to email.
- Alarm shelving: Temporarily shelving of alarms.
- Alarm repeat: Alarm repeat if not acknowledged with a certain time.
- Alarm delay: Delay an alarm event after e.g. to limit nuisance alarms.
- Audible alarms: to create audible sounds when a particular alarm becomes active.
- Priority change of alarms: Change alarm priority over time.
- Alarm Trend linkage: based on a tag in alarm, show the related trend.

28.6.2 Alarm Priorities

NOTE: Default priorities are followed.

Alarm priority is a numeric grading for the alarming condition (hence the priority); defined as integer number series from 0 to 15. The grading can be as descending (0 as the highest risk) or ascending (15 as the highest risk).

In this project descending grades is used with the interpretation as (example, to be finalized):

Priority	Interpretation
0	Emergency alarm identifying threat to life and environment.
1	High priority alarm indicating plant trip within 10 minutes
2	Medium priority alarm indicating area trip within 10 minutes.
3	Low priority alarm indicating degradation of product quality.
15	Unconcerned status, Normal

Table 106 – Alarm Priorities Example

28.6.3 Alarm State Transition

Alarm-states are the transition boundary of an evolving condition, defined as:

State	Interpretation
Normal	A condition which considered as a safe or normal event.
Alarm-1	The early stage of an alarming condition, or Low priority Boolean alarm.
Alarm-2	The next higher stage of an alarming condition, or medium priority Boolean alarm.
Alarm-3	The terminal stage of an alarming condition which supposed to be as the tripping point for shut down, or high priority Boolean alarm.

Table 107 – Alarm State Transitions

28.6.4 Alarm Configuration

28.6.5 Operator's action for Alarm

Two actions can be taken by Operator:

- Acknowledge: It's a conscious action by operator to admit that alarm situation has happened, and his team should know it and act accordingly to rectify the problem.
- Shelve: Alarm shelving is provided to prevent distraction from a repeating alarm from some "under repair" or maintenance.

28.6.6 Alarm Acknowledgement

Alarms can be manually or automatically acknowledged. For each type of acknowledgement rule an acknowledgement type is defined. Each tag can be assigned one of these acknowledgement types. For this project there are three acknowledgement types defined:

- Full Manual: Each change in alarm state must be manually acknowledged by the user.

  NORMAL to ALARM<x>, ALARM<x> to ALARM<y> as well as ALARM<x> to NORMAL
- Manual: When there is a change in alarm state from NORMAL to ALARM, the user must acknowledge this alarm. When the tag changes from ALARM to NORMAL, this will be automatically acknowledged.
- Automatic: Any change in alarm state will be acknowledged automatically.

The following tables show the acknowledgement matrices for the three types. The table should be read as follows: select from the left column the current alarm state and for that state the current acknowledgement

state. Then select the column with the new alarm state. On the intersection it shows either "auto" or "manual", specifying how this new alarm should be acknowledged:

Current alarm state \ Next alarm state		No Alarm (N)	Alarm1 (A1)	Alarm2 (A2)	Alarm3 (A3)
No Alarm	Ack	Manual	Manual	Manual	Manual
	Nack	Manual	Manual	Manual	Manual
Alarm1	Ack	Manual	Manual	Manual	Manual
	Nack	Manual	Manual	Manual	Manual
Alarm2	Ack	Manual	Manual	Manual	Manual
	Nack	Manual	Manual	Manual	Manual
Alarm3	Ack	Manual	Manual	Manual	Manual
	Nack	Manual	Manual	Manual	Manual

Table 108 – Full Manual Acknowledge type

Current alarm state \ Next alarm state		No Alarm (N)	Alarm1 (A1)	Alarm2 (A2)	Alarm3 (A3)
No Alarm	Ack	Auto	Manual	Manual	Manual
	Nack	Manual	Manual	Manual	Manual
Alarm1	Ack	Auto	Manual	Manual	Manual
	Nack	Manual	Manual	Manual	Manual
Alarm2	Ack	Auto	Manual	Manual	Manual
	Nack	Manual	Manual	Manual	Manual
Alarm3	Ack	Auto	Manual	Manual	Manual
	Nack	Manual	Manual	Manual	Manual

Table 109 – Manual Acknowledge type

Current alarm state \ Next alarm state		No Alarm (N)	Alarm1 (A1)	Alarm2 (A2)	Alarm3 (A3)
No Alarm	Ack	Auto	Auto	Auto	Auto
	Nack	Auto	Auto	Auto	Auto
Alarm1	Ack	Auto	Auto	Auto	Auto
	Nack	Auto	Auto	Auto	Auto
Alarm2	Ack	Auto	Auto	Auto	Auto
	Nack	Auto	Auto	Auto	Auto
Alarm3	Ack	Auto	Auto	Auto	Auto
	Nack	Auto	Auto	Auto	Auto

Table 110 – Automatic Acknowledge type

Alarm acknowledge types for the project shall be decided/ finalised during FAT. Until then all alarms will be configured with manual type acknowledgment.

28.6.7 Audible Alarm Annunciation

Alarm can be made audible in HMI workstation (CI-View).

For each priority level a different sound is generated: low, medium, and high tone. Furthermore, a horn silence command is available. This will cease the tone until a new alarm event is received.

Please note that the horn silence command will NOT acknowledge the alarm. The horn silence command is available under function key < F10 >.

The following table shows what will be the result when a new alarm event occurs (example, to be finalized):

Previous situation	New event	New situation
No alarm active	Low priority alarm	Audible annunciation (low tone)
No alarm active	High priority alarm	Audible annunciation (high tone)
Low priority alarm active (low tone audible)	Low priority alarm	No change
High priority alarm active (high tone audible)	High priority alarm	No change
Low priority alarm active (low tone)	High priority alarm	Audible annunciation (high tone)
High priority alarm active (high tone)	Low priority alarm	No change
Low priority alarm active (low tone)	Horn silence command	Cease audible annunciation
High priority alarm active (high tone)	Horn silence command	Cease audible annunciation
Alarms are active, no audible because silence command	Low priority alarm	Audible annunciation (low tone)
Alarms are active, no audible because silence command	High priority alarm	Audible annunciation (high tone)

Table 111 – Alarm Event Example

28.6.8 Alarm Selection Area

Alarm selection areas (ASA) are used to filter the output of alarms destinations such as alarm-display or printers. The ASA naming philosophy supports a maximum of 15 characters.

ASA is a logical expression to select alarm / events. Various attributes of the item (tag) can be used to make the ASA filter such as Section, tag-name, alarm-priority.

ASA created for this project is based on Master Alarm Database (123A90-DDL-IN-LIS-40027).

Name	Priority Level
Station/Subsystem NAMES	Alarms can be filtered individually based on Station/Subsystem using AOI filter.
SYSTEM	System based alarms can be grouped as station names

Table 112 – Alarm Selection Area

28.6.9 Area of Interest (AOI)

An area of interest is a name, which represents a specific region. Areas of interest are used to specify what region an Item operates in. By defining area of interest and connecting items to area of interests, it is possible that an operator obtains only relevant alarms. If, however, no areas of interest are used, the operator will receive all possible alarms. To filter and group the relevant alarms for users AOI are used. A Tag can be associated to 16 areas. The following AOI grouping is suggested.

Name	Priority Level
Station/Subsystem NAMES	Alarms can be filtered individually based on Station/Subsystem using AOI filter.
SYSTEM	System based alarms can be grouped as SCS names.

Table 113 – Alarm of Interest

28.6.10 Alarm Collection

Alarm collection group is a mechanism to manage alarms of all items (group items) registered in the group.

The status of each alarm collection group (group status) indicates the arising status, acknowledgement status, and reset status of alarms that are arising in the group items. The group status is represented by a combination of three information:

1. No alarm/Alarm is arising
2. Waiting for Acknowledgement/Acknowledged completed
3. Waiting for reset operation/Reset completed

These are the combination of groups and are independent.

If the group status is "Alarm State," it means that one or more alarms have occurred in all group items. If at least one of the group items has an alarm, the group status indicates an alarm state.

If the group status is "Acknowledgment required," it means that there is one or more Nack alarms in arising alarms in all group items. Only when all the alarms are acknowledged, it indicates the group status is the acknowledged status.

When the group status is "Reset operation," it means that the reset operation is done for the alarm collection group.

Refer Master Alarm Database -123A90-DDL-IN-LIS-40027.

28.7 SYSTEM INTERFACING

From external application (3rd party system), CI-Core data can be accessed via protocols such as OPC-UA. CI-Core acts as data-provider (Client); while 3rd party application acts as data-consumer (Server). This section describes this function.

28.7.1 OPC Interface

OPC-UA Client

CI-Core has an in-built OPC-UA client. The specification as follows:

Specified parameter	Parameters configuration value (options)
Endpoint URL	*
Security policy	*
Message security mode	Sign (only) Sign and encrypt
Login	Username and password

Table 114 – OPC-UA server access parameters

"*": Refer to Cybersecurity Document for the details of IP address and Security policy

28.8 CI SERVER USER MANAGEMENT

Note: Details to be aligned with customer.

In most cases, there are three essential "Authorization Groups" (user level):

- View only group
- Remote
- Operator
- Admin / Engineer

28.8.1 Authorization Group

Five user levels are defined:

- Level 0: View Only

This will be the default level for all workstations, view only level allows the user to view all process values, process displays, system status displays, trends and alarm acceptance. He is not allowed to manipulate any data or Process parameters.

- Level 1: Operation

The process operator can change control set points, outputs, operation modes and acknowledge process & system alarms of certain areas.

- Level 2: Process Operations Supervisor

The process operator can change alarm parameters, Enable / Disable alarms, Enable / Disable point scan and assignment of AOI's, also manual overwrite process values.

- Level 3: Engineer

The engineer has access to system management functions like tag definition (add, modify, and delete), building graphics or changing software.

- Level 4: Administrator

This is the highest level. This user can change/delete user rights, set file permissions and attributes.

Each level can be configured with selectable privileges. Each higher level includes all the lower-level privileges.

System function	System user level				
	0	1	2	3	4
Display process variables	X	X	X	X	X
Change process variables		X	X	X	X
Acknowledge alarms		X	X	X	X
System function	**System user level**				
	0	1	2	3	4
Manually override input process variables			X	X	X
Modify alarm parameters			X	X	X
Assignment of plant areas, view only terminals			X	X	X
USER/FAST system management				X	X
Modify/add displays				X	X
Change passwords					X
Add/delete users					X
Install/modify CI Server software					X
Managing system backup					X
Stop/Start CI Server or Operator Console					X
Restrict file access					X
Setting file attributes					X
Restrict any system resources					X

Table 115 – User level and access rights

Authorization groups have been created for each of the above levels with respective privileges. The Central and Station Controls will have separate authorization groups for each of the above levels.

Note: Authorization group will be modified inline to customer requirements.

28.8.2 User Profiles

The following users are defined for an example, actual users to be received from customer:

Authorization Group	General definitions: - user name (1) - password (2) - Process area	Operator interface: - layout - initial display	Alarming: - alarm selection area - Shelving group
System Administrator	admin ***** 1-999	default system_start_sa	administrator USER_SELF_GROUP
Engineer	Eng ***** 1-999	engineer system_start_en	system USER_SELF_GROUP
Operations Supervisor	super ***** 1-800	opersv system_start_sv	process USER_SELF_GROUP
Operator	oper ***** 1-500	oper system_start_op	oper USER_SELF_GROUP
View only	View ***** <none>	View system_start_vi	View <none>

Table 116 – Defined user profiles Example

Notes:

- The real usernames to be added on production deployment.
- All passwords are temporary; it is to be changed on production deployment.

28.8.3 Active Directory (AD) on CI Server

The following AD functions are available on CI Server:

- Users and user policies can be maintained in one place and are used everywhere in the system that makes up an automated system. No need to log on to the CI Server after logging on to Windows.
- Users are identified by name or password (or other authentication such as fingerprints). No one can access your system without a valid username and password. In addition, strong password rules can be applied at the Windows level without relying on potentially weak authentication of the application.
- Many companies standardize Windows technology, and external software is required to use these standards. Kerberos is a protocol available on Windows and other platforms supported by CI Server. AD is a technology of Microsoft.
- Even if a CI Server system is isolated from the network and has no access to the Windows domain controller, it is still possible to log on and access the application.
- Whether the CI Server uses AD integration can be configured for individual machines.
- The following widely accepted standard mechanisms are used:
- Kerberos - a ticket-based computer network authentication protocol that allows nodes communicating over an insecure network to prove each other's identities in a secure manner.
- Microsoft Active Directory (AD) - an AD domain controller assigns and enforces security policies to all computers, installs and updates software, and authenticates and authorizes all users and computers within a Windows domain type network. For example, when a user logs on to a computer that is part of a Windows domain, AD checks the password sent to determine if the user is a system administrator or a regular user.

CI Server supports a secondary logon mechanism to temporarily elevate the privilege level of users whereas AD and single sign-on do not support a secondary logon mechanism.

The AD integration function of CI Server has priority over the logon method (Login method) configured for each application using the following Authentication and authorization setup file (dssana.sup).

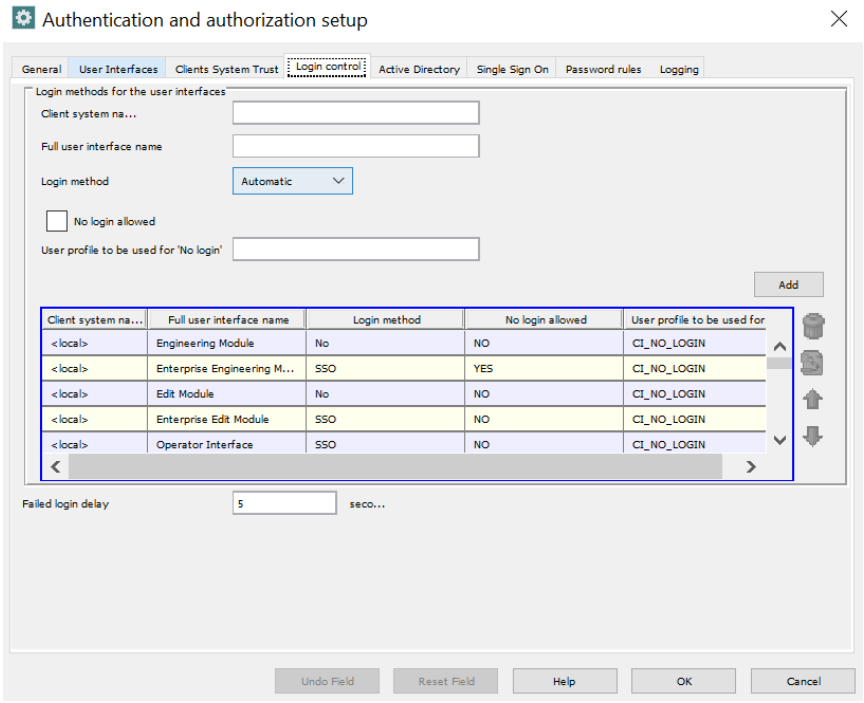

Figure 91 – Authentication and authorization setup

AD will be used for this project.

28.9 CI SERVER SYSTEM SECURITY

CI Server System security holistic approach covers the design, hardware, software component and the network. Refer to 1724000594-IN-RE-00043 - Cyber Security Settings document.

28.9.1 PC access Security

Active Directory

Reference to 1724000594-IN-RE-00043 - Cyber Security Settings document.

28.9.2 Network Security

Reference to 1724000594-IN-RE-00043 - Cyber Security Settings document.

28.9.3 Application security

Reference to 1724000594-IN-RE-00043 - Cyber Security Settings document.

28.9.4 Database security

In general, the field historian data is not considered as sensitive data in CI Server, however the process control set-point is sensitive for some industries. Therefore, it is recommended not to include the set-point value tags into RDBMS exposure.

28.10 SYSTEM BACKUP

28.10.1 System Backup

For a system back-up the software Windows Native Back up tool is used. All systems that are configured for back-up will store the image to the CI Core Machine.

For CI Core the backup is scheduled automatically using Backup recovery Server

All CI Portal are considered as non-critical machines and scheduled automatic back-up shall be taken. For these stations a back-up can be initiated on demand.

28.10.2 Restore

Whenever a system needs to be restored it must be booted with the Back-up Exec recovery CD. From the recovery utility one can select the image to restore. After the image has been restored, the machine must be rebooted. After reboot the system is up and running again.

Restore individual files

The backup software as described in the previous section provides the possibility to retrieve individual files and/or folders from a system back-up.

Note: When a CI server folder structure is retrieved, the CI server software on that machine must be stopped beforehand.

Reference to 1724000594-IN-RE-00043 - Cyber Security Settings document.

28.11 SYSTEM TOOLS

28.11.1 Quickload

A unique functionality of the CI Server engineering environment is loading and exporting the entire application configuration through the “quick load engineering utility”.

This enables the user to “quick load” applications and modifications online without stopping the system from its real-time duties. While loading the application CI Server continuously checks the “quick load” data. An error in the configuration will be reported instantly, stopping the loading process or prompting the user for rejection or acceptance.

The advantages of preparing the applications configuration database this way is:

- Preparation of configuration data can be done off-line
- Data can be pre-checked on: Consistency, Format/Syntax and Completeness
- Re-use for other applications
- Easy and fast configuration of backup-systems

The following configuration data can be prepared off-line:

- Items
- Displays
- I/O-driver configurations
- Alarm collections

- History groups
- User-profiles
- Objects and classes

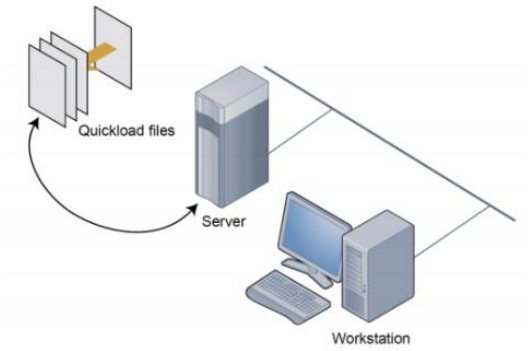

Figure 92 – Quickload Configuration

28.11.2 Report Editor

NOTE: No input received during Development or FAT.

Using the standard tool REPORT, the system manager is able to define and generate reports.

REPORT can be used to:

- Define a report
- Generate a report
- Inspect a report
- List the database field names corresponding to the real-time database

This utility is available through several USER forms.

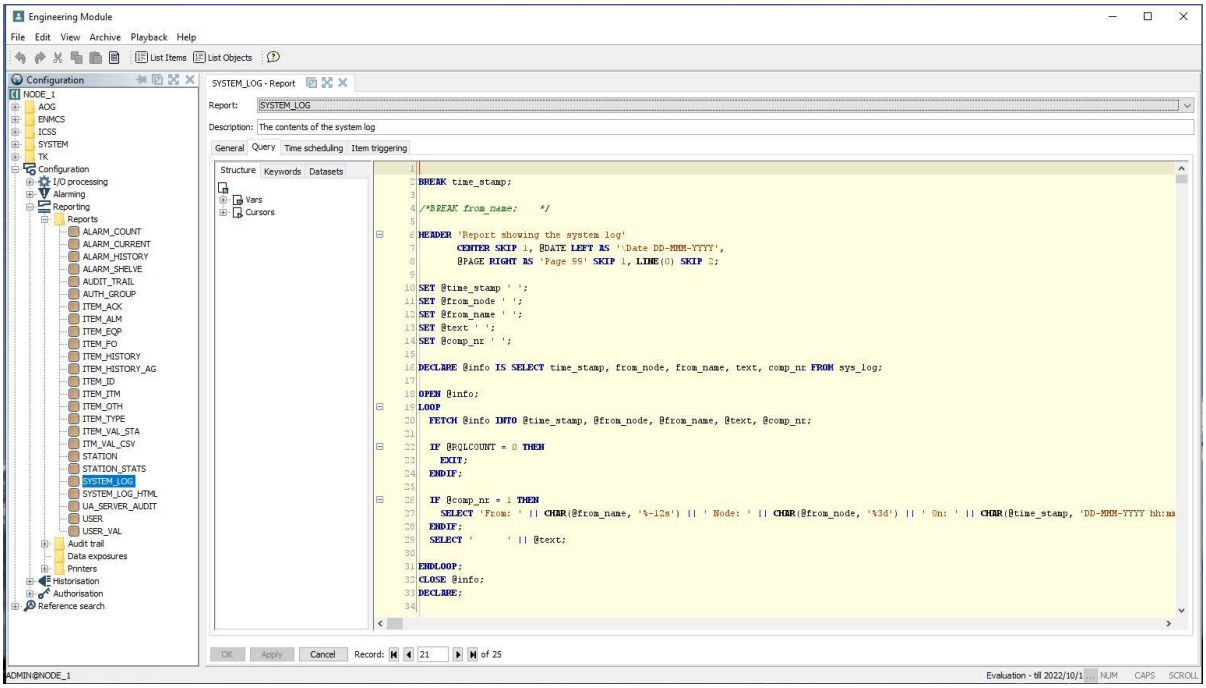

Figure 93 – Report Editor

28.11.3 Diagnostic Tools

CI SERVER provide an extensive set of diagnostic tools allowing online monitoring of:

- Configuration settings
- Real-time values of items, communication statistics, process-load
- Time related issues
- Status values
- Module specific parameters

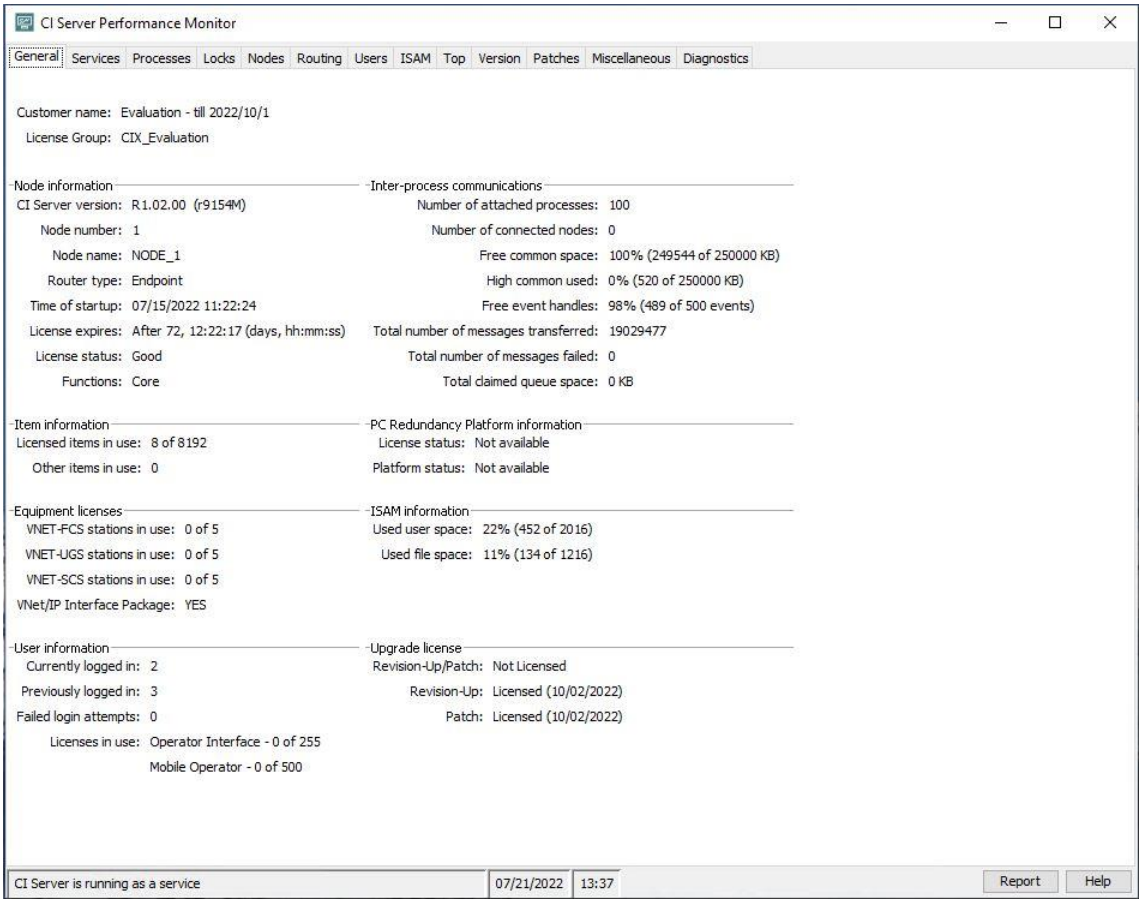

Figure 94 – Performance Monitor

These diagnostic tools are used to locate suspicious faulty situations and to optimize the performance of the CI Server system. Performance optimization can be done by:

- Balancing network traffic between e.g., a server and workstation in a redundant network
- Preventing queue overflows by defining larger queue sizes of CI Server processes that are consuming more than others.
- Perfecting scan times of external process variables in addition some diagnostic tools allow logging diagnostic data to a file on disk, which can be used for analyses later. The diagnostic features are impressive and go as far as byte and bit information.

The following diagnostic tools are available within CI Server:

Internal data traffic diagnostic tool

A lot of information can be gathered related to the internal data traffic in a CI Server based system. Looking into the main data streams will provide the user with information on how to tune the system. By examining the data traffic between processes, a problem can easily be broken down into a single process. Some of the optimization possibilities are:

- Overview of total message traffic.
- Overview of message traffic per process.

- Show outstanding number of messages per process.
- Overview of all time-related actions (clock queue).
- Overview of traffic to other systems.
- Logging of the data contents of messages transferred.
- Block a message queue.
- Influence the order of messages in a queue.
- Selective flush messages from a queue.
- Overview of maximum queue use since system start-up

Process variable related diagnostics

- On process variable level the following information can be collected:
- Statistics about all actions related to process variables since system startup.
- Overview of event streams between process variables and processes.
- Detailed information about all historical samples stored.

29 HARDWARE SPECIFICATION

For hardware configuration (performance) and features of the server cabinet, PC servers, firewalls, console desks, operator workstations and engineering workstation. Reference to be PAS Hardware Functional Design Specification (FDS-HW) 1724000594-IN-SP-00017.

30 HMI / GRAPHIC SPECIFICATION

This chapter describes the graphical user interface for the CI Server System. First, an overview of the mimics itself is given, thereafter an overview of all symbols being used to build the mimics. This graphical user interface is mainly to be used by the operator.

The following definitions are being used in this chapter:

- Screen: Applies to what is shown on the whole physical screen
- Mimic/display: Applies to a part of the screen representing a function which is logically grouped together.

This chapter will be updated accordingly.

30.1 GRAPHIC CONVENTIONS

30.1.1 Framework

Screen Layout

The startup display is automatically activated when the user logs on to the system. It consists of a framework which is always visible:

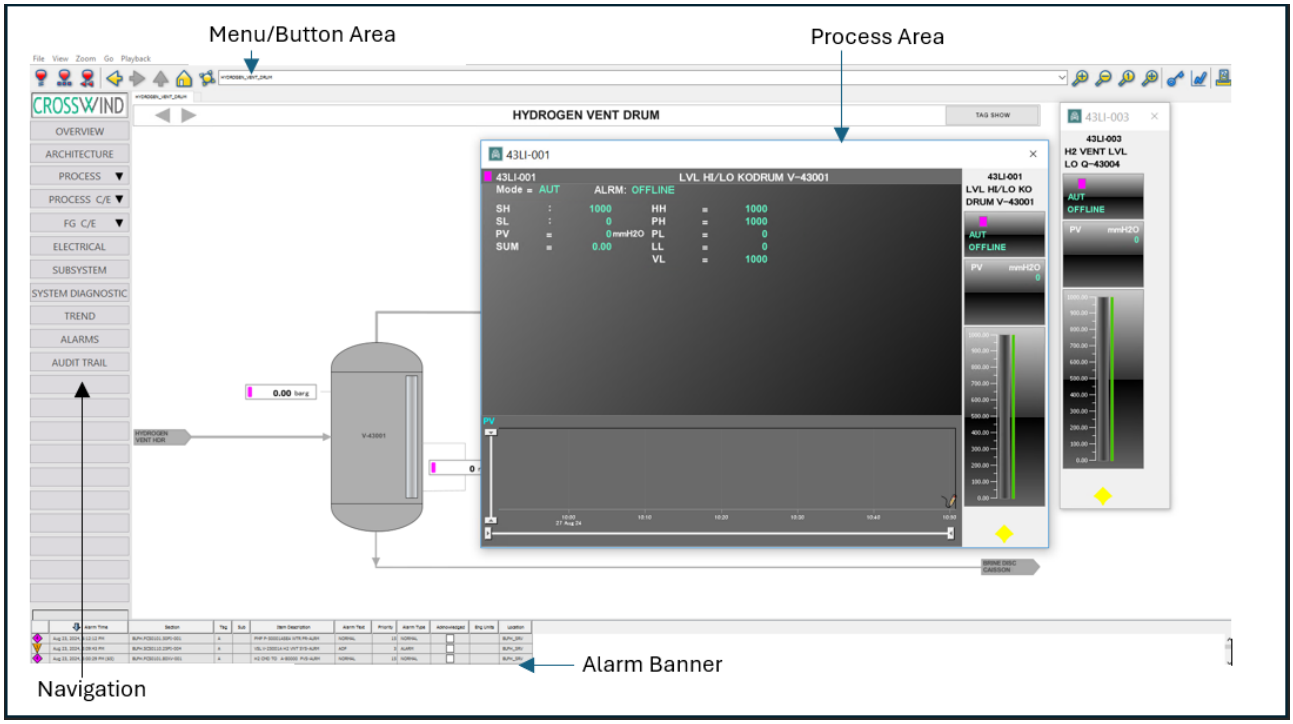

Figure 95 – General Display Layout

The displays resolution for the graphics of this project is 1920 x 1080 pixels (ratio 16:9).

Within this area the following sections are identify

Menu/button area

The menu and button area are always visible and as shown in the below figure, the following options are available for the operator:

Figure 22: Header menu

The menu and button area are always visible on the top part of each display unless a popup display is opened. Buttons will also provide a shortcut to basic HMI functions. Below table shows a summary of buttons and their functions:

Button	Function
	Go to current alarm list
	Go to Shelved alarm list
	Go to historical alarm list
	Go to system alarm list
	Go back to main display
	Reload main display
	Go to previous display or forward
	Zoom in
	Zoom out
	Reset to 100%
	Fit Display
	Login
	Go to Trending
	Print Screen

Table 117 – Header Buttons

Navigation

The left side of the displays is the navigation area. This area is always visible. Via buttons in this area the user can quickly navigate through the displays. The navigation area is designed in such a way to move through the displays efficiently and effectively.

Alarm banner

At the bottom of the display the alarm banner is shown. This part is always visible and shows the 3 most recent high priority alarms.

Process area

In this area the process displays are shown. It is possible to open more process displays and show each display in a separate tab. The tab indication is visible at the top of the process area.

Function Keys

Within the operator interface function keys are available for quick access to certain functions. The keys are accessible regardless of what display is shown. The following table gives an overview of the function keys:

Action	Result
F1	Shows help menu
F2	Horn silence
F3	Print screen

Table 118 – Function Key definition Example

30.1.2 General Conventions

Screen Size

Note: To be aligned & finalized.

The screen size of the project is defined as 1920 x 1080 pixels, the following areas are defined as:

- Navigation menu : 160 x 992 pixels
- Process area : 1760 x 992 pixels
- Alarm banner : 1920 x 80 pixels

Display Titles

The display title helps the user recognize the display objective quickly and should be immediately visible to the user. All main displays shall have a top text line and shall appear in the top left corner of the screen.

Screen Name

Screen shall be derived from P&IDs or SLDs in case of multiple sheets shall be suffixed by" _XX""

XX-Sheet Number.

Text

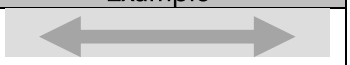
The visual specification for the Graphic Title, Equipment and tag names is as per the table below.

Display Object	Specification	Example
Equipment label/description	Gray (RGB 64,64,64) Arial, Bold, 12 pt	TK-0024
Tag names/EGUT	Black, Arial, Bold, 12 pt	TAG2401B
Graphic Title	Black, Arial, Bold, 24 pt	Subsystem Overview

Table 119 – Text

Lines

The visual specification for the Process/Instrument/Control lines is listed in the table below:

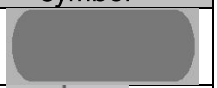


Display Object	Specification	Example
Main process Lines	Gray (RGB 165,165,165) Solid Line 5 pt.	
Instrument/Control Lines	Gray (RGB 128,128,128) Dashed Line 1 pt. (no arrows)	
Minor process lines	Gray (RGB 165,165,165) Solid Line 3 pt.	
Utility lines	Gray (RGB 165,165,165) Solid Line 1 pt.	

Table 120 – Lines

Arrow indicating process flow direction shall only be used where pipe enters equipment, at pipe corners or where lines leave the page.

2–way process lines will show same as process lines, but with at least one pair of double arrows ½ inch apart, spaced along line to make flow direction to and from connect equipment visually obvious.



For crossing lines, the horizontal one will be in the front and the vertical one will be in the background.

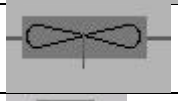
Static Equipment

Representation of static equipment shall be as simple (without extra detail) as possible. Static equipment shall be filled on Gray (RGB 165,165,165) color. Static equipment shapes shall not show any edge colors. Static equipment shall not show any internals.

The equipment name will be shown within the equipment symbol as Gray, Arial, Bold, 12pt. The layout will follow the P&ID representation.

Samples static equipment shapes are shown below:

Equipment Type	Symbol
Vessels	
Tube Exchangers	
Furnace and Heaters	
Pumps	



Positive displacement pumps	
Fin Fan exchangers	
Filters	
Compressors	

Table 121 – Static Equipment Example

Grid Settings

The grid is set to 4x4.

Actions

The following action conventions apply to the project:

Single left-click - Initiate an action on any dynamic symbol.

30.2 DISPLAY OVERVIEW

This section lists all displays that are available for the project. It will describe the contents/purpose of the screen, navigation options to/from the screen and any further details if available. Please note that not all screens are shown. Only for a few types of displays a screenshot is provided to give an overall representation.

30.2.1 Main Overview Display

The below display is an example of the Main Overview display.

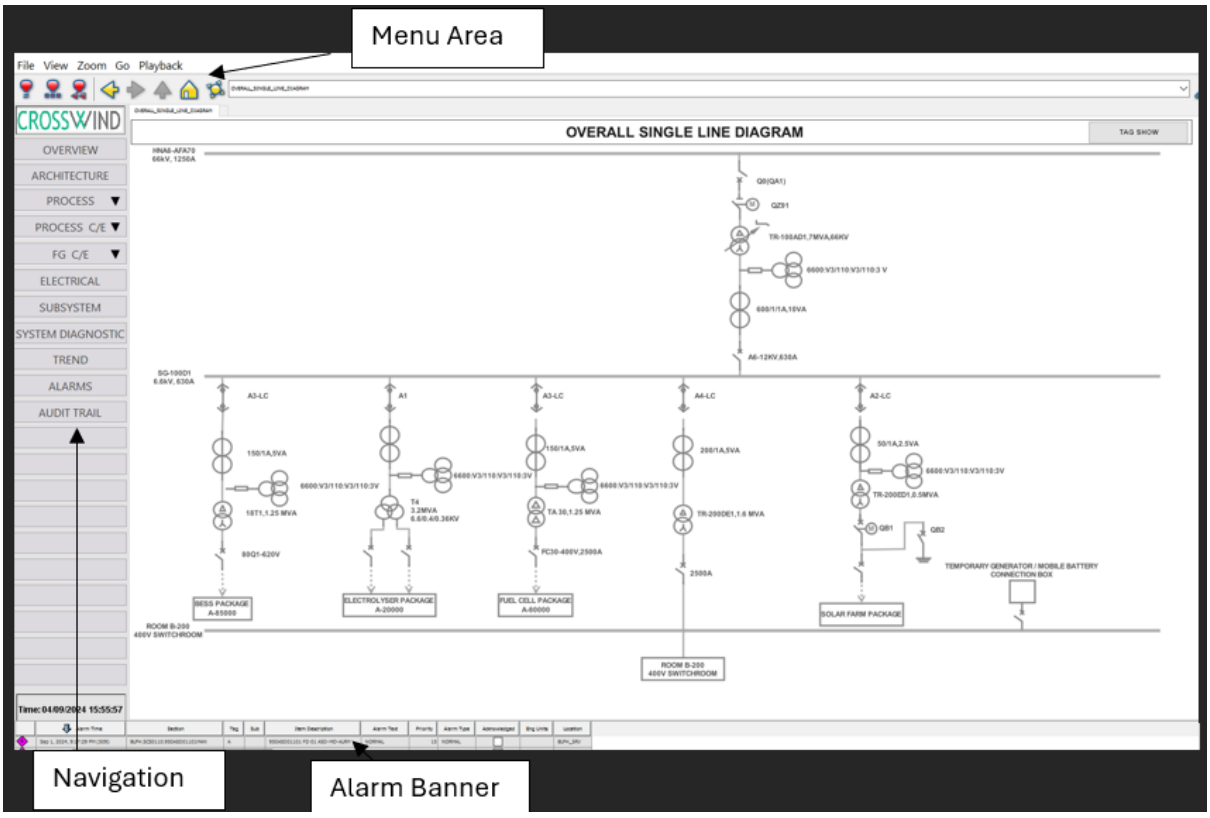


Figure 96 – Main Overview Display Example

30.2.2 System monitoring display

This display is a schematic layout of the cabinets with the CI servers, the local area network with the workstations, and the VNET/IP network. It displays the status of the CI servers, workstations, the local area network, and the cabinet alarms. For status of PIN network, a dedication navigation link shall be provided for accessing the NMS status webpage.

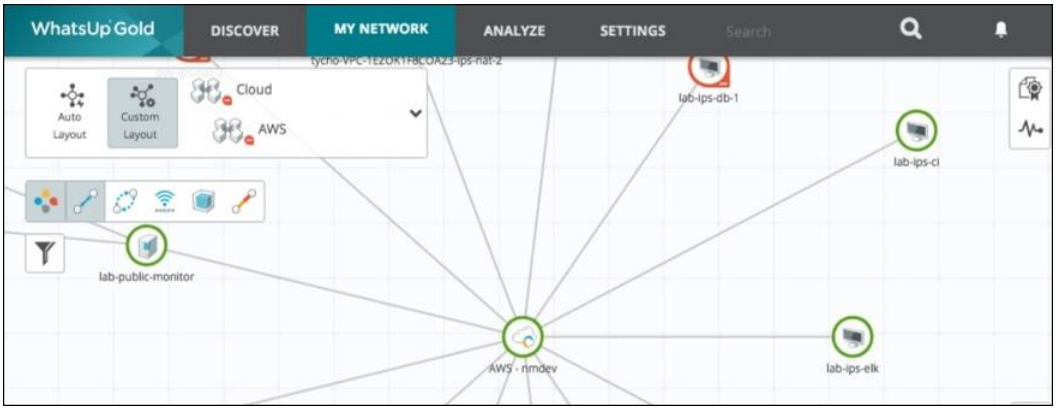

Figure 97 – System monitoring example

Navigation

This display is accessible from the navigation panel on the left side of the screen with the System Monitoring button.

30.2.3 Current Alarm Overview

The current alarm overview shows the alarms that are currently active. All the alarms are displayed in the Alarm overview, which can be accessed by the most left icon from the Header menu. Alarms are aligned in chronological order and operators can sort the alarms the way they want to. All new alarms are currently unacknowledged and must be acknowledged manually. Alarms also have the possibility that they do not need confirmation from the operator.

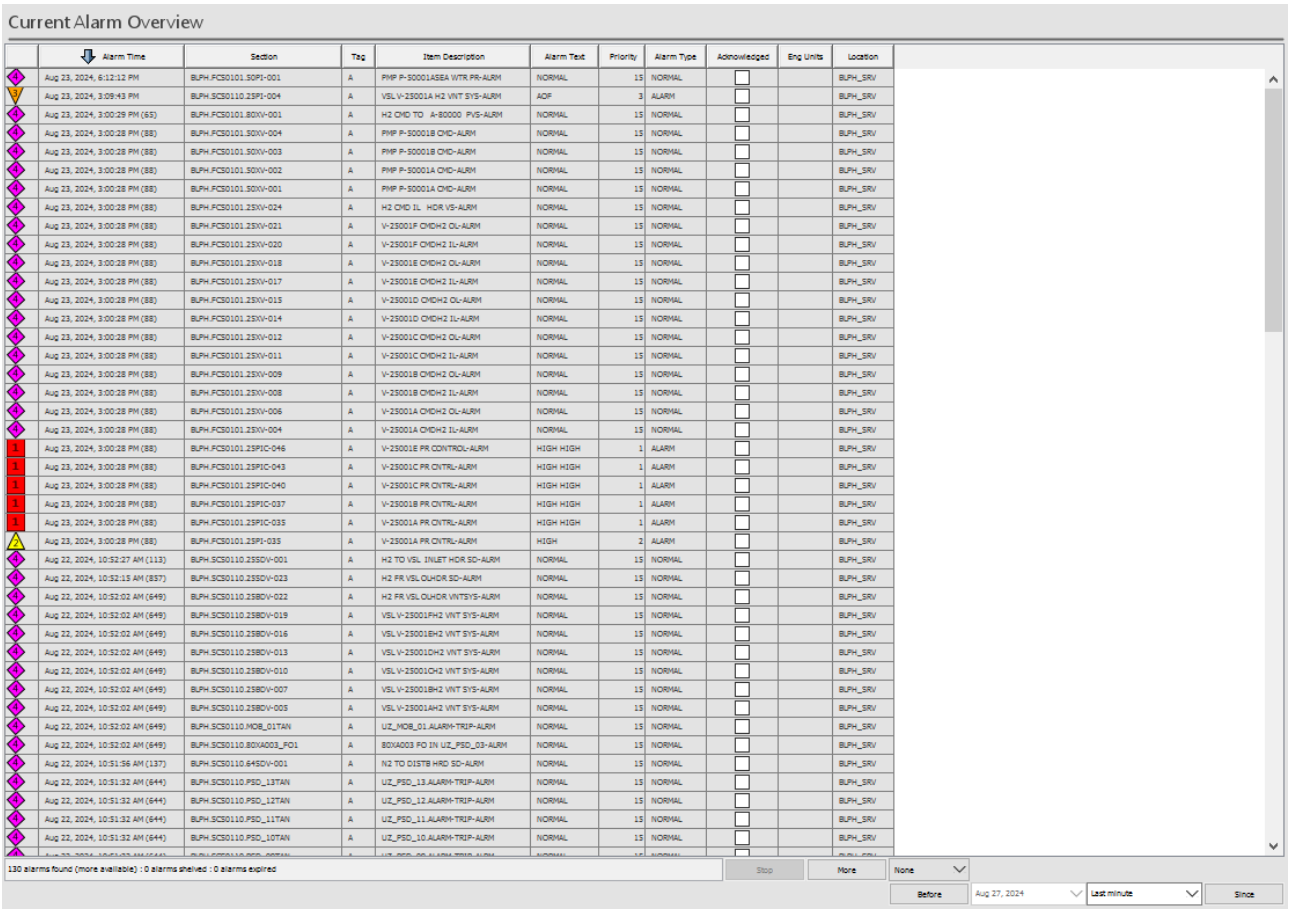

Figure 98 – Current alarm overview example

Alarm Indicator Icon

The alarm indicator icon in the alarm overviews refers to colour and numeric priority of item status. The color of the alarm indicator icon can be changed from system wide definition of item status or overridden by item definitions. See the below figures:

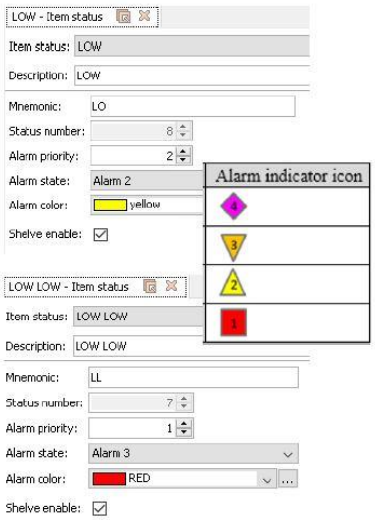

Figure 99 – System Wide Definition example

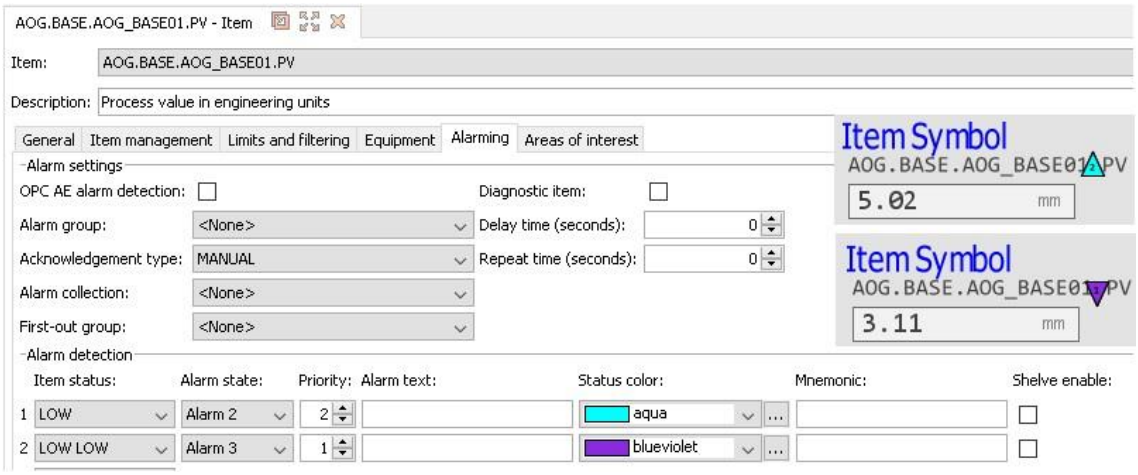

Figure 100 – Item Definition example

Navigation

This display is accessible from the navigation pane on the left side of the screen.

No specific navigation is available from this display.

Actions

Action	Object	Result
Left Mouse-click	Individual alarm line	Acknowledge of the alarm
Right Mouse-click	Any alarm line	Pop-up of a context menu: Acknowledge all visible alarms. Go to related display.

Table 122 – Actions in current alarm overview

30.2.4 Historical Alarm Overview

The historical alarm overview shows the alarms that have occurred in chronological order.

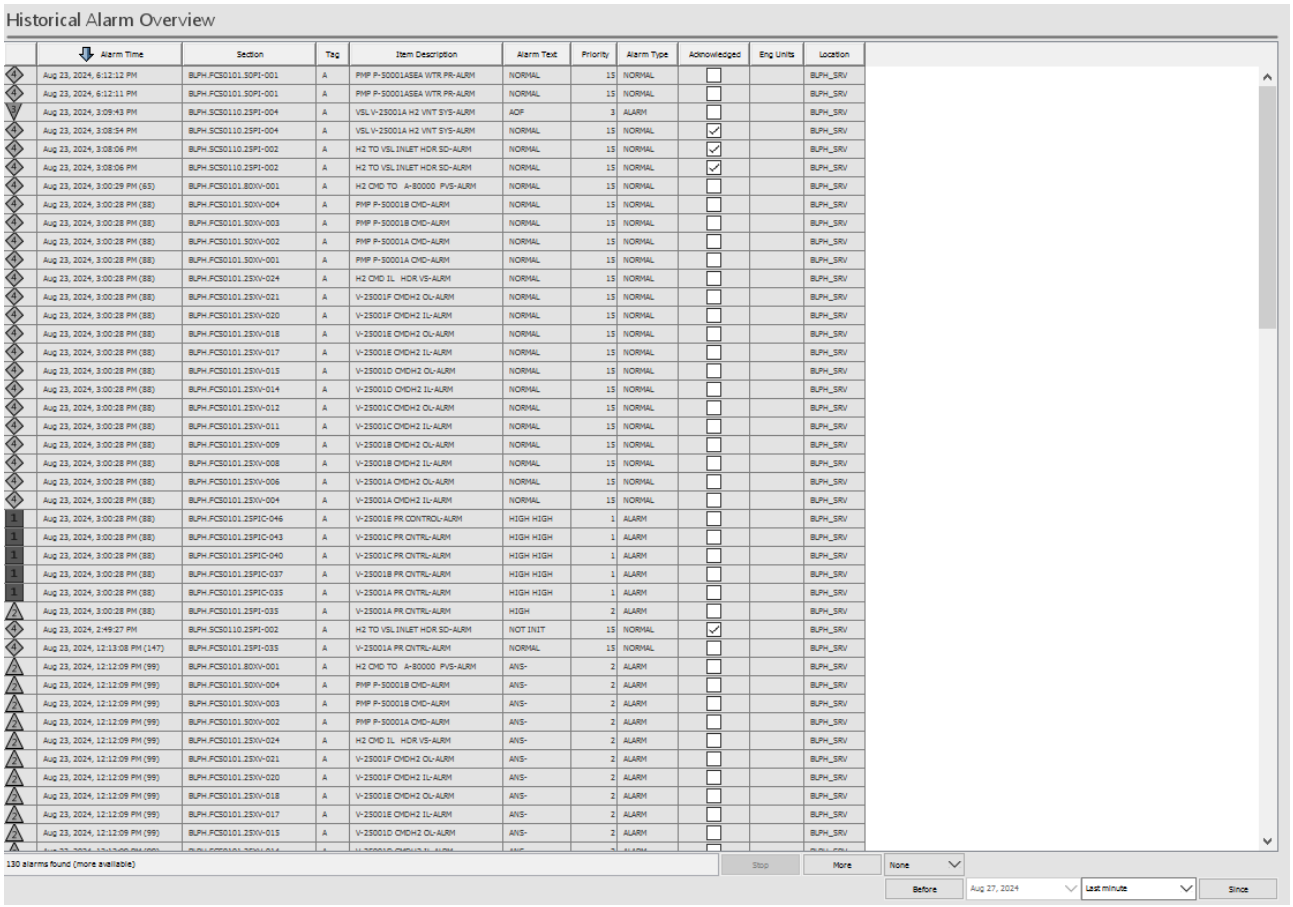

Figure 101 – Historical alarm overview example

Navigation

This display is accessible from the navigation pane on the left side of the screen.

No specific navigation is available from this display.

Actions

In the historical alarm overview no actions are defined.

30.2.5 Trend Display

The "Trend" display allows the user to generate plots of the desired process tag(s) as a function of time. Options for trend generation include multiple tag selection, date/time selection, date/time scroll, zoom in/out functionality, print functionality. The "Trend" display navigation has to defined in accordance with the other process graphics screen.

Layout

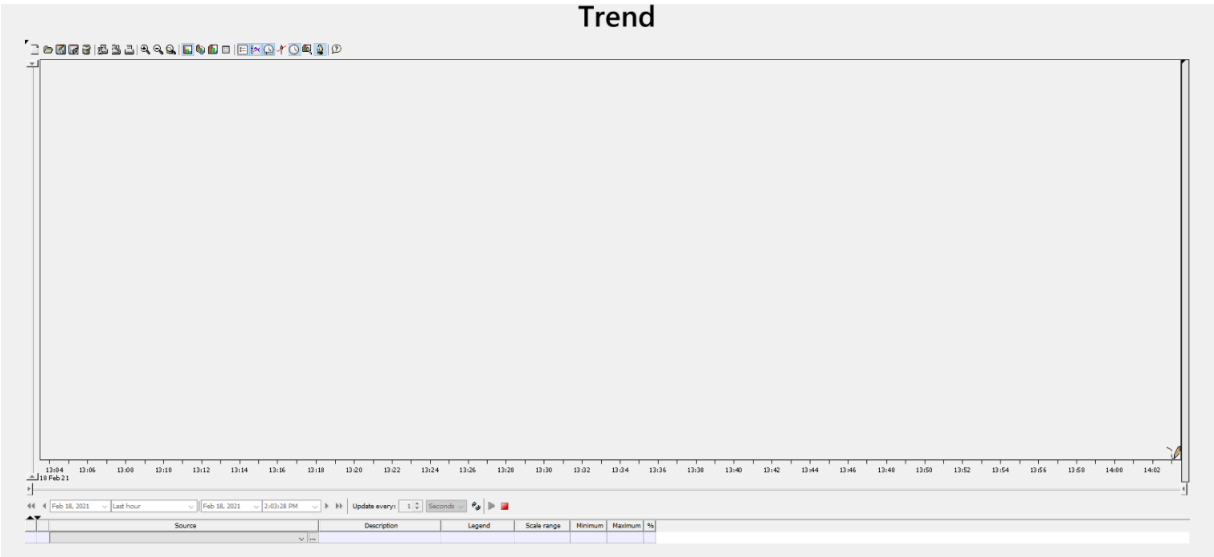

Figure 102 – Trend layout example

Settings

The trend display consists of the following sections:

- Toolbar
- Time/date settings control buttons
- Pen panel

Toolbar

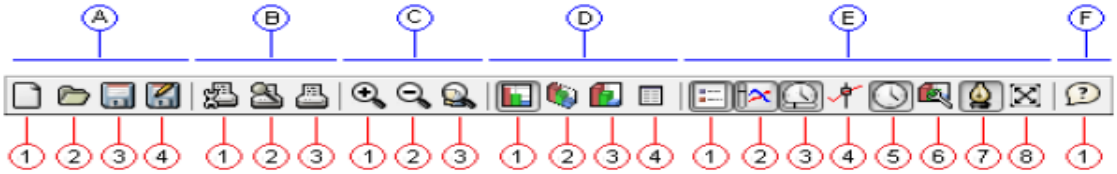

Figure 103 – Toolbar Buttons

Item	Description
A: Create and save trends	
1	Create a new trend
2	Open a trend
3	Save a trend
4	Save a trend as
B: Print	
1	Print page setup

2	Print preview
3	Print
C: Zoom	
1	Zoom in
2	Zoom out
3	Fit in window (to show complete trend contents)
D: Appearance	
1	Switch to 2d rendering
2	Switch to 3d orthographic rendering
3	Switch to 3d oblique rendering
4	Switch to table rendering
E: Show or hide user interface components	
1	Show or hide legend
2	Show or hide value slider
3	Show or hide time slider
4	Show or hide Hairline
5	Show or hide time control
6	Show or hide 3d control panel
7	Show or hide pen selection panel
8	Maximize current trend
F: Help	
1	Help

Table 123 – Trend Toolbar

Time/date settings control buttons

Figure 104 – Time/date settings control buttons

Time interval:

- Last minute
- Last hour
- Last day
- Last week

With one of these options, you select a "Last" period. If you click the “trend refresh” button the data of this "Last" period will be retrieved and shown.

- Current minute
- Current hour
- Current day
- Current week
- Current month
- Current year

With one of these options, you select a "Current" period. If you click the “trend refresh” button the data of this "Current" period will be retrieved and shown.

Example:

- 12:00 AM
- 12:30 AM
- 13:00 AM
- ...
- ...
- 10:30 PM
- 11:00 PM
- 11:30 PM

With one of these time settings, you can set a period from which you want to retrieve the data. If you click the “trend refresh” button the data of this period will be retrieved and shown. You cannot use the play button.

Pen Panel

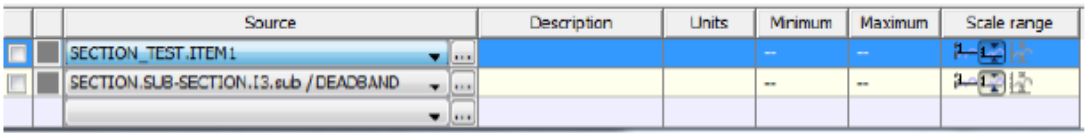

Figure 105 – Pen Panel Controls example

In the pen-panel (the area at the bottom of the application main frame), click in the table cell containing the text “…”. The table-cell will change contents and a small button with dots on it, will be rendered at the right side of the table cell.

Click on this small button in the table cell. This will cause the item selection dialog to appear, in which all currently defined FAST/TOOLS items or sub-items, attributes and history storage groups are rendered in a tree-like hierarchical structure.

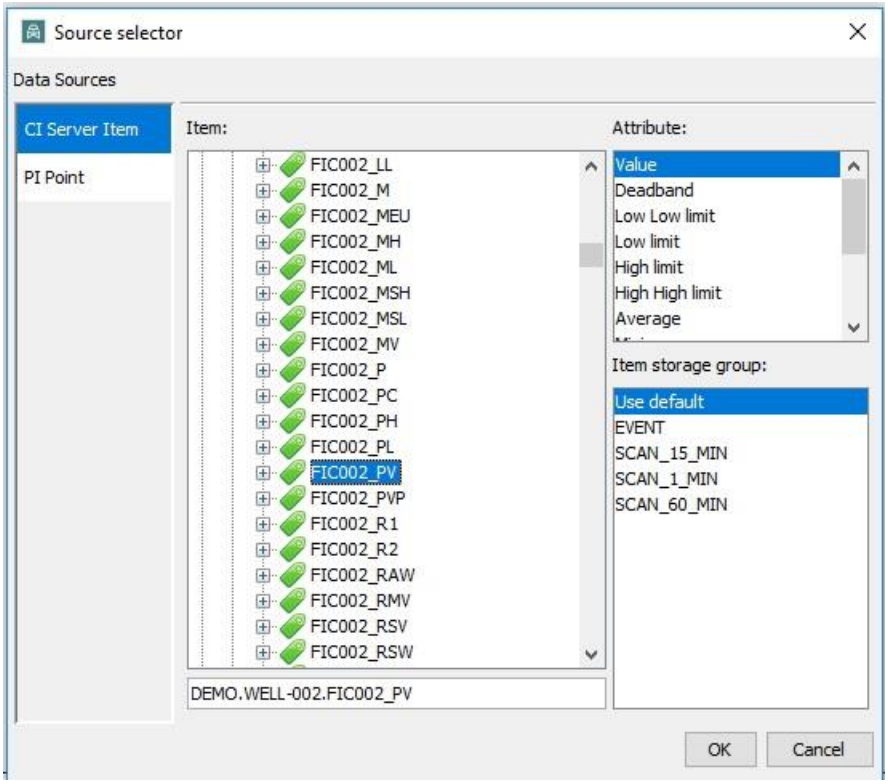

Figure 106 – Pen Selection pop-up example

Navigate in this tree to find the item that has been configured. Once found, click on the item, and press the OK button to select it (a short-cut for doing this is double-clicking on the item). The item selection dialog disappears, and the name of the selected item is depicted in the pen-panel. You can also select attributes or history storage groups.

30.2.6 Alarm Display Relations

From the alarm display the user can select an alarm and open the (process)display related to that item. In CI Server this is so-called alarm-jump functionality. In the Master Tag List, the display can be specified per item.

30.2.7 HMI Graphic Symbols

Refer Appendix-5 HMI Graphic Symbols

1 EDI

Digital input signal for normally open type of inputs without Line Monitoring (EDI)

1.1 PURPOSE

This function is used to process the normally open digital input signal without Line Monitoring.

Functionality:

The EDI function block has the following main functions:

- Trip management with alarming function.
- Optional maintenance override functionality.

The functions of the EDI typical are shown below. This typical is used for normally open digital trip initiator inputs based upon energize to trip function without line monitoring function. The typical has optional maintenance override functionality to override the trip function. The alarm output is independent of the MOS functionality.

The field signal for the typical is a digital input. The typical has an alarm and trip output. When the input becomes energized the output will be tripped and will remain tripped until the input value becomes de-energized again. The trip output will be used in the SIS application logic and the status will be indicated on the OWS. MOS shall be enabled from the OWS.

CROSSWIND	HOLLANDSE KUST NOORD WIND PARK Project **Contract No. CW-I-WP4-2023-05**	ROSETTI MARINO
Document Title:	**TEST REPORT FOR SIS TYPICALS**	Sheet 7 of 95 Date: 06/JAN/2025 Rev: 02

1.2 LOGIC DIAGRAMS

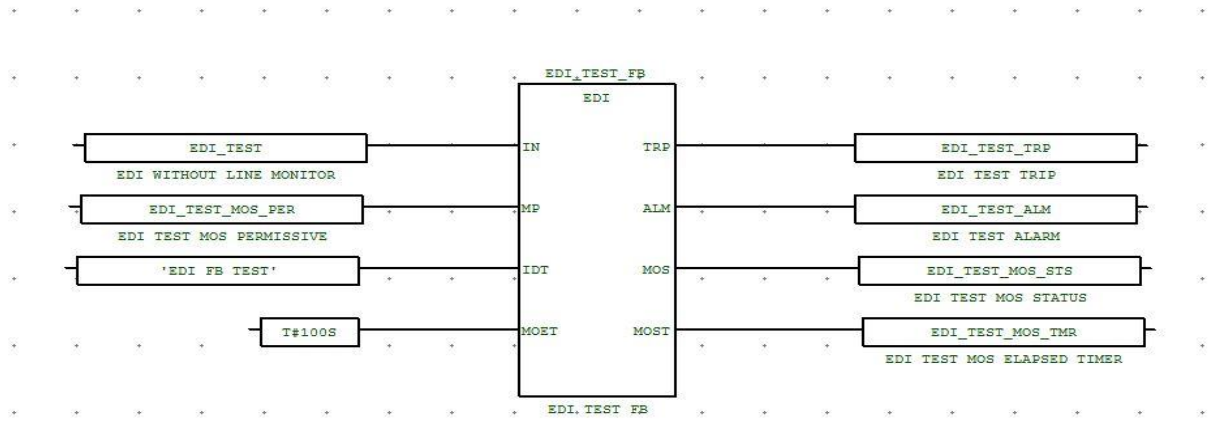

Fig 1 User Defined Function Block EDI

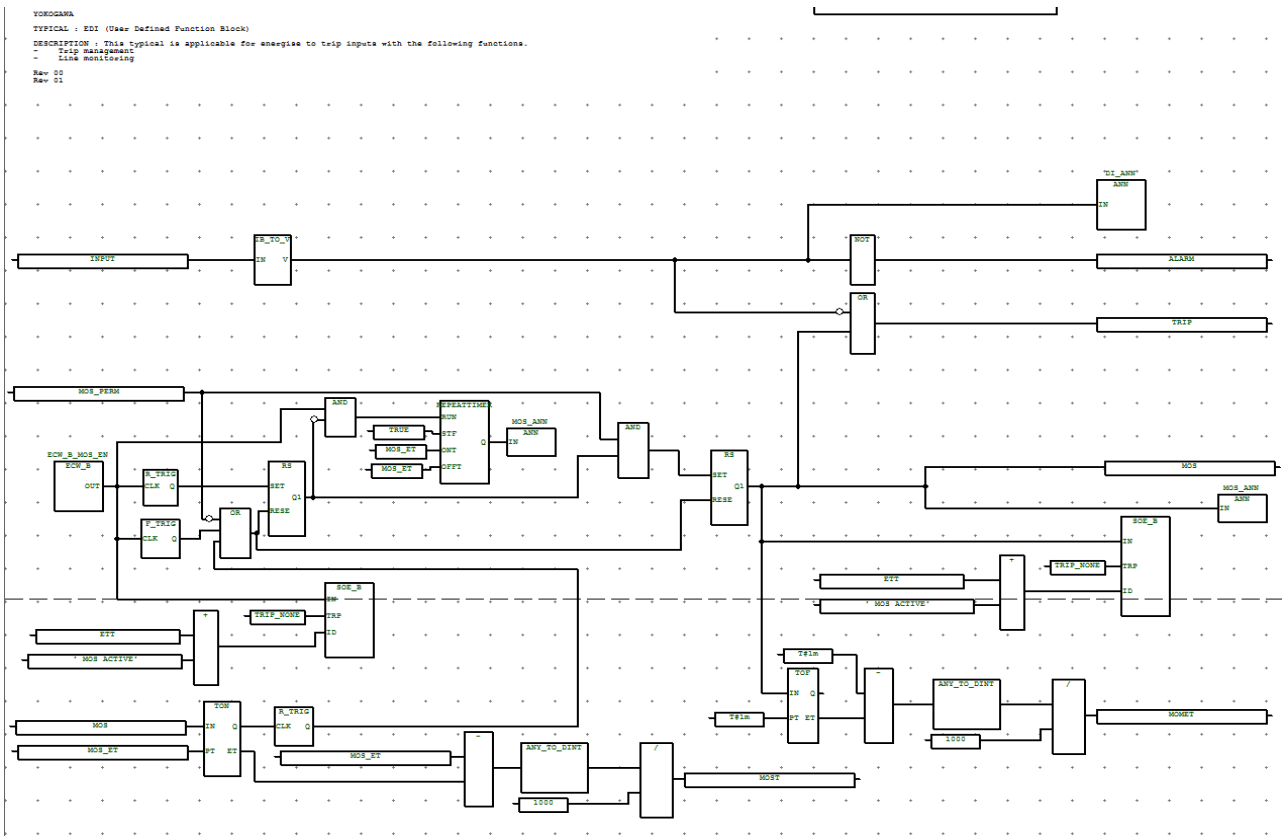

Fig 2 Logic Diagram for Typical EDI

1.3 PREDEFINED VALUES

Predefined Input Parameter values that are indicated below shall be considered for functional test.

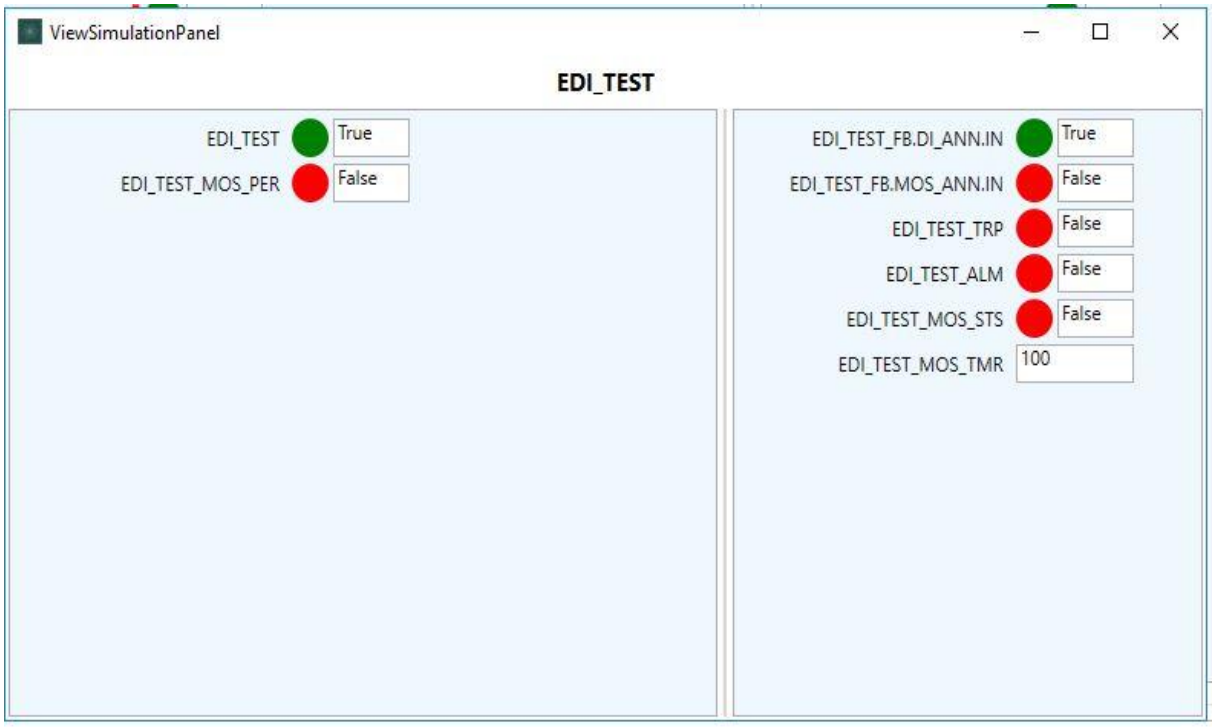
Short Name	Description	Predefined Values
IN	IN is the Field Digital Input	FALSE
MP	MP is the Maintenance Override Enable	FALSE
IDT	IDT is the comment for the “SOE”	"XXXXXXXXX"
MOET	MOET is the MOS Elapse Time	T#100s

Expected output Parameter values that are indicated below shall be verified before start of functional test.

Short Name	Description	Predefined Values
TRP	TRP is the Trip Output	TRUE
ALM	ALM is the Alarm Status	TRUE
MOS	MOS is the MOS status	FALSE
MOST	MOST is the MOS Elapsed Time	100

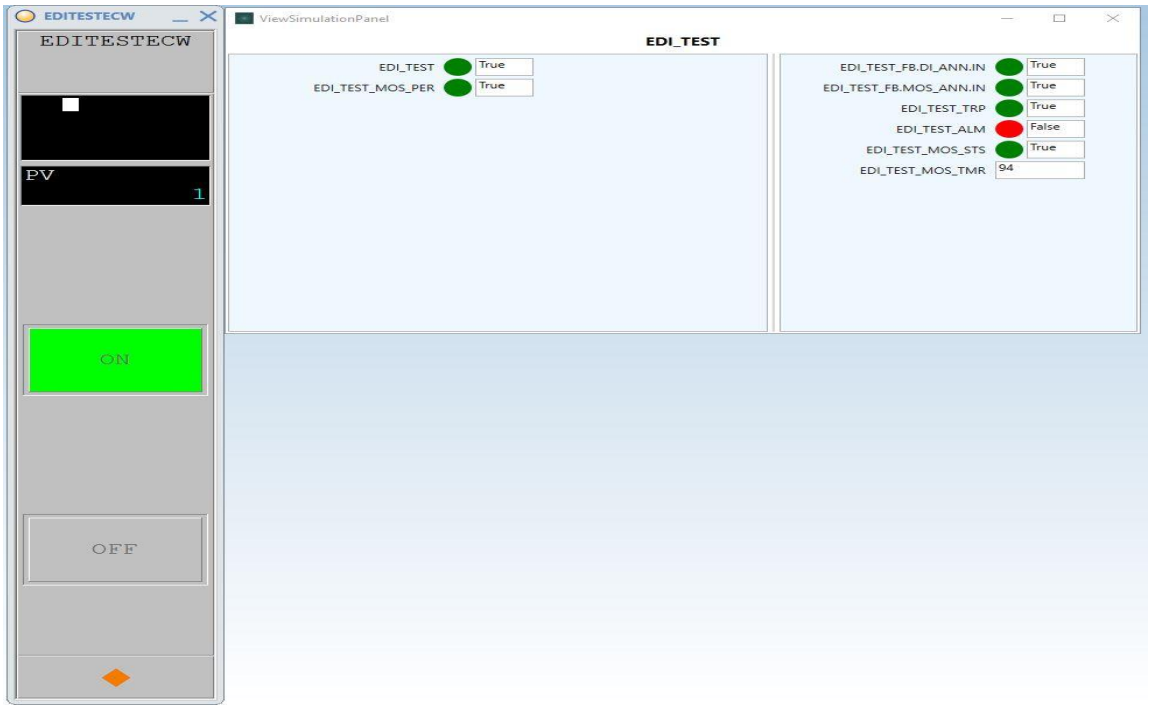
1.4 TEST CASES VS EXPECTED RESULTS

The required input parameters shall be changed from the predefined values based on individual test cases described below to carry out one hundred percent path test. Typical shall be normalized prior to apply the below test cases and make sure typical should read output parameters as stated in the expected output parameter values under 'Predefined Values' section.



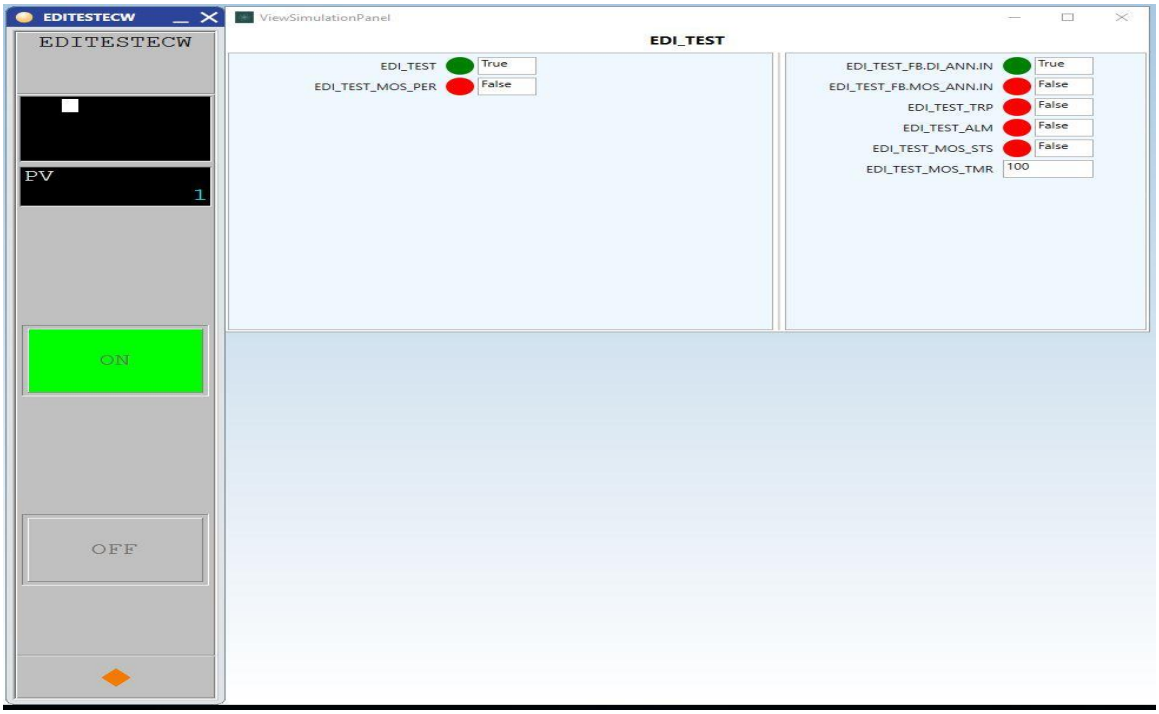
Test Case Number	Test Cases	Input Parameter /Values	Expected Results		
			Trip Output TRP	Logic Alarm ALM	MOS Status MOS
TC#1	IN.Value = TRUE, MP = FALSE	IN.Value = TRUE, MP = FALSE	FALSE	FALSE	N/A
TC#2	IN.Value = TRUE, MP = TRUE, MOS ENABLE = TRUE, MOS Elapse time not Elapsed	IN.Value = TRUE, MP = TRUE, MOS ENABLE = TRUE, MOS Elapse time not Elapsed	TRUE	FALSE	TRUE
TC#3	IN.Value = TRUE, MP = TRUE, MOS ENABLE = TRUE, MOS Elapse time Elapsed	IN.Value = TRUE, MP = TRUE, MOS ENABLE = TRUE, MOS Elapse time Elapsed	FALSE	FALSE	FALSE
TC#4	IN.Value = TRUE, MP = FALSE, MOS ENABLE = TRUE	IN.Value = TRUE, MP = FALSE, MOS ENABLE = TRUE	FALSE	FALSE	FALSE

Note:

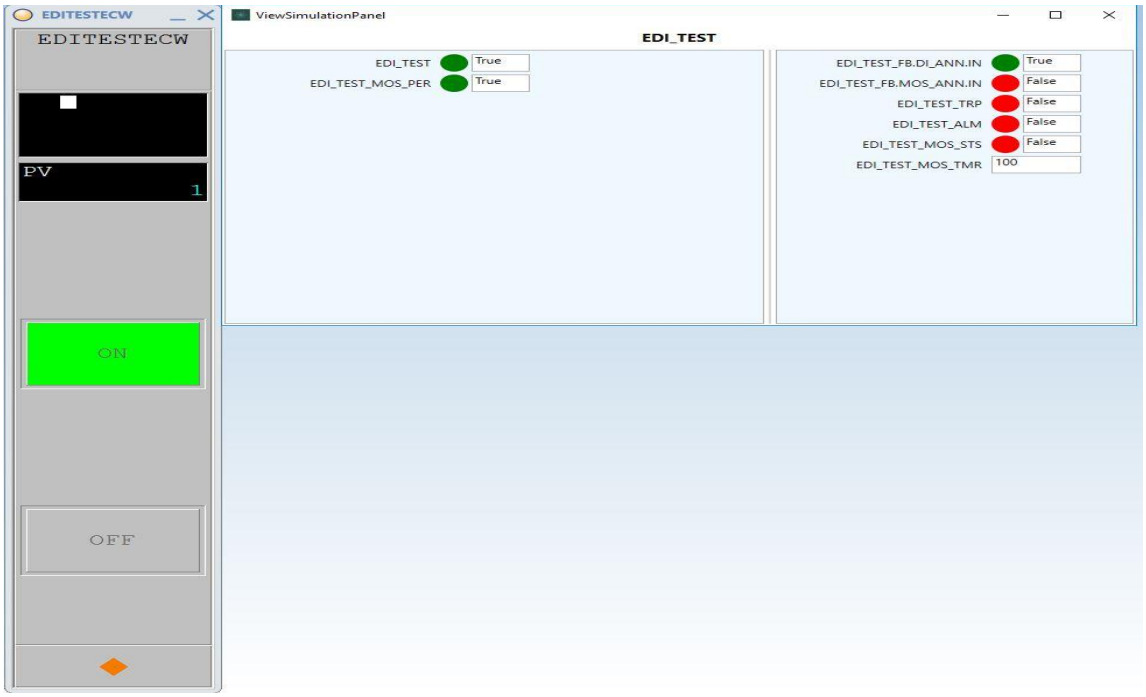


- N/A which are highlighted grey colour indicates that there is no change in the state. (Change not applicable).
- False Indicates Alarm / Trip value changes from "True' to 'False'.

CROSSWIND	HOLLANDSE KUST NOORD WIND PARK Project **Contract No. CW-I-WP4-2023-05**	ROSETTI MARINO
Document Title:	**TEST REPORT FOR SIS TYPICALS**	Sheet 10 of 95 Date: 06/JAN/2025 Rev: 02



1.5 TEST RESULTS:



TC#1 : IN.Value = TRUE,MP = FALSE

TC#2 : IN.Value = TRUE,MP = TRUE,MOS ENABLE = TRUE,MOS Elapse time not Elapsed

TC#3 : IN.Value = TRUE,MP = TRUE,MOS ENABLE = TRUE,MOS Elapse time Elapsed

TC#4 : IN.Value = TRUE,MP = FALSE,MOS ENABLE = TRUE

1.6 SIGNOFF

Functional Check Test Result (**Pass/Fail**)	:	PASS
Test Engineer Name	:	NANDAGOPAL.K.S.
Signature	:	
Date	:	08-OCT-2024

Note:

- Pass / Fail criteria for functional test is based on comparing expected test results with actual test results recorded during simulation environment in IO Simulation Tool.
- Any mismatch observed during manual comparison of expected vs. actual test result then test is considered to be failed. Required logic correction shall be applied and typical to be retested again completely.

2 EDI_LM

Digital input signal for normally open type of inputs with Line Monitoring (EDI_LM)

2.1 PURPOSE

This function is used to process the normally open digital input signal with Line Monitoring.

Functionality:

The EDI_LM function block has the following main functions:

- Trip management with alarming function.
- Optional maintenance override functionality.
- Line fault detection.

The functions of the EDI typical are shown below. This typical is used for normally open digital trip initiator inputs based upon energize to trip function with line monitoring function. The typical has optional maintenance override functionality to override the trip function. The alarm output is independent of the MOS functionality.

The field signal for the typical is a digital input. The typical has an alarm and trip output. When the input becomes energized the output will be tripped and will remain tripped until the input value becomes de-energized again. The trip output will be used in the SIS application logic and the status will be indicated on the OWS. MOS shall be enabled from the OWS.

2.2 LOGIC DIAGRAMS

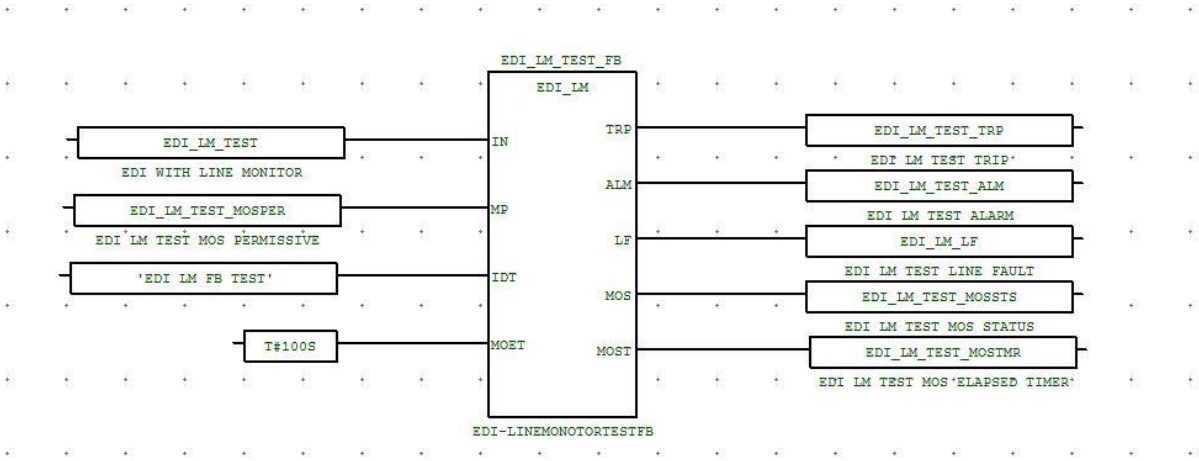


Fig 3 User Defined Function Block EDI_LM

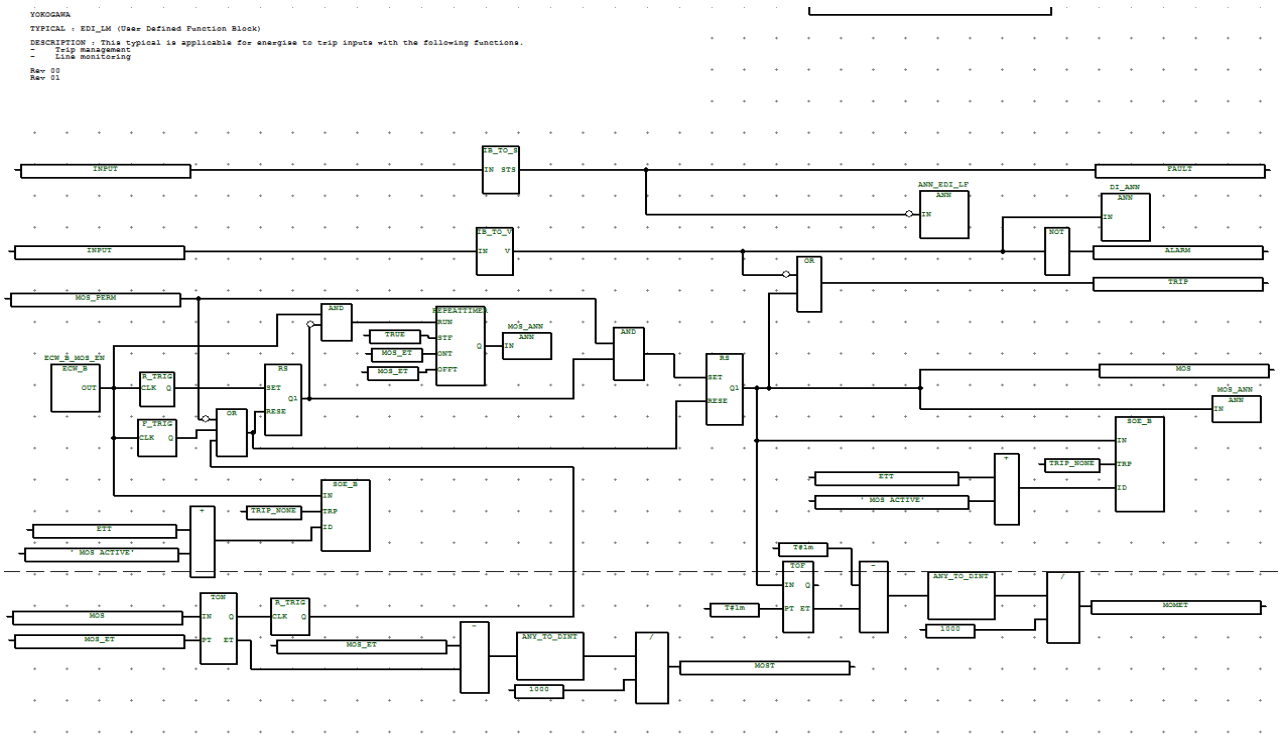

Fig 4 Logic Diagram for Typical EDI_LM

2.3 PREDEFINED VALUES

Predefined Input Parameter values that are indicated below shall be considered for functional test.

Short Name	Description	Predefined Values
IN	IN is the Field Digital Input	FALSE
MP	MP is the Maintenance Override Enable	FALSE
IDT	IDT is the comment for the “SOE”	"XXXXXXXXX"
MOET	MOET is the MOS Elapse Time	T#100s

Expected output Parameter values that are indicated below shall be verified before start of functional test.

Short Name	Description	Predefined Values
TRP	TRP is the Trip Output	TRUE
ALM	ALM is the Alarm Status	TRUE
LF	LF is the Line Fault Alarm	TRUE
MOS	MOS is the MOS status	FALSE
MOST	MOST is the MOS Elapsed Time	100

2.4 TEST CASES VS EXPECTED RESULTS

The required input parameters shall be changed from the predefined values based on individual test cases described below to carry out one hundred percent path test. Typical shall be normalized prior to apply the below test cases and make sure typical should read output parameters as stated in the expected output parameter values under 'Predefined Values' section.

Test Case Number	Test Cases	Input Parameter /Values	Expected Results			
			Trip Output TRP	Logic Alarm ALM	MOS Status MOS	Line Fault LF

2.6 SIGNOFF

Functional Check Test Result (**Pass/Fail**)	:	PASS
Test Engineer Name	:	NANDAGOPAL.K.S.
Signature	:	
Date	:	08-OCT-2024

Note:

- Pass / Fail criteria for functional test is based on comparing expected test results with actual test results recorded during simulation environment in IO Simulation Tool.
- Any mismatch observed during manual comparison of expected vs. actual test result then test is considered to be failed. Required logic correction shall be applied and typical to be retested again completely.

3 DDI

Digital input signal for normally close type of inputs without Line Monitoring (DDI)

3.1 PURPOSE

This function is used to process the normally close digital input signal without Line Monitoring.

Functionality:

The DDI function block has the following main functions:

- Trip management.
- Optional maintenance override function.

The functions of the DDI typical are shown below. This typical is used for digital inputs based upon de-energize to trip function. The typical has optional maintenance override functionality to override the trip function. The alarm output is independent of the MOS functionality.

The field signal for the typical is a digital input. This typical is applicable for normally closed field contact. The typical has a trip output. In case the input becomes de-energized the output will be tripped and will remain de-activated until the input value becomes energized again. The trip output status alarm will be indicated on OWS. MOS shall be enabled from the OWS.

3.2 LOGIC DIAGRAMS

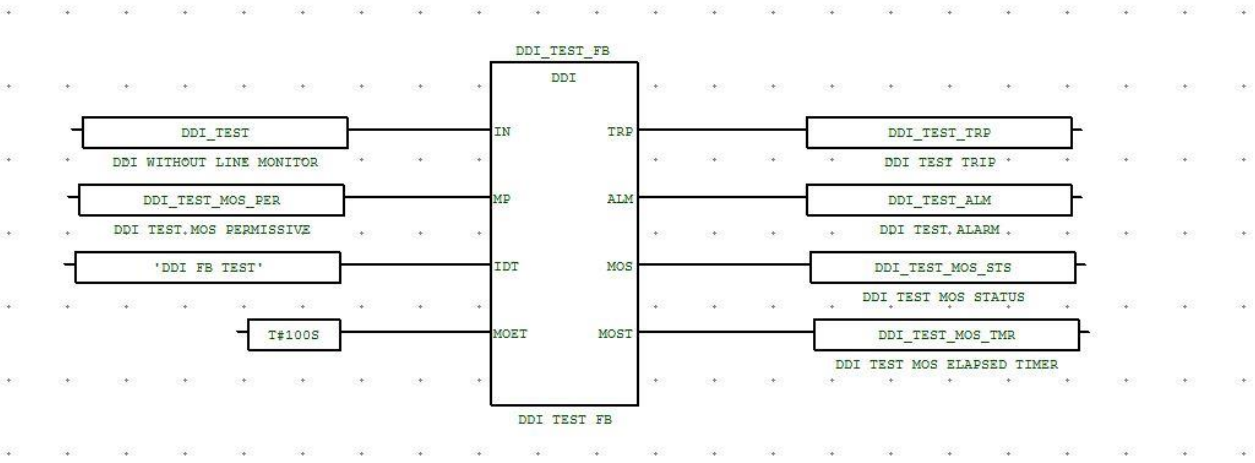

Fig 5 User Defined Function Block DDI

3.3 PREDEFINED VALUES

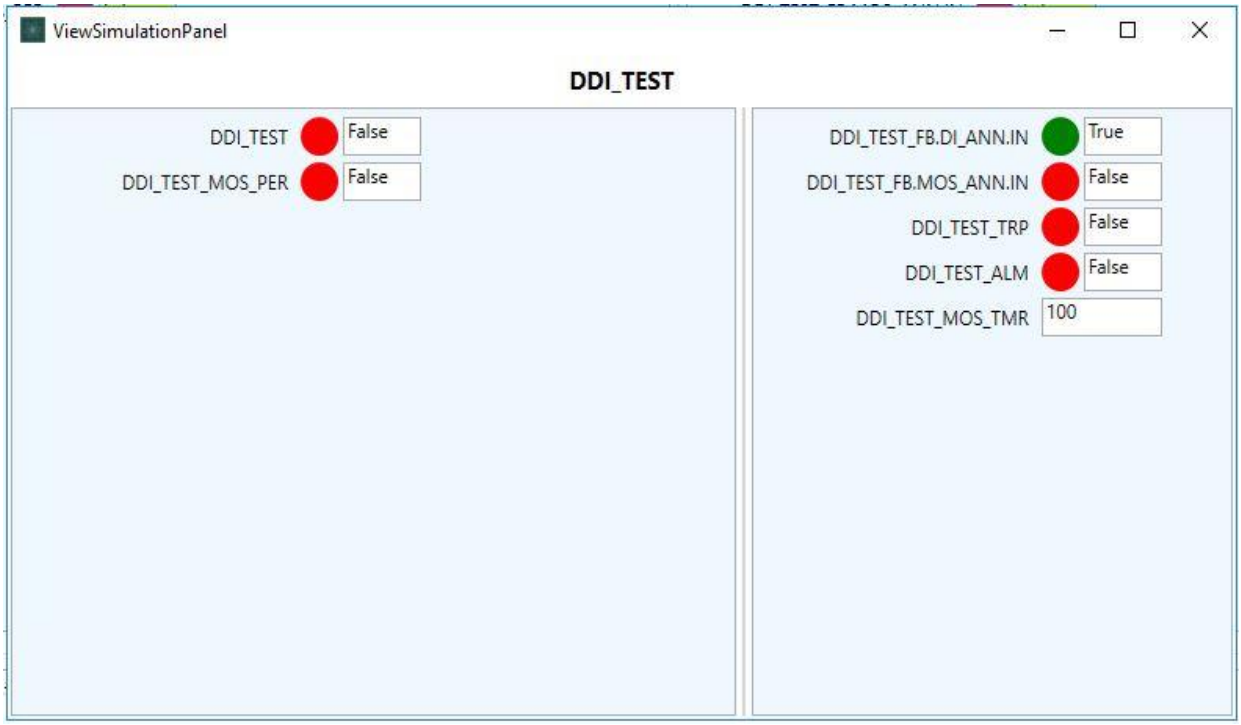
Predefined Input Parameter values that are indicated below shall be considered for functional test.

Short Name	Description	Predefined Values
IN	IN is the Field Digital Input	TRUE
MP	MP is the Maintenance Override Enable	FALSE
IDT	IDT is the comment for the “SOE”	"XXXXXXXXX"
MOET	MOET is the MOS Elapse Time	T#100s

Expected output Parameter values that are indicated below shall be verified before start of functional test.

Short Name	Description	Predefined Values
TRP	TRP is the Trip Output	TRUE
ALM	ALM is the Alarm Status	TRUE
MOS	MOS is the MOS status	FALSE
MOST	MOST is the MOS Elapsed Time	100

3.4 TEST CASES VS EXPECTED RESULTS



The required input parameters shall be changed from the predefined values based on individual test cases described below to carry out one hundred percent path test. Typical shall be normalized prior to apply the below test cases and make sure typical should read output parameters as stated in the expected output parameter values under 'Predefined Values' section.

Test Case Number	Test Cases	Input Parameter /Values	Expected Results		
			Trip Output TRP	Logic Alarm ALM	MOS Status MOS

Note:

- Pass / Fail criteria for functional test is based on comparing expected test results with actual test results recorded during simulation environment in IO Simulation Tool.
- Any mismatch observed during manual comparison of expected vs. actual test result then test is considered to be failed. Required logic correction shall be applied and typical to be retested again completely.

4 DDI_LM

Digital input signal for normally close type of inputs with Line Monitoring (DDI_LM)

4.1 PURPOSE

This function is used to process the normally close digital input signal with Line Monitoring.

Functionality:

The DDI function block has the following main functions:

- Trip management.
- Line fault detection.
- Optional maintenance override function.

The functions of the DDI typical are shown below. This typical is used for digital inputs based upon de-energize to trip function which require line monitoring. The typical has optional maintenance override functionality to override the trip function. The alarm output is independent of the MOS functionality.

The field signal for the typical is a digital input. This typical is applicable for normally closed field contact. The typical has a line fault alarm and trip output. In case the input becomes de-energized the output will be tripped and will remain de-activated until the input value becomes energized again. The trip output status and line fault alarm will be indicated on OWS. MOS shall be enabled from the OWS.

5 SAI

SAI Function block is used to scale the Input signal to the Engineering value

5.1 PURPOSE

SAI Function block is used to scale the Input signal to the Engineering value and will generate trip signal when input value exceeds the Set points of LOW, LOW LOW, HIGH & HIGH HIGH.

Functionality:

The SAI function block has the following main functions:
• Validity check of the signal.
• Process threshold management.
• Optional functions are maintenance override and operational override functionality

This function block is used in logic applications in order to decide whether the input signal is below the Low, or above the High threshold setting. The image below gives the model for the functions specified for the SAI function block. For the threshold, an optional dead-band DB will be available (hysteresis) when changing from a trip state to a normal state.

When the input value drops below the Low Low set-point, the (LL) alarm and trip (SDL) will be set, and will remain latched until the input value rises above the Low Low set-point plus the dead-band. When the input value exceeds the High High set-point, the (HH) alarm and trip (SDH) will be set, and will remain latched until the input value falls below the High High set-point minus the dead-band.
The trip function can be overridden by the maintenance override. The alarm function is independent of the status of the maintenance override. The trip status and line fault alarm will be indicated on OWS. MOS shall be enabled from the OWS.

5.3 PREDEFINED VALUES

Predefined Input Parameter values that are indicated below shall be considered for functional test.

Short Name	Description	Predefined Values
IN	IN is the Field Analog Input	50.00
RH	RH is the "Range High" Value	100.00
RL	RL is the "Range Low" Value	0.00
HH	HH is the Setpoint Value "High High"	90.00
PH	HH is the Setpoint Value "High "	80.00
PL	HH is the Setpoint Value "Low"	20.00
LL	HH is the Setpoint Value "Low Low"	10.00
DB	DB is the "Hysteresis" Value	0.50
TDLY	TDLY is the Trip Delay Time	T#8s
OOS	OOS is the Operational Override	FALSE
MP	MP is the Maintenance Override Enable	FALSE
IDT	IDT is the comment for the “SOE”	"XXXXXXXXX"
MOET	MOET is the MOS Elapse Time	T#100s

Expected output Parameter values that are indicated below shall be verified before start of functional test.

Short Name	Description	Predefined Values
PV	TRP is the Processed Digital Input Signal value	50.00
SDH	Shutdown High High Trip	TRUE
SDL	Shutdown Low Low Trip	TRUE
HH	HH is the High High Alarm Status	TRUE
HI	HI is the High Alarm Status	TRUE
LO	LO is the Low Alarm Status	TRUE
LL	LL is the Low Low Alarm Status	TRUE
STS	STS is the Transmitter Fault Alarm	TRUE
MSTS	MOS is the MOS status	FALSE
MOST	MOST is the MOS Elapsed Time	100

5.4 TEST CASES VS EXPECTED RESULTS

The required input parameters shall be changed from the predefined values based on individual test cases described below to carry out one hundred percent path test. 6 UZGRP

UZGRP typical provides the common functionality for UZ groups in the SIS.

6.1 PURPOSE

UZGRP typical provides the common functionality for UZ groups in the SIS. The functions of the typical are trip latching, alarming and first failure identification.

Functionality:

The UZGRP function block has the following main functions:

- Trip the UZ group if one of the inputs is tripped.
- Initiate a First Failure alarm to indicate which trip came first.
- Latch the UZ trip if a trip condition is active and no reset has been applied.

For every process group in the system at least one UZ block is used. The typical UZ block is designed for 10 inputs. Depending on the number of inputs to the group, more UZ blocks may be used for a process group. The UZ block can be linked together in a chain by linking the UZ Link and UZ Condition of the next UZ block together. If only one UZ block is used to trip a UZ group the UZ Link input shall be set to TRUE. The trip outputs of input typical and/or voting typical in a UZ group are connected to the inputs of the UZ block. A trip condition on an input of the UZ block will trip the UZ group. This will latch the UZ block, further trips on the inputs will be ignored for failure indication, but still affect the UZ group trip. The output of the UZ block will be used in the application logic to the trip related field outputs. The trip alarm and the first failure flag of the tripped input will be shown in the OWS. The Tripped Outputs Latched status will be shown in the OWS until UZGRP is reset.
After all trip conditions are cleared the UZ typical can be reset via the optional UZRST application typical, by a reset signal from SCS. If the UZ group requires an auto-reset function, then the UZ Condition output has to be connected to the Clear input. The Clear input will only react on a positive trigger. The Clear will not only reset the UZ group but also clears the first failure flag, a reset will only have affect if all trip input conditions are normalized (not tripped).

Date	:	05-JUL-2024

Note:

- Pass / Fail criteria for functional test is based on comparing expected test results with actual test results recorded during simulation environment in IO Simulation Tool.
- Any mismatch observed during manual comparison of expected vs. actual test result then test is considered to be failed. Required logic correction shall be applied and typical to be retested again completely.

7 UZRST

UZRST typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip.

7.1 PURPOSE

This typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip. The UZRST block has an input to indicate UZ trip status and an output to reset UZGRP logic.

Functionality:

The UZRST function block has the following main functions:

- Reset UZ groups only when SCS Reset operated from OWS or field reset switch has been applied
- Indicate that SCS reset is allowed.

This typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip. The UZRST block has an input to indicate UZ trip status and an output to reset UZGRP logic.

To indicate that a SCS reset is allowed (i.e. Permissive is ‘TRUE’) the status (Ok to Reset) is sent to OWS. After the reset from OWS, the Ok to Reset status will go off.

Push button field input reset is designed for normally open-momentary closed contacts to reset.

7.6 SIGNOFF

Functional Check Test Result (**Pass/Fail**)	:	PASS
Test Engineer Name	:	NANDAGOPAL.K.S.
Signature	:	
Date	:	05-JUL-2024

Note:

- Pass / Fail criteria for functional test is based on comparing expected test results with actual test results recorded during simulation environment in IO Simulation Tool.
- Any mismatch observed during manual comparison of expected vs. actual test result then test is considered to be failed. Required logic correction shall be applied and typical to be retested again completely.

8 SDV_1

SDV_1 function is used for the Fail to Close Valves with limit switch Feedback

8.1 PURPOSE

This typical drives the output to safe-state when the UZSD input trips.

Functionality:

The SDV_1 typical has the following features:

- Valve operation.
- Limit switch feedback (one or two limit switches)

This typical drives the output to safe-state when the UZSD input trips. When the UZGRP is normal ,then open command can be given from the OWS / AUTO open (OPEN nub)

8.2 LOGIC DIAGRAMS

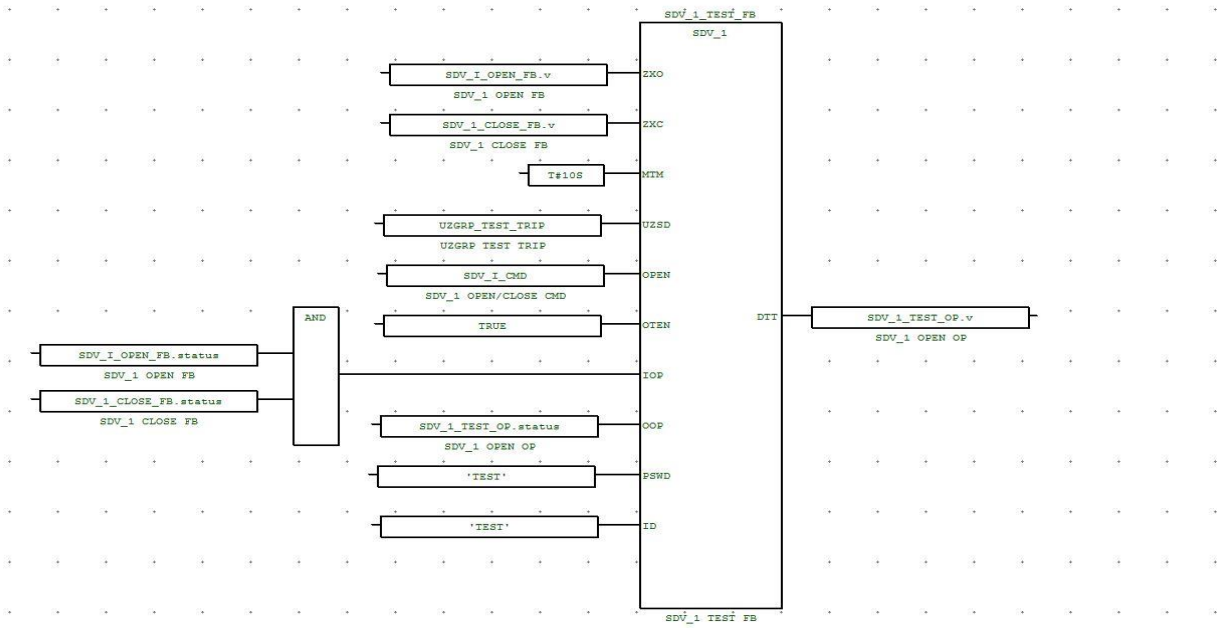

Fig 15 User Defined Function Block SDV_1

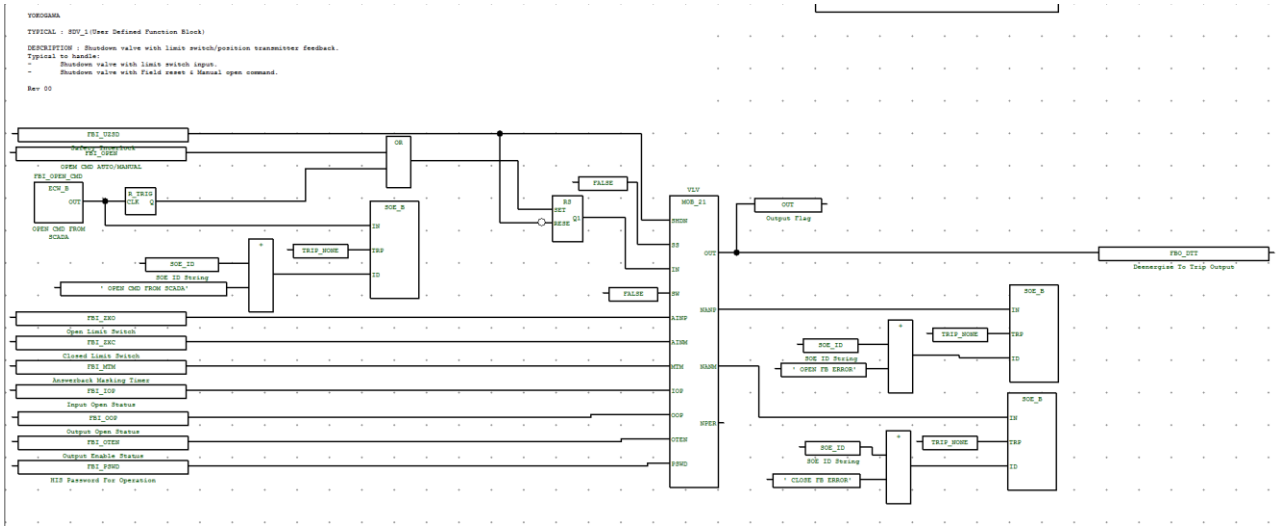

Fig 16 Logic Diagram for AI Typical SDV_1

8.3 PREDEFINED VALUES

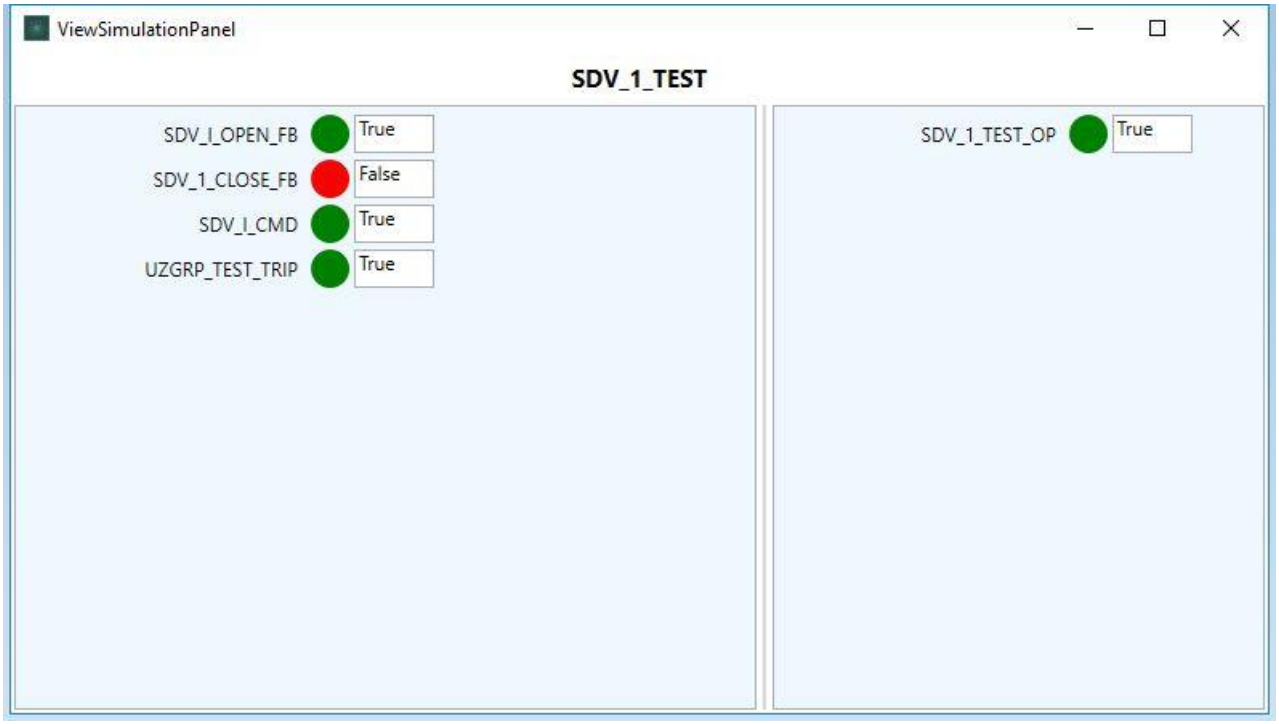
Predefined Input Parameter values that are indicated below shall be considered for functional test.

Short Name	Description	Predefined Values
ZXO	ZXO is the Open Limit Switch	TRUE
ZXC	ZXC is the Close Limit Switch	FALSE
MTM	MTM is the Answer Back Mask Time	T#10s
UZSD	UZSD is the UZ Group SD	TRUE
OPEN	OPEN is the AUTO/Field Open Command	FALSE
OTEN	OTEN is the Output Enable Status	FALSE
IOP	IOP is the Input Open Status	TRUE
OOP	OOP is the Output Open Status	TRUE
PSWD	PSWD is the Password	"XXXXXXXXX"
ID	RSID is the comment for the “SOE”	"XXXXXXXXX"

Expected output Parameter values that are indicated below shall be verified before start of functional test.

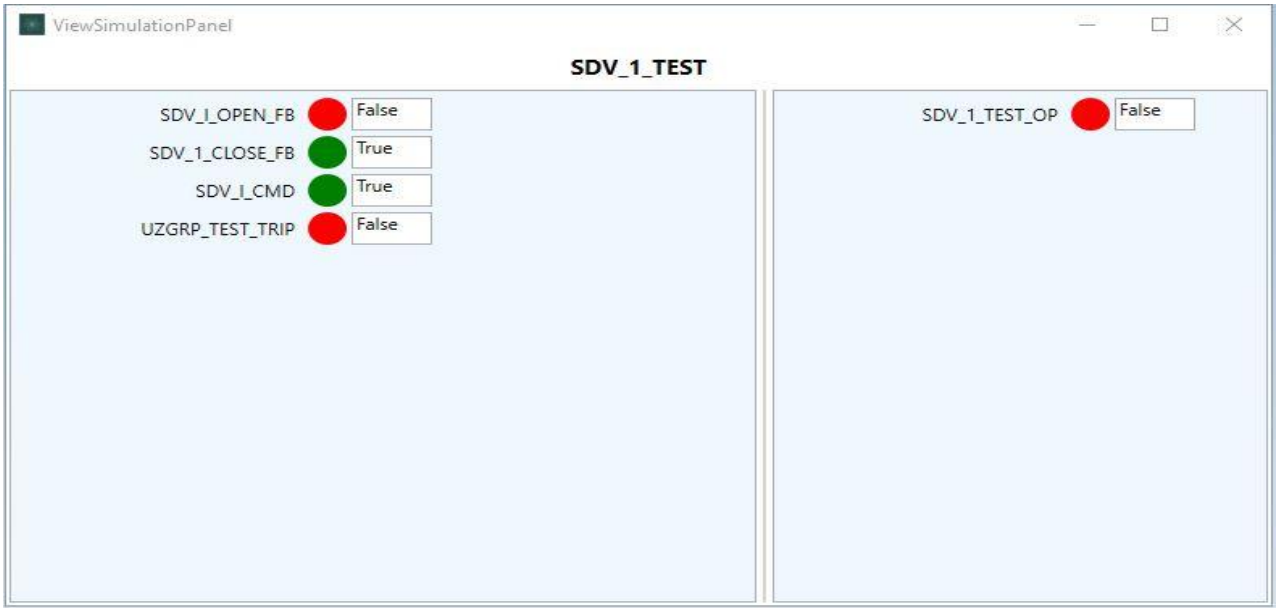
Short Name	Description	Predefined Values
DTT	DTT is the Output to Valve	TRUE

8.4 TEST CASES VS EXPECTED RESULTS



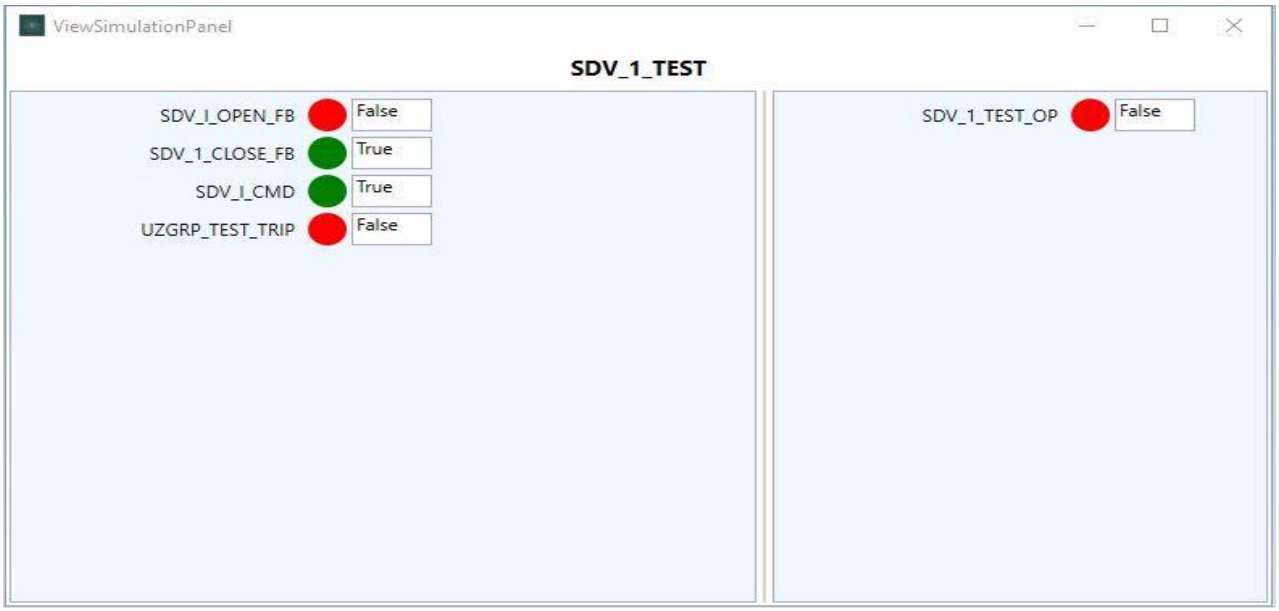
The required input parameters shall be changed from the predefined values based on individual test cases described below to carry out one hundred percent path test. Typical shall be normalized prior to apply the below test cases and make sure typical should read output parameters as stated in the expected output parameter values under 'Predefined Values' section.

Test Case Number	Test Cases	Input Parameter /Values	Expected Results		
			Output DTT	Open FB SOE Record	Close FB SOE Record
TC#1	ZXO = TRUE, ZXC = FALSE, UZSD = TRUE, CMD = TRUE	ZXO = TRUE, ZXC = FALSE, UZSD = TRUE, CMD = TRUE	TRUE	N/A	N/A
TC#2	ZXO = TRUE, ZXC = FALSE, UZSD = FALSE, CMD = TRUE, MTM time not Elapsed	ZXO = TRUE, ZXC = FALSE, UZSD = FALSE, CMD = TRUE, MTM time not Elapsed	FALSE	N/A	N/A
TC#3	ZXO = TRUE, ZXC = FALSE, UZSD = FALSE, CMD = TRUE, MTM time Elapsed	ZXO = TRUE, ZXC = FALSE, UZSD = FALSE, CMD = TRUE, MTM time Elapsed	FALSE	YES	N/A
TC#4	ZXO = FALSE, ZXC = TRUE, UZSD = TRUE, CMD = FALSE	ZXO = FALSE, ZXC = TRUE, UZSD = TRUE, CMD = FALSE	FALSE	N/A	N/A
TC#5	ZXO = FALSE, ZXC = TRUE, UZSD = TRUE, CMD = TRUE	ZXO = FALSE, ZXC = TRUE, UZSD = TRUE, CMD = TRUE	TRUE	N/A	N/A

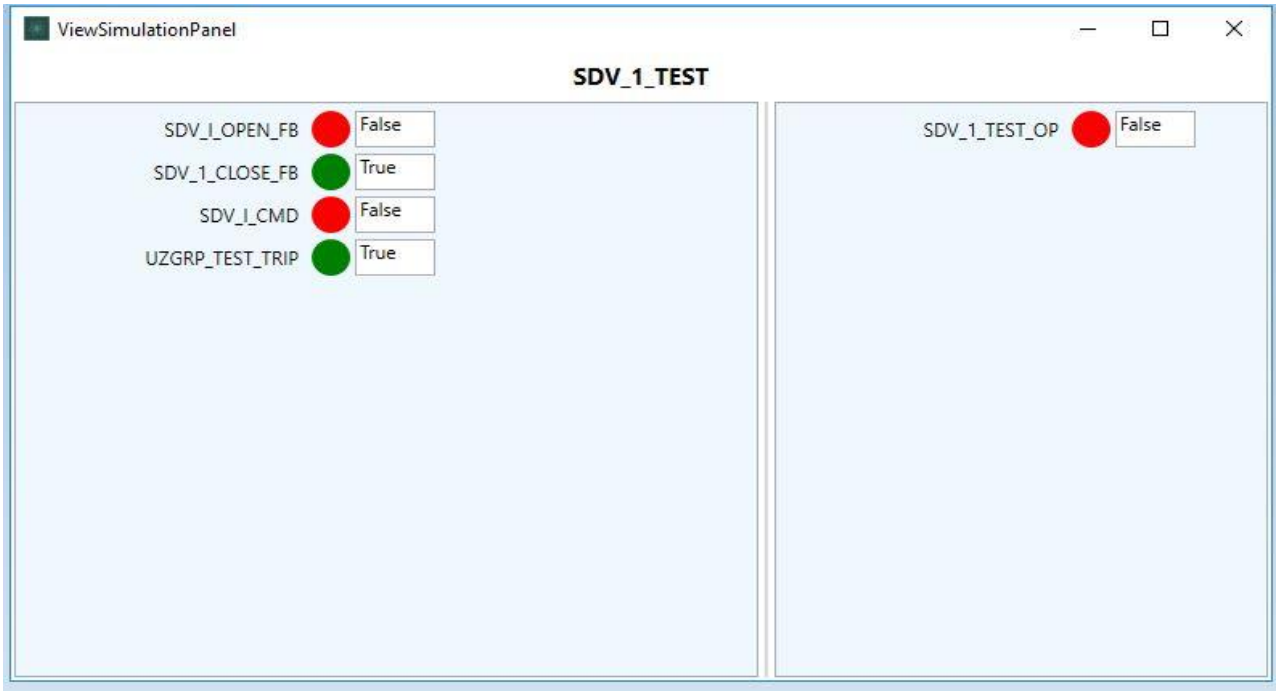


Note:

- N/A which are highlighted grey colour indicates that there is no change in the state. (Change not applicable).
- False Indicates Alarm / Trip value changes from "True' to 'False'.



8.5 TEST RESULTS:



TC#1 : ZXO = TRUE, ZXC = FALSE, UZSD = TRUE, CMD = TRUE

TC#2 : ZXO = TRUE, ZXC = FALSE, UZSD = FALSE, CMD = TRUE, MTM time not Elapsed

Note:

- Pass / Fail criteria for functional test is based on comparing expected test results with actual test results recorded during simulation environment in IO Simulation Tool.
- Any mismatch observed during manual comparison of expected vs. actual test result then test is considered to be failed. Required logic correction shall be applied and typical to be retested again completely.

9 BDV

BDV function is used for the Fail to Open Valves with limit switch Feedback

9.1 PURPOSE

This typical drives the output to safe-state when the UZSD input trips.

Functionality:

The BDV typical has the following features:

- Valve operation.
- Limit switch feedback (one or two limit switches).

This typical drives the output to safe-state when the UZSD input trips. Design of the typical is energize to trip (or activate) the output hence line monitoring of the output is essential. MANUAL operations to the Valve from the OWS are prohibited at all times except in a state when the associated UZ group acting on the BDV recovers from trip state and UZ group is reset. CLOSE command shall be issued from the OWS. Field Hand Switch allows opening of the Valve locally when the valve is in CLOSE condition.

9.2 LOGIC DIAGRAMS

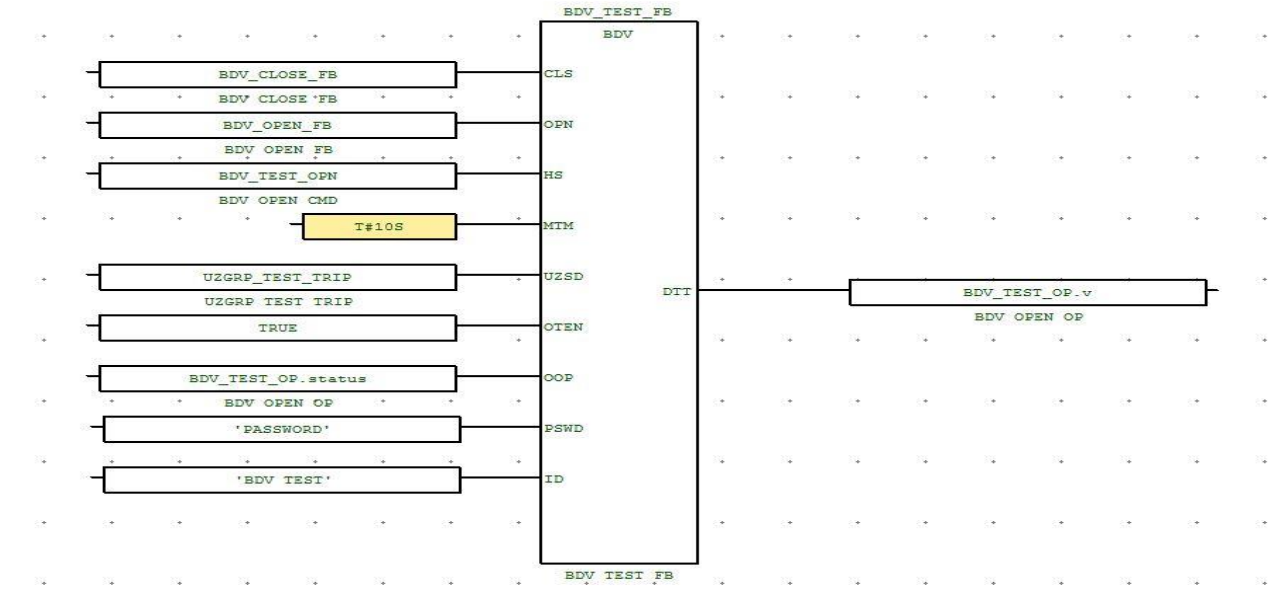

Fig 17 User Defined Function Block BDV

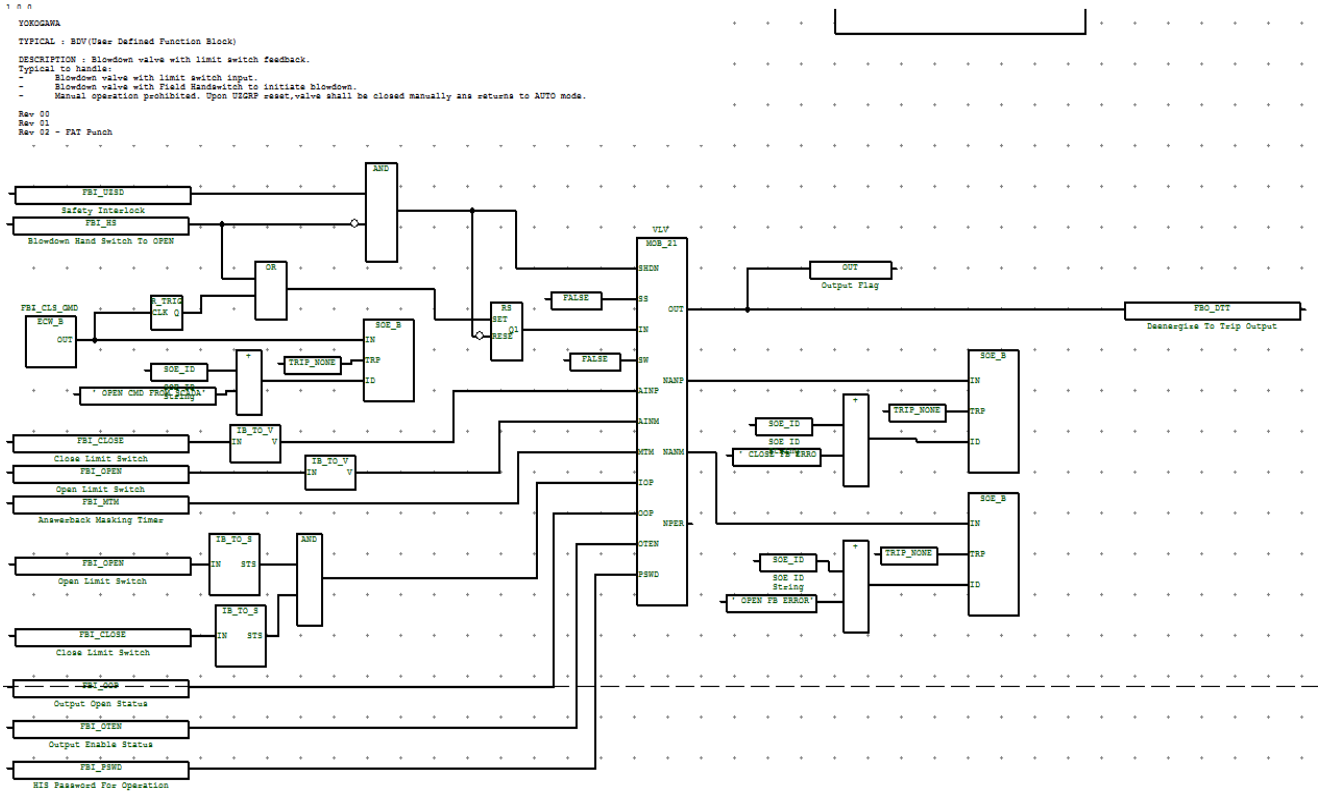

Fig 18 Logic Diagram for Typical BDV

9.3 PREDEFINED VALUES

Predefined Input Parameter values that are indicated below shall be considered for functional test.

Short Name	Description	Predefined Values
CLS	CLS is the Close Limit Switch	TRUE
OPN	OPN is the Open Limit Switch	FALSE
HS	HS is the Field Open Command	FALSE
MTM	MTM is the Answer Back Mask Time	T#10s
UZSD	UZSD is the UZ Group SD	TRUE
OTEN	OTEN is the Output Enable Status	FALSE
OOP	OOP is the Output Open Status	TRUE
PSWD	PSWD is the Password	"XXXXXXXXX"
ID	RSID is the comment for the “SOE”	"XXXXXXXXX"

Expected output Parameter values that are indicated below shall be verified before start of functional test.

Short Name	Description	Predefined Values
DTT	DTT is the Output to Valve	FALSE

9.4 TEST CASES VS EXPECTED RESULTS

The required input parameters shall be changed from the predefined values based on individual test cases described below to carry out one hundred percent path test. Typical shall be normalized prior to apply the below test cases and make sure typical should read output parameters as stated in the expected output parameter values under ‘Predefined Values’ section.

	Test Cases	Input Parameter /Values	Expected Results

10 AOS

AOS function is used for the Start-up Override

10.1 PURPOSE

The Automatic Operational Override (also known as startup override) is used during a unit (re)start. During a unit startup, levels, pressures, flows, and temperatures may be in a state of alarm providing a shutdown signal to the SIS. This in turn prevents the continuation of a process startup. The Automatic Operational Override shall be used to override the Lo-Lo and Hi-Hi shutdown signals as specified in the *Project* allowing operations to bring the unit back up.

Functionality:

The AOS function block has the following main functions:

1. Manage the operational override on startup function.
2. Reset the startup override when the override time is elapsed.
3. Reset the startup override when the process value has reached above the Low set point for at least a predefined time (process settling time) within the allowed operational override time.
4. Reset startup override when UZ group logics shutdown.
5. Reset the operational override (AOS) when the transmitter is faulty.

The operational override is activated by a UZ-group reset. The reset signal is connected to the operational override request input. The operational override will be activated on a rising edge of the reset signal if the following conditions are met:

- If the input typical is in trip alarm;
- And if there is no transmitter fault.

The operational override will be active as long as the operational override time is not elapsed. The operational override will be reset if:

- If the operational override time is elapsed;
- Or if the process value has reached normal condition for at least a predefined time (process settling time) within the allowed operational override time,
- Or if the transmitter is faulty; Start-up sequence should be stopped.
- A trip occurs in the applicable UZ group.

10.2 LOGIC DIAGRAMS

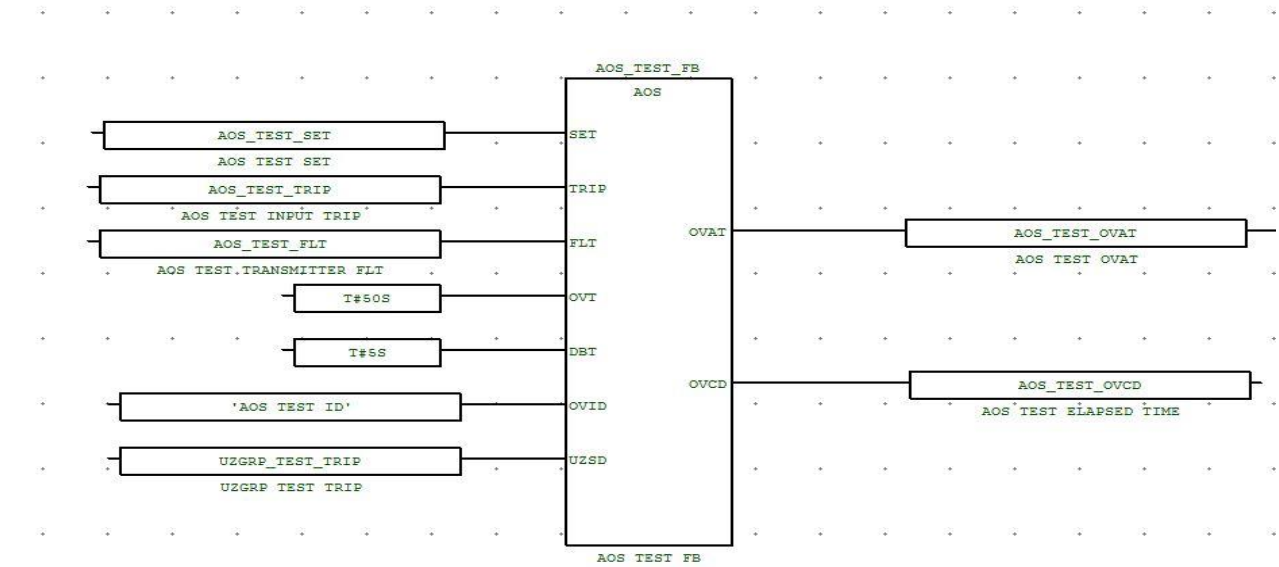

Fig 19 User Defined Function Block AOS

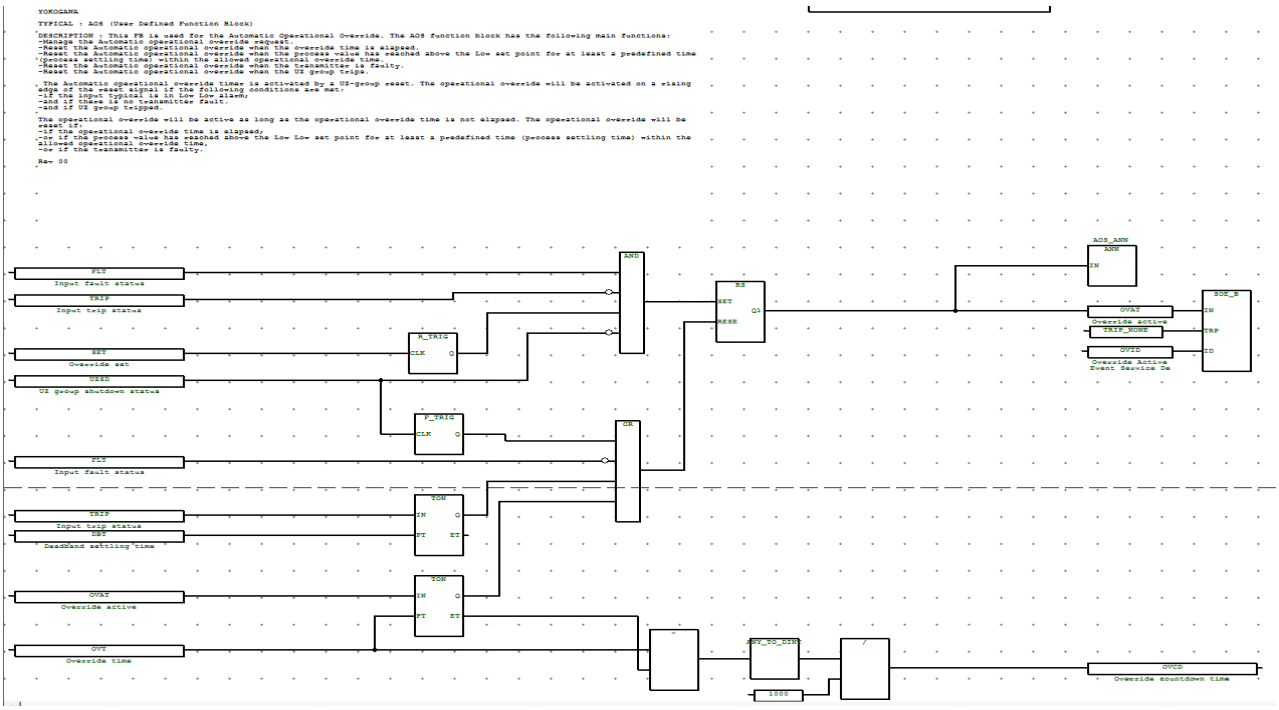

Fig 20 Logic Diagram for Typical AOS

10.3 PREDEFINED VALUES

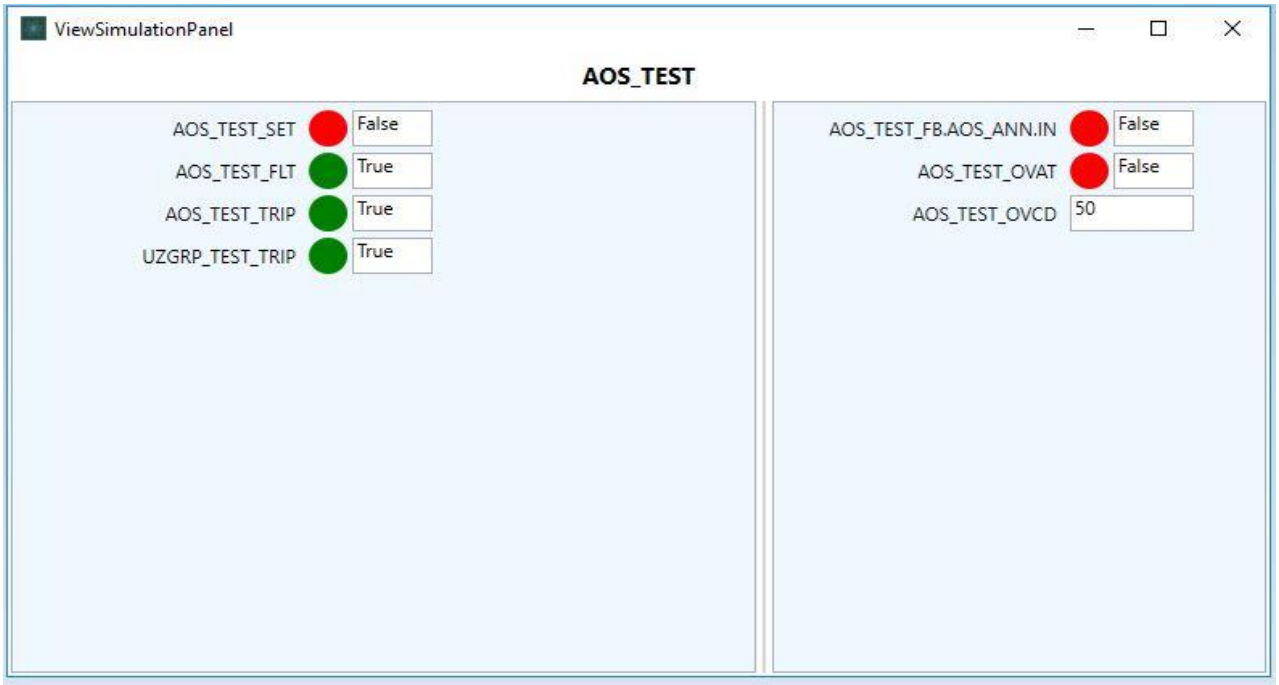
Predefined Input Parameter values that are indicated below shall be considered for functional test.

Short Name	Description	Predefined Values
SET	AOS Set from the UZRST Block	FALSE
TRIP	TRIP is the "LL trip" from the SAI Block	TRUE
FLT	FLT is the "STS" from the SAI Block	TRUE
OVT	OVT is the Override timer	T#50s
DBT	DBT is the Process Settling Time	T#5s
OVID	OVID is the comment for the “SOE”	"XXXXXXXXX"
UZSD	UZSD is the UZ Group Trip Status	TRUE

Expected output Parameter values that are indicated below shall be verified before start of functional test.

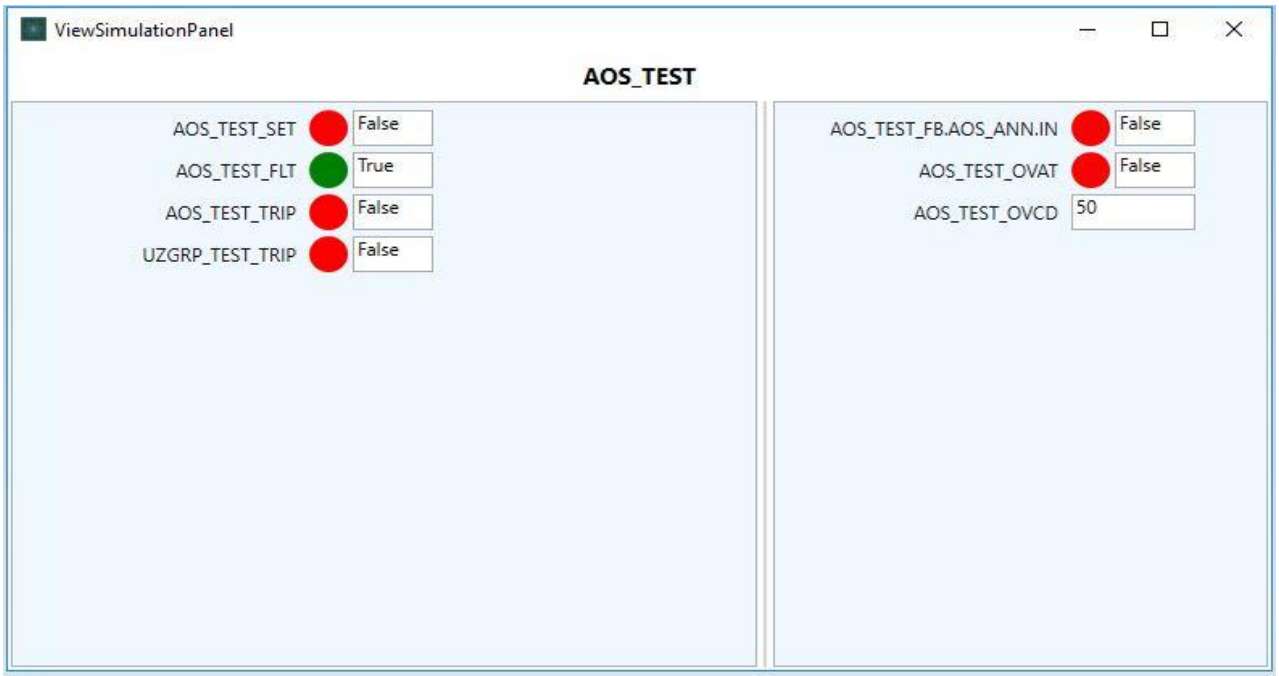
Short Name	Description	Predefined Values
OVAT	OVAT is the Boolean Override bit	FALSE
OVCD	OVCD is the Override Countdown Time	50

10.4 TEST CASES VS EXPECTED RESULTS



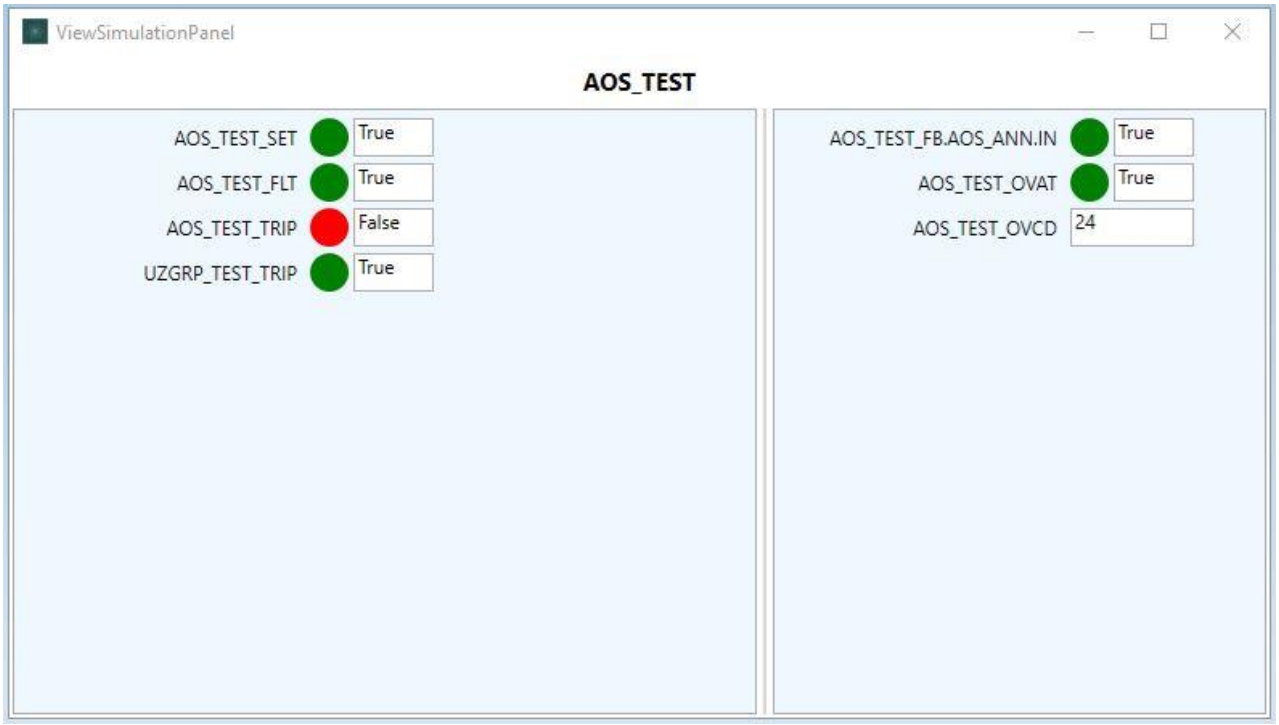
The required input parameters shall be changed from the predefined values based on individual test cases described below to carry out one hundred percent path test. Typical shall be normalized prior to apply the below test cases and make sure typical should read output parameters as stated in the expected output parameter values under 'Predefined Values' section.

	Test Cases	**Input Parameter /Values**	**Expected Results**
Test Case Number			**OVAT**
TC#1	SET = FALSE, TRIP = TRUE, FLT = TRUE, UZSD = TRUE	SET = FALSE, TRIP = TRUE, FLT = TRUE, UZSD = TRUE	N/A
TC#2	SET = FALSE, TRIP = FALSE, FLT = TRUE, UZSD = FALSE	SET = FALSE, TRIP = FALSE, FLT = TRUE, UZSD = FALSE	N/A
TC#3	SET = TRUE, TRIP = FALSE, FLT = TRUE, UZSD = TRUE	SET = TRUE, TRIP = FALSE, FLT = TRUE, UZSD = TRUE	TRUE
TC#4	SET = FALSE, OVAT = TRUE and TRIP = TRUE or OVAT = TRUE and FLT = FALSE or OVAT = TRUE and UZSD = FALSE or OVAT = TRUE and Countdown time Elapse	SET = FALSE, OVAT = TRUE and TRIP = TRUE or OVAT = TRUE and FLT = FALSE or OVAT = TRUE and UZSD = FALSE or OVAT = TRUE and Countdown time Elapse	FALSE

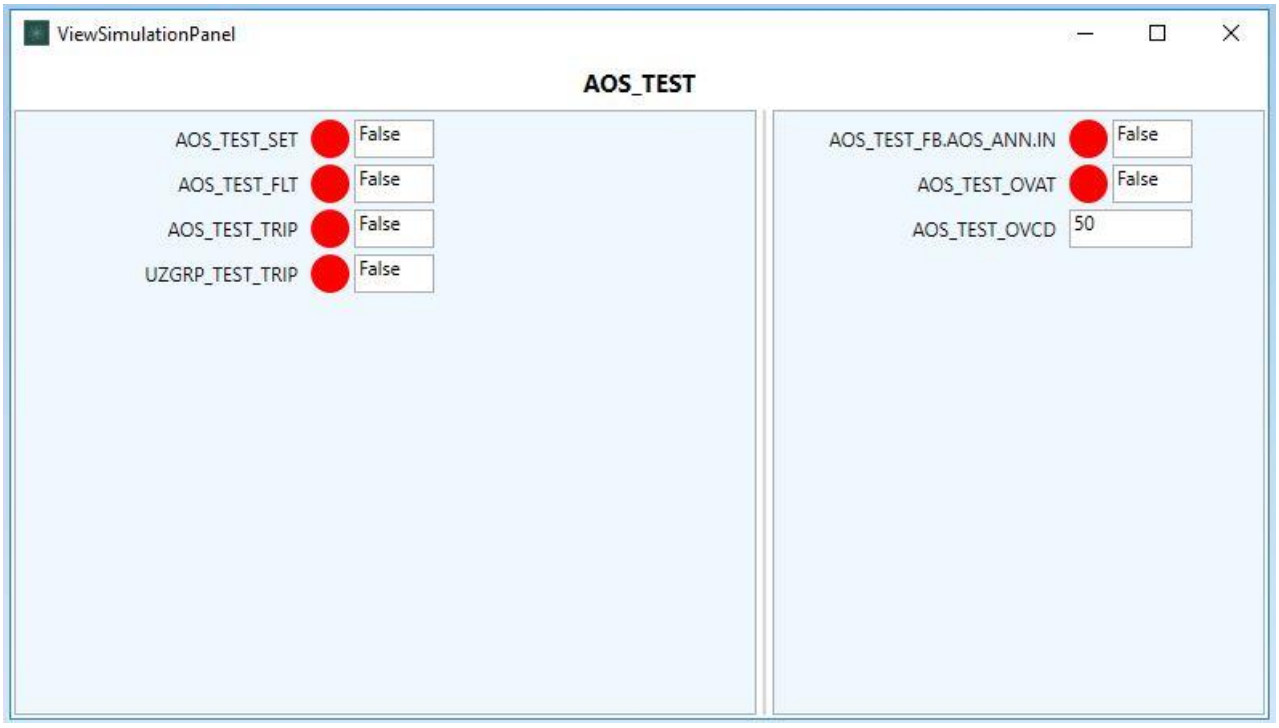


Note:

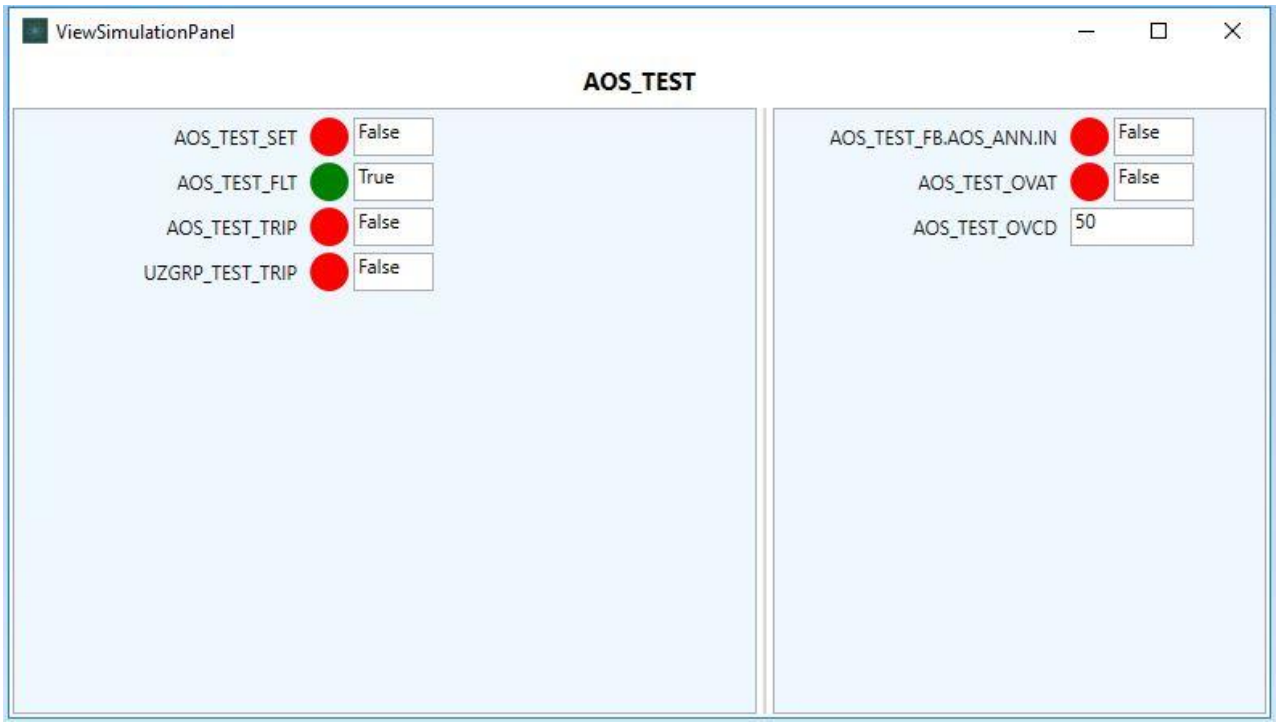
- N/A which are highlighted grey colour indicates that there is no change in the state. (Change not applicable).
- False Indicates Alarm / Trip value changes from "True' to 'False'.

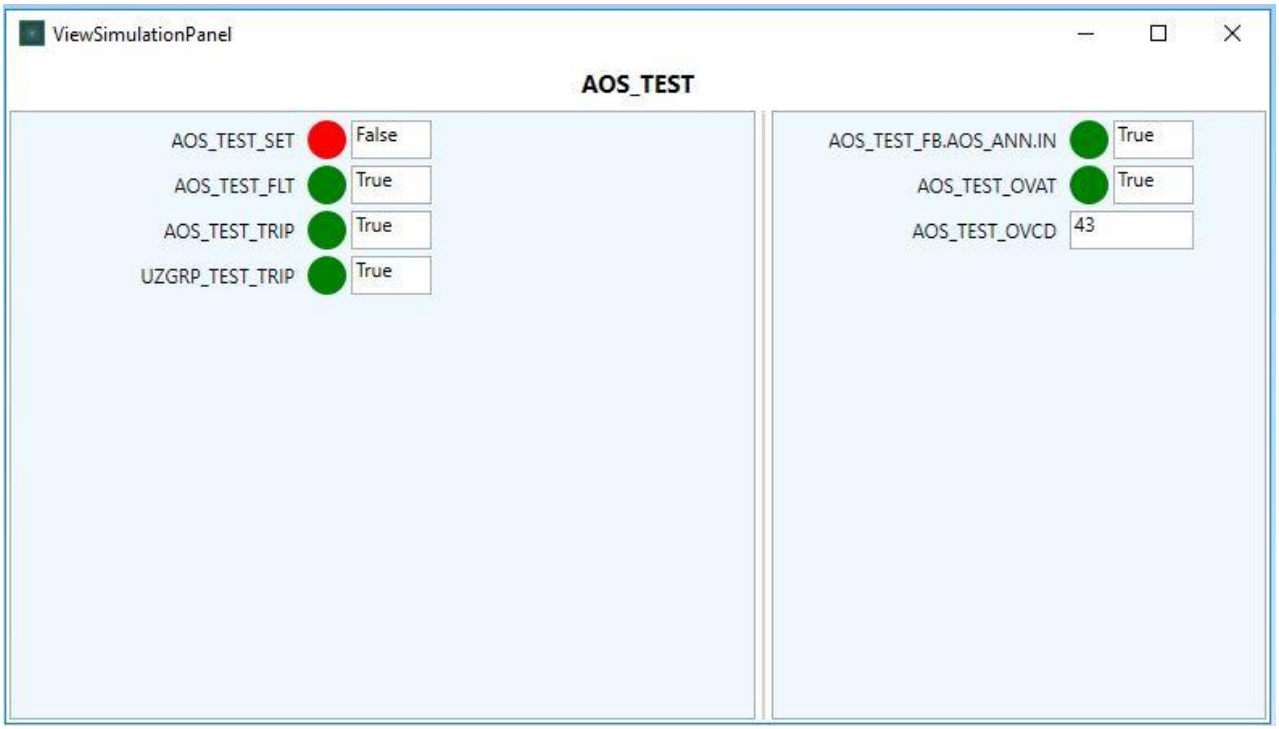


10.5 TEST RESULTS:



TC#1 : SET = FALSE, TRIP = TRUE, FLT = TRUE, UZSD = TRUE





TC#2 : SET = FALSE, TRIP = FALSE, FLT = TRUE, UZSD = FALSE

TC#3 : SET = TRUE, TRIP = FALSE, FLT = TRUE, UZSD = TRUE

TC#4 : SET = FALSE,
OVAT = TRUE and TRIP = TRUE or
OVAT = TRUE and FLT = FALSE or
OVAT = TRUE and UZSD = FALSE or
OVAT = TRUE and Countdown time Elapse

10.6 SIGNOFF

Note:

- Pass / Fail criteria for functional test is based on comparing expected test results with actual test results recorded during simulation environment in IO Simulation Tool.
- Any mismatch observed during manual comparison of expected vs. actual test result then test is considered to be failed. Required logic correction shall be applied and typical to be retested again completely.

11 TOF

Trip Delay Timer (TOF) timer is used to provide delayed actions or alarms in response to a specific condition.

11.1 PURPOSE

Trip delay timer (TOF) timer is often used to provide delayed actions or alarms in response to a specific condition.

Functionality:
The TOF function block has the following main functions:

1. **Activation on Condition**: The TOF timer is triggered when a specific condition is met, such as an abnormal process variable exceeding its safe limit (e.g., high pressure, high temperature).
2. **Timing Period**: Once the condition is met, the TOF timer starts counting. This period is preset and can vary depending on the application. During this time, the condition is monitored continuously.
3. **Condition Sustains Beyond the Timer**:
    1. If the condition persists beyond the timer period, the SIS initiates the corresponding safety action, such as:
        1. **Activating an alarm**
        2. **Triggering an emergency shutdown (ESD)**

11.2 LOGIC DIAGRAMS

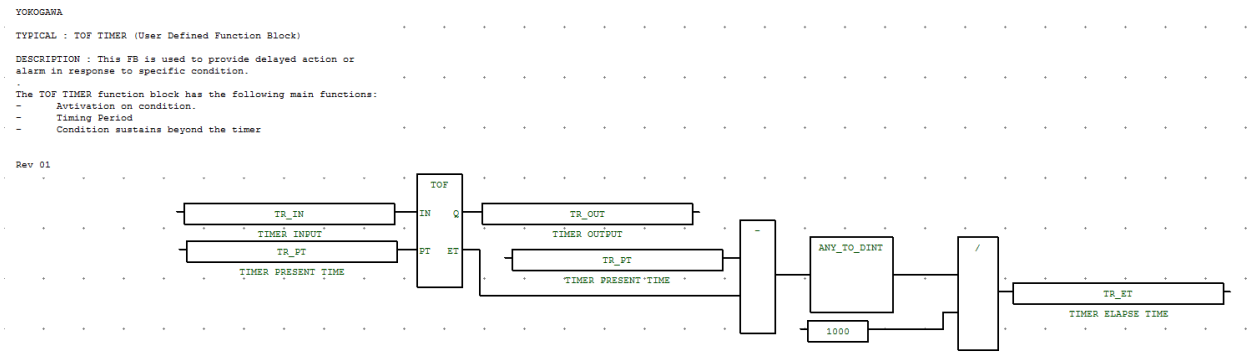

Fig 21 User Defined Function Block TOF

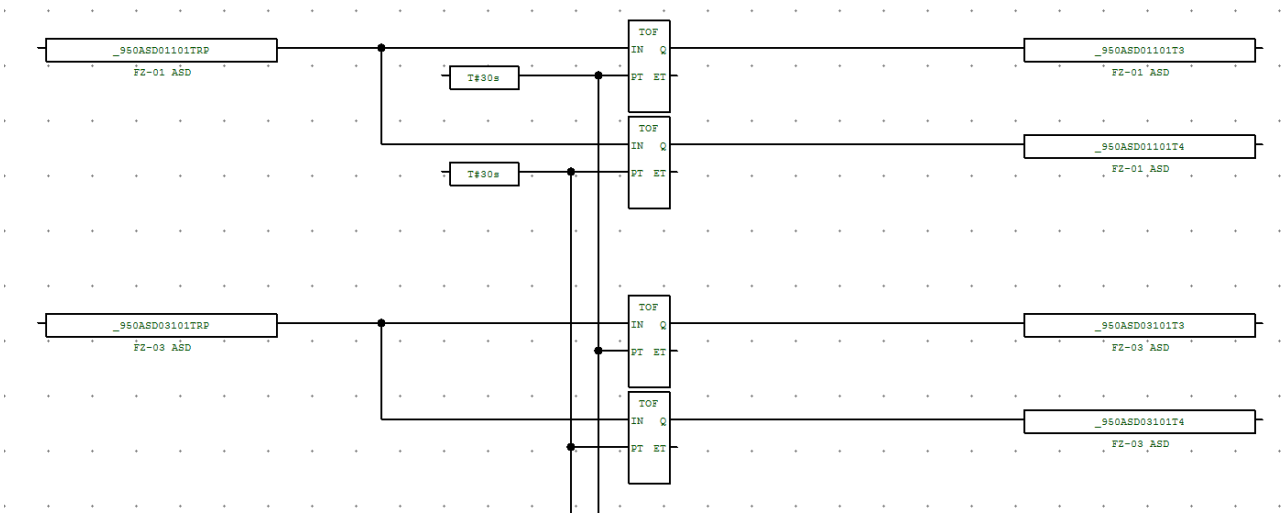

Fig 22 Logic Diagram for Typical TOF

11.3 PREDEFINED VALUES

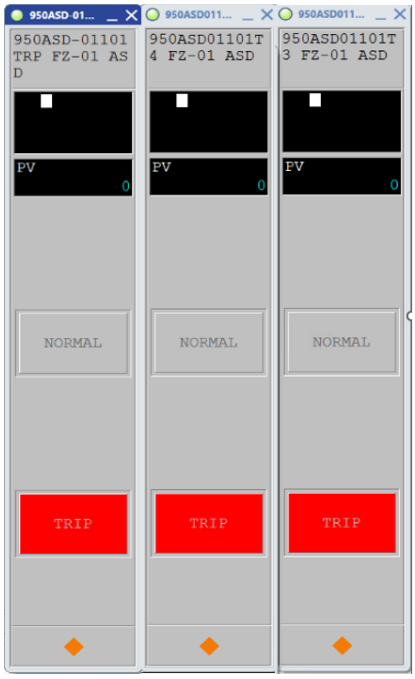
Predefined Input Parameter values that are indicated below shall be considered for functional test.

Short Name	Description	Predefined Values
IN	Input (BOOL)	TRUE
PT	Preset Timer	T#Sec

Expected output Parameter values that are indicated below shall be verified before start of functional test.

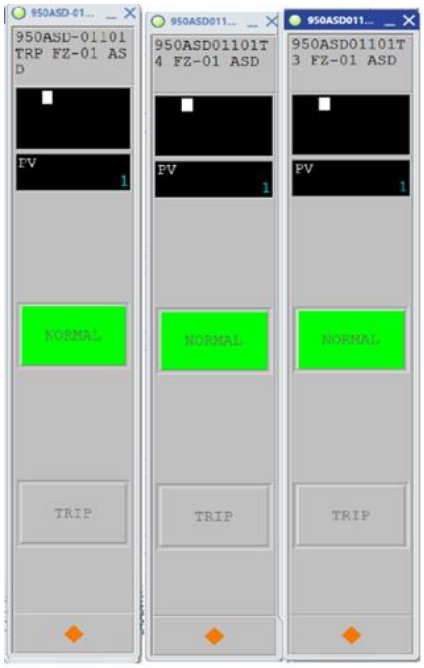
Short Name	Description	Predefined Values
Q	Output (BOOL) If TRUE: total time is not elapsed If FALSE: ET increments till reaches reach PT	TRUE
ET	Elapsed Time	T#Sec

11.4 TEST CASES VS EXPECTED RESULTS



The required input parameters shall be changed from the predefined values based on individual test cases described below to carry out one hundred percent path test. Typical shall be normalized prior to apply the below test cases and make sure typical should read output parameters as stated in the expected output parameter values under 'Predefined Values' section.

Test Case Number	Test Cases	Input Parameter /Values	Expected Results
			Q (OUTPUT)
TC#1	IN = FALSE, Q = FALSE, PT = 0-2147483648, ET = 0-2147483648	IN = FALSE	FALSE
TC#2	IN = TRUE, Q = TRUE, PT = RESET TO ZERO, ET = RESET TO ZERO	IN = TRUE	TRUE



Note:

- N/A which are highlighted grey colour indicates that there is no change in the state. (Change not applicable).
- False Indicates Alarm / Trip value changes from "True' to 'False'.

11.5 TEST RESULTS:

TC#1 : IN = FALSE, Q = FALSE, PT = 0-2147483648, ET = 0-2147483648

TC#1 : IN = TRUE, Q = TRUE, PT =0-2147483648 , ET = RESET TO ZERO

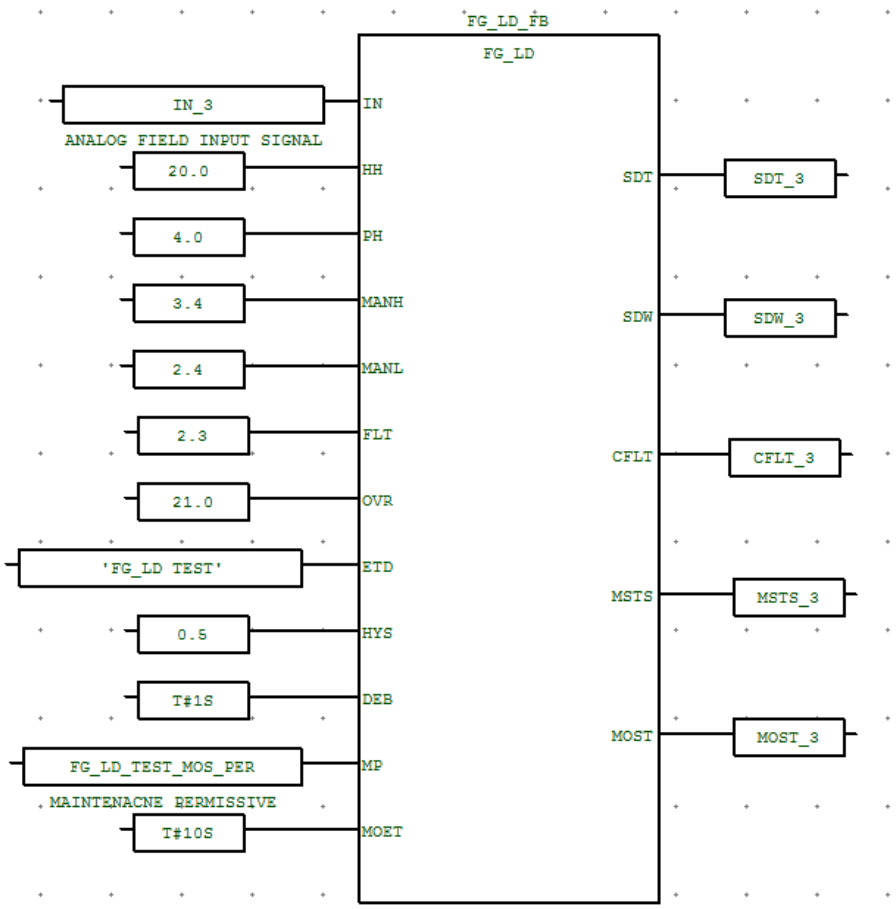
1 FG_LD

Leakage Detector for Fire and Gas Applications.

1.1 PURPOSE

This typical is used for H2 Leak detectors.

Functionality:



- Process Point type gas detectors
- Manage the maintenance override function (MOS) for gas point detector
- Manage detector trip, diagnostic and I/O fault logics

Note: The MOS override function is included inside the function block
MOS function can be disabled by forcing the MOS enable key switch permanently to FALSE.

Gas Point type input processing block:

- Trip and general diagnostic setpoints are hardcoded outside the User Defined Function Block (UDFB).
- Scaling setpoints are inside UDFB.
- LLLL and LTRP values are masked as these provide no function for flame detection.
- HHH and HTRP values is used warning and trip.
- All faults are considered critical and result in degraded voting logic.

1.2 PREDEFINED VALUES

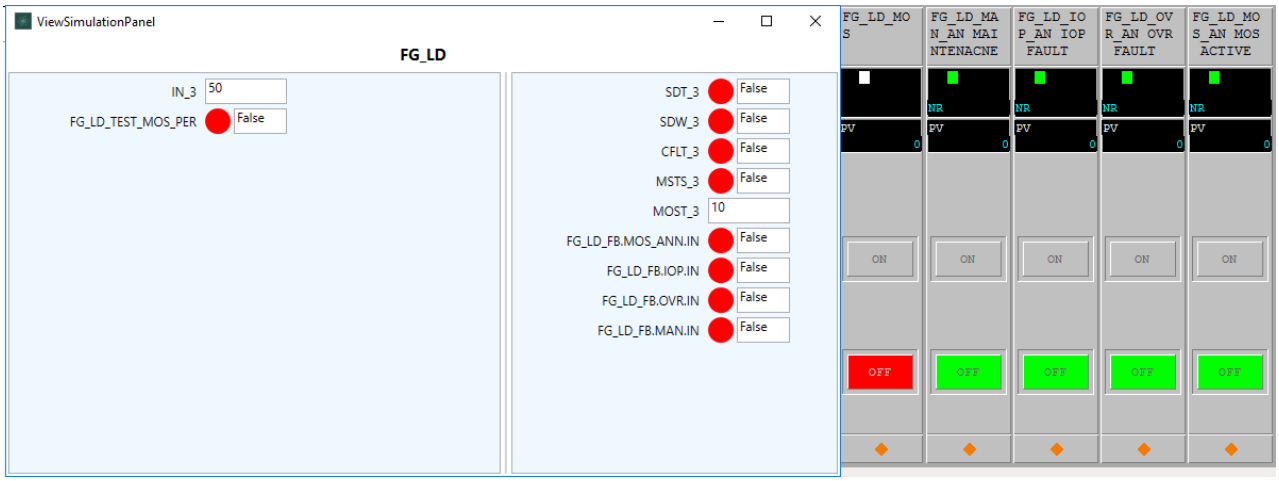
Predefined Input Parameter values that are indicated below shall be considered for functional test.

Short Name	Description	Predefined Values
IN	ANALOG FIELD INPUT SIGNAL	50
HH	HH SETPOINT	80
PH	PH SETPOINT	70
MANH	MAINTENANCE FAULT THRESHOLD HI	-3.4
MANL	MAINTENANCE FAULT THRESHOLD LO	-6.4
FLT	OPEN LOOP FAULT	-8
OVR	OVERRANGE FAULT	105
ETD	EVENT TEXT FOR DEVICE	XXXXXX
HYS	HYSTERESIS %	0.5
DEB	DEBOUNCE TIME	T#1S
MP	MAINTENACNE PERMISSIVE	FALSE
MOET	MOS RESET TIMER	T#10s

Expected output Parameter values that are indicated below shall be verified before start of functional test.

Short Name	Description	Predefined Values
SDT	SHUTDOWN TRIP	FALSE
CFLT	CRITICAL FAULT	FALSE
MSTS	MOS STATUS	FALSE
MOST	MOS RESET TIMER	10s

1.3 TEST CASES VS EXPECTED RESULTS



The required input parameters shall be changed from the predefined values based on individual test cases described below to carry out one hundred percent path test. Typical shall be normalized prior to apply the below test cases and make sure typical should read output parameters as stated in the expected output parameter values under 'Predefined Values' section.

Test Case Number	Test Cases	Input Parameter /Values	Expected Results			
			Shutdown Trip	Shutdown H Trip	Critical Fault	MOS Status
TC#1	IN.Value = 50.0, MP = FALSE	IN.Value = 50.0, MP = FALSE	FALSE	FALSE	FALSE	FALSE
TC#2	IN.Value = 81.0, MP = FALSE,	IN.Value = 81.0, MP = FALSE,	TRUE	TRUE	FALSE	FALSE
TC#3	IN.Value = 81.0, MP = TRUE, @ECW_B_LD = TRUE	IN.Value = 81.0, MP = TRUE, @ECW_B_LD = TRUE	FALSE	FALSE	FALSE	TRUE

1.5 SIGNOFF

Functional Check Test Result (**Pass/Fail**)	:	PASS
Test Engineer Name	:	NANDAGOPAL.K.S.
Signature	:	
Date	:	08-OCT-2024

Note:

- Pass / Fail criteria for functional test is based on comparing expected test results with actual test results recorded during simulation environment in IO Simulation Tool.
- Any mismatch observed during manual comparison of expected vs. actual test result then test is considered to be failed. Required logic correction shall be applied and typical to be retested again completely.

2 FG_GD

GAS Detector for Fire & Gas applications.

2.1 PURPOSE

This typical is used for H2 & O2 gas detectors.

Functionality:

- Process Point type gas detectors
- Manage the maintenance override function (MOS) for gas point detector
- Manage detector trip, diagnostic and I/O fault logics

Note: The MOS override function is included inside the function block
MOS function can be disabled by forcing the MOS enable key switch permanently to FALSE.

Gas Point type input processing block:

- Trip and general diagnostic setpoints are hardcoded outside the User Defined Function Block (UDFB).
- Scaling setpoints are inside UDFB.
- LLL and LTRP values are masked as these provide no function for flame detection.
- HHH and HTRP values is used warning and trip.
- All faults are considered critical and result in degraded voting logic.

2.3 PREDEFINED VALUES

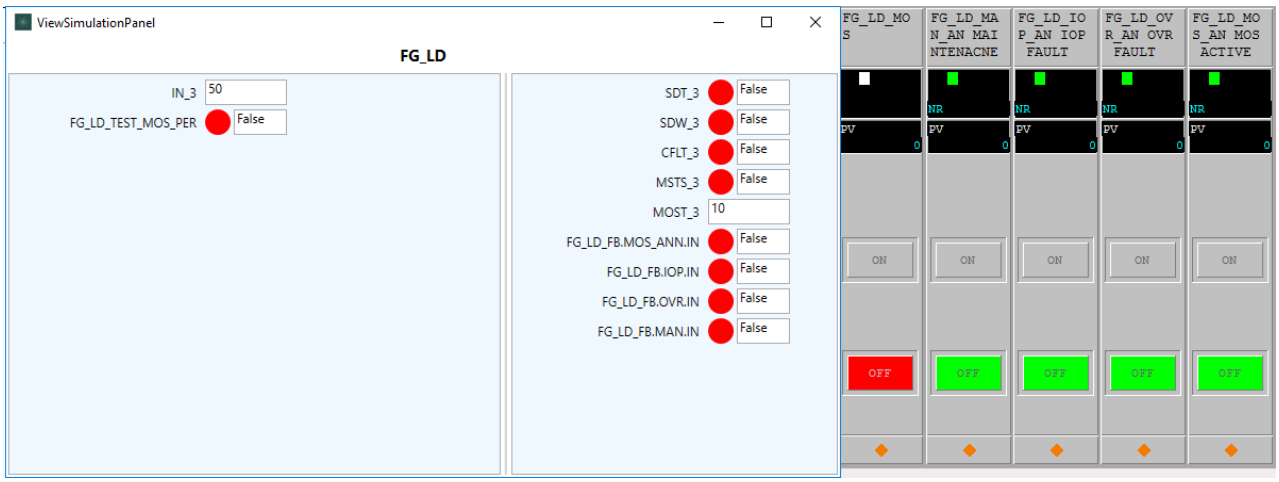
Predefined Input Parameter values that are indicated below shall be considered for functional test.

Short Name	Description	Predefined Values
IN	ANALOG FIELD INPUT SIGNAL	50.0
HH	HH SETPOINT	80.0
PH	PH SETPOINT	70.0
MANH	MAINTENANCE FAULT THRESHOLD HI	-3.4
MANL	MAINTENANCE FAULT THRESHOLD LO	-6.4
FLT	OPEN LOOP FAULT	-8.0
OVR	OVERRANGE FAULT	105.0
ETD	EVENT TEXT FOR DEVICE	XXXXXX
HYS	HYSTERESIS %	0.5
DEB	DEBOUNCE TIME	T#1S
MP	MAINTENACNE PERMISSIVE	FALSE
MOET	MOS RESET TIMER	T#10s

Expected output Parameter values that are indicated below shall be verified before start of functional test.

Short Name	Description	Predefined Values
SDT	SHUTDOWN TRIP	FALSE
CFLT	CRITICAL FAULT	FALSE
MSTS	MOS STATUS	FALSE
MOST	MOS RESET TIMER	10s

2.4 TEST CASES VS EXPECTED RESULTS



The required input parameters shall be changed from the predefined values based on individual test cases described below to carry out one hundred percent path test. Typical shall be normalized prior to apply the below test cases and make sure typical should read output parameters as stated in the expected output parameter values under 'Predefined Values' section.

Test Case Number	Test Cases	Input Parameter /Values	Expected Results		
			Shutdown Trip	Critical Fault	MOS Status
TC#1	IN.Value = 50.0, MP = FALSE	IN.Value = 50.0, MP = FALSE	FALSE	FALSE	FALSE
TC#2	IN.Value = 81.0, MP = FALSE,	IN.Value = 81.0, MP = FALSE,	TRUE	FALSE	FALSE
TC#3	IN.Value = 81.0, MP = TRUE, @ECW_B_GD = TRUE	IN.Value = 81.0, MP = TRUE, @ECW_B_GD = TRUE	FALSE	FALSE	TRUE

4 FG_FLAME_IR

UV IR Flame Detector for Fire & Gas applications.

4.1 PURPOSE

This typical is used for Ultrasonic Flame detector

Functionality:

- Process Flame Ultrasonic type Flame analog gas detectors
- Manage the maintenance override function (MOS) for each FLAME IR detector
- Manage detector trip, diagnostic and I/O fault logics

Note: The MOS override function is included inside the function block.
MOS function can be disabled by forcing the MOS enable key switch permanently to FALSE.

Flame_IR input processing block:

- Trip and general diagnostic setpoints are hardcoded outside the User Defined Function Block (UDFB).
- Scaling setpoints are inside UDFB.
- LLL and LTRP values are masked as these provide no function for flame detection.
- HHH value & HTRP values is used for warning and trip.
- All faults are considered critical and result in degraded voting logic.

5 FG_MAN_REL_NC

This typical is used for discrete inputs that are de-energized to trip.

5.1 PURPOSE

This typical is used for discrete inputs that are de-energized to trip such as Heat, Smoke detectors, ESD or Blowdown switches.

Functionality:

- Process Normally Closed digital input
- Manage the maintenance override function (MOS) for each MAN_REL_NC input
- Manage input trip, diagnostic and I/O fault logics
- Manage input trip alarm reset logics
- Optional line monitoring and fault detection
- All diagnostic and I/O alarms will trigger individual Annunciator alarms.

Note: The MOS override function is included inside the function block

MOS function can be disabled by forcing the MOS enable key switch permanently to FALSE.

Note:

- Pass / Fail criteria for functional test is based on comparing expected test results with actual test results recorded during simulation environment in IO Simulation Tool.
- Any mismatch observed during manual comparison of expected vs. actual test result then test is considered to be failed. Required logic correction shall be applied and typical to be retested again completely.

7 F23

2oo3 Voting typical will be used for Fire and Gas application.

7.1 PURPOSE

This typical is used to Initiate a trip if two of the three inputs are in trip.

Functionality:

The F23 function block has the following main functions:

- Initiate a trip if two of the three inputs are in trip state.
- Degrade voting function.

If two of the three inputs are tripped the output TRP of the F23 block will trip. If either one of the three inputs is not valid (detector critical fault) or a maintenance override is applied the voting function will degrade to 1oo2 and VDG of F23 will become true. If all transmitters are in fault, or if one maintenance override is applied while the other two transmitters are in fault the voting function is disabled.

8 FG_V2N

2ooN Voting logic for Fire & Gas applications.

8.1 PURPOSE

2-out-of-N voting is commonly used in fire and gas system to initiate trip, Process shutdown interlocks and other safety functions. This voting logic requires any two detectors to be in Alarm condition.

Functionality:

The FG_V2N function block has the following main functions:

- Initiate a trip if two of the three inputs are in trip state.
- Degrade voting function.

If two of the N inputs are tripped the output TRP of the FG_V2N block will trip. If any one of the N inputs is not valid (detector critical fault) or a maintenance override is applied the voting function will degrade and VDG of FG_V2N will become true. If all transmitters are in fault, or if one maintenance override is applied while the N transmitters are in fault the voting function is disabled.

9 UZGRP

UZGRP typical provides the common functionality for UZ groups in the FGS.

9.1 PURPOSE

UZGRP typical provides the common functionality for UZ groups in the FGS. The functions of the typical are trip latching, alarming and first failure identification.

Functionality:

The UZGRP function block has the following main functions:

- Trip the UZ group if one of the inputs is tripped.
- Initiate a First Failure alarm to indicate which trip came first.
- Latch the UZ trip if a trip condition is active, and no reset has been applied.

For every process group in the system at least one UZ block is used. The typical UZ block is designed for 10 inputs. Depending on the number of inputs to the group, more UZ blocks may be used for a process group. The UZ block can be linked together in a chain by linking the UZ Link and UZ Condition of the next UZ block together. If only one UZ block is used to trip a UZ group the UZ Link input shall be set to TRUE. The trip outputs of input typical and/or voting typical in a UZ group are connected to the inputs of the UZ block. A trip condition on an input of the UZ block will trip the UZ group. This will latch the UZ block, further trips on the inputs will be ignored for failure indication, but still affect the UZ group trip. The output of the UZ block will be used in the application logic to the trip related field outputs. The trip alarm and the first failure flag of the tripped input will be shown in the OWS. The Tripped Outputs Latched status will be shown in the OWS until UZGRP is reset.
After all trip conditions are cleared the UZ typical can be reset via the optional UZRST application typical, by a reset signal from SCS. If the UZ group requires an auto-reset function, then the UZ Condition output has to be connected to the Clear input. The Clear input will only react on a positive trigger. The Clear will not only reset the UZ group but also clears the first failure flag, a reset will only have affect if all trip input conditions are normalized (not tripped).

10 UZRST

UZRST typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip.

10.1 PURPOSE

This typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip. The UZRST block has an input to indicate UZ trip status and an output to reset UZGRP logic.

Functionality:

The UZRST function block has the following main functions:

- Reset UZ groups only when SCS Reset operated from OWS or field reset switch has been applied
- Indicate that SCS reset is allowed.

This typical will be used to reset UZ safety groups which require a manual reset (from OWS) after a trip. The UZRST block has an input to indicate UZ trip status and an output to reset UZGRP logic.

To indicate that a SCS reset is allowed (i.e. Permissive is ‘TRUE’) the status (Ok to Reset) is sent to OWS. After the reset from OWS, the Ok to Reset status will go off.

Push button field input reset is designed for normally open-momentary closed contacts to reset.

10.2 LOGIC DIAGRAMS

On HOLD	
HOLDs	Description
HOLD 1	~~To the aim of reducing the issues about the fuel cell dynamics, it is assumed that for the current version the EMCS is sufficient to implement a generic rule in the control policy (as a deviation-vs-time filter on the set-point signal).~~
HOLD 2	~~An operator shall be able to set and hold the Supply Guarantee request status on NOT REQUIRED manually.~~
HOLD 3	~~For the EMCS, the BLPH shall be considered off-grid (i.e. not grid-tied) exclusively on the basis of the related hardwired signal. The latter is supposed to be an OR of the open condition of the INCOMMER 6.6kV CB and the GIS Q0(A1). This holds independently from the presence of grid signal and the status of the INCOMMER 6.6kV switchgear and any upward disconnector.~~
HOLD 4	~~(Under analysis, information arrived in May 2024): the "BESS charge level" and the related BESS.MINIMUM-EMERGENCY-RESERVE (and the others parameters about "BESS charge levels") are supposed to be expressed in SoC. However, such thresholds may need to be based on absolute values of energy, expressed in MWh, instead of SoC %: According to the meetings in held May 2024 with the BESS vendor, the BESS expose over the data interface the absolute value of energy available to the discharge, and this value is representative of the BESS ability to produce power and hence to sustain the isolated grid, while SoC value is not.~~
HOLD 5	~~The fuel cell, electrolyzer, BESS, solar farm will each provide a signal, or a set of signals, over the data interface with the EMCS which univocally identify the package status of ready to operate; the package vendor will document a static set of values of the mentioned signals for which such condition is met.~~
HOLD 6	~~the solar farm will provide a signal over the data interface with the EMCS, signaling that the solar farm is not able to guarantee the respect of the set-point from the EMCS (within the declared tolerances).~~
HOLD 7	~~The BESS is healthy is not a mandatory condition to enter in EXPORT MODE, if the fuel cell can produce power.~~
HOLD 8	~~EMCS shall constrain the range among positive set-points only (discharge), so to prevent power flow inversion (with the aim to avoid consequent possible stress on the BESS).~~
HOLD 9	~~The solar farm is able to guarantee the strict respect of the active power limit provided by the EMCS, or the respect of the limit with a maximum upward tolerance (supposed within 10%) in normal operating conditions.~~
HOLD 10	~~In grid-forming mode, if the BESS is not fully charged, it is always able to adsorb up to 1 MW (charging).~~
HOLD 11	~~It is supposed that the "BESS charge level" will be based on the SoC. HOWEVER, according to the BESS vendor, to assess the actually available margins of the BESS to charge and discharge, the energy margins shall be used instead of the SoC. In such case, it is also supposed that it is preferrable to operate around a point were energy margins in charging and discharging have similar values, instead of using the SoC as a reference (for the SoC, the optimal operational point was reported to be 50%). This affects the definition of any parameter related to the BESS stored energy level.~~
HOLD 12	~~BESS, electrolyzer, fuel cell, solar farm vendor will provide a heartbeat/watchdog allowing the package and the BESS to verify the presence of communication between the two systems.~~

HOLD 13	~~The suggested trade-off is the architecture with Fuel Cell in feedforward and BESS in feedback~~
HOLD 14	~~It is assumed that (in EMERGENCY MODE), to prevent the (potential) power overload of the BESS, the sum of the fuel cell set-point and the solar farm set-point shall be less than the BESS charge power in any moment in time, which is assumed to be always more than 0.6 MW.~~
HOLD 15	~~The synchronization procedure shall be required by the EMCS to the BESS, using a dedicated command signal exposed in the data interface of the BESS. The BESS shall start and execute the procedure only if the command is True, stop otherwise.~~
HOLD 16	~~The BESS expose a signal that is True when it is running the synchronization procedure, false otherwise~~
HOLD 17	~~The BESS perform the parallel closing request to the INCOMMER CB automatically after the synchronization, without waiting any input from the EMCS.~~
HOLD 18	~~Time-sync among EMCS and electrical equipment (protections and relays) will be done by PTP protocol.~~
HOLD 19	~~EMCS shall constrain the range among negative set points only (charge), so to prevent power flow inversion (with the aim to avoid consequent possible stress on the BESS).~~
HOLD 20	~~Definition of the condition for Supply Guarantee OFF (by Crosswind).~~
HOLD 21	~~Definition of BESS healthy no more required.~~
HOLD 22	~~To enter in EXPORT MODE, it is allowed to stop the Electrolyzer, i.e.; Able-to-Export shall consider also the possibility to use the ImperativeStop transition of the Electrolyzer. EMCS will allow to disable this possibility parametrically (Default: ImperativeStop allowed)~~
HOLD 23	~~Tanks are full~~
HOLD 24	~~Minimum ON-time inertia~~
HOLD 25	~~Minimum OFF-time inertia~~
HOLD 26	~~Waiting from Crosswind~~
HOLD 27	~~waiting from Crosswind~~
HOLD 28	~~As per the document provided, "HKN1-02-REG-341 Manual for Controlling the Solar Farm via the Client Connector REV A," , mentioned in response to TQ 55, it also consists of a signal list. However, clarification/confirmation about the "availability to control" of the park controller from Crosswind is still required.~~
HOLD 29	~~The electrolyzer PLC requires a custom time synchronization interface, based on dedicated signals (specifically: year, month, day, hour, minute, second) to be updated by the EMCS; it is assumed that the precision required is equal to the resolution.~~
HOLD 30	~~The provided response Fuel Cell Signal Analysis, sent document " TQ-0008 – Signal Analysis Response" lack in item. 2.4, 2.6 and 2.8, awaiting for the updated "Crosswind Modbus Table - Main PLC - External Cut"~~
HOLD 31	~~In consequence conversation with vendor Electrolyzer~~
HOLD 32	~~It is assumed that preventing the hydrogen level to overpass a pre-defined threshold is a sufficient condition to prevent protective/emergency reaction of the PCS and any other~~

	~~safety system~~
HOLD 33	~~Power Surplus formula is WTG.Power - 1 MW~~
HOLD 34	~~CW must provide the signal/s allowing to detect the Supply Guarantee status~~
HOLD 35	~~Total power consumption (W)" EMCS assume that the total Active Power absorbed by the Electrolyzer from the grid is not yet implemented (as per the response from the vendor).~~
HOLD 36	~~"Current Power Setpoint" EMCS assumes that the current power set point followed by Electrolyzer, or " Power setpoint(W)" used this information, there is no equivalent to power setpoint which is not yet implemented by vendor.~~
HOLD 37	~~To have the electrolyzer working it is enough to send the start command without the need to sent a setpoint~~
HOLD 38	~~Vendor shall specify, EL_MAX_SET_POINT in the IO list.~~
HOLD 39	~~Vendor shall specify, MIN_RUNNING_TIME (Minimum time to wait before the electrolyzer can be stopped) in the IO list.~~
HOLD 40	~~Exposed by FC interface~~
HOLD 41	~~This control logic does not prevent the ideal scenario where the BESS gets depleted while there is still some reserve of hydrogen. To guarantee to prevent it, an intentional charging of the BESS from the fuel cell should be foreseen when such incipient condition arises.~~
HOLD 42	~~The HV-SCADA will provide a signal to understand if the HNA5 is in fault.~~
HOLD 43	~~Ask Freqcon if the BESS is able to autoregulate and to follow the Loads energy consumption,~~
HOLD 44	~~In Grid-Forming mode, if the BESS is not fully charged, it is always able to absorb up to 1 MW (charging) only during the time needed for packages to curtail at set point send by EMCS, with the respect of the BESS MAXIMUM OPERATING RESERVE.~~

1. Scope of Document

This document describes the functional requirement specification of the Energy Management and Control System (EMCS) of the CROSSWIND BLPH project. This document is intended to produce a synthesis and unique interpretation of the requirements deriving from all the precedent project documents. The present functional requirement specifications are intended to be the input for the engineering design of the EMCS.

2. Context – Crosswind BLPH

The Base Load Power Hub (BLPH) is an innovation project which includes the piloting of an offshore water electrolysis-fuel cell round trip system and a lithium-ion battery installed on an offshore monopile. The BLPH is designed to integrate with one of the wind turbine generators in the Hollandse Kust Noord (HKN) wind farm thereby delivering a baseload of at least 20% of the average electricity production of a Wind Turbine Generator (WTG) (i.e., 1 MW) 99% of the time independent of wind conditions, demonstrating time-shifting flexibility on hours-to-days resulting in reduction of the intermittent power output.

BLPH will provide 'Innovation and Time Shifting Flexibility' where the power output of a single wind turbine will be shown to remain above 20% of average (1MW) regardless of the prevailing weather conditions for 98.5% of turbine up-time.

2.1 Project Overview

CrossWind, a Shell and Eneco joint venture, was recently awarded the tender to develop the offshore HKN wind farm, located 18.5km off the coast of The Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW, generating at least 3.3TWh per year. This is enough renewable power to supply more than 1 million Dutch households with green electricity. Offshore wind projects produce intermittent electricity. Balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. That is why the offshore wind farm will include several new technology demonstrations that could be implemented at full-scale in the future. Among others, the new technologies being explored include a floating solar farm, a short-term battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a Fuel Cell (FC). The combination of these individual measures, herein referred to as the BLPH, will ensure a continuous power supply regardless of the wind situation. All components included in the BLPH will be installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar farm) and release it during periods of low generation. In practice, it is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability. Electricity in the BLPH will be stored in the form of electrons in a Battery Energy Storage System (BESS) as well as converted into green hydrogen via water electrolysis. In addition of the charge held by the BESS, pressurized H2 gas will be converted back into electricity using a FC cell to extend the discharge duration. Note that transporting H2 out of the BLPH is not an option, energy must leave the BLPH in the form of electricity through an inter-array cable leading to a substation provided by the Transmission System Operator (TSO) TenneT.

2.2 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

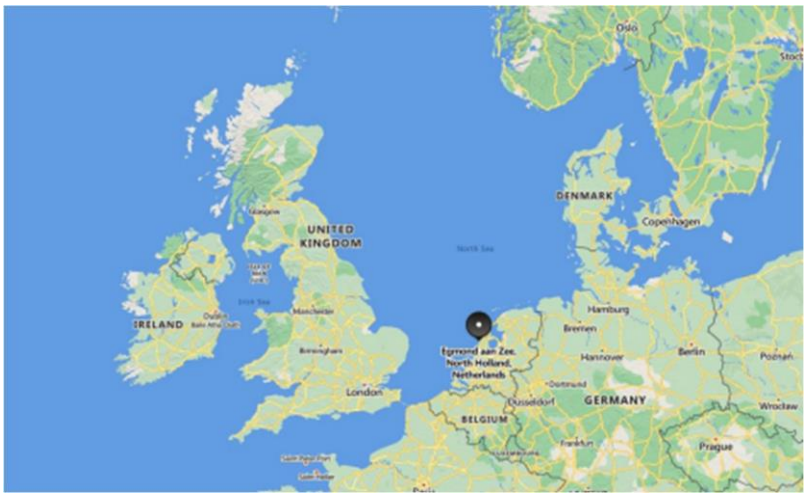

Figure 1 HOLLANDSE KUST NOORD WIND PART Location Map

Figure 2 Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile located on coordinates E 590719.1, N 5841602.3 is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

2.3 Electrical Distribution

All components included in the BLPH will be integrated onshore on a topsides and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating Solar farm) and release it during periods of low generation.

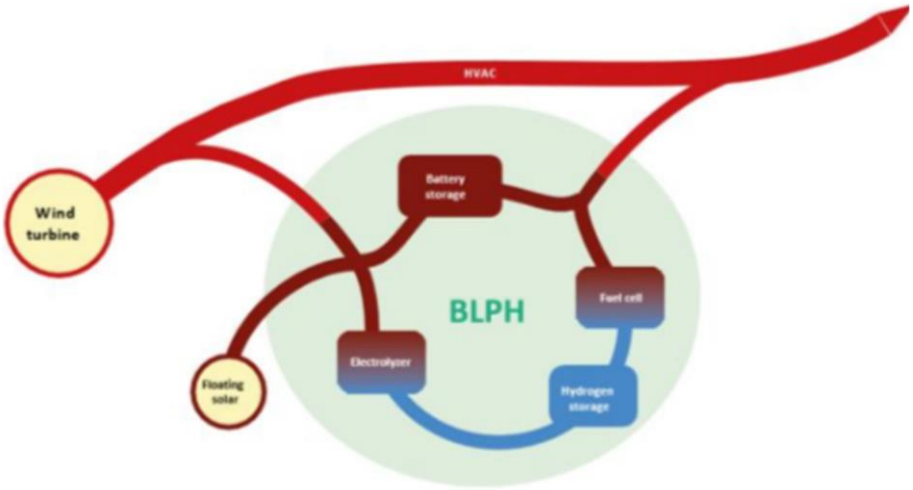

Figure 3 BLPH Concept

In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

2.4 Production Units and Loads

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MW, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration. The purpose of the BLPHs to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

2.5 Operational Constraints

The Central Control System (CCS) is responsible for the normal operations of BLPH, with an independent system to the elements of the Safety System. The components that CCS is required to control all process (power generation) systems, utilities systems, and electrical equipment on the platform following Document 123A90-DDL-IN-DD-40019 Data Network Architecture. As agreed with operations, a single operator shall be required for both electrical and process systems on BLPH. CCS reacts to changes from the HNA5 Wind Turbine, power output only. Only output/status of HNA5 Wind Turbine affects operating modes. The CCS shall act independently of the safety system and shall not interfere with any of its functions. The objective of the BLPH is to demonstrate time shifting flexibility and capability of providing 1MW Power output using the full capacity of the inventory stored on the platform. BLPH does not plan its output on weather forecast – BLPH output is planned depending on the actual power output of the HNA5 Wind Turbine. The facility can be operated remotely from on-shore Control room, and has the ability to shut down, start-up, to adjust and/or tune, to connect and disconnect to the grid and to monitor BLPH. The measured response of BLPH will be tied to the power generation profile of an individual wind turbine HNA5.

The technologies being demonstrated at BLPH are:

1. Floating Solar farm.
2. Short-term Battery Energy Storage.
3. Long-term Hydrogen Energy Storage (Electrolyzer to create green hydrogen).
4. Fuel-Cell.

Energy harvested from both wind and sun will be stored either directly in a Battery Energy Storage System (BESS) or indirectly using water electrolysis to create hydrogen. Stored hydrogen will be consumed onboard by a fuel-cell to produce electrical power. Monitoring and control of BLPH will be remote (shore based control room) and the solar farm, battery and fuel-cell shall act cooperatively so that power from all sources will be combined to export power regardless of the prevailing weather.

NOTE: Energy stored as hydrogen will leave only in the form of electricity through the Inter-Array Cable (IAC) connecting BLPH indirectly to a grid sub- station provided by Transmission System Operator (TSO) TenneT.

The fuel-cell is slow-acting whilst the BESS is fast acting. Therefore, the BESS (whenever available) will be used as ‘lead supply’ / ‘load follower’ and operate in its most efficient / effective manner with the fuel cell operating in parallel or series to optimize both the efficiency and availability of the entire system. The CCS will be programmed to act upon multiple inputs / factors e.g. BESS Available Energy, HNA5 (EMCS will receive the data from HNA5 and based on these values will react), stored hydrogen availability, CCS operation mode, equipment operating status, equipment operating mode, circuit breaker status, etc. Whenever possible the fuel-cell will consume the platform’s stored hydrogen prior to discharging the BESS.

3. Reference Documents

This is a selection of the key documents of the project relevant for the EMCS. It is not an exhaustive list of the available documentation and not even of the relevant documentation for the EMCS. This set of documents should be enough to identify and have a first level refinement of all the requirements, operational constraints and interoperation aspects of the EMCS.

4. Functionalities of the EMCS

The EMCS has the following primary functionalities:

1. Enable Supervision and Control by CCS and Higher-Level SCADA
2. Power Control & Energy Management
3. Load Shedding
4. Manage the Electrical Distribution Equipment
5. Wind Farm Grid Connection Procedure

Each functionality is defined in the following sections.

4.1 Enable Supervision and Control by CCS SCADA HMI

We refer to the “CCS SCADA” as the CI Servers, which are supposed to implement the CCS HMI. The user interaction with the EMCS within the CCS will be made through such HMI.

NOTE: The communication interface between the Electrical Monitoring & Control System (EMCS) and the Process Control System (PCS) will be separated from the one between the EMCS and the CCS SCADA (CI Server).

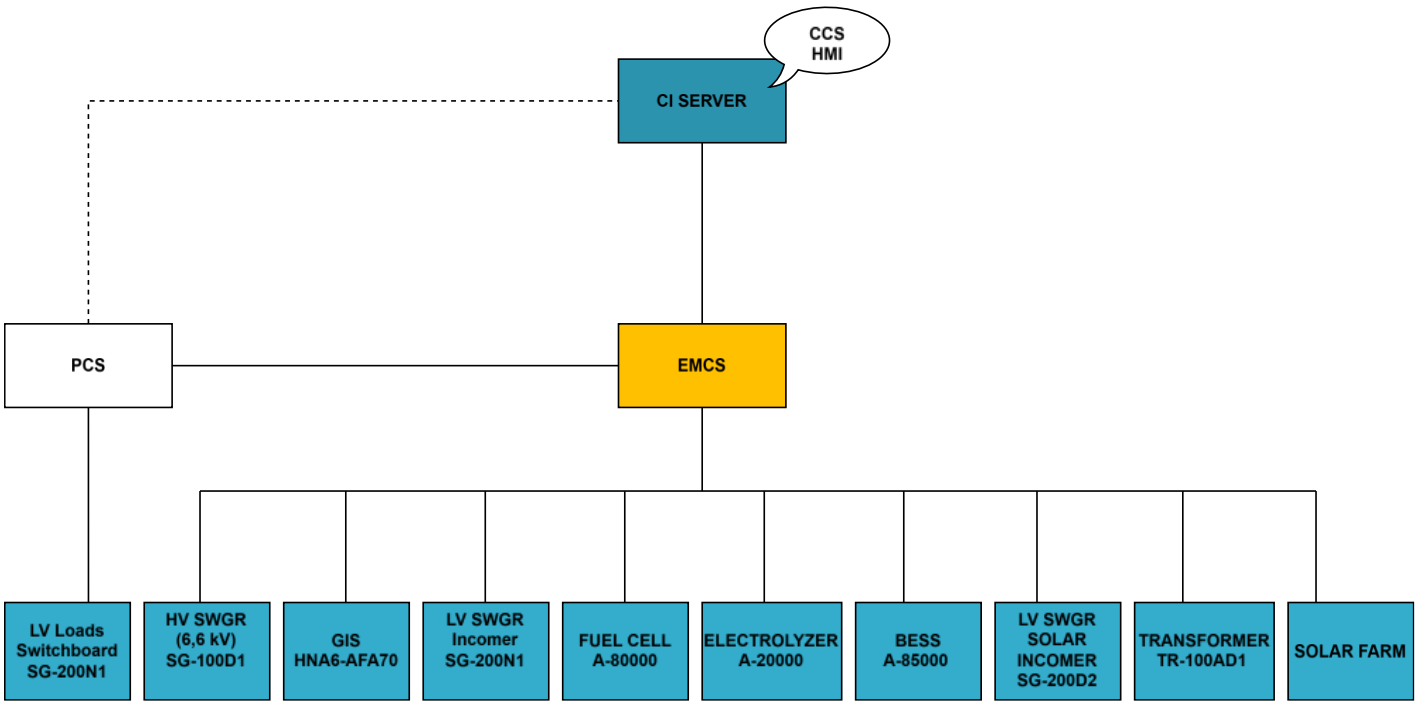

Figure 4 System Architecture Data Flow

4.1.1 Supervision

The EMCS shall gather the real-time power and status signals exposed by the peripheric elements (packages, OLTC, WF HV-SCADA…) and it shall provide these signals to the CCS SCADA, so to feed its supervision and, through the CCS SCADA, enable any higher-level supervision. Among the others, the signals exposed to the CCS SCADA shall include all the permissive signals which enable or prevent the execution of commands, so to allow the SCADA HMI to report to the operator the correct availability of the commands.

The EMCS shall provide to the CCS SCADA all the samples received from the peripheric elements, within the technical limits of the data interface selected.

The EMCS shall expose the original timestamp samples, if available in the communication protocol of the package, in its interface to the CCS SCADA.

For each signal, the EMCS shall expose the data to the CCS SCADA preserving the sequence of events of every sample reported.

In its interface to the CCS SCADA, for these signals the EMCS receives over a protocol without external timestamping, this including hardwired signals, the EMCS shall expose the reception time as the original timestamp of the data.

The EMCS shall expose to the CCS SCADA the real-time value of status and variables defining the state machine of the control policy of the EMCS. The EMCS shall expose to the CCS SCADA its real-time diagnostic signals, so to allow the CCS SCADA to detect the presence of anomalies in the EMCS.

4.1.2 Command

The EMCS shall receive real-time commands, concerning EMCS control functions, from the CCS SCADA.

The EMCS interface for real-time commands with the CCS SCADA, shall be “fire and forget”; i.e.: the reception of a single command message shall be sufficient to produce the execution of the command, without requiring, putting on hold or expecting further interaction with the CCS SCADA.

The EMCS shall not implement intentional delays of the commands received from the CCS SCADA, unless specifically required.

4.1.3 EMCS Flow Chart

In Figure 5 EMCS Flow Chart shows the transition between each mode with respect to the pre-condition.

The 1-minute transition time condition can be considered that the modes transition can take 1-minute. On the other hand, it can be configured in the software algorithm to keep the previous mode until the 1-minute transition time is completed.

These are extreme conditions, but the system knows where to be according to the Status Machine. Additionally, added the "set first execution," which is independent of the time variable. So, if the system is in EMCS automatic mode, grid-tied, and supply guarantee on, the first start/execution will be **1-minute time independent** and moves immediately to the designated mode as per the preconditions. Once the EMCS is in one mode (Export, Cold Stand-by, Hot Stand-by, Import 1A, or Import 1B), it will follow the 1-minute transition time to move from the current mode to another.

If the PCS removes the HotStandby permission, during the HotStandby MODE, the EMCS move to ColdStandby according to BLPH mode Transition.

If the PCS removes the Export permission, during the Export MODE, the EMCS move to ColdStandby according to BLPH mode Transition

If the EMCS is waiting for permission (according to BLPH mode transition) from PCS to enter in Export MODE and PCS don't give the permission within a timeout (PCS.PermissiveModeTimeout), the EMCS move to ColdStandby.

Furthermore, another possible scenario is If the system resets and switches to off-grid mode or EMCS manual mode, the timer will restart. After the reset, the system will focus on meeting the required conditions without considering the timer at first. Once the conditions are met, it will switch between modes every minute (1-minute) based on the timer.

MANUFACTURERS RECORD BOOK (FINAL DOSSIER)

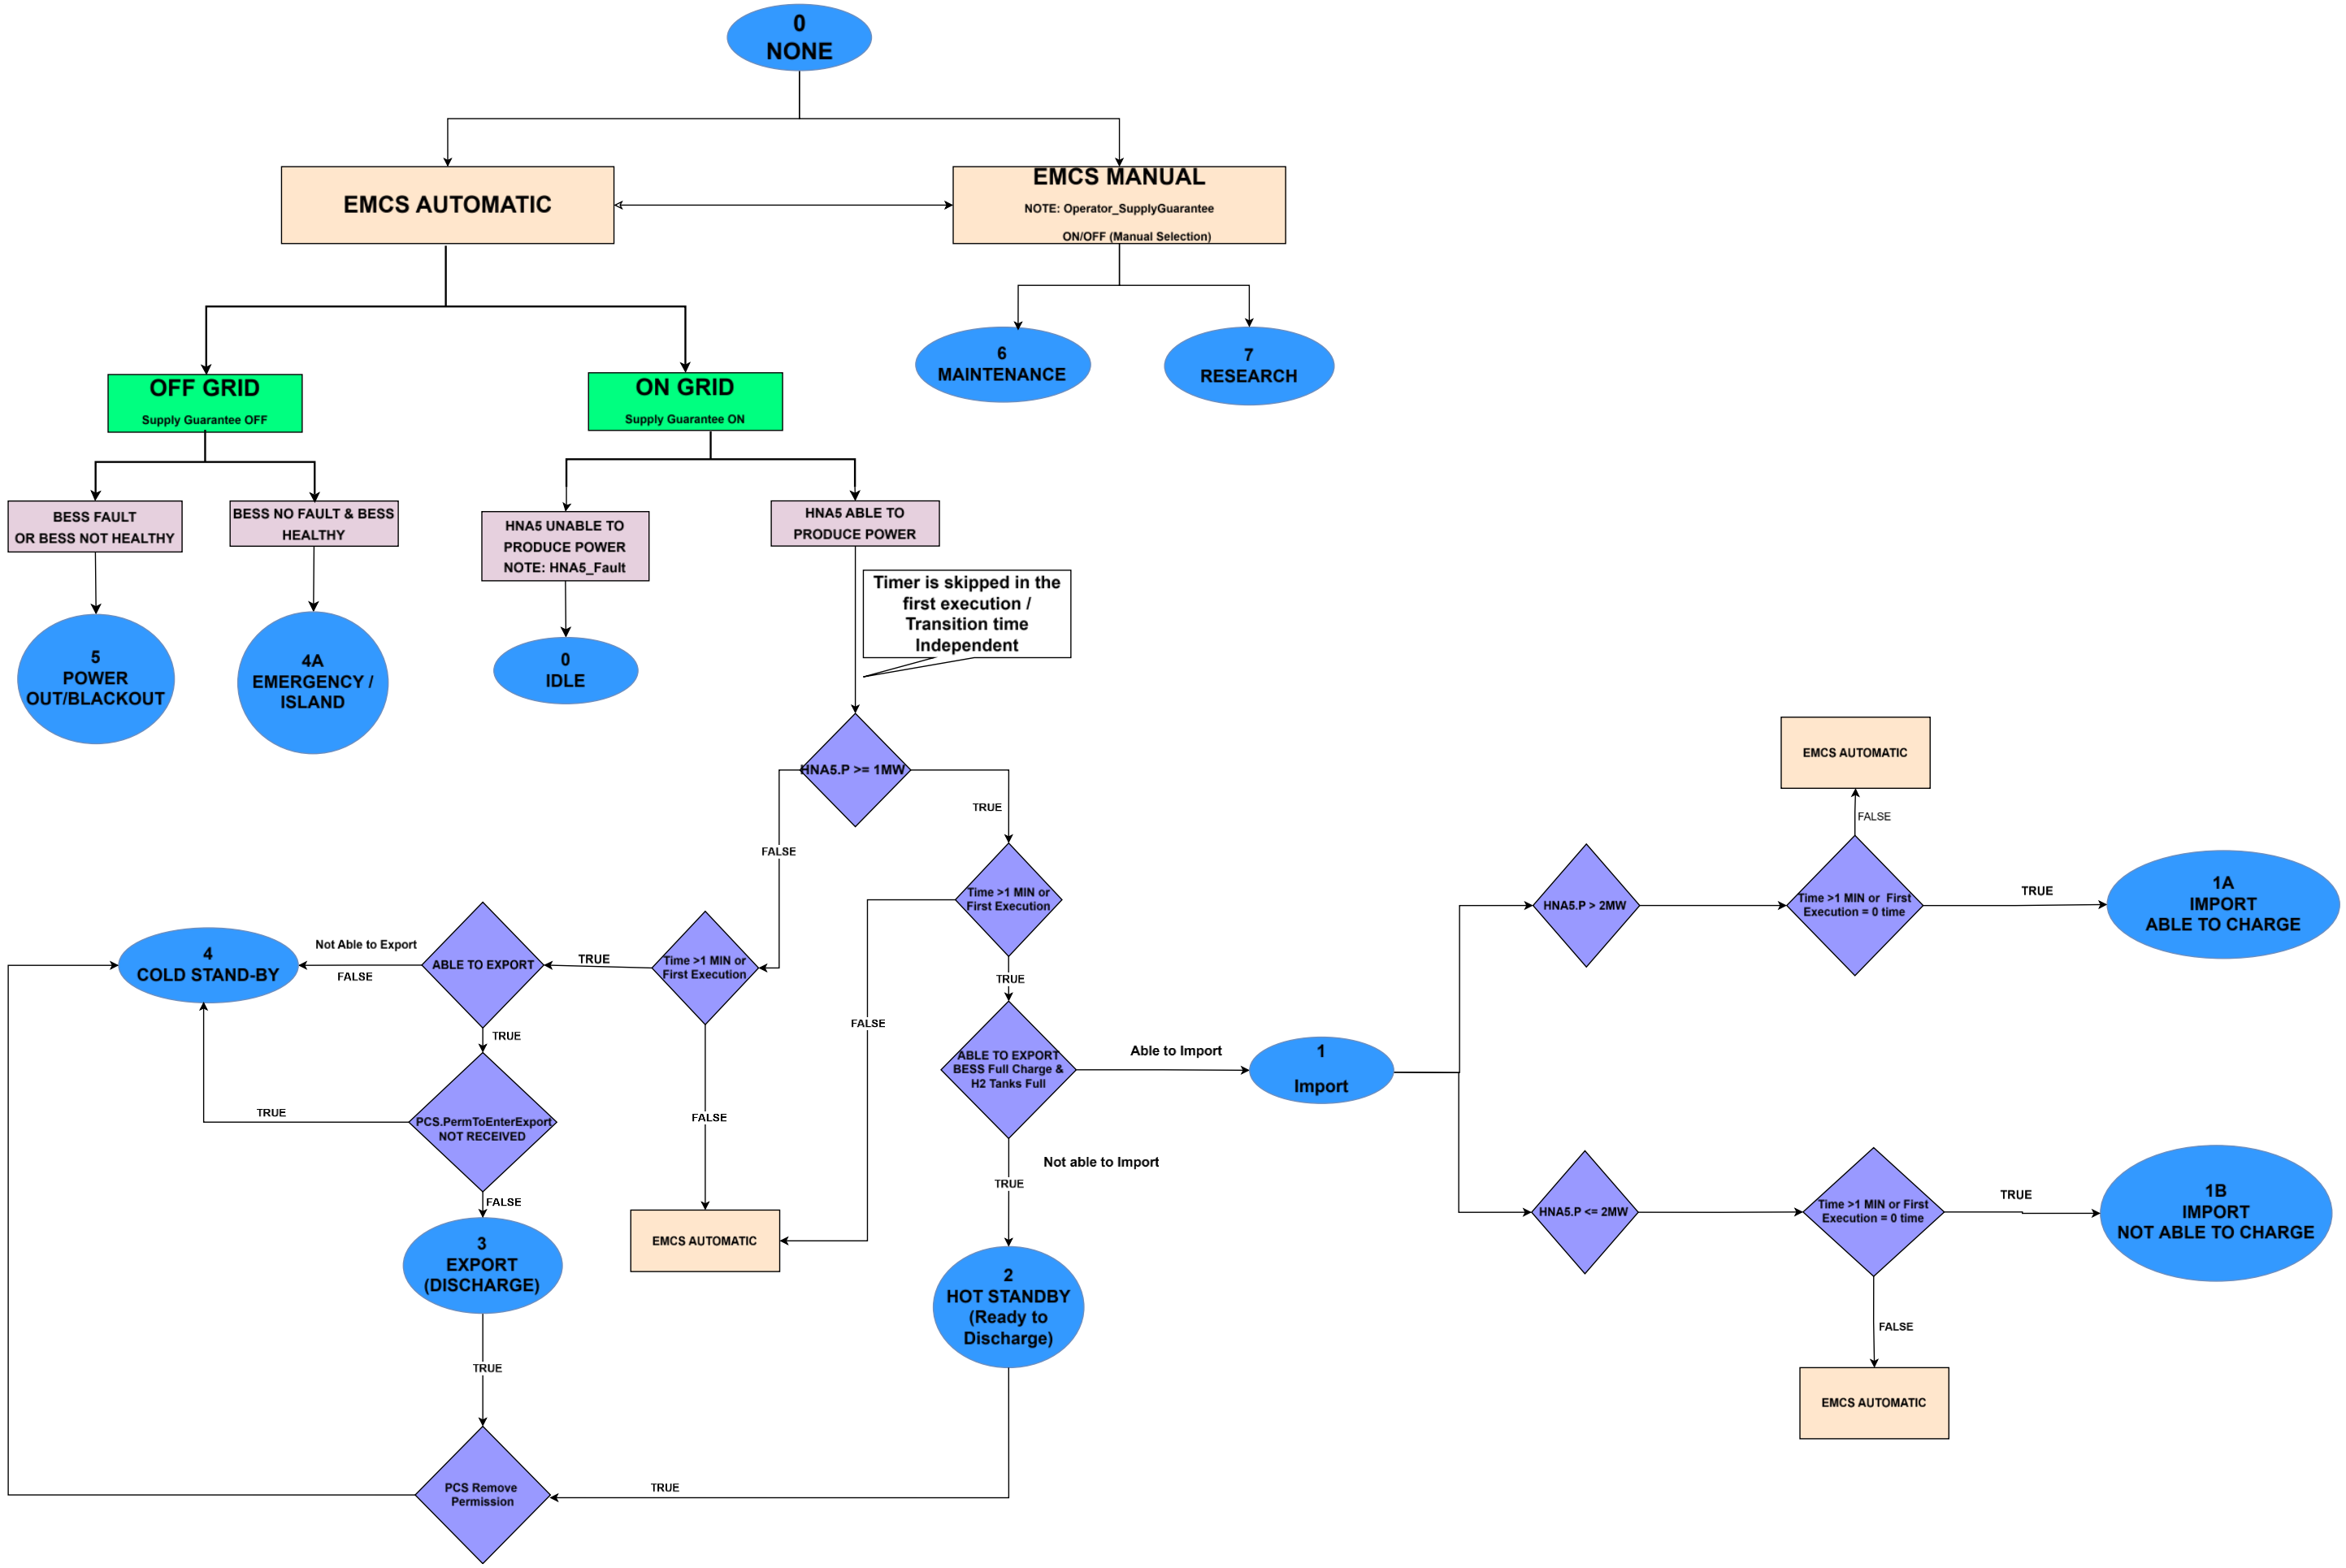

Figure 5 EMCS Flow Chart

4.1.1 EMCS Status Machine

Figure 6 EMCS Status Machine

4.2 Power Control & Energy Management

4.2.1 Energy Management

4.2.1.1 Introduction

When HNA5 is connected / operating and providing at least 1MW to the wind farm 'surplus' power will potentially be available for import to BLPH. This renewable energy will be used to run the plant whilst simultaneously charging the BESS and/or running the electrolyzer to create & store hydrogen.Conversely, when HNA5 provides less than 1MW BLPH will export solar power (if available) and/or the energy stored in the BESS or produced by Fuel Cell to ensure the wind farm continues to receive at least 1MW. NOTE: Power provided by the solar farm shall always (as per preference e.g. Solar production can be curtailed when in Emergency Mode) be used to the fullest extent possible.

The energy management design philosophy described in the project documents is founded on a BLPH logic variable, dubbed MODE, identified by the real time conditions of the BLPH and of the HNA5. The MODE is intended to univocally define the steady-state (i.e. tendential) operational mode of each subsystem of the BLPH, and in particular its power units (Solar Farm, BESS, Fuel Cell, Electrolyzer). In such a design philosophy, the MODE is function of: the ability to operate ("healthiness") of the machines (HNA5, BESS, Fuel Cell, Electrolyzer), the production of the HNA5, the status of electrical interconnection of the BLPH to the grid. The control policy was supposed to do not affect any of these conditions with its activity, with the exception of the state of the energy reserves (BESS and hydrogen), which indirectly affects the ability to operate of BESS and Fuel Cell. Such design philosophy, and particularly the provided descriptions of the MODES, introduces some constraints and deviations from the goal defined in the Functional Statement. Due to this, the latter is not supposed to be the direct basis of the functional requirement of the control.

In the following, we preserved such base structure of the design philosophy, updating it considering the additional available information, merging different statements, and finally translating it into functional requirements. In merging conflicting inputs, we have been driven primarily by the mentioned Functional Statement and secondarily by an interpretation of the aim of the constraints introduced in the definition of the MODES.

There are some main elements introduced in the present definition of the BLPH state-machine that shall be noted:

- **State-machine transitions are driven by trigger conditions**: Instead of having predefined status conditions for each mode, the state machine transitions are defined by specific trigger conditions that occur within each mode.
- **Decoupling of BLPH and subsystem state-machines**: The effect of a MODE on subsystem transitions (mainly for the packages) is clearly defined, rather than relying on a strict, one-to-one mapping between the statuses of the mode and the statuses of the subsystems' state-machines.

4.2.1.2 Assumptions & Definitions

The BLPH is always in a single MODE at a time.

The BLPH MODE state-machine is fully determined by the real-time conditions reported to the EMCS, except for stabilization control features as hysteresis and inertia implemented in the EMCS.

The BLPH MODE state-machine has the following pseudo steady-state statuses, dubbed MODES:

- MODE 0 = IDLE (Power Import Only)
- MODE 1A = IMPORT MODE (Able to Charge)
- MODE 1B = IMPORT MODE (Not Able to Charge)
- MODE 2 = HOT STANDBY (Ready to Discharge)
- MODE 3 = EXPORT MODE (Discharge)
- MODE 4 = COLD STANDBY (Power Import: Not able to Export)
- MODE 4A = EMERGENCY MODE (Island)
- MODE 5 = POWER OUT (Black-Out)
- MODE 6 = MAINTENANCE
- MODE 7 = RESEARCH
- MODE 8 = NONE MODE

The additional NONE MODE is intended for specific conditions, such as during EMCS initialization except after the BLACK START scenario because after black start scenario the initialization will start from RESEARCH MODE.

The EMCS should try to use the solar farm to the maximum extent possible.

The charging of the BESS while the Fuel Cell is producing shall be considered energy inefficient in steady-state condition.

There is no requirement to prevent in hard-lock (as with an interlock) the charging of the BESS while the Fuel Cell is producing; it is allowed to happen in transients (and it must be allowed in off-grid scenario, for system balance).

The EMCS shall be designed such that rapid cycling / quick switching of the BESS, Fuel Cell and Electrolyzer is prevented.

The fuel cell internal production balancing logic implemented by the fuel cell controller foresees committing fuel cell modules in sequence, according to the power set-point. Due to this, the raise of the set-point over specific levels produces the start of the warmup of part of the still unused modules; conversely, the decrease of the fuel cell power set-point may produce the stop of some modules in production.

The HNA5 Active Power value will be delivered to the EMCS through the interface link with the Wind Farm (HV-SCADA)

The Active Power of BLPH is calculated as the sum of BESS, Fuel Cell & HNA5 Power in EXPORT MODE.

The Supply Guarantee is defined on the based of three key signals:

- **Operator_SupplyGuarantee**: A selector configured by the operator via the SCADA HMI, which can take one of three values: AUTOMATIC, ACTIVE, or INACTIVE.
- **HNA5_SupplyGuarantee**: A signal provided by the HV SCADA, indicating whether the BLPH platform is connected to grid (TRUE) or not (FALSE).
- **HV_SCADA_Connected**: A signal confirming whether the EMCS is connected to the HV SCADA communication server.

The Supply Guarantee formula is:

SupplyGurantee (OperatorSupplyGuarantee = AUTOMATIC AND HNA5_SupplyGurantee AND HV_SCADA_Connected) OR

Operator_SupplyGuarantee = ACTIVE

“Power Surplus” definition: It refers to the HNA5 Wind Turbine producing Active Power > 1MW.

The EMCS will drive the electrolyzer as a load (ON/OFF), no partialization will be implemented.

The energy management policy implemented by the EMCS shall foresee to stop the electrolyzer only if the hydrogen storages are full.

For the Energy Management goals, in case HNA5-AFA70 power will go under zero, it shall be considered as zero production.

The EMCS has no control over the HNA5 or the wind farm, this including the related electrical equipment.

The BLPH activity has no direct or indirect effect on the ability to operate or the production of the HNA5 or the wind farm, this includes the status of the related electrical equipment. This includes the absence of any control logic of the HNA5 or wind farm that takes in input any status or level from the BLPH, so to avoid the creation of any feedback loop. The EMCS is not in charge of implementing any electrical protection function. Among the others, this holds true with specific reference to overcurrent, underfrequency, undervoltage, synchronization check functions and safety interlocks.

EMCS will open the CB of a package on SG-100D1 if the package does not apply control requests.

For example, if the EMCS will send the stop command to the Fuel Cell, and it does not stop within a timeout (parametric), the EMCS will open the related CB on the SG-100D1.

POWER GUARANTEE is defined on the basis of the signals:

- SUPPLY GUARANTEE;
- HNA5_FAULT not active

In this way BLPH will be able to compensate the production of HNA5 and ensure, to the grid, at least 1 MW of active energy exported; regardless of the availability of wind/solar energy.

The “BESS charge level” and the related BESS-MINIMUM-OPERATING-RESERVE (and the others parameters about “BESS charge levels”) are based on absolute values of energy, expressed in MWh: As per confirmation from the BESS vendor, the BESS exposes over the data interface the absolute value of energy available to discharge, and this value is representative of the BESS ability to produce power and hence to sustain the isolated grid.

4.2.1.3 Description of Requirements Priority & Evaluation Rule

Conditions						MODE	Specific exit contition
EMCS in automatic identification of the MODE	Grid-tied AND Supply Gurantee ACTIVE	HNA5 NO Fault	HNA5.P < 1 MW for a min time (1 minute)	Able to export		**EXPORT** (Discharge)	PCS.Remove Export Permission
				Not able to export		**COLD STANDBY** (Not Able to Discharge)	
			HNA5.P >= 1 MW for a min time (1 minute)	Not able to import	Able to export (BESS full charge & H2 Tanks full)	**HOT STANDBY** (Ready to Discharge)	When PCS.Remove Hot Standby Permission
				Able to import	HNA5.P > 2 MW for a min time (1 minute)	**IMPORT 1A** (Able to Charge)	
					HNA5.P <= 2 MW for a min time (1 minute)	**IMPORT 1B** (Not Able to Charge)	
		HNA5 Fault				**IDLE** (Power Import Only)	
	Off-grid (i.e. not grid-tied) OR Supply Guarantee INACTIVE	BESS → NO FAULT				**EMERGENCY** (ISLAND)	
		BESS → FAULT (ie. BESS problems, BESS SoC in low range, etc.)				**POWER OUT** (Black Out)	
Command to enter in RESEARCH MODE						**RESEARCH**	Command to return in automatic identificatio the mode
Command to enter in MAINTENANCE MODE						**MAINTENANCE**	Command to return in automatic identificatio the mode
Default / fallback						**NONE**	

Figure 7 BLPH Mode Transition Table

Figure 7 BLPH Mode Transition Table demonstrates the conditions under which the EMCS transitions between different modes take place. It categorizes these conditions based on the system being grid-tied or off-grid (i.e.: not grid-tied), with further distinctions depending on whether the HNA5 Fault or HNA5 No Fault, and specific power thresholds (HNA5.P < 1 MW and HNA5.P >= 1 MW) that determine the system's ability to export or import power. For instance, when grid-tied with the Supply Guarantee on and HNA5.P < 1 MW for a minimum time (1-minute), the system enters either in EXPORT or COLD STANDBY mode based on its export capability. Conversely, with HNA5.P >= 1 MW for a minimum time (1 minute), the system can enter HOT STANDBY (Ready to Discharge) if it can't import (able to export, when BESS is fully charged & H2 storage are full). On the other hand in the similar condition if the system is being grid-tied, Supply Guarantee ON and HNA5.P >= 1 MW but able to Import in two conditions, first condition is if HNA5.P > 2 MW for (1-minute) the system will enter in IMPORT MODE 1A (Able to Charge), second condition is if HNA5.P <= 2 MW for (1-minute) the system will enter in IMPORT MODE 1B (Not able to Charge). If the HNA5 is in Fault, the system remains in IDLE mode. Off-grid scenarios are distinguished by the status of BESS (NO FAULT) & MV 6.6kV bars, with energized bars triggering EMERGENCY mode and non-energized bars triggering POWER OUT mode BESS (FAULT). Special modes like RESEARCH and MAINTENANCE can be manually entered (protected by password), with specific commands to revert to automatic mode identification.

To ensure optimal operation and accurate mode transitions, the system prioritizes safety, placing the highest importance on modes like EMERGENCY and POWER OUT. Operational efficiency follows, prioritizing modes such as EXPORT and IMPORT. Reliability ensures the system transitions seamlessly into HOT STANDBY and COLD STANDBY when needed, while flexibility allows entry into RESEARCH and MAINTENANCE modes without disrupting performance. The system continuously monitors conditions, verifying them against mode criteria and applying transition logic to shift to the appropriate mode. It resolves conflicts using predefined priority rules and checks exit conditions for special modes, reverting to automatic identification when necessary.

If the EMCS is in Export mode and the PCS permission to stay in Export mode is removed, the BLPH will transition to Cold standby.

If the EMCS is in Hot standby mode and the PCS permission to stay in Hot standby mode is removed, or if the BESS is at fault, the BLPH will transition to Cold standby.

If the EMCS is waiting the permission (according to BLPH mode transition) from PCS to enter in Export MODE and PCS don't give the permission within a timeout (PCS.PermissiveModeTimeout), the EMCS move to ColdStandby.

NOTE: The EMCS shall always choose an operating mode. If the conditions to enter or remain in an operating mode fail or are not met, the EMCS will move the BLPH into another operational mode. While waiting for signals from other systems, the BLPH will remain in the previous mode and the HMI will blink.

In healthy status the BESS is able to operate. For the definition of HEALTHY status see paragraph 4.2.1.6.3.

Definition of HNA5_Fault: The HNA5 Fault is determined based on the Wind Turbine Status codes, which reflect the turbine's current state. The status codes are as follows:

Code	Turbine State
0	Operating - On Grid
1	Operating - Waiting for converter cut-in
2	Operating - Waiting for release
3	Operating - Waiting for wind/acceleration
4	Stopped - Pitch exercising/lubrication
5	Stopped - Untwisting cables
6	Stopped - Wind speed too high
7	Stopped - Grid error
8	Stopped - Error with auto-reset (only applicable for WTC3)
9	Stopped - Manual alarm reset required
10	Safety Stop (only applicable for WTC3)
11	Remote Stop

Fault Condition

The wind turbine is considered in a fault state if the status code matches any of the following values:

HNA5_Fault:

- Status = 7
- Status = 8
- Status = 9
- Status = 10
- Status = 11

OR if the HNA5_QA1 CB is OPEN

4.2.1.4 Layered Structure Among State-machine

The state-machine composing the system: Design includes one State Machine for the BLPH and one State Machine for each package, which is as follows:

- BLPH
- Electrolyzer
- BESS
- Fuel Cell
- Solar Farm

In Figure 8 BLPH State Machine Transition, state-machine of each package interacts with the state-machine of BLPH MODE, as the status of one can enable or trigger the transitions in another. The logic works in layer, each layer can perform the actions allowed by the lower layer.

The power control policy is implemented through the BLPH MODE state-machine, which translates these policies into specific operational modes. Subsystem state-machines then execute actions allowed by the BLPH MODE, ensuring that interlocks and permissions managed by the PCS are respected.

4.2.1.5 BLPH State-Machine

The BLPH MODE state-machine governs the overall operational mode of the system. It interacts with the state-machines of various subsystems to coordinate transitions and ensure cohesive operation. This interaction ensures that changes in one subsystem can trigger necessary transitions in others, maintaining an integrated control approach.

The hierarchy of logics is as follows:

- BLPH Power Control Policy
- BLPH MODE state-machine
- Sub-system state-machine
- Interlocks / Permissions (e.g. PCS coordination)
- Physical capability & communication limits.

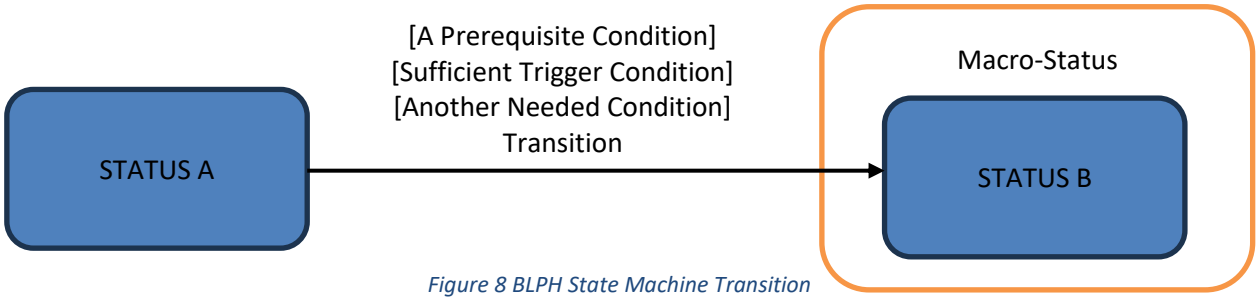

Figure 8 BLPH State Machine Transition

4.2.1.6 Electrolyzer State Machine

In Figure 9 Electrolyzer State Machine manages the electrolyzer's operation through states such as Running, Stoppable, Started, and stop. It transitions between these states based on conditions like running duration and PCS permission.(For Example: the system will transition to Stop state if PCS permission is revoked (i.e., H2 storages are full).

The BLPH State Machine will correspond with Electrolyzer State Machine, to do the following:

- EMCS requires permissive signal from PCS to start the Electrolyzer. (i.e. PCS.PermToStartEL).
- EMCS shall not partialize the Electrolyzer, requiring it either to not produce or to produce at full power (EL_MAX_SET_POINT).
- If the PCS.PermToStartEL is not fulfilled or if the signal shall be remove during the working, the Electrolyzer will be stopped by EMCS.
- If the PCS.PermToStartEL is not reached, EMCS will not give the start command to the Electrolyzer.

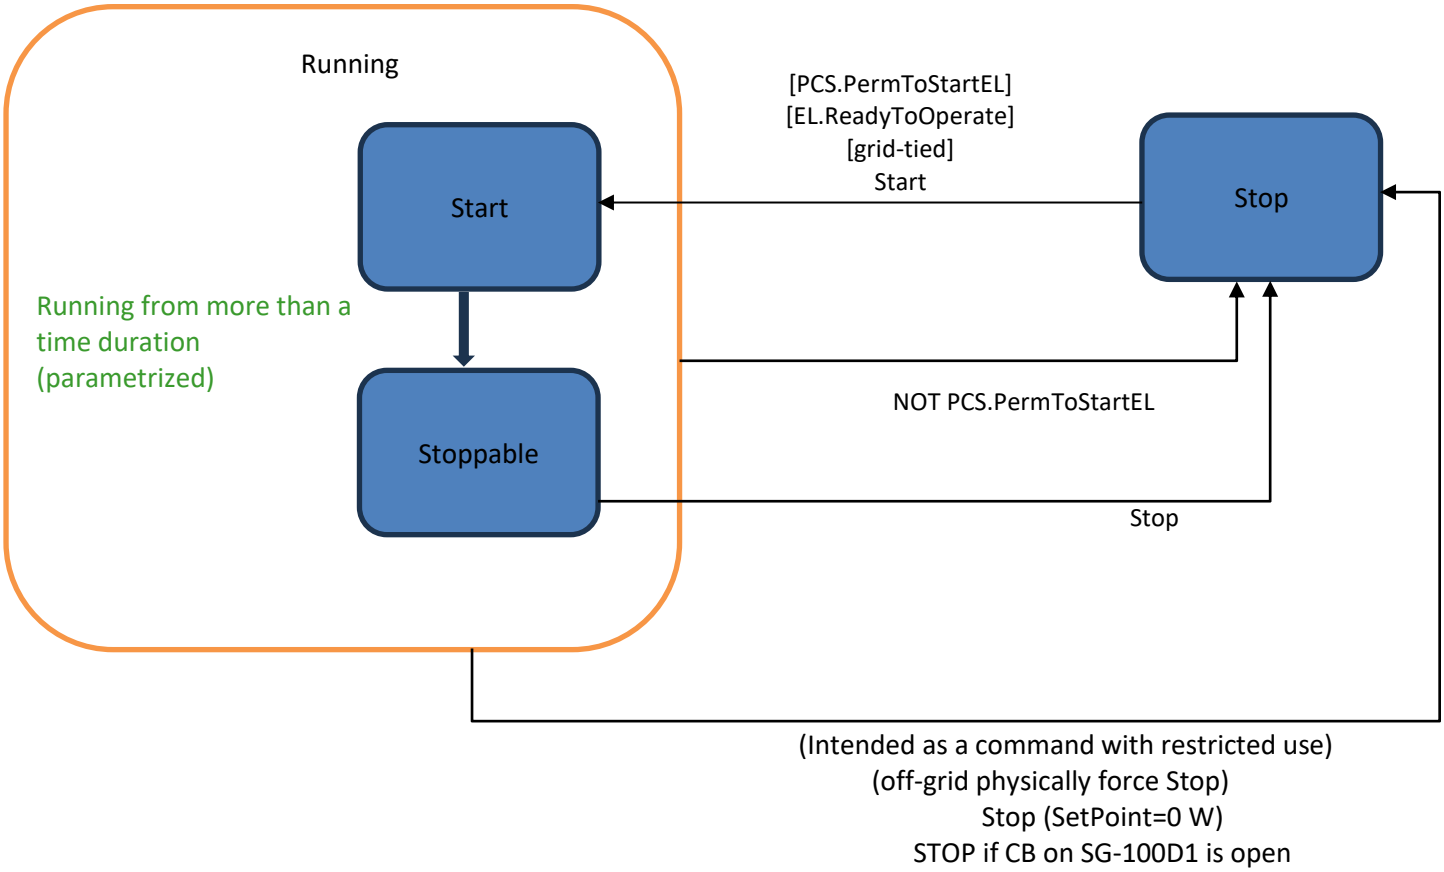

Figure 9 Electrolyzer State Machine

4.2.1.7 Fuel Cell State Machine

EMCS manages the Fuel Cell according to Figure 11 Fuel Cell Container State Machine and transitions between these states are based on conditions like running duration and PCS permission (for example: the system will transition to Stop state if PCS permission is revoked (i.e., H2 storages are empty)).

The BLPH State Machine will correspond with Figure 10 Fuel Cell State Machine , to do the following:

- EMCS requires permissive signal from PCS to start the Fuel Cell. (i.e., PCS.PermToStartFC).
- EMCS send the set point according to the Fuel Cell Setpoint.
- If the PCS.PermToStartFC is not fulfilled the Fuel Cell will be stopped by EMCS.
- If the PCS.PermToStartFC is not reached, EMCS will not give the Start command to the Fuel Cell.

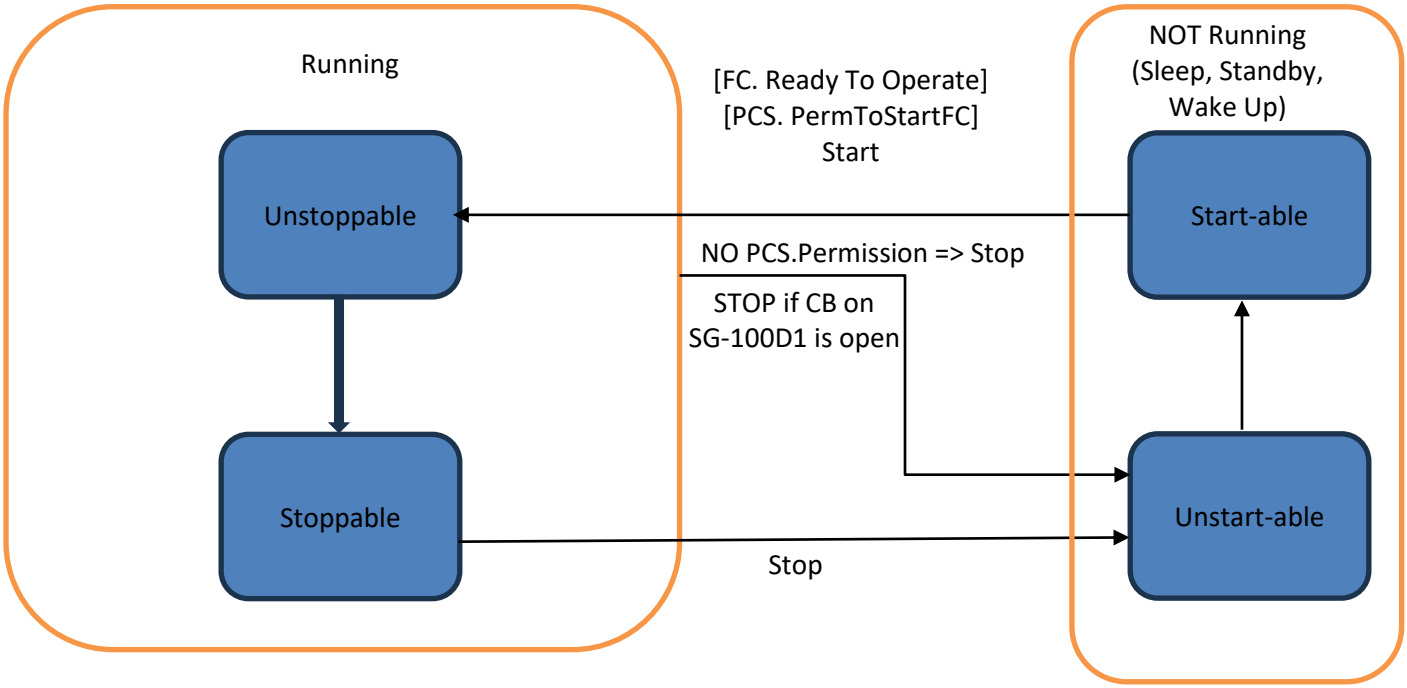

Figure 10 Fuel Cell State Machine

The commands to the Fuel Cell must be issued according to Figure 11 Fuel Cell Container State Machine, the process must follow the steps without skipping any, as detailed below:

1. FC is in SLEEP
   1. EMCS command WAKEUP
   2. FC moves to STANDBY
   3. After receiving the STANDBY feedback from FC → EMCS command START

2. FC moves to RUNNING
   4. FC is in RUNNING
   5. EMCS command STOP
   6. FC moves to STANDBY
   7. After receiving the STANDBY feedback from FC → EMCS command SLEEP (if necessary)

3. The EMCS set-point will be in kilowatts (kW) not in percentage (%), with a minimum set-point of 50 kW. It is possible to send a new set-point value every second, but repetitive toggling (e.g., set-point value → 0 → set-point value → 0 → …) is not allowed.

4. To keep the Fuel Cell in the RUNNING state, a minimum set-point of 50 kW must be provided. The Fuel Cell will then continue to produce 50 kW of energy, otherwise the STOP command is issued, and the Fuel Cell will transition to STANDBY after 5 minutes. In STANDBY state, it can remain indefinitely as needed.

5. After the STOP command from EMCS, the Fuel Cell transitions to the RAMPDOWN state, during this phase, the Fuel Cell continues to produce energy (even if the set-point is 0). In this state, energy production decreases by 100 kW every second. The starting point depends on the previous set-point set by the EMCS during RUNNING state.

6. If the Fuel Cell (CB) on the SG-100D1 panel (6.6kV) opens, there are no issues from the CPI's perspective. The Fuel Cell package will self-adapts.

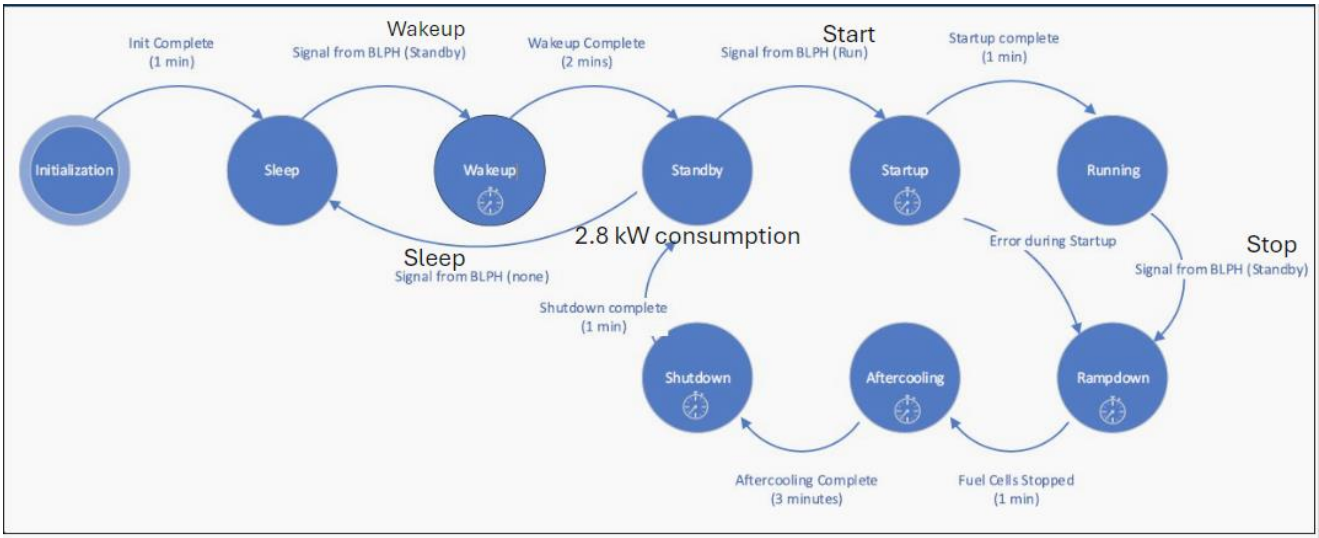

Figure 11 Fuel Cell Container State Machine

4.2.1.8 BESS State Machine

In Figure 12 BESS State Machine Figure 12 BESS State Machinemanages the charging and discharging processes of the Battery Energy Storage System. States include Charging, Discharging, and Idle, influenced by the Available Energy and PCS permissions via EMCS. The system will charge if the Available Energy is below the maximum threshold and PCS permission is granted via EMCS, and it will discharge if the Available Energy is above the minimum threshold and PCS permission is granted via EMCS. The system transitions to Idle if PCS permission is revoked via EMCS.

To start BESS, via EMCS, as per the IO list “23A2007_240628_PROFINET_Register BESS_V1_0_0_3 “ (Profile_converter_control 1.13) which: IF set to 1 = BESS start, IF set to 0 = BESS Stop.

Available Energy for charging, Profile_converter_status_3, charge_energy, defines the remaining capacity that can be charged into the BESS which (i.e., 200(Kwh), then 200(Kwh) can be stored in the BESS).

Available Energy for Discharging, Profile_converter_status_3, discharge_energy, defines the available energy for discharge from the BESS (i.e., 200(Kwh), then 200(Kwh) can be discharged from the BESS)

The Sum of Charge and Discharge Available Energy is equal to the maximum BESS capacity

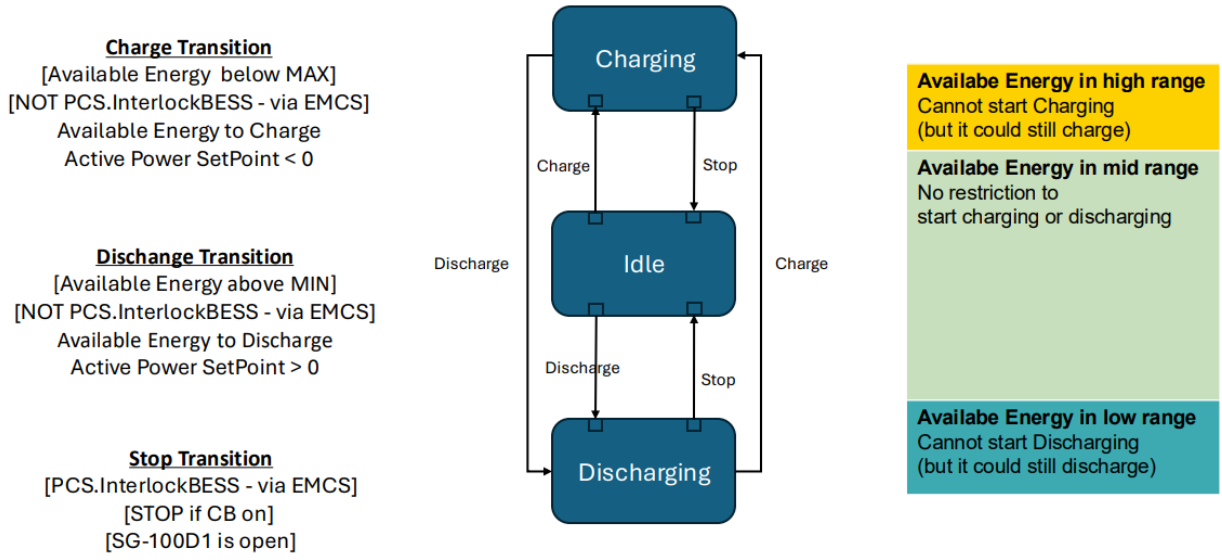

Figure 12 BESS State Machine

4.2.1.9 Solar Farm State Machine

In Figure 13 Solar Farm State Machine Figure 13 Solar Farm State Machineillustrates transitions between "Started" and "Stopped" states within the broader context of "Operating." The "Started" state indicates that the system is actively managing or generating energy, whereas the "Stopped" state signifies that the system is not operating and has been shut down. Conversely, the transition from "Started" to "Stopped," labeled as "Shutdown," can occur due to critical conditions such as emergency mode activation or the system not being grid-tied, ensuring the system is safely deactivated when necessary. Within the "Started" state, there is a loop indicating the "Curtail" action (EMERGENCY MODE only), which allows the system to reduce or adjust its output without shutting down completely, in response to conditions like excess energy production. This ability to curtail helps maintain efficient energy production while staying operational.

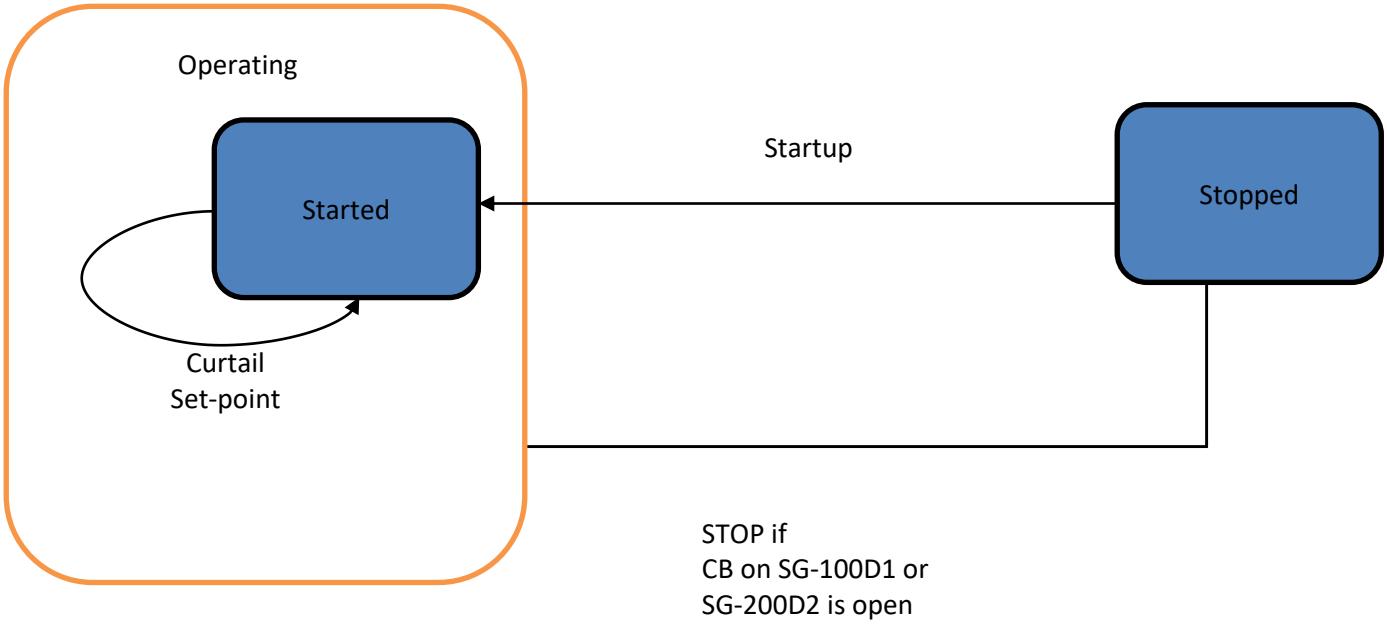

Figure 13 Solar Farm State Machine

4.2.1.10 General requirements on the Energy Management Policy

The EMCS shall drive the production and consumption of the power units in the BLPH and the Solar Farm according to a pre-defined, deterministic state-machine of the BLPH; such state-machine being defined in the present functional requirement specifications, specifically about the MODE.

The EMCS shall identify the real-time value of the BLPH MODE, reporting it over the data interface to the CCS SCADA.

The EMCS shall report the supply Guarantee request status over the data interface to the CCS SCADA.

The EMCS shall expose a command to the CCS SCADA under password protection that allows the operator to set the Operator_SupplyGuarantee to INACTIVE only in manual mode (i.e. Maintenance or Research)

The EMCS shall expose to the CCS SCADA, under password protection, the following parameters:

- WINDFARM_SURPLUS_MIN_POWER (set to +1MW)
- WINDFARM_SURPLUS_MIN_POWER_ABLE_TO_CHARGE (+2MW by HNA5)
- WINDFARM_SURPLUS_MIN_TIME_ENTRANCE_INERTIA (60sec by HNA5)

The EMCS shall expose a command to the CCS SCADA that forces the MODE into any of the listed values. NOTE: This means that the EMCS may act according to the control policy defined by a MODE, independently from the actual conditions of the system under password protection, the wind farm and the environment.

As outlined in the paragraph 4.2 Power Control & Energy Management , these parameters are used to determine the BLPH power in each mode.

The WINDFARM_SURPLUS_MIN_POWER_ABLE_TO_CHARGE parameter must be greater or equal to WINDFARM_SURPLUS_MIN_POWER , the modification of the parameters must be validated at the OPC-UA EMCS interface level. Any change that violate the above rule shall be denied and the current value of the parameter is kept.

4.2.1.11 General requirements on the Power Distribution Management

By default (i.e. unless required to open or keep open), the EMCS shall ask to close and keep closed all the MV (6.6kV) outgoing feeders of the BLPH distribution under the busbar SG-100D1, this including the Solar Farm. This requirement explicitly does not apply to the incoming MV switchgear and upstream equipment.

By default (i.e. unless required to open or keep open), the EMCS interacts with PCS to close and keep closed all the contactors of the BLPH LV loads (switchgear SG-200N1). Solar Farm interacts with EMCS interface to drive the switchgear SG-200D2 (managed by the Solar Farm via EMCS).

If an operator should manually open a circuit breaker locally (BLPH), the EMCS system must not close it automatically, even if it is in automatic logic. Instead, it should send an alarm signal to the HMI and HV-SCADA indicating the authorized opening of a circuit breaker. This is because the command to open the circuit breaker also functions as a STOP protection.

EMCS shall implement out-of-command timeout of the stop packages commands, EMCS shall implement the related open command on each 6.6kV CB on SG-100D1 (even if this is due to the package being in local).

4.2.1.12 Grid forming service

The EMCS shall provide the BESS a HW permissive signal that enables the grid-forming mode. By default, the signal shall be True. If the BESS charge level is below the BESS-MINIMUM-OPERATING-RESERVE threshold, or BESS is not HEALTHY. The EMCS shall set to False the permissive signal that enables the grid-forming mode to the BESS.

BESS will operate in Grid forming only when HW signals (1 from EMCS and 1 from SG-100D1 [parallel of open states of CB]) are active.

BESS will operate in Grid forming, following the loads without any necessity to receive the set-point from the EMCS, the maximum load allowed in Grid forming is 1MVA.

4.2.1.13 General policies on the machines transitions

4.2.1.6.2 ELECTROLYZER

The EMCS shall not partialize the Electrolyzer, requiring it either to not produce or to produce at full power (EL_MAX_SET_POINT).

All the package control signals (Status & Commands) will be exchanged with BLPH State-machine through PROFINET Communication.

The EMCS shall not stop the Electrolyzer on the sole basis of the production needs required by the energy management policy (given by the MODES).

The EMCS shall stop the hydrogen production by the Electrolyzer when the storages are full (i.e. 100% value).

The EMCS request to the PCS the permissive to start the Electrolyzer and, after receiving "PCS.PermToStartEL" (true), it commands the start.

When "PCS.PermToStartEL" (permissive signal allowing the Electrolyzer to run) is set to false, the EMCS sends a command to stop the Electrolyzer. The PCS send also the "Process Fully Charged Status" to EMCS informing that storages are full.

The PCS shall allow to start the Electrolyzer via EMCS only if the stored hydrogen level is below a threshold. When the Electrolyzer starting to produce Hydrogen, as per the EMCS requirement, PCS starts the "Process Charging Mode". The "Process Charging mode" is a normal operating mode when the hydrogen storages are not full after a process discharging mode and the storage that previously contained hydrogen shall be refilled.

"WATCHDOG" EMCS shall write a value in variable periodically, sending different values every second.

EMCS shall set the value of "Setpoint_Choice" to zero and will manage the Electrolyzer only using the PowerSetpoint (FlowSetPoint is not used).

"Status_Electrolyzer", EMCS assumes that the Electrolyzer will ignore all commands when the status is one of the "LOCAL MODE" group. On the other side, the EMCS assumes that the Electrolyzer can receive set points command when the status is one of the "DISTANT MODE/REMOTE MODE" group.

The EMCS will consider the active power of Electrolyzer measured at SG-100D1.

The EMCS shall allow the start of the Electrolyzer only if the Electrolyzer is ready to operate, status_electrolyzer (14: MODE Stand-by)

4.2.1.6.3 BESS

The EMCS shall allow the request of BESS discharge (i.e. start and keep going) only if the BESS charge level is above the BESS-MINIMUM-OPERATING-RESERVE. The EMCS shall allow to set such parameter over the data interface with the CCS SCADA.

The EMCS shall allow the request to start BESS discharge only if the BESS charge level is above the BESS_HIGH_OPERATING_RESERVE. The EMCS shall allow to set such parameter over the data interface with the CCS SCADA, and it shall be not lower than the BESS-MINIMUM-OPERATING-RESERVE value. Signal "Available Energy for Discharging" (profile_converter_status_3.Discharge_Energy in IO List) indicates the available energy for discharge.

The EMCS shall allow the request of BESS charge (i.e. start and keep going) only if the BESS charge level is below the BESS-MAXIMUM-OPERATING-RESERVE. The EMCS shall allow to set such parameter over the data interface with the CCS SCADA. Signal "Available Energy for Charging" (profile_converter_status_3. Charge_Energy in IO List) indicates the remaining capacity that can be charged into the BESS.

The EMCS shall allow the request to start BESS charge only if the BESS charge level is below the BESS_LOW_OPERATING_RESERVE. The EMCS shall allow to set such parameter over the data interface with the CCS SCADA, and it shall be not higher than the BESS-MAXIMUM-OPERATING-RESERVE value.

The figure below shows the BESS operating parameters:

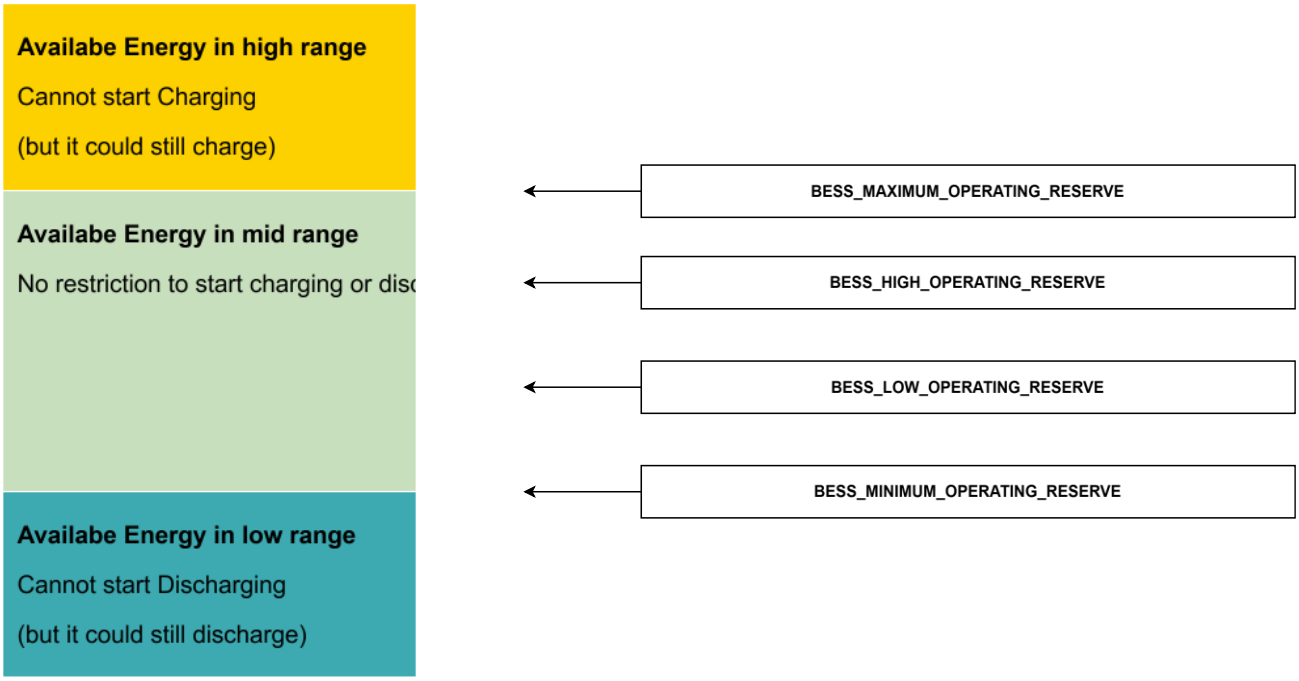

Figure 14 – BESS Operating Parameters

The EMCS shall allow to START & STOP the BESS with control variables (profile_converter_control 1.13):

IF set to 1 = BESS START

IF set to 0 = BESS STOP

The following values must be kept every time the profile_converter_control 1.13 signals are sent to BESS.

In HEALTHY status the BESS can operate in grid-forming mode, ensuring that the BLPH can operate as defined in the EMERGENCY mode (disconnected from the wind farm) providing energy for equipment and most important loads.

If the BESS is not HEALTHY, the BLPH disconnection from the grid will lead the EMCS to operate in POWER OUT mode, causing the opening of the relevant switchgears to prevent damage of the equipment.

On the basis of the BESS I/O list, a healthy status can determined by the satisfaction of the following conditions:

Healthy = Profile_converter_status_3.available == true **AND**
Profile_converter_status_3.BESS_CPI_STATUS = true **AND**
Profile_converter_status_3.SOC > [CONFIGURABLE_SOC_THRESHOLD] **AND**
Profile_converter_status_1.Statusword.BIT_1 == 0 **AND** "Error"
(Profile_converter_status_1.Statusword.BIT_3 == 1 **OR** "Standby State"
Profile_converter_status_1.Statusword.BIT_5 == 1 **OR** "Ready State"
Profile_converter_status_1.Statusword.BIT_6 == 1 **OR**) "Active State"

Give the following StatusWord definition

Bit	**Name**
0	Warning
1	Error
2	Preheat State
3	Standby State
4	Precharge State
5	Ready State
6	Active State "In Operation"
7	Safety relais triggered

When EMCS receives the "BESS in fault" signal from the PCS, the EMCS stops immediately the BESS (regardless of the BLPH operating MODE).

4.2.1.6.4 FUEL CELL

The EMCS shall allow the start of the fuel cell only if it receives the PCS.PermToStartFC permissive signal (i.e., the stored hydrogen level is above a FUEL_CELL_MIN_H2_THRESHOLD: default 0 kg). All the package control signals (Status & Commands) will be exchanged with BLPH State-machine through MODBUS TCP Communication.

The EMCS shall change the fuel cell set-point applying a deviation-vs-time filter on the requested value (the tendential set-point), unless the update is forced. Such deviation-vs-time filter shall produce an update of the signal according to the following conditions (evaluated in this given order), compared to the value and time of the last update:

1. Do not update before a FC-SETPOINT-MIN-UPDATE-TIME (default value 10 seconds);
   - This limitation is used to limit the rate of set point sent;
2. Update after FC-SETPOINT-MAX-UPDATE-TIME (default value 60 seconds);
   - The sent point will be sent after this parametric period (60 seconds) even if the setpoint is not changed;
3. Update if the upward deviation is more than FC-SETPOINT-HIGH-DEVIATION (default value 50 kW) and update if the downward deviation is more than FC-SETPOINT-LOW-DEVIATION (default value 50kW).
   - This parametric range is used as a dead-band: if the set point changes within this range, no sent point is sent to the Fuel Cell (at least before the FC-SETPOINT-MAX-UPDATE-TIME time is elapsed)

The EMCS shall allow to set the parameters of the fuel cell set-point deviation-vs-time filter over the data interface with the CCS SCADA.

The EMCS shall set a power set-point of zero on the fuel cell for any value that would otherwise be less than the FC-MIN-NONZERO-SETPOINT parameter (defined non-negative, default value 0.05 MW), so to prevent the request of set-points lower than the threshold and different from zero. The EMCS shall allow to set such parameter over the data interface with the CCS SCADA.

4.2.1.6.5 SOLAR FARM

The EMCS shall allow the start of the solar farm only if the solar farm is ready to operate.

The EMCS assumes that the Solar Farm Controller will follow a given setpoint (available for control) when the following logic is met:

Status= 0x0001 **AND**	**//**(Operating)
Remote Control Available= 0x0001 **AND**	**//**(Available)
Solar Farm Main CB Closed status = 0x0001 **AND**	**//**(Closed)
Solar Farm Main CB Open status = 0x0000 **AND**	**//**(Not Open)
External CB Closed status = 0x0001 (Closed) **AND**	**//**(Closed)
External CB Open status = 0x0000	//(Not Open)

The signals reported in the previous logical expression are taken from the IO List of the communication interface of the package.

These conditions ensure that the Solar Farm Controller is ready and able to respond to the setpoint provided by the EMCS.

NOTE: in the case the imposed set point is not followed by the solar plant controller, the EMCS will open the related SG-100D1 6.6kV CB., because the SG-200D2 is under control of Solar Farm and is not managed by EMCS. EMCS, however, is in direct communication with SG-200D2 and acts as a proxy for the control of the SG-200D2 by the Solar Farm.

4.2.1.14 Functional requirement related to the BLPH MODE

4.2.1.7.1 MODE 0 = IDLE (POWER IMPORT ONLY)

The BLPH shall enter IDLE MODE if:

- It is grid tied
- Supply Guarantee is ACTIVE.
- HNA5_Fault = True.

The EMCS shall allow to consider an inertia on the above entrance condition to IDLE MODE. Such time duration shall be parametric, positive, with default value zero seconds.

For the HNA5_Fault definition see the paragraph 4.2.1.3.

In IDLE MODE the EMCS shall charge BESS and run the electrolyzer, according to their availability and machine transition policy, as much as the machines allows and follows logic:

- EMCS requires PCS to enter in “IDLE Mode“with “PCS.EnterMode(IDLE)”
- Fuel Cell package is not in production.

NOTE: In IDLE MODE there are no constraints on the power import of BLPH related to any target power exchange level with the wind farm.

NOTE: When the EMCS is in IDLE MODE and the Electrolyzer is running and producing H2, even if the Wind Power goes below the Power Guarantee the EMCS must stay in IDLE MODE, knowing that when the Electrolyzer is started it cannot be stopped until the H2 storages are full (PCS.ProcessFullyCharged).

4.2.1.7.1 MODE 1 = IMPORT

The BLPH shall enter in IMPORT MODE 1, under following conditions:

- It is Grid Tied.
- Supply Guarantee ACTIVE.
- The HNA5 produces more than 1 MW for one minute.
- Check the BESS is NOT fully charged or NOT PCS.ProcessFullyCharge (H2 storages not full)

If the above condition is satisfied, the EMCS requests the PCS to enter in IMPORT MODE. After receiving the permissive “PCS.PermToEnterImport”, the BLPH enter in IMPORT MODE.

The EMCS shall allow to consider an inertia on the above entrance condition to IMPORT MODE. Such time duration shall be parametric, positive, with default value zero seconds. The EMCS shall allow to set such time duration parameter over the data interface with the CCS SCADA.

The BLPH is considered “able to operate in import” if it can charge the BESS or produce H2 with the electrolyzer (at least one of the two) and neither the BESS nor the Fuel Cell are committed to continue producing power (according to their transition policy and any prevailing control logic).

The BLPH shall stay in this mode until the condition to move in MODE 1A or 1B are satisfied.

4.2.1.7.2 MODE 1A = IMPORT (CHARGING)

The BLPH shall enter in IMPORT MODE 1A (Able to Charge), under the following condition:

- HNA5.P > 2 MW for one minute (Power surplus).

EMCS shall constrain the range among negative set-points only (charge), so to prevent power flow inversion (with the aim to avoid consequent possible stress on the BESS).

In IMPORT MODE 1A, the EMCS shall charge the energy storages (charge the BESS and run the electrolyzer to produce hydrogen), using the power surplus available in real-time (HNA5.P > 2MW), so to respect the Power Guarantee (1 MW of active power to the wind farm for 1 minute, at point Q0(QA1) of HNA6-AFA70 66kV), the system will enter in IMPORT 1A (Able to Charge). In this mode, the system is able to import energy, which means it can charge the BESS or store energy in the hydrogen storages. This state indicates surplus energy production that can be utilized for charging.

NOTE: To load the energy storages, the BLPH can utilize only the power surplus, so to respect the Power Guarantee; however, this constraint is subordinated to the electrolyzer and BESS status, and any other machine transition policies. Due to this, the Power Guarantee may be not respected in power reduction conditions, as the EMCS may be not allowed to stop consumption immediately (only for the electrolyzer).

In IMPORT MODE 1A, the EMCS shall allow the start of the electrolyzer only if the power surplus stays above a minimum value (i.e. a threshold relay with inertia) as per power management policy. The default values of these parameters shall be zero (i.e. no effect of the relay).NOTE: This is to avoid untimely the start of the electrolyzer. When the Electrolyzer is started it cannot be stopped until the H2 storages are full (PCS.ProcessFullyCharged).

NOTE: If the EMCS is in IMPORT or IDLE MODE and the Electrolyzer is running and producing H2, even if the Wind Power goes below the Power Guarantee the EMCS must stay in IMPORT or IDLE MODE.

In IMPORT MODE 1A, the EMCS shall give priority to the charging of the BESS over the electrolyzer in the use of the power surplus. NOTE: This means that the EMCS shall start the electrolyzer only when there is sufficient power surplus to run it after considering the BESS power draw. This is an energy requirement, and it does not impose that the BESS will start importing power after the electrolyzer.

NOTE: Electrolyzer policies may foresee to prevent the stop.

The formula for calculating the BESS set point is defined in paragraph 4.2.3.3.

4.2.1.7.3 MODE 1B = IMPORT (NOT ABLE TO CHARGE)

The BLPH shall enter in IMPORT MODE 1B (Not Able to Charge), under following condition:

- HNA5.P <= 2 MW for one minute (Power Deficit).

In IMPORT MODE 1B, the EMCS shall not be able to charge the energy utilizing the power available in real-time (WTG.P <= 2MW), so to respect the Power Guarantee (1 MW of active power to the wind farm for 1 minute, at point Q0(QA1) of HNA6-AFA70 66kV).

The Wind Farm will sustain the platform LOADs only.

4.2.1.7.4 MODE 2 = HOT STANDBY (READY TO EXPORT)

The BLPH shall enter in HOT STAND-BY MODE under following conditions:

- It is Grid Tied
- Supply Guarantee ACTIVE.
- The HNA5 produces more than 1 MW for one minute.
- Check the BESS is full charge AND PCS.ProcessFullyCharge (H2 storages full)

EMCS requires PCS to enter in Hot Standby by “PCS.EnterMode(HOT STAND-BY)”. Once the permissive signal PCS.PermToEnterStartHOTStandby is received, the EMCS moves to the HOT STAND-BY mode.

The EMCS shall allow to consider an inertia on the above entrance condition to HOT STAND-BY MODE. Such time duration shall be parametric, positive, with default value zero seconds. The EMCS shall allow to set such time duration parameter over the data interface with the CCS SCADA.

In HOT STAND-BY, the EMCS shall keep the Fuel Cell in Hot Stand-by (e.g. in the following mode neither Electrolyzer nor the Fuel Cell is required to run).

The Electrolyzer is stopped.

4.2.1.7.5 MODE 3 = EXPORT MODE (DISCHARGING)

The BLPH shall enter in EXPORT MODE under following conditions

- If it is grid tied.
- Supply Guarantee is ACTIVE.
- The HNA5 produces less than 1 MW.
- BESS is Healthy

EMCS requires PCS to enter EXPORT MODE by “PCS.EnterMode(EXPORT)”. Once the permissive signal PCS. PermToStartEXPORT arrives, the EMCS moves to the EXPORT MODE.

The EMCS shall allow to consider an inertia on the above entrance condition to EXPORT MODE. Such time duration shall be parametric, positive, with default value zero seconds. The EMCS shall allow to set such time duration parameter over the data interface with the CCS SCADA.

The BLPH is considered “able to operate in export” if it can produce power from BESS. Electrolyzer will be stopped.
EMCS requires PCS the permission to start the Fuel Cell. Once the permissive signal arrives the EMCS starts the Fuel Cell. If the permission doesn’t arrive, the EMCS stay in EXPORT MODE and continues using the BESS energy until the minimum energy threshold is reached.

EMCS shall constrain the range among positive set-points only (discharge), so to prevent power flow inversion (with the aim to avoid consequent possible stress on the BESS) which is only valid for BESS.

In EXPORT MODE, the EMCS shall not start the Electrolyzer. BLPH exports power from the Solar Farm, BESS and/or fuel Cell to support HNA5, because BLPH will use available power from Solar(day), BESS and/or Fuel Cell to export NOT more than what’s necessary to guarantee the 1 MW energy in wind farm according to the production of HNA5 (to maximize the period of assistance that will be provided) as stated in Electrical System Description & Design Philosophy.

In EXPORT MODE the EMCS shall use the BESS, Fuel Cell and HNA5 Power (if permission is received), according to their availability and machine transition policy, to generate enough power to meet the Power Guarantee of 1 MW, or at least to reduce as much as possible the related power shortfall.

$$\text{Target Power Export} = \text{BESS} + \text{FUEL CELL} + \text{HNA5 Power} \geq 1\ \text{MW}$$

In EXPORT MODE, the EMCS shall give priority to the use of the fuel cell over the BESS in the generation of power to meet the Power Guarantee. This is an energy requirement, and it does not impose that the BESS will start producing power after the fuel cell.

4.2.1.7.6 MODE 4 = COLD STANDBY (NOT ABLE TO EXPORT)

The BLPH shall enter in COLD STANDBY MODE under following conditions:

- If it is in Grid-tied
- Supply Guarantee ACTIVE.
- HNA5 produces less than 1 MW
- BESS is not able to operate in export (BESS Fault)

EMCS requires PCS to enter in COLD STAND-BY MODE by “PCS.EnterMode(COLD STANDBY)”
PCS sends to EMCS the “Permissive to start” for COLD STAND-BY MODE with “PermToStartCOLD STAND-BY”

The EMCS shall allow to consider an inertia on the above entrance condition to COLD STANDBY MODE. Such time duration shall be parametric, positive, with default value zero seconds. The EMCS shall allow to set such time duration parameter over the data interface with the CCS SCADA. In COLD STANDBY MODE the EMCS shall stop the Electrolyzer and the Fuel Cell according to their machine transition policy.

In COLD STAND-BY MODE BLPH is unable to respect the Power Guarantee.

In COLD STAND-BY MODE, all relevant auxiliaries will be operational at reduced capacity due to the equipment being out of operation. **Only those auxiliaries needed for the platform to remain safe will operate in this operation mode.**

The BLPH auxiliaries’ loads will be supported by the wind farm and solar farm.

4.2.1.7.7 MODE 4A = EMERGENCY (ISLAND)

The BLPH shall enter in EMERGENCY MODE if:

- It is islanded (off-grid) OR Supply Guarantee = INACTIVE
- BESS is healthy (NO FAULT)
- BESS charge level is above the BESS-MINIMUM-OPERATING-RESERVE threshold.

The EMCS shall allow to set the value of the BESS-MINIMUM-OPERATING-RESERVE parameter from the data interface with the CCS SCADA. The value shall be strictly positive. In EMERGENCY MODE, the EMCS shall curtail or stop the solar farm production, to prevent the overload of the system in a situation where the BESS cannot compensate the production exceedance.

Solar Farm is able to guarantee the strict respect of the active power limit provided by the EMCS, or the respect of the limit with a maximum upward tolerance (supposed within 10%, parametrized) in normal operating conditions.

In EMERGENCY MODE, if the Solar Farm is not able to guarantee the respect of the received set-point, the EMCS shall open the 6.6 kV CB on SG-100D1 and command Solar Farm to stop.

In EMERGENCY MODE, the EMCS shall curtail or stop the fuel cell production, to prevent the overload of the system in a situation where the BESS cannot compensate for the production exceedance. This also accounts for possible sudden drops in the loads.

In EMERGENCY MODE, The EMCS shall give priority to the use of the fuel cell over the BESS discharge, according to machines reaction times and capabilities.

In EMERGENCY MODE, The EMCS shall give priority to the reduction of fuel cell use over the BESS charge, according to machines reaction times and capabilities.

In EMERGENCY MODE, BLPH operates as an 'Island' and if Solar Farm is not in production, BESS and/or Fuel Cell will use their stored energy to support BLPH for the maximum time possible, CCS will be programmed to minimize the balance of plant and vendor package auxiliary demand to prepare for the potential recovery from a 'black start' condition.

NOTE: There is no requirement to charge the BESS in EMERGENCY MODE; however, the BESS is allowed to charge and may be expected to charge in temporary periods. According to that, the EMCS may act so to track a BESS charge level to a target value or within a range. Charge and discharge periods may alternate in such tracking. Due to the fluctuation of loads (a sudden reduction) and solar production (a sudden increase), there may be transient periods where BESS is charging while the fuel cell is producing.

NOTE: The "BESS charge level" will be based on the "discharge_energy" signal provided by the BESS communication interface. The value is normalized between 0% and 100% (0 to 5MWh) to be used in the calculation of the threshold.

NOTE: In Grid Forming Mode, the BESS production is determined by the energy balance of the BLPH.

EMCS – PCS coordination shall remain in place for package permissions.

For the power management of each single package see the paragraph 4.2.3.4**.**

In this mode the Load Shadding procedure will be applied according to the paragraph Load Shedding.

In EMERGENCY MODE, Formula/algorithm that will be used to estimate the remaining time before moving to POWER OUT MODE, is dependent on the following variables:

- T_{REM} = Remaining Time before Power Out mode
- E_{H2} = Energy available from Hydrogen storages (based on current H2 level)
- E_{BESS} = Remaining Energy in the BESS (based on Available Energy for Discharging)
- P_{SF} = Current Power production from Solar Farm
- P_{Aux} = Power consumption of the auxiliary loads (measured at the incoming breaker SG-200N1)
- P_{Net} = Net power required after accounting for Solar & Auxiliary loads

The net power demand on the BESS and the fuel cell is the difference of total load and the contribution from the solar farm:

$$P_{Net} = P_{Aux} - P_{SF}$$

The total available energy from the BESS and the fuel cell:

$$E_{Total} = E_{H2} + E_{BESS}$$

Where:

- $E_{H2} = H_{2Quanity}$ x Conversion Efficiency x $FC_{Efficiency}$
- E_{BESS} = Available Energy for Discharging

Variable	Description	Notes
$H_{2Quantity}$	Quantity of the H_2 for **all** storages expressed in kg	Exposed by PCS
Conversion Efficiency	kWh produced per 1 kg of H_2	Exposed by FC interface (33.33 kWh/kg)
$FC_{Efficiency}$	Fuel Cell efficiency (> 0 and < 1)	Exposed by FC interface (Input Register 1202)

The remaining time before the energy reserves are depleted:

$$T_{REM} = \frac{E_{Total}}{P_{Net}}$$

The formula to estimate the remaining time T_{REM} before moving to POWER OUT mode is:

$$T_{REM} = \frac{E_{H2} + E_{BESS}}{P_{Aux} - P_{SF}}$$

4.2.1.7.8 MODE 5 = POWER OUT (BLACK-OUT)

The BLPH shall enter in POWER OUT MODE if:

- It is islanded (Off-Grid) **OR** Supply Guarantee = INACTIVE **OR** EMCS is informed of ESD-1D activation (reference doc. “Process Safety Cause & Effect Matrix”)
- BESS NOT Healthy **OR** BESS charge level is below the BESS-MINIMUM-OPERATING-RESERVE threshold (BESS FAULT) **OR** the SG-100D1 voltage measure on the BLPH 6.6kV distribution bus is absent.

In POWER OUT MODE, the EMCS shall open all the CBs under the busbar SG-100D1, immediately.

NOTE: it shall not ensure that the CBs are held open, allowing manual closing.

Once in POWER OUT MODE, EMCS shall send a command to PCS (PCS.PowerOutMode) to trip all the valves, stop command for process items and according to their energy transition policy.

NOTE: When the ESD-1D signal (exposed by the PCS) is active, the EMCS goes in Power Out MODE from any mode except Research Mode.

4.2.1.7.9 MODE 6 = MAINTENANCE

The BLPH shall enter and remain in MAINTENANCE MODE if the EMCS receives the request to enter in this MODE from the data interface of the CCS SCADA (protected under password).

The BLPH shall exit from the MAINTENANCE MODE if, and only if, the EMCS receives the request to return in automatic identification of the MODE from the data interface of the CCS SCADA through a software exit button.

In MAINTENANCE MODE, the EMCS implements the commands arriving from the data interface of the CCS SCADA, respecting permissions.

In MAINTENANCE MODE the EMCS shall not dispatch any command required by any automatic logic in the EMCS, including any open/close command, load shedding command, change in power setpoint.

NOTE: This is to assure total manual control to the operators.

NOTE: In Maintenance Mode the Fuel Cell and the Electrolyzer must remain stopped (start-up is not permitted), also if requested by the operator via CSS SCADA.

Transition Conditions: Entrance on a command to get in the MANTENANCE MODE, Exit on a command to return in automation identification of the MODE.

EMCS performs pass-through of manual commands.

At entrance in the MODE a procedure shall be followed:

- EMCS shall stop and hold stop (prevent start command) the Electrolyzer.
- EMCS shall stop and hold stop (prevent start command) the Fuel Cell.
- EMCS shall stop the BESS.
- EMCS – PCS coordination shall remain in place for package permissions.
- EMCS sent to the PCS the command PCS.EnterMode(MANUAL).

4.2.1.7.10 MODE 7 = RESEARCH

The BLPH shall enter and remain in RESEARCH MODE if the EMCS receives the request to enter in this MODE from the data interface of the CCS SCADA (protected under password). BLPH will ignore the power output of the HNA5 wind turbine.

WARNING for the operator: while in the RESEARCH MODE one the following conditions could lead to BLPH black out:

- Intentionally opening of the QA1 of HNA6-AFA70.
- Intentionally opening the INCOMER CB of SG-100D1.
- Intentionally open the CB of SG-100D1 for supply the SG-200N1.

EMCS requires PCS to enter RESEARCH MODE by “PCS.EnterMode(RESEARCH)”.

The BLPH shall exit from the RESEARCH MODE if, and only if, the EMCS receives the request to return in automatic identification of the MODE from the data interface of the CCS SCADA through an exit button.

RESEARCH MODE shall be used for First Energization and re-energization during Black Start.

In RESEARCH MODE, the EMCS implements the commands arriving from the data interface of the CCS SCADA, respecting permissions of packages state machines.

When the EMCS transitions to Research Mode from any other mode, all machines must be stopped. However, this logic does not prevent the operator from manually performing machine operations.

In RESEARCH MODE the EMCS shall not dispatch any command required by default behavior requirements, including any open/close command, load shedding command, change in power setpoint. NOTE: This does not prevent the EMCS to automatically dispatch commands that are due to specific functional requirements which are not indicated as generic defaults behavior (e.g. it does not prevent the EMCS to automatically stop the electrolyzer when the hydrogen storages are full).

Transition Conditions: BLPH execute control commands arriving from the CCS SCADA. Entrance on a command to get in the RESEARCH MODE, exit on a command to return in automation definition of the MODE.

4.2.1.7.11 MODE 8 = NONE MODE

The EMCS shall identify NONE MODE as default BLPH MODE and during EMCS initialization.

In NONE MODE the EMCS shall not dispatch any command required by default behavior requirements, including any open/close command, load shedding command, change in power setpoint.

NOTE: This does not prevent the EMCS to dispatch commands that are due to specific functional requirements which are not indicated as generic defaults behavior (e.g. it does not prevent the EMCS to automatically stop the electrolyzer when the hydrogen storages are full).

At start-up the EMCS shall enter into an initialization status. During initialization, EMCS shall not dispatch any command, manual or automatic, including any open/close command, load shedding command, change in power setpoint. The EMCS shall exit from initialization status if the conditions to enter in a BLPH MODE (different from None) are met.

4.2.2 Management Under BLPH Internal Communication Failures

Electrolyzer, Fuel Cell, Solar Farm vendor provide heartbeat/watchdog allowing the package and the BESS to verify the presence of communication between the two systems.

In case of loss of communication, after OUT-OF-COM-TIMEOUT of that package, the EMCS shall consider that the package will auto shutdown. After MAX-GRACEFULL-SHUTDOWN- TIME (a parameter with default value zero seconds), if the package still exchange power, the EMCS shall open the related CB on SG-100D1 and EMCS will move BLPH in other MODE accordingly to CPI FAULT.

When the communication with the package is retrieve, the EMCS ensures that the package is stopped, and after the check, the EMCS commands the closing of the related CB.

4.2.3 Power Control

It is described the strategy of dynamic control of the active power tracking. The power control is intended to cope with the state machines, logic and physical constraints and limitations imposed by the system. The scope of the power control is to reach the best performance in chasing the target output, always considering the trade-off with the complexity of the design and implementation.

The EMCS shall implement power control in the following scenarios:

- When in EXPORT MODE, to guarantee the target power export, which is ideally defined as 1 MW export to the wind farm QZ93, by operating on the BESS and Fuel Cell.
- When in IMPORT MODE, to utilize the most, and only, the power surplus to charge the energy reserves of the BLPH, using BESS and electrolyzer for serial or parallel charging.
- In EMERGENCY MODE, to maintain the BESS within the Operating Parameters, by operating the Solar Farm and the Fuel Cell. NOTE: In this scenario, there might be also possible additional requirements, here not considered, to prevent frequent power inversions of the BESS, taking into account the oscillation of the power request, expected to be due to both the oscillation of the solar farm output and the loads.

NOTE: The power control is limited to active powers. No reactive power or power factor shall be controlled or accounted for by the EMCS; this holds in every BLPH operational scenario, independently from the fact that the BLPH is grid tied or islanded. At least for the EMCS purposes, there are no grid code requirements to comply with, except EMERGENCY MODE in which the BESS **is in charge of mitigation** of active power as well as reactive power.

4.2.3.2 Power Control in EXPORT MODE

The ideal goal of the BLPH in EXPORT MODE is, as stated in the Functional Statement, to guarantee 1 MW in export to the Wind Farm at QZ93. However, the measure of such quantity is not available. The goal of the BLPH is hence identified in guaranteeing the export of a quantity of power calculated and sum of BESS, FUEL CELL & HNA5 ≥ 1MW. Such value can be considered independent from the BLPH power production itself (no feedback effect).

Considering the dynamics of the machines, the following control architecture has been identified:

- Pure feedforward (open loop)

The goal of the power control in EXPORT MODE: Guarantee the minimum power export target, ideally defined as 1 MW export to the Wind Farm. The practical goal, the target for the sum of BESS exported power and Fuel Cell exported power is:

$$BESS.ExportedPower + FuelCell.ExportedPower = 1MW - HNA5.Power$$

$$System\ Target = 1\ MW - HNA5.Power$$

Whereas:

- Fuel Cell Setpoint = System Target
- BESS Setpoint = System Target - Fuel Cell Power (Formula floored to zero, i.e., negative values will be considered zero)

During the EXPORT MODE, the Loads consumption is not considered in the power provided to the Wind Farm and the Solar Farm production, because we are assuming that the production will compensate the Loads consumption. This could not guarantee the export of the required power during the night or adverse weather. Supply is guaranteed using BESS and FUEL CELL.

The Fuel Cell set point formula will actually have two parameters (C1 Default = 1; C2 Default = 0): Fuel Cell Setpoint = System Target * C1 - C2 (Formula floored to zero).

4.2.3.1 Pure Feedforward

Track the BLPH target in feedforward (open loop), defining the set-point of BESS and fuel cell as a repartition of the power target form storages according to a theoretical formula of the power need from the energy storages.

Both solar farm and loads are measured and shall not be controlled in this scenario, hence are usable as independent variables.

The repartition of the total power request between the BESS and the Fuel Cell can take into account desired energy priority, desired margins and also the different reaction time of the machines. A proposed repartition of the power request is the following:

1. Calculate the power set-point of the fuel cell (the slower machine) as a percentage of the total power request, or/and considering an absolute margin (to be always left to the BESS); apply a low pass filter in output to better respect fuel cell dynamics (i.e. average the result slowly, so to smooth any rapid movement).
2. Calculate the power set-point of the BESS as the difference between the total power request and the measured power output of the BESS (so to compensate its dynamics).

This architecture has no feedback loops at all, and it is intrinsically stable (in the limits of the internal stability of the machines in following a set-point); the resulting error is the one given by:

- The physical model approximation (i.e. the fact that the sum of the productions is not equal to the output)
- The disturbance due to the dynamics during the settling time of the machines, which is particularly relevant for the fuel cell and may be just partially limited by the BESS.
- The tracking error of the machines.

4.2.3.3 Power Control in IMPORT MODE

The goal of the BLPH in IMPORT MODE is to charge the energy reserves using the power surplus, which is the power available in excess of the Power Guarantee level of 1 MW to the Wind Farm. As already explained in the paragraph 4.2.1.7.1 the BESS will be charged and the Electrolyzer will be started when the power produced by the HNA5 is above 2 MW.

It is particularly relevant that the Electrolyzer cannot be partialized and its power is much more than that the one of the BESS.

Moreover, once the Electrolyzer starts it cannot be stopped according to power needs. It may hence happen that the Electrolyzer is still running even when there is no sufficient power surplus (or even any at all). This consideration, it is assumed that a simple control architecture based on feedforward control is the best trade-off, as there is no point in selecting a more complex architecture given the intrinsic limitations of the possible performances.

NOTE: If the EMCS is in Import Mode and the Electrolyzer is running and producing H2, even if the Wind Power goes below the Power Guarantee the EMCS must stay in Import Mode.

The proposed architecture is to identify the charging set-point of the BESS from the theoretic calculation of the powersurplus available for the BESS charge, considering and based on the power measures of HNA5, solar farm, Electrolyzer and loads consumption, plus an estimation of the internal losses. The set-point shall be limited to the maximum charge power of the BESS.

The Electrolyzer will be started when the theoretic calculation of the power surplus available for the Electrolyzer is higher than its nominal power; the power surplus available for the Electrolyzer shall be calculated considering and based on the power measures of HNA5, solar farm, BESS and loads consumption, plus an estimation of the internal losses.

In this architecture, during a progressive rise of the power from the HNA5 and solar farm, the first to operate will be the BESS, rising from zero to its maximum power. Note that the maximum possible consumption of the BESS can be zero, if it is full. After the BESS has reached it maximum power, the power surplus available to the Electrolyzer will start to rise starting from zero. When it reaches a level higher than the nominal power of the Electrolyzer, the latter will start. Then, if the power from HNA5 and solar farm will decrease, the BESS will progressively reduce its charge power according to the available power surplus, eventually stopping.

NOTE: When the Electrolyzer is not required to produce, the setpoint will be set to zero, and its operating status shall be changed to STOP.

This architecture may produce stable behavior due to the all-or-nothing dynamics of the electrolyzer. However, these behaviors are prevented by the latching policy that prevents to stop the electrolyzer independently from the power needs, in the limit of the latching period.

During a progressive rise in power from the HNA5 and Solar Farm:

- The first to operate will be the BESS, rising from zero to its maximum consumption power. NOTE: The maximum possible consumption of the BESS can be zero, if it is full.
- After the BESS has reached its maximum power, the power surplus available to the Electrolyzer will start to rise starting from zero. When it reaches a level higher than the nominal power of the Electrolyzer, the latter will start.

Afterwards, if the power from HNA5 and Solar Farm progressively decreases:

- The BESS will progressively reduce its power according to the available power surplus, eventually stopping.

- The Electrolyzer will be stopped only when its State-machine allows/impose such transition (which includes pre-conditions on the H_2 level); in case the Electrolyzer status allows the stop transition (but now impose it), the EMCS will stop the Electrolyzer if its start condition is not met (adding a hysteresis margin).

Power Surplus formula is HNA5.Power - 1 MW

The formula for calculating the BESS set point is the following:

BESS Set Point = HNA5.P – 1 MW – BLPH.AuxLoad – EL.Consumption + Solar.P

The formula for calculating the Electrolyzer set point is the following:

IF (ElectrolyzerCanRun()) THEN

Electrolyzer Set Point = ELECTROLYZER_MAX_SET_POINT

ELSE

Electrolyzer Set Point = 0

Where ELECTROLYZER_MAX_SET_POINT is a parameter preset to 2500 kW by default and ElectrolyzerCanRun() is a function taking care of the power surplus available, the permissive to start the Electrolyzer and its electrical connectivity to the 6.6 kV BUS.

4.2.3.4 Power Control In EMERGENCY MODE (Islanded Mode, BESS in Grid Forming)

The goal of the BLPH in EMERGENCY MODE is to sustain the off-grid operativity as much as possible, which means to preserve the energy reserves, especially the one of the BESS. In case of need, the energy priority shall be to utilize the fuel cell before the BESS reserves.

The charging of the BESS while the fuel cell is producing energy is considered inefficient, so it will not be implemented in the control logic.

The control shall avoid the depletion of the BESS and its overload, which would lead to a power outage.

This considering, the goal of the power control can be reduced to maintaining a good level of charge of the BESS, respecting the mentioned constraints. It is assumed that, to prevent the (potential) power overload of the BESS, the sum of the Fuel Cell set-point and the Solar Farm set-point shall be less than the BESS charge power at any moment in time, which is assumed to be always more than 0.6 MW.

The control dispatchment policy shall be to implement such constraints in a hard manner, lowering one set-point increasing the other. The proposed architecture is based on the identification of a control range AA in the BESS charge levels (e.g. SoC 60%-80%), that should be parametrized (BESS-MINIMUM-OPRATING-RESERVE, BESS-MAXIMUM-OPERATING-RESERVE, see the paragraph 4.2.1.6.3).

The term "charge level of BESS AA" refers to the Available Energy of a specific Battery Energy Storage System (BESS) identified as "AA."

If the BESS charge level is below the control range AA (low range):

- The fuel cell set-point will be calculated as the difference between the load consumption and the solar farm production, if positive, averaged over a time window: FC SetPoint = AuxLoad – SolarFarm.
- The solar farm will be NOT curtailed: SolarFarm SetPoint = 100%
- BESS absorbs the power coming from the Solar farm during the settle time of the Fuel Cell setpoint.

If the BESS charge level is within the control range AA (middle range):

- The fuel cell set-point will be calculated as the difference between the load consumption and the solar farm production, if positive, averaged over a time window and progressively limited, from 100% to 0%, linearly decreasing in the control range AA: FC SetPoint = (AuxLoad - SolarFarm) * X.
- The solar farm will be limited to the AuxLoad active power measure; no progressive limitation is applied: SolarFarm SetPoint = AuxLoad.
- BESS is in Load following.

If the BESS charge level is above the control range AA (high range):

- The solar farm will be curtailed to zero power: FC SetPoint = 0%
- The fuel cell set-point will be set to zero: SolarFarm SetPoint = 0%
- BESS is in load following.

If the Available Energy reaches the MAXIMUM_OPERATING_RESERVE, the CB on SG100D1 of Fuel Cell and Solar Farm must be open. When the Available Energy goes below the MAX_DISCHARGE_RESERVE(HIGH) the CB on SG100D1 of Fuel Cell and Solar Farm must be closed back. If the Available Energy goes below the MIN_CHARGE_RESERVE (LOW) the EMCS commands 100% set point to Solar Farm.

The progressive curtailment level of the solar farm within the control range AA is a means to avoid astable behavior.

NOTE: this control logic does not prevent the ideal scenario where the BESS gets depleted while there is still some reserve of hydrogen. To guarantee to prevent it, an intentional charging of the BESS from the Fuel Cell is foreseen when such incipient condition arises (by the operator in Research Mode).The goal of the power control in EMERGENCY MODE: Sustain the BLPH off-grid operativity as much as possible, which means to preserve the energy reserves, especially the one of the BESS, the energy priority shall be to utilize the Fuel Cell before the BESS reserves.

To avoid outages, EMCS shall guarantee that, with the given setpoints:

Fuel Cell Power + Solar Farm Power < BESS Power Charge Capability [PowerLimit]

Available Energy in low range (below the SoC limitation range):

- $FC_{SetPoint}$ = Aux.Power – SolarFarm.Power
- Solar Farm is curtailed to respect the BESS Charge Capability

Available Energy in middle range (Range is intended LOW, HIGH thresholds):

- Fuel Cell set-point defined so to ideally compensate the residual load consumption considering Solar Farm production but capped to a progressively decreasing value.
- Solar Farm is curtailed to respect BESS Charge Capability but capped to a progressively decreasing value.

Available Energy in high range (above the SoC limitation range):

  - $FC_{SetPoint}$ = 0
  - $SF_{SetPoint}$ = 0

4.2.4 Forecasts-based Control

There are no requirements at the EMCS about using or receiving any forecast of data or values.

4.2.5 Coordination with the Process Control System

The EMCS shall not run (i.e. not starting and stop if running) the BESS without a positive permissive signal from the PCS.

PCS communicates with EMCS through internal communication (Modbus TCP) and the following signals (commands, statuses and permissive) will be exchanged between the two systems:

Signal	Description
PCS.EMCS.PermToStartFC	Permissive to start Fuel Cell sent by PCS
PCS.EMCS.PermToStartEL	Permissive to start Electrolyzer sent by PCS
PCS.EMCS.ProcessFullyCharged	PCS indicates if the Fuel Tanks are full
PCS.EMCS.BESSFault	Sent by PCS. 1: fault; 0: OK. When 1 the BESS must be immediately stopped
PCS.CmdToLoadShedStage1	Request sent from EMCS to PCS to activate the Load Shedding of EMERGENCY MODE
PCS.CmdToLoadShedStage2	Request sent from EMCS to PCS to activate the Load Shedding of LOW BESS LEVEL
PCS.EntertMode	Request sent by the EMCS to the PCS to enter in a specific mode. The PCS monitors the value change to capture the mode request. POWER OUT mode is a special condition. The EMCS move to the POWER OUT mode without waiting for the PCS permission.
PCS.CurrentMode	EMCS communicates through this register which is its current MODE. The PCS listens for the mode change. If the POWER OUT MODE is reached, the PCS takes the predefined actions (trip everything).
FuelCellOperatingStatus	Signal exposed by the EMCS to communicate the operating status of the Fuel Cell.
ElectrolyzerOperatingStatus	Signal exposed by the EMCS to communicate the operating status of the Electrolyzer.
PCS.EMCS.PermToEnterMode	Permissive to enter in the mode indicated by the register value.
PCS.EMCS.HydrogenLevel	Hydrogen level in Kg. PCS communicates the level periodically to the EMCS.
PCS.EMCS.ESD-1D	PCS inform the EMCS to go in Power Out mode
PCS.PermissiveModeTimeout	Parameter set by the PCS (default 3 sec). This parameter is used by the EMCS as waiting time for the permissive signal to enter in a MODE.

If the Permissive to stay in **Export** or in **Hot Standby** MODE is removed or if the permission request to enter in these modes is not received within the timeout, the EMCS moves automatically in Cold Standby.

The EMCS before entering the **Emergency**, **Power Out**, **Idle**, **Cold Standby**, **Maintenance** or **Research** MODEs sends the request to enter in the MODE but does not wait until the permission is received. The purpose of the request is to inform the PCS what is the next MODE where the EMCS will transit.

If the EMCS wants to move to the **Import** MODE and the PCS permission is not received, the EMCS stays in the

current MODE until the permission is received or the preconditions to move to some other MODE are satisfied.

The EMCS monitors continuously the permissive signals communicated by the PCS. If the permissive signal to run a package is removed, the EMCS sends the stop command to the related package and, if required by the EMCS MODE transition logic, the EMCS moves to the MODE which preconditions are satisfied.
In some cases, even if the permission to run a package is removed and the package is stopped, the EMCS stays in the current MODE.
For example, if the EMCS is in EXPORT MODE and the permission to run the Fuel Cell is removed, the EMCS continues to operate in EXPORT MODE until it is supported by the BESS.
Another example is, when the EMCS is in IMPORT MODE and the permission to run the Electrolyzer is removed, the EMCS continues to operate in IMPORT until the BESS can be charged.

4.3 Load Shedding

In EMERGENCY MODE, the EMCS shall shed the loads in the list LOAD-TO-SHED-IN-EMERGENCY-MODE, by requesting the PCS “Cmd.To.LoadShed” to open the related LV contactors on the switchboard SG-200N1.

The EMCS shall allow to mark each load, singularly, as included or excluded in the LOAD-TO-SHED-IN-EMERGENCY-MODE from the data interface of the CCS SCADA.

The default list LOAD-TO-SHED-IN-EMERGENCY-MODE(Island) “Cmd.To.LoadShed_1” immediately upon entry is the following:

- PCS Stop Electrolyzer auxiliaries
- PCS Stop Water package
- PCS Stop Sea Water Pumps

The EMCS shall allow to reset the default value of LOAD-TO-SHED-IN-EMERGENCY-MODE from the data interface of the CCS SCADA.

In EMERGENCY MODE, if the Available Energy is below BESS-LIMIT-FOR-ADV-LOAD-SHEDDING parameter value, the EMCS shall shed the loads in the list LOAD-TO-SHED-IN-LOW-BESS-LEVEL, by requesting to the PCS to open the related LV contactors on the switchboard SG-200N1.

The EMCS shall allow to set the value of the parameter BESS-LIMIT-FOR-ADV-LOAD-SHEDDING over the data interface with the CCS SCADA. The default value of the parameter being 25% Available Energy .

The EMCS shall allow to mark each load, singularly, as included or excluded in the LOAD-TO-SHED-IN-LOW-BESS-LEVEL from the data interface of the CCS SCADA.

The list LOAD-TO-SHED-IN-LOW-BESS-LEVEL “Cmd.To.LoadShed_2” is the following:

- HVAC
- Welding Sockets
- BOP Distribution Panel
- Crane

During the electrical mode these systems are DISABLE to START according to Load Shedding:

- Electrolyzer
- Sea Water Pumps
- Water Treatment System
- HVAC
- Welding Sockets
- BOP Distribution Panel
- Crane

The EMCS shall allow to reset the default value of LOAD-TO-SHED-IN-LOW-BESS-LEVEL from the datainterface of the CCS SCADA.

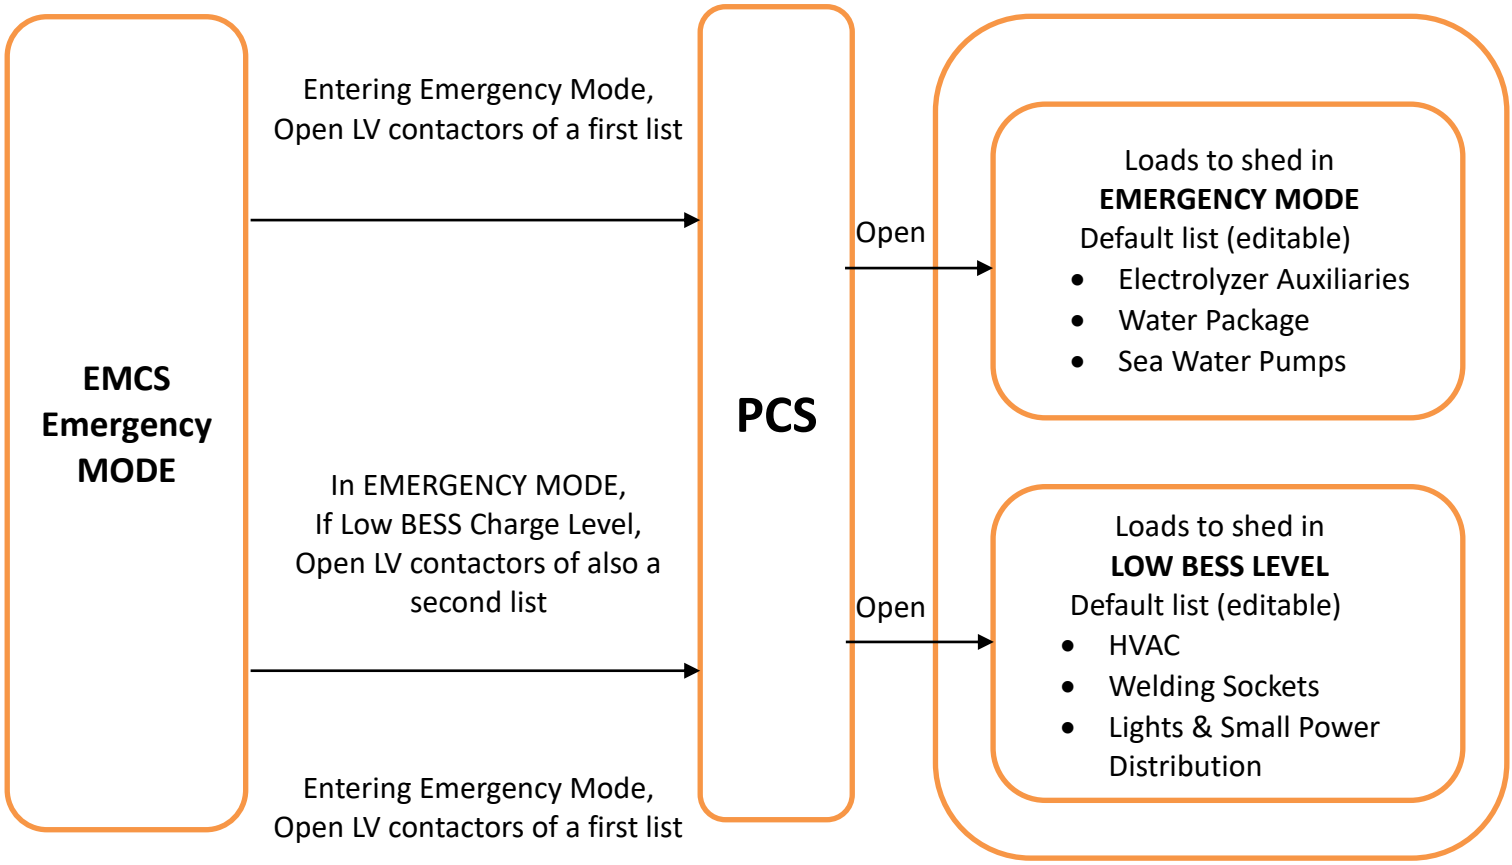

Figure 15 Load Shedding Procedure

The EMCS removes the commands to PCS for CmdToLoadShedStage1 and CmdToLoadShedStage2 when it exit from Emergency mode. PCS manages the contactor on the LV Switchboard SG-200N1 according to the control logic.
EMCS manages the CBs on the 6.6kV Switchgear SG-100D1 and HNA6-AFA70 according to the control logic.

4.4 Management of Electrical Distribution Equipment

If IEC 61850 communication between the HV-SCADA & 66kV HNA6-AFA70 is lost, the HNA6-AFA70 will not take any automatic action.

If OPC-UA communication between the HV-SCADA and EMCS is lost, the EMCS does not take any automatic action on 66kV HNA6-AFA70. In conjunction with this communication loss, the EMCS will immediately command the platform in IDLE MODE “PCS.EnterMode(IDLE)”.

The EMCS shall allow the operator to open the HNA6-AFA70 Q0(QA1) from the data interface of the CCS SCADA.

The EMCS shall allow the operator to close the HNA6-AFA70 Q0(QA1) from the CCS SCADA data interface only in presence of a permissive signal from the wind farm SCADA (and there is communication with the wind farm SCADA).

The HV-SCADA can open any time the HNA6-AFA70 Q0(QA1) through the direct link (IEC-61850), while simultaneously removing the permissive signal to close.

The control of OLTC through AVR command has signals from the EMCS that allow to put the AVR/OLTC in MANUAL mode or AUTO mode, only software manual command by operator will be available (password protected). See the paragraph for the control logic 5.7. The set point of the AVR shall be in the range of 6.6 kV ± 5%

The exiting from any island mode (RESEARCH or EMERGENCY), once the voltage is back on the Wind Farm up to the BLPH 66 kV HNA6-AFA70, it is possible to reconnect the system to the grid by means of manual procedure.

The operator first of all has to close the line switches and the circuit breaker of the 66 kV HNA6-AFA70 in order to energize the step-up transformer, to be ready to take the load from the 6.6 kV system.

Once the transformer is energized, the operator will request from the CCS SCADA to close the incoming breaker on the 6.6 kV switchgear (only after black start scenario or first energization). The closure of the breaker will be managed by the BESS system (only in EMERGENCY mode), which has the capabilities necessary to synchronize the isolated 6.6 kV system with the grid.

With the closure of the 6.6 kV incoming breaker, the 6.6 kV system will be connected back to the grid and the BLPH platform will return in the operating mode requested in that moment.

4.5 Wind Farm Grid Connection and BLPH Synchronization After Emergency Mode

In Figure 16 Status of Signals & Electrical Sequence defines the status of signals and electrical sequence to manage the closing of the HNA6-AFA70 on BLPH. Windfarm will have a direct connection to the BLPH 66kV HNA6-AFA70 CB for control and monitoring, the electrical sequence is as follows:

- Q0(QA1) “CB Open” command, directly to the BLPH HNA6-AFA70 from HV-SCADA
- Q0(QA1) “Ready to close” permissive to EMCS from HV-SCADA
- Full control of QZ92 line and earthing switches from HV-SCADA (not controlled by EMCS)

BLPH Q0(QA1) “CB Close” command and “CB Open” commands will also be available to BLPH HNA6-AFA70 by the EMCS.

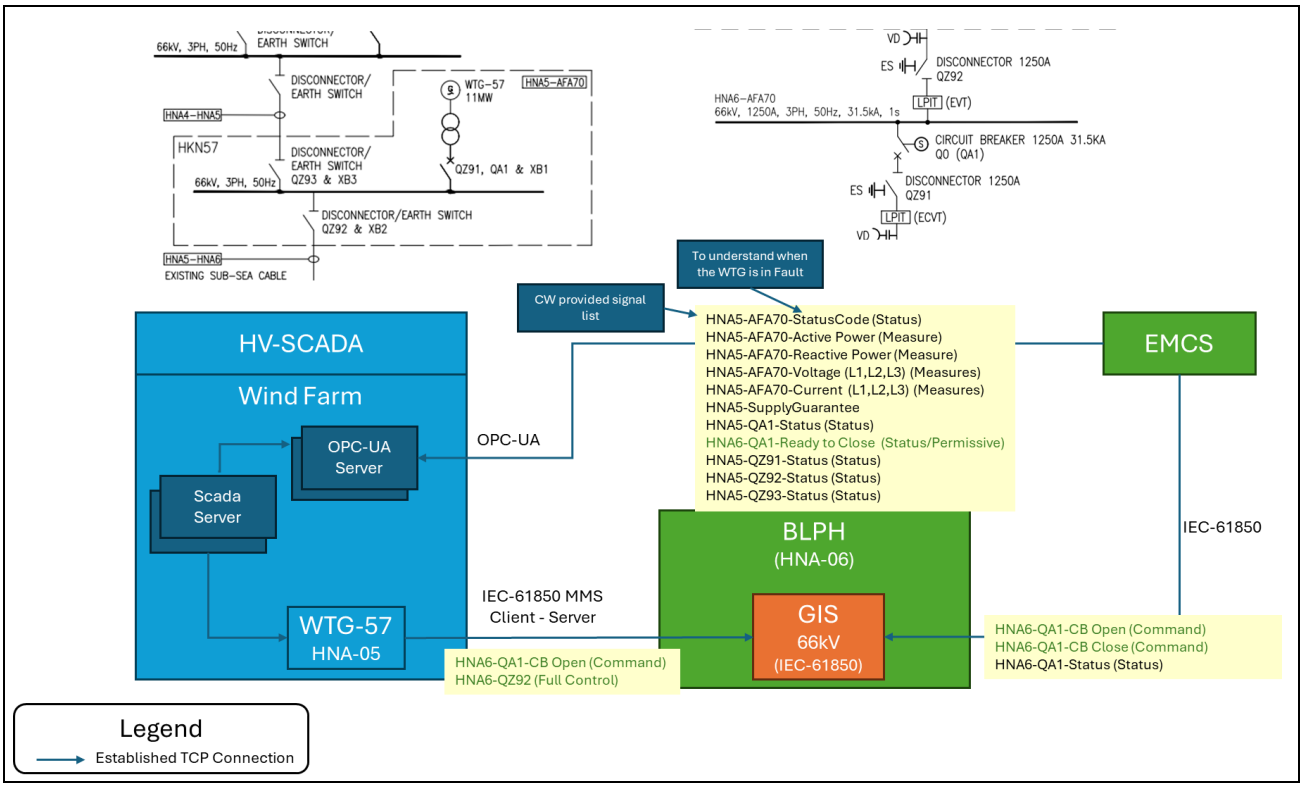

Figure 16 Status of Signals & Electrical Sequence

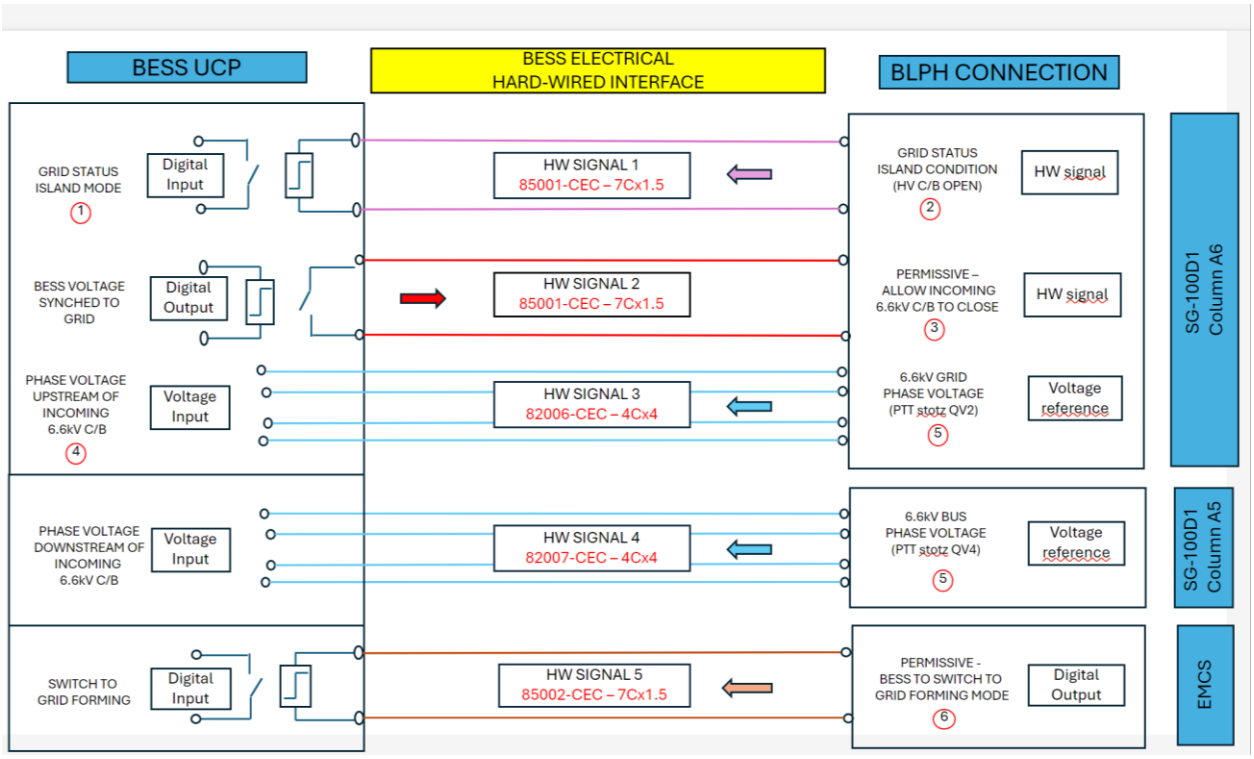
- The synchronization with the grid is performed by the BESS, by means of hardwired voltagemeasures connected directly to the BESS (from the SG-100D1).
- The BESS will provide the (hardwired) closing command directly to the 6.6kV incoming CB to perform the parallel with the grid.
- A hardwired signal will identify off-grid condition (an OR between Open status of Q0(QA1) HNA6-AFA70 and open status of 6.6kV SG INCOMMER CB).
- The EMCS will provide a hardwired permissive signal as described in Figure 17 BESS-Hardwired Interface_rev5_FREQ to the BESS allowing the Grid-Forming mode (enter and stay in such mode = 1)



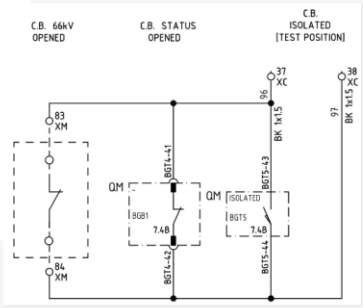


Figure 17 BESS-Hardwired Interface_rev5_FREQ

Signals as described in Figure 18:

1 GRID STATUS ISLAND MODE: 0 = 6.6 kV System is synchronized with the grid and BESS has to operate in grid following
1 = 6.6 kV System is islanded from the grid and BESS has to operate in grid forming IF the permissive is received

2 GRID STATUS ISLAND MODE: the signal is generated as OR of the 66 kV CB open status and the 6.6 kV incoming CB open status as per following scheme

3 PERMISSIVE – ALLOW INCOMING 6.6kV C/B TO CLOSE: This signal is connected as input to the REX 640 protection relay on the 6.6 kV incoming CB in order to close the breaker, provided that the synchrocheck function gives the permissive. The input BI6 on card D will be used.

4 PHASE VOLTAGE UPSTREAM OF INCOMING 6.6 kV CB: Once BESS read a voltage 110 V on this signal it has automatically to start the synchronization to the grid in order to reach the synchronization and send the permissive to close signal to the incoming CB.

5 VOLTAGES FROM 6.6 kV SWITCHGEAR: These signals are voltage references from secondary side of voltage transformers, so they are at 110 V 50 Hz, with 4 wires.

6 PERMISSIVE - BESS TO SWITCH TO GRID FORMING MODE: This signal will be maintained at 1 until the operator will not reset it manually, in order to prevent the islanding or the automatic return from the island (as per note 4)

Figure 18

The BESS performs the parallel closing request to the INCOMMER CB SG-100D1 automatically after the synchronization, without waiting for any input from the EMCS.

5. Data Interoperation

5.1 BESS Data Interface

The EMCS commands and supervises the BESS. The data interface between the EMCS and the BESS will be based on MODBUS TCP/IP.

The signal list of the data interface with the BESS will be as reported in the document “23A2007_240628_PROFINET_Register BESS_V1_0_0_3”.

5.2 Electrolyzer Data Interface

EMCS commands and supervises the Electrolyzer. The data interface between the EMCS and the electrolyzer will be based on PROFINET. No hardwired signals are shared between the EMCS and the electrolyzer.

The electrolyzer PLC requires a custom time synchronization interface, based on dedicated signals (specifically: year, month, day, hour, minute, second) to be updated by the EMCS; it is assumed that the precision required is equal to the resolution.

The signal list of the data interface with the Electrolyzer will be as reported in the document “C63-AUT-002_04_ PLC Communication Table”.

5.3 Fuel Cell Data Interface

EMCS commands and supervises the fuel cell.

The data interface between the EMCS and the fuel cell will be based on Modbus TCP.

The interface will allow to read the power set-point received by the EMCS. It will also provide information on the capability of the fuel cell to respect the power limitation imposed by such set-point within the given design tolerance (as opposite to the presence of an internal fault that prevents it).

No hardwired signals are shared between the EMCS and the fuel cell.

The signal list of the data interface with the Fuel Cell will be as reported in the document “Crosswind Modbus Table - Main PLC - External Cut v3”.

5.4 Solar farm Data Interface

EMCS commands and supervises the solar farm.

The data interface between the EMCS and the solar farm will be based on ModbusTCP.

The interface will allow to read the power set-point received by the EMCS.

It will also provide information on the capability of the solar farm to respect the power limitation imposed by such set-point within the given design tolerance (as opposite to the presence of an internal fault that prevents it) and the signals that allows to communicate the commands to the EMCS regarding the solar farm CB SG-200D2.

No hardwired signals are shared between the EMCS and the solar farm.

The signal list of the data interface with the Electrolyzer will be as reported in the document “HKN1-02-REG-341 Manual for controlling the solar farm via the client connector REV A”.

5.5 Wind Farm Data Interface

The EMCS receives information from the data interface of the Wind Farm SCADA (HV-SCADA).

The data interface between the EMCS and the Wind Farm SCADA (HV-SCADA) will be based on OPC-UA.

The presence of communication between the EMCS and the HV-SCADA is checked intrinsically by the OPC-UA client running in the EMCS.

The IEC-61850 network connection from HNA5 and HNA6-AFA70 on BLPH will not be redundant and it shall be directly connected to HNA6-AFA70, since the EMCS is not allowed to share the same IEC-61850 connection.

The details of the signals exposed by the SCADA refers to Figure 16 Status of Signals & Electrical Sequence.

NOTE: The HNA5 power signal has a sampling rate of 5 seconds and resolution 0.1 MW.

5.6 Electrical Distribution Equipment

The EMCS will supervise and command the equipment of the electrical distribution of the BLPH, including switchgears on the 6.6kV and 66kV sides incoming CB SG-200N1 and 800V SG-200D2 directly. However, the other outgoing feeders of SG-200N1 or main items (UPSs) are supervised and directly controlled by PCS.

The data interface of the EMCS with the electrical distribution equipment of the BLPH will be based on IEC-61850 and Modbus TCP/IP.

5.7 OLTC/AVR Data Interface

The EMCS supervises and controls the AVR/OLTC of the TR-100AD1 6.6kV/66kV transformer.

The HMI can set the AVR/OLTC in AUTO or MANUAL mode, the latter mode intended to enable the possibility to directly control the OLTC position.

EMCS can provide the command to RAISE and the command to LOWER the position of the OLTC directly to the AVR, allowing the OLTC remote control by operator.

The data interface between the EMCS and the AVR will be based on Modbus TCP.

In MANUAL mode the operator pushes the buttons on the HMI which will allow EMCS to INCREASE and DECREASE movements of the OLTC position (one request, one step). In more details, the HMI will write the value 1 in the TapLower or TapRaise signal (of the EMCS OPC UA interface) to perform the related operation. Once the EMCS sends the commands to the AVR interface, it auto resets to zero the TapLower and TapRaise signals.

The EMCS shall provide to the AVR of the OLTC the set-point voltage target on the secondary winding (the 6.6 kV side). Such value being a parameter with default value 6.6 kV. The EMCS shall allow to set this value from the data interface of the CCS SCADA.

Only in RESEARCH MODE, the EMCS shall allow to set the AVR/OLTC in MANUAL mode or AUTO mode, from the data interface of the CCS SCADA.

In AUTO mode the operator writes a SET-POINTs, EMCS checks the error between BLPH voltage and the set-point and EMCS sends the command to AVR to move the OLTC cursors INCREASE or DECREASE (one request, one step) at each step EMCS re-check the error, reiterating the control and commands if necessary.

5.8 PCS and LV Loads

The EMCS exchange real-time signals with the Process Control System (PCS) in order to:

- Coordinate the operation of the packages with PCS (by requests and permissive signals);
- Request the opening/closing of the LV contactors (which are controlled by means of the PCS), in order to manage the load shedding.
- Obtain the hydrogen storage level;
- Obtain time reference for its time synchronization of server's clocks.

The data interface between the EMCS and the PCS will be based on the protocol Modbus TCP.

1 INTRODUCTION

1.1 PROJECT OVERVIEW

Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.

Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.1.1 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

Figure 1 HOLLANDSE KUST NOORD WIND PARK Location Map

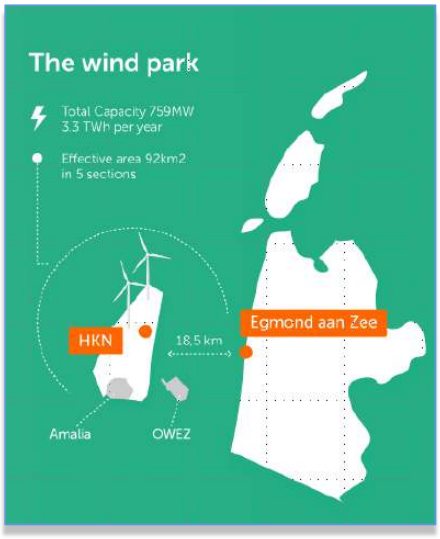

Figure 2 - Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile located on coordinates E 590719.1, N 5841602.3 is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

1.1.2 Project Concept

All components included in the BLPH will be integrated onshore on a topsides and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

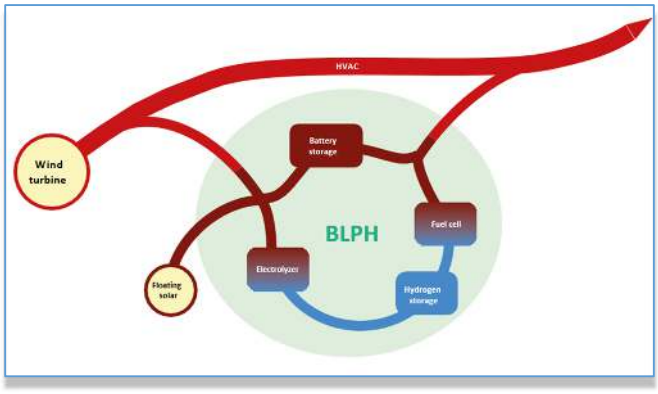

Figure 3 – BLPH Concept

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.

The purpose of the BLPH s to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

2 DOCUMENT SCOPE

Scope of this document is to provide an approximate calculation for controller loading for SIS.

This document can be taken as a reference for detail engineering based on controller loading calculation provided. Refer to attachment-1.

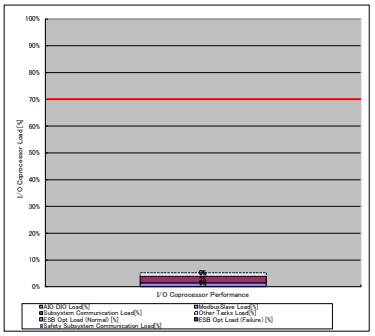
Main CPU Performance

Main CPU Performance

	Estimated Performance	
	Dual	Single
CPU Idle Time[%]	81%	90%
CPU Idle Time[sec/60sec]	49	54
Total Load[%]	19%	10%
Total Execution Time[ms/scan]	57	29
Execution Time[%]	7%	4%
Execution Time[ms/scan]	21	13
External Integration Load[%]	4%	3%
External Integration Exec Time[ms/scan]	13	9
Other Tasks Load[%]	8%	2%
Other Tasks Exec Time[ms/scan]	23	7

Limitation on R4.01.00:
When the CPU load or I/O coprocessor load exceeds 70%, the input processing of SCS is stopped. This causes all the input status to become BAD.
This occurs only when the scan period shorter than 250ms is specified.
This limitation was released with R4.01.01 and R4.02.00.

IO Coprocessor Performance



I/O Coprocessor Performance

	Estimated Performance
IO_Cop Idle Time[%]	95%
IO_Cop Idle Time[sec/60sec]	57
Total Load[%]	5%
Total Execution Time[ms/scan]	16
AIO DIO Load[%]	1%
AIO DIO Time[ms/scan]	4
ModbusSlave Load[%]	0%
ModbusSlave Time[ms/scan]	0
Subsystem Communication Load[%]	2%
Subsystem Communication Time[ms/scan]	7.48
Safety Subsystem Communication Load[%]	0%
Safety Subsystem Communication Time[ms/sca	0
Other Tasks Load[%]	1%
Other Tasks ExecutionTime[ms/scan]	4
ESB Opt Load (Normal) [%]	0%
ESB Opt Load (Normal) [ms/scan]	0
ESB Opt Load (Failure) [%]	0%
ESB Opt Load (Failure) [ms/scan]	0

IO_Cop:
"IO_Cop" is the coprocessor for IO processing on SCP461 and S2CP471. On these CPUs, IO processing was separated from main CPU to improve the performance of IEC logic execution.

ESB Opt Load (Normal):
The load about the optical ESB bus commniuication when the ESB communication is normal.

ESB Opt Load (Failure):
The maximal increased load about the optical ESB bus communication when at least one of the ESB communication bus fails. While both of the ESB communication bus are normal, the ESB Opt Load (Failure) remains 0%

Limitation on R4.01.00:
When the CPU load or I/O coprocessor load exceeds 70%, the input processing of SCS is stopped. This causes all the input status to become BAD.
This occurs only when the scan period shorter than 250ms is specified.
This limitation was released with R4.01.01 and R4.02.00.

*1 Input the number of the single IOMs and the number of the pair of dual-redundant IOMs respectively.
ex. If two DI modules are used dual-redundantly, enter 1 into the IOM (Dual-redundant) cell.

*2 Input number of Programs which classified it's complexity.
See below complexity guide. See also the "Example of complexity of a POU" sheet.

	Description	Channels	Size
Large	VOTER, SYS_*,... Rich	10+	2+ KB
Middle	AI/DI mixed, Ordinary Logic	4 to 8	1 to 2KB
Small	DI Rich, Simple Logic	1 to 6	1- KB

1 POU is estimated to have the following resources approximately.
5 ch/POU (In case of 12ch/IOM)
0 Mapping block/POU

*3 Input average number of data for each connection.
ex. If SCS0101 communicates SCS0102 with 50 send data and 50 receive data,
then input "50" for this parameter. In this case, input "1" for the "Number of Station".

*4 Input number of Modbus Slave connection (sum of ALR1x1 ports and ALE111 connections)
whose access period is faster than 100ms.
(If the access period of a Modbus Slave connection is longer than 100ms,
the load of the Modbus Slave connection is negligible.)

*5 Input the number of ALR1x1/ALE111 for SubSystem Communication.
ex. If one ALR1x1 for two PLCs is implemented for SubSystem connection,
input "1" for the "Number Of ALR1x1".
If two ALR1x1s for redundant configuration are implemented for SubSystem connection,
input "2" for the "Number Of ALR1x1".

*6 Input the total word number to be communicated by SubSystem Communication.
(A word is two bytes.)
ex. If the SCS reads 50 words data from PLC1, and writes 50 words data to PLC1,
and reads 50 words data from PLC2, input 150 for the "Number Of CommWord".

*7 Input the following data.
No Optical ESB Bus Repeaters : 0
Using Optical ESB Bus Repeaters :
Maximum length (km) of optical cable from the CPU node to the farthest I/O node. The length is up to 50km.

For better accuracy, input the calculated distance according to the following formula.
$\Sigma i\ Yi*Xi/Z$
i= from 1 to number of the I/O nodes extended by the Optical N-ESB/ESB Bus Repeaters
Xi = number of the IOMs mounted in the I/O node i
Yi = length of optical cable from the CPU node to the I/O node i (km)
Z= Total number of the IOMs in the group

*8 ex. If the SCS receives the link transmission data from 3 station, input 3 into the parameter.
Number of Station includes SCS and FCS.
If the SCS receives the link transmission data from 2 SCS and 3 FCS, input 5 into the parameter.

*9 Set "True" when "Locking of Internal Variables" on SCS Constants Builder is set to "Enable".
If you set "Enable" to "Locking of Internal Variable", the Execution Time of SCS increases.
Please refer to "Engineering Guide Vol. 1" (IM 32P01C10-01EN) in detail.

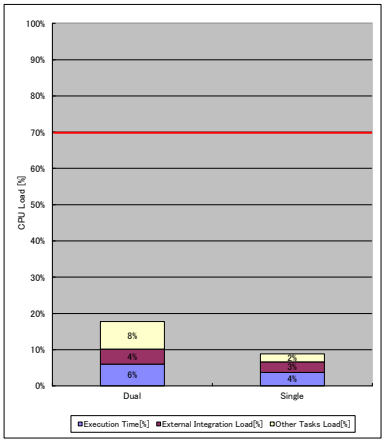
*10 Set "True" if N-IO node is connected to the path from the CPU node to the FIO node.
If you set "True" to "N-IO Node Connection", the load about the optical ESB bus commniuication increases.

*11 Note that "Number of IOM" is the sum of the following:
"N-IO (Single)", "N-IO (Dual-redundant)", "FIO (Single)" and "FIO (Dual-redundant)".
This is not including the number of ALR1x1/ALE111 for Subsystem communication or Modbus slave communication (hereinafter referred to as ALR1x1/ALE111),
while the maximum number of IOM that can be mounted on a SCS, that is 110, is including the number of ALR1x1/ALE111.
So this tool can not check whether the number of IOM exceeds 110 if ALR1x1/ALE111 are implemented.
For detail of maximum configuration, please refer to "ProSafe-RS Safety Instrumented System Overview (for Vnet/IP)" (GS 32P01B10-01EN).

*12 Input the total word number to be communicated by Safety Subsystem Communication.
Maximum number of CommWord per S2LP131 is 1000 words(a word = two bytes).
ex. When acquiring data(a safety data(8 words) and two non-safety data(2 words each)) from each of 50 GS01 devices,
input 600 (=(8+(2*2))*50) for the "Number Of Safety Subsystem CommWord".

*13 Applicable target is GS01.

Crosswind BLPH
Doc No: 1724000594-IN-RE-00008
FGS Controller - SCS0120



Attachment - 1

This tool is for SCS R4.01.00 or later with S2SC70

Item	Input Parameters		
Common	Scan Period [ms]	500	
I/O (The sum of I/O groups)	Number of IOM *11	23	(Read Only) The maximum number of IOM is 110.
	N-IO (Single)	0	(Read Only)
	N-IO (Dual-redundant)	0	(Read Only)
	FIO (Single)	0	(Read Only)
	FIO (Dual-redundant)	23	(Read Only)
	Number Of ALR1x1/ALE111 for Subsystem comm.	0	(Read Only)
	Number Of CommWord	0	(Read Only)
	Number Of S2LP131 for Safety Subsystem comm.	0	(Read Only)
	Number Of Safety Subsystem CommWord	0	(Read Only)
	Number Of Safety Device for Safety Subsystem comm.	0	(Read Only)
N-IO group1	Maximum Extention Distance[km] *7	0	Classify the N-IO nodes into three or less groups as to the maximum length of optical cable. Input necessary parameters in each group. In case of no Optical N-ESB Bus Repeaters, input 0 to Maximum Extension Distance.
	IOM (Single) *1	0	
	IOM (Dual-redundant) *1	0	
N-IO group2	Maximum Extention Distance[km] *7	0	
	IOM (Single) *1	0	
	IOM (Dual-redundant) *1	0	
N-IO group3	Maximum Extention Distance[km] *7	0	
	IOM (Single) *1	0	
	IOM (Dual-redundant) *1	0	
FIO group 1	Maximum Extention Distance[km] *7	0	Classify the FIO nodes into three or less groups as to the maximum length of optical cable. Input necessary parameters in each group. In case of no Optical ESB Bus Repeaters, input 0 to Maximum Extension Distance.
	N-IO Node Connection (True/False) *10	FALSE	
	IOM (Single) *1	0	
	IOM (Dual-redundant) *1	23	
	Number Of ALR1x1/ALE111 for Subsystem comm. *5	0	
	Number Of CommWord *6	0	
	Number Of S2LP131 for Safety Subsystem comm.	0	
	Number Of Safety Subsystem CommWord *12	0	
	Number Of Safety Device for Safety Subsystem comm. *13	0	
FIO group 2	Maximum Extention Distance[km] *7	0	
	N-IO Node Connection (True/False) *10	FALSE	
	IOM (Single) *1	0	
	IOM (Dual-redundant) *1	0	
	Number Of ALR1x1/ALE111 for Subsystem comm. *5	0	
	Number Of CommWord *6	0	
	Number Of S2LP131 for Safety Subsystem comm.	0	
	Number Of Safety Subsystem CommWord *12	0	
	Number Of Safety Device for Safety Subsystem comm. *13	0	
FIO group 3	Maximum Extention Distance[km] *7	0	
	N-IO Node Connection (True/False) *10	FALSE	
	IOM (Single) *1	0	
	IOM (Dual-redundant) *1	0	
	Number Of ALR1x1/ALE111 for Subsystem comm. *5	0	
	Number Of CommWord *6	0	
	Number Of S2LP131 for Safety Subsystem comm.	0	
	Number Of Safety Subsystem CommWord *12	0	
	Number Of Safety Device for Safety Subsystem comm. *13	0	
IEC Logic *2	POU Large	11	(According to the input POU numbers, the total IO channels processed by all POUs are presumed at least 230 ch, at max 405ch.)

ModbusSlave Load[%]	0%
ModbusSlave Time[ms/scan]	0
Subsystem Communication Load[%]	1%
Subsystem Communication Time[ms/scan]	7.48
Safety Subsystem Communication Load[%]	0%
Safety Subsystem Communication Time[ms/sc	0
Other Tasks Load[%]	1%
Other Tasks ExecutionTime[ms/scan]	7
ESB Opt Load (Normal) [%]	0%
ESB Opt Load (Normal) [ms/scan]	0
ESB Opt Load (Failure) [%]	0%
ESB Opt Load (Failure) [ms/scan]	0

IO_Cop:
"IO_Cop" is the coprocessor for IO processing on SCP461 and S2CP471. On these CPUs, IO processing was separated from main CPU to improve the performance of IEC logic execution.

ESB Opt Load (Normal):
The load about the optical ESB bus commnuication when the ESB communication is normal.

ESB Opt Load (Failure):
The maximal increased load about the optical ESB bus communication when at least one of the ESB communicaiton bus fails. While both of the ESB communication bus are normal, the ESB Opt Load (Failure) remains 0%

Limitation on R4.01.00:
When the CPU load or I/O coprocessor load exceeds 70%, the input processing of SCS is stopped. This causes all the input status to become BAD.
This occurs only when the scan period shorter than 250ms is specified.
This limitation was released with R4.01.01 and R4.02.00.

*1 Input the number of the single IOMs and the number of the pair of dual-redundant IOMs respectively.
ex. If two DI modules are used dual-redundantly, enter 1 into the IOM (Dual-redundant) cell.

*2 Input number of Programs which classified it's complexity.
See below complexity guide. See also the "Example of complexity of a POU" sheet.

	Description	Channels	Size
Large	VOTER, SYS_*,... Rich	10<	2< KB
Middle	AI/DI mixed, Ordinary Logic	4 to 8	1 to 2KB
Small	DI Rich, Simple Logic	1 to 6	1- KB

1 POU is estimated to have the following resources approximately.
9 ch/POU (In case of 12ch/IOM)
0 Mapping block/POU

*3 Input average number of data for each connection.
ex. If SCS0101 communicates SCS0102 with 50 send data and 50 receive data,
then input "50" for this parameter. In this case, input "1" for the "Number of Station".

*4 Input number of Modbus Slave connection (sum of ALR1x1 ports and ALE111 connections)
whose access period is faster than 100ms.
(If the access period of a Modbus Slave connection is longer than 100ms,
the load of the Modbus Slave connection is negligible.)

*5 Input the number of ALR1x1/ALE111 for SubSystem Communication.
ex. If one ALR1x1 for two PLCs is implemented for SubSystem connection,
input "1" for the "Number Of ALR1x1".
If two ALR1x1s for redundant configuration are implemented for SubSystem connection,
input "2" for the "Number Of ALR1x1".

*6 Input the total word number to be communicated by SubSystem Communication.
(A word is two bytes.)
ex. If the SCS reads 50 words data from PLC1, and writes 50 words data to PLC1,
and reads 50 words data from PLC2, input 150 for the "Number Of CommWord".

*7 Input the following data.
No Optical ESB Bus Repeaters : 0
Using Optical ESB Bus Repeaters :
Maximum length (km) of optical cable from the CPU node to the farthest I/O node. The length is up to 50km.

For better accuracy, input the calculated distance according to the following formula.
$\Sigma i\ Yi*Xi/Z$
i= from 1 to number of the I/O nodes extended by the Optical N-ESB/ESB Bus Repeaters
Xi = number of the IOMs mounted in the I/O node i
Yi = length of optical cable from the CPU node to the I/O node i (km)
Z= Total number of the IOMs in the group

*8 ex. If the SCS receives the link transmission data from 3 station, input 3 into the parameter.
Number of Station includes SCS and FCS.
If the SCS receives the link transmission data from 2 SCS and 3 FCS, input 5 into the parameter.

*9 Set "True" when "Locking of Internal Variables" on SCS Constants Builder is set to "Enable".
If you set "Enable" to "Locking of Internal Variable", the Execution Time of SCS increases.
Please refer to "Engineering Guide Vol. 1" (IM 32P01C10-01EN) in detail.

*10 Set "True" if N-IO node is connected to the path from the CPU node to the FIO node.
If you set "True" to "N-IO Node Connection", the load about the optical ESB bus commnuication increases.

*11 Note that "Number of IOM" is the sum of the following:
"N-IO (Single)", "N-IO (Dual-redundant)", "FIO (Single)" and "FIO (Dual-redundant)".
This is not including the number of ALR1x1/ALE111 for Subsystem communication or Modbus slave communication (hereinafter referred to as ALR1x1/ALE111),
while the maximum number of IOM that can be mounted on a SCS, that is 110, is including the number of ALR1x1/ALE111.
So this tool can not check whether the number of IOM exceeds 110 if ALR1x1/ALE111 are implemeted.
For detail of maximum configuration, please refer to "ProSafe-RS Safety Instrumented System Overview (for Vnet/IP)" (GS 32P01R10-01EN).

*12 Input the total word number to be communicated by Safety Subsystem Communication.
Maximum number of CommWord per S2LP131 is 1000 words(a word = two bytes).
ex. When acquiring data(a safety data(8 words) and two non-safety data(2 words each)) from each of 50 GS01 devices,
input 600 (=(8+(2*2))*50) for the "Number Of Safety Subsystem CommWord".

*13 Applicable target is GS01.

GENERAL NOTES:

1 System Cable Schedule is prepared based on the following reference documents:
A) Network Architecture for Crosswind BLPH : 1724000594-IN-DD-00015
2 Details of System Cables used are as follows

IT| CABLE	SERVICE	DESCRIPTION
a. CAT6 S/UTP	Vnet/IP BUS-1 and BUS-2	Yokogawa Control Network (Vnet/IP)
b. CAT6 S/UTP	Safety Network	SIS Vnet/IP Network
c. CAT6 S/UTP	PIN	Plant Information Network (Ethernet)
d. CAT6 S/UTP	Modbus/Profinet	Ethernet Communication Module
e. CAT6 S/UTP	Modbus	MODBUS Protocal communication to CI Server
f. CAT6 S/UTP	NTP Interface	Time Synchronising
g. PRE-FAB cables	Conditioned Electrical Signals	PCS IO Card Signal Processing
h. FO Cable	PTP Interface	PTP Interface

3 Colour code summary for cables

S.No	Item	Cable Type	Color
1	Vnet/IP Bus 1	CAT-6	Red
2	Vnet/IP Bus 2	CAT-6	Blue
3	PIN Network	CAT-6	Green
4	FO Patch Cable	Single Mode Fiber optic cable	Yellow
5	Modbus/Profinet TCP/IP	CAT-6	Green
6	KVM Connectivity	CAT-6	Grey
7	NTP Interface	CAT-6	Grey
8	IEC61850/Service	CAT-6	Grey
9	OPC UA	CAT-6	Grey
10	PTP	Multi Mode Fiber optic cable	Aqua
11			
12			

*NOTE: Cable colour code shall be changed during detailed design
4 Solar Farm, Wind Farm ,ICPP and Splice box connections are considered outside battery limits

This document undergoes an issuance cycle within EDMS "Fusionlive".
Its distribution is electronically controlled. Once printed shall be considered as “NOT CONTROLLED” copy

1 INTRODUCTION

1.1 PROJECT OVERVIEW

Crosswind, a Shell and Eneco joint venture, was awarded the tender to develop the offshore Hollandse Kust Noord (HKN) wind farm, located 18.5km off the coast of Netherlands near the town of Egmond aan Zee. The consortium plans to have HKN operational in 2023 with an installed capacity of 759MW generating at least 3.3TWh per year. This is sufficient renewable power to supply more than 1 million Dutch households with green electricity.

Offshore wind farms produce intermittent electricity and balancing these dips and peaks and integrating this electricity into the national energy system requires new technologies. For this reason, the offshore wind farm will include several new technologies that could be implemented at full-scale in the future. The new technologies being explored include a floating solar park, a short-duration battery storage as well as long-term storage via green hydrogen produced by water electrolysis and subsequently consumed in a fuel cell. The combination of these individual measures, herein referred to as the Base Load Power Hub (BLPH) will ensure a continuous power supply regardless of the wind situation.

1.1.1 Project Location

The Hollandse Kust Noord (HKN) wind farm is located 18.5km off the coast of the Netherlands near the town of Egmond aan Zee.

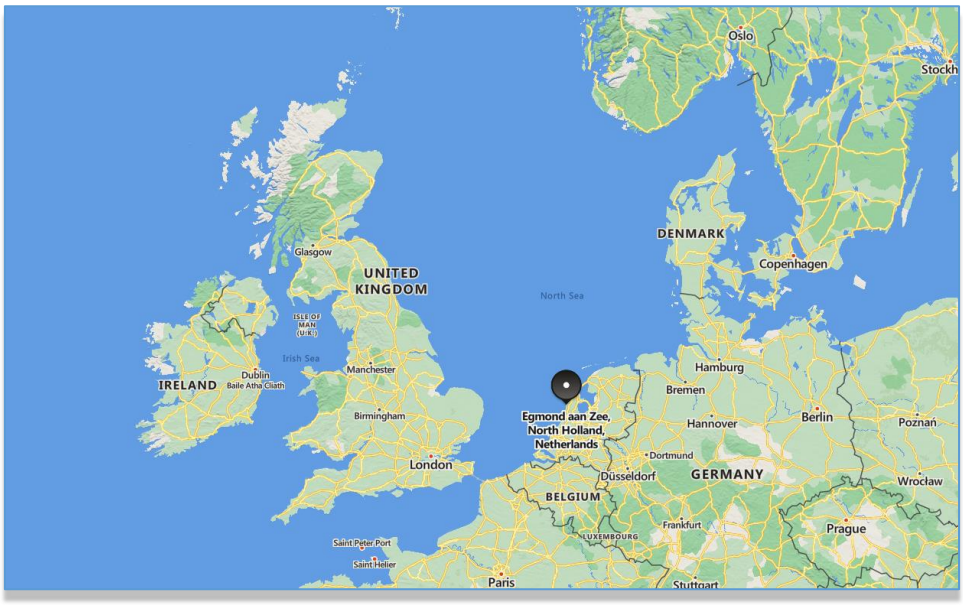

Figure 1 HOLLANDSE KUST NOORD WIND PARK Location Map

CROSSWIND	HOLLANDSE KUST NOORD WIND PARK Project Contract No. CW-I-WP4-2023-05	ROSETTI MARINO
Document Title:	Logic diagram print out PCS	Sheet 6 of 1552 Date: 16/09/2025 Rev: 01

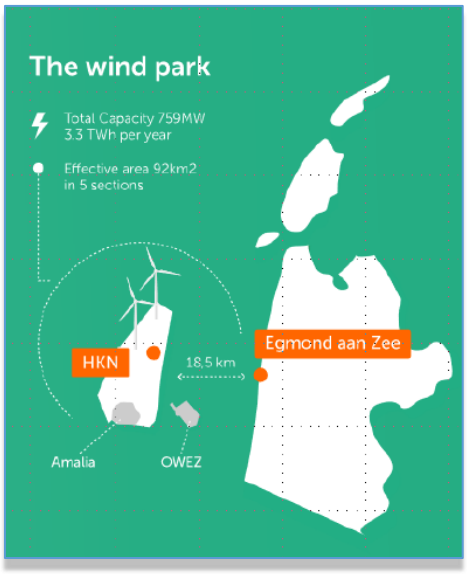

Figure 2 - Wind Park Details

The wind farm will consist of No. 69 x 11.5MW wind turbine generators each to be installed on a dedicated monopile structure. A 70th monopile located on coordinates E 590719.1, N 5841602.3 is reserved for installing the platform accommodating the BLPH. The monopile structure was designed and installed by Van Oord Offshore Wind (VooW) and therefore not part of the BLPH scope.

1.1.2 Project Concept

All components included in the BLPH will be integrated onshore on a topsides and installed in an offshore location within the boundaries of the HKN wind farm. At its simplest, the BLPH will store energy during periods of high electricity generation from renewable sources (a wind turbine generator and the floating solar PV farm) and release it during periods of low generation. In practice. It is expected that the energy stored will supplement generation from renewable sources to ensure that at least 1.0MW of power is exported to the electrical grid regardless of wind/solar availability.

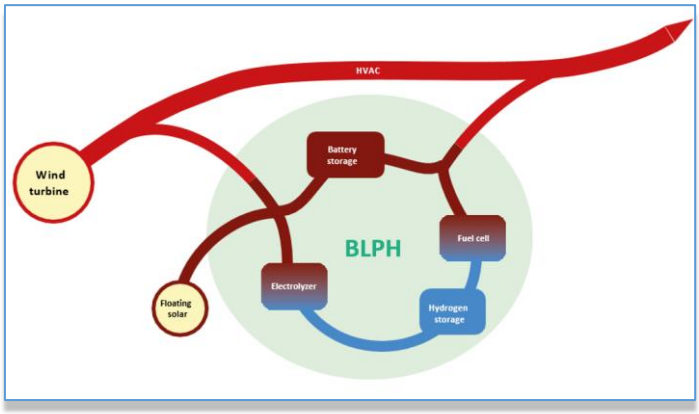

Figure 3 – BLPH Concept

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

Electricity in the BLPH will be stored in the form of electrons in a battery energy storage system (BESS) as well as converted into green hydrogen via water electrolysis. When the power output from the connecting wind turbine drops to below 1 MWe, the BLPH will return its stored energy to supplement the remaining power output. This will be by discharging the BESS, while stored hydrogen will be converted back into electricity using a fuel cell to extend the discharge duration.

The purpose of the BLPH s to function as a testbed for the integration of energy storage technologies with renewable generation. It is expected that equipment installed on the BLPH will operate as Normally Unmanned Installation for at least two (2) years with no or minimal maintenance and it will have its own independent control room with the ability to communicate with Crosswind's control room.

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

2 DOCUMENT SCOPE

Self-documentation is printouts the contents defined on the various builders and the tuning parameters to a document as archived materials.

Table 2 – Yokogawa Project Documents

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

2.3 DEFINITIONS AND ABBREVIATIONS

ALE	Yokogawa Ethernet Communication Module
AMS	Alarm Management System
BLPH	Base Load Power Hub
CAP	Critical Action Panel
Centum VP	Yokogawa's DCS Product
PCS	Process Control System
CI	Collaborative Information
COMPANY	Crosswind
CONTRACTOR (CTR)	ROSETTI MARINO S.p.A.
DCS	Distributed Control System
DEP	Design and Engineering Practice
DOCUMENT NAME	Document Title
EMCS	Electrical Monitoring and Control System
EPC	Engineering, Procurement Construction
EWS	Engineering Workstation
FCS	Field Control Station
FGS	Fire & Gas System
GSD	General Station Description
HART	Highway Addressable Remote Transducer
HKN	Hollandse Kust Noord
HMI	Human Machine Interface
HV	High Voltage
HVAC	Heating, Ventilation and Air Conditioning
HV-SCADA	The given name for the COMPANY's control system for the HKN wind farm infrastructure. BLPH's control system shall operate autonomously but will interface with HV-SCADA.
IAMS	Instrument Asset Management System

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

IEC	International Electrotechnical Commission
ISO	International Organization for Standardization
ITER	Instrument & Telecoms Equipment Room
ITP	Inspection and Test Plan
MAC	Main Automation Contractor
MCC	Motor Control Centre
NA	Not Applicable
OER	Onshore Equipment Room
OPC	OLE (Object Linking Embedded) for Process Control
P&ID	Piping and Instrument Diagram
PCS	Process Control System
PIN	Plant Information Network
PRM	Plant Resource Manager
PROJECT	HOLLANDSE KUST NOORD WIND PARK Project
SCADA	Supervisory Control and Data Acquisition
SHALL	An absolute requirement.
SHOULD	This word indicates a recommendation that whilst preferred may not be implemented provided some equivalent is proposed and agreed by COMPANY. The full implications must be understood and carefully weighed before choosing a different course.
SIF	Safety Instrumented Function
SIL	Safety Instrumented Level
SIS	Safety Instrumented System
TCP/IP	Transmission Control Protocol/Internet Protocol
Vnet/IP	Yokogawa Virtual Network
WSUS	Window Security Update Services

Table 3 - Definitions and Abbreviations

3 LOGIC DIAGRAM PRINT OUT PCS

Self-documentation are the print out of the contents defined on the various builders and the tuning parameters to a document as archived materials. The document can be printed to a PDF file instead of papers. Printing to papers or PDF files is performed in the background. Use letter-sized (US) or A4 paper.

"Print Parameters" can be performed to print the tuning parameters of field control station in one document. It can also print out the tuning parameters of a specified function block by designating its tag name.

3.1 PCS CONTROLLER FCS0101 LOGIC PRINT OUT

Refer Attachment-1 FCS0101 Controller Logic Print Out

This document undergoes an issuance cycle within EDMS Fusionlive". Its distribution is electronically controlled. Once printed shall be considered as "NOT CONTROLLED" copy

Project Property:BLPH-CW1

Name and Position

Project Name	BLPH-CW1
Position	C:\CENTUMVP\eng\BKProject\
Project Comment	
Alias of Project	
User authentication	
Use Windows user names as HIS user names	NO

Outline

Software Information	
Model Name	CENTUM VP
User Name	Windows User
Organization Name	BLPH-CW1
Project information	BLPH-CW1

Constant

Domain Number	1

Detailed Setting

Put Engineering Unit Symbol into MAN Mode	YES
Put Switch Position Label into MAN Mode	YES
Plant Hierarchy	
Start Number	1
Maximum Number of use	32767
Number of in use (Number of Custom facilities)	1287(1000)
Display FF-PID in same style as PID	NO
Do not allow online change of alarm detection (AF)	NO
Enable advanced features of editing headers and footers for self-documentation	YES
Show guide line for aligning I/O area on FCS builder	NO
Define tag name hierarchies	NO
Enable sheet-link on HIS	YES
Apply same permission level of PV to CPV	YES
Prohibit setting SV to a value beyond the range of SVL and SVH	NO
Hide the information related to disabled alarms on HIS	NO
Change the shape of tag marks and alarm marks for each alarm priority	NO

Graphic

Do not apply color change to the transparent control object if Transparent is checked	YES
Exchange text and background colors if Invert is checked	YES
Blink background if Invert is checked while a blinking action is active	YES

UACS

Alarm Management Type	Coexistence
Configuration Operation Keyboard	
ACK key acknowledges	The selected A&E Messages
Configuration Suppression	
Display the recovery message received in Standby.	NO

CAMS for HIS

PROJECT:	BLPH-CW1	FILE NAME:	Project.l	SHEET:		YOKOGAWA	PAGE:2-1-2

Alarm action	
Method	Consolidated
Display Alarm status of suppressed tag	
Detection=Disable	Display alarm status in CAMS for HIS style
Priority=Logging/Reference	Display alarm status in CAMS for HIS style
Suppression=ON	Display alarm status in CAMS for HIS style
Create R3/R4.01 Compatible Database	NO
Multiple project connection	
Equalize the alarm & event data and CAMS engineering data with connected projects	NO
Suppression	
Do not generate recovery message when Suppression is started.	NO
Save data for analysis	
Shelving historical information	YES

Type	
Station Type	AFV30D Duplexed Field Control Unit(for Vnet/IP and FIO, 19" Rack Mountable Type)
Database Type	General-Purpose
Domain number	01
Station number	01
Component number	
Station comment	
Alias of Station	
Station Status Display	
Upper Equipment Name	
Number of Control Drawings	200
Module-based Engineering	NO
Define the SEQ libraries in AD Suite.	NO
Constant	
Medium-speed Scan	YES
Medium-speed Scan Period[msec]	500
Fast Scan	YES
Fast-Scan Period[msec]	200
MC Block	
Pulse Width[sec]	2
Serial Startup Interval[sec]	0
MLD-SW AUT/CAS	AUT
SEBOL Statement	
"drive" Statement Action Type	1
Start Number for user-defined block-type	10000
Number of User-Defined Block-with-Data	380
IOM Online Updating	
Make block input-side IOP	NO
PID Pulse Width Output	
CENTUM V Compatible MV Display	NO
PI-HLD Action after Hold	
CENTUM-XL Compatible	NO
Sequence Table Algorithm	
CENTUM-XL Compatible Sequence Tables	NO
THEN/ELSE Has Higher Precedence	NO
dPV/dCPV Output from SUB Becomes Zero Right After IOP	NO
Accept Batch-End during EMST	YES
Options	DIOENH
Constant 2	
SS-DUAL PV Update during Deviation Alarm	NO
Alarm Notify Action when all AOF released	NO
Specify Reference Station for Tag-List	NO
Station Name	
Annunciator Message with Data	
No.	1
Annunciator Message Head Number	0
Annunciator Message Tail Number	0
Printing Message Head Number	0
Increase Number of System Common Switches	NO
Preset MV valid immediately	Preset MV valid at next scan
Constant 3	
MV of Switch Instrument/MC Instrument follows its CSV change	NO
TM/CTS/CTP blocks hold PALM after CTUP	NO
Raised %AN sends out alarm when AOF released	YES

PROJECT:	BLPH-CW1	FILE NAME:	SFDATA.l	SHEET:		YOKOGAWA	PAGE:3-1-2
STATION:	FCS0101	SAVED DATE:	7/26/2025 1:21:26 PM	COMMENT:

Suppress OOP alarms during online maintenance of ALP121 and dual -redundant ALP111	NO
Suppress system alarm when CALCU calculation error occurs	YES
Use HKU of System Cabinet	NO
Initiate process alarm when CAL is set or released	NO
Allow to change function block to PRD mode while CAL is on(XL compatible)	NO
LC64-E starts with its internal status intact when FCS performs an initial start(except offline download)	YES
Enable output limiter in PRD mode (XL compatible)	NO
Pass calculation block's input QST status to CPV	NO
CENTUM-XL compatible IOP reactions	
Main inputs	NO
Set PV of %Z/%Y to zero upon failure of a DI module	NO
SEBOL Group Assignment Statement – adhere to the order specified in the variable list during data setting	YES
Command	

State Transition

Maximum Specification Number	16
State Transition Matrix	Matrix1

Line1

Make IO Bus Dual-Redundant	YES
Interface Card Type	SB301

Network

Vnet/IP	YES
Control Bus TCP/IP Settings	
Host name	FCS0101
IP address	172.16.1.1
Subnet mask	255.255.0.0
