CCC-Exempt Declaration

As we know, CCC certification is mandatory in China for defined products, and CNCA is the responsible committee for the definition of CCC application range. So please visit the website below for the latest bulletin (No. 45 of year 2014) of CNCA for CCC:

http://www.cnca.gov.cn/xxgk/ggxx/2014/201512/t20151230_44252.shtml

Energy storage devices

Description of product, product group or product family

Product list:
See list on next page(s).

Description of product function:

Energy storage device based on batteries or double layer capacitors for 12Vdc or 24Vdc.

Reason why CCC certification is not required:

For electrical and electronic products, CCC categories only apply to products that can be directly or indirectly connected to power supply over 36V (dc or ac RMS) except for telecommunication terminals, electric welding machines.

Date of creation: 18.07.2018

Declaration of compliance with China RoHS – Devices

Energy storage - UPS-BAT/VRLA/24DC/12AH - 2320322

Energy storage device, lead AGM, VRLA technology, 24 V DC, 12 Ah, tool-free battery replacement, automatic detection, and communication with QUINT UPS-IQ

We herewith declare the compliance of this product with the Chinese marking requirements set forth in the “Management Methods for the Restriction of the Use of Hazardous Substances in Electrical and Electronic Products” (Order No. 32 of the MITT, etc.) and SJ/T 11364-2014 marking for the restriction of the use of hazardous substances in electrical and electronic product.

This product can be recycled and used safely during its environmentally friendly use period.

The Environmentally Friendly Use Period (EFUP) for the product is 3 years, unless otherwise marked. The Environmentally Friendly Use Period is valid only when the product is operated under the conditions defined in the product documentation.

This product should be recycled after its environmental protection use period has expired because it may contain substances or elements as shown in the following table:

	Hazardous Substance					
Part Name	**Lead (Pb)**	**Mercury (Hg)**	**Cadmium (Cd)**	**Hexavalent Chromium (Cr(VI))**	**Polybrominated biphenyls (PBB)**	**Polybrominated diphenyl ethers (PBDE)**
Battery	O	O	O	O	O	O
PCB (printed circuit board)[1]	X	O	O	O	O	O

This table is prepared in accordance with the provisions of SJ/T 11364.

O: Indicates that said hazardous substance contained in all of the homogeneous materials for this part is below the limit requirement of GB/T 26572

X: Indicates that said hazardous substance contained in at least one of the homogeneous materials used for this part is above the limit requirement of GB/T 26572

The table shows where these substances may be found in this Electrical and Electronic Product.

[1]) Printed circuit board includes a printed circuit board and its components.

Declaration of compliance with China RoHS – Devices

The information on substances corresponds to our present knowledge as well as the status of legislation mentioned in this declaration on the date of issue. In this respect we specifically take the statements and indications of our suppliers and service providers as a basis.

UPS-CONF

Power Supplies

User Manual

Configuration and Management Software UPS-CONF

2012-07-02

Designation: UPS-CONF

Revision: 01

Order No.: -

This manual is valid for:

Designation	Order No.
UPS-CONF	2320403

Please observe the following notes

In order to ensure the safe use of the product described, you have to read and understand this manual. The following notes provide information on how to use this manual.

The pictured products do always exemplify the concerned topic.

Target audience for this documentation

The use of products described here solely addresses persons, who are qualified and familiar with electrical equipment and the appropriate and relevant safety concepts. Please also read the section titled "Qualified personnel" in the topic titled "Important safety notes (see page 10)".
Phoenix Contact accepts no liability for erroneous handling or damage to products from Phoenix Contact or third-party products resulting from disregard of information contained in this documentation.

Explanation of symbols used and signal words

DANGER
The danger symbol is used to indicate instructions where non-compliance may result in damage to hardware/software or personal injury (in indirect connection with dangerous process peripherals).

NOTE
The note symbol precedes notes that must be strictly observed in order to ensure error-free operation. It also gives you tips and advice on the efficient use of hardware and on software optimization to save you extra work.

The "Additional Details" symbol indicates cross references (hypertext links or bibliographical references) which lead to detailed descriptions of a term or additional details on the context in question.

General terms and conditions of use for technical documentation

Phoenix Contact reserves the right to alter, correct, and/or improve the technical documentation and the products described in the technical documentation at any time and without giving prior notice, insofar as this is reasonable for the user. The same applies to any technical changes that serve the purpose of technical progress. Technical documentation does not contain any guarantees regarding quality, does not describe any fair marketable quality, and does not make any claims in terms of quality guarantees or guarantees regarding suitability for a specific purpose.

The receipt of technical documentation (data sheets, installation instructions, manuals, online help, etc.) does not constitute any further duty on the part of Phoenix Contact to furnish information on alterations to products and/or technical documentation. Any other agreement shall only apply if expressly confirmed in writing by Phoenix Contact.

Please note that the supplied documentation is intended to serve as product-specific documentation only and that you are responsible for checking the suitability and intended use of the products in your specific application, in particular with regard to observing the applicable standards and directives. Although Phoenix Contact makes every effort to ensure that the information and content is accurate, up-to-date, and refers to the state of the art, technical inaccuracies and/or printing errors in the information cannot be ruled out. Phoenix Contact does not offer any guarantees as to the reliability, accuracy or completeness of the information. All information made available in the technical documentation is supplied without any accompanying guarantee, whether expressly mentioned, implied or tacitly assumed.

Phoenix Contact accepts no liability or responsibility for errors or omissions in the content of the technical documentation (data sheets, installation instructions, manuals, online help, etc.).

The aforementioned limitations of liability and exemptions from liability do not apply insofar as liability must be assumed, e.g., in accordance with product liability law, in cases of premeditation, gross negligence, on account of loss of life, physical injury or damage to health, or on account of the violation of important contractual obligations. Claims for damages for the violation of important contractual obligations are, however, limited to contract-typical, predictable damages, provided there is no premeditation or gross negligence, or unless liability is assumed on account of loss of life, physical injury, or damage to health. This ruling does not imply a change in the burden of proof to the detriment of the user.

Statement of legal authority

This documentation, including all illustrations contained herein, is copyright protected. This documentation is to be used for its intended purpose only. All other means of usage are prohibited. Reproduction, translation, and public disclosure, as well as electronic and photographic archiving and modification, require written consent by Phoenix Contact. Violators are liable for damages.

Phoenix Contact reserves all rights in the case of patent award or listing of a registered design. Third-party products are always named without reference to patent rights. The existence of such rights shall not be excluded.

How to contact us

Internet

Up-to-date information on Phoenix Contact products and our Terms and Conditions can be found on the Internet at:

Index 57

1 Functional overview

UPS-CONF is a management software to configure and monitor QUINT-UPS devices, that come with the IQ technology.

This technology with continuous battery monitoring and intelligent management provides you with information about the charging state, remaining runtime, and service life of your battery at all times. Intelligent communication informs you when a situation becomes critical. This reduces the amount of maintenance involved and increases your system availability.

IQ technology means

- Intelligent Battery Control: automatically detects the connected battery type and maximizes the remaining service life of the battery unit via an optimally adapted charging characteristic.
- Intelligent Battery Management: continuous status information is shown for
  - SOC (State of Charge): current charging state and remaining back-up time of the battery unit
  - SOH (State of Health): remaining life expectancy of the battery unit, provides early warning for a potential battery unit failure
  - SOF (State of Function): determines the current performance of the battery unit.
- Intelligent Charging: adapts the charging current and thereby ensures the fastest possible recharging and availability.
- Intelligent communication: the communication of UPS and PC allows configuration, extensive signaling and parameterization.

The IQ technology also works without UPS-CONF. With this software you have an easier monitoring and configurations can be done.

The UPS-CONF software is intended for a PC as well as an IPC (Industrial PC). In this documentation the term "PC" is used to address both.

The configurable QUINT-UPS device is also referred to as the "UPS" in this documentation.

Features supported by the UPS-CONF software

In order to optimally support the IQ technology, UPS-CONF provides the following features:

- Clear overview about condition of mains, battery, UPS device and connection from PC to UPS
- Automatic PC shutdown and restart functionality while the UPS runs in PC-Mode
- Start of application specific programs for system shutdown
- Configuration of switching outputs
- Chronological event logging
- Setting of customized parameters like the maximum charging current
- Choice of user interface language in the Software settings (see page 5).
  Currently supported languages: English, German

The topic titled Application samples (see page 52) guides through some typical scenarios.

2 Software setup

The UPS-CONF software has to be installed on a PC in order to configure and monitor an UPS system. If the buffered load is a PC, the UPS can be operated in the PC-Mode to additionally enable the automatic PC shutdown and restart functionality.

To setup the software, the following steps have to be executed:

1. Make sure all system requirements (see page 4) for the hardware and software are met.
2. Download and install the software (see page 5).
3. Follow the steps in the hardware setup (see page 11).
4. Start the software (see page 15).
5. Become familiar with the software settings (see page 5) supported by the UPS-CONF software and carry out the required settings.

2.1 System requirements

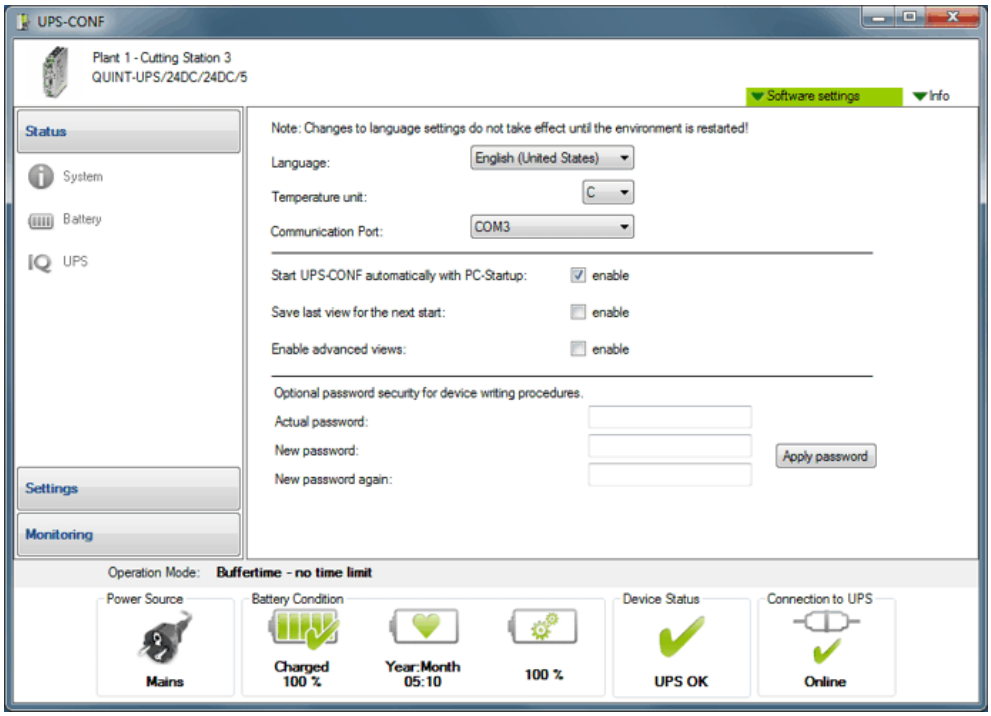
In order to run the UPS-CONF software, your computer must meet the following software and hardware requirements:

Software requirements

- Supported operating systems:
  - Windows 7, 32bit and 64bit
  - Windows Vista SP1
  - XP SP3 (requires .NET Framework 3.5 SP1)
- Supported browser: Internet Explorer version 6 or later

Hardware requirements		
CPU	1 GHz min. 2 GHz recommended	Windows 7 Windows Vista SP1
	Pentium III 1GHz min. 2 GHz recommended	Windows XP SP3
Main memory	1 GB RAM min. 2 GB RAM recommended	Windows 7 Windows Vista SP1
	512 MB RAM min. 1 GB RAM recommended	Windows XP SP3
Main memory used by UPS-CONF	max. 96 MB	
Hard disk drive (recommended) Hard disk used by UPS-CONF	850 MB max. 50 MB	
CD-ROM drive	not necessarily needed	
Interfaces	1 x USB 2.0	
Monitor	VGA, resolution 800 x 600 pixels minimum, 256 colors	
Network	Internet connection needed for program download	

2.2 Installation



The UPS-CONF configuration and management software can be downloaded free of charge at www.phoenixcontact.net/catalog.

To install the software, proceed as follows:

1. Find UPS-CONF at www.phoenixcontact.net/catalog.
2. Save the UPS-CONF_Setup_v....exe file to the preferred download folder.
3. Make sure the IFS-USB-DATACABLE is unplugged.
4. Install UPS-CONF from the selected download folder. Simply follow the screen instructions.
   Read the EULA (End User License Agreement) carefully when it is displayed and agree it to continue the installation.
5. After having completed the UPS-CONF installation, connect the UPS device to the PC (see page 14). If required, select PC-Mode as operating mode (see page 12).
6. As soon as Windows detects the new USB hardware follow the instructions of the driver installation.

2.3 Software settings

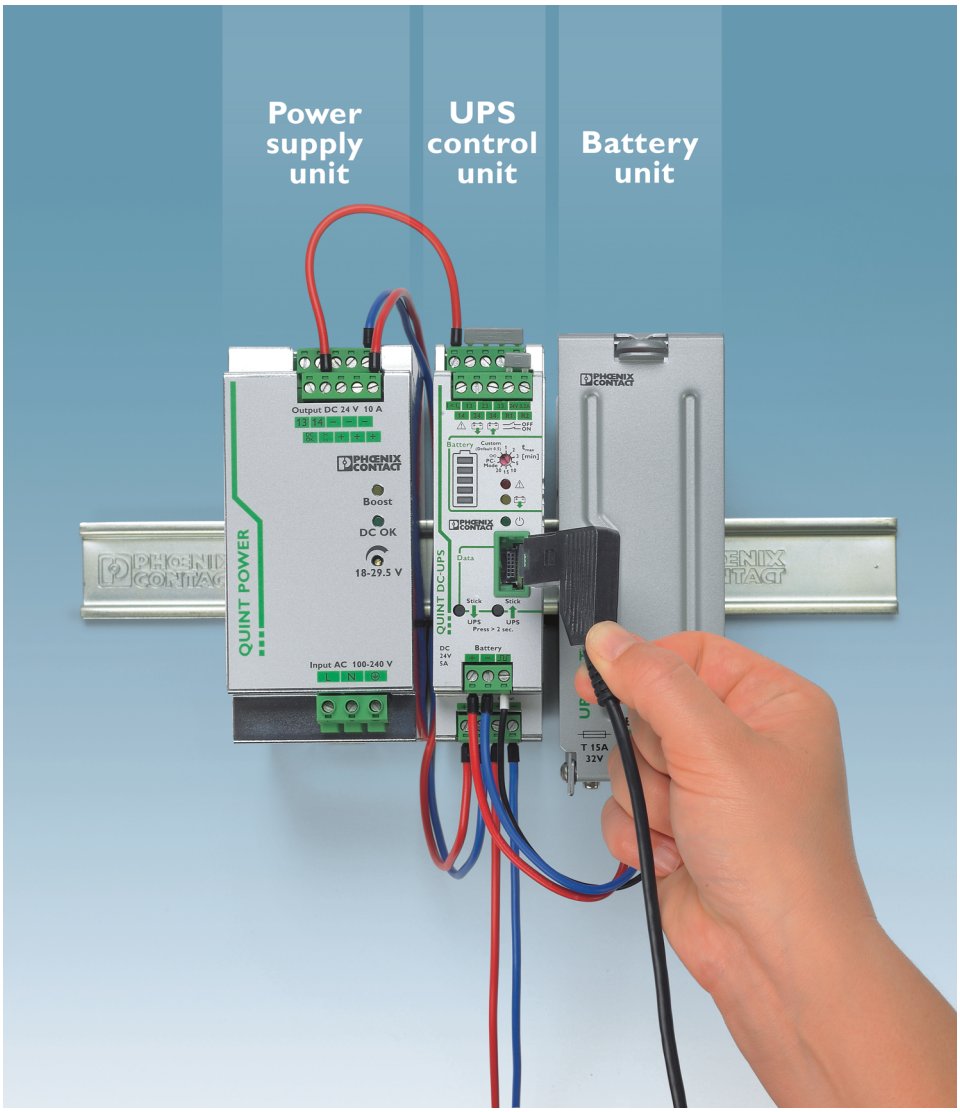
The software settings can be shown by clicking the "Software settings" item in the system menu.

The following settings can be defined:

- Language of the user interface (English, German)

NOTE
To apply the changed language setting, you have to restart the UPS-CONF software.

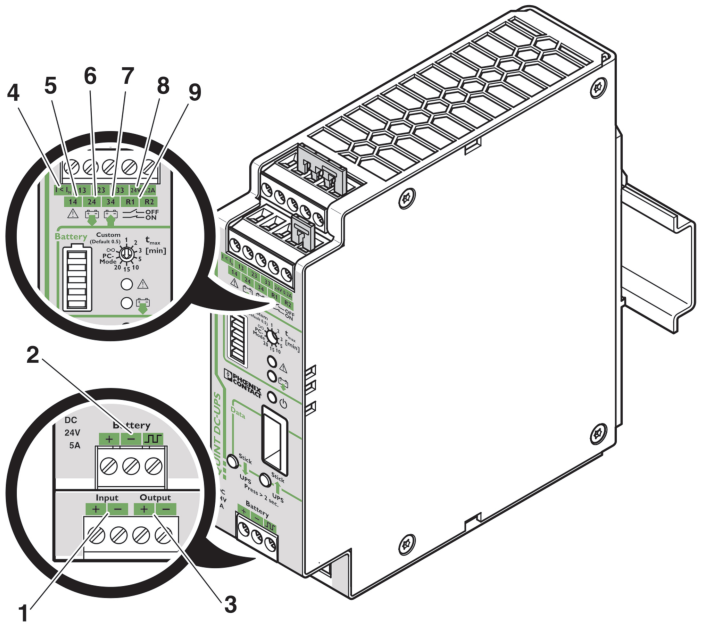
- Temperature unit (Celsius, Kelvin, Fahrenheit)
- Communication (USB) port at the PC for the IFS-USB-DATACABLE (COMx)



Normally, the communication port is set automatically by the UPS-CONF software when connecting the UPS devices. Under normal conditions there is no need to change this setting. If it has not been set automatically during the software installation, refer to the section Communication port (see page 56) in the Troubleshooting topic.

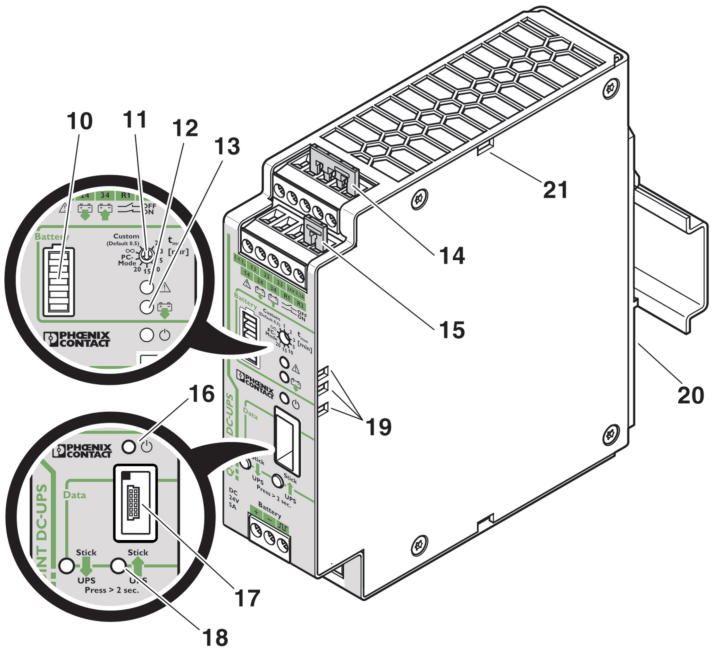
- Enable/disable automatic UPS-CONF startup after PC startup. This option must be checked if the UPS device shall buffer this PC.
- Restore the last view after the next software start.
- Hide or show the advanced views ("Battery Advanced" and "UPS Advanced" in the "Status" group and "Advanced" in the "Settings" group).
- An optional password, when parameters are written to the UPS device.

3 Hardware overview



Choose your customized solution - for your application.

1. Choose your power supply.
2. Choose your UPS unit.
3. Choose your energy storage.



All Products are available in the e-shop: www.phoenixcontact.net/catalog

In the next two graphics and their corresponding lists you can see the location of the main parts of the QUINT DC-UPS.

No.	Connections / Operating elements
1	DC input 18 V DC ... 30V DC
2	Power storage device connection, 24V DC (+,-, communication between UPS and power storage device)
3	DC output, 24 V DC, buffered
4	$I < I_N$, fast battery charging
5	Floating relay contact 13/14: alarm (Related parameter settings are provided in the "Reporting" view (see page 31).)
6	Floating relay contact 23/24: battery mode (Related parameter settings are provided in the "Reporting" view (see page 31).)
7	Floating relay contact 33/34 : battery charge (Related parameter settings are provided in the "Reporting" view (see page 31).)
8	24 V DC supply voltage, maximum current limit 0.2 A for the signal contacts 13, 23, 33
9	Remote control (R1, R2). (Related UPS parameter "Remote Status" (see page 27).)

No.	Connections / Operating elements
10	Bar graph for displaying the current charging state of the power storage device
11	Buffer time setting: unlimited ∞, 1 ... 20 mins., customized (customized default: 0.5), PC mode (refer to topic Buffer time selection (see page 12)).
12	Red LED: alarm (Corresponding indicators are displayed in the software's "Status" view (see page 20).)
13	Yellow LED: battery mode (Corresponding indicators are displayed in the software's "Status" view (see page 20).)
14	Plug-in bridge for signal contact supply voltages, pre-installed
15	Remote control plug-in bridge, pre-installed
16	Green LED: Power In OK, mains mode (Corresponding indicators are displayed in the software's "Status" view (see page 20).)
17	Data port (see page 13) for data linking to the PC or the use of a memory block
18	Button for use of the memory block
19	LED windows for flat mounting position
20	Universal snap-on foot for DIN rails
21	Accommodation for cable binders

3.1 Important safety notes

Please observe all the safety notes outlined in this topic when using UPS-CONF together with the QUINT-UPS device.

Requirements

Knowledge of the following is required:

- QUINT-UPS system
- UPS-CONF configuration software
- Safety regulations in the field of application

Qualified personnel

In the context of using the QUINT-UPS system and the UPS-CONF configuration software described in this documentation, the following operations may only be carried out by qualified personnel:

- Planning, configuration
- Installation, startup, servicing
- Maintenance, decommissioning

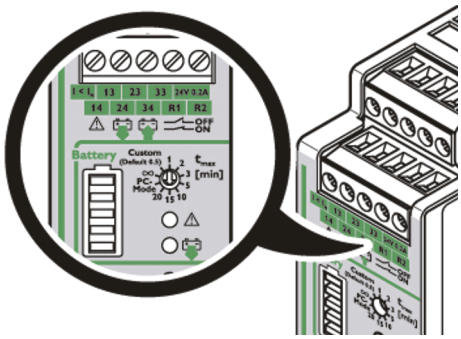
This documentation is therefore aimed at:

Qualified personnel who plan and design electrical equipment for machines and systems and are familiar with regulations governing safety in the workplace and accident prevention.

Within the context of the safety notes in this documentation, qualified personnel are persons who, because of their education, experience and instruction, and their knowledge of relevant standards, regulations, accident prevention regulations, and service conditions, have been authorized to carry out any required operations, and who are able to recognize and avoid any possible dangers.

4 Hardware setup

NOTE
Before setting up the hardware, install the software (see page 5).



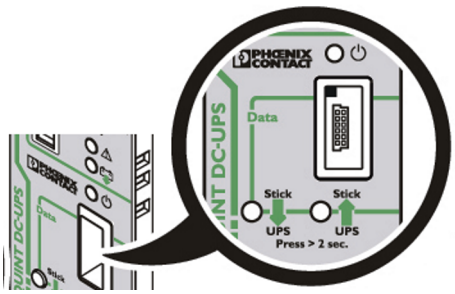
Regarding the communication with the PC and the UPS operation mode, it needs only three steps to setup the hardware:

1. Set the buffer time at the buffer time potentiometer, as described in the topic Buffer time selection. (see page 12)
2. Connect the Data port either with a PC or plug in a configuration stick, as described in the topic Data port (see page 13).
3. Connect the load to be supplied by the UPS (see technical datasheet for each QUINT-UPS).

NOTE
For further information about the hardware installation (connecting the battery module, etc.) please refer to the QUINT DC-UPS technical datasheet.

4.1 Buffer time selection

The buffer time potentiometer at the front of the QUINT-UPS has to be switched to the desired mode with a screwdriver.



The following settings are available:

Operating mode	Description
Custom (default 0.5)	Buffer time can be set to a user-defined value; if no value is set 0.5 minutes is used, as described in the topic Custom Mode (see page 37).
1, 2, 3, 5, 10, 15, 20	Buffer time 1, 2, 3, 5, 10, 15, 20 minute(s).
PC-Mode	This mode is intended to buffer a PC and to initiate a controlled shut-down in battery mode. The buffer time depends on the "Shutdown Delay" time and on the "PC-Shutdown" time, as described in the PC-Mode (see page 38).
∞	No time limit, buffering is continued until the battery is empty (deep discharge security).

The current set buffer time is shown as "Operation mode" in the status bar (see page 17).

4.2 Data port

The Data port is located at the front of the UPS. Via this port, configuration and maintainance of the UPS is done.

The configuration can be done in 2 different ways, depending on what is connected to the Data port:

- Connect the PC (see page 14) with the installed UPS-CONF software, if you want to configure by software.
- Plug in a memory stick which is declared as configuration stick, if you want to configure by configuration stick (see page 46).

In order to perfom maintenance tasks (such as changing a battery), a service stick can be plugged into the Data port, so the UPS switches to service mode (see page 47).

4.3 Connecting the PC

A PC has to be connected to the UPS in one of the following cases:

- You want to configure or monitor the UPS by the UPS-CONF software.
- You want to display currently set QUINT-UPS parameters or modify them using UPS-CONF.
- You want to initiate a controlled PC shutdown in case of a mains failure and if battery runs low.

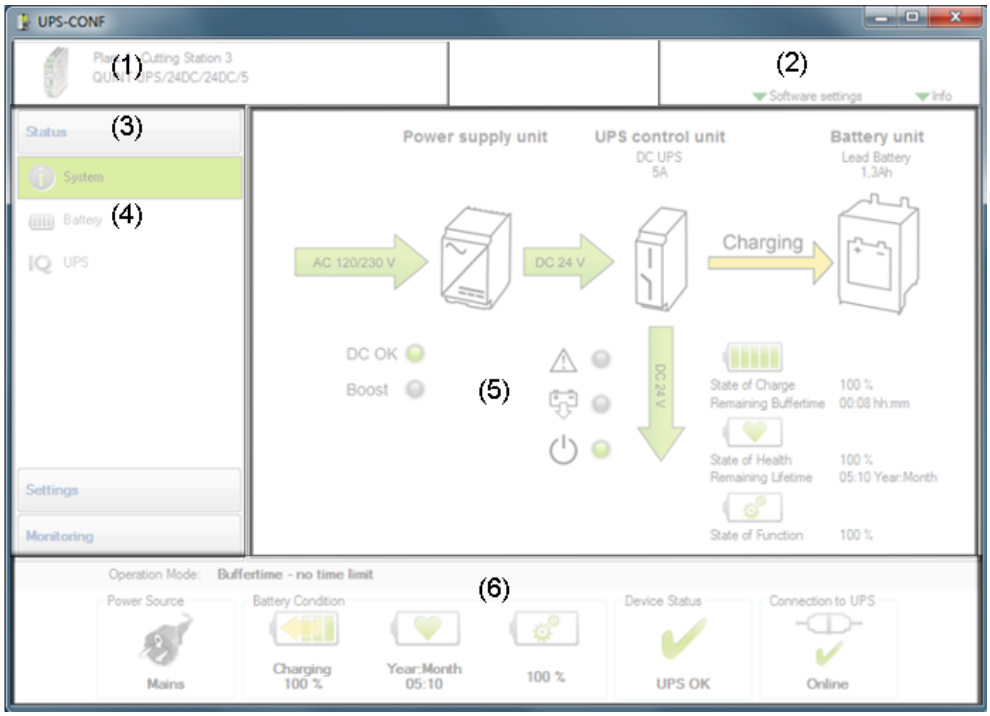
NOTE
First, install the software (see page 5) and then connect the PC afterwards.

To connect the PC to the QUINT-UPS, proceed as follows:

1. Connect the USB connector of the IFS-USB-DATACABLE to a free USB connector of your PC. After detecting the device, the used USB port is entered automatically in the software settings of UPS-CONF.

2. Connect the other side of the IFS-USB-DATACABLE to the Data port of the UPS:

5 Software overview



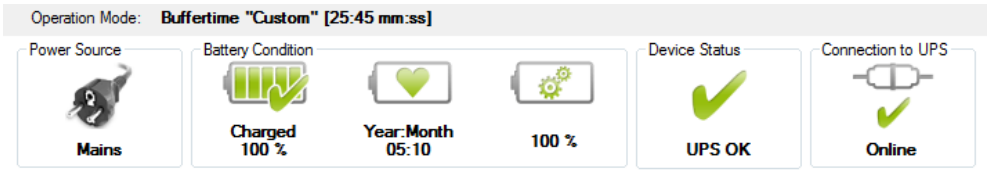
After installing the UPS-CONF software, the program starts up automatically.

As long as you do not change the related default software setting (see page 5), UPS-CONF always starts automatically after every PC reboot.

In the following sections you can get an overview about the screen areas of the UPS-CONF software and you can learn about the different status bar (see page 17) symbols and their meanings.

5.1 User interface

The screen layout consists of the following areas:



The following table explains the several areas.

Area	Description
(1)	Device information: Here, the type of the connected UPS is displayed. If text has been entered for the advanced UPS parameter "Place of installation" (see page 41), it is displayed above the UPS type.
(2)	System menu: Software settings (see page 5): A mouse click leads to the screen, where various software settings can be made. Info: A mouse click shows the contact information of Phoenix Contact.
(3)	Software menu: The Software menu provides various topic buttons such as status information display, parameter settings or monitoring values. A software menu button is expanded/collapsed by simply clicking it. When a software menu button is expanded the corresponding navigation items are listed.
(4)	Navigation items: After clicking a navigation item the corresponding information and parameters are displayed in the action area.
(5)	Action area: The content of the action area depends on the currently selected navigation item. This can be, for example, information, read from the device, or a parameterization table used for configuring the connected UPS.
(6)	Status bar (see page 17): Displays the status of all involved components thus providing a quick system overview. The status bar is always visible, also if the navigation and action area change.

5.2 Status bar

The status bar in the lower part of the screen shows information about the current system state.

When the power supply is available and the system is online and the battery is fully charged, the status bar looks like this:

The operation mode in the upper part of the status bar shows the current setting of the buffer time potentiometer of the UPS, as described in topic Buffer time selection (see page 12).

If it looks different, e.g. Power Source status "UPS off" or no connection to UPS ("Offline"), verify the following:

- All UPS components (QUINT-UPS, battery, power supply) are functional and properly connected.
- The QUINT-UPS is supplied with 24 V DC.
- The IFS-USB-DATACABLE is properly connected between QUINT-UPS and PC.

If an alarm is detected or an existing online connection between the PC and the QUINT-UPS is interrupted, the UPS-CONF software automatically becomes the active window. The status is queried every 5 seconds.

If your system status is like described, you can

- evaluate the UPS system status by displaying the various views contained in the software menu "Status" (see page 20) and/or
- start configuring the UPS by modifiying the default parameter settings in the various views of the software menu "Settings" (see page 29) and/or
- monitor your system.

In the topic Application samples (see page 52), some typical application scenarios are described.

The following tables explain the different status symbols that can be visible in the status bar:

Power Source	Symbol meaning
	The status "Mains" is shown, if the power supply is switched on and available.
	The status "Battery" is shown, if the power supply is switched off or not available. That means, the battery is discharging.
	The status "UPS off" is shown in either case: • The UPS is off, because battery mode is finished. The set buffer time has elapsed. • The power supply is available, but delivers an invalid output voltage.

Battery Condition	Symbol meaning
State of charge: 	Battery is "Fully charged".
State of charge: 	"Charging" is shown, if the battery is currently charging and not yet fully charged.
State of charge: 	The "Discharging" status is shown, if the battery is currently discharging because the system runs in battery mode. Usually, this status is shown in combination with the power source status "Battery".
State of charge: 	"Uncharged" is shown, if the battery mode is finished and the battery is empty.
State of health: 	The "State of Health" status shows the remaining lifetime of the battery. The lifetime value is shown below the symbol.

Battery Condition	Symbol meaning
State of function: 	The "State of Function" status shows the current performance of the battery. This efficiency value is measured in percent and is shown below the symbol.

During battery charging the battery conditions "State of Charge", "State of Health" and "State of Function" are shown as "unknown".

Device Status	Symbol meaning
	The "UPS OK" status is shown during normal UPS operation, i.e., when mains is available (battery mode not active) and no other event is currently upcoming.
	"Bat.-Mode deactivated" is shown, if the bridge is removed from the terminals R1 and R2. Refer to the parameter "Remote Status" in the topic UPS (see page 27).
	The "Alarm" status is shown, when a failure or critical situation exists, for example: • battery almost empty • battery not detected • battery replacement required

Connection to UPS	Symbol meaning
	This status informs about the communication connection between UPS-CONF and the QUINT-UPS device. The "Online" status is shown, if the IFS-USB-DATACABLE is connected. Normally, this status is automatically entered after connecting the UPS to the PC via the IFS-USB-DATACABLE.
	"Offline" means that no communication connection is established via the IFS-USB-DATACABLE.

6 Status - Reported information

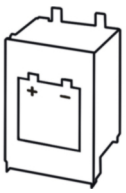
If the "Status" group is selected, the following navigation items are available:

- "System (see page 20)": overview on the current system status
- "Battery (see page 25)": status information for all connected batteries
- "Battery Advanced (see page 26)": advanced status information for all connected batteries
- "UPS (see page 27)" : status information for the connected UPS
- "UPS Advanced (see page 28)": anvanced status information for the connected UPS

6.1 System

If the "System" item is selected in the software menu "Status", an overview on the current system status is visible in the action area. The values shown here are read cyclically from the UPS device, as long as a communication connection to the UPS is established.

The system components and their status information are arranged on the screen as "Power supply unit" on the left hand side, "UPS control unit" in the middle and "Battery unit" on the right hand side. The tables explain the symbols corresponding to the units.

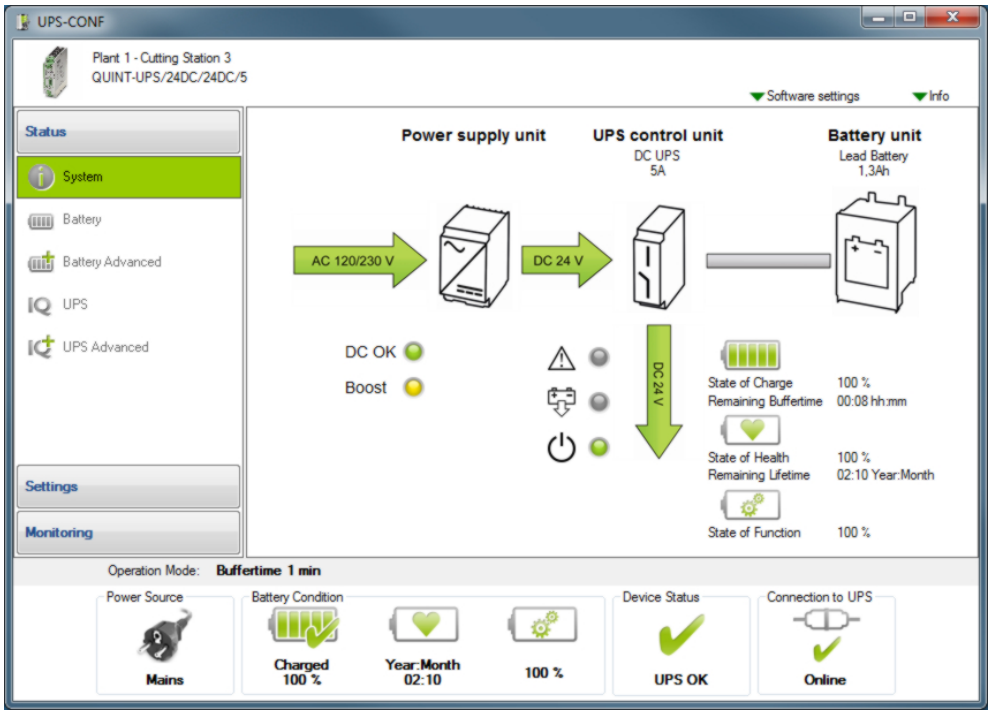


Power supply unit symbols:

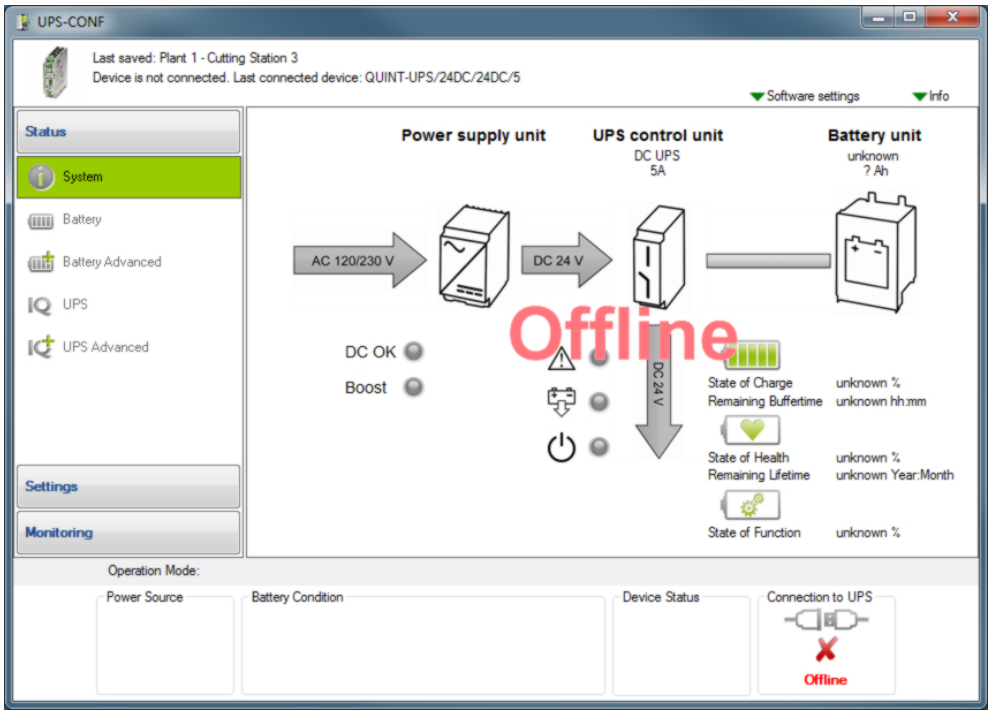
Icon	Meaning of LEDs
DC OK	Green LED on: DC output is available. LED off: DC output is not available.
Boost	Yellow LED on: Boost signal is ON (power supply delivers additional current for a connected load). LED off: Boost signal is OFF.

UPS control unit symbols:

Icon	Meaning of LEDs
⚠	Red LED on: UPS alarm due to one of the reasons: • battery almost empty • battery not detected • battery replacement required LED off: No UPS alarm, power supply available, normal operation.
	Yellow LED on: Battery mode is ON, battery is discharging because power supply failed. LED off: Battery mode is OFF, i.e. mains available.
⏻	Green LED on: Mains is ON. LED off: Mains is OFF.

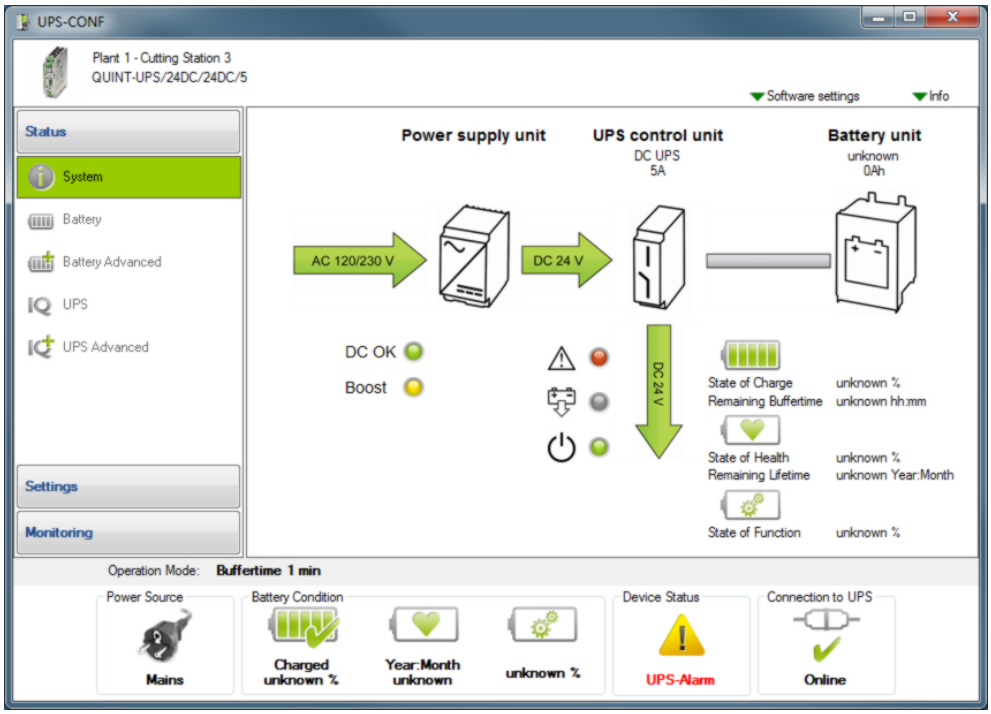


Battery unit symbols:



Icon	Meaning of LEDs
	SOC (State Of Charge) – current charging state and remaining back-up time of the battery unit.
	SOH (State Of Health) – remaining life expectancy of the battery unit, provides early warning for a potential battery unit failure.
	SOF (State Of Function) – determines the current performance of the battery unit.

NOTE
While charging the battery the status is "unknown".

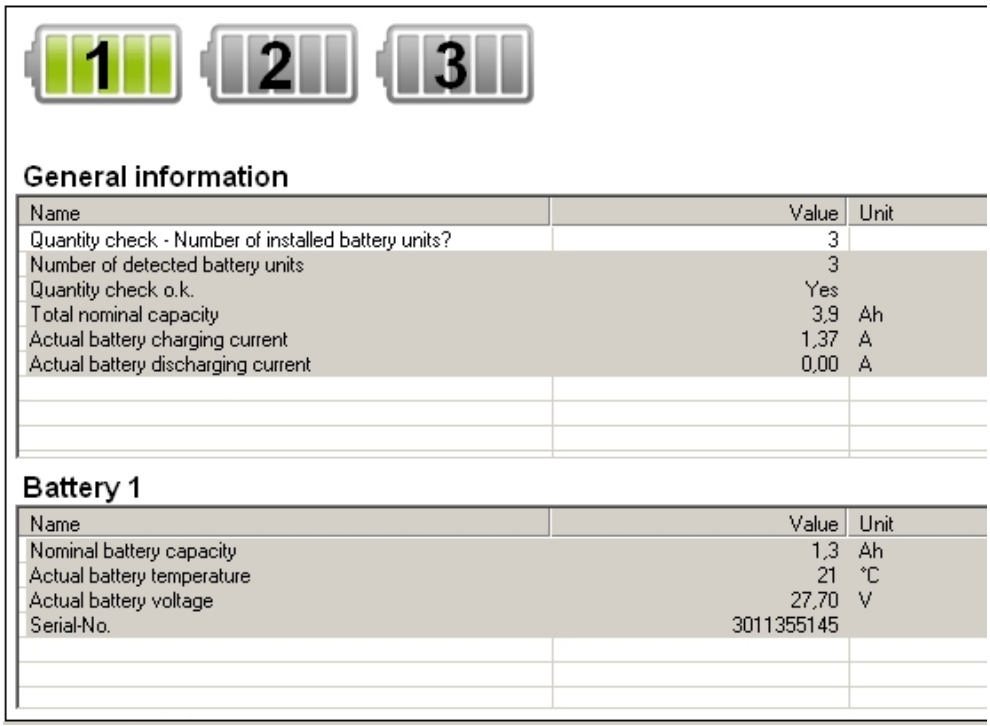


When the system is in normal operation (online and running), the screen looks like this:

When the UPS is offline and has no connection to the PC, the screen looks like this:

When the system status shows an alarm, the screen looks like this:

In such case refer to the topic Troubleshooting (see page 53).



6.2 Battery

If the "Battery" item is selected in the software menu "Status", status information for all connected batteries is shown in the action area.

The information is headed by "General information" for all connected batteries, such as "Number of detected battery units" or "Total nominal capacity".

Individual information for every battery follows.
If several battery units are installed, the data of the individual units can be displayed by clicking on the battery icons on top of the action area:

The status information in the action area could for instance look similar like this:

Battery parameters	Meaning
Except of some parameters explained here, the status information is self-explanatory, this is why it is not explained in detail.	
Quantity check - Number of installed battery units?	This value can be set to the amount of batteries, that were built in.
Number of detected battery units	Number of batteries detected by the QUINT-UPS.

Battery parameters	Meaning
Quantity check o.k.	Shows "Yes", if the number of installed battery units complies with the number of detected batteries. Otherwise "No" is displayed.

6.3 Battery Advanced

This navigation item is only available if the "Enable advanced views" checkbox is marked in the software settings (see page 5).

If the "Battery Advanced" item is selected in the software menu "Status", advanced status information for all connected batteries is shown in the action area.

In normal operation it looks something like this:

Name	Value	Unit
Actual state of charge	100	%
Remaining backup time	00:08	hh:mm
Remaining battery life time	01:03	Year:Month
Actual battery performance	100	%
Actual battery voltage	27,57	V
Actual battery temperature (Average of all units)	26	°C

6.4 UPS

If the "UPS" item is selected in the software menu "Status", status information for the connected UPS is shown in the action area.

In normal operation it looks like this:

Name	Value	Unit
Actual Alarm	No Alarm	
Last Alarm	No Alarm	
Remote Status	UPS ready	
UPS in battery operation (Battery-Mode)	No	
Selected operation mode	Buffertime - no time limit	
Battery is charging (Battery-Charge)	No	

Parameter	Meaning
	Except of some parameters explained here, the status information is self-explanatory, this is why it is not explained in detail.
Remote Status	Remote control (contact R1, R2) The module can be switched on and off via a signal to contacts R1 / R2. Shutdown can take place in mains mode or while battery mode is active. Remote shutdown is deactivated UPS in function (delivery state) – The "R1" and "R2" terminal points are short circuited (delivery with plug-in bridge) OR 24 V DC is present at terminal point "R2". – In the event of a voltage supply failure, the UPS switches over to battery mode. Remote shutdown is activated – The "R1" and "R2" terminal points are not short circuited AND 0 V is present at terminal point "R2". – In the event of a voltage supply failure, the UPS does not switch over to battery mode and the device shuts down.
Selected operation mode	Shows the operation mode that is set via the buffer time potentiometer, as described in topic Buffer time selection (see page 12).

6.5 UPS Advanced

This navigation item is only available if the "Enable advanced views" checkbox is marked in the software settings (see page 5).

If the "UPS Advanced" item is selected in the software menu "Status", advanced status information for the connected UPS is shown in the action area.

The status information is self-explanatory, this is why it is not explained in detail here.

In normal operation it looks something like this:

Name	Value	Unit
Device type	QUINT-UPS/24DC/24DC/5	
Actual input voltage	23,91	V
Actual output voltage	23,66	V
Actual Device Temperature	30	°C
Shutdown event started	No	
UPS serial number	3012001033	
Device firmware	0x00000110	

7 Settings - Defining UPS device parameters

The navigation items contained in the "Settings" group allow access to the various UPS device parameters.
Parameter values can be entered in UPS-CONF and written to the device (see page 29) with only one click of the mouse.

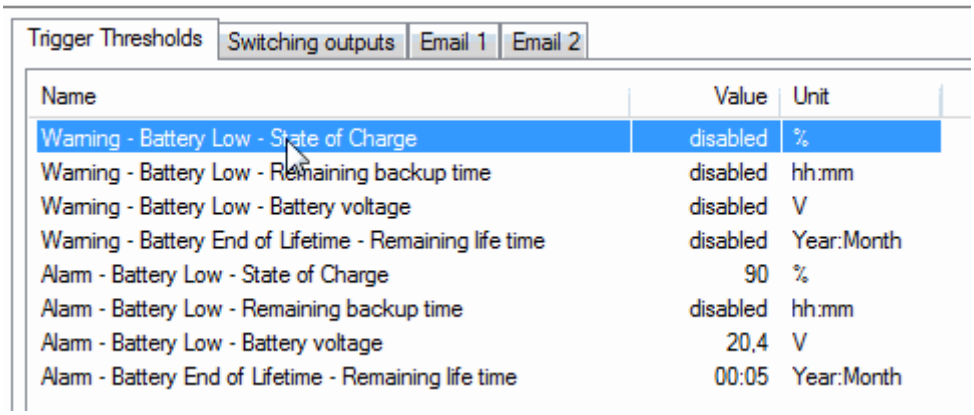
If the software menu "Settings" is selected, the following navigation items are available:

- Reporting (see page 31): Trigger thresholds, switching outputs for UPS alarm, battery mode and battery charging as well as Email settings
- Time Setting (see page 36): Buffer times, (delay) times and programs to execute for PC shutdown
- Service (see page 39): Service mode activation and rights granting, declaration of service stick and configuration stick
- Advanced (see page 41): Battery charging values, wire sizes, thresholds, signaling times and others

How to write parameters

In each of the navigation items, different settings can be made in the action area in order to write it to the UPS.

Beneath settings, that can be made by checking a checkbox or by entering data into an input box, also numerical or textual values contained in the parameter tables can be changed.

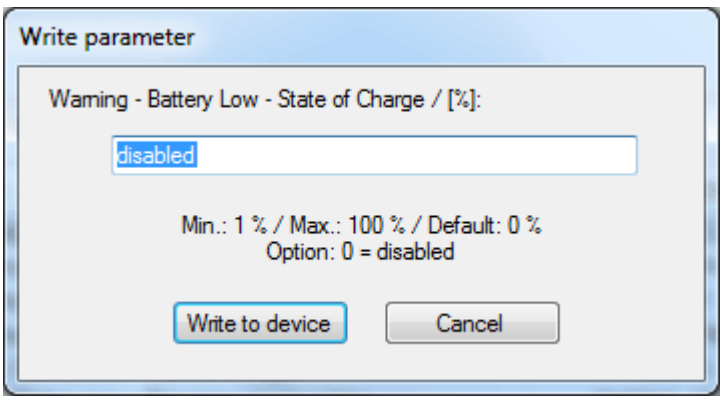


In these parameter tables, changeable parameter values have a white background color. Read-only values, i.e. the ones that are read from the device for monitoring purposes, are shown on a gray background.

To enter a new value for a parameter and write it to the UPS, proceed as follows:

1. Double-click the line, where the parameter text is located or click the "Write..." button in the lower right corner.
   An input box opens showing the currently set value.
2. Enter a value into the input box. Make sure that the chosen value is within the allowed value range and is suitable for your UPS system!
3. Click the "Write to device" button.
4. Verify that the new value is now displayed in the parameter table, i.e., has been accepted by the device.

Sample:



Select the "Reporting" navigation item in the "Settings" group and click the "Trigger Thresholds" tab in the action area.
In this tab, you can set a trigger value, at which battery charging level a "battery low" warning should be generated (first entry in the tab Trigger Thresholds (see page 31)). The value is entered as percentage, see below. By default, the trigger is "disabled", i.e. no warning is reported.

Set the trigger to 20% as follows:

1. Double-click the marked line, as shown in the figure above or left-click the line and then press the "Write..." button in the lower right corner.

   The following dialog appears:

   Below the text field you can see the allowed input range.
2. Enter `20` in the input box and click the "Write to device" button.
3. Verify that the new value is shown in the table.

7.1 Reporting

If the "Reporting" item is selected in the software menu "Settings", the tabs "Trigger Thresholds", "Switching outputs", "Email 1" and "Email 2" are visible in the action area.

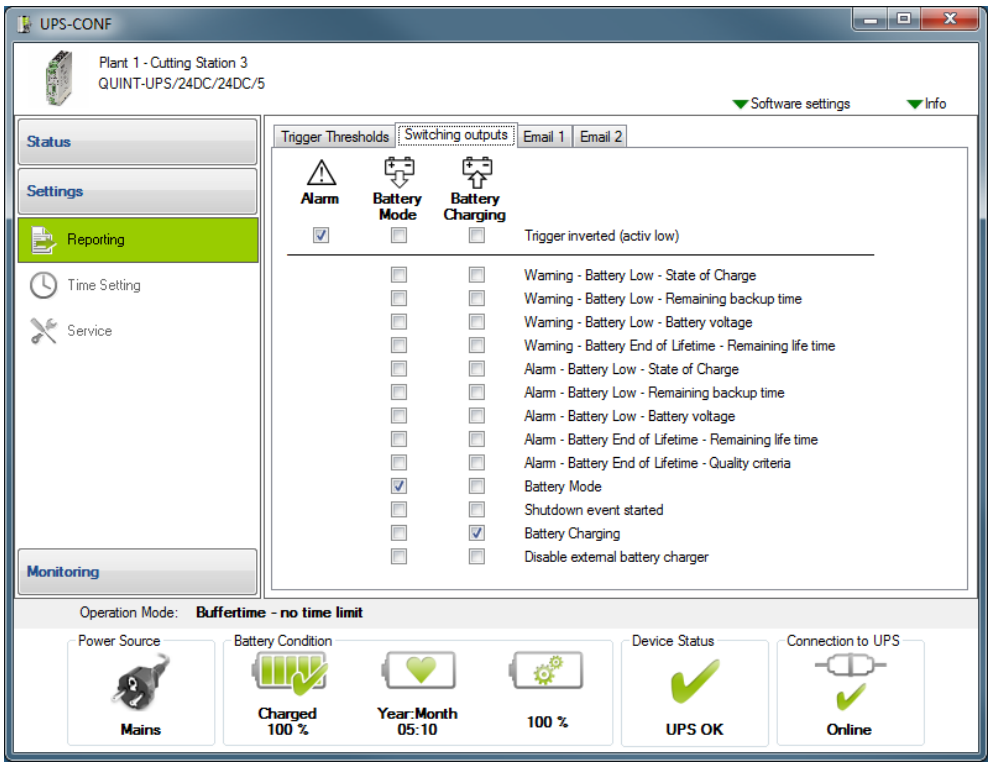
Trigger Thresholds

On the "Trigger Thresholds" tab you can define, whether warnings or alarms shall be reported by the UPS and define the threshold values which must be exceeded in order to trigger a message.

For each of the following conditions, both a warning and an alarm threshold value can be defined:

- Battery is low and the state of charge falls below a certain percentage number.
- Battery is low and the remaining backup time falls below a defined time.
- Battery is low and the battery voltage falls below a certain voltage.
- Battery is at it's end of lifetime and the remaining life time falls below a defined time.

If a warning or alarm is reported, you can define that a switching output must be triggered. For some of the warnings or alarms an Email to be sent can also be defined.



A reported alarm is additionally signaled by the LED at the front of the UPS device as well as in the status bar of the UPS-CONF software.

By means of warnings and alarms you can implement a two-level detection system:

1. Report a warning, when the first threshold value is exceeded.
   Example: battery lifetime is still one year.
2. Report an alarm, when the second threshold value is exceeded.
   Example: remaining lifetime of the battery is only some few months or weeks. Now an Email is additionally sent to the responsible person to ensure that a new battery is ordered in time.

Switching outputs

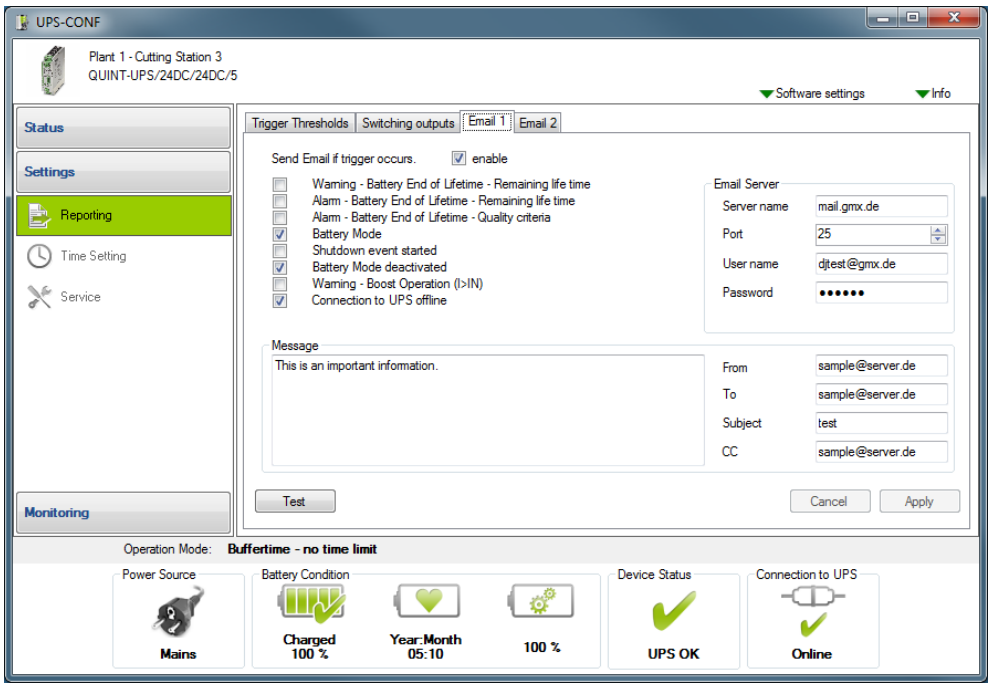
On the "Switching outputs" tab you can define a QUINT-UPS device output signal to be switched, when a certain trigger occurs. With such an output signal you can, for example, control a buzzer, that sounds, if the battery is low or the shutdown has been initiated.

Three different outputs are available to be switched:

- "Alarm",
- "Battery Mode"
- "Battery Charging"

All switching outputs can be triggered inverted, i.e., active low.

The "Battery Mode" and "Battery Charging" output signals can be switched with the following triggers:



- The same triggers as described in section "Trigger Thresholds" for warning and/or alarm, e.g. triggers that are released by an exceeded or underrun threshold.
- The quality criteria is no more fulfilled. The IQ-Technology of the QUINT-UPS-IQ is able to calculate it's own save remaining lifetime for the battery. Based on this calculation, the quality criteria is evaluated as met or not.
- The system switches to battery mode.

- A shutdown event started.
- The battery switches to the "Battery Charging" status.
- For the "Disable external battery charger" trigger, see technical datasheet for the QUINT-UPS.

For "Alarm" switching output, no further options can be defined.

Email 1 / Email 2

On the "Email 1" and "Email 2" tabs you can define two separate Email addresses, to which Emails can be sent if certain events occur. To access the input fields, mark the "enable" checkbox in the upper part of the screen.

The available triggers to initiate Emails to be sent are:

- A warning occurs as battery is at it's end of lifetime and the remaining life time falls below a defined time.
- An alarm occurs as battery is at it's end of lifetime and the remaining life time falls below a defined time.
- An alarm occurs as the quality criteria is no more met.
- The battery switches to battery mode.
- A shutdown event started.
- The battery switches to "Battery Charging" status (battery mode deactivated).

- A warning occurs because boost operation was activated. The power supply now delivers BOOST current, which is up to 1.5 times the nominal current of the power supply (only available with QUINT POWER).
- The connection to the UPS was interrupted ("Offline" status).

In the Email Server area, you have to enter:

- "Server name" for the server managing your outgoing mail. Ask your administrator for details.
- "Port" for outgoing Emails is usually 25. The predefined port 25, however, can be changed.
- "User name" and "Password" of your Email account. In some accounts the "User name" is the Email address.

The Message area contains:

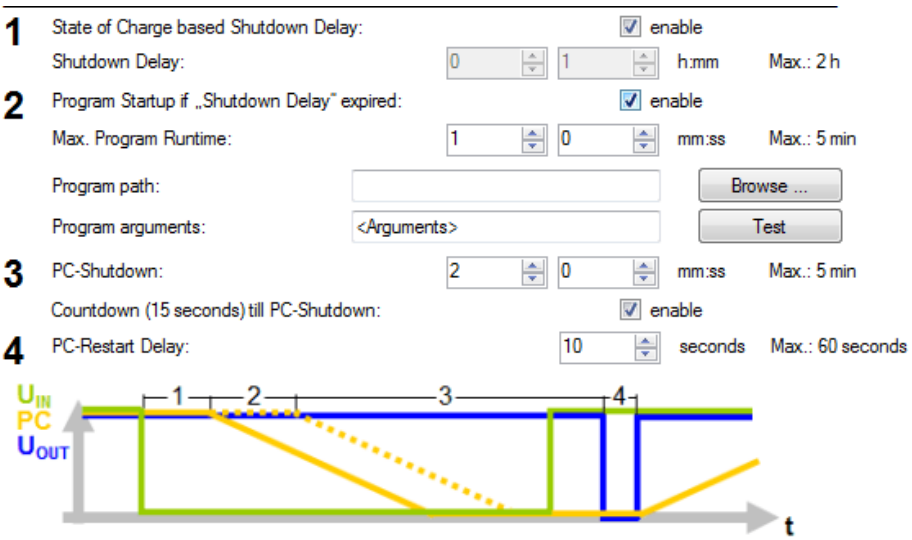
- Messagebox: A short explanation of the trigger, that caused the Email, is sent as default message. You can enter additional text, that will be appended to the default text.
- "From" textbox: Any Email address can be entered here.
- "To" textbox: A valid Email address has to be entered here, where the Email is sent to; it must be an Email address, that exists in the Email server´s configuration.
- "Subject" textbox: the title of your Email is user-defined; it is only used with the Email "Test" button. When the Email is successfully sent, click the "Apply" button.
- "CC" textbox: you can enter an Email address, where a copy is sent to.

You can test your settings by clicking on the "Test" button.

Sample Email:

A sample Email would look like this:

Email part	Content of Email part	Explanation
Subject	[UPS CONF: Parameters change notification]	
Message	*** UPS Status Mail ***	Header of the status mail message
	Hall 125	Place of installation, refer to the topic Advanced (see page 41)
	QUINT-UPS/24DC/24DC/5	Type of connected UPS, refer to the device information area in the User interface (see page 15)
	Trigger: Battery Mode Trigger	Kind of active trigger
	Threshold: -	Threshold (if applicable)
	This is an important information.	User defined text from the message textbox

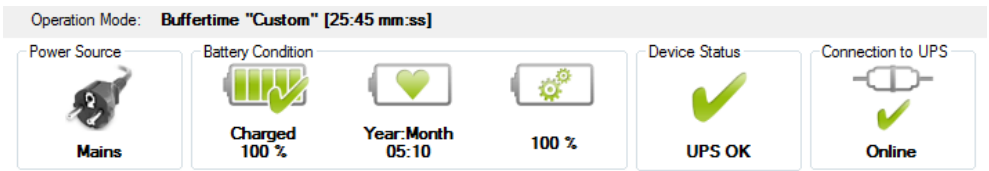


7.2 Time Setting

If the "Time setting" navigation item is selected in the "Settings" group, the action area provides various settings for two different UPS operating modes:

- The upper part (above the separation line) specifies the "Custom" mode.

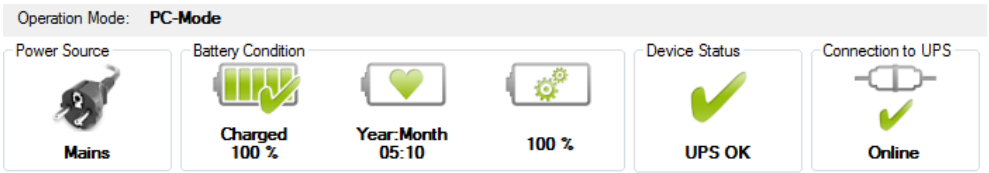
- In the lower part (below the separation line), four different parameter categories can be set concerning the PC-Mode.



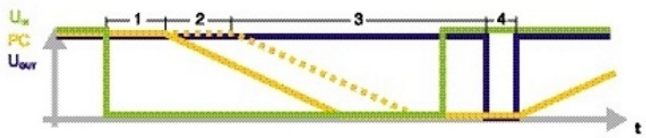
Custom mode

NOTE
These settings only apply if the UPS runs in Custom mode. To set this mode, the buffer time potentiometer located at the device front must be set to "Custom" (refer to topic buffer time selection (see page 12)).

In Custom mode the buffer time for the battery can be set to a maximum of 1 hour (30 seconds default).
When the power supply was interrupted the load will loose it's power after the user-defined buffer time has elapsed. The battery will buffer exactly the set buffer time. If no user-defined time is entered, the buffer time selected by the potentiometer is used.



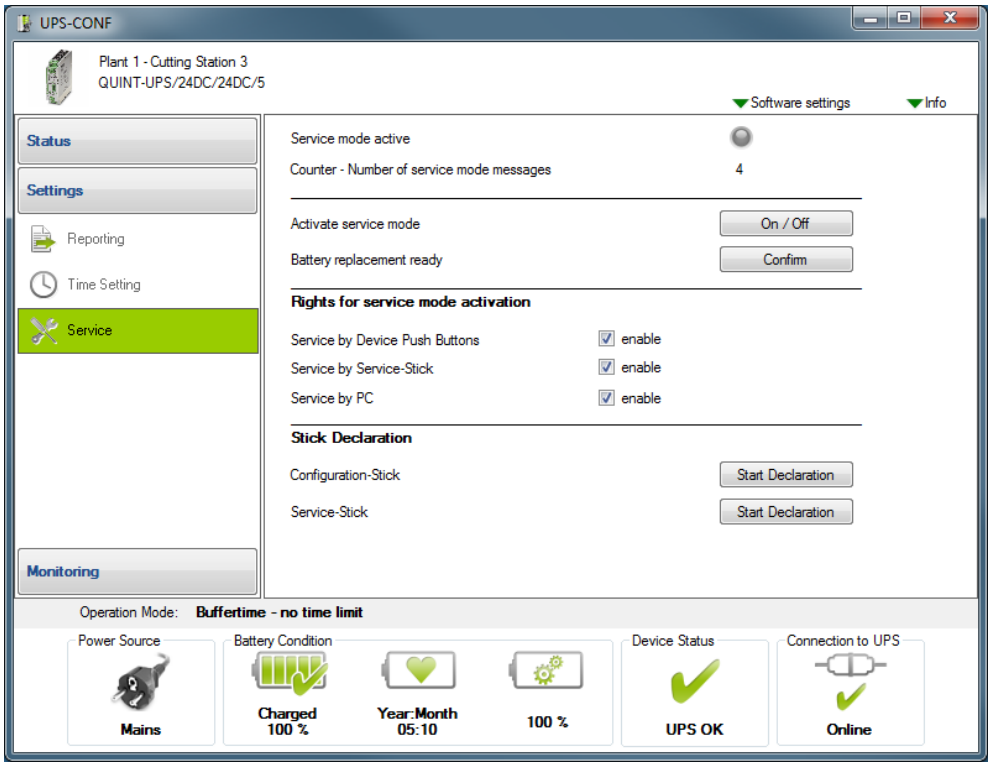
The set time is displayed in the "Operation Mode" of the status bar. An example with 25 minutes and 45 seconds set, shows the following status bar and operation mode:



PC-Mode

NOTE
These settings only apply if the UPS runs in PC-Mode. To set this mode, the buffer time potentiometer located at the device front must be set to "PC-Mode" (refer to topic buffer time selection (see page 12).

When the PC-Mode is set, the status bar shows the operation mode "PC-Mode", as shown in the following screenshot:



In the "PC Mode" setting on the UPS potentiometer, the UPS functionality follows a chronological sequence that can be parameterized via software, and is thus individually customized to the respective application.

Parameter	Meaning / Possible settings
1 Shutdown delay	Delay time is calculated automatically from the current remaining battery life minus the time required by the PC to shutdown. Alternatively, a fixed delay time may be chosen.
2 Program startup	After the delay time has expired it is possible to start a program. Example: a software starts that gradually backs up system data. You can test your settings by clicking on the "Test" button.
3 PC shutdown	The time required by the PC/IPC to shut down is set here.
4 PC restart delay	Only if the PC/IPC is shut down, and the mains has returned in the meantime, the output voltage will be interrupted for the reset time. The PC/IPC is then automatically restarted.

7.3 Service

If the "Service" item is selected in the software menu "Settings", all parameters of switching the UPS to service mode are accessible in the action area.

Here, you can:

- Operate the UPS in service mode (see page 47).
- Grant or deny rights for the service mode activation (see section below).
- Declare memory sticks as either configuration sticks or service sticks, as described in the topic Stick usage (see page 45).

Rights for service mode activation

The rights for all possible methods to activate or terminate the service mode can be defined in the "Rights for service mode activation" part of the "Service" navigation item´s action area. Possible activation methods are:

- Pressing both push buttons ("Stick -> UPS" and "UPS -> Stick") on the device front simultaneously.
- Plugging a service stick into the Data port of the UPS device.

- Clicking the service mode activation button in the "Service" navigation item´s action area in UPS-CONF.

When allowing a service stick for activating the service mode and disabling the use of the push buttons at the same time, the stick can be considered as a kind of hardware key: Only authorized persons who possess a service stick are allowed to switch the device to service mode. For that purpose, a memory stick must be declared accordingly as described in Stick usage (see page 45).

For further information please refer to the "Service stick usage - service mode (see page 47)".

7.4 Advanced

This navigation item is only available if the "Enable advanced views" checkbox is marked in the Software Settings (see page 5).

The "Advanced" navigation item within the "Settings" group allows to set more specific parameters. These are in detail:

Name of parameter:	Sample value:	Unit:	Explanation:
Place of installation (user defined)	Hall 125	(none)	The text entered here is dislayed in the device information area of the User interface (see page 15).
Initial charging current	1.36	A	The battery is charged with this current, when the power supply is available.
Absorption charging end voltage	28.00	V	An equalizing charge, that increases charging voltage to a higher value than the nominal capacity for a short period. This prevents battery stratification and reduces sulfation. When the battery is fully loaded, this voltage is tolerated as a maximum, before the voltage level gets a stable end value.
Float charging end voltage	27.60	V	The charger adjusts the end voltage based upon battery temperature. During high temperature periods, the actual battery voltage will be reduced and during low temperature periods it will be increased.
Temperature compensation	42	mV/K	High ambient temperatures have a negative impact on the service life of the battery. Therefore, the charging voltage should be lower with higher ambient temperatures. The adjustable values relate to one battery cell each.
Wire distance to the battery unit	300	mm	The maximal wire length from the UPS control unit to the battery unit.
Wire cross section to the battery unit	6.0	qmm	The wire cross section from the UPS control unit to the battery unit.

Name of parameter:	Sample value:	Unit:	Explanation:
Fast battery charging	On	(none)	Boost mode is allowed or not.
Dynamic backup threshold	Off	(none)	This parameter can be defined additionally to the overvoltage and undervoltage related parameters, see below. If set to On the voltage increase or decrease within a certain time period is watched (dynamically). The UPS switches to battery mode, if the relative increase/decrease is too much. In contrast the overvoltage and undervoltage parameters have static values. They can become active regardless the dynamic backup threshold did not trigger, because the voltage was alright.
Undervoltage backup threshold	19.00	V	When the DC voltage falls under this threshold (undervoltage), the system switches to battery mode.
Overvoltage backup threshold	30.00	V	When the DC voltage exceeds this threshold (overvoltage), the system switches to battery mode.
Return to mains time	3	seconds	After this time the system returns to mains, when it is in battery mode and the power supply is available again.
Discharging end voltage	19.20	V	The battery voltage may not sink below this voltage value, otherwise it would be deeply discharged and become defective.
Signaling time after battery low cutoff	00:10	hh:mm	When the battery low status has arrived, the UPS cuts off and the status of the power source firstly switches to "UPS off (see page 27)". After the time set here no more power or battery status is displayed, but only the Connection to UPS (see page 17) is offline.
Signaling time after time cutoff	00:10	hh:mm	When the buffer time has elapsed, the UPS cuts off and the status of the power source firstly switches to "UPS off (see page 27)". After the time set here no more power or battery status is displayed, but only the Connection to UPS (see page 17) is offline.

Name of parameter:	Sample value:	Unit:	Explanation:
Battery type (imported item)	"No value assigned"	(none)	The type of battery delivered by the manufacturer. This value is read by the UPS-CONF software.
Nominal capacity (imported item)	"No value assigned"	Ah	The nominal capacity of the battery delivered by the manufacturer. This value is read by the UPS-CONF software.

You can restore the default settings anytime by clicking the "Set factory defaults" button.

You can import / export the list in a .csv file by clicking the button "Import " or "Export".

8 Monitoring - Statistics and logging

If the "Monitoring" group is selected, the navigation items "Statistic (user defined)", "Statistic (system defined)" and "Logging" are available.

The items inform about counted and time measured statistic values and show logged information.

Statistic (user defined)

The "Statistic (user defined)" navigation item shows counter values which start at a user-defined value. If, for example, batteries have been replaced, you can set the values manually to "0" in order to start a new logging period. The following values are displayed and can be reset:

- Number of battery modes: How often did the UPS already change to battery mode?
- Total time of battery mode: How long altogether did the UPS stay in battery mode?
- Number of operation startups: How often was the UPS started?
- Total operation time: How long altogether did the UPS run?

Statistic (device defined)

The "Statistic (system defined)" navigation item shows counter values which always start from the value "0" with the initial device installation. Beneath the same values as shown in the "Statistic (user defined)" navigation item, additional values are displayed:

- Runtime of the current battery operation: How long does the current battery operation (if relevent) altready last?
- Number of battery low cutoffs: How often was the battery completely discharged?
- Number of all messages: How many warnings and alarms were signaled altogether?
- Number of remaining lifetime messages: How often was a remaining lifetime signaled?
- Number of quality criteria messages: How often was signaled, that the quality criteria is no more met?
- Number of battery presence messages: How often was a battery unit not detected, e.g. no fuse plugged or circuit broken?

Logging

The logging is done by the software itself.
The "Logging" navigation item lists events like "Offline", "Online" or "UPS in battery mode" with date and time stamp. The event colors differ between green and red depending on the type of event. They are chronologically sorted, the latest uppermost.

You can delete the list by clicking the button "Delete history".
You can export the list in a .csv file by clicking the button "Export".

9 Stick usage

At the Data port of the UPS device, a memory stick can be connected (see image below). After plugging in, the UPS either acts as configuration stick or as service stick, depending on how the respective stick has been declared before in the "Service" screen of the UPS-CONF software.

A configuration stick is used to copy parameterization data from/to the UPS device, as described in the topic Configuration stick usage (see page 46).

A service stick can be used to switch the device to service mode (see page 47) in order to perform maintenance tasks.

To declare a memory stick proceed as follows:

NOTE
When declaring a stick, its current content is deleted, i.e. already stored configuration data are lost.

1. Open the software menu "Settings".
2. Click the "Service" navigation item.
3. In the "Stick declaration" area of the action area, click the appropriate "Start declaration" button.

After this declaration, the UPS device automatically formats the stick after plugging it into the Data port the next time and then acts accordingly.

9.1 Configuration stick usage

A configuration stick stores UPS configurations, i.e.complete parameter sets. Configurations can be copied from the UPS to the stick and vice versa. This way, the stick can be used to transfer configurations from one UPS to another.

NOTE
The configuration stick cannot be used, while the UPS runs in battery mode. The power supply must be available.

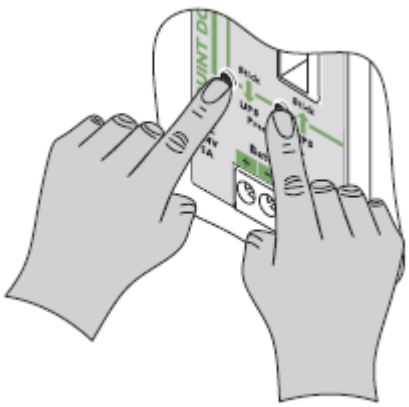
The usage of configuration sticks is explained by the following steps:

1. Make sure that the used memory stick is already declared as configuration stick as described in the topic Stick usage (see page 45).
2. To transfer parameters between the stick and the UPS, execute one of the following steps:
   - To copy parameters from the stick to the QUINT-UPS push the "Stick -> UPS" button for more than 2 seconds.
   - To copy parameters from the QUINT-UPS to the stick push the "UPS -> Stick" button for more than 2 seconds.
3. Connect the configuration stick to the Data port of the UPS under consideration of the plug direction.
   The parameter transfer is started automatically and the progress is signalled by the LEDs:
   - While data is transferred they flash red - yellow - green.
   - A successful tranfer completion is signalled by a permanent green LED.
   - A faulty tranfer completion is signalled by a permanent red LED.
4. Remove the stick from the Data port.
5. After copying a parameter set from an UPS to the stick you can "clone" this configuration by plugging this stick into another UPS and copying the stored data from the stick into this UPS.

9.2 Service stick usage - service mode

The service mode is used, when installation and maintenance work has to be achieved, such as a battery has to be replaced.

There are several possibilities to switch the UPS to service mode.



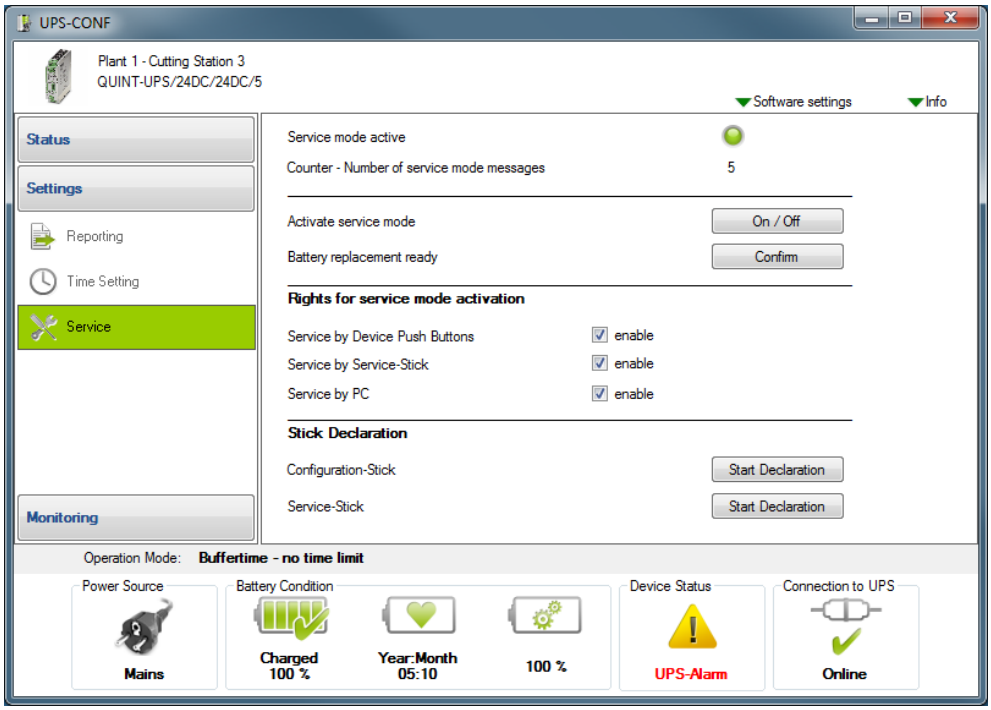
The corresponding activation rights have to be granted for service mode activation and deactivation, as described in the topic Rights for service mode activation (see page 39).

Service mode activation

The service mode cannot be activated, while the QUINT-UPS runs in battery mode. The power supply must be available.

Depending on the granted activation rights, the service mode can be activated in three different ways:

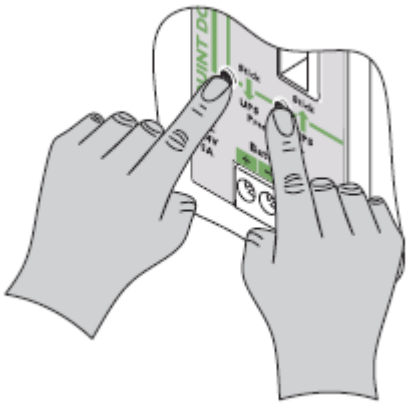
- By holding down both push buttons on the QUINT-UPS named "Stick -> UPS" and "UPS -> Stick" for at least 6 seconds.



- By connecting a service stick (see page 45) to the Data port (see page 13) of the UPS.
- By using the UPS-CONF software as follows:
  In the "Settings" group, select the "Service" item, and click the "On / Off" button near the "Activate service mode" text.

While the service mode is active

- the alarm status is activated,



- the charging current is interrupted,
- the status LED "Service mode active" in the UPS-CONF software ("Settings" group / "Service" item) is green.

Service mode deactivation

The service mode can be deactivated in different ways:

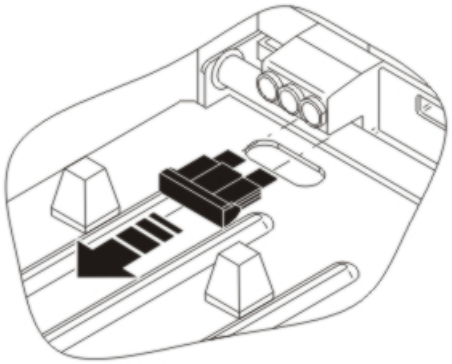
- By holding down both push buttons on the QUINT-UPS named "Stick -> UPS" and "UPS -> Stick" for at least 6 seconds.

- By removing the service stick from the Data port of the UPS.
- By using the UPS-CONF software as follows:
  In the "Settings" group, select the "Service" item, and click the "On / Off" button near the "Activate service mode" text.

After the service mode is deactivated, the status LED "Service mode active" in the UPS-CONF software ("Settings" / "Status") switches back from green to gray.

Service mode operation

To operate the QUINT-UPS in the service mode in order to replace a battery for example, execute the steps described below.



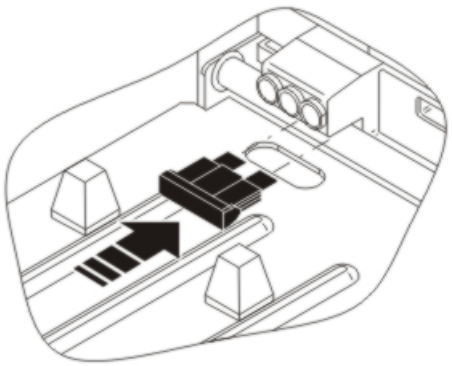
DANGER
Before activating the service mode read and obey carefully the safety instructions in the topic Important safety notes (see page 10).

DANGER
Watch polarity when connecting cables!

1. Activate the service mode by one of the ways described above.
2. Replace the battery as follows:.

   i. Open battery housing.

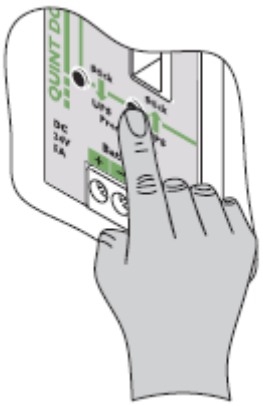
   ii. Remove fuses.



iii. Remove cabling.

iv. Change battery.

v. Connect cabling.



vi. Insert fuses.

vii. Close battery housing.

3. As soon as the work is finished, the parameters of the new battery have to be read into the UPS, so it's status information is available. To introduce this battery registration, do one of the following actions:

   - Push one of the push buttons on the QUINT-UPS named "Stick -> UPS" or "UPS -> Stick" and hold it down for more than 6 seconds.

or

- In the "Settings" group of the UPS-CONF software select the "Service" item, locate the text "Battery replacement ready" and click the "Confirm" button near the text.

The bar graph at the QUINT-UPS flashes, the alarm status is still active.

NOTE

If the service mode has been deactivated by removing the service stick from the Data port before the battery replacement has been confirmed, it can be confirmed by the UPS-CONF software. A popup window will remind the user to confirm the battery replacement.

4. Deactivate the service mode as described above.

10 Application samples

For further information, please take a look at the Software Tutorials or the Quick Start Poster on www.phoenixcontact.net/catalog. You will find the data if you link to UPS-CONF or QUINT-UPS.

10.1 Functional test

One of the main functions of the QUINT-UPS is to supply the load, when the mains fails. To test, if the UPS buffers the load, follow these steps:

1. Switch off the power supply of the QUINT-UPS.
2. Check if the QUINT-UPS buffers the load as long as set with the buffer time potentiometer, refer to Buffer time selection (see page 12).

10.2 PC-Mode: PC shutdown and restart

The IQ technology of the QUINT-UPS is able to control the power supply for a PC. For that purpose the PC with the UPS-CONF software installed has to be connected to the UPS and the PC-Mode activated. The PC-Mode enables the automatic PC shutdown and restart functionality.

To test the PC shutdown and restart functionality in the PC-Mode, proceed as follows:

1. Switch the buffer time potentiometer to "PC-Mode", as described in the topic Buffer time selection (see page 12).
2. Connect the UPS device to a USB port of the PC where UPS-CONF is installed (refer to topic Hardware setup (see page 11)).
3. Open the software menu "Settings" and click "Time Settings".
4. Set the parameters for the four different parameter categories, as described in the topic PC-Mode (see page 38).
5. Check if the PC shuts down and restarts corresponding to the set parameters. If a program execution has been set, verify that it is executed.

11 Troubleshooting

If your system does not work properly for any reason, approach the problem in the following manner:

1. Check the system status:

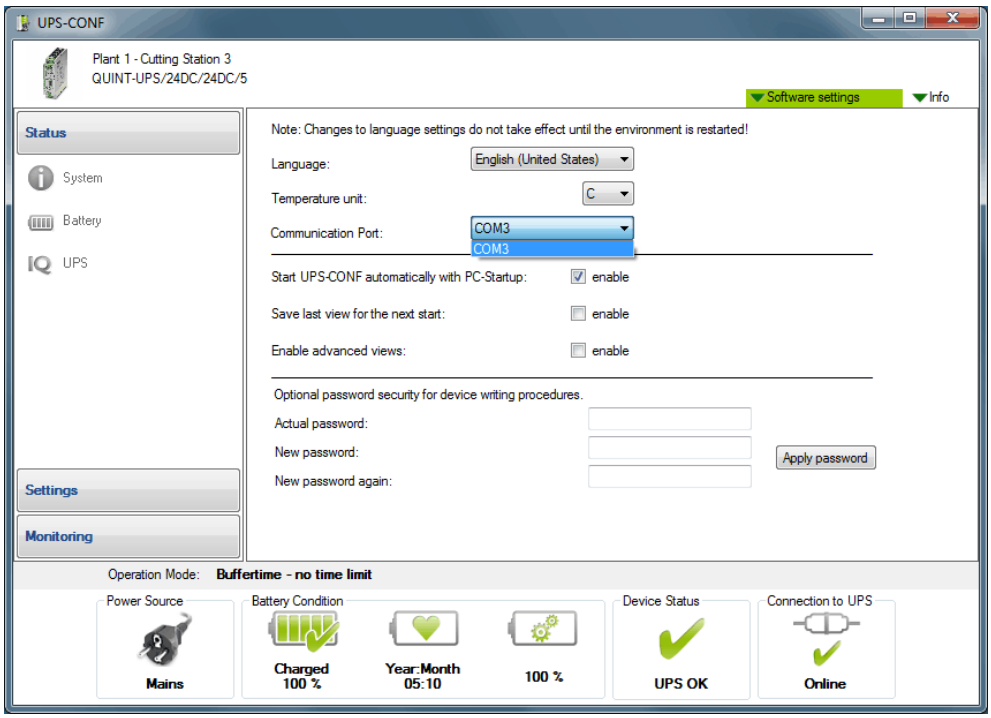
   - If the UPS-CONF software is installed, check the status bar (see page 17) and take a look at the system status.
   - If the UPS-CONF software is not installed, take a look at the front side of the UPS and check the LEDs (see page 20).

2. Proceed with the section Unexpected status symbols (see page 54) to find out, what is wrong.

The section Unexpected status symbols (see page 54) will lead you closer to the solution of the problem. If there are specific solutions for a single problem, you will be lead to the section, that describes the problem solving.

11.1 Unexpected status symbols

The meaning of status symbols showing an unexpected status is explained in the following topic.
The first table lists the symbols for the system status, that you can find in the action area and the second table lists the symbols from the status bar.



System status Symbol	Current situation and possible reason	Possible correction
 Gray: Mains OFF	There is no current available. Probably the Mains is switched OFF.	• Switch the Mains ON. • Take care that the power supply is available again.
DC  Gray: DC output not available	The power supply unit cannot deliver DC. Either the power supply is not available or the Mains switch is set to OFF.	• Switch the Mains ON. • Take care that the power supply is available again.
 Yellow: Battery mode	No current is available, thus the load gets it's power supply from the battery.	• Switch the Mains ON. • Take care that the power supply is available again.
 Red: UPS alarm	There may be different reasons: • No power supply is available. • The battery is soon empty. • The battery has to be replaced. • The battery cannot be detected. • There is another battery problem. • A set threshold has been reached.	• Switch the Mains ON. • Take care that the power supply is available again. • Check the set thresholds and compare with the current status. • Solve the battery problem. • Replace the battery. • Check the cables between UPS and battery. • Verify that the fuse is installed in the battery.

Status bar Symbol	Current situation and possible reason	Possible correction
	The UPS is in battery mode, because no power supply is available.	• Switch the Mains ON. • Take care that the power supply is available again.
	The bridge between the UPS terminals R1 and R2 is removed. Battery is deactivated therefore. Refer to the parameter "Remote Status" in the topic UPS (see page 27).	If you want the battery to be activated and the battery mode to be introduced, when the mains fail, bridge the terminals R1 and R2. Refer to the hardware overview (see page 7).
	There is no power supply available. One of these states is ongoing: • The UPS is off, because battery mode is finished. The set buffer time has elapsed. • The power source is not ok, because input voltage is in an invalid range.	If the UPS is off, because battery mode is finished, but the battery is funcional: • Switch the Mains ON. • Take care that the power supply is available again. If the UPS is off, because battery mode is finished, and the battery is no more funcional or at it's end of lifetime: • Change the battery. If the power source is not ok, because input voltage is in an invalid range: • Check the power supply.
	The battery is discharging, because no power supply is available.	• Switch the Mains ON. • Take care that the power supply is available again.
	The battery mode is finished, because the battery is empty.	• Take care that the power supply is available again to reload the battery. • Change the battery, if battery lifetime is exhausted.
	(see UPS alarm in the table above)	(see UPS alarm in the table above)
	• The connection between PC and UPS via the IFS-USB-DATACABLE is interrupted. • The communication port is not set.	• Connect the UPS and PC via the IFS-USB-DATACABLE. • Check if the communication port is set, as described in the topic Communication port (see page 56).

11.2 Communication port

The PC USB communication port for the communication between the UPS and the PC is automatically set during software installation. In case the communication port has not been set, the status bar shows the "Connection to UPS: Offline" status.

Although the communication port has not been set, it is detected automatically. Thus you can set it manually. You just have to select it in the software settings of the system menu.

If you click the combo box near the text "Communication port" the correct port is shown and you can select it.

CCC-Exempt Declaration

As we know, CCC certification is mandatory in China for defined products, and CNCA is the responsible committee for the definition of CCC application range. So please visit the website below for the latest bulletin (No. 45 of year 2014) of CNCA for CCC:

http://www.cnca.gov.cn/xxgk/ggxx/2014/201512/t20151230_44252.shtml

Primary-switched power supplies

Description of product, product group or product family

Product list:
See list on next page(s).

Description of product function:

Primary-switched power supplies for DIN rail mounting in industrial switch cabinets.

Reason why CCC certification is not required:

The listed power supplies are not for computers and adapters for information technology equipment (such as laptop) and they are not for audio/video products. So these above mentioned products do not belong to CCC categories and therefore are not in CCC application range.

Date of creation: 01. July 2018

Description

TRIO POWER is the rail mountable 24 V power supply unit with basic functions. With an output voltage of 24 V DC and 1-phase and 3-phase versions with 60 W or 960 W, it is particularly suited for use in series production in mechanical engineering. The wide-range input and international certification package allows worldwide implementation.
The high MTBF of 500,000 h stands for high supply reliability. The devices can be connected in parallel to increase the capacity and redundancy.
The clear LED signaling and the device connection with double terminal block for plus and minus for fast potential distribution are further advantages of this device series. A third terminal block for minus simplifies the grounding on the secondary side. All power supply units are idle proof and short circuit proof and provide a regulated and settable output voltage of 22.5 V DC to 29.5 V DC with output currents of 2.5 A, 5 A, 10 A, 20 A or 40 A.

- Reliable power supply unit even at high ambient temperatures
- No load and short circuiting resistance
- High dielectric strength
- Can be used worldwide in all industrial sectors due to a wide-range input and an international approval package

DANGER OF EXPLOSION!
Remove an item only when it is not connected to power or if it is located in the non-explosive area.

DANGER
Components with dangerously high voltage and high stored energy are located in the device!
Never carry out work on live parts!
Depending on the ambient temperature and the load, the housing can become very hot!

Make sure you always use the the latest documentation.
It can be downloaded at www.download.phoenixcontact.com.

A conversion table is available on the Internet at

Accessories	Type	Order No.	Pcs./Pkt.
Universal wall adapter	UWA 182/52	2938235	1

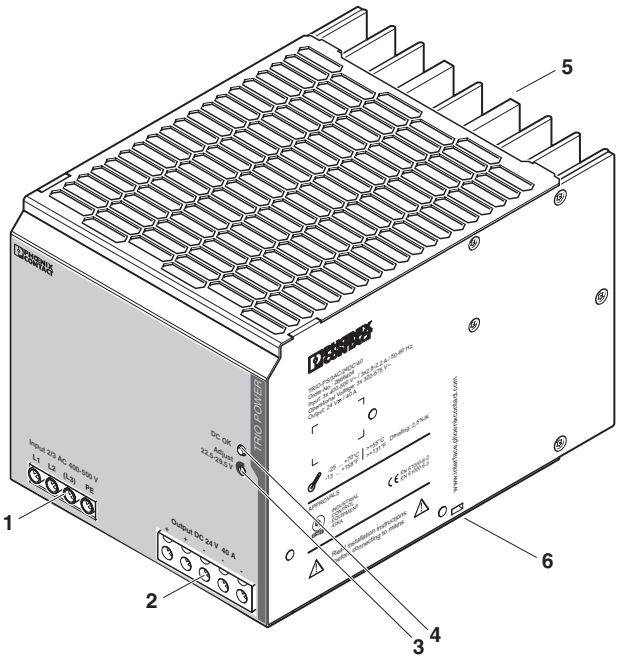
Technical data

Input data	
Input nominal voltage range	2x / 3x 400 V AC ... 500 V AC
AC input voltage range	320 V AC ... 575 V AC (for 3-phase operation) 2x 360 V AC ... 575 V AC (for 2-phase operation)
AC frequency range	45 Hz ... 65 Hz
Current consumption	3x 2 A (400 V AC) 3x 1.6 A (480 V AC)
Inrush current limitation	< 20 A
I^2t	1.3 A^2s
Power failure bypass	> 16 ms (400 V AC) > 20 ms (480 V AC)
Typical response time	< 1 s
Power factor (cos phi)	0.76
Protective circuitry	Transient surge protection Varistor
Recommended backup fuse for mains protection	3x 10 A (characteristic B) 3x 16 A (characteristic B)
Required backup fuse (device and line protection)	(externally via 3 10 A or 16 A circuit breakers, characteristic B)
Discharge current to PE	< 3.5 mA

Output data	
Nominal output voltage	24 V DC ±1%
Setting range of the output voltage	22.5 V DC ... 29.5 V DC
Output current	40 A (-25 °C ... 55 °C)
Derating	Above +55°C: 2.5% per Kelvin
Current limitation	Approx. 48 A
Max. capacitive load	Unlimited
Control deviation	< 1 % (change in load, static 10% ... 90%) < 2 % (change in load, dynamic 10% ... 90%) < 0.1 % (change in input voltage ±10%)
Power loss nominal load max.	87 W
Maximum power dissipation idling	11 W
Efficiency	> 91.5 %
Ascent time	< 2 ms (U_{OUT} (10% ... 90%))
Residual ripple	< 20 mV_{PP}
Peak switching voltages	< 40 mV_{PP}
Connection in parallel	Yes, for redundancy and increased capacity
Connection in series	No
Surge protection against internal surge voltages	Yes, < 35 V DC
Resistance to reverse feed	35 V DC

Signal output DC OK active	
Status display	"DC OK" LED green / U_{OUT} > 21.5 V: LED lights up

General data	
Insulation voltage input/output	4 kV AC (Type test) 2 kV AC (routine test)
Insulation voltage input / PE	2 kV AC (type test) 2 kV AC (routine test)
Insulation voltage output / PE	500 V DC (routine test)
Degree of protection	IP20
Class of protection	I, with PE connection
MTBF	> 500 000 h in acc. with IEC 61709 (SN 29500)
Housing version	Steel sheet, zinc-plated
Side element version	Aluminum
Dimensions W / H / D (state of delivery)	139 mm / 130 mm / 190 mm
Weight	3.2 kg



Ambient conditions	
Ambient temperature (operation)	-25 °C ... 70 °C (> 55° C derating)
Ambient temperature (storage/transport)	-40 °C ... 85 °C
Max. permissible relative humidity (operation)	95 % (at 25°C, no condensation)
Vibration (operation)	< 15 Hz, amplitude ±2.5 mm in acc. with IEC 60068-2-6 15 Hz ... 150 Hz, 2.3g, 90 min.
Shock	15g in all directions in acc. with IEC 60068-2-27
Pollution degree in acc. with EN 50178	2
Climatic class	3K3 (in acc. with EN 60721)

Block diagram

Safety and warning notes

The power supply units are built-in devices. The device may only be installed and put into operation by qualified personnel. The corresponding national regulations must be observed.

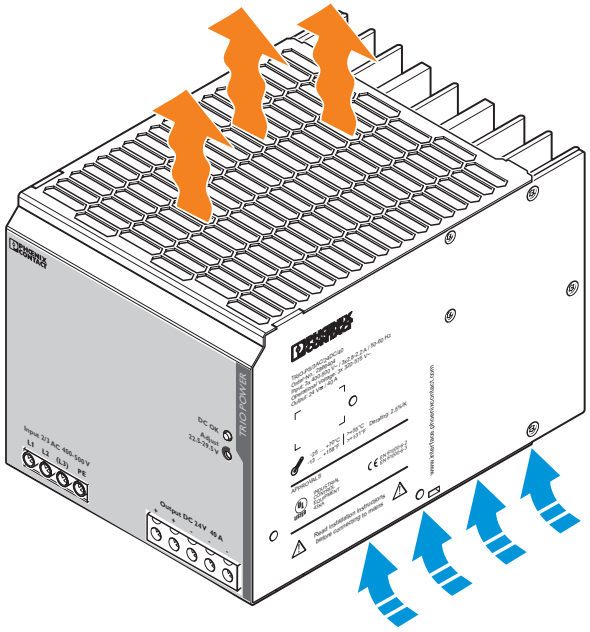
DANGER OF EXPLOSION!
Remove an item only when it is not connected to power or if it is located in the non-explosive area.

DANGER
Components with dangerously high voltage and high stored energy are located in the device!
Never carry out work on live parts!
Depending on the ambient temperature and the load, the housing can become very hot!

Before startup please ensure:

The mains connection has been carried out by a competent person and protection against electric shock is guaranteed!

The device can be disconnected outside the power supply unit in accordance with the regulations as in EN 60950 (e.g. through primary side line protection)!

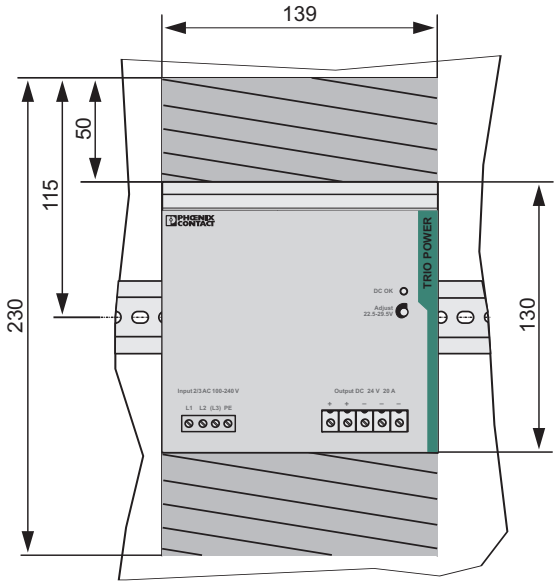


The ground conductor is connected!

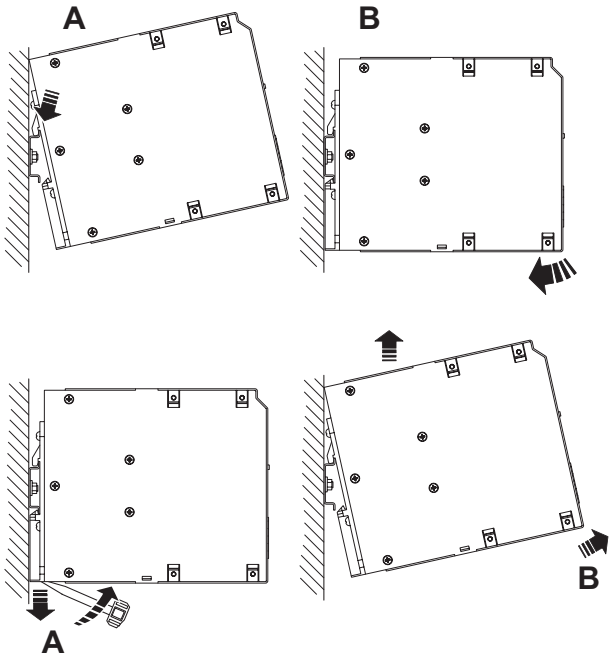
All feed lines are sufficiently protected and dimensioned!

All output lines are dimensioned according to the maximum output current of the device or separately protected!

Sufficient convection is guaranteed!



Installation

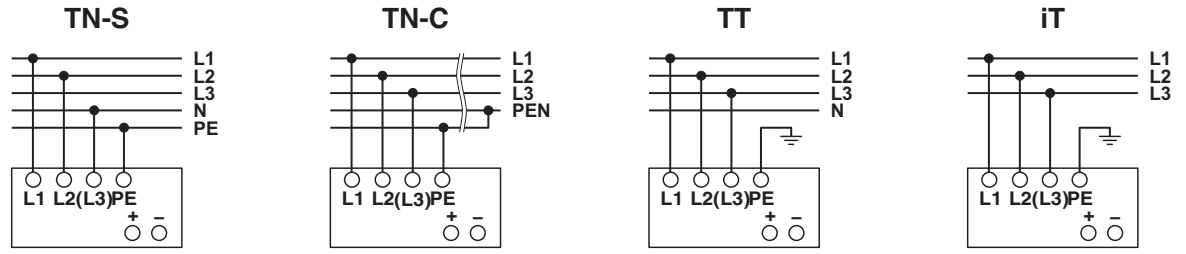


In order to guarantee sufficient convection, we recommend observing the following minimum distance to other modules: 5 cm in a vertical direction and 0 cm in a horizontal direction.

The power supply unit can be snapped onto all DIN rails in acc. with EN 60715. They must be mounted horizontally (connecting terminal blocks bottom).

Installation position

Mounting position: Installation depth 190 mm (+ DIN rail)

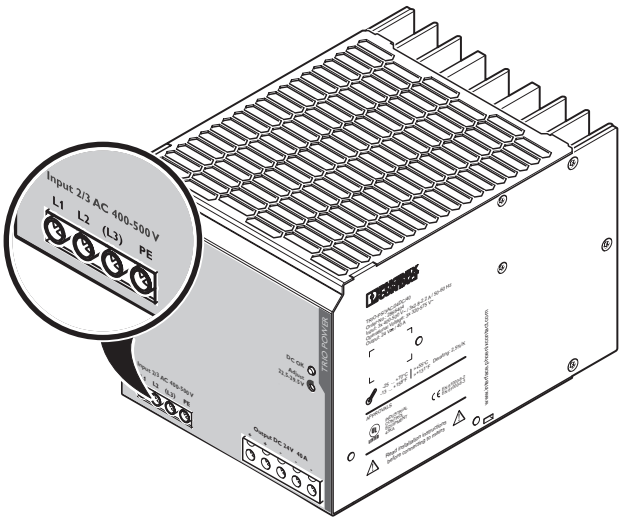


Assembly

Position the module with the DIN rail guide on the upper edge of the DIN rail, and snap it in with a downward motion.

Removing

Pull the snap lever open with the aid of a screwdriver and slide the module out at the lower edge of the DIN rail.



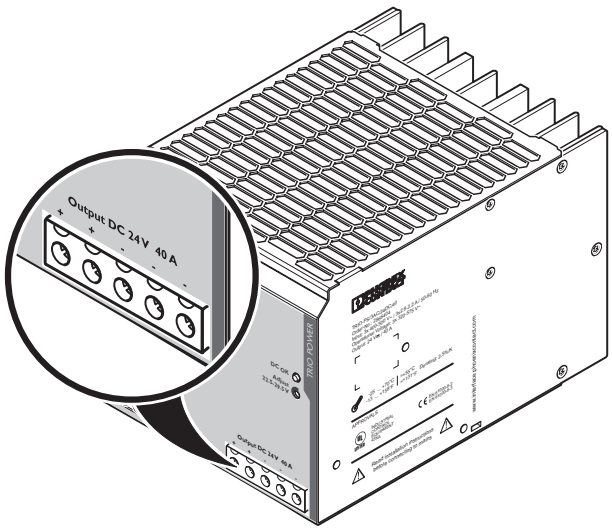
Connection to various network forms

The connection for 2x/3x 400 V AC ... 500 V AC is made using the L1, L2, L3 and PE screw connections.
The device can be connected to 2/3-phase AC networks with nominal voltages 2x/3x 400 V AC ... 500 V AC.
In the event of a phase failure, unrestricted operation is possible with nominal capacity.

In order to comply with the UL certification, use copper cables that are designed for operating temperatures of > 75°C.
In order to comply with EN 60950/UL 60950, flexible cables require ferrules. To safely connect a device, the ferrules should have a length of at least 10 mm (AC input) or 12 mm (DC output). To achieve a reliable and shock-proof connection, strip the connecting ends according to section "Structure".

Input

Protection of the primary side



The device must be installed in acc. with the regulations as in EN 60950. It must be possible to disconnect the device using a suitable isolating facility outside the power supply. Primary circuit mains protection, for example, is suitable for this purpose.

Required backup fuse (device and line protection)

Three external thermo-magnetic fuses are necessary as device protection: 3 x 10 A or 16 A power circuit breaker, characteristic B (or identical function).

If an external fuse is triggered, there is most probably a malfunction in the device. In this case, the device must be inspected in the factory!

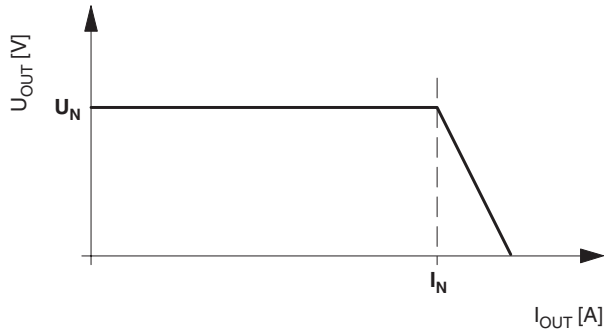
Output

Make sure that all output lines are dimensioned according to the maximum output current or are separately protected. The cables on the secondary side must have sufficiently large cross sections in order to keep the voltage drops on the lines as low as possible.

You can fasten the connection cables to the housing using cable binders.
Ensure that the cable binders and the connection cables are designed for the surface temperatures that occur in operation.
Make sure that the insulation of the connection cables is not damaged when tightening the cable binders.

The connection is made using the "+" and "-" screw connections on the screw connection of the DC output. At the time of delivery, the output voltage is 24 V DC. The output voltage can be set on the potentiometer.

Protection of the secondary side



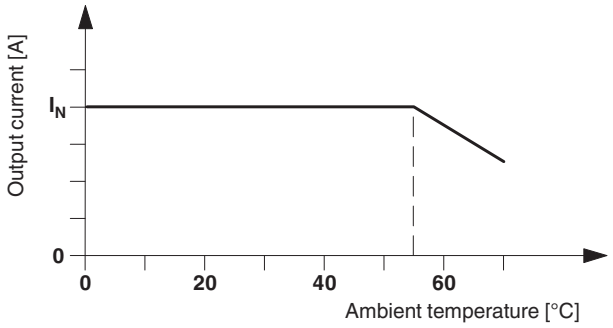
The device is electronically protected against short circuit and idling. In the event of a malfunction, the output voltage is limited to 35 V DC.

Signaling

The "DC OK" LED enables evaluation of the function of the power supply directly on site.

	State 1	State 2
"DC OK" LED	ON	OFF
Cause	Output voltage > 21.5 V	Output voltage < 21.5 V or no voltage at the output
Meaning	Output voltage and output current OK	TRIO POWER is in operation, but there is a fault on the side of the consumer; the current consumption is greater than I_N or the output is short circuited. TRIO POWER is out of operation because there is no mains voltage, the fuse on the primary side has been triggered, or the device is faulty.

Function



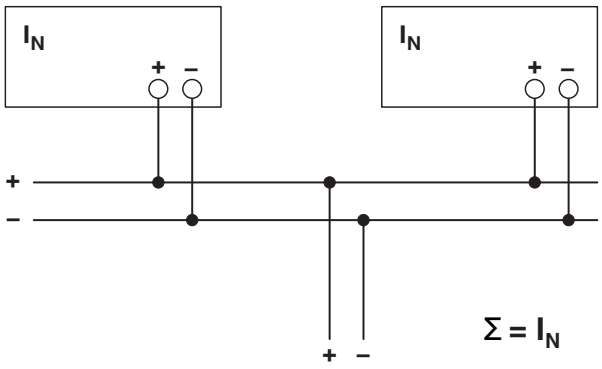
Output characteristic curve

The device functions following the U/I characteristic curve. Under load, the working point follows this curve. The output current is limited in the event of a short circuit or overload. Thereby, the device does not switch off, but rather supplies a continuous output current.
The secondary voltage is reduced until the short circuit or overload on the secondary side has been remedied. The U/I characteristic curve ensures that both heavily capacitive loads and loads with DC/DC converters in the primary circuit can be supplied. Downstream fuses are triggered. Selectivity in the design of your system is guaranteed at all times.

U_N = 24 V

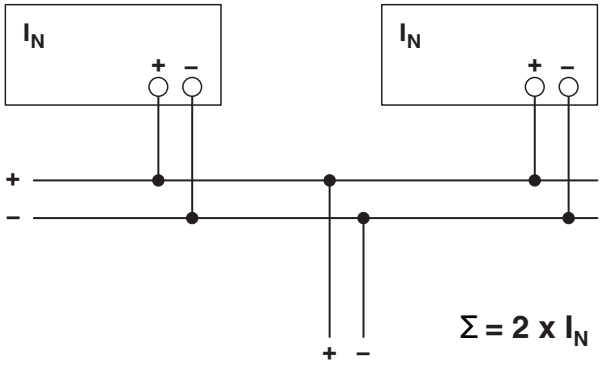
I_N = 40 A

P_N = 960 W



Thermal behavior

With an ambient temperature of up to +55°C, the device supplies the continuous output current of I_N. In the case of ambient temperatures above +55°C, the output current must be reduced by 2.5% per Kelvin increase in temperature. The device does not switch off at ambient temperatures of +70°C or thermal overload. The output capacity is reduced as far as necessary to provide device protection. After it has cooled down, the output capacity is increased again.



Parallel operation

Devices of the same type can be connected in parallel to enable both redundancy and an increase in efficiency. No other alignment is necessary when in the state of delivery.
If the output voltage is adjusted, a uniform distribution of power is guaranteed by setting all parallel operated power supply units to exactly the same output voltage.
To ensure symmetrical distribution of power, we recommend designing all cable connections from the power supply unit to a busbar of the same length and with the same conductor cross section. The system makes it advisable to install a protective circuit at the output of each device when more than two power supply units are connected in parallel (e.g. decoupling diode or DC fuse). This prevents high reverse feed currents in the event of a secondary device fault.

Redundant operation

Redundant circuits are suitable for the supply of systems which make especially high requirements on the operational safety. If a fault occurs in the primary circuit of the first power supply unit, the second device automatically takes over the entire power supply, without interruption, and vice versa. For this reason, the power supply units to be connected in parallel are dimensioned in such a way that the total current requirement of all consumers can be completely covered by one power supply unit. 100% redundancy makes external decoupling diodes necessary (QUINT-DIODE/40, Order No. 2938963)!

Increased performance

For n parallel connected devices, the output current can be increased to n x I_N. Parallel connection to increase efficiency is used for the expansion of existing systems. It is advisable to use parallel connection if the power supply unit does not cover the current requirement of the most powerful consumer. Otherwise the consumers should be spread among individual devices independent of one another. A maximum of five devices can be connected in parallel!

Declaration of compliance with China RoHS – Devices

Power supply unit - TRIO-PS/3AC/24DC/40 - 2866404

Primary-switched TRIO POWER power supply for DIN rail mounting, input: 3-phase, output: 24 V DC/40 A

We herewith declare the compliance of this product with the Chinese marking requirements set forth in the “Management Methods for the Restriction of the Use of Hazardous Substances in Electrical and Electronic Products” (Order No. 32 of the MITT, etc.) and SJ/T 11364-2014 marking for the restriction of the use of hazardous substances in electrical and electronic product.

This product can be recycled and used safely during its environmentally friendly use period.

The Environmentally Friendly Use Period (EFUP) for the product is 25 years, unless otherwise marked. The Environmentally Friendly Use Period is valid only when the product is operated under the conditions defined in the product documentation.

This product should be recycled after its environmental protection use period has expired because it may contain substances or elements as shown in the following table:

	Hazardous Substance					
Part Name	**Lead (Pb)**	**Mercury (Hg)**	**Cadmium (Cd)**	**Hexavalent Chromium (Cr(VI))**	**Polybrominated biphenyls (PBB)**	**Polybrominated diphenyl ethers (PBDE)**
Electronic supplement[1]	X	O	O	O	O	O

This table is prepared in accordance with the provisions of SJ/T 11364.

O: Indicates that said hazardous substance contained in all of the homogeneous materials for this part is below the limit requirement of GB/T 26572

X: Indicates that said hazardous substance contained in at least one of the homogeneous materials used for this part is above the limit requirement of GB/T 26572

The table shows where these substances may be found in this Electrical and Electronic Product.

[1]) Electronic supplement includes additional parts which are not independent devices and are delivered with this article, for example a memory card for a controller.

Declaration of compliance with China RoHS – Devices

The information on substances corresponds to our present knowledge as well as the status of legislation mentioned in this declaration on the date of issue. In this respect we specifically take the statements and indications of our suppliers and service providers as a basis.

© PHOENIX CONTACT 2019-05-22

1 Description

Uninterruptible power supplies (UPS) continue to deliver power even if the mains breaks down.

An uninterruptible solution consists of three function units:

- Power supply
- Electronic switchover unit
- Power storage device

The product described here is an electronic switchover unit. In the event of mains breakdowns or failures, it switches to battery operation without interruption so that loads continue to be consistently supplied.

As an option, you can monitor and configure the device with the free UPS-CONF software. The IFS-CONFSTICK memory stick is available for convenient transfer of parameters between more than one QUINT-UPS.

Features

- IQ technology for maximum system availability. The intelligent battery management optimizes and keeps you informed on the remaining runtime, current state of charge, service life and performance of the power storage device.
- Generous power reserve POWER BOOST
- Optimum use of the buffer time
- Preventive battery monitoring
- Fast battery charging
- Extensive signaling and parameterization
- SFB technology

Make sure you always use the latest documentation.
It can be downloaded from the product at www.phoenixcontact.net/catalog.

4 Technical data

Input data	
Nominal input voltage	24 V DC
DC input voltage range	18 V DC ... 30 V DC
Buffer period	0.5 h ()
Current consumption mains mode Max. No load Charging process	 51.9 A 66 mA 6.9 A
Fixed connect threshold	≤ 22 V DC

Output data	
Nominal output voltage	24 V DC
Output voltage range	18 V DC ... 30 V DC
Nominal output current	40 A
Derating	60 °C ... 70 °C (2.5%/K)
Output current limit	(In mains mode according to connected upstream current limiting device) > 45 A (Battery operation)
Power dissipation (mains mode) Idle Nominal Load BOOST	 1.6 W 9.3 W 10.3 W
Power dissipation (battery operation) Idle Nominal Load BOOST	 1.4 W 20.9 W 26.5 W
Output power	960 W
Efficiency	> 98.7 %
Connection in parallel	Yes, up to 2 modules with redundancy module
Connection in series	No

Output data (mains operation)	
Nominal output voltage	24 V DC
Output voltage range	18 V DC ... 30 V DC
Output current (according to connected upstream power supply unit) Nominal output current I_N POWER BOOST I_{BOOST} SFB technology I_{SFB}	 40 A (-25 °C ... +60 °C) 45 A (-25 °C ... +40 °C) 215 A (-25 °C ... +60 °C)
Duration	12 ms (SFB technology)

Output data (battery operation)	
Nominal output voltage	24 V DC
Output voltage range	19.2 V DC ... 27.6 V DC (U_{OUT} = U_{BAT} - 0.5 V DC)
Output current Nominal output current I_N POWER BOOST I_{BOOST} SFB technology I_{SFB}	 40 A (-25 °C ... +60 °C) 45 A (-25 °C ... +40 °C) 215 A (-25 °C ... +60 °C)
Duration	15 ms (SFB technology)

Power storage device	
Nominal voltage U_N	24 V DC
End-of-charge voltage	24 V DC ... 29 V DC (temperature compensated)
Temperature compensation	42 mV/K (preset)
Nominal capacity range	7 Ah ... 200 Ah
Charge current	0.2 A ... 5 A
Battery presence check (time interval)	1 min

Power In OK	
Status display	LED / Static to / green

Alarm	
Inverting with the UPS-CONF configuration and management software	
Switching output	Relay
Maximum switching voltage	≤ 30 V AC/DC
Maximum switching current	≤ 100 mA
Status display	LED / Static to / red

Battery charge	
Signal options are adjustable with the UPS-CONF configuration and management software	
Switching output	Relay
Maximum switching voltage	≤ 30 V AC/DC
Maximum switching current	≤ 100 mA
Status display	LED bar graph / dynamic / green

Battery mode	
Signal options are adjustable with the UPS-CONF configuration and management software	
Switching output	Relay
Maximum switching voltage	≤ 30 V AC/DC
Maximum switching current	≤ 100 mA
Status display	LED / Static to / yellow

General data	
MTBF	> 500000 h
Mounting position	horizontal DIN rail NS 35, EN 60715
Housing material	Steel sheet, zinc-plated
Dimensions W / H / D	47 mm / 130 mm / 125 mm
Dimensions W / H / D (90° turned)	122 mm / 130 mm / 50 mm
Weight	0.7 kg

Security	
Degree of protection	IP20
Protection class	III

Connection data

Connection method	Screw connection
Conductor cross section, solid	0.5 mm² ... 16 mm²
Conductor cross section, stranded	0.5 mm² ... 16 mm²
Conductor cross section AWG/kcmil	8 ... 6
Stripping length	10 mm
Screw thread	M4
Tightening torque	1.2 Nm ... 1.5 Nm

Ambient conditions

Ambient temperature (operation)	-25 °C ... 70 °C
Ambient temperature (storage/transport)	-40 °C ... 85 °C
Max. permissible relative humidity (operation)	≤ 95 % (25°C, no condensation)
Vibration (operation)	< 15 Hz, amplitude ±2.5 mm in acc. with IEC 60068-2-6 15 Hz ... 150 Hz, 2.3 g t_v = 90 min.
Shock	30g in all directions in acc. with IEC 60068-2-27
Climatic class	3K3 (in acc. with EN 60721)

Standards

Electrical safety (of information technology equipment)	EN 60950-1/VDE 0805 (SELV) EN 61558-2-17
Electronic equipment for use in electrical power installations	EN 50178/VDE 0160 (PELV)

5 Safety regulations and installation notes

EXPLOSION HAZARD

Only remove equipment when it is disconnected and not in the potentially explosive area!

DANGER

Never carry out work on live parts!
The housing can become very hot, depending on the ambient temperature and load!

CAUTION:

Before startup please ensure:

The connection must be carried out by a competent person and protection against electric shock guaranteed.

It must be possible to switch off power to device according to EN 60950.

All feed lines are sufficiently protected and dimensioned!

All output lines are dimensioned according to the maximum output current of the device or separately protected!

Sufficient convection must be guaranteed.

Observe mechanical and thermal limits.

ATTENTION: Danger if used improperly

Uninterruptible power supplies are installable devices. Installation and startup may only be carried out by qualified personnel. The relevant country-specific regulations must be observed.

CAUTION: Risk of injury

Cover termination area after installation in order to avoid accidental contact with live parts (e. g., installation in control cabinet).

Do not dispose of used batteries in the household waste! Dispose of these according to the currently valid national regulations.

They can also be returned to Phoenix Contact or the manufacturer.

CAUTION: Risk of injury

Use the device with the UPS-BAT.... recommended in the table of accessories. When using power storage devices other than UPS-BAT..., make sure that the corresponding parameters for the charging characteristics are adjusted and adhered to.

Phoenix Contact accepts no liability or responsibility for possible for any consequential damage.

	Selector switch

8 Installation

8.1 Convection

The device supplies the specified values in the case of sufficient convection cooling and when mounted on a horizontal DIN rail.

To enable sufficient convection, we recommend a minimum vertical gap to other modules of 5 cm.
A lateral gap of 5 mm is recommendable.

The module can be snapped onto all DIN rails according to EN 60715 and must be mounted horizontally (connecting terminal blocks on top and bottom).

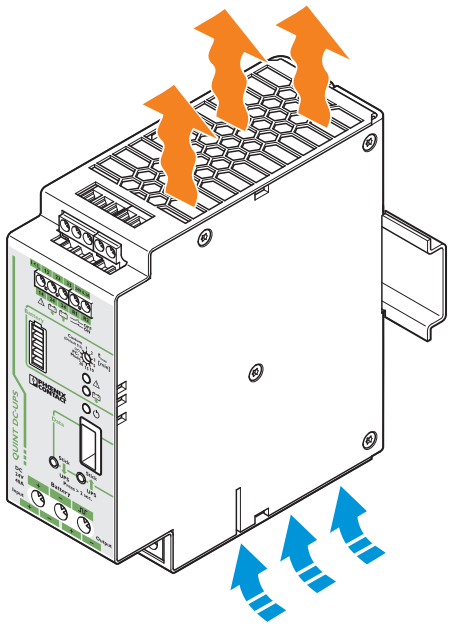

Figure 3 Convection

8.2 Mounting position

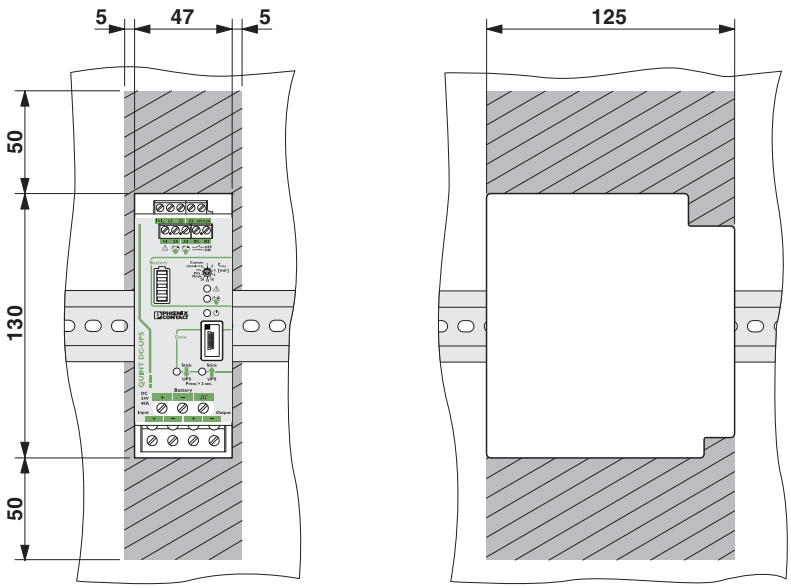

Figure 4 Installation dimensions

Installation depth 125 mm

8.3 Mounting on a DIN rail

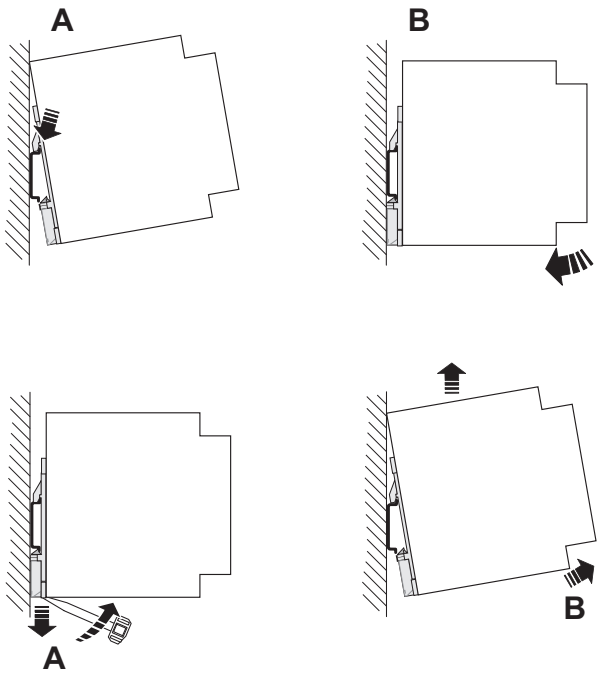

Figure 5 Mounting and removing

Slim-style installation

Assembly:

Position the module with the DIN rail guide on the upper edge of the DIN rail, and snap it in with a downward motion.

Removing:

Pull the snap lever open with the aid of a screwdriver and slide the module out at the lower edge of the DIN rail.

Mounting position rotated 90°

Low-profile installation can be achieved by mounting the device at right-angles to the DIN rail. Mount the DIN rail adapter (UTA 107) as described in the figure. No additional mounting material is required. Fixing screws: Torx T10 (torque 0.8 Nm ... 0.9 Nm).

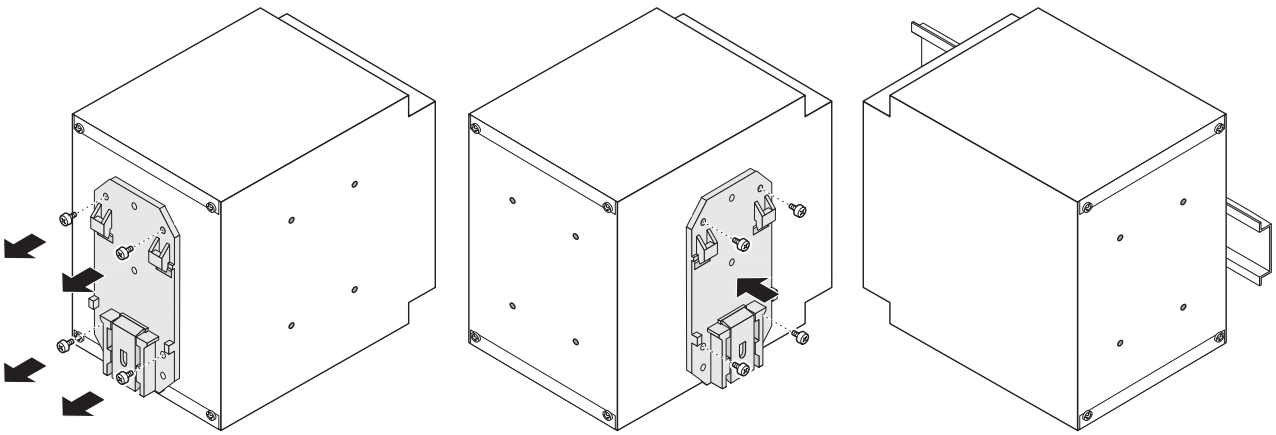

Figure 6 Mounting position rotated 90°

8.4 Connection terminal blocks

Use a screwdriver with a suitable blade width for wiring. For a reliable and touch-proof connection, use a suitable cable cross section and insulate the cable ends according to the above-mentioned specifications.

Terminal block	Solid conductor [mm^2]	stranded conductor [mm^2]	AWG	Stripping length [mm]	Torque [Nm]	Torque [lb in]
DC input: +/-	0.5 ... 16	0.5 ... 16	8 ... 6	10	1.2 ... 1.5	15
DC output: +/-	0.5 ... 16	0.5 ... 16	8 ... 6	10	1.2 ... 1.5	15
Battery: +/-/signal	0.5 ... 16	0.5 ... 16	20 ... 6	10	1.2 ... 1.5	15
Signals: R1, R2/I<I_N	0.2 ... 4	0.2 ... 2.5	24 ... 12	8	0.5 ... 0.6	5 ... 7

508:

Copper cable; operating temperature > 75°C (ambient temperature < 55°C) and > 90°C (ambient temperature < 75°C).

60950:

Use ferrules for flexible cables.

8.5 Installation of individual components

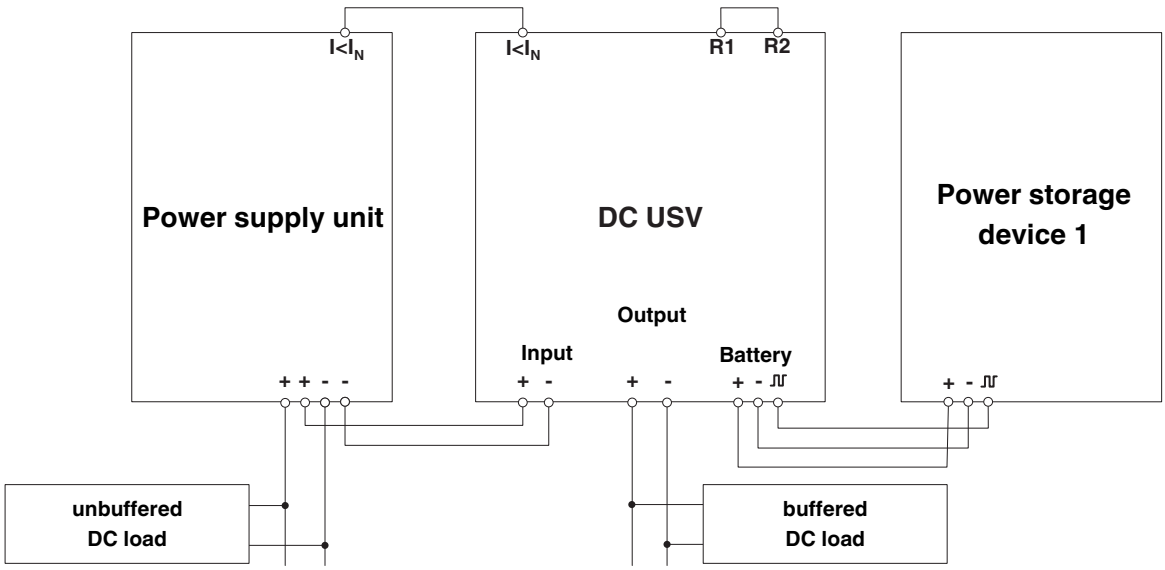

Figure 7 Schematic design

The image is a schematic representation of the design and does not contain all parts.

Observe the installation instructions.

Power supply unit

Use current-limited source (e. g., QUINT POWER power supply) or a suitable fuse. If loads must **not** be supplied in the event of a mains breakdown or failure, they must be connected directly to the output of the power supply as unbuffered DC load.

DC UPS

- Input: the input is supplied with 18 … 30 V DC.
- Output: in the event of mains interruption or failure, the connected DC load is supplied with voltage without interruption.
- Battery: the required power is made available by the power storage device. The signal cable is used for communication between the UPS and power storage device.
- Signal $I<I_N$: when connected to the $I<I_N$ output of the QUINT POWER power supply unit, the power supply unit is charged with the maximum charging current as quickly as possible (fast battery charging). Supply of the buffered DC load always has priority. This function is available when the power supply unit makes a static power reserve available with corresponding signal contact e. g., QUINT POWER with POWER BOOST and preventive function monitoring. Without this, charging is performed at reduced current.
- Signal R1, R2: remote control

Power storage device

Depending on the desired buffering time, select the power storage device listed under accessories.

VRLA power storage devices are temperature dependent. If possible and to ensure optimum function, install at a cool location e. g., at the bottom of the control cabinet.

9 Connection and protection

9.1 Input and protection of the primary side

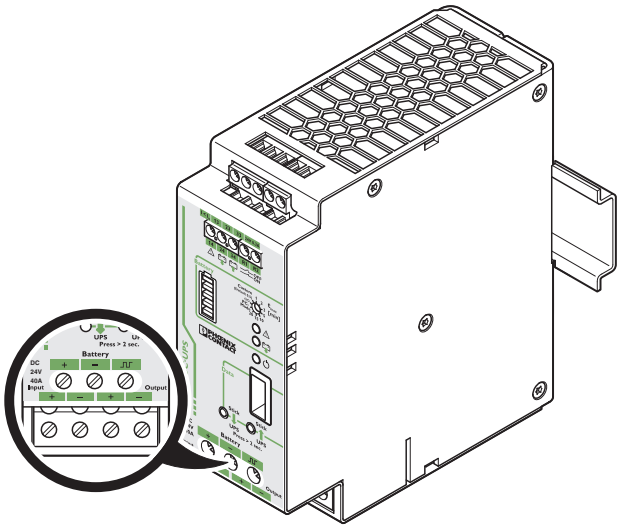

Figure 8 Input

Connection of the input is made via connection terminal blocks "Input +/-" (input reverse polarity protection).

The maximum current for each input is 53 A.

Therefore use a current-limited source (e. g., QUINT POWER) or a suitable fuse.

Installation of the device must correspond to EN 60950 regulations.

All cables must have large cross sections in order to keep voltage drops as small as possible.

9.2 Output and protection on the secondary side

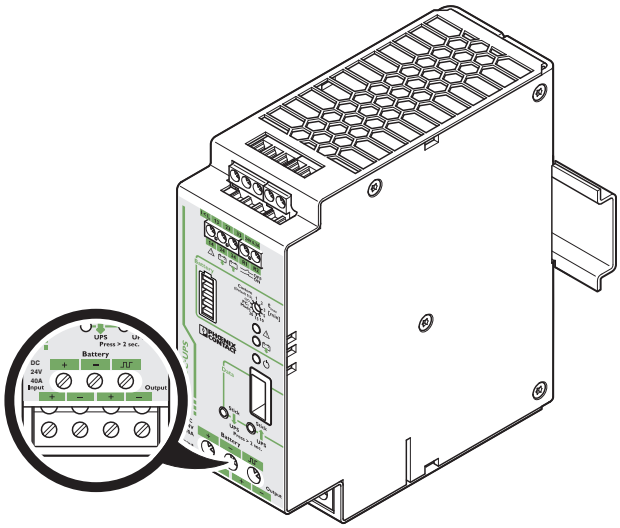

Figure 9 Output

Connection of the output takes place via the connection terminal block "Output +/-".

The device is electronically short-circuit-proof and idle-proof. In the event of a malfunction, the output voltage is limited to a maximum of 35 V DC. It must be ensured that all output cables are dimensioned or separately protected according to the maximum output current. All cables must have large cross sections in order to keep voltage drops as small as possible.

9.3 Power storage device

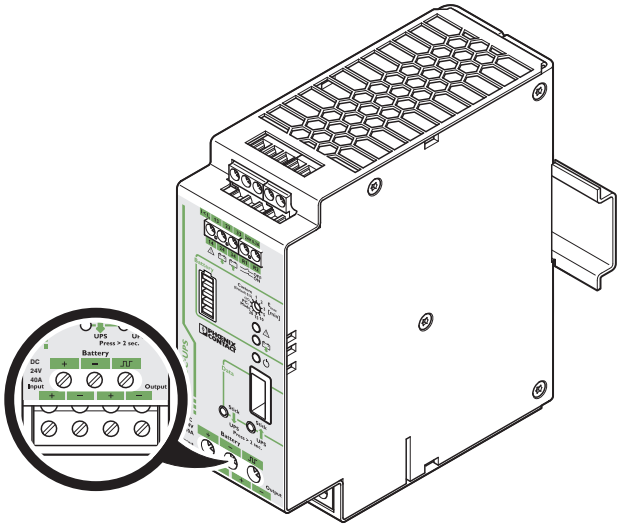

Figure 10 Output, battery

Connection of the power storage device takes place via the connection terminal block "Battery +/-". To make use of intelligent IQ technology, you must also install a cable for the communication between the UPS and power storage device.

You will find a clearly arranged selection table for suitable power storage devices next to the product at www.phoenixcontact.net/catalog.

9.4 SFB technology

SFB (Selective Fuse Breaking) technology reliably switches off faulty current paths in the event of a short circuit. It supplies six times the nominal current for 12 ms in mains mode and for 15 ms in battery mode. SFB technology therefore safely triggers standard circuit breakers. Faults are located reliably and important system parts remain in operation.

9.5 Power reserves

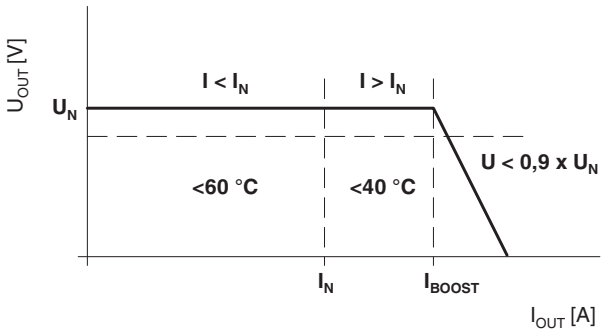

Figure 11 Output characteristic curve

Both the POWER BOOST static power reserve and the SFB (Selective Fuse Breaking) technology dynamic power reserve are available in mains and battery mode if a QUINT POWER power supply unit from Phoenix Contact is connected upstream.

In mains mode, the power reserve is forwarded to the buffered DC load via the UPS.

In battery mode, the power storage device supplies sufficient power to ensure the same behavior as a QUINT POWER power supply unit with SFB technology.

9.6 Temperature response

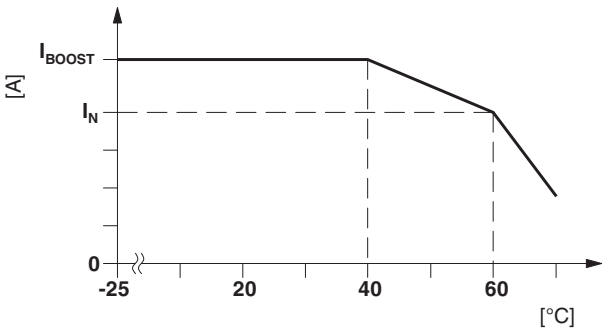

Figure 12 Derating diagram

At an ambient operating temperature of up to +40 °C, the UPS makes the I_{BOOST} continuous output current available. The device can supply the I_N nominal output current up to ambient temperatures of +60 °C. In the case of ambient temperatures above +60 °C, The output power must be decreased by 2.5 % per Kelvin temperature increase.

10 Signaling

Three LED indicators, an LED bar graph and three floating relay contacts are available for function monitoring.

In addition, you can use the UPS-CONF configuration and management software.

The software and the associated user manual are available free of charge at www.phoenixcontact.net/catalog.

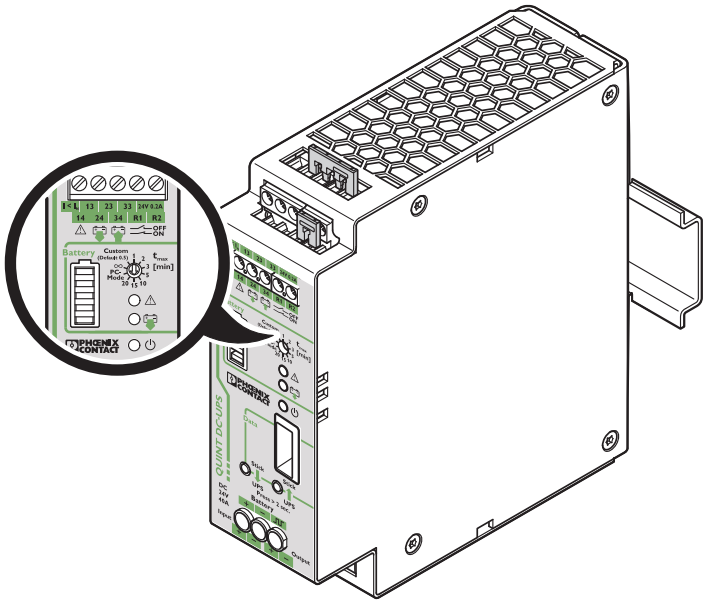

Figure 13 Display elements

State	LED	Switching output	Signal, default
Power In OK, mains mode	Green	-	-
Alarm	Red	13/14	Active low
Battery mode	Yellow	23/24	Active high
Battery charge	Bar graph	33/34	Active high

Alarms, warnings and/or operating states can be individually assigned to the battery mode and battery charge switching outputs via the UPS-CONF configuration and management software. Warnings are not indicated by the LED indicators.

ATTENTION:

LED indicator states are also simultaneously signaled via the switching outputs in the default settings. If an individual assignment of the switching outputs takes place, signal states deviating from the LED indicators are possible. Make sure that only sensible combinations are signaled.

10.1 LED and bar graph test

An LED test is performed automatically during startup of the device. The LEDs indicate the following error states:

1. All LEDs and the bar graph light up.
2. The LEDs light up, the bar graph does not light up, the lower bar changes its color from green to red.
3. All LEDs and the bar graph are off.
4. The LEDs and the bar graph light up according to their current status.

10.2 LED indicator

State	Green LED	Red LED	Yellow LED	Description
1	OFF	OFF	Lit	Battery mode, bar graph displays current charging state
2	OFF	Lit	Lit	Battery mode, power storage device is almost empty, lower bar graph LED is red
3	Lit	OFF	OFF	Mains mode, bar graph displays current charging state
4	Lit	Lit	OFF	Mains mode, alarm in the event of battery problem: lower bar graph LED flashes red

Green LED (mains mode), yellow LED (battery mode)

Either the green or the yellow LED lights up.

Green LED lights up, yellow LED is off: the load connected to the UPS is supplied from the mains.

Green LED off, yellow LED lights up: mains is not available. The load connected to the UPS is supplied by the power storage device.

Red LED, alarm in mains mode

Red LED lights up, the lower bar graph LED flashes red: there is a problem with the power storage device.

When using the UPS-BAT... power storage device and a connected communication cable, the current life expectancy (SOH, State of Health) is determined via the IQ technology. An alarm is signaled in the following cases:

– The adjustable threshold "remaining life expectancy" is reached.
– Different types of battery technology were connected that cannot be charged simultaneously, e. g. VRLA and LI-ION.
– The presence check is negative.
– The quality check is negative.

When using power storage devices other than UPS-BAT..., an alarm is signaled if it is not present or if the quality of the power storage device is no longer sufficient for supplying the load in the event of a mains failure.

If the lower bar graph LED does not flash, the alarm indicates overload or service mode.

Red LED, alarm in battery mode

Red LED lights up: the power storage device is almost completely discharged.

When using the recommended UPS-BAT power storage device and connected communication cable, the current charging state (SOC, State of Charge)., is displayed via the IQ technology. The preset alarm signaling threshold is 10%. The lower bar graph LED lights up red.

As an option, a time can be set via the UPS-CONF software, for example, 10 mins. In this case, the UPS signals an alarm when the power storage device is able to supply the connected load for a further 10 minutes.

When using power storage devices other than the UPS-BAT..., the alarm indicates battery voltage too low (default: 20.4 V).

ATTENTION:

Signaling of all states is determined by calculated, individual or preset thresholds and operating states. The detection that is the base of signaling takes place with high accuracy. However, detection is subject to the respective ambient conditions in each case. In particular power storage devices can contribute to further deviations, irrespective of the storage technology.

10.3 Bar graph-display when the communication cable is installed

The current charging state and the remaining runtime of the power storage device is determined during startup of the UPS. The LED light lights up from bottom to top during this (charging the battery in mains mode) or from top to bottom (discharging the battery in battery mode).

When the power storage device is fully charged and the charging state is determined, this is displayed by the bar graph. Depending on the charging state and the size of the power storage device, this can range from a few minutes to hours.

Each LED corresponds to 20% of the total capacity. The lowest LED is divided into two parts: red for 0-10%, green for 11-20%.

The current capacity level is indicated by flashing during charging.

10.4 Bar graph display without communication cable

If no communication cable is installed between the UPS and the power storage device, the LEDs indicate the following states during startup of the UPS in mains mode.

The upper 4 LEDs are off.

The lower LED can indicate the following states.

– Flashing: power storage device is being charged
– Off: power storage device is not being charged
– Red: battery problem

11 Function

In mains mode (DC input voltage present), the output voltage corresponds to the applied input voltage. In the event of a failure of the voltage supply, switching to battery mode takes place without interruption. The output voltage is not directly dependent on the battery voltage.

11.1 IQ technology

Intelligent Battery Management

- SOC (State of Charge): current charging state and remaining runtime of the power storage device is always available.
- SOH (State of Health): displays the remaining life expectancy of the power storage device and warns of failures at an early stage.
- SOF (State of Function): determines the current performance of the power storage device.

Intelligent Battery Control

Intelligent Battery Control – automatically detects the connected battery type via the connected communication cable and maximizes the remaining service life of the power storage device via an optimally adapted charging characteristic.

Intelligent Charging

The device adapts the charging current and thereby ensures the fastest possible recharging and maximum availability

Intelligent Communication

The data port is used for communication between the UPS and PC, e. g., for configuring the UPS.

11.2 SOC application example

Task: an industrial PC must be continuously supplied with 24 V DC.

Previous solution: the UPS is buffered with 3.4 Ah and supplies 24 V DC / 5 A for 20 under optimum conditions Minutes

Problem: can the power storage device actually bridge this time? Charging state, performance and remaining runtime of the battery are unknown.

Solution with IQ technology:
The intelligent UPS determines all relevant battery states. This ensures the transparency required to guarantee the stability of the supply and optimum use of the battery at all times.

The intelligent battery management detects the current charging state of the connected battery and uses this to calculate the remaining runtime.

The QUINT UPS-IQ also signals whether the buffer time is actually 20 minutes. As soon as an adjustable threshold value is reached, the floating relay contact or the software generates a warning message or the PC is shut down. The industrial PC works for as long as possible and is shut down only if absolutely necessary.

11.3 SOH/SOF application example

Task: electrical loads in remote systems widely separated from each other must be continuously supplied with 24 V DC.

Previous solution: The user invests in a new battery every two years assuming that the system is reliably protected by this.

Problem: is the power storage device really 100% available for two years? Hs the battery aged more quickly as a result of higher ambient temperatures and cannot deliver sufficient performance?

Solution with IQ technology:
The remaining life expectancy of the battery is known. This allows servicing to be planned. If the battery is replaced at the ideal time, costs are also avoided that would occur by replacing the battery too early or after failure. It is particularly important for applications that are widely separated from each other to ascertain whether the battery works reliably for another two years or only two months. For example, replacing power storage devices in offshore wind power plants is associated with high costs. Indication of the current life expectancy of the battery saves unnecessary labor and material costs.

11.4 Charging characteristic

When the recommended UPS-BAT… power storage device is used, the intelligent battery management of the UPS adapts itself to the respective connected storage technology such as Lithium or lead (VRLA – Valve Regulated Lead Acid) batteries. Additional settings of charging parameters are not necessary due to automatic detection.

The UPS is equipped with an integrated charging unit. Charging is performed according to the current battery state. By measuring the current temperature at the battery, temperature-compensated charging takes place. The intelligent battery management ensures fast availability and maximum service life of the power storage device. Depending on the performance class of the UPS, the integrated charging unit can have the following maximum charging current.

UPS	Max. charging current
5 A	1.36 A
10 A	2.88 A
20 A	5 A
40 A	5 A

The recharging time results from the maximum available charging current and the total capacity of the storage device type connected.

Charge control depends on the IUoU charging characteristic. This is a 3-stage charging process that is represented as follows.

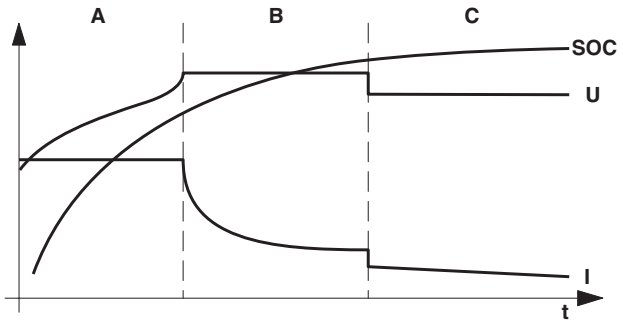

Figure 14 Charging curve

Stage	Name	Description
A	Main charge	Constant current charging phase (CC), initial charging current
B	Compensation charging	Constant voltage charging phase (CV), compensation trickle charge voltage
C	Trickle charging	Constant voltage charging phase (CV), trickle charging final voltage

If the communication cable between the UPS and the power storage device is interrupted, the temperature detected in the UPS module is used temporarily to ensure temperature compensation.

Temperature recording only takes place in the UPS module when using power storage devices other than the UPS-BAT…. In addition, adjustment and adherence to the charging parameters is necessary.

11.5 Fast battery charging, intelligent charging (contact $I < I_N$)

The adaptive current management of the charging unit charges the power storage device considerably faster when the $I<I_N$ input of the UPS is connected to the corresponding output of the power supply. This ensures shorter recharging times and the power storage device is available with full capacity much more quickly.

At the same time, the module supplies sufficient power for buffered DC loads. As long as the upstream connected power supply unit has sufficient power reserves, charging continues with high current. If the load requires a higher current, this is supplied at the highest priority. In this case the power storage device is charged more slowly.

The fast battery charging function is only available when the power supply unit makes a static power reserve available with corresponding signal contact, e. g., QUINT POWER with POWER BOOST and preventive function monitoring.

11.6 Setting the buffer time

You can set the time for exiting battery mode via the selection switch on the front of the device.

t_{max} [min] setting	Meaning
1, 2, 3, 5, 10, 15, 20	The UPS switches off after the set buffer time.
Custom (default 0.5)	The UPS switches off after the individual buffer time set via UPS-CONF.
≤ (unlimited, delivery state)	Buffering with the total stored power. A warning is generated as soon as the power storage device only has 10 % charge (default).
PC mode	In PC mode, it is possible to continue working with a PC after a mains failure, perform a controlled shutdown and restart automatically.

11.7 PC mode

In "PC mode", the UPS function follows a chronological sequence that can be parameterized via the software and individually optimized for the relevant application.

In the event of a mains failure, PC can continue to work, perform a controlled shutdown and restart automatically.

It is required that the following is installed:

IFS-USB-DATACABLE data cable (Order No. 2320500)

UPS-CONF software (Order No. 2320403, available free of charge at www.phoenixcontact.net/catalog)

Communication cable between the UPS and the power storage device

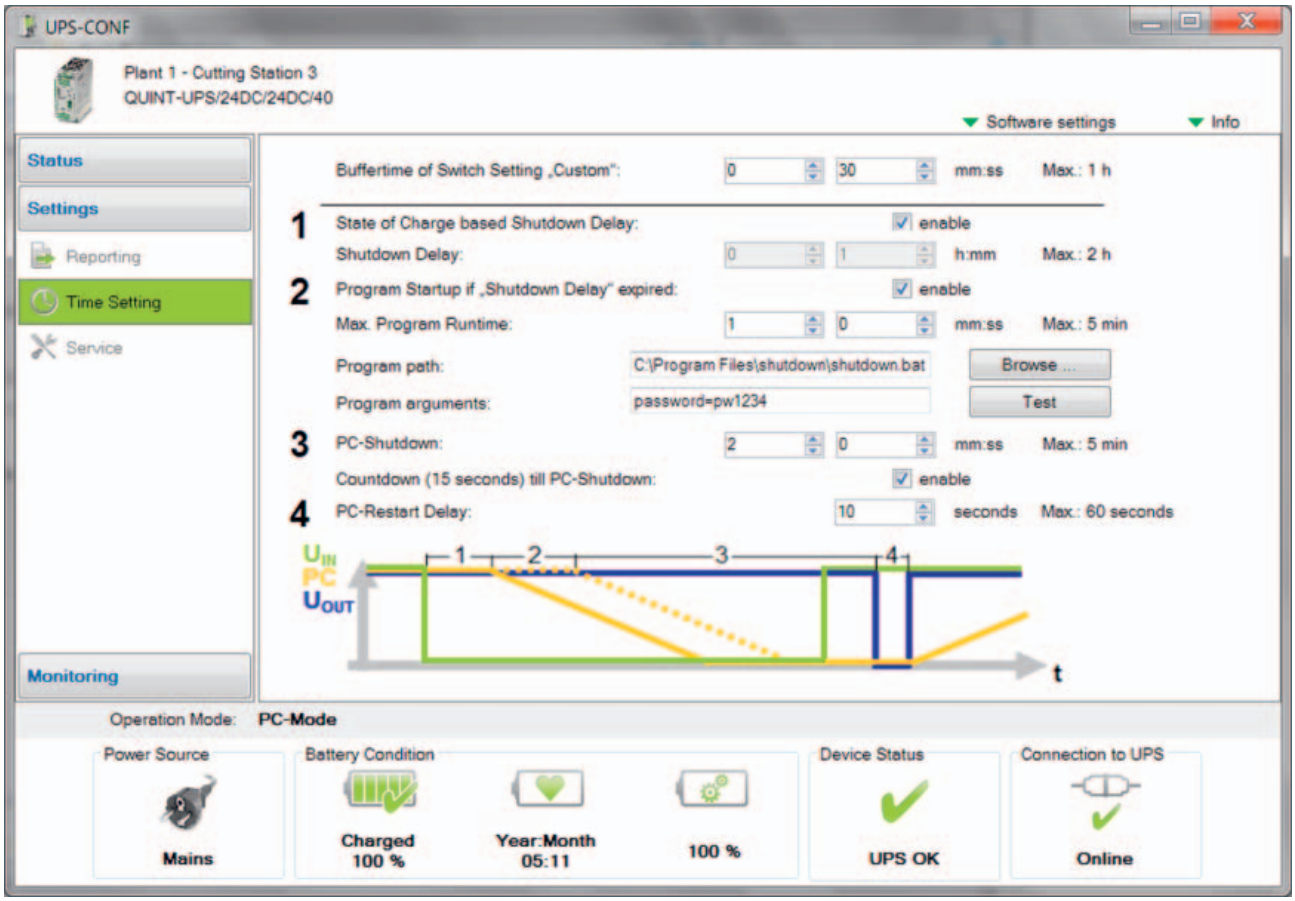

Figure 15 PC mode

1: Delay time

Delay time is calculated automatically from the current remaining battery life minus the time required by the PC to shut Delay time is calculated automatically from the current remaining battery life minus the time required by the PC / IPC to shut-down. Alternatively, a fixed delay time may be chosen.

Example: setting is 10 mins. and if mains power has not returned within 10 minutes, a corresponding alarm is signaled.

2: Program start

After the delay time has expired, it is possible to start a program.

Example: the software starts and begins successive back up of system data.

In the "PC-Mode" setting, on the selection switch of the UPS, the UPS function follows a chronological sequence that can be parameterized via the software and individually optimized for the relevant application

Menu: Settings > Time setting

3: PC shut-down

The time required for shutdown of the PC is set here.

4: PC idle time

The output voltage is interrupted during the reset time and the PC automatically restarted only if the PC is shut down and the mains returned in the mean time

11.8 Remote control (contact R1, R2)

The module can be switched on and off via a signal to contacts R1 / R2. Shutdown can take place in mains mode or while battery mode is active

Remote shutdown is deactivated

UPS in function (delivery state)

– The "R1" and "R2" terminal points are short circuited (delivery with plug-in bridge) OR 24 V DC is present at terminal point "R2".
– In the event of a voltage supply failure, the UPS switches over to battery mode.

Remote shutdown is activated

– The "R1" and "R2" terminal points are not short circuited AND O V is present at terminal point "R2".
– In the event of a voltage supply failure, the UPS does not switch over to battery mode and the device shuts down.

12 Interfaces

Optionally, you can the data port interface.

12.1 IFS-USB-DATACABLE

The module is connected via the data port to the USB port of the PC using the IFS-USB-DATACABLE.

The data cable between the PC and the UPS is necessary for parameterization and monitoring. It contains the interface electronics and electrical isolation.

12.2 IFS-CONFSTICK

The IFS-CONFSTICK is a multi-functional memory block for easy storage and backup of configuration and parameter data. You can copy the parameterization of one UPS to another UPS of the same type using the IFS-CONFSTICK.

Transferring UPS parameters to the IFS-CONFSTICK

1. Press the "UPS -> Stick" button and hold for at least 2 seconds.
2. Insert the IFS-CONFSTICK carefully into the "Data Port" of the UPS while observing the plug-in direction.
3. Parameter transfer is started and indicated by cyclic control of the three LED indicators. Light-up sequence: green/yellow/red

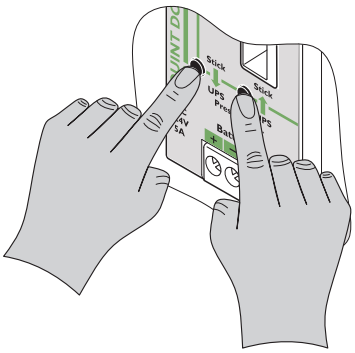
– Error-free transfer: green LED indicator on
– Transfer error: red LED indicator on

Transferring IFS-CONFSTICK parameters to the UPS

1. Press the "Stick -> UPS" button and hold for at least 2 seconds.
2. Insert the IFS-CONFSTICK carefully into the "Data Port" of the UPS while observing the plug-in direction.
3. Parameter transfer is started and indicated by cyclic control of the three LED indicators. Light-up sequence: green/yellow/red

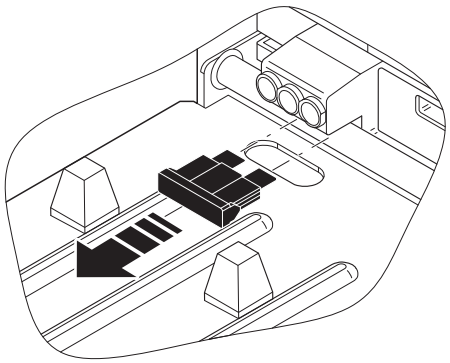
– Error-free transfer: green LED indicator on
– Transfer error: red LED indicator on

13 Servicing



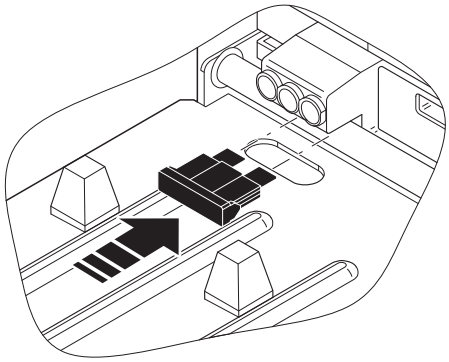
To switch to service mode, the following options are available:

– Button on the front of the UPS
– UPS-CONF software
– Service stick

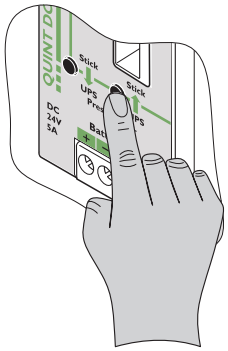


Details can be found in the UPS-CONF user manual at www.phoenixcontact.net/catalog.

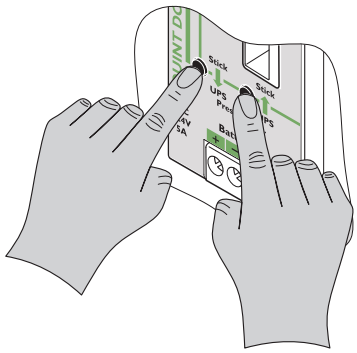
Replacing the battery



- Press and hold down both buttons on the front of the UPS longer than 6 s to switch to service mode.
  The red LED lights up.



- Remove the fuses.



- Remove the cabling of the battery blocks.
- Remove the batteries.
- Install new batteries.
- Connect the cabling of the battery blocks.
- Insert the fuses.

- Press and hold down both buttons on the front of the UPS for longer than 6 s to register the batteries.
  The bar graph flashes.

- Press and hold down both buttons on the front of the UPS for longer than 6 s to exit the service mode.
  The red LED extinguishes.

An exact description of the replacement procedure for all power storage devices can be found in the corresponding data sheet at www.phoenixcontact.net/catalog.

14 Application examples

14.1 Parallel connection of the power storage devices

To increase the buffer time, a maximum of 15 power storage devices can be switched in parallel. It is recommended to keep the number as low as possible and use power storage devices with a higher capacity of necessary. For parallel operation, only use power storage devices with the same batch number .

After discharging of the power storage device, the recharging time depends on the maximum charging current that the UPS can make available.

Use a suitable fuse. Flat-type fuse inserts with the same nominal values from the battery used are recommended.

If possible, install at a cool location e. g., at the bottom of the control cabinet to ensure optimum function. For this, the following cabling design is advantageous.

Value	Description
l_1	Cable distance to the power storage device, to the node in the case of parallel connection, including fuse terminal block
mm^2	Conductor cross section to the power storage device
l_2	Cable distance between the power storage device and node

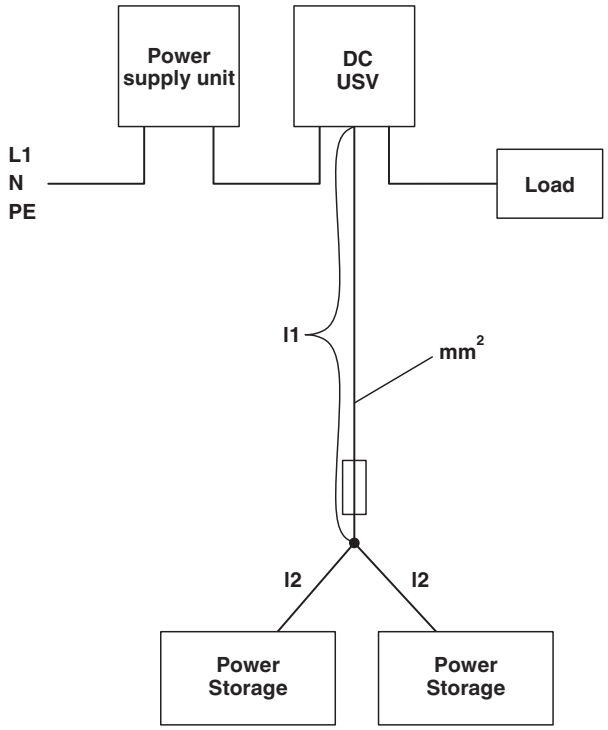


Figure 16 Parallel connection of the power storage devices in the control cabinet

14.2 Parallel connection for redundancy

Redundant circuits are suitable for supplying systems, which place particularly high demands on operational safety.

In order to set up a redundant power supply solution, two UPS systems of the same type (consisting of a power supply unit, DC-PS, redundant 1 .... n) are connected in parallel and decoupled. No further adjustments to the default setting are necessary.

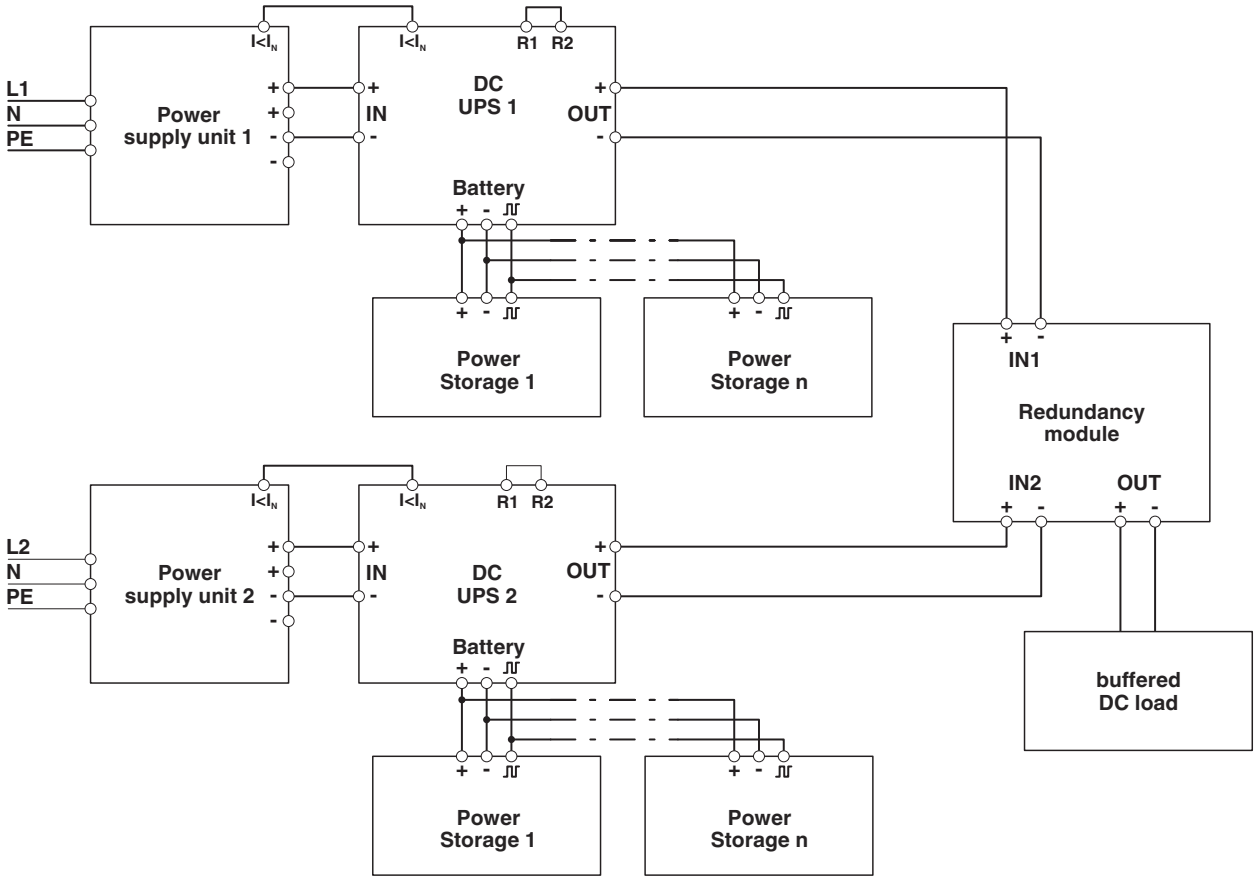

Figure 17 Parallel connection for redundancy

If a fault occurs in the first UPS system, the second UPS system automatically takes over the entire supply without interruption and vice versa. For this purpose, the UPS systems to be connected in parallel are dimensioned so that the total current requirements of all loads can be fully met by one UPS system.

Uninterruptible power supply - QUINT-UPS/ 24DC/ 24DC/40 - 2320241

Uninterruptible power supply with IQ technology for DIN rail mounting, input: 24 V DC, output: 24 V DC/40 A, including mounted universal DIN rail adapter UTA 107/30

We herewith declare the compliance of this product with the Chinese marking requirements set forth in the “Management Methods for the Restriction of the Use of Hazardous Substances in Electrical and Electronic Products” (Order No. 32 of the MITT, etc.) and SJ/T 11364-2014 marking for the restriction of the use of hazardous substances in electrical and electronic product.

This product can be recycled and used safely during its environmentally friendly use period.

The Environmentally Friendly Use Period (EFUP) for the product is 25 years, unless otherwise marked. The Environmentally Friendly Use Period is valid only when the product is operated under the conditions defined in the product documentation.

This product should be recycled after its environmental protection use period has expired because it may contain substances or elements as shown in the following table:

	Hazardous Substance					
Part Name	**Lead (Pb)**	**Mercury (Hg)**	**Cadmium (Cd)**	**Hexavalent Chromium (Cr(VI))**	**Polybrominated biphenyls (PBB)**	**Polybrominated diphenyl ethers (PBDE)**
Electronic supplement[1]	X	O	O	O	O	O

This table is prepared in accordance with the provisions of SJ/T 11364.

O: Indicates that said hazardous substance contained in all of the homogeneous materials for this part is below the limit requirement of GB/T 26572

X: Indicates that said hazardous substance contained in at least one of the homogeneous materials used for this part is above the limit requirement of GB/T 26572

The table shows where these substances may be found in this Electrical and Electronic Product.

[1]) Electronic supplement includes additional parts which are not independent devices and are delivered with this article, for example a memory card for a controller.

Declaration of compliance with China RoHS – Devices

The information on substances corresponds to our present knowledge as well as the status of legislation mentioned in this declaration on the date of issue. In this respect we specifically take the statements and indications of our suppliers and service providers as a basis.

Configuration and Management Software UPS-CONF

2012-07-02

Designation: UPS-CONF

Revision: 01

Order No.: -

This manual is valid for:

Designation	Order No.
UPS-CONF	2320403

Please observe the following notes

In order to ensure the safe use of the product described, you have to read and understand this manual. The following notes provide information on how to use this manual.

The pictured products do always exemplify the concerned topic.

Target audience for this documentation

The use of products described here solely addresses persons, who are qualified and familiar with electrical equipment and the appropriate and relevant safety concepts. Please also read the section titled "Qualified personnel" in the topic titled "Important safety notes (see page 10)".
Phoenix Contact accepts no liability for erroneous handling or damage to products from Phoenix Contact or third-party products resulting from disregard of information contained in this documentation.

Explanation of symbols used and signal words

DANGER
The danger symbol is used to indicate instructions where non-compliance may result in damage to hardware/software or personal injury (in indirect connection with dangerous process peripherals).

NOTE
The note symbol precedes notes that must be strictly observed in order to ensure error-free operation. It also gives you tips and advice on the efficient use of hardware and on software optimization to save you extra work.

The "Additional Details" symbol indicates cross references (hypertext links or bibliographical references) which lead to detailed descriptions of a term or additional details on the context in question.

General terms and conditions of use for technical documentation

Phoenix Contact reserves the right to alter, correct, and/or improve the technical documentation and the products described in the technical documentation at any time and without giving prior notice, insofar as this is reasonable for the user. The same applies to any technical changes that serve the purpose of technical progress. Technical documentation does not contain any guarantees regarding quality, does not describe any fair marketable quality, and does not make any claims in terms of quality guarantees or guarantees regarding suitability for a specific purpose.

The receipt of technical documentation (data sheets, installation instructions, manuals, online help, etc.) does not constitute any further duty on the part of Phoenix Contact to furnish information on alterations to products and/or technical documentation. Any other agreement shall only apply if expressly confirmed in writing by Phoenix Contact.

Please note that the supplied documentation is intended to serve as product-specific documentation only and that you are responsible for checking the suitability and intended use of the products in your specific application, in particular with regard to observing the applicable standards and directives. Although Phoenix Contact makes every effort to ensure that the information and content is accurate, up-to-date, and refers to the state of the art, technical inaccuracies and/or printing errors in the information cannot be ruled out. Phoenix Contact does not offer any guarantees as to the reliability, accuracy or completeness of the information. All information made available in the technical documentation is supplied without any accompanying guarantee, whether expressly mentioned, implied or tacitly assumed.

Phoenix Contact accepts no liability or responsibility for errors or omissions in the content of the technical documentation (data sheets, installation instructions, manuals, online help, etc.).

The aforementioned limitations of liability and exemptions from liability do not apply insofar as liability must be assumed, e.g., in accordance with product liability law, in cases of premeditation, gross negligence, on account of loss of life, physical injury or damage to health, or on account of the violation of important contractual obligations. Claims for damages for the violation of important contractual obligations are, however, limited to contract-typical, predictable damages, provided there is no premeditation or gross negligence, or unless liability is assumed on account of loss of life, physical injury, or damage to health. This ruling does not imply a change in the burden of proof to the detriment of the user.

Statement of legal authority

This documentation, including all illustrations contained herein, is copyright protected. This documentation is to be used for its intended purpose only. All other means of usage are prohibited. Reproduction, translation, and public disclosure, as well as electronic and photographic archiving and modification, require written consent by Phoenix Contact. Violators are liable for damages.

Phoenix Contact reserves all rights in the case of patent award or listing of a registered design. Third-party products are always named without reference to patent rights. The existence of such rights shall not be excluded.

1 Functional overview

UPS-CONF is a management software to configure and monitor QUINT-UPS devices, that come with the IQ technology.

This technology with continuous battery monitoring and intelligent management provides you with information about the charging state, remaining runtime, and service life of your battery at all times. Intelligent communication informs you when a situation becomes critical. This reduces the amount of maintenance involved and increases your system availability.

IQ technology means

- Intelligent Battery Control: automatically detects the connected battery type and maximizes the remaining service life of the battery unit via an optimally adapted charging characteristic.
- Intelligent Battery Management: continuous status information is shown for
  - SOC (State of Charge): current charging state and remaining back-up time of the battery unit
  - SOH (State of Health): remaining life expectancy of the battery unit, provides early warning for a potential battery unit failure
  - SOF (State of Function): determines the current performance of the battery unit.
- Intelligent Charging: adapts the charging current and thereby ensures the fastest possible recharging and availability.
- Intelligent communication: the communication of UPS and PC allows configuration, extensive signaling and parameterization.

The IQ technology also works without UPS-CONF. With this software you have an easier monitoring and configurations can be done.

The UPS-CONF software is intended for a PC as well as an IPC (Industrial PC). In this documentation the term "PC" is used to address both.

The configurable QUINT-UPS device is also referred to as the "UPS" in this documentation.

Features supported by the UPS-CONF software

In order to optimally support the IQ technology, UPS-CONF provides the following features:

- Clear overview about condition of mains, battery, UPS device and connection from PC to UPS
- Automatic PC shutdown and restart functionality while the UPS runs in PC-Mode
- Start of application specific programs for system shutdown
- Configuration of switching outputs
- Chronological event logging
- Setting of customized parameters like the maximum charging current
- Choice of user interface language in the Software settings (see page 5).
  Currently supported languages: English, German

The topic titled Application samples (see page 52) guides through some typical scenarios.

2 Software setup

The UPS-CONF software has to be installed on a PC in order to configure and monitor an UPS system. If the buffered load is a PC, the UPS can be operated in the PC-Mode to additionally enable the automatic PC shutdown and restart functionality.

To setup the software, the following steps have to be executed:

1. Make sure all system requirements (see page 4) for the hardware and software are met.
2. Download and install the software (see page 5).
3. Follow the steps in the hardware setup (see page 11).
4. Start the software (see page 15).
5. Become familiar with the software settings (see page 5) supported by the UPS-CONF software and carry out the required settings.

2.1 System requirements

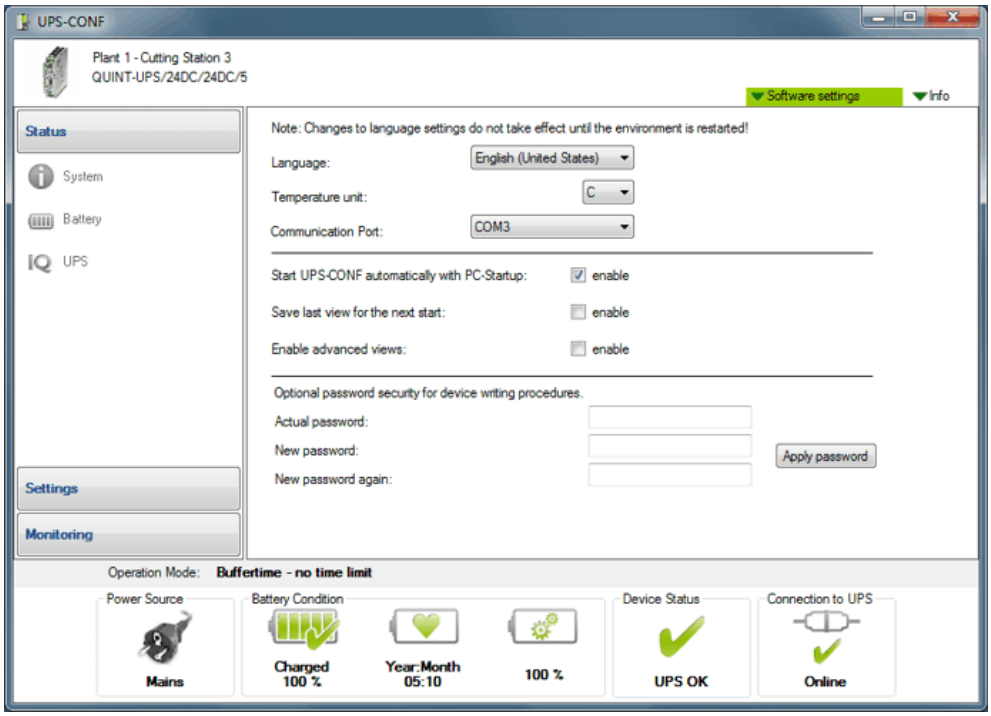
In order to run the UPS-CONF software, your computer must meet the following software and hardware requirements:

Software requirements

- Supported operating systems:
  - Windows 7, 32bit and 64bit
  - Windows Vista SP1
  - XP SP3 (requires .NET Framework 3.5 SP1)
- Supported browser: Internet Explorer version 6 or later

Hardware requirements		
CPU	1 GHz min. 2 GHz recommended	Windows 7 Windows Vista SP1
	Pentium III 1GHz min. 2 GHz recommended	Windows XP SP3
Main memory	1 GB RAM min. 2 GB RAM recommended	Windows 7 Windows Vista SP1
	512 MB RAM min. 1 GB RAM recommended	Windows XP SP3
Main memory used by UPS-CONF	max. 96 MB	
Hard disk drive (recommended) Hard disk used by UPS-CONF	850 MB max. 50 MB	
CD-ROM drive	not necessarily needed	
Interfaces	1 x USB 2.0	
Monitor	VGA, resolution 800 x 600 pixels minimum, 256 colors	
Network	Internet connection needed for program download	

2.2 Installation



The UPS-CONF configuration and management software can be downloaded free of charge at www.phoenixcontact.net/catalog.

To install the software, proceed as follows:

1. Find UPS-CONF at www.phoenixcontact.net/catalog.
2. Save the UPS-CONF_Setup_v....exe file to the preferred download folder.
3. Make sure the IFS-USB-DATACABLE is unplugged.
4. Install UPS-CONF from the selected download folder. Simply follow the screen instructions.
   Read the EULA (End User License Agreement) carefully when it is displayed and agree it to continue the installation.
5. After having completed the UPS-CONF installation, connect the UPS device to the PC (see page 14). If required, select PC-Mode as operating mode (see page 12).
6. As soon as Windows detects the new USB hardware follow the instructions of the driver installation.

2.3 Software settings

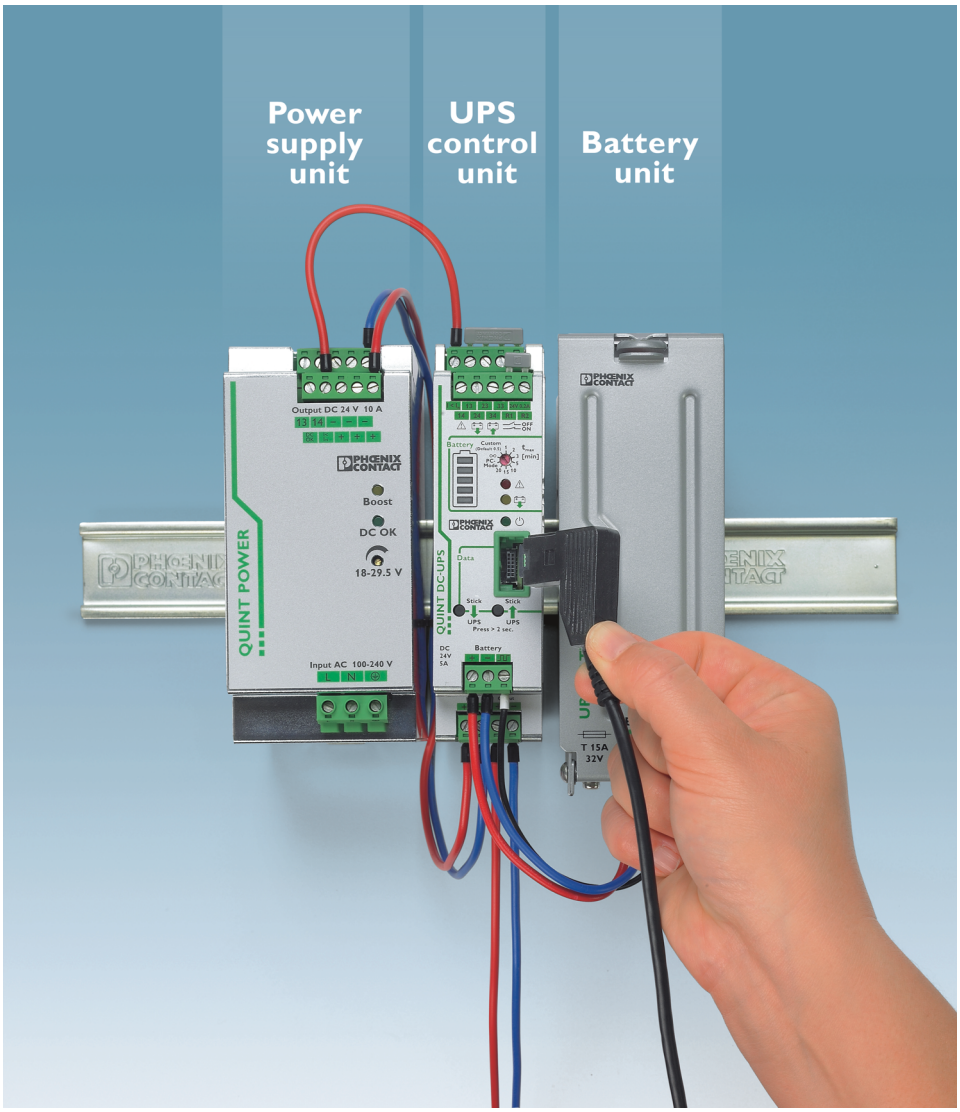
The software settings can be shown by clicking the "Software settings" item in the system menu.

The following settings can be defined:

- Language of the user interface (English, German)

NOTE
To apply the changed language setting, you have to restart the UPS-CONF software.

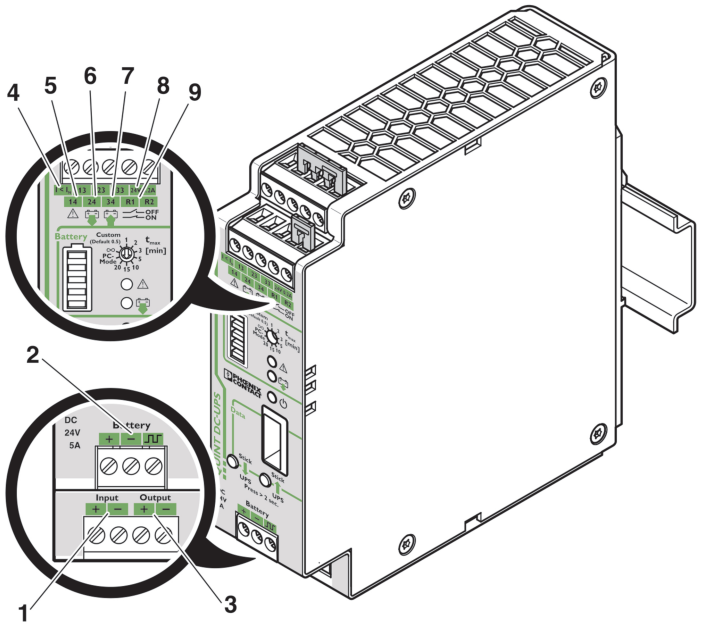
- Temperature unit (Celsius, Kelvin, Fahrenheit)
- Communication (USB) port at the PC for the IFS-USB-DATACABLE (COMx)



Normally, the communication port is set automatically by the UPS-CONF software when connecting the UPS devices. Under normal conditions there is no need to change this setting. If it has not been set automatically during the software installation, refer to the section Communication port (see page 56) in the Troubleshooting topic.

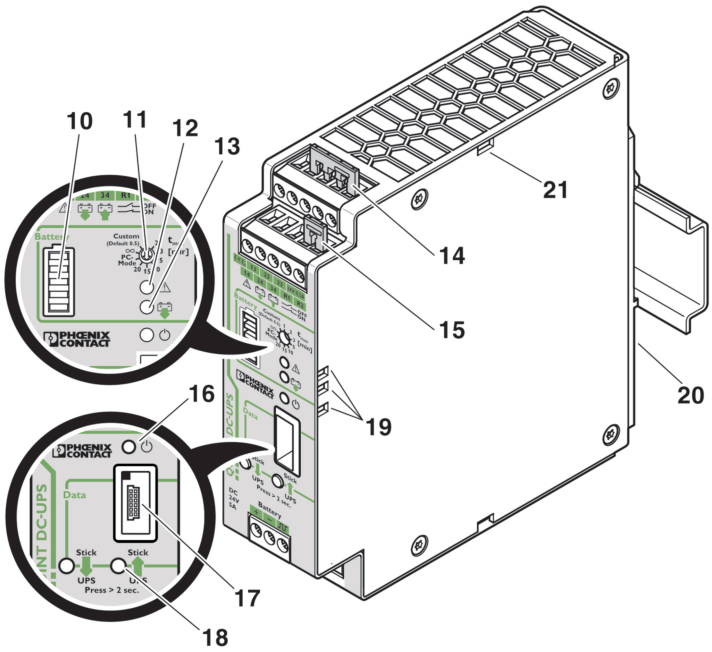
- Enable/disable automatic UPS-CONF startup after PC startup. This option must be checked if the UPS device shall buffer this PC.
- Restore the last view after the next software start.
- Hide or show the advanced views ("Battery Advanced" and "UPS Advanced" in the "Status" group and "Advanced" in the "Settings" group).
- An optional password, when parameters are written to the UPS device.

3 Hardware overview



Choose your customized solution - for your application.

1. Choose your power supply.
2. Choose your UPS unit.
3. Choose your energy storage.



All Products are available in the e-shop: www.phoenixcontact.net/catalog

In the next two graphics and their corresponding lists you can see the location of the main parts of the QUINT DC-UPS.

No.	Connections / Operating elements
1	DC input 18 V DC ... 30V DC
2	Power storage device connection, 24V DC (+,-, communication between UPS and power storage device)
3	DC output, 24 V DC, buffered
4	$I < I_N$, fast battery charging
5	Floating relay contact 13/14: alarm (Related parameter settings are provided in the "Reporting" view (see page 31).)
6	Floating relay contact 23/24: battery mode (Related parameter settings are provided in the "Reporting" view (see page 31).)
7	Floating relay contact 33/34 : battery charge (Related parameter settings are provided in the "Reporting" view (see page 31).)
8	24 V DC supply voltage, maximum current limit 0.2 A for the signal contacts 13, 23, 33
9	Remote control (R1, R2). (Related UPS parameter "Remote Status" (see page 27).)

No.	Connections / Operating elements
10	Bar graph for displaying the current charging state of the power storage device
11	Buffer time setting: unlimited ∞, 1 ... 20 mins., customized (customized default: 0.5), PC mode (refer to topic Buffer time selection (see page 12)).
12	Red LED: alarm (Corresponding indicators are displayed in the software's "Status" view (see page 20).)
13	Yellow LED: battery mode (Corresponding indicators are displayed in the software's "Status" view (see page 20).)
14	Plug-in bridge for signal contact supply voltages, pre-installed
15	Remote control plug-in bridge, pre-installed
16	Green LED: Power In OK, mains mode (Corresponding indicators are displayed in the software's "Status" view (see page 20).)
17	Data port (see page 13) for data linking to the PC or the use of a memory block
18	Button for use of the memory block
19	LED windows for flat mounting position
20	Universal snap-on foot for DIN rails
21	Accommodation for cable binders

3.1 Important safety notes

Please observe all the safety notes outlined in this topic when using UPS-CONF together with the QUINT-UPS device.

Requirements

Knowledge of the following is required:

- QUINT-UPS system
- UPS-CONF configuration software
- Safety regulations in the field of application

Qualified personnel

In the context of using the QUINT-UPS system and the UPS-CONF configuration software described in this documentation, the following operations may only be carried out by qualified personnel:

- Planning, configuration
- Installation, startup, servicing
- Maintenance, decommissioning

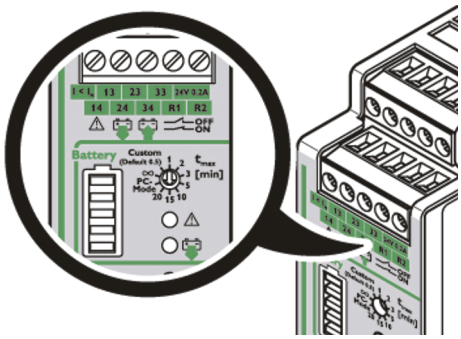
This documentation is therefore aimed at:

Qualified personnel who plan and design electrical equipment for machines and systems and are familiar with regulations governing safety in the workplace and accident prevention.

Within the context of the safety notes in this documentation, qualified personnel are persons who, because of their education, experience and instruction, and their knowledge of relevant standards, regulations, accident prevention regulations, and service conditions, have been authorized to carry out any required operations, and who are able to recognize and avoid any possible dangers.

4 Hardware setup

NOTE
Before setting up the hardware, install the software (see page 5).



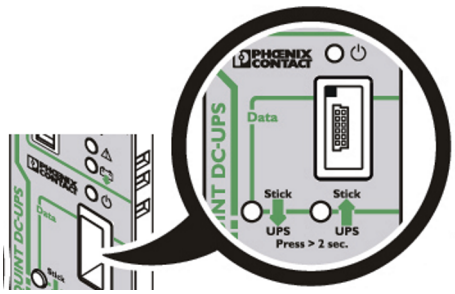
Regarding the communication with the PC and the UPS operation mode, it needs only three steps to setup the hardware:

1. Set the buffer time at the buffer time potentiometer, as described in the topic Buffer time selection. (see page 12)
2. Connect the Data port either with a PC or plug in a configuration stick, as described in the topic Data port (see page 13).
3. Connect the load to be supplied by the UPS (see technical datasheet for each QUINT-UPS).

NOTE
For further information about the hardware installation (connecting the battery module, etc.) please refer to the QUINT DC-UPS technical datasheet.

4.1 Buffer time selection

The buffer time potentiometer at the front of the QUINT-UPS has to be switched to the desired mode with a screwdriver.



The following settings are available:

Operating mode	Description
Custom (default 0.5)	Buffer time can be set to a user-defined value; if no value is set 0.5 minutes is used, as described in the topic Custom Mode (see page 37).
1, 2, 3, 5, 10, 15, 20	Buffer time 1, 2, 3, 5, 10, 15, 20 minute(s).
PC-Mode	This mode is intended to buffer a PC and to initiate a controlled shut-down in battery mode. The buffer time depends on the "Shutdown Delay" time and on the "PC-Shutdown" time, as described in the PC-Mode (see page 38).
∞	No time limit, buffering is continued until the battery is empty (deep discharge security).

The current set buffer time is shown as "Operation mode" in the status bar (see page 17).

4.2 Data port

The Data port is located at the front of the UPS. Via this port, configuration and maintainance of the UPS is done.

The configuration can be done in 2 different ways, depending on what is connected to the Data port:

- Connect the PC (see page 14) with the installed UPS-CONF software, if you want to configure by software.
- Plug in a memory stick which is declared as configuration stick, if you want to configure by configuration stick (see page 46).

In order to perfom maintenance tasks (such as changing a battery), a service stick can be plugged into the Data port, so the UPS switches to service mode (see page 47).

4.3 Connecting the PC

A PC has to be connected to the UPS in one of the following cases:

- You want to configure or monitor the UPS by the UPS-CONF software.
- You want to display currently set QUINT-UPS parameters or modify them using UPS-CONF.
- You want to initiate a controlled PC shutdown in case of a mains failure and if battery runs low.

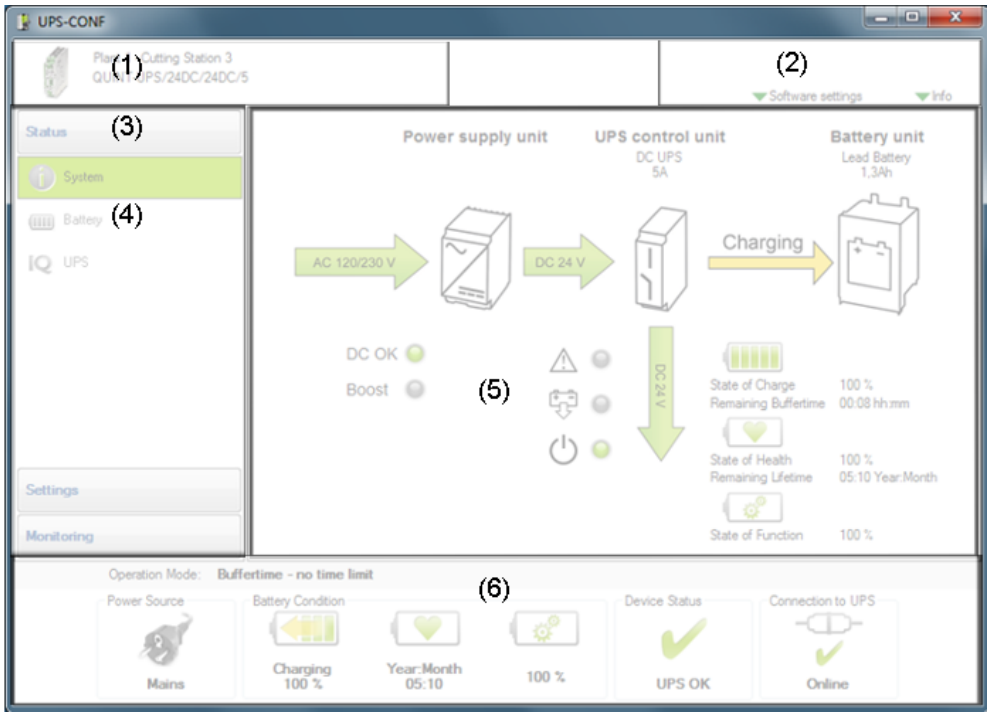
NOTE
First, install the software (see page 5) and then connect the PC afterwards.

To connect the PC to the QUINT-UPS, proceed as follows:

1. Connect the USB connector of the IFS-USB-DATACABLE to a free USB connector of your PC. After detecting the device, the used USB port is entered automatically in the software settings of UPS-CONF.

2. Connect the other side of the IFS-USB-DATACABLE to the Data port of the UPS:

5 Software overview



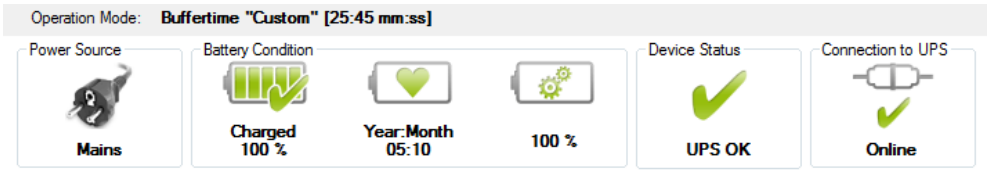
After installing the UPS-CONF software, the program starts up automatically.

As long as you do not change the related default software setting (see page 5), UPS-CONF always starts automatically after every PC reboot.

In the following sections you can get an overview about the screen areas of the UPS-CONF software and you can learn about the different status bar (see page 17) symbols and their meanings.

5.1 User interface

The screen layout consists of the following areas:



The following table explains the several areas.

Area	Description
(1)	Device information: Here, the type of the connected UPS is displayed. If text has been entered for the advanced UPS parameter "Place of installation" (see page 41), it is displayed above the UPS type.
(2)	System menu: Software settings (see page 5): A mouse click leads to the screen, where various software settings can be made. Info: A mouse click shows the contact information of Phoenix Contact.
(3)	Software menu: The Software menu provides various topic buttons such as status information display, parameter settings or monitoring values. A software menu button is expanded/collapsed by simply clicking it. When a software menu button is expanded the corresponding navigation items are listed.
(4)	Navigation items: After clicking a navigation item the corresponding information and parameters are displayed in the action area.
(5)	Action area: The content of the action area depends on the currently selected navigation item. This can be, for example, information, read from the device, or a parameterization table used for configuring the connected UPS.
(6)	Status bar (see page 17): Displays the status of all involved components thus providing a quick system overview. The status bar is always visible, also if the navigation and action area change.

5.2 Status bar

The status bar in the lower part of the screen shows information about the current system state.

When the power supply is available and the system is online and the battery is fully charged, the status bar looks like this:

The operation mode in the upper part of the status bar shows the current setting of the buffer time potentiometer of the UPS, as described in topic Buffer time selection (see page 12).

If it looks different, e.g. Power Source status "UPS off" or no connection to UPS ("Offline"), verify the following:

- All UPS components (QUINT-UPS, battery, power supply) are functional and properly connected.
- The QUINT-UPS is supplied with 24 V DC.
- The IFS-USB-DATACABLE is properly connected between QUINT-UPS and PC.

If an alarm is detected or an existing online connection between the PC and the QUINT-UPS is interrupted, the UPS-CONF software automatically becomes the active window. The status is queried every 5 seconds.

If your system status is like described, you can

- evaluate the UPS system status by displaying the various views contained in the software menu "Status" (see page 20) and/or
- start configuring the UPS by modifiying the default parameter settings in the various views of the software menu "Settings" (see page 29) and/or
- monitor your system.

In the topic Application samples (see page 52), some typical application scenarios are described.

The following tables explain the different status symbols that can be visible in the status bar:

Power Source	Symbol meaning
	The status "Mains" is shown, if the power supply is switched on and available.
	The status "Battery" is shown, if the power supply is switched off or not available. That means, the battery is discharging.
	The status "UPS off" is shown in either case: • The UPS is off, because battery mode is finished. The set buffer time has elapsed. • The power supply is available, but delivers an invalid output voltage.

Battery Condition	Symbol meaning
State of charge: 	Battery is "Fully charged".
State of charge: 	"Charging" is shown, if the battery is currently charging and not yet fully charged.
State of charge: 	The "Discharging" status is shown, if the battery is currently discharging because the system runs in battery mode. Usually, this status is shown in combination with the power source status "Battery".
State of charge: 	"Uncharged" is shown, if the battery mode is finished and the battery is empty.
State of health: 	The "State of Health" status shows the remaining lifetime of the battery. The lifetime value is shown below the symbol.

Battery Condition	Symbol meaning
State of function: 	The "State of Function" status shows the current performance of the battery. This efficiency value is measured in percent and is shown below the symbol.

During battery charging the battery conditions "State of Charge", "State of Health" and "State of Function" are shown as "unknown".

Device Status	Symbol meaning
	The "UPS OK" status is shown during normal UPS operation, i.e., when mains is available (battery mode not active) and no other event is currently upcoming.
	"Bat.-Mode deactivated" is shown, if the bridge is removed from the terminals R1 and R2. Refer to the parameter "Remote Status" in the topic UPS (see page 27).
	The "Alarm" status is shown, when a failure or critical situation exists, for example: • battery almost empty • battery not detected • battery replacement required

Connection to UPS	Symbol meaning
	This status informs about the communication connection between UPS-CONF and the QUINT-UPS device. The "Online" status is shown, if the IFS-USB-DATACABLE is connected. Normally, this status is automatically entered after connecting the UPS to the PC via the IFS-USB-DATACABLE.
	"Offline" means that no communication connection is established via the IFS-USB-DATACABLE.

6 Status - Reported information

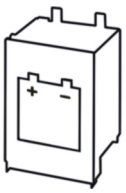
If the "Status" group is selected, the following navigation items are available:

- "System (see page 20)": overview on the current system status
- "Battery (see page 25)": status information for all connected batteries
- "Battery Advanced (see page 26)": advanced status information for all connected batteries
- "UPS (see page 27)" : status information for the connected UPS
- "UPS Advanced (see page 28)": anvanced status information for the connected UPS

6.1 System

If the "System" item is selected in the software menu "Status", an overview on the current system status is visible in the action area. The values shown here are read cyclically from the UPS device, as long as a communication connection to the UPS is established.

The system components and their status information are arranged on the screen as "Power supply unit" on the left hand side, "UPS control unit" in the middle and "Battery unit" on the right hand side. The tables explain the symbols corresponding to the units.

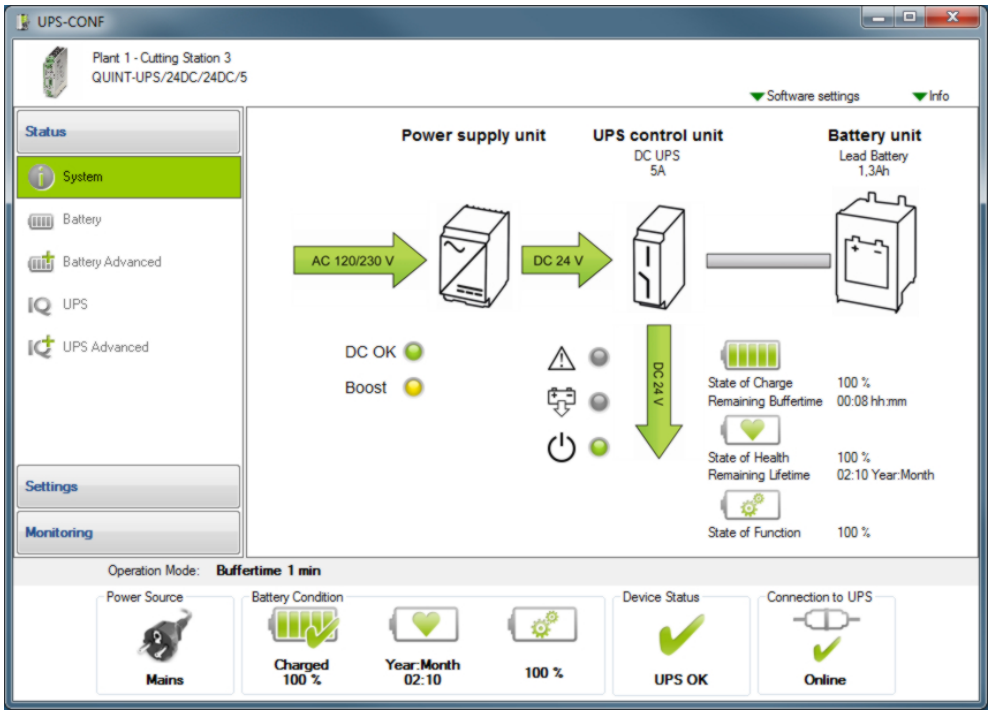


Power supply unit symbols:

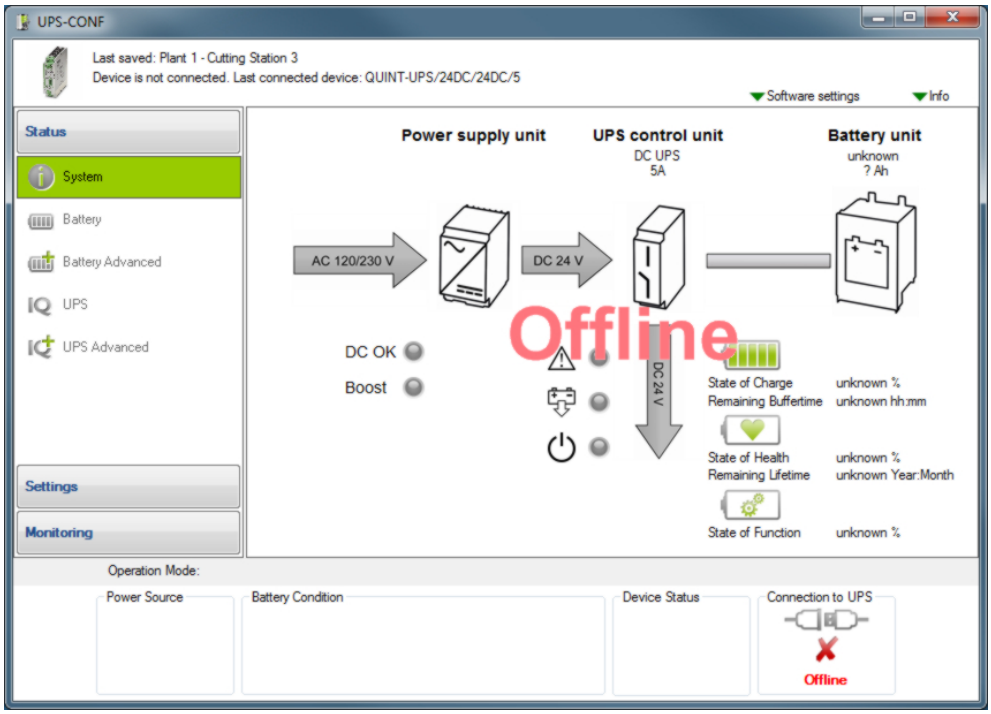
Icon	Meaning of LEDs
DC OK	Green LED on: DC output is available. LED off: DC output is not available.
Boost	Yellow LED on: Boost signal is ON (power supply delivers additional current for a connected load). LED off: Boost signal is OFF.

UPS control unit symbols:

Icon	Meaning of LEDs
⚠	Red LED on: UPS alarm due to one of the reasons: • battery almost empty • battery not detected • battery replacement required LED off: No UPS alarm, power supply available, normal operation.
	Yellow LED on: Battery mode is ON, battery is discharging because power supply failed. LED off: Battery mode is OFF, i.e. mains available.
⏻	Green LED on: Mains is ON. LED off: Mains is OFF.

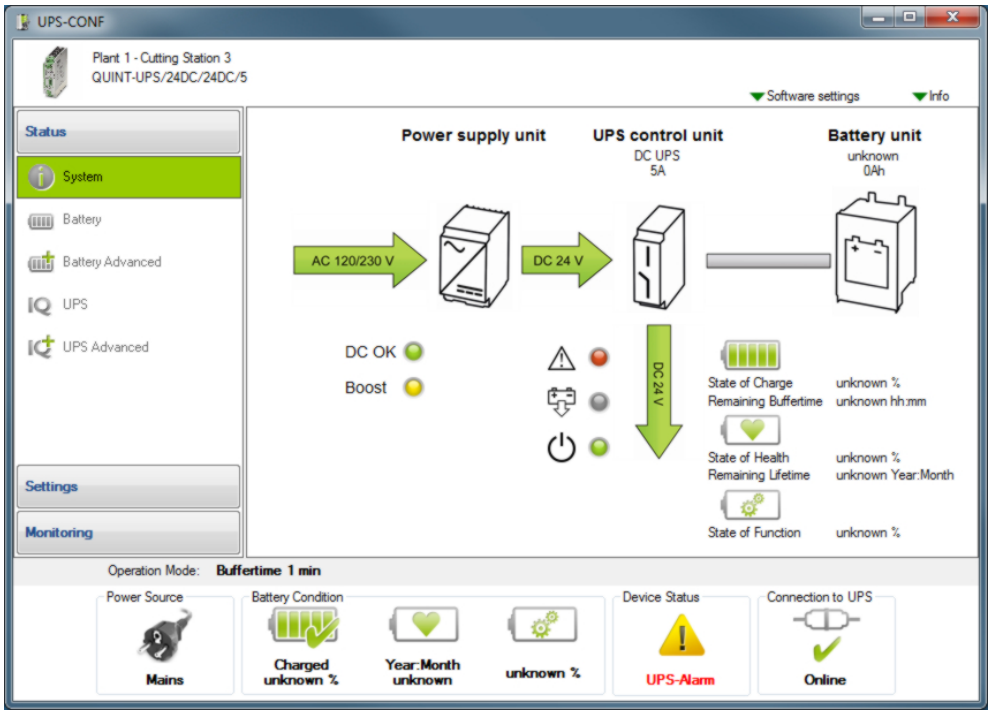


Battery unit symbols:



Icon	Meaning of LEDs
	SOC (State Of Charge) – current charging state and remaining back-up time of the battery unit.
	SOH (State Of Health) – remaining life expectancy of the battery unit, provides early warning for a potential battery unit failure.
	SOF (State Of Function) – determines the current performance of the battery unit.

NOTE
While charging the battery the status is "unknown".

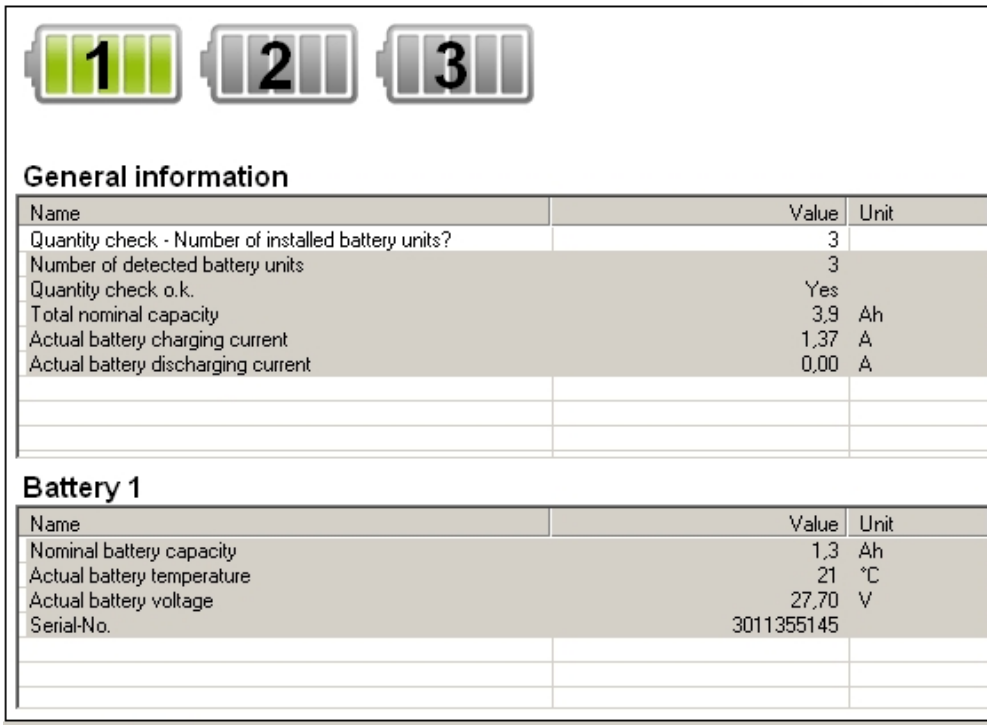


When the system is in normal operation (online and running), the screen looks like this:

When the UPS is offline and has no connection to the PC, the screen looks like this:

When the system status shows an alarm, the screen looks like this:

In such case refer to the topic Troubleshooting (see page 53).



6.2 Battery

If the "Battery" item is selected in the software menu "Status", status information for all connected batteries is shown in the action area.

The information is headed by "General information" for all connected batteries, such as "Number of detected battery units" or "Total nominal capacity".

Individual information for every battery follows.
If several battery units are installed, the data of the individual units can be displayed by clicking on the battery icons on top of the action area:

The status information in the action area could for instance look similar like this:

Battery parameters	Meaning
Except of some parameters explained here, the status information is self-explanatory, this is why it is not explained in detail.	
Quantity check - Number of installed battery units?	This value can be set to the amount of batteries, that were built in.
Number of detected battery units	Number of batteries detected by the QUINT-UPS.

Battery parameters	Meaning
Quantity check o.k.	Shows "Yes", if the number of installed battery units complies with the number of detected batteries. Otherwise "No" is displayed.

6.3 Battery Advanced

This navigation item is only available if the "Enable advanced views" checkbox is marked in the software settings (see page 5).

If the "Battery Advanced" item is selected in the software menu "Status", advanced status information for all connected batteries is shown in the action area.

In normal operation it looks something like this:

Name	Value	Unit
Actual state of charge	100	%
Remaining backup time	00:08	hh:mm
Remaining battery life time	01:03	Year:Month
Actual battery performance	100	%
Actual battery voltage	27,57	V
Actual battery temperature (Average of all units)	26	°C

6.4 UPS

If the "UPS" item is selected in the software menu "Status", status information for the connected UPS is shown in the action area.

In normal operation it looks like this:

Name	Value	Unit
Actual Alarm	No Alarm	
Last Alarm	No Alarm	
Remote Status	UPS ready	
UPS in battery operation (Battery-Mode)	No	
Selected operation mode	Buffertime - no time limit	
Battery is charging (Battery-Charge)	No	

Parameter	Meaning
	Except of some parameters explained here, the status information is self-explanatory, this is why it is not explained in detail.
Remote Status	Remote control (contact R1, R2) The module can be switched on and off via a signal to contacts R1 / R2. Shutdown can take place in mains mode or while battery mode is active. Remote shutdown is deactivated UPS in function (delivery state) – The "R1" and "R2" terminal points are short circuited (delivery with plug-in bridge) OR 24 V DC is present at terminal point "R2". – In the event of a voltage supply failure, the UPS switches over to battery mode. Remote shutdown is activated – The "R1" and "R2" terminal points are not short circuited AND 0 V is present at terminal point "R2". – In the event of a voltage supply failure, the UPS does not switch over to battery mode and the device shuts down.
Selected operation mode	Shows the operation mode that is set via the buffer time potentiometer, as described in topic Buffer time selection (see page 12).

6.5 UPS Advanced

This navigation item is only available if the "Enable advanced views" checkbox is marked in the software settings (see page 5).

If the "UPS Advanced" item is selected in the software menu "Status", advanced status information for the connected UPS is shown in the action area.

The status information is self-explanatory, this is why it is not explained in detail here.

In normal operation it looks something like this:

Name	Value	Unit
Device type	QUINT-UPS/24DC/24DC/5	
Actual input voltage	23,91	V
Actual output voltage	23,66	V
Actual Device Temperature	30	°C
Shutdown event started	No	
UPS serial number	3012001033	
Device firmware	0x00000110	

7 Settings - Defining UPS device parameters

The navigation items contained in the "Settings" group allow access to the various UPS device parameters.
Parameter values can be entered in UPS-CONF and written to the device (see page 29) with only one click of the mouse.

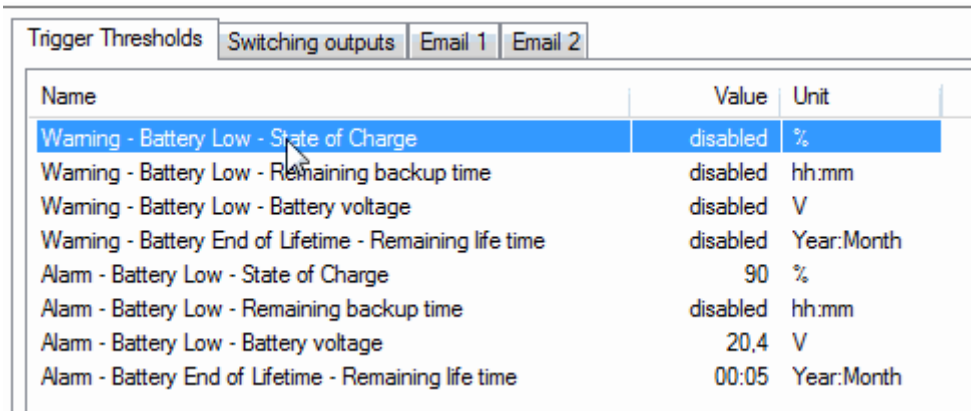
If the software menu "Settings" is selected, the following navigation items are available:

- Reporting (see page 31): Trigger thresholds, switching outputs for UPS alarm, battery mode and battery charging as well as Email settings
- Time Setting (see page 36): Buffer times, (delay) times and programs to execute for PC shutdown
- Service (see page 39): Service mode activation and rights granting, declaration of service stick and configuration stick
- Advanced (see page 41): Battery charging values, wire sizes, thresholds, signaling times and others

How to write parameters

In each of the navigation items, different settings can be made in the action area in order to write it to the UPS.

Beneath settings, that can be made by checking a checkbox or by entering data into an input box, also numerical or textual values contained in the parameter tables can be changed.

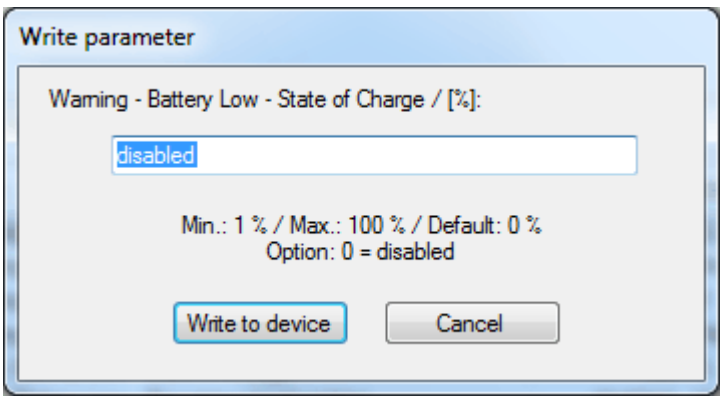


In these parameter tables, changeable parameter values have a white background color. Read-only values, i.e. the ones that are read from the device for monitoring purposes, are shown on a gray background.

To enter a new value for a parameter and write it to the UPS, proceed as follows:

1. Double-click the line, where the parameter text is located or click the "Write..." button in the lower right corner.
   An input box opens showing the currently set value.
2. Enter a value into the input box. Make sure that the chosen value is within the allowed value range and is suitable for your UPS system!
3. Click the "Write to device" button.
4. Verify that the new value is now displayed in the parameter table, i.e., has been accepted by the device.

Sample:



Select the "Reporting" navigation item in the "Settings" group and click the "Trigger Thresholds" tab in the action area.
In this tab, you can set a trigger value, at which battery charging level a "battery low" warning should be generated (first entry in the tab Trigger Thresholds (see page 31)). The value is entered as percentage, see below. By default, the trigger is "disabled", i.e. no warning is reported.

Set the trigger to 20% as follows:

1. Double-click the marked line, as shown in the figure above or left-click the line and then press the "Write..." button in the lower right corner.

   The following dialog appears:

   Below the text field you can see the allowed input range.
2. Enter `20` in the input box and click the "Write to device" button.
3. Verify that the new value is shown in the table.

7.1 Reporting

If the "Reporting" item is selected in the software menu "Settings", the tabs "Trigger Thresholds", "Switching outputs", "Email 1" and "Email 2" are visible in the action area.

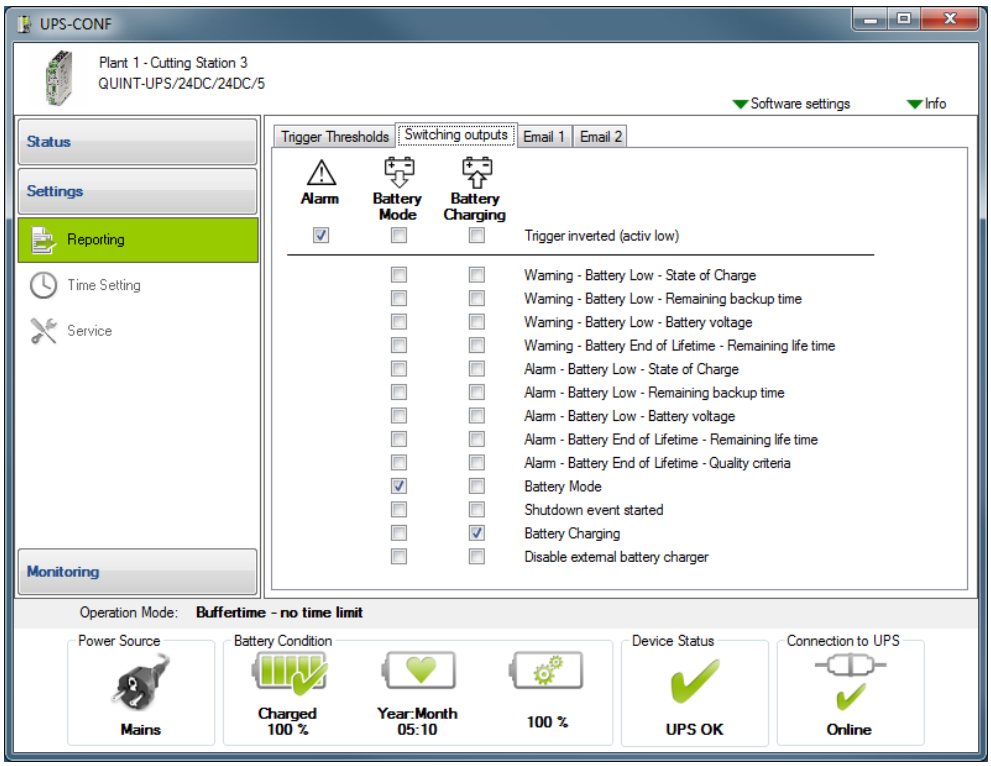
Trigger Thresholds

On the "Trigger Thresholds" tab you can define, whether warnings or alarms shall be reported by the UPS and define the threshold values which must be exceeded in order to trigger a message.

For each of the following conditions, both a warning and an alarm threshold value can be defined:

- Battery is low and the state of charge falls below a certain percentage number.
- Battery is low and the remaining backup time falls below a defined time.
- Battery is low and the battery voltage falls below a certain voltage.
- Battery is at it's end of lifetime and the remaining life time falls below a defined time.

If a warning or alarm is reported, you can define that a switching output must be triggered. For some of the warnings or alarms an Email to be sent can also be defined.



A reported alarm is additionally signaled by the LED at the front of the UPS device as well as in the status bar of the UPS-CONF software.

By means of warnings and alarms you can implement a two-level detection system:

1. Report a warning, when the first threshold value is exceeded.
   Example: battery lifetime is still one year.
2. Report an alarm, when the second threshold value is exceeded.
   Example: remaining lifetime of the battery is only some few months or weeks. Now an Email is additionally sent to the responsible person to ensure that a new battery is ordered in time.

Switching outputs

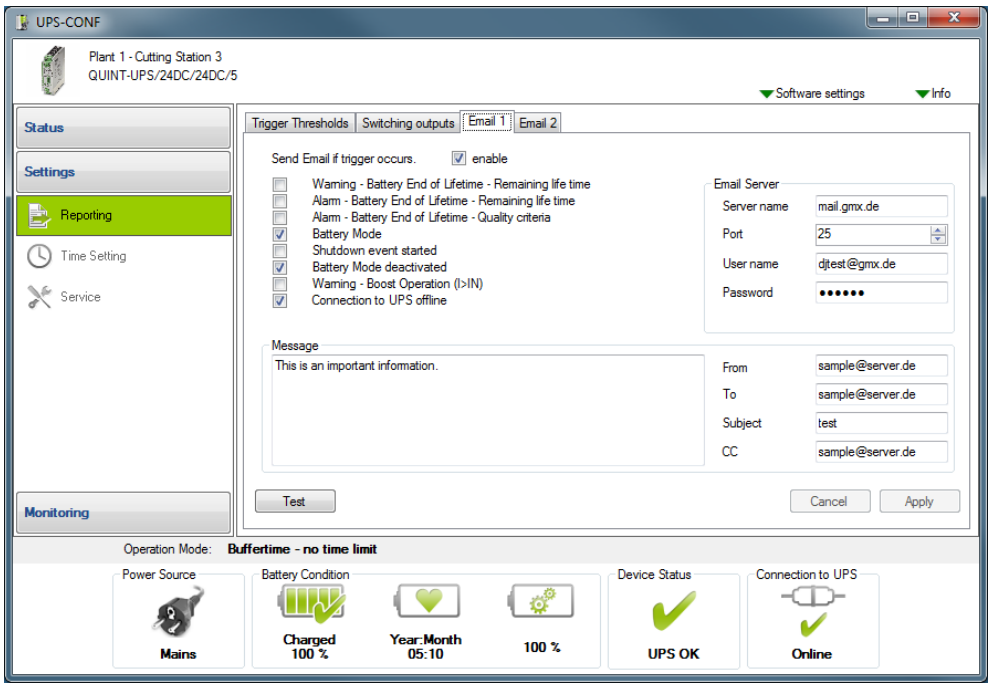
On the "Switching outputs" tab you can define a QUINT-UPS device output signal to be switched, when a certain trigger occurs. With such an output signal you can, for example, control a buzzer, that sounds, if the battery is low or the shutdown has been initiated.

Three different outputs are available to be switched:

- "Alarm",
- "Battery Mode"
- "Battery Charging"

All switching outputs can be triggered inverted, i.e., active low.

The "Battery Mode" and "Battery Charging" output signals can be switched with the following triggers:



- The same triggers as described in section "Trigger Thresholds" for warning and/or alarm, e.g. triggers that are released by an exceeded or underrun threshold.
- The quality criteria is no more fulfilled. The IQ-Technology of the QUINT-UPS-IQ is able to calculate it's own save remaining lifetime for the battery. Based on this calculation, the quality criteria is evaluated as met or not.
- The system switches to battery mode.

- A shutdown event started.
- The battery switches to the "Battery Charging" status.
- For the "Disable external battery charger" trigger, see technical datasheet for the QUINT-UPS.

For "Alarm" switching output, no further options can be defined.

Email 1 / Email 2

On the "Email 1" and "Email 2" tabs you can define two separate Email addresses, to which Emails can be sent if certain events occur. To access the input fields, mark the "enable" checkbox in the upper part of the screen.

The available triggers to initiate Emails to be sent are:

- A warning occurs as battery is at it's end of lifetime and the remaining life time falls below a defined time.
- An alarm occurs as battery is at it's end of lifetime and the remaining life time falls below a defined time.
- An alarm occurs as the quality criteria is no more met.
- The battery switches to battery mode.
- A shutdown event started.
- The battery switches to "Battery Charging" status (battery mode deactivated).

- A warning occurs because boost operation was activated. The power supply now delivers BOOST current, which is up to 1.5 times the nominal current of the power supply (only available with QUINT POWER).
- The connection to the UPS was interrupted ("Offline" status).

In the Email Server area, you have to enter:

- "Server name" for the server managing your outgoing mail. Ask your administrator for details.
- "Port" for outgoing Emails is usually 25. The predefined port 25, however, can be changed.
- "User name" and "Password" of your Email account. In some accounts the "User name" is the Email address.

The Message area contains:

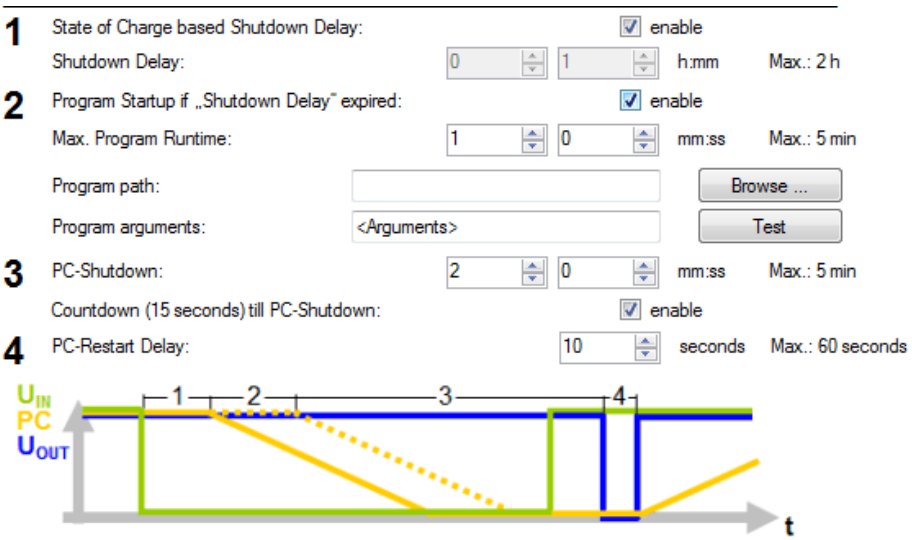
- Messagebox: A short explanation of the trigger, that caused the Email, is sent as default message. You can enter additional text, that will be appended to the default text.
- "From" textbox: Any Email address can be entered here.
- "To" textbox: A valid Email address has to be entered here, where the Email is sent to; it must be an Email address, that exists in the Email server´s configuration.
- "Subject" textbox: the title of your Email is user-defined; it is only used with the Email "Test" button. When the Email is successfully sent, click the "Apply" button.
- "CC" textbox: you can enter an Email address, where a copy is sent to.

You can test your settings by clicking on the "Test" button.

Sample Email:

A sample Email would look like this:

Email part	Content of Email part	Explanation
Subject	[UPS CONF: Parameters change notification]	
Message	*** UPS Status Mail ***	Header of the status mail message
	Hall 125	Place of installation, refer to the topic Advanced (see page 41)
	QUINT-UPS/24DC/24DC/5	Type of connected UPS, refer to the device information area in the User interface (see page 15)
	Trigger: Battery Mode Trigger	Kind of active trigger
	Threshold: -	Threshold (if applicable)
	This is an important information.	User defined text from the message textbox

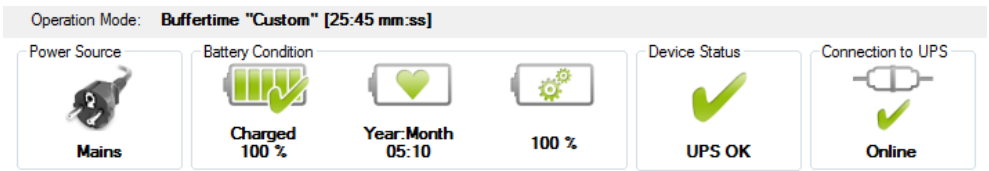


7.2 Time Setting

If the "Time setting" navigation item is selected in the "Settings" group, the action area provides various settings for two different UPS operating modes:

- The upper part (above the separation line) specifies the "Custom" mode.

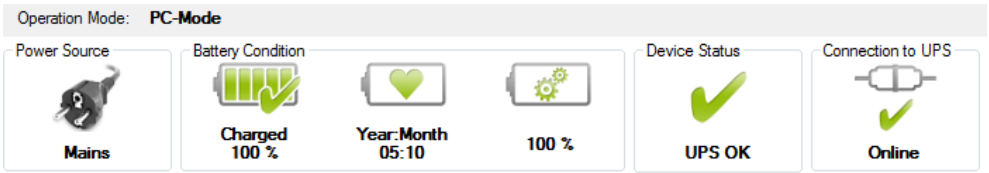
- In the lower part (below the separation line), four different parameter categories can be set concerning the PC-Mode.



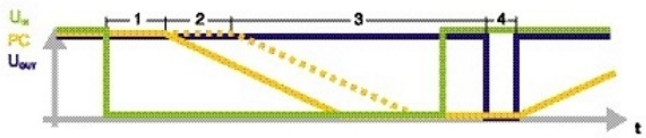
Custom mode

NOTE
These settings only apply if the UPS runs in Custom mode. To set this mode, the buffer time potentiometer located at the device front must be set to "Custom" (refer to topic buffer time selection (see page 12)).

In Custom mode the buffer time for the battery can be set to a maximum of 1 hour (30 seconds default).
When the power supply was interrupted the load will loose it's power after the user-defined buffer time has elapsed. The battery will buffer exactly the set buffer time. If no user-defined time is entered, the buffer time selected by the potentiometer is used.



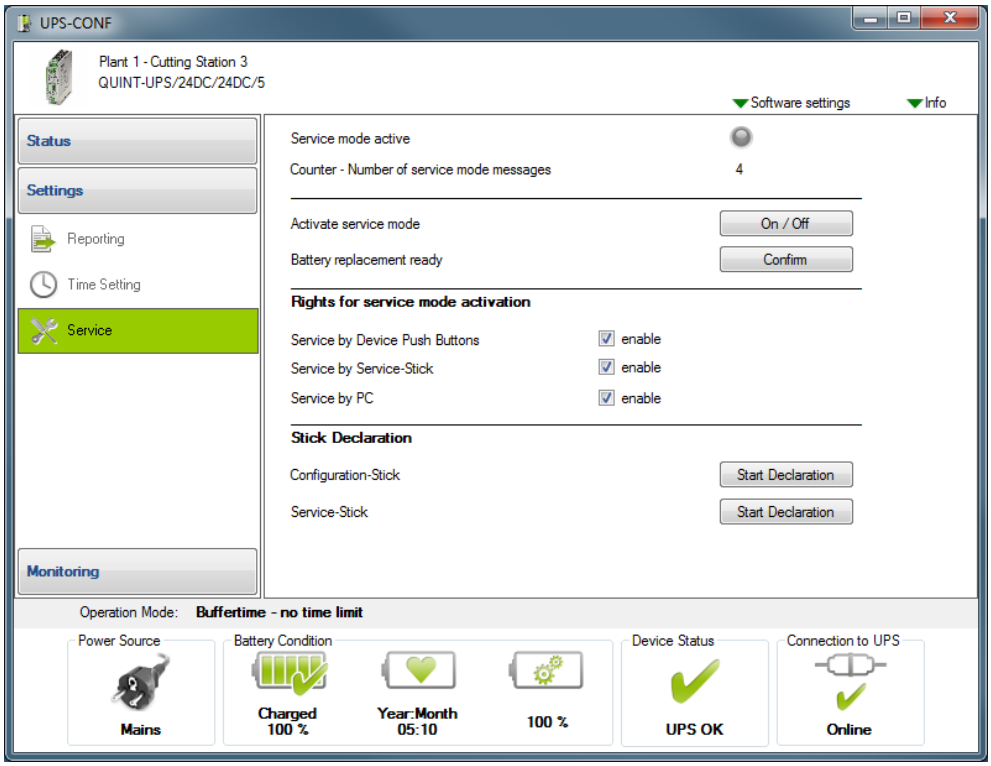
The set time is displayed in the "Operation Mode" of the status bar. An example with 25 minutes and 45 seconds set, shows the following status bar and operation mode:



PC-Mode

NOTE
These settings only apply if the UPS runs in PC-Mode. To set this mode, the buffer time potentiometer located at the device front must be set to "PC-Mode" (refer to topic buffer time selection (see page 12).

When the PC-Mode is set, the status bar shows the operation mode "PC-Mode", as shown in the following screenshot:



In the "PC Mode" setting on the UPS potentiometer, the UPS functionality follows a chronological sequence that can be parameterized via software, and is thus individually customized to the respective application.

Parameter	Meaning / Possible settings
1 Shutdown delay	Delay time is calculated automatically from the current remaining battery life minus the time required by the PC to shutdown. Alternatively, a fixed delay time may be chosen.
2 Program startup	After the delay time has expired it is possible to start a program. Example: a software starts that gradually backs up system data. You can test your settings by clicking on the "Test" button.
3 PC shutdown	The time required by the PC/IPC to shut down is set here.
4 PC restart delay	Only if the PC/IPC is shut down, and the mains has returned in the meantime, the output voltage will be interrupted for the reset time. The PC/IPC is then automatically restarted.

7.3 Service

If the "Service" item is selected in the software menu "Settings", all parameters of switching the UPS to service mode are accessible in the action area.

Here, you can:

- Operate the UPS in service mode (see page 47).
- Grant or deny rights for the service mode activation (see section below).
- Declare memory sticks as either configuration sticks or service sticks, as described in the topic Stick usage (see page 45).

Rights for service mode activation

The rights for all possible methods to activate or terminate the service mode can be defined in the "Rights for service mode activation" part of the "Service" navigation item´s action area. Possible activation methods are:

- Pressing both push buttons ("Stick -> UPS" and "UPS -> Stick") on the device front simultaneously.
- Plugging a service stick into the Data port of the UPS device.

- Clicking the service mode activation button in the "Service" navigation item´s action area in UPS-CONF.

When allowing a service stick for activating the service mode and disabling the use of the push buttons at the same time, the stick can be considered as a kind of hardware key: Only authorized persons who possess a service stick are allowed to switch the device to service mode. For that purpose, a memory stick must be declared accordingly as described in Stick usage (see page 45).

For further information please refer to the "Service stick usage - service mode (see page 47)".

7.4 Advanced

This navigation item is only available if the "Enable advanced views" checkbox is marked in the Software Settings (see page 5).

The "Advanced" navigation item within the "Settings" group allows to set more specific parameters. These are in detail:

Name of parameter:	Sample value:	Unit:	Explanation:
Place of installation (user defined)	Hall 125	(none)	The text entered here is dislayed in the device information area of the User interface (see page 15).
Initial charging current	1.36	A	The battery is charged with this current, when the power supply is available.
Absorption charging end voltage	28.00	V	An equalizing charge, that increases charging voltage to a higher value than the nominal capacity for a short period. This prevents battery stratification and reduces sulfation. When the battery is fully loaded, this voltage is tolerated as a maximum, before the voltage level gets a stable end value.
Float charging end voltage	27.60	V	The charger adjusts the end voltage based upon battery temperature. During high temperature periods, the actual battery voltage will be reduced and during low temperature periods it will be increased.
Temperature compensation	42	mV/K	High ambient temperatures have a negative impact on the service life of the battery. Therefore, the charging voltage should be lower with higher ambient temperatures. The adjustable values relate to one battery cell each.
Wire distance to the battery unit	300	mm	The maximal wire length from the UPS control unit to the battery unit.
Wire cross section to the battery unit	6.0	qmm	The wire cross section from the UPS control unit to the battery unit.

Name of parameter:	Sample value:	Unit:	Explanation:
Fast battery charging	On	(none)	Boost mode is allowed or not.
Dynamic backup threshold	Off	(none)	This parameter can be defined additionally to the overvoltage and undervoltage related parameters, see below. If set to On the voltage increase or decrease within a certain time period is watched (dynamically). The UPS switches to battery mode, if the relative increase/decrease is too much. In contrast the overvoltage and undervoltage parameters have static values. They can become active regardless the dynamic backup threshold did not trigger, because the voltage was alright.
Undervoltage backup threshold	19.00	V	When the DC voltage falls under this threshold (undervoltage), the system switches to battery mode.
Overvoltage backup threshold	30.00	V	When the DC voltage exceeds this threshold (overvoltage), the system switches to battery mode.
Return to mains time	3	seconds	After this time the system returns to mains, when it is in battery mode and the power supply is available again.
Discharging end voltage	19.20	V	The battery voltage may not sink below this voltage value, otherwise it would be deeply discharged and become defective.
Signaling time after battery low cutoff	00:10	hh:mm	When the battery low status has arrived, the UPS cuts off and the status of the power source firstly switches to "UPS off (see page 27)". After the time set here no more power or battery status is displayed, but only the Connection to UPS (see page 17) is offline.
Signaling time after time cutoff	00:10	hh:mm	When the buffer time has elapsed, the UPS cuts off and the status of the power source firstly switches to "UPS off (see page 27)". After the time set here no more power or battery status is displayed, but only the Connection to UPS (see page 17) is offline.

Name of parameter:	Sample value:	Unit:	Explanation:
Battery type (imported item)	"No value assigned"	(none)	The type of battery delivered by the manufacturer. This value is read by the UPS-CONF software.
Nominal capacity (imported item)	"No value assigned"	Ah	The nominal capacity of the battery delivered by the manufacturer. This value is read by the UPS-CONF software.

You can restore the default settings anytime by clicking the "Set factory defaults" button.

You can import / export the list in a .csv file by clicking the button "Import " or "Export".

8 Monitoring - Statistics and logging

If the "Monitoring" group is selected, the navigation items "Statistic (user defined)", "Statistic (system defined)" and "Logging" are available.

The items inform about counted and time measured statistic values and show logged information.

Statistic (user defined)

The "Statistic (user defined)" navigation item shows counter values which start at a user-defined value. If, for example, batteries have been replaced, you can set the values manually to "0" in order to start a new logging period. The following values are displayed and can be reset:

- Number of battery modes: How often did the UPS already change to battery mode?
- Total time of battery mode: How long altogether did the UPS stay in battery mode?
- Number of operation startups: How often was the UPS started?
- Total operation time: How long altogether did the UPS run?

Statistic (device defined)

The "Statistic (system defined)" navigation item shows counter values which always start from the value "0" with the initial device installation. Beneath the same values as shown in the "Statistic (user defined)" navigation item, additional values are displayed:

- Runtime of the current battery operation: How long does the current battery operation (if relevent) altready last?
- Number of battery low cutoffs: How often was the battery completely discharged?
- Number of all messages: How many warnings and alarms were signaled altogether?
- Number of remaining lifetime messages: How often was a remaining lifetime signaled?
- Number of quality criteria messages: How often was signaled, that the quality criteria is no more met?
- Number of battery presence messages: How often was a battery unit not detected, e.g. no fuse plugged or circuit broken?

Logging

The logging is done by the software itself.
The "Logging" navigation item lists events like "Offline", "Online" or "UPS in battery mode" with date and time stamp. The event colors differ between green and red depending on the type of event. They are chronologically sorted, the latest uppermost.

You can delete the list by clicking the button "Delete history".
You can export the list in a .csv file by clicking the button "Export".

9 Stick usage

At the Data port of the UPS device, a memory stick can be connected (see image below). After plugging in, the UPS either acts as configuration stick or as service stick, depending on how the respective stick has been declared before in the "Service" screen of the UPS-CONF software.

A configuration stick is used to copy parameterization data from/to the UPS device, as described in the topic Configuration stick usage (see page 46).

A service stick can be used to switch the device to service mode (see page 47) in order to perform maintenance tasks.

To declare a memory stick proceed as follows:

NOTE
When declaring a stick, its current content is deleted, i.e. already stored configuration data are lost.

1. Open the software menu "Settings".
2. Click the "Service" navigation item.
3. In the "Stick declaration" area of the action area, click the appropriate "Start declaration" button.

After this declaration, the UPS device automatically formats the stick after plugging it into the Data port the next time and then acts accordingly.

9.1 Configuration stick usage

A configuration stick stores UPS configurations, i.e.complete parameter sets. Configurations can be copied from the UPS to the stick and vice versa. This way, the stick can be used to transfer configurations from one UPS to another.

NOTE
The configuration stick cannot be used, while the UPS runs in battery mode. The power supply must be available.

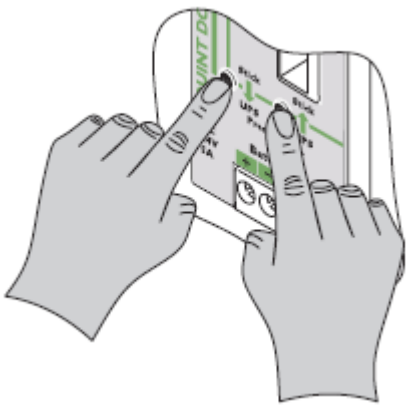
The usage of configuration sticks is explained by the following steps:

1. Make sure that the used memory stick is already declared as configuration stick as described in the topic Stick usage (see page 45).
2. To transfer parameters between the stick and the UPS, execute one of the following steps:
   - To copy parameters from the stick to the QUINT-UPS push the "Stick -> UPS" button for more than 2 seconds.
   - To copy parameters from the QUINT-UPS to the stick push the "UPS -> Stick" button for more than 2 seconds.
3. Connect the configuration stick to the Data port of the UPS under consideration of the plug direction.
   The parameter transfer is started automatically and the progress is signalled by the LEDs:
   - While data is transferred they flash red - yellow - green.
   - A successful tranfer completion is signalled by a permanent green LED.
   - A faulty tranfer completion is signalled by a permanent red LED.
4. Remove the stick from the Data port.
5. After copying a parameter set from an UPS to the stick you can "clone" this configuration by plugging this stick into another UPS and copying the stored data from the stick into this UPS.

9.2 Service stick usage - service mode

The service mode is used, when installation and maintenance work has to be achieved, such as a battery has to be replaced.

There are several possibilities to switch the UPS to service mode.



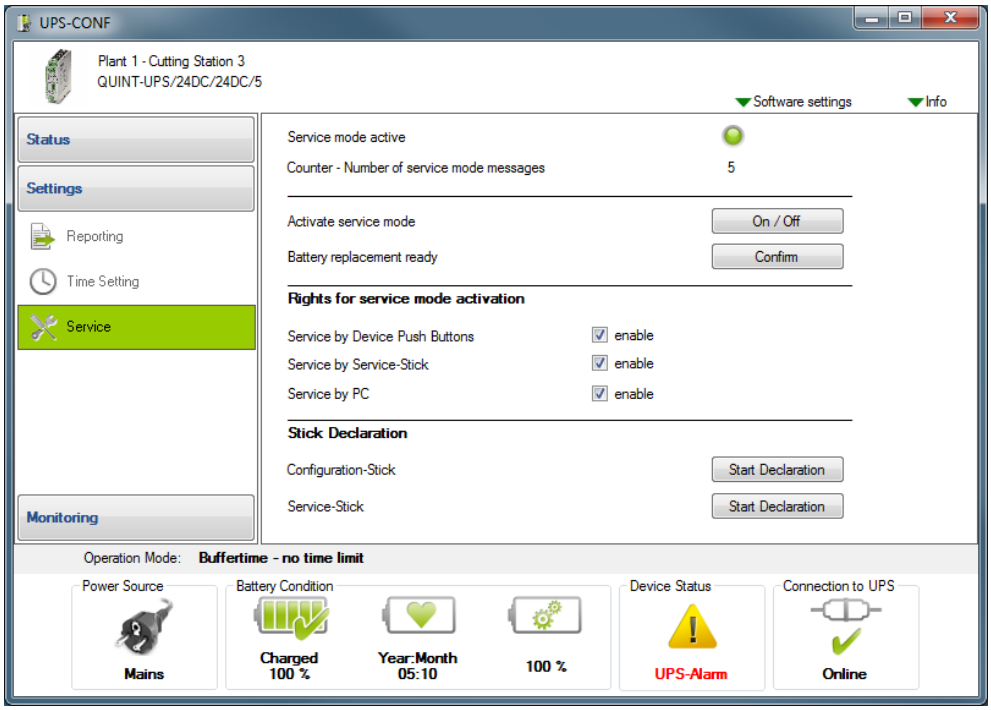
The corresponding activation rights have to be granted for service mode activation and deactivation, as described in the topic Rights for service mode activation (see page 39).

Service mode activation

The service mode cannot be activated, while the QUINT-UPS runs in battery mode. The power supply must be available.

Depending on the granted activation rights, the service mode can be activated in three different ways:

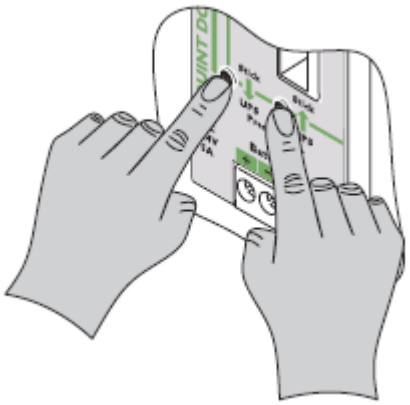
- By holding down both push buttons on the QUINT-UPS named "Stick -> UPS" and "UPS -> Stick" for at least 6 seconds.



- By connecting a service stick (see page 45) to the Data port (see page 13) of the UPS.
- By using the UPS-CONF software as follows:
  In the "Settings" group, select the "Service" item, and click the "On / Off" button near the "Activate service mode" text.

While the service mode is active

- the alarm status is activated,



- the charging current is interrupted,
- the status LED "Service mode active" in the UPS-CONF software ("Settings" group / "Service" item) is green.

Service mode deactivation

The service mode can be deactivated in different ways:

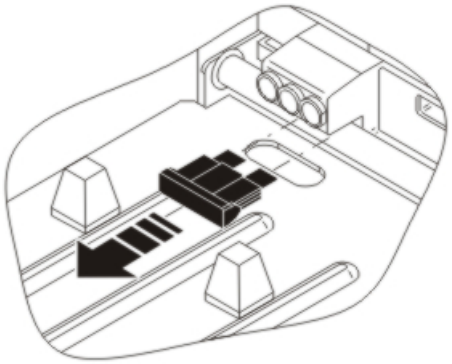
- By holding down both push buttons on the QUINT-UPS named "Stick -> UPS" and "UPS -> Stick" for at least 6 seconds.

- By removing the service stick from the Data port of the UPS.
- By using the UPS-CONF software as follows:
  In the "Settings" group, select the "Service" item, and click the "On / Off" button near the "Activate service mode" text.

After the service mode is deactivated, the status LED "Service mode active" in the UPS-CONF software ("Settings" / "Status") switches back from green to gray.

Service mode operation

To operate the QUINT-UPS in the service mode in order to replace a battery for example, execute the steps described below.



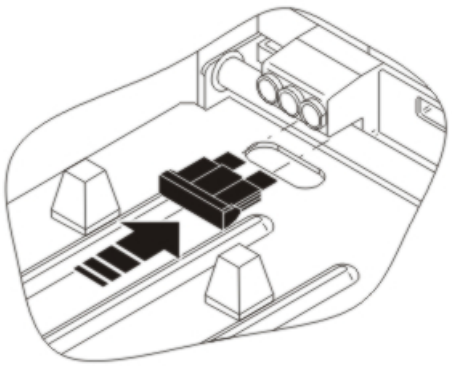
DANGER
Before activating the service mode read and obey carefully the safety instructions in the topic Important safety notes (see page 10).

DANGER
Watch polarity when connecting cables!

1. Activate the service mode by one of the ways described above.
2. Replace the battery as follows:.

   i. Open battery housing.

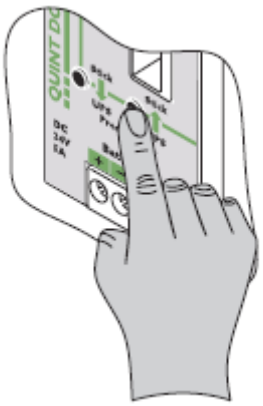
   ii. Remove fuses.



iii. Remove cabling.

iv. Change battery.

v. Connect cabling.



vi. Insert fuses.

vii. Close battery housing.

3. As soon as the work is finished, the parameters of the new battery have to be read into the UPS, so it's status information is available. To introduce this battery registration, do one of the following actions:

   - Push one of the push buttons on the QUINT-UPS named "Stick -> UPS" or "UPS -> Stick" and hold it down for more than 6 seconds.

or

- In the "Settings" group of the UPS-CONF software select the "Service" item, locate the text "Battery replacement ready" and click the "Confirm" button near the text.

The bar graph at the QUINT-UPS flashes, the alarm status is still active.

NOTE

If the service mode has been deactivated by removing the service stick from the Data port before the battery replacement has been confirmed, it can be confirmed by the UPS-CONF software. A popup window will remind the user to confirm the battery replacement.

4. Deactivate the service mode as described above.

10 Application samples

For further information, please take a look at the Software Tutorials or the Quick Start Poster on www.phoenixcontact.net/catalog. You will find the data if you link to UPS-CONF or QUINT-UPS.

10.1 Functional test

One of the main functions of the QUINT-UPS is to supply the load, when the mains fails. To test, if the UPS buffers the load, follow these steps:

1. Switch off the power supply of the QUINT-UPS.
2. Check if the QUINT-UPS buffers the load as long as set with the buffer time potentiometer, refer to Buffer time selection (see page 12).

10.2 PC-Mode: PC shutdown and restart

The IQ technology of the QUINT-UPS is able to control the power supply for a PC. For that purpose the PC with the UPS-CONF software installed has to be connected to the UPS and the PC-Mode activated. The PC-Mode enables the automatic PC shutdown and restart functionality.

To test the PC shutdown and restart functionality in the PC-Mode, proceed as follows:

1. Switch the buffer time potentiometer to "PC-Mode", as described in the topic Buffer time selection (see page 12).
2. Connect the UPS device to a USB port of the PC where UPS-CONF is installed (refer to topic Hardware setup (see page 11)).
3. Open the software menu "Settings" and click "Time Settings".
4. Set the parameters for the four different parameter categories, as described in the topic PC-Mode (see page 38).
5. Check if the PC shuts down and restarts corresponding to the set parameters. If a program execution has been set, verify that it is executed.

11 Troubleshooting

If your system does not work properly for any reason, approach the problem in the following manner:

1. Check the system status:

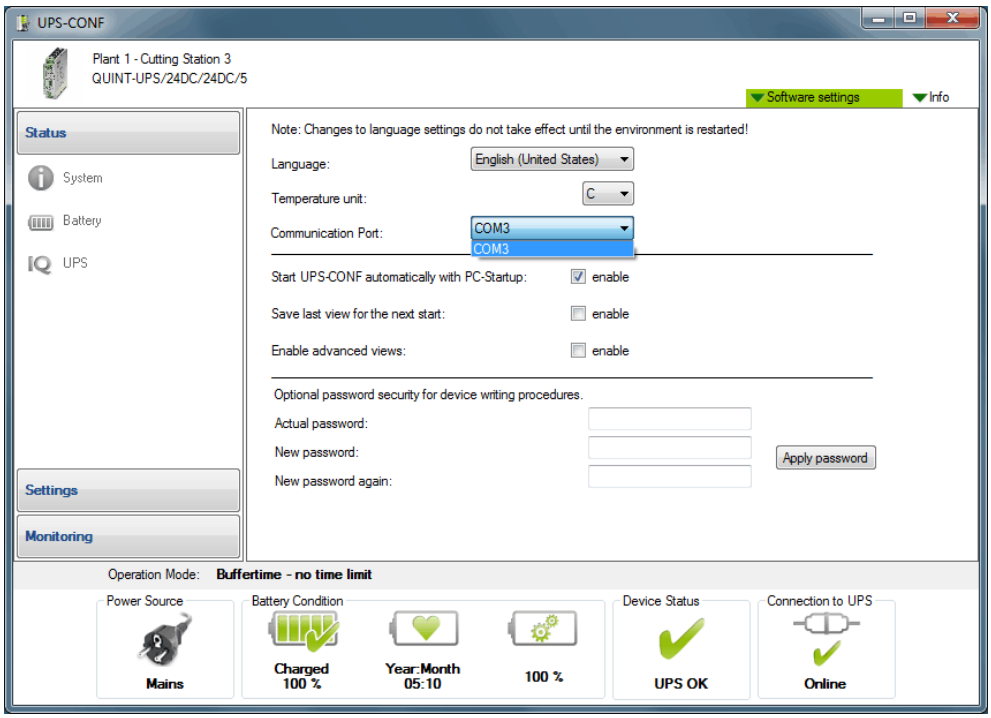
   - If the UPS-CONF software is installed, check the status bar (see page 17) and take a look at the system status.
   - If the UPS-CONF software is not installed, take a look at the front side of the UPS and check the LEDs (see page 20).

2. Proceed with the section Unexpected status symbols (see page 54) to find out, what is wrong.

The section Unexpected status symbols (see page 54) will lead you closer to the solution of the problem. If there are specific solutions for a single problem, you will be lead to the section, that describes the problem solving.

11.1 Unexpected status symbols

The meaning of status symbols showing an unexpected status is explained in the following topic.
The first table lists the symbols for the system status, that you can find in the action area and the second table lists the symbols from the status bar.



System status Symbol	Current situation and possible reason	Possible correction
 Gray: Mains OFF	There is no current available. Probably the Mains is switched OFF.	• Switch the Mains ON. • Take care that the power supply is available again.
DC  Gray: DC output not available	The power supply unit cannot deliver DC. Either the power supply is not available or the Mains switch is set to OFF.	• Switch the Mains ON. • Take care that the power supply is available again.
 Yellow: Battery mode	No current is available, thus the load gets it's power supply from the battery.	• Switch the Mains ON. • Take care that the power supply is available again.
 Red: UPS alarm	There may be different reasons: • No power supply is available. • The battery is soon empty. • The battery has to be replaced. • The battery cannot be detected. • There is another battery problem. • A set threshold has been reached.	• Switch the Mains ON. • Take care that the power supply is available again. • Check the set thresholds and compare with the current status. • Solve the battery problem. • Replace the battery. • Check the cables between UPS and battery. • Verify that the fuse is installed in the battery.

Status bar Symbol	Current situation and possible reason	Possible correction
	The UPS is in battery mode, because no power supply is available.	• Switch the Mains ON. • Take care that the power supply is available again.
	The bridge between the UPS terminals R1 and R2 is removed. Battery is deactivated therefore. Refer to the parameter "Remote Status" in the topic UPS (see page 27).	If you want the battery to be activated and the battery mode to be introduced, when the mains fail, bridge the terminals R1 and R2. Refer to the hardware overview (see page 7).
	There is no power supply available. One of these states is ongoing: • The UPS is off, because battery mode is finished. The set buffer time has elapsed. • The power source is not ok, because input voltage is in an invalid range.	If the UPS is off, because battery mode is finished, but the battery is funcional: • Switch the Mains ON. • Take care that the power supply is available again. If the UPS is off, because battery mode is finished, and the battery is no more funcional or at it's end of lifetime: • Change the battery. If the power source is not ok, because input voltage is in an invalid range: • Check the power supply.
	The battery is discharging, because no power supply is available.	• Switch the Mains ON. • Take care that the power supply is available again.
	The battery mode is finished, because the battery is empty.	• Take care that the power supply is available again to reload the battery. • Change the battery, if battery lifetime is exhausted.
	(see UPS alarm in the table above)	(see UPS alarm in the table above)
	• The connection between PC and UPS via the IFS-USB-DATACABLE is interrupted. • The communication port is not set.	• Connect the UPS and PC via the IFS-USB-DATACABLE. • Check if the communication port is set, as described in the topic Communication port (see page 56).

11.2 Communication port

The PC USB communication port for the communication between the UPS and the PC is automatically set during software installation. In case the communication port has not been set, the status bar shows the "Connection to UPS: Offline" status.

Although the communication port has not been set, it is detected automatically. Thus you can set it manually. You just have to select it in the software settings of the system menu.

If you click the combo box near the text "Communication port" the correct port is shown and you can select it.

Datenblatt 6ES7214-1AG40-0XB0

SIMATIC S7-1200, CPU 1214C, Kompakt-CPU, DC/DC/DC, onboard I/O: 14 DI DC 24V; 10 DO 24V DC; 2 AI 0-10V DC, Stromversorgung: DC 20,4-28,8V DC, Programm-/Datenspeicher 100 KB

Allgemeine Informationen	
Produkttyp-Bezeichnung	CPU 1214C DC/DC/DC
Firmware-Version	V4.4
Engineering mit	
● Programmierpaket	ab STEP 7 V16
Versorgungsspannung	
Nennwert (DC)	
● DC 24 V	Ja
zulässiger Bereich, untere Grenze (DC)	20,4 V
zulässiger Bereich, obere Grenze (DC)	28,8 V
Verpolschutz	Ja
Lastspannung L+	
● Nennwert (DC)	24 V
● zulässiger Bereich, untere Grenze (DC)	20,4 V
● zulässiger Bereich, obere Grenze (DC)	28,8 V
Eingangsstrom	
Stromaufnahme (Nennwert)	500 mA; nur CPU
Stromaufnahme, max.	1 500 mA; CPU mit allen Erweiterungsbaugruppen
Einschaltstrom, max.	12 A; bei 28,8 V
I^2t	0,5 $A^2 \cdot s$
Ausgangsstrom	
für Rückwandbus (DC 5 V), max.	1 600 mA; max. DC 5 V für SM und CM
Geberversorgung	
24 V-Geberversorgung	
● 24 V	L+ minus 4 V DC min.
Verlustleistung	
Verlustleistung, typ.	12 W
Speicher	
Arbeitsspeicher	
● integriert	100 kbyte
● erweiterbar	Nein
Ladespeicher	
● integriert	4 Mbyte
● steckbar (SIMATIC Memory Card), max.	mit SIMATIC Memory Card
Pufferung	
● vorhanden	Ja
● wartungsfrei	Ja

Störfestigkeit gegen Entladen statischer Elektrizität	
● Störfestigkeit gegen Entladen statischer Elektrizität nach IEC 61000-4-2	Ja
— Prüfspannung bei Luftentladung	8 kV
— Prüfspannung bei Kontaktentladung	6 kV
Störfestigkeit gegen leitungsgebundene Störgrößen	
● Störfestigkeit auf Versorgungsleitungen nach IEC 61000-4-4	Ja
● Störfestigkeit auf Signalleitungen nach IEC 61000-4-4	Ja
Störfestigkeit gegen Stoßspannungen (Surge)	
● Störfestigkeit auf Versorgungsleitungen nach IEC 61000-4-5	Ja
Störfestigkeit gegen leitungsgeführte Störgrößen, induziert durch hochfrequente Felder	
● Störfestigkeit gegen Hochfrequenzeinstrahlung nach IEC 61000-4-6	Ja
Emission von Funkstörungen nach EN 55 011	
● Grenzwertklasse A, für den Einsatz im Industriebereich	Ja; Gruppe 1
● Grenzwertklasse B, für den Einsatz in Wohngebieten	Ja; wenn durch geeignete Maßnahmen gewährleistet wird, dass die Grenzwerte für Klasse B nach EN 55011 eingehalten werden
Schutzart und Schutzklasse	
Schutzart IP	IP20
Normen, Zulassungen, Zertifikate	
CE-Kennzeichen	Ja
UL-Zulassung	Ja
cULus	Ja
FM-Zulassung	Ja
RCM (ehemals C-TICK)	Ja
KC-Zulassung	Ja
Schiffbau-Zulassung	Ja
Umgebungsbedingungen	
Freier Fall	
● Fallhöhe, max.	0,3 m; fünfmal, in Versandverpackung
Umgebungstemperatur im Betrieb	
● min.	-20 °C
● max.	60 °C; Anzahl gleichzeitig eingeschalteter Ein- bzw. Ausgänge: 7 bzw. 5 (keine benachbarten Punkte) bei 60 °C horizontal oder 50 °C vertikal, 14 bzw. 10 bei 55 °C horizontal oder 45 °C vertikal
● waagerechte Einbaulage, min.	-20 °C
● waagerechte Einbaulage, max.	60 °C
● senkrechte Einbaulage, min.	-20 °C
● senkrechte Einbaulage, max.	50 °C
Umgebungstemperatur bei Lagerung/Transport	
● min.	-40 °C
● max.	70 °C
Luftdruck nach IEC 60068-2-13	
● Betrieb, min.	795 hPa
● Betrieb, max.	1 080 hPa
● Lagerung/Transport, min.	660 hPa
● Lagerung/Transport, max.	1 080 hPa
Höhe im Betrieb bezogen auf Meeresspiegel	
● Aufstellungshöhe, min.	-1 000 m
● Aufstellungshöhe, max.	2 000 m
Relative Luftfeuchte	
● Betrieb, max.	95 %; keine Betauung
Schwingungen	
● Schwingfestigkeit während Betrieb gemäß IEC 60068-2-6	2 g (m/s²) Wandmontage, 1 g (m/s²) DIN Hutschiene

Dachlüfter, Dachentlüftung – SK 3140.100

erstellt am: 12.07.2021 auf www.rittal.com/de-de

Produktbeschreibung

Beschreibung:	Dachlüfter mit hoher Schutzart und flexibler Montage von innen oder außen.
Farbe:	RAL 7035
Schutzart IP nach IEC 60 529:	IP 21 ohne Filtermatte IP 55 inkl. Filtermatte
Schutzart NEMA:	NEMA 12
Lieferumfang:	Komplett einbaufertige Einheit, inkl. Filtermatte
Hinweis:	Zur Verbesserung der Energieeffizienz und Erhöhung der Gerätelebensdauer wird der Einsatz von Temperaturreglern oder -anzeigen empfohlen.

Produktbeschreibung

Luftleistung (freiblasend):	873 m³/h
Luftleistung freiblasend (ohne Filtermatten):	873 m³/h / 965 m³/h
Luftleistung freiblasend (mit Filtermatten):	725 m³/h / 759 m³/h
Bemessungsbetriebsspannung:	220 V - 240 V, 1~, 50 Hz/60 Hz
Abmessungen:	Breite: 400 mm Höhe: 133 mm Tiefe: 400 mm

Erforderlicher Montageausbruch:	Breite: 258 mm Tiefe: 258 mm
Einbautiefe:	34,6 mm
Temperaturbereich:	Lagerung: -40 °C...+70 °C Betrieb (Umgebung): -20 °C...+55 °C
Nennleistung P_{el}:	Bei 50 Hz: 99 W Bei 60 Hz: 130 W
Bemessungsstrom max.:	Bei 50 Hz: 0,43 A Bei 60 Hz: 0,56 A
Sicherungsautomat/Schmelzsicherung:	3 A
Lebensdauer bei 50 Hz:	62800 h
Lebensdauer bei 60 Hz:	65800 h
Schalldruckpegel:	Bei 50 Hz: 58 dB(A) Bei 60 Hz: 60 dB(A)
Ventilator:	Radial, Kondensatormotor
eCl@ss 8.0/8.1:	27180716
Verpackungseinheit:	1 St.
Gewicht/VE:	6 kg
EAN:	4028177709140
Zolltarifnummer:	84145915
ETIM 7.0:	EC000320
ETIM 6.0:	EC000320
eCl@ss 8.0/8.1:	27180716
eCl@ss 6.0/6.1:	27180716
Produktbeschreibung:	SK Dachlüfter TopTherm, 873/965 m³/h, 220-240 V, 1~, 50/60 Hz, BHT: 400 x 133 x 400 mm

Ausschreibungstext

Die neue Dachlüfter-Generation ist ein System für alle Größen: es wird
Nennleistung 50/60 Hz: 99 / 130 W

Bemessungsstrom 50/60 Hz: 0,43 / 0,56 A

Bemessungsbetriebsspannung: 220-240 V, 1~, 50/60 Hz,,

Ausführung Ventilator: Radial, Kondensatormotor

Abmessungen [BxHxT]: 400x133x400 mm
Einbautiefe: 34,6 mm
Erforderlicher Montageausbruch [BxT]: 258x258 mm

Betriebstemperatur: -20°C bis +55°C
Lagertemperatur: -40°C bis +70°C

Farbe: RAL 7035

Schutzart NEMA: NEMA 12

Schalldruckpegel 50/60 Hz: 58 / 60 dB(A)

Lebensdauer 50/60 Hz: 62.800 / 65.800 h

Gewicht: 6 kg

CLASS 3211 02 - INDUSTRIAL CONTROL EQUIPMENT - Kits

Filter fan kits, models SK 3139.100, 3139.110, 3140.100, 3140.110, 3140.140, 3140.500, 3140.510
Filter kits, models SK 3138.000
Filter mat, accessory, cat. No.: 3174.100

RATINGS
Filter fan kits bear the following ratings.

Model Cat. No.	Voltage	AC/DC	Frequency	Wattage	Max. Surrounding temp.
	[V]		[Hz]	[W]	[°C]
3139.100	230	ac	50 / 60	52 / 65	55
3139.110	115	ac	50 / 60	53 / 66	55
3140.100	230	ac	50 / 60	102 / 135	55

3140.110	115	ac	50 / 60	105 / 140	55
3140.140	400	ac	50 / 60	98 / 130	55
3140.500	230	ac	50 / 60	168	55
3140.510	115	ac	50 / 60	170	55

Filter kit bear the following ratings.

Model Cat. No.	Voltage	AC/DC	Frequency	Wattage	Max. Surrounding temp.
	[V]		[Hz]	[W]	[°C]
3138.000	N/A	N/A	N/A	N/A	55

Notes:

1. These devices have been evaluated for environmental Type Ratings, Type 12, if mounted according to manufacturing instruction and used with manufacturer's filter mat, cat. No.: 3174.100.
2. The suitability of these fans for use with a solid state control has not been evaluated.
3. Filter mat, accessory, cat. No.: 3174.100 is intended for use with filter fan kits, cat. No.: 3139.100, 3139.110, 3140.100, 3140.110, 3140.140, 3140.500, 3140.510 and filter kits, cat. No.: 3138.000. Suitability with other than the above noted models was not evaluated and shall be considered in the end use.

Appendix V: Electric performance curve 8

1. Scope

This specification is applied to Rechargeable LFP Power Battery with aluminum shell (3.2V 280Ah) manufactured by EVE Energy Co., Ltd., in which the description and model, main performance, test conditions and precautions of the product are included.

The product can be applied for Vehicle power supply, Storage system, etc.

2. Description and Model

2.1 Description：LFP Li-ion Power Battery with aluminum shell.

2.2 Model：LF280K

3. General Technical Parameter

#	Item		Parameter	Remark
1	Nominal Capacity		280.0 Ah	(25±2)℃，Standard charge and discharge
2	Typical Voltage		3.2 V	
3	AC Impedance Resistance(1KHz)		≤0.25 mΩ	
4	Standard charge and discharge	Charge / discharge current	0.5 C/0.5 C	
		Cut off voltage of charge / discharge	3.65 V/2.5 V	
5	Maximum charge / discharge current	Continuous charge / discharge	1 C/1 C	According to continuous / pulse charge and discharge ammeters
		Pulse charge / discharge (30s)	2 C/2 C	
6	Recommended scope of SOC		10%～90%	N.A.
7	Charging Temperature		0 ℃～55 ℃	According to continuous / pulse charge and discharge ammeters
8	Discharging Temperature		-20 ℃～55 ℃	

#	Item		Parameter	Remark
9	Storage temperature	Short term (within 1 month)	-20℃～45℃	N.A.
		Long term (within 1 year)	0℃～35℃	
10	Storage humidity range		＜90%	
11	Self-discharge rate per month		≤3%/month	Temperature：(25±2)℃, Storage scope of SOC：30%~50%SOC
12	Dimension	Width	173.7 ±0.5 mm	Refer to Appendix I
13		Thickness (under 300±20 kgf , 30%～40% SOC)	72.0 ±1.0 mm	
		Average thickness (200 pcs, under 300±20 kgf , 30%～40% SOC)	72.0 ±0.5 mm	
14		High（total）	207.5 ±0.5 mm	
15		High（subject）	204.6 ±0.5 mm	
16		Tabs Distance	123.0±0.3 mm	
17	Battery weight		5.42±0.3 kg	

4. Test conditions

4.1 Test environment conditions

Temperature：25±2℃

Relative humidity (RH)： 15%~85%

Atmospheric condition：86KPa~106KPa

4.2 Standard Charge

The standard charge means charging the cell with charge current 0.5C(A) and constant voltage 3.65V at (25±2)℃, 0.05C cutoff.

4.3 Standard Discharge

The standard discharge means discharging the cell with discharge current 0.5C(A) and cutoff voltage 2.5V at (25±2) ℃.

4.4 Pole and Busbar welding requirements

No.	Item	Parameter	Remark
1	Penetration	≤ 2.5mm	
2	Pulling force	60-100kgf	
3	Temperature of pole plastic part	≤ 150℃	Related to power and time
4	The pressure on the pole	≤ 700N	

5. Main Performance

5.1 Electrical performance

No.	Item	Requirements	Measuring Procedure
1	Rate discharge performance at 25℃	Discharge capacity/nominal capacity×100％ A）0.5C (A) ≥100％ B）1.0C (A) ≥98％	After standard charge and 1h rest, discharge to 2.5V cutoff with the current of 0.5 C (A), 1.0C (A), respectively. If the discharge capacity fails to meet the technical requirements, this test is allowed to be repeated three times
2	Discharge performance at different temperature	Discharge capacity/nominal capacity×100％ A)55℃≥95%（Cutoff 2.5V） B)-20℃≥70%（Cutoff 2.0V）	Measure the initial capacity and state of the battery：A) after standard charge and 5h rest at 55℃, discharge to 2.5V cutoff with the current of 0.5C(A)；B) after standard charge at 25±2℃ and 24h rest at -20℃±2℃, discharge to 2.0V cutoff with the current of 0.5C(A).
3	The capacity retention and recovery at 25℃	Capacity Retention ≥ nominal capacity×95％ Capacity Recovery ≥ nominal capacity×97％	Measure the initial capacity and state of the battery, after standard charge and stored for 28 days, discharge to 2.5V cutoff with the current of 0.5C (A), calculate the remaining capacity, the retention can be expressed as a percentage of nominal capacity. After standard charged and 30mins rest, calculate the discharging capacity (Ah), the recovery can be expressed as a percentage of nominal capacity. The recovery is measured with discharge current 0.5C (A) with 2.5V cut-off at (25±2) ℃.
4	cycle life at 25℃	≥6000 cycle @0.5C/0.5C	Under the 300kgf clamp, after standard charged and 30mins rest, discharge to 2.5V cutoff with the current of 0.5C(A) at (25±2) ℃, and then start the next cycle，end with the capacity decreasing to 80% of the

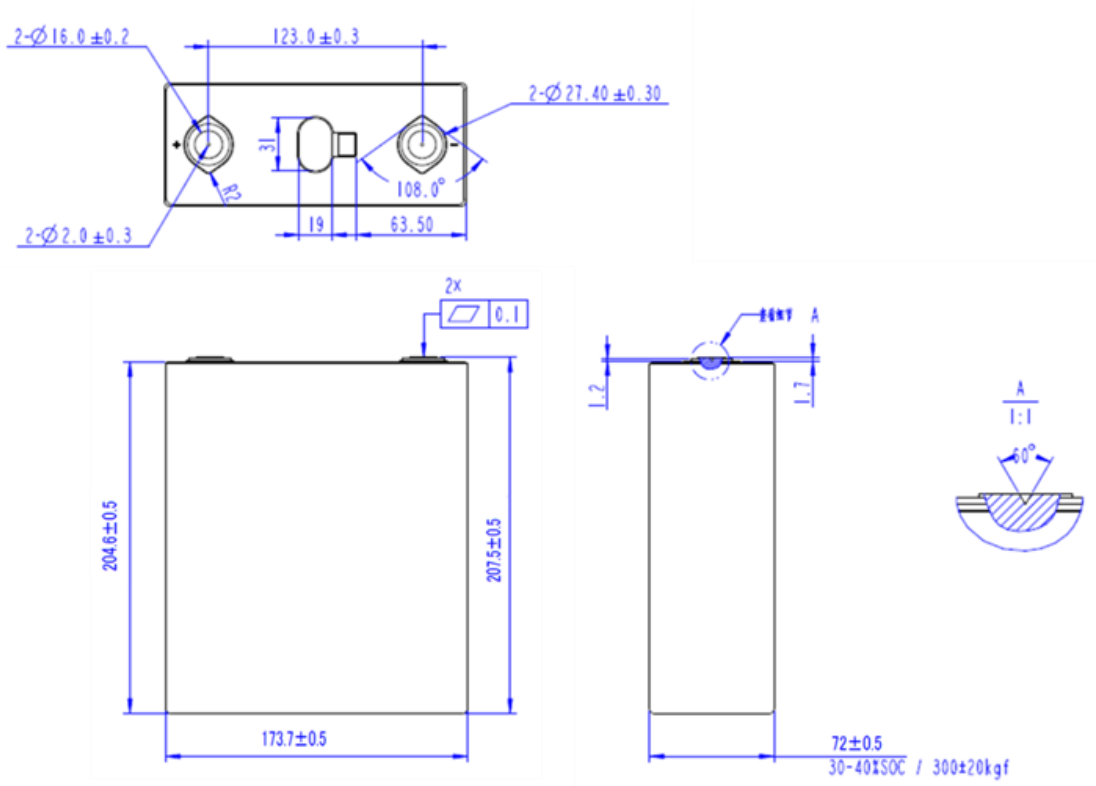
			initial capacity. The number of cycles is defined as the cycle life of the battery.
5	cycle life at 45℃	≥2500 cycle @0.5C/0.5C	Under the 300kgf clamp, after standard charged and 30mins rest, discharge to 2.5V cutoff with the current of 0.5C(A) at (45±2) ℃, and then start the next cycle，end with the capacity decreasing to 80% of the initial capacity. The number of cycles is defined as the cycle life of the battery.
6	End of life managem ent	capacity/nominal capacity ＜70%	During the use of the battery, the battery s hall be stopped when the end of life regul ations are exceeded.

5.2 Safety performance

No.	Item	Requirements	Measuring Procedure
1	Over Discharge	No fire、No explosion	Reference: GB/T 36276-2018《Lithium ion battery for electrical energy storage》
2	Over Charging	No fire、No explosion	
3	Short-Circuit Test	No fire、No explosion	
4	Drop Test	No fire、No explosion	
5	Heating	No fire、No explosion	
6	Extrusion Test	No fire、No explosion	
7	Low pressure test	No fire、No explosion、No leakage	
8	Thermal runaway	No fire、No explosion	

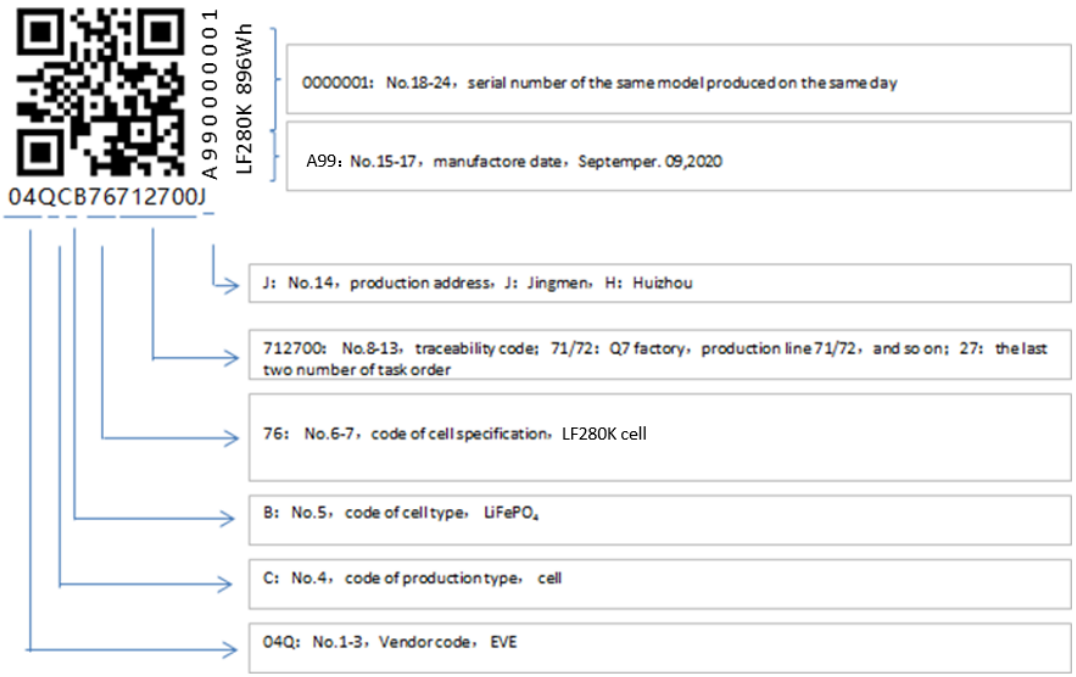
6. Transportation

Battery for shipping should be packed in boxes with the State of charge (30%~50%SOC). The Violent vibration, impact extrusion, sun and rain should be prevented during shipping.



7. Storage

Batteries should be stored (more than 1 month) indoor with a dry and clean environment at 0 ℃~35 ℃. Avoiding contact with corrosive substances and staying away from fire and heat source. The battery should be charged and discharged every 6 months. The SOC for storage is between 30% ~ 50%.



8. Points for attention

1. When the battery is charged and discharged, the conditions for monitoring and protecting the battery voltage, current and temperature shall be ensured.
2. Please keep the battery away from the heat source, fire source and other corrosive environments such as heating, strong acid and strong alkali.
3. Do not short circuit the battery or install it with incorrect polarity at any time，otherwise it can cause serious damage to the battery and cause danger.
4. Do not mix batteries of different models or manufacturers.
5. Do not use external force to make the battery fall, impact or puncture. Do not disassemble the battery or change the external structure.
6. When the battery is not used for a long time, please keep the battery in the state of 30%-50% SOC, and avoid the environment of strong direct sunlight or high temperature and humidity.
7. When operating the battery, it is necessary to wear rubber gloves and other protective devices.
8. In case of leakage, smoke or damage of battery, please stop using immediately and contact our company for handling.

Battery Module LF280

Key component of FREQCON LFP battery energy storage solutions

FREQCON

- Safest LFP chemistry, thermally and structurally stable design for robustness and longest battery lifetime
- Compatible for all long duration applications (up to 1C operation)
- Active battery monitoring with individual PCB and numerous sensors per module
- Compact design with high energy density (137 Wh/kg)

High Energy Density for all Applications

- 4x higher density than lead-acid batteries
- Up to 1C continuous operation for applications such as long duration UPS, grid ancillary services, off-grid storage and more

Longest Lifetime

- > 6000 full load cycles at 0.5C operation
- LFP batteries have no memory effect with very little calendar life degradation

Active Monitoring

- Each battery module is equipped with monitoring PCB, temperature sensors, thermal runaway detectors
- Data exchange per module provides high resolution data for increased analysis and safety

Safe and Robust Design

- Safest LFP batteries on the market
- Thermally and structurally stable housing design to secure batteries during operation and transport
- Highly recyclable environmentally friendly solution

Function

The LF280 Battery Module is the central component in turnkey energy storage systems provided by FREQCON GmbH. The modules are an ideal economical solution for a variety of applications. Each module consists of 10 powerful lithium iron phosphate cells, offering many safety advantages. The corresponding reliable BMS ensures high longevity of the battery cells. Each cabinet is equipped with 28 battery modules and a control system.

System Design

The lithium iron phosphate cells (LiFePO4) inside the LFP battery modules are connected in series and provide a total energy content of 8.96 kWh per module.

Each module is equipped with a monitoring PCB, providing the following functions:

- Voltage monitoring of single cells for charging and discharging
- Battery temperature monitoring
- Selective cell balancing
- Data exchange with central BESS controller
- Local insulation measurement
- Robust industrial design for transport, assembly and operation

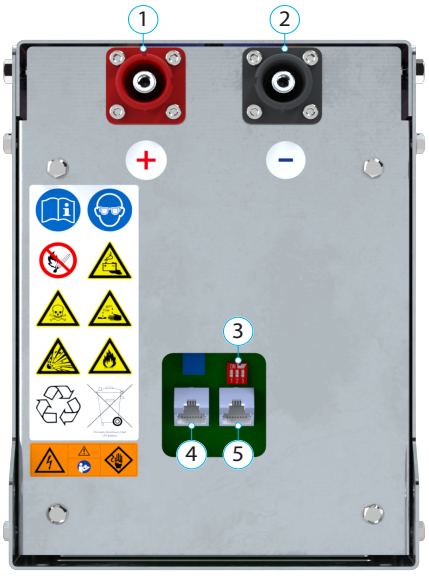
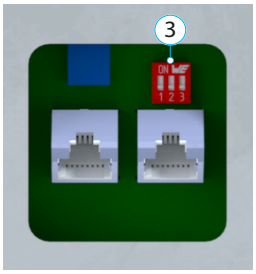
Technical Data
Battery Module

Module Data	Value
Part number	52365 / 52375 / 52157
Voltage (rated)	32 V DC
Total capacity	280 Ah
Number of cells per battery module	10
Stored energy	8960 Wh
Maximum voltage	36 V DC
Max. current	280 A
Max. charge and discharge rate (continuous)	1 C
Temperature range (storage)	-20 °C … +45 °C (long-term storage at 0…35°C)
Temperature range (continuous operation)	0 °C … +55 °C
Connections for DC+ / DC-	Surlock Plus
Communication connections	RJ45
Protection class	IP 20
Weight	65.3 kg
Dimensions (WxHxD)	188 mm x 239 mm x 908 mm
Single Cell Data	
Type	Prismatic cells
Capacity (typ.)	280 Ah
Voltage (typ.)	3.2 V
Voltage (max.)	3.65 V
Voltage (min.)	2.5 V
Battery life (@1C continuous operation)	>3500 cycles (80% remaining capacity)
Impedance (AC)	<0.25 mΩ
BMS Back Universal	
Power supply (external)	24 V DC (rated), <0.5 W
Power supply (internal)	36 V DC (max.), < 0.2 W
Communication	EIA-485, Modbus RTU
Baud rate (max.)	19200 Bit/s
Bus participants (max.)	32
Balancer Design	Load resistor
Balancer current @3.5 V	1.06 A
Voltage measurement	10 measurements per 14-bit resolution
Temperature measurements	8x NTC 10 kΩ (up to 14 bit analogue/digital converter) / 1x PT100 (12 bit analogue/digital converter)
Isolation measurement	Earth fault monitoring

Dimensions



FREQCON
Battery Module LF280



System Overview

Pos.	Component
1	Battery module LF280
2	Boreholes for lifting device (M6)
3	DC positive (+) socket
4	DC negative (-) socket
5	COM-Connection RJ45 and DIP-switches
6	Boreholes for transport handle mounting
7	Label with safety and warning instructions

Connections and Operating Elements

Connection Elements

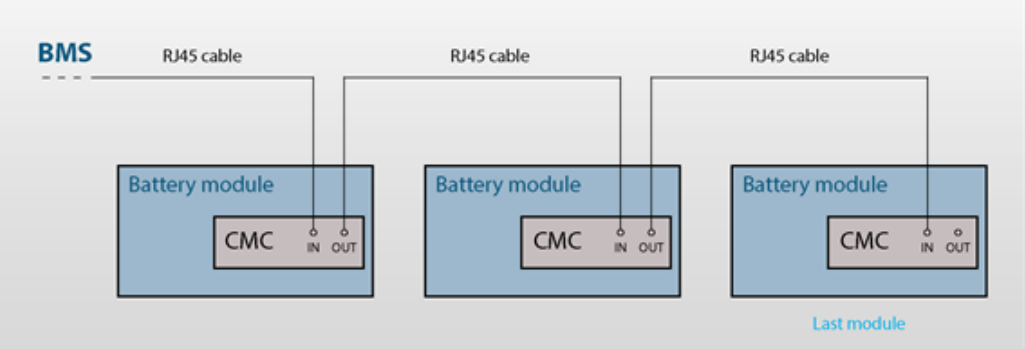
Pos.	Terminal	Description	Connection type	Cable
1	X1	DC + Battery module	10.3 mm Surlock Plus	Pay attention to cable routing in cabinet
2	X2	DC – Battery module	10.3 mm Surlock Plus	Pay attention to cable routing in cabinet
4	X3	Communication (input)	RJ45, 45°	PiMF, 4x2 min. AWG 27/7
5	X4	Communication (Output)	RJ45, 45°	PiMF, 4x2 min. AWG 27/7

Operating Elements

Pos.	Design.	Description	Function
3	S1	Dip switch for termination resistor and safety chain	ON (first switch): activates termination resistor for EIA-485 communication and safety chain (for last battery module)

The dip switch located on the modules front side is used for activation of the termination resistor and the safety chain of the system and must be set to "ON" position at the last module of a string connected in series.

"ON" switch position for **last module:**

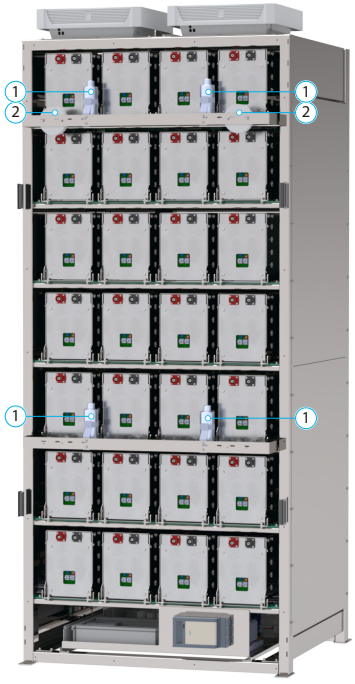


Only first dip switch set to ON position

"OFF" switch positions for **all remaining modules:**

All three dip switches set to OFF position

BMS Communication



Energy Storage System

Turnkey Battery Energy Storage System (BESS) equipped with battery cabinets and active cooling system housed in a 20ft HC container with side doors.

(2 MWh installed per 20 ft HC container)

Battery Cabinets

Fully equipped battery cabinet with smoke detectors and active fire extinguishing system consisting of self-activating aerosol cartridges.

Pos.	Component
1	Active Stat-X aerosol cartridge
2	Smoke detector

Battery Module LF280

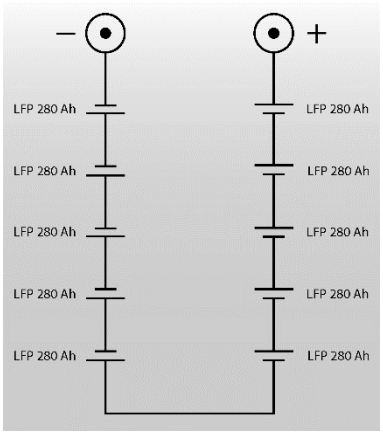
Part No. 52365 /52375 / 52157

Version 1.0

The LF280 Battery Module is the central component in turnkey energy storage systems provided by FREQCON GmbH.

The modules are an ideal economical solution for a variety of applications. Each module consists of 10 powerful lithium iron phosphate cells, offering many safety advantages. The corresponding reliable BMS ensures high longevity of the battery cells. Each cabinet is equipped with 28 battery modules and a battery control system.

System Design



The lithium iron phosphate cells ($LiFePO_4$) inside the L280 battery modules are connected in series and provide a total energy content of 8.96 kWh per module.

Each module is equipped with a monitoring PCB, providing the following functions:

- Voltage monitoring of single cells for charging and discharging
- Battery temperature monitoring
- Selective cell balancing
- Data exchange with central BESS controller
- Local insulation measurement
- Robust industrial design for transport, assembly und operation

ACHTUNG

Nicht korrekt platzierte Bohrlöcher durch Verwendung dieser Zeichnung als Bohrschablone.
Diese Bohrschablone ist nicht im Maßstab 1:1 dargestellt. Fertigen Sie auf Grundlage der Zeichnung eine korrekte Bohrschablone an.

ATTENTION

Incorrectly placed drill holes as a result of using this drawing as a drilling template.
This hole drilling template is not exactly to scale (1:1). Please make a correct hole drilling template on the basis of the drawing.

ATTENTION

Ce dessin ne peut pas être utilisé comme gabarit de perçage.
En effet, il n'est pas à l'échelle. Il peut cependant être utilisé pour créer un gabarit à l'échelle.

ATENCIÓN

Taladros de fijación mal posicionados si este dibujo se usa como plantilla para taladrar.
Este dibujo no está a escala 1:1, por ello no sirve como plantilla. Elabore una plantilla correcta en base a las dimensiones reales indicadas en el dibujo.

ATTENZIONE

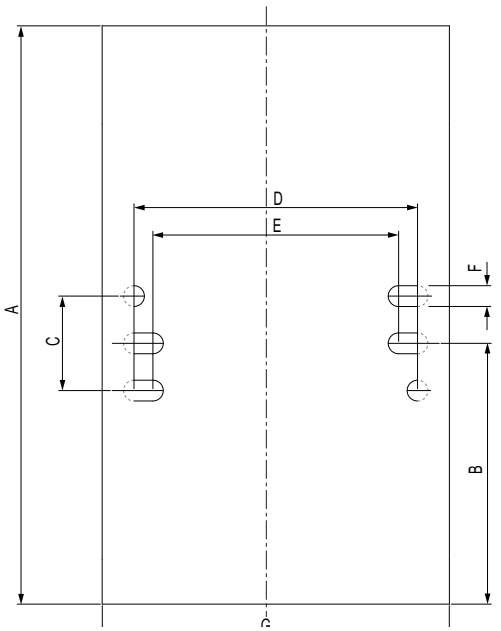
Fori situati non correttamente a causa dell'utilizzo di questo disegno quale schema di foratura.
Questo schema di foratura non è raffigurato in scala 1:1. Preparare uno schema di foratura corretto sulla base del disegno.

ATENÇÃO

Furos posicionados incorretamente devido ao uso do presente desenho como gabarito de furação.
O gabarito de furação não está representado em escala 1:1. Produza um gabarito de furação correto com base no desenho.

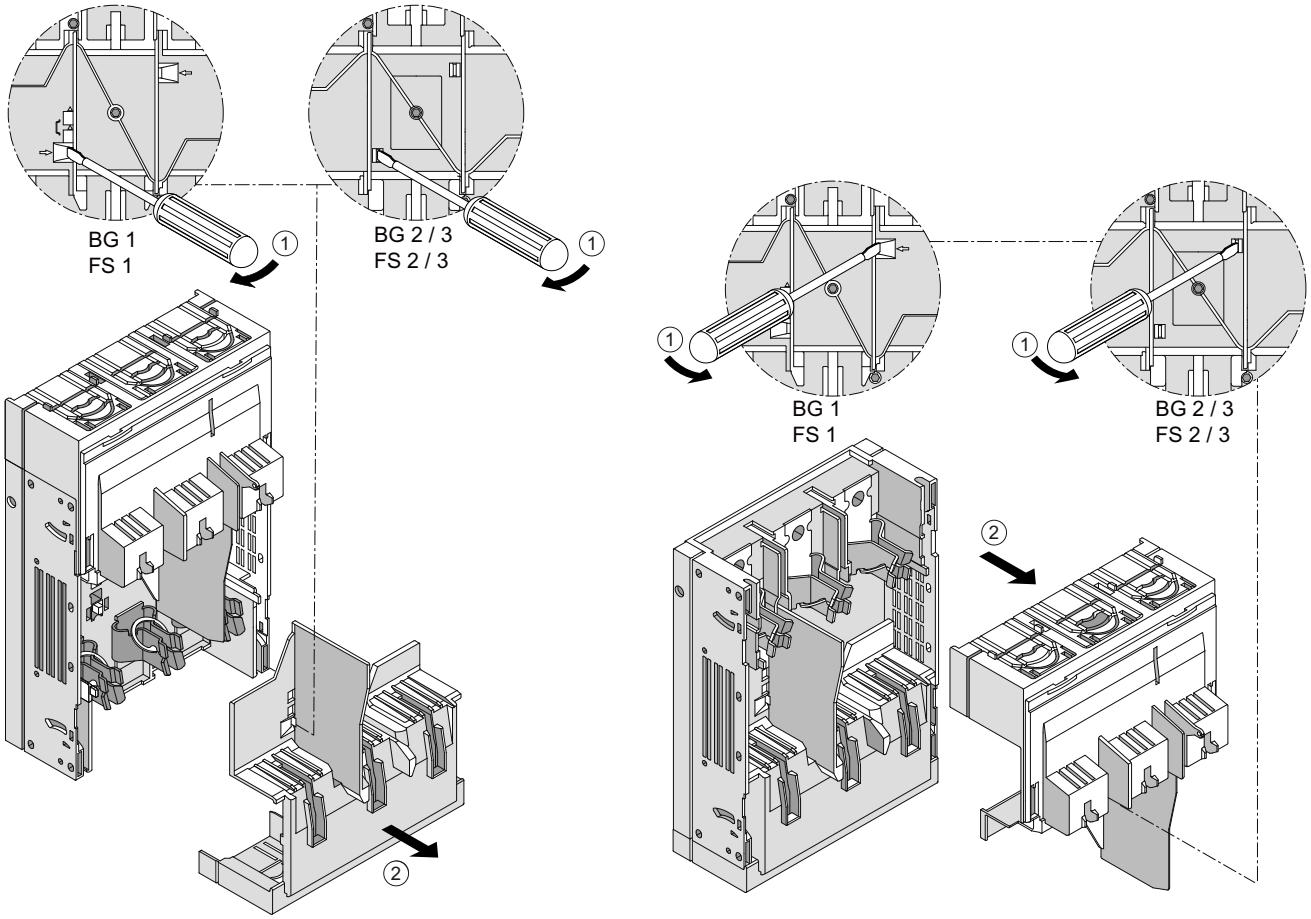
DİKKAT

Delik şablonu olarak bu çizimin kullanılması nedeniyle doğru yerleştirilmemiş matkap delikleri.
Bu delik şablonu 1:1 ölçekte gösterilmemektedir. Çizimi temel alarak doğru bir delik şablonu hazırlayın.

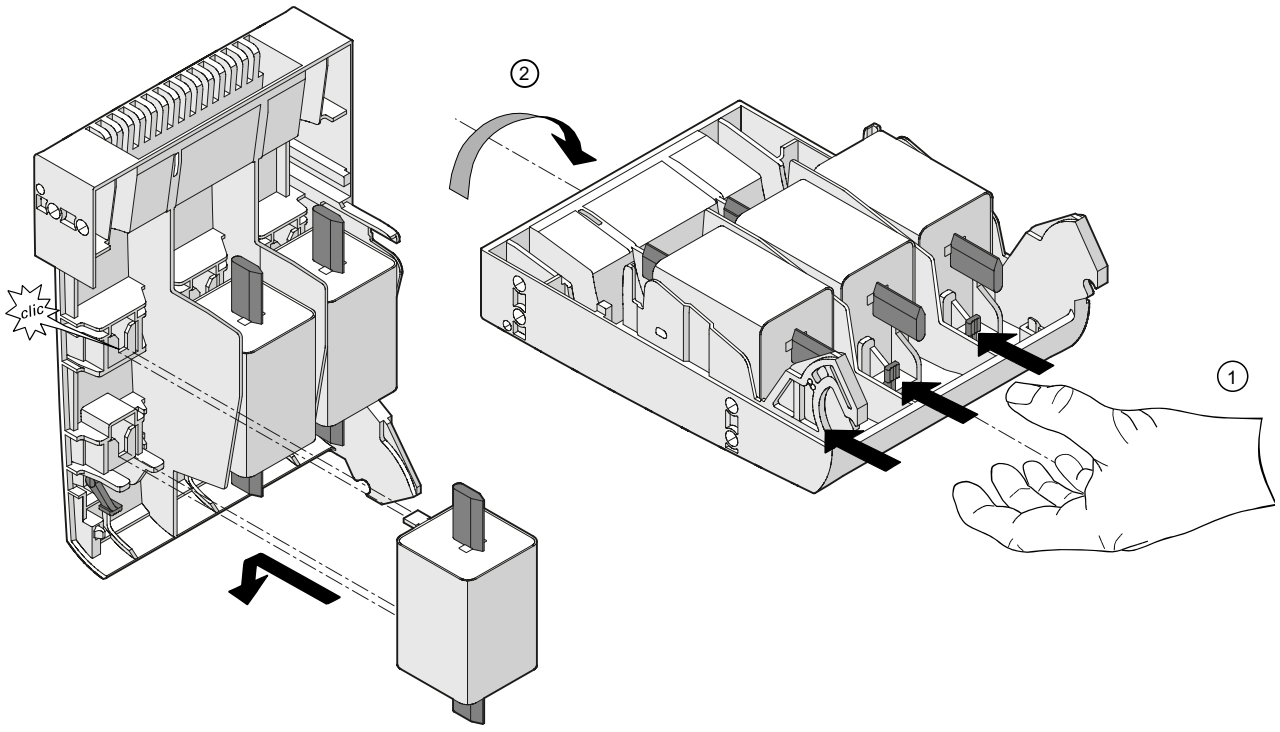


ВНИМАНИЕ

Неправильное положение просверленных отверстий при использовании данного чертежа в качестве шаблона для сверления.
Данный шаблон для сверления представлен не в масштабе 1:1. На основе чертежа подготовьте правильный шаблон для сверления.



注意



使用该图纸作为钻孔模板导致钻孔选位错误。

该钻孔模板的比例不正好是 1:1。请根据图纸制作正确的钻孔模板。

DE	**ACHTUNG**	Falls bei spannungsführender Einspeisung eine andere Anschlussform der elektronischen Sicherungsüberwachung EFM als die oben genannte gewählt wurde und mehr als eine Sicherung defekt ist, leuchtet bei EFM 10 die grüne LED oder EFM 20 / 25 die Anzeige nicht. Die Eigenversorgung der elektronischen Sicherungsüberwachung EFM ist in diesem Fall nicht gewährleistet. Tauschen Sie die defekten Sicherungen aus.
EN	**ATTENTION**	If the green LED on EFM 10 or the display on EFM 20 / 25 does not light up although the electronic fuse monitoring device is correctly connected and the infeed is live, no signal or an incorrect signal is transmitted. Replace the electronic fuse monitoring device straight away.
FR	**ATTENTION**	Si la LED verte de l'EFM 10 ou l'affichage de l'EFM 20 / 25 ne sont pas allumés alors que l'alimentation fournit la tension et que la surveillance électonique de fusible est correctement raccordée, aucun signal ou un signal erronné sont émis. Remplacer immédiatement la surveillance électronique de fusible
ES	**ATENCIÓN**	Si estando presente la tensión de alimentación a la entrada y correctamente conectado el dispositivo electrónico de control de fusibles no lucen el LED verde en el EFM 10 o el display en el EFM 20 / 25, entonces no se envía señal o ésta es incorrecta. Sustituya inmediatamente el dispositivo electrónico de control de fusibles.
IT	**ATTENZIONE**	Se nonostante l'alimentazione di tensione presente e il collegamento corretto del controllo elettronico dei fusibili, il LED verde su EFM 10 o il display su EFM 20 / 25 non si accendono, non si ha l'invio di alcun segnale o si ha l'invio di un segnale errato. Sostituire immediatamente il controllo elettronico dei fusibili.
PT	**ATENÇÃO**	Se numa alimentação condutora de tensão e conexão correta da supervisão eletrônica de fusíveis o LED verde na EFM 10 ou o display na EFM 20 / 25 não acender, não é enviado qualquer sinal ou é enviado um sinal errado. É imprescindível a substituição imediata da supervisão eletrônica de fusíveis
TR	**DIKKAT**	Gerilim ileten besleme ve elektronik sigorta denetiminin doğru şekilde bağlanması durumunda EFM 10'da yeşil LED veya EFM 20 / 25'de gösterge yanmazsa, sinyal gönderilmemektedir ya da yanlış sinyal gönderilmektedir. Zaman kaybetmeden elektronik sigorta denetimini değiştirin
РУ	**ВНИМАНИЕ**	В случае если при подаче напряжения и правильном подключении устройства электронного контроля предохранителей на EFM 10 не горит зеленый светодиод или на EFM 20 / 25 индикатор, то не передается сигнал или передается неправильный сигнал. Немедленно замените устройство электронного контроля предохранителей
中文	**注意**	如果电子熔断器监视设备正确连接且馈电线路带电，但 EFM 10 上的绿色 LED 或 EFM 20 / 25 上的指示灯没有点亮，则不会传送信号或可能传送错误信号。 请立即更换该电子熔断器监视设备。

DE	**VORSICHT**	Falls bei spannungsführender Einspeisung und korrektem Anschluss der elektronischen Sicherungsüberwachung bei EFM 10 die grüne LED oder EFM 20 / 25 die Anzeige nicht leuchtet, wird kein Signal oder ein falsches Signal gesendet. Tauschen Sie unverzüglich die elektronische Sicherungsüberwachung aus.
EN	**CAUTION**	The green LED on EFM 10 or the display on EFM 20 / 25 does not light up if the electronic fuse monitoring device EFM is connected in a way other than that described above when the infeed is live and more than one fuse is faulty. In this case, the internal power supply of the electronic fuse monitoring device EFM can no longer be guaranteed. Replace the defective fuses.
FR	**PRUDENCE**	Lorsque la tenison d'alimentation est délivrée correctement et qu'une autre type de raccordement de la surveillance élecronique de fusible a été choisi, la LED verte de l'EFM 10 s'allume et l'affichage de l'EFM 20 / 25 n'est pas allumé lorsque plus d'un fusible est défectueux. L'alimentation interne de la surveillance électronique de fsible EFM n'est alors pas assurée. Remplacer les fusibles défectueux.
ES	**PRECAUCIÓN**	Si estando presente la tensión de alimentación a la entrada y la forma de conexión del dispositivo electrónico de control de fusibles EFM difiere de la arriba mencionada y está defectuoso más de un fusible, entonces no luce el LED verde en el EFM 10 o en el EFM 20 / 25 el display. En tal caso no está garantizada la alimentación correcta del dispositivo electrónico de control de fusibles EFM. Sustituya los fusibles defectuosos.
IT	**CAUTELA**	Se con alimentazione di tensione presente è stato scelto un tipo di collegamento del controllo elettronico dei fusibili EFM diverso da quello sopra citato e più di un fusibile è guasto, il LED verde su EFM 10 o il display su EFM 20 / 25 non si accendono. In questo caso l'autoalimentazione del controllo elettronico dei fusibili EFM non è assicurata. Sostituire i fusibili guasti.
PT	**CUIDADO**	Se numa alimentação condutora de tensão foi escolhida uma outra forma de conexão da supervisão eletrônica de fusíveis EFM do que a acima mencionada, e se mais de um fusível estiverem defeituosos, o LED verde na EFM 10 ou o display na EFM 20 / 25 não acenderá. Neste caso, não está assegurada a alimentação própria da supervisão eletrônica de fusíveis EFM. Substitua os fusíveis defeituosos.
TR	**DIKKAT**	Gerilim ileten beslemede EFM elektronik sigorta denetiminin yukarıda belirtilenden farklı bir bağlantı şekli seçilmişse ve birden çok sigorta arızalıysa, EFM 10'da yeşil LED ve EFM 20 / 25'de gösterge yanmaz. Bu durumda, EFM elektronik sigorta denetiminin giriş beslemesi sağlanmamaktadır. Arızalı sigortaları değiştirin.
РУ	**ОСТО-РОЖНО**	В случае если при подаче напряжения выбран иной вид подключения электронного контроля предохранителей EFM, отличный от указанного выше, и при дефекте более одного предохранителя зеленый светодиод EFM 10 или индикатор EFM 20 / 25 не горят. В данном случае не обеспечивается автономное питание устройства электронного контроля предохранителей EFM. Замените дефектные предохранители.
中文	小心	如果电子熔断器监视设备 EFM 不是按照上述方式进行连接，则当馈电线路带电且多个熔断器故障时，EFM 10 上的绿色 LED 或 EFM 20 / 25 上的指示灯不会点亮。在这种情况下，无法再保证该电子熔断器监视设备 EFM 的内部供电。 请更换有故障的熔断器。

12 V Optical Smoke Detector

Art. no. RM1000

- Suitable for connecting to alarm and fire detection systems
- Detects visible smoke particles
- Self-adjusting
- Potential-free alarm relay
- Tested according to EN54-7

The 12 V optical smoke detector reacts to visible smoke particles. If too much smoke enters its measuring chamber, an alarm is triggered. In the measuring chamber, an integrated infrared light source generates a light pulse every 8 seconds. Smoke particles from a fire change the light signal received by the light diode. A relay trips and the alarm center reports a fire alarm. The 12 V optical smoke detector is mounted on the ceiling in the center of the room. The minimum distance to the side wall should be 30cm. We recommend a separate smoke detector for each entrance area, staircase, living-room, and bedroom. By changing a jumper, you can configure the optical smoke detector as NO or as NC detector. It is therefore suitable for every wired alarm system. The smoke detector is supplied externally with 12V operating voltage and is EN54 certified.

Technical Data:

Dimensions	(HxD) 46x100 mm
Connections	Screw terminal NO or NC, 1A at 30V DC
Width	100 mm
Type of detection	Optical
Housing material	ABS
Height	46 mm
Power consumption	0,368
Max. operating temperature	50 °C
Max. humidity	95 %

Installation location	Ceiling
Net weight	0.13 kg
Sensor type	Photodiode
DC voltage supply	10,5-13,8 V
Status display	Yes
Power consumption	35 mA
Certifications	EN54-7

Technical alterations reserved. Misprints and errors excepted. Copyright. © ABUS 12/2014

Air Conditioning

Product Information

PCA-M R32 Standard Inverter
Ceiling Suspended System
Standard Inverter Heat Pump (Single Phase)

Making a World of Difference

Mr.SLIM

The **PCA-M Standard Inverter** range is a ceiling suspended system that blends a host of outstanding features with a sophisticated streamlined design. Offering advanced control options and quiet operation, this range provides extreme flexibility and ease of installation whilst being cost effective..

Key Features

- Flush to wall installation for concealment of service connections
- High / Low ceiling height modes
- Improved airflow control, including automatic air speed adjustment for greater comfort
- Replace Technology available
- New single fan chassis on 12.5 and 14kW models

MITSUBISHI ELECTRIC

Note: The fuse rating is for guidance only. Please refer to the relevant databook for detailed specification. It is the responsibility of a qualified electrician/electrical engineer to select the correct cable size and fuse rating based on current regulation and site specific conditions. Mitsubishi Electric's air conditioning equipment and heat pump systems contain a fluorinated greenhouse gas, R410A (GWP:2088), R32 (GWP:675), R407C (GWP:1774) or R134a (GWP:1430). *These GWP values are based on Regulation (EU) No 517/2014 from IPCC 4th edition. In case of Regulation (EU) No.626/2011 from IPCC 3rd edition, these are as follows. R410A (GWP:1975), R32 (GWP: 550), R407C (GWP:1650) or R134a (GWP:1300).

Effective as of January 2019

PUMA FIRE

OPERATING AND MAINTENANCE INSTRUCTIONS

FIRE EXTINGUISHANT EXTRACT UNITS - SERIES 200-550 DIRECT DRIVEN (DD)

DESCRIPTION

The Puma fire extinguishant extract units are manufactured to a very high standard of construction. A double inlet, single phase, centrifugal fan is selected to meet the required performance, then is fixed directly to the internal sections of the main casing.

The casing, internal sections and lid are formed using 18, 16 or 14 SWG mild steel plate. The units are then finished in an attractive satin black, polyester powdercoat paint to RAL 9005. Weatherproof or external units are finished in blue to RAL 5017.

Both intake and discharge ends of the unit are internally flanged, and fitted with M6 nutserts. These are for connection to suitable ducts and external weather louvre. The room air intake end is fitted with a 1/2" Square Weld Mesh as a Finger Guard.

Puma extract units fitted with Fire / Smoke Dampers (FSD) are situated on the air discharge side. The damper should be located as close as possible to the wall cut out. This will then ensure the fire integrity of the wall is maintained. The fire rating of the FSD is 2 hours tested to BS 476 Part 8 & 23.

OPERATION

The extract unit requires a 230 V ac single phase supply or where specified a 380/415 V ac three phase supply may be required on larger fans (check serial plate on side of unit). This supply will normally be interlocked with the fire detection system in relation to power shutdown in the event of fire detection.

When a damper and motor is fitted to the unit, the damper motor is wired in lieu with the fan controls and proceeds to open when power is supplied to the fan unit. The motor takes approximately 75 seconds to fully open and will then 'Spring Return' on power failure at approximately 15 seconds.

Director Mr Phillip Newton M Inst.R, M.A.S.H.R.A.E.

INSTALLATION

The unit must be situated in a position with sufficient access to the top of the unit. A distance of at least the given height of the unit must be allowed, as access to the serviceable components are via the flat plate lid.

The clearance height is not necessary when the units are located underneath raised modular floors, as it is assumed that the appropriate floor tile/s are accessible and removable.

The mains supply to all units must be disconnected at source before removing the lid.

The unit may be suspended or supported by correctly sized anti-vibration isolators if required (supplied by others).

SERVICE AND MAINTENANCE

Periodically the extract unit must be electrically tested to ensure that the supply to the unit is continuous and that mechanically the FSD and motor open and close effectively.

It is recommended that this test be carried out twice yearly or to fit in with existing service and maintenance contracts.

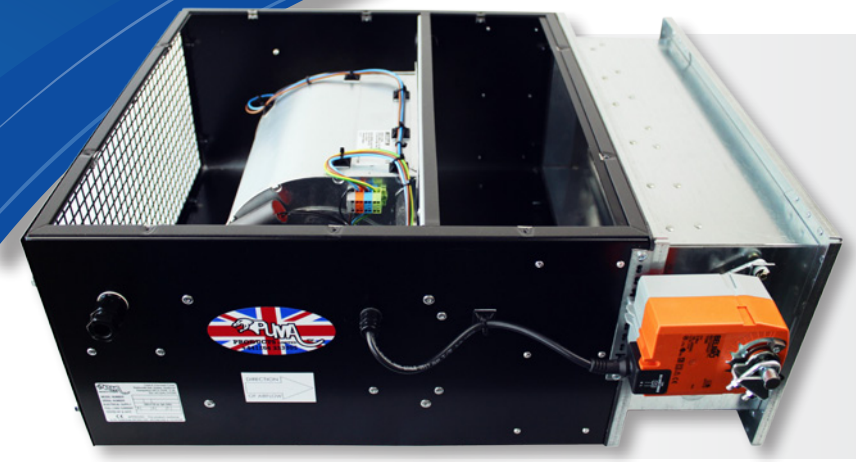
The air flow failure switch should be checked for free movement and electrical conductance.

Refer to Puma technical sales leaflet for further information regarding dimensions, weights and unit performance and fan curves.

FAULT FINDING

FAN FAILS TO RUN

The extract unit is normally wired directly to via fire panel, if the fan fails to run the supply and control circuit should be checked first then the fan/unit.



1. Check there is a voltage at the fan.
2. Check all connections.
3. If the above are ok a faulty/damaged fan is likely.

Most faults/problems can be resolved by following the above, if the unit still fails please contact Puma Fire Products Ltd for technical assistance.

PUMA
PRODUCTS

Post Discharge Fire Extinguishant Extract Units Direct Driven Range

Bespoke Fire Extinguishant Gas Extract Units for Data or Server Rooms

Internal Duct Mounted Unit

- Monocoque construction - single skin
- Ral 9005 satin black powder coat finish
- Top or bottom access lid
- Vertical / ceiling mounting
- Internal flange duct connections
- Fully sealed 2hr fire/smoke damper (FSD)

Options and Accessories available on request

Weatherproof Roof Mounted Unit

- Channel & Tray construction
- RAL 5017 mid blue powder coat finish
- Top access pitched lid
- Weather cowl on discharge
- Ducted both ends version available
- External flange duct connection
- Internal fire/smoke damper available (FSD)

Fire Extinguishant Extract Units (denoted **FE**) models are selected for Electronic Data Processing areas (EDP) to extract harmful fire extinguishing gases. Refer to BS ISO 14520 & BS EN 15004-1:2008 Section 5.1

Fitted as standard with 2 Hr rated (BS EN 1634-1:2008) fully sealed damper & motor, (power open spring return), and a single or three phase, double inlet direct driven centrifugal fan.

Pre-wired to terminal block for mains supply and Volt Free Contacts (VFC) for airflow indication normally interlocking with fire detection panel or BMS.

FE 550/4500	4.5**	22.5**	1100	79	76	74	72	67	64	58	48	62	47

* The dBA quoted is the mean 'A' weighted sound pressure level measured at a distance of 3m. It is included for comparative purposes only, and the actual sound level experienced will depend on the acoustic characteristics of the area being served. Ductwork and Silencers also have a major influence on breakout noise and actual noise levels in the system.

PUMA AIR

OPERATING AND MAINTENANCE INSTRUCTIONS

TWIN FAN EXTRACT DIRECT DRIVEN UNITS – RUN & STANDBY

DESCRIPTION

All units are manufactured to a very high standard of construction.

The casing, internal fan plates, lid and spigots are formed from 18 swg or 16 swg mild steel plate. The units are generally finished in an attractive RAL 5017 blue polyester powder coat for weather proof units. Internal units have galvanised panels or powder coated to RAL 9005 satin black.

The supply and extract fans are of the double inlet, direct drive centrifugal type fitted with single phase motors to class E insulation. They are sized to suit the duty required with allowances for internal pressure drop within the unit. The extract air section is insulated with 25mm thick pyrosorb class O insulation, this has excellent noise absorption qualities and anti-condensation properties.

OPERATION

The twin fan units generally require a 240 Vac single phase supply. Where specified a 380/415 V ac 3 phase and neutral supply may be required (check serial plate on side of unit or sales literature).

Each unit is provided with cable entry glands and suitable terminal block. This is wired through a mains isolator switch.

Internal speed control devices for each fan are available to commission fan airflow duties when required.

All twin fan extract units require a Puma auto changeover panel to operate correctly.

When energised, the selected fan will run as the duty fan, if the fan fails then an airflow switch automatically switches on the standby fan and illuminates a fan fail (red) light on the auto changeover panel (see data sheet on auto changeover panels for differences in the basic and deluxe panel models). The duty fan can be manually selected by the fan selector switch on the auto changeover panel.

Unit C Alexander Bell Centre, Hopkinson Way, West Portway Business Park, Andover, Hampshire, England, SP10 3UR
Telephone: 0044 1264 333310 Co Reg No 12192146
Email: sales@pumaair.co.uk Website: www.pumaproducts.co.uk
Director Mr Phillip Newton M Inst.R, M.A.S.H.R.A.E.

INSTALLATION

The unit must be situated in a position with sufficient access to the removable panel/s. A distance given on the certified drawing of the unit must be allowed for access to the serviceable components.

The units are suitable for floor mounting on 'tico' pad or anti-vibration isolators if required (by others). Flexible connections may be required between spigot connections and solid ductwork if noise levels are appropriate (by others).

Twin fan extract units are available as weather proof versions (denoted WTFE). Anti-vibration isolators are recommended when installed on flat roofs.

SERVICE AND MAINTENANCE

The mains supply to all units must be disconnected at source before removing the lid.

The airflow failure switches should be checked for free movement and electrical conductance.

These fans are fitted with direct drive motors with sealed for life bearings that require no maintenance.

Refer to Puma colour technical sales leaflet for further information regarding dimensions, weights and unit performance and fan curves.

FAULT FINDING

FAN/MOTOR FAILS TO RUN

1. Check the unit is connected correctly, as per the supplied wiring diagram.
2. Check the mains supply.
3. Check the control circuit fuse.
4. Is there a voltage at the fan? Yes would indicate motor failure or a neutral/phase problem. If no follow steps 4-7 below.
5. Check the mains isolator fitted to the side of the unit, if ok is the SR link (where fitted L1 L2 or SR1 SR2) in place.
6. Check the fan fuse, located below the isolator.(single phase fans only)
7. Three phase fans and belt driven units check the MCB is on, and the fan overload is on by pushing the manual reset button(red) on the fan contactor.(usually situated to the side of the fan on the fan plate left or right depending on handing of the unit)
8. If the MCB keeps tripping check the phases are ok, on belt drive units check the belt tension is correct and the fan motor overload is set to the rating of the motor. See motor serial plate for size/rating.

Most faults/problems can be resolved by following the above if the unit still fails to work correctly please contact Puma Air Movement Ltd for technical assistance.

PUMA FIRE

OPERATING AND MAINTENANCE INSTRUCTIONS

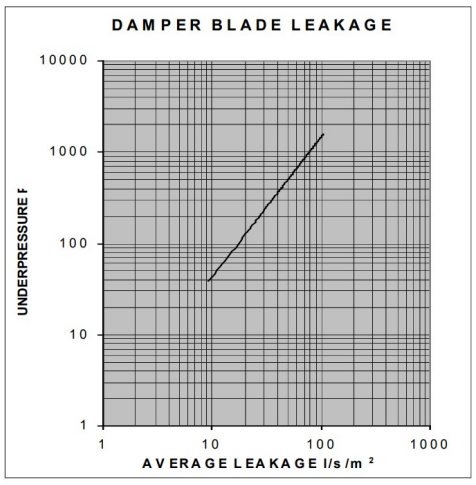
AIR MAKE UP DAMPERS (A.M.D) ALL UNITS

GENERAL DESCRIPTION

Air Make up Dampers (AMD), are designed to provide replacement air to the protected space whilst extracting gaseous extinguishant via a Puma gas extract unit. Refer to drawing No. COMMS 001.

The damper should be located as close as possible to the wall aperture. This will maintain the fire integrity of the wall. The fire rating of the fire smoke damper is 2 hours, tested to BS EN 1634.1:2008.

The casing and blades are constructed from galvanised steel. 25mm external flanges are fitted as standard, 50mm flanges are available upon request. Optional circular / rectangular spigot connections are also available on request.



External Walls require a Telescopic Duct (TD) and Weather Louvre (WL).

Internal Walls require a Wall Sleeve (WS) and Egg Crate Grille (ECG).

The blades are fitted with high temperature silicon blade seals. They have a leakage performance of 53 ltr/s/m2 @ 250 Pa to 103 ltr/s/m2 @ 1000Pa.

All Dampers are available with a fusible link rated at 75˚C, electro thermal link or pneumatic actuators. HEVAC installation frames for masonry walls are available.

Compliant to BS EN 1366-2 with regards to leakage rates not exceeding 200m³/hr/m².

Unit C Alexander Bell Centre, Hopkinson Way, West Portway Business Park, Andover, Hampshire, England, SP10 3UR
Telephone: 0044 1264 333305 Co Reg No 3230570
Email: sales@pumafire.co.uk Website: www.pumaproducts.co.uk
Director Mr Phillip Newton M Inst.R, M.A.S.H.R.A.E.

DAMPER MOTOR

This motor type is 'powered open' and will 'spring return' on power failure. The mains supply must be interlocked with the Puma FE gas extract unit to open simultaneously.

The damper motor is a fully sealed unit and is provided with 1.5m mains supply cable. The motor is factory fitted to the damper casing to prevent any movement of the motor during operation.
Any tampering of the motor seal or cable will invalidate warranty.

In the event of a fire condition, the damper motor will commence opening and be fully open in 75 seconds. When power is removed, the damper will shut in 20 Seconds.

INSTALLATION

The fresh air make up damper is to be installed directly to the face of the wall using self-tapping screws or raw plugs and sufficient fixings, depending on the wall construction. Before fixing the damper to the wall, ensure the flange is lined with fire-rated sealant to allow for a tight seal between the wall and the damper.

SERVICE & MAINTENANCE

The Damper and motor require no service as such, but a periodic mechanical and electrical test of the working mechanisms should be carried out at least twice yearly, or to coincide with existing service and maintenance contracts.
See appropriate certified drawing of units for further information re: sizes etc.

Unit C Alexander Bell Centre, Hopkinson Way, West Portway Business Park, Andover, Hampshire, England, SP10 3UR

Puma™

Air Makeup Dampers and Fire/ Smoke & Volume Control Dampers

Fire Smoke Damper & Actuator

Fire Smoke Dampers are fitted to the intake section of an air handling unit or fitted to an opening in a fire rated wall to maintain the integrity whilst allowing movement of air in normal operation.

Tested to BS 476 Part 20 and BS EN 1634-1:2008 - 2 Hr Fire Rating.

Complies to BS EN 1366-2 for leakage rates. The standard states the damper must leak no more than 200m^3/hr/m^2 which as you can see from the graph our dampers do not exceed 200m^3/hr/m^2.

Minimum size of 100x100mm
Maximum size of 1200x1800mm (in one section)
For large dampers we can supply in sections with multiple actuators to be assembled on site.

Frame and blades are constructed from 1.6mm galvinised mild steel (430 stainless steel option available). Die formed corner channels 'button locked' for strength and rigidity. All blades are linked externally out of the airstream connected by a shaft suitable for actuators. Complete with close silicon sealed blades, stainless steel side jambs and oilite bearings, they provide an excellent seal from smoke and fire.

Fitted with a Power Failure Spring Return Actuator, the F.S.D will open in 75 seconds and shut in 20 seconds after power has been removed.

TECHNICAL SUPPORT

Puma™

Air Makeup Dampers and Fire/ Smoke & Volume Control Dampers

Air Make up Damper with Telescopic Duct and Egg Crate Grille

Air Make up Damper with Telescopic Duct and Weather Louvre

Air Makeup Damper (A.M.D) assemblies are required for areas that have Fire Extinguishant extract facility. Comprising of a Fire Smoke Damper (F.S.D), power failure spring return motor, telescopic wall liner, Egg Crate Grille (Internal Walls) or Weather Louvre (External Walls). On energisation of the Extract Fan the AMD simultaneously opens, allowing sufficient air to make up the negative pressure created by the Fire Extinguishant. For selection, please contact sales.

Volume Control Damper

Volume Control Dampers are generally fitted to the intake section of a unit. Complete with aerofoil blades and st/st side jambs, they provide an effective semi seal fitted with either a Power Failure Spring Return Motor that opens in 75 seconds and shuts in 20 seconds after the power has been removed, or is fitted with a hand control (as shown above).

* The dBA quoted is the mean 'A' weighted sound pressure level measured at a distance of 3m. It is included for comparative purposes only, and the actual sound level experienced will depend on the acoustic characteristics of the area being served. Ductwork and Silencers also have a major influence on breakout noise and actual noise levels in the system.

1 For your safety

1.1 General safety statements

- Before using this product, carefully read the Instructions for Use.
- Strictly follow the Instructions for Use. The user must fully understand and strictly observe the instructions. Use the product only for the purposes specified in the Intended use section of this document.
- Do not dispose of the Instructions for Use. Ensure that they are retained and appropriately used by the product user.
- Only fully trained and competent users are permitted to use this product.
- Comply with all local and national rules and regulations associated with this product.
- Only trained and competent personnel are permitted to inspect, repair and service the product as detailed in these Instructions for Use. Further maintenance work that is not detailed in these Instructions for Use must only be carried out by Dräger or personnel qualified by Dräger.
- Properly trained service personnel must inspect and service this product as detailed in the Maintenance section of this document.
- Use only genuine Dräger spare parts and accessories, or the proper functioning of the product may be impaired.
- Do not use a faulty or incomplete product, and do not modify the product.
- The flameproof threads for the explosion proof enclosure do not conform to the minimum/maximum values in EN/IEC 60079-1. The threads must not be modified by the user.
- The measuring function of the gas measurement transmitter for explosion protection according to Annex II, Sections 1.5.5, 1.5.6 and 1.5.7 of Directive 94/9/EG is not covered at present.
- Exchanging components may compromise the intrinsic safety. This only applies if the device is intrinsically safe.
- Only operate the product within the framework of a risk-based alarm signalling concept.

Safe coupling with electrical devices

- Electrical connections to devices which are not listed in these Instructions for Use should only be made following consultation with the respective manufacturers or an expert.

Use in areas subject to explosion hazards

- Devices or components for use in explosion-hazard areas which have been tested and approved according to national, European or international Explosion Protection Regulations may only be used under the conditions specified in the approval and with consideration of the relevant legal regulations. The devices or components may not be modified in any manner. The use of faulty or incomplete parts is forbidden. The appropriate regulations must be observed at all times when carrying out repairs on these devices or components.

1.2 Definitions of alert icons

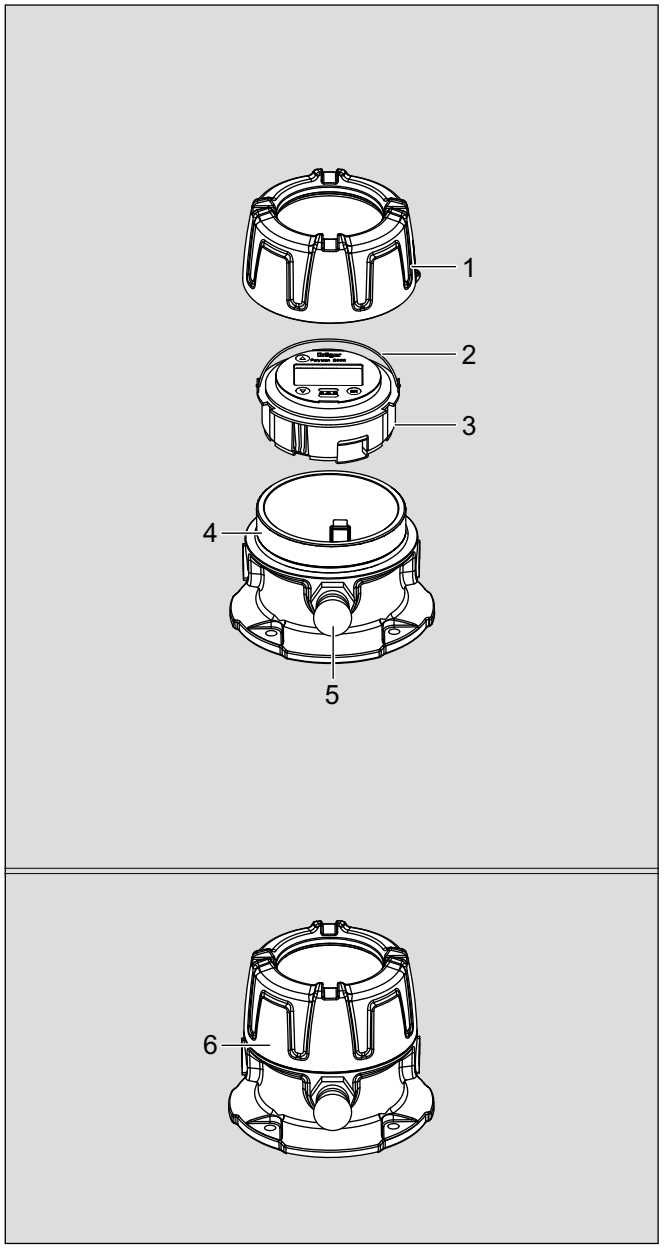
The following alert icons are used in this document to provide and highlight areas of the associated text that require a greater awareness by the user. A definition of the meaning of each icon is as follows:

WARNING

Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

CAUTION

Indicates a potentially hazardous situation which, if not avoided, could result in physical injury, or damage to the product or environment. It may also be used to alert against unsafe practices.



NOTICE

Indicates additional information on how to use the product.

2.2 Functional description

2.2.1 Principle of operation of the DrägerSensor DD, LC

The DrägerSensor is a transducer for measuring the partial pressure of flammable gases and vapors in ambient air. It operates on the heat of combustion principle.

The ambient air to be monitored diffuses through the flame arrestor in the sensor. The mixture of flammable gases and vapors is burned catalytically on the heated measuring element (pellistor). The oxygen required for combustion is taken from the monitored ambient air (must be greater than 12 vol.%). The measuring element receives additional warming from the heat arising from the combustion. This warming causes a change in the resistance of the measuring element which is proportional to the concentration of the mixture of flamable gases and vapors in the air being monitored.

In addition to the catalytically activated measuring element, the sensor also has a compensating element. Both elements are part of a Wheatstone bridge circuit. Consequently, environmental influences such as changes in temperature or humidity are almost completely compensated for.

The DrägerSensor LC includes additional processing and amplification of the measuring signal. As a result, the sensor is suitable for the measuring range 0 - 10 %LEL.

2.2.2 Principle of operation of the DrägerSensor IR

The DrägerSensor IR infrared gas sensor is a gas transmitter for determining the concentration of gases and vapors in ambient air. The measuring principle is based on the concentration-dependent absorption of infrared radiation in the measured gases.

The ambient air to be monitored diffuses through a sintered body into the pressure-tight housing of a measurement cuvette. The broadband light produced by the emitter passes through the gas in the cuvette, is reflected from the cuvette walls and is focused on the entrance window of a dual-element detector. One channel of the detector measures the gas-dependent light transmission of the cuvette (measuring channel) and the other is used as the reference. The gas concentration in the cuvette can be determined from the ratio of the measured signal to the reference signal. The cuvette is heated to prevent condensation of atmospheric humidity.

The calculation of the concentration is performed by internal electronics and software. For the output signal, the gas sensor emulates the half bridge of a catalytic bead sensor.

2.2.3 Contaminating gases for the DrägerSensor DD, LC

NOTICE

Certain substances in the atmosphere to be measured can impair the sensitivity of the sensors.

a) Polymerizing substances such as acrylonitrile, butadiene and styrene

b) Corrosive compunds such as halogenated hydrocarbons (which release halogens such as bromine, chlorine or fluorine on oxidation) and halogen hydracids, as well as gaseous acidic compounds such as sulfur dioxide and oxides of nitrogen.

c) Catalyst poisons such as sulfur and phosphorus compounds, silicon compounds (particularly silicones) and organometallic vapors. The sensors used work with measuring elements (pellistors) that are poison-resistant (PR) and thus have a longer life than conventional sensors when catalyst poisons are present.

It may be necessary to check the calibration if the sensor has been exposed for a long time to a high concentration of flammable gases or vapors or the above-mentioned contaminating substances.

2.3 Intended use

The Dräger Polytron 8200/8310 is an explosion proof device for continuous monitoring of the concentration of gases and vapors containing hydrocarbons. The housing for the device consists of robust, non-corroding stainless steel or aluminum and is suitable for indoor or outdoor applications. The unit can be connected to a Dräger monitoring system or a programmable logic controller (PLC) by means of a sealed conduit or an appropriately approved cable gland. With the optionally integrated relay module, the device can be operated without a central controller (with additional local alarm signalling). The device is designed for fixed installation and is approved for use in potentially explosive atmospheres, see chapter 2.5 on page 7.

WARNING

Not tested in oxygen enriched atmospheres (>21% O_2). High off-scale readings may indicate an explosive concentration.

2.3.1 Dräger Polytron 8200 with DrägerSensor® [1] Ex DD

Catalytic bead sensor for monitoring flammable gases and vapors containing hydrocarbons

- Detection range: 0 to 100 % LEL [2]

2.3.2 Dräger Polytron 8200 with DrägerSensor Ex LC

Catalytic bead sensor for monitoring flammable gases and vapors containing hydrocarbons

- Detection range: 0 to 10 % LEL [2)]

1 DrägerSensor® is a registered trademark of Dräger.
2 Lower Explosion Limit, depending on substance and the locally applicable regulations.

2.3.3 Dräger Polytron 8310 with DrägerSensor IR

Infrared sensor for monitoring flammable gases and vapors containing hydrocarbons

- Detection range: 0 to 100 % LEL [2)]

WARNING

Explosive. Not to be used in oxygen enriched atmospheres. None of the Polytron 8000 transmitters is certified and approved to be operated in oxygen enriched atmospheres.

2.4 Intended operating area and operating conditions

Hazardous areas classified by zones:
The device is only designed for use in Zone 1 or Zone 2 potentially explosive atmospheres for which a temperature range as specified on the device must be observed and in which gases of Explosion Groups IIA, IIB or IIC and Temperature Classes T4 or T6 (depending on maximum ambient temperature) or dust of Groups IIIA, IIIB or IIIC may occur.

Hazardous areas classified by divisions:
The device is only designed for use in potentially explosive atmospheres of Classes I&II, Div. 1 or 2, for which a temperature range as specified on the device must be observed and in which gases or dust of Groups A, B, C, D or E, F, G and Temperature Classes T4 or T6 (depending on maximum ambient temperature) may occur.

2.5 Approvals

See printed version for approval markings.

2.6 Device marking

The device marking is supplied with the device as a copy on a separate document.

Key to the Serial Number: The third letter of the Serial Number specifies the year of manufacture: A = 2009, B = 2010, C = 2011, D = 2012, E = 2013, F = 2014, H = 2015, J = 2016, K = 2017 etc. Example: Serial Number ARBH-0054: The third letter is B, i.e. the device was manufactured in 2010.

3 Installation

3.1 General information for the installation

The selection of a suitable mounting location is crucial for the effectiveness and performance of the entire system. Every detail of the installation must be thoroughly thought out. The following must be noted in particular:

- the local and national rules and regulations for the installation of gas monitoring systems,
- the applicable regulations for running and connecting power and signal cables to gas monitoring systems,
- the full extent of environmental influences to which the device will be subjected,
- the physical properties of the gases and vapors to be measured,
- the details of the particular application (e.g., potential leaks, air movements/flows, etc.),
- accessibility for required maintenance activities,
- the geometric of the accessories that are used with the system,
- all other limiting factors and stipulations that may affect the installation of the system.
- For installation without a conduit, an approved cable gland (e.g. Hawke A501/421/A/¾" NPT or equivalent) must be used (see chapter 12 on page 28). To increase the RF interference immunity, it may be necessary to connect the cable screen to the cable gland and to the control unit.
- The explosion proof enclosure has three ¾" NPT connections, which can be used for field wiring, the direct attachment of a sensor or wiring an external sensor. Unused openings must be closed off with a plug. For the correct tightening torques for cable bushings, plugs, sensors and connectors, see chapter 12 on page 28.
- The secondary are supposed to be supplied from an isolating source (does not apply to relay contacts).
- The optional e-Box has up to four 20 mm connections, which can be used for field wiring or wiring an external sensor. The permissible cable diameter is 7 to 12 mm.
- If the device is installed in locations where ambient temperatures of over 55 °C prevail, appropriate cables which are specified for use at temperatures of 25 °C above the maximum ambient temperature must be used.
- Strip back the insulation on conductors by 5 to 7 mm.
- Connect the cable as shown in Chapter 3.5 on page 9 (shown here also with protective ground) oder Chapter 3.6 on page 10.
- The connecting wires for the optional relay module must be selected and fused according to the rated voltages, currents and environmental conditions.
- When stranded conductors are used, an end ferrule must also be used.

3.2 Restrictions on the installation

- The device requires a DC voltage between 10 and 30 V. The minimum supply voltage of 10 V and the cross-section of the conductors used determine the distance of the device from the supply or the central controller (see chapter 12 on page 28). The device is designed for cables of sizes 12 to 24 AWG (0.2 to 2.5 mm^2). Use a three-wire, shielded cable as a minimum.
- The device must not be subjected to any radiant heat (e.g. direct sunlight) as this will result in a temperature rise above the specified thresholds (see chapter 12 on page 28). The use of a reflective screen is recommended.
- The housing is weather resistant and suitable for outdoor applications. The use of the optional splash guard is recommended to protect the sensor from water and dust.
- The device must be installed and operated in an environment which conforms to the stated specifications (see chapter 12 on page 28).
- To insure proper operation of the device, the impedance of the 4 to 20 mA signal loop must not exceed 500 ohms. Depending on the operating voltage and according to the application (e.g. HART operation), certain minimum impedances must be adhered to (see chapter 3.3 on page 8). The conductors for the power supply must have an adequately low resistance to insure the correct supply voltage at the device.

NOTICE

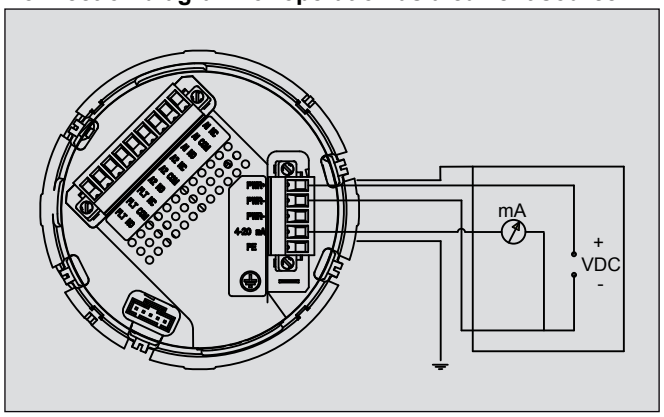
A dust cap can be fitted to the cable entry of the device. This cap is only used for transport purposes and must be removed before the device is connected to a sealed conduit.

3.3 Impedance range of the signal loop

Devices with a HART interface can be operated with HART communication or in HART Multidrop mode.

Operating mode	Impedance range of the signal loop	Supply voltage range
Operation without HART communication	0 to 230 Ω	at 10 V DC
	Rising linearly with the supply voltage from: 0 to 230 Ω at 10 V to 0 to 500 Ω at 16 V	10 to 18 V DC
	0 to 500 Ω	18 to 30 V DC
Operation with HART communication (HART mode)	230 to 270 Ω	at 13 V DC
	Rising linearly with the supply voltage from: 230 to 270 Ω at 11 V to 230 to 500 Ω at 16 V	11 to 16 V DC
	230 to 500 Ω	18 to 30 V DC
HART Multidrop operation	230 to 500 Ω	10 to 30 V DC

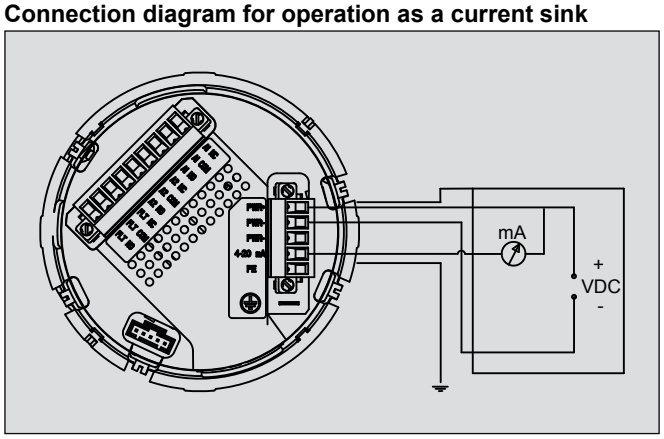
3.4 Mechanical installation



- Use the supplied drilling template for mounting on a wall.
- The mounting surface should be even and free of sharp edges.
- Dräger recommends using M6 Allen bolts.
- The openings must be readily accessible to the surrounding atmosphere.

3.5 Electrical installation without e-Box

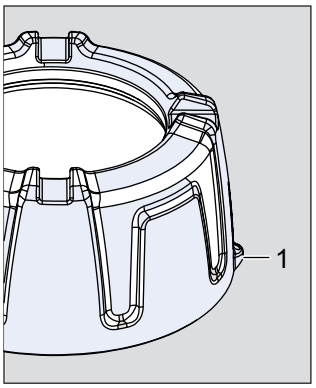
CAUTION



First connect the cables for the relays and make the connections to the sensor before connecting the device to the power supply.

Connection diagram for operation as a current source

01133300.eps



Connection diagram for operation as a current sink

01033300.eps

3.5.1 Power and signal cables

1. Release the set screw (1) and unscrew the housing cover from the device.
2. Lift the handle and remove the enclosure with the main electronics.
3. Connect the device electrically to the protective ground.
4. Rotate the main electronics and disconnect the 5-way plug.

00933300.eps

5. Connect the three cables for the power supply and the signal to the corresponding terminals (see following table of connections for the 5-way plug).

Connections for 5-way plug (power supply and signal):

5-way plug (power supply and signal)					
Terminal	1	2	3	4	5
Ident.	PWR+	PWR-	PWR-	4 to 20 mA signal	PE
Function	V+	V-	V-	4 to 20 mA signal (Operation as source or sink)	PE

6. For operation without a central controller: connect Terminal 3 to Terminal 4.
7. Fit the plug back in the socket and tighten the screws.
8. The screen of the cable must only be connected to the control unit.
9. Insert the main electronics back in the housing.
10. Screw the cover on again and tighten the set screw.

3.5.2 Version with relays

WARNING

At voltages >30 V AC or >42.4 V DC, the relay cables must be enclosed in protective tubing, or double-insulated cables must be used.

When the relay module is fitted, the wires for the alarm device are connected to the 9-way plug.

1. Disconnect the 9-way plug on the rear of the main electronics.
2. Connect the wires for Alarm Relay 1, Alarm Relay 2 and the Fault relay to the corresponding terminals, (see following table of connections for the 9-way plug).
3. The relays are energized when the default settings are used and in the measurement mode. This insures "fail-safe" operation. The terminal assignments in the connection table below apply when the default settings are used and when in measuring mode (see chapter 4.6 on page 13).
4. Fit the plug back in the socket and tighten the screws.
5. Fit the enclosed protective cover over the plug and secure it with cable ties if necessary.

NOTICE

For clear and far-ranging detection of a device fault, an alarm device should be switched by the fault relay.

Connections for 9-way plug (relays):

9-way plug (relays)									
	Fault relay			A2 relay			A1 relay		
Terminal	1	2	3	4	5	6	7	8	9
Ident.	FLT NO	FLT C	FLT NC	A2 NO	A2 C	A2 NC	A1 NO	A1 C	A1 NC

(NO = Normally open, NC = Normally closed, C = Common)

3.5.3 Remote Sensor

The remote junction box (Order Number 45 44 098 for stainless steel / Order Number 45 44 099 for aluminum) permits the installation of the sensors remote from the device electronics. This installation enables operation of the device in difficult to access or unfavourable positions (see the Instructions for Use for the Dräger Polytron 5000 Junction Box). The maximum permissible distance between the Polytron 8200/8310 and the sensors is 30 m.

3.6 Electrical installation with e-Box

- Install the e-Box in accordance with the Installation Instructions for the Polytron 5000/8000 e-Box.

NOTICE

The e-Box can be pre-installed, wired and closed off with the supplied cover. As soon as the installation is ready for commissioning, the device is connected to the e-Box and put into operation. This prevents the device from being damaged during the construction phase.

3.7 Connecting the device to a Dräger control unit

NOTICE

Information on connection can be found in the Instructions for Use accompanying the particular Dräger control unit (e.g. Regard, QuadGard).

Electrical connections to the control unit

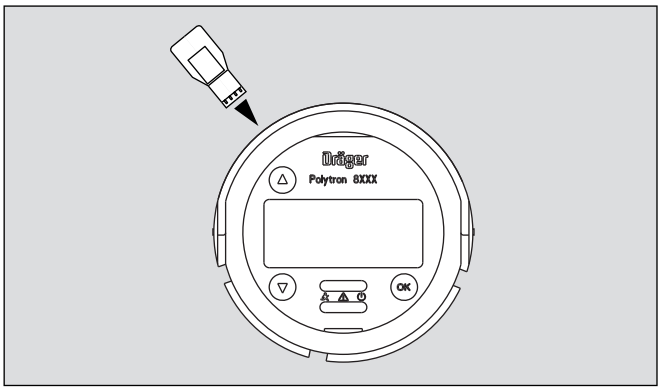
- Connect the screen for the wires to the grounding point in the control unit (e.g., chassis, grounding rail).

3.8 Connecting the device to a PC

The separately available Polytron 5000/8000 IR connection kit is intended for use with the Polytron 5000/8000 and enables communication between the Polytron 5000/8000 and a PC.

3.9 PolySoft 8000 PC software (optional)

The PolySoft 8000 PC software is used to display device information, edit configuration settings and read out from the measurements memory.



3.10 Installing software dongles

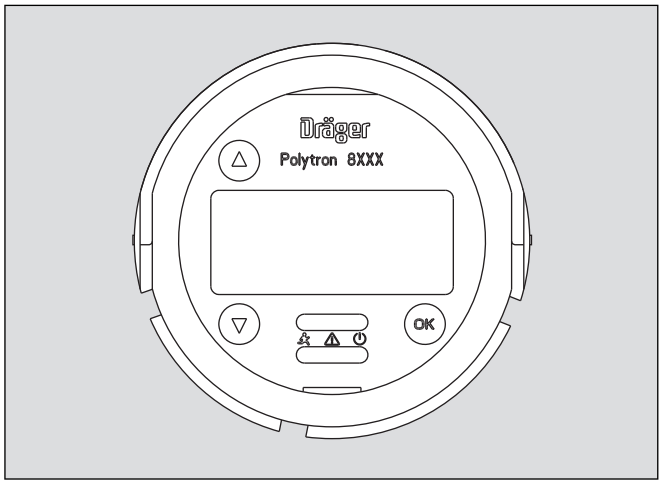
The following SW dongles are available for the Polytron 8200:

Datalogger dongle 83 17 618	Enables the datalogger and the graphic display of concentrations.
Sensor test dongle 83 17 619	Enables the sensor self test (for certain versions only)
Diagnostic dongle 83 17 860	Enables the sensor self test, the display of the remaining sensor activity and the sensor diagnostic function (for certain functions only)

Combi-dongle (datalogger and sensor test dongle)
83 23 218

Combi-dongle (datalogger and diagnostic dongle)
83 23 219

00833300.eps



To install a SW dongle:

1. Switch off the power to the unit or declassify the area according to the local regulations.
2. Release the set screw and unscrew the housing cover from the device.
3. Lift the handle and remove the enclosure with the main electronics.
4. Insert the dongle in the slot with the Dräger lettering facing upwards.
5. Insert the main electronics back in the housing.
6. Screw the cover on again and tighten the set screw.
   The dongle is installed.
7. Switch on the power.

4 Operation

4.1 Operating fundamentals

4.1.1 Menu navigation

00733300.eps

It is possible to scroll throught he menu items by tapping the ▲ and ▼ symbols with the magnetic wand (Part Number 4544101, blue). OK confirms a function.

NOTICE

The housing cover should be fitted when using the magnetic wand. If the housing cover is not fitted, the magnetic wand might activate two or more buttons at the same time (crosstalk).

Graphic symbols facilitate navigation in the various menus.

- Together with the text » Back «, » Menu «, etc., exit the menu or go back 1 step.
- Closed folder
  Further functions or sub-menus are located under this item.
- Opened folder
  The functions and sub-menus available here are listed under this item.
- Function
  When activated, functions can be executed in one or more steps.
- Selection activated
  For functions that can be selected and activated, the activation is initiated by taping » OK «.
- List closed above / complete
  There are no further functions, menus or sub-menus listed above.
- List can be scrolled upwards
  There are further functions, menus or sub-menus listed above.
- List closed below / complete
  There are no further functions, menus or sub-menus listed below.
- List can be scrolled downwards
  There are further functions, menus or sub-menus listed below.
- Next
  Perform context-related action.
- 3/3 Number / total number of steps (screens) within the function.
- 2/2 Entry
  Enter data with » ▲ « and » ▼ «.

4.1.2 Changing parameter values or the parameter status

1. Select the desired menu item with ▲ and ▼.
2. Confirm the menu item with OK.
   The current value or status will be displayed.
3. Using ▲ and ▼, the value of a numerical parameter can be changed or preset values can be selected.
4. As soon as the desired value or the selection is displayed, tap OK to validate/confirm the new parameter.
5. Tap OK to access the next higher level.

- If exiting using **Back to menu** or **Previous**, all changes will be discarded.

4.1.3 Exiting menus

- ▲ Tap **Back to measurement** and OK to exit the menu.

4.2 Display and LEDs

In measurement mode, the current gas concentration, the name of the gas and the measurement units are shown on the display. The green LED lights.

In addition, the following symbols may be displayed:

- " ↑ ↑ ↑ ↑ ", if the measurement range is exceeded
- " **- - - -** " and " **X** " in the event of a malfunction. The yellow LED lights, (see chapter 4.2.2 on page 12).
- "SIL", when SIL status is activated.

When the optional relay PCB is used:

- If the first alarm has been triggered, the red LED gives single flashes.
- If the second alarm has been triggered, the red LED gives double flashes.

4.2.1 Special symbols

The following special symbols, which indicate the device state, may be displayed on the right hand side in measurement mode.

- Warning message present –
  to display warnings, see chapter 7.1.1 on page 17.
  Information can be called up in Info mode, see chapter 4.3 on page 12.
- Fault message present –
  To display the fault, see chapter 7.1.2 on page 17
- Maintenance signal will be output on the interface, see chapter 8.3.2 on page 21.
- Measurement range of analog interface exceeded
- Measurement less than range of analog interface
- Analog interface is set to a fixed value (e.g. Multidrop HART communication) and is not transmitting any measurements.
- "Preventive" maintenance: The sensor is ready for operation
- "Preventive" maintenance: The sensor is ready for operation but is close to the end of its life cycle.
- "Preventive" maintenance: The sensor is still ready for operation but should be changed as soon as possible.
- The datalogger is active in rolling mode.
  To activate/deactivate, see chapter 8.5.2 on page 24.
- The datalogger is active in stacking mode.
  To activate/deactivate, see chapter 8.5.2 on page 24.
- SIL SIL is activated (observe Safety Manual - Order Number 9033307).

4.2.2 LED symbols

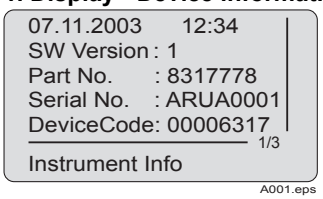
Symbol	LED	Description
	red	Alarm triggered
	yellow	Malfunction / Warning
	green	Switched on Measurement mode

NOTICE

The alarm triggering function is only available when the optionally integrated relay module is used.

When the optional relay PCB is used:

- If the first alarm has been triggered, the red LED gives single flashes. A1 relay is activated.
- If the second alarm has been triggered, the red LED gives double flashes. A2 relay is activated.
- If an alarm can be acknowledged and is acknowledged, the LED stops flashing and lights continuously instead until the alarm condition is no longer present. The corresponding relay is deactivated.

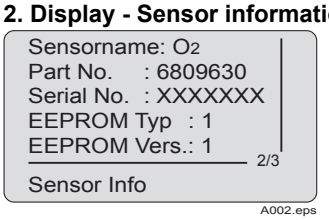


4.3 Activating the Info mode

The Info mode is used to present information about the central device settings and states.

- Tap ▲ and hold for 3 seconds.
  The device information appears on several displays. No changes can be made.
- Tap ▲ or ▼ briefly to switch between the displays.
- The Info mode can be ended at any time by selecting OK.
- If no button is selected within 30 seconds, the device reverts automatically to the measurement mode.

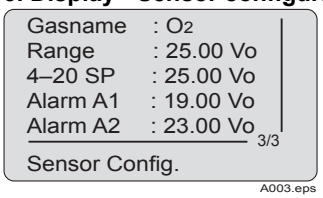
Example of the Info mode
(Displays vary depending on sensor):



1. Display - Device information:

A001.eps

- Date and Time
- Software version
- Part number of the device
- Serial number of the device
- Device code



2. Display - Sensor information:

A002.eps

- Sensor description
- Part number of sensor (only for certain sensors)
- Serial number of sensor (only for certain sensors)
- Software version (only for certain sensors)
- Software revision (only for certain sensors)

3. Display - Sensor configuration:

A003.eps

- Gas description
- Maximum measurement limit and measurement units for the sensor
- Measurement range and measurement units for the analog interface. Only displayed when the 4-20 mA interface is enabled.

- A1 Alarm limit and measurement units[1]
- A2 Alarm limit and measurement units[1]

4.4 Switching to the Quick Menu mode

- Tap ▼ and hold for 1 to 2 seconds.
  The Quick Menu will open. This menu is displayed without any password request. No changes can be made.
  The selected information about status and device settings can be retrieved (e.g. warning messages, error messages, installed modules and calibration data).

4.5 Switching to Menu mode (password protected)

1. Tap ▼ and hold for longer than 3 seconds.
   The password request appears.
2. **Enter the password** and confirm.
   The screen for password entry appears.
3. Set the password and confirm the entry.
   The menu hierarchy corresponding to the entered password will open.

- An error message appears if the entered password is invalid.

Password presets:
Password for the **Calibration** menu: _ _ _ 1
Password for the **Settings** menu: _ _ _ 2

4.6 Measurement mode

WARNING

The configuration and calibration settings must be checked before the device is operated in measurement mode.

- Switch on the power.
  - The device runs through a start-up sequence (LCD test by inverting the video, LED test, software version and initialization) and starts the warm-up phase. The display indicates that the sensor will be ready to operate in hh:mm:ss (the countdown begins) and the Polytron 8200/8310 sends the Maintenance signal.
  - After the warm-up phase, the device passes into the measurement mode.
  - The current gas concentration, the selected gas and the units of measure appear on the display.
  - The ⏻ LED lights green.
  - The sensor is ready to take measurements.

NOTICE

The correct date and time settings are important for many functions (see chapter 8.2.3 on page 19).

4.6.1 Analog signals

In measurement mode the output current of the device is between 4 and 20 mA and is proportional to the measured gas concentration.

The device uses various current values to indicate different operating modes. This conforms to the NAMUR NE43 recommendation. The 4-20 mA interface on the device can be customized and configured to individual requirements. The device is provided with suitable standard settings at the factory (see chapter 12.3 on page 29).

1 Only displayed when relay is configured.

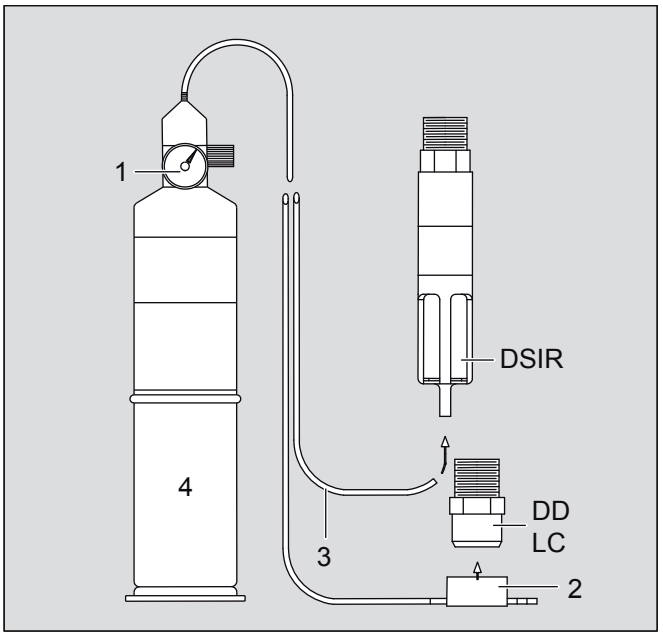
5 Calibration

Repeat the calibration of the device at regular intervals as specified in the particular sensor data sheet.

CAUTION

Danger to health! Do not inhale the test gas. Observe the hazard information in the corresponding safety data sheets. Provide venting into a fume cupboard or outside the building.

Always calibrate the zero point first before the sensitivity. Otherwise the calibration will be faulty!



NOTICE

Calibration is not possible if the date and time are not set (see chapter 8.2.3 on page 19).

Dräger recommends calibrating devices with the gas that is to be measured operationally. This method of measured gas calibration is more accurate than a surrogate gas calibration. A surrogate gas calibration may only be performed as an alternative if a measured gas calibration is not possible.

5.1 Calibrating the device

1. Connect the pressure reducer to the calibration gas cylinder.
2. Attach the calibration adapter to the sensor.
3. The gas flow should be between 0.5 and 2.0 L/min.
4. Connect the hose to the calibration adapter.

1 Pressure reducer
2 Calibration adapter
3 Test gas cylinder
4 Hose

For DSIR only (see also Instructions for Use for DrägerSensor IR)

1. Position the magnetic wand on the sensor button marked with ⇩0 and hold it there for at least 5 seconds.
   A negative value will be displayed for as long as the magnetic wand is held on the button (e.g. -10 %LEL). This will start the automatic zeroing of the sensor.
2. Remove the magnetic wand.
   The sensor ends the automatic zeroing after approx. 30 seconds. A negative value (e.g. -10 %LEL) is displayed again as confirmation.

After the zero-point calibration of the DrägerSensor IR, the instrument should show 0 %LEL in the display. If this is not the case, a zero-point calibration must be performed on the instrument (see chapter 5.1.1 on page 14).

5.1.1 Zero point calibration

NOTICE

Ambient air can also be used instead of nitrogen or synthetic air to zero the sensor, provided it is insured that the ambient air contains no measured gas or any other gas for which the sensor may exhibit cross-sensitivity (see the details in the sensor data sheet). In this case, neither a gas cylinder nor a calibration adapter is required for the zero point calibration.

1. Select **Calibration > Zero Calibration** and confirm.
   The Maintenance signal is transmitted.
   The message **Apply zero gas** appears.
2. Apply zero gas (synthetic air or nitrogen) to the sensor.
3. Select **Next** and confirm.
   The current value is displayed.

After the displayed value is stable:

4. Set the value to 0 and confirm.
   The message **Please wait…** appears.
   The actual value is displayed.

- Actual value within the permissible range:
  - Select **Next** and confirm.
  - Shut off the test gas and remove the calibration adapter from the sensor or disconnect the hose.

5.1.2 Span calibration

1. Check which gas category is set (only for DrägerSensor IR, see also the Instructions for Use for the DrägerSensor IR).
1. Select **Calibration > Span calibration** and confirm.
2. Apply calibration gas (e.g., 50 % LEL methane).
   The current value is displayed.

After the displayed value is stable:

3. Set the value to 50 and confirm.
4. Shut off the test gas and remove the calibration adapter from the sensor or disconnect the hose.

5.2 Performing Auto Calibration

The device offers the option of an automatically sequenced calibration. This reduces the number of otherwise manual interactions with the device. The auto calibration is only suitable for experienced users, as calibration errors can occur here as a result of tightened procedures.

NOTICE

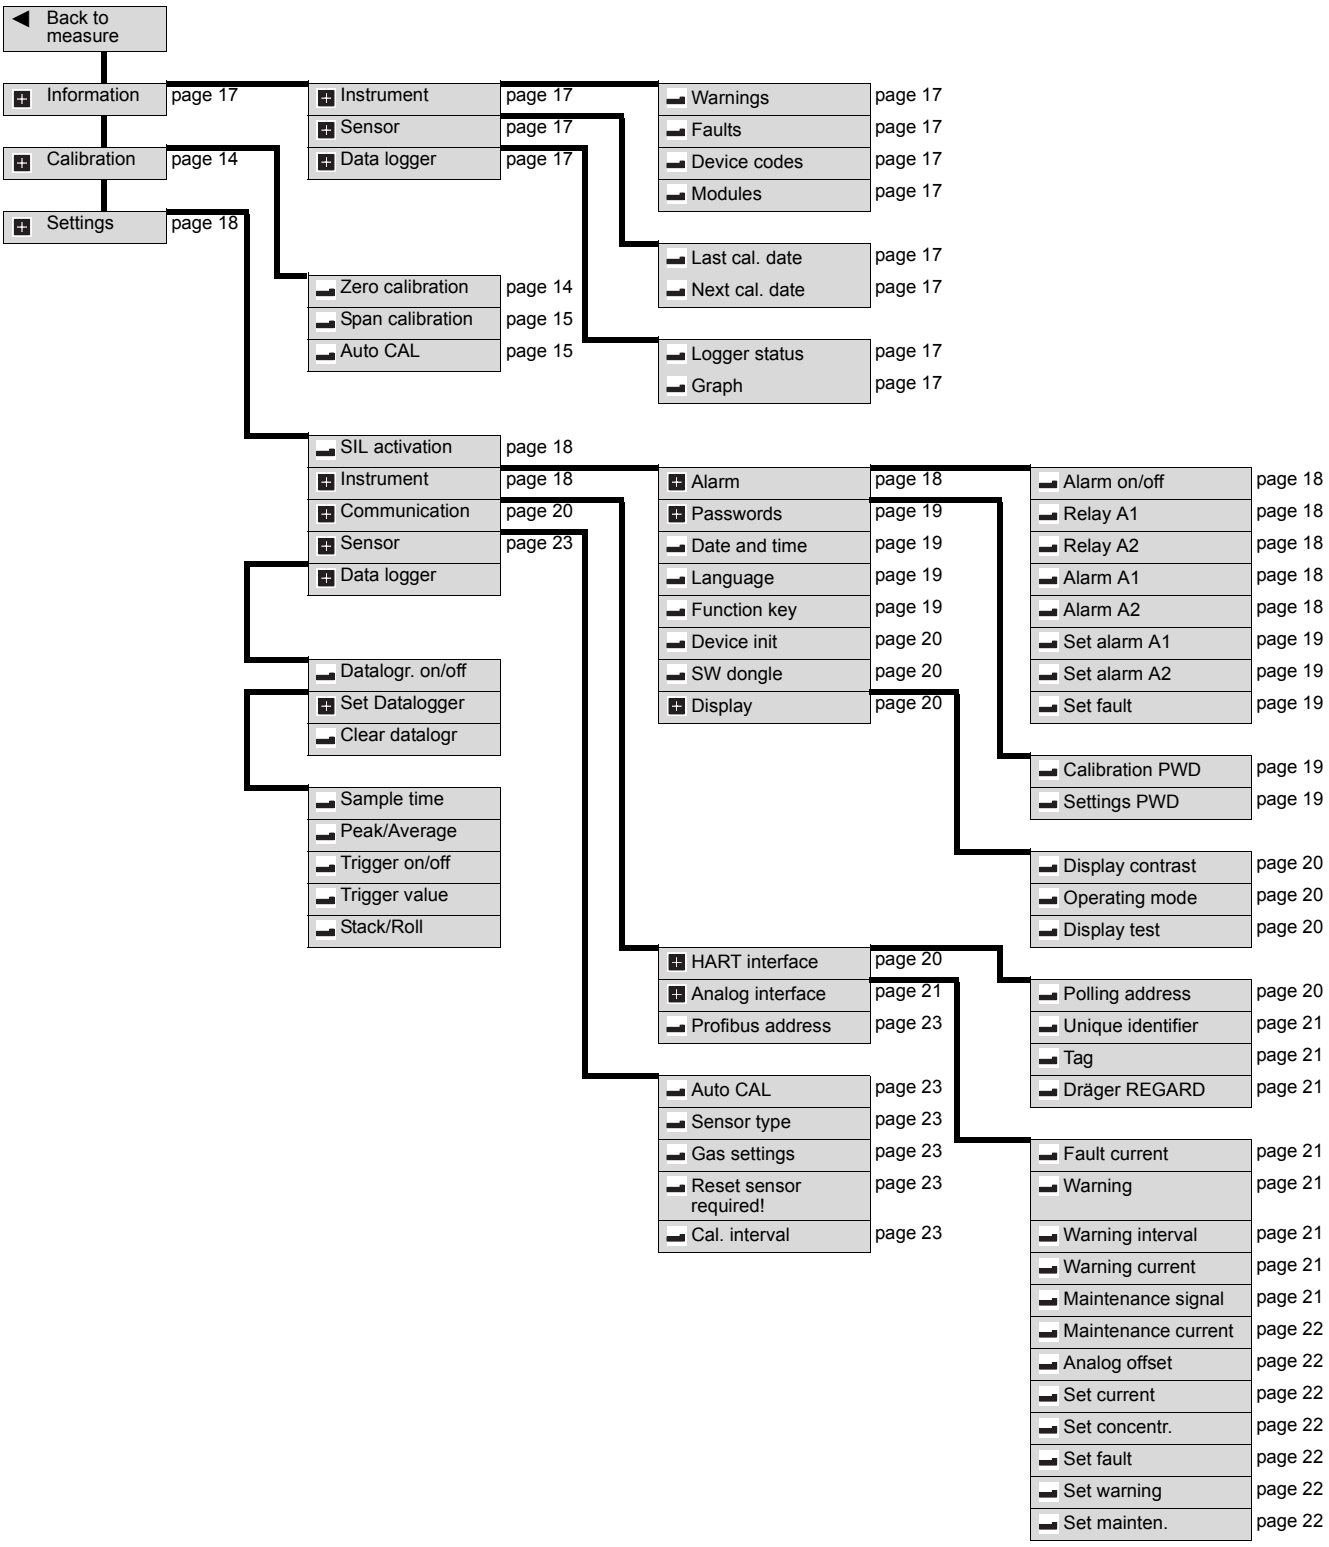
Not all of the available sensors and gases support auto calibration. If the function is not available, a manual calibration must be performed.

1. Select **Settings > Sensor > Autocal. set.** to enable or disable the function.
2. Supply fresh air or feed nitrogen or compressed air at a flow rate of 0.5 - 2.0 L/min to the sensor.

WARNING

It must be insured that during the zero point calibration, no measured gas is present in the supplied calibration gas. Particularly with a fresh air calibration, Dräger recommends performing a second, independent measurement. Some sensors may only be calibrated with synthetic air or nitrogen (observe the relevant sensor data sheets).

3. Select **Calibration > Auto cal.** and confirm.
   - **Please wait...** is displayed and a calibration of the zero point is performed automatically.
   - After a successful zero point calibration, the span calibration is started.
   - The calibration gas concentration, the units and, where appropriate, the calibration gas are displayed and can be changed.
4. Start the calibration with **Next**; **Back to menu** aborts the calibration.



NOTICE

After 10 minutes, without confirmation the device reverts to measurement mode without performing a calibration.

5. Feed the relevant calibration gas to the sensor at a flow rate of 0.5 - 2.0 L/min.
   - When the measured value is stable, the device performs the calibration automatically.
   - After a successful calibration, the measurement and the message **Value OK?** are displayed
6. When the measurement is stable, shut off the calibration gas and wait until the measurement is below any possible alarm thresholds again.

- The calibration is performed again with **Redo**.
- Complete the calibration with **Accept value**.
  The device returns to the measurement mode.

6 Menu overview

7 Information menu

Specific data about the device, the sensor used and the measured gas are summarized in this menu. The menu can be accessed without a password. Changes to the data are not possible.

7.1 Device settings

7.1.1 Displaying warning messages

To display warnings in plain text with warning numbers, see chapter 9 on page 25.
The ⚠ symbol is displayed when there is a warning present.

- Select **Information > Instrument > Warnings** and confirm.
  Warnings are displayed in plain text.
  If several warnings are present, this is indicated in the upper right-hand corner of the display, e.g., 1/3 = Screen 1 of 3.

7.1.2 displaying fault messages

To display faults present in plain text with fault numbers, see chapter 9 on page 25.
The ☒ symbol is displayed when there is a fault present.

- Select **Information > Instrument > Faults** and confirm.
  Faults are displayed in plain text.
  If several faults are present, this is indicated in the upper right-hand corner of the display, e.g., 1/2 = Screen 1 of 2.

7.1.3 Displaying device codes

Display of codes for faults/warnings in a numerical table (hexadecimal).
The ☒ symbol is displayed when there is a fault present.

- Select **Information > Instrument > Device codes** and confirm.
  Faults are displayed as a hexadecimal numerical code in tabular form. If all the numerical groups are displayed as **00**, there are no faults or warnings present.

NOTICE

The fault code is very helpful for technical support and should always be stated in full in the event of a fault.

7.1.4 Displaying installed modules

Display of the installed hardware modules.

- Select **Information > Instrument > Modules** and confirm.
  A list of all possible modules is displayed. The installed modules are identified by a ■, those not installed by a □.
- Mark a module and request detailed information with OK.

7.2 Sensor information

This menu contains the functions for retrieving the calibration data.

7.2.1 Display last calibration date

Display the date of the last calibration.

- Select **Information > Sensor > Last cal. date** and confirm.
  The date of the last calibration is displayed

7.2.2 Display next calibration date

Display the date of the next calibration.

- Select **Information > Sensor > Next cal. date** and confirm.
  The date when the next calibration of the sensor is due is displayed.

7.3 Datalogger information (only with data dongle)

This menu contains the functions for querying the datalogger.

7.3.1 Displaying the datalogger status

- Select **Information > Datalogger > Logger status** and confirm.
  The current status of the datalogger is displayed: Datalogr. : on or off (datalogger on or off)
- To switch the datalogger on/off, see chapter 8.5.1 on page 24.

7.3.2 Displaying a graph of measured values

Show the measurements from the sensor on a 15-minute time axis.

- Select **Information > Datalogger > Graph** and confirm.

8 Settings menu

This menu contains all the functions that are required for the individual configuration of the device.

8.1 Switching SIL lock on or off

NOTICE

SIL lock is only available for certain sensors (see also the sensor data sheets or the Dräger Polytron 8X00 Safety Manual).

With this function, the device can be protected against unauthorized changes to the configuration with a password. Changing the configuration (e.g., changing the measurement range from 100 %LEL to 50 %LEL) will cause the device to display all the safety-relevant parameters to the user once more before it returns to the measurement mode. The correctness of the parameters and settings must be confirmed.

1. Select **Settings > Instrument > Set SIL**.
2. Select the desired state **On** or **Off** and confirm.

NOTICE

When SIL is activated, the device displays all the important parameters and setting before returning to measurement mode. Check the parameters and settings carefully and confirm.

8.2 Device settings

8.2.1 Alarm settings (only with installed relay module)

Alarms issued via relays and LEDs.

CAUTION

In the normal state, the relays in the relay module are energized. That is, the relays change their state if the power supply is interrupted!

Switching the alarm on or off

1. Select **Settings > Instrument > Alarm > Alarm on/off**.
2. Select the desired state **On** or **Off** and confirm.

CAUTION

If the alarm is inactive, the alarm state will not be issued by the LEDs or the relay interface! A warning message ▯ will be shown on the display!

Configuring Relay A1 or A2

This function is used to define whether the alarm relay is energized in standard operation or in an alarm state. If the configuration of the relay is set to "Normally energized", the corresponding relay contact is closed in the normal case and drops out in the event of an alarm. This configuration results in an alarm being triggered in the event of a loss of power to the transmitter (fail-safe). The fault relay is factory-configured to "Normally energized" and cannot be changed.

1. Select **Settings > Instrument > Alarm > Relay A1** or **Relay A2** and confirm.
2. Select **Normal energy supply** oder **Energy supply during alarm** and confirm.

Configuring Alarm A1 or A2

1. Select **Settings > Instrument > Alarm > Alarm A1** or **Alarm A2** and confirm.
2. Select the line for entering the alarm limit and confirm.
3. Set the threshold and confirm.
   The setting for the alarm threshold is displayed.
4. Select **Next** and confirm.
   The setting for the alarm direction is displayed.
5. Select **Rising** or **Falling** and confirm.
6. Select **Next** and confirm.
   The setting for the alarm direction is displayed.
7. Select **Latching** or **Non Latching** and confirm.
8. Select **Next** and confirm.
   The setting for the acknowledgement is displayed.
9. Select **Acknowledgeable** or **NonAcknowledgeabl** or **PreAcknowledgeabl** and confirm.
10. Select **Next** and confirm.
    The function for setting the A1 hysteresis is opened.

NOTICE

This function permits the setting of a zone within which a triggered relay maintains its status until the gas concentration is outside the zone. This function prevents relays from chattering at an alarm threshold.
Example: A2 at 40 %LEL methane
Maximum possible hysteresis: 3 %LEL
Alarm activation at measured values ≥40 %LEL
Alarm deactivation at measured values ≤37 %LEL (40 %LEL - 3 %LEL)

11. Select the line for entering the hysteresis and confirm.
12. Set the hysteresis for A1 and confirm.
    The hysteresis setting for A1 is displayed.
13. Select **Next** and confirm.
    The settings for A1 are displayed.
14. Select and confirm with **Confirm**.
    The settings for the A1 alarm are now complete.

The functional relationship between the various settings is explained in the following table:

Latching and acknowledgeable	The alarm must be acknowledged manually. The alarm can be acknowledged when the alarm condition is still present.
Latching and not acknowledgeable	The alarm must be acknowledged manually. The alarm can only be acknowledged when the alarm condition is no longer present.
Latching and pre-acknowledgeable	The alarm must be acknowledged manually. The alarm can be acknowledged when the alarm condition is still present but will only be reset when the alarm condition is no longer present.
Non-latching and acknowledgeable	The alarm is acknowledged automatically when there is no longer any alarm condition present, or it can be acknowledged manually.
Non-latching and not acknowledgeable	The alarm is acknowledged automatically when there is no longer any alarm condition present. The alarm cannot be acknowledged manually.
Non-latching and pre-acknowledgeable	Corresponds to the alarm behavior for "Non-latching" and "Not acknowledgeable".

Testing Alarm A1

NOTICE

When the function **Set Alarm A1** is exited in the menu, the Polytron 8200/8310 reverts automatically to measurement mode.

This function simulates the A1 alarm status.

1. Select **Settings > Instrument > Alarm > Set Alarm A1** and confirm.
2. Select **On** or **Off** and confirm.

When the function is activated, the relay and the interface are set to the A1 alarm status and the red LED gives single flashes.

Testing Alarm A2

NOTICE

When the function **Set Alarm A2** is exited in the menu, the Polytron 8200/8310 reverts automatically to measurement mode.

This function simulates the A2 alarm status.

1. Select **Settings > Instrument > Alarm > Set Alarm A2** and confirm.
2. Select **On** or **Off** and confirm.

When the function is activated, the relay and the interface are set to the A2 alarm status and the red LED gives double flashes.

Testing Fault status

NOTICE

When the function **Set fault** is exited in the menu, the Polytron 8200/8310 reverts automatically to measurement mode.

This function simulates the Fault alarm.

1. Select **Settings > Instrument > Alarm > Set fault** and confirm.
2. Select **On** or **Off** and confirm.

When the function is activated, the Fault relay and the 4-20 mA interface are set to the fault current and the yellow LED lights.

8.2.2 Changing passwords

The passwords for calibration (zero and span calibrations) and for the settings (full configuration) can be defined in this menu.

1. Select **Settings > Instrument > Passwords > Calibration/ Settings PWD** and confirm.
2. Select the line for the password settings and confirm.
3. Set the password and confirm.
   The setting for the password is displayed.
4. Select **Confirm** and confirm.

8.2.3 Setting the date and time

1. Select **Settings > Instrument > Date and time** and confirm.
2. Select the desired line and confirm in order to switch to the Change mode.
3. Set each digit and confirm each setting.
4. Select **Confirm** and confirm.

8.2.4 Changing the display language

1. Select **Settings > Instrument > Language** and confirm.
2. Select the desired language from the list and confirm.

8.2.5 Configuring the function key

This function is used to assign a predefined function to the ▲ key. The selected function is activated by briefly taping the ▲ key.

1. Select **Settings> Instrument > Function key** and confirm.
2. Select the desired function and confirm.

- Repeating the confirmation deactivates the selected function.
- If **Bumptest** is selected:
  The maintenance symbol 🔧 is shown on the right hand side of the display and the maintenance signal is output. Repeating the confirmation ends the bump test and the device reverts to the normal measurement mode.
- In measurement mode, the selected function can be activated by briefly taping ▲.

Selection options:

Graph (only with datalogger)	The measurements from the sensor are displayed graphically on a time axis (see chapter 7.3.2 on page 17).
Faults	Faults are displayed in plain text (see chapter 7.1.2 on page 17).
Warnings	Warnings are displayed in plain text (see chapter 7.1.1 on page 17).
Bump test	The bump test allows gas to be applied without an alarm being issued. The maintenance signal is output on the 4-20 mA output.
Sensor vitality	Shows the remaining sensor vitality (only available for certain sensors).

8.2.6 Resetting the device to factory settings

The following device parameters are reset to the factory settings with this function (see chapter 12.3 on page 29).

- Alarm parameters
- Passwords
- Language
- Function key
- HART interface
- Data logger
- Analog interface
- Relay configuration

1. Select **Settings > Instrument > Device init.** and confirm.
2. Select **Confirm** and confirm in order to reset the device to the factory settings.

8.2.7 Deactivating the software dongle

This function allows the SW dongles to be deactivated before they are removed or in the event of a fault.
A dongle can only be reactivated by switching the power to the device off and on.

1. Select **Settings > Instrument > SW dongle > Dongle datalogger/Dongle sensortest/Dongle diagnostic** and confirm.
2. Select **Deactivate func.** and deactivate Dongle datalogger/ Dongle sensortest/Dongle diagnostic with ⓞⓚ.

8.2.8 Display settings

Changing the contrast

1. Select **Settings > Instrument > Display > Display contrast** and confirm.
2. Change the contrast and confirm.

Changing the display mode
The display of measured values can be turned on or off with this function.

1. Select **Settings > Instrument > Display > Display mode** and confirm.
2. Select **Standard** or **Non display** and confirm.

If "Non display" has been selected, the display shows the start screen and the symbols.

If the relay option is set and an alarm is triggered, the display shows the current gas concentration and the red LED flashes, regardless of the selected display mode.

Switching the display test on or off
The function of the display and the LEDs is tested with this function.

1. Select **Settings > Instrument > Display > Displaytest** and confirm.
2. Select **On** or **Off** and confirm.

When this function is activated, the display is shown inverted and all the LEDs are lit.

8.3 Communication settings

8.3.1 Settings for the HART interface (only for devices with the optional HART interface)

This group contains the setting functions for the HART interface.

Setting the polling address
The polling address configures the device for analog operation (4 to 20 mA) or multidrop operation. Analog operation (4 to 20 mA) is activated by setting the polling address to 0. For multidrop operation the polling address must be configured to a value between 1 and 15, which will result in the analog interface being deactivated and set to a constant current of approx. 1 mA. To allow the control unit to request the Unique Identifier (unique HART address) with HART command #0, all the devices on a line must be configured with different polling addresses. It is advisable to choose a sequence starting with 1 and incrementing continuously.
This setting corresponds to HART command #6 (Write Polling Address).

1. Select **Settings > Communication > HART interface > Polling address** and confirm.
2. Select the address line for the entry and confirm in order to switch to the Change mode.
3. Set the polling address and confirm.
4. Select **Confirm** and confirm.

Displaying the Unique Identifier
This function enables reading of the Unique Identifier (unique HART address), which has to be known for almost all the HART addressing commands. However this information is only required for those systems that are not able to read back the Unique Identifier using HART command #0 in Short-Frame Format or HART command #11. The display corresponds to the address for HART command #0 (Read Unique Identifier) or #11 (Read Unique Identifier associated with Tag).

- Select **Settings > Communication > HART interface > Unique Identifier** and confirm.
  The Unique Identifier is displayed.

Changing the measuring point name
The tag can be used to identify special devices. It can contain up to 8 alphanumeric characters. The tag can also function as an address for reading the unique identifier from the device using HART command #11 (Read Unique Identifier Associated With Tag), even when the polling address is unknown.
This requires that a unique tag has previously been configured.

1. Select **Settings > Communication > HART interface > Tag** and confirm.
2. Select the tag line for the entry and confirm.
3. Set the tag and confirm.
4. Select **Confirm** and confirm.

Selecting Dräger REGARD
This function enables switching between different HART protocols.

NOTICE

REGARD SW 2.0 is the standard setting. REGARD SW 1.4 must be set on REGARD controllers with SW 1.4.

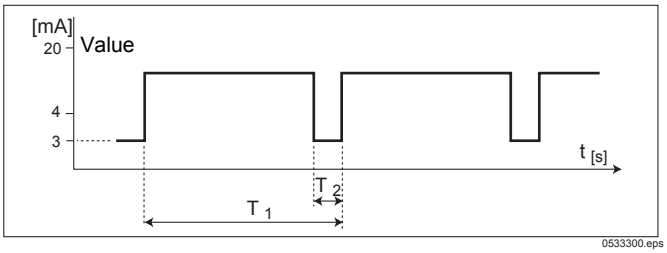
1. Select **Settings > Communication > HART interface > Dräger REGARD** and confirm.
2. Select **REGARD SW 2.0** or **REGARD SW 1.4** and confirm.

8.3.2 Settings for the analog interface

The test and setting functions for the analog interface are summarized in this menu.

Setting the fault current
This function is used to set the current for the fault signal on the analog interface.

1. Select **Settings > Communication > Analog interface > Fault current** and confirm.
2. Select the fault current line and confirm.
3. Set the currrent and confirm.
4. Select **Confirm** and confirm.



Switching the warning signal on or off
This function is used to switch the warning signal on the analog interface on and off. If an existing warning is to be output over the analog interface, the warning signal must be turned on. During a warning, the current on the analog interface is switched to the "Warning" status for one second. The measurement is transmitted for the rest of the time. The interval between warning signals and the analog signal phase can be customized.

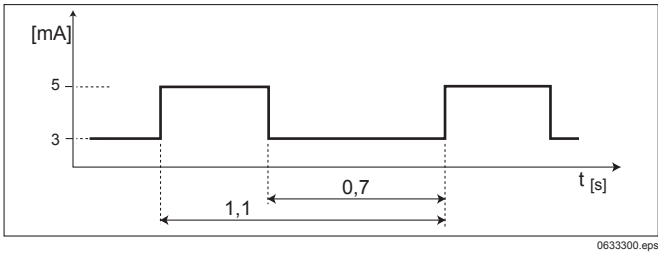
To switch the warning signal on or off:

1. Select **Settings > Communication > Analog interface > Warning** and confirm.
2. Select **On** or **Off** and confirm.

Setting the warning interval
This function is used to set the interval between the warning signals and the analog interface.

1. Select **Settings > Communication > Analog interface > Warning interval** and confirm.
2. Select line **T1** for the entry and confirm.
3. Set the time and confirm.
   The setting for Time T1 is displayed.
4. Select **Next** and confirm.
5. Select line **T2** for the entry and confirm.
6. Set the time and confirm each setting.
   The setting for Time T2 is displayed.
7. Select **Confirm** and confirm.

Setting the warning current
This function is used to set the current for the warning signal on the analog interface.



1. Select **Settings > Communication > Analog interface > Warning current** and confirm.
2. Select the current line for the entry and confirm.
3. Set the currrent and confirm.
   The setting for the warning current is displayed.
4. Select **Confirm** and confirm.

Changing the maintenance signal type
This function is sets the type of signal used on the analog interface for the maintenance signal.

1. Select **Settings > Communication > Analog interface > Maint. signal** and confirm.
2. Select **static** or **dynamic** signal type and confirm.

NOTICE

The **static** signal type is a constant current. The current can be configured.
The **dynamic** signal type is a square wave signal with the following characteristics:

Setting the maintenance current
This function is used to set the current for the maintenance signal on the analog interface.

1. Select **Settings > Communication > Analog interface > Maint. current** and confirm.
2. Select the current line for the entry and confirm.
3. Set the currrent and confirm.
   The setting for the maintenance current is displayed.
4. Select **Confirm** and confirm.

NOTICE

The maintenance current can only be set if the maintenance signal has been set to static. This function is not available otherwise.

Setting the 4-20 mA offset
This function can be used to set an adjustable offset current on the analog interface. The offset is constant over the entire range of the output signal.

1. Select **Settings > Communication > Analog interface > Analog offset** and confirm.
2. Select the current line for the entry (max. range: -0.2 to 1.5 mA) and confirm.
3. Set the currrent and confirm.
   The setting for the 4-20 mA offset is displayed.
4. Select **Confirm** and confirm.

Test functions for the analog interface

NOTICE

Alarms in the central controller may be triggered by these functions! If necessary, the alarms in the central controller must be disabled beforehand.

Setting current signals
Using this function, various currents in the range from 0 to 22 mA can be set on the analog interface.

1. Select **Settings > Communication > Analog interface > Set current** and confirm.
2. If the alarm in the control unit is disabled, confirm the message **Disable all alarm settings**.
3. Select the current line for the entry and confirm.
4. Set the currrent and confirm.
   The setting for the current is displayed.
5. Select **Next** and confirm.
6. Select **Set current out** or **Current off** and confirm.
7. Select **Next** and confirm. The function is terminated.
8. After the alarm settings in the control unit have been re-enabled, confirm the **Enable all alarm settings** message.

Setting the concentration
This function is used to set various concentrations in the range between 0 and 100 % of the selected unit of measure. The current output is set to correspond to the selected concentration.

1. Select **Settings > Communication > Analog interface > Set concentr.** and confirm.
2. If the alarm in the control unit is disabled, confirm the message **Disable all alarm settings**.
3. Select the concentration line for the entry and confirm.
4. Set the concentration and confirm.
   The setting for the concentration is displayed.
5. Select **Next** and confirm.
6. Select **Define concentr. output** or **Conc. off** and activate.
7. Select **Next** and confirm. The function is terminated.
8. After the alarm settings in the control unit have been re-enabled, confirm the **Enable all alarm settings** message.

Testing the Fault signal
This function is used to set the analog interface for the fault signal.

1. Select **Settings > Communication > Analog interface > Set fault** and confirm.
2. Select **On** or **Off** and confirm.
   The current for the Fault signal will be transmitted on the analog interface.

Testing the warning signal
This function is used to set the analog interface for the warning signal.

1. Select **Settings > Communication > Analog interface > Set warning** and confirm.
2. Select **On** or **Off** and confirm.
   The current for the warning signal will be transmitted on the analog interface.

Testing the maintenance signal
This function is used to set the analog interface for the maintenance signal.

1. Select **Settings > Communication > Analog interface > Set mainten.** and confirm.
2. Select **On** or **Off** and confirm.
   The current for the maintenance signal will be transmitted on the analog interface.

8.3.3 Profibus address

Not yet active - for future functions.

8.4 Sensor settings

8.4.1 Switching Auto CAL on or off

NOTICE

The auto-calibration from the **Calibration** menu is only available if this function is enabled.

1. Select **Settings > Sensor > Set auto calibration** and confirm.
2. Select **On** or **Off** and confirm.

8.4.2 Setting the sensor type (for DrägerSensor DD only)

This function is used to set the sensor type.

1. Select **Settings > Sensor > Sensor type** and confirm.

8.4.3 Changing the gas settings

Settings for gas type, measuring range and measurement units can be made in this menu.

1. Select **Settings > Sensor > Gas setting** and confirm.
2. Select the measured gas from the list and confirm.
   The measurement units display will be shown.
3. Select the measurement units and confirm.
   The full scale reading display will be shown.
4. Set the full scale reading and confirm.
   The setting for the full scale reading is displayed.
5. Select **Next** and confirm.
   an overview of the new gas settings is displayed.

- Return to the previous view with **Previous** or confirm the settings with **Confirm**.

Information about measurement units

The Polytron 8200/8310 represents the measured value in various optional units. The following are available:

- %LEL
- %LIE
- %UEG

The Polytron 8000 automatically calculates the correct value.

Information about the 20 mA measuring range

The full scale reading can be set with this function. At the full scale reading set, the device outputs 20 mA on the 4-20 mA interface.

8.4.4 Resetting the sensor to factory settings

This function resets all the sensor parameters to the factory default settings (see chapter 12.3 on page 29).

1. Select **Settings > Sensor > Reset sensor required!** and confirm.
2. Select **Confirm** and confirm.

8.4.5 Setting the calibration interval

NOTICE

The calibration interval can be set between 0 and 720 days.

1. Select **Settings > Sensor > Calibration interval** and confirm.
2. Set the calibration interval and confirm.

8.5 Datalogger settings (only with data dongle)

NOTICE

The functions are only available if the Polytron 8000 is fitted with the data dongle (Order Number 83 17 618), see chapter 3.10 on page 10.

The datalogger has a storage capacity of approx. 3000 measurements. At a sampling interval of 1 minute, this would allow monitoring for approx. 50 hours. The monitoring time can be significantly increased if the **Trigger** function is enabled.

The results in the datalogger can only be evaluated with the PolySoft 8000 PC software. An evaluation of the datalogger contents over the last 15 minutes is available in the menu under **Information > Datalogger > Graph** (see chapter 7.3.2 on page 17).

8.5.1 Switching the datalogger on or off

1. Select **Settings > Datalogger > Datalogr. on/off** and confirm.
2. Select **On** or **Off** and confirm.

8.5.2 Setting up the datalogger

Setting the sampling interval

1. Select **Settings > Datalogger > Datalogr. on/off > Sample time** and confirm.
2. Select the sample time and confirm.

Setting peak/average

1. Select **Settings > Datalogger > Set datalogger > Peak/average** and confirm.
2. Select the desired function and confirm.

Peak value	The measured maximum (for O_2, the minimum value) value of the concentration within the selected sampling interval is stored.
Average	The average value of all the concentrations measured within the selected sampling time is stored.

Switching the trigger on or off

1. Select **Settings > Datalogger > Set datalogger > Trigger on/off** and confirm.
2. Select **On** or **Off** and confirm.

On	Concentrations will only be stored if they exceed (relative to the last stored value) a threshold set under Trigger Value.
Off	The measurements made within the set sampling time are always stored.

Setting the trigger threshold

The trigger threshold is specified as a percentage of the full scale reading.
Example: A trigger threshold of 2 % is entered for a full scale reading of 500 ppm. Consequently the datalogger will only store measurements if they deviate (relative to the last stored value) by 10 ppm.

1. Select **Settings > Datalogger > Datalogr. on/off > Trigger value** and confirm.
2. Set the trigger value and confirm.

Setting the storage mode

1. Select **Settings > Datalogger > Set Datalogger > Stack/Roll** and confirm.
2. Select the desired condition and confirm

Overwrite	When the capacity of the datalogger is used up, the older data will be overwritten.
Hold	When the capacity of the datalogger is used up, no more data can be stored. An appropriate warning is issued.

8.5.3 Clearing the datalogger

1. Select **Settings > Datalogger > Clear Datalogr.** and confirm.
2. To clear the datalogger, select **Confirm** and confirm.

9 Troubleshooting

9.1 Fault reference

Fault number	Cause	Remedy
#001 #003 #004 #005 #011 - #014 #020 - #024 #043 #060 #067	Serious device fault, various causes.	Have the device checked by DrägerService®[1].
#002 #025 - #027 #030 - #034 #041 #042 #044 #050 #052 #081 #085	Serious data error in the device, various causes.	Reset the device to factory settings (see chapter 8.2.6 on page 20). If this fault occurs again: Have the device checked by DrägerService.
#10	4-20 mA interface cable not connected.	Disconnect the powwer supply, connect the 4-20 mA interface and reconnect the power supply.
#045	Device not detecting any sensor.	Check contacts. If this fault occurs again: Have the device checked by DrägerService.
#051 #054	Faulty zero-point.	Perform zero-point calibration (see chapter 5.1.1 on page 14).
#055	Faulty span calibration was performed.	Perform new span calibration (see chapter 5.1.2 on page 15).
#076 #080 - #084	Device fault.	Check contacts. If this fault occurs again: Have the device checked by DrägerService.

1 DrägerService® is a registered trademark of Dräger.

9.2 Warning reference

Warning number	Cause	Remedy
#101	Datalogger in Stack mode is 100 % full and is not logging any more data.	Read out the data, clear the datalogger and start again.
#102	Datalogger in Stack mode is 90 % full.	Read out the data as soon as possible, clear the datalogger and start again.
#103 #106	Data error in the device. Functions such as the datalogger or dongle functions may no longer be available.	Reset the device to factory settings (see chapter 8.2.6 on page 20). If this fault occurs again: Have the device checked by DrägerService.
#105	Device fault.	Have the device checked by DrägerService.
#104	No valid date or time set.	Set time and date (see chapter 8.2.3 on page 19).
#107	Battery almost used up.	Have the device checked by DrägerService.
#110 #111 #112	SW dongle has been removed without logging out.	Disable SW dongle (see chapter 8.2.7 on page 20).
#113	Alarms disabled.	Enable alarms (see chapter 8.2.1 on page 18).
#137	Device fault.	Restart. If this fault occurs again: Have device checked by DrägerService.
#164 #165	Sensor warm-up phase has not ended yet. Increased measurement error must be expected.	Wait until the sensor has warmed up.
#167 #170	Calibration interval expired.	Recalibrate the device (see chapter 5.1 on page 14).

10 Maintenance

10.1 Maintenance intervals

10.1.1 During commissioning

- Check calibration.
- Check signal transmission to controller and triggering of alarms.

10.1.2 Every 6 months

- Inspection by trained service personnel.

The inspection intervals must be established in each individual case and shortened if necessary, depending on technical safety considerations, engineering conditions, and the technical requirements of the equipment.
Contact DrägerService if you wish to take out a service contract and have any repairs carried out.

10.1.3 As required

- Change the sensor, see chapter 10.2 on page 27.

10.2 Changing the sensor

WARNING

As a matter of principle, always check a newly installed sensor with measured gas to insure correct operation.

CAUTION

When the sensor is changed, all settings and parameters must be checked for correctness.

The sensor is changed as follows:

1. Switch off the power to the device or declassify the area according to the local regulations.
2. Release the set screw and unscrew the housing cover from the device.
3. Lift the handle and remove the enclosure with the main electronics.
4. Disconnect the sensor cable.
5. Unscrew the DrägerSensor.
6. Pass the sensor cable through the threaded connection in the housing.
7. Screw in the DrägerSensor.

WARNING

Five threads must be engaged to insure explosion protection (see chapter 12.1 on page 29).

8. Plug the sensor cable into the socket.
9. Re-fit the sensor electronics and enclosure.
10. Screw the housing cover on again and tighten the set screw.
11. Switch on the power to the device.
12. If necessary, switch off SIL activation (see chapter 8.1 on page 18).
13. Calibrate the device if necessary (see chapter 5 on page 14).
14. If required, switch on SIL activation (see chapter 8.1 on page 18).

10.3 Changing the main electronics

CAUTION

When the main electronics are changed, all settings and parameters must be checked for correctness.

1. Switch off the power to the device or declassify the area according to the local regulations.
2. Release the set screw and unscrew the housing cover from the device.
3. Lift the handle and remove the enclosure with the main electronics.
4. Remove the protective caps for the connectors.
5. Unscrew the connector locking ring for the power supply and relay and withdraw the connector.
6. Change the main electronics.
7. Plug the sensor cable and the connector for the power supply and relay into the corresponding sockets and screw them tight.
8. Re-fit the dust caps for the connectors.
9. Re-fit the sensor electronics and enclosure.
10. Screw the housing cover on again and tighten the set screw.
11. Switch on the power to the device.
12. Check and adjust the configuration as required.
13. Calibrate the device if necessary (see chapter 5 on page 14).

11 Disposal

Disposal of electrical and electronic equipment:
EU-wide regulations governing the disposal of electric and electronic appliances which have been defined in the EU Directive 2002/96/EC and in national laws have been effective from August 2005 and apply to this device. Common household appliances can be disposed of using special collecting and recycling facilities. However, as this device has not been registered for household usage, it must not be disposed of through these means. The device can be returned to your national Dräger Safety Sales Organization for disposal. Please do not hesitate to contact the above if you have any further questions on this issue.

12 Technical data

CAUTION

Specifications and restrictions in the Instructions for Use and/or data sheets for the sensors used must be observed. For SIL applications the Dräger Polytron 8X00 Safety Manual must be observed.

The measuring range and performance characteristics are dependent on the sensor installed, see the Instructions for Use and/or data sheets for the sensors used.

Signal transmission to the central controller	
Analog	
Output current	4 mA to 20 mA
Drift below zero-point	3.8 mA to 4 mA
Measuring range exceeded	20 mA to 20.5 mA
Device malfunction	≤1.2 mA
Fault on analog output	>21 mA
Maintenance signal	3.4 mA constant signal or 1 Hz modulation between 3 and 5 mA (selectable)
Supply voltage	
Operating voltage	3-wire shielded cable, 10 to 30 V DC
Inrush current	2.5 A for 0.8 ms at 24 V DC, 10 Ω conductor resistance
Operating current (max.)	
with DrägerSensor Ex DD	105 mA at 24 V DC, no relay, sensor not remote 145 mA at 24 V DC, with relay, remote sensor
with DrägerSensor Ex LC	130 mA at 24 V DC, no relay, sensor not remote 165 mA at 24 V DC, with relay, remote sensor
with DrägerSensor IR	145 mA at 24 V DC, no relay, sensor not remote 185 mA at 24 V DC, with relay, remote sensor
Relay design (optional)	SPDT, 5 A at 230 V AC, 5 A at 30 V DC, resistive load For safety-related applications (SIL2), the maximum contact rating is reduced (see also the Dräger Polytron 8X00 Safety Manual).
Housing	NEMA 4X
Protection Class	IP 65/66/67
Dimensions (LxWxD)	
Without e-Box (DrägerSensor LC, DD)	approx. 180 x 150 x 130 mm (7" x 5.8" x 5.1")
With e-Box (DrägerSensor LC, DD)	approx. 185 x 180 x 190 mm (7.3" x 7.1" x 7.4")
Without e-Box (DrägerSensor IR)	approx. 295 x 150 x 130 mm (11,6" x 5,8" x 5,1")
With e-Box (DrägerSensor IR)	approx. 300 x 180 x 190 mm (11,9" x 7,1" x 7,4")
Weight	
Without e-Box, aluminum	approx. 2.2 kg (4.9 lbs.)
Without e-Box, stainless steel 316	approx. 4.0 kg (8.8 lbs.)
With e-Box, aluminum	approx. 3.5 kg (7.7 lbs.)
With e-Box, stainless steel 316	approx. 5.4 kg (11.9 lbs.)
Display	Resolution 128 x 64, back-lit

Environmental conditions	Specifications for the sensor: see sensor data sheet
Pressure	700 to 1300 hPa (20.7 to 38.4 in. Hg)
Humidity	0 to 100 % R. H., non-condensing
Temperature	
DrägerSensor DD, LC no relay	-40 to +80 °C (-40 to +176 °F)
DrägerSensor DD, LC with relay	-40 to +70 °C (-40 to +158 °F)
DrägerSensor IR no relay	-40 to +65 °C (-40 to +149 °F)
DrägerSensor IR with relay	-40 to +65 °C (-40 to +149 °F)
Environmental influences	See respective sensor data sheets.

12.1 Torques

(The torques are valid for the aluminum and stainless steel 316 variants)

Part	Torque Lb. In.	Torque Nm
Housing cover	min. 266	min. 30
Sensors	min. 266	min. 30
Plug	min. 266	min. 30
Cable bushing	min. 443	min. 50
Device to e-Box	71	8

If an optional e-Box is being used, fasten the device securely to the e-Box with 4 screws and a tightening torque of 8 Nm.

12.2 Tightening torque and cable size for field wiring terminals

Electronic		
Torque Lb. In.	**Cable size in AWG**	**Cable size in mm^2**
All field wiring terminals 4.4–7.0 (0.5–0.8 Nm)	20–12	0.5–2.5

12.3 Factory settings

12.3.1 Alterable settings for the Polytron 8200/8310

Menu	Standard setting	
	DrägerSensor DD, IR	**DrägerSensor LC**
A1 Alarm	20 %LEL	2.0 %LEL
A2 Alarm	40 %LEL	4.0 %LEL
A1 Relay alarm: Direction	Rising	Rising
A2 Relay Alarm: Direction	Rising	Rising
A1 latching mode	Non-latching	Non-latching
A2 latching mode	Latching	Latching
A1 Acknowledgement mode	Acknowledgeable	Acknowledgeable
A2 Acknowledgement mode	Not acknowledgeable	Not acknowledgeable
A1 enrg / wired in e-Box	Energized / NO	Energized / NO
A2 enrg / wired in e-Box	Energized / NO	Energized / NO
Maintenance password	0000	0000
LCD setting	on	on
Configuration/SIL password	_ _ _2	_ _ _2
SIL status	Off	Off
Language	English	English
Fault current	1.2 mA	1.2 mA
Warning current	3.0 mA	3.0 mA
Maintenance current	3.4 mA	3.4 mA
HART address	0	0
Auto-cal.	Off	Off
Calibration interval	360	360
Function key	Faults	Faults

12.3.2 Unalterable settings

Fault	Meaning
Fault relay / wired in e-Box	Energized / NO
Yellow Fault LED	Lights when a fault is present (see chapter 9 on page 25).
Red Alarm LED	Gives single flashes when an A1 alarm is present. Gives double flashes when an A2 alarm is present. If an alarm is configured as acknowledgeable and the alarm is acknowledged, the LED lights. Alarm hierarchy: A2 has a higher priority for the LED than A1. However the A1 and A2 relays operate independently of one another, i.e. if A1 is acknowledgeable and A2 is not and the gas concentration is so high that A1 and A2 are triggered, an acknowledgement results in the A1 relay dropping out. However the red LED continues to give double flashes as long as the A2 condition exists.

13 Order list

13.1 Dräger Polytron 8200/83X0

Name and description	Order Number
Dräger Polytron 8200 DD d A 4-20/HART	45 44 439
Dräger Polytron 8200 DD d A 4-20/HART Relay	45 44 440
Dräger Polytron 8200 DD d S 4-20/HART	45 44 448
Dräger Polytron 8200 DD d S 4-20/HART Relay	45 44 449
Dräger Polytron 8200 DD e A 4-20/HART	45 44 457
Dräger Polytron 8200 DD e A 4-20/HART Relay	45 44 458
Dräger Polytron 8200 DD e S 4-20/HART	45 44 466
Dräger Polytron 8200 DD e S 4-20/HART Relay	45 44 467
Dräger Polytron 8200 Remote DD e A 4-20/HART	45 44 511
Dräger Polytron 8200 Remote DD e A 4-20/ HART Relay	45 44 512
Dräger Polytron 8200 Remote DD e S 4-20/HART	45 44 520
Dräger Polytron 8200 Remote DD e S 4-20/ HART Relay	45 44 521
Dräger Polytron 8200 LC d A 4-20/HART	45 44 475
Dräger Polytron 8200 LC d A 4-20/HART Relay	45 44 476
Dräger Polytron 8200 LC d S 4-20/HART	45 44 484
Dräger Polytron 8200 LC d S 4-20/HART Relay	45 44 485
Dräger Polytron 8200 LC e A 4-20/HART	45 44 493
Dräger Polytron 8200 LC e A 4-20/HART Relay	45 44 494
Dräger Polytron 8200 LC e S 4-20/HART	45 44 502
Dräger Polytron 8200 LC e S 4-20/HART Relay	45 44 503
Dräger Polytron 8200 Remote e A 4-20/HART	45 44 529
Dräger Polytron 8200 Remote LC e A 4-20/ HART Relay	45 44 530
Dräger Polytron 8200 Remote LC e S 4-20/HART	45 44 538
Dräger Polytron 8200 Remote LC e S 4-20/ HART Relay	45 44 539
Dräger Polytron 8310 d A 4-20/HART	45 44 807
Dräger Polytron 8310 d A 4-20/HART Relay	45 44 808
Dräger Polytron 8310 d S 4-20/HART	45 44 816
Dräger Polytron 8310 d S 4-20/HART Relay	45 44 817
Dräger Polytron 8310 e A 4-20/HART	45 44 825
Dräger Polytron 8310 e A 4-20/HART Relay	45 44 826

Dräger Polytron 8310 e S 4-20/HART Relay	45 44 835
Dräger Polytron 8310 Remote e A 4-20/HART	45 44 843

Name and description	Order Number
Dräger Polytron 8310 Remote e A 4-20/ HART Relay	45 44 844
Dräger Polytron 8310 Remote e S 4-20/HART	45 44 852
Dräger Polytron 8310 Remote e S 4-20/ HART Relay	45 44 853
e-Box standard version (power only)	68 12 420
e-Box power / relay / remote version (with 2 cable glands)	68 12 275

13.2 Sensors for remote versions

NOTICE

The sensors are not included with the remote versions.

Name and description	Order Number
For Polytron 8200 DD remote e	
Sensing head, Polytron SE Ex PR M1 DD	68 12 711
Sensing head, Polytron SE Ex PR M2 DD	68 12 710
Sensing head, Polytron SE Ex PR M3 DD	68 12 718
Sensing head, Polytron SE Ex HT M DD	68 12 720
For Polytron 8200 LC remote e	
Sensing head, Polytron SE Ex LC M1 DD	68 12 722
Sensing head, Polytron SE Ex LC M2 DD	68 12 721
Sensing head, Polytron SE Ex LC M3 DD	68 12 719
For Polytron 8310 remote e	
Sensing head, DrägerSensor IR, complete set e	68 11 165
Sensing head, DrägerSensor IR, complete set e2	68 11 265

13.3 Replacement sensors (except for remote versions)

Name and description	Order Number
DrägerSensor Ex DD NPT	68 12 380
DrägerSensor Ex LC NPT	68 10 675
DrägerSensor IR NPT	68 11 901

13.4 Accessories

Name and description	Order Number
Accessories for Polytron 8200/83X0	
D-Junction Box, aluminum	45 44 099
D-Junction Box, stainless steel 316	45 44 098
Duct mounting kit, Polytron 5000 for DrägerSensor DD, LC, IR	68 12 725
Pipe mounting kit, Polytron 5000/8000	45 44 198
IR connection kit, 5000/8000	45 44 197
Magnetic wand with key chain	45 44 101

1 Safety-related information

Both the latest edition and other languages of these instructions for use can be downloaded in the Technical Documentation database (www.draeger.com/ifu). Due to product actualizations, Dräger recommends always using the latest edition of the instructions for use.

1.1 Safety instructions

- Before using this product, carefully read these Instructions for Use and those of the associated products.
- Strictly follow the instruction for use. The user must fully understand and strictly observe the instructions. Use the product only for the purposes and under the conditions specified in this document.
- Do not dispose of the Instructions for Use. Ensure that they are retained and appropriately used by the product user.
- Only trained and competent users are permitted to use this product.
- Notify Dräger in the event of any component fault or failure.
- Comply with all local and national laws, rules, and regulations associated with this product.
- Only trained and competent personnel are permitted to inspect, repair and service the product as detailed in these instructions for use. Further maintenance work that is not detailed in these instructions for use must only be carried out by Dräger or personnel qualified by Dräger.
- Dräger recommends a Dräger service contract for all maintenance activities and that all repairs are carried out by Dräger.
- Use only genuine Dräger spare parts and accessories. Otherwise the proper functioning of the product may be impaired.
- Maintenance must be performed as described, see 10 Maintenance.
- Only operate the product within the framework of a risk-based alarm signaling concept.
- Before connecting this instrument to electrical devices not mentioned in the IFU consult Dräger
- The instruments or components may not be modified in any manner.
- The use of faulty or incomplete parts is forbidden.
- The appropriate regulations must be observed at all times when carrying out repairs on these instruments or components.
- Do not open the instrument during operation.
- The corresponding regulations must be observed when carrying out repairs on these instruments or components.
- Follow the directions of EN 60079-29-2 for the measurement of flammable gases and oxygen.
- Follow the directions of EN 45544-4 for the measurement of toxic gases.

Polytron® 8100 EC-specific:

- **WARNING**: Risk of ignition of flammable or explosive atmospheres! Substitution of components may impair Intrinsic Safety.

1.2 Operating area and conditions

- For SIL applications, observe the Dräger Polytron® 8xx0 safety manual.
- Only applies for Polytron 8200 CAT:
  If the device is exposed to a targeted flow of air that is mixed with gas, the measured values may be elevated. For deviating values, see the instructions for use provided with the corresponding sensor.
- Observe the information and restrictions in the instructions for use for the sensors used.
- **CAUTION** Risk of ignition of flammable or explosive atmospheres! Not tested in oxygen enriched atmospheres (>21% O_2).
- **Using the product in areas subject to explosion hazards:** Instruments or components for use in explosion-hazard areas which have been tested and approved according to national, European or international Explosion Protection Regulations may only be used under the conditions specified in the approval and with consideration of the relevant legal regulations.

Hazardous areas classified by zones:

- The instrument is designed for use in Zone 1 or Zone 2 hazardous areas where gases of explosion groups IIA, IIB or IIC and temperature class T4 or T6 may be present. Temperature classes depend on the maximum ambient temperature. The instrument must not be operated in ambient temperatures outside of the temperature range indicated on the instrument.
- The instrument is designed for use in Zone 21 or Zone 22 hazardous areas where dusts of explosion groups IIIA, IIIB or IIIC and dust temperatures of T80 °C or T130 °C (T135 °C for the Polytron 5100 EC and Polytron 8100 EC) may be present. Dust temperatures depend on the maximum ambient temperature. The instrument must not be operated in ambient temperatures outside of the temperature range indicated on the instrument.

Hazardous areas classified by divisions:

- The instrument is designed for use in Class I, Div. 1 or Div. 2 hazardous areas where gases of groups A, B, C or D and temperature class T4 or T6 may be present. Temperature classes depend on the maximum ambient temperature. The instrument must not be operated in ambient temperatures outside of the temperature range indicated on the instrument.
- The instrument is designed for use in Class II, Div. 1 or Div. 2 hazardous areas where dusts of groups E, F or G may be present. The instrument must not be operated in ambient temperatures outside of the temperature range indicated on the instrument.

2 Conventions in this document

2.1 Meaning of the warnings

The following warnings are used in this document to alert the user to potential dangers. A definition of the meaning of each warning is as follows:

Alert icon	Signal word	Warning classification
⚠	WARNING	Indicates a potentially hazardous situation. If not avoided, it could result in death or serious injury.
⚠	CAUTION	Indicates a potentially hazardous situation. If not avoided, it could result in physical injury. It may also be used to alert against unsafe practices.
	NOTICE	Indicates a potentially hazardous situation. If not avoided, it could result in damage to the product or environment.

2.2 Trademarks

Trademark	Trademark owner
PROFIBUS®	PROFIBUS Nutzerorganisation e. V.
HART®	HART Communication Foundation
Polytron®	Dräger Safety AG & Co. KGaA
DrägerSensor®	Dräger Safety AG & Co. KGaA

The following webpage lists the countries in which Dräger's trademarks are registered: www.draeger.com/trademarks.

A 10	Explosion-proof instrument with docking station for increased safety
A 11	Explosion-proof instrument with mounting spacer (only for Polytron 87x0 IR)
A 12	Mounting spacer (only for Polytron 87x0 IR)
B	Test setup for calibration
C	Polytron 8100 EC
D	Sensor dongle connection (only Polytron 8100 EC)
E 1	Polytron 8200 CAT
E 2	Polytron 8310 IR
F 1	Polytron 8710 IR with splash guard
F 2	Polytron 8710 IR without splash guard

3.2 Feature description

The Polytron 8000 family includes the following instrument versions:

– Polytron 8100 EC, operates with electrochemical sensors (EC sensors)
– Polytron 8200 CAT, operates with catalytic Ex sensors (CatEx sensors/catalytic, DQ or LC DrägerSensors)
– Polytron 8310 IR, operates with infrared Ex sensors (IREx sensors)
– Polytron 8700 IR, operates with infrared sensors (PIR 7000 sensors)
– Polytron 8720 IR, operates with infrared sensors (PIR 7200 sensors)

The following interfaces are possible:

– 4 to 20 mA analog (per NAMUR recommendation NE43)
– Relay board
– Digital HART output signal
– Foundation Fieldbus[1)]
– PROFIBUS PA[1)]
– Modbus RTU[1)]

If the 4 to 20 mA interface is used, the current must be monitored between 0 mA and 3.5 mA. Currents between 0 mA and 3.5 mA can indicate a special state (see "Special states", page 16).

If a relay board is used, local alarm devices can be activated. If no relay board is used and an alarm is pending, only the red LED on the instrument will flash.

Gas concentrations, status messages, and menu choices are displayed on a backlit graphic LC-display and 3 colored LEDs.

Navigation through the menu takes place by tapping the relevant key on the pane of the enclosure lid with a magnetic wand. The instrument can be configured, calibrated and maintained non-intrusively without declassifying the area.

The instruments are supplied with a data logger. The data logger can store up to 35,000 values. At a sampling interval of 1 measurement per minute, the data logger can store the measurement history of approximately 24 days. This time can be significantly increased if the trigger function is activated. The data logger can only be downloaded using the PolySoft

1) No relays are available when the fieldbus interface is used. The fieldbus interface does not conform to BVS 13 ATEX G 001 X. Dräger SensorAlive is not supported.

PC software. The download generates an .ofb file and a .txt file. The .txt file includes the data logger information in readable form.

The instruments can be connected to a Dräger controller or a programmable logic control (PLC) with a sealed conduit or approved cable gland.

The instruments can be operated as a current source or current sink if the power is supplied by the controller. If the instruments are connected to a separate power supply, they can only operate as a current source.

The enclosures of the instruments are made of sturdy stainless steel or aluminum, and are suitable for indoor and outdoor application.

The instruments are designed for stationary installation. They are available in the following designs:

– Explosion-proof instrument (Ex d)
  The flameproof, explosion-proof enclosure provides three ¾ " NPT connections which can be used for field wiring, direct connection of a sensor, or wiring of a remote sensor.
– Instrument for increased safety (Ex e)
  The instrument is supplemented by an increased safety terminal box (docking station) providing up to four 20 mm connections for field wiring or wiring of a remote sensor. If the cable gland from Dräger is used, the permissible cable diameter is 7 mm to 12 mm.

The following dongles are available for the Polytron 8100 EC:

Sensor-test dongle	Activates the sensor self-test (not for hydrazine sensor 6810180)
Diagnostic dongle	Activates the sensor self-test, the display of the sensor vitality and the sensor diagnostic functions (not for hydrazine sensor 6810180)

3.3 Intended use

The instruments in the Polytron 8000 family are intended for continuous monitoring of the ambient air.

With the optionally integrated relay module, the instrument can be operated without a central controller (with additional local alarm signaling).

The instrument can be connected to a Dräger controller or a programmable logic control (PLC) with a sealed conduit or approved cable gland.

If the 4-20 mA interface is used, the current between 0 mA and 3.5 mA must be monitored. Currents between 0 mA and 3.5 mA can indicate a special state.

The instruments are designed for permanent installation and are approved for use in hazardous areas.

– Polytron 8100 EC is a combined intrinsically safe/explosion proof instrument for continuous monitoring of toxic gases or oxygen in the ambient air.
– Polytron 8200 CAT with catalytic DrägerSensor DQ or LC is an explosion-proof instrument for continuous monitoring of combustible gases and vapors containing hydrocarbons and non-hydrocarbons (e.g., hydrogen or ammonia) in ambient air.
– Polytron 8310 IR with infrared DrägerSensor IR is an explosion-proof instrument for continuous monitoring of combustible gases and vapors containing hydrocarbons in ambient air.
– Polytron 8700 IR with PIR 7000 is an explosion proof instrument for the continuous monitoring of combustible gases and vapors containing hydrocarbons in an appropriate atmosphere.
– Polytron 8720 IR with PIR 7200 is an explosion proof instrument for the continuous monitoring of carbon dioxide in ambient air.

3.4 Approvals

3.4.1 ATEX, IECEx, UL, CSA

An example of a name plate is shown on the fold-out page. A print-out of the name plate can also be found on the instrument's shipping box.

3.4.2 Additional information

Declaration of conformity: see supplement 4544300 or www.draeger.com/product-certificates

For additional information on approvals, see supplement 4544300.

4 Transmitter installation

4.1 Explosion proof (Ex d) installation - without Docking Station

4.1.1 Mechanical installation

4.1.1.1 General information on mechanical installation

– Local, state, and national rules and regulations that govern the installation of gas monitoring equipment must be strictly observed.
– The physical properties of the gas or vapor to be detected and the details of the corresponding application (e.g., possible leaks, air movement/drafts, etc.) must be taken into account.
– The future use of accessories and maintenance equipment must be considered.
– The free gas or vapor flow to the sensor must not be obstructed.
– The instrument must not be exposed to radiant heat that will cause the temperature to rise beyond the indicated limit values (16.6 Environmental parameters). The use of a reflective shield is recommended.
– A dust cap may be attached to the cable entry of the instrument. This cap is neither explosion-proof nor watertight and must be removed before connecting the instrument to a sealed conduit or before installation of a flameproof cable gland.

– Unused openings must be closed with blind plugs. For the required tightening torques for cable bushings, cable glands, plugs and sensors, see 16.7 Tightening torques.
– For non-conduit installations, an approved cable gland must be used (e.g., Hawke A501/421/A/¾ " NPT or equivalent).
– **WARNING:** Only for conduit installations: To reduce the risk of ignition of hazardous atmospheres, the conduit must be sealed within 45 cm (18 ") of the enclosure.
– **CAUTION:** If the gas detector is connected to controllers, the total response time may be delayed. The entire measurement path must be taken into account (e.g., latency of the controller). Ensure that the required response time is kept.

Polytron® 8100 EC-specific:

– Recommended sensor orientation: Downwards (see Figure C on the fold-out page).

Polytron® 8200 CAT-specific:

– Preferred sensor orientation: Downwards (see Figure E on the fold-out page). If the sensor inlet is protected against mechanical damage and the ingress of dirt and water, any orientation is permitted.
– For CSA-conform operation only:
The use of the optional splash guard (6812510) is required for CSA approval.

Polytron® 8310 IR-specific:

– Recommended sensor orientation: Downwards (see Figure E on the fold-out page).

Polytron® 87x0 IR-specific:

– The preferred orientation of the Dräger PIR 7x00 sensor must be observed (see Figure F on the fold-out page). Larger deviations and the use of the preassembled splash guard will increase the response time (see PIR 7x00 instructions for use).
– Any other orientation is only permissible if the PIR 7x00 is used without a splash guard, e.g., for use in ducts. If the sensor is installed vertically, there is an increased risk of deposits forming on the optical surfaces.
– The use of the preassembled splash guard is recommended to protect the sensor from water and dust.
– If a splash guard (part number 6811911 or 6811912) is used, the status lights must be arranged in a vertical line and the Dräger logo on the splash guard must be horizontal. A maximum deviation of ±30 degrees from the horizontal position is permissible.
– Liquid and/or deposits on the optical surfaces of the PIR 7x00 may result in a warning or fault.
– For the explosion-proof version, using a spacer (part number 6812617) when the instrument is mounted on a wall or to a level surface is recommended.

Special conditions in accordance with EN/IEC 60079-1

– The threads for the flameproof / explosion-proof enclosure do not conform to the minimum/maximum values indicated in EN/IEC 60079-1. The threads must not be re-worked by the user.

4.1.1.2 Installation

The instrument can be mounted for measuring gases in ambient air or inside of a duct/pipe.

1. Use M6 (1/4'') bolts with hex socket caps to mount the enclosure to one of the following options.

Option	Accessory
Mounting on a flat surface	Drilling template: 4544300 Additionally for Polytron 87x0 IR: Spacer 6812617
Mounting on a pole	Pole mount kit: 4544198
Mounting on a duct/pipe	Duct mount kit: 6812725 For Polytron® 87x0 IR:: 6812300

4.1.2 Electrical installation

4.1.2.1 General information on electrical installation

– For tightening torques, see 16.7, for permissible cable specifications, see 16.3.
– Strict compliance must be given to the electrical codes that govern the routing and connection of electrical power and signal cables to gas monitoring equipment.
– Ferrules must be used.
– The conductors for the power supply must have an adequately low resistance to ensure the correct supply voltage at the instrument.
– Wire insulation must be stripped by 5 to 7mm.
– The secondary circuit supplying power must be electrically isolated from the mains circuit (does not apply for the relay circuit).
– When installed at locations exceeding ambient temperatures of 55 °C, use only appropriate wiring, specified for at least 25 °C above the maximum ambient temperature.
– Only use cable glands that are approved in the country the system is installed in and suitable for the application.
– In accordance with EU Directive 2014/30/EU, this instrument may not be connected to a DC system. Providing the instrument with its own source of supply is recommended.

Analog interface

– To ensure proper operation of the instrument, the resistance of the 4 to 20 mA signal loop must not exceed 500 ohms.
When used in accordance with the metrological suitability test compliant with EN IEC 62990-1, EN IEC 60079-29-1 or EN 50104, the resistance must not exceed 300 ohms. With values above 300 ohms, supply voltage monitoring cannot be ensured.
Depending on the operating voltage and the application (e. g. HART® operation), a specified minimum resistance must be observed (see "Signal transmission to the controller", page 42).

Relay option

– At voltages >30 V AC or >42.4 V DC, the relay cables must be enclosed in protective tubing, or double-insulated cables must be used.
– The wiring for the optional relay module must be selected and fused according to the rated voltages, currents and environmental conditions.
– To ensure that a fault is recognized - without having to look at the instrument - an alarm device must be connected to the fault relay.
– Voltage differences can cause insulation faults. Do not mix electric loads with different voltage types (AC or DC). Using DC loads, ensure that relay contacts only control devices with the same DC voltage rating. Using AC loads, ensure that relay contacts are only connected to devices sharing a common phase.

Special conditions in accordance with IEC 60664-1

– The device variants incorporating a FISCO fieldbus interface as well as gas detection transmitter type ETR 02…5** must operate in circuits that are limited to overvoltage category I/II/III in accordance with IEC 60664-1.

4.1.2.2 Connection diagrams

The fold-out pages show the following connection diagrams:

Figure	Connection diagram for instruments
G	Without relay, enclosure grounding
H	With relay, enclosure grounding
I1	4-20 mA / HART (current source)
I2	4-20 mA / HART (current sink)
I3	4-20 mA / HART (separate power supply, current source)
H1	Standalone, relay only
J	Foundation Fieldbus / PROFIBUS PA, enclosure grounding
K	Modbus RTU, enclosure grounding
J1	Foundation Fieldbus / PROFIBUS PA, field wiring
K1	Modbus RTU, field wiring
L	Power supply digital interfaces

4.1.2.3 Wiring tables

4 to 20 mA/HART interface

Pin	Mark	Function
1	PWR+	V+
2	PWR-	V-
3	PWR-	V- Use if the instrument is connected to a separate power supply (operation as source).
4	4-20 mA	4 to 20 mA signal (Operation as source or sink)
5	PE	Protective earth Optional PE for relay connection. Connecting PE together with the 4-20mA analog output may cause ground loops.

Fieldbus interface

Pin	Mark	Function
1	Data-A	Signal Line A
2	Data-B	Signal Line B
3	GND	Ground
4	SHIELD	Cable Shield

Pin	Mark	Function
1	PWR+	V+
2	PWR-	V-

Relay connectors

All relays (A1, A2, FLT) of the device can be configured as "normally energized" (normally closed relay) or "energized on alarm" (normally open relay). The relays are configured at the factory as normally closed relays ("normally energized"). This ensures fail-safe operation.
Contrary to convention, the NO, COM, NC markings on the instrument are selected to correspond to the normally energized state. When the device is energized, the marking corresponds to the function of the pins.

Pin	Mark		Relay	
1	NO	FLT	Fault	Normally open
2	COM		Fault	Common connection
3	NC		Fault	Normally closed
4	NO	A2	A2	Normally open
5	COM		A2	Common connection
6	NC		A2	Normally closed
7	NO	A1	A1	Normally open
8	COM		A1	Common connection
9	NC		A1	Normally closed

4.1.2.4 Preparing the electrical installation

1. Loosen the set screw (2) and unscrew the enclosure lid from the lower part of the enclosure, see figure A on the fold-out page.
2. Pull out the PCB unit.
3. Proceed with the figure that contains your Polytron® model and signal output, see fold-out page.

4.1.2.5 Connecting the device with relays (stand-alone)

The wires for alarm devices must be connected to the 9-pin relay connector. A piece of wire insulation (heat-shrink tube) and a protective cover are included for extra protection of the relay wires.

1. Remove the 5-pin connector.
2. Connect the cable for the power supply to the corresponding connection terminals, see figure H1 on the fold-out page..
3. Bridge pins 3 and 4 of the 5-pin connector.
4. Remove the 9-pin connector.
5. Cut the heat-shrink tube as needed and slide it over the relay wires before insertion into the 9-pin connector.
6. Position the heat-shrink tube at the edge of the wire insulation and use a heat gun to shrink the tubing securely onto the wire insulation.
7. Slide the protective cover over the wires.
8. Connect the wires for alarm 1 (pre-alarm), alarm 2 (main alarm), and error alert to the relevant terminals as indicated in the following wiring table.
9. Plug the connector back into the socket and tighten the screws.
10. Close the device, see 4.1.2.9 Closing the gas detector.

The following tables display the status of a connected alarm indicator and whether it indicates faults (e.g., power failure for the gas detector).

The behavior of the relay depends on the alarm configuration and the relay contact the alarm indicator is connected to.

Relay configuration: Normally energized

Contact	Alarm indicator status and fault indication by the alarm indicator		
	Alarm triggered	Gas detector-specific fault	Field wiring fault
Normally closed	ON	displayed	not displayed
Normally open	OFF	displayed	displayed

Relay configuration: Energized on alarm

Contact	Alarm indicator status and fault indication by the alarm indicator		
	Alarm triggered	Gas detector-specific fault	Field wiring fault
Normally closed	OFF	not displayed	displayed
Normally open	ON	not displayed	not displayed

4.1.2.6 Connecting the 4-20mA/HART® interface

For connections to a control unit (PLC), refer to the documentation corresponding to the control unit.

1. Pull off the 5-pin connector.
2. Connect the three wires for power and signal to the appropriate terminal as indicated in the wiring table and figure.
3. Plug connector back into socket and tighten screws.
4. Close the instrument, see 4.1.2.9 Closing the gas detector.

4.1.2.7 Grounding

1. Ground the enclosure of the instrument locally at the grounding lug, see figures G and H on the fold-out page..
2. Connect the shield of the wires only to the instrument earth ground of the controller (e g. chassis, ground busbar, etc.).

ℹ Unless special measures are taken (e. g. capacitive earthing), the shield must only be connected at one end.

Information on grounding fieldbus and Modbus connections is provided in the following documents.

Interface	Document
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

4.1.2.8 Connecting the fieldbus interface

1. Pull off the 2-pin and 4-pin connector.
2. Connect the two wires for power and the four wires for signal to the appropriate terminals as indicated in the wiring table and figure.
3. Plug connector back into socket and tighten screws.
4. Close the instrument, see 4.1.2.9 Closing the gas detector.

For further information regarding the fieldbus interface installation consult the corresponding Technical Handbook.

4.1.2.9 Closing the gas detector

1. Ensure that the following connections are correctly established:
   a. The screws for the wiring are tightened with the correct torque.
   b. All cable connections are secured with screws.
   c. The front port of the sensor is inserted.
   d. The grounding cable that leads from the enclosure is connected with the eye on the PCB unit, see figures G and H on the fold-out page.
2. Place the PCB unit in the lower part of the enclosure.
3. Screw the enclosure lid onto the lower part of the enclosure and tighten with the correct torque.
4. Tighten the set screw.

4.2 Increased safety (Ex e) installation - with Docking Station

The installation with enhanced safety (Ex e) is described in the assembly instructions for the docking station (part number 9033242).

5 Installation of sensors or sensing heads

5.1 Installing the EC sensor on the Polytron 8100 EC

See figure C on the fold-out page.

1. Unscrew the locking screw (2) (2 mm hexagon socket screw).
2. Unscrew and remove the bayonet ring (3) and remove the dummy disk.
3. Insert the sensor (4) in the opening and turn until it engages in the gas detector. This does not damage the sensor connector.
4. Secure the sensor with the corresponding bayonet ring (3).

   ℹ For Dräger SensorAlive, a different bayonet ring must be used than for other EC sensors.

5. Tighten the locking screw (2) so that the bayonet ring cannot come loose (required for installations in zone 22).

   ℹ If the Dräger SensorAlive is being installed in an existing system for the first time, the firmware must be updated to version 4.0.0 or higher. Contact Dräger for support.

5.2 Installing the sensing head

Depending on the type of explosion protection, there will be various sensing heads used. Information relating to the installation of the sensing heads can be found in the respective sensing head manual.

For remote applications, the cable shielding must be attached on both the sensor and transmitter side. The cable length should be ≤ 30 m.

Remote versions with "Explosion-proof (Ex d)" explosion protection

Transmitter	Sensing head IFU part numbers
Polytron 8100 EC	Remote EC sensing head (9033247)
Polytron 8200 CAT (for DQ sensors)	DQ NPT aluminum remote sensor, DQ NPT steel remote sensor (4544286)
Polytron 87x0 IR	Remote PIR 7000 (334) with stainless steel or aluminum sensor connection housing (4544286)
Polytron 8200 CAT (for LC sensors) Polytron 8310 IR Polytron 87x0 IR	Stainless steel or aluminum sensor connection housing (4544286)

Remote versions with "Increased safety (Ex e)" explosion protection

Transmitter	Sensing head IFU part numbers
Polytron 8100 EC	Remote EC sensing head (9033247)
Polytron 8200 CAT	Polytron SE Ex sensing heads (9033888)
Polytron 8310 IR	DrägerSensor IR (9023843)
Polytron 87x0 IR	PIR 7x00 (9023885)

6 Commissioning

6.1 General information

– Before connecting the instrument to the power supply, connect the wires for the relay and connect up the sensor.
– Before starting normal operation of the instrument, check whether the configuration and adjustment settings are correct.

In order to guarantee its safe operation according to BVS 13 ATEX G 001 X and PFG 14 G 001 X, the following standard alarm settings for the instrument must remain unchanged.

– The relays must be set to ***Normally energ.*** and the alarm A2 (main alarm) to ***Latching*** and ***Non-acknowledgeable*** or ***Pre-Acknowledgeable***.
– Alarm A1 (pre-alarm) may only be set to ***Acknowledgeable*** if used for activation of an acoustic alarm device.
– Latching in the event of over range (see "Setting the DQ sensor latching", page 37).

When operating in accordance with BVS 13 ATEX G 001 X and PFG 14 G 001 X, consideration must be given to the following special conditions:

– Polytron 8200 CAT:
  – When streaming the DQ or LC sensor with air containing measured gas, measured values may increase by up to 32 %.
    These values may increase by up to 70 % when operating with the DQ remote calibration adapter.
  – The transmitter with LC sensor must be operated in combination with a control unit that indicates over range with a latching signal. Internal transmitter alarm relays are not permitted.
  – The transmitter with LC sensor must be adjusted with its sensor in the standard operating position.
  – False alarms may be triggered during the warm up period of the LC sensor.
– Polytron 8100 EC:
  Minor changes to the concentration may see the setting time t20 of the transmitter with EC sensor exceed the EN 50104 threshold.

6.2 Commissioning the gas detector

1. To prevent false alarms, turn off the alarm activation for the gas detector (see "Turning the alarms on and off", page 30).
2. Switch on the power supply.
   ⇒ The device performs a start-up sequence (LCD/LED test, software version, and initialization).
   ⇒ The display indicates that the sensor will be ready for measurement in hh:mm:ss (countdown). The device transmits the maintenance signal. The fault relay is activated.
   ⇒ The sensor warms up. The maintenance signal on the 4 to 20 mA interface remains until the sensor has warmed up. The length of the warm-up time depends on the type of sensor and the ambient conditions. Maximum warm-up time of a new sensor: See the instructions for use of the sensor.
3. Check the date and time. Settings can be changed during the sensor's warm-up time.
   ⇒ After the sensor's warm-up time, the device switches to normal operation. The display shows the current gas concentration, the unit of measurement, and the selected gas if applicable. The green LED is lit.

If the device is operated with a Dräger SensorAlive, Dräger recommends setting the correct date and time. The sensor's warm-up time is followed by the start-up period of the Dräger SensorAlive. The sensor is ready for measurement during this phase, but the self diagnostics do not yet take place.

4. Adjust the device as necessary.
5. Turn on the alarm activation for the gas detector (see "Turning the alarms on and off", page 30).

7 Operation

7.1 Control panel

The control panel contains

– buttons for navigating in the menu
– a display
– LEDs and associated symbols

The buttons for navigation have different functions depending on the menu that is in use.

The instrument is operated with a magnetic wand. To do so, the enclosure lid must be in place on the instrument. If the enclosure lid is not in place, the magnetic wand may activate two or more buttons at once (cross-talk).

7.2 LEDs and symbols

The following symbols and LEDs can be found on the control panel:

Symbol	LED	Description
	Red	Alarm Triggered
	Yellow	Fault
	Green	Power on

LED status

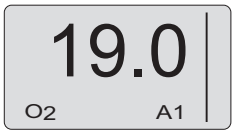
– If alarm A1 (pre-alarm) has been triggered, the red LED will flash once .
– If alarm A2 (main alarm) has been triggered, the red LED will flash twice .
– If an alarm is acknowledged before the reason for the alarm has been rectified, the red LED will light continuously to indicate that there is a fault.

7.3 Readings on the display

7.3.1 All devices

Symbol	Explanation
	An error message is present. Additional information is available in the ***Information*** menu.
	A warning message is present. Additional information is available in the ***Information*** menu.
	Maintenance signal is transmitted.
	The set full scale deflection is exceeded at the 4-20 mA interface.
	The set threshold limit value is not met at the 4-20 mA interface.
	HART® operation is active. Analog interface is set to a fixed value and is not transmitting any measurement signal.
	Once the capacity of the data logger is reached, the old data are overwritten by new values ("roll" function).
	Once the capacity of the data logger is reached, no more data can be stored ("stack" function).
SIL	SIL operation mode is activated.

7.3.2 Polytron 8100 EC-specific symbols



Symbol	Explanation
	The sensor is ready for operation.
	The sensor is ready for operation but is close to the end of its useful life.
	The sensor is still ready for operation but should be changed as soon as possible. The vitality is <25%.
LT	A LifeTest of the Dräger SensorAlive is carried out.

7.3.3 Measuring mode

The following display examples show the Polytron 8100 EC.

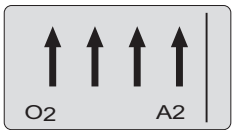
Gas names are not predefined for the Polytron 8200 CAT and Polytron 8310 IR. Gas names must be entered via the DrägerPolysoft PC software. After modifying parameters with the DrägerPolysoft PC software or another software, verify all parameters by downloading them from the Polytron® 8xx0 or by checking them directly on the instrument.

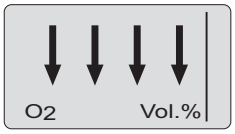
The following is displayed in measuring mode:

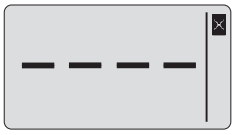
Display example	Description
	In normal operation, the display shows the measured gas concentration, the selected gas type, and the unit of measurement. **Analog interface:** Corresponding current value **Relays:** All relays are in the normal state
	Exceeding the alarm thresholds. Example shows pre-alarm A1. **Analog interface:** Corresponding current value **Relays:** Relay A1 is in alarm state.

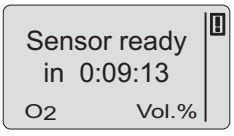
7.3.4 Special states

If the instrument is in a special state, proper measurement or alarm activation can no longer be guaranteed.









This is the case:

- When the gas concentration exceeds the measuring range.
- When a fault occurs.
- When alarms are deactivated.
- When calibrations are performed.
- When bump tests are performed.
- When a sensor is in the warm-up phase.
- When the system is in maintenance mode.
- When a Dräger SensorAlive is used and the system is configured such that the measured value is not indicated during a LifeTest.

For the current of the analog interface corresponding to the analog signal, see 16.2.

The signals of the digital interfaces are described in the following documents.

Interface	Document
PROFIBUS PA	9033782
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

Display example	Description
	**Value above measuring range** The gas concentration is outside of the measuring range of the sensor[1]. **Analog interface:** Over range **Relays:** A2 relay switch ***Note for the Polytron 8200 and Polytron 8310:*** The message that the measuring range has been exceeded can also be caused by a short circuit or an interruption in the line to a remote sensor.
	**Value below measuring range** The gas concentration is outside of the measuring range of the sensor. **Analog interface:** Drift below zero **Relays:** Fault relay switch
	**Fault display** The ⊠ symbol is displayed on the right side of the display. **Analog interface:** Fault current **Relays:** Fault relay switch
	**Maintenance display** The 🔧 symbol is displayed on the right side of the display. This is displayed when alarms are deactivated, and during adjustment, bump tests, and maintenance work. **Analog interface:** Maintenance current **Relays:** No change
	**Warning display** The ⚠ symbol is displayed on the right side of the display. **Analog interface:** Warning current[2] **Relays:** No change
	**Warm-up phase 1** The ⚠ symbol is displayed on the right side of the display. The remaining time is displayed on the left side. **Analog interface:** Maintenance current **Relays:** Fault relay switch The fault relay behavior can be configured for warm-up phase 1 (see "Setting fault relay warm-up 1", page 30).

Display example	Description
	**Warm-up phase 2** The ! symbol is displayed on the right side of the display. The measured value is displayed on the left side. **Analog interface:** Measured value **Relays:** Behavior as in measuring mode (the fault relay does not indicate warm-up phase 2).

1) When the gas concentration exceeds the full scale deflection of the 4 to 20 mA interface, the display continues to display the measured value plus "Analog interface over range" .
2) Only when warning current is activated. Factory setting: Deactivated.

7.3.5 Ending special states

Error display / warning display

Error displays and warning displays are usually non-latching. As soon as the causes of the errors or warnings have been rectified, no more error or warning is displayed. Exceptions are "SensorAlive fault detection" and "SensorAlive clogging detection".

To eliminate the causes, display the error or warning (see "The Information menu", page 18) and start troubleshooting (see "Troubleshooting", page 25).

Value exceeds/falls below the measuring range

The display indicates that the gas concentration is beyond the measuring range of the sensor. The information on the display disappears as soon as the gas concentration is back within the measuring range. After an over range occurrence, the sensitivity and response time of the sensor may deteriorate.

NOTICE

Sensor malfunction

Gas concentrations outside the sensor's measuring range can cause the sensor to malfunction.

► Recalibrate the sensor if necessary.

Polytron® 8200 CAT with DQ sensor:

An over range has to be acknowledged with [OK] after verifying that the gas concentration is below 100 %LEL (e.g. using a portable instrument).

Latching alarms is the default setting of the instrument.

For instruments without relays, the over range can be set to non-latching. In this case, the over range indication disappears. The control unit must support this function! For further information see: "Setting the DQ sensor latching", page 37.

Polytron® 8200 CAT with LC sensor:

⚠ WARNING

Ambiguous readings for measured values that exceed the measuring range

Latching alarms for over range situations are not supported by LC sensors.

For safe operation in line with BVS 13 ATEX G 001 X, the gas detector must be operated with a controller that can display latching alarms. Do not use internal alarm relays of the gas detector.

► Make sure that over range latching is active at the controller.

After over range measuring values, verify that the gas concentration is below 100 %LEL (e.g. using a portable instrument).

7.4 Info mode and function keys

7.4.1 Opening Info mode

Info mode is used to show relevant device information. This does not interrupt the normal operation of the device.

- Tap and hold ▲ for 3 seconds in measuring mode.

7.4.2 Navigating in Info mode

Button	Function
▲	Switches to the next screen
▼M	Switches to the previous screen
OK	Ends info mode

If no key is tapped within 30 seconds, the instrument will automatically return to normal operation.

7.4.3 Using function key

Using the function key, a pre-set function can be executed. By default the faults are displayed.

- Tap and hold ▲ for 1 seconds in measuring mode.

To configure the function key, see 11.4 Configuring function key.

7.5 Menus

7.5.1 Navigating in a menu

Button	Function
▲	Scrolls upwards. Sets values.
▼M	Scrolls downwards. Sets values.
OK	Confirms entry. Selects menus and functions.

7.5.2 Opening menus

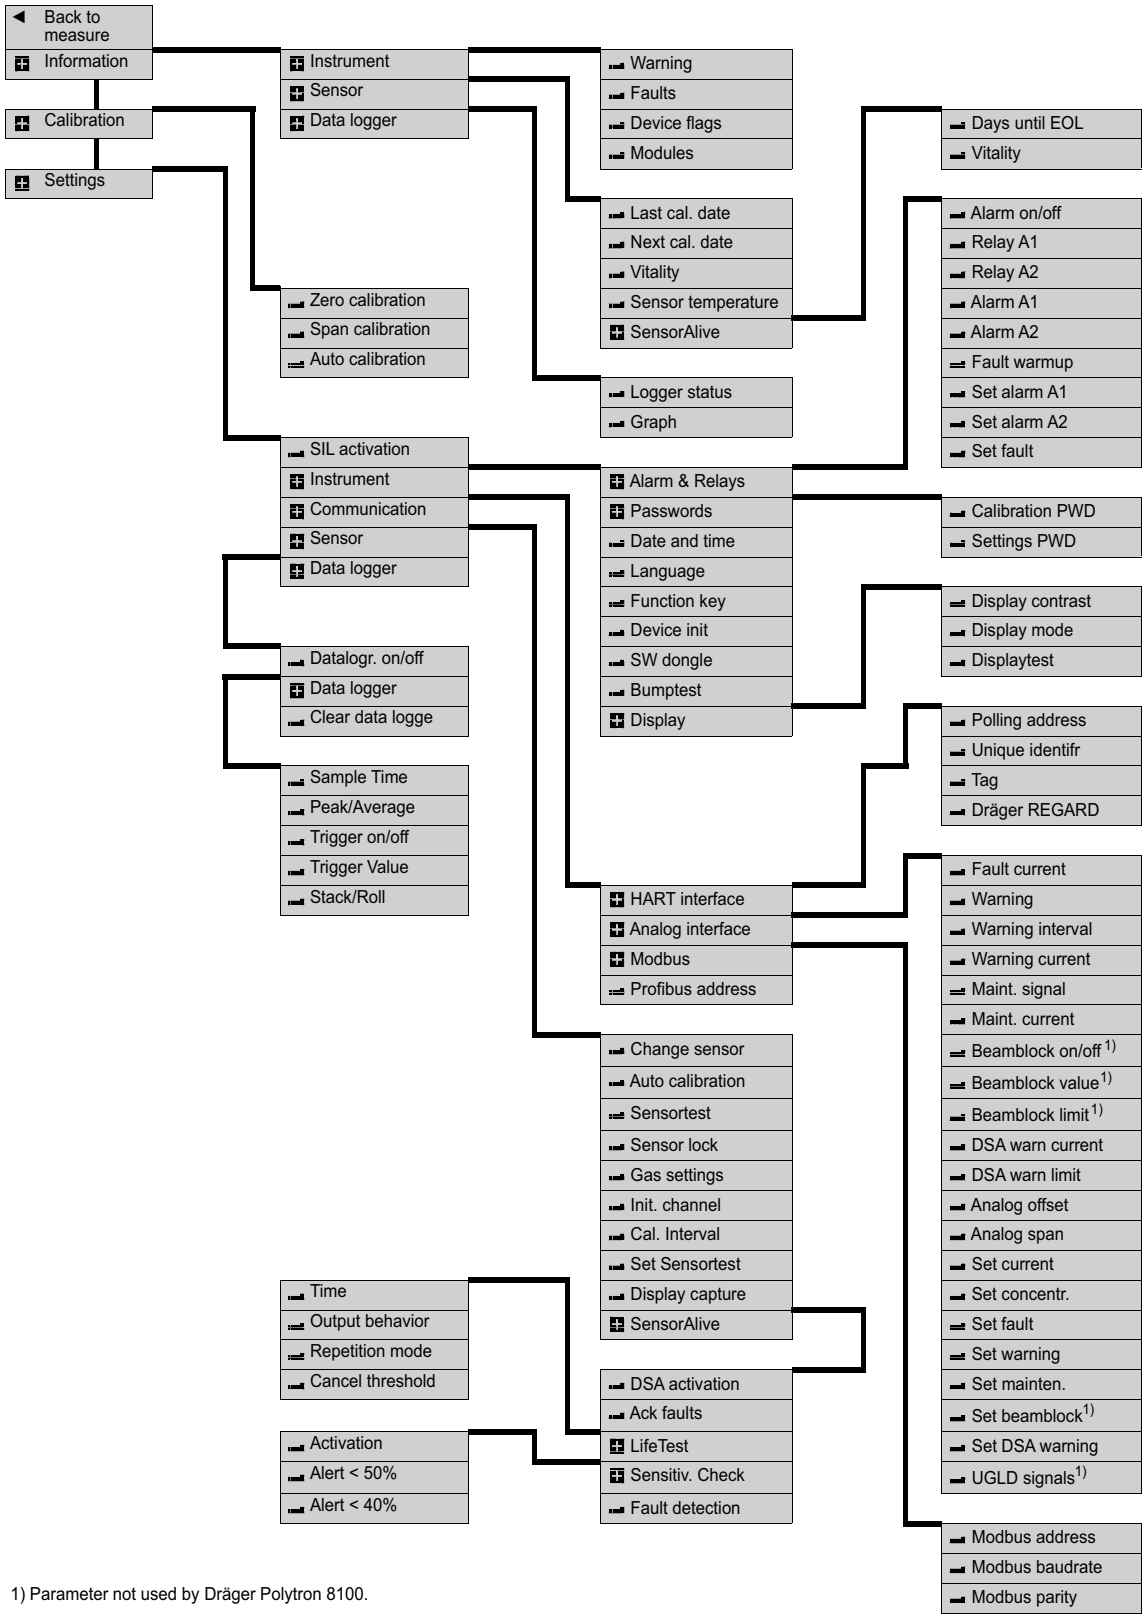
- To open the ***Information*** menu:
  a. Tap and hold ▼ for 1 second in measuring mode.
- To open the ***Calibration*** menu:
  a. Tap and hold ▼ for 3 seconds in measuring mode.
  b. Select ***Enter password***.
  c. Enter the corresponding password and confirm with [OK].
- To access all menus:
  a. Tap and hold ▼ for 3 seconds in measuring mode.
  b. Select ***Enter password***.
  c. Enter the corresponding password and confirm with [OK].

7.5.3 Passwords

Calibration PWD	Permits access to the ***Information*** menu and the ***Calibration*** menu (adjustment settings) Default value: **_ _ _ 1**
Settings PWD	Permits access to all configurations and menus Default value: **_ _ _ 2**

Information on changing the passwords can be found in 11.1.

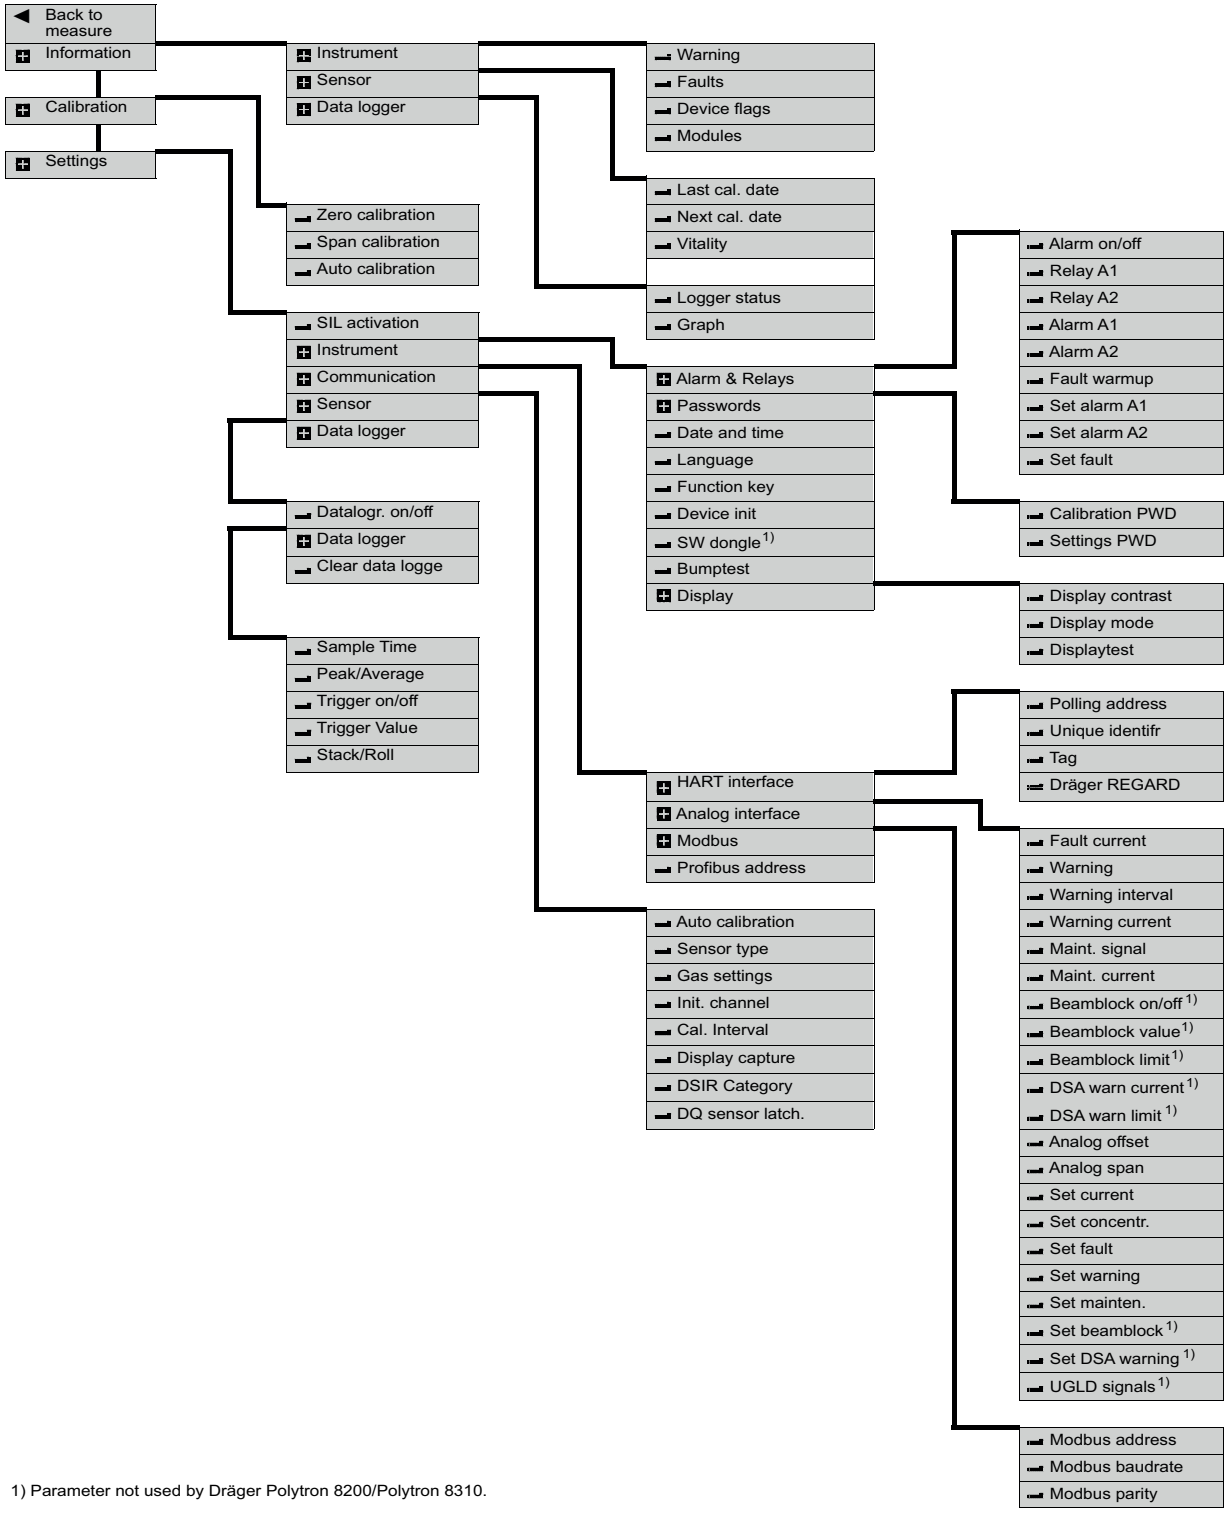
7.5.4 The *Information* menu



In the ***Information*** menu, the following information can be called up:

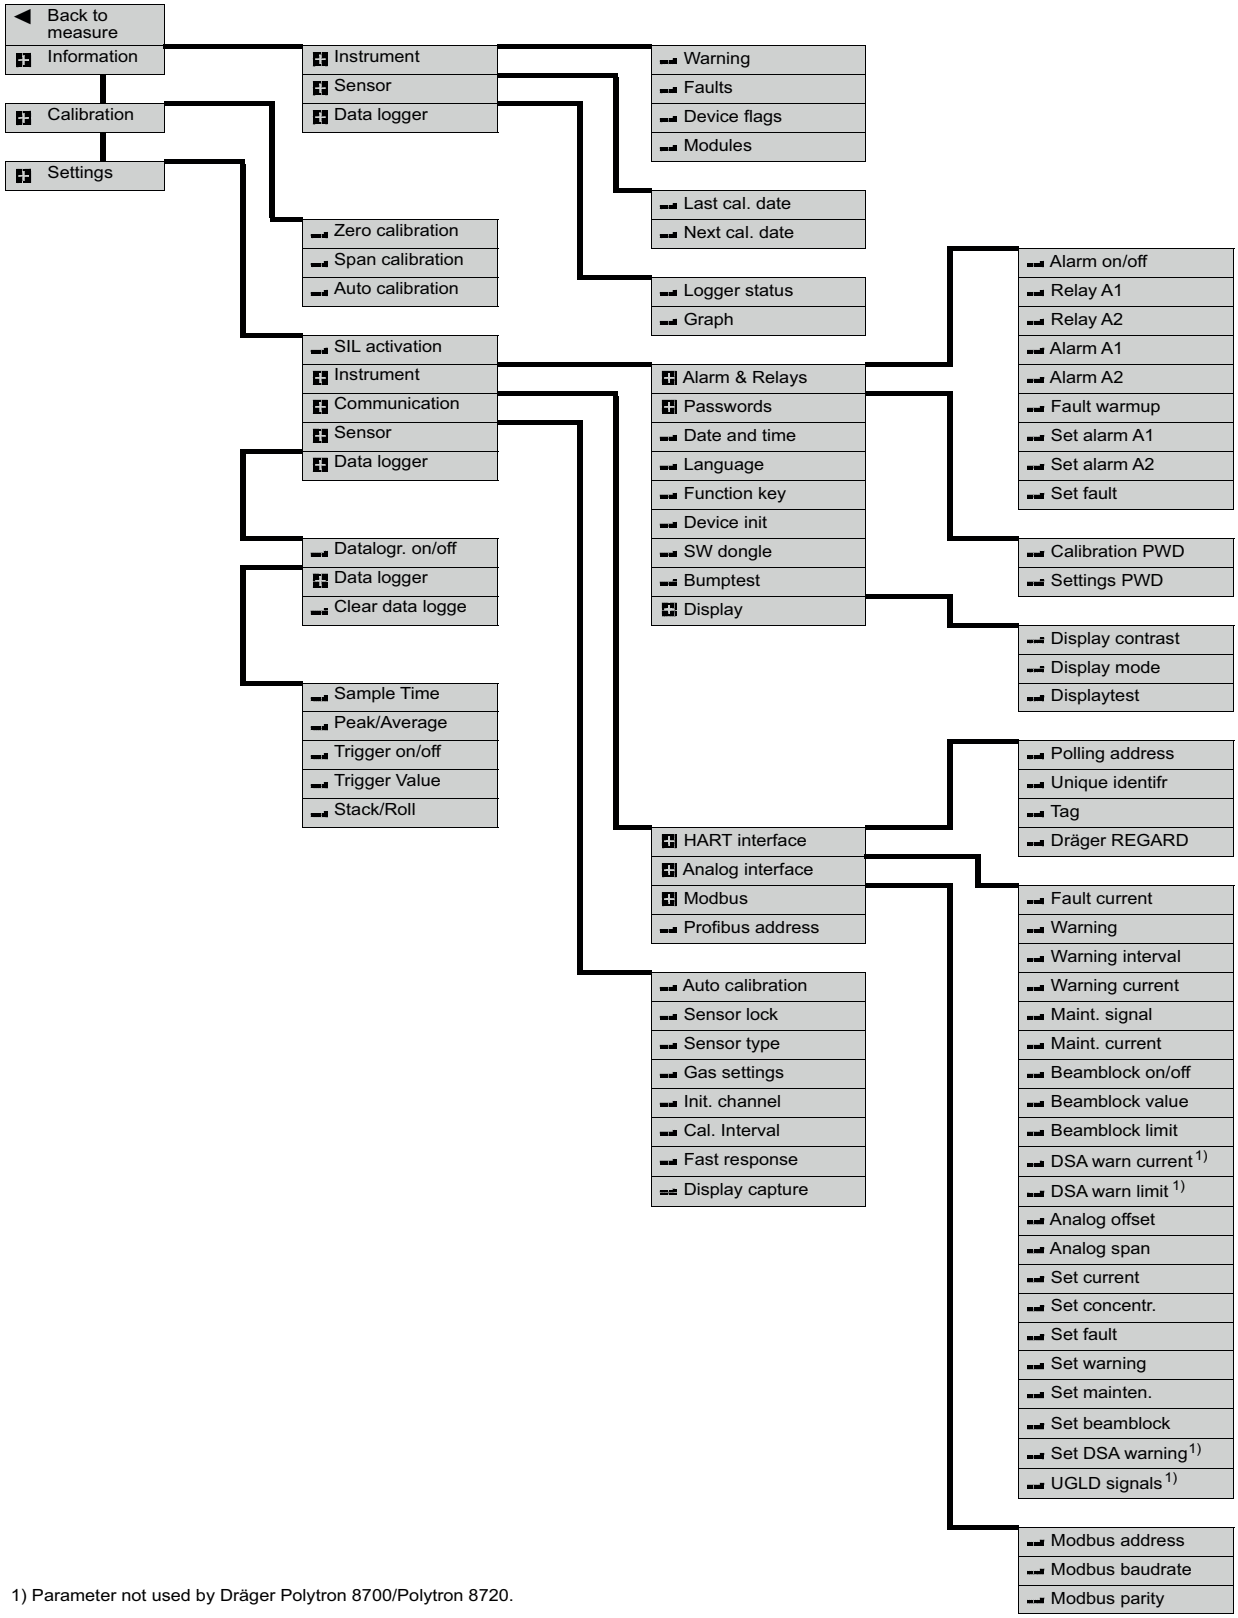
Instrument	
Warnings	Warning messages in plain text, including the corresponding number. If there are several warning messages, this will be shown accordingly (e.g. with 1/3 = screen 1 of 3).
Faults	Error messages in plain text, including the corresponding number. If there are several errors, this will be shown accordingly (e.g. with 1/3 = screen 1 of 3).
Device flag	With this function, the warning and error codes are shown in table format. If the value 00 is shown for all codes, then there are no warning or error messages present.
Modules	An overview of the installed hardware modules, as well as the software version of the SIOS-specified EC sensor interface, will be shown. For more detailed information, select the corresponding module. ■ = installed modules □ = modules not installed
Sensor	
Last cal. date	Adjustment date, unit, gas and concentration of the last adjustment are shown.
Next cal. date	Shows the date of the adjustment that is due next.
Vitality[1)]	The sensor vitality is shown in %. Dräger recommends replacing the sensor when vitality is < 25 %.
Sensor temperature[1)]	The current and highest sensor temperature will be shown.
SensorAlive	The sub-menu shows the number of days left for the expected service life and the vitality in %.
Data logger	
Logger status	Data logger status display (active or inactive)
Graph	Display of progress over last 15 minutes in a time/concentration graph.

1) The function is only available with the diagnostic dongle.



7.5.5 Menu overviews

Polytron 8100



1) Parameter not used by Dräger Polytron 8100.

Polytron 8200, Polytron 8310

1) Parameter not used by Dräger Polytron 8200/Polytron 8310.

Polytron 8700, Polytron 8720

1) Parameter not used by Dräger Polytron 8700/Polytron 8720.

7.6 Information on operation with a Dräger SensorAlive

– If a menu is accessed on the transmitter or certain errors are set, the Dräger SensorAlive does not perform a LifeTest.
– The Dräger SensorAlive can suppress the instrument calibration for a certain period of time (H_2S sensor: 30 minutes).
– If a high level of accuracy is required for the duration of the LifeTests, the time on the transmitter should be regularly checked and adjusted as necessary.
– The menu entries for the Dräger SensorAlive are only displayed if a Dräger SensorAlive is connected. The dongle functions are also visible in this case, but are not active.

8 Calibration

8.1 General information

– To ensure proper operation, adjust the zero-point first and then the sensitivity. If these procedures are performed in the incorrect order, adjustment cannot be continued due to software settings.
– If the intended operation is at high altitudes, the display value will be lower than that at sea level (reduced partial pressure). New span adjustment is recommended if the altitude or the ambient pressure changes. The factory adjustment is set to sea level.
– Dräger recommends adjusting instruments with the gas to be detected. This method is more accurate than a surrogate gas adjustment. A surrogate gas adjustment may only be performed as an alternative if a measured gas adjustment is not possible.
– Sensors for methane and hydrogen should only be adjusted with measured gas and not with surrogate gas.
– For the Polytron 8310 IR: Also observe the information in the instructions for use for the DrägerSensor IR[1].

During adjustment, the measurement accuracy of the sensor is checked and adjusted with a known test gas concentration. Adjustment must be performed on a regular basis. The length of the adjustment intervals depends on the ambient conditions in which the sensor is operated.

Ambient conditions and aging results in sensor drift. Sensor drift reduces the display accuracy of measured gases. Adjustment restores this display accuracy. Shorter adjustment intervals must be selected depending on the extent of the drift.

To gauge the ambient conditions for new installations, selecting short adjustment intervals and documenting the drift is recommended. The system operator should define the adjustment interval length with the aid of the collected data.

If a Dräger SensorAlive is used, the drift is compensated and can be read out.

Under normal conditions, Dräger recommends the following adjustment intervals[2]:
– Electrochemical sensors (EC): 6–12 months[3]
– Catalytic sensors (CAT): 4 months
– Infrared sensors (IR): 6–24 months[3]

8.2 Test gases

Please refer to the instructions for use provided for the respective sensor for the test gas properties (e.g. relative humidity, concentration). If there is no information provided relating to relative humidity, dry test gas can be used for the adjustment. The humidity of the test gas is not relevant for O_2 sensors.

Depending on the type of adjustment, various types of test gas are used.

Zero gas

The zero gas is a test gas used for adjustment of the zero-point of a sensor. Nitrogen (N_2) is used for O_2 and CO_2 sensors. With other sensors, ambient air can be used once it is free from disruptive contamination and the measured gas.

Adjustment gas

The adjustment gas is a test gas used for adjustment of the sensitivity of a sensor. The adjustment gas is a known concentration of the measured gas, diluted with clean air and nitrogen. Adjustment gas is not required for O_2 sensors, as oxygen from the ambient air is used.

8.3 Gas flow for adjustments

The gas flow varies according to each sensor.

EC sensor, CAT sensor	0.5 L/min ± 10 %
All other sensors	0.5 L/min - 2 L/min

The gas flow should correspond with the ambient conditions during operation (e.g. duct measurement with flow higher than 2 L/min)

8.4 Preparing for adjustment

General information

⚠ WARNING
Health hazard due to test gas
Inhaling test gas may risk health or lead to death.
► Do not inhale test gas.
► Observe risks and security statements related to the test gas (Refer to data sheets and instructions figuring on calibration devices).

1) 9023981 (English), 9033555 (Bulgarian, Romanian), 9023984 (Spanish, Portuguese), 9023986 (Danish, Norwegian), 9033556 (Czech, Croatian), 9033809 (Chinese), 9023985 (Hungarian, Polish), 9023982 (French), 9033557 (Slovak, Slovenian), 9033558 (Greek, Turkish), 9023987 (Italian, Dutch), 9023983 (Finnish, Swedish), 9023843 (German)

2) Observe the instructions for use for the sensor.
3) For applications in accordance with EN 45544-1 and EN IEC 62990-1, the adjustment interval must not exceed 6 months.

⚠ CAUTION
Triggering alerts by test gas
Applied test gas may trigger alerts.
► Make sure that test gas is no longer applied after calibration.

Prerequisites
– The sensor warm-up phase has been completed (see "Commissioning the gas detector", page 15).
– The date and time have been set (see "Setting date and time", page 29).
– If a Dräger SensorAlive is used, the last LifeTest must be sufficiently long ago (see the instructions for use of the sensor).

Special feature of the Polytron 8310
Dräger recommends carrying out an automatic zero calibration on the sensor before adjustment of the zero-point. This resets the zero-point tracking of the DrägerSensor IR, and the full tracking range is available.
1. Turn off the alarm activation for the gas detector (see "Turning the alarms on and off", page 30).
2. Use the calibration adapter to apply nitrogen, synthetic air, or clean air to the sensor and wait until a stable measured value is shown.
3. Set the magnetic wand on the area marked with the ⇩0 symbol (inside of the black border) on the surface of the sensor shell and hold it in place for at least 5 seconds. After 5 seconds, the sensor output signal switches to the display of the calibration signal (display change by approx. –10 %LEL) for as long as the magnetic wand is held in place. At the same time, a zero calibration of the optical measurement system is automatically performed.
4. Remove the magnetic wand. After 30 seconds, the instrument exits the automatic zero calibration routine. To confirm the automatic zero calibration, the output signal switches back to the calibration signal (display change to approx. –10 %LEL). This signal is also displayed for the same length of time as when starting the automatic zero calibration routine.
5. Turn on the alarm activation for the gas detector.

Polytron 8100, Polytron 8200, Polytron 8310
See figure B on the fold-out page.

Adjustment equipment:
– Dräger pressure regulator (1), use a stainless steel pressure regulator for reactive gases
– Dräger calibration adapter (2) (part number 6810536)
– Hose (3)
– Dräger test gas cylinder (4)

Preparing adjustment:
1. Connect the pressure regulator to the test gas cylinder.
2. Mount the calibration adapter on the sensor.
3. Connect the hose to the plug nipple connection.
4. Open the menu (see "Opening menus", page 18).

Polytron 87x0 IR
See figure B on the fold-out page.

Adjustment equipment:
– Dräger pressure regulator (1), use a stainless steel pressure regulator for reactive gases
– Dräger calibration adapter (5) (part number 6811610)
– Hose (3)
– Dräger test gas cylinder (4)

Preparing adjustment:
1. Connect the pressure regulator to the test gas cylinder.
2. Fit the calibration adapter to the splash guard so it snaps into place.
   This does not apply for mounting on ducts or if a process adapter or process cuvette is used (see installation instructions for the corresponding PIR 7x00 accessory).
3. Ensure that the sealing surfaces around the openings of the splash guard are clean. The insect guard does not have to be removed.
4. Connect the hose to the plug nipple connection.
5. Open the menu (see "Opening menus", page 18).

8.5 Zero calibration

8.5.1 General information

Ambient air can be used to calibrate the zero-point of the sensor instead of nitrogen or synthetic air only if the ambient air is known to be free of the target gas and any other gas to which the sensor may be cross-sensitive (as listed on the sensor data sheet). In this case, no cylinder or calibration adapter is needed for the zero calibration.

⚠ WARNING
Calibration fault at zero calibration
Insufficient ambient air flow may cause calibration errors.
► Make sure that the ambient air flow to the sensor is sufficient.

Polytron® 8100 EC-specific:

For Oxygen (O_2) sensors a zero calibration does not change any value in the firmware or sensor. Thus, the zero calibration function can be used to check the correct zero reading when Nitrogen is applied to the sensor. The Polytron 8100 EC will indicate a fault state if a zero check fails with a deviation of more than 0.6 Vol% O_2 from zero. In case of a fault, repeat the zero check or change the sensor if necessary. Use Nitrogen (N_2) for verification.

Polytron® 8200 CAT-specific:

Sensors must not be calibrated with pure nitrogen. Catalytic sensors need oxygen to work properly.

Polytron® 8720 IR-specific:

For Polytron 8720 IR (with PIR 7200 to detect carbon dioxide), only Nitrogen or Synthetic Air without any CO_2 content may be used for a zero calibration.

8.5.2 Performing a zero calibration

ℹ Calibration can be aborted at any time. To abort calibration select ***back***.

Prerequisites:
– Sensor has finished the warm-up phase
– Calibration is prepared.

Calibrate the zero-point as follows:
1. Select ***Calibration*** > ***Zero calibration*** and confirm.
   ⇒ The maintenance signal is transmitted via the analog interface. No alarms or fault relays are activated and the 🔧 symbol is displayed.
   ⇒ The message ***Apply zero gas*** is displayed.
2. Apply Synthetic Air or Nitrogen if ambient air cannot be used.
   a. Set the gas flow corresponding to the sensor used (see "Gas flow for adjustments", page 22)
3. Select ***Next*** and confirm.
   ⇒ The current value is displayed.

ℹ After 15 minutes without confirmation, the instrument reverts to the calibration menu without performing a calibration.

After the test gas has been applied to the sensor for 3 minutes and the displayed value is stable perform calibration.
4. Select ***calibrate*** and confirm.
   ⇒ The message ***please wait...*** is displayed.
   ⇒ The new current value is displayed.
5. Select ***Next*** and confirm.
6. Turn off the gas flow and remove the calibration adapter from the sensor or disconnect the hose.
   If the current value is not within the alarm range:
7. Select ***Next*** and confirm.
   ⇒ The instrument returns to the calibration menu.

8.6 Span calibration

8.6.1 General information

Polytron® 8310 IR-specific:

Due to the design of the DSIR gas sensor, the output signal of the gas sensor is limited to 45 %. . . 55 % of the internal supply voltage. If the gas concentrations increase further after the maximum sensor output signal has been reached, this does not lead to an increase of the values displayed on the instrument response transmitted to the central device. In case of substances with particularly low calibration factors and/or manual configuration of a high span calibration factor at the sensor, this may already happen at concentrations below 100 %LEL. For substitute gas calibrations, correct triggering of the alarm should therefore be checked with a test gas concentration corresponding to the alarm threshold. If necessary, the measuring range that can be displayed can be increased by reducing the sensor output signal as required with subsequent calibration on the instrument (see chapter "Manual span calibration of the output signal" in the instructions for use of the DSIR gas sensor).

8.6.2 Performing a span adjustment

ℹ Calibration can be aborted at any time. To abort calibration select ***back***.

Prerequisites:
– Adjustment is prepared.
– The zero-point has been adjusted.
– Specifically for all Polytron 8xx0 except the Polytron 8100 EC:
  The last valid zero adjustment was no longer than 24 hours ago.

Adjust the sensitivity as follows:
1. Select and confirm ***Calibration*** > ***Span calibration***.
   ⇒ The maintenance signal is transmitted via the analog interface. No alarms or fault relays are triggered and the 🔧 symbol is displayed.
   ⇒ The parameters for the adjustment gas are displayed, e.g.:[1)]
   Gas : H_2S
   Unit: ppm
   Concentr.: 25
2. If the displayed parameters do not match the target gas, adjust the parameters:
   a. Select and confirm ***Gas***.
   b. Select and confirm the adjustment gas from the list.
   c. Select and confirm ***Unit***.
   d. Select and confirm the unit of measurement from the list.
   e. Select and confirm ***Conc.***.
   f. Set the concentration of the adjustment gas.
3. If the settings are correct:
   a. Select and confirm ***Next***.
      ⇒ A message like ***Gas flow ON H_2S*** is displayed.
4. Apply adjustment gas.
   a. Set the gas flow corresponding to the sensor used (see "Gas flow for adjustments", page 22).
5. Select and confirm ***Next***.
   ⇒ The current value is displayed

ℹ After 15 minutes without confirmation, the instrument returns to the adjustment menu without performing an adjustment.

After the test gas has been applied to the sensor for 3 minutes and the displayed value is stable, perform adjustment.[2)]:
6. Select and confirm ***Next***.
   ⇒ The message ***please wait...*** is displayed.
   ⇒ The newly detected (current) value is displayed.

1) Not applicable for all sensors (see "Measuring mode", page 16).
2) For LC sensors, the test gas must be applied for at least 6 minutes.

7. Select and confirm ***Next***.
8. Turn off the gas flow and remove the calibration adapter from the sensor or disconnect the hose.

   If the current value is not within the alarm range:
9. Select and confirm ***Next***.
   ⇒ The instrument returns to the adjustment menu.

8.7 Automatic calibration

8.7.1 General information

Automatic calibration includes the zero calibration and a subsequent span calibration. It is an alternative to manually carrying out the zero and span calibration.

Not all sensors and gases support automatic calibration. If the function is not available, perform the calibration manually.

8.7.2 Perform automatic calibration

i After 24 hours, zero calibration is not up-to-date any more. Thus, automatic calibration cannot be performed unless zero calibration is performed again.

i Calibration can be aborted at any time. To abort calibration select ***back***.

Prerequisites:

– Automatic calibration is enabled.
– Sensor has finished the warm-up phase.
– Calibration is prepared.

Perform the automatic calibration as follows:

1. Apply Synthetic Air or Nitrogen if ambient air cannot be used.
2. Select ***Calibration*** > ***Auto calibration*** and confirm.
   ⇒ The message ***please wait...*** is displayed and the instrument automatically performs the zero calibration.
   ⇒ In the case of an O_2 sensor, ***Fresh air cal.*** is displayed.

   i The Maintenance signal is transmitted by the analog interface, no alarm or fault relays are switched and the symbol is displayed.
3. After a successful zero calibration, the span calibration is started.
   ⇒ The parameters for the gas are displayed, e. g.:[1)]
   Gas : H_2S
   Unit: ppm
   Concentr.:25
4. If the displayed parameters do not match the target gas, adjust the parameters:[2)]
   a. Select ***Gas*** and confirm.
   b. Select the calibration gas from the list and confirm.
   c. Select ***Unit*** and confirm.
   d. Select the unit of measurement from the list and confirm.
   e. Select ***Conc.*** and confirm.
   f. Set the concentration of the calibration gas.
5. If settings are correct:
   a. Select ***Next*** and confirm.
      ⇒ A message like ***Gas flow ON H_2S*** is displayed.
6. Apply calibration gas.
   a. Set the gas flow corresponding to the sensor used (see "Gas flow for adjustments", page 22)
7. Select ***Next*** and confirm.
   ⇒ The current value is displayed

   i After 15 minutes without confirmation, the instrument reverts to the calibration menu without performing a calibration.
8. Once the current value is stable, the instrument automatically performs the span calibration.
9. After a successful calibration, the new current value and the message ***Value OK?*** are displayed.
   - If not, select Redo and confirm to perform the calibration again.
   - If the value corresponds the target value, proceed.
10. Turn off the gas flow and remove the calibration adapter from the sensor or disconnect the hose.
11. Select ***Accept value*** and confirm to finish the calibration. The instrument returns to the calibration menu.

9 Troubleshooting

9.1 Faults

Number	Cause	Remedy
001, 003 - 004, 012 - 014, 020 - 024, 043, 060, 067	Serious instrument fault, various causes.	Have the instrument checked by DrägerService.
002, 025 - 027, 030 - 034, 041, 042, 044, 050, 052, 081, 085	Serious data error in the instrument, various causes.	Reset the instrument to factory settings. If the fault occurs again: Have the instrument checked by DrägerService.
005	Supply voltage is out of range.	Check the power supply.
010	4 to 20 mA interface cable not connected.	Check the 4 to 20 mA interface connection. If operated as a stand-alone instrument without a central controller, wire pin 3 to pin 4.

1) Not applicable for all sensors (see "Measuring mode", page 16).
2) Only possible for certain sensors.

Number	Cause	Remedy
011	Serious instrument fault, various causes.	Have the instrument checked by DrägerService. If the fault occurs again: Check the load or the cables.
045	Instrument does not detect any sensor.	Check the connections. If the fault occurs again: Have the instrument checked by DrägerService.
051, 054	Faulty zero adjustment.	Perform zero adjustment.
055	Faulty span adjustment.	Perform span adjustment.
076, 080 - 084	Instrument fault.	Check the electrical connections. If the fault occurs again: Have the instrument checked by DrägerService.
090	Sensor lock feature is activated. A sensor with a different part number has been connected.	Use a sensor with the same part number or deactivate the sensor lock feature.
105	Instrument fault.	Have the instrument checked by DrägerService.
137, 64, 91	Instrument fault.	Turn the instrument off and back on. If the fault occurs again: Have the instrument checked by DrägerService.

Only for Polytron 8100 EC with Dräger SensorAlive

Number	Cause	Remedy
220	Sensor opening is clogged.	Clean the sensor opening or replace the dust filter. Then confirm the clogged sensor in the menu (see "Dräger SensorAlive settings", page 36).
221	Sensor sensitivity is less than 40 % (calculated value).	Adjust or replace the sensor.
222	Gas value is too high after electrolysis due to a fault.	Replace the sensor or contact DrägerService.
223	Sensor sensitivity is too low.	Adjust or replace the sensor.
224	Conditioning current is not within the permissible range.	Replace the sensor or contact DrägerService.

Only for Polytron 87x0 IR

Number	Cause	Remedy
064, 071	Communication fault.	Check connection to PIR 7x00.
083	PIR 7x00 optics dirty.	Clean PIR 7x00 optics.
086	Supply voltage outside range	Check supply voltage.
087	4 to 20 mA fault at PIR 7x00 sensor.	Check 4 to 20 mA connection to PIR 7x00.
094, 095	Data error in the instrument.	Reset the sensor to factory default settings. If this error occurs again: Have the instrument checked by DrägerService.
096	SIL password does not match with PIR 7x00.	Enter password again.

9.2 Warnings

Number	Cause	Remedy
101	Data logger in Stack mode is 100 % full and is not logging any more data.	Have the instrument checked by DrägerService.
102	Data logger in Stack mode is 90 % full.	Download the data as soon as possible and clear the data logger.
103, 106	Data error in the instrument. Some dongle functions like the data logger, sensor test, etc. may no longer be available.	Reset the instrument to factory settings. If this error occurs again: Have the instrument checked by DrägerService.
104	Date or time setting not valid.	Set the date and time.
105	Instrument fault.	Have the instrument checked by DrägerService.
107	Battery for data memory empty.	Have the instrument checked by DrägerService.
110, 111, 112	The SW dongle has been removed without first being deactivated.	Deactivate the SW dongle.
113	Alarms inhibited.	Activate the alarms.
164, 165	Sensor warm-up phase not yet complete. Increased measurement errors must be expected.	Wait until the sensor warm-up phase has ended. Do not adjust the sensor before it is fully warmed-up.

Number	Cause	Remedy
167, 170	Adjustment interval expired.	Readjust the instrument.

Only for Polytron 8100 EC

Number	Cause	Remedy
163	Low EC sensor vitality	Replace sensor.
171	Negative reading. Value below range minimum.	Recalibrate zero point.

Only for Polytron 8100 EC with Dräger SensorAlive

Number	Cause	Remedy
320	Communication with the sensor failed. Diagnosis and gas generator no longer work.	Remove the sensor, do not use it for approx. 1 day and reinsert it. Check the firmware version and have it updated by DrägerService if necessary. Replace the sensor.
321	Evaluation of the sensor data failed. The sensor cannot perform or evaluate a LifeTest (preconditions are not met).	Change the time of the LifeTest or set the repeat profile to "Flexible" (see "Dräger SensorAlive settings", page 36). If the warning occurs again, contact DrägerService.
322	Sensor data set is faulty.	Replace the sensor.
323	Sensor data set is incompatible.	Contact DrägerService.
324	Sensor sensitivity is less than 50 % (calculated value).	Adjust the sensor and prepare for sensor replacement (e.g., order the spare part).
325	Sensor sensitivity is less than 40 % (calculated value).	Adjust or replace the sensor.
326	Sensor cannot be adjusted during a LifeTest and for a certain period afterwards.	To be able to perform a scheduled adjustment, the LifeTest can be temporarily inhibited in PolySoft via the Inhibit mode.
327, 330, 344, 347	Gas generator is not working.	Adjust or replace the sensor.
331	Gas generation failed.	Adjust the sensor.
332	Sensor is in the safe state. No LifeTests are performed (group warning).	Determine the cause and rectify it.
333	Real time clock of sensor is not working correctly.	Set the clock.
334	Sensor synchronization not complete.	Wait until synchronization is complete. Depending on the condition of the sensor, this state may last for several minutes. Have the firmware updated by DrägerService if necessary.
336	Internal sensor checks return faulty results.	Restart the system.
337	Transmitter firmware must be updated.	Contact DrägerService.
340	Sensor is synchronized after the system is restarted.	Wait until synchronization is complete.
342	Temperature difference between the two temperature measurement points is too great.	Wait and check if the LifeTest is evaluated, or replace the sensor.
347	Configuration failed due to an interruption in the communication between the transmitter and the sensor.	Reconfigure the sensor and check the configuration.
350	Gas generator is in the start-up phase.	Wait until the start-up phase has ended. During the start-up phase, the error detection and clogging detection functions are not active.
352	Sensor self-test failed.	Replace the sensor or contact DrägerService.
353	Sensor is temporarily in Inhibit mode. No LifeTests are performed during this time.	Inhibit mode can be exited manually via PolySoft or is exited automatically.
354	Error during system start.	Perform manual restart.
355	Sensor firmware is incompatible with the hardware.	Have the firmware updated by DrägerService.
356	Hardware data faulty.	Perform a restart or replace the sensor.
357	Sensor was set to the safe state manually, e.g., to perform a firmware update.	To exit the mode, restart the sensor.

Only for Polytron 87x0 IR:

Number	Cause	Remedy
163	Sensor temperature is very high.	
171	Zero drift too high.	Perform zero calibration.
172	PIR 7x00 optics dirty.	Clean PIR 7x00 optics.
173	Zero calibration expired for span calibration	Perform zero calibration.
182	Automatic calibration not possible with PIR 7200.	Perform new zero and span calibration

10 Maintenance

– The maintenance intervals must be established for each individual installation. Depending on safety considerations and application specific conditions the instrument is used in, these might need to be shortened.

Every 6 months:

– Inspection by trained service personnel.
– Check signal transmission to the controller (see "Testing the analog interface", page 33).
– Check LEDs as well as the triggering of the alarm device (see "Testing alarms/relays", page 31).

Regularly:

– Perform calibrations, see 8 Calibration

10.1 Performing a bump test and checking the response time (t90)

A bump test checks the response time without setting off an alarm.

1. Select and confirm ***Settings*** > ***Instrument*** > ***Bump test***.
   ⇒ The Maintenance symbol is displayed.
   ⇒ The analog output is set to the maintenance signal.
2. Apply a known gas concentration to the sensor.
3. Check the response time and compare it with the t90 value indicated in the corresponding sensor data sheet.
4. Press [OK] to return to measurement.

10.2 Sensor replacement

⚠ WARNING
Faulty Calibration
Faulty Calibration may cause inaccurate readings.
► If the sensor is replaced, all settings and parameters must be checked for correctness.
► Check calibration to verify proper operation.

10.2.1 Polytron® 8100 EC

A sensor can be replaced in the hazardous, classified area, without interrupting the power supply.

Sensor lock feature

If a sensor of the same type (same part number) was previously installed, the instrument-specific configuration is retained (gas type, measuring range, test gas, adjustment interval, etc.). Otherwise, the factory default settings of the new sensor are uploaded and will overwrite the instrument-specific configuration. This can be prevented if the sensor lock feature is activated (see "Setting sensor lock", page 35).

Sensor change function

The ***Change Sensor*** menu function lets you replace a sensor during operation without triggering a fault signal at the controller. It also ensures that all sensor data in the microprocessor can be saved in the sensor memory (EEPROM) before disconnecting the sensor.

Replacing a sensor

See figure C on the fold-out page.

A sensor can be replaced at any time.

1. Select ***Settings*** > ***Sensor*** > ***Change Sensor*** and confirm.
   ⇒ The maintenance signal is generated on the 4-20mA interface.
   ⇒ The display shows the following: ***Please remove the sensor***.
   ⇒ The Maintenance symbol is displayed.
2. Replace the old sensor with a new sensor:
   a. Loosen the locking screw (2) (2 mm Allen screw).
   b. Unscrew bayonet ring (3)
   c. Insert the sensor (4) into the opening and turn until it engages in the gas detector. This does not damage the sensor plug.
   d. Secure the sensor with the associated bayonet ring (3).

   ℹ For Dräger SensorAlive, a different bayonet ring needs to be used than for other EC sensors.

   e. Tighten the locking screw (2) so that the bayonet ring cannot come loose (required for installations in zone 22).
      ⇒ The display shows the following: ***Loading data, please wait***
3. If necessary, apply the label included with the sensor to the instrument. This identifies the gas type from a distance, even if the power has failed.
4. When the sensor data are loaded, the display shows: ***Data loaded***.
5. Select ***Back to menu*** and confirm.
   ⇒ The maintenance signal on the 4-20mA interface remains pending until the sensor is warmed-up.

   Maximum warm-up time of a new sensor: see the Instructions for Use for the sensor. For Oxygen: EN 50104 approvals.

6. Check calibration. If necessary, calibrate the instrument (see "Calibration", page 22).
7. Check the installation requirements and instrument for SIL status.
   See sections "Explosion proof (Ex d) installation - without Docking Station" to "Installation of sensors or sensing heads".

10.2.2 Polytron® 8200 CAT, 8310 IR, 87x0 IR

Replacing a sensor

1. If necessary, set the maintenance current for the analog interface.
2. Turn off power to the instrument or declassify the area according to local regulations.
3. Loosen set-screw and unscrew lid from instrument.
4. Pull out the PCB unit.
5. Turn PCB unit over and pull off the sensor connector.
6. Unscrew the sensor.
7. Insert the sensor wires through he threaded port of the enclosure.

⚠ WARNING
Explosion hazard!
The enclosure openings must be sealed to prevent ignition of hazardous atmospheres in case of an ignition inside the enclosure.

► Five threads must be engaged to ensure explosion proof status.

8. Screw in the sensor and tighten with the correct tightening torque (min. 266 in-lbs / min. 30 Nm)
9. Polytron® 8200 CAT-specific:
   Twist the sensor wires together. If necessary, fit a cable tie to keep the wires tight.
10. Plug the sensor connector back into socket.
11. Place PCB unit back into the enclosure.
12. Screw the cover on the instrument until it is correctly engaged (min. ≥44 in-lbs / min. ≥5 Nm) and tighten the locking screw.
13. Apply power to the instrument, if necessary.
    ⇒ The maintenance signal on the 4-20mA interface remains pending until the sensor is warmed-up.

    Maximum warm-up time of a new sensor: see the Instructions for Use for the sensor.
14. Check calibration. If necessary, calibrate the instrument (see "Calibration", page 22).
15. Check the installation requirements and instrument for SIL status.
    See sections "Explosion proof (Ex d) installation - without Docking Station" to "Installation of sensors or sensing heads".

10.3 Performing a display test

1. Select and confirm ***Settings*** > ***Instrument*** > ***Display*** > ***Displaytest***.
2. Select and confirm ***Enable***.
   ⇒ The information on the display is shown inverted. All LEDs are turned on.
   When the menu is exited, the inversion is ended.

11 Instrument settings

11.1 Setting passwords

1. Select ***Settings*** > ***Instrument*** > ***Passwords*** the desired password and confirm.

Calibration PWD	Access to zero and span calibration
Settings PWD	Access to all configuration parameters

2. Select the line for editing the password and confirm.
3. Set the password and confirm.
4. Select ***Confirm*** and confirm with [OK].

11.2 Setting date and time

1. Select ***Settings*** > ***Instrument*** > ***Date and time*** and confirm.
2. Select the line for editing the date or time and confirm.
3. Select ***Confirm*** and confirm with [OK].

11.3 Setting language

1. Select ***Settings*** > ***Instrument*** > ***Language*** and confirm.
2. Select a language from the list and confirm.

11.4 Configuring function key

1. Select ***Settings*** > ***Instrument*** > ***Function key*** and confirm.
2. Select a function and confirm.

Graph	The measurements of the past 15 minutes are displayed as a time/concentration graph.
Faults	Fault messages are displayed in plain text.
Warnings	Warning messages are displayed in plain text.
Bump test	The bump-test allows applying gas to the sensor without generating an alarm. The maintenance signal is transmitted. After 15 minutes or tapping [OK] again ends the bump test and the instrument returns to normal operation.
Sensor vitality[1)]	Shows the remaining sensor vitality.

1) Only with diagnostic dongle

11.5 Resetting to default settings

This function resets the instrument to factory default settings.

1. Select ***Settings*** > ***Instrument*** > ***Device init*** and confirm.
2. Select ***Confirm*** and confirm with [OK].

11.6 Changing the display contrast

1. Select ***Settings*** > ***Instrument*** > ***Display*** > ***Display contrast*** and confirm.
2. Change the contrast and confirm.

11.7 Changing the display mode

1. Select ***Settings*** > ***Instrument*** > ***Display*** > ***Display mode*** and confirm.
2. Select the desired mode and confirm.

Standard	Shows the standard display.
Non-display	Shows the start screen and the applicable symbols.

If an alarm is triggered, the display shows the current gas concentration and the red LED blinks regardless of the selected display mode.

11.8 Relays

11.8.1 Combinations of latching and alarm acknowledgment

The following examples give an overview of relay acknowledgment combinations.

	Latching (Manual relay reset)	**Non-Latching** (Automatic relay reset after alarm condition cleared)
Acknowledgeable	Relay reset possible at any time.	
Non-acknowledgeable	Relay reset not possible before alarm condition cleared.	
Pre-acknowledgeable	Alarm acknowledgment possible before the alarm condition cleared. The relay resets automatically after the alarm condition cleared.	

Latching and non-latching signals are not time-limited. Latching signals stay active until they are acknowledged. Non-latching signals stop as soon as the triggering condition clears.

11.8.2 Configuring relay A1 or A2

This function defines whether the alarm relay is energized during normal operation or energized at an alarm condition.

1. Select ***Settings*** > ***Instrument*** > ***Alarm***> ***Relay A1*** or ***Relay A2*** and confirm.
2. Select the desired option and confirm.

Normally energized	The relay contact is energized during normal operation and changes if an alarm is triggered. At a loss of power this triggers an alarm (fail-safe).
Energ. on alarm	If an alarm is triggered, the relay contact is energized.

11.8.3 Setting fault relay warm-up 1

This function is used to set operation of the fault relay during warm-up 1 to indicate the warm-up 1 state on the relay output.

1. Select ***Settings*** > ***Instrument*** > ***Alarm***> ***Fault warm up*** the desired option and confirm.

static	The fault relay triggers a connected alarm indicator permanently. The orange LED is lit continuously.
dynamic	The fault relay switches state for 9 seconds. *Example:* – A horn is connected to fault relay output Normally Open. – Relays are configured as normally energized. ⇒ The horn and the orange LED of the transmitter are 1 second active and 9 seconds in-active.

11.9 Alarm configuration

11.9.1 Turning the alarms on and off

1. Select ***Settings*** > ***Instrument*** > ***Alarm*** > ***Alarm on/off***.

Enable	Alarm activation is switched on.
Disable	Alarm activation is switched off. LEDs, relays and interfaces do not indicate an alarm condition. The 4-to-20 mA interface transmits the maintenance signal. The value determined and the ! symbol will be shown. The fault relay indicates an error.

2. Select and confirm ***Enable*** or ***Disable***.

11.9.2 Configuring alarms

1. Select and confirm ***Settings*** > ***Instrument*** > ***Alarm*** > ***Alarm A1*** or ***Alarm A2***.
   The current alarm threshold is displayed.
2. Accept the displayed suggestion or change the following settings (confirm the configuration steps one after the other with ***Next***):
   a. Set the value for the alarm threshold.

b. Set the alarm direction.

Rising	The alarm direction is called rising if the gas concentration has to exceed a certain value to activate an alarm.
Falling	The alarm direction is called falling if the gas concentration has to fall below a certain value to activate an alarm.

c. Set the latch mode.

Latching	Once the alarm threshold is reached, the instrument will trigger the alarm. It will remain in the alarm state even if the gas concentration no longer meets the alarm condition. To clear a latching alarm, it must be acknowledged.
Non-latching	The alarm state clears if the gas concentration no longer meets the alarm condition.

d. Set the acknowledgement mode.

Acknowledgeable	The alarm relay and the alarm LED can be reset before the alarm condition clears.
Non-acknowledgeable	The alarm relay and the alarm LED cannot be reset until the alarm condition clears.
Pre-Acknowledgeable	The alarm state can be acknowledged before the alarm condition clears. The alarm relay and the alarm LED stay active until the alarm condition clears, however.

e. Set the hysteresis value.
The hysteresis function defines a range in which a triggered relay will remain in its state until the gas concentration is outside the defined range again. Example: The alarm threshold is set to 40 ppm and hysteresis to 3 ppm. The alarm remains active until the value falls below 37 ppm. This prevents relays from closing and opening in rapid succession at an alarm threshold ("chattering").

ℹ If the direction of an alarm is changed (from falling to rising or vice versa), the hysteresis value must be checked and corrected if necessary.

⇒ A confirmation screen shows all settings.

f. Select ***Confirm*** and confirm with OK.

✓ The new settings are saved.

11.9.3 Testing alarms/relays

These functions change the statuses of a relay and an LED for test purposes (e.g., to check the function of alarm devices connected to the relay). The ℹ symbol is displayed. After exiting this function, the statuses of the relay and the LED will automatically return to their previous statuses.

1. Select and confirm the desired alarm condition via ***Settings*** > ***Instrument*** > ***Alarm***.

Set Alarm A1	Simulates a pre-alarm
Set alarm A2	Simulates a main alarm
Set fault	Simulates a fault signal

2. Select and confirm ***Enable***.
⇒ The fault relay is de-energized and the 4 to 20 mA interface is set to fault current. The yellow LED is lit, the symbol for maintenance is shown.
When the menu is exited, the simulation is ended.

11.10 Data logger settings

11.10.1 Displaying graph

The last 15 minutes as a time/concentration graph can be viewed.

1. Select ***Information*** > ***Data logger*** > ***Graph***

11.10.2 Switching data logger on or off

1. Select ***Settings*** > ***Data logger*** > ***Datalogr. on/off*** and confirm.
2. Select ***Enable*** or ***Disable*** and confirm.

11.10.3 Setting the sampling time

This function defines how often a value is stored.

1. Select ***Settings*** > ***Data logger*** > ***Datalogr. on/off*** > ***Sample time*** and confirm.
2. Select the sample time and confirm.

11.10.4 Setting peak/average

This function determines which value is stored.

1. Select ***Settings*** > ***Data logger*** > ***Data logger*** > ***Peak/Average*** and confirm.
2. Select ***Peak*** or ***Average*** and confirm.

Peak	The maximum value (if monitoring falling concentrations, the minimum value) of the measured concentrations within the selected sampling time is stored.
Average	The average value of all the measured concentrations within the selected sampling time is stored

11.10.5 Switching triggering mode on or off

This function allows storing values from a certain value on.

1. Select ***Settings*** > ***Data logger*** > ***Data logger*** > ***Trigger on/off*** and confirm.
2. Select ***On*** or ***Off*** and confirm.

On	Measurements are stored if they exceed a threshold beyond the trigger value (relative to the last stored value).
Off	Measurements within the sampling time are stored.

11.10.6 Setting trigger value

This function defines the trigger threshold to store a value.The trigger value is defined as a percentage of the full scale deflection.

Example: A trigger value of 2 % at full scale deflection of 500 ppm will only store values if they deviate by 10 ppm (relative to the previously stored value).

1. Select ***Settings*** > ***Data logger*** > ***Datalogr. on/off Trigger value*** and confirm.
2. Set the trigger value and confirm.

11.10.7 Setting stack/roll function

1. Select ***Settings*** > ***Data logger*** > ***Data logger*** > ***Stack/Roll*** and confirm.
2. Select ***Stack*** or ***Roll*** and confirm.

Roll	Once the capacity of the data logger is reached, the old data are overwritten by new values.
Stack	Once the capacity of the data logger is reached, no more data can be stored. The instrument issues a warning.

11.10.8 Clearing data logger

This function deletes the stored data.

1. Select ***Settings*** > ***Data logger*** >***Clear data logger*** and confirm.
2. To clear the data-logger, select ***Confirm*** and confirm with [OK].

12 Interface settings

12.1 4-20mA interface

The current output of the instrument during normal operation is between 4 and 20 mA and is proportional to the detected gas concentration.

Polytron 8xx0 uses different current values to indicate various modes of operation. The factory default settings are user adjustable for application specific requirements. This follows the NAMUR recommendation NE43.

12.1.1 Full scale deflection

Polytron® 8100 EC, 87x0 IR and 8200 CAT LC only

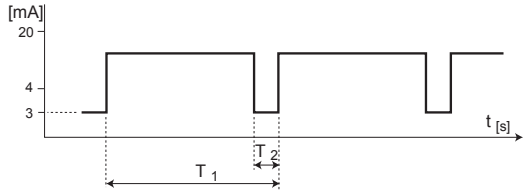
Some sensors offer an adjustable full scale deflection to limit the measuring range for the 4-20 mA interface.

The full scale deflection (FSD) sets an endpoint within the measuring range of the sensor. If the gas concentration reaches this endpoint, the 4-20mA interface transmits 20mA.

Example: Required range 0 to 500 ppm CO (e.g. part number 6809605 default 300 ppm, range min/max = 50/1000 ppm).Select full scale deflection as 500 ppm. The analog output will be linear between 4 mA = 0 ppm and 20 mA = 500 ppm.

12.1.2 Setting fault current

This function defines the current for the fault signal.



1. Select ***Settings*** > ***Communication*** > ***Analog interface*** >***Fault current*** and confirm.
2. Select the line for editing the current and confirm.
3. Set the current and confirm.
   ⇒ The setting for the ***Fault current*** is displayed.
4. Select ***Confirm*** and confirm with [OK].

12.1.3 Information regarding the warning signal

To transmit a warning signal via the analog interface, it must be switched on.
The warning signal alternates between the warning current and the measurement current.

– Warning current (interval T2)
– Measurement current (interval T1-T2)

Time intervals and the warning current are configurable.

12.1.4 Switching the warning signal on or off

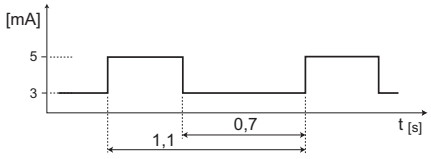
1. Select ***Settings*** > ***Communication*** > ***Analog interface*** > ***Warning*** and confirm.
2. Select ***Enable*** or ***Disable*** and confirm.

12.1.5 Setting warning interval

1. Select ***Settings*** > ***Communication*** > ***Analog interface*** > ***Warning interval*** and confirm.
2. Set times for warning intervals T1 and T2 and confirm.

12.1.6 Setting warning current

1. Select ***Settings*** > ***Communication*** > ***Analog interface*** > ***Warning current*** and confirm.
2. Set the current and confirm with [OK].



12.1.7 Setting the warnings of the Dräger SensorAlive

This menu can be used to set various parameters of the warning current:

- To set the warning current, select ***Settings*** > ***Communication*** > ***Analog interface*** > ***DSA warn current*** and enter the value.
- To set the threshold value for the warning, select ***Settings*** > ***Communication*** > ***Analog interface*** > ***DSA warn limit*** and enter the value.
- To enable or disable the warning, select ***Settings*** > ***Communication*** > ***Analog interface*** > ***Set DSA warning*** and confirm.
  Select ***Enable*** or ***Disable*** and confirm.

12.1.8 Setting maintenance signal

1. Select ***Settings*** > ***Communication*** > ***Analog interface*** > ***Maint. signal*** and confirm.
2. Set the signal type and confirm.

static	A constant current that can be configured.
dynamic	A square wave signal with the following characteristics: 

12.1.9 Setting the maintenance current

The maintenance current can only be set if the maintenance signal has been set to static.

1. Select ***Settings*** > ***Communication*** > ***Analog interface*** >***Maint. current*** and confirm.
2. Set the current and confirm.

12.1.10 Setting analog offset

This function adds an offset to the analog output at 4 mA. The offset adjusts the current at 4 mA without affecting the 20 mA set point.

1. Select ***Settings*** > ***Communication*** > ***Analog interface*** >***Analog offset*** and confirm.
2. Select the line for editing the offset (range: -0.5 to 0.5 mA, SIL: -0.1 to 0.1) and confirm.
3. Set the current and confirm.
   ⇒ The setting for the ***Analog offset*** is displayed.
4. Select ***Confirm*** and confirm with [OK].

12.1.11 Setting analog span

This function adjusts the analog output at 20 mA without affecting the 4 mA set point.

1. Select ***Settings*** > ***Communication*** > ***Analog interface*** > ***Analog span*** and confirm.
2. Select the line for editing the offset (range: -0.5 to 0.5 mA, SIL: -0.1 to 0.1) and confirm.
3. Set the current and confirm.
   ⇒ The setting for the ***Analog span*** is displayed.
4. Select ***Confirm*** and confirm with [OK].

12.1.12 Testing the analog interface

These functions change the current of the analog interface for test purposes (e.g., to check the programming of the controller). It may be necessary to temporarily inhibit the alarms at the controller to avoid false alarms. After exiting these functions, the currents automatically return to the maintenance signal. During the test, the maintenance symbol is displayed.

- To set the current or concentration:

1. Select the desired option via ***Settings*** > ***Communication*** > ***Analog interface***.

Set Current	This function sets the current to any value between 0 and 22 mA. Offset current and analog span are not used in this function.
Set concentr.	This function sets the current to any measured value between 0 ppm and full scale deflection.

2. Once the alarms at the controller are inhibited, confirm the message ***Inhibit all alarms*** with ***Next***.
3. Select the line for editing and confirm with [OK].
4. Set the desired value.
5. Select and confirm ***Next***.
6. Select the desired option:

Set concentr. out / ***set current out***	This function simulates the preset measured value or test current value. During the test, the maintenance symbol is displayed.
concentration off / ***current off***	This function aborts the transmission of the preset test value.

7. Select and confirm ***Next***.
   ⇒ The function is aborted.
8. Once the alarms at the controller are enabled again, confirm the following message: ***Enable all alarms***.

- To set the test signal:

1. Select the desired test via ***Settings*** > ***Communication*** > ***Analog interface***.

Set fault	This function sets the current to the fault current.
Set warning	This function sets the current to the warning current.
Set mainten.	This function sets the current to the maintenance current.

2. Once the alarms at the controller are inhibited, confirm the message ***Inhibit all alarms***.
3. Select and confirm ***Enable*** or ***Disable***.

12.1.13 Beam block

This function is only available for Polytron 87x0 IR (using the sensor PIR 7000/7200).

The factory default setting for the beam block function is off.

If turned On, the beam block signal will be transmitted on the analog interface if the optics of the PIR 7000/7200 sensor is “dirty”. The optics of the PIR 7000/7200 can become “dirty” if there is a build-up of deposits on the optical surfaces. However, if the gas concentration rises to a level above beam block limit, the instrument returns to normal operation.

If the build-up of deposits on the optical surfaces increases beyond the point where a measurement is possible, the instrument will go into fault.

- To set beam block signals on/off:

1. Select ***Settings*** > ***Communication*** > ***Analog interface*** and the desired option.

Beamblock on/off	This function switches the beam block on or off
Set beamblock	This function sets the current to the beam block warning current

2. Select ***Enable*** or ***Disable*** and confirm.

- To set beam block signals:

1. Select ***Settings*** > ***Communication*** > ***Analog interface*** and the desired option.

Beambl. current	This function defines the current for the beam block signal.
Beamblock limit.	This function defines the maximum limit if the beam block signal will be transmitted on the analog interface.

2. Select the current line for editing the current and confirm.
3. Set the current and confirm.
   ⇒ The setting for the beam block current is displayed.
4. Select ***Confirm*** and confirm with OK.

12.2 HART interface

12.2.1 Setting the polling address

The polling address (query address) configures the gas detector for analog operation or multidrop operation.

HART command: #6 (Write Polling Address)

1. Select ***Settings*** > ***Communication*** > ***Hart interface*** > ***Polling address***.
2. Set the polling address and select ***Confirm***.

0	Activates analog operation.
1 to 15	Activates multidrop operation. The 4 to 20 mA interface is deactivated and set to a constant current of approx. 1 mA.

ℹ Configure all instruments on a line with different polling addresses. It is advised to choose a sequence starting with 1.

12.2.2 Displaying the Unique Identifier

The Unique Identifier (unique HART address) must be known for almost all HART addressing commands.

HART commands:

– #0 (Read Unique Identifier)
– #11 (Read Unique Identifier associated with Tag)

1. Select ***Settings*** > ***Communication*** > ***Hart interface*** > ***Unique identifier***.
2. The Unique Identifier is displayed.

12.2.3 Setting the HART tag

The HART tag (measurement point identification) is used to mark a measurement point.

1. Select ***Settings*** > ***Communication*** > ***Hart interface*** > ***Tag***.
2. Set the HART tag and select ***Confirm***. The HART tag can consist of up to 8 alphanumeric characters.

12.2.4 Setting the Dräger REGARD protocol

This function switches between different HART protocols.

1. Select ***Settings*** > ***Communication*** > ***Hart interface*** > ***Dräger REGARD***.
2. Select the software version corresponding to the REGARD controller.

12.3 Digital interfaces

Information on configuring the other interfaces is provided in the following documents:

Interface	Document
PROFIBUS PA	9033782
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

13 Sensor settings

13.1 Switching automatic calibration on or off

1. Select ***Settings*** > ***Sensor*** > ***Auto calibration*** and confirm.
2. Select ***Enable*** or ***Disable*** confirm with [OK].

13.2 Capture range

The capture range blanks out measurement fluctuations. Measurement fluctuations are minor variations in measured values (such as signal noise, variations in concentration). Those variations do not change the transmitted or displayed value. Measured values within this range will be displayed with the capture value. Measured values outside the capture range will be displayed with the actual measured value.

Capture value (offset)

The capture value is displayed continuously, as long as the measured value ranges between the upper and lower capture value limits.

Upper capture value limit

The upper capture value limit marks the upper limit of the range in which the capture value is displayed.

Lower capture value limit

The lower capture value limit marks the lower limit of the range in which the capture value is displayed.

13.2.1 Setting capture range

1. Select ***Settings*** > ***Sensor*** > ***Display Capture*** and confirm.
2. Set offset in the first window.
3. Set the lowest value of the capture range and confirm with ***Next***.
4. Set the highest value of the capture range and confirm with ***Next***.
5. Check all the values and confirm with ***Next***.

13.2.2 Switching capture range off

1. Select ***Settings*** > ***Sensor*** > ***Display Capture*** and confirm.
2. Set offset in the first window.
3. Set the lowest value of the capture range to 0 and confirm with ***Next***.
4. Set the highest value of the capture range to 0 and confirm with ***Next***.
5. Check all the values and confirm with ***Next***.

13.3 Resetting sensor

This function resets the sensor to factory default settings.

1. Select ***Settings*** > ***Sensor*** > ***Init. channel*** and confirm.
2. Select ***Confirm*** and confirm with [OK].

13.4 Setting calibration interval

After the calibration interval expires, the instrument will issue a warning that the calibration is past due.

1. Select ***Settings*** > ***Sensor*** > ***Cal. interval*** and confirm.
2. Set the calibration interval and confirm with [OK].

13.5 Setting sensor lock

This point is only valid for Polytron 8100 EC and Polytron 87x0 IR.

1. Select ***Settings*** >***Sensor*** > ***Sensor lock*** and confirm.
2. Select ***On*** or ***Off***.

On	The instrument rejects any sensor whose part number does not match the part number of the previously installed sensor.
Off	The instrument accepts any suitable sensor, uploading the default settings of this sensor. However, this overwrites any customized settings with the default settings of the new sensor.

13.6 Software dongles for EC sensors

13.6.1 Installing the dongle

1. Switch off power to the instrument or declassify the area according to the local regulations.
2. Loosen set-screw and unscrew lid from instrument.
3. Insert the dongle with the Dräger logo facing upwards in the slot of the PCB unit, See figure D on the fold-out page..
4. Position the PCB unit back cover and close the instrument (see "Closing the gas detector", page 13).

13.6.2 Deactivating dongles

This function deactivates a dongle to safely remove the dongle or if the dongle is faulty.

A dongle can only be reactivated by cycling the power to the instrument.

1. Select ***Settings*** > ***Instrument*** > ***SW dongle*** > and the dongle to be deactivated, and confirm.
2. Select ***Deactivation func.***. The selected dongle is deactivated.

13.7 Sensor settings Polytron® 8100 EC

13.7.1 Sensor self-test

This function is only active if the sensor-test dongle or diagnostic dongle is installed. If the sensor does not pass the self-test, a warning or error message is issued.

Setting regular sensor self-tests

This feature triggers the sensor self-test at regular intervals. The instrument then routinely checks that the sensor is functioning correctly.

1. Select and confirm ***Settings*** > ***Sensor*** > ***Set Sensortest***.
2. Select and confirm ***Enable*** or ***Disable***.

Starting sensor test manually

This function starts a single sensor self-test.

1. Select ***Settings*** > ***Sensor*** > ***Sensor test*** and confirm.
2. ***Start sensor test*** is displayed.
3. Select ***Confirm***.

✓ The test result is displayed.

13.7.2 Gas settings

This function sets the gas type, measuring range, and units of measurement. Different settings are possible depending on the installed sensor.

1. Select and confirm ***Settings*** > ***Sensor*** > ***Gas settings***.
   ⇒ The current measured gas is displayed.
2. Select and confirm the measured gas from the list.
   ⇒ The current unit of measurement is displayed.
3. Select and confirm the unit of measurement from the list.
   ⇒ The current full scale deflection is displayed.
4. For certain EC sensors only: Set and confirm the full scale deflection.
   ⇒ The new full scale deflection is displayed.
5. Select and confirm ***Next***.
   ⇒ An overview of the new gas settings is displayed.
6. After reviewing it, select ***Back to menu*** or ***Confirm***.

Back to menu	Select Back to menu to exit the function without changes and confirm with [OK].
Confirm	Select Confirm to accept the settings and confirm with [OK].

13.7.3 Dräger SensorAlive settings

This menu lets you select various parameters that define the behavior of the Dräger SensorAlive:

- To activate or deactivate the LifeTest functions of the sensor, select and confirm ***Settings*** > ***Sensor*** > ***SensorAlive*** > ***DSA activation***.
  Select and confirm ***Enable*** or ***Disable***.
- To acknowledge a clogged sensor, select ***Settings*** > ***Sensor*** > ***SensorAlive*** > ***Ack faults***.
- To enable or disable fault detection, select and confirm ***Settings*** > ***Sensor*** > ***SensorAlive*** > ***Fault detection***.
  Select and confirm ***Enable*** or ***Disable***.

The ***SensorAlive*** menu has the following sub-menus:

– LifeTest
– Sensitivity monitoring

The following parameters can be set in the LifeTest sub-menu:

- To define when to start a test run, select ***Time***.
  Enter a time and confirm. The test run is started when this time is reached on the transmitter.

  ℹ Transmitters do not support an automatic daylight savings changeover.

- To define the value to be output via the transmitter during the LifeTest, select ***Output behavior***.
  Select and confirm ***Fixed***, ***Maintenance*** or ***Measurement val.***.
- To define whether retests are to be carried out in a test run if a LifeTest has a negative test result, select ***Repetition mode***.
  Select and confirm ***Flexible***.
  If ***Static*** is selected, no retests are carried out and a new test run is carried out at the indicated time instead.
- To define when to abort a LifeTest, select ***Cancel threshold***.
  Enter a value and confirm.

  ℹ During a LifeTest, test gas is applied to the Dräger SensorAlive. This causes the measured value to rise. To prevent an alarm from being triggered, the measured value is not transmitted for a maximum of 15 minutes by default. The behavior during a LifeTest can be configured in the ***Output behavior*** menu, however. Independent of this, the sensor detects a gas leak if the measured gas concentration is greater than the gas concentration expected as a result of the LifeTest. The difference corresponds to the concentration of the gas leak and is compared with the value entered in ***Cancel threshold***. If this value is exceeded, the LifeTest is immediately aborted. The sensor switches back to measuring mode and the transmitter once again outputs a measured value. If relays are used, these are tripped on the transmitter and, where applicable, an alarm is triggered.

The following parameters can be set in the ***Sensitiv. check*** sub-menu:

- To define whether a warning needs to be issued, select and confirm ***Activation***.
- To define when a warning must be output, select and confirm ***Alert < 50%*** or ***Alert < 40%***.

13.8 Sensor settings Polytron® 8200 CAT / 8310 IR

13.8.1 Sensor type

This function defines the sensor type installed.

1. Select ***Settings*** > ***Sensor*** > ***Sensor type*** and confirm.
2. Select the sensor type and confirm.

13.8.2 Gas settings

This function sets the unit of measurement.

For LC sensors, this function also sets the full scale deflection.

1. Select ***Settings*** > ***Sensor*** > ***Gas settings*** and confirm.
2. Select the unit of measurement from the list and confirm.
   ⇒ For DQ sensors and DSIR:
   An overview of the new gas settings is displayed.
   Continue with step 4.
   ⇒ For LC sensors:
   The current full scale deflection is displayed. Continue with step 3.
3. Set the full scale deflection and confirm (only for LC sensors).
   ⇒ An overview of the new gas settings is displayed.
4. After review, select ***Back to menu*** or ***Confirm***.

Back to menu	Select Back to menu for leaving the function without changes and confirm with [OK].
Confirm	Select Confirm to accept the settings and confirm with [OK].

13.8.3 Setting the DQ sensor latching

This feature is only available if there are no relays installed.
This feature is used to determine whether the DQ sensor must be acknowledged after measuring a concentration higher than 100 %LEL.
This setting does not apply for LC sensors.

1. Select and confirm ***Settings*** > ***Sensor*** > ***DQ Sensor latch.***.
   ⇒ The current setting is displayed.
2. Select and confirm ***Enable*** or ***Disable***.

⚠ WARNING
Explosion Hazard
If sensor latching is disabled and an alarm indicating an explosion hazard is acknowledged, the instrument informs the end user of such hazard by having the red LED on the display being continuously lit.

► Before acknowledging an over range, ensure that the gas concentration has fallen under 100%LEL.

⚠ WARNING
Explosion Hazard possible
Operation is non-compliant with BVS type examination.
If DQ sensor latching is disabled, for safe operation in accordance with BVS 13 ATEX G 001 X, the central controller must support this function.

► Make sure that over range latching is active at the display unit.

13.9 Sensor settings Polytron 8310 IR

13.9.1 Changing the gas category

The DrägerSensor IR can measure gases and vapors that belong to the methane, propane, or ethene (ethylene) gas categories. A gas category must be set for the DrägerSensor IR depending on which target gas is to be measured. For the assignment of gases and vapors to the gas categories, see the DrägerSensor IR documentation.

13.9.2 Changing the gas category

Prerequisites

– The gas detector was turned on less than an hour ago.
– The automatic zero calibration on the sensor was performed less than an hour ago (see "Special feature of the Polytron 8310", page 23).
– The gas concentration measures by the gas detector is below 10 %LEL (apply zero gas to the sensor if necessary).

1. Turn off the alarm activation for the gas detector (see "Turning the alarms on and off", page 30).
2. Select ***Settings*** > ***Sensor*** > ***DSIR Category*** and confirm.
   ⇒ The gas category is displayed on the instrument.

ℹ The next steps are carried out on the sensor.

3. To select the gas category on the sensor, tap the ⇧S or ⇩0 symbol with the magnetic wand.
   ⇒ START is displayed on the gas detector.
4. Remove the magnetic wand.
   ⇒ The sensor switches to an output signal that represents the gas category currently set:
   Output signal 20 %LEL: Methane gas category
   Output signal 40 %LEL: Propane gas category
   Output signal 60 %LEL: Ethene (ethylene) gas category
5. This output signal is maintained for 30 seconds. During this period, the next gas can be selected by placing the magnetic wand on the area marked with the ⇧S symbol.
   ⇒ The sensor's output signal then switches to the value that matches the newly selected gas category. If no further input with the magnetic wand takes place for more than 30 seconds, the setting is saved.
6. Check the span calibration on the gas detector (see "Span calibration", page 24)
7. Turn on the alarm activation for the gas detector (see "Turning the alarms on and off", page 30).

ℹ The setting on the sensor can result in an incorrect gas category being displayed in the ***DSIR Category*** menu item or that a change in gas category is no longer visible.

13.10 Sensor settings Polytron® 87x0 IR

13.10.1 Gas settings

This function sets the gas type, measuring range and units of measurement. Only certain sensors support these settings.

1. Select ***Settings*** > ***Sensor*** > ***Gas settings*** and confirm.
   ⇒ The current measured gas is displayed.
2. Select a measured gas from the list and confirm.
   ⇒ The current unit of measurement is displayed.
3. Select the unit of measurement from the list and confirm.
   ⇒ If the unit of measurement is set to %LEL, %UEG, or %LIE, the category will be displayed. Continue with step 4.
   ⇒ Otherwise the current full scale deflection is displayed. Continue with step 6.
4. Select a category and confirm.
5. Set the LEL value and confirm.
6. Set the full scale deflection and confirm.
   ⇒ The new full scale deflection is displayed.
7. Select ***Next*** and confirm.
   ⇒ An overview of the new gas settings is displayed.
8. After review, select ***Back to menu*** or ***Confirm***.

Back to menu	Select Back to menu for leaving the function without changes and confirm with [OK].
Confirm	Select Confirm to accept the settings and confirm with [OK].

9. Check the alarm settings after changing the category or the LEL value.

14 Factory default settings

14.1 Unchangeable settings for relay, LED, and alarm

	Setting
Fault relay:	Energized / Normally Open
Yellow LED:	Lit if a fault message is available
Red LED:	Single flash if A1 alarm is present. Double flash if A2 alarm is present. If an alarm is configured as acknowledgeable and the alarm is acknowledged, single/double flash changes to continuously lit.
Alarm Hierarchy	A2 overrides A1 on the LED. However, the A1 and A2 relays operate independently. (Example: if A1 is acknowledgeable, A2 is not, and the gas concentration is such that it triggers A1 and A2: acknowledging the alarm will cause the A1 relay to release. But the red LED continues its double flash as long as the state that triggers the A2 alarm persists.

14.2 Settings which can be changed via the menu

Menu	Default setting	Range
Relay active on alarm / No alarm	Active on alarm	On/Off
A1 alarm: direction	Rising (falling for O_2 sensors)	Falling/Rising
A2 alarm: direction	Rising	
A1 latch mode	Non-latching	Latching/Non-latching
A2 latch mode	Latching	
A1 acknowledge mode	Acknowledgeable	Acknowledgeable/Non-acknowledgeable/Pre-acknowledgeable
A2 acknowledge mode	Not acknowledgeable	
Normal operation A1 relay	Energized	Energized/Not energized
Normal operation A2 relay		
Calibration password	_ _ _ 1	
Settings password	_ _ _ 2	
LCD setting	On	On/Off
SIL status	Off	On/Off
Language	EN	DE / EN / FR / ES / RU / ZH
Automatic calibration	Off	On/Off
Function key	Error	Graphic, fault, warning, vitality, bump test

Interface	Default setting	Range
Fault current	1.2 mA	0 to 3.5 mA
Warning	Off	On/Off
Warning current	3.0 mA	0 to 3.5 mA
Warning cycle interval T1	10 s	5 to 60 s

Interface	Default setting	Range
Warning cycle interval T2 (warning current)	1 s	1 to (T1-1) s
Maintenance signal	static	Static/dynamic
Maintenance current	3.4 mA	0 to 3.5 mA
Analog offset	0 mA	-0.5 to 0.5 mA
Sensitivity analog output	0 mA	-0.5 to 0.5 mA
HART® address	0	0 to 15
Modbus address[1)]	126	2-126
Modbus parity[1)]	even (default)	even, odd parity, no parity
Modbus baud rate[1)]	9600 bps	9600 or 19200 bps
PROFIBUS® address[1)]	126	2-126

1) Fieldbus interfaces are not in accordance with the BVS 13 ATEX G001 X. Using the fieldbus interface no relays are available.

14.3 Sensor-specific values

Further specifications are provided in the instructions for use for the relevant sensor.

14.3.1 Polytron 8100 EC

Menu	Default setting	Range
Alarm A1	Depending on sensor	
Alarm A2	Depending on sensor	
Hysteresis for A1 alarm in rising direction	0	0 to A1
Hysteresis for A2 alarm in rising direction	0	0 to A2
Hysteresis for A1 alarm in falling direction	0	0 to full scale deflection -A1
Hysteresis for A2 alarm in falling direction	0	0 to full scale deflection -A2
Calibration interval [days]	Depending on sensor	0 to 720

14.3.2 Polytron 8100 EC with O_2 sensors

Menu	Default setting	Range
Display capture range offset	20.9 Vol% (O_2)	0 to 25 Vol% (O_2 LS) 0 to 100 Vol% (O_2)
Display capture range low	-0.25 Vol% (O_2)	0 to -0.75 Vol%
Display capture range high	0.25 Vol% (O_2)	0 to 0.75 Vol%
Full scale value	25 Vol% (O_2, O_2 LS)	5 to 25 Vol% (O_2 LS) 5 to 100 Vol% (O_2)

14.3.3 Polytron 8100 EC with Dräger SensorAlive

Menu	Default setting	Range
DSA warn current	2.0 mA	0 mA to 3.5 mA
DSA warn limit	Depending on sensor	
DSA activation	On	On / Off
LifeTest		
Time	Depending on sensor	
Output behavior	Fixed	Fixed/maintenance/measured value
Repeat profile	Flexible	Flexible/static
Cancel threshold	Depending on sensor	
Senor monitoring		
Activation	Depending on sensor	
Alarm <50 %	Off	Off/warning
Alarm <40 %	DSA warning	Off/DSA warning/error
Fault detection	On	On / Off

14.3.4 Polytron 8200 CAT DrägerSensor® DQ

Menu	Default setting	Range
Alarm A1	20 %LEL	1 to 100 %LEL
Alarm A2	40 %LEL	
Hysteresis for alarm A1 with increasing direction	1 %LEL	0 to A1
Hysteresis for alarm A2 with increasing direction	1 %LEL	0 to A2
Adjustment interval [days]	180	0 to 360
Display capture range offset	0 %LEL	-5 to 4 %LEL
Display capture range low	-5 %LEL	-5 to 0 %LEL
Display capture range high	2 %LEL	0 to 4 %LEL
Full scale value	100 %LEL	Not possible to set range

14.3.5 Polytron 8200 CAT DrägerSensor® LC

Menu	Default setting	Range
Alarm A1	2.0 %LEL	0.1 to 10 %LEL
Alarm A2	4.0 %LEL	
Hysteresis for alarm A1 with increasing direction	0.1 %LEL	0 to A1
Hysteresis for alarm A2 with increasing direction	0.1 %LEL	0 to A2
Full scale value	10 %LEL	5 to 10[1] % LEL 1 to 10 %LEL
Adjustment interval [days]	180	0 to 360
Display capture range offset	0 %LEL	-0.5 to 0.4 %LEL
Display capture range low	-0.5 %LEL	-0.5 to 0 %LEL
Display capture range high	0.2 %LEL	0 to 0.4 %LEL

1) For firmware versions < 3.0.0

14.3.6 Polytron 8310 IR

Menu	Default setting	Range
Alarm A1	20 %LEL	1 to 100 %LEL
Alarm A2	40 %LEL	
Hysteresis for alarm A1 with increasing direction	1 %LEL	0 to A1
Hysteresis for alarm A2 with increasing direction	1 %LEL	0 to A2
Adjustment interval [days]	180	0 to 360
Display capture range offset	0 %LEL	-3 to 4 %LEL
Display capture range low	-3 %LEL	-3 to 0 %LEL
Display capture range high	2 %LEL	0 to 4 %LEL
Full scale value	100 %LEL	Not possible to set range

14.3.7 Polytron 8700 IR

Type 334

Menu	Default setting	Range
Test gas	Methane	
Test gas units	%LEL	
Test gas concentrations	50 %LEL	
Alarm A1	20 %LEL	0.01 to 100 Vol% with %LEL = 0.3 to 100 %LEL
Alarm A2	40 %LEL	
LEL type	NIOSH	IEC / PTB / NIOSH / configurable
Measured gas	Methane	
Units of measured gas	%LEL	Vol.% / PPM / %LEL / %LIE
Full scale value	100 %LEL	20 to 100 %LEL
Beam block	Off	On/Off
Beam block current	2 mA	0 to 3.5 mA
Beam block limit	7.5 %LEL	0 to max. 15 %LEL[1]
Adjustment interval [days]	360	0 to 720

Menu	Default setting	Range
Response behavior	normal	normal / fast
Display capture range offset	0	The absolute values of the display capture range must be within these limits: -1000 to 2200 ppm (Methane type 334) -850 to 850 ppm (Propane type 334) -1200 to 1150 ppm (Ethylene type 334)
Display capture range low	-750 ppm (Methane) -315 ppm (Propane) -405 ppm (Ethylene)	
Display capture range high	750 ppm (Methane) 315 ppm (Propane) 405 ppm (Ethylene)	

1) The maximum limit of the beam block depends on the type of gas detector and the measured gas selected.

Type 340

Menu	Default setting	Range
Test gas	Propane	
Test gas units	%LEL	
Test gas concentrations	50 %LEL	
Alarm A1	20 %LEL	0.01 to 100 Vol% with %LEL = 0.3 to 100 %LEL
Alarm A"	40 %LEL	
LEL type	NIOSH	IEC / PTB / NIOSH / configurable
Measured gas	Propane	
Units of measured gas	%LEL	Vol% / PPM / %LEL / %LIE
Full scale value	100 %LEL	20 to 100 %LEL
Beam block	Off	On/Off
Beam block current	2 mA	0 to 3.5 mA
Beam block limit	2.5 %LEL	0 to max. 15 %LEL[1)]
Adjustment interval [days]	360	0 to 720
Response behavior	normal	normal / fast
Display capture range offset	0	The absolute values of the display capture range must be within these limits: -850 to 425 ppm (Propane type 340) -1800 to 2200 ppm (Methane type 340)
Display capture range low	-750 ppm (Methane) -85 ppm (Propane)	
Display capture range high	750 ppm (Methane) 85 ppm (Propane)	

1) The maximum limit of the beam block depends on the type of gas detector and the measured gas selected.

14.3.8 Polytron 8720 IR

Menu	Default setting	Range
Test gas	CO_2	
Test gas units	Vol%	
Test gas concentrations	4.0 Vol%	0.2 to 100 Vol%
Alarm A1	1 Vol%	0.01 to 100 Vol%
Alarm A2	2 Vol%	
LEL type	-	
Measured gas	CO_2	
Units of measured gas	Vol%	Vol% / ppm
Full scale value	10 Vol%	0.2 to 100 Vol%
Beam block	Off	On/Off
Beam block current	2 mA	0 to 3.5 mA
Beam block limit	0.1 Vol%	0 to 0.1 Vol%
Adjustment interval [days]	360	0 to 720
Response behavior	normal	normal / fast
Display capture range offset	340 ppm	The absolute values of the display capture range must be within these limits: -1000 to 1000 ppm (carbon dioxide)
Display capture range low	-200 ppm	
Display capture range high	200 ppm	

15 Disposal

This product must not be disposed of as household waste. This is indicated by the adjacent icon.
You can return this product to Dräger free of charge. For information please contact the national marketing organisations and Dräger.

Disposal of electrochemical sensors

⚠ WARNING
Danger of explosions and risk of chemical burns!
Sensor fluids may leak out and can cause acid burns.
► Do not dispose sensors in fire.
► Do not open with force.

16 Technical data

16.1 Measuring ranges

Sensor	Measuring range
Polytron 8100 EC with DrägerSensor® EC	Depending on sensor
Polytron 8200 CAT with DrägerSensor® DQ	0 to 100 %LEL
Polytron 8200 CAT with DrägerSensor®LC	0 to 10 %LEL[1)]
Polytron 8310 IR with DrägerSensor® IR	0 to 100 %LEL
Polytron 8700 IR with PIR 7000 infrared gas sensor	
Type 334 (IDS 01x1)	0 to 10,000 ppm[1)] 0 to 100 %LEL,[1)] 0 to (1.25 x LEL_{max}) Vol%,[1)2)] For CH4 (methane) 0 to 100 Vol%[1)]
Type 340 (IDS 01x2)	0 to 10,000 ppm[1)] 0 to 100 %LEL[1)] 0 to 5 Vol%[1)]
Polytron 8720 IR with PIR 7200 infrared gas sensor (IDS 01x5)	0 to 100 Vol%[1)]

1) For adjustable full scale deflection, see 14.3.
2) Range changes depending on the substance to be measured

16.2 Signal transmission to the controller

The measuring range and performance characteristics depend on the installed sensor (see the instructions for use for the installed sensor).

Frequency of measurement calculation: 1 x per second (update of display, analog interface and relays).

Analog signal	
Normal operation	4 ... 20 mA
Drift below zero	3.8 ... 4 mA
Over range	20 ... 20.5 mA
Instrument fault	≤ 1.2 mA
Fault on analog interface	> 21 mA
Maintenance signal	3.4 mA steady signal or 1 Hz modulation between 3 and 5 mA (selectable)

Resistance of the signal loop

Operating mode	Resistance range of the signal loop	Power supply range
Operation without HART® communication	0 to 230 Ω	at 10 V DC
	Rising linearly with the supply voltage from: 0 to 230 Ω at 10 V to 0 to 500 Ω at 16 V	10 to 18 V DC
	0 to 500 Ω	18 to 30 V DC
Operation with HART® communication	230 to 270 Ω	at 13 V DC
	Rising linearly with the supply voltage from: 230 to 270 Ω at 11 V to 230 to 500 Ω at 16 V	11 to 16 V DC
	230 to 500 Ω	18 to 30 V DC
HART® multidrop operation	230 to 500 Ω	10 to 30 V DC

When used in accordance with the metrological suitability test compliant with EN IEC 62990-1, EN IEC 60079-29-1 or EN 50104, the resistance must not exceed 300 ohms. Further information on installing the fieldbus interface is provided in document 9033783.

16.3 Cable specifications

For non-conduit installations, use shielded cables.

Analog and HART® connection with controller and power supply	
Power supply and signals	3-core shielded cable 24 - 12 AWG / 0.2 - 2.5 mm²
Relays	20 - 12 AWG / 0.5 - 2.5 mm²

Digital connection with controller	
Instruments with fieldbus interfaces and remote sensors must be installed with shielded cables.	
Modbus RTU	2-core or 3-core[1], ≥ 26 AWG
PROFIBUS PA Foundation Fieldbus	2-core, cable type A Wave impedance Rw: 135 - 165 Ω Capacitance / unit length C‘: < 30 pF/m Loop resistance R‘: 110 Ω/km Core diameter d: 0.64 mm Core cross section q: > 0.34 mm² Shield coverage: ≥ 90 %
Power supply	2-core, 24 - 12 AWG / 0.2 - 2.5 mm²

1) If the distance between the controller and the transmitter is very long (>1 km) and the power supplies of the controller and the transmitter are separate, interference or differential differences can occur. In this case, 3-core cabling with ground must be selected. Ground is then connected to the transmitter and looped through to the ground of the controller.

16.4 Power supply and relays

Relay rating[1] SPDT[2]	
230 V ~	0.1 A - 5 A
30 V ⎓, resistive load	0.1 A (minimum) - 5 A

1) For safety-related applications (SIL 2), the maximum contact rating is reduced (see Polytron® 8xx0 Safety Manual).
2) Single pole, double throw, (changeover electrical contacts)

Power supply Polytron 8xx0	
Operating voltage	10[1] to 30 V⎓ at the instrument
Inrush current	2.3 A for 2 ms at 24 V⎓,10 Ω resistor

1) At supply voltages of < 7 V DC the instrument provides a fault signal. The warning signal "undervoltage" depends on the connected load at the 4-20 mA output and the cable resistance. In case of lower load (e.g. 230 Ω), the fault relay drops out and the current output is 0 mA. In case of higher load (e.g. 500 Ω), warning message 011 is indicated.

Operating current	
Polytron® 8100 EC	
without relay, non-remote sensor	80 mA
with relay, remote sensor	100 mA
Polytron® 8200 CAT	
without relay, non-remote sensor	105 mA (DrägerSensor DQ) 130 mA (DrägerSensor LC)
with relay, remote sensor	145 mA (DrägerSensor DQ) 165 mA (DrägerSensor LC)
Polytron® 8310 IR	
without relay, non-remote sensor	145 mA
with relay, remote sensor	185 mA
Polytron® 87x0 IR	
without relay, non-remote sensor	330 mA
with relay, remote sensor	350 mA

16.5 General specifications

Polytron 8xx0 enclosure	
Enclosure material	Copper-free aluminum
Enclosure guard	NEMA 4X[1] IP 65/66/67[2]
Display	Resolution 128 x 64 pixels, backlit[3]

1) Polytron 8100 EC NEMA 4X enclosure guard pending.
2) The IP degrees of protection do not cover the detection of a gas, during or after exposure of the equipment to these conditions. In the event of dust deposits and contact with water through immersion or a jet of water, check the adjustment and functional integrity of the instrument.
3) There is only a limited visibility of the display at high temperatures (>65 °C).

16.6 Environmental parameters

Further sensor specifications and influences can be found in the instructions for use provided for the respective sensor.

The values for accessories and spare parts may deviate from the values given here. The exact values can be found in the corresponding manual.

Polytron 8xx0	
Values in accordance with explosion protection testing	
During operation:	
Pressure	23.6 to 32.5 in. Hg (800 to 1100 hPa)
Humidity	0 to 100 % RH, non-condensing
Temperatures	
Polytron 8100 EC	-40 to +70 °C (-40 to +158 °F)
Polytron 8200 CAT	-40 to +80 °C (-40 to +176 °F)
Polytron 8310 IR	-40 to +65 °C (-40 to +149 °F)
Polytron 87x0 IR	-40 to +80 °C (-40 to +176 °F)
Values according to performance approval	
During operation:	
Pressure	20.7 to 38.4 in. Hg (700 to 1300 hPa)[1)]
Humidity	0 to 95 % RH, non-condensing
Temperatures	
Polytron 8100 EC[2)]	-40 to +65 °C (-40 to +149 °F)
Polytron 8200 CAT	-40 to +80 °C (-40 to +176 °F)
Polytron 8310 IR	-40 to +65 °C (-40 to +149 °F)
Polytron 87x0 IR	-40 to +77 °C (-40 to +170 °F)
During storage:	
Pressure	26.5 to 32.4 in. Hg (900 to 1100 hPa)
Humidity	0 to 100 % RH, non-condensing
Temperature	-20 to +65 °C (-4 to +149 °F)
Recommended storage period	5 years
Values for relay option and installations with UL approval	
During operation:	
Temperatures	
Polytron 8200 CAT	-40 to +70 °C (-40 to +158 °F)
Polytron 87x0 IR	-40 to +70 °C (-40 to +158 °F)

1) Polytron 8200 CAT: 23.6 to 35.44 in. Hg (800 to 1200 hPa)
2) See 18.3, 18.3.2 and the instructions for use provided for the EC sensor for the constraints of the maximum specification.

16.7 Tightening torques

Instrument threads	
Enclosure cover	≥44 in-lbs / ≥5 Nm
Sensor	min. 266 in-lbs / min. 30 Nm
Blind plugs	min. 266 in-lbs / min. 30 Nm
Ports (for conduits or cable glands)	min. 443 in-lbs / min. 50 Nm
Docking Station blind plugs	62 in-lbs / 7 Nm
Docking Station cable glands	70 in-lbs / 8 Nm
Remote EC sensing head	177 in-lbs ±9 in-lbs / 20 Nm ±1 Nm
Field wiring terminals	
Power supply, signals and relays	4.4 - 7.0 in-lbs / 0.5 - 0.8 Nm
Grounding screw	10.6 in-lbs / 1.2 Nm

17 Accessories and spare parts

This chapter provides an overview of the components that are covered by the BVS 13 ATEX G 001 X- and PFG 14 G 001 X-type examination. Further parts are listed in the spare parts list or can be requested from DrägerService.

17.1 Polytron® 8xx0

Description	Part number
IRDA to PC interface	4544197
Magnetic wand with key chain	4544101
Dräger PolySoft, configuration software	8328600 / 8328639
EXd blind plug, stainless steel, 2 pcs.	4544897
Exd blind plug, galvanic steel, 3 pcs.	8344041

17.1.1 Docking station

Description	Part number
Docking Station Power Only Version	8344027
Docking Station Power, Relay (includes 2 cable glands)	8344028
Docking Station Fieldbus	8344029
Cable Gland Docking Station	6812868
Blind plug Docking Station	8344042

17.2 Polytron® 8100 EC

Description	Part number
Polytron 8100 4-20/HART printed circuit board	4544781
Polytron 8100 4-20/HART printed circuit board, relay	4544782
Bayonet ring	4544366
Bayonet ring for Dräger SensorAlive	6800132
Duct adapter for remote EC sensing head[1)]	8317617
Rod attachment for remote EC sensing head	4544213
Sensor-test dongle	8317619
Diagnostic dongle	8317860
Calibration adapter	6810536

1) May influence the measurement, e.g. extend the response time. Not covered by BVS 13 ATEX G 001 X and PFG 14 G 001 X.

17.3 Polytron® 8200 CAT

Description	Part number
Polytron 8200 PCB unit 4-20/HART	4544788
Polytron 8200 PCB unit 4-20/HART relay	4544789
PE calibration adapter, Europe	6806978
DQ remote calibration adapter	6812480
LC remote calibration adapter[1)]	6812482
21.50X14.50 membranes spare part set, 2 pcs.	8326840
Dust filters for DrägerSensor DQ, 10 pcs.	6810537
DQ process adapter	6812470
LC process adapter[1)]	6812465
Splash guard	6812510

1) not covered by performance approval.

17.3.1 CAT sensors

Description	Part number
DrägerSensor DQ NPT	6814150
DrägerSensor DQ NPT S[1)]	3701800
DrägerSensor LC NPT	6810675
Sensing head, Polytron SE Ex PR M1 DQ	6812711
Sensing head, Polytron SE Ex PR M2 DQ	6812710
Sensing head, Polytron SE Ex HT M DQ	6812720
DQ NPT aluminum remote sensor	3706933
DQ NPT steel remote sensor	3706934

1) The DrägerSensor DQ NPT S can also be used instead of the DrägerSensor DQ NPT.

17.4 Polytron® 8310 IR

Description	Part Number
Splash Guard	6810796
Process Adapter	6811330
Protection Labyrinth	6811135
Calibration adapter	6810859
PCB unit Polytron 8310 4-20/HART	4544788
PCB unit Polytron 8310 4-20/HART Relay	4544789

17.4.1 DSIR sensors

Description	Part number
DrägerSensor IR NPT	6811901
Sensing head, DrägerSensor IR complete set e	6811165
Sensing head, DrägerSensor IR complete set e2	6811265

17.5 Polytron® 87x0 IR

Description	Part number
Polytron 87x0 PCB unit 4-20/HART[1)]	4544795
Polytron 87x0 PCB unit 4-20/HART relay[1)]	4544796
PIR 7000 attachment set	6811648
PIR 7000 process cuvette, stainless steel	6811415
PIR 7000 SGR process cuvette	6813219
PIR 7000 / 7200 status indicator	6811625 / 6811920
PIR 7000 / 7200 splash guard	6811911 / 6811912
PIR 7000 / 7200 flowcell	6811490 / 6811910

Description	Part number
PIR 7000 / 7200 remote test adapter	6811630 / 6811930
PIR 7000 insect protection	6811609
PIR 7000 hydrophobic filter	6811890
PIR 7000 calibration adapter	6811610
PIR 7000 / 7200 POM process adapter (polyoxymethylene)	6811915
PIR 7000 assembly set	6811648
Terminal box Ex e	6811989
Terminal box Ex d	4520561
Magnetic wand	4544101

1) Check firmware compatibility of sensor and gas detector. Changing the PCB unit may require a firmware update. Contact Dräger for support.

17.5.1 Sensors

Check firmware compatibility of sensor and gas detector. Changing the sensor may require a firmware update. Contact Dräger for support.

Description	Part number
Dräger PIR 7000 type 334 (NPT)	6811822
Dräger PIR 7000 type 340 (NPT)	6811832
Dräger PIR 7000 334 (M25) complete set	6811825
Dräger PIR 7000 340 (M25) complete set	6811819
Dräger PIR 7200 (NPT)	6811572
Dräger PIR 7200 (M25) HART complete set	6812290

18 Performance Approvals

In combination with certain sensors, Polytron 8xx0 is performance approved based on the following standards:

– EU and Type Examination Certificates in line with EN 60079-29-1, EN 50104, EN 45544 and DIN IEC 62990-1. Issued by DEKRA Testing and Certification GmbH, Handwerkstr. 15, D-70565 Stuttgart.
– FM performance approval in line with ANSI/ISA-92.00.01 FM6340

For further information on sensor specifications and restrictions (e.g., measuring principles, performance, cross-sensitivity), refer to the instructions for use for the relevant sensor.

18.1 EU-TYPE Examination Certificate, BVS 13 ATEX G 001 X

Measurement of flammable gases and vapors mixed with air.

– Polytron 8200 CAT with DrägerSensor DQ
  Special conditions:
  - When streaming with air containing measured gas, measured values may increase by up to 32 %.
  - When operating with the DQ remote calibration adapter, measured values may increase by up to 70 %.
– Polytron 8200 CAT with DrägerSensor LC
  Approved with 10 %LEL full scale deflection.
  A connection to a controller with approved measuring function (e.g., REGARD® 7000) is required. Latching alarms for over range measured values must be activated at the controller.
– Polytron 8310 IR with DrägerSensor IR
– Polytron 8700 IR with PIR 7000 type 334 and 340

Measurement of oxygen (inertization)

– Polytron 8100 EC with DrägerSensor O_2 (6809720) and DrägerSensor O_2 LS (6809630) within a measuring range of 0-5...25 Vol% O_2.

Approved are:

– 4 to 20 mA interface
– Relay module
– Remote sensor
– HART
– Factory default full scale deflections

Not approved are the fieldbus interface and the data logger.

18.2 Type Examination Certificate, PFG 14 G 001 X

Measurement of oxygen (deficiency and excess oxygen)

– Polytron 8100 EC with DrägerSensor O_2 (6809720) and DrägerSensor O_2 LS (6809630) within a measuring range of 0–25 Vol% O_2.

Measurement of hydrogen sulfide

– Polytron 8100 EC with Dräger SensorAlive (6809630) within the following measuring ranges:
  - 0.5 - 100 ppm (Type HM)
  - 0 - 100 ppm (Type SM)

Measurement of carbon dioxide

– Polytron 8720 IR with PIR 7200 within the following measuring ranges:
  - 1 Vol% and 10 Vol% – EN 45544-2
  - 2000 ppm, 1 Vol% and 10 Vol% – EN 45544-3

Approved are:

– 4 to 20 mA interface
– Relay module
– Remote sensor

Not approved are:
– Fieldbus interface
– Data logger
– Only Polytron 8100 EC with Dräger SensorAlive: Self-test functionality when using a gas generator

18.3 DrägerSensor O_2, O_2LS and Dräger SensorAlive certified operating conditions

Cross-sensitivities

There are no known cross-sensitivities against interfering gases with a concentration of up to 100 ppm. Further information can be requested from Dräger.

18.3.1 DrägerSensor O_2 (6809720)

The DrägerSensor O_2 (6809720) is an electrochemical two-electrode sensor for measuring oxygen (O_2) in ambient air.

Environmental parameters	
Pressure	20.7 to 38.4 in. Hg (700 to 1300 hPa)
Humidity	10 to 95 % RH, non-condensing
Temperature	Application of EN 50104 limits the temperature range to 0 °C to +55 °C.

Storage	
Pressure	no influence
Humidity	30 to 70 % RH, non-condensing (only relevant if sensor packaging is open)
Temperature	0 to +40 °C
Time	Storage of sensors is not intended. Sensors should be used immediately. Remaining life span = expected life span - storage time

Influence of environmental parameters	**Zero-point**	**Sensitivity[1)]**
Temperature[2)3)]		
0 to 55 °C	≤ 0.3 Vol% O_2	≤ 0.9 Vol% O_2
Pressure	< ± 0.2 Vol% O_2	Relative deviation from the reading at 1013 hPa: < 10 % of the measured value / 100 hPa
Humidity	No influence	Relative deviation from the reading at 50 % rel. humidity: < 1 % of the measured value

1) Relative deviation of the display reading is caused by atmospheric pressure fluctuations.
2) At temperatures below -5 °C, the measurement deviation is higher than specified in EN 50104.
3) For operating temperatures outside -5 °C to 40 °C, an adjustment at operating temperature must be performed.

Response time[1)]	**$t_{0...20}$**	**$t_{0...90}$**
0-5 Vol% O_2	≤ 15 seconds[2)]	≤ 33 seconds
0-25 Vol% O_2	≤ 10 seconds	≤ 26 seconds

1) At temperatures below -5 °C, the response time may increase.
2) Response time is higher than the permissible limit of EN 50104.

Stabilization time: 5 x $t_{0...90}$

Measuring range

0-5 Vol% O_2 to 0-100 Vol% O_2

Default value: 25 Vol% O_2 Minimum reading: -1.25 Vol% O_2

Sensor warm-up time

Operation: <20 minutes / Adjustment: ≤ 2 hours

18.3.2 DrägerSensor O_2LS (6809630)

The DrägerSensor O_2LS (6809630) is an electrochemical three-electrode sensor for measuring oxygen (O_2) in ambient air.

Environmental parameters	
Pressure	20.7 to 38.4 in. Hg (700 to 1300 hPa)
Humidity	5 to 95 % RH, non-condensing
Temperature	-40 to +60 °C short-term +65 °C

Storage	
Pressure	no influence
Humidity	30 to 70 % RH, non-condensing (only relevant if sensor packaging is open)
Temperature	0 to +40 °C
Time	Storage of sensors is not intended. Sensors should be used immediately. Remaining life span = expected life span - storage time

Influence of environmental parameters	Zero-point	Sensitivity
Temperature		
-20 to 40 °C	≤ 0.1 Vol% O_2	≤ 0.1 Vol% O_2
-40 to 65 °C	≤ 0.2 Vol% O_2	≤ 0.5 Vol% O_2
Pressure	< ± 0.1 Vol% O_2	≤ 0.8 Vol% O_2
Humidity	≤ 0.1 Vol% O_2	≤ 0.9 Vol% O_2

When measuring oxygen in the presence of helium, helium compensation can be used. The option of helium compensation is no certified measuring function according to EN 50104.

⚠ CAUTION

Sensor failure

The exposure of the sensor to higher concentrations of unsaturated hydrocarbons, alcohols, or hydrogen over an extended period of time (dose approx. 100,000 ppm x hours) can cause the instrument to fail.

► Ensure that the sensor is not exposed to such concentrations over an extended period of time.

Response time	$t_{0...20}$	$t_{0...90}$
0-5 Vol% O_2	≤ 14 seconds[1)]	≤ 45 seconds
0-25 Vol% O_2	≤ 10 seconds	≤ 27 seconds

1) Response time is higher than the permissible limit of EN 50104.

Stabilization time: 5 x $t_{0...90}$

Measuring range

0-5...25 Vol% O_2, 0-25 Vol% O_2

Default value: 25 Vol% O_2

Minimum reading: -1.25 Vol% O_2

Sensor warm-up time

Operation: ≤ 20 minutes / Adjustment: ≤ 6 hours

18.3.3 Dräger SensorAlive (6814014)

The Dräger SensorAlive (6814014) is an electrochemical diffusion sensor with an integrated gas generator for measuring hydrogen sulfide (H_2S) in ambient air.

Environmental parameters	
Pressure	20.7 to 35.5 in. Hg (700 to 1200 hPa)
Humidity	5 to 95 % RH, non-condensing
Temperature	-40 to +65 °C
Maximum flow speed of the ambient air	6 m/s

Storage	
Pressure	no influence
Humidity	30 to 70 % RH, non-condensing (only relevant if sensor packaging is open)
Temperature	0 to +40 °C
Time	Storage of sensors is not intended. Sensors should be used immediately. Remaining life span = expected life span - storage time

Influence of environmental parameters	Relative deviation from the reading
Pressure	At 1000 hPa: ≤ 0.15 ppm
Humidity (at +40 °C)	at 0 and 95 %RH: ≤ 0.29 ppm
Temperature	at 20 °C: ≤ 0.44 ppm

Interference gases (e.g., NH_3) can impair the function of the sensor.

Response times in diffusion operation	
t(50)	≤ 20 s
t(90)	≤ 55 s

Decay times in diffusion operation	
t(50)	≤ 20 s
t(10)	≤ 55 s

18.4 FM performance approval for DrägerSensor H_2S and H_2S LC

The DrägerSensor H_2S and H_2S LC are electrochemical diffusion sensors measuring hydrogen sulfide (H_2S) in ambient air.

DrägerSensor H_2S (6810435)	
Examination Type P8100	ETR 0400, 0401, 0500, 0501
Interface[1)]	4-20mA, relay
Environmental parameters	
Humidity	5 to 95%RH, non-condensing
Temperature	-40/+65 °C (-40/149 °F)
Storage temperature	0/+40°C (32/104°F)
Enclosure protection [2)]	IP 65/66/67
Range	0-100 ppm
Accuracy (whichever is greater)	measurement uncertainly (of meas. value) ≤ ±3 % or minimum ≤ ±0.5 ppm
Accessory	
Dust filter	6809595
Adapter kit	6810536
Standard	ANSI/ISA-92.00.01FM6340

1) HART communication must not be used for safety-relevant communication.
2) After submersion and jet water the sensor must be replaced.

DrägerSensor H_2S LC (6809610)	
Examination Type P8100	ETR 0400, 0401, 0500, 0501
Interface[1)]	4-20mA, relay
Environmental parameters	
Humidity	5 to 95%RH, non-condensing
Temperature	-20/+65 °C (-4/149 °F)
Storage temperature	0/+40°C (32/104°F)
Enclosure protection [2)]	IP 65/66/67
Range	0-100 ppm
Accuracy (whichever is greater)	measurement uncertainly (of meas.value) ≤ ±3 % or minimum ≤ ±0.5 ppm in the range >50 ppm, ±10 % or ±3 ppm
Accessory	
Dust filter	6809595
Adapter kit	6810536
Standard	ANSI/ISA-92.00.01FM6340

1) HART communication must not be used for safety-relevant communication.
2) After submersion and jet water the sensor must be replaced.

1 Sicherheitsbezogene Informationen

Die aktuelle Ausgabe und weitere Sprachen dieser Gebrauchsanweisung können in der Datenbank für Technische Dokumentation (www.draeger.com/ifu) in elektronischer Form heruntergeladen werden. Dräger empfiehlt aufgrund von Produktaktualisierungen, immer die aktuelle Ausgabe der Gebrauchsanweisung zu verwenden.

1.1 Sicherheitshinweise

- Vor Gebrauch des Produkts diese Gebrauchsanweisung und die der zugehörigen Produkte aufmerksam lesen.
- Gebrauchsanweisung genau beachten. Der Anwender muss die Anweisungen vollständig verstehen und den Anweisungen genau Folge leisten. Das Produkt nur für die in diesem Dokument angegebenen Zwecke und unter den angegebenen Bedingungen verwenden.
- Gebrauchsanweisung nicht entsorgen. Aufbewahrung und ordnungsgemäße Verwendung durch die Nutzer sicherstellen.
- Nur geschultes und fachkundiges Personal darf dieses Produkt verwenden.
- Wenn eine Komponente fehlerhaft ist oder eine Funktionsstörung vorliegt, Dräger benachrichtigen.
- Alle lokalen und nationalen Vorschriften und Bestimmungen im Zusammenhang mit diesem Produkt einhalten.
- Nur entsprechend geschultes Personal darf das Produkt, wie in dieser Gebrauchsanweisung beschrieben, überprüfen, reparieren und instand halten. Instandhaltungsarbeiten, die in dieser Gebrauchsanweisung nicht beschrieben sind, dürfen nur von Dräger oder von durch Dräger qualifiziertem Fachpersonal durchgeführt werden.
- Dräger empfiehlt, einen Servicevertrag mit Dräger abzuschließen und alle Instandhaltungsarbeiten durch Dräger durchführen zu lassen.
- Für Instandhaltungsarbeiten nur Original-Dräger-Teile und -Zubehör verwenden. Sonst könnte die korrekte Funktion des Produkts beeinträchtigt werden.
- Die Wartungsarbeiten müssen gemäß den Anweisungen durchgeführt werden, siehe 10 Instandhaltung.
- Produkt nur im Rahmen eines risikobasierten Alarmgebungskonzepts betreiben.
- Bevor dieses Gerät an elektrische Geräte angeschlossen wird, welche nicht in der Gebrauchsanweisung beschrieben werden, muss Dräger zu Rate gezogen werden.
- An Geräten und Komponenten dürfen keine Änderungen vorgenommen werden.
- Der Einsatz von defekten oder unvollständigen Teilen ist unzulässig.
- Bei Instandsetzung an diesen Geräten oder Bauteilen müssen die entsprechenden Bestimmungen beachtet werden.
- Gerät nicht während des Betriebs öffnen.
- Bei Instandsetzung an diesen Geräten oder Bauteilen müssen die entsprechenden Bestimmungen beachtet werden.
- Für die Messung von brennbaren Gasen und Sauerstoff die Anweisungen der EN 60079-29-2 beachten.
- Für die Messung von toxischen Gasen die Anweisungen der EN 45544-4 beachten.

Polytron® 8100 EC-spezifisch:

- **WARNUNG**: Gefahr der Entzündung von brennbarem oder explosivem Gas! Der Austausch von Komponenten kann die Eigensicherheit beeinträchtigen.

1.2 Einsatzbereich und Betriebsbedingungen

- Für SIL-Anwendungen muss das Dräger Polytron® 8xx0 Safety Manual beachtet werden.
- Gilt nur für Polytron 8200 CAT:
  Ist das Gerät einem gerichteten Luftstrom ausgesetzt, der mit Gas vermischt ist, können die Messwerte erhöht sein. Zu abweichenden Werten siehe Gebrauchsanweisung des entsprechenden Sensors.
- Angaben und Einschränkungen aus den Gebrauchsanweisungen der verwendeten Sensoren beachten.
- **VORSICHT** Gefahr der Entzündung von brennbarem oder explosivem Gas. Nicht in Umgebungen mit erhöhtem Sauerstoffgehalt geprüft (> 21 % O_2).
- **Einsatz des Produkts in explosionsgefährdeten Bereichen:** Geräte oder Bauteile, die in explosionsgefährdeten Bereichen genutzt werden und nach nationalen, europäischen oder internationalen Explosionsschutz-Richtlinien geprüft und zugelassen sind, dürfen nur unter den in der Zulassung angegebenen Bedingungen und unter Beachtung der gesetzlichen Bestimmungen eingesetzt werden.

Gefahrenbereiche in Zonen klassifiziert:

- Das Gerät ist für den Einsatz in Ex-Bereichen der Zone 1 oder Zone 2 ausgelegt, in denen Gase der Explosionsgruppen IIA, IIB oder IIC und Temperaturklassen T4 oder T6 auftreten können. Temperaturklassen hängen von der maximalen Umgebungstemperatur ab. Das Gerät darf nicht in Umgebungstemperaturen außerhalb des auf dem Gerät angegebenen Temperaturbereichs verwendet werden.
- Das Gerät ist für den Einsatz in Ex-Bereichen der Zone 21 oder 22 ausgelegt, in denen Stäube der Explosionsgruppen IIIA, IIIB oder IIIC und Staubtemperaturen von T80 °C oder T130 °C (T135 °C für Polytron 5100 EC und Polytron 8100 EC) auftreten können. Staubtemperaturen hängen von der maximalen Umgebungstemperatur ab. Das Gerät darf nicht in Umgebungstemperaturen außerhalb des auf dem Gerät angegebenen Temperaturbereichs verwendet werden.

Gefahrenbereiche in Divisionen klassifiziert:

– Das Gerät ist für den Einsatz in Ex-Bereichen der Klasse I, Div. 1 oder Div. 2, ausgelegt, in denen Gase der Gruppen A, B, C, D und Temperaturklassen T4 oder T6 auftreten können. Temperaturklassen hängen von der maximalen Umgebungstemperatur ab. Das Gerät darf nicht in Umgebungstemperaturen außerhalb des auf dem Gerät angegebenen Temperaturbereichs verwendet werden.
– Das Gerät ist für den Einsatz in Ex-Bereichen der Klasse II, Div. 1 oder Div. 2, ausgelegt, in denen Stäube der Gruppen E, F, G auftreten können. Das Gerät darf nicht in Umgebungstemperaturen außerhalb des auf dem Gerät angegebenen Temperaturbereichs verwendet werden.

2 Konventionen in diesem Dokument

2.1 Bedeutung der Warnhinweise

Die folgenden Warnhinweise werden in diesem Dokument verwendet, um den Anwender auf mögliche Gefahren hinzuweisen. Die Bedeutungen der Warnhinweise sind wie folgt definiert:

Warnzeichen	Signalwort	Klassifizierung des Warnhinweises
⚠	WARNUNG	Weist auf eine potenziell gefährliche Situation hin. Eine Missachtung kann zu schweren Verletzungen oder zum Tod führen.
⚠	VORSICHT	Weist auf eine potenziell gefährliche Situation hin. Eine Missachtung kann zu körperlichen Verletzungen führen. Kann auch verwendet werden, um vor unsicheren Praktiken zu warnen.
	HINWEIS	Weist auf eine potenziell gefährliche Situation hin. Eine Missachtung kann zu Produkt- und Umweltschäden führen.

F 2	Polytron 8710 IR ohne Spritzschutz

3.2 Funktionsbeschreibung

Zur Polytron 8000-Familie gehören folgende Gerätevarianten:

– Polytron 8100 EC arbeitet mit elektrochemischen Sensoren (EC-Sensoren).
– Polytron 8200 CAT arbeitet mit katalytischen Ex-Sensoren (CatEx-Sensoren//katalytischer, DQ- oder LC-Dräger-Sensor).
– Polytron 8310 IR arbeitet mit Infrarot-Ex-Sensoren (IREx-Sensoren).
– Polytron 8700 IR arbeitet mit Infrarot-Sensoren (PIR 7000-Sensoren).
– Polytron 8720 IR arbeitet mit Infrarot-Sensoren (PIR 7200-Sensoren).

Folgende Schnittstellen sind möglich:
– 4 bis 20 mA analog (nach NAMUR-Empfehlung NE43)
– Relais-Platine
– Digitales HART-Ausgangssignal
– Foundation Fieldbus[1)]
– PROFIBUS PA[1)]
– Modbus RTU[1)]

Wenn die 4–20-mA-Schnittstelle verwendet wird, muss die Stromstärke zwischen 0 mA und 3,5 mA überwacht werden. Stromstärken zwischen 0 mA und 3,5 mA können einen Sonderzustand anzeigen (siehe „Sonderzustände“, Seite 61).

Wenn eine Relais-Platine verwendet wird, können lokal Alarmmittel aktiviert werden. Wenn keine Relais-Platine verwendet wird und ein Alarm anliegt, blinkt nur die rote LED am Gerät.

Gaskonzentrationen, Statusmeldungen und Menüelemente werden auf einem beleuchteten Grafikdisplay (LCD) und über 3 farbige LEDs angezeigt.

Die Navigation durch das Menü erfolgt durch Antippen der entsprechenden Taste auf der Glasscheibe der Gehäuseabdeckung mit einem Magnetstab. Das Gerät kann ohne Deklassifizierung des Bereichs und ohne dieses zu öffnen konfiguriert, justiert und gewartet werden.

Die Geräte werden mit einem Datenlogger geliefert. Der Datenlogger kann bis zu 35 000 Werte speichern. Bei einem Abtastinvervall von 1 Messung pro Minute speichert der Datenlogger den Messverlauf von ca 24 Tagen. Diese Zeit kann durch die Aktivierung der Trigger-Funktion deutlich verlängert werden. Der Datenlogger kann nur über die PC-Software PolySoft ausgelesen werden. Beim Auslesen erhält man eine .ofb-Datei und eine .txt-Datei. Die .txt-Datei enthält die Informationen des Datenloggers in lesbarer Form.

Über eine versiegelte Rohrleitung oder eine zugelassene Kabelverschraubung können die Geräte an eine Dräger-Auswerteeinheit oder eine speicherprogrammierbare Steuerung (SPS) angeschlossen werden.

Die Geräte können als Stromquelle oder Stomsenke betrieben werden, wenn die Spannungsversorgung über die Auswerteeinheit erfolgt. Wenn die Geräte an eine separate Spannungsversorgung angeschlossen sind, können sie nur als Stromquelle betrieben werden.

Das Gehäuse der Geräte besteht aus robustem rostfreiem Edelstahl oder Aluminium und ist für Innen- und Außenanwendungen geeignet.

Die Geräte sind für eine stationäre Installation ausgelegt. Sie sind in folgender Ausführung erhältlich:
– Explosionsgeschütztes Gerät (Ex d)
  Das druckfest gekapselte, explosionsgeschützte Gehäuse weist drei ¾"-NPT-Anschlüsse auf, die für die Feldverdrahtung, das direkte Anschließen eines Sensors oder die Verdrahtung eines abgesetzten Sensors genutzt werden können.
– Gerät mit erhöhter Sicherheit (Ex e)
  Das Gerät wird durch einen Klemmenkasten für erhöhte Sicherheit (Docking Station) erweitert, der über bis zu vier 20-mm-Anschlüsse verfügt, die für die Feldverdrahtung oder die Verdrahtung eines abgesetzten Sensors genutzt werden können. Wenn die Kabelverschraubung von Dräger verwendet wird, beträgt der zulässige Kabeldurchmesser 7 mm bis 12 mm.

Folgende Dongles sind für Polytron 8100 EC verfügbar:

Sensortestdongle	Aktiviert den Sensor-Selbsttest (nicht für den Hydrazinsensor 6810180)
Diagnosedongle	Aktiviert den Sensor-Selbsttest, die Anzeige der Sensorvitalität und die Sensordiagnosefunktionen (nicht für den Hydrazinsensor 6810180)

3.3 Verwendungszweck

Die Geräte der Polytron 8000-Familie sind für eine kontinuierliche Überwachung der Umgebungsluft bestimmt.

Mit dem optional integrierten Relais-Modul kann das Gerät unabhängig ohne Auswerteeinheit (mit zusätzlicher lokaler Alarmgebung) betrieben werden.

Über eine versiegelte Rohrleitung oder eine zugelassene Kabelverschraubung kann das Gerät an eine Dräger-Auswerteeinheit oder eine speicherprogrammierbare Steuerung (SPS) angeschlossen werden.

Wird die 4–20-mA-Schnittstelle verwendet, muss die Stromstärke zwischen 0 mA und 3,5 mA überwacht werden. Stromstärken zwischen 0 mA und 3,5 mA können einen Sonderzustand anzeigen.

Die Geräte sind für eine stationäre Installation ausgelegt und für den Gebrauch in Ex-Bereichen zugelassen.
– Polytron 8100 EC ist ein kombiniertes eigensicheres / explosionsgeschütztes Gerät für die kontinuierliche Überwachung von toxischen Gasen oder Sauerstoff in der Umgebungsluft.
– Polytron 8200 CAT mit katalytischem DQ- oder LC-Dräger-Sensor ist ein explosionsgeschütztes Gerät für die kontinuierliche Überwachung von brennbaren Gasen und Dämpfen in Umgebungsluft, die Kohlenwasserstoffe und Nicht-Kohlenwasserstoffe (z. B. Wasserstoff oder Ammoniak) enthalten.
– Polytron 8310 IR mit dem Infrarotsensor DrägerSensor IR ist ein explosionsgeschütztes Gerät für die kontinuierliche Überwachung von brennbaren und kohlenwasserstoffhaltigen Gasen und Dämpfen in der Umgebungsluft.

1) Bei Verwendung mit der Feldbus-Schnittstelle sind keine Relais vorhanden. Die Feldbus-Schnittstelle entspricht nicht BVS 13 ATEX G 001 X.
DrägerSensorAlive wird nicht unterstützt.

– Polytron 8700 IR mit PIR 7000 ist ein explosionsgeschütztes Gerät für die kontinuierliche Überwachung von brennbaren und kohlenwasserstoffhaltigen Gasen und Dämpfen in geeigneter Atmosphäre.
– Polytron 8720 IR mit PIR 7200 ist ein explosionsgeschütztes Gerät für die kontinuierliche Überwachung von Kohlenstoffdioxid in der Umgebungsluft.

3.4 Zulassungen

3.4.1 ATEX, IECEx, UL, CSA

Ein Beispiel für ein Typenschild ist auf der Ausklappseite abgebildet. Außerdem befindet sich ein Ausdruck des Typenschilds in der Versandverpackung des Geräts.

3.4.2 Weitere Informationen

Konformitätserklärung: siehe Einlegeblatt 4544300 oder www.draeger.com/product-certificates

Weitere Informationen zu Zulassungen siehe Einlegeblatt 4544300.

4 Installation des Transmitters

4.1 Explosionsgeschützte (Ex d) Installation - ohne Docking Station

4.1.1 Mechanische Installation

4.1.1.1 Allgemeine Hinweise zur mechanischen Installation

– Die Bestimmungen und Vorschriften auf lokaler, bundesstaatlicher und nationaler Ebene für die Installation von Gasmesssystemen müssen strikt eingehalten werden.
– Die physikalischen Eigenschaften der zu messenden Gase oder Dämpfe und die Details zur jeweiligen Anwendung (z. B. mögliche Leckagen, Luftbewegungen/-strömungen usw.) müssen berücksichtigt werden.
– Die zukünftige Verwendung von Zubehörteilen und Wartungsausrüstung muss berücksichtigt werden.
– Der freie Gas- oder Dampfzustrom zum Sensor darf nicht behindert werden.
– Das Gerät darf keiner Strahlungswärme ausgesetzt werden, da diese zu einem Temperaturanstieg über die angegebenen Grenzwerte (16.6 Umgebungsparameter) führt. Es wird empfohlen, eine reflektierende Abschirmung zu verwenden.
– An der Kabeleinführung des Geräts kann eine Staubkappe angebracht sein. Diese Kappe ist weder explosionsgeschützt noch wasserdicht und muss vor Anschluss des Geräts an eine versiegelte Rohrleitung oder vor Installation einer feuerfesten Kabelverschraubung entfernt werden.
– Unbenutzte Öffnungen sind durch einen Verschlussstopfen zu verschließen. Siehe 16.7 Anzugsdrehmomente für die erforderlichen Anzugsdrehmomente für Kabeldurchführungen, Kabelverschraubung, Stecker und Sensor.
– Bei Installationen ohne Rohrleitung muss eine zugelassene Kabelverschraubung (z. B. Hawke A501/421/A/¾" NPT oder gleichwertig) verwendet werden.
– **WARNUNG:** Nur bei Installation mit Rohrleitung: Um die Entzündungsgefahr von gefährlicher atmosphärischer Luft zu reduzieren, die ersten 45 cm (18 Zoll) der Rohrleitung vom Gehäuse aus versiegeln.
– **VORSICHT:** Wenn das Gasmessgerät an Auswerteeinheiten angeschlossen ist, kann die gesamte Ansprechzeit verzögert werden. Die gesamte Messstrecke muss berücksichtigt werden (z. B. Latenzzeit der Auswerteeinheit). Sicherstellen, dass die benötigte Ansprechzeit eingehalten wird.

Polytron® 8100 EC-spezifisch:

– Empfohlene Ausrichtung des Sensors: nach unten (siehe Abbildung C auf der Ausklappseite).

Polytron® 8200 CAT-spezifisch:

– Vorzugsausrichtung des Sensors: nach unten (siehe Abbildung E auf der Ausklappseite). Wenn der Sensoreinlass vor mechanischem Schaden, Schmutz- und Wassereintritt geschützt ist, ist jede Ausrichtung zulässig.
– Nur für CSA-konformen Betrieb:
Die Verwendung des optionalen Spritzschutzes (6812510) ist durch die CSA-Zulassung vorgeschrieben.

Polytron® 8310 IR-spezifisch:

– Empfohlene Ausrichtung des Sensors: nach unten (siehe Abbildung E auf der Ausklappseite).

Polytron® 87x0 IR-spezifisch:

– Die Vorzugsstellung des Dräger PIR 7x00 Sensors ist einzuhalten (siehe Abbildung F auf der Ausklappseite). Größere Abweichungen und die Verwendung des vormontierten Spritzschutzes erhöhen die Ansprechzeit (siehe Gebrauchsanweisung für PIR 7x00).
– Jegliche andere Ausrichtung ist nur zulässig, wenn der PIR 7x00 ohne Spritzschutz verwendet wird, z. B. bei Anwendungen in Lüftungskanälen. Wird der Sensor senkrecht installiert, können sich verstärkt Ablagerungen auf den optischen Oberflächen ansammeln.
– Es wird empfohlen, den vormontierten Spritzschutz zu verwenden, um den Sensor vor Wasser und Staub zu schützen.
– Wird ein Spritzschutz (Sachnummer 6811911 oder 6811912) verwendet, muss sichergestellt sein, dass die Statusleuchten vertikal angeordnet sind und das Dräger-Logo des Spritzschutzes horizontal ausgerichtet ist. Eine maximale Abweichung von ±30 Grad von der horizontalen Position ist zulässig.
– Flüssigkeiten bzw. Ablagerungen auf den optischen Oberflächen des PIR 7x00 können eine Warnung oder Störung auslösen.
– Für die explosionsgeschützte Version ist es empfehlenswert, einen Abstandhalter (Sachnummer 6812617) zu verwenden, wenn das Gerät an einer Wand oder einer ebenen Oberfläche angebracht wird.

Besondere Bedingungen gemäß EN/IEC 60079-1

– Die Gewinde für die druckfeste / explosionsgeschützte Kapselung entsprechen nicht den Mindest-/Höchstwerten aus EN/IEC 60079-1. Die Gewinde dürfen nicht durch den Benutzer überarbeitet werden.

4.1.1.2 Installation

Das Gerät kann zur Messung von Gasen in Umgebungsluft oder in einem Lüftungskanal/Rohr montiert werden.

1. Es sind M6 (1/4") Sechskant-Zylinderschrauben zur Montage des Gehäuses in einer der folgenden Ausführungen zu verwenden.

Option	Zubehör
Befestigung an einer ebenen Oberfläche	Bohrbild: 4544300 Zusätzlich für das Polytron 87x0 IR: Abstandshalter 6812617
Befestigung an einer Stange	Set für Stangenbefestigung: 4544198
Befestigung in einem Lüftungskanal/Rohr	Set für Kanalbefestigung: 6812725 Für Polytron® 87x0 IR:: 6812300

4.1.2 Elektrische Installation

4.1.2.1 Allgemeine Hinweise zur elektrischen Installation

– Anzugsdrehmomente siehe 16.7, zulässige Kabelspezifikationen siehe 16.3.
– Die einschlägigen Vorschriften für die Verlegung und den Anschluss von Strom- und Signalleitungen an Gasmesssysteme müssen strikt eingehalten werden.
– Es müssen Aderendhülsen verwendet werden.
– Die Leiter der Stromversorgung müssen einen ausreichend niedrigen Widerstand haben, damit die korrekte Versorgungsspannung am Gerät gewährleistet ist.
– Die Kabelisolierung muss auf 5 bis 7 mm entfernt werden.
– Der speisende Sekundärstromkreis muss galvanisch vom Netzstromkreis getrennt sein (gilt nicht für die Relais-Stromkreise).
– Wenn das Gerät an Standorten installiert wird, an denen eine Umgebungstemperatur von über 55 °C herrscht, sind entsprechende Kabel zu verwenden, die für eine Verwendung bei Temperaturen von mindestens 25 °C über der maximalen Umgebungstemperatur ausgelegt sind.
– Nur Kabeldurchführungen verwenden, die in dem Land zugelassen sind, in dem die Anlage installiert wird, und die für die Anwendung geeignet sind.
– Gemäß der EU-Richtlinie 2014/30/EU darf dieses Gerät nicht an ein Gleichstromnetz angeschlossen werden. Es wird empfohlen, eine eigene Stromversorgung für das Gerät einzurichten.

Analogschnittstelle

– Damit ein korrekter Betrieb des Geräts sichergestellt ist, darf der Widerstand der 4-bis-20-mA-Signalschleife 500 Ohm nicht überschreiten.
Bei Einsatz gemäß Messtechnischer Eignungsprüfung nach EN IEC 62990-1, EN IEC 60079-29-1 oder EN 50104 darf der Widerstand 300 Ohm nicht überschreiten. Bei Werten über 300 Ohm kann eine Überwachung der Versorgungsspannung nicht garantiert werden.
Je nach Betriebsspannung und Anwendung (z. B. Verwendung mit HART®) ist ein bestimmter Mindestwiderstand zu beachten (siehe „Signalübertragung zur Auswerteeinheit“, Seite 89).

Ausführung mit Relais

– Bei Spannungen von >30 VAC bzw. >42,4 VDC sind die Relais-Leitungen mit einem Schutzschlauch zu überziehen, oder es sind doppelt isolierte Leitungen zu verwenden.
– Die Drähte zum optionalen Relais-Modul sind entsprechend den Bemessungsspannungen, Strömen und Umweltbedingungen auszuwählen und abzusichern.
– Um sicherzustellen, dass eine Störung erkannt wird, ohne auf das Gerät blicken zu müssen, muss an das Störungsrelais ein Alarmgeber angeschlossen werden.
– Spannungsunterschiede können zu Isolationsfehlern führen. Keine elektrischen Lasten mit unterschiedlicher Spannungsart (AC oder DC) miteinander vermischen. Bei DC-Lasten sicherstellen, dass über die Relaiskontakte nur Geräte mit derselben DC-Nennspannung gesteuert werden. Bei AC-Lasten sicherstellen, dass die Relaiskontakte nur mit Geräten verbunden sind, mit denen diese eine Phase teilen.

Besondere Bedingungen gemäß IEC 60664-1

– Die Gerätevarianten, die sowohl eine FISCO-Feldbus-Schnittstelle als auch einen Gastransmitter ETR 02…5** verwenden, müssen über Stromkreise versorgt werden, die gegen Überspannungen der Kategorie I/II/III nach IEC 60664-1 geschützt sind.

4.1.2.2 Anschlussschemata

Auf den Ausklappseiten sind folgende Anschlussschemata dargestellt:

Abbildung	Anschlussschema für Geräte
G	Ohne Relais, Gehäuseerdung
H	Mit Relais, Gehäuseerdung
I1	4-20 mA / HART (Stromquelle)
I2	4-20 mA / HART (Stromsenke)
I3	4-20 mA / HART (separate Spannungsversorgung, Stromquelle)
H1	Standalone, nur Relais
J	Foundation Fieldbus / PROFIBUS PA, Gehäuseerdung
K	Modbus RTU, Gehäuseerdung

Abbildung	Anschlussschema für Geräte
J1	Foundation Fieldbus / PROFIBUS PA, Feldverdrahtung
K1	Modbus RTU, Feldverdrahtung
L	Spannungsversorgung digitaler Schnittstellen

4.1.2.3 Verdrahtungstabellen

4-bis-20-mA- / HART-Schnittstelle

Pin	Kennz.	Funktion
1	PWR+	V+
2	PWR-	V-
3	PWR-	V- Zu verwenden, wenn das Gerät an eine separate Spannungsversorgung angeschlossen wird (Betrieb als Quelle).
4	4-20 mA	4-20 mA-Signal (Betrieb als Quelle oder Senke)
5	PE	Schutzleiter Optionaler Schutzleiter für den Relaisanschluss. Bei einem Anschluss des Schutzleiters zusammen mit dem 4-20-mA-Analogausgang kann es zu Masseschleifen kommen.

Feldbus-Schnittstelle

Pin	Kennz.	Funktion
1	Daten-A	Signalführung A
2	Daten-B	Signalführung B
3	GND	Erdung
4	ABSCHIRMUNG	Kabelabschirmung

Pin	Kennz.	Funktion
1	PWR+	V+
2	PWR-	V-

Steckverbinder Relais

Alle Relais (A1, A2, FLT) des Geräts können als "normal erregt" (Ruhestromrelais) oder "bei Alarm erregt" (Arbeitsstromrelais) konfiguriert werden. Werkseitig sind die Relais als Ruhestromrelais ("normal erregt") konfiguriert. Hierdurch wird ein ausfallsicherer Betrieb gewährleistet. Entgegen der Konventionen sind die Kennzeichnungen NO, COM, NC am Gerät so gewählt, dass sie dem normal erregten Zustand entsprechen. Wenn das Gerät mit Spannung versorgt wird, stimmt die Kennzeichnung mit der Funktion der Pins überein.

Pin	Kennz.		Relais	
1	NO	FLT	Störung	Arbeitskontakt (Normally Open)
2	COM		Störung	Gemeinsamer Anschluss (Common)
3	NC		Störung	Ruhekontakt (Normally Closed)
4	NO	A2	A2	Arbeitskontakt (Normally Open)
5	COM		A2	Gemeinsamer Anschluss (Common)
6	NC		A2	Ruhekontakt (Normally Closed)
7	NO	A1	A1	Arbeitskontakt (Normally Open)
8	COM		A1	Gemeinsamer Anschluss (Common)
9	NC		A1	Ruhekontakt (Normally Closed)

4.1.2.4 Elektrische Installation vorbereiten

1. Gewindestift (2) lösen und die Gehäuseabdeckung vom Gehäuseunterteil abschrauben, siehe Abbildung A auf der Ausklappseite.
2. Die Leiterplatteneinheit herausziehen.
3. Mit der Abbildung fortfahren, die das entsprechende Polytron®-Modell und den Signalausgang enthält, siehe Ausklappseite.

4.1.2.5 Anschluss des Geräts mit Relais (Stand-Alone)

Die Leitungen für die Alarmgeber müssen an den 9-poligen Relais-Anschluss angeschlossen werden. Ein Stück Kabelisolierung (Wärmeschrumpfschlauch) und eine Schutzhülle sind als zusätzlicher Schutz für die Relais-Kabel mitgeliefert.

1. Den 5-poligen Steckverbinder entfernen.
2. Kabel für Stromversorgung an die entsprechenden Anschlussklemmen anschließen, siehe Abbildung H1 auf der Ausklappseite.
3. Kontakte 3 und 4 des 5-poligen Steckverbinders überbrücken.
4. Den 9-poligen Steckverbinder entfernen.

5. Den Schrumpfschlauch nach Bedarf zurechtschneiden und vor dem Einstecken in den 9-poligen Stecker über die Relais-Kabel schieben.
6. Den Schrumpfschlauch am Rand der Kabelisolierung platzieren und mit einer Wärmepistole vorsichtig über der Kabelisolierung schrumpfen lassen.
7. Die Schutzhülle über die Drähte schieben.
8. Die Drähte für Alarm 1 (Voralarm), Alarm 2 (Hauptalarm) und Fehleralarm an die entsprechenden Klemmen anschließen, wie in der folgenden Anschlusstabelle angegeben.
9. Den Stecker wieder in die Buchse stecken und die Schrauben anziehen.
10. Gerät schließen, siehe 4.1.2.9 Gasmessgerät schließen.

Die folgenden Tabellen zeigen den Status einer angeschlossenen Alarmanzeige und ob diese Fehler (z. B. Stromausfall am Gasmessgerät) anzeigt.

Das Verhalten des Relais ist abhängig von der Alarmkonfiguration und dem Relaiskontakt, mit dem die Alarmanzeige verbunden ist.

Relais-Konfiguration: Normal erregt

Kontakt	Status der Alarmanzeige und Fehlerangabe durch die Alarmanzeige		
	Alarm ausgelöst	Gasmessgerät-spezifischer Fehler	Fehler der Feldverdrahtung
Ruhekontakt (Normally Closed)	EIN	angezeigt	nicht angezeigt
Arbeitskontakt (Normally Open)	AUS	angezeigt	angezeigt

Relais-Konfiguration: Bei Alarm erregt

Kontakt	Status der Alarmanzeige und Fehlerangabe durch die Alarmanzeige		
	Alarm ausgelöst	Gasmessgerät-spezifischer Fehler	Fehler der Feldverdrahtung
Ruhekontakt (Normally Closed)	AUS	nicht angezeigt	angezeigt
Arbeitskontakt (Normally Open)	EIN	nicht angezeigt	nicht angezeigt

4.1.2.6 Anschluss der 4-20-mA- / HART®-Schnittstelle

Informationen zum Anschluss an eine Auswerteeinheit (SPS) entnehmen Sie der Dokumentation der jeweiligen Auswerteeinheit.

1. Den 5-poligen Anschlussstecker herausziehen.
2. Die drei Drähte für Spannung und Signal gemäß Verdrahtungstabelle und Abbildung an die jeweilige Klemme anschließen.
3. Den Stecker wieder an der Buchse anschließen und die Schrauben anziehen.
4. Das Gerät schließen, siehe 4.1.2.9 Gasmessgerät schließen.

4.1.2.7 Erdung

1. Das Gehäuse des Geräts lokal an der Erdungsöse erden, siehe Abbildungen G und H auf der Ausklappseite..
2. Den Schirm der Drähte nur an die Geräteerdung der Auswerteeinheit (z. B. Masse, Erdungsschiene) anschließen.

> ℹ Sofern keine besonderen Maßnahmen getroffen werden (z. B. kapazitive Erdung), muss der Schirm nur an einem Ende angeschlossen werden.

Informationen zur Erdung von Feldbus- und Modbus-Verbindungen sind den folgenden Dokumenten zu entnehmen.

Schnittstelle	Dokument
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

4.1.2.8 Anschluss der Feldbus-Schnittstelle

1. Den 2-poligen und 4-poligen Steckverbinder entfernen.
2. Die zwei Kabel für Stromversorgung und die vier Kabel für das Signal an die entsprechenden Anschlussklemmen anschließen, wie in der Anschlusstabelle und im Anschlussbild dargestellt.
3. Den Stecker wieder in die Buchse stecken und die Schrauben anziehen.
4. Gerät schließen, siehe 4.1.2.9 Gasmessgerät schließen.

Weitere Informationen zur Installation der Feldbus-Schnittstelle sind dem entsprechenden Technischen Handbuch zu entnehmen.

4.1.2.9 Gasmessgerät schließen

1. Sicherstellen, dass die folgenden Verbindungen korrekt hergestellt wurden:
   a. Die Schrauben der Verdrahtung sind mit dem richtigen Drehmoment angezogen.
   b. Alle Kabelverbindungen sind mit Schrauben gesichert.
   c. Das Anschlussstück des Sensors ist eingesteckt.
   d. Das Erdungskabel, das aus dem Gehäuse führt, ist mit der Öse an der Leiterplatteneinheit angeschlossen, siehe Abbildungen G und H auf der Ausklappseite.
2. Die Leiterplatteneinheit in das Gehäuseunterteil einsetzen.
3. Die Gehäuseabdeckung auf das Gehäuseunterteil schrauben und mit dem korrekten Drehmoment festziehen.
4. Gewindestift festziehen.

4.2 Installation mit erhöhter Sicherheit (Ex e) - mit Docking Station

Die Installation mit erhöhter Sicherheit (Ex e) ist in der Montageanleitung der Docking Station beschrieben (Sachnummer 9033242).

5 Installation von Sensoren oder Messköpfen

5.1 EC-Sensor am Polytron 8100 EC installieren

Siehe Abbildung C auf der Ausklappseite.

1. Feststellschraube (2) lösen (2 mm-Innensechskantschraube).
2. Bajonettring (3) abschrauben und Blindscheibe entfernen.
3. Sensor (4) in die Öffnung einsetzen und drehen, bis er im Gasmessgerät einrastet. Der Sensorstecker wird dabei nicht beschädigt.
4. Sensor mit dem zugehörigen Bajonettring (3) sichern.

   ℹ Für Dräger SensorAlive muss ein anderer Bajonettring verwendet werden als für andere EC-Sensoren.

5. Feststellschraube (2) so weit anziehen, dass der Bajonettring nicht gelöst werden kann (für Installationen in Zone 22 vorgeschrieben).

   ℹ Wenn Dräger SensorAlive zum ersten Mal in einer bestehenden Anlage installiert wird, muss sichergestellt werden, dass die Firmware Version 4.0.0 oder höher ist. Zur Unterstützung Dräger kontaktieren.

5.2 Messkopf installieren

Abhängig von der Explosionsschutzart werden unterschiedliche Messköpfe verwendet. Informationen zur Installation der Messköpfe sind der jeweiligen Anleitung des Messkopfs zu entnehmen.

Bei abgesetzten Anwendungen muss die Kabelabschirmung sowohl auf der Sensor- als auch auf der Transmitterseite aufgelegt werden. Die Kabellänge sollte ≤ 30 m sein.

Abgesetzte Versionen mit Explosionsschutz „explosionsgeschützt (Ex d)“

Transmitter	Messkopf-GA-Sachnummern
Polytron 8100 EC	Abgesetzter EC-Messkopf (9033247)
Polytron 8200 CAT (für DQ-Sensoren)	Abgesetzter Sensor DQ NPT Alu, abgesetzter Sensor DQ NPT Stahl (4544286)
Polytron 87x0 IR	Abgesetzter PIR 7000 (334) mit Sensoranschlussgehäuse Edelstahl oder Aluminium (4544286)
Polytron 8200 CAT (für LC-Sensoren) Polytron 8310 IR Polytron 87x0 IR	Sensoranschlussgehäuse Edelstahl oder Aluminium (4544286)

Abgesetzte Versionen mit Explosionsschutz „erhöhte Sicherheit (Ex e)“

Transmitter	Messkopf-GA-Sachnummern
Polytron 8100 EC	Abgesetzter EC-Messkopf (9033247)
Polytron 8200 CAT	Messköpfe Polytron SE Ex (9033888)
Polytron 8310 IR	DrägerSensor IR (9023843)
Polytron 87x0 IR	PIR 7x00 (9023885)

6 Inbetriebnahme

6.1 Allgemeine Hinweise

– Zuerst die Drähte für die Relais anschließen und die Anschlüsse für den Sensor herstellen, bevor das Gerät an die Spannungsversorgung angeschlossen wird.
– Bevor das Gerät für den Normalbetrieb in Betrieb genommen wird, überprüfen, ob die Konfigurations- und Justiereinstellungen korrekt sind.

Um den sicheren Betrieb gemäß BVS 13 ATEX G 001 X und PFG 14 G 001 X zu gewährleisten, müssen folgende Standardalarmeinstellungen des Geräts beibehalten werden.

– Die Relais müssen auf ***Normal erregt*** und der Alarm A2 (Hauptalarm) auf ***Selbsthaltend*** und ***Nicht quittierbar*** bzw. ***Vorquittierbar*** eingestellt sein.
– Der Alarm A1 (Voralarm) darf nur auf ***Quittierbar*** eingestellt sein, wenn dieser zur Ansteuerung eines akustischen Alarmmittels verwendet wird.
– Verriegelung bei Messbereichsüberscheitung (siehe „DQ-Sensorverriegelung einstellen“, Seite 84).

Beim Betrieb gemäß BVS 13 ATEX G 001 X und PFG 14 G 001 X müssen folgende besondere Bedingungen berücksichtigt werden:

– Polytron 8200 CAT:
  – Bei Anströmung mit messgashaltiger Luft des DQ- oder LC-Sensors können um bis zu 32% erhöhte Messwerte auftreten.
    Bei Betrieb mit dem Fernkalibrieradapter DQ kann diese Erhöhung bis zu 70% betragen.
  – Der Transmitter mit LC-Sensor muss in Verbindung mit einer Steuereinheit betrieben werden, die eine Messbereichsüberschreitung selbsthaltend signalisiert. Interne Alarmrelais des Transmitters dürfen nicht verwendet werden.
  – Der Transmitter mit LC-Sensor muss mit seinem Sensor in seiner betriebsüblichen Gebrauchslage justiert werden.
  – Während der Anwärmzeit des LC-Sensors können Fehlalarme auftreten.
– Polytron 8100 EC:
  Die Einstellzeit t20 der Transmitter mit EC-Sensor kann bei kleinen Konzentrationsänderungen den Grenzwert der EN 50104 überschreiten.

6.2 Gasmessgerät in Betrieb nehmen

1. Zur Vermeidung von Fehlalarmen die Alarmgebung des Gasmessgeräts ausschalten (siehe „Alarme ein- oder ausschalten“, Seite 77).
2. Die Spannungsversorgung einschalten.
   ⇒ Das Gerät durchläuft eine Startsequenz (LCD-/LED-Test, Softwareversion und Initialisierung).
   ⇒ Das Display zeigt an, dass der Sensor in hh:mm:ss (Countdown) bereit für die Messung ist. Das Gerät überträgt das Wartungssignal. Das Fehlerrelais wird aktiviert.
   ⇒ Der Sensor läuft ein. Das Wartungssignal auf der 4–20-mA-Schnittstelle bleibt bestehen, bis der Sensor eingelaufen ist. Die Länge der Einlaufzeit hängt von der Art des Sensors sowie den Umweltbedingungen ab. Maximale Einlaufzeit eines neuen Sensors: Siehe Gebrauchsanweisung des Sensors.
3. Datum und Uhrzeit prüfen. Einstellungen können während der Einlaufzeit des Sensors gemacht werden.
   ⇒ Nach der Einlaufzeit des Sensors geht das Gerät in den Normalbetrieb über. Auf dem Display wird die aktuelle Gaskonzentration, die Messeinheit und ggf. das gewählte Gas angezeigt. Die grüne LED leuchtet.

   ℹ Wenn das Gerät mit einem Dräger SensorAlive betrieben wird, empfiehlt Dräger, Datum und Uhrzeit korrekt einzustellen. Nach der Einlaufzeit des Sensors findet die Anlaufzeit des Dräger SensorAlive statt. Während dieser Phase ist der Sensor messfähig, die Selbstdiagnose findet aber noch nicht statt.
4. Das Gerät bei Bedarf justieren.
5. Die Alarmgebung des Gasmessgeräts einschalten (siehe „Alarme ein- oder ausschalten“, Seite 77).

7 Betrieb

7.1 Bedienfeld

Auf dem Bedienfeld befinden sich
– Tasten zur Navigation im Menü
– ein Display
– LEDs und zugehörige Symbole

Die Tasten zur Navigation haben unterschiedliche Funktionen, je nachdem, in welchem Menü man sich befindet.

Das Gerät wird mit einem Magnetstab bedient. Dabei muss die Gehäuseabdeckung auf dem Gerät aufgesetzt sein. Wenn die Gehäuseabdeckung nicht aufgesetzt ist, kann der Magnetstab möglicherweise zwei oder mehr Schaltflächen auf einmal aktivieren (Crosstalk).

7.2 LEDs und Symbole

Auf dem Bedienfeld befinden sich folgende Symbole und LEDs:

Symbol	LED	Beschreibung
	Rot	Alarm ausgelöst
	Gelb	Störung
	Grün	Eingeschaltet

LED-Status

– Wenn der Alarm A1 (Voralarm) ausgelöst wurde, blinkt die rote LED einfach .
– Wenn der Alarm A2 (Hauptalarm) ausgelöst wurde, blinkt die rote LED zweifach .
– Wenn ein Alarm quittiert wurde, bevor die Ursache behoben worden ist, leuchtet die rote LED dauerhaft, um anzuzeigen, dass eine Störung vorliegt.

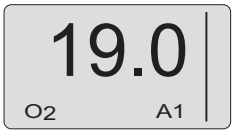
7.3 Anzeigen am Display

7.3.1 Alle Geräte

Symbol	Erklärung
	Eine Fehlermeldung liegt vor. Weitere Informationen sind im Menü ***Information*** erhältlich.
	Eine Warnmeldung liegt vor. Weitere Informationen sind im Menü ***Information*** erhältlich.
	Wartungssignal wird ausgegeben.
	Der eingestellte Messbereichsendwert wird an der 4-20-mA-Schnittstelle überschritten.
	Der eingestellte Messbereichsanfangswert wird an der 4-20-mA-Schnittstelle unterschritten.

Symbol	Erklärung
	HART®-Betrieb ist aktiviert. Die Analogschnittstelle ist auf einen festen Wert eingestellt und überträgt kein Messsignal.
	Sobald die Kapazität des Datenloggers erschöpft ist, werden die alten Daten durch neue Werte überschrieben (Funktion "roll").
	Sobald die Kapazität des Datenloggers erschöpft ist, werden keine weiteren Daten gespeichert (Funktion "stack").
SIL	Der SIL-Betriebsmodus ist aktiv.

7.3.2 Polytron 8100 EC-spezifische Symbole



Symbol	Erklärung
	Der Sensor ist betriebsbereit.
	Der Sensor ist betriebsbereit, jedoch nahe dem Ende der Nutzungsdauer.
	Der Sensor ist noch betriebsbereit, sollte aber so bald wie möglich gewechselt werden. Die Vitalität ist <25%.
LT	Ein LifeTest des Dräger SensorAlive wird durchgeführt.

7.3.3 Messbetrieb

Die folgenden Beispielanzeigen stammen von Polytron 8100 EC.

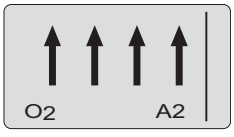
Für Polytron 8200 CAT und Polytron 8310 IR sind keine Gasbezeichnungen vordefiniert. Die Gasbezeichnungen müssen über die PC-Software DrägerPolysoft eingegeben werden. Wenn einzelne Parameter mit der PC-Software DrägerPolysoft oder einer anderen Software verändert werden, müssen alle Parameter aus dem Polytron® 8xx0 ausgelesen oder direkt am Gerät verifiziert werden.

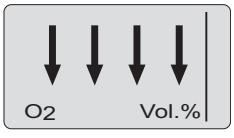
Im Messbetrieb wird folgendes angezeigt:

Beispiel für Anzeige	Beschreibung
	Im Normalbetrieb werden auf dem Display die gemessene Gaskonzentration, die gewählte Gasart und die Messeinheit angezeigt. **Analogschnittstelle:** korrespondierender Stromwert **Relais:** alle Relais sind im Normalzustand
	Überschreiten der Alarmschwellen. Das Beispiel zeigt Voralarm A1. **Analogschnittstelle:** korrespondierender Stromwert **Relais:** Relais A1 ist im Alarmzustand.

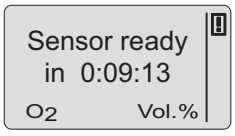
7.3.4 Sonderzustände

Wenn sich das Gerät in einem Sonderzustand befindet, kann eine ordnungsgemäße Messung oder Alarmgebung nicht mehr garantiert werden.





Dies ist der Fall,



- wenn die Gaskonzentration den Messbereich überschreitet.
- wenn eine Störung auftritt.
- wenn Alarme deaktiviert sind.
- wenn Justierungen durchgeführt werden.
- wenn Begasungstests durchgeführt werden.
- wenn ein Sensor in der Einlaufphase ist.
- wenn das System im Wartungsmodus ist.
- wenn ein Dräger SensorAlive verwendet wird und das System so konfiguriert ist, dass der Messwert während eines LifeTests nicht ausgegeben wird.

Welche Stromstärke der Analogschnittstelle mit welchem Analogsignal verknüpft ist, siehe 16.2.

Die Signale der digitalen Schnittstellen sind den folgenden Dokumenten zu entnehmen.

Schnittstelle	Dokument
PROFIBUS PA	9033782
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

Beispiel für Anzeige	Beschreibung
	**Wert liegt über dem Messbereich** Die Gaskonzentration liegt außerhalb des Messbereichs des Sensors[1)]. **Analogschnittstelle:** Messbereichsüberschreitung **Relais:** A2-Relais-Schalter ***Hinweis für Polytron 8200 und Polytron 8310:*** Die Meldung, dass der Messbereich überschritten wurde, kann auch auf einen Kurzschluss oder eine Unterbrechung der Verbindung zu einem abgesetzten Sensor zurückzuführen sein.
	**Wert liegt unter dem Messbereich** Die Gaskonzentration liegt außerhalb des Messbereichs des Sensors. **Analogschnittstelle:** Drift unter Null **Relais:** Fehlerrelais-Schalter
	**Fehleranzeige** Auf der rechten Seite wird das Symbol ⊠ angezeigt. **Analogschnittstelle:** Fehlerstrom **Relais:** Fehlerrelais-Schalter

Beispiel für Anzeige	Beschreibung
	**Instandhaltungsanzeige** Auf der rechten Seite wird das Symbol angezeigt. Dies wird angezeigt, wenn Alarme deaktiviert sind, während der Justierung, eines Begasungstests und Instandhaltungsarbeiten. **Analogschnittstelle:** Wartungsstrom **Relais:** Keine Änderung
	**Warnanzeige** Auf der rechten Seite wird das Symbol angezeigt. **Analogschnittstelle:** Warnungsstrom[2)] **Relais:** Keine Änderung
	**Einlaufphase 1** Auf der rechten Seite wird das Symbol angezeigt. Die verbleibende Zeit wird auf der linken Seite angezeigt. **Analogschnittstelle:** Wartungsstrom **Relais:** Fehlerrelais-Schalter Das Fehlerrelais-Verhalten lässt sich für Einlaufphase 1 konfigurieren (siehe „Fehlerrelais Einlaufen 1 einstellen“, Seite 77)
	**Einlaufphase 2** Auf der rechten Seite wird das Symbol angezeigt. Der gemessene Wert wird auf der linken Seite angezeigt. **Analogschnittstelle:** Messwert **Relais:** Verhalten wie im Messbetrieb (das Fehlerrelais zeigt nicht Einlaufphase 2 an.)

1) Wenn die Gaskonzentration den Messbereichsendwert der 4-20 mA-Schnittstelle überschreitet, wird auf dem Display weiterhin der Messwert sowie der Hinweis „Messbereichsüberschreitung der analogen Schnittstelle“ angezeigt .
2) Nur wenn der Warnungsstrom aktiviert ist. Werkseinstellung: deaktiviert.

7.3.5 Beendigung der Sonderzustände

Fehleranzeige / Warnanzeige

Fehleranzeigen und Warnanzeigen sind in der Regel nicht selbsthaltend. Sobald die Ursachen der Fehler oder Warnungen behoben sind, wird kein Fehler und keine Warnung mehr angezeigt. Ausnahmen sind "SensorAlive Fehlererkennung" und "SensorAlive Verstopfungserkennung".

Um die Ursachen zu beheben, den Fehler oder die Warnung anzeigen lassen (siehe „Das Menü Information“, Seite 63) und mit der Störungsbeseitigung (siehe „Störungsbeseitigung“, Seite 71) beginnen.

Wert über-/unterschreitet den Messbereich

Die Anzeige gibt an, dass die Gaskonzentration außerhalb des Messbereichs des Sensors ist. Die Anzeige erlischt, sobald die Gaskonzentration wieder im Messbereich ist. Nach einer Messbereichsüberschreitung kann sich die Empfindlichkeit und die Ansprechzeit des Sensors verschlechtern.

HINWEIS

Fehlfunktion des Sensors

Gaskonzentrationen außerhalb des Messbereichs des Sensors können Fehlfunktionen des Sensors verursachen.

► Sensor ggf. neu justieren.

Polytron® 8200 CAT mit DQ-Sensor:

Eine Messbereichsüberschreitung muss mit [OK] bestätigt werden, nachdem geprüft wurde, dass die Gaskonzentration unter 100 %UEG liegt (z. B. mit einem tragbaren Gasmessgerät).

Die Standardeinstellung des Geräts ist: selbsthaltende Alarme.

Bei Geräten ohne Relais lässt sich die Messbereichsüberschreitung auf nicht selbsthaltend stellen. In diesem Fall erlischt die Anzeige Messbereichsüberschreitung. Diese Funktion muss von der Auswerteeinheit unterstützt werden! Für weitere Informationen siehe: „DQ-Sensorverriegelung einstellen“, Seite 84.

Polytron® 8200 CAT mit LC-Sensor:

⚠ WARNUNG

Missverständliche Anzeigen bei Messwerten, die den Messbereich überschreiten

Selbsthaltende Alarme bei Messbereichsüberschreitungen werden von LC-Sensoren nicht unterstützt.
Für einen sicheren Betrieb entsprechend BVS 13 ATEX G 001 X muss das Gasmessgerät mit einer Auswerteeinheit betrieben werden, die selbsthaltende Alarme anzeigen kann. Die internen Alarmrelais des Gasmessgeräts dürfen nicht verwendet werden.

► Sicherstellen, dass eine selbsthaltende Anzeige von Messbereichsüberschreitungen an der Auswerteeinheit aktiviert ist.

Nach der Anzeige von Werten mit Messbereichsüberschreitung muss sichergestellt werden, dass die Gaskonzentration unter 100 %UEG liegt (z. B. mit einem tragbaren Gasmessgerät).

7.4 Infomodus und Funktionstaste

7.4.1 Infomodus aufrufen

Der Infomodus wird verwendet, um für das Gerät relevante Informationen einzusehen. Dadurch wird der Normalbetrieb des Geräts nicht unterbrochen.

- Im Messbetrieb 3 Sekunden lang die Taste gedrückt halten.

7.4.2 Im Infomodus navigieren

Taste	Funktion
▲	Blättert zur nächsten Seite.
▼	Blättert zur vorherigen Seite.
OK	Beendet den Infomodus.

Nach 30 Sekunden ohne Tastenbetätigung beendet das Gasmessgerät den Infomodus automatisch.

7.4.3 Funktionstaste verwenden

Mit der Funktionstaste kann eine der Funktionstaste zugewiesene Funktion direkt aufgerufen werden. Per Voreinstellung wird der Fehlerbericht angezeigt.

- Im Messmodus ▲ ca. 1 Sekunde gedrückt halten.

Funktionstaste konfigurieren (siehe Kapitel 11.4 Funktionstaste konfigurieren).

7.5 Menüs

7.5.1 In einem Menü navigieren

Taste	Funktion
▲	Navigiert aufwärts. Stellt Werte ein.
▼	Navigiert abwärts. Stellt Werte ein.
OK	Bestätigt Eingaben. Wählt Menüs und Funktionen.

7.5.2 Menüs aufrufen

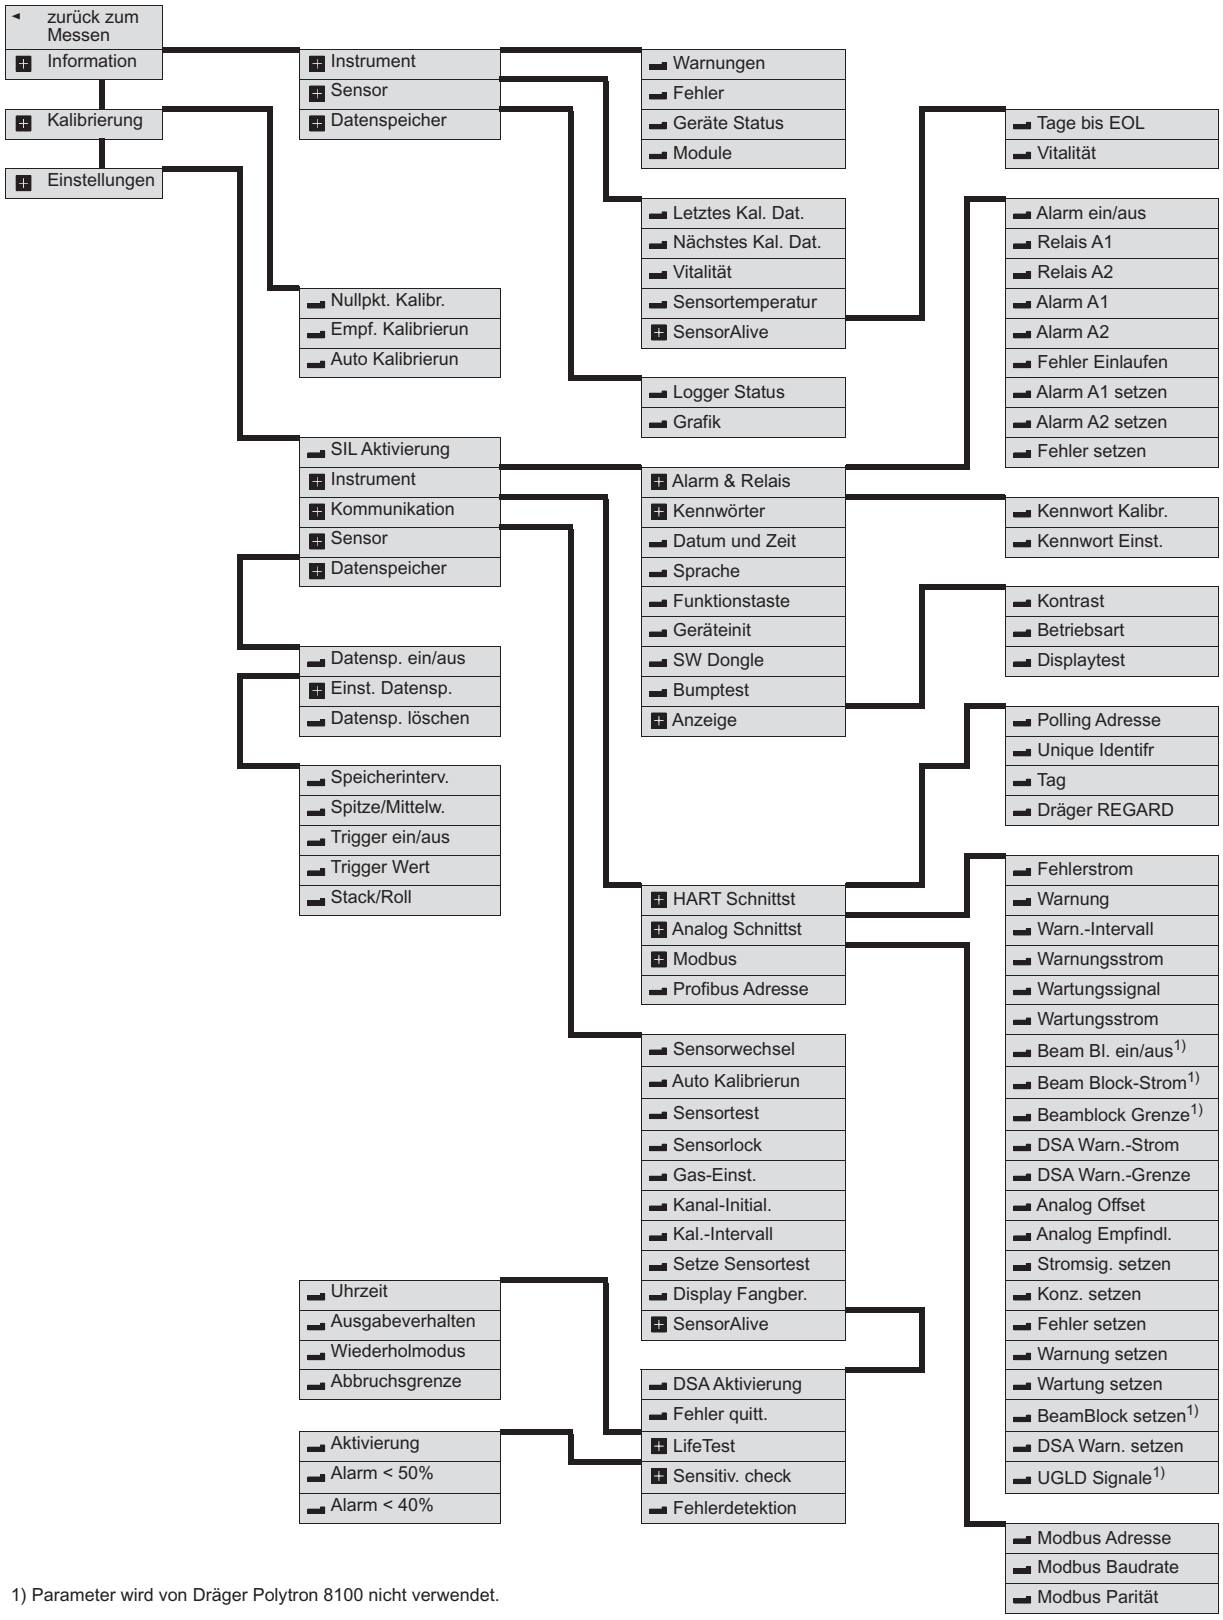
- Um das Menü ***Information*** aufzurufen:
  a. Im Messbetrieb ▼ 1 Sekunde lang gedrückt halten.
- Um das Menü ***Kalibrierung*** aufzurufen:
  a. Im Messbetrieb ▼ 3 Sekunden lang gedrückt halten.
  b. ***Kennw. eingeben*** wählen.
  c. Das entsprechende Kennwort eingeben und mit [OK] bestätigen.
- Um auf alle Menüs zuzugreifen:
  a. Im Messbetrieb ▼ 3 Sekunden lang gedrückt halten.
  b. ***Kennw. eingeben*** wählen.
  c. Das entsprechende Kennwort eingeben und mit [OK] bestätigen.

7.5.3 Kennwörter

Kennwort Kalibr.	erlaubt den Zugriff auf das Menü ***Information*** und das das Menü ***Kalibrierung*** (Justiereinstellungen) Standardwert: **_ _ _ 1**
Kennwort Einst.	erlaubt den Zugriff auf Konfigurationen und Menüs Standardwert: **_ _ _ 2**

Informationen zur Änderung des Passworts können 11.1 entnommen werden.

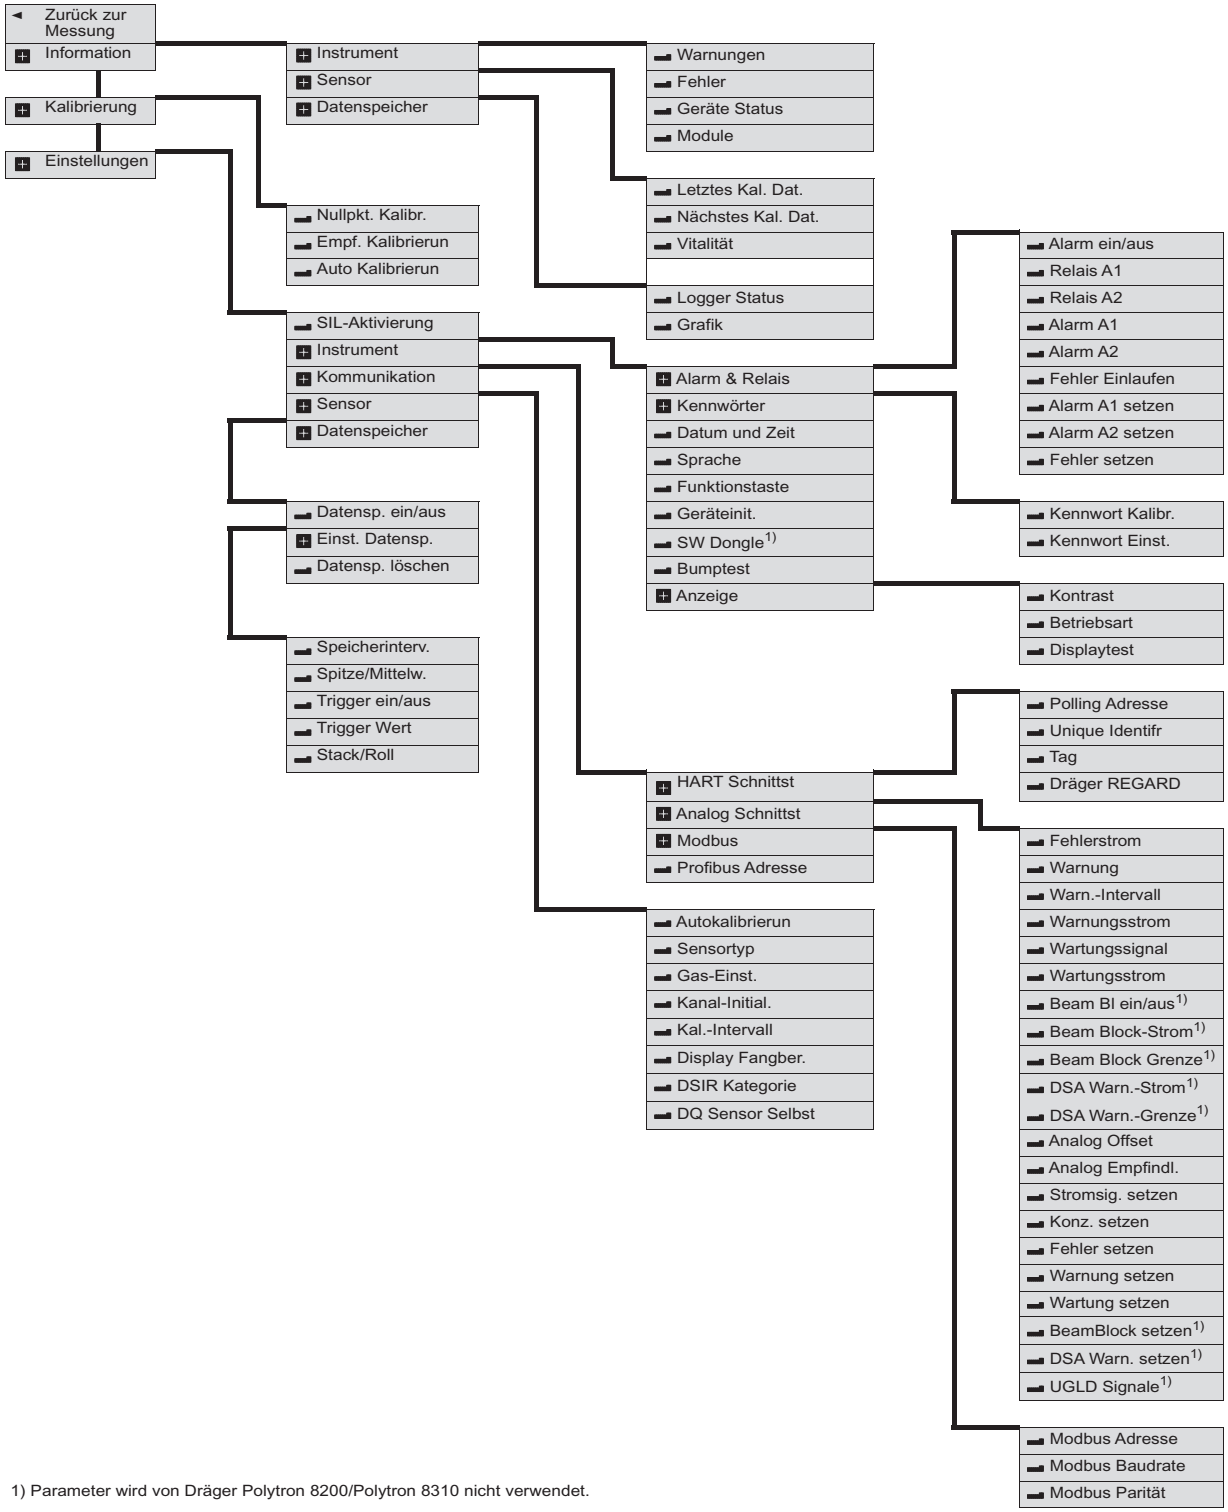
7.5.4 Das Menü *Information*



Im Menü ***Information*** können folgende Informationen aufgerufen werden:

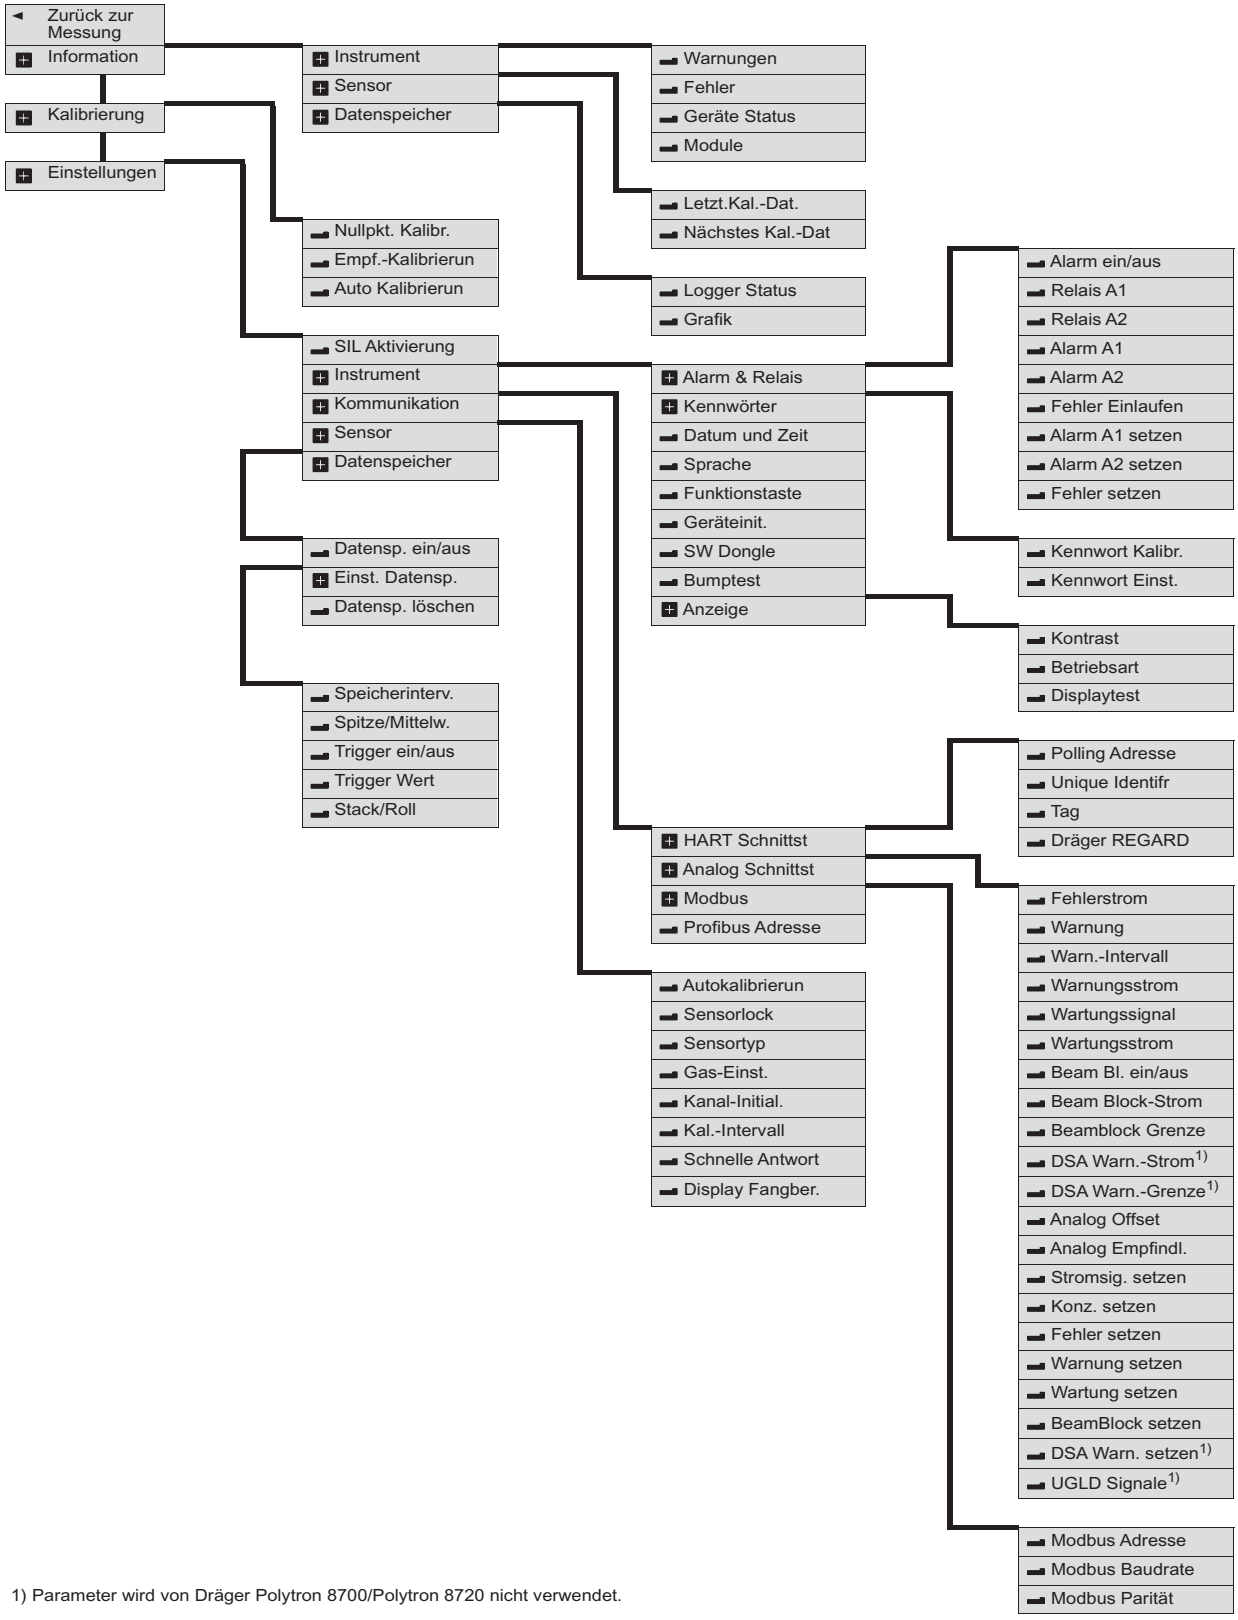
Instrument	
Warnungen	Anzeige von Warnmeldungen in Klartext samt der dazugehörigen Nummer. Wenn mehrere Warnmeldungen vorliegen, wird dies entsprechend angezeigt (z. B. durch 1/3 = Bildschirm 1 von 3).
Fehler	Anzeige von Fehlermeldungen in Klartext samt der dazugehörigen Nummer. Wenn mehrere Fehler vorliegen, wird dies entsprechend angezeigt (z. B. durch 1/3 = Bildschirm 1 von 3).
Geräte Status	Mit dieser Funktion werden Warn- und Fehlercodes in Form einer Tabelle angezeigt. Wenn für sämtliche Codes der Wert 00 angezeigt wird, liegen keine Warn- oder Fehlermeldungen vor.
Module	Installierte Hardware-Module sowie die Softwareversion der SIOS genannten EC-Sensorschnittstelle werden in einer Übersicht angezeigt. Für Detailangaben das entsprechende Modul auswählen. ■ = installierte Module □ = nicht installierte Module
Sensor	
Letztes Kal. Dat.	Justierdatum, Einheit, Gas und Konzentration der letzten Justierung werden angezeigt.
Nächstes Kal. Dat.	Zeigt das Datum der nächsten fälligen Justierung an.
Vitalität[1)]	Die Sensorvitalität wird in % angezeigt. Dräger empfiehlt, den Sensor auszutauschen, wenn die Vitalität < 25 % beträgt.
Sensortemperatur[1)]	Es werden die aktuelle und die höchste Sensortemperatur angezeigt.
SensorAlive	Im Untermenü werden die Tage bis zum Ende der prognostizierten Nutzungsdauer und die Vitalität in % angezeigt.
Datenspeicher	
Logger Status	Anzeige des Datenlogger-Status (aktiv oder nicht aktiv)
Grafik	Anzeige des Verlaufs der letzten 15 Minuten in einer Zeit/Konzentrations-Grafik.

1) Die Funktion ist nur mit dem Diagnosedongle verfügbar.



7.5.5 Menüübersichten

Polytron 8100



1) Parameter wird von Dräger Polytron 8100 nicht verwendet.

Polytron 8200, Polytron 8310

1) Parameter wird von Dräger Polytron 8200/Polytron 8310 nicht verwendet.

Polytron 8700, Polytron 8720

1) Parameter wird von Dräger Polytron 8700/Polytron 8720 nicht verwendet.

7.6 Informationen zum Betrieb mit einem Dräger SensorAlive

– Wenn am Transmitter ein Menü aufgerufen ist oder bestimmte Fehler gesetzt sind, führt der Dräger SensorAlive keinen LifeTest durch.
– Der Dräger SensorAlive kann die Justierung des Geräts für eine bestimmte Zeit unterdrücken (H_2S-Sensor: 30 Minuten).
– Wenn eine hohe Genauigkeit für die Durchführungszeit der LifeTests gefordert ist, sollte die Uhrzeit am Transmitter regelmäßig geprüft und ggf. neu eingestellt werden.
– Die Menüeinträge für den Dräger SensorAlive werden nur angezeigt, wenn ein Dräger SensorAlive eingesteckt ist. Die Dongle-Funktionen sind dann auch sichtbar, aber nicht aktiv.

8 Justierung

8.1 Allgemeine Hinweise

– Zur Sicherstellung eines ordnungsgemäßen Betriebs erst den Nullpunkt justieren und dann die Empfindlichkeit. Werden diese Vorgänge in der falschen Reihenfolge durchgeführt, kann die Justierung aufgrund der Softwareeinstellungen nicht weiter durchgeführt werden.
– Ist ein Betrieb in großen Höhen vorgesehen, fällt der Anzeigewert niedriger aus als beim Ablesen auf Meereshöhe (verringerter Partialdruck). Eine neue Empfindlichkeitsjustierung wird empfohlen, wenn sich die Höhe oder der Umgebungsdruck ändern. Die werkseitige Justierung ist auf Meereshöhe eingestellt.
– Dräger empfiehlt, Geräte mit dem Gas zu justieren, das nachgewiesen werden soll. Diese Methode ist genauer als eine Ersatzgasjustierung. Nur wenn eine Messgasjustierung nicht möglich ist, kann alternativ eine Ersatzgasjustierung durchgeführt werden.
– Sensoren für Methan und Wasserstoff sollten nur mit Messgas und nicht mit Ersatzgas justiert werden.
– Für Polytron 8310 IR: Außerdem die Angaben in der Gebrauchsanweisung für den DrägerSensor IR beachten[1)].

Beim Justieren wird die Messgenauigkeit des Sensors mit einer bekannten Prüfgaskonzentration überprüft und eingestellt. Justierungen müssen regelmäßig durchgeführt werden. Die Länge der Justierintervalle hängt von den Umgebungseinflüssen ab, bei denen der Sensor betrieben wird.

Umgebungseinflüsse und Alterung führen zum Drift von Sensoren. Bei einem Sensordrift sinkt die Anzeigegenauigkeit von Messgasen. Justierungen stellen die Anzeigegenauigkeit wieder her. Je nach Stärke des Drifts müssen kürzere Justierintervalle gewählt werden.

Um die Umgebungseinflüsse bei Neuinstallationen abzuschätzen, wird empfohlen kurze Justierintervalle zu wählen und den Drift zu dokumentieren. Anhand der ermittelten Daten sollte der Anlagenbetreiber die Länge der Justierintervalle festlegen.

Wenn ein Dräger SensorAlive verwendet wird, wird der Drift kompensiert und kann ausgelesen werden.

Unter normalen Bedingungen empfiehlt Dräger die folgenden Justierintervalle[2)]:

– Elektrochemische Sensoren (EC): 6-12 Monate[3)]
– Katalytische Sensoren (CAT): 4 Monate
– Infrarotsensoren (IR): 6-24 Monate[3)]

8.2 Prüfgase

Prüfgaseigenschaften (z. B. relative Feuchte, Konzentration) sind der Gebrauchsanweisung des jeweiligen Sensors zu entnehmen. Sind keine Angaben zur Feuchte enthalten, kann trockenes Prüfgas zur Justierung verwendet werden. Die Feuchte des Prüfgases ist bei O_2-Sensoren nicht relevant.

Je nach Art der Justierung werden unterschiedliche Prüfgase verwendet.

Nullgas

Das Nullgas ist ein Prüfgas, das verwendet wird, um den Nullpunkt eines Sensors zu justieren. Für O_2- und CO_2-Sensoren wird Stickstoff (N_2) verwendet. Bei anderen Sensoren kann die Umgebungsluft verwendet werden, wenn sie frei von störenden Verunreinigungen und dem Messgas ist.

Justiergas

Das Justiergas ist ein Prüfgas, das verwendet wird, um die Empfindlichkeit eines Sensors zu justieren. Das Justiergas ist eine bekannte Konzentration des Messgases, verdünnt mit Frischluft und Stickstoff. Für O_2-Sensoren wird kein Justiergas benötigt, da Sauerstoff aus der Umgebungsluft verwendet wird.

8.3 Gasdurchfluss für Justierungen

Der Gasdurchfluss variiert je nach Sensor.

EC-Sensor, CAT-Sensor	0,5 l/min ± 10 %
Alle anderen Sensoren	0,5 l/min - 2 l/min

Der Gasdurchfluss sollte mit den Umweltbedingungen während des Betriebs übereinstimmen (z. B. Lüftungskanalmessung mit höherem Durchfluss als 2 l/min)

1) 9023981 (Englisch), 9033555 (Bulgarisch, Rumänisch), 9023984 (Spanisch, Portugiesisch), 9023986 (Dänisch, Norwegisch), 9033556 (Tschechisch, Kroatisch), 9033809 (Chinesisch), 9023985 (Ungarisch, Polnisch), 9023982 (Französisch), 9033557 (Slowakisch, Slowenisch), 9033558 (Griechisch, Türkisch), 9023987 (Italienisch, Niederländisch), 9023983 (Finnisch, Schwedisch), 9023843 (Deutsch)

2) Gebrauchsanweisung des Sensors beachten
3) Für Anwendungen gemäß EN 45544-1 und EN IEC 62990-1 darf das Justierintervall 6 Monate nicht überschreiten.

8.4 Justierungen vorbereiten

Allgemeine Hinweise

⚠ WARNUNG
Gesundheitsgefährdung durch Prüfgas
Das Einatmen von Prüfgas kann die Gesundheit gefährden oder zum Tod führen.
► Prüfgas nicht einatmen.
► Vom Prüfgas ausgehende Gefahren, Gefahrenhinweise und Sicherheitsratschläge beachten (siehe z. B. Sicherheitsdatenblätter, Anweisungen auf den Prüfmitteln).

⚠ VORSICHT
Auslösen von Alarmen durch Prüfgas
Bei noch anstehendem Prüfgas können Alarme ausgelöst werden.
► Sicherstellen, dass das Zuführen von Prüfgas beendet wird.

Voraussetzungen
– Die Einlaufphase des Sensors ist abgeschlossen (siehe „Gasmessgerät in Betrieb nehmen“, Seite 60).
– Datum und Uhrzeit sind eingestellt (siehe „Datum und Uhrzeit einstellen“, Seite 75).
– Wenn ein Dräger SensorAlive verwendet wird, muss der letzte LifeTest lange genug her sein (siehe Gebrauchsanweisung des Sensors).

Besonderheit beim Polytron 8310

Dräger empfiehlt, einen automatischen Nullpunktabgleich am Sensor zu machen, bevor der Nullpunkt justiert wird. Dadurch wird die Nullpunktnachführung des DrägerSensor IR zurückgesetzt und der volle Nachführbereich steht wieder zur Verfügung.

1. Alarmgebung des Gasmessgeräts ausschalten (siehe „Alarme ein- oder ausschalten“, Seite 77).
2. Sensor über den Kalibrieradapter mit Stickstoff, synthetischer Luft bzw. Frischluft begasen und stabilen Messwert abwarten.
3. Magnetstab auf den mit dem Symbol ⇩0 markierten Bereich (innerhalb des schwarzen Rahmens) auf der Sensormantelfläche aufsetzen und für mindestens 5 Sekunden halten. Das Ausgangssignal des Sensors wechselt nach 5 Sekunden auf die Anzeige des Kalibriersignals (Anzeigeänderung um ca. –10 %UEG), solange der Magnetstab gehalten wird. Gleichzeitig wird automatisch ein Nullpunktabgleich des optischen Messsystems durchgeführt.
4. Magnetstab entfernen. Nach 30 Sekunden verlässt das Gerät die automatische Nullpunktabgleich-Routine. Zur Bestätigung des automatischen Nullpunktabgleichs wechselt das Ausgangssignal wieder auf das Kalibriersignal (Anzeigeänderung auf ca. –10 %UEG). Dieses Signal wird ebenso lange angezeigt wie beim Einstieg in die automatische Nullpunktabgleich-Routine.
5. Alarmgebung des Gasmessgeräts einschalten.

Polytron 8100, Polytron 8200, Polytron 8310
Siehe Abbildung B auf der Ausklappseite.

Justierausrüstung:
– Dräger Druckminderer (1), für reaktive Gase Druckminderer aus Edelstahl verwenden
– Dräger Kalibrieradapter (2) (Sachnummer 6810536)
– Schlauch (3)
– Dräger-Prüfgasflasche (4)

Justierung vorbereiten:
1. Den Druckminderer an die Prüfgasflasche anschließen.
2. Den Kalibrieradapter am Sensor befestigen.
3. Den Schlauch an die Stecknippelverbindung anschließen.
4. Auf das Menü zugreifen (siehe „Menüs aufrufen“, Seite 63).

Polytron 87x0 IR
Siehe Abbildung B auf der Ausklappseite.

Justierausrüstung:
– Dräger Druckminderer (1), für reaktive Gase Druckminderer aus Edelstahl verwenden
– Dräger Kalibrieradapter (5) (Sachnummer 6811610).
– Schlauch (3)
– Dräger-Prüfgasflasche (4)

Justierung vorbereiten:
1. Den Druckminderer an die Prüfgasflasche anschließen.
2. Den Kalibrieradapter am Spritzschutz befestigen, so dass er einrastet.
   Dies gilt nicht für die Anbringung an Lüftungskanälen oder wenn ein Prozessadapter oder eine Prozessküvette verwendet wird (siehe Installationsanweisung für das jeweilige PIR 7x00-Zubehör).
3. Darauf achten, dass die Dichtflächen um die Öffnungen des Spritzschutzes sauber sind. Der Insektenschutz muss nicht entfernt werden.
4. Den Schlauch an die Stecknippelverbindung anschließen.
5. Auf das Menü zugreifen (siehe „Menüs aufrufen“, Seite 63).

8.5 Nullpunktjustierung

8.5.1 Allgemeines

Anstelle von Stickstoff oder synthetischer Luft kann nur dann Umgebungsluft verwendet werden, um den Nullpunkt des Sensors zu justieren, wenn sichergestellt ist, dass die Umgebungsluft kein Zielgas und kein anderes Gas enthält, für das der Sensor möglicherweise Querempfindlichkeit aufweist (vgl. die Angaben im Datenblatt des Sensors). In diesem Fall wird keine Gasflasche bzw. kein Kalibrieradapter für die Nullpunktjustierung benötigt.

⚠ WARNUNG
Justierungsfehler bei Nullpunktjustierung
Unzureichende Umgebungsluftströmung kann zu Justierungsfehlern führen.
► Sicherstellen, dass ausreichend viel Umgebungsluft an den Sensor gelangt.

Polytron® 8100 EC-spezifisch:

Bei Sauerstoffsensoren (O_2) verändert eine Nullpunktjustierung keine Werte in der Firmware oder dem Sensor. Die Nullpunktjustierung kann also dazu eingesetzt werden, eine korrekte Nullpunktanzeige zu überprüfen, wenn Stickstoff auf den Sensor gegeben wird. Das Polytron 8100 EC zeigt einen Fehlerzustand an, wenn eine Nullpunktkontrolle mit einer Abweichung von mehr als 0,6 Vol% O_2 von Null fehlschlägt. Im Fall eines Fehlers die Nullpunktkontrolle wiederholen oder bei Bedarf den Sensor austauschen. Stickstoff (N_2) zur Verifizierung verwenden.

Polytron® 8200 CAT-spezifisch:

Sensoren dürfen nicht mit reinem Stickstoff justiert werden. Katalytische Sensoren benötigen Sauerstoff, um korrekt zu funktionieren.

Polytron® 8720 IR-spezifisch:

Für die Nullpunktjustierung von Polytron 8720 IR (mit PIR 7200 zum Nachweis von Kohlenstoffdioxid) dürfen nur Stickstoff oder synthetische Luft ohne CO_2-Bestandteil verwendet werden.

8.5.2 Nullpunktjustierung durchführen

ℹ Die Justierung kann jederzeit abgebrochen werden. Zum Abbrechen ***zurück*** wählen.

Voraussetzungen:
– Die Einlaufphase des Sensors ist abgeschlossen
– Die Justierung wurde vorbereitet.

Nullpunkt folgendermaßen justieren:
1. ***Kalibrierung*** > ***Nullpkt. Kalibr.*** wählen und bestätigen.
   ⇒ Das Wartungssignal wird über die analoge Schnittstelle übertragen. Es werden keine Alarme oder Fehlerrelais geschaltet und das Symbol 🔧 wird angezeigt.
   ⇒ Die Meldung ***Nullgas zuführen*** wird angezeigt.
2. Wenn die Umgebungsluft nicht verwendet werden kann, synthetische Luft oder Stickstoff benutzen.
   a. Den Gasdurchfluss entsprechend dem verwendeten Sensor einstellen (siehe „Gasdurchfluss für Justierungen“, Seite 67)
3. ***weiter*** wählen und bestätigen.
   ⇒ Der aktuelle Wert wird angezeigt.

ℹ Nach 15 Minuten ohne Bestätigung kehrt das Gerät ohne eine Justierung durchzuführen in das Justierungsmenü zurück.

Nachdem das Prüfgas 3 Minuten lang auf den Sensor gegeben wurde und der angezeigte Wert stabil ist, ist die Justierung durchzuführen.
4. ***justieren*** wählen und bestätigen.
   ⇒ Die Meldung ***bitte warten...*** wird angezeigt.
   ⇒ Der neu ermittelte aktuelle Wert wird angezeigt.
5. ***weiter*** wählen und bestätigen.
6. Den Gasdurchfluss abstellen und den Kalibrieradapter vom Sensor entfernen oder den Schlauch lösen.
   Liegt der aktuelle Wert außerhalb des Alarmbereichs:
7. ***weiter*** wählen und bestätigen.
   ⇒ Das Gerät schaltet in das Justierungsmenü zurück.

8.6 Empfindlichkeitsjustierung

8.6.1 Allgemeines

Polytron® 8310 IR-spezifisch:

Aufgrund der Gestaltung des DSIR-Gassensors ist das Ausgangssignal des Gassensors auf 45 % . . . 55 % der geräteinternen Versorgungsspannung begrenzt. Sollte die Gaskonzentration nach Erreichen der Obergrenze des Ausgangssignals des Sensors weiter ansteigen, erhöhen sich die vom Gerät an die Auswerteeinheit zurückgemeldeten und dort dargestellten Werte nicht. Bei Substanzen mit besonders niedrigen Justierungsfaktoren bzw. manueller Konfiguration eines hohen Empfindlichkeitsjustierungsfaktors am Sensor kann dies bereits bei Konzentrationen unterhalb von 100 %UEG der Fall sein. Bei Justierung mit Ersatzgas sollte daher mithilfe der zur Alarmschwelle passenden Prüfgaskonzentration überprüft werden, ob der Alarm richtig ausgelöst wird. Bei Bedarf kann der darstellbare Messbereich dadurch erhöht werden, dass das Sensorausgangssignal den Anforderungen entsprechend reduziert und anschließend am Gerät justiert wird (siehe Kapitel "Manuelle Empfindlichkeitskalibrierung des Ausgangssignals" in der Gebrauchsanweisung des DSIR-Gassensors).

8.6.2 Empfindlichkeitsjustierung durchführen

ℹ Die Justierung kann jederzeit abgebrochen werden. Zum Abbrechen ***zurück*** wählen.

Voraussetzungen:
- Die Justierung wurde vorbereitet.
- Der Nullpunkt wurde justiert.
- Spezifisch für alle Polytron 8xx0 außer Polytron 8100 EC: Die letzte gültige Nullpunktjustierung liegt nicht länger als 24 Stunden zurück.

Empfindlichkeit folgendermaßen justieren:

1. ***Kalibrierung*** > ***Empf. Kalibrierun*** wählen und bestätigen.
   ⇒ Das Wartungssignal wird über die analoge Schnittstelle übertragen. Es werden keine Alarme oder Fehlerrelais geschaltet und das Symbol 🔧 wird angezeigt.
   ⇒ Die Parameter für das Justiergas werden angezeigt, z. B.:[1)]
   Gas : H_2S
   Einheit: ppm
   Konzentr.: 25
2. Wenn die angezeigten Parameter nicht zum Zielgas passen, müssen die Parameter angepasst werden:
   a. ***Gas*** wählen und bestätigen.
   b. Das Justiergas aus der Liste wählen und bestätigen.
   c. ***Einheit*** wählen und bestätigen.
   d. Messeinheit aus der Liste wählen und bestätigen.
   e. ***Konz.*** wählen und bestätigen.
   f. Die Konzentration des Justiergases einstellen.
3. Wenn die Einstellungen korrekt sind:
   a. ***weiter*** wählen und bestätigen.
      ⇒ Eine Meldung wie ***Gasflow an H_2S*** wird angezeigt.
4. Justiergas einleiten.
   a. Den Gasdurchfluss entsprechend dem verwendeten Sensor einstellen (siehe „Gasdurchfluss für Justierungen“, Seite 67)
5. ***weiter*** wählen und bestätigen.
   ⇒ Der aktuelle Wert wird angezeigt

   ℹ Nach 15 Minuten ohne Bestätigung kehrt das Gerät ohne eine Justierung durchzuführen in das Justierungsmenü zurück.

   Nachdem das Prüfgas 3 Minuten lang auf den Sensor gegeben wurde und der angezeigte Wert stabil ist, ist die Justierung durchzuführen.[2)]:
6. ***weiter*** wählen und bestätigen.
   ⇒ Die Meldung ***bitte warten...*** wird angezeigt.
   ⇒ Der neu ermittelte aktuelle Wert wird angezeigt.
7. ***weiter*** wählen und bestätigen.
8. Den Gasdurchfluss abstellen und den Kalibrieradapter vom Sensor entfernen oder den Schlauch lösen.

   Liegt der aktuelle Wert außerhalb des Alarmbereichs:
9. ***weiter*** wählen und bestätigen.
   ⇒ Das Gerät schaltet in das Justierungsmenü zurück.

8.7 Automatische Justierung

8.7.1 Allgemeines

Die automatische Justierung umfasst die Nullpunktjustierung und eine anschließende Empfindlichkeitsjustierung. Sie stellt eine Alternative zur manuellen Durchführung der Nullpunkt- und Empfindlichkeitsjustierung dar.

Nicht alle Sensoren und Gase unterstützen die automatische Justierung. Wenn die Funktion nicht verfügbar ist, muss die Justierung manuell durchgeführt werden.

8.7.2 Automatische Justierung durchführen

ℹ Nach 24 Stunden ist die Nullpunktjustierung nicht mehr auf dem neuesten Stand. Daher ist die automatische Justierung nur möglich, nachdem die Nullpunktjustierung erneut durchgeführt wurde.

ℹ Die Justierung kann jederzeit abgebrochen werden. Zum Abbrechen ***zurück*** wählen.

Voraussetzungen:
- Die automatische Justierung ist aktiviert.
- Die Einlaufphase des Sensors ist abgeschlossen.
- Die Justierung wurde vorbereitet.

Automatische Justierung folgendermaßen durchführen:

1. Wenn die Umgebungsluft nicht verwendet werden kann, synthetische Luft oder Stickstoff benutzen.
2. ***Kalibrierung*** > ***Auto Kalibrierun*** wählen und bestätigen.
   ⇒ Die Meldung ***bitte warten...*** wird angezeigt und das Gerät führt die Nullpunktjustierung automatisch durch.
   ⇒ Bei einem O_2-Sensor wird ***Frischluft Kal.*** angezeigt.

   ℹ Die 4-20-mA-Schnittstelle gibt das Wartungssignal aus. Alarm oder Fehlerrelais werden nicht gesetzt und das Display zeigt das Wartungssymbol 🔧.
3. Nach erfolgreicher Nullpunktjustierung wird die Empfindlichkeitsjustierung gestartet.
   ⇒ Die Parameter für das Gas werden angezeigt, z. B.:[3)]
   Gas : H_2S
   Einheit: ppm
   Konzentr.:25
4. Wenn die angezeigten Parameter nicht zum Zielgas passen, müssen die Parameter angepasst werden:[4)]
   a. ***Gas*** wählen und bestätigen.
   b. Das Justiergas aus der Liste wählen und bestätigen.
   c. ***Einheit*** wählen und bestätigen.
   d. Messeinheit aus der Liste wählen und bestätigen.

1) Nicht für alle Sensoren zutreffend (siehe „Messbetrieb“, Seite 61).
2) Bei LC-Sensoren muss das Prüfgas mindestens 6 Minuten lang aufgegeben werden.
3) Gilt nicht für alle Sensoren (siehe „Messbetrieb“, Seite 61).
4) Nur bei bestimmten Sensoren möglich.

e. ***Konz.*** wählen und bestätigen.
f. Die Konzentration des Justiergases einstellen.

5. Wenn die Einstellungen korrekt sind:
   a. ***weiter*** wählen und bestätigen.
      ⇒ Eine Meldung wie ***Gasflow an H_2S*** wird angezeigt.
6. Justiergas einleiten.
   a. Den Gasdurchfluss entsprechend dem verwendeten Sensor einstellen (siehe „Gasdurchfluss für Justierungen“, Seite 67)
7. ***weiter*** wählen und bestätigen.
   ⇒ Der aktuelle Wert wird angezeigt

ℹ Nach 15 Minuten ohne Bestätigung kehrt das Gerät ohne eine Justierung durchzuführen in das Justierungsmenü zurück.

8. Sobald der aktuelle Wert stabil ist, führt das Gerät automatisch die Empfindlichkeitsjustierung durch.
9. Nach erfolgreicher Justierung wird der neu ermittelte aktuelle Wert mit der Meldung ***Messwert OK?*** angezeigt.
   - Ist dies nicht der Fall, Ändern wählen und bestätigen, um die Justierung erneut durchzuführen.
   - Wenn der Wert dem Sollwert entspricht, fortfahren.
10. Den Gasdurchfluss abstellen und den Kalibrieradapter vom Sensor entfernen oder den Schlauch lösen.
11. ***Speichern*** wählen und bestätigen, um die Justierung zu beenden. Das Gerät schaltet in das Justierungsmenü zurück.

9 Störungsbeseitigung

9.1 Fehler

Nummer	Ursache	Abhilfe
001, 003 - 004, 012 - 014, 020 - 024, 043, 060, 067	Schwerwiegender Gerätefehler, diverse Ursachen.	Gerät durch den Dräger-Service überprüfen lassen.
002, 025 - 027, 030 - 034, 041, 042, 044, 050, 052, 081, 085	Schwerwiegender Datenfehler im Gerät, diverse Ursachen.	Gerät auf Werkseinstellungen zurücksetzen. Falls der Fehler erneut auftritt: Gerät durch den DrägerService überprüfen lassen.
005	Versorgungsspannung außerhalb des zulässigen Bereichs.	Spannungsversorgung prüfen.
010	Kabel der 4-bis-20-mA-Schnittstelle nicht angeschlossen.	Die 4-bis-20-mA-Schnittstellenverbindung prüfen. Bei Betrieb als Standalone-Gerät ohne Auswerteeinheit, Stift 3 mit Stift 4 verdrahten.
011	Schwerwiegender Gerätefehler, diverse Ursachen.	Gerät durch den Dräger-Service überprüfen lassen. Falls der Fehler erneut auftritt: Bürde bzw. Kabel überprüfen.
045	Gerät erkennt keinen Sensor.	Anschlüsse prüfen. Falls der Fehler erneut auftritt: Gerät durch den Dräger-Service überprüfen lassen.
051, 054	Fehlerhafte Nullpunktjustierung.	Nullpunktjustierung durchführen.
055	Fehlerhafte Empfindlichkeitsjustierung.	Empfindlichkeitsjustierung durchführen.
076, 080 - 084	Gerätefehler.	Elektrische Anschlüsse prüfen. Falls der Fehler erneut auftritt: Gerät durch den DrägerService überprüfen lassen.
090	Sensor-Sperrfunktion ist aktiviert. Es wurde ein Sensor mit abweichender Sachnummer eingesetzt.	Einen Sensor mit derselben Sachnummer verwenden oder die Sensor-Sperrfunktion deaktivieren.
105	Gerätefehler.	Gerät durch den Dräger-Service überprüfen lassen.
137, 64, 91	Gerätefehler.	Aus- und wieder einschalten. Falls der Fehler erneut auftritt: Gerät durch den DrägerService überprüfen lassen.

nur bei Polytron 8100 EC mit Dräger SensorAlive

Nummer	Ursache	Abhilfe
220	Die Sensoröffnung ist verstopft.	Sensoröffnung reinigen oder den Staubfilter tauschen. Anschließend die Verstopfung im Menü bestätigen (siehe „Einstellungen des Dräger SensorAlive“, Seite 83).
221	Die Empfindlichkeit des Sensors ist kleiner als 40% (berechneter Wert).	Sensor justieren oder austauschen.
222	Aufgrund eines Fehlers ist nach der Elektrolyse ein zu hoher Gaswert vorhanden.	Sensor austauschen oder DrägerService kontaktieren.
223	Die Empfindlichkeit des Sensors ist zu niedrig.	Sensor justieren oder austauschen.

Nummer	Ursache	Abhilfe
224	Der Konditionierungsstrom ist nicht im erlaubten Bereich.	Sensor austauschen oder DrägerService kontaktieren.

nur bei Polytron 87x0 IR

Nummer	Ursache	Abhilfe
064, 071	Kommunikationsfehler.	Anschluss an PIR 7x00 prüfen.
083	Optisches System des PIR 7x00 verschmutzt.	Optisches System des PIR 7x00 reinigen.
086	Spannungsversorgung außerhalb des Bereichs	Spannungsversorgung prüfen.
087	4-bis-20-mA-Störung am PIR 7x00-Sensor.	4-bis-20-mA-Anschluss am PIR 7x00 prüfen.
094, 095	Datenfehler im Gerät.	Sensor auf Werkseinstellungen zurücksetzen. Wenn dieser Fehler wiederholt auftritt: Gerät durch den DrägerService überprüfen lassen.
096	SIL-Kennwort stimmt nicht mit PIR 7x00 überein.	Kennwort erneut eingeben.

9.2 Warnungen

Nummer	Ursache	Abhilfe
101	Der Datenlogger im Stackmodus ist zu 100 % voll und protokolliert keine weiteren Daten.	Gerät durch den DrägerService überprüfen lassen.
102	Der Datenlogger im Stackmodus ist zu 90 % voll.	Die Daten so bald wie möglich herunterladen und den Datenlogger leeren.
103, 106	Datenfehler im Gerät. Einige Dongle-Funktionen wie Datenlogger, Sensortest usw. stehen ggf. nicht mehr zur Verfügung.	Gerät auf Werkseinstellungen zurücksetzen. Wenn dieser Fehler wiederholt auftritt: Gerät durch den DrägerService überprüfen lassen.
104	Ungültige Datums- oder Uhrzeiteinstellung.	Datum und Uhrzeit einstellen.
105	Gerätefehler.	Gerät durch den DrägerService überprüfen lassen.
107	Die Batterie für den Datenspeicher ist leer.	Gerät durch den DrägerService überprüfen lassen.
110, 111, 112	Der SW-Dongle wurde entfernt, ohne zuvor deaktiviert zu werden.	SW-Dongle deaktivieren.
113	Alarme sind gesperrt.	Alarme aktivieren.
164, 165	Die Einlaufphase des Sensors ist noch nicht abgeschlossen. Es ist von erhöhten Messfehlern auszugehen.	Das Ende der Einlaufphase des Sensors abwarten. Sensor nicht justieren, bevor dieser vollständig eingelaufen ist.
167, 170	Justierintervall abgelaufen.	Gerät neu justieren.

nur bei Polytron 8100 EC

Nummer	Ursache	Abhilfe
163	Niedrige Vitalität des EC-Sensors	Sensor austauschen.
171	Negative Anzeige. Wert unterhalb des Mindestbereichs.	Nullpunkt neu justieren.

nur bei Polytron 8100 EC mit Dräger SensorAlive

Nummer	Ursache	Abhilfe
320	Die Kommunikation mit dem Sensor ist fehlgeschlagen. Diagnose und Gasgenerator funktionieren nicht mehr.	Sensor ziehen, ca. 1 Tag liegen lassen und wieder einstecken. Die Firmwareversion prüfen und ggf durch den DrägerService aktualisieren lassen.. Sensor austauschen.
321	Die Auswertung der Sensordaten ist fehlgeschlagen. Der Sensor kann keinen LifeTest durchführen (weil Vorbedingungen nicht erfüllt sind) oder auswerten.	Die Uhrzeit des LifeTests ändern oder das Wiederholprofil auf "Flexibel" stellen (siehe „Einstellungen des Dräger SensorAlive“, Seite 83). Falls die Warnung wiederholt auftritt, DrägerService kontaktieren.
322	Der Datensatz des Sensors ist defekt.	Sensor austauschen.
323	Der Datensatz des Sensors ist inkompatibel.	DrägerService kontaktieren.
324	Die Empfindlichkeit des Sensors ist kleiner als 50% (berechneter Wert).	Sensor justieren und Sensortausch vorbereiten (z. B. Ersatzteil bestellen).

Nummer	Ursache	Abhilfe
325	Die Empfindlichkeit des Sensors ist kleiner als 40% (berechneter Wert).	Sensor justieren oder austauschen.
326	Während eines LifeTests und eine bestimmte Zeit danach kann der Sensor nicht justiert werden.	Um eine geplante Justierung durchführen zu können, kann der LifeTest in der PolySoft temporär über den Inhibit-Modus unterdrückt werden.
327, 330, 344, 347	Der Gasgenerator funktioniert nicht.	Sensor justieren oder austauschen.
331	Die Gaserzeugung ist fehlgeschlagen.	Sensor justieren.
332	Der Sensor ist im sicheren Zustand. Es werden keine LifeTests durchgeführt (Sammelwarnung).	Grund herausfinden und diesen beheben.
333	Die Echtzeituhr des Sensors funktioniert nicht richtig.	Uhr stellen.
334	Die Synchronisierung des Sensors ist nicht beendet.	Warten, bis die Synchronisierung abgeschlossen ist. Je nach Zustand des Sensors kann dieser Zustand mehrere Minuten anliegen. Gegebenenfalls Firmware durch den DrägerService aktualisieren lassen.
336	Interne Überprüfungen im Sensor haben fehlerhafte Ergebnisse.	System neu starten
337	Die Firmware des Transmitters muss aktualisiert werden.	DrägerService kontaktieren.
340	Der Sensor wird sychronisiert, nachdem das System neu gestartet worden ist.	Warten, bis die Synchronisierung abgeschlossen ist.
342	Die Temperaturdifferenz zwischen den beiden Temperaturmesspunkten ist zu hoch.	Warten und überprüfen, ob der LifeTest ausgewertet wird oder Sensor austauschen.
347	Die Konfiguration ist wegen einer Unterbrechung in der Kommunikation zwischen Transmitter und Sensor fehlgeschlagen.	Sensor erneut konfigurieren und die Konfiguration überprüfen.
350	Der Gasgenerator ist in der Anlaufphase.	Warten, bis die Anlaufphase beendet ist. Während der Anlaufphase werden die Funktionen Fehlererkennung und Verstopfungserkennung nicht durchgeführt.
352	Der Selbsttest des Sensors ist fehlgeschlagen.	Sensor austauschen oder DrägerService kontaktieren.
353	Der Sensor ist temporär im Inhibit-Modus. Während dieser Zeit werden keine LifeTests durchgeführt.	Der Inhibit-Modus kann über die PolySoft manuell verlassen werden oder wird automatisch verlassen.
354	Fehler beim Starten der Anlage.	Neustart manuell durchführen.
355	Die Firmware des Sensors ist mit der Hardware nicht kompatibel.	Firmware durch den DrägerService aktualisieren lassen.
356	Hardware-Daten defekt.	Neustart durchführen oder Sensor austauschen.
357	Der Sensor wurde manuell in den sicheren Zustand gesetzt, z. B. um ein Firmware-Update durchzuführen.	Um den Modus zu verlassen, einen Neustart des Sensors durchführen.

nur bei Polytron 87x0 IR:

Nummer	Ursache	Abhilfe
163	Sensortemperatur ist sehr hoch.	
171	Nullpunktdrift zu hoch.	Nullpunktjustierung durchführen.
172	Optisches System des PIR 7x00 verschmutzt.	Optisches System des PIR 7x00 reinigen.
173	Nullpunktjustierung für Empfindlichkeitsjustierung abgelaufen	Nullpunktjustierung durchführen.

Nummer	Ursache	Abhilfe
182	Automatische Justierung mit PIR 7200 nicht möglich.	Nullpunkt- und Empfindlichkeitsjustierung erneut durchführen.

10 Instandhaltung

– Die Wartungsintervalle sind für jede einzelne Installation festzulegen. Je nach Sicherheitsüberlegungen und den anwendungsspezifischen Bedingungen, in denen das Gerät verwendet wird, müssen diese ggf. verkürzt werden.

Alle 6 Monate:

– Inspektion durch Fachleute.
– Signalübertragung zur Auswerteeinheit prüfen (siehe „Analogschnittstelle testen“, Seite 80).
– LEDs sowie die Auslösung der Alarmgeber prüfen (siehe „Alarme/Relais testen“, Seite 78).

regelmäßig:

– Justierungen durchführen, siehe 8 Justierung

10.1 Begasungstest durchführen und Ansprechzeit (t90) prüfen

Ein Begasungstest (Bump Test) prüft die Ansprechzeit, ohne einen Alarm auszulösen.

1. ***Einstellungen*** > ***Instrument*** > ***Bumptest*** wählen und bestätigen.
   ⇒ Das Wartungssymbol wird angezeigt
   ⇒ Der Analogausgang wird auf das Wartungssignal eingestellt.
2. Den Sensor einer bekannten Gaskonzentration aussetzen.
3. Die Ansprechzeit prüfen und mit dem t90-Wert vergleichen, der im entsprechenden Sensordatenblatt angegeben sind.
4. [OK] drücken, um zur Messung zurückzukehren.

10.2 Sensoren austauschen

⚠ WARNUNG
Fehlerhafte Justierung
Eine fehlerhafte Justierung kann zu fehlerhaften Anzeigewerten führen.

► Nach Austauschen des Sensors, müssen sämtliche Einstellungen und Parameter auf Richtigkeit überprüft werden.
► Justierung überprüfen, um korrekten Betrieb sicherzustellen.

10.2.1 Polytron® 8100 EC

Der Austausch eines Sensors ist, falls erforderlich, ohne Unterbrechung der Versorgungsspannung im Ex-Bereich möglich.

Sensor-Sperrfunktion

Wenn zuvor ein Sensor des gleichen Typs (gleiche Sachnummer) installiert wurde, bleibt die gerätespezifische Konfiguration erhalten (Gasart, Messbereich, Prüfgas, Justierintervall usw.). Andernfalls werden die werkseitigen Standardeinstellungen des neuen Sensors geladen und überschreiben die gerätespezifische Konfiguration. Dies kann verhindert werden, wenn die Sensor-Sperrfunktion aktiviert ist (siehe „Sensor-Sperrfunktion einstellen“, Seite 82).

Sensorwechsel-Funktion

Mit der Menüfunktion ***Sensorwechsel*** lässt sich ein Sensor im Betrieb auswechseln, ohne dass ein Fehlersignal an der Auswerteeinheit ausgelöst wird. Außerdem wird sichergestellt, dass alle im Mikroprozessor vorliegenden Sensordaten vor dem Ziehen des Sensorsteckers noch im Speicherbaustein (EEPROM) des Sensors abgespeichert werden können.

Sensor austauschen

Siehe Abbildung C auf der Ausklappseite.

Ein Sensorwechsel kann grundsätzlich zu jeder Zeit erfolgen.

1. ***Einstellungen*** > ***Sensor*** > ***Sensorwechsel*** wählen und bestätigen.
   ⇒ An der 4–20-mA-Schnittstelle wird das Wartungssignal erzeugt.
   ⇒ Auf dem Display wird Folgendes angezeigt: ***Bitte entfernen Sie den Sensor***.
   ⇒ Das Wartungssymbol wird angezeigt.
2. Alten Sensor durch einen neuen Sensor ersetzen:
   a. Feststellschraube (2) lösen (2 mm-Innensechskantschraube).
   b. Bajonettring (3) abschrauben.
   c. Sensor (4) in die Öffnung einsetzen und drehen, bis er im Gasmessgerät einrastet. Der Sensorstecker wird dabei nicht beschädigt.
   d. Sensor mit dem zugehörigen Bajonettring (3) sichern.

   ℹ Für Dräger SensorAlive muss ein anderer Bajonettring verwendet werden als für andere EC-Sensoren.

   e. Feststellschraube (2) so weit anziehen, dass der Bajonettring nicht gelöst werden kann (für Installationen in Zone 22 vorgeschrieben).
      ⇒ Auf dem Display wird Folgendes angezeigt: ***Daten werden geladen, bitte warten***
3. Falls erforderlich, das im Lieferumfang des Sensors inbegriffene Etikett am Gerät anbringen. Dadurch lässt sich auch bei Stromausfall bereits von Weitem erkennen, welche Gasart gemessen wird.
4. Wenn die Sensordaten geladen sind, wird auf dem Display Folgendes angezeigt: ***Daten geladen***.

5. ***Zurück zum Menü*** wählen und bestätigen.
   ⇒ Das Wartungssignal auf der 4–20-mA-Schnittstelle bleibt solange bestehen, bis der Sensor eingelaufen ist.

   Maximale Einlaufzeit eines neuen Sensors: siehe Gebrauchsanweisung des Sensors. Für Sauerstoff: Zulassungen gemäß EN 50104.
6. Justierung überprüfen. Das Gerät bei Bedarf justieren (siehe „Justierung“, Seite 67).
7. Die Installationsanforderungen und den SIL-Status des Geräts überprüfen.
   Siehe Abschnitt „Explosionsgeschützte (Ex d) Installation - ohne Docking Station“ bis „Installation von Sensoren oder Messköpfen“.

10.2.2 Polytron® 8200 CAT, 8310 IR, 87x0 IR

Sensor austauschen

1. Falls erforderlich, den Wartungsstrom für die analoge Schnittstelle einstellen.
2. Die Spannungsversorgung zum Gerät ausschalten oder den Bereich gemäß den örtlichen Vorschriften deklassifizieren.
3. Feststellschraube lösen und Abdeckung vom Gerät abschrauben.
4. Die Leiterplatteneinheit herausziehen.
5. Die Leiterplatteneinheit umdrehen und den Sensoranschluss abziehen.
6. Den Sensor abschrauben.
7. Die Sensordrähte durch den Gewindeanschluss im Gehäuse einführen.

⚠ WARNUNG
Explosionsgefahr!
Die Öffnungen des Gehäuses müssen versiegelt werden, um eine Zündung von gefährlicher atmosphärischer Luft im Fall einer Zündung im Gehäuse zu verhindern.

► Es müssen fünf Gewindegänge eingreifen, um den Explosionsschutz zu gewährleisten.

8. Den Sensor einschrauben und mit dem richtigen Anzugsdrehmoment anziehen (min. 266 in-lbs / min. 30 Nm)
9. Polytron® 8200 CAT-spezifisch:
   Die Leitungen des Sensors zusammendrehen. Bei Bedarf einen Kabelbinder verwenden, um die Kabel dicht zusammen zu halten.
10. Den Sensoranschluss wieder in die Buchse stecken.
11. Die Leiterplatteneinheit wieder in das Gehäuse einsetzen.
12. Die Abdeckung auf das Gerät schrauben, bis sie richtig verriegelt ist (min. ≥44 in-lbs / min. ≥5 Nm), und die Feststellschraube anziehen.
13. Die Spannungsversorgung zum Gerät einschalten, wenn nötig.
    ⇒ Das Wartungssignal auf der 4–20-mA-Schnittstelle bleibt solange bestehen, bis der Sensor eingelaufen ist.

    Maximale Einlaufzeit eines neuen Sensors: siehe Gebrauchsanweisung des Sensors.
14. Justierung überprüfen. Das Gerät bei Bedarf justieren (siehe „Justierung“, Seite 67).
15. Die Installationsanforderungen und den SIL-Status des Geräts überprüfen.
    Siehe Abschnitt „Explosionsgeschützte (Ex d) Installation - ohne Docking Station“ bis „Installation von Sensoren oder Messköpfen“.

10.3 Displaytest durchführen

1. ***Einstellungen*** > ***Instrument*** > ***Anzeige*** > ***Displaytest*** wählen und bestätigen.
2. ***Ein*** wählen und bestätigen.
   ⇒ Die Informationen auf dem Display werden invertiert dargestellt. Alle LEDs werden eingeschaltet.
   Wenn das Menü verlassen wird, wird die Invertierung beendet.

11 Geräteeinstellungen

11.1 Kennwörter einstellen

1. Unter ***Einstellungen*** > ***Instrument*** > ***Kennwörter*** > das gewünschte Kennwort wählen und bestätigen.

Kennwort Kalibr.	Zugriff auf Nullpunkt- und Empfindlichkeitsjustierung
Kennwort Einst.	Zugriff auf alle Konfigurationsparameter

2. Die Zeile zur Bearbeitung des Kennworts wählen und bestätigen.
3. Kennwort einstellen und bestätigen.
4. ***Bestätigen*** wählen und mit [OK] bestätigen.

11.2 Datum und Uhrzeit einstellen

1. ***Einstellungen*** > ***Instrument*** > ***Datum und Zeit*** wählen und bestätigen.
2. Zeile zur Bearbeitung von Datum und Uhrzeit wählen und bestätigen.
3. ***Bestätigen*** wählen und mit [OK] bestätigen.

11.3 Sprache einstellen

1. ***Einstellungen*** > ***Instrument*** > ***Sprache*** wählen und bestätigen.
2. Sprache aus der Liste wählen und bestätigen.

11.4 Funktionstaste konfigurieren

1. ***Einstellungen*** > ***Instrument*** > ***Funktionstaste*** wählen und bestätigen.
2. Eine Funktion wählen und bestätigen.

Grafik	Die Messwerte der letzten 15 Minuten werden als Zeit/Konzentrations-Grafik dargestellt.
Fehler	Fehlermeldungen werden als Klartext angezeigt.
Warnungen	Warnmeldungen werden als Klartext angezeigt.
Bumptest	Mithilfe des Begasungstests kann Gas auf den Sensor geleitet werden, ohne dass ein Alarm ausgelöst wird. Das Wartungssignal wird übertragen. Nach 15 Minuten oder durch erneutes Antippen von [OK] wird der Begasungstest beendet und das Gerät in den Normalbetrieb zurückgeschaltet.
Vitalität[1)]	Zeigt die verbleibende Sensorvitalität an.

1) Nur mit Diagnosedongle

11.5 Auf Standardeinstellungen zurücksetzen

Diese Funktion setzt das Gerät auf die Standardeinstellungen zurück.

1. ***Einstellungen*** > ***Instrument*** > ***Geräteinit*** wählen und bestätigen.
2. ***Bestätigen*** wählen und mit [OK] bestätigen.

11.6 Kontrast des Displays ändern

1. ***Einstellungen*** > ***Instrument*** > ***Anzeige*** > ***Kontrast*** wählen und bestätigen.
2. Kontrast ändern und bestätigen.

11.7 Anzeigemodus ändern

1. ***Einstellungen*** > ***Instrument*** > ***Anzeige*** > ***Betriebsart*** wählen und bestätigen.
2. Gewünschten Modus wählen und bestätigen.

Standard	Zeigt die Standardanzeige.
Keine Anzeige	Zeigt den Startbildschirm und die entsprechenden Symbole.

Wenn ein Alarm ausgelöst wird, wird auf dem Display die aktuelle Gaskonzentration angezeigt und die rote LED blinkt, unabhängig vom ausgewählten Anzeigemodus.

11.8 Relais konfigurieren

11.8.1 Kombinationen von selbsthaltenden Alarmen und Alarmquittierung

Die folgenden Beispiele geben einen Überblick der Relaisquittierungskombinationen.

	selbsthaltend (Manuelles Zurücksetzen des Relais)	**Nicht selbsthaltend** (Relais wird nach behobener Alarmbedingung automatisch zurückgesetzt)
quittierbar	Ein Zurücksetzen des Relais ist jederzeit möglich.	
nicht quittierbar	Ein Zurücksetzen des Relais ist nicht möglich, bevor die Alarmbedingung behoben wurde.	
vor-quittierbar	Eine Alarmquittierung ist möglich, bevor die Alarmbedingung behoben wurde. Das Relais wird automatisch zurückgesetzt, nachdem die Alarmbedingung behoben wurde.	

Es gibt keine Zeitbeschränkung für selbsthaltende und nicht selbsthaltende Signale. Selbsthaltende Signale bleiben bis zu ihrer Quittierung aktiv. Nicht selbsthaltende Signale enden, sobald die auslösende Bedingung behoben ist.

11.8.2 Relais A1 oder A2 konfigurieren

Mit dieser Funktion wird festgelegt, ob das Alarmrelais im Normalbetrieb oder im Alarmzustand erregt ist.

1. ***Einstellungen*** > ***Instrument*** > ***Alarm & Relais*** > ***Relais A1*** oder ***Relais A2*** wählen und bestätigen.
2. Gewünschte Option wählen und bestätigen.

Normal erregt	Der Relaiskontakt ist im Normalbetrieb erregt und wird durch Auslösen eines Alarms geändert. Bei Stromausfall wird dadurch ein Alarm (ausfallsicher) ausgelöst.
Alarm erregt	Wenn ein Alarm ausgelöst wird, wird der Relaiskontakt erregt.

11.8.3 Fehlerrelais Einlaufen 1 einstellen

Mit dieser Funktion wird der Betrieb des Fehlerrelais während Einlaufen 1 eingestellt, um den Status Einlaufen 1 auf dem Relaisausgang darzustellen.

1. Unter ***Einstellungen*** > ***Instrument*** > ***Alarm & Relais*** > ***Fehler Einlaufen*** die gewünschte Option wählen und bestätigen.

Statisch	Das Fehlerrelais löst eine angeschlossene Alarmanzeige dauerhaft aus. Die orangefarbene LED leuchtet dauerhaft.
Dynamisch	Das Fehlerrelais wechselt den Status für 9 Sekunden. *Beispiel:* – Ein Signalhorn ist an den Arbeitskontakt (Normally Open) des Fehlerrelais angeschlossen. – Die Relais sind als normal erregt konfiguriert. ⇒ Das Signalhorn und die orangefarbene LED des Gasmessgeräts sind für 1 Sekunde aktiviert und für 9 Sekunden deaktiviert.

11.9 Alarmkonfiguration

11.9.1 Alarme ein- oder ausschalten

1. ***Einstellungen*** > ***Instrument*** > ***Alarm & Relais*** > ***Alarm ein/aus*** wählen.

Einschalten	Alarmgebung ist eingeschaltet.
Ausschalten	Alarmgebung ist ausgeschaltet. LEDs, Relais und Schnittstellen zeigen keine Alarmbedingung an. Die 4-bis-20-mA-Schnittstelle überträgt das Wartungssignal. Der ermittelte Wert und das Symbol ⚠ werden angezeigt. Das Fehlerrelais zeigt einen Fehler an.

2. ***Einschalten*** oder ***Ausschalten*** wählen und bestätigen.

11.9.2 Alarme konfigurieren

1. ***Einstellungen*** > ***Instrument*** > ***Alarm & Relais*** > ***Alarm A1*** oder ***Alarm A2*** wählen und bestätigen.
   Die aktuelle Alarmschwelle wird angezeigt.
2. Den angezeigten Vorschlag übernehmen oder folgende Einstellungen verändern (die Konfigurationsschritte nacheinander mit ***Weiter*** bestätigen):
   a. Den Wert für die Alarmschwelle einstellen.
   b. Die Alarmrichtung einstellen.

Steigend	Die Alarmrichtung wird als "steigend" bezeichnet, wenn die Gaskonzentration einen bestimmten Wert übersteigen muss, um einen Alarm auszulösen.
Fallend	Die Alarmrichtung wird als "fallend" bezeichnet, wenn die Gaskonzentration einen bestimmten Wert unterschreiten muss, um einen Alarm auszulösen.

   c. Den Selbsthaltungsmodus einstellen.

Selbsthaltend	Wenn die Alarmschwelle erreicht wird, löst das Gerät den Alarm aus. Es verbleibt auch dann im Alarmzustand, wenn die Gaskonzentration die Alarmbedingung nicht mehr erfüllt. Um einen selbsthaltenden Alarm aufzuheben, muss dieser quittiert werden.
Nicht selbsth.	Der Alarmzustand wird aufgehoben, wenn die Gaskonzentration die Alarmbedingung nicht mehr erfüllt.

   d. Den Quittierungsmodus einstellen.

Quittierbar	Das Alarmrelais und die Alarm-LED können zurückgesetzt werden, bevor die Alarmbedingung behoben wird.
Nicht quittierbar	Das Alarmrelais und die Alarm-LED können nicht zurückgesetzt werden, bevor die Alarmbedingung behoben wird.
Vorquittierbar	Der Alarmzustand kann quittiert werden, bevor die Alarmbedingung behoben wird. Das Alarmrelais und die Alarm-LED bleiben jedoch aktiv, bis die Alarmbedingung behoben wird.

e. Den Hysteresewert einstellen.
Mit der Hysteresefunktion wird ein Bereich definiert, in dem ein ausgelöstes Relais seinen Zustand beibehält, bis die Gaskonzentration sich wieder außerhalb des definierten Bereichs befindet. Beispiel: Die Alarmschwelle wird auf 40 ppm eingestellt und die Hysterese wird auf 3 ppm eingestellt. Der Alarm bleibt aktiv, bis der Wert unter 37 ppm sinkt. Hierdurch wird verhindert, dass Relais an einer Alarmschwelle mehrfach kurzzeitig schließen und öffnen ("prellen").

ℹ Wenn die Richtung eines Alarms geändert wurde (von fallend zu steigend oder andersherum), muss der Hysteresewert überprüft und ggf. korrigiert werden.

⇒ Auf einem Bestätigungsbildschirm werden alle Einstellungen angezeigt.

f. ***Bestätigen*** wählen und mit OK bestätigen.

✓ Die neuen Einstellungen werden gespeichert.

11.9.3 Alarme/Relais testen

Mit diesen Funktionen lassen sich die Status eines Relais und einer LED für Testzwecke ändern (z. B. um die Funktion von an das Relais angeschlossen Alarmgeräten zu überprüfen). Das Symbol wird angezeigt. Nach Beenden dieser Funktion werden die Status des Relais und der LED automatisch wieder auf den vorherigen Status zurückgesetzt.

1. Unter ***Einstellungen*** > ***Instrument*** > ***Alarm & Relais*** > die gewünschte Alarmbedingung wählen und bestätigen.

Alarm A1 setzen	Simuliert einen Voralarm
Alarm A2 setzen	Simuliert einen Hauptalarm
Fehler setzen	Simuliert ein Fehlersignal

2. ***Ein*** wählen und bestätigen.
⇒ Das Fehlerrelais wird aberregt und die 4-bis-20-mA-Schnittstelle auf Fehlerstrom gesetzt. Die gelbe LED leuchtet auf, das Wartungssymbol wird angezeigt. Wenn das Menü verlassen wird, wird die Simulation beendet.

11.10 Einstellungen des Datenloggers

11.10.1 Grafik anzeigen

Die letzten 15 Minuten werden als Zeit/Konzentrations-Grafik angezeigt.

1. ***Information*** > ***Datenspeicher*** > ***Grafik*** wählen.

11.10.2 Datenlogger ein- oder ausschalten

1. ***Einstellungen*** > ***Datenspeicher*** > ***Datensp. ein/aus*** wählen und bestätigen.
2. ***Ein*** oder ***Aus*** wählen und bestätigen.

11.10.3 Probennahmezeitfenster einstellen

Mithilfe dieser Funktion lässt sich einstellen, wie oft ein Wert gespeichert werden soll.

1. ***Einstellungen*** > ***Datenspeicher*** > ***Datensp. ein/aus*** > ***Speicherinterv.*** wählen und bestätigen.
2. Speicherintervall wählen und bestätigen.

11.10.4 Spitzen-/Mittelwert einstellen

Mithilfe dieser Funktion lässt sich festlegen, welcher Wert gespeichert wird.

1. ***Einstellungen*** > ***Datenspeicher*** > ***Einst. Datensp.*** > ***Spitze/Mittelw.*** wählen und bestätigen.
2. ***Spitze*** oder ***Mittelwert*** wählen und bestätigen.

Spitze	Es wird der Höchstwert (bei Überwachung fallender Konzentrationen der niedrigste Wert) der gemessenen Konzentrationen innerhalb des gewählten Probennahmezeitfensters gespeichert.
Mittelwert	Es wird der Mittelwert aller gemessenen Konzentrationswerte innerhalb des gewählten Probennahmezeitfensters gespeichert.

11.10.5 Auslösemodus ein- oder ausschalten

Mithilfe dieser Funktion lassen sich Werte ab einem bestimmten Wert speichern.

1. ***Einstellungen*** > ***Datenspeicher*** > ***Einst. Datensp.*** > ***Trigger ein/aus*** wählen und bestätigen.
2. ***Ein*** oder ***Aus*** wählen und bestätigen.

Ein	Messungen werden gespeichert, wenn sie einen Grenzwert oberhalb der Triggerschwelle übersteigen (bezogen auf den zuletzt gespeicherten Wert).
Aus	Messungen innerhalb des Probennahmezeitfensters werden gespeichert.

11.10.6 Triggerschwelle einstellen

Mit dieser Funktion lässt sich der Grenzwert für den Trigger bestimmen, um einen Wert zu speichern. Die Triggerschwelle bezieht sich prozentual auf den Messbereichsendwert.

Beispiel: Bei einer Triggerschwelle von 2 % und einem Messbereichsendwert von 500 ppm werden nur solche Werte gespeichert, die um 10 ppm abweichen (bezogen auf den zuvor gespeicherten Wert).

1. ***Einstellungen*** > ***Datenspeicher*** > ***Datensp. ein/aus Trigger Wert*** wählen und bestätigen.
2. Triggerschwelle einstellen und bestätigen.

11.10.7 Stackfunktion oder Rollfunktion einstellen

1. ***Einstellungen*** > ***Datenspeicher*** > ***Einst. Datensp.*** > ***Stack/Roll*** wählen und bestätigen.
2. ***Stack*** oder ***Roll*** wählen und bestätigen.

Roll	Sobald die Kapazität des Datenloggers erschöpft ist, werden die alten Daten durch neue Werte überschrieben.
Stack	Sobald die Kapazität des Datenloggers erschöpft ist, können keine weiteren Daten gespeichert werden. Das Gerät gibt eine Warnung aus.

11.10.8 Leeren des Datenloggers

Diese Funktion löscht die gespeicherten Daten.

1. ***Einstellungen*** > ***Datenspeicher*** >***Datensp. löschen*** wählen und bestätigen.
2. Um den Datenlogger zu leeren, ***Bestätigen*** auswählen und mit [OK] bestätigen.

12 Schnittstelleneinstellungen

12.1 4–20-mA-Schnittstelle

Der Stromausgang des Geräts im Normalbetrieb beträgt zwischen 4 und 20 mA und ist proportional zur gemessenen Gaskonzentration.

Polytron 8xx0 verwendet verschiedene Stromwerte zur Anzeige unterschiedlicher Betriebsarten. Die Werkseinstellungen können für anwendungsspezifische Anforderungen durch den Benutzer geändert werden. Dies entspricht den NAMUR-Empfehlungen NE43.

12.1.1 Messbereichsendwert

Nur Polytron® 8100 EC, 87x0 IR und 8200 CAT LC

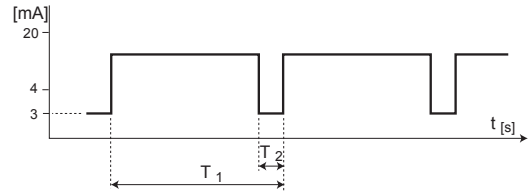
Manche Sensoren bieten einen justierbaren Messbereichsendwert zur Begrenzung des Messbereichs für die 4-bis-20-mA-Schnittstelle.

Über den Messbereichsendwert wird ein Endpunkt innerhalb des Messbereichs des Sensors bestimmt. Falls die Gaskonzentration diesen Endpunkt erreicht, überträgt die 4-bis-20-mA-Schnittstelle 20 mA.

Beispiel: Erforderlicher Bereich 0 bis 500 ppm CO (z. B. Sachnummer 6809605 Standard 300 ppm, min./max. Bereich = 50/1000 ppm). Messbereichsendwert von 500 ppm wählen. Das Analogsignal wird zwischen 4 mA = 0 ppm und 20 mA = 500 ppm linear ausgegeben.

12.1.2 Fehlerstrom einstellen

Mithilfe dieser Funktion lässt sich der Strom für die Fehlermeldung bestimmen.



1. ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** >***Fehlerstrom*** wählen und bestätigen.
2. Die Zeile zur Bearbeitung des Stroms wählen und bestätigen.
3. Stromstärke einstellen und bestätigen.
   ⇒ Die Einstellung für die ***Fehlerstrom*** wird angezeigt.
4. ***Bestätigen*** wählen und mit [OK] bestätigen.

12.1.3 Informationen zum Warnungssignal

Damit ein Warnungssignal über die Analogschnittstelle gesendet werden kann, muss dieses eingeschaltet sein. Das Warnungssignal wechselt zwischen dem Warnungsstrom und dem Messstrom.

– Warnungsstrom (Intervall T2)
– Messstrom (Intervall T1-T2)

Die Zeitintervalle und der Warnungsstrom können konfiguriert werden.

12.1.4 Warnungssignal ein- oder ausschalten

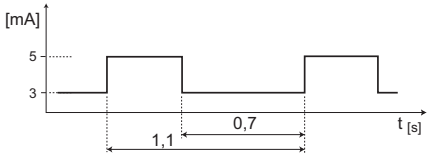
1. ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** > ***Warnung*** wählen und bestätigen.
2. ***Ein*** oder ***Aus*** wählen und bestätigen.

12.1.5 Warnungsintervall einstellen

1. ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** > ***Warn.-Intervall*** wählen und bestätigen.
2. Zeiten für Warnungsintervalle T1 und T2 einstellen und bestätigen.

12.1.6 Warnungsstrom einstellen

1. ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** > ***Warnungsstrom*** wählen und bestätigen.
2. Stromstärke einstellen und mit [OK] bestätigen.



12.1.7 Warnungen des Dräger SensorAlive einstellen

In diesem Menü können verschiedene Parameter des Warnungsstroms eingestellt werden:

- Um den Warnungsstrom einzustellen, ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** > ***DSA Warn.-Strom*** wählen und den Wert eingeben.
- Um einen Schwellenwert für die Warnung einzustellen, ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** > ***DSA Warn.-Grenze*** wählen und den Wert eingeben.
- Um die Warnung zu aktivieren oder zu deaktivieren, ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** > ***DSA Warn. setzen*** wählen und bestätigen.
  Ein oder ***Aus*** wählen und bestätigen.

12.1.8 Wartungssignal einstellen

1. ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** > ***Wartungssignal*** wählen und bestätigen.
2. Den Signaltyp festlegen und bestätigen.

Statisch	Ein Konstantstrom, der konfiguriert werden kann.
Dynamisch	Ein Rechtecksignal mit folgenden Eigenschaften: 

12.1.9 Wartungsstrom einstellen

Der Wartungsstrom kann nur dann eingestellt werden, wenn für das Wartungssignal die Einstellung „statisch“ gewählt wurde.

1. ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** >***Wartungsstrom*** wählen und bestätigen.
2. Strom festlegen und bestätigen.

12.1.10 Analogen Offset einstellen

Diese Funktion fügt dem analogen Ausgang bei 4 mA ein Offset hinzu. Das Offset passt den Strom bei 4 mA an, ohne den 20 mA-Sollwert zu beeinflussen.

1. ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** >***Analog Offset*** wählen und bestätigen.
2. Die Zeile zur Bearbeitung des Offset (Bereich: –0,5 bis 0,5 mA, SIL: –0,1 bis 0,1) wählen und bestätigen.
3. Stromstärke einstellen und bestätigen.
   ⇒ Die Einstellung für das ***Analog Offset*** wird angezeigt.
4. ***Bestätigen*** wählen und mit [OK] bestätigen.

12.1.11 Analogempfindlichkeit einstellen

Mit dieser Funktion kann der 20-mA-Analogausgang angepasst werden, ohne den 4-mA-Sollwert zu beeinflussen.

1. ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** > ***Analog Empfindl.*** wählen und bestätigen.
2. Die Zeile zur Bearbeitung des Offset (Bereich: –0,5 bis 0,5 mA, SIL: –0,1 bis 0,1) wählen und bestätigen.
3. Stromstärke einstellen und bestätigen.
   ⇒ Die Einstellung für das ***Analog Empfindl.*** wird angezeigt.
4. ***Bestätigen*** wählen und mit [OK] bestätigen.

12.1.12 Analogschnittstelle testen

Mithilfe dieser Funktionen lässt sich der Strom der Analogschnittstelle für Prüfzwecke ändern (z. B. um die Programmierung der Auswerteeinheit zu überprüfen). Gegebenenfalls ist es erforderlich, die Alarme an der Auswerteeinheit vorübergehend zu sperren, um Fehlalarme zu vermeiden. Nach Beenden dieser Funktion werden die Ströme automatisch auf das Wartungssignal zurückgestellt. Während der Prüfung wird das Wartungssymbol angezeigt.

- Um Strom oder Konzentration einzustellen:

1. Unter ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** die gewünschte Option auswählen.

Stromsig. setzen	Mithilfe dieser Funktion lässt sich der Strom auf einen beliebigen Wert zwischen 0 und 22 mA einstellen. Offsetstrom und Analogempfindlichkeit werden bei dieser Funktion nicht verwendet.
Konz. setzen	Mithilfe dieser Funktion lässt sich der Strom auf einen frei wählbaren Messwert zwischen 0 ppm und dem Messbereichsendwert einstellen.

2. Nachdem die Alarme an der Auswerteeinheit gesperrt wurden, die Meldung ***Alle Alarme ausschalten*** mit ***Weiter*** bestätigen.
3. Die Zeile zur Bearbeitung wählen und mit [OK] bestätigen.
4. Den gewünschten Wert einstellen.
5. ***Weiter*** wählen und bestätigen.
6. Gewünschte Option auswählen:

Konzentration aus / ***Setze Stromausg.***	Diese Funktion simuliert den voreingestellten Messwert bzw. den Teststromwert. Während der Prüfung wird das Wartungssymbol angezeigt.
Konzentration aus / ***Strom aus***	Mithilfe dieser Funktion kann die Übertragung des voreingestellten Testwerts abgebrochen werden.

7. ***Weiter*** wählen und bestätigen.
   ⇒ Die Funktion wird abgebrochen.
8. Nachdem die Alarme an der Auswerteeinheit wieder aktiviert wurden, folgende Meldung bestätigen: ***Alle Alarme einschalten***.

- Um das Prüfsignal einzustellen:

1. Unter ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** den gewünschten Test auswählen.

Fehler setzen	Mithilfe dieser Funktion lässt sich die Stromstärke auf den Fehlerstrom setzen.
Warnung setzen	Mithilfe dieser Funktion lässt sich die Stromstärke auf den Warnungsstrom setzen.
Wartung setzen	Mithilfe dieser Funktion lässt sich die Stromstärke auf den Wartungsstrom setzen.

2. Nachdem die Alarme an der Auswerteeinheit gesperrt wurden, die Meldung ***Alle Alarme ausschalten*** bestätigen.
3. ***Ein*** oder ***Aus*** wählen und bestätigen.

12.1.13 Beam Block-Signal einstellen

Diese Funktion steht nur für Polytron 87x0 IR (mit PIR 7000/7200-Sensor) zur Verfügung.

Wenn die Beam Block-Funktion eingeschaltet und das optische System des PIR 7000/7200-Sensors verschmutzt ist, wird das Beam Block-Signal auf die Analogschnittstelle übertragen. Das optische System des Sensors kann durch Ablagerungen auf der optischen Oberfläche verschmutzt werden. Steigt die Gaskonzentration jedoch auf ein Niveau über der Beam Block-Grenze, kehrt das Gerät in den Normalbetrieb zurück.

Übersteigen die Ablagerungen auf der optischen Oberfläche ein Maß, das eine Messung unmöglich macht, schaltet das Gerät in den Störbetrieb.

- Um das Beam Block-Signal zu aktivieren/deaktivieren:

1. Unter ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** > die gewünschte Option auswählen.

Beam Bl. ein/aus	Mithilfe dieser Funktion lässt sich der Beam Block ein- bzw. ausschalten.
BeamBlock setzen	Mithilfe dieser Funktion lässt sich der Strom auf den Beam Block-Warnungsstrom setzen.

2. ***Ein*** oder ***Aus*** wählen und bestätigen.

- Um Beam Block-Signale einzustellen:

1. Unter ***Einstellungen*** > ***Kommunikation*** > ***Analog Schnittst*** > die gewünschte Option auswählen.

Beam Block-Strom	Mithilfe dieser Funktion lässt sich der Strom für den Beam Block bestimmen.
Beamblock Grenze	Mit dieser Funktion wird die Höchstgrenze definiert, wenn das Beam Block-Signal mit der Analogschnittstelle übertragen wird.

2. Die Zeile zur Bearbeitung des Stroms auswählen und bestätigen.
3. Stromstärke einstellen und bestätigen.
   ⇒ Der eingestellte Beam Block-Strom wird angezeigt.
4. ***Bestätigen*** wählen und mit [OK] bestätigen.

12.2 HART-Schnittstelle

12.2.1 Polling-Adresse einstellen

Die Polling-Adresse (Abfrageadresse) konfiguriert das Gasmessgerät für den Analogbetrieb oder den Multidrop-Betrieb.

HART-Kommando: #6 (Write Polling Adress)

1. ***Einstellungen*** > ***Kommunikation*** > ***HART Schnittst*** > ***Polling Adresse*** wählen.
2. Polling-Adresse einstellen und ***bestätigen*** wählen.

0	Aktiviert den Analogbetrieb
1 bis 15	Aktiviert den Multidrop-Betrieb. Die 4-20-mA-Schnittstelle wird deaktiviert und auf einen konstanten Strom von ca. 1 mA gesetzt.

ℹ Alle Geräte einer Leitung mit unterschiedlichen Polling-Adressen konfigurieren. Sinnvollerweise eine bei 1 beginnende Folge verwenden.

12.2.2 Unique Identifier anzeigen

Der Unique Identifier (eindeutige HART-Adresse) muss für fast alle HART-Kommandos zur Adressierung bekannt sein.

HART-Kommandos:

– #0 (Read Unique Identifier)
– #11 (Read Unique Identifier associated with Tag)

1. ***Einstellungen*** > ***Kommunikation*** > ***HART Schnittst*** > ***Unique Identifr*** wählen.
2. Der Unique Identifier wird angezeigt.

12.2.3 HART-Tag einstellen

Das HART-Tag (Messstellenbezeichnung) dient zum Kennzeichnen einer Messstelle.

1. ***Einstellungen*** > ***Kommunikation*** > ***HART Schnittst*** > ***Tag*** wählen.
2. HART-Tag einstellen und ***bestätigen*** wählen. Das HART-Tag kann aus bis zu 8 alphanumerischen Zeichen bestehen.

12.2.4 Dräger REGARD-Protokoll einstellen

Mit dieser Funktion wird zwischen verschiedenen HART-Protokollen gewechselt.

1. ***Einstellungen*** > ***Kommunikation*** > ***HART Schnittst*** > ***Dräger REGARD*** auswählen.
2. Die der REGARD-Auswerteeinheit entsprechende Softwareversion auswählen.

12.3 Digitale Schnittstellen

Informationen zur Konfiguration der anderen Schnittstellen sind den folgenden Dokumenten zu entnehmen:

Schnittstelle	Dokument
PROFIBUS PA	9033782
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

13 Sensoreinstellungen

13.1 Automatische Justierung ein- oder ausschalten

1. ***Einstellungen*** > ***Sensor*** > ***Auto Kalibrierun*** wählen und bestätigen.
2. ***Ein*** oder ***Aus*** wählen und mit [OK] bestätigen.

13.2 Fangbereich

Der Fangbereich blendet Messwertschwankungen aus. Messwertschwankungen sind geringe Variationen in den Messwerten (auf Grund von Signalrauschen, Schwankungen der Konzentration). Diese Variationen ändern den übertragenen oder angezeigten Wert nicht. Messwerte innerhalb des Bereichs werden mit dem Fangbereichswert angezeigt. Messwerte außerhalb des Bereichs werden mit dem tatsächlichen Wert angezeigt.

Fangbereichswert (Offset)

Der Fangbereichswert wird dauerhaft angezeigt, solange der Messwert sich zwischen der oberen und unteren Fangbereichsgrenze befindet.

Obere Fangbereichsgrenze

Die obere Fangbereichsgrenze bestimmt den höchsten Wert des Bereichs, in welchem der Fangwert angezeigt wird.

Untere Fangbereichsgrenze

Die untere Fangbereichsgrenze bestimmt den niedrigsten Wert des Bereichs, in welchem der Fangwert angezeigt wird.

13.2.1 Fangbereich einstellen

1. ***Einstellungen*** > ***Sensor*** > ***Display Fangber.*** wählen und bestätigen.
2. Den Offset im ersten Fenster einstellen.
3. Den niedrigsten Wert für den Fangbereich einstellen und mit ***Weiter*** bestätigen.
4. Den höchsten Wert für den Fangbereich einstellen und mit ***Weiter*** bestätigen.
5. Die Werte prüfen und mit ***Weiter*** bestätigen.

13.2.2 Fangbereich deaktivieren

1. ***Einstellungen*** > ***Sensor*** > ***Display Fangber.*** wählen und bestätigen.
2. Den Offset im ersten Fenster einstellen.
3. Den niedrigsten Wert für den Fangbereich auf 0 einstellen und mit ***Weiter*** bestätigen.
4. Den höchsten Wert für den Fangbereich auf 0 einstellen und mit ***Weiter*** bestätigen.
5. Alle Werte prüfen und mit ***Weiter*** bestätigen.

13.3 Sensor zurücksetzen

Diese Funktion setzt den Sensor auf die Standardeinstellungen zurück.

1. ***Einstellungen*** > ***Sensor*** > ***Kanal Initial.*** wählen und bestätigen.
2. ***Bestätigen*** wählen und mit [OK] bestätigen.

13.4 Justierintervall einstellen

Nach Ablauf des Justierintervalls, gibt das Gerät die Warnung aus, dass eine Justierung überfällig ist.

1. ***Einstellungen*** > ***Sensor*** > ***Kal.-Intervall*** wählen und bestätigen.
2. Justierintervall einstellen und mit [OK] bestätigen.

13.5 Sensor-Sperrfunktion einstellen

Dieser Punkt gilt nur für Polytron 8100 EC und Polytron 87x0 IR.

1. ***Einstellungen*** >***Sensor*** > ***Sensorlock*** wählen und bestätigen.
2. ***Ein*** oder ***Aus*** wählen.

Ein	Das Gerät lehnt jeden Sensor ab, dessen Sachnummer nicht mit der Sachnummer des zuvor installierten Sensors übereinstimmt.
Aus	Das Gerät nimmt jeden geeigneten Sensor an und liest die Standardeinstellungen für diesen Sensor ein. Dadurch werden allerdings sämtliche benutzerdefinierten Einstellungen durch die Standardeinstellungen des neuen Sensors überschrieben.

13.6 Software-Dongle für EC-Sensoren

13.6.1 Dongle installieren

1. Die Spannungsversorgung des Geräts ausschalten oder den Bereich gemäß den örtlichen Vorschriften deklassifizieren.
2. Feststellschraube lösen und Abdeckung vom Gerät abschrauben.
3. Dongle mit Dräger-Logo nach oben in den Steckplatz auf der Leiterplatteneinheit einsetzen, Siehe Abbildung D auf der Ausklappseite.
4. Die Rückabdeckung der Leiterplatteneinheit auflegen und das Gerät schließen (siehe „Gasmessgerät schließen“, Seite 58).

13.6.2 Dongle deaktivieren

Diese Funktion deaktiviert einen Dongle, damit der Dongle sicher entfernt werden kann bzw. falls dieser defekt ist.

Ein Dongle lässt sich nur durch Ein- und Ausschalten der Spannungsversorgung am Gerät reaktivieren.

1. ***Einstellungen*** > ***Instrument*** > ***SW Dongle*** > und den zu deaktivierenden Dongle wählen und bestätigen.
2. ***Deaktivierung Funktion*** wählen. Der gewählte Dongle wird deaktiviert.

13.7 Sensoreinstellungen Polytron® 8100 EC

13.7.1 Sensorselbsttest

Diese Funktion ist nur aktiv, wenn der Sensortestdongle oder der Diagnosedongle installiert ist. Wenn der Sensor den Selbsttest nicht besteht, wird eine Warnung oder Fehlermeldung ausgegeben.

Regelmäßige Sensorselbsttests einstellen

Diese Funktion löst in regelmäßigen Abständen den Sensorselbsttest aus. Das Gerät überprüft dann routinemäßig das ordnungsgemäße Funktionieren des Sensors.

1. ***Einstellungen*** > ***Sensor*** > ***Setze Sensortest*** wählen und bestätigen.
2. ***Ein*** oder ***Aus*** wählen und bestätigen.

Sensorselbsttest manuell starten

Mit dieser Funktion wird ein einzelner Sensorselbsttest gestartet.

1. ***Einstellungen*** > ***Sensor*** > ***Sensortest*** wählen und bestätigen.
2. ***Start Sensortest*** wird angezeigt.
3. ***Bestätigen*** wählen.

✓ Das Testergebnis wird angezeigt.

13.7.2 Gaseinstellungen

Mit dieser Funktion lassen sich Gasart, Messbereich und Messeinheiten einstellen. Je nachdem, welcher Sensor installiert ist, sind unterschiedliche Einstellungen möglich.

1. ***Einstellungen*** > ***Sensor*** > ***Gas-Einst.*** wählen und bestätigen.
   ⇒ Das aktuelle Messgas wird angezeigt.
2. Messgas aus der Liste wählen und bestätigen.
   ⇒ Die aktuelle Messeinheit wird angezeigt.
3. Messeinheit aus der Liste wählen und bestätigen.
   ⇒ Der aktuelle Messbereichsendwert wird angezeigt.
4. Nur für bestimmte EC-Sensoren: Messbereichsendwert einstellen und bestätigen.
   ⇒ Der neue Messbereichsendwert wird angezeigt.
5. ***Weiter*** wählen und bestätigen.
   ⇒ Eine Übersicht mit den neuen Gaseinstellungen wird angezeigt.
6. Nach der Überprüfung ***Zurück zum Menü*** oder ***Bestätigen*** wählen.

Zurück zum Menü	Zurück zum Menü wählen, um die Funktion ohne Änderung zu verlassen und mit [OK] bestätigen.
Bestätigen	Bestätigen wählen, um die Einstellungen zu übernehmen, und mit [OK] bestätigen.

13.7.3 Einstellungen des Dräger SensorAlive

In diesem Menü können verschiedene Parameter eingestellt werden, die das Verhalten des Dräger SensorAlive definieren:

- Um die LifeTest-Funktionen des Sensors zu aktivieren oder zu deaktivieren, ***Einstellungen*** > ***Sensor*** > ***SensorAlive*** > ***DSA-Aktivierung*** wählen und bestätigen. ***Ein*** oder ***Aus*** wählen und bestätigen.
- Um eine Verstopfung des Sensors zu quittieren, ***Einstellungen*** > ***Sensor*** > ***SensorAlive*** > ***Fehler quitt.*** wählen.
- Um die Fehlererkennung zu aktivieren oder zu deaktivieren, ***Einstellungen*** > ***Sensor*** > ***SensorAlive*** > ***Fehlerdetektion*** wählen und bestätigen. ***Ein*** oder ***Aus*** wählen und bestätigen.

Im Menü ***SensorAlive*** gibt es folgende Untermenüs:

– LifeTest
– Sensitivitätsüberwachung

Im Untermenü LifeTest können folgende Parameter eingestellt werden:

- Um festzulegen, wann ein Testdurchlauf gestartet werden soll, ***Uhrzeit*** wählen.
  Eine Uhrzeit eingeben und bestätigen. Der Testdurchlauf wird begonnen, wenn diese Zeit am Transmitter erreicht wird.

  ℹ Transmitter unterstützen keine automatische Sommer-/Winterzeitumstellung.

- Um festzulegen, welcher Wert während des LifeTests über den Transmitter ausgeben werden soll, ***Ausgabeverhalten*** wählen.
  Festgesetzt, ***Wartung*** oder ***Messwert*** wählen und bestätigen.
- Um festzulegen, ob Wiederholungstests in einem Testdurchlauf gemacht werden sollen, wenn ein LifeTest ein negatives Testergebnis hat, ***Wiederholmodus*** wählen.
  Flexibel wählen und bestätigen.
  Wenn ***Statisch*** gewählt wird, werden keine Wiederholungstests gemacht, sondern zur angegebenen Uhrzeit ein neuer Testdurchlauf gemacht.
- Um festzulegen, wann ein LifeTest abgebrochen wird, ***Abbruchsgrenze*** wählen.
  Einen Wert eingeben und bestätigen.

ℹ Während eines LifeTests wird der Dräger SensorAlive mit Testgas beaufschlagt. Daher steigt der Messwert. Um zu verhindern, dass ein Alarm ausgelöst wird, wird der Messwert standardmäßig für max. 15 Minuten nicht übertragen. Das Verhalten während eines LifeTests kann jedoch im Menü ***Ausgabeverhalten*** konfiguriert werden. Trotzdem erkennt der Sensor einen Gasausbruch, wenn die gemessene Gaskonzentration größer wird als die durch den LifeTest zu erwartende Gaskonzentration. Die Differenz entspricht der Konzentration des Gasausbruchs und wird mit dem Wert verglichen, der unter ***Abbruchsgrenze*** eingegeben wurde. Wenn dieser Wert überschritten wird, wird der LifeTest sofort abgebrochen. Der Sensor schaltet in den Messbetrieb zurück und der Transmitter gibt wieder einen Messwert aus. Wenn Relais verwendet werden, werden diese am Transmitter geschaltet und ggf. Alarme ausgelöst.

Im Untermenü ***Sensitiv. check*** können folgende Parameter eingestellt werden:

- Um festzulegen, ob eine Warnung ausgegeben werden soll, ***Aktivierung*** wählen und bestätigen.
- Um festzulegen, wann eine Warnung ausgegeben werden soll, ***Alarm < 50%*** oder ***Alarm < 40%*** wählen und bestätigen.

13.8 Sensoreinstellungen Polytron® 8200 CAT / 8310 IR

13.8.1 Sensortyp

Mit dieser Funktion wird der installierte Sensortyp definiert.

1. ***Einstellungen*** > ***Sensor*** > ***Sensortyp*** wählen und bestätigen.
2. Den Sensortyp festlegen und bestätigen.

13.8.2 Gaseinstellungen

Mit dieser Funktion wird die Messeinheit eingestellt.

Bei LC-Sensoren wird mit dieser Funktion außerdem der Messbereichsendwert eingestellt.

1. ***Einstellungen*** > ***Sensor*** > ***Gas-Einst.*** wählen und bestätigen.
2. Messeinheit aus der Liste wählen und bestätigen.
   ⇒ Bei DQ-Sensoren und DSIR:
   Eine Übersicht mit den neuen Gaseinstellungen wird angezeigt. Mit Schritt 4. fortfahren
   ⇒ Bei LC-Sensoren:
   Der aktuelle Messbereichsendwert wird angezeigt. Mit Schritt 3. fortfahren
3. Messbereichsendwert einstellen und bestätigen (nur bei LC-Sensoren).
   ⇒ Eine Übersicht mit den neuen Gaseinstellungen wird angezeigt.
4. Nach der Überprüfung ***Zurück zum Menü*** oder ***Bestätigen*** wählen.

Zurück zum Menü	Zurück zum Menü wählen, um die Funktion ohne Änderung zu verlassen und mit [OK] bestätigen.
Bestätigen	Bestätigen wählen, um die Einstellungen zu übernehmen, und mit [OK] bestätigen.

13.8.3 DQ-Sensorverriegelung einstellen

Diese Funktion steht nur zur Verfügung, wenn keine Relais installiert sind. Mit dieser Funktion wird eingestellt, ob der DQ-Sensor nach einer Messung einer höheren Konzentration als 100 %UEG quittiert werden muss.
Diese Einstellung gilt nicht für LC-Sensoren.

1. ***Einstellungen*** > ***Sensor*** > ***DQ Sensor Selbst.*** wählen und bestätigen.
   ⇒ Die aktuelle Einstellung wird angezeigt.
2. ***Ein*** oder ***Aus*** wählen und bestätigen.

⚠ WARNUNG
Explosionsgefahr
Wenn die Sensorverriegelung deaktiviert ist und ein Alarm mit einer Explosionsgefahr quittiert wird, informiert das Gerät den Endbenutzer über eine solche Gefahr durch dauerhaftes Leuchten der roten LED.

► Vor der Quittierung einer Messbereichsüberschreitung sicherstellen, dass die Gaskonzentration unter 100 %UEG gesunken ist.

⚠ WARNUNG
Mögliche Explosionsgefahr
Betrieb ist nicht mit der BVS-Baumusterprüfung konform.
Ist die DQ-Sensorverriegelung deaktiviert, muss die Auswerteeinheit diese Funktion für den sicheren Betrieb gemäß BVS 13 ATEX G 001 X unterstützen.

► Sicherstellen, dass eine selbsthaltende Anzeige von Messbereichsüberschreitungen an der Anzeigeeinheit aktiviert ist.

13.9 Sensoreinstellungen Polytron 8310 IR

13.9.1 Änderung der Gaskategorie

Der DrägerSensor IR kann Gase und Dämpfe messen, die zu den Gaskategorien Methan, Propan oder Ethen (Ethylen) gehören. Je nachdem, welches Zielgas gemessen werden soll, muss eine Gaskategorie für den DrägerSensor IR eingestellt werden. Für die Zuordnung der Gase und Dämpfe zu den Gaskategorien siehe die Dokumentation des DrägerSensor IR.

13.9.2 Gaskategorie wechseln

Voraussetzungen

– Das Gasmessgerät wurde vor weniger als einer Stunde eingeschaltet.
– Der automatische Nullpunktabgleich am Sensor wurde vor weniger als einer Stunde durchgeführt (siehe „Besonderheit beim Polytron 8310“, Seite 68).
– Die vom Gasmessgerät gemessene Gaskonzentration liegt unter 10 %UEG (Sensor gegebenenfalls mit Nullgas begasen).

1. Alarmgebung des Gasmessgeräts ausschalten (siehe „Alarme ein- oder ausschalten“, Seite 77).
2. ***Einstellungen*** > ***Sensor*** > ***DSIR Kategorie*** wählen und bestätigen.
   ⇒ Die Gaskategorie wird am Gerät angezeigt.

ℹ Die weiteren Schritte werden am Sensor durchgeführt.

3. Zum Auswählen der Gaskategorie am Sensor das Symbol ⇧S oder ⇩0 mit dem Magnetstab berühren.
   ⇒ Am Gasmessgerät wird START angezeigt.
4. Magnetstab entfernen.
   ⇒ Der Sensor wechselt auf ein Ausgangssignal, das die aktuell eingestellte Gaskategorie repräsentiert:
   Ausgangssignal 20 %UEG: Gaskategorie Methan
   Ausgangssignal 40 %UEG: Gaskategorie Propan
   Ausgangssignal 60 %UEG: Gaskategorie Ethen (Ethylen)
5. Dieses Ausgangssignal wird für 30 Sekunden gehalten. Innerhalb dieses Zeitraums kann durch Aufsetzen des Magnetstabs auf den mit dem Symbol ⇧S markierten Bereich das nächstfolgende Gas gewählt werden.
   ⇒ Das Ausgangssignal des Sensors wechselt dabei auf den der neu gewählten Gaskategorie entsprechenden Wert. Erfolgt für mehr als 30 Sekunden keine weitere Eingabe mit dem Magnetstift, wird die Einstellung gespeichert.
6. Empfindlichkeitskalibrierung am Gasmessgerät überprüfen (siehe „Empfindlichkeitsjustierung“, Seite 69)
7. Alarmgebung des Gasmessgeräts einschalten (siehe „Alarme ein- oder ausschalten“, Seite 77).

ℹ Die Einstellung am Sensor kann dazu führen, dass im Menüpunkt ***DSIR Kategorie*** eine falsche Gaskategorie angezeigt wird oder kein Wechsel der Gaskategorie mehr sichtbar ist.

13.10 Sensoreinstellungen Polytron® 87x0 IR

13.10.1 Gaseinstellungen

Mithilfe dieser Funktion lassen sich Gasart, Messbereich und Messeinheiten einstellen. Nur bestimmte Sensoren unterstützen diese Einstellungen.

1. ***Einstellungen*** > ***Sensor*** > ***Gas-Einst.*** wählen und bestätigen.
   ⇒ Das aktuelle Messgas wird angezeigt.
2. Messgas aus der Liste wählen und bestätigen.
   ⇒ Die aktuelle Messeinheit wird angezeigt.
3. Messeinheit aus der Liste wählen und bestätigen.
   ⇒ Wenn die Messeinheit %LEL, %UEG oder %LIE eingestellt ist, wird die Kategorie angezeigt. Weiter mit Schritt 4.
   ⇒ Andernfalls wird der aktuelle Messbereichsendwert angezeigt. Weiter mit Schritt 6.
4. Eine Kategorie wählen und bestätigen.
5. UEG-Wert einstellen und bestätigen.
6. Messbereichsendwert einstellen und bestätigen.
   ⇒ Der neue Messbereichsendwert wird angezeigt.
7. ***Weiter*** wählen und bestätigen.
   ⇒ Eine Übersicht mit den neuen Gaseinstellungen wird angezeigt.
8. Nach der Überprüfung ***Zurück zum Menü*** oder ***Bestätigen*** wählen.

Zurück zum Menü	Zurück zum Menü wählen, um die Funktion ohne Änderung zu verlassen und mit [OK] bestätigen.
Bestätigen	Bestätigen wählen, um die Einstellungen zu übernehmen, und mit [OK] bestätigen.

9. Die Alarmeinstellungen prüfen, nachdem die Kategorie oder der UEG-Wert geändert wurde.

14 Werkseinstellungen

14.1 Unveränderbare Einstellungen für Relais, LED und Alarm

	Einstellung
Fehler-Relais:	Erregt / Arbeitskontakt (Normally Open)
Gelbe LED:	Leuchtet, wenn eine Fehlermeldung vorliegt
Rote LED:	Blinkt einfach, wenn ein Alarm A1 vorliegt. Blinkt zweifach, wenn ein Alarm A2 vorliegt. Wenn ein Alarm als quittierbar konfiguriert ist und der Alarm quittiert wurde, hört die LED auf, einfach oder zweifach zu blinken und leuchtet durchgehend.
Alarmhierarchie:	A2 hat an der LED eine höhere Priorität als A1. Die Relais A1 und A2 arbeiten jedoch unabhängig voneinander. (Beispiel: Wenn A1 quittierbar ist und A2 nicht und die Gaskonzentration so hoch ist, dass A1 und A2 ausgelöst werden, fällt das Relais A1 ab, wenn der Alarm quittiert wird. Die rote LED blinkt jedoch weiterhin zweifach, solange der Zustand besteht, der den Alarm A2 auslöst.

14.2 Einstellungen, die sich über das Menü ändern lassen

Menü	Standardeinstellung	Bereich
Relais aktiv bei Alarm / kein Alarm	Aktiv bei Alarm	Ein / Aus
Alarm A1: Richtung	steigend (fallend für O_2-Sensoren)	Fallend / steigend
Alarm A2: Richtung	Steigend	
A1 Selbsthaltungsmodus	Nicht selbsthaltend	Selbsthaltend / nicht selbsthaltend
A2 Selbsthaltungsmodus	Selbsthaltend	
A1 Quittiermodus	Quittierbar	Quittierbar / nicht quittierbar / vorab quittierbar
A2 Quittiermodus	Nicht quittierbar	
Normalbetrieb Relais A1	Erregt	Erregt / nicht erregt
Normalbetrieb Relais A2		
Justierungs-Kennwort	_ _ _ 1	
Einstellungen Kennwort	_ _ _ 2	
LCD-Einstellung	Ein	Ein / Aus
SIL-Status	Aus	Ein / Aus
Sprache	EN	DE / EN / FR / ES / RU / ZH
Automatische Justierung	Aus	Ein / Aus
Funktionstaste	Fehler	Graph, Fehler, Warnung, Vitalität, Begasungstest

Schnittstelle	Standardeinstellung	Bereich
Fehlerstrom	1,2 mA	0 bis 3,5 mA
Warnung	Aus	Ein / Aus
Warnungsstrom	3,0 mA	0 bis 3,5 mA
Warnungszyklusintervall T1	10 s	5 bis 60 s
Warnzyklusintervall T2 (Warnstrom)	1 s	1 bis (T1-1) s
Wartungssignal	statisch	Statisch / dynamisch
Wartungsstrom	3,4 mA	0 bis 3,5 mA
Analog-Offset	0 mA	-0,5 bis 0,5 mA
Empfindlichkeit Analogausgang	0 mA	-0,5 bis 0,5 mA
HART®-Adresse	0	0 bis 15
Modbus-Adresse[1)]	126	2-126
Modbus-Parität[1)]	gerade (Standard)	gerade, ungerade Parität, keine Parität
Modbus-Baudrate[1)]	9600 bit/s	9600 oder 19200 bit/s
PROFIBUS®-Adresse[1)]	126	2-126

1) Feldbus-Schnittstellen entsprechen nicht BVS 13 ATEX G001 X. Bei Verwendung der Feldbus-Schnittstelle stehen keine Relais zur Verfügung.

14.3 Sensorspezifische Werte

Weitere Spezifikationen sind der Gebrauchsanweisung des jeweiligen Sensors zu entnehmen.

14.3.1 Polytron 8100 EC

Menü	Standardeinstellung	Bereich
Alarm A1	Sensor-abhängig	
Alarm A2	Sensor-abhängig	
Hysterese für Alarm A1 bei steigender Richtung	0	0 bis A1
Hysterese für Alarm A2 bei steigender Richtung	0	0 bis A2
Hysterese für Alarm A1 bei fallender Richtung	0	0 bis Messbereichsendwert -A1
Hysterese für Alarm A2 bei fallender Richtung	0	0 bis Messbereichsendwert -A2
Justierintervall [Tage]	Sensor-abhängig	0 bis 720

14.3.2 Polytron 8100 EC mit O_2-Sensoren

Menü	Standardeinstellung	Bereich
Display-Fangbereichsoffset	20,9 Vol% (O_2)	0 bis 25 Vol% (O_2 LS) 0 bis 100 Vol% (O_2)
Display-Fangbereich niedrig	-0,25 Vol% (O_2)	0 bis -0,75 Vol%
Display-Fangbereich hoch	0,25 Vol% (O_2)	0 bis 0,75 Vol%

Menü	Standardeinstellung	Bereich
Messbereichsendwert	25 Vol% (O_2, O_2 LS)	5 bis 25 Vol% (O_2 LS) 5 bis 100 Vol% (O_2)

14.3.3 Polytron 8100 EC mit Dräger SensorAlive

Menü	Standardeinstellung	Bereich
DSA Warn.-Strom	2,0 mA	0 mA bis 3,5 mA
DSA Warn.-Grenze	Sensor-abhängig	
DSA Aktivierung	Ein	Ein/Aus

Beam Block-Grenze	0,1 Vol%	0 bis 0,1 Vol%
Justierintervall [Tage]	360	0 bis 720
Ansprechverhalten	normal	normal / schnell
Display-Fangbereichsoffset	340 ppm	Die Absolutwerte des Display-Fangbereichs müssen innerhalb dieser Grenzen liegen: -1000 bis 1000 ppm (Kohlenstoffdioxid)
Display-Fangbereich niedrig	-200 ppm	
Display-Fangbereich hoch	200 ppm	

15 Entsorgung

Dieses Produkt darf nicht als Siedlungsabfall entsorgt werden. Es ist daher mit dem nebenstehenden Symbol gekennzeichnet.
Dräger nimmt dieses Produkt kostenlos zurück. Informationen dazu geben die nationalen Vertriebsorganisationen und Dräger.

Entsorgung elektrochemischer Sensoren:

⚠ WARNUNG
Gefahr von Explosionen und Verätzungsgefahr!
Sensorflüssigkeiten können austreten und Verätzungen verursachen.
► Sensoren nicht im Feuer entsorgen.
► Nicht gewaltsam öffnen.

16 Technische Daten

16.1 Messbereiche

Sensor	Messbereich
Polytron 8100 EC mit Dräger-Sensor® EC	Sensor-abhängig
Polytron 8200 CAT mit DrägerSensor® DQ	0 bis 100 %UEG
Polytron 8200 CAT mit DrägerSensor®LC	0 bis 10 %UEG[1)]
Polytron 8310 IR mit Dräger-Sensor® IR	0 bis 100 %UEG
Polytron 8700 IR mit PIR 7000-Infrarot-Gassensor	
Typ 334 (IDS 01x1)	0 bis 10.000 ppm[1)] 0 bis 100 %UEG,[1)] 0 bis (1,25 x UEG_{max}) Vol%,[1)2)] Für CH4 (Methan) 0 bis 100 Vol%[1)]
Typ 340 (IDS 01x2)	0 bis 10.000 ppm[1)] 0 bis 100 %UEG[1)] 0 bis 5 Vol%[1)]
Polytron 8720 IR mit PIR 7200-Infrarot-Gassensor (IDS 01x5)	0 bis 100 Vol%[1)]

1) Für anpassbaren Messbereichsendwert, siehe 14.3.
2) Bereich ändert sich je nach zu messender Substanz

16.2 Signalübertragung zur Auswerteeinheit

Messbereich und messtechnische Eigenschaften hängen vom installierten Sensor ab (siehe Gebrauchsanweisung des installierten Sensors).

Frequenz der Messwertberechnung: 1 x pro Sekunde (Aktualisierung der Anzeige, der Analogschnittstelle und der Relais).

Analogsignal	
Normalbetrieb	4 ... 20 mA
Drift unter Null	3,8 ... 4 mA
Messbereichsüberschreitung	20 ... 20,5 mA
Gerätefehler	≤ 1,2 mA
Fehler an der Analogschnittstelle	> 21 mA
Wartungssignal	3,4 mA stetiges Signal oder 1 Hz-Modulation zwischen 3 und 5 mA (wählbar)

Widerstand der Signalschleife

Betriebsmodus	Widerstandsbereich der Signalschleife	Bereich der Spannungsversorgung
Betrieb ohne HART®-Kommunikation	0 bis 230 Ω	bei 10 V DC
	Linearer Anstieg mit der Versorgungsspannung von: 0 bis 230 Ω bei 10 V auf 0 bis 500 Ω bei 16 V	10 bis 18 V DC
	0 bis 500 Ω	18 bis 30 V DC
Betrieb mit HART®-Kommunikation	230 bis 270 Ω	bei 13 V DC
	Linearer Anstieg mit der Versorgungsspannung von: 230 bis 270 Ω bei 11 V auf 230 bis 500 Ω bei 16 V	11 bis 16 V DC
	230 bis 500 Ω	18 bis 30 V DC
HART®-Multidrop-Betrieb	230 bis 500 Ω	10 bis 30 V DC

Bei Einsatz gemäß Messtechnischer Eignungsprüfung nach EN IEC 62990-1, EN IEC 60079-29-1 oder EN 50104 darf der Widerstand 300 Ohm nicht überschreiten. Weitere Informationen zur Installation der Feldbus-Schnittstelle sind dem Dokument 9033783 zu entnehmen.

16.3 Kabeleigenschaften

Bei Installation ohne Rohrleitung geschirmte Kabel verwenden.

Analoger Anschluss und HART®-Anschluss mit Auswerteeinheit und Spannungsversorgung	
Spannungsversorgung und Signale	3-adriges geschirmtes Kabel 24 - 12 AWG / 0,2 - 2,5 mm²
Relais	20 - 12 AWG / 0,5 - 2,5 mm²

Digitale Verbindung mit Auswerteeinheit	
Geräte mit Feldbus-Schnittstellen und abgesetzten Sensoren müssen mit geschirmten Kabeln installiert werden.	
Modbus RTU	2-adrig oder 3-adrig[1], ≥ 26 AWG

Digitale Verbindung mit Auswerteeinheit	
PROFIBUS PA Foundation Fieldbus	2-adrig, Kabeltyp A Wellenwiderstand R_W: 135 - 165 Ω Kapazität / Längeneinheit C‘: < 30 pF/m Schleifenwiderstand R‘: 110 Ω/km Aderdurchmesser d: 0,64 mm Aderquerschnitt q: > 0,34 mm² Geflechtschirm: ≥ 90 %
Spannungsversorgung	2-adrig, 24 - 12 AWG / 0,2 - 2,5 mm²

1) Wenn der Weg zwischen Auswerteeinheit und Transmitter sehr lang ist (>1 km) und die Spannungsversorgung von Auswerteeinheit und Transmitters getrennt ist, können Störungen oder Differentialunterschiede entstehen. In diesem Fall sollte die 3-adrige Verkabelung mit Ground gewählt werden. Ground wird dann am Transmitter angeschlossen und zum Ground der Auswerteeinheit durchgeschleift.

16.4 Spannungsversorgung und Relais

Relais-Auslegung[1] SPDT[2]	
230 V ~	0,1 A - 5 A
30 V ⎓, ohmsche Last	0,1 A (Minimum) - 5 A

1) Bei sicherheitsrelevanten Anwendungen (SIL 2) reduziert sich die maximale Schaltleistung (siehe Polytron® 8xx0 Safety Manual).
2) Einpoliger Umschalter (Wechsel elektrischer Kontakte)

Spannungsversorgung Polytron 8xx0	
Betriebsspannung	10[1] bis 30 V⎓ am Gerät
Einschaltstrom	2,3 A für 2 ms bei 24 V⎓,10-Ω-Widerstand

1) Bei einer Versorgungsspannung von <9,5 V DC gibt das Gerät ein Fehlersignal aus.

Betriebsstrom	
Polytron® 8100 EC	
ohne Relais, kein abgesetzter Sensor	80 mA
mit Relais, abgesetzter Sensor	100 mA
Polytron® 8200 CAT	
ohne Relais, kein abgesetzter Sensor	105 mA (DrägerSensor DQ) 130 mA (DrägerSensor LC)
mit Relais, abgesetzter Sensor	145 mA (DrägerSensor DQ) 165 mA (DrägerSensor LC)
Polytron® 8310 IR	
ohne Relais, kein abgesetzter Sensor	145 mA
mit Relais, abgesetzter Sensor	185 mA
Polytron® 87x0 IR	
ohne Relais, kein abgesetzter Sensor	330 mA
mit Relais, abgesetzter Sensor	350 mA

16.5 Allgemeine Spezifikationen

Gehäuse Polytron 8xx0	
Gehäusematerial	kupferfreies Aluminium
Gehäuseschutz	NEMA 4X[1)] IP 65/66/67[2)]
Display	Auflösung 128 x 64 Pixel, hinterleuchtet[3)]

1) Polytron 8100 EC NEMA 4X-Gehäuseschutz ausstehend.
2) Die IP-Schutzarten beinhalten nicht, dass die Ausrüstung ein Gas nachweist, während oder nachdem sie diesen Bedingungen ausgesetzt war. Im Falle von Staubablagerungen und dem Kontakt mit Wasser durch Eintauchen oder einen Wasserstrahl die Justierung und die Funktionstüchtigkeit des Geräts überprüfen.
3) Bei hohen Temperaturen (>65 °C) ist das Display nur eingeschränkt ablesbar.

16.6 Umgebungsparameter

Weitere Sensorspezifikationen und Einflüsse sind der Gebrauchsanweisung des jeweiligen Sensors zu entnehmen.

Die Werte für Zubehörteile und Ersatzteile können von den hier genannten Werten abweichen. Genaue Werte sind der entsprechenden Anleitung zu entnehmen.

Polytron 8xx0	
Werte gemäß Explosionsschutzprüfung	
während des Betriebs:	
Druck	23,6 bis 32,5 in. Hg (800 bis 1100 hPa)
Feuchte	0 bis 100 % r. F., nicht kondensierend
Temperaturen	
Polytron 8100 EC	-40 bis +70 °C (-40 bis +158 °F)
Polytron 8200 CAT	-40 bis +80 °C (-40 bis +176 °F)
Polytron 8310 IR	-40 bis +65 °C (-40 bis +149 °F)
Polytron 87x0 IR	-40 bis +80 °C (-40 bis +176 °F)
Werte gemäß messtechnischem Gutachten	
während des Betriebs:	
Druck	20,7 bis 38,4 in. Hg (700 bis 1300 hPa)[1)]
Feuchte	0 bis 95 % r. F., nicht kondensierend
Temperaturen	
Polytron 8100 EC[2)]	-40 bis +65 °C (-40 bis +149 °F)
Polytron 8200 CAT	-40 bis +80 °C (-40 bis +176 °F)
Polytron 8310 IR	-40 bis +65 °C (-40 bis +149 °F)
Polytron 87x0 IR	-40 bis +77 °C (-40 bis +170 °F)
während der Lagerung:	
Druck	26,5 bis 32,4 in. Hg (900 bis 1100 hPa)
Feuchte	0 bis 100 % r. F., nicht kondensierend
Temperatur	-20 bis +65 °C (-4 bis +149 °F)
empfohlene Lagerdauer	5 Jahre
Werte für Relais-Option und Installationen mit UL-Zulassung	
während des Betriebs:	
Temperaturen	
Polytron 8200 CAT	-40 bis +70 °C (-40 bis +158 °F)
Polytron 87x0 IR	-40 bis +70 °C (-40 bis +158 °F)

1) Polytron 8200 CAT: 23,6 bis 35,44 in. Hg (800 bis 1200 hPa)
2) Siehe 18.3, 18.3.2 und Gebrauchsanweisung des EC-Sensors für die Einschränkungen der maximalen Spezifikation.

16.7 Anzugsdrehmomente

Gerätegewinde	
Gehäuseabdeckung	≥44 in-lbs / ≥5 Nm
Sensor	min. 266 in-lbs / min. 30 Nm
Blindstopfen	min. 266 in-lbs / min. 30 Nm
Anschlüsse (für Rohrleitungen oder Kabelverschraubungen)	min. 443 in-lbs / min. 50 Nm
Blindstopfen für Docking Station	62 in-lbs / 7 Nm
Kabeldurchführungen für Docking-Station	70 in-lbs / 8 Nm
abgesetzter EC-Messkopf	177 in-lbs ±9 in-lbs / 20 Nm ±1 Nm

Feldverdrahtungsklemmen	
Spannungsversorgung, Signale und Relais	4,4 - 7,0 in-lbs / 0,5 - 0,8 Nm
Erdungsschraube	10,6 in-lbs / 1,2 Nm

17 Zubehör und Ersatzteile

Dieses Kapitel enthält einen Überblick über die Komponenten, die durch die BVS 13 ATEX G 001 X- und PFG 14 G 001 X-Baumusterprüfung abgedeckt sind. Weitere Teile sind in der Ersatzteilliste aufgeführt oder über den DrägerService zu erfragen.

17.1 Polytron® 8xx0

Beschreibung	Sachnummer
IRDA zu PC-Schnittstelle	4544197
Magnetstab mit Schlüsselanhänger	4544101
Dräger PolySoft, Konfigurationssoftware	8328600 / 8328639
EXd Blindstopfen, Edelstahl, 2 St.	4544897
EXd Blindstopfen, verzinkter Stahl, 3 St.	8344041

17.1.1 Docking Station

Beschreibung	Sachnummer
Docking Station, Version nur Spannung	8344027
Docking Station Spannung, Relais (enthält 2 Kabelverschraubungen)	8344028
Docking Station, Feldbus	8344029
Kabelverschraubung Docking Station	6812868
Docking Station, Blindstopfen	8344042

17.2 Polytron® 8100 EC

Beschreibung	Sachnummer
Leiterplatteneinheit Polytron 8100 4-20/HART	4544781
Leiterplatteneinheit Polytron 8100 4-20/HART, Relais	4544782
Bajonettring	4544366
Bajonettring für Dräger SensorAlive	6800132
Lüftungskanaladapter für abgesetzten EC-Messkopf[1)]	8317617
Stangenbefestigung für abgesetzten EC-Messkopf	4544213
Sensortestdongle	8317619
Diagnosedongle	8317860
Kalibrieradapter	6810536

1) Kann Einfluss auf die Messleistung haben, z. B. die Ansprechzeit vergrößern. Wird nicht durch BVS 13 ATEX G 001 X und PFG 14 G 001 X abgedeckt.

17.3 Polytron® 8200 CAT

Beschreibung	Sachnummer
Leiterplatteneinheit Polytron 8200 4-20/HART	4544788
Leiterplatteneinheit Polytron 8200 4-20/HART Relais	4544789
Justieradapter PE, Europa	6806978
Fernkalibrieradapter DQ	6812480
Fernkalibrieradapter LC[1)]	6812482
E-Set Membrane 21,50x14,50, 2 Stück	8326840
Staubfilter für DrägerSensor DQ, 10 Stück	6810537
Prozessadapter DQ	6812470
Prozessadapter LC[1)]	6812465
Spritzschutz	6812510

1) nicht durch das Messtechnische Gutachten abgedeckt.

17.3.1 CAT-Sensoren

Beschreibung	Sachnummer
DrägerSensor DQ NPT	6814150
DrägerSensor DQ NPT S[1)]	3701800
DrägerSensor LC NPT	6810675
Messkopf, Polytron SE Ex PR M1 DQ	6812711
Messkopf, Polytron SE Ex PR M2 DQ	6812710
Messkopf, Polytron SE Ex HT M DQ	6812720
Abgesetzter Sensor DQ NPT Alu	3706933
Abgesetzter Sensor DQ NPT Stahl	3706934

1) Der DrägerSensor DQ NPT S kann auch anstelle des DrägerSensor DQ NPT verwendet werden.

17.4 Polytron® 8310 IR

Beschreibung	Sachnummer
Spritzschutz	6810796
Prozessadapter	6811330
Schutzlabyrinth	6811135
Kalibrieradapter	6810859
Leiterplatteneinheit Polytron 8310 4-20/HART	4544788
Leiterplatteneinheit Polytron 8310 4-20/HART Relais	4544789

17.4.1 DSIR-Sensoren

Beschreibung	Sachnummer
DrägerSensor IR NPT	6811901
Messkopf, DrägerSensor IR Komplettsatz e	6811165
Messkopf, DrägerSensor IR Komplettsatz e2	6811265

17.5 Polytron® 87x0 IR

Beschreibung	Sachnummer
Leiterplatteneinheit Polytron 87x0 4-20/HART[1)]	4544795
Leiterplatteneinheit Polytron 87x0 4-20/HART Relais[1)]	4544796
Befestigungsset PIR 7000	6811648
Prozessküvette PIR 7000, Edelstahl	6811415
Prozessküvette PIR 7000 SGR	6813219
Statusanzeige PIR 7000 / 7200	6811625 / 6811920
Spritzschutz PIR 7000 / 7200	6811911 / 6811912
Flowcell PIR 7000 / 7200	6811490 / 6811910
Ferntestadapter PIR 7000 / 7200	6811630 / 6811930
Insektenschutz PIR 7000	6811609
Hydrophobes Filter PIR 7000	6811890
Kalibrieradapter PIR 7000	6811610
Prozessadapter PIR 7000 / 7200 POM (Polyoxymethylen)	6811915
Montageset PIR 7000	6811648
Klemmenkasten Ex e	6811989
Klemmenkasten Ex d	4520561
Magnetstab	4544101

1) Die Kompatibilität der Firmware von Sensor und Gasmessgerät prüfen. Der Wechsel der Leiterplatteneinheit erfordert möglicherweise eine Firmware-Aktualisierung. Zur Unterstützung Dräger kontaktieren.

17.5.1 Sensoren

Die Kompatibilität der Firmware von Sensor und Gasmessgerät prüfen. Der Wechsel des Sensors erfordert möglicherweise eine Firmware-Aktualisierung. Zur Unterstützung Dräger kontaktieren.

Beschreibung	Sachnummer
Dräger PIR 7000 Typ 334 (NPT)	6811822
Dräger PIR 7000 Typ 340 (NPT)	6811832
Dräger PIR 7000 334 (M25) Komplettsatz	6811825
Dräger PIR 7000 340 (M25) Komplettsatz	6811819
Dräger PIR 7200 (NPT)	6811572
Dräger PIR 7200 (M25) HART Komplettsatz	6812290

18 Messtechnisches Gutachten

In Kombination mit bestimmten Sensoren hat Polytron 8xx0 ein messtechnisches Gutachten gemäß folgender Normen:

– EU- und Baumusterprüfbescheinigungen nach EN 60079-29-1, EN 50104, EN 45544 und DIN IEC 62990-1. Ausgestellt durch DEKRA Testing and Certification GmbH, Handwerkstr. 15, D-70565 Stuttgart.
– FM Messtechnisches Gutachten nach ANSI/ISA-92.00.01 FM6340

Weitere Informationen zu den Spezifikationen und Einschränkungen der Sensoren (z. B. Messgrundlagen, Leistung, Querempfindlichkeit) siehe Gebrauchsanweisung des jeweiligen Sensors.

18.1 EU-Prüfbescheinigung, BVS 13 ATEX G 001 X

Messung von mit Luft vermischten brennbaren Gasen und Dämpfen.

– Polytron 8200 CAT mit DrägerSensor DQ

  Besondere Bedingungen:

  - Bei Anströmung mit messgashaltiger Luft können um bis zu 32% erhöhte Messwerte auftreten.
  - Bei Betrieb mit dem Fernkalibrieradapter DQ können um bis zu 70% erhöhte Messwerte auftreten.

– Polytron 8200 CAT mit DrägerSensor LC
  Zugelassen mit 10 %UEG Messbereichsendwert.
  Es ist eine Verbindung zu einer Auswerteeinheit mit zugelassener Messfunktion (z. B. REGARD® 7000) erforderlich. Selbsthaltende Alarme für Messwerte mit Messbereichsüberschreitung müssen an der Auswerteeinheit aktiviert sein.
– Polytron 8310 IR mit DrägerSensor IR
– Polytron 8700 IR mit PIR 7000 Typ 334 und 340

Messung von Sauerstoff (Inertisierung)

– Polytron 8100 EC mit DrägerSensor O_2 (6809720) und DrägerSensor O_2 LS (6809630) innerhalb eines Messbereichs von 0-5...25 Vol% O_2.

Zugelassen sind:

– 4-20-mA-Schnittstelle
– Relaismodul
– Abgesetzter Sensor
– HART
– Werksseitige Standard-Messbereichsendwerte

Nicht zugelassen sind Feldbus-Schnittstelle und Datenlogger.

18.2 Prüfbescheinigung, PFG 14 G 001 X

Messung von Sauerstoff (Sauerstoffmangel und -überschuss)

– Polytron 8100 EC mit DrägerSensor O_2 (6809720) und DrägerSensor O_2 LS (6809630) innerhalb eines Messbereichs von 0-25 Vol% O_2.

Messung von Schwefelwasserstoff

– Polytron 8100 EC mit Dräger SensorAlive (6809630) innerhalb der folgenden Messbereiche:
  - 0,5 - 100 ppm (Typ HM)
  - 0 - 100 ppm (Typ SM)

Messung von Kohlenstoffdioxid

– Polytron 8720 IR mit PIR 7200 innerhalb der folgenden Messbereiche:
  - 1 Vol% und 10 Vol% – EN 45544-2
  - 2000 ppm, 1 Vol% und 10 Vol% – EN 45544-3

Zugelassen sind:

– 4-20-mA-Schnittstelle
– Relaismodul
– Abgesetzter Sensor

Nicht zugelassen sind:

– Feldbus-Schnittstelle
– Datenlogger
– nur Polytron 8100 EC mit Dräger SensorAlive: Selbsttest-Funktionalität bei Betrieb des Gasgenerators

18.3 Zertifizierte Betriebsbedingungen DrägerSensor O_2, O_2LS und Dräger SensorAlive

Querempfindlichkeiten

Es sind keine Querempfindlichkeiten gegenüber Störgasen mit einer Konzentration von bis zu 100 ppm bekannt. Weitere Informationen erhalten Sie von Dräger.

18.3.1 DrägerSensor O_2 (6809720)

Der DrägerSensor O_2 (6809720) ist ein elektrochemischer 2-Elektrodensensor zur Messung von Sauerstoff (O_2) in der Umgebungsluft.

Umgebungsparameter	
Druck	20,7 bis 38,4 in. Hg (700 bis 1300 hPa)
Feuchte	10 bis 95 % r. F., nicht kondensierend
Temperatur	Bei Anwendung der EN 50104 ist der Temperaturbereich auf 0° C bis +55 °C eingeschränkt.

Lagerung	
Druck	kein Einfluss
Feuchte	30 bis 70 % r. F., nicht kondensierend (nur relevant, wenn Sensorverpackung offen ist)
Temperatur	0 bis +40 °C
Zeit	Die Lagerung von Sensoren ist nicht vorgesehen. Gelieferte Sensoren sollten sofort in Betrieb genommen werden. Verbleibende Lebensdauer = Erwartete Lebensdauer - Lagerzeit

Einfluss von Umgebungsparametern	Nullpunkt	Empfindlichkeit[1)]
Temperatur[2)3)]		
0 bis 55 °C	≤ 0,3 Vol% O_2	≤ 0,9 Vol% O_2
Druck	< ± 0,2 Vol% O_2	Relative Abweichung von der Anzeige bei 1013 hPa: < 10 % des Messwertes / 100 hPa
Feuchte	Kein Einfluss	Relative Abweichung von der Anzeige bei 50 % r. F.: < 1 % des Messwertes

1) Die relative Abweichung des Anzeigewerts wird durch Schwankungen des atmosphärischen Drucks verursacht.
2) Bei Temperaturen unter -5 °C ist die Messabweichung höher als in EN 50104 angegeben.
3) Für Betriebstemperaturen außerhalb von -5 °C bis 40 °C muss eine Justierung bei Betriebstemperatur durchgeführt werden.

Ansprechzeit[1)]	$t_{0...20}$	$t_{0...90}$
0-5 Vol% O_2	≤ 15 Sekunden[2)]	≤ 33 Sekunden
0-25 Vol% O_2	≤ 10 Sekunden	≤ 26 Sekunden

1) Bei Temperaturen unterhalb von -5 °C kann sich die Ansprechzeit erhöhen.
2) Die Ansprechzeit liegt über dem gemäß EN 50104 zulässigen Grenzwert.

Stabilisierungszeit: 5 x $t_{0...90}$

Messbereich

0-5 Vol% O_2 bis 0-100 Vol% O_2

Standardwert: 25 Vol% O_2 Minimalwert: -1,25 Vol% O_2

Einlaufzeit des Sensors

Betrieb: < 20 Minuten / Justierung: ≤ 2 Stunden

18.3.2 DrägerSensor O_2LS (6809630)

Der DrägerSensor O_2LS (6809630) ist ein elektrochemischer 3-Elektrodensensor zur Messung von Sauerstoff (O_2) in der Umgebungsluft.

Umgebungsparameter	
Druck	20,7 bis 38,4 in. Hg (700 bis 1300 hPa)
Feuchte	5 bis 95 % r. F., nicht kondensierend
Temperatur	-40 bis +60 °C kurzzeitig +65 °C

Lagerung	
Druck	kein Einfluss
Feuchte	30 bis 70 % r. F., nicht kondensierend (nur relevant, wenn Sensorverpackung offen ist)
Temperatur	0 bis +40 °C
Zeit	Die Lagerung von Sensoren ist nicht vorgesehen. Gelieferte Sensoren sollten sofort in Betrieb genommen werden. Verbleibende Lebensdauer = Erwartete Lebensdauer - Lagerzeit

Einfluss von Umgebungsparametern	Nullpunkt	Empfindlichkeit
Temperatur		
-20 bis 40 °C	≤ 0,1 Vol% O_2	≤ 0,1 Vol% O_2
-40 bis 65 °C	≤ 0,2 Vol% O_2	≤ 0,5 Vol% O_2
Druck	< ± 0,1 Vol% O_2	≤ 0,8 Vol% O_2
Feuchte	≤ 0,1 Vol% O_2	≤ 0,9 Vol% O_2

Bei der Messung von Sauerstoff in Gegenwart von Helium kann die Heliumkompensation verwendet werden. Die optionale Heliumkompensation ist keine zertifizierte Messfunktion nach EN 50104.

⚠ VORSICHT

Sensorfehler

Wird der Sensor über einen längeren Zeitraum höheren Konzentrationen an ungesättigten Kohlenwasserstoffen, Alkoholen oder Wasserstoff ausgesetzt (Dosierung ca. 100.000 ppm x Stunden), kann dies zum Ausfall des Geräts führen.

► Stellen Sie sicher, dass der Sensor solchen Konzentrationen nicht über einen längeren Zeitraum ausgesetzt wird.

Ansprechzeit		
	$t_{0...20}$	$t_{0...90}$
0-5 Vol% O_2	≤ 14 Sekunden[1)]	≤ 45 Sekunden
0-25 Vol% O_2	≤ 10 Sekunden	≤ 27 Sekunden

1) Die Ansprechzeit liegt über dem gemäß EN 50104 zulässigen Grenzwert.

Stabilisierungszeit: 5 x $t_{0...90}$

Messbereich

0-5...25 Vol% O_2, 0-25 Vol% O_2

Standardwert: 25 Vol% O_2

Minimalwert: -1,25 Vol% O_2

Einlaufzeit des Sensors

Betrieb: ≤ 20 Minuten / Justierung: ≤ 6 Stunden

18.3.3 Dräger SensorAlive (6814014)

Der Dräger SensorAlive (6814014) ist ein elektrochemischer Diffusionssensor mit integriertem Gasgenerator zur Messung von Schwefelwasserstoff (H_2S) in der Umgebungsluft.

Umgebungsparameter	
Druck	20,7 bis 35,5 in. Hg (700 bis 1200 hPa)
Feuchte	5 bis 95 % r. F., nicht kondensierend
Temperatur	-40 bis +65 °C
maximale Strömungsgeschwindigkeit der Umgebungsluft	6 m/s

Lagerung	
Druck	kein Einfluss
Feuchte	30 bis 70 % r. F., nicht kondensierend (nur relevant, wenn Sensorverpackung offen ist)
Temperatur	0 bis +40 °C
Zeit	Die Lagerung von Sensoren ist nicht vorgesehen. Gelieferte Sensoren sollten sofort in Betrieb genommen werden. Verbleibende Lebensdauer = Erwartete Lebensdauer - Lagerzeit

Einfluss von Umgebungsparametern	
	Relative Abweichung von der Anzeige
Druck	bei 1000 hPa: ≤ 0,15 ppm
Feuchte (bei +40 °C)	bei 0 und 95 % r. F.: ≤ 0,29 ppm
Temperatur	bei 20 °C: ≤ 0,44 ppm

ℹ Interferenzgase (z. B. NH_3) können die Funktion des Sensors beeinträchtigen.

Ansprechzeiten im Diffusionsbetrieb	
t(50)	≤ 20 s
t(90)	≤ 55 s

Abklingzeiten im Diffusionsbetrieb	
t(50)	≤ 20 s
t(10)	≤ 55 s

18.4 FM-Messtechnisches Gutachten für DrägerSensor H_2S und H_2S LC

DrägerSensor H_2S und H_2S LC sind elektrochemische Diffusionssensoren, die Schwefelwasserstoff (H_2S) in Umgebungsluft messen.

DrägerSensor H_2S (6810435)	
Untersuchungsart P8100	ETR 0400, 0401, 0500, 0501
Schnittstelle[1)]	4-20 mA, Relais
Umgebungsparameter	
Feuchte	5 bis 95 % r. F., nicht kondensierend
Temperatur	-40/+65 °C (-40/149 °F)
Lagertemperatur	0/+40 °C (32/104 °F)
Gehäuseschutz [2)]	IP 65/66/67
Bereich	0-100 ppm
Genauigkeit (je nachdem was größer ist)	Messunsicherheit (des Messwertes) ≤ ±3 % oder mindestens ≤ ±0,5 ppm
Zubehör	
Staubfilter	6809595
Adapterkit	6810536
Standard	ANSI/ISA-92.00.01FM6340

1) HART-Kommunikation darf nicht für sicherheitsrelevante Kommunikation verwendet werden.
2) Nach Untertauchen und Wasserstrahlen muss der Sensor ausgetauscht werden.

DrägerSensor H_2S LC (6809610)	
Untersuchungsart P8100	ETR 0400, 0401, 0500, 0501
Schnittstelle[1)]	4-20 mA, Relais
Umgebungsparameter	
Feuchte	5 bis 95 % r. F., nicht kondensierend
Temperatur	-20/+65 °C (-4/149 °F)
Lagertemperatur	0/+40 °C (32/104 °F)
Gehäuseschutz [2)]	IP 65/66/67
Bereich	0-100 ppm
Genauigkeit (je nachdem was größer ist)	Messunsicherheit (des Messwertes) ≤ ±3 % oder mindestens ≤ ±0,5 ppm im Bereich >50 ppm, ±10 % oder ±3 ppm
Zubehör	
Staubfilter	6809595
Adapterkit	6810536
Standard	ANSI/ISA-92.00.01FM6340

1) HART-Kommunikation darf nicht für sicherheitsrelevante Kommunikation verwendet werden.
2) Nach Untertauchen und Wasserstrahlen muss der Sensor ausgetauscht werden.

Sommaire

1 Informations relatives à la sécurité

La dernière édition de cette notice d'utilisation et la version de la notice dans d'autres langues peuvent être téléchargées dans la base de données de la documentation technique (www.draeger.com/ifu). En raison de la mise à jour des produits, Dräger recommande de toujours utiliser la dernière édition de la notice d'utilisation.

1.1 Consignes de sécurité

- Avant d'utiliser cet appareil, veuillez lire attentivement la présente notice d'utilisation et celles des produits correspondants.
- Observer scrupuleusement la notice d'utilisation. L'utilisateur doit comprendre complètement les indications et les exécuter très précisément. Utiliser l'appareil uniquement pour les applications et dans les conditions spécifiées dans ce document.
- Ne pas jeter la notice d'utilisation. Veillez à ce que les utilisateurs conservent et utilisent cette notice de manière adéquate.
- Seul un personnel formé et compétent est autorisé à utiliser ce produit.
- Aviser Dräger en cas du défaut ou d'une panne de tout composant.
- Respecter toutes les lois, règles et réglementations locales et nationales s'appliquant à cet appareil.
- Seul le personnel formé en conséquence peut contrôler, réparer et entretenir ce produit, comme décrit dans cette notice d'utilisation. Les opérations de maintenance qui ne sont pas décrites dans cette notice d'utilisation doivent exclusivement être exécutées par Dräger ou par le personnel spécialisé agréé par Dräger.
- Dräger recommande de souscrire un contrat de service avec Dräger pour tous les travaux de maintenance et de confier toutes les réparations à Dräger.
- Pour la maintenance, n'utiliser que des pièces et accessoires Dräger authentiques. Dans le cas contraire, le bon fonctionnement du produit ne pourrait plus être garanti.
- La maintenance doit être effectuée comme décrit, voir 10 Maintenance.
- N'utiliser le produit que si les risques encourus par l'environnement ont été évalués.
- Avant de connecter cet instrument à d'autres appareils électriques non mentionnés dans la notice d'utilisation, consulter Dräger
- Les instruments ou composants ne doivent pas être modifiés, de quelque manière que ce soit.
- L'utilisation de pièces défectueuses ou incomplètes n'est pas autorisée.
- Toujours observer la réglementation applicable lors des travaux de réparation effectués sur ces instruments ou composants.
- Ne pas ouvrir l’appareil pendant son utilisation.
- Respecter les dispositions correspondantes lors de la maintenance de ces appareils ou de ces composants.
- Observer les instructions indiquées dans EN 60079-29-2 relatives à la mesure des gaz inflammables et de l’oxygène.
- Observer les instructions indiquées dans EN 45544-4 relatives à la mesure des gaz toxiques.

Polytron® 8100 spécifique EC :

- **AVERTISSEMENT** : Risque d'incendie dans les atmosphères inflammables ou explosives ! Le remplacement de composants peut entraver la sécurité intrinsèque.

1.2 Domaine d’application et conditions d’utilisation

- Pour les applications SIL, tenir compte du manuel de sécurité du Dräger Polytron® 8xx0.
- Valable uniquement pour Polytron 8200 CAT : L’exposition à un flux d’air direct mélangé avec du gaz peut entraîner une augmentation des valeurs mesurées. Pour les valeurs différentes, voir la notice d’utilisation du capteur correspondant.
- Tenir compte des indications et restrictions des notices d’utilisation des capteurs utilisés.
- **ATTENTION** Risque d'incendie dans les atmosphères inflammables ou explosives ! Non testé dans les atmosphères enrichies en oxygène (>21 % d'O_2).
- **Utilisation du produit dans les environnements à risque d'explosion :** Les instruments ou les composants stipulés pour une utilisation dans des zones à risque d'explosion et ayant été testés et homologués selon les règlements nationaux, européens ou internationaux de protection contre les explosions peuvent seulement être utilisés dans les conditions spécifiées dans l'attestation et dans le respect des dispositions légales pertinentes.

Zones de danger, classées en sections :

- L’appareil est prévu pour être utilisé dans des zones de danger classées zone 1 ou zone 2, pouvant contenir des gaz des groupes d’explosion IIA, IIB ou IIC et des classes de températures T4 ou T6. Les classes de température dépendent de la température ambiante maximale. L’appareil ne doit pas être utilisé à la température ambiante si celle-ci est en-dehors de la plage indiquée sur l'appareil.
- L’appareil est prévu pour être utilisé dans les zones de danger 21 ou 22 pouvant contenir des poussières des groupes d’explosion IIIA, IIIB ou IIIC et des températures de poussière de T80 °C ou T130 °C (T135 °C pour Polytron 5100 EC et Polytron 8100 EC). Les températures de poussière dépendent de la température ambiante maximale. L’appareil ne doit pas être utilisé à la température ambiante si celle-ci est en-dehors de la plage indiquée sur l'appareil.

Zones de danger, classées par divisions :

– L'appareil est prévu pour être utilisé dans des zones de danger de classe I, Div. 1 ou Div. 2, pouvant contenir des gaz des groupes A, B, C, D et des classes de températures T4 ou T6. Les classes de température dépendent de la température ambiante maximale. L'appareil ne doit pas être utilisé à la température ambiante si celle-ci est en-dehors de la plage indiquée sur l'appareil.
– L'appareil est prévu pour être utilisé dans des zones de danger de classe II, Div. 1 ou Div. 2, pouvant contenir des poussières des groupes E, F, G. L'appareil ne doit pas être utilisé à la température ambiante si celle-ci est en-dehors de la plage indiquée sur l'appareil.

2 Conventions utilisées dans ce document

2.1 Signification des avertissements

Les avertissements suivants sont utilisés dans ce document ; ils signalent à l'utilisateur des dangers potentiels. Les avertissements sont définis comme suit :

Symbole d'avertissement	Mention d'avertissement	Classification de l'avertissement
⚠	AVERTISSEMENT	Indique une situation dangereuse potentielle. Si elle n'est pas évitée, elle peut entraîner de graves blessures ou la mort.
⚠	ATTENTION	Indique une situation dangereuse potentielle. Si elle n'est pas évitée, elle peut entraîner des blessures physiques. Peut également signaler des pratiques à risque.
	REMARQUE	Indique une situation dangereuse potentielle. Si elle n'est pas évitée, elle peut entraîner des dommages produits ou environnementaux.

2.2 Marques

Marque	Propriétaire de la marque
PROFIBUS®	PROFIBUS Nutzerorganisation e. V.
HART®	HART Communication Foundation
Polytron®	Dräger Safety AG & Co. KGaA
DrägerSensor®	Dräger Safety AG & Co. KGaA

Vous trouverez sur la page internet suivante les pays dans lesquels les marques de Dräger sont déposées : www.draeger.com/trademarks.

F 2	Polytron 8710 IR sans protection anti-éclaboussures

3.2 Description du fonctionnement

La série Polytron 8000 comprend les variantes d'appareils suivantes :

– Polytron 8100 EC, fonctionne avec des capteurs électrochimiques (capteurs EC).
– Polytron 8200 CAT, fonctionne avec des capteurs Ex catalytiques (capteurs CatEx//capteurs catalytiques, capteurs Dräger DQ ou LC).
– Polytron 8310 IR, fonctionne avec des capteurs Ex à infrarouge (capteurs IREx).
– Polytron 8700 IR, fonctionne avec des capteurs à infrarouge (capteurs PIR 7000).
– Polytron 8720 IR, fonctionne avec des capteurs à infrarouge (capteurs PIR 7200).

Interfaces disponibles :

– 4 à 20 mA analogique (recommandation NAMUR NE43)
– Plaque de relais
– Signal de sortie numérique HART
– Foundation Fieldbus[1)]
– PROFIBUS PA[1)]
– Modbus RTU[1)]

Si l’interface 4 à 20 mA est utilisée, surveiller l’intensité électrique entre 0 et 3,5 mA. Des intensités électriques entre 0 et 3,5 mA peuvent indiquer un statut spécial (Voir "Statuts spéciaux", page 109).

Si une plaque de relais est utilisée, des dispositifs d’alarme peuvent être activés localement. Si aucune plaque de relais n’est utilisée, une alarme n’entraîne que le clignotement de la LED rouge de l’appareil.

Les concentrations de gaz, les informations d'état et le menu déroulant sont affichés sur un écran LCD rétroéclairé et 3 LED de couleur.

Pour naviguer à l’intérieur du menu, appuyer sur la touche correspondante de la vitre du couvercle du boîtier en verre avec une baguette magnétique. L’appareil peut être configuré, ajusté et entretenu de manière non intrusive sans avoir besoin de déclasser la zone.

Les appareils livrés sont dotés d'un enregistreur de données. Il peut conserver jusqu’à 35 000 valeurs. Avec un intervalle d’échantillonnage d’une mesure par minute, l’enregistreur conserve l’historique des mesures d’environ 24 jours. Cette durée peut être considérablement prolongée si la fonction Trigger est activée. Le dispositif peut uniquement être téléchargé avec le logiciel PC PolySoft. La lecture génère un fichier .ofb et un fichier .txt. Le fichier .txt contient les informations de l’enregistreur de données sous une forme lisible.

Les appareils peuvent être connectés à une centrale de commande Dräger ou à un automate programmable industriel (API) avec une conduite scellée ou un presse-étoupe agréé.

Les appareils peuvent être utilisés comme source ou réception de courant si l’alimentation électrique est fournie par la centrale de commande. Si les appareils sont connectés à une alimentation électrique séparée, ils ne peuvent être utilisés que comme source de courant.

Le boîtier des appareils en acier inoxydable robuste ou en aluminium convient aux applications intérieures et extérieures.

Les appareils sont conçus pour une installation fixe. Versions disponibles :

– Appareil antidéflagrant (Ex d)
  Le boîtier antidéflagrant encapsulé étanche à la pression présente trois raccords avec filetage NPT ¾" pour le câblage de terrain, la connexion directe d'un capteur ou le câblage d’un capteur déporté.
– Appareil à sécurité renforcée (Ex e)
  La sécurité de l’appareil est renforcée par un bornier (station d'accueil) comprenant jusqu’à quatre raccords 20 mm pour le câblage de terrain ou d’un capteur déporté. Si le presse-étoupe de Dräger est utilisé, le diamètre de câble autorisé est de 7 à 12 mm.

Dongles disponibles pour le Polytron 8100 EC :

Dongle de test capteur	Active l’autotest du capteur (incompatible avec le capteur d'hydrazine 6810180)
Dongle Diagnostics	Active l’auto-test, l’affichage de la vitalité et les fonctions de diagnostic du capteur (incompatible avec le capteur Hydrazine 6810180)

3.3 Domaine d'application

Les appareils de la série Polytron 8000 sont prévus pour la surveillance continue de l’air ambiant.

Avec le module relais intégré en option, l’appareil peut fonctionner sans centrale de commande (avec déclenchement local de l’alarme).

L’appareil peut être connecté à une centrale de commande Dräger ou à un automate programmable industriel (API) avec une conduite scellée ou un presse-étoupe agréé.

Si l’interface 4 à 20 mA est utilisée, l’intensité électrique entre 0 et 3,5 mA doit être surveillée. Des intensités électriques entre 0 et 3,5 mA peuvent indiquer un statut spécial.

Les appareils sont conçus pour une installation fixe et homologués pour une utilisation en zones Ex.

– Le Polytron 8100 EC est un appareil antidéflagrant combiné à sécurité intrinsèque destiné à la surveillance continue des gaz toxiques ou de l’oxygène dans l’air ambiant.
– Le Polytron 8200 CAT avec DrägerSensor catalytique DQ ou LC est un appareil antidéflagrant conçu pour la surveillance continue de gaz et vapeurs combustibles de l’air ambiant contenant des substances hydrocarbures ou non (comme l’hydrogène ou l’ammoniac).
– Le Polytron 8310 IR avec capteur infrarouge DrägerSensor IR est un appareil antidéflagrant destiné à la surveillance continue des gaz et vapeurs inflammables de l’air ambiant contenant des hydrocarbures.
– Le Polytron 8700 IR avec PIR 7000 est un appareil antidéflagrant destiné à la surveillance continue des gaz et vapeurs inflammables de l’air ambiant contenant des hydrocarbures.
– Le Polytron 8720 IR avec PIR 7200 est un appareil antidéflagrant destiné à la surveillance continue du dioxyde de carbone dans l’air ambiant.

3.4 Homologations

3.4.1 ATEX, IECEx, UL, CSA

Un exemple de plaque signalétique est illustré sur la page dépliante. De plus, une image de la plaque signalétique se trouve dans l’emballage d’expédition de l’appareil.

3.4.2 Autres informations

Déclaration de conformité, voir le Complément 4544300 ou www.draeger.com/product-certificates

Vous trouverez de plus amples informations sur les homologations dans le Complément 4544300.

1) Aucun relais n’est disponible avec une interface bus de terrain. L’interface bus de terrain n’est pas conforme à BVS 13 ATEX G 001 X. DrägerSensorAlive n’est pas pris en charge.

4 Installation du transmetteur

4.1 Installation antidéflagrante (Ex d) - sans station d'accueil

4.1.1 Installation mécanique

4.1.1.1 Remarques générales sur l'installation mécanique

– Respecter strictement les règles et réglementations locales, fédérales et nationales relatives à l'installation de systèmes de détection de gaz.
– Tenir compte des données physiques du gaz ou de la vapeur à détecter et des spécificités de l'application, (par ex. fuites possibles, mouvement d'air/courant d'air, etc.).
– Prendre en compte l'utilisation future des accessoires et des équipements de maintenance.
– La libre circulation du gaz ou de la vapeur vers le capteur ne doit pas être entravée.
– L'appareil ne doit pas être exposé à une chaleur radiante entraînant une augmentation de la température supérieure aux limites indiquées (16.6 Paramètres ambiants). L'utilisation d'un blindage écran est recommandée.
– L'entrée de la conduite de l'appareil peut être équipée d'un cache anti-poussière. Ce cache n'est ni antidéflagrant ni étanche à l'eau et doit être retiré avant de connecter l'appareil à une conduite scellée ou d'installer 'un presse-étoupe ignifuge.
– Poser des bouchons sur les ouvertures non utilisées. Les couples de serrage des connexions des conduites, des presse-étoupes, des obturateurs et du capteur sont détaillés ici : 16.7 Couples de serrage.
– Pour les installations hors conduite, utiliser un presse-étoupe agréé (par ex. Hawke A501/421/A/filetage ¾" NPT ou équivalent).
– **AVERTISSEMENT :** pour installations avec conduites seulement : Pour réduire le risque d'incendie dans des atmosphères dangereuses, sceller les premiers 45 cm (18 pouces) de la conduite à partir du boîtier.
– **ATTENTION :** Si le détecteur de gaz est connecté à des centrales de commande, le temps de réponse total peut être différé. La course de mesure complète doit être prise en compte (p. ex. la latence de la centrale de commande). Vérifier que le temps de réponse requis est respecté.

Polytron® 8100 spécifique EC :

– Orientation du capteur recommandée : vers le bas (voir figure C de la page dépliante).

Polytron® 8200 spécifique CAT :

– Orientation du capteur recommandée : vers le bas (voir figure E de la page dépliante). Si l'entrée du capteur est protégée contre les dommages mécaniques et la pénétration de saletés et d'eau, il peut être orienté dans toutes les directions.
– Pour le fonctionnement conformes CSA seulement : L'utilisation de la protection anti-éclaboussures (6812510) en option est obligatoire pour se conformer à l'homologation CSA.

Polytron® 8310 spécifique IR :

– Orientation du capteur recommandée : vers le bas (voir figure E de la page dépliante).

Polytron® 87x0 spécifique IR :

– Respecter l'orientation recommandée du capteur Dräger PIR 7x00 (voir figure F de la page dépliante). Un écart plus important et l'utilisation de la protection anti-éclaboussures préinstallée augmenteront le temps de réponse (voir notice d'utilisation du PIR 7x00).
– Le PIR 7x00 ne peut être orienté autrement que s'il est utilisé sans protection anti-éclaboussures, par exemple pour les applications dans des conduites de ventilation. Installer le capteur verticalement peut augmenter l'accumulation de dépôts sur les surfaces optiques.
– L'utilisation de la protection anti-éclaboussures préinstallée est recommandée pour protéger le capteur de l'eau et de la poussière.
– Lorsque la protection anti-éclaboussures préinstallée (référence de pièce 6811911 ou 6811912) est installée, vérifier que les voyants d'état sont alignés verticalement et que le logo Dräger est à l'horizontal. Un écart maximal de ±30 degrés par rapport à l'horizontale est acceptable.
– Les liquides et dépôts sur les surfaces optiques du PIR 7x00 peuvent entraîner le déclenchement d'un avertissement ou d'un défaut.
– Pour la version antidéflagrante, il est recommandé d'utiliser une entretoise (référence de pièce 6812617) si l'appareil est monté au mur ou sur une surface plane.

Conditions particulières selon la norme EN/IEC 60079-1

– Les filetages pour capsule antidéflagrante/étanche à la pression ne sont pas conformes aux valeurs minimales/maximales de la norme EN/IEC 60079-1. Les filetage ne sont pas prévus pour être modifiés par l'utilisateur.

4.1.1.2 Installation

L'appareil peut être fixé pour mesurer des gaz dans l'air ambiant ou à l'intérieur d'une conduite de ventilation / d'un tuyau.

1. Utiliser des boulons M6 (1/4") avec des vis à tête hexagonale pour monter le boîtier sur l'une des options suivantes.

Option	Accessoires
Montage sur surface plane	Gabarit de perçage : 4544300 Supplément pour Polytron 87x0 IR : entretoise 6812617
Montage sur poteau	Kit de montage sur poteau : 4544198
Montage dans un tube/une conduite de ventilation	Kit de montage sur conduite : 6812725 Pour Polytron® 87x0 IR :: 6812300

4.1.2 Installation électrique

4.1.2.1 Remarques générales sur l’installation mécanique

– Pour les couples de serrage, voir 16.7, pour les spécifications de câble autorisées, voir 16.3.
– Les codes en matière d'électricité régissant la mise en place et la connexion du courant électrique et des câbles de signalisation vers les équipements de surveillance doivent être strictement observés.
– L'utilisation d'embouts est obligatoire.
– Les conducteurs de l'alimentation électrique doivent avoir une résistance suffisamment faible afin de garantir l'alimentation électrique correcte de l'instrument.
– L'isolation du câble doit être dénudée de 5 à 7 mm.
– Le circuit électrique secondaire doit être séparé galvaniquement du circuit du réseau (ne s’applique pas aux circuits des relais).
– En cas d'installation sur des sites dont la température ambiante est supérieure à 55 °C, utiliser uniquement le câblage approprié, spécifié pour une température supérieure d'au moins 25 °C à la température ambiante maximale.
– N’utiliser que des presse-étoupes adaptés à l’application et homologués dans le pays où l’équipement est installé.
– Conformément à la directive européenne 2014/30/UE, cet appareil ne doit pas être raccordé à un réseau d’alimentation en courant continu. Il est recommandé de mettre en place une alimentation électrique propre à l’appareil.

Interface analogique

– Pour garantir un fonctionnement correct de l’appareil, la résistance de la boucle de signaux de 4 à 20 mA ne doit pas dépasser 500 ohms.
  En cas d’utilisation conformément au test d’aptitude métrologique selon EN IEC 62990-1, EN IEC 60079-29-1 ou EN 50104, la résistance ne doit pas dépasser 300 ohms. Pour des valeurs supérieures à 300 ohms, la surveillance de la tension d’alimentation ne peut pas être garantie.
  En fonction de la tension de fonctionnement et de l’application (p. ex. opération HART®), respecter une résistance minimale (Voir "Transmission du signal vers la centrale de commande", page 137).

Option de relais

– Pour les tensions > 30 V CA ou > 42,4 V CA, on recouvrira les lignes de relais avec une gaine de protection ou on utilisera des lignes à double isolation.
– Les câbles de raccord au module de relais en option doivent être sélectionnés et sécurisés en fonction des tensions de mesure, des intensités électriques et des conditions ambiantes.
– Pour garantir la détection des défauts, sans devoir consulter le dispositif, un système d'alarme doit être connecté au relais de défaut.
– Les différences de tension peuvent provoquer des défauts au niveau de l'isolement. Ne pas mélanger différentes charges électriques avec différents types de tension (AC ou DC). Lors de l'utilisation de charges DC, s'assurer que les contacts de relais ne contrôlent que les dispositifs qui partagent la même tension DC. Lors de l'utilisation de charges AC, s'assurer que les contacts de relais ne sont connectés qu'aux dispositifs qui partagent la même phase.

Conditions particulières selon la norme IEC 60664-1

– Les variantes d’appareils qui utilisent à la fois une interface de bus de terrain FISCO et un transmetteur de gaz ETR 02...5** doivent être alimentées par des circuits électriques protégés contre les surtensions de catégorie I/II/III selon la norme IEC 60664-1.

4.1.2.2 Schémas de raccordement

Les schémas de raccordement suivants sont présentés sur les pages dépliantes :

Figure	Schéma de raccordement des appareils
G	Sans relais, mise à la terre du boîtier
H	Avec relais, mise à la terre du boîtier
I1	4-20 mA / HART (source de courant)
I2	4-20 mA / HART (réception de courant)
I3	4-20 mA / HART (alimentation électrique séparée, source de courant)
H1	Autonome, relais uniquement
J	Foundation Fieldbus / PROFIBUS PA, mise à la terre du boîtier
V	Modbus RTU, mise à la terre du boîtier
J1	Foundation Fieldbus / PROFIBUS PA, câblage de terrain
K1	Modbus RTU, câblage de terrain
L	Interfaces numériques de l’alimentation électrique

4.1.2.3 Tableaux de câblage

Interface 4 à 20 mA / HART

Broche	Marquage	Fonction
1	PWR+	V+
2	PWR-	V-
3	PWR-	V- À utiliser lorsque l’appareil est raccordé à une alimentation électrique séparée (fonctionnement comme source).
4	4 à 20 mA	Signal 4 à 20 mA (fonctionnement comme source ou réception)
5	PE	Terre de protection En option pour le raccordement des relais. La raccordement de la terre de protection à une sortie analogique 4 à 20 mA peut causer des boucles de terre.

Interface bus de terrain

Broche	Marquage	Fonction
1	Données A	Acheminement du signal A
2	Données B	Acheminement du signal B
3	GND	Mise à la terre
4	BLINDAGE	Blindage de câble

Broche	Marquage	Fonction
1	PWR+	V+
2	PWR-	V-

Connecteur de relais

ℹ Tous les relais (A1, A2, FLT) de l'appareil peuvent être configurés comme « normalement excités » (relais de courant de repos) ou « excités en cas d'alarme » (relais de courant de travail). En usine, les relais sont configurés comme des relais de courant de repos (« normalement excités »). Ceci garantit une utilisation à « sûreté intégrée ».
Contrairement aux conventions, les marquages NO, COM, NC sur l'appareil sont choisis pour correspondre à un état normalement excité. Lorsque l'appareil est sous tension, le marquage correspond à la fonction des broches.

Broche	Marquage		Relais	
1	NO	FLT	Défaut	Contact de travail (Normally Open)
2	COM		Défaut	Raccordement commun (Common)
3	NC		Défaut	Contact de repos (Normally Closed)
4	NO	A2	A2	Contact de travail (Normally Open)
5	COM		A2	Raccordement commun (Common)
6	NC		A2	Contact de repos (Normally Closed)
7	NO	A1	A1	Contact de travail (Normally Open)
8	COM		A1	Raccordement commun (Common)
9	NC		A1	Contact de repos (Normally Closed)

4.1.2.4 Préparation de l'installation électrique

1. Desserrer la vis de réglage (2) et dévisser le couvercle du boîtier de la partie inférieure du boîtier, voir la figure A de la page dépliante.
2. Sortir la carte de circuit imprimé.
3. Suivre les indications sur la figure comprenant le modèle Polytron® et la sortie de signal, voir la page dépliante.

4.1.2.5 Raccordement de l'appareil avec relais (autonome)

Les câbles des dispositifs d'alarme doivent être connectés au raccord de relais à 9 broches. Une isolation de câble (gaine thermorétractable) et une enveloppe protectrice fournies assurent la protection supplémentaire des câbles du relais.

1. Retirer le connecteur à 5 broches.
2. Connecter les câbles d'alimentation aux bornes correspondantes, voir la figure H1 de la page dépliante.
3. Ponter les broches 3 et 4 du connecteur à 5 broches.
4. Retirer le connecteur à 9 broches.
5. Couper la gaine thermorétractable à la longueur désirée et l'enfiler sur les câbles du relais avant d'insérer le connecteur à 9 broches.
6. Positionner la gaine thermorétractable sur le bord de l'isolation de câble puis utiliser un pistolet à air chaud avec précaution pour la faire se rétracter sur l'isolation du câble.
7. Faire glisser l'enveloppe protectrice sur les câbles.
8. Connecter les câbles des alarmes 1 (pré-alarme), 2 (alarme principale) et de défaut aux bornes, comme indiqué dans le tableau de câblage.
9. Rebrancher le connecteur sur la prise et serrer les vis.
10. Fermer l'appareil, voir 4.1.2.9 Fermeture du détecteur de gaz.

Les tableaux suivants indiquent le statut d'un indicateur d'alarme connecté et s'il indique des défaut (par exemple, une panne de courant sur le détecteur de gaz).

Le comportement du relais dépend de la configuration des alarmes et du contact du relais auquel l'indicateur d'alarme est connecté.

Configuration des relais : Normalement excité

Contact	Statut de l'indicateur d'alarme et indication de défaut par celui-ci		
	Alarme déclenchée	Défaut spécifique au détecteur de gaz	Défaut du câblage de terrain
Contact de repos (Normally Closed)	MARCHE	indiqué	non indiqué
Contact de travail (Normally Open)	ARRÊT	indiqué	indiqué

Configuration des relais : Excité en cas d'alarme

Contact	Statut de l'indicateur d'alarme et indication de défaut par celui-ci		
	Alarme déclenchée	Défaut spécifique au détecteur de gaz	Défaut du câblage de terrain
Contact de repos (Normally Closed)	ARRÊT	non indiqué	indiqué
Contact de travail (Normally Open)	MARCHE	non indiqué	non indiqué

4.1.2.6 Raccordement de l'interface 4-20 mA/HART®

Vous trouverez des informations sur le raccordement à une centrale de commande (API) dans sa documentation.

1. Retirer le connecteur à 5 broches.
2. Raccorder les trois fils pour la tension et le signal à la borne correspondante conformément au tableau de câblage et à l'illustration.
3. Rebrancher le connecteur sur la prise et serrer les vis.
4. Fermer l'appareil, voir 4.1.2.9 Fermeture du détecteur de gaz.

4.1.2.7 Mise à la terre

1. Mettre localement à la terre l'instrument sur la crosse de terre, voir les figures G et H de la page dépliante..
2. Connecter le blindage des câbles uniquement à la prise de terre du système de commande (par ex. le châssis, la barre omnibus de terre, etc.).

ℹ À moins que des mesures spéciales soient prises (p.ex. mise à la terre capacitive), le blindage doit être connecté à l'autre extrémité.

Les documents suivants contiennent de plus amples informations sur la mise à la terre des connexions bus de terrain et Modbus.

Interface	Document
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

4.1.2.8 Connexion de l'interface bus de terrain

1. Retirer le connecteur à 2 et à 4 broches.
2. Connecter les deux câbles électriques et les quatre câbles de signalisation aux bornes correspondantes comme indiqué sur le tableau et la figure.
3. Rebrancher le connecteur sur la prise et serrer les vis.
4. Fermer l'instrument, voir 4.1.2.9 Fermeture du détecteur de gaz.

Pour obtenir de plus amples renseignements concernant l'installation de l'interface bus de terrain, consulter le Manuel technique correspondant.

4.1.2.9 Fermeture du détecteur de gaz

1. Vérifier que les connexions suivantes sont établies correctement :
   a. Les vis de câblage sont serrées avec le bon couple de serrage.
   b. Tous les connecteurs de câble sont sécurisés par des vis.
   c. La pièce de raccordement est branchée.
   d. Le câble de mise à la terre venant du boîtier est connecté à l'œillet de la carte de circuit imprimé, voir les figures G et H de la page dépliante.
2. Mettre la carte de circuit imprimé dans la partie inférieure du boîtier.
3. Visser le couvercle du boîtier sur la partie inférieure du boîtier et serrer au couple correct.
4. Serrer fermement la vis de réglage.

4.2 Installation avec sécurité augmentée (Ex e) - avec station d'accueil

L'installation à sécurité renforcée (Ex e) est décrite dans la notice de montage de la station d'accueil (référence de pièce 9033242).

5 Installation des capteurs ou des têtes de mesure

5.1 Installation du capteur EC sur le Polytron 8100 EC

Voir la figure C de la page dépliante.

1. Desserrer la vis de blocage (2) (vis creuse six pans 2 mm).
2. Dévisser l'anneau à baïonnette (3) et retirer le joint plein.
3. Insérer le capteur (4) dans l'ouverture et le tourner jusqu'à ce qu'il s'enclenche dans le détecteur de gaz. Veiller à ne pas endommager la fiche du capteur.
4. Sécuriser le capteur avec l'anneau à baïonnette (3) correspondant.

ℹ Le Dräger SensorAlive requiert un anneau à baïonnette différent des autres capteurs EC.

5. Serrer la vis de blocage (2) jusqu'à ce que l'anneau à baïonnette ne puisse pas être desserré (obligatoire pour les installations en zone 22).

ℹ Si le Dräger SensorAlive est installé pour la première fois dans une installation, vérifier que la version de son micrologiciel est 4.0.0 ou supérieure. Contacter Dräger en cas de besoin.

5.2 Installation de la tête de mesure

Différentes têtes de mesure sont utilisées en fonction du type de protection contre l'explosion. La notice de chaque tête de mesure comprend des informations sur son installation.

Pour les applications déportées, le blindage du câble doit être posé à la fois du côté du capteur et du côté du transmetteur. La longueur du câble doit être inférieure ou égale à 30 m.

Versions déportées avec protection contre l'explosion « antidéflagrante (Ex d) »

Transmetteur	Références de pièce de la notice d'utilisation de la tête de mesure
Polytron 8100 EC	Tête de mesure EC déportée (9033247)
Polytron 8200 CAT (pour capteurs DQ)	Capteur déporté DQ NPT aluminium, capteur déporté DQ NPT acier (4544286)
Polytron 87x0 IR	PIR 7000 déporté (334) avec boîtier de raccordement du capteur acier inoxydable ou aluminium (4544286)
Polytron 8200 CAT (pour capteurs LC) Polytron 8310 IR Polytron 87x0 IR	Boîtier de raccordement du capteur en acier inoxydable ou aluminium (4544286)

Versions déportées avec protection contre l'explosion « Sécurité renforcée (Ex e) »

Transmetteur	Références de pièce de la notice d'utilisation de la tête de mesure
Polytron 8100 EC	Tête de mesure EC déportée (9033247)
Polytron 8200 CAT	Têtes de mesure Polytron SE Ex (9033888)
Polytron 8310 IR	DrägerSensor IR (9023843)
Polytron 87x0 IR	PIR 7x00 (9023885)

6 Mise en service

6.1 Remarques générales

– Connecter d'abord les fils pour les relais et établir les connexions pour le capteur avant de connecter l'appareil à l'alimentation électrique.
– Avant d'activer le mode de fonctionnement normal de l'appareil, vérifier que les réglages de configuration et d'ajustage sont corrects.

Pour garantir un fonctionnement sûr conformément à BVS 13 ATEX G 001 X et PFG 14 G 001 X, conserver les paramètres d'alarme par défaut de l'appareil suivants.

– Les relais doivent être réglés sur ***Normal actif*** et l'alarme A2 (alarme principale) sur ***Auto-maintien*** et ***Non-acquittable*** ou ***Pre-acquittement***.
– L'alarme A1 (pré-alarme) ne doit être réglée sur ***Acquittable*** que si elle est utilisée pour commander un dispositif d'alarme sonore.
– Verrouillage en cas de dépassement de la plage de mesure (Voir "Configuration du verrouillage du capteur DQ", page 131).

Pour garantir un fonctionnement sûr conformément à BVS 13 ATEX G 001 X et PFG 14 G 001 X, il faut observer les conditions suivantes :

– Polytron 8200 CAT :
  – En cas d'écoulement d'air contenant des gaz de mesure du capteur DQ ou LC, les valeurs mesurées peuvent augmenter jusqu'à 32 %.
  En cas d'utilisation avec l'adaptateur de calibrage à distance DQ, cette augmentation peut aller jusqu'à 70 %.
  – Le transmetteur avec capteur LC doit être utilisé en combinaison avec une unité de contrôle qui signale de manière auto-maintenue un dépassement de la plage de mesure. Ne pas utiliser les relais d'alarme interne du transmetteur.
  – Le transmetteur avec capteur LC doit être ajusté avec celui-ci dans sa position d'utilisation normale.
  – De fausses alarmes peuvent se produire pendant le temps de préchauffage du capteur LC.
– Polytron 8100 EC :
  Le temps de réglage t20 des transmetteurs avec capteur EC peut dépasser la valeur limite de la norme EN 50104 en cas de faibles variations de concentration.

6.2 Mise en service du détecteur de gaz

1. Pour éviter les fausses alertes, désactiver l'alarme du détecteur de gaz (Voir "Activer ou désactiver une alarme", page 124).
2. Mettre l'appareil sous tension.
   ⇒ L'appareil passe par une séquence de démarrage (test LCD/LED, version du logiciel et initialisation).
   ⇒ L'écran indique que le capteur est prêt pour la mesure dans hh:mm:ss (compte à rebours). L'appareil transmet le signal de maintenance. Le relais de défaut est activé.
   ⇒ Le capteur se stabilise. Le signal de maintenance sur l'interface 4 à 20 mA demeure jusqu'à ce que le capteur soit stabilisé. Le temps de stabilisation dépend du capteur et des conditions ambiantes. Temps de stabilisation maximal d'un nouveau capteur : voir sa notice d'utilisation.

3. Contrôler la date et l'heure. Les réglages peuvent être effectués pendant le temps de stabilisation du capteur.
   ⇒ Après le temps de stabilisation du capteur, l'appareil passe en mode de fonctionnement normal. L'écran affiche la concentration de gaz actuelle, l'unité de mesure et, le cas échéant, le gaz sélectionné. La LED verte est allumée.

   Si l'appareil est utilisé avec un Dräger SensorAlive, Dräger recommande de régler correctement la date et l'heure. Lorsque le temps de stabilisation du capteur est écoulée, le temps de démarrage du Dräger SensorAlive commence. Pendant cette phase, le capteur est prêt pour la mesure, mais l'autodiagnostic n'a pas encore lieu.

4. Si nécessaire, ajuster l'appareil.
5. Activer l'alarme du détecteur de gaz (Voir "Activer ou désactiver une alarme", page 124).

7 Fonctionnement

7.1 Panneau de commande

Composants du panneau de commande :
– Touches de navigation dans le menu
– Écran
– LED et symboles correspondants

Les touches de navigation ont des fonctions différentes selon le menu dans lequel vous vous trouvez.

L'appareil est actionné par une baguette magnétique. Pour cela, le couvercle du boîtier doit être placé sur l'appareil. Sinon, la baguette magnétique peut activer deux ou plusieurs touches la fois (activation croisée).

7.2 LED et symboles

Symboles et LED du panneau de commande :

Symbole	LED	Description
	Rouge	Alarme déclenchée
⚠	Jaune	Dysfonctionnement
	Vert	Sous tension

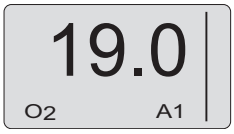
Statut LED
– Lorsque l'alarme A1 (pré-alarme) a été déclenchée, la LED rouge clignote une fois .
– Lorsque l'alarme A2 (alarme principale) a été déclenchée, la LED rouge clignote deux fois .
– Si une alarme a été acquittée avant que la cause n'ait été corrigée, la LED rouge s'allume en continu pour indiquer la présence d'un problème.

7.3 Affichages à l'écran

7.3.1 Tous les appareils

Symbol	Explication
	Message d'erreur actif. Le menu ***Information*** contient de plus amples informations.
	Message d'avertissement actif. Le menu ***Information*** contient de plus amples informations.
	Le signal de maintenance est transmis.
	La valeur maximale de la plage de mesure réglée est dépassée sur l'interface 4 à 20 mA.
	La valeur inférieure de la plage de mesure réglée n'est pas atteinte sur l'interface 4 à 20 mA.
	L'opération HART® est activée. L'interface analogique est réglée sur une valeur fixe et ne transmet aucun signal de mesure.
	Dès que la capacité de l'enregistreur de données est épuisée, les anciennes données sont écrasées par de nouvelles valeurs (fonction « roll »).
	Dès que la capacité de l'enregistreur de données est épuisée, aucune nouvelle valeur n'est enregistrée (fonction « stack »).
SIL	Le mode de fonctionnement SIL est activé.

7.3.2 Symboles spécifiques au Polytron 8100 EC



Symbol	Explication
	Le capteur est opérationnel.
	Le capteur est opérationnel, mais sa durée de vie est pratiquement épuisée.
	Le capteur est encore opérationnel, mais il devrait être remplacé le plus tôt possible. Vitalité <25 %.
LT	Un LifeTest du Dräger SensorAlive est en cours d'exécution.

7.3.3 Mode mesure

Les exemples suivants montrent l'affichage du Polytron 8100 EC.

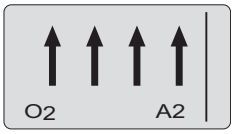
Pour le Polytron 8200 CAT et le Polytron 8310 IR, aucun nom de gaz n'est prédéfini. Les noms de gaz doivent être saisis via le logiciel PC DrägerPolysoft. Si certains paramètres ont été modifiés avec le logiciel PC DrägerPolysoft ou un autre logiciel, relire tous les paramètres à partir du Polytron® 8xx0 ou les vérifier directement sur l'appareil.

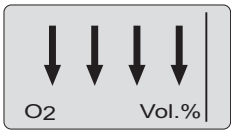
Affichage en mode mesure :

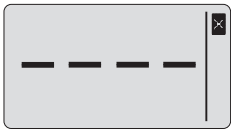
Exemple d'affichage	Description
	En mode normal de fonctionnement, l'affichage montre la concentration de gaz mesurée, le gaz sélectionné et l'unité de mesure. **Interface analogique :** valeur de courant correspondante **Relais :** tous les relais sont à l'état normal
	Dépassement des seuils d'alarme. L'exemple montre la préalarme A1. **Interface analogique :** valeur de courant correspondante **Relais :** le relais A1 est à l'état d'alarme.

7.3.4 Statuts spéciaux

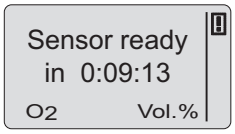
Si l'appareil se trouve dans un état spécial, la validité de la mesure ou de l'alarme ne peut plus être garantie.







Cela est le cas :



- Lorsque la concentration en gaz dépasse la plage de mesure.
- Lorsqu'un défaut survient.
- Lorsque des alarmes sont désactivées.
- Lorsque des ajustages sont effectués.
- Lorsque des tests au gaz sont effectués.
- Lorsqu'un capteur est en phase de stabilisation.
- Lorsque le système est mode maintenance.
- lorsqu'un Dräger SensorAlive est utilisé et que le système est configuré de manière à ce que la valeur de mesure ne soit pas émise pendant un LifeTest.

Pour l'intensité électrique de l'interface analogique correspondant au signal analogique, voir 16.2.

Les documents suivants détaillent les signaux des interfaces numériques.

Interface	Document
PROFIBUS PA	9033782
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

Exemple d'affichage	Description
	**La valeur dépasse la plage de mesure** La concentration en gaz se situe hors de la plage de mesure du capteur[1]. **Interface analogique :** Dépassement de la plage de mesure **Relais :** commutateur de relais A2 ***Remarques relatives aux Polytron 8200 et 8310 :*** le message indiquant que la plage de mesure a été dépassée peut également être causé par un court-circuit ou une interruption de la ligne reliée au capteur déporté.
	**La valeur est en dessous de la plage de mesure** La concentration en gaz se situe en dehors de la plage de mesure du capteur. **Interface analogique :** Dérive en-dessous de zéro **Relais :** commutateur de relais de défaut
	**Voyant de défaut** Le symbole ⊠ s'affiche sur le côté droit. **Interface analogique :** Courant de défaut **Relais :** Commutateur de relais de défaut
	**Voyant de maintenance** Le symbole 🔧 s'affiche sur le côté droit. Il est affiché lorsque les alarmes sont désactivées, pendant les ajustages, le test au gaz et les interventions de maintenance. **Interface analogique :** courant de maintenance **Relais :** aucune modification
	**Voyant d'avertissement** Le symbole ▯ s'affiche sur le côté droit. **Interface analogique :** courant d´avertissement[2] **Relais :** aucune modification

Exemple d'affichage	Description
	**Phase de stabilisation 1** Le symbole ▯ s'affiche sur le côté droit. Le temps restant est indiqué sur le côté gauche. **Interface analogique :** courant de maintenance **Relais :** commutateur de relais de défaut Pendant la phase de stabilisation 1, le fonctionnement du relais de défaut est configurable (Voir "Réglage relais défaut période de stabilisation 1", page 124)
	**Phase de stabilisation 2** Le symbole ▯ s'affiche sur le côté droit. La valeur mesurée est indiquée sur le côté gauche. **Interface analogique :** valeur mesurée **Relais :** comportement conformément au mode de mesure (le relais de défaut n'indique pas une phase de stabilisation 2.)

1) Si la concentration en gaz dépasse la valeur maximale de la plage de mesure de l'interface 4 à 20 mA, l'écran continue d'afficher la valeur mesurée et la remarque « Dépassement de la plage de mesure de l'interface analogique » .
2) Uniquement lorsque le courant d'avertissement est activé. Configuration d'usine : désactivé.

7.3.5 Terminer les status spéciaux

Voyant de défaut / voyant d'avertissement

Les voyants de défaut et d'avertissement ne sont généralement pas auto-maintenus. Une fois que les causes des défauts ou des avertissements ont été résolues, ils disparaissent. Exceptions : « Détection de défaut SensorAlive » et « Détection d'obstruction SensorAlive ».

Pour y remédier, afficher le défaut ou l'avertissement (Voir "Le menu Information", page 111) et commencer le dépannage (Voir "Dépannage", page 119).

La valeur est en dehors de la plage de mesure

L'écran indique que la concentration en gaz se situe en dehors de la plage de mesure du capteur. Le voyant disparaît dès que la concentration en gaz revient dans la plage de mesure. Un dépassement de la plage de mesure peut entraîner une diminution de la sensibilité et du temps de réponse du capteur.

REMARQUE
Dysfonctionnement du capteur
Des concentrations en gaz en dehors de la plage de mesure du capteur peuvent provoquer son dysfonctionnement.
► Ajuster à nouveau le capteur le cas échéant.

Polytron® 8200 CAT avec capteur DQ :

Un dépassement de la plage de mesure doit être acquitté avec [OK] après avoir vérifié que la concentration de gaz est en dessous de 100 % LIE (p.ex. en utilisant un instrument portatif).

L'auto-maintien des alarmes est le réglage par défaut de l'instrument.

Pour les instruments sans relais, le dépassement de la plage peut être réglé sur Sans auto-maintien. Dans ce cas, l'indication de dépassement de la plage disparaît. L'unité de commande doit prendre en charge cette fonction ! Pour plus d'informations voir : "Configuration du verrouillage du capteur DQ", page 131.

Polytron® 8200 CAT avec capteur LC :

⚠ AVERTISSEMENT
Indicateurs équivoques dans le cas de valeurs mesurées en dehors de la plage de mesure
Des alarmes auto-maintenues en cas de dépassement de la plage de mesure ne sont pas prises en charge par les capteurs LC.
Pour un fonctionnement sûr conformément à BVS 13 ATEX G 001 X, le détecteur de gaz doit être utilisé avec une centrale de commande capable d'afficher des alarmes auto-maintenues. Ne pas utiliser les relais d'alarme interne du détecteur de gaz.
► S'assurer qu'un indicateur auto-maintenu de dépassement de la plage de mesure est activé sur la centrale de commande.

Après avoir obtenu des valeurs mesurées hors plage, vérifiez que la concentration de gaz soit inférieure à 100 % LIE, par exemple, en utilisant un instrument portable.

7.4 Mode Info et touche de fonction

7.4.1 Affichage du mode Info

Le mode Info sert à afficher les informations relatives à l'appareil. Le fonctionnement normal de l'appareil n'est pas interrompu.

- Appuyer sur la touche ▲ pendant 3 secondes en mode mesure et la maintenir enfoncée.

7.4.2 Navigation en mode Info

Bouton	Fonction
▲	Passe à l'écran suivant
▼	Revient à l'écran précédent
OK	Met fin au mode Info

Si aucune touche n'est actionnée pendant 30 secondes, l'instrument repasse automatiquement en fonctionnement normal.

7.4.3 Utiliser la touche de fonction

En utilisant la touche de fonction, une fonction préréglée peut être exécutée. Par défaut, les dysfonctionnements sont affichés.

- Appuyer et maintenir la pression sur ▲ pendant 1 seconde en mode de mesure.

Pour configurer la touche de fonction, voir 11.4 Configuration de la touche de fonction.

7.5 Menus

7.5.1 Navigation dans le menu

Bouton	Fonction
▲	Défiler vers le haut. Définir des valeurs.
▼	Défiler vers le bas. Définir des valeurs.
OK	Confirmer la saisie. Sélectionner des menus et des fonctions.

7.5.2 Affichage des menus

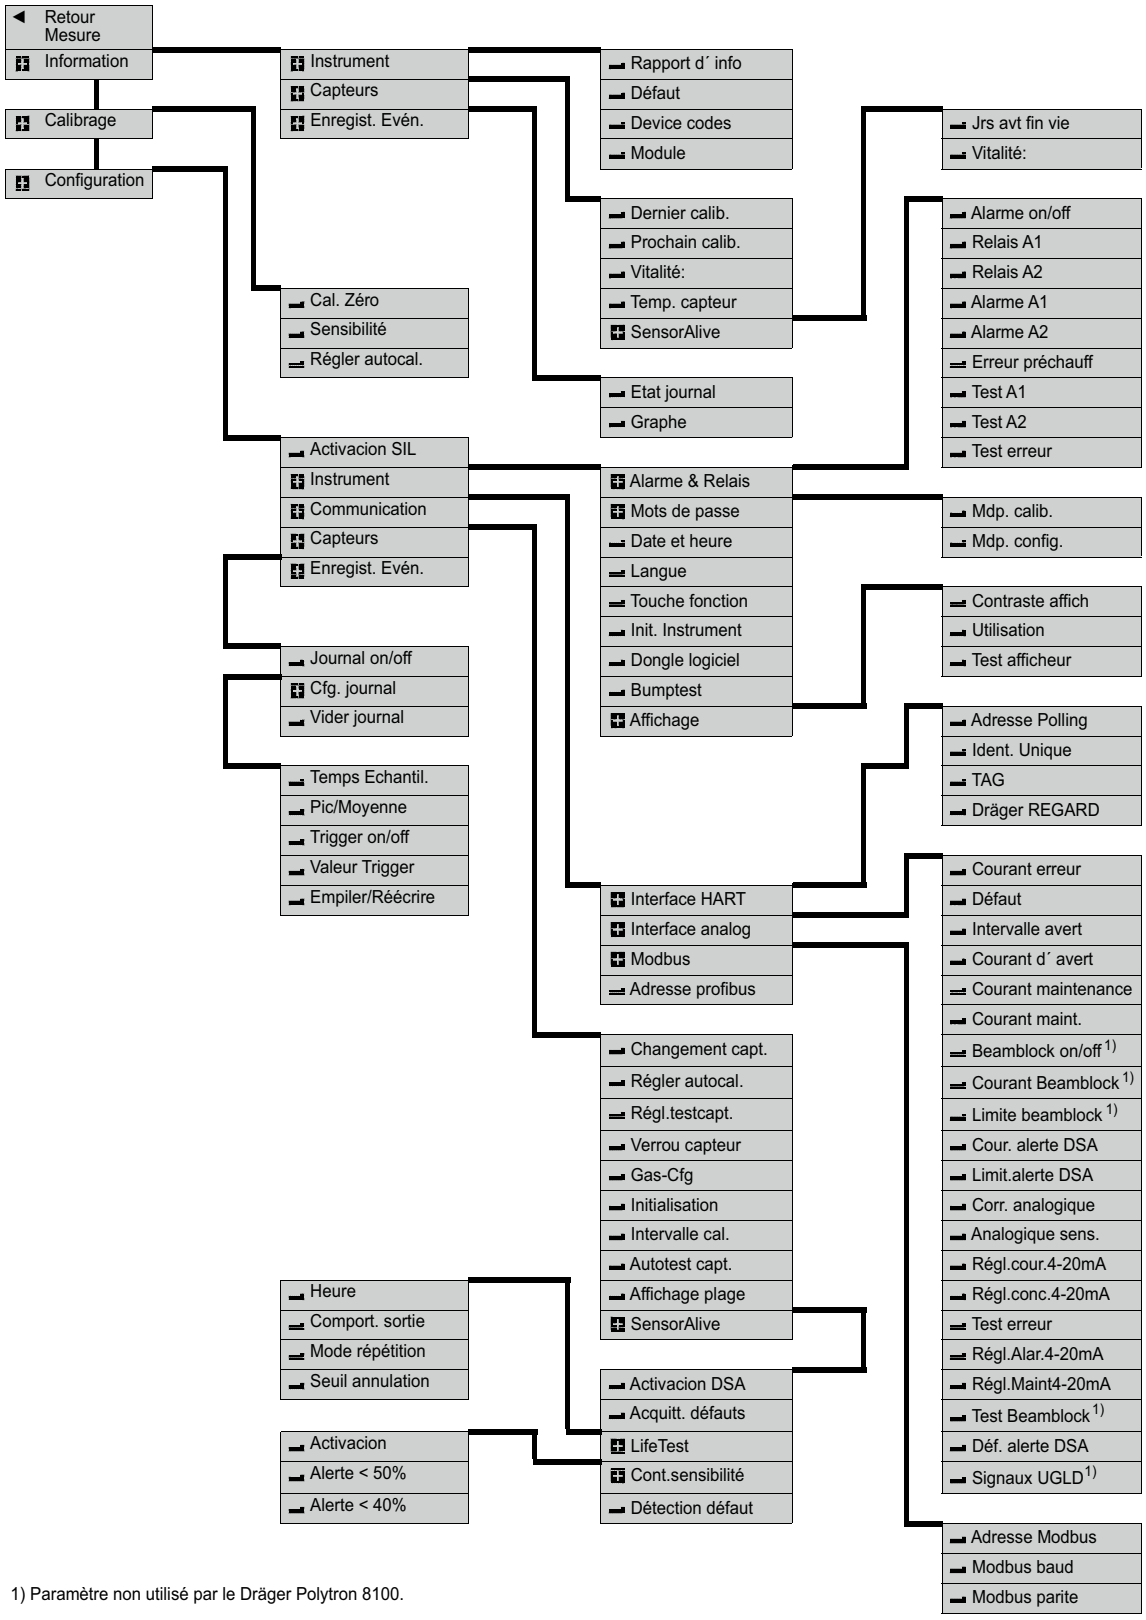
- Pour afficher le menu ***Information*** :
  a. appuyer sur ▼ pendant 1 seconde en mode mesure en maintenant enfoncé.
- Pour afficher le menu ***Calibrage*** :
  a. Appuyer sur ▼ pendant 3 secondes en mode mesure en maintenant enfoncé.
  b. Sélectionner ***Entrer code***.
  c. Saisir le mot de passe correspondant et confirmer avec [OK].
- Pour accéder à tous les menus :
  a. appuyer sur ▼ pendant 3 secondes en mode mesure en maintenant enfoncé.
  b. Sélectionner ***Entrer code***.
  c. Saisir le mot de passe correspondant et confirmer avec [OK].

7.5.3 Mots de passe

Code Mainten.	Pour accéder aux menus ***Information*** et ***Calibrage*** (paramètres d'ajustage) Valeur standard : **_ _ _ 1**
Code Config.	Permet d'accéder aux configurations et menus Valeur standard : **_ _ _ 2**

Pour modifier les mots de passe, voir 11.1.

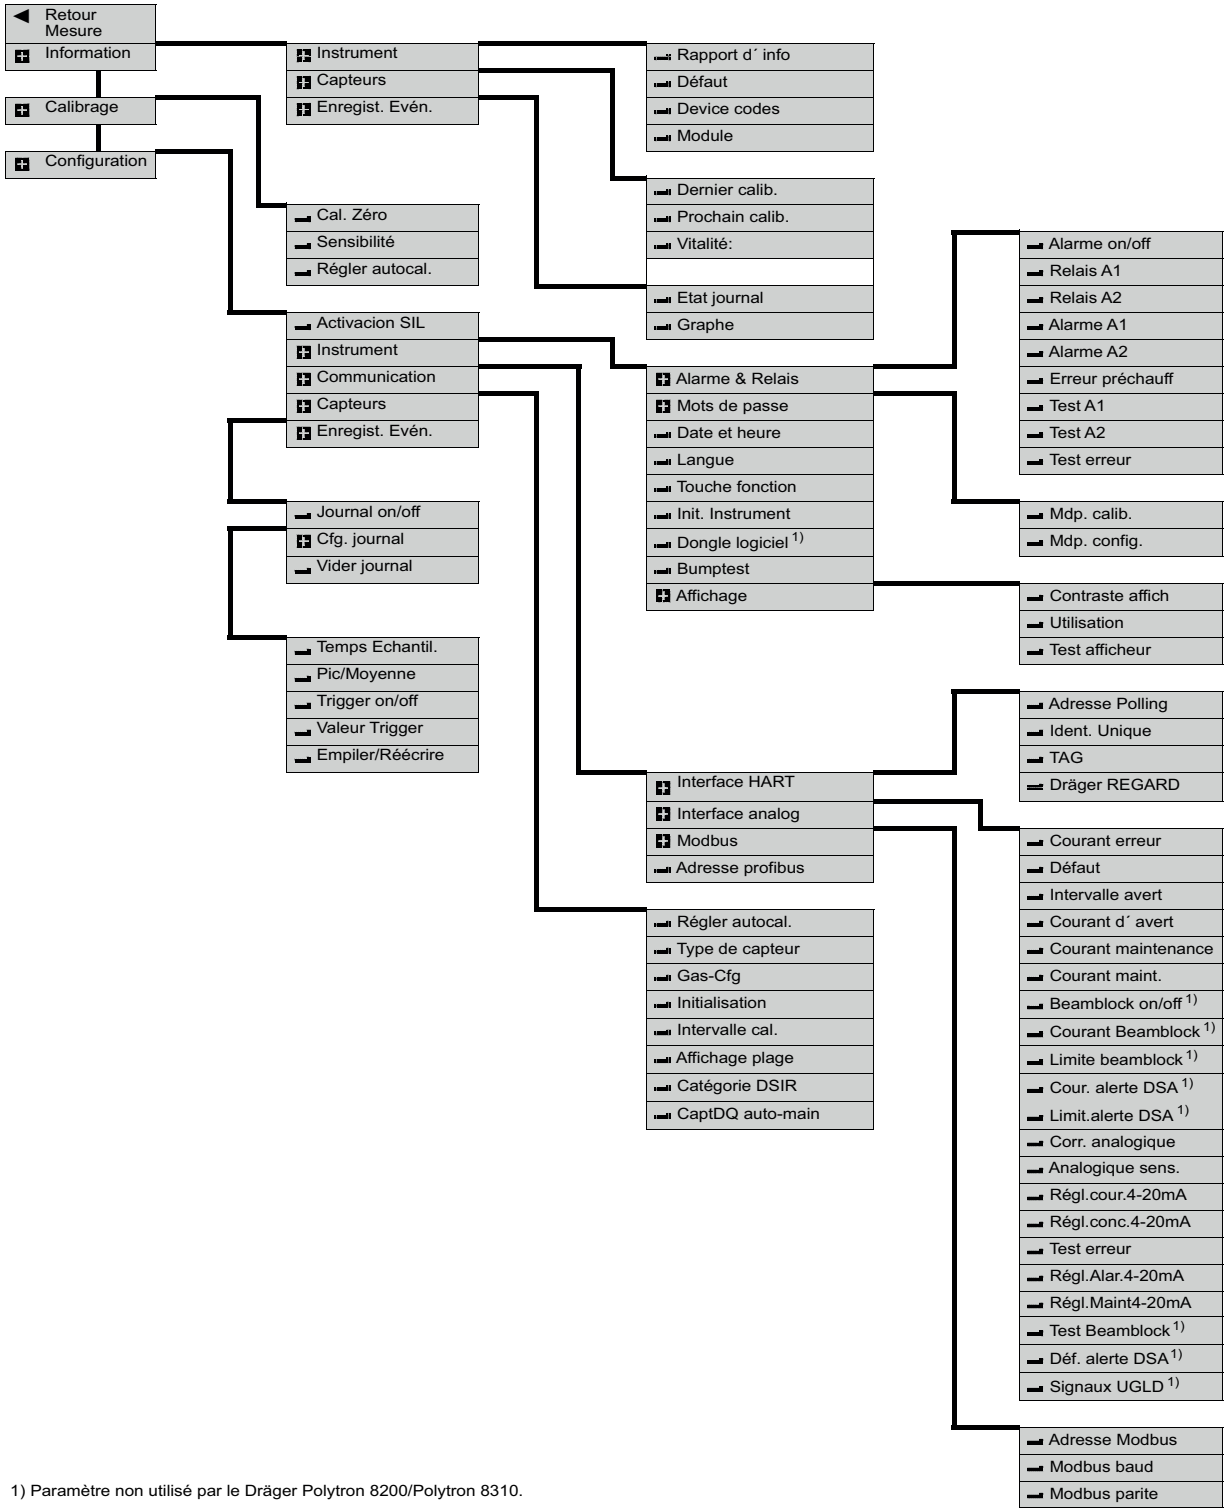
7.5.4 Le menu *Information*



Le menu ***Information*** contient les informations suivantes :

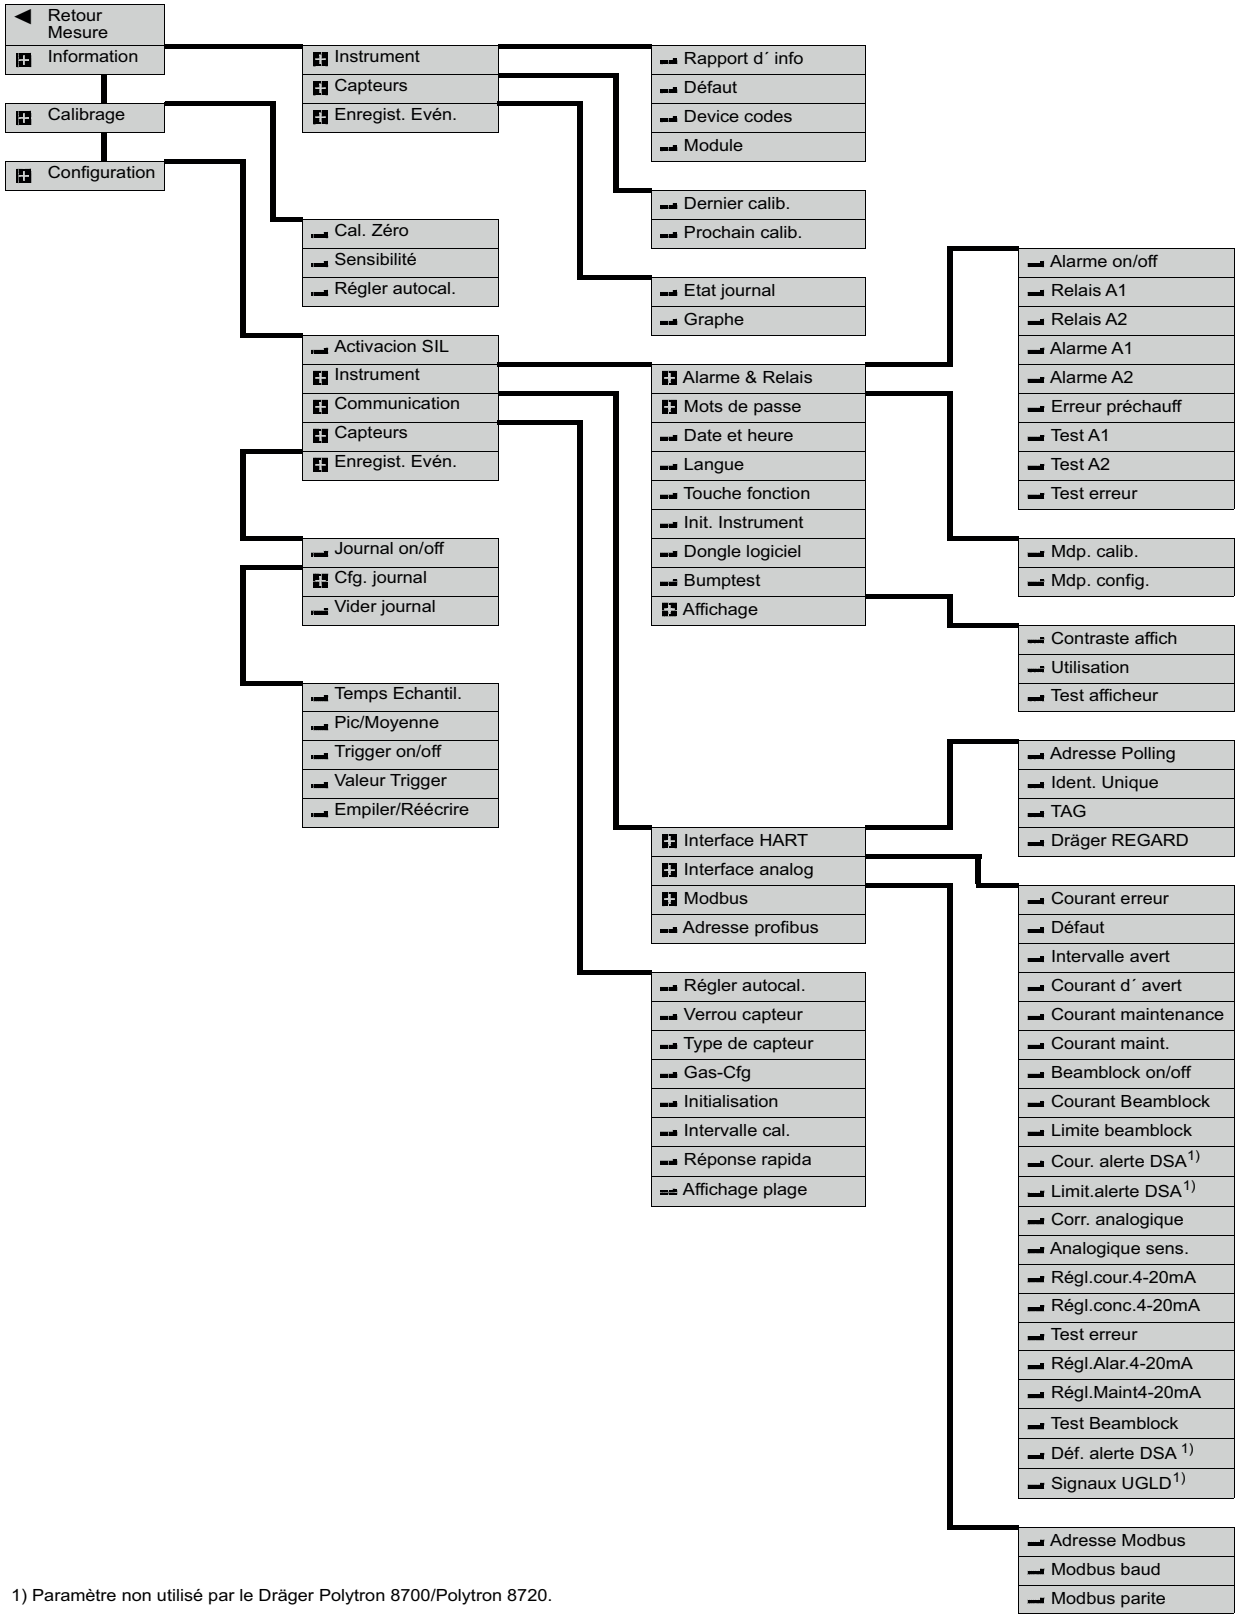
Instrument	
Rapport d' Info	Affiche les messages d'avertissement en texte clair avec leur numéro. Si plusieurs messages d'avertissement sont actifs, cela est indiqué (par exemple 1/3 = écran 1 sur 3).
Liste d'erreurs	Affiche les messages de défaut en texte clair avec leur numéro. Si plusieurs défauts sont actifs, cela est indiqué (par exemple 1/3 = écran 1 sur 3).
Drapeaux de l'appareil	Les codes d'avertissement et de défaut sont affichés dans un tableau. Si tous les codes sont 00, il n'y a pas de message d'avertissement ou de défaut actif.
Afficher Modules	Affiche un aperçu des modules matériels installés et de la version logicielle de l'interface de capteur EC, appelée SIOS. Sélectionner le module correspondant pour afficher les informations détaillées. ■ = modules installés □ = modules non installés
Capteurs	
Date du dernier calibrage	Date de l'ajustage, unité, gaz et concentration du concentration du dernier ajustage sont affichés.
Date du prochain calibrage	Affiche la date du prochain ajustage.
Vitalité[1)]	Affiche la vitalité du capteur en %. Dräger recommande de remplacer le capteur lorsque sa vitalité est < 25 %.
Temp, du capteur[1)]	Affiche la température actuelle et la plus élevée du capteur.
SensorAlive	Le sous-menu affiche les jours restants jusqu'à la fin de la durée de vie prévue et la vitalité en %.
Mémoire	
État de la mémoire	Affiche le statut de l'enregistreur de données (actif ou non)
Graphe	Affiche l'historique des 15 dernières minutes sous forme de graphique temps/concentration.

1) La fonction n'est disponible qu'avec le dongle Diagnostic.



7.5.5 Vues d’ensemble des menus

Polytron 8100



1) Paramètre non utilisé par le Dräger Polytron 8100.

Polytron 8200, Polytron 8310

1) Paramètre non utilisé par le Dräger Polytron 8200/Polytron 8310.

Polytron 8700, Polytron 8720

1) Paramètre non utilisé par le Dräger Polytron 8700/Polytron 8720.

7.6 Informations sur le fonctionnement avec un Dräger SensorAlive

– Si un menu est appelé sur le transmetteur ou si certains défauts sont définis, le Dräger SensorAlive n'effectue pas de LifeTest.
– Le Dräger SensorAlive peut empêcher l'ajustage de l'appareil pendant un certain temps (capteur H_2S : 30 minutes).
– Si une grande précision est requise pour le temps d'exécution des LifeTests, l'horloge du transmetteur doit être vérifiée régulièrement et à nouveau réglée au besoin.
– Les éléments de menu pour le Dräger SensorAlive ne sont affichés que si un Dräger SensorAlive est connecté. Les fonctions du dongle sont alors également visibles, mais pas actives.

8 Calibrage

8.1 Remarques générales

– Pour garantir un fonctionnement correct, ajuster d'abord le zéro, puis la sensibilité. Si ces opérations sont effectuées dans le mauvais ordre, les paramètres du logiciel empêchent la poursuite de l'ajustage.
– Si l'appareil est utilisé à haute altitude, la valeur affichée est inférieure à celle au niveau de la mer (réduction de la pression partielle). Il est recommandé de refaire ll'ajustage sensibilité en cas de changement d'altitude ou de pression ambiante. l'ajustage a été fait en usine au niveau de la mer.
– Dräger recommande d'ajuster les appareils avec le gaz qui devra ensuite être détecté. Cette méthode est plus précise qu'un ajustage de remplacement. Un ajustage de remplacement ne peut être effectué que si un ajustage du gaz à mesurer est impossible.
– Les capteurs pour méthane et hydrogène ne doivent être ajustés qu'avec un gaz cible et non avec un gaz remplacement.
– Polytron 8310 IR : Tenir compte en outre des indications de la notice d'utilisation du DrägerSensor IR[1)].

Lors de l'ajustage, la précision de mesure du capteur est vérifiée et réglée avec une concentration de gaz étalon connue. Les ajustages doivent être effectués régulièrement. La longueur des intervalles d'ajustage dépend des conditions ambiantes dans lesquels le capteur est utilisé.

Dérives du capteur dues aux conditions ambiantes et à son vieillissement. Les dérives du capteur ont un impact négatif sur la précision de la mesure. Les ajustages rétablissent la précision. Les intervalles d'ajustage doivent être raccourcis en fonction de l'ampleur des dérives du capteur.

Pour évaluer les conditions ambiantes d'une nouvelle installation, des intervalles d'ajustage plus courts doivent être définis et la dérive du capteur doit être consignée. L'exploitant de l'installation doit définir les intervalles d'ajustage avec les données obtenues.

Si un Dräger SensorAlive est utilisé, la dérive est compensée et peut être lue.

Dans des conditions normales, Dräger recommande les intervalles d'ajustage suivants[2)]:

– Capteurs électrochimiques (EC) : 6 à 12 mois[3)]
– Capteurs catalytiques (CAT) : 4 mois
– Capteurs infrarouges (IR) : 6 à 24 mois[3)]

8.2 Gaz étalons

La notice d'utilisation du capteur détaille les propriétés du gaz étalon (p.ex. humidité, concentration). Si aucune indication relative à l'humidité n'est fournie, un gaz étalon sec peut être utilisé pour l'ajustage. L'humidité du gaz étalon n'est pas pertinente pour les capteurs d'O_2.

Différents gaz étalons sont utilisés selon le type d'ajustage.

Gaz neutre

Le gaz neutre est un gaz étalon utilisé pour ajuster le point zéro. Pour les capteurs O_2 et CO_2, on utilise de l'azote (N_2). Pour les autres capteurs, l'air ambiant peut être utilisé s'il ne contient ni impuretés gênantes ni gaz de mesure.

Gaz d'ajustage

Le gaz d'ajustage est un gaz étalon utilisé pour ajuster la sensibilité d'un capteur. Le gaz d'ajustage a une concentration connue du gaz de mesure, diluée avec de l'air pur ou de l'azote. Pour les capteurs d'O_2, aucun gaz d'ajustage n'est requis, puisque l'on utilise l'oxygène de l'air ambiant.

8.3 Débit de gaz pour les ajustages

Le débit de gaz varie en fonction du capteur.

Capteur EC, capteur CAT	0,5 L/min ± 10 %
Tous les autres capteurs	0,5 L/min - 2 L/min

Le débit de gaz doit correspondre aux conditions ambiantes pendant le fonctionnement (par ex., mesure dans une conduite de ventilation avec un débit supérieur à 2 L/min)

1) 9023981 (Anglais), 9033555 (Bulgare, Roumain), 9023984 (Espagnol, Portugais), 9023986 (Danois, Norvégien), 9033556 (Tchèque, Croate), 9033809 (Chinois), 9023985 (Hongrois, Polonais), 9023982 (Français), 9033557 (Slovaque, Slovène), 9033558 (Grec, Turc), 9023987 (Italien, Néerlandais), 9023983 (Finnois, Suédois), 9023843 (Allemand)

2) Tenir compte de la notice d'utilisation du capteur
3) Pour les applications conformes aux normes EN 45544-1 et EN CEI 62990-1, l'intervalle d'ajustage ne doit pas dépasser 6 mois.

8.4 Préparation de l'ajustage

Remarques générales

⚠ AVERTISSEMENT
Risque pour la santé en raison du gaz étalon
Respirer le gaz étalon peut poser un risque pour la santé ou entraîner la mort.
► Ne pas respirer le gaz étalon.
► Respecter les consignes en matière de risques et de sécurité concernant le gaz étalon (se reporter aux fiches techniques et aux instructions des dispositifs de calibrage).

⚠ ATTENTION
Déclenchement d'alertes pour les gaz étalons
Les gaz étalons peuvent déclencher des alertes.
► S'assurer de ne plus appliquer le gaz étalon une fois le calibrage terminé.

Conditions préalables
– La phase de stabilisation du capteur est terminée (Voir "Mise en service du détecteur de gaz", page 107).
– La date et l'heure sont réglées (Voir "Réglage de la date et de l'heure", page 123).
– Pour utiliser le Dräger SensorAlive, le dernier LifeTest doit avoir été effectué depuis suffisamment de temps (voir la notice d'utilisation du capteur).

Particularité du Polytron 8310
Dräger recommande d'effectuer sur le capteur une compensation automatique du point zéro avant de l'ajuster. Cela réinitialise le suivi du point zéro du DrägerSensor IR et la plage complète de suivi est à nouveau disponible.
1. Désactiver l'alarme du détecteur de gaz (Voir "Activer ou désactiver une alarme", page 124).
2. Injecter de l'azote, de l'air synthétique ou de l'air frais dans le capteur avec l'adaptateur d'ajustage et attendre que la valeur mesurée soit stable.
3. Maintenir la baguette magnétique sur la zone marquée avec le symbole ⇩0 (à l'intérieur du cadre noir) sur la surface du capteur pendant au moins 5 secondes. Le signal de sortie du capteur passe à l'affichage du signal d'ajustage après 5 secondes (changement d'affichage d'environ -10 %LIE) tant que la baguette magnétique est maintenue. Un réglage du point zéro du système de mesure optique est automatiquement effectué simultanément.
4. Retirer la baguette magnétique. Après 30 secondes, l'appareil quitte la procédure de compensation automatique du point zéro. Pour confirmer la compensation automatique du point zéro, le signal de sortie repasse au signal d'ajustage (changement d'affichage à environ -10 %LIE). Ce signal est affiché aussi longtemps que lors de l'entrée dans la procédure de compensation automatique du point zéro.
5. Activer l'alarme du détecteur de gaz.

Polytron 8100, Polytron 8200, Polytron 8310
Voir la figure B de la page dépliante.

Équipement d'ajustage :
– Détendeur Dräger (1) ; pour les gaz réactifs, utiliser un détendeur en acier inoxydable
– Adaptateur d'ajustage Dräger (2) (référence de pièce 6810536)
– Tuyau (3)
– Bouteille de gaz étalon Dräger (4)

Préparation de l'ajustage :
1. Raccorder le détendeur à la bouteille de gaz étalon.
2. Fixer l'adaptateur d'ajustage sur le capteur.
3. Brancher le tuyau au raccord cannelé.
4. Accéder au menu (Voir "Affichage des menus", page 111).

Polytron 87x0 IR
Voir la figure B de la page dépliante.

Équipement d'ajustage :
– Détendeur Dräger (1) ; pour les gaz réactifs, utiliser un détendeur en acier inoxydable
– Adaptateur d'ajustage Dräger (5) (référence de pièce 6811610).
– Tuyau (3)
– Bouteille de gaz étalon Dräger (4)

Préparation de l'ajustage :
1. Raccorder le détendeur à la bouteille de gaz étalon.
2. Fixer l'adaptateur d'ajustage sur la protection anti-éclaboussures jusqu'à ce qu'il s'enclenche.
   Cela ne vaut pas pour le montage sur des conduites de ventilation ou en cas d'utilisation d'un adaptateur de processus ou d'une cuvette de processus (voir la notice d'installation de l'accessoire PIR 7x00).
3. Vérifier la propreté des surfaces d'étanchéité autour des ouvertures de la protection anti-éclaboussures. Il n'est pas nécessaire de retirer la protection contre les insectes.
4. Brancher le tuyau au raccord cannelé.
5. Afficher le menu (Voir "Affichage des menus", page 111).

8.5 Ajustage du point zéro

8.5.1 Généralités

L'air ambiant ne peut être utilisé à la place de l'azote ou de l'air synthétique pour ajuster le point zéro du capteur que s'il est certain que l'air ambiant ne contient pas de gaz cible ni d'autre gaz pour lesquels le capteur peut présenter une sensibilité transversale (voir les informations dans la fiche technique du capteur). Dans ce cas, l'ajustage du point zéro ne requiert ni bouteille de gaz ni adaptateur d'ajustage.

⚠ AVERTISSEMENT
Défaut de calibrage du point zéro
Un débit insuffisant de l'air ambiant peut causer des erreurs de calibrage.
► S'assurer que le débit de l'air ambiant au niveau du capteur est suffisant.

Polytron® 8100 spécifique EC :

En ce qui concerne les capteurs d'oxygène (O_2), le réglage du point zéro ne modifie aucune valeur du micrologiciel ou du capteur. Ainsi, la fonction de calibrage du point zéro peut être utilisée pour vérifier la mesure du point zéro lorsque le capteur détecte de l'azote. Le Polytron 8100 EC affiche un état de défaut si une vérification du point zéro échoue avec un écart de plus de 0,6 Vol% d'O_2 par rapport à zéro. Dans le cas d'un défaut, refaire la vérification du point zéro ou remplacer le capteur au besoin. Utiliser de l'azote (N_2) pour effectuer la vérification.

Polytron® 8200 spécifique CAT :

Les capteurs ne doivent pas être calibrés avec de l'azote pur. Les capteurs catalytiques ont besoin d'oxygène pour fonctionner correctement.

Polytron® 8720 spécifique IR :

Pour le Polytron 8720 IR (avec PIR 7200 pour détecter le dioxyde de carbone), vous pouvez utiliser uniquement de l'azote ou de l'air synthétique sans CO_2 pour le réglage du point zéro.

8.5.2 Ajustage du point zéro

ℹ Il est possible d'interrompre un calibrage à tout moment. Pour interrompre un calibrage, sélectionner ***Retour***.

Conditions préalables :

– Le capteur a terminé sa phase de stabilisation
– Le calibrage est préparé.

Ajustage du point zéro :

1. sélectionner ***Calibrage*** > ***Calibrage Zéro*** et confirmer.
   ⇒ Le signal de maintenance est transmis via l'interface analogique. Aucune alarme et aucun relais de défaut n'est activé et le symbole 🔧 est affiché.
   ⇒ Le message ***Appliquer Gaz zé*** s'affiche.
2. Appliquer de l'air synthétique ou de l'azote si l'air ambiant ne peut pas être utilisé.
   a. Régler le débit de gaz en fonction du capteur utilisé (Voir "Débit de gaz pour les ajustages", page 115)
3. Sélectionner ***Suite*** et confirmer.
   ⇒ La valeur actuelle est affichée.

ℹ Au bout de 15 minutes sans validation, l'appareil revient au menu ajustage sans effectuer celui-ci.

Effectuer l'ajustage après avoir appliqué le gaz étalon sur le capteur pendant 3 minutes et attendu que la valeur affichée devienne stable.

4. Sélectionner ***Calibrage*** et confirmer.
   ⇒ Le message ***Attendre SVP..*** s'affiche.
   ⇒ La nouvelle valeur actuelle est affichée.
5. Sélectionner ***Suite*** et confirmer.
6. Couper le débit de gaz et retirer l'adaptateur d'ajustage du capteur ou desserrer le tuyau.
   Si la valeur actuelle n'est pas dans la plage d'alarme :
7. Sélectionner ***Suite*** et confirmer.
   ⇒ L'appareil retourne au menu ajustage.

8.6 Calibrage sensibilité

8.6.1 Généralités

Polytron® 8310 spécifique IR :

La conception du capteur de gaz DSIR limite le signal de sortie du capteur de gaz à 45 %. . . 55 % de la tension d'alimentation interne de l'appareil. Si la concentration en gaz continue d'augmenter après que le signal de sortie maximal du capteur a été atteint, cela ne fait pas augmenter les valeurs affichées sur la réponse de l'appareil transmise à la centrale de commande. Dans le cas des substances ayant des facteurs d'ajustage particulièrement bas et / ou de la configuration manuelle d'un facteur d'ajustage sensibilité élevé, cela peut se produire dès une concentration inférieure à 100 % LIE. Pour les ajustages de gaz de substitution, le déclenchement correct de l'alarme doit pour cette raison être contrôlé au moyen d'une concentration de gaz étalon correspondant au seuil d'alarme. Si nécessaire, augmenter la plage de mesure affichable en réduisant le signal de sortie du capteur en fonction des exigences avant de l'ajuster sur l'appareil (voir le chapitre « Ajustage manuel de la sensibilité du signal de sortie » dans la notice d'utilisation du capteur de gaz DSIR).

8.6.2 Ajustage sensibilité

ℹ Il est possible d'interrompre un calibrage à tout moment. Pour interrompre un calibrage, sélectionner ***Retour***.

Conditions préalables :

– L'ajustage a été préparé.
– Le point zéro a été ajusté.
– Spécifiquement pour tous les Polytron 8xx0 à part le Polytron 8100 EC :
  le dernier ajustage du point zéro valide a été effectué il y a moins de 24 heures.

Pour ajuster la sensibilité :

1. Sélectionner ***Calibrage*** > ***Calibrage Sens.*** et confirmer.
   ⇒ Le signal de maintenance est transmis via l'interface analogique. 🔧Aucune alarme et aucun relais de défaut n'est activé et le symbole 🔧 est affiché.
   ⇒ Les paramètres pour le gaz d'ajustage sont affichés, par ex. :[1)]
   Gaz : H_2S
   Unité: ppm
   Concentr.: 25
2. Si les paramètres affichés ne correspondent pas au gaz cible, régler les paramètres :
   a. Sélectionner ***Gaz*** et confirmer.
   b. Sélectionner le gaz d'ajustage dans la liste et valider.
   c. Sélectionner ***Unité*** et confirmer.
   d. Sélectionner l'unité de mesure dans la liste et valider.

1) Ne s'applique pas à tous les capteurs (Voir "Mode mesure", page 108).

e. Sélectionner ***Conc.*** et confirmer.
f. Régler la concentration du gaz d'ajustage.

3. Si les réglages sont corrects :
   a. Sélectionner ***Suite*** et confirmer.
      ⇒ Un message de type ***Débit de gaz ON H_2S*** s'affiche.
4. Appliquer du gaz d'ajustage.
   a. Régler le débit de gaz correspondant au capteur utilisé (Voir "Débit de gaz pour les ajustages", page 115)
5. Sélectionner ***Suite*** et confirmer.
   ⇒ La valeur actuelle est affichée

ℹ Au bout de 15 minutes sans validation, l'appareil revient au menu ajustage sans effectuer celui-ci.

Effectuer l'ajustage après avoir appliqué le gaz étalon sur le capteur pendant 3 minutes et attendu que la valeur affichée devienne stable.[1]:

6. Sélectionner ***Suite*** et confirmer.
   ⇒ Le message ***Attendre SVP..*** s'affiche.
   ⇒ La nouvelle valeur actuelle est affichée.
7. Sélectionner ***Suite*** et confirmer.
8. Couper le débit de gaz et retirer l'adaptateur d'ajustage du capteur ou desserrer le tuyau.

Si la valeur actuelle n'est pas dans la plage d'alarme :

9. Sélectionner ***Suite*** et confirmer.
   ⇒ L'appareil retourne au menu ajustage.

8.7 Ajustage automatique

8.7.1 Généralités

L'ajustage automatique comprend l'ajustage du point zéro suivi de celui de la sensibilité. Il constitue une alternative à leur exécution manuelle.

L'ajustage automatique n'est possible que pour certains capteurs et gaz. Si cette fonction n'est pas disponible, effectuer l'ajustage manuellement.

8.7.2 Exécution de l'ajustage automatique

ℹ Au bout de 24 heures, le calibrage du point zéro n'est plus à jour. Par conséquent, le calibrage automatique ne peut pas être effectué à moins que le calibrage du point zéro ne soit effectué à nouveau.

ℹ Il est possible d'interrompre un calibrage à tout moment. Pour interrompre un calibrage, sélectionner ***Retour***.

Conditions préalables :

– L'ajustage automatique est activé.
– La phase de stabilisation du capteur est terminée.
– L'ajustage a été préparé.

Pour exécuter l'ajustage automatique :

1. Appliquer de l'air synthétique ou de l'azote si l'air ambiant ne peut pas être utilisé.
2. Sélectionner ***Calibrage*** > ***Autocalibrage*** et confirmer.
   ⇒ Le message ***Attendre SVP..*** s'affiche et l'appareil effectue automatiquement l'ajustage du point zéro.
   ⇒ Dans le cas d'un capteur d'O_2, ***Cal. air frais*** s'affiche.

ℹ Le signal de maintenance est transmis par l'interface analogique, aucune alarme ou aucun relais de défaut n'est activé et le symbole 🔧 est affiché.

3. Une fois l'ajustage du point zéro exécuté avec succès, l'ajustage sensibilité démarre.
   ⇒ Les paramètres pour le gaz s'affichent, par exemple :[2]
   Gaz : H_2S
   Unité: ppm
   Concentr.:25
4. Si les paramètres affichés ne correspondent pas au gaz cible, régler les paramètres :[3]
   a. Sélectionner ***Gaz*** et confirmer.
   b. Sélectionner le gaz d'ajustage dans la liste et valider.
   c. Sélectionner ***Unité*** et confirmer.
   d. Sélectionner l'unité de mesure dans la liste et valider.
   e. Sélectionner ***Conc.*** et confirmer.
   f. Régler la concentration du gaz d'ajustage.
5. Si les réglages sont corrects :
   a. Sélectionner ***Suite*** et confirmer.
      ⇒ Un message de type ***Débit de gaz ON H_2S*** s'affiche.
6. Appliquer du gaz d'ajustage.
   a. Régler le débit de gaz en fonction du capteur utilisé (Voir "Débit de gaz pour les ajustages", page 115)
7. Sélectionner ***Suite*** et confirmer.
   ⇒ La valeur actuelle est affichée

ℹ Au bout de 15 minutes sans validation, l'appareil revient au menu ajustage sans effectuer celui-ci.

8. Une fois que la valeur actuelle est stable, l'appareil effectue automatiquement l'ajustage sensibilité.
9. ***Valeur OK?***Une fois l'ajustage exécuté avec succès, la nouvelle valeur s'affiche, ainsi que le message ***Valeur OK?***.
   - Sinon, sélectionner Modifier et confirmer pour refaire l'ajustage.
   - Si la valeur correspond à la valeur de consigne, poursuivre la procédure.
10. Couper le débit de gaz et retirer l'adaptateur d'ajustage du capteur ou desserrer le tuyau.
11. Sélectionner ***Valeur OK*** et confirmer pour terminer l'ajustage. L'appareil retourne au menu ajustage.

1) Pour les capteurs LC, le gaz d'ajustage doit être appliqué pendant au moins 6 minutes.

2) Ne s'applique pas à tous les capteurs (Voir "Mode mesure", page 108).
3) ceci n'est possible que pour certains capteurs.

9 Dépannage

9.1 Défauts

Numéro	Cause	Solution
001, 003 - 004, 012 - 014, 020 - 024, 043, 060, 067	Défaut fatal de l'appareil, causes diverses.	Faire contrôler l'appareil par le DrägerService.
002, 025 - 027, 030 - 034, 041, 042, 044, 050, 052, 081, 085	Erreurs de données graves dans l'appareil, causes diverses.	Rétablir les paramètres d'usine de l'appareil. Si cette erreur persiste : faire contrôler l'appareil par le DrägerService.
005	Tension d'alimentation en dehors de la plage réglée.	Contrôler l'alimentation électrique.
010	Le câble de l'interface 4 à 20 mA n'est pas raccordé.	Contrôler la connexion à l'interface 4 à 20 mA. Si le dispositif est utilisé de manière autonome sans contrôleur central, raccorder les broches 3 et 4.
011	Défaut fatal de l'appareil, causes diverses.	Faire contrôler l'appareil par le DrägerService. Si cette erreur persiste : vérifier la charge ou le câble.
045	L'appareil ne détecte pas de capteur.	Vérifier les connexions. Si cette erreur persiste : faire contrôler l'appareil par le DrägerService.
051, 054	Échec de l'ajustage du point zéro.	Effectuer un ajustagedu point zéro.
055	Échec de l'ajustage sensibilité.	Effectuer un ajustage sensibilité.
076, 080 - 084	Défaut de l'appareil.	Vérifier les connexions électriques. Si cette erreur persiste : faire contrôler l'appareil par le DrägerService.
090	La fonction de blocage du capteur est activée. La référence de pièce du capteur utilisé est différente.	Utiliser un capteur avec la même référence de pièce ou désactiver la fonction de blocage du capteur.
105	Défaut de l'appareil.	Faire contrôler l'appareil par le DrägerService.
137, 64, 91	Défaut de l'appareil.	Éteindre puis rallumer l'appareil. Si cette erreur persiste : faire contrôler l'appareil par le DrägerService.

Polytron 8100 EC avec Dräger SensorAlive seulement

Numéro	Cause	Solution
220	L'ouverture du capteur est bouchée.	Nettoyer l'ouverture du capteur ou remplacer le filtre à poussière. Confirmer ensuite l'obstruction dans le menu (Voir "Configuration du Dräger SensorAlive", page 130).
221	La sensibilité du capteur est inférieure à 40 % (valeur calculée).	Ajuster ou remplacer le capteur.
222	Un défaut induit une valeur de gaz trop élevée après l'électrolyse.	Remplacer le capteur ou contacter le DrägerService.
223	La sensibilité du capteur est trop faible.	Ajuster ou remplacer le capteur.
224	Le flux de conditionnement n'est pas dans la plage autorisée.	Remplacer le capteur ou contacter le DrägerService.

Polytron 87x0 IR seulement

Numéro	Cause	Solution
064, 071	Défaut de communication.	Contrôler la connexion au PIR 7x00.
083	Système optique du PIR 7x00 sale.	Nettoyer le système optique du PIR 7x00.
086	Alimentation en tension en dehors de la plage	Contrôler l'alimentation électrique.
087	Panne 4 à 20 mA sur le capteur PIR 7x00.	Contrôler la connexion 4 à 20 mA sur le PIR 7x00.
094, 095	Erreur de données dans l'appareil.	Rétablir les paramètres d'usine du capteur. Si ce défaut persiste : faire contrôler l'appareil par le DrägerService.
096	Le mot de passe SIL ne correspond pas à celui du PIR 7x00.	Saisir à nouveau le mot de passe.

9.2 Rapport d'Info

Numéro	Cause	Solution
101	L'enregistreur de données en mode Stack est plein et n'enregistre plus de données.	Faire contrôler l'appareil par le DrägerService.
102	L'enregistreur de données en mode Stack est plein à 90 %.	Télécharger les données dès que possible et vider l'enregistreur de données.
103, 106	Erreur de données dans l'appareil. Il est possible que certaines fonctions du dongle comme l'enregistreur de données, le test du capteur, etc. ne soient plus disponibles.	Rétablir les paramètres d'usine de l'appareil. Si ce défaut persiste : faire contrôler l'appareil par le DrägerService.
104	Le réglage de la date ou de l'heure n'est pas valide.	Régler la date et l'heure.
105	Défaut de l'appareil.	Faire contrôler l'appareil par le DrägerService.
107	La batterie de la mémoire de données est vide.	Faire contrôler l'appareil par le DrägerService.
110, 111, 112	Le dongle du logiciel a été retiré sans avoir été désactivé au préalable.	Désactiver le dongle du logiciel.
113	Les alarmes sont verrouillées.	Activer les alarmes.
164, 165	La phase de stabilisation du capteur n'est pas encore terminée. Les erreurs de mesure seront probablement plus importantes.	Attendre jusqu'à ce que le capteur se soit stabilisé. Ne pas procéder à l'ajustage avant que le capteur se soit complètement stabilisé.
167, 170	Intervalle d'ajustage écoulé.	Ajuster à nouveau l'appareil.

Polytron 8100 EC seulement

Numéro	Cause	Solution
163	La vitalité du capteur EC est faible	Remplacer le capteur.
171	Affichage négatif. Valeur inférieure au minimum de la plage.	Ajuster à nouveau le point zéro.

Polytron 8100 EC avec Dräger SensorAlive seulement

Numéro	Cause	Solution
320	Échec de la communication avec le capteur. Le diagnostic et le générateur de gaz ne fonctionnent plus.	Débrancher le capteur, laisser reposer pendant environ 1 jour et le rebrancher. Vérifier la version du micrologiciel et, le cas échéant, la faire mettre à jour par le DrägerService. Remplacer le capteur.
321	Échec de l'analyse des données du capteur. Le capteur ne peut pas effectuer ou analyser un LifeTest (les conditions préalables ne sont pas remplies).	Modifier l'heure du LifeTest ou régler le profil de répétition sur « Flexible » (Voir "Configuration du Dräger SensorAlive", page 130). Si l'avertissement se répète, contacter le DrägerService.
322	Le jeu de données du capteur est défectueux.	Remplacer le capteur.
323	Le jeu de données du capteur est incompatible.	Contacter le DrägerService.
324	La sensibilité du capteur est inférieure à 50 % (valeur calculée).	Ajuster le capteur et préparer son remplacement (par exemple, commander une pièce détachée).
325	La sensibilité du capteur est inférieure à 40 % (valeur calculée).	Ajuster ou remplacer le capteur.
326	Pendant un LifeTest et un certain temps après, le capteur ne peut pas être ajusté.	Pour pouvoir effectuer un ajustage planifié, le LifeTest peut être temporairement supprimé dans PolySoft avec le mode Inhibit.
327, 330, 344, 347	Le générateur de gaz ne fonctionne as.	Ajuster ou remplacer le capteur.
331	Échec de la génération de gaz.	Ajuster le capteur.
332	Le capteur est à l'état sécurisé. Aucun LifeTest n'est exécuté (avertissement collectif).	Déterminer la raison et l'éliminer.
333	L'horloge en temps réel du capteur ne fonctionne pas correctement.	Régler l'horloge.

Numéro	Cause	Solution
334	La synchronisation du capteur n’est pas terminée.	Attendre la fin de la synchronisation. Selon l’état du capteur, ceci peut durer plusieurs minutes. Le cas échéant, faire mettre à jour le micrologiciel par le DrägerService.
336	Les contrôles internes dans le capteur donnent des résultats erronés.	Redémarrer le système
337	Le micrologiciel du transmetteur doit être mis à jour.	Contacter le DrägerService.
340	Le capteur est synchronisé après le redémarrage du système.	Attendre la fin de la synchronisation.
342	La différence de température entre les deux points de mesure de la température est trop élevée.	Attendre et vérifier si le LifeTest est analysé ou remplacer le capteur.
347	La configuration a échoué en raison d’une interruption de la communication entre le transmetteur et le capteur.	Reconfigurer le capteur et vérifier la configuration.
350	Le générateur de gaz est en phase de démarrage.	Attendre la fin de la phase de démarrage. Pendant la phase de démarrage, les fonctions de détection des erreurs et de détection des obstructions ne sont pas exécutées.
352	Échec de l’autotest du capteur.	Remplacer le capteur ou contacter le DrägerService.
353	Le capteur est temporairement en mode Inhibit. Pendant ce temps, aucun LifeTest n’est exécuté.	Le mode Inhibit peut être quitté manuellement avec PolySoft ou est quitté automatiquement.
354	Défaut au démarrage de l’installation.	Effectuer un redémarrage manuel.
355	Le micrologiciel du capteur n’est pas compatible avec le matériel.	Faire mettre à jour le micrologiciel par le DrägerService.
356	Données matérielles invalides.	Effectuer un redémarrage ou remplacer le capteur.
357	Le capteur a été placé manuellement à l'état sécurisé, par exemple pour mettre à jour le micrologiciel .	Pour quitter ce mode, redémarrer le capteur.

Polytron 87x0 IR seulement :

Numéro	Cause	Solution
163	La température du capteur est très élevée.	
171	Dérive du point zéro trop haute.	Effectuer un ajustage du point zéro.
172	Système optique du PIR 7x00 sale.	Nettoyer le système optique du PIR 7x00.
173	Ajustage du point zéro expiré pour l'ajustage sensibilité	Effectuer un ajustage du point zéro.
182	Ajustage automatique avec le PIR 7200 impossible.	Effectuer à nouveau l’ajustage du point zéro et l'ajustage sensibilité.

10 Maintenance

– Les intervalles de maintenance doivent être définis pour chaque installation. Selon les considérations de sécurité et les conditions particulières à une application dans lesquelles l'instrument est utilisé, il peut être nécessaire de réduire les intervalles.

Tous les 6 mois :

– Faire contrôler par des spécialistes.
– Contrôler la transmission de signaux à la centrale de commande (Voir "Test de l’interface analogique", page 127).
– Contrôler les LED et le déclenchement de l’alarme (Voir "Test des alarmes / relais", page 125).

Régulièrement :

– Effectuer un ajustage, voir 8 Calibrage

10.1 Réalisation d'un test au gaz et contrôle du temps de réponse (t90)

Un test au gaz (Bump Test) permet de vérifier le temps de réponse sans déclencher d'alarme.

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Bumptest*** et confirmer.
   ⇒ Le symbole de maintenance est affiché
   ⇒ La sortie analogique est réglée sur le signal de maintenance.
2. Appliquer une concentration connue de gaz.
3. Comparer le temps de réponse à la valeur t90 indiquée dans la fiche technique du capteur correspondant.
4. Appuyer sur [OK] pour retourner à la mesure.

10.2 Remplacement du capteur

⚠ AVERTISSEMENT
Calibrage erroné
Un calibrage erroné peut entraîner des lectures imprécises.
► En cas de remplacement du capteur, il faudra contrôler toutes les configurations et les paramètres.
► Vérifier le calibrage pour garantir un fonctionnement correct.

10.2.1 Polytron® 8100 EC

Un capteur peut être remplacé dans la zone classée dangereuse sans interrompre l'alimentation électrique.

Fonction de blocage du capteur

Si le capteur installé auparavant était de même type (référence de pièce identique), garder la configuration spécifique à l'appareil (type de gaz, plage de mesure, gaz étalon, intervalle d'ajustage, etc.). Sinon, les réglages par défaut du nouveau capteur sont téléchargés et écrasent la configuration spécifique à l'appareil. Activer la fonction verrouillage du capteur (Voir "Réglage du verrouillage du capteur", page 130)permet d'éviter cette situation (Voir "Réglage du verrouillage du capteur", page 130).

Fonction de remplacement de capteur

La fonction ***Changement capt.*** du menu permet de remplacer un capteur en cours de fonctionnement sans déclencher de signal de défaut sur la centrale de commande. Elle permet en outre de garantir que toutes les données du capteur présentes dans le microprocesseur sont sauvegardées dans sa mémoire (EEPROM) avant de débrancher sa fiche.

Remplacement du capteur

Voir la figure C de la page dépliante.

En principe, le capteur peut être remplacé à tout moment.

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Changement capt.*** et confirmer.
   ⇒ Le signal de maintenance est généré sur l'interface 4 à 20 mA.
   ⇒ L'écran affiche : ***Retirer capteur***.
   ⇒ Le symbole de maintenance est affiché.
2. Pour remplacer l'ancien capteur :
   a. Desserrer la vis de blocage (2) (vis creuse six pans 2 mm).
   b. Dévisser l'anneau à baïonnette (3).
   c. Insérer le capteur (4) dans l'ouverture et le tourner jusqu'à ce qu'il s'enclenche dans le détecteur de gaz. Veiller à ne pas endommager la fiche du capteur.
   d. Sécuriser le capteur avec l'anneau à baïonnette (3) correspondant.

   ℹ Le Dräger SensorAlive requiert un anneau à baïonnette différent des autres capteurs EC.

   e. Serrer la vis de blocage (2) jusqu'à ce que l'anneau à baïonnette ne puisse pas être desserrée (obligatoire pour les installations en zone 22).
      ⇒ L'écran affiche : ***Chargement des données en cours, veuillez patienter***
3. Le cas échéant, coller l'étiquette incluse avec le capteur sur l'appareil. Cela permet d'identifier le type de gaz à distance, même en cas de coupure de courant.
4. Lorsque les données du capteur sont chargées, l'écran affiche : ***Données chargées***.
5. Sélectionner ***Retour Menu*** et confirmer.
   ⇒ Le signal de maintenance sur l'interface 4 à 20 mA demeure jusqu'à ce que le capteur soit stabilisé.

   Temps maximal de stabilisation d'un nouveau capteur : voir sa notice d'utilisation. Pour l'oxygène : homologation selon EN 50104.
6. Vérifier l'ajustage. Si nécessaire, ajuster l'appareil (Voir "Calibrage", page 115).
7. Contrôler les exigences de l'installation et le niveau d'intégrité de sécurité SIL de l'appareil.
   Voir les sections "Installation antidéflagrante (Ex d) - sans station d'accueil" à "Installation des capteurs ou des têtes de mesure".

10.2.2 Polytron® 8200 CAT, 8310 IR, 87x0 IR

Remplacement du capteur

1. Le cas échéant, ajuster le courant de maintenance pour l'interface analogique.
2. Mettre l'appareil hors tension ou déclasser la zone conformément aux règlementations locales.
3. Desserrer la vis de blocage et dévisser le couvercle de l'appareil.
4. Sortir la carte de circuit imprimé.
5. Retourner la carte de circuit imprimé et retirer le connecteur du capteur.
6. Dévisser le capteur.
7. Insérer les câbles du capteur au travers du raccord fileté du boîtier.

⚠ AVERTISSEMENT
Risque d'explosion !
Les ouvertures du boîtier doivent être étanches pour éviter l'inflammation de l'atmosphère dangereuse en cas de feu à l'intérieur du boîtier.
► Cinq filets doivent être engagés pour assurer la protection contre les explosions.

8. Visser le capteur et serrer au couple prescrit (min. 266 in-lbs / min. 30 Nm)
9. Polytron® 8200 spécifique CAT :
   Entortiller ensemble les câbles du capteur. Si nécessaire, utiliser une attache de câble pour maintenir les câbles serrés.
10. Rebrancher le connecteur sur sa prise.
11. Remettre la carte de circuit imprimé dans le boîtier.
12. Visser le couvercle sur l'appareil jusqu'à ce qu'il soit correctement verrouillé (min. ≥44 in-lbs / min. ≥5 Nm) et serrer la vis de blocage.
13. Mettre au besoin l'appareil sous tension.
    ⇒ Le signal de maintenance sur l'interface 4 à 20 mA demeure jusqu'à ce que le capteur soit stabilisé.

    Temps maximal de stabilisation d'un nouveau capteur : voir sa notice d'utilisation.
14. Vérifier l'ajustage. Si nécessaire, ajuster 'appareil (Voir "Calibrage", page 115).
15. Contrôler les exigences de l'installation et le niveau d'intégrité de sécurité SIL de l'appareil.
    Voir les sections "Installation antidéflagrante (Ex d) - sans station d'accueil" à "Installation des capteurs ou des têtes de mesure".

10.3 Exécution du test de l'écran

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Affichage*** > ***Test afficheur*** et confirmer.
2. Sélectionner ***Activée*** et confirmer.
   ⇒ Les informations affichées à l'écran sont inversées. Les LED sont allumées.
   L'inversion est terminée à la sortie du menu.

11 Réglages de l'appareil

11.1 Configuration des mots de passe

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Code*** le mot de passe souhaité et confirmer.

Code Mainten.	Accès au calibrage du point zéro et de la sensibilité
Code Config.	Accès à tous les paramètres de configuration

2. Sélectionner la ligne correspondant à la modification du mot de passe et valider.
3. Régler le mot de passe et valider.
4. Sélectionner ***Confirmer*** et valider avec [OK].

11.2 Réglage de la date et de l'heure

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Date et Heure*** et confirmer.
2. Sélectionner la ligne pour modifier la date ou l'heure et confirmer.
3. Sélectionner ***Confirmer*** et confirmer avec [OK].

11.3 Réglage de la langue

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Langue*** et confirmer.
2. Sélectionner la langue dans la liste et confirmer.

11.4 Configuration de la touche de fonction

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Touche Fonction*** et confirmer.
2. Sélectionner une fonction et valider.

Graphe	Les mesures des 15 dernières minutes s'affichent sous forme de graphique temps/concentration.
Liste d'erreurs	Les messages de défaut s'affichent en texte clair.
Rapport d' Info	Les messages d'avertissement s'affichent en texte clair.
Bumptest	Le test au gaz permet d'appliquer du gaz sur le capteur sans générer d'alarme. Le signal de maintenance est transmis. Au bout de 15 minutes, ou en appuyant à nouveau sur [OK], le test au gaz s'arrête et l'appareil revient en fonctionnement normal.
Vitalité Capteur[1)]	Affiche la vitalité restante du capteur.

1) Avec le dongle Diagnostic seulement

11.5 Réinitialisation des réglages par défaut

Cette fonction restaure les paramètres par défauts d'usine de l'instrument.

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Init. instrument*** et confirmer.
2. Sélectionner ***Confirmer*** et valider avec [OK].

11.6 Modifier le contraste de l'affichage

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Affichage*** > ***Contraste affich*** et confirmer.
2. Modifier le contraste et valider les changements.

11.7 Changer le mode d'affichage

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Affichage*** > ***Utilisation*** et confirmer.
2. Sélectionner le mode de son choix et confirmer.

Standard	Affiche l'écran standard.
Aucun affichage	Affiche l'écran d'accueil et les symboles applicables.

Si une alarme est déclenchée, l'écran affiche la concentration de gaz actuelle et la LED rouge clignote, peu importe le mode d'affichage sélectionné.

11.8 Configuration d'un relais

11.8.1 Associations d'auto-maintien et d'acquittement d'alarme

Les exemples suivants donnent une vue d'ensemble des combinaisons d'acquittement d'alarme.

	Auto-maintien (Réinitialisation manuelle de relais)	**Sans auto-maintien** (Le relais se réinitialise une fois que la condition d'alarme a été supprimée)
Acquittable	Réinitialisation de relais possible à tout moment.	
Non acquittable	Réinitialisation de relais impossible avant d'avoir supprimé la condition d'alarme.	
Pré-acquittable	Acquittement d'alarme possible avant la suppression de la condition d'alarme. Le relais se réinitialise automatiquement une fois que la condition d'alarme a été supprimée.	

Les signaux d'auto-maintien / sans auto-maintien ne sont pas limités dans le temps. Les signaux d'auto-maintien restent actifs jusqu'à ce qu'ils soient acquittés. Les signaux sans auto-maintien s'arrêtent dès que la condition d'activation est supprimée.

11.8.2 Configuration du relais A1 ou A2

Cette fonction définit si le relais d'alarme est alimenté en fonctionnement normal ou en état d'alarme.

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Alarme*** > ***Relais A1*** ou ***Relais A2*** et confirmer.
2. Sélectionner l'option de son choix et confirmer.

Normal actif	Le contact du relais est actif pendant un fonctionnement normal et change si une alarme est déclenchée. En cas de perte de tension, une alarme se déclenche (sécurité intégrée).
Alarme actif	Si une alarme est déclenchée, le contact du relais devient actif.

11.8.3 Réglage relais défaut période de stabilisation 1

Cette fonction est utilisée pour régler le fonctionnement du relais de défaut pendant la stabilisation 1 afin d'indiquer l'état de stabilisation 1 à la sortie du relais.

1. Sélectionner sous ***Configuration*** > ***Instrument*** > ***Alarme*** > ***Erreur de stabilisation*** l'option souhaitée et confirmer.

Statique	Le relais de défaut active en permanence un indicateur d'alarme connecté. La LED orange LED est allumée en continu.
Dynamique	Le relais de défaut commute l'état pendant 9 secondes. *Exemple :* – Un avertisseur sonore est connecté à la sortie du relais de défaut « normalement ouvert ». – Les relais sont configurés sur « normal actif ». ⇒ L'avertisseur sonore et la LED orange du transmetteur sont actifs 1 seconde et inactifs 9 secondes.

11.9 Configuration de l'alarme

11.9.1 Activer ou désactiver une alarme

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Alarme*** > ***Alarme on/off***.

Activée	L'alarme est activée.
Désactivée	L'alarme est désactivée. Les LED, les relais et les interfaces n'indiquent aucune condition d'alarme. L'interface 4-20 mA transmet le signal de maintenance. La valeur actuelle et le symbole [!] sont affichés. Le relais de défaut signale un défaut.

2. Sélectionner ***Activée*** ou ***Désactivée*** et confirmer.

11.9.2 Configuration des alarmes

1. Sélectionner ***Configuration*** > ***Instrument*** > ***Alarme*** > ***Alarme A1*** ou ***Alarme A2*** et confirmer.
   Le seuil d'alarme actuel de l'alarme s'affiche.
2. Accepter la proposition affichée ou modifier les paramètres suivants (confirmer les étapes de configuration les unes après les autres avec ***Suite***) :
   a. Définir la valeur pour le seuil d'alarme.

b. Définir le sens de l’alarme.

En Hausse	Le sens de l’alarme est dit ascendant, si la concentration de gaz doit être supérieure à une certaine valeur pour déclencher une alarme.
En Baisse	Le sens de l’alarme est dit descendant, si la concentration de gaz doit être inférieure à une certaine valeur pour déclencher une alarme.

c. Définir le mode d’auto-maintien.

Auto-maintien	Lorsque le seuil d’alarme est atteint, l’appareil déclenche l’alarme. L’appareil conserve l’état d’alarme même si la concentration de gaz ne satisfait plus la condition d’alarme. Pour effacer une alarme d’auto-maintien, celle-ci doit être acquittée.
Sans auto-maintie	L’état d’alarme s’efface si la concentration de gaz ne satisfait plus la condition d’alarme.

d. Définir le mode d'acquittement.

Acquittable	Le relais d’alarme et la LED peuvent être réinitialisés avant que la condition d’alarme ne s’efface.
Non-acquittable	Le relais d’alarme et la LED ne peuvent pas être réinitialisés tant que la condition d’alarme n’est pas effacée.
Pre-acquittement	L’état d’alarme peut être acquitté avant que la condition d’alarme ne s’efface. Cependant, le relais d’alarme et la LED restent actifs tant que la condition d’alarme n’est pas effacée.

e. Régler la valeur d’hystérésis.
La fonction d’hystérésis définit un intervalle durant lequel un relais déclenché maintient son état jusqu’à ce que la concentration de gaz soit en dehors de l’intervalle défini. Exemple : le seuil d’alarme est réglé sur 40 ppm et l’hystérésis sur 3 ppm. L’alarme reste active jusqu’à ce que la valeur devienne inférieure à 37 ppm. Cela permet d’éviter que les relais ne se ferment et s'ouvrent plusieurs fois à un seuil d’alarme (« rebond »).

ℹ Lorsque le sens d’une alarme a été modifié (de descendante à ascendante ou vice versa), vérifier et corriger à nouveau la valeur de l’hystérésis le cas échéant.

⇒ Un écran de confirmation affiche tous les paramètres.

f. Sélectionner ***Confirmer*** et confirmer avec OK.

✓ Les nouveaux paramètres sont enregistrés.

11.9.3 Test des alarmes / relais

Ces fonctions changent l’état d’un relais et d’une LED dans un but de test (par exemple pour vérifier le fonctionnement des appareils d’alarme connectés au relais). Le symbole 🔧 est affiché. Après avoir quitté cette fonction, les statuts du relais et de la LED retourneront automatiquement à leur valeur précédente.

1. Sélectionner la condition d’alarme souhaitée dans ***Configuration*** > ***Instrument*** > ***Alarme*** > et confirmer.

Alarme A1	Simule une pré-alarme
Alarme A2	Simule une alarme principale
test. Erreur	Simule un signal de défaut

2. Sélectionner ***Activée*** et confirmer.
   ⇒ Le relais de défaut est désexcité et l’interface 4 à 20 mA est réglée sur courant de défaut. La LED jaune est allumée, le symbole maintenance s’affiche. La simulation est terminée à la sortie du menu.

11.10 Configuration de l’enregistreur de données

11.10.1 Afficher le graphe

Il est possible de visualiser les 15 dernières minutes sous forme de graphe temps / concentration.

1. Sélectionner ***Information*** > ***Mémoire*** > ***Graphe***

11.10.2 Activation/désactivation de l’enregistreur de données

1. Sélectionner ***Configuration*** > ***Mémoire*** > ***Mémoire on/off*** et confirmer.
2. Sélectionner ***Activée*** ou ***Désactivée*** et confirmer.

11.10.3 Régler la période d'échantillonnage

Cette fonction définit la fréquence à laquelle une valeur sera enregistrée.

1. Sélectionner ***Configuration*** > ***Mémoire*** > ***Mémoire on/off*** > ***Temps Echantil.*** et confirmer.
2. Sélectionner l'intervalle d'enregistrement et valider.

11.10.4 Régler la valeur de pic/moyenne

Cette fonction permet de définir la valeur à enregistrer.

1. Sélectionner ***Configuration*** > ***Mémoire*** > ***Cfg. Mémoire*** > ***Pic/Moyenne*** et confirmer.
2. Sélectionner ***Pic*** ou ***Moyenne*** et confirmer.

Pic	La valeur maximale (en cas de surveillance de concentrations décroissantes, la valeur la plus basse) des concentrations mesurées dans la période d'échantillonnage sélectionnée est enregistrée.
Moyenne	La valeur moyenne de toutes les valeurs de concentration mesurées pendant la période d'échantillonnage sélectionnée est enregistrée.

11.10.5 Activation ou désactivation du mode de déclenchement

Cette fonction permet l'enregistrement de valeurs à partir d'une certaine valeur.

1. Sélectionner ***Configuration*** > ***Mémoire*** > ***Cfg. Mémoire*** > ***Trigger on/off*** et confirmer.
2. Sélectionner ***On*** ou ***Off*** et confirmer.

On	Les mesures sont enregistrées si elles dépassent un seuil supérieur à la valeur de déclenchement (par rapport à la dernière valeur enregistrée).
Off	Les mesures dans la période d'échantillonnage sont enregistrées.

11.10.6 Régler la valeur de déclenchement

Cette fonction définit le seuil de déclenchement pour enregistrer une valeur. La valeur de déclenchement est définie en pourcentage du dépassement d'échelle.

Exemple : Une valeur de déclenchement de 2 % pour un dépassement d'échelle de 500 ppm n'enregistrera que les valeurs s'écartant de 10 ppm de la valeur précédemment enregistrée.

1. Sélectionner ***Configuration*** > ***Mémoire*** > ***Mémoire on/off Valeur trigger*** et confirmer.
2. Régler et valider le seuil de déclenchement.

11.10.7 Réglage de la fonction Stack ou Roll

1. Sélectionner ***Configuration*** > ***Mémoire*** > ***Cfg. Mémoire*** > ***Empiler/Réécrire*** et confirmer.
2. Sélectionner ***Empiler*** ou ***Réécrire*** et confirmer.

Roll	Dès que la capacité de l'enregistreur de données est épuisée, les anciennes données sont écrasées par de nouvelles valeurs.
Stack	Dès que la capacité de l'enregistreur de données est épuisée, aucune nouvelle valeur ne peut être enregistrée. L'appareil émet un avertissement.

11.10.8 Vider l'enregistreur de données

Cette fonction supprime les données enregistrées.

1. Sélectionner ***Configuration*** > ***Mémoire*** >***Effacer Mémoire*** et confirmer.
2. Pour vider l'enregistreur de données, sélectionner ***Confirmer*** et confirmer avec [OK].

12 Réglages de l'interface

12.1 Interface 4-20mA

La sortie électrique de l'instrument en mode normal de fonctionnement est comprise entre 4 et 20 mA et est proportionnelle à la concentration de gaz détectée.

Polytron 8xx0 utilise plusieurs valeurs de courant pour indiquer plusieurs modes de fonctionnement. Les paramètres par défaut sont réglables par l'utilisateur selon les exigences de ses applications particulières. Cela est conforme à la recommandation NAMUR NE43.

12.1.1 Dépassement d'échelle

Polytron® 8100 EC, 87x0 IR et 8200 CAT LC uniquement

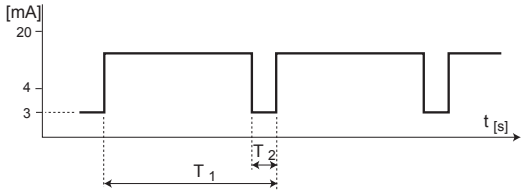
Certains capteurs permettent un dépassement d'échelle ajustable pour limiter la plage de mesures pour l'interface de 4-20 mA.

Le dépassement d'échelle (FSD) détermine un point final dans la plage de mesure du capteur. Si la concentration de gaz atteint ce point final, l'interface de 4-20 mA transmet 20°mA.

Exemple : Plage requise de 0 à 500 ppm CO (par exemple numéro de référence 6809605, par défaut 300 ppm, plage min/max = 50 / 1000 ppm). Sélectionner un dépassement d'échelle de 500 ppm. La sortie analogique est linéaire entre 4 mA = 0 ppm et 20 mA = 500 ppm.

12.1.2 Réglage du signal d'erreur

Cette fonction définit l'intensité pour le signal d'erreur.



1. Sélectionner ***Configuration*** > ***Interface analog*** >***Courant erreur*** > ***Communication*** et confirmer.
2. Sélectionner la ligne pour modifier le courant et confirmer.
3. Régler et valider le courant.
   ⇒ Le réglage du ***Courant erreur*** est affiché.
4. Sélectionner ***Confirmer*** et valider avec [OK].

12.1.3 Informations sur le signal d'avertissement

Pour transmettre un signal d'avertissement via l'interface analogique, celui-ci doit être activé.
Le signal d'avertissement alterne entre le courant d'avertissement et le courant de mesure.

– Courant d'avertissement (intervalle T2)
– Courant de mesure (intervalle T1-T2)

Les intervalles de temps et le courant d'avertissement sont configurables.

35869

12.1.4 Pour activer ou désactiver le courant d'avertissement

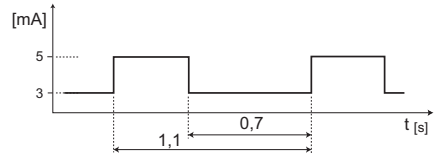
1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface analog*** > ***Rapport d' Info*** et confirmer.
2. Sélectionner ***Activée*** ou ***Désactivée*** et confirmer.

12.1.5 Réglage de l'intervalle d'avertissement

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface analog*** > ***Interval avert.*** et confirmer.
2. Régler l'heure et les intervalles d'avertissement T1 et T2 et confirmer.

12.1.6 Régler le courant d'avertissement

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface analog*** > ***Courant d'avert.*** et confirmer.
2. Régler l'intensité et valider avec [OK].



12.1.7 Réglage des avertissements du Dräger SensorAlive

Ce menu sert à configurer divers paramètres du courant d'avertissement :

- Pour régler le courant d'avertissement, sélectionner ***Configuration*** > ***Communication*** > ***Interface Analog*** > ***Cour. alerte DSA*** et saisir la valeur.
- Pour régler un seuil de l'avertissement, sélectionner ***Configuration*** > ***Communication*** > ***Interface Analog*** > ***Limit.alerte DSA*** et saisir la valeur.
- Pour activer/désactiver la fonction d'avertissement, sélectionner ***Configuration*** > ***Communication*** > ***Interface Analog*** > ***Déf. alerte DSA*** et confirmer. Sélectionner ***Activée*** ou ***Désactivée*** et confirmer.

12.1.8 Réglage du signal de maintenance

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface analog*** > ***Signal Mainten.*** et confirmer.
2. Régler le type de signal et confirmer.

Statique	Un courant constant configurable.
Dynamique	Un signal d'onde carré avec les caractéristiques suivantes : 

12.1.9 Réglage du courant de maintenance

Le courant de maintenance ne peut être réglé que si le signal de maintenance a été réglé sur « statique ».

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface analog*** >***Courant Maint.*** et confirmer.
2. Régler le courant et confirmer.

12.1.10 Ajustage signal sortie

Cette fonction ajoute une correction à la sortie analogique à 4 mA. Cette correction règle l'intensité à 4 mA sans affecter la valeur de consigne de 20 mA.

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface analog*** >***Corr. Analogique*** et confirmer.
2. Sélectionner la ligne correspondant à la modification de la correction (Plage : –0,5 à 0,5 mA, SIL : –0,1 à 0,1) et confirmer.
3. Régler et valider le courant.
   ⇒ Le réglage pour ***Corr. Analogique*** est affiché.
4. Sélectionner ***Confirmer*** et valider avec [OK].

12.1.11 Ajustage signal sortie

Cette fonction règle la sortie analogique à 20 mA sans affecter la valeur de consigne de 4 mA.

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface analog*** > ***Sensibilité analogique*** et confirmer.
2. Sélectionner la ligne correspondant à la modification de la correction (Plage : –0,5 à 0,5 mA, SIL : –0,1 à 0,1) et confirmer.
3. Régler et valider le courant.
   ⇒ Le réglage pour ***Sensibilité analogique*** est affiché.
4. Sélectionner ***Confirmer*** et valider avec [OK].

12.1.12 Test de l'interface analogique

Ces fonctions modifient l'intensité de l'interface analogique dans un but de test (par exemple pour contrôler la programmation de la centrale de commande). Il peut être nécessaire de bloquer les alarmes sur la centrale de commande pour éviter les fausses alarmes. Une fois cette fonction quittée, les intensités reviennent automatiquement au signal de maintenance. Durant le test, le symbole de maintenance s'affiche.

- Pour régler le courant ou la concentration :

1. Sélectionner l'option souhaitée dans ***Configuration*** > ***Communication*** > ***Interface analog***.

Régl. courant	Cette fonction règle le courant sur une valeur entre 0 et 22 mA. Le courant de décalage et la sensibilité analogique ne sont pas utilisés dans cette fonction.
Régl. concentr.	Cette fonction permet de régler le courant sur une valeur de mesure librement sélectionnable entre 0 ppm et la valeur maximale de la plage de mesure.

2. Une fois que les alarmes ont été bloquées sur la centrale de commande, confirmer le message ***Alarmes désactivées*** avec ***Suite***.
3. Sélectionner la ligne à modifier et valider avec [OK].
4. Sélectionner la valeur souhaitée.
5. Sélectionner ***Suite*** et confirmer.
6. Sélectionner l'option souhaitée :

Reglage concentr. / ***Régl.cour.sort***	Cette fonction définit la valeur de mesure ou la valeur test de courant prédéfinie. Durant le test, le symbole de maintenance s'affiche.
Concentr. off / ***Courant off***	Cette fonction annule la transmission de la valeur test prédéfinie.

7. Sélectionner ***Suite*** et confirmer.
   ⇒ La fonction est interrompue.
8. Une fois que les alarmes ont été réactivées sur la centrale de commande, confirmer le message : ***Alarmes activées***.

- Pour régler le signal de test :

1. Sélectionner le test à réaliser dans ***Configuration*** > ***Communication*** > ***Interface analog***.

test. Erreur	Règle l'intensité électrique sur la valeur du courant de défaut.
Régl. alarme	Règle l'intensité électrique sur la valeur du courant d'avertissement.
Régl.mainten.	Règle l'intensité électrique sur la valeur du courant de maintenance.

2. Une fois que les alarmes ont été bloquées sur la centrale de commande, confirmer le message ***Alarmes désactivées***.
3. Sélectionner ***Activée*** ou ***Désactivée*** et confirmer.

12.1.13 Beam Block

Cette fonction est disponible seulement pour le Polytron 87x0 IR (avec le capteur PIR 7000/7200).

Par défaut, la fonction beam block est désactivée en réglage d'usine.

S'il est activé, le signal du beam block sera transmis à l'interface analogique si le système optique du capteur PIR 7000/7200 est « sale ». Le système optique du PIR 7000/7200 peut devenir « sale » s'il y a formation de dépôts sur les surfaces optiques. Cependant, si la concentration de gaz dépasse la limite du beam block, l'instrument revient en fonctionnement normal.

Si les dépôts sur les surfaces optiques sont tels que la mesure n'est plus possible, l'instrument passe en défaut.

- Pour mettre les signaux beam block sur activé/désactivé :

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface analog*** et l'option souhaitée.

Beamblock On/Off	Cette fonction active ou désactive le beam block
Régl.beamblock	Cette fonction définit l'intensité sur l'intensité d'avertissement du beam block

2. Sélectionner ***Activée*** ou ***Désactivée*** et confirmer.

- Pour régler les signaux du beam block :

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface analog*** et l'option souhaitée.

Courant beambl.	Cette fonction définit l'intensité pour le signal du beamblock.
Limite Beamblock	Cette fonction définit la limite maximale si le signal du beam block doit être transmis par l'interface analogique.

2. Sélectionner la ligne correspondant à la modification du signal et valider.
3. Régler le courant et confirmer.
   ⇒ Le réglage du signal du beam block est affiché.
4. Sélectionner ***Confirmer*** et confirmer avec OK.

12.2 Interface HART

12.2.1 Définition de l'adresse de polling

L'adresse de polling (adresse de requête) configure le détecteur de gaz pour le mode analogique ou multipoint.

Commande HART : #6 (Write Polling Adress)

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface Hart*** > ***Polling address***.
2. Définir l'adresse de polling et sélectionner ***Confirmer***.

0	Active le mode analogique
1 à 15	Active le mode multipoint. L'interface 4 à 20 mA est désactivée et configurée pour un courant constant d'environ 1 mA.

ℹ Configurer tous les appareils d'une ligne avec des adresses de polling différentes. Utiliser de préférence une séquence commençant à 1.

12.2.2 Affichage de l'identificateur unique

L'identificateur unique (adresse HART unique) doit être connu pour pratiquement toutes les commandes HART d'adressage.

Commandes HART :

– #0 (Read Unique Identifier)
– #11 (Read Unique Identifier associated with Tag)

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface Hart*** > ***Unique identifr***.
2. L'identificateur unique s'affiche.

12.2.3 Configuration du Tag HART

Le Tag HART (désignation du point de mesure) sert à repérer un point de mesure.

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface Hart*** > ***TAG***.
2. Définir le Tag HART et sélectionner ***Confirmer***. Le Tag HART peut comporter jusqu'à 8 caractères alphanumériques.

12.2.4 Configuration du protocole Dräger REGARD

Cette fonction permet de basculer entre différents protocoles HART.

1. Sélectionner ***Configuration*** > ***Communication*** > ***Interface Hart*** > ***Dräger REGARD***.
2. Sélectionner la version logicielle correspondant à la centrale de commande REGARD.

12.3 Interfaces numériques

Les documents suivants détaillent la configuration des autres interfaces :

Interface	Document
PROFIBUS PA	9033782
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

13 Configuration du capteur

13.1 Activation ou désactivation du calibrage automatique

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Autocalibrage*** et confirmer.
2. Sélectionner ***Activée*** ou ***Désactivée*** et valider avec [OK].

13.2 Plage de capture

La plage de capture masque les de mesure. Les fluctuations de mesure sont des variations mineures des valeurs mesurées (telles que le bruit du signal, les variations de concentration). Ces variations ne modifient pas la valeur transmise ou affichée. Les valeurs mesurées dans cette plage sont affichées avec la valeur de capture. Les valeurs mesurées en dehors de la plage de capture sont affichées avec la valeur mesurée actuelle.

Valeur de capture (correction)

La valeur de capture est affichée en permanence, tant que la valeur mesurée se situe entre les limites supérieure et inférieure de la valeur de capture.

Limite supérieure de la valeur de capture

La limite supérieure de la valeur de capture indique la limite supérieure de la plage dans laquelle la valeur de capture est affichée.

Limite inférieure de la valeur de capture

La limite inférieure de la valeur de capture indique la limite inférieure de la plage dans laquelle la valeur de capture est affichée.

13.2.1 Réglage de la plage de capture

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Affichage plage*** et confirmer.
2. Régler la correction dans la première fenêtre.
3. Régler la valeur minimale de la plage de capture et valider avec ***Suite***.
4. Régler la valeur maximale de la plage de capture et valider avec ***Suite***.
5. Vérifier toutes les valeurs et valider avec ***Suite***.

13.2.2 Désactivation de la plage de capture

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Affichage plage*** et confirmer.
2. Définir la correction dans la première fenêtre.
3. Régler la valeur minimale de la plage de capture sur 0 et confirmer avec ***Suite***.
4. Régler la valeur maximale de la plage de capture sur 0 et confirmer avec ***Suite***.
5. Contrôler toutes les valeurs et confirmer avec ***Suite***.

13.3 Réinitialiser le capteur

Cette fonction rétablit les paramètres d'usine sur le capteur.

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Init basic Canal*** et confirmer.
2. Sélectionner ***Confirmer*** et valider avec [OK].

13.4 Configuration période de calibrage

Une fois l'intervalle de calibration expiré, l'instrument émet un avertissement indiquant que le calibrage doit être effectué.

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Interval de cal.*** et confirmer.
2. Régler et valider l'intervalle de calibrage avec [OK].

13.5 Réglage du verrouillage du capteur

Ce point ne s'applique qu'au Polytron 8100 EC et au Polytron 87x0 IR.

1. Sélectionner ***Configuration*** >***Capteurs*** > ***Verrou capteur*** et confirmer.
2. Sélectionner ***On*** ou ***Off***.

On	L'instrument rejettera tout capteur dont la référence ne correspond pas à la référence du capteur installée précédemment.
Off	L'instrument accepte tous types de capteur et chargera les réglages par défaut de ce capteur. Cependant, ces paramètres par défaut recouvriront tout réglage personnalisé du nouveau capteur.

13.6 Dongles logciels pour capteurs EC

13.6.1 Installation du dongle

1. Mettre l’appareil hors tension ou déclasser la zone conformément aux règlementations locales.
2. Desserrer la vis de blocage et dévisser le couvercle de l’appareil.
3. Insérer le module de test avec son logo Dräger vers le haut dans l’emplacement de la carte de circuit imprimé, Voir la figure D de la page dépliante.
4. Positionner la carte de circuit imprimé et fermer l’appareil (Voir "Fermeture du détecteur de gaz", page 106).

13.6.2 Désactivation du dongle

Cette fonction désactive un dongle pour le retirer de manière sûre ou s’il est défectueux.

Un dongle ne peut être réactivé qu’en coupant puis en rétablissant l'alimentation électrique de l’appareil.

1. Sélectionner***Configuration*** > ***Instrument*** > ***Fiche logiciel*** > et le dongle à désactivé puis confirmer.
2. Sélectionner ***Désactivation fonc.***. Le dongle sélectionné est désactivé.

13.7 Réglages du capteur sur le Polytron® 8100 EC

13.7.1 Autotest du capteur

Cette fonction n’est active que si le dongle de test du capteur ou de diagnostic est installé. Si le capteur échoue à l’autotest, le système émet un message d’avertissement ou d’erreur.

Configurer l’autotest régulier du capteur

Cette fonction déclenche périodiquement l’autotest du capteur. L’appareil contrôle régulièrement le bon fonctionnement du capteur.

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Autotest capt.*** et confirmer.
2. Sélectionner ***Activée*** ou ***Désactivée*** et confirmer.

Démarrage manuel d’un autotest du capteur

Cette fonction permet le démarrage manuel d’un autotest du capteur.

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Autotest capt.*** et confirmer.
2. ***Start test du capteur*** s'affiche.
3. Sélectionner ***Confirmer***.

✓ Le résultat du test est affiché.

13.7.2 Configuration du gaz

Cette fonction règle le type de gaz ainsi que la plage et les unités de mesure. Les réglages dépendent du capteur installé.

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Gas-Cfg*** et confirmer.
   ⇒ Le gaz de mesure actuel s’affiche.
2. Sélectionner le gaz de mesure dans la liste et valider.
   ⇒ L’unité de mesure actuelle s’affiche.
3. Sélectionner l’unité de mesure dans la liste et valider.
   ⇒ La valeur maximale actuelle de la plage de mesure s’affiche.
4. Pour certains capteurs EC seulement : régler la valeur maximale de la plage de mesure et confirmer.
   ⇒ La nouvelle valeur maximale de la plage de mesure s’affiche.
5. Sélectionner ***Suite*** et confirmer.
   ⇒ Une vue d’ensemble des nouveaux réglages du gaz s’affiche.
6. Après les avoir contrôlé, sélectionner ***Retour Menu*** ou ***Confirmer***.

Retour Menu	Sélectionner Retour au menu pour quitter la fonction sans apporter de modifications et valider avec [OK].
Confirmer	Sélectionner Confirmer pour accepter les réglages et valider avec [OK].

13.7.3 Configuration du Dräger SensorAlive

Ce menu permet de régler différents paramètres définissant le comportement du Dräger SensorAlive :

- Pour activer ou désactiver les fonctions LifeTest du capteur, sélectionner ***Configuration*** > ***Capteurs*** > ***SensorAlive*** > ***Activation DSA*** et confirmer.
  Sélectionner ***Activée*** ou ***Désactivée*** et confirmer.
- Pour confirmer une obstruction du capteur, sélectionner ***Configuration*** > ***Capteurs*** > ***SensorAlive*** > ***Acquitt. défauts***.
- Pour activer ou désactiver la détection des défauts, sélectionner ***Configuration*** > ***Capteurs*** > ***SensorAlive*** > ***Détection défaut*** et confirmer.
  Sélectionner ***Activée*** ou ***Désactivée*** et confirmer.

Le menu ***SensorAlive*** contient les sous-menus suivants :

– LifeTest
– Surveillance de la sensibilité

Le sous-menu LifeTest permet de régler les paramètres suivants :

- Pour définir le moment où un test doit être lancé, sélectionner ***Heure***.
  Saisir une heure et confirmer. Le test est lancé lorsque cette heure est atteinte sur le transmetteur.

  ℹ Les transmetteurs ne prennent pas en charge le passage automatique à l'heure d'été/d'hiver.

- Pour déterminer quelle valeur doit être émise par le transmetteur pendant le LifeTest, sélectionner ***Comport. sortie***.
  Sélectionner ***Fixé***, ***Maintenance*** ou ***Valeur mesurée*** et confirmer.
- Pour spécifier si les tests répétés doivent être effectués en une seule fois lorsqu'un LifeTest donne un résultat négatif, sélectionner ***Mode répétition***.
  Sélectionner ***Flexible*** et confirmer.
  Si l'option ***Statique*** est sélectionnée, les tests ne seront pas répétés, mais une nouvelle série de tests sera effectuée à l'heure indiquée.
- Pour définir le moment où un LifeTest est interrompu, sélectionner ***Seuil annulation***.
  Saisir une valeur et confirmer.

  ℹ Pendant un LifeTest, le Dräger SensorAlive est exposé à un gaz de test. La valeur mesurée augmente. Pour éviter qu'une alarme ne se déclenche, la valeur mesurée n'est pas transmise par défaut pendant 15 minutes au maximum. Le comportement pendant un LifeTest peut toutefois être configuré dans le menu ***Comport. sortie***. Néanmoins, le capteur détecte une éruption de gaz lorsque la concentration de gaz mesurée devient supérieure à celle attendue par le LifeTest. La différence correspond à la concentration de l'éruption de gaz et est comparée à la valeur saisie dans ***Seuil annulation***. Si cette valeur est dépassée, le LifeTest est immédiatement interrompu. Le capteur repasse en mode mesure et le transmetteur affiche une nouvelle valeur. Si des relais sont utilisés, ils sont commutés sur le transmetteur et des alarmes sont déclenchées le cas échéant.

Le sous-menu ***Cont.sensibilité*** permet de régler les paramètres suivants :

- Pour indiquer si un avertissement doit être émis, sélectionner ***Activation*** et confirmer.
- Pour définir le moment où un avertissement doit être émis, sélectionner ***Alerte < 50%*** ou ***Alerte < 40%*** et confirmer.

13.8 Réglages du capteur sur le Polytron® 8200 CAT / 8310 IR

13.8.1 Type de capteur

Cette fonction définit le type de capteur installé.

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Type de capteur*** et valider.
2. Sélectionner le type de capteur et valider.

13.8.2 Configuration de gaz

Cette fonction règle l'unité de mesure.

Pour les capteurs LC, cette fonction permet également de régler le dépassement d'échelle.

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Gas-Cfg*** et valider.
2. Sélectionner l'unité de mesure de votre choix dans la liste et valider.
   ⇒ Pour les capteurs DQ et DSIR :
   Une vue d'ensemble des nouveaux réglages du gaz apparaît. Poursuivez avec l'étape 4.
   ⇒ Pour les capteurs LC :
   L'actuel dépassement d'échelle complet s'affiche. Poursuivez avec l'étape 3.
3. Régler le dépassement d'échelle et valider (seulement pour les capteurs LC).
   ⇒ Une vue d'ensemble des nouveaux réglages du gaz apparaît.
4. Après avoir effectué la révision, sélectionnez ***Retour Menu*** ou ***Confirmer***.

Retour Menu	Sélectionner Retour au menu pour quitter la fonction sans apporter de modifications, et valider avec [OK].
Confirmer	Sélectionner Confirmer pour accepter les réglages et valider avec [OK].

13.8.3 Configuration du verrouillage du capteur DQ

Cette fonction n'est disponible que si aucun relais n'est installé. Cette fonction permet de définir si le capteur DQ doit être acquitté après une mesure de concentration supérieure à 100 %LIE.
Ce réglage ne s'applique pas aux capteurs LC.

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Verrouillage du capteur DD*** et confirmer.
   ⇒ Le réglage actuel s'affiche.
2. Sélectionner ***Activée*** ou ***Désactivée*** et confirmer.

⚠ AVERTISSEMENT
Risque d'explosion
Si l'auto-maintien du capteur est désactivé et qu'une alarme indiquant un risque d'explosion est acquittée, l'instrument informe l'utilisateur final de ce danger en allumant en permanence la LED rouge à l'écran.

► Avant d'acquitter un dépassement de plage, s'assurer que la concentration du gaz est passée en dessous de 100 %LIE.

⚠ AVERTISSEMENT
Risque d'explosion potentiel
Fonctionnement non conforme aux épreuves de test BVS.
Si le verrouillage du capteur DQ est désactivé, la centrale de commande doit prendre en charge cette fonction pour assurer le fonctionnement sécurisé conformément à BVS 13 ATEX G 001 X.

► Vérifier qu'un indicateur automaintenu de dépassement de la plage de mesure est activé sur Il'unité d'affichage.

13.9 Configuration du capteur Polytron 8310 IR

13.9.1 Modification de la catégorie du gaz

Le DrägerSensor IR peut mesurer des gaz et des vapeurs appartenant aux catégories de gaz méthane, propane ou éthène (éthylène). La catégorie de gaz doit être définie pour le DrägerSensor IR en fonction du gaz cible à mesurer. La documentation du DrägerSensor IR détaille l'affectation des gaz et des vapeurs aux catégories de gaz.

13.9.2 Modification de la catégorie du gaz

Conditions nécessaires

– Le détecteur de gaz a été mis en marche il y a moins d'une heure.
– La compensation automatique du point zéro. sur le capteur a été effectué il y a moins d'une heure (Voir "Particularité du Polytron 8310", page 116).
– La concentration de gaz mesurée par le détecteur de gaz est inférieure à 10 %LIE (exposer le capteur à un gaz neutre le cas échéant).

1. Désactiver la fonction d'alarme du détecteur de gaz (Voir "Activer ou désactiver une alarme", page 124).
2. Sélectionner ***Configuration*** > ***Capteurs*** > ***Catégorie DSIR*** et confirmer.
   ⇒ La catégorie du gaz est affichée sur l'appareil.

ℹ Les autres étapes sont effectuées sur le capteur.

3. Pour sélectionner la catégorie du gaz sur le capteur, appuyer sur le symbole ⇧S ou ⇩0 avec la baguette magnétique.
   ⇒ Le détecteur de gaz affiche START.
4. Retirer la baguette magnétique.
   ⇒ Le capteur passe à un signal de sortie qui représente la catégorie de gaz actuellement définie :
   Signal de sortie 20 %LIE : Catégorie de gaz Méthane
   Signal de sortie 40 %LIE : Catégorie de gaz Propane
   Signal de sortie 60 %LIE : Catégorie de gaz éthène (éthylène)
5. Ce signal de sortie est maintenu pendant 30 secondes. Pendant cette période, le gaz suivant peut être sélectionné en plaçant la barrette magnétique sur la zone marquée par le symbole ⇧S.
   ⇒ Le signal de sortie du capteur passe alors à la valeur correspondant à la nouvelle catégorie de gaz sélectionnée. Si aucune autre saisie n'est effectuée avec la baguette magnétique pendant plus de 30 secondes, le réglage est enregistré.
6. Vérifier l'ajustage sensibilité sur le détecteur de gaz (Voir "Calibrage sensibilité", page 117)
7. Activer la fonction d'alarme du détecteur de gaz (Voir "Activer ou désactiver une alarme", page 124).

ℹ Le réglage sur le capteur peut entraîner l'affichage d'une catégorie de gaz incorrecte dans le menu ***Catégorie DSIR*** ou l'impossibilité de voir le changement de catégorie de gaz.

13.10 Réglages du capteur Polytron® 87x0 IR

13.10.1 Configuration de gaz

Cette fonction règle le type de gaz, la plage de mesure et les unités de mesure. Seuls certains capteurs peuvent prendre ces réglages en charge.

1. Sélectionner ***Configuration*** > ***Capteurs*** > ***Gas-Cfg*** et confirmer.
   ⇒ Le gaz actuellement mesuré s'affiche.
2. Sélectionner le gaz cible dans la liste et valider.
   ⇒ L'unité de mesure actuelle s'affiche.
3. Sélectionner l'unité de mesure de votre choix dans la liste et valider.
   ⇒ Si l'unité de mesure est réglée sur %LEL, %UEG ou %LIE, la catégorie s'affiche. Poursuivre à l'étape 4.
   ⇒ Sinon, le dépassement d'échelle du signal s'affiche. Poursuivre à l'étape 6.
4. Sélectionner une fonction et valider.
5. Régler et valider le seuil de LIE.
6. Régler le dépassement d'échelle et confirmer.
   ⇒ Le nouveau dépassement d'échelle du signal s'affiche.
7. Sélectionner ***Suite*** et confirmer.
   ⇒ Une vue d'ensemble des nouveaux réglages du gaz apparaît.
8. Après révision, sélectionner ***Retour Menu*** ou ***Confirmer***.

Retour Menu	Sélectionner Retour au menu pour quitter la fonction sans apporter de modifications, et valider avec [OK].
Confirmer	Sélectionner Confirmer pour accepter les réglages et valider avec [OK].

9. Contrôler les réglages d'alarme après avoir modifié la catégorie ou la valeur LIE.

14 Réglages par défaut d'usine

14.1 Réglages fixes pour relais, LED et alarme

	Réglage
Relais de défaut :	Excité / contact de travail (Normally Open)
LED jaune :	Allumée lorsqu'un message de défaut est actif
LED rouge :	Clignote une fois lorsqu'une alarme A1 est active. Clignote deux fois lorsqu'une alarme A2 est active. Si une alarme a été configurée comme pouvant être acquittée et qu'elle a effectivement été acquittée, la LED arrête de clignoter une ou deux fois et reste allumée.
Hiérarchie des alarmes :	A2 est prioritaire sur A1 sur la LED. Toutefois, les relais A1 et A2 fonctionnent indépendamment. (Exemple : si A1 peut être acquittée et A2 ne l'est pas et que la concentration de gaz est suffisamment élevée pour déclencher A1 et A2, le relais A1 se désexcite lorsque l'alarme est acquittée. Toutefois, la LED rouge continue de clignoter deux fois tant que la condition ayant déclenché l'alarme A2 est présente.

14.2 Configurations modifiables dans le menu

Menu	Réglage par défaut	Plage
Relais actif en cas d'alarme/aucune alarme	Actif en cas d'alarme	Marche/Arrêt
Alarme A1 : Sens	Ascendante (descendante pour les capteurs O_2)	Descendante/Ascendante
Alarme A2 : Sens	Ascendante	
Mode automaintien A1	Sans automaintien	Avec automaintien/sans automaintien
Mode automaintien A2	Automaintien	
Mode d'acquittement A1	Acquittable	Acquittable/Non acquittable/préaquittable
Mode d'acquittement A2	Non acquittable	
Mode de fonctionnement normal Relais A1	Excité	Excité/Non excité
Mode de fonctionnement normal Relais A2		

Menu	Réglage par défaut	Plage
Mot de passe Ajustage	_ _ _ 1	
Mot de passe Réglages	_ _ _ 2	
Réglage LCD	Marche	Marche/Arrêt
Statut SIL	Arrêt	Marche/Arrêt
Langue	EN	DE / EN / FR / ES / RU / ZH
Ajustage automatique	Arrêt	Marche/Arrêt
Touche de fonction	Défaut	Graphique, défaut, avertissement, vitalité, test au gaz

Interface	Réglage par défaut	Plage
Courant de défaut	1,2 mA	0 à 3,5 mA
Avertissement	Arrêt	Marche/Arrêt
Courant d´avertissement	3,0 mA	0 à 3,5 mA
Intervalle du cycle d'avertissement T1	10 s	5 à 60 s
Intervalle du cycle d'avertissement T2 (courant d'avertissement)	1 s	1 à (T1-1) sec
Signal de maintenance	statique	Statique/dynamique
Courant de maintenance	3,4 mA	0 à 3,5 mA
Décalage analogique	0 mA	-0,5-0,5 mA
Sensibilité sortie analogique	0 mA	-0,5-0,5 mA
Adresse HART®	0	0-15
Adresse Modbus[1)]	126	2-126
Parité Modbus[1)]	Pair (par défaut)	Pair, impair, sans parité
Vitesse en bauds Modbus[1)]	9600 bit/s	9600 ou 19200 bit/s
Adresse PROFIBUS®[1)]	126	2-126

1) Les interfaces bus de terrain ne sont pas conformes à BVS 13 ATEX G001 X. Aucun relais n'est disponible en utilisant une interface bus de terrain.

14.3 Valeurs spécifiques du capteur

La notice d'utilisation du capteur contient d'autres spécifications.

14.3.1 Polytron 8100 EC

Menu	Réglage par défaut	Plage
Alarme A1	En fonction du capteur utilisé	
Alarme A2	En fonction du capteur utilisé	
Hystérésis pour l'alarme A1 dans le sens ascendant	0	0 à A1
Hystérésis pour l'alarme A2 dans le sens ascendant	0	0 à A2
Hystérésis pour l'alarme A1 dans le sens descendant	0	0 à valeur maximale de la plage de mesure -A1
Hystérésis pour l'alarme A2 dans le sens descendant	0	0 à valeur maximale de la plage de mesure -A2
Intervalle d'ajustage [jours]	En fonction du capteur utilisé	0 à 720

14.3.2 Polytron 8100 EC Avec capteurs O_2

Menu	Réglage par défaut	Plage
Décalage de la plage de capture de l'écran	20,9 Vol% (O_2)	0-25 Vol% (O_2 LS) 0 à 100 Vol% (O_2)
Plage de capture de l'écran bas	-0,25 Vol% (O_2)	0 à -0,75 Vol%
Plage de capture de l'écran haut	0,25 Vol% (O_2)	0 à 0,75 Vol%
Valeur maximale de la plage de mesure	25 Vol% (O_2, O_2 LS)	5 à 25 Vol% (O_2 LS) 5 à 100 Vol% (O_2)

14.3.3 Polytron 8100 EC avec Dräger SensorAlive

Menu	Réglage par défaut	Plage

Limite du Beam Block	2,5 %LIE	0 à 15 %LIE max[1)]
Intervalle d'ajustage [jours]	360	0 à 720
Comportement de réponse	Normal	Normal/rapide
Décalage de la plage de capture de l'écran	0	Les valeurs absolues de la plage de capture d'écran doivent rester à l'intérieur de ces limites : -850 à 425 ppm (propane de type 340) -1800 à 2200 ppm (méthane de type 340)
Plage de capture de l'écran bas	-750 ppm (méthane) -85 ppm (propane)	
Plage de capture de l'écran haut	750 ppm (méthane) 85 ppm (propane)	

1) La limite max. du Beam Block dépend du type de détecteur de gaz et du gaz de mesure sélectionné.

14.3.8 Polytron 8720 IR

Menu	Réglage par défaut	Plage
Gaz étalon	CO_2	
Unités de gaz étalon	Vol%	
Concentrations de gaz étalon	4,0 Vol%	0,2 à 100 Vol%
Alarme A1	1 Vol%	0,01 à 100 Vol%
Alarme A2	2 Vol%	
Type LIE	-	
Gaz de mesure	CO_2	
Unités du gaz de mesure	Vol%	Vol%/ppm
Valeur maximale de la plage de mesure	10 Vol%	0,2 à 100 Vol%
Beam Block	Arrêt	Marche/Arrêt
Courant Beam Block	2 mA	0 à 3,5 mA
Limite du Beam Block	0,1 Vol%	0 à 0,1 Vol%
Intervalle d'ajustage [jours]	360	0 à 720
Comportement de réponse	Normal	Normal/rapide
Décalage de la plage de capture de l'écran	340 ppm	Les valeurs absolues de la plage de capture d'écran doivent rester à l'intérieur de ces limites : -1000 à 1000 ppm (dioxyde de carbone)
Plage de capture de l'écran bas	-200 ppm	
Plage de capture de l'écran haut	200 ppm	

15 Élimination

Il est interdit d'éliminer ce produit avec les déchets domestiques. C'est pourquoi, il est marqué du symbole ci-contre.
Dräger reprend gratuitement ce produit. Pour de plus amples informations, veuillez contacter les distributeurs nationaux ou vous adresser directement à Dräger.

Mise au rebut des capteurs électrochimiques

⚠ AVERTISSEMENT
Danger d'explosion et risque de brûlures chimiques !
Des fluides peuvent s'échapper du capteur et causer des brûlures à l'acide.
► Ne pas jeter les capteurs au feu.
► Ne pas ouvrir en forçant.

16 Caractéristiques techniques

16.1 Plages de mesure

Capteur	Plage de mesure
Polytron 8100 EC avec DrägerSensor® EC	En fonction du capteur utilisé
Polytron 8200 CAT avec DrägerSensor® DQ	0 à 100 %LIE
Polytron 8200 CAT avec DrägerSensor®LC	0 à 10 %LIE[1)]
Polytron 8310 IR avec DrägerSensor® IR	0 à 100 %LIE
Polytron 8700 IR avec détecteur de gaz à infrarouge PIR 7000	
Type 334 (IDS 01x1)	0 à 10 000 ppm[1)] 0 à 100 %LIE, [1)] 0 à (1,25 x LIE_{max}) Vol%,[1)2)] Pour CH4 (méthane) de 0 à 100 Vol%[1)]
Type 340 (IDS 01x2)	0 à 10 000 ppm[1)] 0 à 100 %LIE[1)] 0 à 5 Vol%[1)]
Polytron 8720 IR avec détecteur de gaz à infrarouge PIR 7200 (IDS 01x5)	0 à 100 Vol%[1)]

1) Pour une valeur maximale de la plage de mesure adaptable, voir 14.3.
2) La plage change en fonction de la substance à mesurer

16.2 Transmission du signal vers la centrale de commande

La plage de mesure et les caractéristiques techniques de mesure dépendent du capteur installé (voir la notice d'utilisation du capteur installé).

Fréquence du calcul de la valeur mesurée : 1 x par seconde (mise à jour de l'affichage, de l'interface analogique et du relais).

Signal analogique	
Fonctionnement normal	4 ... 20 mA
Dérive en-dessous de zéro	3,8 ... 4 mA
Dépassement de la plage de mesure	20 ... 20,5 mA
Erreur de l'appareil	≤ 1,2 mA
Défaut sur l'interface analogique	> 21 mA
Signal de maintenance	Signal fixe 3,4 mA ou modulation de 1 Hz entre 3 et 5 mA (sélectionnable)

Résistance de la boucle de signal

Mode de fonctionnement	Plage de résistance de la boucle de signal	Plage de l'alimentation électrique
Fonctionnement sans communication HART®	0 à 230 Ω	à 10 V CC
	Augmentation linéaire avec la tension d'alimentation de : 0 à 230 Ω à 10 V 0 à 500 Ω à 16 V	10 à 18 V CC
	0 à 500 Ω	18 à 30 V CC
Fonctionnement avec communication HART®	230 à 270 Ω	à 13 V CC
	Augmentation linéaire avec la tension d'alimentation de : 230 à 270 Ω à 11 V sur 230 à 500 Ω à 16 V	11 à 16 V CC
	230 à 500 Ω	18 à 30 V CC
Mode multipoint HART®	230 à 500 Ω	10 à 30 V CC

En cas d'utilisation conformément au test d'aptitude métrologique selon EN IEC 62990-1, EN IEC 60079-29-1 ou EN 50104, la résistance ne doit pas dépasser 300 ohms. Vous trouverez de plus amples informations sur l'installation de l'interface bus de terrain dans le document 9033783.

16.3 Caractéristiques du câble

Pour les installations hors conduite, utiliser des câbles blindés.

Connexion analogique et HART®Connexion analogique et HART® avec centrale de commande et alimentation électrique	
Alimentation électrique et signaux	Câble blindé 3 fils 24 à 12 AWG / 0,2 à 2,5 mm²
Relais	20 à 12 AWG / 0,5 à 2,5 mm²

Connexion numérique avec centrale de commande	
Les appareils avec interfaces bus de terrain et capteurs déportés doivent être installés avec des câbles blindés.	
Modbus RTU	2 ou 3 fils[1], ≥ 26 AWG
PROFIBUS PA Foundation Fieldbus	2 fils, câble type A Résistance d'onde R_W : 135 à 165 Ω Capacité / longueur d'unité C' : < 30 pF/m Résistance de la boucle R' : 110 Ω/km Diamètre du fil d : 0,64 mm Coupe transversale du fil q : > 0,34 mm² Couverture du blindage : ≥ 90 %
Alimentation électrique	2 fils, 24 à 12 AWG / 0,2 à 2,5 mm²

1) Si la distance entre la centrale de commande et le transmetteur est très longue (>1 km) et que l'alimentation électrique de la centrale de commande et du transmetteur est séparée, des défauts ou des différences de différentiel peuvent apparaître. Dans ce cas, choisir le câblage à 3 fils avec terre. La terre est ensuite connectée au transmetteur et bouclée vers la terre de la centrale de commande.

16.4 Alimentation électrique et relais

Puissance du relais[1] SPDT[2]	
230 V ~	0,1 A à 5 A
30 V ⎓, charge ohmique	0,1 A (minimum) à 5 A

1) Pour les applications liées à la sécurité (SIL 2), la puissance de couplage max. est réduite (voir Manuel de sécurité du Polytron® 8xx0).
2) Commutateur unipolaire (contacts électriques inverseurs)

Alimentation électrique Polytron 8xx0	
Tension de service	10[1] jusqu'à 30 V⎓ sur l'appareil
Courant de démarrage	2,3 A pour 2 ms à 24 V⎓, résistance 10 Ω

1) L'appareil déclenche une alarme de défaut lorsque la tension d'alimentation inférieure à 9,5 V CC.

Courant de fonctionnement	
Polytron® 8100 EC	
sans relais, capteur non déporté	80 mA
avec relais, capteur déporté	100 mA
Polytron® 8200 CAT	
sans relais, capteur non déporté	105 mA (DrägerSensor DQ) 130 mA (DrägerSensor LC)
avec relais, capteur déporté	145 mA (DrägerSensor DQ) 165 mA (DrägerSensor LC)
Polytron® 8310 IR	
sans relais, capteur non déporté	145 mA
avec relais, capteur déporté	185 mA
Polytron® 87x0 IR	
sans relais, capteur non déporté	330 mA
avec relais, capteur déporté	350 mA

16.5 Spécifications générales

Boîtier Polytron 8xx0	
Matériau du boîtier	Aluminium sans cuivre
Protection du boîtier	NEMA 4X[1] IP 65/66/67[2]
Écran	Résolution 128 x 64 pixels, rétroéclairé[3]

1) Absence de protection du boîtier Polytron 8100 EC NEMA 4X.
2) Les indices de protection IP n'impliquent pas que l'équipement détecte un gaz pendant ou après son exposition à ces conditions. En cas de dépôt de poussière et de contact avec de l'eau suite à une immersion ou un jet d'eau, vérifier l'ajustage et le bon fonctionnement de l'appareil.
3) Dans le cas de températures élevées : (>65 °C), la lisibilité de l'écran est limitée.

16.6 Paramètres ambiants

La notice d'utilisation du capteur contient d'autres spécifications et influences.

Les valeurs des accessoires et des pièces détachée peuvent différer de celles indiquées ici. Les valeurs exactes sont indiquées dans le manuel correspondant.

Polytron 8xx0	
Valeurs selon l'essai de protection contre l'explosion	
Pendant le fonctionnement :	
Pression	23,6 à 32,5 po. Hg (800 à 1100 hPa)
Humidité	0 à 100 % d'humidité relative, sans condensation
Températures	
Polytron 8100 EC	-40 à +70 °C (-40 à +158 °F)
Polytron 8200 CAT	-40 à +80 °C (-40 à +176 °F)
Polytron 8310 IR	-40 à +65 °C (-40 à +149 °F)
Polytron 87x0 IR	-40 à +80 °C (-40 à +176 °F)
Valeurs selon l'expertise métrologique	
Pendant le fonctionnement :	
Pression	20,7 à 38,4 po. Hg (700 à 1300 hPa)[1)]
Humidité	0 à 95 % d'humidité relative, sans condensation
Températures	
Polytron 8100 EC[2)]	-40 à +65 °C (-40 à +149 °F)
Polytron 8200 CAT	-40 à +80 °C (-40 à +176 °F)
Polytron 8310 IR	-40 à +65 °C (-40 à +149 °F)
Polytron 87x0 IR	-40 à +77 °C (-40 à +170 °F)
Pendant le stockage :	
Pression	26,5 à 32,4 po. Hg (900 à 1100 hPa)
Humidité	0 à 100 % d'humidité relative, sans condensation
Température	-20 à +65 °C (-4 à +149 °F)
Durée de stockage recommandée	5 ans
Valeurs pour l'option relais et les installations avec homologation UL	
Pendant le fonctionnement :	
Températures	
Polytron 8200 CAT	-40 à +70 °C (-40 à +158 °F)
Polytron 87x0 IR	-40 à +70 °C (-40 à +158 °F)

1) Polytron 8200 CAT : 23,6 à 35,44 in. Hg (800 à 1200 hPa)
2) Les restrictions relatives à la spécification maximale sont détaillées dans 18.3, 18.3.2 et dans la notice d'utilisation du capteur EC.

16.7 Couples de serrage

Filetage de l'appareil	
Couvercle du boîtier	≥44 in-lbs / ≥5 Nm
Capteur	min. 266 in-lbs / min. 30 Nm
Bouchons aveugles	min. 266 in-lbs / min. 30 Nm
Raccords (pour les conduites et les presse-étoupe)	min. 443 in-lbs / min. 50 Nm
Bouchons aveugles de la station d'accueil	62 in-lbs / 7 Nm
Presse-étoupes pour la station d'accueil	70 in-lbs / 8 Nm
Tête de mesure EC déportée	177 in-lbs ±9 in-lbs / 20 Nm ±1 Nm
Bornes de câblage de terrain	
Alimentation électrique, signaux et relais	4,4 à 7,0 in-lbs / 0,5 à 0,8 Nm
Vis de mise à la terre	10,6 in-lbs / 1,2 Nm

17 Accessoires et pièces détachées

Ce chapitre présente les composants couverts par l'examen de type BVS 13 ATEX G 001 X et PFG 14 G 001 X. D'autres pièces sont mentionnés dans la liste des pièces de rechange ou peuvent être obtenues auprès du DrägerService.

17.1 Polytron® 8xx0

Description	Référence de pièce
IRDA vers interface PC	4544197
Baguette magnétique avec porte-clés	4544101
Dräger PolySoft, logiciel de configuration	8328600 / 8328639
Bouchons aveugles EXd, acier inoxydable, 2x	4544897
Bouchons aveugles EXd, acier galvanisé, 3x	8344041

17.1.1 Station d'accueil

Description	Référence de pièce
Version seulement électrique de la station d'accueil	8344027
Alimentation de la station d'accueil, relais (comprend 2 presse-étoupes)	8344028
Station d'accueil bus de terrain	8344029

Description	Référence de pièce
Presse-étoupe, station d'accueil	6812868
Prise aveugle de station d'accueil	8344042

17.2 Polytron® 8100 EC

Description	Référence de pièce
Carte de circuit imprimé Polytron 8100 4–20/HART	4544781
Carte de circuit imprimé Polytron 8100 4–20/HART, relais	4544782
Anneau à baïonnette	4544366
Anneau à baïonnette pour Dräger SensorAlive	6800132
Adaptateur pour montage sur conduite de ventilation pour tête de mesure EC déportée[1)]	8317617
Kit de montage sur poteau pour tête de mesure déportée EC	4544213
Dongle de test capteur	8317619
Dongle Diagnostics	8317860
Adaptateur d'ajustage	6810536

1) Peut influencer la mesure, p.ex. en augmentant le temps de réponse. Non couvert par BVS 13 ATEX G 001 X et PFG 14 G 001 X.

17.3 Polytron® 8200 CAT

Description	Référence de pièce
Carte de circuit imprimé Polytron 8200 4–20/HART	4544788
Carte de circuit imprimé Polytron 8200 Relais 4–20/HART	4544789
Adaptateur d'ajustage PE, Europe	6806978
Adaptateur d'ajustage à distance DQ	6812480
Adaptateur d'ajustage à distance LC[1)]	6812482
Jeu de pièces détachées Membrane 21,50x14,50, 2x	8326840
Filtre à poussière pour DrägerSensor DQ, 10x	6810537
Adaptateur de processus DQ	6812470
Adaptateur de processus LC[1)]	6812465
Protection anti-éclaboussures	6812510

1) Non couverts par l'expertise métrologique.

17.3.1 Capteurs CAT

Description	Référence de pièce
DrägerSensor DQ NPT	6814150
DrägerSensor DQ NPT S[1)]	3701800
DrägerSensor LC NPT	6810675
Tête de mesure, Polytron SE Ex PR M1 DQ	6812711
Tête de mesure, Polytron SE Ex PR M2 DQ	6812710
Tête de mesure Polytron SE Ex HT M DQ	6812720
Capteur déporté DQ NPT alu	3706933
Capteur déporté DQ NPT acier	3706934

1) Le DrägerSensor DQ NPT S peut aussi être utilisé à la place du DrägerSensor DQ NPT.

17.4 Polytron® 8310 IR

Description	Référence de pièce
Protection anti-éclaboussures	6810796
Adaptateur de processus	6811330
Labyrinthe de protection	6811135
Adaptateur de calibrage	6810859
Carte de circuits imprimés Polytron 8310 4–20/HART	4544788
Carte de circuits imprimés Polytron 8310 Relais 4–20/HART	4544789

17.4.1 Capteurs DSIR

Description	Référence de pièce
DrägerSensor IR NPT	6811901
Tête de mesure, DrägerSensor IR set complet e	6811165
Tête de mesure, DrägerSensor IR set complet e2	6811265

17.5 Polytron® 87x0 IR

Description	Référence de pièce
Carte de circuit imprimé Polytron 87x0 4–20/HART[1)]	4544795
Carte de circuit imprimé Polytron 87x0 Relais 4–20/HART[1)]	4544796
Kit de montage PIR 7000	6811648
Cuvette de processus PIR 7000, acier inoxydable	6811415
Cuvette de processus PIR 7000 SGR	6813219
Indicateur d'état PIR 7000 / 7200	6811625 / 6811920
Protection anti-éclaboussures PIR 7000 / 7200	6811911 / 6811912
Flowcell PIR 7000/7200	6811490 / 6811910
Adaptateur pour essai à distance PIR 7000/7200	6811630 / 6811930
Protection contre les insectes PIR 7000	6811609
Filtre hydrophobique PIR 7000	6811890
Adaptateur de calibrage PIR 7000	6811610
Adaptateur de processus PIR 7000 / 7200 POM (polyoxyméthylène)	6811915
Kit de montage PIR 7000	6811648
Boîte à bornes Ex e	6811989
Boîte à bornes Ex d	4520561
Barre magnétique	4544101

1) Vérifier la compatibilité des micrologiciels du capteur et du détecteur de gaz. Le remplacement de la carte de circuit imprimé peut nécessiter une actualisation du micrologiciel . Contacter Dräger le cas échéant.

17.5.1 Capteurs

Vérifier la compatibilité des micrologiciels du capteur et du détecteur de gaz. Le remplacement du capteur peut nécessiter une actualisation du micrologiciel. Contacter Dräger le cas échéant.

Description	Référence de pièce
Dräger PIR 7000 Type 334 (NPT)	6811822
Dräger PIR 7000 Type 340 (NPT)	6811832
Dräger PIR 7000 334 (M25) Kit complet	6811825
Dräger PIR 7000 340 (M25) Kit complet	6811819
Dräger PIR 7200 (NPT)	6811572
Dräger PIR 7200 (M25) HART Kit complet	6812290

18 Homologations de performance

En combinaison avec certains capteurs, Polytron 8xx0 a un avis métrologique selon les normes suivantes :

– Certificats d'examen UE et de type selon les normes EN 60079-29-1, EN 50104, EN 45544 et DIN IEC 62990-1. Publié par DEKRA Testing and Certification GmbH, Handwerkstr. 15, 70565 Stuttgart, Allemagne.
– Expertise métrologique FM selon ANSI/ISA-92.00.01 FM6340

La notice d'utilisation de chaque capteur détaille ses spécifications et restrictions (p.ex. principes de mesure, performances, sensibilités transversales).

18.1 Certificat d'essai UE, BVS 13 ATEX G 001 X

Mesure de gaz et vapeurs inflammables mélangés avec de l'air.

– Polytron 8200 CAT avec DrägerSensor DQ

  Conditions particulières :

  - En cas d'écoulement d'air contenant des gaz de mesure, les valeurs mesurées peuvent augmenter jusqu'à 32 %.
  - En cas d'utilisation avec l'adaptateur de télécalibrage DQ, les valeurs mesurées peuvent augmenter jusqu'à 70 %.

– Polytron 8200 CAT avec DrägerSensor LC
  Homologué avec la valeur maximale de la plage de mesure 10 %LIE.
  Établir une liaison avec une centrale de commande disposant d'une fonction de mesure homologuée (par exemple, REGARD® 7000). Les alarmes auto-maintenues pour les valeurs mesurées dépassant la plage de mesure doivent être activées sur la centrale de commande.
– Polytron 8310 IR avec DrägerSensor IR
– Polytron 8700 IR avec PIR 7000 de types 334 et 340

Mesure de l'oxygène (inertisation)

– Polytron 8100 EC avec DrägerSensor O_2 (6809720) et DrägerSensor O_2 LS (6809630) dans une plage de mesure de 0 à 5...25 Vol% d'O_2.

Homologués :
– Interface 4 à 20 mA
– Module relais
– Capteur déporté
– HART
– Valeurs maximales de la plage de mesure par défaut définies en usine

L'interface bus de terrain et l'enregistreur de données ne sont pas homologués.

18.2 Certificat d'essai, PFG 14 G 001 X

Mesure de l'oxygène (carence et enrichissement)
– Polytron 8100 EC avec DrägerSensor O_2 (6809720) et DrägerSensor O_2 LS (6809630) dans la plage de mesure 0 à 25 Vol% d'O_2.

Mesure de l'hydrogène sulfuré
– Polytron 8100 EC avec Dräger SensorAlive (6809630) dans les plages de mesure suivantes :
  ● 0,5 – 100 ppm (Type HM)
  ● 0 – 100 ppm (Type SM)

Mesure du dioxyde de carbone
– Polytron 8720 IR avec PIR 7200 dans les plages de mesure suivantes :
  ● 1 Vol% et 10 Vol% – EN 45544-2
  ● 2000 ppm, 1 Vol% et 10 Vol% – EN 45544-3

Homologués :
– Interface 4 à 20 mA
– Module relais
– Capteur déporté

Non homologués :
– Interface bus de terrain
– Enregistreur de données
– Polytron 8100 EC avec Dräger SensorAlive seulement : Fonctionnalité d'autotest en cas d'utilisation du générateur de gaz

18.3 Conditions de fonctionnement certifiées DrägerSensor O_2, O_2LS et Dräger SensorAlive

Sensibilités transversales

Il n'y a pas de sensibilité transversale connue à des gaz d'interférence avec une concentration allant jusqu'à 100 ppm. Contacter Dräger pour de plus amples informations.

18.3.1 DrägerSensor O_2 (6809720)

Le DrägerSensor O_2 (6809720) est un capteur électrochimique à 2 électrodes pour la mesure de l'oxygène (O_2) dans l'air ambiant.

Paramètres ambiants	
Pression	20,7 à 38,4 po. Hg (700 à 1300 hPa)
Humidité	10 à 95 % d'humidité relative, sans condensation
Température	En cas d'application de la norme EN 50104, la plage de température est comprise entre 0 °C et +55 °C.

Stockage	
Pression	Aucune influence
Humidité	30 à 70 % d'humidité relative, sans condensation (uniquement si l'emballage du capteur est ouvert)
Température	0 à +40 °C
Durée	Le stockage des capteurs n'est pas prévu. Les capteurs doivent être utilisés dès leur réception. Durée de vie restante = durée de vie prévue - durée de stockage

Influence des paramètres ambiants	**Point zéro**	**Sensibilité[1)]**
Température[2)3)]		
0 à 55 °C	≤ 0,3 Vol% d'O_2	≤ 0,9 Vol% d'O_2
Pression	< 0,2 Vol% d'O_2	Écart relatif par rapport à la valeur à 1013 hPa : < 10 % de la valeur mesurée / 100 hPa
Humidité	Aucune influence	Écart relatif par rapport à la valeur à 50 % d'humidité relative : < 1 % de la valeur mesurée

1) L'écart relatif de la valeur affichée est causé par les changements de pression atmosphérique.
2) À des températures inférieures à -5 °C, l'écart de la valeur mesurée est supérieur à celui indiqué dans EN 50104.
3) Effectuer un ajustage à la température de fonctionnement si les températures de fonctionnement sont en dehors de la plage -5 °C à +40 °C.

Temps de réponse[1)]	**$t_{0...20}$**	**$t_{0...90}$**
0 à 5 Vol% d'O_2	≤ 15 secondes[2)]	≤ 33 secondes
0 à 25 Vol% d'O_2	≤ 10 secondes	≤ 26 secondes

1) En dessous de -5 °C, le temps de réponse peut augmenter.
2) Le temps de réponse est supérieur à la valeur limite autorisée par la norme EN 50104.

Temps de stabilisation : 5 x $t_{0...90}$

Plage de mesure

0 à 5 Vol% d'O_2 à 0 à 100 Vol% d'O_2

Valeur standard : 25 Vol% d'O_2 Valeur minimale : -1,25 Vol% d'O_2

Temps de stabilisation du capteur

En fonctionnement : <20 minutes / Ajustage : ≤ 2 heures

18.3.2 DrägerSensor O_2LS (6809630)

Le DrägerSensor O_2LS (6809630) est un capteur électrochimique à 3 électrodes pour mesurer l'oxygène (O_2) dans l'air ambiant.

Paramètres ambiants	
Pression	20,7 à 38,4 po. Hg (700 à 1300 hPa)
Humidité	5 à 95 % d'humidité relative, sans condensation
Température	-40 à +60 °C +65 °C pendant une courte période

Stockage	
Pression	Aucune influence
Humidité	30 à 70 % d'humidité relative, sans condensation (uniquement si l'emballage du capteur est ouvert)
Température	0 à +40 °C
Durée	Le stockage des capteurs n'est pas prévu. Les capteurs doivent être utilisés dès leur réception. Durée de vie restante = durée de vie prévue - durée de stockage

Influence des paramètres ambiants	Point zéro	Sensibilité
Température		
-20 à 40 °C	≤ 0,1 Vol% d'O_2	≤ 0,1 Vol% d'O_2
-40 à +65 °C	≤ 0,2 Vol% d'O_2	≤ 0,5 Vol% d'O_2
Pression	< ± 0,1 Vol% d'O_2	≤ 0,8 Vol% d'O_2
Humidité	≤ 0,1 Vol% d'O_2	≤ 0,9 Vol% d'O_2

ℹ Lors de la mesure de l'oxygène en présence d'hélium, la compensation d'hélium peut être utilisée. L'option de compensation d'hélium n'est pas une fonction de mesure certifiée conforme à la norme EN 50104.

⚠ ATTENTION

Défaut du capteur

Cette exposition à des concentrations plus élevées d'hydrocarbures non saturés, d'alcool ou d'hydrogène pendant une période prolongée (environ 100 000 ppm x nombre d'heures) peut provoquer une panne du capteur.

► Vérifier que le capteur n'est pas exposé à de telles concentrations pendant une période prolongée.

Temps de réponse	$t_{0...20}$	$t_{0...90}$
0 à 5 Vol% d'O_2	≤ 14 secondes[1)]	≤ 45 secondes
0 à 25 Vol% d'O_2	≤ 10 secondes	≤ 27 secondes

1) Le temps de réponse est supérieur à la valeur limite autorisée par la norme EN 50104.

Temps de stabilisation : 5 x $t_{0...90}$

Plage de mesure

0 à 5...25 Vol% d'O_2, 0 à 25 Vol% d'O_2

Valeur standard : 25 Vol% d'O_2

Valeur minimale : -1,25 Vol% d'O_2

Temps de stabilisation du capteur

En fonctionnement : ≤ 20 minutes / Ajustage : ≤ 6 heures

18.3.3 Dräger SensorAlive (6814014)

Le Dräger SensorAlive (6814014) est un capteur électrochimique de diffusion avec générateur de gaz intégré pour la mesure de l'hydrogène sulfuré (H_2S) dans l'air ambiant.

Paramètres ambiants	
Pression	20,7 à 35,5 po. Hg (700 à 1200 hPa)
Humidité	5 à 95 % d'humidité relative, sans condensation
Température	-40 à +65 °C
Vitesse maximale du flux d'air ambiant	6 m/s

Stockage	
Pression	Aucune influence
Humidité	30 à 70 % d'humidité relative, sans condensation (uniquement si l'emballage du capteur est ouvert)
Température	0 à +40 °C
Durée	Le stockage des capteurs n'est pas prévu. Les capteurs doivent être utilisés dès leur réception. Durée de vie restante = durée de vie prévue - durée de stockage

Influence des paramètres ambiants	
	Écart relatif par rapport à la valeur affichée
Pression	à 1000 hPa : ≤ 0,15 ppm
Humidité (à +40 °C)	à 0 et 95 % d'humidité relative : ≤ 0,29 ppm
Température	à 20 °C : ≤ 0,44 ppm

Des gaz d'interférence (par exemple, NH_3) peuvent affecter le fonctionnement du capteur.

Temps de réponse en mode diffusion	
t(50)	≤ 20 s
t(90)	≤ 55 s

Temps de décroissance en mode diffusion	
t(50)	≤ 20 s
t(10)	≤ 55 s

18.4 Expertise métrologique FM pour DrägerSensor H_2S et H_2S LC

Les DrägerSensor H_2S et H_2S LC sont des capteurs électrochimiques de diffusion mesurant l'hydrogène sulfuré (H_2S) dans l'air ambiant.

DrägerSensor H_2S (6810435)	
Type d'examen P8100	ETR 0400, 0401, 0500, 0501
Interface[1)]	4 à 20 mA, relais
Paramètres ambiants	
Humidité	5 à 95 % d'humidité relative, sans condensation
Température	-40/+65 °C (-40/149 °F)
Température de stockage	0/+40 °C (32/104 °F)
Protection du boîtier [2)]	IP 65/66/67
Plage	0 à 100 ppm
Précision (selon la valeur la plus élevée)	incertitude de mesure (de la valeur mesurée) ≤ ±3 % ou minimum ≤ ±0,5 ppm
Accessoires	
Filtre à poussières	6809595
Kit adaptateur	6810536
Standard	ANSI/ISA-92.00.01FM6340

1) La communication HART ne doit pas être utilisée pour la communication relative à la sécurité.
2) Le capteur doit être remplacé après immersion ou s'il a été exposé à des projections d'eau.

DrägerSensor H_2S LC (6809610)	
Type d'examen P8100	ETR 0400, 0401, 0500, 0501
Interface[1)]	4 à 20 mA, relais
Paramètres ambiants	
Humidité	5 à 95 % d'humidité relative, sans condensation
Température	-20/+65 °C (-4/149 °F)
Température de stockage	0/+40 °C (32/104 °F)
Protection du boîtier [2)]	IP 65/66/67
Plage	0 à 100 ppm
Précision (selon la valeur la plus élevée)	incertitude de mesure (de la valeur mesurée) ≤ ±3 % ou minimum ≤ ±0,5 ppm dans la plage >50 ppm, ±10 % ou ±3 ppm
Accessoires	
Filtre à poussières	6809595
Kit adaptateur	6810536
Standard	ANSI/ISA-92.00.01FM6340

1) La communication HART ne doit pas être utilisée pour la communication relative à la sécurité.
2) Le capteur doit être remplacé après immersion ou s'il a été exposé à des projections d'eau.

1 Información relativa a la seguridad

En la base de datos Technical Documentation (Documentación técnica) (www.draeger.com/ifu), podrá descargar tanto la última edición como estas instrucciones de uso en otros idiomas. Debido a las actualizaciones del producto, Dräger recomienda utilizar la edición más reciente de las instrucciones de uso.

1.1 Indicaciones de seguridad

- Antes de usar este producto, leer detenidamente estas instrucciones de uso y las de los productos asociados.
- Observar con exactitud las instrucciones de uso. El usuario debe comprender íntegramente las instrucciones y cumplirlas estrictamente. Utilizar el producto exclusivamente para aquellos fines y bajo las condiciones especificadas en este documento.
- No eliminar las instrucciones de uso. Se debe garantizar que los usuarios guarden y usen las instrucciones correctamente.
- Solo personal especializado y formado debe utilizar este producto.
- Notificar a Dräger en caso de que algún componente falle o esté defectuoso.
- Cumplir todas las leyes, normas y reglamentos locales y nacionales asociados a este producto.
- Únicamente personal con la formación correspondiente debe inspeccionar, reparar o mantener el producto según se describe en estas instrucciones de uso. Los trabajos de mantenimiento no descritos en estas instrucciones de uso deben efectuarse exclusivamente por Dräger o por personal cualificado por Dräger.
- Dräger recomienda cerrar un contrato de mantenimiento con Dräger para todas las actividades de mantenimiento y que todas las reparaciones sean llevadas a cabo por Dräger.
- Utilizar únicamente piezas y accesorios originales Dräger para realizar los trabajos de mantenimiento. En caso contrario, el funcionamiento correcto del producto podría verse afectado.
- Los trabajos de mantenimiento se tienen que realizar del modo descrito; véase 10 Mantenimiento.
- Utilizar el producto solo en el marco de un concepto de alarma basado en riesgo.
- Antes de conectar este instrumento a dispositivos eléctricos no mencionados en las instrucciones de uso, consultar primero a Dräger.
- Los instrumentos o componentes no pueden modificarse en ningún modo.
- Queda prohibido el uso de componentes defectuosos o incompletos.
- Deberán observarse las normativas adecuadas en cada momento cuando se lleven a cabo reparaciones en estos instrumentos o componentes.
- No abra el equipo durante el funcionamiento.
- En caso de reparación de estos instrumentos o de sus componentes se deben observar las normativas aplicables.
- Siga las directrices de la norma EN 60079-29-2 para la medición de gases inflamables y oxígeno.
- Siga las directrices de la norma EN 45544-4 para la medición de gases tóxicos.

Específico para Polytron® 8100 EC:

- **ADVERTENCIA**: ¡Riesgo de ignición de atmósferas inflamables o explosivas! La sustitución de componentes puede perjudicar la seguridad intrínseca del producto.

1.2 Condiciones de funcionamiento y ámbito de aplicación

- Observe el manual de seguridad del Dräger Polytron® 8xx0 para aplicaciones SIL.
- Válido solo para Polytron 8200 CAT:
  Cuando se expone a un flujo de aire dirigido mezclado con gas, los valores medidos pueden incrementarse. Consulte las instrucciones de uso del sensor correspondiente para conocer los valores de desviación.
- Observe las especificaciones y limitaciones contenidas en las instrucciones de uso de los sensores utilizados.
- **PRECAUCIÓN** ¡Riesgo de ignición de atmósferas inflamables o explosivas! No probado en atmósferas sobreoxigenadas (>21 % de O_2).
- **Uso del producto en zonas sujetas a peligros de explosión:** Los instrumentos o componentes para uso en zonas de peligro de explosión, que han sido probados y aprobados de acuerdo a las disposiciones nacionales, europeas o internacionales en materia de protección contra explosiones, sólo se podrán utilizar en las condiciones especificadas de conformidad y en consideración con las disposiciones legales relevantes.

Áreas peligrosas clasificadas por zonas:

- El dispositivo está destinado al uso en áreas con peligro de explosión con clasificación de Zona 1 y Zona 2, en las que puede haber presencia de gases de explosión de los Grupos IIA, IIB o IIC y clase de temperatura T4 o T6. Las clases de temperatura dependen de la temperatura ambiente máxima. El dispositivo no debe ser operado a temperaturas ambiente que se encuentren fuera del rango de temperaturas indicado en el dispositivo.
- El dispositivo ha sido diseñado para ser utilizado en áreas con peligro de explosión con clasificación de Zona 21 o Zona 22 en el que puede haber presencia de polvos de explosión de los Grupos IIIA, IIIB o IIIC y temperatura del polvo T80 °C o T130 °C (T135 °C para Polytron 5100 EC y Polytron 8100 EC). La temperatura del polvo depende de la temperatura ambiente máxima. El dispositivo no debe ser operado a temperaturas ambiente que se encuentren fuera del rango de temperaturas indicado en el dispositivo.

Áreas peligrosas clasificadas por divisiones:

– El dispositivo está destinado al uso en áreas con peligro de explosión de clase I, división 1 o 2, en las que puede haber presencia de gases de los grupos A, B, C, D y clase de temperatura T4 o T6 . Las clases de temperatura dependen de la temperatura ambiente máxima. El dispositivo no debe ser operado a temperaturas ambiente que se encuentren fuera del rango de temperaturas indicado en el dispositivo.
– El dispositivo está destinado al uso en áreas con peligro de explosión de clase II, división 1 o 2, en las que puede haber presencia de gases de los grupos E, F, G. El dispositivo no debe ser operado a temperaturas ambiente que se encuentren fuera del rango de temperaturas indicado en el dispositivo.

2 Convenciones en este documento

2.1 Significado de las advertencias

Las siguientes advertencias se utilizan en este documento para alertar al usuario sobre posibles peligros. Los significados de las advertencias se definen de la siguiente manera:

Señal de advertencia	Palabra de advertencia	Clasificación de la advertencia
⚠	ADVERTENCIA	Indica una situación potencialmente peligrosa. De no evitarse, podría conllevar lesiones graves o incluso la muerte.
⚠	PRECAUCIÓN	Indica una situación potencialmente peligrosa. De no evitarse, podría conllevar lesiones físicas. También puede utilizarse para alertar de prácticas no seguras.
	AVISO	Indica una situación potencialmente peligrosa. De no evitarse, podría ocasionar daños en el producto o el medio ambiente.

2.2 Marcas comerciales

Marca comercial	Propietario de marca
PROFIBUS®	PROFIBUS Nutzerorganisation e. V.
HART®	HART Communication Foundation
Polytron®	Dräger Safety AG & Co. KGaA
DrägerSensor®	Dräger Safety AG & Co. KGaA

En el siguiente sitio web se enumeran los países en los que están registradas las marcas de Dräger: www.draeger.com/trademarks.

F 1	Polytron 8710 IR con protector contra salpicaduras
F 2	Polytron 8710 IR sin protector contra salpicaduras

3.2 Descripción del funcionamiento

La familia Polytron 8000 incluye las siguientes variantes del equipo:

– Polytron 8100 EC, que trabaja con sensores electroquímicos (sensores EC).
– Polytron 8200 CAT, que trabaja con sensores Ex catalíticos (sensores CatEx//catalíticos, DrägerSensor DQ o LC).
– Polytron 8310 IR, que trabaja con sensores Ex infrarrojos (sensores IREx).
– Polytron 8700 IR, que trabaja con sensores infrarrojos (sensores PIR 7000).
– Polytron 8720 IR, que trabaja con sensores infrarrojos (sensores PIR 7200).

Son posibles las siguientes interfaces:

– 4 a 20 mA analógica (según recomendación NAMUR NE43)
– Placa de relés
– Señal de salida HART digital
– Foundation Fieldbus[1)]
– PROFIBUS PA[1)]
– Modbus RTU[1)]

Si se usa la interfaz de 4–20 mA, debe monitorizarse la intensidad de corriente entre 0 y 3,5 mA. Las intensidades de corriente entre 0 y 3,5 mA pueden indicar un estado especial (consulte "Estados especiales", página 156).

Si se usa una placa de relés, pueden activarse dispositivos de alarma localmente. Si no se usa una placa de relés y hay una alarma activa, solo se encenderá el LED rojo en el dispositivo.

Las concentraciones de gas, los mensajes de estado y las opciones de menú del software se visualizan en una pantalla LCD retroiluminada y 3 indicadores LED a color.

Se puede navegar a través del menú pulsando con una varita magnética en el botón correspondiente en el vidrio de la tapa de la carcasa. El instrumento se puede configurar, ajustar y mantener sin abrirlo y sin desclasificar el área.

El instrumento incluye un registrador de datos. El registrador de datos puede almacenar hasta 35 000 valores. En un intervalo de muestreo de 1 medición por minuto, el registrador de datos almacena el historial de mediciones de aproximadamente 24 días. Este tiempo se puede incrementar notablemente si la función de disparo está habilitada. El registrador de datos solo se puede descargar con el software para PC PolySoft. Durante la lectura se genera un archivo .ofb y otro .txt. El archivo .txt contiene la información del registrador de datos en formato legible.

Con un conducto hermético o racor de cable homologado, los instrumentos se pueden conectar a una unidad de control Dräger o a un controlador lógico programable (PLC).

Los instrumentos pueden utilizarse como fuente o como sumidero de corriente si la alimentación eléctrica se efectúa a través de la unidad de control. Si los instrumentos están conectados a una fuente de alimentación separada, solo podrán funcionar como fuente de corriente.

La carcasa de los instrumentos está fabricada en acero inoxidable o aluminio reforzado y es adecuada para aplicaciones interiores y exteriores.

Los instrumentos están diseñados para la instalación en ubicaciones permanentes. Están disponibles en las siguientes versiones:

– Instrumento a prueba de explosión (Ex d)
  La carcasa encapsulada a prueba de llamas/explosión presenta tres conexiones NPT de ¾", que pueden utilizarse para el cableado de campo, para la conexión directa de un sensor o para el cableado de un sensor remoto.
– Instrumento con mayor seguridad (Ex e)
  El dispositivo se amplía por medio de una caja de conexiones para una mayor seguridad (Docking Station). Esta cuenta con un máx. de cuatro conexiones de 20 mm que se pueden utilizar para el cableado de campo o el cableado de un sensor remoto. Si se utiliza el racor de cable de Dräger, el diámetro de cable admisible es de 7 mm hasta 12 mm.

Las siguientes mochilas están disponibles para Polytron 8100 EC:

Mochila de test de sensor	Activa la autocomprobación del sensor (no disponible para el sensor de hidracina 6810180)
Mochila de diagnóstico	Activa el autotest del sensor, la visualización de la vitalidad del sensor y las funciones de diagnóstico del sensor (no disponible para el sensor de hidracina 6810180)

3.3 Uso previsto

Los instrumentos de la familia Polytron 8000 están pensados para una monitorización continua del aire ambiente.

Con el módulo de relé integrado opcionalmente, el instrumento puede funcionar sin una unidad de control (con señalización de alarma local adicional).

Con un conducto hermético o racor de cable homologado, el instrumento se puede conectar a una unidad de control Dräger o a un controlador lógico programable (PLC).

Si se usa la interfaz de 4–20 mA, debe monitorizarse la intensidad de corriente entre 0 y 3,5 mA. Las intensidades de corriente entre 0 y 3,5 mA pueden indicar un estado especial.

Los instrumentos están diseñados para la instalación en ubicaciones permanentes y homologados para el uso en áreas con peligro de explosión.

– El Polytron 8100 EC es un instrumento combinado de seguridad intrínseca / a prueba de explosión para la monitorización continua de gases tóxicos u oxígeno en el aire ambiental.
– El Polytron 8200 CAT con sensor catalítico DrägerSensor DQ o LC es un instrumento a prueba de explosión para la monitorización continua de gases y vapores combustibles que contienen hidrocarburos y no hidrocarburos (p. ej., hidrógeno o amoniaco) en el aire ambiente.
– El Polytron 8310 IR con el sensor infrarrojo DrägerSensor IR es un instrumento a prueba de explosión para la monitorización continua de gases y vapores combustibles que contienen hidrocarburos en el aire ambiente.
– El Polytron 8700 IR con PIR 7000 es un instrumento a prueba de explosión para la monitorización continua de gases y vapores combustibles que contienen hidrocarburos en una atmósfera adecuada.
– El Polytron 8720 IR con PIR 7200 es un instrumento a prueba de explosión para la monitorización continua de dióxido de carbono en el aire ambiental.

3.4 Homologaciones

3.4.1 ATEX, IECEx, UL, CSA

En la página desplegable se muestra una placa de características a modo de ejemplo. También hay una copia impresa de la placa de características en el interior de la caja de envío del equipo.

1) Si se utiliza la interfaz de bus de campo, no se dispondrá de relés. La interfaz de bus de campo no está en conformidad con la norma BVS 13 ATEX G 001 X.
No hay compatibilidad con DrägerSensorAlive.

3.4.2 Información adicional

Declaración de conformidad: consulte el anexo 4544300 o visite la página www.draeger.com/product-certificates

Para más información acerca de las homologaciones, consulte el anexo 4544300.

4 Instalación del transmisor

4.1 Instalación a prueba de explosión (Ex d) - sin estación de acoplamiento

4.1.1 Instalación mecánica

4.1.1.1 Indicaciones generales sobre la instalación mecánica

– Se deben cumplir estrictamente las disposiciones y normativas locales, estatales, nacionales que rigen la instalación de sistemas de monitorización de gas.
– Deben tenerse en cuenta las propiedades físicas de los gases o vapores que van a ser medidos y las especificaciones de la aplicación correspondiente (p. ej., posibles fugas, movimiento de aire, corrientes de aire, etc.).
– Debe considerarse el uso futuro de accesorios y equipamiento de mantenimiento.
– El acceso del gas o vapor al sensor no debe estar obstruido.
– El instrumento no debe exponerse a calor radiante, ya que esto provocaría un aumento de la temperatura por encima de los valores límites (16.6 Parámetros ambientales). Se recomienda el uso de un blindaje reflectante.
– El instrumento se puede equipar con una tapa antipolvo en la entrada de cables. Esta tapa no es a prueba de explosiones ni resistente al agua, y se debe retirar antes de conectar el instrumento a un conducto hermético o antes de instalar un racor de cable a prueba de llamas.
– Las aberturas no utilizadas deben cerrarse con un tapón ciego. Para los pares de apriete correctos de los pasos de cable, racores de cable, enchufes y sensores, véase 16.7 Pares de apriete.
– Para instalaciones sin tubo, debe utilizarse un racor de cable homologado (p. ej., Hawke A501/421/A/¾" NPT o equivalente).
– **ADVERTENCIA:** Solo en caso de instalación con tubo: para reducir el riesgo de ignición del aire atmosférico peligroso, deben sellarse los primeros 45 cm (18 pulgadas) del tubo desde la carcasa.
– **PRECAUCIÓN:** Si el detector de gases está conectado a una unidad de control, se puede retrasar el tiempo de respuesta total. Debe tenerse en cuenta todo el trayecto de medición (p. ej., latencia de la unidad de control). Asegúrese de que se mantenga el tiempo de respuesta requerido.

Específico para Polytron® 8100 EC:

– Orientación recomendada del sensor: hacia abajo (véase la figura C de la página desplegable).

Específico para Polytron® 8200 CAT:

– Orientación preferente del sensor: hacia abajo (véase la figura E de la página desplegable). Si la entrada del sensor está protegida frente a daños mecánicos, suciedad y entrada de agua, se permite cualquier otra orientación.
– Solo para operaciones conformes a CSA:
El uso del protector opcional contra salpicaduras (6812510) es obligatorio en virtud de la homologación CSA.

Específico para Polytron® 8310 IR:

– Orientación recomendada del sensor: hacia abajo (véase la figura E de la página desplegable).

Específico para Polytron® 87x0 IR:

– Se debe observar la posición preferente del sensor Dräger PIR 7x00 (véase la figura F en la página desplegable). Unas desviaciones grandes y el uso del protector contra salpicaduras preinstalado aumentarán el tiempo de respuesta (véanse las instrucciones de uso del PIR 7x00).
– Cualquier otra orientación solamente estará permitida si el PIR 7x00 es utilizado sin protector contra salpicaduras, p.ej., para aplicaciones en conductos de ventilación. Si el sensor se instala en posición vertical, es posible que se produzca una fuerte acumulación de sedimentos sobre la superficie óptica del sensor.
– Se recomienda utilizar el protector contra salpicaduras preinstalado para proteger el sensor contra el agua y el polvo.
– Si se utiliza el protector contra salpicaduras preinstalado (número de referencia 6811911 o 6811912), debe asegurarse de que las luces indicadoras de estado estén dispuestas verticalmente y el logotipo de Dräger en el protector contra salpicaduras esté en posición horizontal. Se admite una desviación máxima de ±30 grados de la posición horizontal.
– Los líquidos y/o la formación de depósitos en las superficies ópticas del PIR 7x00 pueden provocar un mensaje de advertencia o un fallo.
– Para la versión a prueba de explosión se recomienda utilizar un distanciador (número de pieza 6812617) si el instrumento es montado en una pared o en una superficie plana.

Condiciones especiales según EN/IEC 60079-1

– Las roscas para la protección contra llamas/explosión no cumplen los valores mínimos o máximos relevantes de la norma EN/IEC 60079-1. Dichas roscas no deben ser retocadas por parte del usuario.

4.1.1.2 Instalación

El instrumento se puede montar para medir gases en aire ambiental o en el interior de un conducto de ventilación/tubería.

1. Utilice pernos de cabeza cilíndrica hexagonal M6 (1/4'') para montar la carcasa conforme a una de las siguientes opciones.

Opción	Accesorios
Montaje en una superficie plana	Plantilla de taladro: 4544300 Adicionalmente para Polytron 87x0 IR: Distanciador 6812617
Montaje en una barra	Kit de montaje en barra: 4544198
Montaje en un conducto de ventilación/tubería	Kit de montaje en conducto: 6812725 Para Polytron® 87x0 IR:: 6812300

4.1.2 Instalación eléctrica

4.1.2.1 Indicaciones generales sobre la instalación eléctrica

- Para los pares de apriete, consulte 16.7; para las especificaciones de cable permitidas, consulte 16.3.
- Se deben cumplir estrictamente los códigos eléctricos que rigen el tendido y la conexión de cables de señal y corriente eléctrica a equipos de monitorización de gas.
- Se deben utilizar férrulas.
- Los cables de la alimentación eléctrica deben tener una resistencia suficientemente baja para garantizar una tensión de alimentación correcta para el instrumento.
- El aislamiento del cable se debe pelar entre 5 y 7 mm.
- El circuito eléctrico secundario debe estar separado mediante aislamiento galvánico del circuito de corriente de red (no se aplica a circuitos con relé).
- Si se instala en lugares con una temperatura ambiente que exceda los 55 °C, utilice únicamente cableado adecuado, especificado para al menos 25 °C por encima de la temperatura ambiente máxima.
- Utilice solo los pasos de cable homologados en el país en el que se va a instalar el equipo y que sean adecuados para la aplicación.
- De conformidad con la Directiva de la UE 2014/30/UE, este instrumento no debe conectarse a una red de corriente continua. Se recomienda instalar una fuente de alimentación independiente para el instrumento.

Interfaz analógica

- Para garantizar el correcto funcionamiento del instrumento, la resistencia del bucle de señal de 4 a 20 mA no debe superar los 500 ohmios.
  Para el uso de acuerdo con la prueba de idoneidad metrológica según las normas EN IEC 62990-1, EN IEC 60079-29-1 o EN 50104, la resistencia no debe superar los 300 ohmios. Si los valores superan los 300 ohmios no se puede garantizar la monitorización de la tensión de alimentación.
  Dependiendo de la tensión operativa y de la aplicación (ejemplo de operación HART®), debe respetarse una resistencia mínima determinada (consulte "Transmisión de la señal a la unidad de control", página 185).

Opción con relé

- Con tensiones > 30 V CA o > 42,4 V CC, los cables de los relés deben revestirse con una manguera de protección o deben utilizarse cables con doble aislamiento.
- Los cables de conexión para el módulo de relés opcional deben seleccionarse y asegurarse con fusibles según las tensiones y corrientes nominales y las condiciones medioambientales.
- Para asegurar que se detecta un fallo -sin tener que mirar al instrumento- debe haber una alarma conectada al relé de fallo.
- Las diferencias de tensión eléctrica pueden causar fallos de aislamiento. No mezclar cargas eléctricas con diferentes tipos de tensión (CA o CC). Al usar cargas de CC, asegurarse de que los contactos de los relés solo controlan dispositivos con el mismo rango de tensión eléctrica de CC. Al usar cargas de CA, asegurarse de que los contactos de los relés solo están conectados a los dispositivos que comparten una fase común.

Condiciones especiales según EN/IEC 60664-1

- Las variantes de instrumento que utilizan tanto una interfaz de bus de campo FISCO como un transmisor de gas ETR 02...5** deben alimentarse a través de circuitos protegidos contra sobretensiones de categoría I/II/III según la norma IEC 60664-1.

4.1.2.2 Diagramas de conexiones

En las páginas desplegables se muestran los siguientes esquemas de conexión:

Figura	Esquema de conexión para equipos
G	Sin relé, puesta a tierra de la carcasa
H	Con relé, puesta a tierra de la carcasa
I1	4-20 mA / HART (fuente de corriente)
I2	4-20 mA / HART (sumidero de corriente)
I3	4-20 mA / HART (alimentación separada, fuente de corriente)
H1	Autónomo, solo relé
J	Foundation Fieldbus / PROFIBUS PA, puesta a tierra de la carcasa
K	Modbus RTU, puesta a tierra de la carcasa
J1	Foundation Fieldbus / PROFIBUS PA, cableado de campo
K1	Modbus RTU, cableado de campo
L	Alimentación eléctrica interfaces digitales

4.1.2.3 Tablas de cableado

Interfaz de 4 a 20 mA/HART®

Clavija	Marca	Función
1	PWR+	V+
2	PWR-	V-
3	PWR-	V- Debe utilizarse cuando el instrumento se conecta a una fuente de alimentación separada (funcionamiento como fuente).
4	4-20 mA	Señal de 4-20 mA (operación como fuente o sumidero de corriente)
5	PE	Conductor de protección Conductor de protección opcional para conexión de relé. La conexión del conductor de protección junto con la salida analógica de 4-20 mA puede causar bucles de masa.

Interfaz de bus de campo

Clavija	Marca	Función
1	Datos A	Enrutamiento de señal A
2	Datos B	Enrutamiento de señal B
3	GND	Conexión a tierra
4	SHIELD (blindaje)	Blindaje de cable

Clavija	Marca	Función
1	PWR+	V+
2	PWR-	V-

Conector de relé

Todos los relés del instrumento (A1, A2, FLT) pueden configurarse como "normalmente excitado" (relé de corriente estática) o "excitado en alarma" (relé de corriente de trabajo). Los relés están configurados de fábrica como "relé de corriente estática" ("normalmente excitado"). Esto permite un funcionamiento a prueba de fallos.
Contrario a las convenciones, las marcas NO, COM, NC en el instrumento han sido elegidas de tal manera que se correspondan con el estado normalmente excitado. Si el instrumento es alimentado con tensión eléctrica, el marcado coincide plenamente con la función de las clavijas.

Clavija	Marca		Relé	
1	NO	FLT	Fallo	Contacto normalmente abierto (Normally Open)
2	COM		Fallo	Conexión común (Common)
3	NC		Fallo	Contacto normalmente cerrado (Normally Closed)
4	NO	A2	A2	Contacto normalmente abierto (Normally Open)
5	COM		A2	Conexión común (Common)
6	NC		A2	Contacto normalmente cerrado (Normally Closed)
7	NO	A1	A1	Contacto normalmente abierto (Normally Open)
8	COM		A1	Conexión común (Common)
9	NC		A1	Contacto normalmente cerrado (Normally Closed)

4.1.2.4 Preparación de la instalación eléctrica

1. Suelte el tornillo prisionero (2) y desenrosque la tapa de la carcasa de la parte inferior de la carcasa, véase la figura A en la página desplegable..
2. Extraiga la unidad de tarjeta de circuito impreso.
3. Proceda con la figura correspondiente a la salida de señal y el modelo Polytron®, véase la página desplegable.

4.1.2.5 Conexión del equipo con relé (autónomo)

Los cables de dispositivos de alarma tienen que conectarse al conector de relé de 9 clavijas. Se incluyen un aislamiento de cable (tubo termorretráctil) y una funda protectora para una protección adicional de los cables de relé.

1. Extraiga el conector de 5 clavijas.
2. Conecte los cables de alimentación al borne adecuado, véase la figura H1 en la página desplegable.
3. Puentee las clavijas 3 y 4 del conector de 5 clavijas.
4. Retire el conector de 9 clavijas.
5. Corte el tubo termorretráctil según las necesidades y deslícelo por encima de los cables de relé antes de insertarlos al conector de 9 clavijas.
6. Posicione el tubo termorretráctil en el canto del aislamiento de cable y emplee una pistola de aire caliente para contraer el tubo de forma segura sobre el aislamiento.
7. Deslice funda protectora por encima de los cables.
8. Conecte los cables para alarma 1 (prealarma), alarma 2 (alarma principal) y alarma de fallo a los bornes respectivos, tal y como se indica en la siguiente tabla de conexiones.
9. Vuelva a enchufar el conector a la toma y apriete los tornillos.
10. Cierre el instrumento, véase 4.1.2.9 Cierre del detector de gases.

Las siguientes tablas muestran el estado de un indicador de alarma conectado y si éste indica fallos, como un fallo de alimentación en el detector de gases.

El comportamiento del relé depende de la configuración de la alarma y del contacto del relé al que está conectado el indicador de alarma.

Configuración de relé: Normalmente excitado

Contacto	Estado del indicador de alarma e indicación de fallos por el indicador de alarma		
	Alarma activada	Fallo específico del detector de gases	Fallo de cableado de campo
Contacto normalmente cerrado (Normally Closed)	ON	indicado	no indicado
Contacto normalmente abierto (Normally Open)	OFF	indicado	indicado

Configuración de relé: Excitado en alarma

Contacto	Estado del indicador de alarma e indicación de fallos por el indicador de alarma		
	Alarma activada	Fallo específico del detector de gases	Fallo de cableado de campo
Contacto normalmente cerrado (Normally Closed)	OFF	no indicado	indicado
Contacto normalmente abierto (Normally Open)	ON	no indicado	no indicado

4.1.2.6 Conexión de la interfaz de 4-20 mA HART®

Para obtener información acerca de la conexión a una unidad de control (PLC), consulte la documentación de la unidad de control correspondiente.

1. Extraiga el conector de 5 clavijas.
2. Conecte los tres cables de tensión eléctrica y señal al borne correspondiente según se indica en la tabla de cableado y la figura.
3. Vuelva a conectar el conector a la toma y apriete los tornillos.
4. Cierre el instrumento, véase 4.1.2.9 Cierre del detector de gases.

4.1.2.7 Conexión a tierra

1. Ponga la caja del instrumento a tierra localmente en la lengüeta de tierra, véanse las figuras G y H en la página desplegable.
2. Conecte el blindaje de los cables únicamente a la toma de tierra del controlador (p. ej., caja, conductor de tierra colectiva, etc.).

ℹ A menos que se tomen medidas especiales (p. ej., puesta a tierra capacitiva), el blindaje solamente se debe conectar al final.

Encontrará información acerca de la puesta a tierra de las conexiones del bus de campo y del modbus en los siguientes documentos.

Interfaz	Documento
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

4.1.2.8 Conexión de la interfaz de bus de campo

1. Quite el conector de 4 y de 2 clavijas.
2. Conecte los dos hilos para alimentación eléctrica y los cuatro hilos para señales a los bornes adecuados, tal y como se indica en la tabla de conexiones y figura.
3. Vuelva a insertar el conector en el enchufe y apriete los tornillos.
4. Cierre el instrumento, véase 4.1.2.9 Cierre del detector de gases.

Para más información sobre la instalación de la interfaz de bus de campo, consulte el manual técnico correspondiente.

4.1.2.9 Cierre del detector de gases

1. Cerciórese de que las siguientes conexiones estén establecidas correctamente:
   a. Los tornillos del cableado están apretados con el par de apriete correcto.
   b. Todas las conexiones de cables están aseguradas con tornillos.
   c. El conector del sensor está enchufado.
   d. El cable de puesta a tierra proveniente de la carcasa está conectado a la lengüeta en la unidad de tarjeta de circuito impreso, véanse las figuras G y H en la página desplegable
2. Introduzca la unidad de tarjeta de circuito impreso en la parte inferior de la carcasa.
3. Enrosque la tapa de la carcasa sobre la parte inferior de la carcasa y apriétela con el par de apriete correcto.
4. Apriete el tornillo prisionero.

4.2 Instalación de seguridad aumentada (Ex e) - con estación de acoplamiento

La instalación de seguridad aumentada (Ex e) se describe en las instrucciones de montaje de la estación de acoplamiento (número de referencia 9033242).

5 Instalación de sensores o cabezales detectores

5.1 Instalación del sensor EC en el Polytron 8100 EC

Véase la figura C en la página desplegable.

1. Suelte el tornillo de sujeción (2) (tornillo Allen de 2 mm).
2. Desenrosque el anillo de bayoneta (3) y retire la arandela ciega.
3. Inserte el sensor (4) en la abertura y gírelo hasta que encaje en el detector de gases. El conector del sensor no sufrirá ningún daño.
4. Bloquee el sensor con el anillo de bayoneta (3) correspondiente.

   ℹ Para Dräger SensorAlive debe utilizarse un anillo de bayoneta distinto al que se usa para otros sensores EC.

5. Apriete el tornillo de sujeción (2) de modo que el anillo de bayoneta no pueda soltarse (obligatorio para instalaciones de Zona 22).

   ℹ Si el Dräger SensorAlive se instala por primera vez en una instalación existente, es necesario asegurarse de que la versión de firmware sea la 4.0.0 o superior. Contacte con Dräger para obtener asistencia.

5.2 Instalación del cabezal detector

Dependiendo del tipo de protección contra explosiones, se utilizan diferentes cabezales detectores. Encontrará la información de los cabezales detectores en las instrucciones del detector correspondiente.

En las aplicaciones remotas, el blindaje del cable debe terminar tanto en el lado del sensor como en el del transmisor. El cable debe tener ≤ 30 m de longitud.

Versiones remotas con protección contra explosiones "a prueba de explosiones (Ex d)"

Transmisor	Números de referencia cabezal detector GA
Polytron 8100 EC	Cabezal detector EC remoto (9033247)
Polytron 8200 CAT (para sensores DQ)	Sensor remoto DQ NPT aluminio, sensor remoto DQ NPT acero (4544286)
Polytron 87x0 IR	PIR 7000 (334) remoto con carcasa de conexión de sensor de acero inoxidable o aluminio (4544286)
Polytron 8200 CAT (para sensores LC) Polytron 8310 IR Polytron 87x0 IR	Carcasa de conexión de sensor de acero inox. o aluminio (4544286)

Versiones remotas con protección contra explosiones "Mayor seguridad (Ex e)"

Transmisor	Números de referencia cabezal detector GA
Polytron 8100 EC	Cabezal detector EC remoto (9033247)
Polytron 8200 CAT	Cabezal detector Polytron SE Ex (9033888)
Polytron 8310 IR	DrägerSensor IR (9023843)
Polytron 87x0 IR	PIR 7x00 (9023885)

6 Puesta en marcha

6.1 Indicaciones generales

– Asegúrese de conectar primero los cables para los relés y las conexiones para el sensor antes de conectar el instrumento a la corriente.
– Antes de dejar el instrumento preparado para el funcionamiento normal, compruebe si está configurado y ajustado correctamente.

Para un funcionamiento seguro según las normas BVS 13 ATEX G 001 X y PFG 14 G 001 X, deben mantenerse los ajustes de alarma por defecto del instrumento como se indica a continuación.

– Los relés deben estar ajustados a ***Normal. tensión*** y la alarma A2 (alarma principal) a ***Latching*** y ***No-achknowledgeable*** o ***Preconfirm.***.
– La alarma A1 (prealarma) solo se debe ajustar a ***Acknowledging*** si se utiliza para disparar un dispositivo de alarma acústica.
– Bloqueo en caso de valores por encima del rango de medición (consulte "Ajuste del enclavamiento del sensor DQ", página 179).

Para un funcionamiento seguro según las normas BVS 13 ATEX G 001 X y PFG 14 G 001 X, deben mantenerse las siguientes condiciones especiales:

– Polytron 8200 CAT:
  – Si el sensor DQ o LC se expone a un flujo de aire que contenga gas de medición, los valores medidos pueden aumentar hasta un 32 %.
    Cuando funciona con el adaptador de calibración remota DQ, este aumento puede ser de hasta el 70 %.
  – El transmisor con sensor LC debe funcionar junto con una unidad de control que señale un exceso de rango de medición de forma autónoma. No emplee los relés de alarma internos del transmisor.
  – El transmisor con sensor LC debe ajustarse con el sensor en su posición de uso operativa habitual.
  – Pueden producirse falsas alarmas durante el tiempo de calentamiento del sensor LC.
– Polytron 8100 EC:
  El tiempo de ajuste t20 de los transmisores con sensor EC puede superar el valor límite de la norma EN 50104 con pequeños cambios en la concentración.

6.2 Puesta en funcionamiento del detector de gases

1. Para evitar falsas alarmas, apague la señalización de alarma del detector de gases (consulte "Conexión o desconexión de alarmas", página 172).
2. Active la alimentación eléctrica.
   ⇒ El instrumento llevará a cabo una secuencia de arranque (prueba LCD / LED, versión de software e inicialización).
   ⇒ La pantalla indica que el sensor estará listo para la medición en hh:mm:ss (cuenta atrás). El instrumento transmite la señal de mantenimiento. El relé de fallo se activa.
   ⇒ El sensor comienza la fase de iniciación. La señal de mantenimiento en la interfaz de 4-20 mA sigue pendiente hasta que el sensor haya finalizado la fase de iniciación. El periodo de iniciación depende del tipo de sensor y de las condiciones del entorno. Tiempo de iniciación máximo de un sensor nuevo: consulte las instrucciones de uso del sensor.
3. Compruebe la fecha y hora. Los ajustes se pueden realizar durante el periodo de iniciación del sensor.
   ⇒ Después del periodo de iniciación del sensor, el instrumento pasa al modo de funcionamiento normal. En la pantalla se muestra la concentración de gas actual, la unidad de medición y, dado el caso, el gas seleccionado. El LED verde se enciende.

Si el instrumento se pone en funcionamiento con un Dräger SensorAlive, Dräger recomienda configurar la fecha y la hora correctamente. Después del periodo de iniciación del sensor se inicia el periodo de puesta en marcha del Dräger SensorAlive. Durante esta fase, el sensor puede realizar mediciones, pero el autodiagnóstico no se lleva a cabo.

4. Si es necesario, ajuste el instrumento.
5. Encienda la señalización de alarma del detector de gases (consulte "Conexión o desconexión de alarmas", página 172).

7 Funcionamiento

7.1 Panel de mandos

El panel de mandos contiene:
– Botones para navegar por el menú
– Una pantalla
– LED y símbolos correspondientes

Los botones de navegación tienen diferentes funciones dependiendo del menú en el que uno se encuentre.

El instrumento se maneja por medio de una varita magnética. Para ello es necesario que la tapa de la carcasa esté colocada en el instrumento. Si la tapa de la carcasa no está en su lugar, la varita magnética podría activar dos o más botones a la vez (interferencia).

7.2 LED y símbolos

El panel de mandos contiene los siguientes símbolos y LED:

Símbolo	LED	Descripción
	Roja	Alarma activada
	Amarillo	Avería
	Verde	Encendido

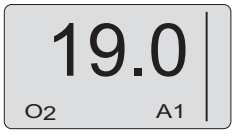
LED de estados
– Cuando se ha activado la alarma A1 (prealarma), el LED rojo parpadea emitiendo destellos individuales .
– Cuando se ha activado la alarma A2 (alarma principal), el LED rojo parpadea emitiendo destellos dobles .
– Cuando se confirma una alarma, antes de que se haya subsanado la causa, se enciende el LED rojo de forma permanente para indicar que hay un fallo.

7.3 Indicadores en la pantalla

7.3.1 Todos los equipos

Símbolo	Explicación
	Mensaje de error activo. En el menú ***Información*** hay más información disponible.
	Mensaje de advertencia activo. En el menú ***Información*** hay más información disponible.
	Señal de mantenimiento transmitida.
	El valor final del rango de medición ajustado se sobrepasa en la interfaz de 4-20 mA.
	El valor inicial del rango de medición ajustado no es alcanzado en la interfaz de 4-20 mA.
	La operación HART® está activa. La interfaz analógica se establece en un valor fijo y no está transmitiendo ninguna señal de medición.
	Cuando se haya agotado la capacidad del registrador de datos, los datos antiguos se sobrescribirán con nuevos valores (función "roll").
	Cuando se haya agotado la capacidad del registrador de datos, no se almacenarán nuevos datos (función "stack").
SIL	El modo de funcionamiento SIL está activado.

7.3.2 Símbolos específicos para Polytron® 8100 EC



Símbolo	Explicación
	El sensor está operativo.
	El sensor está operativo, pero se acerca al final de su vida útil.
	El sensor está aún operativo, pero debería sustituirse cuanto antes. La vitalidad es < 25 %.
LT	Se está ejecutando un LifeTest del Dräger SensorAlive.

7.3.3 Modo de medición

Los siguientes ejemplos de visualización son tomados del Polytron 8100 EC.

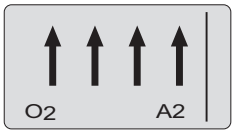
Para Polytron 8200 CAT y Polytron 8310 IR no hay nombres de gases predefinidos. Los nombres de gases se tienen que introducir mediante el software para PC DrägerPolysoft. Después de modificar parámetros con el software para PC DrägerPolysoft u otro software, deben leerse todos los parámetros del Polytron® 8xx0 o verificarse directamente en el instrumento.

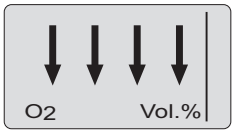
En el modo de funcionamiento se muestra lo siguiente:

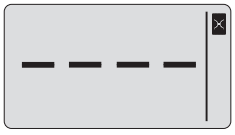
Ejemplo de visualización	Descripción
	Durante el funcionamiento normal, la pantalla muestra la concentración de gas medida, el gas seleccionado y la unidad de medida. **Interfaz analógica:** valor de corriente correspondiente **Relé:** todos los relés se encuentran en estado normal
	Se sobrepasan los umbrales de alarma. El ejemplo muestra la prealarma A1. **Interfaz analógica:** valor de corriente correspondiente **Relé:** el relé A1 se encuentra en estado de alarma.

7.3.4 Estados especiales

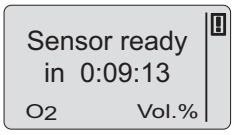
Si el instrumento se encuentra en un estado especial, ya no se puede garantizar una alarma o medición correcta.







Este es el caso:



- Cuando la concentración de gas excede el rango de medición.
- Cuando ocurre un fallo.
- Cuando las alarmas están desactivadas.
- Cuando se realizan ajustes.
- Cuando se realizan pruebas con gas.
- Cuando un sensor está en fase de inicialización.
- Cuando el sistema está en modo de mantenimiento.
- Cuando se utiliza un Dräger SensorAlive y el sistema está configurado para que no se emita el valor de medición durante un LifeTest.

Para la corriente de la interfaz analógica que corresponde a la señal analógica, véase 16.2.

Las señales de las interfaces digitales pueden consultarse en los siguientes documentos.

Interfaz	Documento
PROFIBUS PA	9033782
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

Ejemplo de visualización	Descripción
	**El valor está por encima del rango de medición** La concentración de gas se encuentra fuera del rango de medición del sensor[1)]. **Interfaz analógica:** Superación del rango de medición **Relé:** Interruptores de relé A2 ***Aviso para Polytron 8200 y Polytron 8310:*** El mensaje de que se ha excedido el rango de medición puede también haber sido causado por un cortocircuito o una interrupción en la conexión a un sensor remoto.
	**El valor está por debajo del rango de medición** La concentración de gas se encuentra fuera del rango de medición del sensor. **Interfaz analógica:** Deriva por debajo de cero **Relé:** Interruptores de relé de fallo
	**Indicación de fallo** El símbolo ⊠ aparece en el lado derecho de la pantalla. **Interfaz analógica:** Corriente de fallo **Relé:** Interruptores de relé de fallo
	**Indicación de mantenimiento** El símbolo 🔧 aparece en el lado derecho de la pantalla. Esto es visualizado cuando las alarmas están desactivadas, durante el ajuste, pruebas con gas y trabajos de mantenimiento. **Interfaz analógica:** Corriente de mantenimiento **Relé:** Ningún cambio

Ejemplo de visualización	Descripción
	**Indicación de advertencia** El símbolo ▯ aparece en el lado derecho de la pantalla. **Interfaz analógica:** Corrientede advertencia[2)] **Relé:** Ningún cambio
	**Fase de iniciación 1** El símbolo ▯ aparece en el lado derecho de la pantalla. El tiempo restante se indica en el lado izquierdo de la pantalla. **Interfaz analógica:** Corriente de mantenimiento **Relé:** Interruptores de relé de fallo Para la fase de iniciación 1, el comportamiento del relé de fallo es configurable (consulte "Ajuste del calentamiento 1 del relé de fallo", página 172)
	**Fase de iniciación 2** El símbolo ▯ aparece en el lado derecho de la pantalla. El valor medido se indica en el lado izquierdo de la pantalla. **Interfaz analógica:** Valor de medición **Relé:** Comportamiento como en el modo de medición (el relé de fallo no indica fase de iniciación 2).

1) Si la concentración de gas supera el valor final del rango de medición de la interfaz de 4-20 mA, la pantalla sigue indicando el valor medido, así como la indicación "Rango de medición de la interfaz analógica excedido" .
2) Solo cuando la corriente de advertencia está activada. Ajuste de fábrica: desactivada.

7.3.5 Finalización de estados especiales

Indicación de fallo / indicación de advertencia

Por regla general, las indicaciones de fallo y de aviso son sin enclavamiento. Una vez subsanadas las causas de los fallos o las advertencias, no se indicará más un fallo o una advertencia. Se exceptúan: "Detección de fallos SensorAlive" y "Detección de obstrucciones SensorAlive".

Para subsanar las causas, visualice el fallo o la advertencia (consulte "El menú Información", página 158) y empiece con la eliminación de averías (consulte "Eliminación de averías", página 166).

Valor por encima/por debajo del rango de medición

La pantalla indica que la concentración de gas se encuentra fuera del rango de medición del sensor. La indicación desaparece en cuanto la concentración de gas se encuentre dentro del rango de medición. Si se ha superado el rango de medición, la sensibilidad y el tiempo de respuesta del sensor pueden desmejorarse.

AVISO
Fallo de funcionamiento del sensor
Las concentraciones de gas que sobrepasen el rango de medición del sensor podrían provocar fallos de funcionamiento en el sensor.
► Vuelva a ajustar el sensor, si es necesario.

Polytron® 8200 CAT con sensor DQ:

Un valor por encima del rango tiene que ser confirmado con [OK] después de haber verificado que la concentración de gas es inferior a 100 %LIE (p. ej., utilizando un instrumento portátil).

Las alarmas en modo autoenclavador son el ajuste por defecto del instrumento.

Para instrumentos sin relés, valores por encima del rango se pueden ajustar a no autoenclavador. En este caso, la indicación de un valor por encima del rango desaparece. ¡La unidad de control tiene que apoyar esta función! Para obtener más información, consulte: "Ajuste del enclavamiento del sensor DQ", página 179.

Polytron® 8200 CAT con sensor LC:

⚠ ADVERTENCIA
Lecturas ambiguas en valores de medición por encima del rango
Las alarmas de enclavamiento por encima del rango no son compatibles con los sensores LC.
Para un funcionamiento seguro conforme a BVS 13 ATEX G 001 X, el detector de gases debe ser operado con una unidad de control que pueda mostrar alarmas de enclavamiento. No emplee los relés de alarma internos del detector de gases.
► Asegúrese de que la indicación de enclavamiento por encima del rango de medición esté activa en la unidad de control.

Después de obtener valores de medición por encima del rango, verificar que la concentración de gas es inferior a 100 %LIE (p. ej., utilizando un instrumento portátil).

7.4 Modo de información y tecla de función

7.4.1 Abrir el modo de información

El modo de información se utiliza para mostrar información relevante del instrumento. Esto no interrumpe el funcionamiento normal del instrumento.

- Pulse y mantenga ▲ durante 3 segundos en el modo de medición.

7.4.2 Navegación en el modo de información

Botón	Función
▲	Cambiar a la pantalla siguiente
▼M	Cambiar a la pantalla anterior
OK	Terminar el modo de información

Si no se pulsa ninguna tecla durante 30 segundos, el instrumento retornará automáticamente al modo de funcionamiento normal.

7.4.3 Uso de la tecla de función

Mediante la tecla de función se puede ejecutar una función preconfigurada. De forma predeterminada, se muestran todos los fallos.

- Pulsar y mantener ▲ durante 1 segundo en el modo de medición.

Para configurar la tecla de función, véase 11.4 Configuración de la tecla de función.

7.5 Menús

7.5.1 Navegación por menús

Botón	Función
▲	Desplazarse hacia arriba. Ajustar valores.
▼M	Desplazarse hacia abajo. Ajustar valores.
OK	Confirmar introducción. Seleccionar menús y funciones.

7.5.2 Abrir los menús

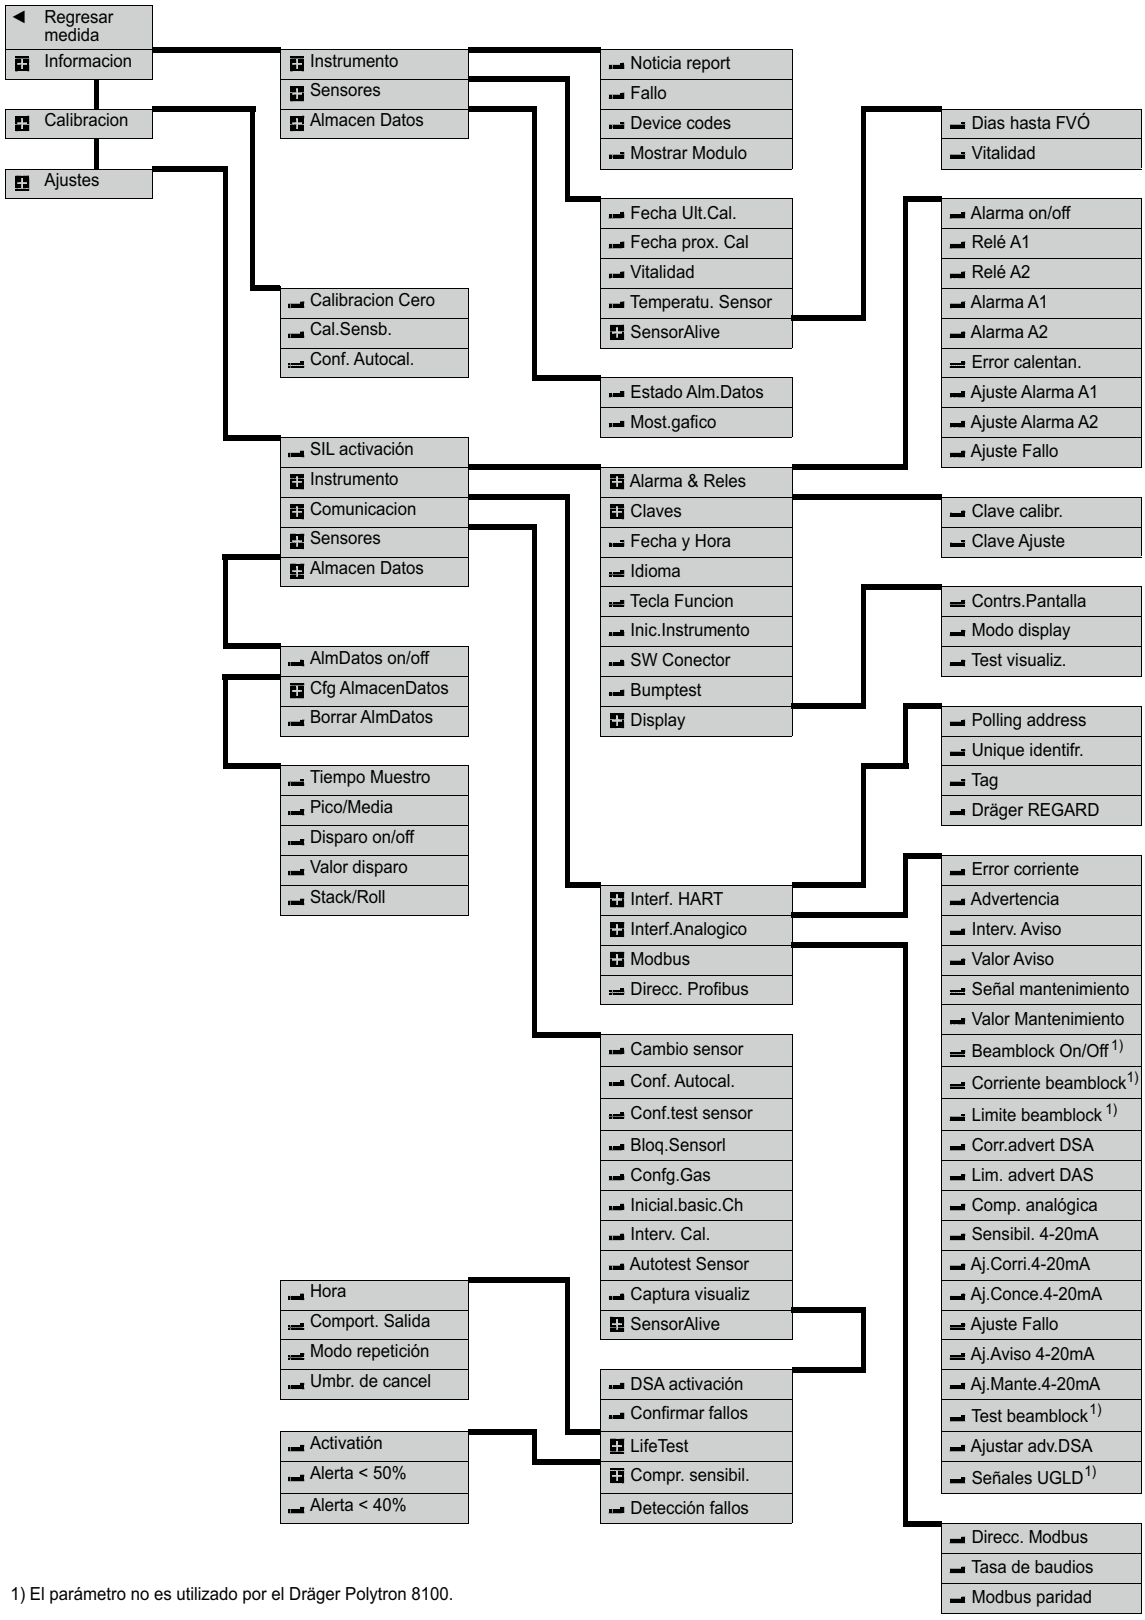
- Para abrir el menú ***Información***:
  a. Mantenga presionado ▼ durante 1 segundo en el modo de medición.
- Para abrir el menú ***Calibracion***:
  a. Mantenga presionado ▼ durante 3 segundos en el modo de medición.
  b. Seleccione ***Intro. Clave***.
  c. Introduzca la contraseña respectiva y confirme con [OK].
- Para entrar en todos los menús:
  a. Mantenga presionado ▼ durante 3 segundos en el modo de medición.
  b. Seleccione ***Intro. Clave***.
  c. Introduzca la contraseña respectiva y confirme con [OK].

7.5.3 Contraseñas

Clave calibr.	Permite el acceso al menú ***Información*** y al menú ***Calibracion*** (configuración de ajustes) Por defecto: **_ _ _ 1**
Clave Ajuste	Permite el acceso a los ajustes y a los menús Por defecto: **_ _ _ 2**

Para cambiar las contraseñas, véase 11.1.

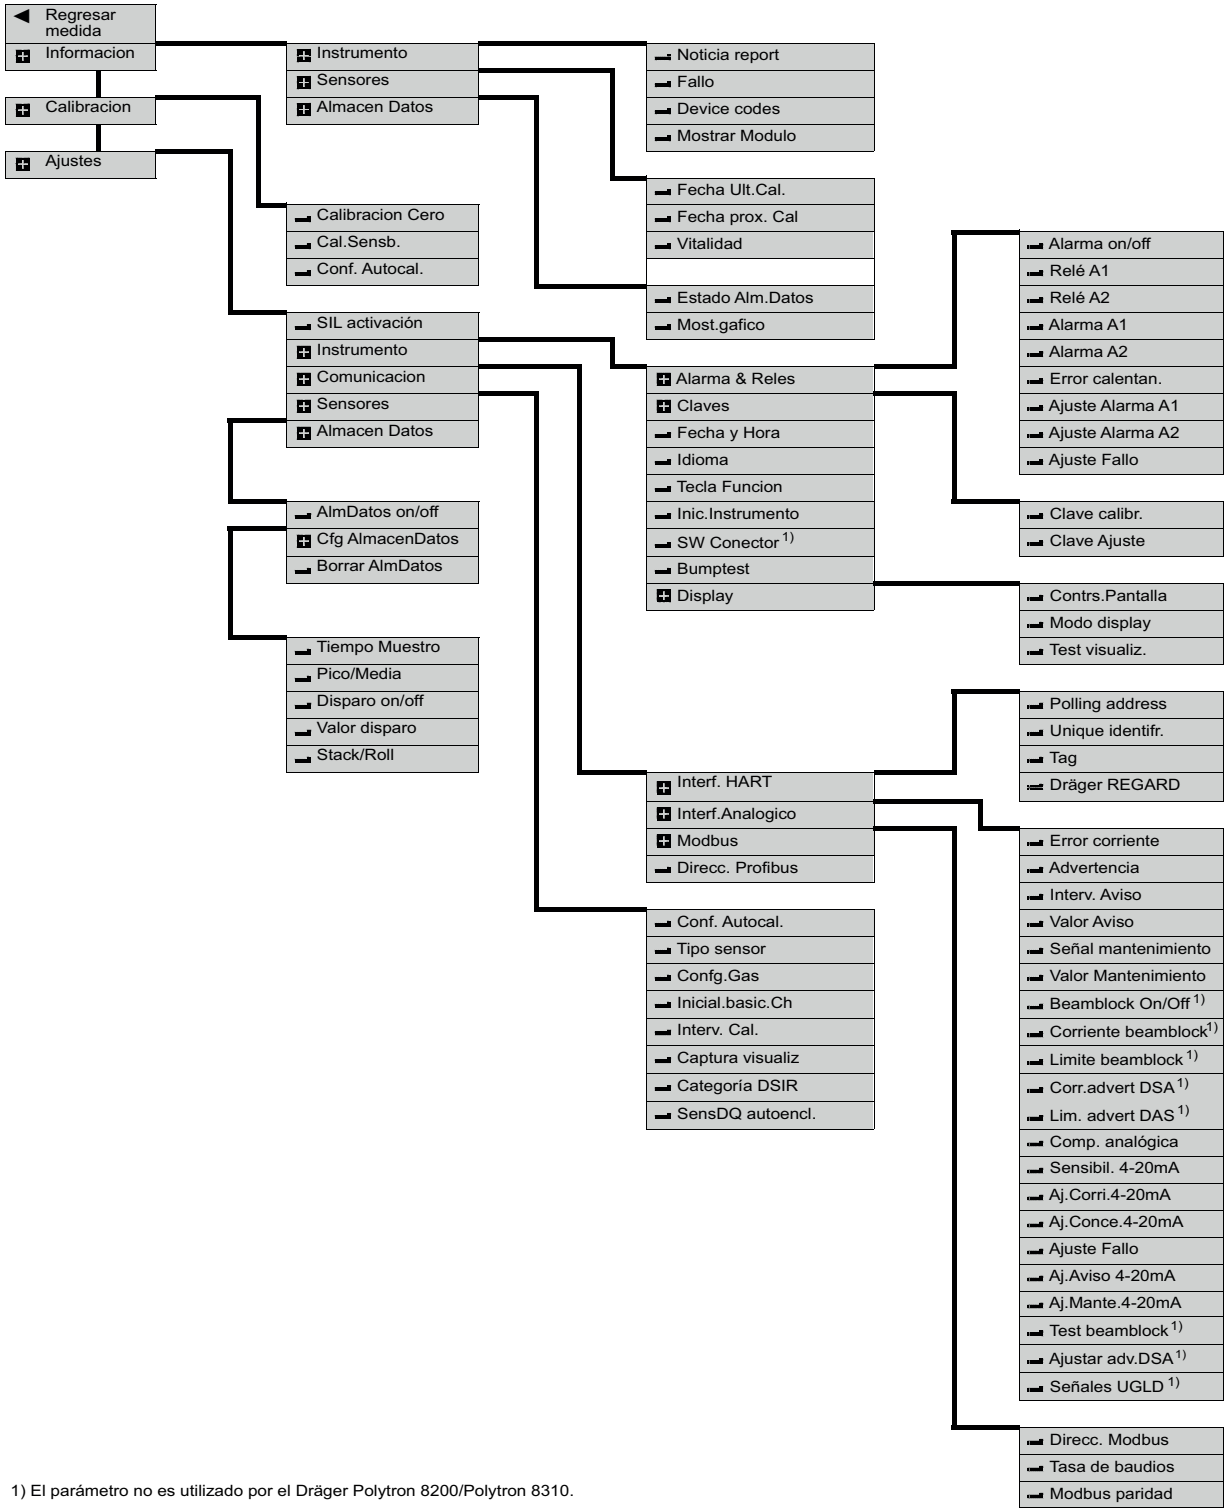
7.5.4 El menú *Información*



En el menú ***Información*** se puede acceder a la siguiente información:

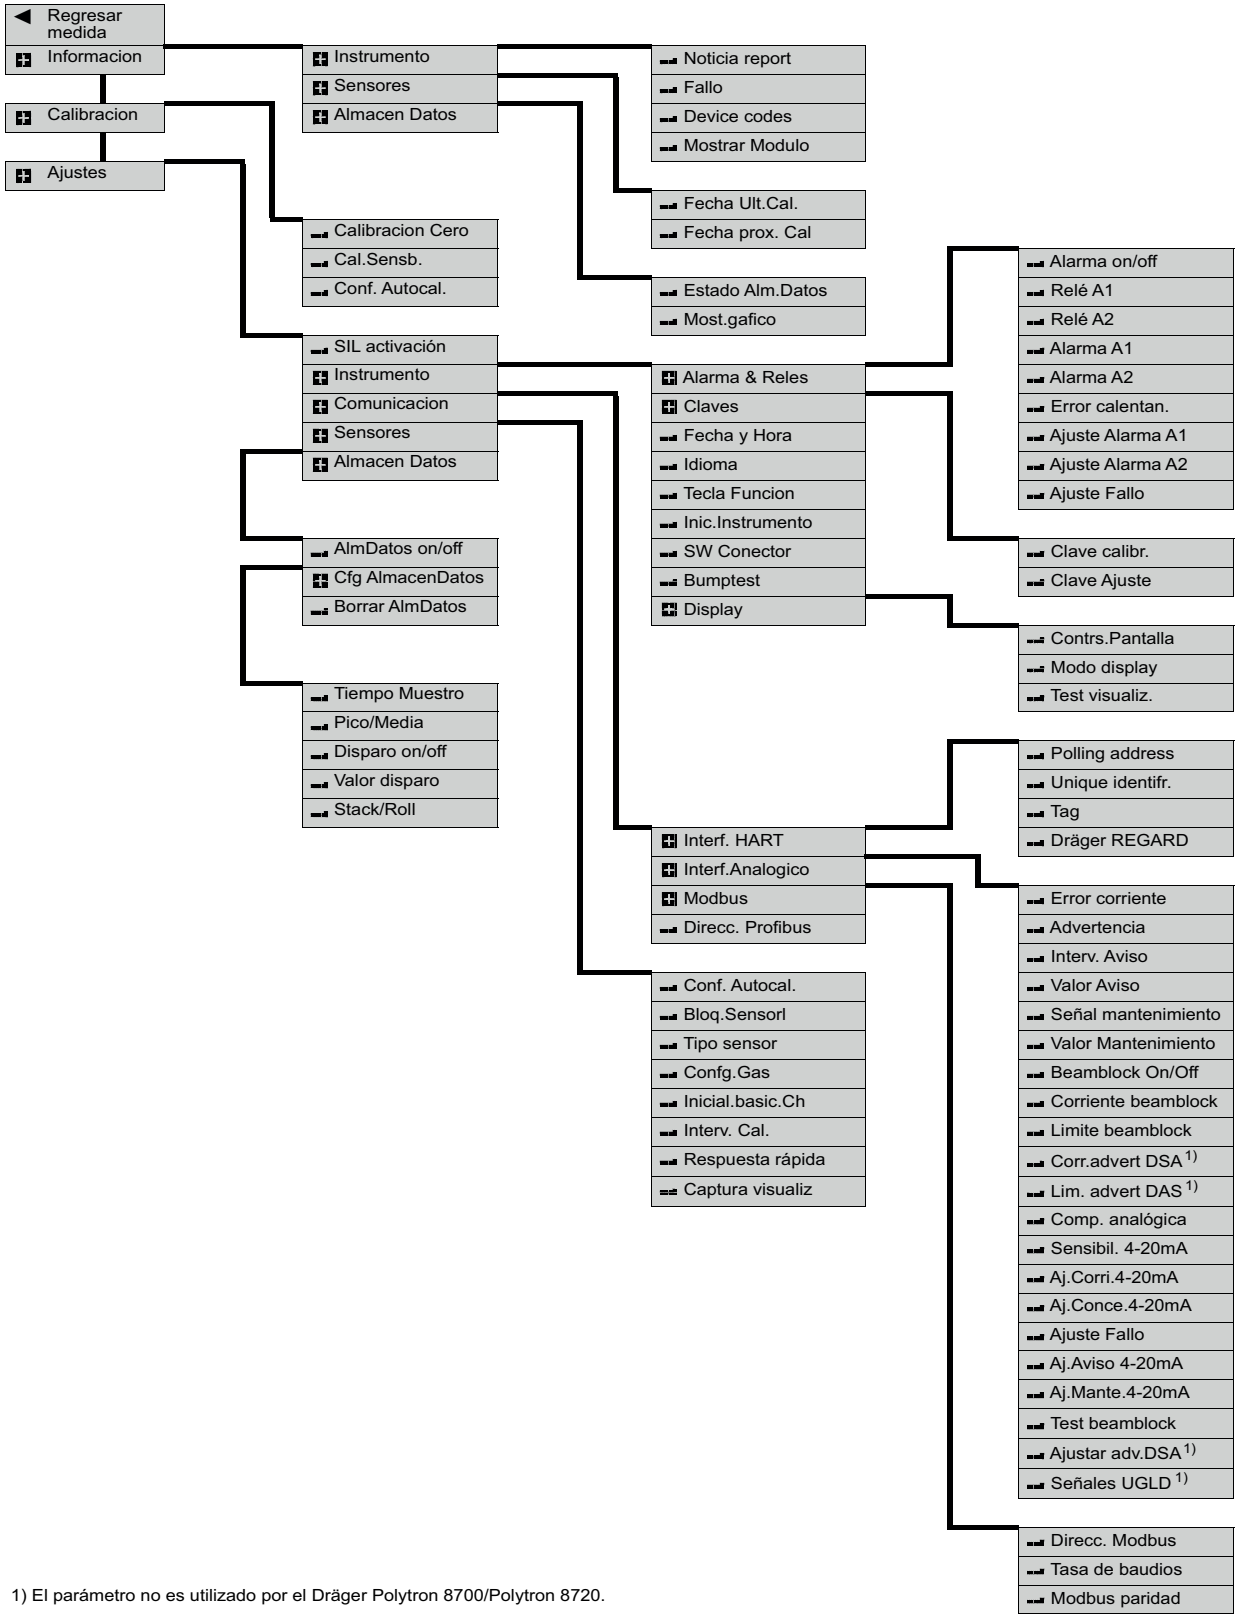
Instrumento	
Noticia report	Visualización de mensajes de advertencia en texto legible junto con el número correspondiente. Si hay varios mensajes de advertencia disponibles, existirá un indicador (por ejemplo, 1/3 = pantalla 1 de 3).
Error report	Visualización de mensajes de fallos en texto legible junto con el número correspondiente. Si hay varios fallos, existirá un indicador (por ejemplo, 1/3 = pantalla 1 de 3).
Indicadores del dispositivo	Con esta función se muestran los códigos de advertencia y fallo en forma de tabla. Si se muestra el valor 00 para todos los códigos, significará que no hay mensajes de advertencia o fallo disponibles.
Módulos	Muestra una descripción general de los módulos de hardware instalados y la versión del software de la interfaz de sensor EC llamada SIOS. Para acceder a información detallada, seleccione el módulo correspondiente. ■ = módulos instalados □ = módulos no instalados
Sensores	
Fecha últ.cal.	Se muestran la fecha, la unidad, el gas y la concentración del último ajuste.
Fecha próx. cal.	Muestra la fecha límite del próximo ajuste.
Vitalidad[1)]	La vitalidad del sensor se muestra en %. Dräger recomienda sustituir el sensor cuando la vitalidad sea de < 25 %.
Temp. sensor[1)]	Se muestra la temperatura actual y la temperatura más alta del sensor.
SensorAlive	En el submenú se muestran los días restantes hasta el final de la vida útil pronosticada y la vitalidad en %.
Almacen Datos	
Estado registrador	Muestra el estado del registrador de datos (activo o no activo)
Grafico	Muestra el historial de los últimos 15 minutos en un gráfico de tiempo/concentración.

1) Función solo disponible con la mochila de diagnóstico.



7.5.5 Vistas generales de los menús

Polytron 8100



1) El parámetro no es utilizado por el Dräger Polytron 8100.

Polytron 8200, Polytron 8310

1) El parámetro no es utilizado por el Dräger Polytron 8200/Polytron 8310.

Polytron 8700, Polytron 8720

1) El parámetro no es utilizado por el Dräger Polytron 8700/Polytron 8720.

7.6 Información acerca del funcionamiento con un Dräger SensorAlive

– El Dräger SensorAlive no ejecutará ningún LifeTest cuando está abierto un menú o están pendientes determinados errores en el transmisor.
– El Dräger SensorAlive puede suprimir el ajuste del instrumento durante un tiempo determinado (sensor H_2S: 30 minutos).
– Cuando se requiere una alta precisión del tiempo de ejecución del LifeTest, se debe comprobar la hora en el transmisor periódicamente y reajustar, si es necesario.
– Las entradas del menú para el Dräger SensorAlive solo se muestran si el Dräger SensorAlive está enchufado. Las funciones de la mochila pueden visualizarse pero no están activas.

8 Calibración

8.1 Indicaciones generales

– Para garantizar un funcionamiento correcto, ajuste primero el punto cero y luego la sensibilidad. Si estos procesos se ejecutan en el orden incorrecto, no se podrá continuar con el ajuste debido a la configuración del software.
– Si el uso está previsto a alturas elevadas, la lectura será más baja que la lectura a nivel del mar (presión parcial reducida). Se recomienda un nuevo ajuste de sensibilidad si la altura o la presión ambiental ha variado. El ajuste de fábrica está ajustado a la presión a nivel del mar.
– Dräger recomienda ajustar los instrumentos con el gas objetivo de la medición. Este método es más preciso que un ajuste con gas sustituto. Solo cuando no sea posible realizar un ajuste con gas objetivo, puede recurrirse alternativamente a un ajuste con gas sustituto.
– Los sensores para metano e hidrógeno solo se deberían ajustar con gas de medición y no con un gas sustituto.
– Para Polytron 8310 IR: deben tenerse en cuenta adicionalmente las instrucciones de uso del DrägerSensor IR.[1)].

Al realizar el ajuste se comprueba y se ajusta la exactitud de medición del sensor con una concentración del gas de prueba conocida. Los ajustes se tienen que realizar regularmente. La duración de los intervalos de ajuste depende de las condiciones ambientales en las cuales funciona el sensor.

Las condiciones ambientales y envejecimiento causan derivas del sensor. Las derivas del sensor tienen un impacto negativo sobre la exactitud de medición. Los ajustes restauran dicha exactitud. Dependiendo de la gravedad de la deriva, deben establecerse unos intervalos de ajuste más cortos.

Para evaluar las condiciones ambientales de instalaciones nuevas, se recomienda establecer unos intervalos de ajuste más cortos y documentar la deriva. El operador de la planta debería establecer unos intervalos de ajuste personalizados con los datos obtenidos.

Si se utiliza un Dräger SensorAlive, la deriva es compensada y se puede leer.

Bajo condiciones normales, Dräger recomienda los siguientes intervalos de ajuste[2)]:

– Sensores electroquímicos (EC): 6-12 meses[3)]
– Sensores catalíticos (CAT): 4 meses
– Sensores infrarrojos (IR): 6-24 meses[3)]

8.2 Gases de prueba

Para las propiedades de los gases de prueba (p. ej., humedad, concentración), consulte las instrucciones de uso del sensor correspondiente. Si no hay información sobre la humedad, se puede utilizar gas de prueba seco para el ajuste. La humedad del gas de prueba es irrelevante para los sensores de O_2.

Dependiendo del tipo de ajuste se utilizan diferentes gases de prueba.

Gas de ajuste de cero

El gas de ajuste de cero es un gas de prueba que se utiliza para ajustar el punto cero de un sensor. Para sensores de O_2 y CO_2, se utiliza nitrógeno (N_2). Para otros sensores se puede utilizar el aire ambiental, siempre que esté libre de contaminantes que interfieran y de gases de medición.

Gas de ajuste

El gas de ajuste es un gas de prueba que se utiliza para ajustar la sensibilidad de un sensor. El gas de ajuste es una concentración conocida del gas de medición diluido con aire limpio o nitrógeno. Para sensores de O_2 no se requiere ningún gas de ajuste, ya que se utiliza el oxígeno del aire ambiental.

8.3 Flujo de gas para los ajustes

El flujo de gas varía en función del sensor.

Sensor EC, sensor CAT	0,5 L/min ± 10 %
Resto de sensores	0,5 L/min - 2 L/min

El flujo de gas debe coincidir con las condiciones ambientales durante el funcionamiento (por ejemplo, medición del conducto de ventilación con un flujo superior a 2 L/min)

1) 9023981 (inglés), 9033555 (búlgaro, rumano), 9023984 (español, portugués), 9023986 (danés, noruego), 9033556 (checo, croata), 9033809 (chino), 9023985 (húngaro, polaco), 9023982 (francés), 9033557 (eslovaco, esloveno), 9033558 (griego, turco), 9023987 (italiano, neerlandés), 9023983 (finés, sueco), 9023843 (alemán)

2) Observar las instrucciones de uso del sensor
3) Para aplicaciones según las normas EN 45544-1 y EN IEC 62990-1, el intervalo de ajuste no debe superar los 6 meses.

8.4 Preparación del ajuste

Indicaciones generales

⚠ ADVERTENCIA
Peligro para la salud por gas de prueba
Inhalar gas de prueba puede poner en riesgo la salud o incluso provocar la muerte.
► No inhalar el gas de prueba.
► Observar los riesgos y los avisos de seguridad relacionados con el gas de prueba (consultar las hojas de datos y las instrucciones que figuran en los dispositivos de calibración).

⚠ PRECAUCIÓN
Activación de advertencias por el gas de prueba
El gas de prueba aplicado puede activar advertencias.
► Asegurarse de que el gas de prueba ya no se aplica tras la calibración.

Condiciones previas
– La fase de iniciación del sensor ha finalizado (consulte "Puesta en funcionamiento del detector de gases", página 155).
– Se ha ajustado la fecha y la hora (consulte "Ajuste de la fecha y la hora", página 170).
– Si se utiliza un Dräger SensorAlive, el último LifeTest debe haberse realizado hace suficiente tiempo (véanse las instrucciones de uso del sensor).

Particularidad del Polytron 8310

Dräger recomienda realizar un ajuste automático del punto cero en el sensor antes de ajustar el punto cero. Esto restablece el seguimiento del punto cero del DrägerSensor IR y todo el rango de seguimiento vuelve a estar disponible.

1. Desactive la señalización de alarma del detector de gases (consulte "Conexión o desconexión de alarmas", página 172).
2. Aplique nitrógeno, aire sintético o aire limpio al sensor por medio del adaptador de calibración y espere a que se estabilice el valor medido.
3. Coloque la varita magnética en el área marcada con el símbolo ⇩0 (dentro del marco negro) de la superficie del sensor y manténgala así durante al menos 5 segundos. La señal de salida del sensor cambia a la indicación de la señal de calibración después de 5 segundos (cambio de indicación en aprox. –10 %LIE) mientras se mantenga la varita magnética. Simultáneamente se realiza automáticamente un ajuste del punto cero del sistema óptico de medición.
4. Retire la varita magnética. Transcurridos 30 segundos, el instrumento termina la rutina de ajuste del punto cero automática. Para confirmar el ajuste automático del punto cero, la señal de salida vuelve a cambiar a la señal de calibración (cambio de la indicación a aprox. –10 %LIE). Esta señal se visualiza durante el mismo tiempo que al entrar en la rutina de ajuste automático del punto cero.
5. Encienda la señalización de alarma del detector de gases.

Polytron 8100, Polytron 8200, Polytron 8310

Véase la figura B en la página desplegable.

Equipo de ajuste:
– Manorreductor Dräger (1); para gases reactivos, utilice un manorreductor de acero inoxidable
– Adaptador de calibración Dräger (2) (número de referencia 6810536)
– Tubo (3)
– Botella de gas de ajuste Dräger (4)

Preparación del ajuste:
1. Conecte el manorreductor a la botella de gas de ajuste.
2. Coloque el adaptador de calibración en el sensor.
3. Conecte el tubo al empalme estriado.
4. Entre al menú; véase (consulte "Abrir los menús", página 158).

Polytron 87x0 IR

Véase la figura B en la página desplegable.

Equipo de ajuste:
– Manorreductor Dräger (1); para gases reactivos, utilice un manorreductor de acero inoxidable
– Adaptador de calibración Dräger (5) (número de referencia 6811610).
– Tubo (3)
– Botella de gas de ajuste Dräger (4)

Preparación del ajuste:
1. Conecte el manorreductor a la botella de gas de ajuste.
2. Acople el adaptador de calibración al protector contra salpicaduras hasta que encaje en su sitio.
   Esto no se aplica para el montaje en un conducto de ventilación o si se utiliza el adaptador de proceso o una cubeta de proceso (véanse las instrucciones de instalación para el correspondiente accesorio PIR 7x00).
3. Cerciórese de que las superficies de sellado alrededor de las aberturas del protector contra salpicaduras estén limpias. El protector contra insectos no se tiene que desmontar.
4. Conecte el tubo al empalme estriado.
5. Entre al menú; véase (consulte "Abrir los menús", página 158).

8.5 Ajuste del punto cero

8.5.1 Aspectos generales

El aire ambiental solo se puede utilizar para ajustar el punto cero del sensor en lugar de nitrógeno o aire sintético si se tiene seguridad de que el aire ambiental está libre del gas objetivo o de cualquier otro gas al que el sensor pueda reaccionar con interferencia cruzada (consulte lo indicado en la hoja de datos del sensor). En este caso no se requiere ningún adaptador de botella o de calibración para el ajuste del punto cero.

⚠ ADVERTENCIA
Fallo de calibración en la calibración del punto cero
Un flujo insuficiente de aire ambiental puede causar errores de calibración.
► Asegurarse de que el flujo de aire ambiental al sensor es suficiente.

Específico para Polytron® 8100 EC:

En los sensores de oxígeno (O_2), una calibración del punto cero no modifica ningún valor en el firmware o en el sensor. Por ello, la función de calibración del punto cero se puede utilizar para comprobar la lectura correcta de punto cero cuando nitrógeno es aplicado al sensor. El Polytron 8100 EC indicará un estado de fallo si la comprobación del punto cero falla con una desviación de más de 0,6 vol% de O_2 del punto cero. En caso de un fallo, repita la comprobación del punto cero o cambie el sensor en caso necesario. Utilice nitrógeno (N_2) para la verificación.

Específico para Polytron® 8200 CAT:

Los sensores no se deben calibrar con nitrógeno puro. Los sensores catalíticos necesitan oxígeno para funcionar correctamente.

Específico para Polytron® 8720 IR:

Para Polytron 8720 IR (con sensor PIR 7200 para la detección de dióxido de carbono), solamente se debe utilizar nitrógeno o aire sintético sin ningún contenido de CO_2 para una calibración del punto cero.

8.5.2 Ejecución del ajuste del punto cero

ℹ La calibración puede cancelarse en cualquier momento. Para cancelar la calibración, seleccionar ***Regresar***.

Requisitos previos:
– El sensor ha finalizado la fase de calentamiento
– La calibración está preparada.

Ajuste el punto cero de la siguiente manera:
1. Seleccione ***Calibracion*** > ***Calibracion Cero*** y confirme.
   ⇒ La señal de mantenimiento se transmite a través de la interfaz analógica. No se conmuta ninguna alarma ni ningún relé de error y se muestra el símbolo 🔧.
   ⇒ Se muestra el mensaje ***Sumin.gas cero***.
2. Aplique aire sintético o nitrógeno si no se puede usar aire ambiental.
   a. Ajuste el flujo de gas según el sensor utilizado (consulte "Flujo de gas para los ajustes", página 162)
3. Seleccione ***Siguiente*** y confirme.
   ⇒ Se muestra el valor actual.

ℹ Después de 15 minutos sin confirmación, el instrumento regresa al menú de ajuste sin realizar un ajuste.

Después de que el gas de prueba se haya aplicado al sensor durante 3 minutos y el valor mostrado sea estable, realice el ajuste.

4. Seleccione ***Calibrar*** y confirme.
   ⇒ Se muestra el mensaje ***Porfavor Espere***.
   ⇒ Se muestra un valor actual nuevo.
5. Seleccione ***Siguiente*** y confirme.
6. Cierre el flujo de gas y retire el adaptador de calibración del sensor o suelte el tubo.
   Si el valor actual no se encuentra dentro del rango de alarma:
7. Seleccione ***Siguiente*** y confirme.
   ⇒ El instrumento retorna al menú de ajuste.

8.6 Calibración de la sensibilidad

8.6.1 Aspectos generales

Específico para Polytron® 8310 IR:

Debido al diseño del sensor de gas DSIR, la señal de salida del sensor de gas está limitada a 45 %. . . 55 % de la tensión de alimentación interna del instrumento. Si las concentraciones de gas aumentan más después de haber alcanzado la señal de salida máxima del sensor, esto no conduce a un aumento de los valores visualizados en la respuesta del instrumento transmitida a la unidad de control. En caso de sustancias con unos factores de ajuste particularmente bajos y/o la configuración manual de un factor alto de ajuste de sensibilidad en el sensor, esto ya puede suceder a concentraciones inferiores a 100 % LIE. Para ajustes con gas sustituto, la activación correcta de la alarma se debería comprobar utilizando una concentración de gas de prueba que corresponda al umbral de alarma. En caso necesario, el rango de medición representable puede aumentarse reduciendo la señal de salida del sensor en función de las necesidades y ajustándola a continuación en la unidad (véase el capítulo "Calibración manual de la sensibilidad de la señal de salida" en las instrucciones de uso del sensor de gas DSIR).

8.6.2 Ejecución del ajuste de sensibilidad

ℹ La calibración puede cancelarse en cualquier momento. Para cancelar la calibración, seleccionar ***Regresar***.

Condiciones previas:
– El ajuste ha sido preparado.
– El punto cero ha sido ajustado.
– Indicaciones específicas para todos los Polytron 8xx0 salvo el Polytron 8100 EC:
  el último ajuste válido del punto cero se realizó hace menos de 24 horas.

Ajuste la sensibilidad de la siguiente manera:

1. Seleccione ***Calibracion*** > ***Calib. Sensibil.*** y confirme.
   ⇒ La señal de mantenimiento se transmite a través de la interfaz analógica. No se conmuta ninguna alarma ni ningún relé de error y se muestra el símbolo .
   ⇒ Se muestran los parámetros para el gas de ajuste, p. ej.:[1)]
   Gas : H_2S
   Unidad: ppm
   Concentr.: 25
2. Si los parámetros mostrados no coinciden con el gas objetivo, ajuste los parámetros:
   a. Seleccione ***Gas*** y confirme.
   b. Seleccione el gas de ajuste de la lista y confírmelo.
   c. Seleccione ***Unidad*** y confirme.
   d. Seleccione la unidad de medida deseada de la lista y confírmela.
   e. Seleccione ***Conc.*** y confirme.
   f. Ajuste la concentración del gas de ajuste.
3. Si los ajustes son correctos:
   a. Seleccione ***Siguiente*** y confirme.
      ⇒ Se muestra un mensaje como ***Flujo de gas ON H_2S***.
4. Aplique el gas de ajuste.
   a. Ajuste el flujo de gas según el sensor utilizado (consulte "Flujo de gas para los ajustes", página 162)
5. Seleccione ***Siguiente*** y confirme.
   ⇒ Se muestra el valor actual.

Después de 15 minutos sin confirmación, el instrumento regresa al menú de ajuste sin realizar un ajuste.

Después de que el gas de prueba se haya aplicado al sensor durante 3 minutos y el valor mostrado sea estable, realice el ajuste.[2)]:

6. Seleccione ***Siguiente*** y confirme.
   ⇒ Se muestra el mensaje ***Porfavor Espere***.
   ⇒ Se muestra un valor actual nuevo.
7. Seleccione ***Siguiente*** y confirme.
8. Cierre el flujo de gas y retire el adaptador de calibración del sensor o suelte el tubo.

   Si el valor actual no se encuentra dentro del rango de alarma:
9. Seleccione ***Siguiente*** y confirme.
   ⇒ El instrumento retorna al menú de ajuste.

1) No aplicable a todos los sensores (consulte "Modo de medición", página 156).
2) En los sensores LC, el gas de prueba debe aplicarse durante al menos 6 minutos.

8.7 Ajuste automático

8.7.1 Aspectos generales

El ajuste automático incluye el ajuste del punto cero y un ajuste posterior de sensibilidad. Es una alternativa al ajuste del punto cero y de la sensibilidad de forma manual.

No todos los sensores y gases son compatibles con el ajuste automático. Si la función no está disponible, realice el ajuste manualmente.

8.7.2 Ejecución del ajuste automático

Después de 24 horas, la calibración del punto cero deja de estar actualizada. Por lo tanto, la calibración automática no podrá realizarse a menos que se realice de nuevo la calibración del punto cero.

La calibración puede cancelarse en cualquier momento. Para cancelar la calibración, seleccionar ***Regresar***.

Condiciones previas:

– El ajuste automático está activado.
– La fase de iniciación del sensor ha finalizado.
– El ajuste ha sido preparado.

Ejecute el ajuste automático de la siguiente manera:

1. Aplique aire sintético o nitrógeno si no se puede usar aire ambiental.
2. Seleccione ***Calibracion*** > ***Auto calibracion*** y confirme.
   ⇒ Se muestra el mensaje ***Porfavor Espere*** y el instrumento realiza automáticamente el ajuste del punto cero.
   ⇒ En caso de un sensor de O_2, se muestra ***Aire fresco cal.***.

   La señal de mantenimiento se transmite por la interfaz analógica, no se conmutan relés de alarma o fallo y se muestra el símbolo .
3. Después de un ajuste del punto cero correcto, se inicia el ajuste de sensibilidad.
   ⇒ Se visualizan los parámetros para el gas, p. ej.:[3)]
   Gas : H_2S
   Unidad: ppm
   Concentr.:25
4. Si los parámetros mostrados no coinciden con el gas objetivo, ajuste los parámetros:[4)]
   a. Seleccione ***Gas*** y confirme.
   b. Seleccione el gas de ajuste de la lista y confírmelo.
   c. Seleccione ***Unidad*** y confirme.
   d. Seleccione la unidad de medida deseada de la lista y confírmela.
   e. Seleccione ***Conc.*** y confirme.
   f. Ajuste la concentración del gas de ajuste.

3) Esto no es aplicable a todos los sensores (consulte "Modo de medición", página 156).
4) Solo es posible para determinados sensores.

5. Si los ajustes son correctos:
   a. Seleccione ***Siguiente*** y confirme.
      ⇒ Se muestra un mensaje como ***Flujo de gas ON H_2S***.
6. Aplique el gas de ajuste.
   a. Ajuste el flujo de gas según el sensor utilizado (consulte "Flujo de gas para los ajustes", página 162)
7. Seleccione ***Siguiente*** y confirme.
   ⇒ Se muestra el valor actual.

   Después de 15 minutos sin confirmación, el instrumento regresa al menú de ajuste sin realizar un ajuste.

8. Una vez que el valor actual se estabilice, el instrumento realizará automáticamente el ajuste de sensibilidad.
9. Después de un ajuste correcto, se muestran el nuevo valor actual determinado y el mensaje ***Valor ok?***.
   - Si no es así, seleccione «Rehacer» y confírmelo para volver a realizar el ajuste.
   - Si el valor se corresponde con el valor de consigna, continúe.
10. Cierre el flujo de gas y retire el adaptador de calibración del sensor o suelte el tubo.
11. Seleccione ***Aceptar valor*** y confirme para terminar el ajuste. El instrumento retorna al menú de ajuste.

9 Eliminación de averías

9.1 Fallos

Número	Causa	Solución
001, 003 - 004, 012 - 014, 020 - 024, 043, 060, 067	Error grave del instrumento, diversas causas.	Haga que DrägerService compruebe el instrumento.
002, 025 - 027, 030 - 034, 041, 042, 044, 050, 052, 081, 085	Error de datos grave en el instrumento, varias causas.	Restablezca el instrumento a los ajustes de fábrica. Si este fallo se vuelve a producir: Haga que DrägerService compruebe el instrumento.
005	La tensión de alimentación está fuera del rango admisible.	Compruebe la alimentación eléctrica.
010	El cable no está conectado a la interfaz de 4 a 20 mA.	Compruebe la conexión de la interfaz de 4 a 20 mA. Si se utiliza como instrumento autónomo sin un controlador central, cablee la clavija 3 a la clavija 4.
011	Error grave del instrumento, diversas causas.	Haga que DrägerService compruebe el instrumento. Si este fallo se vuelve a producir: Compruebe la carga o el cable.
045	El instrumento no detecta ningún sensor.	Compruebe las conexiones. Si este fallo se vuelve a producir: Haga que DrägerService compruebe el instrumento.
051, 054	Fallo en el ajuste del punto cero.	Realice el ajuste del punto cero.
055	Fallo en el ajuste de sensibilidad.	Realice el ajuste de sensibilidad.
076, 080 - 084	Fallo del instrumento.	Compruebe las conexiones eléctricas. Si este fallo se vuelve a producir: Haga que DrägerService compruebe el instrumento.
090	La función de bloqueo del sensor está activada. Se ha utilizado un sensor con un número de referencia diferente.	Utilice un sensor con el mismo número de referencia o desactive la función de bloqueo del sensor.
105	Fallo del instrumento.	Haga que DrägerService compruebe el instrumento.
137, 64, 91	Fallo del instrumento.	Apague y vuelva a encender. Si este fallo se vuelve a producir: Haga que DrägerService compruebe el instrumento.

Solo para Polytron 8100 EC con Dräger SensorAlive

Número	Causa	Solución
220	La abertura del sensor está obstruida.	Limpie la abertura del sensor o sustituya el filtro de polvo. A continuación, confirme la obstrucción en el menú (consulte "Ajustes del Dräger SensorAlive", página 178).
221	La sensibilidad del sensor es inferior al 40 % (valor calculado).	Ajuste o sustituya el sensor.
222	Debido a un error, hay un valor de gas demasiado alto después de la electrólisis.	Sustituya el sensor o póngase en contacto con DrägerService.
223	La sensibilidad del sensor es demasiado baja.	Ajuste o sustituya el sensor.

Número	Causa	Solución
224	El flujo de acondicionamiento está fuera del rango permitido.	Sustituya el sensor o póngase en contacto con DrägerService.

Solo para Polytron 87x0 IR

Número	Causa	Solución
064, 071	Fallo de comunicación.	Compruebe la conexión al sensor PIR 7x00.
083	El sistema óptico del PIR 7x00 está sucio.	Limpie el sistema óptico del PIR 7x00.
086	La tensión de alimentación está fuera de rango	Compruebe la alimentación eléctrica.
087	Fallo de 4 a 20 mA en el sensor PIR 7x00.	Compruebe la conexión de 4 a 20 mA en el sensor PIR 7x00.
094, 095	Error de datos en el instrumento.	Restablezca el sensor a los ajustes de fábrica. Si se repite este error: Haga que DrägerService compruebe el instrumento.
096	La contraseña SIL no coincide con el PIR 7x00.	Introduzca la contraseña nuevamente.

9.2 Noticia report

Número	Causa	Solución
101	El registrador de datos en el modo "Stack" está lleno al 100 % y ya no registra más datos.	Haga que DrägerService compruebe el instrumento.
102	El registrador de datos en modo "Stack" está lleno al 90 %.	Descargue los datos lo antes posible y vacíe el registrador de datos.
103, 106	Error de datos en el instrumento. Es posible que algunas funciones de la mochila como el registrador de datos, la prueba del sensor, etc., ya no estén disponibles.	Restablezca el instrumento a los ajustes de fábrica. Si se repite este error: Haga que DrägerService compruebe el instrumento.
104	El ajuste de fecha u hora no es válido.	Ajuste la fecha y la hora.
105	Fallo del instrumento.	Haga que DrägerService compruebe el instrumento.
107	La batería de la memoria de datos está vacía.	Haga que DrägerService compruebe el instrumento.
110, 111, 112	La mochila de software se ha retirado sin haber sido desactivada.	Desactive la mochila de software.
113	Alarmas inhibidas.	Active las alarmas.
164, 165	La fase de iniciación del sensor no ha terminado. Se debe prever un aumento de los errores de medición.	Espere hasta que el sensor finalice la fase de iniciación. No ajuste el sensor antes de que la iniciación haya finalizado completamente.
167, 170	El intervalo de ajuste ha expirado.	Ajuste de nuevo el instrumento.

Solo para Polytron 8100 EC

Número	Causa	Solución
163	Baja vitalidad del sensor EC	Sustituya el sensor.
171	Lectura negativa. Valor por debajo del rango mínimo.	Ajuste de nuevo el punto cero.

Solo para Polytron 8100 EC con Dräger SensorAlive

Número	Causa	Solución
320	La comunicación con el sensor ha fallado. El diagnóstico y el generador de gas ya no funcionan.	Extraiga el sensor, déjelo a un lado durante aprox. 1 día y vuélvalo a enchufar. Compruebe la versión del firmware y, si es necesario, pida una actualización a DrägerService. Sustituya el sensor.
321	La evaluación de los datos del sensor ha fallado. El sensor no puede realizar ni evaluar un LifeTest (porque no se cumplen las condiciones previas).	Cambie la hora del LifeTest o ajuste el perfil de repetición a "Flexible" (consulte "Ajustes del Dräger SensorAlive", página 178). Si vuelve a repetirse la advertencia, póngase en contacto con DrägerService.
322	El conjunto de datos del sensor es defectuoso.	Sustituya el sensor.
323	El conjunto de datos del sensor es incompatible.	Póngase en contacto con DrägerService.
324	La sensibilidad del sensor es inferior al 50 % (valor calculado).	Ajuste el sensor y prepare su sustitución (p. ej., pida la pieza de repuesto).

Número	Causa	Solución
325	La sensibilidad del sensor es inferior al 40 % (valor calculado).	Ajuste o sustituya el sensor.
326	Durante un LifeTest y durante cierto tiempo después, el sensor no puede ser ajustado.	Para poder realizar un ajuste planificado, se puede inhibir temporalmente el LifeTest en el PolySoft mediante el modo de inhibición.
327, 330, 344, 347	El generador de gas no funciona.	Ajuste o sustituya el sensor.
331	La generación de gas ha fallado.	Ajuste el sensor.
332	El sensor está en estado seguro. No se realizan LifeTest (advertencia colectiva).	Encuentre la causa y subsánela.
333	El reloj en tiempo real del sensor no funciona correctamente.	Ajuste el reloj.
334	La sincronización del sensor no ha terminado.	Espere a que la sincronización haya finalizado. En función del estado del sensor, este estado puede estar presente durante varios minutos. Si es necesario, solicite a DrägerService la actualización del firmware.
336	Las comprobaciones internas del sensor arrojan resultados erróneos.	Reinicie el sistema.
337	Es necesario actualizar el firmware del transmisor.	Póngase en contacto con DrägerService.
340	El sensor se sincroniza después de que se ha reiniciado el sistema.	Espere a que la sincronización haya finalizado.
342	La diferencia de temperatura entre los dos puntos de medición de la temperatura es demasiado elevada.	Espere y compruebe si se evalúa el LifeTest o sustituya el sensor.
347	La configuración ha fallado debido a una interrupción en la comunicación entre el transmisor y el sensor.	Vuelva a configurar el sensor y compruebe la configuración.
350	El generador de gas está en fase de puesta en marcha.	Espere a que la fase de puesta en marcha haya finalizado. Durante la fase de puesta en marcha no se ejecutan las funciones de detección de errores y detección de obstrucciones.
352	La autocomprobación del sensor ha fallado.	Sustituya el sensor o póngase en contacto con DrägerService.
353	El sensor se encuentra temporalmente en modo inhibición. No se realizan LifeTest durante este tiempo.	Se puede salir del modo de inhibición manualmente a través de PolySoft o se sale automáticamente.
354	Error al iniciar el sistema.	Realice un reinicio manualmente.
355	El firmware del sensor no es compatible con el hardware.	Solicite a DrägerService la actualización del firmware.
356	Los datos del hardware son defectuosos.	Realice un reinicio o sustituya el sensor.
357	El sensor ha sido puesto manualmente en estado seguro, p. ej., para ejecutar una actualización del firmware.	Para salir de dicho modo, reinicie el sensor.

Solo para Polytron 87x0 IR:

Número	Causa	Solución
163	La temperatura del sensor es muy alta.	
171	La deriva del punto cero es demasiado elevada.	Realice el ajuste del punto cero.
172	El sistema óptico del PIR 7x00 está sucio.	Limpie el sistema óptico del PIR 7x00.
173	El ajuste del punto cero ha expirado para el ajuste de sensibilidad.	Realice el ajuste del punto cero.

Número	Causa	Solución
182	No es posible el ajuste automático con PIR 7200.	Realice un nuevo ajuste del punto cero y de sensibilidad.

10 Mantenimiento

– Los intervalos de mantenimiento se tienen que establecer para cada una de las instalaciones. Dependiendo de las consideraciones de seguridad y condiciones específicas de la aplicación en las que se utiliza el instrumento, éstos tal vez se tengan que acortar.

Cada 6 meses:

– Inspección por parte del personal especializado.
– Compruebe la transmisión de la señal a la unidad de control (consulte "Comprobación de la interfaz analógica", página 175).
– Compruebe los LED y la activación de los dispositivos de alarma (consulte "Comprobación de alarmas/relés", página 172).

Regularmente:

– Realice los ajustes, véase 8 Calibración

10.1 Realización de la prueba con gas y comprobación del tiempo de respuesta (t90)

En una prueba con gas (Bump Test) se comprueba el tiempo de respuesta sin activar una alarma.

1. Seleccione ***Ajustes*** > ***Instrumento*** > ***Bumptest*** y confirme.
   ⇒ Se muestra el símbolo de mantenimiento
   ⇒ La salida analógica es ajustada a la señal de mantenimiento.
2. Aplique al sensor una concentración de gas conocida.
3. Compruebe el tiempo de respuesta y compárelo con el valor t90 indicado en la hoja de datos correspondiente del sensor.
4. Pulse [OK] para volver a la medición.

10.2 Sustitución del sensor

⚠ ADVERTENCIA
Calibración defectuosa
Una calibración defectuosa puede causar lecturas inexactas.
► Si se sustituye el sensor, es preciso comprobar que todos los ajustes y parámetros son correctos.
► Comprobar la calibración para verificar el funcionamiento correcto.

10.2.1 Polytron® 8100 EC

Un sensor se puede sustituir en el área clasificada como peligrosa sin interrumpir la alimentación eléctrica.

Función de bloqueo del sensor

Si previamente se había instalado un sensor del mismo tipo (mismo número de referencia), se conservará la configuración específica del dispositivo (tipo de gas, rango de medición, gas de prueba, intervalo de ajuste, etc.). De lo contrario, se cargarán los ajustes predeterminados de fábrica del nuevo sensor y se sobrescribirá la configuración específica del dispositivo. Esto puede evitarse si la función de bloqueo del sensor (consulte "Ajuste del bloqueo del sensor", página 177) está activada.

Función de cambio de sensor

Con la función de menú ***Cambio sensor***, puede realizarse un cambio de sensor durante el funcionamiento sin activar una señal de fallo en la unidad de control. Además se asegura que todos los datos del sensor, que se encuentran en el microprocesador, se pueden guardan en la memoria enchufable (EEPROM) del sensor antes de desenchufar el conector del sensor.

Sustitución del sensor

Véase la figura C en la página desplegable.

En principio, es posible realizar una sustitución del sensor en cualquier momento.

1. Seleccione ***Ajustes*** > ***Sensores*** > ***Cambio sensor*** y confirme.
   ⇒ La señal de mantenimiento se genera en la interfaz de 4-20 mA.
   ⇒ En la pantalla se muestra lo siguiente: ***Por favor retire sensor***.
   ⇒ Se muestra el símbolo de mantenimiento.
2. Sustituya el sensor usado por un sensor nuevo:
   a. Suelte el tornillo de sujeción (2) (tornillo Allen de 2 mm).
   b. Desenrosque el anillo de bayoneta (3).
   c. Inserte el sensor (4) en la abertura y gírelo hasta que encaje en el detector de gases. El conector del sensor no sufrirá ningún daño.
   d. Bloquee el sensor con el anillo de bayoneta (3) correspondiente.

   Para Dräger SensorAlive debe utilizarse un anillo de bayoneta distinto al que se usa para otros sensores EC.

   e. Apriete el tornillo de sujeción (2) de modo que el anillo de bayoneta no pueda soltarse (obligatorio para instalaciones de Zona 22).
      ⇒ En la pantalla se muestra lo siguiente: ***Cargando datos, por favor espere***
3. Si fuera necesario, coloque la etiqueta suministrada con el sensor en el instrumento. Esto permite identificar desde la distancia el tipo de gas que se está midiendo, incluso si hay un fallo del suministro eléctrico.

4. Cuando los datos del sensor se han cargado, la pantalla muestra: ***Datos cargados***.
5. Seleccione ***Regresar al menu*** y confirme.
   ⇒ La señal de mantenimiento en la interfaz 4-20 mA sigue pendiente hasta que el sensor haya finalizado la iniciación.

   Tiempo de iniciación máximo de un nuevo sensor: consulte las instrucciones de uso del sensor. Para oxígeno: homologaciones según la norma EN 50104.
6. Compruebe el ajuste. Si es necesario, ajuste el instrumento (consulte "Calibración", página 162).
7. Compruebe los requisitos de instalación y el estado SIL del instrumento.
   Véanse las secciones "Instalación a prueba de explosión (Ex d) - sin estación de acoplamiento" hasta "Instalación de sensores o cabezales detectores".

10.2.2 Polytron® 8200 CAT, 8310 IR, 87x0 IR

Sustitución del sensor

1. Si fuera necesario, ajuste la corriente de mantenimiento para la interfaz analógica.
2. Desconecte la alimentación eléctrica del instrumento o desclasifique el área según lo especificado en las normativas locales.
3. Afloje el tornillo de fijación y desenrosque la tapa del instrumento.
4. Extraiga la unidad de tarjeta de circuito impreso.
5. Gire la unidad de tarjeta de circuito impreso y retire el conector del sensor.
6. Desenrosque el sensor.
7. Inserte los cables del sensor a través del puerto roscado de la carcasa.

⚠ ADVERTENCIA
¡Peligro de explosión!
Las aberturas de la carcasa se deben sellar para prevenir una ignición de aire atmosférico peligroso en caso de ignición en el interior de la carcasa.
► Cinco pasos de la rosca deben enroscarse para garantizar el estado a prueba de explosiones.

8. Enrosque el sensor y apriete con el par de apriete correcto (mín. 266 in-lbs / mín. 30 Nm).
9. Específico para Polytron® 8200 CAT:
   Una los cables del sensor torciéndolos. Si fuera necesario, coloque una brida sujetacables para mantenerlos apretados.
10. Inserte el conector del sensor de nuevo en la hembrilla.
11. Coloque la unidad de tarjeta de circuito impreso nuevamente en la carcasa.
12. Atornille la tapa en el instrumento hasta que quede bien encajada (mín. ≥44 in-lbs / mín. ≥5 Nm) y apriete el tornillo de fijación.
13. Si es necesario, conecte la alimentación eléctrica del instrumento.
    ⇒ La señal de mantenimiento en la interfaz 4-20 mA sigue pendiente hasta que el sensor haya finalizado la iniciación.

    Tiempo de iniciación máximo de un nuevo sensor: consulte las instrucciones de uso del sensor.
14. Compruebe el ajuste. Si es necesario, ajuste el instrumento (consulte "Calibración", página 162).
15. Compruebe los requisitos de instalación y el estado SIL del instrumento.
    Véanse las secciones "Instalación a prueba de explosión (Ex d) - sin estación de acoplamiento" hasta "Instalación de sensores o cabezales detectores".

10.3 Realización de una prueba de visualización

1. Seleccione ***Ajustes*** > ***Instrumento*** > ***Display*** > ***Test visualiz.*** y confirme.
2. Seleccione ***Activado*** y confirme.
   ⇒ La información de la pantalla se muestra invertida. Se encienden todos los LED.
   Al salir del menú, finaliza la inversión.

11 Ajustes del dispositivo

11.1 Ajuste de contraseñas

1. Seleccionar ***Ajustes*** > ***Instrumento*** > ***Claves*** la contraseña deseada y confirmar.

Clave calibr.	Acceder a la calibración del punto cero y de la sensibilidad.
Clave Ajustes	Acceder a todos los parámetros de configuración.

2. Seleccionar la línea para editar la contraseña y confirmar.
3. Ajustar la contraseña y confirmar.
4. Seleccionar ***Confirmar*** y confirmar con [OK].

11.2 Ajuste de la fecha y la hora

1. Seleccione ***Ajustes*** > ***Instrumento*** > ***Fecha y hora*** y confirme.
2. Seleccione la línea para editar la fecha y la hora y confirme.
3. Seleccione ***Confirmar*** y confírmelo con [OK].

11.3 Ajuste del idioma

1. Seleccione ***Ajustes*** > ***Instrumento*** > ***Idioma*** y confirme.
2. Seleccionar el idioma deseado de la lista y confirme.

11.4 Configuración de la tecla de función

1. Seleccione ***Ajustes*** > ***Instrumento*** > ***Tecla Funcion*** y confirme.
2. Seleccione una función y confirme.

Grafico	Las mediciones de los últimos 15 minutos son visualizadas en forma de gráfico de tiempo/concentración.
Error report	Los mensajes de fallo se muestran en texto legible.
Noticia report	Los mensajes de advertencia se muestran en texto legible.
Bumptest	La prueba con gas permite aplicar gas a un sensor sin generar una alarma. La señal de mantenimiento es transmitida. Después de 15 minutos, o pulsando nuevamente [OK], se termina la prueba con gas y el instrumento retorna al funcionamiento normal.
Vida Sensor[1)]	Muestra la vitalidad restante del sensor.

1) Solo con mochila de diagnóstico.

11.5 Restablecimiento de los ajustes por defecto

Esta función reinicia el instrumento a los ajustes por defecto de fábrica.

1. Seleccionar ***Ajustes*** > ***Instrumento*** > ***Inic.Instrumento*** y confirmar.
2. Seleccionar ***Confirmar*** y confirmar con [OK].

11.6 Cambio del contraste de la pantalla

1. Seleccionar ***Ajustes*** > ***Instrumento*** > ***Display*** > ***Contrs.Pantalla*** y confirmar.
2. Cambiar el contraste y confirmar.

11.7 Cambio del modo de pantalla

1. Seleccionar ***Ajustes*** > ***Instrumento*** > ***Display*** > ***Modo display*** y confirmar.
2. Seleccionar el modo deseado y confirmar.

Estándar	Muestra la pantalla estándar.
No display	Muestra la pantalla de inicio y los símbolos aplicables.

Si se activa una alarma, la pantalla muestra la concentración de gas actual y el LED rojo parpadea sea cual sea el modo de pantalla seleccionado.

11.8 Configuración del relé

11.8.1 Combinaciones de autoenclavador y confirmación de alarmas

Los siguientes ejemplos proporcionan una visión general de combinaciones de confirmación de relé.

	Autoenclavador (Reinicio manual de relé)	**No autoenclavador** (Reinicio automático del relé después de que la condición de alarma desaparezca)
Confirmable	Reinicio de relé posible en cualquier momento.	
No confirmable	Reinicio de relé no posible antes de que la condición de alarma desaparezca.	
Preconfirmable	Confirmación de alarma posible antes de que la condición de alarma desaparezca. El relé se reinicia automáticamente después de que la condición de alarma desaparezca.	

Las señales «autoenclavador» y «no autoenclavador» no están limitadas en el tiempo. Las señales «autoenclavador» permanecen activas hasta que se confirmen. Las señales «no autoenclavador» se detienen en cuanto la condición de activación desaparezca.

11.8.2 Configuración del relé A1 o A2

Esta función define si el relé de alarma está excitado durante el funcionamiento normal o excitado en una condición de alarma.

1. Seleccionar ***Ajustes*** > ***Instrumento*** > ***Alarma***> ***Relé A1*** o ***Relé A2*** y confirmar.
2. Seleccionar la opción deseada y confirmar.

Normal. Tensión	El contacto del relé se excita durante el funcionamiento normal y cambia si se activa una alarma. En caso de pérdida de energía eléctrica, se dispara una alarma (a prueba de fallos).
Tension en Alarm	Si se dispara una alarma, se excita el contacto de relé.

11.8.3 Ajuste del calentamiento 1 del relé de fallo

Esta función se utiliza para ajustar el funcionamiento del relé de fallo durante el calentamiento 1 para indicar el estado de calentamiento 1 en la salida del relé.

1. Seleccione ***Ajustes*** > ***Instrumento*** > ***Alarma*** > ***Fallo calentamiento*** la opción deseada y confírmelo.

Estático	El relé de fallo activa un indicador de alarma conectado permanentemente. El indicador LED naranja se ilumina continuamente.
Dinámico	El relé de fallo conmuta el estado por 9 segundos. *Ejemplo:* – Una bocina está conectada a la salida del relé de fallo «normalmente abierto». – Los relés están configurados como «normalmente excitado». ⇒ La bocina y el indicador LED naranja del transmisor están activos 1 segundo e inactivos 9 segundos.

11.9 Configuración de alarma

11.9.1 Conexión o desconexión de alarmas

1. Seleccione ***Ajustes*** > ***Instrumento*** > ***Alarma*** > ***Alarma on/off***.

Activado	La señalización de alarma está conectada.
Desactivado	La señalización de alarma está desconectada. Los LED, relés y las interfaces no muestran ninguna condición de alarma. La interfaz de 4 a 20 mA transmite la señal de mantenimiento. Se muestran el valor determinado y el símbolo [!]. El relé de fallo indica un fallo.

2. Seleccione ***Activado*** o ***Desactivado*** y confirme.

11.9.2 Configuración de la alarma

1. Seleccione ***Ajustes*** > ***Instrumento*** > ***Alarma*** > ***Alarma A1*** o ***Alarma A2*** y confirme.
   Se muestra el umbral de alarma actual.
2. Acepte la sugerencia mostrada o modifique los siguientes ajustes (confirme los pasos de configuración uno tras otro con ***Sigue***):
   a. Ajuste el valor para el umbral de alarma.
   b. Ajuste la dirección de alarma.

Subida	La dirección de alarma se denomina "ascendente", si la concentración de gas tiene que superar un determinado valor para activar una alarma.
Caída	La dirección de alarma se denomina "descendente", si la concentración de gas tiene que caer por debajo de un determinado valor para activar una alarma.

   c. Establezca el modo de enclavamiento.

Latching	Una vez que se alcance el umbral de alarma, el instrumento activará la alarma. Permanecerá en estado de alarma aunque la concentración de gas ya no cumpla la condición de alarma. Para eliminar una alarma de enclavamiento, hay que confirmarla.
Non Latching	El estado de alarma se borrará en cuanto la concentración de gas ya no cumpla la condición de alarma.

   d. Establezca el modo de confirmación.

Acknowledging	El relé de alarma y el LED pueden restablecerse antes de que desaparezca la condición de alarma.
No-achknowledgeable	El relé de alarma y el LED no pueden restablecerse hasta que la condición de alarma haya desaparecido.
Preconfirm.	El estado de alarma se puede confirmar antes de que la condición de alarma desaparezca. Sin embargo, el relé de alarma y el LED permanecen activos hasta que la condición de alarma haya desaparecido.

   e. Ajuste el valor de histéresis.
   La función de histéresis define un intervalo en el que un relé activado mantiene su estado hasta que la concentración de gas vuelva a estar fuera del intervalo definido. Ejemplo: el umbral de alarma se establece en 40 ppm y la histéresis en 3 ppm. La alarma se mantiene activa hasta que el valor caiga por debajo de 37 ppm. Esto evita que los relés se cierren y abran brevemente en un umbral de alarma.

   [i] Cuando se cambia la dirección de una alarma (de descendente a ascendente o viceversa), hay que comprobar el valor de la histéresis y corregirlo en caso necesario.

   ⇒ Una pantalla de confirmación muestra todos los ajustes.
   f. Seleccione ***Confirmar*** y confirme con OK.
   ✓ Los nuevos ajustes se guardan.

11.9.3 Comprobación de alarmas/relés

Estas funciones cambian el estado de un relé y un indicador LED para fines de prueba (p. ej., para comprobar el funcionamiento de dispositivos de alarma conectados al relé).

Se muestra el símbolo . Al salir de esta función, el estado del relé y el indicador LED volverán automáticamente a su estado anterior.

1. En ***Ajustes*** > ***Instrumento*** > ***Alarma*** > seleccione la condición de alarma deseada y confírmela.

Alarma A1	Simula una prealarma
Alarma A2	Simula una alarma principal
Ajuste fallo	Simula una señal de fallo

2. Seleccione ***Activado*** y confirme.
   ⇒ El relé de fallo deja de estar excitado y la interfaz de 4 a 20 mA se ajusta a la corriente de fallo. El LED amarillo se enciende, se muestra el símbolo de mantenimiento.
   Al salir del menú, finaliza la simulación.

11.10 Configuración del registrador de datos

11.10.1 Visualización del gráfico

Se pueden ver los últimos 15 minutos como gráfico de tiempo/concentración.

1. Seleccionar ***Información*** > ***Almacen Datos*** > ***Grafico***

11.10.2 Conexión o desconexión de un registrador de datos

1. Seleccione ***Ajustes*** > ***Almacen Datos*** > ***AlmDatos on/off*** y confirme.
2. Seleccione ***Activado*** o ***Desactivado*** y confirme.

11.10.3 Ajuste del tiempo de muestreo

Esta función define con qué frecuencia se guarda un valor.

1. Seleccionar ***Ajustes*** > ***Almacen Datos*** > ***AlmDatos on/off*** > ***Tiempo muestreo*** y confirmar.
2. Seleccionar el intervalo de memorización y confirmar.

11.10.4 Ajuste de pico/media

Con ayuda de esta función se puede establecer qué valor se guarda.

1. Seleccione ***Ajustes*** > ***Almacen Datos*** > ***Cfg AlmacenDatos*** > ***Pico/Media*** y confirme.
2. Seleccione ***Pico*** o ***Media*** y confirme.

Pico	Se guarda el valor más alto (el valor más bajo cuando se monitorizan concentraciones decrecientes) de las concentraciones medidas dentro de la ventana de tiempo de muestreo seleccionada.
Media	Se guarda la media de todos los valores de concentración medidos dentro de la ventana de tiempo de muestreo seleccionada.

11.10.5 Conexión y desconexión del modo de disparo

Esta función permite guardar valores a partir de un valor determinado.

1. Seleccionar ***Ajustes*** > ***Almacen Datos*** > ***Cfg AlmacenDatos*** > ***Disparo on/off*** y confirmar.
2. Seleccionar ***On*** o ***Off*** y confirmar.

On	Se guardan las mediciones si exceden un valor umbral más allá del valor de disparo (relativo al último valor guardado).
Off	Se guardan las mediciones que están dentro del tiempo de muestreo.

11.10.6 Ajuste del valor de disparo

Esta función define el valor límite de disparo para guardar un valor. El valor de disparo o trigger está definido como un porcentaje de la desviación total de la escala.

Ejemplo: un valor de disparo de 2 % a una desviación a plena escala de 500 ppm solamente guardará valores si estos se desvían por 10 ppm (relativo al valor previamente guardado).

1. Seleccionar ***Ajustes*** > ***Almacen Datos*** > ***AlmDatos on/off Valor disparo*** y confirmar.
2. Ajustar y confirmar el umbral de disparo.

11.10.7 Configuración de la función "stack" o "roll"

1. Seleccione ***Ajustes*** > ***Almacen Datos*** > ***Cfg AlmacenDatos*** > ***Stack/Roll*** y confirme.
2. Seleccione ***Stack*** o ***Roll*** y confirme.

Roll	Cuando se haya agotado la capacidad del registrador de datos, los datos antiguos se sobrescribirán con nuevos valores.
Stack	Cuando se haya agotado la capacidad del registrador de datos, no se almacenarán nuevos datos. El instrumento emite una advertencia.

11.10.8 Vaciado del registrador de datos

Esta función borra los datos almacenados.

1. Seleccione ***Ajustes*** > ***Almacen Datos*** >***Borrar AlmDatos*** y confirme.
2. Para vaciar el registrador de datos, seleccione ***Confirmar*** y confirme con [OK].

12 Ajustes de interfaz

12.1 Interfaz de 4-20 mA

La salida de corriente del instrumento durante el funcionamiento normal es de 4 a 20 mA y es proporcional a la concentración de gas detectada.

El Polytron 8xx0 emplea diferentes valores de corriente para indicar varios modos de funcionamiento. Los ajustes por defecto establecidos en fábrica pueden ser adaptados por el usuario a requisitos específicos de la aplicación. Esto se atiene a la recomendación NE43 de la norma NAMUR.

12.1.1 Desviación total de la escala

Solo Polytron® 8100 EC, 87x0 IR y 8200 CAT LC

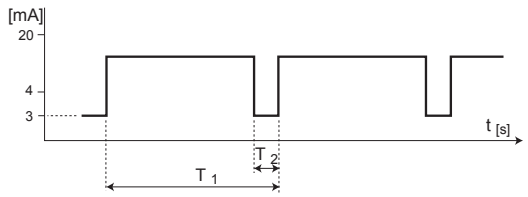
Algunos sensores ofrecen una desviación a plena escala para limitar el rango de medición de la interfaz 4-20 mA.

La desviación a plena escala (FSD) determina un extremo en el rango de medición del sensor. Si la concentración de gas alcanza este extremo, la interfaz 4-20 mA transmite 20 mA.

Ejemplo: Rango requerido 0 a 500 ppm CO (p. ej., número de referencia 6809605, valor por defecto 300 ppm, rango mín./máx. = 50/1000 ppm). Seleccionar la desviación total de la escala como 500 ppm. La salida analógica será lineal entre 4 mA = 0 ppm y 20 mA = 500 ppm.

12.1.2 Ajuste de la corriente de fallo

Esta función define la corriente para la señal de fallo.



1. Seleccionar ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** >***Error corriente*** y confirmar.
2. Seleccionar la línea para editar la corriente y confirmar.
3. Ajustar y confirmar la corriente.
   ⇒ Se muestra el ajuste de la ***Error corriente***.
4. Seleccionar ***Confirmar*** y confirmar con [OK].

12.1.3 Información sobre la señal de advertencia

Para transmitir una señal de advertencia a través de una interfaz analógica, la señal de advertencia debe estar activada.
La señal de advertencia alterna entre la corriente de advertencia y la corriente de medición.

– Corriente de advertencia (intervalo T2)
– Corriente de medición (intervalo T1-T2)

Los intervalos de tiempo y la corriente de advertencia son configurables.

12.1.4 Conexión o desconexión de la señal de aviso

1. Seleccionar ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** > ***Noticia report*** y confirmar.
2. Seleccionar ***Activado*** o ***Desactivado*** y confirmar.

12.1.5 Ajuste del intervalo de aviso

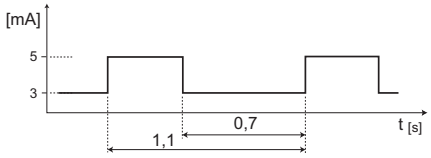
1. Seleccionar ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** > ***Interv. Aviso*** y confirmar.
2. Ajustar el tiempo para los intervalos de aviso T1 y T2 y confirmar.

12.1.6 Ajuste de la corriente de aviso

1. Seleccionar ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** > ***Corriente Aviso*** y confirmar.
2. Ajustar la corriente y confirmar con [OK].

12.1.7 Configuración de las advertencias del Dräger SensorAlive

En este menú se pueden ajustar diversos parámetros de la corriente de advertencia:



- Para configurar la corriente de advertencia, seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf.Analogico*** > ***Corr.advert. DSA*** e introduzca el valor.
- Para establecer un valor para la advertencia, seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf.Analogico*** > ***Lím. advert. DSA*** e introduzca un valor.
- Para activar o desactivar la advertencia, seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf.Analogico*** > ***Ajustar adv. DSA*** y confirme.
  Seleccione ***Activado*** o ***Desactivado*** y confirme.

12.1.8 Configuración de la señal de mantenimiento

1. Seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** > ***Señal mantenim.*** y confirme.
2. Establezca el tipo de señal y confirme.

Estático	Una corriente constante que puede configurarse.

Dinámico	Una señal de onda cuadrada con las siguientes características:

12.1.9 Configuración de la corriente de mantenimiento

La corriente de mantenimiento solo puede configurarse si la señal de mantenimiento se ha establecido en "estática".

1. Seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** >***Corri. mantenim.*** y confirme.
2. Establezca la corriente y confirme.

12.1.10 Ajuste de la desviación analógica

Esta función añade una desviación a la salida analógica a 4 mA. La desviación ajusta la corriente a 4 mA sin afectar al valor de consigna de 20 mA.

1. Seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** >***Comp. analógica*** y confirme.
2. Seleccione la línea para editar la desviación (rango: –0,5 a 0,5 mA, SIL: –0,1 a 0,1) y confirme.
3. Ajustar y confirmar la corriente.
   ⇒ Se muestra el ajuste de la ***Comp. analógica***.
4. Seleccione ***Confirmar*** y confírmelo con [OK].

12.1.11 Ajuste de la sensibilidad analógica

Esta función ajusta la salida analógica a 20 mA sin afectar al valor de consigna de 4 mA.

1. Seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** > ***Sensibilidad analógica*** y confirme.
2. Seleccione la línea para editar la desviación (rango: –0,5 a 0,5 mA, SIL: –0,1 a 0,1) y confirme.
3. Ajustar y confirmar la corriente.
   ⇒ Se muestra el ajuste de la ***Sensibilidad analógica***.
4. Seleccione ***Confirmar*** y confírmelo con [OK].

12.1.12 Comprobación de la interfaz analógica

Estas funciones cambian la corriente de la interfaz analógica para fines de prueba (p. ej., para comprobar la programación de la unidad de control). Puede que sea necesario inhibir temporalmente las alarmas en la unidad de control para evitar falsas alarmas. Tras salir de esta función, las corrientes se restablecen automáticamente a la señal de mantenimiento. Durante la prueba se muestra el símbolo de mantenimiento .

- Para ajustar la corriente o la concentración:

1. En ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** seleccione la opción deseada.

Ajuste corriente	Esta función permite ajustar la corriente a cualquier valor entre 0 y 22 mA. La desviación analógica y la sensibilidad analógica no se utilizan para esta función.
Ajuste concentr.	Esta función permite ajustar la corriente a cualquier valor de medición entre 0 ppm y el valor final del rango de medición.

2. Una vez que se hayan inhibido las alarmas en la unidad de control, confirme el mensaje ***Por favor apaga el alarma*** con ***Sigue***.
3. Seleccione la línea a editar y confírmelo con [OK].
4. Ajuste el valor deseado.
5. Seleccione ***Sigue*** y confirme.
6. Seleccione la opción deseada:

Ponga concentr. / ***Corriente on***	Esta función simula el valor de medición preestablecido o el valor de la corriente de prueba. Durante la prueba se muestra el símbolo de mantenimiento .
apagar concentr. / ***Corriente off***	Esta función permite interrumpir la transmisión del valor de prueba preestablecido.

7. Seleccione ***Sigue*** y confirme.
   ⇒ La función se cancela.
8. Una vez que se hayan activado nuevamente las alarmas en la unidad de control, confirme el mensaje: ***Por favor ponga el alarma***.

- Para ajustar la señal de prueba:

1. En ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** seleccione la prueba deseada.

Ajuste fallo	Con esta función se ajusta la intensidad de corriente para la corriente de fallo.
Ajuste aviso	Con esta función se ajusta la intensidad de corriente para la corriente de advertencia.
Ajuste mantenim.	Con esta función se ajusta la intensidad de corriente para la corriente de mantenimiento.

2. Una vez que se hayan inhibido las alarmas en la unidad de control, confirme el mensaje ***Por favor apaga el alarma***.

3. Seleccione ***Activado*** o ***Desactivado*** y confirme.

12.1.13 Beam block

Esta función solamente está disponible para Polytron 87x0 IR (utilizando el sensor PIR 7000/7200).

El ajuste por defecto de fábrica para la función beam block está «apagado».

Si se activa, la señal beamblock será transmitida por la interfaz analógica si la óptica del sensor PIR 7000/7200 está “sucia”. La óptica del PIR 7000/7200 puede “ensuciarse” si se forman depósitos en las superficies ópticas. No obstante, si la concentración de gas aumenta hasta llegar a un nivel por encima del límite beamblock, el instrumento retornará al funcionamiento normal.

Si la formación de depósitos en las superficies ópticas aumenta tanto que ya no es posible realizar mediciones, el instrumento emitirá un mensaje de fallo.

- Para ajustar las señales beam block a encendido/apagado:

1. Seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** y la opción deseada.

Beamblock on/off	Esta función activa o desactiva el beam block
Ajustar beambloc	Esta función ajusta la corriente para la corriente de aviso beam block

2. Seleccione ***Activado*** o ***Desactivado*** y confirme.

- Para ajustar las señales beam block:

1. Seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf.analogico*** y la opción deseada.

Corriente Beamb.	Esta función define la corriente para la señal beamblock.
Límite beamblock	Esta función define el límite máximo si la señal beamblock será transmitida vía interfaz analógica.

2. Seleccione la línea de corriente para editar la corriente y confirme.
3. Ajustar y confirmar la corriente.
   ⇒ Se muestra el ajuste de la corriente beamblock.
4. Seleccione ***Confirmar*** y confirme con OK.

12.2 Interfaz HART

12.2.1 Ajuste de la dirección de sondeo

La dirección de sondeo (polling address) configura el detector de gases para el funcionamiento analógico o Multidrop.

Comando HART: #6 (Write Polling Address)

1. Seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf. Hart*** > ***Polling address***.
2. Ajuste la dirección de sondeo y seleccione ***Confirmar***.

0	Activa el funcionamiento analógico
1 a 15	Activa el funcionamiento Multidrop. La interfaz 4-20 mA se desactiva y se establece a una corriente constante de aprox. 1 mA.

ℹ Configure todos los equipos de un cable con diferentes direcciones de sondeo. Se recomienda utilizar una serie que comience por 1.

12.2.2 Mostrar el identificador único

El identificador único (dirección HART inequívoca) debe ser conocido para casi todos los comandos HART de direccionamiento.

Comandos HART:

– #0 (Read Unique Identifier)
– #11 (Read Unique Identifier associated with Tag)

1. Seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf. Hart*** > ***Unique identifr.***.
2. Se muestra el identificador único.

12.2.3 Ajuste de la etiqueta HART

La etiqueta HART (definición de punto de medición) sirve para identificar un punto de medición.

1. Seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf. Hart*** > ***Tag***.
2. Ajuste la etiqueta HART y seleccione ***Confirmar***. La etiqueta HART puede estar compuesta por un máx. de 8 caracteres alfanuméricos.

12.2.4 Ajuste del protocolo Dräger REGARD

Esta función se utiliza para cambiar entre diferentes protocolos HART.

1. Seleccione ***Ajustes*** > ***Comunicacion*** > ***Interf. Hart*** > ***Dräger REGARD***.
2. Seleccione la versión de software correspondiente a la unidad de control REGARD.

12.3 Interfaces digitales

Para obtener más información sobre la configuración de otras interfaces, consulte los siguientes documentos:

Interfaz	Documento
PROFIBUS PA	9033782
Foundation Fieldbus FF	9033783
Modbus RTU	9033781

13 Ajustes del sensor

13.1 Conexión y desconexión de la calibración automática

1. Seleccionar ***Ajustes*** > ***Sensores*** > ***Auto calibracion*** y confirmar.
2. Seleccionar ***Activado*** o ***Desactivado*** y confirmar con [OK].

13.2 Rango de captura

El rango de captura elimina las fluctuaciones de medición. Las fluctuaciones de medición son unas variaciones menores existentes en valores medidos (como ruido de señal, variaciones en la concentración). Esas variaciones no cambian el valor transmitido o visualizado. Los valores medidos dentro de este rango serán visualizados con el valor de captura. Los valores medidos fuera del rango de captura serán visualizados con el valor medido real.

Valor de captura (desviación)

El valor de captura se visualiza continuamente, siempre y cuando el valor medido oscile entre los límites de valor de captura superior e inferior.

Límite de valor de captura superior

El límite de valor de captura superior marca el límite superior del rango en el cual el valor de captura es visualizado.

Límite de valor de captura inferior

El límite de valor de captura inferior marca el límite inferior del rango en el cual el valor de captura es visualizado.

13.2.1 Ajuste del rango de captura

1. Seleccionar ***Ajustes*** > ***Sensores*** > ***Captura visualiz*** y confirmar.
2. Ajustar la desviación en la primera ventana.
3. Ajustar el valor más bajo del rango de captura y confirmar con ***Sigue***.
4. Ajustar el valor más alto del rango de captura y confirmar con ***Sigue***.
5. Comprobar todos los valores y confirmar con ***Sigue***.

13.2.2 Desactivación del rango de captura

1. Seleccione ***Ajustes*** > ***Sensores*** > ***Captura visualiz*** y confírmelo.
2. Ajuste desviación (offset) en la primera ventana.
3. Ajuste el valor inferior del rango de captura a 0 y confírmelo con ***Sigue***.
4. Ajuste el valor superior del rango de captura a 0 y confírmelo con ***Sigue***.
5. Compruebe todos los valores y confírmelo con ***Sigue***.

13.3 Reinicio del sensor

Esta función reinicia el sensor a los ajustes por defecto de fábrica.

1. Seleccione ***Ajustes*** > ***Sensores*** > ***Inicial. basic. Ch*** y confírmelo.
2. Seleccione ***Confirmar*** y confírmelo con [OK].

13.4 Ajuste del intervalo de calibración

Una vez expirado el intervalo de calibración, el instrumento emitirá un aviso indicando que la calibración está atrasada.

1. Seleccione ***Ajustes*** > ***Sensores*** > ***Interv. Cal.*** y confírmelo.
2. Ajuste el intervalo de calibración y confírmelo con [OK].

13.5 Ajuste del bloqueo del sensor

Este punto solo es válido para Polytron 8100 EC y Polytron 87x0 IR.

1. Seleccionar ***Ajustes*** >***Sensores*** > ***Bloq.sensor*** y confirmar.
2. Seleccionar ***On*** o ***Off***.

On	El instrumento rechaza cualquier sensor cuyo número de pieza no coincida con el número de pieza del sensor previamente instalado.
Off	El instrumento acepta cualquier sensor adecuado, cargando los ajustes por defecto de este sensor. Sin embargo, esto sobrescribe los ajustes personalizados con los ajustes por defecto del nuevo sensor.

13.6 Mochilas de software para sensores EC

13.6.1 Instalación de la mochila

1. Desconecte la alimentación eléctrica del instrumento o desclasifique el área según las normativas locales.
2. Afloje el tornillo de fijación y desenrosque la tapa del instrumento.
3. Inserte la mochila con el logotipo de Dräger mirando hacia arriba en la unidad de tarjeta de circuito impreso, Véase la figura D en la página desplegable.
4. Coloque la tapa trasera de la unidad de tarjeta de circuito impreso y cierre el instrumento (consulte "Cierre del detector de gases", página 153).

13.6.2 Desactivación de la mochila

Esta función desactiva una mochila para poder retirarla de manera segura o si la mochila está defectuosa.

Una mochila se puede reactivar únicamente desconectando y conectando de nuevo la alimentación del equipo.

1. Seleccione ***Ajustes*** > ***Instrumento*** > ***SW conector*** > y la mochila que desea desactivar confírmelo.
2. Seleccione ***Desactivar func.***. La mochila seleccionada se desactiva.

13.7 Ajustes de sensor Polytron® 8100 EC

13.7.1 Autocomprobación del sensor

Esta función solamente está activa si la mochila de test del sensor o la mochila de diagnóstico está instalada. Si el sensor no supera la autocomprobación, se emite un mensaje de advertencia o de fallo correspondiente.

Configuración de autocomprobaciones periódicas del sensor

Esta función inicia la autocomprobación del sensor en intervalos regulares. El instrumento comprueba el funcionamiento correcto del sensor de manera rutinaria.

1. Seleccione y confirme ***Ajustes*** > ***Sensores*** > ***Autotest Sensor***.
2. Seleccione ***Activado*** o ***Desactivado*** y confirme.

Inicio manual de la autocomprobación del sensor

Esta función inicia una autocomprobación del sensor.

1. Seleccione ***Ajustes*** > ***Sensores*** > ***Auto test sensor*** y confirme.
2. Se muestra ***Iniciar test de sensor***.
3. Seleccione ***Confirmar***.

✓ Se muestra el resultado de la prueba.

13.7.2 Ajustes de gas

Con esta función se ajusta el tipo de gas, el rango de medición y las unidades de medida. En función del sensor instalado, es posible realizar diferentes ajustes.

1. Seleccione ***Ajustes*** > ***Sensores*** > ***Confg. Gas*** y confirme.
   ⇒ Se muestra el gas actualmente medido.
2. Seleccione un gas medido de la lista y confírmelo.
   ⇒ Se muestra la unidad de medida actual.
3. Seleccione la unidad de medida deseada de la lista y confírmela.
   ⇒ Se muestra el valor final actual del rango de medición.
4. Solo para determinados sensores EC: ajuste el valor final del rango de medición y confirme.
   ⇒ Se muestra el nuevo valor final del rango de medición.
5. Seleccione ***Sigue*** y confirme.
   ⇒ Se muestra una relación de los nuevos ajustes de gas.
6. Después de la comprobación, seleccione ***Regresar al menu*** o ***Confirmar***.

Regresar al menu	Seleccione «Regresar al menú» para abandonar la función sin ningún cambio y confírmelo con [OK].
Confirmar	Seleccione «Confirmar» para aceptar los ajustes y confírmelo con [OK].

13.7.3 Ajustes del Dräger SensorAlive

En este menú se pueden ajustar diversos parámetros que definen el comportamiento del Dräger SensorAlive:

- Para activar o desactivar las funciones LifeTest del sensor, seleccione ***Ajustes*** > ***Sensores*** > ***SensorAlive*** > ***Activación DSA*** y confirme.
  Seleccione ***Activado*** o ***Desactivado*** y confirme.
- Para confirma una obstrucción del sensor, seleccione ***Ajustes*** > ***Sensores*** > ***SensorAlive*** > ***Confirmar fallos***.
- Para activar o desactivar la detección de fallos, seleccione ***Ajustes*** > ***Sensores*** > ***SensorAlive*** > ***Detección fallos*** y confirme.
  Seleccione ***Activado*** o ***Desactivado*** y confirme.

En el menú ***SensorAlive*** existen los siguientes submenús:

– LifeTest
– Control de la sensibilidad

En el submenú LifeTest se pueden ajustar los siguientes parámetros:

- Para definir cuándo debe iniciarse un ciclo de prueba, seleccione ***Hora***.
  Indique una hora y confirme. El ciclo de prueba comenzará cuando se alcance dicho tiempo en el transmisor.

  ℹ Los transmisores no admiten el cambio automático entre horario de verano/invierno.

- Para definir qué valor debe emitirse a través del transmisor durante el LifeTest, seleccione ***Comport. salida***.
  Seleccione ***Fijado***, ***Mantenimiento*** o ***Val. de medición*** y confirme.
- Para definir si se deben realizar nuevas pruebas en un ciclo de prueba si un LifeTest arroja un resultado negativo, seleccione ***Modo repetición***.
  Seleccione ***Flexible*** y confirme.
  Si se selecciona ***Estático*** no se repite ninguna prueba, sino que se ejecuta un nuevo ciclo de prueba a la hora especificada.
- Para definir cuando se debe cancelar un LifeTest, seleccione ***Umbr. de cancel.***.
  Indique un valor y confirme.

  ℹ Durante un LifeTest se aplica gas de prueba al Dräger SensorAlive. Por ello, el valor medido aumenta. Para evitar que se active una alarma, de forma estandarizada el valor medido no se transmite durante un máximo de 15 minutos. Sin embargo, el comportamiento durante un LifeTest puede configurarse en el menú ***Comport. salida***. No obstante, el sensor detecta una erupción de gas, cuando la concentración de gas medida supera la concentración de gas esperada por el LifeTest. La diferencia corresponde a la concentración de la erupción de gas y se compara con el valor introducido en ***Umbr. de cancel.***. Si se supera este valor, el LifeTest se interrumpe de inmediato. El sensor vuelve al modo de medición y el transmisor emite de nuevo el valor medido. Si se utilizan relés, estos se conmutan en el transmisor y se disparan las alarmas, dado el caso.

En el submenú ***Compr. sensibil.*** se pueden ajustar los siguientes parámetros:

- Para definir si debe emitirse una advertencia, seleccione ***Activación*** y confirme.
- Para definir cuándo debe emitirse una advertencia, seleccione ***Alerta < 50%*** o ***Alerta < 40%*** y confirme.

13.8 Ajustes de sensor Polytron® 8200 CAT / 8310 IR

13.8.1 Tipo de sensor

Esta función define el tipo de sensor instalado.

1. Seleccione ***Ajustes*** > ***Sensores*** > ***Tipo sensor*** y confirme.
2. Seleccione el tipo de sensor y confirme.

13.8.2 Ajustes de gas

Esta función ajusta la unidad de medida.

Para los sensores LC, esta función ajusta también la desviación total de la escala.

1. Seleccione ***Ajustes*** > ***Sensores*** > ***Confg. Gas*** y confirme.
2. Seleccione la unidad de medida deseada de la lista y confírmelo.
   ⇒ Para sensores DQ y DSIR:
   Se muestra una relación de los nuevos ajustes de gas.
   Continúe con el paso 4.
   ⇒ Para sensores LC:
   Se muestra la desviación total actual de la escala.
   Continúe con el paso 3.
3. Ajuste la desviación total de la escala y confirme (solo para sensores LC).
   ⇒ Se muestra una relación de los nuevos ajustes de gas.
4. Después de la revisión, seleccione ***Regresar al menu*** o ***Confirmar***.

Regresar al menu	Seleccione «Regresar al menú» para abandonar la función sin ningún cambio y confírmelo con [OK].
Confirmar	Seleccione «Confirmar» para aceptar los ajustes y confír-melo con [OK].

13.8.3 Ajuste del enclavamiento del sensor DQ

Esta función solo está disponible si no hay relés instalados.
Esta función se utiliza para establecer si el sensor DQ debe ser confirmado después de una medición de una concentración superior al 100 % LIE.
Este ajuste no es aplicable para sensores LC.

1. Seleccione ***Ajustes*** > ***Sensores*** > ***Sensor DD autoencl.*** y confirme.
   ⇒ Se muestra el ajuste actual.
2. Seleccione ***Activado*** o ***Desactivado*** y confirme.

⚠ ADVERTENCIA
Peligro de explosión
Si el enclavamiento de sensor está desactivado y una alarma indicando un peligro de explosión es confirmada, el instrumento informa al usuario final de tal peligro iluminando el indicador LED rojo de forma continua.

► Antes de confirmar un valor por encima del rango, cerciórese de que la concentración de gas ha caído por debajo de 100 %LIE.

⚠ ADVERTENCIA
Posible peligro de explosión
Funcionamiento no compatible con el examen de tipo BVS.
Si el enclavamiento del sensor DQ está desactivado, la unidad de control debe admitir esta función para un funcionamiento seguro conforme a la norma BVS 13 ATEX G 001 X.

► Asegúrese de que la indicación de enclavamiento por encima del rango de medición esté activa en la unidad de visualización.

13.9 Ajustes del sensor para Polytron 8310 IR

13.9.1 Cambio de la categoría de gas

El DrägerSensor IR puede medir gases y vapores pertenecientes a las categorías de gas metano, propano o eteno (etileno). Dependiendo del gas objetivo que se vaya a medir, se debe definir una categoría de gas para el DrägerSensor IR. Para la asignación de gases y vapores a las categorías de gas, consulte la documentación del DrägerSensor IR.

13.9.2 Cambio de la categoría de gas

Requisitos previos

– El detector de gases se encendió hace menos de una hora.
– El ajuste automático del punto cero en el sensor se ha realizado hace menos de una hora (consulte "Particularidad del Polytron 8310", página 163).
– La concentración de gas medida por el detector de gases es inferior al 10 % LIE (aplique gas de ajuste de cero al sensor, si es necesario).

1. Desactive la señalización de alarma del detector de gases (consulte "Conexión o desconexión de alarmas", página 172).
2. Seleccione ***Ajustes*** > ***Sensores*** > ***Categoría DSIR*** y confirme.
   ⇒ La categoría de gas se muestra en el instrumento.

ℹ Los pasos siguientes se realizan en el instrumento.

3. Para seleccionar la categoría de gas en el sensor, toque el símbolo ⇧S o ⇩0 con la varita magnética.
   ⇒ En el detector de gases se muestra START.

4. Retire la varita magnética.
   ⇒ El sensor cambia a una señal de salida que representa la categoría de gas ajustada en ese momento:
   Señal de salida 20 % LIE: categoría de gas metano
   Señal de salida 40 % LIE: categoría de gas propano
   Señal de salida 60 % LIE: categoría de gas eteno (etileno)
5. Esta señal de salida se mantiene durante 30 segundos. Durante dicho periodo se puede seleccionar el siguiente gas colocando la varita magnética en el área marcada con el símbolo ⇧S.
   ⇒ Al hacerlo, la señal de salida del sensor cambia al valor correspondiente a la nueva categoría de gas seleccionada. Si durante más de 30 segundos no se realiza ninguna otra entrada con la varita magnética, el ajuste se guarda.
6. Compruebe el ajuste de sensibilidad en el detector de gases (consulte "Calibración de la sensibilidad", página 164).
7. Encienda la señalización de alarma del detector de gases (consulte "Conexión o desconexión de alarmas", página 172).

ℹ El ajuste en el sensor puede provocar que el elemento de menú ***Categoría DSIR*** muestre una categoría de gas incorrecta o que ya no sea visible un cambio de categoría de gas.

13.10 Ajustes de sensor Polytron® 87x0 IR

13.10.1 Ajustes de gas

Esta función ajusta el tipo de gas, el rango de medición y las unidades de medida. Solo determinados sensores permiten estos ajustes.

1. Seleccione ***Ajustes*** > ***Sensores*** > ***Confg. Gas*** y confírmelo.
   ⇒ Se muestra el gas actualmente medido.
2. Seleccione un gas medido de la lista y confírmelo.
   ⇒ Se muestra la unidad de medida actual.
3. Seleccione la unidad de medida deseada de la lista y confírmelo.
   ⇒ Si la unidad de medida es ajustada a % LEL, % UEG o % LIE, la categoría será visualizada. Continúe con el paso 4.
   ⇒ De lo contrario, se muestra la actual desviación a plena escala. Continúe con el paso 6.
4. Seleccione una categoría y confirme.
5. Ajuste el valor LIE y confirme.
6. ajustar la desviación total de la escala y confirmar.
   ⇒ Se muestra la nueva desviación total de la escala.
7. Seleccione ***Sigue*** y confírmelo.
   ⇒ Se muestra una relación de los nuevos ajustes de gas.
8. Después de la revisión, seleccione ***Regresar al menu*** o ***Confirmar***.

Regresar al menu	Seleccione «Regresar al menú» para abandonar la función sin ningún cambio y confírmelo con [OK].
Confirmar	Seleccione «Confirmar» para aceptar los ajustes y confírmelo con [OK].

9. Compruebe los ajustes de alarma después de cambiar la categoría o valor LIE.

14 Ajustes por defecto de fábrica

14.1 Ajustes inalterables para relés, LED y alarma

	Ajuste
Relé de fallo:	Excitado / contacto normalmente abierto (Normally Open)
LED amarillo:	Está iluminado si existe un mensaje de fallo
LED rojo:	Parpadea una vez cuando hay una alarma A1. Parpadea dos veces cuando hay una alarma A2. Si una alarma está configurada como confirmable y es confirmada, el parpadeo simple/doble cambia a luz continua.
Jerarquía de alarmas:	A2 tiene mayor prioridad que A1 en el LED. Sin embargo, los relés A1 y A2 funcionan independientemente. (Ejemplo: Si A1 es confirmable y A2 no y la concentración de gas es tan alta que A1 y A2 se disparan, el relé A1 se abre cuando se reconoce la alarma. Sin embargo, el LED rojo seguirá parpadeando dos veces mientras exista la condición que activa la alarma A2.

14.2 Ajustes que pueden modificarse a través del menú

Menú	**Ajuste por defecto**	**Rango**
Relé activo con alarma/sin alarma	Activo con alarma	Activo/inactivo
Alarma A1: Dirección	ascendente (descendente para sensores de O_2)	Descendente/ascendente
Alarma A2: Dirección	Ascendente	
Modo de enclavamiento A1	Sin enclavamiento	Enclavamiento / sin enclavamiento
Modo de enclavamiento A2	Enclavamiento	

Menú	Ajuste por defecto	Rango
Modo de confirmación A1	Confirmable	Confirmable/No confirmable/Pre-confirmable
Modo de confirmación A2	No confirmable	
Funcionamiento normal relé A1	Excitado	Excitado /no excitado
Funcionamiento normal relé A2		
Contraseña de ajuste	_ _ _ 1	
Contraseña de ajustes	_ _ _ 2	
Ajustes de la LCD	Activo	Activo/inactivo
SIL de estados	Inactivo	Activo/inactivo
Idioma	EN	DE / EN / FR / ES / RU / ZH
Ajuste automático	Inactivo	Activo/inactivo
Tecla de función	Fallo	Gráfico, fallo, advertencia, vitalidad, prueba con gas

Interfaz	Ajuste por defecto	Rango
Corriente de fallo	1,2 mA	Entre 0 y 3,5 mA
Advertencia	Inactivo	Activo/inactivo
Corriente de advertencia	3,0 mA	Entre 0 y 3,5 mA
Intervalo del ciclo de advertencia T1	10 s	Entre 5 y 60 s
Intervalo del ciclo de advertencia T2 (corriente de advertencia)	1 s	Entre 1 y (T1-1) s
Señal de mantenimiento	estática	estática/dinámica
Corriente de mantenimiento	3,4 mA	Entre 0 y 3,5 mA
Compensación analógica	0 mA	-0,5 a 0,5 mA
Sensibilidad salida analógica	0 mA	-0,5 a 0,5 mA
Dirección HART®	0	Entre 0 y 15
Dirección Modbus[1)]	126	2-126
Paridad Modbus[1)]	par (por defecto)	paridad par, impar, sin paridad
Tasa de baudios Modbus[1)]	9600 bit/s	9600 o 19200 bit/s
Dirección PROFIBUS® [1)]	126	2-126

1) Las interfaces de bus de campo no cumplen la norma BVS 13 ATEX G001 X. Si se utiliza la interfaz de bus de campo, no se dispondrá de relés.

14.3 Valores específicos del sensor

Encontrará más especificaciones en las instrucciones de uso del sensor correspondiente.

14.3.1 Polytron 8100 EC

Menú	Ajuste por defecto	Rango
Alarma A1	En función del sensor	
Alarma A2	En función del sensor	
Histéresis para alarma A1 en dirección ascendente	0	0 a A1
Histéresis para alarma A2 en dirección ascendente	0	0 a A2
Histéresis para alarma A1 en dirección descendente	0	0 a valor final del rango de medición - A1
Histéresis para alarma A2 en dirección descendente	0	0 a valor final del rango de medición - A2
Intervalo de ajuste [días]	En función del sensor	0 a 720

14.3.2 Polytron 8100 EC con sensores de O_2

Menú	Ajuste por defecto	Rango
Offset de rango de captura pantalla	20,9 Vol% (O_2)	0 a 25 Vol% (O_2 LS) 0 a 100 Vol% (O_2)
Rango de captura pantalla bajo	-0,25 Vol% (O_2)	0 a -0,75 Vol%
Rango de captura pantalla alto	0,25 Vol% (O_2)	0 a 0,75 Vol%
Valor final del rango de medición	25 Vol% (O_2, O_2 LS)	5 a 25 Vol% (O_2 LS) 5 a 100 Vol% (O_2)

14.3.3 Polytron 8100 EC con Dräger SensorAlive

Menú	Ajuste por defecto	Rango
Corr. advert. DSA	2,0 mA	0 mA a 3,5 mA
Lim. advert DAS	En función del sensor	
Activación DSA	Activo	Activo/inactivo

Comportamiento de respuesta	normal	normal / Rápida
Offset de rango de captura pantalla	340 ppm	Los valores absolutos del rango de captura de pantalla tienen que estar dentro de estos límites: -1000 a 1000 ppm (dióxido de carbono)
Rango de captura pantalla bajo	-200 ppm	
Rango de captura pantalla alto	200 ppm	

15 Eliminación

Este producto no debe eliminarse como residuo doméstico. Por este motivo está identificado con el símbolo contiguo.
Dräger recoge el producto de forma totalmente gratuita. La información a este respecto le puede ser proporcionada por los distribuidores nacionales y por Dräger.

Eliminación de sensores electroquímicos

⚠ ADVERTENCIA
¡Peligro de explosiones y riesgo de quemaduras químicas!
Los fluidos del sensor se pueden escapar y causar quemaduras de ácido.
- ► No elimine los sensores arrojándolos al fuego.
- ► No abra los sensores a la fuerza.

16 Características técnicas

16.1 Rangos de medición

Sensor	Rango de medición
Polytron 8100 EC con DrägerSensor® EC	En función del sensor
Polytron 8200 CAT con DrägerSensor® DQ	0 a 100 % LIE
Polytron 8200 CAT con DrägerSensor®LC	0 a 10 % LIE[1)]
Polytron 8310 IR con DrägerSensor® IR	0 a 100 % LIE
Polytron 8700 IR con sensor de gas infrarrojo PIR 7000	
Tipo 334 (IDS 01x1)	0 a 10.000 ppm[1)] 0 a 100 % LIE,[1)] 0 a (1,25 x LIE_{max}) Vol%,[1)2)] Para CH4 (metano) 0 a 100 vol%[1)]
Tipo 340 (IDS 01x2)	0 a 10.000 ppm[1)] 0 a 100 % LIE[1)] 0 a 5 vol%[1)]
Polytron 8720 IR con sensor de gas infrarrojo PIR 7200 (IDS 01x5)	0 a 100 vol%[1)]

1) Para conocer el valor final del rango de medición ajustable, consulte 14.3.
2) El rango varía en función de la sustancia a medir

16.2 Transmisión de la señal a la unidad de control

El rango de medición y las características de rendimiento dependen del sensor instalado (véanse las instrucciones de uso del sensor instalado).

Frecuencia de cálculo del valor de medición: 1 vez por segundo (actualización de la indicación, de la interfaz analógica y de los relés).

Señal analógica	
Funcionamiento normal	4 ... 20 mA
Deriva por debajo de cero	3,8 ... 4 mA
Superación del rango de medición	20 ... 20,5 mA
Error del dispositivo	≤ 1,2 mA
Fallo en la interfaz analógica	> 21 mA
Señal de mantenimiento	Señal constante de 3,4 mA o modulación de 1 Hz entre 3 y 5 mA (seleccionable)

Resistencia del bucle de señal

Modo de funcionamiento	**Rango de resistencia del bucle de señal**	**Rango de la tensión de suministro**
Funcionamiento sin comunicación HART®	0 a 230 Ω	a 10 V CC
	Ascendente linealmente con la tensión de suministro de: 0 a 230 Ω a 10 V a 0 a 500 Ω a 16 V	10 a 18 V CC
	0 a 500 Ω	18 a 30 V CC
Funcionamiento con comunicación HART®	230 a 270 Ω	a 13 V CC
	Ascendente linealmente con la tensión de suministro de: 230 a 270 Ω a 11 V a 230 a 500 Ω a 16 V	11 a 16 V CC
	230 a 500 Ω	18 a 30 V CC
Funcionamiento multipunto HART®	230 a 500 Ω	10 a 30 V CC

Para el uso de acuerdo con la prueba de idoneidad metrológica según las normas EN IEC 62990-1, EN IEC 60079-29-1 o EN 50104, la resistencia no debe superar los 300 ohmios. Para más información sobre la instalación de la interfaz de bus de campo, consulte el documento 9033783.

16.3 Propiedades del cable

Para instalaciones sin conductos, utilice cables blindados.

Conexión analógica y HART® con unidad de control y fuente de alimentación	
Alimentación eléctrica y señales	Cable blindado de 3 hilos 24 - 12 AWG / 0,2 - 2,5 mm²
Relé	20 - 12 AWG / 0,5 - 2,5 mm²

Conexión digital con unidad de control	
Los instrumentos con interfaces de bus de campo y sensores remotos se tienen que instalar con cables blindados.	
Modbus RTU	2 o 3 hilos[1], ≥ 26 AWG
PROFIBUS PA Foundation Fieldbus	2 hilos, cable de tipo A Impedancia de onda R_W: 135 - 165 Ω Capacidad / longitud de unidad C‘: < 30 pF/m Resistencia en bucle R‘: 110 Ω/km Diámetro del hilo d: 0,64 mm Sección transversal del hilo q: > 0,34 mm² Cobertura del blindaje: ≥ 90 %
Alimentación eléctrica	2 hilos, 24 - 12 AWG / 0,2 - 2,5 mm²

1) Si la distancia entre la unidad de control y el transmisor es muy grande (>1 km) y la fuente de alimentación de la unidad de control y del transmisor están separadas, pueden producirse interferencias o discrepancias diferenciales. En este caso, debe seleccionarse el cableado de 3 hilos con toma de tierra. A continuación, la toma de tierra se conecta al transmisor y se pasa en bucle hasta la toma de tierra de la unidad de control.

16.4 Alimentación eléctrica y relés

Capacidad de relés[1] SPDT[2]	
230 V ~	0,1 A - 5 A
30 V ⎓, carga resistiva	0,1 A (mínimo) - 5 A

1) En caso de aplicaciones relevantes para la seguridad (SIL 2), la potencia de ruptura máxima se reduce (véase Manual de seguridad Polytron® 8xx0).
2) Conmutador unipolar (inversión de contactos eléctricos)

Alimentación eléctrica Polytron 8xx0	
Tensión de servicio	10[1] hasta 30 V⎓ en el instrumento
Corriente de conexión	2,3 A durante 2 ms a 24 V⎓, resistencia de 10 Ω

1) Con una tensión de alimentación <9,5 V CC, el instrumento proporciona una señal de fallo.

Corriente de servicio	
Polytron® 8100 EC	
sin relé, sensor no remoto	80 mA
con relé, sensor remoto	100 mA
Polytron® 8200 CAT	
sin relé, sensor no remoto	105 mA (DrägerSensor DQ) 130 mA (DrägerSensor LC)
con relé, sensor remoto	145 mA (DrägerSensor DQ) 165 mA (DrägerSensor LC)
Polytron® 8310 IR	
sin relé, sensor no remoto	145 mA
con relé, sensor remoto	185 mA
Polytron® 87x0 IR	
sin relé, sensor no remoto	330 mA
con relé, sensor remoto	350 mA

16.5 Especificaciones generales

Carcasa Polytron 8xx0	
Material de la carcasa	Aluminio libre de cobre
Protección de la carcasa	NEMA 4X[1] IP 65/66/67[2]
Pantalla	Resolución 128 x 64 píxeles, con retroiluminación[3]

1) Polytron 8100 EC NEMA 4X con protección de carcasa pendiente
2) Los grados de protección IP no implican que el equipo vaya a detectar un gas durante o después de la exposición a estas condiciones. En caso de depósitos de polvo y de contacto con el agua por inmersión o con un chorro de agua, compruebe el ajuste y el funcionamiento del instrumento.
3) Con temperaturas elevadas (>65 °C), la pantalla solo puede leerse de forma limitada.

16.6 Parámetros ambientales

Encontrará otras especificaciones del sensor e influencias en las instrucciones de uso del sensor correspondiente.

Los valores de los accesorios y las piezas de repuesto pueden diferir de los valores aquí indicados. Para valores exactos, consulte las instrucciones correspondientes.

Polytron 8xx0	
Valores de acuerdo con la homologación de la protección contra explosiones	
durante el funcionamiento:	
Presión	23,6 a 32,5 in. Hg (800 a 1100 hPa)
Humedad	0 al 100 % HR, sin condensación
Temperaturas	
Polytron 8100 EC	-40 a +70 °C (-40 a +158 °F)
Polytron 8200 CAT	-40 a +80 °C (-40 a +176 °F)
Polytron 8310 IR	-40 a +65 °C (-40 a +149 °F)
Polytron 87x0 IR	-40 a +80 °C (-40 a +176 °F)
Valores de acuerdo con informe metrológico	
durante el funcionamiento:	
Presión	20,7 a 38,4 in. Hg (700 a 1300 hPa)[1]
Humedad	0 a 95 % h.r., sin condensación
Temperaturas	
Polytron 8100 EC[2]	-40 a +65 °C (-40 a +149 °F)
Polytron 8200 CAT	-40 a +80 °C (-40 a +176 °F)
Polytron 8310 IR	-40 a +65 °C (-40 a +149 °F)
Polytron 87x0 IR	-40 a +77 °C (-40 a +170 °F)

Polytron 8xx0	
durante el almacenamiento:	
Presión	26,5 a 32,4 in. Hg (900 a 1100 hPa)
Humedad	0 al 100 % HR, sin condensación
Temperatura	-20 a +65 °C (-4 a +149 °F)
Periodo de almacenamiento recomendado	5 años
Valores para opción de relé e instalaciones con homologación UL	
durante el funcionamiento:	
Temperaturas	
Polytron 8200 CAT	-40 a +70 °C (-40 a +158 °F)
Polytron 87x0 IR	-40 a +70 °C (-40 a +158 °F)

1) Polytron 8200 CAT: 23,6 a 35,44 in. Hg (800 a 1200 hPa)
2) Consulte 18.3, 18.3.2 y las instrucciones de uso del sensor EC para las limitaciones de la especificación máxima.

16.7 Pares de apriete

Rosca del instrumento	
Tapa de la carcasa	≥44 in-lbs / ≥5 Nm
Sensor	mín. 266 in-lbs / mín. 30 Nm
Tapones ciegos	mín. 266 in-lbs / mín. 30 Nm
Conexiones (para tuberías o racores de cable)	mín. 443 in-lbs / mín. 50 Nm
Tapones ciegos de la estación de acoplamiento	62 in-lbs / 7 Nm
Pasos de cable de la estación de acoplamiento	70 n-lbs / 8 Nm
Cabezal detector EC remoto	177 in-lbs ±9 in-lbs / 20 Nm ±1 Nm
Bornes de cableado de campo	
Alimentación eléctrica, señales y relés	4,4 - 7,0 in-lbs / 0,5 - 0,8 Nm
Tornillos de puesta a tierra	10,6 in-lbs / 1,2 Nm

17 Accesorios y piezas de repuesto

Este capítulo contiene un resumen de los componentes cubiertos por el examen de tipo BVS 13 ATEX G 001 X- y PFG 14 G 001 X. Otras piezas se enumeran en la lista de repuestos o se pueden consultar a través de DrägerService.

17.1 Polytron® 8xx0

Descripción	Número de referencia
IRDA a interfaz de PC	4544197
Varita magnética con llavero	4544101
Dräger PolySoft, Software de configuración	8328600 / 8328639
Tapones ciegos EXd, acero inoxidable, 2 uds.	4544897
Tapón ciego EXd, acero galvanizado, 3 uds.	8344041

17.1.1 Estación de acoplamiento

Descripción	Número de pieza
Versión solo Docking Station Power	8344027
Docking Station Power, relé (incluye 2 prensaestopas)	8344028
Docking Station Fieldbus	8344029
Prensaestopas estación de acoplamiento	6812868
Tapón ciego estación de acoplamiento	8344042

17.2 Polytron® 8100 EC

Descripción	Número de referencia
Unidad de tarjeta de circuito impreso Polytron 8100 4-20/HART	4544781
Unidad de tarjeta de circuito impreso Polytron 8100 4-20/HART, relé	4544782
Anillo de bayoneta	4544366
Anillo de bayoneta para Dräger SensorAlive	6800132
Adaptador para montaje en conducto de aire para cabezal detector EC remoto[1)]	8317617
Kit de montaje en barra para cabezal detector remoto EC	4544213
Mochila de test de sensor	8317619
Mochila de diagnóstico	8317860
Adaptador de calibración	6810536

1) Puede tener influencia sobre el rendimiento de medición, p. ej., puede incrementar el tiempo de respuesta. No cubierto por BVS 13 ATEX G 001 X ni PFG 14 G 001 X.

17.3 Polytron® 8200 CAT

Descripción	Número de referencia
Unidad de tarjeta de circuito impreso Polytron 8200 4-20/HART	4544788
Unidad de tarjeta de circuito impreso Polytron 8200 4-20/HART relé	4544789
Adaptador de ajuste PE, Europa	6806978
Adaptador de calibración remota DQ	6812480
Adaptador de calibración remota LC[1)]	6812482
Juego de repuestos membrana 21,50x14,50, 2 uds.	8326840
Filtro de polvo para DrägerSensor DQ, 10 uds.	6810537
Adaptador de proceso DQ	6812470
Adaptador de proceso LC[1)]	6812465
Protector contra salpicaduras	6812510

1) no cubierto por el informe metrológico.

17.3.1 Sensores CAT

Descripción	Número de referencia
DrägerSensor DQ NPT	6814150
DrägerSensor DQ NPT S[1)]	3701800
DrägerSensor LC NPT	6810675
Detector, Polytron SE Ex PR M1 DQ	6812711
Detector, Polytron SE Ex PR M2 DQ	6812710
Detector Polytron SE Ex HT M DQ	6812720
Sensor remoto DQ NPT aluminio	3706933
Sensor remoto DQ NPT acero	3706934

1) El DrägerSensor DQ NPT S también puede utilizarse en lugar del DrägerSensor DQ NPT.

17.4 Polytron® 8310 IR

Descripción	Número de pieza
Protector contra salpicaduras	6810796
Adaptador de proceso	6811330
Laberinto de protección	6811135
Adaptador de calibración	6810859
Placa de C.I. Polytron 8310 4-20/HART	4544788
Placa de C.I. Polytron 8310 4-20/HART relé	4544789

17.4.1 Sensores DSIR

Descripción	Número de pieza
DrägerSensor IR NPT	6811901
Cabezal detector, DrägerSensor IR juego completo e	6811165
Cabezal detector, DrägerSensor IR juego completo e2	6811265

17.5 Polytron® 87x0 IR

Descripción	Número de referencia
Unidad de tarjeta de circuito impreso Polytron 87x0 4-20/HART[1)]	4544795
Unidad de tarjeta de circuito impreso Polytron 87x0 4-20/HART relé[1)]	4544796
Kit de montaje PIR 7000	6811648
Cubeta de proceso PIR 7000, acero inoxidable	6811415
Cubeta de proceso PIR 7000 SGR	6813219
Indicador de estado PIR 7000 / 7200	6811625 / 6811920
Protector contra salpicaduras PIR 7000 / 7200	6811911 / 6811912
Flowcell PIR 7000 / 7200	6811490 / 6811910
Adaptador de prueba a distancia PIR 7000 / 7200	6811630 / 6811930
Protector contra insectos PIR 7000	6811609
Filtro hidrófobo PIR 7000	6811890
Adaptador de calibración PIR 7000	6811610
Adaptador de proceso PIR 7000 / 7200 POM (polioximetileno)	6811915

Descripción	Número de referencia
Set de montaje PIR 7000	6811648
Caja de conexiones Ex e	6811989
Caja de conexiones Ex d	4520561
Varita magnética	4544101

1) Verifique la compatibilidad del firmware del sensor y del detector de gases. Posiblemente sea necesaria una actualización de firmware para cambiar la unidad de tarjeta de circuito impreso. Contacte con Dräger para obtener asistencia.

17.5.1 Sensores

Verifique la compatibilidad del firmware del sensor y del detector de gases. Posiblemente sea necesaria una actualización de firmware para cambiar el sensor. Contacte con Dräger para obtener asistencia.

Descripción	Número de referencia
Dräger PIR 7000 tipo 334 (NPT)	6811822
Dräger PIR 7000 tipo 340 (NPT)	6811832
Dräger PIR 7000 334 (M25) Juego completo	6811825
Dräger PIR 7000 340 (M25) Juego completo	6811819
Dräger PIR 7200 (NPT)	6811572
Dräger PIR 7200 (M25) HART Juego completo	6812290

18 Homologaciones de rendimiento

En combinación con determinados sensores, Polytron 8xx0 dispone de un informe metrológico de acuerdo con las siguientes normas:

– Certificados UE y de examen de tipo según EN 60079-29-1, EN 50104, EN 45544 y DIN IEC 62990-1. Expedidos por DEKRA Testing and Certification GmbH, Handwerkstr. 15, D-70565 Stuttgart.
– Informe metrológico FM según la norma ANSI/ISA-92.00.01 FM6340

Para más información sobre las especificaciones y restricciones de los sensores (p. ej., principios de medición, rendimiento, interferencia cruzada), consulte las instrucciones de uso del sensor correspondiente.

18.1 Certificado de examen UE, BVS 13 ATEX G 001 X

Medición de gases y vapores inflamables mezclados con aire.

– Polytron 8200 CAT con DrägerSensor DQ

  Condiciones especiales:

  - En caso de exposición a un flujo de aire que contenga gas de medición, los valores medidos pueden aumentar hasta un 32 %.
  - En caso de funcionamiento con el adaptador de calibración remota DQ, los valores medidos pueden aumentar hasta un 70 %.

– Polytron 8200 CAT con DrägerSensor LC
  Homologado con valor final del rango de medición del 10 % LIE.
  Se necesita una conexión a una unidad de control con función de medición homologada (p. ej., REGARD® 7000). Las alarmas de enclavamiento para valores de medición por encima del rango deben habilitarse en la unidad de control.
– Polytron 8310 IR con DrägerSensor IR
– Polytron 8700 IR con PIR 7000 tipo 334 y 340

Medición de oxígeno (inertización)

– Polytron 8100 EC con DrägerSensor O_2 (6809720) y DrägerSensor O_2 LS (6809630) dentro de un rango de medición de 0-5...25 Vol% de O_2.

Están homologados:

– Interfaz de 4-20 mA
– Módulo de relé
– Sensor remoto
– HART
– Valores finales del rango de medición predeterminados de fábrica

No están homologados la interfaz de bus de campo ni el registrador de datos.

18.2 Certificado de examen, PFG 14 G 001 X

Medición de oxígeno (deficiencia y exceso de oxígeno)

– Polytron 8100 EC con DrägerSensor O_2 (6809720) y DrägerSensor O_2 LS (6809630) dentro de un rango de medición de 0-25 Vol% O_2.

Medición del sulfuro de hidrógeno

– Polytron 8100 EC con Dräger SensorAlive (6809630) dentro de los siguientes rangos de medición:
  - 0,5 - 100 ppm (tipo HM)
  - 0 - 100 ppm (tipo SM)

Medición de dióxido de carbono

– Polytron 8720 IR con PIR 7200 dentro de los siguientes rangos de medición:
  - 1 Vol% y 10 Vol% - EN 45544-2
  - 2000 ppm, 1 Vol% y 10 Vol% – EN 45544-3

Están homologados:
– Interfaz de 4-20 mA
– Módulo de relé
– Sensor remoto

No están homologados:
– Interfaz de bus de campo
– Registrador de datos
– Solo Polytron 8100 EC con Dräger SensorAlive: Funcionalidad de autocomprobación cuando se utiliza el generador de gas

18.3 Condiciones de funcionamiento certificadas DrägerSensor O_2, O_2LS y Dräger SensorAlive

Interferencias cruzadas

No hay interferencias cruzadas conocidas contra gases de interferencia con una concentración de hasta 100 ppm. Para obtener información más detallada, póngase en contacto con Dräger.

18.3.1 DrägerSensor O_2 (6809720)

El DrägerSensor O_2 (6809720) es un sensor electroquímico de dos electrodos para medir el oxígeno (O_2) en el aire ambiental.

Parámetros ambientales	
Presión	20,7 a 38,4 in. Hg (700 a 1300 hPa)
Humedad	10 a 95 % h.r., sin condensación
Temperatura	Cuando se aplica la norma EN 50104, el rango de temperaturas se limita de 0 °C a +55 °C.

Almacenamiento	
Presión	no influye
Humedad	30 a 70 % h.r., sin condensación (solo relevante si el embalaje del sensor está abierto)
Temperatura	0 a +40 °C
Tiempo	No está previsto el almacenamiento de sensores. Los sensores deberían ponerse en funcionamiento inmediatamente después de recibidos. Vida útil restante = vida útil esperada - tiempo de almacenamiento

Influencia de los parámetros ambientales		
	Punto cero	**Sensibilidad[1)]**
Temperatura[2)3)]		
0 a 55 °C	≤ 0,3 Vol% de O_2	≤ 0,9 Vol% de O_2
Presión	< ± 0,2 Vol% de O_2	Desviación relativa de la lectura a 1013 hPa: < 10% del valor de medición / 100 hPa
Humedad	no influye	Desviación relativa de lectura con 50 % h.r.: < 1 % del valor de medición

1) La desviación relativa de la lectura mostrada en pantalla está provocada por los cambios de presión atmosférica.
2) A temperaturas por debajo de -5 °C, la desviación de la medición es superior a lo indicado en la norma EN 50104.
3) Para temperaturas de funcionamiento fuera de -5 °C a 40 °C es necesario efectuar un ajuste a la temperatura de funcionamiento.

Tiempo de respuesta[1)]		
	$t_{0...20}$	**$t_{0...90}$**
0-5 Vol% de O_2	≤ 15 segundos[2)]	≤ 33 segundos
0-25 Vol% O_2	≤ 10 segundos	≤ 26 segundos

1) A temperaturas inferiores a -5 °C, el tiempo de respuesta puede aumentar.
2) El tiempo de respuesta es superior al valor límite permitido según EN 50104.

Tiempo de estabilización: 5 x $t_{0...90}$

Rango de medición

0-5 Vol% de O_2 a 0-100 Vol% de O_2

Por defecto: 25 Vol% de O_2, valor mínimo: -1,25 Vol% de O_2

Tiempo de iniciación del sensor

Funcionamiento: < 20 minutos / ajuste: ≤ 2 horas

18.3.2 DrägerSensor O_2LS (6809630)

El DrägerSensor O_2LS (6809630) es un sensor electroquímico de 3 electrodos para la medición de oxígeno (O_2) en el aire ambiental.

Parámetros ambientales	
Presión	20,7 a 38,4 in. Hg (700 a 1300 hPa)
Humedad	5 a 95 % h.r., sin condensación
Temperatura	-40 a +60 °C brevemente +65 °C

Almacenamiento	
Presión	no influye
Humedad	30 a 70 % h.r., sin condensación (solo relevante si el embalaje del sensor está abierto)
Temperatura	0 a +40 °C
Tiempo	No está previsto el almacenamiento de sensores. Los sensores deberían ponerse en funcionamiento inmediatamente después de recibidos. Vida útil restante = vida útil esperada - tiempo de almacenamiento

Influencia de los parámetros ambientales	Punto cero	Sensibilidad
Temperatura		
-20 a 40 °C	≤ 0,1 Vol% de O_2	≤ 0,1 Vol% de O_2
de -40 a +65 °C	≤ 0,2 Vol% de O_2	≤ 0,5 Vol% de O_2
Presión	< ± 0,1 Vol% de O_2	≤ 0,8 Vol% de O_2
Humedad	≤ 0,1 Vol% de O_2	≤ 0,9 Vol% de O_2

ℹ Si al medir oxígeno hay helio presente, puede utilizarse la compensación de helio. La opción de compensación de helio no es una función de medición certificada conforme a EN 50104.

⚠ PRECAUCIÓN

Fallo del sensor

La exposición a concentraciones elevadas de hidrocarburos no saturados, alcoholes o hidrógeno a lo largo de un periodo prolongado (dosis de aprox. 100.000 ppm x horas) podría provocar el fallo del sensor.

► Asegúrese de que el sensor no se expone a concentraciones de esas características durante un periodo prolongado.

Tiempo de respuesta	$t_{0...20}$	$t_{0...90}$
0-5 Vol% de O_2	≤ 14 segundos[1)]	≤ 45 segundos
0-25 Vol% O_2	≤ 10 segundos	≤ 27 segundos

1) El tiempo de respuesta es superior al valor límite permitido según EN 50104.

Tiempo de estabilización: 5 x $t_{0...90}$

Rango de medición

0-5...25 Vol% de O_2, 0-25 Vol% de O_2

Por defecto: 25 Vol% O_2

Lectura mínima: -1,25 Vol% de O_2

Tiempo de iniciación del sensor

Funcionamiento: ≤ 20 minutos / ajuste: ≤ 6 horas

18.3.3 Dräger SensorAlive (6814014)

El Dräger SensorAlive (6814014) es un sensor de difusión electroquímico con generador de gas integrado para medir el sulfuro de hidrógeno (H_2S) en el aire ambiente.

Parámetros ambientales	
Presión	20,7 a 35,5 in. Hg (700 a 1200 hPa)
Humedad	5 a 95 % h.r., sin condensación
Temperatura	de -40 a +65 °C
Velocidad de circulación máxima del aire ambiental	6 m/s

Almacenamiento	
Presión	no influye
Humedad	30 a 70 % h.r., sin condensación (solo relevante si el embalaje del sensor está abierto)
Temperatura	0 a +40 °C
Tiempo	No está previsto el almacenamiento de sensores. Los sensores deberían ponerse en funcionamiento inmediatamente después de recibidos. Vida útil restante = vida útil esperada - tiempo de almacenamiento

Influencia de los parámetros ambientales	Desviación relativa de la lectura
Presión	a 1000 hPa: ≤ 0,15 ppm
Humedad (a +40 °C)	a 0 y 95 % h.r.: ≤ 0,29 ppm
Temperatura	a 20 °C: ≤ 0,44 ppm

ℹ Los gases de interferencia (p. ej., NH_3) pueden perjudicar el funcionamiento del sensor.

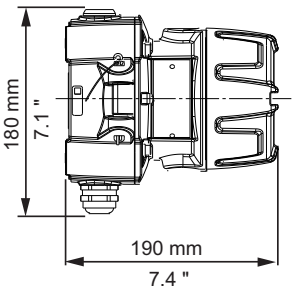
Tiempos de respuesta en modo difusión	
t(50)	≤ 20 s
t(90)	≤ 55 s

Tiempos de relajación en modo difusión	
t(50)	≤ 20 s
t(10)	≤ 55 s

18.4 Informe metrológico FM para DrägerSensor H_2S y H_2S LC

DrägerSensor H_2S y H_2S LC son sensores de difusión electroquímicos que miden el sulfuro de hidrógeno (H_2S) en el aire ambiente.

DrägerSensor H_2S (6810435)	
Tipo de examen P8100	ETR 0400, 0401, 0500, 0501
Interfaz[1)]	4-20 mA, relé
Parámetros ambientales	
Humedad	5 a 95 % h.r., sin condensación
Temperatura	-40/+65 °C (–40/149 °F)
Temperatura de almacenamiento	0/+40 °C (32/104 °F)
Protección de la carcasa [2)]	IP 65/66/67
Rango	0 a 100 ppm
Exactitud (lo que sea mayor)	Incertidumbre de medición (del valor med.) ≤ ±3 % o mínimo ≤ ±0,5 ppm
Accesorios	
Filtro de polvo	6809595
Kit adaptador	6810536
Estándar	ANSI/ISA-92.00.01FM6340



1) La comunicación HART no debe usarse para comunicación relevante para la seguridad.

Dräger Polytron® 8200 CAT
Detektion brennbarer Gase und Dämpfe

Der Dräger Polytron® 8200 CAT ist ein explosionsgeschützter Highend-Transmitter zur Detektion von brennbaren Gasen und Dämpfen. Er nutzt den katalytischen DrägerSensor® Ex ... DQ. Neben dem 3-Leiterbetrieb 4 bis 20 mA Analogausgang, bietet er auch HART®, Feldbusoptionen und Modbus, so dass Sie den Transmitter mit den meisten Auswertesystemen in Ihrer Gaswarnanlage kombinieren können.

Dräger

Technik für das Leben

Dräger Polytron® 8200 CAT

Produktvorteile

Schnell und stabil – der DrägerSensor® Ex ... DQ

Der eingebaute Gassensor vom Typ DQ basiert auf dem bewährten Messprinzip der katalytischen Wärmetönung. Er ist sehr langzeitstabil. Ebenso hervorragend ist seine Vergiftungsbeständigkeit. Und hierauf begründet sich seine Langlebigkeit. Durch die neuartige Gaseintrittsöffnung spricht der Sensor in nur wenigen Sekunden auf Gas an. So können Sie unverzüglich mit Gegenmaßnahmen reagieren und das Entstehen zündfähiger Atmosphäre verhindern.

Einfaches Gerätemanagement durch digitale Kommunikation

Der Dräger Polytron 8200 ist mit digitalen Schnittstellen ausgestattet. Durch diese beurteilen Sie den Transmitterzustand einfach und schnell aus der Ferne. Die Integration in bereits bestehende Managementsysteme (z. B. PACTware™) ist mittels DTM möglich. Neben der gängigen HART®-Kommunikation, sind auch die Feldbus-Schnittstellen PROFIBUS® PA, FOUNDATION fieldbus™ H1 und Modbus RTU verfügbar.

Gleiche Struktur, gleiche Handhabung

Der Dräger Polytron 8200 gehört zur Polytron 8000-Serie. Alle Transmitter dieser Serie sind gleich aufgebaut und haben die gleiche Benutzeroberfläche. Das ermöglicht Ihnen eine einheitliche Bedienung mit geringerem Schulungs- und Wartungsaufwand. Auf der beleuchteten Anzeige lesen Sie Statusinformationen strukturiert und übersichtlich ab. Im Normalbetrieb werden die gemessene Gaskonzentration und die Maßeinheit angezeigt. Farbige LEDs (grün, gelb, rot) informieren zusätzlich über den Status. Das Sensorsignal kann ausgewertet werden, indem Sie das 4 bis 20 mA Signal nutzen. Sie bedienen den Polytron 8200 mit einem Magnetstift über Kontaktflächen.

Drei Relais zur Schaltung externer Betriebsmittel

Auf Wunsch erhalten Sie den Polytron 8200 auch mit drei eingebauten Relais. So können Sie ihn als unabhängige Gaswarnanlage mit zwei frei einstellbaren Konzentrationsalarmen und einem Störungsalarm verwenden. Hupen, Signalleuchten oder ähnliches lassen sich damit lokal schalten, ohne dass Sie ein zusätzliches Kabel zwischen Transmitter und Zentraleinheit verlegen müssen.

Sicheres, robustes Gehäuse für jede Anwendung

Der Polytron 8200 ist druckfestgekapselt und entspricht damit der Explosionsschutzart ›d‹. Für die Schutzart erhöhte Sicherheit ›e‹ gibt es zusätzlich einen Klemmenkasten. Dieser erleichtert Ihnen auch die Vormontage. Je nach Umgebungsbedingung können Sie den Dräger Polytron 8200 mit Aluminium- oder Edelstahlgehäuse wählen.

Unmögliches möglich machen mit Remote-Sensor

Das abgesetzte Sensoranschlussgehäuse ermöglicht Ihnen die Installation des Sensors getrennt vom Transmitter. So platzieren Sie den Sensor einfach näher an der Gaswolke an schwer zu erreichenden Stellen. Das Display bleibt dabei sichtbar auf Augenhöhe.

Datenlogger

Das Polytron 8200 verfügt über einen Datenlogger. In diesem können Mess- und Ereignisdaten der letzten Jahre gespeichert werden.

Systemkomponenten

D-6806-2016

Dräger REGARD® 7000

Das Dräger REGARD® 7000 ist ein modulares und damit auf lange Sicht erweiterbares Auswertesystem für die Überwachung von verschiedenen Gasen und Dämpfen. Geeignet für Gaswarnanlagen unterschiedlichster Komplexität und Anzahl von Transmittern, zeichnet sich das Dräger REGARD® 7000 durch ein hohes Maß an Zuverlässigkeit und Effizienz aus. Ein weiterer Pluspunkt: die Rückwärtskompatibilität zum REGARD®.

D-1130-2010

Dräger REGARD® 3900 Serie

Die Geräte der Dräger REGARD® 3900 Serie sind eigenständige Auswerteeinheiten. Sie sind konfigurierbar für bis zu 16 Messkanäle. Der modulare Aufbau erlaubt Ihnen, die Auswerteeinheit den Bedingungen Ihrer Anlage anzupassen. Beispielweise, indem Sie weitere Alarmmittel einbinden.

D-39957-2021

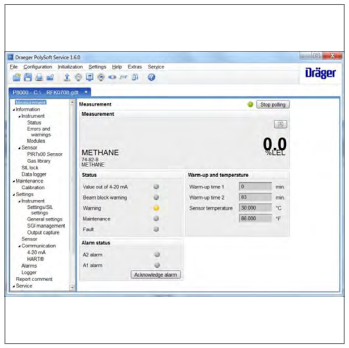
Dräger REGARD® 3000

Überwachen Sie verschiedene Gase und Dämpfe mit dem modularen Auswertesystem Dräger REGARD® 3000. Sein mehrfarbiges Status-Licht signalisiert Ihnen den Zustand Ihrer Gaswarnanlage. Der Controller ermöglicht Ihnen drei verschiedene Module zu kombinieren: Input-, Relais- und Gateway-Modul. Dabei können Sie bis zu vier analoge Transmitter und acht Relais in Kombination anschließen.

Zubehör

D-15035-2010

Docking Station



Für die Schutzart erhöhte Sicherheit ›e‹ gibt es eine Docking Station. Diese erleichtert Ihnen auch die Vormontage. Die Docking Station ist bei allen Transmittern der Polytron® 5000 und Polytron® 8000 Serien mit erhöhter Sicherheit inklusive.

D-85345-2013

Rohranschluss-Set

Mit dem Rohranschluss-Set messen Sie die Gaskonzentration direkt in Rohrleitungen.

D-4316-2019

Dräger PolySoft Software

Die optionale Dräger PolySoft Windows®-Software wird für die Konfiguration, Firmware-Upgrades, Diagnose und den Download desim Datenlogger integrierten Polytron® verwendet. Alles bequem von Ihrem Kontrollraum aus mit dem digitalen HART®-Signal, das auf demanalogen 4-20 mA-Signal fährt. Im Außeneinsatz verbindet ein IRDongle den Polytron® problemlos mit der PolySoft.

Verwandte Produkte

D-15005-2010

Dräger Polytron® 5200 CAT

Der Dräger Polytron® 5200 CAT ist ein kostengünstiger, explosionsgeschützter Transmitter zur Detektion von brennbaren Gasen und Dämpfen. Er nutzt den katalytischen DrägerSensor® Ex ... DQ. Durch den 3-Leiterbetrieb und den 4 bis 20 mA Analogausgang können Sie den Transmitter mit den meisten Auswertesystemen in Ihrer Gaswarnanlage kombinieren.

D-1047-2024

Dräger PEX 3000

Der Transmitter Dräger PEX 3000 detektiert brennbare Gase und Dämpfe in Konzentrationen unterhalb der Unteren Explosionsgrenze (100 % UEG). Er erhöht so den Ex-Schutz Ihrer Anlage. Sein Wärmetönungssensor reagiert in nur wenigen Sekunden auf Gas und das Messsignal ist besonders langzeitstabil.

D-6572-2023

Dräger PointGard 3200

Das Dräger PointGard 3200 ist eine vollständige 1-Kanal-Gaswarnanlage zur Messung von brennbaren Gasen oder Dämpfen in der Umgebungsluft. In dem robusten und gleichzeitig kompakten Gehäuse mit der Schutzklasse IP66 sind bereits alle notwendigen Alarmmittel enthalten.

Technische Daten

Dräger Polytron® 8200 CAT

Typ	Druckfest gekapselter Transmitter (›d‹) oder kombiniert mit erhöhter Sicherheit (›d/e‹)

1.4 Generic Terms and Abbreviations Used

This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
PCS	Power Conversion System

Table 3: Generic terms and abbreviations used

2 General

The noise emission from the offered BESS is 77.1 dBA at 1 m distance. This noise is generated primarily by the heat exchangers installed on the front side of the PCS container.

The test protocol "Determination of sound pressure level referring to EN ISO 3744" of a sound level test conducted by of SLG Prüf- und Zertifzierungs GmbH is attached to this document (*see section 1.3 "Other Applicable Documents"*).

The BESS containers which come without heat exchangers generate noise emissions of 50.5 dBA at 1 m distance. This value was determined during sound level tests performed by FREQCON. The data sheet of the air conditioning units located at the cooling niche of the BESS containers is also attached to this document (*see section 1.3 "Other Applicable Documents"*).

SLG Prüf- und Zertifizierungs GmbH

SUMMARY OF TESTING

Measuring instruments:

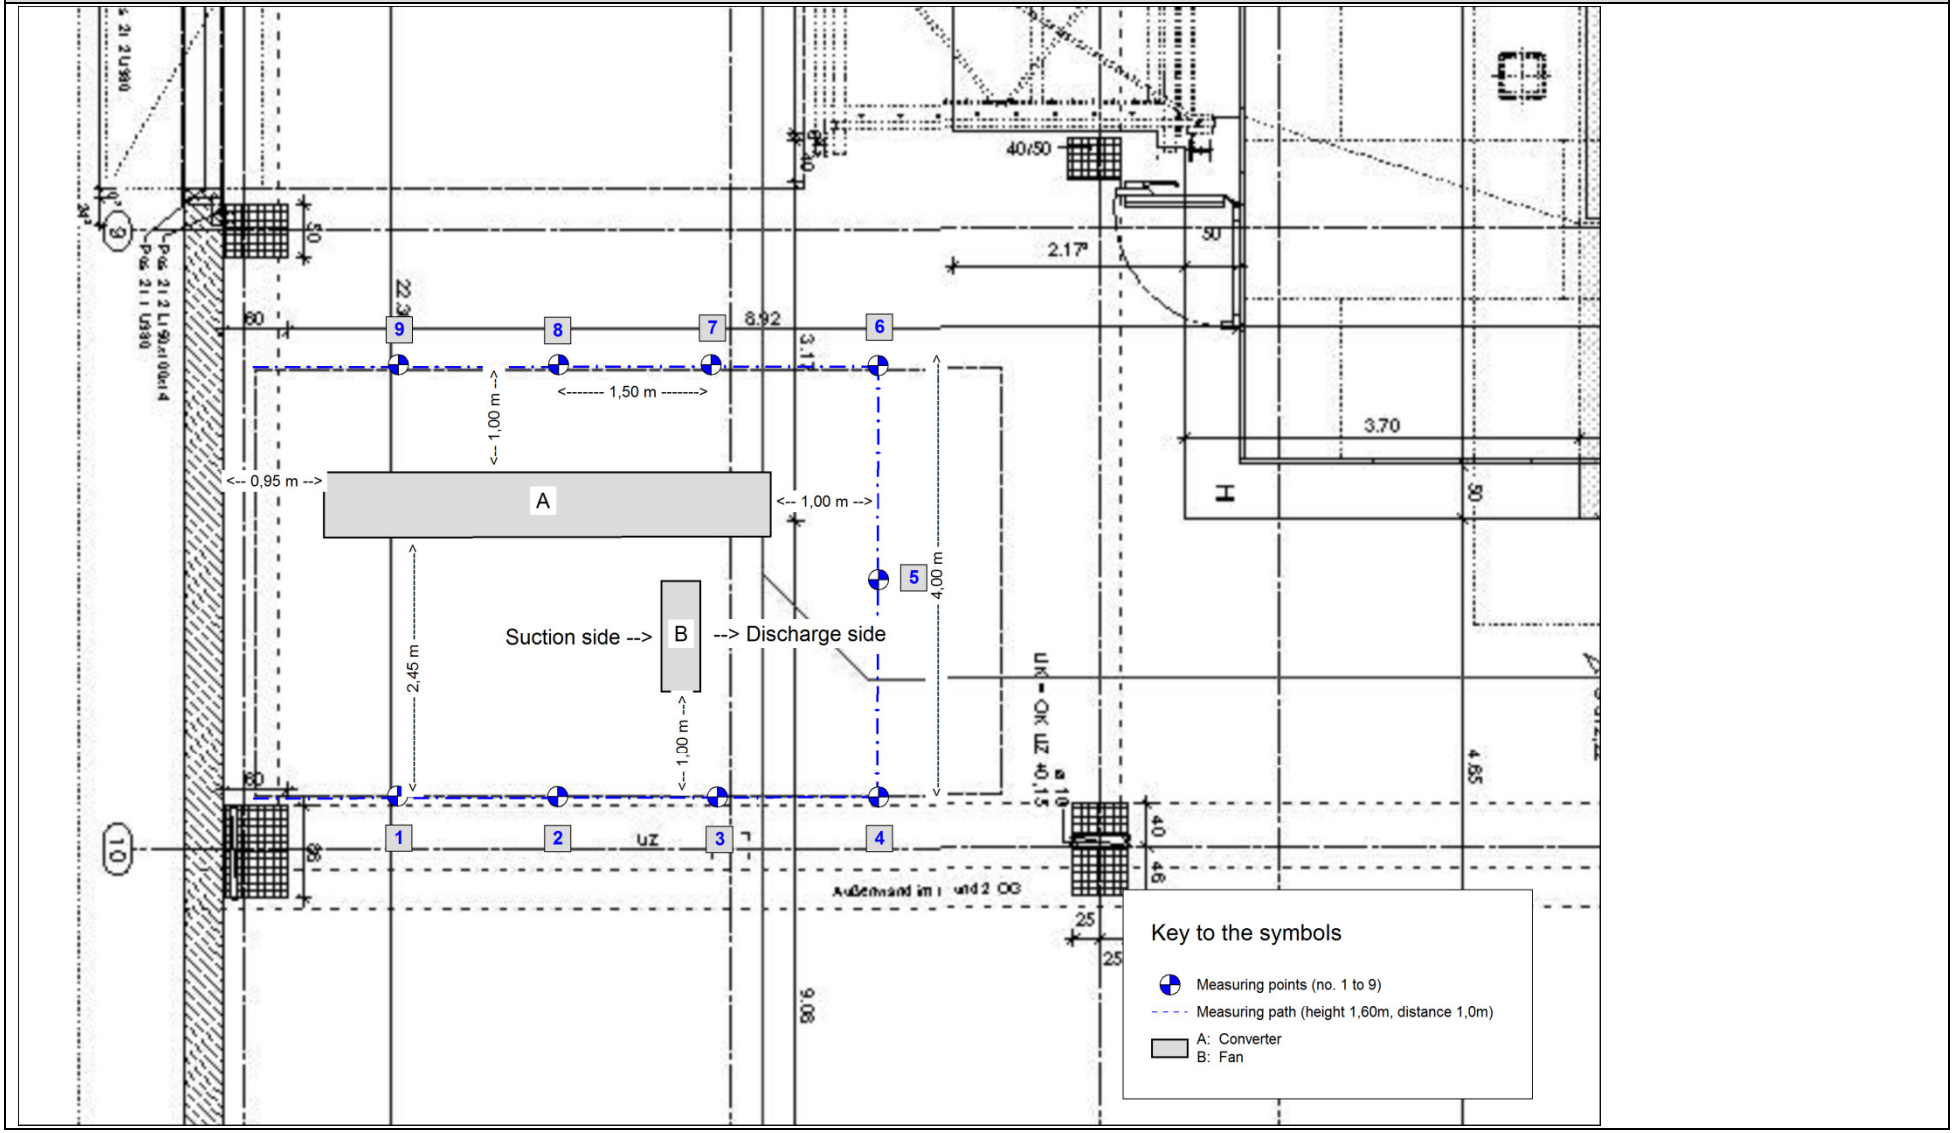
- Hand-held Analyser System Type 2250, S.-No.: 3008766, Brüel & Kjær, Denmark Calibration Certificate 1276-2017-04, D-K-15183-01-00, Spektra Dresden, Germany
- Meteorology monitoring system Type OPUS 10, S.-No.: 049.1206, G. Lufft Mess- und Regeltechnik GmbH Fellbach, Germany, Calibration Certificate 1606072, SLG Prüf- und Zertifizierungs GmbH, Germany
- Digital Barometer Type GPB 1300, Inv.-No.: 5049, Greisinger electronic, Germany, Calibration Certificate 1606071, SLG Prüf- und Zertifizierungs GmbH, Germany

Measurement referring to:

EN ISO 3740:2000 Acoustics - Determination of sound power levels of noise sources - Guidelines for the use of basic standards

EN ISO 3744:2000 Acoustics - Determination of sound power levels and sound energy levels of noise sources using sound pressure - Engineering methods for an essentially free field over a reflecting plane

Test conditions:



- The measurements were carried out in the EMC Laboratory of SLG without specific acoustic requirements. The test conditions of converter and fans were defined by the customer.
- Determination of averaged sound pressure level on rectangular parallelepiped with nine microphone positions (1,60 m height above ground and measurement distance 1 m)
- For detailed information see sketch on page 4.
- The measured values were determined as energetic mean value over at least 30 s per measuring point in the frequency range 6,3 Hz up to 20k Hz. The results were not corrected by the effect of background noise and environmental conditions.
- The following operating conditions were tested
  - converter and cooler fan
  - only converter (without cooler fan)
  - background noise (UUT switched off)
- climatic conditions: temperature: 23 °C; atmospheric pressure: 986 hPa; humidity: 45 %

Test results

Measuring point	Sound pressure level $L_{pA,\,1m}$ for operating conditions		
	converter and cooler fan	only converter	background noise
1	77,9	58,9	45,7
2	78,3	58,4	44,5
3	78,9	57,0	43,5
4	78,0	57,1	43,7
5	78,8	59,2	44,2

Air Conditioning

Product Information

PCA-M R32 Standard Inverter
Ceiling Suspended System
Standard Inverter Heat Pump (Single Phase)

Making a World of Difference

Mr.SLIM

The **PCA-M Standard Inverter** range is a ceiling suspended system that blends a host of outstanding features with a sophisticated streamlined design. Offering advanced control options and quiet operation, this range provides extreme flexibility and ease of installation whilst being cost effective..

Key Features

- Flush to wall installation for concealment of service connections
- High / Low ceiling height modes
- Improved airflow control, including automatic air speed adjustment for greater comfort
- Replace Technology available
- New single fan chassis on 12.5 and 14kW models

MITSUBISHI ELECTRIC

1 Introduction

1.1 About this Document

This document is part of project phase “Detailed Design Engineering” for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, phase 2 or later documents supersede the information provided in this document.

1.2 Display Elements

Symbol	Meaning
➜	Action with one or several steps for which the sequence is irrelevant.
Step 1 : **Step 2 :**	Action with several steps for which the sequence is relevant.

Table 1: Display Elements

1.3 Other Applicable Documents

The following documents are applicable:

Document type	Document Name
Battery Cells LF280K - Material Safety Data Sheet	LF280K MSDS.pdf
Stat-X – Material Safety Data Sheet	19012.10-SDSR-Stat-X-Class-1.4S
Antifrogen N coolant - Material Safety Data Sheet	MSDS-Antifrogen-N_EN_2019-1.pdf

Table 2: Other applicable documents

1.4 Generic Terms and Abbreviations Used

This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
PCS	Power Conversion System
MSDS	Material Safety Data Sheet

Table 3: Generic terms and abbreviations used

2 General

The following components of the proposed PCS and BESS unit are falling under REACH regulation and thereby require a Material Safety Data Sheet (MSDS):

Item	Component	Purpose	Manufacturer	Type
1	Battery cells	Used for energy storage, packed inside modules	EVE	LF280K
2	Fire suppression aerosol cartridges	Fire suppression system inside battery cabinets	Stat-X	Aero-X Stat-X 60E Aerosol Extinguisher
3	Coolant	Coolant used for PCS water-cooling system	Clariant	Antifrogen N

Table 4: Other applicable documents

The Material Safety Data Sheets are attached to this document (*see section 1.3 "Other Applicable Documents"*).

3 Appendix

1. MSDS - Battery cells - EVE LF280K
2. MSDS - Fire suppression aerosol cartridges – Aero-X Stat-X 60E Aerosol Extinguisher
3. MSDS - Coolant – Clariant Antifrogen N

Material Safety Data Sheet

Section 1 – IDENTIFICATION OF THE SUBSTANCE/PREPARATION AND OF THE COMPANY/UNDERTAKING

Product Name: Li-ion Battery

Battery type: Li-ion Battery

Model	Voltage	Capacity（Ah）			Energy（Wh）
		Typical	Min	MAX	
LF280K	3.2V	280	/	/	896

Product Use: Energy Storage System

MSDS Date of Preparation: April 6th, 2021 ； Updated：/

Company Identification:

Name： EVE POWER Co., Ltd.

Address: No.68, Jingnan Avenue, Jingmen Hi-teck Zone, 448000 Jingmen City, Hubei Province

Post Code: 448000

Tel: +86-724-6079630

Fax:+86-724-6079688

Section 2 - Hazards Identification

- **Health Hazards (Acute and Chronic)**

These chemicals are contained in a sealed Al foil. Risk of exposure occurs only if the battery is mechanically or electrically abused. Contact of electrolyte with skin and eyes should be avoided.

- **Sign/Symptoms of Exposure**

A shorted battery can cause thermal and chemical burns upon contact with the skin. Maybe a reproductive hazard.

These products are classified as Articles under REACH and are not subject to the requirements for Information in the Supply Chain (Safety Data Sheets and Labels). While batteries may release hazardous substances if damaged, this is not an intended release as defined under REACH. Batteries are not classified as hazardous under the CLP.

The following information is provided to assist in the safe use of our products.

CAUTION: Battery can explode or leak if heated, disassembled, shorted, recharged, exposed to fire or high temperature or inserted incorrectly. Keep in original package until ready to use. Do not carry batteries

loose in your pocket or purse. Keep batteries away from children. If swallowed, consult a physician at once.

Under certain misuse conditions and by abusively opening the battery, exposed lithium can react with water or moisture in the air causing potential thermal burns or fire.

Section 3 – Composition/Information on Ingredient

Material or ingredient	Chemical Formula	CAS No.	Wt %

Lithium iron phosphate	$LiFePO_4$	/	37.0
Phosphate(1-),hexafluoro,lithium	$LiPF_6$	(CAS-No.)21324-40-3 (EC-No.)244-334-7	3.2
Graphite	C	(CAS-No.)7782-42-5 (EC-No.)231-955-3	19.1
Aluminum	Al	(CAS-No.)7429-90-5 (EC-No.)231-072-3 (EC Index-No.)013-002-00-1	4.6
Copper	Cu	(CAS-No.)7440-50-8 (EC-No.)231-159-6	7.5
Polypropylene	PP	(CAS-No.) 9003-07-0 (EC-No.)618-352-4	4.8

Section 4 - First Aid Measures

- **General Advice**

  The chemicals in this product are contained in a sealed package. Exposure to the contents will not occur unless the battery leaks, is exposed to high temperatures or is mechanically, physically, or electrically abused.

- **Eye**

  Flush eyes with plenty of water for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid.

- **Skin**

  Remove contaminated clothes and rinse skin with plenty of water or shower for 15 minutes. Get medical aid.

- **Inhalation**

  Remove from exposure and move to fresh air immediately. Use oxygen if available.

- **Ingestion**

  Give at least 2 glasses of milk or water. Induce vomiting unless patient is unconscious. Call a physician.

- **Note to Physician**

  Published reports recommend removal from the esophagus be done endoscopically (under direct visualization). Batteries beyond the esophagus need not be retrieved unless there are signs of injury to the GI tract or a large diameter battery fails to pass the pylorus. If asymptomatic, follow up x rays are necessary only to confirm the passage of larger batteries. Confirmation by stool inspection is preferable under most circumstances. Potential leakage of less than 50 milligrams of dimethoxyethane and propylene carbonate. Dimethoxyethane rapidly evaporates. Do not give ipecac.

Section 5 - Fire Fighting Measures

- **Fire and Explosion Hazards**: Batteries may burst and release hazardous decomposition products when exposed to a fire situation.
- **Extinguishing Media**

  CO_2.

- **Special Fire-Fighting Procedures**

  Self-contained breathing apparatus.
- **Unusual Fire and Explosion Hazards**

  Cell may vent when subjected to excessive heat-exposing battery contents.
- **Hazardous Combustion Products**

  Carbon monoxide, carbon dioxide, lithium oxide fumes.

Section 6 - Accidental Release Measures

- **Steps to be Taken in case Material is Released or Spilled**

  If the battery material is released, remove personnel from area until fumes dissipate. Provide maximum ventilation to clear out hazardous gases. Wipe it up with a cloth, and dispose of it in a plastic bag and put into a steel can. The preferred response is to leave the area and allow the battery to cool and vapors to dissipate. Provide maximum ventilation. Avoid skin and eye contact or inhalation of vapors. Remove spilled liquid with absorbent and incinerate.
- **Waste Disposal Method**

  It is recommended to discharge the battery to the end, handing in the abandoned batteries to related department unified, dispose of the batteries in accordance with approved local, state, and federal requirements. Consult state environmental protection agency and/or federal EPA.

Section 7 - Handling and Storage

The battery should not be opened, destroyed or incinerate, since they may leak or rupture and release to the environment the ingredients that they contain in the hermetically sealed container.

Do not short circuit terminals, or over charge the battery, forced over-discharge, throw to fire. Do not crush or puncture the battery, or immerse in liquids.

- **Precautions to be taken in Handling and Storing**

  Avoid mechanical or electrical abuse. Storage preferably in cool, dry and ventilated area, which is subject to little temperature change. Storage at high temperatures should be avoided.

  Do not place the battery near heating equipment, nor expose to direct sunlight for long periods.
- **Other Precautions**

  The battery may explode or cause burns, if disassembled, crushed or exposed to fire or high temperatures.

  Do not short or install with incorrect polarity.
- **Storage**

  Store batteries in a dry place at normal room temperature.

Section 8 - Exposure Controls, Personal Protection

- **Exposure Limits**: No exposure to the battery components should occur during normal use.
- **Ventilation:** Not necessary under conditions of normal use.
- **Respiratory Protection**

  In case of battery venting, provide as much ventilation as possible. Avoid confined areas with venting cell cores. Respiratory Protection is not necessary under conditions of normal use.
- **Skin Protection:** None required for normal use. Use butyl rubber gloves when handling leaking

batteries..

- **Eye Protection:** None required for normal use. Wear safety goggles when handling leaking batteries.
- **Protective Gloves**

  Not need
- **Other Protective Clothing or Equipment**

  Not necessary under conditions of normal use.

  Personal Protection is recommended for venting battery: Respiratory protection, Protective gloves, protective clothing and safety glass with side shields.

Section 9 - Physical and Chemical Properties

Appearance and Odor: prismatic cell, no odor.

Water Solubility: Insoluble

Flash Point: Not Applicable

Section 10 - Stability and Reactivity

- **Stability**

  Stable
- **Conditions to Avoid**

  Heating, mechanical abuse and electrical abuse.
- **Hazardous Decomposition Products**

  N/A.
- **Hazardous Polymerization**

  N/A.

Section 11 - Toxicological Information

- **Potential Health Effects**: The chemicals in this product are contained in a sealed package. Exposure to the contents will not occur unless the battery leaks, is exposed to high temperatures or is mechanically, physically, or electrically abused.
- **Eye Contact**: Contact with battery contents may cause irritation.
- **Skin Contact**: Contact with battery contents may cause irritation.
- **Inhalation**: Inhalation of vapors or fumes released due to heat or a large number of leaking batteries may cause respiratory and eye irritation.
- **Ingestion**: Seek immediate medical advice. Batteries lodged in the esophagus should be removed immediately since leakage, caustic burns and perforation package occur as soon as two hours after ingestion. Irritation to the internal/external mouth areas, may occur following exposure to a leaking battery.

Section 12 - Ecological Information

When promptly used or disposed the battery does not present environmental hazard. When disposed, keep away from water, rain and snow.

Section 13 - Disposal Considerations

- **APPROPRIATE METHOD OF DISPOSAL OF SUBSTANCE OR PREPARATION**

  If batteries are still fully charged or only partially discharged, they can be considered a reactive hazardous waste because of significant amount of not reaction or unconsumed lithium remaining in the spent battery. The battery must be neutralized through an approved secondary treatment facility prior to disposal as a hazardous waste. Recycling of battery can be done in authorized facility, through licensed waste carrier.

  lithium ion cell batteries are labeled in compliance with the EU Battery Directive 2006/66/EC.

Section 14 - Transport Information

Emergency Phone Number:

CHEMTREC 24 Hour Emergency Response Hotline （+86-752-2606966）

Persons who prepare or offer lithium batteries for transport are required by regulation to be trained and certified.

The information provided below is for informational purposes only.

Lithium Ion Batteries
UN No.：UN3480
EmS No.:F-A,S-I
Marine pollutant:No
Proper shipping name:Lithium ion battery（Including lithium ion ploymer batteries）
Hazard classification: The goods shall be complied with the requirements of section IA of Packing Instructions 965 of 61 th DGR Manual of IATA（2020）Edition and special provision 188 of IMDG CODE（Amdt.39-18）Edition,including the passing of the UN38.3 test.

The products meet all the requirements of the IATA DGR 61th edition, under special provisions including UN 38.3 test . If the package exceeds the table 965 - the - standard, so it belongs to the ninth category of dangerous goods. Only cargo transport. According to the packing instructions 965 Part IA IATA 61th version of the DGR requirements.

Lithium ion cells and batteries must be offered for transport at a state of charge (SoC) not exceeding 30% of their rated design capacity from 1 April 2016.

Shipping packages containing rechargeable lithium batteries must be labeled, regardless of size or number of batteries, with a lithium battery handling label.

More information concerning shipping, testing, marking and packaging can be obtained from Label master at http://www.labelmaster.com.

Separate battery when shipping to prevent short-circuiting. They should be packed in strong packaging for support during transport. Take in a cargo of them without falling, dropping, and breakage. Prevent

collapse of cargo piles and wet by rain.

  《California Proposition 65》

  《Code of Federal Regulations》(CFR)

EU BATTERY DIRECTIVE: These batteries comply with the Directive substance limits and labeling requirements.

EU REACH REGISTRATION: These products are manufactured articles and not subject to REACH registration requirements.

EU Labeling: lithium ion cell batteries are labeled in compliance with the EU Battery Directive 2006/66/EC.

Section 16 – Other Information

EVE Hazard Rating: Health: 0 Fire: 0 Reactivity: 0

==========

Data supplied is for use only in connection with occupational safety and health.

DISCLAIMER: This MSDS is intended to provide a brief summary of our knowledge and guidance regarding the use of this material. The information contained here has been compiled from sources considered by EVE to be dependable and is accurate to the best of the Company's knowledge. It is not meant to be an all inclusive document on worldwide hazard communication regulations.

Stat-X® Aerosol Fire Suppression

Fireaway

Safety Data Sheet according to Regulation (EC) No. 1907/2006 & Amendment 987/2008 (REACH) & HazCom 2012

5852 Baker Road
Minnetonka, MN
55345
USA

SDSR# FU011B
DATE: 11/18

SECTION 1: Identification of the Substance/Mixture and of the Company/undertaking Product Identifier

Stat-X® Condensed Aerosol Generators - Models 30 to 2500.

Details of the supplier of the safety data sheet:
Fireaway Inc., 5852 Baker Road, Minnetonka, MN, 55345, USA
Telephone +1 (952) 935-9745, Fax +1 (952) 935-9757
Email address of the competent person: info@statx.com

For information only, call 1-952-935-9745.
For emergencies, call
INFOTRAC
USA & CANADA: +1-800-535-5053
INTERNATIONAL: +1-352-323-3500 (collect)

Only Representative Contact:
Blue Frog Scientific Limited, Quantum House,
91 George Street, Edinburgh, EH2 3ES
+44 (0) 131 523 1412

SECTION 2: Hazards Identification

Possible exposure to aerosol suppression agent if generator is activated. May cause temporary, mild irritation of mucous membranes if inhaled. US EPA listed under US EPA SNAP List for use as a total flooding fire suppression agent in normally occupied spaces.

2.1 Classification

OSHA Regulatory Status

All 3 chemicals listed below are not stored as raw loose powder but homogenously blended and pressed into a single solid aerosol forming compound pellet. Exposure to raw dust from the pellet is very limited which may contain any of the 3 chemicals listed in Section 3.

Potassium nitrate: Oxidizer solid

Dicyandiamide: Not a hazardous substance or mixture

Phonolic resin: This chemical is considered hazardous under 29 CFR 1910.1200 (Hazard Communication)

2.2 Label Elements

Signal Word

WARNING

Hazard Statements

Potassium nitrate dust:

May intensity fire; oxidizer (H272)

Dicyandiamide dust: Not a hazardous substance or mixture

Phenolic Resin dust:

Causes skin irritation (H315)

Causes eye irritation (H319)

May cause respiratory irritation (H335)

Precautionary Statements

Potassium nitrate: Keep/store away from clothing/combustible materials

Prevention

Wash face, hands and any exposed skin thoroughly after handling. Wear protective gloves/protective clothing/eye protection/face protection. Avoid breathing particles/dust/gas. Handle in accordance with good industrial hygiene and safety practice. Keep away from heat.

Response

IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rising. If eye irritation persists: Get medical advice/attention.

IF ON SKIN: Wash with plenty of soap and water. If skin irritation or rash occurs: Get medical advice/attention.

IF ON CLOTHING: Dispose of contaminated clothing and gloves after use in accordance with applicable laws and good industrial hygiene practices. Contaminated clothing should not be allowed out of the workplace unless well rinsed with water.

Disposal

Dispose of contents/container to an approved waste disposal plant.

2.3 Hazards Not Otherwise Classified (HNOC)

Not applicable.

SECTION 3: Composition/Information on Ingredients

Hazardous components: Does not contain dangerous materials as defined by ordinance on hazardous materials.

Components – Chemical (Hazardous Components ≥ 1%)	**CAS#**	**Weight %**	**COMMENTS:**
Potassium Nitrate ECHA Registration no. 01-2119488224-35-0066	7757-79-1	75.0	Components are blended and pressed into a highly stable, molded form. Molded composition is contained within a sealed double-walled stainless steel housing – no environmental exposure. Upon generator unit activation these chemical elements are not discharged from the unit but are fully consumed by an internal chemical reaction.
DCDA	461-58-5	16.5	
Organic Resin	9003-35-4	8.5	
Appearance & Odor:			Beige to white in color. No odor.
Auto-Ignition Temperature:			300^0 C
Solubility in Water:			Slightly Soluble

SECTION 4: First aid measures

Contact Method:	**Procedure:**
Inhalation	Remove to fresh air
Eye Contact	Flush with water
Skin Contact	Wash with soap and water.
Ingestion	Not a likely route of exposure.
Seek medical attention for further treatment, observation, and support if necessary.	

SECTION 5: Firefighting Measures

In the event of a fire, evacuate the area and inform emergency services. Ignition of Stat-X produces a fire-suppression aerosol. Water may be used as an additional suppression agent.

SECTION 6: Accidental Release Measures

If these devices are spilled they can be safely recovered by hand and should be inspected for damage prior to repacking. Suspect or damaged articles should be labeled and consigned for correct destruction.

SECTION 7: Handling and Storage

Store in temperate conditions. Avoid shock, electric currents, static discharge, excessive heat and extended periods of storage at temperatures greater than 65°C.

SECTION 8: Exposure Controls/Personal Protection

Respiratory Protection	Ventilate area completely after discharge. Do not enter area prior to complete venting of enclosure. Use filter mask as necessary during clean-up.
Hand Protection	Wear gloves if handling generators prior to cooling.
Eye Protection	Safety glasses are advisable.
Skin Protection	N/A

SECTION 9: Physical and Chemical Properties

Appearance:	Stainless Steel Cylinder up to 270 mm in length

SECTION 10: Stability and Reactivity

These devices are extremely stable below 125°C. They are packaged to protect the articles from electrical power and shock. As with any stored products, stored packaging should be protected from fire and high temperatures.

SECTION 11: Toxicological Information

Toxic by-products of combustion are extremely low. Main by-products are listed below with 15-minute TWA values for a maximum 100g/m^3 concentration in a hermetically sealed volume.

Gas	15 minute Time Weighted Average in parts per million
NO_2	1.08
NO	0.97
CO	84.20

SECTION 12: Ecological Information

These devices are sealed and present no ecological hazards. The aerosol produced upon ignition has very low global warming potential and an ozone depletion potential = 0.

SECTION 13: Disposal Considerations

Comply with all local, state, and federal/international regulations.

SECTION 14: Transport Information

UN Number: 0432	Authorized Modes of Transport: Motor Vehicle, Rail, Cargo Vessel, Cargo and Passenger Air
UN Classification: Class 1.4S Articles Pyrotechnic for Technical Purposes	Shipping Limitations: Cargo Aircraft: Max single packaging – 100 kg. Passenger Aircraft: Max single packaging – 25 kg.

SECTION 15: Regulatory Information

Safety, health and environmental regulations/legislation specific for the substance or mixture
EU regulations

Phenolic Resin:

Regulation (EC) No. 1005/2009 on substances that deplete the ozone layer, Annex I, as amended:
Not listed.
Regulation (EC) No. 1005/2009 on substances that deplete the ozone layer, Annex II, as amended:
Not listed.
Regulation (EC) No. 850/2004 On persistent organic pollutants, Annex I as amended:
Not listed.
Regulation (EC) No. 689/2008 concerning the export and import of dangerous chemicals, Annex I, part 1 as amended:
Not listed.
Regulation (EC) No. 689/2008 concerning the export and import of dangerous chemicals, Annex I, part 2 as amended:
Not listed.
Regulation (EC) No. 689/2008 concerning the export and import of dangerous chemicals, Annex I, part 3 as Amended:
Not listed.
Regulation (EC) No. 689/2008 concerning the export and import of dangerous chemicals, Annex V as amended
Not listed.
Regulation (EC) No. 166/2006 Annex II Pollutant Release and Transfer Registry, as amended
Not listed.
Regulation (EC) No. 1907/2006, REACH Article 59(1) Candidate List as currently published by ECHA
Not listed.

Authorizations

Regulation (EC) No. 143/2011 Annex XIV Substances Subject to Authorization:
Not listed.
Regulation (EC) No. 1907/2006, REACH Annex XIV Substances subject to authorization, as amended:
FORMALDEHYDE (CAS 50-00-0):

Restrictions on use

Regulation (EC) No. 1907/2006, REACH Annex XVII Substances subject to restriction on marketing and use as amended

FORMALDEHYDE (CAS 50-00-0)

Directive 2004/37/EC: on the protection of workers from the risks related to exposure to carcinogens and mutagens at work, as amended:

FORMALDEHYDE (CAS 50-00-0)

Directive 92/85/EEC: on the safety and health of pregnant workers and workers who have recently given birth or are breastfeeding, as amended:

FORMALDEHYDE (CAS 50-00-0)

Other EU regulations

Directive 2012/18/EU on major accident hazards involving dangerous substances:

FORMALDEHYDE (CAS 50-00-0)

Directive 98/24/EC on the protection of the health and safety of workers from the risks related to chemical agents at work, as amended:

FORMALDEHYDE (CAS 50-00-0)

Directive 94/33/EC on the protection of young people at work, as amended

FORMALDEHYDE (CAS 50-00-0)

Other regulations

The product is classified and labelled in accordance with EC directives or respective national laws.

National regulations

This preparation is not classified as dangerous according to European Union legislation. Young people under 18 years old are not allowed to work with this product according to EU Directive 94/33/EC on the protection of young people at work. Follow national regulation for work with chemical agents.

U.S. INFORMATION

Potassium Nitrate:

TSCA 8(b) inventory: Potassium Nitrate
CALIFORNIA PROPOSITION 65: Potassium Nitrate (CAS 7757-79-1) is not listed.
Clean Water Act (CWA): No product found

Phenolic Resin:

CALIFORNIA PROPOSITION 65: Formaldehyde (CAS 50-00-0) is listed.
Clean Water Act (CWA): Hazardous substance

SECTION 16: Other Information

Comply with manufacturer's installation and maintenance procedures.

Disclaimer: The information contained herein is accurate to the best knowledge and belief of Fireaway Inc., and is intended to describe the product for health, safety, and environmental requirements only. It is not intended and should not be construed as a warranty. Consult Fireaway for further information.

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1. Product identifier

Trade name
ANTIFROGEN N

Material number: 107601

Chemical nature: Monoethylene glycol (1,2-ethane diol) with corrosion inhibitors

1.2. Relevant identified uses of the substance or mixture and uses advised against

Relevant identified uses of the substance or mixture

Industry sector :	Functional Fluids
Type of use :	Brine for refrigeration

Exposure scenarios: see annex

1.3. Details of the supplier of the safety data sheet

Identification of the company
Clariant Produkte (Deutschland) GmbH
65926 Frankfurt am Main
Telephone no. : +49 69 305 18000

Information about the substance/mixture
BU Industrial & Consumer Specialties
Product Stewardship
e-mail: SDS.Europe@clariant.com

1.4. Emergency telephone number

00800-5121 5121 (24 h)

SECTION 2: Hazards identification

2.1 Classification of the substance or mixture

Classification (REGULATION (EC) No 1272/2008)

Acute toxicity, Category 4	H302: Harmful if swallowed.
Specific target organ toxicity - repeated exposure, Category 2	H373: May cause damage to organs through prolonged or repeated exposure.

2.2 Label elements

Labelling (REGULATION (EC) No 1272/2008)

Hazard pictograms :

Signal word : Warning

Hazard statements : H302 Harmful if swallowed.

H373 May cause damage to organs through prolonged or repeated exposure.

Precautionary statements :

Prevention:

P260 Do not breathe dust/ fume/ gas/ mist/ vapours/ spray.
P264 Wash skin thoroughly after handling.
P280 Wear protective gloves/ protective clothing/ eye protection/ face protection.

Response:

P314 Get medical advice/ attention if you feel unwell.
P337 + P313 If eye irritation persists: Get medical advice/ attention.

Disposal:

P501 Dispose of contents/ container to an approved waste disposal plant.

2.3 Other hazards

After consideration of all available toxicity and ecotoxicity data it is concluded that the substance does not fulfil the PBT or vPvB criteria.

No additional hazards are known except those derived from the labelling.

SECTION 3: Composition/information on ingredients

3.2 Mixtures

Hazardous components

Chemical name	CAS-No. EC-No. Index-No. Registration number	Classification	Concentration (% w/w)
Ethanediol	107-21-1 203-473-3 603-027-00-1 01-2119456816-28 01-2119456816-28-0000 01-2119456816-28-0003 01-2119456816-28-0038 01-2119456816-28-XXXX	STOT RE 2; H373 Acute Tox. 4; H302	>= 90 - <= 95

For explanation of abbreviations see section 16.

SECTION 4: First aid measures

4.1 Description of first aid measures

General advice : Remove/Take off immediately all contaminated clothing.

If inhaled	:	Get medical attention if symptoms occur.
In case of skin contact	:	In case of contact, immediately flush skin with plenty of water.
In case of eye contact	:	In the case of contact with eyes, rinse immediately with plenty of water and seek medical advice.
If swallowed	:	Get medical attention immediately.

4.2 Most important symptoms and effects, both acute and delayed

Symptoms	:	No symptoms known currently.
Risks	:	No hazards known at this time.

4.3 Indication of any immediate medical attention and special treatment needed

Treatment	:	Treat symptomatically.

SECTION 5: Firefighting measures

5.1 Extinguishing media

Suitable extinguishing media	:	Water spray jet Alcohol-resistant foam Carbon dioxide (CO2) Dry powder

5.2 Special hazards arising from the substance or mixture

Specific hazards during firefighting	:	In case of fires, hazardous combustion gases are formed: Carbon monoxide (CO) Nitrogen oxides (NOx)

5.3 Advice for firefighters

Special protective equipment for firefighters	:	Self-contained breathing apparatus

SECTION 6: Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Personal precautions	:	Ensure adequate ventilation. Wear suitable protective equipment.

6.2 Environmental precautions

Environmental precautions	:	Do not allow to enter drains or waterways

6.3 Methods and material for containment and cleaning up

Methods for cleaning up : Soak up with inert absorbent material (e.g. sand, silica gel, acid binder, universal binder, sawdust).

Can be landfilled or incinerated, when in compliance with local regulations.

6.4 Reference to other sections

Information regarding Safe handling, see chapter 7., For personal protection see section 8., For disposal considerations see section 13.

SECTION 7: Handling and storage

7.1 Precautions for safe handling

Advice on safe handling : Handle and open container with care.
Provide adequate ventilation.

Advice on protection against fire and explosion : Observe the general rules of industrial fire protection

Hygiene measures : Keep away from food and drink.

7.2 Conditions for safe storage, including any incompatibilities

Advice on common storage : Do not store with alkalies
Do not store with strong oxidizing agents

7.3 Specific end use(s)

Specific use(s) : No further recommendations.

SECTION 8: Exposure controls/personal protection

8.1 Control parameters

Occupational Exposure Limits

Components	CAS-No.	Value type (Form of exposure)	Control parameters	Basis
Ethanediol	107-21-1	TWA	20 ppm 52 mg/m3	2000/39/EC
Further information	Identifies the possibility of significant uptake through the skin, Indicative			
		STEL	40 ppm 104 mg/m3	2000/39/EC
Further information	Identifies the possibility of significant uptake through the skin, Indicative			

Derived No Effect Level (DNEL) according to Regulation (EC) No. 1907/2006:

Substance name	End Use	Exposure routes	Potential health effects	Value
Ethanediol CAS-No.: 107-21-1	Workers	Dermal	Long-term systemic effects	106 mg/kg bw/day

Remarks:	DNEL			
	Workers	Inhalation	Long-term local effects	35 mg/m3
Remarks:	DNEL			
	General population	Dermal	Long-term systemic effects	53 mg/kg bw/day
Remarks:	DNEL			
	General population	Inhalation	Long-term local effects	7 mg/m3

Predicted No Effect Concentration (PNEC) according to Regulation (EC) No. 1907/2006:

Substance name	Environmental Compartment	Value
Ethanediol CAS-No.: 107-21-1	Fresh water	10 mg/l
	salt water	1 mg/l
	Water (intermittent release)	10 mg/l
	Fresh water sediment	37 mg/kg dry weight (d.w.)
	Soil	1,53 mg/kg dry weight (d.w.)
	Sewage treatment plant	199,5 mg/l
	Marine sediment	3,7 mg/kg dry weight (d.w.)

8.2 Exposure controls

Personal protective equipment

Eye protection : Depending on the risk, wear sufficient eye protection (safety glasses with side protection or goggles, and if necessary, face shield.)

Hand protection
- Break through time : 480 min
- Glove thickness : 0,7 mm
- Remarks : Long-term exposure Impervious butyl rubber gloves

- Break through time : 30 min
- Glove thickness : 0,4 mm
- Remarks : For short-term exposure (splash protection): Nitrile rubber gloves.

- Remarks : These types of protective gloves are offered by various manufacturers. Please note the manufacturers´ detailed statements, especially about the minimum thickness and the minimum breakthrough time. Consider also the particular working conditions under which the gloves are being used.

Respiratory protection : Use respiratory protection in case of insufficient exhaust ventilation or prolonged exposure
Full mask to standard DIN EN 136
Filter A (organic gases and vapours) to standard DIN EN 141
The use of filter apparatus presupposes that the environment atmosphere contains at least 17% oxygen by volume, and does not exceed the maximum gas concentration, usually

0.5% by volume. Relevant guidelines to be considered include EN 136/141/143/371/372 as well as other national regulations.

Protective measures : Do not inhale vapours
Avoid contact with skin and eyes.

SECTION 9: Physical and chemical properties

9.1 Information on basic physical and chemical properties

Appearance	:	Liquid
Colour	:	yellow
Odour	:	slightly perceptible
Odour Threshold	:	not tested.
pH	:	approx. 8 (20 °C) Concentration: 100 g/l Method: DIN 19268
Melting point	:	-32 °C Method: DIN 51583
Boiling point	:	approx. 165 °C (1.013 hPa) Method: ASTM D 1120 166 °C (1.013 hPa) Method: ASTM D 1120
Flash point	:	119 °C Method: ASTM D6450 (closed cup)
Evaporation rate	:	not tested.
Flammability (solid, gas)	:	Not applicable
Burning number	:	Not applicable
Upper explosion limit / upper flammability limit	:	not tested.
Lower explosion limit / Lower flammability limit	:	3 %(V) Data relate to solvent
Vapour pressure	:	< 0,01 kPa (20 °C) Method: Calculated by Syracuse.
Relative vapour density	:	not tested.

Density	:	1,1138 g/cm3 (20 °C) Method: DIN 51757
Bulk density	:	Not applicable
Solubility(ies)		
Water solubility	:	completely miscible (20 °C)
Solubility in other solvents	:	not tested. Solvent: fat
Partition coefficient: n-octanol/water	:	Not applicable
Auto-ignition temperature	:	> 400 °C Method: DIN 51794
Decomposition temperature	:	> 300 °C Method: DSC Measurement under nitrogen No decomposition up to 300 °C.
Viscosity		
Viscosity, dynamic	:	20,3 mPa.s (20 °C)
Viscosity, kinematic	:	20,3 mm2/s (20 °C) Method: DIN 51562
Explosive properties	:	Not explosive Method: Expert judgement
Oxidizing properties	:	The substance or mixture is not classified as oxidizing. Method: Expert judgement

9.2 Other information

Surface tension	:	33,8 mN/m
Molecular weight	:	Not applicable
Metal corrosion rate	:	< 6,25 mm/a
Minimum ignition energy	:	not tested.
Particle size	:	Not applicable
Self-ignition	:	Not applicable

SECTION 10: Stability and reactivity

10.1 Reactivity

See section 10.3. "Possibility of hazardous reactions"

10.2 Chemical stability

Stable under normal conditions.
hygroscopic

10.3 Possibility of hazardous reactions

Hazardous reactions : Reactions with alkalies.
Reactions with oxidising agents.

Stable

10.4 Conditions to avoid

Conditions to avoid : None known.

10.5 Incompatible materials

Materials to avoid : not known

10.6 Hazardous decomposition products

When handled and stored appropriately, no dangerous decomposition products are known

SECTION 11: Toxicological information

11.1 Information on toxicological effects

Acute toxicity

Product:

Acute oral toxicity : Acute toxicity estimate: 519,54 mg/kg
Method: Calculation method

Acute inhalation toxicity : LC50 (Rat, male and female): > 2,5 mg/l
Exposure time: 6 h
Test atmosphere: dust/mist
Remarks: Information refers to the main component.

Acute dermal toxicity : LD50 (Mouse, male and female): > 3.500 mg/kg
Remarks: Information refers to the main component.

Components:

Ethanediol:

Acute oral toxicity : LD50 (Rat, male and female): 22.000 mg/kg
Method: Other
GLP: no

Acute inhalation toxicity : LC50 (Rat, male and female): > 2,5 mg/l
Exposure time: 6 h

Test atmosphere: dust/mist
Method: Other
GLP: yes

Acute dermal toxicity : LD50 (Mouse, male and female): > 3.500 mg/kg
Method: Other
GLP: yes

Skin corrosion/irritation

Product:

Species : Rabbit
Result : No skin irritation
Remarks : Information refers to the main component.

Components:

Ethanediol:

Species : Rabbit
Exposure time : 20 h
Method : Other
Result : No skin irritation
GLP : no

Serious eye damage/eye irritation

Product:

Remarks : no data available

Components:

Ethanediol:

Species : Rabbit
Exposure time : 24 h
Method : Other
Result : No eye irritation
GLP : no

Respiratory or skin sensitisation

Product:

Test Type : Guinea pig maximization test
Species : Guinea pig
Method : Magnusson/Kligman
Result : non-sensitizing
Remarks : Information refers to the main component.

Components:

Ethanediol:

Test Type : Maximisation Test
Exposure routes : Dermal

Species	:	Guinea pig
Method	:	OECD Test Guideline 406
Result	:	Not a skin sensitizer.
GLP	:	yes

Assessment : Harmful if swallowed.

Germ cell mutagenicity

Product:

Germ cell mutagenicity- Assessment : It is concluded that the product is not mutagenic based on evaluation of several mutagenicity tests.

Information refers to the main component.

Components:

Ethanediol:

Genotoxicity in vitro :
Test Type: Ames test
Test system: Salmonella typhimurium
Concentration: 33 - 5000 µg/plate
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 471
Result: negative
GLP: yes

Test Type: Ames test
Test system: Escherichia coli
Concentration: 33 - 5000 µg/plate
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 471
Result: negative
GLP: yes

Test Type: Chromosome aberration test in vitro
Test system: Chinese hamster ovary cells
Metabolic activation: with and without metabolic activation
Method: Other
Result: negative
GLP: yes

Test Type: In vitro mammalian cell gene mutation test
Test system: mouse lymphoma cells
Metabolic activation: with and without metabolic activation
Method: OECD Test Guideline 476
Result: negative
GLP: yes

Genotoxicity in vivo :
Test Type: Dominant lethal assay
Species: Rat (male and female)
Strain: Fischer F344
Application Route: oral (feed)

Exposure time: 3 generation
Dose: 40 - 200 - 1000 mg/kg
Method: Other
Result: negative
GLP: no

Germ cell mutagenicity-Assessment : It is concluded that the product is not mutagenic based on evaluation of several mutagenicity tests.

Carcinogenicity

Product:

Carcinogenicity - Assessment : No evidence of carcinogenicity in animal studies.

Information refers to the main component.

Components:

Ethanediol:

Species	:	Mouse, male and female
Application Route	:	oral (feed)
Exposure time	:	2 a
Dose	:	6250-12500-25000-50000 ppm
Group	:	yes
Frequency of Treatment	:	daily
NOAEL	:	1.500 mg/kg bw/day
Method	:	Other
GLP	:	yes

Carcinogenicity - Assessment : Not classifiable as a human carcinogen.

Reproductive toxicity

Product:

Reproductive toxicity - Assessment : No indications of toxic effects were observed in reproduction studies in animals.

No reproductive toxicity to be expected.

Information refers to the main component.

Information refers to the main component.

Components:

Ethanediol:

Effects on fertility : Test Type: Three-generation study
Species: Rat, male and female
Strain: Fischer F344
Application Route: oral (feed)
Dose: 40 - 200 - 1000

General Toxicity - Parent: NOAEL: > 1.000 mg/kg body weight
General Toxicity F1: NOAEL: > 1.000 mg/kg body weight
General Toxicity F2: NOAEL: > 1.000 mg/kg body weight
Method: Other
GLP: no

Effects on foetal development	:	Test Type: reproductive and developmental toxicity study Species: Rat, female Strain: Sprague-Dawley Application Route: oral (gavage) Dose: 150 - 500 - 1000 - 2500 mg/kg Duration of Single Treatment: 9 d General Toxicity Maternal: NOEL: 1.500 mg/kg body weight Teratogenicity: NOEL: 150 mg/kg body weight Method: Other GLP: yes
Reproductive toxicity - Assessment	:	No reproductive toxicity to be expected. No teratogenic effects to be expected.

STOT - single exposure

Product:

Remarks : no data available

Components:

Ethanediol:

Assessment : The substance or mixture is not classified as specific target organ toxicant, single exposure.

STOT - repeated exposure

Product:

Remarks : no data available

Components:

Ethanediol:

Target Organs : Kidney
Assessment : May cause damage to organs through prolonged or repeated exposure.

Repeated dose toxicity

Product:

Species : Rat, male and female
NOAEL : 200 mg/kg
Application Route : oral (gavage)
Method : OECD Test Guideline 407
Remarks : Information refers to the main component.

Species	:	Rat, male
NOAEL	:	150 mg/kg
Application Route	:	oral (feed)
Method	:	OECD Test Guideline 408
Remarks	:	Information refers to the main component.

Species	:	Dog, male
NOAEL	:	2,22 mg/kg
Application Route	:	Dermal
Method	:	OECD Test Guideline 410
Remarks	:	Information refers to the main component.

Components:

Ethanediol:

Species	:	Rat, male
NOAEL	:	150 mg/kg bw/day
Application Route	:	oral (feed)
Exposure time	:	16 w
Number of exposures	:	daily
Dose	:	50 - 150 - 500 - 1000 mg/kg
Group	:	yes
Method	:	OECD Test Guideline 408
GLP	:	No information available.

Species	:	Dog, male
NOAEL	:	2.200 - 4.400 mg/kg bw/day
Application Route	:	Dermal
Exposure time	:	4 w
Number of exposures	:	daily
Dose	:	2 - 4 mL/kg bw
Group	:	yes
Method	:	OECD Test Guideline 410
GLP	:	yes

Aspiration toxicity

Product:

no data available

Components:

Ethanediol:

No aspiration toxicity classification

Further information

Product:

Remarks	:	Kidney injury may occur.
Remarks	:	Poisoning affects the central nervous system
Remarks	:	The classification was made by the conventional (calculation)

method of the CLP Regulation (EC) No 1272/2008.

SECTION 12: Ecological information

12.1 Toxicity

Product:

Toxicity to fish	:	LC0 (Leuciscus idus (Golden orfe)): 1.000 mg/l LL50 (Danio rerio (zebra fish)): > 100 mg/l Exposure time: 96 h Test Type: static test Method: OECD Test Guideline 203 GLP: yes Remarks: By analogy with a product of similar composition
Toxicity to daphnia and other aquatic invertebrates	:	EC50 (Daphnia magna (Water flea)): > 100 mg/l Exposure time: 48 h Method: OECD Test Guideline 202 Remarks: Information refers to the main component.
Toxicity to algae	:	EC50 (Selenastrum capricornutum (green algae)): 6.500 - 13.000 mg/l Exposure time: 96 h Remarks: Information refers to the main component.
Toxicity to microorganisms	:	EC20 (activated sludge): > 1.995 mg/l Exposure time: 30 min Method: ISO 8192 Remarks: Information refers to the main component.

Components:

Ethanediol:

Toxicity to fish	:	LC50 (Pimephales promelas (fathead minnow)): 72.860 mg/l Exposure time: 96 h Test Type: static test Analytical monitoring: yes Method: EPA GLP: no Remarks: The details of the toxic effect relate to the nominal concentration.
Toxicity to daphnia and other aquatic invertebrates	:	EC50 (Daphnia magna (Water flea)): > 100 mg/l Exposure time: 48 h Test Type: static test Analytical monitoring: yes Method: OECD Test Guideline 202 GLP: yes
Toxicity to algae	:	EC50 (Pseudokirchneriella subcapitata (green algae)): 6.500 - 13.000 mg/l End point: Growth rate

Exposure time: 7 d
Test Type: static test
Analytical monitoring: no data available
Method: EPA
GLP: No information available.

Toxicity to microorganisms : EC20 (activated sludge, domestic): > 1.995 mg/l
End point: Bacteria toxicity (respiration inhibition)
Exposure time: 0,5 h
Analytical monitoring: no
Method: ISO 8192
GLP: no

Toxicity to fish (Chronic toxicity) : Chronic Toxicity Value: 2.629 mg/l
End point: Other
Exposure time: 30 d
Species: Fish
Method: Other
GLP: no
Remarks: The value is given based on a SAR/AAR approach using OECD Toolbox, DEREK, VEGA QSAR models (CAESAR models), etc.

Toxicity to daphnia and other aquatic invertebrates (Chronic toxicity) : NOEC: 8.590 mg/l
End point: Reproduction rate
Exposure time: 7 d
Species: Ceriodaphnia spec.
Test Type: semi-static test
Analytical monitoring: yes
Method: Other
GLP: No information available.
Remarks: The details of the toxic effect relate to the nominal concentration.

12.2 Persistence and degradability

Product:

Biodegradability : Biodegradation: 90 - 100 %
Exposure time: 10 d
Method: OECD Test Guideline 301A
Remarks: Readily biodegradable, according to appropriate OECD test.
Information refers to the main component.

Components:

Ethanediol:

Biodegradability : Test Type: aerobic
Inoculum: activated sludge
Concentration: 53 mg/l
Result: Readily biodegradable.
Biodegradation: 90 - 100 %
Related to: Dissolved organic carbon (DOC)

Exposure time: 10 d
Method: OECD Test Guideline 301A
GLP: yes

12.3 Bioaccumulative potential

Product:

Bioaccumulation	:	Remarks: no data available

Components:

Ethanediol:

Bioaccumulation	:	Remarks: Due to the low logPow bioaccumulation is not expected
Partition coefficient: n-octanol/water	:	log Pow: -1,36 Method: estimated GLP: no

12.4 Mobility in soil

Product:

Distribution among environmental compartments	:	Remarks: no data available

Components:

Ethanediol:

Distribution among environmental compartments	:	Adsorption/Soil Medium: water - soil log Koc: 0 Method: other (calculated)

12.5 Results of PBT and vPvB assessment

Product:

Assessment	:	After consideration of all available toxicity and ecotoxicity data it is concluded that the substance does not fulfil the PBT or vPvB criteria. . Remarks: Information refers to the main component.

Components:

Ethanediol:

Assessment	:	This substance is not considered to be persistent, bioaccumulating and toxic (PBT)..

12.6 Other adverse effects

Product:

Additional ecological information	:	If handled correctly it causes no disturbance in treatment plants. The classification was made by the conventional (calculation) method of the CLP Regulation (EC) No 1272/2008.

Components:

Ethanediol:

Environmental fate and pathways	:	not available
Additional ecological information	:	Do not allow to enter ground water, waterways or waste water.

SECTION 13: Disposal considerations

13.1 Waste treatment methods

Product	:	Dispose of in accordance with local regulations.
Contaminated packaging	:	Uncontaminated packaging may be reused Packaging that cannot be cleaned should be disposed of as product waste

SECTION 14: Transport information

Section 14.1. to 14.5.

ADR	not restricted
ADN	not restricted
RID	not restricted
IATA	not restricted
IMDG	not restricted

14.6. Special precautions for user

See sections 6 to 8 of this Safety Data Sheet.

14.7. Transport in bulk according to Annex II of MARPOL73/78 and the IBC Code (International Bulk Chemicals Code)

No transport as bulk according IBC - Code.

SECTION 15: Regulatory information

15.1 Safety, health and environmental regulations/legislation specific for the substance or mixture

Volatile organic compounds	:	Directive 1999/13/EC on the limitation of emissions of volatile organic compounds According to the composition the product contains no VOC

component as defined by Directive 1999/13/EC.

Directive 2004/42/EC
According to the composition, the product contains no VOC components as defined by Directive 2004/42/EC.

Other regulations:

Apart from the data/regulations specified in this chapter, no further information is available concerning safety, health and environmental protection.

15.2 Chemical safety assessment

Chemical Safety Assessments (CSAs) are available for one or more of the component substances contained in this product.

SECTION 16: Other information

Full text of H-Statements

H302	:	Harmful if swallowed.
H373	:	May cause damage to organs through prolonged or repeated exposure if swallowed.

Full text of other abbreviations

Acute Tox.	:	Acute toxicity
STOT RE	:	Specific target organ toxicity - repeated exposure
2000/39/EC	:	Europe. Commission Directive 2000/39/EC establishing a first list of indicative occupational exposure limit values
2000/39/EC / TWA	:	Limit Value - eight hours
2000/39/EC / STEL	:	Short term exposure limit

ADN - European Agreement concerning the International Carriage of Dangerous Goods by Inland Waterways; ADR - European Agreement concerning the International Carriage of Dangerous Goods by Road; AICS - Australian Inventory of Chemical Substances; ASTM - American Society for the Testing of Materials; bw - Body weight; CLP - Classification Labelling Packaging Regulation; Regulation (EC) No 1272/2008; CMR - Carcinogen, Mutagen or Reproductive Toxicant; DIN - Standard of the German Institute for Standardisation; DSL - Domestic Substances List (Canada); ECHA - European Chemicals Agency; EC-Number - European Community number; ECx - Concentration associated with x% response; ELx - Loading rate associated with x% response; EmS - Emergency Schedule; ENCS - Existing and New Chemical Substances (Japan); ErCx - Concentration associated with x% growth rate response; GHS - Globally Harmonized System; GLP - Good Laboratory Practice; IARC - International Agency for Research on Cancer; IATA - International Air Transport Association; IBC - International Code for the Construction and Equipment of Ships carrying Dangerous Chemicals in Bulk; IC50 - Half maximal inhibitory concentration; ICAO - International Civil Aviation Organization; IECSC - Inventory of Existing Chemical Substances in China; IMDG - International Maritime Dangerous Goods; IMO - International Maritime Organization; ISHL - Industrial Safety and Health Law (Japan); ISO - International Organisation for Standardization; KECI - Korea Existing Chemicals Inventory; LC50 - Lethal Concentration to 50 % of a test population; LD50 - Lethal Dose to 50% of a test population (Median Lethal Dose); MARPOL - International Convention for the Prevention of Pollution from Ships; n.o.s. - Not Otherwise Specified; NO(A)EC - No Observed (Adverse) Effect Concentration; NO(A)EL - No Observed (Adverse) Effect Level; NOELR - No Observable Effect Loading Rate; NZIoC - New Zealand Inventory of Chemicals; OECD - Organization for Economic Co-operation and Development; OPPTS - Office of Chemical Safety and Pollution Prevention;

PBT - Persistent, Bioaccumulative and Toxic substance; PICCS - Philippines Inventory of Chemicals and Chemical Substances; (Q)SAR - (Quantitative) Structure Activity Relationship; REACH - Regulation (EC) No 1907/2006 of the European Parliament and of the Council concerning the Registration, Evaluation, Authorisation and Restriction of Chemicals; RID - Regulations concerning the International Carriage of Dangerous Goods by Rail; SADT - Self-Accelerating Decomposition Temperature; SDS - Safety Data Sheet; SVHC - Substance of Very High Concern; TCSI - Taiwan Chemical Substance Inventory; TRGS - Technical Rule for Hazardous Substances; TSCA - Toxic Substances Control Act (United States); UN - United Nations; vPvB - Very Persistent and Very Bioaccumulative

Further information

Other information : Observe national and local legal requirements

Classification of the mixture:		**Classification procedure:**
Acute Tox. 4	H302	Calculation method
STOT RE 2	H373	Calculation method

Exposure scenario

Number	Title
ES 1	**Industrial use; Use as an intermediate** PROC1, PROC2, PROC3, PROC4, PROC5, PROC8a, PROC8b, PROC9, PROC15 - ERC6a Ethane-1,2-diol
ES 2	**Industrial use; Use of non-reactive processing aid at industrial site (no inclusion into or onto article)** PROC1, PROC2, PROC3, PROC4, PROC5, PROC8a, PROC8b, PROC9, PROC13, PROC14, PROC15 - ERC4 Ethane-1,2-diol
ES 3	**Industrial use; Distribution of substance** PROC1, PROC2, PROC3, PROC4, PROC8a, PROC8b, PROC9, PROC15 - ERC1, ERC2, ERC3, ERC4, ERC5, ERC6a, ERC6b, ERC6c, ERC6d, ERC7 Ethane-1,2-diol
ES 4	**Industrial use; Formulation [mixing] of preparations and/or re-packaging** PROC1, PROC2, PROC3, PROC4, PROC5, PROC8a, PROC8b, PROC9, PROC14, PROC15 - ERC2 Ethane-1,2-diol
ES 5	**Industrial use; Use in polymer production** PROC1, PROC2, PROC3, PROC4, PROC5, PROC6, PROC8a, PROC8b, PROC9, PROC15 - ERC6c Ethane-1,2-diol
ES 6	**Industrial use; Coatings and paints, thinners, paint removers** PROC1, PROC2, PROC3, PROC4, PROC5, PROC7, PROC8a, PROC8b, PROC10, PROC13, PROC15 - ERC4 Ethane-1,2-diol
ES 7	**Professional use; Coatings and paints, thinners, paint removers, Adhesives, sealants, Foaming, Use in polymer processing** PROC1, PROC2, PROC3, PROC4, PROC5, PROC8a, PROC8b, PROC9, PROC10, PROC11, PROC13, PROC14, PROC15, PROC19 - ERC8a, ERC8c, ERC8d, ERC8f Ethane-1,2-diol
ES 8	**Consumer use; Coatings and paints, thinners, paint removers, Surface treatment** PC9a, PC15, PC18, PC31, PC24, PC34 - ERC8a, ERC8c, ERC8d, ERC8f Ethane-1,2-diol
ES 9	**Industrial use; Use in cleaning agents** PROC1, PROC2, PROC3, PROC4, PROC7, PROC8a, PROC8b, PROC10, PROC13 - ERC4 Ethane-1,2-diol
ES 10	**Professional use; Use in cleaning agents**

	PROC1, PROC2, PROC3, PROC4, PROC8a, PROC8b, PROC10, PROC11, PROC13 - ERC8a, ERC8d Ethane-1,2-diol
ES 11	**Consumer use; Use in cleaning agents** PC35 - ERC8a, ERC8d Ethane-1,2-diol
ES 12	**Industrial use; Use in lubricants** PROC1, PROC2, PROC3, PROC4, PROC5, PROC7, PROC8a, PROC8b, PROC9, PROC10, PROC13, PROC17, PROC18 - ERC4, ERC7 Ethane-1,2-diol
ES 13	**Industrial use; Metal working fluids** PROC1, PROC2, PROC3, PROC4, PROC5, PROC7, PROC8a, PROC8b, PROC9, PROC10, PROC13, PROC17 - ERC4 Ethane-1,2-diol
ES 14	**Professional use; Metal working fluids** PROC1, PROC2, PROC3, PROC5, PROC8a, PROC8b, PROC9, PROC10, PROC11, PROC13, PROC17 - ERC8a, ERC8d Ethane-1,2-diol
ES 15	**Professional use; Use in agrochemicals** PROC1, PROC2, PROC4, PROC8a, PROC8b, PROC9, PROC11, PROC13 - ERC8a, ERC8d Ethane-1,2-diol
ES 16	**Industrial use; Use in functional fluids** PROC1, PROC2, PROC3, PROC4, PROC8a, PROC8b, PROC9 - ERC7 Ethane-1,2-diol
ES 17	**Professional use; Use in functional fluids** PROC1, PROC2, PROC3, PROC4, PROC8a, PROC9, PROC20 - ERC9a, ERC9b Ethane-1,2-diol
ES 18	**Consumer use; Heat transfer fluids, Hydraulic fluids** PC16, PC17 - ERC9a, ERC9b Ethane-1,2-diol
ES 19	**Professional use; Anti-freeze and de-icing products** PROC1, PROC2, PROC8a, PROC8b, PROC11 - ERC8d Ethane-1,2-diol
ES 20	**Consumer use; Anti-freeze and de-icing products** PC4 - ERC8d Ethane-1,2-diol
ES 21	**Industrial use, Professional use; Use in laboratories** PROC15 - ERC8a Ethane-1,2-diol
ES 22	**Industrial use; Use in water treatment agents**

	PROC1, PROC2, PROC3, PROC4, PROC8a, PROC8b, PROC13 - ERC3, ERC4 Ethane-1,2-diol
ES 23	**Consumer use; Adhesives, sealants** PC1 - ERC8c, ERC8f Ethane-1,2-diol
ES 24	**Industrial use; Manufacture of substance, Adhesives, sealants, Foaming, Use in coatings, Use in polymer production** PROC1, PROC2, PROC3, PROC4, PROC5, PROC7, PROC8a, PROC8b, PROC9, PROC10, PROC13, PROC14, PROC15 - ERC2, ERC3, ERC5, ERC6c Ethane-1,2-diol
ES 25	**Consumer use; Insulation foams** PC32 - ERC8c, ERC8f Ethane-1,2-diol

1. ES 1: Industrial use; Use as an intermediate

1.1. Title section

Environment		
CS1:	Industrial use (Use of intermediate)	ERC6a
Workers		
CS2:	Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	PROC1
CS3:	Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	PROC2
CS4:	Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises)	PROC3, PROC4
CS5:	Industrial use (Mixing or blending in batch processes)	PROC5
CS6:	Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS7:	Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	PROC8b, PROC9
CS8:	Industrial use (Use as laboratory reagent)	PROC15

1.2. ES 1 Conditions of use affecting exposure

1.2.1 ES 1 - CS 1: Control of environmental exposure: Industrial use (Use of intermediate) (ERC6a)

Remarks	:	As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

1.2.2 ES 1 - CS 2: Control of worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

1.2.3 ES 1 - CS 3: Control of worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

1.2.4 ES 1 - CS 4: Control of worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production where opportunity for exposure arises

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition

Note	:	Chemical production where opportunity for exposure arises No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

1.2.5 ES 1 - CS 5: Control of worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with specific activity training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

1.2.6 ES 1 - CS 6: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.

Covers skin contact area up to : 960 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : inhalative
Technical conditions and measures : Local exhaust ventilation
Effectiveness (of a measure) : 90 %
Personal protective measures : If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

1.2.7 ES 1 - CS 7: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

1.2.8 ES 1 - CS 8: Control of worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Product characteristics
Concentration of the Substance in : <= 100 %

Mixture/Article

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Amount used
Storage : < 1 kg, < 1 l

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 240 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Use as laboratory reagent
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

1.3. ES 1 Exposure estimation and reference to its source

1.3.2 ES 1 - CS 2: Worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

1.3.3 ES 1 - CS 3: Worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,08

1.3.4 ES 1 - CS 4: Worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,22
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,43

1.3.5 ES 1 - CS 5: Worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,38

1.3.6 ES 1 - CS 6: Worker exposure: Industrial use (Transfer of substance or mixture

(charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,20

1.3.7 ES 1 - CS 7: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities	0,43
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)	0,43

1.3.8 ES 1 - CS 8: Worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,37

1.4. ES 1 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

2. ES 2: Industrial use; Use of non-reactive processing aid at industrial site (no inclusion into or onto article)

CS7:	Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	PROC8b, PROC9
CS8:	Industrial use (Treatment of articles by dipping and pouring)	PROC13
CS9:	Industrial use (Tabletting, compression, extrusion, pelettisation, granulation)	PROC14
CS10:	Industrial use (Use as laboratory reagent)	PROC15

2.2. ES 2 Conditions of use affecting exposure

2.2.1 ES 2 - CS 1: Control of environmental exposure: Industrial use (Use of non-reactive processing aid at industrial site (no inclusion into or onto article)) (ERC4)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

2.2.2 ES 2 - CS 2: Control of worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent

containment conditions) (PROC1)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

2.2.3 ES 2 - CS 3: Control of worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

2.2.4 ES 2 - CS 4: Control of worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production where opportunity for exposure arises

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Note	:	Chemical production where opportunity for exposure arises No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

2.2.5 ES 2 - CS 5: Control of worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with specific activity training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

2.2.6 ES 2 - CS 6: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative

Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

2.2.7 ES 2 - CS 7: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

2.2.8 ES 2 - CS 8: Control of worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min

Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : dermal
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

2.2.9 ES 2 - CS 9: Control of worker exposure: Industrial use (Tabletting, compression, extrusion, pelettisation, granulation) (PROC14)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

2.2.10 ES 2 - CS 10: Control of worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Product characteristics
Concentration of the Substance in : <= 100 %

Mixture/Article

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Amount used
Storage : < 1 kg, < 1 l

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 240 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Use as laboratory reagent
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

2.3. ES 2 Exposure estimation and reference to its source

2.3.2 ES 2 - CS 2: Worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

2.3.3 ES 2 - CS 3: Worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,08

2.3.4 ES 2 - CS 4: Worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,22
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,43

2.3.5 ES 2 - CS 5: Worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,38

2.3.6 ES 2 - CS 6: Worker exposure: Industrial use (Transfer of substance or mixture

(charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,20

2.3.7 ES 2 - CS 7: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities	0,43
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)	0,43

2.3.8 ES 2 - CS 8: Worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,75

2.3.9 ES 2 - CS 9: Worker exposure: Industrial use (Tabletting, compression, extrusion, pelettisation, granulation) (PROC14)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	3,43 mg/kg bw/day (ECETOC TRA worker v2.0)	0,03
combined routes	ECETOC TRA worker v2.0	0,40

2.3.10 ES 2 - CS 10: Worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,37

2.4. ES 2 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

3. ES 3: Industrial use; Distribution of substance

3.1. Title section

Environment		
CS1:	Industrial use (Manufacture of the substance, Formulation into mixture, Formulation into solid matrix, Use of non-reactive processing aid at industrial site (no inclusion into or onto article), Use at industrial site leading to inclusion into/onto article, Use of intermediate, Use of reactive processing aid at industrial site (no inclusion into or onto article), Use of monomer in polymerisation processes at industrial site (inclusion or not into/onto article), Use of reactive process regulators in polymerisation processes at industrial site (inclusion or not into/onto article), Use of functional fluid at industrial site)	ERC1, ERC2, ERC3, ERC4, ERC5, ERC6a, ERC6b, ERC6c, ERC6d, ERC7
Workers		
CS2:	Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	PROC1
CS3:	Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with	PROC2

	equivalent containment conditions)	
CS4:	Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises)	PROC3, PROC4
CS5:	Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS6:	Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	PROC8b, PROC9
CS7:	Industrial use (Use as laboratory reagent)	PROC15

3.2. ES 3 Conditions of use affecting exposure

3.2.1 ES 3 - CS 1: Control of environmental exposure: Industrial use (Manufacture of the substance, Formulation into mixture, Formulation into solid matrix, Use of non-reactive processing aid at industrial site (no inclusion into or onto article), Use at industrial site leading to inclusion into/onto article, Use of intermediate, Use of reactive processing aid at industrial site (no inclusion into or onto article), Use of monomer in polymerisation processes at industrial site (inclusion or not into/onto article), Use of reactive process regulators in polymerisation processes at industrial site (inclusion or not into/onto article), Use of functional fluid at industrial site) (ERC1, ERC2, ERC3, ERC4, ERC5, ERC6a, ERC6b, ERC6c, ERC6d, ERC7)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

3.2.2 ES 3 - CS 2: Control of worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Product characteristics

Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use

Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management

Dermal exposure : Palm of one hand
Covers skin contact area up to : 240 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor : Indoor use

Risk Management Measures
Technical conditions and measures : Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions
Sample via a closed loop or other system to avoid exposure.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

3.2.3 ES 3 - CS 3: Control of worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm^2

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

3.2.4 ES 3 - CS 4: Control of worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production where opportunity for exposure arises

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Note	:	Chemical production where opportunity for exposure arises No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

3.2.5 ES 3 - CS 5: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

3.2.6 ES 3 - CS 6: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

3.2.7 ES 3 - CS 7: Control of worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Amount used
Storage : < 1 kg, < 1 l

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 240 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Use as laboratory reagent
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

3.3. ES 3 Exposure estimation and reference to its source

3.3.2 ES 3 - CS 2: Worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

3.3.3 ES 3 - CS 3: Worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term -	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01

systemic		
combined routes	ECETOC TRA worker v2.0	0,08

3.3.4 ES 3 - CS 4: Worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,22
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,43

3.3.5 ES 3 - CS 5: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,20

3.3.6 ES 3 - CS 6: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Route of exposure and type	Exposure estimate	RCR

of effects		
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities	0,43
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,37

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,37

3.4. ES 3 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

4. ES 4: Industrial use; Formulation [mixing] of preparations and/or re-packaging

4.1. Title section

Environment	
CS1: Industrial use (Formulation into mixture)	ERC2
Workers	

CS2:	Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	PROC1
CS3:	Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	PROC2
CS4:	Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises)	PROC3, PROC4
CS5:	Industrial use (Mixing or blending in batch processes)	PROC5
CS6:	Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS7:	Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	PROC8b, PROC9
CS8:	Industrial use (Tabletting, compression, extrusion, pelettisation, granulation)	PROC14
CS9:	Industrial use (Use as laboratory reagent)	PROC15

4.2. ES 4 Conditions of use affecting exposure

4.2.1 ES 4 - CS 1: Control of environmental exposure: Industrial use (Formulation into mixture) (ERC2)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

4.2.2 ES 4 - CS 2: Control of worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Product characteristics

Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use

Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management

Dermal exposure : Palm of one hand
Covers skin contact area up to : 240 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor : Indoor use

Risk Management Measures
Technical conditions and measures : Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions
Sample via a closed loop or other system to avoid exposure.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

4.2.3 ES 4 - CS 3: Control of worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm^2

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

4.2.4 ES 4 - CS 4: Control of worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production where opportunity for exposure arises

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Note	:	Chemical production where opportunity for exposure arises No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

4.2.5 ES 4 - CS 5: Control of worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with specific activity training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

4.2.6 ES 4 - CS 6: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

4.2.7 ES 4 - CS 7: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

4.2.8 ES 4 - CS 8: Control of worker exposure: Industrial use (Tabletting, compression, extrusion, pelettisation, granulation) (PROC14)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

4.2.9 ES 4 - CS 9: Control of worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Amount used
Storage : < 1 kg, < 1 l

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 240 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Use as laboratory reagent
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

4.3. ES 4 Exposure estimation and reference to its source

4.3.2 ES 4 - CS 2: Worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

4.3.3 ES 4 - CS 3: Worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,08

4.3.4 ES 4 - CS 4: Worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,22
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,43

4.3.5 ES 4 - CS 5: Worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,38

4.3.6 ES 4 - CS 6: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,20

4.3.7 ES 4 - CS 7: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities	0,43
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)	0,43

4.3.8 ES 4 - CS 8: Worker exposure: Industrial use (Tabletting, compression, extrusion, pelettisation, granulation) (PROC14)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	3,43 mg/kg bw/day (ECETOC TRA worker v2.0)	0,03
combined routes	ECETOC TRA worker v2.0	0,40

4.3.9 ES 4 - CS 9: Worker exposure: Industrial use (Use as laboratory reagent)

(PROC15)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,37

4.4. ES 4 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

5. ES 5: Industrial use; Use in polymer production

5.1. Title section

Environment		
CS1:	Industrial use (Use of monomer in polymerisation processes at industrial site (inclusion or not into/onto article))	ERC6c
Workers		
CS2:	Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	PROC1
CS3:	Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	PROC2
CS4:	Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises)	PROC3, PROC4
CS5:	Industrial use (Mixing or blending in batch processes)	PROC5
CS6:	Industrial use (Calendering operations)	PROC6
CS7:	Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS8:	Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	PROC8b, PROC9
CS9:	Industrial use (Use as laboratory reagent)	PROC15

5.2. ES 5 Conditions of use affecting exposure

5.2.1 ES 5 - CS 1: Control of environmental exposure: Industrial use (Use of monomer in polymerisation processes at industrial site (inclusion or not into/onto article)) (ERC6c)

Remarks	:	As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

5.2.2 ES 5 - CS 2: Control of worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

5.2.3 ES 5 - CS 3: Control of worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

5.2.4 ES 5 - CS 4: Control of worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production where opportunity for exposure arises

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Note	:	Chemical production where opportunity for exposure arises No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

5.2.5 ES 5 - CS 5: Control of worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with specific activity training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

5.2.6 ES 5 - CS 6: Control of worker exposure: Industrial use (Calendering operations) (PROC6)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

5.2.7 ES 5 - CS 7: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

5.2.8 ES 5 - CS 8: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

5.2.9 ES 5 - CS 9: Control of worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Amount used

Storage	:	< 1 kg, < 1 l

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	240 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Use as laboratory reagent
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

5.3. ES 5 Exposure estimation and reference to its source

5.3.2 ES 5 - CS 2: Worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

5.3.3 ES 5 - CS 3: Worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,08

5.3.4 ES 5 - CS 4: Worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or	0,22

- local and systemic	formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,43

5.3.5 ES 5 - CS 5: Worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,38

5.3.6 ES 5 - CS 6: Worker exposure: Industrial use (Calendering operations) (PROC6)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	2,74 mg/kg bw/day (ECETOC TRA worker v2.0)	0,03
combined routes	ECETOC TRA worker v2.0	0,40

5.3.7 ES 5 - CS 7: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07

Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,20

5.3.8 ES 5 - CS 8: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities	0,43
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)	0,43

5.3.9 ES 5 - CS 9: Worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,37

5.4. ES 5 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

6. ES 6: Industrial use; Coatings and paints, thinners, paint

removers

6.1. Title section

Environment		
CS1:	Industrial use (Use of non-reactive processing aid at industrial site (no inclusion into or onto article))	ERC4
Workers		
CS2:	Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	PROC1
CS3:	Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	PROC2
CS4:	Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises)	PROC3, PROC4
CS5:	Industrial use (Mixing or blending in batch processes)	PROC5
CS6:	Industrial use (Industrial spraying)	PROC7
CS7:	Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS8:	Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities)	PROC8b
CS9:	Industrial use (Roller application or brushing)	PROC10
CS10:	Industrial use (Treatment of articles by dipping and pouring)	PROC13
CS11:	Industrial use (Use as laboratory reagent)	PROC15

6.2. ES 6 Conditions of use affecting exposure

6.2.1 ES 6 - CS 1: Control of environmental exposure: Industrial use (Use of non-reactive processing aid at industrial site (no inclusion into or onto article)) (ERC4)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

6.2.2 ES 6 - CS 2: Control of worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Product characteristics

Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Palm of one hand
Covers skin contact area up to : 240 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Technical conditions and measures : Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions
Sample via a closed loop or other system to avoid exposure.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

6.2.3 ES 6 - CS 3: Control of worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

6.2.4 ES 6 - CS 4: Control of worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production where opportunity for exposure arises

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Note	:	Chemical production where opportunity for exposure arises No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

6.2.5 ES 6 - CS 5: Control of worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with specific activity training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

6.2.6 ES 6 - CS 6: Control of worker exposure: Industrial use (Industrial spraying) (PROC7)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Amount used

Amounts used	:	0,6 L/min

Frequency and duration of use

Exposure duration	:	360 min
Frequency of use	:	<= 5 days per week

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	> 1000 m3

Risk Management Measures

Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	50 %
Note	:	Ensure that the direction of airflow is clearly away from the worker.
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %

Personal protective measures	:	Wear suitable protective clothing. Wear suitable coveralls to prevent exposure to the skin.
Effectiveness (of a measure)	:	80 %
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the distance from worker to task is greater than 1 m.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that direction of application is only horizontal or downward.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of work area
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of equipment
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure regular inspection, cleaning and maintenance of equipment and machines.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

6.2.7 ES 6 - CS 7: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation

Effectiveness (of a measure)	:	90 %
Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

6.2.8 ES 6 - CS 8: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities) (PROC8b)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	Transfer of substance or mixture (charging/discharging) at dedicated facilities No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

6.2.9 ES 6 - CS 9: Control of worker exposure: Industrial use (Roller application or brushing) (PROC10)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure : Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to : 960 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : dermal
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

6.2.10 ES 6 - CS 10: Control of worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : dermal
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

6.2.11 ES 6 - CS 11: Control of worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Amount used
Storage : < 1 kg, < 1 l

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 240 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Use as laboratory reagent
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

6.3. ES 6 Exposure estimation and reference to its source

6.3.2 ES 6 - CS 2: Worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

6.3.3 ES 6 - CS 3: Worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Route of exposure and type	Exposure estimate	RCR

of effects		
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,08

6.3.4 ES 6 - CS 4: Worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,22
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,43

6.3.5 ES 6 - CS 5: Worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,38

6.3.6 ES 6 - CS 6: Worker exposure: Industrial use (Industrial spraying) (PROC7)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	9,79 mg/m³ (Stoffenmanager v4.0)	0,28
Worker - dermal, long-term - systemic	54,6 mg/kg bw/day (RISKOFDERM v2.1)	0,52
combined routes	Not applicable	0,80

6.3.7 ES 6 - CS 7: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,20

6.3.8 ES 6 - CS 8: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities) (PROC8b)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0)	0,06
combined routes	ECETOC TRA worker v2.0	0,43

6.3.9 ES 6 - CS 9: Worker exposure: Industrial use (Roller application or brushing) (PROC10)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	2,74 mg/kg bw/day (ECETOC TRA worker v2.0)	0,03
combined routes	ECETOC TRA worker v2.0	0,77

6.3.10 ES 6 - CS 10: Worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Route of exposure and type	Exposure estimate	RCR

of effects		
Worker - inhalative, long-term - local and systemic	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,75

6.3.11 ES 6 - CS 11: Worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,37

6.4. ES 6 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

7. ES 7: Professional use; Coatings and paints, thinners, paint removers, Adhesives, sealants, Foaming, Use in polymer processing

7.1. Title section

Environment		
CS1:	Professional use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor), Widespread use leading to inclusion into/onto article (indoor), Widespread use of non-reactive processing aid (no inclusion into or onto article, outdoor), Widespread use leading to inclusion into/onto article (outdoor))	ERC8a, ERC8c, ERC8d, ERC8f
Workers		
CS2:	Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	PROC1, PROC2, PROC3

CS3:	Professional use (Chemical production where opportunity for exposure arises, Mixing or blending in batch processes)	PROC4, PROC5
CS4:	Professional use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS5:	Professional use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	PROC8b, PROC9
CS6:	Professional use (Roller application or brushing)	PROC10
CS7:	Professional use (Non-industrial spraying)	PROC11
CS8:	Professional use (Treatment of articles by dipping and pouring, Tabletting, compression, extrusion, pelettisation, granulation)	PROC13, PROC14
CS9:	Professional use (Use as laboratory reagent)	PROC15
CS10:	Professional use (Manual activities involving hand contact)	PROC19

7.2. ES 7 Conditions of use affecting exposure

7.2.1 ES 7 - CS 1: Control of environmental exposure: Professional use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor), Widespread use leading to inclusion into/onto article (indoor), Widespread use of non-reactive processing aid (no inclusion into or onto article, outdoor), Widespread use leading to inclusion into/onto article (outdoor)) (ERC8a, ERC8c, ERC8d, ERC8f)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

7.2.2 ES 7 - CS 2: Control of worker exposure: Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition) (PROC1, PROC2, PROC3)

Product characteristics

Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use

Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management

Dermal exposure : Palm of one hand
Covers skin contact area up to : 240 cm²

Remarks	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.
Technical conditions and measures	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions
Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition With occasional controlled exposure

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

7.2.3 ES 7 - CS 3: Control of worker exposure: Professional use (Chemical production where opportunity for exposure arises, Mixing or blending in batch processes) (PROC4, PROC5)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

7.2.4 ES 7 - CS 4: Control of worker exposure: Professional use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to : 960 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : inhalative
Technical conditions and measures : Local exhaust ventilation
Effectiveness (of a measure) : 80 %
Personal protective measures : If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure) : 80 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

7.2.5 ES 7 - CS 5: Control of worker exposure: Professional use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

7.2.6 ES 7 - CS 6: Control of worker exposure: Professional use (Roller application or brushing) (PROC10)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to : 960 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : dermal
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure) : 90 %

Exposure routes : inhalative
Technical conditions and measures : Local exhaust ventilation
Effectiveness (of a measure) : 80 %

Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	80 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

7.2.7 ES 7 - CS 7: Control of worker exposure: Professional use (Non-industrial spraying) (PROC11)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Amount used

Amounts used	:	0,05 L/min

Frequency and duration of use

Exposure duration	:	150 min
Frequency of use	:	<= 5 days per week

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	<= 1000 m3

Risk Management Measures

Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	Wear suitable protective clothing. Wear suitable coveralls to prevent exposure to the skin.
Effectiveness (of a measure)	:	80 %
Personal protective measures	:	Wear a respirator conforming to EN140.
Effectiveness (of a measure)	:	40 %
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that direction of application is only horizontal or downward.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the distance from worker to task is greater than 1 m.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the direction of airflow is clearly away from the worker.
Note	:	Not applicable

Organisational measures to prevent /limit releases, dispersion and exposure	:	Provide enhanced general ventilation by mechanical means.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of work area
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of equipment
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure regular inspection, cleaning and maintenance of equipment and machines.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the task is not carried out by more than one worker simultaneously.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

7.2.8 ES 7 - CS 8: Control of worker exposure: Professional use (Treatment of articles by dipping and pouring, Tabletting, compression, extrusion, pelettisation, granulation) (PROC13, PROC14)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %
Note	:	Treatment of articles by dipping and pouring

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice : Wear solely goggles.

7.2.9 ES 7 - CS 9: Control of worker exposure: Professional use (Use as laboratory reagent) (PROC15)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Amount used
Storage : < 1 kg, < 1 l

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 240 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Use as laboratory reagent
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

7.2.10 ES 7 - CS 10: Control of worker exposure: Professional use (Manual activities involving hand contact) (PROC19)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : < 15 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to hands and forearms.
Covers skin contact area up to : 1980 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

7.3. ES 7 Exposure estimation and reference to its source

7.3.2 ES 7 - CS 2: Worker exposure: Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition) (PROC1, PROC2, PROC3)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0, Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	0,003
combined routes	ECETOC TRA worker v2.0, Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions	0,004
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	0,37
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	0,01
combined routes	ECETOC TRA worker v2.0, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions	0,38
Worker - inhalative, long-term	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or	0,22

- local and systemic	formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23

7.3.3 ES 7 - CS 3: Worker exposure: Professional use (Chemical production where opportunity for exposure arises, Mixing or blending in batch processes) (PROC4, PROC5)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,88 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,74
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,80
Worker - inhalative, long-term - local and systemic	25,88 mg/m³ (ECETOC TRA worker v2.0, Mixing or blending in batch processes)	0,74
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0, Mixing or blending in batch processes)	0,01
combined routes	ECETOC TRA worker v2.0, Mixing or blending in batch processes	0,75

7.3.4 ES 7 - CS 4: Worker exposure: Professional use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,50

7.3.5 ES 7 - CS 5: Worker exposure: Professional use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,88 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,74
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities	0,80
Worker - inhalative, long-term - local and systemic	25,88 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,74
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)	0,80

7.3.6 ES 7 - CS 6: Worker exposure: Professional use (Roller application or brushing) (PROC10)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	2,74 mg/kg bw/day (ECETOC TRA worker v2.0)	0,03
combined routes	ECETOC TRA worker v2.0	0,40

7.3.7 ES 7 - CS 7: Worker exposure: Professional use (Non-industrial spraying) (PROC11)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	14,05 mg/m³ (Stoffenmanager v4.0)	0,40
Worker - dermal, long-term - systemic	53,75 mg/kg bw/day (RISKOFDERM v2.1)	0,51
combined routes	Not applicable	0,91

7.3.8 ES 7 - CS 8: Worker exposure: Professional use (Treatment of articles by dipping and pouring, Tabletting, compression, extrusion, pelettisation, granulation) (PROC13, PROC14)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,88 mg/m³ (ECETOC TRA worker v2.0, Treatment of articles by dipping and pouring)	0,74
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0, Treatment of articles by dipping and pouring)	0,01
combined routes	ECETOC TRA worker v2.0, Treatment of articles by dipping and pouring	0,75
Worker - inhalative, long-term - local and systemic	25,88 mg/m³ (ECETOC TRA worker v2.0, Tabletting, compression, extrusion, pelettisation, granulation)	0,74
Worker - dermal, long-term - systemic	3,43 mg/kg bw/day (ECETOC TRA worker v2.0, Tabletting, compression, extrusion, pelettisation, granulation)	0,03
combined routes	ECETOC TRA worker v2.0, Tabletting, compression, extrusion, pelettisation, granulation	0,77

7.3.9 ES 7 - CS 9: Worker exposure: Professional use (Use as laboratory reagent) (PROC15)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,37

7.3.10 ES 7 - CS 10: Worker exposure: Professional use (Manual activities involving hand contact) (PROC19)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	6,47 mg/m³ (ECETOC TRA worker v2.0)	0,18
Worker - dermal, long-term - systemic	14,14 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,31

7.4. ES 7 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

8. ES 8: Consumer use; Coatings and paints, thinners, paint removers, Surface treatment

8.1. Title section

Coatings and paints, thinners, paint removers (PC9a) Non-metal surface treatment products (PC15) Ink and toners (PC18) Polishes and wax blends (PC31) Lubricants, greases, release products (PC24) Textile dyes and impregnating products (PC34)		
Environment		
CS1:	Consumer use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor), Widespread use leading to inclusion into/onto article (indoor), Widespread use of non-reactive processing aid (no inclusion into or onto article, outdoor), Widespread use leading to inclusion into/onto article (outdoor))	ERC8a, ERC8c, ERC8d, ERC8f
Consumer		
CS2:	Consumer use (Coatings and paints, thinners, paint removers, Non-metal surface treatment products)	PC9a, PC15
CS3:	Consumer use (Coatings and paints, thinners, paint removers, Non-metal surface treatment products)	PC9a, PC15
CS4:	Consumer use (Ink and toners)	PC18
CS5:	Consumer use (Ink and toners)	PC18
CS6:	Consumer use (Polishes and wax blends)	PC31

8.2. ES 8 Conditions of use affecting exposure

8.2.1 ES 8 - CS 1: Control of environmental exposure: Consumer use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor), Widespread use leading to inclusion into/onto article (indoor), Widespread use of non-reactive processing aid (no inclusion into or onto article, outdoor), Widespread use leading to inclusion into/onto article (outdoor)) (ERC8a, ERC8c, ERC8d, ERC8f)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

8.2.2 ES 8 - CS 2: Control of consumer exposure: Consumer use (Coatings and paints, thinners, paint removers, Non-metal surface treatment products) (PC9a, PC15)

Remarks : Waterborne paint
Rolling, Brushing
No spraying

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 5 %
Molecular weight	:	45 g/mol
Physical Form (at time of use)	:	Liquid
Vapour pressure	:	0,123 hPa

Amount used

Amounts used	:	1,25 kg/day

Frequency and duration of use

Application duration	:	120 min
Frequency of use	:	1 days per year
Exposure duration	:	132 min

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands and forearms.
Covers skin contact area up to	:	1900 cm²
dermal	:	0,00003 kg/min

Other given operational conditions affecting consumers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	20 m3
Temperature	:	25 °C
Ventilation rate per hour	:	0,6
Mass transfer rate	:	0,331 m/min
Release area	:	10 m2

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)

Consumer Measures	:	No specific measures identified.

8.2.3 ES 8 - CS 3: Control of consumer exposure: Consumer use (Coatings and paints, thinners, paint removers, Non-metal surface treatment products) (PC9a, PC15)

Remarks	:	Spraying

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 5 %
Physical Form (at time of use)	:	Liquid
Vapour pressure	:	0,123 hPa

Amount used

Amounts used	:	0,0198 kg/min

Frequency and duration of use

Application duration	:	15 min
Frequency of use	:	2 days per year
Exposure duration	:	15 min

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands and forearms.
Covers skin contact area up to	:	1900 cm²
dermal	:	0,0001 kg/min
Uptake fraction, oral	:	100 %

Other given operational conditions affecting consumers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	34 m3
Temperature	:	25 °C
Ventilation rate per hour	:	1,5
Room height	:	2,25 m
Weight percent	:	30 %
Remarks	:	Non-Volatile
Density	:	1,5 g/cm3
Remarks	:	Non-Volatile
Airborne fraction	:	100 %
Remarks	:	Non-Volatile
Inhalation cut-off diameter	:	0,015 mm

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)

Consumer Measures	:	Ensure spraying away from persons.

8.2.4 ES 8 - CS 4: Control of consumer exposure: Consumer use (Ink and toners) (PC18)

Remarks	:	Refilling

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 5 %
Molecular weight	:	22 g/mol
Physical Form (at time of use)	:	Liquid
Vapour pressure	:	0,123 hPa

Amount used

Amount per use	:	0,05 kg

Frequency and duration of use

Application duration	:	0,3 min
Frequency of use	:	104 days per year
Exposure duration	:	0,75 min

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	215 cm²

Other given operational conditions affecting consumers exposure

Outdoor / Indoor	:	Indoor use
Temperature	:	25 °C
Ventilation rate per hour	:	0,5
Mass transfer rate	:	0,331 m/min
Release area	:	20 cm²

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)

Consumer Measures	:	No specific measures identified.

8.2.5 ES 8 - CS 5: Control of consumer exposure: Consumer use (Ink and toners) (PC18)

Remarks	:	Printing process

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 5 %
Physical Form (at time of use)	:	Liquid
Vapour pressure	:	0,123 hPa

Amount used

: 0,016 kg/day

Frequency and duration of use

Exposure duration	:	600 min
Frequency of use	:	365 days per year

Other given operational conditions affecting consumers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	25 m3
Temperature	:	25 °C
Ventilation rate per hour	:	0,6

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)

Consumer Measures	:	No specific measures identified.

8.2.6 ES 8 - CS 6: Control of consumer exposure: Consumer use (Polishes and wax blends) (PC31)

Remarks	:	No spraying

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 2,5 %
Molecular weight	:	272 g/mol
Physical Form (at time of use)	:	Liquid
Vapour pressure	:	0,123 hPa

Amount used
: 0,55 kg/day

Frequency and duration of use
Application duration : 900 min
Frequency of use : 1 days per year
Release duration : 120 min
Exposure duration : 240 min

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 430 cm²
dermal : 0,00003 kg/min

Other given operational conditions affecting consumers exposure
Outdoor / Indoor : Indoor use
Room size : 58 m3
Temperature : 25 °C
Ventilation rate per hour : 0,5

Mass transfer rate : 4740 m/min
Release area : 22 m2

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)
Consumer Measures : No specific measures identified.

8.3. ES 8 Exposure estimation and reference to its source

8.3.2 ES 8 - CS 2: Consumer exposure: Consumer use (Coatings and paints, thinners, paint removers, Non-metal surface treatment products) (PC9a, PC15)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	0,72 mg/m³ (Consexpo v4.1)	0,10
Chronic dermal systemic exposure	2,77 mg/kg bw/day (Consexpo v4.1)	0,05
Consumer - oral, long-term - systemic	Consexpo v4.1, Not applicable	
combined routes	Consexpo v4.1	0,15

8.3.3 ES 8 - CS 3: Consumer exposure: Consumer use (Coatings and paints, thinners, paint removers, Non-metal surface treatment products) (PC9a, PC15)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	0,26 mg/m³ (Consexpo v4.1)	0,04
Chronic dermal systemic exposure	1,15 mg/kg bw/day (Consexpo v4.1)	0,02
Consumer - oral, long-term - systemic	0,13 mg/kg bw/day (Consexpo v4.1, Risk management measures are based on qualitative risk characterisation.)	
combined routes	Consexpo v4.1	0,06

8.3.4 ES 8 - CS 4: Consumer exposure: Consumer use (Ink and toners) (PC18)

Route of exposure and type of effects	Exposure estimate	RCR
Chronic dermal systemic exposure	0,008 mg/kg bw/day (Consexpo v4.1)	0,0002

8.3.5 ES 8 - CS 5: Consumer exposure: Consumer use (Ink and toners) (PC18)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	1,29 mg/m³ (Consexpo v4.1)	0,18

8.3.6 ES 8 - CS 6: Consumer exposure: Consumer use (Polishes and wax blends) (PC31)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	3,93 mg/m³ (Consexpo v4.1)	0,56
Chronic dermal systemic exposure	2,12 mg/kg bw/day (Consexpo v4.1)	0,04
combined routes	Consexpo v4.1	0,60

8.4. ES 8 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

9. ES 9: Industrial use; Use in cleaning agents

9.1. Title section

Environment		
CS1:	Industrial use (Use of non-reactive processing aid at industrial site (no inclusion into or onto article))	ERC4
Workers		
CS2:	Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	PROC1
CS3:	Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	PROC2
CS4:	Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises)	PROC3, PROC4
CS5:	Industrial use (Industrial spraying)	PROC7
CS6:	Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS7:	Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities)	PROC8b
CS8:	Industrial use (Roller application or brushing)	PROC10
CS9:	Industrial use (Treatment of articles by dipping and pouring)	PROC13

9.2. ES 9 Conditions of use affecting exposure

9.2.1 ES 9 - CS 1: Control of environmental exposure: Industrial use (Use of non-reactive processing aid at industrial site (no inclusion into or onto article)) (ERC4)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

Concentration of the Substance in Mixture/Article : <= 100 %

9.2.2 ES 9 - CS 2: Control of worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Product characteristics

Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use

Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Palm of one hand
Covers skin contact area up to : 240 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Technical conditions and measures : Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions
Sample via a closed loop or other system to avoid exposure.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

9.2.3 ES 9 - CS 3: Control of worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

9.2.4 ES 9 - CS 4: Control of worker exposure: Industrial use (Manufacture or

formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production where opportunity for exposure arises

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Note	:	Chemical production where opportunity for exposure arises No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

9.2.5 ES 9 - CS 5: Control of worker exposure: Industrial use (Industrial spraying) (PROC7)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Amount used

Amounts used	:	0,6 L/min

Frequency and duration of use

Exposure duration	:	360 min
Frequency of use	:	<= 5 days per week

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	> 1000 m3

Risk Management Measures

Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	50 %
Note	:	Ensure that the direction of airflow is clearly away from the worker.
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	Wear suitable protective clothing. Wear suitable coveralls to prevent exposure to the skin.
Effectiveness (of a measure)	:	80 %
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the distance from worker to task is greater than 1 m.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that direction of application is only horizontal or downward.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of work area
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of equipment
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure regular inspection, cleaning and maintenance of equipment and machines.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

9.2.6 ES 9 - CS 6: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %

Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

9.2.7 ES 9 - CS 7: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities) (PROC8b)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	Transfer of substance or mixture (charging/discharging) at dedicated facilities No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

9.2.8 ES 9 - CS 8: Control of worker exposure: Industrial use (Roller application or brushing) (PROC10)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to : 960 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : dermal
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

9.2.9 ES 9 - CS 9: Control of worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : dermal
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

9.3. ES 9 Exposure estimation and reference to its source

9.3.2 ES 9 - CS 2: Worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

9.3.3 ES 9 - CS 3: Worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,08

9.3.4 ES 9 - CS 4: Worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,22
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,43

9.3.5 ES 9 - CS 5: Worker exposure: Industrial use (Industrial spraying) (PROC7)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	9,79 mg/m³ (Stoffenmanager v4.0)	0,28
Worker - dermal, long-term - systemic	54,6 mg/kg bw/day (RISKOFDERM v2.1)	0,52
combined routes	Not applicable	0,80

9.3.6 ES 9 - CS 6: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,20

9.3.7 ES 9 - CS 7: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities) (PROC8b)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0)	0,06
combined routes	ECETOC TRA worker v2.0	0,43

9.3.8 ES 9 - CS 8: Worker exposure: Industrial use (Roller application or brushing) (PROC10)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	2,74 mg/kg bw/day (ECETOC TRA worker v2.0)	0,03
combined routes	ECETOC TRA worker v2.0	0,77

9.3.9 ES 9 - CS 9: Worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,75

9.4. ES 9 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

10. ES 10: Professional use; Use in cleaning agents

10.1. Title section

Environment		
CS1:	Professional use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor), Widespread use of non-reactive	ERC8a, ERC8d

	processing aid (no inclusion into or onto article, outdoor))	
Workers		
CS2:	Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	PROC1, PROC2, PROC3
CS3:	Professional use (Chemical production where opportunity for exposure arises)	PROC4
CS4:	Professional use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS5:	Professional use (Transfer of substance or mixture (charging/discharging) at dedicated facilities)	PROC8b
CS6:	Professional use (Roller application or brushing)	PROC10
CS7:	Professional use (Non-industrial spraying)	PROC11
CS8:	Professional use (Treatment of articles by dipping and pouring)	PROC13

10.2. ES 10 Conditions of use affecting exposure

10.2.1 ES 10 - CS 1: Control of environmental exposure: Professional use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor), Widespread use of non-reactive processing aid (no inclusion into or onto article, outdoor)) (ERC8a, ERC8d)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

10.2.2 ES 10 - CS 2: Control of worker exposure: Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition) (PROC1, PROC2, PROC3)

Product characteristics

Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use

Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.
Technical conditions and measures	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions
Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition With occasional controlled exposure

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

10.2.3 ES 10 - CS 3: Control of worker exposure: Professional use (Chemical production where opportunity for exposure arises) (PROC4)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside

hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

10.2.4 ES 10 - CS 4: Control of worker exposure: Professional use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to : 960 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : inhalative
Technical conditions and measures : Local exhaust ventilation
Effectiveness (of a measure) : 80 %
Personal protective measures : If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure) : 80 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

10.2.5 ES 10 - CS 5: Control of worker exposure: Professional use (Transfer of substance or mixture (charging/discharging) at dedicated facilities) (PROC8b)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

10.2.6 ES 10 - CS 6: Control of worker exposure: Professional use (Roller application or brushing) (PROC10)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to : 960 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : inhalative
Technical conditions and measures : Local exhaust ventilation
Effectiveness (of a measure) : 80 %
Personal protective measures : If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure) : 80 %

Exposure routes : dermal

Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

10.2.7 ES 10 - CS 7: Control of worker exposure: Professional use (Non-industrial spraying) (PROC11)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Amount used

Amounts used	:	0,05 L/min

Frequency and duration of use

Exposure duration	:	150 min
Frequency of use	:	<= 5 days per week

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	<= 1000 m3

Risk Management Measures

Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	Wear suitable protective clothing. Wear suitable coveralls to prevent exposure to the skin.
Effectiveness (of a measure)	:	80 %
Personal protective measures	:	Wear a respirator conforming to EN140.
Effectiveness (of a measure)	:	40 %
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that direction of application is only horizontal or downward.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the distance from worker to task is greater than 1 m.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the direction of airflow is clearly away from the worker.
Note	:	Not applicable

Organisational measures to prevent /limit releases, dispersion and exposure	:	Provide enhanced general ventilation by mechanical means.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of work area
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of equipment
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure regular inspection, cleaning and maintenance of equipment and machines.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the task is not carried out by more than one worker simultaneously.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

10.2.8 ES 10 - CS 8: Control of worker exposure: Professional use (Treatment of articles by dipping and pouring) (PROC13)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

10.3. ES 10 Exposure estimation and reference to its source

10.3.2 ES 10 - CS 2: Worker exposure: Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition) (PROC1, PROC2, PROC3)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0, Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	0,003
combined routes	ECETOC TRA worker v2.0, Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions	0,004
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	0,37
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	0,01
combined routes	ECETOC TRA worker v2.0, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions	0,38
Worker - inhalative, long-term - local and systemic	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,22
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003

combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23

10.3.3 ES 10 - CS 3: Worker exposure: Professional use (Chemical production where opportunity for exposure arises) (PROC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,88 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0)	0,06
combined routes	ECETOC TRA worker v2.0	0,80

CS5:	Consumer use (Washing and cleaning products)	PC35
CS6:	Consumer use (Washing and cleaning products)	PC35
CS7:	Consumer use (Washing and cleaning products)	PC35

11.2. ES 11 Conditions of use affecting exposure

11.2.1 ES 11 - CS 1: Control of environmental exposure: Consumer use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor), Widespread use of non-reactive processing aid (no inclusion into or onto article, outdoor)) (ERC8a, ERC8d)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

11.2.2 ES 11 - CS 2: Control of consumer exposure: Consumer use (Washing and cleaning products) (PC35)

Remarks : No spraying
Default database: cleaning and washing/all purpose cleaner/liquid/mixing and loading

Product characteristics

Concentration of the Substance in Mixture/Article : <= 20 %

Molecular weight : 22 g/mol
Physical Form (at time of use) : Liquid
Vapour pressure : 0,123 hPa

Amount used

Amounts used : 0,5 kg/day

Frequency and duration of use

Application duration : 0,3 min
Frequency of use : 104 days per year
Exposure duration : 0,75 min

Human factors not influenced by risk management

Dermal exposure : Palm of one hand
Covers skin contact area up to : 215 cm^2

Other given operational conditions affecting consumers exposure

Outdoor / Indoor	:	Indoor use
Temperature	:	25 °C
Ventilation rate per hour	:	0,5
Mass transfer rate	:	4740 m/min
Release area	:	20 cm²

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)

Consumer Measures	:	No specific measures identified.

11.2.3 ES 11 - CS 3: Control of consumer exposure: Consumer use (Washing and cleaning products) (PC35)

Remarks	:	No spraying Application

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 4 %
Molecular weight	:	18 g/mol
Physical Form (at time of use)	:	Liquid
Vapour pressure	:	0,123 hPa

Amount used

Amounts used	:	0,4 kg/day

Frequency and duration of use

Application duration	:	20 min
Frequency of use	:	104 days per year
Exposure duration	:	240 min

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	215 cm²

Other given operational conditions affecting consumers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	58 m3
Temperature	:	25 °C
Ventilation rate per hour	:	0,5
Mass transfer rate	:	4740 m/min
Release area	:	10 m2

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)

Consumer Measures	:	No specific measures identified.

11.2.4 ES 11 - CS 4: Control of consumer exposure: Consumer use (Washing and cleaning products) (PC35)

Remarks	:	Sprays Spraying

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 5 %
Physical Form (at time of use)	:	Liquid
Vapour pressure	:	0,123 hPa

Amount used

Amounts used	:	0,0468 kg/min

Frequency and duration of use

Spray duration	:	0,41 min
Frequency of use	:	365 days per year
Exposure duration	:	60 min
Release duration	:	2,6 s

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands and forearms.
Covers skin contact area up to	:	1900 cm²
dermal	:	0,000046 kg/min
Uptake fraction, oral	:	100 %

Other given operational conditions affecting consumers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	15 m3
Temperature	:	25 °C
Ventilation rate per hour	:	2,5
Room height	:	2,5 m
Weight percent	:	5 %
Remarks	:	Non-Volatile
Density	:	1,8 g/cm3
Remarks	:	Non-Volatile
Airborne fraction	:	20 %
Remarks	:	Non-Volatile
Inhalation cut-off diameter	:	0,015 mm

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)

Consumer Measures	:	Ensure spraying away from persons.

11.2.5 ES 11 - CS 5: Control of consumer exposure: Consumer use (Washing and cleaning products) (PC35)

Remarks	:	Sprays Cleaning

Product characteristics

Concentration of the Substance in	:	<= 5 %

Mixture/Article

Molecular weight	:	22 g/mol

Amounts used	:	0,5 kg/day

Frequency and duration of use

Application duration	:	0,3 min
Frequency of use	:	104 days per year
Exposure duration	:	0,75 min

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	215 cm²

Other given operational conditions affecting consumers exposure

Outdoor / Indoor	:	Indoor use
Temperature	:	25 °C
Ventilation rate per hour	:	1,0
Mass transfer rate	:	4740 m/min
Release area	:	20 cm²

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)

Consumer Measures	:	No specific measures identified.

11.2.7 ES 11 - CS 7: Control of consumer exposure: Consumer use (Washing and cleaning products) (PC35)

Remarks	:	Floor cleaning (liquids) Application

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 2,5 %
Molecular weight	:	18 g/mol
Physical Form (at time of use)	:	Liquid
Vapour pressure	:	0,123 hPa

Amount used

Amounts used	:	0,88 kg/day

Frequency and duration of use

Application duration	:	30 min
Frequency of use	:	104 days per year
Exposure duration	:	240 min

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	215 cm²

Other given operational conditions affecting consumers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	58 m3
Temperature	:	25 °C
Ventilation rate per hour	:	0,5
Mass transfer rate	:	4740 m/min
Release area	:	22 m2

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)
Consumer Measures : No specific measures identified.

11.3. ES 11 Exposure estimation and reference to its source

11.3.2 ES 11 - CS 2: Consumer exposure: Consumer use (Washing and cleaning products) (PC35)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	0,01 mg/m³ (Consexpo v4.1)	0,001
Chronic dermal systemic exposure	0,03 mg/kg bw/day (Consexpo v4.1)	0,0006
Consumer - oral, long-term - systemic	Consexpo v4.1, Not applicable	
combined routes	Consexpo v4.1	0,002

11.3.3 ES 11 - CS 3: Consumer exposure: Consumer use (Washing and cleaning products) (PC35)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	0,61 mg/m³ (Consexpo v4.1)	0,09
Chronic dermal systemic exposure	11,70 mg/kg bw/day (Consexpo v4.1)	0,22
Consumer - oral, long-term - systemic	Consexpo v4.1, Not applicable	
combined routes	Consexpo v4.1	0,31

11.3.4 ES 11 - CS 4: Consumer exposure: Consumer use (Washing and cleaning products) (PC35)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	0,000011 mg/m³ (Consexpo v4.1)	
Chronic dermal systemic exposure	0,01 mg/kg bw/day (Consexpo v4.1)	0,0002
Consumer - oral, long-term - systemic	0,0006 mg/kg bw/day (Consexpo v4.1)	
combined routes	Consexpo v4.1	0,0002

11.3.5 ES 11 - CS 5: Consumer exposure: Consumer use (Washing and cleaning products) (PC35)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	0,11 mg/m³ (Consexpo v4.1)	0,02
Chronic dermal systemic exposure	0,12 mg/kg bw/day (Consexpo v4.1)	0,002
Consumer - oral, long-term - systemic	Consexpo v4.1, Not applicable	
combined routes	Consexpo v4.1	0,02

11.3.6 ES 11 - CS 6: Consumer exposure: Consumer use (Washing and cleaning products) (PC35)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	0,01 mg/m³ (Consexpo v4.1)	0,001
Chronic dermal systemic exposure	0,04 mg/kg bw/day (Consexpo v4.1)	0,0008
Consumer - oral, long-term - systemic	Consexpo v4.1, Not applicable	
combined routes	Consexpo v4.1	0,002

11.3.7 ES 11 - CS 7: Consumer exposure: Consumer use (Washing and cleaning products) (PC35)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	0,38 mg/m³ (Consexpo v4.1)	0,05
Chronic dermal systemic exposure	7,31 mg/kg bw/day (Consexpo v4.1)	0,14
Consumer - oral, long-term - systemic	Consexpo v4.1, Not applicable	
combined routes	Consexpo v4.1	0,19

11.4. ES 11 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

12. ES 12: Industrial use; Use in lubricants

12.1. Title section

Environment		
CS1:	Industrial use (Use of non-reactive processing aid at industrial site (no inclusion into or onto article), Use of functional fluid at industrial site)	ERC4, ERC7
Workers		
CS2:	Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	PROC1
CS3:	Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	PROC2
CS4:	Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises)	PROC3, PROC4
CS5:	Industrial use (Mixing or blending in batch processes)	PROC5
CS6:	Industrial use (Industrial spraying)	PROC7
CS7:	Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS8:	Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	PROC8b, PROC9
CS9:	Industrial use (Roller application or brushing)	PROC10
CS10:	Industrial use (Treatment of articles by dipping and pouring)	PROC13
CS11:	Industrial use (Lubrication at high energy conditions in metal working operations, General greasing/lubrication at high kinetic energy conditions)	PROC17, PROC18

12.2. ES 12 Conditions of use affecting exposure

12.2.1 ES 12 - CS 1: Control of environmental exposure: Industrial use (Use of non-reactive processing aid at industrial site (no inclusion into or onto article), Use of functional fluid at industrial site) (ERC4, ERC7)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

12.2.2 ES 12 - CS 2: Control of worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

12.2.3 ES 12 - CS 3: Control of worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	Chemical production or refinery in closed continuous process

with occasional controlled exposure or processes with equivalent containment conditions
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

12.2.4 ES 12 - CS 4: Control of worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production where opportunity for exposure arises

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Note	:	Chemical production where opportunity for exposure arises No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

12.2.5 ES 12 - CS 5: Control of worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Product characteristics

Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : dermal
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with specific activity training.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

12.2.6 ES 12 - CS 6: Control of worker exposure: Industrial use (Industrial spraying) (PROC7)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Amount used
Amounts used : 0,6 L/min

Frequency and duration of use
Exposure duration : 360 min
Frequency of use : <= 5 days per week

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use
Room size : > 1000 m3

Risk Management Measures
Technical conditions and measures : Local exhaust ventilation
Effectiveness (of a measure) : 50 %

Note	:	Ensure that the direction of airflow is clearly away from the worker.
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	Wear suitable protective clothing. Wear suitable coveralls to prevent exposure to the skin.
Effectiveness (of a measure)	:	80 %
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the distance from worker to task is greater than 1 m.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that direction of application is only horizontal or downward.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of work area
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of equipment
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure regular inspection, cleaning and maintenance of equipment and machines.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

12.2.7 ES 12 - CS 7: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

12.2.8 ES 12 - CS 8: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

12.2.9 ES 12 - CS 9: Control of worker exposure: Industrial use (Roller application or brushing) (PROC10)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid

Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to : 960 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : dermal
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

12.2.10 ES 12 - CS 10: Control of worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : dermal
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

12.2.11 ES 12 - CS 11: Control of worker exposure: Industrial use (Lubrication at high energy conditions in metal working operations, General greasing/lubrication at high kinetic energy conditions) (PROC17, PROC18)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	90 %
Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %
Note	:	Lubrication at high energy conditions in metal working operations

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

12.3. ES 12 Exposure estimation and reference to its source

12.3.2 ES 12 - CS 2: Worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Route of exposure and type of effects	Exposure estimate	RCR

Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

12.3.3 ES 12 - CS 3: Worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,08

12.3.4 ES 12 - CS 4: Worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,22
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,43

12.3.5 ES 12 - CS 5: Worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,38

12.3.6 ES 12 - CS 6: Worker exposure: Industrial use (Industrial spraying) (PROC7)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	9,79 mg/m³ (Stoffenmanager v4.0)	0,28
Worker - dermal, long-term - systemic	54,6 mg/kg bw/day (RISKOFDERM v2.1)	0,52
combined routes	Not applicable	0,80

12.3.7 ES 12 - CS 7: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,20

12.3.8 ES 12 - CS 8: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities	0,43
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated	0,37

	filling line, including weighing))	
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)	0,43

12.3.9 ES 12 - CS 9: Worker exposure: Industrial use (Roller application or brushing) (PROC10)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	2,74 mg/kg bw/day (ECETOC TRA worker v2.0)	0,03
combined routes	ECETOC TRA worker v2.0	0,77

12.3.10 ES 12 - CS 10: Worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,75

12.3.11 ES 12 - CS 11: Worker exposure: Industrial use (Lubrication at high energy conditions in metal working operations, General greasing/lubrication at high kinetic energy conditions) (PROC17, PROC18)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0, Lubrication at high energy conditions in metal working operations)	0,07
Worker - dermal, long-term - systemic	2,74 mg/kg bw/day (ECETOC TRA worker v2.0, Lubrication at high energy conditions in metal working operations)	0,03
combined routes	ECETOC TRA worker v2.0, Lubrication at high energy conditions in metal working operations	0,10
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0, General greasing/lubrication at high kinetic energy conditions)	0,07
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0, General greasing/lubrication at high kinetic energy conditions)	0,13

combined routes	ECETOC TRA worker v2.0, General greasing/lubrication at high kinetic energy conditions	0,20

CS10:	Industrial use (Treatment of articles by dipping and pouring)	PROC13
CS11:	Industrial use (Lubrication at high energy conditions in metal working operations)	PROC17

13.2. ES 13 Conditions of use affecting exposure

13.2.1 ES 13 - CS 1: Control of environmental exposure: Industrial use (Use of non-reactive processing aid at industrial site (no inclusion into or onto article)) (ERC4)

Remarks : As no environmental hazard was identified no environmental-

related exposure assessment and risk characterization was performed.

13.2.2 ES 13 - CS 2: Control of worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

13.2.3 ES 13 - CS 3: Control of worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside

hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures

No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

13.2.4 ES 13 - CS 4: Control of worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Palm of one hand
Covers skin contact area up to : 240 cm²
Remarks : Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²
Remarks : Chemical production where opportunity for exposure arises

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Technical conditions and measures : Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition

Note : Chemical production where opportunity for exposure arises
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

13.2.5 ES 13 - CS 5: Control of worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm^2

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : dermal
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with specific activity training.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

13.2.6 ES 13 - CS 6: Control of worker exposure: Industrial use (Industrial spraying) (PROC7)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Amount used
Amounts used : 0,6 L/min

Frequency and duration of use
Exposure duration : 360 min
Frequency of use : <= 5 days per week

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	> 1000 m3

Risk Management Measures

Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	50 %
Note	:	Ensure that the direction of airflow is clearly away from the worker.
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	Wear suitable protective clothing. Wear suitable coveralls to prevent exposure to the skin.
Effectiveness (of a measure)	:	80 %
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the distance from worker to task is greater than 1 m.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that direction of application is only horizontal or downward.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of work area
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of equipment
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure regular inspection, cleaning and maintenance of equipment and machines.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

13.2.7 ES 13 - CS 7: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min

Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to : 960 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : inhalative
Technical conditions and measures : Local exhaust ventilation
Effectiveness (of a measure) : 90 %
Personal protective measures : If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

13.2.8 ES 13 - CS 8: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

13.2.9 ES 13 - CS 9: Control of worker exposure: Industrial use (Roller application or

brushing) (PROC10)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

13.2.10 ES 13 - CS 10: Control of worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

13.2.11 ES 13 - CS 11: Control of worker exposure: Industrial use (Lubrication at high energy conditions in metal working operations) (PROC17)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	90 %
Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

13.3. ES 13 Exposure estimation and reference to its source

13.3.2 ES 13 - CS 2: Worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

13.3.3 ES 13 - CS 3: Worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,08

13.3.4 ES 13 - CS 4: Worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,22
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,43

13.3.5 ES 13 - CS 5: Worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,38

13.3.6 ES 13 - CS 6: Worker exposure: Industrial use (Industrial spraying) (PROC7)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	9,79 mg/m³ (Stoffenmanager v4.0)	0,28
Worker - dermal, long-term - systemic	54,6 mg/kg bw/day (RISKOFDERM v2.1)	0,52
combined routes	Not applicable	0,80

13.3.7 ES 13 - CS 7: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,20

13.3.8 ES 13 - CS 8: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or	0,43

	mixture (charging/discharging) at dedicated facilities	
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)	0,43

13.3.9 ES 13 - CS 9: Worker exposure: Industrial use (Roller application or brushing) (PROC10)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	2,74 mg/kg bw/day (ECETOC TRA worker v2.0)	0,03
combined routes	ECETOC TRA worker v2.0	0,77

13.3.10 ES 13 - CS 10: Worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,75

13.3.11 ES 13 - CS 11: Worker exposure: Industrial use (Lubrication at high energy conditions in metal working operations) (PROC17)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0, Lubrication at high energy conditions in metal working operations)	0,07
Worker - dermal, long-term - systemic	2,74 mg/kg bw/day (ECETOC TRA worker v2.0, Lubrication at high energy conditions in metal working operations)	0,03
combined routes	ECETOC TRA worker v2.0, Lubrication at high energy conditions in metal working operations	0,10

13.4. ES 13 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

14. ES 14: Professional use; Metal working fluids

14.1. Title section

Environment		
CS1:	Professional use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor), Widespread use of non-reactive processing aid (no inclusion into or onto article, outdoor))	ERC8a, ERC8d
Workers		
CS2:	Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	PROC1, PROC2, PROC3
CS3:	Professional use (Mixing or blending in batch processes)	PROC5
CS4:	Professional use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS5:	Professional use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	PROC8b, PROC9
CS6:	Professional use (Roller application or brushing)	PROC10
CS7:	Professional use (Non-industrial spraying)	PROC11
CS8:	Professional use (Treatment of articles by dipping and pouring)	PROC13
CS9:	Professional use (Lubrication at high energy conditions in metal working operations)	PROC17

14.2. ES 14 Conditions of use affecting exposure

14.2.1 ES 14 - CS 1: Control of environmental exposure: Professional use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor), Widespread use of non-reactive processing aid (no inclusion into or onto article, outdoor)) (ERC8a, ERC8d)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

14.2.2 ES 14 - CS 2: Control of worker exposure: Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition) (PROC1, PROC2, PROC3)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.
Technical conditions and measures	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions
Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition With occasional controlled exposure

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

14.2.3 ES 14 - CS 3: Control of worker exposure: Professional use (Mixing or blending in batch processes) (PROC5)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

14.2.4 ES 14 - CS 4: Control of worker exposure: Professional use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to : 960 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	80 %
Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	80 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

14.2.5 ES 14 - CS 5: Control of worker exposure: Professional use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

14.2.6 ES 14 - CS 6: Control of worker exposure: Professional use (Roller application or brushing) (PROC10)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	80 %
Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	80 %
Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

14.2.7 ES 14 - CS 7: Control of worker exposure: Professional use (Non-industrial spraying) (PROC11)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Amount used

Amounts used	:	0,05 L/min

Frequency and duration of use

Exposure duration	:	150 min
Frequency of use	:	<= 5 days per week

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	<= 1000 m3

Risk Management Measures

Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.

Effectiveness (of a measure)	:	90 %
Personal protective measures	:	Wear suitable protective clothing. Wear suitable coveralls to prevent exposure to the skin.
Effectiveness (of a measure)	:	80 %
Personal protective measures	:	Wear a respirator conforming to EN140.
Effectiveness (of a measure)	:	40 %
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that direction of application is only horizontal or downward.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the distance from worker to task is greater than 1 m.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the direction of airflow is clearly away from the worker.
Note	:	Not applicable
Organisational measures to prevent /limit releases, dispersion and exposure	:	Provide enhanced general ventilation by mechanical means.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of work area
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of equipment
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure regular inspection, cleaning and maintenance of equipment and machines.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the task is not carried out by more than one worker simultaneously.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

14.2.8 ES 14 - CS 8: Control of worker exposure: Professional use (Treatment of articles by dipping and pouring) (PROC13)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid

Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management

Worker - dermal, long-term - systemic	2,74 mg/kg bw/day (ECETOC TRA worker v2.0)	0,03
combined routes	ECETOC TRA worker v2.0	0,40

14.4. ES 14 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

15. ES 15: Professional use; Use in agrochemicals

15.1. Title section

Environment		
CS1:	Professional use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor), Widespread use of non-reactive processing aid (no inclusion into or onto article, outdoor))	ERC8a, ERC8d
Workers		
CS2:	Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	PROC1, PROC2
CS3:	Professional use (Chemical production where opportunity for exposure arises)	PROC4
CS4:	Professional use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS5:	Professional use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	PROC8b, PROC9
CS6:	Professional use (Non-industrial spraying)	PROC11
CS7:	Professional use (Treatment of articles by dipping and pouring)	PROC13

15.2. ES 15 Conditions of use affecting exposure

15.2.1 ES 15 - CS 1: Control of environmental exposure: Professional use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor), Widespread use of non-reactive processing aid (no inclusion into or onto article, outdoor)) (ERC8a, ERC8d)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was

performed.

15.2.2 ES 15 - CS 2: Control of worker exposure: Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC1, PROC2)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.
Technical conditions and measures	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

15.2.3 ES 15 - CS 3: Control of worker exposure: Professional use (Chemical production where opportunity for exposure arises) (PROC4)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

15.2.4 ES 15 - CS 4: Control of worker exposure: Professional use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and	:	Local exhaust ventilation

measures
Effectiveness (of a measure) : 80 %
Personal protective measures : If technical measures not practical:
Wear suitable respiratory protection.
Effectiveness (of a measure) : 80 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

15.2.5 ES 15 - CS 5: Control of worker exposure: Professional use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

15.2.6 ES 15 - CS 6: Control of worker exposure: Professional use (Non-industrial spraying) (PROC11)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Amount used
Amounts used : 0,05 L/min

Frequency and duration of use

Exposure duration	:	150 min
Frequency of use	:	<= 5 days per week

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	<= 1000 m3

Risk Management Measures

Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	Wear suitable protective clothing. Wear suitable coveralls to prevent exposure to the skin.
Effectiveness (of a measure)	:	80 %
Personal protective measures	:	Wear a respirator conforming to EN140.
Effectiveness (of a measure)	:	40 %
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that direction of application is only horizontal or downward.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the distance from worker to task is greater than 1 m.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the direction of airflow is clearly away from the worker.
Note	:	Not applicable
Organisational measures to prevent /limit releases, dispersion and exposure	:	Provide enhanced general ventilation by mechanical means.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of work area
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of equipment
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure regular inspection, cleaning and maintenance of equipment and machines.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the task is not carried out by more than one worker simultaneously.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

15.2.7 ES 15 - CS 7: Control of worker exposure: Professional use (Treatment of articles by dipping and pouring) (PROC13)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm^2

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

15.3. ES 15 Exposure estimation and reference to its source

15.3.2 ES 15 - CS 2: Worker exposure: Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC1, PROC2)

Route of exposure and type of effects	Exposure estimate	RCR

16.4. ES 16 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

17. ES 17: Professional use; Use in functional fluids

17.1. Title section

Environment		
CS1:	Professional use (Widespread use of functional fluid (indoor), Widespread use of functional fluid (outdoor))	ERC9a, ERC9b
Workers		
CS2:	Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	PROC1, PROC2, PROC3
CS3:	Professional use (Chemical production where opportunity for exposure arises)	PROC4
CS4:	Professional use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS5:	Professional use (Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	PROC9

CS6: Professional use (Use of functional fluids in small devices)	PROC20

17.2. ES 17 Conditions of use affecting exposure

17.2.1 ES 17 - CS 1: Control of environmental exposure: Professional use (Widespread use of functional fluid (indoor), Widespread use of functional fluid (outdoor)) (ERC9a, ERC9b)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

17.2.2 ES 17 - CS 2: Control of worker exposure: Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition) (PROC1, PROC2, PROC3)

Product characteristics

Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use

Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management

Dermal exposure : Palm of one hand
Covers skin contact area up to : 240 cm²
Remarks : Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition

Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²
Remarks : Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions

Other operational conditions affecting workers exposure

Outdoor / Indoor : Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.
Technical conditions and measures	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions
Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition With occasional controlled exposure

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

17.2.3 ES 17 - CS 3: Control of worker exposure: Professional use (Chemical production where opportunity for exposure arises) (PROC4)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

17.2.4 ES 17 - CS 4: Control of worker exposure: Professional use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in	:	<= 100 %

Mixture/Article

Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	80 %
Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	80 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

17.2.5 ES 17 - CS 5: Control of worker exposure: Professional use (Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC9)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

17.2.6 ES 17 - CS 6: Control of worker exposure: Professional use (Use of functional fluids in small devices) (PROC20)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

17.3. ES 17 Exposure estimation and reference to its source

17.3.2 ES 17 - CS 2: Worker exposure: Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition) (PROC1, PROC2, PROC3)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0, Chemical production or refinery in closed process without likelihood	0,0007

	of exposure or processes with equivalent containment conditions)

Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

19.2.5 ES 19 - CS 5: Control of worker exposure: Professional use (Non-industrial spraying) (PROC11)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Amount used
Amounts used : 0,05 L/min

Frequency and duration of use
Exposure duration : 150 min
Frequency of use : <= 5 days per week

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use
Room size : <= 1000 m3

Risk Management Measures
Personal protective measures : Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure) : 90 %

Personal protective measures : Wear suitable protective clothing.
Wear suitable coveralls to prevent exposure to the skin.
Effectiveness (of a measure) : 80 %

Personal protective measures : Wear a respirator conforming to EN140.
Effectiveness (of a measure) : 40 %

Organisational measures to : Ensure that direction of application is only horizontal or

prevent /limit releases, dispersion and exposure		downward.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the distance from worker to task is greater than 1 m.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the direction of airflow is clearly away from the worker.
Note	:	Not applicable
Organisational measures to prevent /limit releases, dispersion and exposure	:	Provide enhanced general ventilation by mechanical means.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of work area
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of equipment
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure regular inspection, cleaning and maintenance of equipment and machines.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the task is not carried out by more than one worker simultaneously.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

19.3. ES 19 Exposure estimation and reference to its source

19.3.2 ES 19 - CS 2: Worker exposure: Professional use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions, Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC1, PROC2)

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)
Consumer Measures : No specific measures identified.

20.3. ES 20 Exposure estimation and reference to its source

20.3.2 ES 20 - CS 2: Consumer exposure: Consumer use (Anti-freeze and de-icing products) (PC4)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	0,0006 mg/m³ (Consexpo v4.1)	0,0001
Chronic dermal systemic exposure	0,50 mg/kg bw/day (Consexpo v4.1)	0,009
Consumer - oral, long-term - systemic	0,005 mg/kg bw/day (Consexpo v4.1)	
combined routes	Consexpo v4.1	0,009

20.3.3 ES 20 - CS 3: Consumer exposure: Consumer use (Anti-freeze and de-icing products) (PC4)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	Not applicable	
Chronic dermal systemic exposure	4,46 mg/kg bw/day (Consexpo v4.1)	0,08
Consumer - oral, long-term - systemic	Not applicable	
combined routes	Consexpo v4.1	0,08

20.3.4 ES 20 - CS 4: Consumer exposure: Consumer use (Anti-freeze and de-icing products) (PC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	1,93 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	0,28
Worker - dermal, long-term - systemic	4,11 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	0,08
oral	Not applicable	
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at non dedicated-facilities	0,36

20.4. ES 20 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

21. ES 21: Industrial use, Professional use; Use in

laboratories

21.1. Title section

Environment		
CS1:	Industrial use, Professional use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor))	ERC8a
Workers		
CS2:	Industrial use, Professional use (Use as laboratory reagent)	PROC15

21.2. ES 21 Conditions of use affecting exposure

21.2.1 ES 21 - CS 1: Control of environmental exposure: Industrial use, Professional use (Widespread use of non-reactive processing aid (no inclusion into or onto article, indoor)) (ERC8a)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

21.2.2 ES 21 - CS 2: Control of worker exposure: Industrial use, Professional use (Use as laboratory reagent) (PROC15)

Product characteristics

Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use

Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management

Dermal exposure : Palm of one hand
Covers skin contact area up to : 240 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor : Indoor use

Risk Management Measures

Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice : Wear solely goggles.

21.3. ES 21 Exposure estimation and reference to its source

21.3.2 ES 21 - CS 2: Worker exposure: Industrial use, Professional use (Use as laboratory reagent) (PROC15)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

21.4. ES 21 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

22. ES 22: Industrial use; Use in water treatment agents

22.1. Title section

Environment		
CS1:	Industrial use (Formulation into solid matrix, Use of non-reactive processing aid at industrial site (no inclusion into or onto article))	ERC3, ERC4
Workers		
CS2:	Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	PROC1
CS3:	Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	PROC2
CS4:	Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises)	PROC3, PROC4
CS5:	Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS6:	Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities)	PROC8b
CS7:	Industrial use (Treatment of articles by dipping and pouring)	PROC13

22.2. ES 22 Conditions of use affecting exposure

22.2.1 ES 22 - CS 1: Control of environmental exposure: Industrial use (Formulation into solid matrix, Use of non-reactive processing aid at industrial site (no inclusion into or onto article)) (ERC3, ERC4)

Remarks	:	As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

22.2.2 ES 22 - CS 2: Control of worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

22.2.3 ES 22 - CS 3: Control of worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Product characteristics

Concentration of the Substance in	:	<= 100 %

Mixture/Article

Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

22.2.4 ES 22 - CS 4: Control of worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production where opportunity for exposure arises

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Technical conditions and measures : Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition

Note : Chemical production where opportunity for exposure arises
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

22.2.5 ES 22 - CS 5: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to : 960 cm^2

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Exposure routes : inhalative
Technical conditions and measures : Local exhaust ventilation
Effectiveness (of a measure) : 90 %
Personal protective measures : If technical measures not practical:
Wear suitable respiratory protection.
Effectiveness (of a measure) : 90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

22.2.6 ES 22 - CS 6: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities) (PROC8b)

Product characteristics
Concentration of the Substance in : <= 100 %

Mixture/Article

Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	Transfer of substance or mixture (charging/discharging) at dedicated facilities No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

22.2.7 ES 22 - CS 7: Control of worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

22.3. ES 22 Exposure estimation and reference to its source

22.3.2 ES 22 - CS 2: Worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

22.3.3 ES 22 - CS 3: Worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,08

22.3.4 ES 22 - CS 4: Worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,22
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled	0,003

	exposure or processes with equivalent containment condition)	
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,43

22.3.5 ES 22 - CS 5: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,20

22.3.6 ES 22 - CS 6: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities) (PROC8b)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0)	0,06
combined routes	ECETOC TRA worker v2.0	0,43

22.3.7 ES 22 - CS 7: Worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,75

22.4. ES 22 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

23. ES 23: Consumer use; Adhesives, sealants

23.1. Title section

Adhesives, sealants (PC1)		
Environment		
CS1:	Consumer use (Widespread use leading to inclusion into/onto article (indoor), Widespread use leading to inclusion into/onto article (outdoor))	ERC8c, ERC8f
Consumer		
CS2:	Consumer use (Adhesives, sealants)	PC1

23.2. ES 23 Conditions of use affecting exposure

23.2.1 ES 23 - CS 1: Control of environmental exposure: Consumer use (Widespread use leading to inclusion into/onto article (indoor), Widespread use leading to inclusion into/onto article (outdoor)) (ERC8c, ERC8f)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

23.2.2 ES 23 - CS 2: Control of consumer exposure: Consumer use (Adhesives, sealants) (PC1)

Remarks : Worst case assumption
Mixing operations (open systems)
Loading of application equipment

Product characteristics

Concentration of the Substance in Mixture/Article : <= 0,075 %

Molecular weight : 3.000 g/mol
Physical Form (at time of use) : Liquid
Vapour pressure : 0,123 hPa

Amount used

Amounts used : 9 kg/day

Frequency and duration of use

Application duration	:	75 min
Frequency of use	:	0,25 days per year
Exposure duration	:	75 min

Human factors not influenced by risk management

Covers skin contact area up to	:	110 cm²
dermal	:	0,00003 kg/min

Other given operational conditions affecting consumers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	58 m3
Temperature	:	25 °C
Ventilation rate per hour	:	0,5
Mass transfer rate	:	4740 m/min
Release area	:	4 m2

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)

Consumer Measures	:	No specific measures identified.

23.3. ES 23 Exposure estimation and reference to its source

23.3.2 ES 23 - CS 2: Consumer exposure: Consumer use (Adhesives, sealants) (PC1)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	4,1 mg/m³ (Consexpo v4.1)	0,59
Chronic dermal systemic exposure	0,26 mg/kg bw/day (Consexpo v4.1)	0,005
Consumer - oral, long-term - systemic	Not applicable	
combined routes	Consexpo v4.1	0,60

23.4. ES 23 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

24. ES 24: Industrial use; Manufacture of substance,

Adhesives, sealants, Foaming, Use in coatings, Use in polymer production

24.1. Title section

Environment		
CS1:	Industrial use (Formulation into mixture, Formulation into solid matrix, Use at industrial site leading to inclusion into/onto article, Use of monomer in polymerisation processes at industrial site (inclusion or not into/onto article))	ERC2, ERC3, ERC5, ERC6c
Workers		
CS2:	Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions)	PROC1
CS3:	Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions)	PROC2
CS4:	Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises)	PROC3, PROC4
CS5:	Industrial use (Mixing or blending in batch processes)	PROC5
CS6:	Industrial use (Industrial spraying)	PROC7
CS7:	Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities)	PROC8a
CS8:	Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	PROC8b, PROC9
CS9:	Industrial use (Roller application or brushing)	PROC10
CS10:	Industrial use (Treatment of articles by dipping and pouring)	PROC13
CS11:	Industrial use (Tabletting, compression, extrusion, pelettisation, granulation)	PROC14
CS12:	Industrial use (Use as laboratory reagent)	PROC15

24.2. ES 24 Conditions of use affecting exposure

24.2.1 ES 24 - CS 1: Control of environmental exposure: Industrial use (Formulation into mixture, Formulation into solid matrix, Use at industrial site leading to inclusion into/onto article, Use of monomer in polymerisation processes at industrial site (inclusion or not into/onto article)) (ERC2, ERC3, ERC5, ERC6c)

Remarks : As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

24.2.2 ES 24 - CS 2: Control of worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with

equivalent containment conditions) (PROC1)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions Sample via a closed loop or other system to avoid exposure.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

24.2.3 ES 24 - CS 3: Control of worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

24.2.4 ES 24 - CS 4: Control of worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Palm of one hand
Covers skin contact area up to	:	240 cm²
Remarks	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²
Remarks	:	Chemical production where opportunity for exposure arises

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Technical conditions and measures	:	Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition
Note	:	Chemical production where opportunity for exposure arises No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

24.2.5 ES 24 - CS 5: Control of worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with specific activity training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

24.2.6 ES 24 - CS 6: Control of worker exposure: Industrial use (Industrial spraying) (PROC7)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Amount used

Amounts used	:	0,6 L/min

Frequency and duration of use

Exposure duration	:	360 min
Frequency of use	:	<= 5 days per week

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	> 1000 m3

Risk Management Measures

Technical conditions and	:	Local exhaust ventilation

measures		
Effectiveness (of a measure)	:	50 %
Note	:	Ensure that the direction of airflow is clearly away from the worker.
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	Wear suitable protective clothing. Wear suitable coveralls to prevent exposure to the skin.
Effectiveness (of a measure)	:	80 %
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that the distance from worker to task is greater than 1 m.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure that direction of application is only horizontal or downward.
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of work area
Organisational measures to prevent /limit releases, dispersion and exposure	:	Regular cleaning of equipment
Organisational measures to prevent /limit releases, dispersion and exposure	:	Ensure regular inspection, cleaning and maintenance of equipment and machines.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

24.2.7 ES 24 - CS 7: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm^2

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	inhalative
Technical conditions and measures	:	Local exhaust ventilation
Effectiveness (of a measure)	:	90 %
Personal protective measures	:	If technical measures not practical: Wear suitable respiratory protection.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

24.2.8 ES 24 - CS 8: Control of worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Note	:	No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

24.2.9 ES 24 - CS 9: Control of worker exposure: Industrial use (Roller application or brushing) (PROC10)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %

Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to hands.
Covers skin contact area up to	:	960 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment

Additional good practice advice	:	Wear solely goggles.

24.2.10 ES 24 - CS 10: Control of worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 100 %
Physical Form (at time of use)	:	Low volatile liquid
Vapour pressure	:	0,123 hPa

Frequency and duration of use

Exposure duration	:	<= 480 min
Frequency of use	:	<= 240 days per year

Human factors not influenced by risk management

Dermal exposure	:	Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to	:	480 cm²

Other operational conditions affecting workers exposure

Outdoor / Indoor	:	Indoor use

Risk Management Measures

Exposure routes	:	dermal
Personal protective measures	:	Wear chemically resistant gloves (tested to EN374) in combination with 'basic' employee training.
Effectiveness (of a measure)	:	90 %

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

24.2.11 ES 24 - CS 11: Control of worker exposure: Industrial use (Tabletting, compression, extrusion, pelettisation, granulation) (PROC14)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 480 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

24.2.12 ES 24 - CS 12: Control of worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Product characteristics
Concentration of the Substance in Mixture/Article : <= 100 %

Physical Form (at time of use) : Low volatile liquid
Vapour pressure : 0,123 hPa

Amount used
Storage : < 1 kg, < 1 l

Frequency and duration of use
Exposure duration : <= 480 min
Frequency of use : <= 240 days per year

Human factors not influenced by risk management
Dermal exposure : Assumes that potential dermal contact is limited to inside hands / one hand / palm of hands.
Covers skin contact area up to : 240 cm²

Other operational conditions affecting workers exposure
Outdoor / Indoor : Indoor use

Risk Management Measures
Note : Use as laboratory reagent
No specific measures identified.

Additional good practice advice beyond the REACH Chemical Safety Assessment
Additional good practice advice : Wear solely goggles.

24.3. ES 24 Exposure estimation and reference to its source

24.3.2 ES 24 - CS 2: Worker exposure: Industrial use (Chemical production or refinery in closed process without likelihood of exposure or processes with equivalent containment conditions) (PROC1)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	0,03 mg/m³ (ECETOC TRA worker v2.0)	0,0007
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,004

24.3.3 ES 24 - CS 3: Worker exposure: Industrial use (Chemical production or refinery in closed continuous process with occasional controlled exposure or processes with equivalent containment conditions) (PROC2)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,08

24.3.4 ES 24 - CS 4: Worker exposure: Industrial use (Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition, Chemical production where opportunity for exposure arises) (PROC3, PROC4)

Route of exposure and type of effects	Exposure estimate	RCR

Worker - inhalative, long-term - local and systemic	7,76 mg/m³ (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,22
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition)	0,003
combined routes	ECETOC TRA worker v2.0, Manufacture or formulation in the chemical industry in closed batch processes with occasional controlled exposure or processes with equivalent containment condition	0,23
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises)	0,06
combined routes	ECETOC TRA worker v2.0, Chemical production where opportunity for exposure arises	0,43

24.3.5 ES 24 - CS 5: Worker exposure: Industrial use (Mixing or blending in batch processes) (PROC5)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,38

24.3.6 ES 24 - CS 6: Worker exposure: Industrial use (Industrial spraying) (PROC7)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	9,79 mg/m³ (Stoffenmanager v4.0)	0,28
Worker - dermal, long-term - systemic	54,6 mg/kg bw/day (RISKOFDERM v2.1)	0,52
combined routes	Not applicable	0,80

24.3.7 ES 24 - CS 7: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at non dedicated-facilities) (PROC8a)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term	2,59 mg/m³ (ECETOC TRA worker v2.0)	0,07

- local and systemic		
Worker - dermal, long-term - systemic	13,71 mg/kg bw/day (ECETOC TRA worker v2.0)	0,13
combined routes	ECETOC TRA worker v2.0	0,20

24.3.8 ES 24 - CS 8: Worker exposure: Industrial use (Transfer of substance or mixture (charging/discharging) at dedicated facilities, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)) (PROC8b, PROC9)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities)	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture (charging/discharging) at dedicated facilities	0,43
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,37
Worker - dermal, long-term - systemic	6,86 mg/kg bw/day (ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing))	0,06
combined routes	ECETOC TRA worker v2.0, Transfer of substance or mixture into small containers (dedicated filling line, including weighing)	0,43

24.3.9 ES 24 - CS 9: Worker exposure: Industrial use (Roller application or brushing) (PROC10)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74
Worker - dermal, long-term - systemic	2,74 mg/kg bw/day (ECETOC TRA worker v2.0)	0,03
combined routes	ECETOC TRA worker v2.0	0,77

24.3.10 ES 24 - CS 10: Worker exposure: Industrial use (Treatment of articles by dipping and pouring) (PROC13)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term	25,87 mg/m³ (ECETOC TRA worker v2.0)	0,74

- local and systemic		
Worker - dermal, long-term - systemic	1,37 mg/kg bw/day (ECETOC TRA worker v2.0)	0,01
combined routes	ECETOC TRA worker v2.0	0,75

24.3.11 ES 24 - CS 11: Worker exposure: Industrial use (Tabletting, compression, extrusion, pelettisation, granulation) (PROC14)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	3,43 mg/kg bw/day (ECETOC TRA worker v2.0)	0,03
combined routes	ECETOC TRA worker v2.0	0,40

24.3.12 ES 24 - CS 12: Worker exposure: Industrial use (Use as laboratory reagent) (PROC15)

Route of exposure and type of effects	Exposure estimate	RCR
Worker - inhalative, long-term - local and systemic	12,94 mg/m³ (ECETOC TRA worker v2.0)	0,37
Worker - dermal, long-term - systemic	0,34 mg/kg bw/day (ECETOC TRA worker v2.0)	0,003
combined routes	ECETOC TRA worker v2.0	0,37

24.4. ES 24 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users
Section 2

25. ES 25: Consumer use; Insulation foams

25.1. Title section

Polymer preparations and compounds (PC32)	
Environment	
CS1: Consumer use (Widespread use leading to inclusion into/onto article (indoor), Widespread use leading to inclusion into/onto article (outdoor))	ERC8c, ERC8f
Consumer	
CS2: Consumer use (Polymer preparations and compounds)	PC32

25.2. ES 25 Conditions of use affecting exposure

25.2.1 ES 25 - CS 1: Control of environmental exposure: Consumer use (Widespread use leading to inclusion into/onto article (indoor), Widespread use leading to inclusion into/onto article (outdoor)) (ERC8c, ERC8f)

Remarks	:	As no environmental hazard was identified no environmental-related exposure assessment and risk characterization was performed.

25.2.2 ES 25 - CS 2: Control of consumer exposure: Consumer use (Polymer preparations and compounds) (PC32)

Product characteristics

Concentration of the Substance in Mixture/Article	:	<= 5 %
Physical Form (at time of use)	:	Liquid
Vapour pressure	:	0,123 hPa

Amount used

Amount per use	:	0,825 kg

Frequency and duration of use

Exposure duration	:	30 min
Frequency of use	:	0,2 days per year

Human factors not influenced by risk management

Covers skin contact area up to	:	1900 cm^2
Breathing volume	:	1,5 m3/day

Other given operational conditions affecting consumers exposure

Outdoor / Indoor	:	Indoor use
Room size	:	57,5 m3
Temperature	:	25 °C

Conditions and measures related to protection of consumer (e.g. behavioural advice, personal protection and hygiene)

Consumer Measures	:	No specific measures identified.

25.3. ES 25 Exposure estimation and reference to its source

25.3.2 ES 25 - CS 2: Consumer exposure: Consumer use (Polymer preparations and compounds) (PC32)

Route of exposure and type of effects	Exposure estimate	RCR
Consumer- inhalative, long-term - local and systemic	0,06 mg/m³ (Consexpo v4.1)	0,009
Chronic dermal systemic exposure	0,007 mg/kg bw/day (Consexpo v4.1)	0,0008
Consumer - oral, long-term - systemic	Not applicable	
combined routes	Consexpo v4.1	0,01

25.4. ES 25 Guidance to Downstream User to evaluate whether he works inside the boundaries set by the Exposure Scenario

ECHA guidance for downstream users

1 Introduction

1.1 About this Document

This document is part of the documentation for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, phase 2 or later documents supersede the information provided in this document.

1 Introduction

1.1 About this Document

This document is part of project phase “Detailed Design Engineering” for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, phase 2 or later documents supersede the information provided in this document.

1.2 Display Elements

Symbol	Meaning
➜	Action with one or several steps for which the sequence is irrelevant.
Step 1 : **Step 2 :**	Action with several steps for which the sequence is relevant.
•	First level of list.
-	Second level of list.

Table 1: Display Elements

1.3 Other Applicable Documents

The following documents are applicable:

Document type	Document Name
BESS and PCS circuit diagram	10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_20230316_V0.01_preliminary

Table 2: Other applicable documents

1.4 Generic Terms and Abbreviations Used

This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
PCS	Power Conversion System

Table 3: Generic terms and abbreviations used

2 General

The terminal block diagrams are integrated in the electrical schematics, that are attached to this document (*see section 1.3 "Other Applicable Documents"*).

3 Appendix

1. 10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_20230316_V0.01_preliminary

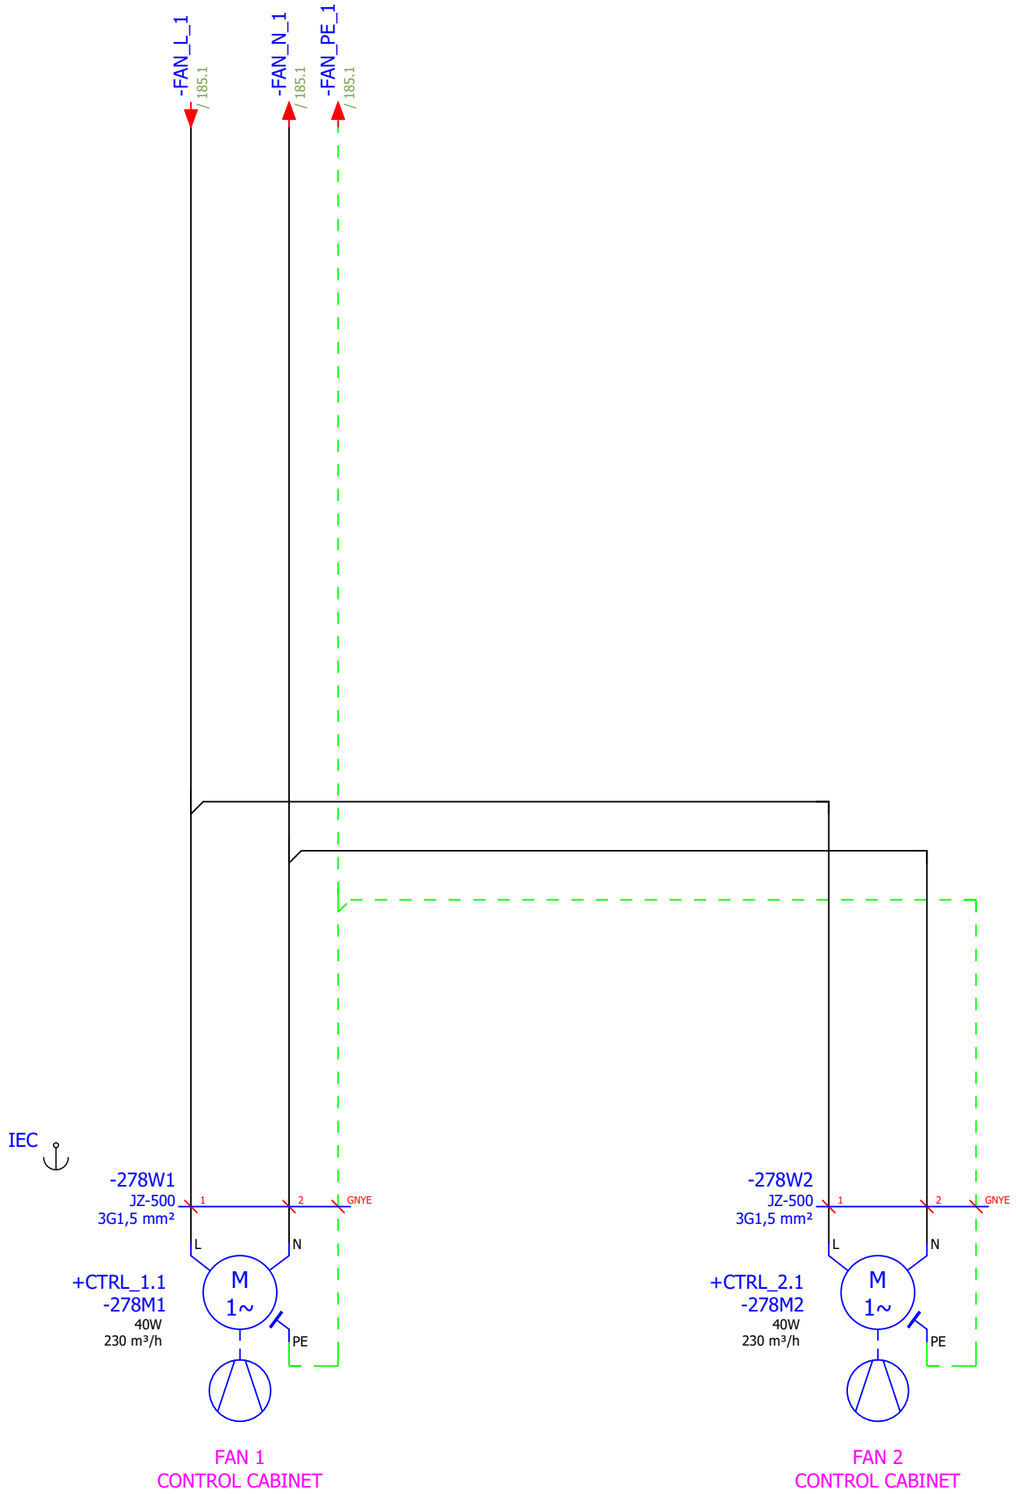
SHUTDOWN CIRCUIT BREAKERS / DC CONTACTORS

FAULT SIGNAL SAFETY RELAY



If the safety relais triggers or a failure is detected, then is the feedback "true".

Note:
The feedback circuit monitors the positions of the positive-guided NC contacts on the contactors 195K1 and 195K2. If one of their contacts latsches, then it is not possible to switch the contactors back on.

SPECIFICATION

TERMINAL STRIP

-XE1	MAIN POWER SUPPLY 600V AC
-XE2	DC POWER SUPPLY 1000V DC
-XE	MAIN POWER SUPPLY 400V AC
-X1	MAIN POWER 400V/230V AC
-X2	LIGHT CABINET 230V AC
-X3	CONTROL VOLTAGE 24V DC
-14X1	CONTROL VOLTAGE 24V DC (TO DC CONTACTORS)
-X5	LOW-VOLTAGE SIGNALS
-XDC0	24V DC POWER SUPPLY
-XDC1-4	CONTROL VOLTAGE 24V DC (UPS)
-XT	TRANSFER TERMINAL BLOCK 24V DC / 230V AC

WIRING COLOR

L1 / L2 / L3	=	BLACK
N	=	LIGHT BLUE (IEC) / GREY (UL)
PE	=	YELLOW-GREEN
EXTERNAL VOLTAGE	=	ORANGE
CONTROL VOLTAGE 24 V DC	=	DARK BLUE
ANALOG SIGNALS	=	WHITE

PLACE

+CTRL	=	Control cabinet
+CON	=	Converter cabinet
+IND	=	Inductor cabinet
+CIR	=	Circuit breaker cabinet
+COSY	=	Cooling System
+FAN	=	External fan
